#### 1 Overview

- 1.1 Intended Audience
- 1.2 Reference Documents
  - 1.2.1 Documentation Conventions
- 1.3 Conventions
  - 1.3.1 Numbering
  - 1.3.2 Arithmetic And Logical Operators
  - 1.3.2.1 Operator Precedence and Associativity
  - 1.3.3 Register Mnemonics
  - 1.3.3.1 Logical Mnemonic
  - 1.3.3.2 Physical Mnemonic
  - 1.3.4 Register Format
  - 1.3.4.1 A Register is a group of Register Instances
  - 1.3.4.2 Register Physical Mnemonic, Title, and Name
  - 1.3.4.3 Full Width Register Attributes
  - 1.3.4.4 Register Description
  - 1.3.4.5 Register Instance Table
  - 1.3.4.5.1 Content Ordering in a Row
  - 1.3.4.5.2 Multiple Instances Per Row
  - 1.3.4.5.3 MSR Access Method
  - 1.3.4.5.3.1 MSR Per-Thread Example
  - 1.3.4.5.3.2 MSR Range Example
  - 1.3.4.5.4 BAR Access Method
  - 1.3.4.5.4.1 BAR as a Register Reference
  - 1.3.4.5.5 PCICFG Access Method
  - 1.3.4.5.5.1 PCICFG Bus Implied to be 00h
  - 1.3.4.5.6 Data Port Access Method
  - 1.3.4.6 Register Field Format
  - 1.3.4.7 Simple Register Field Format
  - 1.3.4.8 Complex Register Field Format
  - 1.3.4.9 Field Name is Reserved
  - 1.3.4.10 Field Access Type
  - 1.3.4.10.1 Conditional Access Type Expression
  - 1.3.4.11 Field Reset
  - 1.3.4.12 Field Initialization
  - 1.3.4.13 Field Check
  - 1.3.4.14 Field Valid Values
- 1.4 Definitions
- 1.5 Changes Between Revisions and Product Variations
- 1.5.1 Revision Conventions
- 1.6 Package

1.8

- 1.6.1 Package type
- 1.7 Processor Overview
  - 1.7.1 Features
  - System Overview
    - 1.8.1 AM4 Desktop
    - 1.8.2 SP3 MCM Server Single-Socket
    - 1.8.2.1 SP3 1P Coherent Interconnect Topology
    - 1.8.2.2 SP3 1P Memory Support
    - 1.8.2.3 SP3 1P I/O Support

1.8.3 Mixed Processor Revision Support

# 2 Core Complex (CCX)

- 2.1 Processor x86 Core
  - 2.1.1 Core Functional Information
  - 2.1.2 Core Definitions
  - 2.1.3 Secure Virtual Machine Mode (SVM)
  - 2.1.3.1 BIOS support for SVM Disable
  - 2.1.3.1.1 Enable AMD Virtualization<sup>™</sup>
  - 2.1.3.1.2 Disable AMD Virtualization<sup>™</sup>
  - 2.1.3.1.3 Disable AMD Virtualization<sup>™</sup>, with a user supplied key
  - 2.1.4 Memory Encryption
  - 2.1.5 Effective Frequency
  - 2.1.6 Address Space
  - 2.1.6.1 Virtual Address Space
  - 2.1.6.2 Physical Address Space
  - 2.1.6.3 System Address Map
  - 2.1.6.3.1 Memory Access to the Physical Address Space
  - 2.1.6.3.1.1 Determining Memory Type
  - 2.1.7 Configuration Space
  - 2.1.7.1 MMIO Configuration Coding Requirements
  - 2.1.7.2 MMIO Configuration Ordering
  - 2.1.7.3 Processor Configuration Space
  - 2.1.8 PCI Configuration Legacy Access
  - 2.1.9 System Software Interaction With SMT Enabled
  - 2.1.10 Register Sharing
  - 2.1.11 Timers
  - 2.1.12 Interrupts
  - 2.1.12.1 System Management Mode (SMM)
  - 2.1.12.1.1 SMM Overview
  - 2.1.12.1.2 Mode and Default Register Values
  - 2.1.12.1.3 SMI Sources And Delivery
  - 2.1.12.1.4 SMM Initial State
  - 2.1.12.1.5 SMM Save State
  - 2.1.12.1.6 System Management State
  - 2.1.12.1.7 Exceptions and Interrupts in SMM
  - 2.1.12.1.8 The Protected ASeg and TSeg Areas
  - 2.1.12.1.9 SMM Special Cycles
  - 2.1.12.1.10 Locking SMM
  - 2.1.12.2 Local APIC
  - 2.1.12.2.1 Local APIC Functional Description
  - 2.1.12.2.1.1 Detecting and Enabling
  - 2.1.12.2.1.2 APIC Register Space
  - 2.1.12.2.1.3 ApicId Enumeration Requirements
  - 2.1.12.2.1.4 Physical Destination Mode
  - 2.1.12.2.1.5 Logical Destination Mode
  - 2.1.12.2.1.6 Interrupt Delivery
  - 2.1.12.2.1.7 Vectored Interrupt Handling
  - 2.1.12.2.1.8 Interrupt Masking
  - 2.1.12.2.1.9 Spurious Interrupts
  - 2.1.12.2.1.10 Spurious Interrupts Caused by Timer Tick Interrupt
  - 2.1.12.2.1.11 Lowest-Priority Interrupt Arbitration

# 1 Overview

# 1.1 Intended Audience

This document provides the processor behavioral definition and associated design notes. It is intended for platform designers and for programmers involved in the development of BIOS functions, drivers, and operating system kernel modules.

Table 1: Reference Documents Listing

# **1.2.1** Documentation Conventions

When referencing information found in external documents listed in Reference Documents, the "=>" operator is used. This notation represents the item to be searched for in the reference document. For example:

docExDoc => Header1 => Header2

is to have the reader use the search facility when opening referenced document "docExDoc" and search for "Header2". "Header2" may appear more than once in "docExDoc", therefore, referencing the one that follows "Header1". In that case, the easiest way to get to Header2 is to use the search to locate Header1, then again to locate "Header2".

# 1.3 Conventions

# 1.3.1 Numbering

- Binary numbers: Binary numbers are indicated either by appending a "b" at the end (e.g., 0110b) or by verilog syntax (e.g., 4'b0110).
- Hexadecimal numbers: Hexadecimal numbers are indicated by appending an "h" to the end (e.g., 45F8h) or by verilog syntax (e.g., 16'h45F8).
- Decimal numbers: A number is decimal if not specified to be binary or hex.
- Exception: Physical register mnemonics are implied to be hex without the h suffix.
- Underscores in numbers: Underscores are used to break up numbers to make them more readable. They do not imply any operation (e.g., 0110\_1100).

# 1.3.2 Arithmetic And Logical Operators

In this document, formulas generally follow Verilog conventions for logic equations.

| Operator                | Definition  |
|-------------------------|---|
| {}                      | Concatenation. Curly brackets are used to indicate a group of bits that are concatenated together.<br>Each set of bits is separated by a comma (e.g., {Addr[3:2], Xlate[3:0]} represents a 6-bit values;<br>the two MSBs are Addr[3:2] and the four LSBs are Xlate[3:0]). |
| 1                       | Bitwise OR (e.g., 01b   10b == 11b).  |
|                         | Logical OR (e.g., 01b    10b == 1b). It treats a multi-bit operand as 1 if >= 1 and produces a 1-bit result.  |
| &                       | Bitwise AND (e.g., 01b & 10b == 00b).   |
| &&                      | Logical AND (e.g., 01b && 10b == 1b). It treats a multi-bit operand as 1 if >= 1 and produces a 1-bit result.   |
| Λ                       | Bitwise exclusive-OR (e.g., $01b \land 10b == 11b$ ). Sometimes used as "raised to the power of" as well, as indicated by the context in which it is used (e.g., $2^2 == 4$ ).  |
| ~                       | Bitwise NOT (also known as one's complement). (e.g., ~10b == 01b).  |
| !                       | Logical NOT (e.g., !10b == 0b). It treats a multi-bit operand as 1 if >= 1 and produces a 1-bit result.   |
| <, <=, >,<br>>=, ==, != | Relational. Less than, Less than or equal, greater, greater than or equal, equal, and not equal.  |
| +, -, *, /,<br>%        | Arithmetic. Addition, subtraction, multiplication, division, and modulus.   |
| <<                      | Bitwise left shift. Shift left first operand by the number of bits specified by the 2nd operand (e.g., $01b \ll 01b == 10b$ ).  |
| >>                      | Bitwise right shift. Shift right first operand by the number of bits specified by the 2nd operand (e.g., $10b >> 01b == 01b$ ).   |
| ?:                      | Ternary conditional (e.g., condition ? value if true : value if false).   |

Table 2: Arithmetic and Logical Operator Definitions

# *Table 3: Function Definitions*

| Term  | Description  |
|-------|--|
| ABS   | ABS(integer expression): Remove sign from signed value.  |
| FLOOR | FLOOR(integer expression): Rounds real number down to nearest integer.   |
| CEIL  | CEIL(real expression): Rounds real number up to nearest integer.   |
| MIN   | MIN(integer expression list): Picks minimum integer or real value of comma separated list.                     |
| MAX   | MAX(integer expression list): Picks maximum integer or real value of comma separated list.                     |
| COUNT | COUNT(integer expression): Returns the number of binary 1's in the integer.                                    |
| ROUND | ROUND(real expression): Rounds to the nearest integer; halfway rounds away from zero.                          |
| UNIT  | UNIT(register field reference): Input operand is a register field reference that contains a valid values table |

|     | that defines a value with a unit (e.g., clocks, ns, ms, etc). This function takes the value in the register field and |
|-----|---|
|     | returns the value associated with the unit (e.g., If the field had a valid value definition where 1010b was           |
|     | defined as 5 ns). Then if the field had the value of 1010b, then UNIT() would return the value 5.                     |
| POW | POW(base, exponent): POW(x,y) returns the value x to the power of y.  |

# **1.3.2.1 Operator Precedence and Associativity**

This document follows C operator precedence and associativity. The following table lists operator precedence (highest to lowest). Their associativity indicates in what order operators of equal precedence in an expression are applied. Parentheses are also used to group subexpressions to force a different precedence; such parenthetical expressions can be nested and are evaluated from inner to outer (e.g., "X = A  $\parallel$  !B && C" is the same as "X = A  $\parallel$  ((!B) && C)").

| Operator   | Description                             | Associativity |
|------------|---|---------------|
| !, ~       | Logical negation/bitwise complement     | right to left |
| *,/,%      | Multiplication/division/modulus         | left to right |
| +, -       | Addition/subtraction                    | left to right |
| <<, >>     | Bitwise shift left, Bitwise shift right | left to right |
| < , <=, >, | Relational operators                    | left to right |
| >=, ==, != |   |               |
| &          | Bitwise AND                             | left to right |
| ^          | Bitwise exclusive OR                    | left to right |
| 1          | Bitwise inclusive OR                    | left to right |
| &&         | Logical AND                             | left to right |
|            | Logical OR                              | left to right |
| ?:         | Ternary conditional                     | right to left |

Table 4: Operator Precedence and Associativity

# 1.3.3 Register Mnemonics

A register mnemonic is a short name that uniquely refers to a register, either all instances of that register, some instances, or a single instance.

Every register instance can be expressed in 2 forms, logical and physical, as defined below.

Table 5: Register Mnemonic Definitions

| Term              | Description   |
|-------------------|---|
| logical mnemonic  | The register mnemonic format that describes the register functionally, what namespace to        |
|                   | which the register belongs, a name for the register that connotes its function, and optionally, |
|                   | named parameters that indicate the different function of each instance (e.g.,                   |
|                   | Link::Phy::PciDevVendIDF3). See 1.3.3.1 [Logical Mnemonic].                                     |
| physical mnemonic | The register mnemonic that is formed based on the physical address used to access the           |
|                   | register (e.g., D18F3x00). See 1.3.3.2 [Physical Mnemonic].                                     |

#### 1.3.3.1 Logical Mnemonic

The logical mnemonic format consists of a register namespace, a register name, and optionally a register instance specifier (e.g., register namespace::register name register instance specifier).

For Unb::PciDevVendIDF3:

- The register namespace is Unb, which is the UNB IP register namespace.
- The register name is PciDevVendIDF3, which reads as PCICFG device and vendor ID in Function 3.
- There is no register instance specifier because there is just a single instance of this register.

For Dct::Phy::CalMisc2\_dct[1:0]\_chiplet[BCST,3:0]\_pad[BCST,11:0]:

- The register namespace is Dct::Phy, which is the DCT PHY register namespace.
- The register name is CalMisc2, which reads as miscellaneous calibration register 2.
- The register instance specifier is \_dct[1:0]\_chiplet[BCST,3:0]\_pad[BCST,11:0], which indicates that there are 2 DCTPHY instances, each IP for this register has 5 chiplets (0-3 and BCST), and for each chiplet 13 pads (0-11 and BCST). This register has 130 instances. (2\*5\*13)

| Term                                     | Description   |
|--|---|
| register namespace                       | A namespace for which the register name must be unique. A register namespace indicates to which IP it belongs and an IP may have multiple namespaces. A namespace is a string that supports a list of "::" separated names. The convention is for the list of names to be hierarchical, with the most significant name first and the least significant name last (e.g., Link::Phy::Rx is the RX component in the Link PHY).               |
| register name                            | A name that cannotes the function of the register.  |
| register instance specifier              | The register instance specifier exists when there is more than one instance for a register. The register instance specifier consists of one or more register instance parameter specifier (e.g., The register instance specifierdct[1:0]_chiplet[BCST,3:0]_pad[BCST,11:0] consists of 3 register instance parameter specifiers, _dct[1:0], _chiplet[BCST,3:0], and _pad[BCST,11:0]).  |
| register instance parameter<br>specifier | A register instance parameter specifier is of the form _register parameter<br>name[register parameter value list] (e.g., The register instance parameter specifier<br>_dct[1:0] has a register parameter name of dct (The DCT PHY instance name) and<br>a register parameter value list of "1:0" or 2 instances of DCT PHY).  |
| register parameter name                  | A register parameter name is the name of the number of instances at some level of<br>the logical hierarchy (e.g., The register parameter name dct specifies how many<br>instances of the DCT PHY exist).  |
| register parameter value list            | The register parameter value list is the logical name for each instance of the register parameter name (e.g., For _dct[1:0], there are 2 DCT PHY instances, with the logical names 0 and 1, but it should be noted that the logical names 0 and 1 can correspond to physical values other than 0 and 1). It is the purpose of the AddressMappingTable to map these register parameter values to physical address values for the register. |

Table 6: Logical Mnemonic Definitions

# 1.3.3.2 Physical Mnemonic

The physical register mnemonic format varies by the access method. The following table describes the supported physical register mnemonic formats.

| Term   | Description  |
|--------|--|
| PCICFG | The PCICFG, or PCI defined configuration space, physical register mnemonic format    |
|        | is of the form DXFYxZZZ.   |
| BAR    | The BAR, or base address register, physical register mnemonic format is of the form  |
|        | PREFIXxZZZ.  |
| MSR    | The MSR, or x86 model specific register, physical register mnemonic format is of the |

Table 7: Physical Mnemonic Definitions

|       | form MSRXXXX_XXXX, where XXXX_XXXX is the hexadecimal MSR number.<br>This space is accessed through x86 defined RDMSR and WRMSR instructions.  |
|-------|--|
| РМС   | The PMC, or x86 performance monitor counter, physical register mnemonic format is any of the forms {PMCxXXX, L2IPMCxXXX, NBPMCxXXX}, where XXX is the performance monitor select.                            |
| CPUID | The CPUID, or x86 processor identification state, physical register mnemonic format is of the form CPUID FnXXXX_XXX_EiX[_xYYY], where XXXX_XXXX is the hex value in the EAX and YYY is the hex value in ECX. |

# 1.3.4 Register Format

A register is a group of register instances that have the same field format (same bit indices and field names).

#### **1.3.4.1** A Register is a group of Register Instances

All instances of a register:

- Have the same:
  - Field bit indices and names
  - Field titles, descriptions, valid values.
  - Register title
  - Register description
  - Fields may have different: (instance specific)
    - Access Type. See 1.3.4.10 [Field Access Type].
    - Reset. See 1.3.4.11 [Field Reset].
    - Init. See 1.3.4.12 [Field Initialization].
    - Check. See 1.3.4.13 [Field Check].

#### 1.3.4.2 Register Physical Mnemonic, Title, and Name

A register definition is identified by a table that starts with a heavy bold line. The information above the bold line in order is:

- 1. The physical mnemonic of the register.
  - A register that has multiple instances, may have instances that have different access methods, each with it's own physical mnemonic format.
  - In the event that there are multiple physical mnemonic formats, the physical mnemonic format chosen is the most commonly used physical mnemonic.
  - The physical mnemonic is not intended to represent the physical mnemonics of all instances of the register. It is only a visual aid to identify a register when scanning down a list, for readers that prefer to find registers by physical mnemonic. If "..." occurs in the physical mnemonic, the range is first ... last. There is no implication as to how many instances exist between first and last. See 1.3.4.5 [Register Instance Table].
- 2. The register title in brackets.
- 3. The register name in parenthesis.

| Physical M | nemonic Title Name  |
|------------|---|
| MSR00      | 00_0010[[Time Stamp Counter]](TSC)  |
| Read-w     | rite,Volatile. Reset: 0000_0000_0000_0000h.   |
| Core::X86  | ::Msr::TSC_lthree[1:0]_core[3:0]_thread[1:0]; MSR00000010   |
| Bits       | Description   |
| 63:0       | TSC: time stamp counter. Read-write, Volatile. Reset: 0. The TSC increments at the P0 frequency. The      |
|            | TSC counts at the same rate in all P-states, all C states, S0, or S1. A read of this MSR in guest mode is |
|            | affected by Core::X86::Msr::TscRateMsr. The value (TSC/TSCRatio) is the TSC P0 frequency based            |
|            | value (as if TSCRatio == 1.0) when (TSCRatio != 1.0).   |

Figure 1: Register Physical Mnemonic, Title, and Name

#### 1.3.4.3 Full Width Register Attributes

The first line that follows the bold line contains the attributes that apply to all fields of the register. This row is rendered as a convenience to the reader and replicates content that exists in the register field.

- AccessType: If all non-reserved fields of a register have the same access type, then the access type is rendered in this row.
  - The supported access types are specified by 1.3.4.10 [Field Access Type].
  - The example figure shows that the access type "Read-write, Volatile" applies to all non-reserved fields of the register.
- Reset: If all non-reserved fields of a register have a constant reset and are all the same type (Warm, Cold, Fixed), then the full width register reset is rendered in this row. The example figure shows the reset "0000\_0000\_0000\_0000h". See 1.3.4.11 [Field Reset].
  - The value zero (0) is assumed for display purposes for all reserved fields.
- If none of the above content is rendered, then this row of the register is not rendered.

#### MSR0000\_0010 [Time Stamp Counter] (TSC)

| Read-wi     | Read-write,Volatile.]Reset: 0000_0000_0000_0000h.   |  |
|-------------|---|--|
| Core::X86:: | Msr::TSC_lthree[1:0]_core[3:0]_thread[1:0]; MSR00000010   |  |
| Bits        | Bits Description  |  |
| 63:0        | <b>TSC</b> : <b>time stamp counter</b> . Read-write, Volatile. Reset: 0. The TSC increments at the P0 frequency. The TSC counts at the same rate in all P-states, all C states, S0, or S1. A read of this MSR in guest mode is affected by Core::X86::Msr::TscRateMsr. The value (TSC/TSCRatio) is the TSC P0 frequency based value (as if TSCRatio == 1.0) when (TSCRatio != 1.0). |  |

# Figure 2: Full Width Register Attributes

#### 1.3.4.4 Register Description

The register description is optional and appears after the "full width register attributes" row and before the "register instance table" rows. The register description can be one or more paragraphs.

#### PciDevVendIDF3 [Device/Vendor ID]

| Read-onl     | y. Reset: 0000_1022h.   |  |  |
|--------------|---|--|--|
| A register   | A register description.   |  |  |
| That can     | That can be multiple paragraphs.                                  |  |  |
| Link::Phy::T | Link::Phy::Tx::PciDevVendIDF3; D18F3x00                           |  |  |
| Bits         | Description   |  |  |
| 31:16        | DeviceID: device ID. Read-only. Reset: Fixed,0000h.               |  |  |
| 15:0         | VendorID: vendor ID. Read-only. Reset: Fixed, 1022h. Init: 1234h. |  |  |

# *Figure 3: Register Description*

#### 1.3.4.5 **Register Instance Table**

The zero or more rows of 8-pt font before the Bits/Description row is the register instance table.

The register instance table can generally be described as follows:

- Each row describes the access method of one or more register instances.
- If a row describes two or more instances, then the logical instance range, left to right, corresponds to the physical range, left to right.
- The absence of register instance rows indicates that the register exists for documentation purposes, and no access method is described for the register.

Because there are multiple access methods for all the registers, each of the following subsections describes an aspect of the register instance table in isolation.

#### 1.3.4.5.1 Content Ordering in a Row

٠

Content in a register instance table row is ordered as follows:

- The text up to the first semicolon is the logical mnemonic.
  - See 1.3.3.1 [Logical Mnemonic].
- The text after the first semicolon is the physical mnemonic.
  - See 1.3.3.2 [Physical Mnemonic].
- Optionally, content after the physical mnemonic provides additional information about the access method for the register instances in the row.

#### BXXD00F0x000 (NB\_VENDOR\_ID)

| Read-only. Reset: 1022h.  |  |  |
|---|--|--|
| Vendor ID Register  |  |  |
| IOHC::NB_VENDOR_ID_aliasHOS[T; BXXD00F0x000; BXX=IOHC::NB_BUS_NUM_CNTL_aliasSMN[NB_BUS_NUM] |  |  |
| IOHC::NB_VENDOR_ID_aliasSMV; NBCFGx000000000; NBCFG=13B0_0000h                              |  |  |

*Figure 4: Register Instance Table: Content Ordering in a Row* 

#### 1.3.4.5.2 Multiple Instances Per Row

Multiple instances in a row is represented by a single dimension "range" in the logical mnemonic and the physical mnemonic.

The single dimension order of instances is the same for both the logical and physical mnemonic. The first logical

mnemonic is associated with the first physical mnemonic, so forth for the 2nd, up until the last.

- Brackets indicates a list, most significant to least significant.
- The ":" character indicates a continuous range between 2 values.
- The "," character separates non-contiguous values.
- There are some cases where more than one logical mnemonic maps to a single physical mnemonic.

Note that it is implied that the MSR {lthree,core,thread} parameters are not part of a range.

#### Example:

NAMESP::REGNAME\_inst[BLOCK[5:0],BCST]\_aliasHOST; FFF1x00000088\_x[000[B:6]\_0001,00000000]

- There are 7 instances.
- NAMESP is the namespace.
- 6 instances are represented by the sub-range 000[B:6]\_0001.
- \_instBCST corresponds to FFF1x00000088\_x00000000.
- \_inst BLOCK 0 corresponds to FFF1x00000088\_x00060001.
- ...
- \_inst BLOCK 5 corresponds to FFF1x00000088\_x000B0001.

# 1.3.4.5.3 MSR Access Method

The MSR parameters {lthree,core,thread} are implied by the identity of the core on which the RDMSR/WRMSR is being executed, and therefore are not represented in the physical mnemonic.

MSRs that are:

- per-thread have the {lthree,core,thread} parameters.
- per-core do not have the thread parameter.
- per-L3 do not have the {core,thread} parameters.
- common to all L3's do not have the {lthree,core,thread} parameters.

# 1.3.4.5.3.1 MSR Per-Thread Example

An MSR that is per-thread has all three {lthree,core,thread} parameters and all instances have the same physical mnemonic.

#### MSR0000\_0010 [Time Stamp Counter] (TSC)

| Read-write, Volatile. Reset: 0000_0000_0000_0000h.   |   |  |  |
|--|---|--|--|
| Core::X86::1   | Core::X86::Msr::TSC_lthree[1:0]_core[3:0]_thread[1:0];[MSR00000010]                                       |  |  |
| Bits   | its Description   |  |  |
| 63:0 TSC: time stamp counter. Read-write, Volatile. Reset: 0. The TSC increments at the P0 frequence |   |  |  |
|  | TSC counts at the same rate in all P-states, all C states, S0, or S1. A read of this MSR in guest mode is |  |  |
|  | affected by Core::X86::Msr::TscRateMsr. The value (TSC/TSCRatio) is the TSC P0 frequency based            |  |  |
|  | value (as if TSCRatio == 1.0) when (TSCRatio != 1.0).   |  |  |

*Figure 5: Register Instance Table: MSR Example* 

# 1.3.4.5.3.2 MSR Range Example

An MSR can exist as a range for a parameter other than the {lthree,core,thread} parameters.

In the following example the n parameter is a range. The \_n0 value corresponds to MSR0000\_0201, and so on.

#### MSR0000\_0201 [Variable-Size MTRRs Mask] (MtrrVarMask)

Reset: 0000\_0000\_0000 0000h. Core::X86::Msr::MtrrVarMask\_n[7:0]\_three[1:0]\_core[3:0]; MSR0000\_020[[F,D,B,9,7,5,3,1]]

*Figure 6: Register Instance Table: MSR Range Example* 

#### 1.3.4.5.4 BAR Access Method

The BAR access method is indicated by a physical mnemonic that has the form PREFIXxNUMBER.

• Example: APICx0000. The BAR prefix is "APIC".

The BAR prefix represents either a constant or an expression that consists of a register reference.

#### **1.3.4.5.4.1** BAR as a Register Reference

A relocatable BAR is when the base of an IP is not a constant.

• The prefix NTBPRIBAR0 represents the base of the IP, the value of which comes from the register NBIFEPFNCFG::BASE\_ADDR\_1\_aliasHOST\_instNBIF0\_func1[BASE\_ADDR].

#### NTBPRIBAR0x00000 (NTB\_SMU\_PCTRL0)

| Reset: 0000_0000h.   |
|--|
| NTB::NTB_SMU_PCTRL0_aliasHOSTPRI <mark>, NTBPRIBAR0</mark> x00000;       |
| NTBPRIBAR0=NBIFEPFNCFG::BASE_ADDR_1_aliasHOST_instNBIF0_func1[BASE_ADDR] |
| NTB::NTB_SMU_PCTRL0_aliasHOSTSEC; NTBSECBAR0x00000;                      |
| NTBSECBAR0=NBIFEPFNCFG::BASE ADDR 1 aliasHOST instNBIF2 func1[BASE ADDR] |
| NTB::NTB_SMU_PCTRL0_aliasSMN; NTBx00000000; NTB=0400_0000h               |

*Figure 7: Register Instance Table: BAR as Register Reference* 

#### 1.3.4.5.5 PCICFG Access Method

The PCICFG access method is indicated by a physical mnemonic that has the form DXXFXxNUMBER. There are 2 cases:

- Bus omitted and implied to be 00h.
- Bus represented as BXX and indicates that the bus is indicated by a register field.

Example:

- Example: D18F0x000. (The bus, when omitted, is implied to be 00h)
- Example: BXXD0F0x000. (The bus as an expression that includes a register reference)

#### 1.3.4.5.5.1 PCICFG Bus Implied to be 00h

#### Example:

• The absence of a B before the D14 implies that the bus is 0. FCH::ITF::LPC::PciDevVendID\_aliasHOST\_D14F3x000

Figure 8: Register Instance Table: Bus Implied to be 00h

# 1.3.4.5.6 Data Port Access Method

A data port requires that the data port select be written before the register is accessed via the data port.

Example:

- The data port select value follows the "\_x".
- The data port select register follows the "DataPortWrite=".

```
DF::FabricBlockInstanceCount_inst[PIE0,BCST]_aliasHOST; D18F0x040_x[00050001,00000000]; DataPortWrite=DF::FabricConfigAccessControl
DF::FabricBlockInstanceCount_inst[PIE0,BCST]_aliasSMN; DFF0x00000040_x[00050001,00000000]; DFF0=0001_C000h;
DataPortWrite=DF::FabricConfigAccessControl
```

Figure 9: Register Instance Table: Data Port Select

# 1.3.4.6 Register Field Format

The register field definition are all rows that follow the Bits/Description row. Each field row represents the definition of a bit range, with the bit ranges ordered from most to least significant. There are 2 columns, with the left column defining the field bit range, and the right column containing the field definition.

There are 2 field definition formats, simple and complex. If the description can be described in the simple one paragraph format then the simple format is used, else the complex format is used.

# 1.3.4.7 Simple Register Field Format

The simple register format compresses all content into a single paragraph with the following implied order:

- 1. Field name (required)
  - Allowed to be Reserved. See 1.3.4.9 [Field Name is Reserved].
  - "FFXSE" in the example figure.
- 2. Field title
  - "fast FXSAVE/FRSTOR enable" in the example figure.
- 3. Field Access Type. See 1.3.4.10 [Field Access Type].
  - In the example figure the access type is "Read-write".
- 4. Field Reset. See 1.3.4.11 [Field Reset].
  - In the example figure the reset is warm reset and "0".
- 5. Field Init. See 1.3.4.12 [Field Initialization].
- 6. Field Check. See 1.3.4.13 [Field Check].
- 7. Field Valid Values, if the valid values are single bit (E.g. 0=, 1=). See 1.3.4.14 [Field Valid Values].
  - In the example figure the 1= definition begins with "Enables" and ends with "mechanism".
    - In the example figure there is no 0= definition.
- 8. Field description, if it is a single paragraph.
  - In the example figure the field description begins with "This is" and ends with "afterwards".

All fields that don't exist are omitted.

14 FFXSE: fast FXSAVE/FRSTOR enable. Read-write Reset: 0. 1=Enables the fast FXSAVE/FRSTOR mechanism. A 64-bit operating system may enable the fast FXSAVE/FRSTOR mechanism if (Core::X86::Cpuid::FeatureExtIdEdx[FFXSR] == 1). This bit is set once by the operating system and its value is not changed afterwards.

# 1.3.4.8 Complex Register Field Format

Content that can't be expressed in the single paragraph format is broken out to a separate sub-row (a definition column row).

Additional sub-rows are added in the following order:

- 1. Complex expression for {Reset,AccessType,Init,Check}.
- 2. Instance specific {Reset,AccessType,Init,Check} values.
- 3. Description, if more than 1 paragraph.
- 4. Valid values, if more than 0=/1=. Or a Valid bit table. (see figure)

The following figure highlights a complex access type specification.

63:0 APerfReadOnly: read-only actual core clocks counter. Reset: 0. This register increments in proportion to the actual number of core clocks cycles while the core is in C0. See Core::X86::Msr::MPerfReadOnly. This register is not affected by writes to Core::X86::Msr::APERF. AccessType: Core::X86::Msr::HWCR[EffFreqReadOnlyLock] ? Read-only, Volatile : Read-write, Volatile.

Figure 11: Register Field Sub-Row for {Reset, AccessType, Init, Check}

The following figure highlights a complex description specification.

| 4 | <b>INVDWBINVD: INVD to WBINVD conversion</b> . Read-write. Reset: 1. Check: 1. 1=Convert INVD to WBINVD.     |  |  |
|---|--|--|--|
|   | <b>Description</b> : This bit is required to be set for normal operation when any of the following are true: |  |  |
|   | <ul> <li>An L2 is shared by multiple threads.</li> </ul>   |  |  |
|   | <ul> <li>An L3 is shared by multiple cores.</li> </ul>   |  |  |
|   | CC6 is enabled.  |  |  |
|   | Probe filter is enabled.   |  |  |

Figure 12: Register Field Sub-Row for Description

The following figure highlights a complex valid value table, used either when the field is more than 1 bit or when the definition is more than a single sentence.

| 2:1 CpuWdtTimeBase: CPU watchdog timer time base. Read-write. Reset: 0. Specifies the time |   |                |  |
|--|---|----------------|--|
|  | the timeout period specified in CpuWdtCountSel. |                |  |
|  | ValidValues:                                    |                |  |
|  | Value   | Description    |  |
|  | 00ь   | 1.31ms         |  |
|  | 01b   | 1.28us         |  |
|  | 10b   | Reserved (5ns) |  |
|  | 11b   | Reserved       |  |

Figure 13: Register Field Sub-Row for Valid Value Table

The following figure highlights a valid bit table which is used when each bit has a specific function.

| Reserved     | 1.  |
|--------------|---|
| SliceMa      | sk. Read-write. Reset: 0.                       |

Figure 14: Register Field Sub-Row for Valid Bit Table

#### 1.3.4.9 Field Name is Reserved

When a register field name is Reserved, and it does not explicitly specify an access type, then the implied access type is "Reserved-write-as-read".

- The Reserved-write-as-read access type is:
  - Reads must not depend on the read value.
  - Writes must only write the value that was read.

# 1.3.4.10 Field Access Type

•

The AccessType keyword is optional and specifies the access type for a register field. The access type for a field is a comma separated list of the following access types.

| Term                    | Description   |
|-------------------------|---|
| Read-only               | Readable; writes are ignored.   |
| <b>Read-write</b>       | Readable and writable.  |
| Read                    | Readable; must be associated with one of the following {Write-once, Write-1-only, Write-1-to-clear, Error-on-write}.        |
| Write-once              | Capable of being written once; all subsequent writes have no effect. If not associated with Read, then reads are undefined. |
| Write-only              | Writable. Reads are undefined.  |
| Write-1-only            | Writing a 1 sets to a 1; Writing a 0 has no effect. If not associated with Read, then reads are undefined.                  |
| Write-1-to-clear        | Writing a 1 clears to a 0; Writing a 0 has no effect. If not associated with Read, then reads are undefined.                |
| Write-0-only            | Writing a 0 clears to a 0; Writing a 1 has no effect. If not associated with Read, then reads are undefined.                |
| Error-on-read           | Error occurs on read.   |
| Error-on-write          | Error occurs on write.  |
| Error-on-write-0        | Error occurs on bitwise write of 0.   |
| Error-on-write-1        | Error occurs on bitwise write of 1.   |
| Inaccessible            | Not readable or writable (e.g., Hide ? Inaccessible : Read-Write).  |
| Configurable            | Indicates that the access type is configurable as described by the documentation.   |
| Unpredictable           | The behavior of both reads and writes is unpredictable.   |
| Reserved-write-<br>as-1 | Reads are undefined. Must always write 1.   |

Table 8: AccessType Definitions

| ] | Reserved-write- | Reads are undefined. Must always write 0.   |
|---|-----------------|---|
|   | as-0            |   |
|   | Volatile        | Indicates that a register field value may be modified by hardware, firmware, or microcode when fetching the first instruction and/or might have read or write side effects. No read may depend on the results of a previous read and no write may be omitted based on the value of a previous read or |
|   |                 | write.  |

#### 1.3.4.10.1 Conditional Access Type Expression

The ternary operator can be used to express an access type that is conditional on an expression that can contain any of the following:

- A register field value
- A constant
- A definition

#### 1.3.4.11 Field Reset

The Reset keyword is optional and specifies the value for a register field at the time that hardware exits reset, before firmware initialization initiates.

Unless preceded by one of the following prefixes, the reset value is called warm reset and the value is applied at both warm and cold reset.

Table 9: Reset Type Definitions

| Туре  | Description  |
|-------|--|
| Cold  | Cold reset. The value is applied only at cold reset. |
| Fixed | The value applies at all time.                       |

#### 1.3.4.12 Field Initialization

The Init keyword is optional and specifies an initialization recommendation for a register field.

If present, then there is an optional prefix that specifies the owner of the initialization. See Table 10 [Init Type Definitions].

• Example: Init: BIOS,2'b00. //A initialization recommendation for a field to be programmed by BIOS.

| Туре  | Description   |
|-------|---|
| BIOS  | Initialized by AMD provided AMD Generic Encapsulated Software Architecture (AGESA™) |
|       | x86 software.   |
| SBIOS | Initialized by OEM or IBV provided x86 software, also called Platform BIOS.         |
| OS    | Initialized by OS or Driver.  |

Table 10: Init Type Definitions

#### 1.3.4.13 Field Check

The Check keyword is optional and specifies the value that is recommended for firmware/software to write for a register field. It is a recommendation, not a requirement, and may not under all circumstances be what software programs.

# 1.3.4.14 Field Valid Values

A register can optionally have either a valid values table or a valid bit table:

- A valid values table specifies the definition for specific field values.
- A valid bit table specifies the definition for specific field bits.

# 1.4 Definitions

#### Table 11: Definitions

| Term                  | Description   |
|-----------------------|---|
| AGESATM               | AMD Generic Encapsulated Software Architecture.   |
| APML                  | Advanced Platform Management Link.  |
| BCD                   | Binary Coded Decimal number format.   |
| BCS                   | Base Configuration Space.   |
| BIST                  | Built-In Self-Test. Hardware within the processor that generates test patterns and verifies that they are stored correctly (in the case of memories) or received without error (in the case of links).  |
| Boot VID              | Boot Voltage ID. This is the VDD and VDDNB voltage level that the processor requests from the external voltage regulator during the initial phase of the cold boot sequence.  |
| C-states              | These are ACPI defined core power states. C0 is operational. All other C-states are low-power states in which the processor is not executing code. See docACPI.   |
| COF                   | Current operating frequency of a given clock domain.  |
| Cold reset            | PWROK is deasserted and RESET_L is asserted.  |
| DID                   | Divisor Identifier. Specifies the post-PLL divisor used to reduce the COF.  |
| Doubleword            | A 32-bit value.   |
| DW                    | Doubleword.   |
| ECS                   | Extended Configuration Space.   |
| EDC                   | Electrical design current. Indicates the maximum current the voltage rail can demand for a short, thermally insignificant time.   |
| FCH                   | The integrated platform subsystem that contains the IO interfaces and bridges them to the system BIOS. Previously included in the Southbridge.  |
| FDS                   | Functional Data Sheet. There is one FDS for each package type. See docSAM4.   |
| FID                   | Frequency Identifier. Specifies the PLL frequency multiplier for a given clock domain.  |
| GB                    | Gbyte or Gigabyte; 1,073,741,824 bytes.   |
| GT/s                  | Giga-Transfers per second.  |
| HTC                   | Hardware Thermal Control.   |
| HTC-active state      | Hardware-controlled lower-power, lower performance state used to reduce temperature.  |
| IO configuration      | Access to configuration space though IO ports CF8h and CFCh.  |
| IP                    | In electronic design, a semiconductor Intellectual Property, IP, or IP block is a reusable unit of logic, cell, or integrated circuit layout design that is the intellectual property of one party.   |
| KB                    | Kbyte or Kilobyte; 1024 bytes.  |
| Master abort          | This is a PCI-defined term that is applied to transactions on other than PCI buses. It indicates that the transaction is terminated without affecting the intended target; reads return all 1s; write are discarded; the master abort error code is returned in the response, if applicable; master abort error bits are set if applicable. |
| MB                    | Megabyte; 1024 KB.  |
| MMIO                  | Memory-Mapped Input-Output range. This is physical address space that is mapped to the IO functions such as the IO links or MMIO configuration.   |
| MMIO<br>configuration | Access to configuration space through memory space.   |

| Node              | A node, is an integrated circuit device that includes one to 8 cores (one or two Core Complexes).   |
|-------------------|---|
| OW                | Octword. An 128-bit value.  |
| Processor         | A package containing one or more Nodes. See Node.   |
| QW                | Quadword. A 64-bit value.   |
| RX                | Receiver.   |
| REFCLK            | Reference clock. Refers to the clock frequency (100 MHz) or the clock period (10 ns) depending on the context used.   |
| Shutdown          | A state in which the affected core waits for either INIT, RESET, or NMI. When shutdown state is entered, a shutdown special cycle is sent on the IO links.                        |
| SMAF              | System Management Action Field. This is the code passed from the SMC to the processors in STPCLK assertion messages.  |
| SMC               | System Management Controller. This is the platform device that communicates system management state information to the processor through an IO link, typically the system IO hub. |
| Speculative event | A performance monitor event counter that counts all occurrences of the event even if the event occurs during speculative code execution.  |
| TCC               | Temperature Calculation Circuit.  |
| Tctl              | Processor Temperature control value.  |
| TDC               | Thermal Design Current.   |
| TDP               | Thermal Design Power. A power consumption parameter that is used in conjunction with thermal specifications to design appropriate cooling solutions for the processor.            |
| Token             | A scheduler entry used in various DF queues to track outstanding requests.  |
| ТХ                | Transmitter.  |
| UMI               | Unified Media Interface. The link between the processor and the FCH.  |
| VDD               | Main power supply to the processor core logic.  |
| VID               | Voltage level identifier.   |
| Warm reset        | RESET_L is asserted only (while PWROK stays high).  |
| XBAR              | Cross bar; command packet switch.   |
| PCIe®             | PCI Express.  |

# **1.5** Changes Between Revisions and Product Variations

### 1.5.1 **Revision Conventions**

The processor revision is specified by CPUID\_Fn0000001\_EAX (FamModStep) or CPUID\_Fn80000001\_EAX (FamModStepExt). This document uses a revision letter instead of specific model numbers. Where applicable, the processor stepping is indicated after the revision letter. All behavior marked with a revision letter apply to future revisions unless they are superseded by a change in a later revision. See the revision guide in 1.2 [Reference Documents] for additional information about revision determination.

#### 1.6 Package

#### 1.6.1 Package type

The following packages are supported.

*Table 12: Package Definitions* 

Term Description

|       | Desktop, single die, single socket. For client platform DDR4. AM4 = (Core::X86::Cpuid::BrandId[PkgType] == 02h). |
|-------|--|
| SP3   | Server, four die MCM, single and dual socket.  |
| SP3r2 | High performance desktop, 4-die, single socket, lidded LGA.  |

# 1.7 Processor Overview

#### 1.7.1 Features

Family 17h Models 00h-0Fh are a microprocessor System-On-a-Chip (SOC) featuring AMD x86 cores. It also uses a scalable data fabric (SDF), integrated IO, and integrated southbridge control hub, SCH where no supporting chipset is necessary.

- CPU:
  - 2 Core Complexes (CCX). The Core represents the x86 ISA core from AMD designed for FX and 7th generation APU offerings.
    - Supports Simultaneous Multithreading over previous generations clusters.
  - Each core complex consists of:

•

- 4 cores where each core may run in single-thread mode (1T) or two-thread SMT mode (2T) for a total of up to 8 threads per complex
- 512KB of L2 per core for a total of 2MB L2 per complex
  - 4MB L2 total
- 8MB of L3 shared across all cores within the complex
  - 16MB L3 total
- Scalable Data Fabric. This provides the data path that connects the compute complexes, the I/O interfaces, and the memory interfaces to each other.
  - Handles request, response, and data traffic
  - Handles probe traffic to facilitate coherency, including a probe filter supporting up to 512GB per DRAM channel
  - Handles interrupt request routing (APIC)
- Memory interface
  - 2 Unified Memory Controllers (UMC), each supporting one DRAM channel
    - 2 DDR4 PHYs. Each PHY supports:
      - 64-bit data plus ECC
      - 1 DRAM channel per PHY
      - 2 DIMMs per channel
        - DDR4 transfer rates from 1333MT/s to 3200MT/s
        - UDIMM,SODIMM
- PSP and SMU
  - MP0 (PSP) and MP1 (SMU) microcontrollers
    - This document refers to the AMD Secure Processor technology as Platform Security Processor (PSP).
  - Thermal monitoring
  - Fuses
  - Clock control
- NBIO
  - 2 SYSHUBs
  - 1 IOHUB
  - Two 8x16 PCIe® controllers supporting Gen1/Gen2/Gen3. Note that SATA Express is supported by combining an x2 PCIe® port and two SATA ports on the same 2 lanes.
- Enterprise 12G (E12G) Combo PHYs, PCS, and UPI muxing

- 6 x4 PHYs plus 5 x2 PHYs
- PHYs can support the following controller types: PCIe®, WAFL, xGMI, SATA, and Ethernet (SGMII 1000/100/10, 10GBASE-KR, 1000BASE-KX protocols). In addition, SATA Express can be supported by combining PCIe® and SATA controllers on the same lanes with a GPIO for a device to indicate its controller type.
- PHY muxing is provided that allows different package or board configurations to enable a single PHY to support functionality from multiple on-die controllers
- Fusion Controller Hub (FCH) or southbridge (SB))
  - ACPI
  - CLKGEN/CGPLL for refclk generation
  - eMMC
  - GPIOs (varying number depending on muxing)
    - (6 ports)
  - LPC
  - Real-Time Clock (RTC)
  - SMBus (2 ports)
  - SPI/eSPI
  - UART (4 ports)
- Azalia
  - High Definition Audio
- Ethernet complex
  - Up to 4 lanes of 10/100/1000 SGMII, or 10GBASE-KR, or 1000BASE-KX Ethernet operation
  - 2 instances of a "lite" controller configuration
  - 2 instances of a "heavy" controller configuration
- SATA
  - Up to 8 lanes of SATA Gen1/Gen2/Gen3, also provides the legacy SATA support for SATAe ports
- SGPIO
- USB3.0
  - 4 ports of USB3 SuperSpeed
  - includes support for legacy USB speeds

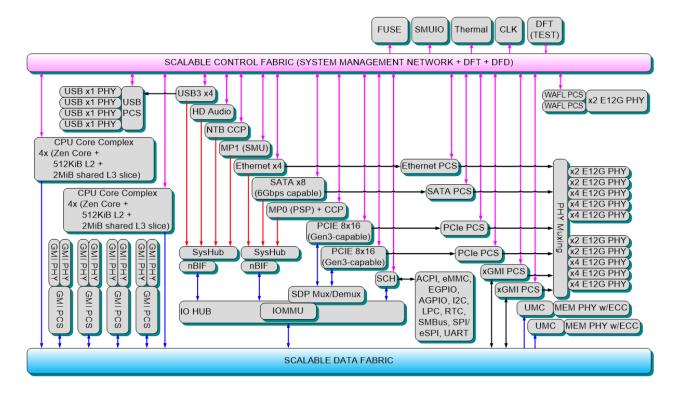

Figure 15: Family 17h Models 00h-0Fh Processor Overview

#### **1.8** System Overview

#### 1.8.1 AM4 Desktop

AM4 is a single-socket client infrastructure supporting DDR4 and PCIe $\mathbb{R}$  for non-coherent I/O communication. The AM4 package is a lidded  $\mu$ PGA package that supports AMD Family 17h Models 00h-0Fh die, and Family 17h Models 70h - 7Fh,.

|   | AM4 1P Configuration                                    |  |  |  |
|---|---|--|--|--|
| Module Type   | Single or multi-die, micro pin grid array common socket |  |  |  |
|   | infrastructure with other AM4 products                  |  |  |  |
| Cores / module  | 8   |  |  |  |
| Memory channel/module   | 2   |  |  |  |
| Max DIMMs/channel   | 2   |  |  |  |
| DIMM Type   | 1.2V up to DDR4-3200                                    |  |  |  |
| Combo links/module (note1)  | PHY groupings of 16 lanes may each have a               |  |  |  |
|   | maximum of 8 PCIe® ports, where a port consists of a    |  |  |  |
|   | power-of-2 lanes (x1, x2, x4, x8, x16) or a SATA        |  |  |  |
|   | Express port  |  |  |  |
| Max PCIe®/module  | 24 lanes: 16 for dGPU, 4 for IO expander, 4 for storage |  |  |  |
|   | (NVMe or 2 ports SATA Express)                          |  |  |  |
| Max SATA/ module (note2)  | Up to 4 Gen 3   |  |  |  |
| Native I/O  | USB3/2, SPI, LPC, I2C, RTC, Power control, etc.         |  |  |  |
| Notes:  |   |  |  |  |
| 1: Combo links can take the form of PCIe®, SATA, SATA Express with configuration            |   |  |  |  |
| restrictions.   |   |  |  |  |
| 2: These functions are in lieu of PCIe® on those ports (e.g., a group of 8 SATA displaces 8 |   |  |  |  |
| PCIe® lanes).   |   |  |  |  |

Table 13: AM4 1P Capabilities

# 1.8.2 SP3 MCM Server Single-Socket

SP3-based one socket systems target a new paradigm of high end single socket commercial servers. These servers have a large number of memory channels, memory capacity, and I/O ports and target the following form factors:

- 1U traditional rack servers.
- Blade servers.
- Multi node, 1P "twins" type of shared infrastructure servers.
- EATX or EATX+ servers.

The characteristics and capabilities of the SP3 product in 1 socket systems are shown in the following table:

Table 14: SP3 1P Capabilities

| 1                      |                                   |
|------------------------|-----------------------------------|
|                        | SP3 1P Configuration              |
| Module Type            | 4 die MCM socketed LGA            |
| Module size, pad pitch | 58.5 x 75.4 @ 1.00 x 0.87mm pitch |

| Socket size   | 78.9 x 119.3 mm, heatsink actuated                    |  |  |  |
|---|---|--|--|--|
| Cores / module  | 32 (8 per die)  |  |  |  |
| Memory chan/module  | 2 (2 per die)   |  |  |  |
| Max DIMMs/channel   | 2   |  |  |  |
| DIMM Type   | R/LR/NV DIMM, 3DS                                     |  |  |  |
| Combo links/module (note1)  | Eight – 16 bit links (2 per die)                      |  |  |  |
| xGMI links (16 bit)   | N/A   |  |  |  |
| Max PCIe®/module  | 128 lanes (32 per die)                                |  |  |  |
| Max SATA/module (note2)   | 32  |  |  |  |
| Max 10GigE/module (note2)   | 16 (note3)  |  |  |  |
| Native I/O  | USB3/2, SPI, LPC, UART, I2C, RTC, Power control, etc. |  |  |  |
| Notes:  |   |  |  |  |
| 1: Combo links can take the form of PCIe®, SATA, SATA Express, 10GBASE-KR,                  |   |  |  |  |
| 1000BASE-KX, SGMII with configuration restrictions.   |   |  |  |  |
| 2: These functions are in lieu of PCIe® on those ports (e.g., a group of 8 SATA displaces 8 |   |  |  |  |
| PCIe® lanes).   |   |  |  |  |
| 3: Half of the Ethernet ports have 16 TX/RX DMA queues (WHQL compliant for 10GBASE-         |   |  |  |  |
| KR or SGMII or 1000BASE-KX). Half have 2 TX/RX DMA queues (WHQL compliant for               |   |  |  |  |
|   |   |  |  |  |

SGMII or 1000BASE-KX only).

#### 1.8.2.1 SP3 1P Coherent Interconnect Topology

Referring to 1P System Block Diagram below: Each of the 4 dies on the SP3 MCM is interconnected by one GMI link on the substrate, creating a fully connected 4-die topology. Since this is deployed as a 1P server, xGMI mode is not utilized. Instead, the links can be deployed to double the I/O connectivity.

#### 1.8.2.2 SP3 1P Memory Support

Each die on the MCM system generates two memory channels resulting in 16 memory channels in a two socket system. Each channel can accommodate two DDR4 DIMM connectors. DDR3 is not supported. The supported DIMM types are:

- One and two rank DDR4 RDIMMs.
- Four and eight physical rank DDR4 LRDIMMs.
- DDR4 3DS DIMMs.
- NVDIMM-Ns.

#### 1.8.2.3 SP3 1P I/O Support

The I/O interfaces for the Family 17h Models 00h-0Fh die are configurable and extremely flexible. Each die generates two 16 bit "combo" links, one is type A and the other is type B.

Type A links can be configured to support:

- One 16-lane PCIe<sup>®</sup> Gen3 controller with 8 ports.
- Up to eight SATA 3 ports.
- Up to four 10Gbps-capable Ethernet ports.
- Up to two SATA Express ports.

Type B links can support:

• One 16 lane PCIe<sup>®</sup> gen 3 controller with 8 ports.

This configuration capability of the links is shown in the Link Capabilities figure below.

In one socket systems, there are 8 links, 4 type A and 4 type B, all of which can be used as I/O. As an example, a one socket system that maximizes PCIe<sup>®</sup> connectivity can support up to 128 lanes of PCIe<sup>®</sup> Gen3. This can be divided up into smaller link widths as long as there are no more than 8 ports per 16-lane group.

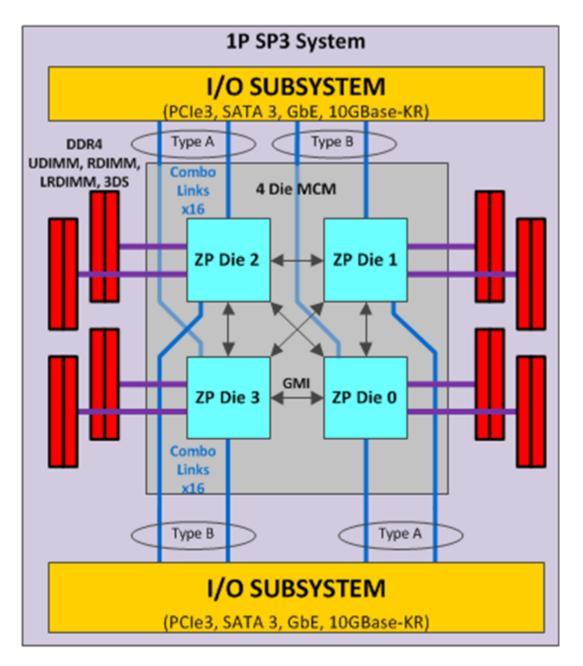

Figure 16: 1P System Block Diagram

# 1.8.3 Mixed Processor Revision Support

AMD Family 17h processors with different OPNs or different revisions cannot be mixed in a multiprocessor system. If an

PPR for AMD Family 17h Models 01h,08h B2

unsupported configuration is detected, BIOS should configure the BSP as a single processor system and signal an error.

