MPLAB® Harmony Help - Peripheral Libraries

MPLAB Harmony Integrated Software Framework v1.11

Peripheral Libraries Help

This section provides descriptions of the peripheral libraries that are available in MPLAB Harmony.

Description

The source code for the MPLAB Harmony Peripheral Libraries (PLIBs) is distributed in the installation (`<install-dir>/framework/`peripheral). Each PLIB folder has (at least) two sub-folders: `processor` and `templates`. The files within the `processor` directory are generated mechanically during the MPLAB Harmony development process. These files define register macro translations and translate between the API function prototypes and different variants of the "inline" function implementations that are contained in the `templates` folder.

With a few exceptions PLIBs are implemented as C-language inline functions and translated by the preprocessor at build time. If almost any optimization is used and constants are passed into them, each call will normally compile away to just a few bytes of code. Prebuilt binary (`.a`) files are also provided (built at a -O3 optimization level) for times when no optimization is used or any time the compiler decides to generate a true function call instead of inlining the function. The prebuilt binary (`.a`) libraries are generated by changing the definitions of the PLIB_INLINE and PLIB_INLINE_API macros attached to the PLIB implementations from "inline extern" to just "extern" when the binaries are built. A MPLAB X IDE project is provided in the `<install-dir>/build/framework/peripheral` folder to allow a user to rebuild these binaries, if desired. Be sure to inspect the compiler settings and post-build steps, to see how this is done and to ensure the desired settings are used.

Peripheral Library Overview

This topic provides an overview of the peripheral libraries that are available in MPLAB Harmony.

Introduction

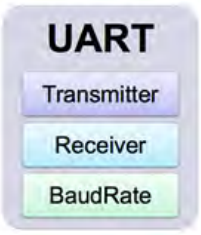
This topic provides an overview of the peripheral libraries in MPLAB Harmony.

Description

Supported PIC32 Devices and Release Type

Note: Refer to the *Release Contents* > *Peripheral Libraries* section in the MPLAB Harmony Release Notes for the list of supported PIC32 devices and their release type. A PDF copy of the release notes is provided in the `<install-dir>/doc` folder of your installation.

MPLAB Harmony peripheral libraries (PLIBs) model the hardware peripheral modules available on Microchip microcontrollers by breaking each peripheral down into a set of individual features. For example, a (simplified) UART peripheral module may have three features, as shown in the following diagram.



Every feature of a peripheral will have one or more primitive operations that can be performed using that feature. These operations are named in a way that identifies the module, feature, and operation and the fact that they are Peripheral Library functions, as shown in the following figure.

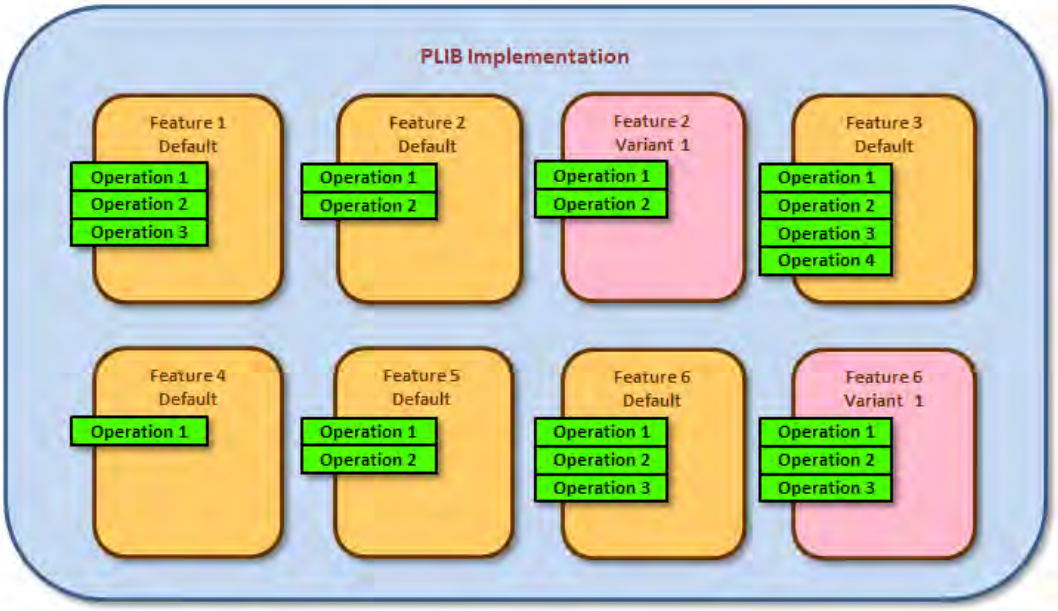
The simplified UART peripheral example has a "baud rate" feature. That feature may have two operations that it can perform. One operation might be a "set" function to set the current baud rate at which the UART will send and receive data and the other might be a "get" operation to find out the baud rate at which the UART is currently transmitting and receiving. Example C-language function signatures of these operations is as follows:

```
void    PLIB_USART_BaudRateSet( USART_MODULE_ID index, uint32_t clockFrequency,
                                uint32_t baudRate );

uint32_t    PLIB_USART_BaudRateGet( USART_MODULE_ID index, int32_t clockFrequency );
```

Notice that each function accepts an "index" parameter, as well as data parameters relevant to the operation itself, such as the input clock frequency and desired baud rate. The "index" parameter allows one set of PLIB functions to support any number of instances of the peripheral on a give microcontroller. Thus, each peripheral library exposes all of the features available on all instances of a given type of peripheral.

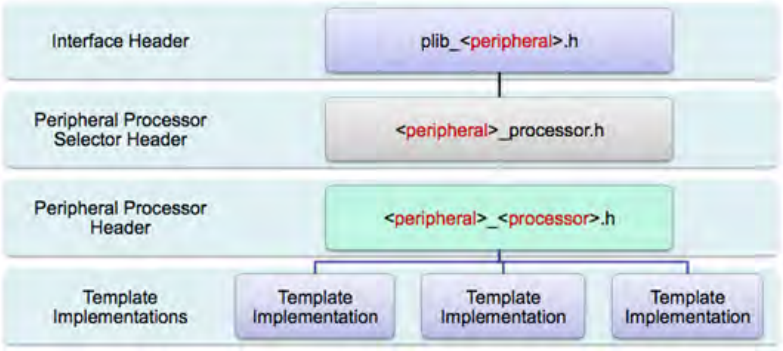
The function signature (name, parameters, and return value) for the operations supported by that feature will be the same on all microcontrollers even if the implementations of those functions are different from one microcontroller to another. These are known as "implementation variants". As illustrated in the following diagram, a PLIB implementation is made up of the complete set of default and variant implementations of the operations of every feature supported by a specific type of peripheral on a specific microcontroller.



Using this method, MPLAB Harmony Peripheral Libraries provide consistent C-language functional interfaces to access the peripherals available on all supported microcontrollers.

However, if a feature is not supported on all instances of the peripheral on all supported microcontrollers, the peripheral library communicates this to the developer in one of two ways. If a feature is not supported by any instance of the peripheral on a given microcontroller, the primitive functions related to that feature will also be unsupported and they will cause build warnings indicating this if they are called. If a feature is supported on at least one, but not on all of the available instances of a the peripheral on the microcontroller in use, the functions will be supported; however, they will provide a run-time error to facilitate debugging. Which features are supported on each instance of each microcontroller is documented in the help material for each peripheral library.

Peripheral libraries are primarily implemented as C-language "inline" functions. This allows the implementation of each function to be selected at build time, based upon the processor selection. To facilitate this, MPLAB Harmony peripheral libraries are implemented in layers of C-language header (`.h`) files, as shown in the following diagram.



For a given peripheral, "Interface Header" defines set of functions and data types (although, potentially not all of the data types, as discussed in a following section) that make up the interface to that peripheral library. To select the correct implementation for each processor, a "Peripheral Processor Selector Header" includes only the appropriate "Peripheral Processor Header" for the selected processor. This header then acts as a "mapping" header that translates the interface functions defined in the interface header to the correct implementation variant template for each function in the "Template Implementation" files.

This may seem a little confusing at first, but since all functions are implemented in header files as "inline" functions, the compiler can perform all of the mapping at build time, resulting in very small static implementations when static data is passed to the PLIB functions.

One more key concept is that, although peripheral libraries do provide a level of abstraction, they are still very low level. PLIBs combine accesses to multiple registers to implement a single operation when possible. They hiding register details from the caller and provide a consistent "functional" interface to a peripheral that hides differences in implementation variants. But, PLIBs do not manage the state of the peripheral to keep it running and they do not control access to the peripheral to prevent conflicts between different clients. Those jobs belong to the device drivers.

Fundamentally, peripheral libraries are peripheral access libraries. PLIB function calls do not block or call anything outside of the PLIB itself (with the exception of some removable debugging support). A PLIB function does not maintain any state data (outside of the data stored in hardware registers) as it may be called from within the main line of execution, from within an RTOS thread, or from within an ISR. And, PLIB functions are normally generated as "PLIB_INLINE", not as actual function calls (although optimized, prebuilt PLIB libraries are provided to support those times when the compiler does not generate the function "PLIB_INLINE"). A PLIB simply provides the ability to directly access and manipulate the features of a given peripheral using primitive operations. It is the responsibility of the calling module (usually the device driver) to store and appropriately protect any state data necessary to keep the peripheral running.

So, while an application (or any other layer) may directly access the PLIB for any particular peripheral in the system, if it does, it must be the only

module in the system that does this and it then becomes responsible for the correct operation that peripheral instance in that system. That is why PLIBs are not normally the recommended way to access peripherals. It is usually better to access a peripheral through a driver or system service that manages the state machine of the peripheral and protects the peripheral so that accesses to it from multiple clients will not interfere with the correct operation of the peripheral.

Configuring a Library

The library is configured for the supported processor when the processor is chosen in the MPLAB X IDE.

Description

Peripheral library interfaces are common across all supported processors. But, their implementations are part specific and are provided in two forms that must normally be used together to avoid the possibility of build errors.

The first form of the PLIB implementation is as a set of C-language "inline" functions found in `.h` header files in the `<install-dir>/framework/peripheral` folder in the MPLAB Harmony installation. The correct implementation template files for the functions supported by each variant of a feature found on a selected processor is selected and included in the header file hierarchy when a PLIB interface header is included in a source file that uses it (either directly or by including `peripheral.h`). The second form in which the peripheral library implementations are provided is as a set of part-specific prebuilt binary library `.a` files (available in the `<install-dir>/bin/framework/peripheral` folder in the MPLAB Harmony installation.

To ensure that your MPLAB Harmony project builds correctly (regardless of the level of optimization selected), you must do two things. You must include the appropriate PLIB interface header file (either by including `peripheral.h` or the specific PLIB interface header) in any C-language file that calls a PLIB function. And, you must include the appropriate prebuilt binary library file (the one whose file name includes the appropriate part name) for the processor you selected in your MPLAB X IDE project.

Both of these steps are necessary because the compiler decides at build time if it will generate an actual function call to each PLIB function or if it will generate the function directly in line with the code that calls it. When the optimization level is high enough, the compiler will directly generate the PLIB function code inline with the calling code and no prebuilt library would be required. But, if the compiler "judges" that the function is too large to inline (or if optimizations are turned off), it will generate an actual function call. When this happens, the prebuilt library is required or the linker will generate an error when it tries to link the function call to an actual implementation. Since the compiler makes this determination for each function call it encounters, the safest choice is to always include the prebuilt binary `.a` file in your project.

Fortunately, the MPLAB Harmony installation provides prebuilt binary `.a` forms of the peripheral libraries that were built using a "-O3" level of optimization so that users of free versions of the compiler, which do not support this advanced level of optimization, can benefit from them. This level of optimization usually provides the best over-all compromise between code size and speed. However, if a different level of optimization is desired, users of the pro version of the compiler can rebuild the peripheral library `.a` file using the MPLAB X IDE project provided in the `<install-dir>/build/framework/peripheral` folder of the MPLAB Harmony installation.

To build the binary `.a` form of the peripheral libraries, the PLIBs require the project to define two macros before any file that includes any PLIB header. These macros are used to enable or disable the "inline" attribute on the peripheral library function definitions so that they can be built into a binary `.a` file that exports the PLIB API function symbols. These macros, their usage, and their default definitions are described as follows.

Macro:

PLIB_INLINE_API

Summary:

Determines if PLIB interface (API) functions are treated by the compiler as inline or extern (called) functions.

Description:

This macro is used as an attribute of every peripheral library interface (API) function. Its default definition allows the compiler to choose to either generate the function directly in line with the calling code or to generate an actual function call which must later be linked to an actual function implementation, based on the size of the code generated with the current optimization settings.

Remarks:

The default definition of this macro is:

```
#ifndef PLIB_INLINE_API
    #define PLIB_INLINE_API extern inline
#endif
```

To build a binary `.a` form of the peripheral libraries, define this macro as shown in the following example to export all PLIB API functions so that calls to them can be linked to the library generated.

```
#define PLIB_INLINE_API  extern
```

Macro:

PLIB_INLINE

Summary:

Determines if PLIB support functions are generated as static inline or extern inline functions.

Description:

This macro is used as an attribute of every peripheral library (PLIB) support function. PLIB support functions are functions that are called by the PLIB interface (API) functions, but are not themselves intended to be exported as PLIB interface functions. This macro's default definition prevents the compiler from generating superfluous error messages that would occur if the PLIB support functions were declared with a different scope (static versus extern) from the PLIB interface functions, which would occur when the PLIB headers are included in calling code.

This superfluous error message would occur because, the support functions do not need to be exported when a binary `.a` file is generated (and, thus should be declared with "static" scope). But, the compiler would detect the mismatch between the scope of the support functions when the API functions are declared with external scope when the PLIBs are directly included in calling code.

Remarks:

The default definition of this macro is:

```
#ifndef PLIB_INLINE
    #define PLIB_INLINE extern inline
#endif
```

To build a binary `.a` form of the peripheral libraries, define this macro as shown in the following example. This prevents the binary `.a` library from exporting all PLIB support functions, dramatically reducing the size of the generated library's symbol table.

```
#define PLIB_INLINE  static inline
```

Peripheral Library Porting Example

Peripheral Library Porting Example Help

Introduction

Provides an example on how to port a legacy (i.e., prior to MPLAB Harmony) USART Peripheral Library (PLIB) demonstration application to a MPLAB Harmony application using the MPLAB Harmony Configurator (MHC).

Description

This section describes the process to port the legacy UART PLIB Interrupt demonstration application (`<compiler-install-dir>/examples/plib_examples/uart/uart_interrupt`) to MPLAB Harmony.

The following assumptions are made:

- The PIC32MX795F512L device will be used; however, the process described in this section is applicable for other PIC32 devices with appropriate changes
- The Explorer 16 Development Board is the hardware used in this example
- For the v1.33 MPLAB XC32 C/C++ Compiler, the `examples` folder is not present. To view the legacy USART PLIB example, refer to v1.31 or earlier of the MPLAB XC32 C/C++ compiler.

Porting Procedure

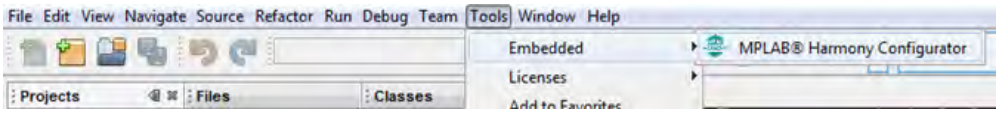
Describes the steps to set up the porting process.

Description

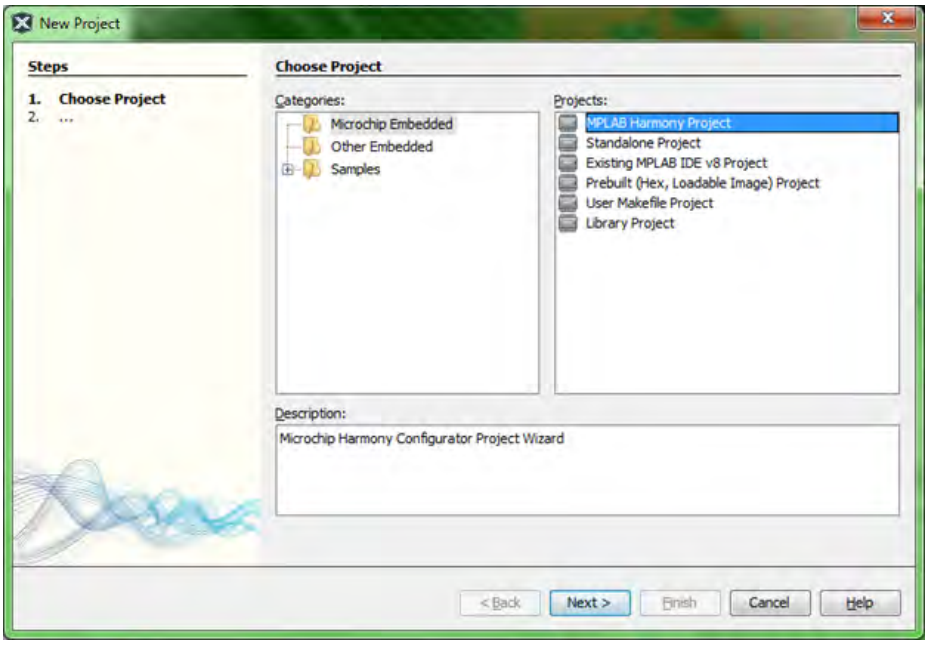
Step 1: Install the latest version of MPLAB Harmony. Throughout this porting guide, it is assumed that MPLAB Harmony is installed in its default location: `C:/microchip/harmony/<version>`. The `<version>` folder is assumed to be the root directory and all further steps will be explained relative to this root folder.

Step 2: Open MPLAB X IDE.

Step 3: Since the project will be created using the MHC, ensure that the MHC plug-in has been installed in MPLAB X IDE. You can verify the installation by selecting Tools > Embedded. If MHC is installed, you will see MPLAB Harmony Configurator is available as an option. Refer to Installing a Plug-in Module for information on installing the plug-in.

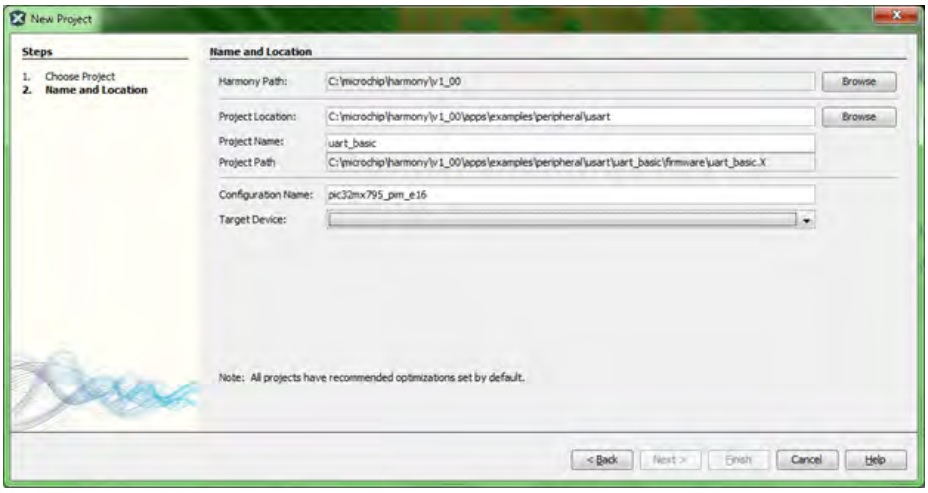


Step 4: Select *File > New Project* or click the New Project icon in MPLAB X IDE. In Categories, select **Microchip Embedded** and in Projects select **MPLAB Harmony Project** from the list of available project templates, and then click **Next** to launch the Microchip Harmony Configurator Project Wizard.

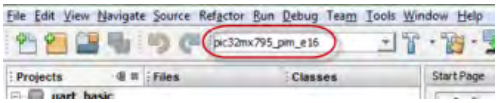


Step 5: Specify the following in the New Project dialog:

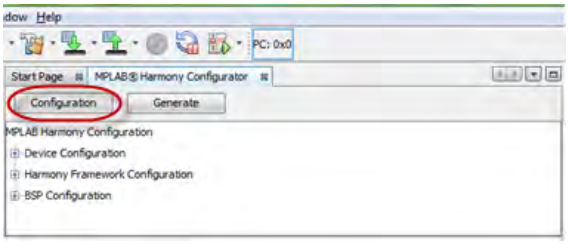
- Project Location: `<install-dir>/apps/examples/peripheral/usart`
  - Project Name: uart_basic
  - Configuration Name: pic32mx795_pim_e16
  - Target Device of PIC32MX795F512L



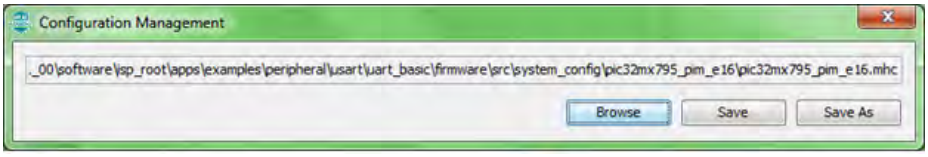
Step 6: Once the project is created, the configuration name will be set as "pic32mx795_pim_e16", as shown in the following figure.



Step 7: In the MPLAB Harmony Configurator tab, click **Configuration**.

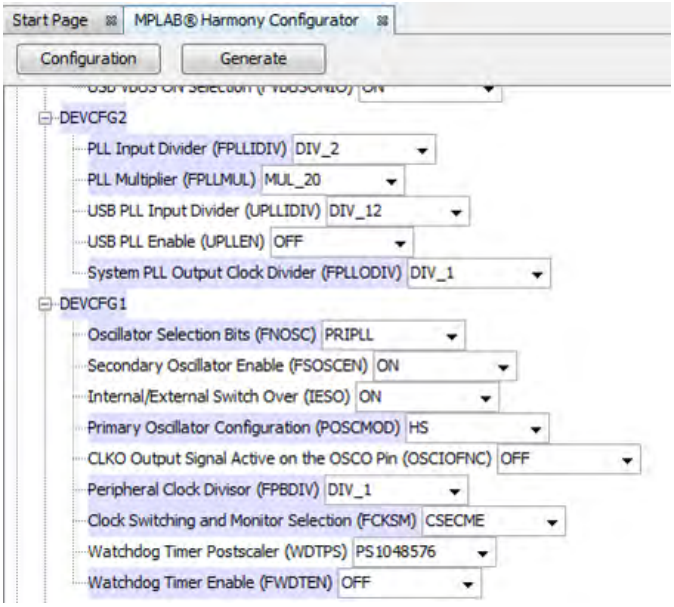


The Configuration Management dialog appears, which lists the folder path where the default configurator file (`.mhc`) will be saved. It is recommended not to modify the default path. Click **Save** to continue.

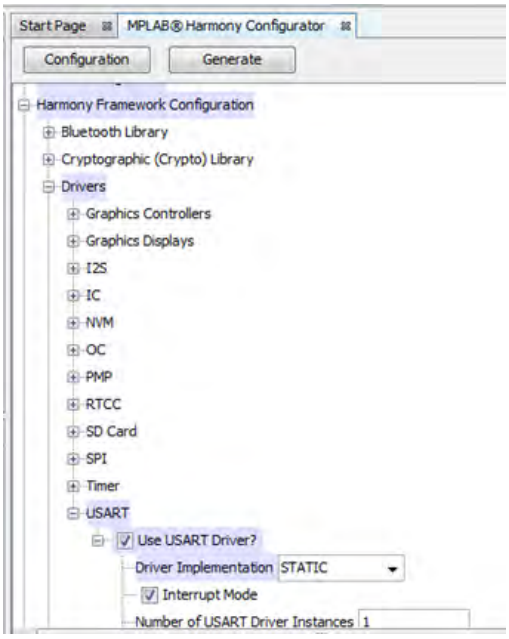


Step 8: In the MPLAB Harmony Configuration tab, configure the Device Configuration, Harmony Framework Configuration and BSP Configuration by selecting appropriate items from each drop down menu.

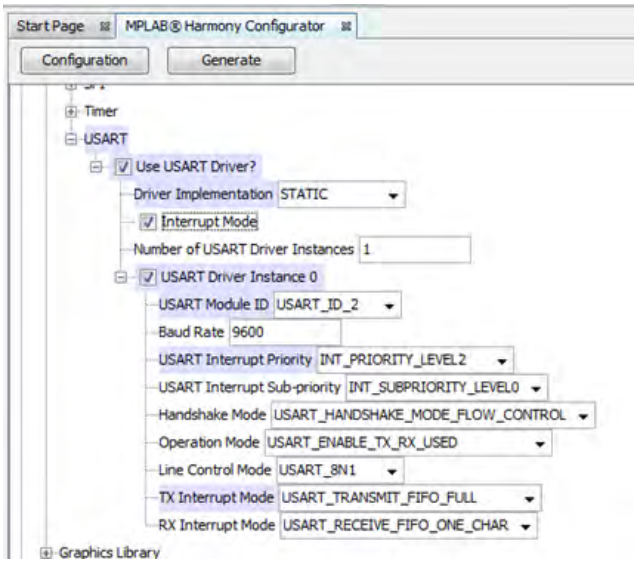
- Device Configuration: Since the controller should be running at 80 MHz with an 8 MHz external crystal, the configuration bits are set from the drop down menu, as shown in the following figure



- Harmony Framework Configuration: To enabler use of the UART Peripheral Library, the UART driver should be selected in the STATIC configuration in Interrupt mode, as shown in the following figure



- UART Configuration: Configure the UART2 with baud rate set to 9600, and interrupt enabled only for RX and Error. Also, set the other UART parameters, as shown in the following figure.

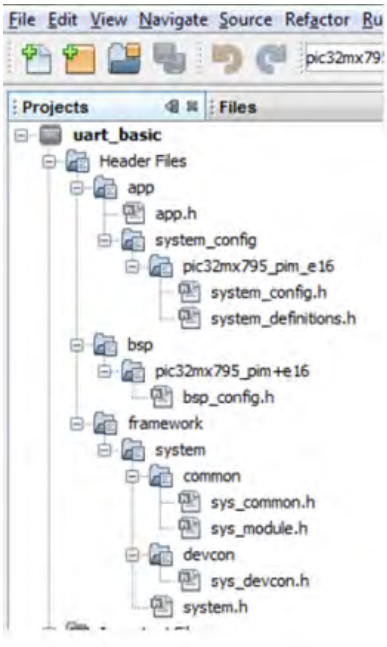


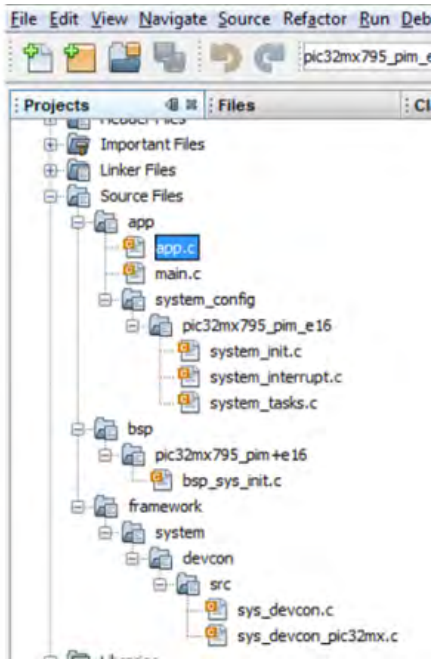
- BSP Configuration: Configure the BSP to use the PIC32MX795F512L and Explorer 16 Development Board, as shown in the following figure

Step 9: Click **Generate**. Since, the configurations were modified from the default values, MHC will ask whether or not the new configuration setting file (`.mhc`) should be saved. Click **Save** to continue.

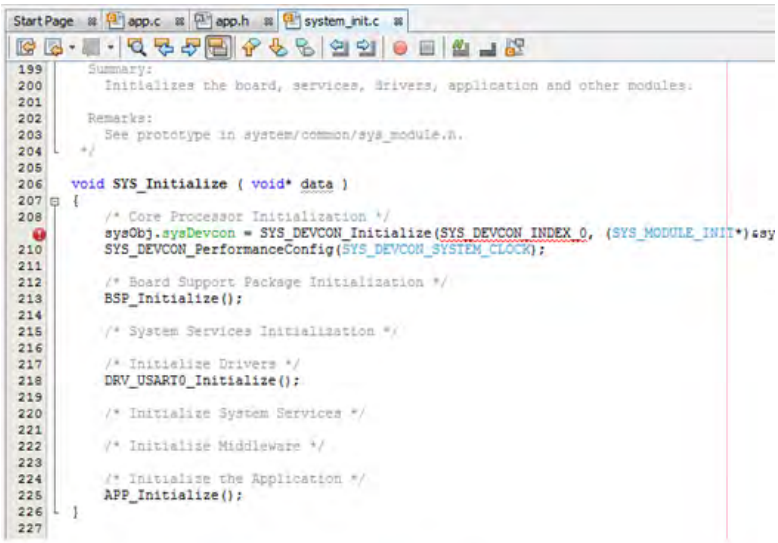
Step 10: Click **Generate**. Once the files are generated, the header, source, and library files will be added to the `uart_basic` project. The explanation of each logical folder is as follows:

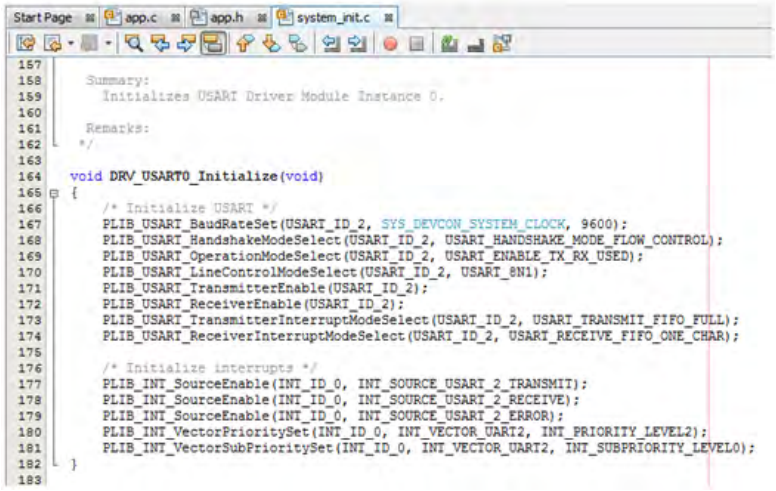
- `app` – Contains all application specific source files
- `bsp` – Contains all board specific source files
- `framework` – Contains all framework files from MPLAB Harmony
- `system_config` – Contains the system and application configuration, initialization, and Interrupt Service Routine (ISR)





Step 11: At this point in the process, the `system_init.c` file will have functions/code to initialize the device clock and initialize the UART2. The code will be consistent to the settings previously done with MHC in **Step 8**.

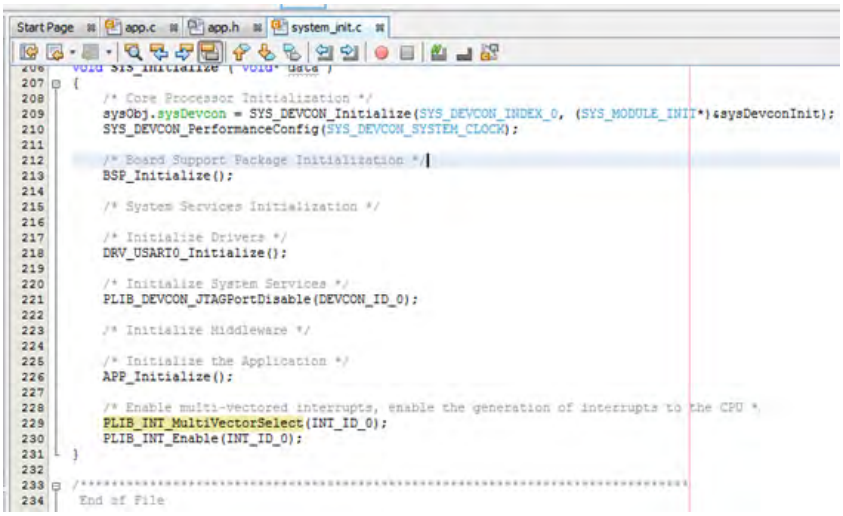




Step 12: Since the LEDs on the Explorer 16 Development Board are controlled by pins of PIC32MX795F512L device, which are shared with the JTAG function, JTAG should be disabled by manually adding the PLIB_DEVCON_JTAGPortDisable function in `system_init.c`. In addition, manually add the functions to set Multi-vector mode (PLIB_INT_MultiVectorSelect) and enable interrupt (PLIB_INT_Enable).

```
/* Initialize System Services */
PLIB_DEVCON_JTAGPortDisable(DEVCON_ID_0);

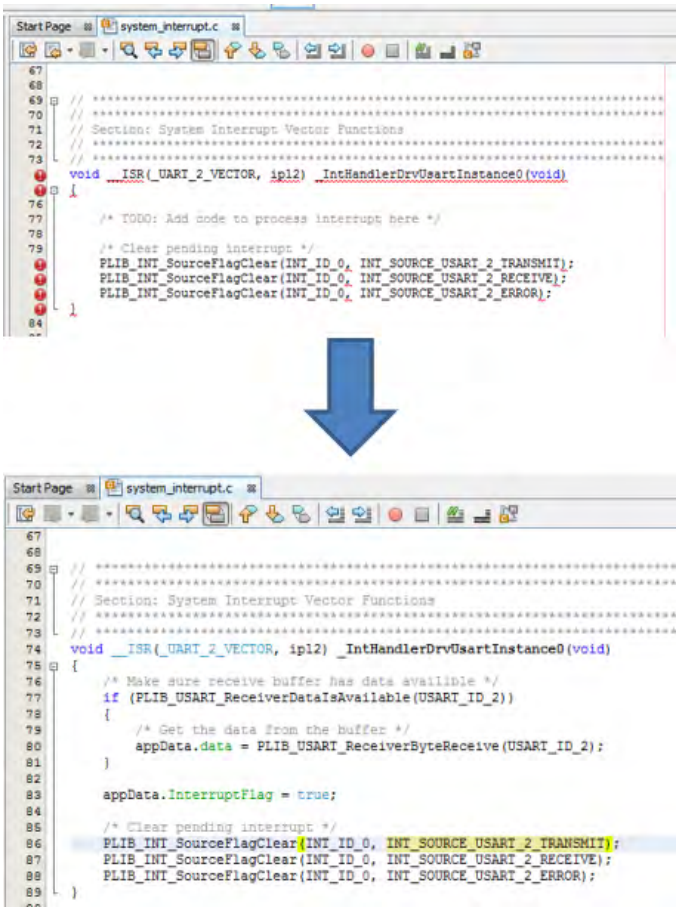
/* Enable multi-vectored interrupts, enable the generation of interrupts to the CPU */
PLIB_INT_MultiVectorSelect(INT_ID_0);
PLIB_INT_Enable(INT_ID_0);
```



Step 13: In the ISR function of the `system_interrupt.c` file, add code to echo back the received character.

```
    /* Make sure receive buffer has data available */
    if (PLIB_USART_ReceiverDataIsAvailable(USART_ID_2))
    {
        /* Get the data from the buffer */
        appData.data = PLIB_USART_ReceiverByteReceive(USART_ID_2);
    }

    appData.InterruptFlag = true;
;
```



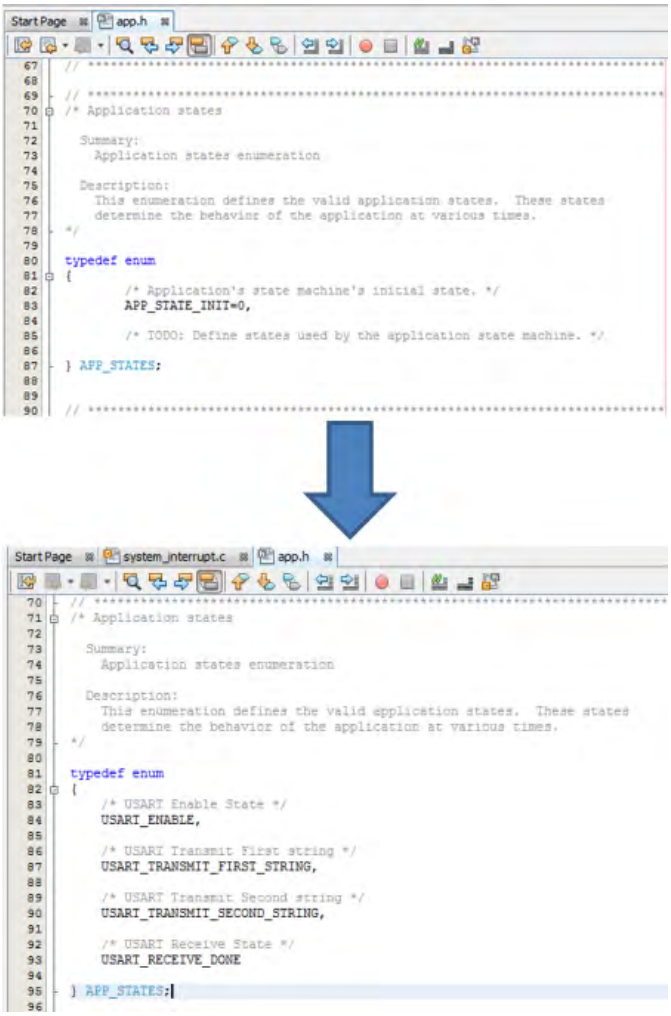
Step 14: In the file `app.h`, define the application-specific members of the APP_STATES enumeration.

```
    /* USART Enable State */
    USART_ENABLE,

    /* USART Transmit First string */
    USART_TRANSMIT_FIRST_STRING,

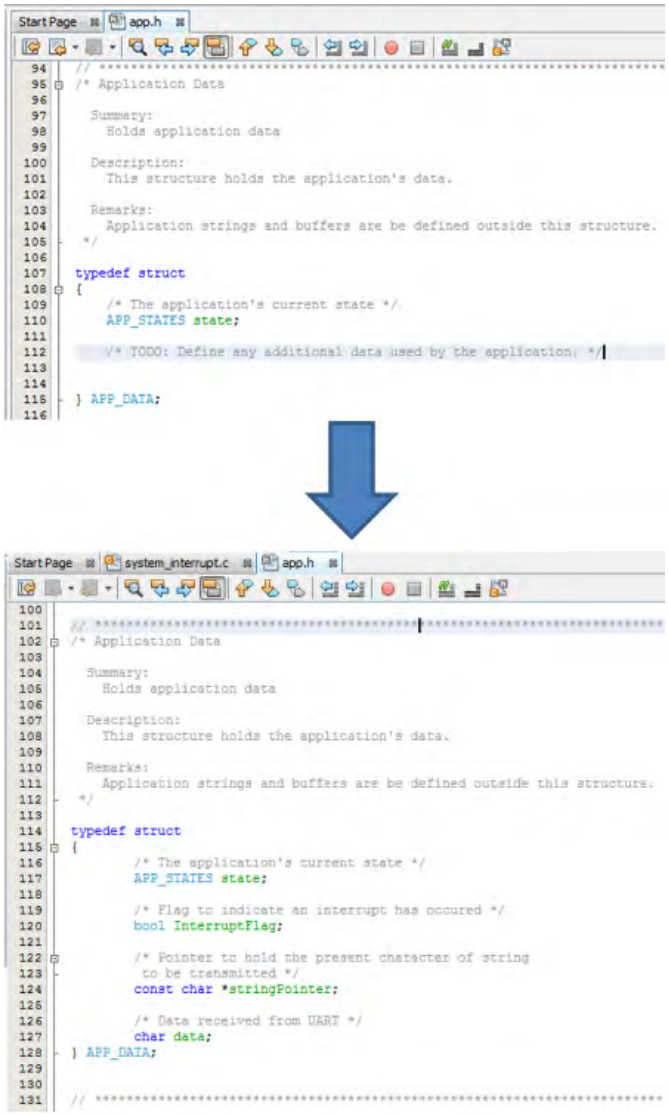
    /* USART Transmit Second string */
    USART_TRANSMIT_SECOND_STRING,

    /* USART Receive State */
    USART_RECEIVE_DONE
```



Step 15: For APP_DATA structure, define three variables. The first variable is of type Boolean to act as a flag for interrupt indication, the second pointer variable will hold the address of the string that needs to be transmitted to the UART, and the third variable will hold the data received from the UART.

```
const char *stringPointer;
char data;
bool InterruptFlag;
```



Step 16: Towards the end of the file, insert the prototype declaration for two functions: PutCharacter and WriteString. These functions will later be added to `app.c` (in **Step 20**). Also, declare the `extern APP_DATA appData`, so that the appData variable is available across the project.

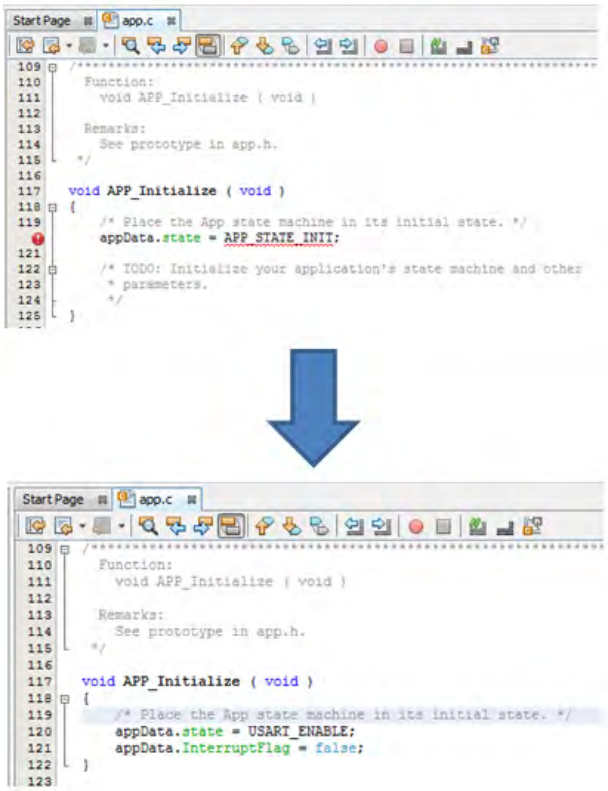
```
bool PutCharacter(const char character);

bool WriteString(void);

extern APP_DATA appData;
```

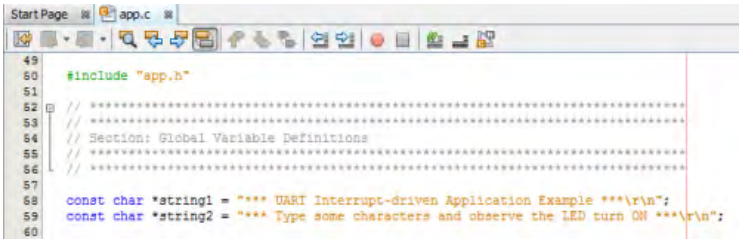
Step 17: In the APP_Initialize of the `app.c` file, add code to set the initial state of application.

```
    /* Place the App state machine in its initial state. */
    appData.state = USART_ENABLE;
    appData.InterruptFlag = false;
```



Step 18: Declare two global strings: string1 and string2.

```
const char *string1 = "*** UART Interrupt-driven Application Example ***\r\n";
const char *string2 = "*** Type some characters and observe the LED turn ON ***\r\n";
```



Step 19: Next, add application-specific code to the APP_Tasks function.

```
void APP_Tasks ( void )
{
    /* check the application state*/
    switch ( appData.state )
    {
        case USART_ENABLE:

            /* Enable the UART module*/
            PLIB_USART_Enable(USART_ID_2);
            appData.stringPointer = string1;

            appData.state =  USART_TRANSMIT_FIRST_STRING;

            break;

        case USART_TRANSMIT_FIRST_STRING:
            if(true == WriteString())
            {
                appData.state = USART_TRANSMIT_SECOND_STRING;
                appData.stringPointer = string2;
            }

            break;

        case USART_TRANSMIT_SECOND_STRING:
            if(true == WriteString())
```

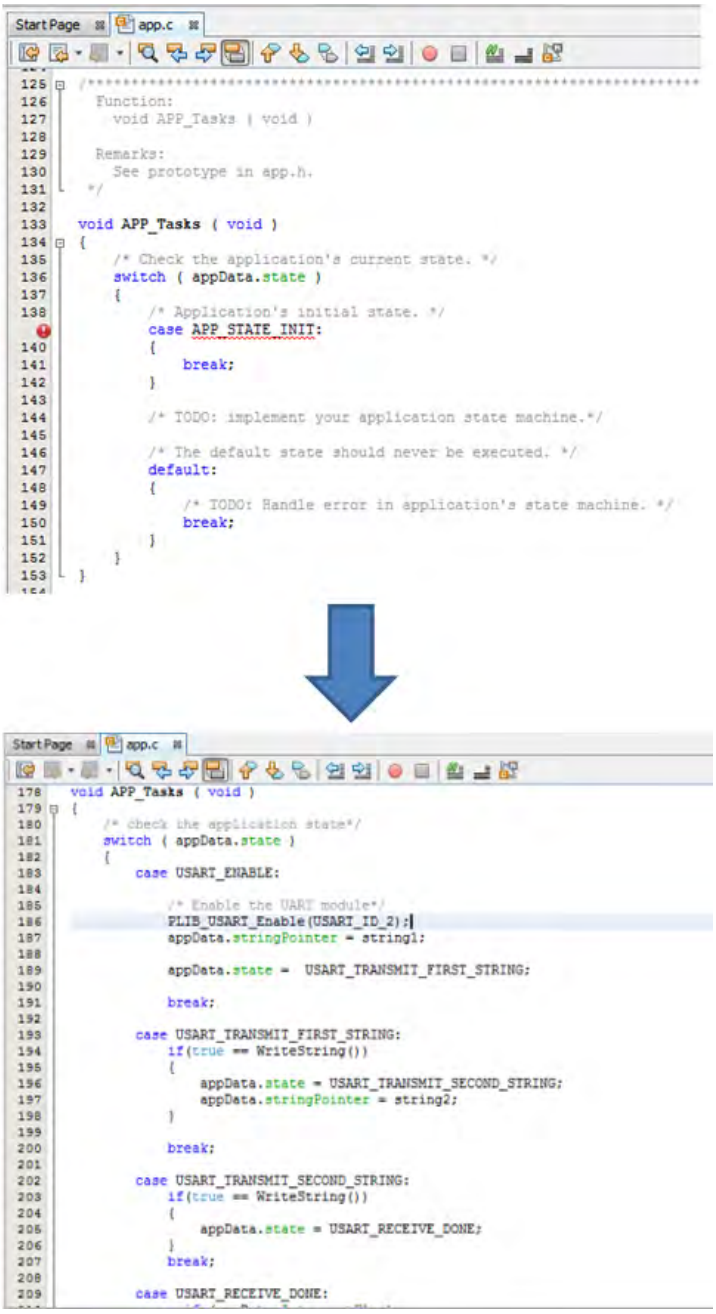
```
            {
                appData.state = USART_RECEIVE_DONE;
            }
            break;

        case USART_RECEIVE_DONE:
              if (appData.InterruptFlag)
              {
                  if(true == PutCharacter(appData.data))
                  {
                    BSP_LEDOn(BSP_LED_3);
                    appData.InterruptFlag = false;
                  }
              }
            break;

        default:
            SYS_DEBUG (SYS_ERROR_FATAL,"ERROR! Invalid state\r\n");
            while (1);

    }

}
```



Step 20: Next, add functions for PutCharacter and WriteString.

```
bool WriteString(void)
{
    if(*appData.stringPointer == '\0')
    {
        return true;
    }

    /* Write a character at a time, only if transmitter is empty */
    while (PLIB_USART_TransmitterIsEmpty(USART_ID_2))
    {
        /* Send character */
        PLIB_USART_TransmitterByteSend(USART_ID_2, *appData.stringPointer);

        /* Increment to address of next character */
        appData.stringPointer++;

        if(*appData.stringPointer == '\0')
        {
            return true;
```

```
        }
    }
    return false;
}

bool PutCharacter(const char character)
{
    /* Check if buffer is empty for a new transmission */
    if(PLIB_USART_TransmitterIsEmpty(USART_ID_2))
    {
        /* Send character */
        PLIB_USART_TransmitterByteSend(USART_ID_2, character);
        return true;
    }
    else
        return false;
}
```

```
/*******************************************************************************
  Function:
    bool WriteString (void)

  Summary:
    Writes a string to the console
*/
bool WriteString(void)
{
    if(*appData.stringPointer == '\0')
    {
        return true;
    }

    /* Write a character at a time, only if transmitter is empty */
    while (PLIB_USART_TransmitterIsEmpty(USART_ID_2))
    {
        /* Send character */
        PLIB_USART_TransmitterByteSend(USART_ID_2, *appData.stringPointer);

        /* Increment to address of next character */
        appData.stringPointer++;

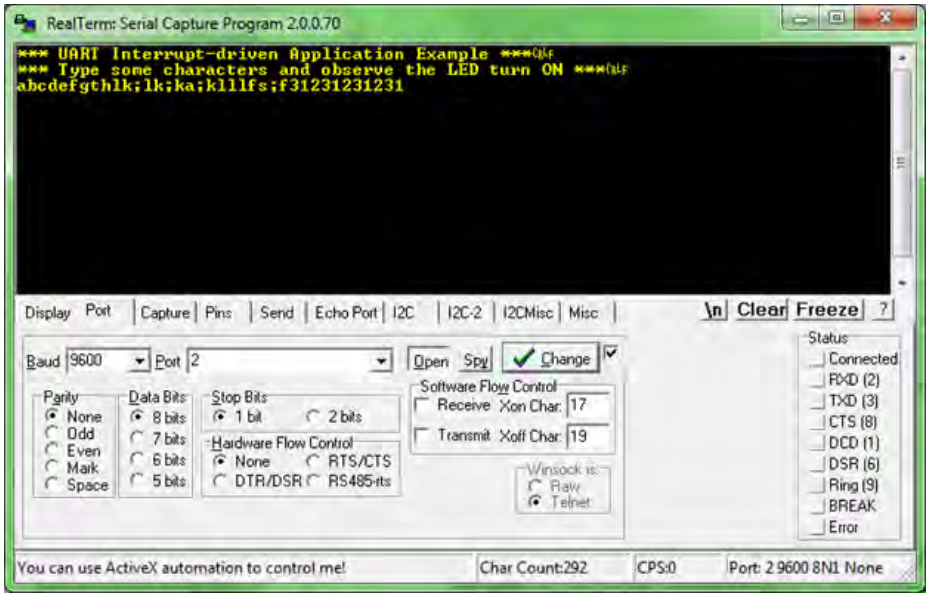
        if(*appData.stringPointer == '\0')
        {
            return true;
        }
    }
    return false;
}
```

```
/*******************************************************************
  Function:
    bool PutCharacter (const char character)

  Summary:
    Sends a character to the console
*/
bool PutCharacter(const char character)
{
    /* Check if buffer is empty for a new transmission */
    if(PLIB_USART_TransmitterIsEmpty(USART_ID_2))
    {
        /* Send character */
        PLIB_USART_TransmitterByteSend(USART_ID_2, character);
        return true;
    }
    else
        return false;
}
```

Step 21: At this point in the process, all of the files have been added to the project with the proper code. Once the project is built, it should build without any errors or warnings.

Step 22: Once the device is programmed and run, a serial cable should be connected to the Explorer 16 Development Board. The appropriate COM port is selected with a baud rate of 9600. As shown in the following RealTerm example, the terminal will echo the typed characters and the LED on the Explorer 16 Development Board will illuminate.



Notes:

1. Refer to the USART Peripheral Library section in the MPLAB Harmony help for a detailed explanation and the example code for the peripheral library functions used in the application.
2. The demonstration code is provided at the same location `<install-dir>/apps/examples/peripheral/usart`.

ADC Peripheral Library

This section describes the Analog-to-Digital Converter (ADC) Peripheral Library.

Introduction

This library provides a low-level abstraction of the Analog-to-Digital Converter (ADC) module, which is available on the Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, thus hiding differences from one microcontroller variant to another.

Description

An ADC is an analog peripheral that converts a continuous quantity to a discrete digital number. An ADC is a signal conversion process that periodically samples and converts a continuously varying signal - analog level into digital values. An ADC might be used to make an isolated measurement. ADCs are also used to quantize time-varying signals by turning them into a sequence of digital samples. This results in the signal being quantized in both time and value. The resolution of a converter indicates the number of discrete values it can produce over the range of analog values.

Using the Library

This topic describes the basic architecture of the ADC Peripheral Library and provides information and examples on its use.

Description

Interface Header File: `plib_adc.h`

The interface to the ADC library is defined in the `plib_adc.h` header file, which is included by the `peripheral.h` peripheral library header file. Any C language source (`.c`) file that uses the ADC library must include `peripheral.h`.

Library File:

The ADC peripheral library is part of the processor-specific peripheral library installed with the compiler. This library is automatically available (in the default search path) for any project built using a Microchip compiler.

Please refer to the What is MPLAB Harmony? section for information on how the library interacts with the framework.

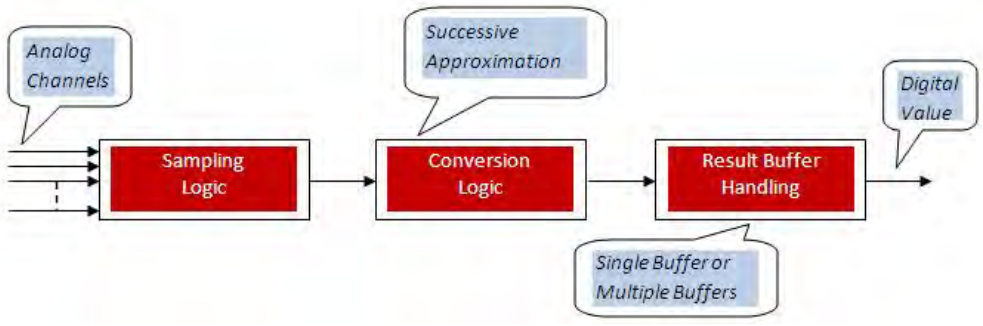
Hardware Abstraction Model

This library provides a low-level abstraction of the ADC module on Microchip microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Description

The ADC module accepts an analog signal at any one instance and converts it to a corresponding 10-bit digital value. It can accommodate a number of analog inputs and separate reference inputs; the actual number available on a particular device depends on the package size.

Hardware Abstraction Block Diagram



A combination of input multiplexers can select the signal to be converted from multiple analog input pins. The entire multiplexer path includes provision for differential analog input, although the number of negative input pins is limited, and the signal difference must remain positive (i.e., unipolar).

Sampling Logic

An internal Sample and Hold (S&H) circuit acquires a sample of an input signal, and then holds that value constant during the conversion process. The purpose of the S&H circuitry is to take a snapshot of the sensor signal and hold the value. The sampled voltage is held and converted to a digital value, which strictly speaking, represents the ratio of that input voltage to a reference voltage. Configuration choices can allow connection of an external reference or use of the device power and ground (AVDD and AVSS).

Conversion Logic

The heart of the ADC is the conversion logic that converts the analog signal value into its equivalent discrete representation. Conversions can be started individually by program control, continuously free-running, or triggered by selected hardware events. A single channel may be repeatedly converted, alternate conversions may be performed on two channels, or any or all of the channels may be sequentially scanned and converted according to a user-defined bit map.

Result Handling

The resulting conversion output is 10-bit digital number in a 16-bit word.

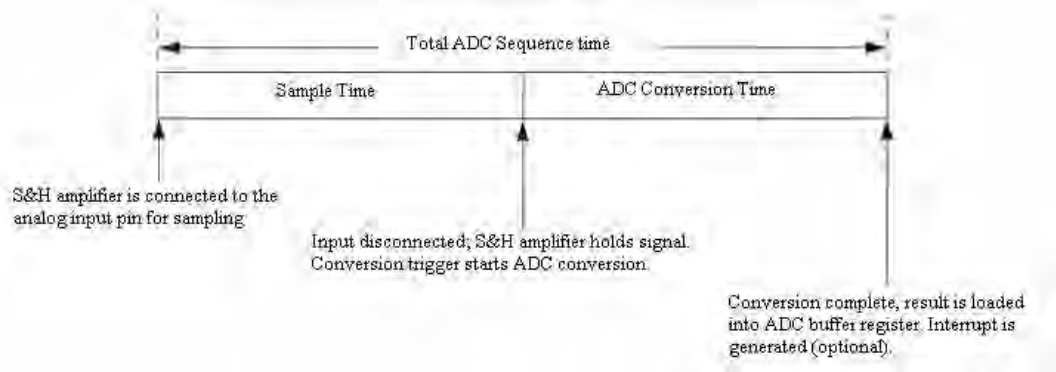
ADC Timing Details

Sample time is the time that the ADC module's S&H circuit is connected to the analog input pin. The sample time may be started and ended automatically by the ADC's hardware or under direct program control. There is a minimum sample time to ensure that the S&H circuit will provide sufficient accuracy for the analog-to-digital conversion.

Conversion time is the time required for the ADC to convert the voltage held by the S&H circuit. The conversion trigger ends the sampling time and begins an analog-to-digital conversion or a repeating sequence. The conversion trigger sources can be taken from a variety of hardware sources or can be controlled directly in software.

Once the conversion is complete, the S&H circuit can be reconnected to the input pin and a CPU interrupt may be generated. The sum of the sample time and the analog-to-digital conversion time provides the total ADC sequence time. The following figure shows the basic conversion sequence and the relationship between intervals.

ADC Sample/Convert Sequence



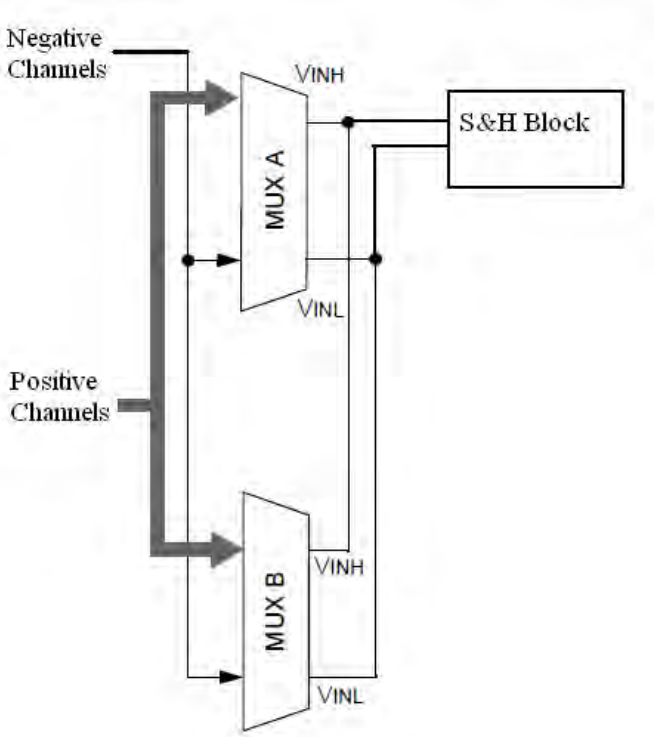
The conversion trigger sources can be taken from a variety of hardware sources, or can be controlled directly by software. One of the conversion trigger options is an auto-conversion, which uses a counter and the ADC clock to set the time between auto-conversions. The Auto-Sample mode and auto-conversion trigger can be used together to provide continuous automatic conversions without software intervention.

A sample/convert sequence that uses multiple S&H channels can be simultaneously sampled or sequentially sampled. Simultaneously sampling multiple signals ensures that the snapshot of the analog inputs occurs at precisely the same time for all inputs. Sequential sampling takes a snapshot of each analog input just before conversion starts on that input. The sampling of multiple inputs is not correlated.

Channel Multiplexers

On some devices, S&H circuits have analog multiplexers on both their non-inverting and inverting inputs to select which analog input(s) are sampled. The ADC of some devices incorporate two independent sets of input multiplexers (MUX A and MUX B), which allow users to choose the analog channels that are to be sampled. Functionally, MUX A and MUX B are very similar to each other. Both multiplexers allow any of the analog input channels to be selected for individual sampling and allow selection of a negative reference source for differential signals. In addition, MUX A can be configured for sequential analog channel scanning. By default the ADC only samples and converts the inputs selected by MUX A. There is also a possibility to alternate between two sets of inputs selected by MUX A and MUX B during successive samples.

MUX Abstraction Model



When using MUX A to select analog inputs, the ADC module has the ability to scan multiple analog channels sequentially.

Input Selection

The ADC module provides a flexible mechanism to select analog inputs for conversion:

- Fixed input selection
- Alternate input selection
- Channel scanning

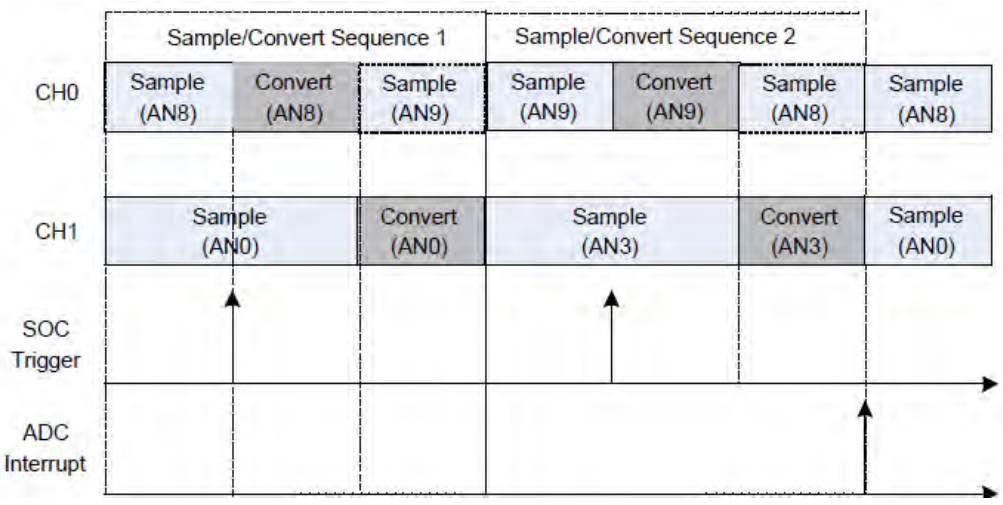
Fixed Input Selection

This is achieved through one or more of the S&H channels available in the device. The S&H channels are connected to the analog input pins through the analog multiplexer.

Alternate Sampling

In an Alternate Input Selection mode, the ADC completes one sweep using the MUX A selection, and then another sweep using the MUX B selection, and then another sweep using the MUX A selection, and so on.

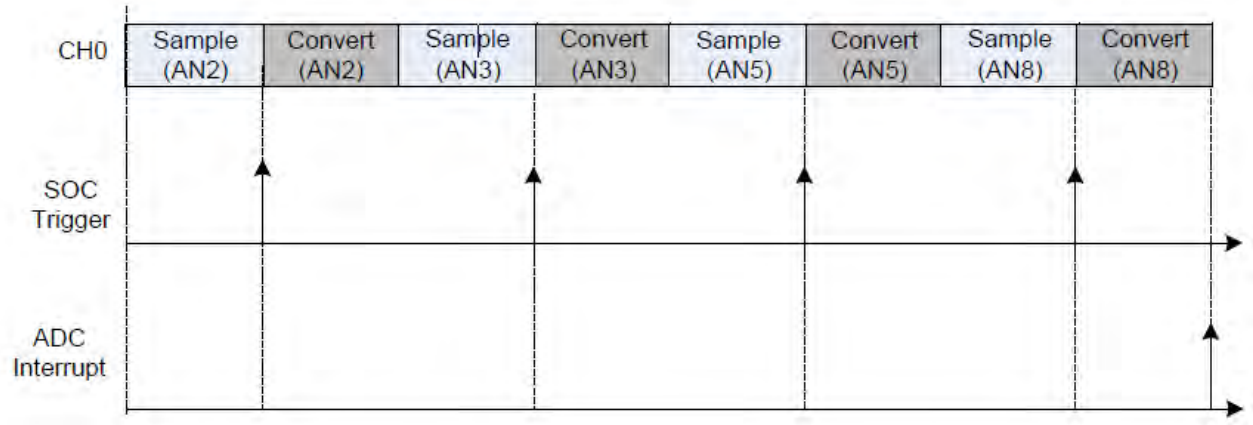
Alternate Input Selection in 2-Channel Sequential Sampling Configuration



Channel Scanning

On some devices, the ADC module supports the Channel Scan mode using S&H Channel 0 (CH0). The number of inputs scanned is software selectable. Any subset of the analog inputs from AN0 to AN31 (depending on the number of analog inputs present on a specific device) can be selected for conversion. The selected inputs are converted in ascending order. For example, if the input selection includes AN4, AN1, and AN3, the conversion sequence is AN1, AN3, and AN4.

Scan Four Analog Inputs Using CH0



Library Overview

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the ADC Peripheral Library.

Library Interface Section	Description
General Configuration	Interface routines for: • Voltage reference selection (positive/negative) • Channel group selection • Positive/negative channel selection • Add/remove channels for scan • Enabling/disabling the ADC module • Enabling/disabling the calibration • Stop in Idle enable/disable • Internal reference channel enable/disable
MUX Selection and Channel Scan	Interface routines for: • Channel 0 positive/negative input selection for MUX A/MUX B • MUX A scan enable/disable
Sample and Hold Control Logic	Interface routines for: • Sampling start/stop, status • Enabling/disabling of sample auto start • Acquisition/auto-sample time selection • Sample per interrupt selection
Conversion Control Logic	Interface routines for: • Conversion start/status • Conversion clock selection set/get • Conversion clock source selection • Conversion trigger source selection • Conversion stop sequence enable/disable
Output Configuration	Interface routines for: • Result format selection • Result buffer fill status • Result buffer mode select • Result based on the buffer index
Feature Existence Functions	These functions determine whether or not a particular feature is supported by the device.

How the Library Works

How the Library Works

The following processes are involved while using an ADC module:

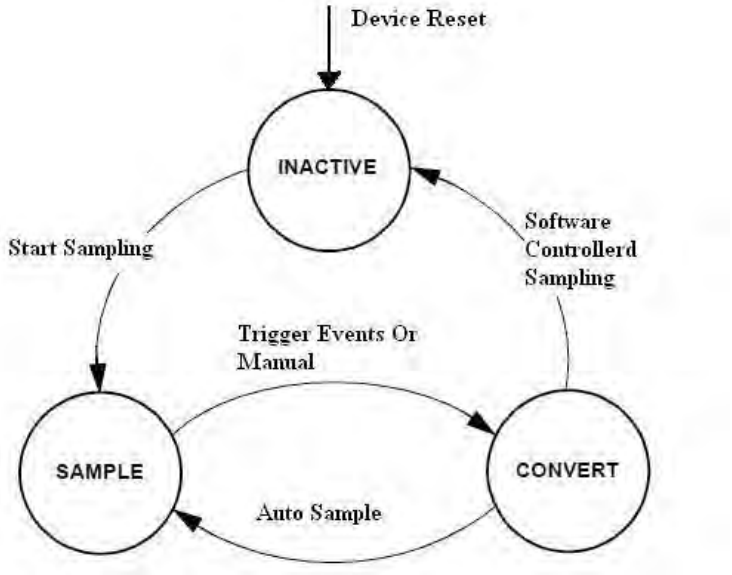
- Initialization
- Controlling the sampling process
- Controlling the conversion process
- Accessing the results buffer

General

The ADC conversion process can be thought of in terms of a finite state machine. The sample state represents the time that the input channel is connected to the S&H circuit and the signal is passed to the converter input. The convert state is transitory; the module enters this state as soon as it exits the sample state and transitions to a different state when that is done. The inactive state is the default state prior to module initialization and following a software-controlled conversion; it can be avoided in operation by using Auto-Sample mode.

Description

ADC Conversion Sequence or State Machine



Initialization

This topic provides information on the different processes needed to perform an analog-to-digital conversion.

Description

The following processes should be followed for performing an analog-to-digital conversion:

Initialize the ADC Module:

Number	Description	Functions associated
1	Selecting the voltage reference source Idle mode control	PLIB_ADC_VoltageReferenceSelect PLIB_ADC_StopInIdleEnable PLIB_ADC_StopInIdleDisable
2	Selecting the ADC conversion clock	PLIB_ADC_ConversionClockSet

3	Input channel selection Configuring MUX A and MUX B inputs, Alternating MUX A and MUX B input selections, Scanning through several inputs	**Scan Mask Selection** PLIB_ADC_InputScanMaskAdd PLIB_ADC_InputScanMaskRemove **Positive Inputs** PLIB_ADC_MuxChannel0InputPositiveSelect **Negative Inputs** PLIB_ADC_MuxChannel0InputNegativeSelect **Scan Mode Selection** PLIB_ADC_MuxAInputScanEnable PLIB_ADC_MuxAInputScanDisable
4	Enabling the ADC module	PLIB_ADC_Enable
5	Determine how sampling will occur	**Sampling Control** PLIB_ADC_SamplingModeSelect PLIB_ADC_SampleAcquisitionTimeSet
6	Selecting Manual or Auto-Sampling	PLIB_ADC_SampleAutoStartEnable PLIB_ADC_SampleAutoStartDisable PLIB_ADC_SamplingStart
7	Select conversion trigger and sampling time	PLIB_ADC_ConversionStart PLIB_ADC_ConversionClockSourceSelect PLIB_ADC_ConversionTriggerSourceSelect PLIB_ADC_ConversionStopSequenceEnable PLIB_ADC_ConversionStopSequenceDisable
8	Select how conversion results are stored in buffer	PLIB_ADC_ResultBufferModeSelect
9	Select the result format	PLIB_ADC_ResultFormatSelect
10	Select the number of readings per interrupt	PLIB_ADC_SamplesPerInterruptSelect

The ADC is configured by the following steps:

1. Select the acquisition time using PLIB_ADC_SampleAcquisitionTimeSet.
2. Select the conversion clock for ADC using PLIB_ADC_ConversionClockSet.
3. The reference for ADC can be set using the function PLIB_ADC_VoltageReferenceSelect.
4. Select the appropriate analog MUX and analog input where the analog voltage is connected.
5. Select the appropriate trigger source using PLIB_ADC_ConversionTriggerSourceSelect.
6. Configure the ADC interrupt (if required):
   - Clear the interrupt status flag
   - Select the ADC interrupt priority
   - Enable ADC interrupt
7. Turn on the ADC module using PLIB_ADC_Enable.

Example Initialization:

```
// Include all channels in scan
PLIB_ADC_InputScanMaskAdd(MY_ADC_INSTANCE, ADC_INPUT_SCAN_ALL);

// Internal Counter triggers conversion
PLIB_ADC_ConversionTriggerSourceSelect(MY_ADC_INSTANCE, ADC_CONVERSION_TRIGGER_INTERNAL_COUNT);

// Sample Time = 31TAD and TAD = 2TCY
PLIB_ADC_SampleAcquisitionTimeSet(MY_ADC_INSTANCE, 30);
PLIB_ADC_ConversionClockSet(MY_ADC_INSTANCE, 80000000, 20000000);

// Set the interrupt every 16 samples
PLIB_ADC_SamplesPerInterruptSelect(MY_ADC_INSTANCE, ADC_16SAMPLES_PER_INTERRUPT);

// Enable scanning of channels
PLIB_ADC_MuxAInputScanEnable(MY_ADC_INSTANCE);

// Enable the ADC
PLIB_ADC_Enable(MY_ADC_INSTANCE);
```

Note: Not all functionality is available on all devices. Refer to the **"Analog-to-Digital Converter (ADC)"** chapter in the specific device data sheet for availability.

Controlling the Sampling Process

This topic describes the modes and related sampling functionality for the sampling process.

Description

The sampling process can be set up using the following two modes:

Manual Sampling

Calling PLIB_ADC_SamplingStart causes the ADC to begin sampling. One of several options as discussed in "Controlling the Conversion Process" can be used to end sampling and complete conversions. Sampling does not resume until PLIB_ADC_SamplingStart is called again.

Automatic Sampling

Setting the ADC in the Auto-Sampling mode using PLIB_ADC_SampleAutoStartEnable automatically begins sampling a channel whenever a conversion is not active on that channel. One of several options can be used to end sampling and complete conversions, as discussed in "Controlling the Conversion Process". If the simultaneous sampling is selected using PLIB_ADC_SamplingModeSelect with parameter ADC_SAMPLING_MODE_SIMULTANEOUS, sampling on a channel resumes after the conversion of all channels completes.

Other sampling related functionality:

- **Monitoring Sample Status:** PLIB_ADC_SamplingIsActive obtains the status as sampling or holding for the ADC module.
- **Aborting a Sample:** While in Manual Sampling mode, calling PLIB_ADC_SamplingStop will terminate sampling. If the conversion trigger source is selected as ADC_CONVERSION_TRIGGER_SAMP_CLEAR using PLIB_ADC_ConversionTriggerSourceSelect, this causes a conversion to start automatically. While in Auto-Sampling mode, calling PLIB_ADC_SampleAutoStartEnable does not terminate an outgoing sample/convert sequence; however, sampling will not resume after a subsequent conversion.
- **Sampling Modes:** Different sampling modes can be changed using PLIB_ADC_SamplingModeSelect with the appropriate parameter such as ADC_SAMPLING_MODE_ALTERNATE_INPUT for alternate input mode, ADC_SAMPLING_MODE_SIMULTANEOUS for simultaneous sampling mode, or ADC_SAMPLING_MODE_SEQUENTIAL for the sequential sampling mode. There is a possibility to combine the sampling modes say the Alternate input mode with either the simultaneous or the sequential sampling modes.

Note: Not all functionality is available on all devices. Refer to the **"Analog-to-Digital Converter (ADC)"** chapter in the specific device data sheet for availability.

Controlling the Conversion Process

The conversion trigger source will terminate sampling and start a selected sequence of conversions. It is also possible to obtain the value of the conversion clock, which is obtained by calling PLIB_ADC_ConversionClockGet. 'PLIB_ADC_ConversionTriggerSourceSelect' selects the source of the conversion trigger.

Description

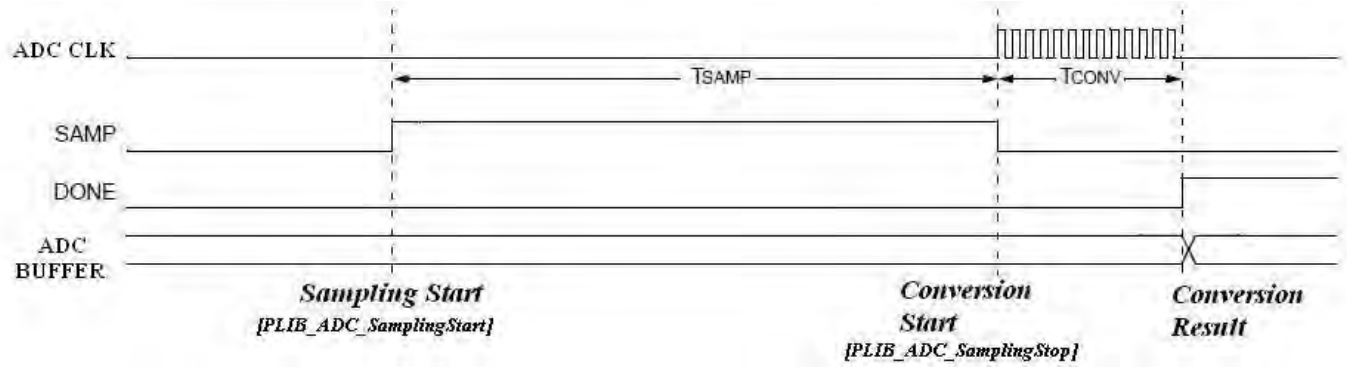
Conversion can be started in one of the following three ways:

Manual Conversion Sequence

Manual Sample Start, Manual Conversion Start

When ADC_CONVERSION_TRIGGER_SAMP_CLEAR is selected using PLIB_ADC_ConversionTriggerSourceSelect, the conversion trigger is under software control. Calls to PLIB_ADC_SamplingStop will stop the sampling and start the conversion sequence. The user must call PLIB_ADC_SamplingStart and PLIB_ADC_SamplingStop in a timed manner, to ensure adequate sampling time.

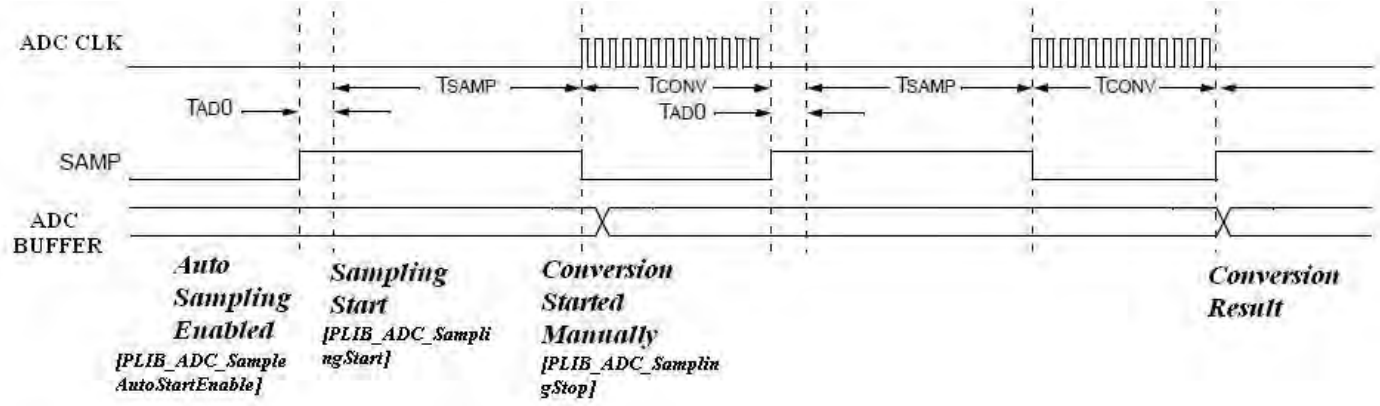
Converting One Channel, Manual Sample Start, Manual Conversion Start



Automatic Sample Start, Manual Conversion Start

Automatic sampling is initiated using PLIB_ADC_SampleAutoStartEnable, calling PLIB_ADC_SamplingStop will terminate sampling and start conversion. After the conversion, the sampling starts again automatically. The user must call PLIB_ADC_SamplingStop in a timed manner, to ensure adequate sampling time. Wait for required acquisition/auto sample time (minimum of 1 TAD), and then call PLIB_ADC_SamplingStop to start the conversion process.

Converting One Channel, Automatic Sample Start, Manual Conversion Start

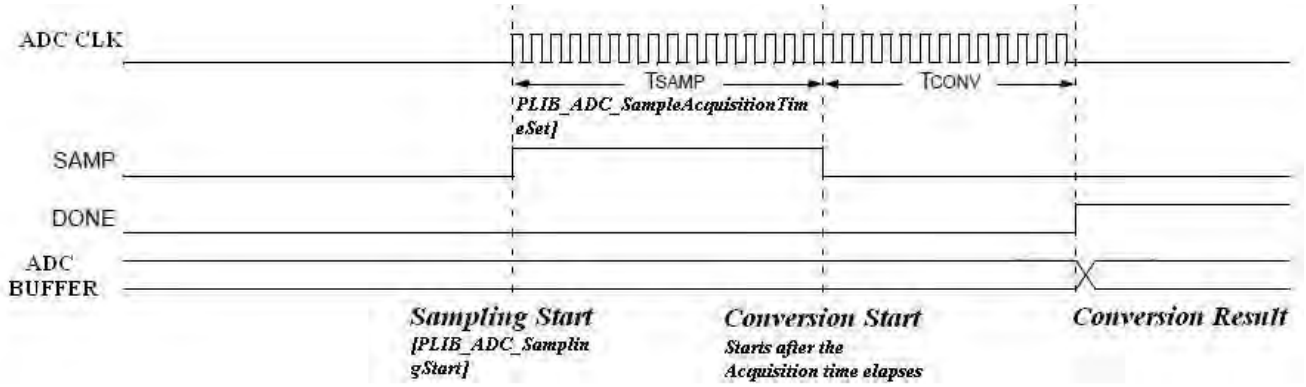


Clocked Conversion Sequence

Manual Sample Start and TAD based Conversion Start

When ADC_CONVERSION_TRIGGER_INTERNAL_COUNT is selected using PLIB_ADC_ConversionTriggerSourceSelect, the conversion trigger is under analog-to-digital clock control. PLIB_ADC_SampleAcquisitionTimeSet selects the TAD clock cycles between the start of sampling and the start of conversion. [Minimum 1 clock cycle has to be selected to ensure the sampling requirements are met]. PLIB_ADC_SamplingStart starts the sampling for the configured acquisition time, and then PLIB_ADC_SamplingStop starts the conversion process.

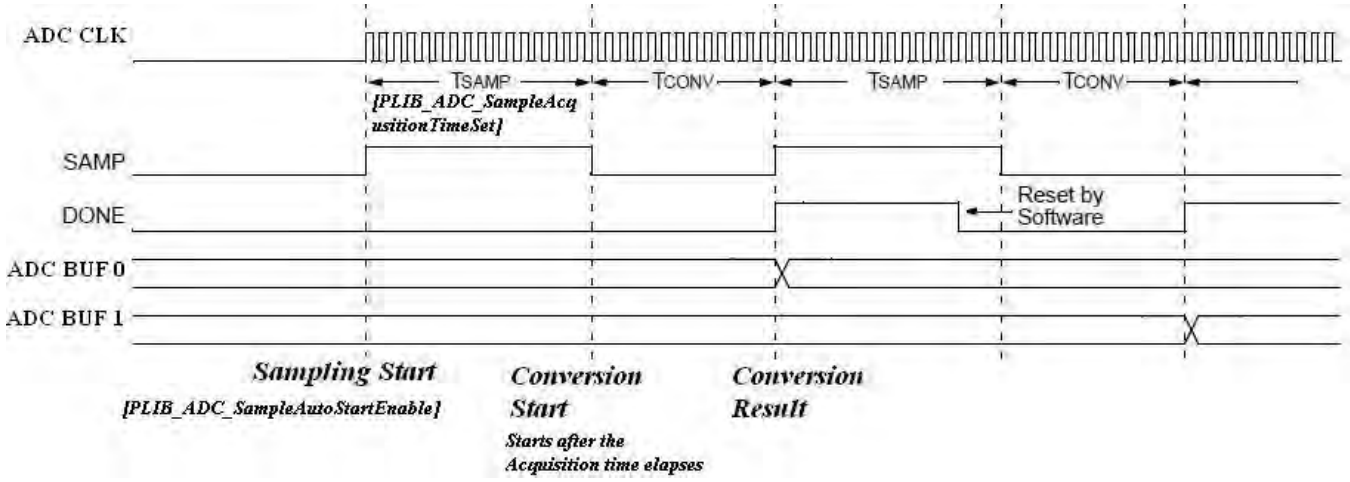
Converting One Channel, Manual Sample Start, TAD-Based Conversion Start



Auto Sample Start and TAD based Conversion Start or Free Running Sample Conversion

With the selection of ADC_CONVERSION_TRIGGER_INTERNAL_COUNT using PLIB_ADC_ConversionTriggerSourceSelect and Automatic sampling initiation using PLIB_ADC_SampleAutoStartEnable allows the ADC module to schedule sample/conversion sequences with no intervention by the user or other device resources.

Converting One Channel, Auto-Sample Start, TAD-Based Conversion Start



Event Trigger Conversion Start

It may be necessary to synchronize the end of sampling and the start of conversion with some other time event. The ADC module may use one of following as conversion trigger sequences:

- **External Pin Trigger:** When ADC_CONVERSION_TRIGGER_INT0_TRANSITION is selected using PLIB_ADC_ConversionTriggerSourceSelect
- **General Purpose Timer Compare Match:** When ADC_CONVERSION_TRIGGER_TMR3_COMPARE_MATCH or ADC_CONVERSION_TRIGGER_TMR5_COMPARE_MATCH is selected using PLIB_ADC_ConversionTriggerSourceSelect

Both of the event trigger conversion modes previously described can be used in combination with auto-sampling (PLIB_ADC_SampleAutoStartEnable) to cause the ADC to synchronize the sample conversion events to the trigger pulse source.

Users should note that some devices have additional conversion trigger sources as part of the enumeration ADC_CONVERSION_TRIGGER_SOURCE.

Other Operations During Conversion Process

- **Monitoring Conversion process:** The status of the conversion can be obtained using PLIB_ADC_ConversionHasCompleted
- **Generating ADC Interrupt:** PLIB_ADC_SamplesPerInterruptSelect controls the generation of the ADC interrupt. To enable the interrupt it is also essential to enable the ADC interrupt.
- **Aborting the Conversion:** Calling PLIB_ADC_Disable will abort the current conversion. The result buffer is not updated with the partially completed ADC conversion sequence.

Timing Details

TAD - The ADC module has a maximum rate at which conversions may be completed. An analog module clock, TAD, controls the conversion timing.

TSAMP - The time required to sample and hold the sampled analog signal, configured through PLIB_ADC_SampleAcquisitionTimeSet.

TCONV - The time required to convert the sampled analog signal, configured through PLIB_ADC_ConversionClockSet. The conversion clock can be verified using PLIB_ADC_ConversionClockGet.

Note: Not all functionality is available on all devices. Refer to the **"Analog-to-Digital Converter (ADC)"** chapter in the specific device data sheet for availability.

Accessing the Result Buffers

The result buffers can be formatted to the desired format using the function PLIB_ADC_ResultFormatSelect.

Description

As the analog-to-digital conversions are completed, the ADC module writes the results of the conversions into the ADC result buffer. This buffer is a RAM array of 16 words, accessed through the Special Function Register (SFR) space.

User software may attempt to read each ADC conversion result as it is generated; however, this might consume too much CPU time. Generally, to minimize software overhead, the ADC module will fill the buffer with results, and then generate an interrupt when the buffer is filled. There are two different modes for accessing the result buffers.

Note: Refer to the **"Analog-to-Digital Converter (ADC)"** chapter in the specific device data sheet to determine the correct mode for accessing the result buffer for your device.

Single Buffer Mode

Conversion results are automatically stored in a dedicated buffer. The module sets its interrupt flag after the conversion is complete, it also marks the conversion status as complete. After the interrupt, the conversion sequence can restart. The converted values are available through PLIB_ADC_ResultGetByIndex.

Multiple Buffer Mode

Conversion results are automatically stored in a dedicated position in the result buffer comprising an array of 16 words, allowing for multiple successive readings to be taken before software service is needed. Successive conversions are placed into sequential buffer positions. Alternatively, the buffer can be split into two arrays of 8 words for simultaneous conversion and read operations. The ADC module sets its interrupt flag after a selectable number of conversions, from 1 to 16, when the all buffer positions can be read. After the interrupt, the sequence restarts at the beginning of the buffer. When the interrupt flag is set, scan selections and the output buffer pointer return to their starting positions. The ADC result buffer is a set of 16 words, accessed through PLIB_ADC_ResultGetByIndex , where buffer index can be can be any value ranging from 0 to 15.

PLIB_ADC_SamplesPerInterruptSelect selects how many analog-to-digital conversions will take place before the CPU is interrupted.

The buffer fill mode can be selected using PLIB_ADC_ResultBufferModeSelect with the parameter of the type ADC_BUFFER_MODE.

When the conversion result buffer is split (ADC_BUFFER_MODE_TWO_8WORD_BUFFERS used as the parameter for PLIB_ADC_ResultBufferModeSelect), PLIB_ADC_ResultBufferStatusGet indicates which half of the buffer is being currently written by the ADC module.

Note: Not all functionality is available on all devices. Refer to the **"Analog-to-Digital Converter (ADC)"** chapter in the specific device data sheet for availability.

Power-Saving Modes

This topic provides information on the power-saving modes available for use with the ADC module.

Description

Operation in Sleep Mode

Operation in Sleep mode requires that the internal RC clock is selected using PLIB_ADC_ConversionClockSourceSelect with the parameter ADC_CLOCK_SOURCE_INTERNAL_RC. If the ADC interrupt is enabled, the device will wake up from Sleep mode on the ADC interrupt. On some microcontrollers, operation in Sleep mode requires that ADC_CONVERSION_CLOCK_FRC is selected using PLIB_ADC_ConversionClockSourceSelect. If the ADC interrupt is enabled, the device will wake up from Sleep mode on the ADC interrupt.

Operation in Idle Mode

PLIB_ADC_StopInIdleEnable and PLIB_ADC_StopInIdleDisable determine if the ADC module stops or continues operation in Idle mode. If PLIB_ADC_StopInIdleDisable is used, the module will continue operation in Idle mode. If the ADC interrupt is enabled, the device will wake up from Idle mode on the ADC interrupt. If PLIB_ADC_StopInIdleEnable is used, the module will stop in Idle mode. If the device enters Idle mode in the middle of conversion, the conversion is aborted.

Operation in other Power-Saving modes

If the ADC module is expected to operate in a power-saving mode, configure the acquisition time and the conversion clock using the functions in accordance with the power-saving mode clock that will be used. After the power-saving mode is entered, an analog-to-digital acquisition can be started. Once the acquisition is started, the device can continue to be clocked by the same power-saving source until the conversion has completed. If desired, the device may be placed in the power-saving Idle mode during conversion.

Note: Not all functionality is available on all devices. Refer to the **"Analog-to-Digital Converter (ADC)"** chapter in the specific device data sheet for availability.

Conversion Sequence Examples

This topic provides examples on how the sampling and conversion will occur in various configurations.

Description

Converting Single Channel, Manual Sample Start, Manual Conversion Start

```
// Where MY_ADC_INSTANCE, is the instance of ADC that the application is using. It is one of the possible
values
// from ADC_MODULE_ID

int16_t ADCValue;
```

```
// Enabling the sampling manually
PLIB_ADC_ConversionTriggerSourceSelect(MY_ADC_INSTANCE, ADC_CONVERSION_TRIGGER_SAMP_CLEAR);

// Disabling ADC Input channels for Scan
PLIB_ADC_InputScanMaskRemove(MY_ADC_INSTANCE, ADC_INPUT_SCAN_ALL);

// Connect AN2 as Positive Input
PLIB_ADC_MuxChannel0InputPositiveSelect(ADC_ID_1, ADC_MUX_A, ADC_INPUT_POSITIVE_AN2);

// Manual Sample and TAD = 2TCY
PLIB_ADC_SampleAcquisitionTimeSet(MY_ADC_INSTANCE, 2);
PLIB_ADC_ConversionClockSet(MY_ADC_INSTANCE, 80000000, 20000000);

// Enable the ADC
PLIB_ADC_Enable(MY_ADC_INSTANCE);

while(1)
{
   // Start Sampling
   PLIB_ADC_SamplingStart(MY_ADC_INSTANCE);

   Delay(); // Ensure, correct sampling time has elapsed before starting conversion.

   // Is Conversion Done ??
   while(!PLIB_ADC_ConversionHasCompleted(MY_ADC_INSTANCE));

   ADCValue = PLIB_ADC_ResultGetByIndex(MY_ADC_INSTANCE, 0);

}
```

Converting Single Channel, Manual Sample Start, TAD-based Conversion Start

```
// Where MY_ADC_INSTANCE, is the instance of ADC that the application is using. It is one of the possible
values
// from ADC_MODULE_ID

// Sample Time = 1TAD and TAD = 2TCY
PLIB_ADC_SampleAcquisitionTimeSet(MY_ADC_INSTANCE, 0);
PLIB_ADC_ConversionClockSet(MY_ADC_INSTANCE, 80000000, 20000000);

// Enable the ADC
PLIB_ADC_Enable(MY_ADC_INSTANCE);

while(1)
{
   // Start Sampling
   PLIB_ADC_SamplingStart(MY_ADC_INSTANCE);

   // Is Conversion Done ??
   while(!PLIB_ADC_ConversionHasCompleted(MY_ADC_INSTANCE));

   ADCValue = PLIB_ADC_ResultGet(MY_ADC_INSTANCE);
}
```

Configuring the Library

The library is configured for the supported ADC modules with the multi-buffer interface when the processor is chosen in the MPLAB X IDE.

Library Interface

a) General Configuration

	Name	Description
	PLIB_ADC_Enable	ADC module is enabled (turned ON).
	PLIB_ADC_Disable	ADC module is disabled (turned OFF).
	PLIB_ADC_StopInIdleDisable	Continue ADC module operation when the device is in Idle mode.
	PLIB_ADC_StopInIdleEnable	Discontinue ADC module operation when device enters Idle mode.
	PLIB_ADC_VoltageReferenceSelect	Voltage reference configuration.
	PLIB_ADC_CalibrationEnable	Calibration is performed on the next ADC conversion.
	PLIB_ADC_CalibrationDisable	Normal ADC module operation (no calibration is performed).
	PLIB_ADC_InputScanMaskAdd	Select ADC analog channel for input scan.
	PLIB_ADC_InputScanMaskRemove	Omits ADC analog channel for input scan.
	PLIB_ADC_InputScanMaskAddExtended	Select extended ADC analog channel for input scan.
	PLIB_ADC_InputScanMaskRemoveExtended	Omits extended ADC analog channel for input scan.

c) Conversion Control Logic

	Name	Description
	PLIB_ADC_ConversionStart	Starts ADC module manual conversion process.
	PLIB_ADC_ConversionHasCompleted	Provides the conversion completion status of the ADC.
	PLIB_ADC_ConversionTriggerSourceSelect	Selects the conversion trigger source.
	PLIB_ADC_ConversionStopSequenceEnable	Stop conversion sequence (when the first ADC module interrupt is generated).
	PLIB_ADC_ConversionStopSequenceDisable	Normal conversion sequence.
	PLIB_ADC_ConversionClockSet	Sets the ADC module conversion clock.
	PLIB_ADC_ConversionClockGet	Obtains the conversion clock.
	PLIB_ADC_ConversionClockSourceSelect	Selects the ADC module conversion clock source.

d) Sample and Hold Control Logic

	Name	Description
	PLIB_ADC_SampleAutoStartDisable	Sampling auto-start is disabled.
	PLIB_ADC_SampleAutoStartEnable	Sampling auto-start is enabled.
	PLIB_ADC_SamplesPerInterruptSelect	Interrupts at the completion of conversion for each nth sample.
	PLIB_ADC_SamplingIsActive	Provides the ADC sampling status.
	PLIB_ADC_SamplingModeSelect	Enable the selected sampling mode.
	PLIB_ADC_SamplingStart	Sampling is enabled.
	PLIB_ADC_SamplingStop	Holding is enabled.
	PLIB_ADC_SampleAcquisitionTimeSet	Sets the ADC acquisition/auto-sample time in TADs.

f) Output Configuration

	Name	Description
	PLIB_ADC_ResultBufferModeSelect	Selects the result buffer mode.
	PLIB_ADC_ResultBufferStatusGet	Provides the buffer fill status.
	PLIB_ADC_ResultFormatSelect	Selects the result format.
	PLIB_ADC_ResultGetByIndex	Provides the ADC conversion result based on the buffer index.

g) MUX Selection and Channel Scan

	Name	Description
	PLIB_ADC_MuxAInputScanDisable	Do not scan input selections for CH0+ of MUX A.
	PLIB_ADC_MuxAInputScanEnable	Scan input selections for CH0+ of MUX A.
	PLIB_ADC_MuxChannel0InputNegativeSelect	Channel 0 negative input select for multiplexer setting.
	PLIB_ADC_MuxChannel0InputPositiveSelect	Channel 0 positive input select for multiplexer setting.

h) Feature Existence Functions

	Name	Description
	PLIB_ADC_ExistsCalibrationControl	Identifies whether the CalibrationControl feature exists on the ADC module
	PLIB_ADC_ExistsConversionClock	Identifies whether the ConversionClock feature exists on the ADC module
	PLIB_ADC_ExistsConversionClockSource	Identifies whether the ConversionClockSource feature exists on the ADC module
	PLIB_ADC_ExistsConversionControl	Identifies whether the ConversionControl feature exists on the ADC module
	PLIB_ADC_ExistsConversionStatus	Identifies whether the ConversionStatus feature exists on the ADC module
	PLIB_ADC_ExistsConversionStopSequenceControl	Identifies whether the ConversionStopSequenceControl feature exists on the ADC module
	PLIB_ADC_ExistsConversionTriggerSource	Identifies whether the ConversionTriggerSource feature exists on the ADC module
	PLIB_ADC_ExistsEnableControl	Identifies whether the EnableControl feature exists on the ADC module
	PLIB_ADC_ExistsMuxChannel0NegativeInput	Identifies whether the MuxChannel0NegativeInput feature exists on the ADC module
	PLIB_ADC_ExistsMuxChannel0PositiveInput	Identifies whether the MuxChannel0PositiveInput feature exists on the ADC module
	PLIB_ADC_ExistsMuxInputScanControl	Identifies whether the MuxInputScanControl feature exists on the ADC module
	PLIB_ADC_ExistsMuxInputScanSelect	Identifies whether the MuxInputScanSelect feature exists on the ADC module
	PLIB_ADC_ExistsResultBufferFillStatus	Identifies whether the ResultBufferFillStatus feature exists on the ADC module
	PLIB_ADC_ExistsResultBufferMode	Identifies whether the ResultBufferMode feature exists on the ADC module
	PLIB_ADC_ExistsResultFormat	Identifies whether the ResultFormat feature exists on the ADC module
	PLIB_ADC_ExistsResultGetByIndex	Identifies whether the ResultGetByIndex feature exists on the ADC module
	PLIB_ADC_ExistsSamplesPerInterruptSelect	Identifies whether the SamplesPerInterruptSelect feature exists on the ADC module
	PLIB_ADC_ExistsSamplingAcquisitionTime	Identifies whether the SamplingAcquisitionTime feature exists on the ADC module
	PLIB_ADC_ExistsSamplingAutoStart	Identifies whether the SamplingAutoStart feature exists on the ADC module
	PLIB_ADC_ExistsSamplingControl	Identifies whether the SamplingControl feature exists on the ADC module
	PLIB_ADC_ExistsSamplingModeControl	Identifies whether the SamplingModeControl feature exists on the ADC module
	PLIB_ADC_ExistsSamplingStatus	Identifies whether the SamplingStatus feature exists on the ADC module
	PLIB_ADC_ExistsStopInIdleControl	Identifies whether the StopInIdle feature exists on the ADC module
	PLIB_ADC_ExistsVoltageReference	Identifies whether the VoltageReference feature exists on the ADC module
	PLIB_ADC_ExistsMuxInputScanSelectExtended	Identifies whether the MuxInputScanSelectExtended feature exists on the ADC module

i) Data Types & Constants

	Name	Description
	ADC_MODULE_ID	Identifies the available ADC modules.
	ADC_VOLTAGE_REFERENCE	Defining the different ADC Voltage Reference by which the ADC can be configured.
	ADC_INPUTS_NEGATIVE	Defines the different ADC Negative Input Enumeration.
	ADC_SAMPLES_PER_INTERRUPT	Defining the Samples Per Interrupt Enumeration.
	ADC_CLOCK_SOURCE	Defines the ADC Clock Source Select.
	ADC_CONVERSION_TRIGGER_SOURCE	Defines the ADC Conversion Trigger Source.
	ADC_BUFFER_MODE	Defines the ADC Buffer Mode.
	ADC_RESULT_BUF_STATUS	Defines the ADC Result Buffer Status
	ADC_MUX	Defining the different ADC MUX Enumeration.
	ADC_SAMPLING_MODE	Defines the ADC Sampling Mode Select.
	ADC_INPUTS_SCAN	Defines the ADC Scan inputs.
	ADC_RESULT_FORMAT	Defines the ADC Result Format.
	ADC_INPUTS_POSITIVE	Defines the ADC inputs.
	ADC_ACQUISITION_TIME	Data type defining the different ADC acquisition times by which the ADC can be configured.
	ADC_CONVERSION_CLOCK	Data type defines the different ADC Conversion clock
	ADC_SAMPLE	Data type defining the size of the ADC sample register.

Description

This section describes the Application Programming Interface (API) functions of the Pipelined Analog-to-Digital Converter (ADC) Peripheral Library.
Refer to each section for a detailed description.

a) General Configuration

PLIB_ADC_Enable Function

ADC module is enabled (turned ON).

File

plib_adc.h

C

```
void PLIB_ADC_Enable(ADC_MODULE_ID index);
```

Returns

None.

Description

This function enables (turns ON) the selected ADC module.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_ADC_ExistsEnableControl in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_Enable(MY_ADC_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_ADC_Enable(ADC_MODULE_ID index)

PLIB_ADC_Disable Function

ADC module is disabled (turned OFF).

File

plib_adc.h

C

```
void PLIB_ADC_Disable(ADC_MODULE_ID index);
```

Returns

None.

Description

This function disables (turns OFF) the selected ADC module.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_ADC_ExistsEnableControl in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_Disable(MY_ADC_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_ADC_Disable(ADC_MODULE_ID index)

PLIB_ADC_StopInIdleDisable Function

Continue ADC module operation when the device is in Idle mode.

File

plib_adc.h

C

```
void PLIB_ADC_StopInIdleDisable(ADC_MODULE_ID index);
```

Returns

None.

Description

This function enables the ADC module to continue operation when the device is in Idle mode.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_ADC_ExistsStopInIdleControl in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_StopInIdleDisable(MY_ADC_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_ADC_StopInIdleDisable(ADC_MODULE_ID index)

PLIB_ADC_StopInIdleEnable Function

Discontinue ADC module operation when device enters Idle mode.

File

plib_adc.h

C

```
void PLIB_ADC_StopInIdleEnable(ADC_MODULE_ID index);
```

Returns

None.

Description

This function discontinues ADC module operation when the device enters Idle mode.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_ADC_ExistsStopInIdleControl in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_StopInIdleEnable(MY_ADC_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_ADC_StopInIdleEnable(ADC_MODULE_ID index)

PLIB_ADC_VoltageReferenceSelect Function

Voltage reference configuration.

File

plib_adc.h

C

```
void PLIB_ADC_VoltageReferenceSelect(ADC_MODULE_ID index, ADC_VOLTAGE_REFERENCE configValue);
```

Returns

None.

Description

This function configures the ADC module voltage reference.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_ADC_ExistsVoltageReference in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_VoltageReferenceSelect(MY_ADC_INSTANCE, ADC_REFERENCE_VREFPLUS_TO_AVSS);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
configValue	One of the possible values from ADC_VOLTAGE_REFERENCE

Function

void PLIB_ADC_VoltageReferenceSelect(ADC_MODULE_ID index,
ADC_VOLTAGE_REFERENCE configValue)

PLIB_ADC_CalibrationEnable Function

Calibration is performed on the next ADC conversion.

File

plib_adc.h

C

```
void PLIB_ADC_CalibrationEnable(ADC_MODULE_ID index);
```

Returns

None.

Description

This function enables calibration to be performed on the next ADC conversion.

When the Calibration bit is enabled, inputs are disconnected and tied to AVss. This sets the inputs of the ADC to zero. Then, the user can perform a conversion. Use of the Calibration mode is not affected if the ADC line has been configured as analog or digital, nor by channel input selection. Any analog input switches are disconnected from the ADC module in this mode. The conversion result is stored by the user software and is used to compensate subsequent conversions. This can be done by adding the two's complement of the result obtained during calibration to all normal ADC conversions.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_ADC_ExistsCalibrationControl in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_CalibrationEnable(MY_ADC_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_ADC_CalibrationEnable(ADC_MODULE_ID index)

PLIB_ADC_CalibrationDisable Function

Normal ADC module operation (no calibration is performed).

File

plib_adc.h

C

```
void PLIB_ADC_CalibrationDisable(ADC_MODULE_ID index);
```

Returns

None.

Description

This function enables normal ADC module operation without any calibration.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_ADC_ExistsCalibrationControl in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_CalibrationDisable(MY_ADC_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_ADC_CalibrationDisable(ADC_MODULE_ID index)

PLIB_ADC_InputScanMaskAdd Function

Select ADC analog channel for input scan.

File

plib_adc.h

C

```
void PLIB_ADC_InputScanMaskAdd(ADC_MODULE_ID index, ADC_INPUTS_SCAN scanInputs);
```

Returns

None.

Description

This function selects the ADC analog channel for input scanning.

Remarks

Multiple channels can be added simultaneously by ORing.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_ADC_ExistsMuxInputScanSelect in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
// Single channel addition
PLIB_ADC_InputScanMaskAdd(MY_ADC_INSTANCE, ADC_INPUT_SCAN_AN2);
// Multiple channels addition
PLIB_ADC_InputScanMaskAdd(ADC_ID_1, ADC_INPUT_SCAN_AN2 | ADC_INPUT_SCAN_AN2);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
scanInputs	One of the possible values from ADC_INPUTS_SCAN. Inputs are added for scanning.

Function

void PLIB_ADC_InputScanMaskAdd(ADC_MODULE_ID index,
ADC_INPUTS_SCAN scanInputs)

PLIB_ADC_InputScanMaskRemove Function

Omits ADC analog channel for input scan.

File

plib_adc.h

C

```
void PLIB_ADC_InputScanMaskRemove(ADC_MODULE_ID index, ADC_INPUTS_SCAN scanInputs);
```

Returns

None.

Description

This function allows the ADC analog channel to be omitted from input scanning.

Remarks

Multiple channels can be removed simultaneously by ORing.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_ADC_ExistsMuxInputScanSelect in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
// Single channel removing
PLIB_ADC_InputScanMaskRemove(MY_ADC_INSTANCE, ADC_INPUT_SCAN_AN2);
// Multiple channels removing
PLIB_ADC_InputScanMaskRemove(ADC_ID_1, ADC_INPUT_SCAN_AN2 | ADC_INPUT_SCAN_AN3);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
scanInputs	One of the possible values from ADC_INPUTS_SCAN. Inputs are removed from scanning.

Function

void PLIB_ADC_InputScanMaskRemove(ADC_MODULE_ID index,
ADC_INPUTS_SCAN scanInputs)

PLIB_ADC_InputScanMaskAddExtended Function

Select extended ADC analog channel for input scan.

File

plib_adc.h

C

```
void PLIB_ADC_InputScanMaskAddExtended(ADC_MODULE_ID index, ADC_INPUTS_SCAN_EXTENDED scanInputs);
```

Returns

None.

Description

This function selects the extended ADC analog channel for input scanning.

Remarks

Multiple channels can be added simultaneously by ORing.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_ADC_ExistsMuxInputScanSelectExtended in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Single channel addition
PLIB_ADC_InputScanMaskAddExtended(ADC_ID_1, ADC_INPUT_SCAN_AN36);
// Multiple channels addition
PLIB_ADC_InputScanMaskAddExtended(ADC_ID_1, ADC_INPUT_SCAN_AN36 | ADC_INPUT_SCAN_AN39);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
scanInputs	One of the possible values from ADC_INPUTS_SCAN_EXTENDED. Inputs are added for scanning.

Function

void PLIB_ADC_InputScanMaskAddExtended(ADC_MODULE_ID index,

ADC_INPUTS_SCAN_EXTENDED scanInputs)

PLIB_ADC_InputScanMaskRemoveExtended Function

Omits extended ADC analog channel for input scan.

File

plib_adc.h

C

```
void PLIB_ADC_InputScanMaskRemoveExtended(ADC_MODULE_ID index, ADC_INPUTS_SCAN_EXTENDED scanInputs);
```

Returns

None.

Description

This function allows the extended ADC analog channel to be omitted from input scanning.

Remarks

Multiple channels can be removed simultaneously by ORing.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_ADC_ExistsMuxInputScanSelectExtended in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Single channel removing
PLIB_ADC_InputScanMaskRemove(ADC_ID_1, ADC_INPUT_SCAN_AN36);
// Multiple channels removing
PLIB_ADC_InputScanMaskRemove(ADC_ID_1, ADC_INPUT_SCAN_AN36 | ADC_INPUT_SCAN_AN39);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
scanInputs	One of the possible values from ADC_INPUTS_SCAN_EXTENDED. Inputs are removed from scanning.

Function

void PLIB_ADC_InputScanMaskRemove(ADC_MODULE_ID index,

ADC_INPUTS_SCAN_EXTENDED scanInputs)

b) DMA Transactions

c) Conversion Control Logic

PLIB_ADC_ConversionStart Function

Starts ADC module manual conversion process.

File

plib_adc.h

C

```
void PLIB_ADC_ConversionStart(ADC_MODULE_ID index);
```

Returns

None.

Description

This function starts the ADC module manual conversion process.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_ADC_ExistsConversionControl in your application to determine whether this feature is available.

Preconditions

Automatic sampling must be disabled.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_ConversionStart(MY_ADC_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_ADC_ConversionStart(ADC_MODULE_ID index)

PLIB_ADC_ConversionHasCompleted Function

Provides the conversion completion status of the ADC.

File

plib_adc.h

C

```
bool PLIB_ADC_ConversionHasCompleted(ADC_MODULE_ID index);
```

Returns

Boolean:

- true - ADC conversion is done/completed
- false - ADC conversion is in progress or has not started

Description

This function provides the completion status of analog-to-digital conversion.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_ADC_ExistsConversionStatus in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
bool my_status = PLIB_ADC_ConversionHasCompleted(MY_ADC_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

bool PLIB_ADC_ConversionHasCompleted(ADC_MODULE_ID index)

PLIB_ADC_ConversionTriggerSourceSelect Function

Selects the conversion trigger source.

File

plib_adc.h

C

```
void PLIB_ADC_ConversionTriggerSourceSelect(ADC_MODULE_ID index, ADC_CONVERSION_TRIGGER_SOURCE source);
```

Returns

None.

Description

This function selects the ADC module conversion trigger source.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_ADC_ExistsConversionTriggerSource in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_ConversionTriggerSourceSelect(MY_ADC_INSTANCE, ADC_CONVERSION_TRIGGER_INTERNAL_COUNT);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
source	One of the possible values from ADC_CONVERSION_TRIGGER_SOURCE

Function

void PLIB_ADC_ConversionTriggerSourceSelect(ADC_MODULE_ID index,
ADC_CONVERSION_TRIGGER_SOURCE source)

PLIB_ADC_ConversionStopSequenceEnable Function

Stop conversion sequence (when the first ADC module interrupt is generated).

File

plib_adc.h

C

```
void PLIB_ADC_ConversionStopSequenceEnable(ADC_MODULE_ID index);
```

Returns

None.

Description

This function stops conversions when the first ADC module interrupt is generated. Hardware clears the Automatic Sampling bit when the ADC interrupt is generated.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_ADC_ExistsConversionStopSequenceControl in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_ConversionStopSequenceEnable(MY_ADC_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_ADC_ConversionStopSequenceEnable(ADC_MODULE_ID index)

PLIB_ADC_ConversionStopSequenceDisable Function

Normal conversion sequence.

File

plib_adc.h

C

```
void PLIB_ADC_ConversionStopSequenceDisable(ADC_MODULE_ID index);
```

Returns

None.

Description

This function enables normal operation, wherein the buffer contents will be overwritten by the next conversion sequence.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_ADC_ExistsConversionStopSequenceControl in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_ConversionStopSequenceDisable(MY_ADC_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_ADC_ConversionStopSequenceDisable(ADC_MODULE_ID index)

PLIB_ADC_ConversionClockSet Function

Sets the ADC module conversion clock.

File

plib_adc.h

C

```
void PLIB_ADC_ConversionClockSet(ADC_MODULE_ID index, uint32_t baseFrequency, ADC_CONVERSION_CLOCK value);
```

Returns

None.

Description

This function sets the ADC module conversion clock prescaler.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_ADC_ExistsConversionClock in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
// Following functions passed the input clock to ADC as 80MHz and
// required conversion clock as 20MHz.
PLIB_ADC_ConversionClockSet(MY_ADC_INSTANCE, 80000000, 20000000);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
baseFrequency	Input clock frequency in Hertz (Hz). This is the input clock to ADC module.
value	Unsigned value of type ADC_CONVERSION_CLOCK. This is the required conversion clock of ADC module in Hz.

Function

void PLIB_ADC_ConversionClockSet(ADC_MODULE_ID index,

uint32_t baseFrequency,

ADC_CONVERSION_CLOCK value)

PLIB_ADC_ConversionClockGet Function

Obtains the conversion clock.

File

plib_adc.h

C

```
ADC_CONVERSION_CLOCK PLIB_ADC_ConversionClockGet(ADC_MODULE_ID index, uint32_t baseFrequency);
```

Returns

ADC_CONVERSION_CLOCK - ADC Conversion clock value (in Hz) of type ADC_CONVERSION_CLOCK

Description

This function obtains the conversion clock that is being used by the ADC module.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_ADC_ExistsConversionClock in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
// baseFrequency is the peripheral input frequency
ADC_CONVERSION_CLOCK conversionClock; // To store the conversion clock value
conversionClock = PLIB_ADC_ConversionClockGet(MY_ADC_INSTANCE, 8000000);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
baseFrequencyHz	Input clock frequency to the ADC module in Hz

Function

ADC_CONVERSION_CLOCK PLIB_ADC_ConversionClockGet(ADC_MODULE_ID index,
uint32_t baseFrequencyHz)

PLIB_ADC_ConversionClockSourceSelect Function

Selects the ADC module conversion clock source.

File

plib_adc.h

C

```
void PLIB_ADC_ConversionClockSourceSelect(ADC_MODULE_ID index, ADC_CLOCK_SOURCE source);
```

Returns

None.

Description

This function selects the ADC module conversion clock source.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_ADC_ExistsConversionClockSource in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_ConversionClockSourceSelect(MY_ADC_INSTANCE, ADC_CLOCK_SOURCE_PERIPHERAL_BUS_CLOCK);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
source	One of the possible values from ADC_CLOCK_SOURCE

Function

void PLIB_ADC_ConversionClockSourceSelect(ADC_MODULE_ID index,
ADC_CLOCK_SOURCE source)

d) Sample and Hold Control Logic

PLIB_ADC_SampleAutoStartDisable Function

Sampling auto-start is disabled.

File

plib_adc.h

C

```
void PLIB_ADC_SampleAutoStartDisable(ADC_MODULE_ID index);
```

Returns

None.

Description

This function disables auto-sampling and enables manual sampling.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_ADC_ExistsSamplingAutoStart in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_SampleAutoStartDisable(MY_ADC_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_ADC_SampleAutoStartDisable(ADC_MODULE_ID index)

PLIB_ADC_SampleAutoStartEnable Function

Sampling auto-start is enabled.

File

plib_adc.h

C

```
void PLIB_ADC_SampleAutoStartEnable(ADC_MODULE_ID index);
```

Returns

None.

Description

This function enables auto-sampling. Sampling begins immediately after the last conversion is completed.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_ADC_ExistsSamplingAutoStart in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_SampleAutoStartEnable(MY_ADC_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_ADC_SampleAutoStartEnable(ADC_MODULE_ID index)

PLIB_ADC_SamplesPerInterruptSelect Function

Interrupts at the completion of conversion for each nth sample.

File

plib_adc.h

C

```
void PLIB_ADC_SamplesPerInterruptSelect(ADC_MODULE_ID index, ADC_SAMPLES_PER_INTERRUPT value);
```

Returns

None.

Description

This function interrupts at the completion of conversion for each nth sample/convert sequence.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_ADC_ExistsSamplesPerInterruptSelect in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_SamplesPerInterruptSelect(MY_ADC_INSTANCE, ADC_16SAMPLES_PER_INTERRUPT);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
value	Possible values from ADC_SAMPLES_PER_INTERRUPT

Function

void PLIB_ADC_SamplesPerInterruptSelect(ADC_MODULE_ID index,
ADC_SAMPLES_PER_INTERRUPT value)

PLIB_ADC_SamplingIsActive Function

Provides the ADC sampling status.

File

plib_adc.h

C

```
bool PLIB_ADC_SamplingIsActive(ADC_MODULE_ID index);
```

Returns

Boolean:

- true - ADC Sample and Hold circuit is sampling
- false - ADC Sample and Hold circuit is holding

Description

This function returns the ADC sampling status on whether the ADC is sampling or holding.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_ADC_ExistsSamplingStatus in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
bool my_status = PLIB_ADC_SamplingIsActive(MY_ADC_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

bool PLIB_ADC_SamplingIsActive(ADC_MODULE_ID index)

PLIB_ADC_SamplingModeSelect Function

Enable the selected sampling mode.

File

plib_adc.h

C

```
void PLIB_ADC_SamplingModeSelect(ADC_MODULE_ID index, ADC_SAMPLING_MODE mode);
```

Returns

None.

Description

This function selects the sampling mode.

Remarks

Sampling mode could be alternate input or Simultaneous or Sequential mode. Alternate input can be combined with Simultaneous or Sequential modes.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_ADC_ExistsSamplingModeControl in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_SamplingModeSelect(MY_ADC_INSTANCE, ADC_SAMPLING_MODE_ALTERNATE_INPUT);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
mode	One of the possible values from ADC_SAMPLING_MODE

Function

void PLIB_ADC_SamplingModeSelect(ADC_MODULE_ID index, ADC_SAMPLING_MODE mode)

PLIB_ADC_SamplingStart Function

Sampling is enabled.

File

plib_adc.h

C

```
void PLIB_ADC_SamplingStart(ADC_MODULE_ID index);
```

Returns

None.

Description

This function starts the ADC Sample and Hold circuit to sample the input channel.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_ADC_ExistsSamplingControl in your application to determine whether this feature is available.

Preconditions

Automatic sampling must be disabled.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_SamplingStart(MY_ADC_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_ADC_SamplingStart(ADC_MODULE_ID index)

PLIB_ADC_SamplingStop Function

Holding is enabled.

File

plib_adc.h

C

```
void PLIB_ADC_SamplingStop(ADC_MODULE_ID index);
```

Returns

None.

Description

This function stops the ADC Sample and Hold circuit from sampling and holds the sampled data.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_ADC_ExistsSamplingControl in your application to determine whether this feature is available.

Preconditions

Automatic sampling must be disabled.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
```

```
PLIB_ADC_SamplingStop(MY_ADC_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_ADC_SamplingStop(ADC_MODULE_ID index)

PLIB_ADC_SampleAcquisitionTimeSet Function

Sets the ADC acquisition/auto-sample time in TADs.

File

plib_adc.h

C

```
void PLIB_ADC_SampleAcquisitionTimeSet(ADC_MODULE_ID index, ADC_ACQUISITION_TIME acqTime);
```

Returns

None.

Description

This function sets the ADC acquisition/auto-sample time in TADs.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_ADC_ExistsSamplingAcquisitionTime in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_SampleAcquisitionTimeSet(MY_ADC_INSTANCE, 2);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
acqTime	Unsigned value of type ADC_ACQUISITION_TIME

Function

void PLIB_ADC_SampleAcquisitionTimeSet(ADC_MODULE_ID index,
ADC_ACQUISITION_TIME acqTime)

e) Channel Pairs Control

f) Output Configuration

PLIB_ADC_ResultBufferModeSelect Function

Selects the result buffer mode.

File

plib_adc.h

C

```
void PLIB_ADC_ResultBufferModeSelect(ADC_MODULE_ID index, ADC_BUFFER_MODE mode);
```

Returns

None.

Description

This function selects the result buffer mode.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_ADC_ExistsResultBufferMode in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_ResultBufferModeSelect(MY_ADC_INSTANCE,
                                ADC_BUFFER_MODE_TWO_8WORD_BUFFERS);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
mode	One of the possible values from ADC_BUFFER_MODE

Function

void PLIB_ADC_ResultBufferModeSelect(ADC_MODULE_ID index,
ADC_BUFFER_MODE mode)

PLIB_ADC_ResultBufferStatusGet Function

Provides the buffer fill status.

File

plib_adc.h

C

```
ADC_RESULT_BUF_STATUS PLIB_ADC_ResultBufferStatusGet(ADC_MODULE_ID index);
```

Returns

Boolean:

- true = ADC is currently filling buffer 08-0F, user should access data in 00-07
- false = ADC is currently filling buffer 00-07, user should access data in 08-0F

Description

This function obtains the buffer fill status.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_ADC_ExistsResultBufferFillStatus in your application to determine whether this feature is available.

Preconditions

ADC multi-buffer support is available and configured.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
ADC_RESULT_BUF_STATUS my_status;

my_status = PLIB_ADC_ResultBufferStatusGet(MY_ADC_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

ADC_RESULT_BUF_STATUS PLIB_ADC_ResultBufferStatusGet(ADC_MODULE_ID index)

PLIB_ADC_ResultFormatSelect Function

Selects the result format.

File

plib_adc.h

C

```
void PLIB_ADC_ResultFormatSelect(ADC_MODULE_ID index, ADC_RESULT_FORMAT resultFormat);
```

Returns

None.

Description

This function selects the result format.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_ADC_ExistsResultFormat in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_ResultFormatSelect(MY_ADC_INSTANCE, ADC_RESULT_FORMAT_INTEGER_16BIT);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
resultFormat	One of the possible values from ADC_RESULT_FORMAT

Function

void PLIB_ADC_ResultFormatSelect(ADC_MODULE_ID index,
ADC_RESULT_FORMAT resultFormat)

PLIB_ADC_ResultGetByIndex Function

Provides the ADC conversion result based on the buffer index.

File

plib_adc.h

C

```
ADC_SAMPLE PLIB_ADC_ResultGetByIndex(ADC_MODULE_ID index, uint8_t bufferIndex);
```

Returns

int16_t - ADC Conversion result at the respective bufferIndex

Description

This function provides the ADC module conversion result based on the buffer index.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_ADC_ExistsResultGetByIndex in your application to determine whether this feature is available.

Preconditions

ADC multi-buffer support available and configured.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
ADC_SAMPLE my_res = PLIB_ADC_ResultGetByIndex(MY_ADC_INSTANCE, 15);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
bufferIndex	Value ranging from 0 to 15

Function

ADC_SAMPLE PLIB_ADC_ResultGetByIndex(ADC_MODULE_ID index,
uint8_t bufferIndex)

g) MUX Selection and Channel Scan

PLIB_ADC_MuxAInputScanDisable Function

Do not scan input selections for CH0+ of MUX A.

File

plib_adc.h

C

```
void PLIB_ADC_MuxAInputScanDisable(ADC_MODULE_ID index);
```

Returns

None.

Description

This function disables scan input for CH0+ of MUX A.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_ADC_ExistsMuxInputScanControl in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_MuxAInputScanDisable(MY_ADC_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_ADC_MuxAInputScanDisable(ADC_MODULE_ID index)

PLIB_ADC_MuxAInputScanEnable Function

Scan input selections for CH0+ of MUX A.

File

plib_adc.h

C

```
void PLIB_ADC_MuxAInputScanEnable(ADC_MODULE_ID index);
```

Returns

None.

Description

This function enables scan input for CH0+ of MUX A.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_ADC_ExistsMuxInputScanControl in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_MuxAInputScanEnable(MY_ADC_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_ADC_MuxAInputScanEnable(ADC_MODULE_ID index)

PLIB_ADC_MuxChannel0InputNegativeSelect Function

Channel 0 negative input select for multiplexer setting.

File

plib_adc.h

C

```
void PLIB_ADC_MuxChannel0InputNegativeSelect(ADC_MODULE_ID index, ADC_MUX muxType, ADC_INPUTS_NEGATIVE
input);
```

Returns

None.

Description

This function selects the negative input for channel 0 of MUX A or MUX B.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_ADC_ExistsMuxChannel0NegativeInput in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
```

```
PLIB_ADC_MuxChannel0InputNegativeSelect(MY_ADC_INSTANCE, ADC_MUX_A, ADC_INPUT_NEGATIVE_VREF_MINUS);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
muxType	One of the possible values from ADC_MUX

Function

void PLIB_ADC_MuxChannel0InputNegativeSelect(ADC_MODULE_ID index,
ADC_MUX muxType,
ADC_INPUTS_NEGATIVE input)

PLIB_ADC_MuxChannel0InputPositiveSelect Function

Channel 0 positive input select for multiplexer setting.

File

plib_adc.h

C

```
void PLIB_ADC_MuxChannel0InputPositiveSelect(ADC_MODULE_ID index, ADC_MUX muxType, ADC_INPUTS_POSITIVE
input);
```

Returns

None.

Description

This function selects the positive input for channel 0 of MUX A or MUX B.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_ADC_ExistsMuxChannel0PositiveInput in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_MuxChannel0InputPositiveSelect(MY_ADC_INSTANCE, ADC_MUX_A, ADC_INPUT_POSITIVE_AN2);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
muxType	One of the possible values from ADC_MUX

Function

void PLIB_ADC_MuxChannel0InputPositiveSelect(ADC_MODULE_ID index,
ADC_MUX muxType,
ADC_INPUTS_POSITIVE input)

h) Feature Existence Functions

PLIB_ADC_ExistsCalibrationControl Function

Identifies whether the CalibrationControl feature exists on the ADC module

File

plib_adc.h

C

```
bool PLIB_ADC_ExistsCalibrationControl(ADC_MODULE_ID index);
```

Returns

- true - The CalibrationControl feature is supported on the device
- false - The CalibrationControl feature is not supported on the device

Description

This function identifies whether the CalibrationControl feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- PLIB_ADC_CalibrationEnable
- PLIB_ADC_CalibrationDisable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ADC_ExistsCalibrationControl(ADC_MODULE_ID index)

PLIB_ADC_ExistsConversionClock Function

Identifies whether the ConversionClock feature exists on the ADC module

File

plib_adc.h

C

```
bool PLIB_ADC_ExistsConversionClock(ADC_MODULE_ID index);
```

Returns

- true - The ConversionClock feature is supported on the device
- false - The ConversionClock feature is not supported on the device

Description

This function identifies whether the ConversionClock feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- PLIB_ADC_ConversionClockSet
- PLIB_ADC_ConversionClockGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ADC_ExistsConversionClock(ADC_MODULE_ID index)

PLIB_ADC_ExistsConversionClockSource Function

Identifies whether the ConversionClockSource feature exists on the ADC module

File

plib_adc.h

C

```
bool PLIB_ADC_ExistsConversionClockSource(ADC_MODULE_ID index);
```

Returns

- true - The ConversionClockSource feature is supported on the device
- false - The ConversionClockSource feature is not supported on the device

Description

This function identifies whether the ConversionClockSource feature is available on the ADC module. When this function returns true, this function is supported on the device:

- PLIB_ADC_ConversionClockSourceSelect

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ADC_ExistsConversionClockSource(ADC_MODULE_ID index)

PLIB_ADC_ExistsConversionControl Function

Identifies whether the ConversionControl feature exists on the ADC module

File

plib_adc.h

C

```
bool PLIB_ADC_ExistsConversionControl(ADC_MODULE_ID index);
```

Returns

- true - The ConversionControl feature is supported on the device
- false - The ConversionControl feature is not supported on the device

Description

This function identifies whether the ConversionControl feature is available on the ADC module. When this function returns true, this function is supported on the device:

- PLIB_ADC_ConversionStart

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ADC_ExistsConversionControl(ADC_MODULE_ID index)

PLIB_ADC_ExistsConversionStatus Function

Identifies whether the ConversionStatus feature exists on the ADC module

File

plib_adc.h

C

```
bool PLIB_ADC_ExistsConversionStatus(ADC_MODULE_ID index);
```

Returns

- true - The ConversionStatus feature is supported on the device
- false - The ConversionStatus feature is not supported on the device

Description

This function identifies whether the ConversionStatus feature is available on the ADC module. When this function returns true, this function is supported on the device:

- PLIB_ADC_ConversionHasCompleted

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ADC_ExistsConversionStatus(ADC_MODULE_ID index)

PLIB_ADC_ExistsConversionStopSequenceControl Function

Identifies whether the ConversionStopSequenceControl feature exists on the ADC module

File

plib_adc.h

C

```
bool PLIB_ADC_ExistsConversionStopSequenceControl(ADC_MODULE_ID index);
```

Returns

- true - The ConversionStopSequenceControl feature is supported on the device
- false - The ConversionStopSequenceControl feature is not supported on the device

Description

This function identifies whether the ConversionStopSequenceControl feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- PLIB_ADC_ConversionStopSequenceEnable
- PLIB_ADC_ConversionStopSequenceDisable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ADC_ExistsConversionStopSequenceControl(ADC_MODULE_ID index)

PLIB_ADC_ExistsConversionTriggerSource Function

Identifies whether the ConversionTriggerSource feature exists on the ADC module

File

plib_adc.h

C

```
bool PLIB_ADC_ExistsConversionTriggerSource(ADC_MODULE_ID index);
```

Returns

- true - The ConversionTriggerSource feature is supported on the device
- false - The ConversionTriggerSource feature is not supported on the device

Description

This function identifies whether the ConversionTriggerSource feature is available on the ADC module. When this function returns true, this function is supported on the device:

- PLIB_ADC_ConversionTriggerSourceSelect

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ADC_ExistsConversionTriggerSource(ADC_MODULE_ID index)

PLIB_ADC_ExistsEnableControl Function

Identifies whether the EnableControl feature exists on the ADC module

File

plib_adc.h

C

```
bool PLIB_ADC_ExistsEnableControl(ADC_MODULE_ID index);
```

Returns

- true - The EnableControl feature is supported on the device
- false - The EnableControl feature is not supported on the device

Description

This function identifies whether the EnableControl feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- PLIB_ADC_Enable
- PLIB_ADC_Disable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ADC_ExistsEnableControl(ADC_MODULE_ID index)

PLIB_ADC_ExistsMuxChannel0NegativeInput Function

Identifies whether the MuxChannel0NegativeInput feature exists on the ADC module

File

plib_adc.h

C

```
bool PLIB_ADC_ExistsMuxChannel0NegativeInput(ADC_MODULE_ID index);
```

Returns

- true - The MuxChannel0NegativeInput feature is supported on the device
- false - The MuxChannel0NegativeInput feature is not supported on the device

Description

This function identifies whether the MuxChannel0NegativeInput feature is available on the ADC module. When this function returns true, this function is supported on the device:

- PLIB_ADC_MuxChannel0InputNegativeSelect

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ADC_ExistsMuxChannel0NegativeInput(ADC_MODULE_ID index)

PLIB_ADC_ExistsMuxChannel0PositiveInput Function

Identifies whether the MuxChannel0PositiveInput feature exists on the ADC module

File

plib_adc.h

C

```
bool PLIB_ADC_ExistsMuxChannel0PositiveInput(ADC_MODULE_ID index);
```

Returns

- true - The MuxChannel0PositiveInput feature is supported on the device
- false - The MuxChannel0PositiveInput feature is not supported on the device

Description

This function identifies whether the MuxChannel0PositiveInput feature is available on the ADC module. When this function returns true, this function is supported on the device:

- PLIB_ADC_MuxChannel0InputPositiveSelect

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ADC_ExistsMuxChannel0PositiveInput(ADC_MODULE_ID index)

PLIB_ADC_ExistsMuxInputScanControl Function

Identifies whether the MuxInputScanControl feature exists on the ADC module

File

plib_adc.h

C

```
bool PLIB_ADC_ExistsMuxInputScanControl(ADC_MODULE_ID index);
```

Returns

- true - The MuxInputScanControl feature is supported on the device
- false - The MuxInputScanControl feature is not supported on the device

Description

This function identifies whether the MuxInputScanControl feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- PLIB_ADC_MuxAInputScanEnable
- PLIB_ADC_MuxAInputScanDisable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ADC_ExistsMuxInputScanControl(ADC_MODULE_ID index)

PLIB_ADC_ExistsMuxInputScanSelect Function

Identifies whether the MuxInputScanSelect feature exists on the ADC module

File

plib_adc.h

C

```
bool PLIB_ADC_ExistsMuxInputScanSelect(ADC_MODULE_ID index);
```

Returns

- true - The MuxInputScanSelect feature is supported on the device
- false - The MuxInputScanSelect feature is not supported on the device

Description

This function identifies whether the MuxInputScanSelect feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- PLIB_ADC_InputScanMaskAdd
- PLIB_ADC_InputScanMaskRemove

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ADC_ExistsMuxInputScanSelect(ADC_MODULE_ID index)

PLIB_ADC_ExistsResultBufferFillStatus Function

Identifies whether the ResultBufferFillStatus feature exists on the ADC module

File

plib_adc.h

C

```
bool PLIB_ADC_ExistsResultBufferFillStatus(ADC_MODULE_ID index);
```

Returns

- true - The ResultBufferFillStatus feature is supported on the device
- false - The ResultBufferFillStatus feature is not supported on the device

Description

This function identifies whether the ResultBufferFillStatus feature is available on the ADC module. When this function returns true, this function is supported on the device:

- PLIB_ADC_ResultBufferStatusGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ADC_ExistsResultBufferFillStatus(ADC_MODULE_ID index)

PLIB_ADC_ExistsResultBufferMode Function

Identifies whether the ResultBufferMode feature exists on the ADC module

File

plib_adc.h

C

```
bool PLIB_ADC_ExistsResultBufferMode(ADC_MODULE_ID index);
```

Returns

- true - The ResultBufferMode feature is supported on the device
- false - The ResultBufferMode feature is not supported on the device

Description

This function identifies whether the ResultBufferMode feature is available on the ADC module. When this function returns true, this function is supported on the device:

- PLIB_ADC_ResultBufferModeSelect

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ADC_ExistsResultBufferMode(ADC_MODULE_ID index)

PLIB_ADC_ExistsResultFormat Function

Identifies whether the ResultFormat feature exists on the ADC module

File

plib_adc.h

C

```
bool PLIB_ADC_ExistsResultFormat(ADC_MODULE_ID index);
```

Returns

- true - The ResultFormat feature is supported on the device
- false - The ResultFormat feature is not supported on the device

Description

This function identifies whether the ResultFormat feature is available on the ADC module. When this function returns true, this function is supported on the device:

- PLIB_ADC_ResultFormatSelect

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ADC_ExistsResultFormat(ADC_MODULE_ID index)

PLIB_ADC_ExistsResultGetByIndex Function

Identifies whether the ResultGetByIndex feature exists on the ADC module

File

plib_adc.h

C

```
bool PLIB_ADC_ExistsResultGetByIndex(ADC_MODULE_ID index);
```

Returns

- true - The ResultGetByIndex feature is supported on the device
- false - The ResultGetByIndex feature is not supported on the device

Description

This function identifies whether the ResultGetByIndex feature is available on the ADC module. When this function returns true, this function is supported on the device:

- PLIB_ADC_ResultGetByIndex

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ADC_ExistsResultGetByIndex(ADC_MODULE_ID index)

PLIB_ADC_ExistsSamplesPerInterruptSelect Function

Identifies whether the SamplesPerInterruptSelect feature exists on the ADC module

File

plib_adc.h

C

```
bool PLIB_ADC_ExistsSamplesPerInterruptSelect(ADC_MODULE_ID index);
```

Returns

- true - The SamplesPerInterruptSelect feature is supported on the device
- false - The SamplesPerInterruptSelect feature is not supported on the device

Description

This function identifies whether the SamplesPerInterruptSelect feature is available on the ADC module. When this function returns true, this function is supported on the device:

- PLIB_ADC_SamplesPerInterruptSelect

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ADC_ExistsSamplesPerInterruptSelect(ADC_MODULE_ID index)

PLIB_ADC_ExistsSamplingAcquisitionTime Function

Identifies whether the SamplingAcquisitionTime feature exists on the ADC module

File

plib_adc.h

C

```
bool PLIB_ADC_ExistsSamplingAcquisitionTime(ADC_MODULE_ID index);
```

Returns

- true - The SamplingAcquisitionTime feature is supported on the device
- false - The SamplingAcquisitionTime feature is not supported on the device

Description

This function identifies whether the SamplingAcquisitionTime feature is available on the ADC module. When this function returns true, this function is supported on the device:

- PLIB_ADC_SampleAcquisitionTimeSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ADC_ExistsSamplingAcquisitionTime(ADC_MODULE_ID index)

PLIB_ADC_ExistsSamplingAutoStart Function

Identifies whether the SamplingAutoStart feature exists on the ADC module

File

plib_adc.h

C

```
bool PLIB_ADC_ExistsSamplingAutoStart(ADC_MODULE_ID index);
```

Returns

- true - The SamplingAutoStart feature is supported on the device
- false - The SamplingAutoStart feature is not supported on the device

Description

This function identifies whether the SamplingAutoStart feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- PLIB_ADC_SampleAutoStartEnable
- PLIB_ADC_SampleAutoStartDisable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ADC_ExistsSamplingAutoStart(ADC_MODULE_ID index)

PLIB_ADC_ExistsSamplingControl Function

Identifies whether the SamplingControl feature exists on the ADC module

File

plib_adc.h

C

```
bool PLIB_ADC_ExistsSamplingControl(ADC_MODULE_ID index);
```

Returns

- true - The SamplingControl feature is supported on the device
- false - The SamplingControl feature is not supported on the device

Description

This function identifies whether the SamplingControl feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- PLIB_ADC_SamplingStart
- PLIB_ADC_SamplingStop

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ADC_ExistsSamplingControl(ADC_MODULE_ID index)

PLIB_ADC_ExistsSamplingModeControl Function

Identifies whether the SamplingModeControl feature exists on the ADC module

File

plib_adc.h

C

```
bool PLIB_ADC_ExistsSamplingModeControl(ADC_MODULE_ID index);
```

Returns

- true - The SamplingModeControl feature is supported on the device
- false - The SamplingModeControl feature is not supported on the device

Description

This function identifies whether the SamplingModeControl feature is available on the ADC module. When this function returns true, this function is supported on the device:

- PLIB_ADC_SamplingModeSelect

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ADC_ExistsSamplingModeControl(ADC_MODULE_ID index)

PLIB_ADC_ExistsSamplingStatus Function

Identifies whether the SamplingStatus feature exists on the ADC module

File

plib_adc.h

C

```
bool PLIB_ADC_ExistsSamplingStatus(ADC_MODULE_ID index);
```

Returns

- true - The SamplingStatus feature is supported on the device
- false - The SamplingStatus feature is not supported on the device

Description

This function identifies whether the SamplingStatus feature is available on the ADC module. When this function returns true, this function is supported on the device:

- PLIB_ADC_SamplingIsActive

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ADC_ExistsSamplingStatus(ADC_MODULE_ID index)

PLIB_ADC_ExistsStopInIdleControl Function

Identifies whether the StopInIdle feature exists on the ADC module

File

plib_adc.h

C

```
bool PLIB_ADC_ExistsStopInIdleControl(ADC_MODULE_ID index);
```

Returns

- true - The StopInIdle feature is supported on the device
- false - The StopInIdle feature is not supported on the device

Description

This function identifies whether the StopInIdle feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- PLIB_ADC_StopInIdleEnable
- PLIB_ADC_StopInIdleDisable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ADC_ExistsStopInIdleControl(ADC_MODULE_ID index)

PLIB_ADC_ExistsVoltageReference Function

Identifies whether the VoltageReference feature exists on the ADC module

File

plib_adc.h

C

```
bool PLIB_ADC_ExistsVoltageReference(ADC_MODULE_ID index);
```

Returns

- true - The VoltageReference feature is supported on the device
- false - The VoltageReference feature is not supported on the device

Description

This function identifies whether the VoltageReference feature is available on the ADC module. When this function returns true, this function is supported on the device:

- PLIB_ADC_VoltageReferenceSelect

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ADC_ExistsVoltageReference(ADC_MODULE_ID index)

PLIB_ADC_ExistsMuxInputScanSelectExtended Function

Identifies whether the MuxInputScanSelectExtended feature exists on the ADC module

File

plib_adc.h

C

```
bool PLIB_ADC_ExistsMuxInputScanSelectExtended(ADC_MODULE_ID index);
```

Returns

- true - The MuxInputScanSelectExtended feature is supported on the device
- false - The MuxInputScanSelectExtended feature is not supported on the device

Description

This function identifies whether the MuxInputScanSelectExtended feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- PLIB_ADC_InputScanMaskAddExtended
- PLIB_ADC_InputScanMaskRemoveExtended

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ADC_ExistsMuxInputScanSelectExtended(ADC_MODULE_ID index)

i) Data Types & Constants

ADC_MODULE_ID Enumeration

Identifies the available ADC modules.

File

help_plib_adc.h

C

```
typedef enum {
  ADC_ID_1,
  ADC_ID_2,
  ADC_ID_3,
  ADC_ID_4,
  ADC_ID_5,
  ADC_NUMBER_OF_MODULES
} ADC_MODULE_ID;
```

Members

Members	Description
ADC_ID_1	ADC Module 1 ID
ADC_ID_2	ADC Module 2 ID
ADC_ID_3	ADC Module 3 ID
ADC_ID_4	ADC Module 4 ID
ADC_ID_5	ADC Module 5 ID
ADC_NUMBER_OF_MODULES	Number of available ADC modules.

Description

ADC Module ID

This enumeration identifies the available ADC modules.

Remarks

The caller should not rely on the specific numbers assigned to any of these values as they may change from one processor to the next.

Not all modules are available on all devices. Refer to the specific device data sheet to determine which modules are supported. The numbers used in the enumeration values will match the numbers provided in the data sheet.

ADC_VOLTAGE_REFERENCE Enumeration

Defining the different ADC Voltage Reference by which the ADC can be configured.

File

help_plib_adc.h

C

```
typedef enum {
  ADC_REFERENCE_VDD_TO_AVSS,
  ADC_REFERENCE_VREFPLUS_TO_AVSS,
  ADC_REFERENCE_AVDD_TO_VREF_NEG,
  ADC_REFERENCE_VREFPLUS_TO_VREFNEG
} ADC_VOLTAGE_REFERENCE;
```

Members

Members	Description
ADC_REFERENCE_VDD_TO_AVSS	Positive voltage reference supplied internally by VDD and Negative voltage reference supplied internally through VSS
ADC_REFERENCE_VREFPLUS_TO_AVSS	Positive voltage reference supplied externally through VREF+ pin and Negative voltage reference supplied internally through VSS
ADC_REFERENCE_AVDD_TO_VREF_NEG	Positive voltage reference supplied internally by VDD and Negative voltage reference supplied externally through VREF- pin
ADC_REFERENCE_VREFPLUS_TO_VREFNEG	Positive voltage reference supplied externally through VREF+ pin and Negative voltage reference supplied externally through VREF- pin

Description

ADC Voltage Reference Enumeration

This data type defines the different ADC Voltage Reference by which the ADC can be configured.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADC_INPUTS_NEGATIVE Enumeration

Defines the different ADC Negative Input Enumeration.

File

help_plib_adc.h

C

```
typedef enum {
  ADC_INPUT_NEGATIVE_VREF_MINUS,
  ADC_INPUT_NEGATIVE_AN1,
  ADC_INPUT_NEGATIVE_AN2,
  ADC_INPUT_NEGATIVE_AN3,
  ADC_INPUT_NEGATIVE_AN4,
  ADC_INPUT_NEGATIVE_AN5,
  ADC_INPUT_NEGATIVE_AN6
} ADC_INPUTS_NEGATIVE;
```

Members

Members	Description
ADC_INPUT_NEGATIVE_VREF_MINUS	Negative input is VREF
ADC_INPUT_NEGATIVE_AN1	Negative input is AN1
ADC_INPUT_NEGATIVE_AN2	Negative input is AN2
ADC_INPUT_NEGATIVE_AN3	Negative input is AN3
ADC_INPUT_NEGATIVE_AN4	Negative input is AN4
ADC_INPUT_NEGATIVE_AN5	Negative input is AN5
ADC_INPUT_NEGATIVE_AN6	Negative input is AN6

Description

ADC Negative Input Enumeration

This data type defines the different ADC Negative Input Enumeration.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADC_SAMPLES_PER_INTERRUPT Enumeration

Defining the Samples Per Interrupt Enumeration.

File

help_plib_adc.h

C

```
typedef enum {
  ADC_1SAMPLE_PER_INTERRUPT,
  ADC_2SAMPLES_PER_INTERRUPT,
  ADC_3SAMPLES_PER_INTERRUPT,
  ADC_4SAMPLES_PER_INTERRUPT,
  ADC_5SAMPLES_PER_INTERRUPT,
  ADC_6SAMPLES_PER_INTERRUPT,
  ADC_7SAMPLES_PER_INTERRUPT,
  ADC_8SAMPLES_PER_INTERRUPT,
  ADC_9SAMPLES_PER_INTERRUPT,
  ADC_10SAMPLES_PER_INTERRUPT,
  ADC_11SAMPLES_PER_INTERRUPT,
  ADC_12SAMPLES_PER_INTERRUPT,
  ADC_13SAMPLES_PER_INTERRUPT,
  ADC_14SAMPLES_PER_INTERRUPT,
  ADC_15SAMPLES_PER_INTERRUPT,
  ADC_16SAMPLES_PER_INTERRUPT
} ADC_SAMPLES_PER_INTERRUPT;
```

Members

Members	Description
ADC_1SAMPLE_PER_INTERRUPT	Interrupts at the completion of conversion for each sample/convert sequence
ADC_2SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 2nd sample/convert sequence
ADC_3SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 3rd sample/convert sequence
ADC_4SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 4th sample/convert sequence
ADC_5SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 5th sample/convert sequence
ADC_6SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 6th sample/convert sequence
ADC_7SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 7th sample/convert sequence
ADC_8SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 8th sample/convert sequence
ADC_9SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 9th sample/convert sequence
ADC_10SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 10th sample/convert sequence
ADC_11SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 11th sample/convert sequence
ADC_12SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 12th sample/convert sequence
ADC_13SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 13th sample/convert sequence
ADC_14SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 14th sample/convert sequence
ADC_15SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 15th sample/convert sequence
ADC_16SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 16th sample/convert sequence

Description

ADC samples per Interrupt Enumeration

This data type defines the Samples Per Interrupt Enumeration.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADC_CLOCK_SOURCE Enumeration

Defines the ADC Clock Source Select.

File

help_plib_adc.h

C

```
typedef enum {
  ADC_CLOCK_SOURCE_PERIPHERAL_BUS_CLOCK,
  ADC_CLOCK_SOURCE_SYSTEM_CLOCK,
  ADC_CLOCK_SOURCE_INTERNAL_RC
} ADC_CLOCK_SOURCE;
```

Members

Members	Description
ADC_CLOCK_SOURCE_PERIPHERAL_BUS_CLOCK	A/D Peripheral clock
ADC_CLOCK_SOURCE_SYSTEM_CLOCK	This option is deprecated, use ADC_CLOCK_SOURCE_PERIPHERAL_BUS_CLOCK
ADC_CLOCK_SOURCE_INTERNAL_RC	A/D internal RC clock

Description

ADC Clock Source Select

This data type defines the ADC Clock Source Select.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADC_CONVERSION_TRIGGER_SOURCE Enumeration

Defines the ADC Conversion Trigger Source.

File

help_plib_adc.h

C

```
typedef enum {
  ADC_CONVERSION_TRIGGER_SAMP_CLEAR,
  ADC_CONVERSION_TRIGGER_INT0_TRANSITION,
  ADC_CONVERSION_TRIGGER_TMR3_COMPARE_MATCH,
  ADC_CONVERSION_TRIGGER_CTMU_EVENT,
  ADC_CONVERSION_TRIGGER_INTERNAL_COUNT
} ADC_CONVERSION_TRIGGER_SOURCE;
```

Members

Members	Description
ADC_CONVERSION_TRIGGER_SAMP_CLEAR	Clearing SAMP bit (full program control)
ADC_CONVERSION_TRIGGER_INT0_TRANSITION	Active transition on INT0 pin (basic sync convert)
ADC_CONVERSION_TRIGGER_TMR3_COMPARE_MATCH	Timer3 compare match
ADC_CONVERSION_TRIGGER_CTMU_EVENT	CTMU event
ADC_CONVERSION_TRIGGER_INTERNAL_COUNT	Internal counter (auto-convert)

Description

ADC Conversion Trigger Source

This data type defines the ADC Conversion Trigger Source.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADC_BUFFER_MODE Enumeration

Defines the ADC Buffer Mode.

File

help_plib_adc.h

C

```
typedef enum {
  ADC_BUFFER_MODE_ONE_16WORD_BUFFER,
  ADC_BUFFER_MODE_TWO_8WORD_BUFFERS
} ADC_BUFFER_MODE;
```

Members

Members	Description
ADC_BUFFER_MODE_ONE_16WORD_BUFFER	Buffer configured as one 16-word buffer (ADC1BUF0 to ADC1BUFF)
ADC_BUFFER_MODE_TWO_8WORD_BUFFERS	Buffer configured as two 8-word buffers (ADC1BUF0 to ADC1BUF7 and ADC1BUF8 to ADC1BUFF)

Description

ADC Buffer Mode

This data type defines the ADC Buffer Mode.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADC_RESULT_BUF_STATUS Enumeration

Defines the ADC Result Buffer Status

File

help_plib_adc.h

C

```
typedef enum {
  ADC_FILLING_BUF_0TO7,
  ADC_FILLING_BUF_8TOF
} ADC_RESULT_BUF_STATUS;
```

Members

Members	Description
ADC_FILLING_BUF_0TO7	Buffers 0x0 to 0x7 are getting filled
ADC_FILLING_BUF_8TOF	Buffers 0x8 to 0xF are getting filled

Description

ADC Result Buffer Status

This data type defines the elements that specify which group of eight buffers the ADC is currently filling.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADC_MUX Enumeration

Defining the different ADC MUX Enumeration.

File

help_plib_adc.h

C

```
typedef enum {
  ADC_MUX_A,
  ADC_MUX_B
} ADC_MUX;
```

Members

Members	Description
ADC_MUX_A	ADC Mux A Selection
ADC_MUX_B	ADC Mux B Selection

Description

ADC MUX Enumeration

This data type defines the different ADC MUX Enumeration.

Remarks

None.

ADC_SAMPLING_MODE Enumeration

Defines the ADC Sampling Mode Select.

File

help_plib_adc.h

C

```
typedef enum {
  ADC_SAMPLING_MODE_MUXA,
  ADC_SAMPLING_MODE_ALTERNATE_INPUT
} ADC_SAMPLING_MODE;
```

Members

Members	Description
ADC_SAMPLING_MODE_MUXA	Always Mux A Sampling Mode
ADC_SAMPLING_MODE_ALTERNATE_INPUT	Alternate Input Sampling Mode

Description

ADC Sampling Mode Select

This data type defines the ADC Sampling Mode Select.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADC_INPUTS_SCAN Enumeration

Defines the ADC Scan inputs.

File

help_plib_adc.h

C

```
typedef enum {
  ADC_INPUT_SCAN_AN0,
  ADC_INPUT_SCAN_AN1,
  ADC_INPUT_SCAN_AN2,
  ADC_INPUT_SCAN_AN3,
  ADC_INPUT_SCAN_AN4,
  ADC_INPUT_SCAN_AN5,
  ADC_INPUT_SCAN_AN6,
  ADC_INPUT_SCAN_AN7,
  ADC_INPUT_SCAN_AN8,
  ADC_INPUT_SCAN_AN9,
  ADC_INPUT_SCAN_AN10,
  ADC_INPUT_SCAN_AN11,
  ADC_INPUT_SCAN_AN12,
  ADC_INPUT_SCAN_AN13,
  ADC_INPUT_SCAN_AN14,
  ADC_INPUT_SCAN_AN15,
  ADC_INPUT_SCAN_AN16,
```

```
  ADC_INPUT_SCAN_AN17,
  ADC_INPUT_SCAN_AN18,
  ADC_INPUT_SCAN_AN19,
  ADC_INPUT_SCAN_AN20,
  ADC_INPUT_SCAN_AN21,
  ADC_INPUT_SCAN_AN22,
  ADC_INPUT_SCAN_AN23,
  ADC_INPUT_SCAN_AN24,
  ADC_INPUT_SCAN_AN25,
  ADC_INPUT_SCAN_AN26,
  ADC_INPUT_SCAN_AN27,
  ADC_INPUT_SCAN_AN28,
  ADC_INPUT_SCAN_AN29,
  ADC_INPUT_SCAN_AN30,
  ADC_INPUT_SCAN_AN31,
  ADC_INPUT_SCAN_IVREF,
  ADC_INPUT_SCAN_CTMU,
  ADC_INPUT_SCAN_VSS
} ADC_INPUTS_SCAN;
```

Members

Members	Description
ADC_INPUT_SCAN_AN0	Scan input is AN0
ADC_INPUT_SCAN_AN1	Scan input is AN1
ADC_INPUT_SCAN_AN2	Scan input is AN2
ADC_INPUT_SCAN_AN3	Scan input is AN3
ADC_INPUT_SCAN_AN4	Scan input is AN4
ADC_INPUT_SCAN_AN5	Scan input is AN5
ADC_INPUT_SCAN_AN6	Scan input is AN6
ADC_INPUT_SCAN_AN7	Scan input is AN7
ADC_INPUT_SCAN_AN8	Scan input is AN8
ADC_INPUT_SCAN_AN9	Scan input is AN9
ADC_INPUT_SCAN_AN10	Scan input is AN10
ADC_INPUT_SCAN_AN11	Scan input is AN11
ADC_INPUT_SCAN_AN12	Scan input is AN12
ADC_INPUT_SCAN_AN13	Scan input is AN13
ADC_INPUT_SCAN_AN14	Scan input is AN14
ADC_INPUT_SCAN_AN15	Scan input is AN15
ADC_INPUT_SCAN_AN16	Scan input is AN16
ADC_INPUT_SCAN_AN17	Scan input is AN17
ADC_INPUT_SCAN_AN18	Scan input is AN18
ADC_INPUT_SCAN_AN19	Scan input is AN19
ADC_INPUT_SCAN_AN20	Scan input is AN20
ADC_INPUT_SCAN_AN21	Scan input is AN21
ADC_INPUT_SCAN_AN22	Scan input is AN22
ADC_INPUT_SCAN_AN23	Scan input is AN23
ADC_INPUT_SCAN_AN24	Scan input is AN24
ADC_INPUT_SCAN_AN25	Scan input is AN25
ADC_INPUT_SCAN_AN26	Scan input is AN26
ADC_INPUT_SCAN_AN27	Scan input is AN27
ADC_INPUT_SCAN_AN28	Scan input is AN28
ADC_INPUT_SCAN_AN29	Scan input is AN29
ADC_INPUT_SCAN_AN30	Scan input is AN30
ADC_INPUT_SCAN_AN31	Scan input is AN31
ADC_INPUT_SCAN_IVREF	Scan input is IVref
ADC_INPUT_SCAN_CTMU	Scan input is CTMU input
ADC_INPUT_SCAN_VSS	Scan input is VSS

Description

ADC Scan Inputs Enumeration

This data type defines the ADC Scan inputs.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADC_RESULT_FORMAT Enumeration

Defines the ADC Result Format.

File

help_plib_adc.h

C

```
typedef enum {
  ADC_RESULT_FORMAT_INTEGER_16BIT,
  ADC_RESULT_FORMAT_SIGNED_INTEGER_16BIT,
  ADC_RESULT_FORMAT_FRACTIONAL_16BIT,
  ADC_RESULT_FORMAT_SIGNED_FRACTIONAL_16BIT,
  ADC_RESULT_FORMAT_INTEGER_32BIT,
  ADC_RESULT_FORMAT_SIGNED_INTEGER_32BIT,
  ADC_RESULT_FORMAT_FRACTIONAL_32BIT,
  ADC_RESULT_FORMAT_SIGNED_FRACTIONAL_32BIT
} ADC_RESULT_FORMAT;
```

Members

Members	Description
ADC_RESULT_FORMAT_INTEGER_16BIT	Integer 16-bit
ADC_RESULT_FORMAT_SIGNED_INTEGER_16BIT	Signed Integer 16-bit
ADC_RESULT_FORMAT_FRACTIONAL_16BIT	Fractional 16-bit
ADC_RESULT_FORMAT_SIGNED_FRACTIONAL_16BIT	Signed Fractional 16-bit
ADC_RESULT_FORMAT_INTEGER_32BIT	Integer 32-bit
ADC_RESULT_FORMAT_SIGNED_INTEGER_32BIT	Signed Integer 32-bit
ADC_RESULT_FORMAT_FRACTIONAL_32BIT	Fractional 32-bit
ADC_RESULT_FORMAT_SIGNED_FRACTIONAL_32BIT	Signed Fractional 32-bit

Description

ADC Result Format

This data type defines the ADC Result Format.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADC_INPUTS_POSITIVE Enumeration

Defines the ADC inputs.

File

help_plib_adc.h

C

```
typedef enum {
  ADC_INPUT_POSITIVE_AN0,
  ADC_INPUT_POSITIVE_AN1,
  ADC_INPUT_POSITIVE_AN2,
  ADC_INPUT_POSITIVE_AN3,
  ADC_INPUT_POSITIVE_AN4,
  ADC_INPUT_POSITIVE_AN5,
  ADC_INPUT_POSITIVE_AN6,
  ADC_INPUT_POSITIVE_AN7,
  ADC_INPUT_POSITIVE_AN8,
  ADC_INPUT_POSITIVE_AN9,
  ADC_INPUT_POSITIVE_AN10,
  ADC_INPUT_POSITIVE_AN11,
  ADC_INPUT_POSITIVE_AN12,
  ADC_INPUT_POSITIVE_AN13,
  ADC_INPUT_POSITIVE_AN14,
```

```
    ADC_INPUT_POSITIVE_AN15,
    ADC_INPUT_POSITIVE_AN16,
    ADC_INPUT_POSITIVE_AN17,
    ADC_INPUT_POSITIVE_AN18,
    ADC_INPUT_POSITIVE_AN19,
    ADC_INPUT_POSITIVE_AN20,
    ADC_INPUT_POSITIVE_AN21,
    ADC_INPUT_POSITIVE_AN22,
    ADC_INPUT_POSITIVE_AN23,
    ADC_INPUT_POSITIVE_AN24,
    ADC_INPUT_POSITIVE_AN25,
    ADC_INPUT_POSITIVE_AN26,
    ADC_INPUT_POSITIVE_AN27,
    ADC_INPUT_POSITIVE_AN28,
    ADC_INPUT_POSITIVE_AN29,
    ADC_INPUT_POSITIVE_AN30,
    ADC_INPUT_POSITIVE_AN31,
    ADC_INPUT_POSITIVE_AN32,
    ADC_INPUT_POSITIVE_AN33,
    ADC_INPUT_POSITIVE_AN34,
    ADC_INPUT_POSITIVE_AN35,
    ADC_INPUT_POSITIVE_AN36,
    ADC_INPUT_POSITIVE_AN37,
    ADC_INPUT_POSITIVE_AN38,
    ADC_INPUT_POSITIVE_AN39,
    ADC_INPUT_POSITIVE_AN40,
    ADC_INPUT_POSITIVE_AN41,
    ADC_INPUT_POSITIVE_AN42,
    ADC_INPUT_POSITIVE_AN43,
    ADC_INPUT_POSITIVE_AN44,
    ADC_INPUT_POSITIVE_AN45,
    ADC_INPUT_POSITIVE_AN46,
    ADC_INPUT_POSITIVE_AN47,
    ADC_INPUT_POSITIVE_CTMU,
    ADC_INPUT_POSITIVE_IVREF,
    ADC_INPUT_POSITIVE_OPEN
} ADC_INPUTS_POSITIVE;
```

Members

Members	Description
ADC_INPUT_POSITIVE_AN0	Positive input is AN0
ADC_INPUT_POSITIVE_AN1	Positive input is AN1
ADC_INPUT_POSITIVE_AN2	Positive input is AN2
ADC_INPUT_POSITIVE_AN3	Positive input is AN3
ADC_INPUT_POSITIVE_AN4	Positive input is AN4
ADC_INPUT_POSITIVE_AN5	Positive input is AN5
ADC_INPUT_POSITIVE_AN6	Positive input is AN6
ADC_INPUT_POSITIVE_AN7	Positive input is AN7
ADC_INPUT_POSITIVE_AN8	Positive input is AN8
ADC_INPUT_POSITIVE_AN9	Positive input is AN9
ADC_INPUT_POSITIVE_AN10	Positive input is AN10
ADC_INPUT_POSITIVE_AN11	Positive input is AN11
ADC_INPUT_POSITIVE_AN12	Positive input is AN12
ADC_INPUT_POSITIVE_AN13	Positive input is AN13
ADC_INPUT_POSITIVE_AN14	Positive input is AN14
ADC_INPUT_POSITIVE_AN15	Positive input is AN15
ADC_INPUT_POSITIVE_AN16	Positive input is AN16
ADC_INPUT_POSITIVE_AN17	Positive input is AN17
ADC_INPUT_POSITIVE_AN18	Positive input is AN18
ADC_INPUT_POSITIVE_AN19	Positive input is AN19
ADC_INPUT_POSITIVE_AN20	Positive input is AN20
ADC_INPUT_POSITIVE_AN21	Positive input is AN21
ADC_INPUT_POSITIVE_AN22	Positive input is AN22
ADC_INPUT_POSITIVE_AN23	Positive input is AN23
ADC_INPUT_POSITIVE_AN24	Positive input is AN24

ADC_INPUT_POSITIVE_AN25	Positive input is AN25
ADC_INPUT_POSITIVE_AN26	Positive input is AN26
ADC_INPUT_POSITIVE_AN27	Positive input is AN27
ADC_INPUT_POSITIVE_AN28	Positive input is AN28
ADC_INPUT_POSITIVE_AN29	Positive input is AN29
ADC_INPUT_POSITIVE_AN30	Positive input is AN30
ADC_INPUT_POSITIVE_AN31	Positive input is AN31
ADC_INPUT_POSITIVE_AN32	Positive input is AN32
ADC_INPUT_POSITIVE_AN33	Positive input is AN33
ADC_INPUT_POSITIVE_AN34	Positive input is AN34
ADC_INPUT_POSITIVE_AN35	Positive input is AN35
ADC_INPUT_POSITIVE_AN36	Positive input is AN36
ADC_INPUT_POSITIVE_AN37	Positive input is AN37
ADC_INPUT_POSITIVE_AN38	Positive input is AN38
ADC_INPUT_POSITIVE_AN39	Positive input is AN39
ADC_INPUT_POSITIVE_AN40	Positive input is AN40
ADC_INPUT_POSITIVE_AN41	Positive input is AN41
ADC_INPUT_POSITIVE_AN42	Positive input is AN42
ADC_INPUT_POSITIVE_AN43	Positive input is AN43
ADC_INPUT_POSITIVE_AN44	Positive input is AN44
ADC_INPUT_POSITIVE_AN45	Positive input is AN45
ADC_INPUT_POSITIVE_AN46	Positive input is AN46
ADC_INPUT_POSITIVE_AN47	Positive input is AN47
ADC_INPUT_POSITIVE_CTMU	Positive input is from CTMU
ADC_INPUT_POSITIVE_IVREF	Positive input is IVref
ADC_INPUT_POSITIVE_OPEN	Positive input is Open

Description

ADC Inputs Enumeration

This data type defines the ADC inputs.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADC_ACQUISITION_TIME Type

Data type defining the different ADC acquisition times by which the ADC can be configured.