# 2 Core Complex (CCX)

# 2.1 Processor x86 Core

# 2.1.1 Core Functional Information

# 2.1.2 Core Definitions

# Table 15: Definitions

| Term                        | Description  |  |
|-----------------------------|--|--|
| CCX                         | Core Complex where more than one core shares L3 resources.   |  |
| Core                        | The instruction execution unit of the processor when the term Core is used in a x86 core context.  |  |
| CoreCOF                     | Core current operating frequency in MHz. CoreCOF = (Core::X86::Msr::PStateDef[CpuFid[7:0]]/Core::X86::Msr::PStateDef[CpuDfsId])*200.   |  |
| CPL                         | Current Privilege Level of the running task when the term CPL is used in a x86 core context.   |  |
| CpuCoreNum                  | Specifies the core number.   |  |
| IBS                         | Instruction based sampling.  |  |
| IO configuration            | Access to configuration space through IO ports CF8h and CFCh.  |  |
| IORR                        | IO range register.   |  |
| L1 cache                    | The level 1 caches (instruction cache and the data cache).   |  |
| L2 cache                    | The level 2 caches.  |  |
| L3                          | Level 3 Cache. The L3 term is also in Addrmaps to enumerate CCX units.   |  |
| L3 cache                    | Level 3 Cache.   |  |
| Linear (virtual)<br>address | The address generated by a core after the segment is applied.  |  |
| LINT                        | Local interrupt.   |  |
| Logical address             | The address generated by a core before the segment is applied.   |  |
| LVT                         | Local vector table. A collection of APIC registers that define interrupts for local events (e.g., APIC[530:500] [Extended Interrupt [3:0] Local Vector Table]).  |  |
| Micro-op                    | <ul> <li>Micro-op. Instructions have variable-length encoding and many perform multiple primitive operations. The processor does not execute these complex instructions directly, but, instead, decodes them internally into simpler fixed-length instructions called macro-ops. Processor schedulers subsequently break down macro-ops into sequences of even simpler instructions called micro-ops, each of which specifies a single primitive operation.</li> </ul> |  |
| MTRR                        | Memory-type range register. The MTRRs specify the type of memory associated with various memory ranges.  |  |
| NTA                         | Non-Temporal Access.   |  |
| РТЕ                         | Page table entry.  |  |
| SMI                         | System management interrupt.   |  |
| Speculative event           | A performance monitor event counter that counts all occurrences of the event even if the event occurs during speculative code execution.   |  |
| SVM                         | Secure virtual machine.  |  |
| BSC                         | Boot strap core. Core 0 of the BSP.  |  |
| BSP                         | Boot strap processor.  |  |

| Canonical-address | An address in which the state of the most-significant implemented bit is duplicated in all the remaining higher-order bits, up to bit 63. |  |
|-------------------|---|--|
| СМР               | Specifies the core number.  |  |
| #GP               | A general-protection exception.   |  |
| #GP(0)            | Notation indicating a general-protection exception (#GP) with error code of 0.  |  |
| NBC               | NBC = (CPUID Fn00000001_EBX[LocalApicId[3:0]]==0). Node Base Core. The lowest   |  |
|                   | numbered core in the node.  |  |
| SMM               | System Management Mode.   |  |
| SMT               | Simultaneous multithreading. See Core::X86::Cpuid::CoreId[ThreadsPerCore].  |  |
| Thread            | One architectural context for instruction execution.  |  |
| WDT               | Watchdog timer. A timer that detects activity and triggers an error if a specified period of time expires without the activity.           |  |

#### 2.1.3 Secure Virtual Machine Mode (SVM)

Support for SVM mode is indicated by Core::X86::Cpuid::FeatureExtIdEcx[SVM].

#### 2.1.3.1 BIOS support for SVM Disable

The BIOS should include the following user setup options to enable and disable AMD Virtualization<sup>™</sup> technology.

#### 2.1.3.1.1 Enable AMD Virtualization<sup>™</sup>

- Core::X86::Msr::VM\_CR[SvmeDisable] = 0.
- Core::X86::Msr::VM\_CR[Lock] = 1.
- Core::X86::Msr::SvmLockKey[SvmLockKey] = 0000\_0000\_0000\_0000h.

#### 2.1.3.1.2 Disable AMD Virtualization<sup>™</sup>

- Core::X86::Msr::SvmLockKey[SvmLockKey] = 0000\_0000\_0000\_0000h.
- Core::X86::Msr::VM\_CR[SvmeDisable] = 1.
- Core::X86::Msr::VM\_CR[Lock] = 1.

The BIOS may also include the following user setup options to disable AMD Virtualization technology.

#### 2.1.3.1.3 Disable AMD Virtualization<sup>™</sup>, with a user supplied key

- Core::X86::Msr::VM\_CR[SvmeDisable] = 1.
- Core::X86::Msr::VM\_CR[Lock] = 1.
- Core::X86::Msr::SvmLockKey[SvmLockKey] programmed with value supplied by user. This value should be stored in NVRAM.

#### 2.1.4 Memory Encryption

For details of the memory encryption, see docAPM2 section Secure Encrypted Virtualization. See docAPM2 section Enabling Memory Encryption Extensions for details about enabling memory encryption extensions.

#### 2.1.5 Effective Frequency

The effective frequency interface allows software to discern the average, or effective, frequency of a given core over a configurable window of time. This provides software a measure of actual performance rather than forcing software to assume the current frequency of the core is the frequency of the last P-state requested. Core::X86::Msr::MPERF is incremented by hardware at the P0 frequency while the core is in C0. Core::X86::Msr::APERF increments in proportion to the actual number of core clocks cycles while the core is in C0.

The following procedure calculates effective frequency using Core::X86::Msr::MPERF and Core::X86::Msr::APERF:

- 1. At some point in time, write 0 to both MSRs.
- 2. At some later point in time, read both MSRs.
- 3. Effective frequency = (value read from Core::X86::Msr::APERF / value read from Core::X86::Msr::MPERF) \* P0 frequency.

Additional notes:

- The amount of time that elapses between steps 1 and 2 is determined by software.
- It is software's responsibility to disable interrupts or any other events that may occur in between the write of Core::X86::Msr::MPERF and the write of Core::X86::Msr::APERF in step 1 or between the read of Core::X86::Msr::MPERF and the read of Core::X86::Msr::APERF in step 2.
- The behavior of Core::X86::Msr::MPERF and Core::X86::Msr::APERF may be modified by Core::X86::Msr::HWCR[EffFreqCntMwait].
- The effective frequency interface provides +/- 50MHz accuracy if the following constraints are met:
  - Effective frequency is read at most one time per millisecond.
    - When reading or writing Core::X86::Msr::MPERF and Core::X86::Msr::APERF software executes only MOV instructions, and no more than 3 MOV instructions, between the two RDMSR or WRMSR instructions.
    - Core::X86::Msr::MPERF and Core::X86::Msr::APERF are invalid if an overflow occurs.

# 2.1.6 Address Space

# 2.1.6.1 Virtual Address Space

The processor supports 48-bit address bits of virtual memory space (256 TB) as indicated by Core::X86::Cpuid::LongModeInfo.

# 2.1.6.2 Physical Address Space

The processor supports a 48-bit physical address space. See Core::X86::Cpuid::LongModeInfo. The processor master aborts the following upper-address transactions (to address PhysAddr):

• Link or core requests with non-zero PhysAddr[63:48].

# 2.1.6.3 System Address Map

The processor defines a reserved memory address region starting at FFFD\_0000\_0000h and extending up to FFFF\_FFFF. System software must not map memory into this region. Downstream host accesses to the reserved address region results in a page fault. Upstream system device accesses to the reserved address region results in an undefined operation.

# 2.1.6.3.1 Memory Access to the Physical Address Space

All memory accesses to the physical address space from a core are sent to its associated Data Fabric (DF). All memory accesses from a link are routed through the DF. An IO link access to physical address space indicates

to the DF the cache attribute (Coherent or Non-coherent, based on bit[0] of the Sized Read and Write commands).

A core access to physical address space has two important attributes that must be determined before issuing the access to the NB: the memory type (e.g., WB, WC, UC; as described in the MTRRs) and the access destination (DRAM or MMIO).

If the memory map maps a region as DRAM that is not populated with real storage behind it, then that area of DRAM must be mapped as UC memtype.

This mechanism is managed by the BIOS and does not require any setup or changes by system software.

# 2.1.6.3.1.1 Determining Memory Type

The memory type for a core access is determined by the highest priority of the following ranges that the access falls in: 1=Lowest priority.

- 1. The memory type as determined by architectural mechanisms.
  - See the APM2 chapter titled "Memory System", sections "Memory-Type Range Registers" and "Page-Attribute Table Mechanism".
  - See the APM2 chapter titled "Nested Paging", section "Combining Memory Types, MTRRs".
  - See Core::X86::Msr::MTRRdefType, Core::X86::Msr::MtrrVarBase, Core::X86::Msr::MtrrVarMask, Core::X86::Msr::MtrrFix\_64K and Core::X86::Msr::MtrrFix\_16K\_0 through Core::X86::Msr::MtrrFix\_4K\_7.
- 2. TSeg & ASeg SMM mechanism. (see Core::X86::Msr::SMMAddr and Core::X86::Msr::SMMMask)
- 3. CR0[CD]: If (CR0[CD]==1) then MemType=CD.
- 4. MMIO configuration space, APIC space.
  - MMIO APIC space and MMIO config space must not overlap.
  - MemType=UC.
- 5. If ("In SMM Mode"&& ~((Core::X86::Msr::SMMMask[AValid] && "The address falls within the ASeg region") || (Core::X86::Msr::SMMMask[TValid] && "The address falls within the TSeg region"))) then MemType=CD.

# 2.1.7 Configuration Space

PCI-defined configuration space was originally defined to allow up to 256 bytes of register space for each function of each device; these first 256 bytes are called base configuration space (BCS). It was expanded to support up to 4096 bytes per function; bytes 256 through 4095 are called extended configuration space (ECS).

The processor includes configuration space registers located in both BCS and ECS. Processor configuration space is accessed through bus 0, devices 18h to 1Fh, where device 18h corresponds to node 0 and device 1Fh corresponds to node 7. See 2.1.7.3 [Processor Configuration Space].

Configuration space is accessed by the processor through two methods as follows:

- IO-space configuration: IO instructions to addresses CF8h and CFCh.
  - Enabled through IO::IoCfgAddr[ConfigEn], which allows access to BCS.
  - Use of IO-space configuration can be programmed to generate GP faults through Core::X86::Msr::HWCR[IoCfgGpFault].
  - SMI trapping for these accesses is specified by Core::X86::Msr::SMI\_ON\_IO\_TRAP\_CTL\_STS and Core::X86::Msr::SMI\_ON\_IO\_TRAP.
- MMIO configuration: configuration space is a region of memory space.
  - The base address and size of this range is specified by Core::X86::Msr::MmioCfgBaseAddr. The size is controlled by the number of configuration-space bus numbers supported by the system. Accesses to this range are converted configuration space as follows:
  - Address[31:0] = {0h, bus[7:0], device[4:0], function[2:0], offset[11:0]}.

The BIOS may use either configuration space access mechanism during boot. Before booting the OS, BIOS must disable IO access to ECS, enable MMIO configuration and build an ACPI defined MCFG table. BIOS ACPI code must use MMIO to access configuration space.

## 2.1.7.1 MMIO Configuration Coding Requirements

MMIO configuration space accesses must use the uncacheable (UC) memory type. Instructions used to read MMIO configuration space are required to take the following form: mov eax/ax/al, any\_address\_mode;

No other source/target registers may be used other than eax/ax/al.

In addition, all such accesses are required not to cross any naturally aligned DW boundary. Access to MMIO configuration space registers that do not meet these requirements result in undefined behavior

## 2.1.7.2 MMIO Configuration Ordering

Since MMIO configuration cycles are not serializing in the way that IO configuration cycles are, their ordering rules relative to posted may result in unexpected behavior.

Therefore, processor MMIO configuration space is designed to match the following ordering relationship that exists naturally with IO-space configuration: if a core generates a configuration cycle followed by a posted write cycle, then the posted write is held in the processor until the configuration cycle completes. As a result, any unexpected behavior that might have resulted if the posted-write cycle were to pass MMIO configuration cycle is avoided.

## 2.1.7.3 **Processor Configuration Space**

Accesses to unimplemented registers of implemented functions are ignored: writes dropped; reads return 0. Accesses to unimplemented functions also ignored: writes are dropped; however, reads return all F's. The processor does not log any master abort events for accesses to unimplemented registers or functions.

Accesses to device numbers of devices not implemented in the processor are routed based on the configuration map registers. If such requests are master aborted, then the processor can log the event.

## 2.1.8 PCI Configuration Legacy Access

## IOx0CF8 [IO-Space Configuration Address] (IO::IoCfgAddr)

Read-write. Reset: 0000\_0000h.

IO::IoCfgAddr, and IO::IoCfgData are used to access system configuration space, as defined by the PCI specification. IO::IoCfgAddr provides the address register and IO::IoCfgData provides the data port. Software sets up the configuration address by writing to IO::IoCfgAddr. Then, when an access is made to IO::IoCfgData, the processor generates the corresponding configuration access to the address specified in IO::IoCfgAddr. See 2.1.7 [Configuration Space].

IO::IoCfgAddr may only be accessed through aligned, DW IO reads and writes; otherwise, the accesses are passed to the appropriate IO link. Accesses to IO::IoCfgAddr and IO::IoCfgData received from an IO link are treated as all other IO transactions received from an IO link. IO::IoCfgAddr and IO::IoCfgData in the processor are not accessible from an IO link.

Instructions used to write MMIO configuration space are required to take the following form: mov any\_address\_mode, eax/ax/al;

| _aliasIO; | IOx0CF8; IO=0000_0000h  |  |  |  |  |
|-----------|---|--|--|--|--|
| Bits      | Description   |  |  |  |  |
| 31        | ConfigEn: configuration space enable. Read-write. Reset: 0. 0=IO read and write accesses are passed to the      |  |  |  |  |
|           | appropriate IO link and no configuration access is generated. 1=IO read and write accesses to IO::IoCfgData are |  |  |  |  |
|           | translated into configuration cycles at the configuration address specified by this register.                   |  |  |  |  |
| 30:28     | Reserved.   |  |  |  |  |
| 27:24     | ExtRegNo: extended register number. Read-write. Reset: 0h. ExtRegNo provides bits[11:8] and RegNo               |  |  |  |  |
|           | provides bits[7:2] of the byte address of the configuration register.   |  |  |  |  |
| 23:16     | BusNo: bus number. Read-write. Reset: 00h. Specifies the bus number of the configuration cycle.                 |  |  |  |  |
| 15:11     | <b>Device:</b> device number. Read-write. Reset: 00h. Specifies the device number of the configuration cycle.   |  |  |  |  |
| 10:8      | Function. Read-write. Reset: 0h. Specifies the function number of the configuration cycle.                      |  |  |  |  |
| 7:2       | RegNo: register address. Read-write. Reset: 00h. See IO::IoCfgAddr[ExtRegNo].                                   |  |  |  |  |
| 1:0       | Reserved.   |  |  |  |  |

#### IOx0CFC [IO-Space Configuration Data Port] (IO::IoCfgData)

| Read-    | Read-write. Reset: 0000_0000h.                          |  |  |
|----------|---|--|--|
| _aliasIO | _aliasIO; IOx0CFC; IO=0000_0000h                        |  |  |
| Bits     | Description   |  |  |
| 31:0     | Data. Read-write. Reset: 0000_0000h. See IO::IoCfgAddr. |  |  |

#### 2.1.9 System Software Interaction With SMT Enabled

If Core::X86::Cpuid::CoreId[ThreadsPerCore] > 0, then SMT is enabled in all cores in the system. When SMT is enabled, the resources of each core are dynamically balanced among the hardware threads executing on that core. The number of hardware threads (hereafter "threads") supported by a single core when SMT is enabled is reported in Core::X86::Cpuid::CoreId[ThreadsPerCore]. System software that is SMT-aware may take advantage of the knowledge that core resources are being shared among multiple threads when scheduling tasks to be run by each thread on each core. System software that is not SMT-aware sees each thread as an independent core.

#### 2.1.10 Register Sharing

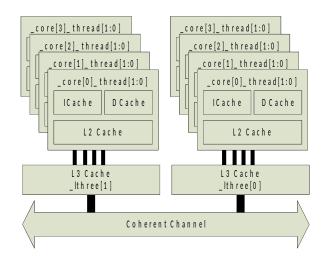

Figure 17: Register Sharing Domains

#### MSR0000\_0010 [Time Stamp Counter] (TSC)

|              | Read-write,Vola <u>tile. Reset: 0000_0000_</u> 0000_0000h.   |  |  |  |  |  |
|--------------|--|--|--|--|--|--|
| Core::X86::M | Core::X86::Msr::TS9_lthree[1:0]_core[3:0]_thread[1:0] MSR00000010  |  |  |  |  |  |
| Bits         | Description  |  |  |  |  |  |
|              | TSC: time stamp counter. Read-write, Volatile. Reset: 0. The TSC increments at the P0 frequency. The TSC counts at the same rate in all P-states, all C states, S0, or S1. A read of this MSR in guest mode is |  |  |  |  |  |
|              | affected by Core::X86::Msr::TscRateMsr. The value (TSC/TSCRatio) is the TSC P0 frequency based   |  |  |  |  |  |
|              | affected by ColeAbdWist Ischalewist. The value (15C/15Chalo) is the 15C Fo frequency based   |  |  |  |  |  |

### *Figure 18: Instance Parameters*

Instances of core registers are designated as lthree[n:0]\_core[n:0]\_thread[1:0]. Core registers may be shared at various levels of hierarchy as one register instance per die, per L3 complex, per core or per thread. The absence of the instance parameter \_thread[1:0] signifies that there is not a specific instance of said register per thread and thus the register is shared between thread 1 and thread 0. Similarly, the absence of the instance parameter \_core[n:0] signifies that there is not a specific instance parameter \_core[n:0] signifies that there is not a specific instance of said register per core and thus the register is shared by all cores in that L3 complex, and so on. Software must coordinate writing to shared registers with other threads in the same sharing hierarchy level.

#### 2.1.11 Timers

Each core includes the following timers. These timers do not vary in frequency regardless of the current P-state or C-state.

- Core::X86::Msr::TSC; the TSC increments at the rate specified by the P0 Pstate
- The APIC timer (Core::X86::Apic::TimerInitialCount and Core::X86::Apic::TimerCurrentCount), which increments at the rate of 2xCLKIN; the APIC timer may increment in units of between 1 and 8.

#### 2.1.12 Interrupts

## 2.1.12.1 System Management Mode (SMM)

System management mode (SMM) is typically used for system control activities such as power management. These activities are typically transparent to the operating system.

#### 2.1.12.1.1 SMM Overview

SMM is entered by a core on the next instruction boundary after a system management interrupt (SMI) is received and recognized. A core may be programmed to broadcast a special cycle to the system, indicating that it is entering SMM mode. The core then saves its state into the SMM memory state save area and jumps to the SMI service routine (or SMI handler). The pointer to the SMI handler is specified by MSRs. The code and data for the SMI handler are stored in the SMM memory area, which may be isolated from the main memory accesses.

The core returns from SMM by executing the RSM instruction from the SMI handler. The core restores its state from the SMM state save area and resumes execution of the instruction following the point where it entered SMM. The core may be programmed to broadcast a special bus cycle to the system, indicating that it is exiting SMM mode.

#### 2.1.12.1.2 Mode and Default Register Values

The software environment after entering SMM has the following characteristics:

• Addressing and operation is in Real mode.

- A far jump, call or return in the SMI handler can only address the lower 1M of memory, unless the SMI handler first switches to protected mode.
  - If (Core::X86::Msr::SMM\_BASE[SmmBase]>=0010\_0000h) then:
    - The value of the CS selector is undefined upon SMM entry.
    - The undefined CS selector value should not be used as the target of a far jump, call, or return.
- 4-Gbyte segment limits.
- Default 16-bit operand, address, and stack sizes (instruction prefixes can override these defaults).
- Control transfers that do not override the default operand size truncate the EIP to 16 bits.
- Far jumps or calls cannot transfer control to a segment with a base address requiring more than 20 bits, as in Real mode segment-base addressing, unless a change is made into protected mode.
- Interrupt vectors use the Real mode interrupt vector table.
- The IF flag in EFLAGS is cleared (INTR is not recognized).
- The TF flag in EFLAGS is cleared.
- The NMI and INIT interrupts are masked.
- Debug register DR7 is cleared (debug traps are disabled).

The SMM base address is specified by Core::X86::Msr::SMM\_BASE[SmmBase]. Important offsets to the base address pointer are:

- Core::X86::Msr::SMM\_BASE[SmmBase] + 8000h: SMI handler entry point.
- Core::X86::Msr::SMM\_BASE[SmmBase] + FE00h FFFFh: SMM state save area.

## 2.1.12.1.3 SMI Sources And Delivery

The processor accepts SMIs as link-defined interrupt messages only. The core/node destination of these SMIs is a function of the destination field of these messages. However, the expectation is that all such SMI messages are specified to be delivered globally (to all cores of all nodes).

There are also several local events that can trigger SMIs. However, these local events do not generate SMIs directly. Each of them triggers a programmable IO cycle that is expected to target the SMI command port in the IO hub and trigger a global SMI interrupt message back to the coherent fabric.

Local sources of SMI events that generate the IO cycle specified in Core::X86::Msr::SmiTrigIoCycle are:

- In the core, as specified by:
  - Core::X86::Msr::McExcepRedir.
  - Core::X86::Msr::SMI\_ON\_IO\_TRAP.
  - All local APIC LVT registers programmed to generate SMIs.

The status for these is stored in Core::X86::Smm::LocalSmiStatus.

## 2.1.12.1.4 SMM Initial State

After storing the save state, execution starts at Core::X86::Msr::SMM\_BASE[SmmBase] + 08000h. The SMM initial state is specified in the following table.

| Register | SMM Initial State |
|----------|-------------------|
| CS       | SmmBase[19:4]     |
| DS       | 0000h             |
| ES       | 0000h             |
| FS       | 0000h             |

#### Table 16: SMM Initial State

| GS                        | 0000h  |
|---------------------------|--|
| SS                        | 0000h  |
| General-Purpose Registers | Unmodified   |
| EFLAGS                    | 0000_0002h   |
| RIP                       | 0000_0000_0000_8000h   |
| CR0                       | Bits 0, 2, 3, and 31 cleared (PE, EM, TS, and PG); remainder is unmodified |
| CR4                       | 0000_0000_0000_0000h   |
| GDTR                      | Unmodified   |
| LDTR                      | Unmodified   |
| IDTR                      | Unmodified   |
| TR                        | Unmodified   |
| DR6                       | Unmodified   |
| DR7                       | 0000_0000_0000_0400h   |
| EFER                      | All bits are cleared except bit 12 (SVME) which is unmodified.             |

## 2.1.12.1.5 SMM Save State

In the following table, the offset field provides the offset from the SMM base address specified by Core::X86::Msr::SMM\_BASE[SmmBase].

| Offset | Size           | Contents |                                   | Access    |
|--------|----------------|----------|-----------------------------------|-----------|
| FE00h  | Word           | ES       | Selector                          | Read-only |
| FE02h  | 6 Bytes        | ]        | Reserved                          |           |
| FE08h  | Quadword       | 1        | Descriptor in memory format       |           |

Notes:

1. This notation specifies that bit[47] is replicated in each of the 16 MSBs of the DW (sometimes called sign extended). The 16 LSBs contain bits[47:32].

2. Only used for an SMI in guest mode with nested paging enabled.

The SMI save state includes most of the integer execution unit. Not included in the save state are: the floating point state, MSRs, and CR2. In order to be used by the SMI handler, these must be saved and restored. The save state is the same, regardless of the operating mode (32-bit or 64-bit).

## 2.1.12.1.6 System Management State

The following are offsets in the SMM save state area.

#### SMMxFEC0 [SMM IO Trap Offset] (Core::X86::Smm::TrapOffset)

Read-only, Volatile. Reset: 0000\_0000h.

If the assertion of SMI is recognized on the boundary of an IO instruction, Core::X86::Smm::TrapOffset contains information about that IO instruction. For example, if an IO access targets an unavailable device, the system can assert SMI and trap the IO instruction. Core::X86::Smm::TrapOffset then provides the SMI handler with information about the IO instruction that caused the trap. After the SMI handler takes the appropriate action, it can reconstruct and then re-execute the IO instruction from SMM. Or, more likely, it can use Core::X86::Smm::IoRestart to cause the core to re-execute the IO instruction immediately after resuming from SMM.

| Bits  | Description  |
|-------|--|
| 31:16 | Port: trapped IO port address. Read-only, Volatile. Reset: 0000h. This provides the address of the IO                            |
|       | instruction.   |
| 15:12 | BPR: IO breakpoint match. Read-only, Volatile. Reset: 0h.  |
| 11    | TF: EFLAGS TF value. Read-only, Volatile. Reset: 0.  |
| 10:7  | Reserved.  |
| 6     | SZ32: size 32 bits. Read-only, Volatile. Reset: 0. 1=Port access was 32 bits.  |
| 5     | SZ16: size 16 bits. Read-only, Volatile. Reset: 0. 1=Port access was 16 bits.  |
| 4     | SZ8: size 8 bits. Read-only, Volatile. Reset: 0. 1=Port access was 8 bits.   |
| 3     | <b>REP</b> : <b>repeated port access</b> . Read-only, Volatile. Reset: 0.  |
| 2     | STR: string-based port access. Read-only, Volatile. Reset: 0.  |
| 1     | <b>V</b> : <b>IO</b> trap word valid. Read-only, Volatile. Reset: 0. 0=The other fields of this offset are not valid. 1=The core |
|       | entered SMM on an IO instruction boundary; all information in this offset is valid.  |
| 0     | <b>RW</b> : <b>port access type</b> . Read-only, Volatile. Reset: 0. 0=IO write (OUT instruction). 1=IO read (IN instruction).   |

### SMMxFEC4 [Local SMI Status] (Core::X86::Smm::LocalSmiStatus)

#### Read-only, Volatile. Reset: 0000\_0000h.

This offset stores status bits associated with SMI sources local to the core. For each of these bits, 1=The associated mechanism generated an SMI.

| Bits | Description  |  |  |  |
|------|--|--|--|--|
| 31:9 | Reserved.  |  |  |  |
|      | <b>AceRedirSts</b> : machine check exception redirection status. Read-only, Volatile. Reset: 0. This bit is associated |  |  |  |
|      | with the SMI source specified in Core::X86::Msr::McExcepRedir[RedirSmiEn].   |  |  |  |
| 7:4  | Reserved.  |  |  |  |
| 3:0  | IoTrapSts: IO trap status. Read-only, Volatile. Reset: 0h. Each of these bits is associated with each of the           |  |  |  |
|      | respective SMI sources specified in Core::X86::Msr::SMI_ON_IO_TRAP.  |  |  |  |

#### SMMxFEC8 [IO Restart Byte] (Core::X86::Smm::IoRestart)

#### Read-write. Reset: 00h.

If the core entered SMM on an IO instruction boundary, the SMI handler may write this to FFh. This causes the core to re-execute the trapped IO instruction immediately after resuming from SMM. The SMI handler should only write to this byte if Core::X86::Smm::TrapOffset[V] == 1; otherwise, the behavior is undefined.

If a second SMI is asserted while a valid IO instruction is trapped by the first SMI handler, the core services the second SMI prior to re-executing the trapped IO instruction. Core::X86::Smm::TrapOffset[V] == 0 during the second entry into SMM, and the second SMI handler must not rewrite this byte.

If there is a simultaneous SMI IO instruction trap and debug breakpoint trap, the processor first responds to the SMI and postpones recognizing the debug exception until after resuming from SMM. If debug registers other than DR6 and DR7 are used while in SMM, they must be saved and restored by the SMI handler. If Core::X86::Smm::IoRestart is set to FFh when the RSM instruction is executed, the debug trap does not occur until after the IO instruction is re-executed.

## Bits Description

7:0 **RST: SMM IO Restart Byte**. Read-write. Reset: 00h.

#### SMMxFEC9 [Auto Halt Restart Offset] (Core::X86::Smm::AutoHalt)

Read-write. Reset: 00h.

| Bits | Description   |
|------|---|
| 7:1  | Reserved.   |
| 0    | HLT: halt restart. Read-write. Reset: 0. 0=Entered SMM on a normal x86 instruction boundary. 1=Entered                  |
|      | SMM from the Halt state. Upon SMM entry, this bit indicates whether SMM was entered from the Halt state.                |
|      | Before returning from SMM, this bit can be written by the SMI handler to specify whether the return from SMM            |
|      | should take the processor back to the Halt state or to the instruction-execution state specified by the SMM state       |
|      | save area (normally, the instruction after the halt). Clearing this bit the returns to the instruction specified in the |
|      | SMM save state. Setting this bit returns to the halt state. If the return from SMM takes the processor back to the      |
|      | Halt state, the HLT instruction is not refetched and re-executed. However, the Halt special bus cycle is broadcast      |
|      | and the processor enters the Halt state.  |

#### SMMxFECA [NMI Mask] (Core::X86::Smm::NmiMask)

Read-write. Reset: 00h.

- Bits Description
- 7:1 Reserved.
  - 0 **NmiMask: NMI Mask.** Read-write. Reset: 0. 0=NMI not masked. 1=NMI masked. Specifies whether NMI was masked upon entry to SMM.

#### SMMxFED8 [SMM SVM State] (Core::X86::Smm::SvmState)

Read-only, Volatile. Reset: 0000\_0000\_0000\_0000h.

This offset stores the SVM state of the processor upon entry into SMM.

| Bits | Descripti | on   |  |  |
|------|-----------|--|--|--|
| 63:5 | Reserved. | Reserved.  |  |  |
| 4    | SmmFro    | SmmFromSev. Read-only, Volatile. Reset: 0. 1= SMM was entered while executing on a guest with SEV enabled. |  |  |
| 3    | HostEfla  | HostEflagesIF: host EFLAGS IF. Read-only, Volatile. Reset: 0.  |  |  |
| 2:0  | SvmState  | SvmState. Read-only, Volatile. Reset: 0h.  |  |  |
|      | ValidValı | ValidValues:   |  |  |
|      | Value     | Description  |  |  |
|      | 0h        | SMM entered from a non-guest state.  |  |  |
|      | 1h        | Reserved.  |  |  |
|      | 2h        | SMM entered from a guest state.  |  |  |
|      | 5h-3h     | Reserved.  |  |  |
|      | 6h        | SMM entered from a guest state with nested paging enabled.   |  |  |
|      | 7h        | Reserved.  |  |  |

#### SMMxFEFC [SMM Revision Identifier] (Core::X86::Smm::SmmRevID)

This offset stores the SVM state of the processor upon entry into SMM.

| Bits | Description |
|------|-------------|
|------|-------------|

31:18 Reserved.

17 **BRL**. Read-only. Reset: 1. 1=Base relocation supported.

16 **IOTrap**. Read-only. Reset: 1. 1=IO trap supported.

15:0 **Revision**. Read-only. Reset: 0064h.

#### SMMxFE00 [SMM Base Address] (Core::X86::Smm::SmmBase)

Read-write, Volatile. Reset: 0000\_0000\_0000\_0000h.

This offset stores the base of the SMM-State of the processor upon entry into SMM.

Bits Description

63:32 Reserved.

31:0 SmmBase. Read-write, Volatile. Reset: 0000\_0000h. See Core::X86::Msr::SMM\_BASE[SmmBase].

## 2.1.12.1.7 Exceptions and Interrupts in SMM

When SMM is entered, the core masks INTR, NMI, SMI, and INIT interrupts. The core clears the IF flag to disable INTR interrupts. To enable INTR interrupts within SMM, the SMM handler must set the IF flag to 1.

Generating an INTR interrupt can be used for unmasking NMI interrupts in SMM. The core recognizes the assertion of NMI within SMM immediately after the completion of an IRET instruction. Once NMI is recognized within SMM, NMI recognition remains enabled until SMM is exited, at which point NMI masking is restored to the state it was in before entering SMM.

While in SMM, the core responds to STPCLK interrupts, as well as to all exceptions that may be caused by the SMI handler.

## 2.1.12.1.8 The Protected ASeg and TSeg Areas

These ranges are controlled by Core::X86::Msr::SMMAddr and Core::X86::Msr::SMMMask; see those registers for details.

#### 2.1.12.1.9 SMM Special Cycles

Special cycles can be initiated on entry and exit from SMM to acknowledge to the system that these transitions are occurring. These are controlled by Core::X86::Msr::HWCR[RsmSpCycDis,SmiSpCycDis].

### 2.1.12.1.10 Locking SMM

The SMM registers (Core::X86::Msr::SMMAddr and Core::X86::Msr::SMMMask) can be locked from being altered by setting Core::X86::Msr::HWCR[SmmLock]. SBIOS must lock the SMM registers after initialization to prevent unexpected changes to these registers.

#### 2.1.12.2 Local APIC

#### 2.1.12.2.1 Local APIC Functional Description

The local APIC contains logic to receive interrupts from a variety of sources and to send interrupts to other local APICs, as well as registers to control its behavior and report status. Interrupts can be received from:

- IO devices including the IO hub (IO APICs)
- Other local APICs (inter-processor interrupts)
- APIC timer
- Thermal events
- Performance counters
- Legacy local interrupts from the IO hub (INTR and NMI)
- APIC internal errors

The APIC timer, thermal events, performance counters, local interrupts, and internal errors are all considered local interrupt sources, and their routing is controlled by local vector table entries. These entries assign a message type and vector to each interrupt, allow them to be masked, and track the status of the interrupt.

IO and inter-processor interrupts have their message type and vector assigned at the source and are unaltered by the local APIC. They carry a destination field and a mode bit that together determine which local APIC(s) accepts them. The destination mode (DM) bit specifies if the interrupt request packet should be handled in physical or logical destination mode.

#### 2.1.12.2.1.1 Detecting and Enabling

APIC is detected and enabled via Core::X86::Cpuid::FeatureIdEdx[APIC].

The local APIC is enabled via Core::X86::Msr::APIC\_BAR[ApicEn]. Reset forces APIC disabled.

#### 2.1.12.2.1.2 APIC Register Space

MMIO APIC space:

- Memory mapped to a 4 KB range. The memory type of this space is the UC memory type. The base address of this range is specified by {Core::X86::Msr::APIC\_BAR[ApicBar[47:12]],000h}.
- The mnemonic is defined to be APICXXX; XXX is the byte address offset from the base address.
- MMIO APIC registers memory in xAPIC mode is defined by the register starting with Core::X86::Apic::ApicId at offset (Core::X86::Msr::APIC\_BAR[ApicBar[47:12]] + 20h) ending with

Core::X86::Apic::ExtendedInterruptLvtEntries at offsets Core::X86::Msr::APIC\_BAR[ApicBar[47:12]] + 533h.

• Treated as normal memory space when APIC is disabled, as specified by Core::X86::Msr::APIC\_BAR[ApicEn].

## 2.1.12.2.1.3 ApicId Enumeration Requirements

Note: Family 17h processors do not require contiguous ApicId assignments.

Operating systems are expected to use Core::X86::Cpuid::SizeId[ApicIdSize], the number of least significant bits in the Initial APIC ID that indicate core ID within a processor, in constructing per-core CPUID masks. Core::X86::Cpuid::SizeId[ApicIdSize] determines the maximum number of cores (MNC) that the processor could theoretically support, not the actual number of cores that are actually implemented or enabled on the processor, as indicated by Core::X86::Cpuid::SizeId[NC].

Each Core::X86::Apic::ApicId[ApicId] register is preset as follows:

- ApicId[6] = Socket ID.
- ApicId[5:4] = Node ID.
- ApicId[3] = Logical CCX L3 complex ID
- ApicId[2:0]= (SMT) ? {LogicalCoreID[1:0],ThreadId} : {1'b0,LogicalCoreID[1:0]}.

#### 2.1.12.2.1.4 Physical Destination Mode

The interrupt is only accepted by the local APIC whose Core::X86::Apic::ApicId[ApicId] matches the destination field of the interrupt. Physical mode allows up to 255 APICs to be addressed individually.

#### 2.1.12.2.1.5 Logical Destination Mode

A local APIC accepts interrupts selected by Core::X86::Apic::LocalDestination and the destination field of the interrupt using either cluster or flat format as configured by Core::X86::Apic::DestinationFormat[Format].

If flat destinations are in use, bits[7:0] of Core::X86::Apic::LocalDestination[Destination] are checked against bits[7:0] of the arriving interrupt's destination field. If any bit position is set in both fields, the local APIC is a valid destination. Flat format allows up to 8 APICs to be addressed individually.

If cluster destinations are in use, bits[7:4] of Core::X86::Apic::LocalDestination[Destination] are checked against bits[7:4] of the arriving interrupt's destination field to identify the cluster. If all of bits[7:4] match, then bits[3:0] of Core::X86::Apic::LocalDestination[Destination] and the interrupt destination are checked for any bit positions that are set in both fields to identify processors within the cluster. If both conditions are met, the local APIC is a valid destination. Cluster format allows 15 clusters of 4 APICs each to be addressed.

## 2.1.12.2.1.6 Interrupt Delivery

SMI, NMI, INIT, Startup, and External interrupts are classified as non-vectored interrupts.

When an APIC accepts a non-vectored interrupt, it is handled directly by the processor instead of being queued in the APIC. When an APIC accepts a fixed or lowest-priority interrupt, it sets the bit in Core::X86::Apic::InterruptRequest corresponding to the vector in the interrupt. For local interrupt sources, this comes from the vector field in that interrupt's local vector table entry. The corresponding bit in Core::X86::Apic::TriggerMode is set if the interrupt is level-triggered and cleared if edge-triggered. If a subsequent interrupt with the same vector arrives when the corresponding bit in Core::X86::Apic::InterruptRequest[RequestBits] is already set, the two interrupts are collapsed into one. Vectors 15-0 are reserved.

#### 2.1.12.2.1.7 Vectored Interrupt Handling

Core::X86::Apic::TaskPriority and Core::X86::Apic::ProcessorPriority each contain an 8-bit priority divided into a main priority (bits[7:4]) and a priority sub-class (bits[3:0]). The task priority is assigned by software to set a threshold priority

at which the processor is interrupted.

The processor priority is calculated by comparing the main priority (bits[7:4]) of Core::X86::Apic::TaskPriority[Priority] to bits[7:4] of the 8-bit encoded value of the highest bit set in Core::X86::Apic::InService. The processor priority is the higher of the two main priorities.

The processor priority is used to determine if any accepted interrupts (indicated by Core::X86::Apic::InterruptRequest[RequestBits]) are high enough priority to be serviced by the processor. When the processor is ready to service an interrupt, the highest bit in Core::X86::Apic::InterruptRequest[RequestBits] is cleared, and the corresponding bit is set in Core::X86::Apic::InService[InServiceBits].

When the processor has completed service for an interrupt, it performs a write to Core::X86::Apic::EndOfInterrupt, clearing the highest bit in Core::X86::Apic::InService[InServiceBits] and causing the next-highest interrupt to be serviced. If the corresponding bit in Core::X86::Apic::TriggerMode[TriggerModeBits] is set, a write to Core::X86::Apic::EndOfInterrupt is performed on all APICs to complete service of the interrupt at the source.

## 2.1.12.2.1.8 Interrupt Masking

Interrupt masking is controlled by the Core::X86::Apic::ExtendedApicControl. If Core::X86::Apic::ExtendedApicControl[IerEn] is set, Core::X86::Apic::InterruptEnable are used to mask interrupts. Any bit in Core::X86::Apic::InterruptEnable[InterruptEnableBits] that is clear indicates the corresponding interrupt is masked. A masked interrupt is not serviced and the corresponding bit in Core::X86::Apic::InterruptRequest[RequestBits] remains set.

#### 2.1.12.2.1.9 Spurious Interrupts

In the event that the task priority is set to or above the level of the interrupt to be serviced, the local APIC delivers a spurious interrupt vector to the processor, as specified by Core::X86::Apic::SpuriousInterruptVector. Core::X86::Apic::InService is not changed and no write to Core::X86::Apic::EndOfInterrupt occurs.

## 2.1.12.2.1.10 Spurious Interrupts Caused by Timer Tick Interrupt

A typical interrupt is asserted until it is serviced. An interrupt is deasserted when software clears the interrupt status bit within the interrupt service routine. Timer tick interrupt is an exception, since it is deasserted regardless of whether it is serviced or not.

The processor is not always able to service interrupts immediately (i.e., when interrupts are masked by clearing EFLAGS.IM).

If the processor is not able to service the timer tick interrupt for an extended period of time, the INTR caused by the first timer tick interrupt asserted during that time is delivered to the local APIC in ExtInt mode and latched, and the subsequent timer tick interrupts are lost. The following cases are possible when the processor is ready to service interrupts:

- An ExtInt interrupt is pending, and INTR is asserted. This results in timer tick interrupt servicing. This occurs 50 percent of the time.
- An ExtInt interrupt is pending, and INTR is deasserted. The processor sends the interrupt acknowledge cycle, but when the PIC receives it, INTR is deasserted, and the PIC sends a spurious interrupt vector. This occurs 50 percent of the time.

There is a 50 percent probability of spurious interrupts to the processor.

## 2.1.12.2.1.11 Lowest-Priority Interrupt Arbitration

Fixed and non-vectored interrupts are accepted by their destination APICs without arbitration.

Delivery of lowest-priority interrupts requires all APICs to arbitrate to determine which one accepts the interrupt. If Core::X86::Apic::SpuriousInterruptVector[FocusDisable] is clear, then the focus processor for an interrupt always accepts the interrupt. A processor is the focus of an interrupt if it is already servicing that interrupt (corresponding bit in Core::X86::Apic::InService[InServiceBits] is set) or if it already has a pending request for that interrupt (corresponding bit in Core::X86::Apic::InterruptRequest[RequestBits] is set). If Core::X86::Apic::ExtendedApicControl[IerEn] is set the interrupt must also be enabled in Core::X86::Apic::InterruptEnable[InterruptEnableBits] for a processor to be the focus processor. If there is no focus processor for an interrupt, or focus processor checking is disabled, then each APIC calculates an arbitration priority value, stored in Core::X86::Apic::ArbitrationPriority, and the one with the lowest result accepts the interrupt.

The arbitration priority value is calculated by comparing Core::X86::Apic::TaskPriority[Priority] with the 8-bit encoded value of the highest bit set in Core::X86::Apic::InterruptRequest[RequestBits] (IRRVec) and the 8-bit encoded value of the highest bit set Core::X86::Apic::InService[InServiceBits] (ISRVec). If Core::X86::Apic::ExtendedApicControl[IerEn] is set the IRRVec and ISRVec are based off the highest enabled interrupt. The main priority bits[7:4] are compared as follows:

```
if ((TaskPriority[Priority[7:4]] >= InterruptRequest[IRRVec[7:4]])
&&(TaskPriority[Priority[7:4]] > InService[ISRVec[7:4]])) {
ArbitrationPriority[Priority] = TaskPriority[Priority]
} elsif { (InterruptRequest[IRRVec[7:4]] > InService[ISRVec[7:4]])
ArbitrationPriority[Priority] = {InterruptRequest[IRRVec[7:4]],0h}
} else {
ArbitrationPriority[Priority] = {InService[ISRVect[7:4]],0h}
}
```

## 2.1.12.2.1.12 Inter-Processor Interrupts

The Core::X86::Apic::InterruptCommandLow and Core::X86::Apic::InterruptCommandHigh provide a mechanism for generating interrupts in order to redirect an interrupt to another processor, originate an interrupt to another processor, or allow a processor to interrupt itself. A write to register Core::X86::Apic::InterruptCommandLow causes an interrupt to be generated with the properties specified by the Core::X86::Apic::InterruptCommandLow and Core::X86::Apic::InterruptCommandLow and Core::X86::Apic::InterruptCommandLow and Core::X86::Apic::InterruptCommandLow and Core::X86::Apic::InterruptCommandHigh fields.

Message type (bits[10:8]) == 011b (Remote Read) is deprecated.

Not all combinations of ICR fields are valid. Only the following combinations are valid: Note: x indicates a don't care.

| Message Type                       | Trigger Mode | Level  | Destination Shorthand             |
|------------------------------------|--------------|--------|-----------------------------------|
| Fixed                              | Edge         | X      | х                                 |
|                                    | Level        | Assert | X                                 |
| Lowest Priority, SMI,<br>NMI, INIT | Edge         | X      | Destination or all excluding self |
|                                    | Level        | Assert | Destination or all excluding self |
| Startup                            | X            | X      | Destination or all excluding self |

Table 18: ICR Valid Combinations

## 2.1.12.2.1.13 APIC Timer Operation

The local APIC contains a 32-bit timer, controlled by Core::X86::Apic::TimerLvtEntry,

Core::X86::Apic::TimerInitialCount, and Core::X86::Apic::TimerDivideConfiguration. The processor bus clock is divided by the value in Core::X86::Apic::TimerDivideConfiguration[Div[3:0]] to obtain a time base for the timer. When Core::X86::Apic::TimerInitialCount[Count] is written, the value is copied into Core::X86::Apic::TimerCurrentCount. Core::X86::Apic::TimerCurrentCount[Count] is decremented at the rate of the divided clock. When the count reaches 0, a timer interrupt is generated with the vector specified in Core::X86::Apic::TimerLvtEntry[Vector]. If Core::X86::Apic::TimerLvtEntry[Mode] specifies periodic operation, Core::X86::Apic::TimerCurrentCount[Count] is reloaded with the Core::X86::Apic::TimerInitialCount[Count] value, and it continues to decrement at the rate of the divided clock. If Core::X86::Apic::TimerLvtEntry[Mask] is set, timer interrupts are not generated.

## 2.1.12.2.1.14 Generalized Local Vector Table

All LVTs (Core::X86::Apic::ThermalLvtEntry to Core::X86::Apic::LVTLINT, and Core::X86::Apic::ExtendedInterruptLvtEntries) support a generalized message type as follows:

- 000b=Fixed
- 010b=SMI
- 100b=NMI
- 111b=ExtINT
- All other messages types are reserved.

## 2.1.12.2.1.15 State at Reset

At power-up or reset, the APIC is hardware disabled (Core::X86::Msr::APIC\_BAR[ApicEn] == 0) so only SMI, NMI, INIT, and ExtInt interrupts may be accepted.

The APIC can be software disabled through Core::X86::Apic::SpuriousInterruptVector[APICSWEn]. The software disable has no effect when the APIC is hardware disabled.

When a processor accepts an INIT interrupt, the APIC is reset as at power-up, with the exception that:

- Core::X86::Apic::ApicId is unaffected.
- Pending APIC register writes complete.

## 2.1.12.2.2 Local APIC Registers

#### APICx020 [APIC ID] (Core::X86::Apic::ApicId)

Read-only.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; APICx020; APIC={Core::X86::Msr::APIC\_BAR[ApicBar[47:12]], 000h}

#### Bits Description

31:24 ApicId: APIC ID. Read-only. Reset: XXh. The reset value varies based on core number. See 2.1.12.2.1.3 [ApicId Enumeration Requirements].

23:0 Reserved.

## APICx030 [APIC Version] (Core::X86::Apic::ApicVersion)

Read-only.

|           | 5  |
|-----------|--|
| _lthree[1 | :0]_core[3:0]_thread[1:0]; APICx030; APIC={Core::X86::Msr::APIC_BAR[ApicBar[47:12]] , 000h}                  |
| Bits      | Description  |
| 31        | <b>ExtApicSpace: extended APIC register space present</b> . Read-only. Reset: 1. 1=Indicates the presence of |
|           | extended APIC register space starting at Core::X86::Apic::ExtendedApicFeature.                               |
| 30:25     | Reserved.  |

| 24    | DirectedEoiSupport: directed EOI support. Read-only. Reset: Fixed,0. 0=Directed EOI capability not       |
|-------|--|
|       | supported.   |
| 23:16 | MaxLvtEntry. Read-only. Reset: XXh. Specifies the number of entries in the local vector table minus one. |
| 15:8  | Reserved.  |
| 7:0   | Version. Read-only. Reset: 10h. Indicates the version number of this APIC implementation.                |
| APIC  | x080 [Task Priority] (Core::X86::Apic::TaskPriority)   |
| Read- | write. Reset: 0000_0000h.  |

\_lthree[1:0]\_core[3:0]\_thread[1:0]; APICx080; APIC={Core::X86::Msr::APIC\_BAR[ApicBar[47:12]], 000h}

Bits Description

31:8 Reserved.

7:0 **Priority**. Read-write. Reset: 00h. This field is assigned by software to set a threshold priority at which the core is interrupted.

#### APICx090 [Arbitration Priority] (Core::X86::Apic::ArbitrationPriority)

Read-only, Volatile. Reset: 0000\_0000h.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; APICx090; APIC={Core::X86::Msr::APIC\_BAR[ApicBar[47:12]], 000h}

| Bits | Description   |
|------|---|
| 31:8 | Reserved.   |
| 7:0  | <b>Priority</b> . Read-only, Volatile. Reset: 00h. Indicates the current priority for a pending interrupt, or a task or |
|      | interrupt being serviced by the core. The priority is used to arbitrate between cores to determine which accepts a      |
|      | lowest-priority interrupt request.  |

#### APICx0A0 [Processor Priority] (Core::X86::Apic::ProcessorPriority)

Read-only, Volatile. Reset: 0000\_0000h.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; APICx0A0; APIC={Core::X86::Msr::APIC\_BAR[ApicBar[47:12]], 000h}

| Bits | Description  |
|------|--|
| 31:8 | Reserved.  |
| 7:0  | <b>Priority</b> . Read-only, Volatile. Reset: 00h. Indicates the core's current priority servicing a task or interrupt, and is |
|      | used to determine if any pending interrupts should be serviced. It is the higher value of the task priority value and          |
|      | the current highest in-service interrupt.  |

#### APICx0B0 [End of Interrupt] (Core::X86::Apic::EndOfInterrupt)

#### Write-only.

This register is written by the software interrupt handler to indicate the servicing of the current interrupt is complete. \_lthree[1:0]\_core[3:0]\_thread[1:0]; APICx0B0; APIC={Core::X86::Msr::APIC\_BAR[ApicBar[47:12]], 000h}

Bits Description

31:0 Reserved. Write-only.

#### APICx0C0 [Reserved] (Core::X86::Apic::RemoteRead)

Read-only. Reset: 0000\_0000h.

Remote Read is deprecated.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; APICx0C0; APIC={Core::X86::Msr::APIC\_BAR[ApicBar[47:12]], 000h}

Bits Description

31:0 Reserved. Read-only. Reset: 0000\_0000h.

#### APICx0D0 [Logical Destination] (Core::X86::Apic::LocalDestination)

Read-write, Volatile. Reset: 0000\_0000h.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; APICx0D0; APIC={Core::X86::Msr::APIC\_BAR[ApicBar[47:12]], 000h}

# BitsDescription31:24Destination. Read-write, Volatile. Reset: 00h. This APIC's destination identification. Used to determine which<br/>interrupts should be accepted.23:0Reserved.

#### APICx0E0 [Destination Format] (Core::X86::Apic::DestinationFormat)

Read-write. Reset: F000\_0000h.

Only supported in xAPIC mode.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; APICx0E0; APIC={Core::X86::Msr::APIC\_BAR[ApicBar[47:12]], 000h}

### Bits Description

31:28 Format. Read-write. Reset: Fh. Controls which format to use when accepting interrupts with a logical destination mode.

 ValidValues:

 Value
 Description

 0h
 Cluster destinations are used.

 Eh-1h
 Reserved.

 Fh
 Flat destinations are used.

27:0 Reserved.

#### **APICx0F0** [Spurious-Interrupt Vector] (Core::X86::Apic::SpuriousInterruptVector)

| Reset:    | Reset: 0000_00FFh.  |  |  |
|-----------|---|--|--|
| _lthree[1 | _lthree[1:0]_core[3:0]_thread[1:0]; APICx0F0; APIC={Core::X86::Msr::APIC_BAR[ApicBar[47:12]] , 000h}                        |  |  |
| Bits      | 5 Description   |  |  |
| 31:10     | Reserved.   |  |  |
| 9         | <b>FocusDisable</b> . Read-write. Reset: 0. 1=Disable focus core checking during lowest-priority arbitrated interrupts.     |  |  |
| 8         | APICSWEn: APIC software enable. Read-write, Volatile. Reset: 0. 0=SMI, NMI, INIT, LINT[1:0], and Startup                    |  |  |
|           | interrupts may be accepted; pending interrupts in Core::X86::Apic::InService and  |  |  |
|           | Core::X86::Apic::InterruptRequest are held, but further fixed, lowest-priority, and ExtInt interrupts are not               |  |  |
|           | accepted. All LVT entry mask bits are set and cannot be cleared.  |  |  |
| 7:0       | <b>Vector</b> . Read-write, Volatile. Reset: FFh. The vector that is sent to the core in the event of a spurious interrupt. |  |  |

## APICx1[0...7]0 [In-Service] (Core::X86::Apic::InService)

Read-only, Volatile. Reset: 0000\_0000h.

The in-service registers provide a bit per interrupt to indicate that the corresponding interrupt is being serviced by the core. The first 16 InServiceBits of the first Core::X86::Apic::InService register are reserved.

\_lthree[1:0]\_core[3:0]\_thread[1:0]\_n0; APICx100; APIC={Core::X86::Msr::APIC\_BAR[ApicBar[47:12]], 000h}

\_lthree[1:0]\_core[3:0]\_thread[1:0]\_n1; APICx110; APIC={Core::X86::Msr::APIC\_BAR[ApicBar[47:12]], 000h}

\_lthree[1:0]\_core[3:0]\_thread[1:0]\_n2; APICx120; APIC={Core::X86::Msr::APIC\_BAR[ApicBar[47:12]], 000h} \_lthree[1:0]\_core[3:0]\_thread[1:0]\_n3; APICx130; APIC={Core::X86::Msr::APIC\_BAR[ApicBar[47:12]], 000h}

\_three[1:0]\_core[3:0]\_thread[1:0]\_n4; APICx140; APIC={Core::X86::Msr::APIC\_BAR[ApicBar[47:12]], 000h}

\_three[1:0]\_core[3:0]\_thread[1:0]\_n5; APICx150; APIC={Core::X86::Msr::APIC\_BAR[ApicBar[47:12]], 000h}

Bits Description

31:0 **InServiceBits**. Read-only, Volatile. Reset: 0000\_0000h. These bits are set when the corresponding interrupt is being serviced by the core.

## APICx1[8...F]0 [Trigger Mode] (Core::X86::Apic::TriggerMode)

Read-only, Volatile. Reset: 0000\_0000h.