File

plib_adc.h

C

```
typedef uint32_t ADC_ACQUISITION_TIME;
```

Description

ADC Acquisition Time Selection Data Type

This data type defines the different ADC acquisition times by which the ADC can be configured.

Remarks

None.

ADC_CONVERSION_CLOCK Type

Data type defines the different ADC Conversion clock

File

plib_adc.h

C

```
typedef uint32_t ADC_CONVERSION_CLOCK;
```

Description

ADC Conversion Clock Selection Data Type

This data type defines the different ADC Conversion clock

Remarks

None.

ADC_SAMPLE Type

Data type defining the size of the ADC sample register.

File

plib_adc.h

C

```
typedef uint32_t ADC_SAMPLE;
```

Description

ADC Sample size

This data type defines the size of the ADC sample register.

Remarks

None.

Files

Files

Name	Description
plib_adc.h	ADC PLIB interface header for definitions common to the ADC peripheral.
help_plib_adc.h	This is file help_plib_adc.h.

Description

This section lists the source and header files used by the library.

plib_adc.h

ADC PLIB interface header for definitions common to the ADC peripheral.

Functions

	Name	Description
	PLIB_ADC_CalibrationDisable	Normal ADC module operation (no calibration is performed).
	PLIB_ADC_CalibrationEnable	Calibration is performed on the next ADC conversion.
	PLIB_ADC_ConversionClockGet	Obtains the conversion clock.
	PLIB_ADC_ConversionClockSet	Sets the ADC module conversion clock.
	PLIB_ADC_ConversionClockSourceSelect	Selects the ADC module conversion clock source.
	PLIB_ADC_ConversionHasCompleted	Provides the conversion completion status of the ADC.
	PLIB_ADC_ConversionStart	Starts ADC module manual conversion process.
	PLIB_ADC_ConversionStopSequenceDisable	Normal conversion sequence.
	PLIB_ADC_ConversionStopSequenceEnable	Stop conversion sequence (when the first ADC module interrupt is generated).
	PLIB_ADC_ConversionTriggerSourceSelect	Selects the conversion trigger source.
	PLIB_ADC_Disable	ADC module is disabled (turned OFF).
	PLIB_ADC_Enable	ADC module is enabled (turned ON).
	PLIB_ADC_ExistsCalibrationControl	Identifies whether the CalibrationControl feature exists on the ADC module
	PLIB_ADC_ExistsConversionClock	Identifies whether the ConversionClock feature exists on the ADC module

	PLIB_ADC_ExistsConversionClockSource	Identifies whether the ConversionClockSource feature exists on the ADC module
	PLIB_ADC_ExistsConversionControl	Identifies whether the ConversionControl feature exists on the ADC module
	PLIB_ADC_ExistsConversionStatus	Identifies whether the ConversionStatus feature exists on the ADC module
	PLIB_ADC_ExistsConversionStopSequenceControl	Identifies whether the ConversionStopSequenceControl feature exists on the ADC module
	PLIB_ADC_ExistsConversionTriggerSource	Identifies whether the ConversionTriggerSource feature exists on the ADC module
	PLIB_ADC_ExistsEnableControl	Identifies whether the EnableControl feature exists on the ADC module
	PLIB_ADC_ExistsMuxChannel0NegativeInput	Identifies whether the MuxChannel0NegativeInput feature exists on the ADC module
	PLIB_ADC_ExistsMuxChannel0PositiveInput	Identifies whether the MuxChannel0PositiveInput feature exists on the ADC module
	PLIB_ADC_ExistsMuxInputScanControl	Identifies whether the MuxInputScanControl feature exists on the ADC module
	PLIB_ADC_ExistsMuxInputScanSelect	Identifies whether the MuxInputScanSelect feature exists on the ADC module
	PLIB_ADC_ExistsMuxInputScanSelectExtended	Identifies whether the MuxInputScanSelectExtended feature exists on the ADC module
	PLIB_ADC_ExistsResultBufferFillStatus	Identifies whether the ResultBufferFillStatus feature exists on the ADC module
	PLIB_ADC_ExistsResultBufferMode	Identifies whether the ResultBufferMode feature exists on the ADC module
	PLIB_ADC_ExistsResultFormat	Identifies whether the ResultFormat feature exists on the ADC module
	PLIB_ADC_ExistsResultGetByIndex	Identifies whether the ResultGetByIndex feature exists on the ADC module
	PLIB_ADC_ExistsSamplesPerInterruptSelect	Identifies whether the SamplesPerInterruptSelect feature exists on the ADC module
	PLIB_ADC_ExistsSamplingAcquisitionTime	Identifies whether the SamplingAcquisitionTime feature exists on the ADC module
	PLIB_ADC_ExistsSamplingAutoStart	Identifies whether the SamplingAutoStart feature exists on the ADC module
	PLIB_ADC_ExistsSamplingControl	Identifies whether the SamplingControl feature exists on the ADC module
	PLIB_ADC_ExistsSamplingModeControl	Identifies whether the SamplingModeControl feature exists on the ADC module
	PLIB_ADC_ExistsSamplingStatus	Identifies whether the SamplingStatus feature exists on the ADC module
	PLIB_ADC_ExistsStopInIdleControl	Identifies whether the StopInIdle feature exists on the ADC module
	PLIB_ADC_ExistsVoltageReference	Identifies whether the VoltageReference feature exists on the ADC module
	PLIB_ADC_InputScanMaskAdd	Select ADC analog channel for input scan.
	PLIB_ADC_InputScanMaskAddExtended	Select extended ADC analog channel for input scan.
	PLIB_ADC_InputScanMaskRemove	Omits ADC analog channel for input scan.
	PLIB_ADC_InputScanMaskRemoveExtended	Omits extended ADC analog channel for input scan.
	PLIB_ADC_MuxAInputScanDisable	Do not scan input selections for CH0+ of MUX A.
	PLIB_ADC_MuxAInputScanEnable	Scan input selections for CH0+ of MUX A.
	PLIB_ADC_MuxChannel0InputNegativeSelect	Channel 0 negative input select for multiplexer setting.
	PLIB_ADC_MuxChannel0InputPositiveSelect	Channel 0 positive input select for multiplexer setting.
	PLIB_ADC_ResultBufferModeSelect	Selects the result buffer mode.
	PLIB_ADC_ResultBufferStatusGet	Provides the buffer fill status.
	PLIB_ADC_ResultFormatSelect	Selects the result format.
	PLIB_ADC_ResultGetByIndex	Provides the ADC conversion result based on the buffer index.
	PLIB_ADC_SampleAcquisitionTimeSet	Sets the ADC acquisition/auto-sample time in TADs.
	PLIB_ADC_SampleAutoStartDisable	Sampling auto-start is disabled.
	PLIB_ADC_SampleAutoStartEnable	Sampling auto-start is enabled.
	PLIB_ADC_SamplesPerInterruptSelect	Interrupts at the completion of conversion for each nth sample.
	PLIB_ADC_SamplingIsActive	Provides the ADC sampling status.
	PLIB_ADC_SamplingModeSelect	Enable the selected sampling mode.
	PLIB_ADC_SamplingStart	Sampling is enabled.
	PLIB_ADC_SamplingStop	Holding is enabled.
	PLIB_ADC_StopInIdleDisable	Continue ADC module operation when the device is in Idle mode.
	PLIB_ADC_StopInIdleEnable	Discontinue ADC module operation when device enters Idle mode.
	PLIB_ADC_VoltageReferenceSelect	Voltage reference configuration.

Types

	Name	Description
	ADC_ACQUISITION_TIME	Data type defining the different ADC acquisition times by which the ADC can be configured.
	ADC_CONVERSION_CLOCK	Data type defines the different ADC Conversion clock
	ADC_SAMPLE	Data type defining the size of the ADC sample register.

Description

ADC Peripheral Library Interface Header

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the ADC PLIB for all families of Microchip microcontrollers. The definitions in this file are common to the ADC peripheral.

File Name

plib_adc.h

Company

Microchip Technology Inc.

help_plib_adc.h

Enumerations

	Name	Description
	ADC_BUFFER_MODE	Defines the ADC Buffer Mode.
	ADC_CLOCK_SOURCE	Defines the ADC Clock Source Select.
	ADC_CONVERSION_TRIGGER_SOURCE	Defines the ADC Conversion Trigger Source.
	ADC_INPUTS_NEGATIVE	Defines the different ADC Negative Input Enumeration.
	ADC_INPUTS_POSITIVE	Defines the ADC inputs.
	ADC_INPUTS_SCAN	Defines the ADC Scan inputs.
	ADC_MODULE_ID	Identifies the available ADC modules.
	ADC_MUX	Defining the different ADC MUX Enumeration.
	ADC_RESULT_BUF_STATUS	Defines the ADC Result Buffer Status
	ADC_RESULT_FORMAT	Defines the ADC Result Format.
	ADC_SAMPLES_PER_INTERRUPT	Defining the Samples Per Interrupt Enumeration.
	ADC_SAMPLING_MODE	Defines the ADC Sampling Mode Select.
	ADC_VOLTAGE_REFERENCE	Defining the different ADC Voltage Reference by which the ADC can be configured.

ADCHS Peripheral Library

This section describes the 12-bit High-Speed Successive Approximation Register (SAR) Analog-to-Digital Converter (ADCHS) Peripheral Library.

Introduction

This library provides a low-level abstraction of the High-Speed SAR ADC (ADCHS) Peripheral Library that is available on the Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the registers, thereby hiding differences from one microcontroller variant to another.

Description

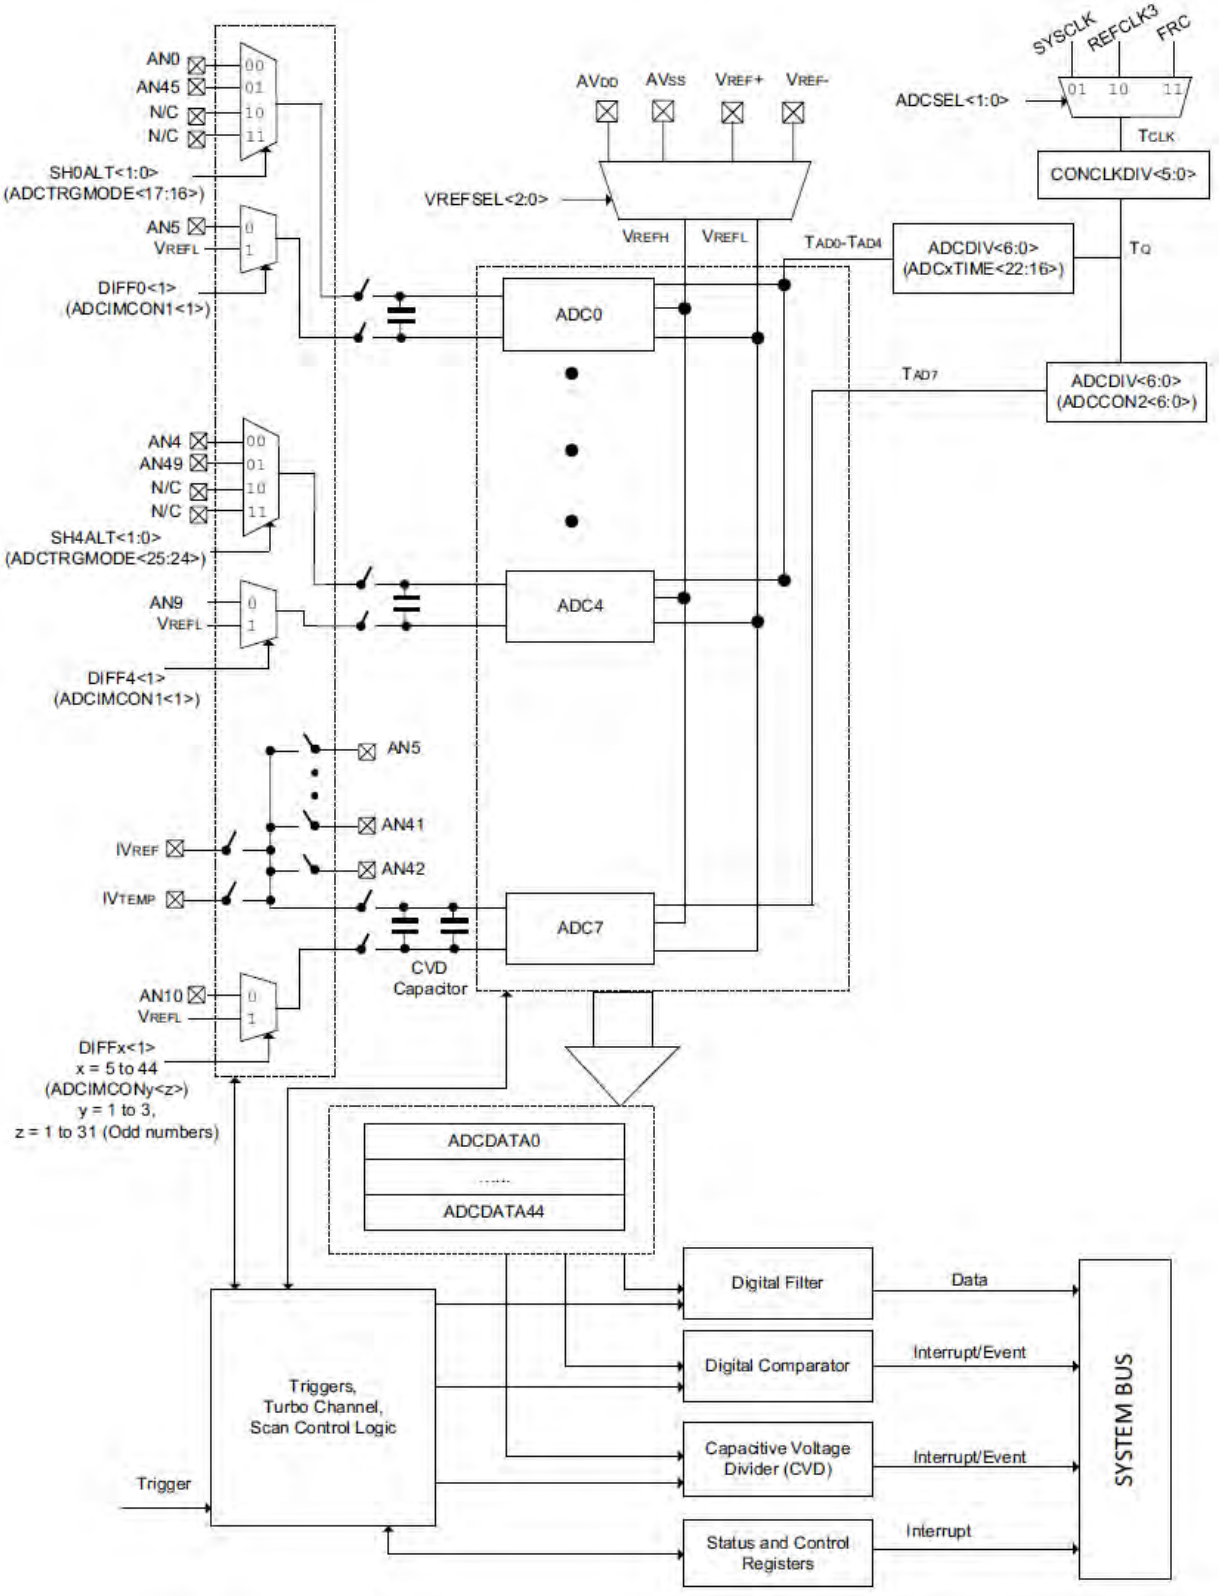
The ADCHS is used to convert an analog input into a digital number that represents that input voltage. When the input is periodically converted, the result is a sequence of digital values that have converted a continuous-time and continuous-amplitude analog signal to a discrete-time and discrete-amplitude digital signal.

This particular ADC architecture consists of multiple SAR channels (maximum of eight). The SAR channels are numbered from Channel 0 to Channel 7. Out of these channels, Channels 0 through 6 have dedicated sample and hold (S&H) circuits connected to a single (selectable) analog input. These SAR channels work independently from each other and are designed to capture time sensitive or transitory analog signals. The remaining channel, Channel 7, has its S&H circuit connected to multiple analog inputs through a multiplexer. Channel 7 is used to convert analog signals that do not need a high conversion rate.

Features of the ADCHS module include:

- Channels 0 through 6 have selectable analog inputs (default, alternate), which can be connected to a S&H circuit
- Channel 7 has multiple analog inputs connected to a S&H circuit
- Analog inputs connected to Channels 0 through 6 are Class 1 analog inputs. Analog inputs connected to Channel 7 are classified as Class 2 and Class 3 analog inputs.
  - Class 1 analog inputs have their individual trigger source and are converted by dedicated Channels (0 through 6).
  - Class 2 analog inputs have their individual trigger source, but are converted by shared channel-7
  - Class 3 analog inputs do not have individual trigger source and are converted by scan mode using Channel 7
- Analog input scan is available, which allows a single trigger to start a sample/conversion sequence of multiple analog inputs using a predefined scan list
- The inputs to a S&H can be configured as unipolar/bipolar and single-ended/differential mode
- For each channel, the converted data resolution can be set as 6, 8, 10, or 12-bits
- Each channel (0 through 7) can have its individual conversion clock and sample time setting
- A voltage reference is required for the ADCHS module. The voltage reference setting is a global setting for the ADCHS module and does not vary across channels.
- Result registers store the conversion results and can be read by the software application. Software is notified of ready results by either polling or through the use of interrupts.
- For Channels 0 through 6, the converted data can be stored in an optional FIFO or directly to RAM using the dedicated DMA interface
- Optional Digital Filters can be used to provide increased resolution at the sacrifice of sample rate. Digital Filters also have an averaging mode.
- Optional Digital Comparators can be used to test conversion results against set high and low limits, which are independent of software, and generate interrupts based on predefined conditions
- Digital Comparators also have Capacitive Voltage Divider (CVD) mode, which can be used to detect a touch event in touch sense application
- Early interrupt generation, providing extremely fast processing of converted data

A block diagram of the ADCHS module is provided in the following figure.



Using the Library

This topic describes the basic architecture of the ADCHS Peripheral Library and provides information and examples on its use.

Description

Interface Header File: `plib_adchs.h`

The interface to the ADCHS Peripheral library is defined in the `plib_adchs.h` header file, which is included by the `peripheral.h` file. Any C

language source (`.c`) file that uses the ADCHS Peripheral library must include `peripheral.h`.

Library File:

The ADCHS Peripheral library archive (`.a`) file is installed with MPLAB Harmony.

Please refer to the What is MPLAB Harmony? section for information on how the library interacts with the framework.

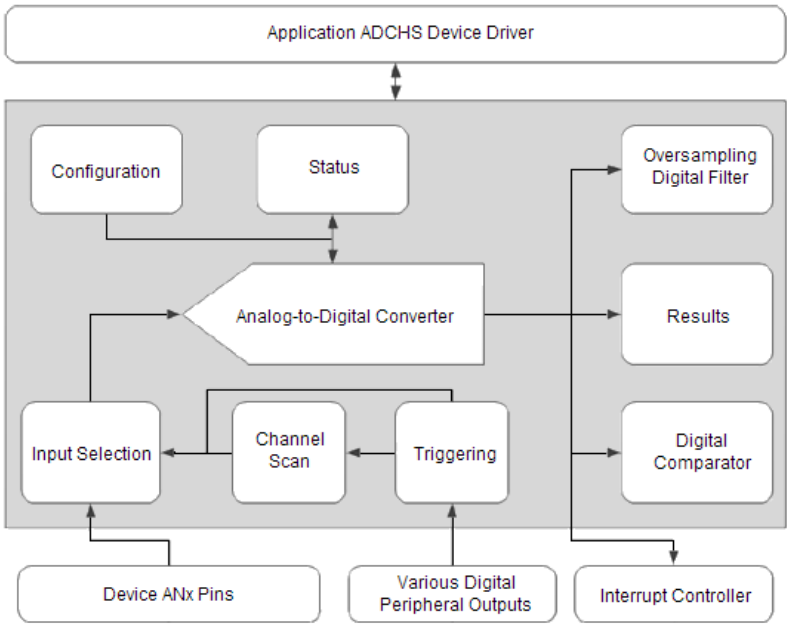
Hardware Abstraction Model

This library provides the low-level abstraction of the ADCHS module on the Microchip family of microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in the software and introduces the library interface.

Note: The interface provided is a superset of all the functionality of the available ADCHS module on the device. Refer to the **"ADC"** chapter in the specific device data sheet or the family reference manual section specified in that chapter to determine the set of functions that are supported for each ADCHS module on the device.

Description

High-Speed SAR Analog-to-Digital Converter (ADCHS) Software Abstraction Block Diagram



Library Overview

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the ADCHS module.

Library Interface Section	Description
Configuration Functions	These functions are used to configure, enable, and disable the ADCHS.
Analog Input Functions	These functions are used to configure analog input features.
Analog Input Selection Functions	These functions select and configure the ANx inputs to the ADCHS.
CVD Functions	These functions configure the Capacitive Voltage Divider (CVD) mode.
DMA Functions	These functions are used to configure and enable/disable the DMA, enable/ disable interrupts linked to the DMA, and to get the DMA status.
Channel Related Functions	These functions configure Channels 0 through 7, enable/disable the analog and digital circuitry, and control interrupt generation.
Digital Comparator Functions	These functions are used to configure and query the digital comparators.
Digital Filter Functions	These functions are used to configure the Oversampling Digital Filter and fetch results from it.
FIFO Functions	These functions configure the FIFO and control the interrupt generation.
Status Functions	These functions return status information related to the ADCHS.
Interrupt Functions	These functions control interrupt generation.

Turbo Mode Functions	These functions are used to configure, enable, and disable Turbo mode.
Triggering Functions	These functions configure the trigger source for various cores.
Voltage Reference Functions	These functions control the Voltage Reference (VREF) input for the ADC cores and query VREF status and interrupt generation.
Feature Existence Functions	These functions determine whether or not a particular feature is supported by the device.

How the Library Works

Note: Not all modes are available on all devices. Please refer to the specific device data sheet to determine the supported modes.

Functionality

This topic describes the functionality of the ADCHS Peripheral Library.

Description

Analog-to-Digital conversion using the ADCHS involves the following three steps:

1. Sampling of the input signal.
2. Capture of the input signal by the S&H circuit and transfer to the converter.
3. Conversion of the analog signal to its digital representation.

Sampling of the input signal involves charging of the S&H capacitor. The sampling time must be adequate so that the capacitor charges to a value equal to the input voltage. At the appropriate time, the input is disconnected and the capacitor voltage is transferred to the converter. The converter then digitizes the analog signal and provides the result. The converter requires a clock source (common input to individual clock setting of all channels) and a reference voltage. The common input clock is referred to as the control clock and has a period of TQ. The control clock and reference voltage sources are selectable, as well as the clock prescaling that determines the TQ.

The ADCHS has multiple SAR channels. Each channel has independent clocks named TAD0 through TAD7. The analog inputs connected to the SAR channels can be divided as Class 1, Class 2, and Class 3.

- Class 1 inputs are associated with a SAR Channel 0 through 6. Each SAR channel has a single (selectable) Class 1 input associated with it. Each Class 1 input has a unique trigger selection register. Class 1 inputs can also be part of a channel scan list, triggered by the common scan trigger source.
- Class 2 inputs are connected to Channel 7 and are either individually triggered or as part of a channel scan list. When used individually their trigger source is selected by their unique trigger register.
- Class 3 inputs are connected to Channel 7 and are used in channel scan exclusively. They share a common trigger source. When using channel scan it is possible to combine Class 1, Class 2, and Class 3 inputs in the scan list.

Note: For details regarding configuration and triggering options was well as sampling requirements, refer to the **"ADC"** chapter in the specific device data sheet and the family reference manual section specified in that chapter.

Example - Simultaneous Sampling and Conversion of Three Class 1 Inputs

Simultaneous sampling and conversion is used when the application requires capture of more than one signal at the same instance of time. Simultaneous sampling and conversion requires the use of multiple Class 1 inputs where each is assigned the same trigger source. The following example illustrates simultaneous sampling of AN0, AN1 and AN2 using the global software trigger as the trigger source. The respective SAR channels are configured for single-ended input and a unipolar (unsigned) output.

No interrupts are used so the results are polled for ready status.

```
{
    int result[3];                              // storage for results
    // Configure the ADC
    PLIB_ADCHS_Setup
    (
        MY_ADCHS_INSTANCE,

}
```

Example - Channel Scanning

Channel scanning is used in applications where precise timing of the sample to an external source is not needed. Channel scanning allows a large number of analog inputs to be sampled and converted in sequence each time a single trigger occurs.

The following example illustrates how to configure channel scanning of multiple Class 2 and Class 3 inputs using Channel 7. This example uses inputs AN8, AN31 through AN33. AN8 is Class 2 inputs. AN31 to AN33 are Class 3 inputs. The global software trigger is used to initiate the scan. A 3 TAD7 sample time is specified for Channel 7, which is configured for single-ended operation and a unipolar output. No interrupts are used so the results are polled for ready status.

```
{
    int result[4]; // storage for results
    // Configure the ADC
    PLIB_ADCHS_Setup
    (
        MY_ADCHS_INSTANCE,
        ADCHS_VREF_AVDD_AVSS,                    // AVDD and AVSS as reference
        ADCHS_CHARGEPUMP_DISABLE,                // No charge pump
        ADCHS_OUTPUT_DATA_FORMAT_FRACTIONAL,     // Use fractional format
        true,                                    // Do stop in idle
        ADCHS_FAST_SYNC_SYSTEM_CLOCK_ENABLE,     // Enable Fast synchronous system clock
        ADCHS_FAST_SYNC_PERIPHERAL_CLOCK_DISABLE, // Disable Fast synchronous peripheral clock
        ADCHS_INTERRUPT_BIT_SHIFT_LEFT_0_BITS,   // vector shift unused, interrupt not used
        0,                                       // vector base address unused, interrupt not used
        ADCHS_CLOCK_SOURCE_SYSCLK,               // SYSCLK is the clock source
        1,                                       // TQ = 1/SYSCLK * 2
        ADCHS_WARMUP_CLOCK_32                    // Warm-up time = 32 clocks
    );

```

Example - Digital Filter

The Digital Oversampling filter can be used to increase resolution of the conversion result at the expense of throughput. The following example shows how two extra bits of resolution can be obtained using 16x oversampling (sixteen samples are used to create one higher resolution result). AN0 is used for the input. The sampling time for the retriggers is set to 3 TAD0.

```
{
```

```
int result; // storage for results
bool eventFlag = false; // Digital comparator event flag
// Configure the ADC
PLIB_ADCHS_Setup
(
    MY_ADCHS_INSTANCE,
    ADCHS_VREF_AVDD_AVSS,                    // AVDD and AVSS as reference
    ADCHS_CHARGEPUMP_DISABLE,                // No charge pump
    ADCHS_OUTPUT_DATA_FORMAT_FRACTIONAL,     // Use fractional format

```

Example - Digital Comparator

The Digital Comparator is used to automatically evaluate results as they are output by the converter. The following example illustrates an automated test of AN8 for values that are greater than or equal to 80% of full scale or less than 20% of full scale. A count is incremented each time an event occurs.

```
{
    int result; // storage for results
    bool eventFlag = false; // Digital comparator event flag
    // Configure the ADC
    PLIB_ADCHS_Setup
    (
        MY_ADCHS_INSTANCE,
        ADCHS_VREF_AVDD_AVSS,                    // AVDD and AVSS as reference
        ADCHS_CHARGEPUMP_DISABLE,                // No charge pump
        ADCHS_OUTPUT_DATA_FORMAT_FRACTIONAL,     // Use fractional format
        true,                                    // Do stop in idle
        ADCHS_FAST_SYNC_SYSTEM_CLOCK_ENABLE,     // Enable Fast synchronous system clock
        ADCHS_FAST_SYNC_PERIPHERAL_CLOCK_DISABLE, // Disable Fast synchronous peripheral clock
        ADCHS_INTERRUPT_BIT_SHIFT_LEFT_0_BITS,   // vector shift not used since interrupt not used
        0,                                       // vector base address unused, interrupt not used
        ADCHS_CLOCK_SOURCE_SYSCLK,               // SYSCLK is the clock source
        1,                                       // TQ = 1/SYSCLK * 2
        ADCHS_WARMUP_CLOCK_32                    // Warm-up time = 32 clocks
    );
    // Configure the ADC SAR Channel-7
    PLIB_ADCHS_ChannelSetup
```

```
(
    MY_ADCHS_INSTANCE,
    ADCHS_CHANNEL_7,                        // Channel - 7
    ADCHS_DATA_RESOLUTION_12BIT,            // resolution is set to 12bits
    1,                                      // clock divider bit is, TAD7 = 2 * TQ

            }
        }
        return(1);
    }
```

Example - CVD Mode

The CVD mode is used to detect a touch event by measuring the voltage across external capacitor using the capacitive voltage divider method. The Digital Comparator used in conjunction with CVD mode automatically compares the voltage with set limits. Once the voltage is beyond the set limit, a comparator event is generated. In the following example, AN40 is used as an analog input. Physically, the AN40 pin should be connected to a touch sense pad. Once a touch is detected, a comparator event will be generated.

```
{
    int result; // storage for result
    // Configure the ADC
    PLIB_ADCHS_Setup
    (
        MY_ADCHS_INSTANCE,
        ADCHS_VREF_AVDD_AVSS,                    // AVDD and AVSS as reference
        ADCHS_CHARGEPUMP_DISABLE,                // No charge pump
        ADCHS_OUTPUT_DATA_FORMAT_FRACTIONAL,     // Use fractional format
        true,                                    // Do stop in idle
        ADCHS_FAST_SYNC_SYSTEM_CLOCK_ENABLE,     // Enable Fast synchronous system clock
        ADCHS_FAST_SYNC_PERIPHERAL_CLOCK_DISABLE, // Disable Fast synchronous peripheral clock
        ADCHS_INTERRUPT_BIT_SHIFT_LEFT_0_BITS,   // vector shift unused, interrupt not used
        0,                                       // vector base address unused, interrupt not used
        ADCHS_CLOCK_SOURCE_SYSCLK,               // SYSCLK is the clock source
        1,                                       // TQ = 1/SYSCLK * 2
        ADCHS_WARMUP_CLOCK_32                    // Warm-up time = 32 clocks
    );
    // Configure the ADC SAR Channel-7
    PLIB_ADCHS_ChannelSetup
    (

        PLIB_ADCHS_GlobalSoftwareTriggerEnable( MY_ADCHS_INSTANCE );
        // Wait, if there is no touch event sensed by CVD + comparator
        while(!PLIB_ADCHS_DigitalComparatorEventHasOccurred
            (
            MY_ADCHS_INSTANCE,
            ADCHS_DIGITAL_COMPARATOR_1
            )
        );
        // Verify of the CVD selected input is AN40
        // This is not required, but provided as an example
        if(ADCHS_AN40 == PLIB_ADCHS_DigitalComparatorAnalogInputGet( MY_ADCHS_INSTANCE,
        ADCHS_DIGITAL_COMPARATOR_1 ))
        {
            result == PLIB_ADCHS_CVDResultGet( MY_ADCHS_INSTANCE );
        }
    }
    return(1);
}
```

Other Functionality

This topic provides information on additional functionality.

Description

The ADCHS also implements the following additional functionalities:

- Digital Filter
- Digital Comparator
- Capacitive Voltage Divider (CVD) mode
- Turbo mode
- FIFO and DMA Interface for dedicated cores

Digital Filter

The Digital Filter consists of an accumulator and a decimator (downsampler), which function together as a low-pass filter. By sampling an analog input at a higher-than-required sample rate (oversampling), and then processing the data through the oversampling digital filter, the number of usable bits of the ADC channel can be increased at the expense of decreased conversion throughput. For example, using 4x oversampling yields one extra usable bit, 16x oversampling yields two extra usable bits, 64x oversampling provides three extra usable bits, and 256x oversampling provides four extra usable bits. Once configured, the application provides a single trigger to the analog input specified for oversampling, and then fetches the result when the process is complete.

Digital Comparator

The ADCHS module features multiple Digital Comparators that can be used to monitor selected analog input conversion results and generate an interrupt when a conversion result matches the user-specified limits. Conversion triggers are still required to initiate conversions. The comparison occurs automatically once the conversion is complete. When using a hardware source as a periodic trigger, it is possible to monitor analog inputs and create an interrupt when the converted level matches specified criteria without any software overhead.

CVD Mode

The CVD mode allows the ADCHS module to detect a touch event by measuring the voltage difference of internal and external capacitors by alternately connecting it to VDD and GND. The CVD mode works in conjunction with the Digital Comparator and can generate an event (interrupt) once the voltage difference is more than the set value (indicating a touch event).

Turbo Mode

The Turbo mode allows two Class 1 analog inputs to work in an interleaved manner to generate converted data at almost double the maximum throughput of a single Class 1 analog input.

FIFO and DMA Interfaces for Channels 0 through 6

The FIFO and DMA interfaces are applicable only for Channel 0 through 6. Using the FIFO, Channel 0 through 6 can save converted data into a FIFO. Using the DMA interface, Channel 0 through 6 can save the converted data directly into RAM.

Configuring the Library

The library is configured for the supported processor when the processor is chosen in the MPLAB X IDE.

Library Interface

a) Configuration Functions

	Name	Description
	PLIB_ADCHS_Disable	High-Speed SAR ADC module is disabled (turned OFF).
	PLIB_ADCHS_Enable	Enables the High-Speed SAR ADC module.
	PLIB_ADCHS_Setup	Configures the High-Speed SAR ADC converter.
	PLIB_ADCHS_ControlRegistersCanBeUpdated	Returns the status of update-ready.
	PLIB_ADCHS_ControlRegistersCanBeUpdatedInterruptDisable	Disables the update-ready interrupt.
	PLIB_ADCHS_ControlRegistersCanBeUpdatedInterruptEnable	Enables the update-ready interrupt.
	PLIB_ADCHS_ExternalConversionRequestDisable	Disables the external conversion request.
	PLIB_ADCHS_ExternalConversionRequestEnable	Enables the external conversion request.
	PLIB_ADCHS_GlobalLevelSoftwareTriggerDisable	Disables the global level software trigger.
	PLIB_ADCHS_GlobalLevelSoftwareTriggerEnable	Initiates a global level software trigger.
	PLIB_ADCHS_GlobalSoftwareTriggerEnable	Initiate a Global Software Trigger.
	PLIB_ADCHS_ScanCompleteInterruptDisable	Disables the end of scan interrupt.
	PLIB_ADCHS_ScanCompleteInterruptEnable	Enables the end of scan interrupt.
	PLIB_ADCHS_SoftwareConversionInputSelect	Selects the analog input of Channel 7 for manual conversion.
	PLIB_ADCHS_SoftwareConversionStart	Triggers the conversion of analog input signal connected to Channel 7.
	PLIB_ADCHS_SoftwareSamplingStart	Enables sampling of analog input for Channel 7.

	PLIB_ADCHS_SoftwareSamplingStop	Disables sampling of analog input for Channel 7, which places Channel 7 into Hold mode.
	PLIB_ADCHS_TriggerSuspendDisable	Disables trigger suspend.
	PLIB_ADCHS_TriggerSuspendEnable	Suspends all trigger for all ADCHS channels.

b) CVD Functions

	Name	Description
	PLIB_ADCHS_CVDDisable	Disables the CVD feature.
	PLIB_ADCHS_CVDEnable	Enables the CVD feature.
	PLIB_ADCHS_CVDResultGet	Returns a CVD result measured by an ADCHS instance.
	PLIB_ADCHS_CVDSetup	Configures the CVD related setting of ADCHS channel.

c) Analog Input Functions

	Name	Description
	PLIB_ADCHS_AnalogInputDataIsReady	Returns the data ready status of analog inputs.
	PLIB_ADCHS_AnalogInputDataReadyInterruptDisable	Disables the data ready interrupt for the selected analog inputs.
	PLIB_ADCHS_AnalogInputDataReadyInterruptEnable	Enables the data ready interrupt for the selected analog input.
	PLIB_ADCHS_AnalogInputEarlyInterruptDisable	Disables the early interrupt for the analog input.
	PLIB_ADCHS_AnalogInputEarlyInterruptEnable	Enables the early interrupt for the analog input.
	PLIB_ADCHS_AnalogInputEarlyInterruptIsReady	Returns the early interrupt ready status of analog input.
	PLIB_ADCHS_AnalogInputIsAvailable	Returns the analog input configuration of ADCHS channel.
	PLIB_ADCHS_AnalogInputModeGet	Returns the mode for the specified analog input.
	PLIB_ADCHS_AnalogInputResultGet	Returns a ADC conversion result.
	PLIB_ADCHS_AnalogInputScanIsComplete	Returns the state of End of scan completion.
	PLIB_ADCHS_AnalogInputScanIsSelected	Returns whether or note an analog input is selected for scanning.
	PLIB_ADCHS_AnalogInputScanRemove	Removes the analog input from scanning selection.

d) Analog Input Selection Functions

	Name	Description
	PLIB_ADCHS_AnalogInputModeSelect	Selects the mode for the specified analog input.
	PLIB_ADCHS_AnalogInputScanSelect	Selects the analog input for scanning.
	PLIB_ADCHS_ChannelTriggerSampleSelect	Selects the trigger and sampling modes for channels of High-Speed SAR ADC
	PLIB_ADCHS_AnalogInputEdgeTriggerSet	Sets the trigger as edge sensitive for selected class 1 and 2 analog input.
	PLIB_ADCHS_AnalogInputLevelTriggerSet	Sets the trigger as level sensitive for selected Class 1 and 2 analog input.
	PLIB_ADCHS_AnalogInputScanSetup	Selects input to include in Analog Input Scan mode.
	PLIB_ADCHS_AnalogInputTriggerSourceSelect	Selects a trigger Source for analog input (Class 1 or Class 2 analog inputs only).

e) Digital Comparator Functions

	Name	Description
	PLIB_ADCHS_DigitalComparatorAnalogInputGet	Returns the analog input ID used by the digital comparator.
	PLIB_ADCHS_DigitalComparatorAnalogInputSelect	Selects analog inputs, whose converted data will be processed by the comparator.
	PLIB_ADCHS_DigitalComparatorDisable	Disables the specified digital comparator.
	PLIB_ADCHS_DigitalComparatorEnable	Enables the specified digital comparator.
	PLIB_ADCHS_DigitalComparatorEventHasOccurred	Returns the status of the selected digital comparator.
	PLIB_ADCHS_DigitalComparatorInterruptDisable	Disables the interrupt for the selected digital comparator.
	PLIB_ADCHS_DigitalComparatorInterruptEnable	Enables the interrupt for the selected digital comparator.
	PLIB_ADCHS_DigitalComparatorLimitSet	Sets the limit for the specified digital comparator.
	PLIB_ADCHS_DigitalComparatorSetup	Configures the Digital Comparator on the High-Speed SAR ADC converter.

f) Digital Filter Functions

	Name	Description
	PLIB_ADCHS_DigitalFilterAveragingModeSampleCountSelect	Selects the number of samples which are averaged by the Digital Filter.
	PLIB_ADCHS_DigitalFilterAveragingModeSetup	Configures the Digital Filter on the High-Speed SAR ADC converter in Averaging mode.
	PLIB_ADCHS_DigitalFilterDataGet	Used to fetch the data result from the Digital Filter.

	PLIB_ADCHS_DigitalFilterDataIsReady	Used to determine if the Digital Filter has data ready.
	PLIB_ADCHS_DigitalFilterDataReadyInterruptDisable	Disables the interrupt for the selected Digital Filter.
	PLIB_ADCHS_DigitalFilterDataReadyInterruptEnable	Enables the interrupt for the selected Digital Filter.
	PLIB_ADCHS_DigitalFilterDisable	Disables the Digital Filter.
	PLIB_ADCHS_DigitalFilterEnable	Enables the Digital Filter.
	PLIB_ADCHS_DigitalFilterOversamplingModeRatioSelect	Selects the oversampling ratio for the Digital Filter.
	PLIB_ADCHS_DigitalFilterOversamplingModeSetup	Configures the Digital Filter on the High-Speed SAR ADC converter in Oversampling mode.

g) DMA Functions

	Name	Description
	PLIB_ADCHS_DMABuffer_A_InterruptDisable	Disables the DMA Buffer A full interrupt for the specified Channel 0 to 6.
	PLIB_ADCHS_DMABuffer_A_InterruptEnable	Enables the DMA Buffer A full interrupt for the specified Channel 0 to 6.
	PLIB_ADCHS_DMABuffer_A_IsFull	Used to determine if the DMA Buffer A is full, for the specified Channel 0 to 6.
	PLIB_ADCHS_DMABuffer_B_InterruptDisable	Disables the DMA Buffer B full interrupt for the specified Channel 0 to 6.
	PLIB_ADCHS_DMABuffer_B_InterruptEnable	Enables the DMA Buffer B full interrupt for the specified Channel 0 to 6.
	PLIB_ADCHS_DMABuffer_B_IsFull	Used to determine if the DMA Buffer B is full, for the specified Channel 0 to 6.
	PLIB_ADCHS_DMADisable	Disables the DMA in the High-Speed SAR ADC module.
	PLIB_ADCHS_DMAEnable	Enables the DMA in the High-Speed SAR ADC module.
	PLIB_ADCHS_DMAOverflowErrorHasOccurred	Used to determine if the DMA Buff had an overflow error.
	PLIB_ADCHS_DMASetup	Configures the DMA on the High-Speed SAR ADC.
	PLIB_ADCHS_DMASourceRemove	Disables the DMA for the specified Channel 0 to 6.
	PLIB_ADCHS_DMASourceSelect	Enables the DMA for the specified Channel 0 to 6.

h) Channel Related Functions

	Name	Description
	PLIB_ADCHS_ChannelAnalogFeatureDisable	Disables the analog circuit for channels of High-Speed SAR ADC.
	PLIB_ADCHS_ChannelAnalogFeatureEnable	Enables the analog circuit for High-Speed SAR ADC channels.
	PLIB_ADCHS_ChannelConfigurationGet	Used to get the configuration for the specified channel.
	PLIB_ADCHS_ChannelConfigurationSet	Used to set the configuration for the specified channel.
	PLIB_ADCHS_ChannelDigitalFeatureDisable	Disables the digital circuit for channels of High-Speed SAR ADC.
	PLIB_ADCHS_ChannelDigitalFeatureEnable	Enables (turns ON) the digital circuit for channels.
	PLIB_ADCHS_ChannelIsReady	Returns the state of the channel.
	PLIB_ADCHS_ChannelIsReadyInterruptDisable	Disables the Channel ready interrupt for the specified channel.
	PLIB_ADCHS_ChannelIsReadyInterruptEnable	Enables the Channel ready interrupt for the specified channel.
	PLIB_ADCHS_ChannelSetup	Configures the High-Speed SAR ADC channels.
	PLIB_ADCHS_ChannelInputSelect	Selects the analog input for Channel 0 to 6.

i) FIFO Functions

	Name	Description
	PLIB_ADCHS_FIFODataCountGet	Returns the number of data to be read from FIFO.
	PLIB_ADCHS_FIFODataIsAvailable	Used to determine if the FIFO has data ready.
	PLIB_ADCHS_FIFODataIsNegative	Returns the sign of data stored in FIFO.
	PLIB_ADCHS_FIFODataReadyInterruptDisable	Disables the interrupt for FIFO.
	PLIB_ADCHS_FIFODataReadyInterruptEnable	Enables the interrupt for FIFO.
	PLIB_ADCHS_FIFODisable	Disables the FIFO in the High-Speed SAR ADC.
	PLIB_ADCHS_FIFOEnable	Enables the FIFO in the High-Speed SAR ADC
	PLIB_ADCHS_FIFOErrorHasOccurred	Used to determine if the FIFO has encountered an overflow error.
	PLIB_ADCHS_FIFORead	Used to fetch the data result from the FIFO.
	PLIB_ADCHS_FIFOSourceGet	Returns the channel ID using the FIFO.
	PLIB_ADCHS_FIFOSourceSelect	Sets the Channel 0 to 6 using the FIFO.

j) Interrupt Functions

	Name	Description
	PLIB_ADCHS_EarlyInterruptDisable	Disables the early interrupt for the ADCHS.
	PLIB_ADCHS_EarlyInterruptEnable	Enables the early interrupt for the ADCHS.

k) Turbo Mode Functions

	Name	Description
	PLIB_ADCHS_TurboModeChannelSelect	Configures the channels for Turbo mode.
	PLIB_ADCHS_TurboModeDisable	Disables Turbo mode for High-Speed SAR ADC module.
	PLIB_ADCHS_TurboModeEnable	Enables Turbo mode for the High-Speed SAR ADC module.
	PLIB_ADCHS_TurboModeErrorHasOccurred	Returns the error state of Turbo mode.

l) Voltage Reference Functions

	Name	Description
	PLIB_ADCHS_VREFFaultHasOccurred	Returns the state of VREF fault.
	PLIB_ADCHS_VREFFaultInterruptDisable	Disables the VREF Fault interrupt.
	PLIB_ADCHS_VREFFaultInterruptEnable	Enables the VREF fault interrupt.
	PLIB_ADCHS_VREFIsReady	Returns the state of VREF.
	PLIB_ADCHS_VREFReadyInterruptDisable	Disables the VREF ready interrupt.
	PLIB_ADCHS_VREFReadyInterruptEnable	Enables the VREF ready interrupt.

m) Feature Existence Functions

	Name	Description
	PLIB_ADCHS_ExistsAnalogInputCheck	Identifies whether the System Configuration feature exists on the ADCHS module.
	PLIB_ADCHS_ExistsAnalogInputModeControl	Identifies whether the analog input mode control exists on the ADCHS module.
	PLIB_ADCHS_ExistsAnalogInputScan	Identifies whether the Analog input Scan exists on the ADCHS module.
	PLIB_ADCHS_ExistsChannelAnalogControl	Identifies whether the Channel Analog control exists on the ADCHS module.
	PLIB_ADCHS_ExistsChannelConfiguration	Identifies whether the Channel Configuration feature exists on the ADCHS module.
	PLIB_ADCHS_ExistsChannelDigitalControl	Identifies whether the Channel Digital control exists on the ADCHS module.
	PLIB_ADCHS_ExistsChannelInputSelectControl	Identifies whether the Channel 0 to 6 Input select feature exists on the ADCHS module.
	PLIB_ADCHS_ExistsConfiguration	Identifies whether the Configuration feature exists on the ADCHS module.
	PLIB_ADCHS_ExistsConversionResults	Identifies whether the Conversion Results feature exists on the ADCHS module.
	PLIB_ADCHS_ExistsCVD	Identifies whether the CVD exists on the ADCHS module.
	PLIB_ADCHS_ExistsDigitalComparator	Identifies whether the Digital Comparator feature exists on the ADCHS module .
	PLIB_ADCHS_ExistsDigitalFilter	Identifies whether the Digital Filter feature exists on the ADCHS module.
	PLIB_ADCHS_ExistsDMA	Identifies whether the DMA exists on the ADCHS module.
	PLIB_ADCHS_ExistsEarlyInterruptControl	Identifies whether the Early Interrupt control exists on the ADCHS module.
	PLIB_ADCHS_ExistsEnableControl	Identifies whether the EnableControl feature exists on the ADCHS module
	PLIB_ADCHS_ExistsExternalConversionRequestControl	Identifies whether the External Convert feature exists on the ADCHS module.
	PLIB_ADCHS_ExistsFIFO	Identifies whether the FIFO exists on the ADCHS module.
	PLIB_ADCHS_ExistsManualControl	Identifies whether the Manual control exists on the ADCHS module.
	PLIB_ADCHS_ExistsTriggerControl	Identifies whether the Trigger control exists on the ADCHS module.
	PLIB_ADCHS_ExistsTriggerSampleControl	Identifies whether the Trigger Sample control feature exists on the ADCHS module.
	PLIB_ADCHS_ExistsTurboMode	Identifies whether the Turbo mode feature exists on the ADCHS module.
	PLIB_ADCHS_ExistsUpdateReadyControl	Identifies whether the Update Ready feature exists on the ADCHS module.
	PLIB_ADCHS_ExistsVREFControl	Identifies whether the VREF control exists on the ADCHS module.

n) Data Types and Constants

	Name	Description
	ADCHS_AN_INPUT_ID	Type for identifying the available ADC Inputs
	ADCHS_CHARGEPUMP_MODE	Defines the selection for the charge pump.
	ADCHS_CLOCK_SOURCE	Defines the ADCHS Clock Source Select.
	ADCHS_CVD_CAPACITOR	Defines the value of the internal capacitor during CVD mode.
	ADCHS_DATA_RESOLUTION	Identifies the resolution of the ADC output.
	ADCHS_DIGITAL_COMPARATOR_ID	Identifies the supported Digital Comparators.
	ADCHS_DIGITAL_FILTER_AVERAGE_SAMPLE_COUNT	Identifies the Digital Filter averaging sample count.
	ADCHS_DIGITAL_FILTER_ID	Identifies the supported Digital Filters.
	ADCHS_DIGITAL_FILTER_OVERSAMPLE_RATIO	Identifies the supported Digital Filter oversampling ratios.
	ADCHS_DIGITAL_FILTER_SIGNIFICANT_BITS	Data length of digital filter.
	ADCHS_DMA_BUFFER_LENGTH	Defines the length of the DMA buffer length.
	ADCHS_DMA_COUNT	Defines the enable/disable of the count feature for DMA.
	ADCHS_EARLY_INTERRUPT_PRIOR_CLOCK	Defines the number of clocks prior to the arrival of valid data that the associated interrupt is generated.
	ADCHS_FAST_SYNC_PERIPHERAL_CLOCK	Defines the selection of the fast synchronous peripheral clock.
	ADCHS_FAST_SYNC_SYSTEM_CLOCK	Defines the selection of the fast synchronous system clock.
	ADCHS_INPUT_MODE	Defines the available modes for the selected input.
	ADCHS_INTERRUPT_BIT_SHIFT_LEFT	Identifies the bits shift for calculating the interrupt vector.
	ADCHS_OUTPUT_DATA_FORMAT	Defines the selection for the output data format.
	ADCHS_SCAN_TRIGGER_SENSITIVE	Trigger level for scan trigger.
	ADCHS_SCAN_TRIGGER_SOURCE	Defines the ADCHS Channel Scan Trigger Source Selections.
	ADCHS_TRIGGER_SOURCE	Defines the ADCHS Trigger Source Selections.
	ADCHS_VREF_SOURCE	Defines the ADCHS VREF Source Select.
	ADCHS_WARMUP_CLOCK	Identifies the number of clocks before the channel can be ready
	ADCHS_MODULE_ID	Identifies the number of ADC supported.
	ADCHS_CHANNEL_INP_SEL	Defines the alternate input selection for channels 0 to 6.
	ADCHS_CHANNEL_ID	Identifies the ADC channel from 0 to 7.
	ADCHS_CHANNEL_TRIGGER_SAMPLING_SEL	Defines the selection of trigger and sampling for channels 0 to 6.
	ADCHS_CLASS12_AN_INPUT_ID	Type for identifying the available Class 1 and 2 analog Inputs.

Description

This section describes the Application Programming Interface (API) functions of the ADCHS Peripheral Library.

Refer to each section for a detailed description.

a) Configuration Functions

PLIB_ADCHS_Disable Function

High-Speed SAR ADC module is disabled (turned OFF).

File

plib_adchs.h

C

```
void PLIB_ADCHS_Disable(ADCHS_MODULE_ID index);
```

Returns

None.

Description

This function disables (turns OFF) the selected High-Speed SAR ADC module.

Remarks

Not all functionality is available on all devices. Please refer to the specific device data sheet for the list of available features.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.
PLIB_ADCHS_Disable(MY_ADCHS_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.

Function

void PLIB_ADCHS_Disable(ADCHS_MODULE_ID index)

PLIB_ADCHS_Enable Function

Enables the High-Speed SAR ADC module.

File

plib_adchs.h

C

```
void PLIB_ADCHS_Enable(ADCHS_MODULE_ID index);
```

Returns

None.

Description

This function enables (turns ON) the selected High-Speed SAR ADC module. There are many ADCHS functionalities which should be set/ selected before the ADCHS module is turned ON. Once the ADCHS is turned ON, the application code should check if the VREF is ready and without any fault. Subsequently, the analog bias circuitry for the required channel should be enabled followed by enabling the digital section.

Remarks

None.

Preconditions

All channels and analog input related selections should be made before enabling the ADCHS module.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.
PLIB_ADCHS_Enable(MY_ADCHS_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.

Function

void PLIB_ADCHS_Enable(ADCHS_MODULE_ID index)

PLIB_ADCHS_Setup Function

Configures the High-Speed SAR ADC converter.

File

plib_adchs.h

C

```
void PLIB_ADCHS_Setup(ADCHS_MODULE_ID index, ADCHS_VREF_SOURCE voltageRefSelect, ADCHS_CHARGEPUMP_MODE
chargePump, ADCHS_OUTPUT_DATA_FORMAT outputFormat, bool stopInIdle, ADCHS_FAST_SYNC_SYSTEM_CLOCK sysClk,
```

```
ADCHS_FAST_SYNC_PERIPHERAL_CLOCK periClk, ADCHS_INTERRUPT_BIT_SHIFT_LEFT intVectorShift, uint16_t
intVectorBase, ADCHS_CLOCK_SOURCE adcClockSource, int8_t adcClockDivider, ADCHS_WARMUP_CLOCK warmUpClock);
```

Returns

None.

Description

Configures all ADC parameters which are common to all ADC channels (from 0 to 7). This configuration must occur prior to enabling the ADC and therefore must be called when the ADC is disabled.

Remarks

This function must be called when the ADC is disabled.

Preconditions

The ADCHS module is disabled when calling this function.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Configure the ADC
PLIB_ADCHS_Setup
(
    MY_ADCHS_INSTANCE,
    ADCHS_VREF_AVDD_AVSS,                   // AVDD and AVSS as reference
    ADCHS_CHARGEPUMP_DISABLE,               // Charge pump is disabled
    ADCHS_OUTPUT_DATA_FORMAT_FRACTIONAL,    // Use fractional format
    true,                                   // Stop in idle
    ADCHS_FAST_SYNC_SYSTEM_CLOCK_ENABLE,    // Enable Fast synchronous system clock
    ADCHS_FAST_SYNC_PERIPHERAL_CLOCK_DISABLE, // Disable Fast synchronous peripheral clock
    ADCHS_INTERRUPT_BIT_SHIFT_LEFT_2_BITS,  // vector left shift set to 2
    0x1600,                                 // vector base address set to 0x1600
    ADCHS_CLOCK_SOURCE_SYSCLK,              // SYSCLK is the clock source
    1,                                      // Control clock, TQ = 1/SYSCLK * 2
    ADCHS_WARMUP_CLOCK_32                   // Warm-up up time = 32 clocks
);

// Enable the ADC
PLIB_ADCHS_Enable(MY_ADCHS_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.
voltageRefSelect	VREF Source Selection.
chargePump	Enables/ disables the charge pump. This variable is of ADCHS_CHARGEPUMP_MODE type. Use when
VREFH	VREFL < .64 (AVDD - AVSS). This feature is not available on all devices.
outputFormat	Sets output data format to be integer or fractional. This parameter is of ADCHS_OUTPUT_DATA_FORMAT type.
stopInIdle	Sets ADC to stop when device is in Idle mode if true
sysClk	Sets the Fast synchronous system clock to ADC control clock. This variable is of type ADCHS_FAST_SYNC_SYSTEM_CLOCK.
periClk	Sets the Fast synchronous peripheral clock to ADC control clock. This variable is of type ADCHS_FAST_SYNC_PERIPHERAL_CLOCK.
intVectorShift	Sets the interrupt vector shift left shift. This variable is of ADCHS_INTERRUPT_BIT_SHIFT_LEFT type.
intVectorBase	Sets the interrupt vector base address.
adcClockSource	Clock source selection. This variable is of type ADCHS_CLOCK_SOURCE.
adcClockDivider	Clock source divider. Values range from 0 to 63. This divider determines the input clock frequency which goes as input to all ADC channels (all ADC channels, 0 to 7). This clock is also known as the "control clock" of ADC. The frequency of control
clock for ADC, as per the following equation	Control clock frequency = (frequency of "adcClockSource")/(adcClockDivider * 2) For adcClockDivider = 0, control clock frequency is same as frequency of "adcClockSource".

warmUpClock	This parameter determines the number of channel clock (not control clock) which is required as warm up time for the ADC channel, once the analog feature of that ADC channel is enabled. The variable is of type ADCHS_WARMUP_CLOCK.

Function

```
void PLIB_ADCHS_Setup
(
    ADCHS_MODULE_ID index,
    ADCHS_VREF_SOURCE voltageRefSelect,    // voltage reference
    ADCHS_CHARGEPUMP_MODE chargePump,      // Charge pump enabled/disabled
    ADCHS_OUTPUT_DATA_FORMAT outputFormat,  // result format fractional
bool stopInIdle,                   // stop in idle
    ADCHS_FAST_SYNC_SYSTEM_CLOCK sysClk,   // Fast synchronous system clock
// to ADC control clock
    ADCHS_FAST_SYNC_PERIPHERAL_CLOCK periClk,      // Fast synchronous peripheral
// clock to ADC control clock
    ADCHS_INTERRUPT_BIT_SHIFT_LEFT intVectorShift,  // Interrupt vector shift bits
uint16_t intVectorBase,            // Interrupt vector base address
    ADCHS_CLOCK_SOURCE adcClockSource,     // clock source
int8_t adcClockDivider,            // clock divider
    ADCHS_WARMUP_CLOCK warmUpClock         // Analog channel warm-up clocks.
)
```

PLIB_ADCHS_ControlRegistersCanBeUpdated Function

Returns the status of update-ready.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_ControlRegistersCanBeUpdated(ADCHS_MODULE_ID index);
```

Returns

- true - The ADCHS module can be safely updated (settings can be configured)
- false - The ADCHS module is not yet ready to be safely updated

Description

Once the triggers are suspended, the ADCHS raises an update-ready flag indicating that the updates to ADCHS registers can be performed. This function returns the status of update ready.

Remarks

None.

Preconditions

None.

Example

```
// Suspend trigger
PLIB_ADCHS_TriggerSuspendEnable(MY_ADCHS_INSTANCE);

// Wait until the channel registers can be updated
while(!PLIB_ADCHS_ControlRegistersCanBeUpdated(MY_ADCHS_INSTANCE));

// Once the function returns true, update the configurations of ADCHS
//....

// Enable triggers
PLIB_ADCHS_TriggerSuspendDisable(MY_ADCHS_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.

Function

bool PLIB_ADCHS_ControlRegistersCanBeUpdated(ADCHS_MODULE_ID index)

PLIB_ADCHS_ControlRegistersCanBeUpdatedInterruptDisable Function

Disables the update-ready interrupt.

File

plib_adchs.h

C

```
void PLIB_ADCHS_ControlRegistersCanBeUpdatedInterruptDisable(ADCHS_MODULE_ID index);
```

Returns

None.

Description

This function disables the update-ready interrupt.

Remarks

None.

Preconditions

None.

Example

```
PLIB_ADCHS_ControlRegistersCanBeUpdatedInterruptDisable(MY_ADCHS_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.

Function

void PLIB_ADCHS_ControlRegistersCanBeUpdatedInterruptDisable(ADCHS_MODULE_ID index)

PLIB_ADCHS_ControlRegistersCanBeUpdatedInterruptEnable Function

Enables the update-ready interrupt.

File

plib_adchs.h

C

```
void PLIB_ADCHS_ControlRegistersCanBeUpdatedInterruptEnable(ADCHS_MODULE_ID index);
```

Returns

None.

Description

Once the triggers are suspended, the ADC channel raises an update ready flag indicating that the updates to ADCHS registers can be performed. This function enables the interrupt which occurs once the flag is raised.

Remarks

None.

Preconditions

None.

Example

```
PLIB_ADCHS_ControlRegistersCanBeUpdatedInterruptEnable(MY_ADCHS_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.

Function

void PLIB_ADCHS_ControlRegistersCanBeUpdatedInterruptEnable(ADCHS_MODULE_ID index)

PLIB_ADCHS_ExternalConversionRequestDisable Function

Disables the external conversion request.

File

plib_adchs.h

C

```
void PLIB_ADCHS_ExternalConversionRequestDisable(ADCHS_MODULE_ID index);
```

Returns

None.

Description

This function disables (turns OFF) the external conversion request. Once disabled, the external sources such as PTG cannot request a conversion.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Disable external conversion request
PLIB_ADCHS_ExternalConversionRequestDisable( MY_ADCHS_INSTANCE );
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.

Function

void PLIB_ADCHS_ExternalConversionRequestDisable(ADCHS_MODULE_ID index)

PLIB_ADCHS_ExternalConversionRequestEnable Function

Enables the external conversion request.

File

plib_adchs.h

C

```
void PLIB_ADCHS_ExternalConversionRequestEnable(ADCHS_MODULE_ID index);
```

Returns

None.

Description

This function enables (turns ON) the external conversion request. Once enabled, the ADCHS can accept conversion request from external sources

such as the PTG module.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Enable external conversion request
PLIB_ADCHS_ExternalConversionRequestEnable( MY_ADCHS_INSTANCE );
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.

Function

void PLIB_ADCHS_ExternalConversionRequestEnable(ADCHS_MODULE_ID index)

PLIB_ADCHS_GlobalLevelSoftwareTriggerDisable Function

Disables the global level software trigger.

File

plib_adchs.h

C

```
void PLIB_ADCHS_GlobalLevelSoftwareTriggerDisable(ADCHS_MODULE_ID index);
```

Returns

None.

Description

This function disables the global level software trigger on the specified channel.

Remarks

None.

Preconditions

None.

Example

```
PLIB_ADCHS_GlobalLevelSoftwareTriggerDisable(MY_ADCHS_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.

Function

void PLIB_ADCHS_GlobalLevelSoftwareTriggerDisable(ADCHS_MODULE_ID index)

PLIB_ADCHS_GlobalLevelSoftwareTriggerEnable Function

Initiates a global level software trigger.

File

plib_adchs.h

C

```
void PLIB_ADCHS_GlobalLevelSoftwareTriggerEnable(ADCHS_MODULE_ID index);
```

Returns

None.

Description

This function initiates a global level software trigger. All inputs or the scan list configured to trigger on the global level software trigger are triggered. Once initiated, the trigger continues until the global level trigger is disabled using the function PLIB_ADCHS_GlobalLevelSoftwareTriggerDisable.

Remarks

None.

Preconditions

None.

Example

```
PLIB_ADCHS_GlobalLevelSoftwareTriggerEnable(MY_ADCHS_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.

Function

void PLIB_ADCHS_GlobalLevelSoftwareTriggerEnable(ADCHS_MODULE_ID index)

PLIB_ADCHS_GlobalSoftwareTriggerEnable Function

Initiate a Global Software Trigger.

File

plib_adchs.h

C

```
void PLIB_ADCHS_GlobalSoftwareTriggerEnable(ADCHS_MODULE_ID index);
```

Returns

None.

Description

All inputs or scan list that is configured to trigger on the global software trigger are triggered. Once enabled, the trigger automatically gets disabled (edge sensitive).

Remarks

None.

Preconditions

None.

Example

```
PLIB_ADCHS_GlobalSoftwareTriggerEnable(MY_ADCHS_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.

Function

void PLIB_ADCHS_GlobalSoftwareTriggerEnable(ADCHS_MODULE_ID index)

PLIB_ADCHS_ScanCompleteInterruptDisable Function

Disables the end of scan interrupt.

File

plib_adchs.h

C

```
void PLIB_ADCHS_ScanCompleteInterruptDisable(ADCHS_MODULE_ID index);
```

Returns

None.

Description

This function disables (turns OFF) the end of scan interrupt.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Disable EOS interrupt
PLIB_ADCHS_ScanCompleteInterruptDisable( MY_ADCHS_INSTANCE );
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.

Function

void PLIB_ADCHS_ScanCompleteInterruptDisable(ADCHS_MODULE_ID index)

PLIB_ADCHS_ScanCompleteInterruptEnable Function

Enables the end of scan interrupt.

File

plib_adchs.h

C

```
void PLIB_ADCHS_ScanCompleteInterruptEnable(ADCHS_MODULE_ID index);
```

Returns

None.

Description

This function enables (turns ON) the end of scan interrupt. The interrupt is generated when scanning of all of the selected analog inputs has completed.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
```

```
// application developer.

// Enable EOS interrupt
PLIB_ADCHS_ScanCompleteInterruptEnable( MY_ADCHS_INSTANCE );
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.

Function

void PLIB_ADCHS_ScanCompleteInterruptEnable(ADCHS_MODULE_ID index)

PLIB_ADCHS_SoftwareConversionInputSelect Function

Selects the analog input of Channel 7 for manual conversion.

File

plib_adchs.h

C

```
void PLIB_ADCHS_SoftwareConversionInputSelect(ADCHS_MODULE_ID index, ADCHS_AN_INPUT_ID anInput);
```

Returns

None.

Description

This function selects the analog input for Channel 7, which is used for manual conversion (using software control).

Remarks

None.

Preconditions

None.

Example

```
// Select AN24 for manual conversion
PLIB_ADCHS_SoftwareConversionInputSelect(MY_ADCHS_INSTANCE, ADCHS_AN24);

// Place S&H into Sampling mode
PLIB_ADCHS_SoftwareSamplingStart(MY_ADCHS_INSTANCE);

// Wait for the required sampling time
int del;
for(del = 0; del<=20; del++);

// Now, make the S&H into Hold mode
PLIB_ADCHS_SoftwareSamplingStop(MY_ADCHS_INSTANCE);

// Now, start conversion
PLIB_ADCHS_SoftwareConversionStart(MY_ADCHS_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.
anInput	Analog input of type ADCHS_AN_INPUT_ID.

Function

void PLIB_ADCHS_SoftwareConversionInputSelect

(

ADCHS_MODULE_ID index,

ADCHS_AN_INPUT_ID anInput

)

PLIB_ADCHS_SoftwareConversionStart Function

Triggers the conversion of analog input signal connected to Channel 7.

File

plib_adchs.h

C

```
void PLIB_ADCHS_SoftwareConversionStart(ADCHS_MODULE_ID index);
```

Returns

None.

Description

After a signal is held on the S&H of Channel 7, the conversion can be triggered manually using software by using this function.

Remarks

None.

Preconditions

None.

Example

```
PLIB_ADCHS_SoftwareConversionStart(MY_ADCHS_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.

Function

void PLIB_ADCHS_SoftwareConversionStart(ADCHS_MODULE_ID index)

PLIB_ADCHS_SoftwareSamplingStart Function

Enables sampling of analog input for Channel 7.

File

plib_adchs.h

C

```
void PLIB_ADCHS_SoftwareSamplingStart(ADCHS_MODULE_ID index);
```

Returns

None.

Description

This function can be used if Channel 7 needs to be brought to Sampling mode manually (i.e., through software).

Remarks

None.

Preconditions

None.

Example

```
PLIB_ADCHS_SoftwareSamplingStart(MY_ADCHS_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.

Function

void PLIB_ADCHS_SoftwareSamplingStart(ADCHS_MODULE_ID index)

PLIB_ADCHS_SoftwareSamplingStop Function

Disables sampling of analog input for Channel 7, which places Channel 7 into Hold mode.

File

plib_adchs.h

C

```
void PLIB_ADCHS_SoftwareSamplingStop(ADCHS_MODULE_ID index);
```

Returns

None.

Description

After sampling for a significant time (using the function PLIB_ADCHS_SoftwareSamplingStart), the sampling can be disabled, which will bring the channel to Hold mode.

Remarks

None.

Preconditions

None.

Example

```
PLIB_ADCHS_SoftwareSamplingStop(MY_ADCHS_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.

Function

void PLIB_ADCHS_SoftwareSamplingStop(ADCHS_MODULE_ID index)

PLIB_ADCHS_TriggerSuspendDisable Function

Disables trigger suspend.

File

plib_adchs.h

C

```
void PLIB_ADCHS_TriggerSuspendDisable(ADCHS_MODULE_ID index);
```

Returns

None.

Description

By calling this function, all triggers are allowed to reach the channel and triggers are not suspended.

Remarks

None.

Preconditions

None.

Example

```
PLIB_ADCHS_TriggerSuspendDisable(MY_ADCHS_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.

Function

void PLIB_ADCHS_TriggerSuspendDisable(ADCHS_MODULE_ID index)

PLIB_ADCHS_TriggerSuspendEnable Function

Suspends all trigger for all ADCHS channels.

File

plib_adchs.h

C

```
void PLIB_ADCHS_TriggerSuspendEnable(ADCHS_MODULE_ID index);
```

Returns

None.

Description

This function suspends all triggers for all channels on the ADCHS module. The trigger needs to be suspended so that the channels could be configured without disabling (and subsequently enabling) the channels.

Remarks

None.

Preconditions

None.

Example

```
PLIB_ADCHS_TriggerSuspendEnable(MY_ADCHS_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.

Function

void PLIB_ADCHS_TriggerSuspendEnable(ADCHS_MODULE_ID index)

b) CVD Functions

PLIB_ADCHS_CVDDisable Function

Disables the CVD feature.

File

plib_adchs.h

C

```
void PLIB_ADCHS_CVDDisable(ADCHS_MODULE_ID index);
```

Returns

None.

Description

This function disables the CVD feature of an ADCHS instance.

Remarks

None.

Preconditions

None.

Example

```
PLIB_ADCHS_CVDDisable(MY_ADCHS_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.

Function

void PLIB_ADCHS_CVDDisable(ADCHS_MODULE_ID index)

PLIB_ADCHS_CVDEnable Function

Enables the CVD feature.

File

plib_adchs.h

C

```
void PLIB_ADCHS_CVDEnable(ADCHS_MODULE_ID index);
```

Returns

None.

Description

ADCHS channel supports the Capacitive Voltage Divider (CVD) mode. This function enables the CVD feature of an ADCHS instance.

Remarks

None.

Preconditions

None.

Example

```
PLIB_ADCHS_CVDEnable(MY_ADCHS_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.

Function

void PLIB_ADCHS_CVDEnable(ADCHS_MODULE_ID index)

PLIB_ADCHS_CVDResultGet Function

Returns a CVD result measured by an ADCHS instance.

File

plib_adchs.h

C

```
int16_t PLIB_ADCHS_CVDResultGet(ADCHS_MODULE_ID index);
```

Returns

The conversion result expressed as a signed 16-bit integer.

Description

During CVD measurement, the difference between the voltage measured during positive and negative phases is calculated. This function return the difference value.

Remarks

None.

Preconditions

CVD must be enabled and a comparator event linked to CVD should have occurred.

Example

```
int16_t     result;
...
// fetch result for CVD
result = PLIB_ADCHS_CVDResultGet( MY_ADCHS_INSTANCE );
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.

Function

int16_t PLIB_ADCHS_CVDResultGet(ADCHS_MODULE_ID index)

PLIB_ADCHS_CVDSetup Function

Configures the CVD related setting of ADCHS channel.

File

plib_adchs.h

C

```
void PLIB_ADCHS_CVDSetup(ADCHS_MODULE_ID index, ADCHS_CVD_CAPACITOR capSel, bool inBetweenOrEqual, bool
greaterEqualHi, bool lessThanHi, bool greaterEqualLo, bool lessThanLo, ADCHS_AN_INPUT_ID inputEnable,
int16_t hiLimit, int16_t loLimit);
```

Returns

None.

Description

While selecting the CVD mode, the internal capacitor should be similar in magnitude to the external capacitor being sensed. This function configures the internal capacitance. Additionally, the functions sets the limits for CVD measurement and the condition to detect a touch event. Since, CVD is implemented with digital comparator 0, using the CVD functionality also needs that digital comparator is enabled.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Configure the CVD mode
// Creates an event when the reading of AN3 is between 20% to 80% of the
// full scale 12-bit output. This will be the touch event.

PLIB_ADCHS_CVDSetup(    MY_ADCHS_INSTANCE,
                          ADCHS_CVD_CAPACITOR_5PF,
                          false,            // no test for between low and high
                          true,             // Once touch event occurs, CVD output will
                                            // be higher than the set limits
                          false,            // no test for less than high
```

```
                                false,          // no test for greater than equal to low
                                false,          // no test for less than low
                                ADCHS_AN3,      // enable AN3
                                0x0CCD,         // high limit, 80% of full scale
                                0x0333);        // low limit, 20% of full scale
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.
capSel	Selection of value of input capacitor of type ADCHS_CVD_CAPACITOR.
inBetweenOrEqual	Event is generated when result is greater than or equal to loLimit and less than hiLimit.
greaterEqualHi	Event is generated when result is greater than or equal to hiLimit.
lessThanHi	Event is generated when result is less than hiLimit.
greaterEqualLo	Event is generated when result is greater than or equal to loLimit.
lessThanLo	Event is generated when result is less than loLimit.
inputEnable	Bit field which determines which analog inputs are tested by this comparator. This parameter is of type ADCHS_AN_INPUT_ID.
hiLimit	High limit in the same format as the conversion result.
loLimit	Low limit in the same format as the conversion result.

Function

```
void PLIB_ADCHS_CVDSetup
(
    ADCHS_MODULE_ID index,
    ADCHS_CVD_CAPACITOR capSel,     // Input capacitor
bool inBetweenOrEqual,          // between low and high
bool greaterEqualHi,            // greater than equal to high
bool lessThanHi,                // less than high
bool greaterEqualLo,            // greater than equal to low
bool lessThanLo,                // less than low
    ADCHS_AN_INPUT_ID inputEnable,  // input enable bit
int16_t  hiLimit,               // high limit
int16_t  loLimit                // low limit
)
```

c) Analog Input Functions

PLIB_ADCHS_AnalogInputDataIsReady Function

Returns the data ready status of analog inputs.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_AnalogInputDataIsReady(ADCHS_MODULE_ID index, ADCHS_AN_INPUT_ID analogInput);
```

Returns

- true - Converted data is ready for selected analog input
- false - Conversion is not yet complete and data is not ready

Description

This function returns if the converted data is ready for the analog input.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Check if data is ready for AN10
if(PLIB_ADCHS_AnalogInputDataIsReady(MY_ADCHS_INSTANCE, ADCHS_AN10) == true)
{
    // Do further processing
}
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.
analogInput	An analog input selection of type ADCHS_AN_INPUT_ID.

Function

bool PLIB_ADCHS_AnalogInputDataIsReady
(
    ADCHS_MODULE_ID index,
    ADCHS_AN_INPUT_ID analogInput
)

PLIB_ADCHS_AnalogInputDataReadyInterruptDisable Function

Disables the data ready interrupt for the selected analog inputs.

File

plib_adchs.h

C

```
void PLIB_ADCHS_AnalogInputDataReadyInterruptDisable(ADCHS_MODULE_ID index, ADCHS_AN_INPUT_ID analogInput);
```

Returns

None.

Description

This function disables (turns OFF) the data ready interrupt for the selected analog input.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Disable interrupt for AN10 and AN11
PLIB_ADCHS_AnalogInputDataReadyInterruptDisable(MY_ADCHS_INSTANCE, ADCHS_AN10);
PLIB_ADCHS_AnalogInputDataReadyInterruptDisable(MY_ADCHS_INSTANCE, ADCHS_AN11);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.
analogInput	An analog input selection of type ADCHS_AN_INPUT_ID.

Function

void PLIB_ADCHS_AnalogInputDataReadyInterruptDisable
(
ADCHS_MODULE_ID index,
ADCHS_AN_INPUT_ID analogInput
)

PLIB_ADCHS_AnalogInputDataReadyInterruptEnable Function

Enables the data ready interrupt for the selected analog input.

File

plib_adchs.h

C

```
void PLIB_ADCHS_AnalogInputDataReadyInterruptEnable(ADCHS_MODULE_ID index, ADCHS_AN_INPUT_ID analogInput);
```

Returns

None.

Description

This function enables (turns ON) the data ready interrupt for the selected analog input. The interrupt is generated when the converted data is ready for the selected analog input.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Enable interrupt for AN10 and AN11
PLIB_ADCHS_AnalogInputDataReadyInterruptEnable(MY_ADCHS_INSTANCE, ADCHS_AN10);
PLIB_ADCHS_AnalogInputDataReadyInterruptEnable(MY_ADCHS_INSTANCE, ADCHS_AN11);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.
analogInput	An analog input selection of type ADCHS_AN_INPUT_ID.

Function

void PLIB_ADCHS_AnalogInputDataReadyInterruptEnable
(
ADCHS_MODULE_ID index,
ADCHS_AN_INPUT_ID analogInput
)

PLIB_ADCHS_AnalogInputEarlyInterruptDisable Function

Disables the early interrupt for the analog input.

File

plib_adchs.h

C

```
void PLIB_ADCHS_AnalogInputEarlyInterruptDisable(ADCHS_MODULE_ID index, ADCHS_AN_INPUT_ID analogInput);
```

Returns

None.

Description

This function disables (turns OFF) the early interrupt for the selected analog input.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Disable interrupt for AN10 and AN11
PLIB_ADCHS_AnalogInputEarlyInterruptDisable(MY_ADCHS_INSTANCE, ADCHS_AN10);
PLIB_ADCHS_AnalogInputEarlyInterruptDisable(MY_ADCHS_INSTANCE, ADCHS_AN11);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.
analogInput	An analog input selection of type ADCHS_AN_INPUT_ID.

Function

void PLIB_ADCHS_AnalogInputEarlyInterruptDisable

(

ADCHS_MODULE_ID index,

ADCHS_AN_INPUT_ID analogInput

)

PLIB_ADCHS_AnalogInputEarlyInterruptEnable Function

Enables the early interrupt for the analog input.

File

plib_adchs.h

C

```
void PLIB_ADCHS_AnalogInputEarlyInterruptEnable(ADCHS_MODULE_ID index, ADCHS_AN_INPUT_ID analogInput);
```

Returns

None.

Description

This function enables (turns ON) the early interrupt for the selected analog input. The interrupt is generated at a set number of clock prior to conversion complete. The number of clock for early interrupt is set using the "configure" function for a specific channel.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Enable interrupt for AN10 and AN11
PLIB_ADCHS_AnalogInputEarlyInterruptEnable(MY_ADCHS_INSTANCE, ADCHS_AN10);
```

```
PLIB_ADCHS_AnalogInputEarlyInterruptEnable(MY_ADCHS_INSTANCE, ADCHS_AN11);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.
analogInput	An analog input selection of type ADCHS_AN_INPUT_ID.

Function

void PLIB_ADCHS_AnalogInputEarlyInterruptEnable
(
ADCHS_MODULE_ID index,
ADCHS_AN_INPUT_ID analogInput
)

PLIB_ADCHS_AnalogInputEarlyInterruptIsReady Function

Returns the early interrupt ready status of analog input.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_AnalogInputEarlyInterruptIsReady(ADCHS_MODULE_ID index, ADCHS_AN_INPUT_ID analogInput);
```

Returns

- true - Early interrupt event is ready
- false - Early interrupt event has not occurred

Description

This function returns the status of early interrupt for the selected analog input.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Check if early interrupt is ready for AN10
if(PLIB_ADCHS_AnalogInputEarlyInterruptIsReady(MY_ADCHS_INSTANCE, ADCHS_AN10))
{
    // Do further processing
}
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.
analogInput	An analog input selection of type ADCHS_AN_INPUT_ID.

Function

bool PLIB_ADCHS_AnalogInputEarlyInterruptIsReady
(
ADCHS_MODULE_ID index,
ADCHS_AN_INPUT_ID analogInput
)

PLIB_ADCHS_AnalogInputIsAvailable Function

Returns the analog input configuration of ADCHS channel.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_AnalogInputIsAvailable(ADCHS_MODULE_ID index, ADCHS_AN_INPUT_ID analogInput);
```

Returns

- true - Selected analog input is available.
- false - Selected analog input is not available in the ADCHS channel.

Description

This function returns the if the selected analog input is available in the ADCHS channel.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Check if AN10 is available in the ADCHS channel
if(PLIB_ADCHS_AnalogInputIsAvailable(MY_ADCHS_INSTANCE, ADCHS_AN10))
{
    // do further processing
}
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.
analogInput	An analog input selection of type ADCHS_AN_INPUT_ID.

Function

bool PLIB_ADCHS_AnalogInputIsAvailable
(
    ADCHS_MODULE_ID index,
    ADCHS_AN_INPUT_ID analogInput
)

PLIB_ADCHS_AnalogInputModeGet Function

Returns the mode for the specified analog input.

File

plib_adchs.h

C

```
ADCHS_INPUT_MODE PLIB_ADCHS_AnalogInputModeGet(ADCHS_MODULE_ID index, ADCHS_AN_INPUT_ID analogInput);
```

Returns

Mode of the selected analog input of type ADCHS_INPUT_MODE type.

Description

This function returns the mode (single ended or differential) and encoding (unipolar or two's compliment) for the specified analog input.

When getting the mode of analog input which is meant to be alternate input for an ADC channel, the default analog input ID should be passed to this function.

For example, for CHANNEL_0, the default analog input is AN0 and alternate analog input is AN45. If the mode for AN45 needs to be obtained, the default input ID (i.e., AN0) should be passed.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Declare a variable of type "ADCHS_INPUT_MODE"
ADCHS_INPUT_MODE mode;

// Get mode for AN10
mode = PLIB_ADCHS_AnalogInputModeGet(MY_ADCHS_INSTANCE, ADCHS_AN10);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance
analogInput	An analog input selection of type ADCHS_AN_INPUT_ID

Function

```
 ADCHS_INPUT_MODE PLIB_ADCHS_AnalogInputModeGet
(
    ADCHS_MODULE_ID index,
    ADCHS_AN_INPUT_ID analogInput
)
```

PLIB_ADCHS_AnalogInputResultGet Function

Returns a ADC conversion result.

File

plib_adchs.h

C

```
uint32_t PLIB_ADCHS_AnalogInputResultGet(ADCHS_MODULE_ID index, ADCHS_AN_INPUT_ID analogInput);
```

Returns

The conversion result expressed as a 32-bit integer.

Description

This function returns the converted result for the specified analog input.

Remarks

None.

Preconditions

A valid conversion is ready to be fetched.

Example

```
uint32_t        result;
//...
```

```
// Check if data is ready for AN10
if(PLIB_ADCHS_AnalogInputDataIsReady(MY_ADCHS_INSTANCE, ADCHS_AN10))
{
    result = PLIB_ADCHS_AnalogInputResultGet( MY_ADCHS_INSTANCE, ADCHS_AN10 );
}
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.
analogInput	An analog input selection of type ADCHS_AN_INPUT_ID.

Function

uint32_t PLIB_ADCHS_AnalogInputResultGet
(
ADCHS_MODULE_ID index,
ADCHS_AN_INPUT_ID analogInput
)

PLIB_ADCHS_AnalogInputScanIsComplete Function

Returns the state of End of scan completion.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_AnalogInputScanIsComplete(ADCHS_MODULE_ID index);
```

Returns

- true - Analog input scanning is complete for the selected analog inputs
- false - Analog input scanning is not complete

Description

This function returns 'true', if all of the selected Analog Inputs have completed scanning.

Remarks

None.

Preconditions

The ADCHS module should have Analog Inputs Scanning mode selected and enabled for scanning to occur.

Example

```
bool EOSState = PLIB_ADCHS_AnalogInputScanIsComplete(MY_ADCHS_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance

Function

bool PLIB_ADCHS_AnalogInputScanIsComplete(ADCHS_MODULE_ID index)

PLIB_ADCHS_AnalogInputScanIsSelected Function

Returns whether or note an analog input is selected for scanning.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_AnalogInputScanIsSelected(ADCHS_MODULE_ID index, ADCHS_AN_INPUT_ID analogInput);
```

Returns

- true - Analog input is in selected for scanning
- false - Analog input is not selected for scanning

Description

This function returns whether or not an analog input is included in the scanning queue.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Determine if AN10 is selected for scanning or not
if(PLIB_ADCHS_AnalogInputScanIsSelected(MY_ADCHS_INSTANCE, ADCHS_AN10)  == true)
{
    // Perform further operations
}
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.
analogInput	An analog input selection of type ADCHS_AN_INPUT_ID.

Function

bool PLIB_ADCHS_AnalogInputScanIsSelected

(

ADCHS_MODULE_ID index,

ADCHS_AN_INPUT_ID analogInput

)

PLIB_ADCHS_AnalogInputScanRemove Function

Removes the analog input from scanning selection.

File

plib_adchs.h

C

```
void PLIB_ADCHS_AnalogInputScanRemove(ADCHS_MODULE_ID index, ADCHS_AN_INPUT_ID analogInput);
```

Returns

None.

Description

This function removes the analog input for scanning queue. Therefore, the analog input is no longer used for scanning.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Remove AN10 and AN11 from scanning
PLIB_ADCHS_AnalogInputScanRemove(MY_ADCHS_INSTANCE, ADCHS_AN10);
PLIB_ADCHS_AnalogInputScanRemove(MY_ADCHS_INSTANCE, ADCHS_AN11);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.
analogInput	An analog input selection of type ADCHS_AN_INPUT_ID.

Function

void PLIB_ADCHS_AnalogInputScanRemove

(

ADCHS_MODULE_ID index,

ADCHS_AN_INPUT_ID analogInput

)

d) Analog Input Selection Functions

PLIB_ADCHS_AnalogInputModeSelect Function

Selects the mode for the specified analog input.

File

plib_adchs.h

C

```
void PLIB_ADCHS_AnalogInputModeSelect(ADCHS_MODULE_ID index, ADCHS_AN_INPUT_ID analogInput,
ADCHS_INPUT_MODE mode);
```

Returns

None.

Description

This function selects the mode (single ended or differential) and encoding (unipolar or two's compliment) for the specified analog input.

When selecting the mode of analog input which is meant to be alternate input for an ADC channel, the default analog input ID should be passed to this function.

For example, for CHANNEL_0, the default analog input is AN0 and the alternate analog input is AN45. If the mode for AN45 needs to be changed, the default input ID (i.e., AN0) should be passed.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Set AN10 and AN11 to use the single ended, two's complement mode
// selection.
PLIB_ADCHS_AnalogInputModeSelect(MY_ADCHS_INSTANCE,
                        ADCHS_AN10,
                        ADCHS_INPUT_MODE_SINGLE_ENDED_TWOS_COMP);

PLIB_ADCHS_AnalogInputModeSelect(MY_ADCHS_INSTANCE,
```

```
                        ADCHS_AN11,
                        ADCHS_INPUT_MODE_SINGLE_ENDED_TWOS_COMP);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance
analogInput	Analog input ID for which the input mode is to be selected. It is of type ADCHS_AN_INPUT_ID.
mode	An ADCHS_INPUT_MODE type indicating the mode selection

Function

void PLIB_ADCHS_AnalogInputModeSelect

(

ADCHS_MODULE_ID index,

ADCHS_AN_INPUT_ID analogInput,

ADCHS_INPUT_MODE mode

)

PLIB_ADCHS_AnalogInputScanSelect Function

Selects the analog input for scanning.

File

plib_adchs.h

C

```
void PLIB_ADCHS_AnalogInputScanSelect(ADCHS_MODULE_ID index, ADCHS_AN_INPUT_ID analogInput);
```

Returns

None.

Description

This function selects the analog input for scanning.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Select for AN10 and AN11 for scanning
PLIB_ADCHS_AnalogInputScanSelect(MY_ADCHS_INSTANCE, ADCHS_AN10);
PLIB_ADCHS_AnalogInputScanSelect(MY_ADCHS_INSTANCE, ADCHS_AN11);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.
analogInput	An analog input selection of type ADCHS_AN_INPUT_ID.

Function

void PLIB_ADCHS_AnalogInputScanSelect

(

ADCHS_MODULE_ID index,

ADCHS_AN_INPUT_ID analogInput

)

PLIB_ADCHS_ChannelTriggerSampleSelect Function

Selects the trigger and sampling modes for channels of High-Speed SAR ADC

File

plib_adchs.h

C

```
bool PLIB_ADCHS_ChannelTriggerSampleSelect(ADCHS_MODULE_ID index, ADCHS_CHANNEL_ID channelID,
ADCHS_CHANNEL_TRIGGER_SAMPLING_SEL sampSel);
```

Returns

- true - The function successfully selected the sampling and trigger mode
- false - The function could not select the sampling and trigger mode because Channel 7 was selected and Channel 7 does not implement this feature

Description

The channels from 0 through 6 have features to select the trigger as presynchronized or unsynchronized. Also, the sampling can be selected as synchronous. This function provides the functionality to select the trigger and sampling for ADC channels. The valid channels for selecting trigger and sampling is 0 to 6. Channel 7 does not have the feature. Therefore, calling this function for Channel 7 will result in failure. This selection must occur prior to enabling the ADC and therefore must be called when the ADC is disabled. Also, this selection must occur prior to enabling the digital circuit and analog bias circuit for the specified ADC channel.

Remarks

This function must be called when the ADC is disabled.

Preconditions

The channel is disabled when calling this function.

Example

```
bool status = false;

// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Configure the ADC
PLIB_ADCHS_ChannelSetup( MY_ADCHS_INSTANCE,
        ADCHS_CHANNEL_1,                        // channel - 1
        ADCHS_DATA_RESOLUTION_12BIT,            // resolution is set to 12bits
        1,                                      // channel clock divider bit is, TAD =  2 * TQ
        1,                                      // Sample time is 3 * TAD
        ADCHS_EARLY_INTERRUPT_PRIOR_CLOCK_1);   // Interrupt, 1 clock early

status = PLIB_ADCHS_ChannelTriggerSampleSelect( MY_ADCHS_INSTANCE,
        ADCHS_CHANNEL_1,                        // channel - 1
        ADCHS_CHANNEL_SYNC_SAMPLING);           // Synchronous sampling selected

if( false == status)
{
    // error has occurred
    while(1);
}

// Enable the ADC
PLIB_ADCHS_Enable(MY_ADCHS_INSTANCE);

// Wait until the reference voltage is ready
while(!PLIB_ADCHS_VREFIsReady(MY_ADCHS_INSTANCE));

//Check if there is a fault in reference voltage
if(PLIB_ADCHS_VREFFaultHasOccurred(MY_ADCHS_INSTANCE))
{
    // process fault accordingly
    while(1);
}
```

```
// Enable the analog circuit
PLIB_ADCHS_ChannelAnalogFeatureEnable(MY_ADCHS_INSTANCE, ADCHS_CHANNEL_1);

// Wait until the channel wakes up after warm-up
while(!PLIB_ADCHS_ChannelIsReady(MY_ADCHS_INSTANCE, ADCHS_CHANNEL_1));

// Enable the digital circuit
PLIB_ADCHS_ChannelDigitalFeatureEnable(MY_ADCHS_INSTANCE, ADCHS_CHANNEL_1);

// ADC will begin conversion now, after a valid trigger
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.
channelID	Channel ID from 0 to 6.
sampSel	Sets the presync trigger or sync sampling options. This variable is of type ADCHS_CHANNEL_TRIGGER_SAMPLING_SEL.

Function

bool PLIB_ADCHS_ChannelTriggerSampleSelect

(

ADCHS_MODULE_ID index,

ADCHS_CHANNEL_ID channelID,

ADCHS_CHANNEL_TRIGGER_SAMPLING_SEL sampSel

)

PLIB_ADCHS_AnalogInputEdgeTriggerSet Function

Sets the trigger as edge sensitive for selected class 1 and 2 analog input.

File

plib_adchs.h

C

```
void PLIB_ADCHS_AnalogInputEdgeTriggerSet(ADCHS_MODULE_ID index, ADCHS_CLASS12_AN_INPUT_ID analogInput);
```

Returns

None.

Description

This function sets the trigger as edge sensitive for selected Class 1 and 2 analog input.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Set for AN10 and AN11 for edge trigger
PLIB_ADCHS_AnalogInputEdgeTriggerSet( MY_ADCHS_INSTANCE, ADCHS_CLASS12_AN10 );
PLIB_ADCHS_AnalogInputEdgeTriggerSet( MY_ADCHS_INSTANCE, ADCHS_CLASS12_AN11 );
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.

analogInput	An analog input selection of type ADCHS_AN_INPUT_ID. Since the trigger level can be selected only for Class 1 and 2 analog inputs.

Function

void PLIB_ADCHS_AnalogInputEdgeTriggerSet
(
ADCHS_MODULE_ID index,
ADCHS_CLASS12_AN_INPUT_ID analogInput
)

PLIB_ADCHS_AnalogInputLevelTriggerSet Function

Sets the trigger as level sensitive for selected Class 1 and 2 analog input.

File

plib_adchs.h

C

```
void PLIB_ADCHS_AnalogInputLevelTriggerSet(ADCHS_MODULE_ID index, ADCHS_CLASS12_AN_INPUT_ID analogInput);
```

Returns

None.

Description

This function sets the trigger as level sensitive for selected Class 1 and 2 analog input.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Set for AN5 and AN6 for level trigger
PLIB_ADCHS_AnalogInputLevelTriggerSet( MY_ADCHS_INSTANCE, ADCHS_CLASS12_AN5 );
PLIB_ADCHS_AnalogInputLevelTriggerSet( MY_ADCHS_INSTANCE, ADCHS_CLASS12_AN6 );
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.
analogInput	An analog input selection of type ADCHS_AN_INPUT_ID. Since the trigger level can be selected only for Class 1 and 2 analog inputs.

Function

void PLIB_ADCHS_AnalogInputLevelTriggerSet
(
ADCHS_MODULE_ID index,
ADCHS_CLASS12_AN_INPUT_ID analogInput
)

PLIB_ADCHS_AnalogInputScanSetup Function

Selects input to include in Analog Input Scan mode.

File

plib_adchs.h

C

```
void PLIB_ADCHS_AnalogInputScanSetup(ADCHS_MODULE_ID index, ADCHS_AN_INPUT_ID analogInput,
ADCHS_SCAN_TRIGGER_SENSITIVE trgSensitive, ADCHS_SCAN_TRIGGER_SOURCE triggerSource);
```

Returns

None.

Description

Selects inputs, as determined by the low and high enable scan list for inclusion in the analog input scan sequence. If the input is a Class 1 or Class 2 type, it will also select the trigger source for that input to be the scan trigger, which is required if included in analog input scanning. This function configures the scan functionality with a single ADC input. If more inputs are required to be added for scanning, the PLIB_ADCHS_AnalogInputScanSelect function should be used.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Configure analog input Scanning
// Analog inputs 10 through 13
// Trigger on Timer 1 match.

PLIB_ADCHS_AnalogInputScanSetup(MY_ADCHS_INSTANCE,
                                ADCHS_AN10,
                                ADCHS_SCAN_TRIGGER_SENSITIVE_EDGE,   // Edge sensitive
                                ADCHS_SCAN_TRIGGER_SOURCE_TMR1_MATCH);

PLIB_ADCHS_AnalogInputScanSelect(MY_ADCHS_INSTANCE, ADCHS_AN11);
PLIB_ADCHS_AnalogInputScanSelect(MY_ADCHS_INSTANCE, ADCHS_AN12);
PLIB_ADCHS_AnalogInputScanSelect(MY_ADCHS_INSTANCE, ADCHS_AN13);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.
analogInput	An analog input selection of type ADCHS_AN_INPUT_ID.
trgSensitive	Enables level/edge sensitive scan trigger.
triggerSource	Trigger source used to initiate analog input scan.

Function

void PLIB_ADCHS_AnalogInputScanSetup

(

ADCHS_MODULE_ID index,

ADCHS_AN_INPUT_ID analogInput,

ADCHS_SCAN_TRIGGER_SENSITIVE trgSensitive,

ADCHS_SCAN_TRIGGER_SOURCE triggerSource

)

PLIB_ADCHS_AnalogInputTriggerSourceSelect Function

Selects a trigger Source for analog input (Class 1 or Class 2 analog inputs only).

File

plib_adchs.h

C

```
void PLIB_ADCHS_AnalogInputTriggerSourceSelect(ADCHS_MODULE_ID index, ADCHS_CLASS12_AN_INPUT_ID inputId,
ADCHS_TRIGGER_SOURCE triggerSource);
```

Returns

None.

Description

This function selects the trigger source for Class 1 or Class 2 inputs. A call to this function is not required when the input is being used as part of an analog input scan, as the input scan configure function also configures all trigger sources.

Remarks

None.

Preconditions

The function only applies to Class 1 and Class 2 inputs.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Configure AN4 for triggering from INT0.
PLIB_ADCHS_AnalogInputTriggerSourceSelect( MY_ADCHS_INSTANCE,
                                   ADCHS_CLASS12_AN4,
                                   ADCHS_TRIGGER_SOURCE_INT0 );
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.
inputId	Class 1 or Class 2 input trigger to be configured.
triggerSource	Trigger source to use for this input of type ADCHS_TRIGGER_SOURCE.

Function

void PLIB_ADCHS_AnalogInputTriggerSourceSelect

(

ADCHS_MODULE_ID index,

ADCHS_CLASS12_AN_INPUT_ID inputId,

ADCHS_TRIGGER_SOURCE triggerSource

)

e) Digital Comparator Functions

PLIB_ADCHS_DigitalComparatorAnalogInputGet Function

Returns the analog input ID used by the digital comparator.

File

plib_adchs.h

C

```
ADCHS_AN_INPUT_ID PLIB_ADCHS_DigitalComparatorAnalogInputGet(ADCHS_MODULE_ID index,
ADCHS_DIGITAL_COMPARATOR_ID digComparator);
```

Returns

An analog input ID of type ADCHS_AN_INPUT_ID.

Description

This function returns the analog input ID, whose converted data is being compared by the specified digital comparator. In a typical application, when a comparator event is recorded, the application will need to know the analog input which caused the event. This function returns the value of type ADCHS_AN_INPUT_ID, indicating the analog input ID.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

ADCHS_AN_INPUT_ID input;

// Get analog input tied to digital comparator 2
input = PLIB_ADCHS_DigitalComparatorAnalogInputGet( MY_ADCHS_INSTANCE, ADCHS_DIGITAL_COMPARATOR_2 );
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.
digComparator	Digital comparator ID of type ADCHS_DIGITAL_COMPARATOR_ID.

Function

```
ADCHS_AN_INPUT_ID PLIB_ADCHS_DigitalComparatorAnalogInputGet
(
    ADCHS_MODULE_ID index,
    ADCHS_DIGITAL_COMPARATOR_ID digComparator
)
```

PLIB_ADCHS_DigitalComparatorAnalogInputSelect Function

Selects analog inputs, whose converted data will be processed by the comparator.

File

plib_adchs.h

C

```
void PLIB_ADCHS_DigitalComparatorAnalogInputSelect(ADCHS_MODULE_ID index, ADCHS_DIGITAL_COMPARATOR_ID
digComparator, ADCHS_AN_INPUT_ID analogInput);
```

Returns

None.

Description

This function selects the analog input, whose converted data (once available) will be processed by the specified digital comparator. This function should be called only when the comparator is in a disabled state.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Set digital comparator 2 to process the output of AN2
PLIB_ADCHS_DigitalComparatorAnalogInputSelect( MY_ADCHS_INSTANCE,
                                    ADCHS_DIGITAL_COMPARATOR_2, ADCHS_AN2);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.
digComparator	Digital comparator ID of type ADCHS_DIGITAL_COMPARATOR_ID.
analogInput	An analog input selection of type ADCHS_AN_INPUT_ID. The valid input range for "analogInput" is from ADCHS_AN0 to ADCHS_AN31. Values from ADCHS_AN32 and higher will be ignored.

Function

void PLIB_ADCHS_DigitalComparatorAnalogInputSelect

(

ADCHS_MODULE_ID index,

ADCHS_DIGITAL_COMPARATOR_ID digComparator,

ADCHS_AN_INPUT_ID analogInput

)

PLIB_ADCHS_DigitalComparatorDisable Function

Disables the specified digital comparator.

File

plib_adchs.h

C

```
void PLIB_ADCHS_DigitalComparatorDisable(ADCHS_MODULE_ID index, ADCHS_DIGITAL_COMPARATOR_ID digComparator);
```

Returns

None.

Description

This function disables (turns OFF) the specified digital comparator.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.
PLIB_ADCHS_DigitalComparatorDisable(MY_ADCHS_INSTANCE, ADCHS_DIGITAL_COMPARATOR_2);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.
digComparator	Digital comparator of type ADCHS_DIGITAL_COMPARATOR_ID.

Function

void PLIB_ADCHS_DigitalComparatorDisable

(

ADCHS_MODULE_ID index,

ADCHS_DIGITAL_COMPARATOR_ID digComparator

)

PLIB_ADCHS_DigitalComparatorEnable Function

Enables the specified digital comparator.

File

plib_adchs.h

C

```
void PLIB_ADCHS_DigitalComparatorEnable(ADCHS_MODULE_ID index, ADCHS_DIGITAL_COMPARATOR_ID digComparator);
```

Returns

None.

Description

This function enables (turns ON) the specified digital comparator.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.
PLIB_ADCHS_DigitalComparatorEnable(MY_ADCHS_INSTANCE, ADCHS_DIGITAL_COMPARATOR_2);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.
digComparator	Digital comparator of type ADCHS_DIGITAL_COMPARATOR_ID.

Function

void PLIB_ADCHS_DigitalComparatorEnable

(

ADCHS_MODULE_ID index,

ADCHS_DIGITAL_COMPARATOR_ID digComparator

)

PLIB_ADCHS_DigitalComparatorEventHasOccurred Function

Returns the status of the selected digital comparator.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_DigitalComparatorEventHasOccurred(ADCHS_MODULE_ID index, ADCHS_DIGITAL_COMPARATOR_ID id);
```

Returns

None.

Description

This function returns the status of the selected digital comparator, whether or not an event related to this comparator has occurred. A comparator event will occur if the analog input selected for the comparator is outside the set limits.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.
```

```
// Check, if comparator event has occurred for digital comparator 2
if(PLIB_ADCHS_DigitalComparatorEventHasOccurred( MY_ADCHS_INSTANCE, ADCHS_DIGITAL_COMPARATOR_2 ))
{
    // Perform related tasks
}
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.
id	Identifier for the digital comparator in this device.

Function

bool PLIB_ADCHS_DigitalComparatorEventHasOccurred

(

ADCHS_MODULE_ID index,

ADCHS_DIGITAL_COMPARATOR_ID id

)

PLIB_ADCHS_DigitalComparatorInterruptDisable Function

Disables the interrupt for the selected digital comparator.

File

plib_adchs.h

C

```
void PLIB_ADCHS_DigitalComparatorInterruptDisable(ADCHS_MODULE_ID index, ADCHS_DIGITAL_COMPARATOR_ID
digComparator);
```

Returns

None.

Description

This function disables (turns OFF) the interrupt for the selected digital comparator. The interrupt will not be generated, once a comparator event occurs.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Disable interrupt for comparator 2
PLIB_ADCHS_DigitalComparatorInterruptDisable( MY_ADCHS_INSTANCE, ADCHS_DIGITAL_COMPARATOR_2 );
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.
digComparator	Digital comparator of type ADCHS_DIGITAL_COMPARATOR_ID.

Function

void PLIB_ADCHS_DigitalComparatorInterruptDisable

(

ADCHS_MODULE_ID index,

ADCHS_DIGITAL_COMPARATOR_ID digComparator

)

PLIB_ADCHS_DigitalComparatorInterruptEnable Function

Enables the interrupt for the selected digital comparator.

File

plib_adchs.h

C

```
void PLIB_ADCHS_DigitalComparatorInterruptEnable(ADCHS_MODULE_ID index, ADCHS_DIGITAL_COMPARATOR_ID
digComparator);
```

Returns

None.

Description

This function enables (turns ON) the interrupt for the selected digital comparator. The interrupt is generated when the converted analog data for the related analog input goes out of the specified limits (set for comparator).

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Enable interrupt for comparator 2
PLIB_ADCHS_DigitalComparatorInterruptEnable( MY_ADCHS_INSTANCE, ADCHS_DIGITAL_COMPARATOR_2 );
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.
digComparator	Digital comparator of type ADCHS_DIGITAL_COMPARATOR_ID.

Function

void PLIB_ADCHS_DigitalComparatorInterruptEnable

(

ADCHS_MODULE_ID index,

ADCHS_DIGITAL_COMPARATOR_ID digComparator

)

PLIB_ADCHS_DigitalComparatorLimitSet Function

Sets the limit for the specified digital comparator.

File

plib_adchs.h

C

```
void PLIB_ADCHS_DigitalComparatorLimitSet(ADCHS_MODULE_ID index, ADCHS_DIGITAL_COMPARATOR_ID id, int16_t
hiLimit, int16_t loLimit);
```

Returns

None.

Description

This function sets the high and low limits for the specified digital comparator.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Configure the Digital Comparator
// Creates an event when the reading of AN3 is between 20% to 80% of the
// full scale 12-bit output.
PLIB_ADCHS_DigitalComparatorLimitSet( MY_ADCHS_INSTANCE,    // ADCHS module ID
                      ADCHS_DIGITAL_COMPARATOR_1,           // Comparator ID
                      0x0CCD,                               // high limit, 80% of full scale
                      0x0333);                              // low limit, 20% of full scale
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.
id	Identifier for the digital comparator in this device.
hiLimit	High limit in the same format as the conversion result.
loLimit	Low limit in the same format as the conversion result.

Function

void PLIB_ADCHS_DigitalComparatorLimitSet

(

ADCHS_MODULE_ID index,

ADCHS_DIGITAL_COMPARATOR_ID id,

int16_t hiLimit,

int16_t loLimit

)

PLIB_ADCHS_DigitalComparatorSetup Function

Configures the Digital Comparator on the High-Speed SAR ADC converter.

File

plib_adchs.h

C

```
void PLIB_ADCHS_DigitalComparatorSetup(ADCHS_MODULE_ID index, ADCHS_DIGITAL_COMPARATOR_ID id, bool
intEnable, bool inBetweenOrEqual, bool greaterEqualHi, bool lessThanHi, bool greaterEqualLo, bool
lessThanLo, ADCHS_AN_INPUT_ID analogInput, int16_t hiLimit, int16_t loLimit);
```

Returns

None.

Description

This function configures all parameters for the Digital Comparator of the ADCHS module.

Remarks

This function must be called when the ADC is disabled. The format of hiLimit and loLimit must match the output format of analog input specified in analogInput.

Preconditions

The module is disabled when calling this function.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Configure the Digital Comparator
// Creates an event when the reading of AN3 is between 20% to 80% of the
// full scale 12-bit output.
PLIB_ADCHS_DigitalComparatorSetup( MY_ADCHS_INSTANCE,   // ADCHS module ID
                       ADCHS_DIGITAL_COMPARATOR_1,      // Comparator ID
                       false,                           // No Int Enable
                       true,                            // test for between low and high
                       false,                           // no test for greater than equal to high
                       false,                           // no test for less than high
                       false,                           // no test for greater than equal to low
                       false,                           // no test for less than low
                       ADCHS_AN3,                       // select AN3
                       0x0CCD,                          // high limit, 80% of full scale
                       0x0333);                         // low limit, 20% of full scale

// Enable Digital Comparator 1
PLIB_ADCHS_DigitalComparatorEnable(MY_ADCHS_INSTANCE, ADCHS_DIGITAL_COMPARATOR_1);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.
id	Identifier for the digital comparator specified.
intEnable	When true, comparator events generates interrupt.
inBetweenOrEqual	Event is generated when result is greater than or equal to loLimit and less than hiLimit.
greaterEqualHi	Event is generated when result is greater than or equal to hiLimit.
lessThanHi	Event is generated when result is less than hiLimit.
greaterEqualLo	Event is generated when result is greater than or equal to loLimit.
lessThanLo	Event is generated when result is less than loLimit.
analogInput	An analog input selection of type ADCHS_AN_INPUT_ID. The valid input range for "analogInput" is from ADCHS_AN0 to ADCHS_AN31. Values from ADCHS_AN32 and higher will be ignored.
hiLimit	High limit in the same format as the conversion result.
loLimit	Low limit in the same format as the conversion result.

Function

```
void PLIB_ADCHS_DigitalComparatorSetup
(
    ADCHS_MODULE_ID index,          // ADCHS channel ID
    ADCHS_DIGITAL_COMPARATOR_ID id,    // Comparator ID
bool intEnable,                 // Int Enable
bool inBetweenOrEqual,          // between low and high
bool greaterEqualHi,            // greater than equal to high
bool lessThanHi,                // less than high
bool greaterEqualLo,            // greater than equal to low
bool lessThanLo,                // less than low
    ADCHS_AN_INPUT_ID analogInput,     // input enable bits
int16_t  hiLimit,               // high limit
int16_t  loLimit                // low limit
)
```

f) Digital Filter Functions

PLIB_ADCHS_DigitalFilterAveragingModeSampleCountSelect Function

Selects the number of samples which are averaged by the Digital Filter.

File

plib_adchs.h

C

```
void PLIB_ADCHS_DigitalFilterAveragingModeSampleCountSelect(ADCHS_MODULE_ID index, ADCHS_DIGITAL_FILTER_ID
id, ADCHS_DIGITAL_FILTER_AVERAGE_SAMPLE_COUNT count);
```

Returns

None.

Description

This function selects the number of samples which are averaged by the Digital Filter, when the Digital Filter is configured for Averaging mode.

Remarks

This function must be called when the ADC is disabled.

Preconditions

The Digital Filter is disabled when calling this function.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Disable Digital Filter
PLIB_ADCHS_DigitalFilterDisable(MY_ADCHS_INSTANCE, ADCHS_DIGITAL_FILTER_1);

// Select the sample count to be 64 samples
PLIB_ADCHS_DigitalFilterAveragingModeSampleCountSelect( MY_ADCHS_INSTANCE,      // ADCHS module ID
                              ADCHS_DIGITAL_FILTER_1,                          // Filter ID
                              ADCHS_DIGITAL_FILTER_AVERAGE_SAMPLE_COUNT_64);   // 64 samples averaged

// Enable Digital Filter-1
PLIB_ADCHS_DigitalFilterEnable(MY_ADCHS_INSTANCE, ADCHS_DIGITAL_FILTER_1);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.
id	Identifier for the Digital Filter in this device.
count	Sets the number of samples which will be averaged by the Digital Filter. This variable is of type. ADCHS_DIGITAL_FILTER_AVERAGE_SAMPLE_COUNT.

Function

void PLIB_ADCHS_DigitalFilterAveragingModeSampleCountSelect

(

ADCHS_MODULE_ID index, // ADCHS module ID

ADCHS_DIGITAL_FILTER_ID id, // Filter ID

ADCHS_DIGITAL_FILTER_AVERAGE_SAMPLE_COUNT count // Sample count

)

PLIB_ADCHS_DigitalFilterAveragingModeSetup Function

Configures the Digital Filter on the High-Speed SAR ADC converter in Averaging mode.

File

plib_adchs.h

C

```
void PLIB_ADCHS_DigitalFilterAveragingModeSetup(ADCHS_MODULE_ID index, ADCHS_DIGITAL_FILTER_ID id,
ADCHS_AN_INPUT_ID analogInput, ADCHS_DIGITAL_FILTER_SIGNIFICANT_BITS length,
ADCHS_DIGITAL_FILTER_AVERAGE_SAMPLE_COUNT count, bool intEnable);
```

Returns

None.

Description

This function configures the Digital Filter on the High-Speed SAR ADC converter in Averaging mode.

Remarks

This function must be called when the ADC is disabled.

Preconditions

The Digital Filter is disabled when calling this function.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Configure the Digital Filter in Averaging mode
// AN4 is averaged with 64 samples.  No global interrupt is enabled.
PLIB_ADCHS_DigitalFilterAveragingModeSetup( MY_ADCHS_INSTANCE,               // ADCHS module ID
                                ADCHS_DIGITAL_FILTER_1,                     // Filter ID
                                ADCHS_AN4,                                  // Oversample AN4
                                ADCHS_DIGITAL_FILTER_SIGNIFICANT_ALL_16BITS, // all 16bits significant
                                ADCHS_DIGITAL_FILTER_AVERAGE_SAMPLE_COUNT_64, // 64 samples averaged
                                false );                                    // No Int Enable

// Enable Digital Filter-1
PLIB_ADCHS_DigitalFilterEnable(MY_ADCHS_INSTANCE, ADCHS_DIGITAL_FILTER_1);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.
id	Identifier for the Digital Filter in this device.
analogInput	Identifier for the analog input to be filtered.
length	Sets the significant date length.
count	Sets the number of samples which will be averaged by Digital Filter. This variable is of type. ADCHS_DIGITAL_FILTER_AVERAGE_SAMPLE_COUNT.
intEnable	When set, Filter events generated interrupt.

Function

```
void PLIB_ADCHS_DigitalFilterAveragingModeSetup
(
    ADCHS_MODULE_ID index,                  // ADCHS module ID
    ADCHS_DIGITAL_FILTER_ID id,               // Filter ID
    ADCHS_AN_INPUT_ID analogInput,              // analog input ID
    ADCHS_DIGITAL_FILTER_SIGNIFICANT_BITS length,    // Significant data bit
    ADCHS_DIGITAL_FILTER_AVERAGE_SAMPLE_COUNT count, // Sample count
bool intEnable                          // Int Enable
)
```

PLIB_ADCHS_DigitalFilterDataGet Function

Used to fetch the data result from the Digital Filter.

File

plib_adchs.h

C

```
int16_t PLIB_ADCHS_DigitalFilterDataGet(ADCHS_MODULE_ID index, ADCHS_DIGITAL_FILTER_ID dfltrID);
```

Returns

A 16-bit result in the format specified by the filter's configuration setting.

Description

This function is used to fetch data from the Digital Filter.

Remarks

None.

Preconditions

This function will function only if the Digital Filter was already configured (in Oversampling mode or Averaging mode) and the Digital Filter was enabled.

Example

```
int16_t myDFLTRResult;

if (PLIB_ADCHS_DigitalFilterDataIsReady(MY_ADCHS_INSTANCE, ADCHS_DIGITAL_FILTER_1)) {
    // fetch data
    myDFLTRResult = PLIB_ADCHS_DigitalFilterDataGet(MY_ADCHS_INSTANCE, ADCHS_DIGITAL_FILTER_1);
    // process result
    ...
}
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.
dfltrID	Identifier for the Digital Filter in this device.

Function

int16_t PLIB_ADCHS_DigitalFilterDataGet

(

ADCHS_MODULE_ID index,

ADCHS_DIGITAL_FILTER_ID dfltrID

)

PLIB_ADCHS_DigitalFilterDataIsReady Function

Used to determine if the Digital Filter has data ready.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_DigitalFilterDataIsReady(ADCHS_MODULE_ID index, ADCHS_DIGITAL_FILTER_ID id);
```

Returns

- true - Digital Filter has filtered data ready to be read
- false - Digital Filter data is not yet ready

Description

This function can be used to determine if the ADCHS Digital Filter has data ready. A 'true' is returned when data is available, which can be fetched using PLIB_ADCHS_DigitalFilterDataGet.

Remarks

None.

Preconditions

None.

Example

```
if (PLIB_ADCHS_DigitalFilterDataIsReady(MY_ADCHS_INSTANCE, ADCHS_DIGITAL_FILTER_1)) {
            // fetch and process data
    }
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.
id	Identifier for the Digital Filter in this device.

Function

bool PLIB_ADCHS_DigitalFilterDataIsReady

(

ADCHS_MODULE_ID index,

ADCHS_DIGITAL_FILTER_ID id

)

PLIB_ADCHS_DigitalFilterDataReadyInterruptDisable Function

Disables the interrupt for the selected Digital Filter.

File

plib_adchs.h

C

```
void PLIB_ADCHS_DigitalFilterDataReadyInterruptDisable(ADCHS_MODULE_ID index, ADCHS_DIGITAL_FILTER_ID
digFilter);
```

Returns

None.

Description

This function disables (turns OFF) the interrupt for the selected Digital Filter. The interrupt will not be generated, once filter data is ready.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Disable interrupt for filter 2
PLIB_ADCHS_DigitalFilterDataReadyInterruptDisable( MY_ADCHS_INSTANCE, ADCHS_DFLTR2 );
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.
digFilter	Digital Filter of type ADCHS_DIGITAL_FILTER_ID.

Function

void PLIB_ADCHS_DigitalFilterDataReadyInterruptDisable

(

ADCHS_MODULE_ID index,

ADCHS_DIGITAL_FILTER_ID digFilter

)

PLIB_ADCHS_DigitalFilterDataReadyInterruptEnable Function

Enables the interrupt for the selected Digital Filter.

File

plib_adchs.h

C

```
void PLIB_ADCHS_DigitalFilterDataReadyInterruptEnable(ADCHS_MODULE_ID index, ADCHS_DIGITAL_FILTER_ID
digFilter);
```

Returns

None.

Description

This function enables (turns ON) the interrupt for the selected Digital Filter. The interrupt is generated when the Digital Filter completes the filtering and data is ready in the register (to be read).

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Enable interrupt for filter - 2
PLIB_ADCHS_DigitalFilterDataReadyInterruptEnable( MY_ADCHS_INSTANCE, ADCHS_DFLTR2 );
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.
digFilter	Digital Filter of type ADCHS_DIGITAL_FILTER_ID.

Function

void PLIB_ADCHS_DigitalFilterDataReadyInterruptEnable

(

ADCHS_MODULE_ID index,

ADCHS_DIGITAL_FILTER_ID digFilter

)

PLIB_ADCHS_DigitalFilterDisable Function

Disables the Digital Filter.

File

plib_adchs.h

C

```
void PLIB_ADCHS_DigitalFilterDisable(ADCHS_MODULE_ID index, ADCHS_DIGITAL_FILTER_ID id);
```

Returns

None.

Description

This function Disables (turns OFF) the selected Digital Filter.

Remarks

None.

Preconditions

None..

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Disable Digital Filter 1
PLIB_ADCHS_DigitalFilterDisable(MY_ADCHS_INSTANCE, ADCHS_DIGITAL_FILTER_1);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.
id	Identifier for the Digital Filter in the ADCHS channel.

Function

void PLIB_ADCHS_DigitalFilterDisable

(

ADCHS_MODULE_ID index,

ADCHS_DIGITAL_FILTER_ID id

)

PLIB_ADCHS_DigitalFilterEnable Function

Enables the Digital Filter.

File

plib_adchs.h

C

```
void PLIB_ADCHS_DigitalFilterEnable(ADCHS_MODULE_ID index, ADCHS_DIGITAL_FILTER_ID id);
```

Returns

None.

Description

This function enables (turns ON) the selected Digital Filter.

Remarks

None.

Preconditions

The ADC channel should be configured using the PLIB_ADCHS_Setup function prior to enabling.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Enable Digital Filter-1
PLIB_ADCHS_DigitalFilterEnable(MY_ADCHS_INSTANCE, ADCHS_DIGITAL_FILTER_1);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.
id	Identifier for the digital Filter in the ADCHS channel.

Function

void PLIB_ADCHS_DigitalFilterEnable

(

ADCHS_MODULE_ID index,

ADCHS_DIGITAL_FILTER_ID id
)

PLIB_ADCHS_DigitalFilterOversamplingModeRatioSelect Function

Selects the oversampling ratio for the Digital Filter.

File

plib_adchs.h

C

```
void PLIB_ADCHS_DigitalFilterOversamplingModeRatioSelect(ADCHS_MODULE_ID index, ADCHS_DIGITAL_FILTER_ID id,
ADCHS_DIGITAL_FILTER_OVERSAMPLE_RATIO ratio);
```

Returns

None.

Description

This function selects the oversampling ratio for the Digital Filter. This function can be used to change the oversampling ratio of the Digital Filter, when set in Oversampling mode.

Remarks

This function must be called when the ADC is disabled.

Preconditions

The Digital Filter is disabled when calling this function.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Disable Digital Filter
PLIB_ADCHS_DigitalFilterDisable(MY_ADCHS_INSTANCE, ADCHS_DIGITAL_FILTER_1);

// Select the oversampling ratio
PLIB_ADCHS_DigitalFilterOversamplingModeRatioSelect( MY_ADCHS_INSTANCE,     // ADCHS module ID
                              ADCHS_DIGITAL_FILTER_1,                      // Filter ID
                              ADCHS_DIGITAL_FILTER_OVERSAMPLE_RATIO_16X);  // 16 x oversampling

// Enable Digital Filter-1
PLIB_ADCHS_DigitalFilterEnable(MY_ADCHS_INSTANCE, ADCHS_DIGITAL_FILTER_1);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.
id	Identifier for the Digital Filter in this device.
ratio	Sets the oversampling filter ratio. This variable is of type ADCHS_DIGITAL_FILTER_OVERSAMPLE_RATIO.

Function

void PLIB_ADCHS_DigitalFilterOversamplingModeRatioSelect
(
ADCHS_MODULE_ID index, // ADCHS module ID
ADCHS_DIGITAL_FILTER_ID id, // Filter ID
ADCHS_DIGITAL_FILTER_OVERSAMPLE_RATIO ratio // Oversampling ratio
)

PLIB_ADCHS_DigitalFilterOversamplingModeSetup Function

Configures the Digital Filter on the High-Speed SAR ADC converter in Oversampling mode.

File

plib_adchs.h

C

```
void PLIB_ADCHS_DigitalFilterOversamplingModeSetup(ADCHS_MODULE_ID index, ADCHS_DIGITAL_FILTER_ID id,
ADCHS_AN_INPUT_ID analogInput, ADCHS_DIGITAL_FILTER_SIGNIFICANT_BITS length,
ADCHS_DIGITAL_FILTER_OVERSAMPLE_RATIO ratio, bool intEnable);
```

Returns

None.

Description

This function configures the Digital Filter on the High-Speed SAR ADC converter in Oversampling mode.

Remarks

This function must be called when the ADC is disabled.

Preconditions

The Digital Filter channel is disabled when calling this function.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Configure the Digital Filter in Oversampling mode
// AN4 is oversampled at a 16X rate.  No global interrupt is enabled.
PLIB_ADCHS_DigitalFilterOversamplingModeSetup( MY_ADCHS_INSTANCE,           // ADCHS module ID
                               ADCHS_DIGITAL_FILTER_1,                     // Filter ID
                               ADCHS_AN4,                                  // Oversample AN4
                               ADCHS_DIGITAL_FILTER_SIGNIFICANT_ALL_16BITS, // all 16bits significant
                               ADCHS_DIGITAL_FILTER_OVERSAMPLE_RATIO_16X,   // 16 x oversampling
                               false );                                    // No Int Enable

// Enable Digital Filter-1
PLIB_ADCHS_DigitalFilterEnable(MY_ADCHS_INSTANCE, ADCHS_DIGITAL_FILTER_1);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.
id	Identifier for the Digital Filter in this device.
analogInput	Identifier for the analog input to be filtered.
length	Sets the significant data length.
ratio	Sets the oversampling filter ratio. This variable is of type ADCHS_DIGITAL_FILTER_OVERSAMPLE_RATIO.
intEnable	When set, Filter events generated interrupt.

Function

```
void PLIB_ADCHS_DigitalFilterOversamplingModeSetup
(
    ADCHS_MODULE_ID index,                  // ADCHS ID
    ADCHS_DIGITAL_FILTER_ID id,             // Filter ID
    ADCHS_AN_INPUT_ID analogInput,          // analog input ID
    ADCHS_DIGITAL_FILTER_SIGNIFICANT_BITS length,   // Significant data bit
    ADCHS_DIGITAL_FILTER_OVERSAMPLE_RATIO ratio,    // Oversampling ratio
bool intEnable                          // Int Enable
)
```

g) DMA Functions

PLIB_ADCHS_DMABuffer_A_InterruptDisable Function

Disables the DMA Buffer A full interrupt for the specified Channel 0 to 6.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_DMABuffer_A_InterruptDisable(ADCHS_MODULE_ID index, ADCHS_CHANNEL_ID channelID);
```

Returns

- true - The function successfully disabled interrupt
- false - The function could not disable the interrupt, as the selected Channel is 7, which does not implement this feature

Description

This function disables (turns OFF) the DMA Buffer A full interrupt for the specified Channel 0 to 6. Since Channel 7 does not implement this feature, passing Channel 7 will result in an error.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Enable DMA interrupt
PLIB_ADCHS_DMABuffer_A_InterruptDisable( MY_ADCHS_INSTANCE, ADCHS_CHANNEL_1 );
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.
channelID	Channel ID from 0 to 6.

Function

bool PLIB_ADCHS_DMABuffer_A_InterruptDisable

(

ADCHS_MODULE_ID index,

ADCHS_CHANNEL_ID channelID // Channel ID 0 to 6

)

PLIB_ADCHS_DMABuffer_A_InterruptEnable Function

Enables the DMA Buffer A full interrupt for the specified Channel 0 to 6.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_DMABuffer_A_InterruptEnable(ADCHS_MODULE_ID index, ADCHS_CHANNEL_ID channelID);
```

Returns

- true - The function successfully enabled interrupt
- false - The function could not enable the interrupt, as the selected Channel is 7, which does not implement this feature

Description

This function enables (turns ON) the DMA Buffer A full interrupt for the specified Channel 0 to 6. The interrupt is generated when the DMA buffer A is full. Since Channel 7 does not implement this feature, passing Channel 7 will result in an error.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Enable DMA interrupt
PLIB_ADCHS_DMABuffer_A_InterruptEnable( MY_ADCHS_INSTANCE, ADCHS_CHANNEL_1 );
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.
channelID	Channel ID from 0 to 6.

Function

bool PLIB_ADCHS_DMABuffer_A_InterruptEnable

(

ADCHS_MODULE_ID index,

ADCHS_CHANNEL_ID channelID // Channel ID 0 to 6

)

PLIB_ADCHS_DMABuffer_A_IsFull Function

Used to determine if the DMA Buffer A is full, for the specified Channel 0 to 6.

File

plib_adchs.h

C

```
int8_t PLIB_ADCHS_DMABuffer_A_IsFull(ADCHS_MODULE_ID index, ADCHS_CHANNEL_ID channelID);
```

Returns

- 1 - Buffer is full
- 0 - Buffer is empty
- -1 - Invalid channel ID passed

Description

This function can be used to determine if the ADCHS DMA Buffer A is full for the specified Channel 0 to 6.

A value of '1' is returned when the Buffer A is full. A value of '0' is returned when the Buffer A is empty.

This feature is not implemented for Channel 7. Therefore, passing Channel 7 returns an error.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

if (1 == PLIB_ADCHS_DMABuffer_A_IsFull(MY_ADCHS_INSTANCE, ADCHS_CHANNEL_1 ))
{
    // process data, if DMA Buffer A is full
}
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.
channelID	Channel ID from 0 to 6.

Function

int8_t PLIB_ADCHS_DMABuffer_A_IsFull
(
    ADCHS_MODULE_ID index,
    ADCHS_CHANNEL_ID channelID   // channel ID 0 to 6
)

PLIB_ADCHS_DMABuffer_B_InterruptDisable Function

Disables the DMA Buffer B full interrupt for the specified Channel 0 to 6.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_DMABuffer_B_InterruptDisable(ADCHS_MODULE_ID index, ADCHS_CHANNEL_ID channelID);
```

Returns

- true - The function successfully disabled interrupt
- false - The function could not disable the interrupt, as the selected Channel is 7, which does not implement this feature

Description

This function disables (turns OFF) the DMA Buffer B full interrupt for specified Channel 0 to 6. Since Channel 7 does not implement this feature, passing Channel 7 will result in an error.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Enable DMA interrupt
PLIB_ADCHS_DMABuffer_B_InterruptDisable( MY_ADCHS_INSTANCE, ADCHS_CHANNEL_1 );
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.
channelID	Channel ID from 0 to 6.

Function

bool PLIB_ADCHS_DMABuffer_B_InterruptDisable
(
    ADCHS_MODULE_ID index,
    ADCHS_CHANNEL_ID channelID   // Channel ID 0 to 6
)

PLIB_ADCHS_DMABuffer_B_InterruptEnable Function

Enables the DMA Buffer B full interrupt for the specified Channel 0 to 6.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_DMABuffer_B_InterruptEnable(ADCHS_MODULE_ID index, ADCHS_CHANNEL_ID channelID);
```

Returns

- true - The function successfully enabled interrupt
- false - The function could not enable the interrupt, as the selected Channel is 7, which does not implement this feature

Description

This function enables (turns ON) the DMA Buffer B full interrupt for specified Channel 0 to 6. The interrupt is generated when the DMA Buffer B is full. Since Channel 7 does not implement this feature, passing Channel 7 will result in an error.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Enable DMA interrupt
PLIB_ADCHS_DMABuffer_B_InterruptEnable( MY_ADCHS_INSTANCE, ADCHS_CHANNEL_1 );
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.
channelID	Channel ID from 0 to 6.

Function

void PLIB_ADCHS_DMABuffer_B_InterruptEnable

(

ADCHS_MODULE_ID index,

ADCHS_CHANNEL_ID channelID // Channel ID 0 to 6

)

PLIB_ADCHS_DMABuffer_B_IsFull Function

Used to determine if the DMA Buffer B is full, for the specified Channel 0 to 6.

File

plib_adchs.h

C

```
int8_t PLIB_ADCHS_DMABuffer_B_IsFull(ADCHS_MODULE_ID index, ADCHS_CHANNEL_ID channelID);
```

Returns

- 1 - Buffer is full
- 0 - Buffer is empty
- -1 - Invalid channel ID passed

Description

This functino is used to determine if the ADCHS DMA Buffer B is full for the specified Channel 0 to 6.

A value of '1' is returned when Buffer B is full. A value of '0' is returned when Buffer B is empty.

This feature is not implemented for Channel 7. Therefore, passing Channel 7 returns an error.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

if (1 == PLIB_ADCHS_DMABuffer_B_IsFull(MY_ADCHS_INSTANCE, ADCHS_CHANNEL_1 ))
{
    // process data, if DMA Buffer B is full
}
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.
channelID	Channel ID from 0 to 6.

Function

int8_t PLIB_ADCHS_DMABuffer_B_IsFull
(
    ADCHS_MODULE_ID index,
    ADCHS_CHANNEL_ID channelID // Channel ID 0 to 6
)

PLIB_ADCHS_DMADisable Function

Disables the DMA in the High-Speed SAR ADC module.

File

plib_adchs.h

C

```
void PLIB_ADCHS_DMADisable(ADCHS_MODULE_ID index);
```

Returns

None.

Description

This function disables (turns OFF) the DMA in the High-Speed SAR ADC module.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Disable DMA
PLIB_ADCHS_DMADisable( MY_ADCHS_INSTANCE );
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.

Function

void PLIB_ADCHS_DMADisable(ADCHS_MODULE_ID index)

PLIB_ADCHS_DMAEnable Function

Enables the DMA in the High-Speed SAR ADC module.

File

plib_adchs.h

C

```
void PLIB_ADCHS_DMAEnable(ADCHS_MODULE_ID index);
```

Returns

None.

Description

This function enables (turns ON) the DMA in the High-Speed SAR ADC module.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Enable DMA
PLIB_ADCHS_DMAEnable( MY_ADCHS_INSTANCE );
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.

Function

void PLIB_ADCHS_DMAEnable(ADCHS_MODULE_ID index)

PLIB_ADCHS_DMAOverflowErrorHasOccurred Function

Used to determine if the DMA Buff had an overflow error.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_DMAOverflowErrorHasOccurred(ADCHS_MODULE_ID index);
```

Returns

Boolean:

- true - If an overflow error occurred
- false - If an overflow error has not occurred

Description

DMA Buffers are circular in nature. If reading the data from DMA buffer is slower as compared to filling the buffer, the newer data will overwrite the previous data (before the data is read). This function returns 'true' if an overflow error has occurred.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

if (PLIB_ADCHS_DMAOverflowErrorHasOccurred(MY_ADCHS_INSTANCE)
{
    // Error occurred
    while(1);
}
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance

Function

bool PLIB_ADCHS_DMAOverflowErrorHasOccurred(ADCHS_MODULE_ID index)

PLIB_ADCHS_DMASetup Function

Configures the DMA on the High-Speed SAR ADC.

File

plib_adchs.h

C

```
void PLIB_ADCHS_DMASetup(ADCHS_MODULE_ID index, ADCHS_DMA_BUFFER_LENGTH bufferLengthBytes, uint32_t
baseAddress, ADCHS_DMA_COUNT countMode, uint32_t countBaseAddress);
```

Returns

None.

Description

This functin configures all parameters for the DMA of the High-Speed SAR ADC.

Remarks

This function must be called when the ADC is disabled.

Preconditions

The ADC channel and the Channel 0 to 6 using DMA are disabled.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Configure the DMA
void PLIB_ADCHS_DMASetup(   MY_ADCHS_INSTANCE,              // ADCHS module ID
                            ADCHS_DMA_BUFFER_LENGTH_8BYTES, // buffer length is 8 Bytes
                            0xA002,                         // Base address is 0xA002
                            ADCHS_DMA_COUNT_ENABLE,         // count is enabled
                            0xC400  );                      // Count base address is 0xC400

// Enable DMA
PLIB_ADCHS_DMAEnable(MY_ADCHS_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.
bufferLengthBytes	Length of DMA Buffer in number of bytes. Buffer is saved on RAM. The variable is of type ADCHS_DMA_BUFFER_LENGTH.

baseAddress	Address of RAM, which holds the buffer.
countMode	Enable/ Disable the DMA feature to keep count of number of converted data saved by DMA.
countBaseAddress	Address of RAM, which holds the counts.

Function

```
void PLIB_ADCHS_DMASetup
(
    ADCHS_MODULE_ID index,                  // ADCHS module ID
    ADCHS_DMA_BUFFER_LENGTH bufferLengthBytes,    // Buffer length
uint32_t baseAddress,                   // Base address for data
    ADCHS_DMA_COUNT countMode,              // Enable/ Disable count
uint32_t countBaseAddress               // Base address for count
)
```

PLIB_ADCHS_DMASourceRemove Function

Disables the DMA for the specified Channel 0 to 6.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_DMASourceRemove(ADCHS_MODULE_ID index, ADCHS_CHANNEL_ID channelID);
```

Returns

- true - The function successfully removed the DMA source
- false - The function could not remove the DMA source, as selected Channel is 7, which does not implement this feature

Description

This function disables (turns OFF) the DMA for specified Channel 0 to 6. If Channel 7 is selected, this function returns error.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// DMA for Channel 1
if(!PLIB_ADCHS_DMASourceRemove( MY_ADCHS_INSTANCE, ADCHS_CHANNEL_1 ))
{
    // error
    while(1);
}
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.
channelID	Channel ID from 0 to 6.

Function

```
bool PLIB_ADCHS_DMASourceRemove
(
    ADCHS_MODULE_ID index,
    ADCHS_CHANNEL_ID channelID      // Channel ID 0 to 6
)
```

PLIB_ADCHS_DMASourceSelect Function

Enables the DMA for the specified Channel 0 to 6.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_DMASourceSelect(ADCHS_MODULE_ID index, ADCHS_CHANNEL_ID channelID);
```

Returns

- true - The function successfully selected the DMA source
- false - The function could not select the DMA source, as selected Channel is 7, which does not implement this feature

Description

This function enables (turns ON) the DMA for specified Channel 0 to 6. If selected Channel is 7, this function return error.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// DMA for Channel 1
if(!PLIB_ADCHS_DMASourceSelect( MY_ADCHS_INSTANCE, ADCHS_CHANNEL_1 ))
{
    // error
    while(1);
}
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.
channelID	Channel ID from 0 to 6.

Function

bool PLIB_ADCHS_DMASourceSelect

(

ADCHS_MODULE_ID index,

ADCHS_CHANNEL_ID channelID // Channel ID 0 to 6

)

h) Channel Related Functions

PLIB_ADCHS_ChannelAnalogFeatureDisable Function

Disables the analog circuit for channels of High-Speed SAR ADC.

File

plib_adchs.h

C

```
void PLIB_ADCHS_ChannelAnalogFeatureDisable(ADCHS_MODULE_ID index, ADCHS_CHANNEL_ID channelID);
```

Returns

None.

Description

This function disables (turns OFF) the analog circuit for channels. The analog circuit for unused channels can be disabled to reduce current consumption.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.
PLIB_ADCHS_ChannelAnalogFeatureDisable(MY_ADCHS_INSTANCE, ADCHS_CHANNEL_1);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.
channelID	ID of the required channel.

Function

void PLIB_ADCHS_ChannelAnalogFeatureDisable

(

ADCHS_MODULE_ID index,

ADCHS_CHANNEL_ID channelID

)

PLIB_ADCHS_ChannelAnalogFeatureEnable Function

Enables the analog circuit for High-Speed SAR ADC channels.

File

plib_adchs.h

C

```
void PLIB_ADCHS_ChannelAnalogFeatureEnable(ADCHS_MODULE_ID index, ADCHS_CHANNEL_ID channelID);
```

Returns

None.

Description

This function enables (turns ON) the analog circuit for channels. The analog circuit can be disabled (when not required) to reduce current consumption by the channel. Since, each channel has the feature to individually enable/disable the analog circuit, the unused channel's analog circuit can be disabled. When the analog circuit for a channel is enabled, it needs a minimum warm-up time before which the channel is ready to perform conversion. Once the channel analog feature (circuit) is enabled, its ready status can be check with PLIB_ADCHS_ChannelIsReady function.

Remarks

None.

Preconditions

The ADCHS module should be enabled before calling this function. The ADCHS module can be enabled by calling the PLIB_ADCHS_Enable function.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.
PLIB_ADCHS_ChannelAnalogFeatureEnable(MY_ADCHS_INSTANCE, ADCHS_CHANNEL_1);
```

```
// wait until the channel is ready
while(!PLIB_ADCHS_ChannelIsReady(MY_ADCHS_INSTANCE, ADCHS_CHANNEL_1));
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.
channelID	ID of the required channel.

Function

void PLIB_ADCHS_ChannelAnalogFeatureEnable
(
ADCHS_MODULE_ID index,
ADCHS_CHANNEL_ID channelID
)

PLIB_ADCHS_ChannelConfigurationGet Function

Used to get the configuration for the specified channel.

File

plib_adchs.h

C

```
uint32_t PLIB_ADCHS_ChannelConfigurationGet(ADCHS_MODULE_ID index, ADCHS_CHANNEL_ID channelID);
```

Returns

32-bit value of the configuration for ADCHS channel.

Description

This functions returns the configuration for the specified channel.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

uint32_t config;

config = PLIB_ADCHS_ChannelConfigurationGet(MY_ADCHS_INSTANCE, ADCHS_CHANNEL_1);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.
channelID	Channel ID.

Function

uint32_t PLIB_ADCHS_ChannelConfigurationGet
(
ADCHS_MODULE_ID index,
ADCHS_CHANNEL_ID channelID // Channel ID
)

PLIB_ADCHS_ChannelConfigurationSet Function

Used to set the configuration for the specified channel.

File

plib_adchs.h

C

```
void PLIB_ADCHS_ChannelConfigurationSet(ADCHS_MODULE_ID index, ADCHS_CHANNEL_ID channelID, uint32_t config);
```

Returns

None.

Description

This functions sets the configuration for the specified channel.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

uint32_t config = 0x12345678;

PLIB_ADCHS_ChannelConfigurationSet(MY_ADCHS_INSTANCE, ADCHS_CHANNEL_1, config);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.
channelID	Channel ID.
config	32-bit value for the configuration of channel.

Function

void PLIB_ADCHS_ChannelConfigurationSet
(
ADCHS_MODULE_ID index,
ADCHS_CHANNEL_ID channelID,
uint32_t config
)

PLIB_ADCHS_ChannelDigitalFeatureDisable Function

Disables the digital circuit for channels of High-Speed SAR ADC.

File

plib_adchs.h

C

```
void PLIB_ADCHS_ChannelDigitalFeatureDisable(ADCHS_MODULE_ID index, ADCHS_CHANNEL_ID channelID);
```

Returns

None.

Description

This function disables (turns OFF) the digital circuit for channels. The digital feature (circuit) of unused channels can be disabled to reduce current

consumption. The advantage of disabling the digital feature is that re-enabling the digital feature does not require any warm up time and the channel can be immediately used for conversion.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.
PLIB_ADCHS_ChannelDigitalFeatureDisable( MY_ADCHS_INSTANCE,
                                         ADCHS_CHANNEL_1 );
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.
channelID	ID of the required channel.

Function

void PLIB_ADCHS_ChannelDigitalFeatureDisable

(

ADCHS_MODULE_ID index,

ADCHS_CHANNEL_ID channelID

)

PLIB_ADCHS_ChannelDigitalFeatureEnable Function

Enables (turns ON) the digital circuit for channels.

File

plib_adchs.h

C

```
void PLIB_ADCHS_ChannelDigitalFeatureEnable(ADCHS_MODULE_ID index, ADCHS_CHANNEL_ID channelID);
```

Returns

None.

Description

This function enables (turns ON) the digital circuit for channels. Unlike enabling the analog feature, enabling the digital feature does not require any warm-up time.

Remarks

None.

Preconditions

The ADCHS module should be enabled before calling this function. The ADCHS module can be enabled by calling PLIB_ADCHS_Enable function. Also, for the channel to perform conversion, the analog features of the channel should be enabled using PLIB_ADCHS_ChannelAnalogFeatureEnable, prior to enabling the digital feature.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Enable analog feature for Channel 1
PLIB_ADCHS_ChannelAnalogFeatureEnable( MY_ADCHS_INSTANCE,
                                       ADCHS_CHANNEL_1 );

// wait until channel is ready
while(!PLIB_ADCHS_ChannelIsReady( MY_ADCHS_INSTANCE,
                                  ADCHS_CHANNEL_1 ));
```

```
// Enable the digital Channel 1
PLIB_ADCHS_ChannelDigitalFeatureEnable( MY_ADCHS_INSTANCE,
                                        ADCHS_CHANNEL_1 );
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.
channelID	ID of the required channel.

Function

void PLIB_ADCHS_ChannelDigitalFeatureEnable

(

ADCHS_MODULE_ID index,

ADCHS_CHANNEL_ID channelID

)

PLIB_ADCHS_ChannelIsReady Function

Returns the state of the channel.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_ChannelIsReady(ADCHS_MODULE_ID index, ADCHS_CHANNEL_ID channelID);
```

Returns

- true - Channel is ready after warm-up time has elapsed
- false - Channel is not ready

Description

This function returns the state, indicating whether the channel is awake and ready after the warm-up time is complete. When a analog feature (circuit) of a channel is enabled, there is a warm-up time required before the channel is ready and can be used for conversion. The ready state of the channel can be acquired using this function.

Remarks

None.

Preconditions

The analog feature for the channel should be enabled using the PLIB_ADCHS_ChannelAnalogFeatureEnable function. Also, the ADCHS module should be enabled before calling this function.

Example

```
// Enable the analog feature for Channel 1
PLIB_ADCHS_ChannelAnalogFeatureEnable(MY_ADCHS_INSTANCE, ADCHS_CHANNEL_1);

// wait until the channel is ready
while(!PLIB_ADCHS_ChannelIsReady(MY_ADCHS_INSTANCE, ADCHS_CHANNEL_1));
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured
channelID	ID of the required channel

Function

bool PLIB_ADCHS_ChannelIsReady

(

ADCHS_MODULE_ID index,

ADCHS_CHANNEL_ID channelID

)

PLIB_ADCHS_ChannelIsReadyInterruptDisable Function

Disables the Channel ready interrupt for the specified channel.

File

plib_adchs.h

C

```
void PLIB_ADCHS_ChannelIsReadyInterruptDisable(ADCHS_MODULE_ID index, ADCHS_CHANNEL_ID channelID);
```

Returns

None.

Description

This function disables (turns OFF) the channel ready interrupt for the specified channel.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Disable wakeup interrupt for Channel 1
PLIB_ADCHS_ChannelIsReadyInterruptDisable( MY_ADCHS_INSTANCE, ADCHS_CHANNEL_1 );
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.
channelID	Channel ID.

Function

void PLIB_ADCHS_ChannelIsReadyInterruptDisable

(

ADCHS_MODULE_ID index,

ADCHS_CHANNEL_ID channelID // channel ID

)

PLIB_ADCHS_ChannelIsReadyInterruptEnable Function

Enables the Channel ready interrupt for the specified channel.

File

plib_adchs.h

C

```
void PLIB_ADCHS_ChannelIsReadyInterruptEnable(ADCHS_MODULE_ID index, ADCHS_CHANNEL_ID channelID);
```

Returns

None.

Description

This function enables (turns ON) the channel ready interrupt for the specified channel. The interrupt is generated when the channel is ready after wake-up (following warm-up time).

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Enable wakeup interrupt for Channel 1
PLIB_ADCHS_ChannelIsReadyInterruptEnable( MY_ADCHS_INSTANCE, ADCHS_CHANNEL_1 );
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.
channelID	Channel ID.

Function

void PLIB_ADCHS_ChannelIsReadyInterruptEnable

(

ADCHS_MODULE_ID index,

ADCHS_CHANNEL_ID channelID // channel ID

)

PLIB_ADCHS_ChannelSetup Function

Configures the High-Speed SAR ADC channels.

File

plib_adchs.h

C

```
void PLIB_ADCHS_ChannelSetup(ADCHS_MODULE_ID index, ADCHS_CHANNEL_ID channelID, ADCHS_DATA_RESOLUTION res,
uint8_t channelClockDivider, uint16_t sampleTimeCount, ADCHS_EARLY_INTERRUPT_PRIOR_CLOCK earlyInterruptClk);
```

Returns

None.

Description

This function configures all ADC parameters that are common to the specified ADC Channel 0 to 7.

This configuration must occur prior to enabling the ADC, and therefore, must be called when the ADC is disabled. Also, this configuration must occur prior to enabling the digital circuit and analog bias circuit for the specified ADC Channel 0 to 7.

Remarks

This function must be called when the ADC is disabled.

Preconditions

The channel is disabled when calling this function.

Example

```
bool status = false;

// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Configure the ADC
PLIB_ADCHS_ChannelSetup( MY_ADCHS_INSTANCE,
        ADCHS_CHANNEL_1,                        // channel - 1
        ADCHS_DATA_RESOLUTION_12BIT,            // resolution is set to 12bits
        1,                                      // channel clock divider bit is, TAD =  2 * TQ
        1,                                      // Sample time is 3 * TAD
        ADCHS_EARLY_INTERRUPT_PRIOR_CLOCK_1);   // Interrupt, 1 clock early

status = PLIB_ADCHS_ChannelTriggerSampleSelect( MY_ADCHS_INSTANCE,
```

```
        ADCHS_CHANNEL_1,                        // channel - 1
        ADCHS_CHANNEL_SYNC_SAMPLING);           // Synchronous sampling selected

if( false == status)
{
    // error has occurred
    while(1);
}
// Enable the ADC
PLIB_ADCHS_Enable(MY_ADCHS_INSTANCE);

// Wait until the reference voltage is ready
while(!PLIB_ADCHS_VREFIsReady(MY_ADCHS_INSTANCE));

//Check if there is a fault in reference voltage
if(PLIB_ADCHS_VREFFaultHasOccurred(MY_ADCHS_INSTANCE))
{
    // process fault accordingly
    while(1);
}

// Enable the analog circuit
PLIB_ADCHS_ChannelAnalogFeatureEnable(MY_ADCHS_INSTANCE, ADCHS_CHANNEL_1);

// Wait until the channel wakes up after warm-up
while(!PLIB_ADCHS_ChannelIsReady(MY_ADCHS_INSTANCE, ADCHS_CHANNEL_1));

// Enable the digital circuit
PLIB_ADCHS_ChannelDigitalFeatureEnable(MY_ADCHS_INSTANCE, ADCHS_CHANNEL_1);

// ADC will begin conversion now, after a valid trigger
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.
channelID	Channel ID of the required ADC channel.
res	Sets the output data resolution.
channelClockDivider	Channel Clock source divider. Values range from 1 to 127. This divider determines the channel clock (clock frequency at which the channel 0 to 7 is running). The frequency of
channel clock, as per following equation	Channel clock frequency = (control clock frequency)/(channelClockDivider * 2). Please note that value of "0" for channelClockDivider is not allowed. The minimum value of channelClockDivider is "1", which also means that the highest channel clock frequency is half of control clock frequency.
sampleTimeCount	Sets the sample time for ADC channel, 0 to 7. Values range from
0 to 1023. The sample time is given by the equation	Sample time = ((1/Channel clock frequency) * (sampleTimeCount + 2)).
earlyInterruptClk	Sets the number of channel clocks prior to the availability of actual data that the early interrupt is generated. This variable if of type ADCHS_EARLY_INTERRUPT_PRIOR_CLOCK. The selection of this parameter is dependent on the resolution of output data.

Function

```
void PLIB_ADCHS_ChannelSetup
(
    ADCHS_MODULE_ID index,
    ADCHS_CHANNEL_ID channelID,                 // channel ID 0 to 7
    ADCHS_DATA_RESOLUTION res,                  // Output data resolution
uint8_t channelClockDivider,                    // Clock divider
uint16_t sampleTimeCount,                       // Sample time
    ADCHS_EARLY_INTERRUPT_PRIOR_CLOCK earlyInterruptClk // early interrupt clock setting
)
```

PLIB_ADCHS_ChannelInputSelect Function

Selects the analog input for Channel 0 to 6.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_ChannelInputSelect(ADCHS_MODULE_ID index, ADCHS_CHANNEL_ID channelID, ADCHS_CHANNEL_INP_SEL
sel);
```

Returns

- true - The function successfully selected the analog input for the channel
- false - The function could not select the input, as selected channel is 7, which does not implement this feature. Otherwise, the selected analog input is not available for the selected channel.

Description

Selects the analog input for Channel 0 to 6. The inputs for Channel 0 to 6 can be changed between different inputs. This feature is not available for Channel 7; therefore, calling this function for Channel 7 will result in an error. Also, the input selected should match the ones available for the selected channel. Selecting an input which is not available for the channel will return an error.

Remarks

None.

Preconditions

None.

Example

```
bool status = false;

// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Set Channel-0 to use the first input.
status = PLIB_ADCHS_ChannelInputSelect
                    (
                        MY_ADCHS_INSTANCE,
                        ADCHS_CHANNEL_0,
                        ADCHS_CHANNEL_0_DEFAULT_INP_AN0
                    );

if(false == status)
{
    // error
    while(1);
}
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.
channelID	Channel ID.
sel	Selection of inputs of type ADCHS_CHANNEL_INP_SEL.

Function

bool PLIB_ADCHS_ChannelInputSelect

(

ADCHS_MODULE_ID index,

ADCHS_CHANNEL_ID channelID,

ADCHS_CHANNEL_INP_SEL sel

)

i) FIFO Functions

PLIB_ADCHS_FIFODataCountGet Function

Returns the number of data to be read from FIFO.

File

plib_adchs.h

C

```
uint8_t PLIB_ADCHS_FIFODataCountGet(ADCHS_MODULE_ID index);
```

Returns

The number of the data stored in the FIFO.

Description

This function returns the number of data which can be read from FIFO.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// variable to save data
uint32_t convData;

// Check, if FIFO has some data
while(!PLIB_ADCHS_FIFODataIsAvailable(MY_ADCHS_INSTANCE));

// Once data is available, check if the data belongs to channel ID -1
if(PLIB_ADCHS_FIFOSourceGet(MY_ADCHS_INSTANCE) == ADCHS_CHANNEL_1)
{
    // Continue reading FIFO, until the count is zero
    while(PLIB_ADCHS_FIFODataCountGet(MY_ADCHS_INSTANCE) != 0)
    {
        // Read from FIFO. For each read, the count is decremented
        convData = PLIB_ADCHS_FIFORead(MY_ADCHS_INSTANCE);
    }
}
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.

Function

uint8_t PLIB_ADCHS_FIFODataCountGet(ADCHS_MODULE_ID index)

PLIB_ADCHS_FIFODataIsAvailable Function

Used to determine if the FIFO has data ready.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_FIFODataIsAvailable(ADCHS_MODULE_ID index);
```

Returns

Boolean:

- true - If data is ready
- false - If data is not ready

Description

Used to determine if the ADCHS FIFO has data ready. A 'true' is returned when data is available, which can be fetched using PLIB_ADCHS_FIFORead.

Remarks

None.

Preconditions

None.

Example

```
if (PLIB_ADCHS_FIFODataIsAvailable(MY_ADCHS_INSTANCE)) {
            // fetch and process data
    }
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.

Function

bool PLIB_ADCHS_FIFODataIsAvailable(ADCHS_MODULE_ID index)

PLIB_ADCHS_FIFODataIsNegative Function

Returns the sign of data stored in FIFO.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_FIFODataIsNegative(ADCHS_MODULE_ID index);
```

Returns

Boolean:

- true - If sign is negative
- false - If sign is not negative

Description

This function returns the sign of data stored in the FIFO.

Remarks

None.

Preconditions

None.

Example

```
if (PLIB_ADCHS_FIFODataIsNegative(MY_ADCHS_INSTANCE)) {
            //process data
    }
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.

Function

bool PLIB_ADCHS_FIFODataIsNegative(ADCHS_MODULE_ID index)

PLIB_ADCHS_FIFODataReadyInterruptDisable Function

Disables the interrupt for FIFO.

File

plib_adchs.h

C

```
void PLIB_ADCHS_FIFODataReadyInterruptDisable(ADCHS_MODULE_ID index);
```

Returns

None.

Description

This function disables (turns OFF) the interrupt for FIFO.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Disable interrupt for FIFO
PLIB_ADCHS_FIFODataReadyInterruptDisable( MY_ADCHS_INSTANCE );
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.

Function

void PLIB_ADCHS_FIFODataReadyInterruptDisable(ADCHS_MODULE_ID index)

PLIB_ADCHS_FIFODataReadyInterruptEnable Function

Enables the interrupt for FIFO.

File

plib_adchs.h

C

```
void PLIB_ADCHS_FIFODataReadyInterruptEnable(ADCHS_MODULE_ID index);
```

Returns

None.

Description

This function enables (turns ON) the interrupt for FIFO. The interrupt is generated when the FIFO has data to be read.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Enable interrupt for FIFO
PLIB_ADCHS_FIFODataReadyInterruptEnable( MY_ADCHS_INSTANCE );
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.

Function

void PLIB_ADCHS_FIFODataReadyInterruptEnable(ADCHS_MODULE_ID index)

PLIB_ADCHS_FIFODisable Function

Disables the FIFO in the High-Speed SAR ADC.

File

plib_adchs.h

C

```
void PLIB_ADCHS_FIFODisable(ADCHS_MODULE_ID index);
```

Returns

None.

Description

This function disables (turns OFF) the FIFO.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Disable FIFO
PLIB_ADCHS_FIFODisable( MY_ADCHS_INSTANCE );
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.

Function

void PLIB_ADCHS_FIFODisable(ADCHS_MODULE_ID index)

PLIB_ADCHS_FIFOEnable Function

Enables the FIFO in the High-Speed SAR ADC

File

plib_adchs.h

C

```
void PLIB_ADCHS_FIFOEnable(ADCHS_MODULE_ID index);
```

Returns

None.

Description

This function enables (turns ON) the FIFO.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Enable FIFO
PLIB_ADCHS_FIFOEnable( MY_ADCHS_INSTANCE );
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.

Function

void PLIB_ADCHS_FIFOEnable(ADCHS_MODULE_ID index)

PLIB_ADCHS_FIFOErrorHasOccurred Function

Used to determine if the FIFO has encountered an overflow error.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_FIFOErrorHasOccurred(ADCHS_MODULE_ID index);
```

Returns

- true - An error has occurred
- false - No error occurred has in the FIFO

Description

This function can be used to determine if the ADCHS FIFO had a data, which was overwritten by the next round of a FIFO write (overflow error). A 'true' is returned when an overflow error has occurred.

Remarks

None.

Preconditions

None.

Example

```
if (!PLIB_ADCHS_FIFOErrorHasOccurred(MY_ADCHS_INSTANCE)) {
            // process data, if overflow error did not occur
    }
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.

Function

bool PLIB_ADCHS_FIFOErrorHasOccurred(ADCHS_MODULE_ID index)

PLIB_ADCHS_FIFORead Function

Used to fetch the data result from the FIFO.

File

plib_adchs.h

C

```
int32_t PLIB_ADCHS_FIFORead(ADCHS_MODULE_ID index);
```

Returns

A 32-bit result in the format specified by the ADC configuration for the module using the FIFO.

Description

This function is used to fetch data from the FIFO. The FIFO can only be assigned to a Class 1 ADC analog input.

Remarks

None.

Preconditions

The FIFO should have data ready to be read from it.

Example

```
int32_t myFIFOResult;

if (PLIB_ADCHS_FIFODataIsAvailable(MY_ADCHS_INSTANCE)) {
    // fetch data
    myDFLTRResult = PLIB_ADCHS_FIFORead(MY_ADCHS_INSTANCE);
    // process result
    ...
}
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.

Function

int32_t PLIB_ADCHS_FIFORead(ADCHS_MODULE_ID index)

PLIB_ADCHS_FIFOSourceGet Function

Returns the channel ID using the FIFO.

File

plib_adchs.h

C

```
ADCHS_CHANNEL_ID PLIB_ADCHS_FIFOSourceGet(ADCHS_MODULE_ID index);
```

Returns

The Channel ID of data type ADCHS_CHANNEL_ID.

Description

This function returns the channel ID of Channel 0 to 6, whose data is stored on the FIFO.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// variable to save data
uint32_t convData;

// Check, if FIFO has some data
while(!PLIB_ADCHS_FIFODataIsAvailable(MY_ADCHS_INSTANCE));

// Once data is available, check if the data belongs to channel ID -1
if(PLIB_ADCHS_FIFOSourceGet(MY_ADCHS_INSTANCE) == ADCHS_CHANNEL_1)
{
    // Continue reading FIFO, until the count is zero
    while(PLIB_ADCHS_FIFODataCountGet(MY_ADCHS_INSTANCE) != 0)
    {
        // Read from FIFO. For each read, the count is decremented
        convData = PLIB_ADCHS_FIFORead(MY_ADCHS_INSTANCE);
    }
}
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.

Function

ADCHS_CHANNEL_ID PLIB_ADCHS_FIFOSourceGet(ADCHS_MODULE_ID index)

PLIB_ADCHS_FIFOSourceSelect Function

Sets the Channel 0 to 6 using the FIFO.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_FIFOSourceSelect(ADCHS_MODULE_ID index, ADCHS_CHANNEL_ID channelID);
```

Returns

- true - The function successfully selected the FIFO source
- false - The function could not select the FIFO source, as selected Channel is 7, which does not implement this feature

Description

This function sets the Channel 0 to 6 ID, which would be storing data into FIFO. If this function is called with Channel ID as 7, the function will return an error.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Set Channel 1 to be storing data into FIFO
if(!PLIB_ADCHS_FIFOSourceSelect( MY_ADCHS_INSTANCE, ADCHS_CHANNEL_1 ))
{
    // error has occurred
    while(1);
}
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.
channelID	Channel ID from 0 to 6.