The trigger mode registers provide a bit per interrupt to indicate the assertion mode of each interrupt. The first 16 TriggerModeBits of the each thread's APIC[1F0:180] registers are reserved. \_lthree[1:0]\_core[3:0]\_thread[1:0]\_n0; APICx180; APIC={Core::X86::Msr::APIC\_BAR[ApicBar[47:12]], 000h} \_lthree[1:0]\_core[3:0]\_thread[1:0]\_n1; APICx190; APIC={Core::X86::Msr::APIC\_BAR[ApicBar[47:12]], 000h} \_lthree[1:0]\_core[3:0]\_thread[1:0]\_n2; APICx1A0; APIC={Core::X86::Msr::APIC\_BAR[ApicBar[47:12]], 000h} \_lthree[1:0]\_core[3:0]\_thread[1:0]\_n3; APICx1B0; APIC={Core::X86::Msr::APIC\_BAR[ApicBar[47:12]], 000h} \_lthree[1:0]\_core[3:0]\_thread[1:0]\_n3; APICx1C0; APIC={Core::X86::Msr::APIC\_BAR[ApicBar[47:12]], 000h} \_lthree[1:0]\_core[3:0]\_thread[1:0]\_n5; APICx1D0; APIC={Core::X86::Msr::APIC\_BAR[ApicBar[47:12]], 000h} \_lthree[1:0]\_core[3:0]\_thread[1:0]\_n6; APICx1E0; APIC={Core::X86::Msr::APIC\_BAR[ApicBar[47:12]], 000h} \_lthree[1:0]\_core[3:0]\_thread[1:0]\_n6; APICx1E0; APIC={Core::X86::Msr::APIC\_BAR[ApicBar[47:12]], 000h} \_lthree[1:0]\_core[3:0]\_thread[1:0]\_n6; APICx1E0; APIC={Core::X86::Msr::APIC\_BAR[ApicBar[47:12]], 000h} \_lthree[1:0]\_core[3:0]\_thread[1:0]\_n6; APICx1E0; APIC={Core::X86::Msr::APIC\_BAR[ApicBar[47:12]], 000h}

| Bits Description  |
|---|
| 31:0 <b>TriggerModeBits</b> . Read-only, Volatile. Reset: 0000_0000h. The corresponding trigger mode bit is updated when an interrupt is accepted. 1=Level-triggered interrupt. 0=Edge-triggered interrupt.   |
|   |
| APICx2[07]0 [Interrupt Request] (Core::X86::Apic::InterruptRequest)   |
| Read-only. Reset: 0000_0000h.   |
| The interrupt request registers provide a bit per interrupt to indicate that the corresponding interrupt has been accepted  |
| by the APIC. The first 16 RequestBits of the first Core::X86::Apic::InterruptRequest register are reserved.   |

| Bits Description  |
| 31:0 <b>RequestBits</b> . Read-only. Reset: 0000_0000h. The corresponding request bit is set when the an interrupt is   |
| accepted by the APIC.   |
| $ADIC_{2}00[\Gamma_{2},\ldots,\Gamma_{4},\ldots,\Gamma$ |

## APICx280 [Error Status] (Core::X86::Apic::ErrorStatus)

Writes to this register trigger an update of the register state. The value written by software is arbitrary. Each write causes the internal error state to be loaded into this register, clearing the internal error state. Consequently, a second write prior to the occurrence of another error causes the register to be overwritten with cleared data.

| _lthree[1 | 1:0]_core[3:0]_thread[1:0]; APICx280; APIC={Core::X86::Msr::APIC_BAR[ApicBar[47:12]] , 000h}                                       |
|-----------|--|
| Bits      | Description  |
| 31:8      | Reserved.  |
| 7         | IllegalRegAddr: illegal register address. Read-write. Reset: 0. This bit indicates that an access to a nonexistent                 |
|           | register location within this APIC was attempted. Can only be set in xAPIC mode.   |
| 6         | <b>RcvdIllegalVector</b> : <b>received illegal vector</b> . Read-write. Reset: 0. This bit indicates that this APIC has received a |
|           | message with an illegal vector (00h to 0Fh for fixed and lowest priority interrupts).  |
| 5         | SentIllegalVector. Read-write. Reset: 0. This bit indicates that this APIC attempted to send a message with an                     |
|           | illegal vector (00h to 0Fh for fixed and lowest priority interrupts).  |
| 4         | Reserved.  |
| 3         | RcvAcceptError: receive accept error. Read-write. Reset: 0. This bit indicates that a message received by this                     |
|           | APIC was not accepted by this or any other APIC.   |
| 2         | SendAcceptError. Read-write. Reset: 0. This bit indicates that a message sent by this APIC was not accepted by                     |
|           | any APIC.  |
| 1:0       | Reserved.  |

## APICx300 [Interrupt Command Low] (Core::X86::Apic::InterruptCommandLow)

#### 2.1.13 CPUID Instruction

Processor feature capabilities and configuration information are provided through the CPUID instruction. The information is accessed by (1) selecting the CPUID function setting EAX and optionally ECX for some functions, (2) executing the CPUID instruction, and (3) reading the results in the EAX, EBX, ECX, and EDX registers. The syntax CPUID FnXXXX\_EiX[\_xYYY] refers to the function where EAX == X, and optionally ECX == Y, and the registers specified by EiX. EiX can be any single register such as {EAX, EBX, ECX, and EDX}, or a range of registers, such as E[C,B,A]X. Undefined function numbers return 0's in all 4 registers.

Unless otherwise specified, single-bit feature fields are encoded as 1=Feature is supported by the processor; 0=Feature is not supported by the processor.

#### 2.1.13.1 CPUID Instruction Functions

Processor feature capabilities and configuration information are provided through the CPUID instruction. The information is accessed by (1) selecting the CPUID function setting EAX and optionally ECX for some functions, (2) executing the CPUID instruction, and (3) reading the results in the EAX, EBX, ECX, and EDX registers. The syntax CPUID FnXXXXXX\_EiX[\_xYYY] refers to the function where EAX==X, and optionally ECX==Y, and the registers specified by EiX. EiX can be any single register such as {EAX, EBX, ECX, and EDX}, or a range of registers, such as E[C,B,A]X. Undefined function numbers return 0's in all 4 registers.

Unless otherwise specified, single-bit feature fields are encoded as 1=Feature is supported by the processor; 0=Feature is not supported by the processor. CPUID functions not listed are reserved.

The following provides processor specific details about CPUID.

#### CPUID\_Fn0000000\_EAX [Processor Vendor and Largest Standard Function Number] (Core::X86::Cpuid::LargFuncNum)

 Read-orly. Reset: Fixed,0000\_000Dh.

 \_lthree[1:0]\_core[3:0]\_thread[1:0]; CPUID\_Fn0000000\_EAX

 Bits
 Description

 31:0
 LFuncStd: largest standard function. Read-only. Reset: Fixed,0000\_000Dh. The largest CPUID standard function input value supported by the processor implementation.

#### CPUID\_Fn0000000\_EBX [Processor Vendor (ASCII Bytes [3:0])] (Core::X86::Cpuid::ProcVendEbx)

Read-only. Reset: Fixed,6874\_7541h.

Core::X86::Cpuid::ProcVendEbx and Core::X86::Cpuid::ProcVendExtEbx return the same value.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; CPUID\_Fn00000000\_EBX

## Bits Description

31:0 Vendor. Read-only. Reset: Fixed,6874\_7541h. ASCII Bytes [3:0] ("h t u A") of the string "AuthenticAMD".

#### CPUID\_Fn0000000\_ECX [Processor Vendor (ASCII Bytes [11:8])] (Core::X86::Cpuid::ProcVendEcx)

Read-only. Reset: Fixed,444D\_4163h.

Core::X86::Cpuid::ProcVendEcx and Core::X86::Cpuid::ProcVendExtEcx return the same value.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; CPUID\_Fn00000000\_ECX

### Bits Description

31:0 Vendor. Read-only. Reset: Fixed,444D\_4163h. ASCII Bytes [11:8] ("D M A c") of the string "AuthenticAMD".

#### CPUID\_Fn00000000\_EDX [Processor Vendor (ASCII Bytes [7:4])] (Core::X86::Cpuid::ProcVendEdx)

Read-only. Reset: Fixed,6974\_6E65h.

Core::X86::Cpuid::ProcVendEdx and Core::X86::Cpuid::ProcVendExtEdx return the same value.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; CPUID\_Fn00000000\_EDX

## Bits Description

31:0 **Vendor**. Read-only. Reset: Fixed,6974\_6E65h. ASCII Bytes [7:4] ("i t n e") of the string "AuthenticAMD".

#### CPUID\_Fn0000001\_EAX [Family, Model, Stepping Identifiers] (Core::X86::Cpuid::FamModStep)

#### Read-only.

Core::X86::Cpuid::FamModStep and Core::X86::Cpuid::FamModStepExt return the same value.

Family: Is an 8-bit value and is defined as: Family[7:0]=({0000b,BaseFamily[3:0]}+ExtendedFamily[7:0]).

• E.g., If BaseFamily[3:0] == Fh and ExtendedFamily[7:0] == 08h, then Family[7:0] = 17h.

Model: Is an 8-bit value and is defined as: Model[7:0]={ExtendedModel[3:0],BaseModel[3:0]}.

- E.g., If ExtendedModel[3:0] == 1h and BaseModel[3:0] == 8h, then Model[7:0] = 18h.
  - Model numbers vary with product.

Model numbers are are assigned a letter, 0h = "A", 1h = "B", and so on. Model and Stepping form the Revision. E.g., B2. \_lthree[1:0]\_core[3:0]\_thread[1:0]; CPUID\_Fn00000001\_EAX

| Bits  | Description   |
|-------|---|
| 31:28 | Reserved.   |
| 27:20 | ExtFamily: extended family. Read-only. Reset: 08h. See Family above.      |
| 19:16 | ExtModel: extended model. Read-only. Reset: 0h. See Model above.          |
| 15:12 | Reserved.   |
| 11:8  | BaseFamily. Read-only. Reset: Fh. See Family description above.           |
| 7:4   | <b>BaseModel</b> , Read-only, Reset: Xh. Model numbers vary with product. |

3:0 **Stepping**. Read-only. Reset: 2h. Processor stepping (revision) for a specific model.

#### CPUID\_Fn00000001\_EBX [LocalApicId, LogicalProcessorCount, CLFlush] (Core::X86::Cpuid::FeatureIdEbx)

 Read-only.

 \_lthree[1:0]\_core[3:0]\_thread[1:0]; CPUID\_Fn0000001\_EBX

 Bits
 Description

 31:24
 LocalApicId. Read-only. Reset: XXh. Initial local APIC physical ID.

 23:16
 LogicalProcessorCount: logical processor count. Read-only. Reset: Fixed,(Core::X86::Cpuid::SizeId[NC] + 1).

 Specifies the number of threads in the processor as Core::X86::Cpuid::SizeId[NC]+1.

 15:8
 CLFlush. Read-only. Reset: Fixed,08h. CLFLUSH size in quadwords.

 7:0
 Reserved.

#### CPUID\_Fn0000001\_ECX [Feature Identifiers] (Core::X86::Cpuid::FeatureIdEcx)

Read-only.

| These values can be over-written by | Core::X86::Msr::CPUID Features. |
|-------------------------------------|---------------------------------|
|                                     |                                 |

\_lthree[1:0]\_core[3:0]\_thread[1:0]; CPUID\_Fn00000001\_ECX

## Bits Description

31 Reserved. Read-only. Reset: Fixed,0. Reserved for use by hypervisor to indicate guest status.

30 **RDRAND**. Read-only. Reset: Fixed,1. RDRAND instruction support.

| 29   | <b>F16C</b> . Read-only. Reset: Fixed, 1. Half-precision convert instruction support.   |  |  |  |  |
|--|---|--|--|--|--|
| 28   | AVX. Read-only. Reset: Fixed,1. AVX instruction support.  |  |  |  |  |
| 27   | <b>OSXSAVE</b> . Read-only. Reset: X. 1=The OS has enabled support for XGETBV/XSETBV instructions to query processor extended states. OS enabled support for XGETBV/XSETBV.   |  |  |  |  |
| 26   | <b>XSAVE</b> . Read-only. Reset: Fixed,1. 1=Support provided for the XSAVE, XRSTOR, XSETBV, and XGETBV instructions and the XFEATURE_ENABLED_MASK register. XSAVE (and related) instruction support.  |  |  |  |  |
| 25   | <b>AES: AES instruction support</b> . Read-only. Reset: X. AES instruction support.   |  |  |  |  |
| 24   | Reserved.   |  |  |  |  |
| 23   | <b>POPCNT</b> . Read-only. Reset: Fixed,1. POPCNT instruction.  |  |  |  |  |
| 22   | MOVBE. Read-only. Reset: Fixed,1. MOVBE instruction support.  |  |  |  |  |
| 21   | <b>X2APIC</b> . Read-only. Reset: Fixed,0. x2APIC capability.   |  |  |  |  |
| 20   | SSE42. Read-only. Reset: Fixed,1. SSE4.2 instruction support.   |  |  |  |  |
| 19   | SSE41. Read-only. Reset: Fixed,1. SSE4.1 instruction support.   |  |  |  |  |

#### CPUID\_Fn000000D\_ECX\_x01 [Processor Extended State Enumeration] (Core::X86::Cpuid::ProcExtStateEnumEcx01)

Read-only. Reset: Fixed,0000\_0000h.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; CPUID\_Fn0000000D\_ECX\_x01

#### Bits Description

31:0 Reserved. Read-only. Reset: Fixed,0000\_0000h.

#### CPUID\_Fn000000D\_EDX\_x01 [Processor Extended State Enumeration] (Core::X86::Cpuid::ProcExtStateEnumEdx01)

Read-only. Reset: Fixed,0000\_0000h.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; CPUID\_Fn0000000D\_EDX\_x01

### Bits Description

31:0 Reserved. Read-only. Reset: Fixed,0000\_0000h.

#### CPUID\_Fn000000D\_EAX\_x02 [Processor Extended State Enumeration] (Core::X86::Cpuid::ProcExtStateEnumEax02)

Read-only. Reset: Fixed,0000\_0100h.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; CPUID\_Fn0000000D\_EAX\_x02

Bits Description

31:0 **YmmSaveStateSize**. Read-only. Reset: Fixed,0000\_0100h. YMM save state byte size.

#### CPUID\_Fn000000D\_EBX\_x02 [Processor Extended State Enumeration] (Core::X86::Cpuid::ProcExtStateEnumEbx02)

Read-only. Reset: Fixed,0000 0240h.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; CPUID\_Fn0000000D\_EBX\_x02

Bits Description

31:0 **YmmSaveStateOffset**. Read-only. Reset: Fixed,0000\_0240h. YMM save state byte offset.

#### CPUID\_Fn000000D\_ECX\_x02 [Processor Extended State Enumeration] (Core::X86::Cpuid::ProcExtStateEnumEcx02)

Read-only. Reset: Fixed,0000 0000h.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; CPUID\_Fn0000000D\_ECX\_x02

#### Bits Description

31:0 Reserved. Read-only. Reset: Fixed,0000\_0000h.

CPUID\_Fn000000D\_EDX\_x02 [Processor Extended State Enumeration]

#### (Core::X86::Cpuid::ProcExtStateEnumEdx02)

Read-only. Reset: Fixed,0000 0000h.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; CPUID\_Fn0000000D\_EDX\_x02

#### Bits Description

31:0 Reserved. Read-only. Reset: Fixed,0000\_0000h.

#### CPUID\_Fn80000000\_EAX [Largest Extended Function Number] (Core::X86::Cpuid::LargExtFuncNum)

Read-only. Reset: Fixed,8000\_001Fh.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; CPUID\_Fn80000000\_EAX

## Bits Description

31:0 **LFuncExt: largest extended function**. Read-only. Reset: Fixed,8000\_001Fh. The largest CPUID extended function input value supported by the processor implementation.

#### CPUID\_Fn80000000\_EBX [Processor Vendor (ASCII Bytes [3:0])] (Core::X86::Cpuid::ProcVendExtEbx)

Read-only. Reset: Fixed,6874\_7541h.

Core::X86::Cpuid::ProcVendEbx and Core::X86::Cpuid::ProcVendExtEbx return the same value.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; CPUID\_Fn80000000\_EBX

Bits Description

31:0 Vendor. Read-only. Reset: Fixed,6874\_7541h. ASCII Bytes [3:0] ("h t u A") of the string "AuthenticAMD".

#### CPUID\_Fn80000000\_ECX [Processor Vendor (ASCII Bytes [11:8])] (Core::X86::Cpuid::ProcVendExtEcx)

Read-only. Reset: Fixed,444D\_4163h.

Core::X86::Cpuid::ProcVendEcx and Core::X86::Cpuid::ProcVendExtEcx return the same value.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; CPUID\_Fn80000000\_ECX

Bits Description

31:0 Vendor. Read-only. Reset: Fixed,444D\_4163h. ASCII Bytes [11:8] ("D M A c") of the string "AuthenticAMD".

#### CPUID\_Fn80000000\_EDX [Processor Vendor (ASCII Bytes [7:4])] (Core::X86::Cpuid::ProcVendExtEdx)

Read-only. Reset: Fixed,6974\_6E65h.

Core::X86::Cpuid::ProcVendEdx and Core::X86::Cpuid::ProcVendExtEdx return the same value.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; CPUID\_Fn80000000\_EDX

#### Bits Description

31:0 Vendor. Read-only. Reset: Fixed,6974\_6E65h. ASCII Bytes [7:4] ("i t n e") of the string "AuthenticAMD".

## CPUID\_Fn80000001\_EAX [Family, Model, Stepping Identifiers] (Core::X86::Cpuid::FamModStepExt)

Read-only.

Core::X86::Cpuid::FamModStep and Core::X86::Cpuid::FamModStepExt return the same value. See Core::X86::Cpuid::FamModStep.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; CPUID\_Fn80000001\_EAX

| Bits  | Description  |

| 5.0 | <b>CBit</b> Read-only Reset: 2Fb Page table bit number used to enable memory encryption |   |

# 5:0 **CBit**. Read-only. Reset: 2Fh. Page table bit number used to enable memory encryption.

#### CPUID\_Fn8000001F\_ECX [AMD Secure Encryption ECX] (Core::X86::Cpuid::SecureEncryptionEcx)

Read-only. Reset: 0000\_000Fh.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; CPUID\_Fn8000001F\_ECX

#### Bits Description

31:0 **NumEncryptedGuests**. Read-only. Reset: 0000\_000Fh. Indicates the maximum ASID value that may be used for an SEV-enabled guest.

#### CPUID\_Fn8000001F\_EDX [Minimum ASID] (Core::X86::Cpuid::SecureEncryptionEdx)

Read-only.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; CPUID\_Fn8000001F\_EDX

 
 Bits
 Description

 31:0
 MinimumSEVASID: Minimum SEV enabled, SEV-ES disabled ASID. Read-only. Reset: 0000\_000Xh. Indicates the minimum ASID value that must be used for an SEV-enabled, SEV-ES-disabled guest.

#### 2.1.14 MSR Registers

#### 2.1.14.1 MSRs - MSR0000\_xxxx

See 1.3.3 [Register Mnemonics] for a description of the register naming convention. MSRs are accessed through x86 WRMSR and RDMSR instructions.

# MSR0000\_0010 [Time Stamp Counter] (Core::X86::Msr::TSC) Read-write Volatile, Reset: 0000\_0000\_0000 0000h.

| ittuu-    | white, volutile. Reset: 0000_0000_00001.   |  |  |
|-----------|--|--|--|
| The T     | The TSC uses a common reference for all sockets, cores and threads.  |  |  |
| _lthree[2 | ree[1:0]_core[3:0]_thread[1:0]; MSR0000_0010   |  |  |
| Bits      | 5 Description  |  |  |
| 63:0      | <b>TSC: time stamp counter</b> . Read-write, Volatile. Reset: 0000_0000_0000h. The TSC increments at the PO      |  |  |
|           | frequency. The TSC counts at the same rate in all P-states, all C states, S0, or S1. A read of this MSR in guest |  |  |
|           | mode is affected by Core::X86::Msr::TscRateMsr. The value (TSC/TSCRatio) is the TSC P0 frequency based           |  |  |
|           | value (as if TSCRatio == 1.0) when (TSCRatio != 1.0).  |  |  |

#### MSR0000\_001B [APIC Base Address] (Core::X86::Msr::APIC\_BAR)

|           | /   |  |  |

| 63:48     | Reserved. Read-only,Error-on-write-1. Reset: Fixed,0000h.   |  |  |
|           | ApicBar[47:12]: APIC base address register. Read-write. Reset: 0_000F_EE00h. Specifies the base address,                |  |  |
|           | physical address [47:12], for the APICXX register set in xAPIC mode. See 2.1.12.2.1.2 [APIC Register Space].            |  |  |
| 11        | <b>ApicEn</b> : <b>APIC enable</b> . Read-write. Reset: 0. 0=Disable Local Apic. 1=Local APIC is enabled in xAPIC mode. |  |  |
|           | See 2.1.12.2.1.2 [APIC Register Space].   |  |  |
| 10        | Described Dood only Error on a wite 1 Descrit Fixed 0   |  |  |

10 Reserved. Read-only,Error-on-write-1. Reset: Fixed,0.

| 9 | Reserved. Read-only,Error-on-write-1. Reset: Fixed,0. |
|---|---|
|---|---|

- **BSC: boot strap core.** Read-write, Volatile. Reset: X. 0=The core is not the boot core of the BSP. 1=The core is the boot core of the BSP.
- 7:0 Reserved. Read-only,Error-on-write-1. Reset: Fixed,00h.

#### MSR0000\_002A [Cluster ID] (Core::X86::Msr::EBL\_CR\_POWERON)

Writes to this register result in a GP fault with error code 0.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; MSR0000\_002A

# Bits Description

63:18 Reserved. Read-only,Error-on-write-1. Reset: Fixed,0000\_0000\_0000h.

17:16 **ClusterID**. Read,Error-on-write. Reset: 0h. The field does not affect hardware.

15:0 Reserved. Read-only,Error-on-write-1. Reset: Fixed,0000h.

#### MSR0000\_008B [Patch Level] (Core::X86::Msr::PATCH\_LEVEL)

Read,Error-on-write,Volatile. Reset: 0000\_0000\_0000\_0000h.

\_lthree[1:0]\_core[3:0]; MSR0000\_008B

Bits Description

63:32 Reserved.

31:0 **PatchLevel**. Read,Error-on-write,Volatile. Reset: 0000\_0000h. This returns an identification number for the microcode patch that has been loaded. If no patch has been loaded, this returns 0.

#### MSR0000\_00E7 [Max Performance Frequency Clock Count] (Core::X86::Msr::MPERF)

Read-write, Volatile. Reset: 0000\_0000\_0000\_0000h.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; MSR0000\_00E7

#### Bits Description

63:0 **MPERF: maximum core clocks counter**. Read-write, Volatile. Reset: 0000\_0000\_0000\_0000h. Incremented by hardware at the P0 frequency while the core is in C0. This register does not increment when the core is in the stop-grant state. In combination with Core::X86::Msr::APERF, this is used to determine the effective frequency of the core. A read of this MSR in guest mode is affected by Core::X86::Msr::TscRateMsr. This field uses software P-state numbering. See Core::X86::Msr::HWCR[EffFreqCntMwait], 2.1.5 [Effective Frequency]

### MSR0000\_00E8 [Actual Performance Frequency Clock Count] (Core::X86::Msr::APERF)

Read-write, Volatile. Reset: 0000\_0000\_0000h.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; MSR0000\_00E8

#### Bits Description

63:0 **APERF: actual core clocks counter**. Read-write, Volatile. Reset: 0000\_0000\_0000\_0000h. This register increments in proportion to the actual number of core clocks cycles while the core is in C0. The register does not increment when the core is in the stop-grant state. See Core::X86::Msr::MPERF.

#### MSR0000\_00FE [MTRR Capabilities] (Core::X86::Msr::MTRRcap)

Read,Error-on-write. Reset: 0000\_0000\_0000\_0508h.

| _lthree[1 | 1:0]_core[3:0]; MSR0000_00FE  |  |  |
|-----------|---|--|--|
| Bits      | Description   |  |  |
| 63:11     | Reserved.   |  |  |
| 10        | MtrrCapWc: write-combining memory type. Read,Error-on-write. Reset: 1. 1=The write combining memory           |  |  |
|           | type is supported.  |  |  |
| 9         | Reserved.   |  |  |
| 8         | <b>MtrrCapFix</b> : <b>fixed range register</b> . Read,Error-on-write. Reset: 1. 1=Fixed MTRRs are supported. |  |  |
| 7:0       | MtrrCapVCnt: variable range registers count. Read, Error-on-write. Reset: 08h. Specifies the number of        |  |  |
|           | variable MTRRs supported.   |  |  |

#### MSR0000\_0174 [SYSENTER CS] (Core::X86::Msr::SYSENTER\_CS)

Read-write. Reset: 0000\_0000\_0000\_0000h.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; MSR0000\_0174

**Bits** Description

63:16 Reserved.

15:0 SysEnterCS: SYSENTER target CS. Read-write. Reset: 0000h. Holds the called procedure code segment.

#### MSR0000\_0175 [SYSENTER ESP] (Core::X86::Msr::SYSENTER\_ESP)

Read-write. Reset: 0000\_0000\_0000\_0000h.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; MSR0000\_0175

#### Bits Description

63:32 Reserved.

31:0 **SysEnterESP: SYSENTER target SP.** Read-write. Reset: 0000\_0000h. Holds the called procedure stack pointer.

#### MSR0000\_0176 [SYSENTER EIP] (Core::X86::Msr::SYSENTER\_EIP)

Read-write. Reset: 0000\_0000\_0000\_0000h.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; MSR0000\_0176

|                 | Bits | Description  |  |  |
|-----------------|------|--|--|--|
| 63:32 Reserved. |      | Reserved.  |  |  |
|                 | 31:0 | <b>SysEnterEIP</b> : <b>SYSENTER target IP</b> . Read-write. Reset: 0000_0000h. Holds the called procedure instruction |  |  |

# pointer.

#### MSR0000\_0179 [Global Machine Check Capabilities] (Core::X86::Msr::MCG\_CAP)

| _lthree[1 | lthree[1:0]_core[3:0]_thread[1:0]; MSR0000_0179  |  |  |
|-----------|--|--|--|
| Bits      | Description  |  |  |
| 63:9      | Reserved.  |  |  |
| 8         | McgCtlP: MCG_CTL register present. Read-only,Error-on-write. Reset: Fixed,1. 1=The machine check control               |  |  |
|           | registers (MCi_CTL) are present. See 3.1 [Machine Check Architecture].   |  |  |
| 7:0       | <b>Count</b> . Read-only,Error-on-write,Volatile. Reset: XXh. Indicates the number of error reporting banks visible to |  |  |
|           | each core.   |  |  |

#### MSR0000\_017A [Global Machine Check Status] (Core::X86::Msr::MCG\_STAT)

Read-write, Volatile. Reset: 0000\_0000\_0000\_0000h.

See 3.1 [Machine Check Architecture].

\_lthree[1:0]\_core[3:0]\_thread[1:0]; MSR0000\_017A

Bits Description

63:3 Reserved.

- 2 **MCIP: machine check in progress.** Read-write, Volatile. Reset: 0. 1=A machine check is in progress. Machine check progress.
- **EIPV: error instruction pointer valid**. Read-write, Volatile. Reset: 0. 1=The instruction pointer that was pushed onto the stack by the machine check mechanism references the instruction that caused the machine check error.

**0 RIPV: restart instruction pointer valid**. Read-write, Volatile. Reset: 0. 0=The interrupt was not precise and/or the process (task) context may be corrupt; continued operation of this process may not be possible without intervention, however system processing or other processes may be able to continue with appropriate software clean up. 1=Program execution can be reliably restarted at the EIP address on the stack.

#### MSR0000\_017B [Global Machine Check Exception Reporting Control] (Core::X86::Msr::MCG\_CTL)

Read-write. Reset: 0000\_0000\_0000\_0000h.

This register controls enablement of the individual error reporting banks; see 3.1 [Machine Check Architecture]. When a machine check register bank is not enabled in MCG\_CTL, errors for that bank are not logged or reported, and actions enabled through the MCA are not taken; each MCi\_CTL register identifies which errors are still corrected when MCG\_CTL[i] is disabled.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; MSR0000\_017B

#### **Bits** Description

63:23 Reserved.

22:0 **MCnEn**. Read-write. Reset: 00\_0000h. 1=The MC0 machine check register bank is enabled.

#### MSR0000\_01D9 [Debug Control] (Core::X86::Msr::DBG\_CTL\_MSR)

| _lthree[1 | _three[1:0]_core[3:0]_thread[1:0]; MSR0000_01D9   |  |  |

| Bits      | <b>Description</b>  |  |  |
| 63:7      | Reserved.   |  |  |
| 6         | Reserved. Read-only,Error-on-write-1. Reset: Fixed,0.   |  |  |
| 5:2       | <b>PB</b> : <b>performance monitor pin control</b> . Read-write. Reset: 0h. This field does not control any hardware.   |  |  |
| 1         | BTF. Read-write. Reset: 0. 1=Enable branch single step.         LBR. Read-write. Reset: 0. 1=Enable last branch record. |  |  |
| 0         |   |  |  |

#### MSR0000\_01DB [Last Branch From IP] (Core::X86::Msr::BR\_FROM)

Read,Error-on-write,Volatile. Reset: 0000\_0000\_0000\_0000h.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; MSR0000\_01DB

# Bits Description

63:0 **LastBranchFromIP**. Read,Error-on-write,Volatile. Reset: 0000\_0000\_0000h. Loaded with the segment offset of the branch instruction.

#### MSR0000\_01DC [Last Branch To IP] (Core::X86::Msr::BR\_TO)

Read, Error-on-write, Volatile. Reset: 0000\_0000\_0000\_0000h.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; MSR0000\_01DC

# Bits Description

63:0 **LastBranchToIP**. Read,Error-on-write,Volatile. Reset: 0000\_0000\_0000\_0000h. Holds the target RIP of the last branch that occurred before an exception or interrupt.

#### MSR0000\_01DD [Last Exception From IP] (Core::X86::Msr::LastExcpFromIp)

Read, Error-on-write, Volatile. Reset: 0000\_0000\_0000\_0000h.

## \_lthree[1:0]\_core[3:0]\_thread[1:0]; MSR0000\_01DD

# Bits Description

63:0 **LastIntFromIP**. Read,Error-on-write,Volatile. Reset: 0000\_0000\_0000\_0000h. Holds the source RIP of the last branch that occurred before the exception or interrupt.

#### MSR0000\_01DE [Last Exception To IP] (Core::X86::Msr::LastExcpToIp)

Read, Error-on-write, Volatile. Reset: 0000\_0000\_0000\_0000h.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; MSR0000\_01DE

#### Bits Description

63:0 **LastIntToIP**. Read,Error-on-write,Volatile. Reset: 0000\_0000\_0000\_0000h. Holds the target RIP of the last branch that occurred before the exception or interrupt.

### MSR0000\_020[0...E] [Variable-Size MTRRs Base] (Core::X86::Msr::MtrrVarBase)

Each MTRR (Core::X86::Msr::MtrrVarBase, Core::X86::Msr::MtrrFix\_64K through Core::X86::Msr::MtrrFix\_4K\_7, or Core::X86::Msr::MTRRdefType) specifies a physical address range and a corresponding memory type (MemType) associated with that range. Setting the memory type to an unsupported value results in a #GP.

The variable-size MTRRs come in pairs of base and mask registers (MSR0000\_0200 and MSR0000\_0201 are the first pair, etc.). Variables MTRRs are enabled through Core::X86::Msr::MTRRdefType[MtrrDefTypeEn]. A core access--with address CPUAddr--is determined to be within the address range of a variable-size MTRR if the following equation is true:

CPUAddr[47:12] & PhyMask[47:12] == PhyBase[47:12] & PhyMask[47:12].

For example, if the variable MTRR spans 256 KB and starts at the 1 MB address the PhyBase would be set to 0\_0010\_0000h and the PhyMask to F\_FFFC\_0000h (with zeros filling in for bits[11:0]). This results in a range from

| 0_0010_0000h to 0_0013_FFFFh. |   |   |  |
|-------------------------------|---|---|--|
|                               | _lthree[1:0]_core[3:0]_n0; MSR0000_0200   |   |  |

#### MSR0000\_0250 [Fixed-Size MTRRs] (Core::X86::Msr::MtrrFix\_64K)

See Core::X86::Msr::MtrrVarBase for general MTRR information. Fixed MTRRs are enabled through Core::X86::Msr::MTRRdefType[MtrrDefTypeFixEn,MtrrDefTypeEn]. For addresses below 1MB, the appropriate Fixed MTRRs override the default access destination. Each fixed MTRR includes two bits, RdDram and WrDram, that determine the destination based on the access type. Writing reserved MemType values causes an error-on-write. lthree[1:0] core[3:0] nSIZE64K; MSR0000 0250

# MSR0000\_0268 [Fixed-Size MTRRs] (Core::X86::Msr::MtrrFix\_4K\_0)

See Core::X86::Msr::MtrrVarBase for general MTRR information. Fixed MTRRs are enabled through Core::X86::Msr::MTRRdefType[MtrrDefTypeFixEn,MtrrDefTypeEn]. For addresses below 1MB, the appropriate Fixed MTRRs override the default access destination. Each fixed MTRR includes two bits, RdDram and WrDram, that determine the destination based on the access type. Writing reserved MemType values causes an error-on-write.

# MSR0000\_0269 [Fixed-Size MTRRs] (Core::X86::Msr::MtrrFix\_4K\_1)

See Core::X86::Msr::MtrrVarBase for general MTRR information. Fixed MTRRs are enabled through Core::X86::Msr::MTRRdefType[MtrrDefTypeFixEn,MtrrDefTypeEn]. For addresses below 1MB, the appropriate Fixed MTRRs override the default access destination. Each fixed MTRR includes two bits, RdDram and WrDram, that determine the destination based on the access type. Writing reserved MemType values causes an error-on-write. \_lthree[1:0]\_core[3:0]\_nSIZE4K1; MSR0000\_0269

#### MSR0000\_026A [Fixed-Size MTRRs] (Core::X86::Msr::MtrrFix\_4K\_2)

See Core::X86::Msr::MtrrVarBase for general MTRR information. Fixed MTRRs are enabled through Core::X86::Msr::MTRRdefType[MtrrDefTypeFixEn,MtrrDefTypeEn]. For addresses below 1MB, the appropriate Fixed MTRRs override the default access destination. Each fixed MTRR includes two bits, RdDram and WrDram, that determine the destination based on the access type. Writing reserved MemType values causes an error-on-write. \_lthree[1:0]\_core[3:0]\_nSIZE4K2; MSR0000\_026A

### MSR0000\_026B [Fixed-Size MTRRs] (Core::X86::Msr::MtrrFix\_4K\_3)

See Core::X86::Msr::MtrrVarBase for general MTRR information. Fixed MTRRs are enabled through Core::X86::Msr::MTRRdefType[MtrrDefTypeFixEn,MtrrDefTypeEn]. For addresses below 1MB, the appropriate Fixed MTRRs override the default access destination. Each fixed MTRR includes two bits, RdDram and WrDram, that determine the destination based on the access type. Writing reserved MemType values causes an error-on-write.

lthree[1:0]\_core[3:0]\_nSIZE4K3; MSR0000\_026B **Bits** Description 63:61 Reserved. Read-only, Error-on-write-1. Reset: Fixed, 0h. ### MSR0000\_026C [Fixed-Size MTRRs] (Core::X86::Msr::MtrrFix\_4K\_4)

See Core::X86::Msr::MtrrVarBase for general MTRR information. Fixed MTRRs are enabled through Core::X86::Msr::MTRRdefType[MtrrDefTypeFixEn,MtrrDefTypeEn]. For addresses below 1MB, the appropriate Fixed MTRRs override the default access destination. Each fixed MTRR includes two bits, RdDram and WrDram, that determine the destination based on the access type. Writing reserved MemType values causes an error-on-write. \_lthree[1:0]\_core[3:0]\_nSIZE4K4; MSR0000\_026C

### MSR0000\_026F [Fixed-Size MTRRs] (Core::X86::Msr::MtrrFix\_4K\_7)

See Core::X86::Msr::MtrrVarBase for general MTRR information. Fixed MTRRs are enabled through Core::X86::Msr::MTRRdefType[MtrrDefTypeFixEn,MtrrDefTypeEn]. For addresses below 1MB, the appropriate Fixed MTRRs override the default access destination. Each fixed MTRR includes two bits, RdDram and WrDram, that determine the destination based on the access type. Writing reserved MemType values causes an error-on-write.

# MSR0000\_02FF [MTRR Default Memory Type] (Core::X86::Msr::MTRRdefType)

See Core::X86::Msr::MtrrVarBase for general MTRR information.

| _lthree[1 | _tthree[1:0]_core[3:0]; MSR0000_02FF   |  |  |
|-----------|--|--|--|
| Bits      | Description  |  |  |
| 63:12     | Reserved. Read-only,Error-on-write-1. Reset: Fixed,0_0000_0000_0000h.                                    |  |  |
| 11        | MtrrDefTypeEn: variable and fixed MTRR enable. Read-write. Reset: 0. 0=Fixed and variable MTRRs are not  |  |  |
|           | enabled. 1=Core::X86::Msr::MtrrVarBase, and Core::X86::Msr::MtrrFix_64K through                          |  |  |
|           | Core::X86::Msr::MtrrFix_4K_7 are enabled.  |  |  |
| 10        | MtrrDefTypeFixEn: fixed MTRR enable. Read-write. Reset: 0. 0=Core::X86::Msr::MtrrFix_64K through         |  |  |
|           | Core::X86::Msr::MtrrFix_4K_7 are not enabled. 1=Core::X86::Msr::MtrrFix_64K through                      |  |  |
|           | Core::X86::Msr::MtrrFix_4K_7 are enabled. This field is ignored (and the fixed MTRRs are not enabled) if |  |  |
|           | Core::X86::Msr::MTRRdefType[MtrrDefTypeEn] == 0.   |  |  |

| 9:8 | Reserved. Read-only,Error-on-write-1. Reset: Fixed,0h.   |
|-----|--|
| 7:0 | MemType: memory type. Read-write. Reset: 00h.  |
|     | <b>Description</b> : If MtrrDefTypeEn == 1 then MemType specifies the memory type for memory space that is not |
|     | specified by either the fixed or variable range MTRRs. If MtrrDefTypeEn == 0 then the default memory type for  |
|     | all of memory is UC.   |
|     | Valid encodings are {00000b, Core::X86::Msr::MtrrFix_64K through Core::X86::Msr::MtrrFix_4K_7[2:0]}.           |
|     | Other write values cause a GP(0).  |

#### 2.1.14.2 MSRs - MSRC000\_0xxx

See 1.3.3 [Register Mnemonics] for a description of the register naming convention. MSRs are accessed through x86 WRMSR and RDMSR instructions.

| MSRO  | C000_0080 [Extended Feature Enable] (Core::X86::Msr::EFER)   |
|-------|--|
|       | T Execution: 0000_0000_0000h.  |
|       | :0]_core[3:0]_thread[1:0]; MSRC000_0080  |
| Bits  | Description  |
|       | Reserved. Read-only,Error-on-write-1. Reset: Fixed,0000_0000_0000h.  |
| 15    | <b>TCE: translation cache extension enable</b> . Read-write. Reset: 0. 1=Translation cache extension is enabled. PDC entries related to the linear address of the INVLPG instruction are invalidated. If this bit is 0 all PDC entries are invalidated by the INVLPG instruction.  |
| 14    | <b>FFXSE: fast FXSAVE/FRSTOR enable</b> . Read-write. Reset: 0. 1=Enables the fast FXSAVE/FRSTOR mechanism. A 64-bit operating system may enable the fast FXSAVE/FRSTOR mechanism if (Core::X86::Cpuid::FeatureExtIdEdx[FFXSR] == 1). This bit is set once by the operating system and its value is not changed afterwards.  |
| 13    | <b>LMSLE:</b> long mode segment limit enable. Read-write. Reset: 0. 1=Enables the long mode segment limit check mechanism.   |
| 12    | <b>SVME</b> : <b>secure virtual machine (SVM) enable</b> . Reset: Fixed,0. 1=SVM features are enabled.   |
|       | AccessType: Core::X86::Msr::VM_CR[SvmeDisable] ? Read-only,Error-on-write-1 : Read-write.  |
| 11    | <b>NXE</b> : <b>no-execute page enable</b> . Read-write. Reset: 0. 1=The no-execute page protection feature is enabled.  |
| 10    | <b>LMA: long mode active</b> . Read-only. Reset: 0. 1=Indicates that long mode is active. When writing the EFER register the value of this bit must be preserved. Software must read the EFER register to determine the value of LMA, change any other bits as required and then write the EFER register. An attempt to write a value that differs from the state determined by hardware results in a #GP fault. |
| 9     | Reserved. Read-only,Error-on-write-1. Reset: Fixed,0.  |
| 8     | LME: long mode enable. Read-write. Reset: 0. 1=Long mode is enabled.   |
| 7:1   | Reserved. Read-only. Reset: Fixed,00h.   |
| 0     | <b>SYSCALL:</b> system call extension enable. Read-write. Reset: 0. 1=SYSCALL and SYSRET instructions are enabled. This adds the SYSCALL and SYSRET instructions which can be used in flat addressed operating systems as low latency system calls and returns.  |
| 1.000 |  |

### MSRC000\_0081 [SYSCALL Target Address] (Core::X86::Msr::STAR)

Read-write. Reset: 0000\_0000\_0000\_0000h.

This register holds the target address used by the SYSCALL instruction and the code and stack segment selector bases used by the SYSCALL and SYSRET instructions.

| _lthree[1 | 1:0]_core[3:0]_thread[1:0]; MSRC000_0081                       |
|-----------|--|
| Bits      | Description  |
| 63:48     | SysRetSel: SYSRET CS and SS. Read-write. Reset: 0000h.         |
| 47:32     | SysCallSel: SYSCALL CS and SS. Read-write. Reset: 0000h.       |
| 31:0      | Target: SYSCALL target address. Read-write. Reset: 0000_0000h. |

### MSRC000\_0082 [Long Mode SYSCALL Target Address] (Core::X86::Msr::STAR64)

Read-write. Reset: 0000\_0000\_0000\_0000h.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; MSRC000\_0082

### Bits Description

63:0 **LSTAR: long mode target address.** Read-write. Reset: 0000\_0000\_0000\_0000h. Target address for 64-bit mode calling programs. The address stored in this register must be in canonical form (if not canonical, a #GP fault occurs).

### MSRC000\_0083 [Compatibility Mode SYSCALL Target Address] (Core::X86::Msr::STARCOMPAT)

Read-write. Reset: 0000\_0000\_0000\_0000h.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; MSRC000\_0083

Bits Description

63:0 **CSTAR: compatibility mode target address**. Read-write. Reset: 0000\_0000\_0000\_0000h. Target address for compatibility mode. The address stored in this register must be in canonical form (if not canonical, a #GP fault occurs).

### MSRC000\_0084 [SYSCALL Flag Mask] (Core::X86::Msr::SYSCALL\_FLAG\_MASK)

| _lthree[1 | :0]_core[3:0]_thread[1:0]; MSRC000_0084   |
|-----------|---|
| Bits      | Description   |
| 63:32     | Reserved. Read-only. Reset: Fixed,0000_0000h.   |
| 31:0      | Mask: SYSCALL flag mask. Read-write. Reset: 0000_0000h. This register holds the EFLAGS mask used by the |
|           | SYSCALL instruction. 1=Clear the corresponding EFLAGS bit when executing the SYSCALL instruction.       |

### MSRC000\_00E7 [Read-Only Max Performance Frequency Clock Count] (Core::X86::Msr::MPerfReadOnly)

Reset: 0000\_0000\_0000\_0000h.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; MSRC000\_00E7

BitsDescription63:0MPerfReadOnly: read-only maximum core clocks counter. Reset: 0000\_0000\_0000h. Incremented by<br/>hardware at the P0 frequency while the core is in C0. In combination with Core::X86::Msr::APerfReadOnly, this<br/>is used to determine the effective frequency of the core. A read of this MSR in guest mode is affected by<br/>Core::X86::Msr::TscRateMsr. This field uses software P-state numbering. See<br/>Core::X86::Msr::HWCR[EffFreqCntMwait], 2.1.5 [Effective Frequency]. This register is not affected by writes to<br/>Core::X86::Msr::MPERF.AccessType: Core::X86::Msr::HWCR[EffFreqReadOnlyLock]? Read-only, Volatile : Read-write, Volatile.

MSRC000\_00E8 [Read-Only Actual Performance Frequency Clock Count] (Core::X86::Msr::APerfReadOnly)

Reset: 0000 0000 0000 0000h.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; MSRC000\_00E8

 Bits
 Description

 63:0
 APerfReadOnly: read-only actual core clocks counter. Reset: 0000\_0000\_0000h. This register increments in proportion to the actual number of core clocks cycles while the core is in C0. See Core::X86::Msr::MPerfReadOnly. This register is not affected by writes to Core::X86::Msr::APERF.

 AccessType: Core::X86::Msr::HWCR[EffFreqReadOnlyLock] ? Read-only, Volatile : Read-write, Volatile.

### MSRC000\_00E9 [Instructions Retired Performance Count] (Core::X86::Msr::IRPerfCount)

Reset: 0000 0000 0000 0000h.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; MSRC000\_00E9

Bits Description

63:0 **IRPerfCount: instructions retired counter.** Reset: 0000\_0000\_0000\_0000h. Dedicated Instructions Retired register increments on once for every instruction retired. See Core::X86::Msr::HWCR[IRPerfEn].

AccessType: Core::X86::Msr::HWCR[EffFreqReadOnlyLock] ? Read-only, Volatile : Read-write, Volatile.

### MSRC000\_0100 [FS Base] (Core::X86::Msr::FS\_BASE)

Read-write. Reset: 0000\_0000\_0000\_0000h.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; MSRC000\_0100

### Bits Description

63:0 **FSBase: expanded FS segment base**. Read-write. Reset: 0000\_0000\_0000\_0000h. This register provides access to the expanded 64-bit FS segment base. The address stored in this register must be in canonical form (if not canonical, a #GP fault fill occurs).

### MSRC000\_0101 [GS Base] (Core::X86::Msr::GS\_BASE)

Read-write. Reset: 0000\_0000\_0000\_0000h.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; MSRC000\_0101

 Bits
 Description

 63:0
 GSBase: expanded GS segment base. Read-write. Reset: 0000\_0000\_0000\_0000h. This register provides access to the expanded 64-bit GS segment base. The address stored in this register must be in canonical form (if not canonical, a #GP fault fill occurs).

### MSRC000\_0102 [Kernel GS Base] (Core::X86::Msr::KernelGSbase)

Read-write. Reset: 0000\_0000\_0000\_0000h.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; MSRC000\_0102

| Bits | Description  |
|------|--|
| 63:0 | KernelGSBase: kernel data structure pointer. Read-write. Reset: 0000_0000_0000_0000h. This register holds      |
|      | the kernel data structure pointer which can be swapped with the GS_BASE register using the SwapGS instruction. |
|      | The address stored in this register must be in canonical form (if not canonical, a #GP fault occurs).          |

### MSRC000\_0103 [Auxiliary Time Stamp Counter] (Core::X86::Msr::TSC\_AUX)

Read-write, Volatile. Reset: 0000\_0000\_0000\_0000h.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; MSRC000\_0103

 Bits
 Description

 63:32
 Reserved.

 31:0
 TscAux: auxiliary time stamp counter data. Read-write, Volatile. Reset: 0000\_0000h. It is expected that this is initialized by privileged software to a meaningful value, such as a processor ID. This value is returned in the RDTSCP instruction.

### MSRC000\_0104 [Time Stamp Counter Ratio] (Core::X86::Msr::TscRateMsr)

Core::X86::Msr::TscRateMsr allows the hypervisor to control the guest's view of the Time Stamp Counter. It provides a multiplier that scales the value returned when Core::X86::Msr::TSC[TSC], Core::X86::Msr::MPERF[MPERF], and Core::X86::Msr::MPerfReadOnly[MPerfReadOnly] are read by a guest running under virtualization. This allows the hypervisor to provide a consistent TSC, MPERF, and MPerfReadOnly rate for a guest process when moving that process between cores that have a differing P0 rate. The TSC Ratio MSR does not affect the value read from the TSC, MPERF, and MPerfReadOnly MSRs when read when in host mode or when virtualization is not being used or when accessed by code executed in system management mode (SMM) unless the SMM code is executed within a guest container. The TSC Ratio value does not affect the rate of the underlying TSC, MPERF, and MPerfReadOnly counters, or the value that gets written to the TSC, MPERF, and MPerfReadOnly MSRs counters on a write by either the host or the guest. The TSC Ratio MSR contains a fixed-point number in 8.32 format, which is 8 bits of integer and 32 bits of fraction. This number is the ratio of the desired P0 frequency to the P0 frequency of the core. The reset value of the TSC Ratio MSR is 1.0, which results in a guest frequency matches the core P0 frequency.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; MSRC000\_0104

| _iunee[1 |   |
|----------|---|
| Bits     | Description   |
| 63:40    | Reserved. Read-only,Error-on-write-1. Reset: Fixed,00_0000h.  |
| 39:32    | <b>TscRateMsrInt: time stamp counter rate integer</b> . Read-write. Reset: 01h. Specifies the integer part of the MSR |
|          | TSC ratio value.  |
| 31:0     | TscRateMsrFrac: time stamp counter rate fraction. Read-write. Reset: 0000_0000h. Specifies the fractional             |
|          | part of the MSR TSC ratio value.  |

# MSRC000\_0410 [MCA Interrupt Configuration] (Core::X86::Msr::McaIntrCfg)

| Read-  | write. Reset: 0000_0000_0000h.   |
|--------|--|
| MSRC00 | 00_0410  |
| Bits   | Description  |
| 63:16  | Reserved.  |
| 15:12  | ThresholdLvtOffset. Read-write. Reset: 0h. For error thresholding interrupts, specifies the address of the LVT |
|        | entry in the APIC registers as follows: LVT address = (LvtOffset shifted left 4 bits) + 500h (see              |
|        | Core::X86::Apic::ExtendedInterruptLvtEntries).   |
| 11:8   | Reserved.  |
| 7:4    | DeferredLvtOffset. Read-write. Reset: 0h.  |
|        | <b>Description</b> : For deferred error interrupts, specifies the address of the LVT                           |
|        | entry in the APIC registers as follows: LVT address = (LvtOffset shifted left 4 bits) + 500h (see              |
|        | APIC[530:500]).  |
| 3:0    | Reserved.  |

### 2.1.14.2.1 MSRs - MSRC000\_2xxx

The MCA registers including the legacy aliases (MSR0000\_000[1:0], MSR0000\_04xx) are mapped to MSRC000\_2xxx. See 3.2.5 [MCA Banks].

## 2.1.14.3 MSRs - MSRC001\_0xxx

See 1.3.3 [Register Mnemonics] for a description of the register naming convention. MSRs are accessed through x86 WRMSR and RDMSR instructions.

| MSRC001_000[03] [Performance Event Select [3:0]] (Core::X86::Msr::PERF_LEGACY_CTL)                                |

|        | :0]_core[3:0]_thread[1:0]; MSRC001_0015   |
|        | Description   |
|        | Reserved.   |
| 30     | <b>IRPerfEn: enable instructions retired counter</b> . Read-write. Reset: 0. 1=Enable Core::X86::Msr::IRPerfCount.  |
|        | Reserved.   |
|        |   |
| 27     | <b>EffFreqReadOnlyLock</b> : <b>read-only effective frequency counter lock</b> . Write-1-only. Reset: 0. Init: BIOS,1.  |
|        | 1=Core::X86::Msr::MPerfReadOnly, Core::X86::Msr::APerfReadOnly and Core::X86::Msr::IRPerfCount are  |
|        | read-only.  |
| 26     | <b>EffFreqCntMwait: effective frequency counting during mwait.</b> Read-write. Reset: 0. 0=The registers do not   |
|        | increment. 1=The registers increment. Specifies whether Core::X86::Msr::MPERF and Core::X86::Msr::APERF   |
|        | increment while the core is in the monitor event pending state. See 2.1.5 [Effective Frequency].  |
|        |   |

| 25    | <b>CpbDis: core performance boost disable</b> . Read-write. Reset: 0. 0=CPB is requested to be enabled. 1=CPB is disabled. Specifies whether core performance boost is requested to be enabled or disabled. If core performance  |
|-------|--|
|       | boost is disabled while a core is in a boosted P-state, the core automatically transitions to the highest performance  |
|       | non-boosted P-state.   |
| 24    | <b>TscFreqSel: TSC frequency select</b> . Read-only. Reset: 1. 1=The TSC increments at the P0 frequency.   |
| 23:22 | Reserved.  |
| 21    | <b>LockTscToCurrentP0: lock the TSC to the current P0 frequency</b> . Read-write. Reset: 0. 0=The TSC will count at the P0 frequency. 1=The TSC frequency is locked to the current P0 frequency at the time this bit is set and  |
|       | remains fixed regardless of future changes to the P0 frequency.  |
| 20    | <b>IoCfgGpFault: IO-space configuration causes a GP fault</b> . Read-write. Reset: 0. 1=IO-space accesses to   |
|       | configuration space cause a GP fault. The fault is triggered if any part of the IO read/write address range is   |
|       | between CF8h and CFFh, inclusive. These faults only result from single IO instructions, not to string and REP IO   |
|       | instructions. This fault takes priority over the IO trap mechanism described by  |
| 10    | Core::X86::Msr::SMI_ON_IO_TRAP_CTL_STS.  |
| 19    | Reserved.  |
| 18    | <b>McStatusWrEn: machine check status write enable</b> . Read-write. Reset: 0. 0=MCi_STATUS registers are readable; writing a non-zero pattern to these registers causes a general protection fault. 1=MCi_STATUS registers are read-write, including reserved fields; do not cause general protection faults; such writes update all implemented bits in these registers; All fields of all threshold registers are Read-write when accessed from MSR space, including Locked, except BlkPtr which is always read-only; McStatusWrEn does not change the access type for the thresholding registers accessed via configuration space. |
|       | <b>Description</b> : McStatusWrEn can be used to debug machine check exception and interrupt handlers.   |
|       | See 3.1 [Machine Check Architecture].  |
| 17    | Wrap32Dis: 32-bit address wrap disable. Read-write. Reset: 0. 1=Disable 32-bit address wrapping. Software  |
|       | can use Wrap32Dis to access physical memory above 4 Gbytes without switching into 64-bit mode. To do so, software should write a greater-than 4 Gbyte address to Core::X86::Msr::FS_BASE and   |
|       | Core::X86::Msr::GS_BASE. Then it would address ±2 Gbytes from one of those bases using normal memory   |
|       | reference instructions with a FS or GS override prefix. However, the INVLPG, FST, and SSE store instructions   |
|       | generate 32-bit addresses in legacy mode, regardless of the state of Wrap32Dis.  |
| 16:15 | Reserved.  |
| 14    | <b>RsmSpCycDis: RSM special bus cycle disable</b> . Reset: 0. 0=A link special bus cycle, SMIACK, is generated on  |
|       | a resume from SMI.   |
|       | AccessType: Core::X86::Msr::HWCR[SmmLock] ? Read-only : Read-write.  |
| 13    | SmiSpCycDis: SMI special bus cycle disable. Reset: 0. 0=A link special bus cycle, SMIACK, is generated when  |
|       | an SMI interrupt is taken.   |
|       | AccessType: Core::X86::Msr::HWCR[SmmLock] ? Read-only : Read-write.  |
|       | Reserved.  |
| 10    | MonMwaitUserEn: MONITOR/MWAIT user mode enable. Read-write. Reset: 0. 0=The MONITOR and  |
|       | MWAIT instructions are supported only in privilege level 0; these instructions in privilege levels 1 to 3 cause a  |
|       | #UD exception. 1=The MONITOR and MWAIT instructions are supported in all privilege levels. The state of this   |
|       | bit is ignored if MonMwaitDis is set.  |
| 9     | <b>MonMwaitDis: MONITOR and MWAIT disable</b> . Read-write. Reset: 0. 1=The MONITOR and MWAIT  |
| 0     | opcodes become invalid. This affects what is reported back through Core::X86::Cpuid::FeatureIdEcx[Monitor].  |
| 8     | <b>IgnneEm: IGNNE port emulation enable</b> . Read-write. Reset: 0. 1=Enable emulation of IGNNE port.  |
| 7     | <b>AllowFerrOnNe: allow FERR on NE</b> . Read-write. Reset: 0. 0=Disable legacy FERR signaling and generate FERR exception directly. 1=Legacy FERR signaling.  |
| 6:5   | Reserved.  |
| 4     | <b>INVDWBINVD: INVD to WBINVD conversion</b> . Read-write. Reset: 1. Check: 1. 1=Convert INVD to   |
| -     | WBINVD.  |
|       | <b>Description</b> : This bit is required to be set for normal operation when any of the following are true:   |
|       | • An L2 is shared by multiple threads.   |

|        | An L3 is shared by multiple cores.  |
|--------|---|
|        | • CC6 is enabled.   |
|        | Probe filter is enabled.  |
| 3      | <b>TlbCacheDis</b> : <b>cacheable memory disable</b> . Read-write. Reset: 0. 1=Disable performance improvement that       |
|        | assumes that the PML4, PDP, PDE and PTE entries are in cacheable WB DRAM.   |
|        | Description: Operating systems that maintain page tables in any other memory type must set the TlbCacheDis bit            |
|        | to insure proper operation.   |
|        | • TlbCacheDis does not override the memory type specified by the SMM ASeg and TSeg memory regions                         |
|        | controlled by Core::X86::Msr::SMMAddr Core::X86::Msr::SMMMask.  |
| 2:1    | Reserved.   |
| 0      | SmmLock: SMM code lock. Read, Write-1-only. Reset: 0. Init: BIOS, 1. Check: 1. 1=SMM code in the ASeg and                 |
|        | TSeg range and the SMM registers are read-only and SMI interrupts are not intercepted in SVM. See 2.1.12.1.10             |
|        | [Locking SMM].  |
| MSR    | C001_001[68] [IO Range Base] (Core::X86::Msr::IORR_BASE)  |
|        |   |
| Read-  |   |
|        | X86::Msr::IORR_BASE and Core::X86::Msr::IORR_MASK combine to specify the two sets of base and mask                        |
|        | or two IORR ranges. A core access, with address CPUAddr, is determined to be within IORR address range if the             |
|        | ring equation is true:  |
|        | ddr[47:12] & PhyMask[47:12] == PhyBase[47:12] & PhyMask[47:12].   |
|        | can use the IORRs to create an IO hole within a range of addresses that would normally be mapped to DRAM. It              |
|        | so use the IORRs to re-assert a DRAM destination for a range of addresses that fall within a bigger IO hole that ys DRAM. |
|        | ys DKAM.<br>:0]_core[3:0]_n0; MSRC001_0016  |

| Bits        | Description                  |

47:23 **TOM[47:23]: top of memory**. Read-write. Reset: XXX\_XXXh. Specifies the address that divides between

MMIO and DRAM. This value is normally placed below 4G. From TOM to 4G is MMIO; below TOM is DRAM. See 2.1.6.3 [System Address Map].

22:0 Reserved.

### MSRC001\_001D [Top Of Memory 2] (Core::X86::Msr::TOM2)

Read-write.

\_lthree[1:0]\_core[3:0]; MSRC001\_001D

# Bits Description

63:48 Reserved. 47:23 **TOM2[47:2** 

47:23 **TOM2[47:23]: second top of memory**. Read-write. Reset: XXX\_XXXh. Specifies the address divides between MMIO and DRAM. This value is normally placed above 4G. From 4G to TOM2 - 1 is DRAM; TOM2 and above is MMIO. See 2.1.6.3 [System Address Map]. This register is enabled by Core::X86::Msr::SYS\_CFG[MtrrTom2En].

22:0 Reserved.

### MSRC001\_0022 [Machine Check Exception Redirection] (Core::X86::Msr::McExcepRedir)

Read-write. Reset: 0000\_0000\_0000\_0000h.

This register can be used to redirect machine check exceptions (MCEs) to SMIs or vectored interrupts. If both RedirSmiEn and RedirVecEn are set, then undefined behavior results.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; MSRC001\_0022

| Bits  | Description   |
|-------|---|
| 63:10 | Reserved.   |
| 9     | RedirSmiEn. Read-write. Reset: 0. 1=Redirect MCEs (that are directed to this core) to generate an SMI-trigger |
|       | IO cycle via Core::X86::Msr::SmiTrigIoCycle. The status is stored in  |
|       | Core::X86::Smm::LocalSmiStatus[MceRedirSts].  |
| 8     | RedirVecEn. Read-write. Reset: 0. 1=Redirect MCEs (that are directed to this core) to generate a vectored     |
|       | interrupt, using the interrupt vector specified in RedirVector.   |
| 7:0   | RedirVector. Read-write. Reset: 00h. See RedirVecEn.  |

### MSRC001\_003[0...5] [Processor Name String] (Core::X86::Msr::ProcNameString)

Read-write.

These 6 registers hold the CPUID name string in ASCII. The state of these registers are returned by CPUID instructions, Core::X86::Cpuid::ProcNameStr0Eax through Core::X86::Cpuid::ProcNameStr2Edx. BIOS should set these registers to the product name for the processor as provided by AMD. Each register contains a block of 8 ASCII characters; the least byte corresponds to the first ASCII character of the block; the most-significant byte corresponds to the last character of the block. MSRC001\_0030 contains the first block of the name string; MSRC001\_0035 contains the last block of the name string.

## MSRC001\_005[0...3] [IO Trap] (Core::X86::Msr::SMI\_ON\_IO\_TRAP)

Read-write. Reset: 0000\_0000\_0000\_0000h.

Core::X86::Msr::SMI\_ON\_IO\_TRAP and Core::X86::Msr::SMI\_ON\_IO\_TRAP\_CTL\_STS provide a mechanism for executing the SMI handler if a an access to one of the specified addresses is detected. Access address and access type checking is performed before IO instruction execution. If the access address and access type match one of the specified IO address and access types, then: (1) the IO instruction is not executed; (2) any breakpoint, other than the single-step breakpoint, set on the IO instruction is not taken (the single-step breakpoint is taken after resuming from SMM); and (3) issue the SMI-trigger IO cycle specified by Core::X86::Msr::SmiTrigIoCycle if enabled. The status is stored in Core::X86::Smm::LocalSmiStatus[IoTrapSts].

IO-space configuration accesses are special IO accesses. An IO access is defined as an IO-space configuration access when IO instruction address bits[31:0] are CFCh, CFDh, CFEh, or CFFh when IO-space configuration is enabled (IO::IoCfgAddr[ConfigEn]). The access address for a configuration space access is the current value of IO::IoCfgAddr[BusNo,Device,Function,RegNo]. The access address for an IO access that is not a configuration access is

equivalent to the IO instruction address, bits[31:0].

The access address is compared with SmiAddr, and the instruction access type is compared with the enabled access types defined by ConfigSMI, SmiOnRdEn, and SmiOnWrEn. Access address bits[23:0] can be masked with SmiMask. IO and configuration space trapping to SMI applies only to single IO instructions; it does not apply to string and REP IO instructions. The conditional GP fault described by Core::X86::Msr::HWCR[IoCfgGpFault] takes priority over this trap.

\_lthree[1:0]\_core[3:0]\_thread[1:0]\_n0; MSRC001\_0050

63:0 Reserved. Read-only. Reset: Fixed,0000\_0000\_0000\_0000h.

### MSRC001\_0056 [SMI Trigger IO Cycle] (Core::X86::Msr::SmiTrigIoCycle)

Read-write. Reset: 0000\_0000\_0000\_0000h.

See 2.1.12.1.3 [SMI Sources And Delivery]. This register specifies an IO cycle that may be generated when a local SMI trigger event occurs. If IoCycleEn is set and there is a local SMI trigger event, then the IO cycle generated is a byte read or write, based on IoRd, to address IoPortAddress. If the cycle is a write, then IoData contains the data written. If the cycle is a read, the value read is discarded. If IoCycleEn is clear and a local SMI trigger event occurs, then undefined behavior results.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; MSRC001\_0056

Bits Description

63:27 Reserved.

26 **IoRd: IO Read.** Read-write. Reset: 0. 0=IO write. 1=IO read.

### MSRC001\_0061 [P-state Current Limit] (Core::X86::Msr::PStateCurLim)

| _lthree[1:0]_core[3:0]; MSRC001_0061 |   |  |  |
|--------------------------------------|---|--|--|
| Bits                                 | Description   |  |  |
| 63:7                                 | Reserved.   |  |  |
| 6:4                                  | PstateMaxVal: P-state maximum value. Read, Error-on-write, Volatile. Reset: XXXb. Specifies the lowest- |  |  |
|                                      | performance non-boosted P-state (highest non-boosted value) allowed. Attempts to change                 |  |  |

|     | Core::X86::Msr::PStateCtl[PstateCmd] to a lower-performance P-state (higher value) are clipped to the value of |  |
|-----|--|--|
|     | this field.  |  |
| 3   | Reserved. Read-only. Reset: Fixed,0.   |  |
| 2:0 | CurPstateLimit: current P-state limit. Read,Error-on-write,Volatile. Reset: XXXb. Specifies the highest-       |  |
|     | performance P-state (lowest value) allowed. CurPstateLimit is always bounded by                                |  |
|     | Core::X86::Msr::PStateCurLim[PstateMaxVal]. Attempts to change the CurPstateLimit to a value greater (lower    |  |
|     | performance) than Core::X86::Msr::PStateCurLim[PstateMaxVal] leaves CurPstateLimit unchanged.                  |  |

### MSRC001\_0062 [P-state Control] (Core::X86::Msr::PStateCtl)

\_lthree[1:0]\_core[3:0]\_thread[1:0]; MSRC001\_0062

Bits Description

63:3 Reserved. Read,Error-on-write-1.

2:0 **PstateCmd**: **P-state change command**. Read-write. Reset: XXXb. Cold reset value varies by product; after a warm reset, value initializes to the P-state the core was in prior to the reset. Writes to this field cause the core to change to the indicated non-boosted P-state number, specified by Core::X86::Msr::PStateDef. 0=P0, 1=P1, etc. P-state limits are applied to any P-state requests made through this register. Reads from this field return the last written value, regardless of whether any limits are applied.

### MSRC001\_0063 [P-state Status] (Core::X86::Msr::PStateStat)

Read,Error-on-write,Volatile.

\_lthree[1:0]\_core[3:0]; MSRC001\_0063

Bits Description

63:3 Reserved.

2:0 **CurPstate: current P-state**. Read,Error-on-write,Volatile. Reset: XXXb. This field provides the frequency component of the current non-boosted P-state of the core (regardless of the source of the P-state change, including Core::X86::Msr::PStateCtl[PstateCmd]. 0=P0, 1=P1, etc. The value of this field is updated when the COF transitions to a new value associated with a P-state.

## MSRC001\_006[4...B] [P-state [7:0]] (Core::X86::Msr::PStateDef)

### Read-write.

Each of these registers specify the frequency and voltage associated with each of the core P-states.

The CpuVid field in these registers is required to be programmed to the same value in all cores of a processor, but are allowed to be different between processors in a multi-processor system. All other fields in these registers are required to be programmed to the same value in each core of the coherent fabric.

### MSRC001\_0111 [SMM Base Address] (Core::X86::Msr::SMM\_BASE)

### Reset: 0000\_0000\_0003\_0000h.

This holds the base of the SMM memory region. The value of this register is stored in the save state on entry into SMM (see 2.1.12.1.5 [SMM Save State]) and it is restored on returning from SMM. The 16-bit CS (code segment) selector is loaded with SmmBase[19:4] on entering SMM. SmmBase[3:0] is required to be 0. The SMM base address can be changed in two ways:

- The SMM base address, at offset FF00h in the SMM state save area, may be changed by the SMI handler. The RSM instruction updates SmmBase with the new value.
- Normal WRMSR access to this register.

| _lthree[1 | _three[1:0]_core[3:0]_thread[1:0]; MSRC001_0111                     |  |  |

| Bits      | Description   |  |  |
| 63:32     | Reserved.   |  |  |
| 31:0      | SmmBase. Reset: 0003_0000h.   |  |  |
|           | AccessType: Core::X86::Msr::HWCR[SmmLock] ? Read-only : Read-write. |  |  |
|           |   |  |  |

### MSRC001\_0112 [SMM TSeg Base Address] (Core::X86::Msr::SMMAddr)

Configurable. Reset: 0000\_0000\_0000\_0000h.

See 2.1.12.1 [System Management Mode (SMM)] and 2.1.6.3.1 [Memory Access to the Physical Address Space]. See Core::X86::Msr::SMMMask for more information about the ASeg and TSeg address ranges.

Each CPU access, directed at CPUAddr, is determined to be in the TSeg range if the following is true:

CPUAddr[47:17] & TSegMask[47:17] == TSegBase[47:17] & TSegMask[47:17].

For example, if TSeg spans 256 KB and starts at the 1 MB address. The Core::X86::Msr::SMMAddr[TSegBase[47:17]] would be set to 0010\_0000h and the Core::X86::Msr::SMMMask[TSegMask[47:17]] to FFFC\_0000h (with zeros filling in for bits[16:0]). This results in a TSeg range from 0010\_0000 to 0013\_FFFFh.

\_lthree[1:0]\_core[3:0]; MSRC001\_0112

Bits Description

63:48 Reserved.

47:17 **TSegBase[47:17]: TSeg address range base**. Configurable. Reset: 0000\_0000h. AccessType:

(Core::X86::Msr::HWCR[SmmLock]) ? Read-only : Read-write.

16:0 Reserved.

### MSRC001\_0113 [SMM TSeg Mask] (Core::X86::Msr::SMMMask)

Configurable. Reset: 0000\_0000\_0000\_0000h.

See 2.1.12.1 [System Management Mode (SMM)].

The ASeg address range is located at a fixed address from A0000h–BFFFFh. The TSeg range is located at a variable base (specified by Core::X86::Msr::SMMAddr[TSegBase[47:17]]) with a variable size (specified by

Core::X86::Msr::SMMMask[TSegMask[47:17]]). These ranges provide a safe location for SMM code and data that is not readily accessible by non-SMM applications. The SMI handler can be located in one of these two ranges, or it can be located outside these ranges. These ranges must never overlap each other.

This register specifies how accesses to the ASeg and TSeg address ranges are controlled as follows:

- If [A,T]Valid == 1, then:
  - If in SMM, then:
    - If [A, T]Close == 0, then the accesses are directed to DRAM with memory type as specified in [A, T]MTypeDram.
    - If [A, T]Close == 1, then instruction accesses are directed to DRAM with memory type as specified in [A, T]MTypeDram and data accesses are directed at MMIO space and with attributes based on [A, T]MTypeIoWc.
  - If not in SMM, then the accesses are directed at MMIO space with attributes based on [A,T]MTypeIoWc.
- See 2.1.6.3.1.1 [Determining Memory Type].

\_lthree[1:0]\_core[3:0]\_thread[1:0]; MSRC001\_0118

#### Bits Description

63:0 **SvmLockKey**: **SVM lock key**. Read-write. Reset: Fixed,0000\_0000\_0000\_0000h. Writes to this register when (Core::X86::Msr::VM\_CR[Lock] == 0) modify SvmLockKey. If ((Core::X86::Msr::VM\_CR[Lock] == 1) && (SvmLockKey!=0) && (The write value == The value stored in SvmLockKey)) for a write to this register then hardware updates Core::X86::Msr::VM\_CR[Lock]=0.

#### MSRC001\_011A [Local SMI Status] (Core::X86::Msr::LocalSmiStatus)

Read-write. Reset: 0000\_0000\_0000\_0000h.

This register returns the same information that is returned in Core::X86::Smm::LocalSmiStatus portion of the SMM save state. The information in this register is only updated when Core::X86::Msr::SMM\_CTL[SmmDismiss] is set by software.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; MSRC001\_011A

Bits Description

63:32 Reserved.

31:0 LocalSmiStatus. Read-write. Reset: 0000\_0000h. See Core::X86::Smm::LocalSmiStatus.

#### MSRC001\_011B [AVIC Doorbell] (Core::X86::Msr::AvicDoorbell)

Reset: 0000\_0000\_0000\_0000h.

The ApicId is a physical APIC Id; not valid for logical APIC ID.

See Core::X86::Cpuid::SvmRevFeatIdEdx[AVIC].

\_lthree[1:0]\_core[3:0]\_thread[1:0]; MSRC001\_011B

Bits Description

63:8 Reserved. Error-on-read,Error-on-write-1. Reset: 00\_0000\_0000\_0000h.

7:0 ApicId: APIC ID [7:0]. Write-only,Error-on-read. Reset: 00h.

#### MSRC001\_011E [VM Page Flush] (Core::X86::Msr::VMPAGE\_FLUSH)

Writes to this MSR cause 4KB of encrypted, guest-tagged data to be flushed from caches if present.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; MSRC001\_011E

| Bits  | Descripti | on   |

#### MSRC001\_1019 [Address Mask For DR1 Breakpoint] (Core::X86::Msr::DR1\_ADDR\_MASK)

#### Read-write. Reset: 0000\_0000\_0000\_0000h.

Support indicated by Core::X86::Cpuid::FeatureExtIdEcx[DataBreakpointExtension].

\_lthree[1:0]\_core[3:0]\_thread[1:0]; MSRC001\_1019

Bits Description

# 63:32 Reserved.

31:0 AddrMask: mask for DR linear address data breakpoint DR1. Read-write. Reset: 0000\_0000h. 1=Exclude bit into address compare. 0=Include bit into address compare. See Core::X86::Msr::DR1\_ADDR\_MASK. AddrMask[11:0] qualifies the DR1 linear address instruction breakpoint, allowing the DR1 instruction breakpoint on a range of addresses in memory.

#### MSRC001\_101A [Address Mask For DR2 Breakpoint] (Core::X86::Msr::DR2\_ADDR\_MASK)

Read-write. Reset: 0000\_0000\_0000\_0000h.

Support indicated by Core::X86::Cpuid::FeatureExtIdEcx[DataBreakpointExtension].

\_lthree[1:0]\_core[3:0]\_thread[1:0]; MSRC001\_101A

Bits Description

63:32 Reserved.

31:0 AddrMask: mask for DR linear address data breakpoint DR2. Read-write. Reset: 0000\_0000h. 1=Exclude bit into address compare. 0=Include bit into address compare. See Core::X86::Msr::DR0\_ADDR\_MASK. AddrMask[11:0] qualifies the DR2 linear address instruction breakpoint, allowing the DR2 instruction breakpoint on a range of addresses in memory.

#### MSRC001\_101B [Address Mask For DR3 Breakpoint] (Core::X86::Msr::DR3\_ADDR\_MASK)

Read-write. Reset: 0000\_0000\_0000\_0000h.

Support indicated by Core::X86::Cpuid::FeatureExtIdEcx[DataBreakpointExtension].

\_lthree[1:0]\_core[3:0]\_thread[1:0]; MSRC001\_101B

Bits Description

63:32 Reserved.

31:0 AddrMask: mask for DR linear address data breakpoint DR3. Read-write. Reset: 0000\_0000h. 1=Exclude bit into address compare. 0=Include bit into address compare. See Core::X86::Msr::DR0\_ADDR\_MASK. AddrMask[11:0] qualifies the DR3 linear address instruction breakpoint, allowing the DR3 instruction breakpoint on a range of addresses in memory.

#### MSRC001\_1023 [Table Walker Configuration] (Core::X86::Msr::TW\_CFG)

Read-write. Reset: 0000\_0000\_0000\_0000h.

#### MSRC001\_1027 [Address Mask For DR0 Breakpoints] (Core::X86::Msr::DR0\_ADDR\_MASK)

Read-write. Reset: 0000\_0000\_0000\_0000h.

Support for DR0[31:12] is indicated by Core::X86::Cpuid::FeatureExtIdEcx[DataBreakpointExtension]. See Core::X86::Msr::DR1\_ADDR\_MASK.

\_lthree[1:0]\_core[3:0]\_thread[1:0]; MSRC001\_1027

# Bits Description

63:32 Reserved.

31:0 **DR0: mask for DR0 linear address data breakpoint**. Read-write. Reset: 0000\_0000h. 1=Exclude bit into address compare. 0=Include bit into address compare. See Core::X86::Msr::DR1\_ADDR\_MASK. This field qualifies the DR0 linear address data breakpoint, allowing the DR0 data breakpoint on a range of addresses in memory. AddrMask[11:0] qualifies the DR0 linear address instruction breakpoint, allowing the DR0 instruction breakpoint on a range of addresses in memory. DR0[31:12] is only valid for data breakpoints. The legacy DR0 breakpoint function is provided by DR0[31:0] == 0000\_0000h). The mask bits are active high. DR0 is always used, and it can be used in conjunction with any debug function that uses DR0.

# MSRC001\_1030 [IBS Fetch Control] (Core::X86::Msr::IBS\_FETCH\_CTL)

| Reset:   | 0000_000   | 00_0000_0000h.  |  |
|--|--|---|--|
| See 2.   | 1.16 [Instr  | uction Based Sampling (IBS)].   |  |
|  |  | mpling engine is described as follows:  |  |
| •  |  | odic fetch counter is an internal 20-bit counter:   |  |
|  |  | The periodic fetch counter [19:4] is set to IbsFetchCnt[19:4] and the periodic fetch counter [3:0] is set       |  |
|  |  | according to IbsRandEn when IbsFetchEn is changed from 0 to 1.  |  |
|  |  | It increments for every fetch cycle that completes when IbsFetchEn == 1 and IbsFetchVal == 0.                   |  |
|  |  | • The periodic fetch counter is undefined when IbsFetchEn == 0 or IbsFetchVal == 1.                             |  |
|  | • 1  | When IbsFetchCnt[19:4] is read it returns the current value of the periodic fetch counter [19:4].               |  |
| •  |  | e periodic fetch counter reaches {IbsFetchMaxCnt[19:4],0h} and the selected instruction fetch                   |  |
|  |  | es or is aborted:   |  |
|  | -  | lbsFetchVal is set to 1.  |  |
|  |  | • Drivers can't assume that IbsFetchCnt[19:4] is 0 when IbsFetchVal == 1.                                       |  |
| •  | The statu  | us of the operation is written to the IBS fetch registers (this register,                                       |  |
|  |  | B6::Msr::IBS_FETCH_LINADDR and Core::X86::Msr::IBS_FETCH_PHYSADDR).   |  |
| •  |  | rupt is generated as specified by Core::X86::Msr::IBS_CTL. The interrupt service routine associated             |  |
|  |  | interrupt is responsible for saving the performance information stored in IBS execution registers.              |  |
|  |  | _thread[1:0]; MSRC001_1030  |  |
| Bits   | Descripti  | ion   |  |
| 63:59  | Reserved   |   |  |
| 58   | IbsFetch   | L2Miss: L2 cache miss for the sampled fetch. Read-only, Volatile. Reset: 0. 1=The instruction fetch             |  |
|  | missed in  | the L2 Cache. Qualified by (IbsFetchComp == 1).   |  |
| 57   | IbsRand  | En: random instruction fetch tagging enable. Read-write. Reset: 0. 0=Bits[3:0] of the fetch counter             |  |
|  |  | 0h when IbsFetchEn is set to start the fetch counter. 1=Bits[3:0] of the fetch counter are randomized           |  |
|  | when Ibs   | FetchEn is set to start the fetch counter.  |  |
| 56   | IbsL2Tlt   | Miss: instruction cache L2TLB miss. Read-only, Volatile. Reset: 0. 1=The instruction fetch missed in            |  |
|  | the L2 TI  | LB.   |  |
| 55   | IbsL1Tlt   | Miss: instruction cache L1TLB miss. Read-only, Volatile. Reset: 0. 1=The instruction fetch missed in            |  |
|  | the L1 TI  | LB.   |  |
| 54:53 IbsL1TlbPgSz: instruction cache L1TLB page size. Read-on |  | <b>PgSz: instruction cache L1TLB page size</b> . Read-only, Volatile. Reset: 0h. Indicates the page size of the |  |
|  | translation in the L1 TLB. This field is only valid if IbsPhyAddrValid == 1. |   |  |
| ValidValues:   |  |   |  |
|  | Value  | Description   |  |
|  | 0h   | 4 KB  |  |
|  | 1h   | 2 MB  |  |
|  | 2h   | 1 GB  |  |
|  | 3h   | Reserved.   |  |
| 52   | IbsPhvA  | ddrValid: instruction fetch physical address valid. Read-only, Volatile. Reset: 0. 1=The physical               |  |
|  |  | Core::X86::Msr::IBS_FETCH_PHYSADDR and the IbsL1TlbPgSz field are valid for the instruction                     |  |
|  | fetch.   |   |  |
| 51   |  | s: instruction cache miss. Read-only, Volatile. Reset: 0. 1=The instruction fetch missed in the                 |  |
|  | instructio   | 5.  |  |
| 50   |  | <b>Comp:</b> instruction fetch complete. Read-only, Volatile. Reset: 0. 1=The instruction fetch completed and   |  |
|  |  |   |  |

|       | the data is available for use by the instruction decoder.   |  |  |
|-------|---|--|--|
| 49    | <b>IbsFetchVal</b> : <b>instruction fetch valid</b> . Read-only, Volatile. Reset: 0. 1=New instruction fetch data available. When |  |  |
|       | this bit is set, the fetch counter stops counting and an interrupt is generated as specified by                                   |  |  |
|       | Core::X86::Msr::IBS_CTL. This bit must be cleared for the fetch counter to start counting. When clearing this bit,                |  |  |
|       | software can write 0000h to IbsFetchCnt[19:4] to start the fetch counter at IbsFetchMaxCnt[19:4].                                 |  |  |
| 48    | <b>IbsFetchEn</b> : <b>instruction fetch enable</b> . Read-write. Reset: 0. 1=Instruction fetch sampling is enabled.              |  |  |

|       | from when the instruction fetch was initiated to when the data was delivered to the core. If the instruction fetch is             |  |  |
|       | abandoned before the fetch completes, this field returns the number of clock cycles from when the instruction                     |  |  |
|       | fetch was initiated to when the fetch was abandoned.  |  |  |
| 31:16 | <b>IbsFetchCnt[19:4]</b> . Read-write, Volatile. Reset: 0000h. Provides read/write access to bits[19:4] of the periodic           |  |  |
|       | fetch counter. Programming this field to a value greater than or equal to IbsFetchMaxCnt[19:4] results in                         |  |  |
|       | undefined behavior.   |  |  |
| 15:0  | IbsFetchMaxCnt[19:4]. Read-write. Reset: 0000h. Specifies bits[19:4] of the maximum count value of the                            |  |  |
|       | periodic fetch counter. Programming this field to 0000h and setting IbsFetchEn results in undefined behavior.                     |  |  |
|       | Bits[3:0] of the maximum count are always 0000b.  |  |  |
|       |   |  |  |
| MSRO  | MSRC001_1031 [IBS Fetch Linear Address] (Core::X86::Msr::IBS_FETCH_LINADDR)   |  |  |

Read-write, Volatile. Reset: 0000\_0000\_0000\_0000h.

Reset: 0000\_0000\_0000\_0000h.

# Bits Description

63:0 **IbsFetchLinAd: instruction fetch linear address.** Read-write, Volatile. Reset: 0000\_0000\_0000\_0000h. Provides the linear address in canonical form for the tagged instruction fetch.

# MSRC001\_1032 [IBS Fetch Physical Address] (Core::X86::Msr::IBS\_FETCH\_PHYSADDR)

| _lthree[1 | _lthree[1:0]_core[3:0]_thread[1:0]; MSRC001_1032   |  |  |
|-----------|--|--|--|
| Bits      | Description  |  |  |
| 63:48     | Reserved. Read-only. Reset: Fixed,0000h.   |  |  |
| 47:0      | IbsFetchPhysAd: instruction fetch physical address. Read-write, Volatile. Reset: 0000_0000_0000h. Provides           |  |  |
|           | the physical address for the tagged instruction fetch. The lower 12 bits are not modified by address translation, so |  |  |
|           | they are always the same as the linear address. This field contains valid data only if                               |  |  |
|           | CorouX86. MeruIBS FETCH CTI [IbcDbyAddrValid] is assorted  |  |  |

Core::X86::Msr::IBS\_FETCH\_CTL[IbsPhyAddrValid] is asserted.

# MSRC001\_1033 [IBS Execution Control] (Core::X86::Msr::IBS\_OP\_CTL)

Reset: 0000\_0000\_0000\_0000h.

See 2.1.16 [Instruction Based Sampling (IBS)].

The IBS execution sampling engine is described as follows for IbsOpCntCtl == 1. If IbsOpCntCtl == 1n then references to "periodic op counter" mean "periodic cycle counter".

- The periodic op counter is an internal 27-bit counter:
  - It is set to IbsOpCurCnt[26:0] when IbsOpEn is changed from 0 to 1.
    - It increments every dispatched op when IbsOpEn == 1 and IbsOpVal == 0.
      - The periodic op counter is undefined when IbsOpEn == 0 or IbsOpVal == 1.
  - When IbsOpCurCnt[26:0] is read then it returns the current value of the periodic micro-op counter [26:0].
- When the periodic micro-op counter reaches IbsOpMaxCnt:
  - The next dispatched micro-op is tagged if IbsOpCntCtl == 1. A valid op in the next dispatched line is tagged if IbsOpCntCtl == 0. See IbsOpCntCtl.
  - The periodic micro-op counter [26:7]=0; [6:0] is randomized by hardware.
  - The periodic micro-op counter is not modified when a tagged micro-op is flushed.
  - When a tagged micro-op is retired:
    - IbsOpVal is set to 1.
      - Drivers can't assume that IbsOpCurCnt is 0 when IbsOpVal == 1.

- The status of the operation is written to the IBS execution registers (this register, Core::X86::Msr::IBS\_OP\_RIP, Core::X86::Msr::IBS\_OP\_DATA, Core::X86::Msr::IBS\_OP\_DATA2, Core::X86::Msr::IBS\_OP\_DATA3, Core::X86::Msr::IBS\_DC\_LINADDR and Core::X86::Msr::IBS\_DC\_PHYSADDR).
- An interrupt is generated as specified by Core::X86::Msr::IBS\_CTL. The interrupt service routine associated with this interrupt is responsible for saving the performance information stored in IBS execution registers. [three[1:0]\_core[3:0]\_thread[1:0]; MSRC001\_1033

Support for this register indicated by Core::X86::Cpuid::IbsIdEax[IbsFetchCtlExtd].

\_lthree[1:0]\_core[3:0]\_thread[1:0]; MSRC001\_103C

Bits Description

63:16 Reserved.

15:0 **IbsItlbRefillLat: ITLB Refill Latency for the sampled fetch, if there is a reload**. Read-only, Volatile. Reset: 0000h. The number of cycles when the fetch engine is stalled for an ITLB reload for the sampled fetch. If there is no reload, the latency is 0.

#### 2.1.15 **Performance Monitor Counters**

Any undefined UnitMask bits should be set to zero when selecting an event.

# 2.1.15.1 **RDPMC** Assignments

There are six core performance event counters per thread, six performance events counters per L3 complex and four Data Fabric performance events counters mapped to the RDPMC instruction as follows:

- The RDPMC[5:0] instruction accesses core events. See 2.1.15.4 [Core Performance Monitor Counters].
- The RDPMC[9:6] instruction accesses data fabric events.
- The RDPMC[F:A] instruction accesses L3 cache events. See 2.1.15.5 [L3 Cache Performance Monitor Counters].

#### 2.1.15.2 **Performance Measurement**

This section contains AMD's recommended method for collecting microarchitecture performance common to software optimization. This may require combining multiple performance event selections. Table 19 [Guidance for Common Performance Statistics with Complex Event Selects] lists formulas for collecting common performance statistics. ٠

- The term Event is the full value written to Core::X86::Msr::PERF CTL.
  - Core PMC select bits [63:36,31:16] are at the user's discretion, (i.e. they are not part of the event ٠ selection).
- The term L3Event is the full value written to Core::X86::Msr::ChL3PmcCfg. •
- The term DFEvent is the full value written to Core::X86::Msr::DF\_PERF\_CTL. •

Table 19: Guidance for Common Performance Statistics with Complex Event Selects

# 2.1.15.3 Large Increment per Cycle Events

The maximum increment for a regular performance event is 15 (i.e., a 4-bit event). However some event types can have a large increment every cycle (example: Core::X86::Pmc::Core::FpRetSseAvxOps).

An option is provided for merging a pair of even/odd performance monitors to acquire an accurate count. The even performance monitor is programmed with the desired event (example: Core::X86::Pmc::Core::FpRetSseAvxOps). First the odd numbered Core::X86::Msr::PERF\_CTL is programmed with the event Core::X86::Pmc::Core::Merge (PMCxFFF) with the enable bit (En) turned on and with the remaining bits off. Then the corresponding even numbered Core::X86::Msr::PERF\_CTL is programmed with the desired PMC event. The performance monitor combines the count value to an 8-bit increment event and extends the counter to a 64-bit counter.

Software wanting to preload a value to a merged counter pair writes the high-order 16-bit value to the low-order 16 bits of the odd counter and then writes the low-order 48-bit value to the even counter. Reading the even counter of the merged counter pair returns the full 64-bit value.

If an even performance monitor is programmed with the event Core::X86::Pmc::Core::Merge the read results are undetermined. If an even performance monitor is programmed with a non-merge-able event (i.e., less than 5-bit event) while the corresponding odd performance monitor is programmed as Merge, the read results are undetermined. When discontinuing use of a merged counter pair, clear the Merge event from the odd performance monitor.

#### PMCxFFF [Merge] (Core::X86::Pmc::Core::Merge)

| See 2.1.15.3 [Large Increment per Cycle Events]. |             |  |

#### 2.1.15.4 Core Performance Monitor Counters

This section provides the core performance counter events that may be selected through Core::X86::Msr::PERF\_CTL[EventSelect[11:8],EventSelect[7:0],UnitMask]. See Core::X86::Msr::PERF\_LEGACY\_CTR. See Core::X86::Msr::PERF\_LEGACY\_CTL and Core::X86::Msr::PERF\_LEGACY\_CTR.

# 2.1.15.4.1 Floating Point (FP) Events

#### PMCx000 [FPU Pipe Assignment] (Core::X86::Pmc::Core::FpuPipeAssignment)

Read-only. Reset: 00h.

The number of operations (uOps) and dual-pipeuOps dispatched to each of the 4 FPU execution pipelines. This event reflects how busy the FPU pipelines are and may be used for workload characterization. This includes all operations performed by x87, MMX, and SSE instructions, including moves. Each increment represents a one-cycle dispatch event. This event is a speculative event. (See Core::X86::Pmc::Core::ExRetMmxFpInstr). Since this event includes non-numeric operations it is not suitable for measuring MFLOPs.

| PMCx000 |  |
|---------|--|
| Bits    | Description  |
| 7       | Dual3: Total number multi-pipe uOps assigned to Pipe 3. Read-only. Reset: 0. |
| 6       | Dual2: Total number multi-pipe uOps assigned to Pipe 2. Read-only. Reset: 0. |
| 5       | Dual1: Total number multi-pipe uOps assigned to Pipe 1. Read-only. Reset: 0. |
| 4       | Dual0: Total number multi-pipe uOps assigned to Pipe 0. Read-only. Reset: 0. |
| 3       | Total3: Total number uOps assigned to Pipe 3. Read-only. Reset: 0.           |
| 2       | Total2: Total number uOps assigned to Pipe 2. Read-only. Reset: 0.           |

**1 Total1: Total number uOps assigned to Pipe 1**. Read-only. Reset: 0.

0 **Total0: Total number uOps assigned to Pipe 0**. Read-only. Reset: 0.

#### PMCx001 [FP Scheduler Empty] (Core::X86::Pmc::Core::FpSchedEmpty)

This is a speculative event. The number of cycles in which the FPU scheduler is empty. Note that some Ops like FP loads bypass the scheduler. Invert this (Core::X86::Msr::PERF\_CTL[Inv] == 1) to count cycles in which at least one FPU operation is present in the FPU.

PMCx001

Bits Description

7:0 Reserved.

#### PMCx002 [Retired x87 Floating Point Operations] (Core::X86::Pmc::Core::FpRetx87FpOps)

Read-write. Reset: 00h.

The number of x87 floating-point Ops that have retired. The number of events logged per cycle can vary from 0 to 8. PMCx002

**Bits** Description

7:3 Reserved.

2 **DivSqrROps: Divide and square root Ops**. Read-write. Reset: 0.

1 **MulOps: Multiply Ops.** Read-write. Reset: 0.

0 AddSubOps: Add/subtract Ops. Read-write. Reset: 0.

#### PMCx003 [Retired SSE/AVX Operations] (Core::X86::Pmc::Core::FpRetSseAvxOps)

Read-write. Reset: 00h.

This is a retire-based event. The number of retired SSE/AVX FLOPs. The number of events logged per cycle can vary from 0 to 64. This event can count above 15. See 2.1.15.3 [Large Increment per Cycle Events].

PMCx003

Bits Description

7 **DpMultAddFLOPs: Double precision multiply-add FLOPs.** Read-write. Reset: 0. Multiply-add counts as 2 FLOPs.

6 **DpDivFLOPs: Double precision divide/square root FLOPs**. Read-write. Reset: 0.

5 **DpMultFLOPs: Double precision multiply FLOPs**. Read-write. Reset: 0.

- 4 **DpAddSubFLOPs: Double precision add/subtract FLOPs**. Read-write. Reset: 0.
- 3 **SpMultAddFLOPs: Single precision multiply-add FLOPs**. Read-write. Reset: 0. Multiply-add counts as 2 FLOPs.
- 2 SpDivFLOPs: Single-precision divide/square root FLOPs. Read-write. Reset: 0.
- 1 **SpMultFLOPs**: **Single-precision multiply FLOPs**. Read-write. Reset: 0.
- 0 **SpAddSubFLOPs: Single-precision add/subtract FLOPs**. Read-write. Reset: 0.

#### PMCx004 [Number of Move Elimination and Scalar Op Optimization] (Core::X86::Pmc::Core::FpNumMovElimScalOp)

Read-write. Reset: 00h.

This is a dispatch based speculative event, and is useful for measuring the effectiveness of the Move elimination and Scalar code optimization schemes.

| PMCx004 |   |
|---------|---|
| Bits    | Description   |
| 7:4     | Reserved.   |
| 3       | <b>Optimized</b> : Number of Scalar Ops optimized. Read-write. Reset: 0.  |
| 2       | <b>OptPotential</b> : Number of Ops that are candidates for optimization (have Z-bit either set or pass). Read- |
|         | write. Reset: 0.  |
| 1       | SseMovOpsElim: Number of SSE Move Ops eliminated. Read-write. Reset: 0.   |
| 0       | SseMovOps: Number of SSE Move Ops. Read-write. Reset: 0.  |

# PMCx005 [Retired Serializing Ops] (Core::X86::Pmc::Core::FpRetiredSerOps)

| Read-  | Read-write. Reset: 00h.   |  |  |
|--------|---|--|--|

#### 2.1.15.5 L3 Cache Performance Monitor Counters

The L3 cache is organized as 4 2MB slices shared by 4 cores.

This section provides the core performance counter events that may be selected through Core::X86::Msr::ChL3PmcCfg.

- Unless otherwise noted, L3 Perfmon events require the Core::X86::Msr::ChL3PmcCfg[SliceMask] field to be set. If it is not set, the PMC count will be zero.
- Unless otherwise noted, L3 PMC's require Core::X86::Msr::ChL3PmcCfg[ThreadMask] to be set. The events that don't require a ThreadMask will continue to count, even if the ThreadMask is 0. All other events will have a count of 0 when the ThreadMask is 0.
- When in non-SMT mode, ThreadMask must be 0 for events that don't ignore ThreadMask,

# 2.1.16 Instruction Based Sampling (IBS)

IBS is a code profiling mechanism that enables the processor to select a random instruction fetch or micro-Op after a programmed time interval has expired and record specific performance information about the operation. An interrupt is generated when the operation is complete as specified by Core::X86::Msr::IBS\_CTL. An interrupt handler can then read the performance information that was logged for the operation.

The IBS mechanism is split into two parts: instruction fetch performance controlled by

Core::X86::Msr::IBS\_FETCH\_CTL; and instruction execution performance controlled by

Core::X86::Msr::IBS\_OP\_CTL. Instruction fetch sampling provides information about instruction TLB and instruction cache behavior for fetched instructions. Instruction execution sampling provides information about micro-Op execution behavior. The data collected for instruction fetch performance is independent from the data collected for instruction execution performance. Support for the IBS feature is indicated by the Core::X86::Cpuid::FeatureExtIdEcx[IBS].

Instruction fetch performance is profiled by recording the following performance information for the tagged instruction fetch:

- If the instruction fetch completed or was aborted. See Core::X86::Msr::IBS\_FETCH\_CTL.
- The number of clock cycles spent on the instruction fetch. See Core::X86::Msr::IBS\_FETCH\_CTL.
- If the instruction fetch hit or missed the IC, hit/missed in the L1 and L2 TLBs, and page size. See Core::X86::Msr::IBS\_FETCH\_CTL.
- The linear address, physical address associated with the fetch. See Core::X86::Msr::IBS\_FETCH\_LINADDR, Core::X86::Msr::IBS\_FETCH\_PHYSADDR.

Instruction execution performance is profiled by tagging one micro-Op associated with an instruction. Instructions that decode to more than one micro-Op return different performance data depending upon which micro-Op associated with the instruction is tagged. These micro-Ops are associated with the RIP of the next instruction to retire. The following performance information is returned for the tagged micro-Op:

- Branch and execution status for micro-ops. See Core::X86::Msr::IBS\_OP\_DATA.
- Branch target address for branch micro-ops. See Core::X86::Msr::BP\_IBSTGT\_RIP.
- The logical address associated with the micro-Op. See Core::X86::Msr::IBS\_OP\_RIP.
- The linear and physical address associated with a load or store micro-Op. See Core::X86::Msr::IBS\_DC\_LINADDR, Core::X86::Msr::IBS\_DC\_PHYSADDR.
- The data cache access status associated with the micro-Op: DC hit/miss, DC miss latency, TLB hit/miss, TLB page size. See Core::X86::Msr::IBS\_OP\_DATA3.
- The number clocks from when the micro-Op was tagged until the micro-Op retires. See

Core::X86::Msr::IBS\_OP\_DATA.

- The number clocks from when the micro-Op completes execution until the micro-Op retires. See Core::X86::Msr::IBS\_OP\_DATA.
- Source information for DRAM and MMIO. See Core::X86::Msr::IBS\_OP\_DATA2.

# 3 Reliability, Availability, and Serviceability (RAS) Features

A full implementation of RAS involves capabilities and support from the processor design, board hardware design, BIOS, firmware, and software. A broad view of the RAS environment can be found in docRAS. This section describes the capabilities provided by the Family 17h Model 00h-0Fh processor.

### 3.1 Machine Check Architecture

#### Table 20: Machine Check Terms and Acronyms

| Term  | Description     |  |  |  |  |  |
|---|-----------------|--|--|--|--|--|
| MCA Machine Check Architecture.             |                 |  |  |  |  |  |
| MCAX Machine Check Architecture eXtensions. |                 |  |  |  |  |  |
| WRIG  | Writes Ignored. |  |  |  |  |  |

#### 3.1.1 Overview

The processor contains logic and registers to detect, log, and correct errors in the data or control paths. The Machine Check Architecture (MCA) defines facilities by which processor and system hardware errors are logged and reported to system software. This allows system software to perform a strategic role in recovery from and diagnosis of hardware errors.

### 3.1.1.1 Legacy Machine Check Architecture

The legacy x86 Machine Check Architecture (MCA) refers to the standard x86 facilities for error logging and reporting. Refer to the AMD64 Architecture Programmer's Manual for an architectural overview of the Machine Check Architecture.

Support for the MCA is indicated by Core::X86::Cpuid::FeatureIdEdx[MCA] or Core::X86::Cpuid::FeatureExtIdEdx[MCA].

#### 3.1.1.2 Machine Check Architecture Extensions

Machine Check Architecture Extensions (MCAX) is AMD's x86-64 extension to the Machine Check Architecture.

Goals of MCAX include:

- Accommodate a variety of implementations, where each implementation may have a different assignment of MCA bank to block.
  - For example, one implementation may have 1 memory channel with an MCA bank, and another otherwise identical implementation may have 2 memory channels, each with their own MCA bank. Therefore, MCA bank allocation will appear different between these two implementations. MCAX is designed to require no assumptions about which MCA banks access which blocks.
  - Provide granular information for error logging, to improve error handling and diagnosibility.
  - Preserve compatibility with system software which is not MCAX-aware.

Features of the MCA Extensions include:

- Increased MCA Bank Count: Features to support an expansion of the number of MCA banks supported by AMD processors.
- MCA Extension Registers: Expanded information logged in MCA banks to allow for improved error handling, better diagnosability, and future scalability.

• MCA DOER/SEER Roles: Separation of MCA information to take advantage of emerging software roles, namely Error Management (Dynamic Operational Error Handling, or DOER) for managing running programs, and Fault Management (Symptom Elaboration of Errors, or SEER) for hardware diagnosability and reconfiguration. This clearer separation is accompanied by the assurances of architectural state (vs. implementation dependent state), so that operating systems can rely on the state and exploit new functionality.

Support for Machine Check Architecture Extensions (MCAX) is indicated by Core::X86::Cpuid::RasCap[ScalableMca].

# 3.1.1.3 Use of MCA Information

The MCA registers contain information that can be used for multiple purposes. Some of this information is architecturally specified, and remains consistent from generation to generation, enabling portable, stable code. Some of this information is implementation specific; it is vital for diagnosis and other software functions, but may change with new implementations. It is important to understand how this information is categorized, and how it should be used. This section describes a framework for that.

There are two fundamental roles to be carried out after an error occurs; Error Management and Fault Management. All information required for Error Management is architectural and stable; some information required for Fault Management is also architectural.

# 3.1.1.3.1 Error Management

Error Management describes actions necessary by operational software (e.g., the operating system or the hypervisor) to manage running programs that are affected by the error. The list of possible actions for operational error management is generally fairly short: take no action; terminate a single affected process, program, or virtual machine; terminate system operation. The Error Management role is defined as the DOER role (Dynamic Operational Error Handling). The name is intended to indicate an active role in managing running programs. Information used by the DOER is fairly limited and straightforward. It includes only those status fields needed to make decisions about the scope and severity of the error, and to determine what immediate action is to be taken.

#### 3.1.1.3.2 Fault Management

Fault Management describes optional actions for purposes of diagnosis, repair, and reconfiguration of the underlying hardware. The Fault Management role is described as SEER (Symptom Elaboration of Errors) because it peers further into hardware behavior and may try to influence future behavior via Predictive Fault Analysis, reconfiguration, service actions, etc. Because the SEER depends on understanding specifics of hardware configuration, it necessarily requires implementation specific knowledge and is portable.

Fields that are not explicitly specified as DOER are SEER. By separating error handling software into DOER and SEER roles, programmers can create both simpler and more functional code. The terms DOER and SEER appear in other sections of this document as an aid to reasoning about error handling and understanding actions to be taken.

# 3.1.2 Machine Check Registers

Host software references MCA registers via MSRs. MSRs are accessed through x86 WRMSR and RDMSR instructions. MSR addresses are private to a logical core; a given MSR referenced by two different cores results in references to two different MCA registers.

#### 3.1.2.1 Global Registers

Core::X86::Cpuid::FeatureIdEdx[MCA] or Core::X86::Cpuid::FeatureExtIdEdx[MCA] indicates the presence of the

•

following machine check registers:

- Core::X86::Msr::MCG\_CAP
  - Reports how many machine check register banks are supported. This is a per-thread value, and reflects the number of MCA banks visible to that thread. Some banks may be RAZ/WRIG either due to the bank being reserved or unused on this processor or because the block's MCA bank is controlled by another thread.
- Core::X86::Msr::MCG\_STAT
  - Provides basic information about processor state after the occurrence of a machine check error.
- Core::X86::Msr::MCG\_CTL
  - Used by software to enable or disable the logging and reporting of machine check errors in the error reporting banks.
  - Core::X86::Msr::McaIntrCfg
    - Used by software to configure certain machine check interrupts

# 3.1.2.2 Machine Check Banks

A processor contains multiple blocks, and some of them have banks of machine check architecture registers (MCA banks). An MCA bank logs and reports errors to software.

The legacy MCA supports up to 32 MCA banks per logical core. MCAX supports up to 64 MCA banks per logical core.

The processor ensures that non-zero error status in an MCA bank is visible to exactly one logical core in a system, and that error notifications are directed to that logical core. Hardware also makes MCA bank configuration and control registers available to exactly one logical core. Banks associated with a CPU core are controlled by that logical core. Banks associated with other blocks are controlled by an implementation-specific logical core.

# 3.1.2.2.1 Legacy MCA Registers

Each legacy MCA bank allocates address space for 4 legacy MCA registers.

The legacy MCA registers include:

- MCA\_CTL
  - Enables error reporting via machine check exception.
- MCA\_STATUS
  - Logs information associated with errors.
- MCA\_ADDR
  - Logs address information associated with errors.
- MCA\_MISC0
  - Logs miscellaneous information associated with errors.

# 3.1.2.2.2 Legacy MCA MSRs

The legacy MCA MSRs are MSR0000\_04[7F:00]. The legacy MCA MSR space contains 32 banks of 4 registers per bank. The layout of the legacy MCA MSR space is given in Table 21 [Legacy MCA MSR Layout].

| MCA bank  | MCA_CTL        | MCA_STATUS | MCA_ADDR | MCA_MISC0 |  |  |  |
|-----------|----------------|------------|----------|-----------|--|--|--|
| (decimal) | (MSR0000_0xxx) |            |          |           |  |  |  |
| 0         | 400            | 401        | 402      | 403       |  |  |  |
| 1         | 404            | 405        | 406      | 407       |  |  |  |
| 2         | 408            | 409        | 40A      | 40B       |  |  |  |

 Table 21: Legacy MCA MSR Layout

54945 Rev 3.03 - Jun 14, 2019

| 3 | 40C | 40D | 40E | 40F |
|---|-----|-----|-----|-----|
| 4 | 410 | 411 | 412 | 413 |
| 5 | 414 | 415 | 416 | 417 |
| 6 | 418 | 419 | 41A | 41B |

Features and registers associated with the MCA Extensions are not available in this legacy MSR address range. AMD recommends that operating systems use the MCAX MSR address range, rather than rely on the legacy MCA MSR address range.

All unimplemented or unused registers in the legacy MCA MSR address range are RAZ/WRIG. MC4 registers (MSR0000\_0410:0000\_0413) are RAZ/WRIG.

MSR0000\_0000 is aliased to the MCAX MSR address for MC0\_ADDR, and MSR0000\_0001 is aliased to the MCAX MSR address of MC0\_STATUS.

# 3.1.2.2.3 MCAX Registers

Each MCAX bank allocates address space for 16 MCA registers. All unimplemented registers in the MCA MSR space are RAZ/WRIG. MCAX bank registers include the legacy MCA registers as well as registers associated with the MCA Extensions.

The MCA Extension registers include:

- MCA\_CONFIG
  - Provide configuration capabilities for this MCA bank.
- MCA\_IPID
  - Provides information on the block associated with this MCA bank.
- MCA\_SYND
  - Logs physical location information associated with a logged error.
- MCA\_DESTATUS
  - Logs status information associated with a deferred error.
- MCA\_DEADDR
  - Logs address information associated with a deferred error.
- MCA\_MISC[1:4]
  - Provides additional threshold counters within an MCA bank.

# 3.1.2.2.4 MCAX MSRs

MCAX MSRs are present at MSRC000\_2[3FF:000]. This MSR address range contains space for 64 banks of 16 registers each. MSRC000\_2[FFF:400] are reserved for future use. The MCAX MSR address range allows access to both legacy MCA registers and MCAX registers in each MCA bank.

The x86 MCAX MSR address format is SSSS\_SBBR (hex). S = MCA register space (i.e. MSRC000\_2xxx). B=MCA bank. R=Register offset within MCA bank. The layout of the MCAX MSR space is given in Table 22 [MCAX MSR Layout].

Access to unused MCAX MSRs is RAZ/WRIG. MCA Bank 4 is always read-as-zero (RAZ/WRIG).

Table 22: MCAX MSR Layout

| MCA  | MCAX MSR (MSRC000_2xxx)  |     |     |     |     |                     |     |           |     |     |         |
|------|--|-----|-----|-----|-----|---------------------|-----|-----------|-----|-----|---------|
| bank | Legacy MCA Bank registers  |     |     |     |     | MCAX Bank registers |     |           |     |     |         |
|      | CTL STATUS ADDR MISC0 CONFIG IPID SYND Reserved DESTATUS DEADDR MISC[4:1 |     |     |     |     |                     |     | MISC[4:1] |     |     |         |
| 0    | 000  | 001 | 002 | 003 | 004 | 005                 | 006 | 007       | 800 | 009 | 00D:00A |

| 1  | 010 | 011 | 012 | 013 | 014 | 015 |     | 017 | 018 | 019 | 01D:01A |
|----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|---------|
| 2  | 020 | 021 | 022 | 023 | 024 | 025 | 026 | 027 | 028 | 029 | 02D:02A |
|    |     |     |     |     |     |     |     |     |     |     |         |
| 63 | 3F0 | 3F1 | 3F2 | 3F3 | 3F4 | 3F5 | 3F6 | 3F7 | 3F8 | 3F9 | 3FD:3FA |

All processors maintain the same mapping of MSR to MCA bank number (MSRC000\_2000 for the beginning of MCA Bank 0, MSRC000\_2010 for the beginning of MCA Bank 1, etc.), regardless of what block the bank represents (see 3.1.5.5 [Determining Bank Type]).

MCA\_CTL\_MASK MSRs are present at MSRC001\_04[3F:00]. MSRC001\_04[FF:40] are reserved for future use. The layout of these registers is given in Table 23 [MCAX Implementation-Specific Register Layout].

Table 23: MCAX Implementation-Specific Register Layout

| MCA bank | MCA_CTL_MASK   |
|----------|----------------|
|          | (MSRC001_04xx) |
| 0        | 00             |
| 1        | 01             |
| 2        | 02             |
|          |                |
| 63       | 3F             |

#### 3.1.2.3 Access Permissions

When McStatusWrEn==0, a write to an implemented MCA\_STATUS register causes a General Protection Fault (#GP) unless the value being written is zero. When McStatusWrEn==1, a write to an implemented MCA\_STATUS register does not cause a #GP regardless of data value.

Access to legacy MCA\_CTL\_MASK (MSRC001\_00xx) causes a General Protection Fault (#GP).

Access to legacy MC4\_MISC1-8 (MSRC000\_0408:C000\_040F) is RAZ/WRIG.

#### 3.1.3 Machine Check Errors

#### 3.1.3.1 Error Severities

The classes of machine check errors are, in priority order from highest to lowest:

- Uncorrected
- Deferred
- Corrected

Uncorrected errors cannot be corrected by hardware. Uncorrected errors update the status and address registers if not masked from logging in MCA\_CTL\_MASK. Information in the status and address registers from a previously logged lower priority error is overwritten. Previously logged errors of the same priority are not overwritten. Uncorrected errors that are enabled for reporting in MCA\_CTL result in reporting to software via machine check exceptions. If an uncorrected error is masked from logging, the error is ignored by hardware (exceptions are noted in the register definitions). If an uncorrected error is disabled from reporting, containment of the error and logging/reporting of subsequent errors may be affected. Therefore, enable reporting of unmasked uncorrected errors for normal operation. Disable reporting of uncorrected errors only for debug purposes.