Function

bool PLIB_ADCHS_FIFOSourceSelect
(
ADCHS_MODULE_ID index,
ADCHS_CHANNEL_ID channelID // Channel ID from 0 to 6
)

j) Interrupt Functions

PLIB_ADCHS_EarlyInterruptDisable Function

Disables the early interrupt for the ADCHS.

File

plib_adchs.h

C

```
void PLIB_ADCHS_EarlyInterruptDisable(ADCHS_MODULE_ID index);
```

Returns

None.

Description

This function Disables (turns OFF) the early interrupt for the entire ADCHS. Since early interrupt function is disabled, setting early interrupt enable for individual analog input will not work.

Further selection (enabling/disabling) of interrupt feature for individual analog input is possible through the functions PLIB_ADCHS_AnalogInputDataReadyInterruptEnable or PLIB_ADCHS_AnalogInputDataReadyInterruptDisable.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Disable early interrupt
PLIB_ADCHS_EarlyInterruptDisable( MY_ADCHS_INSTANCE );
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.

Function

void PLIB_ADCHS_EarlyInterruptDisable(ADCHS_MODULE_ID index)

PLIB_ADCHS_EarlyInterruptEnable Function

Enables the early interrupt for the ADCHS.

File

plib_adchs.h

C

```
void PLIB_ADCHS_EarlyInterruptEnable(ADCHS_MODULE_ID index);
```

Returns

None.

Description

This function enables (turns ON) the early interrupt for the entire ADCHS. Further selection (enabling/disabling) of early interrupt feature for individual analog input through the functions PLIB_ADCHS_AnalogInputEarlyInterruptEnable or PLIB_ADCHS_AnalogInputEarlyInterruptDisable.

The interrupt is generated at a set number of clock prior to conversion complete. The number of clock for early interrupt is set using the "configure" function for specific channel.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Enable early interrupt
PLIB_ADCHS_EarlyInterruptEnable( MY_ADCHS_INSTANCE );

// Now, enable the early interrupt for each analog inputs
PLIB_ADCHS_AnalogInputEarlyInterruptEnable(MY_ADCHS_INSTANCE, ADCHS_AN10);
PLIB_ADCHS_AnalogInputEarlyInterruptEnable(MY_ADCHS_INSTANCE, ADCHS_AN11);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.

Function

void PLIB_ADCHS_EarlyInterruptEnable(ADCHS_MODULE_ID index)

k) Turbo Mode Functions

PLIB_ADCHS_TurboModeChannelSelect Function

Configures the channels for Turbo mode.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_TurboModeChannelSelect(ADCHS_MODULE_ID index, ADCHS_CHANNEL_ID masterChannelID,
ADCHS_CHANNEL_ID slaveChannelID);
```

Returns

- true - The function successfully selected the channels for Turbo mode
- false - The function could not select the channels for Turbo mode for the following reasons:
  - Both the master and slave channels are the same
  - Channel 7 was used to set up Turbo mode (either as a master or a slave or both)

Description

While running the High-Speed SAR ADC in Turbo mode, two channels (from 0 to 6) are interleaved to get higher throughput. This function configures the two channels. This configuration must occur prior to enabling the ADC and prior to enabling Turbo mode. Only valid channels from 0 to 6 can be made as master or slave. If Channel 7 is used, the function will return error

Remarks

This function must be called when the ADC is disabled.

Preconditions

The channels are disabled and Turbo mode is disabled when calling this function.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Configure the ADC with Channel 0 as master and Channel 1 as slave
if(!PLIB_ADCHS_TurboModeChannelSelect( MY_ADCHS_INSTANCE, ADCHS_CHANNEL_0, ADCHS_CHANNEL_1))
{
    // Error occurred while setting up Turbo mode
    while(1);
}

// Enable Turbo mode
PLIB_ADCHS_TurboModeEnable(MY_ADCHS_INSTANCE);

// Check for Turbo mode error
if(PLIB_ADCHS_TurboModeErrorHasOccurred(MY_ADCHS_INSTANCE);
{
    // Configuration of Turbo mode has caused an error
    // Process error here or reconfigure Turbo Mode
    while(1);
}

// Enable the ADC
PLIB_ADCHS_Enable(MY_ADCHS_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.
masterChannelID	Channel ID of master channel. Valid channel IDs are from 0 to 6.
slaveChannelID	Channel ID of slave channel. Valid channel IDs are from 0 to 6.

Function

bool PLIB_ADCHS_TurboModeChannelSelect
(
ADCHS_MODULE_ID index,
ADCHS_CHANNEL_ID masterChannelID,
ADCHS_CHANNEL_ID slaveChannelID
)

PLIB_ADCHS_TurboModeDisable Function

Disables Turbo mode for High-Speed SAR ADC module.

File

plib_adchs.h

C

```
void PLIB_ADCHS_TurboModeDisable(ADCHS_MODULE_ID index);
```

Returns

None.

Description

This function disables (turns OFF) Turbo mode on the High-Speed SAR ADC module.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.
PLIB_ADCHS_TurboModeDisable(MY_ADCHS_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.

Function

void PLIB_ADCHS_TurboModeDisable(ADCHS_MODULE_ID index)

PLIB_ADCHS_TurboModeEnable Function

Enables Turbo mode for the High-Speed SAR ADC module.

File

plib_adchs.h

C

```
void PLIB_ADCHS_TurboModeEnable(ADCHS_MODULE_ID index);
```

Returns

None.

Description

This function enables (turns ON) Turbo mode on the High-Speed SAR ADC module.

Remarks

None.

Preconditions

The master and slave channels must be selected to work in Turbo mode, before enabling Turbo mode.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.
PLIB_ADCHS_TurboModeEnable(MY_ADCHS_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.

Function

void PLIB_ADCHS_TurboModeEnable(ADCHS_MODULE_ID index)

PLIB_ADCHS_TurboModeErrorHasOccurred Function

Returns the error state of Turbo mode.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_TurboModeErrorHasOccurred(ADCHS_MODULE_ID index);
```

Returns

- true - Turbo mode error has occurred
- false - Turbo mode error has not occurred

Description

Returns the state of error bit for Turbo mode. When Turbo mode is enabled, some parameters of master and slave channels should be same. They are ADC channel clock divisor, ADC resolution, and Sampling time. Also, both master and slave channels should use synchronous sampling. If any or all these conditions are not met, the Turbo mode error will be set, which can be read by calling

Remarks

None.

Preconditions

None.

Example

```
bool errorState = PLIB_ADCHS_TurboModeErrorHasOccurred(MY_ADCHS_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance.

Function

bool PLIB_ADCHS_TurboModeErrorHasOccurred(ADCHS_MODULE_ID index)

l) Voltage Reference Functions

PLIB_ADCHS_VREFFaultHasOccurred Function

Returns the state of VREF fault.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_VREFFaultHasOccurred(ADCHS_MODULE_ID index);
```

Returns

- true - A VREF Fault has occurred
- false - No Fault occurred on VREF

Description

This function returns the Fault state for VREF, Band Gap, or AVDD BOR.

Remarks

None.

Preconditions

The ADCHS module should be enabled before calling this function. The ADCHS module can be enabled by calling the PLIB_ADCHS_Enable function.

Example

```
bool vrefFaultState = PLIB_ADCHS_VREFFaultHasOccurred(MY_ADCHS_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance

Function

bool PLIB_ADCHS_VREFFaultHasOccurred(ADCHS_MODULE_ID index)

PLIB_ADCHS_VREFFaultInterruptDisable Function

Disables the VREF Fault interrupt.

File

plib_adchs.h

C

```
void PLIB_ADCHS_VREFFaultInterruptDisable(ADCHS_MODULE_ID index);
```

Returns

None.

Description

This function disables (turns OFF) the VREF Fault interrupt.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Disable VREF fault interrupt
PLIB_ADCHS_VREFFaultInterruptDisable( MY_ADCHS_INSTANCE );
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.

Function

void PLIB_ADCHS_VREFFaultInterruptDisable(ADCHS_MODULE_ID index)

PLIB_ADCHS_VREFFaultInterruptEnable Function

Enables the VREF fault interrupt.

File

plib_adchs.h

C

```
void PLIB_ADCHS_VREFFaultInterruptEnable(ADCHS_MODULE_ID index);
```

Returns

None.

Description

This function enables (turns ON) the VREF fault interrupt. The interrupt is generated when a fault is encountered with VREF (mostly by BOR of the analog supply).

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Enable VREF fault interrupt
PLIB_ADCHS_VREFFaultInterruptEnable( MY_ADCHS_INSTANCE );
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.

Function

void PLIB_ADCHS_VREFFaultInterruptEnable(ADCHS_MODULE_ID index)

PLIB_ADCHS_VREFIsReady Function

Returns the state of VREF.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_VREFIsReady(ADCHS_MODULE_ID index);
```

Returns

- true - Both band gap reference voltage and ADC VREF are ready
- false - Either band gap reference voltage or ADC VREF is not ready

Description

This function returns the VREF state.

Remarks

None.

Preconditions

The ADCHS module should be enabled before checking for VREF status. The ADCHS module can be enabled by calling the PLIB_ADCHS_Enable function.

Example

```
bool vrefState = PLIB_ADCHS_VREFIsReady(MY_ADCHS_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance

Function

bool PLIB_ADCHS_VREFIsReady(ADCHS_MODULE_ID index)

PLIB_ADCHS_VREFReadyInterruptDisable Function

Disables the VREF ready interrupt.

File

plib_adchs.h

C

```
void PLIB_ADCHS_VREFReadyInterruptDisable(ADCHS_MODULE_ID index);
```

Returns

None.

Description

This function disables (turns OFF) the VREF ready interrupt.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Disable VREF interrupt
PLIB_ADCHS_VREFReadyInterruptDisable( MY_ADCHS_INSTANCE );
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.

Function

void PLIB_ADCHS_VREFReadyInterruptDisable(ADCHS_MODULE_ID index)

PLIB_ADCHS_VREFReadyInterruptEnable Function

Enables the VREF ready interrupt.

File

plib_adchs.h

C

```
void PLIB_ADCHS_VREFReadyInterruptEnable(ADCHS_MODULE_ID index);
```

Returns

None.

Description

This function enables (turns ON) the VREF ready interrupt. The interrupt is generated when the Band gap voltage/VREF is ready to be used by the ADCHS instance.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCHS_INSTANCE, is the ADCHS instance selected for use by the
// application developer.

// Enable VREF ready interrupt
PLIB_ADCHS_VREFReadyInterruptEnable( MY_ADCHS_INSTANCE );
```

Parameters

Parameters	Description
index	Identifier for the ADCHS instance to be configured.

Function

void PLIB_ADCHS_VREFReadyInterruptEnable(ADCHS_MODULE_ID index)

m) Feature Existence Functions

PLIB_ADCHS_ExistsAnalogInputCheck Function

Identifies whether the System Configuration feature exists on the ADCHS module.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_ExistsAnalogInputCheck(ADCHS_MODULE_ID index);
```

Returns

Existence of the System Configuration feature:

- true - The System Configuration feature is supported on the device
- false - The System Configuration feature is not supported on the device

Description

This function identifies whether the System Configuration feature is available on the ADCHS module. When this function returns true, this function is supported on the device:

- PLIB_ADCHS_AnalogInputIsAvailable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.

Function

PLIB_ADCHS_ExistsAnalogInputCheck(ADCHS_MODULE_ID index)

PLIB_ADCHS_ExistsAnalogInputModeControl Function

Identifies whether the analog input mode control exists on the ADCHS module.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_ExistsAnalogInputModeControl(ADCHS_MODULE_ID index);
```

Returns

Existence of the input mode control feature:

- true - The analog input mode control feature is supported on the device
- false - The analog input mode control feature is not supported on the device

Description

This function identifies whether the analog input mode control feature is available on the ADCHS module. When this function returns true, these functions are supported on the device:

- PLIB_ADCHS_AnalogInputModeSelect
- PLIB_ADCHS_AnalogInputModeGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.

Function

PLIB_ADCHS_ExistsAnalogInputModeControl(ADCHS_MODULE_ID index)

PLIB_ADCHS_ExistsAnalogInputScan Function

Identifies whether the Analog input Scan exists on the ADCHS module.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_ExistsAnalogInputScan(ADCHS_MODULE_ID index);
```

Returns

Existence of the Scan feature:

- true - The Analog Input Scan feature is supported on the device
- false - The Analog Input Scan feature is not supported on the device

Description

This function identifies whether the Analog Input Scan feature is available on the ADCHS module. When this function returns true, these functions are supported on the device:

- PLIB_ADCHS_AnalogInputScanIsComplete
- PLIB_ADCHS_AnalogInputScanSelect
- PLIB_ADCHS_AnalogInputScanRemove
- PLIB_ADCHS_AnalogInputScanIsSelected
- PLIB_ADCHS_AnalogInputScanSetup
- PLIB_ADCHS_ScanCompleteInterruptEnable
- PLIB_ADCHS_ScanCompleteInterruptDisable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.

Function

PLIB_ADCHS_ExistsAnalogInputScan(ADCHS_MODULE_ID index)

PLIB_ADCHS_ExistsChannelAnalogControl Function

Identifies whether the Channel Analog control exists on the ADCHS module.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_ExistsChannelAnalogControl(ADCHS_MODULE_ID index);
```

Returns

Existence of the Channel Analog control feature:

- true - The Channel Analog control feature is supported on the device
- false - The Channel Analog control feature is not supported on the device

Description

This function identifies whether the Channel Analog control feature is available on the ADCHS module. When this function returns true, these functions are supported on the device:

- PLIB_ADCHS_ChannelAnalogFeatureEnable
- PLIB_ADCHS_ChannelAnalogFeatureDisable
- PLIB_ADCHS_ChannelIsReady
- PLIB_ADCHS_ChannelIsReadyInterruptEnable
- PLIB_ADCHS_ChannelIsReadyInterruptDisable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.

Function

PLIB_ADCHS_ExistsChannelAnalogControl(ADCHS_MODULE_ID index)

PLIB_ADCHS_ExistsChannelConfiguration Function

Identifies whether the Channel Configuration feature exists on the ADCHS module.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_ExistsChannelConfiguration(ADCHS_MODULE_ID index);
```

Returns

Existence of the Channel Configuration feature:

- true - The Channel Configuration feature is supported on the device
- false - The Channel Configuration feature is not supported on the device

Description

This function identifies whether the Channel Configuration feature is available on the ADCHS module. When this function returns true, these functions are supported on the device:

- PLIB_ADCHS_ChannelConfigurationGet
- PLIB_ADCHS_ChannelConfigurationSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.

Function

PLIB_ADCHS_ExistsChannelConfiguration(ADCHS_MODULE_ID index)

PLIB_ADCHS_ExistsChannelDigitalControl Function

Identifies whether the Channel Digital control exists on the ADCHS module.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_ExistsChannelDigitalControl(ADCHS_MODULE_ID index);
```

Returns

Existence of the Channel Digital control feature:

- true - The Channel Digital control feature is supported on the device
- false - The Channel Digital control feature is not supported on the device

Description

This function identifies whether the Channel Digital control feature is available on the ADCHS module. When this function returns true, these functions are supported on the device:

- PLIB_ADCHS_ChannelDigitalFeatureEnable
- PLIB_ADCHS_ChannelDigitalFeatureDisable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.

Function

PLIB_ADCHS_ExistsChannelDigitalControl(ADCHS_MODULE_ID index)

PLIB_ADCHS_ExistsChannelInputSelectControl Function

Identifies whether the Channel 0 to 6 Input select feature exists on the ADCHS module.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_ExistsChannelInputSelectControl(ADCHS_MODULE_ID index);
```

Returns

Existence of the Channel 0 to 6 Input feature:

- true - The Channel 0 to 6 Input Select feature is supported on the device
- false - The Channel 0 to 6 Input Select feature is not supported on the device

Description

This function identifies whether the Channel 0 to 6 Input select feature is available on the ADCHS module. When this function returns true, this function is supported on the device:

- PLIB_ADCHS_ChannelInputSelect

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ADCHS_ExistsChannelInputSelectControl(ADCHS_MODULE_ID index)

PLIB_ADCHS_ExistsConfiguration Function

Identifies whether the Configuration feature exists on the ADCHS module.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_ExistsConfiguration(ADCHS_MODULE_ID index);
```

Returns

Existence of the Configuration feature:

- true - The Configuration feature is supported on the device
- false - The Configuration feature is not supported on the device

Description

This function identifies whether the Configuration feature is available on the ADCHS module. When this function returns true, these functions are supported on the device:

- PLIB_ADCHS_Setup
- PLIB_ADCHS_ChannelSetup

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.

Function

PLIB_ADCHS_ExistsConfiguration(ADCHS_MODULE_ID index)

PLIB_ADCHS_ExistsConversionResults Function

Identifies whether the Conversion Results feature exists on the ADCHS module.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_ExistsConversionResults(ADCHS_MODULE_ID index);
```

Returns

Existence of the ConversionResults feature:

- true - The ConversionResults feature is supported on the device
- false - The ConversionResults feature is not supported on the device

Description

This function identifies whether the Conversion Results feature is available on the ADCHS module. When this function returns true, these functions are supported on the device:

- PLIB_ADCHS_AnalogInputDataReadyInterruptEnable
- PLIB_ADCHS_AnalogInputDataReadyInterruptDisable
- PLIB_ADCHS_AnalogInputDataIsReady
- PLIB_ADCHS_AnalogInputResultGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.

Function

PLIB_ADCHS_ExistsConversionResults(ADCHS_MODULE_ID index)

PLIB_ADCHS_ExistsCVD Function

Identifies whether the CVD exists on the ADCHS module.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_ExistsCVD(ADCHS_MODULE_ID index);
```

Returns

Existence of the CVD feature:

- true - The CVD feature is supported on the device
- false - The CVD feature is not supported on the device

Description

This function identifies whether the CVD feature is available on the ADCHS module. When this function returns true, these functions are supported on the device:

- PLIB_ADCHS_CVDEnable
- PLIB_ADCHS_CVDDisable
- PLIB_ADCHS_CVDSetup
- PLIB_ADCHS_CVDResultGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.

Function

PLIB_ADCHS_ExistsCVD(ADCHS_MODULE_ID index)

PLIB_ADCHS_ExistsDigitalComparator Function

Identifies whether the Digital Comparator feature exists on the ADCHS module .

File

plib_adchs.h

C

```
bool PLIB_ADCHS_ExistsDigitalComparator(ADCHS_MODULE_ID index);
```

Returns

Existence of the Digital Comparator feature:

- true - The Digital Comparator feature is supported on the device
- false - The Digital Comparator feature is not supported on the device

Description

This function identifies whether the Digital Comparator feature is available on the ADCHS module. When this function returns true, these functions are supported on the device:

- PLIB_ADCHS_DigitalComparatorAnalogInputSelect
- PLIB_ADCHS_DigitalComparatorAnalogInputGet
- PLIB_ADCHS_DigitalComparatorEnable
- PLIB_ADCHS_DigitalComparatorDisable
- PLIB_ADCHS_DigitalComparatorInterruptEnable
- PLIB_ADCHS_DigitalComparatorInterruptDisable
- PLIB_ADCHS_DigitalComparatorSetup
- PLIB_ADCHS_DigitalComparatorEventHasOccurred
- PLIB_ADCHS_DigitalComparatorLimitSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.

Function

PLIB_ADCHS_ExistsDigitalComparator(ADCHS_MODULE_ID index)

PLIB_ADCHS_ExistsDigitalFilter Function

Identifies whether the Digital Filter feature exists on the ADCHS module.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_ExistsDigitalFilter(ADCHS_MODULE_ID index);
```

Returns

Existence of the Digital Filter feature:

- true - The Digital Filter feature is supported on the device
- false - The Digital Filter feature is not supported on the device

Description

This function identifies whether the Digital Filter feature is available on the ADCHS module. When this function returns true, these functions are supported on the device:

- PLIB_ADCHS_DigitalFilterEnable
- PLIB_ADCHS_DigitalFilterDisable
- PLIB_ADCHS_DigitalFilterOversamplingModeSetup
- PLIB_ADCHS_DigitalFilterAveragingModeSetup
- PLIB_ADCHS_DigitalFilterOversamplingModeRatioSelect

- PLIB_ADCHS_DigitalFilterAveragingModeSampleCountSelect
- PLIB_ADCHS_DigitalFilterDataIsReady
- PLIB_ADCHS_DigitalFilterDataGet
- PLIB_ADCHS_DigitalFilterDataReadyInterruptEnable
- PLIB_ADCHS_DigitalFilterDataReadyInterruptDisable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.

Function

PLIB_ADCHS_ExistsDigitalFilter(ADCHS_MODULE_ID index)

PLIB_ADCHS_ExistsDMA Function

Identifies whether the DMA exists on the ADCHS module.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_ExistsDMA(ADCHS_MODULE_ID index);
```

Returns

Existence of the DMA feature:

- true - The DMA feature is supported on the device
- false - The DMA feature is not supported on the device

Description

This function identifies whether the DMA feature is available on the ADCHS module. When this function returns true, these functions are supported on the device:

- PLIB_ADCHS_DMAEnable
- PLIB_ADCHS_DMADisable
- PLIB_ADCHS_DMASetup
- PLIB_ADCHS_DMASourceSelect
- PLIB_ADCHS_DMASourceRemove
- PLIB_ADCHS_DMABuffer_A_InterruptEnable
- PLIB_ADCHS_DMABuffer_A_InterruptDisable
- PLIB_ADCHS_DMABuffer_B_InterruptEnable
- PLIB_ADCHS_DMABuffer_B_InterruptDisable
- PLIB_ADCHS_DMABuffer_A_IsFull
- PLIB_ADCHS_DMABuffer_B_IsFull
- PLIB_ADCHS_DMAOverflowErrorHasOccurred

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.

Function

PLIB_ADCHS_ExistsDMA(ADCHS_MODULE_ID index)

PLIB_ADCHS_ExistsEarlyInterruptControl Function

Identifies whether the Early Interrupt control exists on the ADCHS module.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_ExistsEarlyInterruptControl(ADCHS_MODULE_ID index);
```

Returns

Existence of the Early Interrupt control feature:

- true - The Early Interrupt control feature is supported on the device
- false - The Early Interrupt control feature is not supported on the device

Description

This function identifies whether the Early Interrupt control feature is available on the ADCHS module. When this function returns true, these functions are supported on the device:

- PLIB_ADCHS_EarlyInterruptEnable
- PLIB_ADCHS_EarlyInterruptDisable
- PLIB_ADCHS_AnalogInputEarlyInterruptEnable
- PLIB_ADCHS_AnalogInputEarlyInterruptDisable
- PLIB_ADCHS_AnalogInputEarlyInterruptIsReady

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.

Function

PLIB_ADCHS_ExistsEarlyInterruptControl(ADCHS_MODULE_ID index)

PLIB_ADCHS_ExistsEnableControl Function

Identifies whether the EnableControl feature exists on the ADCHS module

File

plib_adchs.h

C

```
bool PLIB_ADCHS_ExistsEnableControl(ADCHS_MODULE_ID index);
```

Returns

Existence of the EnableControl feature:

- true - The EnableControl feature is supported on the device
- false - The EnableControl feature is not supported on the device

Description

This function identifies whether the EnableControl feature is available on the ADCHS module. When this function returns true, these functions are supported on the device:

- PLIB_ADCHS_Enable
- PLIB_ADCHS_Disable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.

Function

PLIB_ADCHS_ExistsEnableControl(ADCHS_MODULE_ID index)

PLIB_ADCHS_ExistsExternalConversionRequestControl Function

Identifies whether the External Convert feature exists on the ADCHS module.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_ExistsExternalConversionRequestControl(ADCHS_MODULE_ID index);
```

Returns

Existence of the External Convert feature:

- true - The External Convert feature is supported on the device
- false - The External Convert feature is not supported on the device

Description

This function identifies whether the External Convert feature is available on the ADCHS module. When this function returns true, these functions are supported on the device:

- PLIB_ADCHS_ExternalConversionRequestEnable
- PLIB_ADCHS_ExternalConversionRequestDisable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.

Function

PLIB_ADCHS_ExistsExternalConversionRequestControl(ADCHS_MODULE_ID index)

PLIB_ADCHS_ExistsFIFO Function

Identifies whether the FIFO exists on the ADCHS module.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_ExistsFIFO(ADCHS_MODULE_ID index);
```

Returns

Existence of the FIFO feature:

- true - The FIFO feature is supported on the device

- false - The FIFO feature is not supported on the device

Description

This function identifies whether the FIFO feature is available on the ADCHS module. When this function returns true, these functions are supported on the device:

- PLIB_ADCHS_FIFORead
- PLIB_ADCHS_FIFODataIsAvailable
- PLIB_ADCHS_FIFODataReadyInterruptEnable
- PLIB_ADCHS_FIFODataReadyInterruptDisable
- PLIB_ADCHS_FIFOEnable
- PLIB_ADCHS_FIFODisable
- PLIB_ADCHS_FIFOSourceSelect
- PLIB_ADCHS_FIFODataCountGet
- PLIB_ADCHS_FIFOSourceGet
- PLIB_ADCHS_FIFOErrorHasOccurred
- PLIB_ADCHS_FIFODataIsNegative

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.

Function

PLIB_ADCHS_ExistsFIFO(ADCHS_MODULE_ID index)

PLIB_ADCHS_ExistsManualControl Function

Identifies whether the Manual control exists on the ADCHS module.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_ExistsManualControl(ADCHS_MODULE_ID index);
```

Returns

Existence of the Manual control feature:

- true - The Manual control feature is supported on the device
- false - The Manual control feature is not supported on the device

Description

This function identifies whether the Manual control feature is available on the ADCHS module. When this function returns true, these functions are supported on the device:

- PLIB_ADCHS_SoftwareSamplingStart
- PLIB_ADCHS_SoftwareSamplingStop
- PLIB_ADCHS_SoftwareConversionStart
- PLIB_ADCHS_SoftwareConversionInputSelect

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.

Function

PLIB_ADCHS_ExistsManualControl(ADCHS_MODULE_ID index)

PLIB_ADCHS_ExistsTriggerControl Function

Identifies whether the Trigger control exists on the ADCHS module.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_ExistsTriggerControl(ADCHS_MODULE_ID index);
```

Returns

Existence of the Trigger control feature:

- true - The Trigger control feature is supported on the device
- false - The Trigger control feature is not supported on the device

Description

This function identifies whether the Trigger control feature is available on the ADCHS module. When this function returns true, these functions are supported on the device:

- PLIB_ADCHS_AnalogInputLevelTriggerSet
- PLIB_ADCHS_AnalogInputEdgeTriggerSet
- PLIB_ADCHS_AnalogInputTriggerSourceSelect
- PLIB_ADCHS_GlobalSoftwareTriggerEnable
- PLIB_ADCHS_GlobalLevelSoftwareTriggerEnable
- PLIB_ADCHS_GlobalLevelSoftwareTriggerDisable
- PLIB_ADCHS_TriggerSuspendEnable
- PLIB_ADCHS_TriggerSuspendDisable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.

Function

PLIB_ADCHS_ExistsTriggerControl(ADCHS_MODULE_ID index)

PLIB_ADCHS_ExistsTriggerSampleControl Function

Identifies whether the Trigger Sample control feature exists on the ADCHS module.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_ExistsTriggerSampleControl(ADCHS_MODULE_ID index);
```

Returns

Existence of the Trigger Sample control feature:

- true - The Trigger Sample control feature is supported on the device

- false - The Trigger Sample control feature is not supported on the device

Description

This function whether the Trigger Sample control feature exists on the ADCHS module. When this function returns true, this function is supported on the device:

- PLIB_ADCHS_ChannelTriggerSampleSelect

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.

Function

PLIB_ADCHS_ExistsTriggerSampleControl(ADCHS_MODULE_ID index)

PLIB_ADCHS_ExistsTurboMode Function

Identifies whether the Turbo mode feature exists on the ADCHS module.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_ExistsTurboMode(ADCHS_MODULE_ID index);
```

Returns

Existence of the Turbo mode feature:

- true - The Turbo mode feature is supported on the device
- false - The Turbo mode feature is not supported on the device

Description

This function identifies whether the Turbo mode feature is available on the ADCHS module. When this function returns true, these functions are supported on the device:

- PLIB_ADCHS_TurboModeEnable
- PLIB_ADCHS_TurboModeDisable
- PLIB_ADCHS_TurboModeErrorHasOccurred
- PLIB_ADCHS_TurboModeChannelSelect

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.

Function

PLIB_ADCHS_ExistsTurboMode(ADCHS_MODULE_ID index)

PLIB_ADCHS_ExistsUpdateReadyControl Function

Identifies whether the Update Ready feature exists on the ADCHS module.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_ExistsUpdateReadyControl(ADCHS_MODULE_ID index);
```

Returns

Existence of the Update Ready feature:

- true - The Update Ready feature is supported on the device
- false - The Update Ready feature is not supported on the device

Description

This function identifies whether the Update Ready feature is available on the ADCHS module. When this function returns true, these functions are supported on the device:

- PLIB_ADCHS_ControlRegistersCanBeUpdatedInterruptEnable
- PLIB_ADCHS_ControlRegistersCanBeUpdatedInterruptDisable
- PLIB_ADCHS_ControlRegistersCanBeUpdated

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.

Function

PLIB_ADCHS_ExistsUpdateReadyControl(ADCHS_MODULE_ID index)

PLIB_ADCHS_ExistsVREFControl Function

Identifies whether the VREF control exists on the ADCHS module.

File

plib_adchs.h

C

```
bool PLIB_ADCHS_ExistsVREFControl(ADCHS_MODULE_ID index);
```

Returns

Existence of the VREF control feature:

- true - The VREF control feature is supported on the device
- false - The VREF control feature is not supported on the device

Description

This function identifies whether the VREF control feature is available on the ADCHS module. When this function returns true, these functions are supported on the device:

- PLIB_ADCHS_VREFIsReady
- PLIB_ADCHS_VREFFaultHasOccurred
- PLIB_ADCHS_VREFReadyInterruptEnable
- PLIB_ADCHS_VREFReadyInterruptDisable
- PLIB_ADCHS_VREFFaultInterruptEnable
- PLIB_ADCHS_VREFFaultInterruptDisable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.

Function

PLIB_ADCHS_ExistsVREFControl(ADCHS_MODULE_ID index)

n) Data Types and Constants

ADCHS_AN_INPUT_ID Enumeration

Type for identifying the available ADC Inputs

File

help_plib_adchs.h

C

```
typedef enum {

ADCHS_AN60	Analog Input AN60
ADCHS_AN61	Analog Input AN61
ADCHS_AN62	Analog Input AN62
ADCHS_AN63	Analog Input AN63

Description

ADC Analog Input ID

Type for identifying the available ADC Inputs, regardless of Class.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADCHS_CHARGEPUMP_MODE Enumeration

Defines the selection for the charge pump.

File

help_plib_adchs.h

C

```
typedef enum {
  ADCHS_CHARGEPUMP_DISABLE,
  ADCHS_CHARGEPUMP_ENABLE
} ADCHS_CHARGEPUMP_MODE;
```

Members

Members	Description
ADCHS_CHARGEPUMP_DISABLE	Charge pump is disabled
ADCHS_CHARGEPUMP_ENABLE	Charge pump is enabled

Description

ADCHS Charge pump setting

This data type defines the state of the charge pump as either enabled or disabled.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADCHS_CLOCK_SOURCE Enumeration

Defines the ADCHS Clock Source Select.

File

help_plib_adchs.h

C

```
typedef enum {
```

```
  ADCHS_CLOCK_SOURCE_PBCLK,
  ADCHS_CLOCK_SOURCE_FRC,
  ADCHS_CLOCK_SOURCE_RFCLK3,
  ADCHS_CLOCK_SOURCE_SYSCLK
} ADCHS_CLOCK_SOURCE;
```

Members

Members	Description
ADCHS_CLOCK_SOURCE_PBCLK	TAD clock set to peripheral bus clock (PBCLK)
ADCHS_CLOCK_SOURCE_FRC	TAD clock set to FRC
ADCHS_CLOCK_SOURCE_RFCLK3	TAD clock set to REFCLK3
ADCHS_CLOCK_SOURCE_SYSCLK	TAD clock set to SYSCLK (TCY)

Description

ADCHS Clock source selection

This enumeration data type defines the ADCHS Clock Source Select.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADCHS_CVD_CAPACITOR Enumeration

Defines the value of the internal capacitor during CVD mode.

File

help_plib_adchs.h

C

```
typedef enum {
  ADCHS_CVD_CAPACITOR_0PF,
  ADCHS_CVD_CAPACITOR_2_5PF,
  ADCHS_CVD_CAPACITOR_5PF,
  ADCHS_CVD_CAPACITOR_7_5PF,
  ADCHS_CVD_CAPACITOR_10PF,
  ADCHS_CVD_CAPACITOR_12_5PF,
  ADCHS_CVD_CAPACITOR_15PF,
  ADCHS_CVD_CAPACITOR_17_5PF
} ADCHS_CVD_CAPACITOR;
```

Members

Members	Description
ADCHS_CVD_CAPACITOR_0PF	While in CVD mode, internal capacitor is 0pF
ADCHS_CVD_CAPACITOR_2_5PF	While in CVD mode, internal capacitor is 2.5pF
ADCHS_CVD_CAPACITOR_5PF	While in CVD mode, internal capacitor is 5pF
ADCHS_CVD_CAPACITOR_7_5PF	While in CVD mode, internal capacitor is 7.5pF
ADCHS_CVD_CAPACITOR_10PF	While in CVD mode, internal capacitor is 10pF
ADCHS_CVD_CAPACITOR_12_5PF	While in CVD mode, internal capacitor is 12.5pF
ADCHS_CVD_CAPACITOR_15PF	While in CVD mode, internal capacitor is 15pF
ADCHS_CVD_CAPACITOR_17_5PF	While in CVD mode, internal capacitor is 17.5pF

Description

ADCHS CVD capacitor selection

This data type defines the value of the internal capacitor during CVD mode.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADCHS_DATA_RESOLUTION Enumeration

Identifies the resolution of the ADC output.

File

help_plib_adchs.h

C

```
typedef enum {
  ADCHS_DATA_RESOLUTION_6BIT,
  ADCHS_DATA_RESOLUTION_8BIT,
  ADCHS_DATA_RESOLUTION_10BIT,
  ADCHS_DATA_RESOLUTION_12BIT
} ADCHS_DATA_RESOLUTION;
```

Members

Members	Description
ADCHS_DATA_RESOLUTION_6BIT	ADC Output Data resolution is 6 bits
ADCHS_DATA_RESOLUTION_8BIT	ADC Output Data resolution is 8 bits
ADCHS_DATA_RESOLUTION_10BIT	ADC Output Data resolution is 10 bits
ADCHS_DATA_RESOLUTION_12BIT	ADC Output Data resolution is 12 bits

Description

ADC Data Resolution

This data type is used to identify the resolution of the ADC output.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADCHS_DIGITAL_COMPARATOR_ID Enumeration

Identifies the supported Digital Comparators.

File

help_plib_adchs.h

C

```
typedef enum {
  ADCHS_DIGITAL_COMPARATOR_1,
  ADCHS_DIGITAL_COMPARATOR_2,
  ADCHS_DIGITAL_COMPARATOR_3,
  ADCHS_DIGITAL_COMPARATOR_4,
  ADCHS_DIGITAL_COMPARATOR_5,
  ADCHS_DIGITAL_COMPARATOR_6,
  ADCHS_NUMBER_OF_DIGITAL_COMPARATOR
} ADCHS_DIGITAL_COMPARATOR_ID;
```

Members

Members	Description
ADCHS_DIGITAL_COMPARATOR_1	Digital Comparator 1
ADCHS_DIGITAL_COMPARATOR_2	Digital Comparator 2
ADCHS_DIGITAL_COMPARATOR_3	Digital Comparator 3
ADCHS_DIGITAL_COMPARATOR_4	Digital Comparator 4
ADCHS_DIGITAL_COMPARATOR_5	Digital Comparator 5
ADCHS_DIGITAL_COMPARATOR_6	Digital Comparator 6
ADCHS_NUMBER_OF_DIGITAL_COMPARATOR	Number of Digital Comparators

Description

ADCHS Digital Comparator

This enumeration identifies all supported Digital Comparators for this ADCHS channel.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADCHS_DIGITAL_FILTER_AVERAGE_SAMPLE_COUNT Enumeration

Identifies the Digital Filter averaging sample count.

File

help_plib_adchs.h

C

```
typedef enum {
  ADCHS_DIGITAL_FILTER_AVERAGE_SAMPLE_COUNT_2,
  ADCHS_DIGITAL_FILTER_AVERAGE_SAMPLE_COUNT_4,
  ADCHS_DIGITAL_FILTER_AVERAGE_SAMPLE_COUNT_8,
  ADCHS_DIGITAL_FILTER_AVERAGE_SAMPLE_COUNT_16,
  ADCHS_DIGITAL_FILTER_AVERAGE_SAMPLE_COUNT_32,
  ADCHS_DIGITAL_FILTER_AVERAGE_SAMPLE_COUNT_64,
  ADCHS_DIGITAL_FILTER_AVERAGE_SAMPLE_COUNT_128,
  ADCHS_DIGITAL_FILTER_AVERAGE_SAMPLE_COUNT_256
} ADCHS_DIGITAL_FILTER_AVERAGE_SAMPLE_COUNT;
```

Members

Members	Description
ADCHS_DIGITAL_FILTER_AVERAGE_SAMPLE_COUNT_2	Averaging is performed on 2 samples
ADCHS_DIGITAL_FILTER_AVERAGE_SAMPLE_COUNT_4	Averaging is performed on 4 samples
ADCHS_DIGITAL_FILTER_AVERAGE_SAMPLE_COUNT_8	Averaging is performed on 8 samples
ADCHS_DIGITAL_FILTER_AVERAGE_SAMPLE_COUNT_16	Averaging is performed on 16 samples
ADCHS_DIGITAL_FILTER_AVERAGE_SAMPLE_COUNT_32	Averaging is performed on 32 samples
ADCHS_DIGITAL_FILTER_AVERAGE_SAMPLE_COUNT_64	Averaging is performed on 64 samples
ADCHS_DIGITAL_FILTER_AVERAGE_SAMPLE_COUNT_128	Averaging is performed on 128 samples
ADCHS_DIGITAL_FILTER_AVERAGE_SAMPLE_COUNT_256	Averaging is performed on 256 samples

Description

ADCHS Averaging sample

This enumeration identifies all supported digital Filter averaging sample count for this ADCHS channel. Once, the set number of samples are acquired by ADC channel, it starts the averaging process.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADCHS_DIGITAL_FILTER_ID Enumeration

Identifies the supported Digital Filters.

File

help_plib_adchs.h

C

```
typedef enum {
  ADCHS_DIGITAL_FILTER_1,
  ADCHS_DIGITAL_FILTER_2,
  ADCHS_DIGITAL_FILTER_3,
  ADCHS_DIGITAL_FILTER_4,
  ADCHS_DIGITAL_FILTER_5,
  ADCHS_DIGITAL_FILTER_6,
  ADCHS_NUMBER_OF_DIGITAL_FILTER
} ADCHS_DIGITAL_FILTER_ID;
```

Members

Members	Description
ADCHS_DIGITAL_FILTER_1	Digital Filter 1
ADCHS_DIGITAL_FILTER_2	Digital Filter 2
ADCHS_DIGITAL_FILTER_3	Digital Filter 3
ADCHS_DIGITAL_FILTER_4	Digital Filter 4

ADCHS_DIGITAL_FILTER_5	Digital Filter 5
ADCHS_DIGITAL_FILTER_6	Digital Filter 6
ADCHS_NUMBER_OF_DIGITAL_FILTER	Number of Digital Filters

Description

ADCHS Digital Filter

This enumeration identifies all supported digital Filters for this ADCHS channel.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADCHS_DIGITAL_FILTER_OVERSAMPLE_RATIO Enumeration

Identifies the supported Digital Filter oversampling ratios.

File

help_plib_adchs.h

C

```
typedef enum {
  ADCHS_DIGITAL_FILTER_OVERSAMPLE_RATIO_4X,
  ADCHS_DIGITAL_FILTER_OVERSAMPLE_RATIO_16X,
  ADCHS_DIGITAL_FILTER_OVERSAMPLE_RATIO_64X,
  ADCHS_DIGITAL_FILTER_OVERSAMPLE_RATIO_256X,
  ADCHS_DIGITAL_FILTER_OVERSAMPLE_RATIO_2X,
  ADCHS_DIGITAL_FILTER_OVERSAMPLE_RATIO_8X,
  ADCHS_DIGITAL_FILTER_OVERSAMPLE_RATIO_32X,
  ADCHS_DIGITAL_FILTER_OVERSAMPLE_RATIO_128X
} ADCHS_DIGITAL_FILTER_OVERSAMPLE_RATIO;
```

Members

Members	Description
ADCHS_DIGITAL_FILTER_OVERSAMPLE_RATIO_4X	4x oversampling, shift sum 1 bit to right, output data is 13 bits
ADCHS_DIGITAL_FILTER_OVERSAMPLE_RATIO_16X	16x oversampling, shift sum 2 bits to right, output data is 14 bits
ADCHS_DIGITAL_FILTER_OVERSAMPLE_RATIO_64X	64x oversampling, shift sum 3 bits to right, output data is 15 bits
ADCHS_DIGITAL_FILTER_OVERSAMPLE_RATIO_256X	256x oversampling, shift sum 4 bits to right, output data is 16 bits
ADCHS_DIGITAL_FILTER_OVERSAMPLE_RATIO_2X	2x oversampling, shift sum 0 bits to right, output data is in 12.1 format
ADCHS_DIGITAL_FILTER_OVERSAMPLE_RATIO_8X	8x oversampling, shift sum 1 bit to right, output data is in 13.1 format
ADCHS_DIGITAL_FILTER_OVERSAMPLE_RATIO_32X	32x oversampling, shift sum 2 bits to right, output data is in 14.1 format
ADCHS_DIGITAL_FILTER_OVERSAMPLE_RATIO_128X	128x oversampling, shift sum 3 bit to right, output data is in 15.1 format

Description

ADCHS Oversampling Ratio

This enumeration identifies all supported digital Filter oversampling ratios for this ADCHS channel. Oversampling ratios determine the number of samples used to generate a single output and the resulting resolution and format.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADCHS_DIGITAL_FILTER_SIGNIFICANT_BITS Enumeration

Data length of digital filter.

File

help_plib_adchs.h

C

```
typedef enum {
  ADCHS_DIGITAL_FILTER_SIGNIFICANT_FIRST_12BITS,
  ADCHS_DIGITAL_FILTER_SIGNIFICANT_ALL_16BITS
} ADCHS_DIGITAL_FILTER_SIGNIFICANT_BITS;
```

Members

Members	Description
ADCHS_DIGITAL_FILTER_SIGNIFICANT_FIRST_12BITS	Output of digital filter has only first 12 bits significant (remaining 4 zeros)
ADCHS_DIGITAL_FILTER_SIGNIFICANT_ALL_16BITS	Output of digital filter has all 16 bits significant

Description

ADCHS Digital filter data length

The output of digital filter can be set as all 16-bit to be significant or only first 12-bit significant followed by 4 zeros.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADCHS_DMA_BUFFER_LENGTH Enumeration

Defines the length of the DMA buffer length.

File

help_plib_adchs.h

C

```
typedef enum {
  ADCHS_DMA_BUFFER_LENGTH_2BYTES,
  ADCHS_DMA_BUFFER_LENGTH_4BYTES,
  ADCHS_DMA_BUFFER_LENGTH_8BYTES,
  ADCHS_DMA_BUFFER_LENGTH_16BYTES,
  ADCHS_DMA_BUFFER_LENGTH_32BYTES,
  ADCHS_DMA_BUFFER_LENGTH_64BYTES,
  ADCHS_DMA_BUFFER_LENGTH_128BYTES,
  ADCHS_DMA_BUFFER_LENGTH_256BYTES
} ADCHS_DMA_BUFFER_LENGTH;
```

Members

Members	Description
ADCHS_DMA_BUFFER_LENGTH_2BYTES	Allocate 2 bytes in RAM for each analog input
ADCHS_DMA_BUFFER_LENGTH_4BYTES	Allocate 4 bytes in RAM for each analog input
ADCHS_DMA_BUFFER_LENGTH_8BYTES	Allocate 8 bytes in RAM for each analog input
ADCHS_DMA_BUFFER_LENGTH_16BYTES	Allocate 16 bytes in RAM for each analog input
ADCHS_DMA_BUFFER_LENGTH_32BYTES	Allocate 32 bytes in RAM for each analog input
ADCHS_DMA_BUFFER_LENGTH_64BYTES	Allocate 64 bytes in RAM for each analog input
ADCHS_DMA_BUFFER_LENGTH_128BYTES	Allocate 128 bytes in RAM for each analog input
ADCHS_DMA_BUFFER_LENGTH_256BYTES	Allocate 256 bytes in RAM for each analog input

Description

ADCHS Class-1 DMA buffer length

This data type defines the length of the DMA buffer (in bytes).

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADCHS_DMA_COUNT Enumeration

Defines the enable/disable of the count feature for DMA.

File

help_plib_adchs.h

C

```
typedef enum {
  ADCHS_DMA_COUNT_DISABLE,
  ADCHS_DMA_COUNT_ENABLE
} ADCHS_DMA_COUNT;
```

Members

Members	Description
ADCHS_DMA_COUNT_DISABLE	DMA does not keep count of number of data saved by DMA
ADCHS_DMA_COUNT_ENABLE	DMA keeps count of number of data saved by DMA

Description

ADCHS DMA count enable

This data type defines whether or not the DMA should count the number of samples and store it in DMA RAM location.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADCHS_EARLY_INTERRUPT_PRIOR_CLOCK Enumeration

Defines the number of clocks prior to the arrival of valid data that the associated interrupt is generated.

File

help_plib_adchs.h

C

```
typedef enum {
  ADCHS_EARLY_INTERRUPT_PRIOR_CLOCK_1,
  ADCHS_EARLY_INTERRUPT_PRIOR_CLOCK_2,
  ADCHS_EARLY_INTERRUPT_PRIOR_CLOCK_3,
  ADCHS_EARLY_INTERRUPT_PRIOR_CLOCK_4,
  ADCHS_EARLY_INTERRUPT_PRIOR_CLOCK_5,
  ADCHS_EARLY_INTERRUPT_PRIOR_CLOCK_6,
  ADCHS_EARLY_INTERRUPT_PRIOR_CLOCK_7,
  ADCHS_EARLY_INTERRUPT_PRIOR_CLOCK_8
} ADCHS_EARLY_INTERRUPT_PRIOR_CLOCK;
```

Members

Members	Description
ADCHS_EARLY_INTERRUPT_PRIOR_CLOCK_1	The data ready interrupt is generated 1 ADC clock prior to end of conversion
ADCHS_EARLY_INTERRUPT_PRIOR_CLOCK_2	The data ready interrupt is generated 2 ADC clock prior to end of conversion
ADCHS_EARLY_INTERRUPT_PRIOR_CLOCK_3	The data ready interrupt is generated 3 ADC clock prior to end of conversion
ADCHS_EARLY_INTERRUPT_PRIOR_CLOCK_4	The data ready interrupt is generated 4 ADC clock prior to end of conversion
ADCHS_EARLY_INTERRUPT_PRIOR_CLOCK_5	The data ready interrupt is generated 5 ADC clock prior to end of conversion
ADCHS_EARLY_INTERRUPT_PRIOR_CLOCK_6	The data ready interrupt is generated 6 ADC clock prior to end of conversion
ADCHS_EARLY_INTERRUPT_PRIOR_CLOCK_7	The data ready interrupt is generated 7 ADC clock prior to end of conversion
ADCHS_EARLY_INTERRUPT_PRIOR_CLOCK_8	The data ready interrupt is generated 8 ADC clock prior to end of conversion

Description

ADCHS Early interrupt prior clock selection

This data type defines the number of clocks prior to the arrival of valid data that the associated interrupt is generated. All options are available when the selected resolution for converted data is 12-bit or 10-bit. For a resolution of 8-bit, options from ADCHS_EARLY_INTERRUPT_PRIOR_CLOCK_1 to ADCHS_EARLY_INTERRUPT_PRIOR_CLOCK_6 are valid. For a resolution of 6-bit, options from ADCHS_EARLY_INTERRUPT_PRIOR_CLOCK_1 to ADCHS_EARLY_INTERRUPT_PRIOR_CLOCK_4 are valid.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADCHS_FAST_SYNC_PERIPHERAL_CLOCK Enumeration

Defines the selection of the fast synchronous peripheral clock.

File

help_plib_adchs.h

C

```
typedef enum {
```

```
  ADCHS_FAST_SYNC_PERIPHERAL_CLOCK_DISABLE,
  ADCHS_FAST_SYNC_PERIPHERAL_CLOCK_ENABLE
} ADCHS_FAST_SYNC_PERIPHERAL_CLOCK;
```

Members

Members	Description
ADCHS_FAST_SYNC_PERIPHERAL_CLOCK_DISABLE	Peripheral clock is not used for ADCHS
ADCHS_FAST_SYNC_PERIPHERAL_CLOCK_ENABLE	Peripheral clock is used for ADCHS

Description

ADCHS Fast synchronous peripheral clock mode

This data type defines whether the fast synchronous peripheral clock to the ADCHS channel is enabled or disabled.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADCHS_FAST_SYNC_SYSTEM_CLOCK Enumeration

Defines the selection of the fast synchronous system clock.

File

help_plib_adchs.h

C

```
typedef enum {
  ADCHS_FAST_SYNC_SYSTEM_CLOCK_DISABLE,
  ADCHS_FAST_SYNC_SYSTEM_CLOCK_ENABLE
} ADCHS_FAST_SYNC_SYSTEM_CLOCK;
```

Members

Members	Description
ADCHS_FAST_SYNC_SYSTEM_CLOCK_DISABLE	System clock is not used for ADCHS
ADCHS_FAST_SYNC_SYSTEM_CLOCK_ENABLE	System clock is used for ADCHS

Description

ADCHS Fast synchronous system clock mode

This data type defines whether the fast synchronous system clock to ADCHS channel is enabled or disabled.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADCHS_INPUT_MODE Enumeration

Defines the available modes for the selected input.

File

help_plib_adchs.h

C

```
typedef enum {
  ADCHS_INPUT_MODE_SINGLE_ENDED_UNIPOLAR,
  ADCHS_INPUT_MODE_SINGLE_ENDED_TWOS_COMP,
  ADCHS_INPUT_MODE_DIFFERENTIAL_UNIPOLAR,
  ADCHS_INPUT_MODE_DIFFERENTIAL_TWOS_COMP
} ADCHS_INPUT_MODE;
```

Members

Members	Description
ADCHS_INPUT_MODE_SINGLE_ENDED_UNIPOLAR	Single-ended input, Unipolar encoded
ADCHS_INPUT_MODE_SINGLE_ENDED_TWOS_COMP	Single-ended input, two's compliment encoded
ADCHS_INPUT_MODE_DIFFERENTIAL_UNIPOLAR	Differential input, Unipolar encoded
ADCHS_INPUT_MODE_DIFFERENTIAL_TWOS_COMP	Differential input, two's compliment encoded

Description

ADCHS Input Mode

This data type defines the available modes for the selected input.

Remarks

None.

ADCHS_INTERRUPT_BIT_SHIFT_LEFT Enumeration

Identifies the bits shift for calculating the interrupt vector.

File

help_plib_adchs.h

C

```
typedef enum {
  ADCHS_INTERRUPT_BIT_SHIFT_LEFT_0_BITS,
  ADCHS_INTERRUPT_BIT_SHIFT_LEFT_1_BITS,
  ADCHS_INTERRUPT_BIT_SHIFT_LEFT_2_BITS,
  ADCHS_INTERRUPT_BIT_SHIFT_LEFT_3_BITS,
  ADCHS_INTERRUPT_BIT_SHIFT_LEFT_4_BITS,
  ADCHS_INTERRUPT_BIT_SHIFT_LEFT_5_BITS,
  ADCHS_INTERRUPT_BIT_SHIFT_LEFT_6_BITS,
  ADCHS_INTERRUPT_BIT_SHIFT_LEFT_7_BITS
} ADCHS_INTERRUPT_BIT_SHIFT_LEFT;
```

Members

Members	Description
ADCHS_INTERRUPT_BIT_SHIFT_LEFT_0_BITS	Bit shift by 0 bits
ADCHS_INTERRUPT_BIT_SHIFT_LEFT_1_BITS	Bit shift by 1 bits
ADCHS_INTERRUPT_BIT_SHIFT_LEFT_2_BITS	Bit shift by 2 bits
ADCHS_INTERRUPT_BIT_SHIFT_LEFT_3_BITS	Bit shift by 3 bits
ADCHS_INTERRUPT_BIT_SHIFT_LEFT_4_BITS	Bit shift by 4 bits
ADCHS_INTERRUPT_BIT_SHIFT_LEFT_5_BITS	Bit shift by 5 bits
ADCHS_INTERRUPT_BIT_SHIFT_LEFT_6_BITS	Bit shift by 6 bits
ADCHS_INTERRUPT_BIT_SHIFT_LEFT_7_BITS	Bit shift by 7 bits

Description

ADCHS Interrupt vector shift bits

Interrupt vector address, is calculated by (Base_Address + x << vector_shift), where 'x' is the smallest active channel ID from the status register (AD1DSTAT1 or 2) registers (which has highest priority).

This enumeration identifies all the possible bits shift.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADCHS_OUTPUT_DATA_FORMAT Enumeration

Defines the selection for the output data format.

File

help_plib_adchs.h

C

```
typedef enum {
  ADCHS_OUTPUT_DATA_FORMAT_INTEGER,
  ADCHS_OUTPUT_DATA_FORMAT_FRACTIONAL
} ADCHS_OUTPUT_DATA_FORMAT;
```

Members

Members	Description
ADCHS_OUTPUT_DATA_FORMAT_INTEGER	Output data format is integer
ADCHS_OUTPUT_DATA_FORMAT_FRACTIONAL	Output data format is fractional

Description

ADCHS output data format

The output of ADC can be specified as either integer or fractional. This enum defines the setting of the output data format.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADCHS_SCAN_TRIGGER_SENSITIVE Enumeration

Trigger level for scan trigger.

File

help_plib_adchs.h

C

```
typedef enum {
  ADCHS_SCAN_TRIGGER_SENSITIVE_EDGE,
  ADCHS_SCAN_TRIGGER_SENSITIVE_LEVEL
} ADCHS_SCAN_TRIGGER_SENSITIVE;
```

Members

Members	Description
ADCHS_SCAN_TRIGGER_SENSITIVE_EDGE	Scan trigger is edge sensitive
ADCHS_SCAN_TRIGGER_SENSITIVE_LEVEL	Scan trigger is level sensitive

Description

ADCHS scan trigger level

The scan trigger can be configured to be sensitive to level or sensitive to edge. This data type defines the different configurations.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADCHS_SCAN_TRIGGER_SOURCE Enumeration

Defines the ADCHS Channel Scan Trigger Source Selections.

File

help_plib_adchs.h

C

```
typedef enum {
  ADCHS_SCAN_TRIGGER_SOURCE_NONE,
  ADCHS_SCAN_TRIGGER_SOURCE_GLOBAL_SOFTWARE_EDGE,
  ADCHS_SCAN_TRIGGER_SOURCE_SOFTWARE_LEVEL,
  ADCHS_SCAN_TRIGGER_SOURCE_INT0,
  ADCHS_SCAN_TRIGGER_SOURCE_TMR1_MATCH,
  ADCHS_SCAN_TRIGGER_SOURCE_TMR3_MATCH,
  ADCHS_SCAN_TRIGGER_SOURCE_TMR5_MATCH,
  ADCHS_SCAN_TRIGGER_SOURCE_OC1,
  ADCHS_SCAN_TRIGGER_SOURCE_OC3,
  ADCHS_SCAN_TRIGGER_SOURCE_OC5,
  ADCHS_SCAN_TRIGGER_SOURCE_COUT1,
  ADCHS_SCAN_TRIGGER_SOURCE_COUT2
} ADCHS_SCAN_TRIGGER_SOURCE;
```

Members

Members	Description
ADCHS_SCAN_TRIGGER_SOURCE_NONE	No scan trigger source is selected
ADCHS_SCAN_TRIGGER_SOURCE_GLOBAL_SOFTWARE_EDGE	Global Software edge trigger selected as scan trigger source
ADCHS_SCAN_TRIGGER_SOURCE_SOFTWARE_LEVEL	Level Software trigger selected as scan trigger source
ADCHS_SCAN_TRIGGER_SOURCE_INT0	Interrupt 0 (INT0) selected as scan trigger source
ADCHS_SCAN_TRIGGER_SOURCE_TMR1_MATCH	Timer 1 Match (TMR1) selected as scan trigger source
ADCHS_SCAN_TRIGGER_SOURCE_TMR3_MATCH	Timer 3 Match (TMR3) selected as scan trigger source
ADCHS_SCAN_TRIGGER_SOURCE_TMR5_MATCH	Timer 5 Match (TMR5) selected as scan trigger source
ADCHS_SCAN_TRIGGER_SOURCE_OC1	Output Compare 1(OC1) period end selected as scan trigger source
ADCHS_SCAN_TRIGGER_SOURCE_OC3	Output Compare 3 (OC3) period end selected as scan trigger source
ADCHS_SCAN_TRIGGER_SOURCE_OC5	Output Compare 5 (OC5) period end selected as scan trigger source
ADCHS_SCAN_TRIGGER_SOURCE_COUT1	Comparator Output 1 selected as scan trigger source
ADCHS_SCAN_TRIGGER_SOURCE_COUT2	Comparator Output 2 selected as scan trigger source

Description

ADCHS Channel Scan Trigger Source Select

This data type defines the ADCHS Channel Scan Trigger Source Selections.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADCHS_TRIGGER_SOURCE Enumeration

Defines the ADCHS Trigger Source Selections.

File

help_plib_adchs.h

C

```
typedef enum {
  ADCHS_TRIGGER_SOURCE_NONE,
  ADCHS_TRIGGER_SOURCE_GLOBAL_SOFTWARE_EDGE,
  ADCHS_TRIGGER_SOURCE_SOFTWARE_LEVEL,
  ADCHS_TRIGGER_SOURCE_STRIG,
  ADCHS_TRIGGER_SOURCE_INT0,
  ADCHS_TRIGGER_SOURCE_TMR1_MATCH,
  ADCHS_TRIGGER_SOURCE_TMR3_MATCH,
  ADCHS_TRIGGER_SOURCE_TMR5_MATCH,
  ADCHS_TRIGGER_SOURCE_OC1,
  ADCHS_TRIGGER_SOURCE_OC3,
  ADCHS_TRIGGER_SOURCE_OC5,
  ADCHS_TRIGGER_SOURCE_COUT1,
  ADCHS_TRIGGER_SOURCE_COUT2
} ADCHS_TRIGGER_SOURCE;
```

Members

Members	Description
ADCHS_TRIGGER_SOURCE_NONE	No trigger source is selected
ADCHS_TRIGGER_SOURCE_GLOBAL_SOFTWARE_EDGE	Global Software edge trigger selected as trigger source
ADCHS_TRIGGER_SOURCE_SOFTWARE_LEVEL	Level Software trigger selected as trigger source
ADCHS_TRIGGER_SOURCE_STRIG	Scan trigger source
ADCHS_TRIGGER_SOURCE_INT0	Interrupt 0 (INT0) selected as trigger source
ADCHS_TRIGGER_SOURCE_TMR1_MATCH	Timer 1 Match (TMR1) selected as trigger source
ADCHS_TRIGGER_SOURCE_TMR3_MATCH	Timer 3 Match (TMR3) selected as trigger source
ADCHS_TRIGGER_SOURCE_TMR5_MATCH	Timer 5 Match (TMR5) selected as trigger source
ADCHS_TRIGGER_SOURCE_OC1	Output Compare 1(OC1) period end selected as trigger source
ADCHS_TRIGGER_SOURCE_OC3	Output Compare 3 (OC3) period end selected as trigger source
ADCHS_TRIGGER_SOURCE_OC5	Output Compare 5 (OC5) period end selected as trigger source
ADCHS_TRIGGER_SOURCE_COUT1	Comparator Output 1 selected as trigger source

ADCHS_TRIGGER_SOURCE_COUT2	Comparator Output 2 selected as trigger source

Description

ADCHS Trigger Source Select

This data type defines the ADCHS Trigger Source Selections.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADCHS_VREF_SOURCE Enumeration

Defines the ADCHS VREF Source Select.

File

help_plib_adchs.h

C

```
typedef enum {
  ADCHS_VREF_AVDD_AVSS,
  ADCHS_VREF_EXTVREFP_AVSS,
  ADCHS_VREF_AVDD_EXTVREFN,
  ADCHS_VREF_EXTVREFP_EXTVREFN,
  ADCHS_VREF_INTVREFP_INTVREFN,
  ADCHS_VREF_INTVREFP_EXTVREFN,
  ADCHS_VREF_INTVREFP_AVSS,
  ADCHS_VREF_AVDD_INTVREFN
} ADCHS_VREF_SOURCE;
```

Members

Members	Description
ADCHS_VREF_AVDD_AVSS	Reference voltage set to AVDD and AVSS
ADCHS_VREF_EXTVREFP_AVSS	Reference voltage set to external VREF positive and AVSS
ADCHS_VREF_AVDD_EXTVREFN	Reference voltage set to AVDD and external VREF negative
ADCHS_VREF_EXTVREFP_EXTVREFN	Reference voltage set to external VREF positive and external VREF negative
ADCHS_VREF_INTVREFP_INTVREFN	Reference voltage set to internal VREF positive and internal VREF negative
ADCHS_VREF_INTVREFP_EXTVREFN	Reference voltage set to internal VREF positive and external VREF negative
ADCHS_VREF_INTVREFP_AVSS	Reference voltage set to internal VREF positive and AVSS
ADCHS_VREF_AVDD_INTVREFN	Reference voltage set to AVDD positive and internal VREF negative

Description

ADCHS VREF Source Select

This data type defines the ADCHS Reference Voltage (VREF) Source Select.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADCHS_WARMUP_CLOCK Enumeration

Identifies the number of clocks before the channel can be ready

File

help_plib_adchs.h

C

```
typedef enum {
  ADCHS_WARMUP_CLOCK_16,
  ADCHS_WARMUP_CLOCK_32,
  ADCHS_WARMUP_CLOCK_64,
  ADCHS_WARMUP_CLOCK_128,
  ADCHS_WARMUP_CLOCK_256,
  ADCHS_WARMUP_CLOCK_512,
  ADCHS_WARMUP_CLOCK_1024,
  ADCHS_WARMUP_CLOCK_2048,
```

```
  ADCHS_WARMUP_CLOCK_4096,
  ADCHS_WARMUP_CLOCK_8192,
  ADCHS_WARMUP_CLOCK_16384,
  ADCHS_WARMUP_CLOCK_32768
} ADCHS_WARMUP_CLOCK;
```

Members

Members	Description
ADCHS_WARMUP_CLOCK_16	Warm-up time is 16 ADC clocks
ADCHS_WARMUP_CLOCK_32	Warm-up time is 32 ADC clocks
ADCHS_WARMUP_CLOCK_64	Warm-up time is 64 ADC clocks
ADCHS_WARMUP_CLOCK_128	Warm-up time is 128 ADC clocks
ADCHS_WARMUP_CLOCK_256	Warm-up time is 256 ADC clocks
ADCHS_WARMUP_CLOCK_512	Warm-up time is 512 ADC clocks
ADCHS_WARMUP_CLOCK_1024	Warm-up time is 1024 ADC clocks
ADCHS_WARMUP_CLOCK_2048	Warm-up time is 2048 ADC clocks
ADCHS_WARMUP_CLOCK_4096	Warm-up time is 4096 ADC clocks
ADCHS_WARMUP_CLOCK_8192	Warm-up time is 8192 ADC clocks
ADCHS_WARMUP_CLOCK_16384	Warm-up time is 16384 ADC clocks
ADCHS_WARMUP_CLOCK_32768	Warm-up time is 32768 ADC clocks

Description

ADCHS Wakeup warm-up clocks

When the analog section of an ADC channel is enabled, the channel needs a certain amount of warm-up time before it can be ready to perform conversion. This enumeration contains the various warm-up time in terms of the number of clocks.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADCHS_MODULE_ID Enumeration

Identifies the number of ADC supported.

File

help_plib_adchs.h

C

```
typedef enum {
  ADCHS_ID_0,
  ADCHS_NUMBER_OF_MODULES
} ADCHS_MODULE_ID;
```

Members

Members	Description
ADCHS_ID_0	ADC ID 0
ADCHS_NUMBER_OF_MODULES	Number of available ADC.

Description

This enumeration identifies the available ADC.

Remarks

The caller should not rely on the specific numbers assigned to any of these values as they may change from one processor to the next.

Refer to the specific device data sheet to determine how many ADC modules are supported. The numbers used in the enumeration values will match the numbers provided in the data sheet.

ADCHS_CHANNEL_INP_SEL Enumeration

Defines the alternate input selection for channels 0 to 6.

File

help_plib_adchs.h

C

```
typedef enum {
  ADCHS_CHANNEL_0_DEFAULT_INP_AN0,
  ADCHS_CHANNEL_0_ALTERNATE_INP_AN45,
  ADCHS_CHANNEL_1_DEFAULT_INP_AN1,
  ADCHS_CHANNEL_1_ALTERNATE_INP_AN46,
  ADCHS_CHANNEL_2_DEFAULT_INP_AN2,
  ADCHS_CHANNEL_2_ALTERNATE_INP_AN47,
  ADCHS_CHANNEL_3_DEFAULT_INP_AN3,
  ADCHS_CHANNEL_3_ALTERNATE_INP_AN48,
  ADCHS_CHANNEL_4_DEFAULT_INP_AN4,
  ADCHS_CHANNEL_4_ALTERNATE_INP_AN49
} ADCHS_CHANNEL_INP_SEL;
```

Members

Members	Description
ADCHS_CHANNEL_0_DEFAULT_INP_AN0	AN0 is the default input for Channel 0
ADCHS_CHANNEL_0_ALTERNATE_INP_AN45	AN45 is the alternate input for Channel 0
ADCHS_CHANNEL_1_DEFAULT_INP_AN1	AN1 is the default input for Channel 1
ADCHS_CHANNEL_1_ALTERNATE_INP_AN46	AN46 is the alternate input for Channel 1
ADCHS_CHANNEL_2_DEFAULT_INP_AN2	AN2 is the default input for Channel 2
ADCHS_CHANNEL_2_ALTERNATE_INP_AN47	AN47 is the alternate input for Channel 2
ADCHS_CHANNEL_3_DEFAULT_INP_AN3	AN3 is the default input for Channel 3
ADCHS_CHANNEL_3_ALTERNATE_INP_AN48	AN48 is the alternate input for Channel 3
ADCHS_CHANNEL_4_DEFAULT_INP_AN4	AN4 is the default input for Channel 4
ADCHS_CHANNEL_4_ALTERNATE_INP_AN49	AN49 is the alternate input for Channel 4

Description

ADCHS Alternate input selection for channel- 0 to 6.

This data type defines the possible alternate input selections for channels 0 to 6. For channel 7, alternate selection does not exist. Passing the values for channel 7 will return an error.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADCHS_CHANNEL_ID Enumeration

Identifies the ADC channel from 0 to 7.

File

help_plib_adchs.h

C

```
typedef enum {
  ADCHS_CHANNEL_0,
  ADCHS_CHANNEL_1,
  ADCHS_CHANNEL_2,
  ADCHS_CHANNEL_3,
  ADCHS_CHANNEL_4,
  ADCHS_CHANNEL_5,
  ADCHS_CHANNEL_6,
  ADCHS_CHANNEL_7,
  ADCHS_NUMBER_OF_CHANNEL
} ADCHS_CHANNEL_ID;
```

Members

Members	Description
ADCHS_CHANNEL_0	ADCHS channel 0
ADCHS_CHANNEL_1	ADCHS channel 1
ADCHS_CHANNEL_2	ADCHS channel 2
ADCHS_CHANNEL_3	ADCHS channel 3

ADCHS_CHANNEL_4	ADCHS channel 4
ADCHS_CHANNEL_5	ADCHS channel 5
ADCHS_CHANNEL_6	ADCHS channel 6
ADCHS_CHANNEL_7	ADCHS channel 7
ADCHS_NUMBER_OF_CHANNEL	Number of channels

Description

ADCHS channel Select

This enumeration identifies the ADC channels from 0 to 7. Not all devices have all ADCHS channels. Refer to the specific device data sheet for the number of available channels. Some features that are available in channels 0 to 6 may not be available on channel 7.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADCHS_CHANNEL_TRIGGER_SAMPLING_SEL Enumeration

Defines the selection of trigger and sampling for channels 0 to 6.

File

help_plib_adchs.h

C

```
typedef enum {
  ADCHS_CHANNEL_UNSYNC_TRIGGER_UNSYNC_SAMPLING,
  ADCHS_CHANNEL_SYNC_SAMPLING,
  ADCHS_CHANNEL_SYNC_TRIGGER_UNSYNC_SAMPLING
} ADCHS_CHANNEL_TRIGGER_SAMPLING_SEL;
```

Members

Members	Description
ADCHS_CHANNEL_UNSYNC_TRIGGER_UNSYNC_SAMPLING	Unsynchronized trigger and unsynchronous sampling
ADCHS_CHANNEL_SYNC_SAMPLING	Synchronous sampling (trigger selection is ignored)
ADCHS_CHANNEL_SYNC_TRIGGER_UNSYNC_SAMPLING	Synchronized trigger and unsynchronous sampling

Description

ADCHS channel trigger and sampling selection

This data type defines the selection of trigger and sampling for ADCHS channels 0 to 6. Passing this value for channel 7 will result in an error.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADCHS_CLASS12_AN_INPUT_ID Enumeration

Type for identifying the available Class 1 and 2 analog Inputs.

File

help_plib_adchs.h

C

```
typedef enum {
} ADCHS_CLASS12_AN_INPUT_ID;
```

Description

ADC Analog Input ID of type class-1 and class-2

These enums are passed to functions meant to control or enable/disable "triggers". This is because only Class 1 and Class 2 analog inputs have individual triggers associated with them.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

This section lists the source and header files used by the library.

help_plib_adchs.h

ADCHS Peripheral Library interface header file template.

Enumerations

	Name	Description
	ADCHS_AN_INPUT_ID	Type for identifying the available ADC Inputs
	ADCHS_CHANNEL_ID	Identifies the ADC channel from 0 to 7.
	ADCHS_CHANNEL_INP_SEL	Defines the alternate input selection for channels 0 to 6.
	ADCHS_CHANNEL_TRIGGER_SAMPLING_SEL	Defines the selection of trigger and sampling for channels 0 to 6.
	ADCHS_CHARGEPUMP_MODE	Defines the selection for the charge pump.
	ADCHS_CLASS12_AN_INPUT_ID	Type for identifying the available Class 1 and 2 analog Inputs.
	ADCHS_CLOCK_SOURCE	Defines the ADCHS Clock Source Select.
	ADCHS_CVD_CAPACITOR	Defines the value of the internal capacitor during CVD mode.
	ADCHS_DATA_RESOLUTION	Identifies the resolution of the ADC output.
	ADCHS_DIGITAL_COMPARATOR_ID	Identifies the supported Digital Comparators.
	ADCHS_DIGITAL_FILTER_AVERAGE_SAMPLE_COUNT	Identifies the Digital Filter averaging sample count.
	ADCHS_DIGITAL_FILTER_ID	Identifies the supported Digital Filters.
	ADCHS_DIGITAL_FILTER_OVERSAMPLE_RATIO	Identifies the supported Digital Filter oversampling ratios.
	ADCHS_DIGITAL_FILTER_SIGNIFICANT_BITS	Data length of digital filter.
	ADCHS_DMA_BUFFER_LENGTH	Defines the length of the DMA buffer length.
	ADCHS_DMA_COUNT	Defines the enable/disable of the count feature for DMA.
	ADCHS_EARLY_INTERRUPT_PRIOR_CLOCK	Defines the number of clocks prior to the arrival of valid data that the associated interrupt is generated.
	ADCHS_FAST_SYNC_PERIPHERAL_CLOCK	Defines the selection of the fast synchronous peripheral clock.
	ADCHS_FAST_SYNC_SYSTEM_CLOCK	Defines the selection of the fast synchronous system clock.
	ADCHS_INPUT_MODE	Defines the available modes for the selected input.
	ADCHS_INTERRUPT_BIT_SHIFT_LEFT	Identifies the bits shift for calculating the interrupt vector.
	ADCHS_MODULE_ID	Identifies the number of ADC supported.
	ADCHS_OUTPUT_DATA_FORMAT	Defines the selection for the output data format.
	ADCHS_SCAN_TRIGGER_SENSITIVE	Trigger level for scan trigger.
	ADCHS_SCAN_TRIGGER_SOURCE	Defines the ADCHS Channel Scan Trigger Source Selections.
	ADCHS_TRIGGER_SOURCE	Defines the ADCHS Trigger Source Selections.
	ADCHS_VREF_SOURCE	Defines the ADCHS VREF Source Select.
	ADCHS_WARMUP_CLOCK	Identifies the number of clocks before the channel can be ready

Description

ADCHS Peripheral Library Interface Header File Template

This file is provided for documentation purposes.

File Name

help_plib_adchs.h

Company

Microchip Technology Inc.

plib_adchs.h

ADCHS Peripheral Library Interface Header for ADCHS common definitions.

Functions

	Name	Description
	PLIB_ADCHS_AnalogInputDataIsReady	Returns the data ready status of analog inputs.
	PLIB_ADCHS_AnalogInputDataReadyInterruptDisable	Disables the data ready interrupt for the selected analog inputs.
	PLIB_ADCHS_AnalogInputDataReadyInterruptEnable	Enables the data ready interrupt for the selected analog input.
	PLIB_ADCHS_AnalogInputEarlyInterruptDisable	Disables the early interrupt for the analog input.
	PLIB_ADCHS_AnalogInputEarlyInterruptEnable	Enables the early interrupt for the analog input.
	PLIB_ADCHS_AnalogInputEarlyInterruptIsReady	Returns the early interrupt ready status of analog input.
	PLIB_ADCHS_AnalogInputEdgeTriggerSet	Sets the trigger as edge sensitive for selected class 1 and 2 analog input.
	PLIB_ADCHS_AnalogInputIsAvailable	Returns the analog input configuration of ADCHS channel.
	PLIB_ADCHS_AnalogInputLevelTriggerSet	Sets the trigger as level sensitive for selected Class 1 and 2 analog input.
	PLIB_ADCHS_AnalogInputModeGet	Returns the mode for the specified analog input.
	PLIB_ADCHS_AnalogInputModeSelect	Selects the mode for the specified analog input.
	PLIB_ADCHS_AnalogInputResultGet	Returns a ADC conversion result.
	PLIB_ADCHS_AnalogInputScanIsComplete	Returns the state of End of scan completion.
	PLIB_ADCHS_AnalogInputScanIsSelected	Returns whether or note an analog input is selected for scanning.
	PLIB_ADCHS_AnalogInputScanRemove	Removes the analog input from scanning selection.
	PLIB_ADCHS_AnalogInputScanSelect	Selects the analog input for scanning.
	PLIB_ADCHS_AnalogInputScanSetup	Selects input to include in Analog Input Scan mode.
	PLIB_ADCHS_AnalogInputTriggerSourceSelect	Selects a trigger Source for analog input (Class 1 or Class 2 analog inputs only).
	PLIB_ADCHS_ChannelAnalogFeatureDisable	Disables the analog circuit for channels of High-Speed SAR ADC.
	PLIB_ADCHS_ChannelAnalogFeatureEnable	Enables the analog circuit for High-Speed SAR ADC channels.
	PLIB_ADCHS_ChannelConfigurationGet	Used to get the configuration for the specified channel.
	PLIB_ADCHS_ChannelConfigurationSet	Used to set the configuration for the specified channel.
	PLIB_ADCHS_ChannelDigitalFeatureDisable	Disables the digital circuit for channels of High-Speed SAR ADC.
	PLIB_ADCHS_ChannelDigitalFeatureEnable	Enables (turns ON) the digital circuit for channels.
	PLIB_ADCHS_ChannelInputSelect	Selects the analog input for Channel 0 to 6.
	PLIB_ADCHS_ChannelIsReady	Returns the state of the channel.
	PLIB_ADCHS_ChannelIsReadyInterruptDisable	Disables the Channel ready interrupt for the specified channel.
	PLIB_ADCHS_ChannelIsReadyInterruptEnable	Enables the Channel ready interrupt for the specified channel.
	PLIB_ADCHS_ChannelSetup	Configures the High-Speed SAR ADC channels.
	PLIB_ADCHS_ChannelTriggerSampleSelect	Selects the trigger and sampling modes for channels of High-Speed SAR ADC
	PLIB_ADCHS_ControlRegistersCanBeUpdated	Returns the status of update-ready.
	PLIB_ADCHS_ControlRegistersCanBeUpdatedInterruptDisable	Disables the update-ready interrupt.
	PLIB_ADCHS_ControlRegistersCanBeUpdatedInterruptEnable	Enables the update-ready interrupt.
	PLIB_ADCHS_CVDDisable	Disables the CVD feature.
	PLIB_ADCHS_CVDEnable	Enables the CVD feature.
	PLIB_ADCHS_CVDResultGet	Returns a CVD result measured by an ADCHS instance.
	PLIB_ADCHS_CVDSetup	Configures the CVD related setting of ADCHS channel.
	PLIB_ADCHS_DigitalComparatorAnalogInputGet	Returns the analog input ID used by the digital comparator.
	PLIB_ADCHS_DigitalComparatorAnalogInputSelect	Selects analog inputs, whose converted data will be processed by the comparator.
	PLIB_ADCHS_DigitalComparatorDisable	Disables the specified digital comparator.
	PLIB_ADCHS_DigitalComparatorEnable	Enables the specified digital comparator.
	PLIB_ADCHS_DigitalComparatorEventHasOccurred	Returns the status of the selected digital comparator.
	PLIB_ADCHS_DigitalComparatorInterruptDisable	Disables the interrupt for the selected digital comparator.
	PLIB_ADCHS_DigitalComparatorInterruptEnable	Enables the interrupt for the selected digital comparator.
	PLIB_ADCHS_DigitalComparatorLimitSet	Sets the limit for the specified digital comparator.

	PLIB_ADCHS_DigitalComparatorSetup	Configures the Digital Comparator on the High-Speed SAR ADC converter.
	PLIB_ADCHS_DigitalFilterAveragingModeSampleCountSelect	Selects the number of samples which are averaged by the Digital Filter.
	PLIB_ADCHS_DigitalFilterAveragingModeSetup	Configures the Digital Filter on the High-Speed SAR ADC converter in Averaging mode.
	PLIB_ADCHS_DigitalFilterDataGet	Used to fetch the data result from the Digital Filter.
	PLIB_ADCHS_DigitalFilterDataIsReady	Used to determine if the Digital Filter has data ready.
	PLIB_ADCHS_DigitalFilterDataReadyInterruptDisable	Disables the interrupt for the selected Digital Filter.
	PLIB_ADCHS_DigitalFilterDataReadyInterruptEnable	Enables the interrupt for the selected Digital Filter.
	PLIB_ADCHS_DigitalFilterDisable	Disables the Digital Filter.
	PLIB_ADCHS_DigitalFilterEnable	Enables the Digital Filter.
	PLIB_ADCHS_DigitalFilterOversamplingModeRatioSelect	Selects the oversampling ratio for the Digital Filter.
	PLIB_ADCHS_DigitalFilterOversamplingModeSetup	Configures the Digital Filter on the High-Speed SAR ADC converter in Oversampling mode.
	PLIB_ADCHS_Disable	High-Speed SAR ADC module is disabled (turned OFF).
	PLIB_ADCHS_DMABuffer_A_InterruptDisable	Disables the DMA Buffer A full interrupt for the specified Channel 0 to 6.
	PLIB_ADCHS_DMABuffer_A_InterruptEnable	Enables the DMA Buffer A full interrupt for the specified Channel 0 to 6.
	PLIB_ADCHS_DMABuffer_A_IsFull	Used to determine if the DMA Buffer A is full, for the specified Channel 0 to 6.
	PLIB_ADCHS_DMABuffer_B_InterruptDisable	Disables the DMA Buffer B full interrupt for the specified Channel 0 to 6.
	PLIB_ADCHS_DMABuffer_B_InterruptEnable	Enables the DMA Buffer B full interrupt for the specified Channel 0 to 6.
	PLIB_ADCHS_DMABuffer_B_IsFull	Used to determine if the DMA Buffer B is full, for the specified Channel 0 to 6.
	PLIB_ADCHS_DMADisable	Disables the DMA in the High-Speed SAR ADC module.
	PLIB_ADCHS_DMAEnable	Enables the DMA in the High-Speed SAR ADC module.
	PLIB_ADCHS_DMAOverflowErrorHasOccurred	Used to determine if the DMA Buff had an overflow error.
	PLIB_ADCHS_DMASetup	Configures the DMA on the High-Speed SAR ADC.
	PLIB_ADCHS_DMASourceRemove	Disables the DMA for the specified Channel 0 to 6.
	PLIB_ADCHS_DMASourceSelect	Enables the DMA for the specified Channel 0 to 6.
	PLIB_ADCHS_EarlyInterruptDisable	Disables the early interrupt for the ADCHS.
	PLIB_ADCHS_EarlyInterruptEnable	Enables the early interrupt for the ADCHS.
	PLIB_ADCHS_Enable	Enables the High-Speed SAR ADC module.
	PLIB_ADCHS_ExistsAnalogInputCheck	Identifies whether the System Configuration feature exists on the ADCHS module.
	PLIB_ADCHS_ExistsAnalogInputModeControl	Identifies whether the analog input mode control exists on the ADCHS module.
	PLIB_ADCHS_ExistsAnalogInputScan	Identifies whether the Analog input Scan exists on the ADCHS module.
	PLIB_ADCHS_ExistsChannelAnalogControl	Identifies whether the Channel Analog control exists on the ADCHS module.
	PLIB_ADCHS_ExistsChannelConfiguration	Identifies whether the Channel Configuration feature exists on the ADCHS module.
	PLIB_ADCHS_ExistsChannelDigitalControl	Identifies whether the Channel Digital control exists on the ADCHS module.
	PLIB_ADCHS_ExistsChannelInputSelectControl	Identifies whether the Channel 0 to 6 Input select feature exists on the ADCHS module.
	PLIB_ADCHS_ExistsConfiguration	Identifies whether the Configuration feature exists on the ADCHS module.
	PLIB_ADCHS_ExistsConversionResults	Identifies whether the Conversion Results feature exists on the ADCHS module.
	PLIB_ADCHS_ExistsCVD	Identifies whether the CVD exists on the ADCHS module.
	PLIB_ADCHS_ExistsDigitalComparator	Identifies whether the Digital Comparator feature exists on the ADCHS module .
	PLIB_ADCHS_ExistsDigitalFilter	Identifies whether the Digital Filter feature exists on the ADCHS module.

	PLIB_ADCHS_ExistsDMA	Identifies whether the DMA exists on the ADCHS module.
	PLIB_ADCHS_ExistsEarlyInterruptControl	Identifies whether the Early Interrupt control exists on the ADCHS module.
	PLIB_ADCHS_ExistsEnableControl	Identifies whether the EnableControl feature exists on the ADCHS module
	PLIB_ADCHS_ExistsExternalConversionRequestControl	Identifies whether the External Convert feature exists on the ADCHS module.
	PLIB_ADCHS_ExistsFIFO	Identifies whether the FIFO exists on the ADCHS module.
	PLIB_ADCHS_ExistsManualControl	Identifies whether the Manual control exists on the ADCHS module.
	PLIB_ADCHS_ExistsTriggerControl	Identifies whether the Trigger control exists on the ADCHS module.
	PLIB_ADCHS_ExistsTriggerSampleControl	Identifies whether the Trigger Sample control feature exists on the ADCHS module.
	PLIB_ADCHS_ExistsTurboMode	Identifies whether the Turbo mode feature exists on the ADCHS module.
	PLIB_ADCHS_ExistsUpdateReadyControl	Identifies whether the Update Ready feature exists on the ADCHS module.
	PLIB_ADCHS_ExistsVREFControl	Identifies whether the VREF control exists on the ADCHS module.
	PLIB_ADCHS_ExternalConversionRequestDisable	Disables the external conversion request.
	PLIB_ADCHS_ExternalConversionRequestEnable	Enables the external conversion request.
	PLIB_ADCHS_FIFODataCountGet	Returns the number of data to be read from FIFO.
	PLIB_ADCHS_FIFODataIsAvailable	Used to determine if the FIFO has data ready.
	PLIB_ADCHS_FIFODataIsNegative	Returns the sign of data stored in FIFO.
	PLIB_ADCHS_FIFODataReadyInterruptDisable	Disables the interrupt for FIFO.
	PLIB_ADCHS_FIFODataReadyInterruptEnable	Enables the interrupt for FIFO.
	PLIB_ADCHS_FIFODisable	Disables the FIFO in the High-Speed SAR ADC.
	PLIB_ADCHS_FIFOEnable	Enables the FIFO in the High-Speed SAR ADC
	PLIB_ADCHS_FIFOErrorHasOccurred	Used to determine if the FIFO has encountered an overflow error.
	PLIB_ADCHS_FIFORead	Used to fetch the data result from the FIFO.
	PLIB_ADCHS_FIFOSourceGet	Returns the channel ID using the FIFO.
	PLIB_ADCHS_FIFOSourceSelect	Sets the Channel 0 to 6 using the FIFO.
	PLIB_ADCHS_GlobalLevelSoftwareTriggerDisable	Disables the global level software trigger.
	PLIB_ADCHS_GlobalLevelSoftwareTriggerEnable	Initiates a global level software trigger.
	PLIB_ADCHS_GlobalSoftwareTriggerEnable	Initiate a Global Software Trigger.
	PLIB_ADCHS_ScanCompleteInterruptDisable	Disables the end of scan interrupt.
	PLIB_ADCHS_ScanCompleteInterruptEnable	Enables the end of scan interrupt.
	PLIB_ADCHS_Setup	Configures the High-Speed SAR ADC converter.
	PLIB_ADCHS_SoftwareConversionInputSelect	Selects the analog input of Channel 7 for manual conversion.
	PLIB_ADCHS_SoftwareConversionStart	Triggers the conversion of analog input signal connected to Channel 7.
	PLIB_ADCHS_SoftwareSamplingStart	Enables sampling of analog input for Channel 7.
	PLIB_ADCHS_SoftwareSamplingStop	Disables sampling of analog input for Channel 7, which places Channel 7 into Hold mode.
	PLIB_ADCHS_TriggerSuspendDisable	Disables trigger suspend.
	PLIB_ADCHS_TriggerSuspendEnable	Suspends all trigger for all ADCHS channels.
	PLIB_ADCHS_TurboModeChannelSelect	Configures the channels for Turbo mode.
	PLIB_ADCHS_TurboModeDisable	Disables Turbo mode for High-Speed SAR ADC module.
	PLIB_ADCHS_TurboModeEnable	Enables Turbo mode for the High-Speed SAR ADC module.
	PLIB_ADCHS_TurboModeErrorHasOccurred	Returns the error state of Turbo mode.
	PLIB_ADCHS_VREFFaultHasOccurred	Returns the state of VREF fault.
	PLIB_ADCHS_VREFFaultInterruptDisable	Disables the VREF Fault interrupt.
	PLIB_ADCHS_VREFFaultInterruptEnable	Enables the VREF fault interrupt.
	PLIB_ADCHS_VREFIsReady	Returns the state of VREF.
	PLIB_ADCHS_VREFReadyInterruptDisable	Disables the VREF ready interrupt.
	PLIB_ADCHS_VREFReadyInterruptEnable	Enables the VREF ready interrupt.

Description

High-Speed Successive Approximation Register Analog-to-Digital Converter (ADCHS) Peripheral Library Interface Header

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the ADCHS PLIB for all families of Microchip microcontrollers.The definitions in this file are common to ADCHS peripheral.

File Name

plib_adchs.h

Company

Microchip Technology Inc.

ADCP Peripheral Library

This section describes the Pipelined Analog-to-Digital Converter (ADCP) Peripheral Library.

Introduction

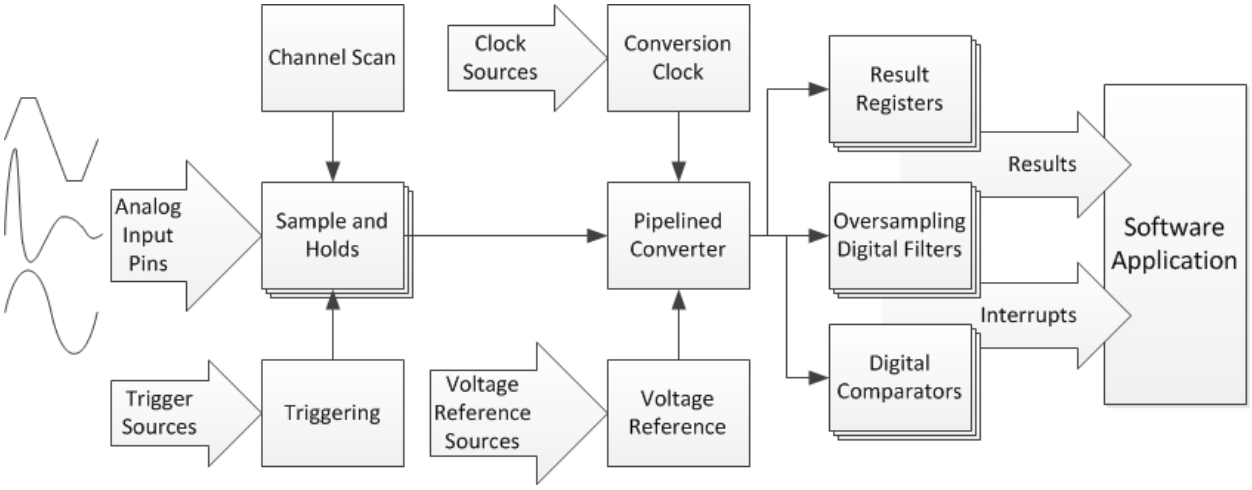
This library provides a low-level abstraction of the Pipelined Analog-to-Digital Converter (ADCP) Peripheral Library that is available on the Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, thereby hiding differences from one microcontroller variant to another.

Description

The Pipelined Analog-to-Digital Converter (ADCP) peripheral is used to convert an analog input into a digital number that represents that input voltage. When the input is periodically converted, the result is a sequence of digital values that have converted a continuous-time and continuous-amplitude analog signal to a discrete-time and discrete-amplitude digital signal. This particular ADC architecture is pipelined allowing it to simultaneously convert up to six samples, each at a different stage of conversion resulting in a low overall latency of multiple sampled inputs.

The structure of the ADCP is shown in the following diagram.

- Analog input pins connect to the sample and hold (S&H) circuits. These circuits capture the analog signal so that it can be passed to the pipeline converter.
- The S&H circuits are controlled by predefined trigger sources. These trigger sources switch the sample and hold circuit to hold and queue the conversion of the sample.
- Channel scan is available which allows a single trigger to start a sample/conversion sequence of multiple analog inputs using a predefined scan list
- A conversion clock is required for the pipeline converter. This clock determines the conversion speed and latency and affects power consumption.
- A voltage reference is required for the pipeline converter. This voltage reference determines allowable input range of the analog signal.
- Result registers store the conversion results and can be read by the software application. Software is notified of ready results by either polling or through the use of interrupts.
- Optional Oversampling Digital Filters can be used to provide increased measurement accuracy at the sacrifice of sample rate. Software is notified of ready oversampling results by either polling or through the use of interrupts.
- Optional digital comparators can be used to test conversion results independent of software and generate interrupts based on predefined conditions



Using the Library

This topic describes the basic architecture of the Pipelined Analog-to-Digital Converter (ADCP) Peripheral Library and provides information and examples on its use.

Description

Interface Header File: `plib_adcp.h`

The interface to the ADCP Peripheral library is defined in the `plib_adcp.h` header file, which is included by the `peripheral.h` file. Any C language source (`.c`) file that uses the Pipelined Analog-to-Digital Converter (ADCP) Peripheral library must include `peripheral.h`.

Library File:

The ADCP Peripheral library archive (`.a`) file is installed with MPLAB Harmony.

Please refer to the What is MPLAB Harmony? section for information on how the library interacts with the framework.

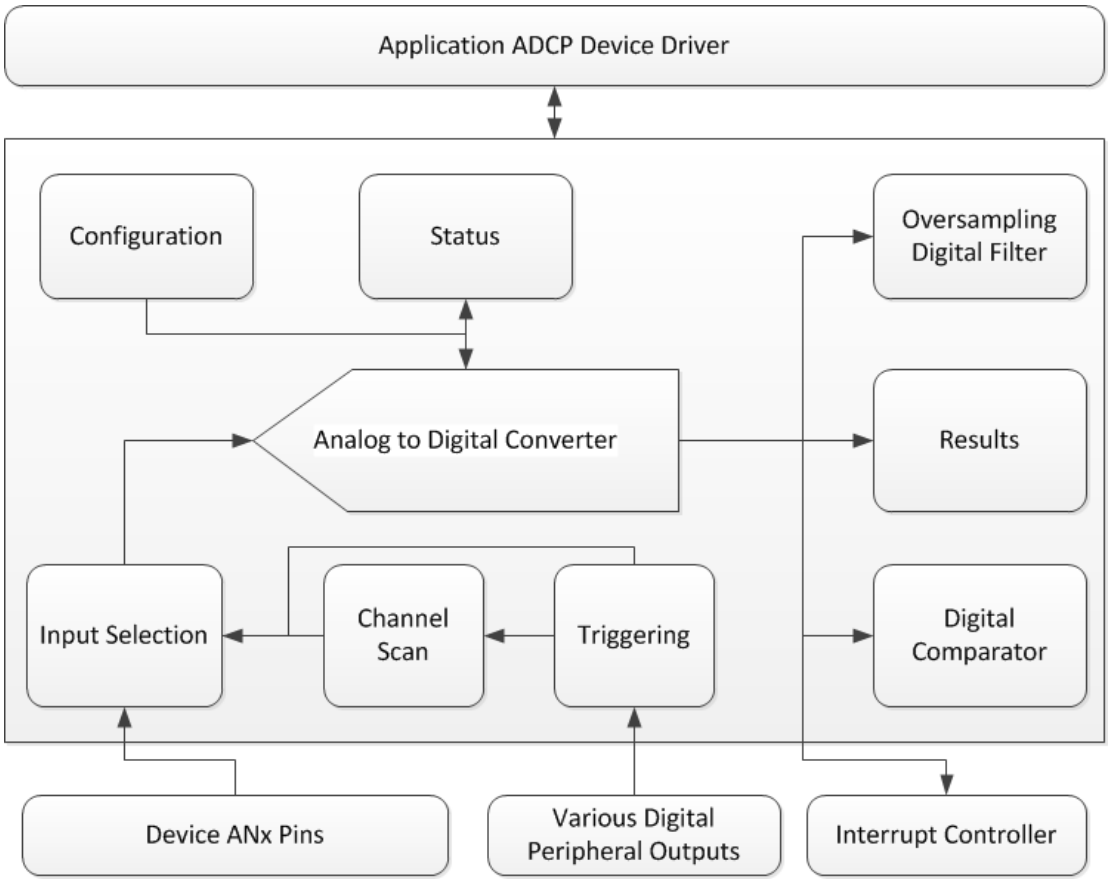
Hardware Abstraction Model

This library provides the low-level abstraction of the ADCP module on the Microchip family of microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in the software and introduces the library interface.

Note: The interface provided is a super set of all the functionality of the available Pipelined Analog-to-Digital Converter (ADCP) on the device. Refer to the **"ADC"** chapter in the specific device data sheet or the family reference manual section specified in that chapter to determine the set of functions that are supported for each ADCP module on the device.

Description

Pipelined Analog-to-Digital Converter (ADCP) Software Abstraction Block Diagram



Library Overview

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the ADCP module.

Library Interface Section	Description
Configuration Functions	These library functions are used to configure the ADC, enable and disable it, initiate a calibration and manage low power states.
Status Functions	These library functions return status information related to the ADC.
Input Selection Functions	These library functions select and configure the ANx inputs to the ADC.
Channel Scan Functions	These library functions are used to configure the channel scan feature.
Triggering Functions	These library functions are used to configure and initiate conversion triggers.
Analog Input Conversion Results Functions	These library function are used to retrieve individual conversion results for ANx pins.
Digital Comparator Functions	These library functions are used to configure and query the digital comparators.
Oversampling Digital Filter Functions	These library functions are used to configure the Oversampling Digital Filter and fetch results from it.

How the Library Works

Note: Not all modes are available on all devices. Please refer to the specific device data sheet to determine the supported modes.

Core Functionality

This topic describes the core functionality of the ADCP Peripheral Library.

Description

Analog-to-Digital conversion using the ADCP involves the following three steps:

1. Sampling of the input signal.
2. Capture of the input signal by the sample and hold (S&H) circuit and transfer to the converter.
3. Conversion of the analog signal to its digital representation.

Sampling of the input signal involves charging of the S&H capacitor. The sampling time must be adequate so that the capacitor charges to a value equal to the input voltage. At the appropriate time, the input is disconnected and the capacitor voltage is transferred to the converter. The converter then digitizes the analog signal and provides the result.

The converter requires a clock source and a reference voltage. The clock is referred to as the ADC clock and has a period of TAD. The clock and reference voltage sources are selectable, as well as the clock prescaling that determines the TAD.

The ADCP uses two types of S&H circuits: dedicated and shared. Each ADC implementation includes up to five dedicated S&H circuits and a single shared S&H. Analog inputs connected to the S&H circuits are categorized into three types: Class 1, Class 2, and Class 3.

- Class 1 inputs are associated with a dedicated S&H circuit. Each dedicated S&H has a single Class 1 input associated with it. Each Class 1 input has a unique trigger selection register. Class 1 inputs can also be part of a channel scan list, triggered by the common scan trigger source.
- Class 2 inputs are sampled only on the shared S&H and are either individually triggered or as part of a channel scan list. When used individually their trigger source is selected by their unique trigger register.
- Class 3 inputs are sampled only on the shared S&H and are used in channel scan exclusively. They share a common trigger source. When using channel scan it is possible to combine Class 1, Class 2, and Class 3 inputs in the scan list.

Note: For details regarding configuration and triggering options was well as sampling requirements, refer to the **"ADC"** chapter in the specific device data sheet or the family reference manual section specified in that chapter.

Example - Simultaneous Sampling Three Class 1 Inputs

Simultaneous sampling is used when the application requires capture of more than one signal at the same instance of time. Simultaneous sampling requires the use of multiple Class 1 inputs where each is assigned the same trigger source. The following example illustrates simultaneous sampling of AN0, AN1 and AN2 using the global software trigger as the trigger source. The dedicated Sample and Holds (S&H) circuits are configured for single-ended input and a unipolar (unsigned) output. No interrupts are used so the results are polled for ready status.

Example:

```
int32_t results[3] ;  // storage for results

// This structure is used to simplify testing for a ready channel
AN_READY anReady ;

// Configure the ADC
// AVDD/AVSS reference, ADC clock is system clock (SYSCLK) divided by 8
// No need to specify sample time for class 2/3 inputs or oversampling
// sample time as Class 2/3 inputs and oversampling is not used.
PLIB_ADCP_Configure ( ADCP_ID_1 ,
                      ADCP_VREF_AVDD_AVSS ,    // AVDD and AVSS as reference
                      FALSE ,                  // No VREF boost
                      FALSE ,                  // Do not use fractional format
                      FALSE ,                  // Do not stop in idle
                      ADCP_CLK_SRC_SYSCLK ,    // SYSCLK is the clock source
                      4 ,                      // TAD = 1/SYSCLK * 2 * 4
                                               // or ADC Clock = SYSCLK / (2 * 4)
                      0 ,                      // Oversampling is not used.
                      0 ,                      // No early interrupt.
                      0 );                     // No class 2 or 3 channels are used

// Set up the triggers
// Configure AN0 for triggering from software.
PLIB_ADCP_Class12TriggerConfigure ( ADCP_ID_1 ,
```

```
                                    ADCP_CLASS12_AN0 ,
                                    ADCP_TRG_SRC_SOFTWARE ) ;
    // Configure AN1 for triggering from software.
    PLIB_ADCP_Class12TriggerConfigure ( ADCP_ID_1 ,
                                    ADCP_CLASS12_AN1 ,
                                    ADCP_TRG_SRC_SOFTWARE ) ;
    // Configure AN2 for triggering from software.
    PLIB_ADCP_Class12TriggerConfigure ( ADCP_ID_1 ,
                                    ADCP_CLASS12_AN2 ,
                                    ADCP_TRG_SRC_SOFTWARE ) ;
    // Set S&H modes
    PLIB_ADCP_SHModeSelect ( ADCP_ID_1 , ADCP_SH0 , ADCP_SH_MODE_SINGLE_ENDED_UNIPOLAR ) ;
    PLIB_ADCP_SHModeSelect ( ADCP_ID_1 , ADCP_SH1 , ADCP_SH_MODE_SINGLE_ENDED_UNIPOLAR ) ;
    PLIB_ADCP_SHModeSelect ( ADCP_ID_1 , ADCP_SH2 , ADCP_SH_MODE_SINGLE_ENDED_UNIPOLAR ) ;
    // Enable the ADC Module
    PLIB_ADCP_Enable ( ADCP_ID_1 ) ;

    // Wait for a ready status
    while (!PLIB_ADCP_ModuleIsReady ( ADCP_ID_1 )) ;

    while (1)
    {
        // Initiate a trigger
        PLIB_ADCP_GlobalSoftwareTrigger ( ADCP_ID_1 ) ;

        // Wait for a data results to be ready
        // if lowest priority channel is done then all are done.
        do
        {
            anReady = PLIB_ADCP_ResultReady ( ADCP_ID_1 ) ;
        }
        while (anReady.AN2 == 0) ;

        // fetch AN0
        if (anReady.AN0 == 1)
            results[0] = PLIB_ADCP_ResultGet ( ADCP_ID_1 , ADCP_AN0 ) ;

        // fetch AN1
        if (anReady.AN1 == 1)
            results[1] = PLIB_ADCP_ResultGet ( ADCP_ID_1 , ADCP_AN1 ) ;

        // fetch AN2
        if (anReady.AN2 == 1)
            results[2] = PLIB_ADCP_ResultGet ( ADCP_ID_1 , ADCP_AN2 ) ;
     }
```

Example - Channel Scanning

Channel scanning is used in applications where precise timing of the sample to an external source is not needed. Channel scanning allows a large number of analog inputs to be sampled and converted in sequence each time a single trigger occurs. The following example illustrates how to configure channel scanning of multiple Class 2 and Class 3 inputs using the shared S&H. This example uses inputs AN5, AN11 - AN14. AN5 and AN11 are Class 2 inputs. AN13 and AN 14 are Class 3 inputs. The global software trigger is used to initiate the scan. A 4 TAD sample time is specified for the shared S&H. The shared S&H is configured for single-ended operation and a unipolar output. No interrupts are used so the results are polled for ready status.

Example:

```
    int32_t results[5] ;  // storage for results

    // This structure is used to simplify testing of the ready status
    AN_READY anReady ;

    // This structure is used to simplify specifying channels for scan
    // AN5, AN11, AN12, AN13 and AN14 are selected for scanning.
    AN_SELECT anSelect ;
    anSelect.highWord = 0 ;
    anSelect.lowWord = 0 ;
    anSelect.AN5 = 1 ;
    anSelect.AN11 = 1 ;
    anSelect.AN12 = 1 ;
```

```
anSelect.AN13 = 1 ;
anSelect.AN14 = 1 ;

// Configure the ADC
// AVDD/AVSS reference, ADC clock is system clock (SYSCLK) divided by 8
// The sample for the shared S&H must be adequate for all inputs.
// In this example it is set to 4 TAD.
// No need to specify sample time for oversampling as it is not used.
PLIB_ADCP_Configure ( ADCP_ID_1 ,
                      ADCP_VREF_AVDD_AVSS ,    // AVDD and AVSS as reference
                      FALSE ,                  // No VREF boost
                      FALSE ,                  // Do not use fractional format
                      FALSE ,                  // Do not stop in idle
                      ADCP_CLK_SRC_SYSCLK ,    // SYSCLK is the clock source
                      4 ,                      // TAD = 1/SYSCLK * 2 * 4
                                               // or ADC Clock = SYSCLK / (2 * 4)
                      0 ,                      // Oversampling is not used.
                      0 ,                      // No early interrupt.
                      3 ) ;                    // 3 + 1 = 4 TAD for Class 2 and 3
                                               // Sample Time.
// Specify the inputs to include in the Channel Scan using the selections made when
// initializing anSelect.  Use the software trigger to initiate the scan.
PLIB_ADCP_ChannelScanConfigure ( ADCP_ID_1 ,
                                 anSelect.lowWord , anSelect.highWord ,
                                 ADCP_SCAN_TRG_SRC_SOFTWARE ) ;

// Set S&H 5 (shared S&H) to use the single ended, unipolar mode
PLIB_ADCP_SHModeSelect ( ADCP_ID_1 , ADCP_SH5 , ADCP_SH_MODE_SINGLE_ENDED_UNIPOLAR ) ;

// Enable the ADC Module
PLIB_ADCP_Enable ( ADCP_ID_1 ) ;

// Wait for a ready status
while (!PLIB_ADCP_ModuleIsReady ( ADCP_ID_1 )) ;

while (1)
{
    // Initiate a trigger
    PLIB_ADCP_GlobalSoftwareTrigger ( ADCP_ID_1 ) ;

    // Wait for a data results to be ready
    // if lowest priority channel is done then all are done.
    do
    {
        anReady = PLIB_ADCP_ResultReady ( ADCP_ID_1 ) ;
    }
    while (anReady.AN14 == 0) ;

    // fetch AN5
    if (anReady.AN5 == 1)
        results[0] = PLIB_ADCP_ResultGet ( ADCP_ID_1 , ADCP_AN5 ) ;

    // fetch AN11
    if (anReady.AN11 == 1)
        results[1] = PLIB_ADCP_ResultGet ( ADCP_ID_1 , ADCP_AN11 ) ;

    // fetch AN12
    if (anReady.AN12 == 1)
        results[2] = PLIB_ADCP_ResultGet ( ADCP_ID_1 , ADCP_AN12 ) ;

    // fetch AN13
    if (anReady.AN13 == 1)
        results[3] = PLIB_ADCP_ResultGet ( ADCP_ID_1 , ADCP_AN13 ) ;

    // fetch AN14
    if (anReady.AN14 == 1)
        results[4] = PLIB_ADCP_ResultGet ( ADCP_ID_1 , ADCP_AN14 ) ;
}
```

Other Functionality

This topic provides information on additional functionality.

Description

The ADCP also implements a Digital Oversampling Filter and Digital Comparator.

The oversampling digital filter consists of an accumulator and a decimator (down-sampler), which function together as a low-pass filter. By sampling an analog input at a higher-than-required sample rate, and then processing the data through the oversampling digital filter, the number of usable bits of the ADCP module can be increased at the expense of decreased conversion throughput. For example, using 4x oversampling yields one extra usable bit , 16x oversampling yields two extra usable bits, 64x oversampling provides three extra usable bits, and 256x oversampling provides four extra usable bits. Once configured, the application provides a single trigger to the analog input specified for oversampling, it then fetches the result when the process is complete.

The ADCP module features a digital comparator that can be used to monitor selected analog input conversion results and generate an interrupt when a conversion result matches the user-specified limits. Conversion triggers are still required to initiate conversions. The comparison occurs automatically once the conversion is complete. When using a hardware source as a periodic trigger, it is possible to monitor analog inputs and create an interrupt when the converted level matches specified criteria without any software overhead.

Example - Digital Oversampling Filter

The Digital Oversampling filter can be used to increase resolution of the conversion result at the expense of throughput. The following example shows how two extra bits of resolution can be obtained using 16X oversampling (sixteen samples are used to create one higher resolution result). AN0 is used for the input. The sampling time for the retriggers is set to 3.5 TAD.

Example:

```
int32_t result; // storage for result

// Configure the ADC
// AVDD/AVSS reference, ADC clock is system clock (SYSCLK) divided by 8
// No need to specify sample time for Class 2/3 inputs as they are not used.
// Oversampling sample time is set to 3.5 TAD.
PLIB_ADCP_Configure(ADCP_ID_1,
                    ADCP_VREF_AVDD_AVSS, // AVDD and AVSS as reference
                    FALSE,               // No VREF boost
                    FALSE,               // Do not use fractional format
                    FALSE,               // Do not stop in idle
                    ADCP_CLK_SRC_SYSCLK, // SYSCLK is the clock source
                    4,                   // TAD = 1/SYSCLK * 2 * 4
                                         // or ADC Clock = SYSCLK / (2 * 4)
                    2,                   // 2 + 1.5 = 3.5 TAD between
                                         // oversampling triggers
                    0,                   // No early interrupt.
                    0);                  // No Class 2 and 3 are used.

// Set up the triggers
// Configure AN0 for triggering from software.
PLIB_ADCP_Class12TriggerConfigure(ADCP_ID_1, ADCP_CLASS12_AN0, ADCP_TRG_SRC_SOFTWARE);

// Set S&H modes
// Set S&H 0 to use the single ended, unipolar mode
PLIB_ADCP_SHModeSelect(ADCP_ID_1, ADCP_SH0, ADCP_SH_MODE_SINGLE_ENDED_UNIPOLAR);

// Configure the Oversampling Filter
PLIB_ADCP_OsampDigFilterConfig(ADCP_ID_1,            // ADCP module ID
                               ADCP_ODFLTR1,         // Filter ID
                               ADCP_AN0,             // Oversample AN0
                               ADCP_ODFLTR_16X,      // 16 x oversampling
                               FALSE);               // No Global Int Enable

// Enable ODFLTR0
PLIB_ADCP_OsampDigFilterEnable(ADCP_ID_1, ADCP_ODFLTR1);

// Enable the ADC Module
PLIB_ADCP_Enable(ADCP_ID_1);

// Wait for a ready status
```

```
while (!PLIB_ADCP_ModuleIsReady(ADCP_ID_1));

while (1) {
    // Initiate a trigger
    PLIB_ADCP_GlobalSoftwareTrigger(ADCP_ID_1);

    // Wait for data to be ready
    while (PLIB_ADCP_OsampDigFilterDataRdy(ADCP_ID_1, ADCP_ODFLTR1) == FALSE);

    // get the result
    result = PLIB_ADCP_OsampDigFilterDataGet(ADCP_ID_1, ADCP_ODFLTR1);

}
```

Example - Digital Comparator

The Digital Comparator is used to automatically evaluate results as they are output by the converter. The following example illustrates an automated

test of AN5 for values >= 80% of full scale or < 20% of full scale. A count is incremented each time an event occurs.

Example:

```
int32_t result; // storage for result
int32_t count = 0;

/* This structure is used to simplify testing for a ready channel */
AN_READY anReady;

// Configure the ADC
// AVDD/AVSS reference, ADC clock is system clock (SYSCLK) divided by 8
// The sample for the shared S&H must be adequate for all inputs.
// In this example it is set to 4 TAD.
// No need to specify sample time for oversampling as it is not used.
PLIB_ADCP_Configure(ADCP_ID_1,
                    ADCP_VREF_AVDD_AVSS, // AVDD and AVSS as reference
                    FALSE,               // No VREF boost
                    FALSE,               // Do not use fractional format
                    FALSE,               // Do not stop in idle
                    ADCP_CLK_SRC_SYSCLK, // SYSCLK is the clock source
                    4,                   // TAD = 1/SYSCLK * 2 * 4 or
                                         // ADC Clock = SYSCLK / (2 * 4)
                    0,                   // no oversampling
                    0,                   // No early interrupt.
                    3);                  // 3 + 1 = 4 TAD for Class 2 and 3 Sample Time.

// Set up the triggers
// Configure AN5 for triggering from software.
PLIB_ADCP_Class12TriggerConfigure(ADCP_ID_1, ADCP_CLASS12_AN5, ADCP_TRG_SRC_SOFTWARE);

// Set S&H modes
// Set S&H 5 to use the single ended, unipolar mode
PLIB_ADCP_SHModeSelect(ADCP_ID_1, ADCP_SH5, ADCP_SH_MODE_SINGLE_ENDED_UNIPOLAR);

// Configure the Digital Comparator
// Creates an event when the reading of AN5 is less than 20% or
// greater than or equal to 80% of the full scale 12-bit output.
PLIB_ADCP_DigCmpConfig(ADCP_ID_1,           // ADCP module ID
                       ADCP_DCMP1,          // Comparator ID
                       FALSE,               // No Global Int Enable
                       FALSE,               // no test for between low and high
                       TRUE,                // test for greater than or equal to high
                       FALSE,               // no test for less than high
                       FALSE,               // no test for greater than or equal to low
                       TRUE,                // test for less than low
                       1 << 5,              // enable AN5 for comparison
                       0xFFF - (0xFFF / 5), // high limit is 80% of full scale
                       0xFFF / 5);          // low limit is 20% of full scale

// Enable DigCmp1
```

```
PLIB_ADCP_DigCmpEnable(ADCP_ID_1, ADCP_DCMP1);

// Enable the ADC Module
PLIB_ADCP_Enable(ADCP_ID_1);

// Wait for a ready status
while (!PLIB_ADCP_ModuleIsReady(ADCP_ID_1));

while (1) {
    // Initiate a trigger
    PLIB_ADCP_GlobalSoftwareTrigger(ADCP_ID_1);

    // wait for conversion to complete
    do {
        anReady = PLIB_ADCP_ResultReady(ADCP_ID_1);
    } while (anReady.AN5 == 0);

    // Check result and increment count if an out of range event
    // occurred on digital comparator 1 for AN5
    if (PLIB_ADCP_DigCmpAIdGet(ADCP_ID_1, ADCP_DCMP1) == 5) {
        count++;
    }
}
```

Configuring the Library

The library is configured for the supported processor when the processor is chosen in the MPLAB X IDE.

Library Interface

a) Configuration Functions

	Name	Description
	PLIB_ADCP_Configure	Configures the Pipelined ADC module including the ADC calibration registers.
	PLIB_ADCP_Enable	Enables the Pipelined ADC module.
	PLIB_ADCP_Disable	Pipelined ADC module is disabled (turned OFF).
	PLIB_ADCP_CalibrationStart	Initiates Pipelined ADC Calibration.
	PLIB_ADCP_LowPowerStateEnter	Places the Pipelined ADC module in a low power state.
	PLIB_ADCP_LowPowerStateExit	Takes the Pipelined ADC module out of low power state and puts it into an operational mode.
	PLIB_ADCP_LowPowerStateGet	Returns the state of the low power setting.
	PLIB_ADCP_ExistsCalibration	Identifies whether the Calibration feature exists on the ADCP module.
	PLIB_ADCP_ExistsEnableControl	Identifies whether the EnableControl feature exists on the ADCP module.
	PLIB_ADCP_ExistsLowPowerControl	Identifies whether the LowPowerControl feature exists on the ADCP module.
	PLIB_ADCP_ExistsConfiguration	Identifies whether the Configuration feature exists on the ADCP module.

b) Status Functions

	Name	Description
	PLIB_ADCP_ModuleIsReady	Returns the overall ready status of the module.
	PLIB_ADCP_ExistsReadyStatus	Identifies whether the ReadyStatus feature exists on the ADCP module.

c) Input Selection Functions

	Name	Description
	PLIB_ADCP_AlternateInputSelect	Selects the alternate physical input for the specified dedicated (Class 1) S&H.
	PLIB_ADCP_DefaultInputSelect	Selects the default physical input for the specified dedicated (Class 1) S&H.
	PLIB_ADCP_ExistsInputSelect	Identifies whether the InputSelect feature exists on the ADCP module.
	PLIB_ADCP_ExistsModeSelect	Identifies whether the ModeSelect feature exists on the ADCP module.
	PLIB_ADCP_SHModeSelect	Selects the mode for the specified S&H.

d) Channel Scan Functions

	Name	Description
	PLIB_ADCP_ChannelScanConfigure	Selects input to include in Channel Scan Mode
	PLIB_ADCP_ExistsChannelScan	Identifies whether the ChannelScan feature exists on the ADCP module.

e) Triggering Functions

	Name	Description
	PLIB_ADCP_GlobalSoftwareTrigger	Initiates a Global Software Trigger on the specified module.
	PLIB_ADCP_IndividualTrigger	Triggers an individual channel independent of the configured trigger source
	PLIB_ADCP_Class12TriggerConfigure	Configures a Class 1 or Class 2 Trigger Source.
	PLIB_ADCP_ExistsTriggering	Identifies whether the Triggering feature exists on the ADCP module.

f) Individual Analog Input Conversion Results Functions

	Name	Description
	PLIB_ADCP_ResultReady	Returns the ADC conversion result ready bits for the module.
	PLIB_ADCP_ResultGet	Returns a Pipelined ADC conversion result.
	PLIB_ADCP_ResultReadyGrpIntConfigure	Selects input to include in global interrupt.
	PLIB_ADCP_ExistsConversionResults	Identifies whether the ConversionResults feature exists on the ADCP module.

g) Digital Comparator Functions

	Name	Description
	PLIB_ADCP_DigCmpEnable	Enables the Digital Comparator in the Pipelined ADC module.
	PLIB_ADCP_DigCmpDisable	Disables the Digital Comparator in the Pipelined ADC module.
	PLIB_ADCP_DigCmpAIdGet	Returns the Analog Input ID of for the Comparator Event
	PLIB_ADCP_DigCmpConfig	Configures the Digital Comparator on the Pipelined ADC converter.
	PLIB_ADCP_ExistsDigCmp	Identifies whether the DigitalComparator feature exists on the ADCP module.

h) Oversampling Digital Filter Functions

	Name	Description
	PLIB_ADCP_OsampDigFilterEnable	Enables the Oversampling Digital Filter in the Pipelined ADC module
	PLIB_ADCP_OsampDigFilterDisable	Disables the Oversampling Digital Filter in the Pipelined ADC module.
	PLIB_ADCP_OsampDigFilterDataRdy	Determines if the Oversampling Digital Filter has data ready.
	PLIB_ADCP_OsampDigFilterDataGet	Fetches the data result from the Oversampling Digital Filter.
	PLIB_ADCP_ExistsOsampDigFilter	Identifies whether the OsampDigitalFilter feature exists on the ADCP module.
	PLIB_ADCP_OsampDigFilterConfig	Configures the Oversampling Digital Filter on the Pipelined ADC converter.

i) Data Types and Constants

	Name	Description
	ADCP_MODULE_ID	Identifies the number of ADC Modules Supported.
	ADCP_VREF_SOURCE	Defines the ADCP VREF Source Select.
	ADCP_CLOCK_SOURCE	Defines the ADCP Clock Source Select.
	ADCP_CLASS12_INPUT_ID	Identifies the Class 1 and Class 2 ADC Inputs.
	ADCP_SH_ID	Identifies the supported S&H circuits regardless of type.
	ADCP_DSH_ID	Identifies the supported Dedicated Sample and Hold (S&H) circuits.
	ADCP_SH_MODE	Defines the available modes for the S&H.
	ADCP_INPUT_ID	Identifies the available ADC Inputs.
	ADCP_DCMP_ID	Identifies the supported Digital Comparators.
	ADCP_ODFLTR_ID	Identifies the supported Oversampling Digital Filters.
	ADCP_ODFLTR_OSR	Identifies the supported Digital Filter oversampling ratios.
	ADCP_SCAN_TRG_SRC	Defines the ADCP Channel Scan Trigger Source Selections.
	ADCP_TRG_SRC	Defines the ADCP Trigger Source Selections.
	AN_SELECT	This union of structures is provided to simply selection of analog inputs for inclusion in a particular function.
	AN_READY	This union (identical to the AN_SELECT union) is used as the return value by the PLIB_ADCP_Result_Ready function.

Description

This section describes the Application Programming Interface (API) functions of the Pipelined Analog-to-Digital Converter (ADCP) Peripheral Library.

Refer to each section for a detailed description.

a) Configuration Functions

PLIB_ADCP_Configure Function

Configures the Pipelined ADC module including the ADC calibration registers.

File

plib_adcp.h

C

```
void PLIB_ADCP_Configure(ADCP_MODULE_ID index, ADCP_VREF_SOURCE voltageRefSelect, bool boostVref, bool
fractionalOutputOn, bool stopInIdle, ADCP_CLOCK_SOURCE adcClockSource, int8_t adcClockDivider, int8_t
oversampleDigFilterSamTime, int8_t earlyIntEnable, int8_t class2and3SampleTime);
```

Returns

None.

Description

This function configures all ADC parameters common to all inputs. This configuration must occur prior to enabling the ADC and therefore must be called when the ADC is disabled.

Remarks

This function must be called when the ADC is disabled.

Preconditions

The module is disabled when calling this function.

Example

```
// Where MY_ADCP_INSTANCE, is the ADCP instance selected for use by the
// application developer.

// Configure the ADC
PLIB_ADCP_Configure( MY_ADCP_INSTANCE,
        ADCP_VREF_VREFP_VREFN,  // VREF+ and VREF- as reference
        FALSE,          // No VREF boost
        TRUE,           // Use fractional format
        TRUE,           // Do stop in idle
        ADCP_CLK_SRC_SYSCLK,    // SYSCLK is the clock source
        3,              // TAD = 1/SYSCLK * 2 * 3
                        // or ADC Clock = SYSCLK / (2 * 3)
        2,              // 2 + 1.5 = 3.5 TAD between
                        // oversampling triggers
        0,              // No early interrupt.
        3 );            // 3 + 1 = 4 TAD for Class 2 and 3
                        // Sample Time.

// Enable the ADC
PLIB_ADCP_Enable(MY_ADCP_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the ADCP instance
voltageRefSelect	VREF Source Selection
boostVref	Enables the VREF boost if TRUE.
Use when VREFH	VREFL < .64 (AVDD - AVSS)
fractionalOutputOn	sets output to a fractional format if TRUE

stopInIdle	sets ADC to stop when device is in idle mode if TRUE
adcClockSource	Clock source selection
adcClockDivider	Clock source divider. Values range from 0 to 254.
oversampleDigFilterSamTime	Sets the delay (sample time) between automatically generated oversampling filter triggers. Values range from 0 to 31 for 1.5 TAD to 32.5 TAD respectively.
earlyIntEnable	Sets the number of clocks prior to the actual arrival of data that the ADRDY bit is set. Range is 0 to 7. Used to generate an early interrupt.
class2and3SampleTime	Set the sample time for Class 2 and Class 3 inputs. Range is 0 to 255 for a sample time of 1 to 256, respectively.

Function

void PLIB_ADCP_Configure(ADCP_MODULE_ID index,
ADCP_VREF_SOURCE voltageRefSelect, // voltage reference
bool boostVref, // VREF boost
bool fractionalOutputOn, // result format fractional
bool stopInIdle, // stop in idle
ADCP_CLOCK_SOURCE adcClockSource, // clock source
int8_t adcClockDivider, // clock divider
int8_t oversampleDigFilterSamTime, // sample time between digital filter samples
int8_t earlyIntEnable, // early interrupt enable
int8_t class2and3SampleTime) // Class 2&3 Sample time

PLIB_ADCP_Enable Function

Enables the Pipelined ADC module.

File

plib_adcp.h

C

```
void PLIB_ADCP_Enable(ADCP_MODULE_ID index);
```

Returns

None.

Description

This function enables (turns ON) the selected Pipelined ADC module.

Remarks

None

Preconditions

None.

Example

```
// Where MY_ADCP_INSTANCE, is the ADCP instance selected for use by the
// application developer.
PLIB_ADCP_Enable(MY_ADCP_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the ADCP instance to be configured

Function

void PLIB_ADCP_Enable(ADCP_MODULE_ID index)

PLIB_ADCP_Disable Function

Pipelined ADC module is disabled (turned OFF).

File

plib_adcp.h

C

```
void PLIB_ADCP_Disable(ADCP_MODULE_ID index);
```

Returns

None.

Description

This function disables (turns OFF) the selected Pipelined ADC module.

Remarks

Not all functionality is available on all devices. Please refer to the specific device data sheet for the list of available features.

Preconditions

None.

Example

```
// Where MY_ADCP_INSTANCE, is the ADCP instance selected for use by the
// application developer.
PLIB_ADCP_Disable(MY_ADCP_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the ADCP instance to be configured

Function

void PLIB_ADCP_Disable(ADCP_MODULE_ID index)

PLIB_ADCP_CalibrationStart Function

Initiates Pipelined ADC Calibration.

File

plib_adcp.h

C

```
void PLIB_ADCP_CalibrationStart(ADCP_MODULE_ID index);
```

Returns

None.

Description

This function initiates calibration of the module. During calibration the module cannot perform conversion.

Remarks

Calibration is complete when PLIB_ADCP_ModuleIsReady() returns a TRUE result.

Preconditions

None.

Example

```
// Where MY_ADCP_INSTANCE, is the ADCP instance selected for use by the
// application developer.
PLIB_ADCP_CalibrationStart(MY_ADCP_INSTANCE);
    while (!PLIB_ADCP_ModuleIsRead(MY_ADCP_INSTANCE));
```

Parameters

Parameters	Description
index	Identifier for the ADCP instance to be configured

Function

void PLIB_ADCP_CalibrationStart(ADCP_MODULE_ID index)

PLIB_ADCP_LowPowerStateEnter Function

Places the Pipelined ADC module in a low power state.

File

plib_adcp.h

C

```
void PLIB_ADCP_LowPowerStateEnter(ADCP_MODULE_ID index);
```

Returns

None.

Description

This function places the Pipelined ADC module in a low power state. The feature is used in place of disabling the ADC when power reduction is needed. The Pipelined ADC can come out of low power state and be operational much faster since recalibration is not required.

Remarks

None.

Preconditions

The Pipelined ADC must be enabled.

Example

```
PLIB_ADCP_LowPowerStateEnter(MY_ADCP_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the ADCP instance

Function

void PLIB_ADCP_LowPowerStateEnter (ADCP_MODULE_ID index)

PLIB_ADCP_LowPowerStateExit Function

Takes the Pipelined ADC module out of low power state and puts it into an operational mode.

File

plib_adcp.h

C

```
void PLIB_ADCP_LowPowerStateExit(ADCP_MODULE_ID index);
```

Returns

None.

Description

This function takes the Pipelined ADC module out of a low power state and places it into an operational mode.

Remarks

The first five conversions following the exit from ADC Low-power mode may be subject to lower accuracy than specified in the device data sheet.

Preconditions

None.

Example

```
PLIB_ADCP_LowPowerStateExit(MY_ADCP_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the ADCP instance

Function

void PLIB_ADCP_LowPowerStateExit(ADCP_MODULE_ID index)

PLIB_ADCP_LowPowerStateGet Function

Returns the state of the low power setting.

File

plib_adcp.h

C

```
bool PLIB_ADCP_LowPowerStateGet(ADCP_MODULE_ID index);
```

Returns

A Boolean indicating the state of the low power setting.

Description

This function returns the state of the low power setting.

Remarks

None.

Preconditions

None.

Example

```
bool lowPowerSate = PLIB_ADCP_LowPowerStateGet(MY_ADCP_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the ADCP instance

Function

bool PLIB_ADCP_LowPowerStateGet(ADCP_MODULE_ID index)

PLIB_ADCP_ExistsCalibration Function

Identifies whether the Calibration feature exists on the ADCP module.

File

plib_adcp.h

C

```
bool PLIB_ADCP_ExistsCalibration(ADCP_MODULE_ID index);
```

Returns

Existence of the Calibration feature:

- true - When Calibration feature is supported on the device
- false - When Calibration feature is not supported on the device

Description

This function identifies whether the Calibration feature is available on the ADCP module. When this function returns true, this function is supported on the device:

- PLIB_ADCP_CalibrationStart

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ADCP_ExistsCalibration(ADCP_MODULE_ID index)

PLIB_ADCP_ExistsEnableControl Function

Identifies whether the EnableControl feature exists on the ADCP module.

File

plib_adcp.h

C

```
bool PLIB_ADCP_ExistsEnableControl(ADCP_MODULE_ID index);
```

Returns

Existence of the EnableControl feature:

- true - When EnableControl feature is supported on the device
- false - When EnableControl feature is not supported on the device

Description

This function identifies whether the EnableControl feature is available on the ADCP module. When this function returns true, these functions are supported on the device:

- PLIB_ADCP_Enable
- PLIB_ADCP_Disable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ADCP_ExistsEnableControl(ADCP_MODULE_ID index)

PLIB_ADCP_ExistsLowPowerControl Function

Identifies whether the LowPowerControl feature exists on the ADCP module.

File

plib_adcp.h

C

```
bool PLIB_ADCP_ExistsLowPowerControl(ADCP_MODULE_ID index);
```

Returns

Existence of the LowPowerControl feature:

- true - When LowPowerControl feature is supported on the device

- false - When LowPowerControl feature is not supported on the device

Description

This function identifies whether the LowPowerControl feature is available on the ADCP module. When this function returns true, these functions are supported on the device:

- PLIB_ADCP_LowPowerStateEnter
- PLIB_ADCP_LowPowerStateExit
- PLIB_ADCP_LowPowerStateGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ADCP_ExistsLowPowerControl(ADCP_MODULE_ID index)

PLIB_ADCP_ExistsConfiguration Function

Identifies whether the Configuration feature exists on the ADCP module.

File

plib_adcp.h

C

```
bool PLIB_ADCP_ExistsConfiguration(ADCP_MODULE_ID index);
```

Returns

Existence of the Configuration feature:

- true - When Configuration feature is supported on the device
- false - When Configuration feature is not supported on the device

Description

This function identifies whether the Configuration feature is available on the ADCP module. When this function returns true, this function is supported on the device:

- PLIB_ADCP_Configure

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ADCP_ExistsConfiguration(ADCP_MODULE_ID index)

b) Status Functions

PLIB_ADCP_ModuleIsReady Function

Returns the overall ready status of the module.

File

plib_adcp.h

C

```
bool PLIB_ADCP_ModuleIsReady(ADCP_MODULE_ID index);
```

Returns

Boolean indicating ready status.

Description

This function returns the ready status of the Pipelined ADC. The ADC must be ready before operation.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCP_INSTANCE, is the ADCP instance selected for use by the
// application developer.

// Enable the module
PLIB_ADCP_Enable(MY_ADCP_INSTANCE);

// wait for calibration to complete
while (!PLIB_ADCP_ModuleIsReady(MY_ADCP_INSTANCE));

// begin sampling
...
```

Parameters

Parameters	Description
index	Identifier for the ADCP instance

Function

bool PLIB_ADCP_ModuleIsReady(ADCP_MODULE_ID index)

PLIB_ADCP_ExistsReadyStatus Function

Identifies whether the ReadyStatus feature exists on the ADCP module.

File

plib_adcp.h

C

```
bool PLIB_ADCP_ExistsReadyStatus(ADCP_MODULE_ID index);
```

Returns

Existence of the ReadyStatus feature:

- true - When ReadyStatus feature is supported on the device
- false - When ReadyStatus feature is not supported on the device

Description

This function identifies whether the ReadyStatus feature is available on the ADCP module. When this function returns true, this function is supported on the device:

- PLIB_ADCP_ModuleIsReady

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ADCP_ExistsReadyStatus(ADCP_MODULE_ID index)

c) Input Selection Functions

PLIB_ADCP_AlternateInputSelect Function

Selects the alternate physical input for the specified dedicated (Class 1) S&H.

File

plib_adcp.h

C

```
void PLIB_ADCP_AlternateInputSelect(ADCP_MODULE_ID index, ADCP_DSH_ID id);
```

Returns

None.

Description

This function selects the alternate physical input for the specified S&H.

Remarks

None.

Preconditions

The function only applies to dedicated S&H circuits (Class 1 Inputs).

Example

```
// Where MY_ADCP_INSTANCE, is the ADCP instance selected for use by the
// application developer.

// Set S&H 1 to use the alternate input.
PLIB_ADCP_AlternateInputSelect(MY_ADCP_INSTANCE, ADCP_DSH1)
```

Parameters

Parameters	Description
index	Identifier for the ADCP instance
id	An ADCP_DSH_ID type indicating which dedicated Class 1 S&H to configure for its alternate input source.

Function

void PLIB_ADCP_AlternateInputSelect(ADCP_MODULE_ID index, ADCP_DSH_ID id)

PLIB_ADCP_DefaultInputSelect Function

Selects the default physical input for the specified dedicated (Class 1) S&H.

File

plib_adcp.h

C

```
void PLIB_ADCP_DefaultInputSelect(ADCP_MODULE_ID index, ADCP_DSH_ID id);
```

Returns

None.

Description

This function selects the default physical input for the specified S&H.

Remarks

None.

Preconditions

The function only applies to dedicated S&H circuits (Class 1 Inputs).

Example

```
// Where MY_ADCP_INSTANCE, is the ADCP instance selected for use by the
// application developer.

// Set S&H 1 to use the default input.
PLIB_ADCP_DefaultInputSelect(MY_ADCP_INSTANCE, ADCP_DSH1)
```

Parameters

Parameters	Description
index	Identifier for the ADCP instance
id	An ADCP_DSH_ID type indicating which dedicated Class 1 S&H to configure for its alternate input source.

Function

void PLIB_ADCP_DefaultInputSelect(ADCP_MODULE_ID index, ADCP_DSH_ID id)

PLIB_ADCP_ExistsInputSelect Function

Identifies whether the InputSelect feature exists on the ADCP module.

File

plib_adcp.h

C

```
bool PLIB_ADCP_ExistsInputSelect(ADCP_MODULE_ID index);
```

Returns

Existence of the InputSelect feature:

- true - When InputSelect feature is supported on the device
- false - When InputSelect feature is not supported on the device

Description

This function identifies whether the InputSelect feature is available on the ADCP module. When this function returns true, this function is supported on the device:

- PLIB_ADCP_DedicatedSHInputSelect

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ADCP_ExistsInputSelect(ADCP_MODULE_ID index)

PLIB_ADCP_ExistsModeSelect Function

Identifies whether the ModeSelect feature exists on the ADCP module.

File

plib_adcp.h

C

```
bool PLIB_ADCP_ExistsModeSelect(ADCP_MODULE_ID index);
```

Returns

Existence of the ModeSelect feature:

- true - When ModeSelect feature is supported on the device
- false - When ModeSelect feature is not supported on the device

Description

This function identifies whether the ModeSelect feature is available on the ADCP module. When this function returns true, this function is supported on the device:

- PLIB_ADCP_SHModeSelect

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ADCP_ExistsModeSelect(ADCP_MODULE_ID index)

PLIB_ADCP_SHModeSelect Function

Selects the mode for the specified S&H.

File

plib_adcp.h

C

```
void PLIB_ADCP_SHModeSelect(ADCP_MODULE_ID index, ADCP_DSH_ID id, ADCP_SH_MODE mode);
```

Returns

None.

Description

This function selects the mode (single ended or differential) and encoding (unipolar or two's compliment) for the specified S&H.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCP_INSTANCE, is the ADCP instance selected for use by the
// application developer.

// Set S&H 1 to use the single ended, two's complement mode
// selection.
```

```
PLIB_ADCP_SHModeSelect(MY_ADCP_INSTANCE,
                       ADCP_SH1,
                       ADCP_SH_MODE_SINGLE_ENDED_TWOS_COMP)
```

Parameters

Parameters	Description
index	Identifier for the ADCP instance
id	An ADCP_DSH_ID type indicating which dedicated S&H to configure to use its alternate source
mode	An ADCP_SH_MODE type indicating the mode selection

Function

void PLIB_ADCP_SHModeSelect(ADCP_MODULE_ID index,
ADCP_SH_ID id,
ADCP_SH_MODE mode)

d) Channel Scan Functions

PLIB_ADCP_ChannelScanConfigure Function

Selects input to include in Channel Scan Mode

File

plib_adcp.h

C

```
void PLIB_ADCP_ChannelScanConfigure(ADCP_MODULE_ID index, uint32_t lowEnable, uint32_t highEnable,
ADCP_SCAN_TRG_SRC triggerSource);
```

Returns

None.

Description

This function selects inputs, as determined by the low and high enable scan list for inclusion in the channel scan sequence. If the input is a Class 1 or Class 2 type, it will also select the trigger source for that input to be the scan trigger, which is required if included in channel scanning.

Remarks

The type def AN_SELECT can be used to create a variable to simplify selection of the inputs to include in the channel scan. This typedef creates bit field structures for each ANx input that are joined with unions for the low and high 32-bit words. See the code example for Channel scan in the ADCP PLIB help documentation for details on its use.

Preconditions

None.

Example

```
// Where MY_ADCP_INSTANCE, is the ADCP instance selected for use by the
// application developer.

// Configure Channel Scanning
// Channels 10 through 13
// Trigger on Timer 1 match.
PLIB_ADCP_ChannelScanConfigure(MY_ADCP_INSTANCE,
                               0XF000, //   AN12 - AN15
                               0X0F00, //  AN24 - AN27
                               ADCP_SCAN_TRG_SRC_TMR1_MATCH)
```

Parameters

Parameters	Description
index	Identifier for the ADCP instance
lowEnable	bit mask for selecting low order scan channels

highEnable	bit mask for selecting high order scan channels
triggerSource	Trigger source used to initiate channel scan

Function

void PLIB_ADCP_ChannelScanConfigure(ADCP_MODULE_ID index,
uint32_t lowEnable,
uint32_t highEnable,
ADCP_SCAN_TRG_SRC triggerSource)

PLIB_ADCP_ExistsChannelScan Function

Identifies whether the ChannelScan feature exists on the ADCP module.

File

plib_adcp.h

C

```
bool PLIB_ADCP_ExistsChannelScan(ADCP_MODULE_ID index);
```

Returns

Existence of the ChannelScan feature:

- true - When ChannelScan feature is supported on the device
- false - When ChannelScan feature is not supported on the device

Description

This function identifies whether the ChannelScan feature is available on the ADCP module. When this function returns true, this function is supported on the device:

- PLIB_ADCP_ChannelScanConfigure

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ADCP_ExistsChannelScan(ADCP_MODULE_ID index)

e) Triggering Functions

PLIB_ADCP_GlobalSoftwareTrigger Function

Initiates a Global Software Trigger on the specified module.

File

plib_adcp.h

C

```
void PLIB_ADCP_GlobalSoftwareTrigger(ADCP_MODULE_ID index);
```

Returns

None.

Description

All inputs or scan list that is configured to trigger on the global software trigger are triggered by this function.

Remarks

None.

Preconditions

None.

Example

```
PLIB_ADCP_GlobalSoftwareTrigger(MY_ADCP_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the ADCP instance

Function

void PLIB_ADCP_GlobalSoftwareTrigger(ADCP_MODULE_ID index)

PLIB_ADCP_IndividualTrigger Function

Triggers an individual channel independent of the configured trigger source

File

plib_adcp.h

C

```
void PLIB_ADCP_IndividualTrigger(ADCP_MODULE_ID index, ADCP_INPUT_ID inputId);
```

Returns

None.

Description

This function forces a trigger of an individual Class 1 or Class 2 channel independent of its configured trigger source.

Remarks

None.

Preconditions

The function only applies to Class 1 and Class 2 inputs.

Example

```
// Where MY_ADCP_INSTANCE, is the ADCP instance selected for use by the
// application developer.

// Force a trigger of AN5
PLIB_ADCP_IndividualTrigger(MY_ADCP_INSTANCE, ADCP_CLASS12_AN5)
```

Parameters

Parameters	Description
index	Identifier for the ADCP instance
inputId	An ADCP_INPUT_ID type indicating which input to trigger.

Function

void PLIB_ADCP_IndividualTrigger(ADCP_MODULE_ID index, ADCP_INPUT_ID inputId)

PLIB_ADCP_Class12TriggerConfigure Function

Configures a Class 1 or Class 2 Trigger Source.

File

plib_adcp.h

C

```
void PLIB_ADCP_Class12TriggerConfigure(ADCP_MODULE_ID index, ADCP_CLASS12_INPUT_ID inputId, ADCP_TRG_SRC
triggerSource);
```

Returns

none.

Description

This function configures the trigger source for Class 1 or Class 2 inputs. A call to this function is not required when the input is being used as part of a channel scan as the channel scan configure function also configures all trigger sources.

Remarks

None.

Preconditions

The function only applies to Class 1 and Class 2 inputs.

Example

```
// Where MY_ADCP_INSTANCE, is the ADCP instance selected for use by the
// application developer.

// Configure AN0 for triggering from INT0.
PLIB_ADCP_Class12TriggerConfigure(MY_ADCP_INSTANCE,
                                  ADCP_CLASS12_AN0,
                                  ADCP_TRG_SRC_INT0);
```

Parameters

Parameters	Description
index	Identifier for the ADCP instance
inputId	Class 1 or Class 2 input to configure the trigger for.
triggerSource	Trigger source to use for this input.

Function

void PLIB_ADCP_Class12TriggerConfigure(ADCP_MODULE_ID index,
ADCP_CLASS12_INPUT_ID inputId,
ADCP_TRG_SRC triggerSource)

PLIB_ADCP_ExistsTriggering Function

Identifies whether the Triggering feature exists on the ADCP module.

File

plib_adcp.h

C

```
bool PLIB_ADCP_ExistsTriggering(ADCP_MODULE_ID index);
```

Returns

Existence of the Triggering feature:

- true - When Triggering feature is supported on the device
- false - When Triggering feature is not supported on the device

Description

This function identifies whether the Triggering feature is available on the ADCP module. When this function returns true, these functions are supported on the device:

- PLIB_ADCP_Class12TriggerConfigure
- PLIB_ADCP_GlobalSoftwareTrigger
- PLIB_ADCP_IndividualTrigger

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ADCP_ExistsTriggering(ADCP_MODULE_ID index)

f) Individual Analog Input Conversion Results Functions

PLIB_ADCP_ResultReady Function

Returns the ADC conversion result ready bits for the module.

File

plib_adcp.h

C

```
AN_READY PLIB_ADCP_ResultReady(ADCP_MODULE_ID index);
```

Returns

A AN_READY type indicating conversion result status.

Description

This function returns a result indicating which analog inputs have conversion results ready.

Remarks

This function returns individual conversion results. It does not return results from the module.

Preconditions

None.

Example

```
// Where MY_ADCP_INSTANCE, is the ADCP instance selected for use by the
// application developer.
AN_READY     MyRdyStatus;

// check for data and process it
if ((MyRdyStatus = PLIB_ADCP_ResultReady(MY_ADCP_INSTANCE)) != 0) {
    // fetch the results and process
}
```

Parameters

Parameters	Description
index	Identifier for the ADCP instance

Function

AN_READY PLIB_ADCP_ResultReady(ADCP_MODULE_ID index)

PLIB_ADCP_ResultGet Function

Returns a Pipelined ADC conversion result.

File

plib_adcp.h

C

```
int32_t PLIB_ADCP_ResultGet(ADCP_MODULE_ID index, ADCP_INPUT_ID inputId);
```

Returns

The conversion result expressed as a 32-bit integer.

Description

This function returns the specified Pipelined ADC analog input conversion result.

Remarks

None.

Preconditions

A valid conversion is ready to be fetched.

Example

```
int32_t     result;
...
// fetch result for AN31
result = PLIB_ADCP_ResultGet( MY_ADCP_INSTANCE, ADCP_AN31 );
```

Parameters

Parameters	Description
index	Identifier for the ADCP instance
inputId	Identifier for the input

Function

int32_t PLIB_ADCP_ResultGet(ADCP_MODULE_ID index, ADCP_INPUT_ID inputId)

PLIB_ADCP_ResultReadyGrpIntConfigure Function

Selects input to include in global interrupt.

File

plib_adcp.h

C

```
void PLIB_ADCP_ResultReadyGrpIntConfigure(ADCP_MODULE_ID index, uint32_t lowEnable, uint32_t highEnable);
```

Returns

None.

Description

This function selects inputs, as determined by the input mask channel scan list for inclusion in the global or global interrupt.

Remarks

The type def AN_SELECT can be used to create a variable to simplify selection of the inputs to include in the global interrupt. This typedef creates bit field structures for each ANx input that are joined with unions for the low and high 32-bit words. See the code example for Channel scan in the ADCP PLIB help documentation for details on its use.

Preconditions

None.

Example

```
// Where MY_ADCP_INSTANCE, is the ADCP instance selected for use by the
// application developer.

// Configure Global Interrupts
// Analog inputs 10 through 13 are included in the global interrupt.
```

```
PLIB_ADCP_ResultReadyGrpIntConfigure(MY_ADCP_INSTANCE,
                                     0x0F00,    // inputs AN8 - AN11
                                     0x000F );  // inputs AN16 - AN19
```

Parameters

Parameters	Description
index	Identifier for the ADCP instance
lowEnable	bit mask for selecting low order scan channels
highEnable	bit mask for selecting high order scan channels

Function

void PLIB_ADCP_ResultReadyGrpIntConfigure(ADCP_MODULE_ID index,

uint32_t lowEnable,

uint32_t highEnable)

PLIB_ADCP_ExistsConversionResults Function

Identifies whether the ConversionResults feature exists on the ADCP module.

File

plib_adcp.h

C

```
bool PLIB_ADCP_ExistsConversionResults(ADCP_MODULE_ID index);
```

Returns

Existence of the ConversionResults feature:

- true - When ConversionResults feature is supported on the device
- false - When ConversionResults feature is not supported on the device

Description

This function identifies whether the ConversionResults feature is available on the ADCP module. When this function returns true, these functions are supported on the device:

- PLIB_ADCP_ResultReady
- PLIB_ADCP_ResultGet
- PLIB_ADCP_ResultReadyGrpIntConfigure

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ADCP_ExistsConversionResults(ADCP_MODULE_ID index)

g) Digital Comparator Functions

PLIB_ADCP_DigCmpEnable Function

Enables the Digital Comparator in the Pipelined ADC module.

File

plib_adcp.h

C

```
void PLIB_ADCP_DigCmpEnable(ADCP_MODULE_ID index, ADCP_DCMP_ID id);
```

Returns

None.

Description

This function enables (turns ON) the selected Digital Comparator in the specified Pipelined ADC module.

Remarks

None

Preconditions

The digital comparator should be configured using the PLIB_ADCP_Configure() function prior to enabling.

Example

```
// Where MY_ADCP_INSTANCE, is the ADCP instance selected for use by the
// application developer.

// Enable Digital Comparator 1
PLIB_ADCP_DigCmpEnable(MY_ADCP_INSTANCE, ADCP_DCMP1);
```

Parameters

Parameters	Description
index	Identifier for the ADCP instance
id	Identifier for the digital comparator in the ADCP module.

Function

void PLIB_ADCP_DigCmpEnable(ADCP_MODULE_ID index, ADCP_DCMP_ID id)

PLIB_ADCP_DigCmpDisable Function

Disables the Digital Comparator in the Pipelined ADC module.

File

plib_adcp.h

C

```
void PLIB_ADCP_DigCmpDisable(ADCP_MODULE_ID index, ADCP_DCMP_ID id);
```

Returns

None.

Description

This function Disables (turns OFF) the selected Digital Comparator in the specified Pipelined ADC module.

Remarks

None

Preconditions

None.

Example

```
// Where MY_ADCP_INSTANCE, is the ADCP instance selected for use by the
// application developer.

// Disable Digital Comparator 1
PLIB_ADCP_DigCmpDisable(MY_ADCP_INSTANCE, ADCP_DCMP1);
```

Parameters

Parameters	Description
index	Identifier for the ADCP instance
id	Identifier for the digital comparator in the ADCP module.

Function

void PLIB_ADCP_DigCmpDisable(ADCP_MODULE_ID index, ADCP_DCMP_ID id)

PLIB_ADCP_DigCmpAIdGet Function

Returns the Analog Input ID of for the Comparator Event

File

plib_adcp.h

C

```
int16_t PLIB_ADCP_DigCmpAIdGet(ADCP_MODULE_ID index, ADCP_DCMP_ID id);
```

Returns

Value 'x' of type int16_t where 'x' is the index to the analog input ANx, which caused the event or -1 if no event has occurred.

Description

This function tests the DigCmp Event Flag and if true, returns the ANx Identifier for the input that caused the event, or -1 if there was no pending DigCmp event. The ID value returned corresponds to numeric portion of the analog input ID, ANx.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCP_INSTANCE, is the ADCP instance selected for use by the
// application developer.
int16_t     DigCmpResult;

// Get Digital Comparator 1 result.
DigCmpResult = PLIB_ADCP_DigCmpAIdGet(MY_ADCP_INSTANCE, ADCP_DCMP1);
if (DigCmpResult != -1) {
    // process event
}
```

Parameters

Parameters	Description
index	Identifier for the ADCP instance
id	Identifier for the digital comparator in the ADCP module

Function

int16_t PLIB_ADCP_DigCmpAIdGet(ADCP_MODULE_ID index, ADCP_DCMP_ID id)

PLIB_ADCP_DigCmpConfig Function

Configures the Digital Comparator on the Pipelined ADC converter.

File

plib_adcp.h

C

```
void PLIB_ADCP_DigCmpConfig(ADCP_MODULE_ID index, ADCP_DCMP_ID id, bool globalIntEnable, bool
inBetweenOrEqual, bool greaterEqualHi, bool lessThanHi, bool greaterEqualLo, bool lessThanLo, uint32_t
inputEnable, int32_t hiLimit, int32_t loLimit);
```

Returns

None.

Description

This function configures all parameters for the Digital Comparator module of the pipelined ADC.

Remarks

This function must be called when the ADC is disabled. The format of hiLimit and loLimit must match the output format of the channel(s) specified in inputEnable.

Preconditions

The module is disabled when calling this function.

Example

```
// Where MY_ADCP_INSTANCE, is the ADCP instance selected for use by the
// application developer.

// Configure the Digital Comparator
// Creates an event when the reading of AN0 is between 20% to 80% of the
// full scale 12-bit output.
PLIB_ADCP_DigCmpConfig( MY_ADCP_INSTANCE,   // ADCP module ID
                        ADCP_DCMP1,       // Comparator ID
                        FALSE,            // Global Int Enable
                        TRUE,             // test for between low and high
                        FALSE,            // no test for greater than equal to high
                        FALSE,            // no test for less than high
                        FALSE,            // no test for greater than equal to low
                        FALSE,            // no test for less than low
                        1 << 3,           // enable AN3
                        0x0CCD,           // high limit, 80% of full scale
                        0x0333);          // low limit, 20% of full scale

// Enable Digital Comparator 1
PLIB_ADCP_DigCmpEnable(MY_ADCP_INSTANCE, ADCP_DCMP1);
```

Parameters

Parameters	Description
index	Identifier for the ADCP instance
id	Identifier for the digital comparator in this device
globalIntEnable	When set, comparator events are included in the Global Interrupt
inBetweenOrEqual	Event is generated when result is greater than or equal to loLimit and less than hiLimit
greaterEqualHi	Event is generated when result is greater than or equal to hiLimit
lessThanHi	Event is generated when result is less than hiLimit
greaterEqualLo	Event is generated when result is greater than or equal to loLimit
lessThanLo	Event is generated when result is less than loLimit
inputEnable	Bit field which determines which analog inputs are tested by this comparator module. Bit 0 applies to AN0 and bit 31 to AN31.
hiLimit	High limit in the same format as the conversion result.
loLimit	Low limit in the same format as the conversion result.

Function

```
void PLIB_ADCP_DigCmpConfig(   ADCP_MODULE_ID index,  // ADCP module ID
                               ADCP_DCMP_ID id,       // Comparator ID
bool globalIntEnable,  // Global Int Enable
bool inBetweenOrEqual, // between low and high
bool greaterEqualHi,   // greater than equal to high
bool lessThanHi,       // less than high
bool greaterEqualLo,   // greater than equal to low
bool lessThanLo,       // less than low
uint32_t inputEnable,  // input enable bits
```

```
int32_t  hiLimit,     // high limit
int32_t  loLimit )    // low limit
```

PLIB_ADCP_ExistsDigCmp Function

Identifies whether the DigitalComparator feature exists on the ADCP module.

File

plib_adcp.h

C

```
bool PLIB_ADCP_ExistsDigCmp(ADCP_MODULE_ID index);
```

Returns

Existence of the DigitalComparator feature:

- true - When DigitalComparator feature is supported on the device
- false - When DigitalComparator feature is not supported on the device

Description

This function identifies whether the DigitalComparator feature is available on the ADCP module. When this function returns true, these functions are supported on the device:

- PLIB_ADCP_DigCmpConfig
- PLIB_ADCP_DigCmpEnable
- PLIB_ADCP_DigCmpDisable
- PLIB_ADCP_DigCmpAIdGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ADCP_ExistsDigCmp(ADCP_MODULE_ID index)

h) Oversampling Digital Filter Functions

PLIB_ADCP_OsampDigFilterEnable Function

Enables the Oversampling Digital Filter in the Pipelined ADC module

File

plib_adcp.h

C

```
void PLIB_ADCP_OsampDigFilterEnable(ADCP_MODULE_ID index, ADCP_ODFLTR_ID id);
```

Returns

None.

Description

This function enables (turns ON) the selected Oversampling Digital Filter in the specified Pipelined ADC module.

Remarks

None.

Preconditions

The Oversampling Digital Filter should be configured using the PLIB_ADCP_Configure() function prior to enabling.

Example

```
// Where MY_ADCP_INSTANCE, is the ADCP instance selected for use by the
// application developer.

// Enable OsampDigFilter1
PLIB_ADCP_OsampDigFilterEnable(MY_ADCP_INSTANCE, ADCP_ODFLTR1);
```

Parameters

Parameters	Description
index	Identifier for the ADCP instance
id	Identifier for the digital Filter in the ADCP module

Function

void PLIB_ADCP_OsampDigFilterEnable(ADCP_MODULE_ID index, ADCP_ODFLTR_ID id)

PLIB_ADCP_OsampDigFilterDisable Function

Disables the Oversampling Digital Filter in the Pipelined ADC module.

File

plib_adcp.h

C

```
void PLIB_ADCP_OsampDigFilterDisable(ADCP_MODULE_ID index, ADCP_ODFLTR_ID id);
```

Returns

None.

Description

This function Disables (turns OFF) the selected Oversampling Digital Filter in the specified Pipelined ADC module.

Remarks

None.

Preconditions

None.

Example

```
// Where MY_ADCP_INSTANCE, is the ADCP instance selected for use by the
// application developer.

// Disable OsampDigFilter1
PLIB_ADCP_OsampDigFilterDisable(MY_ADCP_INSTANCE, ADCP_ODFLTR1);
```

Parameters

Parameters	Description
index	Identifier for the ADCP instance
id	Identifier for the digital Filter in the ADCP module

Function

void PLIB_ADCP_OsampDigFilterDisable(ADCP_MODULE_ID index, ADCP_ODFLTR_ID id)

PLIB_ADCP_OsampDigFilterDataRdy Function

Determines if the Oversampling Digital Filter has data ready.

File

plib_adcp.h

C

```
bool PLIB_ADCP_OsampDigFilterDataRdy(ADCP_MODULE_ID index, ADCP_ODFLTR_ID id);
```

Returns

Boolean:

- true - Data is ready
- false - Data is not ready

Description

This function can be used to determine if the ADCP digital filter has data ready. A TRUE is returned when data is available, which can be fetched using PLIB_ADCP_OsampDigFilterDataGet.

Remarks

None.

Preconditions

None.

Example

```
if (PLIB_ADCP_OsampDigFilterDataRdy(MY_ADCP_INSTANCE, ADCP_ODFLTR_ID_0)) {
            // fetch and process data
    }
```

Parameters

Parameters	Description
index	Identifier for the ADCP instance
id	Identifier for the digital Filter in this device

Function

bool PLIB_ADCP_OsampDigFilterDataRdy(ADCP_MODULE_ID index, ADCP_ODFLTR_ID id)

PLIB_ADCP_OsampDigFilterDataGet Function

Fetches the data result from the Oversampling Digital Filter.

File

plib_adcp.h

C

```
int16_t PLIB_ADCP_OsampDigFilterDataGet(ADCP_MODULE_ID index, ADCP_ODFLTR_ID id);
```

Returns

A 16-bit result in the format specified by the filter's oversampling setting.

Description

This function is used to fetch data from the Oversampling Digital Filter. The format of the data is determined by the oversampling setting configuration defined in the call of PLIB_ADCP_OsampDigFilterConfig.

Remarks

None.

Preconditions

None.

Example

```
int16_t myODFLTRResult;

if (PLIB_ADCP_OsampDigFilterDataRdy(MY_ADCP_INSTANCE, ADCP_ODFLTR1)) {
    // fetch data
    myODFLTRResult = PLIB_ADCP_OsampDigFilterDataGet(MY_ADCP_INSTANCE, ADCP_ODFLTR1);
    // process result
    ...
```

}

Parameters

Parameters	Description
index	Identifier for the ADCP instance
dfltrID	Identifier for the digital Filter in this device

Function

int16_t PLIB_ADCP_OsampDigFilterDataGet(ADCP_MODULE_ID index, ADCP_ODFLTR_ID dfltrID)

PLIB_ADCP_ExistsOsampDigFilter Function

Identifies whether the OsampDigitalFilter feature exists on the ADCP module.

File

plib_adcp.h

C

```
bool PLIB_ADCP_ExistsOsampDigFilter(ADCP_MODULE_ID index);
```

Returns

Existence of the OsampDigitalFilter feature:

- true - When OsampDigitalFilter feature is supported on the device
- false - When OsampDigitalFilter feature is not supported on the device

Description

This function identifies whether the OsampDigitalFilter feature is available on the ADCP module. When this function returns true, these functions are supported on the device:

- PLIB_ADCP_OsampDigFilterConfig
- PLIB_ADCP_OsampDigFilterEnable
- PLIB_ADCP_OsampDigFilterDisable
- PLIB_ADCP_OsampDigFilterDataRdy
- PLIB_ADCP_OsampDigFilterDataGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ADCP_ExistsOsampDigFilter(ADCP_MODULE_ID index)

PLIB_ADCP_OsampDigFilterConfig Function

Configures the Oversampling Digital Filter on the Pipelined ADC converter.

File

plib_adcp.h

C

```
void PLIB_ADCP_OsampDigFilterConfig(ADCP_MODULE_ID index, ADCP_ODFLTR_ID id, ADCP_INPUT_ID inputId,
ADCP_ODFLTR_SAMPLE_RATIO oversampleRatio, bool globalIntEnable);
```

Returns

None.

Description

Configures all parameters for the Oversampling Digital Filter module of the pipelined ADC.

Remarks

This function must be called when the ADC is disabled.

Preconditions

The Oversampling Digital Filter module is disabled when calling this function.

Example

```
// Where MY_ADCP_INSTANCE, is the ADCP instance selected for use by the
// application developer.