Deferred errors are errors that cannot be corrected by hardware, but do not cause an immediate interruption in

program flow, loss of data integrity, or corruption of processor state. These errors indicate that data has been corrupted but not consumed; no exception is generated because the data has not been referenced by a core or an IO link. Hardware writes information to the status and address registers in the corresponding bank that identifies the source of the error if deferred errors are enabled for logging. If there is information in the status and address registers from a previously logged lower priority error, it is overwritten. Previously logged errors of the same or higher priority are not overwritten. Deferred errors are not reported via machine check exceptions; they can optionally be reported via LVT or SMI.

Corrected errors are those which have been corrected by hardware and cause no loss of data or corruption of processor state. Hardware writes the status and address registers in the corresponding register bank with information that identifies the source of the error if they are enabled for logging. Corrected errors are not reported via machine check exceptions. Some corrected errors may optionally be reported to software via error threshold.

An error to be logged when the status register contains valid data can result in an overflow condition. During error overflow conditions, the new error may not be logged or an error which has already been logged in the status register may be overwritten.

Table 24 [Error Overwrite Priorities] indicates which errors are overwritten in the error status registers.

|       |             | Older Error |           |           |  |
|-------|-------------|-------------|-----------|-----------|--|
|       |             | Uncorrected | Deferred  | Corrected |  |
|       | Uncorrected | -           | Overwrite | Overwrite |  |
| Newer | Deferred    | -           | -         | Overwrite |  |
| Error | Corrected   | -           | -         | -         |  |

*Table 24: Error Overwrite Priorities* 

Table 25 [Error Scope Hierarchy] provides a hierarchy of error scopes that determine the potential ability to recover the system based on fields in MCA\_STATUS when MCA\_STATUS[Val]=1.

| PCC | UC | TCC | Deferred | Comments  |
|-----|----|-----|----------|---|
| 1   | X  | X   | X        | Uncorrected system fatal error. Action required. A hardware-<br>uncorrected error has corrupted system state. The error is fatal to the<br>system and the system processing must be terminated.   |
| 0   | 1  | 1   | X        | Uncorrected thread fatal error. Action required. A hardware-<br>uncorrected error has corrupted state for the process thread executing<br>on the interrupted logical core. State for other process threads is<br>unaffected.  |
| 0   | 1  | 0   | X        | Uncorrected recoverable error. Action required.<br>A hardware-uncorrected error has not corrupted state of the process<br>thread. Recovery of the process thread is possible if the uncorrected<br>error is corrected by software.  |
| 0   | 0  | 0   | 1        | Deferred error. Action optional. A hardware-uncorrected error has<br>been discovered but not yet consumed. Error handling software may<br>attempt to correct this error, or prevent access by processes which<br>map the data, or make the physical resource containing<br>the data inaccessible. |
| 0   | 0  | 0   | 0        | Corrected error. Action optional. A hardware-corrected error has been corrected. No action is required by error handling software.  |

Table 25: Error Scope Hierarchy

#### 3.1.3.2 Exceptions and Interrupts

Some or all errors logged in the MCA may require an interrupt or exception to be signaled.

The processor supports the following x86 interrupt/exception types to be communicated to the x86 core in response to an error:

- Machine Check Exception (MCE)
- System Management Interrupt (SMI)
- APIC based interrupt (LVT)

MCEs can be architecturally precise, context-synchronous, or asynchronous. An MCE that sets Core::X86::Msr::MCG\_STAT[RIPV]=1 and Core::X86::Msr::MCG\_STAT[EIPV]=1 is precise and the program can be restarted reliably. Other interrupts are architecturally asynchronous.

The ability of hardware to generate a machine check exception upon an error is indicated by Core::X86::Cpuid::FeatureIdEdx[MCE] or Core::X86::Cpuid::FeatureExtIdEdx[MCE].

#### 3.1.3.3 Error Codes

The MCA\_STATUS[ErrorCode] field contains information used to identify the logged error. This section identifies how to decode the ErrorCode field.

| Table 20. Error Code Types |                       |                                |  |  |  |
|----------------------------|-----------------------|--------------------------------|--|--|--|
| Error Code                 | Error Code Type       | Description                    |  |  |  |
| 0000 0000 0001 TTLL        | TLB                   | TT = Transaction Type          |  |  |  |
|                            |                       | LL = Cache Level               |  |  |  |
| 0000 0001 RRRR TTLL        | Memory                | RRRR = Memory Transaction Type |  |  |  |
|                            |                       | TT = Transaction Type          |  |  |  |
|                            |                       | LL = Cache Level               |  |  |  |
| 0000 1XXT RRRR XXLL        | Bus                   | XX = Reserved                  |  |  |  |
|                            |                       | T = Timeout                    |  |  |  |
|                            |                       | RRRR = Memory Transaction Type |  |  |  |
|                            |                       | LL = Cache Level               |  |  |  |
| 0000 01UU 0000 0000        | Internal Unclassified | UU = Internal Error Type       |  |  |  |

#### Table 26: Error Code Types

#### Table 27: Error code: transaction type (TT)

| TT | Transaction Type |
|----|------------------|
| 00 | Instruction      |
| 01 | Data             |
| 10 | Generic          |
| 11 | Reserved         |

#### Table 28: Error codes: cache level (LL)

| LL | Cache Level |
|----|-------------|
| 00 |             |
| 01 | L1: Level 1 |
| 10 | L2: Level 2 |
| 11 | LG: Generic |

| Tuble 25. Error coues, memory transaction type (tutter) |                         |  |  |  |
|---|-------------------------|--|--|--|
| RRRR  | Memory Transaction Type |  |  |  |
| 0000  | Generic                 |  |  |  |
| 0001  | Generic Read            |  |  |  |
| 0010  | Generic Write           |  |  |  |
| 0011  | Data Read               |  |  |  |
| 0100  | Data Write              |  |  |  |
| 0101  | Instruction Fetch       |  |  |  |
| 0110  | Prefetch                |  |  |  |
| 0111  | Evict                   |  |  |  |
| 1000  | Snoop (Probe)           |  |  |  |

#### Table 29: Error codes: memory transaction type (RRRR)

Errors can also be identified by the MCA\_STATUS[ErrorCodeExt] field. MCA\_STATUS[ErrorCodeExt] indicates which bit position in the corresponding MCA\_CTL register enables error reporting for the logged error. For instance, MCA\_STATUS[ErrorCodeExt]=0x9 means that the logged error is enabled by MCA\_CTL[9], and the description of MCA\_CTL[9] contains information on decoding the error log. Specific ErrorCodeExt values are implementation dependent, and should not be used by architectural or portable code.

#### 3.1.3.4 Extended Error Codes

The MCA\_STATUS[ErrorCodeExt] field contains additional information used to identify the logged error. Error positions in MCA\_CTL and MCA\_CTL\_MASK and Extended Error Codes are fixed within a given bank type. That is, for an MCA bank with a given MCA\_IPID[HwId, McaType] value, the processor ensures that the same error is reported in a given bit position of of MCA\_CTL regardless of the product in which that bank appears. Similarly, for an MCA bank with a given MCA\_IPID[HwId, McaType] value, hardware ensures that the mapping of errors to Extended Error Codes is consistent across products.

#### 3.1.3.5 DOER and SEER State

The DOER fields are:

- MCG\_STAT
  - Count
  - MCIP
  - RIPV
  - EIPV
  - MCA\_STATUS
    - Val
    - PCC
    - TCC
    - UC
    - MiscV
    - AddrV

The MCA\_STATUS[Deferred] bit is used for SEER functionality but is architectural.

#### 3.1.3.6 MCA Overflow Recovery

MCA Overflow Recovery is a feature allowing recovery of the system when the overflow bit is set. MCA Overflow Recovery is supported when Core::X86::Cpuid::RasCap[McaOverflowRecov]=1.

When MCA Overflow Recovery is supported, software may rely on MCA\_STATUS[PCC]=1 to indicate all system-fatal conditions. When MCA Overflow Recovery is not supported, an uncorrected error logged with MCA\_STATUS[Overflow]=1 may indicate the system-fatal condition that an error requiring software intervention was not logged. Therefore, software must terminate system processing whenever an uncorrected error is logged with MCA\_STATUS[Overflow]=1.

#### 3.1.3.7 MCA Recovery

MCA Recovery is a feature allowing recovery of the system when the hardware cannot correct an error. MCA Recovery is supported when Core::X86::Cpuid::RasCap[SUCCOR]=1.

When MCA Recovery is supported and an uncorrected error has been detected that the hardware can contain to the task or process to which the machine check has been delivered, it logs a context-synchronous uncorrectable error (MCA\_STATUS[UC]=1, MCA\_STATUS[PCC]=0). The rest of the system is unaffected and may continue running if supervisory software can terminate only the affected process or VM.

#### 3.1.4 Machine Check Features

#### 3.1.4.1 Error Thresholding

For some types of errors, the hardware maintains counts of the number of errors. When the counter reaches a programmable threshold, an event may optionally be triggered to signal system software. This is known as error thresholding. The primary purpose of error thresholding is to help software recognize an excessive rate of errors, which may indicate marginal or failing hardware. This information can be used to make decisions about deconfiguring hardware or scheduling service actions. Counts are incremented for corrected, deferred, and uncorrected errors.

The MCA\_MISCx registers contain the architectural interface for error thresholding. The registers contain a 12-bit error counter that can be initialized to any value, with the option to interrupt when the counter reaches FFFh.

MCA\_MISCx[ThresholdIntType] determines the type of interrupt to be generated for threshold overflow errors in that counter. This can be set to None, LVT, or SMI. If this is set to LVT, Core::X86::Msr::McaIntrCfg[ThresholdLvtOffset] specifies the LVT offset that is used. Only one LVT offset is used per socket and the interrupt is routed to the APIC of the logical core from which the MCA bank is visible.

#### 3.1.4.2 Error Simulation

Error simulation involves creating the appearance to software that an error occurred, and can be used to debug machine check interrupt handlers. See Core::X86::Msr::HWCR[McStatusWrEn] for making MCA registers writable for non-zero values. When McStatusWrEn is set, privileged software can write non-zero values to the specified registers without generating exceptions, and then simulate a machine check using the INT18 instruction (INTn instruction with an operand of 18). Setting a reserved bit in these registers does not generate an exception when this mode is enabled. However, setting a reserved bit may result in undefined behavior.

#### 3.1.5 Software Guidelines

#### 3.1.5.1 Recognizing MCAX Support

Software which reads the MCA registers must recognize whether an implementation uses the legacy format or the MCAX format. This is accomplished by starting with CPUID Fn8000\_0007\_EBX[ScalableMca]. If ScalableMca==1, then the implementation supports the MCAX indicator (MCA\_CONFIG[Mcax]). An MCA bank is an MCAX bank if MCA\_CONFIG[Mcax]=1 in that bank.

#### 3.1.5.2 Communicating MCAX Support

Software which supports MCAX must set MCA\_CONFIG[McaxEn]=1 in each MCA bank.

Software that supports MCAX should use the MCAX MSRs to access both legacy and MCAX registers.

#### 3.1.5.3 Machine Check Initialization

The following initialization sequence must be followed:

- Platform firmware must initialize the MCA\_CTL\_MASK registers prior to the initialization of the MCA\_CTL registers and Core::X86::Msr::MCG\_CTL. Platform firmware and the operating system must not clear MCA\_CTL\_MASK bits that are set to 1. MCA\_CTL\_MASK registers must be set the same across all cores.
- The operating system must initialize the MCA\_CONFIG registers prior to initialization of the MCA\_CTL registers.
- The MCA\_CTL registers must be initialized prior to enabling the error reporting banks in MCG\_CTL.
- The Core::X86::Msr::MCG\_CTL register must be programmed identically for all cores in a processor.
- CR4.MCE must be set to enable machine check exceptions.

The operating system should configure the MCA\_CONFIG registers as follows:

- MCA\_CONFIG[McaxEn]=1 if the operating system has been updated to use the MCA Extension MSR addresses. Otherwise, the operating system should preserve the platform firmware-programmed value of this field.
- MCA\_CONFIG[LogDeferredInMcaStat] and MCA\_CONFIG[DeferredIntType] to appropriate values based on OS support for deferred errors.

MCA\_STATUS MSRs are cleared by hardware after a cold reset. If initializing after a warm reset, then platform firmware should check for valid MCA errors and if present save the status for later diagnostic use.

Platform firmware may initialize the MCA without setting CR4.MCE; this results in a shutdown on any machine check which would have caused a machine check exception (followed by a reboot if configured). Alternatively, platform firmware that wishes to ensure continued operation in the event that a machine check occurs during boot may write MCG\_CTL with all ones and write zeros into each MCA\_CTL register. With these settings, a machine check error results in MCA\_STATUS being written without generating a machine check exception or a shutdown. Platform firmware may then poll MCA\_STATUS registers during critical sections of boot to ensure system integrity. Note that the system may be operating with corrupt data before polling MCA\_STATUS registers. Before passing control to the operating system, platform firmware should restore the values of those registers to what the operating system is expecting.

After MCA initialization, system software should check the Val bit on each MCA\_STATUS register. It is possible that valid error status information has already been logged in the MCA\_STATUS registers at the time software is attempting to initialize them. The status can reflect errors logged prior to a warm reset or errors recorded during the system power-up and boot process. Before clearing the MCA\_STATUS registers, software should examine their contents and log any errors found.

#### 3.1.5.4 Determining Bank Count

System software should read Core::X86::Msr::MCG\_CAP[Count] to determine the number of machine check banks visible to a logical core. The banks are numbered from 0 to one less than the value found in

Core::X86::Msr::MCG\_CAP[Count]. For example, if the Count field indicates five banks are supported, they are numbered MC0 through MC4.

#### 3.1.5.5 Determining Bank Type

To determine which type of block is mapped to an MCA bank, software can query the MCA\_IPID register within that bank. This register exists when MCA\_CONFIG[McaX]=1 in a given bank.

MCA\_IPID[HardwareID] provides the block type for the block that contains this MCA bank. For blocks that contain multiple MCA bank types (e.g., CPU cores), MCA\_IPID[McaType] provides an identifier for the type of MCA bank. MCA\_IPID[McaType] values are specific to a given MCA\_IPID[HardwareID]. Therefore, an MCA bank type can be identified by the value of {MCA\_IPID[Hwid], MCA\_IPID[McaType]}. For instance, the CPU core's LS bank is identified by MCA::LS::MCA\_IPID\_LS[HardwareID]==176 and MCA::LS::MCA\_IPID\_LS[McaType]==0. An MCA\_IPID[HardwareID] value of 0 indicates an unpopulated MCA bank that is ensured to be RAZ/WRIG.

MCA\_IPID[InstanceId] provides a unique instance number to allow software to differentiate blocks with multiple identical instances within a processor. MCA\_IPID[InstanceId] values are processor-specific and are not ensured to be stable across different processor generations.

#### 3.1.5.6 Recognizing Error Type

Software can use the combination of MCA\_IPID[HwId, McaType] and MCA\_STATUS[ErrorCodeExt] to recognize a specific error type.

#### 3.1.5.7 Machine Check Error Handling

A machine check handler is invoked to handle an exception for a particular thread. The information needed by the machine check handler is not shared with other threads, so no cross-thread coordination or special handling is required. Specifically, all MCA banks are only visible from a single thread, so software on a single thread can access each bank through MSR space without contention from other threads.

At a minimum, the machine check handler must be capable of logging error information for later examination. The handler should log as much information as is needed to diagnose the error. More thorough exception handler implementations can analyze errors to determine if each error is recoverable by software. If a recoverable error is identified, the exception handler can attempt to correct the error and restart the interrupted program. An error may not be recoverable for the process or virtual machine it directly affects, but may be containable, so that other processes or virtual machines in the system are unaffected and system operation is recovered.

Machine check exception handlers that attempt to recover must be thorough in their analysis and the corrective actions they take. The following guidelines should be used when writing such a handler:

- Data collection:
  - Read Core::X86::Msr::MCG\_CAP[Count] to determine the number of status registers visible to the thread.
  - All status registers in all error reporting banks must be examined to identify the cause of the machine check exception.
  - Check the valid bit in each status register (MCA\_STATUS[Val]). The remainder of the status register should be examined only when its valid bit is set.
  - When identifying the error condition and determining how to handle the error, portable exception handlers should examine only DOER fields in machine check registers.
  - Error handlers should collect all available MCA information, but should only interrogate details to the level which affects their actions. Lower level details may be useful for diagnosis and root cause analysis, but not for error handling.

- Error handlers should save the values in MCA\_ADDR, MCA\_MISCO, and MCA\_SYND even if MCA\_STATUS[AddrV], MCA\_STATUS[MiscV], and MCA\_STATUS[SyndV] are zero.
- DOER Error Management:
  - Check MCA\_STATUS[PCC].
    - If PCC is set, error recovery is not possible. The handler should log the error information and terminate the system. If PCC is clear, the handler may continue with the following recovery steps.
  - Check MCA\_STATUS[UC].
    - If UC is set, the processor did not correct the error. Continue with the following recovery steps.
      - If MCA Overflow Recovery is not supported, and MCA\_STATUS[Overflow]=1, error recovery is not possible; follow the steps for PCC=1. See 3.1.3.6 [MCA Overflow Recovery].
      - If MCA Recovery is not supported, error recovery is not possible; follow the steps for PCC=1. See 3.1.3.7 [MCA Recovery].
      - If MCA Recovery is supported:
        - Check MCA\_STATUS[TCC].
          - If TCC is set, the context of the process thread executing on the interrupted logical core may be corrupt and the thread cannot be recovered. The rest of the system is unaffected; it is possible to terminate only the affected process thread.
          - If TCC is clear, the context of the process thread executing on the interrupted logical core is not corrupt. Recovery of the process thread may be possible, but only if the uncorrected error condition is first corrected by software; otherwise, the interrupted process thread must be terminated.
          - Legacy exception handlers can check
             Core::X86::Msr::MCG\_STAT[RIPV] and
             Core::X86::Msr::MCG\_STAT[EIPV] in place of MCA\_STATUS[TCC].
             If RIPV=EIPV=1, the interrupted program can be restarted reliably.
             Otherwise, the program cannot be restarted reliably.
    - If UC is clear, the processor either corrected or deferred the error and no software action is needed. The handler can log the error information and continue process execution.
- Exit:
  - When an exception handler is able to successfully log an error condition, clear the MCA\_STATUS registers prior to exiting the machine check handler.
  - Prior to exiting the machine check handler, clear Core::X86::Msr::MCG\_STAT[MCIP]. MCIP indicates that a machine check exception is in progress. If this bit is set when another machine check exception occurs, the processor enters the shutdown state.

#### **3.2** Machine Check Architecture Implementation

#### 3.2.1 Implemented Machine Check Banks

Blocks capable of supporting MCA banks are given in Table 30 [Blocks Capable of Supporting MCA Banks]. Whether a particular block implements an MCA bank is processor-specific and can be determined by querying MCA\_IPID for each MCA bank. The block type can be uniquely identified by the MCA\_IPID[HardwareId] and MCA\_IPID[McaType] values in each MCA bank.

| ſ | Block | Block Function         | MCA_IPID[HardwareId] | MCA_IPID[McaType] |
|---|-------|------------------------|----------------------|-------------------|
|   | LS    | Load-Store Unit        | 0xb0                 | 0x0               |
|   | IF    | Instruction Fetch Unit | 0xb0                 | 0x1               |

 Table 30: Blocks Capable of Supporting MCA Banks

| L2  | L2 Cache Unit                      | 0xb0 | 0x2 |
|-----|------------------------------------|------|-----|
| DE  | Decode Unit                        | 0xb0 | 0x3 |
| EX  | Execution Unit                     | 0xb0 | 0x5 |
| FP  | Floating Point Unit                | 0xb0 | 0x6 |
| L3  | L3 Cache Unit                      | 0xb0 | 0x7 |
| UMC | Unified Memory Controller          | 0x96 | 0x0 |
| SMU | System Management Unit             | 0x01 | 0x0 |
| PSP | Platform Security Processor        | 0xFF | 0x0 |
| PB  | Parameter Block                    | 0x5  | 0x0 |
| CS  | Coherent Slave                     | 0x2E | 0x0 |
| PIE | Power Management, Interrupts, Etc. | 0x2E | 0x1 |

#### 3.2.2 Implemented Machine Check Bank Registers

Table 31 [Legacy MCA Registers] provides links to the description of each block's Legacy MCA registers. Table 32 [MCAX Registers] provides links to the description of each block's MCA Extension Registers.

| Block | MCA Register          |                       |                      |                       |                      |
|-------|-----------------------|-----------------------|----------------------|-----------------------|----------------------|
|       | CTL                   | STATUS                | ADDR                 | MISC                  | CTL_MASK             |

#### 3.2.4 Decoding Error Type

If a valid error is logged in MCA\_STATUS or MCA\_DESTAT of an MCA bank:

- 1. Read the values of this bank's MCA\_IPID and MCA\_STATUS registers.
- 2. Use Table 30 [Blocks Capable of Supporting MCA Banks] to look up the block associated with the values of MCA\_IPID[HwId] and MCA\_IPID[McaType].
- 3. In 3.2.5 [MCA Banks], find the sub-section associated with the block in error.
- 4. In this sub-section, find the MCA\_STATUS table.
- 5. In the table, look up the row associated with the MCA\_STATUS[ErrorCodeExt] value.
- 6. The error type in this row is the logged error. The MCA\_STATUS, MCA\_ADDR and MCA\_SYND tables contain information associated with this error.

7. If there is an error in both MCA\_STATUS and MCA\_DESTAT, the registers contain the same error if MCA\_STATUS[Deferred] is set. If MCA\_STATUS[Deferred] is not set, MCA\_DESTAT contains information for a different error than MCA\_STATUS. MCA\_DESTAT does not contain an ErrorCodeExt field, so in this case it is not possible to determine the type of error logged in MCA\_DESTAT.

| Bits     | Description  |  |  |
|----------|--|--|--|
| 63       | <b>Val</b> . Reset: Cold,0. 1=A valid error has been detected. This bit should be cleared by software after the register has   |  |  |
|          | been read.   |  |  |
|          | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |  |  |
| 62       | <b>Overflow</b> . Reset: Cold,0. 1=An error was detected while the valid bit (Val) was set; at least one error was not   |  |  |
|          | logged. Overflow is set independently of whether the existing error is overwritten. See 3.1.3 [Machine Check   |  |  |
|          | Errors].   |  |  |
| 64       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |  |  |
| 61       | UC. Reset: Cold,0. 1=The error was not corrected by hardware.  |  |  |
| <u> </u> | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |  |  |
| 60       | <b>En</b> . Reset: Cold,0. 1=MCA error reporting is enabled for this error, as indicated by the corresponding bit in MCA::LS::MCA_CTL_LS. This bit is a copy of bit in MCA::LS::MCA_CTL_LS for this error. |  |  |
|          | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |  |  |
| 59       | <b>MiscV</b> . Reset: Cold,0. 1=Valid thresholding in MCA::LS::MCA_MISC0_LS.   |  |  |
| 55       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |  |  |
| 58       | <b>AddrV</b> . Reset: Cold,0. 1=MCA::LS::MCA_ADDR_LS contains address information associated with the error.   |  |  |
| 00       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |  |  |
| 57       | <b>PCC</b> . Reset: Cold,0. 1=Hardware context held by the processor may have been corrupted. Continued operation of   |  |  |
| 0.       | the system may have unpredictable results. The error is not recoverable or survivable, and the system should be  |  |  |
|          | reinitialized.   |  |  |
|          | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |  |  |
| 56       | <b>ErrCoreIdVal</b> . Reset: Cold,0. 1=The ErrCoreId field is valid.   |  |  |
|          | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |  |  |
| 55       | <b>TCC</b> . Reset: Cold,0. 0=The thread which consumed the error can be restarted reliably at the instruction pointer   |  |  |
|          | address pushed onto the exception handler stack if any uncorrected error has been corrected by software. 1=The   |  |  |
|          | thread which consumed the error is not restartable and must be terminated. Only meaningful when MCA::LS::MCA_STATUS_LS[PCC]=0.   |  |  |
|          | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |  |  |
| 54       | Reserved.  |  |  |
| 53       | SyndV. Reset: Cold,0. 1=This error logged information in MCA::LS::MCA_SYND_LS. If  |  |  |
| 00       | MCA::LS::MCA_SYND_LS[ErrorPriority] is the same as the priority of the error in  |  |  |
|          | MCA::LS::MCA_STATUS_LS, then the information in MCA::LS::MCA_SYND_LS is associated with the error  |  |  |
|          | in MCA::LS::MCA_STATUS_LS.   |  |  |
|          | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |  |  |
| 52:47    | Reserved.  |  |  |
| 46       | <b>CECC</b> . Reset: Cold,0. 1=The error was a correctable ECC error according to the restrictions of the ECC  |  |  |
|          | algorithm. UC indicates whether the error was actually corrected by the processor.   |  |  |
| 4        | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read, Write-0-only, Error-on-write-1.  |  |  |
| 45       | <b>UECC</b> . Reset: Cold,0. 1=The error was an uncorrectable ECC error according to the restrictions of the ECC algorithm. UC indicates whether the error was actually corrected by the processor.        |  |  |
|          | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |  |  |
| 44       | <b>Deferred</b> . Reset: Cold,0. 1=A deferred error was created. A deferred error is the result of an uncorrectable data   |  |  |
|          | error which did not immediately cause a processor exception; an exception is deferred until the erroneous data is  |  |  |
|          | consumed.  |  |  |
|          | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |  |  |
| 43       | <b>Poison</b> . Reset: Cold,0. 1=The error was the result of attempting to consume poisoned data.  |  |  |
|          | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |  |  |

#### Table 34: MCA STATUS LS[ErrorCodeExt] Decode

#### MSR0000\_0000...MSRC000\_2002 [LS Machine Check Address Thread 0] (MCA::LS::MCA\_ADDR\_LS)

Read-write, Volatile. Reset: Cold,0000 0000 0000 0000h.

MCA::LS::MCA\_ADDR\_LS stores an address and other information associated with the error in MCA::LS::MCA\_STATUS\_LS. The register is only meaningful if MCA::LS::MCA\_STATUS\_LS[Val]=1 and MCA::LS::MCA STATUS LS[AddrV]=1.

lthree[1:0]\_core[3:0]\_thread[1:0]\_inst0\_aliasMSRLSLEGACY; MSR0000\_0000

lthree[1:0]\_core[3:0]\_thread[1:0]\_inst0\_aliasMSRLEGACY; MSR0000\_0402 lthree[1:0]\_core[3:0]\_thread[1:0]\_inst0\_aliasMSR; MSRC000\_2002

#### **Bits** Description

63:62 Reserved.

61:56 **LSB**. Read-write, Volatile. Reset: Cold,00h. Specifies the least significant valid bit of the address contained in MCA::LS::MCA ADDR LS[ErrorAddr]. A value of 0 indicates that MCA::LS::MCA ADDR LS[55:0] contains a valid byte address. A value of 6 indicates that MCA::LS::MCA\_ADDR\_LS[55:6] contains a valid cache line address and that MCA::LS::MCA\_ADDR\_LS[5:0] are not part of the address and should be ignored by error handling software. A value of 12 indicates that MCA::LS::MCA\_ADDR\_LS[55:12] contain a valid 4KB memory page and that MCA::LS::MCA\_ADDR\_LS[11:0] should be ignored by error handling software.

55:0 **ErrorAddr**. Read-write, Volatile. Reset: Cold,00\_0000\_0000\_0000h. Unless otherwise specified by an error, contains the address associated with the error logged in MCA::LS::MCA\_STATUS\_LS. For physical addresses, the most significant bit is given by Core::X86::Cpuid::LongModeInfo[PhysAddrSize].

| 62     | <b>CntP</b> . Reset: 1. 1=A valid threshold counter is present.  |
|--------|--|
|        | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read-only.   |
| 61     | <b>Locked</b> . Reset: 0. 1=Writes to this register are ignored. This bit is set by BIOS to indicate that this register is not   |
|        | available for OS use. BIOS should set this bit if ThresholdIntType is set to SMI.  |
|        | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read-only.   |
| 60     | <b>IntP</b> . Reset: 1. 1=ThresholdIntType can be used to generate interrupts. 0=ThresholdIntType and interrupt  |
|        | generation are not supported.  |
|        | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::LS::MCA_MISC0_LS[Locked]) ? Read-write :   |
| 50 50  | Read-only.   |
|        | Reserved.  |
| 55:52  | <b>LvtOffset</b> . Reset: 0h. One per die. For error thresholding interrupts, specifies the address of the LVT entry in the  |
|        | APIC registers as follows: LVT address = (LvtOffset shifted left 4 bits) + 500h (see   |
|        | Core::X86::Apic::ExtendedInterruptLvtEntries).<br>AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::LS::MCA_MISC0_LS[Locked]) ? Read-write :   |
|        | Read-only.   |
| 51     | CntEn. Reset: 0. 1=Count thresholding errors.  |
| 51     | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::LS::MCA_MISC0_LS[Locked]) ? Read-write :   |
|        | Read-only.   |
| 50:49  | <b>ThresholdIntType</b> . Reset: Cold,0h. Specifies the type of interrupt signaled when Ovrflw is set and IntP==1. 00b   |
|        | = No interrupt. 01b = APIC based interrupt (see Core::X86::Msr::McaIntrCfg[ThresholdLvtOffset]). 10b = SMI   |
|        | trigger event. 11b = Reserved.   |
|        | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::LS::MCA_MISC0_LS[Locked]) ? Read-write :   |
|        | Read-only.   |
| 48     | <b>Ovrflw</b> . Reset: Cold,0. Set by hardware when ErrCnt transitions from FFEh to FFFh. When this field is set,  |
|        | ErrCnt no longer increments. When this bit is set, the interrupt selected by the ThresholdIntType field is   |
|        | generated.   |
|        | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::LS::MCA_MISC0_LS[Locked]) ? Read-write :   |
| 17.11  | Read-only.<br>Reserved.  |
|        | <b>ErrCnt</b> . Reset: Cold,000h. This is written by software to set the starting value of the error counter. This is  |
| 45.52  | incremented by hardware when errors are logged. When this counter overflows, it stays at FFFh (no rollover). The   |
|        | threshold value, written by software, is (FFFh - the desired error count (the number of errors necessary in order  |
|        | for an interrupt to be taken)); the desired error count of 0 (a write value of FFFh) is not supported.   |
|        | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::LS::MCA_MISC0_LS[Locked]) ? Read-write :   |
|        | Read-only.   |
| 31:24  | BlkPtr. Read-write. Reset: 01h. 00h=Extended MISC MSR block is not valid. 01h=Extended MSR block is valid.   |
| 23:0   | Reserved.  |
| MSRO   | C000_2004 [LS Machine Check Configuration] (MCA::LS::MCA_CONFIG_LS)  |
| Reset: | 0000_0000_0025h.   |
|        | bls configuration of the associated machine check bank.  |

|        | MCA::LS::MCA_CONFIG_LS[LogDeferredInMcaStat] controls the logging behavior of these errors.                     |  |  |
|        | MCA::LS::MCA_DESTAT_LS and MCA::LS::MCA_DEADDR_LS are supported in this MCA bank.                               |  |  |
|        | 0=Deferred errors are not supported in this bank.   |  |  |
| 1      | Reserved.   |  |  |
| 0      | McaX. Read-only. Reset: 1. 1=This bank provides Machine Check Architecture Extensions. Up to 4 additional       |  |  |
|        | MISC registers (MISC1-MISC4) are supported. MCA::LS::MCA_MISC0_LS[BlkPtr] indicates the presence of             |  |  |
|        | the additional MISC registers, but is not used to determine their MSR numbers. Deferred error interrupt type is |  |  |
|        | specifiable by MCA bank. MCA::LS::MCA_STATUS_LS[TCC] is present.  |  |  |
| MSD    | C000_2005 [LS IP Identification] (MCA::LS::MCA_IPID_LS)   |  |  |
|        |   |  |  |
| Reset: | 0000 00B0 0000 0000h.   |  |  |

Reset: 0000\_00B0\_0000\_0000n.

The MCA::LS::MCA\_IPID\_LS register is used by software to determine what IP type and revision is associated with the MCA bank.

\_lthree[1:0]\_core[3:0]\_inst0\_aliasMSR; MSRC000\_2005

Bits Description

63:48 McaType. Read-only. Reset: 0000h. The McaType of the MCA bank within this IP.

47:44 Reserved.

43:32 **HardwareID**. Read-only. Reset: 0B0h. The Hardware ID of the IP associated with this MCA bank.

31:0 **InstanceId**. Read-write. Reset: 0000\_0000h. The instance ID of this IP. This is initialized to a unique ID per instance of this register.

#### MSRC000\_2006 [LS Machine Check Syndrome Thread 0] (MCA::LS::MCA\_SYND\_LS)

Read-write, Volatile. Reset: Cold, 0000\_0000\_0000h.

Logs physical location information associated with error in MCA::LS::MCA\_STATUS\_LS Thread 0 lthree[1:0] core[3:0] thread[1:0] inst0 aliasMSR; MSRC000 2006

| _meel1 | ince[1.0]_core[5.0]_tinead[1.0]_nisto_anasistist, insteedoo_2000   |  |  |
|--------|--|--|--|
| Bits   | Description  |  |  |
| 63:39  | Reserved.  |  |  |
| 38:32  | Syndrome. Read-write, Volatile. Reset: Cold,00h. Contains the syndrome, if any, associated with the error logged |  |  |
|        | in MCA::LS::MCA_STATUS_LS. The low-order bit of the syndrome is stored in bit 0, and the syndrome has a          |  |  |
|        | length specified by MCA::LS::MCA_SYND_LS[Length]. The Syndrome field is only valid when                          |  |  |
|        | MCA::LS::MCA_SYND_LS[Length] is not 0.   |  |  |
| 31:27  | Reserved.  |  |  |
| 26:24  | ErrorPriority. Read-write, Volatile. Reset: Cold, 0h. Encodes the priority of the error logged in                |  |  |
|        | MCA::LS::MCA_SYND_LS. 3'b000 = No error; 3'b001 = Reserved; 3'b010 = Corrected Error; 3'b011 = Deferred          |  |  |
|        | Error; 3'b100 = Uncorrected Error; 3'b101 = Fatal Error; all others reserved.                                    |  |  |
| 23:18  | Length. Read-write, Volatile. Reset: Cold, 00h. Specifies the length in bits of the syndrome contained in        |  |  |
|        | MCA::LS::MCA_SYND_LS[Syndrome]. A value of 0 indicates that there is no valid syndrome in                        |  |  |
|        | MCA::LS::MCA_SYND_LS. For example, a syndrome length of 9 means that   |  |  |
|        | MCA::LS::MCA_SYND_LS[Syndrome] bits [8:0] contains a valid syndrome.   |  |  |

17:0 **ErrorInformation**. Read-write, Volatile. Reset: Cold,0\_0000h. Contains error-specific information about the location of the error. Decoding is available in Table 36 [MCA\_SYND\_LS Register].

#### MSRC000\_2008 [LS Machine Check Deferred Error Status Thread 0] (MCA::LS::MCA\_DESTAT\_LS)

Read-write, Volatile. Reset: Cold, 0000\_0000\_0000.

Holds status information for the first deferred error seen in this bank.

\_lthree[1:0]\_core[3:0]\_thread[1:0]\_inst0\_aliasMSR; MSRC000\_2008 Bits Description

63 **Val**. Read-write, Volatile. Reset: Cold, 0. 1=A valid error has been detected (whether it is enabled or not).

| 62    | <b>Overflow</b> . Read-write, Volatile. Reset: Cold, 0. 1=An error was detected while the valid bit (Val) was set; at least |
|-------|---|
|       | one error was not logged. Overflow is set independently of whether the existing error is overwritten. (See the              |
|       | section on overwrite priorities.)   |
| 61:59 | Reserved.   |

| 58 | AddrV. Read-write, Volatile. Reset: Cold, 0. 1=MCA::LS::MCA_DEADDR_LS contains address information |
|----|--|
|    | associated with the error.   |

| 57:54 | Reserved.   |  |  |
|-------|---|--|--|
| 53    | 53 <b>SyndV</b> . Read-write, Volatile. Reset: Cold, 0. 1=This error logged information in MCA::LS::MCA_SYND_LS. If |  |  |
|       | MCA::LS::MCA_SYND_LS[ErrorPriority] is the same as the priority of the error in                                     |  |  |
|       | MCAULSUMCA STATUS IS then the information in MCAULSUMCA SVND IS is accordiated with the error                       |  |  |

MCA::LS::MCA\_STATUS\_LS, then the information in MCA::LS::MCA\_SYND\_LS is associated with the error in MCA::LS::MCA\_DESTAT\_LS.

52:45 Reserved.

44 **Deferred**. Read-write, Volatile. Reset: Cold, 0. 1=A deferred error was created. A deferred error is the result of an uncorrectable data error which did not immediately cause a processor exception; poison is created and an exception is deferred until the poison data is consumed.

43:0 Reserved.

#### MSRC000\_2009 [LS Deferred Error Address Thread 0] (MCA::LS::MCA\_DEADDR\_LS)

Read-write, Volatile. Reset: Cold,0000\_0000\_0000.

| The MCA::LS::MCA_DEADDR_LS register stores the address associated with the error in   |      |  |  |
|---|------|--|--|
| MCA::LS::MCA_DESTAT_LS. The register is only meaningful if MCA::LS::MCA_DESTAT_LS[Val]=1 and                                    |      |  |  |
| MCA::LS::MCA_DESTAT_LS[AddrV]=1. The lowest valid bit of the address is defined by  |      |  |  |
| MCA::LS::MCA_DEADDR_LS[LSB].  |      |  |  |
| _lthree[1:0]_core[3:0]_thread[1:0]_inst0_aliasMSR; MSRC000_2009   |      |  |  |
| Bits Description  |      |  |  |
| 63:62 Reserved.   |      |  |  |
| 61:56 <b>LSB</b> . Read-write, Volatile. Reset: Cold,00h. Specifies the least significant valid bit of the address contained in |      |  |  |
| MCA::LS::MCA_DEADDR_LS[ErrorAddr]. A value of 0 indicates that MCA::LS::MCA_DEADDR_LS[55:0                                      | - 1  |  |  |
| contains a valid byte address. A value of 6 indicates that MCA::LS::MCA_DEADDR_LS[55:6] contains a valid                        | id   |  |  |
| cache line address and that MCA::LS::MCA_DEADDR_LS[5:0] are not part of the address and should be                               |      |  |  |
| ignored by error handling software. A value of 12 indicates that MCA::LS::MCA_DEADDR_LS[55:12] conta                            | in a |  |  |
| valid 4KB memory page and that MCA::LS::MCA_DEADDR_LS[11:0] should be ignored by error handling                                 |      |  |  |
| software.   |      |  |  |
| 55:0 ErrorAddr. Read-write, Volatile. Reset: Cold,00_0000_0000_0000h. Contains the address, if any, associated v                | with |  |  |

the error logged in MCA::LS::MCA\_DESTAT\_LS. The lowest-order valid bit of the address is specified in MCA::LS::MCA\_DEADDR\_LS[LSB].

| 0      | <b>LDQ</b> . Read-write. Reset: 0. Load queue parity error.   |  |  |  |

#### 3.2.5.2 IF

#### MSR0000\_0404...MSRC000\_2010 [IF Machine Check Control] (MCA::IF::MCA\_CTL\_IF)

Read-write. Reset: 0000\_0000\_0000\_0000h.

0=Disables error reporting for the corresponding error. 1=Enables error reporting via machine check exception for the corresponding error. The MCA::IF::MCA\_CTL\_IF register must be enabled by the corresponding enable bit in Core::X86::Msr::MCG\_CTL. Does not affect error detection, correction, or logging.

| Bits | Description  |  |  |  |
| 63   | <b>Val.</b> Reset: Cold,0. 1=A valid error has been detected. This bit should be cleared by software after the register has    |  |  |  |
| 05   | been read.   |  |  |  |
|      | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                              |  |  |  |
| 62   | <b>Overflow</b> . Reset: Cold,0. 1=An error was detected while the valid bit (Val) was set; at least one error was not         |  |  |  |
|      | logged. Overflow is set independently of whether the existing error is overwritten. See 3.1.3 [Machine Check Errors].          |  |  |  |
|      | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                              |  |  |  |
| 61   | UC. Reset: Cold,0. 1=The error was not corrected by hardware.  |  |  |  |
|      | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                              |  |  |  |
| 60   | <b>En</b> . Reset: Cold,0. 1=MCA error reporting is enabled for this error, as indicated by the corresponding bit in           |  |  |  |
|      | MCA::IF::MCA_CTL_IF. This bit is a copy of bit in MCA::IF::MCA_CTL_IF for this error.  |  |  |  |
|      | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                              |  |  |  |
| 59   | MiscV. Reset: Cold,0. 1=Valid thresholding in MCA::IF::MCA_MISC0_IF.   |  |  |  |
|      | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                              |  |  |  |
| 58   | AddrV. Reset: Cold,0. 1=MCA::IF::MCA_ADDR_IF contains address information associated with the error.                           |  |  |  |
|      | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                              |  |  |  |
| 57   | <b>PCC</b> . Reset: Cold,0. 1=Hardware context held by the processor may have been corrupted. Continued operation of           |  |  |  |
|      | the system may have unpredictable results. The error is not recoverable or survivable, and the system should be                |  |  |  |
|      | reinitialized.   |  |  |  |
| - 0  | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                              |  |  |  |
| 56   | ErrCoreIdVal. Reset: Cold,0. 1=The ErrCoreId field is valid.   |  |  |  |
|      | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                              |  |  |  |
| 55   | <b>TCC</b> . Reset: Cold,0. 0=The thread which consumed the error can be restarted reliably at the instruction pointer         |  |  |  |
|      | address pushed onto the exception handler stack if any uncorrected error has been corrected by software. 1=The                 |  |  |  |
|      | thread which consumed the error is not restartable and must be terminated. Only meaningful when MCA::IF::MCA_STATUS_IF[PCC]=0. |  |  |  |
|      | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                              |  |  |  |
| 54   | Reserved.  |  |  |  |
| 53   | SyndV. Reset: Cold,0. 1=This error logged information in MCA::IF::MCA_SYND_IF. If  |  |  |  |
| 55   | MCA::IF::MCA_SYND_IF[ErrorPriority] is the same as the priority of the error in  |  |  |  |
|      | MCA::IF::MCA_STATUS_IF, then the information in MCA::IF::MCA_SYND_IF is associated with the error in                           |  |  |  |

|       | MCA::IF::MCA_STATUS_IF.  |  |  |  |  |  |
|-------|--|--|--|--|--|--|
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                              |  |  |  |  |  |
| 52:47 | Reserved.  |  |  |  |  |  |
| 46    | <b>CECC</b> . Reset: Cold,0. 1=The error was a correctable ECC error according to the restrictions of the ECC                  |  |  |  |  |  |
|       | algorithm. UC indicates whether the error was actually corrected by the processor.   |  |  |  |  |  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read, Write-0-only, Error-on-write-1.                            |  |  |  |  |  |
| 45    | <b>UECC</b> . Reset: Cold,0. 1=The error was an uncorrectable ECC error according to the restrictions of the ECC               |  |  |  |  |  |
|       | algorithm. UC indicates whether the error was actually corrected by the processor.   |  |  |  |  |  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                              |  |  |  |  |  |
| 44    | <b>Deferred</b> . Reset: Cold,0. 1=A deferred error was created. A deferred error is the result of an uncorrectable data       |  |  |  |  |  |
|       | error which did not immediately cause a processor exception; an exception is deferred until the erroneous data is              |  |  |  |  |  |
|       | consumed.  |  |  |  |  |  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                              |  |  |  |  |  |
| 43    | <b>Poison</b> . Reset: Cold,0. 1=The error was the result of attempting to consume poisoned data.                              |  |  |  |  |  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                              |  |  |  |  |  |
| 42:38 | 3 Reserved.  |  |  |  |  |  |
| 37:32 | <b>ErrCoreId</b> . Reset: Cold,00h. When ErrCoreIdVal=1 this field indicates which core within the processor is                |  |  |  |  |  |
|       | associated with the error; Otherwise this field is reserved.   |  |  |  |  |  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                              |  |  |  |  |  |
| 31:22 | Reserved.  |  |  |  |  |  |
| 21:16 |  |  |  |  |  |  |
|       | analysis. This field indicates which bit position in MCA::IF::MCA_CTL_IF enables error reporting for the logged                |  |  |  |  |  |
|       | error.   |  |  |  |  |  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                              |  |  |  |  |  |
| 15:0  | <b>ErrorCode</b> . Reset: Cold,0000h. Error code for this error. See 3.1.3.3 [Error Codes] for details on decoding this field. |  |  |  |  |  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                              |  |  |  |  |  |
| 15:0  | <b>ErrorCode</b> . Reset: Cold,0000h. Error code for this error. See 3.1.3.3 [Error Codes] for details on decoding this field. |  |  |  |  |  |

#### MSR0000\_0406...MSRC000\_2012 [IF Machine Check Address Thread 0] (MCA::IF::MCA\_ADDR\_IF)

Read-write, Volatile. Reset: Cold,0000\_0000\_0000h.

MCA::IF::MCA\_ADDR\_IF stores an address and other information associated with the error in MCA::IF::MCA\_STATUS\_IF. The register is only meaningful if MCA::IF::MCA\_STATUS\_IF[Val]=1 and

#### MCA::IF::MCA\_STATUS\_IF[AddrV]=1.

\_lthree[1:0]\_core[3:0]\_thread[1:0]\_inst1\_aliasMSRLEGACY; MSR0000\_0406

\_lthree[1:0]\_core[3:0]\_thread[1:0]\_inst1\_aliasMSR; MSRC000\_2012

BitsDescription63:62Reserved.61:56LSB. Read-write, Volatile. Reset: Cold,00h. Specifies the least significant valid bit of the address contained in<br/>MCA::IF::MCA\_ADDR\_IF[ErrorAddr]. A value of 0 indicates that MCA::IF::MCA\_ADDR\_IF[55:0] contains a<br/>valid byte address. A value of 6 indicates that MCA::IF::MCA\_ADDR\_IF[55:6] contains a valid cache line<br/>address and that MCA::IF::MCA\_ADDR\_IF[5:0] are not part of the address and should be ignored by error<br/>handling software. A value of 12 indicates that MCA::IF::MCA\_ADDR\_IF[55:12] contain a valid 4KB memory<br/>page and that MCA::IF::MCA\_ADDR\_IF[11:0] should be ignored by error handling software.55:0ErrorAddr. Read-write, Volatile. Reset: Cold,00\_0000\_0000\_0000h. Unless otherwise specified by an error,<br/>contains the address associated with the error logged in MCA::IF::MCA\_STATUS\_IF. For physical addresses, the<br/>most significant bit is given by Core::X86::Cpuid::LongModeInfo[PhysAddrSize].

#### Table 38: MCA\_ADDR\_IF Register

#### MSR0000\_0407...MSRC000\_2013 [IF Machine Check Miscellaneous 0 Thread 0] (MCA::IF::MCA\_MISC0\_IF)

Log miscellaneous information associated with errors. \_lthree[1:0]\_core[3:0]\_thread[1:0]\_inst1\_aliasMSRLEGACY; MSR0000\_0407

| lthree[1   | 1:0]_core[3:0]_thread[1:0]_inst1_aliasMSR; MSRC000_2013  |  |  |  |
|--|--|--|--|--|
|  | Description  |  |  |  |
| 63   | Valid. Reset: 1. 1=A valid CntP field is present in this register.   |  |  |  |
|  | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read-only.   |  |  |  |
| 62   | <b>CntP</b> . Reset: 1. 1=A valid threshold counter is present.  |  |  |  |
| 02   | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read-only.   |  |  |  |
| 61   | <b>Locked</b> . Reset: 0. 1=Writes to this register are ignored. This bit is set by BIOS to indicate that this register is not   |  |  |  |
| 01   | available for OS use. BIOS should set this bit if ThresholdIntType is set to SMI.  |  |  |  |
|  | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read-only.   |  |  |  |
| 60   | <b>IntP</b> . Reset: 1. 1=ThresholdIntType can be used to generate interrupts. 0=ThresholdIntType and interrupt  |  |  |  |
| 00   | generation are not supported.  |  |  |  |
|  | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::IF::MCA_MISC0_IF[Locked]) ? Read-write :   |  |  |  |
|  | Read-only.   |  |  |  |
| 59:56  | Reserved.  |  |  |  |
| 55:52  | LvtOffset. Reset: 0h. One per die. For error thresholding interrupts, specifies the address of the LVT entry in the  |  |  |  |
|  | APIC registers as follows: LVT address = (LvtOffset shifted left 4 bits) + 500h (see   |  |  |  |
|  | Core::X86::Apic::ExtendedInterruptLvtEntries).   |  |  |  |
|  | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::IF::MCA_MISC0_IF[Locked]) ? Read-write :   |  |  |  |
|  | Read-only.   |  |  |  |
| 51   | CntEn. Reset: 0. 1=Count thresholding errors.  |  |  |  |
|  | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::IF::MCA_MISC0_IF[Locked]) ? Read-write :   |  |  |  |
|  | Read-only.   |  |  |  |
| 50:49  |  |  |  |  |
|  | = No interrupt. 01b = APIC based interrupt (see Core::X86::Msr::McaIntrCfg[ThresholdLvtOffset]). 10b = SMI   |  |  |  |
|  | trigger event. 11b = Reserved.   |  |  |  |
|  | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::IF::MCA_MISC0_IF[Locked]) ? Read-write :   |  |  |  |
|  | Read-only.   |  |  |  |
| 48   | <b>Ovrflw</b> . Reset: Cold,0. Set by hardware when ErrCnt transitions from FFEh to FFFh. When this field is set,  |  |  |  |
|  | ErrCnt no longer increments. When this bit is set, the interrupt selected by the ThresholdIntType field is   |  |  |  |
|  | generated.   |  |  |  |
|  | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::IF::MCA_MISC0_IF[Locked]) ? Read-write :   |  |  |  |
| 47.44  | Read-only.<br>Reserved.  |  |  |  |
|  |  |  |  |  |
| 45:52  | <b>ErrCnt</b> . Reset: Cold,000h. This is written by software to set the starting value of the error counter. This is incremented by hardware when errors are logged. When this counter overflows, it stays at FFFh (no rollover). The |  |  |  |
|  | threshold value, written by software, is (FFFh - the desired error count (the number of errors necessary in order  |  |  |  |
|  | for an interrupt to be taken)); the desired error count of 0 (a write value of FFFh) is not supported.   |  |  |  |
|  | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::IF::MCA_MISC0_IF[Locked]) ? Read-write :   |  |  |  |
|  | Read-only.   |  |  |  |
| 31:24  | <b>BlkPtr</b> . Read-write. Reset: 01h. 00h=Extended MISC MSR block is not valid. 01h=Extended MSR block is valid.   |  |  |  |
| 23:0   | Reserved.  |  |  |  |
|  |  |  |  |  |

 Bits
 Description

 63:39
 Reserved.

 38:37
 DeferredIntType. Read-write. Reset: 0h. Specifies the type of interrupt signaled when a deferred error is logged. 00b = No interrupt. 01b = APIC based interrupt (see Core::X86::Msr::McaIntrCfg[DeferredLvtOffset]). 10b = SMI trigger event. 11b = Reserved.

| 36:33  | Reserved.  |  |  |  |  |
|--------|--|--|--|--|--|
| 32     | <b>McaXEnable</b> . Read-write. Reset: 0. Init: BIOS,1. Check: 1. 1=Software has acknowledged support for the MCAX feature set. 0=Software has not acknowledged support for the MCAX feature set. All uncorrected and fatal errors will cause an ErrorEvent packet to be generated. Deferred error interrupts are configured via Core::X86::Msr::McaIntrCfg.   |  |  |  |  |
| 31:6   | Reserved.  |  |  |  |  |
| 5      | <b>DeferredIntTypeSupported</b> . Read-only. Reset: 1. 1=MCA::IF::MCA_CONFIG_IF[DeferredIntType] controls the type of interrupt generated on a deferred error. Deferred errors are supported in this bank only if MCA::IF::MCA_CONFIG_IF[DeferredErrorLoggingSupported]=1.   |  |  |  |  |
| 4:3    | Reserved.  |  |  |  |  |
| 2      | <b>DeferredErrorLoggingSupported</b> . Read-only. Reset: 0. 1=Deferred errors are supported in this MCA bank, and the LogDeferredInMcaStat field in this register controls the logging behavior of these errors. MCA_DESTAT and MCA_DEADDR are supported in this MCA bank. 0=Deferred errors are not supported in this bank.   |  |  |  |  |
| 1      | Reserved.  |  |  |  |  |
| 0      | <b>McaX</b> . Read-only. Reset: 1. 1=This bank provides Machine Check Architecture Extensions. Up to 4 additional MISC registers (MISC1-MISC4) are supported. MCA::IF::MCA_MISC0_IF[BlkPtr] indicates the presence of the additional MISC registers, but is not used to determine their MSR numbers. Deferred error interrupt type is specifiable by MCA bank. MCA::IF::MCA_STATUS_IF[TCC] is present. |  |  |  |  |
| MSRO   | C000_2015 [IF IP Identification] (MCA::IF::MCA_IPID_IF)  |  |  |  |  |
| Reset: | 0001_00B0_0000_0000h.  |  |  |  |  |
|        | CA::IF::MCA_IPID_IF register is used by software to determine what IP type and revision is associated with the   |  |  |  |  |
|        | :0]_core[3:0]_inst1_aliasMSR; MSRC000_2015   |  |  |  |  |
|        | Description  |  |  |  |  |
| 63:48  | <b>McaType</b> . Read-only. Reset: 0001h. The McaType of the MCA bank within this IP.  |  |  |  |  |
| 47:44  | Reserved.  |  |  |  |  |
| 43:32  | HardwareID. Read-only. Reset: 0B0h. The Hardware ID of the IP associated with this MCA bank.   |  |  |  |  |
| 31:0   | <b>InstanceId</b> . Read-write. Reset: 0000_0000h. The instance ID of this IP. This is initialized to a unique ID per instance of this register.   |  |  |  |  |
| MSR    | C000_2016 [IF Machine Check Syndrome Thread 0] (MCA::IF::MCA_SYND_IF)  |  |  |  |  |
|        | write, Volatile. Reset: Cold,0000_0000_0000_0000h.   |  |  |  |  |
|        | ohysical location information associated with error in MCA::IF::MCA_STATUS_IF Thread 0   |  |  |  |  |
|        | :0]_core[3:0]_thread[1:0]_inst1_aliasMSR; MSRC000_2016   |  |  |  |  |
| Bits   | Description  |  |  |  |  |
|        | Reserved.  |  |  |  |  |
| 32     | <b>Syndrome</b> . Read-write, Volatile. Reset: Cold,0. Contains the syndrome, if any, associated with the error logged in MCA::IF::MCA_STATUS_IF. The low-order bit of the syndrome is stored in bit 0, and the syndrome has a length specified by MCA::IF::MCA_SYND_IF[Length]. The Syndrome field is only valid when MCA::IF::MCA_SYND_IF[Length] is not 0.  |  |  |  |  |
| 31:27  | 27 Reserved.   |  |  |  |  |
| 26:24  | <b>ErrorPriority</b> . Read-write, Volatile. Reset: Cold,0h. Encodes the priority of the error logged in MCA::IF::MCA_SYND_IF. 3'b000 = No error; 3'b001 = Reserved; 3'b010 = Corrected Error; 3'b011 = Deferred Error; 3'b100 = Uncorrected Error; 3'b101 = Fatal Error; all others reserved.   |  |  |  |  |
| 23:18  | <b>Length</b> . Read-write, Volatile. Reset: Cold,00h. Specifies the length in bits of the syndrome contained in MCA::IF::MCA_SYND_IF[Syndrome]. A value of 0 indicates that there is no valid syndrome in MCA::IF::MCA_SYND_IF. For example, a syndrome length of 9 means that  |  |  |  |  |

MCA::IF::MCA\_SYND\_IF[Syndrome] bits [8:0] contains a valid syndrome.