// Configure the Oversampling Digital Filter
// AN4 is oversampled at a 16X rate.  No global interrupt is enabled.
PLIB_ADCP_OsampDigFilterConfig( MY_ADCP_INSTANCE,   // ADCP module ID
                                ADCP_ODFLTR1,       // Filter ID
                                ADCP_AN4,           // Oversample AN4
                                ADCP_ODFLTR_16X,    // 16 x oversampling
                                FALSE );            // No Global Int Enable

// Enable OsampDigFilter1
PLIB_ADCP_OsampDigFilterEnable(MY_ADCP_INSTANCE, ADCP_ODFLTR1);
```

Parameters

Parameters	Description
index	Identifier for the ADCP instance
id	Identifier for the digital Filter in this device
inputId	Identifier for the analog input to be oversampled
oversampleRatio	Enumerator specifying the oversampling ratio
globalIntEnable	When set, Filter events are included in the Global Interrupt

Function

void PLIB_ADCP_OsampDigFilterConfig(ADCP_MODULE_ID index, // ADCP module ID
ADCP_ODFLTR_ID id, // Filter ID
ADCP_INPUT_ID inputId, // Input Id
ADCP_ODFLTR_OSR oversampleRatio, // Oversampling ratio
bool globalIntEnable) // Global Int Enable

i) Data Types and Constants

ADCP_MODULE_ID Enumeration

Identifies the number of ADC Modules Supported.

File

help_plib_adcp.h

C

```
typedef enum {
  ADCP_ID_1,
  ADC_NUMBER_OF_MODULES
} ADCP_MODULE_ID;
```

Members

Members	Description
ADCP_ID_1	ADC Module 1 ID
ADC_NUMBER_OF_MODULES	Number of available ADC modules.

Description

This enumeration identifies the available ADC modules.

Remarks

The caller should not rely on the specific numbers assigned to any of these values as they may change from one processor to the next.

Not all modules will be available on all microcontrollers. Refer to the data sheet for the specific controller in use to determine which modules are supported. The numbers used in the enumeration values will match the numbers provided in the data sheet.

ADCP_VREF_SOURCE Enumeration

Defines the ADCP VREF Source Select.

File

help_plib_adcp.h

C

```
typedef enum {
  ADCP_VREF_AVDD_AVSS,
  ADCP_VREF_VREFP_AVSS,
  ADCP_VREF_AVDD_VREFN,
  ADCP_VREF_VREFP_VREFN
} ADCP_VREF_SOURCE;
```

Members

Members	Description
ADCP_VREF_AVDD_AVSS	Reference voltage set to AVDD and AVSS
ADCP_VREF_VREFP_AVSS	Reference voltage set to VREF positive and AVSS
ADCP_VREF_AVDD_VREFN	Reference voltage set to AVDD and VREF negative
ADCP_VREF_VREFP_VREFN	Reference voltage set to VREF positive and VREF negative

Description

ADCP VREF Source Select

This data type defines the ADCP Reference Voltage (VREF) Source Select.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADCP_CLOCK_SOURCE Enumeration

Defines the ADCP Clock Source Select.

File

help_plib_adcp.h

C

```
typedef enum {
  ADCP_CLK_SRC_NONE,
  ADCP_CLK_SRC_SYSCLK,
  ADCP_CLK_SRC_RFCLK3,
  ADCP_CLK_SRC_FRC
} ADCP_CLOCK_SOURCE;
```

Members

Members	Description
ADCP_CLK_SRC_NONE	TAD clock disabled
ADCP_CLK_SRC_SYSCLK	TAD clock set to SYSCLK (TCY)
ADCP_CLK_SRC_RFCLK3	TAD clock set to REFCLK3
ADCP_CLK_SRC_FRC	TAD clock set to FRC

Description

This enumeration data type defines the ADCP Clock Source Select.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADCP_CLASS12_INPUT_ID Enumeration

Identifies the Class 1 and Class 2 ADC Inputs.

File

help_plib_adcp.h

C

```
typedef enum {
  ADCP_CLASS12_AN0,
  ADCP_CLASS12_AN1,
  ADCP_CLASS12_AN2,
  ADCP_CLASS12_AN3,
  ADCP_CLASS12_AN4,
  ADCP_CLASS12_AN5,
  ADCP_CLASS12_AN6,
  ADCP_CLASS12_AN7,
  ADCP_CLASS12_AN8,
  ADCP_CLASS12_AN9,
  ADCP_CLASS12_AN10,
  ADCP_CLASS12_AN11
} ADCP_CLASS12_INPUT_ID;
```

Members

Members	Description
ADCP_CLASS12_AN0	Analog Input AN0
ADCP_CLASS12_AN1	Analog Input AN1
ADCP_CLASS12_AN2	Analog Input AN2
ADCP_CLASS12_AN3	Analog Input AN3
ADCP_CLASS12_AN4	Analog Input AN4
ADCP_CLASS12_AN5	Analog Input AN5
ADCP_CLASS12_AN6	Analog Input AN6
ADCP_CLASS12_AN7	Analog Input AN7
ADCP_CLASS12_AN8	Analog Input AN8
ADCP_CLASS12_AN9	Analog Input AN9
ADCP_CLASS12_AN10	Analog Input AN10
ADCP_CLASS12_AN11	Analog Input AN11

Description

ADC Class 1 and Class 2 Input ID

This data type identifies the Class 1 and Class 2 ADC analog inputs.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADCP_SH_ID Enumeration

Identifies the supported S&H circuits regardless of type.

File

help_plib_adcp.h

C

```
typedef enum {
  ADCP_SH0,
  ADCP_SH1,
  ADCP_SH2,
  ADCP_SH3,
  ADCP_SH4,
```

```
  ADCP_SH5,
  ADCP_NUMBER_OF_SH
} ADCP_SH_ID;
```

Members

Members	Description
ADCP_SH0	S&H 0
ADCP_SH1	S&H 1
ADCP_SH2	S&H 2
ADCP_SH3	S&H 3
ADCP_SH4	S&H 4
ADCP_SH5	S&H 5
ADCP_NUMBER_OF_SH	Number of S&H circuits

Description

ADCP S&H Select

This enumeration identifies all supported S&H circuits.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADCP_DSH_ID Enumeration

Identifies the supported Dedicated Sample and Hold (S&H) circuits.

File

help_plib_adcp.h

C

```
typedef enum {
  ADCP_DSH0,
  ADCP_DSH1,
  ADCP_DSH2,
  ADCP_DSH3,
  ADCP_DSH4,
  ADCP_NUMBER_OF_DSH
} ADCP_DSH_ID;
```

Members

Members	Description
ADCP_DSH0	Dedicated S&H 0
ADCP_DSH1	Dedicated S&H 1
ADCP_DSH2	Dedicated S&H 2
ADCP_DSH3	Dedicated S&H 3
ADCP_DSH4	Dedicated S&H 4
ADCP_NUMBER_OF_DSH	Number of Dedicated S&H circuits

Description

ADCP Dedicated S&H Select

This enumeration identifies the supported Dedicated S&H circuits.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADCP_SH_MODE Enumeration

Defines the available modes for the S&H.

File

help_plib_adcp.h

C

```
typedef enum {
  ADCP_SH_MODE_SINGLE_ENDED_UNIPOLAR,
  ADCP_SH_MODE_SINGLE_ENDED_TWOS_COMP,
  ADCP_SH_MODE_DIFFERENTIAL_UNIPOLAR,
  ADCP_SH_MODE_DIFFERENTIAL_TWOS_COMP
} ADCP_SH_MODE;
```

Members

Members	Description
ADCP_SH_MODE_SINGLE_ENDED_UNIPOLAR	Single-ended input, Unipolar encoded
ADCP_SH_MODE_SINGLE_ENDED_TWOS_COMP	Single-ended input, two's compliment encoded
ADCP_SH_MODE_DIFFERENTIAL_UNIPOLAR	Differential input, Unipolar encoded
ADCP_SH_MODE_DIFFERENTIAL_TWOS_COMP	Differential input, two's compliment encoded

Description

ADCP S&H Mode

This data type defines the available modes for the S&H.

Remarks

None.

ADCP_INPUT_ID Enumeration

Identifies the available ADC Inputs.

File

help_plib_adcp.h

C

```
typedef enum {
  ADCP_AN0,
  ADCP_AN1,
  ADCP_AN2,

ADCP_ODFLTR5	ODFLTR5
ADCP_ODFLTR6	ODFLTR6
ADCP_NUMBER_OF_ODFLTR	Number of Oversampling Digital Filters

Description

ADCP Oversampling Digital Filter

This enumeration identifies all supported Digital Filters for this ADCP module.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADCP_ODFLTR_OSR Enumeration

Identifies the supported Digital Filter oversampling ratios.

File

help_plib_adcp.h

C

```
typedef enum {
  ADCP_ODFLTR_4X,
  ADCP_ODFLTR_16X,
  ADCP_ODFLTR_64X,
  ADCP_ODFLTR_256X,
  ADCP_ODFLTR_2X,
  ADCP_ODFLTR_8X,
  ADCP_ODFLTR_32X,
  ADCP_ODFLTR_128X
} ADCP_ODFLTR_OSR;
```

Members

Members	Description
ADCP_ODFLTR_4X	4x oversampling, shift sum 1 bit to right, output data is 13 bits
ADCP_ODFLTR_16X	16x oversampling, shift sum 2 bits to right, output data is 14 bits
ADCP_ODFLTR_64X	64x oversampling, shift sum 3 bits to right, output data is 15 bits
ADCP_ODFLTR_256X	256x oversampling, shift sum 4 bits to right, output data is 16 bits
ADCP_ODFLTR_2X	2x oversampling, shift sum 0 bits to right, output data is in 12.1 format
ADCP_ODFLTR_8X	8x oversampling, shift sum 1 bit to right, output data is in 13.1 format
ADCP_ODFLTR_32X	32x oversampling, shift sum 2 bits to right, output data is in 14.1 format
ADCP_ODFLTR_128X	128x oversampling, shift sum 3 bit to right, output data is in 15.1 format

Description

ADCP Oversampling Ratio

This enumeration identifies all supported Digital Filter oversampling ratios for this ADCP module. Oversampling ratios determine the number of samples used to generate a single output and the resulting resolution and format.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADCP_SCAN_TRG_SRC Enumeration

Defines the ADCP Channel Scan Trigger Source Selections.

File

help_plib_adcp.h

C

```
typedef enum {
  ADCP_SCAN_TRG_SRC_NONE,
  ADCP_SCAN_TRG_SRC_SOFTWARE,
  ADCP_SCAN_TRG_SRC_INT0,
  ADCP_SCAN_TRG_SRC_TMR1_MATCH,
  ADCP_SCAN_TRG_SRC_TMR3_MATCH,
  ADCP_SCAN_TRG_SRC_TMR5_MATCH,
  ADCP_SCAN_TRG_SRC_OCMP1,
  ADCP_SCAN_TRG_SRC_OCMP3,
  ADCP_SCAN_TRG_SRC_OCMP5,
  ADCP_SCAN_TRG_SRC_COMP1_COUT,
  ADCP_SCAN_TRG_SRC_COMP2_COUT
} ADCP_SCAN_TRG_SRC;
```

Members

Members	Description
ADCP_SCAN_TRG_SRC_NONE	No scan trigger source is selected
ADCP_SCAN_TRG_SRC_SOFTWARE	Global Software trigger selected as scan trigger source
ADCP_SCAN_TRG_SRC_INT0	Interrupt 0 (INT0) selected as scan trigger source
ADCP_SCAN_TRG_SRC_TMR1_MATCH	Timer 1 Match (TMR1) selected as scan trigger source
ADCP_SCAN_TRG_SRC_TMR3_MATCH	Timer 3 Match (TMR3) selected as scan trigger source

ADCP_SCAN_TRG_SRC_TMR5_MATCH	Timer 5 Match (TMR5) selected as scan trigger source
ADCP_SCAN_TRG_SRC_OCMP1	Output Compare 1 (OCMP1) selected as scan trigger source
ADCP_SCAN_TRG_SRC_OCMP3	Output Compare 3 (OCMP3) selected as scan trigger source
ADCP_SCAN_TRG_SRC_OCMP5	Output Compare 5 (OCMP5) selected as scan trigger source
ADCP_SCAN_TRG_SRC_COMP1_COUT	Analog Comparator 1 (COUT) selected as scan trigger source
ADCP_SCAN_TRG_SRC_COMP2_COUT	Analog Comparator 2 (COUT) selected as scan trigger source

Description

ADCP Channel Scan Trigger Source Select

This data type defines the ADCP Channel Scan Trigger Source Selections.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

ADCP_TRG_SRC Enumeration

Defines the ADCP Trigger Source Selections.

File

help_plib_adcp.h

C

```
typedef enum {
  ADCP_TRG_SRC_NONE,
  ADCP_TRG_SRC_SOFTWARE,
  ADCP_TRG_SRC_SCAN_TRG,

  ADCP_TRG_SRC_COMP2_COUT
} ADCP_TRG_SRC;
```

Members

Members	Description
ADCP_TRG_SRC_NONE	No trigger source is selected
ADCP_TRG_SRC_SOFTWARE	Global Software trigger selected as the trigger source
ADCP_TRG_SRC_SCAN_TRG	Use the Channel Scan Trigger as the trigger source (input is part of ch scan)
ADCP_TRG_SRC_INT0	Interrupt 0 (INT0) selected as the trigger source
ADCP_TRG_SRC_TMR1_MATCH	Timer 1 Match (TMR1) selected as the trigger source
ADCP_TRG_SRC_TMR3_MATCH	Timer 3 Match (TMR3) selected as the trigger source
ADCP_TRG_SRC_TMR5_MATCH	Timer 5 Match (TMR5) selected as the trigger source
ADCP_TRG_SRC_OCMP1	Output Compare 1 (OCMP1) selected as the trigger source
ADCP_TRG_SRC_OCMP3	Output Compare 3 (OCMP3) selected as the trigger source
ADCP_TRG_SRC_OCMP5	Output Compare 5 (OCMP5) selected as the trigger source
ADCP_TRG_SRC_COMP1_COUT	Analog Comparator 1 (COUT) selected as the trigger source
ADCP_TRG_SRC_COMP2_COUT	Analog Comparator 2 (COUT) selected as the trigger source

Description

ADCP Trigger Source Select

This data type defines the ADCP Trigger Source Selections.

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

AN_SELECT Union

This union of structures is provided to simply selection of analog inputs for inclusion in a particular function.

File

plib_adcp.h

C

```
union AN_SELECT {
  int ret_val;
  struct {
    uint32_t lowWord;
    uint32_t highWord;
  };
  struct {
    uint32_t AN0 : 1;
    uint32_t AN1 : 1;
    uint32_t AN2 : 1;
    uint32_t AN3 : 1;
    uint32_t AN4 : 1;
    uint32_t AN5 : 1;
    uint32_t AN6 : 1;
    uint32_t AN7 : 1;
    uint32_t AN8 : 1;
    uint32_t AN9 : 1;
    uint32_t AN10 : 1;
    uint32_t AN11 : 1;
    uint32_t AN12 : 1;
    uint32_t AN13 : 1;
    uint32_t AN14 : 1;
    uint32_t AN15 : 1;
    uint32_t AN16 : 1;
    uint32_t AN17 : 1;
    uint32_t AN18 : 1;
    uint32_t AN19 : 1;
    uint32_t AN20 : 1;
    uint32_t AN21 : 1;
    uint32_t AN22 : 1;

    uint32_t AN60 : 1;
    uint32_t AN61 : 1;
    uint32_t AN62 : 1;
    uint32_t AN63 : 1;
  };
};
```

Description

ADCP AN Select Union

The structure labels identify the analog inputs associated with each bit when initializing the structure. Unsigned 32-bit integers, lowWord and highWord are used as arguments to the function.

Remarks

See the Channel Scanning example in the ADCP Help documentation regarding use of this type define.

AN_READY Type

This union (identical to the AN_SELECT union) is used as the return value by the PLIB_ADCP_Result_Ready function.

File

plib_adcp.h

C

```
typedef AN_SELECT AN_READY;
```

Description

ADCP AN Ready Union

The structure labels identify the analog inputs associated with each bit for testing ready status of individual inputs. Unsigned 32-bit integers, lowWord and highWord allow for testing ready status of groups of bits using a mask.

Remarks

See the Simultaneous Sampling or Channel Scanning examples in the ADCP Help documentation regarding use of this type define.

Description

This section lists the source and header files used by the library.

plib_adcp.h

ADCP Peripheral Library Interface Header for ADCP common definitions

Functions

	Name	Description
	PLIB_ADCP_AlternateInputSelect	Selects the alternate physical input for the specified dedicated (Class 1) S&H.
	PLIB_ADCP_CalibrationStart	Initiates Pipelined ADC Calibration.
	PLIB_ADCP_ChannelScanConfigure	Selects input to include in Channel Scan Mode
	PLIB_ADCP_Class12TriggerConfigure	Configures a Class 1 or Class 2 Trigger Source.
	PLIB_ADCP_Configure	Configures the Pipelined ADC module including the ADC calibration registers.
	PLIB_ADCP_DefaultInputSelect	Selects the default physical input for the specified dedicated (Class 1) S&H.
	PLIB_ADCP_DigCmpAIdGet	Returns the Analog Input ID of for the Comparator Event
	PLIB_ADCP_DigCmpConfig	Configures the Digital Comparator on the Pipelined ADC converter.

	PLIB_ADCP_DigCmpDisable	Disables the Digital Comparator in the Pipelined ADC module.
	PLIB_ADCP_DigCmpEnable	Enables the Digital Comparator in the Pipelined ADC module.
	PLIB_ADCP_Disable	Pipelined ADC module is disabled (turned OFF).
	PLIB_ADCP_Enable	Enables the Pipelined ADC module.
	PLIB_ADCP_ExistsCalibration	Identifies whether the Calibration feature exists on the ADCP module.
	PLIB_ADCP_ExistsChannelScan	Identifies whether the ChannelScan feature exists on the ADCP module.
	PLIB_ADCP_ExistsConfiguration	Identifies whether the Configuration feature exists on the ADCP module.
	PLIB_ADCP_ExistsConversionResults	Identifies whether the ConversionResults feature exists on the ADCP module.
	PLIB_ADCP_ExistsDigCmp	Identifies whether the DigitalComparator feature exists on the ADCP module.
	PLIB_ADCP_ExistsEnableControl	Identifies whether the EnableControl feature exists on the ADCP module.
	PLIB_ADCP_ExistsInputSelect	Identifies whether the InputSelect feature exists on the ADCP module.
	PLIB_ADCP_ExistsLowPowerControl	Identifies whether the LowPowerControl feature exists on the ADCP module.
	PLIB_ADCP_ExistsModeSelect	Identifies whether the ModeSelect feature exists on the ADCP module.
	PLIB_ADCP_ExistsOsampDigFilter	Identifies whether the OsampDigitalFilter feature exists on the ADCP module.
	PLIB_ADCP_ExistsReadyStatus	Identifies whether the ReadyStatus feature exists on the ADCP module.
	PLIB_ADCP_ExistsTriggering	Identifies whether the Triggering feature exists on the ADCP module.
	PLIB_ADCP_GlobalSoftwareTrigger	Initiates a Global Software Trigger on the specified module.
	PLIB_ADCP_IndividualTrigger	Triggers an individual channel independent of the configured trigger source
	PLIB_ADCP_LowPowerStateEnter	Places the Pipelined ADC module in a low power state.
	PLIB_ADCP_LowPowerStateExit	Takes the Pipelined ADC module out of low power state and puts it into an operational mode.
	PLIB_ADCP_LowPowerStateGet	Returns the state of the low power setting.
	PLIB_ADCP_ModuleIsReady	Returns the overall ready status of the module.
	PLIB_ADCP_OsampDigFilterConfig	Configures the Oversampling Digital Filter on the Pipelined ADC converter.
	PLIB_ADCP_OsampDigFilterDataGet	Fetches the data result from the Oversampling Digital Filter.
	PLIB_ADCP_OsampDigFilterDataRdy	Determines if the Oversampling Digital Filter has data ready.
	PLIB_ADCP_OsampDigFilterDisable	Disables the Oversampling Digital Filter in the Pipelined ADC module.
	PLIB_ADCP_OsampDigFilterEnable	Enables the Oversampling Digital Filter in the Pipelined ADC module
	PLIB_ADCP_ResultGet	Returns a Pipelined ADC conversion result.
	PLIB_ADCP_ResultReady	Returns the ADC conversion result ready bits for the module.
	PLIB_ADCP_ResultReadyGrpIntConfigure	Selects input to include in global interrupt.
	PLIB_ADCP_SHModeSelect	Selects the mode for the specified S&H.

Types

	Name	Description
	AN_READY	This union (identical to the AN_SELECT union) is used as the return value by the PLIB_ADCP_Result_Ready function.

Unions

	Name	Description
	AN_SELECT	This union of structures is provided to simply selection of analog inputs for inclusion in a particular function.

Description

Pipelined Analog-to-Digital Converter (ADCP) Peripheral Library Interface Header

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the ADCP PLIB for all families of Microchip microcontrollers. The definitions in this file are common to the ADCP peripheral.

File Name

plib_adcp.h

Company

Microchip Technology Inc.

help_plib_adcp.h

ADCP Peripheral Library interface header file template.

Enumerations

	Name	Description
	ADCP_CLASS12_INPUT_ID	Identifies the Class 1 and Class 2 ADC Inputs.
	ADCP_CLOCK_SOURCE	Defines the ADCP Clock Source Select.
	ADCP_DCMP_ID	Identifies the supported Digital Comparators.
	ADCP_DSH_ID	Identifies the supported Dedicated Sample and Hold (S&H) circuits.
	ADCP_INPUT_ID	Identifies the available ADC Inputs.
	ADCP_MODULE_ID	Identifies the number of ADC Modules Supported.
	ADCP_ODFLTR_ID	Identifies the supported Oversampling Digital Filters.
	ADCP_ODFLTR_OSR	Identifies the supported Digital Filter oversampling ratios.
	ADCP_SCAN_TRG_SRC	Defines the ADCP Channel Scan Trigger Source Selections.
	ADCP_SH_ID	Identifies the supported S&H circuits regardless of type.
	ADCP_SH_MODE	Defines the available modes for the S&H.
	ADCP_TRG_SRC	Defines the ADCP Trigger Source Selections.
	ADCP_VREF_SOURCE	Defines the ADCP VREF Source Select.

BMX Peripheral Library

This section describes the Bus Matrix (BMX) Peripheral Library.

Introduction

This library provides a low-level abstraction of the Bus Matrix (BMX) modules on Microchip microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, thus hiding differences from one microcontroller variant to another.

Description

The Bus Matrix is essentially a high-speed switch that establishes connections between devices. Devices can be either master (initiator) or slave (target).

The Bus Matrix also performs these other important functions:

- Partition memory - The Bus Matrix provides the ability to partition both RAM and Flash memory into kernel and user areas. It also controls the type of access, program or data, for each memory area.
- Enable/disable program Flash memory cache for Direct Memory Access (DMA)
- Enable/disable bus error exceptions - The Bus Matrix provides the ability to disable bus error exceptions for debugging. They are enabled by default.
- Set Bus Arbitration mode - The Bus Matrix provides the ability to select between arbitration modes. The arbitration modes control the order and priority of initiator access to peripherals.

Using the Library

This topic describes the basic architecture of the BMX Peripheral Library and provides information and examples on its use.

Description

Interface Header File: `plib_bmx.h`

The interface to the BMX library is defined in the `plib_bmx.h` header file, which is included by the `peripheral.h` peripheral library header file. Any C language source (`.c`) file that uses the BMX library must include `peripheral.h`.

Library File:

The BMX Peripheral Library is part of the processor-specific peripheral library archive (`.a`) file installed with the compiler. Libraries in this archive are automatically available to the linker (in the default search path) for any project built using the Microchip compiler.

Please refer to the What is MPLAB Harmony? section for information on how the library interacts with the framework.

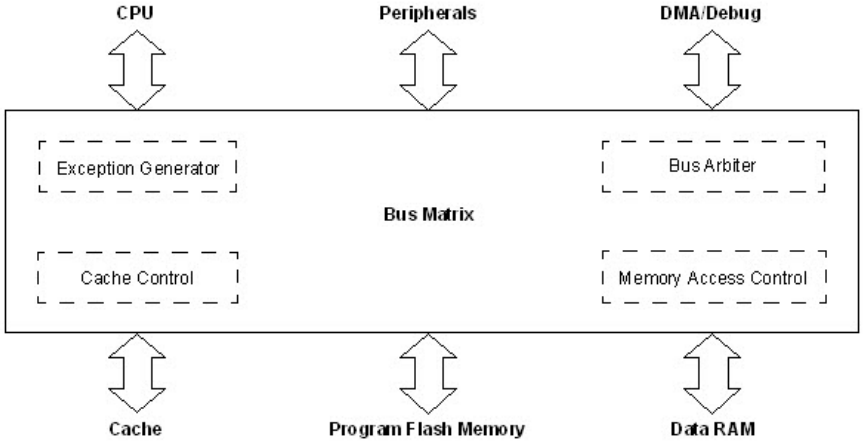
Hardware Abstraction Model

This library provides a low-level abstraction of the BMX module on Microchip family microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Description

The following figure shows the Bus Matrix hardware abstraction model.

Hardware Abstraction Model



The BMX Peripheral Library provides interface routines to interact with the blocks shown in the previous diagram.

The **Exception Generator** generates a bus error exception for unmapped address accesses from all Bus Matrix initiators:

- Initiator Expansion Interface (IXI) shared bus
- In-Circuit Debug (ICD) unit
- Direct Memory Access (DMA) controller
- CPU data bus
- CPU instruction bus

Each of the initiators can be individually enabled or disabled with Exception Generator peripheral library routines. All are enabled by default.

The **Cache Control** simply enables/disables program Flash memory (PFM) data cacheability for DMA accesses. The default setting is disabled. When enabled, the PCACHE module must have data caching enabled.

The **Bus Arbitrator** assigns priority levels to bus initiators following one of three priority schemes:

- Fixed, with CPU higher than DMA
- Fixed, with DMA higher than CPU (default)
- Rotating between four priority sequences

The **Memory Access Control** partitions program Flash memory and RAM into kernel and user areas. The RAM can be further partitioned into data and program segments for both kernel and user areas. By default, the full PFM and RAM are mapped to Kernel mode.

Library Overview

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the BMX module.

Library Interface Section	Description
Bus Exception Routines	Provide an interface to individually enable or disable initiator access to unmapped memory.
Program Flash Cache Routines	Provide an interface to enable or disable caching of DMA accesses to Program Flash Memory.
Arbiter Routines	Provide an interface to set or change the bus initiator priority sequence.
Memory Access Control Routines	Provide an interface to partition Program Flash and Data Memories into user and kernel regions. Provide an interface to read the size of the Boot Flash, Program Flash and Data SRAM memories.
Feature Existence Routines	These functions determine whether or not a particular feature is supported by the device.

How the Library Works

The Bus Matrix is initialized in the start-up code, before an application is invoked. Most applications will not need to modify the Bus Matrix default settings. The BMX Peripheral Library is available for those applications requiring more complex memory partitioning, including operating systems and applications requiring specialized memory access. The ability to disable exceptions for unmapped memory access may be useful for debugging, but is not recommended for normal use. Changes to the arbitration scheme may improve performance for CPU or DMA intensive applications.

Exception Generator

Any unmapped address access by a Bus Matrix initiator will by default generate an exception. These exceptions may be individually enabled or disabled with the peripheral library.

Example: Enable CPU instruction exception

```
// Enable CPU instruction exception
PLIB_BMX_ISBusExceptionEnable();
```

Cache Control

This peripheral library function enables program Flash memory (data) cacheability for DMA accesses. Data caching must be enabled in the Pcache. Hits are still read from the cache, but misses do not update the cache. This function is disabled by default.

Example: Enable PFM Cacheability for DMA access

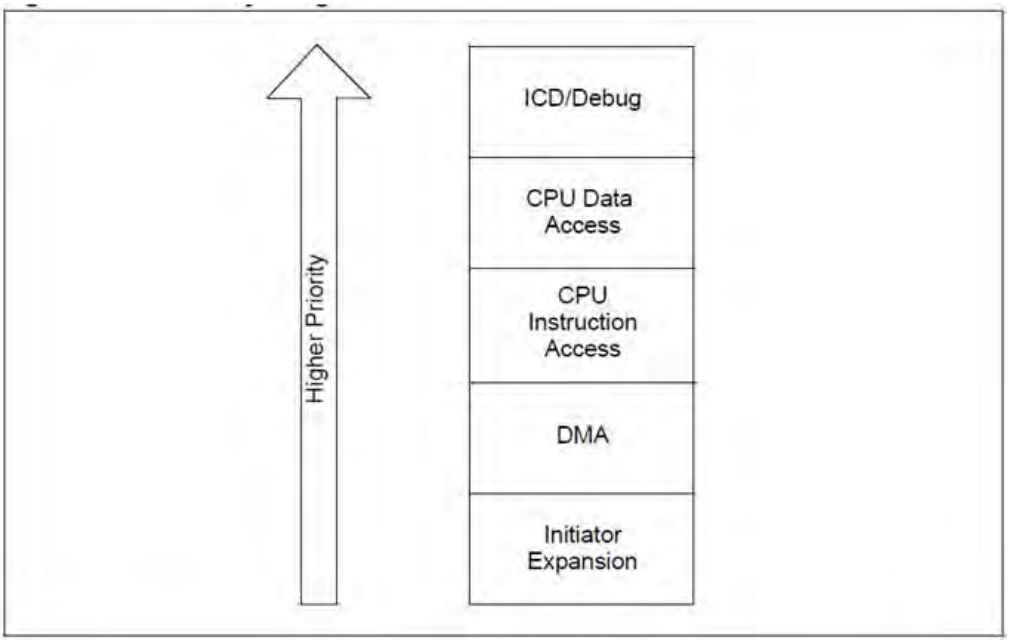
```
PLIB_BMX_EnablePfmCacheDma()
```

Bus Arbiter

Since there can be more than one initiator attempting to access the same target, an arbitration scheme must be used to control access to the target. The arbitration modes assign priority levels to all the initiators. The initiator with the higher priority level will always win target access over a lower priority initiator. The BMX Bus Arbitrator allows the programmer to select from one of three arbitration modes.

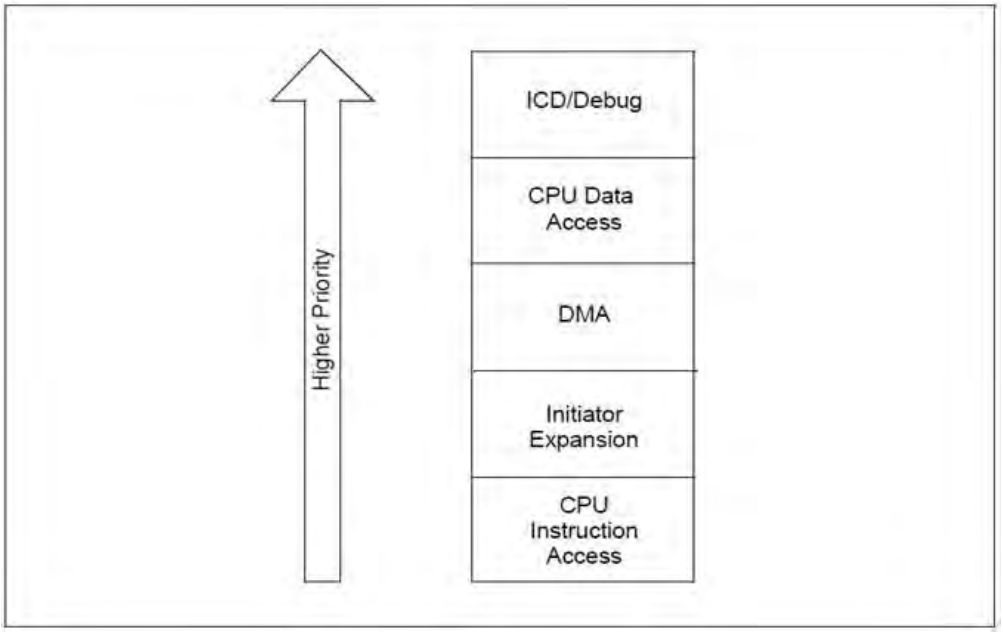
PLIB_BMX_ARB_MODE_INST

Arbitration mode 0 is a fixed priority scheme, with the CPU given higher priority than DMA. This mode can starve the DMA, so choose this mode when DMA is not being used.



PLIB_BMX_ARB_MODE_DMA

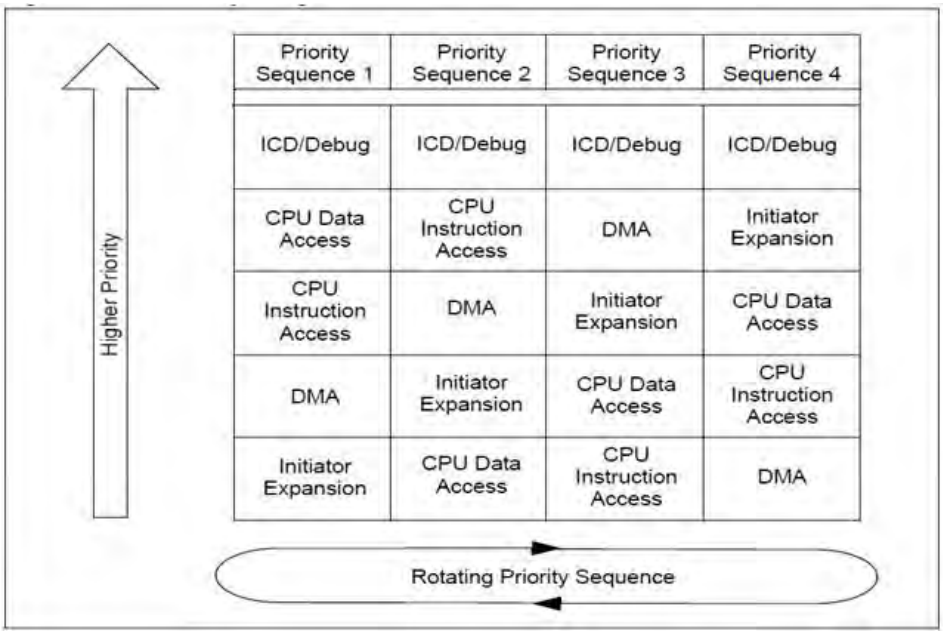
Arbitration Mode 1 is a fixed priority scheme like Mode 0, except that the CPU is always the lowest priority. Mode 1 is the default mode.



PLIB_BMX_ARB_MODE_ROT

Mode 2 arbitration supports rotating priority assignments to all initiators. Instead of a fixed priority assignment, each initiator is assigned the highest priority in a rotating fashion. In this mode, the rotating priority is applied with the following exceptions:

1. CPU data is always selected over CPU instruction.
2. ICD is always the highest priority.
3. When the CPU is processing an exception (EXL = 1) or an error (ERL = 1), the arbitrator temporarily reverts to Mode 0.



Note: Priority Sequence 2 is not selected in the rotation priority scheme if there is a pending CPU data access. In this case, once the data access is complete, Sequence 2 is selected.

Example: Set Bus Arbitration Mode to Rotating Priority

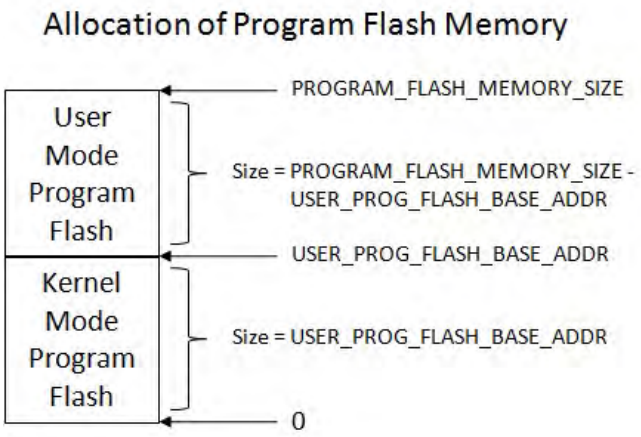
```
PLIB_BMX_SetArbitrationMode(PLIB_BMX_ARB_ROT);
```

Memory Access Control

The Bus Matrix allows the programmer to partition program Flash memory into user and kernel partitions. It also allows the programmer to partition data RAM into user and kernel partitions, each of which can be sub-divided into program and data partitions. At reset, the entire program Flash memory is one kernel partition and the entire data RAM is one kernel data partition.

Program Flash Memory Partitioning

Partitioning of the program Flash memory is accomplished by setting the offset of the user partition within the program Flash memory using the PLIB_BMX_ProgramFlashPartitionSet function. The size of the program Flash memory varies among devices, but can be retrieved with the PLIB_BMX_ProgramFlashMemorySizeGet function. The offset must be a multiple of the program Flash memory block size. The program Flash memory block size may vary among devices. If programmed with a value that is not a multiple of the block size, the value will automatically be truncated to a block size boundary. At reset, the entire program Flash memory is mapped to Kernel mode.



Example: Create a User Mode Partition of 12K in Program Flash Memory

```
size_t pfmSize;
size_t userSize = (6 * PLIB_PCACHE_PFM_BLOCK_SIZE);
size_t userOffset;

// Get size of PFM
pfmSize = PLIB_BMX_ProgramFlashMemorySizeGet();
userOffset = pfmSize - userSize;
if (userOffset > 0)
{
    PLIB_BMX_ProgramFlashPartitionSet(userOffset);
}
```

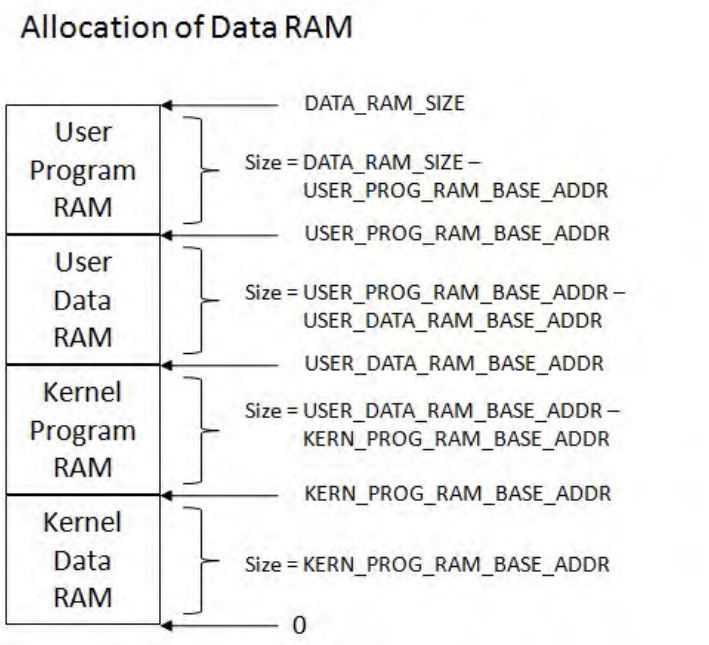
Data RAM Memory Partitioning

The Data RAM Can be partitioned into four sections:

- Kernel Data
- Kernel Program
- User Data
- User Program

Similar to the program Flash memory partitioning, the data RAM partitions are created by setting the base addresses of the various partitions. The BMX Peripheral Library provides a function to set all of the partitions at once. The size of the data RAM varies among devices, but may be retrieved with the PLIB_BMX_DataRAMSizeGet function. The partitions must be a multiple of the Data RAM memory block size. The data RAM memory block size may vary among devices. If programmed with a value that is not a multiple of the block size, the partition will automatically be truncated to a block size boundary. At reset, the entire data RAM is mapped to Kernel mode.

Note: At Reset, the entire data RAM is mapped to Kernel mode and all of the offsets are set to zero. To partition the data RAM, all of the offsets must be programmed. If any of the offsets are set to zero, the entire data RAM is allocated to kernel data.



Example: RAM Partitioned as Kernel Data, Kernel Program, User Data and User Program

```
//Total Data RAM = 32KB.
size_t totalRamSize;
size_t kernProgOffset;
size_t userDataOffset;
size_t userProgOffset;

size_t kernDataRamSize = (3 * PLIB_PCACHE_DRM_BLOCK_SIZE); //Kernel Data RAM = 6KB
size_t kernProgRamSize = (2 * PLIB_PCACHE_DRM_BLOCK_SIZE); //Kernel Program RAM = 4KB
size_t userDataRamSize = (6 * PLIB_PCACHE_DRM_BLOCK_SIZE); //User Data RAM = 12KB
size_t userProgRamSize = (5 * PLIB_PCACHE_DRM_BLOCK_SIZE); //User Program RAM = 10KB

//Get Size of Data RAM
totalRamSize = PLIB_BMX_DataRAMSizeGet();

//Verify our partition sizes fit our RAM
if ((kernDataRamSize + kernProgRamSize + userDataRamSize + userProgRamSize) != totalRamSize)
{
    printf("RAM Partitioning Error\n");
    return -1;
}

kernProgOffset = kernDataRamSize;
userDataOffset = kernDataRamSize + kernProgRamSize;
userProgOffset = userDataOffset + userDataRamSize;

PLIB_BMX_DataRAMPartitionSet(kernProgOffset, userDataOffset, userProgOffset);
```

Example: Determine the size of Data RAM partitions

```
size_t kernProgOffset;
size_t userDataOffset;
size_t userProgOffset;
size_t kernDataPart;
size_t kernProgPart;
size_t userDataPart;
size_t userProgPart;
size_t totalRamSize;
totalRamSize = PLIB_BMX_DataRAMSizeGet();
kernProgOffset = PLIB_BMX_DataRAMKernelProgramOffsetGet();
userDataOffset = PLIB_BMX_DataRAMUserDataOffsetGet();
userProgOffset = PLIB_BMX_DataRAMUserProgramOffsetGet();

kernDataPart = kernProgOffset;
kernProgPart = userDataOffset - kernProgOffset;
```

```
userDataPart = userProgOffset - userDataOffset;
userProgPart = totalRamSize - userProgOffset;
```

Configuring the Library

The library is configured for the supported BMX module when the processor is chosen in the MPLAB X IDE.

Library Interface

a) Bus Exception Functions

	Name	Description
	PLIB_BMX_BusExceptionDataDisable	Disables the data bus exception.
	PLIB_BMX_BusExceptionDataEnable	Enables the Data bus exception.
	PLIB_BMX_BusExceptionDMADisable	Disables the DMA bus exception.
	PLIB_BMX_BusExceptionDMAEnable	Enables the DMA bus exception.
	PLIB_BMX_BusExceptionICDDisable	Disables the ICD bus exception.
	PLIB_BMX_BusExceptionICDEnable	Enables the ICD bus exception.
	PLIB_BMX_BusExceptionInstructionDisable	Disables the instruction bus exception.
	PLIB_BMX_BusExceptionInstructionEnable	Enables the instruction bus exception.
	PLIB_BMX_BusExceptionIXIDisable	Disables the IXI bus exception.
	PLIB_BMX_BusExceptionIXIEnable	Enables the IXI bus exception.

b) Program Flash Cache Functions

	Name	Description
	PLIB_BMX_ProgramFlashMemoryCacheDmaDisable	Disables the bus matrix program Flash cacheability for DMA.
	PLIB_BMX_ProgramFlashMemoryCacheDmaEnable	Enables the bus matrix program Flash cacheability for DMA.

c) Arbiter Functions

	Name	Description
	PLIB_BMX_ArbitrationModeGet	Returns the bus matrix arbitration mode.
	PLIB_BMX_ArbitrationModeSet	Sets the bus matrix arbitration mode.

d) Memory Access Control Functions

	Name	Description
	PLIB_BMX_DataRAMKernelProgramOffsetGet	Gets the offset (from start of RAM) of the kernel program partition.
	PLIB_BMX_DataRAMPartitionSet	Sets the size of the kernel and user partitions in data RAM memory.
	PLIB_BMX_DataRAMSizeGet	Gets the size of data RAM memory.
	PLIB_BMX_DataRAMUserDataOffsetGet	Gets the offset (from start of RAM) of the user data partition.
	PLIB_BMX_DataRAMUserProgramOffsetGet	Gets the offset (from start of RAM) of the user program partition.
	PLIB_BMX_DataRamWaitStateGet	Returns the number of data RAM Wait states.
	PLIB_BMX_DataRamWaitStateSet	Sets the number of data RAM Wait states.
	PLIB_BMX_ProgramFlashBootSizeGet	Gets the size of boot program Flash memory.
	PLIB_BMX_ProgramFlashMemorySizeGet	Gets the size of program Flash memory.
	PLIB_BMX_ProgramFlashPartitionGet	Gets the size of the kernel partition in program Flash memory.
	PLIB_BMX_ProgramFlashPartitionSet	Sets the size of the kernel and user partitions in program Flash memory.

e) Feature Existence Functions

	Name	Description
	PLIB_BMX_ExistsArbitrationMode	Identifies that the ArbitrationMode feature exists on the BMX module.
	PLIB_BMX_ExistsBusExceptionData	Identifies that the BusExceptionData feature exists on the BMX module.
	PLIB_BMX_ExistsBusExceptionDMA	Identifies that the BusExceptionDMA feature exists on the BMX module.
	PLIB_BMX_ExistsBusExceptionICD	Identifies that the BusExceptionICD feature exists on the BMX module.
	PLIB_BMX_ExistsBusExceptionInstruction	Identifies that the BusExceptionInstruction feature exists on the BMX module.
	PLIB_BMX_ExistsBusExceptionIXI	Identifies that the BusExceptionIXI feature exists on the BMX module.
	PLIB_BMX_ExistsDataRAMPartition	Identifies that the DataRAMPartition feature exists on the BMX module.
	PLIB_BMX_ExistsDataRAMSize	Identifies that the DataRAMSize feature exists on the BMX module.

	PLIB_BMX_ExistsDataRamWaitState	Identifies that the DataRamWaitState feature exists on the BMX module.
	PLIB_BMX_ExistsProgramFlashBootSize	Identifies that the ProgramFlashBootSize feature exists on the BMX module.
	PLIB_BMX_ExistsProgramFlashMemoryCacheDma	Identifies that the ProgramFlashMemoryCacheDma feature exists on the BMX module.
	PLIB_BMX_ExistsProgramFlashMemorySize	Identifies that the ProgramFlashMemorySize feature exists on the BMX module.
	PLIB_BMX_ExistsProgramFlashPartition	Identifies that the ProgramFlashPartition feature exists on the BMX module.

f) Data Types and Constants

	Name	Description
	BMX_MODULE_ID	Lists the possible Module IDs for the bus matrix.
	PLIB_BMX_ARB_MODE	Lists the possible arbitration modes for the bus matrix.
	PLIB_BMX_DATA_RAM_WAIT_STATES	Defines the number of data RAM wait states for address setup.
	PLIB_BMX_EXCEPTION_SRC	Defines which events trigger a bus exception.
	PLIB_BMX_DRM_BLOCK_SIZE	Defines the minimum partition block size in data RAM memory.
	PLIB_BMX_PFM_BLOCK_SIZE	Defines the minimum partition block size in program Flash memory.

Description

This section describes the Application Programming Interface (API) functions of the BMX Peripheral Library.

Refer to each section for a detailed description.

a) Bus Exception Functions

PLIB_BMX_BusExceptionDataDisable Function

Disables the data bus exception.

File

plib_bmx.h

C

```
void PLIB_BMX_BusExceptionDataDisable(BMX_MODULE_ID index);
```

Returns

None.

Description

This function disables the data bus exception.

Remarks

This function implements an operation of the BusExceptionData feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_BMX_ExistsBusExceptionData in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_BMX_BusExceptionDataDisable(BMX_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be disabled

Function

void PLIB_BMX_BusExceptionDataDisable(BMX_MODULE_ID index)

PLIB_BMX_BusExceptionDataEnable Function

Enables the Data bus exception.

File

plib_bmx.h

C

```
void PLIB_BMX_BusExceptionDataEnable(BMX_MODULE_ID index);
```

Returns

None.

Description

This function enables the Data bus exception.

Remarks

This function implements an operation of the BusExceptionData feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_BMX_ExistsBusExceptionData in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_BMX_BusExceptionDataEnable(BMX_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be enabled

Function

void PLIB_BMX_BusExceptionDataEnable(BMX_MODULE_ID index)

PLIB_BMX_BusExceptionDMADisable Function

Disables the DMA bus exception.

File

plib_bmx.h

C

```
void PLIB_BMX_BusExceptionDMADisable(BMX_MODULE_ID index);
```

Returns

None.

Description

This function disables the DMA bus exception.

Remarks

This function implements an operation of the BusExceptionDMA feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_BMX_ExistsBusExceptionDMA in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_BMX_BusExceptionDMADisable(BMX_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be disabled

Function

void PLIB_BMX_BusExceptionDMADisable(BMX_MODULE_ID index)

PLIB_BMX_BusExceptionDMAEnable Function

Enables the DMA bus exception.

File

plib_bmx.h

C

```
void PLIB_BMX_BusExceptionDMAEnable(BMX_MODULE_ID index);
```

Returns

None.

Description

This function enables the DMA bus exception.

Remarks

This function implements an operation of the BusExceptionDMA feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_BMX_ExistsBusExceptionDMA in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_BMX_BusExceptionDMAEnable(BMX_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be enabled

Function

void PLIB_BMX_BusExceptionDMAEnable(BMX_MODULE_ID index)

PLIB_BMX_BusExceptionICDDisable Function

Disables the ICD bus exception.

File

plib_bmx.h

C

```
void PLIB_BMX_BusExceptionICDDisable(BMX_MODULE_ID index);
```

Returns

None.

Description

This function disables the ICD bus exception.

Remarks

This function implements an operation of the BusExceptionICD feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_BMX_ExistsBusExceptionICD in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_BMX_BusExceptionICDDisable(BMX_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be disabled

Function

void PLIB_BMX_BusExceptionICDDisable(BMX_MODULE_ID index)

PLIB_BMX_BusExceptionICDEnable Function

Enables the ICD bus exception.

File

plib_bmx.h

C

```
void PLIB_BMX_BusExceptionICDEnable(BMX_MODULE_ID index);
```

Returns

None.

Description

This function enables the ICD bus exception.

Remarks

This function implements an operation of the BusExceptionICD feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_BMX_ExistsBusExceptionICD in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_BMX_BusExceptionICDEnable(BMX_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be enabled

Function

void PLIB_BMX_BusExceptionICDEnable(BMX_MODULE_ID index)

PLIB_BMX_BusExceptionInstructionDisable Function

Disables the instruction bus exception.

File

plib_bmx.h

C

```
void PLIB_BMX_BusExceptionInstructionDisable(BMX_MODULE_ID index);
```

Returns

None.

Description

This function disables the instruction bus exception.

Remarks

This function implements an operation of the BusExceptionInstruction feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_BMX_ExistsBusExceptionInstruction in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_BMX_BusExceptionInstructionDisable(BMX_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be disabled

Function

void PLIB_BMX_BusExceptionInstructionDisable(BMX_MODULE_ID index)

PLIB_BMX_BusExceptionInstructionEnable Function

Enables the instruction bus exception.

File

plib_bmx.h

C

```
void PLIB_BMX_BusExceptionInstructionEnable(BMX_MODULE_ID index);
```

Returns

None.

Description

This function enables the instruction bus exception.

Remarks

This function implements an operation of the BusExceptionInstruction feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_BMX_ExistsBusExceptionInstruction in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_BMX_BusExceptionInstructionEnable(BMX_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be enabled

Function

void PLIB_BMX_BusExceptionInstructionEnable(BMX_MODULE_ID index)

PLIB_BMX_BusExceptionIXIDisable Function

Disables the IXI bus exception.

File

plib_bmx.h

C

```
void PLIB_BMX_BusExceptionIXIDisable(BMX_MODULE_ID index);
```

Returns

None.

Description

This function disables the IXI bus exception.

Remarks

This function implements an operation of the BusExceptionIXI feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_BMX_ExistsBusExceptionIXI in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_BMX_BusExceptionIXIDisable(BMX_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be disabled

Function

void PLIB_BMX_BusExceptionIXIDisable(BMX_MODULE_ID index)

PLIB_BMX_BusExceptionIXIEnable Function

Enables the IXI bus exception.

File

plib_bmx.h

C

```
void PLIB_BMX_BusExceptionIXIEnable(BMX_MODULE_ID index);
```

Returns

None.

Description

This function enables the IXI bus exception.

Remarks

This function implements an operation of the BusExceptionIXI feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_BMX_ExistsBusExceptionIXI in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_BMX_BusExceptionIXIEnable(BMX_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be enabled

Function

void PLIB_BMX_BusExceptionIXIEnable(BMX_MODULE_ID index)

b) Program Flash Cache Functions

PLIB_BMX_ProgramFlashMemoryCacheDmaDisable Function

Disables the bus matrix program Flash cacheability for DMA.

File

plib_bmx.h

C

```
void PLIB_BMX_ProgramFlashMemoryCacheDmaDisable(BMX_MODULE_ID index);
```

Returns

None.

Description

This function disables the program Flash cacheability for DMA.

Remarks

This function implements an operation of the ProgramFlashMemoryCacheDma feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_BMX_ExistsProgramFlashMemoryCacheDma in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_BMX_ProgramFlashMemoryCacheDmaDisable(BMX_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be disabled

Function

void PLIB_BMX_ProgramFlashMemoryCacheDmaDisable(BMX_MODULE_ID index)

PLIB_BMX_ProgramFlashMemoryCacheDmaEnable Function

Enables the bus matrix program Flash cacheability for DMA.

File

plib_bmx.h

C

```
void PLIB_BMX_ProgramFlashMemoryCacheDmaEnable(BMX_MODULE_ID index);
```

Returns

None.

Description

This function enables the program Flash cacheability for DMA.

Remarks

This function implements an operation of the ProgramFlashMemoryCacheDma feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_BMX_ExistsProgramFlashMemoryCacheDma in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_BMX_ProgramFlashMemoryCacheDmaEnable(BMX_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be enabled

Function

void PLIB_BMX_ProgramFlashMemoryCacheDmaEnable(BMX_MODULE_ID index)

c) Arbiter Functions

PLIB_BMX_ArbitrationModeGet Function

Returns the bus matrix arbitration mode.

File

plib_bmx.h

C

```
PLIB_BMX_ARB_MODE PLIB_BMX_ArbitrationModeGet(BMX_MODULE_ID index);
```

Returns

PLIB_BMX_ARB_MODE enumerator value representing the arbitration mode.

Description

This function returns the bus matrix arbitration mode.

Remarks

This function implements an operation of the ArbitrationMode feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_BMX_ExistsArbitrationMode in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_BMX_ARB_MODE mode;
mode = PLIB_BMX_ArbitrationModeGet(BMX_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be read

Function

PLIB_BMX_ARB_MODE PLIB_BMX_ArbitrationModeGet (BMX_MODULE_ID index)

PLIB_BMX_ArbitrationModeSet Function

Sets the bus matrix arbitration mode.

File

plib_bmx.h

C

```
void PLIB_BMX_ArbitrationModeSet(BMX_MODULE_ID index, PLIB_BMX_ARB_MODE mode);
```

Returns

None.

Description

This function sets the bus matrix arbitration mode.

Remarks

This function implements an operation of the ArbitrationMode feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_BMX_ExistsArbitrationMode in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_BMX_ArbitrationModeSet(BMX_ID_0, PLIB_BMX_ARB_MODE_DMA);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
mode	Identifies the desired arbitration mode

Function

void PLIB_BMX_ArbitrationModeSet (BMX_MODULE_ID index,
PLIB_BMX_ARB_MODE mode)

d) Memory Access Control Functions

PLIB_BMX_DataRAMKernelProgramOffsetGet Function

Gets the offset (from start of RAM) of the kernel program partition.

File

plib_bmx.h

C

```
size_t PLIB_BMX_DataRAMKernelProgramOffsetGet(BMX_MODULE_ID index);
```

Returns

Offset of kernel program partition from base of RAM.

Description

This function returns the offset of start address of the kernel program RAM partition. This represents the size of the kernel data RAM partition.

Remarks

This function implements an operation of the DataRAMPartition feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_BMX_ExistsDataRAMPartition in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
size_t kernProgOffset;
kernProgOffset = PLIB_BMX_DataRAMKernelProgramOffsetGet(BMX_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be read

Function

size_t PLIB_BMX_DataRAMKernelProgramOffsetGet(BMX_MODULE_ID index)

PLIB_BMX_DataRAMPartitionSet Function

Sets the size of the kernel and user partitions in data RAM memory.

File

plib_bmx.h

C

```
void PLIB_BMX_DataRAMPartitionSet(BMX_MODULE_ID index, size_t kernProgOffset, size_t userDataOffset, size_t
userProgOffset);
```

Returns

None.

Description

This function sets the size of the kernel and user partitions in the data RAM memory (DRM). By default, the entire data RAM is mapped to Kernel mode and all of the offsets are zero. To partition the data RAM, all of the offsets must be set to a minimum of one DRM block size. If any of the offsets are set to zero, the entire data RAM is allocated to kernel data. The partitions must be a multiple of PLIB_BMX_DRM_BLOCK_SIZE. If programmed with a value that is not a multiple of PLIB_BMX_DRM_BLOCK_SIZE, the value will be automatically truncated to PLIB_BMX_DRM_BLOCK_SIZE.

Remarks

This function implements an operation of the DataRAMPartition feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_BMX_ExistsDataRAMPartition in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
//Total Data RAM = 32 KB.
size_t totalRamSize;
size_t kernDataRamSize = (3 * PLIB_BMX_DRM_BLOCK_SIZE);
size_t kernProgRamSize = (2 * PLIB_BMX_DRM_BLOCK_SIZE);
size_t userDataRamSize = (6 * PLIB_BMX_DRM_BLOCK_SIZE);
size_t userProgRamSize = (5 * PLIB_BMX_DRM_BLOCK_SIZE);

//Get Size of Data RAM
totalRamSize = PLIB_BMX_DataRAMSizeGet(BMX_ID_0);

//Verify our partition sizes fit our RAM
if ((kernDataRamSize + kernProgRamSize + userDataRamSize +
     userProgRamSize) != totalRamSize)
{
    printf("RAM Partitioning Errorn");
}

size_t kernProgOffset;
size_t userDataOffset;
size_t userProgOffset;

kernProgOffset = kernDataRamSize;
userDataOffset = kernDataRamSize + kernProgRamSize;
userProgOffset = userDataOffset + userDataRamSize;

PLIB_BMX_DataRAMPartitionSet(BMX_ID_0, kernProgOffset,
                             userDataOffset, userProgOffset);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
kernProgOffset	Size of the offset of the Kernel Program partition
userDataOffset	Size of the offset of the User Data partition
userProgOffset	Size of the offset of the User Program partition

Function

void PLIB_BMX_DataRAMPartitionSet(BMX_MODULE_ID index,
size_t kernProgOffset,
size_t userDataOffset,
size_t userProgOffset)

PLIB_BMX_DataRAMSizeGet Function

Gets the size of data RAM memory.

File

plib_bmx.h

C

```
size_t PLIB_BMX_DataRAMSizeGet(BMX_MODULE_ID index);
```

Returns

Size of data RAM memory.

Description

This function returns the size of the data RAM memory.

Remarks

This function implements an operation of the DataRAMSize feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_BMX_ExistsDataRAMSize in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
size_t drmSize;
drmSize = PLIB_BMX_DataRAMSizeGet(BMX_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be read

Function

size_t PLIB_BMX_DataRAMSizeGet (BMX_MODULE_ID index)

PLIB_BMX_DataRAMUserDataOffsetGet Function

Gets the offset (from start of RAM) of the user data partition.

File

plib_bmx.h

C

```
size_t PLIB_BMX_DataRAMUserDataOffsetGet(BMX_MODULE_ID index);
```

Returns

Offset of user data partition from base of RAM.

Description

This function returns the offset of start address of the user data RAM partition. Subtracting the kernel program offset from the user data offset gives the size of the kernel program RAM partition.

Remarks

This function implements an operation of the DataRAMPartition feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_BMX_ExistsDataRAMPartition in your application to automatically determine

whether this feature is available.

Preconditions

None.

Example

```
size_t userDataOffset;
userDataOffset = PLIB_BMX_DataRAMUserDataOffsetGet(BMX_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

size_t PLIB_BMX_DataRAMUserDataOffsetGet(BMX_MODULE_ID index)

PLIB_BMX_DataRAMUserProgramOffsetGet Function

Gets the offset (from start of RAM) of the user program partition.

File

plib_bmx.h

C

```
size_t PLIB_BMX_DataRAMUserProgramOffsetGet(BMX_MODULE_ID index);
```

Returns

Offset of user data partition from base of RAM.

Description

This function returns the offset of start address of the user program RAM partition. Subtracting the user data offset from the user program offset gives the size of the user data RAM partition.

Remarks

This function implements an operation of the DataRAMPartition feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_BMX_ExistsDataRAMPartition in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
size_t userProgOffset;
userProgOffset = PLIB_BMX_DataRAMUserProgramOffsetGet(BMX_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be read

Function

size_t PLIB_BMX_DataRAMUserProgramOffsetGet(BMX_MODULE_ID index)

PLIB_BMX_DataRamWaitStateGet Function

Returns the number of data RAM Wait states.

File

plib_bmx.h

C

```
PLIB_BMX_DATA_RAM_WAIT_STATES PLIB_BMX_DataRamWaitStateGet(BMX_MODULE_ID index);
```

Returns

PLIB_BMX_DATA_RAM_WAIT_STATES enumeration representing the number of wait states.

Description

This function returns the number of data RAM Wait states.

Remarks

This function implements an operation of the DataRamWaitState feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_BMX_ExistsDataRamWaitState in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_BMX_DATA_RAM_WAIT_STATES wait;
wait = PLIB_BMX_DataRamWaitStateGet(BMX_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be read

Function

PLIB_BMX_DATA_RAM_WAIT_STATES PLIB_BMX_DataRamWaitStateGet(BMX_MODULE_ID index)

PLIB_BMX_DataRamWaitStateSet Function

Sets the number of data RAM Wait states.

File

plib_bmx.h

C

```
void PLIB_BMX_DataRamWaitStateSet(BMX_MODULE_ID index, PLIB_BMX_DATA_RAM_WAIT_STATES wait);
```

Returns

None.

Description

This function sets the number of data RAM Wait states.

Remarks

This function implements an operation of the DataRamWaitState feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_BMX_ExistsDataRamWaitState in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_BMX_DataRamWaitStateSet(BMX_ID_0, PLIB_BMX_DATA_RAM_WAIT_ONE);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
PLIB_BMX_DATA_RAM_WAIT_STATES	Enumeration representing the number of Wait states

Function

void PLIB_BMX_DataRamWaitStateSet(BMX_MODULE_ID index,
PLIB_BMX_DATA_RAM_WAIT_STATES wait)

PLIB_BMX_ProgramFlashBootSizeGet Function

Gets the size of boot program Flash memory.

File

plib_bmx.h

C

```
size_t PLIB_BMX_ProgramFlashBootSizeGet(BMX_MODULE_ID index);
```

Returns

Size of boot program Flash memory.

Description

This function returns the size of the boot program Flash memory.

Remarks

This function implements an operation of the ProgramFlashBootSize feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_BMX_ExistsProgramFlashBootSize in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
size_t bootSize;
bootSize = PLIB_BMX_ProgramFlashBootSizeGet(BMX_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be read

Function

size_t PLIB_BMX_ProgramFlashBootSizeGet (BMX_MODULE_ID index)

PLIB_BMX_ProgramFlashMemorySizeGet Function

Gets the size of program Flash memory.

File

plib_bmx.h

C

```
size_t PLIB_BMX_ProgramFlashMemorySizeGet(BMX_MODULE_ID index);
```

Returns

Size of program Flash memory.

Description

This function returns the size of the program Flash memory.

Remarks

This function implements an operation of the ProgramFlashMemorySize feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_BMX_ExistsProgramFlashMemorySize in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
size_t pfmSize;
```

```
pfmSize = PLIB_BMX_ProgramFlashMemorySizeGet(BMX_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be read

Function

size_t PLIB_BMX_ProgramFlashMemorySizeGet (BMX_MODULE_ID index)

PLIB_BMX_ProgramFlashPartitionGet Function

Gets the size of the kernel partition in program Flash memory.

File

plib_bmx.h

C

```
size_t PLIB_BMX_ProgramFlashPartitionGet(BMX_MODULE_ID index);
```

Returns

Size of the kernel partition in program Flash memory.

Description

This function gets the size of the kernel partition in the program Flash memory. The remaining Flash is set to user mode, and may be accessed by user programs. On reset, the entire Flash is mapped to Kernel mode, and this function will return zero.

Remarks

This function implements an operation of the ProgramFlashPartition feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_BMX_ExistsProgramFlashPartition in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
size_t pfmSize;
size_t userPfmSize;
size_t kernPfmSize;

// Get size of PFM
pfmSize = PLIB_BMX_ProgramFlashMemorySizeGet(BMX_ID_0);
kernPfmSize = PLIB_BMX_ProgramFlashPartitionGet(BMX_ID_0);
userPfmSize = pfmSize - kernPfmSize;
```

Parameters

Parameters	Description
index	Identifier for the device instance to be read

Function

size_t PLIB_BMX_ProgramFlashPartitionGet(BMX_MODULE_ID index)

PLIB_BMX_ProgramFlashPartitionSet Function

Sets the size of the kernel and user partitions in program Flash memory.

File

plib_bmx.h

C

```
void PLIB_BMX_ProgramFlashPartitionSet(BMX_MODULE_ID index, size_t user_size);
```

Returns

None.

Description

This function sets the size of the kernel and user partitions in program Flash memory (PFM). Kernel programs may access both partitions, but user programs may not access the kernel partition (including peripheral registers). By default, the entire Flash is mapped to Kernel mode. If called with a non-zero value, a user partition of size user_size is created, and the remaining PFM remains in Kernel mode. The user partition must be a multiple of PLIB_BMX_PFM_BLOCK_SIZE. If programmed with a value that is not a multiple of PLIB_BMX_PFM_BLOCK_SIZE, the value will be truncated to a PLIB_BMX_PFM_BLOCK_SIZE boundary.

Remarks

This function implements an operation of the ProgramFlashPartition feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_BMX_ExistsProgramFlashPartition in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
size_t pfm_size;
size_t userSize = (6 * PLIB_BMX_PFM_BLOCK_SIZE);
size_t userOffset;

// Get size of PFM
size_t pfmSize;
pfmSize = PLIB_BMX_ProgramFlashMemorySizeGet(BMX_ID_0);
userOffset = pfmSize - userSize;
if (userOffset > 0)
{
    PLIB_BMX_ProgramFlashPartitionSet(BMX_ID_0, userOffset);
}
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
userSize	Size of the user partition in PFM

Function

void PLIB_BMX_ProgramFlashPartitionSet(BMX_MODULE_ID index,
size_t userSize)

e) Feature Existence Functions

PLIB_BMX_ExistsArbitrationMode Function

Identifies that the ArbitrationMode feature exists on the BMX module.

File

plib_bmx.h

C

```
bool PLIB_BMX_ExistsArbitrationMode(BMX_MODULE_ID index);
```

Returns

- true = The ArbitrationMode feature is supported on the device
- false = The ArbitrationMode feature is not supported on the device

Description

This interface identifies that the ArbitrationMode feature is available on the BMX module. When this interface returns true, these functions are supported on the device:

- PLIB_BMX_ArbitrationModeSet

- PLIB_BMX_ArbitrationModeGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_BMX_ExistsArbitrationMode(BMX_MODULE_ID index)

PLIB_BMX_ExistsBusExceptionData Function

Identifies that the BusExceptionData feature exists on the BMX module.

File

plib_bmx.h

C

```
bool PLIB_BMX_ExistsBusExceptionData(BMX_MODULE_ID index);
```

Returns

- true = The BusExceptionData feature is supported on the device
- false = The BusExceptionData feature is not supported on the device

Description

This interface identifies that the BusExceptionData feature is available on the BMX module. When this interface returns true, these functions are supported on the device:

- PLIB_BMX_BusExceptionDataEnable
- PLIB_BMX_BusExceptionDataDisable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_BMX_ExistsBusExceptionData(BMX_MODULE_ID index)

PLIB_BMX_ExistsBusExceptionDMA Function

Identifies that the BusExceptionDMA feature exists on the BMX module.

File

plib_bmx.h

C

```
bool PLIB_BMX_ExistsBusExceptionDMA(BMX_MODULE_ID index);
```

Returns

- true = The BusExceptionDMA feature is supported on the device
- false = The BusExceptionDMA feature is not supported on the device

Description

This interface identifies that the BusExceptionDMA feature is available on the BMX module. When this interface returns true, these functions are supported on the device:

- PLIB_BMX_BusExceptionDMAEnable
- PLIB_BMX_BusExceptionDMADisable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_BMX_ExistsBusExceptionDMA(BMX_MODULE_ID index)

PLIB_BMX_ExistsBusExceptionICD Function

Identifies that the BusExceptionICD feature exists on the BMX module.

File

plib_bmx.h

C

```
bool PLIB_BMX_ExistsBusExceptionICD(BMX_MODULE_ID index);
```

Returns

- true = The BusExceptionICD feature is supported on the device
- false = The BusExceptionICD feature is not supported on the device

Description

This interface identifies that the BusExceptionICD feature is available on the BMX module. When this interface returns true, these functions are supported on the device:

- PLIB_BMX_BusExceptionICDEnable
- PLIB_BMX_BusExceptionICDDisable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_BMX_ExistsBusExceptionICD(BMX_MODULE_ID index)

PLIB_BMX_ExistsBusExceptionInstruction Function

Identifies that the BusExceptionInstruction feature exists on the BMX module.

File

plib_bmx.h

C

```
bool PLIB_BMX_ExistsBusExceptionInstruction(BMX_MODULE_ID index);
```

Returns

- true = The BusExceptionInstruction feature is supported on the device
- false = The BusExceptionInstruction feature is not supported on the device

Description

This interface identifies that the BusExceptionInstruction feature is available on the BMX module. When this interface returns true, these functions are supported on the device:

- PLIB_BMX_BusExceptionInstructionEnable
- PLIB_BMX_BusExceptionInstructionDisable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_BMX_ExistsBusExceptionInstruction(BMX_MODULE_ID index)

PLIB_BMX_ExistsBusExceptionIXI Function

Identifies that the BusExceptionIXI feature exists on the BMX module.

File

plib_bmx.h

C

```
bool PLIB_BMX_ExistsBusExceptionIXI(BMX_MODULE_ID index);
```

Returns

true = The BusExceptionIXI feature is supported on the device

- false = The BusExceptionIXI feature is not supported on the device

Description

This interface identifies that the BusExceptionIXI feature is available on the BMX module. When this interface returns true, these functions are supported on the device:

- PLIB_BMX_BusExceptionIXIEnable
- PLIB_BMX_BusExceptionIXIDisable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_BMX_ExistsBusExceptionIXI(BMX_MODULE_ID index)

PLIB_BMX_ExistsDataRAMPartition Function

Identifies that the DataRAMPartition feature exists on the BMX module.

File

plib_bmx.h

C

```
bool PLIB_BMX_ExistsDataRAMPartition(BMX_MODULE_ID index);
```

Returns

- true = The DataRAMPartition feature is supported on the device
- false = The DataRAMPartition feature is not supported on the device

Description

This interface identifies that the DataRAMPartition feature is available on the BMX module. When this interface returns true, these functions are supported on the device:

- PLIB_BMX_DataRAMPartitionSet
- PLIB_BMX_DataRAMKernelProgramOffsetGet
- PLIB_BMX_DataRAMUserDataOffsetGet
- PLIB_BMX_DataRAMUserProgramOffsetGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_BMX_ExistsDataRAMPartition(BMX_MODULE_ID index)

PLIB_BMX_ExistsDataRAMSize Function

Identifies that the DataRAMSize feature exists on the BMX module.

File

plib_bmx.h

C

```
bool PLIB_BMX_ExistsDataRAMSize(BMX_MODULE_ID index);
```

Returns

- true = The DataRAMSize feature is supported on the device
- false = The DataRAMSize feature is not supported on the device

Description

This interface identifies that the DataRAMSize feature is available on the BMX module. When this interface returns true, this function is supported on the device:

- PLIB_BMX_DataRAMSizeGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_BMX_ExistsDataRAMSize(BMX_MODULE_ID index)

PLIB_BMX_ExistsDataRamWaitState Function

Identifies that the DataRamWaitState feature exists on the BMX module.

File

plib_bmx.h

C

```
bool PLIB_BMX_ExistsDataRamWaitState(BMX_MODULE_ID index);
```

Returns

- true = The DataRamWaitState feature is supported on the device
- false = The DataRamWaitState feature is not supported on the device

Description

This interface identifies that the DataRamWaitState feature is available on the BMX module. When this interface returns true, these functions are supported on the device:

- PLIB_BMX_DataRamWaitStateSet
- PLIB_BMX_DataRamWaitStateGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_BMX_ExistsDataRamWaitState(BMX_MODULE_ID index)

PLIB_BMX_ExistsProgramFlashBootSize Function

Identifies that the ProgramFlashBootSize feature exists on the BMX module.

File

plib_bmx.h

C

```
bool PLIB_BMX_ExistsProgramFlashBootSize(BMX_MODULE_ID index);
```

Returns

- true = The ProgramFlashBootSize feature is supported on the device
- false = The ProgramFlashBootSize feature is not supported on the device

Description

This interface identifies that the ProgramFlashBootSize feature is available on the BMX module. When this interface returns true, this function is supported on the device:

- PLIB_BMX_ProgramFlashBootSizeGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_BMX_ExistsProgramFlashBootSize(BMX_MODULE_ID index)

PLIB_BMX_ExistsProgramFlashMemoryCacheDma Function

Identifies that the ProgramFlashMemoryCacheDma feature exists on the BMX module.

File

plib_bmx.h

C

```
bool PLIB_BMX_ExistsProgramFlashMemoryCacheDma(BMX_MODULE_ID index);
```

Returns

- true = The ProgramFlashMemoryCacheDma feature is supported on the device
- false = The ProgramFlashMemoryCacheDma feature is not supported on the device

Description

This interface identifies that the ProgramFlashMemoryCacheDma feature is available on the BMX module. When this interface returns true, these functions are supported on the device:

- PLIB_BMX_ProgramFlashMemoryCacheDmaEnable
- PLIB_BMX_ProgramFlashMemoryCacheDmaDisable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_BMX_ExistsProgramFlashMemoryCacheDma(BMX_MODULE_ID index)

PLIB_BMX_ExistsProgramFlashMemorySize Function

Identifies that the ProgramFlashMemorySize feature exists on the BMX module.

File

plib_bmx.h

C

```
bool PLIB_BMX_ExistsProgramFlashMemorySize(BMX_MODULE_ID index);
```

Returns

- true = The ProgramFlashMemorySize feature is supported on the device
- false = The ProgramFlashMemorySize feature is not supported on the device

Description

This interface identifies that the ProgramFlashMemorySize feature is available on the BMX module. When this interface returns true, this function is supported on the device:

- PLIB_BMX_ProgramFlashMemorySizeGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_BMX_ExistsProgramFlashMemorySize(BMX_MODULE_ID index)

PLIB_BMX_ExistsProgramFlashPartition Function

Identifies that the ProgramFlashPartition feature exists on the BMX module.

File

plib_bmx.h

C

```
bool PLIB_BMX_ExistsProgramFlashPartition(BMX_MODULE_ID index);
```

Returns

- true = The ProgramFlashPartition feature is supported on the device
- false = The ProgramFlashPartition feature is not supported on the device

Description

This interface identifies that the ProgramFlashPartition feature is available on the BMX module. When this interface returns true, these functions are supported on the device:

- PLIB_BMX_ProgramFlashPartitionGet
- PLIB_BMX_ProgramFlashPartitionSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_BMX_ExistsProgramFlashPartition(BMX_MODULE_ID index)

f) Data Types and Constants

BMX_MODULE_ID Enumeration

Lists the possible Module IDs for the bus matrix.

File

help_plib_bmx.h

C

```
typedef enum {
  BMX_ID_0,
  BMX_NUMBER_OF_MODULES
} BMX_MODULE_ID;
```

Description

Module ID

This enumeration lists the possible Module IDs for the bus matrix.

Remarks

Refer to the specific device data sheet to obtain the correct number of modules defined for the desired device.

PLIB_BMX_ARB_MODE Enumeration

Lists the possible arbitration modes for the bus matrix.

File

plib_bmx.h

C

```
typedef enum {
  PLIB_BMX_ARB_MODE_INST,
  PLIB_BMX_ARB_MODE_DMA,
  PLIB_BMX_ARB_MODE_ROT
} PLIB_BMX_ARB_MODE;
```

Members

Members	Description
PLIB_BMX_ARB_MODE_INST	Arbitration Mode 0
PLIB_BMX_ARB_MODE_DMA	Arbitration Mode 1
PLIB_BMX_ARB_MODE_ROT	Arbitration Mode 2

Description

Arbitration Mode

This enumeration lists the possible arbitration modes for the bus matrix.

PLIB_BMX_DATA_RAM_WAIT_STATES Enumeration

Defines the number of data RAM wait states for address setup.

File

plib_bmx.h

C

```
typedef enum {
  PLIB_BMX_DATA_RAM_WAIT_ZERO,
  PLIB_BMX_DATA_RAM_WAIT_ONE
} PLIB_BMX_DATA_RAM_WAIT_STATES;
```

Members

Members	Description
PLIB_BMX_DATA_RAM_WAIT_ZERO	Zero wait states for address setup
PLIB_BMX_DATA_RAM_WAIT_ONE	One wait state for address setup

Description

Wait States

This definition specifies the number of data RAM wait states for address setup.

PLIB_BMX_EXCEPTION_SRC Enumeration

Defines which events trigger a bus exception.

File

plib_bmx.h

C

```
typedef enum {
  PLIB_BMX_ERR_IXI,
  PLIB_BMX_ERR_ICD,
  PLIB_BMX_ERR_DMA,
  PLIB_BMX_ERR_DATA,
  PLIB_BMX_ERR_INST
} PLIB_BMX_EXCEPTION_SRC;
```

Members

Members	Description
PLIB_BMX_ERR_IXI	IXI Shared Bus
PLIB_BMX_ERR_ICD	In-Circuit Debugger
PLIB_BMX_ERR_DMA	DMA Controller
PLIB_BMX_ERR_DATA	CPU Data Bus
PLIB_BMX_ERR_INST	CPU Instruction Bus

Description

Exception Bits

This definition specifies which events trigger a bus exception.

PLIB_BMX_DRM_BLOCK_SIZE Macro

Defines the minimum partition block size in data RAM memory.

File

plib_bmx.h

C

```
#define PLIB_BMX_DRM_BLOCK_SIZE 2048
```

Description

Program Flash Partition Block Size

This definition specifies the minimum partition block size in data RAM memory.

PLIB_BMX_PFM_BLOCK_SIZE Macro

Defines the minimum partition block size in program Flash memory.

File

plib_bmx.h

C

```
#define PLIB_BMX_PFM_BLOCK_SIZE 2048
```

Description

Program Flash Partition Block Size

This definition specifies the minimum partition block size in program Flash memory.

plib_bmx.h

Defines the Bus Matrix (BMX) Peripheral Library interface

Enumerations

	Name	Description
	PLIB_BMX_ARB_MODE	Lists the possible arbitration modes for the bus matrix.
	PLIB_BMX_DATA_RAM_WAIT_STATES	Defines the number of data RAM wait states for address setup.
	PLIB_BMX_EXCEPTION_SRC	Defines which events trigger a bus exception.

Functions

	Name	Description
	PLIB_BMX_ArbitrationModeGet	Returns the bus matrix arbitration mode.
	PLIB_BMX_ArbitrationModeSet	Sets the bus matrix arbitration mode.
	PLIB_BMX_BusExceptionDataDisable	Disables the data bus exception.
	PLIB_BMX_BusExceptionDataEnable	Enables the Data bus exception.
	PLIB_BMX_BusExceptionDMADisable	Disables the DMA bus exception.
	PLIB_BMX_BusExceptionDMAEnable	Enables the DMA bus exception.
	PLIB_BMX_BusExceptionICDDisable	Disables the ICD bus exception.
	PLIB_BMX_BusExceptionICDEnable	Enables the ICD bus exception.
	PLIB_BMX_BusExceptionInstructionDisable	Disables the instruction bus exception.
	PLIB_BMX_BusExceptionInstructionEnable	Enables the instruction bus exception.
	PLIB_BMX_BusExceptionIXIDisable	Disables the IXI bus exception.
	PLIB_BMX_BusExceptionIXIEnable	Enables the IXI bus exception.
	PLIB_BMX_DataRAMKernelProgramOffsetGet	Gets the offset (from start of RAM) of the kernel program partition.
	PLIB_BMX_DataRAMPartitionSet	Sets the size of the kernel and user partitions in data RAM memory.
	PLIB_BMX_DataRAMSizeGet	Gets the size of data RAM memory.
	PLIB_BMX_DataRAMUserDataOffsetGet	Gets the offset (from start of RAM) of the user data partition.
	PLIB_BMX_DataRAMUserProgramOffsetGet	Gets the offset (from start of RAM) of the user program partition.
	PLIB_BMX_DataRamWaitStateGet	Returns the number of data RAM Wait states.
	PLIB_BMX_DataRamWaitStateSet	Sets the number of data RAM Wait states.
	PLIB_BMX_ExistsArbitrationMode	Identifies that the ArbitrationMode feature exists on the BMX module.
	PLIB_BMX_ExistsBusExceptionData	Identifies that the BusExceptionData feature exists on the BMX module.
	PLIB_BMX_ExistsBusExceptionDMA	Identifies that the BusExceptionDMA feature exists on the BMX module.
	PLIB_BMX_ExistsBusExceptionICD	Identifies that the BusExceptionICD feature exists on the BMX module.
	PLIB_BMX_ExistsBusExceptionInstruction	Identifies that the BusExceptionInstruction feature exists on the BMX module.
	PLIB_BMX_ExistsBusExceptionIXI	Identifies that the BusExceptionIXI feature exists on the BMX module.
	PLIB_BMX_ExistsDataRAMPartition	Identifies that the DataRAMPartition feature exists on the BMX module.
	PLIB_BMX_ExistsDataRAMSize	Identifies that the DataRAMSize feature exists on the BMX module.
	PLIB_BMX_ExistsDataRamWaitState	Identifies that the DataRamWaitState feature exists on the BMX module.
	PLIB_BMX_ExistsProgramFlashBootSize	Identifies that the ProgramFlashBootSize feature exists on the BMX module.
	PLIB_BMX_ExistsProgramFlashMemoryCacheDma	Identifies that the ProgramFlashMemoryCacheDma feature exists on the BMX module.

	PLIB_BMX_ExistsProgramFlashMemorySize	Identifies that the ProgramFlashMemorySize feature exists on the BMX module.
	PLIB_BMX_ExistsProgramFlashPartition	Identifies that the ProgramFlashPartition feature exists on the BMX module.
	PLIB_BMX_ProgramFlashBootSizeGet	Gets the size of boot program Flash memory.
	PLIB_BMX_ProgramFlashMemoryCacheDmaDisable	Disables the bus matrix program Flash cacheability for DMA.
	PLIB_BMX_ProgramFlashMemoryCacheDmaEnable	Enables the bus matrix program Flash cacheability for DMA.
	PLIB_BMX_ProgramFlashMemorySizeGet	Gets the size of program Flash memory.
	PLIB_BMX_ProgramFlashPartitionGet	Gets the size of the kernel partition in program Flash memory.
	PLIB_BMX_ProgramFlashPartitionSet	Sets the size of the kernel and user partitions in program Flash memory.

Macros

	Name	Description
	PLIB_BMX_DRM_BLOCK_SIZE	Defines the minimum partition block size in data RAM memory.
	PLIB_BMX_PFM_BLOCK_SIZE	Defines the minimum partition block size in program Flash memory.

Description

Bus Matrix Peripheral Library Interface Header

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the Bus Matrix (BMX) Peripheral Library (PLIB) for Microchip microcontrollers. The definitions in this file are for the bus matrix controller module.

File Name

CAN Peripheral Library

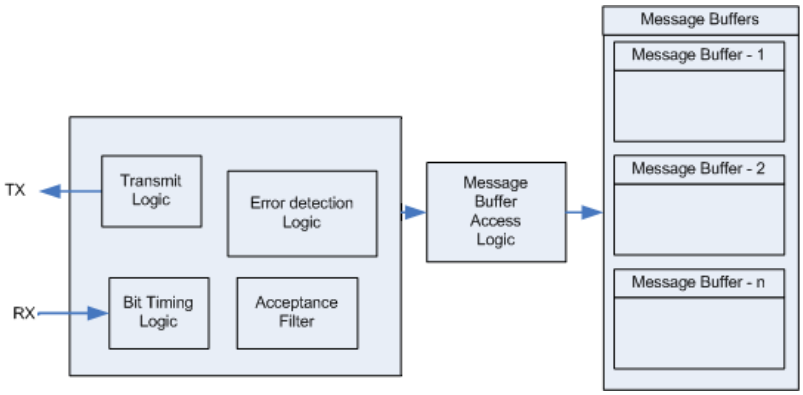
This section describes the CAN Peripheral Library.

Introduction

This library provides a low-level abstraction of the CAN module on Microchip microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, thus hiding differences from one microcontroller variant to another.

Description

The Controller Area Network (CAN) is used primarily in industrial and automotive applications. It is an asynchronous serial data communication protocol that provides reliable communication in an electrically noisy environment.



Note: Trademarks and Intellectual Property are property of their respective owners. Customers are responsible for obtaining appropriate licensing or rights before using this software. Refer to the MPLAB Harmony *Software License Agreement* for complete licensing information. A copy of this agreement is available in the `<install-dir>/doc` folder of your MPLAB Harmony installation.

Using the Library

This topic describes the basic architecture of the CAN Peripheral Library and provides information and examples on its use.

Description

Interface Header File: `plib_can.h`

The interface to the CAN Peripheral library is defined in the `plib_can.h` header file, which is included in the peripheral library header file, `peripheral.h`. Any C language source (`.c`) file that uses the CAN Peripheral library must include `peripheral.h`.

Library File:

The CAN Peripheral library archive (`.a`) file is installed with MPLAB Harmony.

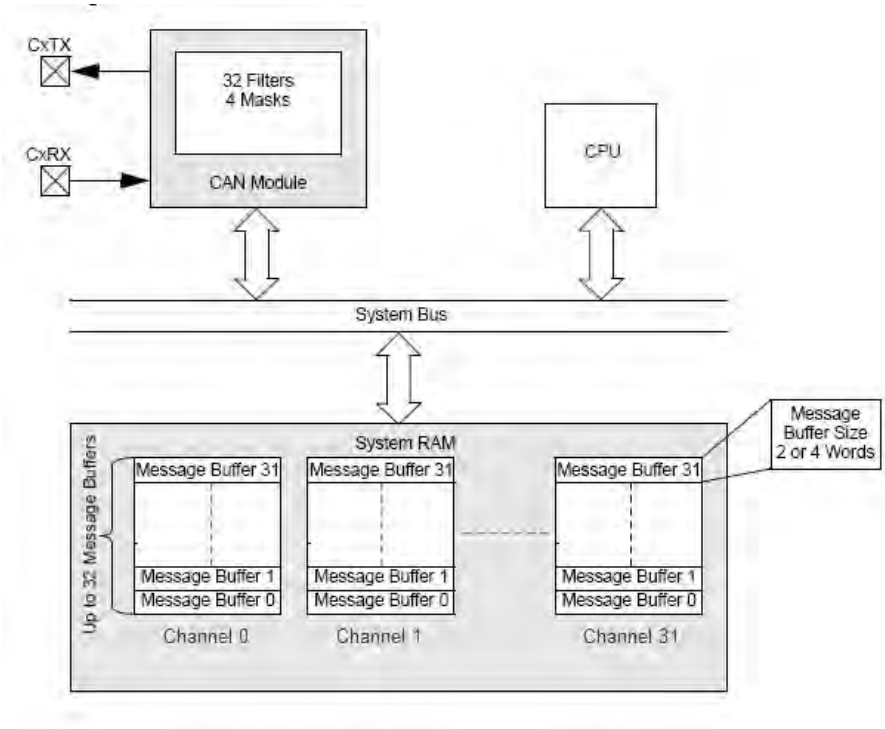
Please refer to the What is MPLAB Harmony? section for how the Peripheral interacts with the framework.

Hardware Abstraction Model

Note: The interface provided is a super set of all of the functionality of the available CAN on the device. Refer to the specific device data sheet or the related family reference manual to determine the set of functions that are supported for each CAN module on the device.

This library provides the low-level abstraction of the CAN module on the Microchip family of microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in the software and introduces the library interface.

CAN Software Abstraction Block Diagram



Software Model:

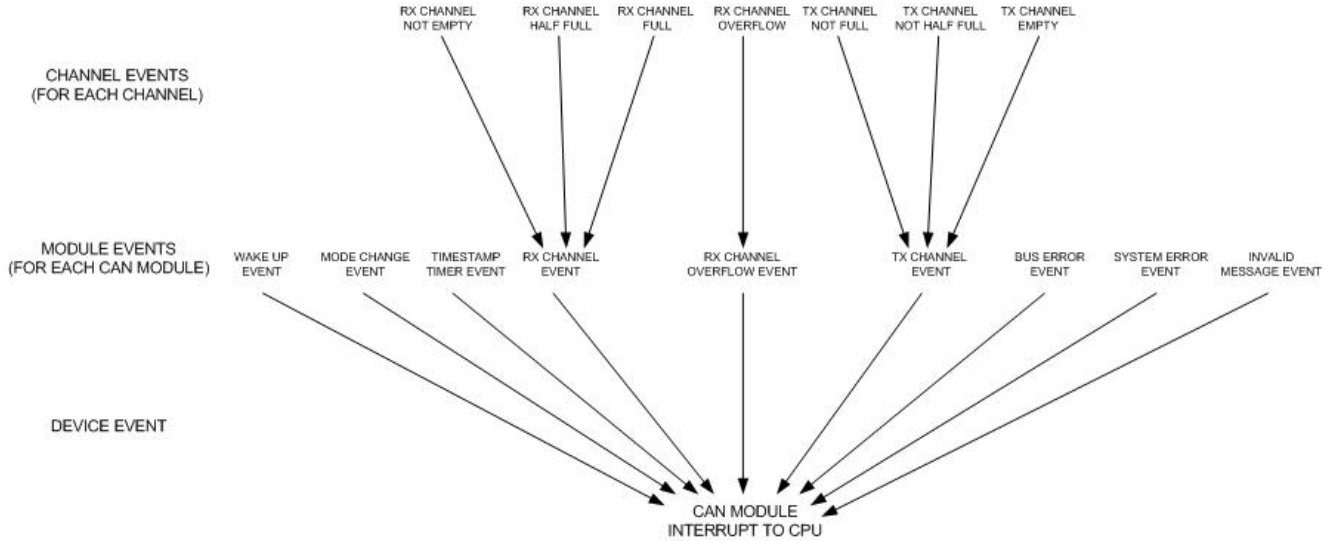
The CAN Peripheral Library provides interface routines to interact with the blocks shown in the previous diagram. A channel can be either a transmit channel or a receive channel. The size of a CAN message is typically 16 bytes (8 bytes for data-only receive messages). The size of a channel (the number of messages it can buffer) is configurable. Each channel has a minimum size of one message buffer. The message buffer area for all channels is assigned at configuration time. The CAN Peripheral Library then provides access to these channels and buffers via the library interface.

The user code must enable and configure message acceptance filters to receive messages. These filters compare the ID field of the incoming message with configured value and accepts the messages if IDs match. The message is then stored in a selectable receive channel. At least one message acceptance filter and one filter mask should be enabled for the CAN module to receive messages. A filter mask allows specified filter bits to be ignored during the comparison process. This allows the filter to accept a message with an ID range.

The CAN Peripheral Library allows the CAN module to generate events. Events can be generated at the channel level and at the module level.

Events:

The CAN module is capable of notifying the user application when specific events occur in the module. The following diagram shows these events and how they are organized.



There are two types of events in the CAN module: Channel events and Module events. Channel events are generated by transmit and receive channels. Module events are generated by various sources (including channels) within the CAN module. Each event can be enabled or disabled. Enabling a channel event will cause the CAN module to generate a module event. An enabled module level event will cause the CAN module to generate an interrupt to the CPU.

The application can also poll channel events to check if these are active. This may be done in cases where a polling scheme (rather than an interrupt scheme) needs to be implemented. In this case, the CAN module provides events status on a channel basis. If a channel event is found active, the application can then use library API calls to inspect which channel condition caused the channel event.

Library Overview

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the CAN module.

Library Interface Section	Description
Basic Configuration Functions	APIs that are used for basic control of the module, such as enabling and disabling the module.
Advanced Configuration Functions	These functions enable advanced configuration, such as selection of the operation mode.
Bus Speed Configuration Functions	These functions enable bus speed configuration.
Event Management Functions	These functions can be used to manage the events.
Message Transmit Functions	These functions can be used for message transmission.
Message Receive Functions	These functions are related to data reception.
Error State Tracking Functions	These functions are used for error tracking.
Information Functions	These functions provide information about the module.
Feature Existence Functions	These functions determine whether or not a particular feature is supported by the device.

How the Library Works

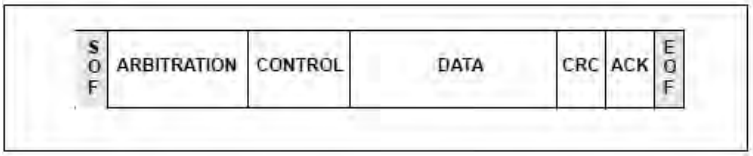
Note: Not all modes are available on all the devices. Please refer to the specific device data sheet to determine the set of modes that are supported for your device.

About CAN Protocol

This section briefly discusses the CAN Protocol briefly. For complete details on the CAN protocol, refer to the CAN 2.0 specification available from Bosch.

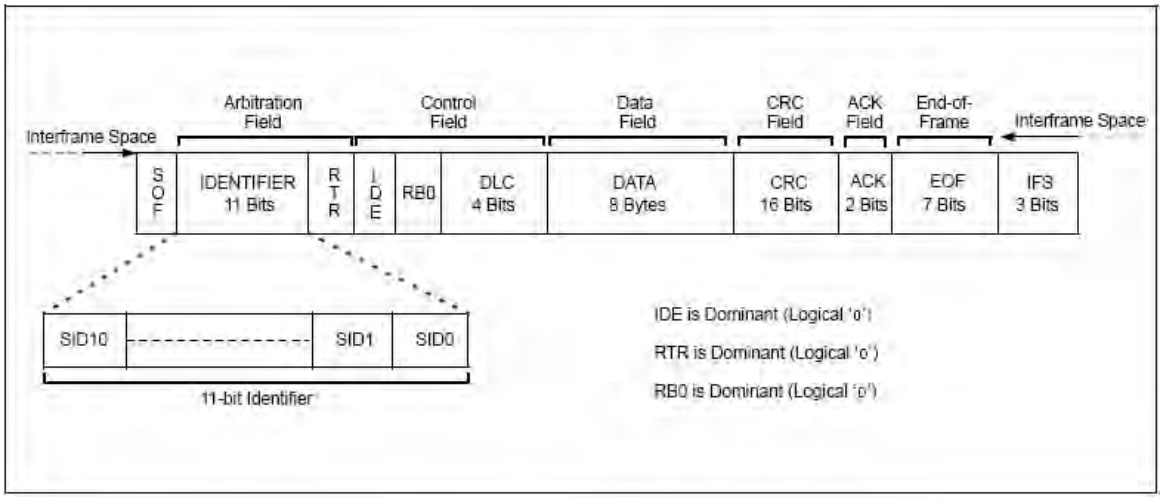
Description

The CAN bus protocol uses asynchronous communication. Information is passed from transmitters to receivers in data frames, which are composed of byte fields that define the contents of the data frame. This is shown in the following figure.



Each frame begins with a Start-of-Frame (SOF) bit and terminates with an End-of-Frame (EOF) bit field. The SOF is followed by arbitration and control fields, which identify the message type, format, length and priority. This information allows each node on the CAN bus to respond appropriately to the message. The data field conveys the message content and is of variable length, ranging from 0 to 8 bytes. Error protection is provided by the Cyclic Redundancy Check (CRC) and acknowledgement (ACK) fields.

Standard ID Message Format



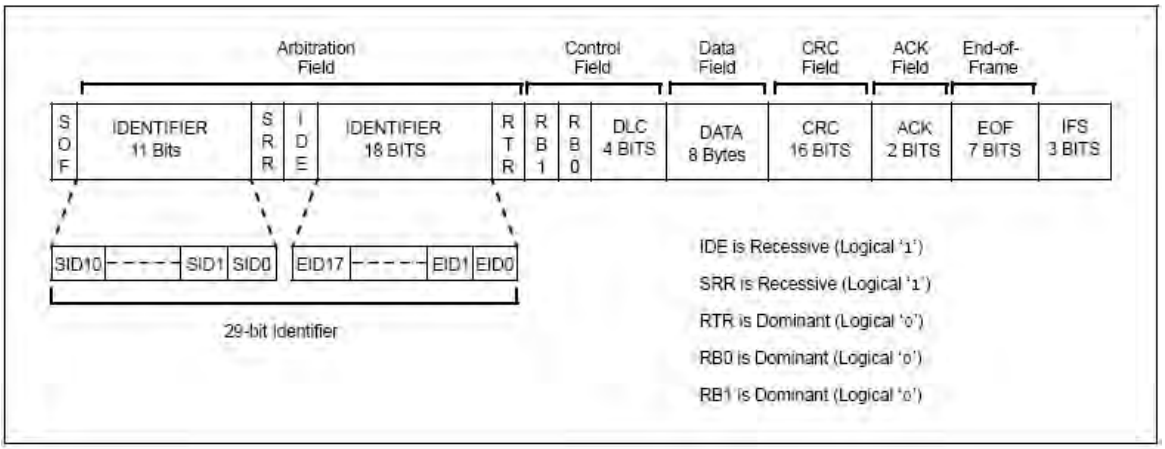
The Standard ID message begins with a Start-of-Frame bit followed by a 12-bit arbitration field. The arbitration field contains an 11-bit identifier and the Remote Transmit Request (RTR) bit. The identifier defines the type of information contained in the message and is used by each receiving node to determine if the message is of interest. The RTR bit distinguishes a data frame from a remote frame. For a standard data frame, the RTR bit is clear.

Following the arbitration field is a 6-bit control field, which provides more information about the contents of the message. The first bit in the control field is an Identifier Extension (IDE) bit, which distinguishes the message as either a standard or extended data frame. A standard data frame is indicated by a dominant state (logic level '0') during transmission of the IDE bit. The second bit in the control field is a reserved (RB0) bit, which is in the dominant state (logic level '0'). The last 4 bits in the control field represent the Data Length Code (DLC), which specifies the number of data bytes present in the message.

The data field follows the control field. This field carries the message data – the actual payload of the data frame. This field is of variable length, ranging from 0 to 8 bytes. The number of bytes is user-selectable.

The data field is followed by the Cyclic Redundancy Check (CRC) field, which is a 15-bit CRC sequence with one delimiter bit. The acknowledgement (ACK) field is sent as a recessive bit (logic level '1') and is overwritten as a dominant bit by any receiver that has received the data correctly. The message is acknowledged by the receiver regardless of the result of the acceptance filter comparison. The last field is the End-of-Frame field, which consists of 7 recessive bits that indicate the end of message.

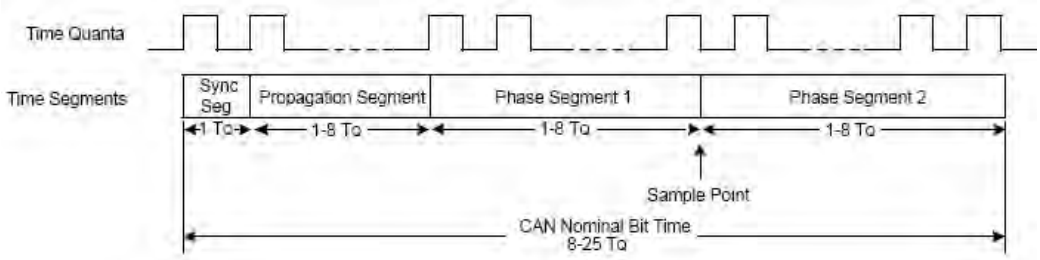
Extended ID Message Format



The Extended ID Message frame begins with an SOF bit followed by a 31-bit arbitration field. The arbitration field for the extended data frame contains 29 identifier bits in two fields separated by a Substitute Remote Request (SRR) bit and an IDE bit. The SRR bit determines if the message is a remote frame. SRR = 1 for extended data frames. The IDE bit indicates the data frame type. For the extended data frame, IDE = 1.

The extended data frame Control field consists of 7 bits. The first bit is the RTR. For the extended data frame, RTR = 0. The next two bits, RB1 and RB0, are reserved bits that are in the dominant state (logic level '0'). The last 4 bits in the Control field are the Data Length Code, which specifies the number of data bytes present in the message. The remaining fields in an extended data frame are identical to a standard data frame.

CAN Bit Time Quanta



The nominal bit rate is the number of bits per second transmitted on the CAN bus.

Nominal bit time = 1 ÷ Nominal Bit Rate.

There are four time segments in a bit time to compensate for any phase shifts due to oscillator drifts or propagation delays. These time segments do not overlap each other and are represented in terms of Time Quantum (TQ). One TQ is a fixed unit of time derived from the oscillator clock. The total number of time quanta in a nominal bit time must be programmed between 8 and 25 TQ.

Each bit transmission time consists of four time segments:

Synchronization Segment – This time segment synchronizes the different nodes connected on the CAN bus. A bit edge is expected to be within this segment. Based on CAN protocol, the Synchronization Segment is assumed to be one Time Quantum.

Propagation Segment – This time segment compensates for any time delay that may occur due to the bus line or due to the various transceivers connected on that bus.

Phase Segment 1 – This time segment compensates for errors that may occur due to phase shift in the edges. The time segment may be lengthened during resynchronization to compensate for the phase shift.

Phase Segment 2 – This time segment compensates for errors that may occur due to phase shift in the edges. The time segment may be shortened during resynchronization to compensate for the phase shift. The Phase Segment 2 time can be configured to be either programmable or specified by the Phase Segment 1 time.

Two types of synchronization are used – Hard Synchronization and Resynchronization. A Hard Synchronization occurs once at the start of a frame. Resynchronization occurs inside a frame.

Hard synchronization takes place on the recessive-to-dominant transition of the start bit. The bit time is restarted from that edge.

Resynchronization takes place when a bit edge does not occur within the Synchronization Segment in a message. One of the Phase Segments is shortened or lengthened by an amount that depends on the phase error in the signal. The maximum amount that can be used is determined by the Synchronization Jump Width parameter.

The length of Phase Segment 1 and Phase Segment 2 can be changed depending on oscillator tolerances of the transmitting and receiving node. Resynchronization compensates for any phase shifts that may occur due to the different oscillators used by the transmitting and receiving nodes.

Bit Lengthening – If the transmitting node in CAN has a slower oscillator than the receiving node, the next falling edge, and therefore, the sample point, can be delayed by lengthening Phase Segment 1 in the bit time.

Bit Shortening – If the transmitting node in CAN has a faster oscillator than the receiving node, the next falling edge, and therefore, the sample point of the next bit, can be reduced by shortening the Phase Segment 2 in the bit time.

Synchronization Jump Width (SJW) – This determines the synchronization jump width by limiting the amount of lengthening or shortening that can be applied to the Phase Segment 1 and Phase Segment 2 time intervals. This segment should not be longer than Phase Segment 2 time. The width can be 1-4 TQ

Initialization of CAN

This section provides information on initializing CAN, including channel, filters, masks, and mode configuration, setting the bus speed, assigning buffer memory, and enabling events.

Mode Configuration

The CAN module must be enabled before configuration. Enabling the CAN module gives it control over the CAN pins of the device. The following code example shows how the PLIB_CAN_Enable function is used to enable the module.

```
/* This code expects the data direction settings to be done from other modules */
/* Switch the CAN module ON */
PLIB_CAN_Enable(CAN_ID_1);
```

The CAN module must be placed in Configuration mode before attempting to configure it. The following features are available in Configuration mode only:

- Configuring the CAN module clock and CAN bus speed
- Configuring the message acceptance filter mask

- Assigning the channel buffer memory
- Configuring channel size and Receive Channel Data-only mode.

The CAN module operating mode can be changed by using the PLIB_CAN_OperationModeSelect function. The caller should wait until the operating mode is set before proceeding. The PLIB_CAN_OperationModeGet function can be used to obtain the current operating mode of the CAN module.

```
/* Switch the CAN module to Configuration mode. Wait until the switch is complete */
PLIB_CAN_Enable(CAN_ID_1);
PLIB_CAN_OperationModeSelect(CAN_ID_1, CAN_CONFIGURATION_MODE);
while(PLIB_CAN_OperationModeGet(CAN_ID_1) != CAN_CONFIGURATION_MODE);
```

The CAN module must be placed in Normal mode to be able to send and receive messages.

The caller should wait until the Normal operating mode is set before proceeding. The PLIB_CAN_OperationModeSelect function can be used to obtain the current operating mode of the CAN module.

```
/* Switch the CAN module to Normal mode. Wait until the switch is complete */
PLIB_CAN_OperationModeSelect(CAN_ID_1, CAN_NORMAL_MODE);
while(PLIB_CAN_OperationModeGet(CAN_ID_1) != CAN_NORMAL_MODE);
```

Setting Bus Speed

The bus speed at which the CAN node operates is determined by the CAN module clock and the number of Bit Time Quanta (TQ) assigned to the CAN bit.

The following code shows an example of setting the CAN module clock and CAN bus speed. In this example, the number of TQ is 11.

```
/*The CPU core frequency is 80000000 Hz and the desired CAN bus speed is 500 kbps.
  Use ECAN Bit Rate Calculator plug-in to get parameter values for 500 kbps Baud rate*/

    #define MY_CAN_ID       CAN_ID_1
    #define PRESCALE        6
    #define SYNCJUMPWIDTH   1
    #define PROPAGATION     2
    #define SEGMENT1        4
    #define SEGMENT2        4
    #define CAN_CLOCK       80000000ul

    uint32_t baudRate;
    bool result;

    if (CAN_CONFIGURATION_MODE == PLIB_CAN_OperationModeGet(MY_CAN_ID))
    {
        result = PLIB_CAN_PrecalculatedBitRateSetup( MY_CAN_ID, PRESCALE, SYNCJUMPWIDTH,
                                            PROPAGATION, SEGMENT1, SEGMENT2 );

        if(false == result)
        {
            // Error occurred, handle accordingly
        }
        else
        {
            baudRate = PLIB_CAN_BaudRateGet(MY_CAN_ID, CAN_CLOCK);
        }

    }
```

Assigning Buffer Memory

The CAN module requires RAM memory to store received messages and queue message that need to be transmitted. The total amount of memory required depends on the size of each channel. While each channel has a minimum size of one message buffer (16 bytes), to simplify usage issues, channels should be used in a sequentially ascending order starting with channel 0.

To better understand the buffer memory requirements of the CAN module, consider the following examples:

Example 1: Two transmit channels (each with eight message buffers) and one full receive channel (with 10 message buffers):

- Two transmit channels with eight message buffers: 2 * 8 * 16 = 256 bytes
- One receive channel with 10 message buffers: 1 * 10 * 16 = 160 bytes
- Total memory required in bytes = 416 bytes

Example 2: Four transmit channels (two with eight message buffers and other two with 10 message buffers) and two full receive channels (one with 10 message buffers and one with 20 message buffers):

- Two transmit channels with eight message buffers: 2 * 8 * 16 = 256 bytes
- Two transmit channels with 10 message buffers: 2 * 10 * 16 = 320 bytes
- One receive channel with 10 message buffers: 1 * 10 * 16 = 160 bytes
- One receive channel with 20 message buffers: 1 * 20 * 16 = 320 bytes
- Total memory required in bytes = 1056 bytes

Example 3: One transmit channel (with maximum message buffers) and two receive Channels (one full receive with 10 message buffers and one data-only channel with maximum message buffers):

- One transmit channel with maximum (32) message buffers: 1 * 32 * 16 = 512 bytes
- One receive channel with 10 message buffers: 1 * 10 * 16 = 160 bytes
- One data-only receive channel with 32 message buffers: 1 * 32 * 8 = 256 bytes
- Total memory required in bytes = 928 bytes

The PLIB_CAN_MemoryBufferAssign function is used to assign a memory buffer to the CAN module, which is shown in the following example.

```
    /* Assign the buffer area to the CAN module.
     * In this case assign enough memory for 2
     * channels, each with 8 message buffers.*/

    uint8_t MY_CAN_MessageFifoArea[2 * 8 * 16];
    PLIB_CAN_MemoryBufferAssign(CAN_ID_1, MY_CAN_MessageFifoArea);
```

Channel Configuration

To transmit and receive CAN messages, the user application must configure channels. The PLIB_CAN_ChannelForTransmitSet function is used to configure a channel for transmit operation. The PLIB_CAN_ChannelForReceiveSet function is used to configure a channel for receive operation.

Note: To receive CAN messages, at least one message acceptance filter with a receive channel must be configured.

A CAN Transmit channel can be enabled to process a Remote Transmit Request (RTR). In this case, the transmit channel will automatically transmit all queued messages when an RTR message is accepted by the CAN module.

The following code shows an example of configuring a CAN Transmit channel.

```
/* Configure CAN1 Channel 0 for Transmit operation. Allocate 8 message buffer,
 * disable the RTR feature and assign low medium priority for transmissions. */

 PLIB_CAN_ChannelForTransmitSet(CAN_ID_1, CAN_CHANNEL0, 8, CAN_TX_RTR_DISABLED,
      CAN_LOW_MEDIUM_PRIORITY);
```

A CAN receive channel can be enabled to store the data payload portion of an accepted message. This mode is called the Data-only mode. The CAN module otherwise stores both the ID and data payload portion of the accepted message.

The following code shows an example of configuring a CAN Receive channel.

```
/* Configure CAN1 Channel 1 for Receive operation. Allocate 8 message buffers,
 * disable the Data-only feature (specify full receive mode). */

 PLIB_CAN_ChannelForReceiveSet(CAN_ID_1, CAN_CHANNEL1, 8, CAN_RX_FULL_RECEIVE);
```

Filters and Masks Configuration

The CAN message acceptance filter allows an application to accept only selected messages from the CAN bus. The CAN module achieves this by comparing the Standard or Extended ID of a message with the configured filter ID. The message is accepted on an ID match. The accepted message is stored in the configured destination channel.

The CAN message acceptance filter mask directs the CAN module to ignore specified bits in the filter comparison. This allows the application to accept messages within an ID range.

At least one filter and one mask must be configured for the CAN module to be able to receive messages. The destination channel for a filter must be a receive channel unless the channel is a transmit channel with the RTR feature enabled.

The PLIB_CAN_FilterConfigure function is used to configure a message acceptance filter. The PLIB_CAN_FilterMaskConfigure function is used to configure a message acceptance filter mask. The filter and mask must be linked together to a channel. This is done using the PLIB_CAN_FilterToChannelLink function. The CAN filter should be enabled to allow messages to be processed. This is done using the PLIB_CAN_FilterEnable function.

To better understand how the filter and masks can be used to implement filtering, consider the following code examples:

Example 1: Configure a CAN filter to accept a Standard ID message with ID 0x201

```
/* Only one message ID is to be accepted. All bits are to be compared
 * therefore, the mask value should be 0x7FF. The message type is Standard ID.
 * Configure CAN1, Filter 0, Mask 0 and set the destination channel as
 * Channel 1. */

PLIB_CAN_FilterConfigure(CAN_ID_1, CAN_FILTER0, 0x201, CAN_SID);
```

```
PLIB_CAN_FilterMaskConfigure(CAN_ID_1, CAN_FILTER_MASK0, 0x7FF, CAN_SID,
    CAN_FILTER_MASK_IDE_TYPE);
PLIB_CAN_FilterToChannelLink(CAN_ID_1, CAN_FILTER0, CAN_FILTER_MASK0,
    CAN_CHANNEL1);
PLIB_CAN_FilterEnable(CAN_ID_1, CAN_FILTER0);
```

Example 2: Configure a CAN filter to accept an Extended ID message with ID 0x8004001

```
/* Only one message ID is to be accepted. All bits are to be compared
 * therefore, the mask value should be 0x8004001. The message type is Extended ID.
 * Configure CAN1, Filter 0, Mask 0 and set the destination channel as
 * Channel 1. */

PLIB_CAN_FilterConfigure(CAN_ID_1, CAN_FILTER0, 0x8004001, CAN_EID);
PLIB_CAN_FilterMaskConfigure(CAN_ID_1, CAN_FILTER_MASK0, 0x3FFFFFFF, CAN_EID,
    CAN_FILTER_MASK_IDE_TYPE);
PLIB_CAN_FilterToChannelLink(CAN_ID_1, CAN_FILTER0, CAN_FILTER_MASK0,
    CAN_CHANNEL1);
PLIB_CAN_FilterEnable(CAN_ID_1, CAN_FILTER0);
```

Example 3: Configure a CAN filter to accept an Extended ID message within ID range 0x8004000 - 0x8004003

```
/* A message ID range is to be implemented. The 2 least significant bits can be
 * ignored. Therefore, the mask value should be 0x3FFFFFFC. The message type is
 * Extended ID. Configure CAN1, Filter 0, Mask 0 and set the destination channel
 * as Channel 1. */

PLIB_CAN_FilterConfigure(CAN_ID_1, CAN_FILTER0, 0x8004000, CAN_EID);
PLIB_CAN_FilterMaskConfigure(CAN_ID_1, CAN_FILTER_MASK0, 0x3FFFFFFC,
    CAN_EID, CAN_FILTER_MASK_IDE_TYPE);
PLIB_CAN_FilterToChannelLink(CAN_ID_1, CAN_FILTER0, CAN_FILTER_MASK0,
    CAN_CHANNEL1);
PLIB_CAN_FilterEnable(CAN_ID_1, CAN_FILTER0);
```

Note: Refer to About CAN Protocol for more information on Standard and Extended ID addressing.

Enabling Events

The CAN module can generate events that indicate the status of the module. Events can be generated at the channel level and at the module level. Enabling a channel event will cause the CAN module to generate a module level event when the channel event occurs. Enabling a module event will cause the CAN module to interrupt the CPU.

The following code shows an example of using the PLIB_CAN_ChannelEventEnable and PLIB_CAN_ModuleEventEnable functions to enable channel and module events.

```
    /* Enable the Receive channel not empty and Receive channel
     * full events at the channel level. Enable the Receive event
     * at the module level. */
    PLIB_CAN_ChannelEventEnable(CAN_ID_1, CAN_CHANNEL1,
               (CAN_RX_CHANNEL_NOT_EMPTY|CAN_RX_CHANNEL_FULL));
    PLIB_CAN_ModuleEventEnable (CAN_ID_1, CAN_RX_EVENT);
```

Note: The caller must use the Interrupt Peripheral Library to enable the CAN CPU interrupt.

Transmitting a CAN Message

The caller application can transmit a CAN message by queuing the message in a transmit channel, updating the channel, and then flushing it. Flushing a transmit channel will cause the CAN module to transmit all of the CAN messages that are queued in the channel.

The PLIB_CAN_TransmitBufferGet function should be used to obtain a CAN_TX_MSG_BUFFER handle type to an empty message buffer. The application should then populate this buffer. The PLIB_CAN_ChannelUpdate function must be called when the buffer has been populated. Finally, the PLIB_CAN_TransmitChannelFlush function is called to flush the channel.

The following code shows an example of transmitting an Extended ID message using Channel 0 on the CAN1 module.

```
CAN_TX_MSG_BUFFER * My_Message;

/* Get a pointer to the next buffer in the Transmit channel
 * check if the returned value is null. */
My_Message = PLIB_CAN_TransmitBufferGet(CAN_ID_1, CAN_CHANNEL0);

if(My_Message != NULL)
{
```

```
    /* Form a Extended ID CAN message. Start by clearing the buffer.
    Set the IDE bit to 1 to indicate extended ID message. Clear RTR bit
    as this is not a RTR message. */
    My_Message->messageWord[0] = 0;
    My_Message->messageWord[1] = 0;
    My_Message->messageWord[2] = 0;
    My_Message->messageWord[3] = 0;
    My_Message->msgSID.sid    = 0x200;
    My_Message->msgEID.eid    = 0x4002;
    My_Message->msgEID.ide    = 1;
    My_Message->msgEID.sub_remote_req    = 0;
    My_Message->msgEID.data_length_code  = 1;
    My_Message->data[0]       = 0xAA;

    /* This function lets the CAN module
     know that the message processing is done.*/
    PLIB_CAN_ChannelUpdate(CAN_ID_1, CAN_CHANNEL0);

    /* Direct the CAN module to flush the
     Transmit channel. This will send any pending
     message in the Transmit channel. */
    PLIB_CAN_TransmitChannelFlush(CAN_ID_1, CAN_CHANNEL0);
}
```

Note: The PLIB_CAN_TransmitBufferGet function will return NULL if the transmit channel is full. In this occurs, the PLIB_CAN_TransmitChannelFlush function should be called to empty the channel.

The following code shows an example of transmitting a Standard ID message using Channel 0 on the CAN1 module.

```
CAN_TX_MSG_BUFFER * myMessage;

/* Get a pointer to the next buffer in the channel
 check if the returned value is null. */
myMessage = PLIB_CAN_TransmitBufferGet(CAN_ID_1, CAN_CHANNEL0);

if(myMessage != NULL)
{

    /* Form a Standard ID CAN message. Start by clearing the buffer.
     Send message to the CAN2 module. IDE = 0 means Standard ID message.
     Send one byte of data.
     */
    myMessage->messageWord[0] = 0;
    myMessage->messageWord[1] = 0;
    myMessage->messageWord[2] = 0;
    myMessage->messageWord[3] = 0;

    myMessage->msgSID.sid     = 0x202;
    myMessage->msgEID.ide     = 0;
    myMessage->msgEID.data_length_code     = 1;
    myMessage->data[0]        = 0x23;

    /* This function lets the CAN module
     know that the message processing is done
     and message is ready to be processed. */
    PLIB_CAN_ChannelUpdate(CAN_ID_1, CAN_CHANNEL0);

    /* Direct the CAN module to flush the
     Transmit channel. This will send any pending
     message in the Transmit channel. */
    PLIB_CAN_TransmitChannelFlush(CAN_ID_1, CAN_CHANNEL0);
}
```

Receiving a CAN Message

The caller application can use either the interrupt or polling technique to detect when a message has been received.

The following code shows how the PLIB_CAN_ReceivedMessageGet function can be used to read a received message.

```
CAN_RX_MSG_BUFFER * message;
```

```
message = (CAN_RX_MSG_BUFFER *)PLIB_CAN_ReceivedMessageGet(CAN_ID_1,
    CAN_CHANNEL1);
if(message != NULL)
{
    //Process the message received

   /* Call the PLIB_CAN_ChannelUpdate function to let
    the CAN module know that the message processing
    is done. */
    PLIB_CAN_ChannelUpdate(CAN_ID_1, CAN_CHANNEL1);
}
```

The PLIB_CAN_ReceivedMessageGet function returns an address pointer after converting it from physical address space to virtual address space.

Handling Events

The CAN module can generate events at the channel level and at the module level. An enabled channel event will cause a module event. An enabled module event will cause a CAN CPU interrupt. See Channel Events and Module Events more information on each type of event.

Channel Events

Each channel in the module has its own set of events. The type of events are common to all channels. While a specific channel event may be active and can be inspected, it will cause a module event only if the channel event is enabled.

The following code shows an example of enabling and disabling channel events using the PLIB_CAN_ChannelEventEnable function.

```
/* CAN 1 Channel 1 and 3 are Transmit channels and Channel 2 and 4 are Receive
 channels */
/* Enable Channel 1 empty event and channel not full event. Disable Channel 2 full
 and overflow event */
/* Enable all Transmit events on Channel 2 and disable all RX events on Channel 4 */

PLIB_CAN_ChannelEventEnable(CAN_ID_1, CAN_CHANNEL1,
    (CAN_TX_CHANNEL_EMPTY | CAN_TX_CHANNEL_NOT_FULL));
PLIB_CAN_ChannelEventEnable(CAN_ID_1, CAN_CHANNEL2,
    (CAN_RX_CHANNEL_FULL | CAN_RX_CHANNEL_OVERFLOW));
PLIB_CAN_ChannelEventEnable(CAN_ID_1, CAN_CHANNEL3, CAN_TX_CHANNEL_ANY_EVENT);
PLIB_CAN_ChannelEventEnable(CAN_ID_1, CAN_CHANNEL4, CAN_RX_CHANNEL_ANY_EVENT);
```

The PLIB_CAN_ModuleEventGet function can be used to check if a specific event is active in a specific channel.

It is only necessary for the event to be active and not enabled for this to work, as shown in the following code example.

```
// Check if RX Channel 2 of CAN module 1 is not empty or if its full.
CAN_CHANNEL_EVENT channelEvent;

channelEvent = PLIB_CAN_ChannelEventGet(CAN_ID_1, CAN_CHANNEL2);

if((channelEvent & (CAN_RX_CHANNEL_NOT_EMPTY | CAN_RX_CHANNEL_FULL)) != 0)
{
    // This means that either RX Channel 2 is not empty
    // or the Channel is full.
}
```

If a channel event is enabled and is active, it will set a channel event status flag. This flag indicates that some event in the channel is active.

The following code example shows how the PLIB_CAN_AllChannelEventsGet function is used to check if any channel event is active.

```
/* Check if RX Channel 2 of CAN module 1 is not empty or if its full */
CAN_CHANNEL_EVENT channelEvent;

channelEvent = PLIB_CAN_ChannelEventGet(CAN_ID_1, CAN_CHANNEL2);

if((channelEvent & (CAN_RX_CHANNEL_NOT_EMPTY | CAN_RX_CHANNEL_FULL)) != 0)
{
    // This means that either RX Channel 2 is not empty
    // or the Channel is full.
}
```

A receive channel overflow condition is special channel event and is available as a module event as well. The PLIB_CAN_AllChannelOverflowStatusGet function returns the status of all channels that have an active overflow event. Only channels with enabled overflow events will be reflected.

The following code shows an example of how this function is used.

```
/* Check if Channel 2 or 3 of CAN module 1 have any active events */
CAN_CHANNEL_MASK channelEvents;
```

```
channelEvents = PLIB_CAN_AllChannelEventsGet(CAN_ID_1);

if((channelEvents & (CAN_CHANNEL2_MASK | CAN_CHANNEL3_MASK)) != 0)
{
    // Either Channel 2 or 3 has an active event.
    // The PLIB_CAN_ChannelEventGet function can be
    // used to query the channel for more details.
}
```

Module Events

The CAN module has various sources of events, which includes the channel events. The PLIB_CAN_ModuleEventEnable function can be used to enable and disable module level events. Enabling a module event will cause the CAN module to generate a CPU interrupt, as shown in the following code example.

```
// Enable CAN1 module Transmit Event and Receive Events.
// Disable Receive Overflow event and operation
// mode change event.
PLIB_CAN_ModuleEventEnable(CAN_ID_1, (CAN_TX_EVENT | CAN_RX_EVENT));
PLIB_CAN_ModuleEventDisable(CAN_ID_1,
    (CAN_OPERATION_MODE_CHANGE_EVENT | CAN_RX_OVERFLOW_EVENT));
```

The PLIB_CAN_ModuleEventGet function can be used to check if any module level events are active. This is shown in the following code example.

```
// Check if the CAN Module 1 Receive event
// or if Transmit event is active
if((PLIB_CAN_ModuleEventGet(CAN_ID_1) & (CAN_RX_EVENT | CAN_TX_EVENT)) != 0)
{
    // Handle the Receive or Transmit module Event here.
}
```

The CAN module also provides code to indicate the highest priority pending event in the CAN module. The PLIB_CAN_PendingEventsGet function can be used to read and analyze this code, as shown in the following code example.

```
/* Implement a switch to check and process any active CAN module events */
CAN_EVENT_CODE eventCode;

eventCode = PLIB_CAN_PendingEventsGet(CAN_ID_1);

switch(eventCode)
{
    case CAN_NO_EVENT:
        /* Procedure to handle no CAN events */
        break;
    case CAN_WAKEUP_EVENT:
        /* Procedure to handle device wake-up on CAN bus activity event */
        break;
    default:
        break;
}
```

Configuring the Library

The library is configured for the supported processor when the processor is chosen in the MPLAB X IDE.

Library Interface

a) Basic Configuration Functions

	Name	Description
	PLIB_CAN_BusActivityWakeupDisable	Disables the wake-up on bus activity receive line filter.
	PLIB_CAN_BusActivityWakeupEnable	Enables the wake-up on bus activity receive line filter.
	PLIB_CAN_Disable	Disables the specified CAN module.
	PLIB_CAN_Enable	Enables the specified CAN module.
	PLIB_CAN_IsActive	Returns 'true' if the CAN module is active.
	PLIB_CAN_OperationModeGet	Obtains the current CAN operating mode.
	PLIB_CAN_OperationModeSelect	Sets the CAN operating mode.

	PLIB_CAN_StopInIdleDisable	Disables the Stop in Idle feature.
	PLIB_CAN_StopInIdleEnable	Enables the CAN module to stop when the processor enters Idle mode.
	PLIB_CAN_TimeStampDisable	Disables the time stamp feature for the CAN module.
	PLIB_CAN_TimeStampEnable	Enables the time stamp feature for the CAN module.
	PLIB_CAN_ExistsTimeStampPrescaler	Identifies whether the TimeStampPrescaler feature exists on the CAN module.
	PLIB_CAN_TimeStampPrescalerSet	Sets the CAN receive message time stamp timer prescaler.
	PLIB_CAN_MemoryBufferAssign	Assigns buffer memory to the CAN module.

b) Advanced Configuration Functions

	Name	Description
	PLIB_CAN_ChannelResetIsComplete	Returns 'true' if the specified channel reset is complete.
	PLIB_CAN_DeviceNetConfigure	Configures the CAN module DeviceNet(TM) filter feature.
	PLIB_CAN_TimeStampValueGet	Returns the current value of the CAN receive message time stamp timer value.
	PLIB_CAN_TimeStampValueSet	Sets the CAN receive message time stamp timer value.

c) Bus Speed Configuration Functions

	Name	Description
	PLIB_CAN_BusLine3TimesSamplingDisable	Disables the bus line three times sampling.
	PLIB_CAN_BusLine3TimesSamplingEnable	Enables the bus line three times sampling.
	PLIB_CAN_BaudRateGet	Returns the current CAN module Baud rate.
	PLIB_CAN_BaudRatePrescaleSetup	Sets the prescale divisor applied to the CAN module's input clock before it is used to determine the CAN baud rate.
	PLIB_CAN_PrecalculatedBitRateSetup	Sets the desired Baud rate for the respective CAN module.
	PLIB_CAN_BitSamplePhaseSet	Sets the CAN bit-sampling phase parameters.

d) Channel Configuration Functions

	Name	Description
	PLIB_CAN_ChannelForReceiveSet	Configures a CAN channel for receive operation.
	PLIB_CAN_ChannelForTransmitSet	Configures a CAN channel for transmission.
	PLIB_CAN_ChannelReset	Resets a CAN channel.
	PLIB_CAN_ChannelUpdate	Updates the CAN Channel internal pointers.
	PLIB_CAN_ChannelEventDisable	Enables channel level events.

e) Event Management Functions

	Name	Description
	PLIB_CAN_ModuleEventClear	Clears the CAN module level events.
	PLIB_CAN_ModuleEventDisable	Disables the module level events.
	PLIB_CAN_ModuleEventEnable	Enables the module level events.
	PLIB_CAN_ModuleEventGet	Returns the status of the CAN module events.
	PLIB_CAN_AllChannelEventsGet	Returns a value representing the event status of all CAN channels.
	PLIB_CAN_AllChannelOverflowStatusGet	Returns a value representing the receive overflow event status of all CAN channels.
	PLIB_CAN_ChannelEventClear	Clears CAN channel events.
	PLIB_CAN_ChannelEventEnable	Enables channel level events.
	PLIB_CAN_ChannelEventGet	Returns a value representing the event status of a CAN channel.
	PLIB_CAN_PendingEventsGet	Returns a value representing the highest priority active event in the module.

f) Message Transmit Functions

	Name	Description
	PLIB_CAN_PendingTransmissionsAbort	Aborts any pending transmit operations.
	PLIB_CAN_TransmissionIsAborted	Returns 'true' if the transmit abort operation is complete.
	PLIB_CAN_TransmitBufferGet	Returns a pointer to an empty transmit buffer.
	PLIB_CAN_TransmitChannelFlush	Causes all messages in the specified transmit channel to be transmitted.
	PLIB_CAN_TransmitChannelStatusGet	Returns the condition of the transmit channel.
	PLIB_CAN_TransmitErrorCountGet	Returns the CAN transmit error count

g) Message Receive Functions

	Name	Description
	PLIB_CAN_ReceivedMessageGet	Returns a pointer to a message to be read from the CAN channel.

h) Message Filtering Functions

	Name	Description
	PLIB_CAN_FilterConfigure	Configures a CAN message acceptance filter.
	PLIB_CAN_FilterDisable	Disables a CAN message acceptance filter.
	PLIB_CAN_FilterEnable	Enables a CAN message acceptance filter.
	PLIB_CAN_FilterIsDisabled	Returns 'true' if the specified filter is disabled.
	PLIB_CAN_FilterMaskConfigure	Configures a CAN filter mask.
	PLIB_CAN_FilterToChannelLink	Links a filter to a channel.
	PLIB_CAN_LatestFilterMatchGet	Returns the index of the filter that accepted the latest message.

i) Error State Tracking Functions

	Name	Description
	PLIB_CAN_ReceiveErrorCountGet	Returns the CAN receive error count.
	PLIB_CAN_ErrorStateGet	Returns the CAN error status word.

j) Information Functions

	Name	Description
	PLIB_CAN_TotalChannelsGet	Returns the total number of CAN channels per CAN module.
	PLIB_CAN_TotalFiltersGet	Returns the total number of CAN Filters per CAN module.
	PLIB_CAN_TotalMasksGet	Returns the total number of CAN masks per CAN module.

k) Feature Existence Functions

	Name	Description
	PLIB_CAN_ExistsActiveStatus	Identifies whether the ActiveStatus feature exists on the CAN module.
	PLIB_CAN_ExistsAllChannelEvents	Identifies whether the AllChannelEvents feature exists on the CAN module.
	PLIB_CAN_ExistsAllChannelOverflow	Identifies whether the AllChannelOverflow feature exists on the CAN module.
	PLIB_CAN_ExistsBusActivityWakeup	Identifies whether the BusActivityWakeup feature exists on the CAN module.
	PLIB_CAN_ExistsBusLine3TimesSampling	Identifies whether the BusLine3TimesSampling feature exists on the CAN module.
	PLIB_CAN_ExistsChannelEvent	Identifies whether the ChannelEventGet feature exists on the CAN module.
	PLIB_CAN_ExistsChannelEventEnable	Identifies whether the ChannelEventEnable feature exists on the CAN module.
	PLIB_CAN_ExistsChannelForReceiveSet	Identifies whether the ChannelForReceiveSet feature exists on the CAN module.
	PLIB_CAN_ExistsChannelForTransmitSet	Identifies whether the ChannelForTransmitSet feature exists on the CAN module.
	PLIB_CAN_ExistsChannelReset	Identifies whether the ChannelReset feature exists on the CAN module.
	PLIB_CAN_ExistsChannelUpdate	Identifies whether the ChannelUpdate feature exists on the CAN module.
	PLIB_CAN_ExistsDeviceNet	Identifies whether the DeviceNet feature exists on the CAN module.
	PLIB_CAN_ExistsEnableControl	Identifies whether the EnableControl feature exists on the CAN module.
	PLIB_CAN_ExistsErrorState	Identifies whether the ErrorStateGet feature exists on the CAN module.
	PLIB_CAN_ExistsFilterConfigure	Identifies whether the FilterConfigure feature exists on the CAN module.
	PLIB_CAN_ExistsFilterEnable	Identifies whether the FilterEnable feature exists on the CAN module.
	PLIB_CAN_ExistsFilterMaskConfigure	Identifies whether the FilterMaskConfigure feature exists on the CAN module.
	PLIB_CAN_ExistsFilterToChannelLink	Identifies whether the FilterToChannelLink feature exists on the CAN module.
	PLIB_CAN_ExistsLatestFilterMatchGet	Identifies whether the LatestFilterMatchGet feature exists on the CAN module.
	PLIB_CAN_ExistsMemoryBufferAssign	Identifies whether the MemoryBufferAssign feature exists on the CAN module.
	PLIB_CAN_ExistsModuleEventClear	Identifies whether the ModuleEvents feature exists on the CAN module.
	PLIB_CAN_ExistsModuleEventEnable	Identifies whether the ModuleEventEnable feature exists on the CAN module.
	PLIB_CAN_ExistsModuleInfo	Identifies whether the ModuleInformation feature exists on the CAN module.
	PLIB_CAN_ExistsOperationModeRead	Identifies whether the OperationModeRead feature exists on the CAN module.
	PLIB_CAN_ExistsOperationModeWrite	Identifies whether the OperationModeSet feature exists on the CAN module.
	PLIB_CAN_ExistsPendingEventsGet	Identifies whether the PendingEventsGet feature exists on the CAN module.
	PLIB_CAN_ExistsPendingTransmissionsAbort	Identifies whether the PendingTransmissionsAbort feature exists on the CAN module.

	PLIB_CAN_ExistsReceivedMessageGet	Identifies whether the ReceivedMessageGet feature exists on the CAN module.
	PLIB_CAN_ExistsReceiveErrorCount	Identifies whether the ReceiveErrorCount feature exists on the CAN module.
	PLIB_CAN_ExistsStopInIdle	Identifies whether the StopInIdle feature exists on the CAN module.
	PLIB_CAN_ExistsTimeStampEnable	Identifies whether the TimeStampEnable feature exists on the CAN module
	PLIB_CAN_ExistsTimeStampValue	Identifies whether the TimeStampValue feature exists on the CAN module.
	PLIB_CAN_ExistsTransmissionIsAborted	Identifies whether the TransmissionAbortStatus feature exists on the CAN module.
	PLIB_CAN_ExistsTransmitBufferGet	Identifies whether the TransmitBufferGet feature exists on the CAN module.
	PLIB_CAN_ExistsTransmitChannelFlush	Identifies whether the TransmitChannelFlush feature exists on the CAN module.
	PLIB_CAN_ExistsTransmitChannelStatus	Identifies whether the TransmitChannelStatus feature exists on the CAN module.
	PLIB_CAN_ExistsTransmitErrorCountGet	Identifies whether the TransmitErrorCountGet feature exists on the CAN module.
	PLIB_CAN_ExistsBaudRateGet	Identifies whether the BaudRateGet feature exists on the CAN module.
	PLIB_CAN_ExistsBaudRatePrescaleSetup	Identifies whether the BaudRatePrescaleSetup feature exists on the CAN module.
	PLIB_CAN_ExistsBitSamplePhaseSet	Identifies whether the BitSamplePhaseSet feature exists on the CAN module.
	PLIB_CAN_ExistsPrecalculatedBitRateSetup	Identifies whether the PrecalculatedBitRateSetup feature exists on the CAN module.

I) Data Types and Constants

	Name	Description
	CAN_CHANNEL	Identifies the supported CAN Channels.
	CAN_CHANNEL_EVENT	Identifies all Layer 3 interrupts.
	CAN_CHANNEL_MASK	Lists the series of useful masks.
	CAN_DNET_FILTER_SIZE	Specifies the size of the DeviceNet filter.
	CAN_ERROR_STATE	Specifies the CAN module error states.
	CAN_FILTER	CAN event code returned by the CAN module.
	CAN_FILTER_MASK	Identifies the available CAN filter masks.
	CAN_FILTER_MASK_TYPE	Specifies the CAN filter mask type.
	CAN_ID_TYPE	Specifies the CAN ID type.
	CAN_MODULE_EVENT	Specifies the CAN module events
	CAN_MODULE_ID	Enumeration: CAN_MODULE_ID This enumeration defines the number of modules that are available on the microcontroller. This is the super set of all the possible instances that might be available on Microchip microcontrollers. Refer to the specific device data sheet to get the correct number of modules defined for the desired microcontroller.
	CAN_MSG_EID	Defines the structure of the EID word section of the transmit and receive message.
	CAN_OPERATION_MODES	Lists all possible CAN module operational modes.
	CAN_RECEIVE_CHANNEL	Lists all possible CAN module receive channels.
	CAN_RECEIVE_MODES	Lists all possible CAN module receive modes.
	CAN_RX_DATA_MODE	Enables the Data-only Receive mode or Full Receive mode of a CAN receive channel.
	CAN_RX_MSG_BUFFER	Defines the structure of the CAN receive message buffer
	CAN_RX_MSG_SID	Defines the structure of the SID word section of the receive message.
	CAN_TIME_SEGMENT_LENGTH	All possible values for the assignable number of Time Quanta.
	CAN_TX_CHANNEL_STATUS	Identifies possible transmit channel-specific conditions.
	CAN_TX_MSG_BUFFER	Defines the structure of the CAN transmit message buffer.
	CAN_TX_MSG_SID	Defines the structure of the SID word section of the transmit message.
	CAN_TX_RTR	Specifies the status of the CAN Remote Transmit Request (RTR) feature for a CAN transmit channel.
	CAN_TXCHANNEL_PRIORITY	Specifies the priority of a transmit channel.
	CAN_RX_DATA_ONLY_SIZE_BYTES	Used as the size of the CAN data-only receive message buffer in bytes.
	CAN_TX_RX_MESSAGE_SIZE_BYTES	Used as the array size of the CAN transmit and full receive message buffer.

Description

This section describes the Application Programming Interface (API) functions of the CAN Peripheral Library.

Refer to each section for a detailed description.

a) Basic Configuration Functions

PLIB_CAN_BusActivityWakeupDisable Function

Disables the wake-up on bus activity receive line filter.

File

plib_can.h

C

```
void PLIB_CAN_BusActivityWakeupDisable(CAN_MODULE_ID index);
```

Returns

None.

Description

This function disables the Wake up on bus activity receive line filter.

Remarks

The MY_CAN_ID macro in the example above is used as a place holder for the actual CAN bus ID (as defined by the processor-specific CAN_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsBusActivityWakeup in your application to determine whether this feature is available.

Preconditions

None.

Example

```
#define MY_CAN_ID CAN_ID_1

PLIB_CAN_BusActivityWakeupDisable(MY_CAN_ID);
```

Parameters

Parameters	Description
index	Identifies the desired CAN module

Function

void PLIB_CAN_BusActivityWakeupDisable (CAN_MODULE_ID index)

PLIB_CAN_BusActivityWakeupEnable Function

Enables the wake-up on bus activity receive line filter.

File

plib_can.h

C

```
void PLIB_CAN_BusActivityWakeupEnable(CAN_MODULE_ID index);
```

Returns

None.

Description

This function enables the wake-up on bus activity receive line filter.

Remarks

The MY_CAN_ID macro in the example above is used as a place holder for the actual CAN bus ID (as defined by the processor-specific CAN_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsBusActivityWakeup in your application to determine whether this feature is available.

Preconditions

None.

Example

```
#define MY_CAN_ID CAN_ID_1

PLIB_CAN_BusActivityWakeupEnable(MY_CAN_ID);
```

Parameters

Parameters	Description
index	Identifies the desired CAN module

Function

void PLIB_CAN_BusActivityWakeupEnable (CAN_MODULE_ID index)

PLIB_CAN_Disable Function

Disables the specified CAN module.

File

plib_can.h

C

```
void PLIB_CAN_Disable(CAN_MODULE_ID index);
```

Returns

None.

Description

This function disables the specified CAN module.

Remarks

The MY_CAN_ID macro in the example above is used as a place holder for the actual CAN bus ID (as defined by the processor-specific CAN_MODULE_ID enum).

If the user application clears this bit, it may take a number of cycles before the CAN module completes the current transaction and responds to this request. The user application should check this using the PLIB_CAN_IsActive function to verify that the request has been honored.

This function works only if the CAN module is in Configuration mode. Use the PLIB_CAN_OperationModeGet function to get the current mode and the PLIB_CAN_OperationModeSelect function to change the mode.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsEnableControl in your application to determine whether this feature is available.

Preconditions

None.

Example

```
#define MY_CAN_ID CAN_ID_1

PLIB_CAN_Disable(MY_CAN_ID);
```

Parameters

Parameters	Description
index	Identifies the desired CAN module

Function

void PLIB_CAN_Disable (CAN_MODULE_ID index)

PLIB_CAN_Enable Function

Enables the specified CAN module.

File

plib_can.h

C

```
void PLIB_CAN_Enable(CAN_MODULE_ID index);
```

Returns

None.

Description

This function enables the specified CAN module.

Remarks

The MY_CAN_ID macro in the example above is used as a place holder for the actual CAN bus ID (as defined by the processor-specific CAN_MODULE_ID enum).

Some of the CAN module settings can be done only when the module is off. Therefore, always call the PLIB_CAN_Enable Function after all other configurations are complete.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsEnableControl in your application to determine whether this feature is available.

Preconditions

The module should be appropriately configured before being enabled.

Example

```
#define MY_CAN_ID CAN_ID_1

//Do all the other configurations before enabling.

PLIB_CAN_Enable(MY_CAN_ID);
```

Parameters

Parameters	Description
index	Identifies the desired CAN module

Function

void PLIB_CAN_Enable (CAN_MODULE_ID index)

PLIB_CAN_IsActive Function

Returns 'true' if the CAN module is active.

File

plib_can.h

C

```
bool PLIB_CAN_IsActive(CAN_MODULE_ID index);
```

Returns

- true = The module is still active
- false = The module is completely disabled

Description

This function returns 'true' if the CAN module is active. This function is typically called after the CAN module is disabled using the PLIB_CAN_Disable function. The CAN module disable request does not complete immediately when requested and depends on the CAN bus status. This function should be called to check whether the module disable is completed.

Remarks

The CAN module disable operation should not be confused with placing the CAN module in the Disable mode using the PLIB_CAN_OperationModeSelect function. The Disable mode is one of the operating modes of the CAN module. The CAN module is still enabled while in Disable mode. The module disable operation switches the CAN module off.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsActiveStatus in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Disable CAN module 1. Wait until the module is completely disabled.

PLIB_CAN_Disable(CAN_ID_1);

while(PLIB_CAN_IsActive(CAN_ID_1) == true);
```

Parameters

Parameters	Description
index	Identifies the desired CAN module

Function

bool PLIB_CAN_IsActive (CAN_MODULE_ID index)

PLIB_CAN_OperationModeGet Function

Obtains the current CAN operating mode.

File

plib_can.h

C

```
CAN_OPERATION_MODES PLIB_CAN_OperationModeGet(CAN_MODULE_ID index);
```

Returns

The current CAN_OP_MODE type of operation mode of the CAN module.

Description

This function obtains the current CAN operating mode. This function is typically called after the PLIB_CAN_OperationModeSelect function to check if the requested operation mode change is complete.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsOperationModeRead in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Check and wait until the CAN module is in Disable Mode.

while(PLIB_CAN_OperationModeGet(CAN_ID_1) != CAN_DISABLE_MODE);
```

Parameters

Parameters	Description
index	Identifies the desired CAN module

Function

CAN_OPERATION_MODES PLIB_CAN_OperationModeGet (CAN_MODULE_ID index)

PLIB_CAN_OperationModeSelect Function

Sets the CAN operating mode.

File

plib_can.h

C

```
void PLIB_CAN_OperationModeSelect(CAN_MODULE_ID index, CAN_OPERATION_MODES opMode);
```

Returns

None.

Description

This function sets the CAN operating mode. The CAN module requires itself to be in certain modes to gain access to module functionality. For example, the module should be in Normal mode to send and receive messages. Note that after this function is called, it should be checked to determine whether the mode was set by using the PLIB_CAN_OperationModeGet function.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsOperationModeWrite in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Set the CAN_ID_1 operating mode to Configuration mode.

PLIB_CAN_OperationModeSelect(CAN_ID_1, CAN_CONFIGURATION_MODE);
```

Parameters

Parameters	Description
module	Identifies the desired CAN module
opMode	Desired CAN_OP_MODE type of the mode to be set

Function

void PLIB_CAN_OperationModeSelect (CAN_MODULE_ID index, CAN_OPERATION_MODES opMode)

PLIB_CAN_StopInIdleDisable Function

Disables the Stop in Idle feature.

File

plib_can.h

C

```
void PLIB_CAN_StopInIdleDisable(CAN_MODULE_ID index);
```

Returns

None.

Description

This function disables the CAN module from stopping operation when the system enters Idle mode. The module continues operation when the system enters Idle mode.

Remarks

The MY_CAN_ID macro in the example above is used as a place holder for the actual CAN bus ID (as defined by the processor-specific CAN_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsStopInIdle in your application to determine whether this feature is available.

Preconditions

None.

Example

```
#define MY_CAN_ID CAN_ID_1

PLIB_CAN_StopInIdleDisable(MY_CAN_ID);
```

Parameters

Parameters	Description
index	Identifies the desired CAN module

Function

void PLIB_CAN_StopInIdleDisable (CAN_MODULE_ID index)

PLIB_CAN_StopInIdleEnable Function

Enables the CAN module to stop when the processor enters Idle mode.

File

plib_can.h

C

```
void PLIB_CAN_StopInIdleEnable(CAN_MODULE_ID index);
```

Returns

None.

Description

This function configures the CAN module to stop operation when the system enters Idle mode.

Remarks

The MY_CAN_ID macro in the example above is used as a place holder for the actual CAN bus ID (as defined by the processor-specific CAN_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsStopInIdle in your application to determine whether this feature is available.

Preconditions

None.

Example

```
#define MY_CAN_ID CAN_ID_1

PLIB_CAN_StopInIdleEnable(MY_CAN_ID);
```

Parameters

Parameters	Description
index	Identifies the desired CAN module

Function

void PLIB_CAN_StopInIdleEnable (CAN_MODULE_ID index)

PLIB_CAN_TimeStampDisable Function

Disables the time stamp feature for the CAN module.

File

plib_can.h

C

```
void PLIB_CAN_TimeStampDisable(CAN_MODULE_ID index);
```

Returns

None.

Description

This function disables time stamp capture feature for the CAN module. This conserves power by stopping the CAN timer.

Remarks

The MY_CAN_ID macro in the example above is used as a place holder for the actual CAN bus ID (as defined by the processor-specific CAN_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsTimeStampEnable in your application to determine whether this feature is available.

Preconditions

None.

Example

```
#define MY_CAN_ID CAN_ID_1

PLIB_CAN_TimeStampDisable(MY_CAN_ID);
```

Parameters

Parameters	Description
index	Identifies the desired CAN module

Function

void PLIB_CAN_TimeStampDisable (CAN_MODULE_ID index)

PLIB_CAN_TimeStampEnable Function

Enables the time stamp feature for the CAN module.

File

plib_can.h

C

```
void PLIB_CAN_TimeStampEnable(CAN_MODULE_ID index);
```

Returns

None.

Description

This function enables the time stamp capture feature for the CAN module. The CAN timer value will be stored on valid message reception and is stored with the message.

Remarks

The MY_CAN_ID macro in the example above is used as a place holder for the actual CAN bus ID (as defined by the processor-specific CAN_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsTimeStampEnable in your application to determine whether this feature is available.

Preconditions

None

Example

```
#define MY_CAN_ID CAN_ID_1

PLIB_CAN_TimeStampEnable(MY_CAN_ID);
```

Parameters

Parameters	Description
index	Identifies the desired CAN module

Function

void PLIB_CAN_TimeStampEnable (CAN_MODULE_ID index)

PLIB_CAN_ExistsTimeStampPrescaler Function

Identifies whether the TimeStampPrescaler feature exists on the CAN module.

File

plib_can.h

C

```
bool PLIB_CAN_ExistsTimeStampPrescaler(CAN_MODULE_ID index);
```

Returns

- true = The TimeStampPrescaler feature is supported on the device
- false = The TimeStampPrescaler feature is not supported on the device

Description

This function identifies whether the TimeStampPrescaler feature is available on the CAN module. When this function returns true, this function is supported on the device:

- PLIB_CAN_TimeStampPrescalerSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CAN_ExistsTimeStampPrescaler(CAN_MODULE_ID index)

PLIB_CAN_TimeStampPrescalerSet Function

Sets the CAN receive message time stamp timer prescaler.

File

plib_can.h

C

```
void PLIB_CAN_TimeStampPrescalerSet(CAN_MODULE_ID index, unsigned preScaler);
```

Returns

None.

Description

This function sets the CAN receive message time stamp timer prescaler. This prescaler determines the rate at the which the time stamp timer is incremented. For example, if the prescaler value is 0xFF, the time stamp timer is incremented by 1 every 255 system clock periods.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsTimeStampPrescaler in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Set the CAN_ID_1 Receive Message Time Stamp Timer prescaler to increment
//the Time Stamp Timer every 1024 system clock periods.

PLIB_CAN_TimeStampPrescalerSet(CAN_ID_1, 1024);
```

Parameters

Parameters	Description
module	Identifies the desired CAN module
preScaler	Prescaler for the CAN receive message time stamp timer. This value should be between 0x0 and 0xFFFF.

Function

void PLIB_CAN_TimeStampPrescalerSet(CAN_MODULE_ID index, unsigned preScaler)

PLIB_CAN_MemoryBufferAssign Function

Assigns buffer memory to the CAN module.

File

plib_can.h

C

```
void PLIB_CAN_MemoryBufferAssign(CAN_MODULE_ID index, void * buffer);
```

Returns

None.

Description

This function assigns buffer memory address to the CAN module. The CAN module uses this buffer memory to store messages to be transmitted and received. The size of the memory buffer should be enough to accommodate the required number of message buffers and channels.

Remarks

This API is useful only if the CAN module uses device RAM for message buffers and message FIFO location is software configurable. This should not be used if the device message buffer is part of SFR.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsMemoryBufferAssign in your application to determine whether this feature is available.

Preconditions

The module should be in Configuration mode (using the PLIB_CAN_OperationModeSelect function).

Example

```
// Define and assign a CAN 1 memory buffer for 2 Transmit channels and 1 Receive
// channel, each with 4 message buffers

uint8_t canMemoryBuffer [3 * 4 * CAN_TX_RX_MESSAGE_SIZE_BYTES];

PLIB_CAN_MemoryBufferAssign(CAN_ID_1, canMemoryBuffer);
```

Parameters

Parameters	Description
index	Identifies the desired CAN module
buffer	Pointer to the buffer memory area

Function

void PLIB_CAN_MemoryBufferAssign (CAN_MODULE_ID index, void * buffer)

b) Advanced Configuration Functions

PLIB_CAN_ChannelResetIsComplete Function

Returns 'true' if the specified channel reset is complete.

File

plib_can.h

C

```
bool PLIB_CAN_ChannelResetIsComplete(CAN_MODULE_ID index, CAN_CHANNEL channel);
```

Returns

- true = Channel reset is complete
- false = Channel reset is in progress

Description

This function returns 'true' if the specified channel reset is complete. This function should preferably be called after calling the PLIB_CAN_ChannelReset function.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsChannelReset in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Reset channel 4 of CAN_ID_1 module
// and wait until the reset is complete
PLIB_CAN_ChannelReset(CAN_ID_1,CAN_CHANNEL4);

while(PLIB_CAN_ChannelResetIsComplete(CAN_ID_1,CAN_CHANNEL4) != true);
```

Parameters

Parameters	Description
index	Identifies the desired CAN module
channel	Identifies the CAN Channel to be inspected for reset

Function

bool PLIB_CAN_ChannelResetIsComplete (CAN_MODULE_ID index, CAN_CHANNEL channel)

PLIB_CAN_DeviceNetConfigure Function

Configures the CAN module DeviceNet(TM) filter feature.

File

plib_can.h

C

```
void PLIB_CAN_DeviceNetConfigure(CAN_MODULE_ID index, CAN_DNET_FILTER_SIZE dncnt);
```

Returns

None.

Description

This function configures the CAN module DeviceNet filter feature. DeviceNet filtering allows a portion of the data payload to be used as a filter criteria. This function allows the size of this filter to be configured in bits. The filter can also be disabled.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsDeviceNet in your application to determine whether this feature is available.

Preconditions

The CAN module should preferably be in Configuration mode (using the PLIB_CAN_OperationModeSelect function).

Example

```
// Disable the CAN_ID_1 DeviceNet filter feature.

PLIB_CAN_DeviceNetConfigure(CAN_ID_1, CAN_DNET_FILTER_DISABLE);
```

```
// Set the CAN_ID_2 Device Net Filter Size to 10 bits.

PLIB_CAN_DeviceNetConfigure(CAN_ID_2, CAN_DNET_FILTER_SIZE_10_BIT);
```

Parameters

Parameters	Description
index	Identifies the desired CAN module
dncnt	Specifies the CAN_DNET_FILTER_SIZE size of the DeviceNet filter in bits

Function

void PLIB_CAN_DeviceNetConfigure (CAN_MODULE_ID index, CAN_DNET_FILTER_SIZE dncnt)

PLIB_CAN_TimeStampValueGet Function

Returns the current value of the CAN receive message time stamp timer value.

File

plib_can.h

C

```
unsigned PLIB_CAN_TimeStampValueGet(CAN_MODULE_ID index);
```

Returns

The current value of the CAN receive message time stamp timer.

Description

This function gets the current value of the CAN receive message time stamp timer value.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsTimeStampValue in your application to determine whether this feature is available.

Preconditions

None.

Example

```
unsigned int timeStampTimerVal;

// Get the current time stamp timer value.
timeStampTimerVal = PLIB_CAN_TimeStampValueGet(CAN_ID_1);
```

Parameters

Parameters	Description
index	Identifies the desired CAN module

Function

unsigned PLIB_CAN_TimeStampValueGet (CAN_MODULE_ID index)

PLIB_CAN_TimeStampValueSet Function

Sets the CAN receive message time stamp timer value.

File

plib_can.h

C

```
void PLIB_CAN_TimeStampValueSet(CAN_MODULE_ID index, unsigned value);
```

Returns

None.

Description

This function sets the CAN receive message time stamp timer value. The timer will then start counting up from this value.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsTimeStampValue in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Set start value of CAN_ID_1 Receive Message Time Stamp Timer to 0x100
PLIB_CAN_TimeStampValueSet(CAN_ID_1, 0x0100);
```

Parameters

Parameters	Description
index	Identifies the desired CAN module
value	Start value of the receive message time stamp timer. This value should be between 0x0 and 0xFFFF.

Function

void PLIB_CAN_TimeStampValueSet (CAN_MODULE_ID index, unsigned value)

c) Bus Speed Configuration Functions

PLIB_CAN_BusLine3TimesSamplingDisable Function

Disables the bus line three times sampling.

File

plib_can.h

C

```
void PLIB_CAN_BusLine3TimesSamplingDisable(CAN_MODULE_ID index);
```

Returns

None.

Description

The bus line will be sampled three times at the sampling point. If this is disabled, the bus line will be sampled only once.

Remarks

The MY_CAN_ID macro in the example above is used as a place holder for the actual CAN bus ID (as defined by the processor-specific CAN_MODULE_ID enum).

This API may not function if the baud rate prescale value is more than a certain limit. Refer to the specific device data sheet to determine the maximum prescale that allows three times sampling.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsBusLine3TimesSampling in your application to determine whether this feature is available.

Preconditions

This function works only if the CAN module is in Configuration mode. Use the PLIB_CAN_OperationModeGet function to get the current mode and the PLIB_CAN_OperationModeSelect function to change the mode.

Example

```
#define MY_CAN_ID CAN_ID_1

if (CAN_CONFIGURATION_MODE == PLIB_CAN_OperationModeGet(MY_CAN_ID))
{
PLIB_CAN_BusLine3TimesSamplingDisable(MY_CAN_ID);

}
```

Parameters

Parameters	Description
index	Identifies the desired CAN module

Function

void PLIB_CAN_BusLine3TimesSamplingDisable (CAN_MODULE_ID index)

PLIB_CAN_BusLine3TimesSamplingEnable Function

Enables the bus line three times sampling.

File

plib_can.h

C

```
void PLIB_CAN_BusLine3TimesSamplingEnable(CAN_MODULE_ID index);
```

Returns

None.

Description

The bus line will be sampled three times at the sampling point. If this is disabled, the bus line will be sampled only once.

Remarks

The MY_CAN_ID macro in the example above is used as a place holder for the actual CAN bus ID (as defined by the processor-specific CAN_MODULE_ID enum).

This API may not function if the baud rate prescale value is more than a certain limit. Refer to the specific device data sheet to determine the maximum prescale that allows three times sampling.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsBusLine3TimesSampling in your application to determine whether this feature is available.

Preconditions

This function works only if the CAN module is in Configuration mode. Use the PLIB_CAN_OperationModeGet function to get the current mode and the PLIB_CAN_OperationModeSelect function to change the mode.

Example

```
#define MY_CAN_ID CAN_ID_1

if (CAN_CONFIGURATION_MODE == PLIB_CAN_OperationModeGet(MY_CAN_ID))
{
PLIB_CAN_BusLine3TimesSamplingEnable(MY_CAN_ID);

}
```

Parameters

Parameters	Description
index	Identifies the desired CAN module

Function

void PLIB_CAN_BusLine3TimesSamplingEnable (CAN_MODULE_ID index)

PLIB_CAN_BaudRateGet Function

Returns the current CAN module Baud rate.

File

plib_can.h

C

```
uint32_t PLIB_CAN_BaudRateGet(CAN_MODULE_ID index, uint32_t sysclock);
```

Returns

Current Baud rate value in kbps.

Description

This function returns the current baud rate of the CAN module.

Remarks

The MY_CAN_ID macro in the example above is used as a place holder for the actual CAN bus ID (as defined by the processor-specific CAN_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsBaudRateGet in your application to determine whether this feature is available.

Preconditions

None.

Example

```
#define MY_CAN_ID   CAN_ID_1
#define CAN_CLOCK   80000000

uint32_t baudRate;

baudRate = PLIB_CAN_BaudRateGet(MY_CAN_ID, CAN_CLOCK);
```

Parameters

Parameters	Description
index	Identifies the desired CAN module
sysclock	CAN input clock frequency

Function

uint32_t PLIB_CAN_BaudRateGet(CAN_MODULE_ID index, uint32_t clock);

PLIB_CAN_BaudRatePrescaleSetup Function

Sets the prescale divisor applied to the CAN module's input clock before it is used to determine the CAN baud rate.

File

plib_can.h

C

```
bool PLIB_CAN_BaudRatePrescaleSetup(CAN_MODULE_ID index, uint16_t prescale);
```

Returns

- true = BaudRate prescale Setup success
- false = BaudRate prescale Setup failure, arguments passed are beyond the possible limits

Description

Sets the prescale divisor applied to the CAN module's input clock before it is used to determine the CAN baud rate.

Remarks

The prescale value is the actual input clock divisor value.

baud rate = input clock / divisor

However, the values must be chosen carefully so that the desired resultant baud rate is an integral number (not fractional).

The MY_CAN_ID macro in the example above is used as a place holder for the actual CAN bus ID (as defined by the processor-specific CAN_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsBaudRatePrescaleSetup in your application to determine whether this feature is available.

Preconditions

This function works only if the CAN module is in Configuration mode. Use the PLIB_CAN_OperationModeGet function to get the current mode and the PLIB_CAN_OperationModeSelect function to change the mode.

Example

```
#define MY_CAN_ID   CAN_ID_1

#define PRESCALE    7
bool result;
if (CAN_CONFIGURATION_MODE == PLIB_CAN_OperationModeGet(MY_CAN_ID))
{

    result = PLIB_CAN_BaudRatePrescaleSetup(MY_CAN_ID, PRESCALE);

    if(false == result)
    {
        // Error occurred
    }
}
```

Parameters

Parameters	Description
index	Identifies the desired CAN module
prescale	Prescale value by which the input clock to the CAN module is divided to determine the CAN baud rate.

Function

bool PLIB_CAN_BaudRatePrescaleSetup(CAN_MODULE_ID index, uint16_t prescale)

PLIB_CAN_PrecalculatedBitRateSetup Function

Sets the desired Baud rate for the respective CAN module.

File

plib_can.h

C

```
bool PLIB_CAN_PrecalculatedBitRateSetup(CAN_MODULE_ID index, uint8_t prescale, uint8_t syncjumpWidth,
uint8_t propagation, uint8_t segment1, uint8_t segment2);
```

Returns

- true = Baud rate setup success
- false = Baud rate setup failure, arguments passed are beyond the possible limits

Description

This function sets the configuration register with the desired Baud rate.

Remarks

This function's parameters must be precalculated for the desired baud rate and properly encoded for the registers of the CAN module that is in use. This function is primarily intended to be used in conjunction with the MPLAB X IDE ECAN Baud Rate calculator or the MPLAB Harmony Configurator (MHC), which precalculates and correctly encodes these values.

The MY_CAN_ID macro in the example above is used as a place holder for the actual CAN bus ID (as defined by the processor-specific CAN_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsPrecalculatedBitRateSetup in your application to determine whether this feature is available.

Preconditions

Use the "ECAN Bit Rate Calculator" MPLAB X IDE plug-in to get all of the parameters needed for the function.

This function works only if the CAN module is in Configuration mode. Use the PLIB_CAN_OperationModeGet function to get the current mode and the PLIB_CAN_OperationModeSelect function to change the mode.

Example

```
// Use ECAN Bit Rate Calculator plug-in to get parameter values for 500kbps
// Baud rate.
#define MY_CAN_ID       CAN_ID_1
#define PRESCALE        6
#define SYNCJUMPWIDTH   1
```

```
#define PROPAGATION     2
#define SEGMENT1        4
#define SEGMENT2        4
bool result;

if (CAN_CONFIGURATION_MODE == PLIB_CAN_OperationModeGet(MY_CAN_ID))
{
   result = PLIB_CAN_PrecalculatedBitRateSetup( MY_CAN_ID, PRESCALE, SYNCJUMPWIDTH,
                                        PROPAGATION, SEGMENT1, SEGMENT2 );

   if(false == result)
   {
       // Error occurred, handle accordingly
   }
}
```

Parameters

Parameters	Description
index	Identifies the desired CAN module
prescale	The CAN module input clock prescale divisor.
syncJumpWidth	The synchronization jump width is the number of time quanta by which the CAN module may adjust phase segment 1 and segment 2 to compensate for jitter in the bit phase.
propagation	Propagation segment length is the number of time quanta allocated to allow for propagation variation in the bit sampling phase.
segment1	Phase segment 1 length(in time quanta) after the propagation segment before sampling of the bit begins.
segment2	Phase segment 2 length (in time quanta) after sampling has begun.

Function

bool PLIB_CAN_PrecalculatedBitRateSetup(CAN_MODULE_ID index,
uint8_t prescale,
uint8_t syncjumpWidth,
uint8_t propagation,
uint8_t segment1,
uint8_t segment2);

PLIB_CAN_BitSamplePhaseSet Function

Sets the CAN bit-sampling phase parameters.

File

plib_can.h

C

```
bool PLIB_CAN_BitSamplePhaseSet(CAN_MODULE_ID index, uint8_t syncJumpWidth, uint8_t propagation, uint8_t
segment1, uint8_t segment2);
```

Returns

- true = BitSamplePhase Setup success
- false = BitSamplePhase Setup failure, arguments passed are beyond the possible limits

Description

This function selects the CAN bit-sampling phase parameters that determine the Baud rate setting.

For a given baud rate setting, a single bit time is divided into a number segments or phases of equal time length called "time quanta". The bit time for a given baud rate (i.e. 1/baud) is divided into a number of time quanta of equal length.

1 time quantum = (one bit time) / (total number of time quanta)

These time quanta are then partitioned into different phases of the bit sample time called synchronization phase (always 1 time quantum long), the propagation phase, and the segment 1 and segment 2 phases. Thus, the total number of time quanta equals the sum of the time quanta allocated to each phase.

total number of time quanta = (1 + propagation + segment1 + segment2)

(Sampling of the bit occurs at the end of the segment 1 phase.)

This function determines the length of each phase (in time quanta) as well as the synchronization jump width, the number of time quanta by which

the CAN module may move time from segment 1 to segment 2 (or vice versa) to adjust for jitter in the bit sampling phase timing.

Remarks

The values of the syncJumpWidth, propagation, segment1 and segment2 parameters should passed as a number of time quanta for each. These values will be encoded by this function correctly for the the part in use before they are written to the registers of the CAN peripheral. To pass in precalculated values that are already encoded for the physical registers of the CAN controller (such as the values provided by the ECAN Baud Rate Calculator or the MPLAB Harmony Configurator (MHC) utility), use the PLIB_CAN_PrecalculatedBitRateSetup function instead.

The MY_CAN_ID macro in the example above is used as a place holder for the actual CAN bus ID (as defined by the processor-specific CAN_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsBitSamplePhaseSet in your application to determine whether this feature is available.

Preconditions

This function works only if the CAN module is in Configuration mode. Use the PLIB_CAN_OperationModeGet function to get the current mode and the PLIB_CAN_OperationModeSelect function to change the mode.

Example

```
#define MY_CAN_ID       CAN_ID_1

#define SYNCJUMPWIDTH   1
#define PROPAGATION     2
#define SEGMENT1        4
#define SEGMENT2        4
bool result;
if (CAN_CONFIGURATION_MODE == PLIB_CAN_OperationModeGet(MY_CAN_ID))
{
   result = PLIB_CAN_BitSamplePhaseSet(MY_CAN_ID, SYNCJUMPWIDTH, PROPAGATION,
                                       SEGMENT1, SEGMENT2);

   if(false == result)
   {
       // Error occurred
   }
}
```

Parameters

Parameters	Description
index	Identifies the desired CAN module
syncJumpWidth	The synchronization jump width is the number of time quanta by which the CAN module may adjust phase segment 1 and segment 2 to compensate for jitter in the bit phase to achieve a valid sampling point.
propagation	Propagation segment length is the number of time quanta allocated to allow for propagation variation in the bit sampling phase.
segment1	Phase segment 1 length(in time quanta) after the propagation segment before sampling of the bit begins.
segment2	Phase segment 2 length (in time quanta) after sampling has begun.

Function

bool PLIB_CAN_BitSamplePhaseSet(CAN_MODULE_ID index,
uint8_t syncJumpWidth,
uint8_t propagation,
uint8_t segment1,
uint8_t segment2)

d) Channel Configuration Functions

PLIB_CAN_ChannelForReceiveSet Function

Configures a CAN channel for receive operation.

File

plib_can.h

C

```
void PLIB_CAN_ChannelForReceiveSet(CAN_MODULE_ID index, CAN_CHANNEL channel, uint32_t channelSize,
CAN_RX_DATA_MODE dataOnly);
```

Returns

None.

Description

This function configures a CAN channel for receive operation. A receive channel can be either a full CAN message receive channel, which receives an entire CAN message (Arbitration field + Data field) or a data-only message channel, which receives only the data payload section of the message. A receive channel can buffer up to 32 messages. The number of messages to buffer (i.e., the size of the channel) is set by the channelSize parameter.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsChannelForReceiveSet in your application to determine whether this feature is available.

Preconditions

The CAN module should be in Configuration mode. This is achieved by using the PLIB_CAN_OperationModeSelect function.

Example

```
// Configure channel 4 of CAN module for receive operation. Set channel
// size to buffer 10 messages.
// Channel should be data only receive channel

PLIB_CAN_ChannelForReceiveSet(CAN_ID_1, CAN_CHANNEL4, 10, CAN_RX_DATA_ONLY);
```

Parameters

Parameters	Description
index	Identifies the desired CAN module
channel	Identifies the desired CAN Receive channel
channelSize	Specifies the number of received messages that the channel can buffer before it overflows. This should be a value between 1 and 32.
dataOnly	Specifies a full CAN message Receive channel or a data-only message channel. • CAN_RX_DATA_ONLY - Channel will be a data-only message receive channel • CAN_RX_FULL_RECEIVE - Channel will be a full CAN message receive channel

Function

void PLIB_CAN_ChannelForReceiveSet(CAN_MODULE_ID index, CAN_CHANNEL channel,
uint32_t channelSize, CAN_RX_DATA_MODE dataOnly)

PLIB_CAN_ChannelForTransmitSet Function

Configures a CAN channel for transmission.

File

plib_can.h

C

```
void PLIB_CAN_ChannelForTransmitSet(CAN_MODULE_ID index, CAN_CHANNEL channel, uint8_t channelSize,
CAN_TX_RTR rtren, CAN_TXCHANNEL_PRIORITY priority);
```

Returns

None.

Description

This function configures a CAN Channel for transmission. The size of the channel specifies the number of messages that the channel can buffer. The channel is a First In First Out (FIFO) type of buffer. The remote transmit request feature allows the transmit channel to start transmitting when an associated filter has received a message. The transmit channel priority determines the priority as compared to other transmit channels. If two transmit channels have the same priority, the natural channel priority determines which channel transmits first.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsChannelForTransmitSet in your application to determine whether this feature is available.

Preconditions

The CAN Module should be in Configuration mode. This is achieved by using the PLIB_CAN_OperationModeSelect function.

Example

```
// Configure CAN 1 Channel 2 for Transmit operation. Set the channel size to 15
// and enable remote transmit request. Set the priority to low medium
// priority.

PLIB_CAN_ChannelForTransmitSet (CAN_ID_1, CAN_CHANNEL2, 15,
    CAN_TX_RTR_ENABLED, CAN_LOW_MEDIUM_PRIORITY);
```

Parameters

Parameters	Description
index	Identifies the desired CAN module
channel	Identifies the desired CAN Channel
channelSize	Size of the channel in messages. This value should be between 1 and 32.
rtren	Enables disables Remote Transmit Request: • CAN_TX_RTR_ENABLED - Remote Transmit Request is enabled • CAN_TX_RTR_DISABLED - Remote Transmit Request is disabled
priority	Specifies the priority of the Transmit channel

Function

void PLIB_CAN_ChannelForTransmitSet (CAN_MODULE_ID index,
CAN_CHANNEL channel, uint8_t channelSize,
CAN_TX_RTR rtren, CAN_TXCHANNEL_PRIORITY priority)

PLIB_CAN_ChannelReset Function

Resets a CAN channel.

File

plib_can.h

C

```
void PLIB_CAN_ChannelReset(CAN_MODULE_ID index, CAN_CHANNEL channel);
```

Returns

None.

Description

This function resets a CAN channel. Resetting a CAN channel causes it to discard any unread received messages or any messages that have not been transmitted yet. The reset operation will wait if a message is being currently transmitted or is being received. The PLIB_CAN_ChannelResetIsComplete function can be used to check if the channel reset is complete.

Remarks

Attempting to read from a channel that is reset will return messages that may have already been read or may not have been read at all.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsChannelReset in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Reset channel 4 of CAN_ID_1 module
// and wait until the reset is complete

PLIB_CAN_ChannelReset(CAN_ID_1,CAN_CHANNEL4);
```

```
while(PLIB_CAN_ChannelResetIsComplete(CAN_ID_1,CAN_CHANNEL4) != true);
```

Parameters

Parameters	Description
index	Identifies the desired CAN module
channel	Identifies the CAN channel to be reset

Function

void PLIB_CAN_ChannelReset(CAN_MODULE_ID index, CAN_CHANNEL channel)

PLIB_CAN_ChannelUpdate Function

Updates the CAN Channel internal pointers.

File

plib_can.h

C

```
void PLIB_CAN_ChannelUpdate(CAN_MODULE_ID index, CAN_CHANNEL channel);
```

Returns

None.

Description

This function updates the CAN Channel internal pointers. This function should be called when a message has been read or processed completely from a CAN receive channel (using the PLIB_CAN_ReceivedMessageGet function). It should be called after a new message has been written to a CAN transmit channel (using the PLIB_CAN_TransmitBufferGet function) and before the PLIB_CAN_TransmitChannelFlush function.

Trying to read a CAN receive channel that has not been updated will cause the PLIB_CAN_ReceivedMessageGet function to return the same message. Writing to a CAN transmit channel that has not been updated will cause the last written message to be overwritten.

Remarks

The PLIB_CAN_ChannelUpdate function should be called on a CAN receive channel only after the message obtained using the PLIB_CAN_ReceivedMessageGet function has been read or processed completely. The CAN module peripheral library does not provide access to older messages once the PLIB_CAN_ChannelUpdate function has been called.

When using the PLIB_CAN_TransmitMessageBuffer function to write to a CAN transmit channel the PLIB_CAN_ChannelUpdate function should be called only when a valid message has been written to the channel. Calling the update function without writing to the CAN channel will cause an incorrect message to be output on the CAN channel when the transmit channel is flushed.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsChannelUpdate in your application to determine whether this feature is available.

Preconditions

This function is effective only when the CAN module is not in Configuration mode or Disable mode.

Example

```
// CAN_ID_1 Channel 1 is a Receive channel and Channel 2 is a Transmit
// channel. Read and update Channel 1. Write a message to Channel 2 and then
// update and flush the channel.

CAN_TX_MSG_BUFFER * TransmitMessage;
CAN_RX_MSG_BUFFER * rxMessage;

rxMessage = PLIB_CAN_ReceivedMessageGet(CAN_ID_1, CAN_CHANNEL1);

if(rxMessage != NULL)
{
    // Process the received message.

    PLIB_CAN_ChannelUpdate(CAN_ID_1, CAN_CHANNEL1);
}

TransmitMessage = PLIB_CAN_TransmitBufferGet(CAN_ID_1, CAN_CHANNEL2);
if(TransmitMessage != NULL)
{
```

```
    // Write a message to buffer

    PLIB_CAN_ChannelUpdate(CAN_ID_1, CAN_CHANNEL2);
    PLIB_CAN_TransmitChannelFlush(CAN_ID_1, CAN_CHANNEL2);
}
```

Parameters

Parameters	Description
index	Identifies the desired CAN module
channel	Identifies the CAN channel to be updated

Function

void PLIB_CAN_ChannelUpdate (CAN_MODULE_ID index, CAN_CHANNEL channel)

PLIB_CAN_ChannelEventDisable Function

Enables channel level events.

File

plib_can.h

C

```
void PLIB_CAN_ChannelEventDisable(CAN_MODULE_ID index, CAN_CHANNEL channel, CAN_CHANNEL_EVENT flags);
```

Returns

None.

Description

This function disables channel level events. Any enabled channel event will cause a CAN module event.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsChannelEventEnable in your application to determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_CAN_ChannelEventDisable(CAN_ID_1, CAN_CHANNEL1, CAN_TX_CHANNEL_EMPTY);
```

Parameters

Parameters	Description
index	Identifies the desired CAN module
channel	Identifies the desired CAN channel
flags	Identifies the CAN channel event(s) to be affected. Several events can be controlled by logically ORed combination of events.

Function

void PLIB_CAN_ChannelEventDisable (CAN_MODULE_ID index, CAN_CHANNEL channel,
CAN_CHANNEL_EVENT flags)

e) Event Management Functions

PLIB_CAN_ModuleEventClear Function

Clears the CAN module level events.

File

plib_can.h

C

```
void PLIB_CAN_ModuleEventClear(CAN_MODULE_ID index, CAN_MODULE_EVENT flags);
```

Returns

None.

Description

This function clears module level events. If the event condition is persistent, clearing the event will have no effect. The event condition itself should be cleared. The CAN_SYSTEM_ERROR_EVENT can only be cleared by disabling the CAN module using the PLIB_CAN_Enable function.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsModuleEventClear in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Clear CAN_ID_1 Transmit Event and Receive Events.

PLIB_CAN_ModuleEventClear(CAN_ID_1, (CAN_TX_EVENT | CAN_RX_EVENT));
```

Parameters

Parameters	Description
index	Identifies the desired CAN module
flags	Identifies the CAN module level events to be affected. Several events can be cleared by specifying a logically ORed combination of events.

Function

void PLIB_CAN_ModuleEventClear (CAN_MODULE_ID index, CAN_MODULE_EVENT flags)

PLIB_CAN_ModuleEventDisable Function

Disables the module level events.

File

plib_can.h

C

```
void PLIB_CAN_ModuleEventDisable(CAN_MODULE_ID index, CAN_MODULE_EVENT flags);
```

Returns

None.

Description

This function disables module level events. Any enabled module event will cause the CAN module to generate a CPU interrupt.

Remarks

An event can be active regardless of it being enabled or disabled.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsModuleEventEnable in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Enable CAN_ID_1 Transmit Event and Receive Events.
// Disable Receive Overflow event and operation
// mode change event.

PLIB_CAN_ModuleEventDisable(CAN_ID_1, (CAN_TX_EVENT | CAN_RX_EVENT));
PLIB_CAN_ModuleEventDisable(CAN_ID_1, (CAN_OPERATION_MODE_CHANGE_EVENT |
```

```
    CAN_RX_OVERFLOW_EVENT));
```

Parameters

Parameters	Description
index	Identifies the desired CAN module
flags	Identifies the CAN module level events to be affected. Several events can be controlled by logically ORed combination of events.

Function

void PLIB_CAN_ModuleEventDisable (CAN_MODULE_ID index, CAN_MODULE_EVENT flags)

PLIB_CAN_ModuleEventEnable Function

Enables the module level events.

File

plib_can.h

C

```
void PLIB_CAN_ModuleEventEnable(CAN_MODULE_ID index, CAN_MODULE_EVENT flags);
```

Returns

None.

Description

This function enables module level events. Any enabled module event will cause the CAN module to generate a CPU interrupt.

Remarks

An event can be active regardless of it being enabled or disabled.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsModuleEventEnable in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Enable CAN_ID_1 Transmit Event and Receive Events.
// Disable Receive Overflow event and operation
// mode change event.

PLIB_CAN_ModuleEventEnable(CAN_ID_1, (CAN_TX_EVENT | CAN_RX_EVENT));
PLIB_CAN_ModuleEventEnable(CAN_ID_1, (CAN_OPERATION_MODE_CHANGE_EVENT |
    CAN_RX_OVERFLOW_EVENT));
```

Parameters

Parameters	Description
index	Identifies the desired CAN module
flags	Identifies the CAN module level events to be affected. Several events can be controlled by logically ORed combination of events.

Function

void PLIB_CAN_ModuleEventEnable (CAN_MODULE_ID index, CAN_MODULE_EVENT flags)

PLIB_CAN_ModuleEventGet Function

Returns the status of the CAN module events.

File

plib_can.h

C

```
CAN_MODULE_EVENT PLIB_CAN_ModuleEventGet(CAN_MODULE_ID index);
```

Returns

A status word representing the status of the CAN module events.

Description

This function returns the status of the CAN module events. The routine returns a status word. This word should be logically ANDed with the desired CAN_MODULE_EVENT event mask. A non-zero result of such an operation would mean that the events specified in the event mask are active. An event mask can contain one event or can be a logical OR combination of multiple events.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsModuleEventClear in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Check if the CAN_ID_1 Module Receive event
// or if Transmit event is active

if((PLIB_CAN_ModuleEventGet(CAN_ID_1) & (CAN_RX_EVENT | CAN_TX_EVENT)) != 0)
{
    // Handle the Receive or Transmit module Event here.

}

// Check if the CAN_ID_2 System Error Event
// is active

if((PLIB_CAN_ModuleEventGet(CAN_ID_2) & CAN_SYSTEM_ERROR_EVENT) != 0)
{
    // CAN_ID_2 System error event is active.

}
```

Parameters

Parameters	Description
index	Identifies the desired CAN module

Function

CAN_MODULE_EVENT PLIB_CAN_ModuleEventGet(CAN_MODULE_ID index)

PLIB_CAN_AllChannelEventsGet Function

Returns a value representing the event status of all CAN channels.

File

plib_can.h

C

```
CAN_CHANNEL_MASK PLIB_CAN_AllChannelEventsGet(CAN_MODULE_ID index);
```

Returns

Returns a value that can be logically ANDed with a CAN_CHANNEL_MASK mask value to check if any event on a channel is active.

Description

This function returns a value representing the event status of all of the CAN channels. The return value can be logically ANDed with a CAN_CHANNEL_MASK type to check whether the channel has any active events. Only an enabled channel event will cause the bit to be updated.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsAllChannelEvents in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Check if Channel 2 or 3 of CAN_ID_1 module
// have any active events

CAN_CHANNEL_MASK channelEvents;

channelEvents = PLIB_CAN_AllChannelEventsGet(CAN_ID_1);

if((channelEvents & (CAN_CHANNEL2_MASK | CAN_CHANNEL3_MASK)) != 0)
{
    // Either Channel 2 or 3 has an active event.
    // The PLIB_CAN_ChannelEventGet function can be
    // used to query the channel for more details.
}

// Check if Channel 31 of CAN_ID_2 module
// has an any active events

channelEvents = PLIB_CAN_AllChannelEventsGet(CAN_ID_2);

if((channelEvents & CAN_CHANNEL31_MASK) != 0)
{
    // Channel 31 of CAN_ID_2 module
    // has an active event.
}
```

Parameters

Parameters	Description
index	Identifies the desired CAN module

Function

CAN_CHANNEL_MASK PLIB_CAN_AllChannelEventsGet(CAN_MODULE_ID index)

PLIB_CAN_AllChannelOverflowStatusGet Function

Returns a value representing the receive overflow event status of all CAN channels.

File

plib_can.h

C

```
CAN_CHANNEL_MASK PLIB_CAN_AllChannelOverflowStatusGet(CAN_MODULE_ID index);
```

Returns

Returns a value that can be logically ANDed with a CAN_CHANNEL_MASK mask value to check if a receive channel overflow event is active.

Description

This function returns a value representing the Receive overflow event status of all the CAN Channels. The return value can be logically ANDed with a CAN_CHANNEL_MASK type to check whether a channel has any active receive overflow events. The return value will reflect the channel status only if the receive overflow event of the channel is enabled.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsAllChannelOverflow in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Check if Receive Channel 2 or 3 of CAN_ID_1 module
// have overflowed
```

```
CAN_CHANNEL_MASK channelOverflowEvent;

channelOverflowEvent = PLIB_CAN_AllChannelOverflowStatusGet(CAN_ID_1);

if((channelOverflowEvent & (CAN_CHANNEL2_MASK | CAN_CHANNEL3_MASK)) != 0)
{
    // Either Receive Channel 2 or 3 has  overflowed.
    // The PLIB_CAN_ChannelEventGet function can be
    // used to query the channel for more details.
}

// Check if Receive Channel 31 of CAN_ID_2 module
// has overflowed

channelOverflowEvent = PLIB_CAN_AllChannelOverflowStatusGet(CAN_ID_2);

if((channelOverflowEvent & CAN_CHANNEL31_MASK) != 0)
{
    // Channel 31 of CAN_ID_2 module
    // has overflowed.
}
```

Parameters

Parameters	Description
index	Identifies the desired CAN module

Function

CAN_CHANNEL_MASK PLIB_CAN_AllChannelOverflowStatusGet (CAN_MODULE_ID index)

PLIB_CAN_ChannelEventClear Function

Clears CAN channel events.

File

plib_can.h

C

```
void PLIB_CAN_ChannelEventClear(CAN_MODULE_ID index, CAN_CHANNEL channel, CAN_CHANNEL_EVENT events);
```

Returns

None.

Description

This function clears channel events. The events to be cleared are specified as mask. Note that only the receive overflow event is clearable. Attempting to clear other events will have no effect since these events are persistent and clear only when the event condition is cleared.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsChannelEvent in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Clear CAN_ID_2 Receive Channel 3 overflow event

PLIB_CAN_ChannelEventClear(CAN_ID_2, CAN_CHANNEL3, CAN_RX_CHANNEL_OVERFLOW);
```

Parameters

Parameters	Description
index	Identifies the desired CAN module
channel	Identifies the desired CAN Channel
events	Mask specifying the events to be cleared

Function

void PLIB_CAN_ChannelEventClear (CAN_MODULE_ID index, CAN_CHANNEL channel, CAN_CHANNEL_EVENT events)

PLIB_CAN_ChannelEventEnable Function

Enables channel level events.

File

plib_can.h

C

```
void PLIB_CAN_ChannelEventEnable(CAN_MODULE_ID index, CAN_CHANNEL channel, CAN_CHANNEL_EVENT flags);
```

Returns

None.

Description

This function enables channel level events. Any enabled channel event will cause a CAN module event. An event can be active regardless of it being enabled or disabled. Enabling a transmit type of event for a receive channel will have no any effect.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsChannelEventEnable in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// CAN_ID_1 Channel 1 and 3 are Transmit channels and Channel 2  and 4 are
// Receive channels. Enable Channel 1 empty event and channel not full
// event. Disable Channel 2 full and overflow event.
// Enable all Transmit events on Channel 2 and disable all Receive events on
// on Channel 4.

PLIB_CAN_ChannelEventEnable(CAN_ID_1, CAN_CHANNEL1, (CAN_TX_CHANNEL_EMPTY |
    CAN_TX_CHANNEL_NOT_FULL));

PLIB_CAN_ChannelEventEnable(CAN_ID_1, CAN_CHANNEL2, (CAN_RX_CHANNEL_FULL |
    CAN_RX_CHANNEL_OVERFLOW));

PLIB_CAN_ChannelEventEnable(CAN_ID_1, CAN_CHANNEL3, CAN_TX_CHANNEL_ANY_EVENT);
PLIB_CAN_ChannelEventEnable(CAN_ID_1, CAN_CHANNEL4, CAN_RX_CHANNEL_ANY_EVENT);
```

Parameters

Parameters	Description
index	Identifies the desired CAN module
channel	Identifies the desired CAN Channel
flags	Identifies the CAN channel event(s) to be affected. Several events can be controlled by logically ORed combination of events.

Function

void PLIB_CAN_ChannelEventEnable (CAN_MODULE_ID index, CAN_CHANNEL channel,
CAN_CHANNEL_EVENT flags)

PLIB_CAN_ChannelEventGet Function

Returns a value representing the event status of a CAN channel.

File

plib_can.h

C

```
CAN_CHANNEL_EVENT PLIB_CAN_ChannelEventGet(CAN_MODULE_ID index, CAN_CHANNEL channel);
```

Returns

Returns a value that can be logically ANDed with a CAN_CHANNEL_EVENT type to check if specific CAN channel events are active.

Description

This function returns a value representing the event status of a CAN channel. The return value can be logically ANDed with CAN_CHANNEL_EVENT type to check for a specific event(s). Channels events are affected regardless of whether the event itself is enabled or disabled.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsChannelEvent in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Check if Receive Channel 2 of CAN_ID_1 module
// is not empty or if its full.

CAN_CHANNEL_EVENT channelEvent;

channelEvent = PLIB_CAN_ChannelEventGet(CAN_ID_1,CAN_CHANNEL2);

if((channelEvent & (CAN_RX_CHANNEL_NOT_EMPTY | CAN_RX_CHANNEL_FULL)) != 0)
{
    // This means that either Receive Channel 2 is not empty
    // or the Channel is full.

}

// Check if Transmit Channel 3 of CAN_ID_2 module
// has any active events

channelEvent = PLIB_CAN_ChannelEventGet(CAN_ID_2, CAN_CHANNEL3);

if((channelEvent & CAN_TX_CHANNEL_ANY_EVENT) != 0)
{
    // This means that some event is active

}

// Check if Transmit Channel 6 of CAN_ID_2 module is not full

channelEvent = PLIB_CAN_ChannelEventGet(CAN_ID_2, CAN_CHANNEL6);

if((channelEvent & CAN_TX_CHANNEL_NOT_FULL) != 0)
{
    // This means the Channel is not full.

}
```

Parameters

Parameters	Description
index	Identifies the desired CAN module
channel	Identifies the desired CAN Channel

Function

CAN_CHANNEL_EVENT PLIB_CAN_ChannelEventGet (CAN_MODULE_ID index, CAN_CHANNEL channel)

PLIB_CAN_PendingEventsGet Function

Returns a value representing the highest priority active event in the module.

File

plib_can.h

C

```
CAN_EVENT_CODE PLIB_CAN_PendingEventsGet(CAN_MODULE_ID index);
```

Returns

Returns a CAN_EVENT_CODE type representing the highest priority active event in the module.

Description

This function returns a value representing the highest priority active event in the module. The return value is a CAN_EVENT_CODE type.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsPendingEventsGet in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Implement a switch to check and process
// any active CAN module events.

CAN_EVENT_CODE eventCode;

eventCode = PLIB_CAN_PendingEventsGet(CAN_ID_1);

switch(eventCode)
    {
        case CAN_NO_EVENT:
            // Procedure to handle no CAN events
            break;

        case CAN_WAKEUP_EVENT:
            // Procedure to handle device wake-up
            // on CAN bus activity event
            break;

        default:
            break;
    }
```

Parameters

Parameters	Description
index	Identifies the desired CAN module

Function

CAN_EVENT_CODE PLIB_CAN_PendingEventsGet (CAN_MODULE_ID index)

f) Message Transmit Functions

PLIB_CAN_PendingTransmissionsAbort Function

Aborts any pending transmit operations.

File

plib_can.h

C

```
void PLIB_CAN_PendingTransmissionsAbort(CAN_MODULE_ID index, CAN_CHANNEL channel);
```

Returns

None.

Description

This function aborts any pending transmit operations. Any messages that are yet to be transmitted will not be transmitted. The messages will still be present in the respective channel. Any message that is in the process of being transmitted will be transmitted completely. Either one channel or all channels can be specified.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsPendingTransmissionsAbort in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Abort any pending transmissions on CAN_ID_1 Channel 4 and
// Channel 5.
PLIB_CAN_PendingTransmissionsAbort(CAN_ID_1, CAN_CHANNEL4);
PLIB_CAN_PendingTransmissionsAbort(CAN_ID_1, CAN_CHANNEL5);
```

Parameters

Parameters	Description
index	Identifies the desired CAN module
channel	Identifies the desired CAN channel. By specifying CAN_ALL_CHANNELS, transmission on all transmit channels will be aborted.

Function

void PLIB_CAN_PendingTransmissionsAbort (CAN_MODULE_ID index, CAN_CHANNEL channel)

PLIB_CAN_TransmissionIsAborted Function

Returns 'true' if the transmit abort operation is complete.

File

plib_can.h

C

```
bool PLIB_CAN_TransmissionIsAborted(CAN_MODULE_ID index, CAN_CHANNEL channel);
```

Returns

- true - If channel = CAN_ALL_CHANNELS, Transmit Abort is complete. If channel = CAN_CHANNELx, Transmit Abort was successful.
- false - If channel = CAN_ALL_CHANNELS, Transmit Abort is in progress. If channel = CAN_CHANNELx, Transmit Abort was not successful.

Description

This function returns 'true' if the transmit abort operation is complete. Either individual channels can be specified or all channels can be specified.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsTransmissionIsAborted in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Abort any pending transmissions on CAN_ID_1 Channel 4 and
// check if the current message transmission was aborted.

PLIB_CAN_PendingTransmissionsAbort(CAN_ID_1, CAN_CHANNEL4);
```

```
if(PLIB_CAN_TransmissionIsAborted(CAN_ID_1, CAN_CHANNEL4) == false)
{
    // The message was not aborted.
}
else
{
    // The message was aborted.
}
```

Parameters

Parameters	Description
index	Identifies the desired CAN module
channel	Identifies the desired CAN channel. By specifying CAN_ALL_CHANNELS the status of transmit abort on all transmit channels will be returned.

Function

bool PLIB_CAN_TransmissionIsAborted (CAN_MODULE_ID index, CAN_CHANNEL channel)

PLIB_CAN_TransmitBufferGet Function

Returns a pointer to an empty transmit buffer.

File

plib_can.h

C

```
CAN_TX_MSG_BUFFER * PLIB_CAN_TransmitBufferGet(CAN_MODULE_ID index, CAN_CHANNEL channel);
```

Returns

Returns a CAN_TX_MSG_BUFFER type pointer to an empty message buffer in the Transmit channel. Returns NULL if the channel is full and there aren't any empty message buffers.

Description

This function returns a pointer to an empty transmit buffer. The routine will return a NULL pointer if there aren't any empty transmit buffers. In such a case, the application should flush the channel and wait until the transmit channel has at least one empty buffer. In order to function correctly, it is essential that the PLIB_CAN_ChannelUpdate function is called in the proper sequence for the PLIB_CAN_TransmitBufferGet function to return a pointer to an empty buffer.

Remarks

Calling the PLIB_CAN_TransmitBufferGet function on a channel that has not been updated after a message was written to the channel, will cause the function to return a pointer to the written message in case of transmit buffer FIFO. Therefore, a non-transmitted message could get overwritten.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsTransmitBufferGet in your application to determine whether this feature is available.

Preconditions

PLIB_CAN_MemoryBufferAssign must be called if the 'transmit buffer' should be in the device RAM. It is not required if the 'transmit buffer' is in SFR space.

Example

```
// Transmit a message through CAN_ID_1 Channel 4

CAN_TX_MSG_BUFFER * msgBuffer;

msgBuffer = PLIB_CAN_TransmitBufferGet(CAN_ID_1, CAN_CHANNEL4);

if(msgBuffer != NULL)
{
    // Load the message here

}
else
{
    // No space in the channel
    // wait until a message
```

```
    // buffer is free.

    while((PLIB_CAN_ChannelEventGet(CAN_ID_1, CAN_CHANNEL4) &
        CAN_TX_CHANNEL_NOT_FULL) == 0);
}
```

Parameters

Parameters	Description
index	Identifies the desired CAN module
channel	Identifies the desired CAN Channel

Function

CAN_TX_MSG_BUFFER * PLIB_CAN_TransmitBufferGet(CAN_MODULE_ID index, CAN_CHANNEL channel)

PLIB_CAN_TransmitChannelFlush Function

Causes all messages in the specified transmit channel to be transmitted.

File

plib_can.h

C

```
void PLIB_CAN_TransmitChannelFlush(CAN_MODULE_ID index, CAN_CHANNEL channel);
```

Returns

None.

Description

This function causes all messages in the specified transmit channel to be transmitted. All messages in the channel at the time of the flush operation will be transmitted. The transmit channel flush operation should preferably be called immediately after the PLIB_CAN_ChannelUpdate function. This will ensure that messages are transmitted promptly.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsTransmitChannelFlush in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Flush CAN_ID_1 Transmit Channel 4.

PLIB_CAN_TransmitChannelFlush(CAN_ID_1, CAN_CHANNEL4);
```

Parameters

Parameters	Description
index	Identifies the desired CAN module
channel	Identifies the desired CAN channel

Function

void PLIB_CAN_TransmitChannelFlush (CAN_MODULE_ID index, CAN_CHANNEL channel)

PLIB_CAN_TransmitChannelStatusGet Function

Returns the condition of the transmit channel.

File

plib_can.h

C

```
CAN_TX_CHANNEL_STATUS PLIB_CAN_TransmitChannelStatusGet(CAN_MODULE_ID index, CAN_CHANNEL channel);
```

Returns

Returns a status word that can be logically ANDed with the CAN_TX_CHANNEL_STATUS type to check whether a condition exists.

Description

This function returns the condition of the transmit channel. The return value can be logically ANDed with CAN_TX_CHANNEL_STATUS type values.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsTransmitChannelStatus in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Check if CAN_ID_1 Transmit Channel 4
// is still transmitting

CAN_TX_CHANNEL_STATUS status;

status = PLIB_CAN_TransmitChannelStatusGet(CAN_ID_1, CAN_CHANNEL4);

if((status & CAN_TX_CHANNEL_TRANSMITTING) != 0)
{
    // This means that channel is still
    // transmitting.

}

// Check if CAN_ID_2 Transmit Channel 5 has lost arbitration
// or other Transmit errors.

status = PLIB_CAN_TransmitChannelStatusGet(CAN_ID_2, CAN_CHANNEL5);

if((status & (CAN_TX_CHANNEL_ARBITRATION_LOST | CAN_TX_CHANNEL_ERROR)) != 0)
{
    // This means that the Transmit channel has either
    // lost arbitration or a Transmit error has occurred.
}
```

Parameters

Parameters	Description
index	Identifies the desired CAN module
channel	Identifies the desired CAN channel

Function

CAN_TX_CHANNEL_STATUS PLIB_CAN_TransmitChannelStatusGet(CAN_MODULE_ID index, CAN_CHANNEL channel)

PLIB_CAN_TransmitErrorCountGet Function

Returns the CAN transmit error count

File

plib_can.h

C

```
int PLIB_CAN_TransmitErrorCountGet(CAN_MODULE_ID index);
```

Returns

Returns the CAN transmit error count.

Description

This function returns the CAN transmit error count. Refer to CAN 2.0B specification for more details on the CAN transmit error count and its

significance.

Remarks

There are multiple bus conditions, which could cause the transmit error count to increase. Please refer to the CAN 2.0B specification for details.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsTransmitErrorCountGet in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Check if the CAN_ID_1 Transmit error count is more than 200
int errorCount;

errorCount = PLIB_CAN_TransmitErrorCountGet(CAN_ID_1);
if(errorCount > 200)
{
    // This error count is high.
    // Do some diagnostics.
}
```

Parameters

Parameters	Description
index	Identifies the desired CAN module

Function

int PLIB_CAN_TransmitErrorCountGet(CAN_MODULE_ID index)

g) Message Receive Functions

PLIB_CAN_ReceivedMessageGet Function

Returns a pointer to a message to be read from the CAN channel.

File

plib_can.h

C

```
CAN_RX_MSG_BUFFER * PLIB_CAN_ReceivedMessageGet(CAN_MODULE_ID index, CAN_CHANNEL channel);
```

Returns

Returns a pointer to a message to be read from the CAN channel; returns a CAN_RX_MSG_BUFFER type pointer to a received CAN message. If the receive channel is a full CAN message receive channel, the caller should use the msgSID, msgEID and data members of the CAN_RX_MSG_BUFFER data structure to access the received CAN message. If the receive channel is a data-only channel, the message will only contain 8 payload data bytes (even if the message was placed on the bus with less than 8 bytes). The caller in this case should use the dataOnlyMsgData member of the CAN_RX_MSG_BUFFER data structure to read the data contained in the received CAN message.

Description

This function returns a CAN_RX_MSG_BUFFER pointer to a message to be read from the CAN channel. The PLIB_CAN_ChannelUpdate routine should be called after the received message has been processed.

Remarks

The CAN receive channel is configured as a full CAN message receive channel or a data-Only channel while configuring the channel using the PLIB_CAN_ChannelForReceiveSet function.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsReceivedMessageGet in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Read a message from the CAN_ID_1 Channel 8
```

```
// which is configured as full CAN message
// receive channel.

CAN_RX_MSG_BUFFER * receivedMsg;

receivedMsg = (CAN_RX_MSG_BUFFER *)PLIB_CAN_ReceivedMessageGet(CAN_ID_1,
    CAN_CHANNEL8);

if(receivedMsg != NULL)
{
    // rxMsg is pointing to
    // a CAN message. Process
    // the message and then update
    // the CAN channel.

    PLIB_CAN_ChannelUpdate(CAN_ID_1, CAN_CHANNEL8);
}

// Read a message from the CAN_ID_2 Channel 9
// which is configured as data only message
// receive channel. Access the message
// as bytes;

CAN_RX_MSG_BUFFER * rxMsg;

rxMsg = PLIB_CAN_ReceivedMessageGet(CAN_ID_2, CAN_CHANNEL9);

if(rxMsg != NULL)
{
    // rxMsg is pointing to
    // a CAN message. Process
    // the message and then update
    // the CAN channel.

    // rxMsg->dataOnlyMsgData[0] is the first byte of message
    // data payload. rxMsg->dataOnlyMsgData[0] is the second
    // byte of message data payload and so on.

    PLIB_CAN_ChannelUpdate(CAN_ID_2, CAN_CHANNEL9);
}
```

Parameters

Parameters	Description
index	Identifies the desired CAN module.
channel	Identifies the desired CAN Receive channel.

Function

CAN_RX_MSG_BUFFER * PLIB_CAN_ReceivedMessageGet(CAN_MODULE_ID index, CAN_CHANNEL channel)

h) Message Filtering Functions

PLIB_CAN_FilterConfigure Function

Configures a CAN message acceptance filter.

File

plib_can.h

C

```
void PLIB_CAN_FilterConfigure(CAN_MODULE_ID index, CAN_FILTER filter, uint32_t id, CAN_ID_TYPE filterType);
```

Returns

None.

Description

This function configures a CAN message acceptance filter. The ID field of the incoming message must match the filter bits for the CAN module to accept the message. A filter can be a EID type filter, which filters EID messages or a SID filter, which in turn filters SID messages. The filter mask bits (configured using the PLIB_CAN_FilterMaskConfigure function) additionally allow specified message ID bits to be ignored in the filtering process.

Remarks

A CAN message acceptance filter can be configured in Normal operation mode. The filter must be disabled before this is done.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsFilterConfigure in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Configure CAN_ID_2 filter 4 to accept standard ID messages
// with SID 0x100

PLIB_CAN_FilterConfigure(CAN_ID_2, CAN_FILTER4, 0x100, CAN_SID);
```

Parameters

Parameters	Description
index	Identifies the desired CAN module
filter	Identifies the desired CAN receive filter
id	A value in the range 0x0 to 0x7FF for SID filter type or 0x0 to 0x1FFFFFFF for EID filter type.
filterType	Specifies the type of filter • CAN_EID - Filter is an extended ID message filter • CAN_SID - Filter is an standard ID message filter

Function

void PLIB_CAN_FilterConfigure (CAN_MODULE_ID index, CAN_FILTER filter,
uint32_t id, CAN_ID_TYPE filterType)

PLIB_CAN_FilterDisable Function

Disables a CAN message acceptance filter.

File

plib_can.h

C

```
void PLIB_CAN_FilterDisable(CAN_MODULE_ID index, CAN_FILTER filter);
```

Returns

None.

Description

This function disables a CAN message acceptance filter. At least one filter must be enabled for the CAN module to receive messages. A receive channel associated with a filter will not receive messages unless the filter is enabled. After a filter is disabled, the PLIB_CAN_FilterIsDisabled function should be called to verify that the filter is disabled. A filter must be disabled before it can be configured.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsFilterEnable in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Enable filter 6 of CAN_ID_2

PLIB_CAN_FilterDisable (CAN_ID_2, CAN_FILTER6);

while(PLIB_CAN_FilterIsDisabled(CAN_ID_1, CAN_FILTER4));
```

Parameters

Parameters	Description
index	Identifies the desired CAN module
filter	Identifies the desired CAN Message Acceptance Filter

Function

void PLIB_CAN_FilterDisable(CAN_MODULE_ID index, CAN_FILTER filter)

PLIB_CAN_FilterEnable Function

Enables a CAN message acceptance filter.

File

plib_can.h

C

```
void PLIB_CAN_FilterEnable(CAN_MODULE_ID index, CAN_FILTER filter);
```

Returns

None.

Description

This function enables a CAN message acceptance filter. At least one filter must be enabled for the CAN module to receive messages. A receive channel associated with a filter will not receive messages unless the filter is enabled. After a filter is disabled, the PLIB_CAN_FilterIsDisabled function should be called to verify that the filter is disabled. A filter must be disabled before it can be configured.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsFilterEnable in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Enable filter 6 of CAN_ID_2

PLIB_CAN_FilterEnable (CAN_ID_2, CAN_FILTER6);

while(!PLIB_CAN_FilterIsDisabled(CAN_ID_1, CAN_FILTER4));
```

Parameters

Parameters	Description
index	Identifies the desired CAN module
filter	Identifies the desired CAN message acceptance filter

Function

void PLIB_CAN_FilterEnable(CAN_MODULE_ID index, CAN_FILTER filter)

PLIB_CAN_FilterIsDisabled Function

Returns 'true' if the specified filter is disabled.

File

plib_can.h

C

```
bool PLIB_CAN_FilterIsDisabled(CAN_MODULE_ID index, CAN_FILTER filter);
```

Returns

- true = The filter is disabled
- false = The filter is enabled

Description

Returns 'true' if the specified filter is disabled. This function should be called to check if the filter is disabled before calling the PLIB_CAN_FilterConfigure function and PLIB_CAN_FilterToChannelLink function.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsFilterEnable in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Disable CAN_ID_1 filter 3 and wait until the filter is disabled.
PLIB_CAN_FilterEnable(CAN_ID_1, CAN_FILTER3);

while(PLIB_CAN_FilterIsDisabled(CAN_ID_1, CAN_FILTER3) == false);
```

Parameters

Parameters	Description
index	Identifies the desired CAN module
filter	Identifies the desired CAN filter

Function

bool PLIB_CAN_FilterIsDisabled(CAN_MODULE_ID index, CAN_FILTER filter)

PLIB_CAN_FilterMaskConfigure Function

Configures a CAN filter mask.

File

plib_can.h

C

```
void PLIB_CAN_FilterMaskConfigure(CAN_MODULE_ID index, CAN_FILTER_MASK mask, uint32_t maskBits, CAN_ID_TYPE
idType, CAN_FILTER_MASK_TYPE mide);
```

Returns

None.

Description

This function configures a CAN filter mask. The mask bits determine which message ID bits are ignored and compared during the filtering process.

Remarks

A mask bit value of zero essentially means that all messages with any ID are accepted. The mode and idType input parameters are still relevant in such a case.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsFilterMaskConfigure in your application to determine whether this feature is available.

Preconditions

The CAN module should be in Configuration mode. This is achieved by using the PLIB_CAN_OperationModeSelect function.

Example

```
// Configure CAN_ID_1 Filter Mask 2 to accept
// extended ID messages in the range 0x4F1DE8 - 0x4F1DEC.
// On analyzing this address range it can be seen that only
// the last two bits of the incoming CAN message should ignored.
// Therefore the mask value should 0x1FFFFFFC.
// This mask will be used with a extended ID filter.
// Set the masking option to filter IDE type.

PLIB_CAN_FilterMaskConfigure(CAN_ID_1, CAN_FILTER_MASK2, 0x1FFFFFFC,
                             CAN_EID, CAN_FILTER_MASK_IDE_TYPE);
```

Parameters

Parameters	Description
index	Identifies the desired CAN module
mask	Identifies the desired CAN receive filter mask.
maskBits	A value in the range 0x0 to 0x7FF for SID range or 0x0 to 0x1FFFFFFF for the EID range. Each set bit will mean that the corresponding bit in the filter will be compared to the corresponding bit in the message ID. A clear mask bit means the corresponding bit in the incoming message ID field will be ignored.
idType	Specifies the value range of maskBits parameter. • CAN_EID - Value range of maskBits parameter is 0x0 (ignore all 29 bits of the incoming message ID) to 0x1FFFFFFF (compare all 29 bits of the incoming message ID). • CAN_SID - Value range of maskBits parameter is 0x0 (ignore all 11 bits of the incoming message ID) to 0x7FF (compare all 11 bits of the incoming message ID).
mide	Specifies ID masking options • CAN_FILTER_MASK_IDE_TYPE - Masking will be performed by filter type only. If the filter is set up for SID messages, the mask will decline all incoming EID messages. If the filter is set up for EID messages, the mask will decline all incoming SID messages • CAN_FILTER_MASK_ANY_TYPE - Masking will be performed regardless of the incoming message ID type. The message will be accepted on a Filter and Message SID match or a filter and message SID/EID match.

Function

void PLIB_CAN_FilterMaskConfigure(CAN_MODULE_ID index, CAN_FILTER_MASK mask,
uint32_t maskBits, CAN_ID_TYPE idType, CAN_FILTER_MASK_TYPE mide)

PLIB_CAN_FilterToChannelLink Function

Links a filter to a channel.

File

plib_can.h

C

```
void PLIB_CAN_FilterToChannelLink(CAN_MODULE_ID index, CAN_FILTER filter, CAN_FILTER_MASK mask, CAN_CHANNEL
channel);
```

Returns

None.

Description

This function links a filter to a channel. A filter is typically linked to a receive channel. This allows the channel to receive messages accepted by the filter. A filter can also be linked to a transmit channel if the transmit channel is configured for remote request transmit. In this case, a message accepted by the filter will automatically cause the linked transmit channel to transmit CAN messages that are buffered in the channel. Note that a filter should be enabled using the PLIB_CAN_FilterEnable function after the filter has been linked to the desired channel.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsFilterToChannelLink in your application to determine whether this feature is available.

Preconditions

Filter should have been disabled using the PLIB_CAN_FilterDisable function.

Example

```
// Configure CAN_ID_1 filter 3 to accept extended ID messages
// with EID 0x1D400 and link the filter to CAN_ID_1 Channel 5.
// Note the sequence in which the steps are performed.
// Disable the filter and check if its disabled.
// Configure the filter. Link it to the Channel and then
// enable the filter.

PLIB_CAN_FilterDisable(CAN_ID_1, CAN_FILTER3);

while(PLIB_CAN_FilterIsDisabled(CAN_ID_1, CAN_FILTER3) == false);

PLIB_CAN_FilterConfigure(CAN_ID_1, CAN_FILTER3, 0x1D400, CAN_EID);

PLIB_CAN_FilterToChannelLink(CAN_ID_1, CAN_FILTER3, CAN_FILTER_MASK0,
    CAN_CHANNEL5);

PLIB_CAN_FilterEnable(CAN_ID_1, CAN_FILTER3);
```

Parameters

Parameters	Description
index	Identifies the desired CAN module
filter	Identifies the desired CAN Filter
mask	Identifies the mask to be used with this filter
channel	Identifies the channel to be linked to this filter. If a transmit channel is linked, the transmit channel should have its remote transmit request feature enabled.

Function

void PLIB_CAN_FilterToChannelLink(CAN_MODULE_ID index, CAN_FILTER filter,
CAN_FILTER_MASK mask, CAN_CHANNEL channel)

PLIB_CAN_LatestFilterMatchGet Function

Returns the index of the filter that accepted the latest message.

File

plib_can.h

C

```
CAN_FILTER PLIB_CAN_LatestFilterMatchGet(CAN_MODULE_ID index);
```

Returns

Index of the filter that accepted the latest message

Description

This function returns the index of the filter that accepted the latest message.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsLatestFilterMatchGet in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Check if CAN_ID_2 module Receive Buffer event
// is active and if so check which filter
// accepted the message.

CAN_FILTER filter;

if((PLIB_CAN_ModuleEventGet(CAN_ID_1) & CAN_RX_EVENT) != 0)
{
```

```
    // Check which filter accepted the message

    filter = PLIB_CAN_LatestFilterMatchGet(CAN_ID_1);
}
```

Parameters

Parameters	Description
index	Identifies the desired CAN module

Function

CAN_FILTER PLIB_CAN_LatestFilterMatchGet(CAN_MODULE_ID index)

i) Error State Tracking Functions

PLIB_CAN_ReceiveErrorCountGet Function

Returns the CAN receive error count.

File

plib_can.h

C

```
int PLIB_CAN_ReceiveErrorCountGet(CAN_MODULE_ID index);
```

Returns

Returns the CAN receive error count.

Description

This function returns the CAN receive error count. Refer to the CAN 2.0B specification for more details on the CAN receive error count and its significance.

Remarks

There are multiple bus conditions, which could cause the receive error count to increase. Please refer to the CAN 2.0b specification for details.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsReceiveErrorCount in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Check if CAN_ID_1 Receive error count is more than 200.
int errCount;

errCount = PLIB_CAN_ReceiveErrorCountGet(CAN_ID_1);
if(errCount > 200)
{
    // This error count is high.
    // Do some diagnostics.
}
```

Parameters

Parameters	Description
index	Identifies the desired CAN module

Function

int PLIB_CAN_ReceiveErrorCountGet(CAN_MODULE_ID index)

PLIB_CAN_ErrorStateGet Function

Returns the CAN error status word.

File

plib_can.h

C

```
CAN_ERROR_STATE PLIB_CAN_ErrorStateGet(CAN_MODULE_ID index);
```

Returns

Returns the CAN_ERROR_STATE word, which can be logically ANDed with the desired CAN_ERROR_STATE member to check whether the CAN module is in a specific error state.

Description

This function returns the CAN error status word. The return word can be logically ANDed with the desired CAN_ERROR_STATE member to check if the CAN module is in a specific error state.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsErrorState in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Check if CAN_ID_1 is in the Transmit or Receive warning state.
CAN_ERROR_STATE errorState;

errorState = PLIB_CAN_ErrorStateGet(CAN_ID_1);

if((errorState & CAN_TX_RX_WARNING_STATE) != 0)
{
    // CAN_ID_1 is in either  Transmit or Receive warning state.
}
// Check if CAN_ID_2 is in the Receive Bus Passive or Transmit Bus passive
// state.
errorState = PLIB_CAN_ErrorStateGet(CAN_ID_2);

if((errorState & (CAN_TX_BUS_PASSIVE_STATE | CAN_RX_BUS_PASSIVE_STATE)) != 0)
{
    // This means that the CAN module is in Transmit Bus Passive
    // or Receive Bus Passive state.
 }
```

Parameters

Parameters	Description
index	Identifies the desired CAN module

Function

CAN_ERROR_STATE PLIB_CAN_ErrorStateGet(CAN_MODULE_ID index)

j) Information Functions

PLIB_CAN_TotalChannelsGet Function

Returns the total number of CAN channels per CAN module.

File

plib_can.h

C

```
char PLIB_CAN_TotalChannelsGet(CAN_MODULE_ID index);
```

Returns

The total number of CAN channels per CAN module.

Description

This function returns the total number of CAN channels per CAN module.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsModuleInfo in your application to determine whether this feature is available.

Preconditions

None.

Example

```
char totalChannels;

totalChannels = PLIB_CAN_TotalChannelsGet(CAN_ID_1);
```

Parameters

Parameters	Description
index	Identifies the desired CAN module

Function

char PLIB_CAN_TotalChannelsGet(CAN_MODULE_ID index)

PLIB_CAN_TotalFiltersGet Function

Returns the total number of CAN Filters per CAN module.

File

plib_can.h

C

```
char PLIB_CAN_TotalFiltersGet(CAN_MODULE_ID index);
```

Returns

The total number of CAN Filters per CAN module.

Description

This function returns the total number of CAN filters per CAN module.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsModuleInfo in your application to determine whether this feature is available.

Preconditions

None.

Example

```
char totalFilters;

totalFilters = PLIB_CAN_TotalFiltersGet(CAN_ID_1);
```

Parameters

Parameters	Description
index	Identifies the desired CAN module

Function

char PLIB_CAN_TotalFiltersGet(CAN_MODULE_ID index)

PLIB_CAN_TotalMasksGet Function

Returns the total number of CAN masks per CAN module.

File

plib_can.h

C

```
char PLIB_CAN_TotalMasksGet(CAN_MODULE_ID index);
```

Returns

The total number of CAN Masks per CAN module.

Description

This function returns the total number of CAN masks per CAN module.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CAN_ExistsModuleInfo in your application to determine whether this feature is available.

Preconditions

None.

Example

```
char totalMasks;

totalMasks = PLIB_CAN_TotalMasksGet(CAN_ID_1);
```

Parameters

Parameters	Description
index	Identifies the desired CAN module

Function

char PLIB_CAN_TotalMasksGet(CAN_MODULE_ID index)

k) Feature Existence Functions

PLIB_CAN_ExistsActiveStatus Function

Identifies whether the ActiveStatus feature exists on the CAN module.

File

plib_can.h

C

```
bool PLIB_CAN_ExistsActiveStatus(CAN_MODULE_ID index);
```

Returns

- true = The ActiveStatus feature is supported on the device
- false = The ActiveStatus feature is not supported on the device

Description

This function identifies whether the ActiveStatus feature is available on the CAN module. When this function returns true, this function is supported on the device:

- PLIB_CAN_IsActive

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CAN_ExistsActiveStatus(CAN_MODULE_ID index)

PLIB_CAN_ExistsAllChannelEvents Function

Identifies whether the AllChannelEvents feature exists on the CAN module.

File

plib_can.h

C

```
bool PLIB_CAN_ExistsAllChannelEvents(CAN_MODULE_ID index);
```

Returns

- true = The AllChannelEvents feature is supported on the device
- false = The AllChannelEvents feature is not supported on the device

Description

This function identifies whether the AllChannelEvents feature is available on the CAN module. When this function returns true, this function is supported on the device:

- PLIB_CAN_AllChannelEventsGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CAN_ExistsAllChannelEvents(CAN_MODULE_ID index)

PLIB_CAN_ExistsAllChannelOverflow Function

Identifies whether the AllChannelOverflow feature exists on the CAN module.

File

plib_can.h

C

```
bool PLIB_CAN_ExistsAllChannelOverflow(CAN_MODULE_ID index);
```

Returns

- true = The AllChannelOverflow feature is supported on the device
- false = The AllChannelOverflow feature is not supported on the device

Description

This function identifies whether the AllChannelOverflow feature is available on the CAN module. When this function returns true, this function is supported on the device:

- PLIB_CAN_AllChannelOverflowStatusGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CAN_ExistsAllChannelOverflow(CAN_MODULE_ID index)

PLIB_CAN_ExistsBusActivityWakeup Function

Identifies whether the BusActivityWakeup feature exists on the CAN module.

File

plib_can.h

C

```
bool PLIB_CAN_ExistsBusActivityWakeup(CAN_MODULE_ID index);
```

Returns

- true = The BusActivityWakeup feature is supported on the device
- false = The BusActivityWakeup feature is not supported on the device

Description

This function identifies whether the BusActivityWakeup feature is available on the CAN module. When this function returns true, these functions are supported on the device:

- PLIB_CAN_BusActivityWakeupEnable
- PLIB_CAN_BusActivityWakeupDisable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CAN_ExistsBusActivityWakeup(CAN_MODULE_ID index)

PLIB_CAN_ExistsBusLine3TimesSampling Function

Identifies whether the BusLine3TimesSampling feature exists on the CAN module.

File

plib_can.h

C

```
bool PLIB_CAN_ExistsBusLine3TimesSampling(CAN_MODULE_ID index);
```

Returns

- true = The BusLine3TimesSampling feature is supported on the device
- false = The BusLine3TimesSampling feature is not supported on the device

Description

This function identifies whether the BusLine3TimesSampling feature is available on the CAN module. When this function returns true, these functions are supported on the device:

- PLIB_CAN_BusLine3TimesSamplingEnable
- PLIB_CAN_BusLine3TimesSamplingDisable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CAN_ExistsBusLine3TimesSampling(CAN_MODULE_ID index)

PLIB_CAN_ExistsChannelEvent Function

Identifies whether the ChannelEventGet feature exists on the CAN module.

File

plib_can.h

C

```
bool PLIB_CAN_ExistsChannelEvent(CAN_MODULE_ID index);
```

Returns

- true = The ChannelEventGet feature is supported on the device
- false = The ChannelEventGet feature is not supported on the device

Description

This function identifies whether the ChannelEventGet feature is available on the CAN module. When this function returns true, these functions are supported on the device:

- PLIB_CAN_ChannelEventGet
- PLIB_CAN_ChannelEventClear

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CAN_ExistsChannelEvent(CAN_MODULE_ID index)

PLIB_CAN_ExistsChannelEventEnable Function

Identifies whether the ChannelEventEnable feature exists on the CAN module.

File

plib_can.h

C

```
bool PLIB_CAN_ExistsChannelEventEnable(CAN_MODULE_ID index);
```

Returns

- true = The ChannelEventEnable feature is supported on the device

- false = The ChannelEventEnable feature is not supported on the device

Description

This function identifies whether the ChannelEventEnable feature is available on the CAN module. When this function returns true, these functions are supported on the device:

- PLIB_CAN_ChannelEventEnable
- PLIB_CAN_ChannelEventDisable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CAN_ExistsChannelEventEnable(CAN_MODULE_ID index)

PLIB_CAN_ExistsChannelForReceiveSet Function

Identifies whether the ChannelForReceiveSet feature exists on the CAN module.

File

plib_can.h

C

```
bool PLIB_CAN_ExistsChannelForReceiveSet(CAN_MODULE_ID index);
```

Returns

- true = The ChannelForReceiveSet feature is supported on the device
- false = The ChannelForReceiveSet feature is not supported on the device

Description

This function identifies whether the ChannelForReceiveSet feature is available on the CAN module. When this function returns true, this function is are supported on the device:

- PLIB_CAN_ChannelForReceiveSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CAN_ExistsChannelForReceiveSet(CAN_MODULE_ID index)

PLIB_CAN_ExistsChannelForTransmitSet Function

Identifies whether the ChannelForTransmitSet feature exists on the CAN module.

File

plib_can.h

C

```
bool PLIB_CAN_ExistsChannelForTransmitSet(CAN_MODULE_ID index);
```

Returns

- true = The ChannelForTransmitSet feature is supported on the device
- false = The ChannelForTransmitSet feature is not supported on the device

Description

This function identifies whether the ChannelForTransmitSet feature is available on the CAN module. When this function returns true, this function is supported on the device:

- PLIB_CAN_ChannelForTransmitSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CAN_ExistsChannelForTransmitSet(CAN_MODULE_ID index)

PLIB_CAN_ExistsChannelReset Function

Identifies whether the ChannelReset feature exists on the CAN module.

File

plib_can.h

C

```
bool PLIB_CAN_ExistsChannelReset(CAN_MODULE_ID index);
```

Returns

- true = The ChannelReset feature is supported on the device
- false = The ChannelReset feature is not supported on the device

Description

This function identifies whether the ChannelReset feature is available on the CAN module. When this function returns true, these functions are supported on the device:

- PLIB_CAN_ChannelReset
- PLIB_CAN_ChannelResetIsComplete

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CAN_ExistsChannelReset(CAN_MODULE_ID index)

PLIB_CAN_ExistsChannelUpdate Function

Identifies whether the ChannelUpdate feature exists on the CAN module.

File

plib_can.h

C

```
bool PLIB_CAN_ExistsChannelUpdate(CAN_MODULE_ID index);
```

Returns

- true = The ChannelUpdate feature is supported on the device
- false = The ChannelUpdate feature is not supported on the device

Description

This function identifies whether the ChannelUpdate feature is available on the CAN module. When this function returns true, this function is supported on the device:

- PLIB_CAN_ChannelUpdate

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CAN_ExistsChannelUpdate(CAN_MODULE_ID index)

PLIB_CAN_ExistsDeviceNet Function

Identifies whether the DeviceNet feature exists on the CAN module.

File

plib_can.h

C

```
bool PLIB_CAN_ExistsDeviceNet(CAN_MODULE_ID index);
```

Returns

- true = The DeviceNet feature is supported on the device
- false = The DeviceNet feature is not supported on the device

Description

This function identifies whether the DeviceNet feature is available on the CAN module. When this function returns true, this function is supported on the device:

- PLIB_CAN_DeviceNetConfigure

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CAN_ExistsDeviceNet(CAN_MODULE_ID index)

PLIB_CAN_ExistsEnableControl Function

Identifies whether the EnableControl feature exists on the CAN module.

File

plib_can.h

C

```
bool PLIB_CAN_ExistsEnableControl(CAN_MODULE_ID index);
```

Returns

- true = The EnableControl feature is supported on the device
- false = The EnableControl feature is not supported on the device

Description

This function identifies whether the EnableControl feature is available on the CAN module. When this function returns true, these functions are supported on the device:

- PLIB_CAN_Enable
- PLIB_CAN_Disable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CAN_ExistsEnableControl(CAN_MODULE_ID index)

PLIB_CAN_ExistsErrorState Function

Identifies whether the ErrorStateGet feature exists on the CAN module.

File

plib_can.h

C

```
bool PLIB_CAN_ExistsErrorState(CAN_MODULE_ID index);
```

Returns

- true = The ErrorStateGet feature is supported on the device
- false = The ErrorStateGet feature is not supported on the device

Description

This function identifies whether the ErrorStateGet feature is available on the CAN module. When this function returns true, this function is supported on the device:

- PLIB_CAN_ErrorStateGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CAN_ExistsErrorState(CAN_MODULE_ID index)

PLIB_CAN_ExistsFilterConfigure Function

Identifies whether the FilterConfigure feature exists on the CAN module.

File

plib_can.h

C

```
bool PLIB_CAN_ExistsFilterConfigure(CAN_MODULE_ID index);
```

Returns

- true = The FilterConfigure feature is supported on the device
- false = The FilterConfigure feature is not supported on the device

Description

This function identifies whether the FilterConfigure feature is available on the CAN module. When this function returns true, this function is supported on the device:

- PLIB_CAN_FilterConfigure

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CAN_ExistsFilterConfigure(CAN_MODULE_ID index)

PLIB_CAN_ExistsFilterEnable Function

Identifies whether the FilterEnable feature exists on the CAN module.

File

plib_can.h

C

```
bool PLIB_CAN_ExistsFilterEnable(CAN_MODULE_ID index);
```

Returns

- true = The FilterEnable feature is supported on the device
- false = The FilterEnable feature is not supported on the device

Description

This function identifies whether the FilterEnable feature is available on the CAN module. When this function returns true, these functions are supported on the device:

- PLIB_CAN_FilterEnable
- PLIB_CAN_FilterDisable
- PLIB_CAN_FilterIsDisabled

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CAN_ExistsFilterEnable(CAN_MODULE_ID index)

PLIB_CAN_ExistsFilterMaskConfigure Function

Identifies whether the FilterMaskConfigure feature exists on the CAN module.

File

plib_can.h

C

```
bool PLIB_CAN_ExistsFilterMaskConfigure(CAN_MODULE_ID index);
```

Returns

- true = The FilterMaskConfigure feature is supported on the device
- false = The FilterMaskConfigure feature is not supported on the device

Description

This function identifies whether the FilterMaskConfigure feature is available on the CAN module. When this function returns true, this function is supported on the device:

- PLIB_CAN_FilterMaskConfigure

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CAN_ExistsFilterMaskConfigure(CAN_MODULE_ID index)

PLIB_CAN_ExistsFilterToChannelLink Function

Identifies whether the FilterToChannelLink feature exists on the CAN module.

File

plib_can.h

C

```
bool PLIB_CAN_ExistsFilterToChannelLink(CAN_MODULE_ID index);
```

Returns

- true = The FilterToChannelLink feature is supported on the device
- false = The FilterToChannelLink feature is not supported on the device

Description

This function identifies whether the FilterToChannelLink feature is available on the CAN module. When this function returns true, this function is supported on the device:

- PLIB_CAN_FilterToChannelLink

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CAN_ExistsFilterToChannelLink(CAN_MODULE_ID index)

PLIB_CAN_ExistsLatestFilterMatchGet Function

Identifies whether the LatestFilterMatchGet feature exists on the CAN module.

File

plib_can.h

C

```
bool PLIB_CAN_ExistsLatestFilterMatchGet(CAN_MODULE_ID index);
```

Returns

- true = The LatestFilterMatchGet feature is supported on the device
- false = The LatestFilterMatchGet feature is not supported on the device

Description

This function identifies whether the LatestFilterMatchGet feature is available on the CAN module. When this function returns true, this function is supported on the device:

- PLIB_CAN_LatestFilterMatchGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CAN_ExistsLatestFilterMatchGet(CAN_MODULE_ID index)

PLIB_CAN_ExistsMemoryBufferAssign Function

Identifies whether the MemoryBufferAssign feature exists on the CAN module.

File

plib_can.h

C

```
bool PLIB_CAN_ExistsMemoryBufferAssign(CAN_MODULE_ID index);
```

Returns

- true = The MemoryBufferAssign feature is supported on the device
- false = The MemoryBufferAssign feature is not supported on the device

Description

This function identifies whether the MemoryBufferAssign feature is available on the CAN module. When this function returns true, this function is supported on the device:

- PLIB_CAN_MemoryBufferAssign

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CAN_ExistsMemoryBufferAssign(CAN_MODULE_ID index)

PLIB_CAN_ExistsModuleEventClear Function

Identifies whether the ModuleEvents feature exists on the CAN module.

File

plib_can.h

C

```
bool PLIB_CAN_ExistsModuleEventClear(CAN_MODULE_ID index);
```

Returns

- true = The ModuleEvents feature is supported on the device
- false = The ModuleEvents feature is not supported on the device

Description

This function identifies whether the ModuleEvents feature is available on the CAN module. When this function returns true, these functions are supported on the device:

- PLIB_CAN_ModuleEventClear
- PLIB_CAN_ModuleEventGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CAN_ExistsModuleEventClear(CAN_MODULE_ID index)

PLIB_CAN_ExistsModuleEventEnable Function

Identifies whether the ModuleEventEnable feature exists on the CAN module.

File

plib_can.h

C

```
bool PLIB_CAN_ExistsModuleEventEnable(CAN_MODULE_ID index);
```

Returns

- true = The ModuleEventEnable feature is supported on the device
- false = The ModuleEventEnable feature is not supported on the device

Description

This function identifies whether the ModuleEventEnable feature is available on the CAN module. When this function returns true, these functions are supported on the device:

- PLIB_CAN_ModuleEventEnable
- PLIB_CAN_ModuleEventDisable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CAN_ExistsModuleEventEnable(CAN_MODULE_ID index)

PLIB_CAN_ExistsModuleInfo Function

Identifies whether the ModuleInformation feature exists on the CAN module.

File

plib_can.h

C

```
bool PLIB_CAN_ExistsModuleInfo(CAN_MODULE_ID index);
```

Returns

- true = The ModuleInformation feature is supported on the device
- false = The ModuleInformation feature is not supported on the device

Description

This function identifies whether the ModuleInformation feature is available on the CAN module. When this function returns true, these functions are supported on the device:

- PLIB_CAN_TotalChannelsGet
- PLIB_CAN_TotalFiltersGet
- PLIB_CAN_TotalMasksGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CAN_ExistsModuleInfo(CAN_MODULE_ID index)

PLIB_CAN_ExistsOperationModeRead Function

Identifies whether the OperationModeRead feature exists on the CAN module.

File

plib_can.h

C

```
bool PLIB_CAN_ExistsOperationModeRead(CAN_MODULE_ID index);
```

Returns

- true = The OperationModeRead feature is supported on the device
- false = The OperationModeRead feature is not supported on the device

Description

This function identifies whether the OperationModeRead feature is available on the CAN module. When this function returns true, this function is supported on the device:

- PLIB_CAN_OperationModeGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CAN_ExistsOperationModeRead(CAN_MODULE_ID index)

PLIB_CAN_ExistsOperationModeWrite Function

Identifies whether the OperationModeSet feature exists on the CAN module.

File

plib_can.h

C

```
bool PLIB_CAN_ExistsOperationModeWrite(CAN_MODULE_ID index);
```

Returns

- true = The OperationModeSet feature is supported on the device
- false = The OperationModeSet feature is not supported on the device

Description

This function identifies whether the OperationModeSet feature is available on the CAN module. When this function returns true, this function is supported on the device:

- PLIB_CAN_OperationModeSelect

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CAN_ExistsOperationModeWrite(CAN_MODULE_ID index)

PLIB_CAN_ExistsPendingEventsGet Function

Identifies whether the PendingEventsGet feature exists on the CAN module.

File

plib_can.h

C

```
bool PLIB_CAN_ExistsPendingEventsGet(CAN_MODULE_ID index);
```

Returns

- true = The PendingEventsGet feature is supported on the device
- false = The PendingEventsGet feature is not supported on the device

Description

This function identifies whether the PendingEventsGet feature is available on the CAN module. When this function returns true, this function is supported on the device:

- PLIB_CAN_PendingEventsGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CAN_ExistsPendingEventsGet(CAN_MODULE_ID index)

PLIB_CAN_ExistsPendingTransmissionsAbort Function

Identifies whether the PendingTransmissionsAbort feature exists on the CAN module.

File

plib_can.h

C

```
bool PLIB_CAN_ExistsPendingTransmissionsAbort(CAN_MODULE_ID index);
```

Returns

- true = The PendingTransmissionsAbort feature is supported on the device
- false = The PendingTransmissionsAbort feature is not supported on the device

Description

This function identifies whether the PendingTransmissionsAbort feature is available on the CAN module. When this function returns true, this function is supported on the device:

- PLIB_CAN_PendingTransmissionsAbort

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CAN_ExistsPendingTransmissionsAbort(CAN_MODULE_ID index)

PLIB_CAN_ExistsReceivedMessageGet Function

Identifies whether the ReceivedMessageGet feature exists on the CAN module.

File

plib_can.h

C

```
bool PLIB_CAN_ExistsReceivedMessageGet(CAN_MODULE_ID index);
```

Returns

- true = The ReceivedMessageGet feature is supported on the device
- false = The ReceivedMessageGet feature is not supported on the device

Description

This function identifies whether the ReceivedMessageGet feature is available on the CAN module. When this function returns true, this function is supported on the device:

- PLIB_CAN_ReceivedMessageGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CAN_ExistsReceivedMessageGet(CAN_MODULE_ID index)

PLIB_CAN_ExistsReceiveErrorCount Function

Identifies whether the ReceiveErrorCount feature exists on the CAN module.

File

plib_can.h

C

```
bool PLIB_CAN_ExistsReceiveErrorCount(CAN_MODULE_ID index);
```

Returns

- true = The ReceiveErrorCount feature is supported on the device
- false = The ReceiveErrorCount feature is not supported on the device

Description

This function identifies whether the ReceiveErrorCount feature is available on the CAN module. When this function returns true, this function is supported on the device:

- PLIB_CAN_ReceiveErrorCountGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CAN_ExistsReceiveErrorCount(CAN_MODULE_ID index)

PLIB_CAN_ExistsStopInIdle Function

Identifies whether the StopInIdle feature exists on the CAN module.

File

plib_can.h

C

```
bool PLIB_CAN_ExistsStopInIdle(CAN_MODULE_ID index);
```

Returns

- true = The StopInIdle feature is supported on the device
- false = The StopInIdle feature is not supported on the device

Description

This function identifies whether the StopInIdle feature is available on the CAN module. When this function returns true, these functions are supported on the device:

- PLIB_CAN_StopInIdleEnable
- PLIB_CAN_StopInIdleDisable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CAN_ExistsStopInIdle(CAN_MODULE_ID index)

PLIB_CAN_ExistsTimeStampEnable Function

Identifies whether the TimeStampEnable feature exists on the CAN module

File

plib_can.h

C

```
bool PLIB_CAN_ExistsTimeStampEnable(CAN_MODULE_ID index);
```

Returns

- true = The TimeStampEnable feature is supported on the device
- false = The TimeStampEnable feature is not supported on the device

Description

This function identifies whether the TimeStampEnable feature is available on the CAN module. When this function returns true, these functions are supported on the device:

- PLIB_CAN_TimeStampEnable
- PLIB_CAN_TimeStampDisable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CAN_ExistsTimeStampEnable(CAN_MODULE_ID index)

PLIB_CAN_ExistsTimeStampValue Function

Identifies whether the TimeStampValue feature exists on the CAN module.

File

plib_can.h

C

```
bool PLIB_CAN_ExistsTimeStampValue(CAN_MODULE_ID index);
```

Returns

- true = The TimeStampValue feature is supported on the device
- false = The TimeStampValue feature is not supported on the device

Description

This function identifies whether the TimeStampValue feature is available on the CAN module. When this function returns true, these functions are supported on the device:

- PLIB_CAN_TimeStampValueSet
- PLIB_CAN_TimeStampValueGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CAN_ExistsTimeStampValue(CAN_MODULE_ID index)

PLIB_CAN_ExistsTransmissionIsAborted Function

Identifies whether the TransmissionAbortStatus feature exists on the CAN module.

File

plib_can.h

C

```
bool PLIB_CAN_ExistsTransmissionIsAborted(CAN_MODULE_ID index);
```

Returns

- true = The TransmissionAbortStatus feature is supported on the device
- false = The TransmissionAbortStatus feature is not supported on the device

Description

This function identifies whether the TransmissionAbortStatus feature is available on the CAN module. When this function returns true, this function is supported on the device:

- PLIB_CAN_TransmissionIsAborted

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CAN_ExistsTransmissionIsAborted(CAN_MODULE_ID index)

PLIB_CAN_ExistsTransmitBufferGet Function

Identifies whether the TransmitBufferGet feature exists on the CAN module.

File

plib_can.h

C

```
bool PLIB_CAN_ExistsTransmitBufferGet(CAN_MODULE_ID index);
```

Returns

- true = The TransmitBufferGet feature is supported on the device
- false = The TransmitBufferGet feature is not supported on the device

Description

This function identifies whether the TransmitBufferGet feature is available on the CAN module. When this function returns true, this function is supported on the device:

- PLIB_CAN_TransmitBufferGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CAN_ExistsTransmitBufferGet(CAN_MODULE_ID index)

PLIB_CAN_ExistsTransmitChannelFlush Function

Identifies whether the TransmitChannelFlush feature exists on the CAN module.

File

plib_can.h

C

```
bool PLIB_CAN_ExistsTransmitChannelFlush(CAN_MODULE_ID index);
```

Returns

- true = The TransmitChannelFlush feature is supported on the device
- false = The TransmitChannelFlush feature is not supported on the device

Description

This function identifies whether the TransmitChannelFlush feature is available on the CAN module. When this function returns true, this function is supported on the device:

- PLIB_CAN_TransmitChannelFlush

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CAN_ExistsTransmitChannelFlush(CAN_MODULE_ID index)

PLIB_CAN_ExistsTransmitChannelStatus Function

Identifies whether the TransmitChannelStatus feature exists on the CAN module.

File

plib_can.h

C

```
bool PLIB_CAN_ExistsTransmitChannelStatus(CAN_MODULE_ID index);
```

Returns

- true = The TransmitChannelStatus feature is supported on the device
- false = The TransmitChannelStatus feature is not supported on the device

Description

This function identifies whether the TransmitChannelStatus feature is available on the CAN module. When this function returns true, this function is supported on the device:

- PLIB_CAN_TransmitChannelStatusGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CAN_ExistsTransmitChannelStatus(CAN_MODULE_ID index)

PLIB_CAN_ExistsTransmitErrorCountGet Function

Identifies whether the TransmitErrorCountGet feature exists on the CAN module.

File

plib_can.h

C

```
bool PLIB_CAN_ExistsTransmitErrorCountGet(CAN_MODULE_ID index);
```

Returns

- true = The TransmitErrorCountGet feature is supported on the device
- false = The TransmitErrorCountGet feature is not supported on the device

Description

This function identifies whether the TransmitErrorCountGet feature is available on the CAN module. When this function returns true, this function is supported on the device:

- PLIB_CAN_TransmitErrorCountGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CAN_ExistsTransmitErrorCountGet(CAN_MODULE_ID index)

PLIB_CAN_ExistsBaudRateGet Function

Identifies whether the BaudRateGet feature exists on the CAN module.

File

plib_can.h

C

```
bool PLIB_CAN_ExistsBaudRateGet(CAN_MODULE_ID index);
```

Returns

- true = The BaudRateGet feature is supported on the device.
- false = The BaudRateGet feature is not supported on the device.

Description

This function identifies whether the BaudRateGet feature is available on the CAN module. When this function returns true, this function is supported on the device:

- PLIB_CAN_BaudRateGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CAN_ExistsBaudRateGet(CAN_MODULE_ID index)

PLIB_CAN_ExistsBaudRatePrescaleSetup Function

Identifies whether the BaudRatePrescaleSetup feature exists on the CAN module.

File

plib_can.h

C

```
bool PLIB_CAN_ExistsBaudRatePrescaleSetup(CAN_MODULE_ID index);
```

Returns

- true = The BaudRatePrescaleSetup feature is supported on the device.
- false = The BaudRatePrescaleSetup feature is not supported on the device.

Description

This function identifies whether the BaudRatePrescaleSetup feature is available on the CAN module. When this function returns true, this function is supported on the device:

- PLIB_CAN_BaudRatePrescaleSetup

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CAN_ExistsBaudRatePrescaleSetup(CAN_MODULE_ID index)

PLIB_CAN_ExistsBitSamplePhaseSet Function

Identifies whether the BitSamplePhaseSet feature exists on the CAN module.

File

plib_can.h

C

```
bool PLIB_CAN_ExistsBitSamplePhaseSet(CAN_MODULE_ID index);
```

Returns

- true = The BitSamplePhaseSet feature is supported on the device.
- false = The BitSamplePhaseSet feature is not supported on the device.

Description

This function identifies whether the BitSamplePhaseSet feature is available on the CAN module. When this function returns true, this function is supported on the device:

- PLIB_CAN_BitSamplePhaseSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CAN_ExistsBitSamplePhaseSet(CAN_MODULE_ID index)

PLIB_CAN_ExistsPrecalculatedBitRateSetup Function

Identifies whether the PrecalculatedBitRateSetup feature exists on the CAN module.

File

plib_can.h

C

```
bool PLIB_CAN_ExistsPrecalculatedBitRateSetup(CAN_MODULE_ID index);
```

Returns

- true = The PrecalculatedBitRateSetup feature is supported on the device.
- false = The PrecalculatedBitRateSetup feature is not supported on the device.

Description

This function identifies whether the PrecalculatedBitRateSetup feature is available on the CAN module. When this function returns true, this function is supported on the device:

- PLIB_CAN_PrecalculatedBitRateSetup

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CAN_ExistsPrecalculatedBitRateSetup(CAN_MODULE_ID index)

I) Data Types and Constants

CAN_CHANNEL Enumeration

Identifies the supported CAN Channels.

File

plib_can_help.h

C

```
typedef enum {
  CAN_CHANNEL0,
  CAN_CHANNEL1,
  CAN_CHANNEL2,
  CAN_CHANNEL3,
  CAN_CHANNEL4,
  CAN_CHANNEL5,
  CAN_CHANNEL6,
  CAN_CHANNEL7,
  CAN_CHANNEL8,
  CAN_CHANNEL9,
  CAN_CHANNEL10,
```

```
  CAN_CHANNEL11,
  CAN_CHANNEL12,
  CAN_CHANNEL13,
  CAN_CHANNEL14,
  CAN_CHANNEL15,
  CAN_CHANNEL16,
  CAN_CHANNEL17,
  CAN_CHANNEL18,
  CAN_CHANNEL19,
  CAN_CHANNEL20,

CAN_CHANNEL30	Channel 30 ID
CAN_CHANNEL31	Channel 31 ID

Description

CAN Channel

This enumeration identifies the available CAN channels.

CAN_CHANNEL_EVENT Enumeration

Identifies all Layer 3 interrupts.

File

plib_can_help.h

C

```
typedef enum {
  CAN_RX_CHANNEL_NOT_EMPTY,
  CAN_RX_CHANNEL_HALF_FULL,
  CAN_RX_CHANNEL_FULL,
  CAN_RX_CHANNEL_OVERFLOW,
  CAN_RX_CHANNEL_ANY_EVENT,
  CAN_TX_CHANNEL_EMPTY,
  CAN_TX_CHANNEL_HALF_EMPTY,
  CAN_TX_CHANNEL_NOT_FULL,
  CAN_TX_CHANNEL_ANY_EVENT
} CAN_CHANNEL_EVENT;
```

Members

Members	Description
CAN_RX_CHANNEL_NOT_EMPTY	CAN Receive Channel Not Empty Event Mask
CAN_RX_CHANNEL_HALF_FULL	CAN Receive Channel Half Full Event Mask
CAN_RX_CHANNEL_FULL	CAN Receive Channel Full Event Mask
CAN_RX_CHANNEL_OVERFLOW	CAN Receive Channel Overflow Event Mask
CAN_RX_CHANNEL_ANY_EVENT	CAN Receive Channel Any Event Mask
CAN_TX_CHANNEL_EMPTY	CAN Transmit Channel Empty Event Mask
CAN_TX_CHANNEL_HALF_EMPTY	CAN Transmit Channel Half Empty Event Mask
CAN_TX_CHANNEL_NOT_FULL	CAN Transmit Channel Not Full Event Mask
CAN_TX_CHANNEL_ANY_EVENT	CAN Transmit Channel Any Event Mask

Description

CAN Layer 3 Interrupts

This enumerates all the leading interrupts generated due to CAN transmit and receive events. This enumeration can be used to enable or disable channel events and as a mask to check if a channel event is active.

A single or a combination of the interrupts can be logically ORed to specify the interrupt(s) to be enabled disabled or events to check.

This enumeration is used by PLIB_CAN_ChannelEventEnable, PLIB_CAN_ChannelEventDisable, PLIB_CAN_ChannelEventClear, and PLIB_CAN_ChannelEventGet functions.

CAN_CHANNEL_MASK Enumeration

Lists the series of useful masks.

File

plib_can_help.h

C

```
typedef enum {
  CAN_CHANNEL0_MASK,
  CAN_CHANNEL1_MASK,
  CAN_CHANNEL2_MASK,

CAN_CHANNEL29_MASK	Channel 29 Mask
CAN_CHANNEL30_MASK	Channel 30 Mask
CAN_CHANNEL31_MASK	Channel 31 Mask
CAN_ANYCHANNEL_MASK	Channel any channel Mask

Description

CAN Channel Masks

This enumeration identifies a series of useful masks. Each mask represents a CAN channel. These masks are used with the PLIB_CAN_AllChannelEventsGet and PLIB_CAN_AllChannelOverflowStatusGet functions. The value returned by these functions can be logically ANDed with any of these masks to check if an event or overflow event for that channel is active.

CAN_DNET_FILTER_SIZE Enumeration

Specifies the size of the DeviceNet filter.

File

plib_can_help.h

C

```
typedef enum {
  CAN_DNET_FILTER_SIZE_18_BIT,
  CAN_DNET_FILTER_SIZE_17_BIT,
  CAN_DNET_FILTER_SIZE_16_BIT,
  CAN_DNET_FILTER_SIZE_15_BIT,
  CAN_DNET_FILTER_SIZE_14_BIT,
  CAN_DNET_FILTER_SIZE_13_BIT,
  CAN_DNET_FILTER_SIZE_12_BIT,
  CAN_DNET_FILTER_SIZE_11_BIT,
  CAN_DNET_FILTER_SIZE_10_BIT,
  CAN_DNET_FILTER_SIZE_9_BIT,
  CAN_DNET_FILTER_SIZE_8_BIT,
  CAN_DNET_FILTER_SIZE_7_BIT,
  CAN_DNET_FILTER_SIZE_6_BIT,
  CAN_DNET_FILTER_SIZE_5_BIT,
  CAN_DNET_FILTER_SIZE_4_BIT,
  CAN_DNET_FILTER_SIZE_3_BIT,
  CAN_DNET_FILTER_SIZE_2_BIT,
  CAN_DNET_FILTER_SIZE_1_BIT,
  CAN_DNET_FILTER_DISABLE
} CAN_DNET_FILTER_SIZE;
```

Members

Members	Description
CAN_DNET_FILTER_SIZE_18_BIT	Compare up to data byte 2 bit 6 with filter mask bit 17
CAN_DNET_FILTER_SIZE_17_BIT	Compare up to data byte 2 bit 7 with filter mask bit 16
CAN_DNET_FILTER_SIZE_16_BIT	Compare up to data byte 1 bit 0 with filter mask bit 15
CAN_DNET_FILTER_SIZE_15_BIT	Compare up to data byte 1 bit 1 with filter mask bit 14
CAN_DNET_FILTER_SIZE_14_BIT	Compare up to data byte 1 bit 2 with filter mask bit 13
CAN_DNET_FILTER_SIZE_13_BIT	Compare up to data byte 1 bit 3 with filter mask bit 12
CAN_DNET_FILTER_SIZE_12_BIT	Compare up to data byte 1 bit 4 with filter mask bit 11
CAN_DNET_FILTER_SIZE_11_BIT	Compare up to data byte 1 bit 5 with filter mask bit 10
CAN_DNET_FILTER_SIZE_10_BIT	Compare up to data byte 1 bit 6 with filter mask bit 9
CAN_DNET_FILTER_SIZE_9_BIT	Compare up to data byte 1 bit 7 with filter mask bit 8
CAN_DNET_FILTER_SIZE_8_BIT	Compare up to data byte 0 bit 0 with filter mask bit 7
CAN_DNET_FILTER_SIZE_7_BIT	Compare up to data byte 0 bit 1 with filter mask bit 6
CAN_DNET_FILTER_SIZE_6_BIT	Compare up to data byte 0 bit 2 with filter mask bit 5
CAN_DNET_FILTER_SIZE_5_BIT	Compare up to data byte 0 bit 3 with filter mask bit 4
CAN_DNET_FILTER_SIZE_4_BIT	Compare up to data byte 0 bit 4 with filter mask bit 3
CAN_DNET_FILTER_SIZE_3_BIT	Compare up to data byte 0 bit 5 with filter mask bit 2
CAN_DNET_FILTER_SIZE_2_BIT	Compare up to data byte 0 bit 6 with filter mask bit 1
CAN_DNET_FILTER_SIZE_1_BIT	Compare up to data byte 0 bit 7 with filter mask bit 0
CAN_DNET_FILTER_DISABLE	Do not compare data bytes, Device Net Filtering is disabled

Description

CAN DeviceNet filter bit numbers.

This enumeration identifies the size of the DeviceNet filter in bits. If the size of the DeviceNet filter is "n", the "n" most significant bits of the data payload are compared with the EID field of enabled filters.

CAN_ERROR_STATE Enumeration

Specifies the CAN module error states.

File

plib_can_help.h

C

```
typedef enum {
  CAN_TX_RX_WARNING_STATE,
  CAN_RX_WARNING_STATE,
  CAN_TX_WARNING_STATE,
  CAN_RX_BUS_PASSIVE_STATE,
  CAN_TX_BUS_PASSIVE_STATE,
  CAN_TX_BUS_OFF_STATE
} CAN_ERROR_STATE;
```

Members

Members	Description
CAN_TX_RX_WARNING_STATE	CAN Module is in a Transmit or Receive warning state.
CAN_RX_WARNING_STATE	CAN Module is in a Receive warning state.
CAN_TX_WARNING_STATE	CAN Module is in a Transmit warning state.
CAN_RX_BUS_PASSIVE_STATE	CAN Receive is in a Bus Passive state.
CAN_TX_BUS_PASSIVE_STATE	CAN Transmit is in a Bus Passive state.
CAN_TX_BUS_OFF_STATE	CAN Transmit is in Bus Off state.

Description

CAN Error States

This enumeration identifies all of the CAN module error states events. The CAN module enters or exits an error state as the transmit and receive error counter values change. Refer to the CAN 2.0B specification for more details on the error states.

This enumeration is used with the PLIB_CAN_ErrorStateGet function.

CAN_FILTER Enumeration

CAN event code returned by the CAN module.

File

plib_can_help.h

C

```
typedef enum {
  CAN_CHANNEL0_EVENT,
  CAN_CHANNEL1_EVENT,
  CAN_CHANNEL2_EVENT,

CAN_RX_CHANNEL_OVERFLOW_EVENT	CAN Receive Channel Overflow Event is active
CAN_ADDRESS_ERROR_EVENT	CAN Address Error Event is active
CAN_BUS_BANDWIDTH_ERROR	CAN Bus Bandwidth Error is active
CAN_TIMESTAMP_TIMER_EVENT	CAN Time Stamp Timer Overflow event is active
CAN_MODE_CHANGE_EVENT	CAN Module Mode Change is active

Description

CAN Event Code

This enumeration identifies all of the event codes returned by the PLIB_CAN_PendingEventsGet function.

CAN_FILTER_MASK Enumeration

Identifies the available CAN filter masks.

File

plib_can_help.h

C

```
typedef enum {
  CAN_FILTER_MASK0,
  CAN_FILTER_MASK1,
  CAN_FILTER_MASK2,
  CAN_FILTER_MASK3,
  CAN_NUMBER_OF_FILTER_MASKS
} CAN_FILTER_MASK;
```

Members

Members	Description
CAN_FILTER_MASK0	CAN Filter Mask 0
CAN_FILTER_MASK1	CAN Filter Mask 1
CAN_FILTER_MASK2	CAN Filter Mask 2
CAN_FILTER_MASK3	CAN Filter Mask 3
CAN_NUMBER_OF_FILTER_MASKS	Total number of filter masks in the module

Description

CAN Filter Masks

This enumeration identifies the available filters masks in each CAN module.

CAN_FILTER_MASK_TYPE Enumeration

Specifies the CAN filter mask type.

File

plib_can_help.h

C

```
typedef enum {
  CAN_FILTER_MASK_IDE_TYPE,
  CAN_FILTER_MASK_ANY_TYPE
} CAN_FILTER_MASK_TYPE;
```

Members

Members	Description
CAN_FILTER_MASK_IDE_TYPE	Mask processes only Filter type of message
CAN_FILTER_MASK_ANY_TYPE	Mask processes any type (SID or EID) of message

Description

CAN Filter Mask Type

This enumeration specifies the filter mask type. The filter mask can either process messages with any type of ID (extended or standard) or can only process by ID specified in the filter configuration. For example, if the filter associated with the mask only accepts EID type messages and if the mask is configured to process by ID type, then SID messages will not be accepted. If the mask is configured to process any type of message, both SID and EID messages will be accepted on a filter match.

CAN_ID_TYPE Enumeration

Specifies the CAN ID type.

File

plib_can_help.h

C

```
typedef enum {
  CAN_EID,
  CAN_SID
} CAN_ID_TYPE;
```

Members

Members	Description
CAN_EID	CAN Extended ID
CAN_SID	CAN Standard ID

Description

CAN ID Type

This enumeration specifies the two CAN ID types: Standard and Extended. The Standard Type ID is 11 bits long and the Extended ID is 29 bits long. This enumeration then specifies the type of the ID specified while configuring filters and filter masks.

CAN_MODULE_EVENT Enumeration

Specifies the CAN module events

File

plib_can_help.h

C

```
typedef enum {
  CAN_TX_EVENT,
  CAN_RX_EVENT,
  CAN_TIMESTAMP_TIMER_OVERFLOW_EVENT,
  CAN_OPERATION_MODE_CHANGE_EVENT,
  CAN_RX_OVERFLOW_EVENT,
  CAN_SYSTEM_ERROR_EVENT,
  CAN_BUS_ERROR_EVENT,
  CAN_BUS_ACTIVITY_WAKEUP_EVENT,
  CAN_INVALID_RX_MESSAGE_EVENT
} CAN_MODULE_EVENT;
```

Members

Members	Description
CAN_TX_EVENT	Transmit channel event. This event will occur if any of the Transmit Channel events are active.
CAN_RX_EVENT	Receive channel event. This event will occur if any of the Receive Channel events are active.
CAN_TIMESTAMP_TIMER_OVERFLOW_EVENT	CAN Time Stamp Timer Overflow event occurs. This event occurs when the Time Stamp Timer has overflowed.
CAN_OPERATION_MODE_CHANGE_EVENT	CAN Operation Mode Change Event. This event occurs when the CAN module has changed its operating mode successfully.
CAN_RX_OVERFLOW_EVENT	CAN Receive Channel Overflow Event. This event occurs when any of the Receive Channel has overflowed.
CAN_SYSTEM_ERROR_EVENT	CAN System Error Event. This event occurs when CAN module tries to access an invalid Device RAM location.
CAN_BUS_ERROR_EVENT	CAN Bus Error Event. This event occurs when the CAN module cannot access the system bus.
CAN_BUS_ACTIVITY_WAKEUP_EVENT	CAN Bus Activity Wakeup. This event occurs when the device is in Sleep mode and bus activity is detected on the CAN bus.
CAN_INVALID_RX_MESSAGE_EVENT	CAN Bus Invalid Receive Message Event. This event occurs when the CAN module receives an Invalid message.

Description

CAN Module Events

This enumeration identifies all of the CAN module events. A combination of listed events can be logically ORed to enable or disable module level events. Similarly, a combination of events can be checked if active.

This enumeration is used with the PLIB_CAN_ModuleEventEnable function and PLIB_CAN_ModuleEventGet function.

CAN_MODULE_ID Enumeration

File

plib_can_help.h

C

```
typedef enum {
  CAN_ID_1,
  CAN_ID_2,
  CAN_ID_3,
  CAN_NUMBER_OF_MODULES
} CAN_MODULE_ID;
```

Members

Members	Description
CAN_NUMBER_OF_MODULES	The total number of modules available.

Description

Enumeration: CAN_MODULE_ID

This enumeration defines the number of modules that are available on the microcontroller. This is the super set of all the possible instances that might be available on Microchip microcontrollers.

Refer to the specific device data sheet to get the correct number of modules defined for the desired microcontroller.

CAN_MSG_EID Structure

Defines the structure of the EID word section of the transmit and receive message.

File

plib_can.h

C

```
typedef struct {
  unsigned data_length_code : 4;
  unsigned reserved0 : 1;
  unsigned unimplemented1 : 3;
  unsigned reserved1 : 1;
```

```
  unsigned remote_request : 1;
  unsigned eid : 18;
  unsigned ide : 1;
  unsigned sub_remote_req : 1;
  unsigned unimplemented2 : 2;
} CAN_MSG_EID;
```

Members

Members	Description
unsigned data_length_code : 4;	Data Length Control. Specifies the size of the data payload section of the CAN packet. Valid values are 0x0 - 0x8
unsigned reserved0 : 1;	Reserved bit. Should be always 0.
unsigned unimplemented1 : 3;	Unimplemented bit. Should be always 0.
unsigned reserved1 : 1;	Reserved bit. Should be always 0.
unsigned remote_request : 1;	Remote Transmit Request bit. Should be set for RTR messages, clear otherwise.
unsigned eid : 18;	CAN Transmit and Receive Extended ID field. Valid values are in range 0x0 - 0x3FFFF
unsigned ide : 1;	Identifier bit. If 0 means that message is SID. If 1 means that message is EID type.
unsigned sub_remote_req : 1;	Substitute Remote request bit. This bit should always be clear for an EID message. It is ignored for an SID message.
unsigned unimplemented2 : 2;	Unimplemented bit. Should be always 0.

Description

CAN Message EID Word

This data structure represents the EID section of the CAN transmit and receive message. The data structure is an element of the CAN_TX_MSG_BUFFER and CAN_RX_MSG_BUFFER data structure.

CAN_OPERATION_MODES Enumeration

Lists all possible CAN module operational modes.

File

plib_can_help.h

C

```
typedef enum {
  CAN_LISTEN_ALL_MESSAGES_MODE,
  CAN_CONFIGURATION_MODE,
  CAN_LISTEN_ONLY_MODE,
  CAN_LOOPBACK_MODE,
  CAN_DISABLE_MODE,
  CAN_NORMAL_MODE
} CAN_OPERATION_MODES;
```

Members

Members	Description
CAN_LISTEN_ALL_MESSAGES_MODE	CAN Listen All Message Mode. The CAN module listens to all messages, regardless of errors
CAN_CONFIGURATION_MODE	CAN Configuration Mode. Various CAN module settings can be configured in this mode
CAN_LISTEN_ONLY_MODE	CAN Listen Only Mode. In this mode, the CAN module will not acknowledge signal and will not participate in error signaling. All messages are captured
CAN_LOOPBACK_MODE	CAN Loopback Mode. In this mode, the CAN module Transmit is internally connected to the Receive line. This mode is useful for debugging operation
CAN_DISABLE_MODE	CAN Disable Mode. The CAN module does not transmit or receive messages in this mode
CAN_NORMAL_MODE	CAN Normal Operation Mode. The CAN module transmits and receives messages in this mode

Description

CAN Operation Modes

This enumerates all operating modes of the CAN module. The application should set the desired mode using the PLIB_CAN_OperationModeSelect function, and should then use the PLIB_CAN_OperationModeGet function to check if the CAN module has entered the requested mode.

CAN_RECEIVE_CHANNEL Enumeration

Lists all possible CAN module receive channels.

File

plib_can_help.h

C

```
typedef enum {
  CAN_RECEIVE_CHANNEL0,
  CAN_RECEIVE_CHANNEL1
} CAN_RECEIVE_CHANNEL;
```

Members

Members	Description
CAN_RECEIVE_CHANNEL0	CAN receive channel 0
CAN_RECEIVE_CHANNEL1	CAN receive channel 1

Description

CAN Receive Channels

This enumerates all CAN module receive channels(channels that are not allowed to be configured for transmit).

CAN_RECEIVE_MODES Enumeration

Lists all possible CAN module receive modes.

File

plib_can_help.h

C

```
typedef enum {
  CAN_RECEIVE_ALL_MSG_MODE,
  CAN_RECEIVE_VALID_EID_MODE,
  CAN_RECEIVE_VALID_STD_MODE,
  CAN_RECEIVE_VALID_MODE
} CAN_RECEIVE_MODES;
```

Members

Members	Description
CAN_RECEIVE_ALL_MSG_MODE	Receive all messages(Including with errors). The message filters will not be considered
CAN_RECEIVE_VALID_EID_MODE	Receive only valid messages(with error will be discarded, filter will be considered) with extended identifier. This is applicable only for functional mode 0
CAN_RECEIVE_VALID_STD_MODE	Receive only valid messages(with error will be discarded, filter will be considered) with standard identifier. This is applicable only for functional mode 0
CAN_RECEIVE_VALID_MODE	Receive only valid messages(with error will be discarded, filter will be considered) with extended identifier/standard identifier Based on the configuration

Description

CAN Receive Modes

This enumerates all operating modes of the CAN module. The application should set the desired mode using the PLIB_CAN_ReceiveModeSelect function, and should then use the PLIB_CAN_ReceiveModeGet function to check if the CAN module has entered the requested mode.

CAN_RX_DATA_MODE Enumeration

Enables the Data-only Receive mode or Full Receive mode of a CAN receive channel.

File

plib_can_help.h

C

```
typedef enum {
```

```
  CAN_RX_DATA_ONLY,
  CAN_RX_FULL_RECEIVE
} CAN_RX_DATA_MODE;
```

Members

Members	Description
CAN_RX_DATA_ONLY	CAN Receive Channel Data Only Mode is enabled
CAN_RX_FULL_RECEIVE	CAN Receive Channel Full Receive Mode is enabled

Description

CAN Receive Channel Data Only Mode

This enumeration specifies the status of the CAN receive channel data-only feature. If the feature is enabled, the CAN module will store only the data payload portion of the received CAN message. If the Full Receive mode is specified, the CAN module stores the entire CAN message (ID field plus data payload). The receive channel can be either in Data-Only mode or Full Receive mode.

CAN_RX_MSG_BUFFER Union

Defines the structure of the CAN receive message buffer

File

plib_can.h

C

```
typedef union {
  struct {
    CAN_RX_MSG_SID msgSID;
    CAN_MSG_EID msgEID;
    uint8_t data[8];
  }
  uint8_t dataOnlyMsgData[8];
  uint32_t messageWord[4];
} CAN_RX_MSG_BUFFER;
```

Members

Members	Description
CAN_RX_MSG_SID msgSID;	This is SID portion of the CAN Receive message
CAN_MSG_EID msgEID;	This is EID portion of the CAN Receive message
uint8_t data[8];	This is the data payload section of the received message
uint8_t dataOnlyMsgData[8];	This can be used if the message buffer is to be read from a Data-Only type of CAN Receive Channel
uint32_t messageWord[4];	This is CAN Receive message organized as a set of 32-bit words

Description

CAN Receive Message Buffer

This data structure represents the CAN receive message buffer. Received messages could be either full-receive messages or data-only messages. A full-receive message contains the message header and data payload section. For a full-receive CAN receive channel, the caller should use the msgSID, msgEID and data members. A data-only message contains only an 8-byte data payload. While using this data structure with a data-only type of CAN receive channel, the caller should use the dataOnlyMsgData member of the structure and should read only 8 bytes of data.

CAN_RX_MSG_SID Structure

Defines the structure of the SID word section of the receive message.

File

plib_can.h

C

```
typedef struct {
  unsigned sid : 11;
  unsigned filter_hit : 5;
  unsigned msg_timestamp : 16;
} CAN_RX_MSG_SID;
```

Members

Members	Description
unsigned sid : 11;	SID of the Received CAN Message
unsigned filter_hit : 5;	Filter which accepted this message
unsigned msg_timestamp : 16;	Time stamp of the received message. This is valid only if the Timestamping is enabled

Description

CAN Receive Message SID Word

This data structure represents the SID section of the CAN receive message. The data structure is an element of the CAN_RX_MSG_BUFFER data structure.

CAN_TIME_SEGMENT_LENGTH Enumeration

All possible values for the assignable number of Time Quanta.

File

plib_can_help.h

C

```
typedef enum {
  CAN_TIME_SEGMENT_LEN_8TQ,
  CAN_TIME_SEGMENT_LEN_7TQ,
  CAN_TIME_SEGMENT_LEN_6TQ,
  CAN_TIME_SEGMENT_LEN_5TQ,
  CAN_TIME_SEGMENT_LEN_4TQ,
  CAN_TIME_SEGMENT_LEN_3TQ,
  CAN_TIME_SEGMENT_LEN_2TQ,
  CAN_TIME_SEGMENT_LEN_1TQ
} CAN_TIME_SEGMENT_LENGTH;
```

Members

Members	Description
CAN_TIME_SEGMENT_LEN_8TQ	Segment length is 8 x TQ
CAN_TIME_SEGMENT_LEN_7TQ	Segment length is 7 x TQ
CAN_TIME_SEGMENT_LEN_6TQ	Segment length is 6 x TQ
CAN_TIME_SEGMENT_LEN_5TQ	Segment length is 5 x TQ
CAN_TIME_SEGMENT_LEN_4TQ	Segment length is 4 x TQ
CAN_TIME_SEGMENT_LEN_3TQ	Segment length is 3 x TQ
CAN_TIME_SEGMENT_LEN_2TQ	Segment length is 2 x TQ
CAN_TIME_SEGMENT_LEN_1TQ	Segment length is 1 x TQ

Description

CAN Segment length

This enumeration defines values that can be assigned while defining the number of Time Quanta in a bit.

CAN_TX_CHANNEL_STATUS Enumeration

Identifies possible transmit channel-specific conditions.

File

plib_can_help.h

C

```
typedef enum {
  CAN_TX_CHANNEL_TRANSMITTING,
  CAN_TX_CHANNEL_ERROR,
  CAN_TX_CHANNEL_ARBITRATION_LOST
} CAN_TX_CHANNEL_STATUS;
```

Members

Members	Description
CAN_TX_CHANNEL_TRANSMITTING	CAN Transmit Channel is currently Transmitting.
CAN_TX_CHANNEL_ERROR	CAN Transmit Channel Error has occurred.
CAN_TX_CHANNEL_ARBITRATION_LOST	CAN Transmit Channel lost arbitration.

Description

CAN Transmit Channel Condition

This enumeration identifies the possible transmit channel condition. These masks can be logically ANDed with values returned by the PLIB_CAN_TransmitChannelStatusGet function to check if a condition is active.

CAN_TX_MSG_BUFFER Union

Defines the structure of the CAN transmit message buffer.

File

plib_can.h

C

```
typedef union {
  struct {
    CAN_TX_MSG_SID msgSID;
    CAN_MSG_EID msgEID;
    unsigned char data[8];
  }
  uint32_t messageWord[4];
} CAN_TX_MSG_BUFFER;
```

Members

Members	Description
CAN_TX_MSG_SID msgSID;	This is SID portion of the CAN Transmit message
CAN_MSG_EID msgEID;	This is EID portion of the CAN Transmit message
unsigned char data[8];	This is the data portion of the CAN Transmit message
uint32_t messageWord[4];	This is CAN Transmit message organized as a set of 32 bit words

Description

CAN Transmit Message Buffer

This data structure represents the CAN transmit message buffer. This should be used for writing data to a CAN transmit channel and transmitting data. A pointer to this type of data structure is returned by the PLIB_CAN_TransmitBufferGet function.

The data structure allows the transmit message buffer to be accessed as fields of a CAN transmit message and also as an array of four 32-bit words. The latter allows for quick initialization of the message buffer.

CAN_TX_MSG_SID Structure

Defines the structure of the SID word section of the transmit message.

File

plib_can.h

C

```
typedef struct {
  unsigned sid : 11;
} CAN_TX_MSG_SID;
```

Members

Members	Description
unsigned sid : 11;	CAN Transmit Message Standard ID. This value should be between 0x0 - 0x7FF

Description

CAN Transmit Message SID Word

This data structure represents the SID section of the CAN transmit message. The data structure is an element of the CAN_TX_MSG_BUFFER data structure.

CAN_TX_RTR Enumeration

Specifies the status of the CAN Remote Transmit Request (RTR) feature for a CAN transmit channel.

File

plib_can_help.h

C

```
typedef enum {
  CAN_TX_RTR_ENABLED,
  CAN_TX_RTR_DISABLED
} CAN_TX_RTR;
```

Members

Members	Description
CAN_TX_RTR_ENABLED	CAN Transmit Channel RTR Feature is enabled
CAN_TX_RTR_DISABLED	CAN Transmit Channel RTR Feature is disabled

Description

CAN Transmit Channel Remote Transmit Request (RTR)

This enumeration specifies the status of the CAN RTR feature for a CAN transmit channel. The RTR feature allows a node on the CAN Bus to request a transmission from another node on the bus. The responding node in this case should have a RTR enabled Transmit Channel in order to be able to respond to this request.

CAN_TXCHANNEL_PRIORITY Enumeration

Specifies the priority of a transmit channel.

File

plib_can_help.h

C

```
typedef enum {
  CAN_LOWEST_PRIORITY,
  CAN_LOW_MEDIUM_PRIORITY,
  CAN_HIGH_MEDIUM_PRIORITY,
  CAN_HIGHEST_PRIORITY
} CAN_TXCHANNEL_PRIORITY;
```

Members

Members	Description
CAN_LOWEST_PRIORITY	CAN lowest priority
CAN_LOW_MEDIUM_PRIORITY	CAN low medium priority
CAN_HIGH_MEDIUM_PRIORITY	CAN high medium priority
CAN_HIGHEST_PRIORITY	CAN highest priority

Description

CAN Transmit Channel Priority

This enumeration identifies the available transmit channel priorities. A transmit channel has its own natural priority order, which determines priority when two or more transmit channels are assigned the same priority level. Channel 1 has higher natural priority than channel 0 and channel 2 has a natural priority than channel 1, and so on.

CAN_RX_DATA_ONLY_SIZE_BYTES Macro

Used as the size of the CAN data-only receive message buffer in bytes.

File

plib_can.h

C

```
#define CAN_RX_DATA_ONLY_SIZE_BYTES 8
```

Description

CAN Data-Only Receive Message Buffer

This constant is used as the size of the CAN data-only receive message buffer in bytes.

CAN_TX_RX_MESSAGE_SIZE_BYTES Macro

Used as the array size of the CAN transmit and full receive message buffer.

File

plib_can.h

C

```
#define CAN_TX_RX_MESSAGE_SIZE_BYTES 16
```

Description

CAN Transmit and Receive Message Buffer size

This constant is used as the array size of the CAN transmit and full receive message buffer.

Functions

	Name	Description
	PLIB_CAN_AllChannelEventsGet	Returns a value representing the event status of all CAN channels.
	PLIB_CAN_AllChannelOverflowStatusGet	Returns a value representing the receive overflow event status of all CAN channels.
	PLIB_CAN_BaudRateGet	Returns the current CAN module Baud rate.
	PLIB_CAN_BaudRatePrescaleSetup	Sets the prescale divisor applied to the CAN module's input clock before it is used to determine the CAN baud rate.
	PLIB_CAN_BitSamplePhaseSet	Sets the CAN bit-sampling phase parameters.
	PLIB_CAN_BusActivityWakeupDisable	Disables the wake-up on bus activity receive line filter.
	PLIB_CAN_BusActivityWakeupEnable	Enables the wake-up on bus activity receive line filter.
	PLIB_CAN_BusLine3TimesSamplingDisable	Disables the bus line three times sampling.
	PLIB_CAN_BusLine3TimesSamplingEnable	Enables the bus line three times sampling.
	PLIB_CAN_ChannelEventClear	Clears CAN channel events.
	PLIB_CAN_ChannelEventDisable	Enables channel level events.
	PLIB_CAN_ChannelEventEnable	Enables channel level events.
	PLIB_CAN_ChannelEventGet	Returns a value representing the event status of a CAN channel.
	PLIB_CAN_ChannelForReceiveSet	Configures a CAN channel for receive operation.
	PLIB_CAN_ChannelForTransmitSet	Configures a CAN channel for transmission.
	PLIB_CAN_ChannelReset	Resets a CAN channel.
	PLIB_CAN_ChannelResetIsComplete	Returns 'true' if the specified channel reset is complete.
	PLIB_CAN_ChannelUpdate	Updates the CAN Channel internal pointers.
	PLIB_CAN_DeviceNetConfigure	Configures the CAN module DeviceNet(TM) filter feature.

	PLIB_CAN_Disable	Disables the specified CAN module.
	PLIB_CAN_Enable	Enables the specified CAN module.
	PLIB_CAN_ErrorStateGet	Returns the CAN error status word.
	PLIB_CAN_ExistsActiveStatus	Identifies whether the ActiveStatus feature exists on the CAN module.
	PLIB_CAN_ExistsAllChannelEvents	Identifies whether the AllChannelEvents feature exists on the CAN module.
	PLIB_CAN_ExistsAllChannelOverflow	Identifies whether the AllChannelOverflow feature exists on the CAN module.
	PLIB_CAN_ExistsBaudRateGet	Identifies whether the BaudRateGet feature exists on the CAN module.
	PLIB_CAN_ExistsBaudRatePrescaleSetup	Identifies whether the BaudRatePrescaleSetup feature exists on the CAN module.
	PLIB_CAN_ExistsBitSamplePhaseSet	Identifies whether the BitSamplePhaseSet feature exists on the CAN module.
	PLIB_CAN_ExistsBusActivityWakeup	Identifies whether the BusActivityWakeup feature exists on the CAN module.
	PLIB_CAN_ExistsBusLine3TimesSampling	Identifies whether the BusLine3TimesSampling feature exists on the CAN module.
	PLIB_CAN_ExistsChannelEvent	Identifies whether the ChannelEventGet feature exists on the CAN module.
	PLIB_CAN_ExistsChannelEventEnable	Identifies whether the ChannelEventEnable feature exists on the CAN module.
	PLIB_CAN_ExistsChannelForReceiveSet	Identifies whether the ChannelForReceiveSet feature exists on the CAN module.
	PLIB_CAN_ExistsChannelForTransmitSet	Identifies whether the ChannelForTransmitSet feature exists on the CAN module.
	PLIB_CAN_ExistsChannelReset	Identifies whether the ChannelReset feature exists on the CAN module.
	PLIB_CAN_ExistsChannelUpdate	Identifies whether the ChannelUpdate feature exists on the CAN module.
	PLIB_CAN_ExistsDeviceNet	Identifies whether the DeviceNet feature exists on the CAN module.
	PLIB_CAN_ExistsEnableControl	Identifies whether the EnableControl feature exists on the CAN module.
	PLIB_CAN_ExistsErrorState	Identifies whether the ErrorStateGet feature exists on the CAN module.
	PLIB_CAN_ExistsFilterConfigure	Identifies whether the FilterConfigure feature exists on the CAN module.
	PLIB_CAN_ExistsFilterEnable	Identifies whether the FilterEnable feature exists on the CAN module.
	PLIB_CAN_ExistsFilterMaskConfigure	Identifies whether the FilterMaskConfigure feature exists on the CAN module.
	PLIB_CAN_ExistsFilterToChannelLink	Identifies whether the FilterToChannelLink feature exists on the CAN module.
	PLIB_CAN_ExistsLatestFilterMatchGet	Identifies whether the LatestFilterMatchGet feature exists on the CAN module.
	PLIB_CAN_ExistsMemoryBufferAssign	Identifies whether the MemoryBufferAssign feature exists on the CAN module.
	PLIB_CAN_ExistsModuleEventClear	Identifies whether the ModuleEvents feature exists on the CAN module.
	PLIB_CAN_ExistsModuleEventEnable	Identifies whether the ModuleEventEnable feature exists on the CAN module.
	PLIB_CAN_ExistsModuleInfo	Identifies whether the ModuleInformation feature exists on the CAN module.
	PLIB_CAN_ExistsOperationModeRead	Identifies whether the OperationModeRead feature exists on the CAN module.
	PLIB_CAN_ExistsOperationModeWrite	Identifies whether the OperationModeSet feature exists on the CAN module.
	PLIB_CAN_ExistsPendingEventsGet	Identifies whether the PendingEventsGet feature exists on the CAN module.
	PLIB_CAN_ExistsPendingTransmissionsAbort	Identifies whether the PendingTransmissionsAbort feature exists on the CAN module.
	PLIB_CAN_ExistsPrecalculatedBitRateSetup	Identifies whether the PrecalculatedBitRateSetup feature exists on the CAN module.
	PLIB_CAN_ExistsReceivedMessageGet	Identifies whether the ReceivedMessageGet feature exists on the CAN module.
	PLIB_CAN_ExistsReceiveErrorCount	Identifies whether the ReceiveErrorCount feature exists on the CAN module.
	PLIB_CAN_ExistsStopInIdle	Identifies whether the StopInIdle feature exists on the CAN module.
	PLIB_CAN_ExistsTimeStampEnable	Identifies whether the TimeStampEnable feature exists on the CAN module
	PLIB_CAN_ExistsTimeStampPrescaler	Identifies whether the TimeStampPrescaler feature exists on the CAN module.
	PLIB_CAN_ExistsTimeStampValue	Identifies whether the TimeStampValue feature exists on the CAN module.
	PLIB_CAN_ExistsTransmissionIsAborted	Identifies whether the TransmissionAbortStatus feature exists on the CAN module.
	PLIB_CAN_ExistsTransmitBufferGet	Identifies whether the TransmitBufferGet feature exists on the CAN module.
	PLIB_CAN_ExistsTransmitChannelFlush	Identifies whether the TransmitChannelFlush feature exists on the CAN module.
	PLIB_CAN_ExistsTransmitChannelStatus	Identifies whether the TransmitChannelStatus feature exists on the CAN module.
	PLIB_CAN_ExistsTransmitErrorCountGet	Identifies whether the TransmitErrorCountGet feature exists on the CAN module.
	PLIB_CAN_FilterConfigure	Configures a CAN message acceptance filter.
	PLIB_CAN_FilterDisable	Disables a CAN message acceptance filter.
	PLIB_CAN_FilterEnable	Enables a CAN message acceptance filter.
	PLIB_CAN_FilterIsDisabled	Returns 'true' if the specified filter is disabled.
	PLIB_CAN_FilterMaskConfigure	Configures a CAN filter mask.
	PLIB_CAN_FilterToChannelLink	Links a filter to a channel.
	PLIB_CAN_IsActive	Returns 'true' if the CAN module is active.
	PLIB_CAN_LatestFilterMatchGet	Returns the index of the filter that accepted the latest message.

	PLIB_CAN_MemoryBufferAssign	Assigns buffer memory to the CAN module.
	PLIB_CAN_ModuleEventClear	Clears the CAN module level events.
	PLIB_CAN_ModuleEventDisable	Disables the module level events.
	PLIB_CAN_ModuleEventEnable	Enables the module level events.
	PLIB_CAN_ModuleEventGet	Returns the status of the CAN module events.
	PLIB_CAN_OperationModeGet	Obtains the current CAN operating mode.
	PLIB_CAN_OperationModeSelect	Sets the CAN operating mode.
	PLIB_CAN_PendingEventsGet	Returns a value representing the highest priority active event in the module.
	PLIB_CAN_PendingTransmissionsAbort	Aborts any pending transmit operations.
	PLIB_CAN_PrecalculatedBitRateSetup	Sets the desired Baud rate for the respective CAN module.
	PLIB_CAN_ReceivedMessageGet	Returns a pointer to a message to be read from the CAN channel.
	PLIB_CAN_ReceiveErrorCountGet	Returns the CAN receive error count.
	PLIB_CAN_StopInIdleDisable	Disables the Stop in Idle feature.
	PLIB_CAN_StopInIdleEnable	Enables the CAN module to stop when the processor enters Idle mode.
	PLIB_CAN_TimeStampDisable	Disables the time stamp feature for the CAN module.
	PLIB_CAN_TimeStampEnable	Enables the time stamp feature for the CAN module.
	PLIB_CAN_TimeStampPrescalerSet	Sets the CAN receive message time stamp timer prescaler.
	PLIB_CAN_TimeStampValueGet	Returns the current value of the CAN receive message time stamp timer value.
	PLIB_CAN_TimeStampValueSet	Sets the CAN receive message time stamp timer value.
	PLIB_CAN_TotalChannelsGet	Returns the total number of CAN channels per CAN module.
	PLIB_CAN_TotalFiltersGet	Returns the total number of CAN Filters per CAN module.
	PLIB_CAN_TotalMasksGet	Returns the total number of CAN masks per CAN module.
	PLIB_CAN_TransmissionIsAborted	Returns 'true' if the transmit abort operation is complete.
	PLIB_CAN_TransmitBufferGet	Returns a pointer to an empty transmit buffer.
	PLIB_CAN_TransmitChannelFlush	Causes all messages in the specified transmit channel to be transmitted.
	PLIB_CAN_TransmitChannelStatusGet	Returns the condition of the transmit channel.
	PLIB_CAN_TransmitErrorCountGet	Returns the CAN transmit error count

Macros

	Name	Description
	CAN_RX_DATA_ONLY_SIZE_BYTES	Used as the size of the CAN data-only receive message buffer in bytes.
	CAN_TX_RX_MESSAGE_SIZE_BYTES	Used as the array size of the CAN transmit and full receive message buffer.

Structures

	Name	Description
	CAN_MSG_EID	Defines the structure of the EID word section of the transmit and receive message.
	CAN_RX_MSG_SID	Defines the structure of the SID word section of the receive message.
	CAN_TX_MSG_SID	Defines the structure of the SID word section of the transmit message.

Unions

	Name	Description
	CAN_RX_MSG_BUFFER	Defines the structure of the CAN receive message buffer
	CAN_TX_MSG_BUFFER	Defines the structure of the CAN transmit message buffer.

Description

CAN Peripheral Library Interface Header

This library provides a low-level abstraction of the Controller Area Network (CAN) module on Microchip microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, thus hiding differences between one microcontroller variant and another.

File Name

plib_can.h

Company

Microchip Technology Inc.

plib_can_help.h

This file contains the enumerations for the CAN Peripheral Library help file.

Enumerations

	Name	Description
	CAN_CHANNEL	Identifies the supported CAN Channels.
	CAN_CHANNEL_EVENT	Identifies all Layer 3 interrupts.
	CAN_CHANNEL_MASK	Lists the series of useful masks.
	CAN_DNET_FILTER_SIZE	Specifies the size of the DeviceNet filter.
	CAN_ERROR_STATE	Specifies the CAN module error states.
	CAN_FILTER	CAN event code returned by the CAN module.
	CAN_FILTER_MASK	Identifies the available CAN filter masks.
	CAN_FILTER_MASK_TYPE	Specifies the CAN filter mask type.
	CAN_ID_TYPE	Specifies the CAN ID type.
	CAN_MODULE_EVENT	Specifies the CAN module events
	CAN_MODULE_ID	Enumeration: CAN_MODULE_ID This enumeration defines the number of modules that are available on the microcontroller. This is the super set of all the possible instances that might be available on Microchip microcontrollers. Refer to the specific device data sheet to get the correct number of modules defined for the desired microcontroller.
	CAN_OPERATION_MODES	Lists all possible CAN module operational modes.
	CAN_RECEIVE_CHANNEL	Lists all possible CAN module receive channels.
	CAN_RECEIVE_MODES	Lists all possible CAN module receive modes.
	CAN_RX_DATA_MODE	Enables the Data-only Receive mode or Full Receive mode of a CAN receive channel.
	CAN_TIME_SEGMENT_LENGTH	All possible values for the assignable number of Time Quanta.
	CAN_TX_CHANNEL_STATUS	Identifies possible transmit channel-specific conditions.
	CAN_TX_RTR	Specifies the status of the CAN Remote Transmit Request (RTR) feature for a CAN transmit channel.
	CAN_TXCHANNEL_PRIORITY	Specifies the priority of a transmit channel.

Comparator Peripheral Library

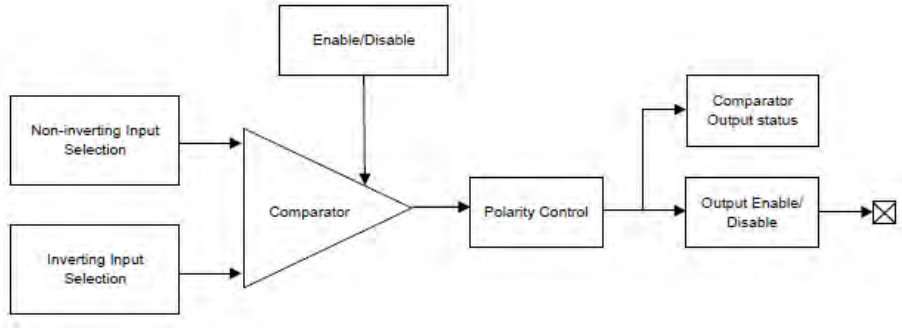
This section describes the Comparator Peripheral Library.

Introduction

The Comparator module is comprised of several identical analog comparator blocks, each complete with its own supporting input selectors and output logic. Each Comparator can be configured in a variety of ways, independent of the other comparators. The input voltage to the module can be either fed externally or it can be configured to use the internal voltage.

Description

This library provides a low-level abstraction of the Comparator module on Microchip microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, thereby abstracting hardware differences from one microcontroller variant to another.



Using the Library

This topic describes the basic architecture of the Comparator Peripheral Library and provides information and examples on its use.

Description

Interface Header File: `plib_cmp.h`

The interface to the Comparator Peripheral Library is defined in the `plib_cmp.h` header file, which is included by the peripheral library header file, `peripheral.h`. Any C language source (`.c`) file that uses the Comparator Peripheral Library must include `peripheral.h`.

Library File:

The Comparator Peripheral Library is part of the processor-specific peripheral library installed with the compiler. This library is automatically available (in the default search path) for any project built using the Microchip compilers.

Peripheral Module IDs

Peripheral libraries are indexed to allow a single library to control any number of instances of a peripheral in a single microcontroller. The first parameter to each operation in a peripheral library is the module instance ID. The module instance ID is defined by an enumeration that is defined in the processor-specific header files (included by the library's interface header). For the Comparator Peripheral Library, the module instance IDs are defined by the Comparator module enumeration.

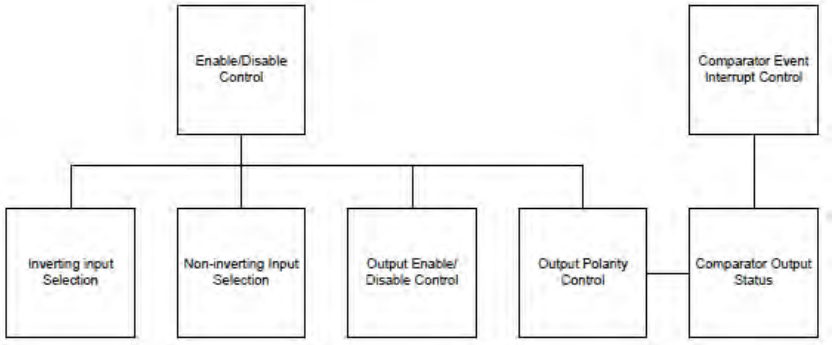
Please refer to the What is MPLAB Harmony? section for information on how the library interacts with the framework.

Hardware Abstraction Model

This library provides a low-level abstraction of the Comparator (CMP) module on Microchip PIC microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Description

Hardware Abstraction Model Diagram



Hardware Abstraction Model Description

The Comparator Peripheral Library provides interface routines to interact with the blocks shown in the previous diagram.

The Comparator VIN+ and VIN- block selects the Comparator non-inverting and inverting inputs, which can be either external or internal inputs.

The Comparator module block compares the voltage level on the inputs and produce an output. If the input VIN+ > VIN-, the output will be high. The output will be low when VIN+ < VIN-.

The Comparator Output Polarity block selects the Comparator output polarity.

The Comparator Output Control block enables/disables the Comparator output pin.

The Comparator Interrupt Logic Control block decide the comparator interrupt generation. The interrupt can happen at Low-to-high, High-to-Low, and for both transitions of the Comparator output.

Library Overview

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the Comparator module

Library Interface Section	Description
General Configuration	Provides the configuration routines for: • Enabling and disabling the module • Enabling and disabling Comparator output • Selecting Comparator input • Comparator status
Comparator Feature Configuration	Provides the configuration routines for various features in the Comparator: • Enabling and disabling Comparator Stop in Idle mode • Selecting Comparator speed/power • Enabling and disabling Comparator hysteresis • Enabling and disabling Comparator filters
Feature Existence Functions	These functions determine whether or not a particular feature is supported by the device.

How the Library Works

The following processes are involved while using a Comparator module:

- CVREF Setup
- Initialization
- Configuring the Comparator interrupt (optional)
- Power-Saving modes
- Turning on the Comparator module

CVREF Setup

This topic describes how to configure the Comparator Voltage Reference (CVREF) if it is to be used as one of the inputs for the Comparator module.

Description

The CVREF is one of the internal voltage references available for the Comparator module, which can be configured for the required voltage value.

Do the following to set up the CVREF:

1. Select the voltage source for CVREF using PLIB_CMP_CVREF_SourceVoltageSelect.
2. Select the CVREF voltage range using PLIB_CMP_CVREF_WideRangeEnable and/or PLIB_CMP_CVREF_WideRangeDisable.
3. Select the CVREF value using PLIB_CMP_CVREF_ValueSelect.
4. Enable or disable the CVREF pin output using PLIB_CMP_CVREF_OutputEnable or PLIB_CMP_CVREF_OutputDisable.
5. Turn on the CVREF module using PLIB_CMP_CVREF_Enable.

Example

```
#define MY_CMP_ID           CMP_ID_1

//Select the CVREF source
PLIB_CMP_CVREF_SourceVoltageSelect(MY_CMP_ID, CMP_CVREF_VOLTAGE_SOURCE_VDD);

//Select the CVREF for wide range
PLIB_CMP_CVREF_WideRangeEnable(MY_CMP_ID);

//Select the CVREF value
PLIB_CMP_CVREF_ValueSelect(MY_CMP_ID, CMP_CVREF_VALUE_15);

//Enable the CVREF output pin
PLIB_CMP_CVREF_OutputEnable(MY_CMP_ID);

//Turn on the CVREF module
PLIB_CMP_CVREF_Enable(MY_CMP_ID);
```

Initialization

This section describes Comparator module initialization.

Description

Do the following when using a Comparator module:

1. Select the Comparator inverting input using PLIB_CMP_InvertingInputChannelSelect.
2. Select the Comparator non-inverting input using PLIB_CMP_NonInvertingInputChannelSelect.
3. Select the Comparator output polarity using PLIB_CMP_OutputInvertEnable and/or PLIB_CMP_OutputInvertDisable.
4. Select the Comparator output pin using PLIB_CMP_OutputEnable and/or PLIB_CMP_OutputDisable.
5. Turn on the Comparator module using PLIB_CMP_Enable.

Example

```
#define MY_CMP_ID           CMP_ID_1

//Select the comparator inverting input
PLIB_CMP_InvertingInputChannelSelect(MY_CMP_INSTANCE,CMP_INVERTING_INPUT_CHANNEL_B);

//Select the comparator non-inverting input
PLIB_CMP_NonInvertingInputChannelSelect(MY_CMP_INSTANCE,CMP_NON_INVERTING_INPUT_A);

//Select the comparator output polarity
 PLIB_CMP_OutputInvertDisable(MY_CMP_INSTANCE);

//Enable the comparator output pin
PLIB_CMP_OutputEnable(MY_CMP_INSTANCE);

//Turn on the comparator module
PLIB_CMP_Enable(MY_CMP_INSTANCE);
```

Configuring the Comparator Interrupts

This section describes the configuration of Comparator module interrupts.

Description

The comparator interrupt can happen for three events. The user must configure the event-detection logic to report changes to the output state of the Comparator, which can in turn be used for event or interrupt generation. The options include event generation on rising state changes (low-to-high), falling state changes (high-to-low), and all state changes. When a configured event occurs, it is flagged by the event detection flag.

The user must clear this flag for the next interrupt generation.

The following step is involved while configuring a Comparator interrupt:

1. Select the Comparator interrupt event using PLIB_CMP_InterruptEventSelect.

Example

```
#define MY_CMP_ID          CMP_ID_1

//This code expects the comparator interrupt
//enabled in the interrupt module

//Select the comparator interrupt event
PLIB_CMP_InterruptEventSelect(MY_CMP_INSTANCE, CMP_LOW_TO_HIGH);

// If the event meets, interrupt will occur. Do the respective
   operation in the ISR and clear the interrupt flag.
```

Note: Not all functionality is available on all devices. Please refer to the specific device data sheet for availability.

Power-Saving Modes

This section provides information on the Power-Saving modes for the Comparator module.

Description

Operation in Sleep mode: If the Comparator interrupt is enabled, the device will wake up from Sleep mode on the Comparator interrupt. If the Comparator interrupt is disabled,the comparator will work, but it will not wake up the device from sleep.

Operation in Idle mode: The functions PLIB_CMP_StopInIdleModeEnable and PLIB_CMP_StopInIdleModeDisable determine if the Comparator module stops or continues operation in Idle mode. If the function PLIB_CMP_StopInIdleModeDisable is used, the module will continue operation in the Idle mode. If the Comparator interrupt is enabled, the device will wake up from Idle mode on the Comparator interrupt. If the function PLIB_CMP_StopInIdleModeEnable is used, the module will work in Idle mode but the interrupt will not generate if it is enabled.

#	Description	Function Associated
1	Enable Comparator Stop in Idle mode.	PLIB_CMP_StopInIdleModeEnable
2	Disable Comparator Stop in Idle mode.	PLIB_CMP_StopInIdleModeDisable

Example

```
//Select comparator stop in idle mode
PLIB_CMP_StopInIdleModeEnable(MY_CMP_INSTANCE);
```

Note: Not all functionality is available on all devices. Please refer to the specific device data sheet for availability.

Configuring the Library

The library is configured for the supported Comparator module when the processor is chosen in the MPLAB X IDE.

Library Interface

a) General Configuration Functions

	Name	Description
	PLIB_CMP_CVREF_BandGapReferenceSourceSelect	Selects the band gap reference voltage source.
	PLIB_CMP_CVREF_Enable	Enables the voltage reference of the Comparator module.
	PLIB_CMP_CVREF_OutputDisable	Disables the output voltage.
	PLIB_CMP_CVREF_OutputEnable	Enables the voltage output.
	PLIB_CMP_CVREF_ReferenceVoltageSelect	Selects the voltage reference value, CVref.
	PLIB_CMP_CVREF_SourceNegativeInputSelect	Configures the Comparator module to use the selected input as a negative reference.
	PLIB_CMP_CVREF_SourceVoltageSelect	Connects the Comparator module to the selected voltage source.
	PLIB_CMP_CVREF_ValueSelect	Selects the voltage reference value.
	PLIB_CMP_CVREF_WideRangeDisable	Disables the wide range.
	PLIB_CMP_CVREF_WideRangeEnable	Enables the wide range.

	PLIB_CMP_CVREF_WideRangeIsEnabled	Returns whether the wide range is selected for the reference voltage.
	PLIB_CMP_CVREF_Disable	Disables the voltage reference of the Comparator module.
	PLIB_CMP_Disable	Disables the Comparator module.
	PLIB_CMP_Enable	Enables the Comparator module.
	PLIB_CMP_InterruptEventSelect	Comparator interrupt event select.
	PLIB_CMP_InvertingInputChannelSelect	Comparator inverting input channel select.
	PLIB_CMP_NonInvertingInputChannelSelect	Comparator input channel select.
	PLIB_CMP_OutputDisable	Disables the Comparator output.
	PLIB_CMP_OutputEnable	Enables the Comparator output.
	PLIB_CMP_OutputStatusGet	Comparator output status.
	PLIB_CMP_OutputInvertDisable	Comparator output is non-inverted.
	PLIB_CMP_OutputInvertEnable	Comparator output is inverted.
	PLIB_CMP_OutputLogicHigh	Comparator output bit will give a 'logic high' on satisfying the input condition.
	PLIB_CMP_OutputLogicLow	Comparator will be set to give 'logic low' on satisfying the input condition.

b) Comparator Feature Configuration Functions

	Name	Description
	PLIB_CMP_StopInIdleModeDisable	Disables Stop in Idle mode.
	PLIB_CMP_StopInIdleModeEnable	Enables Stop in Idle mode.

c) Feature Existence Functions

	Name	Description
	PLIB_CMP_ExistsCVREFBGRefVoltageRangeSelect	Identifies whether the CVREFBGRefVoltageRangeSelect feature exists on the CMP module.
	PLIB_CMP_ExistsCVREFEnableControl	Identifies whether the CVREFEnableControl feature exists on the CMP module.
	PLIB_CMP_ExistsCVREFOutputEnableControl	Identifies whether the CVREFOutputEnableControl feature exists on the CMP module.
	PLIB_CMP_ExistsCVREFRefVoltageRangeSelect	Identifies whether the CVREFRefVoltageRangeSelect feature exists on the CMP module.
	PLIB_CMP_ExistsCVREFValueSelect	Identifies whether the CVREFValueSelect feature exists on the CMP module.
	PLIB_CMP_ExistsCVREFVoltageRangeSelect	Identifies whether the CVREFVoltageRangeSelect feature exists on the CMP module.
	PLIB_CMP_ExistsCVREFWideRangeControl	Identifies whether the CVREFWideRangeControl feature exists on the CMP module.
	PLIB_CMP_ExistsEnableControl	Identifies whether the ComparatorEnableControl feature exists on the CMP module.
	PLIB_CMP_ExistsInterruptEventSelect	Identifies whether the InterruptEventSelect feature exists on the CMP module.
	PLIB_CMP_ExistsInvertingInputSelect	Identifies whether the InvertingInputSelect feature exists on the CMP module.
	PLIB_CMP_ExistsInvertOutputControl	Identifies whether the InvertOutputSelectControl feature exists on the CMP module.
	PLIB_CMP_ExistsNonInvertingInputSelect	Identifies whether the NonInvertingInputSelect feature exists on the CMP module.
	PLIB_CMP_ExistsOutputEnableControl	Identifies whether the ComparatorOutputEnableControl feature exists on the CMP module.
	PLIB_CMP_ExistsOutputLevelControl	Identifies whether the OutputLevelSelectControl feature exists on the CMP module.
	PLIB_CMP_ExistsStopInIdle	Identifies whether the StopInIdle feature exists on the CMP module.
	PLIB_CMP_ExistsOutputStatusGet	Identifies whether the OutputStatusGet feature exists on the CMP module.

d) Data Types and Constants

	Name	Description
	CMP_CLOCK_DIVIDE	Defines Comparator Filter Clock Divide.
	CMP_CVREF_BANDGAP_SELECT	Lists the band gap selection options.
	CMP_CVREF_REFERENCE_SELECT	Lists the reference selection options.

	CMP_CVREF_VALUE	Lists the voltage reference value selection options.
	CMP_CVREF_VOLTAGE_SOURCE	Lists the Voltage source options.
	CMP_FILTER_CLOCK	Defines Comparator filter input clock
	CMP_INTERRUPT_EVENT	Defines Comparator interrupt events.
	CMP_INVERTING_INPUT	Defines the list of Comparator inverting Input.
	CMP_MASK_A	Defines Comparator Mask A Input.
	CMP_MASK_B	Defines Comparator Mask B Input.
	CMP_MASK_C	Defines Comparator Mask C Input.
	CMP_MODULE_ID	Identifies the Comparator modules supported
	CMP_NON_INVERTING_INPUT	Defines the list of Comparator non-inverting Input.
	CMP_SPEED_POWER	Defines the Speed/Power of the Comparator

Description

This section describes the Application Programming Interface (API) functions of the Comparator Peripheral Library.

Refer to each section for a detailed description.

a) General Configuration Functions

PLIB_CMP_CVREF_BandGapReferenceSourceSelect Function

Selects the band gap reference voltage source.

File

plib_cmp.h

C

```
void PLIB_CMP_CVREF_BandGapReferenceSourceSelect(CMP_MODULE_ID index, CMP_CVREF_BANDGAP_SELECT select);
```

Returns

None.

Description

This function selects the band gap reference voltage source from the available options from CMP_CVREF_BANDGAP_SELECT.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CMP_ExistsCVREFBGRefVoltageRangeSelect in your application to determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_CMP_CVREF_BandGapReferenceSourceSelect ( CMP_ID_1,  CMP_CVREF_BANDGAP_0_6V );
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
select	Select a band gap reference source from CMP_CVREF_BANDGAP_SELECT

Function

void PLIB_CMP_CVREF_BandGapReferenceSourceSelect (CMP_MODULE_ID index,
CMP_CVREF_BANDGAP_SELECT bandGap);

PLIB_CMP_CVREF_Enable Function

Enables the voltage reference of the Comparator module.

File

plib_cmp.h

C

```
void PLIB_CMP_CVREF_Enable(CMP_MODULE_ID index);
```

Returns

None.

Description

This function enables the voltage reference of the Comparator module.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CMP_CVREF_ExistsCVREFEnableControl in your application to determine whether this feature is available.

Preconditions

The Comparator module should be appropriately configured before being enabled.

Example

```
PLIB_CMP_CVREF_Enable ( CMP_ID_1 );
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_CMP_CVREF_Enable (CMP_CVREF_MOD index)

PLIB_CMP_CVREF_OutputDisable Function

Disables the output voltage.

File

plib_cmp.h

C

```
void PLIB_CMP_CVREF_OutputDisable(CMP_MODULE_ID index);
```

Returns

None.

Description

This function disables the reference voltage output.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CMP_CVREF_ExistsCVREFOutputEnableControl in your application to determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_CMP_CVREF_OutputDisable ( CMP_ID_1 );
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_CMP_CVREF_OutputDisable (CMP_MODULE_ID index)

PLIB_CMP_CVREF_OutputEnable Function

Enables the voltage output.

File

plib_cmp.h

C

```
void PLIB_CMP_CVREF_OutputEnable(CMP_MODULE_ID index);
```

Returns

None.

Description

This function enables the voltage output

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CMP_CVREF_ExistsCVREFOutputEnableControl in your application to determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_CMP_CVREF_OutputEnable(CMP_ID_1);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_CMP_CVREF_OutputEnable (CMP_MODULE_ID index)

PLIB_CMP_CVREF_ReferenceVoltageSelect Function

Selects the voltage reference value, CVref.

File

plib_cmp.h

C

```
void PLIB_CMP_CVREF_ReferenceVoltageSelect(CMP_MODULE_ID index, CMP_CVREF_REFERENCE_SELECT reference);
```

Returns

None.

Description

This function selects the voltage reference value, CVref. This value decides which voltage source should be taken as reference voltage from the set CMP_CVREF_REFERENCE_SELECT.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CMP_ExistsCVREFRefVoltageRangeSelect in your application to determine whether this feature is available.

Preconditions

Determine the correct value that should be passed.

Example

```
PLIB_CMP_CVREF_ReferenceVoltageSelect ( CMP_ID_1,  CMP_CVREF_RESISTOR_LADDER_VOLTAGE );
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
value	Select value from CMP_CVREF_REFERENCE_SELECT

Function

void PLIB_CMP_CVREF_ReferenceVoltageSelect (CMP_MODULE_ID index,
CMP_CVREF_REFERENCE_SELECT reference);

PLIB_CMP_CVREF_SourceNegativeInputSelect Function

Configures the Comparator module to use the selected input as a negative reference.

File

plib_cmp.h

C

```
void PLIB_CMP_CVREF_SourceNegativeInputSelect(CMP_MODULE_ID index, CMP_CVREF_VOLTAGE_SOURCE_NEG_REFERENCE
negInput);
```

Returns

None.

Description

This function configures the Comparator module to use the selected input as a negative reference for the voltage source.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability. For such devices, selecting the positive source will automatically select the negative input.

Preconditions

None.

Example

```
PLIB_CMP_CVREF_SourceNegativeInputSelect ( CMP_ID_1, CMP_CVREF_VOLTAGE_SOURCE_NEG_REF_GROUND );
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
negInput	Select the voltage source negative reference from CMP_CVREF_VOLTAGE_SOURCE_NEG_REFERENCE

Function

void PLIB_CMP_CVREF_SourceNegativeInputSelect (CMP_MODULE_ID index,
CMP_CVREF_VOLTAGE_SOURCE_NEG_REFERENCE negInput)

PLIB_CMP_CVREF_SourceVoltageSelect Function

Connects the Comparator module to the selected voltage source.

File

plib_cmp.h

C

```
void PLIB_CMP_CVREF_SourceVoltageSelect(CMP_MODULE_ID index, CMP_CVREF_VOLTAGE_SOURCE source);
```

Returns

None.

Description

This function connects the Comparator module to the selected voltage source.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CMP_CVREF_ExistsCVREFVoltageRangeSelect in your application to determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_CMP_CVREF_SourceVoltageSelect ( CMP_ID_1, CMP_CVREF_VOLTAGE_SOURCE_INTERNAL );
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
source	Select the voltage source from CMP_CVREF_VOLTAGE_SOURCE

Function

void PLIB_CMP_CVREF_SourceVoltageSelect (CMP_MODULE_ID index, CMP_CVREF_VOLTAGE_SOURCE source)

PLIB_CMP_CVREF_ValueSelect Function

Selects the voltage reference value.

File

plib_cmp.h

C

```
void PLIB_CMP_CVREF_ValueSelect(CMP_MODULE_ID index, CMP_CVREF_VALUE value);
```

Returns

None.

Description

This function selects the voltage reference value. This value decides how many resistance units will be added and therefore, decides the output voltage.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CMP_CVREF_ExistsCVREFValueSelect in your application to determine whether this feature is available.

Preconditions

Determine the correct value that should be passed.

Example

```
PLIB_CMP_CVREF_ValueSelect ( CMP_ID_1,  CMP_CVREF_VALUE_13 );
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
value	Select value from CMP_CVREF_VALUE

Function

void PLIB_CMP_CVREF_ValueSelect (CMP_MODULE_ID index,
CMP_CVREF_VALUE value);

PLIB_CMP_CVREF_WideRangeDisable Function

Disables the wide range.

File

plib_cmp.h

C

```
void PLIB_CMP_CVREF_WideRangeDisable(CMP_MODULE_ID index);
```

Returns

None.

Description

This function disables the wide range for reference voltage. The range of possible voltages will become narrower, and finer voltage options can be achieved in this case.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CMP_CVREF_ExistsCVREFWideRangeControl in your application to determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_CMP_CVREF_WideRangeDisable ( CMP_ID_1 );
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_CMP_CVREF_WideRangeDisable (CMP_MODULE_ID index)

PLIB_CMP_CVREF_WideRangeEnable Function

Enables the wide range.

File

plib_cmp.h

C

```
void PLIB_CMP_CVREF_WideRangeEnable(CMP_MODULE_ID index);
```

Returns

None.

Description

This function enables the wide range for reference voltage. The voltage range starts from zero if the wide range is selected.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CMP_CVREF_ExistsCVREFWideRangeControl in your application to determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_CMP_CVREF_WideRangeEnable(CMP_ID_1);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_CMP_CVREF_WideRangeEnable (CMP_MODULE_ID index)

PLIB_CMP_CVREF_WideRangeIsEnabled Function

Returns whether the wide range is selected for the reference voltage.

File

plib_cmp.h

C

```
bool PLIB_CMP_CVREF_WideRangeIsEnabled(CMP_MODULE_ID index);
```

Returns

- true = The wide range is enabled
- false = The wide range is not enabled

Description

This function returns whether the wide range is enabled.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CMP_CVREF_ExistsCVREFWideRangeControl in your application to determine whether this feature is available.

Preconditions

None.

Example

```
bool range;

range = PLIB_CMP_CVREF_WideRangeIsEnabled ( MY_CMP_CVREF_ID );
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

bool PLIB_CMP_CVREF_WideRangeIsEnabled (CMP_MODULE_ID index);

PLIB_CMP_CVREF_Disable Function

Disables the voltage reference of the Comparator module.

File

plib_cmp.h

C

```
void PLIB_CMP_CVREF_Disable(CMP_MODULE_ID index);
```

Returns

None.

Description

This function disables the voltage reference of the Comparator module.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CMP_CVREF_ExistsCVREFEnableControl in your application to determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_CMP_CVREF_Disable ( CMP_ID_1 );
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_CMP_CVREF_Disable (CMP_MODULE_ID index)

PLIB_CMP_Disable Function

Disables the Comparator module.

File

plib_cmp.h

C

```
void PLIB_CMP_Disable(CMP_MODULE_ID index);
```

Returns

None.

Description

This function disables (turns OFF) the selected Comparator module.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CMP_ExistsEnableControl in your application to determine whether this feature is available.

Preconditions

None.

Example

```
#define MY_CMP_INSTANCE   CMP_ID_1

// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the
// application developer.
PLIB_CMP_Disable ( MY_CMP_INSTANCE );
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_CMP_Disable (CMP_MODULE_ID index)

PLIB_CMP_Enable Function

Enables the Comparator module.

File

plib_cmp.h

C

```
void PLIB_CMP_Enable(CMP_MODULE_ID index);
```

Returns

None.

Description

This function enables (turns ON) the selected Comparator module.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CMP_ExistsEnableControl in your application to determine whether this feature is available.

Preconditions

None.

Example

```
#define MY_CMP_INSTANCE   CMP_ID_1

// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the
// application developer.
PLIB_CMP_Enable ( MY_CMP_INSTANCE );
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_CMP_Enable (CMP_MODULE_ID index)

PLIB_CMP_InterruptEventSelect Function

Comparator interrupt event select.

File

plib_cmp.h

C

```
void PLIB_CMP_InterruptEventSelect(CMP_MODULE_ID index, CMP_INTERRUPT_EVENT event);
```

Returns

None.

Description

This function will select when the Comparator interrupt should occur.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CMP_ExistsInterruptEventSelect in your application to determine whether this feature is available.

Preconditions

None.

Example

```
#define MY_CMP_INSTANCE   CMP_ID_1

// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the
// application developer.
// CMP_INTERRUPT_EVENT - CMP_LOW_TO_HIGH
PLIB_CMP_InterruptEventSelect ( MY_CMP_INSTANCE,
                        CMP_INTERRUPT_GENERATION_LOW_TO_HIGH );
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
event	One of the possible values from CMP_INTERRUPT_EVENT

Function

void PLIB_CMP_InterruptEventSelect (CMP_MODULE_ID index, CMP_INTERRUPT_EVENT event)

PLIB_CMP_InvertingInputChannelSelect Function

Comparator inverting input channel select.

File

plib_cmp.h

C

```
void PLIB_CMP_InvertingInputChannelSelect(CMP_MODULE_ID index, CMP_INVERTING_INPUT channel);
```

Returns

None.

Description

This function will select the inverting input channels for the Comparator.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CMP_ExistsInvertingInputSelect in your application to determine whether this feature is available.

Preconditions

None.

Example

```
#define MY_CMP_INSTANCE   CMP_ID_1

// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the
// application developer.
 PLIB_CMP_InvertingInputChannelSelect ( MY_CMP_INSTANCE,
                            CMP_INVERTING_INPUT_IVREF );
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	One of the possible values from CMP_INVERTING_INPUT

Function

void PLIB_CMP_InvertingInputChannelSelect (CMP_MODULE_ID index,
CMP_INVERTING_INPUT channel)

PLIB_CMP_NonInvertingInputChannelSelect Function

Comparator input channel select.

File

plib_cmp.h

C

```
void PLIB_CMP_NonInvertingInputChannelSelect(CMP_MODULE_ID index, CMP_NON_INVERTING_INPUT input);
```

Returns

None.

Description

This function will select the non-inverting input channels for the Comparator.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use

PLIB_CMP_ExistsNonInvertingInputSelect in your application to determine whether this feature is available.s

Preconditions

None.

Example

```
#define MY_CMP_INSTANCE   CMP_ID_1

// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the
// application developer.
PLIB_CMP_NonInvertingInputChannelSelect ( MY_CMP_INSTANCE, CMP_NON_INVERTING_INPUT_CVREF );
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	One of the possible values from CMP_NON_INVERTING_INPUT

Function

void PLIB_CMP_NonInvertingInputChannelSelect (CMP_MODULE_ID index,
CMP_NON_INVERTING_INPUT input)

PLIB_CMP_OutputDisable Function

Disables the Comparator output.

File

plib_cmp.h

C

```
void PLIB_CMP_OutputDisable(CMP_MODULE_ID index);
```

Returns

None.

Description

This function disables (turns OFF) the Comparator output.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CMP_ExistsOutputEnableControl in your application to determine whether this feature is available.

Preconditions

None.

Example

```
#define MY_CMP_INSTANCE   CMP_ID_1

// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the
// application developer.
PLIB_CMP_OutputDisable ( MY_CMP_INSTANCE );
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_CMP_OutputDisable (CMP_MODULE_ID index)

PLIB_CMP_OutputEnable Function

Enables the Comparator output.

File

plib_cmp.h

C

```
void PLIB_CMP_OutputEnable(CMP_MODULE_ID index);
```

Returns

None.

Description

This function enables (turns ON) the Comparator output.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CMP_ExistsOutputEnableControl in your application to determine whether this feature is available.

Preconditions

None.

Example

```
#define MY_CMP_INSTANCE   CMP_ID_1

// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the
// application developer.
PLIB_CMP_OutputEnable( MY_CMP_INSTANCE );
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_CMP_OutputEnable (CMP_MODULE_ID index)

PLIB_CMP_OutputStatusGet Function

Comparator output status.

File

plib_cmp.h

C

```
bool PLIB_CMP_OutputStatusGet(CMP_MODULE_ID index);
```

Returns

- true - The status flag is set
- false - The status flag is clear

Description

This function will return the current status of the Comparator output.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Preconditions

None.

Example

```
#define MY_CMP_INSTANCE   CMP_ID_1
bool cmp_status;

// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the
// application developer.
```

```
cmp_status=PLIB_CMP_OutputStatusGet ( MY_CMP_INSTANCE );
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

bool PLIB_CMP_OutputStatusGet (CMP_MODULE_ID index)

PLIB_CMP_OutputInvertDisable Function

Comparator output is non-inverted.

File

plib_cmp.h

C

```
void PLIB_CMP_OutputInvertDisable(CMP_MODULE_ID index);
```

Returns

None.

Description

This function will select the non-inverted comparator output.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CMP_ExistsOutputEnableControlExistsInvertOutputControl in your application to determine whether this feature is available.

Preconditions

None.

Example

```
#define MY_CMP_INSTANCE   CMP_ID_1

// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the
// application developer.
PLIB_CMP_OutputInvertDisable ( MY_CMP_INSTANCE );
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_CMP_OutputInvertDisable (CMP_MODULE_ID index)

PLIB_CMP_OutputInvertEnable Function

Comparator output is inverted.

File

plib_cmp.h

C

```
void PLIB_CMP_OutputInvertEnable(CMP_MODULE_ID index);
```

Returns

None.

Description

Calling this function will set the comparator to make its output inverted.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CMP_ExistsOutputEnableControlExistsInvertOutputControl in your application to determine whether this feature is available.

Setting this bit will invert the signal to the comparator interrupt generator as well. This will result in an interrupt being generated on the opposite edge from the one selected by PLIB_CMP_InterruptEventSelect function.

Preconditions

None.

Example

```
#define MY_CMP_INSTANCE   CMP_ID_1

// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the
// application developer.
PLIB_CMP_OutputDisable ( MY_CMP_INSTANCE );
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_CMP_OutputInvertEnable (CMP_MODULE_ID index)

PLIB_CMP_OutputLogicHigh Function

Comparator output bit will give a 'logic high' on satisfying the input condition.

File

plib_cmp.h

C

```
void PLIB_CMP_OutputLogicHigh(CMP_MODULE_ID index);
```

Returns

None.

Description

Calling this API will set the Comparator module to output a 'logic high' on satisfying the input condition.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CMP_ExistsOutputLevelControl in your application to determine whether this feature is available.

Preconditions

None.

Example

```
#define MY_CMP_INSTANCE   CMP_ID_1

// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the
// application developer.
PLIB_CMP_OutputLogicHigh ( MY_CMP_INSTANCE );
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_CMP_OutputLogicHigh (CMP_MODULE_ID index)

PLIB_CMP_OutputLogicLow Function

Comparator will be set to give 'logic low' on satisfying the input condition.

File

plib_cmp.h

C

```
void PLIB_CMP_OutputLogicLow(CMP_MODULE_ID index);
```

Returns

None.

Description

This function will set the Comparator to give 'logic low' on satisfying the input condition.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CMP_ExistsOutputLevelControl in your application to determine whether this feature is available.

Preconditions

None.

Example

```
#define MY_CMP_INSTANCE   CMP_ID_1

// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the
// application developer.
PLIB_CMP_OutputLogicLow( MY_CMP_INSTANCE );
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_CMP_OutputLogicLow (CMP_MODULE_ID index)

b) Comparator Feature Configuration Functions

PLIB_CMP_StopInIdleModeDisable Function

Disables Stop in Idle mode.

File

plib_cmp.h

C

```
void PLIB_CMP_StopInIdleModeDisable(CMP_MODULE_ID index);
```

Returns

None.

Description

This function will continue operation of all enabled comparators when the device enters Idle mode.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CMP_ExistsStopInIdle in your application to determine whether this feature is available.

Preconditions

None.

Example

```
#define MY_CMP_INSTANCE   CMP_ID_1

// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the
// application developer.
PLIB_CMP_StopInIdleModeDisable ( MY_CMP_INSTANCE );
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_CMP_StopInIdleModeDisable (CMP_MODULE_ID index)

PLIB_CMP_StopInIdleModeEnable Function

Enables Stop in Idle mode.

File

plib_cmp.h

C

```
void PLIB_CMP_StopInIdleModeEnable(CMP_MODULE_ID index);
```

Returns

None.

Description

This function will discontinue operation of all comparators when the device enters Idle mode.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CMP_ExistsStopInIdle in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the
// application developer.
PLIB_CMP_StopInIdleModeEnable ( MY_CMP_INSTANCE );
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_CMP_StopInIdleModeEnable (CMP_MODULE_ID index)

c) Feature Existence Functions

PLIB_CMP_ExistsCVREFBGRefVoltageRangeSelect Function

Identifies whether the CVREFBGRefVoltageRangeSelect feature exists on the CMP module.

File

plib_cmp.h

C

```
bool PLIB_CMP_ExistsCVREFBGRefVoltageRangeSelect(CMP_MODULE_ID index);
```

Returns

- true - The CVREFBGRefVoltageRangeSelect feature is supported on the device
- false - The CVREFBGRefVoltageRangeSelect feature is not supported on the device

Description

This function identifies whether the CVREFBGRefVoltageRangeSelect feature is available on the CMP module. When this function returns true, this function is supported on the device:

- PLIB_CMP_CVREF_BandGapReferenceSourceSelect

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CMP_ExistsCVREFBGRefVoltageRangeSelect(CMP_MODULE_ID index)

PLIB_CMP_ExistsCVREFEnableControl Function

Identifies whether the CVREFEnableControl feature exists on the CMP module.

File

plib_cmp.h

C

```
bool PLIB_CMP_ExistsCVREFEnableControl(CMP_MODULE_ID index);
```

Returns

- true - The CVREFEnableControl feature is supported on the device
- false - The CVREFEnableControl feature is not supported on the device

Description

This function identifies whether the CVREFEnableControl feature is available on the CMP module. When this function returns true, these functions are supported on the device:

- PLIB_CMP_CVREF_Enable
- PLIB_CMP_CVREF_Disable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CMP_ExistsCVREFEnableControl(CMP_MODULE_ID index)

PLIB_CMP_ExistsCVREFOutputEnableControl Function

Identifies whether the CVREFOutputEnableControl feature exists on the CMP module.

File

plib_cmp.h

C

```
bool PLIB_CMP_ExistsCVREFOutputEnableControl(CMP_MODULE_ID index);
```

Returns

- true - The CVREFOutputEnableControl feature is supported on the device
- false - The CVREFOutputEnableControl feature is not supported on the device

Description

This function identifies whether the CVREFOutputEnableControl feature is available on the CMP module. When this function returns true, these functions are supported on the device:

- PLIB_CMP_CVREF_OutputEnable
- PLIB_CMP_CVREF_OutputDisable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CMP_ExistsCVREFOutputEnableControl(CMP_MODULE_ID index)

PLIB_CMP_ExistsCVREFRefVoltageRangeSelect Function

Identifies whether the CVREFRefVoltageRangeSelect feature exists on the CMP module.

File

plib_cmp.h

C

```
bool PLIB_CMP_ExistsCVREFRefVoltageRangeSelect(CMP_MODULE_ID index);
```

Returns

- true - The CVREFRefVoltageRangeSelect feature is supported on the device
- false - The CVREFRefVoltageRangeSelect feature is not supported on the device

Description

This function identifies whether the CVREFRefVoltageRangeSelect feature is available on the CMP module. When this function returns true, this function is supported on the device:

- PLIB_CMP_CVREF_ReferenceVoltageSelect

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CMP_ExistsCVREFRefVoltageRangeSelect(CMP_MODULE_ID index)

PLIB_CMP_ExistsCVREFValueSelect Function

Identifies whether the CVREFValueSelect feature exists on the CMP module.

File

plib_cmp.h

C

```
bool PLIB_CMP_ExistsCVREFValueSelect(CMP_MODULE_ID index);
```

Returns

- true - The CVREFValueSelect feature is supported on the device
- false - The CVREFValueSelect feature is not supported on the device

Description

This function identifies whether the CVREFValueSelect feature is available on the CMP module. When this function returns true, this function is supported on the device:

- PLIB_CMP_CVREF_ValueSelect

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CMP_ExistsCVREFValueSelect(CMP_MODULE_ID index)

PLIB_CMP_ExistsCVREFVoltageRangeSelect Function

Identifies whether the CVREFVoltageRangeSelect feature exists on the CMP module.

File

plib_cmp.h

C

```
bool PLIB_CMP_ExistsCVREFVoltageRangeSelect(CMP_MODULE_ID index);
```

Returns

- true - The CVREFVoltageRangeSelect feature is supported on the device
- false - The CVREFVoltageRangeSelect feature is not supported on the device

Description

This function identifies whether the CVREFVoltageRangeSelect feature is available on the CMP module. When this function returns true, this function is supported on the device:

- PLIB_CMP_CVREF_SourceVoltageSelect

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CMP_ExistsCVREFVoltageRangeSelect(CMP_MODULE_ID index)

PLIB_CMP_ExistsCVREFWideRangeControl Function

Identifies whether the CVREFWideRangeControl feature exists on the CMP module.