17:0 **ErrorInformation**. Read-write, Volatile. Reset: Cold,0\_0000h. Contains error-specific information about the location of the error. Decoding is available in Table 39 [MCA\_SYND\_IF Register].

#### Table 39: MCA\_SYND\_IF Register

| Bits | Description   |
|------|---|
| 63   | <b>Val</b> . Reset: Cold,0. 1=A valid error has been detected. This bit should be cleared by software after the register has been read. |
|      | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                                       |
| 62   | <b>Overflow</b> . Reset: Cold,0. 1=An error was detected while the valid bit (Val) was set; at least one error was not                  |
|      | logged. Overflow is set independently of whether the existing error is overwritten. See 3.1.3 [Machine Check Errors].                   |
|      | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                                       |
| 61   | <b>UC</b> . Reset: Cold,0. 1=The error was not corrected by hardware.   |
|      | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                                       |
| 60   | <b>En</b> . Reset: Cold,0. 1=MCA error reporting is enabled for this error, as indicated by the corresponding bit in                    |
|      | MCA::L2::MCA_CTL_L2. This bit is a copy of bit in MCA::L2::MCA_CTL_L2 for this error.   |
|      | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                                       |
| 59   | <b>MiscV</b> . Reset: Cold,0. 1=Valid thresholding in MCA::L2::MCA_MISC0_L2.  |
|      | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                                       |
| 58   | AddrV. Reset: Cold,0. 1=MCA::L2::MCA_ADDR_L2 contains address information associated with the error.                                    |
|      | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                                       |
| 57   | <b>PCC</b> . Reset: Cold,0. 1=Hardware context held by the processor may have been corrupted. Continued operation of                    |
|      | the system may have unpredictable results. The error is not recoverable or survivable, and the system should be                         |
|      | reinitialized.  |
|      | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                                       |
| 56   | <b>ErrCoreIdVal</b> . Reset: Cold,0. 1=The ErrCoreId field is valid.  |
|      | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                                       |
| 55   | <b>TCC</b> . Reset: Cold,0. 0=The thread which consumed the error can be restarted reliably at the instruction pointer                  |
|      | address pushed onto the exception handler stack if any uncorrected error has been corrected by software. 1=The                          |
|      | thread which consumed the error is not restartable and must be terminated. Only meaningful when   |
|      | MCA::L2::MCA_STATUS_L2[PCC]=0.  |

|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                         |  |  |  |  |
|-------|---|--|--|--|--|
| 54    | Reserved.   |  |  |  |  |
| 53    | SyndV. Reset: Cold,0. 1=This error logged information in MCA::L2::MCA_SYND_L2. If   |  |  |  |  |
|       | MCA::L2::MCA_SYND_L2[ErrorPriority] is the same as the priority of the error in   |  |  |  |  |
|       | MCA::L2::MCA_STATUS_L2, then the information in MCA::L2::MCA_SYND_L2 is associated with the error                         |  |  |  |  |
|       | in MCA::L2::MCA_STATUS_L2.  |  |  |  |  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                         |  |  |  |  |
| 52:47 | Reserved.   |  |  |  |  |
| 46    | <b>CECC</b> . Reset: Cold,0. 1=The error was a correctable ECC error according to the restrictions of the ECC             |  |  |  |  |
|       | algorithm. UC indicates whether the error was actually corrected by the processor.  |  |  |  |  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                         |  |  |  |  |
| 45    | <b>UECC</b> . Reset: Cold,0. 1=The error was an uncorrectable ECC error according to the restrictions of the ECC          |  |  |  |  |
|       | algorithm. UC indicates whether the error was actually corrected by the processor.  |  |  |  |  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                         |  |  |  |  |
| 44    | <b>Deferred</b> . Reset: Cold, 0. 1=A deferred error was created. A deferred error is the result of an uncorrectable data |  |  |  |  |
|       | error which did not immediately cause a processor exception; an exception is deferred until the erroneous data is         |  |  |  |  |
|       | consumed.   |  |  |  |  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                         |  |  |  |  |
| 43    | <b>Poison</b> . Reset: Cold,0. 1=The error was the result of attempting to consume poisoned data.                         |  |  |  |  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                         |  |  |  |  |
|       | Reserved.   |  |  |  |  |

#### MSR0000\_040A...MSRC000\_2022 [L2 Machine Check Address Thread 0] (MCA::L2::MCA\_ADDR\_L2)

Read-write, Volatile. Reset: Cold,0000\_0000\_0000\_0000h.

MCA::L2::MCA\_ADDR\_L2 stores an address and other information associated with the error in MCA::L2::MCA\_STATUS\_L2. The register is only meaningful if MCA::L2::MCA\_STATUS\_L2[Val]=1 and MCA::L2::MCA\_STATUS\_L2[AddrV]=1.

\_lthree[1:0]\_core[3:0]\_thread[1:0]\_inst2\_aliasMSRLEGACY; MSR0000\_040A

\_lthree[1:0]\_core[3:0]\_thread[1:0]\_inst2\_aliasMSR; MSRC000\_2022

#### Bits Description

#### 63:62 Reserved.

61:56 **LSB**. Read-write, Volatile. Reset: Cold,00h. Specifies the least significant valid bit of the address contained in

MCA::L2::MCA\_ADDR\_L2[ErrorAddr]. A value of 0 indicates that MCA::L2::MCA\_ADDR\_L2[55:0] contains a valid byte address. A value of 6 indicates that MCA::L2::MCA\_ADDR\_L2[55:6] contains a valid cache line address and that MCA::L2::MCA\_ADDR\_L2[5:0] are not part of the address and should be ignored by error handling software. A value of 12 indicates that MCA::L2::MCA\_ADDR\_L2[55:12] contain a valid 4KB memory page and that MCA::L2::MCA\_ADDR\_L2[11:0] should be ignored by error handling software.
 55:0 ErrorAddr. Read-write, Volatile. Reset: Cold,00\_0000\_0000h. Unless otherwise specified by an error,

contains the address associated with the error logged in MCA::L2::MCA\_STATUS\_L2. For physical addresses, the most significant bit is given by Core::X86::Cpuid::LongModeInfo[PhysAddrSize].

| Error Type | Bits    | Description      |
|------------|---------|------------------|

| Bits  | Description   |  |  |
|-------|---|--|--|
| 63    | <b>Valid</b> . Reset: 1. 1=A valid CntP field is present in this register.  |  |  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read-only.  |  |  |
| 62    | CntP. Reset: 1. 1=A valid threshold counter is present.   |  |  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read-only.  |  |  |
| 61    | <b>Locked</b> . Reset: 0. 1=Writes to this register are ignored. This bit is set by BIOS to indicate that this register is not            |  |  |
|       | available for OS use. BIOS should set this bit if ThresholdIntType is set to SMI.   |  |  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read-only.  |  |  |
| 60    | IntP. Reset: 1. 1=ThresholdIntType can be used to generate interrupts. 0=ThresholdIntType and interrupt                                   |  |  |
|       | generation are not supported.   |  |  |
|       | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::L2::MCA_MISC0_L2[Locked]) ? Read-write :  |  |  |
|       | Read-only.  |  |  |
|       | Reserved.   |  |  |
| 55:52 | LvtOffset. Reset: 0h. One per die. For error thresholding interrupts, specifies the address of the LVT entry in the                       |  |  |
|       | APIC registers as follows: LVT address = (LvtOffset shifted left 4 bits) + 500h (see  |  |  |
|       | Core::X86::Apic::ExtendedInterruptLvtEntries).  |  |  |
|       | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::L2::MCA_MISC0_L2[Locked]) ? Read-write :  |  |  |
|       | Read-only.  |  |  |
| 51    | CntEn. Reset: 0. 1=Count thresholding errors.   |  |  |
|       | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::L2::MCA_MISC0_L2[Locked]) ? Read-write :  |  |  |
|       | Read-only.  |  |  |
| 50:49 |   |  |  |
|       | = No interrupt. 01b = APIC based interrupt (see Core::X86::Msr::McaIntrCfg[ThresholdLvtOffset]). 10b = SMI trigger event. 11b = Reserved. |  |  |
|       | $r_{100}$ or event $r_{10} = \kappa_{00}$   |  |  |

|        | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::L2::MCA_MISC0_L2[Locked]) ? Read-write : Read-only.               |
|--------|---|
| 48     | <b>Ovrflw</b> . Reset: Cold,0. Set by hardware when ErrCnt transitions from FFEh to FFFh. When this field is set,         |
| 40     | ErrCnt no longer increments. When this bit is set, the interrupt selected by the ThresholdIntType field is                |
|        | generated.  |
|        | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::L2::MCA_MISC0_L2[Locked]) ? Read-write :                          |
|        |   |
| 47.44  | Read-only.<br>Reserved.   |
|        |   |
| 43:32  | <b>ErrCnt</b> . Reset: Cold,000h. This is written by software to set the starting value of the error counter. This is     |
|        | incremented by hardware when errors are logged. When this counter overflows, it stays at FFFh (no rollover). The          |
|        | threshold value, written by software, is (FFFh - the desired error count (the number of errors necessary in order         |
|        | for an interrupt to be taken)); the desired error count of 0 (a write value of FFFh) is not supported.                    |
|        | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::L2::MCA_MISC0_L2[Locked]) ? Read-write :                          |
| 21.24  | Read-only.  |
|        | <b>BlkPtr</b> . Read-write. Reset: 01h. 00h=Extended MISC MSR block is not valid. 01h=Extended MSR block is valid.        |
| 23:0   | Reserved.   |
| MSR    | C000_2024 [L2 Machine Check Configuration] (MCA::L2::MCA_CONFIG_L2)   |
| Reset: | 0000_0000_0025h.  |
| Contro | ols configuration of the associated machine check bank.   |
|        | 1:0]_core[3:0]_inst2_aliasMSR; MSRC000_2024   |
| Bits   | Description   |
| 63:39  | Reserved.   |
| 38:37  | <b>DeferredIntType</b> . Read-write. Reset: 0h. Specifies the type of interrupt signaled when a deferred error is logged. |
|        | 00b = No interrupt. 01b = APIC based interrupt (see Core::X86::Msr::McaIntrCfg[DeferredLvtOffset]). 10b =                 |
|        | SMI trigger event. 11b = Reserved.  |
| 36:35  | Reserved.   |
| 34     | <b>LogDeferredInMcaStat</b> . Read-write. Reset: 0. Init: BIOS,1. 1=Log deferred errors in                                |
|        | MCA::L2::MCA_STATUS_L2 and MCA::L2::MCA_ADDR_L2 in addition to MCA::L2::MCA_DESTAT_L2                                     |
|        | and MCA::L2::MCA_DEADDR_L2. 0=Only log deferred errors in MCA::L2::MCA_DESTAT_L2 and                                      |
|        | MCA::L2::MCA_DEADDR_L2. This bit does not affect logging of deferred errors in  |
|        | MCA::L2::MCA_SYND_L2, MCA::L2::MCA_MISC0_L2.  |
| 33     | Reserved.   |
| 32     | <b>McaXEnable</b> . Read-write. Reset: 0. Init: BIOS,1. Check: 1. 1=Software has acknowledged support for the             |
|        | MCAX feature set. 0=Software has not acknowledged support for the MCAX feature set. All uncorrected and                   |
|        | fatal errors will cause an ErrorEvent packet to be generated. Deferred error interrupts are configured via                |
|        | Core::X86::Msr::McaIntrCfg.   |
| 31:6   | Reserved.   |
| 5      | <b>DeferredIntTypeSupported</b> . Read-only. Reset: 1. 1=MCA::L2::MCA_CONFIG_L2[DeferredIntType] controls                 |
|        | the type of interrupt generated on a deferred error. Deferred errors are supported in this bank only if                   |
|        | MCA::L2::MCA_CONFIG_L2[DeferredErrorLoggingSupported]=1.  |
| 4:3    | Reserved.   |
| 2      | <b>DeferredErrorLoggingSupported</b> . Read-only. Reset: 1. 1=Deferred errors are supported in this MCA bank, and         |
|        | MCA::L2::MCA_CONFIG_L2[LogDeferredInMcaStat] controls the logging behavior of these errors.                               |
|        | MCA::L2::MCA_DESTAT_L2 and MCA::L2::MCA_DEADDR_L2 are supported in this MCA bank.   |
|        | 0=Deferred errors are not supported in this bank.   |
| 1      | Reserved.   |
| 0      | <b>McaX</b> . Read-only. Reset: 1. 1=This bank provides Machine Check Architecture Extensions. Up to 4 additional         |
|        | MISC registers (MISC1-MISC4) are supported. MCA::L2::MCA_MISC0_L2[BlkPtr] indicates the presence of                       |
|        | the additional MISC registers, but is not used to determine their MSR numbers. Deferred error interrupt type is           |
|        | specifiable by MCA bank. MCA::L2::MCA_STATUS_L2[TCC] is present.  |

#### MSRC000\_2025 [L2 IP Identification] (MCA::L2::MCA\_IPID\_L2)

#### Reset: 0002\_00B0\_0000\_0000h.

The MCA::L2::MCA\_IPID\_L2 register is used by software to determine what IP type and revision is associated with the MCA bank.

\_lthree[1:0]\_core[3:0]\_inst2\_aliasMSR; MSRC000\_2025

#### Bits Description

63:48 **McaType**. Read-only. Reset: 0002h. The McaType of the MCA bank within this IP.

47:44 Reserved.

43:32 HardwareID. Read-only. Reset: 0B0h. The Hardware ID of the IP associated with this MCA bank.

31:0 **InstanceId**. Read-write. Reset: 0000\_0000h. The instance ID of this IP. This is initialized to a unique ID per instance of this register.

#### MSRC000\_2026 [L2 Machine Check Syndrome Thread 0] (MCA::L2::MCA\_SYND\_L2)

| Read-v | write,Volatile. Reset: Cold,0000_0000_0000_0000h.   |
|--------|---|
| Logs p | hysical location information associated with error in MCA::L2::MCA_STATUS_L2 Thread 0                               |
|        | :0]_core[3:0]_thread[1:0]_inst2_aliasMSR; MSRC000_2026  |
| Bits   | Description   |
| 63:49  | Reserved.   |
| 48:32  | Syndrome. Read-write, Volatile. Reset: Cold, 0_0000h. Contains the syndrome, if any, associated with the error      |
|        | logged in MCA::L2::MCA_STATUS_L2. The low-order bit of the syndrome is stored in bit 0, and the syndrome            |
|        | has a length specified by MCA::L2::MCA_SYND_L2[Length]. The Syndrome field is only valid when                       |
|        | MCA::L2::MCA_SYND_L2[Length] is not 0.  |
| 31:27  | Reserved.   |
| 26:24  | ErrorPriority. Read-write, Volatile. Reset: Cold, 0h. Encodes the priority of the error logged in                   |
|        | MCA::L2::MCA_SYND_L2. 3'b000 = No error; 3'b001 = Reserved; 3'b010 = Corrected Error; 3'b011 = Deferred             |
|        | Error; 3'b100 = Uncorrected Error; 3'b101 = Fatal Error; all others reserved.                                       |
| 23:18  | Length. Read-write, Volatile. Reset: Cold,00h. Specifies the length in bits of the syndrome contained in            |
|        | MCA::L2::MCA_SYND_L2[Syndrome]. A value of 0 indicates that there is no valid syndrome in                           |
|        | MCA::L2::MCA_SYND_L2. For example, a syndrome length of 9 means that  |
|        | MCA::L2::MCA_SYND_L2[Syndrome] bits [8:0] contains a valid syndrome.  |
| 17:0   | <b>ErrorInformation</b> . Read-write, Volatile. Reset: Cold, 0_0000h. Contains error-specific information about the |
|        | location of the error. Decoding is available in Table 42 [MCA_SYND_L2 Register].                                    |

| Error Type | Bits    | Description        |
|------------|---------|--------------------|
| MultiHit   | [17:8]  | Index              |
|            | [7:0]   | One-hot way vector |
| Tag        | [17:13] | Reserved           |
|            | [12:3]  | Index              |
|            | [2:0]   | Way                |
| Data       | [17:15] | Reserved           |
|            | [14:5]  | Index              |
|            | [4:3]   | Quarter-line       |
|            | [2:0]   | Way                |
| Hwa        | [17:0]  | Reserved           |

#### MSRC000\_2028 [L2 Machine Check Deferred Error Status Thread 0] (MCA::L2::MCA\_DESTAT\_L2)

Read-write, Volatile. Reset: Cold,0000\_0000\_0000\_0000h. Holds status information for the first deferred error seen in this bank. \_lthree[1:0]\_core[3:0]\_thread[1:0]\_inst2\_aliasMSR; MSRC000\_2028

| Bits  | Description  |
|-------|--|
| 63    | <b>Val</b> . Read-write, Volatile. Reset: Cold, 0. 1=A valid error has been detected (whether it is enabled or not).   |
| 62    | <b>Overflow</b> . Read-write, Volatile. Reset: Cold,0. 1=An error was detected while the valid bit (Val) was set; at least one error was not logged. Overflow is set independently of whether the existing error is overwritten. (See the section on overwrite priorities.)  |
| 61:59 | Reserved.  |
| 58    | <b>AddrV</b> . Read-write, Volatile. Reset: Cold, 0. 1=MCA::L2::MCA_DEADDR_L2 contains address information associated with the error.  |
| 57:54 | Reserved.  |
| 53    | <b>SyndV</b> . Read-write, Volatile. Reset: Cold,0. 1=This error logged information in MCA::L2::MCA_SYND_L2. If MCA::L2::MCA_SYND_L2[ErrorPriority] is the same as the priority of the error in MCA::L2::MCA_STATUS_L2, then the information in MCA::L2::MCA_SYND_L2 is associated with the error in MCA::L2::MCA_DESTAT_L2. |
| 52:45 | Reserved.  |
| 44    | <b>Deferred</b> . Read-write, Volatile. Reset: Cold,0. 1=A deferred error was created. A deferred error is the result of an uncorrectable data error which did not immediately cause a processor exception; poison is created and an exception is deferred until the poison data is consumed.                                |
| 43:0  | Reserved.  |

#### MSRC000\_2029 [L2 Deferred Error Address Thread 0] (MCA::L2::MCA\_DEADDR\_L2)

Read-write, Volatile. Reset: Cold,0000\_0000\_0000\_0000h.

The MCA::L2::MCA DEADDR L2 register stores the address associated with the error in MCA::L2::MCA DESTAT L2. The register is only meaningful if MCA::L2::MCA DESTAT L2[Val]=1 and MCA::L2::MCA\_DESTAT\_L2[AddrV]=1. The lowest valid bit of the address is defined by MCA::L2::MCA DEADDR L2[LSB]. \_lthree[1:0]\_core[3:0]\_thread[1:0]\_inst2\_aliasMSR; MSRC000\_2029 **Bits** Description 63:62 Reserved. 61:56 LSB. Read-write, Volatile. Reset: Cold, 00h. Specifies the least significant valid bit of the address contained in MCA::L2::MCA DEADDR L2[ErrorAddr]. A value of 0 indicates that MCA::L2::MCA DEADDR L2[55:0] contains a valid byte address. A value of 6 indicates that MCA::L2::MCA DEADDR L2[55:6] contains a valid cache line address and that MCA::L2::MCA\_DEADDR\_L2[5:0] are not part of the address and should be ignored by error handling software. A value of 12 indicates that MCA::L2::MCA\_DEADDR\_L2[55:12] contain a valid 4KB memory page and that MCA::L2::MCA\_DEADDR\_L2[11:0] should be ignored by error handling software. 55:0 ErrorAddr. Read-write, Volatile. Reset: Cold,00 0000 0000 0000h. Contains the address, if any, associated with the error logged in MCA::L2::MCA\_DESTAT\_L2. The lowest-order valid bit of the address is specified in MCA::L2::MCA DEADDR L2[LSB].

#### MSRC001\_0402 [L2 Machine Check Control Mask] (MCA::L2::MCA\_CTL\_MASK\_L2)

Read-write. Reset: 0000\_0000\_0000\_0000h.

Inhibit detection of an error source.

| _lthree[1 | _three[1:0]_core[3:0]_inst2_aliasMSR; MSRC001_0402              |  |  |
|-----------|---|--|--|
| Bits      | s Description   |  |  |
| 63:4      | Reserved.   |  |  |
| 3         | Hwa. Read-write. Reset: 0. Init: BIOS,1. Hardware Assert Error. |  |  |
| 2         | Data. Read-write. Reset: 0. L2M Data Array ECC Error.           |  |  |
| 1         | Tag. Read-write. Reset: 0. L2M Tag or State Array ECC Error.    |  |  |
| 0         | MultiHit, Read-write, Reset: 0, L2M Tag Multiple-Way-Hit error. |  |  |

#### 3.2.5.4 DE

#### MSR0000\_040C...MSRC000\_2030 [DE Machine Check Control] (MCA::DE::MCA\_CTL\_DE)

| Read-write. Reset: 0000_0000_0000_0000h.  |
|---|
| 0=Disables error reporting for the corresponding error. 1=Enables error reporting via machine check exception for the |
| corresponding error. The MCA::DE::MCA_CTL_DE register must be enabled by the corresponding enable bit in              |
| Core::X86::Msr::MCG_CTL. Does not affect error detection, correction, or logging.                                     |

| Bits   | Description   |
| 63     | <b>Val</b> . Reset: Cold,0. 1=A valid error has been detected. This bit should be cleared by software after the register has been read. |
|        | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                                       |
| 62     | <b>Overflow</b> . Reset: Cold,0. 1=An error was detected while the valid bit (Val) was set; at least one error was not                  |
|        | logged. Overflow is set independently of whether the existing error is overwritten. See 3.1.3 [Machine Check Errors].                   |
|        | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                                       |
| 61     | UC. Reset: Cold,0. 1=The error was not corrected by hardware.   |
|        | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                                       |
| 60     | <b>En</b> . Reset: Cold,0. 1=MCA error reporting is enabled for this error, as indicated by the corresponding bit in                    |
|        | MCA::DE::MCA_CTL_DE. This bit is a copy of bit in MCA::DE::MCA_CTL_DE for this error.   |
|        | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                                       |
| 59     | <b>MiscV</b> . Reset: Cold,0. 1=Valid thresholding in MCA::DE::MCA_MISC0_DE.  |
|        | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                                       |
| 58     | AddrV. Reset: Cold,0. 1=MCA::DE::MCA_ADDR_DE contains address information associated with the error.                                    |
|        | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                                       |
| 57     | <b>PCC</b> . Reset: Cold,0. 1=Hardware context held by the processor may have been corrupted. Continued operation of                    |
|        | the system may have unpredictable results. The error is not recoverable or survivable, and the system should be reinitialized.          |
|        | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                                       |
| 56     | ErrCoreIdVal. Reset: Cold,0. 1=The ErrCoreId field is valid.  |
|        | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                                       |
| 55     | <b>TCC</b> . Reset: Cold,0. 0=The thread which consumed the error can be restarted reliably at the instruction pointer                  |
|        | address pushed onto the exception handler stack if any uncorrected error has been corrected by software. 1=The                          |
|        | thread which consumed the error is not restartable and must be terminated. Only meaningful when   |
|        | MCA::DE::MCA_STATUS_DE[PCC]=0.  |

|                 | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |  |
|-----------------|--|--|
| 54              | Reserved.  |  |
| 53              | <b>SyndV</b> . Reset: Cold,0. 1=This error logged information in MCA::DE::MCA_SYND_DE. If MCA::DE::MCA_SYND_DE[ErrorPriority] is the same as the priority of the error in MCA::DE::MCA_STATUS_DE, then the information in MCA::DE::MCA_SYND_DE is associated with the error in MCA::DE::MCA_STATUS_DE. |  |
|                 | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |  |
| 52:47 Reserved. |  |  |
| 46              | <b>CECC</b> . Reset: Cold,0. 1=The error was a correctable ECC error according to the restrictions of the ECC algorithm. UC indicates whether the error was actually corrected by the processor.   |  |
|                 | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |  |
| 45              | <b>UECC</b> . Reset: Cold,0. 1=The error was an uncorrectable ECC error according to the restrictions of the ECC algorithm. UC indicates whether the error was actually corrected by the processor.  |  |
|                 | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |  |
| 44              | <b>Deferred</b> . Reset: Cold,0. 1=A deferred error was created. A deferred error is the result of an uncorrectable data error which did not immediately cause a processor exception; an exception is deferred until the erroneous data is consumed.   |  |
|                 | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |  |
| 43              | <b>Poison</b> . Reset: Cold,0. 1=The error was the result of attempting to consume poisoned data.  |  |
|                 | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |  |
| 42:38           | Reserved.  |  |
| 37:32           | <b>ErrCoreId</b> . Reset: Cold,00h. When ErrCoreIdVal=1 this field indicates which core within the processor is associated with the error; Otherwise this field is reserved.   |  |
|                 | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |  |
| 31:22           | Reserved.  |  |
| 21:16           | <b>ErrorCodeExt</b> . Reset: Cold,00h. Extended Error Code. This field is used to identify the error type for root cause analysis. This field indicates which bit position in MCA::DE::MCA_CTL_DE enables error reporting for the logged error.  |  |
|                 | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |  |
| 15:0            | <b>ErrorCode</b> . Reset: Cold,0000h. Error code for this error. See 3.1.3.3 [Error Codes] for details on decoding this field.   |  |
|                 | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |  |

#### Table 43: MCA\_STATUS\_DE[ErrorCodeExt] Decode

#### MSR0000\_040E...MSRC000\_2032 [DE Machine Check Address Thread 0] (MCA::DE::MCA\_ADDR\_DE)

Read-write, Volatile. Reset: Cold, 0000\_0000\_0000h.

MCA::DE::MCA\_ADDR\_DE stores an address and other information associated with the error in MCA::DE::MCA\_STATUS\_DE. The register is only meaningful if MCA::DE::MCA\_STATUS\_DE[Val]=1 and

| MCA::DE::MCA_STATUS_DE[AddrV]=1. |
|----------------------------------|
|----------------------------------|

\_lthree[1:0]\_core[3:0]\_thread[1:0]\_inst3\_aliasMSRLEGACY; MSR0000\_040E

\_lthree[1:0]\_core[3:0]\_thread[1:0]\_inst3\_aliasMSR; MSRC000\_2032

BitsDescription63:62Reserved.

61:56
LSB. Read-write, Volatile. Reset: Cold,00h. Specifies the least significant valid bit of the address contained in MCA::DE::MCA\_ADDR\_DE[ErrorAddr]. A value of 0 indicates that MCA::DE::MCA\_ADDR\_DE[55:0] contains a valid byte address. A value of 6 indicates that MCA::DE::MCA\_ADDR\_DE[55:6] contains a valid cache line address and that MCA::DE::MCA\_ADDR\_DE[5:0] are not part of the address and should be ignored by error handling software. A value of 12 indicates that MCA::DE::MCA\_ADDR\_DE[55:12] contain a valid 4KB memory page and that MCA::DE::MCA\_ADDR\_DE[11:0] should be ignored by error handling software.
55:0
ErrorAddr. Read-write, Volatile. Reset: Cold,00\_0000\_0000\_0000h. Unless otherwise specified by an error, contains the address associated with the error logged in MCA::DE::MCA\_STATUS\_DE. For physical addresses, the most significant bit is given by Core::X86::Cpuid::LongModeInfo[PhysAddrSize].

#### Table 44: MCA\_ADDR\_DE Register

| Log m     | iscellaneous information associated with errors.   |  |  |
|-----------|--|--|--|
| _lthree[1 | lthree[1:0]_core[3:0]_thread[1:0]_inst3_aliasMSRLEGACY; MSR0000_040F   |  |  |
| _lthree[1 | :0]_core[3:0]_thread[1:0]_inst3_aliasMSR; MSRC000_2033   |  |  |
| Bits      | its Description  |  |  |
| 63        | <b>Valid</b> . Reset: 1. 1=A valid CntP field is present in this register.   |  |  |
|           | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read-only.   |  |  |
| 62        | <b>CntP</b> . Reset: 1. 1=A valid threshold counter is present.  |  |  |
|           | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read-only.   |  |  |
| 61        | Locked. Reset: 0. 1=Writes to this register are ignored. This bit is set by BIOS to indicate that this register is not |  |  |
|           | available for OS use. BIOS should set this bit if ThresholdIntType is set to SMI.                                      |  |  |
|           | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read-only.   |  |  |
| 60        | IntP. Reset: 1. 1=ThresholdIntType can be used to generate interrupts. 0=ThresholdIntType and interrupt                |  |  |
|           | generation are not supported.  |  |  |
|           | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::DE::MCA_MISC0_DE[Locked]) ? Read-write :                       |  |  |
|           | Read-only.   |  |  |
| 59:56     | Reserved.  |  |  |
| 55:52     | LvtOffset. Reset: 0h. One per die. For error thresholding interrupts, specifies the address of the LVT entry in the    |  |  |
|           | APIC registers as follows: LVT address = (LvtOffset shifted left 4 bits) + 500h (see                                   |  |  |
|           | Core::X86::Apic::ExtendedInterruptLvtEntries).   |  |  |
|           | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::DE::MCA_MISC0_DE[Locked]) ? Read-write :                       |  |  |
|           | Read-only.   |  |  |
| 51        | <b>CntEn</b> . Reset: 0. 1=Count thresholding errors.  |  |  |

|           | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::DE::MCA_MISC0_DE[Locked]) ? Read-write : Read-only.   |
|-----------|---|
| 50:49     | <b>ThresholdIntType</b> . Reset: Cold,0h. Specifies the type of interrupt signaled when Ovrflw is set and IntP==1. 00b = No interrupt. 01b = APIC based interrupt (see Core::X86::Msr::McaIntrCfg[ThresholdLvtOffset]). 10b = SMI trigger event. 11b = Reserved.  |
|           | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::DE::MCA_MISC0_DE[Locked]) ? Read-write : Read-only.   |
| 48        | <b>Ovrflw</b> . Reset: Cold,0. Set by hardware when ErrCnt transitions from FFEh to FFFh. When this field is set, ErrCnt no longer increments. When this bit is set, the interrupt selected by the ThresholdIntType field is generated.<br>AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::DE::MCA_MISC0_DE[Locked]) ? Read-write :   |
|           | Read-only.  |
| 47:44     | Reserved.   |
| 43:32     | <b>ErrCnt</b> . Reset: Cold,000h. This is written by software to set the starting value of the error counter. This is incremented by hardware when errors are logged. When this counter overflows, it stays at FFFh (no rollover). The threshold value, written by software, is (FFFh - the desired error count (the number of errors necessary in order for an interrupt to be taken)); the desired error count of 0 (a write value of FFFh) is not supported.<br>AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::DE::MCA_MISC0_DE[Locked]) ? Read-write : |
| 24.24     | Read-only.  |
|           | BlkPtr. Read-write. Reset: 01h. 00h=Extended MISC MSR block is not valid. 01h=Extended MSR block is valid.  |
| 23:0      | Reserved.   |
| MSRO      | C000_2034 [DE Machine Check Configuration] (MCA::DE::MCA_CONFIG_DE)   |
| Reset:    | 0000_0000_0021h.  |
| Contro    | ols configuration of the associated machine check bank.   |
| _lthree[1 | :0]_core[3:0]_inst3_aliasMSR; MSRC000_2034  |
|           | Description   |
| 63:39     | Reserved.   |
| 38:37     | <b>DeferredIntType</b> . Read-write. Reset: 0h. Specifies the type of interrupt signaled when a deferred error is logged.<br>00b = No interrupt. 01b = APIC based interrupt (see Core::X86::Msr::McaIntrCfg[DeferredLvtOffset]). 10b = SMI trigger event. 11b = Reserved.   |
| 36:33     | Reserved.   |
| 32        | <b>McaXEnable</b> . Read-write. Reset: 0. Init: BIOS,1. Check: 1. 1=Software has acknowledged support for the MCAX feature set. 0=Software has not acknowledged support for the MCAX feature set. All uncorrected and fatal errors will cause an ErrorEvent packet to be generated. Deferred error interrupts are configured via Core::X86::Msr::McaIntrCfg.  |
| 31:6      | Reserved.   |
| 5         | <b>DeferredIntTypeSupported</b> . Read-only. Reset: 1. 1=MCA::DE::MCA_CONFIG_DE[DeferredIntType] controls the type of interrupt generated on a deferred error. Deferred errors are supported in this bank only if MCA::DE::MCA_CONFIG_DE[DeferredErrorLoggingSupported]=1.  |
| 4:3       | Reserved.   |
| 2         | <b>DeferredErrorLoggingSupported</b> . Read-only. Reset: 0. 1=Deferred errors are supported in this MCA bank, and the LogDeferredInMcaStat field in this register controls the logging behavior of these errors. MCA_DESTAT and MCA_DEADDR are supported in this MCA bank. 0=Deferred errors are not supported in this bank.  |
| 1         | Reserved.   |
| 0         | <b>McaX</b> . Read-only. Reset: 1. 1=This bank provides Machine Check Architecture Extensions. Up to 4 additional MISC registers (MISC1-MISC4) are supported. MCA::DE::MCA_MISC0_DE[BlkPtr] indicates the presence of the additional MISC registers, but is not used to determine their MSR numbers. Deferred error interrupt type is specifiable by MCA bank. MCA::DE::MCA_STATUS_DE[TCC] is present.  |
|           |   |

#### MSRC000\_2035 [DE IP Identification] (MCA::DE::MCA\_IPID\_DE)

#### Reset: 0003\_00B0\_0000\_0000h.

The MCA::DE::MCA\_IPID\_DE register is used by software to determine what IP type and revision is associated with the MCA bank.

|              |            |         |            |         |       |

# BitsDescription63:48McaType. Read-only. Reset: 0003h. The McaType of the MCA bank within this IP.47:44Reserved.43:32HardwareID. Read-only. Reset: 0B0h. The Hardware ID of the IP associated with this MCA bank.31:0InstanceId. Read-write. Reset: 0000\_000h. The instance ID of this IP. This is initialized to a unique ID per<br/>instance of this register.

#### MSRC000\_2036 [DE Machine Check Syndrome Thread 0] (MCA::DE::MCA\_SYND\_DE)

Read-write, Volatile. Reset: Cold,0000\_0000\_0000\_0000h.

Logs physical location information associated with error in MCA::DE::MCA\_STATUS\_DE Thread 0

| _lthree[1 | l:0]_core[3:0]_thread[1:0]_inst3_aliasMSR; MSRC000_2036  |
|-----------|--|
| Bits      | Description  |
| 63:33     | Reserved.  |
| 32        | <b>Syndrome</b> . Read-write, Volatile. Reset: Cold,0. Contains the syndrome, if any, associated with the error logged in MCA::DE::MCA_STATUS_DE. The low-order bit of the syndrome is stored in bit 0, and the syndrome has a |
|           | length specified by MCA::DE::MCA_SYND_DE[Length]. The Syndrome field is only valid when  |
|           | MCA::DE::MCA_SYND_DE[Length] is not 0.   |
| 31:27     | Reserved.  |
| 26:24     | <b>ErrorPriority</b> . Read-write, Volatile. Reset: Cold, 0h. Encodes the priority of the error logged in  |
|           | MCA::DE::MCA_SYND_DE. 3'b000 = No error; 3'b001 = Reserved; 3'b010 = Corrected Error; 3'b011 =   |
|           | Deferred Error; 3'b100 = Uncorrected Error; 3'b101 = Fatal Error; all others reserved.   |
| 23:18     | Length. Read-write, Volatile. Reset: Cold, 00h. Specifies the length in bits of the syndrome contained in  |
|           | MCA::DE::MCA_SYND_DE[Syndrome]. A value of 0 indicates that there is no valid syndrome in  |
|           | MCA::DE::MCA_SYND_DE. For example, a syndrome length of 9 means that   |
|           | MCA::DE::MCA_SYND_DE[Syndrome] bits [8:0] contains a valid syndrome.   |
| 17:0      | <b>ErrorInformation</b> . Read-write, Volatile. Reset: Cold, 0_0000h. Contains error-specific information about the  |
|           | location of the error. Decoding is available in Table 45 [MCA_SYND_DE Register].   |

| Bits | Description  |
|------|--|
| 63   | <b>Val</b> . Reset: Cold,0. 1=A valid error has been detected. This bit should be cleared by software after the register has |
|      | been read.   |
|      | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                            |
| 62   | <b>Overflow</b> . Reset: Cold,0. 1=An error was detected while the valid bit (Val) was set; at least one error was not       |
|      | logged. Overflow is set independently of whether the existing error is overwritten. See 3.1.3 [Machine Check                 |
|      | Errors].   |

AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.

| 61    | UC. Reset: Cold,0. 1=The error was not corrected by hardware.  |
|-------|--|
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |
| 60    | <b>En</b> . Reset: Cold,0. 1=MCA error reporting is enabled for this error, as indicated by the corresponding bit in MCA::EX::MCA_CTL_EX. This bit is a copy of bit in MCA::EX::MCA_CTL_EX for this error.   |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |
| 59    | <b>MiscV</b> . Reset: Cold,0. 1=Valid thresholding in MCA::EX::MCA_MISC0_EX.   |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |
| 58    | AddrV. Reset: Cold,0. 1=MCA::EX::MCA_ADDR_EX contains address information associated with the error.   |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |
| 57    | <b>PCC</b> . Reset: Cold,0. 1=Hardware context held by the processor may have been corrupted. Continued operation of the system may have unpredictable results. The error is not recoverable or survivable, and the system should be reinitialized.  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |
| 56    | <b>ErrCoreIdVal</b> . Reset: Cold,0. 1=The ErrCoreId field is valid.   |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |
| 55    | <b>TCC</b> . Reset: Cold,0. 0=The thread which consumed the error can be restarted reliably at the instruction pointer address pushed onto the exception handler stack if any uncorrected error has been corrected by software. 1=The thread which consumed the error is not restartable and must be terminated. Only meaningful when MCA::EX::MCA_STATUS_EX[PCC]=0. |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |
| 54    | Reserved.  |
| 53    | SyndV. Reset: Cold,0. 1=This error logged information in MCA::EX::MCA_SYND_EX. If  |
|       | MCA::EX::MCA_SYND_EX[ErrorPriority] is the same as the priority of the error in  |
|       | MCA::EX::MCA_STATUS_EX, then the information in MCA::EX::MCA_SYND_EX is associated with the error in MCA::EX::MCA_STATUS_EX.   |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |
| 52:47 |  |
| 46    | <b>CECC</b> . Reset: Cold,0. 1=The error was a correctable ECC error according to the restrictions of the ECC algorithm. UC indicates whether the error was actually corrected by the processor.   |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |
| 45    | <b>UECC</b> . Reset: Cold,0. 1=The error was an uncorrectable ECC error according to the restrictions of the ECC algorithm. UC indicates whether the error was actually corrected by the processor.  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |
| 44    | <b>Deferred</b> . Reset: Cold,0. 1=A deferred error was created. A deferred error is the result of an uncorrectable data error which did not immediately cause a processor exception; an exception is deferred until the erroneous data is consumed.   |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |
| 43    | <b>Poison</b> . Reset: Cold,0. 1=The error was the result of attempting to consume poisoned data.  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |
| 42:38 | Reserved.  |
| 37:32 | associated with the error; Otherwise this field is reserved.   |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |
|       | Reserved.  |
| 21:16 | <b>ErrorCodeExt</b> . Reset: Cold,00h. Extended Error Code. This field is used to identify the error type for root cause analysis. This field indicates which bit position in MCA::EX::MCA_CTL_EX enables error reporting for the logged error.  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |
| 15:0  | <b>ErrorCode</b> . Reset: Cold,0000h. Error code for this error. See 3.1.3.3 [Error Codes] for details on decoding this field.   |

AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read, Write-0-only, Error-on-write-1.

| Error Type | Bits  | Description |
|------------|-------|-------------|

### Table 46: MCA\_STATUS\_EX[ErrorCodeExt] Decode

# MSR0000\_0416...MSRC000\_2052 [EX Machine Check Address Thread 0] (MCA::EX::MCA\_ADDR\_EX)

Read-only. Reset: Cold,0000\_0000\_0000.

MCA::EX::MCA\_ADDR\_EX stores an address and other information associated with the error in MCA::EX::MCA\_STATUS\_EX. The register is only meaningful if MCA::EX::MCA\_STATUS\_EX[Val]=1 and MCA::EX::MCA\_STATUS\_EX[AddrV]=1.

\_lthree[1:0]\_core[3:0]\_thread[1:0]\_inst5\_aliasMSRLEGACY; MSR0000\_0416

| _lthree[1 | _three[1:0]_core[3:0]_thread[1:0]_inst5_aliasMSR; MSRC000_2052  |  |  |
|-----------|---|--|--|
| Bits      | Description   |  |  |
| 63:62     | Reserved.   |  |  |
| 61:56     | LSB. Read-only. Reset: Cold,00h. Specifies the least significant valid bit of the address contained in                |  |  |
|           | MCA::EX::MCA_ADDR_EX[ErrorAddr]. A value of 0 indicates that MCA::EX::MCA_ADDR_EX[55:0]                               |  |  |
|           | contains a valid byte address. A value of 6 indicates that MCA::EX::MCA_ADDR_EX[55:6] contains a valid                |  |  |
|           | cache line address and that MCA::EX::MCA_ADDR_EX[5:0] are not part of the address and should be ignored               |  |  |
|           | by error handling software. A value of 12 indicates that MCA::EX::MCA_ADDR_EX[55:12] contain a valid 4KB              |  |  |
|           | memory page and that MCA::EX::MCA_ADDR_EX[11:0] should be ignored by error handling software.                         |  |  |
|           | <b>ErrorAddr</b> . Read-only. Reset: Cold,00_0000_0000_0000h. Contains the address, if any, associated with the error |  |  |
|           | logged in MCA::EX::MCA_STATUS_EX.   |  |  |

### Table 47: MCA\_ADDR\_EX Register

|       | :0]_core[3:0]_thread[1:0]_inst5_aliasMSR; MSRC000_2053   |  |  |
|       | Description  |  |  |
| 63    | Valid. Reset: 1. 1=A valid CntP field is present in this register.   |  |  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read-only.   |  |  |
| 62    | <b>CntP</b> . Reset: 1. 1=A valid threshold counter is present.  |  |  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read-only.   |  |  |
| 61    | <b>Locked</b> . Reset: 0. 1=Writes to this register are ignored. This bit is set by BIOS to indicate that this register is not available for OS use. BIOS should set this bit if ThresholdIntType is set to SMI. |  |  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read-only.   |  |  |
| 60    | <b>IntP</b> . Reset: 1. 1=ThresholdIntType can be used to generate interrupts. 0=ThresholdIntType and interrupt  |  |  |
| 00    | generation are not supported.  |  |  |
|       | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::EX::MCA_MISC0_EX[Locked]) ? Read-write : Read-only.  |  |  |
| 59:56 | Reserved.  |  |  |
|       | <b>LvtOffset</b> . Reset: 0h. One per die. For error thresholding interrupts, specifies the address of the LVT entry in the  |  |  |
| 5515  | APIC registers as follows: LVT address = (LvtOffset shifted left 4 bits) + 500h (see   |  |  |
|       | Core::X86::Apic::ExtendedInterruptLvtEntries).   |  |  |
|       | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::EX::MCA_MISC0_EX[Locked]) ? Read-write :   |  |  |
|       | Read-only.   |  |  |
| 51    | <b>CntEn</b> . Reset: 0. 1=Count thresholding errors.  |  |  |
|       | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::EX::MCA_MISC0_EX[Locked]) ? Read-write :   |  |  |
|       | Read-only.   |  |  |
| 50:49 | <b>ThresholdIntType</b> . Reset: Cold,0h. Specifies the type of interrupt signaled when Ovrflw is set and IntP==1. 00b   |  |  |
| 50115 | = No interrupt. 01b = APIC based interrupt (see Core::X86::Msr::McaIntrCfg[ThresholdLvtOffset]). 10b = SMI   |  |  |
|       | trigger event. 11b = Reserved.   |  |  |
|       | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::EX::MCA_MISC0_EX[Locked]) ? Read-write :   |  |  |
|       | Read-only.   |  |  |
| 48    | <b>Ovrflw</b> . Reset: Cold,0. Set by hardware when ErrCnt transitions from FFEh to FFFh. When this field is set,  |  |  |
| _     | ErrCnt no longer increments. When this bit is set, the interrupt selected by the ThresholdIntType field is   |  |  |
|       | generated.   |  |  |
|       | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::EX::MCA_MISC0_EX[Locked]) ? Read-write :   |  |  |
|       | Read-only.   |  |  |
| 47:44 | •<br>•   |  |  |
|       | <b>ErrCnt</b> . Reset: Cold,000h. This is written by software to set the starting value of the error counter. This is  |  |  |
|       | incremented by hardware when errors are logged. When this counter overflows, it stays at FFFh (no rollover). The   |  |  |
|       | threshold value, written by software, is (FFFh - the desired error count (the number of errors necessary in order  |  |  |
|       | for an interrupt to be taken)); the desired error count of 0 (a write value of FFFh) is not supported.   |  |  |
|       | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::EX::MCA_MISC0_EX[Locked]) ? Read-write :   |  |  |
|       | Read-only.   |  |  |

43:32 **HardwareID**. Read-only. Reset: 0B0h. The Hardware ID of the IP associated with this MCA bank.

31:0 **InstanceId**. Read-write. Reset: 0000\_0000h. The instance ID of this IP. This is initialized to a unique ID per instance of this register.

### MSRC000\_2056 [EX Machine Check Syndrome Thread 0] (MCA::EX::MCA\_SYND\_EX)

Read-write, Volatile. Reset: Cold, 0000\_0000\_0000h.

Logs physical location information associated with error in MCA::EX::MCA\_STATUS\_EX Thread 0 \_lthree[1:0]\_core[3:0]\_thread[1:0]\_inst5\_aliasMSR; MSRC000\_2056

|       | 7  |
|-------|--|
| Bits  | Description  |
| 63:33 | Reserved.  |
| 32    | <b>Syndrome</b> . Read-write, Volatile. Reset: Cold, 0. Contains the syndrome, if any, associated with the error logged in |
|       | MCA::EX::MCA_STATUS_EX. The low-order bit of the syndrome is stored in bit 0, and the syndrome has a                       |
|       | length specified by MCA::EX::MCA_SYND_EX[Length]. The Syndrome field is only valid when                                    |
|       | MCA::EX::MCA_SYND_EX[Length] is not 0.   |
| 31:27 | Reserved.  |
| 26:24 | <b>ErrorPriority</b> . Read-write, Volatile. Reset: Cold,0h. Encodes the priority of the error logged in                   |
|       | MCA::EX::MCA_SYND_EX. 3'b000 = No error; 3'b001 = Reserved; 3'b010 = Corrected Error; 3'b011 =                             |
|       | Deferred Error; 3'b100 = Uncorrected Error; 3'b101 = Fatal Error; all others reserved.                                     |
| 23:18 | Length. Read-write, Volatile. Reset: Cold, 00h. Specifies the length in bits of the syndrome contained in                  |
|       |  |

MCA::EX::MCA\_SYND\_EX[Syndrome]. A value of 0 indicates that there is no valid syndrome in

MCA::EX::MCA\_SYND\_EX. For example, a syndrome length of 9 means that

MCA::EX::MCA\_SYND\_EX[Syndrome] bits [8:0] contains a valid syndrome.

17:0 **ErrorInformation**. Read-write, Volatile. Reset: Cold, 0\_0000h. Contains error-specific information about the location of the error. Decoding is available in Table 48 [MCA\_SYND\_EX Register].

| Bits | Description  |
|------|--|
| 63   | <b>Val</b> . Reset: Cold,0. 1=A valid error has been detected. This bit should be cleared by software after the register has been read.  |
|      | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read, Write-0-only, Error-on-write-1.  |
| 62   | <b>Overflow</b> . Reset: Cold,0. 1=An error was detected while the valid bit (Val) was set; at least one error was not logged. Overflow is set independently of whether the existing error is overwritten. See 3.1.3 [Machine Check Errors].   |
|      | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |
| 61   | UC. Reset: Cold,0. 1=The error was not corrected by hardware.  |
|      | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |
| 60   | <b>En</b> . Reset: Cold,0. 1=MCA error reporting is enabled for this error, as indicated by the corresponding bit in MCA::FP::MCA_CTL_FP. This bit is a copy of bit in MCA::FP::MCA_CTL_FP for this error.   |
|      | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |
| 59   | <b>MiscV</b> . Reset: Cold,0. 1=Valid thresholding in MCA::FP::MCA_MISC0_FP.   |
|      | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |
| 58   | AddrV. Reset: Cold,0. 1=MCA::FP::MCA_ADDR_FP contains address information associated with the error.   |
|      | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |
| 57   | <b>PCC</b> . Reset: Cold,0. 1=Hardware context held by the processor may have been corrupted. Continued operation of the system may have unpredictable results. The error is not recoverable or survivable, and the system should be reinitialized.  |
|      | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |
| 56   | <b>ErrCoreIdVal</b> . Reset: Cold,0. 1=The ErrCoreId field is valid.   |
|      | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |
| 55   | <b>TCC</b> . Reset: Cold,0. 0=The thread which consumed the error can be restarted reliably at the instruction pointer address pushed onto the exception handler stack if any uncorrected error has been corrected by software. 1=The thread which consumed the error is not restartable and must be terminated. Only meaningful when MCA::FP::MCA_STATUS_FP[PCC]=0. |

|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |
|-------|--|
| 54    | Reserved.  |
| 53    | <b>SyndV</b> . Reset: Cold,0. 1=This error logged information in MCA::FP::MCA_SYND_FP. If MCA::FP::MCA_SYND_FP[ErrorPriority] is the same as the priority of the error in MCA::FP::MCA_STATUS_FP, then the information in MCA::FP::MCA_SYND_FP is associated with the error in MCA::FP::MCA_STATUS_FP. |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |
| 52:47 | Reserved.  |
| 46    | <b>CECC</b> . Reset: Cold,0. 1=The error was a correctable ECC error according to the restrictions of the ECC algorithm. UC indicates whether the error was actually corrected by the processor.   |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |
| 45    | <b>UECC</b> . Reset: Cold,0. 1=The error was an uncorrectable ECC error according to the restrictions of the ECC algorithm. UC indicates whether the error was actually corrected by the processor.  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |
| 44    | <b>Deferred</b> . Reset: Cold,0. 1=A deferred error was created. A deferred error is the result of an uncorrectable data error which did not immediately cause a processor exception; an exception is deferred until the erroneous data is consumed.   |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |
| 43    | <b>Poison</b> . Reset: Cold,0. 1=The error was the result of attempting to consume poisoned data.  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |
| 42:38 | Reserved.  |
| 37:32 | <b>ErrCoreId</b> . Reset: Cold,00h. When ErrCoreIdVal=1 this field indicates which core within the processor is associated with the error; Otherwise this field is reserved.   |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |
|       | Reserved.  |
| 21:16 | <b>ErrorCodeExt</b> . Reset: Cold,00h. Extended Error Code. This field is used to identify the error type for root cause analysis. This field indicates which bit position in MCA::FP::MCA_CTL_FP enables error reporting for the logged error.  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |
| 15:0  | <b>ErrorCode</b> . Reset: Cold,0000h. Error code for this error. See 3.1.3.3 [Error Codes] for details on decoding this field.   |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.  |

### Table 49: MCA\_STATUS\_FP[ErrorCodeExt] Decode

| Error Type | Bits  | Description |
|------------|-------|-------------|
| PRF        | [6:0] | 0x0         |
| FL         | [6:0] | 0x1         |

| Bits  | Description  |  |  |
| 63    | Valid. Reset: 1. 1=A valid CntP field is present in this register.   |  |  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read-only.   |  |  |
| 62    | <b>CntP</b> . Reset: 1. 1=A valid threshold counter is present.  |  |  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read-only.   |  |  |
| 61    | <b>Locked</b> . Reset: 0. 1=Writes to this register are ignored. This bit is set by BIOS to indicate that this register is not available for OS use. BIOS should set this bit if ThresholdIntType is set to SMI. |  |  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read-only.   |  |  |
| 60    | <b>IntP</b> . Reset: 1. 1=ThresholdIntType can be used to generate interrupts. 0=ThresholdIntType and interrupt  |  |  |
|       | generation are not supported.  |  |  |
|       | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::FP::MCA_MISC0_FP[Locked]) ? Read-write :   |  |  |
|       | Read-only.   |  |  |
| 59:56 | Reserved.  |  |  |
| 55:52 | LvtOffset. Reset: 0h. One per die. For error thresholding interrupts, specifies the address of the LVT entry in the  |  |  |
|       | APIC registers as follows: LVT address = (LvtOffset shifted left 4 bits) + 500h (see   |  |  |
|       | Core::X86::Apic::ExtendedInterruptLvtEntries).   |  |  |
|       | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::FP::MCA_MISC0_FP[Locked]) ? Read-write :   |  |  |
|       | Read-only.   |  |  |
| 51    | CntEn. Reset: 0. 1=Count thresholding errors.  |  |  |
|       | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::FP::MCA_MISC0_FP[Locked]) ? Read-write :   |  |  |
|       | Read-only.   |  |  |
| 50:49 |  |  |  |
|       | = No interrupt. 01b = APIC based interrupt (see Core::X86::Msr::McaIntrCfg[ThresholdLvtOffset]). 10b = SMI   |  |  |
|       | trigger event. 11b = Reserved.   |  |  |
|       | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::FP::MCA_MISC0_FP[Locked]) ? Read-write :   |  |  |

|       | Dead only   |
|-------|---|
|       | Read-only.  |
|       | <b>Ovrflw</b> . Reset: Cold,0. Set by hardware when ErrCnt transitions from FFEh to FFFh. When this field is set,         |
|       | ErrCnt no longer increments. When this bit is set, the interrupt selected by the ThresholdIntType field is                |
| H     | generated.  |
|       | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::FP::MCA_MISC0_FP[Locked]) ? Read-write :                          |
|       | Read-only.  |
| 47:44 | Reserved.   |
|       | ErrCnt. Reset: Cold,000h. This is written by software to set the starting value of the error counter. This is             |
|       | incremented by hardware when errors are logged. When this counter overflows, it stays at FFFh (no rollover). The          |
|       | threshold value, written by software, is (FFFh - the desired error count (the number of errors necessary in order         |
|       | for an interrupt to be taken)); the desired error count of 0 (a write value of FFFh) is not supported.                    |
|       | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::FP::MCA_MISC0_FP[Locked]) ? Read-write :                          |
|       | Read-only.  |
| 31:24 | BlkPtr. Read-write. Reset: 01h. 00h=Extended MISC MSR block is not valid. 01h=Extended MSR block is valid                 |

# Bits Description

63:48 **McaType**. Read-only. Reset: 0006h. The McaType of the MCA bank within this IP.

| 47:44  | Reserved.  |
|--------|--|
| 43:32  | HardwareID. Read-only. Reset: 0B0h. The Hardware ID of the IP associated with this MCA bank.   |
| 31:0   | <b>InstanceId</b> . Read-write. Reset: 0000_0000h. The instance ID of this IP. This is initialized to a unique ID per instance of this register. |
| MSRO   | C000_2066 [FP Machine Check Syndrome Thread 0] (MCA::FP::MCA_SYND_FP)  |
| Read-  | write,Volatile. Reset: Cold,0000_0000_0000_0000h.  |
| Logs p | hysical location information associated with error in MCA::FP::MCA_STATUS_FP Thread 0  |
|        | :0]_core[3:0]_thread[1:0]_inst6_aliasMSR; MSRC000_2066   |
| Bits   | Description  |
| 63:33  | Reserved.  |
| 32     | <b>Syndrome</b> . Read-write, Volatile. Reset: Cold,0. Contains the syndrome, if any, associated with the error logged in                        |
|        | MCA::FP::MCA_STATUS_FP. The low-order bit of the syndrome is stored in bit 0, and the syndrome has a   |
|        | length specified by MCA::FP::MCA_SYND_FP[Length]. The Syndrome field is only valid when  |
|        | MCA::FP::MCA_SYND_FP[Length] is not 0.   |
| 31:27  | Reserved.  |
| 26:24  | ErrorPriority. Read-write, Volatile. Reset: Cold, 0h. Encodes the priority of the error logged in  |
|        | MCA::FP::MCA_SYND_FP. 3'b000 = No error; 3'b001 = Reserved; 3'b010 = Corrected Error; 3'b011 = Deferred  |
|        | Error; 3'b100 = Uncorrected Error; 3'b101 = Fatal Error; all others reserved.  |
| 23:18  | Length. Read-write, Volatile. Reset: Cold, 00h. Specifies the length in bits of the syndrome contained in  |
|        | MCA::FP::MCA_SYND_FP[Syndrome]. A value of 0 indicates that there is no valid syndrome in  |
|        | MCA::FP::MCA_SYND_FP. For example, a syndrome length of 9 means that   |
|        | MCA::FP::MCA_SYND_FP[Syndrome] bits [8:0] contains a valid syndrome.   |
| 17:0   | <b>ErrorInformation</b> . Read-write, Volatile. Reset: Cold, 0_000h. Contains error-specific information about the                               |
|        | location of the error. Decoding is available in Table 51 [MCA_SYND_FP Register].   |

| Bits     | Description   |
| 63       | Valid. Reset: 1. 1=A valid CntP field is present in this register.  |
|          | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read-only.  |
| 62       | <b>CntP</b> . Reset: 1. 1=A valid threshold counter is present.   |
|          | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read-only.  |
| 61       | Locked. Reset: 0. 1=Writes to this register are ignored. This bit is set by BIOS to indicate that this register is not      |
|          | available for OS use. BIOS should set this bit if ThresholdIntType is set to SMI.   |
|          | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read-only.  |
| 60       | <b>IntP</b> . Reset: 1. 1=ThresholdIntType can be used to generate interrupts. 0=ThresholdIntType and interrupt             |
|          | generation are not supported.   |
|          | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::L3::MCA_MISC0_L3[Locked]) ? Read-write :                            |
|          | Read-only.  |
| 59:56    | Reserved.   |
| 55:52    | <b>LvtOffset</b> . Reset: 0h. One per die. For error thresholding interrupts, specifies the address of the LVT entry in the |
|          | APIC registers as follows: LVT address = (LvtOffset shifted left 4 bits) + 500h (see  |
|          | Core::X86::Apic::ExtendedInterruptLvtEntries).  |
|          | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::L3::MCA_MISC0_L3[Locked]) ? Read-write :                            |
|          | Access type. (CoreAoowisttiw CR[wicstatus wiEii]   :wiCAESwiCA_wiiSCo_ES[E0CRed]) : Read-wiite .                            |

|       | Read-only.   |
|-------|--|
| 51    | CntEn. Reset: 0. 1=Count thresholding errors.  |
|       | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::L3::MCA_MISC0_L3[Locked]) ? Read-write :                       |
|       | Read-only.   |
| 50:49 | <b>ThresholdIntType</b> . Reset: Cold,0h. Specifies the type of interrupt signaled when Ovrflw is set and IntP==1. 00b |
|       | = No interrupt. 01b = APIC based interrupt (see Core::X86::Msr::McaIntrCfg[ThresholdLvtOffset]). 10b = SMI             |
|       | trigger event. 11b = Reserved.   |
|       | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::L3::MCA_MISC0_L3[Locked]) ? Read-write :                       |
|       | Read-only.   |
| 48    | <b>Ovrflw</b> . Reset: Cold,0. Set by hardware when ErrCnt transitions from FFEh to FFFh. When this field is set,      |
|       | ErrCnt no longer increments. When this bit is set, the interrupt selected by the ThresholdIntType field is             |
|       | generated.   |
|       | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::L3::MCA_MISC0_L3[Locked]) ? Read-write :                       |
|       | Read-only.   |
| 47:44 | Reserved.  |
| 43:32 | <b>ErrCnt</b> . Reset: Cold,000h. This is written by software to set the starting value of the error counter. This is  |
|       | incremented by hardware when errors are logged. When this counter overflows, it stays at FFFh (no rollover). The       |
|       | threshold value, written by software, is (FFFh - the desired error count (the number of errors necessary in order      |
|       | for an interrupt to be taken)); the desired error count of 0 (a write value of FFFh) is not supported.                 |
|       | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::L3::MCA_MISC0_L3[Locked]) ? Read-write :                       |
|       | Read-only.   |
| 31:24 | BlkPtr. Read-write. Reset: 01h. 00h=Extended MISC MSR block is not valid. 01h=Extended MSR block is valid.             |
| 23:0  | Reserved.  |

 Bits
 Description

 63:49
 Reserved.