File

plib_cmp.h

C

```
bool PLIB_CMP_ExistsCVREFWideRangeControl(CMP_MODULE_ID index);
```

Returns

- true - The CVREFWideRangeControl feature is supported on the device
- false - The CVREFWideRangeControl feature is not supported on the device

Description

This function identifies whether the CVREFWideRangeControl feature is available on the CMP module. When this function returns true, these functions are supported on the device:

- PLIB_CMP_CVREF_WideRangeEnable
- PLIB_CMP_CVREF_WideRangeDisable
- PLIB_CMP_CVREF_WideRangeIsEnabled

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CMP_ExistsCVREFWideRangeControl(CMP_MODULE_ID index)

PLIB_CMP_ExistsEnableControl Function

Identifies whether the ComparatorEnableControl feature exists on the CMP module.

File

plib_cmp.h

C

```
bool PLIB_CMP_ExistsEnableControl(CMP_MODULE_ID index);
```

Returns

- true - The ComparatorEnableControl feature is supported on the device
- false - The ComparatorEnableControl feature is not supported on the device

Description

This function identifies whether the ComparatorEnableControl feature is available on the CMP module. When this function returns true, these

functions are supported on the device:

- PLIB_CMP_Enable
- PLIB_CMP_Disable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CMP_ExistsEnableControl(CMP_MODULE_ID index)

PLIB_CMP_ExistsInterruptEventSelect Function

Identifies whether the InterruptEventSelect feature exists on the CMP module.

File

plib_cmp.h

C

```
bool PLIB_CMP_ExistsInterruptEventSelect(CMP_MODULE_ID index);
```

Returns

- true - The InterruptEventSelect feature is supported on the device
- false - The InterruptEventSelect feature is not supported on the device

Description

This function identifies whether the InterruptEventSelect feature is available on the CMP module. When this function returns true, this function is supported on the device:

- PLIB_CMP_InterruptEventSelect

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CMP_ExistsInterruptEventSelect(CMP_MODULE_ID index)

PLIB_CMP_ExistsInvertingInputSelect Function

Identifies whether the InvertingInputSelect feature exists on the CMP module.

File

plib_cmp.h

C

```
bool PLIB_CMP_ExistsInvertingInputSelect(CMP_MODULE_ID index);
```

Returns

- true - The InvertingInputSelect feature is supported on the device

- false - The InvertingInputSelect feature is not supported on the device

Description

This function identifies whether the InvertingInputSelect feature is available on the CMP module. When this function returns true, this function is supported on the device:

- PLIB_CMP_InvertingInputChannelSelect

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CMP_ExistsInvertingInputSelect(CMP_MODULE_ID index)

PLIB_CMP_ExistsInvertOutputControl Function

Identifies whether the InvertOutputSelectControl feature exists on the CMP module.

File

plib_cmp.h

C

```
bool PLIB_CMP_ExistsInvertOutputControl(CMP_MODULE_ID index);
```

Returns

- true - The InvertOutputSelectControl feature is supported on the device
- false - The InvertOutputSelectControl feature is not supported on the device

Description

This function identifies whether the InvertOutputSelectControl feature is available on the CMP module. When this function returns true, these functions are supported on the device:

- PLIB_CMP_OutputInvertEnable
- PLIB_CMP_OutputInvertDisable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CMP_ExistsInvertOutputControl(CMP_MODULE_ID index)

PLIB_CMP_ExistsNonInvertingInputSelect Function

Identifies whether the NonInvertingInputSelect feature exists on the CMP module.

File

plib_cmp.h

C

```
bool PLIB_CMP_ExistsNonInvertingInputSelect(CMP_MODULE_ID index);
```

Returns

- true - The NonInvertingInputSelect feature is supported on the device
- false - The NonInvertingInputSelect feature is not supported on the device

Description

This function identifies whether the NonInvertingInputSelect feature is available on the CMP module. When this function returns true, this function is supported on the device:

- PLIB_CMP_NonInvertingInputChannelSelect

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CMP_ExistsNonInvertingInputSelect(CMP_MODULE_ID index)

PLIB_CMP_ExistsOutputEnableControl Function

Identifies whether the ComparatorOutputEnableControl feature exists on the CMP module.

File

plib_cmp.h

C

```
bool PLIB_CMP_ExistsOutputEnableControl(CMP_MODULE_ID index);
```

Returns

- true - The ComparatorOutputEnableControl feature is supported on the device
- false - The ComparatorOutputEnableControl feature is not supported on the device

Description

This function identifies whether the ComparatorOutputEnableControl feature is available on the CMP module. When this function returns true, these functions are supported on the device:

- PLIB_CMP_OutputEnable
- PLIB_CMP_OutputDisable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CMP_ExistsOutputEnableControl(CMP_MODULE_ID index)

PLIB_CMP_ExistsOutputLevelControl Function

Identifies whether the OutputLevelSelectControl feature exists on the CMP module.

File

plib_cmp.h

C

```
bool PLIB_CMP_ExistsOutputLevelControl(CMP_MODULE_ID index);
```

Returns

- true - The OutputLevelSelectControl feature is supported on the device
- false - The OutputLevelSelectControl feature is not supported on the device

Description

This function identifies whether the OutputLevelSelectControl feature is available on the CMP module. When this function returns true, these functions are supported on the device:

- PLIB_CMP_OutputLogicHigh
- PLIB_CMP_OutputLogicLow

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CMP_ExistsOutputLevelControl(CMP_MODULE_ID index)

PLIB_CMP_ExistsStopInIdle Function

Identifies whether the StopInIdle feature exists on the CMP module.

File

plib_cmp.h

C

```
bool PLIB_CMP_ExistsStopInIdle(CMP_MODULE_ID index);
```

Returns

- true - The StopInIdle feature is supported on the device
- false - The StopInIdle feature is not supported on the device

Description

This function identifies whether the StopInIdle feature is available on the CMP module. When this function returns true, these functions are supported on the device:

- PLIB_CMP_StopInIdleModeEnable
- PLIB_CMP_StopInIdleModeDisable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CMP_ExistsStopInIdle(CMP_MODULE_ID index)

PLIB_CMP_ExistsOutputStatusGet Function

Identifies whether the OutputStatusGet feature exists on the CMP module.

File

plib_cmp.h

C

```
bool PLIB_CMP_ExistsOutputStatusGet(CMP_MODULE_ID index);
```

Returns

- true - The OutputStatusGet feature is supported on the device
- false - The OutputStatusGet feature is not supported on the device

Description

This function identifies whether the OutputStatusGet feature is available on the CMP module. When this function returns true, these functions are supported on the device:

- PLIB_CMP_OutputStatusGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CMP_ExistsOutputStatusGet(CMP_MODULE_ID index)

d) Data Types and Constants

CMP_CLOCK_DIVIDE Enumeration

Defines Comparator Filter Clock Divide.

File

help_plib_cmp.h

C

```
typedef enum {
  CMP_FILTER_CLOCK_DIVIDE_1_1,
  CMP_FILTER_CLOCK_DIVIDE_1_2,
  CMP_FILTER_CLOCK_DIVIDE_1_4,
  CMP_FILTER_CLOCK_DIVIDE_1_8,
  CMP_FILTER_CLOCK_DIVIDE_1_16,
  CMP_FILTER_CLOCK_DIVIDE_1_32,
  CMP_FILTER_CLOCK_DIVIDE_1_64,
  CMP_FILTER_CLOCK_DIVIDE_1_128
} CMP_CLOCK_DIVIDE;
```

Members

Members	Description
CMP_FILTER_CLOCK_DIVIDE_1_1	Comparator Filter Clock Division is 1:1
CMP_FILTER_CLOCK_DIVIDE_1_2	Comparator Filter Clock Division is 1:2
CMP_FILTER_CLOCK_DIVIDE_1_4	Comparator Filter Clock Division is 1:4
CMP_FILTER_CLOCK_DIVIDE_1_8	Comparator Filter Clock Division is 1:8
CMP_FILTER_CLOCK_DIVIDE_1_16	Comparator Filter Clock Division is 1:16

CMP_FILTER_CLOCK_DIVIDE_1_32	Comparator Filter Clock Division is 1:32
CMP_FILTER_CLOCK_DIVIDE_1_64	Comparator Filter Clock Division is 1:64
CMP_FILTER_CLOCK_DIVIDE_1_128	Comparator Filter Clock Division is 1:128

Description

Comparator Filter Clock Divide Select

This macro defines the Comparator filter clock divide.

CMP_CVREF_BANDGAP_SELECT Enumeration

Lists the band gap selection options.

File

help_plib_cmp.h

C

```
typedef enum {
  CMP_CVREF_BANDGAP_1_2V,
  CMP_CVREF_BANDGAP_0_6V,
  CMP_CVREF_BANDGAP_VREFPLUS
} CMP_CVREF_BANDGAP_SELECT;
```

Members

Members	Description
CMP_CVREF_BANDGAP_1_2V	Select the Band Gap Reference Source as 1.2 V
CMP_CVREF_BANDGAP_0_6V	Select the Band Gap Reference Source as 0.6 V
CMP_CVREF_BANDGAP_VREFPLUS	Select the Band Gap Reference Source as VREF

Description

CVREF band gap select enumeration

This enumeration lists the possible band gap selection options.

Remarks

None.

CMP_CVREF_REFERENCE_SELECT Enumeration

Lists the reference selection options.

File

help_plib_cmp.h

C

```
typedef enum {
  CMP_CVREF_RESISTOR_LADDER_VOLTAGE,
  CMP_CVREF_POSITIVE_REFERENCE_VOLTAGE
} CMP_CVREF_REFERENCE_SELECT;
```

Members

Members	Description
CMP_CVREF_RESISTOR_LADDER_VOLTAGE	Select the Band Gap Reference Source as 1.2 V
CMP_CVREF_POSITIVE_REFERENCE_VOLTAGE	Select the Band Gap Reference Source as 0.6 V

Description

CVREF reference select enumeration

This enumeration lists the possible reference selection options.

Remarks

None.

CMP_CVREF_VALUE Enumeration

Lists the voltage reference value selection options.

File

help_plib_cmp.h

C

```
typedef enum {
  CMP_CVREF_VALUE_0,
  CMP_CVREF_VALUE_1,
  CMP_CVREF_VALUE_2,
  CMP_CVREF_VALUE_3,
  CMP_CVREF_VALUE_4,
  CMP_CVREF_VALUE_5,
  CMP_CVREF_VALUE_6,
  CMP_CVREF_VALUE_7,
  CMP_CVREF_VALUE_8,
  CMP_CVREF_VALUE_9,
  CMP_CVREF_VALUE_10,
  CMP_CVREF_VALUE_11,
  CMP_CVREF_VALUE_12,
  CMP_CVREF_VALUE_13,
  CMP_CVREF_VALUE_14,
  CMP_CVREF_VALUE_15
} CMP_CVREF_VALUE;
```

Members

Members	Description
CMP_CVREF_VALUE_0	Voltage reference value 0
CMP_CVREF_VALUE_1	Voltage reference value 1
CMP_CVREF_VALUE_2	Voltage reference value 2
CMP_CVREF_VALUE_3	Voltage reference value 3
CMP_CVREF_VALUE_4	Voltage reference value 4
CMP_CVREF_VALUE_5	Voltage reference value 5
CMP_CVREF_VALUE_6	Voltage reference value 6
CMP_CVREF_VALUE_7	Voltage reference value 7
CMP_CVREF_VALUE_8	Voltage reference value 8
CMP_CVREF_VALUE_9	Voltage reference value 9
CMP_CVREF_VALUE_10	Voltage reference value 10
CMP_CVREF_VALUE_11	Voltage reference value 11
CMP_CVREF_VALUE_12	Voltage reference value 12
CMP_CVREF_VALUE_13	Voltage reference value 13
CMP_CVREF_VALUE_14	Voltage reference value 14
CMP_CVREF_VALUE_15	Voltage reference value 15

Description

CVREF voltage reference value selection enumeration

This enumeration lists the possible Voltage reference value selection options.

Remarks

None.

CMP_CVREF_VOLTAGE_SOURCE Enumeration

Lists the Voltage source options.

File

help_plib_cmp.h

C

```
typedef enum {
  CMP_CVREF_VOLTAGE_SOURCE_INTERNAL,
  CMP_CVREF_VOLTAGE_SOURCE_EXTERNAL
} CMP_CVREF_VOLTAGE_SOURCE;
```

Members

Members	Description
CMP_CVREF_VOLTAGE_SOURCE_INTERNAL	Select VDD/VSS source
CMP_CVREF_VOLTAGE_SOURCE_EXTERNAL	Select external voltage source

Description

CVREF Voltage source selection enumeration

This enumeration lists the possible Voltage source selection options.

Remarks

None.

CMP_FILTER_CLOCK Enumeration

Defines Comparator filter input clock

File

help_plib_cmp.h

C

```
typedef enum {
  CMP_FILTER_CLOCK_FP,
  CMP_FILTER_CLOCK_FOSC,
  CMP_FILTER_CLOCK_SYNCO1,
  CMP_FILTER_CLOCK_T2CLK,
  CMP_FILTER_CLOCK_T3CLK,
  CMP_FILTER_CLOCK_T4CLK,
  CMP_FILTER_CLOCK_T5CLK
} CMP_FILTER_CLOCK;
```

Members

Members	Description
CMP_FILTER_CLOCK_FP	FP will be the Comparator filter input clock
CMP_FILTER_CLOCK_FOSC	FOSC will be the Comparator filter input clock
CMP_FILTER_CLOCK_SYNCO1	SYNCO1 will be the Comparator filter input clock
CMP_FILTER_CLOCK_T2CLK	T2CLK will be the Comparator filter input clock
CMP_FILTER_CLOCK_T3CLK	T3CLK will be the Comparator filter input clock
CMP_FILTER_CLOCK_T4CLK	T4CLK will be the Comparator filter input clock
CMP_FILTER_CLOCK_T5CLK	T5CLK will be the Comparator filter input clock

Description

Comparator Filter Input Clock Select

This macro defines the Comparator filter input clock

CMP_INTERRUPT_EVENT Enumeration

Defines Comparator interrupt events.

File

help_plib_cmp.h

C

```
typedef enum {
  CMP_INTERRUPT_GENERATION_DISABLED
} CMP_INTERRUPT_EVENT;
```

Members

Members	Description
CMP_INTERRUPT_GENERATION_DISABLED	Select VDD/VSS source

Description

Comparator interrupt event Select

This macro defines the Comparator interrupt events.

CMP_INVERTING_INPUT Enumeration

Defines the list of Comparator inverting Input.

File

help_plib_cmp.h

C

```
typedef enum {
  CMP_INVERTING_INPUT_EXTERNAL_PIN_B,
  CMP_INVERTING_INPUT_EXTERNAL_PIN_C,
  CMP_INVERTING_INPUT_EXTERNAL_PIN_D,
  CMP_INVERTING_INPUT_EXTERNAL_NEGATIVE_PIN,
  CMP_INVERTING_INPUT_EXTERNAL_POSITIVE_PIN,
  CMP_INVERTING_INPUT_OTHER_MODULE_EXTERNAL_POSITIVE_PIN,
  CMP_INVERTING_INPUT_IVREF,
  CMP_INPUT_C2IN_NEGATIVE,
  CMP_INPUT_C2IN_POSITIVE,
  CMP_INPUT_C1IN_POSITIVE,
  CMP_INPUT_IVREF
} CMP_INVERTING_INPUT;
```

Members

Members	Description
CMP_INVERTING_INPUT_EXTERNAL_PIN_B	Select external voltage source at pin CxINB as inverting input. If using CMP_ID_1 , this pin is C1INB
CMP_INVERTING_INPUT_EXTERNAL_PIN_C	Select external voltage source at pin CxINC as inverting input
CMP_INVERTING_INPUT_EXTERNAL_PIN_D	Select external voltage source at pin CxIND as inverting input
CMP_INVERTING_INPUT_EXTERNAL_NEGATIVE_PIN	Select external voltage source at pin CxIN- as inverting input
CMP_INVERTING_INPUT_EXTERNAL_POSITIVE_PIN	Select external voltage source at pin CxIN+ as inverting input. If using CMP_ID_1 , this pin is C1IN+
CMP_INVERTING_INPUT_OTHER_MODULE_EXTERNAL_POSITIVE_PIN	Select external voltage source at pin CyIN+ as inverting input. If using CMP_ID_1 , this pin is C2IN+. If using CMP_ID_2 , this pin is C1IN+
CMP_INVERTING_INPUT_IVREF	Select internal voltage ,VDD/VSS source as inverting input
CMP_INPUT_C2IN_NEGATIVE	The member is obsolete and maintained here only for the backward compatibility.
CMP_INPUT_C2IN_POSITIVE	The member is obsolete and maintained here only for the backward compatibility.
CMP_INPUT_C1IN_POSITIVE	The member is obsolete and maintained here only for the backward compatibility.
CMP_INPUT_IVREF	The member is obsolete and maintained here only for the backward compatibility.

Description

Comparator inverting input channel select

This macro defines the super set of Comparator inverting Inputs. Not all options will be available on all microcontrollers. Refer to the processor header for the specific controller in use to determine which options are supported.

CMP_MASK_A Enumeration

Defines Comparator Mask A Input.

File

help_plib_cmp.h

C

```
typedef enum {
  CMP_MASK_A_PWM1L,
  CMP_MASK_A_PWM1H,
  CMP_MASK_A_PWM2L,
  CMP_MASK_A_PWM2H,
  CMP_MASK_A_PWM3L,
  CMP_MASK_A_PWM3H,
  CMP_MASK_A_PTGO18,
  CMP_MASK_A_PTGO19,
  CMP_MASK_A_FLT2,
  CMP_MASK_A_FLT4
} CMP_MASK_A;
```

Members

Members	Description
CMP_MASK_A_PWM1L	PWM1L will be the Comparator Mask A input
CMP_MASK_A_PWM1H	PWM1H will be the Comparator Mask A input
CMP_MASK_A_PWM2L	PWM2L will be the Comparator Mask A input
CMP_MASK_A_PWM2H	PWM2H will be the Comparator Mask A input
CMP_MASK_A_PWM3L	PWM3L will be the Comparator Mask A input
CMP_MASK_A_PWM3H	PWM3H will be the Comparator Mask A input
CMP_MASK_A_PTGO18	PTGO18 will be the Comparator Mask A input
CMP_MASK_A_PTGO19	PTGO19 will be the Comparator Mask A input
CMP_MASK_A_FLT2	FLT2 will be the Comparator Mask A input
CMP_MASK_A_FLT4	FLT4 will be the Comparator Mask A input

Description

Comparator Mask A Input Select

This macro defines the Comparator Mask A Input.

CMP_MASK_B Enumeration

Defines Comparator Mask B Input.

File

help_plib_cmp.h

C

```
typedef enum {
  CMP_MASK_B_PWM1L,
  CMP_MASK_B_PWM1H,
  CMP_MASK_B_PWM2L,
  CMP_MASK_B_PWM2H,
  CMP_MASK_B_PWM3L,
  CMP_MASK_B_PWM3H,
  CMP_MASK_B_PTGO18,
  CMP_MASK_B_PTGO19,
  CMP_MASK_B_FLT2,
  CMP_MASK_B_FLT4
} CMP_MASK_B;
```

Members

Members	Description
CMP_MASK_B_PWM1L	PWM1L will be the Comparator Mask B input
CMP_MASK_B_PWM1H	PWM1H will be the Comparator Mask B input
CMP_MASK_B_PWM2L	PWM2L will be the Comparator Mask B input
CMP_MASK_B_PWM2H	PWM2H will be the Comparator Mask B input
CMP_MASK_B_PWM3L	PWM3L will be the Comparator Mask B input

CMP_MASK_B_PWM3H	PWM3H will be the Comparator Mask B input
CMP_MASK_B_PTGO18	PTGO18 will be the Comparator Mask B input
CMP_MASK_B_PTGO19	PTGO19 will be the Comparator Mask B input
CMP_MASK_B_FLT2	FLT2 will be the Comparator Mask B input
CMP_MASK_B_FLT4	FLT4 will be the Comparator Mask B input

Description

Comparator Mask B Input Select

This macro defines the Comparator Mask B Input.

CMP_MASK_C Enumeration

Defines Comparator Mask C Input.

File

help_plib_cmp.h

C

```
typedef enum {
  CMP_MASK_C_PWM1L,
  CMP_MASK_C_PWM1H,
  CMP_MASK_C_PWM2L,
  CMP_MASK_C_PWM2H,
  CMP_MASK_C_PWM3L,
  CMP_MASK_C_PWM3H,
  CMP_MASK_C_PTGO18,
  CMP_MASK_C_PTGO19,
  CMP_MASK_C_FLT2,
  CMP_MASK_C_FLT4
} CMP_MASK_C;
```

Members

Members	Description
CMP_MASK_C_PWM1L	PWM1L will be the Comparator mask C input
CMP_MASK_C_PWM1H	PWM1H will be the Comparator mask C input
CMP_MASK_C_PWM2L	PWM2L will be the Comparator mask C input
CMP_MASK_C_PWM2H	PWM2H will be the Comparator mask C input
CMP_MASK_C_PWM3L	PWM3L will be the Comparator mask C input
CMP_MASK_C_PWM3H	PWM3H will be the Comparator mask C input
CMP_MASK_C_PTGO18	PTGO18 will be the Comparator mask C input
CMP_MASK_C_PTGO19	PTGO19 will be the Comparator mask C input
CMP_MASK_C_FLT2	FLT2 will be the Comparator mask C input
CMP_MASK_C_FLT4	FLT4 will be the Comparator mask C input

Description

Comparator Mask C Input Select

This macro defines the Comparator Mask C Input.

CMP_MODULE_ID Enumeration

Identifies the Comparator modules supported

File

help_plib_cmp.h

C

```
typedef enum {
  CMP_ID_1,
  CMP_ID_2,
  CMP_ID_3
} CMP_MODULE_ID;
```

Members

Members	Description
CMP_ID_1	Comparator Module 1 ID
CMP_ID_2	Comparator Module 2 ID
CMP_ID_3	Comparator Module 3 ID

Description

Comparator Module ID

This enumeration identifies the Comparator modules which are available on the microcontroller. This is the super set of all the possible instances that might be available on the Microchip microcontrollers.

Remarks

The caller should not rely on the specific numbers assigned to any of these values as they may change from one processor to the next.

Not all modules will be available on all microcontrollers. Refer to the data sheet for the specific controller in use to determine which modules are supported. The numbers used in the enumeration values will match the numbers given in the data sheet.

CMP_NON_INVERTING_INPUT Enumeration

Defines the list of Comparator non-inverting Input.

File

help_plib_cmp.h

C

```
typedef enum {
  CMP_NON_INVERTING_INPUT_EXTERNAL_PIN_A,
  CMP_NON_INVERTING_INPUT_EXTERNAL_POSITIVE_PIN,
  CMP_NON_INVERTING_INPUT_CVREF,
  CMP_INPUT_C2IN_POSITIVE,
  CMP_INPUT_INTERNAL_CVREF
} CMP_NON_INVERTING_INPUT;
```

Members

Members	Description
CMP_NON_INVERTING_INPUT_EXTERNAL_PIN_A	Select external voltage source at pin CxINA as non-inverting input
CMP_NON_INVERTING_INPUT_EXTERNAL_POSITIVE_PIN	Select external voltage source at pin CxIN+ as non-inverting input
CMP_NON_INVERTING_INPUT_CVREF	Select internal voltage source CVREF as non-inverting input
CMP_INPUT_C2IN_POSITIVE	The member is obsolete and maintained here only for the backward compatibility.
CMP_INPUT_INTERNAL_CVREF	The member is obsolete and maintained here only for the backward compatibility.

Description

Comparator Non inverting input channel select

This macro defines the super set of Comparator non-inverting Inputs. Not all options will be available on all microcontrollers. Refer to the processor header for the specific controller in use to determine which options are supported.

CMP_SPEED_POWER Enumeration

Defines the Speed/Power of the Comparator

File

help_plib_cmp.h

C

```
typedef enum {
  CMP_SPEED_POWER_LOWER,
  CMP_SPEED_POWER_HIGHER
} CMP_SPEED_POWER;
```

Members

Members	Description
CMP_SPEED_POWER_LOWER	Comparator low-power, low-speed
CMP_SPEED_POWER_HIGHER	Comparator normal power, higher speed

Description

Comparator Speed/Power Select

This macro defines the Speed/Power of the Comparator.

Files

Files

Name	Description
plib_cmp.h	Comparator Peripheral Library Interface Header for Comparator module definitions.
help_plib_cmp.h	

Description

This section lists the source and header files used by the library.

plib_cmp.h

Comparator Peripheral Library Interface Header for Comparator module definitions.

Functions

	Name	Description
	PLIB_CMP_CVREF_BandGapReferenceSourceSelect	Selects the band gap reference voltage source.
	PLIB_CMP_CVREF_Disable	Disables the voltage reference of the Comparator module.
	PLIB_CMP_CVREF_Enable	Enables the voltage reference of the Comparator module.
	PLIB_CMP_CVREF_OutputDisable	Disables the output voltage.
	PLIB_CMP_CVREF_OutputEnable	Enables the voltage output.
	PLIB_CMP_CVREF_ReferenceVoltageSelect	Selects the voltage reference value, CVref.
	PLIB_CMP_CVREF_SourceNegativeInputSelect	Configures the Comparator module to use the selected input as a negative reference.
	PLIB_CMP_CVREF_SourceVoltageSelect	Connects the Comparator module to the selected voltage source.
	PLIB_CMP_CVREF_ValueSelect	Selects the voltage reference value.
	PLIB_CMP_CVREF_WideRangeDisable	Disables the wide range.
	PLIB_CMP_CVREF_WideRangeEnable	Enables the wide range.
	PLIB_CMP_CVREF_WideRangeIsEnabled	Returns whether the wide range is selected for the reference voltage.
	PLIB_CMP_Disable	Disables the Comparator module.
	PLIB_CMP_Enable	Enables the Comparator module.
	PLIB_CMP_ExistsCVREFBGRefVoltageRangeSelect	Identifies whether the CVREFBGRefVoltageRangeSelect feature exists on the CMP module.
	PLIB_CMP_ExistsCVREFEnableControl	Identifies whether the CVREFEnableControl feature exists on the CMP module.
	PLIB_CMP_ExistsCVREFOutputEnableControl	Identifies whether the CVREFOutputEnableControl feature exists on the CMP module.
	PLIB_CMP_ExistsCVREFRefVoltageRangeSelect	Identifies whether the CVREFRefVoltageRangeSelect feature exists on the CMP module.
	PLIB_CMP_ExistsCVREFValueSelect	Identifies whether the CVREFValueSelect feature exists on the CMP module.
	PLIB_CMP_ExistsCVREFVoltageRangeSelect	Identifies whether the CVREFVoltageRangeSelect feature exists on the CMP module.
	PLIB_CMP_ExistsCVREFWideRangeControl	Identifies whether the CVREFWideRangeControl feature exists on the CMP module.
	PLIB_CMP_ExistsEnableControl	Identifies whether the ComparatorEnableControl feature exists on the CMP module.

	PLIB_CMP_ExistsInterruptEventSelect	Identifies whether the InterruptEventSelect feature exists on the CMP module.
	PLIB_CMP_ExistsInvertingInputSelect	Identifies whether the InvertingInputSelect feature exists on the CMP module.
	PLIB_CMP_ExistsInvertOutputControl	Identifies whether the InvertOutputSelectControl feature exists on the CMP module.
	PLIB_CMP_ExistsNonInvertingInputSelect	Identifies whether the NonInvertingInputSelect feature exists on the CMP module.
	PLIB_CMP_ExistsOutputEnableControl	Identifies whether the ComparatorOutputEnableControl feature exists on the CMP module.
	PLIB_CMP_ExistsOutputLevelControl	Identifies whether the OutputLevelSelectControl feature exists on the CMP module.
	PLIB_CMP_ExistsOutputStatusGet	Identifies whether the OutputStatusGet feature exists on the CMP module.
	PLIB_CMP_ExistsStopInIdle	Identifies whether the StopInIdle feature exists on the CMP module.
	PLIB_CMP_InterruptEventSelect	Comparator interrupt event select.
	PLIB_CMP_InvertingInputChannelSelect	Comparator inverting input channel select.
	PLIB_CMP_NonInvertingInputChannelSelect	Comparator input channel select.
	PLIB_CMP_OutputDisable	Disables the Comparator output.
	PLIB_CMP_OutputEnable	Enables the Comparator output.
	PLIB_CMP_OutputInvertDisable	Comparator output is non-inverted.
	PLIB_CMP_OutputInvertEnable	Comparator output is inverted.
	PLIB_CMP_OutputLogicHigh	Comparator output bit will give a 'logic high' on satisfying the input condition.
	PLIB_CMP_OutputLogicLow	Comparator will be set to give 'logic low' on satisfying the input condition.
	PLIB_CMP_OutputStatusGet	Comparator output status.
	PLIB_CMP_StopInIdleModeDisable	Disables Stop in Idle mode.
	PLIB_CMP_StopInIdleModeEnable	Enables Stop in Idle mode.

Description

Comparator Peripheral Library Interface Header

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the Comparator Peripheral Library for all families of Microchip microcontrollers. The definitions in this file are common to the Comparator peripheral.

File Name

plib_cmp.h

Company

Microchip Technology Inc.

help_plib_cmp.h

Enumerations

	Name	Description
	CMP_CLOCK_DIVIDE	Defines Comparator Filter Clock Divide.
	CMP_CVREF_BANDGAP_SELECT	Lists the band gap selection options.
	CMP_CVREF_REFERENCE_SELECT	Lists the reference selection options.
	CMP_CVREF_VALUE	Lists the voltage reference value selection options.
	CMP_CVREF_VOLTAGE_SOURCE	Lists the Voltage source options.
	CMP_FILTER_CLOCK	Defines Comparator filter input clock
	CMP_INTERRUPT_EVENT	Defines Comparator interrupt events.
	CMP_INVERTING_INPUT	Defines the list of Comparator inverting Input.
	CMP_MASK_A	Defines Comparator Mask A Input.
	CMP_MASK_B	Defines Comparator Mask B Input.
	CMP_MASK_C	Defines Comparator Mask C Input.
	CMP_MODULE_ID	Identifies the Comparator modules supported
	CMP_NON_INVERTING_INPUT	Defines the list of Comparator non-inverting Input.
	CMP_SPEED_POWER	Defines the Speed/Power of the Comparator

CTMU Peripheral Library

This section describes the Charge Time Measurement Unit (CTMU) Library.

Introduction

Charge Time Measurement Unit (CTMU) for Microchip Microcontrollers

This library provides a low-level abstraction of Charge Time Measurement Unit (CTMU) features. It provides a convenient C language interface, allowing the easy construction of CTMU code that can function across the full range of Microchip devices with CTMU modules.

Description

The CTMU is a flexible analog module that has a configurable current source with a digital configuration circuit built around it. Using its high precision current source the CTMU can support:

- Pulse timing measurements - pulse to pulse, high pulse width, and low pulse width - using an on-chip ADC
- Pulse regeneration with delays
- Temperature measurement (on devices with a temperature diode) using an on-chip ADC
- Capacitance measurement - capacitive touch, and capacitive sensor support - using an on-chip ADC

The CTMU module has the following features:

- On-chip precision current source with four ranges and trimmable output
- Current source controllable by software or external triggers
- Up to 32 input channels supported (ADC inputs)
- Up to 16 sources for triggering
- Level sensitive triggering with edge triggering available on some devices
- Control of triggering polarity and direction
- Two trigger channels with control of trigger sequence
- Time measurement resolution of 1 nanosecond
- Provides ADC capture strobe to automatically initiate ADC voltage measurements

Using the Library

This topic describes the basic architecture of the CTMU Peripheral Library and provides information and examples on its use.

Description

Interface Header File: `plib_can.h`

The interface to the CTMU Peripheral library is defined in the `plib_can.h` header file, which is included by the peripheral library header file, `peripheral.h`. Any C language source (`.c`) file that uses the CTMU Peripheral library must include `peripheral.h`.

Library File:

The CTMU Peripheral library archive (`.a`) file is installed with MPLAB Harmony.

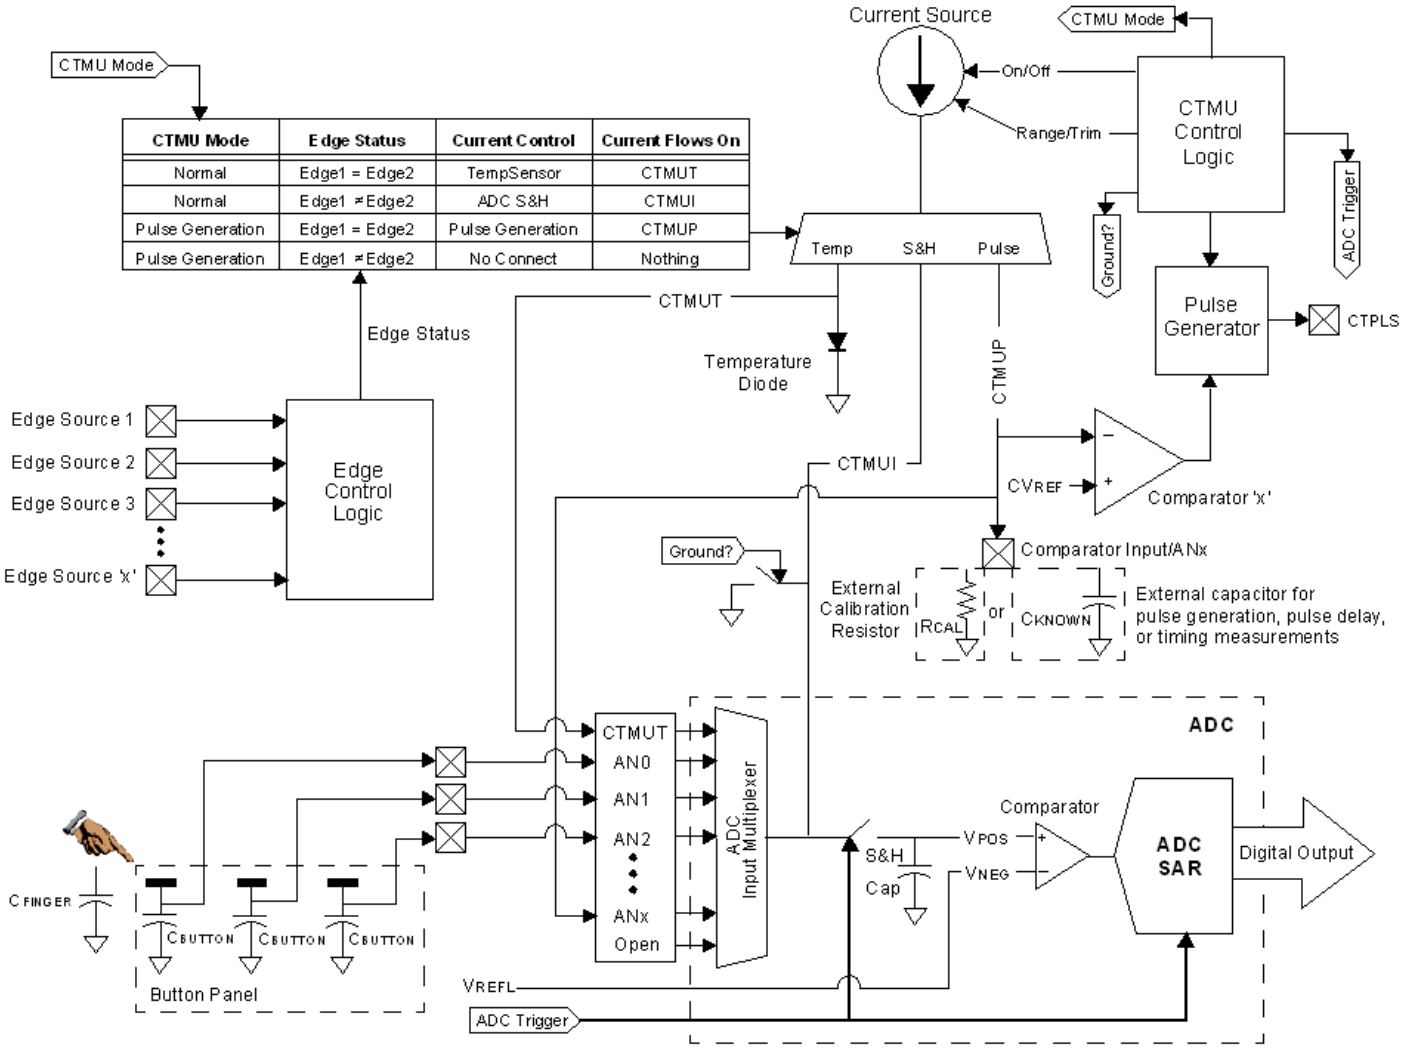
Please refer to the What is MPLAB Harmony? section for how the peripheral interacts with the framework.

Hardware Abstraction Model

This library provides a low-level abstraction of the CTMU module on Microchip microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Description

The following figure shows a block diagram of the CTMU module, focusing on CTMU function rather than the bits in the interface:



The CTMU is built around a high precision current source (i.e., charge pump) and is closely integrated with the device's on-chip Analog-to-Digital Converter (ADC) module and an on-chip Comparator module. The ADC converts the voltage carried by the Sample and Hold (S&H) capacitor into a digital number representing ADC counts. These counts can be converted into a voltage and the voltage used by the embedded application. The Comparator module associated with the CTMU can compare the voltage on an external capacitor with a known voltage and output when the voltages match. See the Example Applications section, for details of these applications.

In the previous block diagram, an analog multiplexer (MUX) controls where the charge pump sends current. This multiplexer is controlled by the CTMU's mode (Normal versus Pulse Generation) and edge status, as shown by the look-up table. In Normal mode, current is switched between the on-chip temperature sensor (**CTMUT** path) and the ADC's S&H capacitor (**CTMUI** path). In the Pulse Generation mode, current is switched on and off over the **CTMUP** path, with the "on" current going to the negative input of the associated comparator and its special input pin, labeled "Comparator Input/ANx" in the diagram.

External triggers can be used to start and stop the charge pump using up to 16 edge sources. The charge pump is also controlled by manipulating two edge status bits in software.

The block labeled Edge Control Logic determines the edge status based on the selected edge sources and edge control settings. Basically, current is off if the edges are equal, and on if the edges are unequal. In other words, Current (on/off) = Edge 1 XOR Edge 2. Sources can trigger an edge in the control logic based on levels or transitions and can trigger going high-low or low-high. The order of edge events can be controlled, with Edge 1 always occurring before Edge 2, or edge events can occur in any order.

The *Ground?* control signal created by the CTMU Control Logic block enables the grounding of the **CTMUI** path, connecting the charge pump and the ADC's S&H capacitor. This is done before starting any capacitance or timing measurement to make sure there is no residual charge on the ADC's Sample and Hold capacitor and on any external capacitor, such as a button. To discharge the ADC's Sample and Hold capacitor the ADC must be sampling the input voltage (i.e., the switch before the S&H capacitor is closed). This is normally done by manually starting ADC sampling using the "Sampling" bit in one the ADC's control registers.

In Normal mode, current flows from the charge pump to the ADC via the **CTMUI** path. Current flows to external capacitors (such as button capacitors) through the ADC's analog input multiplexer.

The ADC input multiplexer has a special input signal, named "Open", which does not connect anything to the ADC's input. This minimizes stray capacitance and provides the smallest internal capacitance for very fast time measurements.

In Pulse Generation mode, current flows directly to a special comparator/analog input pin via the **CTMUP** path, bypassing the ADC's input

multiplexer and its approximately 2500 ohm series resistance. This extra series resistance is why the charge pump should only be calibrated in Pulse Generation mode, as shown in the block diagram. Except in the lowest current settings, this series resistance causes an error that is too large in the overall calibration resistance value to provide useable charge pump current measurements.

Library Overview

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the CTMU module.

Library Interface Section	Description
CTMU Control Functions	These functions can be used to enable, disable, and set CTMU features.
Edge Control and Status Functions	These functions can be used to configure CTMU edge control and status.
Feature Existence Functions	These functions can be used to determine whether or not a particular feature is available on the device.

How the Library Works

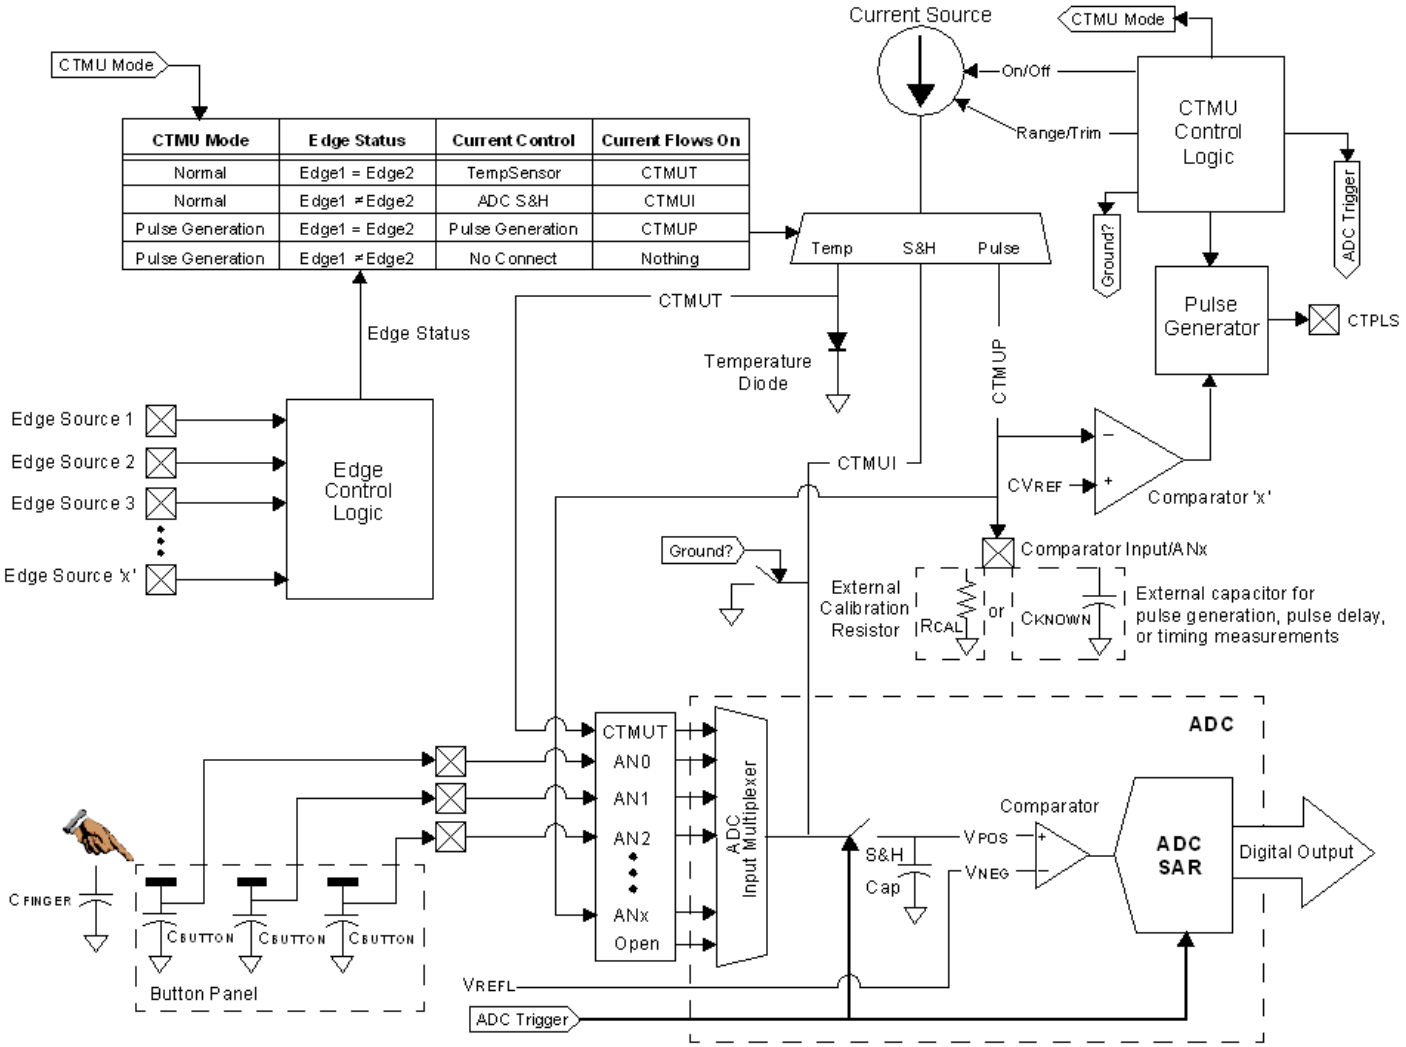
This section describes how the CTMU Peripheral Library works.

Description

The CTMU is a simple analog module, built around a high precision charge pump.

The focus of the CTMU peripheral library is controlling the output of the charge pump and interfacing with the CTMU's associated on-chip ADC.

The block diagram of the CTMU module is repeated here for reference. Next, we will discuss library primitives by functional group, starting with simple things such as turning the module on or off, and then proceeding to more complicated topics such as edge control.



CTMU On/Off and Reset

These features are controlled by these functions:

```
void PLIB_CTMU_Enable ( CTMU_MODULE_ID ctmu_id )
void PLIB_CTMU_Disable ( CTMU_MODULE_ID ctmu_id )
void PLIB_CTMU_PORDefaultsRestore ( CTMU_MODULE_ID ctmu_id )
```

The parameter ctmu_id identifies which CTMU module is referenced. Since all currently available devices only have a single CTMU, this parameter is primarily in support of future expansion.

Operation in Idle Mode

The CTMU can stop operating in Idle mode or operate when the chip is in Idle mode depending on:

```
void PLIB_CTMU_StopInIdleEnable( CTMU_MODULE_ID ctmu_id )
void PLIB_CTMU_StopInIdleDisable( CTMU_MODULE_ID ctmu_id )
```

Current Source

Charge pump output is controlled by a current range, and then a trim off of the nominal current of each of four current ranges.

These functions control current range and current trim:

```
void PLIB_CTMU_CurrentTrimSet( CTMU_MODULE_ID ctmu_id, signed short current_trim )
void PLIB_CTMU_CurrentRangeSet( CTMU_MODULE_ID ctmu_id, CTMU_CURRENT_RANGE current_range )
```

Current is shut off by grounding the charge pump or manipulating the status of two trigger edges, as shown previously. Edge status can be directly controlled in software or determined by two input signals.

The charge pump is grounded or not grounded using:

```
void PLIB_CTMU_CurrentSourceGrounded( CTMU_MODULE_ID ctmu_id )
void PLIB_CTMU_CurrentSourceNotGrounded( CTMU_MODULE_ID ctmu_id )
```

Edge Control

The CTMU can use from four to 16 different sources to provide on and off triggers for the charge pump.

How a source changes edge status is completely controlled. Edges can trigger on source signals going high-to-low or low-to-high. On some devices, source signal transitions can also trigger an edge. On these devices triggers can occur on for both high-low transitions and low-high transitions.

The CTMU can require an edge sequence, with Edge 1 triggering before Edge 2 triggers, or can respond to either Edge 1 or Edge 2 in any order.

After edge sources have caused the charge pump to start and then stop, edge status must be reset by software before the CTMU can respond to edge sources again.

All CTMU edge control functions start with "PLIB_CTMU_Edge". Each type of control function is discussed in the following section.

Control of the CTMU charge pump by the edges is enabled/disabled by:

```
 void PLIB_CTMU_EdgeEnable(CTMU_MODULE_ID ctmu_id)
 void PLIB_CTMU_EdgeDisable(CTMU_MODULE_ID ctmu_id)
```

Even with edges disabled (the default setting after POR) the charge pump can be controlled in software by setting and clearing the module's edge status bits using:

```
 void PLIB_CTMU_EdgeStatusGotEdgeSet(CTMU_MODULE_ID ctmu_id, CTMU_EDGE_NUM edge_number)
 void PLIB_CTMU_EdgeStatusNoEdgeSet(CTMU_MODULE_ID ctmu_id, CTMU_EDGE_NUM edge_number)
```

Since there are two edges and the charge pump is turned on when the edge status is unequal, there are two ways of turning the charge pump on/off in software. The first way is to leave one edge set to its POR default (off) and to manipulate the other status. Typically, Edge 1 is modified and Edge 2 is untouched, as shown in this code example:

```
PLIB_CTMU_EdgeStatusGotEdgeSet( CTMU_ID_1, CTMU_Edge1 ); // Start charging button
// TO DO: Charge Delay
PLIB_CTMU_EdgeStatusNoEdgeSet( CTMU_ID_1, CTMU_Edge1 ); // Stop charging button
```

The other way of turning the charge pump on/off in software mimics what happens when using external sources for edge signals. One edge is set to turn the charge pump on and then the other edge is set to turn the charge pump off:

```
PLIB_CTMU_EdgeStatusGotEdgeSet( CTMU_ID_1, CTMU_Edge1 ); // Start charging button
// TO DO: Charge Delay
PLIB_CTMU_EdgeStatusGotEdgeSet( CTMU_ID_1, CTMU_Edge2 ); // Stop charging button
```

To reset edge status for the next measurement you must clear both edges at the same time:

```
 void PLIB_CTMU_EdgeStatusNoEdgesAllSet(CTMU_MODULE_ID ctmu_id)
```

(To use two calls to PLIB_CTMU_EdgeStatusSetNoEdge would cause the charge pump to pulse between the first call and the second call because in between the status would not be equal, thus enabling the charge pump again.)

Edges can fire based on edges (i.e., transitions) or levels (POR default):

```
 void PLIB_CTMU_EdgeModeEdgeSensitiveSet(CTMU_MODULE_ID ctmu_id, CTMU_EDGE_NUM edge_number)
 void PLIB_CTMU_EdgeModeLevelSensitiveSet(CTMU_MODULE_ID ctmu_id, CTMU_EDGE_NUM edge_number)
```

You can also determine whether a low-to-high change triggers an edge:

```
 void PLIB_CTMU_EdgePolarityPositiveSet(CTMU_MODULE_ID ctmu_id, CTMU_EDGE_NUM edge_number)
```

or whether a high-to-low change triggers an edge:
```
void PLIB_CTMU_EdgePolarityNegativeSet(CTMU_MODULE_ID ctmu_id, CTMU_EDGE_NUM edge_number)
```
If Edge 1 turns on the charge pump and Edge 2 turns it off, you must call:
```
void PLIB_CTMU_EdgeSequenceEnable(CTMU_MODULE_ID ctmu_id)
```
in setting up the CTMU. This feature can be disabled to reinstate the POR default behavior using:
```
void PLIB_CTMU_EdgeSequenceDisable(CTMU_MODULE_ID ctmu_id)
```
With edge sequencing disabled, either edge can be used to control the charge pump.

Finally, the choice of signals for both edges is controlled by:
```
void PLIB_CTMU_EdgeSourceSelect(CTMU_MODULE_ID ctmu_id,
CTMU_EDGE_NUM edge_number,
CTMU_EDGE_SOURCE edge_source)
```

Current Output Control

As shown in the previous block diagram, where the charge pump current goes is controlled by he CTMU mode as well as the edge status.

Whether the CTMU is in capacitance/time or time pulse generation mode is controlled by:
```
void PLIB_CTMU_TimePulseGenEnable( CTMU_MODULE_ID ctmu_id )
void PLIB_CTMU_TimePulseGenDisable( CTMU_MODULE_ID ctmu_id )
```
As shown in the previous block diagram, when the CTMU is in capacitance/time (normal) mode the charge pump runs when Edge 1 Status != Edge 2 Status and stops when Edge 1 Status = Edge 2 Status. (Actually what happens is the charge pump switches from the ADC S&H capacitor to the on-chip temperature diode (if available), but the effect is the same, charge stops flowing.) In pulse generation mode, the charge pump switches to a "no connect" when Edge 1 Status = Edge 2 Status and is connected to CTMUP when Edge 1 Status != Edge 2 Status.

The CTMU charge pump can be manually turned on by the call:
```
PLIB_CTMU_EdgeStatusGotEdgeSet( CTMU_ID_1, PLIB_CTMU_Edge1 );
```
and turned off by the call:
```
PLIB_CTMU_EdgeStatusNoEdgeSet( CTMU_ID_1, PLIB_CTMU_Edge1 );
```
assuming that Edge 2 status is "NoEdge".

Interface with the ADC

Absolute and relative capacitance measurements, as well as pulse timing measurements, require using the associated on-chip ADC to measure the resulting voltage across an ADC input pin. ADC conversion can be triggered by a special ADC trigger strobe signal between the CTMU and ADC modules. The ADC trigger strobe fires when the charge pump changes from running to stopped. Temperature measurements by the ADC involve switching the ADC to a special (internal) input pin attached to the voltage diode.

The ADC trigger strobe is controlled by:
```
void PLIB_CTMU_ADCTriggerEnable( CTMU_MODULE_ID ctmu_id )
void PLIB_CTMU_ADCTriggerDisable( CTMU_MODULE_ID ctmu_id )
```

Power On Reset (POR) Status

The CTMU after a power on reset (POR) has its features configured as follows:
```
PLIB_CTMU_Disable(CTMU_ID_1);              // Turn CTMU off
PLIB_CTMU_EdgeModeLevelSensitiveSet(CTMU_ID_1,CTMU_Edge1);
PLIB_CTMU_EdgeModeLevelSensitiveSet(CTMU_ID_1,CTMU_Edge2);
PLIB_CTMU_EdgePolarityNegativeSet(CTMU_ID_1,CTMU_Edge1);
PLIB_CTMU_EdgePolarityNegativeSet(CTMU_ID_1,CTMU_Edge2);
PLIB_CTMU_EdgeSourceSelect(CTMU_ID_1,CTMU_Edge1,CTMU_EdgeSource_0);
PLIB_CTMU_EdgeSourceSelect(CTMU_ID_1,CTMU_Edge2,CTMU_EdgeSource_0);
PLIB_CTMU_EdgeStatusNoEdgesAllSet(CTMU_ID_1);
PLIB_CTMU_StopInIdleDisable(CTMU_ID_1);   // Continue CTMU operation in Idle mode
PLIB_CTMU_TimePulseGenDisable(CTMU_ID_1); // Capacitance/time measurement
PLIB_CTMU_EdgeDisable(CTMU_ID_1);         // Edges are blocked
PLIB_CTMU_EdgeSequenceDisable(CTMU_ID_1); // Edges can fire in any order
PLIB_CTMU_CurrentSourceNotGrounded(CTMU_ID_1);
PLIB_CTMU_ADCTriggerDisable(CTMU_ID_1);
PLIB_CTMU_CurrentTrimSet(CTMU_ID_1,0);
PLIB_CTMU_CurrentRangeSet(CTMU_ID_1,CTMU_CurrentRangeBase_1000xBase);
All of these functions can be accomplished by a single call to
PLIB_CTMU_PORDefaultsRestore(CTMU_ID_1);
```

Device-to-Device Variations

Some devices do not have an on-chip temperature diode.

Some devices only support edge triggering based on source signal levels rather than transitions. For these devices the function PLIB_CTMU_EdgeModeSetEdgeSensitive does not apply.

The number of possible edge sources varies from device to device. Some have only four possible sources for Edge 1 and Edge 2. Other devices support up to 16 possible sources.

Refer to the **"Charge Time Measurement Unit (CTMU)**" chapter in the specific device data sheet for more information.

CTMU Setup

This section provides the CTMU setup sequence.

Description

The following sequence is a general guideline used to initialize the CTMU module:

1. Reset the CTMU back to POR defaults. (This step isn't necessary if the CTMU is not being reconfigured.)
2. Select the current source range.
3. Adjust the current source trim.
4. Select the operating mode (Normal or Pulse Generation). (If you are using the Comparator Input/ANx pin, you must use the Pulse Generation Mode; otherwise, use the Normal mode).
5. Clear the Edge Status bits.
6. Optional setups:

- Clear the CTMU interrupt flag.
- Configure the ADC to trigger on the CTMU's strobe.
- Configure button/key circuit pins to be ADC inputs.
- Configure the ADC input multiplexer to point to the first button/key pin.
- Turn on the ADC module.

7. Turn on the CTMU module and wait 50 microseconds for the charge pump to stabilize.
8. Discharge the connected circuit by grounding the charge pump. (If using the ADC, enable ADC sampling to connect S&H capacitor to ground.)

```
// 1. Reset CTMU back to POR defaults
    PLIB_CTMU_RestorePORDefaults(CTMU_ID_1);  // POR defaults, turn CTMU off

// 2. Select the current source range.
    PLIB_CTMU_CurrentRangeSet(CTMU_ID_1,CTMU_CurrentRangeBase_Base);

// 3. Adjust the current source trim.
    PLIB_CTMU_CurrentTrimSet(CTMU_ID_1,10); // increase by 20%

// 4. Select the operating mode (Normal or Pulse Generation)
    PLIB_CTMU_TimePulseGenDisable(CTMU_ID_1);

// 5. Clear the Edge Status bits
    PLIB_CTMU_EdgeStatusSetAllNoEdges(CTMU_ID_1);

// 6. Optional setups
//  Clear CTMU interrupt flag
//  Configure ADC to trigger on CTMU strobe
//  Configure button/key circuit pins to be ADC inputs
//  Configure ADC input multiplexer to point to first button/key pin
//  Turn on the ADC

// 7. Turn on the CTMU module, wait 50 us for charge pump to stabilize
    PLIB_CTMU_Enable(CTMU_ID_1);
    // TO DO: Wait 50 microseconds

// 8. Discharge the connected circuit by grounding the charge pump.
    PLIB_CTMU_CurrentSourceGrounded(CTMU_ID_1);
    // TO DO: Enable ADC sampling
    // TO DO: Wait for discharge to occur
```

General Setup

The following sequence is a general guideline used to initialize the CTMU module:

1. Reset CTMU back to POR defaults. (This step isn't necessary if the CTMU is not being reconfigured.)
2. Select the current source range.
3. Adjust the current source trim.
4. Select the operating mode (Normal or Pulse Generation). (If you are using the Comparator Input/AN*x* pin then you must use the Pulse Generation Mode, otherwise, use the Normal mode).
5. Clear the Edge Status bits.
6. Optional setups:

- Clear CTMU interrupt flag.
- Configure ADC to trigger on CTMU strobe.
- Configure button/key circuit pins to be ADC inputs.
- Configure ADC input multiplexer to point to first button/key pin.
- Turn on the ADC module.

7. Turn on the CTMU module, wait 50 microseconds for charge pump to stabilize.
8. Discharge the connected circuit by grounding the charge pump. (If using the ADC, enable ADC sampling to connect S&H capacitor to ground.)

```
// 1. Reset CTMU back to POR defaults
    PLIB_CTMU_PORDefaultsRestore(CTMU_ID_1);  // POR defaults, turn CTMU off

// 2. Select the current source range.
    PLIB_CTMU_CurrentRangeSet(CTMU_ID_1,CTMU_CurrentRangeBase_Base);

// 3. Adjust the current source trim.
    PLIB_CTMU_CurrentTrimSet(CTMU_ID_1,10); // increase by 20%

// 4. Select the operating mode (Normal or Pulse Generation)
    PLIB_CTMU_TimePulseGenDisable(CTMU_ID_1);

// 5. Clear the Edge Status bits
    PLIB_CTMU_EdgeStatusNoEdgesAllSet(CTMU_ID_1);

// 6. Optional setups
//  Clear CTMU interrupt flag
//  Configure ADC to trigger on CTMU strobe
//  Configure button/key circuit pins to be ADC inputs
//  Configure ADC input multiplexer to point to first button/key pin
//  Turn on the ADC

// 7. Turn on the CTMU module, wait 50 us for charge pump to stabilize
    PLIB_CTMU_Enable(CTMU_ID_1);
    // TO DO: Wait 50 microseconds

// 8. Discharge the connected circuit by grounding the charge pump.
    PLIB_CTMU_CurrentSourceGrounded(CTMU_ID_1);
    // TO DO: Enable ADC sampling
    // TO DO: Wait for discharge to occur
```

Measuring Time Between Pulses

This section describes the process for measuring time between pulses.

Description

To measure the time between rising edges of two input signals, first calibrate the CTMU charge pump, using a calibration resistor on the Comparator/ANx input pin. Then replace the resistor with a calibrated capacitor of the correct size for the expected time delay and desired charge pump settings (charge range and trim). Do the following to set up the CTMU for these measurements:

1. Reset the CTMU back to its POR defaults. (This step isn't necessary if the CTMU is not being reconfigured.)
2. Select the current source range.
3. Adjust the current source trim.
4. Select the Pulse Generation generation.
5. Clear the Edge Status bits.
6. Select the input source for each edge.
7. Configure each edge to trigger on a rising edge.
8. Enable edge sequencing so Edge 1 occurs before Edge 2.
9. Enable edges to control the charge pump.
10. Turn on the CTMU module then wait 50 us for charge pump to stabilize.
11. Discharge the connected circuit by grounding the charge pump. (If using the ADC, enable ADC sampling to connect sample and hold capacitor to ground.)

```
// 1. Reset CTMU back to POR defaults
    PLIB_CTMU_PORDefaultsRestore(CTMU_ID_1);  // POR defaults, turn CTMU off

// 2. Select the current source range.
    PLIB_CTMU_CurrentRangeSet(CTMU_ID_1,CTMU_CurrentRangeBase_Base);
```

```
// 3. Adjust the current source trim.
    PLIB_CTMU_CurrentTrimSet(CTMU_ID_1,+10); // increase by 20% = +10 * 2%

// 4. Select the operating mode (Pulse Generation)
    PLIB_CTMU_TimePulseGenEnable(CTMU_ID_1); // Use Comparator Input/ANx pin

// 5. Clear the Edge Status bits
    PLIB_CTMU_EdgeStatusNoEdgesAllSet(CTMU_ID_1);

// 6. Configure the edge input sources for Edge 1 and Edge 2.
    PLIB_CTMU_EdgeSourceSelect(CTMU_ID_1,CTMU_Edge1,CTMU_EdgeSource_0);
    PLIB_CTMU_EdgeSourceSelect(CTMU_ID_1,CTMU_Edge2,CTMU_EdgeSource_1);

// 7. Configure the input polarities:
    PLIB_CTMU_EdgePolarityPositiveSet(CTMU_ID_1,CTMU_Edge1); // Trigger on Rising Edge
    PLIB_CTMU_EdgePolarityPositiveSet(CTMU_ID_1,CTMU_Edge2); // Trigger on Rising Edge

// 8. Enable edge sequencing so Edge1 (rising) occurs before Edge 2 (rising)
    PLIB_CTMU_EdgeSequenceEnable(CTMU_ID_1);

// 9. Enable edges to control charge pump
    PLIB_CTMU_EdgeEnable(CTMU_ID_1);

// 10. Turn on the CTMU module, wait 50 us for charge pump to stabilize
    PLIB_CTMU_Enable(CTMU_ID_1);
    // TO DO: Wait 50 microseconds

// 11. Discharge the connected circuit by grounding the charge pump.
    PLIB_CTMU_CurrentSourceGrounded(CTMU_ID_1);
    // TO DO: Enable ADC sampling
    // TO DO: Wait for discharge to occur
```

The time between the rising edge of each pulse is given by:

```
Time = ( Capacitance * (VDD * ADC_Count / MaxADCCount) ) / Current
```

Measuring Pulse Width

This section describes the process for measuring pulse width.

Description

Measuring the pulse width of a single input is similar to measuring the time between two pulses. The only difference is that the same signal is used for both edges and Edge 2 is triggered on a falling edge rather than a rising edge.

```
// 1. Reset CTMU back to POR defaults
    PLIB_CTMU_PORDefaultsRestore(CTMU_ID_1);  // POR defaults, turn CTMU off

// 2. Select the current source range.
    PLIB_CTMU_CurrentRangeSet(CTMU_ID_1,CTMU_CurrentRangeBase_Base);

// 3. Adjust the current source trim.
    PLIB_CTMU_CurrentTrimSet(CTMU_ID_1,+10); // increase by 20% = +10 * 2%

// 4. Select the operating mode (Pulse Generation)
    PLIB_CTMU_TimePulseGenEnable(CTMU_ID_1); // Use Comparator Input/ANx pin

// 5. Clear the Edge Status bits
    PLIB_CTMU_EdgeStatusSetAllNoEdges(CTMU_ID_1);

// 6. Use the same input source for both edges.
    PLIB_CTMU_EdgeSourceSelect(CTMU_ID_1,CTMU_Edge1,CTMU_EdgeSource_0);
    PLIB_CTMU_EdgeSourceSelect(CTMU_ID_1,CTMU_Edge2,CTMU_EdgeSource_0);

// 7. Configure the input polarities:
    PLIB_CTMU_EdgePolarityPositiveSet(CTMU_ID_1,CTMU_Edge1); // Trigger on Rising Edge
    PLIB_CTMU_EdgePolarityPositiveSet(CTMU_ID_1,CTMU_Edge2); // Trigger on falling Edge

// 8. Enable edge sequencing so Edge 1 (rising) occurs before Edge 2 (falling)
    PLIB_CTMU_EdgeSequenceEnable(CTMU_ID_1);
```

```
// 9. Enable edges to control charge pump
    PLIB_CTMU_EdgeEnable(CTMU_ID_1);

// 10. Turn on the CTMU module, wait 50 us for charge pump to stabilize
    PLIB_CTMU_Enable(CTMU_ID_1);
    // TO DO: Wait 50 microseconds

// 11. Discharge the connected circuit by grounding the charge pump.
    PLIB_CTMU_CurrentSourceGrounded(CTMU_ID_1);
    // TO DO: Enable ADC sampling
    // TO DO: Wait for discharge to occur
```

Again, the time between the rising edge of the pulse and the falling edge is given by:

Time = (Capacitance * (VDD * ADC_Count / MaxADCCount)) / Current

Capacitive Touch Measurement

This section describes how to measure the capacitance of a button.

Description

Assuming that the CTMU has been configured as previously described, the following code example shows how to measure the capacitance of a button.

```
#define MAX_ADC_CHANNELS  13
// Mapping of port (A,B,C) and pin (0-15) for each ADC Channel
   unsigned short int PortPinADC[MAX_ADC_CHANNELS] =
                                      { 0xA0, 0xA1, 0xB0, 0xB1,
                                        0xB2, 0xB3, 0xC0, 0xC1,
                                        0xC2, 0xBF, 0xBE, 0xBD,
                                        0xC3 };
    unsigned short int Vpos;  // ADC voltage measurement
    unsigned short int iChan, // ADC channel assigned to each button
                       PortPinChan, // Entry in PortPinADC coding matrix for each button
                       iPort, // Port for each button (0xA,0xB,0xC for ports A,B,C)
                       iPin;  // Pin for each ADC channel (0-15)

    iChan = ScanChannels[button_set_number]; // button_set_number = button to be scanned
    PortPinChan = PortPinADC[iChan];
    iPort   = (PortPinChan>>4) & 0x0F;
    iPin    =  PortPinChan & 0x0F;

    // TO DO: Switch ADC to sensor pin given by iChan

    switch ( iPort )  // Make sure pin is setup for input
    {
        case 0xA:
            // TO DO: Tri-state iPin for Port A
            break;
        case 0xB:
            // TO DO: Tri-state iPin for Port B
            break;
        case 0xC:
            // TO DO: Tri-state iPin for Port C
            break;
    }

    // TO DO: Start ADC sampling to connect sample and hold cap to charge pump
    PLIB_CTMU_CurrentSourceGrounded(CTMU_ID_1);    // Ground charge pump
    // TO DO: Wait for discharge of any residual charge from ADC S&H cap and button cap

    PLIB_CTMU_CurrentSourceNotGrounded(CTMU_ID_1); // Unground charge pump
    // TO DO: Disable interrupts to prevent ISRs from corrupting charge timing
    PLIB_CTMU_EdgeStatusGotEdgeSet( CTMU_ID_1, CTMU_Edge1 ); // Start charging button
    // TO DO: Wait for charge of button capacitor
    PLIB_CTMU_EdgeStatusNoEdgeSet( CTMU_ID_1, CTMU_Edge1 );  // Stop charging button

 // Start A/D conversion
    // TO DO: Stop ADC sampling to initiate ADC conversion
    // TO DO: Enable interrupts, since timing is no longer critical
```

```
    // TO DO: Wait until ADC conversion complete
    PLIB_CTMU_CurrentSourceGrounded(CTMU_ID_1);  // Ground charge pump

//Read new Vpos
    // TO DO: Read ADC results buffer for Vpos
```

Having measured VPOS, the software can now compare it to a limit. If VPOS is less than limit, the button is being pressed by the user.

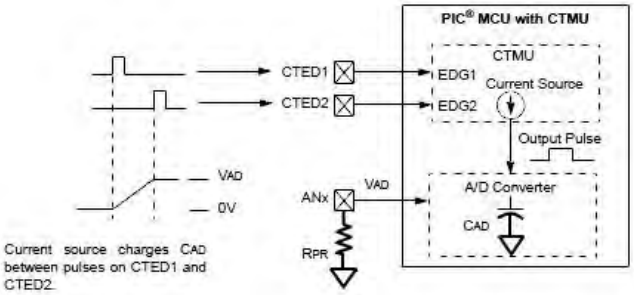
Example Applications

Examples of CTMU applications are discussed.

Description

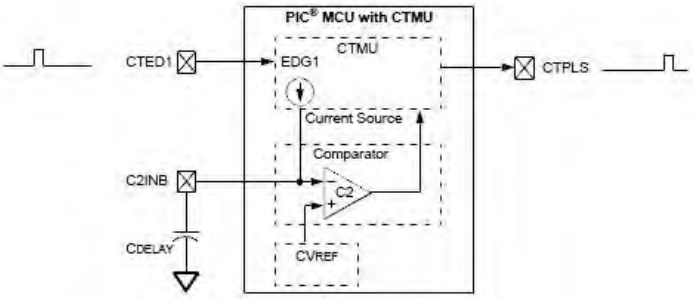
In most applications, the CTMU module provides the current to a circuit and the ADC module measures the resulting voltage. Depending on the setup of the CTMU and the ADC modules, this voltage can represent many things, including:

- On-chip temperature using the built-in temperature diode
- Finger press or swipe on a button panel by measuring relative capacitance
- True or absolute capacitance by measuring capacitance after calibrating the charge pump
- Pulse timing by turning the charge pump on/off with the pulse and then measuring the charge collected by a known capacitor



The CTMU External Edge Input pins, CTED1 and CTED2, are used for connecting two pulse signals to the CTMU. A calibrated capacitor, CKNOWN, is connected to an ADC analog input pin, ANx. The voltage captured by the ADC measures the time difference between the rising edge of the signal on CTED1, which turns on the CTMU's current source, and the rising edge of the signal on CTED2, which turns off the current source.

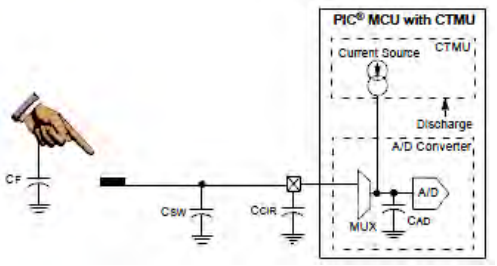
The CTMU and Comparator can be used, without the ADC's help, to delay an input pulse by a variable amount of time, using a known delay capacitor and the charge pumps settings.



In this example, an analog pulse on CTED1 is delayed by a fixed time using a special comparator associated with the CTMU (Comparator 2). Using a calibrated capacitor attached to a special comparator input pin, C2INB, a fixed delay can be added to the analog pulse based on the current and trim settings of the CTMU's charge pump. The time delay is based on the time required to bring the charge voltage on CDELAY up to CVREF. Once there, the comparator's output triggers the start of the output pulse.

Capacitive Touch

Capacitive touch is easy to implement with a CTMU module and its associated on-chip ADC. Since button assertion is a *change* in capacitance, no calibration is required. The software must merely detect the difference between an unpressed button and a button that is pressed. When the user's finger presses a capacitive touch button, the additional capacitance of the finger causes the ADC to see a lower voltage. So software interprets a button voltage drop as a button press by the user.



Configuring the Library

The library is configured for the supported CTMU module when the processor is chosen in the MPLAB X IDE.

Library Interface

a) CTMU Control Functions

	Name	Description
	PLIB_CTMU_CurrentRangeSet	Selects the current source range.
	PLIB_CTMU_Disable	Disables the CTMU module.
	PLIB_CTMU_Enable	Enables the CTMU module.
	PLIB_CTMU_StopInIdleDisable	Sets the CTMU module to continue running when the device is in Idle mode.
	PLIB_CTMU_StopInIdleEnable	Sets the CTMU module to not operate when the device is in Idle mode.
	PLIB_CTMU_AutomaticADCTriggerDisable	Disables the module to automatically trigger an analog-to-digital conversion.
	PLIB_CTMU_AutomaticADCTriggerEnable	Enables the module to automatically trigger an analog-to-digital conversion when the second edge event has occurred.
	PLIB_CTMU_CurrentDischargeDisable	Disables the Current discharge by not connecting the current source output to ground.
	PLIB_CTMU_CurrentDischargeEnable	Enables the Current discharge by connecting the current source output to ground.
	PLIB_CTMU_CurrentTrimSet	Trims current source off of the nominal value.
	PLIB_CTMU_TimePulseGenerationDisable	Disables generation of time pulses using Comparator 2.
	PLIB_CTMU_TimePulseGenerationEnable	Enables the generation of time pulses.

b) Edge Control and Status Functions

	Name	Description
	PLIB_CTMU_EdgeDisable	Disables the edges of the CTMU.
	PLIB_CTMU_EdgeEnable	Enables the edges of the CTMU.
	PLIB_CTMU_EdgeSequenceDisable	Disables the edge sequence of the CTMU.
	PLIB_CTMU_EdgeSequenceEnable	Enables the edge sequence of the CTMU.
	PLIB_CTMU_EdgeIsSet	Gets the status of a CTMU edge.
	PLIB_CTMU_EdgePolaritySet	Sets a CTMU edge to fire on an edge/level with the selected polarity of signal.
	PLIB_CTMU_EdgeSensitivitySet	Sets CTMU sensitivity for the selected edge.
	PLIB_CTMU_EdgeSet	Sets the status of a CTMU edge.
	PLIB_CTMU_EdgeTriggerSourceSelect	Assigns a trigger source for an edge.

c) Feature Existence Functions

	Name	Description
	PLIB_CTMU_ExistsAutomaticADCTrigger	Identifies whether the AutomaticADCTrigger feature exists on the CTMU module.
	PLIB_CTMU_ExistsCurrentDischarge	Identifies whether the CurrentDischarge feature exists on the CTMU module.
	PLIB_CTMU_ExistsCurrentRange	Identifies whether the CurrentRange feature exists on the CTMU module.
	PLIB_CTMU_ExistsCurrentTrim	Identifies whether the CurrentTrim feature exists on the CTMU module.
	PLIB_CTMU_ExistsEdgeEnable	Identifies whether the EdgeEnable feature exists on the CTMU module.
	PLIB_CTMU_ExistsEdgePolarity	Identifies whether the EdgePolarity feature exists on the CTMU module.
	PLIB_CTMU_ExistsEdgeSensitivity	Identifies whether the EdgeSensitivity feature exists on the CTMU module,
	PLIB_CTMU_ExistsEdgeSequencing	Identifies whether the EdgeSequencing feature exists on the CTMU module.
	PLIB_CTMU_ExistsEdgeStatus	Identifies whether the EdgeStatus feature exists on the CTMU module.
	PLIB_CTMU_ExistsEdgeTriggerSource	Identifies whether the EdgeTriggerSource feature exists on the CTMU module.

	PLIB_CTMU_ExistsModuleEnable	Identifies whether the ModuleEnable feature exists on the CTMU module.
	PLIB_CTMU_ExistsStopInIdle	Identifies whether the StopInIdle feature exists on the CTMU module.
	PLIB_CTMU_ExistsTimePulseGeneration	Identifies whether the TimePulseGeneration feature exists on the CTMU module.

Description

This section describes the Application Programming Interface (API) functions of the CTMU Peripheral Library.

Refer to each section for a detailed description.

a) CTMU Control Functions

PLIB_CTMU_CurrentRangeSet Function

Selects the current source range.

File

plib_ctmu.h

C

```
void PLIB_CTMU_CurrentRangeSet(CTMU_MODULE_ID index, CTMU_CURRENT_RANGE currentRange);
```

Returns

None.

Description

This function selects the current source range.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CTMU_ExistsCurrentRange in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Select current range
PLIB_CTMU_CurrentRangeSet ( CTMU_ID_0, CTMU_CURRENT_RANGE_BASE );
```

Parameters

Parameters	Description
index	Identifier for the desired CTMU module
currentRange	Charge pump current range selected, one of the possible enumeration values from CTMU_CURRENT_RANGE enum

Function

void PLIB_CTMU_CurrentRangeSet (CTMU_MODULE_ID index, CTMU_CURRENT_RANGE currentRange)

PLIB_CTMU_Disable Function

Disables the CTMU module.

File

plib_ctmu.h

C

```
void PLIB_CTMU_Disable(CTMU_MODULE_ID index);
```

Returns

None.

Description

This function disables (turns OFF) the CTMU module. Typically, this function is called before reconfiguring the CTMU module.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CTMU_ExistsModuleEnable in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Turn off (disable) CTMU
PLIB_CTMU_Disable ( CTMU_ID_0 );
```

Parameters

Parameters	Description
index	Identifier for the desired CTMU module

Function

void PLIB_CTMU_Disable (CTMU_MODULE_ID index)

PLIB_CTMU_Enable Function

Enables the CTMU module.

File

plib_ctmu.h

C

```
void PLIB_CTMU_Enable(CTMU_MODULE_ID index);
```

Returns

None.

Description

This function enables (turns ON) the CTMU module. This function is called after configuring the CTMU module.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CTMU_ExistsModuleEnable in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Turn on (enable) CTMU Module
PLIB_CTMU_Enable ( CTMU_ID_0 );
```

Parameters

Parameters	Description
index	Identifier for the desired CTMU module

Function

void PLIB_CTMU_Enable (CTMU_MODULE_ID index)

PLIB_CTMU_StopInIdleDisable Function

Sets the CTMU module to continue running when the device is in Idle mode.

File

plib_ctmu.h

C

```
void PLIB_CTMU_StopInIdleDisable(CTMU_MODULE_ID index);
```

Returns

None.

Description

This function sets the CTMU module to continue running when the device is in Idle mode.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CTMU_ExistsStopInIdle in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Enable CTMU to run when CPU is in Idle Mode
PLIB_CTMU_StopInIdleDisable ( CTMU_ID_0 );
```

Parameters

Parameters	Description
index	Identifier for the desired CTMU module

Function

void PLIB_CTMU_StopInIdleDisable (CTMU_MODULE_ID index)

PLIB_CTMU_StopInIdleEnable Function

Sets the CTMU module to not operate when the device is in Idle mode.

File

plib_ctmu.h

C

```
void PLIB_CTMU_StopInIdleEnable(CTMU_MODULE_ID index);
```

Returns

None.

Description

This function sets the CTMU module to not operate when the device is in Idle mode.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CTMU_ExistsStopInIdle in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Do not run in Idle mode
PLIB_CTMU_StopInIdleEnable ( CTMU_ID_0 );
```

Parameters

Parameters	Description
index	Identifier for the desired CTMU module

Function

void PLIB_CTMU_StopInIdleEnable (CTMU_MODULE_ID index)

PLIB_CTMU_AutomaticADCTriggerDisable Function

Disables the module to automatically trigger an analog-to-digital conversion.

File

plib_ctmu.h

C

```
void PLIB_CTMU_AutomaticADCTriggerDisable(CTMU_MODULE_ID index);
```

Returns

None.

Description

This function disables the module to automatically trigger an analog-to-digital conversion.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CTMU_ExistsAutomaticADCTrigger in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Disable ADC trigger from CTMU
PLIB_CTMU_AutomaticADCTriggerDisable ( CTMU_ID_0 );

//To Do: Tell ADC to use CTMU trigger
```

Parameters

Parameters	Description
index	Identifier for the desired CTMU module

Function

void PLIB_CTMU_AutomaticADCTriggerDisable (CTMU_MODULE_ID index)

PLIB_CTMU_AutomaticADCTriggerEnable Function

Enables the module to automatically trigger an analog-to-digital conversion when the second edge event has occurred.

File

plib_ctmu.h

C

```
void PLIB_CTMU_AutomaticADCTriggerEnable(CTMU_MODULE_ID index);
```

Returns

None.

Description

This function enables the module to automatically trigger an analog-to-digital conversion when the second edge event has occurred.

The ADC trigger is asserted whenever the CTMU current source switches from ON to OFF. The ADC can then end sampling and start converting the measured voltage into bits.

Remarks

The ADC must be configured to use the CTMU trigger signal generated.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CTMU_ExistsAutomaticADCTrigger in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Enable ADC trigger from CTMU
PLIB_CTMU_AutomaticADCTriggerEnable ( CTMU_ID_0 );

//To Do: Tell ADC to use CTMU trigger
```

Parameters

Parameters	Description
index	Identifier for the desired CTMU module

Function

void PLIB_CTMU_AutomaticADCTriggerEnable (CTMU_MODULE_ID index)

PLIB_CTMU_CurrentDischargeDisable Function

Disables the Current discharge by not connecting the current source output to ground.

File

plib_ctmu.h

C

```
void PLIB_CTMU_CurrentDischargeDisable(CTMU_MODULE_ID index);
```

Returns

None.

Description

This function disables the Current discharge by not connecting the current source output to ground.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CTMU_ExistsCurrentDischarge in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Measure button voltage
// TO DO: Start ADC sampling to connect S&H capacitor to charge pump
PLIB_CTMU_CurrentDischargeDisable ( CTMU_ID_0 );    // Ground charge pump
```

Parameters

Parameters	Description
index	Identifier for the desired CTMU module

Function

void PLIB_CTMU_CurrentDischargeDisable (CTMU_MODULE_ID index)

PLIB_CTMU_CurrentDischargeEnable Function

Enables the Current discharge by connecting the current source output to ground.

File

plib_ctmu.h

C

```
void PLIB_CTMU_CurrentDischargeEnable(CTMU_MODULE_ID index);
```

Returns

None.

Description

This function enables the Current discharge by connecting the current source output to ground.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CTMU_ExistsCurrentDischarge in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Measure button voltage
// TO DO: Start ADC sampling to connect S&H capacitor to charge pump
PLIB_CTMU_CurrentDischargeEnable ( CTMU_ID_0 );    // Ground charge pump
```

Parameters

Parameters	Description
index	Identifier for the desired CTMU module

Function

void PLIB_CTMU_CurrentDischargeEnable (CTMU_MODULE_ID index)

PLIB_CTMU_CurrentTrimSet Function

Trims current source off of the nominal value.

File

plib_ctmu.h

C

```
void PLIB_CTMU_CurrentTrimSet(CTMU_MODULE_ID index, int16_t currentTrim);
```

Description

This function trims current source off of the nominal value.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CTMU_ExistsCurrentTrim in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Set current trim, adjust from nominal by -10 x 2% = -20%
PLIB_CTMU_CurrentTrimSet ( CTMU_ID_0, -10 );
```

Parameters

Parameters	Description
index	Identifier for the desired CTMU module
currentTrim	Current trim index, from -31 to 31

Function

void PLIB_CTMU_CurrentTrimSet (CTMU_MODULE_ID index, int16_t currentTrim)

PLIB_CTMU_TimePulseGenerationDisable Function

Disables generation of time pulses using Comparator 2.

File

plib_ctmu.h

C

```
void PLIB_CTMU_TimePulseGenerationDisable(CTMU_MODULE_ID index);
```

Returns

None.

Description

This function disables generation of time pulses using Comparator 2.

Current source is made available for other measurements, including capacitance, time, or temperature (if temperature sensor is available).

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CTMU_ExistsTimePulseGeneration in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Return to button relative capacitance measurements
PLIB_CTMU_TimePulseGenerationDisable ( CTMU_ID_0 );
```

Parameters

Parameters	Description
index	Identifier for the desired CTMU module

Function

void PLIB_CTMU_TimePulseGenerationDisable (CTMU_MODULE_ID index)

PLIB_CTMU_TimePulseGenerationEnable Function

Enables the generation of time pulses.

File

plib_ctmu.h

C

```
void PLIB_CTMU_TimePulseGenerationEnable(CTMU_MODULE_ID index);
```

Returns

None.

Description

This function enables generation of time pulses using Comparator 2.

Current source will not be available for capacitance, time, or temperature measurements.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CTMU_ExistsTimePulseGeneration in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Send current to ADC S&H without going through ADC input MUX.
PLIB_CTMU_TimePulseGenerationEnable ( CTMU_ID_0 );
```

Parameters

Parameters	Description
index	Identifier for the desired CTMU module

Function

void PLIB_CTMU_TimePulseGenerationEnable (CTMU_MODULE_ID index)

b) Edge Control and Status Functions

PLIB_CTMU_EdgeDisable Function

Disables the edges of the CTMU.

File

plib_ctmu.h

C

```
void PLIB_CTMU_EdgeDisable(CTMU_MODULE_ID index);
```

Returns

None.

Description

This function disables the edges of the CTMU (makes them blocked).

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CTMU_ExistsEdgeEnable in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Disable edges, now can only turn CTMU on/off by modifying edge status
PLIB_CTMU_EdgeDisable ( CTMU_ID_0 );
```

Parameters

Parameters	Description
index	Identifier for the desired CTMU module

Function

void PLIB_CTMU_EdgeDisable (CTMU_MODULE_ID index)

PLIB_CTMU_EdgeEnable Function

Enables the edges of the CTMU.

File

plib_ctmu.h

C

```
void PLIB_CTMU_EdgeEnable(CTMU_MODULE_ID index);
```

Returns

None.

Description

This function enables the edges of the CTMU (makes it not blocked).

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CTMU_ExistsEdgeEnable in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Enable edges so that input signals can turn the CTMU charge pump on and off
PLIB_CTMU_EdgeEnable ( CTMU_ID_0 );
```

Parameters

Parameters	Description
index	Identifier for the desired CTMU module

Function

void PLIB_CTMU_EdgeEnable (CTMU_MODULE_ID index)

PLIB_CTMU_EdgeSequenceDisable Function

Disables the edge sequence of the CTMU.

File

plib_ctmu.h

C

```
void PLIB_CTMU_EdgeSequenceDisable(CTMU_MODULE_ID index);
```

Returns

None.

Description

This function disables the edge sequence of the CTMU.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CTMU_ExistsEdgeSequencing in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Trigger on Edge1 or Edge2, which ever one occurs first
PLIB_CTMU_EdgeSequenceDisable ( CTMU_ID_0 );
```

Parameters

Parameters	Description
index	Identifier for the desired CTMU module

Function

void PLIB_CTMU_EdgeSequenceDisable (CTMU_MODULE_ID index)

PLIB_CTMU_EdgeSequenceEnable Function

Enables the edge sequence of the CTMU.

File

plib_ctmu.h

C

```
void PLIB_CTMU_EdgeSequenceEnable(CTMU_MODULE_ID index);
```

Returns

None.

Description

This function enables the edge sequence of the CTMU. Edge 1 must occur before Edge 2 can occur.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CTMU_ExistsEdgeSequencing in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Trigger on Edge1 then Edge2, i.e., don't trigger on Edge 2
//until Edge 1 has occurred
PLIB_CTMU_EdgeSequenceEnable ( CTMU_ID_0 );
```

Parameters

Parameters	Description
index	Identifier for the desired CTMU module

Function

void PLIB_CTMU_EdgeSequenceEnable (CTMU_MODULE_ID index)

PLIB_CTMU_EdgeIsSet Function

Gets the status of a CTMU edge.

File

plib_ctmu.h

C

```
bool PLIB_CTMU_EdgeIsSet(CTMU_MODULE_ID index, CTMU_EDGE_SELECT edgeNumber);
```

Returns

None.

Description

This function gets the status of the selected CTMU edge (given by edgeNumber).

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CTMU_ExistsEdgeStatus in your application to determine whether this feature is available.

Preconditions

None.

Example

```
bool edgeStatus;

edgeStatus = PLIB_CTMU_EdgeIsSet ( CTMU_ID_0, CTMU_EDGE1 );
```

Parameters

Parameters	Description
index	Identifier for the desired CTMU module.
edgeNumber	CTMU Edge for which the trigger source to be set, one of the possible elements of the CTMU_EDGE_SELECT enum.

Function

bool PLIB_CTMU_EdgeIsSet (CTMU_MODULE_ID index, CTMU_EDGE_SELECT edgeNumber)

PLIB_CTMU_EdgePolaritySet Function

Sets a CTMU edge to fire on an edge/level with the selected polarity of signal.

File

plib_ctmu.h

C

```
void PLIB_CTMU_EdgePolaritySet(CTMU_MODULE_ID index, CTMU_EDGE_SELECT edgeNumber, CTMU_EDGE_POLARITY
edgePolarity);
```

Returns

None.

Description

This function sets a CTMU edge to fire on an edge/level with the selected polarity of signal.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CTMU_ExistsEdgePolarity in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Example to set both edges to trigger on positive level/edge.
PLIB_CTMU_EdgePolaritySet ( CTMU_ID_0, CTMU_EDGE1, CTMU_EDGE_X_POSITIVE_EDGE );
PLIB_CTMU_EdgePolaritySet ( CTMU_ID_0, CTMU_EDGE2, CTMU_EDGE_X_POSITIVE_EDGE );
```

Parameters

Parameters	Description
index	Identifier for the desired CTMU module.
edgeNumber	CTMU Edge for which the polarity to be set, one of the possible elements of CTMU_EDGE_SELECT enum.
edgeSense	CTMU Edge polarity, one of the possible elements of the CTMU_EDGE_POLARITY enum.

Function

void PLIB_CTMU_EdgePolaritySet (CTMU_MODULE_ID index,CTMU_EDGE_SELECT edgeNumber,

CTMU_EDGE_POLARITY edgePolarity);

PLIB_CTMU_EdgeSensitivitySet Function

Sets CTMU sensitivity for the selected edge.

File

plib_ctmu.h

C

```
void PLIB_CTMU_EdgeSensitivitySet(CTMU_MODULE_ID index, CTMU_EDGE_SELECT edgeNumber, CTMU_EDGE_SENSITIVITY
edgeSense);
```

Returns

None.

Description

This function can be used to set the sensitivity of a particular edge to level-sensitive or edge sensitive.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CTMU_ExistsEdgeSensitivity in your application to determine whether this feature is available.

Preconditions

None.

Example

```
// Example to set both edges to trigger on edges rather than levels
PLIB_CTMU_EdgeSensitivitySet ( CTMU_ID_0, CTMU_EDGE1, CTMU_EDGE_X_EDGE_SENSITIVE );
PLIB_CTMU_EdgeSensitivitySet ( CTMU_ID_0, CTMU_EDGE2, CTMU_EDGE_X_EDGE_SENSITIVE );
```

Parameters

Parameters	Description
index	Identifier for the desired CTMU module.
edgeNumber	CTMU edge for which the sensitivity to be set, one of the possible elements of the CTMU_EDGE_SELECT enum.
edgeSense	CTMU Edge sensitivity, one of the possible elements of the CTMU_EDGE_SENSITIVITY enum.

Function

void PLIB_CTMU_EdgeSensitivitySet (CTMU_MODULE_ID index, CTMU_EDGE_SELECT edgeNumber,
CTMU_EDGE_SENSITIVITY edgeSense)

PLIB_CTMU_EdgeSet Function

Sets the status of a CTMU edge.

File

plib_ctmu.h

C

```
void PLIB_CTMU_EdgeSet(CTMU_MODULE_ID index, CTMU_EDGE_SELECT edgeNumber);
```

Returns

None.

Description

This function sets the status of the selected CTMU edge (given by edge_number).

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CTMU_ExistsEdgeStatus in your application to determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_CTMU_EdgeSet ( CTMU_ID_0, CTMU_EDGE1 );
```

Parameters

Parameters	Description
index	Identifier for the desired CTMU module.
edgeNumber	CTMU Edge for which the trigger source to be set, one of the possible elements of the CTMU_EDGE_SELECT enum.

Function

void PLIB_CTMU_EdgeSet (CTMU_MODULE_ID index, CTMU_EDGE_SELECT edgeNumber)

PLIB_CTMU_EdgeTriggerSourceSelect Function

Assigns a trigger source for an edge.

File

plib_ctmu.h

C

```
void PLIB_CTMU_EdgeTriggerSourceSelect(CTMU_MODULE_ID index, CTMU_EDGE_SELECT edgeNumber,
CTMU_TRIGGER_SOURCES triggerSource);
```

Returns

None.

Description

This function will enable the CTMU edge (given by edge_number) to trigger on the signal provided by the trigger source selected.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_CTMU_ExistsEdgeTriggerSource in your application to determine whether this feature is available.

Preconditions

None.

Example

```
//Set source 0 as the trigger source for both the edges
PLIB_CTMU_EdgeTriggerSourceSelect ( CTMU_ID_0, CTMU_EDGE1, CTMU_TRIGGERSOURCE_0 );
PLIB_CTMU_EdgeTriggerSourceSelect ( CTMU_ID_0, CTMU_EDGE2, CTMU_TRIGGERSOURCE_0 );
```

Parameters

Parameters	Description
index	Identifier for the desired CTMU module.
edgeNumber	CTMU Edge for which the trigger source to be set, one of the possible elements of the CTMU_EDGE_SELECT enum.
triggerSource	CTMU Edge trigger source, one of the possible elements of the CTMU_TRIGGER_SOURCES enum.

Function

void PLIB_CTMU_EdgeTriggerSourceSelect (CTMU_MODULE_ID index,

CTMU_EDGE_SELECT edgeNumber,

CTMU_TRIGGER_SOURCES triggerSource)

c) Feature Existence Functions

PLIB_CTMU_ExistsAutomaticADCTrigger Function

Identifies whether the AutomaticADCTrigger feature exists on the CTMU module.

File

plib_ctmu.h

C

```
bool PLIB_CTMU_ExistsAutomaticADCTrigger(CTMU_MODULE_ID index);
```

Returns

- true - The AutomaticADCTrigger feature is supported on the device
- false - The AutomaticADCTrigger feature is not supported on the device

Description

This function identifies whether the AutomaticADCTrigger feature is available on the CTMU module. When this function returns true, these functions are supported on the device:

- PLIB_CTMU_AutomaticADCTriggerDisable
- PLIB_CTMU_AutomaticADCTriggerEnable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CTMU_ExistsAutomaticADCTrigger(CTMU_MODULE_ID index)

PLIB_CTMU_ExistsCurrentDischarge Function

Identifies whether the CurrentDischarge feature exists on the CTMU module.

File

plib_ctmu.h

C

```
bool PLIB_CTMU_ExistsCurrentDischarge(CTMU_MODULE_ID index);
```

Returns

- true - The CurrentDischarge feature is supported on the device
- false - The CurrentDischarge feature is not supported on the device

Description

This function identifies whether the CurrentDischarge feature is available on the CTMU module. When this function returns true, these functions are supported on the device:

- PLIB_CTMU_CurrentDischargeEnable
- PLIB_CTMU_CurrentDischargeDisable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CTMU_ExistsCurrentDischarge(CTMU_MODULE_ID index)

PLIB_CTMU_ExistsCurrentRange Function

Identifies whether the CurrentRange feature exists on the CTMU module.

File

plib_ctmu.h

C

```
bool PLIB_CTMU_ExistsCurrentRange(CTMU_MODULE_ID index);
```

Returns

- true - The CurrentRange feature is supported on the device
- false - The CurrentRange feature is not supported on the device

Description

This function identifies whether the CurrentRange feature is available on the CTMU module. When this function returns true, this function is supported on the device:

- PLIB_CTMU_CurrentRangeSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CTMU_ExistsCurrentRange(CTMU_MODULE_ID index)

PLIB_CTMU_ExistsCurrentTrim Function

Identifies whether the CurrentTrim feature exists on the CTMU module.

File

plib_ctmu.h

C

```
bool PLIB_CTMU_ExistsCurrentTrim(CTMU_MODULE_ID index);
```

Returns

- true - The CurrentTrim feature is supported on the device
- false - The CurrentTrim feature is not supported on the device

Description

This function identifies whether the CurrentTrim feature is available on the CTMU module. When this function returns true, this function is supported on the device:

- PLIB_CTMU_CurrentTrimSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CTMU_ExistsCurrentTrim(CTMU_MODULE_ID index)

PLIB_CTMU_ExistsEdgeEnable Function

Identifies whether the EdgeEnable feature exists on the CTMU module.

File

plib_ctmu.h

C

```
bool PLIB_CTMU_ExistsEdgeEnable(CTMU_MODULE_ID index);
```

Returns

- true - The EdgeEnable feature is supported on the device
- false - The EdgeEnable feature is not supported on the device

Description

This function identifies whether the EdgeEnable feature is available on the CTMU module. When this function returns true, these functions are supported on the device:

- PLIB_CTMU_EdgeDisable
- PLIB_CTMU_EdgeEnable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CTMU_ExistsEdgeEnable(CTMU_MODULE_ID index)

PLIB_CTMU_ExistsEdgePolarity Function

Identifies whether the EdgePolarity feature exists on the CTMU module.

File

plib_ctmu.h

C

```
bool PLIB_CTMU_ExistsEdgePolarity(CTMU_MODULE_ID index);
```

Returns

- true - The EdgePolarity feature is supported on the device
- false - The EdgePolarity feature is not supported on the device

Description

This function identifies whether the EdgePolarity feature is available on the CTMU module. When this function returns true, this function is supported on the device:

- PLIB_CTMU_EdgePolaritySet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CTMU_ExistsEdgePolarity(CTMU_MODULE_ID index)

PLIB_CTMU_ExistsEdgeSensitivity Function

Identifies whether the EdgeSensitivity feature exists on the CTMU module,

File

plib_ctmu.h

C

```
bool PLIB_CTMU_ExistsEdgeSensitivity(CTMU_MODULE_ID index);
```

Returns

- true - The EdgeSensitivity feature is supported on the device
- false - The EdgeSensitivity feature is not supported on the device

Description

This function identifies whether the EdgeSensitivity feature is available on the CTMU module. When this function returns true, this function is supported on the device:

- PLIB_CTMU_EdgeSensitivitySet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CTMU_ExistsEdgeSensitivity(CTMU_MODULE_ID index)

PLIB_CTMU_ExistsEdgeSequencing Function

Identifies whether the EdgeSequencing feature exists on the CTMU module.

File

plib_ctmu.h

C

```
bool PLIB_CTMU_ExistsEdgeSequencing(CTMU_MODULE_ID index);
```

Returns

- true - The EdgeSequencing feature is supported on the device
- false - The EdgeSequencing feature is not supported on the device

Description

This function identifies whether the EdgeSequencing feature is available on the CTMU module. When this function returns true, these functions are supported on the device:

- PLIB_CTMU_EdgeSequenceDisable
- PLIB_CTMU_EdgeSequenceEnable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CTMU_ExistsEdgeSequencing(CTMU_MODULE_ID index)

PLIB_CTMU_ExistsEdgeStatus Function

Identifies whether the EdgeStatus feature exists on the CTMU module.

File

plib_ctmu.h

C

```
bool PLIB_CTMU_ExistsEdgeStatus(CTMU_MODULE_ID index);
```

Returns

- true - The EdgeStatus feature is supported on the device
- false - The EdgeStatus feature is not supported on the device

Description

This function identifies whether the EdgeStatus feature is available on the CTMU module. When this function returns true, these functions are supported on the device:

- PLIB_CTMU_EdgeIsSet
- PLIB_CTMU_EdgeSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CTMU_ExistsEdgeStatus(CTMU_MODULE_ID index)

PLIB_CTMU_ExistsEdgeTriggerSource Function

Identifies whether the EdgeTriggerSource feature exists on the CTMU module.

File

plib_ctmu.h

C

```
bool PLIB_CTMU_ExistsEdgeTriggerSource(CTMU_MODULE_ID index);
```

Returns

- true - The EdgeTriggerSource feature is supported on the device
- false - The EdgeTriggerSource feature is not supported on the device

Description

This function identifies whether the EdgeTriggerSource feature is available on the CTMU module. When this function returns true, this function is supported on the device:

- PLIB_CTMU_EdgeTriggerSourceSelect

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CTMU_ExistsEdgeTriggerSource(CTMU_MODULE_ID index)

PLIB_CTMU_ExistsModuleEnable Function

Identifies whether the ModuleEnable feature exists on the CTMU module.

File

plib_ctmu.h

C

```
bool PLIB_CTMU_ExistsModuleEnable(CTMU_MODULE_ID index);
```

Returns

- true - The ModuleEnable feature is supported on the device
- false - The ModuleEnable feature is not supported on the device

Description

This function identifies whether the ModuleEnable feature is available on the CTMU module. When this function returns true, these functions are supported on the device:

- PLIB_CTMU_Disable
- PLIB_CTMU_Enable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CTMU_ExistsModuleEnable(CTMU_MODULE_ID index)

PLIB_CTMU_ExistsStopInIdle Function

Identifies whether the StopInIdle feature exists on the CTMU module.

File

plib_ctmu.h

C

```
bool PLIB_CTMU_ExistsStopInIdle(CTMU_MODULE_ID index);
```

Returns

- true - The StopInIdle feature is supported on the device
- false - The StopInIdle feature is not supported on the device

Description

This function identifies whether the StopInIdle feature is available on the CTMU module. When this function returns true, these functions are supported on the device:

- PLIB_CTMU_StopInIdleDisable
- PLIB_CTMU_StopInIdleEnable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CTMU_ExistsStopInIdle(CTMU_MODULE_ID index)

PLIB_CTMU_ExistsTimePulseGeneration Function

Identifies whether the TimePulseGeneration feature exists on the CTMU module.

File

plib_ctmu.h

C

```
bool PLIB_CTMU_ExistsTimePulseGeneration(CTMU_MODULE_ID index);
```

Returns

- true - The TimePulseGeneration feature is supported on the device
- false - The TimePulseGeneration feature is not supported on the device

Description

This function identifies whether the TimePulseGeneration feature is available on the CTMU module. When this function returns true, these functions are supported on the device:

- PLIB_CTMU_TimePulseGenerationDisable
- PLIB_CTMU_TimePulseGenerationEnable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_CTMU_ExistsTimePulseGeneration(CTMU_MODULE_ID index)

Files

Files

Name	Description
plib_ctmu.h	This file contains the interface definition for the CTMU Peripheral Library.

Description

This section lists the source and header files used by the library.

plib_ctmu.h

This file contains the interface definition for the CTMU Peripheral Library.

Functions

	Name	Description
	PLIB_CTMU_AutomaticADCTriggerDisable	Disables the module to automatically trigger an analog-to-digital conversion.
	PLIB_CTMU_AutomaticADCTriggerEnable	Enables the module to automatically trigger an analog-to-digital conversion when the second edge event has occurred.

	PLIB_CTMU_CurrentDischargeDisable	Disables the Current discharge by not connecting the current source output to ground.
	PLIB_CTMU_CurrentDischargeEnable	Enables the Current discharge by connecting the current source output to ground.
	PLIB_CTMU_CurrentRangeSet	Selects the current source range.
	PLIB_CTMU_CurrentTrimSet	Trims current source off of the nominal value.
	PLIB_CTMU_Disable	Disables the CTMU module.
	PLIB_CTMU_EdgeDisable	Disables the edges of the CTMU.
	PLIB_CTMU_EdgeEnable	Enables the edges of the CTMU.
	PLIB_CTMU_EdgeIsSet	Gets the status of a CTMU edge.
	PLIB_CTMU_EdgePolaritySet	Sets a CTMU edge to fire on an edge/level with the selected polarity of signal.
	PLIB_CTMU_EdgeSensitivitySet	Sets CTMU sensitivity for the selected edge.
	PLIB_CTMU_EdgeSequenceDisable	Disables the edge sequence of the CTMU.
	PLIB_CTMU_EdgeSequenceEnable	Enables the edge sequence of the CTMU.
	PLIB_CTMU_EdgeSet	Sets the status of a CTMU edge.
	PLIB_CTMU_EdgeTriggerSourceSelect	Assigns a trigger source for an edge.
	PLIB_CTMU_Enable	Enables the CTMU module.
	PLIB_CTMU_ExistsAutomaticADCTrigger	Identifies whether the AutomaticADCTrigger feature exists on the CTMU module.
	PLIB_CTMU_ExistsCurrentDischarge	Identifies whether the CurrentDischarge feature exists on the CTMU module.
	PLIB_CTMU_ExistsCurrentRange	Identifies whether the CurrentRange feature exists on the CTMU module.
	PLIB_CTMU_ExistsCurrentTrim	Identifies whether the CurrentTrim feature exists on the CTMU module.
	PLIB_CTMU_ExistsEdgeEnable	Identifies whether the EdgeEnable feature exists on the CTMU module.
	PLIB_CTMU_ExistsEdgePolarity	Identifies whether the EdgePolarity feature exists on the CTMU module.
	PLIB_CTMU_ExistsEdgeSensitivity	Identifies whether the EdgeSensitivity feature exists on the CTMU module,
	PLIB_CTMU_ExistsEdgeSequencing	Identifies whether the EdgeSequencing feature exists on the CTMU module.
	PLIB_CTMU_ExistsEdgeStatus	Identifies whether the EdgeStatus feature exists on the CTMU module.
	PLIB_CTMU_ExistsEdgeTriggerSource	Identifies whether the EdgeTriggerSource feature exists on the CTMU module.
	PLIB_CTMU_ExistsModuleEnable	Identifies whether the ModuleEnable feature exists on the CTMU module.
	PLIB_CTMU_ExistsStopInIdle	Identifies whether the StopInIdle feature exists on the CTMU module.
	PLIB_CTMU_ExistsTimePulseGeneration	Identifies whether the TimePulseGeneration feature exists on the CTMU module.
	PLIB_CTMU_StopInIdleDisable	Sets the CTMU module to continue running when the device is in Idle mode.
	PLIB_CTMU_StopInIdleEnable	Sets the CTMU module to not operate when the device is in Idle mode.
	PLIB_CTMU_TimePulseGenerationDisable	Disables generation of time pulses using Comparator 2.
	PLIB_CTMU_TimePulseGenerationEnable	Enables the generation of time pulses.

Description

Charge Time Measurement Unit (CTMU) Peripheral Library Header

This library provides a low-level abstraction of the Charge Time Measurement Unit(CTMU) module on Microchip microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, thus hiding differences between one microcontroller variant and another.

File Name

Microchip Technology Inc.

Deadman Timer Peripheral Library

This section describes the Deadman Timer (DMT) Peripheral Library.

Introduction

This library provides a low-level abstraction of the DMT Peripheral Library that is available on the Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, there by abstracting differences from one microcontroller variant to another.

Description

The primary function of the Deadman Timer (DMT) is to reset the processor in the event of a software malfunction.

Using the Library

This topic describes the basic architecture of the DMT Peripheral Library and provides information and examples on its use.

Description

Interface Header File: `plib_dmt.h`

The interface to the DMT Peripheral Library is defined in the `plib_dmt.h` header file, which is included by the peripheral library header file, `peripheral.h`. Any C language source (`.c`) file that uses the DMT Peripheral Library must include `peripheral.h`.

Library File:

The DMT Peripheral Library archive (`.a`) file is installed with MPLAB Harmony.

Please refer to the What is MPLAB Harmony? section for how the library interacts with the framework.

Hardware Abstraction Model

This library provides the low-level abstraction of the Deadman Timer module on the Microchip family of microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in the software and introduces the library interface.

Description

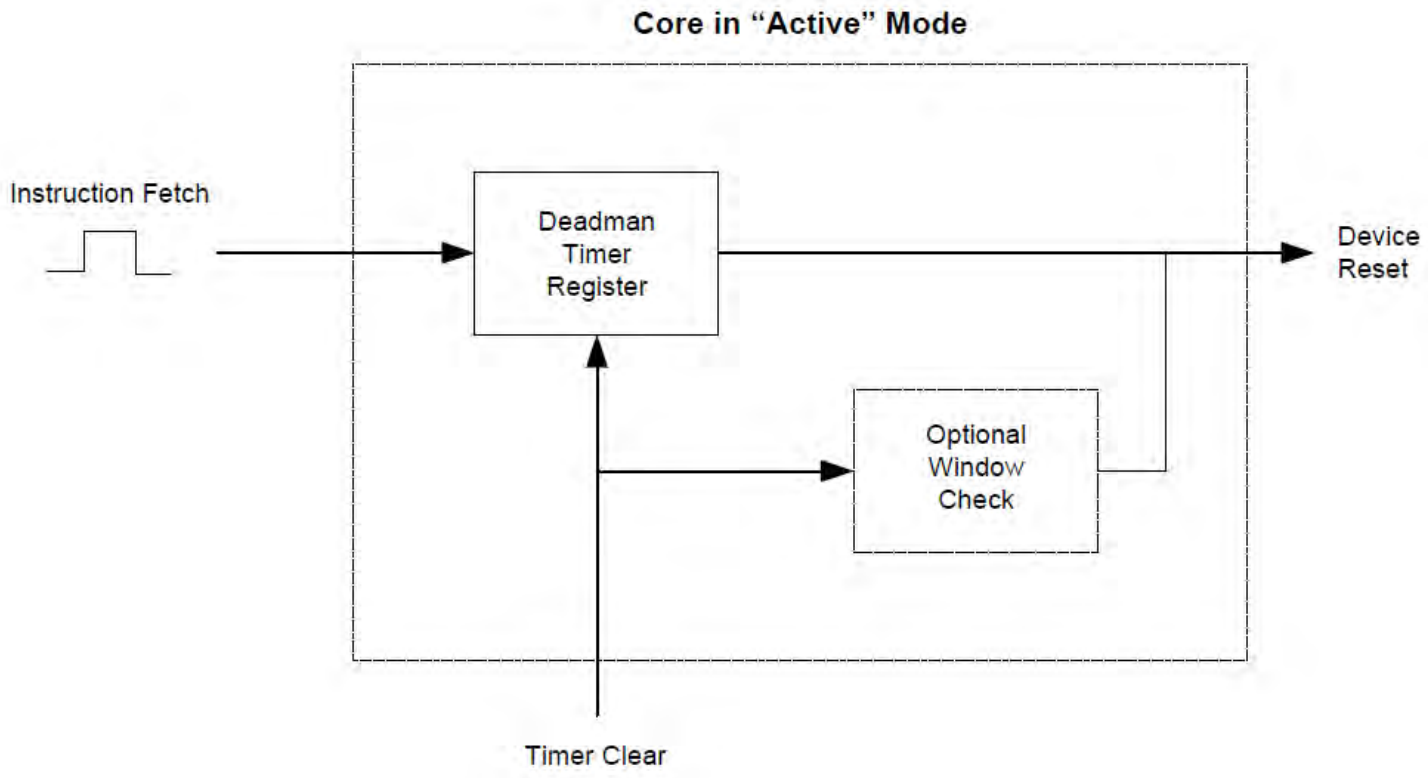
The Deadman Timer is a free-running instruction fetch timer, which is clocked whenever an instruction fetch occurs.

The Deadman Timer is active in the normal mode only. Since the Deadman Timer is only incremented by instruction fetches, the count value will not change when the core is inactive. So, the Deadman Timer remains inactive in Sleep and Idle modes.

The Deadman Timer module uses the Deadman register as a timer. If there is no reset signal from the software and if the counter overflows, this results in the device Reset.

For Windowed mode, resetting the counter when the count is not in the specified window will also lead to the device Reset.

Deadman Timer Software Abstraction Block Diagram



Library Overview

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the Deadman Timer module.

Library Interface Section	Description
General Configuration Functions	Includes module enable and disable functions.
General Status Functions	Status routines for the DMT.
Feature Existence Functions	Functions that determine existence of certain features.

How the Library Works

This section provides information on how the Deadman Timer Peripheral Library works.

Configuring the Library

The library is configured for the supported Deadman Timer module when the processor is chosen in the MPLAB X IDE.

Library Interface

a) General Configuration Functions

	Name	Description
	PLIB_DMT_ClearStep1	Resets the DMT module.
	PLIB_DMT_ClearStep2	Resets the DMT module.
	PLIB_DMT_Disable	Disables the DMT module.
	PLIB_DMT_Enable	Enables the DMT module.

b) General Status Functions

	Name	Description
	PLIB_DMT_BAD1Get	Returns BAD1 flag from the DMT Status Register.
	PLIB_DMT_BAD2Get	Returns BAD2 flag from the DMT Status Register.
	PLIB_DMT_CounterGet	Returns the DMT counter value.
	PLIB_DMT_IsEnabled	Returns the Deadman Timer on/off(enable/disable) status.
	PLIB_DMT_PostscalerIntervalGet	Returns the DMT postscaler interval value.
	PLIB_DMT_PostscalerValueGet	Returns the DMT postscaler value.
	PLIB_DMT_WindowIsOpen	Returns Window is Open flag from the DMT Status Register.
	PLIB_DMT_EventOccurred	Returns Event flag from the DMT Status Register.

c) Feature Existence Functions

	Name	Description
	PLIB_DMT_ExistsCounter	Identifies whether the Counter feature exists on the DMT module.
	PLIB_DMT_ExistsEnableControl	Identifies whether the EnableControl feature exists on the DMT module.
	PLIB_DMT_ExistsPostscalerInterval	Identifies whether the Postscaler Interval feature exists on the DMT module.
	PLIB_DMT_ExistsPostscalerValue	Identifies whether the Postscaler Value feature exists on the DMT module.
	PLIB_DMT_ExistsStatus	Identifies whether the Status feature exists on the DMT module.
	PLIB_DMT_ExistsStep1	Identifies whether the STEP1 Clear feature exists on the DMT module.
	PLIB_DMT_ExistsStep2	Identifies whether the STEP2 Clear feature exists on the DMT module.

d) Data Types and Constants

	Name	Description
	DMT_MODULE_ID	Identifies the supported DMT modules.

Description

This section describes the Application Programming Interface (API) functions of the Deadman Timer Peripheral Library.

Refer to each section for a detailed description.

a) General Configuration Functions

PLIB_DMT_ClearStep1 Function

Resets the DMT module.

File

plib_dmt.h

C

```
void PLIB_DMT_ClearStep1(DMT_MODULE_ID index);
```

Returns

None.

Description

This function performs the STEP1 Clearing of the DMT module. The DMT module should be cleared in two steps, within the interval determined by the Count Window before the DMT forces an NMI or device reset.

Remarks

Resetting the device before the count reaches the window will cause a reset in Windowed mode.

The example code does not include the settings that should be done through the Configuration bits.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_DMT_ExistsTimerClear in your application to determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_DMT_Enable ( DMT_ID_0 );

//Application loop
while(1)
{
    PLIB_DMT_ClearStep1 ( DMT_ID_0 );
    //user code
    PLIB_DMT_ClearStep2 ( DMT_ID_0 );
    //user code
}
```

Parameters

Parameters	Description
index	Identifies the desired DMT module

Function

void PLIB_DMT_ClearStep1 (DMT_MODULE_ID index)

PLIB_DMT_ClearStep2 Function

Resets the DMT module.

File

plib_dmt.h

C

```
void PLIB_DMT_ClearStep2(DMT_MODULE_ID index);
```

Returns

None.

Description

This function performs the STEP2 Clearing of the DMT module. The DMT module should be cleared in two steps, within the interval determined by the Count Window before the DMT forces an NMI or device reset.

Remarks

Resetting the device before the count reaches the window will cause a reset in Windowed mode.

The example code doesn't include the settings that should be done through the Configuration bits.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_DMT_ExistsTimerClear in your application to determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_DMT_Enable ( DMT_ID_0 );

//Application loop
while(1)
{
    PLIB_DMT_ClearStep1 ( DMT_ID_0 );
    //user code
    PLIB_DMT_ClearStep2 ( DMT_ID_0 );
    //user code
}
```

Parameters

Parameters	Description
index	Identifies the desired DMT module

Function

void PLIB_DMT_ClearStep2 (DMT_MODULE_ID index)

PLIB_DMT_Disable Function

Disables the DMT module.

File

plib_dmt.h

C

```
void PLIB_DMT_Disable(DMT_MODULE_ID index);
```

Returns

None.

Description

This function disables the DMT module if it is enabled in software.

Remarks

This function will not disable the DMT module if it is enabled through its Configuration bits.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_DMT_ExistsEnableControl in your application to determine whether this feature is available.

Preconditions

The DMT module must have been enabled through software.

Example

```
PLIB_DMT_Disable ( DMT_ID_0 );
```

Parameters

Parameters	Description
index	Identifies the desired DMT module

Function

void PLIB_DMT_Disable (DMT_MODULE_ID index)

PLIB_DMT_Enable Function

Enables the DMT module.

File

plib_dmt.h

C

```
void PLIB_DMT_Enable(DMT_MODULE_ID index);
```

Returns

None.

Description

This function enables the DMT module. If it is already enabled through the Configuration bits, it will keep it enabled.

Remarks

Calling this function is not necessary if it is enabled through its Configuration bits.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_DMT_ExistsEnableControl in your application to determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_DMT_Enable ( DMT_ID_0 );
```

Parameters

Parameters	Description
index	Identifies the desired DMT module

Function

void PLIB_DMT_Enable (DMT_MODULE_ID index)

b) General Status Functions

PLIB_DMT_BAD1Get Function

Returns BAD1 flag from the DMT Status Register.

File

plib_dmt.h

C

```
bool PLIB_DMT_BAD1Get(DMT_MODULE_ID index);
```

Returns

The flag value, true or false.

Description

This function returns the DMT BAD1 Flag. This flag is set when there is an incorrect write to STEP1, such as the wrong value, writing too early, or writing too late.

Remarks

The flag returned will indicated if a STEP1 write was not successful.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_DMT_ExistsStatus in your application to determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_DMT_Enable ( DMT_ID_0 );
//user code
PLIB_DMT_ClearStep1();
if( PLIB_DMT_BAD1Get ( DMT_ID_0 ))
{
   //user code
}
```

Parameters

Parameters	Description
index	Identifies the desired DMT module

Function

bool PLIB_DMT_BAD1Get (DMT_MODULE_ID index)

PLIB_DMT_BAD2Get Function

Returns BAD2 flag from the DMT Status Register.

File

plib_dmt.h

C

```
bool PLIB_DMT_BAD2Get(DMT_MODULE_ID index);
```

Returns

The flag value, true or false.

Description

This function returns the DMT BAD2 Flag. This flag is set when there is an incorrect write to STEP2, such as the wrong value, writing too early, or writing too late.

Remarks

The flag returned will indicated if a STEP2 write was not successful.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_DMT_ExistsStatus in your application to determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_DMT_Enable ( DMT_ID_0 );
//user code
PLIB_DMT_ClearStep1();
//user code
PLIB_DMT_ClearStep2();
if( PLIB_DMT_BAD2Get ( DMT_ID_0 ))
{
   //user code
}
```

Parameters

Parameters	Description
index	Identifies the desired DMT module

Function

bool PLIB_DMT_BAD2Get (DMT_MODULE_ID index)

PLIB_DMT_CounterGet Function

Returns the DMT counter value.

File

plib_dmt.h

C

```
uint32_t PLIB_DMT_CounterGet(DMT_MODULE_ID index);
```

Returns

The counter value.

Description

This function returns the DMT counter value. The value is the number of instructions counted since the count was last cleared.

Remarks

The value returned will be right-aligned.

Refer the data sheet of the specific device to get the division factor corresponding to the value.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_DMT_ExistsCounterValue in your application to determine whether this feature is available.

Preconditions

None.

Example

```
uint32_t value;

PLIB_DMT_Enable ( DMT_ID_0 );
value = PLIB_DMT_CounterGet ( DMT_ID_0 );
```

Parameters

Parameters	Description
index	Identifies the desired DMT module

Function

uint32_t PLIB_DMT_CounterGet (DMT_MODULE_ID index)

PLIB_DMT_IsEnabled Function

Returns the Deadman Timer on/off(enable/disable) status.

File

plib_dmt.h

C

```
bool PLIB_DMT_IsEnabled(DMT_MODULE_ID index);
```

Returns

true - If the Deadman Timer is on false - If the Deadman Timer is off

Description

Returns the 'true', if the Deadman Timer is already ON. Otherwise returns 'false'.

Remarks

This function returns 'true' if the device is enabled either though the Configuration bits or in the software.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_DMT_ExistsEnableControl in your application to determine whether this feature is available.

Preconditions

None.

Example

```
if (PLIB_DMT_IsEnabled ( DMT_ID_0 ) )
{
    //Do some action
}
```

Parameters

Parameters	Description
index	Identifies the desired DMT module

Function

bool PLIB_DMT_IsEnabled (DMT_MODULE_ID index)

PLIB_DMT_PostscalerIntervalGet Function

Returns the DMT postscaler interval value.

File

plib_dmt.h

C

```
uint32_t PLIB_DMT_PostscalerIntervalGet(DMT_MODULE_ID index);
```

Returns

The postscaler interval.

Description

This function returns the DMT postscaler interval. The value will correspond to a total number of instructions for DMT window, a value determined by configuration bits.

Remarks

The value returned will be right-aligned.

Refer the data sheet of the specific device to get the association of the configuration bits corresponding to this postscaler value.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_DMT_ExistsPostscalerValue in your application to determine whether this feature is available.

Preconditions

None.

Example

```
uint32_t value;

PLIB_DMT_Enable ( DMT_ID_0 );
value = PLIB_DMT_PostscalerIntervalGet ( DMT_ID_0 );
```

Parameters

Parameters	Description
index	Identifies the desired DMT module

Function

uint32_t PLIB_DMT_PostscalerIntervalGet (DMT_MODULE_ID index)

PLIB_DMT_PostscalerValueGet Function

Returns the DMT postscaler value.

File

plib_dmt.h

C

```
uint32_t PLIB_DMT_PostscalerValueGet(DMT_MODULE_ID index);
```

Returns

The postscaler value.

Description

This function returns the DMT postscaler value. The value will correspond to a total number of instructions for DMT timeout, a value determined by configuration bits.

Remarks

The value returned will be right-aligned.

Refer to the specific device data sheet to get the association of the configuration bits corresponding to this postscaler value.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_DMT_ExistsPostscalerValue in your application to determine whether this feature is available.

Preconditions

None.

Example

```
uint32_t value;

PLIB_DMT_Enable ( DMT_ID_0 );
value = PLIB_DMT_PostscalerValueGet ( DMT_ID_0 );
```

Parameters

Parameters	Description
index	Identifies the desired DMT module

Function

uint32_t PLIB_DMT_PostscalerValueGet (DMT_MODULE_ID index)

PLIB_DMT_WindowIsOpen Function

Returns Window is Open flag from the DMT Status Register.

File

plib_dmt.h

C

```
bool PLIB_DMT_WindowIsOpen(DMT_MODULE_ID index);
```

Returns

The flag value, true or false.

Description

This function returns the flag indicating the DMT Window is open.

Remarks

The flag returned will indicated if the DMT window is open.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_DMT_ExistsStatus in your application to determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_DMT_Enable ( DMT_ID_0 );
//user code
PLIB_DMT_ClearStep1();
//user code
if( PLIB_DMT_WindowIsOpen( DMT_ID_0 ))
{
   PLIB_DMT_ClearStep2();
}
```

Parameters

Parameters	Description
index	Identifies the desired DMT module

Function

bool PLIB_DMT_WindowIsOpen(DMT_MODULE_ID index)

PLIB_DMT_EventOccurred Function

Returns Event flag from the DMT Status Register.

File

plib_dmt.h

C

```
bool PLIB_DMT_EventOccurred(DMT_MODULE_ID index);
```

Returns

The flag value, true or false.

Description

This function returns the flag indicating a DMT event has happened, such as a Window Open, or a Bad Flag is set.

Remarks

The flag returned will indicate if a DMT event has happened.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_DMT_ExistsStatus in your application to determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_DMT_Enable ( DMT_ID_0 );
//user code
PLIB_DMT_ClearStep1();
//user code
if( PLIB_DMT_EventOccurred( DMT_ID_0 ))
{
   //user code
}
```

Parameters

Parameters	Description
index	Identifies the desired DMT module

Function

bool PLIB_DMT_EventOccurred(DMT_MODULE_ID index)

c) Feature Existence Functions

PLIB_DMT_ExistsCounter Function

Identifies whether the Counter feature exists on the DMT module.

File

plib_dmt.h

C

```
bool PLIB_DMT_ExistsCounter(DMT_MODULE_ID index);
```

Returns

- true - The Counter feature is supported on the device
- false - The Counter feature is not supported on the device

Description

This function identifies whether the Counter feature is available on the DMT module. When this function returns true, this function is supported on the device:

- PLIB_DMT_CounterGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMT_ExistsCounter(DMT_MODULE_ID index)

PLIB_DMT_ExistsEnableControl Function

Identifies whether the EnableControl feature exists on the DMT module.

File

plib_dmt.h

C

```
bool PLIB_DMT_ExistsEnableControl(DMT_MODULE_ID index);
```

Returns

Existence of the EnableControl feature:

- true - When EnableControl feature is supported on the device
- false - When EnableControl feature is not supported on the device

Description

This function identifies whether the EnableControl feature is available on the DMT module. When this function returns true, these functions are supported on the device:

- PLIB_DMT_Enable
- PLIB_DMT_Disable
- PLIB_DMT_IsEnabled

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMT_ExistsEnableControl(DMT_MODULE_ID index)

PLIB_DMT_ExistsPostscalerInterval Function

Identifies whether the Postscaler Interval feature exists on the DMT module.

File

plib_dmt.h

C

```
bool PLIB_DMT_ExistsPostscalerInterval(DMT_MODULE_ID index);
```

Returns

- true - The Postscaler Interval feature is supported on the device
- false - The Postscaler Interval feature is not supported on the device

Description

This function identifies whether the Postscaler Interval feature is available on the DMT module. When this function returns true, this function is supported on the device:

- PLIB_DMT_PostscalerIntervalGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMT_ExistsInterval(DMT_MODULE_ID index)

PLIB_DMT_ExistsPostscalerValue Function

Identifies whether the Postscaler Value feature exists on the DMT module.

File

plib_dmt.h

C

```
bool PLIB_DMT_ExistsPostscalerValue(DMT_MODULE_ID index);
```

Returns

- true - The Postscaler Value feature is supported on the device
- false - The Postscaler Value feature is not supported on the device

Description

This function identifies whether the PostscalerValue feature is available on the DMT module. When this function returns true, this function is supported on the device:

- PLIB_DMT_PostscalerValueGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMT_ExistsPostscalerValue(DMT_MODULE_ID index)

PLIB_DMT_ExistsStatus Function

Identifies whether the Status feature exists on the DMT module.

File

plib_dmt.h

C

```
bool PLIB_DMT_ExistsStatus(DMT_MODULE_ID index);
```

Returns

Existence of the Status feature:

- true - When Status feature is supported on the device
- false - When Status feature is not supported on the device

Description

This function identifies whether the Status feature is available on the DMT module. When this function returns true, these functions are supported on the device:

- PLIB_DMT_WindowIsOpen
- PLIB_DMT_EventOccurred
- PLIB_DMT_BAD1Get
- PLIB_DMT_BAD2Get

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMT_ExistsStatus(DMT_MODULE_ID index)

PLIB_DMT_ExistsStep1 Function

Identifies whether the STEP1 Clear feature exists on the DMT module.

File

plib_dmt.h

C

```
bool PLIB_DMT_ExistsStep1(DMT_MODULE_ID index);
```

Returns

- true - The STEP1 Clear feature is supported on the device
- false - The STEP1 Clear feature is not supported on the device

Description

This function identifies whether the Step 1 Clear feature is available on the DMT module. When this function returns true, this function is supported on the device:

- PLIB_DMT_ClearStep1

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMT_ExistsStep1(DMT_MODULE_ID index)

PLIB_DMT_ExistsStep2 Function

Identifies whether the STEP2 Clear feature exists on the DMT module.

File

plib_dmt.h

C

```
bool PLIB_DMT_ExistsStep2(DMT_MODULE_ID index);
```

Returns

- true - The STEP2 Clear feature is supported on the device
- false - The STEP2 Clear feature is not supported on the device

Description

This function identifies whether the STEP2 Clear feature is available on the DMT module. When this function returns true, this function is supported on the device:

- PLIB_DMT_ClearStep2

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMT_ExistsStep2(DMT_MODULE_ID index)

d) Data Types and Constants

DMT_MODULE_ID Enumeration

Identifies the supported DMT modules.

File

plib_dmt_help.h

C

```
typedef enum {
  DMT_ID_0,
  DMT_NUMBER_OF_MODULES
} DMT_MODULE_ID;
```

Members

Members	Description
DMT_ID_0	DMT Module 0 ID
DMT_NUMBER_OF_MODULES	Number of available WDT modules.

Description

DMT Module ID

This enumeration identifies the available DMT modules.

Remarks

The caller should not rely on the specific numbers assigned to any of these values as they may change from one processor to the next.

Files

Files

Name	Description
plib_dmt.h	Deadman Timer (DMT) Peripheral Library interface header for Deadman Timer common definitions.
plib_dmt_help.h	

Description

This section lists the source and header files used by the library.

plib_dmt.h

Deadman Timer (DMT) Peripheral Library interface header for Deadman Timer common definitions.

Functions

	Name	Description
	PLIB_DMT_BAD1Get	Returns BAD1 flag from the DMT Status Register.
	PLIB_DMT_BAD2Get	Returns BAD2 flag from the DMT Status Register.
	PLIB_DMT_ClearStep1	Resets the DMT module.
	PLIB_DMT_ClearStep2	Resets the DMT module.
	PLIB_DMT_CounterGet	Returns the DMT counter value.
	PLIB_DMT_Disable	Disables the DMT module.
	PLIB_DMT_Enable	Enables the DMT module.
	PLIB_DMT_EventOccurred	Returns Event flag from the DMT Status Register.
	PLIB_DMT_ExistsCounter	Identifies whether the Counter feature exists on the DMT module.
	PLIB_DMT_ExistsEnableControl	Identifies whether the EnableControl feature exists on the DMT module.
	PLIB_DMT_ExistsPostscalerInterval	Identifies whether the Postscaler Interval feature exists on the DMT module.
	PLIB_DMT_ExistsPostscalerValue	Identifies whether the Postscaler Value feature exists on the DMT module.
	PLIB_DMT_ExistsStatus	Identifies whether the Status feature exists on the DMT module.
	PLIB_DMT_ExistsStep1	Identifies whether the STEP1 Clear feature exists on the DMT module.
	PLIB_DMT_ExistsStep2	Identifies whether the STEP2 Clear feature exists on the DMT module.
	PLIB_DMT_IsEnabled	Returns the Deadman Timer on/off(enable/disable) status.
	PLIB_DMT_PostscalerIntervalGet	Returns the DMT postscaler interval value.
	PLIB_DMT_PostscalerValueGet	Returns the DMT postscaler value.
	PLIB_DMT_WindowIsOpen	Returns Window is Open flag from the DMT Status Register.

Description

Deadman Timer (DMT) Peripheral Library Interface Header

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the Deadman Timer Peripheral Library for all families of Microchip microcontrollers. The definitions in this file are common to the Deadman Timer peripheral.

File Name

plib_dmt.h

Company

Microchip Technology Inc.

plib_dmt_help.h

Enumerations

	Name	Description
	DMT_MODULE_ID	Identifies the supported DMT modules.

Section

Data Types & Constants

Device Control Peripheral Library

This section describes the Device Control Peripheral Library.

Introduction

Device Control Peripheral Library for Microchip microcontrollers.

Description

This library provides a low-level abstraction of the Device Control module on Microchip microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, thereby abstracting hardware differences from one microcontroller variant to another.

Using the Library

This topic describes the basic architecture of the Device Control Peripheral Library and provides information and examples on its use.

Description

Interface Header File: `plib_devcon.h`

The interface to the Device Control Peripheral Library is defined in the `plib_devcon.h` header file, which is included by the peripheral library header file, `peripheral.h`. Any C language source (`.c`) file that uses the Device Control Peripheral Library must include `peripheral.h`.

Library File:

The Device Control Peripheral Library is part of the processor-specific peripheral library archive (`.a`) file installed with the compiler. Libraries in this archive are automatically available to the linker (in the default search path) for any project built using the Microchip compiler.

Please refer to the What is MPLAB Harmony? section for information on how the library interacts with the framework.

Hardware Abstraction Model

This library provides a low-level abstraction of the Device Control module on Microchip family microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Description

The Device Control (DEVCON) peripheral library is a collection of functions that may be used by many different modules to perform tasks not specific to any given module. These functions include:

- System Locking and Unlocking
- JTAG, and Trace enable/disable
- Reading of device ID and version
- Other general device configuration settings

Library Overview

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the Device Control module.

Library Interface Section	Description
System Functions	APIs that are used for general configuration of the module, such as enabling and disabling the Device Control Peripheral Library.
Data Types and Constants	These data types and constants are required while interacting and configuring the Device Control Peripheral Library.
Feature Existence Functions	These functions identify whether a particular feature exists on the Device Control Peripheral Library.

How the Library Works

Provides information on how the library works.

Description

System Locking an Unlocking

Many operations require the system to be unlocked prior to the operation being performed. This is to prevent catastrophic failure due to an inadvertent register write. These operations include but are not limited to:

- Software reset
- Clock, oscillator and peripheral bus frequency changes
- System bus access permissions
- PPS and PMD control register locking

The following functions provide simple APIs to perform system lock/unlock:

- PLIB_DEVCON_SystemLock, PLIB_DEVCON_SystemUnlock
- PLIB_DEVCON_DeviceRegistersLock, PLIB_DEVCON_DeviceRegistersUnlock (PPS/PMD)

JTAG and Trace

JTAG and Trace are enabled/disabled using the following functions:

- PLIB_DEVCON_JTAGPortEnable, PLIB_DEVCON_JTAGPortEnable
- PLIB_DEVCON_2WireJTAGEnableTDO, PLIB_DEVCON_2WireJTAGDisableTDO
- PLIB_DEVCON_TraceOutputEnable, PLIB_DEVCON_TraceOutputDisable

Device ID and Version Number

The device ID and version number are obtained using the following functions:

- PLIB_DEVCON_DeviceIdGet
- PLIB_DEVCON_DeviceVersionGet

General Device Configuration Settings

The following functions provide general device configuration settings:

- PLIB_DEVCON_AlternateClockEnable, PLIB_DEVCON_AlternateClockDisable
- PLIB_DEVCON_FlashErrCorrectionModeSet
- PLIB_DEVCON_IgnoreDebugFreezeEnable, PLIB_DEVCON_IgnoreDebugFreezeDisable

Configuring the Library

The library is configured for the supported Device Control module when the processor is chosen in the MPLAB X IDE.

Library Interface

a) System Functions

	Name	Description
	PLIB_DEVCON_2WireJTAGDisableTDO	Disables 2-Wire JTAG protocol use of TDO.
	PLIB_DEVCON_2WireJTAGEnableTDO	Enables 2-Wire JTAG protocol to use TDO.
	PLIB_DEVCON_AlternateClockDisable	Disables the alternate clock source for Input Capture or Output Compare modules, The primary clock source will be used instead.
	PLIB_DEVCON_AlternateClockEnable	Selects the alternate clock source for Input Capture or Output Compare modules.
	PLIB_DEVCON_DeviceIdGet	Gets the device identifier.
	PLIB_DEVCON_DeviceRegistersLock	Locks device module registers, preventing modifications to the registers.
	PLIB_DEVCON_DeviceRegistersUnlock	Unlocks device module registers, allowing modifications to the registers.
	PLIB_DEVCON_DeviceVersionGet	Gets the device version.
	PLIB_DEVCON_FlashErrCorrectionModeSet	Sets Flash error correction operation.
	PLIB_DEVCON_IgnoreDebugFreezeDisable	Module stops when commanded by debugger.
	PLIB_DEVCON_IgnoreDebugFreezeEnable	Allows module to ignore FREEZE command from debugger and continue running.
	PLIB_DEVCON_JTAGPortDisable	Disables the JTAG port on the device.
	PLIB_DEVCON_JTAGPortEnable	Enables the JTAG port on the device.
	PLIB_DEVCON_SystemLock	Executes the system lock sequence.
	PLIB_DEVCON_SystemUnlock	Executes the system unlock sequence.

	PLIB_DEVCON_TraceOutputDisable	Disables trace outputs and the stop trace clock.
	PLIB_DEVCON_TraceOutputEnable	Enables trace outputs and the start trace clock.
	PLIB_DEVCON_USBPHYSleepModeSet	Selects USB PHY clocking during Sleep mode.
	PLIB_DEVCON_AnalogIOChargePumpDisable	Disables the I/O Analog Charge Pump on the device.
	PLIB_DEVCON_AnalogIOChargePumpEnable	Enables the I/O Analog Charge Pump on the device.
	PLIB_DEVCON_ExistsAnalogChargePumpControl	Identifies whether the I/O Analog Charge Pump feature exists on the DEVCON module.
	PLIB_DEVCON_BootExtSelect	Routes SPI0 pins to the PIC32WK pads.
	PLIB_DEVCON_BootIPFSelect	Routes SPI0 pins to In-Package Flash.
	PLIB_DEVCON_HSUARTDisable	Disables High Speed UART.
	PLIB_DEVCON_HSUARTEnable	Enables High Speed UART.
	PLIB_DEVCON_OTPConfigLock	Locks or unlocks the configuration registers.
	PLIB_DEVCON_OTPConfigUnlock	unlocks the configuration registers.

b) MPLL Functions

	Name	Description
	PLIB_DEVCON_MPLLDisable	Disables the MPLL.
	PLIB_DEVCON_MPLLEnable	Enables the MPLL.
	PLIB_DEVCON_MPLLInputDivSet	Sets the MPLL Input Divider bits.
	PLIB_DEVCON_MPLLIsReady	Reads MPLL status.
	PLIB_DEVCON_MPLLMultiplierSet	Sets the MPLL Multiplier bits.
	PLIB_DEVCON_MPLLODiv1Set	Sets the MPLL output divider 1 bits.
	PLIB_DEVCON_MPLLODiv2Set	Sets the MPLL output divider 2 bits.
	PLIB_DEVCON_MPLLVrefSet	Sets the VREF control setting.
	PLIB_DEVCON_MPLLVregDisable	Disables the MPLL VREG.
	PLIB_DEVCON_MPLLVregEnable	Enables the MPLL VREG.
	PLIB_DEVCON_MPLLVregIsReady	Reads the MPLL VREG status.

c) Feature Existence Functions

	Name	Description
	PLIB_DEVCON_ExistsAlternateClock	Identifies whether the AlternateClock feature exists on the DEVCON module.
	PLIB_DEVCON_ExistsDeviceRegsLockUnlock	Identifies whether the DeviceRegsLockUnlock feature exists on the DEVCON module.
	PLIB_DEVCON_ExistsDeviceVerAndId	Identifies whether the DeviceVerAndId feature exists on the DEVCON module.
	PLIB_DEVCON_ExistsECCModes	Identifies whether the ECCModes feature exists on the DEVCON module.
	PLIB_DEVCON_ExistsIgnoreDebugFreeze	Identifies whether the IgnoreDebugFreeze feature exists on the DEVCON module.
	PLIB_DEVCON_ExistsJTAGEnable	Identifies whether the JTAGEnable feature exists on the DEVCON module.
	PLIB_DEVCON_ExistsJTAGUsesTDO	Identifies whether the JTAGUsesTDO feature exists on the DEVCON module.
	PLIB_DEVCON_ExistsSystemLockUnlock	Identifies whether the SysLockUnlock feature exists on the DEVCON module.
	PLIB_DEVCON_ExistsTraceOutput	Identifies whether the TraceOutput feature exists on the DEVCON module.
	PLIB_DEVCON_ExistsUSB_PHY_SleepModeSet	Identifies whether the USB_PHY_SleepModeSet feature exists on the DEVCON module.
	PLIB_DEVCON_ExistsMPLL	Identifies whether the MPLL feature exists on the DEVCON module.
	PLIB_DEVCON_ExistsBootSelection	Identifies whether the BootSelection feature exists on the DEVCON module
	PLIB_DEVCON_ExistsHSUARTControl	Identifies whether the HSUARTControl feature exists on the DEVCON module
	PLIB_DEVCON_ExistsOTPConfigLockUnlock	Identifies whether the OTPConfigLockUnlock feature exists on the DEVCON module

d) Data Types and Constants

	Name	Description
	DEVCON_ALT_CLOCK_TARGET	Selects Input Capture or Output Compare modules.
	DEVCON_DEBUG_PERIPHERAL	Sets modules to ignore debugger's freeze command.
	DEVCON_ECC_CONFIG	Selects how ECC is applied to Flash memory.
	DEVCON_REGISTER_SET	Selects module registers for write lock or unlock.
	DEVCON_USB_SLEEP_MODE	Selects whether the USB clock operates in Sleep mode.
	DEVCON_MODULE_ID	Identifies the supported DEVCON modules.

	DEVCON_MPLL_OUTPUT_DIVIDER	Specifies the MPLL Output divider bits.
	DEVCON_MPLL_VREF_CONTROL	VREF control.

Description

This section describes the Application Programming Interface (API) functions of the Device Control Peripheral Library.
Refer to each section for a detailed description.

a) System Functions

PLIB_DEVCON_2WireJTAGDisableTDO Function

Disables 2-Wire JTAG protocol use of TDO.

File

plib_devcon.h

C

```
void PLIB_DEVCON_2WireJTAGDisableTDO(DEVCON_MODULE_ID index);
```

Returns

None.

Description

This function disables 2-Wire JTAG protocol use of TDO.

Remarks

The feature is not supported on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Parameters

Parameters	Description
index	Always DEVCON_ID

Function

void PLIB_DEVCON_2WireJTAGDisableTDO(DEVCON_MODULE_ID index)

PLIB_DEVCON_2WireJTAGEnableTDO Function

Enables 2-Wire JTAG protocol to use TDO.

File

plib_devcon.h

C

```
void PLIB_DEVCON_2WireJTAGEnableTDO(DEVCON_MODULE_ID index);
```

Returns

None.

Description

This function enables 2-Wire JTAG protocol to use TDO.

Remarks

The feature is not supported on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Parameters

Parameters	Description
index	Always DEVCON_ID

Function

void PLIB_DEVCON_2WireJTAGEnableTDO(DEVCON_MODULE_ID index)

PLIB_DEVCON_AlternateClockDisable Function

Disables the alternate clock source for Input Capture or Output Compare modules, The primary clock source will be used instead.

File

plib_devcon.h

C

```
void PLIB_DEVCON_AlternateClockDisable(DEVCON_MODULE_ID index, DEVCON_ALT_CLOCK_TARGET targetAltClock);
```

Returns

None.

Description

This function disables the alternate clock source for the Input Capture or Output Compare modules. The primary clock source will be used instead.

Remarks

The feature is not supported on all devices. Refer to the specific device data sheet to determine availability. A system unlock must be performed before this function can be executed.

Preconditions

None.

Example

```
// Call system service to unlock oscillator
PLIB_DEVCON_AlternateClockDisable(DEVCON_ID, DEVCON_ALT_CLOCK_IC || DEVCON_ALT_CLOCK_OC );
```

Parameters

Parameters	Description
index	Always DEVCON_ID
targetAltClock	DEVCON_ALT_CLOCK_IC or DEVCON_ALT_CLOCK_OC

Function

void PLIB_DEVCON_AlternateClockDisable(DEVCON_MODULE_ID index,
DEVCON_ALT_CLOCK_TARGET targetAltClock)

PLIB_DEVCON_AlternateClockEnable Function

Selects the alternate clock source for Input Capture or Output Compare modules.

File

plib_devcon.h

C

```
void PLIB_DEVCON_AlternateClockEnable(DEVCON_MODULE_ID index, DEVCON_ALT_CLOCK_TARGET targetAltClock);
```

Returns

None.

Description

This function selects the alternate clock source for the Input Capture or Output Compare modules.

Remarks

The feature is not supported on all devices. Refer to the specific device data sheet to determine availability. A system unlock must be performed before this function can be executed.

Preconditions

None.

Example

```
// Call system service to unlock oscillator
PLIB_DEVCON_AlternateClockEnable(DEVCON_ID, DEVCON_ALT_CLOCK_IC || DEVCON_ALT_CLOCK_OC );
```

Parameters

Parameters	Description
index	Always DEVCON_ID
targetAltClock	DEVCON_ALT_CLOCK_IC or DEVCON_ALT_CLOCK_OC

Function

void PLIB_DEVCON_AlternateClockEnable(DEVCON_MODULE_ID index,
DEVCON_ALT_CLOCK_TARGET targetAltClock)

PLIB_DEVCON_DeviceIdGet Function

Gets the device identifier.

File

plib_devcon.h

C

```
uint32_t PLIB_DEVCON_DeviceIdGet(DEVCON_MODULE_ID index);
```

Returns

The version of the device.

Description

This function returns the device identifier.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Always DEVCON_ID

Function

uint32_t PLIB_DEVCON_DeviceIdGet(DEVCON_MODULE_ID index)

PLIB_DEVCON_DeviceRegistersLock Function

Locks device module registers, preventing modifications to the registers.

File

plib_devcon.h

C

```
void PLIB_DEVCON_DeviceRegistersLock(DEVCON_MODULE_ID index, DEVCON_REGISTER_SET registersToLock);
```

Returns

None.

Description

This function locks device module registers, preventing modifications to the registers.

Remarks

The feature is not supported on all devices. Refer to the specific device data sheet to determine availability. A system unlock must be performed before this function can be executed.

Preconditions

None.

Example

```
// Call system service to unlock oscillator
PLIB_DEVCON_DeviceRegistersLock(DEVCON_ID,  DEVCON_ALL_REGISTERS);
PLIB_DEVCON_DeviceRegistersUnlock(DEVCON_ID,DEVCON_PPS_REGISTERS);
```

Parameters

Parameters	Description
index	Always DEVCON_ID
registersToLock	element from DEVCON_REGISTER_SET, which can be ORed together

Function

void PLIB_DEVCON_DeviceRegistersLock(DEVCON_MODULE_ID index,
DEVCON_REGISTER_SET registersToLock)

PLIB_DEVCON_DeviceRegistersUnlock Function

Unlocks device module registers, allowing modifications to the registers.

File

plib_devcon.h

C

```
void PLIB_DEVCON_DeviceRegistersUnlock(DEVCON_MODULE_ID index, DEVCON_REGISTER_SET registersToLock);
```

Returns

None.

Description

This function unlocks device module registers, allowing modifications to the registers.

Remarks

The feature is not supported on all devices. Refer to the specific device data sheet to determine availability. A system unlock must be performed before this function can be executed.

Preconditions

None.

Example

```
// Call system service to unlock oscillator
PLIB_DEVCON_DeviceRegistersLock(DEVCON_ID,  DEVCON_ALL_REGISTERS);
PLIB_DEVCON_DeviceRegistersUnlock(DEVCON_ID,DEVCON_PPS_REGISTERS);
```

Parameters

Parameters	Description
index	Always DEVCON_ID
registersToLock	element from DEVCON_REGISTER_SET, which can be ORed together

Function

void PLIB_DEVCON_DeviceRegistersUnlock(DEVCON_MODULE_ID index,
DEVCON_REGISTER_SET registersToLock)

PLIB_DEVCON_DeviceVersionGet Function

Gets the device version.

File

plib_devcon.h

C

```
uint8_t PLIB_DEVCON_DeviceVersionGet(DEVCON_MODULE_ID index);
```

Returns

The version of the device.

Description

This functions returns the device version.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Always DEVCON_ID

Function

uint8_t PLIB_DEVCON_DeviceVersionGet(DEVCON_MODULE_ID index)

PLIB_DEVCON_FlashErrCorrectionModeSet Function

Sets Flash error correction operation.

File

plib_devcon.h

C

```
void PLIB_DEVCON_FlashErrCorrectionModeSet(DEVCON_MODULE_ID index, DEVCON_ECC_CONFIG flashECC);
```

Returns

None.

Description

This function sets Flash error correction operation.

Remarks

The feature is not supported on all devices. Refer to the specific device data sheet to determine availability. Once ECC has been locked, it cannot be unlocked except through a system reset.

Preconditions

None.

Example

Parameters

Parameters	Description
index	Always DEVCON_ID

flashECC	DEVCON_ECC_DISABLED, DEVCON_ECC_DISABLED_LOCKED, DEVCON_DYN_ECC_ENABLED_LOCKED, or DEVCON_FLASH_ECC_ENABLED_LOCKED

Function

void PLIB_DEVCON_FlashErrCorrectionModeSet(DEVCON_MODULE_ID index,
DEVCON_ECC_CONFIG flashECC)

PLIB_DEVCON_IgnoreDebugFreezeDisable Function

Module stops when commanded by debugger.

File

plib_devcon.h

C

```
void PLIB_DEVCON_IgnoreDebugFreezeDisable(DEVCON_MODULE_ID index, DEVCON_DEBUG_PERIPHERAL myPeripheral);
```

Returns

None.

Description

This function stops the module when commanded by the debugger.

Remarks

The feature is not supported on all devices. Refer to the specific device data sheet to determine availability. Peripherals can be ORed together.

Preconditions

None.

Example

```
PLIB_DEVCON_DebugIgnoreFreezeEnable(DEVCON_ID,DEVCON_DEBUG_ALL);
PLIB_DEVCON_DebugIgnoreFreezeDisable(DEVCON_ID,DEVCON_DEBUG_SPI1);
```

Parameters

Parameters	Description
index	Always DEVCON_ID
myPeripheral	DEVCON_DEBUG_USB, DEVCON_DEBUG_UART1, DEVCON_DEBUG_UART2, DEVCON_DEBUG_SPI1, or DEVCON_DEBUG_ALL (for all modules)

Function

void PLIB_DEVCON_IgnoreDebugFreezeDisable(DEVCON_MODULE_ID index,
DEVCON_DEBUG_PERIPHERAL myPeripheral)

PLIB_DEVCON_IgnoreDebugFreezeEnable Function

Allows module to ignore FREEZE command from debugger and continue running.

File

plib_devcon.h

C

```
void PLIB_DEVCON_IgnoreDebugFreezeEnable(DEVCON_MODULE_ID index, DEVCON_DEBUG_PERIPHERAL myPeripheral);
```

Returns

None.

Description

This function allows the module to ignore the FREEZE command from the debugger and continue running.

Remarks

The feature is not supported on all devices. Refer to the specific device data sheet to determine availability. Peripherals can be ORed together.

Preconditions

None.

Example

```
PLIB_DEVCON_DebugIgnoreFreezeEnable(DEVCON_ID,DEVCON_DEBUG_ALL);
PLIB_DEVCON_DebugIgnoreFreezeDisable(DEVCON_ID,DEVCON_DEBUG_SPI1);
```

Parameters

Parameters	Description
index	Always DEVCON_ID
myPeripheral	DEVCON_DEBUG_USB, DEVCON_DEBUG_UART1, DEVCON_DEBUG_UART2, DEVCON_DEBUG_SPI1, or DEVCON_DEBUG_ALL (for all modules)

Function

void PLIB_DEVCON_IgnoreDebugFreezeEnable(DEVCON_MODULE_ID index,
DEVCON_DEBUG_PERIPHERAL myPeripheral)

PLIB_DEVCON_JTAGPortDisable Function

Disables the JTAG port on the device.

File

plib_devcon.h

C

```
void PLIB_DEVCON_JTAGPortDisable(DEVCON_MODULE_ID index);
```

Returns

None.

Description

This function disables the JTAG port on the device.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Always DEVCON_ID

Function

void PLIB_DEVCON_JTAGPortDisable(DEVCON_MODULE_ID index)

PLIB_DEVCON_JTAGPortEnable Function

Enables the JTAG port on the device.

File

plib_devcon.h

C

```
void PLIB_DEVCON_JTAGPortEnable(DEVCON_MODULE_ID index);
```

Returns

None.

Description

This function enables the JTAG port on the device.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Always DEVCON_ID

Function

void PLIB_DEVCON_JTAGPortEnable(DEVCON_MODULE_ID index)

PLIB_DEVCON_SystemLock Function

Executes the system lock sequence.

File

plib_devcon.h

C

```
void PLIB_DEVCON_SystemLock(DEVCON_MODULE_ID index);
```

Returns

None.

Description

This function executes the system lock sequence.

Remarks

Should only be called after PLIB_DEVCON_SystemUnlock and the action that required the unlock have been performed.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DEVCON_SystemLock(DEVCON_MODULE_ID index)

PLIB_DEVCON_SystemUnlock Function

Executes the system unlock sequence.

File

plib_devcon.h

C

```
void PLIB_DEVCON_SystemUnlock(DEVCON_MODULE_ID index);
```

Returns

None.

Description

This function executes the system unlock sequence.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DEVCON_SystemUnlock(DEVCON_MODULE_ID index)

PLIB_DEVCON_TraceOutputDisable Function

Disables trace outputs and the stop trace clock.

File

plib_devcon.h

C

```
void PLIB_DEVCON_TraceOutputDisable(DEVCON_MODULE_ID index);
```

Returns

None.

Description

This function disables trace outputs and the stop trace clock.

Preconditions

None.

Parameters

Parameters	Description
index	Always DEVCON_ID

Function

void PLIB_DEVCON_TraceOutputDisable(DEVCON_MODULE_ID index)

PLIB_DEVCON_TraceOutputEnable Function

Enables trace outputs and the start trace clock.

File

plib_devcon.h

C

```
void PLIB_DEVCON_TraceOutputEnable(DEVCON_MODULE_ID index);
```

Returns

None.

Description

This function enables trace outputs and the start trace clock (trace probe must be present).

Preconditions

None.

Parameters

Parameters	Description
index	Always DEVCON_ID

Function

void PLIB_DEVCON_TraceOutputEnable(DEVCON_MODULE_ID index)

PLIB_DEVCON_USBPHYSleepModeSet Function

Selects USB PHY clocking during Sleep mode.

File

plib_devcon.h

C

```
void PLIB_DEVCON_USBPHYSleepModeSet(DEVCON_MODULE_ID index, DEVCON_USB_SLEEP_MODE sleepOrRun);
```

Returns

None.

Description

This function selects USB PHY clocking during Sleep mode.

Remarks

The feature is not supported on all devices. Refer to the specific device data sheet to determine availability. A system unlock must be performed before this function can be executed.

Preconditions

None.

Example

```
// Call system service to unlock oscillator
PLIB_DEVCON_USBPHYSleepModeSet(DEVCON_ID,DEVCON_USB_NO_CLOCK_IN_SLEEP)
```

Parameters

Parameters	Description
index	Always DEVCON_ID
sleepOrRun	DEVCON_USB_NO_CLOCK_IN_SLEEP or DEVCON_USB_CLOCK_IN_SLEEP

Function

void PLIB_DEVCON_USBPHYSleepModeSet(DEVCON_MODULE_ID index,
DEVCON_USB_SLEEP_MODE sleepOrRun)

PLIB_DEVCON_AnalogIOChargePumpDisable Function

Disables the I/O Analog Charge Pump on the device.

File

plib_devcon.h

C

```
void PLIB_DEVCON_AnalogIOChargePumpDisable(DEVCON_MODULE_ID index);
```

Returns

None.

Description

This function disables the I/O Analog Charge Pump on the device.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Always DEVCON_ID

Function

void PLIB_DEVCON_AnalogIOChargePumpDisable(DEVCON_MODULE_ID index)

PLIB_DEVCON_AnalogIOChargePumpEnable Function

Enables the I/O Analog Charge Pump on the device.

File

plib_devcon.h

C

```
void PLIB_DEVCON_AnalogIOChargePumpEnable(DEVCON_MODULE_ID index);
```

Returns

None.

Description

This function enables the I/O Analog Charge Pump on the device.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Always DEVCON_ID

Function

void PLIB_DEVCON_AnalogIOChargePumpEnable(DEVCON_MODULE_ID index)

PLIB_DEVCON_ExistsAnalogChargePumpControl Function

Identifies whether the I/O Analog Charge Pump feature exists on the DEVCON module.

File

plib_devcon.h

C

```
bool PLIB_DEVCON_ExistsAnalogChargePumpControl(DEVCON_MODULE_ID index);
```

Returns

- true - The I/O Analog Charge Pump feature feature is supported on the device
- false - The I/O Analog Charge Pump feature feature is not supported on the device

Description

This function identifies whether the I/O Analog Charge Pump feature is available on the DEVCON module. When this function returns true, these functions are supported on the device:

- PLIB_DEVCON_AnalogIOChargePumpEnable

- PLIB_DEVCON_AnalogIOChargePumpDisable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DEVCON_ExistsAnalogChargePumpControl(DEVCON_MODULE_ID index)

PLIB_DEVCON_BootExtSelect Function

Routes SPI0 pins to the PIC32WK pads.

File

plib_devcon.h

C

```
void PLIB_DEVCON_BootExtSelect(DEVCON_MODULE_ID index);
```

Returns

None.

Description

This function routes the SPI0 pins to the PIC32WK pads.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_DEVCON_BootExtSelect(DEVCON_MODULE_ID index)

PLIB_DEVCON_BootIPFSelect Function

Routes SPI0 pins to In-Package Flash.

File

plib_devcon.h

C

```
void PLIB_DEVCON_BootIPFSelect(DEVCON_MODULE_ID index);
```

Returns

None.

Description

This function routes the SPI0 pins to In-Package Flash.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_DEVCON_BootIPFSelect(DEVCON_MODULE_ID index)

PLIB_DEVCON_HSUARTDisable Function

Disables High Speed UART.

File

plib_devcon.h

C

```
void PLIB_DEVCON_HSUARTDisable(DEVCON_MODULE_ID index);
```

Returns

None.

Description

This function disables the high speed UART and UART 1 can be configured with PPS.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_DEVCON_HSUARTDisable(DEVCON_MODULE_ID index)

PLIB_DEVCON_HSUARTEnable Function

Enables High Speed UART.

File

plib_devcon.h

C

```
void PLIB_DEVCON_HSUARTEnable(DEVCON_MODULE_ID index);
```

Returns

None.

Description

This function enables the high speed UART and UART 1 will be using dedicated UART pin.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_DEVCON_HSUARTEnable(DEVCON_MODULE_ID index)

PLIB_DEVCON_OTPConfigLock Function

Locks or unlocks the configuration registers.

File

plib_devcon.h

C

```
void PLIB_DEVCON_OTPConfigLock(DEVCON_MODULE_ID index, DEVCON_CFGLOCK lockType);
```

Returns

None.

Description

This function locks or unlocks the configuration register as per the locktype specified.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
lockType	Enumerated config lock value

Function

void PLIB_DEVCON_OTPConfigLock(DEVCON_MODULE_ID index, DEVCON_CFGLOCK lockType)

PLIB_DEVCON_OTPConfigUnlock Function

unlocks the configuration registers.

File

plib_devcon.h

C

```
void PLIB_DEVCON_OTPConfigUnlock(DEVCON_MODULE_ID index);
```

Returns

None.

Description

This function unlocks the configuration register provided, the CFGLOCK field is not to a value to locked until the reset.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_DEVCON_OTPConfigUnlock(DEVCON_MODULE_ID index)

b) MPLL Functions

PLIB_DEVCON_MPLLDisable Function

Disables the MPLL.

File

plib_devcon.h

C

```
void PLIB_DEVCON_MPLLDisable(DEVCON_MODULE_ID index);
```

Returns

None.

Description

This function disables the MPLL.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DEVCON_MPLLDisable(DEVCON_MODULE_ID index)

PLIB_DEVCON_MPLLEnable Function

Enables the MPLL.

File

plib_devcon.h

C

```
void PLIB_DEVCON_MPLLEnable(DEVCON_MODULE_ID index);
```

Returns

None.

Description

This function enables the MPLL.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DEVCON_MPLLEnable(DEVCON_MODULE_ID index)

PLIB_DEVCON_MPLLInputDivSet Function

Sets the MPLL Input Divider bits.

File

plib_devcon.h

C

```
void PLIB_DEVCON_MPLLInputDivSet(DEVCON_MODULE_ID index, uint8_t value);
```

Returns

None.

Description

This function sets the MPLL Input Divider bits.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
value	Multiplier value (between 1 & 63)

Function

PLIB_DEVCON_MPLLInputDivSet(DEVCON_MODULE_ID index, uint8_t value)

PLIB_DEVCON_MPLLIsReady Function

Reads MPLL status.

File

plib_devcon.h

C

```
bool PLIB_DEVCON_MPLLIsReady(DEVCON_MODULE_ID index);
```

Returns

- true - MPLL clock is stable
- false - MPLL clock is not stable

Description

This function reads MPLL status.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DEVCON_MPLLIsReady(DEVCON_MODULE_ID index)

PLIB_DEVCON_MPLLMultiplierSet Function

Sets the MPLL Multiplier bits.

File

plib_devcon.h

C

```
void PLIB_DEVCON_MPLLMultiplierSet(DEVCON_MODULE_ID index, uint8_t value);
```

Returns

None.

Description

This function sets the MPLL Multiplier bits.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
value	Multiplier value (between 16 & 160)

Function

PLIB_DEVCON_MPLLMultiplierSet(DEVCON_MODULE_ID index, uint8_t value)

PLIB_DEVCON_MPLLODiv1Set Function

Sets the MPLL output divider 1 bits.

File

plib_devcon.h

C

```
void PLIB_DEVCON_MPLLODiv1Set(DEVCON_MODULE_ID index, DEVCON_MPLL_OUTPUT_DIVIDER bits);
```

Returns

None.

Description

This function sets the MPLL output divider 1 bits.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
bits	Enumerated divider value

Function

PLIB_DEVCON_MPLLODiv1Set(DEVCON_MODULE_ID index, DEVCON_MPLL_OUTPUT_DIVIDER bits)

PLIB_DEVCON_MPLLODiv2Set Function

Sets the MPLL output divider 2 bits.

File

plib_devcon.h

C

```
void PLIB_DEVCON_MPLLODiv2Set(DEVCON_MODULE_ID index, DEVCON_MPLL_OUTPUT_DIVIDER bits);
```

Returns

None.

Description

This function sets the MPLL output divider 2 bits.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
bits	Enumerated divider value

Function

PLIB_DEVCON_MPLLODiv2Set(DEVCON_MODULE_ID index, DEVCON_MPLL_OUTPUT_DIVIDER bits)

PLIB_DEVCON_MPLLVrefSet Function

Sets the VREF control setting.

File

plib_devcon.h

C

```
void PLIB_DEVCON_MPLLVrefSet(DEVCON_MODULE_ID index, DEVCON_MPLL_VREF_CONTROL vref);
```

Returns

None.

Description

This function sets the VREF control setting.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
value	Enumerated VREF Control setting

Function

PLIB_DEVCON_MPLLVrefSet(DEVCON_MODULE_ID index, DEVCON_MPLL_VREF_CONTROL vref)

PLIB_DEVCON_MPLLVregDisable Function

Disables the MPLL VREG.

File

plib_devcon.h

C

```
void PLIB_DEVCON_MPLLVregDisable(DEVCON_MODULE_ID index);
```

Returns

None.

Description

This function disables the MPLL VREG.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DEVCON_MPLLVregDisable(DEVCON_MODULE_ID index)

PLIB_DEVCON_MPLLVregEnable Function

Enables the MPLL VREG.

File

plib_devcon.h

C

```
void PLIB_DEVCON_MPLLVregEnable(DEVCON_MODULE_ID index);
```

Returns

None.

Description

This function enables the MPLL VREG.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DEVCON_MPLLVregEnable(DEVCON_MODULE_ID index)

PLIB_DEVCON_MPLLVregIsReady Function

Reads the MPLL VREG status.

File

plib_devcon.h

C

```
bool PLIB_DEVCON_MPLLVregIsReady(DEVCON_MODULE_ID index);
```

Returns

- true - MPLL VREG is ready
- false - MPLL VREG is not ready

Description

This function reads the MPLL VREG status.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DEVCON_MPLLVregIsReady(DEVCON_MODULE_ID index)

c) Feature Existence Functions

PLIB_DEVCON_ExistsAlternateClock Function

Identifies whether the AlternateClock feature exists on the DEVCON module.

File

plib_devcon.h

C

```
bool PLIB_DEVCON_ExistsAlternateClock(DEVCON_MODULE_ID index);
```

Returns

- true - The AlternateClock feature is supported on the device
- false - The AlternateClock feature is not supported on the device

Description

This function identifies whether the AlternateClock feature is available on the DEVCON module. When this function returns true, these functions are supported on the device:

- PLIB_DEVCON_AlternateClockEnable
- PLIB_DEVCON_AlternateClockDisable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DEVCON_ExistsAlternateClock(DEVCON_MODULE_ID index)

PLIB_DEVCON_ExistsDeviceRegsLockUnlock Function

Identifies whether the DeviceRegsLockUnlock feature exists on the DEVCON module.

File

plib_devcon.h

C

```
bool PLIB_DEVCON_ExistsDeviceRegsLockUnlock(DEVCON_MODULE_ID index);
```

Returns

- true - The DeviceRegsLockUnlock feature is supported on the device
- false - The DeviceRegsLockUnlock feature is not supported on the device

Description

This function identifies whether the DeviceRegsLockUnlock feature is available on the DEVCON module. When this function returns true, these functions are supported on the device:

- PLIB_DEVCON_DeviceRegistersLock
- PLIB_DEVCON_DeviceRegistersUnlock

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DEVCON_ExistsDeviceRegsLockUnlock(DEVCON_MODULE_ID index)

PLIB_DEVCON_ExistsDeviceVerAndId Function

Identifies whether the DeviceVerAndId feature exists on the DEVCON module.

File

plib_devcon.h

C

```
bool PLIB_DEVCON_ExistsDeviceVerAndId(DEVCON_MODULE_ID index);
```

Returns

- true - The DeviceVerAndId feature is supported on the device
- false - The DeviceVerAndId feature is not supported on the device

Description

This function identifies whether the DeviceVerAndId feature is available on the DEVCON module. When this function returns true, these functions are supported on the device:

- PLIB_DEVCON_DeviceVersionGet
- PLIB_DEVCON_DeviceIdGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DEVCON_ExistsDeviceVerAndId(DEVCON_MODULE_ID index)

PLIB_DEVCON_ExistsECCModes Function

Identifies whether the ECCModes feature exists on the DEVCON module.

File

plib_devcon.h

C

```
bool PLIB_DEVCON_ExistsECCModes(DEVCON_MODULE_ID index);
```

Returns

- true - The ECCModes feature is supported on the device
- false - The ECCModes feature is not supported on the device

Description

This function identifies whether the ECCModes feature is available on the DEVCON module. When this function returns true, this function is supported on the device:

- PLIB_DEVCON_FlashErrCorrectionModeSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DEVCON_ExistsECCModes(DEVCON_MODULE_ID index)

PLIB_DEVCON_ExistsIgnoreDebugFreeze Function

Identifies whether the IgnoreDebugFreeze feature exists on the DEVCON module.

File

plib_devcon.h

C

```
bool PLIB_DEVCON_ExistsIgnoreDebugFreeze(DEVCON_MODULE_ID index);
```

Returns

- true - The IgnoreDebugFreeze feature is supported on the device
- false - The IgnoreDebugFreeze feature is not supported on the device

Description

This function identifies whether the IgnoreDebugFreeze feature is available on the DEVCON module. When this function returns true, these functions are supported on the device:

- PLIB_DEVCON_DebugIgnoreFreezeEnable
- PLIB_DEVCON_IgnoreDebugFreezeDisable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DEVCON_ExistsIgnoreDebugFreeze(DEVCON_MODULE_ID index)

PLIB_DEVCON_ExistsJTAGEnable Function

Identifies whether the JTAGEnable feature exists on the DEVCON module.

File

plib_devcon.h

C

```
bool PLIB_DEVCON_ExistsJTAGEnable(DEVCON_MODULE_ID index);
```

Returns

- true - The JTAGEnable feature is supported on the device
- false - The JTAGEnable feature is not supported on the device

Description

This function identifies whether the JTAGEnable feature is available on the DEVCON module. When this function returns true, these functions are supported on the device:

- PLIB_DEVCON_JTAGPortEnable
- PLIB_DEVCON_JTAGPortDisable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DEVCON_ExistsJTAGEnable(DEVCON_MODULE_ID index)

PLIB_DEVCON_ExistsJTAGUsesTDO Function

Identifies whether the JTAGUsesTDO feature exists on the DEVCON module.

File

plib_devcon.h

C

```
bool PLIB_DEVCON_ExistsJTAGUsesTDO(DEVCON_MODULE_ID index);
```

Returns

- true - The JTAGUsesTDO feature is supported on the device
- false - The JTAGUsesTDO feature is not supported on the device

Description

This function identifies whether the JTAGUsesTDO feature is available on the DEVCON module. When this function returns true, these functions are supported on the device:

- PLIB_DEVCON_2WireJTAGEnableTDO
- PLIB_DEVCON_2WireJTAGDisableTDO

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DEVCON_ExistsJTAGUsesTDO(DEVCON_MODULE_ID index)

PLIB_DEVCON_ExistsSystemLockUnlock Function

Identifies whether the SysLockUnlock feature exists on the DEVCON module.

File

plib_devcon.h

C

```
bool PLIB_DEVCON_ExistsSystemLockUnlock(DEVCON_MODULE_ID index);
```

Returns

- true - The SysLockUnlock feature is supported on the device
- false - The SysLockUnlock feature is not supported on the device

Description

This function identifies whether the SysLockUnlock feature is available on the DEVCON module. When this function returns true, these functions are supported on the device:

- PLIB_DEVCON_SystemUnlock
- PLIB_DEVCON_SystemLock

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DEVCON_ExistsSystemLockUnlock(DEVCON_MODULE_ID index)

PLIB_DEVCON_ExistsTraceOutput Function

Identifies whether the TraceOutput feature exists on the DEVCON module.

File

plib_devcon.h

C

```
bool PLIB_DEVCON_ExistsTraceOutput(DEVCON_MODULE_ID index);
```

Returns

- true - The TraceOutput feature is supported on the device
- false - The TraceOutput feature is not supported on the device

Description

This function identifies whether the TraceOutput feature is available on the DEVCON module. When this function returns true, these functions are supported on the device:

- PLIB_DEVCON_TraceOutputEnable
- PLIB_DEVCON_TraceOutputDisable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DEVCON_ExistsTraceOutput(DEVCON_MODULE_ID index)

PLIB_DEVCON_ExistsUSB_PHY_SleepModeSet Function

Identifies whether the USB_PHY_SleepModeSet feature exists on the DEVCON module.

File

plib_devcon.h

C

```
bool PLIB_DEVCON_ExistsUSB_PHY_SleepModeSet(DEVCON_MODULE_ID index);
```

Returns

- true - The USB_PHY_SleepModeSet feature is supported on the device
- false - The USB_PHY_SleepModeSet feature is not supported on the device

Description

This function identifies whether the USB_PHY_SleepModeSet feature is available on the DEVCON module. When this function returns true, this function is supported on the device:

- PLIB_DEVCON_USBPHYSleepModeSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DEVCON_ExistsUSB_PHY_SleepModeSet(DEVCON_MODULE_ID index)

PLIB_DEVCON_ExistsMPLL Function

Identifies whether the MPLL feature exists on the DEVCON module.

File

plib_devcon.h

C

```
bool PLIB_DEVCON_ExistsMPLL(DEVCON_MODULE_ID index);
```

Returns

- true - The MPLL feature is supported on the device
- false - The MPLL feature is not supported on the device

Description

This function identifies whether the MPLL feature is available on the DEVCON module. When this function returns true, these functions are supported on the device:

- PLIB_DEVCON_MPLLIsReady
- PLIB_DEVCON_MPLLEnable
- PLIB_DEVCON_MPLLDisable
- PLIB_DEVCON_MPLLODiv1Set
- PLIB_DEVCON_MPLLODiv2Set
- PLIB_DEVCON_MPLLVregIsReady
- PLIB_DEVCON_MPLLVregEnable
- PLIB_DEVCON_MPLLVregDisable
- PLIB_DEVCON_MPLLMultiplierSet
- PLIB_DEVCON_MPLLInputDivSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DEVCON_ExistsMPLL(DEVCON_MODULE_ID index)

PLIB_DEVCON_ExistsBootSelection Function

Identifies whether the BootSelection feature exists on the DEVCON module

File

plib_devcon.h

C

```
bool PLIB_DEVCON_ExistsBootSelection(DEVCON_MODULE_ID index);
```

Returns

- true - The BootSelection feature is supported on the device

- false - The BootSelection feature is not supported on the device

Description

This function identifies whether the BootSelection feature is available on the DEVCON module. When this function returns true, these functions are supported on the device:

- PLIB_DEVCON_BootIPFSelect
- PLIB_DEVCON_BootExtSelect

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DEVCON_ExistsBootSelection(DEVCON_MODULE_ID index)

PLIB_DEVCON_ExistsHSUARTControl Function

Identifies whether the HSUARTControl feature exists on the DEVCON module

File

plib_devcon.h

C

```
bool PLIB_DEVCON_ExistsHSUARTControl(DEVCON_MODULE_ID index);
```

Returns

- true - The HSUARTControl feature is supported on the device
- false - The HSUARTControl feature is not supported on the device

Description

This function identifies whether the HSUARTControl feature is available on the DEVCON module. When this function returns true, these functions are supported on the device:

- PLIB_DEVCON_HSUARTEnable
- PLIB_DEVCON_HSUARTDisable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DEVCON_ExistsHSUARTControl(DEVCON_MODULE_ID index)

PLIB_DEVCON_ExistsOTPConfigLockUnlock Function

Identifies whether the OTPConfigLockUnlock feature exists on the DEVCON module

File

plib_devcon.h

C

```
bool PLIB_DEVCON_ExistsOTPConfigLockUnlock(DEVCON_MODULE_ID index);
```

Returns

- true - The OTPConfigLockUnlock feature is supported on the device
- false - The OTPConfigLockUnlock feature is not supported on the device

Description

This function identifies whether the OTPConfigLockUnlock feature is available on the DEVCON module. When this function returns true, these functions are supported on the device:

- PLIB_DEVCON_OTPConfigLock
- PLIB_DEVCON_OTPConfigUnlock

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DEVCON_ExistsOTPConfigLockUnlock(DEVCON_MODULE_ID index)

d) Data Types and Constants

DEVCON_ALT_CLOCK_TARGET Enumeration

Selects Input Capture or Output Compare modules.

File

plib_devcon.h

C

```
typedef enum {
  DEVCON_ALT_CLOCK_IC,
  DEVCON_ALT_CLOCK_OC
} DEVCON_ALT_CLOCK_TARGET;
```

Members

Members	Description
DEVCON_ALT_CLOCK_IC	Input Capture
DEVCON_ALT_CLOCK_OC	Output Compare

Description

Alternate Clock Targets Enumeration

This enumeration selects the Input Capture or Output Compare module for enabling or disabling the alternate clock.

Remarks

None.

DEVCON_DEBUG_PERIPHERAL Enumeration

Sets modules to ignore debugger's freeze command.

File

plib_devcon.h

C

```
typedef enum {
  DEVCON_DEBUG_USB,
  DEVCON_DEBUG_UART1,
  DEVCON_DEBUG_UART2,
  DEVCON_DEBUG_SPI1,
  DEVCON_DEBUG_ALL
} DEVCON_DEBUG_PERIPHERAL;
```

Members

Members	Description
DEVCON_DEBUG_USB	USB module
DEVCON_DEBUG_UART1	UART 1
DEVCON_DEBUG_UART2	UART 2
DEVCON_DEBUG_SPI1	SPI 1
DEVCON_DEBUG_ALL	USB, UART 1, UART 2, and SPI 1

Description

Ignore Debugger Freeze for Peripheral Module(s) enumeration

This enumeration sets modules to ignore the debugger's freeze command.

Remarks

None.

DEVCON_ECC_CONFIG Enumeration

Selects how ECC is applied to Flash memory.

File

plib_devcon.h

C

```
typedef enum {
  DEVCON_ECC_DISABLED,
  DEVCON_ECC_DISABLED_LOCKED,
  DEVCON_DYN_ECC_ENABLED_LOCKED,
  DEVCON_FLASH_ECC_ENABLED_LOCKED
} DEVCON_ECC_CONFIG;
```

Members

Members	Description
DEVCON_ECC_DISABLED	ECC and dynamic ECC are disabled
DEVCON_ECC_DISABLED_LOCKED	ECC and dynamic ECC are disabled and the configuration locked
DEVCON_DYN_ECC_ENABLED_LOCKED	Dynamic Flash ECC is enabled and the configuration is locked
DEVCON_FLASH_ECC_ENABLED_LOCKED	Flash ECC is enabled, the configuration is locked, word Flash writes disabled

Description

Flash Error Correcting Code (ECC) Configuration enumeration

This enumeration selects how ECC is applied to Flash memory.

Remarks

None.

DEVCON_REGISTER_SET Enumeration

Selects module registers for write lock or unlock.

File

plib_devcon.h

C

```
typedef enum {
  DEVCON_PPS_REGISTERS,
  DEVCON_PMD_REGISTERS,
  DEVCON_PERMISSION_GROUP_REGISTERS,
  DEVCON_ALL_REGISTERS
} DEVCON_REGISTER_SET;
```

Members

Members	Description
DEVCON_PPS_REGISTERS	Peripheral Pin Select registers
DEVCON_PMD_REGISTERS	Peripheral Module Disable registers
DEVCON_PERMISSION_GROUP_REGISTERS	Permission Group registers
DEVCON_ALL_REGISTERS	All lockable registers

Description

Module Registers for Lock/Unlock enumeration.

This enumeration selects the module registers for write lock or unlock.

Remarks

Can be ORed together.

DEVCON_USB_SLEEP_MODE Enumeration

Selects whether the USB clock operates in Sleep mode.

File

plib_devcon.h

C

```
typedef enum {
  DEVCON_USB_NO_CLOCK_IN_SLEEP,
  DEVCON_USB_CLOCK_IN_SLEEP
} DEVCON_USB_SLEEP_MODE;
```

Members

Members	Description
DEVCON_USB_NO_CLOCK_IN_SLEEP	USB PHY clock is shut down when Sleep mode is active.
DEVCON_USB_CLOCK_IN_SLEEP	USP PHY clock continues to run when Sleep mode is active

Description

USB Clock In Sleep Mode Enumeration

This enumeration selects whether the USB clock operates in Sleep mode.

Remarks

None.

DEVCON_MODULE_ID Enumeration

Identifies the supported DEVCON modules.

File

help_plib_devcon.h

C

```
typedef enum {
  DEVCON_ID_0,
  DEVCON_NUMBER_OF_MODULES
} DEVCON_MODULE_ID;
```

Members

Members	Description
DEVCON_ID_0	DEVCON Module 0 ID
DEVCON_NUMBER_OF_MODULES	Number of available DEVCON modules.

Description

DEVCON Module ID

This enumeration identifies the DEVCON modules that are available on the microcontroller. This is the super set of all the possible instances that might be available on the Microchip microcontrollers.

Remarks

The caller should not rely on the specific numbers assigned to any of these values as they may change from one processor to the next.

Not all modules will be available on all microcontrollers. Refer to the data sheet for the specific controller in use to determine which modules are supported. The numbers used in the enumeration values will match the numbers given in the data sheet.

DEVCON_MPLL_OUTPUT_DIVIDER Enumeration

Specifies the MPLL Output divider bits.

File

plib_devcon.h

C

```
typedef enum {
  DEVCON_MPLL_ODIV_1,
  DEVCON_MPLL_ODIV_2,
  DEVCON_MPLL_ODIV_3,
  DEVCON_MPLL_ODIV_4,
  DEVCON_MPLL_ODIV_5,
  DEVCON_MPLL_ODIV_6,
  DEVCON_MPLL_ODIV_7
} DEVCON_MPLL_OUTPUT_DIVIDER;
```

Description

MPLL Output Divider bits enumeration

This enumeration specifies the MPLL Output divider bits.

Remarks

None.

DEVCON_MPLL_VREF_CONTROL Enumeration

VREF control.

File

plib_devcon.h

C

```
typedef enum {
  DEVCON_MPLL_VREF_EXT,
  DEVCON_MPLL_VREF_VDD,
  DEVCON_MPLL_VREF_VSS,
  DEVCON_MPLL_VREF_INT
} DEVCON_MPLL_VREF_CONTROL;
```

Description

MPLL VREF Control enumeration

This enumeration provides VREF control.

Remarks

None.

Description

This section lists the source and header files used by the library.

plib_devcon.h

Defines the Device Control Peripheral Library Interface.

Enumerations

	Name	Description
	DEVCON_ALT_CLOCK_TARGET	Selects Input Capture or Output Compare modules.
	DEVCON_DEBUG_PERIPHERAL	Sets modules to ignore debugger's freeze command.
	DEVCON_ECC_CONFIG	Selects how ECC is applied to Flash memory.
	DEVCON_MPLL_OUTPUT_DIVIDER	Specifies the MPLL Output divider bits.
	DEVCON_MPLL_VREF_CONTROL	VREF control.
	DEVCON_REGISTER_SET	Selects module registers for write lock or unlock.
	DEVCON_USB_SLEEP_MODE	Selects whether the USB clock operates in Sleep mode.

Functions

	Name	Description
	PLIB_DEVCON_2WireJTAGDisableTDO	Disables 2-Wire JTAG protocol use of TDO.
	PLIB_DEVCON_2WireJTAGEnableTDO	Enables 2-Wire JTAG protocol to use TDO.
	PLIB_DEVCON_AlternateClockDisable	Disables the alternate clock source for Input Capture or Output Compare modules, The primary clock source will be used instead.
	PLIB_DEVCON_AlternateClockEnable	Selects the alternate clock source for Input Capture or Output Compare modules.
	PLIB_DEVCON_AnalogIOChargePumpDisable	Disables the I/O Analog Charge Pump on the device.
	PLIB_DEVCON_AnalogIOChargePumpEnable	Enables the I/O Analog Charge Pump on the device.
	PLIB_DEVCON_BootExtSelect	Routes SPI0 pins to the PIC32WK pads.
	PLIB_DEVCON_BootIPFSelect	Routes SPI0 pins to In-Package Flash.
	PLIB_DEVCON_DeviceIdGet	Gets the device identifier.
	PLIB_DEVCON_DeviceRegistersLock	Locks device module registers, preventing modifications to the registers.
	PLIB_DEVCON_DeviceRegistersUnlock	Unlocks device module registers, allowing modifications to the registers.
	PLIB_DEVCON_DeviceVersionGet	Gets the device version.
	PLIB_DEVCON_ExistsAlternateClock	Identifies whether the AlternateClock feature exists on the DEVCON module.
	PLIB_DEVCON_ExistsAnalogChargePumpControl	Identifies whether the I/O Analog Charge Pump feature exists on the DEVCON module.
	PLIB_DEVCON_ExistsBootSelection	Identifies whether the BootSelection feature exists on the DEVCON module
	PLIB_DEVCON_ExistsDeviceRegsLockUnlock	Identifies whether the DeviceRegsLockUnlock feature exists on the DEVCON module.
	PLIB_DEVCON_ExistsDeviceVerAndId	Identifies whether the DeviceVerAndId feature exists on the DEVCON module.
	PLIB_DEVCON_ExistsECCModes	Identifies whether the ECCModes feature exists on the DEVCON module.
	PLIB_DEVCON_ExistsHSUARTControl	Identifies whether the HSUARTControl feature exists on the DEVCON module
	PLIB_DEVCON_ExistsIgnoreDebugFreeze	Identifies whether the IgnoreDebugFreeze feature exists on the DEVCON module.
	PLIB_DEVCON_ExistsJTAGEnable	Identifies whether the JTAGEnable feature exists on the DEVCON module.
	PLIB_DEVCON_ExistsJTAGUsesTDO	Identifies whether the JTAGUsesTDO feature exists on the DEVCON module.
	PLIB_DEVCON_ExistsMPLL	Identifies whether the MPLL feature exists on the DEVCON module.
	PLIB_DEVCON_ExistsOTPConfigLockUnlock	Identifies whether the OTPConfigLockUnlock feature exists on the DEVCON module

	PLIB_DEVCON_ExistsSystemLockUnlock	Identifies whether the SysLockUnlock feature exists on the DEVCON module.
	PLIB_DEVCON_ExistsTraceOutput	Identifies whether the TraceOutput feature exists on the DEVCON module.
	PLIB_DEVCON_ExistsUSB_PHY_SleepModeSet	Identifies whether the USB_PHY_SleepModeSet feature exists on the DEVCON module.
	PLIB_DEVCON_FlashErrCorrectionModeSet	Sets Flash error correction operation.
	PLIB_DEVCON_HSUARTDisable	Disables High Speed UART.
	PLIB_DEVCON_HSUARTEnable	Enables High Speed UART.
	PLIB_DEVCON_IgnoreDebugFreezeDisable	Module stops when commanded by debugger.
	PLIB_DEVCON_IgnoreDebugFreezeEnable	Allows module to ignore FREEZE command from debugger and continue running.
	PLIB_DEVCON_JTAGPortDisable	Disables the JTAG port on the device.
	PLIB_DEVCON_JTAGPortEnable	Enables the JTAG port on the device.
	PLIB_DEVCON_MPLLDisable	Disables the MPLL.
	PLIB_DEVCON_MPLLEnable	Enables the MPLL.
	PLIB_DEVCON_MPLLInputDivSet	Sets the MPLL Input Divider bits.
	PLIB_DEVCON_MPLLIsReady	Reads MPLL status.
	PLIB_DEVCON_MPLLMultiplierSet	Sets the MPLL Multiplier bits.
	PLIB_DEVCON_MPLLODiv1Set	Sets the MPLL output divider 1 bits.
	PLIB_DEVCON_MPLLODiv2Set	Sets the MPLL output divider 2 bits.
	PLIB_DEVCON_MPLLVrefSet	Sets the VREF control setting.
	PLIB_DEVCON_MPLLVregDisable	Disables the MPLL VREG.
	PLIB_DEVCON_MPLLVregEnable	Enables the MPLL VREG.
	PLIB_DEVCON_MPLLVregIsReady	Reads the MPLL VREG status.
	PLIB_DEVCON_OTPConfigLock	Locks or unlocks the configuration registers.
	PLIB_DEVCON_OTPConfigUnlock	unlocks the configuration registers.
	PLIB_DEVCON_SystemLock	Executes the system lock sequence.
	PLIB_DEVCON_SystemUnlock	Executes the system unlock sequence.
	PLIB_DEVCON_TraceOutputDisable	Disables trace outputs and the stop trace clock.
	PLIB_DEVCON_TraceOutputEnable	Enables trace outputs and the start trace clock.
	PLIB_DEVCON_USBPHYSleepModeSet	Selects USB PHY clocking during Sleep mode.

Description

Device Control (DEVCON) Peripheral Library Interface Header

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the Device Control Peripheral Library for Microchip microcontrollers. The definitions in this file are for the Device Control module.

DMA Peripheral Library Help

This section describes the Direct Memory Access (DMA) Peripheral Library.

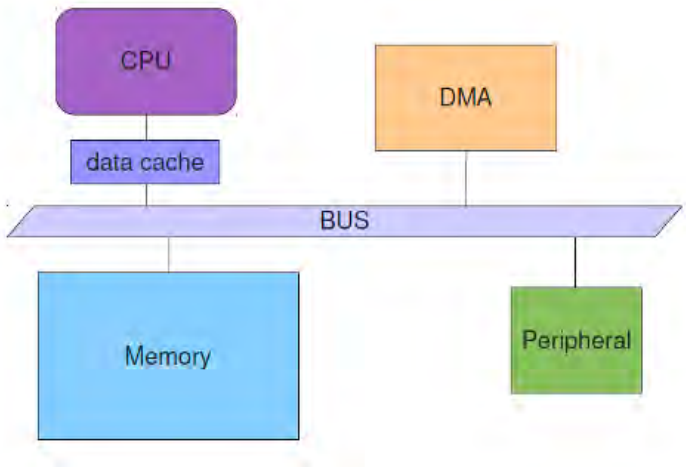
Introduction

Direct Memory Access (DMA) is a feature (sub-system) of the microcontroller that allows certain hardware sub-systems within the microcontroller to access the system memory independently of the processor (or the CPU).

Description

DMA also assists in accessing peripheral memory along with the system memory (data RAM). The DMA sub-system in the PIC family of microcontrollers is optimized for high-performance, real-time, embedded applications where determinism and system latency are priorities.

DMA Hardware Abstraction Model



Using the Library

This topic describes the basic architecture of the DMA Peripheral Library and provides information and examples on its use.

Description

Interface Header File: `plib_dma.h`

The interface to the DMA Peripheral Library is defined in the `plib_dma.h` header file, which is included by the peripheral library header file, `peripheral.h`. Any C language source (`.c`) file that uses the DMA Peripheral Library must include `peripheral.h`.

Library File:

The DMA Peripheral Library (.a) file is installed with MPLAB Harmony.

Please refer to the What is MPLAB Harmony?What is MPLAB Harmony? section for how the peripheral interacts with the framework.

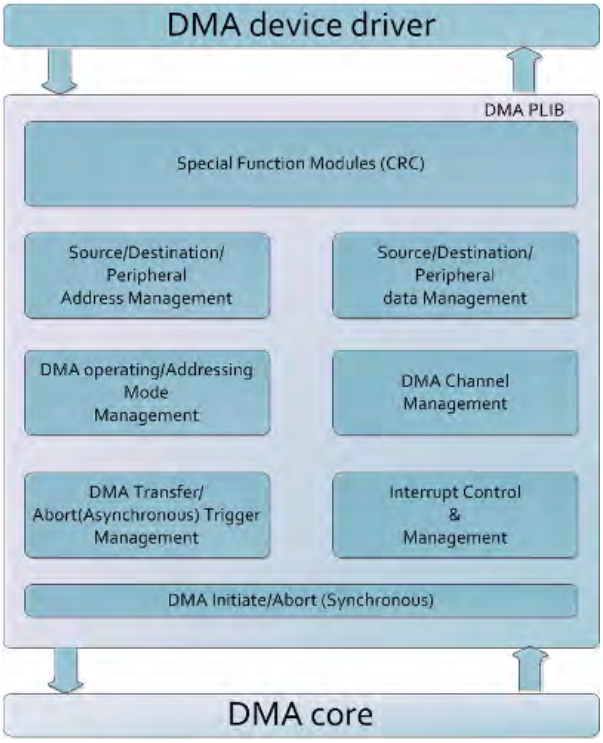
Hardware Abstraction Model

This library provides the low-level abstraction of the DMA module on the Microchip family of microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in the software and introduces the library interface.

Description

The DMA Peripheral Library software is depicted using the following block diagram.

DMA Software Abstraction Block Diagram



The DMA Peripheral Library takes requests from application software or the DMA device driver and controls the DMA core (the DMA hardware) as per the inputs passed to the library.

The major components of the DMA Peripheral Library are:

- Source/Destination/Peripheral Address Management
- Source/Destination/Peripheral Data Management
- DMA Operating/Addressing Mode Management
- DMA Channel Management
- Interrupt Control and Management

The topic Library Overview explains in detail each block of the DMA Peripheral Library software architecture.

Note: The interface provided is a superset of all the functionality of the available DMA module on the device. Refer to the **"DMA"** chapter in the specific device data sheet or the family reference manual section specified in that chapter to determine the set of functions that are supported for each DMA module on your device.

Library Overview

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the DMA module.

Library Interface Section	Description
Transfer/Abort (Synchronous)	Handles the synchronous DMA transfer start and End. This force request is controlled fully by the software.
Transfer/Abort (Asynchronous) Trigger Management	Each DMA transaction can be asynchronously initiated or aborted by an interrupt. This feature handles the required configuration.
Interrupt Control and Management	Each DMA channel can be configured to respond to events such as address error (upper address error, lower address error, etc.), transfer count half done, transfer count done, source data completely transferred, etc.
Operating/Addressing Mode Management	Before initiating a DMA transaction, the addressing and operating modes of the DMA module need to be configured (per channel basis). As an example, the DMA module can be configured for one shot mode with peripheral indirect addressing mode for a DMA transaction.
Channel Management	Each DMA channel can be individually configured for a DMA transaction. Priorities can be assigned, a channel can be enabled or disabled, channel chaining can be used, etc.
Source/Destination/Peripheral Address Management	For each DMA transaction to start, the DMA core needs to know the source and destination addresses. This feature handles this type of configuration.

Source/Destination/Peripheral Data Management	For each DMA transaction, the amount of data to be transferred, the source and destination size, the transaction type (byte/word), and transaction size can be configured by this feature.
Special Function Modules (CRC)	Certain high-end controllers support this CRC generator. This feature can be assigned to any of the available DMA channels. This feature handles the configuration of these aspects.
Status (Including Channel)	This feature specifies the application to access the status information of the DMA and each channel.
Feature Existence Functions	Lists the interface routines that determine whether or not the feature is supported by the device.

How the Library Works

Note: Not all modes are available on all devices. Please refer to the specific device data sheet to determine which modes are supported.

General Configuration

DMA General configuration includes enabling, disabling DMA module globally. It also involves DMA suspend control and behavior in Idle mode.

Enable/Disable DMA

Enabling and disabling the DMA are the basic routines that may be called during initialization and exit routines of the application.

DMA Enable/Disable Example:

```
// Enable the DMA controller
PLIB_DMA_Enable ( DMA_ID_0 );
// Disable the DMA
PLIB_DMA_Disable ( DMA_ID_0 );
// Check the enable status of the DMA controller.
if(PLIB_DMA_IsEnabled( DMA_ID_0 ))
{
// application code
}
```

Transfer/Abort (Synchronous)

A DMA transaction can be initiated/aborted asynchronously by configuring an interrupt for a channel. Refer to Transfer/Abort (Asynchronous) Trigger Management for details.

In many instances, an application or a device driver needs to initiate a DMA transfer or abort an ongoing DMA transfer for reasons not necessarily known. To handle such cases, the DMA core supports a forceful DMA start and abort.

Note: The DMA abort is not supported by all devices. Refer to the specific device data sheet to determine availability of this feature.

When a DMA force start request is sent and the channel is already processing/pending to process an interrupt-based DMA transfer, the force transfer request will be ignored. In certain devices, a flag is raised to indicate a collision of DMA requests. Refer to Status (Including Channel) for details. In certain devices, an interrupt is issued to indicate that the active channel may not be able to keep up with the demands from the peripheral module being serviced. For more details refer to Interrupt Control and Management.

A DMA force transfer is initiated by the PLIB_DMA_StartTransferSet function.

A DMA force abort is initiated by the PLIB_DMA_AbortTransferSet function.

DMA Transfer/Abort (Synchronous) Configuration

A DMA transfer can be initiated or aborted forcefully by the software.

Example:

```
// Initiate a forced transfer on channel-3
PLIB_DMA_StartTransferSet ( DMA_ID_0, DMA_CHANNEL_3 );
// Abort a transfer on channel-3
PLIB_DMA_AbortTransferSet ( DMA_ID_0, DMA_CHANNEL_3 );
```

Transfer/Abort (Asynchronous) Trigger Management

DMA Start IRQ

Each channel can be configured to initiate a DMA transaction based on the interrupt from a source. This can be enabled/disable per channel basis. To initiate a DMA transfer upon an interrupt trigger, the IRQ number needs to be configured as the start IRQ for this channel. Which source can act as the start IRQ is device-dependent. In certain devices, any of the available IRQs can be configured as the starting IRQ, while in other devices, there is restriction on which interrupt source can act as the start IRQ. Refer to the specific device data sheet to determine feature availability.

The starting IRQ is enabled by the PLIB_DMA_ChannelXTriggerEnable function. A DMA channel can be configured to start a DMA transfer based on the event on an IRQ using the PLIB_DMA_ChannelXStartIRQSet function.

DMA Abort IRQ

Each channel can be configured to abort a DMA transaction based on the interrupt from a source. This can be enabled/disabled per channel basis. To abort a DMA transfer upon an interrupt trigger, the IRQ number needs to be configured as the abort IRQ for this channel.

The abort IRQ is enabled by the PLIB_DMA_ChannelXTriggerEnable function. A DMA channel can be configured to abort a DMA transfer based on the event on an IRQ using the ChannelXAbortIRQSet function.

DMA Pattern Matching Termination

Pattern Match Termination mode allows the user to end a transfer if a byte of data written during a transaction matches a specific pattern. This feature is useful in applications where a variable data size is required and eases the setup of the DMA channel. The UART module is a good example of where this can be effectively used. For details about the pattern data configuration refer to Channel Management**.**

DMA Pattern match mode is enabled using the PLIB_DMA_ChannelXTriggerEnable function**.** It can also be disabled using the PLIB_DMA_ChannelXTriggerDisable function**.**

DMA Transfer/Abort (Asynchronous) Configuration

A DMA transfer can also be triggered/aborted asynchronously by using an interrupt event. The interrupt event required to initiate/abort a DMA transfer for a channel needs to be set. Prior to this, the start IRQ and abort IRQ both need to be enabled.

Example:

```
// Enable the start IRQ. An interrupt event can trigger a DMA transfer.
PLIB_DMA_ChannelXTriggerEnable ( DMA_ID_0, DMA_CHANNEL_3, DMA_CHANNEL_TRIGGER_TRANSFER_START );
// Enable the abort IRQ. An interrupt event can abort a DMA transfer on channel-3
PLIB_DMA_ChannelXTriggerEnable ( DMA_ID_0, DMA_CHANNEL_3, DMA_CHANNEL_TRIGGER_TRANSFER_ABORT );
// Set the start IRQ to UART-2 RX Interrupt
PLIB_DMA_ChannelXStartIRQSet ( DMA_ID_0, DMA_CHANNEL_3, DMA_TRIGGER_USART_2_RECEIVE );
// Set the abort IRQ to UART-2 error Interrupt
PLIB_DMA_ChannelXAbortIRQSet ( DMA_ID_0, DMA_CHANNEL_3, DMA_TRIGGER_USART_2_ERROR );
```

In some devices, abort IRQ trigger is not supported. Refer to the specific device data sheet to determine availability.

DMA Transfer Pattern Match Abort Configuration

The DMA transfer can also be aborted on a pattern match trigger (supported on PIC32 devices). Refer to Transfer/Abort (Asynchronous) Trigger Management for more information on pattern match abort. To use this feature, it must first be enabled. The pattern data needs to be programmed for the required channel. Once this is done, when a DMA transfer is in progress on that particular channel, if the DMA controller comes across the data matching the programmed data the transfer is automatically aborted.

Example:

```
// Enable the pattern match abort for channel-3
PLIB_DMA_ChannelXTriggerEnable ( DMA_ID_0, DMA_CHANNEL_3, DMA_CHANNEL_TRIGGER_PATTERN_MATCH_ABORT );
// Set a pattern data to match
PLIB_DMA_ChannelXPatternDataSet ( DMA_ID_0, DMA_CHANNEL_3, 0xEE );
```

Interrupt Control and Management

The DMA module has the ability to generate interrupts reflecting the events that occur during the channel's data transfer.

The following are all of the possible interrupts generated during DMA operation. This topic provides information for configuring these interrupts.

Error Interrupts

This type of event is signalled when an address error has occurred during the channel transfer operation. An address error also can occur if a DMA operation accesses an address beyond configured address limits (low and high).

Abort Interrupts

This type of event is signalled when a DMA transfer is aborted because of a system event matching the abort IRQ configured for the current channel.

DMA Completion Interrupts (Block Completion Interrupts)

This event occurs when a channel transfers a block of configured data.

Call Complete Interrupts

This event occurs when a channel completes a cell sized data transfer.

DMA Midpoint Interrupts

This event occurs when the channel is at the midpoint of completing the data transfer.

Overrun Interrupts

When a DMA channel receives a trigger (software or hardware) while it is servicing another request, an overrun condition occurs. This indicates that the channel is being requested before its current transaction is finished. An overrun condition will not result in termination of the current transaction.

Source Address Pointer Activity Interrupts

This event occurs when the channel source pointer reached the end of the source or when it reaches the midpoint of the source depending on the way this interrupt is configured.

Destination Address Pointer Activity Interrupts

This event occurs when the channel destination pointer reached the end of the destination or when it reaches the midpoint of the destination depending on the way this interrupt is configured.

This feature helps in configuring the previously listed interrupts. Depending on the device selected, all or some of the interrupts can be individually enabled and disabled. In addition, this feature obtains the status of the interrupts previously mentioned.

All of the interrupts belonging to the DMA channel map to the corresponding channel interrupt vector. In general, each channel of the DMA has a dedicated vectored interrupt. Therefore, the ISR for each channel should internally check for the status of the previously mentioned interrupts to respond to the corresponding events.

DMA Interrupt Control and Management

Each DMA channel has a vectored interrupt. However, each DMA channel internally generates various interrupts, which will invoke the same channel interrupt based on various events. This feature helps to enable/disable them and is also used to obtain the interrupt status.

Example:

```
// Enable the channel-3 source done interrupt
PLIB_DMA_ChannelXINTSourceEnable ( DMA_ID_0, DMA_CHANNEL_3, DMA_INT_SOURCE_DONE );
// Get the status of address error on channel-3
if(PLIB_DMA_ChannelXINTSourceFlagGet ( DMA_ID_0, DMA_CHANNEL_3, DMA_INT_ADDRESS_ERROR ))
{
// application code for error handling
}
// Disable the channel abort interrupt
PLIB_DMA_ChannelXINTSourceDisable (DMA_ID_0, DMA_CHANNEL_3, DMA_INT_TRANSFER_ABORT);
```

Operating/Addressing Mode Management

DMA Operating Modes

The various operating/transfer modes supported are:

- One-Shot mode
- Repeated One-Shot mode
- Continuous mode
- Repeated Continuous mode
- Ping-Pong mode
- Null Data Write mode

One-Shot Mode

In One-Shot mode, a single transfer is performed for each trigger event. The trigger event can be synchronous (refer to Transfer/Abort (Synchronous) or asynchronous (refer to Transfer/Abort (Asynchronous) Trigger Management). When a single one-shot transfer occurs and the DMA count is decremented to zero, this disables the channel and requires the channel to be re-enabled to perform the next transaction.

Repeated One-Shot Mode

In Repeated One-Shot mode, single transfers occurs repeatedly so long as triggers are being provided. When the DMA count reaches zero, the

channel is not disabled as in One-Shot mode, but the count is reloaded and transfers begin again.

Continuous Mode

In Continuous mode, a single trigger starts a sequence of back-to-back transfers. These continue with each transfer decrementing the DMA count until it reaches zero. At this point, and like one-shot mode, the channel is disabled.

Repeated Continuous Mode

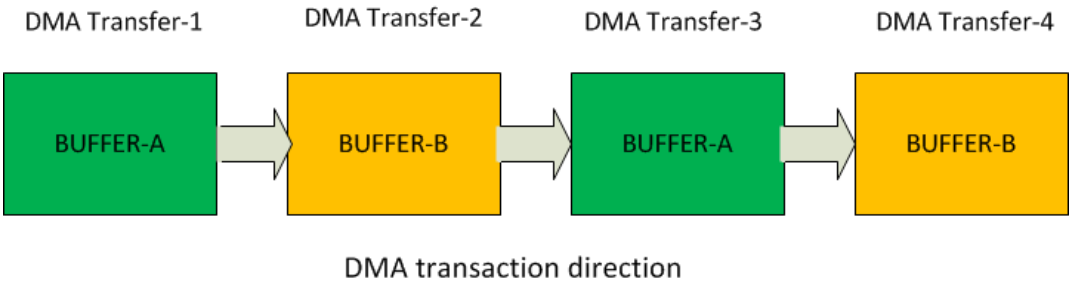
This mode can be seen as a combination of Continuous and Repeated One-Shot modes. Data transfers keep occurring so as long as triggers are provided and multiple transfers can occur with each trigger. When the DMA count reaches zero, the address and data registers are reloaded and the process is repeated.

Ping-Pong Mode

Certain devices support Ping-Pong mode, which allows the CPU to process one buffer while a second buffer operates with the DMA channel. The net result is that the CPU has the entire DMA block transfer time to process the buffer that is currently not being used by the DMA channel.

The following figure demonstrates the data flow for four DMA transactions using Ping-Pong mode.

Ping-Pong Mode



When the DMA is filling buffer-B, the CPU can process buffer-A and vice-versa.

Ping-Pong mode can be combined with One-Shot and Continuous modes (previously discussed) to create other combinations.

Null Data Write Mode

A DMA transfer operates only in one direction from the source address to the destination address. However, some communication protocols require symmetrical buffer accesses, meaning that for every read operation performed on a buffer, there must be an accompanying write operation. The Null Write mode is designed to satisfy this requirement. This mode works by transferring data from the source to the destination like any other DMA operation. Once this is done, the transferred data still with the DMA buffer is written back to the source.

DMA Addressing Modes

The addressing modes can be broadly classified into the following categories:

- Register Indirect with Post Increment Addressing mode
- Register Indirect without Post Increment Addressing mode
- Source/destination increment based on size
- Source/destination decrement based on size
- Peripheral Indirect Addressing mode

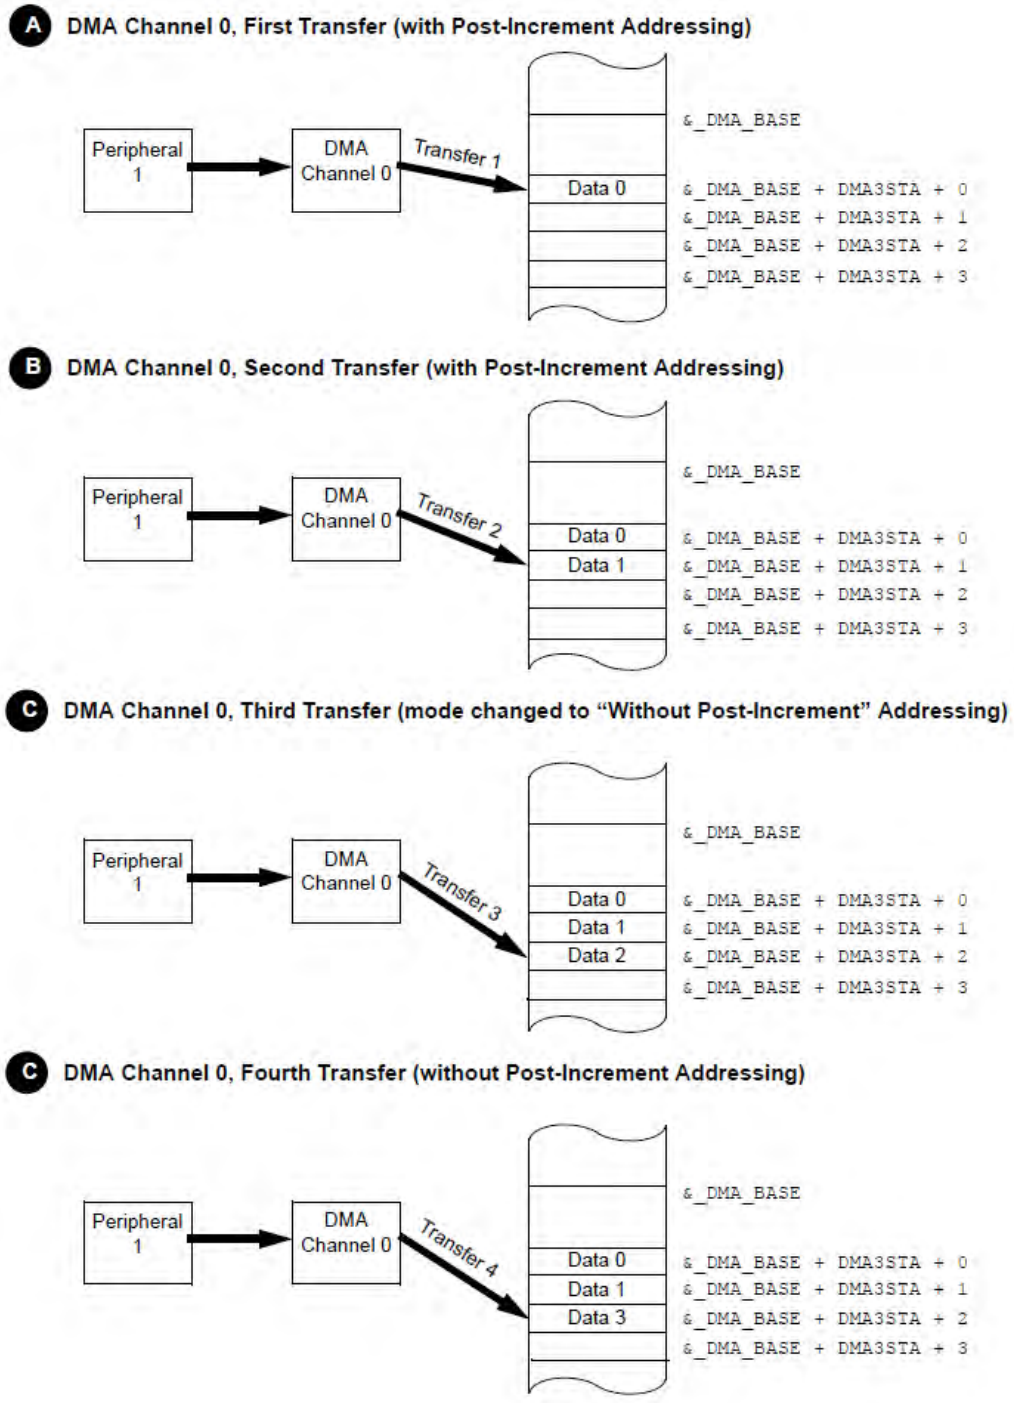
Register Indirect With Post Increment Addressing Mode

In this mode, the source data address is incremented by one location after each DMA transaction. The starting address is provided by a start address offset register.

Register Indirect Without Post Increment Addressing Mode

In this mode, the source data address is not updated after each DMA transaction. Therefore, the next DMA transfer is initiated from the same RAM address. The starting address is provided by a start address offset register.

Register Indirect Addressing With and Without Post-increment



Source/Destination Increment Based on Size

After each DMA transaction, the source/destination (a separate configuration exist for each) address increments by the size of data (word/byte) configured.

Source/Destination Decrement Based on Size

After each DMA transaction, the source/destination (a separate configuration exist for each) address decrements by the size of data (word/byte) configured.

Peripheral Indirect Addressing Mode

Peripheral Indirect Addressing (PIA) is a special auto-incrementing mode for the transfer of data to and from a multi-level peripheral buffer. This mode is only available for specific peripherals designed with its use in mind. Refer to the specific device data sheet to determine availability of this mode.

PIA-capable peripherals - When selected, the PIA-enabled peripheral generates a short Indirect Address (IA) (size defined by the peripheral) to the DMA channel. The IA is logically ORed with either the contents of the source address or the destination address to define a specific address for the peripheral inside the DMA address space.

DMA Operating/Transfer Modes:

Refer to Operating/Addressing Mode Management for descriptions of the available operating modes.

The following code demonstrates usage of Continuous mode.

Example:

```
// Enable the DMA
PLIB_DMA_Enable ( DMA_ID_0 );
// disable the selected channel-3
PLIB_DMA_ChannelXDisable ( DMA_ID_0, DMA_CHANNEL_3 );
// program the source and destination addresses
// Set the source starting address to 0x1000
PLIB_DMA_ChannelXSourceStartAddressSet ( DMA_ID_0, DMA_CHANNEL_3, 0x1000 );
// Set the destination starting address to 0x2000
PLIB_DMA_ChannelXDestinationStartAddressSet ( DMA_ID_0, DMA_CHANNEL_3, 0x2000 );
// Set the transfer count to 100.
PLIB_DMA_ChannelXTransferCountSet ( DMA_ID_0, DMA_CHANNEL_3, 100 );
// set the data transfer mode to one-shot
PLIB_DMA_ChannelXOperatingTransferModeSelect ( DMA_ID_0, DMA_CHANNEL_3, DMA_MODE_CONTINUOUS );
// select the source addressing mode
PLIB_DMA_ChannelXSourceAddressModeSelect ( DMA_ID_0, DMA_CHANNEL_3,
DMA_ADDRESSING_SOURCE_INCREMENT_BASED_ON_SIZE );
// select the destination addressing mode
PLIB_DMA_ChannelXDestinationAddressModeSelect ( DMA_ID_0, DMA_CHANNEL_3,
DMA_ADDRESSING_DESTINATION_INCREMENT_BASED_ON_SIZE );
// Enable the channel
PLIB_DMA_ChannelXEnable ( DMA_ID_0, DMA_CHANNEL_3 );
// Initiate the transfer
PLIB_DMA_StartTransferSet ( DMA_ID_0, DMA_CHANNEL_3 );
```

DMA Addressing Modes:

DMA addressing modes can be selected by using following code example.

DMA Addressing mode Example:

```
// set the source address to increment upon each transfer
PLIB_DMA_ChannelXSourceAddressModeSelect ( DMA_ID_0, DMA_CHANNEL_3,
DMA_ADDRESSING_SOURCE_INCREMENT_BASED_ON_SIZE );
// Set the destination address to decrement upon each transfer
PLIB_DMA_ChannelXDestinationAddressModeSelect ( DMA_ID_0, DMA_CHANNEL_3,
DMA_ADDRESSING_DESTINATION_DECREMENT_BASED_ON_SIZE );
```

Channel Management

Each Channel in the DMA module is can be independently configured for a specific transaction with different properties.

The following aspects of the channel can be configured using this feature.

DMA Channel Enable/Disable

Each channel can be enabled or disabled to control the transactions on the channel. A DMA transfer can only occur when the channel is enabled. A DMA channel can be enabled using the PLIB_DMA_ChannelXEnable function. When a channel is disabled by calling the PLIB_DMA_ChannelXDisable function, no data transfers can occur on the channel.

DMA Channel Priority

The DMA module has a natural priority associated with each of the channels. Channel 0 has the highest priority. Each DMA channel can be assigned priority. This priority scheme changes depending on the device selected. There are three ways in which priorities are assigned in PIC microcontrollers. In the first method, two bits are allocated for each channel for priority. Therefore, priorities 0 to 3 can be assigned to channels. The second is called round-robin. In this method, the module starts by giving Channel 0 preference in any data transfer conflicts. For each successive transfer conflict, the next higher channel receives preference, continuing as a cycle through all the channels. The third method is called fixed scheme, which always gives priority to the lowest requesting channel number. The channel priority can be set using the PLIB_DMA_ChannelPrioritySelect function or the PLIB_DMA_ChannelXPrioritySelect function depending on the device selected.

DMA Channel Chaining

Channel chaining is an enhancement to the DMA channel operation. A channel (slave channel) can be chained to an adjacent channel (master channel). The slave channel will be enabled when a block transfer of the master channel completes. At this point, any event on the slave channel

will initiate a DMA transfer. If the channel has an event pending, a DMA transfer will begin immediately. The channel chaining can be enabled or disabled using the PLIB_DMA_ChannelXChainEnable function and the PLIB_DMA_ChannelXChainDisable function, respectively. The channel chaining higher/lower channel number can be configured using the PLIB_DMA_ChannelXChainToHigher function and the PLIB_DMA_ChannelXChainToLower function.

DMA Channel Transfer Direction

Each DMA transfer will have a direction. It can be memory to peripheral, peripheral to memory, or memory to memory. This can be set using the PLIB_DMA_ChannelXTransferDirectionSelect function.

DMA Channel Pattern Data

On supported devices, a DMA transfer can be aborted by a pattern match (refer to Transfer/Abort (Asynchronous) Trigger Management). The pattern data is per channel basis. It can be set using the PLIB_DMA_ChannelXPatternDataSet function.

Channel Auto Enable

This feature can be used to keep the channel active even if a block transfer or pattern match occurs. This mode is useful for applications that do repeated pattern matching. To enable this feature use the PLIB_DMA_ChannelXAutoEnable function. To disable this feature use the PLIB_DMA_ChannelXAutoDisable function.

DMA Channel Configuration

The following example configures DMA Channel 3 by setting its priority to two, enabling the auto-enable feature (refer to Channel Management section), enabling the channel chain feature and chaining Channel 3 and Channel 2, and finally enabling Channel 3.

Example:

```
// Disable the channel-3
PLIB_DMA_ChannelXDisable ( DMA_ID_0, DMA_CHANNEL_3 );
// set the channel priority to 2
PLIB_DMA_ChannelXPrioritySelect  ( DMA_ID_0, DMA_CHANNEL_3, DMA_CHANNEL_PRIORITY_2 );
// Configure the channel auto enable feature
PLIB_DMA_ChannelXAutoEnable ( DMA_ID_0, DMA_CHANNEL_3 );
// Enable the channel chain feature
PLIB_DMA_ChannelXChainEnable ( DMA_ID_0, DMA_CHANNEL_3 );
// chain channel 3 to channel 2
PLIB_DMA_ChannelXChainToLower ( DMA_ID_0, DMA_CHANNEL_3 );
// Enable channel-3
PLIB_DMA_ChannelXEnable ( DMA_ID_0, DMA_CHANNEL_3 );
```

In some devices it is required to select the DMA transfer direction before initiating DMA transfer. This can be done using the following code.

Example:

```
// Disable channel-3
PLIB_DMA_ChannelXDisable ( DMA_ID_0, DMA_CHANNEL_3 );
// Set the data transfer direction from memory to peripheral
PLIB_DMA_ChannelXTransferDirectionSelect ( DMA_ID_0, DMA_CHANNEL_3,
DMA_READ_FROM_MEMORY_WRITE_TO_PERIPHERAL );
// we can also check the current channels transfer direction
// check the data transfer direction
if ( DMA_READ_FROM_PERIPHERAL_WRITE_TO_MEMORY == PLIB_DMA_ChannelXTransferDirectionGet ( DMA_ID_0,
DMA_CHANNEL_3 ) )
{

// application code

}
```

Source/Destination/Peripheral Address Management

This topic describes configuring the source/destination/peripheral addresses involved in the DMA transfer.

Source/Destination Start Address

Before initiating a DMA transfer, the channel should be programmed with the source and the destination addresses. In supported devices, this can be done using the PLIB_DMA_ChannelXSourceStartAddressSet Function and the PLIB_DMA_ChannelXDestinationStartAddressSet Function, respectively. At any point, the programmed addresses can be read using the PLIB_DMA_ChannelXSourceStartAddressGet Function and the PLIB_DMA_ChannelXDestinationStartAddressGet Function.

Source/Destination Start Address Offset

In some devices, a dedicated region of RAM is allocated for DMA transfers typically called DMA RAM. For any DMA transfer, the source or destination address needs to be defined as an offset from the starting of the DMA RAM for such devices. Use the

PLIB_DMA_ChannelXStartAddressOffsetSet Function to set the offset addresses of buffers A and B. Buffers A and B are used in Ping-Pong mode. To learn more, refer to Operating/Addressing Mode Management.

Peripheral Address

When DMA is used for a peripheral to memory or a memory to peripheral transfer, the peripheral address within a register must be set. This register needs to be programmed with the peripheral location where data transfers takes place. For example this can be the I2C buffer Special Function Register (SFR) location or the UART Receive register, etc. To set the peripheral address use the PLIB_DMA_ChannelXPeripheralAddressSet Function.

DMA Source/Destination/Peripheral Address Control

The first step in initiating a DMA transfer is to set the source and destination addresses.

The following example sets the source address and the destination address for Channel 3.

Example:

```
// Set the source starting address to 0x1000
PLIB_DMA_ChannelXSourceStartAddressSet ( DMA_ID_0, DMA_CHANNEL_3, 0x1000 );
// Set the destination starting address to 0x2000
PLIB_DMA_ChannelXDestinationStartAddressSet ( DMA_ID_0, DMA_CHANNEL_3, 0x2000 );
```

On certain devices, the source starting address needs to be given as an offset from the start of the DMA RAM address (in such devices, only memory to peripheral transfers and vice-versa are possible). In such devices, the source start address is set using the PLIB_DMA_ChannelXStartAddressOffsetSet function, as shown in the following code.

Example:

```
// Set the offset-A register to 0x1000
PLIB_DMA_ChannelXStartAddressOffsetSet ( DMA_ID_0, DMA_CHANNEL_3, 0x1000, DMA_ADDRESS_OFFSET_PRIMARY);
// If ping-pong mode is enabled we will make use of buffer-B, and in that case
// we need to set an address for that also
// Set the offset-B to 0x2000
PLIB_DMA_ChannelXStartAddressOffsetSet ( DMA_ID_0, DMA_CHANNEL_3, 0x2000, DMA_ADDRESS_OFFSET_SECONDARY);
```

The following example sets the peripheral address when the DMA needs to be initiated between memory and peripheral.

DMA Peripheral Address Set Example:

```
// Set the peripheral address to ADC1 buffer for channel-3 transfers.
PLIB_DMA_ChannelXPeripheralAddressSet ( DMA_ID_0, DMA_CHANNEL_3, (volatile uint16_t)(&ADC1BUF0));
```

There are also equivalent functions available within this library that read the source/destination/peripheral address set.

Source/Destination/Peripheral Data Management

This topic describes the data configuration.

Source/Destination Transfer Size Configuration

In supported devices, each channel can be programmed to read a particular sized data from a source, and write in a particular size to a destination. Both the source and destination sizes are configurable. Use the PLIB_DMA_ChannelXSourceSizeSet Function and the PLIB_DMA_ChannelXDestinationSizeSet Function for read size and write size configuration, respectively. For example, the source size can be 200 bytes and the destination size can be 100 bytes. However, it is logical to have both set to the same value. In some devices, the amount of data that needs to be transferred is independent of the source and destination, and is called transfer count. In such devices use the PLIB_DMA_ChannelXTransferCountSet Function to set the total amount of data (block transfer data).

Cell Size Configuration

In supported devices, when DMA transfer is initiated, the amount of data configured for a cell transfer will be delivered to the destination per trigger. This can be configured using the PLIB_DMA_ChannelXCellSizeSet Function.

Channel Data Size

The DMA controller can handle both byte and word (16-bit) transactions. Each DMA channel is individually configurable for the data size using the PLIB_DMA_ChannelXDataSizeSelect Function.

Source/Destination Pointer Read

In supported devices, the application can read the byte in source/destination to which the DMA core is currently pointing. This can be done using the PLIB_DMA_ChannelXSourcePointerGet Function and the PLIB_DMA_ChannelXDestinationPointerGet Function for source and destination, respectively.

DMA Source/Destination/Peripheral Data Control

After setting the source/destination address the amount of data that needs to be transferred is set in a DMA operation.

However, prior to that the data transaction type (byte/word) needs to be configured on certain devices.

Example:
```
// Set channel-3 transactions as byte transactions
PLIB_DMA_ChannelXDataSizeSelect ( DMA_ID_0, DMA_CHANNEL_3, DMA_CHANNEL_DATA_8 );
// Set channel-3 transactions as 16-bit transactions
PLIB_DMA_ChannelXDataSizeSelect ( DMA_ID_0, DMA_CHANNEL_3, DMA_CHANNEL_DATA_16 );
// Get the current data size configured
if( DMA_CHANNEL_BYTE == PLIB_DMA_ChannelXDataSizeGet ( DMA_ID_0, DMA_CHANNEL_3 ))
{
// application code
}
```

Example:
```
// Set the transfer count to 100.
PLIB_DMA_ChannelXTransferCountSet ( DMA_ID_0, DMA_CHANNEL_3, 100 );
```

Some high-end microcontrollers (especially PIC32 devices) use the method of cell transfer and block transfer. A cell transfer is the amount of data a DMA channel transfers per an event. In such microcontrollers the application can configure the sizes of the source and destination (per channel basis). A block transfer is defined as the number of bytes transferred when a channel is enabled. A block transfer is comprised of several cell transfers. For example, if the source and destination size is 100 and the cell size is 10, it will take 10 cell transfers to complete the block transfer, which is 100 bytes (larger of source or destination sizes).

DMA cell transfer configuration Example:
```
// Set the source size to be 100
PLIB_DMA_ChannelXSourceSizeSet ( DMA_ID_0, DMA_CHANNEL_3, 100 );
// Set the destination size to be 100
PLIB_DMA_ChannelXDestinationSizeSet ( DMA_ID_0, DMA_CHANNEL_3, 100 );
// Set the cell size to be 10
PLIB_DMA_ChannelXCellSizeSet ( DMA_ID_0, DMA_CHANNEL_3, 10 );
```

Special Function Modules (CRC)

Selected high-end devices support a special feature called the CRC generator.

Depending on the device, the is a highly configurable, 16-bit or 32-bit CRC generator. The CRC can be assigned to any available DMA channel using PLIB_DMA_CRCChannelSelect Function. The CRC is enabled using the PLIB_DMA_CRCEnable Function.

Optionally, the data from the source can be subjected to byte reordering using the PLIB_DMA_CRCByteOrderSelect Function. The data is then optionally passed to the Linear Shift Feedback Register (LFSR) CRC or the IP header checksum blocks using the PLIB_DMA_CRCTypeSet Function.

The CRC feature is attached to a channel in one of two possible modes, Background or Append.

Background Mode

The CRC is calculated in the background, with normal DMA behavior maintained. This can be selected by disabling the Append mode.

Append Mode

Data read from the source is not written to the destination, but the CRC data is accumulated in the CRC data register. The accumulated CRC is written to the location specified by the destination address when a block transfer completes. This mode is enabled by the PLIB_DMA_CRCAppendModeEnable Function.

The following code shows DMA CRC calculation in Append mode.

Example:
```
// CRC of the Flash block
uint32_t blockCRC;
bool error = false;
// disable the channel 0 interrupts using the Interrupts Peripheral Library
// Enable the DMA controller
PLIB_DMA_Enable ( DMA_ID_0 );
// disable the selected channel-3
PLIB_DMA_ChannelXDisable ( DMA_ID_0, DMA_CHANNEL_3 );
// set the channel priority to 2
PLIB_DMA_ChannelXPrioritySelect  ( DMA_ID_0, DMA_CHANNEL_3, DMA_CHANNEL_PRIORITY_2 );
// Configure the channel auto enable feature
PLIB_DMA_ChannelXAutoEnable ( DMA_ID_0, DMA_CHANNEL_3 );
// Disable the channel chain feature
PLIB_DMA_ChannelXChainDisable ( DMA_ID_0, DMA_CHANNEL_3 );
// Disable the start IRQ.
PLIB_DMA_ChannelXTriggerDisable ( DMA_ID_0, DMA_CHANNEL_3, DMA_CHANNEL_TRIGGER_TRANSFER_START );
// Seed the CRC generator
PLIB_DMA_CRCDataWrite ( DMA_ID_0, 0xFFFF );
// use the standard CCITT CRC 16 polynomial : X^16+X^12+X^5+1
PLIB_DMA_CRCXOREnableSet ( DMA_ID_0, 0x1021 );
```

```
// set polynomial length to 16
PLIB_DMA_CRCPolynomialLengthSet (DMA_ID_0, 16);
// Enable append mode
PLIB_DMA_CRCAppendModeEnable ( DMA_ID_0 );
// Attach CRC to DMA channel-3
PLIB_DMA_CRCChannelSelect (DMA_ID_0, DMA_CHANNEL_3);
// Enable the CRC
PLIB_DMA_CRCEnable ( DMA_ID_0 );
// Set the source starting address to 0x1000
PLIB_DMA_ChannelXSourceStartAddressSet ( DMA_ID_0, DMA_CHANNEL_3, 0x1000 );
// Set the destination starting address to 0x2000
PLIB_DMA_ChannelXDestinationStartAddressSet ( DMA_ID_0, DMA_CHANNEL_3, 0x2000 );
// set source and destination size to 100
PLIB_DMA_ChannelXSourceSizeSet ( DMA_ID_0, DMA_CHANNEL_3, 100 );
PLIB_DMA_ChannelXDestinationSizeSet ( DMA_ID_0, DMA_CHANNEL_3, 100 );
// Set cell size to 100
PLIB_DMA_ChannelXCellSizeSet ( DMA_ID_0, DMA_CHANNEL_3, 100 );
//Enable channel-3
PLIB_DMA_ChannelXEnable ( DMA_ID_0, DMA_CHANNEL_3 );
// Force initiate a transfer
PLIB_DMA_StartTransferSet ( DMA_ID_0, DMA_CHANNEL_3 );
```

Status (including Channel)

This module gives application access to various DMA and channel status information.

Configuring the Library

The library is configured for the supported DMA module when the processor is chosen in the MPLAB X IDE.

Library Interface

a) General Configuration Functions

	Name	Description
	PLIB_DMA_BusyActiveReset	Resets the BUSY bit of the DMA controller.
	PLIB_DMA_BusyActiveSet	Sets the BUSY bit of the DMA controller.
	PLIB_DMA_Disable	DMA module is disabled.
	PLIB_DMA_Enable	DMA module is enabled.
	PLIB_DMA_StopInIdleDisable	DMA transfers continue during Idle mode.
	PLIB_DMA_StopInIdleEnable	DMA transfers are halted during Idle mode.
	PLIB_DMA_SuspendDisable	DMA suspend is disabled and the DMA module operates normally.
	PLIB_DMA_SuspendEnable	DMA transfers are suspended to allow uninterrupted access by the CPU to the data bus.

b) Transfer/Abort (Synchronous) Functions

	Name	Description
	PLIB_DMA_AbortTransferSet	Aborts transfer on the specified channel.
	PLIB_DMA_StartTransferSet	Initiates transfer on the specified channel.

c) Transfer/Abort (Asynchronous) Trigger Management Functions

	Name	Description
	PLIB_DMA_ChannelXAbortIRQSet	Sets the IRQ to abort the DMA transfer on the specified channel.
	PLIB_DMA_ChannelXStartIRQSet	Sets the IRQ to initiate the DMA transfer on the specified channel.
	PLIB_DMA_ChannelXTriggerDisable	Disables the DMA transfer abort via a matching interrupt (specified by the IRQ).
	PLIB_DMA_ChannelXTriggerEnable	Enables the specified DMA channel trigger.
	PLIB_DMA_ChannelXTriggerIsEnabled	Returns the enable status of the specified DMA transfer/abort trigger.
	PLIB_DMA_ChannelXTriggerSourceNumberGet	Gets the source number for the DMA channel interrupts.

d) Interrupt Control and Management Functions

	Name	Description
	PLIB_DMA_ChannelXINTSourceDisable	Disables the specified interrupt source for the specified channel.

	PLIB_DMA_ChannelXINTSourceEnable	Enables the specified interrupt source for the specified channel.
	PLIB_DMA_ChannelXINTSourceFlagClear	Clears the interrupt flag of the specified DMA interrupt source for the specified channel.
	PLIB_DMA_ChannelXINTSourceFlagGet	Returns the status of the interrupt flag of the specified DMA interrupt source for the specified channel.
	PLIB_DMA_ChannelXINTSourceFlagSet	Sets the interrupt flag of the specified DMA interrupt source for the specified channel.
	PLIB_DMA_ChannelXINTSourceIsEnabled	Returns the enable status of the specified interrupt source for the specified channel.

e) Operating/Addressing Mode Configuration Functions

	Name	Description
	PLIB_DMA_ChannelXAddressModeGet	Gets the channel address mode.
	PLIB_DMA_ChannelXAddressModeSelect	Sets the channel address mode.
	PLIB_DMA_ChannelXDestinationAddressModeGet	Gets the source address mode of the specified channel.
	PLIB_DMA_ChannelXDestinationAddressModeSelect	Sets the source address mode of the specified channel.
	PLIB_DMA_ChannelXNullWriteModeDisable	Disables the Null Write mode.
	PLIB_DMA_ChannelXNullWriteModeEnable	Enables the Null Write mode.
	PLIB_DMA_ChannelXOperatingTransferModeGet	Returns the current transfer/operating mode for the specified channel.
	PLIB_DMA_ChannelXOperatingTransferModeSelect	Selects the transfer/operating mode for the specified channel.
	PLIB_DMA_ChannelXReloadDisable	Disables reloading of the address and count registers.
	PLIB_DMA_ChannelXReloadEnable	Enables reloading of the address and count registers.
	PLIB_DMA_ChannelXSourceAddressModeGet	Gets the source address mode of the specified channel.
	PLIB_DMA_ChannelXSourceAddressModeSelect	Sets the source address mode of the specified channel.
	PLIB_DMA_ChannelXReloadIsEnabled	Returns the address and count registers reload enable status.

f) Source/Destination/Peripheral Address Control Interface Functions

	Name	Description
	PLIB_DMA_ChannelXDestinationStartAddressGet	Reads the destination start address configured for the specified channel.
	PLIB_DMA_ChannelXDestinationStartAddressSet	Writes the specified destination start address into the register corresponding to the specified channel.
	PLIB_DMA_ChannelXPeripheralAddressGet	Gets the peripheral address configured for the specified channel.
	PLIB_DMA_ChannelXPeripheralAddressSet	Sets the peripheral address for the specified channel.
	PLIB_DMA_ChannelXSourceStartAddressGet	Reads the source start address configured for the specified channel.
	PLIB_DMA_ChannelXSourceStartAddressSet	Writes the specified source start address into the register corresponding to the specified channel.
	PLIB_DMA_ChannelXStartAddressOffsetGet	Gets the primary/secondary start address (DPSRAM) offset.
	PLIB_DMA_ChannelXStartAddressOffsetSet	Sets the primary/secondary start address (DPSRAM) offset to the value specified depending on the offset type specified for the specified channel.

g) Source/Destination/Peripheral Data Management Functions

	Name	Description
	PLIB_DMA_ChannelXCellProgressPointerGet	Returns the number of bytes transferred since the last event.
	PLIB_DMA_ChannelXCellSizeGet	Reads the cell size (in bytes) configured for the specified channel.
	PLIB_DMA_ChannelXCellSizeSet	Writes the specified cell size into the register corresponding to the specified channel.
	PLIB_DMA_ChannelXDataSizeGet	Returns the current data size for the specified channel.
	PLIB_DMA_ChannelXDataSizeSelect	Selects the data size for the specified channel.
	PLIB_DMA_ChannelXDestinationPointerGet	Reads the current byte of the destination being pointed to for the specified channel.
	PLIB_DMA_ChannelXDestinationSizeGet	Reads the destination size configured for the specified channel.
	PLIB_DMA_ChannelXDestinationSizeSet	Writes the specified destination size into the register corresponding to the specified channel.
	PLIB_DMA_ChannelXPatternDataGet	Returns the pattern matching (for DMA abort) data programmed for the specified channel.
	PLIB_DMA_ChannelXPatternDataSet	Writes the specified pattern matching data (for DMA abort) into the register corresponding to the specified channel.
	PLIB_DMA_ChannelXSourcePointerGet	Reads the current byte of the source being pointed to for the specified channel.
	PLIB_DMA_ChannelXSourceSizeGet	Reads the source size configured for the specified channel.
	PLIB_DMA_ChannelXSourceSizeSet	Writes the specified source size into the register corresponding to the specified channel.
	PLIB_DMA_ChannelXTransferCountGet	Gets the DMA data transfer count that is programmed for the specified channel.

	PLIB_DMA_ChannelXTransferCountSet	Sets the DMA data transfer count for the specified channel.

h) Channel Configuration Functions

	Name	Description
	PLIB_DMA_ChannelPrioritySelect	Sets the priority scheme of the DMA channels.
	PLIB_DMA_ChannelPriorityGet	Gets the priority scheme of the DMA channels.
	PLIB_DMA_ChannelXAutoDisable	Channel is disabled after a block transfer is complete.
	PLIB_DMA_ChannelXAutoEnable	Channel is continuously enabled.
	PLIB_DMA_ChannelXBusyActiveSet	Sets the Busy bit to active.
	PLIB_DMA_ChannelXBusyInActiveSet	Sets the Busy bit to inactive.
	PLIB_DMA_ChannelXChainDisable	Disables the channel chaining for the specified DMA channel.
	PLIB_DMA_ChannelXChainEnable	Channel chain feature is enabled.
	PLIB_DMA_ChannelXChainToHigher	Chains the specified channel to a channel higher in natural priority.
	PLIB_DMA_ChannelXChainToLower	Chains the specified channel to a channel lower in natural priority.
	PLIB_DMA_ChannelXDisable	Disable the specified channel.
	PLIB_DMA_ChannelXEnable	Enable the specified channel.
	PLIB_DMA_ChannelXPriorityGet	Gets the priority of the specified channel.
	PLIB_DMA_ChannelXPrioritySelect	Sets the priority of the specified channel.
	PLIB_DMA_ChannelXTransferDirectionGet	Returns the data transfer direction of the specified channel.
	PLIB_DMA_ChannelXTransferDirectionSelect	Selects the data transfer direction of the specified channel.
	PLIB_DMA_ChannelXDisabledDisablesEvents	Channel start/abort events will be ignored even if the channel is disabled.
	PLIB_DMA_ChannelXDisabledEnablesEvents	Channel start/abort events will be registered even if the channel is disabled.
	PLIB_DMA_ChannelXPatternIgnoreByteDisable	Disables the pattern match ignore byte.
	PLIB_DMA_ChannelXPatternIgnoreByteEnable	Enables the pattern match ignore byte.
	PLIB_DMA_ChannelXPatternIgnoreByteIsEnabled	Returns the state of the pattern match ignore byte.
	PLIB_DMA_ChannelXPatternIgnoreGet	Returns the pattern match ignore value.
	PLIB_DMA_ChannelXPatternIgnoreSet	Sets the pattern match ignore value.
	PLIB_DMA_ChannelXPatternLengthGet	Returns the pattern match length.
	PLIB_DMA_ChannelXPatternLengthSet	Sets the pattern match length.

i) CRC Module Interface Functions

	Name	Description
	PLIB_DMA_CRCAppendModeDisable	Disables the CRC append mode.
	PLIB_DMA_CRCAppendModeEnable	Enables the CRC append mode.
	PLIB_DMA_CRCAppendModeIsEnabled	Gets the enable status of the CRC append mode.
	PLIB_DMA_CRCBitOrderSelect	Selects the bit order for checksum calculation.
	PLIB_DMA_CRCByteOrderGet	Gets the current byte order selected by the DMA module CRC feature.
	PLIB_DMA_CRCByteOrderSelect	Selects the byte order.
	PLIB_DMA_CRCChannelGet	Returns the current DMA channel to which the CRC is assigned.
	PLIB_DMA_CRCChannelSelect	Assigns the CRC to the specified DMA channel.
	PLIB_DMA_CRCDataRead	Reads the contents of the DMA CRC data register.
	PLIB_DMA_CRCDataWrite	Writes the contents of the DMA CRC data register with the specified data.
	PLIB_DMA_CRCDisable	Disables the DMA module CRC feature.
	PLIB_DMA_CRCEnable	Enables the DMA module CRC feature.
	PLIB_DMA_CRCPolynomialLengthGet	Gets the current polynomial length.
	PLIB_DMA_CRCPolynomialLengthSet	Selects the polynomial length.
	PLIB_DMA_CRCTypeGet	Gets the current DMA module CRC feature type.
	PLIB_DMA_CRCTypeSet	Selects the DMA module CRC feature type.
	PLIB_DMA_CRCWriteByteOrderAlter	The source data is written to the destination reordered as defined by the BYTO<1:0> bits.
	PLIB_DMA_CRCWriteByteOrderMaintain	The source data is written to the destination unaltered.
	PLIB_DMA_CRCXOREnableGet	Reads the CRC XOR register.
	PLIB_DMA_CRCXOREnableSet	Writes to the CRC XOR enable register as per the specified enable mask.

j) Global Status Functions

	Name	Description
	PLIB_DMA_CRCIsEnabled	Gets the enable status of the CRC feature.
	PLIB_DMA_IsBusy	Gets the BUSY bit of the DMA controller.
	PLIB_DMA_IsEnabled	Returns the DMA module enable status.
	PLIB_DMA_LastBusAccessIsRead	Returns true if the last DMA bus access was a read.
	PLIB_DMA_LastBusAccessIsWrite	Returns true if the last DMA bus access was a write.
	PLIB_DMA_RecentAddressAccessed	Returns the address of the most recent DMA access.
	PLIB_DMA_SuspendIsEnabled	Returns the DMA suspend status.

k) Channel Status Functions

	Name	Description
	PLIB_DMA_ChannelXAutoIsEnabled	Returns the channel automatic enable status.
	PLIB_DMA_ChannelXBufferedDataIsWritten	Returns the buffered data write status for the specified channel.
	PLIB_DMA_ChannelXBusyIsBusy	Returns the busy status of the specified channel.
	PLIB_DMA_ChannelXChainIsEnabled	Returns the chain status of the specified channel.
	PLIB_DMA_ChannelXCollisionStatus	Returns the status of the specified collision type for the specified channel.
	PLIB_DMA_ChannelXEventIsDetected	Returns the event status on the specified channel.
	PLIB_DMA_ChannelXIsEnabled	Return the enable status of the specified channel.
	PLIB_DMA_ChannelXNullWriteModeIsEnabled	Returns the enable status of the Null Write mode for the specified channel.
	PLIB_DMA_ChannelXPingPongModeGet	Returns the Ping-Pong mode status for the specified channel.
	PLIB_DMA_ChannelBitsGet	Returns the DMA channel bits.

l) Feature Existence Functions

	Name	Description
	PLIB_DMA_ExistsAbortTransfer	Identifies whether the AbortTransfer feature exists on the DMA module.
	PLIB_DMA_ExistsBusy	Identifies whether the Busy feature exists on the DMA module.
	PLIB_DMA_ExistsChannelBits	Identifies whether the ChannelBits feature exists on the DMA module.
	PLIB_DMA_ExistsChannelX	Identifies whether the ChannelX feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXAbortIRQ	Identifies whether the ChannelXAbortIRQ feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXAuto	Identifies whether the ChannelXAuto feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXBusy	Identifies whether the ChannelXBusy feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXCellProgressPointer	Identifies whether the ChannelXCellProgressPointer feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXCellSize	Identifies whether the ChannelXCellSize feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXChain	Identifies whether the ChannelXChain feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXChainEnbl	Identifies whether the ChannelXChainEnbl feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXDestinationPointer	Identifies whether the ChannelXDestinationPointer feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXDestinationSize	Identifies whether the ChannelXDestinationSize feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXDestinationStartAddress	Identifies whether the ChannelXDestinationStartAddress feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXDisabled	Identifies whether the ChannelXDisabled feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXEvent	Identifies whether the ChannelXEvent feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXINTSource	Identifies whether the ChannelXINTSource feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXINTSourceFlag	Identifies whether the ChannelXINTSourceFlag feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXPatternData	Identifies whether the ChannelXPatternData feature exists on the DMA module
	PLIB_DMA_ExistsChannelXPatternIgnore	Identifies whether the ChannelXPatternIgnore feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXPatternIgnoreByte	Identifies whether the ChannelXPatternIgnoreByte feature exists on the DMA module.

	PLIB_DMA_ExistsChannelXPatternLength	Identifies whether the ChannelXPatternLength feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXPriority	Identifies whether the ChannelXPriority feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXSourcePointer	Identifies whether the ChannelXSourcePointer feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXSourceSize	Identifies whether the ChannelXSourceSize feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXSourceStartAddress	Identifies whether the ChannelXSourceStartAddress feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXStartIRQ	Identifies whether the ChannelXStartIRQ feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXTrigger	Identifies whether the ChannelXTrigger feature exists on the DMA module.
	PLIB_DMA_ExistsCRC	Identifies whether the CRC feature exists on the DMA module.
	PLIB_DMA_ExistsCRCAppendMode	Identifies whether the CRCAppendMode feature exists on the DMA module.
	PLIB_DMA_ExistsCRCBitOrder	Identifies whether the CRCBitOrder feature exists on the DMA module.
	PLIB_DMA_ExistsCRCByteOrder	Identifies whether the CRCByteOrder feature exists on the DMA module.
	PLIB_DMA_ExistsCRCChannel	Identifies whether the CRCChannel feature exists on the DMA module.
	PLIB_DMA_ExistsCRCData	Identifies whether the CRCData feature exists on the DMA module.
	PLIB_DMA_ExistsCRCPolynomialLength	Identifies whether the CRCPolynomialLength feature exists on the DMA module.
	PLIB_DMA_ExistsCRCType	Identifies whether the CRCType feature exists on the DMA module.
	PLIB_DMA_ExistsCRCWriteByteOrder	Identifies whether the CRCWriteByteOrder feature exists on the DMA module.
	PLIB_DMA_ExistsCRCXOREnable	Identifies whether the CRCXOREnable feature exists on the DMA module.
	PLIB_DMA_ExistsEnableControl	Identifies whether the EnableControl feature exists on the DMA module.
	PLIB_DMA_ExistsLastBusAccess	Identifies whether the LastBusAccess feature exists on the DMA module.
	PLIB_DMA_ExistsRecentAddress	Identifies whether the RecentAddress feature exists on the DMA module.
	PLIB_DMA_ExistsStartTransfer	Identifies whether the StartTransfer feature exists on the DMA module.
	PLIB_DMA_ExistsStopInIdle	Identifies whether the StopInIdle feature exists on the DMA module.
	PLIB_DMA_ExistsSuspend	Identifies whether the Suspend feature exists on the DMA module.

m) Data Types and Constants

	Name	Description
	DMA_ADDRESS_OFFSET_TYPE	Lists the possible DMA address offsets.
	DMA_CHANNEL	Lists the possible DMA channels available.
	DMA_CHANNEL_ADDRESSING_MODE	Lists the possible channel addressing modes.
	DMA_CHANNEL_COLLISION	Lists the possible channel collision types.
	DMA_CHANNEL_DATA_SIZE	Lists the possible data sizes for the DMA channel.
	DMA_CHANNEL_PRIORITY	Lists the possible channel priorities.
	DMA_CHANNEL_TRANSFER_DIRECTION	Lists the possible data transfer directions.
	DMA_CHANNEL_TRIGGER_TYPE	Lists the possible DMA channel triggers.
	DMA_CRC_BIT_ORDER	Lists the possible CRC calculation bit orders
	DMA_CRC_BYTE_ORDER	Lists the possible byte orders.
	DMA_CRC_TYPE	Lists the possible checksums.
	DMA_DESTINATION_ADDRESSING_MODE	Lists the possible destination addressing modes.
	DMA_INT_TYPE	Lists the possible Interrupt types for a particular channel-X
	DMA_MODULE_ID	Possible instances of the DMA module.
	DMA_PATTERN_LENGTH	Gives the DMA pattern length
	DMA_PING_PONG_MODE	Lists the possible ping-pong modes.
	DMA_SOURCE_ADDRESSING_MODE	Lists the possible source addressing modes.
	DMA_TRANSFER_MODE	Lists the possible DMA transfer/operating modes.
	DMA_TRIGGER_SOURCE	Lists the possible DMA trigger sources.
	DMA_CHANNEL_INT_SOURCE	Lists the Interrupt Source number for the available DMA channels.

Description

This section describes the Application Programming Interface (API) functions of the DMA Peripheral Library.

Refer to each section for a detailed description.

a) General Configuration Functions

PLIB_DMA_BusyActiveReset Function

Resets the BUSY bit of the DMA controller.

File

plib_dma.h

C

```
void PLIB_DMA_BusyActiveReset(DMA_MODULE_ID index);
```

Returns

None.

Description

This function resets the BUSY bit of the DMA controller. The DMA module is disabled and is not actively transferring data.

Remarks

This function implements an operation of the Busy feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsBusy function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_DMA_BusyActiveReset( DMA_ID_0 );
```

Function

void PLIB_DMA_BusyActiveReset (DMA_MODULE_ID index)

PLIB_DMA_BusyActiveSet Function

Sets the BUSY bit of the DMA controller.

File

plib_dma.h

C

```
void PLIB_DMA_BusyActiveSet(DMA_MODULE_ID index);
```

Returns

None.

Description

This function sets the BUSY bit of the DMA controller. The DMA module is active.

Remarks

This function implements an operation of the Busy feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsBusy function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_DMA_BusyActiveSet( DMA_ID_0 );
```

Function

void PLIB_DMA_BusyActiveSet (DMA_MODULE_ID index)

PLIB_DMA_Disable Function

DMA module is disabled.

File

plib_dma.h

C

```
void PLIB_DMA_Disable(DMA_MODULE_ID index);
```

Returns

None.

Description

This function disables the DMA module.

Remarks

This function implements an operation of the EnableControl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsEnableControl function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_DMA_Disable( DMA_ID_0 );
```

Function

void PLIB_DMA_Disable (DMA_MODULE_ID index)

PLIB_DMA_Enable Function

DMA module is enabled.

File

plib_dma.h

C

```
void PLIB_DMA_Enable(DMA_MODULE_ID index);
```

Returns

None.

Description

This function enables the DMA module.

Remarks

This function implements an operation of the EnableControl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsEnableControl function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_DMA_Enable( DMA_ID_0 );
```

Function

void PLIB_DMA_Enable (DMA_MODULE_ID index)

PLIB_DMA_StopInIdleDisable Function

DMA transfers continue during Idle mode.

File

plib_dma.h

C

```
void PLIB_DMA_StopInIdleDisable(DMA_MODULE_ID index);
```

Returns

None.

Description

This function causes DMA transfers to continue during Idle mode.

Remarks

This function implements an operation of the StopInIdle feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsStopInIdle function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_DMA_StopInIdleDisable( DMA_ID_0 );
```

Function

void PLIB_DMA_StopInIdleDisable (DMA_MODULE_ID index)

PLIB_DMA_StopInIdleEnable Function

DMA transfers are halted during Idle mode.

File

plib_dma.h

C

```
void PLIB_DMA_StopInIdleEnable(DMA_MODULE_ID index);
```

Returns

None.

Description

This function halts DMA transfers during Idle mode.

Remarks

This function implements an operation of the StopInIdle feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsStopInIdle function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_DMA_StopInIdleEnable( DMA_ID_0 );
```

Function

void PLIB_DMA_StopInIdleEnable (DMA_MODULE_ID index)

PLIB_DMA_SuspendDisable Function

DMA suspend is disabled and the DMA module operates normally.

File

plib_dma.h

C

```
void PLIB_DMA_SuspendDisable(DMA_MODULE_ID index);
```

Returns

None.

Description

This function disables the DMA suspend. The DMA module continues to operate normally.

Remarks

This function implements an operation of the Suspend feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsSuspend function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_DMA_SuspendDisable( DMA_ID_0 );
```

Function

void PLIB_DMA_SuspendDisable (DMA_MODULE_ID index)

PLIB_DMA_SuspendEnable Function

DMA transfers are suspended to allow uninterrupted access by the CPU to the data bus.

File

plib_dma.h

C

```
void PLIB_DMA_SuspendEnable(DMA_MODULE_ID index);
```

Returns

None.

Description

This function suspends the DMA transfers to allow uninterrupted access by the CPU to the data bus.

Remarks

This function implements an operation of the Suspend feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsSuspend function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_DMA_SuspendEnable( DMA_ID_0 );
```

Function

void PLIB_DMA_SuspendEnable (DMA_MODULE_ID index)

b) Transfer/Abort (Synchronous) Functions

PLIB_DMA_AbortTransferSet Function

Aborts transfer on the specified channel.

File

plib_dma.h

C

```
void PLIB_DMA_AbortTransferSet(DMA_MODULE_ID index, DMA_CHANNEL channel);
```

Returns

None.

Description

This function aborts transfer on the specified channel. This is a forced abort controlled via software.

Remarks

This function implements an operation of the AbortTransfer feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsAbortTransfer function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_DMA_AbortTransferSet (    DMA_ID_0,
                               DMA_CHANNEL_4 );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Function

void PLIB_DMA_AbortTransferSet (DMA_MODULE_ID index,
DMA_CHANNEL channel)

PLIB_DMA_StartTransferSet Function

Initiates transfer on the specified channel.

File

plib_dma.h

C

```
void PLIB_DMA_StartTransferSet(DMA_MODULE_ID index, DMA_CHANNEL channel);
```

Returns

None.

Description

This function initiates transfer on the specified channel. This is a forced transfer controlled via software.

Remarks

This function implements an operation of the StartTransfer feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsStartTransfer function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_DMA_StartTransferSet (    DMA_ID_0,
                               DMA_CHANNEL_4 );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Function

void PLIB_DMA_StartTransferSet (DMA_MODULE_ID index,
DMA_CHANNEL channel)

c) Transfer/Abort (Asynchronous) Trigger Management Functions

PLIB_DMA_ChannelXAbortIRQSet Function

Sets the IRQ to abort the DMA transfer on the specified channel.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXAbortIRQSet(DMA_MODULE_ID index, DMA_CHANNEL channel, DMA_TRIGGER_SOURCE IRQ);
```

Returns

None.

Description

This function sets the IRQ to abort the DMA transfer on the specified channel. (IRQ to start the channel transfer.)

Remarks

This function implements an operation of the ChannelXAbortIRQ feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXAbortIRQ function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
DMA_TRIGGER_SOURCE irq = DMA_TRIGGER_TIMER_CORE;
PLIB_DMA_ChannelXAbortIRQSet (  DMA_ID_0,
                                DMA_CHANNEL_4,
                                irq );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL
IRQnum	The IRQ number of the trigger source of type DMA_TRIGGER_SOURCE

Function

void PLIB_DMA_ChannelXAbortIRQSet (DMA_MODULE_ID index,
DMA_CHANNEL channel,
DMA_TRIGGER_SOURCE IRQ)

PLIB_DMA_ChannelXStartIRQSet Function

Sets the IRQ to initiate the DMA transfer on the specified channel.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXStartIRQSet(DMA_MODULE_ID index, DMA_CHANNEL channel, DMA_TRIGGER_SOURCE IRQnum);
```

Returns

None.

Description

This function sets the IRQ to initiate the DMA transfer on the specified channel. (IRQ to start the channel transfer.)

Remarks

This function implements an operation of the ChannelXStartIRQ feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXStartIRQ function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
DMA_TRIGGER_SOURCE irq = DMA_TRIGGER_OUTPUT_COMPARE_1;
PLIB_DMA_ChannelXStartIRQSet (  DMA_ID_0,
                                DMA_CHANNEL_4,
                                irq );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL
IRQnum	The IRQ number of the trigger source of type DMA_TRIGGER_SOURCE

Function

void PLIB_DMA_ChannelXStartIRQSet (DMA_MODULE_ID index,
DMA_CHANNEL channel,
DMA_TRIGGER_SOURCE IRQnum)

PLIB_DMA_ChannelXTriggerDisable Function

Disables the DMA transfer abort via a matching interrupt (specified by the IRQ).

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXTriggerDisable(DMA_MODULE_ID index, DMA_CHANNEL channel, DMA_CHANNEL_TRIGGER_TYPE
trigger);
```

Returns

None.

Description

This function disables the DMA transfer abort via a matching interrupt (specified by the IRQ). The interrupt number IRQ is ignored and does not terminate a transfer.

Remarks

This function implements an operation of the ChannelXTrigger feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXTrigger function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_DMA_ChannelXTriggerDisable (   DMA_ID_0,
                                    DMA_CHANNEL_4,
                                    DMA_CHANNEL_TRIGGER_PATTERN_MATCH_ABORT );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL
trigger	Type of trigger (transfer start/abort/pattern match abort)

Function

void PLIB_DMA_ChannelXTriggerDisable (DMA_MODULE_ID index,
DMA_CHANNEL channel,
DMA_CHANNEL_TRIGGER_TYPE trigger)

PLIB_DMA_ChannelXTriggerEnable Function

Enables the specified DMA channel trigger.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXTriggerEnable(DMA_MODULE_ID index, DMA_CHANNEL channel, DMA_CHANNEL_TRIGGER_TYPE
trigger);
```

Returns

None.

Description

This function enables the specified DMA channel trigger.

Remarks

This function implements an operation of the ChannelXTrigger feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXTrigger function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_DMA_ChannelXTriggerEnable (    DMA_ID_0,
                                    DMA_CHANNEL_4,
                                    DMA_CHANNEL_TRIGGER_TRANSFER_ABORT );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL
trigger	Type of trigger (transfer start/abort/pattern match abort)

Function

void PLIB_DMA_ChannelXTriggerEnable (DMA_MODULE_ID index,
DMA_CHANNEL channel,
DMA_CHANNEL_TRIGGER_TYPE trigger)

PLIB_DMA_ChannelXTriggerIsEnabled Function

Returns the enable status of the specified DMA transfer/abort trigger.

File

plib_dma.h

C

```
bool PLIB_DMA_ChannelXTriggerIsEnabled(DMA_MODULE_ID index, DMA_CHANNEL channel, DMA_CHANNEL_TRIGGER_TYPE
trigger);
```

Returns

- true - The specified trigger is enabled
- false - The specified trigger is disabled

Description

This function returns the enable status of the specified DMA transfer/abort trigger.

Remarks

This function implements an operation of the ChannelXTrigger feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXTrigger function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
bool startTriggerstatus;
startTriggerstatus = PLIB_DMA_ChannelXTriggerIsEnabled (
                                        DMA_ID_0,
                                        DMA_CHANNEL_4,
                                        DMA_CHANNEL_TRIGGER_TRANSFER_START );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL
trigger	Type of trigger (transfer start/abort/pattern match abort)

Function

bool PLIB_DMA_ChannelXTriggerIsEnabled(DMA_MODULE_ID index,
DMA_CHANNEL channel,
DMA_CHANNEL_TRIGGER_TYPE trigger)

PLIB_DMA_ChannelXTriggerSourceNumberGet Function

Gets the source number for the DMA channel interrupts.

File

plib_dma.h

C

```
DMA_CHANNEL_INT_SOURCE PLIB_DMA_ChannelXTriggerSourceNumberGet(DMA_MODULE_ID index, DMA_CHANNEL channel);
```

Returns

None.

Description

This function returns the interrupt source number for the specified DMA channel.

Remarks

This function implements an operation of the ChannelXTrigger feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXTrigger function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_DMA_ChannelXTriggerSourceNumberGet (   DMA_ID_0,
                                            DMA_CHANNEL_4);
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Function

void PLIB_DMA_ChannelXTriggerSourceNumberGet (DMA_MODULE_ID index,
DMA_CHANNEL channel)

d) Interrupt Control and Management Functions

PLIB_DMA_ChannelXINTSourceDisable Function

Disables the specified interrupt source for the specified channel.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXINTSourceDisable(DMA_MODULE_ID index, DMA_CHANNEL dmaChannel, DMA_INT_TYPE
dmaINTSource);
```

Returns

None.

Description

This function disables the specified interrupt source for the specified channel.

Remarks

This function implements an operation of the ChannelXINTSource feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXINTSource function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
DMA_CHANNEL spiDMAChannel = DMA_CHANNEL_2;
PLIB_DMA_ChannelXINTSourceDisable ( DMA_ID_0,
                                    spiDMAChannel,
                                    DMA_INT_ADDRESS_ERROR );
```

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL
dmaINTSource	One of the DMA interrupt sources specified by DMA_INT_TYPE

Function

void PLIB_DMA_ChannelXINTSourceDisable (DMA_MODULE_ID index,
DMA_CHANNEL dmaChannel,
DMA_INT_TYPE dmaINTSource)

PLIB_DMA_ChannelXINTSourceEnable Function

Enables the specified interrupt source for the specified channel.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXINTSourceEnable(DMA_MODULE_ID index, DMA_CHANNEL dmaChannel, DMA_INT_TYPE
dmaINTSource);
```

Returns

None.

Description

This function enables the specified interrupt source for the specified channel.

Remarks

This function implements an operation of the ChannelXINTSource feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXINTSource function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
DMA_CHANNEL spiDMAChannel = DMA_CHANNEL_2;
PLIB_DMA_ChannelXINTSourceEnable (  DMA_ID_0,
                                    spiDMAChannel,
                                    DMA_INT_ADDRESS_ERROR );
```

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL
dmaINTSource	One of the DMA interrupt sources specified by DMA_INT_TYPE

Function

void PLIB_DMA_ChannelXINTSourceEnable (DMA_MODULE_ID index,
DMA_CHANNEL dmaChannel,
DMA_INT_TYPE dmaINTSource)

PLIB_DMA_ChannelXINTSourceFlagClear Function

Clears the interrupt flag of the specified DMA interrupt source for the specified channel.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXINTSourceFlagClear(DMA_MODULE_ID index, DMA_CHANNEL dmaChannel, DMA_INT_TYPE
dmaINTSource);
```

Returns

None.

Description

This function clears the interrupt flag of the specified DMA interrupt source for the specified channel.

Remarks

This function implements an operation of the ChannelXINTSourceFlag feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXINTSourceFlag function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
DMA_CHANNEL spiDMAChannel = DMA_CHANNEL_2;
PLIB_DMA_ChannelXINTSourceFlagClear (   DMA_ID_0,
                                        spiDMAChannel,
                                        DMA_INT_ADDRESS_ERROR );
```

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL
dmaINTSource	One of the DMA interrupt sources specified by DMA_INT_TYPE

Function

void PLIB_DMA_ChannelXINTSourceFlagClear (DMA_MODULE_ID index,
DMA_CHANNEL dmaChannel,
DMA_INT_TYPE dmaINTSource)

PLIB_DMA_ChannelXINTSourceFlagGet Function

Returns the status of the interrupt flag of the specified DMA interrupt source for the specified channel.

File

plib_dma.h

C

```
bool PLIB_DMA_ChannelXINTSourceFlagGet(DMA_MODULE_ID index, DMA_CHANNEL dmaChannel, DMA_INT_TYPE
dmaINTSource);
```

Returns

- true - The interrupt flag is set
- false - The interrupt flag is not set

Description

This function returns the status of the interrupt flag of the specified DMA interrupt source for the specified channel.

Remarks

This function implements an operation of the ChannelXINTSourceFlag feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXINTSourceFlag function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
DMA_CHANNEL spiDMAChannel = DMA_CHANNEL_2;
bool AddressErrorINTStatus;
AddressErrorINTStatus = PLIB_DMA_ChannelXINTSourceFlagGet (
                                                    DMA_ID_0,
                                                    spiDMAChannel,
                                                    DMA_INT_ADDRESS_ERROR );
```

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL
dmaINTSource	One of the DMA interrupt sources specified by DMA_INT_TYPE

Function

bool PLIB_DMA_ChannelXINTSourceFlagGet (DMA_MODULE_ID index,
DMA_CHANNEL dmaChannel,
DMA_INT_TYPE dmaINTSource)

PLIB_DMA_ChannelXINTSourceFlagSet Function

Sets the interrupt flag of the specified DMA interrupt source for the specified channel.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXINTSourceFlagSet(DMA_MODULE_ID index, DMA_CHANNEL dmaChannel, DMA_INT_TYPE
dmaINTSource);
```

Returns

None.

Description

This function sets the interrupt flag of the specified DMA interrupt source for the specified channel.

Remarks

This function implements an operation of the ChannelXINTSourceFlag feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXINTSourceFlag function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
DMA_CHANNEL spiDMAChannel = DMA_CHANNEL_2;
PLIB_DMA_ChannelXINTSourceFlagSet ( DMA_ID_0,
                                    spiDMAChannel,
                                    DMA_INT_ADDRESS_ERROR );
```

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL
dmaINTSource	One of the DMA interrupt sources specified by DMA_INT_TYPE

Function

void PLIB_DMA_ChannelXINTSourceFlagSet (DMA_MODULE_ID index,
DMA_CHANNEL dmaChannel,
DMA_INT_TYPE dmaINTSource)

PLIB_DMA_ChannelXINTSourceIsEnabled Function

Returns the enable status of the specified interrupt source for the specified channel.

File

plib_dma.h

C

```
bool PLIB_DMA_ChannelXINTSourceIsEnabled(DMA_MODULE_ID index, DMA_CHANNEL dmaChannel, DMA_INT_TYPE
dmaINTSource);
```

Returns

- true - The interrupt is enabled
- false - The interrupt is not enabled

Description

This function returns the enable status of the specified interrupt source for the specified channel.

Remarks

This function implements an operation of the ChannelXINTSource feature. This feature may not be available on all devices. Please refer to the

specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXINTSource function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
DMA_CHANNEL spiDMAChannel = DMA_CHANNEL_2;
bool dmaINTSourceEnableStatus;
dmaINTSourceEnableStatus = PLIB_DMA_ChannelXINTSourceIsEnabled (
                                                    DMA_ID_0,
                                                    spiDMAChannel,
                                                    DMA_INT_ADDRESS_ERROR );
```

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL
dmaINTSource	One of the DMA interrupt sources specified by DMA_INT_TYPE

Function

bool PLIB_DMA_ChannelXINTSourceIsEnabled (DMA_MODULE_ID index,
DMA_CHANNEL dmaChannel,
DMA_INT_TYPE dmaINTSource)

e) Operating/Addressing Mode Configuration Functions

PLIB_DMA_ChannelXAddressModeGet Function

Gets the channel address mode.

File

plib_dma.h

C

```
DMA_CHANNEL_ADDRESSING_MODE PLIB_DMA_ChannelXAddressModeGet(DMA_MODULE_ID index, DMA_CHANNEL channel);
```

Returns

- channelAddressMode - One of the possible source addressing modes listed by DMA_CHANNEL_ADDRESSING_MODE

Description

This function gets the channel address mode.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
DMA_CHANNEL_ADDRESSING_MODE channelAddressMode;
channelAddressMode = PLIB_DMA_ChannelXAddressModeGet (  DMA_ID_0,
                                                        DMA_CHANNEL_4 );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Function

DMA_CHANNEL_ADDRESSING_MODE PLIB_DMA_ChannelXAddressModeGet (
DMA_MODULE_ID index,

DMA_CHANNEL channel)

PLIB_DMA_ChannelXAddressModeSelect Function

Sets the channel address mode.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXAddressModeSelect(DMA_MODULE_ID index, DMA_CHANNEL channel,
DMA_CHANNEL_ADDRESSING_MODE channelAddressMode);
```

Returns

None.

Description

This function sets the channel address mode.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DMA_ChannelXAddressModeSelect (
                    DMA_ID_0,
                    DMA_CHANNEL_4,
                    DMA_ADDRESSING_REGISTER_INDIRECT_WITH_POST_INCREMENT );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL
channelAddressMode	One of the possible channel addressing modes listed by DMA_CHANNEL_ADDRESSING_MODE

Function

void PLIB_DMA_ChannelXAddressModeSelect (

DMA_MODULE_ID index,

DMA_CHANNEL channel,

DMA_CHANNEL_ADDRESSING_MODE channelAddressMode)

PLIB_DMA_ChannelXDestinationAddressModeGet Function

Gets the source address mode of the specified channel.

File

plib_dma.h

C

```
DMA_DESTINATION_ADDRESSING_MODE PLIB_DMA_ChannelXDestinationAddressModeGet(DMA_MODULE_ID index, DMA_CHANNEL
channel);
```

Returns

- destinationAddressMode - One of the possible source addressing modes listed by DMA_DESTINATION_ADDRESSING_MODE

Description

This function gets the source address mode of the specified channel.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
DMA_SOURCE_ADDRESSING_MODE destinationAddressMode;
destinationAddressMode = PLIB_DMA_ChannelXDestinationAddressModeGet (
                                                        DMA_ID_0,
                                                        DMA_CHANNEL_4 );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Function

DMA_DESTINATION_ADDRESSING_MODE PLIB_DMA_ChannelXDestinationAddressModeGet (
DMA_MODULE_ID index,
DMA_CHANNEL channel)

PLIB_DMA_ChannelXDestinationAddressModeSelect Function

Sets the source address mode of the specified channel.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXDestinationAddressModeSelect(DMA_MODULE_ID index, DMA_CHANNEL channel,
DMA_DESTINATION_ADDRESSING_MODE destinationAddressMode);
```

Returns

None.

Description

This function Sets the source address mode of the specified channel.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DMA_ChannelXDestinationAddressModeSelect (
                        DMA_ID_0,
                DMA_CHANNEL_4,
                        DMA_ADDRESSING_DESTINATION_INCREMENT_BASED_ON_SIZE );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL
destinationAddressMode	One of the possible source addressing modes listed by DMA_DESTINATION_ADDRESSING_MODE

Function

void PLIB_DMA_ChannelXDestinationAddressModeSelect (
DMA_MODULE_ID index,
DMA_CHANNEL channel,
DMA_DESTINATION_ADDRESSING_MODE destinationAddressMode)

PLIB_DMA_ChannelXNullWriteModeDisable Function

Disables the Null Write mode.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXNullWriteModeDisable(DMA_MODULE_ID index, DMA_CHANNEL channel);
```

Returns

None.

Description

This function disables the Null Write mode. No dummy write is initiated.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DMA_ChannelXNullWriteModeDisable ( DMA_ID_0,
                                        DMA_CHANNEL_4 );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Function

void PLIB_DMA_ChannelXNullWriteModeDisable(DMA_MODULE_ID index,
DMA_CHANNEL channel)

PLIB_DMA_ChannelXNullWriteModeEnable Function

Enables the Null Write mode.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXNullWriteModeEnable(DMA_MODULE_ID index, DMA_CHANNEL channel);
```

Returns

None.

Description

This function enables the Null Write mode. A dummy write is initiated to the source address for every write to the destination address.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DMA_ChannelXNullWriteModeEnable (  DMA_ID_0,
                                        DMA_CHANNEL_4 );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Function

void PLIB_DMA_ChannelXNullWriteModeEnable (DMA_MODULE_ID index,
DMA_CHANNEL channel)

PLIB_DMA_ChannelXOperatingTransferModeGet Function

Returns the current transfer/operating mode for the specified channel.

File

plib_dma.h

C

```
DMA_TRANSFER_MODE PLIB_DMA_ChannelXOperatingTransferModeGet(DMA_MODULE_ID index, DMA_CHANNEL channel);
```

Returns

- channeltransferMode - One of the possible operating/transfer modes listed by DMA_TRANSFER_MODE

Description

This function returns the current transfer/operating mode for the specified channel. (Transfer mode and operating mode are used interchangeably.)

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
DMA_TRANSFER_MODE channeltransferMode;
channeltransferMode = PLIB_DMA_ChannelXOperatingTransferModeGet (
                                                        DMA_ID_0,
                                                        DMA_CHANNEL_4 );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Function

DMA_TRANSFER_MODE PLIB_DMA_ChannelXOperatingTransferModeGet (
DMA_MODULE_ID index,
DMA_CHANNEL channel)

PLIB_DMA_ChannelXOperatingTransferModeSelect Function

Selects the transfer/operating mode for the specified channel.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXOperatingTransferModeSelect(DMA_MODULE_ID index, DMA_CHANNEL channel,
DMA_TRANSFER_MODE channeltransferMode);
```

Returns

None.

Description

This function selects the transfer/operating mode for the specified channel. (Transfer mode and operating mode are used interchangeably.)

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
DMA_TRANSFER_MODE channeltransferMode = DMA_MODE_REPEATED_CONTINUOUS;
PLIB_DMA_ChannelXOperatingTransferModeSelect (  DMA_ID_0,
                                                DMA_CHANNEL_4,
                                                channeltransferMode );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL
channeltransferMode	One of the possible operating/transfer modes listed by DMA_TRANSFER_MODE

Function

void PLIB_DMA_ChannelXOperatingTransferModeSelect (
DMA_MODULE_ID index,
DMA_CHANNEL channel,
DMA_TRANSFER_MODE channeltransferMode)

PLIB_DMA_ChannelXReloadDisable Function

Disables reloading of the address and count registers.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXReloadDisable(DMA_MODULE_ID index, DMA_CHANNEL channel);
```

Returns

None.

Description

This function disables reloading of the address and count registers. The source, destination address, and the DMA count registers are not reloaded to their previous values upon the start of the next operation.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DMA_ChannelXReloadDisable (    DMA_ID_0,
                                    DMA_CHANNEL_4 );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Function

void PLIB_DMA_ChannelXReloadDisable (DMA_MODULE_ID index,
DMA_CHANNEL channel)

PLIB_DMA_ChannelXReloadEnable Function

Enables reloading of the address and count registers.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXReloadEnable(DMA_MODULE_ID index, DMA_CHANNEL channel);
```

Returns

None.

Description

This function enables reloading of the address and count registers. The source, destination address, and the DMA count registers are reloaded to their previous values upon the start of the next operation.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DMA_ChannelXReloadEnable ( DMA_ID_0,
                                DMA_CHANNEL_4 );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Function

void PLIB_DMA_ChannelXReloadEnable(DMA_MODULE_ID index,
DMA_CHANNEL channel)

PLIB_DMA_ChannelXSourceAddressModeGet Function

Gets the source address mode of the specified channel.

File

plib_dma.h

C

```
DMA_SOURCE_ADDRESSING_MODE PLIB_DMA_ChannelXSourceAddressModeGet(DMA_MODULE_ID index, DMA_CHANNEL channel);
```

Returns

- DMA_SOURCE_ADDRESSING_MODE - One of the possible source addressing modes listed by DMA_SOURCE_ADDRESSING_MODE

Description

This function gets the source address mode of the specified channel.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
DMA_SOURCE_ADDRESSING_MODE sourceAddressMode;
sourceAddressMode = PLIB_DMA_ChannelXSourceAddressModeGet ( DMA_ID_0,
                                                            DMA_CHANNEL_4 );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Function

DMA_SOURCE_ADDRESSING_MODE PLIB_DMA_ChannelXSourceAddressModeGet (
DMA_MODULE_ID index,
DMA_CHANNEL channel)

PLIB_DMA_ChannelXSourceAddressModeSelect Function

Sets the source address mode of the specified channel.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXSourceAddressModeSelect(DMA_MODULE_ID index, DMA_CHANNEL channel,
DMA_SOURCE_ADDRESSING_MODE sourceAddressMode);
```

Returns

None.

Description

This function sets the source address mode of the specified channel.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DMA_ChannelXSourceAddressModeSelect (
                            DMA_ID_0,
                            DMA_CHANNEL_4,
                            DMA_ADDRESSING_SOURCE_INCREMENT_BASED_ON_SIZE );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL
sourceAddressMode	One of the possible source addressing modes listed by DMA_SOURCE_ADDRESSING_MODE

Function

void PLIB_DMA_ChannelXSourceAddressModeSelect (
DMA_MODULE_ID index,
DMA_CHANNEL channel,
DMA_SOURCE_ADDRESSING_MODE sourceAddressMode)

PLIB_DMA_ChannelXReloadIsEnabled Function

Returns the address and count registers reload enable status.

File

plib_dma.h

C

```
bool PLIB_DMA_ChannelXReloadIsEnabled(DMA_MODULE_ID index, DMA_CHANNEL channel);
```

Returns

- true - The address and count registers reload is enabled
- false - The address and count registers reload is disabled

Description

This function returns the address and count registers reload enable status.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
bool chAddressCountReloadStatus;
chAddressCountReloadStatus = PLIB_DMA_ChannelXReloadIsEnabled (
                                                              DMA_ID_0,
                                                              DMA_CHANNEL_4 );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Function

bool PLIB_DMA_ChannelXReloadIsEnabled (DMA_MODULE_ID index,
DMA_CHANNEL channel)

f) Source/Destination/Peripheral Address Control Interface Functions

PLIB_DMA_ChannelXDestinationStartAddressGet Function

Reads the destination start address configured for the specified channel.

File

plib_dma.h

C

```
uint32_t PLIB_DMA_ChannelXDestinationStartAddressGet(DMA_MODULE_ID index, DMA_CHANNEL dmaChannel);
```

Returns

- uint32_t - The destination start address configured for this channel

Description

This function reads the destination start address configured for the specified channel.

Remarks

This function implements an operation of the ChannelXDestinationStartAddress feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXDestinationStartAddress function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
DMA_CHANNEL spiDMAChannel = DMA_CHANNEL_2;
uint32_t DestinationStartAddress;
DestinationStartAddress = PLIB_DMA_ChannelXDestinationStartAddressGet (
                                                              DMA_ID_0,
                                                              spiDMAChannel );
```

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL

Function

uint32_t PLIB_DMA_ChannelXDestinationStartAddressGet (DMA_MODULE_ID index,
DMA_CHANNEL dmaChannel)

PLIB_DMA_ChannelXDestinationStartAddressSet Function

Writes the specified destination start address into the register corresponding to the specified channel.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXDestinationStartAddressSet(DMA_MODULE_ID index, DMA_CHANNEL dmaChannel, uint32_t
destinationStartAddress);
```

Returns

None.

Description

This function writes the specified destination start address into the register corresponding to the specified channel.

Remarks

This function implements an operation of the ChannelXDestinationStartAddress feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXDestinationStartAddress function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
DMA_CHANNEL spiDMAChannel = DMA_CHANNEL_2;
uint32_t destinationStartAddress = 0x00FDEA00;
PLIB_DMA_ChannelXDestinationStartAddressSet(    DMA_ID_0,
                                                spiDMAChannel,
                                                destinationStartAddress );
```

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL
destinationStartAddress	The destination start address

Function

void PLIB_DMA_ChannelXDestinationStartAddressSet (
DMA_MODULE_ID index,
DMA_CHANNEL dmaChannel,
uint32_t destinationStartAddress)

PLIB_DMA_ChannelXPeripheralAddressGet Function

Gets the peripheral address configured for the specified channel.

File

plib_dma.h

C

```
uint16_t PLIB_DMA_ChannelXPeripheralAddressGet(DMA_MODULE_ID index, DMA_CHANNEL channel);
```

Returns

- uint16_t - The peripheral address configured for the specified channel

Description

This function gets the peripheral address configured for the specified channel.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
uint16_t peripheraladdress;
peripheraladdress = PLIB_DMA_ChannelXPeripheralAddressGet ( DMA_ID_0,
                                                            DMA_CHANNEL_4 );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Function

uint16_t PLIB_DMA_ChannelXPeripheralAddressGet(DMA_MODULE_ID index,
DMA_CHANNEL channel)

PLIB_DMA_ChannelXPeripheralAddressSet Function

Sets the peripheral address for the specified channel.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXPeripheralAddressSet(DMA_MODULE_ID index, DMA_CHANNEL channel, uint16_t
peripheraladdress);
```

Returns

None.

Description

This function sets the peripheral address for the specified channel.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
uint16_t peripheraladdress = 0x100;
PLIB_DMA_ChannelXPeripheralAddressSet ( DMA_ID_0,
                                        DMA_CHANNEL_4,
                                        peripheraladdress );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL
peripheraladdress	The peripheral address for the specified channel

Function

void PLIB_DMA_ChannelXPeripheralAddressSet(DMA_MODULE_ID index,

DMA_CHANNEL channel ,
uint16_t peripheraladdress)

PLIB_DMA_ChannelXSourceStartAddressGet Function

Reads the source start address configured for the specified channel.

File

plib_dma.h

C

```
uint32_t PLIB_DMA_ChannelXSourceStartAddressGet(DMA_MODULE_ID index, DMA_CHANNEL dmaChannel);
```

Returns

- uint32_t - The source start address configured for this channel

Description

This function reads the source start address configured for the specified channel.

Remarks

This function implements an operation of the ChannelXSourceStartAddress feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXSourceStartAddress function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
DMA_CHANNEL spiDMAChannel = DMA_CHANNEL_2;
uint32_t SourceStartAddress;
SourceStartAddress = PLIB_DMA_ChannelXSourceStartAddressGet(DMA_ID_0,
                                                            spiDMAChannel );
```

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL

Function

uint32_t PLIB_DMA_ChannelXSourceStartAddressGet (DMA_MODULE_ID index,
DMA_CHANNEL dmaChannel)

PLIB_DMA_ChannelXSourceStartAddressSet Function

Writes the specified source start address into the register corresponding to the specified channel.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXSourceStartAddressSet(DMA_MODULE_ID index, DMA_CHANNEL dmaChannel, uint32_t
sourceStartAddress);
```

Returns

None.

Description

This function writes the specified Source start address into the register corresponding to the specified channel.

Remarks

This function implements an operation of the ChannelXSourceStartAddress feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXSourceStartAddress function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
DMA_CHANNEL spiDMAChannel = DMA_CHANNEL_2;
uint32_t sourceStartAddress = 0x00FDEA00;
PLIB_DMA_ChannelXSourceStartAddressSet (    DMA_ID_0,
                                            spiDMAChannel,
                                            sourceStartAddress );
```

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL
sourceStartAddress	The source start address

Function

void PLIB_DMA_ChannelXSourceStartAddressSet (DMA_MODULE_ID index,
DMA_CHANNEL dmaChannel,
uint32_t sourceStartAddress)

PLIB_DMA_ChannelXStartAddressOffsetGet Function

Gets the primary/secondary start address (DPSRAM) offset.

File

plib_dma.h

C

```
uint16_t PLIB_DMA_ChannelXStartAddressOffsetGet(DMA_MODULE_ID index, DMA_CHANNEL channel,
DMA_ADDRESS_OFFSET_TYPE offset);
```

Returns

- uint16_t - The primary/secondary DPSRAM start address offset

Description

This function gets the primary/secondary start address (DPSRAM) offset.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
uint16_t addressOffsetA;
addressOffsetA = PLIB_DMA_ChannelXStartAddressOffsetGet (
                                                DMA_ID_0,
                                                DMA_CHANNEL_4,
                                                address,
                                                DMA_ADDRESS_OFFSET_PRIMARY );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL
offset	The type of the address offset (primary/secondary)

Function

uint16_t PLIB_DMA_ChannelXStartAddressOffsetGet (DMA_MODULE_ID index,
DMA_CHANNEL channel,
DMA_ADDRESS_OFFSET_TYPE offset)

PLIB_DMA_ChannelXStartAddressOffsetSet Function

Sets the primary/secondary start address (DPSRAM) offset to the value specified depending on the offset type specified for the specified channel.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXStartAddressOffsetSet(DMA_MODULE_ID index, DMA_CHANNEL channel, uint16_t address,
DMA_ADDRESS_OFFSET_TYPE offset);
```

Returns

None.

Description

This function sets the primary/secondary start address (DPSRAM) offset to the value specified depending on the offset type specified for the specified channel.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
uint16_t address = 0x100;
PLIB_DMA_ChannelXStartAddressOffsetSet (    DMA_ID_0,
                                            DMA_CHANNEL_4,
                                            address,
                                            DMA_ADDRESS_OFFSET_PRIMARY );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL
address	The primary/secondary DPSRAM start address offset
offset	The type of the address offset (primary/secondary)

Function

void PLIB_DMA_ChannelXStartAddressOffsetSet(DMA_MODULE_ID index,
DMA_CHANNEL channel ,
uint16_t address,
DMA_ADDRESS_OFFSET_TYPE offset)

g) Source/Destination/Peripheral Data Management Functions

PLIB_DMA_ChannelXCellProgressPointerGet Function

Returns the number of bytes transferred since the last event.

File

plib_dma.h

C

```
uint16_t PLIB_DMA_ChannelXCellProgressPointerGet(DMA_MODULE_ID index, DMA_CHANNEL dmaChannel);
```

Returns

- uint16_t - The number of bytes transferred since the last event.

The cell progress pointer (8-bit, 16-bit) is device-specific. Please refer to the specific device data sheet to determine availability.

Description

This function returns the number of bytes transferred since the last event.

Remarks

This function implements an operation of the ChannelXCellProgressPointer feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXCellProgressPointer function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
DMA_CHANNEL spiDMAChannel = DMA_CHANNEL_2;
uint16_t CellProgress;
CellProgress = PLIB_DMA_ChannelXCellProgressPointerGet (   DMA_ID_0,
                                                           spiDMAChannel );
```

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL

Function

uint16_t PLIB_DMA_ChannelXCellProgressPointerGet (DMA_MODULE_ID index,
DMA_CHANNEL dmaChannel)

PLIB_DMA_ChannelXCellSizeGet Function

Reads the cell size (in bytes) configured for the specified channel.

File

plib_dma.h

C

```
uint16_t PLIB_DMA_ChannelXCellSizeGet(DMA_MODULE_ID index, DMA_CHANNEL dmaChannel);
```

Returns

- uint16_t - The cell size configured (in bytes) for this channel

The cell size (8-bit, 16-bit) is device-specific. Please refer to the specific device data sheet to determine availability.

Description

This function reads the cell size (in bytes) configured for the specified channel.

Remarks

This function implements an operation of the ChannelXCellSize feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXCellSize function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
DMA_CHANNEL spiDMAChannel = DMA_CHANNEL_2;
uint16_t cellSize;
cellSize = PLIB_DMA_ChannelXCellSizeGet (   DMA_ID_0,
                                            spiDMAChannel );
```

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL

Function

uint16_t PLIB_DMA_ChannelXCellSizeGet (DMA_MODULE_ID index,
DMA_CHANNEL dmaChannel)

PLIB_DMA_ChannelXCellSizeSet Function

Writes the specified cell size into the register corresponding to the specified channel.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXCellSizeSet(DMA_MODULE_ID index, DMA_CHANNEL dmaChannel, uint16_t CellSize);
```

Returns

None.

Description

This function writes the specified cell size into the register corresponding to the specified channel.

Remarks

This function implements an operation of the ChannelXCellSize feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXCellSize function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
DMA_CHANNEL spiDMAChannel = DMA_CHANNEL_2;
uint16_t cellSize = 0x10;
PLIB_DMA_ChannelXCellSizeSet ( DMA_ID_0, spiDMAChannel, cellSize );
```

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL
cellSize	The cell size in bytes. The cell size (8-bit, 16-bit) is device-specific. Please refer to the specific device data sheet to determine availability.)

Function

void PLIB_DMA_ChannelXCellSizeSet (DMA_MODULE_ID index,
DMA_CHANNEL dmaChannel,
uint16_t cellSize)

PLIB_DMA_ChannelXDataSizeGet Function

Returns the current data size for the specified channel.

File

plib_dma.h

C

```
DMA_CHANNEL_DATA_SIZE PLIB_DMA_ChannelXDataSizeGet(DMA_MODULE_ID index, DMA_CHANNEL channel);
```

Returns

- channelDataSize - One of the possible data sizes listed by DMA_CHANNEL_DATA_SIZE

Description

This function returns the current data size for the specified channel.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
DMA_CHANNEL_DATA_SIZE channelDataSize;
channelDataSize = PLIB_DMA_ChannelXDataSizeGet( DMA_ID_0,
                                                DMA_CHANNEL_4 );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Function

DMA_CHANNEL_DATA_SIZE PLIB_DMA_ChannelXDataSizeGet (DMA_MODULE_ID index,
DMA_CHANNEL channel)

PLIB_DMA_ChannelXDataSizeSelect Function

Selects the data size for the specified channel.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXDataSizeSelect(DMA_MODULE_ID index, DMA_CHANNEL channel, DMA_CHANNEL_DATA_SIZE
channelDataSize);
```

Returns

None.

Description

This function selects the data size for the specified channel.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
DMA_CHANNEL_DATA_SIZE channelDataSize = DMA_CHANNEL_DATA_8;
PLIB_DMA_ChannelXDataSizeSelect (   DMA_ID_0,
                                    DMA_CHANNEL_4,
                                    channelDataSize );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL
channelDataSize	One of the possible data sizes listed by DMA_CHANNEL_DATA_SIZE

Function

void PLIB_DMA_ChannelXDataSizeSelect (DMA_MODULE_ID index,
DMA_CHANNEL channel,
DMA_CHANNEL_DATA_SIZE channelDataSize)

PLIB_DMA_ChannelXDestinationPointerGet Function

Reads the current byte of the destination being pointed to for the specified channel.

File

plib_dma.h

C

```
uint16_t PLIB_DMA_ChannelXDestinationPointerGet(DMA_MODULE_ID index, DMA_CHANNEL dmaChannel);
```

Returns

- uint16_t - The destination byte being pointed to for this channel.

The destination pointer (8-bit, 16-bit) is device-specific. Please refer to the specific device data sheet to determine availability.

Description

This function reads the current byte of the destination being pointed to for the specified channel.

Remarks

This function implements an operation of the ChannelXDestinationPointer feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXDestinationPointer function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
DMA_CHANNEL spiDMAChannel = DMA_CHANNEL_2;
uint16_t destinationbyte;
destinationbyte = PLIB_DMA_ChannelXDestinationPointerGet ( DMA_ID_0,
                                                           spiDMAChannel );
```

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL

Function

uint16_t PLIB_DMA_ChannelXDestinationPointerGet (DMA_MODULE_ID index,
DMA_CHANNEL dmaChannel)

PLIB_DMA_ChannelXDestinationSizeGet Function

Reads the destination size configured for the specified channel.

File

plib_dma.h

C

```
uint16_t PLIB_DMA_ChannelXDestinationSizeGet(DMA_MODULE_ID index, DMA_CHANNEL dmaChannel);
```

Returns

- uint16_t - The destination size configured (in bytes) for this channel.

The destination size (8-bit, 16-bit) is device-specific. Please refer to the specific device data sheet to determine availability.

Description

This function reads the destination size configured for the specified channel.

Remarks

This function implements an operation of the ChannelXDestinationSize feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXDestinationSize function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
DMA_CHANNEL spiDMAChannel = DMA_CHANNEL_2;
uint16_t DestinationSize;
DestinationSize = PLIB_DMA_ChannelXDestinationSizeGet ( DMA_ID_0,
                                                        spiDMAChannel );
```

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL

Function

uint16_t PLIB_DMA_ChannelXDestinationSizeGet (DMA_MODULE_ID index,
DMA_CHANNEL dmaChannel)

PLIB_DMA_ChannelXDestinationSizeSet Function

Writes the specified destination size into the register corresponding to the specified channel.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXDestinationSizeSet(DMA_MODULE_ID index, DMA_CHANNEL dmaChannel, uint16_t
destinationSize);
```

Returns

None.

Description

This function writes the specified destination size into the register corresponding to the specified channel.

Remarks

This function implements an operation of the ChannelXDestinationSize feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXDestinationSize function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
DMA_CHANNEL spiDMAChannel = DMA_CHANNEL_2;
uint16_t destinationSize = 0xA00;
PLIB_DMA_ChannelXDestinationSizeSet( DMA_ID_0, spiDMAChannel, destinationSize );
```

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL
destinationSize	The destination size. The destination size (8-bit, 16-bit) is device-specific. Please refer to the specific device data sheet to determine availability.)

Function

void PLIB_DMA_ChannelXDestinationSizeSet (DMA_MODULE_ID index,
DMA_CHANNEL dmaChannel,
uint16_t destinationSize)

PLIB_DMA_ChannelXPatternDataGet Function

Returns the pattern matching (for DMA abort) data programmed for the specified channel.

File

plib_dma.h

C

```
uint16_t PLIB_DMA_ChannelXPatternDataGet(DMA_MODULE_ID index, DMA_CHANNEL dmaChannel);
```

Returns

- uint16_t - The pattern matching data programmed for the current channel.

The size of pattern matching data(8-bit, 16-bit) is device-specific. Please refer to the specific device data sheet to determine availability.

Description

This function returns pattern matching (for DMA abort) data programmed for the specified channel. (The size of pattern matching data(8-bit, 16-bit) is device-specific. Please refer to the specific device data sheet to determine availability.)

Remarks

This function implements an operation of the ChannelXPatternData feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXPatternData function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
DMA_CHANNEL spiDMAChannel = DMA_CHANNEL_2;
uint16_t patternData;
patternData = PLIB_DMA_ChannelXPatternDataGet ( DMA_ID_0, spiDMAChannel );
```

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL

Function

uint16_t PLIB_DMA_ChannelXPatternDataGet (DMA_MODULE_ID index,
DMA_CHANNEL dmaChannel)

PLIB_DMA_ChannelXPatternDataSet Function

Writes the specified pattern matching data (for DMA abort) into the register corresponding to the specified channel.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXPatternDataSet(DMA_MODULE_ID index, DMA_CHANNEL dmaChannel, uint16_t patternData);
```

Returns

None.

Description

This function writes the specified pattern matching data (for DMA abort) into the register corresponding to the specified channel. (The size of pattern matching data(8-bit, 16-bit) is device-specific. Please refer to the specific device data sheet to determine availability.)

Remarks

This function implements an operation of the ChannelXPatternData feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXPatternData function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
DMA_CHANNEL spiDMAChannel = DMA_CHANNEL_2;
```

```
uint16_t patternData = '0';
PLIB_DMA_ChannelXPatternDataSet ( DMA_ID_0, spiDMAChannel, patternData );
```

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL
patternData	The pattern matching DATA programmed for the current channel (The size of pattern matching data(8-bit, 16-bit) is device-specific. Please refer to the specific device data sheet to determine availability.)

Function

void PLIB_DMA_ChannelXPatternDataSet (DMA_MODULE_ID index,
DMA_CHANNEL dmaChannel,
uint16_t patternData)

PLIB_DMA_ChannelXSourcePointerGet Function

Reads the current byte of the source being pointed to for the specified channel.

File

plib_dma.h

C

```
uint16_t PLIB_DMA_ChannelXSourcePointerGet(DMA_MODULE_ID index, DMA_CHANNEL dmaChannel);
```

Returns

- uint16_t - The source byte being pointed to for this channel.

The source pointer (8-bit, 16-bit) is device-specific. Please refer to the specific device data sheet to determine availability.

Description

This function reads the current byte of the source being pointed to for the specified channel.

Remarks

This function implements an operation of the ChannelXSourcePointer feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXSourcePointer function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
DMA_CHANNEL spiDMAChannel = DMA_CHANNEL_2;
uint16_t sourcebyte;
sourcebyte = PLIB_DMA_ChannelXSourcePointerGet ( DMA_ID_0, spiDMAChannel );
```

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL

Function

uint16_t PLIB_DMA_ChannelXSourcePointerGet (DMA_MODULE_ID index,
DMA_CHANNEL dmaChannel)

PLIB_DMA_ChannelXSourceSizeGet Function

Reads the source size configured for the specified channel.

File

plib_dma.h

C

```
uint16_t PLIB_DMA_ChannelXSourceSizeGet(DMA_MODULE_ID index, DMA_CHANNEL dmaChannel);
```

Returns

- uint16_t - The Source size configured (in bytes) for this channel.

The source size (8-bit, 16-bit) is device-specific. Please refer to the specific device data sheet to determine availability.

Description

This function reads the source size configured for the specified channel.

Remarks

This function implements an operation of the ChannelXSourceSize feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXSourceSize function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
DMA_CHANNEL spiDMAChannel = DMA_CHANNEL_2;
uint16_t sourceSize;
sourceSize = PLIB_DMA_ChannelXSourceSizeGet (    DMA_ID_0,
                                                 spiDMAChannel );
```

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL

Function

uint16_t PLIB_DMA_ChannelXSourceSizeGet (DMA_MODULE_ID index,
DMA_CHANNEL dmaChannel)

PLIB_DMA_ChannelXSourceSizeSet Function

Writes the specified source size into the register corresponding to the specified channel.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXSourceSizeSet(DMA_MODULE_ID index, DMA_CHANNEL dmaChannel, uint16_t sourceSize);
```

Returns

None.

Description

This function writes the specified source size into the register corresponding to the specified channel.

Remarks

This function implements an operation of the ChannelXSourceSize feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXSourceSize function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
DMA_CHANNEL spiDMAChannel = DMA_CHANNEL_2;
uint16_t sourceSize = 0xA00;
PLIB_DMA_ChannelXSourceSizeSet (    DMA_ID_0,
                                    spiDMAChannel,
                                    sourceSize );
```

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL
sourceSize	The source size. The source size (8-bit, 16-bit) is device-specific. Please refer to the specific device data sheet to determine availability.

Function

void PLIB_DMA_ChannelXSourceSizeSet (DMA_MODULE_ID index,
DMA_CHANNEL dmaChannel,
uint16_t sourceSize)

PLIB_DMA_ChannelXTransferCountGet Function

Gets the DMA data transfer count that is programmed for the specified channel.

File

plib_dma.h

C

```
uint16_t PLIB_DMA_ChannelXTransferCountGet(DMA_MODULE_ID index, DMA_CHANNEL channel);
```

Returns

- uint16_t - The DMA transfer count for the channel

Description

This function gets the DMA data transfer count that is programmed for the specified channel.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
uint16_t transferCount;
transferCount = PLIB_DMA_ChannelXTransferCountGet ( DMA_ID_0,
                                                    DMA_CHANNEL_4 );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Function

uint16_t PLIB_DMA_ChannelXTransferCountGet(DMA_MODULE_ID index,
DMA_CHANNEL channel)

PLIB_DMA_ChannelXTransferCountSet Function

Sets the DMA data transfer count for the specified channel.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXTransferCountSet(DMA_MODULE_ID index, DMA_CHANNEL channel, uint16_t transferCount);
```

Returns

None.

Description

This function sets the DMA data transfer count for the specified channel.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
uint16_t transferCount = 0x10;
PLIB_DMA_ChannelXTransferCountSet ( DMA_ID_0,
                                    DMA_CHANNEL_4,
                                    transferCount );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL
transferCount	The DMA transfer count for the channel

Function

void PLIB_DMA_ChannelXTransferCountSet(DMA_MODULE_ID index,
DMA_CHANNEL channel ,
uint16_t transferCount)

h) Channel Configuration Functions

PLIB_DMA_ChannelPrioritySelect Function

Sets the priority scheme of the DMA channels.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelPrioritySelect(DMA_MODULE_ID index, DMA_CHANNEL_PRIORITY channelPriority);
```

Returns

None.

Description

This function sets the priority scheme of the DMA channels at the global level. This function is used in devices that do not have the per channel priority feature.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
DMA_CHANNEL_PRIORITY channelPriority = DMA_CHANNEL_ROUND_ROBIN;
PLIB_DMA_ChannelPrioritySelect( DMA_ID_0, channelPriority );
```

Parameters

Parameters	Description
channelPriority	One of the supported priorities listed by DMA_CHANNEL_PRIORITY

Function

void PLIB_DMA_ChannelPrioritySelect (DMA_MODULE_ID index,
DMA_CHANNEL_PRIORITY channelPriority)

PLIB_DMA_ChannelPriorityGet Function

Gets the priority scheme of the DMA channels.

File

plib_dma.h

C

```
DMA_CHANNEL_PRIORITY PLIB_DMA_ChannelPriorityGet(DMA_MODULE_ID index);
```

Returns

- channelPriority - One of the supported priorities listed by DMA_CHANNEL_PRIORITY

Description

This function gets the priority scheme of the DMA channels at the global level. This function is used in devices that do not have the per channel priority feature.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
DMA_CHANNEL_PRIORITY channelPriority;
channelPriority = PLIB_DMA_ChannelPriorityGet( DMA_ID_0 );
```

Function

DMA_CHANNEL_PRIORITY PLIB_DMA_ChannelPriorityGet (DMA_MODULE_ID index)

PLIB_DMA_ChannelXAutoDisable Function

Channel is disabled after a block transfer is complete.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXAutoDisable(DMA_MODULE_ID index, DMA_CHANNEL channel);
```

Returns

None.

Description

This function disables a channel after a block transfer is complete.

Remarks

This function implements an operation of the ChannelXAuto feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXAuto function in your application to determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_DMA_ChannelXAutoDisable( DMA_ID_0, DMA_CHANNEL_2 );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Function

void PLIB_DMA_ChannelXAutoDisable (DMA_MODULE_ID index,
DMA_CHANNEL channel)

PLIB_DMA_ChannelXAutoEnable Function

Channel is continuously enabled.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXAutoEnable(DMA_MODULE_ID index, DMA_CHANNEL channel);
```

Returns

None.

Description

This function enables the channel continuously. The channel is not automatically disabled after a block transfer is complete.

Remarks

This function implements an operation of the ChannelXAuto feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXAuto function in your application to determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_DMA_ChannelXAutoEnable( DMA_ID_0, DMA_CHANNEL_2 );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Function

void PLIB_DMA_ChannelXAutoEnable (DMA_MODULE_ID index,
DMA_CHANNEL channel)

PLIB_DMA_ChannelXBusyActiveSet Function

Sets the Busy bit to active.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXBusyActiveSet(DMA_MODULE_ID index, DMA_CHANNEL channel);
```

Returns

None.

Description

This function sets the Busy bit to active, indicating the channel is active or has been enabled.

Remarks

This function implements an operation of the ChannelXBusy feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXBusy function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_DMA_ChannelXBusyActiveSet ( DMA_ID_0, DMA_CHANNEL_4 );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Function

void PLIB_DMA_ChannelXBusyActiveSet (DMA_MODULE_ID index,
DMA_CHANNEL channel)

PLIB_DMA_ChannelXBusyInActiveSet Function

Sets the Busy bit to inactive.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXBusyInActiveSet(DMA_MODULE_ID index, DMA_CHANNEL channel);
```

Returns

None.

Description

This function sets the Busy bit to inactive, indicating the channel is inactive or has been disabled.

Remarks

This function implements an operation of the ChannelXBusy feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXBusy function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_DMA_ChannelXBusyInActiveSet ( DMA_ID_0, DMA_CHANNEL_4 );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Function

void PLIB_DMA_ChannelXBusyInActiveSet (DMA_MODULE_ID index,
DMA_CHANNEL channel)

PLIB_DMA_ChannelXChainDisable Function

Disables the channel chaining for the specified DMA channel.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXChainDisable(DMA_MODULE_ID index, DMA_CHANNEL channel);
```

Returns

None.

Description

This function disables the channel chaining for the specified DMA channel.

Remarks

This function implements an operation of the ChannelXChainEnbl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXChainEnbl function in your application to determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_DMA_ChannelXChainDisable( DMA_ID_0, DMA_CHANNEL_2 );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Function

void PLIB_DMA_ChannelXChainDisable(DMA_MODULE_ID index,
DMA_CHANNEL channel)

PLIB_DMA_ChannelXChainEnable Function

Channel chain feature is enabled.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXChainEnable(DMA_MODULE_ID index, DMA_CHANNEL channel);
```

Returns

None.

Description

This function enables the channel chain feature.

Remarks

This function implements an operation of the ChannelXChainEnbl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXChainEnbl function in your application to determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_DMA_ChannelXChainEnable( DMA_ID_0, DMA_CHANNEL_2 );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Function

void PLIB_DMA_ChannelXChainEnable (DMA_MODULE_ID index,

DMA_CHANNEL channel)

PLIB_DMA_ChannelXChainToHigher Function

Chains the specified channel to a channel higher in natural priority.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXChainToHigher(DMA_MODULE_ID index, DMA_CHANNEL channel);
```

Returns

None.

Description

This function will chain the specified channel to a channel higher in natural priority. CH5 will be enabled by a CH4 transfer complete.

Remarks

This function implements an operation of the ChannelXChain feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXChain function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_DMA_ChannelXChainToHigher ( DMA_ID_0, DMA_CHANNEL_4 );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Function

void PLIB_DMA_ChannelXChainToHigher (DMA_MODULE_ID index,
DMA_CHANNEL channel)

PLIB_DMA_ChannelXChainToLower Function

Chains the specified channel to a channel lower in natural priority.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXChainToLower(DMA_MODULE_ID index, DMA_CHANNEL channel);
```

Returns

None.

Description

This function will chain the specified channel to a channel lower in natural priority. CH3 will be enabled by a CH4 transfer complete.

Remarks

This function implements an operation of the ChannelXChain feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXChain function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_DMA_ChannelXChainToLower ( DMA_ID_0, DMA_CHANNEL_4 );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Function

void PLIB_DMA_ChannelXChainToLower(DMA_MODULE_ID index,
DMA_CHANNEL channel)

PLIB_DMA_ChannelXDisable Function

Disable the specified channel.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXDisable(DMA_MODULE_ID index, DMA_CHANNEL channel);
```

Returns

None.

Description

This function will disable the specified channel.

Remarks

This function implements an operation of the ChannelX feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelX function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_DMA_ChannelXDisable ( DMA_ID_0, DMA_CHANNEL_2 );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Function

void PLIB_DMA_ChannelXDisable (DMA_MODULE_ID index,
DMA_CHANNEL channel)

PLIB_DMA_ChannelXEnable Function

Enable the specified channel.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXEnable(DMA_MODULE_ID index, DMA_CHANNEL channel);
```

Returns

None.

Description

This function will enable the specified channel.

Remarks

This function implements an operation of the ChannelX feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelX function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_DMA_ChannelXEnable ( DMA_ID_0, DMA_CHANNEL_2 );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Function

void PLIB_DMA_ChannelXEnable (DMA_MODULE_ID index,
DMA_CHANNEL channel)

PLIB_DMA_ChannelXPriorityGet Function

Gets the priority of the specified channel.

File

plib_dma.h

C

```
DMA_CHANNEL_PRIORITY PLIB_DMA_ChannelXPriorityGet(DMA_MODULE_ID index, DMA_CHANNEL channel);
```

Returns

- channelPriority - One of the supported priorities listed by DMA_CHANNEL_PRIORITY

Description

This function gets the priority of the specified channel.

Remarks

This function implements an operation of the ChannelXPriority feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXPriority function in your application to determine whether this feature is available.

Preconditions

None.

Example

```
DMA_CHANNEL channel = DMA_CHANNEL_0;
DMA_CHANNEL_PRIORITY channelPriority;
channelPriority = PLIB_DMA_ChannelXPriorityGet( DMA_ID_0, channel );
```

Parameters

Parameters	Description
channel	One of the existing DMA channels listed by DMA_CHANNEL

Function

DMA_CHANNEL_PRIORITY PLIB_DMA_ChannelXPriorityGet (DMA_MODULE_ID index,
DMA_CHANNEL channel)

PLIB_DMA_ChannelXPrioritySelect Function

Sets the priority of the specified channel.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXPrioritySelect(DMA_MODULE_ID index, DMA_CHANNEL channel, DMA_CHANNEL_PRIORITY
channelPriority);
```

Returns

None.

Description

This function sets the priority of the specified channel.

Remarks

This function implements an operation of the ChannelXPriority feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXPriority function in your application to determine whether this feature is available.

Preconditions

None.

Example

```
DMA_CHANNEL channel = DMA_CHANNEL_0;
DMA_CHANNEL_PRIORITY channelPriority = DMA_CHANNEL_PRIORITY_3;
PLIB_DMA_ChannelXPrioritySelect( DMA_ID_0, channel, channelPriority );
```

Parameters

Parameters	Description
channel	One of the existing DMA channels listed by DMA_CHANNEL
channelPriority	One of the supported priorities listed by DMA_CHANNEL_PRIORITY

Function

void PLIB_DMA_ChannelXPrioritySelect (DMA_MODULE_ID index,
DMA_CHANNEL channel,
DMA_CHANNEL_PRIORITY channelPriority)

PLIB_DMA_ChannelXTransferDirectionGet Function

Returns the data transfer direction of the specified channel.

File

plib_dma.h

C

```
DMA_CHANNEL_TRANSFER_DIRECTION PLIB_DMA_ChannelXTransferDirectionGet(DMA_MODULE_ID index, DMA_CHANNEL
channel);
```

Returns

- DMA_CHANNEL_TRANSFER_DIRECTION - The transfer direction indicated by the DMA_CHANNEL_TRANSFER_DIRECTION

Description

This function returns the data transfer direction of the specified channel.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
DMA_CHANNEL_TRANSFER_DIRECTION chTransferDirection;
chTransferDirection = PLIB_DMA_ChannelXTransferDirectionGet (
                                                              DMA_ID_0,
                                                              DMA_CHANNEL_4 );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Function

DMA_CHANNEL_TRANSFER_DIRECTION PLIB_DMA_ChannelXTransferDirectionGet (
DMA_MODULE_ID index,
DMA_CHANNEL channel)

PLIB_DMA_ChannelXTransferDirectionSelect Function

Selects the data transfer direction of the specified channel.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXTransferDirectionSelect(DMA_MODULE_ID index, DMA_CHANNEL channel,
DMA_CHANNEL_TRANSFER_DIRECTION chTransferDirection);
```

Returns

None.

Description

This function selects the data transfer direction of the specified channel.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DMA_ChannelXTransferDirectionSelect (
                              DMA_ID_0,
                              DMA_CHANNEL_4,
                              DMA_READ_FROM_MEMORY_WRITE_TO_PERIPHERAL );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL
chTransferDirection	The transfer direction indicated by DMA_CHANNEL_TRANSFER_DIRECTION

Function

void PLIB_DMA_ChannelXTransferDirectionSelect (DMA_MODULE_ID index,
DMA_CHANNEL channel,
DMA_CHANNEL_TRANSFER_DIRECTION chTransferDirection)

PLIB_DMA_ChannelXDisabledDisablesEvents Function

Channel start/abort events will be ignored even if the channel is disabled.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXDisabledDisablesEvents(DMA_MODULE_ID index, DMA_CHANNEL channel);
```

Returns

None.

Description

This function will allow the channel start/abort events to be ignored even if the channel is disabled.

Remarks

This function implements an operation of the ChannelXDisabled feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXDisabled function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_DMA_ChannelXDisabledDisablesEvents ( DMA_ID_0, DMA_CHANNEL_2 );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Function

void PLIB_DMA_ChannelXDisabledDisablesEvents (DMA_MODULE_ID index,
DMA_CHANNEL channel)

PLIB_DMA_ChannelXDisabledEnablesEvents Function

Channel start/abort events will be registered even if the channel is disabled.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXDisabledEnablesEvents(DMA_MODULE_ID index, DMA_CHANNEL channel);
```

Returns

None.

Description

This function will allow the channel register start/abort events even if the channel is disabled.

Remarks

This function implements an operation of the ChannelXDisabled feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXDisabled function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_DMA_ChannelXDisabledEnablesEvents ( DMA_ID_0, DMA_CHANNEL_2 );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Function

void PLIB_DMA_ChannelXDisabledEnablesEvents (DMA_MODULE_ID index,
DMA_CHANNEL channel)

PLIB_DMA_ChannelXPatternIgnoreByteDisable Function

Disables the pattern match ignore byte.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXPatternIgnoreByteDisable(DMA_MODULE_ID index, DMA_CHANNEL channel);
```

Returns

None.

Description

This function disables the pattern match ignore byte.

Remarks

This function implements an operation of the ChannelXPatternIgnoreByte feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXPatternIgnoreByte function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
DMA_CHANNEL dmaChannel = DMA_CHANNEL_2;
PLIB_DMA_ChannelXPatternIgnoreByteDisable(DMA_ID_0, dmaChannel);
```

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL

Function

void PLIB_DMA_ChannelXPatternIgnoreByteDisable (DMA_MODULE_ID index,
DMA_CHANNEL channel);

PLIB_DMA_ChannelXPatternIgnoreByteEnable Function

Enables the pattern match ignore byte.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXPatternIgnoreByteEnable(DMA_MODULE_ID index, DMA_CHANNEL channel);
```

Returns

None.

Description

This function enables the pattern match ignore byte.

Remarks

This function implements an operation of the ChannelXPatternIgnoreByte feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXPatternIgnoreByte function in your application to

automatically determine whether this feature is available.

Preconditions

None.

Example

```
DMA_CHANNEL dmaChannel = DMA_CHANNEL_2;
PLIB_DMA_ChannelXPatternIgnoreByteEnable(DMA_ID_0, dmaChannel);
```

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL

Function

void PLIB_DMA_ChannelXPatternIgnoreByteEnable (DMA_MODULE_ID index,
DMA_CHANNEL channel);

PLIB_DMA_ChannelXPatternIgnoreByteIsEnabled Function

Returns the state of the pattern match ignore byte.

File

plib_dma.h

C

```
bool PLIB_DMA_ChannelXPatternIgnoreByteIsEnabled(DMA_MODULE_ID index, DMA_CHANNEL channel);
```

Returns

- true - The pattern match ignore byte is enabled
- false - The pattern match ignore byte is disabled

Description

This function returns the state (enabled or disabled) of the pattern match ignore byte.

Remarks

This function implements an operation of the ChannelXPatternIgnoreByte feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXPatternIgnoreByte function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
bool patternIsEnabled;
DMA_CHANNEL dmaChannel = DMA_CHANNEL_2;
patternIsEnabled = PLIB_DMA_ChannelXPatternIgnoreByteIsEnabled(DMA_ID_0, dmaChannel);
```

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL

Function

bool PLIB_DMA_ChannelXPatternIgnoreByteIsEnabled (DMA_MODULE_ID index,
DMA_CHANNEL channel);

PLIB_DMA_ChannelXPatternIgnoreGet Function

Returns the pattern match ignore value.

File

plib_dma.h

C

```
uint8_t PLIB_DMA_ChannelXPatternIgnoreGet(DMA_MODULE_ID index, DMA_CHANNEL channel);
```

Returns

- uint8_t - Pattern match ignore value

Description

This function returns the value of the pattern match ignore.

Remarks

This function implements an operation of the ChannelXPatternIgnore feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXPatternIgnore function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
uint8_t patternMatch;
DMA_CHANNEL dmaChannel = DMA_CHANNEL_2;
patternMatch = PLIB_DMA_ChannelXPatternIgnoreGet ( DMA_ID_0, dmaChannel);
```

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL

Function

uint8_t PLIB_DMA_ChannelXPatternIgnoreGet(DMA_MODULE_ID index,
DMA_CHANNEL channel);

PLIB_DMA_ChannelXPatternIgnoreSet Function

Sets the pattern match ignore value.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXPatternIgnoreSet(DMA_MODULE_ID index, DMA_CHANNEL channel, uint8_t pattern);
```

Returns

None.

Description

This function sets the value of the pattern match ignore.

Remarks

This function implements an operation of the ChannelXPatternIgnore feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXPatternIgnore function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
uint8_t patternMatch = 0x8;
DMA_CHANNEL dmaChannel = DMA_CHANNEL_2;
PLIB_DMA_ChannelXPatternIgnoreSet ( DMA_ID_0, dmaChannel,patternMatch);
```

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL
pattern	Pattern match ignore value

Function

void PLIB_DMA_ChannelXPatternIgnoreSet (DMA_MODULE_ID index,
DMA_CHANNEL channel, uint8_t pattern);

PLIB_DMA_ChannelXPatternLengthGet Function

Returns the pattern match length.

File

plib_dma.h

C

```
DMA_PATTERN_LENGTH PLIB_DMA_ChannelXPatternLengthGet(DMA_MODULE_ID index, DMA_CHANNEL dmaChannel);
```

Returns

- patternLen - Length of pattern match (either 1 or 2)

Description

This function returns the length of the byte matching the CHPIGN bits during a pattern match that may be ignored during the pattern match determination when the CHPIGNEN bit is set.

Remarks

This function implements an operation of the ChannelXPatternLength feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXPatternLength function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
DMA_CHANNEL dmaChannel = DMA_CHANNEL_2;
DMA_PATTERN_LENGTH patternLen;
patternLen = PLIB_DMA_ChannelXPatternLengthGet(DMA_ID_0, dmaChannel);
```

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL

Function

DMA_PATTERN_LENGTH PLIB_DMA_ChannelXPatternLengthGet(DMA_MODULE_ID index,
DMA_CHANNEL dmaChannel);

PLIB_DMA_ChannelXPatternLengthSet Function

Sets the pattern match length.

File

plib_dma.h

C

```
void PLIB_DMA_ChannelXPatternLengthSet(DMA_MODULE_ID index, DMA_CHANNEL dmaChannel, DMA_PATTERN_LENGTH patternLen);
```

Returns

None.

Description

This function sets the length of the pattern match ignore to 1 or 2 bytes.

Remarks

This function implements an operation of the ChannelXPatternLength feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXPatternLength function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
DMA_CHANNEL dmaChannel = DMA_CHANNEL_2;
DMA_PATTERN_LENGTH patternLen;
patternLen = DMA_PATTERN_MATCH_LENGTH_1BYTE;
PLIB_DMA_ChannelXPatternLengthSet(DMA_ID_0, dmaChannel, patternLen);
```

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL
patternLen	Length of pattern match (either 1 or 2)

Function

void PLIB_DMA_ChannelXPatternLengthSet(DMA_MODULE_ID index,
DMA_CHANNEL dmaChannel,DMA_PATTERN_LENGTH patternLen)

i) CRC Module Interface Functions

PLIB_DMA_CRCAppendModeDisable Function

Disables the CRC append mode.

File

plib_dma.h

C

```
void PLIB_DMA_CRCAppendModeDisable(DMA_MODULE_ID index);
```

Returns

None.

Description

This function disables the CRC append mode. The DMA transfers data from the source through the CRC obeying WBO (DMA_MODULE_ID index, write byte order) as it writes the data to the destination.

Remarks

This function implements an operation of the CRCAppendMode feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsCRCAppendMode function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_DMA_CRCAppendModeDisable( DMA_ID_0 );
```

Function

void PLIB_DMA_CRCAppendModeDisable (DMA_MODULE_ID index)

PLIB_DMA_CRCAppendModeEnable Function

Enables the CRC append mode.

File

plib_dma.h

C

```
void PLIB_DMA_CRCAppendModeEnable(DMA_MODULE_ID index);
```

Returns

None.

Description

This function enables the CRC append mode. The DMA transfers data from the source into the CRC, but not to the destination. When a block transfer completes, the DMA writes the calculated CRC value to the location specified by the CHxDSA register.

Remarks

This function implements an operation of the CRCAppendMode feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsCRCAppendMode function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_DMA_CRCAppendModeEnable( DMA_ID_0 );
```

Function

void PLIB_DMA_CRCAppendModeEnable (DMA_MODULE_ID index)

PLIB_DMA_CRCAppendModeIsEnabled Function

Gets the enable status of the CRC append mode.

File

plib_dma.h

C

```
bool PLIB_DMA_CRCAppendModeIsEnabled(DMA_MODULE_ID index);
```

Returns

- true - CRC append mode is enabled
- false - CRC append mode is disabled

Description

This function gets the enable status of the CRC append mode.

Remarks

This function implements an operation of the CRCAppendMode feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsCRCAppendMode function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
bool DMAcrcAppendMode;
DMAcrcAppendMode = PLIB_DMA_CRCAppendModeIsEnabled( DMA_ID_0 );
```

Function

bool PLIB_DMA_CRCAppendModeIsEnabled (DMA_MODULE_ID index)

PLIB_DMA_CRCBitOrderSelect Function

Selects the bit order for checksum calculation.

File

plib_dma.h

C

```
void PLIB_DMA_CRCBitOrderSelect(DMA_MODULE_ID index, DMA_CRC_BIT_ORDER bitOrder);
```

Returns

None.

Description

This function selects the bit order for checksum calculation.

Remarks

This function implements an operation of the CRCBitOrder feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsCRCBitOrder function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_DMA_CRCBitOrderSelect ( DMA_ID_0,DMA_CRC_BIT_ORDER_LSB );
```

Parameters

Parameters	Description
bitOrder	Specifies the bit order for CRC calculation

Function

void PLIB_DMA_CRCBitOrderSelect (DMA_MODULE_ID index,
DMA_CRC_BIT_ORDER bitOrder)

PLIB_DMA_CRCByteOrderGet Function

Gets the current byte order selected by the DMA module CRC feature.

File

plib_dma.h

C

```
DMA_CRC_BYTE_ORDER PLIB_DMA_CRCByteOrderGet(DMA_MODULE_ID index);
```

Returns

- byteOrder - One of the possible byte orders specified by DMA_CRC_BYTE_ORDER

Description

This function gets the current byte order selected by the DMA module CRC feature.

Remarks

This function implements an operation of the CRCByteOrder feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsCRCByteOrder function in your application to automatically determine whether this feature is available.

Preconditions

The WBO bit must be set to use this function.

Example

```
DMA_CRC_BYTE_ORDER byteOrder;
```

```
byteOrder = PLIB_DMA_CRCByteOrderGet ( DMA_ID_0 );
```

Function

DMA_CRC_BYTE_ORDER PLIB_DMA_CRCByteOrderGet (DMA_MODULE_ID index)

PLIB_DMA_CRCByteOrderSelect Function

Selects the byte order.

File

plib_dma.h

C

```
void PLIB_DMA_CRCByteOrderSelect(DMA_MODULE_ID index, DMA_CRC_BYTE_ORDER byteOrder);
```

Returns

None.

Description

This function selects the byte order.

Remarks

This function implements an operation of the CRCByteOrder feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsCRCByteOrder function in your application to automatically determine whether this feature is available.

Preconditions

The WBO bit must be set to use this function.

Example

```
PLIB_DMA_CRCByteOrderSelect (   DMA_ID_0,
                                DMA_CRC_SWAP_HALF_WORD_ON_WORD_BOUNDARY );
```

Parameters

Parameters	Description
byteOrder	One of the possible byte orders specified by DMA_CRC_BYTE_ORDER

Function

void PLIB_DMA_CRCByteOrderSelect (DMA_MODULE_ID index,
DMA_CRC_BYTE_ORDER byteOrder)

PLIB_DMA_CRCChannelGet Function

Returns the current DMA channel to which the CRC is assigned.

File

plib_dma.h

C

```
DMA_CHANNEL PLIB_DMA_CRCChannelGet(DMA_MODULE_ID index);
```

Returns

crcChannel - One of the possible DMA channels listed by DMA_CHANNEL

Description

This function returns the current DMA channel to which the CRC is assigned.