 48:32
 Syndrome. Read-write, Volatile. Reset: Cold,0\_0000h. Contains the syndrome, if any, associated with the error logged in MCA::L3::MCA\_STATUS\_L3. The low-order bit of the syndrome is stored in bit 0, and the syndrome has a length specified by MCA::L3::MCA\_SYND\_L3[Length]. The Syndrome field is only valid when MCA::L3::MCA\_SYND\_L3[Length] is not 0.

31:27 Reserved.

26:24 **ErrorPriority**. Read-write, Volatile. Reset: Cold,0h. Encodes the priority of the error logged in MCA::L3::MCA\_SYND\_L3. 3'b000 = No error; 3'b001 = Reserved; 3'b010 = Corrected Error; 3'b101 = Deferred Error; 3'b100 = Uncorrected Error; 3'b101 = Fatal Error; all others reserved.

| 23:18 | Length. Read-write, Volatile. Reset: Cold, 00h. Specifies the length in bits of the syndrome contained in          |
|-------|--|
|       | MCA::L3::MCA_SYND_L3[Syndrome]. A value of 0 indicates that there is no valid syndrome in                          |
|       | MCA::L3::MCA_SYND_L3. For example, a syndrome length of 9 means that   |
|       | MCA::L3::MCA_SYND_L3[Syndrome] bits [8:0] contains a valid syndrome.   |
| 17:0  | <b>ErrorInformation</b> . Read-write, Volatile. Reset: Cold, 0_000h. Contains error-specific information about the |
|       | location of the error. Decoding is available in Table 54 [MCA_SYND_L3 Register].                                   |

#### MSR0000\_0452...MSRC000\_2152 [CS Machine Check Address] (MCA::CS::MCA\_ADDR\_CS)

Read-write, Volatile. Reset: Cold, 0000\_0000\_0000h.

MCA::CS::MCA\_ADDR\_CS stores an address and other information associated with the error in MCA::CS::MCA\_STATUS\_CS. The register is only meaningful if MCA::CS::MCA\_STATUS\_CS[Val]=1 and MCA::CS::MCA\_STATUS\_CS[AddrV]=1.

|   | Bits  | Description   |
|---|-------|---|
| ſ | 63:62 | Reserved.   |
| ſ | 61:56 | <b>LSB</b> . Read-write, Volatile. Reset: Cold,00h. Specifies the least significant valid bit of the address contained in |
| I |       | MCA.CS.MCA ADDR CS[ErrorAddr] A value of 0 indicates that MCA.CS.MCA ADDR CS[55:0]  |

MCA::CS::MCA\_ADDR\_CS[ErrorAddr]. A value of 0 indicates that MCA::CS::MCA\_ADDR\_CS[55:0] contains a valid byte address. A value of 6 indicates that MCA::CS::MCA\_ADDR\_CS[55:6] contains a valid cache line address and that MCA::CS::MCA\_ADDR\_CS[5:0] are not part of the address and should be ignored by error handling software. A value of 12 indicates that MCA::CS::MCA\_ADDR\_CS[55:12] contain a valid 4KB memory page and that MCA::CS::MCA\_ADDR\_CS[11:0] should be ignored by error handling software.

55:0 **ErrorAddr**. Read-write, Volatile. Reset: Cold,00\_0000\_0000\_0000h. Unless otherwise specified by an error, contains the address associated with the error logged in MCA::CS::MCA\_STATUS\_CS. For physical addresses, the most significant bit is given by Core::X86::Cpuid::LongModeInfo[PhysAddrSize].

| Bits  | Description  |  |
| 63  | <b>Valid</b> . Reset: 1. 1=A valid CntP field is present in this register.   |  |
|   | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read-only.   |  |
| 62  | 62 <b>CntP</b> . Reset: 1. 1=A valid threshold counter is present.   |  |
|   | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read-only.   |  |
| 61  | <b>Locked</b> . Reset: 0. 1=Writes to this register are ignored. This bit is set by BIOS to indicate that this register is not available for OS use. BIOS should set this bit if ThresholdIntType is set to SMI. |  |

|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read-only.  |
|-------|---|
| 60    | <b>IntP</b> . Reset: 1. 1=ThresholdIntType can be used to generate interrupts. 0=ThresholdIntType and interrupt       |
| 00    | generation are not supported.   |
|       | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::CS::MCA_MISC0_CS[Locked]) ? Read-write :                      |
|       | Read-only.  |
| 59:56 | Reserved.   |
| 55:52 | LvtOffset. Reset: 0h. One per die. For error thresholding interrupts, specifies the address of the LVT entry in the   |
|       | APIC registers as follows: LVT address = (LvtOffset shifted left 4 bits) + 500h (see                                  |
|       | Core::X86::Apic::ExtendedInterruptLvtEntries).  |
|       | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::CS::MCA_MISC0_CS[Locked]) ? Read-write :                      |
|       | Read-only.  |
| 51    | CntEn. Reset: 0. 1=Count thresholding errors.   |
|       | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::CS::MCA_MISC0_CS[Locked]) ? Read-write :                      |
|       | Read-only.  |
| 50:49 |   |
|       | = No interrupt. 01b = APIC based interrupt (see Core::X86::Msr::McaIntrCfg[ThresholdLvtOffset]). 10b = SMI            |
|       | trigger event. 11b = Reserved.  |
|       | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::CS::MCA_MISC0_CS[Locked]) ? Read-write : Read-only.           |
| 48    | <b>Ovrflw</b> . Reset: Cold,0. Set by hardware when ErrCnt transitions from FFEh to FFFh. When this field is set,     |
| 40    | ErrCnt no longer increments. When this bit is set, the interrupt selected by the ThresholdIntType field is            |
|       | generated.  |
|       | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::CS::MCA_MISC0_CS[Locked]) ? Read-write :                      |
|       | Read-only.  |
| 47:44 | Reserved.   |
| 43:32 | <b>ErrCnt</b> . Reset: Cold,000h. This is written by software to set the starting value of the error counter. This is |
|       | incremented by hardware when errors are logged. When this counter overflows, it stays at FFFh (no rollover). The      |
|       | threshold value, written by software, is (FFFh - the desired error count (the number of errors necessary in order     |
|       | for an interrupt to be taken)); the desired error count of 0 (a write value of FFFh) is not supported.                |
|       | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::CS::MCA_MISC0_CS[Locked]) ? Read-write :                      |
|       | Read-only.  |
|       | BlkPtr. Read-write. Reset: 01h. 00h=Extended MISC MSR block is not valid. 01h=Extended MSR block is valid.            |
| 23:0  | Reserved.   |
|       |   |

# MSRC000\_21[4...5]4 [CS Machine Check Configuration] (MCA::CS::MCA\_CONFIG\_CS)

| Reset:   | Reset: 0000_0000_0025h.   |  |  |  |
|----------|---|--|--|--|
| Contro   | Controls configuration of the associated machine check bank.  |  |  |  |
| _instCS0 | )_aliasMSR; MSRC000_2144  |  |  |  |
| _instCS1 | _aliasMSR; MSRC000_2154   |  |  |  |
| Bits     | Description   |  |  |  |
| 63:39    | Reserved.   |  |  |  |
| 38:37    | <b>DeferredIntType</b> . Read-write. Reset: 0h. Specifies the type of interrupt signaled when a deferred error is logged. |  |  |  |
|          | 00b = No interrupt. 01b = APIC based interrupt (see Core::X86::Msr::McaIntrCfg[DeferredLvtOffset]). 10b =                 |  |  |  |
|          | SMI trigger event. 11b = Reserved.  |  |  |  |
| 36:35    | Reserved.   |  |  |  |
| 34       | LogDeferredInMcaStat. Read-write. Reset: 0. Init: BIOS, 1. 1=Log deferred errors in                                       |  |  |  |
|          | MCA::CS::MCA_STATUS_CS and MCA::CS::MCA_ADDR_CS in addition to MCA::CS::MCA_DESTAT_CS                                     |  |  |  |
|          | and MCA::CS::MCA_DEADDR_CS. 0=Only log deferred errors in MCA::CS::MCA_DESTAT_CS and                                      |  |  |  |
|          | MCA::CS::MCA_DEADDR_CS. This bit does not affect logging of deferred errors in  |  |  |  |
|          | MCA::CS::MCA_SYND_CS, MCA::CS::MCA_MISC0_CS.  |  |  |  |
| 33       | Reserved.   |  |  |  |
|          |   |  |  |  |

32 **McaXEnable**. Read-write. Reset: 0. Init: BIOS,1. Check: 1. 1=Software has acknowledged support for the MCAX feature set. 0=Software has not acknowledged support for the MCAX feature set. All uncorrected and fatal errors will cause an ErrorEvent packet to be generated. Deferred error interrupts are configured via Core::X86::Msr::McaIntrCfg.

# 31:6 Reserved.

5 **DeferredIntTypeSupported**. Read-only. Reset: 1. 1=MCA::CS::MCA\_CONFIG\_CS[DeferredIntType] controls the type of interrupt generated on a deferred error. Deferred errors are supported in this bank only if MCA::CS::MCA\_CONFIG\_CS[DeferredErrorLoggingSupported]=1.

4:3 Reserved.

| 2 | <b>DeferredErrorLoggingSupported</b> . Read-only. Reset: 1. 1=Deferred errors are supported in this MCA bank, and |  |  |
|---|---|--|--|
|   | MCA::CS::MCA_CONFIG_CS[LogDeferredInMcaStat] controls the logging behavior of these errors.                       |  |  |
|   | MCA::CS::MCA_DESTAT_CS and MCA::CS::MCA_DEADDR_CS are supported in this MCA bank.                                 |  |  |
|   | 0=Deferred errors are not supported in this bank.   |  |  |
| 1 | Reserved.   |  |  |
| 0 | <b>McaX</b> . Read-only. Reset: 1. 1=This bank provides Machine Check Architecture Extensions. Up to 4 additional |  |  |
|   | MISC registers (MISC1-MISC4) are supported. MCA::CS::MCA_MISC0_CS[BlkPtr] indicates the presence of               |  |  |
|   | the additional MISC registers, but is not used to determine their MSR numbers. Deferred error interrupt type is   |  |  |

# MSRC000\_21[4...5]5 [CS IP Identification] (MCA::CS::MCA\_IPID\_CS)

specifiable by MCA bank. MCA::CS::MCA\_STATUS\_CS[TCC] is present.

Reset: 0000\_002E\_0000\_0000h.

The MCA::CS::MCA\_IPID\_CS register is used by software to determine what IP type and revision is associated with the MCA bank.

\_instCS0\_aliasMSR; MSRC000\_2145

\_instCS1\_aliasMSR; MSRC000\_2155

| Bits  | Description   |  |  |
|-------|---|--|--|
| 63:48 | McaType. Read-only. Reset: 0000h. The McaType of the MCA bank within this IP.   |  |  |
| 47:44 | Reserved.   |  |  |
| 43:32 | HardwareID. Read-only. Reset: 02Eh. The Hardware ID of the IP associated with this MCA bank.                          |  |  |
| 31:0  | <b>InstanceId</b> . Read-write. Reset: 0000_0000h. The instance ID of this IP. This is initialized to a unique ID per |  |  |
|       | instance of this register.  |  |  |

# MSRC000\_21[4...5]6 [CS Machine Check Syndrome] (MCA::CS::MCA\_SYND\_CS)

Read-write, Volatile. Reset: Cold, 0000\_0000\_0000h.

Logs physical location information associated with error in MCA::CS::MCA\_STATUS\_CS Thread 0

\_instCS0\_aliasMSR; MSRC000\_2146 \_instCS1\_aliasMSR; MSRC000\_2156

\_instCS1\_allasMSR; MSRC000\_2

| Bits  | Description   |  |
|-------|---|--|
| 63:48 | Reserved.   |  |
| 47:32 | <b>Syndrome</b> . Read-write, Volatile. Reset: Cold,0000h. Contains the syndrome, if any, associated with the error |  |
|       | logged in MCA::CS::MCA_STATUS_CS. The low-order bit of the syndrome is stored in bit 0, and the syndrome            |  |
|       | has a length specified by MCA::CS::MCA_SYND_CS[Length]. The Syndrome field is only valid when                       |  |
|       | MCA::CS::MCA_SYND_CS[Length] is not 0.  |  |
| 31:27 | Reserved.   |  |
| 26:24 | ErrorPriority. Read-write, Volatile. Reset: Cold, 0h. Encodes the priority of the error logged in                   |  |
|       | MCA::CS::MCA_SYND_CS. 3'b000 = No error; 3'b001 = Reserved; 3'b010 = Corrected Error; 3'b011 =                      |  |
|       | Deferred Error; 3'b100 = Uncorrected Error; 3'b101 = Fatal Error; all others reserved.                              |  |
| 23:18 | Length. Read-write, Volatile. Reset: Cold, 00h. Specifies the length in bits of the syndrome contained in           |  |
|       | MCA::CS::MCA_SYND_CS[Syndrome]. A value of 0 indicates that there is no valid syndrome in                           |  |
|       | MCA::CS::MCA_SYND_CS. For example, a syndrome length of 9 means that  |  |
|       | MCA::CS::MCA_SYND_CS[Syndrome] bits [8:0] contains a valid syndrome.  |  |
| 17:0  | <b>ErrorInformation</b> . Read-write, Volatile. Reset: Cold, 0_0000h. Contains error-specific information about the |  |

### location of the error. Decoding is available in Table 57 [MCA\_SYND\_CS Register].

| Error Type      | Bits   | Description |
|-----------------|--------|-------------|
| FTI_ILL_REQ     | [8:0]  |             |
| FTI_ADDR_VIOL   | [8:0]  |             |
| FTI_SEC_VIOL    | [8:0]  |             |
| FTI_ILL_RSP     | [2:0]  |             |
| FTI_RSP_NO_MTCH | [2:0]  |             |
| FTI_PAR_ERR     | [7:0]  |             |
| SDP_PAR_ERR     | [7:0]  |             |
| ATM_PAR_ERR     | [7:0]  |             |
| SPF_ECC_ERR     | [17:0] |             |

# Table 57: MCA\_SYND\_CS Register

### MSRC000\_21[4...5]8 [CS Machine Check Deferred Error Status] (MCA::CS::MCA\_DESTAT\_CS)

Read-write, Volatile. Reset: Cold, 0000\_0000\_0000h.

Holds status information for the first deferred error seen in this bank.

\_instCS0\_aliasMSR; MSRC000\_2148

|          | <u>_aliasivisk</u> , iviskC000_2140  |  |  |
|----------|--|--|--|
| _instCS1 | S1_aliasMSR; MSRC000_2158  |  |  |
| Bits     | Description  |  |  |
| 63       | <b>Val</b> . Read-write, Volatile. Reset: Cold, 0. 1=A valid error has been detected (whether it is enabled or not).         |  |  |
| 62       | <b>Overflow</b> . Read-write, Volatile. Reset: Cold,0. 1=An error was detected while the valid bit (Val) was set; at least   |  |  |
|          | one error was not logged. Overflow is set independently of whether the existing error is overwritten. (See the               |  |  |
|          | section on overwrite priorities.)  |  |  |
| 61:59    | 9 Reserved.  |  |  |
| 58       | AddrV. Read-write, Volatile. Reset: Cold, 0. 1=MCA::CS::MCA_DEADDR_CS contains address information                           |  |  |
|          | associated with the error.   |  |  |
| 57:54    | 4 Reserved.  |  |  |
| 53       | SyndV. Read-write, Volatile. Reset: Cold, 0. 1=This error logged information in MCA::CS::MCA_SYND_CS. If                     |  |  |
|          | MCA::CS::MCA_SYND_CS[ErrorPriority] is the same as the priority of the error in  |  |  |
|          | MCA::CS::MCA_STATUS_CS, then the information in MCA::CS::MCA_SYND_CS is associated with the error                            |  |  |
|          | in MCA::CS::MCA_DESTAT_CS.   |  |  |
| 52:45    | 5 Reserved.  |  |  |
| 44       | <b>Deferred</b> . Read-write, Volatile. Reset: Cold, 0. 1=A deferred error was created. A deferred error is the result of an |  |  |
|          | uncorrectable data error which did not immediately cause a processor exception; poison is created and an                     |  |  |
|          | exception is deferred until the poison data is consumed.   |  |  |
| 43:0     | Reserved.  |  |  |

# MSRC000\_21[4...5]9 [CS Deferred Error Address] (MCA::CS::MCA\_DEADDR\_CS)

Read-write, Volatile. Reset: Cold, 0000\_0000\_0000.

| Τ  | The MCA::CS::MCA_DEADDR_CS register stores the address associated with the error in          |  |  |
|----|--|--|--|
| N  | MCA::CS::MCA_DESTAT_CS. The register is only meaningful if MCA::CS::MCA_DESTAT_CS[Val]=1 and |  |  |
| N  | 1CA:   | :CS::MCA_DESTAT_CS[AddrV]=1. The lowest valid bit of the address is defined by   |  |
| N  | ICA:   | :CS::MCA_DEADDR_CS[LSB].   |  |
| _i | nstCS0   | )_aliasMSR; MSRC000_2149   |  |
| _i | _instCS1_aliasMSR; MSRC000_2159  |  |  |
| ł  | Bits   | Description  |  |
| 6  | 3:62   | Reserved.  |  |
| 6  | 1:56   | 56 <b>LSB</b> . Read-write, Volatile. Reset: Cold,00h. Specifies the least significant valid bit of the address contained in |  |
|    |  | MCA::CS::MCA_DEADDR_CS[ErrorAddr]. A value of 0 indicates that MCA::CS::MCA_DEADDR_CS[55:0]                                  |  |
|    |  | contains a valid byte address. A value of 6 indicates that MCA::CS::MCA_DEADDR_CS[55:6] contains a valid                     |  |

cache line address and that MCA::CS::MCA\_DEADDR\_CS[5:0] are not part of the address and should be ignored by error handling software. A value of 12 indicates that MCA::CS::MCA\_DEADDR\_CS[55:12] contain a valid 4KB memory page and that MCA::CS::MCA\_DEADDR\_CS[11:0] should be ignored by error handling software.

55:0 **ErrorAddr**. Read-write, Volatile. Reset: Cold,00\_0000\_0000\_0000h. Contains the address, if any, associated with the error logged in MCA::CS::MCA\_DESTAT\_CS. The lowest-order valid bit of the address is specified in MCA::CS::MCA\_DEADDR\_CS[LSB].

### MSRC001\_041[4...5] [CS Machine Check Control Mask] (MCA::CS::MCA\_CTL\_MASK\_CS)

Read-write. Reset: 0000\_0000\_0000\_0000h.

Inhibit detection of an error source.

| minore detection of an error source. |
|--------------------------------------|
| _instCS0_aliasMSR; MSRC001_0414      |
| _instCS1_aliasMSR; MSRC001_0415      |

| Bits | Description   |  |  |
|------|---|--|--|
| 63:9 | Reserved.   |  |  |
| 8    | <b>SPF_ECC_ERR</b> . Read-write. Reset: 0. Probe Filter ECC Error: An ECC error occurred on a probe filter access.      |  |  |
| 7    | ATM_PAR_ERR. Read-write. Reset: 0. Atomic Request Parity Error: Parity error on read of an atomic                       |  |  |
|      | transaction.  |  |  |
| 6    | <b>SDP_PAR_ERR</b> . Read-write. Reset: 0. Read Response Parity Error: Parity error on incoming read response data.     |  |  |
| 5    | <b>FTI_PAR_ERR</b> . Read-write. Reset: 0. Request or Probe Parity Error: Parity error on incoming request or probe     |  |  |
|      | response data.  |  |  |
| 4    | <b>FTI_RSP_NO_MTCH</b> . Read-write. Reset: 0. Unexpected Response: A response was received from the transport          |  |  |
|      | layer which does not match any request.   |  |  |
| 3    | <b>FTI_ILL_RSP</b> . Read-write. Reset: 0. Illegal Response: An illegal response was received from the transport layer. |  |  |
| 2    | FTI_SEC_VIOL. Read-write. Reset: 0. Security Violation: A security violation was received from the transport            |  |  |
|      | layer.  |  |  |
| 1    | FTI_ADDR_VIOL. Read-write. Reset: 0. Address Violation: An address violation was received from the                      |  |  |
|      | transport layer.  |  |  |
| 0    | <b>FTI_ILL_REQ</b> . Read-write. Reset: 0. Illegal Request: An illegal request was received from the transport layer.   |  |  |

# 3.2.5.9 PIE

### MSR0000\_0458...MSRC000\_2160 [PIE Machine Check Control] (MCA::PIE::MCA\_CTL\_PIE)

Read-write. Reset: 0000\_0000\_0000\_0000h.

0=Disables error reporting for the corresponding error. 1=Enables error reporting via machine check exception for the corresponding error. The MCA::PIE::MCA\_CTL\_PIE register must be enabled by the corresponding enable bit in Core::X86::Msr::MCG\_CTL. Does not affect error detection, correction, or logging.

\_instPIE\_aliasMSRLEGACY; MSR0000\_0458

| 60                              | <b>En</b> . Reset: Cold,0. 1=MCA error reporting is enabled for this error, as indicated by the corresponding bit in  |  |  |  |
|                                 | MCA::PIE::MCA_CTL_PIE. This bit is a copy of bit in MCA::PIE::MCA_CTL_PIE for this error.   |  |  |  |
|                                 | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.   |  |  |  |
| 59                              | MiscV. Reset: Cold,0. 1=Valid thresholding in MCA::PIE::MCA_MISC0_PIE.  |  |  |  |
|                                 | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.   |  |  |  |
| 58                              | AddrV. Reset: Cold,0. 1=MCA::PIE::MCA_ADDR_PIE contains address information associated with the error.  |  |  |  |
|                                 | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.   |  |  |  |
| 57                              | <b>PCC</b> . Reset: Cold,0. 1=Hardware context held by the processor may have been corrupted. Continued operation of  |  |  |  |
|                                 | the system may have unpredictable results. The error is not recoverable or survivable, and the system should be   |  |  |  |
|                                 | reinitialized.  |  |  |  |
|                                 | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.   |  |  |  |
| 56                              | ErrCoreIdVal. Reset: Cold,0. 1=The ErrCoreId field is valid.  |  |  |  |
|                                 | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.   |  |  |  |
|                                 | <b>TCC</b> . Reset: Cold,0. 0=The thread which consumed the error can be restarted reliably at the instruction pointer  |  |  |  |
|                                 | address pushed onto the exception handler stack if any uncorrected error has been corrected by software. 1=The  |  |  |  |
|                                 | thread which consumed the error is not restartable and must be terminated. Only meaningful when   |  |  |  |
|                                 | MCA::PIE::MCA_STATUS_PIE[PCC]=0.  |  |  |  |
|                                 | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.   |  |  |  |
|                                 |   |  |  |  |
|                                 | SyndV. Reset: Cold,0. 1=This error logged information in MCA::PIE::MCA_SYND_PIE. If   |  |  |  |
|                                 | MCA::PIE::MCA_SYND_PIE[ErrorPriority] is the same as the priority of the error in   |  |  |  |
|                                 | MCA::PIE::MCA_STATUS_PIE, then the information in MCA::PIE::MCA_SYND_PIE is associated with the   |  |  |  |
|                                 | error in MCA::PIE::MCA_STATUS_PIE.<br>AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.   |  |  |  |
|                                 | Reserved.   |  |  |  |
|                                 | <b>CECC</b> . Reset: Cold,0. 1=The error was a correctable ECC error according to the restrictions of the ECC   |  |  |  |
|                                 | algorithm. UC indicates whether the error was actually corrected by the processor.  |  |  |  |
|                                 | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.   |  |  |  |
|                                 | <b>UECC.</b> Reset: Cold,0. 1=The error was an uncorrectable ECC error according to the restrictions of the ECC   |  |  |  |
|                                 | algorithm. UC indicates whether the error was actually corrected by the processor.  |  |  |  |
| -                               | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.   |  |  |  |
|                                 | <b>Deferred</b> . Reset: Cold,0. 1=A deferred error was created. A deferred error is the result of an uncorrectable data  |  |  |  |
|                                 | error which did not immediately cause a processor exception; an exception is deferred until the erroneous data is   |  |  |  |
|                                 | consumed.   |  |  |  |
|                                 | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.   |  |  |  |
|                                 | <b>Poison</b> . Reset: Cold,0. 1=The error was the result of attempting to consume poisoned data.   |  |  |  |
|                                 | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.   |  |  |  |
|                                 | Reserved.   |  |  |  |

| 37:32 | <b>ErrCoreId</b> . Reset: Cold,00h. When ErrCoreIdVal=1 this field indicates which core within the processor is          |  |  |  |
|-------|--|--|--|--|
|       | associated with the error; Otherwise this field is reserved.   |  |  |  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                        |  |  |  |
| 31:22 | Reserved.  |  |  |  |
| 21:16 | <b>ErrorCodeExt</b> . Reset: Cold,00h. Extended Error Code. This field is used to identify the error type for root cause |  |  |  |
|       | analysis. This field indicates which bit position in MCA::PIE::MCA_CTL_PIE enables error reporting for the               |  |  |  |
|       | logged error.  |  |  |  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                        |  |  |  |
| 15:0  | <b>ErrorCode</b> . Reset: Cold,0000h. Error code for this error. See 3.1.3.3 [Error Codes] for details on decoding this  |  |  |  |
|       | field.   |  |  |  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                        |  |  |  |

### *Table 58: MCA\_STATUS\_PIE[ErrorCodeExt] Decode*

| Error Type   | Bits  | Description |
|--------------|-------|-------------|
| HW_ASSERT    | [6:0] | 0x0         |
| CSW          | [6:0] | 0x1         |
| GMI          | [6:0] | 0x2         |
| FTI_DAT_STAT | [6:0] | 0x3         |

### MSR0000\_045A...MSRC000\_2162 [PIE Machine Check Address] (MCA::PIE::MCA\_ADDR\_PIE)

Read-only. Reset: Cold,0000\_0000\_0000\_0000h.

MCA::PIE::MCA\_ADDR\_PIE stores an address and other information associated with the error in MCA::PIE::MCA\_STATUS\_PIE. The register is only meaningful if MCA::PIE::MCA\_STATUS\_PIE[Val]=1 and MCA::PIE::MCA\_STATUS\_PIE[AddrV]=1.

### Bits Description

63 **Valid**. Reset: 1. 1=A valid CntP field is present in this register.

|          | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read-only.   |  |  |  |
|----------|--|--|--|--|
| 62       | CntP. Reset: 1. 1=A valid threshold counter is present.  |  |  |  |
|          | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read-only.   |  |  |  |
| 61       | <b>Locked</b> . Reset: 0. 1=Writes to this register are ignored. This bit is set by BIOS to indicate that this register is not |  |  |  |
|          | available for OS use. BIOS should set this bit if ThresholdIntType is set to SMI.  |  |  |  |
|          | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read-only.   |  |  |  |
| 60       | IntP. Reset: 1. 1=ThresholdIntType can be used to generate interrupts. 0=ThresholdIntType and interrupt                        |  |  |  |
|          | generation are not supported.  |  |  |  |
|          | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::PIE::MCA_MISC0_PIE[Locked]) ? Read-                                    |  |  |  |
|          | write : Read-only.   |  |  |  |
| 59:56    | Reserved.  |  |  |  |
| 55:52    | LvtOffset. Reset: 0h. One per die. For error thresholding interrupts, specifies the address of the LVT entry in the            |  |  |  |
|          | APIC registers as follows: LVT address = (LvtOffset shifted left 4 bits) + 500h (see   |  |  |  |
|          | Core::X86::Apic::ExtendedInterruptLvtEntries).   |  |  |  |
|          | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::PIE::MCA_MISC0_PIE[Locked]) ? Read-                                    |  |  |  |
|          | write : Read-only.   |  |  |  |
| 51       | CntEn. Reset: 0. 1=Count thresholding errors.  |  |  |  |
|          | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::PIE::MCA_MISC0_PIE[Locked]) ? Read-                                    |  |  |  |
|          | write : Read-only.   |  |  |  |
| 50:49    | <b>ThresholdIntType</b> . Reset: Cold,0h. Specifies the type of interrupt signaled when Ovrflw is set and IntP==1. 00b         |  |  |  |
|          | = No interrupt. 01b = APIC based interrupt (see Core::X86::Msr::McaIntrCfg[ThresholdLvtOffset]). 10b = SMI                     |  |  |  |
|          | trigger event. 11b = Reserved.   |  |  |  |
|          | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::PIE::MCA_MISC0_PIE[Locked]) ? Read-                                    |  |  |  |
|          | write : Read-only.   |  |  |  |
| 48       | <b>Ovrflw</b> . Reset: Cold,0. Set by hardware when ErrCnt transitions from FFEh to FFFh. When this field is set,              |  |  |  |
| -        | ErrCnt no longer increments. When this bit is set, the interrupt selected by the ThresholdIntType field is                     |  |  |  |
|          | generated.   |  |  |  |
|          | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::PIE::MCA_MISC0_PIE[Locked]) ? Read-                                    |  |  |  |
|          | write : Read-only.   |  |  |  |
| 47:44    | Reserved.  |  |  |  |
| 43:32    | <b>ErrCnt</b> . Reset: Cold,000h. This is written by software to set the starting value of the error counter. This is          |  |  |  |
|          | incremented by hardware when errors are logged. When this counter overflows, it stays at FFFh (no rollover). The               |  |  |  |
|          | threshold value, written by software, is (FFFh - the desired error count (the number of errors necessary in order              |  |  |  |
|          | for an interrupt to be taken)); the desired error count of 0 (a write value of FFFh) is not supported.                         |  |  |  |
|          | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::PIE::MCA_MISC0_PIE[Locked]) ? Read-                                    |  |  |  |
|          | write : Read-only.   |  |  |  |
| 31:24    | <b>BlkPtr</b> . Read-write. Reset: 01h. 00h=Extended MISC MSR block is not valid. 01h=Extended MSR block is valid.             |  |  |  |
|          | Reserved.  |  |  |  |
|          |  |  |  |  |
| MSRO     | C000_2164 [PIE Machine Check Configuration] (MCA::PIE::MCA_CONFIG_PIE)   |  |  |  |
| Reset:   | 0000_0000_0025h.   |  |  |  |
| Contro   | ols configuration of the associated machine check bank.  |  |  |  |
| _instPIE | _aliasMSR; MSRC000_2164  |  |  |  |
| Bits     | Description  |  |  |  |
| 63:39    | Reserved.  |  |  |  |
| 38:37    | <b>DeferredIntType</b> . Read-write. Reset: 0h. Specifies the type of interrupt signaled when a deferred error is logged.      |  |  |  |
|          | 00b = No interrupt. 01b = APIC based interrupt (see Core::X86::Msr::McaIntrCfg[DeferredLvtOffset]). 10b =                      |  |  |  |
|          | SMI trigger event. 11b = Reserved.   |  |  |  |
| 36:35    | Reserved.  |  |  |  |
|          | LogDeferredInMcaStat. Read-write. Reset: 0. Init: BIOS,1. 1=Log deferred errors in   |  |  |  |
|          | MCA::PIE::MCA_STATUS_PIE and MCA::PIE::MCA_ADDR_PIE in addition to   |  |  |  |
|          | <b></b>  |  |  |  |

|      | MCA::PIE::MCA_DESTAT_PIE and MCA::PIE::MCA_DEADDR_PIE. 0=Only log deferred errors in MCA::PIE::MCA_DESTAT_PIE and MCA::PIE::MCA_DEADDR_PIE. This bit does not affect logging of deferred errors in MCA::PIE::MCA_SYND_PIE, MCA::PIE::MCA_MISC0_PIE. |  |  |
|------|---|--|--|
| 33   | Reserved.   |  |  |
|      |   |  |  |
| 32   | 32 <b>McaXEnable</b> . Read-write. Reset: 0. Init: BIOS,1. Check: 1. 1=Software has acknowledged support for the  |  |  |
|      | MCAX feature set. 0=Software has not acknowledged support for the MCAX feature set. All uncorrected and   |  |  |
|      | fatal errors will cause an ErrorEvent packet to be generated. Deferred error interrupts are configured via  |  |  |
|      | Core::X86::Msr::McaIntrCfg.   |  |  |
| 31:6 | Reserved.   |  |  |
| 5    | <b>DeferredIntTypeSupported</b> . Read-only. Reset: 1. 1=MCA::PIE::MCA_CONFIG_PIE[DeferredIntType]  |  |  |
|      | controls the type of interrupt generated on a deferred error. Deferred errors are supported in this bank only if  |  |  |
|      | MCA::PIE::MCA_CONFIG_PIE[DeferredErrorLoggingSupported]=1.  |  |  |
| 4:3  | Reserved.   |  |  |
| 2    | <b>DeferredErrorLoggingSupported</b> . Read-only. Reset: 1. 1=Deferred errors are supported in this MCA bank, and   |  |  |
|      | MCA::PIE::MCA_CONFIG_PIE[LogDeferredInMcaStat] controls the logging behavior of these errors.   |  |  |
|      | MCA::PIE::MCA_DESTAT_PIE and MCA::PIE::MCA_DEADDR_PIE are supported in this MCA bank.   |  |  |
|      | 0=Deferred errors are not supported in this bank.   |  |  |
| 1    | Reserved.   |  |  |
| 0    | McaX. Read-only. Reset: 1. 1=This bank provides Machine Check Architecture Extensions. Up to 4 additional   |  |  |
|      | MISC registers (MISC1-MISC4) are supported. MCA::PIE::MCA_MISC0_PIE[BlkPtr] indicates the presence of   |  |  |
|      | the additional MISC registers, but is not used to determine their MSR numbers. Deferred error interrupt type is   |  |  |
|      | specifiable by MCA bank. MCA::PIE::MCA_STATUS_PIE[TCC] is present.  |  |  |
|      |   |  |  |

### MSRC000\_2165 [PIE IP Identification] (MCA::PIE::MCA\_IPID\_PIE)

Reset: 0001\_002E\_0000\_0000h.

The MCA::PIE::MCA\_IPID\_PIE register is used by software to determine what IP type and revision is associated with the MCA bank.

\_instPIE\_aliasMSR; MSRC000\_2165

| _     |   |  |  |
|-------|---|--|--|
| Bits  | Description   |  |  |
| 63:48 | McaType. Read-only. Reset: 0001h. The McaType of the MCA bank within this IP.   |  |  |
| 47:44 | Reserved.   |  |  |
| 43:32 | <sup>32</sup> HardwareID. Read-only. Reset: 02Eh. The Hardware ID of the IP associated with this MCA bank.                |  |  |
| 31:0  | 1:0 <b>InstanceId</b> . Read-write. Reset: 0000_0000h. The instance ID of this IP. This is initialized to a unique ID per |  |  |
|       | instance of this register.  |  |  |

### MSRC000\_2166 [PIE Machine Check Syndrome] (MCA::PIE::MCA\_SYND\_PIE)

Read-write, Volatile. Reset: Cold,0000\_0000\_0000h.

 Logs physical location information associated with error in MCA::PIE::MCA\_STATUS\_PIE Thread 0

 \_instPIE\_aliasMSR; MSRC000\_2166

 Bits
 Description

 63:33
 Reserved.

32 **Syndrome**. Read-write, Volatile. Reset: Cold,0. Contains the syndrome, if any, associated with the error logged in MCA::PIE::MCA\_STATUS\_PIE. The low-order bit of the syndrome is stored in bit 0, and the syndrome has a length specified by MCA::PIE::MCA\_SYND\_PIE[Length]. The Syndrome field is only valid when MCA::PIE::MCA\_SYND\_PIE[Length] is not 0.

31:27 Reserved.

| 26:24 | <b>ErrorPriority</b> . Read-write, Volatile. Reset: Cold, 0h. Encodes the priority of the error logged in |
|-------|---|
|       | MCA::PIE::MCA_SYND_PIE. 3'b000 = No error; 3'b001 = Reserved; 3'b010 = Corrected Error; 3'b011 =          |
|       | Deferred Error; 3'b100 = Uncorrected Error; 3'b101 = Fatal Error; all others reserved.                    |
|       |   |

23:18 **Length**. Read-write, Volatile. Reset: Cold,00h. Specifies the length in bits of the syndrome contained in MCA::PIE::MCA\_SYND\_PIE[Syndrome]. A value of 0 indicates that there is no valid syndrome in MCA::PIE::MCA\_SYND\_PIE. For example, a syndrome length of 9 means that

MCA::PIE::MCA\_SYND\_PIE[Syndrome] bits [8:0] contains a valid syndrome. 17:0 ErrorInformation. Read-write, Volatile. Reset: Cold,0\_0000h. Contains error-specific information about the location of the error. Decoding is available in Table 60 [MCA\_SYND\_PIE Register].

### Table 60: MCA\_SYND\_PIE Register

| Error Type   | Bits   | Description |
|--------------|--------|-------------|
| HW_ASSERT    | [17:0] | Reserved    |
| CSW          | [17:0] | Reserved    |
| GMI          | [4:0]  |             |
| FTI DAT STAT | [3:0]  |             |

# MSRC000\_2168 [PIE Machine Check Deferred Error Status] (MCA::PIE::MCA\_DESTAT\_PIE)

| MSRC000_2168 [PIE Machine Check Deferred Error Status] (MCA::PIE::MCA_DESTAT_PIE)                              |   |  |  |
|--|---|--|--|
| Read-write, Volatile. Reset: Cold,0000_0000_0000h.   |   |  |  |
| Holds  | Holds status information for the first deferred error seen in this bank.  |  |  |
| _instPIE   | _instPIE_aliasMSR; MSRC000_2168   |  |  |
| Bits   | Bits Description  |  |  |
| 63   | Val. Read-write, Volatile. Reset: Cold, 0. 1=A valid error has been detected (whether it is enabled or not).                |  |  |
| 62   | <b>Overflow</b> . Read-write, Volatile. Reset: Cold, 0. 1=An error was detected while the valid bit (Val) was set; at least |  |  |
| one error was not logged. Overflow is set independently of whether the existing error is overwritten. (See the |   |  |  |
|  | section on overwrite priorities.)   |  |  |
| 61:59  | 61:59 Reserved.   |  |  |
| 58   | AddrV. Read-write, Volatile. Reset: Cold, 0. 1=MCA::PIE::MCA_DEADDR_PIE contains address information                        |  |  |
| associated with the error.   |   |  |  |
| 57:54  | 54 Reserved.  |  |  |
| 53   | SyndV. Read-write, Volatile. Reset: Cold, 0. 1=This error logged information in MCA::PIE::MCA_SYND_PIE. If                  |  |  |
|  | MCA::PIE::MCA_SYND_PIE[ErrorPriority] is the same as the priority of the error in   |  |  |
|  | MCA::PIE::MCA_STATUS_PIE, then the information in MCA::PIE::MCA_SYND_PIE is associated with the                             |  |  |
|  | error in MCA::PIE::MCA_DESTAT_PIE.  |  |  |
| 52:45  | Reserved.   |  |  |
| 44   | Deferred. Read-write, Volatile. Reset: Cold, 0. 1=A deferred error was created. A deferred error is the result of an        |  |  |
|  | uncorrectable data error which did not immediately cause a processor exception; poison is created and an                    |  |  |
|  | exception is deferred until the poison data is consumed.  |  |  |
| 43:0   | Reserved.   |  |  |
| MODA   |   |  |  |
| MSRC000_2169 [PIE Deferred Error Address] (MCA::PIE::MCA_DEADDR_PIE)   |   |  |  |
| Read-  | write,Volatile. Reset: Cold,0000_0000_0000_0000h.   |  |  |

| Read-v   | write, Volatile. Reset: Cold,0000_0000_0000_0000h.  |  |  |
|--|---|--|--|
| The MCA::PIE::MCA_DEADDR_PIE register stores the address associated with the error in            |   |  |  |
| MCA::PIE::MCA_DESTAT_PIE. The register is only meaningful if MCA::PIE::MCA_DESTAT_PIE[Val]=1 and |   |  |  |
| MCA:   | MCA::PIE::MCA_DESTAT_PIE[AddrV]=1. The lowest valid bit of the address is defined by                                      |  |  |
| MCA:   | MCA::PIE::MCA_DEADDR_PIE[LSB].  |  |  |
| _instPIE   | _aliasMSR; MSRC000_2169   |  |  |
| Bits   | Description   |  |  |
| 63:62  | Reserved.   |  |  |
| 61:56  | <b>LSB</b> . Read-write, Volatile. Reset: Cold,00h. Specifies the least significant valid bit of the address contained in |  |  |
|  | MCA::PIE::MCA_DEADDR_PIE[ErrorAddr]. A value of 0 indicates that  |  |  |
|  | MCA::PIE::MCA_DEADDR_PIE[55:0] contains a valid byte address. A value of 6 indicates that                                 |  |  |
|  | MCA::PIE::MCA_DEADDR_PIE[55:6] contains a valid cache line address and that   |  |  |
|  | MCA::PIE::MCA_DEADDR_PIE[5:0] are not part of the address and should be ignored by error handling                         |  |  |
|  | software. A value of 12 indicates that MCA::PIE::MCA_DEADDR_PIE[55:12] contain a valid 4KB memory                         |  |  |
|  | page and that MCA::PIE::MCA_DEADDR_PIE[11:0] should be ignored by error handling software.                                |  |  |
| 55:0   | ErrorAddr. Read-write, Volatile. Reset: Cold,00_0000_0000_0000h. Contains the address, if any, associated with            |  |  |

the error logged in MCA::PIE::MCA\_DESTAT\_PIE. The lowest-order valid bit of the address is specified in MCA::PIE::MCA\_DEADDR\_PIE[LSB].

#### MSRC001\_0416 [PIE Machine Check Control Mask] (MCA::PIE::MCA\_CTL\_MASK\_PIE)

Read-write. Reset: 0000\_0000\_0000\_0000h.

Inhibit detection of an error source.

| _instPIE_aliasMSR; MSRC001_0416 |  |  |
|---------------------------------|--|--|

 Bits Description

 63
 Val. Reset: Cold,0. 1=A valid error has been detected. This bit should be cleared by software after the register has been read.

 AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.

 62
 Overflow. Reset: Cold,0. 1=An error was detected while the valid bit (Val) was set; at least one error was not logged. Overflow is set independently of whether the existing error is overwritten. See 3.1.3 [Machine Check Errors].

| 1     |  |  |  |  |  |  |
|-------|--|--|--|--|--|--|
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                        |  |  |  |  |  |
| 61    | UC. Reset: Cold,0. 1=The error was not corrected by hardware.  |  |  |  |  |  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                        |  |  |  |  |  |
| 60    | <b>En</b> . Reset: Cold,0. 1=MCA error reporting is enabled for this error, as indicated by the corresponding bit in     |  |  |  |  |  |
|       | MCA::UMC::MCA_CTL_UMC. This bit is a copy of bit in MCA::UMC::MCA_CTL_UMC for this error.                                |  |  |  |  |  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                        |  |  |  |  |  |
| 59    | MiscV. Reset: Cold,0. 1=Valid thresholding in MCA::UMC::MCA_MISC0_UMC.   |  |  |  |  |  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                        |  |  |  |  |  |
| 58    | AddrV. Reset: Cold,0. 1=MCA::UMC::MCA_ADDR_UMC contains address information associated with the                          |  |  |  |  |  |
|       | error.   |  |  |  |  |  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                        |  |  |  |  |  |
| 57    | <b>PCC</b> . Reset: Cold,0. 1=Hardware context held by the processor may have been corrupted. Continued operation of     |  |  |  |  |  |
|       | the system may have unpredictable results. The error is not recoverable or survivable, and the system should be          |  |  |  |  |  |
|       | reinitialized.   |  |  |  |  |  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                        |  |  |  |  |  |
| 56    | <b>ErrCoreIdVal</b> . Reset: Cold,0. 1=The ErrCoreId field is valid.   |  |  |  |  |  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                        |  |  |  |  |  |
| 55    | TCC. Reset: Cold,0. 0=The thread which consumed the error can be restarted reliably at the instruction pointer           |  |  |  |  |  |
|       | address pushed onto the exception handler stack if any uncorrected error has been corrected by software. 1=The           |  |  |  |  |  |
|       | thread which consumed the error is not restartable and must be terminated. Only meaningful when                          |  |  |  |  |  |
|       | MCA::UMC::MCA_STATUS_UMC[PCC]=0.   |  |  |  |  |  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                        |  |  |  |  |  |
| 54    | Reserved.  |  |  |  |  |  |
| 53    | SyndV. Reset: Cold,0. 1=This error logged information in MCA::UMC::MCA_SYND_UMC. If                                      |  |  |  |  |  |
|       | MCA::UMC::MCA_SYND_UMC[ErrorPriority] is the same as the priority of the error in  |  |  |  |  |  |
|       | MCA::UMC::MCA_STATUS_UMC, then the information in MCA::UMC::MCA_SYND_UMC is associated                                   |  |  |  |  |  |
|       | with the error in MCA::UMC::MCA_STATUS_UMC.  |  |  |  |  |  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                        |  |  |  |  |  |
| 52:47 | Reserved.  |  |  |  |  |  |
| 46    | <b>CECC</b> . Reset: Cold,0. 1=The error was a correctable ECC error according to the restrictions of the ECC            |  |  |  |  |  |
|       | algorithm. UC indicates whether the error was actually corrected by the processor.                                       |  |  |  |  |  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                        |  |  |  |  |  |
| 45    | <b>UECC</b> . Reset: Cold,0. 1=The error was an uncorrectable ECC error according to the restrictions of the ECC         |  |  |  |  |  |
|       | algorithm. UC indicates whether the error was actually corrected by the processor.                                       |  |  |  |  |  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read, Write-0-only, Error-on-write-1.                      |  |  |  |  |  |
| 44    | <b>Deferred</b> . Reset: Cold,0. 1=A deferred error was created. A deferred error is the result of an uncorrectable data |  |  |  |  |  |
|       | error which did not immediately cause a processor exception; an exception is deferred until the erroneous data is        |  |  |  |  |  |
|       | consumed.  |  |  |  |  |  |
| - 10  | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                        |  |  |  |  |  |
| 43    | <b>Poison</b> . Reset: Cold,0. 1=The error was the result of attempting to consume poisoned data.                        |  |  |  |  |  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                        |  |  |  |  |  |
|       | Reserved.  |  |  |  |  |  |
| 37:32 | · ·  |  |  |  |  |  |
|       | associated with the error; Otherwise this field is reserved.   |  |  |  |  |  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                        |  |  |  |  |  |

| 21:16 | <b>ErrorCodeExt</b> . Reset: Cold,00h. Extended Error Code. This field is used to identify the error type for root cause |  |  |  |  |  |
|       | analysis. This field indicates which bit position in MCA::UMC::MCA_CTL_UMC enables error reporting for the               |  |  |  |  |  |
|       | logged error.  |  |  |  |  |  |
|       | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.                        |  |  |  |  |  |

15:0 **ErrorCode**. Reset: Cold,0000h. Error code for this error. See 3.1.3.3 [Error Codes] for details on decoding this field.

AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read, Write-0-only, Error-on-write-1.

#### Table 61: MCA\_STATUS\_UMC[ErrorCodeExt] Decode

| Error Type              | Bits  | Description |
|-------------------------|-------|-------------|
| DramEccErr              | [6:0] | 0x0         |
| WriteDataPoisonErr      | [6:0] | 0x1         |
| SdpParityErr            | [6:0] | 0x2         |
| ApbErr                  | [6:0] | 0x3         |
| AddressCommandParityErr | [6:0] | 0x4         |
| WriteDataCrcErr         | [6:0] | 0x5         |

### MSR0000\_043E...MSRC000\_2102 [UMC Machine Check Address] (MCA::UMC::MCA\_ADDR\_UMC)

Read-write, Volatile. Reset: Cold, 0000\_0000\_0000h.

MCA::UMC::MCA\_ADDR\_UMC stores an address and other information associated with the error in MCA::UMC::MCA\_STATUS\_UMC. The register is only meaningful if MCA::UMC::MCA\_STATUS\_UMC[Val]=1 and MCA::UMC::MCA\_STATUS\_UMC[AddrV]=1.

\_instUMC\_umc0\_aliasMSRLEGACY; MSR0000\_043E

Bits Description

| Dits  | Descriptio |
|-------|------------|
| 63:62 | Reserved.  |

61:56 **LSB**. Read-write, Volatile. Reset: Cold,00h. Specifies the least significant valid bit of the address contained in MCA::UMC::MCA\_ADDR\_UMC[ErrorAddr]. A value of 0 indicates that

MCA::UMC::MCA\_ADDR\_UMC[55:0] contains a valid byte address. A value of 6 indicates that

MCA::UMC::MCA\_ADDR\_UMC[55:6] contains a valid cache line address and that

MCA::UMC::MCA\_ADDR\_UMC[5:0] are not part of the address and should be ignored by error handling software. A value of 12 indicates that MCA::UMC::MCA\_ADDR\_UMC[55:12] contain a valid 4KB memory page and that MCA::UMC::MCA\_ADDR\_UMC[11:0] should be ignored by error handling software.

55:0 **ErrorAddr**. Read-write, Volatile. Reset: Cold,00\_0000\_0000\_0000h. Unless otherwise specified by an error, contains the address associated with the error logged in MCA::UMC::MCA\_STATUS\_UMC. For physical addresses, the most significant bit is given by Core::X86::Cpuid::LongModeInfo[PhysAddrSize].

### Table 62: MCA\_ADDR\_UMC Register

| Error Type              | Bits    | Description |
|-------------------------|---------|-------------|
| DramEccErr              | [55:39] | Reserved    |

|         | Description   |
| 63      | <b>Valid</b> . Reset: 1. 1=A valid CntP field is present in this register.  |
|         | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read-only.  |
| 62      | <b>CntP</b> . Reset: 1. 1=A valid threshold counter is present.   |
|         | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read-only.  |
| 61      | <b>Locked</b> . Reset: 0. 1=Writes to this register are ignored. This bit is set by BIOS to indicate that this register is not available for OS use. BIOS should set this bit if ThresholdIntType is set to SMI.  |
|         | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read-only.  |
| 60      | <b>IntP</b> . Reset: 1. 1=ThresholdIntType can be used to generate interrupts. 0=ThresholdIntType and interrupt generation are not supported.   |
|         | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::UMC::MCA_MISC0_UMC[Locked]) ? Read-<br>write : Read-only.   |
| 59:56   | Reserved.   |
| 55:52   | <b>LvtOffset</b> . Reset: 0h. One per die. For error thresholding interrupts, specifies the address of the LVT entry in the APIC registers as follows: LVT address = (LvtOffset shifted left 4 bits) + 500h (see Core::X86::Apic::ExtendedInterruptLvtEntries).   |
|         | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::UMC::MCA_MISC0_UMC[Locked]) ? Read-<br>write : Read-only.   |
| 51      | CntEn. Reset: 0. 1=Count thresholding errors.   |
|         | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::UMC::MCA_MISC0_UMC[Locked]) ? Read-<br>write : Read-only.   |
| 50:49   | <b>ThresholdIntType</b> . Reset: Cold,0h. Specifies the type of interrupt signaled when Ovrflw is set and IntP==1. 00b = No interrupt. 01b = APIC based interrupt (see Core::X86::Msr::McaIntrCfg[ThresholdLvtOffset]). 10b = SMI trigger event. 11b = Reserved.  |
|         | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::UMC::MCA_MISC0_UMC[Locked]) ? Read-<br>write : Read-only.   |
| 48      | <b>Ovrflw</b> . Reset: Cold,0. Set by hardware when ErrCnt transitions from FFEh to FFFh. When this field is set, ErrCnt no longer increments. When this bit is set, the interrupt selected by the ThresholdIntType field is generated.   |
|         | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::UMC::MCA_MISC0_UMC[Locked]) ? Read-<br>write : Read-only.   |
| 47:44   | Reserved.   |
| 43:32   | <b>ErrCnt</b> . Reset: Cold,000h. This is written by software to set the starting value of the error counter. This is incremented by hardware when errors are logged. When this counter overflows, it stays at FFFh (no rollover). The threshold value, written by software, is (FFFh - the desired error count (the number of errors necessary in order for an interrupt to be taken)); the desired error count of 0 (a write value of FFFh) is not supported. |
|         | AccessType: (Core::X86::Msr::HWCR[McStatusWrEn]   !MCA::UMC::MCA_MISC0_UMC[Locked]) ? Read-<br>write : Read-only.   |
| 31:24   | BlkPtr. Read-write. Reset: 01h. 00h=Extended MISC MSR block is not valid. 01h=Extended MSR block is valid.  |
| 23:0    | Reserved.   |
|         | 2000 200E 1014 [UMC Machine Check Configuration] (MCA. UMC. MCA. CONEIC UMC)  |

# MSRC000\_2[0F...10]4 [UMC Machine Check Configuration] (MCA::UMC::MCA\_CONFIG\_UMC)

Reset: 0000\_0000\_0000\_0025h.

| Contro | ols configuration of the associated machine check bank.   |
|--------|---|
|        | C_umc0_aliasMSR; MSRC000_20F4   |
|        | C_umc1_aliasMSR; MSRC000_2104   |
| Bits   | Description   |
| 63:39  | Reserved.   |
| 38:37  | <b>DeferredIntType</b> . Read-write. Reset: 0h. Specifies the type of interrupt signaled when a deferred error is logged.<br>00b = No interrupt. 01b = APIC based interrupt (see Core::X86::Msr::McaIntrCfg[DeferredLvtOffset]). 10b = SMI trigger event. 11b = Reserved.   |
| 36:35  | Reserved.   |
| 34     | <b>LogDeferredInMcaStat</b> . Read-write. Reset: 0. Init: BIOS,1. 1=Log deferred errors in<br>MCA::UMC::MCA_STATUS_UMC and MCA::UMC::MCA_ADDR_UMC in addition to<br>MCA::UMC::MCA_DESTAT_UMC and MCA::UMC::MCA_DEADDR_UMC. 0=Only log deferred errors in<br>MCA::UMC::MCA_DESTAT_UMC and MCA::UMC::MCA_DEADDR_UMC. This bit does not affect logging<br>of deferred errors in MCA::UMC::MCA_SYND_UMC, MCA::UMC::MCA_MISC0_UMC. |
| 33     | Reserved.   |
| 32     | <b>McaXEnable</b> . Read-write. Reset: 0. Init: BIOS,1. Check: 1. 1=Software has acknowledged support for the MCAX feature set. 0=Software has not acknowledged support for the MCAX feature set. All uncorrected and fatal errors will cause an ErrorEvent packet to be generated. Deferred error interrupts are configured via Core::X86::Msr::McaIntrCfg.  |
| 31:6   | Reserved.   |
| 5      | <b>DeferredIntTypeSupported</b> . Read-only. Reset: 1. 1=MCA::UMC::MCA_CONFIG_UMC[DeferredIntType] controls the type of interrupt generated on a deferred error. Deferred errors are supported in this bank only if MCA::UMC::MCA_CONFIG_UMC[DeferredErrorLoggingSupported]=1.  |
| 4:3    | Reserved.   |
| 2      | <b>DeferredErrorLoggingSupported</b> . Read-only. Reset: 1. 1=Deferred errors are supported in this MCA bank, and MCA::UMC::MCA_CONFIG_UMC[LogDeferredInMcaStat] controls the logging behavior of these errors. MCA::UMC::MCA_DESTAT_UMC and MCA::UMC::MCA_DEADDR_UMC are supported in this MCA bank. 0=Deferred errors are not supported in this bank.   |
| 1      | Reserved.   |
| 0      | <b>McaX</b> . Read-only. Reset: 1. 1=This bank provides Machine Check Architecture Extensions. Up to 4 additional MISC registers (MISC1-MISC4) are supported. MCA::UMC::MCA_MISC0_UMC[BlkPtr] indicates the presence of the additional MISC registers, but is not used to determine their MSR numbers. Deferred error interrupt type is specifiable by MCA bank. MCA::UMC::MCA_STATUS_UMC[TCC] is present.                    |

|                | AccessType: Core::X86::Msr::HWCR[McStatusWrEn] ? Read-write : Read,Write-0-only,Error-on-write-1.   |  |  |

Table 64: MCA\_STATUS\_PB[ErrorCodeExt] Decode

| Error Type | Bits  | Description |
|------------|-------|-------------|
| EccError   | [6:0] | 0x0         |

#### MSR0000 044E...MSRC000 2132 [PB Machine Check Address] (MCA::PB::MCA ADDR PB)

#### Read-only. Reset: Cold,0000 0000 0000 0000h.

MCA::PB::MCA\_ADDR\_PB stores an address and other information associated with the error in MCA::PB::MCA\_STATUS\_PB. The register is only meaningful if MCA::PB::MCA\_STATUS\_PB[Val]=1 and MCA::PB::MCA STATUS PB[AddrV]=1. instPB\_aliasMSRLEGACY; MSR0000\_044E instPB\_aliasMSR; MSRC000\_2132 **Bits** Description 63:62 Reserved. 61:56 **LSB**. Read-only. Reset: Cold,00h. Specifies the least significant valid bit of the address contained in MCA::PB::MCA\_ADDR\_PB[ErrorAddr]. A value of 0 indicates that MCA::PB::MCA\_ADDR\_PB[55:0] contains a valid byte address. A value of 6 indicates that MCA::PB::MCA ADDR PB[55:6] contains a valid cache line address and that MCA::PB::MCA\_ADDR\_PB[5:0] are not part of the address and should be ignored by error handling software. A value of 12 indicates that MCA::PB::MCA ADDR PB[55:12] contain a valid 4KB memory page and that MCA::PB::MCA\_ADDR\_PB[11:0] should be ignored by error handling software. ErrorAddr. Read-only. Reset: Cold,00 0000 0000 0000h. Contains the address, if any, associated with the error 55:0 logged in MCA::PB::MCA STATUS PB.

#### Table 65: MCA\_ADDR\_PB Register

| Error Type | Bits   | Description |
|------------|--------|-------------|
| EccError   | [55:0] | Reserved    |

#### MSR0000 044F...MSRC000 2133 [PB Machine Check Miscellaneous 0] (MCA::PB::MCA MISC0 PB)

Log miscellaneous information associated with errors.

#### 5 Advanced Platform Management Link (APML)

#### 5.1 Overview

The Advanced Platform Management Link (APML) is a SMBus v2.0 compatible 2-wire processor slave interface. APML is also referred as the sideband interface (SBI).

APML is used to communicate with the SBI Temperature Sensor Interface (SB-TSI). For related specifications, see 1.2 [Reference Documents].

#### 5.1.1 Definitions

#### Table 68: APML Definitions

| Term                 | Description  |
|----------------------|--|
| ARA                  | Alert response address.  |
| ARP                  | Address Resolution Protocol  |
| EC                   | Embedded Controller.   |
| KBC                  | Keyboard Controller.   |
| Master or SMBus      | The device that initiates and terminates all communication and drives the clock, SCL.      |
| Master               |  |
| PEC                  | Packet error code.   |
| POR                  | Power on reset.  |
| RTS                  | Remote temperature sensor, typical examples are ADM1032, LM99, MAX6657, EMC1002.           |
| SBI                  | Sideband interface.  |
| Slave or SMBus slave | The slave cannot initiate SMBus communication and cannot drive the clock but can drive the |
|                      | data signal SDA and the alert signal ALERT_L.  |
| TSI                  | Temperature sensor interface.  |

#### 5.2 SBI Bus Characteristics

The SBI largely follows SMBus v2.0. This section describes the exceptions.

#### 5.2.1 SMBus Protocol Support

The SBI follows SMBus protocol except:

- The processor does not implement SMBus master functionality.
- The SBI implements the Send Byte/Receive Byte, Read Byte/Write Byte. Block Read/Block Write and
- Block Write-Block Read Process Call SMBus protocols. The Send Byte/Receive Byte SMBus protocol is only supported by SB-TSI.
- Packet error checking (PEC) is not supported by SB-TSI.
- Address Resolution Protocol (ARP) is not implemented.
- Cumulative clock extensions are not enforced.

#### 5.2.2 I2C Support

The processor supports higher I2C-defined speeds as specified in the Physical Layer Characteristics section. The

processor supports the I2C master code transmission in order to reach the high-speed bus mode. Multiple SBI commands may be sent within a single high-speed mode session. Ten-bit addressing is not supported.

#### 5.3 SBI Processor Information

#### 5.3.1 SBI Processor Pins

Up to six processor pins are used for SBI support: two for data transfer, three for address determination and one for an interrupt output. Of the three address pins, one bit is socket\_id used to determine which package is addressed. These pins do not have changeable pinstrap. The Serial Interface Clock (SIC) and Serial Interface Data (SID) pins function as the SMBus clock and data pins respectively. The SMBus alert pin (ALERT\_L) is used to signal interrupts to the SMBus master.

#### 5.3.1.1 Physical Layer Characteristics

The SIC and SID pins differ from the SMBus specification with regard to voltage. System board voltage translators are necessary to convert the SIC and SID pin voltage levels to that of the SMBus specification. SBI supports frequencies of 100 KHz, 400 KHz over SIC.

#### 5.3.2 Processor States

SBI responds to SMBus traffic except when PWROK is de-asserted (and for a brief period after it is de-asserted).

#### 5.4 SBI Protocols

### 5.4.1 SBI Modified Block Write-Block Read Process Call

SBI uses a modified SMBus PEC-optional Block Write-Block Read Process Call protocol. The change from the SMBus protocol is support for an optional intermediate PEC byte and Ack after the Ack for Data Byte M. The PEC byte after Data Byte N covers all previous bytes excluding the first PEC byte. Figure below shows the transmission protocol. Each byte in the protocol is sent with the most significant bit first (bit[7]). The master may reset the bus by holding the clock low for 25ms as specified by the SMBus Specification.

PPR for AMD Family 17h Models 01h,08h B2

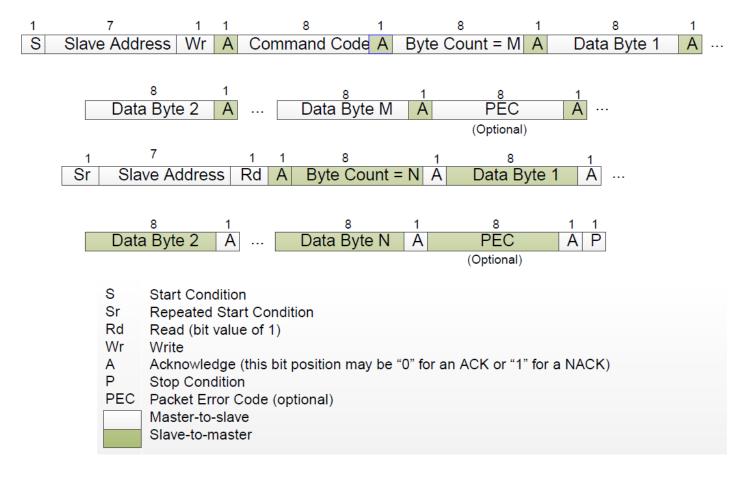

Figure 19: SBI Transmission Protocol

### 5.4.2 SBI Error Detection and Recovery

This section describes the various error detection and recovery methods that can be used on the SBI bus. The important item in providing a high reliability SBI connection is the ability to detect when an error occurs and to gracefully recover from that error. When the SBI connections are noisy, messages can become garbled which, in turn, may cause undefined behavior on the SBI bus. The most common noise sources are cross-talk and clock skew. Cross-talk results when the SBI connections are routed too close to other signal carrying lines. Clock skew is usually a result of higher than expected capacitance, between the SBI signals (clock and / or data) and ground, which causes the master and slave devices to disagree on when data should be stable and when it is allowed to be changing.

### 5.4.2.1 Error Detection

SBI provides several methods of error detection: protocol ACK/NAK, packet error correction (PEC) fields, and timeouts. The ACK/NAK mechanism is always active in SBI, but the PEC and timeouts are optional.

### 5.4.2.1.1 ACK/NAK Mechanism

After each byte of an SBI message, the device receiving that byte must either acknowledge (ACK) that it received the byte correctly, or deny (NAK) that the byte was correctly received. This is most easily seen in the case of the address bytes which follow a START (or REPEATED START) sequence, but can be used anywhere in the message. In the case of an address byte, if a slave device recognizes the address, it will respond with an ACK and await the rest of the message. If a slave device does not recognize the message, it will respond with a NAK and ignore the rest of the message.

#### 5.4.2.1.2 Bus Timeouts

Bus timeouts should be enabled to prevent a device waiting indefinitely on a message that may not be coming. Some timeouts are used to prevent the SBI bus from waiting for a response from a CPU that is in a power-saving idle mode. Other timeouts are used to allow the slave device to recognize that the bus master is attempting to reset all of the devices on the SBI bus. Either way, when a device recognizes a timeout, it should abort its current message transfer.

#### 5.4.2.2 Error Recovery

The simplest form of error recovery is a retry. When the bus master detects an unexpected NAK, it should abort the current transfer and retry the message sequence. In some cases, however, a message can be so garbled that a simple retry is insufficient. This can occur, if there are multiple devices on the bus and a garbled address byte has caused the wrong slave device to be selected. That slave device may even continue to transmit during the retry. In those cases, it will be necessary to force a reset of all devices on the SBI bus, before retrying the message transfer.

#### 5.4.2.2.1 SBI Bus Reset

The bus master can hold the clock low for a period longer the standard timeout in order to force slave devices off the bus (see section 3.1.1.3 of the SMBUS Management Guide). All SBI slave devices are required to reset their communications if another device holds the clock line low for longer than TTimeout, min (25 milliseconds). The devices are required to complete their reset within TTimeout, max (35 milliseconds). SBI bus masters should use the extended timeout to force a reset of all slave devices if a simple retry does not remove an error condition.

#### 5.5 SBI Physical Interface

#### 5.5.1 SBI SMBus Address

The SMBus address is really 7 bits. Some vendors and the SMBus specification show the address as 8 bits, left justified with the R/W bit as a write (0) making bit 0. Some vendors use only the 7 bits to describe the address.

#### 5.5.2 SBI Bus Timing

SBI supports 100KHz standard-mode and 400 KHz fast-mode I2C operation. Refer to the standard-mode and fast-mode timing parameters in the I2C specification.

#### 5.5.3 Pass-FET Option

There is a possibility that a device with a standard SMBus interface will not be able to directly interface to SBI. Therefore, pass FETs must be used to create two SkMBus segments, see the following figure.

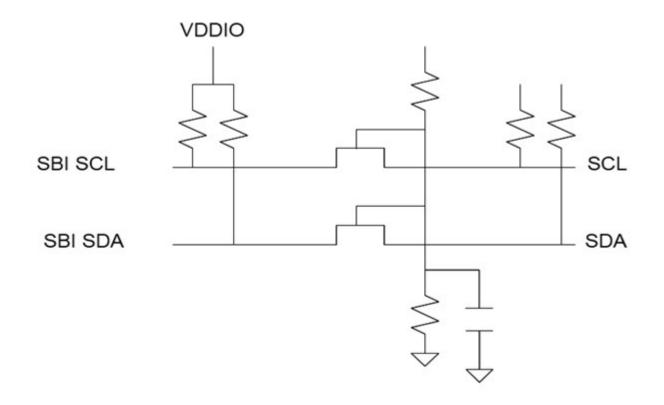

Figure 20: Pass FET Implementation

Notes:

- SCL and SDA pull-up resistors are the normal pull-up resistors for a SMBus segment, and are not part of the translation circuit. They are shown for completeness.
- The gates of the FETs are tied to a voltage approximately Vgs above the lower rail voltage. A resistive divider is shown, but a convenient power rail will also work.
- Care must be taken to install the FETs so that any body diode does not conduct.
- The key requirement is the high side drive low enough to register as low on the low side (High side Vol < Vil on low side)

## 6 SB Temperature Sensor Interface (SB-TSI)

#### 6.1 Overview

The SBI temperature sensor interface (SB-TSI) is an emulation of the software and physical interface of a typical 8-pin remote temperature sensor (RTS), see Figure 21 [RTS Thermal Management Example]. The goal is to resemble a typical RTS so that KBC or BMC firmware requires minimal changes for future AMD products, see Figure 22 [SB-TSI Thermal Management Example]. SB-TSI supports the SMBus protocols that typical RTS supports.

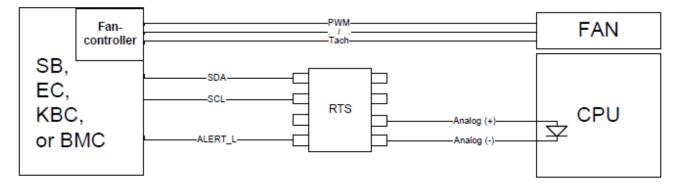

Figure 21: RTS Thermal Management Example

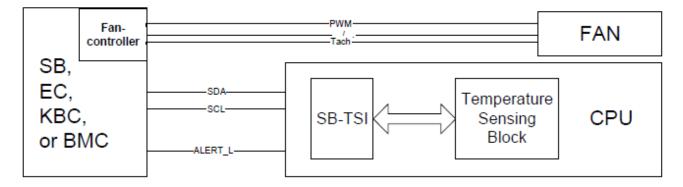

Figure 22: SB-TSI Thermal Management Example

Refer to the following external sources for additional information.

- System Management Bus (SMBus) specification. See docSMB.
- I2C-bus Specification and User Manual, Revision 03. See docI2C.

#### 6.1.1 Definitions

#### Table 69: SB-TSI Definitions

| Term   | Description   |
|--------|---|
| BMC    | Base management controller.                               |
| TSM    | Temperature sensor macro.                                 |
| SB-TSI | Sideband Internal Temperature Sensor Interface. See APML. |

## 6.2 SB-TSI Protocol

The SB-TSI largely follows SMBus v2.0 specification except:

- The combined-format repeated start sequence is not supported in standard-mode and fast-mode. The response of the processor's SB-TSI to the sequence in undefined.
- Only 7-bit SMBus addresses are supported.
- SB-TSI implements the Send/Receive Byte and Read/Write Byte protocols.
- SB-TSI registers can only by written using a write byte command.
- Address Resolution Protocol (ARP) is not supported.
- Packet Error Checking (PEC) is not supported.
- The usage of unsupported protocols may lead to an undefined bus condition.
- To release the bus from an undefined condition and to reset the SB-TSI slave, the bus master must hold the clock low for a duration of time that is longer than Ttimeout.max, as specified for SMBus. The time-out needs to be enabled by SBTSI::TimeoutConfig[TimeoutEn]=1.

#### 6.2.1 SB-TSI Send/Receive Byte Protocol

A SMBus master can read SB-TSI registers by issuing a send byte command with the address of the register to be read as the data byte followed by a receive byte command.

#### 6.2.1.1 SB-TSI Address Pointer

The SB-TSI controller has an internal address pointer that is updated when a register is accessed using a read or write byte command or when a send byte command is received. This address pointer is used to determine the address of the register being read when a receive byte command is processed by the controller.

#### 6.2.2 SB-TSI Read/Write Byte Protocol

An SMBus master can read or write SB-TSI registers by issuing a read or a write byte command with the address of the register to be read or written in the command code field.

#### 6.2.3 Alert Behavior

The ALERT\_L pin is asserted if (SBTSI::Status[TempHighAlert] || SBTSI::Status[TempLowAlert]) &&

- ~SBTSI::Config[AlertMask] as shown in Figure 3. The following registers also affect temperature alert behavior.
  - SBTSI::Config[AraDis]: Disables ARA response.
  - SBTSI::UpdateRate[UpRate]: Specifies rate at which temperature thresholds are checked.
  - {SBTSI::HiTempInt[HiTempInt], SBTSI::HiTempDec[HiTempDec]}: Sets high temperature threshold.
  - {SBTSI::LoTempInt[LoTempInt], SBTSI::LoTempDec[LoTempDec]}: Sets low temperature threshold.
  - SBTSI::AlertThreshold[AlertThr]: Specifies number of consecutive temperature samples to assert an alert.
  - SBTSI::AlertConfig[AlertCompEn]: Specifies ALERT\_L pin to be in latched or comparator mode. Affects ARA.

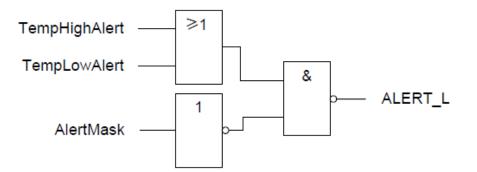

Figure 23: Alert Assertion Diagram

## 6.2.4 Atomic Read Mechanism

To ensure that the two required reads (integer and decimal) for reading the CPU temperature are always originated from one temperature value, atomic reading procedures are required. SB-TSI offers functions to maintain atomicity between the temperature integer and decimal bytes.

[The SB-TSI Configuration Register] SBTSI::Config[ReadOrder] specifies the order for reading integer and decimal part of the CPU temperature value for atomic CPU temperature reads. If SBTSI::Config[ReadOrder] is 0, then a read of the integer part (SBTSI::CpuTempInt) of the CPU temperature triggers a latch of the decimal part (SBTSI::CpuTempDec) until the next read of the integer part. This latch syncs the decimal part with the integer part. The integer part is continuously updated.

If SBTSI::Config[ReadOrder] is 1, then the read order to ensure atomicity is reversed, i.e. decimal part = first, integer part = second.

If it is not possible to ensure a dedicated read order as described above, the Run/Stop bit ([The SB-TSI Configuration Register] SBTSI::Config[RunStop]) may be used to provide atomicity of reading the CPU temperature. If this bit is 0, the CPU temperature registers are updated continuously. If it is 1, they get frozen and always deliver their last value on read requests.

- Set SBTSI::Config[RunStop].
- Read the integer (SBTSI::CpuTempInt) or the decimal (SBTSI::CpuTempDec) part of the CPU temperature.
- Read the remaining part of the CPU temperature.
- Clear SBTSI::Config[RunStop].

### 6.2.5 SB-TSI Temperature and Threshold Encodings

SB-TSI CPU temperature readings and limit registers encode the temperature in increments of 0.125 from 0 to 255.875. The high byte represents the integer portion of the temperature from 0 to 255. One increment in the high byte is equivalent to a step of one. The upper three bits of the low byte represent the decimal portion of the temperature. One increment of these bits is equivalent to a step of 0.125.

| Table 70: SB-TSI CPU Temp | erature and Threshold Encoding Examples |
|---------------------------|---|
|                           |   |

| Temperature | Temperature High Byte         | Temperature Low Byte          |
|-------------|-------------------------------|-------------------------------|
|             | SBTSI::CpuTempInt[CpuTempInt] | SBTSI::CpuTempDec[CpuTempDec] |
|             | SBTSI::HiTempInt[HiTempInt]   | SBTSI::HiTempDec[HiTempDec]   |

|           | SBTSI::LoTempInt[LoTempInt] | SBTSI::LoTempDec[LoTempDec] |
|-----------|-----------------------------|-----------------------------|
| 0.000 °C  | 0000_0000Ъ                  | 0000_0000Ъ                  |
| 1.000 °C  | 0000_0001b                  | 0000_0000Ъ                  |
| 25.125 °C | 0001_1001b                  | 0010_0000b                  |
| 50.875 °C | 0011_0010b                  | 1110_0000b                  |
| 90.000 °C | 0101_1010b                  | 0000_0000Ь                  |

#### 6.2.6 SB-TSI Temperature Offset Encoding

By default, SBTSI::CpuTempInt and SBTSI::CpuTempDec provide Tctl from the processor. Refer to the BIOS and Kernel Developer's Guide for the processor family for further details on Tctl. The temperature offset registers allow the system to adjust the SB-TSI temperature from Tctl.

The SB-TSI temperature offset registers use a different encoding in order to provide negative temperature values. SBTSI::CpuTempOffInt[CpuTempOffInt] and SBTSI::CpuTempOffDec[CpuTempOffDec] form an 11-bit 2's complement value representing the temperature offset. The high byte encodes the integer portion of the temperature and the upper three bits of the low byte represent the fractional portion of the temperature offset. One increment of these bits is equivalent to a step of 0.125 °C. After reset the offset is always set to 0 °C. Software needs to adjust the offset to the appropriate level.

| 1 11        | <u> </u>              |                      |
|-------------|-----------------------|----------------------|

*Table 71: SB-TSI Temperature Offset Encoding Examples* 

### 6.3 SB-TSI Physical Interface

This chapter describes the physical interface of the SB-TSI.

#### 6.3.1 SB-TSI SMBus Address

The SMBus address is really 7 bits. Some vendors and the SMBus specification show the address as 8 bits, left justified with the R/W bit as a write (0) making bit 0. Some vendors use only the 7 bits to describe the address. The addresses can vary with address select pins.

Table 72: SB-TSI Address Encodings

| Socket ID | SB-TSI Address                  |
|-----------|---------------------------------|
| Ob        | 98h for 8 bit or 4Ch for 7 bit. |
| 1b        | 90h for 8 bit or 48h for 7 bit. |

#### 6.3.2 SB-TSI Bus Timing

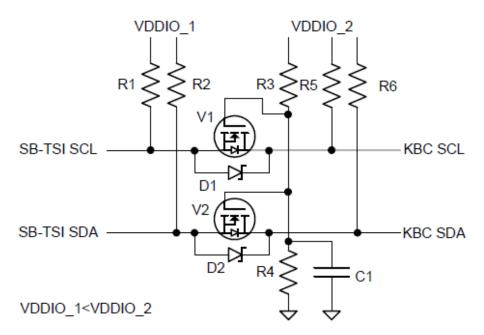

SB-TSI supports standard-mode (100 kHz) and fast-mode (400 kHz) according to the I2C-bus Specification and User Manual.

#### 6.3.3 SB-TSI Bus Electrical Parameters

SB-TSI conforms to most of the I2C fast-mode electrical parameters. See the Electrical Data Sheet for the processor family for electrical parameters.

#### 6.3.4 Pass-FET Option

The KBC may not have the capability to directly interface to SB-TSI. Pass FETs may be used to create two SMBus segments, see Figure 4.

### Figure 24: Pass FET Implementation

Notes:

- SCL and SDA pull-up resistors (R5 and R6, respectively) are the normal pull-up resistors for an SMBus segment and are not part of the translation circuit. They are shown for completeness.
- The gates of the FETs are tied to a voltage approximately Vgs above the lower rail voltage. A resistive divider is shown, but a convenient power rail would do nicely.
- Care must be taken to install the FETs so that any body diode does not conduct.
- The key requirement is that the high side drive low enough to register as a low on the low side. (High side Vol < Vil on low side)

### 6.4 SB-TSI Registers

Reads to unimplemented registers return 00h. Writes to unimplemented registers are discarded.

### SBTSIx01 [CPU Integer Temperature] (SBTSI::CpuTempInt)

| Read-only.   |  |
|--|--|
| The CPU temperature is calculated by adding the CPU temperature offset (SBTSI::CpuTempOffInt,                    |  |
| SBTSI::CpuTempOffDec) to the processor control temperature (Tctl). SBTSI::CpuTempInt and SBTSI::CpuTempDec       |  |
| combine to return the CPU temperature. For the temperature encoding, see 6.2.5 [SB-TSI Temperature and Threshold |  |
| Encodings]   |  |
| Bits Description   |  |

7:0 **CpuTempInt: integer CPU temperature value**. Read-only. Reset: Cold,XXh. This field returns the integer

portion of the CPU temperature.

#### SBTSIx02 [SB-TSI Status] (SBTSI::Status)

#### Read-only, Volatile.

If SBTSI::AlertConfig[AlertCompEn]==0, the temperature alert is latched high until the alert is read. If SBTSI::AlertConfig[AlertCompEn]==1, the alert is cleared when the temperature does not meet the threshold conditions for temperature and number of samples. See 6.2.3 [Alert Behavior].

| Bits | Description   |
|------|---|
| 7:5  | Reserved.   |
| 4    | <b>TempHighAlert</b> : <b>temperature high alert</b> . Read-only, Volatile. Reset: Cold,X. 1=Indicates that the CPU temperature is greater than or equal to the high temperature threshold (SBTSI::HiTempInt, SBTSI::HiTempDec) for SBTSI::AlertThreshold[AlertThr] consecutive samples. 0=Indicates that the CPU tempera- ture is less than the high temperature threshold (SBTSI::HiTempInt, SBTSI::HiTempInt, SBTSI::HiTempInt, SBTSI::AlertThreshold[AlertThr] samples and SBTSI::AlertConfig[AlertCompEn]=1. Hardware will clear this bit when read if SBTSI::AlertConfig[AlertCompEn]=0.  |
| 3    | <b>TempLowAlert: temperature low alert</b> . Read-only, Volatile. Reset: Cold,X. 1=Indicates that the CPU temperature is less than or equal to the low temperature threshold (SBTSI::LoTempInt, SBTSI::LoTempDec) for SBTSI::AlertThreshold[AlertThr] consecutive samples. 0=Indicates the CPU temperature is greater than the low temperature threshold (SBTSI::LoTempInt, SBTSI::AlertThreshold[AlertThr] consecutive samples. 0=Indicates the CPU temperature is greater than the low temperature threshold (SBTSI::LoTempInt, SBTSI::LoTempInt, SBTSI::AlertThreshold[AlertThr] samples and SBTSI::AlertConfig[AlertCompEn]=1. Hardware will clear this bit when read if SBTSI::AlertConfig[AlertCompEn]=0. |

2:0 Reserved.

#### SBTSIx03 [SB-TSI Configuration] (SBTSI::Config)

Reset: Cold,00h.

The bits in this register are read-only and can be written by writing to the corresponding bits in SBTSI::ConfigWr. See 6.2.3 [Alert Behavior] and 6.2.4 [Atomic Read Mechanism].

| Bits | Description   |
|------|---|
| 7    | AlertMask: alert mask. Read-only, Volatile. Reset: Cold, 0. 0=ALERT_L pin enabled. 1=ALERT_L pin disabled             |
|      | and does not assert. IF (SBTSI::Config[AraDis]==0) THEN Read-only; set-by-hardware. ELSE Read-only                    |
|      | ENDIF. Hardware sets this bit if SBTSI::Config[AraDis]=0, either SBTSI::Status[TempHighAlert]==1 or                   |
|      | SBTSI::Status[TempLowAlert]==1, and a successful ARA is sent.   |
| 6    | <b>RunStop</b> : <b>run stop</b> . Read-only. Reset: Cold,0. 0=Updates to SBTSI::CpuTempInt and SBTSI::CpuTempDec and |
|      | the alert comparisons are enabled; Alert history counters (specified by SBTSI::AlertThreshold[AlertThr]) and the      |
|      | corresponding timer (specified by SBTSI::UpdateRate[UpRate]) continue to update. 1=Updates to                         |
|      | SBTSI::CpuTempInt and SBTSI::CpuTempDec and the alert comparisons are disabled; Alert history counters                |
|      | (specified by SBTSI::AlertThreshold[AlertThr]) and the corresponding timer (specified by                              |
|      | SBTSI::UpdateRate[UpRate]) are stopped. See 6.2.4 [Atomic Read Mechanism] for further details.                        |
| 5    | <b>ReadOrder: atomic read order</b> . Read-only. Reset: Cold,0. 0=Reading SBTSI::CpuTempInt causes the state of       |
|      | SBTSI::CpuTempDec to be latched. 1=Reading SBTSI::CpuTempDec causes the state of SBTSI::CpuTempInt to                 |
|      | be latched. See 6.2.4 [Atomic Read Mechanism] for further details.  |
| 4:2  | Reserved.   |
| 1    | AraDis: ARA disable. Read-only. Reset: Cold,0. Read-only. 1=ARA response disabled.                                    |
| 0    | Reserved.   |

#### SBTSIx04 [Update Rate] (SBTSI::UpdateRate)

Read-write. Reset: Cold,08h.

| Bits | Description   |
|------|---|
| 7:0  | <b>UpRate</b> : <b>update rate</b> . Read-write. Reset: Cold,08h. This field specifies the rate at which CPU temperature is   |
|      | compared against the temperature thresholds to determine if an alert event has occurred. Write access causes a reset of the alert history counters (specified by SBTSI::AlertThreshold[AlertThr]) and the corresponding timer (specified by SBTSI::UpdateRate[UpRate]). |

| ValidVal | ues:        |
|----------|-------------|
| Value    | Description |
| 00h      | 0.0625 Hz   |
| 01h      | 0.125 Hz    |
| 02h      | 0.25 Hz     |

| 0Ah      | 64 Hz       |
| FFh-     | Reserved.   |
| 0Bh      |             |

#### SBTSIx07 [High Temperature Integer Threshold] (SBTSI::HiTempInt)

#### Read-write. Reset: Cold, 46h.

The high temperature threshold specifies the CPU temperature that causes ALERT\_L to assert if the CPU temperature is greater than or equal to the threshold. SBTSI::HiTempInt and SBTSI::HiTempDec combine to specify the high temperature threshold. See 6.2.5 [SB-TSI Temperature and Threshold Encodings]. Reset value equals 70 °C. Write access causes a reset of the alert history counters (specified by SBTSI::AlertThreshold[AlertThr]) and the corresponding timer (specified by SBTSI::UpdateRate[UpRate]). See 6.2.3 [Alert Behavior].

#### **Bits** Description

7:0 **HiTempInt: high temperature integer threshold**. Read-write. Reset: Cold,46h. This field specifies the integer portion of the high temperature threshold.

#### SBTSIx08 [Low Temperature Integer Threshold] (SBTSI::LoTempInt)

Read-write. Reset: Cold,00h.

The low temperature threshold specifies the CPU temperature that causes ALERT\_L to assert if the CPU temperature is less than or equal to the threshold. SBTSI::LoTempInt and SBTSI::LoTempDec combine to specify the low temperature threshold. See 6.2.5 [SB-TSI Temperature and Threshold Encodings]. Write access causes a reset of the alert history counters (specified by SBTSI::AlertThreshold[AlertThr]) and the corresponding timer (specified by SBTSI::UpdateRate[UpRate]). See 6.2.3 [Alert Behavior].

| Bits | Description   |
|------|---|
| 7    | <b>LoTempInt</b> : low temperature integer threshold. Read-write. Reset: Cold,0. This field specifies the integer |
|      | portion of the low temperature threshold.   |
| 6:0  | Reserved.   |

#### SBTSIx09 [SB-TSI Configuration Write] (SBTSI::ConfigWr)

Read-write. Reset: Cold,00h.This restrict provides write access to SBTSI::Config.BitsDescription7AlertMask: alert mask. Read-write. Reset: Cold,0. See SBTSI::Config[AlertMask].6RunStop: run stop. Read-write. Reset: Cold,0. See SBTSI::Config[RunStop].5ReadOrder: atomic read order. Read-write. Reset: Cold,0. See SBTSI::Config[ReadOrder].4:2Reserved.1AraDis: ARA disable. Read-write. Reset: Cold,0. See SBTSI::Config[AraDis].0Reserved.

#### SBTSIx10 [CPU Decimal Temperature] (SBTSI::CpuTempDec)

| Read- | only.   |  |
|-------|---|--|
| See S | BTSI::CpuTempInt.   |  |
| Bits  | Description   |  |
| 7:5   | <b>CpuTempDec</b> : <b>decimal CPU temperature value</b> . Read-only. Reset: Cold,XXXb. Read-only. This field returns |  |
|       | the decimal portion of the CPU temperature.   |  |

4:0 Reserved.

#### SBTSIx11 [CPU Temperature Offset High Byte] (SBTSI::CpuTempOffInt)

#### Read-write. Reset: Cold,00h.

SBTSI::CpuTempOffInt and SBTSI::CpuTempOffDec combine to specify the CPU temperature offset. See 6.2.6 [SB-TSI Temperature Offset Encoding] for encoding details.

#### Bits Description

7:0 **CpuTempOffInt: CPU temperature integer offset**. Read-write. Reset: Cold,00h. This field specifies the integer portion of the CPU temperature offset added to Tctl to calculate the CPU temperature. Write access causes a reset of the alert history counters (specified by SBTSI::AlertThreshold[AlertThr]) and the corresponding timer (specified by SBTSI::UpdateRate[UpRate]).

#### SBTSIx12 [CPU Temperature Decimal Offset] (SBTSI::CpuTempOffDec)

Read-write. Reset: Cold,00h.

See SBTSI::CpuTempOffInt.

Bits Description

7:5 **CpuTempOffDec: CPU temperature decimal offset**. Read-write. Reset: Cold,0h. This field specifies the decimal/fractional portion of the CPU temperature offset added to Tctl to calculate the CPU temperature. Write access causes a reset of the alert history counters (specified by SBTSI::AlertThreshold[AlertThr]) and the corresponding timer (specified by SBTSI::UpdateRate[UpRate]).

4:0 Reserved.

#### SBTSIx13 [High Temperature Decimal Threshold] (SBTSI::HiTempDec)

Read-write. Reset: Cold,00h.

See SBTSI::HiTempInt.

| Bits | Description   |
|------|---|
| 7:5  | HiTempDec: high temperature decimal threshold. Read-write. Reset: Cold,0h. This field specifies the decimal |
|      | portion of the high temperature threshold.  |
| 4:0  | Reserved.   |

#### SBTSIx14 [Low Temperature Decimal Threshold] (SBTSI::LoTempDec)

Read-write. Reset: Cold,00h.

| See SI | BTSI::LoTempInt.   |
|--------|--|
| Bits   | Description  |
| 7:5    | <b>LoTempDec</b> : <b>low temperature decimal threshold</b> . Read-write. Reset: Cold,0h. This field specifies the decimal |
|        | portion of the low temperature threshold.  |
| 4:0    | Reserved.  |

#### SBTSIx22 [Timeout Configuration] (SBTSI::TimeoutConfig)

| Read- | ead-write. Reset: Cold,80h.   |  |
|-------|---|--|
| Bits  | Description   |  |
| 7     | <b>TimeoutEn</b> : <b>SMBus timeout enable</b> . Read-write. Reset: Cold,1. 0=SMBus defined timeout support disabled. |  |
|       | 1=SMBus defined timeout support enabled. SMBus timeout enable.  |  |
| 6:0   | Reserved.   |  |

#### SBTSIx32 [Alert Threshold Register] (SBTSI::AlertThreshold)

Read-write. Reset: Cold,00h. See 6.2.3 [Alert Behavior].

#### **Bits Description** 7:3 Reserved. AlertThr: alert threshold. Read-write. Reset: Cold,0h. Specifies the number of consecutive CPU temperature 2:0 samples for which a temperature alert condition needs to remain valid before the corresponding alert bit is set. For SBTSI::AlertConfig[AlertCompEn]=1 it specifies the number of consecutive CPU temperature samples for which a temperature alert condition need to remain not valid before the corresponding alert bit gets cleared. Write access resets the alert history counters (specified by SBTSI::AlertThreshold[AlertThr]) and the corresponding timer (specified by SBTSI::UpdateRate[UpRate]). Details in SBTSI::Status. ValidValues: Value Description 0h 1 Sample 6h-1h <Value+1> Samples 7h 8 Samples

#### SBTSIxBF [Alert Configuration] (SBTSI::AlertConfig)

Read-write.

BitsDescription7:1Reserved.0AlertCompEn: alert comparator mode enable. Read-write. Reset: Cold,X. 0=SBTSI::Status[TempHighAlert]<br/>and SBTSI::Status[TempLowAlert] are read clear. 1=SBTSI::Status[TempHighAlert] and<br/>SBTSI::Status[TempLowAlert] are read only; ARA response disabled. Write access does not change the alert<br/>history counters (specified by SBTSI::AlertThreshold[AlertThr]) or the corresponding timer (specified by<br/>SBTSI::UpdateRate[UpRate]). See SBTSI::Status.

#### SBTSIxFE [Manufacture ID] (SBTSI::ManId)

Read-only. Reset: Cold,00h.

**Bits Description** 

7:1 Reserved.

0 **ManId: Manufacture ID**. Read-only. Reset: Cold,0. Returns the AMD manufacture ID.

#### SBTSIxFF [Revision] (SBTSI::Revision)

Read-only. Reset: Cold,04h.

Bits Description

7:0 Revision: SB-TSI revision. Read-only. Reset: Cold,04h. Specifies the SBI temperature sensor interface revision.

7 UMC

### 7.1 UMC Overview

Each processor die includes two Unified Memory Controllers (UMC).

Each UMC controls one DDR4 channel, either 64-bit or 72-bit with ECC.

The UMC interfaces to the system via the Data Fabric (DF) Coherent Slave. The UMC operates on normalized addresses which only include address bits within a UMC's populated memory address range. The physical to normalized address translation varies based on various Data Fabric settings. The normalized address to DRAM address protocol translation is performed by the UMC.

The following restrictions limit the DRAM and/or DIMM types and configurations supported by the UMC:

- DDR4 DRAM devices.
- Mixing of DDR4 ECC and non-ECC DIMMs within a channel is not supported.
- Mixing of base module types within a channel is not supported.
- All UMCs are required to operate at the same MEMCLK frequency, regardless of the channel.
- Asymmetrical DRAM package types are not supported.
- Additional AM4 package rules:
  - DDR4 x8 and x16 devices are supported. x4 devices are not supported.
- Additional SP3 and SP4 package rules:
  - DIMMs must be of the same type per die (channel pair).
    - NVDIMM-N DIMMs may be populated with a DIMM of the same DIMM base module type.
  - When populating channel pairs, the following conditions apply:
    - Two DIMMs: Populate one per channel and the DIMMs must be identical.
    - Three DIMMs: The channel with two DIMMs must be identical and have the same total capacity as the other channel with one DIMM.
      - Three NVDIMM-N DIMMs across the two channels is not supported.
    - Four DIMMs: DIMMs must be pair-wise identical.
    - Mixing of x4 and x8 devices within a channel is not supported.
  - Mixing of 3DS and non-3DS devices within a channel is not supported.

### 7.1.1 UMC Frequency Support

The motherboard should comply with the relevant AMD socket motherboard design guidelines (MBDG) to achieve the rated speeds. In cases where MBDG design options exist, lower-quality options may compromise the maximum achievable speed; motherboard designers should assess the tradeoffs.

# **List of Definitions**

**ABS**: ABS(integer expression): Remove sign from signed value. **AGESA™**: AMD Generic Encapsulated Software Architecture.

**AGESA**<sup>TM</sup>: AMD Generic Encapsulated Software Architecture. **AM4**: Desktop, single die, single socket. For client platform DDR4. AM4 =

(Core::X86::Cpuid::BrandId[PkgType] == 02h).

APML: Advanced Platform Management Link.

ARA: Alert response address.

ARP: Address Resolution Protocol

**BAR:** The BAR, or base address register, physical register mnemonic format is of the form PREFIXxZZZ.

**BCD**: Binary Coded Decimal number format.

**BCS**: Base Configuration Space.

**BIST**: Built-In Self-Test. Hardware within the processor that generates test patterns and verifies that they are stored correctly (in the case of memories) or received without error (in the case of links).

**BMC**: Base management controller.

BSC: Boot strap core. Core 0 of the BSP.

**BSP**: Boot strap processor.

**C-states**: These are ACPI defined core power states. C0 is operational. All other C-states are low-power states in which the processor is not executing code. See docACPI.

**Canonical-address:** An address in which the state of the most-significant implemented bit is duplicated in all the remaining higher-order bits, up to bit 63.

**CCX**: Core Complex where more than one core shares L3 resources.

**CEIL**: CEIL(real expression): Rounds real number up to nearest integer. **CMP**: Specifies the core number.

**COF**: Current operating frequency of a given clock domain.

**Configurable**: Indicates that the access type is configurable as described by the documentation.

**CoreCOF**: Core current operating frequency in MHz. CoreCOF = (Core::X86::Msr::PStateDef[CpuFid[7:0]]/Core::X86::Msr::PStateDef[CpuD fsId])\*200.

**COUNT**: COUNT(integer expression): Returns the number of binary 1's in the integer.

**CpuCoreNum**: Specifies the core number.

**CPUID**: The CPUID, or x86 processor identification state, physical register mnemonic format is of the form CPUID FnXXXX\_XXXX\_EiX[\_xYYY], where XXXX\_XXXX is the hex value in the EAX and YYY is the hex value in ECX.

**DID**: Divisor Identifier. Specifies the post-PLL divisor used to reduce the COF.

**docACPI**: Advanced Configuration and Power Interface (ACPI)

Specification. <u>http://www.acpi.info</u>.

**docAM4**: Socket AM4 Processor Functional Data Sheet, order# 55509. **docAPM1**: AMD64 Architecture Programmer's Manual Volume 1:

Application Programming, order# 24592.

**docAPM2**: AMD64 Architecture Programmer's Manual Volume 2: System Programming, order# 24593.

**docAPM3**: AMD64 Architecture Programmer's Manual Volume 3: Instruction-Set Reference, order# 24594.

**docAPM4**: AMD64 Architecture Programmer's Manual Volume 4: 128-Bit and 256-Bit Media Instructions, order# 26568.

**docAPM5**: AMD64 Architecture Programmer's Manual Volume 5: 64-Bit Media and x87 Floating-Point Instructions, order# 26569.

docI2C: I2C Bus Specification.

http://www.nxp.com/documents/user\_manual/UM10204.pdf

**docIOMMU**: AMD I/O Virtualization Technology Specification, order# 48882.

docJEDEC: JEDEC Standards. http://www.jedec.org.

docPCIe: PCI Express® Specification. http://www.pcisig.org.

**docPCIIb**: PCI Local Bus Specification. <u>http://www.pcisig.org</u>. **docRAS**: RAS Feature Enablement for AMD Family 17h Models 00h-0Fh,

order# 55987.

**docRevG**: Revision Guide for AMD Family 17h Models 00h-0Fh Processors, order# 55449.

**Doubleword**: A 32-bit value.

DW: Doubleword.

**EC**: Embedded Controller.

ECS: Extended Configuration Space.

EDC: Electrical design current. Indicates the maximum current the voltage

# PPR for AMD Family 17h Models 01h,08h B2

rail can demand for a short, thermally insignificant time. Error-on-read: Error occurs on read. Error-on-write: Error occurs on write. Error-on-write-0: Error occurs on bitwise write of 0. Error-on-write-1: Error occurs on bitwise write of 1. FCH: The integrated platform subsystem that contains the IO interfaces and bridges them to the system BIOS. Previously included in the Southbridge. FDS: Functional Data Sheet. There is one FDS for each package type. See docSAM4. FID: Frequency Identifier. Specifies the PLL frequency multiplier for a given clock domain. FLOOR: FLOOR(integer expression): Rounds real number down to nearest integer. **GB**: Gbyte or Gigabyte; 1,073,741,824 bytes. HTC: Hardware Thermal Control. **IBS**: Instruction based sampling. Inaccessible: Not readable or writable (e.g., Hide ? Inaccessible : Read-Write). **IORR**: IO range register. KB: Kbyte or Kilobyte; 1024 bytes. KBC: Keyboard Controller.

**L3**: Level 3 Cache. The L3 term is also in Addrmaps to enumerate CCX units.

**LINT**: Local interrupt.

**LVT**: Local vector table. A collection of APIC registers that define interrupts for local events (e.g., APIC[530:500] [Extended Interrupt [3:0] Local Vector Table]).

**MAX**: MAX(integer expression list): Picks maximum integer or real value of comma separated list.

**MB**: Megabyte; 1024 KB.

MCA: Machine Check Architecture.

MCAX: Machine Check Architecture eXtensions.

**Micro-op:** Micro-op. Instructions have variable-length encoding and many perform multiple primitive operations. The processor does not execute these complex instructions directly, but, instead, decodes them internally into simpler fixed-length instructions called macro-ops. Processor schedulers subsequently break down macro-ops into sequences of even simpler instructions called micro-ops, each of which specifies a single primitive operation.

**MIN**: MIN(integer expression list): Picks minimum integer or real value of comma separated list.

**MMIO**: Memory-Mapped Input-Output range. This is physical address space that is mapped to the IO functions such as the IO links or MMIO configuration.

**MSR**: The MSR, or x86 model specific register, physical register mnemonic format is of the form MSRXXXX\_XXXX, where XXXX\_XXXX is the hexadecimal MSR number. This space is accessed through x86 defined RDMSR and WRMSR instructions.

**MTRR**: Memory-type range register. The MTRRs specify the type of memory associated with various memory ranges.

**NBC**: NBC = (CPUID Fn00000001\_EBX[LocalApicId[3:0]]==0). Node Base Core. The lowest numbered core in the node.

**Node**: A node, is an integrated circuit device that includes one to 8 cores (one or two Core Complexes).

NTA: Non-Temporal Access.

OW: Octword. An 128-bit value.

**PCICFG:** The PCICFG, or PCI defined configuration space, physical register mnemonic format is of the form DXFYxZZZ.

PCIe®: PCI Express.

**PEC**: Packet error code.

**PMC**: The PMC, or x86 performance monitor counter, physical register mnemonic format is any of the forms {PMCxXXX, L2IPMCxXXX,

NBPMCxXXX}, where XXX is the performance monitor select.

POR: Power on reset.

**POW**: POW(base, exponent): POW(x,y) returns the value x to the power of y.

**Processor**: A package containing one or more Nodes. See Node. **PTE**: Page table entry.

**OW**: Quadword. A 64-bit value.

**REFCLK**: Reference clock. Refers to the clock frequency (100 MHz) or the clock period (10 ns) depending on the context used.

**Reserved-write-as-0**: Reads are undefined. Must always write 0.

Reserved-write-as-1: Reads are undefined. Must always write 1.

#### 54945 Rev 3.03 - Jun 14, 2019

**ROUND**: ROUND(real expression): Rounds to the nearest integer; halfway rounds away from zero.

**RTS**: Remote temperature sensor, typical examples are ADM1032, LM99, MAX6657, EMC1002.

**SB-TSI**: Sideband Internal Temperature Sensor Interface. See APML. **SBI**: Sideband interface.

**Shutdown:** A state in which the affected core waits for either INIT, RESET, or NMI. When shutdown state is entered, a shutdown special cycle is sent on the IO links.

**SMAF**: System Management Action Field. This is the code passed from the SMC to the processors in STPCLK assertion messages.

**SMI**: System management interrupt.

SMM: System Management Mode.

**SMT**: Simultaneous multithreading. See

Core::X86::Cpuid::CoreId[ThreadsPerCore].

**SP3**: Server, four die MCM, single and dual socket.

SP3r2: High performance desktop, 4-die, single socket, lidded LGA.

SVM: Secure virtual machine.

**TCC**: Temperature Calculation Circuit.

Tctl: Processor Temperature control value.

TDC: Thermal Design Current.

**TDP**: Thermal Design Power. A power consumption parameter that is used in conjunction with thermal specifications to design appropriate cooling solutions for the processor.

Thread: One architectural context for instruction execution.

**Token:** A scheduler entry used in various DF queues to track outstanding requests.

**TSI**: Temperature sensor interface.

**TSM**: Temperature sensor macro.

**UMI**: Unified Media Interface. The link between the processor and the FCH. **UNIT**: UNIT(register field reference): Input operand is a register field reference that contains a valid values table that defines a value with a unit (e.g., clocks, ns, ms, etc). This function takes the value in the register field and returns the value associated with the unit (e.g., If the field had a valid value definition where 1010b was defined as 5 ns). Then if the field had the value of 1010b, then UNIT() would return the value 5.

**Unpredictable**: The behavior of both reads and writes is unpredictable. **VDD**: Main power supply to the processor core logic.

VID: Voltage level identifier.

**Volatile**: Indicates that a register field value may be modified by hardware, firmware, or microcode when fetching the first instruction and/or might have read or write side effects. No read may depend on the results of a previous read and no write may be omitted based on the value of a previous read or write.

**WDT**: Watchdog timer. A timer that detects activity and triggers an error if a specified period of time expires without the activity.

WRIG: Writes Ignored. Write-0-only: Writing a 0 clears to a 0; Writing a 1 has no effect. If not

associated with Read, then reads are undefined. **Write-1-only**: Writing a 1 sets to a 1; Writing a 0 has no effect. If not

associated with Read, then reads are undefined.

Write-1-to-clear: Writing a 1 clears to a 0; Writing a 0 has no effect. If not associated with Read, then reads are undefined.

**Write-once**: Capable of being written once; all subsequent writes have no effect. If not associated with Read, then reads are undefined.

XBAR: Cross bar; command packet switch.