Remarks

This function implements an operation of the CRCChannel feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsCRCChannel function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
DMA_CHANNEL crcChannel;
crcChannel = PLIB_DMA_CRCChannelGet( DMA_ID_0 );
```

Function

DMA_CHANNEL PLIB_DMA_CRCChannelGet (DMA_MODULE_ID index)

PLIB_DMA_CRCChannelSelect Function

Assigns the CRC to the specified DMA channel.

File

plib_dma.h

C

```
void PLIB_DMA_CRCChannelSelect(DMA_MODULE_ID index, DMA_CHANNEL channel);
```

Returns

None.

Description

This function assigns the CRC feature to the specified channel.

Remarks

This function implements an operation of the CRCChannel feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsCRCChannel function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_DMA_CRCChannelSelect(  DMA_ID_0,
                            DMA_CHANNEL_5 );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Function

void PLIB_DMA_CRCChannelSelect(DMA_MODULE_ID index,
DMA_CHANNEL channel)

PLIB_DMA_CRCDataRead Function

Reads the contents of the DMA CRC data register.

File

plib_dma.h

C

```
uint32_t PLIB_DMA_CRCDataRead(DMA_MODULE_ID index);
```

Returns

- uint32_t - 32-bit CRC data

The CRC data (16-bit, 32-bit) is device-specific. Please refer to the specific device data sheet to determine availability.

Description

This function reads the contents of the DMA CRC data register.

Remarks

This function implements an operation of the CRCData feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsCRCData function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
uint32_t DMACRCdata;
DMACRCdata = PLIB_DMA_CRCDataRead ( DMA_ID_0 );
```

Function

uint32_t PLIB_DMA_CRCDataRead (DMA_MODULE_ID index)

PLIB_DMA_CRCDataWrite Function

Writes the contents of the DMA CRC data register with the specified data.

File

plib_dma.h

C

```
void PLIB_DMA_CRCDataWrite(DMA_MODULE_ID index, uint32_t DMACRCdata);
```

Returns

None.

Description

This function writes the contents of the DMA CRC data register.

Remarks

This function implements an operation of the CRCData feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsCRCData function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
uint32_t DMACRCdata = 0x0E0E0E;
PLIB_DMA_CRCDataWrite ( DMA_ID_0, DMACRCdata );
```

Function

void PLIB_DMA_CRCDataWrite (DMA_MODULE_ID index,
uint32_t DMACRCdata)

PLIB_DMA_CRCDisable Function

Disables the DMA module CRC feature.

File

plib_dma.h

C

```
void PLIB_DMA_CRCDisable(DMA_MODULE_ID index);
```

Returns

None.

Description

This function disables the DMA module CRC feature. The channel transfers proceed normally.

Remarks

This function implements an operation of the CRC feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsCRC function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_DMA_CRCDisable( DMA_ID_0 );
```

Function

void PLIB_DMA_CRCDisable (DMA_MODULE_ID index)

PLIB_DMA_CRCEnable Function

Enables the DMA module CRC feature.

File

plib_dma.h

C

```
void PLIB_DMA_CRCEnable(DMA_MODULE_ID index);
```

Returns

None.

Description

This function enables the DMA module CRC feature. The channel transfers are routed through the CRC.

Remarks

This function implements an operation of the CRC feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsCRC function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_DMA_CRCEnable( DMA_ID_0 );
```

Function

void PLIB_DMA_CRCEnable (DMA_MODULE_ID index)

PLIB_DMA_CRCPolynomialLengthGet Function

Gets the current polynomial length.

File

plib_dma.h

C

```
uint8_t PLIB_DMA_CRCPolynomialLengthGet(DMA_MODULE_ID index);
```

Returns

- uint8_t - Polynomial length

Description

This function gets the current polynomial length.

Remarks

This function implements an operation of the CRCPolynomialLength feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsCRCPolynomialLength function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
uint8_t polyLength;
polyLength = PLIB_DMA_CRCPolynomialLengthGet( DMA_ID_0 );
```

Function

uint8_t PLIB_DMA_CRCPolynomialLengthGet (DMA_MODULE_ID index)

PLIB_DMA_CRCPolynomialLengthSet Function

Selects the polynomial length.

File

plib_dma.h

C

```
void PLIB_DMA_CRCPolynomialLengthSet(DMA_MODULE_ID index, uint8_t polyLength);
```

Returns

None.

Description

This function Selects the polynomial length.

Remarks

This function implements an operation of the CRCPolynomialLength feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsCRCPolynomialLength function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
uint8_t polyLength = 0x2;
PLIB_DMA_CRCPolynomialLengthSet( DMA_ID_0, polyLength );
```

Parameters

Parameters	Description
polyLength	Polynomial length

Function

void PLIB_DMA_CRCPolynomialLengthSet (DMA_MODULE_ID index,

uint8_t polyLength)

PLIB_DMA_CRCTypeGet Function

Gets the current DMA module CRC feature type.

File

plib_dma.h

C

```
DMA_CRC_TYPE PLIB_DMA_CRCTypeGet(DMA_MODULE_ID index);
```

Returns

- CRCType - One of the possible CRC checksums listed by DMA_CRC_TYPE.

Description

This function gets the DMA module CRC feature type. The CRC feature will compute either the IP header checksum or the Linear Shift Feedback Register (LFSR) checksum.

Remarks

This function implements an operation of the CRCType feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsCRCType function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
DMA_CRC_TYPE CRCType;
CRCType = PLIB_DMA_CRCTypeGet( DMA_ID_0 );
```

Function

DMA_CRC_TYPE PLIB_DMA_CRCTypeGet (DMA_MODULE_ID index)

PLIB_DMA_CRCTypeSet Function

Selects the DMA module CRC feature type.

File

plib_dma.h

C

```
void PLIB_DMA_CRCTypeSet(DMA_MODULE_ID index, DMA_CRC_TYPE CRCType);
```

Returns

None.

Description

This function selects the DMA module CRC feature type. The CRC feature will compute either the IP header checksum or the Linear Shift Feedback Register (LFSR) checksum.

Remarks

This function implements an operation of the CRCType feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsCRCType function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_DMA_CRCTypeSet(DMA_ID_0,
                    DMA_CRC_IP_HEADER );
```

Parameters

Parameters	Description
CRCType	One of the possible CRC checksums listed by DMA_CRC_TYPE

Function

void PLIB_DMA_CRCTypeSet (DMA_MODULE_ID index,
DMA_CRC_TYPE CRCType)

PLIB_DMA_CRCWriteByteOrderAlter Function

The source data is written to the destination reordered as defined by the BYTO<1:0> bits.

File

plib_dma.h

C

```
void PLIB_DMA_CRCWriteByteOrderAlter(DMA_MODULE_ID index);
```

Returns

None.

Description

This function enables byte order alteration as specified by the BYTO<1:0> bits. The source data is written to the destination reordered as defined by the BYTO<1:0> bits.

Remarks

This function implements an operation of the CRCWriteByteOrder feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsCRCWriteByteOrder function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_DMA_CRCWriteByteOrderAlter ( DMA_ID_0 );
```

Function

void PLIB_DMA_CRCWriteByteOrderAlter (DMA_MODULE_ID index)

PLIB_DMA_CRCWriteByteOrderMaintain Function

The source data is written to the destination unaltered.

File

plib_dma.h

C

```
void PLIB_DMA_CRCWriteByteOrderMaintain(DMA_MODULE_ID index);
```

Returns

None.

Description

This function disables byte order alteration. The source data is written to the destination unaltered.

Remarks

This function implements an operation of the CRCWriteByteOrder feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsCRCWriteByteOrder function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_DMA_CRCWriteByteOrderMaintain ( DMA_ID_0 );
```

Function

void PLIB_DMA_CRCWriteByteOrderMaintain (DMA_MODULE_ID index)

PLIB_DMA_CRCXOREnableGet Function

Reads the CRC XOR register.

File

plib_dma.h

C

```
uint32_t PLIB_DMA_CRCXOREnableGet(DMA_MODULE_ID index);
```

Returns

- uint32_t - 32-bit CRC XOR enable mask data

The CRC data (16-bit, 32-bit) is device-specific. Please refer to the specific device data sheet to determine availability.

Description

This function reads the CRC XOR register.

Remarks

This function implements an operation of the CRCXOREnable feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsCRCXOREnable function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
uint32_t DMACRCXORdata;
DMACRCXORdata = PLIB_DMA_CRCXOREnableGet ( DMA_ID_0 );
```

Function

uint32_t PLIB_DMA_CRCXOREnableGet (DMA_MODULE_ID index)

PLIB_DMA_CRCXOREnableSet Function

Writes to the CRC XOR enable register as per the specified enable mask.

File

plib_dma.h

C

```
void PLIB_DMA_CRCXOREnableSet(DMA_MODULE_ID index, uint32_t DMACRCXOREnableMask);
```

Returns

None.

Description

This function writes to the CRC XOR enable register as per the specified enable mask. Each enabled bit will be taken as input to the shift register.

Remarks

This function implements an operation of the CRCXOREnable feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsCRCXOREnable function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
uint32_t DMACRCXOREnableMask = 0x05EFFFFF;
PLIB_DMA_CRCXOREnableSet ( DMA_ID_0, DMACRCXOREnableMask );
```

Function

void PLIB_DMA_CRCXOREnableSet (DMA_MODULE_ID index,

uint32_t DMACRCXOREnableMask)

j) Global Status Functions

PLIB_DMA_CRCIsEnabled Function

Gets the enable status of the CRC feature.

File

plib_dma.h

C

```
bool PLIB_DMA_CRCIsEnabled(DMA_MODULE_ID index);
```

Returns

- true - The CRC feature is enabled
- false - The CRC feature is disabled

Description

This function gets the enable status of the CRC feature.

Remarks

This function implements an operation of the CRC feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsCRC function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
bool DMAcrcStatus;
DMAcrcStatus = PLIB_DMA_CRCIsEnabled( DMA_ID_0 );
```

Function

bool PLIB_DMA_CRCIsEnabled (DMA_MODULE_ID index)

PLIB_DMA_IsBusy Function

Gets the BUSY bit of the DMA controller.

File

plib_dma.h

C

```
bool PLIB_DMA_IsBusy(DMA_MODULE_ID index);
```

Returns

- true - DMA module is active
- false - DMA module is disabled and is not actively transferring data

Description

This function gets the BUSY bit of the DMA controller.

Remarks

This function implements an operation of the Busy feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsBusy function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
bool dmaBusyStatus;
dmaBusyStatus = PLIB_DMA_IsBusy( DMA_ID_0 );
```

Function

bool PLIB_DMA_IsBusy (DMA_MODULE_ID index)

PLIB_DMA_IsEnabled Function

Returns the DMA module enable status.

File

plib_dma.h

C

```
bool PLIB_DMA_IsEnabled(DMA_MODULE_ID index);
```

Returns

- true - The DMA is enabled
- false - The DMA is disabled

Description

This function returns the DMA module enable status.

Remarks

This function implements an operation of the EnableControl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsEnableControl function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
PLIB_DMA_IsEnabled( DMA_ID_0 );
```

Function

bool PLIB_DMA_IsEnabled (DMA_MODULE_ID index)

PLIB_DMA_LastBusAccessIsRead Function

Returns true if the last DMA bus access was a read.

File

plib_dma.h

C

```
bool PLIB_DMA_LastBusAccessIsRead(DMA_MODULE_ID index);
```

Returns

- true - The last bus access was a read
- false - The last bus access was not a read

Description

This function returns true if the last DMA bus access was a read.

Remarks

This function implements an operation of the LastBusAccess feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsLastBusAccess function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
bool dmaLastBusAccessType;
dmaLastBusAccessType = PLIB_DMA_LastBusAccessIsRead( DMA_ID_0 );
```

Function

bool PLIB_DMA_LastBusAccessIsRead (DMA_MODULE_ID index)

PLIB_DMA_LastBusAccessIsWrite Function

Returns true if the last DMA bus access was a write.

File

plib_dma.h

C

```
bool PLIB_DMA_LastBusAccessIsWrite(DMA_MODULE_ID index);
```

Returns

- true - The last bus access was a write operation
- false - The last bus access was not a write operation

Description

This function returns true if the last DMA bus access was a write operation.

Remarks

This function implements an operation of the LastBusAccess feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsLastBusAccess function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
bool dmaLastBusAccessType;
dmaLastBusAccessType = PLIB_DMA_LastBusAccessIsWrite( DMA_ID_0 );
```

Function

bool PLIB_DMA_LastBusAccessIsWrite (DMA_MODULE_ID index)

PLIB_DMA_RecentAddressAccessed Function

Returns the address of the most recent DMA access.

File

plib_dma.h

C

```
uint32_t PLIB_DMA_RecentAddressAccessed(DMA_MODULE_ID index);
```

Returns

- uint32_t - The most recent address accessed by the DMA

Description

This function returns the address of the most recent DMA access.

Remarks

This function implements an operation of the RecentAddress feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsRecentAddress function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
uint32_t dmaLastAddressAccessed;
dmaLastAddressAccessed = PLIB_DMA_RecentAddressAccessed( DMA_ID_0 );
```

Function

uint32_t PLIB_DMA_RecentAddressAccessed (DMA_MODULE_ID index)

PLIB_DMA_SuspendIsEnabled Function

Returns the DMA suspend status.

File

plib_dma.h

C

```
bool PLIB_DMA_SuspendIsEnabled(DMA_MODULE_ID index);
```

Returns

- true - The DMA transfers are suspended
- false - The DMA operates normally

Description

This function returns the DMA suspend status.

Remarks

This function implements an operation of the Suspend feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsSuspend function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
bool dmaSuspendStatus;
dmaSuspendStatus = PLIB_DMA_SuspendIsEnabled( DMA_ID_0 );
```

Function

bool PLIB_DMA_SuspendIsEnabled (DMA_MODULE_ID index)

k) Channel Status Functions

PLIB_DMA_ChannelXAutoIsEnabled Function

Returns the channel automatic enable status.

File

plib_dma.h

C

```
bool PLIB_DMA_ChannelXAutoIsEnabled(DMA_MODULE_ID index, DMA_CHANNEL channel);
```

Returns

- true - Channel automatic enable is on
- false - Channel automatic enable is off

Description

This function returns the channel automatic enable status.

Remarks

This function implements an operation of the ChannelXAuto feature. This feature may not be available on all devices. Please refer to the specific

device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXAuto function in your application to determine whether this feature is available.

Preconditions

None.

Example

```
bool ChAutoEnableStatus;
ChAutoEnableStatus = PLIB_DMA_ChannelXAutoIsEnabled(DMA_ID_0, DMA_CHANNEL_2 );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Function

bool PLIB_DMA_ChannelXAutoIsEnabled (DMA_MODULE_ID index,
DMA_CHANNEL channel)

PLIB_DMA_ChannelXBufferedDataIsWritten Function

Returns the buffered data write status for the specified channel.

File

plib_dma.h

C

```
bool PLIB_DMA_ChannelXBufferedDataIsWritten(DMA_MODULE_ID index, DMA_CHANNEL channel);
```

Returns

- true - The content of the DMA buffer has not been written to the location specified in the destination/source address or in Null Write mode
- false - The content of the DMA buffer has been written to the location specified in the destination/source address or in Null Write mode

Description

This function returns the buffered data write status for the specified channel.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
bool chBuffWriteStatus;
chBuffWriteStatus = PLIB_DMA_ChannelXBufferedDataIsWritten( DMA_ID_0,
                                                            DMA_CHANNEL_3 );
```

Parameters

Parameters	Description
channel	One of the existing DMA channels listed by DMA_CHANNEL

Function

bool PLIB_DMA_ChannelXBufferedDataIsWritten (DMA_MODULE_ID index,
DMA_CHANNEL channel)

PLIB_DMA_ChannelXBusyIsBusy Function

Returns the busy status of the specified channel.

File

plib_dma.h

C

```
bool PLIB_DMA_ChannelXBusyIsBusy(DMA_MODULE_ID index, DMA_CHANNEL channel);
```

Returns

- true - The channel is active or has been enabled
- false - The channel is inactive or has been disabled

Description

This function returns the busy status of the specified channel.

Remarks

This function implements an operation of the ChannelXBusy feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXBusy function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
bool chBusyStatus;
chBusyStatus = PLIB_DMA_ChannelXBusyIsBusy ( DMA_ID_0, DMA_CHANNEL_4 );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Function

bool PLIB_DMA_ChannelXBusyIsBusy (DMA_MODULE_ID index,
DMA_CHANNEL channel)

PLIB_DMA_ChannelXChainIsEnabled Function

Returns the chain status of the specified channel.

File

plib_dma.h

C

```
bool PLIB_DMA_ChannelXChainIsEnabled(DMA_MODULE_ID index, DMA_CHANNEL channel);
```

Returns

- true - The channel chain is on for this channel
- false - The channel chain is off for this channel

Description

This function returns the chain status of the specified channel.

Remarks

This function implements an operation of the ChannelXChainEnbl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelXChainEnbl function in your application to determine whether this feature is available.

Preconditions

None.

Example

```
bool ChchainStatus;
ChchainStatus = PLIB_DMA_ChannelXChainIsEnabled( DMA_ID_0, DMA_CHANNEL_2 );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Function

bool PLIB_DMA_ChannelXChainIsEnabled (DMA_MODULE_ID index,
DMA_CHANNEL channel)

PLIB_DMA_ChannelXCollisionStatus Function

Returns the status of the specified collision type for the specified channel.

File

plib_dma.h

C

```
bool PLIB_DMA_ChannelXCollisionStatus(DMA_MODULE_ID index, DMA_CHANNEL channel, DMA_CHANNEL_COLLISION
collisonType);
```

Returns

- true - A collision specified by collisonType was detected
- false - No collision of type collisonType was detected

Description

This function returns the status of the specified collision type for the specified channel.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
bool memWriteCollisionStatus;
memWriteCollisionStatus = PLIB_DMA_ChannelXMemoryWriteCollisionStatus(
                                        DMA_ID_0,
                                        DMA_CHANNEL_3,
                                        DMA_CHANNEL_COLLISION_MEMORY );
```

Parameters

Parameters	Description
channel	One of the existing DMA channels listed by DMA_CHANNEL
collisonType	Collision type listed by DMA_CHANNEL_COLLISION

Function

bool PLIB_DMA_ChannelXCollisionStatus (DMA_MODULE_ID index,
DMA_CHANNEL channel,
DMA_CHANNEL_COLLISION collisonType)

PLIB_DMA_ChannelXEventIsDetected Function

Returns the event status on the specified channel.

File

plib_dma.h

C

```
bool PLIB_DMA_ChannelXEventIsDetected(DMA_MODULE_ID index, DMA_CHANNEL channel);
```

Returns

- true - An event was detected
- false - No events were detected

Description

This function returns the event status on the specified channel.

Remarks

This function implements an operation of the ChannelXEvent feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or include the PLIB_DMA_ExistsChannelXEvent function in your application to determine whether this feature is available.

Preconditions

None.

Example

```
bool channeleventStatus;
channeleventStatus = PLIB_DMA_ChannelXEventIsDetected(  DMA_ID_0,
                                                        DMA_CHANNEL_2 );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Function

bool PLIB_DMA_ChannelXEventIsDetected (DMA_MODULE_ID index,
DMA_CHANNEL channel)

PLIB_DMA_ChannelXIsEnabled Function

Return the enable status of the specified channel.

File

plib_dma.h

C

```
bool PLIB_DMA_ChannelXIsEnabled(DMA_MODULE_ID index, DMA_CHANNEL channel);
```

Returns

- true - The specified DMA channel is enabled
- false - The specified DMA channel is disabled

Description

This function will return the enable status of the specified channel.

Remarks

This function implements an operation of the ChannelX feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelX function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
bool chEnableStatus;
chEnableStatus = PLIB_DMA_ChannelXIsEnabled ( DMA_ID_0, DMA_CHANNEL_2 );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Function

bool PLIB_DMA_ChannelXIsEnabled (DMA_MODULE_ID index,
DMA_CHANNEL channel)

PLIB_DMA_ChannelXNullWriteModeIsEnabled Function

Returns the enable status of the Null Write mode for the specified channel.

File

plib_dma.h

C

```
bool PLIB_DMA_ChannelXNullWriteModeIsEnabled(DMA_MODULE_ID index, DMA_CHANNEL channel);
```

Returns

- true - Null write mode is enabled for this channel
- false - Null write mode is disabled for this channel

Description

This function returns the enable status of the Null Write mode for the specified channel.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
bool chNullWriteStatus;
chNullWriteStatus = PLIB_DMA_ChannelXNullWriteModeIsEnabled (
                                                              DMA_ID_0,
                                                              DMA_CHANNEL_4 );
```

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Function

bool PLIB_DMA_ChannelXNullWriteModeIsEnabled (DMA_MODULE_ID index,
DMA_CHANNEL channel)

PLIB_DMA_ChannelXPingPongModeGet Function

Returns the Ping-Pong mode status for the specified channel.

File

plib_dma.h

C

```
DMA_PING_PONG_MODE PLIB_DMA_ChannelXPingPongModeGet(DMA_MODULE_ID index, DMA_CHANNEL channel);
```

Returns

mode - One of the possible Ping-Pong modes

Description

This function returns the Ping-Pong mode status for the specified channel.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
DMA_PING_PONG_MODE chPingPongStatus;
chPingPongStatus = PLIB_DMA_ChannelXPingPongModeGet(DMA_ID_0,
                                                    DMA_CHANNEL_3 );
if (DMA_PING_PONG_SECONDARY == chPingPongStatus)
    {
        \Application
    }
```

Parameters

Parameters	Description
channel	One of the existing DMA channels listed by DMA_CHANNEL

Function

DMA_PING_PONG_MODE PLIB_DMA_ChannelXPingPongModeGet(DMA_MODULE_ID index,
DMA_CHANNEL channel)

PLIB_DMA_ChannelBitsGet Function

Returns the DMA channel bits.

File

plib_dma.h

C

```
uint8_t PLIB_DMA_ChannelBitsGet(DMA_MODULE_ID index);
```

Returns

- uint8_t - DMA channel bits

Description

This function returns the channel bits.

Remarks

This function implements an operation of the ChannelBits feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the PLIB_DMA_ExistsChannelBits function in your application to automatically determine whether this feature is available.

Preconditions

None.

Example

```
uint8_t dmaChBits;
dmaChBits = PLIB_DMA_ChannelBitsGet( DMA_ID_0 );
```

Function

uint8_t PLIB_DMA_ChannelBitsGet (DMA_MODULE_ID index)

I) Feature Existence Functions

PLIB_DMA_ExistsAbortTransfer Function

Identifies whether the AbortTransfer feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsAbortTransfer(DMA_MODULE_ID index);
```

Returns

- true - The AbortTransfer feature is supported on the device
- false - The AbortTransfer feature is not supported on the device

Description

This function identifies whether the AbortTransfer feature is available on the DMA module. When this function returns true, this function is supported on the device:

- PLIB_DMA_AbortTransferSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsAbortTransfer(DMA_MODULE_ID index)

PLIB_DMA_ExistsBusy Function

Identifies whether the Busy feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsBusy(DMA_MODULE_ID index);
```

Returns

- true - The Busy feature is supported on the device
- false - The Busy feature is not supported on the device

Description

This function identifies whether the Busy feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- PLIB_DMA_BusyActiveSet
- PLIB_DMA_BusyActiveReset
- PLIB_DMA_IsBusy

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsBusy(DMA_MODULE_ID index)

PLIB_DMA_ExistsChannelBits Function

Identifies whether the ChannelBits feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsChannelBits(DMA_MODULE_ID index);
```

Returns

- true - The ChannelBits feature is supported on the device
- false - The ChannelBits feature is not supported on the device

Description

This function identifies whether the ChannelBits feature is available on the DMA module. When this function returns true, this function is supported on the device:

- PLIB_DMA_ChannelBitsGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsChannelBits(DMA_MODULE_ID index)

PLIB_DMA_ExistsChannelX Function

Identifies whether the ChannelX feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsChannelX(DMA_MODULE_ID index);
```

Returns

- true - The ChannelX feature is supported on the device
- false - The ChannelX feature is not supported on the device

Description

This function identifies whether the ChannelX feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- PLIB_DMA_ChannelXEnable
- PLIB_DMA_ChannelXIsEnabled
- PLIB_DMA_ChannelXDisable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsChannelX(DMA_MODULE_ID index)

PLIB_DMA_ExistsChannelXAbortIRQ Function

Identifies whether the ChannelXAbortIRQ feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsChannelXAbortIRQ(DMA_MODULE_ID index);
```

Returns

- true - The ChannelXAbortIRQ feature is supported on the device
- false - The ChannelXAbortIRQ feature is not supported on the device

Description

This function identifies whether the ChannelXAbortIRQ feature is available on the DMA module. When this function returns true, this function is supported on the device:

- PLIB_DMA_ChannelXAbortIRQSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsChannelXAbortIRQ(DMA_MODULE_ID index)

PLIB_DMA_ExistsChannelXAuto Function

Identifies whether the ChannelXAuto feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsChannelXAuto(DMA_MODULE_ID index);
```

Returns

- true - The ChannelXAuto feature is supported on the device
- false - The ChannelXAuto feature is not supported on the device

Description

This function identifies whether the ChannelXAuto feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- PLIB_DMA_ChannelXAutoEnable
- PLIB_DMA_ChannelXAutoDisable
- PLIB_DMA_ChannelXAutoIsEnabled

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsChannelXAuto(DMA_MODULE_ID index)

PLIB_DMA_ExistsChannelXBusy Function

Identifies whether the ChannelXBusy feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsChannelXBusy(DMA_MODULE_ID index);
```

Returns

- true - The ChannelXBusy feature is supported on the device
- false - The ChannelXBusy feature is not supported on the device

Description

This function identifies whether the ChannelXBusy feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- PLIB_DMA_ChannelXBusyActiveSet
- PLIB_DMA_ChannelXBusyInActiveSet
- PLIB_DMA_ChannelXBusyIsBusy

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsChannelXBusy(DMA_MODULE_ID index)

PLIB_DMA_ExistsChannelXCellProgressPointer Function

Identifies whether the ChannelXCellProgressPointer feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsChannelXCellProgressPointer(DMA_MODULE_ID index);
```

Returns

- true - The ChannelXCellProgressPointer feature is supported on the device
- false - The ChannelXCellProgressPointer feature is not supported on the device

Description

This function identifies whether the ChannelXCellProgressPointer feature is available on the DMA module. When this function returns true, this function is supported on the device:

- PLIB_DMA_ChannelXCellProgressPointerGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsChannelXCellProgressPointer(DMA_MODULE_ID index)

PLIB_DMA_ExistsChannelXCellSize Function

Identifies whether the ChannelXCellSize feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsChannelXCellSize(DMA_MODULE_ID index);
```

Returns

- true - The ChannelXCellSize feature is supported on the device
- false - The ChannelXCellSize feature is not supported on the device

Description

This function identifies whether the ChannelXCellSize feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- PLIB_DMA_ChannelXCellSizeGet
- PLIB_DMA_ChannelXCellSizeSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsChannelXCellSize(DMA_MODULE_ID index)

PLIB_DMA_ExistsChannelXChain Function

Identifies whether the ChannelXChain feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsChannelXChain(DMA_MODULE_ID index);
```

Returns

- true - The ChannelXChain feature is supported on the device
- false - The ChannelXChain feature is not supported on the device

Description

This function identifies whether the ChannelXChain feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- PLIB_DMA_ChannelXChainToLower
- PLIB_DMA_ChannelXChainToHigher

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsChannelXChain(DMA_MODULE_ID index)

PLIB_DMA_ExistsChannelXChainEnbl Function

Identifies whether the ChannelXChainEnbl feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsChannelXChainEnbl(DMA_MODULE_ID index);
```

Returns

- true - The ChannelXChainEnbl feature is supported on the device
- false - The ChannelXChainEnbl feature is not supported on the device

Description

This function identifies whether the ChannelXChainEnbl feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- PLIB_DMA_ChannelXChainEnable
- PLIB_DMA_ChannelXChainDisable
- PLIB_DMA_ChannelXChainIsEnabled

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsChannelXChainEnbl(DMA_MODULE_ID index)

PLIB_DMA_ExistsChannelXDestinationPointer Function

Identifies whether the ChannelXDestinationPointer feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsChannelXDestinationPointer(DMA_MODULE_ID index);
```

Returns

- true - The ChannelXDestinationPointer feature is supported on the device
- false - The ChannelXDestinationPointer feature is not supported on the device

Description

This function identifies whether the ChannelXDestinationPointer feature is available on the DMA module. When this function returns true, this function is supported on the device:

- PLIB_DMA_ChannelXDestinationPointerGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsChannelXDestinationPointer(DMA_MODULE_ID index)

PLIB_DMA_ExistsChannelXDestinationSize Function

Identifies whether the ChannelXDestinationSize feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsChannelXDestinationSize(DMA_MODULE_ID index);
```

Returns

- true - The ChannelXDestinationSize feature is supported on the device
- false - The ChannelXDestinationSize feature is not supported on the device

Description

This function identifies whether the ChannelXDestinationSize feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- PLIB_DMA_ChannelXDestinationSizeGet
- PLIB_DMA_ChannelXDestinationSizeSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsChannelXDestinationSize(DMA_MODULE_ID index)

PLIB_DMA_ExistsChannelXDestinationStartAddress Function

Identifies whether the ChannelXDestinationStartAddress feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsChannelXDestinationStartAddress(DMA_MODULE_ID index);
```

Returns

- true - The ChannelXDestinationStartAddress feature is supported on the device
- false - The ChannelXDestinationStartAddress feature is not supported on the device

Description

This function identifies whether the ChannelXDestinationStartAddress feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- PLIB_DMA_ChannelXDestinationStartAddressGet
- PLIB_DMA_ChannelXDestinationStartAddressSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsChannelXDestinationStartAddress(DMA_MODULE_ID index)

PLIB_DMA_ExistsChannelXDisabled Function

Identifies whether the ChannelXDisabled feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsChannelXDisabled(DMA_MODULE_ID index);
```

Returns

- true - The ChannelXDisabled feature is supported on the device
- false - The ChannelXDisabled feature is not supported on the device

Description

This function identifies whether the ChannelXDisabled feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- PLIB_DMA_ChannelXDisabledEnablesEvents
- PLIB_DMA_ChannelXDisabledDisablesEvents

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsChannelXDisabled(DMA_MODULE_ID index)

PLIB_DMA_ExistsChannelXEvent Function

Identifies whether the ChannelXEvent feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsChannelXEvent(DMA_MODULE_ID index);
```

Returns

- true - The ChannelXEvent feature is supported on the device
- false - The ChannelXEvent feature is not supported on the device

Description

This function identifies whether the ChannelXEvent feature is available on the DMA module. When this function returns true, this function is supported on the device:

- PLIB_DMA_ChannelXEventIsDetected

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsChannelXEvent(DMA_MODULE_ID index)

PLIB_DMA_ExistsChannelXINTSource Function

Identifies whether the ChannelXINTSource feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsChannelXINTSource(DMA_MODULE_ID index);
```

Returns

- true - The ChannelXINTSource feature is supported on the device
- false - The ChannelXINTSource feature is not supported on the device

Description

This function identifies whether the ChannelXINTSource feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- PLIB_DMA_ChannelXINTSourceEnable
- PLIB_DMA_ChannelXINTSourceDisable
- PLIB_DMA_ChannelXINTSourceIsEnabled

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsChannelXINTSource(DMA_MODULE_ID index)

PLIB_DMA_ExistsChannelXINTSourceFlag Function

Identifies whether the ChannelXINTSourceFlag feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsChannelXINTSourceFlag(DMA_MODULE_ID index);
```

Returns

- true - The ChannelXINTSourceFlag feature is supported on the device
- false - The ChannelXINTSourceFlag feature is not supported on the device

Description

This function identifies whether the ChannelXINTSourceFlag feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- PLIB_DMA_ChannelXINTSourceFlagGet
- PLIB_DMA_ChannelXINTSourceFlagSet
- PLIB_DMA_ChannelXINTSourceFlagClear

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsChannelXINTSourceFlag(DMA_MODULE_ID index)

PLIB_DMA_ExistsChannelXPatternData Function

Identifies whether the ChannelXPatternData feature exists on the DMA module

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsChannelXPatternData(DMA_MODULE_ID index);
```

Returns

- true - The ChannelXPatternData feature is supported on the device
- false - The ChannelXPatternData feature is not supported on the device

Description

This function identifies whether the ChannelXPatternData feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- PLIB_DMA_ChannelXPatternDataGet
- PLIB_DMA_ChannelXPatternDataSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsChannelXPatternData(DMA_MODULE_ID index)

PLIB_DMA_ExistsChannelXPatternIgnore Function

Identifies whether the ChannelXPatternIgnore feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsChannelXPatternIgnore(DMA_MODULE_ID index);
```

Returns

- true - The ChannelXPatternIgnore feature is supported on the device
- false - The ChannelXPatternIgnore feature is not supported on the device

Description

This function identifies whether the ChannelXPatternIgnore feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- PLIB_DMA_ChannelXPatternIgnoreSet
- PLIB_DMA_ChannelXPatternIgnoreGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsChannelXPatternIgnore(DMA_MODULE_ID index)

PLIB_DMA_ExistsChannelXPatternIgnoreByte Function

Identifies whether the ChannelXPatternIgnoreByte feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsChannelXPatternIgnoreByte(DMA_MODULE_ID index);
```

Returns

- true - The ChannelXPatternIgnoreByte feature is supported on the device
- false - The ChannelXPatternIgnoreByte feature is not supported on the device

Description

This function identifies whether the ChannelXPatternIgnoreByte feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- PLIB_DMA_ChannelXPatternIgnoreByteEnable
- PLIB_DMA_ChannelXPatternIgnoreByteIsEnabled
- PLIB_DMA_ChannelXPatternIgnoreByteDisable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsChannelXPatternIgnoreByte(DMA_MODULE_ID index)

PLIB_DMA_ExistsChannelXPatternLength Function

Identifies whether the ChannelXPatternLength feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsChannelXPatternLength(DMA_MODULE_ID index);
```

Returns

- true - The ChannelXPatternLength feature is supported on the device
- false - The ChannelXPatternLength feature is not supported on the device

Description

This function identifies whether the ChannelXPatternLength feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- PLIB_DMA_ChannelXPatternLengthSet
- PLIB_DMA_ChannelXPatternLengthGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsChannelXPatternLength(DMA_MODULE_ID index)

PLIB_DMA_ExistsChannelXPriority Function

Identifies whether the ChannelXPriority feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsChannelXPriority(DMA_MODULE_ID index);
```

Returns

- true - The ChannelXPriority feature is supported on the device
- false - The ChannelXPriority feature is not supported on the device

Description

This function identifies whether the ChannelXPriority feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- PLIB_DMA_ChannelXPrioritySelect
- PLIB_DMA_ChannelXPriorityGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsChannelXPriority(DMA_MODULE_ID index)

PLIB_DMA_ExistsChannelXSourcePointer Function

Identifies whether the ChannelXSourcePointer feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsChannelXSourcePointer(DMA_MODULE_ID index);
```

Returns

- true - The ChannelXSourcePointer feature is supported on the device
- false - The ChannelXSourcePointer feature is not supported on the device

Description

This function identifies whether the ChannelXSourcePointer feature is available on the DMA module. When this function returns true, this function is supported on the device:

- PLIB_DMA_ChannelXSourcePointerGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsChannelXSourcePointer(DMA_MODULE_ID index)

PLIB_DMA_ExistsChannelXSourceSize Function

Identifies whether the ChannelXSourceSize feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsChannelXSourceSize(DMA_MODULE_ID index);
```

Returns

- true - The ChannelXSourceSize feature is supported on the device
- false - The ChannelXSourceSize feature is not supported on the device

Description

This function identifies whether the ChannelXSourceSize feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- PLIB_DMA_ChannelXSourceSizeGet
- PLIB_DMA_ChannelXSourceSizeSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsChannelXSourceSize(DMA_MODULE_ID index)

PLIB_DMA_ExistsChannelXSourceStartAddress Function

Identifies whether the ChannelXSourceStartAddress feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsChannelXSourceStartAddress(DMA_MODULE_ID index);
```

Returns

- true - The ChannelXSourceStartAddress feature is supported on the device
- false - The ChannelXSourceStartAddress feature is not supported on the device

Description

This function identifies whether the ChannelXSourceStartAddress feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- PLIB_DMA_ChannelXSourceStartAddressGet
- PLIB_DMA_ChannelXSourceStartAddressSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsChannelXSourceStartAddress(DMA_MODULE_ID index)

PLIB_DMA_ExistsChannelXStartIRQ Function

Identifies whether the ChannelXStartIRQ feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsChannelXStartIRQ(DMA_MODULE_ID index);
```

Returns

- true - The ChannelXStartIRQ feature is supported on the device
- false - The ChannelXStartIRQ feature is not supported on the device

Description

This function identifies whether the ChannelXStartIRQ feature is available on the DMA module. When this function returns true, this function is supported on the device:

- PLIB_DMA_ChannelXStartIRQSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsChannelXStartIRQ(DMA_MODULE_ID index)

PLIB_DMA_ExistsChannelXTrigger Function

Identifies whether the ChannelXTrigger feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsChannelXTrigger(DMA_MODULE_ID index);
```

Returns

- true - The ChannelXTrigger feature is supported on the device
- false - The ChannelXTrigger feature is not supported on the device

Description

This function identifies whether the ChannelXTrigger feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- PLIB_DMA_ChannelXTriggerEnable
- PLIB_DMA_ChannelXTriggerIsEnabled
- PLIB_DMA_ChannelXTriggerDisable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsChannelXTrigger(DMA_MODULE_ID index)

PLIB_DMA_ExistsCRC Function

Identifies whether the CRC feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsCRC(DMA_MODULE_ID index);
```

Returns

- true - The CRC feature is supported on the device
- false - The CRC feature is not supported on the device

Description

This function identifies whether the CRC feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- PLIB_DMA_CRCEnable
- PLIB_DMA_CRCDisable
- PLIB_DMA_CRCIsEnabled

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsCRC(DMA_MODULE_ID index)

PLIB_DMA_ExistsCRCAppendMode Function

Identifies whether the CRCAppendMode feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsCRCAppendMode(DMA_MODULE_ID index);
```

Returns

- true - The CRCAppendMode feature is supported on the device
- false - The CRCAppendMode feature is not supported on the device

Description

This function identifies whether the CRCAppendMode feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- PLIB_DMA_CRCAppendModeEnable
- PLIB_DMA_CRCAppendModeDisable
- PLIB_DMA_CRCAppendModeIsEnabled

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsCRCAppendMode(DMA_MODULE_ID index)

PLIB_DMA_ExistsCRCBitOrder Function

Identifies whether the CRCBitOrder feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsCRCBitOrder(DMA_MODULE_ID index);
```

Returns

- true - The CRCBitOrder feature is supported on the device
- false - The CRCBitOrder feature is not supported on the device

Description

This function identifies whether the CRCBitOrder feature is available on the DMA module. When this function returns true, this function is supported on the device:

- PLIB_DMA_CRCBitOrderSelect

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsCRCBitOrder(DMA_MODULE_ID index)

PLIB_DMA_ExistsCRCByteOrder Function

Identifies whether the CRCByteOrder feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsCRCByteOrder(DMA_MODULE_ID index);
```

Returns

- true - The CRCByteOrder feature is supported on the device
- false - The CRCByteOrder feature is not supported on the device

Description

This function identifies whether the CRCByteOrder feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- PLIB_DMA_CRCByteOrderSelect
- PLIB_DMA_CRCByteOrderGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsCRCByteOrder(DMA_MODULE_ID index)

PLIB_DMA_ExistsCRCChannel Function

Identifies whether the CRCChannel feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsCRCChannel(DMA_MODULE_ID index);
```

Returns

- true - The CRCChannel feature is supported on the device
- false - The CRCChannel feature is not supported on the device

Description

This function identifies whether the CRCChannel feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- PLIB_DMA_CRCChannelSelect
- PLIB_DMA_CRCChannelGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsCRCChannel(DMA_MODULE_ID index)

PLIB_DMA_ExistsCRCData Function

Identifies whether the CRCData feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsCRCData(DMA_MODULE_ID index);
```

Returns

- true - The CRCData feature is supported on the device
- false - The CRCData feature is not supported on the device

Description

This function identifies whether the CRCData feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- PLIB_DMA_CRCDataRead
- PLIB_DMA_CRCDataWrite

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsCRCData(DMA_MODULE_ID index)

PLIB_DMA_ExistsCRCPolynomialLength Function

Identifies whether the CRCPolynomialLength feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsCRCPolynomialLength(DMA_MODULE_ID index);
```

Returns

- true - The CRCPolynomialLength feature is supported on the device
- false - The CRCPolynomialLength feature is not supported on the device

Description

This function identifies whether the CRCPolynomialLength feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- PLIB_DMA_CRCPolynomialLengthSet
- PLIB_DMA_CRCPolynomialLengthGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsCRCPolynomialLength(DMA_MODULE_ID index)

PLIB_DMA_ExistsCRCType Function

Identifies whether the CRCType feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsCRCType(DMA_MODULE_ID index);
```

Returns

- true - The CRCType feature is supported on the device
- false - The CRCType feature is not supported on the device

Description

This function identifies whether the CRCType feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- PLIB_DMA_CRCTypeGet
- PLIB_DMA_CRCTypeSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsCRCType(DMA_MODULE_ID index)

PLIB_DMA_ExistsCRCWriteByteOrder Function

Identifies whether the CRCWriteByteOrder feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsCRCWriteByteOrder(DMA_MODULE_ID index);
```

Returns

- true - The CRCWriteByteOrder feature is supported on the device
- false - The CRCWriteByteOrder feature is not supported on the device

Description

This function identifies whether the CRCWriteByteOrder feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- PLIB_DMA_CRCWriteByteOrderAlter
- PLIB_DMA_CRCWriteByteOrderMaintain

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsCRCWriteByteOrder(DMA_MODULE_ID index)

PLIB_DMA_ExistsCRCXOREnable Function

Identifies whether the CRCXOREnable feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsCRCXOREnable(DMA_MODULE_ID index);
```

Returns

- true - The CRCXOREnable feature is supported on the device
- false - The CRCXOREnable feature is not supported on the device

Description

This function identifies whether the CRCXOREnable feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- PLIB_DMA_CRCXOREnableSet
- PLIB_DMA_CRCXOREnableGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsCRCXOREnable(DMA_MODULE_ID index)

PLIB_DMA_ExistsEnableControl Function

Identifies whether the EnableControl feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsEnableControl(DMA_MODULE_ID index);
```

Returns

- true - The EnableControl feature is supported on the device
- false - The EnableControl feature is not supported on the device

Description

This function identifies whether the EnableControl feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- PLIB_DMA_Enable
- PLIB_DMA_Disable
- PLIB_DMA_IsEnabled

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsEnableControl(DMA_MODULE_ID index)

PLIB_DMA_ExistsLastBusAccess Function

Identifies whether the LastBusAccess feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsLastBusAccess(DMA_MODULE_ID index);
```

Returns

- true - The LastBusAccess feature is supported on the device
- false - The LastBusAccess feature is not supported on the device

Description

This function identifies whether the LastBusAccess feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- PLIB_DMA_LastBusAccessIsRead
- PLIB_DMA_LastBusAccessIsWrite

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsLastBusAccess(DMA_MODULE_ID index)

PLIB_DMA_ExistsRecentAddress Function

Identifies whether the RecentAddress feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsRecentAddress(DMA_MODULE_ID index);
```

Returns

- true - The RecentAddress feature is supported on the device
- false - The RecentAddress feature is not supported on the device

Description

This function identifies whether the RecentAddress feature is available on the DMA module. When this function returns true, this function is supported on the device:

- PLIB_DMA_RecentAddressAccessed

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsRecentAddress(DMA_MODULE_ID index)

PLIB_DMA_ExistsStartTransfer Function

Identifies whether the StartTransfer feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsStartTransfer(DMA_MODULE_ID index);
```

Returns

- true - The StartTransfer feature is supported on the device
- false - The StartTransfer feature is not supported on the device

Description

This function identifies whether the StartTransfer feature is available on the DMA module. When this function returns true, this function is supported on the device:

- PLIB_DMA_StartTransferSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsStartTransfer(DMA_MODULE_ID index)

PLIB_DMA_ExistsStopInIdle Function

Identifies whether the StopInIdle feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsStopInIdle(DMA_MODULE_ID index);
```

Returns

- true - The StopInIdle feature is supported on the device
- false - The StopInIdle feature is not supported on the device

Description

This function identifies whether the StopInIdle feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- PLIB_DMA_StopInIdleEnable
- PLIB_DMA_StopInIdleDisable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsStopInIdle(DMA_MODULE_ID index)

PLIB_DMA_ExistsSuspend Function

Identifies whether the Suspend feature exists on the DMA module.

File

plib_dma.h

C

```
bool PLIB_DMA_ExistsSuspend(DMA_MODULE_ID index);
```

Returns

- true - The Suspend feature is supported on the device
- false - The Suspend feature is not supported on the device

Description

This function identifies whether the Suspend feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- PLIB_DMA_SuspendEnable
- PLIB_DMA_SuspendDisable
- PLIB_DMA_SuspendIsEnabled

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DMA_ExistsSuspend(DMA_MODULE_ID index)

m) Data Types and Constants

DMA_ADDRESS_OFFSET_TYPE Enumeration

Lists the possible DMA address offsets.

File

help_plib_dma.h

C

```
typedef enum {
  DMA_ADDRESS_OFFSET_PRIMARY,
  DMA_ADDRESS_OFFSET_SECONDARY
} DMA_ADDRESS_OFFSET_TYPE;
```

Members

Members	Description
DMA_ADDRESS_OFFSET_PRIMARY	address offset-A
DMA_ADDRESS_OFFSET_SECONDARY	address offset-B

Description

DMA address offsets

This enumeration lists all the possible DMA address offsets.

Remarks

This enumeration is processor specific and is defined in the processor-specific header files (see processor.h).

DMA_CHANNEL Enumeration

Lists the possible DMA channels available.

File

help_plib_dma.h

C

```
typedef enum {
  DMA_CHANNEL_0,
  DMA_CHANNEL_1,
  DMA_CHANNEL_2,
  DMA_CHANNEL_3,
  DMA_CHANNEL_4,
  DMA_CHANNEL_5,
  DMA_CHANNEL_6,
  DMA_CHANNEL_7
} DMA_CHANNEL;
```

Members

Members	Description
DMA_CHANNEL_0	DMA Channel 0
DMA_CHANNEL_1	DMA Channel 1

DMA_CHANNEL_2	DMA Channel 2
DMA_CHANNEL_3	DMA Channel 3
DMA_CHANNEL_4	DMA Channel 4
DMA_CHANNEL_5	DMA Channel 5
DMA_CHANNEL_6	DMA Channel 6
DMA_CHANNEL_7	DMA Channel 7

Description

DMA channel

This enumeration lists all the possible DMA channels available.

Remarks

This enumeration is processor specific and is defined in the processor-specific header files (see processor.h).

DMA_CHANNEL_ADDRESSING_MODE Enumeration

Lists the possible channel addressing modes.

File

help_plib_dma.h

C

```
typedef enum {
  DMA_ADDRESSING_REGISTER_INDIRECT_WITH_POST_INCREMENT,
  DMA_ADDRESSING_REGISTER_INDIRECT_WITHOUT_POST_INCREMENT,
  DMA_ADDRESSING_PERIPHERAL_INDIRECT
} DMA_CHANNEL_ADDRESSING_MODE;
```

Members

Members	Description
DMA_ADDRESSING_REGISTER_INDIRECT_WITH_POST_INCREMENT	register indirect with post increment
DMA_ADDRESSING_REGISTER_INDIRECT_WITHOUT_POST_INCREMENT	register indirect without post increment
DMA_ADDRESSING_PERIPHERAL_INDIRECT	peripheral indirect addressing

Description

DMA channel addressing modes

This enumeration lists all the possible channel addressing modes.

Remarks

This enumeration is processor specific and is defined in the processor-specific header files (see processor.h).

DMA_CHANNEL_COLLISION Enumeration

Lists the possible channel collision types.

File

help_plib_dma.h

C

```
typedef enum {
  DMA_CHANNEL_COLLISION_MEMORY,
  DMA_CHANNEL_COLLISION_PERIPHERAL,
  DMA_CHANNEL_COLLISION_TRANSFER_REQUEST
} DMA_CHANNEL_COLLISION;
```

Members

Members	Description
DMA_CHANNEL_COLLISION_MEMORY	Memory Write Collision
DMA_CHANNEL_COLLISION_PERIPHERAL	Peripheral Write collision
DMA_CHANNEL_COLLISION_TRANSFER_REQUEST	Transfer request collision

Description

DMA channel collision types

This enumeration lists all the possible channel collision types.

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

DMA_CHANNEL_DATA_SIZE Enumeration

Lists the possible data sizes for the DMA channel.

File

help_plib_dma.h

C

```
typedef enum {
  DMA_CHANNEL_DATA_8,
  DMA_CHANNEL_DATA_16
} DMA_CHANNEL_DATA_SIZE;
```

Members

Members	Description
DMA_CHANNEL_DATA_8	8 bit data size
DMA_CHANNEL_DATA_16	16 bit data size

Description

DMA channel data size

This enumeration lists all the possible data sizes for the DMA channels.

Remarks

This enumeration is processor specific and is defined in the processor-specific header files (see processor.h).

DMA_CHANNEL_PRIORITY Enumeration

Lists the possible channel priorities.

File

help_plib_dma.h

C

```
typedef enum {
  DMA_CHANNEL_PRIORITY_0,
  DMA_CHANNEL_PRIORITY_1,
  DMA_CHANNEL_PRIORITY_2,
  DMA_CHANNEL_PRIORITY_3,
  DMA_CHANNEL_ROUND_ROBIN,
  DMA_CHANNEL_FIXED_PRIORITY
} DMA_CHANNEL_PRIORITY;
```

Members

Members	Description
DMA_CHANNEL_PRIORITY_0	priority 0
DMA_CHANNEL_PRIORITY_1	priority 1
DMA_CHANNEL_PRIORITY_2	priority 2
DMA_CHANNEL_PRIORITY_3	priority 3
DMA_CHANNEL_ROUND_ROBIN	round-robin scheme
DMA_CHANNEL_FIXED_PRIORITY	fixed priority scheme

Description

DMA channel priority types

This enumeration lists all the possible channel priorities.

Remarks

This enumeration is processor specific and is defined in the processor-specific header files (see processor.h).

DMA_CHANNEL_TRANSFER_DIRECTION Enumeration

Lists the possible data transfer directions.

File

help_plib_dma.h

C

```
typedef enum {
  DMA_READ_FROM_MEMORY_WRITE_TO_PERIPHERAL,
  DMA_READ_FROM_PERIPHERAL_WRITE_TO_MEMORY,
  DMA_READ_FROM_MEMORY_WRITE_TO_MEMORY,
  DMA_READ_FROM_PERIPHERAL_WRITE_TO_PERIPHERAL
} DMA_CHANNEL_TRANSFER_DIRECTION;
```

Members

Members	Description
DMA_READ_FROM_MEMORY_WRITE_TO_PERIPHERAL	DMA transfer happens from the memory to peripheral
DMA_READ_FROM_PERIPHERAL_WRITE_TO_MEMORY	DMA transfer happens from the peripheral to memory
DMA_READ_FROM_MEMORY_WRITE_TO_MEMORY	DMA transfer happens from the memory to memory
DMA_READ_FROM_PERIPHERAL_WRITE_TO_PERIPHERAL	DMA transfer happens from the peripheral to peripheral

Description

DMA channel data transfer direction

This enumeration lists all the possible data transfer directions.

Remarks

This enumeration is processor specific and is defined in the processor-specific header files (see processor.h).

DMA_CHANNEL_TRIGGER_TYPE Enumeration

Lists the possible DMA channel triggers.

File

help_plib_dma.h

C

```
typedef enum {
  DMA_CHANNEL_TRIGGER_TRANSFER_START,
  DMA_CHANNEL_TRIGGER_TRANSFER_ABORT,
  DMA_CHANNEL_TRIGGER_PATTERN_MATCH_ABORT
} DMA_CHANNEL_TRIGGER_TYPE;
```

Members

Members	Description
DMA_CHANNEL_TRIGGER_TRANSFER_START	Trigger for DMA transfer start
DMA_CHANNEL_TRIGGER_TRANSFER_ABORT	Trigger for DMA transfer abort
DMA_CHANNEL_TRIGGER_PATTERN_MATCH_ABORT	Trigger for DMA transfer abort via pattern match

Description

DMA trigger types

This enumeration lists all the possible DMA channel triggers.

Remarks

This enumeration is processor specific and is defined in the processor-specific header files (see processor.h).

DMA_CRC_BIT_ORDER Enumeration

Lists the possible CRC calculation bit orders

File

help_plib_dma.h

C

```
typedef enum {
  DMA_CRC_BIT_ORDER_LSB,
  DMA_CRC_BIT_ORDER_MSB
} DMA_CRC_BIT_ORDER;
```

Members

Members	Description
DMA_CRC_BIT_ORDER_LSB	CRC is calculated least significant bit first
DMA_CRC_BIT_ORDER_MSB	CRC is calculated most significant bit first

Description

DMA CRC calculation bit order

This enumeration lists all the possible CRC calculation bit orders

Remarks

This enumeration is processor specific and is defined in the processor-specific header files (see processor.h).

DMA_CRC_BYTE_ORDER Enumeration

Lists the possible byte orders.

File

help_plib_dma.h

C

```
typedef enum {
  DMA_CRC_BYTEORDER_NO_SWAPPING,
  DMA_CRC_SWAP_BYTE_ON_WORD_BOUNDARY,
  DMA_CRC_SWAP_HALF_WORD_ON_WORD_BOUNDARY,
  DMA_CRC_SWAP_BYTE_ON_HALF_WORD_BOUNDARY
} DMA_CRC_BYTE_ORDER;
```

Members

Members	Description
DMA_CRC_BYTEORDER_NO_SWAPPING	No swapping, Source byte order
DMA_CRC_SWAP_BYTE_ON_WORD_BOUNDARY	Endian byte swap on word boundaries (reverse source byte order)
DMA_CRC_SWAP_HALF_WORD_ON_WORD_BOUNDARY	Swap half-words on word boundaries (reverse source half-word order with source byte order per half-word)
DMA_CRC_SWAP_BYTE_ON_HALF_WORD_BOUNDARY	Endian byte swap on half-word boundaries (reverse source half-word order with reverse source byte order per half-word)

Description

CRC Byte order type

This enumeration lists all the possible byte orders handled by CRC module.

Remarks

This enumeration is processor specific and is defined in the processor-specific header files (see processor.h).

DMA_CRC_TYPE Enumeration

Lists the possible checksums.

File

help_plib_dma.h

C

```
typedef enum {
  DMA_CRC_IP_HEADER,
  DMA_CRC_LFSR
} DMA_CRC_TYPE;
```

Members

Members	Description
DMA_CRC_IP_HEADER	CRC module will calculate IP header checksum
DMA_CRC_LFSR	CRC module will calculate Linear Feedback Shift Registers checksum

Description

CRC type

This enumeration lists all the possible checksums handled by CRC module.

Remarks

This enumeration is processor specific and is defined in the processor-specific header files (see processor.h).

DMA_DESTINATION_ADDRESSING_MODE Enumeration

Lists the possible destination addressing modes.

File

help_plib_dma.h

C

```
typedef enum {
  DMA_ADDRESSING_DESTINATION_UNCHANGED,
  DMA_ADDRESSING_DESTINATION_INCREMENT_BASED_ON_SIZE,
  DMA_ADDRESSING_DESTINATION_DECREMENT_BASED_ON_SIZE,
  DMA_ADDRESSING_DESTINATION_PERIPHERAL_INDIRECT
} DMA_DESTINATION_ADDRESSING_MODE;
```

Members

Members	Description
DMA_ADDRESSING_DESTINATION_UNCHANGED	DMADST remains unchanged after a transfer completion
DMA_ADDRESSING_DESTINATION_INCREMENT_BASED_ON_SIZE	DMADST is incremented based on SIZE bit after a transfer completion
DMA_ADDRESSING_DESTINATION_DECREMENT_BASED_ON_SIZE	DMADST is decremented based on SIZE bit after a transfer completion
DMA_ADDRESSING_DESTINATION_PERIPHERAL_INDIRECT	DMADST is used in peripheral indirect addressing and remains unchanged

Description

DMA destination addressing modes

This enumeration lists all the possible destination addressing modes.

Remarks

This enumeration is processor specific and is defined in the processor-specific header files (see processor.h).

DMA_INT_TYPE Enumeration

Lists the possible Interrupt types for a particular channel-X

File

help_plib_dma.h

C

```
typedef enum {
  DMA_INT_ADDRESS_ERROR,
```

```
  DMA_INT_TRANSFER_ABORT,
  DMA_INT_CELL_TRANSFER_COMPLETE,
  DMA_INT_BLOCK_TRANSFER_COMPLETE,
  DMA_INT_DESTINATION_HALF_FULL,
  DMA_INT_DESTINATION_DONE,
  DMA_INT_SOURCE_HALF_EMPTY,
  DMA_INT_SOURCE_DONE,
  DMA_INT_COUNT_HALF_DONE,
  DMA_INT_CHANNEL_OVERRUN,
  DMA_INT_COMPLETE,
  DMA_INT_LOW_ADDRESS_LIMIT,
  DMA_INT_HIGH_ADDRESS_LIMIT
} DMA_INT_TYPE;
```

Members

Members	Description
DMA_INT_ADDRESS_ERROR	Channel address error interrupt
DMA_INT_TRANSFER_ABORT	channel transfer abort interrupt
DMA_INT_CELL_TRANSFER_COMPLETE	channel cell transfer complete
DMA_INT_BLOCK_TRANSFER_COMPLETE	Channel block transfer complete
DMA_INT_DESTINATION_HALF_FULL	Channel destination half full interrupt
DMA_INT_DESTINATION_DONE	Channel destination done interrupt
DMA_INT_SOURCE_HALF_EMPTY	Channel source half empty interrupt
DMA_INT_SOURCE_DONE	Channel source done interrupt
DMA_INT_COUNT_HALF_DONE	DMA count has reached its halfway
DMA_INT_CHANNEL_OVERRUN	channel overrun. channel is triggered while it is still completing the operation based on the previous trigger
DMA_INT_COMPLETE	DMA complete operation interrupt
DMA_INT_LOW_ADDRESS_LIMIT	DMA low address limit interrupt
DMA_INT_HIGH_ADDRESS_LIMIT	DMA high address limit interrupt

Description

DMA channel X interrupt types

This enumeration lists all the possible interrupt types for a channel. Not to be confused with the DMA trigger/abort interrupt sources (supported only for few parts).

Remarks

Not to be confused with the DMA trigger/abort interrupt sources (supported only for few parts). This enumeration is processor specific and is defined in the processor-specific header files (see processor.h).

DMA_MODULE_ID Enumeration

Possible instances of the DMA module.

File

help_plib_dma.h

C

```
typedef enum {
  DMA_ID_0
} DMA_MODULE_ID;
```

Members

Members	Description
DMA_ID_0	first instance of the DMA

Description

DMA module ID

This data type defines the possible instances of the DMA module.

Remarks

This enumeration is processor specific and is defined in the processor-specific header files (see processor.h).

DMA_PATTERN_LENGTH Enumeration

Gives the DMA pattern length

File

help_plib_dma.h

C

```
typedef enum {
  DMA_PATTERN_MATCH_LENGTH_1BYTE,
  DMA_PATTERN_MATCH_LENGTH_2BYTES
} DMA_PATTERN_LENGTH;
```

Members

Members	Description
DMA_PATTERN_MATCH_LENGTH_1BYTE	The Length of matching pattern with CHPIGN<7:0> in DCHxCON<31:24> is 1 BYTE
DMA_PATTERN_MATCH_LENGTH_2BYTES	The Length of matching pattern with CHPIGN<7:0> in DCHxCON<31:24> is 2 BYTES

Description

DMA pattern length

This enumeration gives the length of the pattern to be matched with CHPIGN<7:0> in DCHxCON<31:24.

Remarks

This enumeration is processor specific and is defined in the processor-specific header files (see processor.h).

DMA_PING_PONG_MODE Enumeration

Lists the possible ping-pong modes.

File

help_plib_dma.h

C

```
typedef enum {
  DMA_PING_PONG_PRIMARY,
  DMA_PING_PONG_SECONDARY
} DMA_PING_PONG_MODE;
```

Members

Members	Description
DMA_PING_PONG_PRIMARY	DMAxSTA is selected in the ping-pong mode
DMA_PING_PONG_SECONDARY	DMAxSTB is selected in the ping-pong mode

Description

DMA PING-PONG modes

This enumeration lists all the possible ping-pong modes.

Remarks

This enumeration is processor specific and is defined in the processor-specific header files (see processor.h).

DMA_SOURCE_ADDRESSING_MODE Enumeration

Lists the possible source addressing modes.

File

help_plib_dma.h

C

```
typedef enum {
  DMA_ADDRESSING_SOURCE_UNCHANGED,
  DMA_ADDRESSING_SOURCE_INCREMENT_BASED_ON_SIZE,
```

```
  DMA_ADDRESSING_SOURCE_DECREMENT_BASED_ON_SIZE,
  DMA_ADDRESSING_SOURCE_PERIPHERAL_INDIRECT
} DMA_SOURCE_ADDRESSING_MODE;
```

Members

Members	Description
DMA_ADDRESSING_SOURCE_UNCHANGED	DMASRC remains unchanged after a transfer completion
DMA_ADDRESSING_SOURCE_INCREMENT_BASED_ON_SIZE	DMASRC is incremented based on SIZE bit after a transfer completion
DMA_ADDRESSING_SOURCE_DECREMENT_BASED_ON_SIZE	DMASRC is decremented based on SIZE bit after a transfer completion
DMA_ADDRESSING_SOURCE_PERIPHERAL_INDIRECT	DMASRC is used in peripheral indirect addressing and remains unchanged

Description

DMA source addressing modes

This enumeration lists all the possible source addressing modes.

Remarks

This enumeration is processor specific and is defined in the processor-specific header files (see processor.h).

DMA_TRANSFER_MODE Enumeration

Lists the possible DMA transfer/operating modes.

File

help_plib_dma.h

C

```
typedef enum {
  DMA_MODE_ONE_SHOT,
  DMA_MODE_REPEATED_ONE_SHOT,
  DMA_MODE_CONTINUOUS,
  DMA_MODE_REPEATED_CONTINUOUS,
  DMA_MODE_ONE_SHOT_PING_PONG_ENABLED,
  DMA_MODE_ONE_SHOT_PING_PONG_DISABLED,
  DMA_MODE_CONTINUOUS_PING_PONG_DISABLED,
  DMA_MODE_CONTINUOUS_PING_PONG_ENABLED
} DMA_TRANSFER_MODE;
```

Members

Members	Description
DMA_MODE_ONE_SHOT	one-shot transfer
DMA_MODE_REPEATED_ONE_SHOT	repeated one-shot transfer
DMA_MODE_CONTINUOUS	continuous transfer
DMA_MODE_REPEATED_CONTINUOUS	repeated continuous transfer
DMA_MODE_ONE_SHOT_PING_PONG_ENABLED	one-shot transfer with ping-pong buffers
DMA_MODE_ONE_SHOT_PING_PONG_DISABLED	one-shot transfer without the ping-pong buffers
DMA_MODE_CONTINUOUS_PING_PONG_DISABLED	continuous transfer without the ping-pong buffers
DMA_MODE_CONTINUOUS_PING_PONG_ENABLED	continuous transfer with ping-pong buffers

Description

DMA transfer/operating mode

This enumeration lists the possible DMA transfer/operating modes.

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

DMA_TRIGGER_SOURCE Enumeration

Lists the possible DMA trigger sources.

File

help_plib_dma.h

C

```
typedef enum {
  DMA_TRIGGER_TIMER_CORE,
  DMA_TRIGGER_SOFTWARE_0,
  DMA_TRIGGER_SOFTWARE_1,
  DMA_TRIGGER_EXTERNAL_0,
  DMA_TRIGGER_EXTERNAL_1,
  DMA_TRIGGER_EXTERNAL_2,
  DMA_TRIGGER_EXTERNAL_3,
  DMA_TRIGGER_EXTERNAL_4,
  DMA_TRIGGER_TIMER_1,
  DMA_TRIGGER_TIMER_2,
  DMA_TRIGGER_TIMER_3,
  DMA_TRIGGER_TIMER_4,
  DMA_TRIGGER_TIMER_5,
  DMA_TRIGGER_INPUT_CAPTURE_1,
  DMA_TRIGGER_INPUT_CAPTURE_2,
  DMA_TRIGGER_INPUT_CAPTURE_3,
  DMA_TRIGGER_INPUT_CAPTURE_4,
  DMA_TRIGGER_INPUT_CAPTURE_5,
  DMA_TRIGGER_INPUT_CAPTURE_1_ERROR,
  DMA_TRIGGER_INPUT_CAPTURE_2_ERROR,
  DMA_TRIGGER_INPUT_CAPTURE_3_ERROR,
  DMA_TRIGGER_INPUT_CAPTURE_4_ERROR,
  DMA_TRIGGER_INPUT_CAPTURE_5_ERROR,
  DMA_TRIGGER_OUTPUT_COMPARE_1,
  DMA_TRIGGER_OUTPUT_COMPARE_2,
  DMA_TRIGGER_OUTPUT_COMPARE_3,
  DMA_TRIGGER_OUTPUT_COMPARE_4,
  DMA_TRIGGER_OUTPUT_COMPARE_5,
  DMA_TRIGGER_SPI_1_ERROR,
  DMA_TRIGGER_SPI_1_RECEIVE,
  DMA_TRIGGER_SPI_1_TRANSMIT,
  DMA_TRIGGER_SPI_1A_ERROR,
  DMA_TRIGGER_SPI_1A_RECEIVE,
  DMA_TRIGGER_SPI_1A_TRANSMIT,
  DMA_TRIGGER_SPI_2_ERROR,
  DMA_TRIGGER_SPI_2_RECEIVE,
  DMA_TRIGGER_SPI_2_TRANSMIT,
  DMA_TRIGGER_SPI_2A_ERROR,
  DMA_TRIGGER_SPI_2A_RECEIVE,
  DMA_TRIGGER_SPI_2A_TRANSMIT,
  DMA_TRIGGER_SPI_3_ERROR,
  DMA_TRIGGER_SPI_3_RECEIVE,
  DMA_TRIGGER_SPI_3_TRANSMIT,
  DMA_TRIGGER_SPI_3A_ERROR,
  DMA_TRIGGER_SPI_3A_RECEIVE,
  DMA_TRIGGER_SPI_3A_TRANSMIT,
  DMA_TRIGGER_SPI_4_ERROR,
  DMA_TRIGGER_SPI_4_RECEIVE,
  DMA_TRIGGER_SPI_4_TRANSMIT,
  DMA_TRIGGER_I2C_1_ERROR,
  DMA_TRIGGER_I2C_1_SLAVE,
  DMA_TRIGGER_I2C_1_MASTER,
  DMA_TRIGGER_I2C_1A_ERROR,
  DMA_TRIGGER_I2C_1A_SLAVE,
  DMA_TRIGGER_I2C_1A_MASTER,
  DMA_TRIGGER_I2C_2_ERROR,
  DMA_TRIGGER_I2C_2_SLAVE,
  DMA_TRIGGER_I2C_2_MASTER,
  DMA_TRIGGER_I2C_2A_ERROR,
  DMA_TRIGGER_I2C_2A_SLAVE,
  DMA_TRIGGER_I2C_2A_MASTER,
  DMA_TRIGGER_I2C_3_ERROR,
  DMA_TRIGGER_I2C_3_SLAVE,
  DMA_TRIGGER_I2C_3_MASTER,
  DMA_TRIGGER_I2C_3A_ERROR,
  DMA_TRIGGER_I2C_3A_SLAVE,
  DMA_TRIGGER_I2C_3A_MASTER,
  DMA_TRIGGER_I2C_4_ERROR,
  DMA_TRIGGER_I2C_4_SLAVE,
  DMA_TRIGGER_I2C_4_MASTER,
  DMA_TRIGGER_I2C_5_ERROR,
  DMA_TRIGGER_I2C_5_SLAVE,
```

```
    DMA_TRIGGER_I2C_5_MASTER,
    DMA_TRIGGER_USART_1_ERROR,
    DMA_TRIGGER_USART_1_RECEIVE,
    DMA_TRIGGER_USART_1_TRANSMIT,
    DMA_TRIGGER_USART_1A_ERROR,
    DMA_TRIGGER_USART_1A_RECEIVE,
    DMA_TRIGGER_USART_1A_TRANSMIT,
    DMA_TRIGGER_USART_1B_ERROR,
    DMA_TRIGGER_USART_1B_RECEIVE,
    DMA_TRIGGER_USART_1B_TRANSMIT,
    DMA_TRIGGER_USART_2_ERROR,
    DMA_TRIGGER_USART_2_RECEIVE,
    DMA_TRIGGER_USART_2_TRANSMIT,
    DMA_TRIGGER_USART_2A_ERROR,
    DMA_TRIGGER_USART_2A_RECEIVE,
    DMA_TRIGGER_USART_2A_TRANSMIT,
    DMA_TRIGGER_USART_2B_ERROR,
    DMA_TRIGGER_USART_2B_RECEIVE,
    DMA_TRIGGER_USART_2B_TRANSMIT,
    DMA_TRIGGER_USART_3_ERROR,
    DMA_TRIGGER_USART_3_RECEIVE,
    DMA_TRIGGER_USART_3_TRANSMIT,

DMA_TRIGGER_USART_3B_TRANSMIT	USART3B transmit
DMA_TRIGGER_USART_4_ERROR	USART4 error
DMA_TRIGGER_USART_4_RECEIVE	USART3B receive
DMA_TRIGGER_USART_4_TRANSMIT	USART4 transmit
DMA_TRIGGER_USART_5_ERROR	USART5 error
DMA_TRIGGER_USART_5_RECEIVE	USART5 receive
DMA_TRIGGER_USART_5_TRANSMIT	USART5 transmit
DMA_TRIGGER_USART_6_ERROR	USART6 error
DMA_TRIGGER_USART_6_RECEIVE	USART6 receive
DMA_TRIGGER_USART_6_TRANSMIT	USART6 transmit
DMA_TRIGGER_CHANGE_NOTICE	Change notice
DMA_TRIGGER_CHANGE_NOTICE_A	Change notice A
DMA_TRIGGER_CHANGE_NOTICE_B	Change notice B

DMA_TRIGGER_CHANGE_NOTICE_C	Change notice C
DMA_TRIGGER_CHANGE_NOTICE_D	Change notice D
DMA_TRIGGER_CHANGE_NOTICE_E	Change notice E
DMA_TRIGGER_CHANGE_NOTICE_F	Change notice F
DMA_TRIGGER_CHANGE_NOTICE_G	Change notice G
DMA_TRIGGER_DMA_0	DMA Channel 0
DMA_TRIGGER_DMA_1	DMA Channel 1
DMA_TRIGGER_DMA_2	DMA Channel 2
DMA_TRIGGER_DMA_3	DMA Channel 3
DMA_TRIGGER_DMA_4	DMA Channel 4
DMA_TRIGGER_DMA_5	DMA Channel 5
DMA_TRIGGER_DMA_6	DMA Channel 6
DMA_TRIGGER_DMA_7	DMA Channel 7
DMA_TRIGGER_COMPARATOR_1	Comparator 1
DMA_TRIGGER_COMPARATOR_2	DMA Channel 2
DMA_TRIGGER_COMPARATOR_3	DMA Channel 3
DMA_TRIGGER_ADC_1	ADC1
DMA_TRIGGER_PARALLEL_PORT	Parallel port
DMA_TRIGGER_CAN_1	CAN1
DMA_TRIGGER_CAN_2	CAN2
DMA_TRIGGER_CLOCK_MONITOR	Clock monitor
DMA_TRIGGER_RTCC	RTCC
DMA_TRIGGER_FLASH_CONTROL	Flash control
DMA_TRIGGER_USB_1	USB1
DMA_TRIGGER_ETH_1	ETH1
DMA_TRIGGER_PARALLEL_PORT_ERROR	Parallel port error
DMA_TRIGGER_CTMU	CTMU

Description

DMA trigger sources

This enumeration lists all the possible DMA trigger sources.

Remarks

This enumeration is processor specific and is defined in the processor-specific header files (see processor.h).

DMA_CHANNEL_INT_SOURCE Enumeration

Lists the Interrupt Source number for the available DMA channels.

File

help_plib_dma.h

C

```
typedef enum {
  DMA_CHANNEL_0_INT_SOURCE,
  DMA_CHANNEL_1_INT_SOURCE,
  DMA_CHANNEL_2_INT_SOURCE,
  DMA_CHANNEL_3_INT_SOURCE,
  DMA_CHANNEL_4_INT_SOURCE,
  DMA_CHANNEL_5_INT_SOURCE,
  DMA_CHANNEL_6_INT_SOURCE,
  DMA_CHANNEL_7_INT_SOURCE
} DMA_CHANNEL_INT_SOURCE;
```

Members

Members	Description
DMA_CHANNEL_0_INT_SOURCE	DMA Channel 0 Interrupt Source
DMA_CHANNEL_1_INT_SOURCE	DMA Channel 1 Interrupt Source
DMA_CHANNEL_2_INT_SOURCE	DMA Channel 2 Interrupt Source

DMA_CHANNEL_3_INT_SOURCE	DMA Channel 3 Interrupt Source
DMA_CHANNEL_4_INT_SOURCE	DMA Channel 4 Interrupt Source
DMA_CHANNEL_5_INT_SOURCE	DMA Channel 5 Interrupt Source
DMA_CHANNEL_6_INT_SOURCE	DMA Channel 6 Interrupt Source
DMA_CHANNEL_7_INT_SOURCE	DMA Channel 7 Interrupt Source

Description

DMA channel Interrupt source number

This enumeration lists the Interrupt Source number for all of the available DMA channels.

Remarks

These are the superset enumerations provided for documentation, not all constants are available on all devices.

The caller should not rely on the specific numbers assigned to any of these values as they may change from one processor to the next.

Functions

	Name	Description
	PLIB_DMA_AbortTransferSet	Aborts transfer on the specified channel.
	PLIB_DMA_BusyActiveReset	Resets the BUSY bit of the DMA controller.
	PLIB_DMA_BusyActiveSet	Sets the BUSY bit of the DMA controller.
	PLIB_DMA_ChannelBitsGet	Returns the DMA channel bits.
	PLIB_DMA_ChannelPriorityGet	Gets the priority scheme of the DMA channels.
	PLIB_DMA_ChannelPrioritySelect	Sets the priority scheme of the DMA channels.
	PLIB_DMA_ChannelXAbortIRQSet	Sets the IRQ to abort the DMA transfer on the specified channel.
	PLIB_DMA_ChannelXAddressModeGet	Gets the channel address mode.
	PLIB_DMA_ChannelXAddressModeSelect	Sets the channel address mode.
	PLIB_DMA_ChannelXAutoDisable	Channel is disabled after a block transfer is complete.
	PLIB_DMA_ChannelXAutoEnable	Channel is continuously enabled.
	PLIB_DMA_ChannelXAutoIsEnabled	Returns the channel automatic enable status.
	PLIB_DMA_ChannelXBufferedDataIsWritten	Returns the buffered data write status for the specified channel.
	PLIB_DMA_ChannelXBusyActiveSet	Sets the Busy bit to active.
	PLIB_DMA_ChannelXBusyInActiveSet	Sets the Busy bit to inactive.
	PLIB_DMA_ChannelXBusyIsBusy	Returns the busy status of the specified channel.
	PLIB_DMA_ChannelXCellProgressPointerGet	Returns the number of bytes transferred since the last event.
	PLIB_DMA_ChannelXCellSizeGet	Reads the cell size (in bytes) configured for the specified channel.
	PLIB_DMA_ChannelXCellSizeSet	Writes the specified cell size into the register corresponding to the specified channel.
	PLIB_DMA_ChannelXChainDisable	Disables the channel chaining for the specified DMA channel.
	PLIB_DMA_ChannelXChainEnable	Channel chain feature is enabled.
	PLIB_DMA_ChannelXChainIsEnabled	Returns the chain status of the specified channel.
	PLIB_DMA_ChannelXChainToHigher	Chains the specified channel to a channel higher in natural priority.
	PLIB_DMA_ChannelXChainToLower	Chains the specified channel to a channel lower in natural priority.
	PLIB_DMA_ChannelXCollisionStatus	Returns the status of the specified collision type for the specified channel.

	PLIB_DMA_ChannelXDataSizeGet	Returns the current data size for the specified channel.
	PLIB_DMA_ChannelXDataSizeSelect	Selects the data size for the specified channel.
	PLIB_DMA_ChannelXDestinationAddressModeGet	Gets the source address mode of the specified channel.
	PLIB_DMA_ChannelXDestinationAddressModeSelect	Sets the source address mode of the specified channel.
	PLIB_DMA_ChannelXDestinationPointerGet	Reads the current byte of the destination being pointed to for the specified channel.
	PLIB_DMA_ChannelXDestinationSizeGet	Reads the destination size configured for the specified channel.
	PLIB_DMA_ChannelXDestinationSizeSet	Writes the specified destination size into the register corresponding to the specified channel.
	PLIB_DMA_ChannelXDestinationStartAddressGet	Reads the destination start address configured for the specified channel.
	PLIB_DMA_ChannelXDestinationStartAddressSet	Writes the specified destination start address into the register corresponding to the specified channel.
	PLIB_DMA_ChannelXDisable	Disable the specified channel.
	PLIB_DMA_ChannelXDisabledDisablesEvents	Channel start/abort events will be ignored even if the channel is disabled.
	PLIB_DMA_ChannelXDisabledEnablesEvents	Channel start/abort events will be registered even if the channel is disabled.
	PLIB_DMA_ChannelXEnable	Enable the specified channel.
	PLIB_DMA_ChannelXEventIsDetected	Returns the event status on the specified channel.
	PLIB_DMA_ChannelXINTSourceDisable	Disables the specified interrupt source for the specified channel.
	PLIB_DMA_ChannelXINTSourceEnable	Enables the specified interrupt source for the specified channel.
	PLIB_DMA_ChannelXINTSourceFlagClear	Clears the interrupt flag of the specified DMA interrupt source for the specified channel.
	PLIB_DMA_ChannelXINTSourceFlagGet	Returns the status of the interrupt flag of the specified DMA interrupt source for the specified channel.
	PLIB_DMA_ChannelXINTSourceFlagSet	Sets the interrupt flag of the specified DMA interrupt source for the specified channel.
	PLIB_DMA_ChannelXINTSourceIsEnabled	Returns the enable status of the specified interrupt source for the specified channel.
	PLIB_DMA_ChannelXIsEnabled	Return the enable status of the specified channel.
	PLIB_DMA_ChannelXNullWriteModeDisable	Disables the Null Write mode.
	PLIB_DMA_ChannelXNullWriteModeEnable	Enables the Null Write mode.
	PLIB_DMA_ChannelXNullWriteModeIsEnabled	Returns the enable status of the Null Write mode for the specified channel.
	PLIB_DMA_ChannelXOperatingTransferModeGet	Returns the current transfer/operating mode for the specified channel.
	PLIB_DMA_ChannelXOperatingTransferModeSelect	Selects the transfer/operating mode for the specified channel.
	PLIB_DMA_ChannelXPatternDataGet	Returns the pattern matching (for DMA abort) data programmed for the specified channel.
	PLIB_DMA_ChannelXPatternDataSet	Writes the specified pattern matching data (for DMA abort) into the register corresponding to the specified channel.
	PLIB_DMA_ChannelXPatternIgnoreByteDisable	Disables the pattern match ignore byte.
	PLIB_DMA_ChannelXPatternIgnoreByteEnable	Enables the pattern match ignore byte.
	PLIB_DMA_ChannelXPatternIgnoreByteIsEnabled	Returns the state of the pattern match ignore byte.
	PLIB_DMA_ChannelXPatternIgnoreGet	Returns the pattern match ignore value.
	PLIB_DMA_ChannelXPatternIgnoreSet	Sets the pattern match ignore value.
	PLIB_DMA_ChannelXPatternLengthGet	Returns the pattern match length.
	PLIB_DMA_ChannelXPatternLengthSet	Sets the pattern match length.
	PLIB_DMA_ChannelXPeripheralAddressGet	Gets the peripheral address configured for the specified channel.
	PLIB_DMA_ChannelXPeripheralAddressSet	Sets the peripheral address for the specified channel.
	PLIB_DMA_ChannelXPingPongModeGet	Returns the Ping-Pong mode status for the specified channel.
	PLIB_DMA_ChannelXPriorityGet	Gets the priority of the specified channel.
	PLIB_DMA_ChannelXPrioritySelect	Sets the priority of the specified channel.
	PLIB_DMA_ChannelXReloadDisable	Disables reloading of the address and count registers.
	PLIB_DMA_ChannelXReloadEnable	Enables reloading of the address and count registers.
	PLIB_DMA_ChannelXReloadIsEnabled	Returns the address and count registers reload enable status.
	PLIB_DMA_ChannelXSourceAddressModeGet	Gets the source address mode of the specified channel.
	PLIB_DMA_ChannelXSourceAddressModeSelect	Sets the source address mode of the specified channel.
	PLIB_DMA_ChannelXSourcePointerGet	Reads the current byte of the source being pointed to for the specified channel.
	PLIB_DMA_ChannelXSourceSizeGet	Reads the source size configured for the specified channel.

	PLIB_DMA_ChannelXSourceSizeSet	Writes the specified source size into the register corresponding to the specified channel.
	PLIB_DMA_ChannelXSourceStartAddressGet	Reads the source start address configured for the specified channel.
	PLIB_DMA_ChannelXSourceStartAddressSet	Writes the specified source start address into the register corresponding to the specified channel.
	PLIB_DMA_ChannelXStartAddressOffsetGet	Gets the primary/secondary start address (DPSRAM) offset.
	PLIB_DMA_ChannelXStartAddressOffsetSet	Sets the primary/secondary start address (DPSRAM) offset to the value specified depending on the offset type specified for the specified channel.
	PLIB_DMA_ChannelXStartIRQSet	Sets the IRQ to initiate the DMA transfer on the specified channel.
	PLIB_DMA_ChannelXTransferCountGet	Gets the DMA data transfer count that is programmed for the specified channel.
	PLIB_DMA_ChannelXTransferCountSet	Sets the DMA data transfer count for the specified channel.
	PLIB_DMA_ChannelXTransferDirectionGet	Returns the data transfer direction of the specified channel.
	PLIB_DMA_ChannelXTransferDirectionSelect	Selects the data transfer direction of the specified channel.
	PLIB_DMA_ChannelXTriggerDisable	Disables the DMA transfer abort via a matching interrupt (specified by the IRQ).
	PLIB_DMA_ChannelXTriggerEnable	Enables the specified DMA channel trigger.
	PLIB_DMA_ChannelXTriggerIsEnabled	Returns the enable status of the specified DMA transfer/abort trigger.
	PLIB_DMA_ChannelXTriggerSourceNumberGet	Gets the source number for the DMA channel interrupts.
	PLIB_DMA_CRCAppendModeDisable	Disables the CRC append mode.
	PLIB_DMA_CRCAppendModeEnable	Enables the CRC append mode.
	PLIB_DMA_CRCAppendModeIsEnabled	Gets the enable status of the CRC append mode.
	PLIB_DMA_CRCBitOrderSelect	Selects the bit order for checksum calculation.
	PLIB_DMA_CRCByteOrderGet	Gets the current byte order selected by the DMA module CRC feature.
	PLIB_DMA_CRCByteOrderSelect	Selects the byte order.
	PLIB_DMA_CRCChannelGet	Returns the current DMA channel to which the CRC is assigned.
	PLIB_DMA_CRCChannelSelect	Assigns the CRC to the specified DMA channel.
	PLIB_DMA_CRCDataRead	Reads the contents of the DMA CRC data register.
	PLIB_DMA_CRCDataWrite	Writes the contents of the DMA CRC data register with the specified data.
	PLIB_DMA_CRCDisable	Disables the DMA module CRC feature.
	PLIB_DMA_CRCEnable	Enables the DMA module CRC feature.
	PLIB_DMA_CRCIsEnabled	Gets the enable status of the CRC feature.
	PLIB_DMA_CRCPolynomialLengthGet	Gets the current polynomial length.
	PLIB_DMA_CRCPolynomialLengthSet	Selects the polynomial length.
	PLIB_DMA_CRCTypeGet	Gets the current DMA module CRC feature type.
	PLIB_DMA_CRCTypeSet	Selects the DMA module CRC feature type.
	PLIB_DMA_CRCWriteByteOrderAlter	The source data is written to the destination reordered as defined by the BYTO<1:0> bits.
	PLIB_DMA_CRCWriteByteOrderMaintain	The source data is written to the destination unaltered.
	PLIB_DMA_CRCXOREnableGet	Reads the CRC XOR register.
	PLIB_DMA_CRCXOREnableSet	Writes to the CRC XOR enable register as per the specified enable mask.
	PLIB_DMA_Disable	DMA module is disabled.
	PLIB_DMA_Enable	DMA module is enabled.
	PLIB_DMA_ExistsAbortTransfer	Identifies whether the AbortTransfer feature exists on the DMA module.
	PLIB_DMA_ExistsBusy	Identifies whether the Busy feature exists on the DMA module.
	PLIB_DMA_ExistsChannelBits	Identifies whether the ChannelBits feature exists on the DMA module.
	PLIB_DMA_ExistsChannelX	Identifies whether the ChannelX feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXAbortIRQ	Identifies whether the ChannelXAbortIRQ feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXAuto	Identifies whether the ChannelXAuto feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXBusy	Identifies whether the ChannelXBusy feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXCellProgressPointer	Identifies whether the ChannelXCellProgressPointer feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXCellSize	Identifies whether the ChannelXCellSize feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXChain	Identifies whether the ChannelXChain feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXChainEnbl	Identifies whether the ChannelXChainEnbl feature exists on the DMA module.

	PLIB_DMA_ExistsChannelXDestinationPointer	Identifies whether the ChannelXDestinationPointer feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXDestinationSize	Identifies whether the ChannelXDestinationSize feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXDestinationStartAddress	Identifies whether the ChannelXDestinationStartAddress feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXDisabled	Identifies whether the ChannelXDisabled feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXEvent	Identifies whether the ChannelXEvent feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXINTSource	Identifies whether the ChannelXINTSource feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXINTSourceFlag	Identifies whether the ChannelXINTSourceFlag feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXPatternData	Identifies whether the ChannelXPatternData feature exists on the DMA module
	PLIB_DMA_ExistsChannelXPatternIgnore	Identifies whether the ChannelXPatternIgnore feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXPatternIgnoreByte	Identifies whether the ChannelXPatternIgnoreByte feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXPatternLength	Identifies whether the ChannelXPatternLength feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXPriority	Identifies whether the ChannelXPriority feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXSourcePointer	Identifies whether the ChannelXSourcePointer feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXSourceSize	Identifies whether the ChannelXSourceSize feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXSourceStartAddress	Identifies whether the ChannelXSourceStartAddress feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXStartIRQ	Identifies whether the ChannelXStartIRQ feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXTrigger	Identifies whether the ChannelXTrigger feature exists on the DMA module.
	PLIB_DMA_ExistsCRC	Identifies whether the CRC feature exists on the DMA module.
	PLIB_DMA_ExistsCRCAppendMode	Identifies whether the CRCAppendMode feature exists on the DMA module.
	PLIB_DMA_ExistsCRCBitOrder	Identifies whether the CRCBitOrder feature exists on the DMA module.
	PLIB_DMA_ExistsCRCByteOrder	Identifies whether the CRCByteOrder feature exists on the DMA module.
	PLIB_DMA_ExistsCRCChannel	Identifies whether the CRCChannel feature exists on the DMA module.
	PLIB_DMA_ExistsCRCData	Identifies whether the CRCData feature exists on the DMA module.
	PLIB_DMA_ExistsCRCPolynomialLength	Identifies whether the CRCPolynomialLength feature exists on the DMA module.
	PLIB_DMA_ExistsCRCType	Identifies whether the CRCType feature exists on the DMA module.
	PLIB_DMA_ExistsCRCWriteByteOrder	Identifies whether the CRCWriteByteOrder feature exists on the DMA module.
	PLIB_DMA_ExistsCRCXOREnable	Identifies whether the CRCXOREnable feature exists on the DMA module.
	PLIB_DMA_ExistsEnableControl	Identifies whether the EnableControl feature exists on the DMA module.
	PLIB_DMA_ExistsLastBusAccess	Identifies whether the LastBusAccess feature exists on the DMA module.
	PLIB_DMA_ExistsRecentAddress	Identifies whether the RecentAddress feature exists on the DMA module.
	PLIB_DMA_ExistsStartTransfer	Identifies whether the StartTransfer feature exists on the DMA module.
	PLIB_DMA_ExistsStopInIdle	Identifies whether the StopInIdle feature exists on the DMA module.
	PLIB_DMA_ExistsSuspend	Identifies whether the Suspend feature exists on the DMA module.
	PLIB_DMA_IsBusy	Gets the BUSY bit of the DMA controller.
	PLIB_DMA_IsEnabled	Returns the DMA module enable status.
	PLIB_DMA_LastBusAccessIsRead	Returns true if the last DMA bus access was a read.
	PLIB_DMA_LastBusAccessIsWrite	Returns true if the last DMA bus access was a write.
	PLIB_DMA_RecentAddressAccessed	Returns the address of the most recent DMA access.
	PLIB_DMA_StartTransferSet	Initiates transfer on the specified channel.
	PLIB_DMA_StopInIdleDisable	DMA transfers continue during Idle mode.
	PLIB_DMA_StopInIdleEnable	DMA transfers are halted during Idle mode.
	PLIB_DMA_SuspendDisable	DMA suspend is disabled and the DMA module operates normally.
	PLIB_DMA_SuspendEnable	DMA transfers are suspended to allow uninterrupted access by the CPU to the data bus.
	PLIB_DMA_SuspendIsEnabled	Returns the DMA suspend status.

Description

DMA Peripheral Library Interface Header

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the Direct Memory Access (DMA) Peripheral Library for Microchip microcontrollers. The definitions in this file are for the DMA module.

File Name

plib_dma.h

Company

Microchip Technology Inc.

help_plib_dma.h

Defines the DMA Peripheral Library data types.

Enumerations

	Name	Description
	DMA_ADDRESS_OFFSET_TYPE	Lists the possible DMA address offsets.
	DMA_CHANNEL	Lists the possible DMA channels available.
	DMA_CHANNEL_ADDRESSING_MODE	Lists the possible channel addressing modes.
	DMA_CHANNEL_COLLISION	Lists the possible channel collision types.
	DMA_CHANNEL_DATA_SIZE	Lists the possible data sizes for the DMA channel.
	DMA_CHANNEL_INT_SOURCE	Lists the Interrupt Source number for the available DMA channels.
	DMA_CHANNEL_PRIORITY	Lists the possible channel priorities.
	DMA_CHANNEL_TRANSFER_DIRECTION	Lists the possible data transfer directions.
	DMA_CHANNEL_TRIGGER_TYPE	Lists the possible DMA channel triggers.
	DMA_CRC_BIT_ORDER	Lists the possible CRC calculation bit orders
	DMA_CRC_BYTE_ORDER	Lists the possible byte orders.
	DMA_CRC_TYPE	Lists the possible checksums.
	DMA_DESTINATION_ADDRESSING_MODE	Lists the possible destination addressing modes.
	DMA_INT_TYPE	Lists the possible Interrupt types for a particular channel-X
	DMA_MODULE_ID	Possible instances of the DMA module.
	DMA_PATTERN_LENGTH	Gives the DMA pattern length
	DMA_PING_PONG_MODE	Lists the possible ping-pong modes.
	DMA_SOURCE_ADDRESSING_MODE	Lists the possible source addressing modes.
	DMA_TRANSFER_MODE	Lists the possible DMA transfer/operating modes.
	DMA_TRIGGER_SOURCE	Lists the possible DMA trigger sources.

Description

DMA Peripheral Library data types.

This header file contains data types and constants that make up the Interface to the direct memory access(DMA) peripheral library (PLIB) for Microchip microcontrollers. The definitions in this file are for DMA module.

Dual Data Rate (DDR) SDRAM Peripheral Library

This topic describes the Dual Data Rate (DDR) SDRAM Peripheral Library.

Introduction

This library provides a low-level abstraction of the DDR SDRAM Peripheral Library that is available on the Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, there by abstracting differences from one microcontroller variant to another.

Description

The DDR SDRAM controller and associated physical interface (PHY) provide access to external SDRAM from the CPU and other targets within the device. The specific targets may vary between devices, but typically include graphics controller(s), DMA, and other peripherals. External DRAM expands the volatile memory available for the device, and is useful for operating systems, graphics controllers/accelerators, and other operations requiring large amounts of memory.

The SDRAM and controller must be initialized before the SDRAM can be accessed. The initialization is specific to the timing constraints and addressing of the particular SDRAM in use, as well as the clocks to the controller and PHY. This library provides functions for initializing the controller, PHY, and external SDRAM.

Using the Library

This topic describes the basic architecture of the DDR SDRAM Peripheral Library and provides information and examples on its use.

Description

Interface Header File: `plib_ddr.h`

The interface to the DDR SDRAM Peripheral Library is defined in the `plib_ddr.h` header file, which is included by the peripheral library header file, `peripheral.h`. Any C language source (`.c`) file that uses the DDR SDRAM Peripheral Library must include `peripheral.h`.

Library File:

The DDR SDRAM Peripheral Library archive (`.a`) file is installed with MPLAB Harmony.

Please refer to the Understanding MPLAB Harmony section for how the library interacts with the framework.

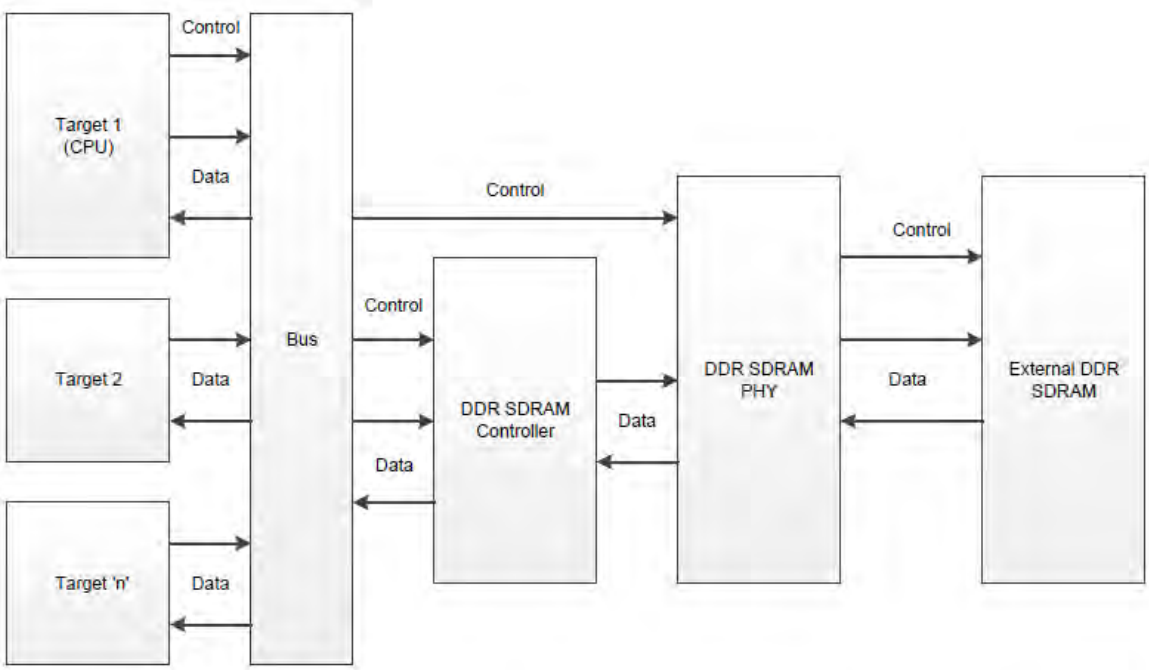
Abstraction Model

This library provides the low-level abstraction of the Dual Data Rate (DDR) SDRAM module on the Microchip family of microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in the software and introduces the library interface.

Description

The DDR SDRAM controller and PHY must be initialized prior to accessing SDRAM. The SDRAM itself must also be initialized. This library provides interface routines to perform these initializations.

DDR SDRAM Peripheral Library Software Abstraction Block Diagram



Library Overview

The library interface routines are divided into various subsections, each of the sub-sections addresses one of the blocks or the overall operation of the DDR SDRAM module.

Library Interface Section	Description
General Configuration Functions	The SDRAM controller must be configured for the system and device in use. General configuration options include DRAM type, operation mode and On-Die-Termination (ODT) settings.
Target Arbitration Functions	Arbitration parameters for each target can be programmed individually. The arbitration parameters determine the relative bandwidth assigned to each target. Adjusting target arbitration parameters can improve overall system performance by maximizing bandwidth utilization among targets.
SDRAM Addressing Functions	DDR SDRAM is addressed in terms of banks, rows and columns. The CPU address space is translated to SDRAM addresses by the controller. The addressing parameters are determined by the size and geometry of the SDRAM, and must be initialized in the controller to access the SDRAM correctly.
SDRAM Timing Functions	To operate correctly, timing delays must be inserted for various SDRAM operations. The timing delays are device-specific, and are specified in the SDRAM data sheet. These delays are used to initialize the controller for correct operation.
SDRAM Initialization Functions	The SDRAM must be initialized prior to use. Initialization consists of writing system-specific values to registers within the SDRAM itself, using the Host Command Interface. The registers and initialization sequence are standardized across SDRAM devices.
PHY Initialization Functions	Like the SDRAM controller, the PHY must be initialized prior to use. PHY parameters include ODT and drive-strength settings, DLL settings, and Self-Calibration-Logic (SCL) settings.
Feature Existence Functions	Interface routines that can be used to determine whether or not the feature is supported by the device.

How the Library Works

This section provides information on how the DDR SDRAM Peripheral Library works.

Description

General Configuration

General configuration of the SDRAM controller includes the following:

- On-Die-Termination (ODT) settings for data reads and writes
- Endianness
- DDR type (DDR2 or DDR3)
- Rate mode (full or half)

Target Arbitration

Initializing the arbitration parameters for each target is a two-step procedure. First, the minimum number of uninterrupted bursts (without interference from another target) is programmed, using the PLIB_DDR_MinLimit function. Then the number of bursts within a specific time-out period is set using the PLIB_DDR_ReqPeriod and PLIB_DDR_MinCommand functions. The relative time-outs and number of bursts between targets determine the total bandwidth allocation.

For details, refer to the **"DDR SDRAM"** chapter in the specific device data sheet and **Section 55. "DDR2 SDRAM Controller"** (DS60001321) in the *"PIC32 Family Reference Manual"*.

SDRAM Addressing

The address used by the CPU to access the SDRAM must be converted into a format understood by the SDRAM. The SDRAM uses bank, row, column and chip select bits to access data within the memory. The SDRAM addressing functions use shift and mask operations to translate the CPU address into bank, row, column and chip-select. There are four addressing functions, one each for bank, row, column and chip select. Each function takes mask and shift arguments. The mask parameter determines the number of bits that make up the address component, and the shift parameter determines where in the 32-bit CPU address the component is located. Refer to the DDR SDRAM Family Reference Manual for more details and examples.

PHY Initialization

The PHY controls the physical interface from the PIC32 to SDRAM. ODT is provided by the pads, and can be enabled or disabled using the PHY initialization functions. Setting ODT correctly for the platform can improve signal integrity by minimizing signal reflection. Enabling/disabling ODT and setting the impedance is done using the following functions:

- PLIB_DDR_PHY_OdtEnable
- PLIB_DDR_PHY_OdtDisable

Similarly, the pad drive strength can be set using the PLIB_DDR_PHY_DriveStrengthSet function.

Fine tuning of the ODT impedance and drive strength can be performed using the calibration functions PLIB_DDR_PHY_OdtCal and PLIB_DDR_PHY_DrvStrgthCal.

The SDRAM PHY contains Self-Calibration-Logic (SCL) that is run automatically during initialization. Various SCL parameters can be set using the following functions:

- PLIB_DDR_PHY_SCLEnable - enables SCL for a specific Chip Select
- PLIB_DDR_PHY_ReadCASLatencySet - sets the read CAS latency during SCL
- PLIB_DDR_PHY_WriteCASLatencySet - sets the write CAS latency during SCL
- PLIB_DDR_PHY_OdtCSEnable - enables ODT on Chip Select during SCL
- PLIB_DDR_PHY_SCLDelay - sets the SCL delay

SDRAM Timing

Several timing parameters must be initialized for the SDRAM interface to operate correctly. These include:

- Refresh interval and delay
- Read and write delays
- Precharge delays
- Addressing delays
- Bank activate delays

Timing parameters for specific SDRAMs are provided in the SDRAM data sheet. These are passed to the SDRAM timing initialization functions along with the controller clock period. The initialization functions then calculate the delays and set the controller timing registers to the correct values. Refer to **Section 55. "DDR2 SDRAM Controller"** (DS60001321)in the *"PIC32 Family Reference Manual"* for details.

SDRAM Initialization

The SDRAM is initialized by writing a series of commands to internal registers of the SDRAM itself. The register command interface is encoded on the control and address lines to the SDRAM. The SDRAM controller includes a series of registers that are initialized and transmitted to the SDRAM using the SDRAM initialization functions.

The sequence is as follows:

1. Write the initialization words to the host command registers using the PLIB_DDR_CmdDataWrite function.
2. Set the number of commands with the PLIB_DDR_NumHostCmdsSet function.
3. Write the commands to the SDRAM using PLIB_DDR_CmdDataSend.
4. Wait for the SDRAM to acknowledge valid initialization using PLIB_DDR_CmdDataIsComplete.
5. Enable the SDRAM for normal operation with the PLIB_DDR_ControllerEnable function.

The initialization command sequence is specified in the data sheet of the SDRAM device. An example initialization sequence is provided in

Section 55. "DDR2 SDRAM Controller" (DS60001321) of the *"PIC32 Family Reference Manual"*.

Configuring the Library

The library is configured for the supported processor when the processor is chosen in the MPLAB X IDE.

Library Interface

a) General Configuration Functions

	Name	Description
	PLIB_DDR_BigEndianSet	Sets the DDR data endianness to big.
	PLIB_DDR_FullRateSet	Sets the DDR controller to Full-rate mode.
	PLIB_DDR_HalfRateSet	Sets the DDR controller to Half-rate mode.
	PLIB_DDR_LittleEndianSet	Sets the DDR data endianness to little.
	PLIB_DDR_MaxPendingRefSet	Initializes the DDR controller refresh configuration.
	PLIB_DDR_OdtReadDisable	Selects which Chip Select to disable ODT for data reads.
	PLIB_DDR_OdtReadEnable	Selects which Chip Select to enable ODT for data reads.
	PLIB_DDR_OdtWriteDisable	Selects which Chip Select to disable ODT for data writes.
	PLIB_DDR_OdtWriteEnable	Selects which Chip Select to enable ODT for data writes.
	PLIB_DDR_AutoPchrgDisable	Prevents the DDR controller from issuing an auto-precharge command to close the bank at the end of every user command.
	PLIB_DDR_AutoPowerDownDisable	Prevents the DDR controller from automatically entering Power-down mode.
	PLIB_DDR_AutoPchrgPowerDownDisable	Prevents the DDR controller from automatically entering Precharge Power-down mode.
	PLIB_DDR_AutoSelfRefreshDisable	Prevents the DDR controller from automatically entering Self-refresh mode.
	PLIB_DDR_AutoPchrgPowerDownEnable	Enables the DDR controller to automatically enter Precharge Power-down mode.
	PLIB_DDR_AutoPowerDownEnable	Enables the DDR controller to automatically enter Power-down mode.
	PLIB_DDR_AutoSelfRefreshEnable	Enables the DDR controller to automatically enter Self-refresh mode.
	PLIB_DDR_AutoPchrgEnable	Enables the DDR controller to issue an auto-precharge command to close the bank at the end of every user command.
	PLIB_DDR_TfawDelaySet	Initializes the DDR controller with the four-bank activation window needed for the specific DDR in use.

b) Target Arbitration Functions

	Name	Description
	PLIB_DDR_MinCommand	Sets the minimum number of bursts to be serviced for a DDR target within (REQPER * 4) number of clocks.
	PLIB_DDR_MinLimit	Sets the minimum number of bursts for a DDR target.
	PLIB_DDR_ReqPeriod	Sets the timeout for MINCMD number of bursts to be serviced for a DDR target.

c) SDRAM Initialization Functions

	Name	Description
	PLIB_DDR_CmdDataIsComplete	Returns the value of the valid bit in the DDR2CMDISSUE register. This bit is cleared by hardware, when the SDRAM initialization data has been transmitted.
	PLIB_DDR_CmdDataSend	Transmits the data in the command registers to the SDRAM.
	PLIB_DDR_CmdDataValid	Indicates to the controller that the data in the command registers is valid.
	PLIB_DDR_ControllerEnable	Enables the controller for normal operations after SDRAM is initialized.
	PLIB_DDR_MaxCmdBrstCntSet	Sets the maximum number of commands that can be written to the controller in Burst mode.
	PLIB_DDR_NumHostCmdsSet	Sets the number of commands to be transmitted to the SDRAM.
	PLIB_DDR_CmdDataWrite	Writes an SDRAM command word to a command register in the controller.

d) SDRAM Addressing Functions

	Name	Description
	PLIB_DDR_BankAddressSet	Initializes the DDR controller memory configuration registers for bank address.
	PLIB_DDR_ChipSelectAddressSet	Initializes the DDR controller memory configuration registers for Chip Select address.
	PLIB_DDR_ColumnAddressSet	Initializes the DDR controller memory configuration registers for the column address.
	PLIB_DDR_RowAddressSet	Initializes the DDR controller memory configuration registers for row address.

e) SDRAM Timing Functions

	Name	Description
	PLIB_DDR_OdtReadParamSet	Sets the ODT parameters for data reads.
	PLIB_DDR_OdtWriteParamSet	Sets the ODT parameters for data writes.
	PLIB_DDR_DataDelaySet	Initializes the DDR controller with the data delays needed for the specific DDR in use.
	PLIB_DDR_PowerDownDelaySet	Initializes the DDR controller with the power down delays needed for the specific DDR in use.
	PLIB_DDR_SelfRefreshDelaySet	Initializes the DDR controller with the self-refresh delays needed for the specific DDR in use.
	PLIB_DDR_PrechargAllBanksSet	Initializes the DDR controller with the read/write precharge delays needed for the specific DDR in use.
	PLIB_DDR_ReadWriteDelaySet	Initializes the DDR controller with the read/write delays needed for the specific DDR in use.
	PLIB_DDR_RefreshTimingSet	Initializes the DDR controller refresh configuration.
	PLIB_DDR_WriteWriteDelaySet	Initializes the DDR controller with the read/write delays needed for the specific DDR in use.
	PLIB_DDR_PrechargeToRASDelaySet	Initializes the DDR controller with the read/write precharge delays needed for the specific DDR in use.
	PLIB_DDR_RASToCASDelaySet	Initializes the DDR controller with the row/column address delays needed for the specific DDR in use.
	PLIB_DDR_RASToPrechargeDelaySet	Initializes the DDR controller with the read/write precharge delays needed for the specific DDR in use.
	PLIB_DDR_RASToRASBankDelaySet	Initializes the DDR controller with the row/column address delays needed for the specific DDR in use.
	PLIB_DDR_RASToRASDelaySet	Initializes the DDR controller with the row/column address delays needed for the specific DDR in use.
	PLIB_DDR_ReadToPrechargeDelaySet	Initializes the DDR controller with the read/write precharge delays needed for the specific DDR in use.
	PLIB_DDR_WriteToPrechargeDelaySet	Initializes the DDR controller with the read/write precharge delays needed for the specific DDR in use.
	PLIB_DDR_ReadReadDelaySet	Initializes the DDR controller with the read/write delays needed for the specific DDR in use.
	PLIB_DDR_WriteReadDelaySet	Initializes the DDR controller with the read/write delays needed for the specific DDR in use.

f) PHY Initialization Functions

	Name	Description
	PLIB_DDR_PHY_DDRTypeSet	Sets the DRAM type for the PHY.
	PLIB_DDR_PHY_DllMasterDelayStartSet	Sets the start value of the digital DLL master delay line.
	PLIB_DDR_PHY_DllRecalibDisable	Disables periodic recalibration of the internal digital DLL.
	PLIB_DDR_PHY_DllRecalibEnable	Enables periodic recalibration of the internal digital DLL, and sets the recalibration period.
	PLIB_DDR_PHY_DriveStrengthSet	Disables On Die Termination.
	PLIB_DDR_PHY_DrvStrgthCal	Calibrates the pad NFET and PFET output impedance.
	PLIB_DDR_PHY_ExternalDllEnable	Enables the use of an external DLL.
	PLIB_DDR_PHY_ExtraClockDisable	Does not enable the drive pad for an extra clock cycle after a write burst.
	PLIB_DDR_PHY_ExtraClockEnable	Enables the drive pad for an extra clock cycle after a write burst.
	PLIB_DDR_PHY_InternalDllEnable	Enables the use of the internal digital DLL.
	PLIB_DDR_PHY_OdtCal	Calibrates the pull-up and pull-down ODT impedance.
	PLIB_DDR_PHY_OdtCSDisable	Disables ODT on Chip Select while running SCL test.
	PLIB_DDR_PHY_OdtCSEnable	Enables ODT on Chip Select while running SCL test.
	PLIB_DDR_PHY_OdtDisable	Disables On Die Termination.
	PLIB_DDR_PHY_OdtEnable	Enables On Die Termination and sets the value.
	PLIB_DDR_PHY_PadReceiveEnable	Enables pad receivers on bidirectional I/O.
	PLIB_DDR_PHY_PreambleDlySet	Sets the length of the preamble for data writes.
	PLIB_DDR_PHY_ReadCASLatencySet	Sets the read CAS latency while running SCL test.
	PLIB_DDR_PHY_SCLDelay	Disables ODT on Chip Select while running SCL test.
	PLIB_DDR_PHY_SCLEnable	Enables SCL on the Chip Select 'cs'.

	PLIB_DDR_PHY_SCLTestBurstModeSet	Sets the burst mode of the DRAM while running SCL test.
	PLIB_DDR_PHY_WriteCASLatencySet	Sets the write CAS latency while running SCL test.
	PLIB_DDR_PHY_PadReceiveDisable	Disables pad receivers on bidirectional I/O.
	PLIB_DDR_PHY_SCLCapClkDelaySet	Sets capture clock delay during SCL.
	PLIB_DDR_PHY_SCLDDRClkDelaySet	Sets DDR clock delay during SCL.
	PLIB_DDR_PHY_HalfRateSet	Sets the PHY to half rate mode.
	PLIB_DDR_PHY_SCLStart	Runs PHY Self Calibration.
	PLIB_DDR_PHY_SCLStatus	Checks status of PHY Self Calibration.
	PLIB_DDR_PHY_AddCtlDriveStrengthSet	Sets the drive strength for the PHY address and control pads.
	PLIB_DDR_PHY_DataDriveStrengthSet	Sets the drive strength for the PHY data pads.
	PLIB_DDR_PHY_WriteCmdDelayDisable	Disables write command delay.
	PLIB_DDR_PHY_WriteCmdDelayEnable	Enables write command delay. The extra delay is needed for devices with even write latency (WL).

g) Feature Existence Functions

	Name	Description
	PLIB_DDR_ExistsAddressMapping	Identifies whether the AddressMapping feature exists on the DDR module.
	PLIB_DDR_ExistsArbitrationControl	Identifies whether the ArbitrationControl feature exists on the DDR module.
	PLIB_DDR_ExistsAutoPowerDown	Identifies whether the AutoPowerDown feature exists on the DDR module.
	PLIB_DDR_ExistsAutoPrecharge	Identifies whether the AutoPrecharge feature exists on the DDR module.
	PLIB_DDR_ExistsAutoSelfRefresh	Identifies whether the AutoSelfRefresh feature exists on the DDR module.
	PLIB_DDR_ExistsDDRCommands	Identifies whether the DDRCommands feature exists on the DDR module.
	PLIB_DDR_ExistsDDRControllerConfig	Identifies whether the DDRControllerConfig feature exists on the DDR module.
	PLIB_DDR_ExistsODTConfig	Identifies whether the ODTConfig feature exists on the DDR module.
	PLIB_DDR_ExistsPHY_DLLCalibration	Identifies whether the PHY_DLLCalibration feature exists on the DDR module.
	PLIB_DDR_ExistsPHY_PadConfig	Identifies whether the PHY_PadConfig feature exists on the DDR module.
	PLIB_DDR_ExistsPHY_SCLConfig	Identifies whether the PHY_SCLConfig feature exists on the DDR module
	PLIB_DDR_ExistsRefreshConfig	Identifies whether the RefreshConfig feature exists on the DDR module.
	PLIB_DDR_ExistsTimingDelays	Identifies whether the TimingDelays feature exists on the DDR module

h) Data Types and Constants

	Name	Description
	DDR_CMD_IDLE_NOP	
	DDR_PHY_DDR_TYPE	Defines the DDR type.
	DDR_CMD_LOAD_MODE	This is macro DDR_CMD_LOAD_MODE.
	DDR_PHY_DRIVE_STRENGTH	Defines the PHY Pad drive strength value.
	DDR_CMD_PRECHARGE_ALL	This is macro DDR_CMD_PRECHARGE_ALL.
	DDR_PHY_ODT	Defines the ODT termination value.
	DDR_CMD_REFRESH	This is macro DDR_CMD_REFRESH.
	DDR_PHY_PREAMBLE_DLY	Defines the PHY preamble delay value.
	DDR_PHY_SCL_BURST_MODE	Defines the burst mode for SCL.
	DDR_PHY_SCL_DELAY	Defines the SCL delay.
	DDR_HOST_CMD_REG	Defines the DDR host command register.
	DDR_MODULE_ID	Enumeration: DDR_MODULE_ID This enumeration defines the number of modules that are available on the microcontroller. This is the superset of all of the possible instances that might be available on Microchip microcontrollers. Refer to the data sheet to get the correct number of modules defined for desired microcontroller.
	DDR_TARGET	Defines the different targets to which the DDR controller is connected.

Description

This section describes the Application Programming Interface (API) functions of the DDR SDRAM Peripheral Library.

Refer to each section for a detailed description.

a) General Configuration Functions

PLIB_DDR_BigEndianSet Function

Sets the DDR data endianness to big.

File

plib_ddr.h

C

```
void PLIB_DDR_BigEndianSet(DDR_MODULE_ID index);
```

Returns

None.

Description

This function sets the DDR data endianness to big.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_BigEndianSet(DDR_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_DDR_BigEndianSet(DDR_MODULE_ID index);

PLIB_DDR_FullRateSet Function

Sets the DDR controller to Full-rate mode.

File

plib_ddr.h

C

```
void PLIB_DDR_FullRateSet(DDR_MODULE_ID index);
```

Returns

None.

Description

This function sets the DDR controller to Full-rate mode.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_FullRateSet(DDR_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_DDR_FullRateSet(DDR_MODULE_ID index);

PLIB_DDR_HalfRateSet Function

Sets the DDR controller to Half-rate mode.

File

plib_ddr.h

C

```
void PLIB_DDR_HalfRateSet(DDR_MODULE_ID index);
```

Returns

None.

Description

This function sets the DDR controller to Half-rate mode.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_HalfRateSet(DDR_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_DDR_HalfRateSet(DDR_MODULE_ID index);

PLIB_DDR_LittleEndianSet Function

Sets the DDR data endianness to little.

File

plib_ddr.h

C

```
void PLIB_DDR_LittleEndianSet(DDR_MODULE_ID index);
```

Returns

None.

Description

This function sets the DDR data endianness to little.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_LittleEndianSet(DDR_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_DDR_LittleEndianSet(DDR_MODULE_ID index);

PLIB_DDR_MaxPendingRefSet Function

Initializes the DDR controller refresh configuration.

File

plib_ddr.h

C

```
void PLIB_DDR_MaxPendingRefSet(DDR_MODULE_ID index, uint8_t maxRefs);
```

Returns

None.

Description

This function initializes the DDR controller refresh configuration and programs the number of refreshes that may be pending at one time. The following register field is programmed with this function:

- MAXREFS<4:0> - DDRREFCFG<24:26>

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
#define MAX_PEND_REF 7

PLIB_DDR_MaxPendingRefSet(DDR_ID_0, MAX_PEND_REF);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
maxRefs	Maximum number of refreshes that may be pending at one time

Function

void PLIB_DDR_MaxPendingRefSet(DDR_MODULE_ID index, uint8_t maxRefs);

PLIB_DDR_OdtReadDisable Function

Selects which Chip Select to disable ODT for data reads.

File

plib_ddr.h

C

```
void PLIB_DDR_OdtReadDisable(DDR_MODULE_ID index, uint8_t odtCS);
```

Returns

None.

Description

This function selects which Chip Select to disable ODT for data reads.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_OdtReadDisable(DDR_ID_0, 0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
odtCS	Chip select to program ODT control value

Function

void PLIB_DDR_OdtReadDisable(DDR_MODULE_ID index, uint8_t odtCS);

PLIB_DDR_OdtReadEnable Function

Selects which Chip Select to enable ODT for data reads.

File

plib_ddr.h

C

```
void PLIB_DDR_OdtReadEnable(DDR_MODULE_ID index, uint8_t odtCS);
```

Returns

None.

Description

This function selects which Chip Select to enable ODT for data reads.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_OdtReadEnable(DDR_ID_0, 0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
odtCS	Chip select to program ODT control value

Function

void PLIB_DDR_OdtReadEnable(DDR_MODULE_ID index, uint8_t odtCS);

PLIB_DDR_OdtWriteDisable Function

Selects which Chip Select to disable ODT for data writes.

File

plib_ddr.h

C

```
void PLIB_DDR_OdtWriteDisable(DDR_MODULE_ID index, uint8_t odtCS);
```

Returns

None.

Description

This function selects which Chip Select to disable ODT for data writes.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_OdtWriteDisable(DDR_ID_0, 0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
odtCS	Chip select to program ODT control value

Function

void PLIB_DDR_OdtWriteDisable(DDR_MODULE_ID index, uint8_t odtCS);

PLIB_DDR_OdtWriteEnable Function

Selects which Chip Select to enable ODT for data writes.

File

plib_ddr.h

C

```
void PLIB_DDR_OdtWriteEnable(DDR_MODULE_ID index, uint8_t odtCS);
```

Returns

None.

Description

This function selects which Chip Select to enable ODT for data writes.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_OdtWriteEnable(DDR_ID_0, 0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
odtCS	Chip select to program ODT control value

Function

void PLIB_DDR_OdtWriteEnable(DDR_MODULE_ID index, uint8_t odtCS);

PLIB_DDR_AutoPchrgDisable Function

Prevents the DDR controller from issuing an auto-precharge command to close the bank at the end of every user command.

File

plib_ddr.h

C

```
void PLIB_DDR_AutoPchrgDisable(DDR_MODULE_ID index);
```

Returns

None.

Description

This function prevents the DDR controller from issuing a auto-precharge command to close the bank at the end of every user command.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_AutoPchrgDisable(DDR_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_DDR_AutoPchrgDisable(DDR_MODULE_ID index);

PLIB_DDR_AutoPowerDownDisable Function

Prevents the DDR controller from automatically entering Power-down mode.

File

plib_ddr.h

C

```
void PLIB_DDR_AutoPowerDownDisable(DDR_MODULE_ID index);
```

Returns

None.

Description

This function prevents the DDR controller from automatically entering Power-down mode.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_AutoPowerDownDisable(DDR_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_DDR_AutoPowerDownDisable(DDR_MODULE_ID index);

PLIB_DDR_AutoPchrgPowerDownDisable Function

Prevents the DDR controller from automatically entering Precharge Power-down mode.

File

plib_ddr.h

C

```
void PLIB_DDR_AutoPchrgPowerDownDisable(DDR_MODULE_ID index);
```

Returns

None.

Description

This function prevents the DDR controller from automatically entering Precharge Power-down mode.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_AutoPchrgPowerDownDisable(DDR_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_DDR_AutoPchrgPowerDownDisable(DDR_MODULE_ID index);

PLIB_DDR_AutoSelfRefreshDisable Function

Prevents the DDR controller from automatically entering Self-refresh mode.

File

plib_ddr.h

C

```
void PLIB_DDR_AutoSelfRefreshDisable(DDR_MODULE_ID index);
```

Returns

None.

Description

This function prevents the DDR controller from automatically entering Self-refresh mode.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_AutoSelfRefreshDisable(DDR_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_DDR_AutoSelfRefreshDisable(DDR_MODULE_ID index);

PLIB_DDR_AutoPchrgPowerDownEnable Function

Enables the DDR controller to automatically enter Precharge Power-down mode.

File

plib_ddr.h

C

```
void PLIB_DDR_AutoPchrgPowerDownEnable(DDR_MODULE_ID index);
```

Returns

None.

Description

This function enables the DDR controller to automatically enter Precharge Power-down mode.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_AutoPchrgPowerDownEnable(DDR_ID_0);
```

I

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_DDR_AutoPchrgPowerDownEnable(DDR_MODULE_ID index);

PLIB_DDR_AutoPowerDownEnable Function

Enables the DDR controller to automatically enter Power-down mode.

File

plib_ddr.h

C

```
void PLIB_DDR_AutoPowerDownEnable(DDR_MODULE_ID index);
```

Returns

None.

Description

This function enables the DDR controller to automatically enter Power-down mode.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_AutoPowerDownEnable(DDR_ID_0, pdd);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_DDR_AutoPowerDownEnable(DDR_MODULE_ID index);

PLIB_DDR_AutoSelfRefreshEnable Function

Enables the DDR controller to automatically enter Self-refresh mode.

File

plib_ddr.h

C

```
void PLIB_DDR_AutoSelfRefreshEnable(DDR_MODULE_ID index);
```

Returns

None.

Description

This function enables the DDR controller to automatically enter Self-refresh mode.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_AutoSelfRefreshEnable(DDR_ID_0, srd);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_DDR_AutoSelfRefreshEnable(DDR_MODULE_ID index);

PLIB_DDR_AutoPchrgEnable Function

Enables the DDR controller to issue an auto-precharge command to close the bank at the end of every user command.

File

plib_ddr.h

C

```
void PLIB_DDR_AutoPchrgEnable(DDR_MODULE_ID index);
```

Returns

None.

Description

This function enables the DDR controller to issue a auto-precharge command to close the bank at the end of every user command.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_AutoPchrgEnable(DDR_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_DDR_AutoPchrgEnable(DDR_MODULE_ID index);

PLIB_DDR_TfawDelaySet Function

Initializes the DDR controller with the four-bank activation window needed for the specific DDR in use.

File

plib_ddr.h

C

```
void PLIB_DDR_TfawDelaySet(DDR_MODULE_ID index, uint32_t tFaw, uint32_t ctrlClkPer);
```

Returns

None.

Description

This function initializes the DDR controller with the four-bank activation window for the DDR in use. The following register field is programmed with this function:

- FAWTDLY<5:0> - DDRDLYCFG3<21:16>

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
#define clock_period    2500    // psec
#define CTRL_CLK_PERIOD (clock_period * 2)
#define tFAW            35000   // psec

PLIB_DDR_TfawDelaySet(DDR_ID_0, tFAW, CTRL_CLK_PERIOD);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
tFaw	Four bank activation window (psec)
ctrlClkPer	DDR Controller clock period (psec)

Function

void PLIB_DDR_TfawDelaySet(DDR_MODULE_ID index, uint32_t tFaw, uint32_t ctrlClkPer);

b) Target Arbitration Functions

PLIB_DDR_MinCommand Function

Sets the minimum number of bursts to be serviced for a DDR target within (REQPER * 4) number of clocks.

File

plib_ddr.h

C

```
void PLIB_DDR_MinCommand(DDR_MODULE_ID index, uint8_t minCmd, DDR_TARGET target);
```

Returns

None.

Description

This function sets the minimum number of bursts to be serviced for a DDR target within (REQPER * 4) number of clocks. Used with PLIB_DDR_ReqPeriod to determine the total bandwidth allocated to a target.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

The target must be selected with PLIB_DDR_TargetSelect() prior to using this function.

Example

```
PLIB_DDR_MinCommand(DDR_ID_0, 83, DDR_TARGET_CPU);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
minCmd	Number of bursts
target	Target for minCmd setting

Function

void PLIB_DDR_MinCommand(DDR_MODULE_ID index, uint8_t minCmd, DDR_TARGET target)

PLIB_DDR_MinLimit Function

Sets the minimum number of bursts for a DDR target.

File

plib_ddr.h

C

```
void PLIB_DDR_MinLimit(DDR_MODULE_ID index, uint8_t minLim, DDR_TARGET target);
```

Returns

None.

Description

This function sets the minimum number of bursts (two cycles per burst) that a target must have uninterrupted access to without interference from another target.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

The target must be selected with PLIB_DDR_TargetSelect prior to using this function.

Example

```
PLIB_DDR_MinLimit(DDR_ID_0, 1, DDR_TARGET_CPU);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
minLim	Number of bursts
target	Target for minLim setting

Function

void PLIB_DDR_MinLimit(DDR_MODULE_ID index, uint8_t minLim, DDR_TARGET target)

PLIB_DDR_ReqPeriod Function

Sets the timeout for MINCMD number of bursts to be serviced for a DDR target.

File

plib_ddr.h

C

```
void PLIB_DDR_ReqPeriod(DDR_MODULE_ID index, uint8_t reqPer, DDR_TARGET target);
```

Returns

None.

Description

This function sets the timeout for MINCMD number of bursts to be serviced for a DDR target. Used with PLIB_DDR_MinCommand to determine the total bandwidth allocated to a target.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

The target must be selected with PLIB_DDR_TargetSelect prior to using this function.

Example

```
PLIB_DDR_ReqPeriod(DDR_ID_0, 167, DDR_TARGET_CPU);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
reqPer	Number of clocks (multiplied by 4)
target	Target for reqPer setting

Function

void PLIB_DDR_ReqPeriod(DDR_MODULE_ID index, uint8_t reqPer, DDR_TARGET target)

c) SDRAM Initialization Functions

PLIB_DDR_CmdDataIsComplete Function

Returns the value of the valid bit in the DDR2CMDISSUE register. This bit is cleared by hardware, when the SDRAM initialization data has been transmitted.

File

plib_ddr.h

C

```
bool PLIB_DDR_CmdDataIsComplete(DDR_MODULE_ID index);
```

Returns

None.

Description

This function returns the value of the valid bit in the DDR2CMDISSUE register. This bit is cleared by hardware, when the SDRAM initialization data has been transmitted.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
while (PLIB_DDR_CmdDataIsComplete(DDR_ID_0));
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

bool PLIB_DDR_CmdDataIsComplete(DDR_MODULE_ID index);

PLIB_DDR_CmdDataSend Function

Transmits the data in the command registers to the SDRAM.

File

plib_ddr.h

C

```
void PLIB_DDR_CmdDataSend(DDR_MODULE_ID index);
```

Returns

None.

Description

This function transmits the data in the command registers to the SDRAM.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_CmdDataSend(DDR_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_DDR_CmdDataSend(DDR_MODULE_ID index);

PLIB_DDR_CmdDataValid Function

Indicates to the controller that the data in the command registers is valid.

File

plib_ddr.h

C

```
void PLIB_DDR_CmdDataValid(DDR_MODULE_ID index);
```

Returns

None.

Description

This function indicates to the controller that the data in the command registers is valid.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_CmdDataValid(DDR_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_DDR_CmdDataValid(DDR_MODULE_ID index);

PLIB_DDR_ControllerEnable Function

Enables the controller for normal operations after SDRAM is initialized.

File

plib_ddr.h

C

```
void PLIB_DDR_ControllerEnable(DDR_MODULE_ID index);
```

Returns

None.

Description

This function enables the controller for normal operations after SDRAM is initialized.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_ControllerEnable(DDR_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_DDR_ControllerEnable(DDR_MODULE_ID index);

PLIB_DDR_MaxCmdBrstCntSet Function

Sets the maximum number of commands that can be written to the controller in Burst mode.

File

plib_ddr.h

C

```
void PLIB_DDR_MaxCmdBrstCntSet(DDR_MODULE_ID index, int8_t maxCmds);
```

Returns

None.

Description

This function sets the maximum number of commands that can be written to the controller in Burst mode.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_MaxCmdBrstCntSet(DDR_ID_0, 3);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
maxCmds	Maximum number of commands that can be written to the controller in burst mode

Function

void PLIB_DDR_MaxCmdBrstCntSet(DDR_MODULE_ID index, int8_t maxCmds);

PLIB_DDR_NumHostCmdsSet Function

Sets the number of commands to be transmitted to the SDRAM.

File

plib_ddr.h

C

```
void PLIB_DDR_NumHostCmdsSet(DDR_MODULE_ID index, int8_t numCmds);
```

Returns

None.

Description

This function sets the number of commands to be transmitted to the SDRAM.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_NumHostCmdsSet(DDR_ID_0, 0x0B);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
numCmds	Number of commands to be transmitted to the SDRAM

Function

void PLIB_DDR_NumHostCmdsSet(DDR_MODULE_ID index, int8_t numCmds);

PLIB_DDR_CmdDataWrite Function

Writes an SDRAM command word to a command register in the controller.

File

plib_ddr.h

C

```
void PLIB_DDR_CmdDataWrite(DDR_MODULE_ID index, DDR_HOST_CMD_REG cmdReg, uint32_t cmdData);
```

Returns

None.

Description

This function writes an SDRAM command word to a command register in the controller.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
#define DDR_CMD_IDLE_NOP 0x00FFFFFF
PLIB_DDR_CmdDataWrite(DDR_ID_0, DDR_HOST_CMD_REG_100, DDR_CMD_IDLE_NOP);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
cmdData	32-bit command data word
cmdReg	Command register

Function

void PLIB_DDR_CmdDataWrite(DDR_MODULE_ID index, DDR_HOST_CMD_REG cmdReg, uint32_t cmdData);

d) SDRAM Addressing Functions

PLIB_DDR_BankAddressSet Function

Initializes the DDR controller memory configuration registers for bank address.

File

plib_ddr.h

C

```
void PLIB_DDR_BankAddressSet(DDR_MODULE_ID index, uint32_t bnkShft, uint32_t bnkMsk);
```

Returns

None.

Description

This function initializes the DDR controller memory configuration registers for the bank address. The following register fields are programmed with this

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_BankAddressSet(DDR_ID_0, 9, 0x03);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
bnkShft	Number of bits to shift the bank address
bnkMsk	Bank address bit mask

Function

void PLIB_DDR_BankAddressSet(DDR_MODULE_ID index, uint32_t bnkShft, uint32_t bnkMsk);

- BNKADDR<4:0> - DDRMEMCFG0<12:8>
- BNKADDRMSK<2:0> - DDRMEMCFG4<2:0>

PLIB_DDR_ChipSelectAddressSet Function

Initializes the DDR controller memory configuration registers for Chip Select address.

File

plib_ddr.h

C

```
void PLIB_DDR_ChipSelectAddressSet(DDR_MODULE_ID index, uint32_t csShft, uint32_t csMsk);
```

Returns

None.

Description

This function initializes the DDR controller memory configuration registers for the Chip Select address. The following register fields are programmed with this

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_ChipSelectAddressSet(DDR_ID_0, 18, 0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
csShft	Number of bits to shift the Chip Select address
csMsk	Chip select address bit mask

Function

void PLIB_DDR_ChipSelectAddressSet(DDR_MODULE_ID index, uint32_t csShft, uint32_t csMsk);

- CSADDR<4:0> - DDRMEMCFG0<20:16>
- CSADDRMSK<2:0> - DDRMEMCFG4<8:6>

PLIB_DDR_ColumnAddressSet Function

Initializes the DDR controller memory configuration registers for the column address.

File

plib_ddr.h

C

```
void PLIB_DDR_ColumnAddressSet(DDR_MODULE_ID index, uint32_t colShft, uint32_t colMskLo, uint32_t colMskHi);
```

Returns

None.

Description

This function initializes the DDR controller memory configuration registers for the column address. The following register fields are programmed with this

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_ColumnAddressSet(DDR_ID_0, 0, 0x1FF, 0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
colShft	Number of bits to shift the column address
colMaskLo	Column address bit mask low
colMaskHi	Column address bit mask high

Function

void PLIB_DDR_ColumnAddressSet(DDR_MODULE_ID index, uint32_t colShft, uint32_t colMskLo, uint32_t colMskHi);

- CLHADDR<4:0> - DDRMEMCFG0<28:24>
- CLADDRHMSK<12:0> - DDRMEMCFG2<12:0>
- CLADDRLMSK<12:0> - DDRMEMCFG3<12:0>

PLIB_DDR_RowAddressSet Function

Initializes the DDR controller memory configuration registers for row address.

File

plib_ddr.h

C

```
void PLIB_DDR_RowAddressSet(DDR_MODULE_ID index, uint32_t rowShft, uint32_t rowMsk);
```

Returns

None.

Description

this function initializes the DDR controller memory configuration registers for the row address. The following register fields are programmed with this function:

- RWADDR<4:0> - DDRMEMCFG0<4:0>
- RWADDRMASK<12:0> - DDRMEMCFG1<12:0>

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_RowAddressSet(DDR_ID_0, 12, 0x1FFF);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
rowShft	Number of bits to shift the row address
rowMask	Row address bit mask

Function

void PLIB_DDR_RowAddressSet(DDR_MODULE_ID index, uint32_t rowShft, uint32_t rowMsk);

e) SDRAM Timing Functions

PLIB_DDR_OdtReadParamSet Function

Sets the ODT parameters for data reads.

File

plib_ddr.h

C

```
void PLIB_DDR_OdtReadParamSet(DDR_MODULE_ID index, uint8_t rLen, uint8_t rDly);
```

Returns

None.

Description

This function sets the ODT parameters for data reads.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_OdtReadParamSet(DDR_ID_0, 2, 4);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
rLen	The number of clocks the ODT is turned on for reads
rDly	The number of clocks after a read command before turning on ODT to the DDR

Function

void PLIB_DDR_OdtReadParamSet(DDR_MODULE_ID index, uint8_t rLen, uint8_t rDly);

PLIB_DDR_OdtWriteParamSet Function

Sets the ODT parameters for data writes.

File

plib_ddr.h

C

```
void PLIB_DDR_OdtWriteParamSet(DDR_MODULE_ID index, uint8_t wLen, uint8_t wDly);
```

Returns

None.

Description

This function sets the ODT parameters for data writes.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_OdtWriteParamSet(DDR_ID_0, 3, 1);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
wLen	The number of clocks the ODT is turned on for writes
wDly	The number of clocks after a write command before turning on ODT to the DDR

Function

void PLIB_DDR_OdtWriteParamSet(DDR_MODULE_ID index, uint8_t wLen, uint8_t wDly);

PLIB_DDR_DataDelaySet Function

Initializes the DDR controller with the data delays needed for the specific DDR in use.

File

plib_ddr.h

C

```
void PLIB_DDR_DataDelaySet(DDR_MODULE_ID index, uint8_t rLat, uint8_t wLat);
```

Returns

None.

Description

This function initializes the DDR controller with the data delays for the DDR in use. The following register fields are programmed with this function:

- RBENDDLY<3:0> - DDRDLYCFG2<31:28>
- NXTDATRQDLY<3:0> - DDRXFERCFG<3:0>
- NXTDATAVDLY<4:0> - DDRXFERCFG<7:4>, DDRDLYCFG1<28>
- RDATENDLY<3:0> - DDRXFERCFG<19:16>

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_DataDelaySet(DDR_ID_0, 5, 4);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
rLat	Read (CAS) latency in cycles (RL)
wLat	Write latency in cycles (WL)

Function

void PLIB_DDR_DataDelaySet(DDR_MODULE_ID index, uint8_t rLat, uint8_t wLat);

PLIB_DDR_PowerDownDelaySet Function

Initializes the DDR controller with the power down delays needed for the specific DDR in use.

File

plib_ddr.h

C

```
void PLIB_DDR_PowerDownDelaySet(DDR_MODULE_ID index, uint32_t pwrDnDly, uint32_t tCKE, uint32_t tXP);
```

Returns

None.

Description

This function initializes the DDR controller with the power down delays for the DDR in use. The folPowerDownDelaySetlowing register fields are programmed with this function:

- PWRDNDLY<7:0> - DDRPWRCFG<11:4>
- PWRDNMINDLY<3:0> - DDR2DLYCFG1<19:16>
- PWRDNEXDLY<5:0> - DDR2DLYCFG1<25:20>

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
#define CLK_PERIOD          2500 // psec
#define CTRL_CLK_PERIOD     (CLK_PERIOD * 2)
#define PWR_DN_DLY          8
#define tCKE                3
#define tXP                 2

PLIB_DDR_PowerDownDelaySet(DDR_ID_0, PWR_DN_DLY, tCKE, tXP);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
pwrDnDly	Power down delay (entry) in cycles
tCKE	Power down minimum delay in cycles (tCKE)
tXP	Power down exit delay in cycles (tXP)

Function

void PLIB_DDR_PowerDownDelaySet(DDR_MODULE_ID index, uint32_t pwrDnDly,
uint32_t tCKE, uint32_t tXP);

PLIB_DDR_SelfRefreshDelaySet Function

Initializes the DDR controller with the self-refresh delays needed for the specific DDR in use.

File

plib_ddr.h

C

```
void PLIB_DDR_SelfRefreshDelaySet(DDR_MODULE_ID index, uint32_t slfRefDly, uint32_t tCKE, uint32_t tDLLK);
```

Returns

None.

Description

This function initializes the DDR controller with the self-refresh delays for the specific DDR in use. The following register fields are programmed

with this function:

- SLFREFDLY<9:0> - DDRPWRCFG<21:12>
- SLFREFMINDLY<7:0> - DDRDLYCFG1<7:0>
- SLFREFEXDLY<8:0> - DDRDLYCFG1<15:8>, DDR2DLYCFG1<30>

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
#define SELF_REF_DLY        17
#define tCKE                3
PLIB_DDR_SelfRefreshDelaySet(DDR_ID_0, SELF_REF_DLY, tCKE, 85);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
slfRefDly	Self refresh delay in number of clock cycles divided by 1024 (e.g., 1 = 1024 clocks, 2 = 2048 clocks, etc.)
tCKE	Power down minimum delay in cycles (tCKE)
tDLLK	DLL lock delay time in cycles (tDLLK)

Function

void PLIB_DDR_SelfRefreshDelaySet(DDR_MODULE_ID index, uint32_t slfRefDly,

uint32_t tCKE, uint32_t tDLLK);

PLIB_DDR_PrechargAllBanksSet Function

Initializes the DDR controller with the read/write precharge delays needed for the specific DDR in use.

File

plib_ddr.h

C

```
void PLIB_DDR_PrechargAllBanksSet(DDR_MODULE_ID index, uint32_t tRP, uint32_t ctrlClkPer);
```

Returns

None.

Description

This function initializes the DDR controller with the read/write precharge delays for the DDR in use. The following register fields are programmed with this function:

- PCHRGALLDLY<3:0> - DDRDLYCFG2<3:0>

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
#define clock_period    2500    // psec
#define CTRL_CLK_PERIOD (clock_period * 2)
#define tRP             12500   // psec

PLIB_DDR_PrechargAllBanksSet(DDR_ID_0, tRP, CTRL_CLK_PERIOD);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

tRP	Precharge to active delay (psec)
ctrlClkPer	DDR Controller clock period (psec)

Function

void PLIB_DDR_PrechargAllBanksSet(DDR_MODULE_ID index, uint32_t tRP, uint32_t ctrlClkPer);

PLIB_DDR_ReadWriteDelaySet Function

Initializes the DDR controller with the read/write delays needed for the specific DDR in use.

File

plib_ddr.h

C

```
void PLIB_DDR_ReadWriteDelaySet(DDR_MODULE_ID index, uint8_t bLen, uint8_t wLat, uint8_t rLat);
```

Returns

None.

Description

This function initializes the DDR controller with the read/write delays for the specific DDR in use. The following register fields are programmed with this function:

- R2WDLY<3:0> - DDRDLYCFG0<27:24>
- RMWDLY<3:0> - DDRDLYCFG0<31:28>

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
#define BL  2
#define WL  4
#define RL  5
PLIB_DDR_ReadWriteDelaySet(DDR_ID_0 BL, WL, RL);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
bLen	Burst length in cycles (BL)
wLat	Write latency in cycles (WL)
rLat	Read latency in cycles (RL)

Function

void PLIB_DDR_ReadWriteDelaySet(DDR_MODULE_ID index, uint8_t bLen,

uint8_t wLat, uint8_t rLat);

PLIB_DDR_RefreshTimingSet Function

Initializes the DDR controller refresh configuration.

File

plib_ddr.h

C

```
void PLIB_DDR_RefreshTimingSet(DDR_MODULE_ID index, uint32_t tRFC, uint32_t tRFI, uint32_t ctrlClkPer);
```

Returns

None.

Description

This function initializes the DDR controller refresh configuration and programs the refresh interval and delay between refreshes. The following register fields are programmed with this function:

- REFCNT<15:0> - DDRREFCFG<15:0>
- REFDLY<5:0> - DDRREFCFG<23:16>

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
#define clock_period    2500    // psec
#define CTRL_CLK_PERIOD (clock_period * 2)

#define tRFC            75000   // psec
#define tRFI            7800000 // psec

PLIB_DDR_RefreshConfig(DDR_ID_0, tRFC, tRFI, CTRL_CLK_PERIOD);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
tRFC	Refresh Cycle Time in clock cycles
tRFI	Refresh Interval in clock cycles
ctrlClkPer	DDR Controller clock period

Function

void PLIB_DDR_RefreshTimingSet(DDR_MODULE_ID index, uint32_t tRFC, uint32_t tRFI,
uint32_t ctrlClkPer);

PLIB_DDR_WriteWriteDelaySet Function

Initializes the DDR controller with the read/write delays needed for the specific DDR in use.

File

plib_ddr.h

C

```
void PLIB_DDR_WriteWriteDelaySet(DDR_MODULE_ID index, uint8_t bLen);
```

Returns

None.

Description

This function initializes the DDR controller with the read/write delays for the specific DDR in use. The following register fields are programmed with this function:

- W2WDLY<3:0> - DDRDLYCFG0<19:16>
- W2WCSDLY<3:0> - DDRDLYCFG0<23:20>

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
#define BL  2
PLIB_DDR_WriteWriteDelaySet(DDR_ID_0, BL);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
bLen	Burst length in cycles (BL)

Function

void PLIB_DDR_WriteWriteDelaySet(DDR_MODULE_ID index, uint8_t bLen);

PLIB_DDR_PrechargeToRASDelaySet Function

Initializes the DDR controller with the read/write precharge delays needed for the specific DDR in use.

File

plib_ddr.h

C

```
void PLIB_DDR_PrechargeToRASDelaySet(DDR_MODULE_ID index, uint32_t tRP, uint32_t ctrlClkPer);
```

Returns

None.

Description

This function initializes the DDR controller with the read/write precharge delays for the DDR in use. The following register fields are programmed with this function:

- PCHRG2RASDLY<3:0> - DDRDLYCFG2<24:27>

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
#define clock_period    2500    // psec
#define CTRL_CLK_PERIOD (clock_period * 2)
#define tRP             12500   // psec

PLIB_DDR_PrechargeToRASDelaySet(DDR_ID_0, tRP, CTRL_CLK_PERIOD);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
tRP	Precharge to active delay (psec)
ctrlClkPer	DDR Controller clock period

Function

void PLIB_DDR_PrechargeToRASDelaySet(DDR_MODULE_ID index, uint32_t tRP,
uint32_t ctrlClkPer);

PLIB_DDR_RASToCASDelaySet Function

Initializes the DDR controller with the row/column address delays needed for the specific DDR in use.

File

plib_ddr.h

C

```
void PLIB_DDR_RASToCASDelaySet(DDR_MODULE_ID index, uint32_t tRCD, uint32_t ctrlClkPer);
```

Returns

None.

Description

This function initializes the DDR controller with the row/column address delays for the DDR in use. The following register fields are programmed with this function:

- RAS2CASDLY<3:0> - DDRDLYCFG2<23:20>

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
#define clock_period    2500    // psec
#define CTRL_CLK_PERIOD (clock_period * 2)
#define tRCD            12500   // psec

PLIB_DDR_RASToCASDelaySet(DDR_ID_0, tRCD, CTRL_CLK_PERIOD);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
tRCD	RAS to CAS delay (psec)
ctrlClkPer	DDR Controller clock period (psec)

Function

void PLIB_DDR_RASToCASDelaySet(DDR_MODULE_ID index, uint32_t tRCD,

uint32_t ctrlClkPer);

PLIB_DDR_RASToPrechargeDelaySet Function

Initializes the DDR controller with the read/write precharge delays needed for the specific DDR in use.

File

plib_ddr.h

C

```
void PLIB_DDR_RASToPrechargeDelaySet(DDR_MODULE_ID index, uint32_t tRAS, uint32_t ctrlClkPer);
```

Returns

None.

Description

This function initializes the DDR controller with the read/write precharge delays for the DDR in use. The following register fields are programmed with this function:

- RAS2PCHRGDLY<4:0> - DDRDLYCFG3<4:0>

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
#define clock_period    2500    // psec
#define CTRL_CLK_PERIOD (clock_period * 2)
#define tRAS            45000   // psec

PLIB_DDR_RASToPrechargeDelaySet(DDR_ID_0, tRAS, CTRL_CLK_PERIOD);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
tRAS	Active to Precharge delay (psec)
ctrlClkPer	DDR Controller clock period (psec)

Function

void PLIB_DDR_RASToPrechargeDelaySet(DDR_MODULE_ID index, uint32_t tRAS, uint32_t ctrlClkPer);

PLIB_DDR_RASToRASBankDelaySet Function

Initializes the DDR controller with the row/column address delays needed for the specific DDR in use.

File

plib_ddr.h

C

```
void PLIB_DDR_RASToRASBankDelaySet(DDR_MODULE_ID index, uint32_t tRC, uint32_t ctrlClkPer);
```

Returns

None.

Description

This function initializes the DDR controller with the row/column address delays for the DDR in use. The following register fields are programmed with this function:

- RAS2RASSBNKDLY<5:0> - DDRDLYCFG3<13:8>

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
#define clock_period    2500    // psec
#define CTRL_CLK_PERIOD (clock_period * 2)
#define tRC             57500   // psec

PLIB_DDR_RASToRASBankDelaySet(DDR_ID_0, tRC, CTRL_CLK_PERIOD);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
tRC	Row cycle time (psec)
ctrlClkPer	DDR Controller clock period (psec)

Function

void PLIB_DDR_RASToRASBankDelaySet(DDR_MODULE_ID index, uint32_t tRC, uint32_t ctrlClkPer);

PLIB_DDR_RASToRASDelaySet Function

Initializes the DDR controller with the row/column address delays needed for the specific DDR in use.

File

plib_ddr.h

C

```
void PLIB_DDR_RASToRASDelaySet(DDR_MODULE_ID index, uint32_t tRRD, uint32_t ctrlClkPer);
```

Returns

None.

Description

This function initializes the DDR controller with the row/column address delays for the DDR in use. The following register fields are programmed with this function:

- RAS2RASDLY<3:0> - DDRDLYCFG2<19:16>

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
#define clock_period    2500    // psec
#define CTRL_CLK_PERIOD (clock_period * 2)
#define tRRD            7500    // psec

PLIB_DDR_RASToRASDelaySet(DDR_ID_0, tRRD, CTRL_CLK_PERIOD);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
tRRD	RAS to RAS delay (psec)
ctrlClkPer	DDR Controller clock period (psec)

Function

void PLIB_DDR_RASToRASDelaySet(DDR_MODULE_ID index, uint32_t tRRD, uint32_t ctrlClkPer);

PLIB_DDR_ReadToPrechargeDelaySet Function

Initializes the DDR controller with the read/write precharge delays needed for the specific DDR in use.

File

plib_ddr.h

C

```
void PLIB_DDR_ReadToPrechargeDelaySet(DDR_MODULE_ID index, uint32_t tRTP, uint8_t bLen, uint32_t
ctrlClkPer);
```

Returns

None.

Description

This function initializes the DDR controller with the read/write precharge delays for the DDR in use. The following register fields are programmed with this function:

- R2PCHRGDLY<3:0> - DDRDLYCFG2<11:8>

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
#define clock_period    2500    // psec
#define CTRL_CLK_PERIOD (clock_period * 2)
#define tRTP            7500    // psec
#define BL              2

PLIB_DDR_ReadToPrechargeDelaySet(DDR_ID_0, tRTP, BL, CTRL_CLK_PERIOD);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
tRTP	Read to precharge delay (psec)
bLen	Burst length in cycles (BL)
ctrlClkPer	DDR Controller clock period (psec)

Function

void PLIB_DDR_ReadToPrechargeDelaySet(DDR_MODULE_ID index, uint32_t tRTP,
uint8_t bLen, uint32_t ctrlClkPer);

PLIB_DDR_WriteToPrechargeDelaySet Function

Initializes the DDR controller with the read/write precharge delays needed for the specific DDR in use.

File

plib_ddr.h

C

```
void PLIB_DDR_WriteToPrechargeDelaySet(DDR_MODULE_ID index, uint32_t tWR, uint8_t bLen, uint8_t wLat,
uint32_t ctrlClkPer);
```

Returns

None.

Description

This function initializes the DDR controller with the read/write precharge delays for the DDR in use. The following register fields are programmed with this function:

- W2PCHRGDLY<4:0> - DDRDLYCFG2<15:12>, DDRDLYCFG1<26>

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
#define clock_period    2500    // psec
#define CTRL_CLK_PERIOD (clock_period * 2)
#define tRTP            7500    // psec
#define BL              2
#define wLat            4

PLIB_DDR_WriteToPrechargeDelaySet(DDR_ID_0, tRTP, BL, wLat, CTRL_CLK_PERIOD);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
tWR	Write recovery delay (psec)
bLen	Burst length in cycles (BL)
wLat	Write latency in cycles (WL)
ctrlClkPer	DDR Controller clock period (psec)

Function

void PLIB_DDR_WriteToPrechargeDelaySet(DDR_MODULE_ID index, uint32_t tWR,
uint8_t bLen, uint8_t wLat, uint32_t ctrlClkPer);

PLIB_DDR_ReadReadDelaySet Function

Initializes the DDR controller with the read/write delays needed for the specific DDR in use.

File

plib_ddr.h

C

```
void PLIB_DDR_ReadReadDelaySet(DDR_MODULE_ID index, uint8_t bLen);
```

Returns

None.

Description

This function initializes the DDR controller with the read/write delays for the specific DDR in use. The following register fields are programmed with this function:

- R2RDLY<3:0> - DDRDLYCFG0<11:8>
- R2RCSDLY<3:0> - DDRDLYCFG0<15:12>

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
#define BL  2
PLIB_DDR_ReadReadDelaySet(DDR_ID_0, BL);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
bLen	Burst length in cycles (BL)

Function

void PLIB_DDR_ReadReadDelaySet(DDR_MODULE_ID index, uint8_t bLen);

PLIB_DDR_WriteReadDelaySet Function

Initializes the DDR controller with the read/write delays needed for the specific DDR in use.

File

plib_ddr.h

C

```
void PLIB_DDR_WriteReadDelaySet(DDR_MODULE_ID index, uint32_t tWTR, uint8_t bLen, uint8_t wLat, uint32_t
ctrlClkPer);
```

Returns

None.

Description

This function initializes the DDR controller with the read/write delays for the specific DDR in use. The following register fields are programmed with this function:

- W2RDLY<4:0> - DDRDLYCFG0<3:0>, DDRDLYCFG1<27>
- W2RCSDLY<4:0> - DDRDLYCFG0<7:4>, DDRDLYCFG1<28>

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
#define CLK_PERIOD          2500 // psec
```

```
#define CTRL_CLK_PERIOD     (CLK_PERIOD * 2)
#define tWTR                7500

PLIB_DDR_WriteReadDelaySet(DDR_ID_0, tWTR, 2, 4, CTRL_CLK_PERIOD);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
tWTR	Write to read latency (in psecs)
bLen	Burst length in cycles (BL)
wLat	Write latency in cycles (WL)
ctrlClkPer	Control clock period (psec)

Function

void PLIB_DDR_WriteReadDelaySet(DDR_MODULE_ID index, uint32_t tWTR,
uint8_t bLen, uint8_t wLat, uint32_t ctrlClkPer);

f) PHY Initialization Functions

PLIB_DDR_PHY_DDRTypeSet Function

Sets the DRAM type for the PHY.

File

plib_ddr.h

C

```
void PLIB_DDR_PHY_DDRTypeSet(DDR_MODULE_ID index, DDR_PHY_DDR_TYPE ddrType);
```

Returns

None.

Description

This function sets the DRAM type for the PHY.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_PHY_DDRTypeSet(DDR_ID_0, DDR_PHY_DDR_TYPE_DDR2);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
ddrType	DDR type (DDR2 or DDR3)

Function

void PLIB_DDR_PHY_DDRTypeSet(DDR_MODULE_ID index, DDR_PHY_DDR_TYPE ddrType);

PLIB_DDR_PHY_DllMasterDelayStartSet Function

Sets the start value of the digital DLL master delay line.

File

plib_ddr.h

C

```
void PLIB_DDR_PHY_DllMasterDelayStartSet(DDR_MODULE_ID index, uint8_t dlyStart);
```

Returns

None.

Description

This function sets the start value of the digital DLL master delay line.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_PHY_DllMasterDelayStartSet(DDR_ID_0, 3);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
dlyStart	

Function

void PLIB_DDR_PHY_DllMasterDelayStartSet(DDR_MODULE_ID index, uint8_t dlyStart);

PLIB_DDR_PHY_DllRecalibDisable Function

Disables periodic recalibration of the internal digital DLL.

File

plib_ddr.h

C

```
void PLIB_DDR_PHY_DllRecalibDisable(DDR_MODULE_ID index);
```

Returns

None.

Description

this function disables periodic recalibration of the internal digital DLL.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_PHY_DllRecalibDisable(DDR_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_DDR_PHY_DllRecalibDisable(DDR_MODULE_ID index);

PLIB_DDR_PHY_DllRecalibEnable Function

Enables periodic recalibration of the internal digital DLL, and sets the recalibration period.

File

plib_ddr.h

C

```
void PLIB_DDR_PHY_DllRecalibEnable(DDR_MODULE_ID index, uint32_t recalibCnt);
```

Returns

None.

Description

This function enables periodic recalibration of the internal digital DLL, and sets the recalibration period.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_PHY_DllRecalibEnable(DDR_ID_0, 100);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
recalibCnt	Period of DLL recalibration in units of (PHY clock * 256)

Function

void PLIB_DDR_PHY_DllRecalibEnable(DDR_MODULE_ID index, uint32_t recalibCnt);

PLIB_DDR_PHY_DriveStrengthSet Function

Disables On Die Termination.

File

plib_ddr.h

C

```
void PLIB_DDR_PHY_DriveStrengthSet(DDR_MODULE_ID index, DDR_PHY_DRIVE_STRENGTH drvStr);
```

Returns

None.

Description

This function disables On Die Termination (ODT).

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_PHY_DriveStrengthSet(DDR_ID_0, DDR_PHY_DRIVE_STRENGTH_FULL);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
drvStr	Drive strength

Function

void PLIB_DDR_PHY_DriveStrengthSet(DDR_MODULE_ID index, DDR_PHY_DRIVE_STRENGTH drvStr);

PLIB_DDR_PHY_DrvStrgthCal Function

Calibrates the pad NFET and PFET output impedance.

File

plib_ddr.h

C

```
void PLIB_DDR_PHY_DrvStrgthCal(DDR_MODULE_ID index, uint8_t nFet, uint8_t pFet);
```

Returns

None.

Description

This function calibrates the pad NFET and PFET output impedance.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_PHY_DrvStrgthCal(DDR_ID_0, 0xF, 0xF);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
nFet	NFET impedance calibration value
pFet	PFET impedance calibration value

Function

void PLIB_DDR_PHY_DrvStrgthCal(DDR_MODULE_ID index, uint8_t nFet, uint8_t pFet);

PLIB_DDR_PHY_ExternalDllEnable Function

Enables the use of an external DLL.

File

plib_ddr.h

C

```
void PLIB_DDR_PHY_ExternalDllEnable(DDR_MODULE_ID index);
```

Returns

None.

Description

This function enables the use of an external DLL.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_PHY_ExternalDllEnable(DDR_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_DDR_PHY_ExternalDllEnable(DDR_MODULE_ID index);

PLIB_DDR_PHY_ExtraClockDisable Function

Does not enable the drive pad for an extra clock cycle after a write burst.

File

plib_ddr.h

C

```
void PLIB_DDR_PHY_ExtraClockDisable(DDR_MODULE_ID index);
```

Returns

None.

Description

This function does not enable the drive pad for an extra clock cycle after a write burst.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_PHY_ExtraClockDisable(DDR_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_DDR_PHY_ExtraClockDisable(DDR_MODULE_ID index);

PLIB_DDR_PHY_ExtraClockEnable Function

Enables the drive pad for an extra clock cycle after a write burst.

File

plib_ddr.h

C

```
void PLIB_DDR_PHY_ExtraClockEnable(DDR_MODULE_ID index);
```

Returns

None.

Description

This function enables the drive pad for an extra clock cycle after a write burst.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_PHY_ExtraClockEnable(DDR_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_DDR_PHY_ExtraClockEnable(DDR_MODULE_ID index);

PLIB_DDR_PHY_InternalDllEnable Function

Enables the use of the internal digital DLL.

File

plib_ddr.h

C

```
void PLIB_DDR_PHY_InternalDllEnable(DDR_MODULE_ID index);
```

Returns

None.

Description

This function enables the use of the internal digital DLL.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_PHY_InternalDllEnable(DDR_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_DDR_PHY_InternalDllEnable(DDR_MODULE_ID index);

PLIB_DDR_PHY_OdtCal Function

Calibrates the pull-up and pull-down ODT impedance.

File

plib_ddr.h

C

```
void PLIB_DDR_PHY_OdtCal(DDR_MODULE_ID index, uint8_t puCal, uint8_t pdCal);
```

Returns

None.

Description

This function calibrates the pull-up and pull-down ODT impedance.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_PHY_OdtCal(DDR_ID_0, 2, 2);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
puCal	Pull-up calibration value
pdCal	Pull-down calibration value

Function

void PLIB_DDR_PHY_OdtCal(DDR_MODULE_ID index, uint8_t puCal, uint8_t pdCal);

PLIB_DDR_PHY_OdtCSDisable Function

Disables ODT on Chip Select while running SCL test.

File

plib_ddr.h

C

```
void PLIB_DDR_PHY_OdtCSDisable(DDR_MODULE_ID index);
```

Returns

None.

Description

This function disables ODT on Chip Select while running SCL test.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_PHY_OdtCSDisable(DDR_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_DDR_PHY_OdtCSDisable(DDR_MODULE_ID index);

PLIB_DDR_PHY_OdtCSEnable Function

Enables ODT on Chip Select while running SCL test.

File

plib_ddr.h

C

```
void PLIB_DDR_PHY_OdtCSEnable(DDR_MODULE_ID index);
```

Returns

None.

Description

This function enables ODT on Chip Select while running SCL test.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_PHY_OdtCSEnable(DDR_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_DDR_PHY_OdtCSEnable(DDR_MODULE_ID index);

PLIB_DDR_PHY_OdtDisable Function

Disables On Die Termination.

File

plib_ddr.h

C

```
void PLIB_DDR_PHY_OdtDisable(DDR_MODULE_ID index);
```

Returns

None.

Description

This function disables On Die Termination.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_PHY_OdtDisable(DDR_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_DDR_PHY_OdtDisable(DDR_MODULE_ID index);

PLIB_DDR_PHY_OdtEnable Function

Enables On Die Termination and sets the value.

File

plib_ddr.h

C

```
void PLIB_DDR_PHY_OdtEnable(DDR_MODULE_ID index, DDR_PHY_ODT odtVal);
```

Returns

None.

Description

This function enables On Die Termination (ODT) and sets the value.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_PHY_OdtEnable(DDR_ID_0, DDR_PHY_ODT_75_OHM);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
odtVal	The ODT value

Function

void PLIB_DDR_PHY_OdtEnable(DDR_MODULE_ID index, DDR_PHY_ODT odtVal);

PLIB_DDR_PHY_PadReceiveEnable Function

Enables pad receivers on bidirectional I/O.

File

plib_ddr.h

C

```
void PLIB_DDR_PHY_PadReceiveEnable(DDR_MODULE_ID index);
```

Returns

None.

Description

This function enables pad receivers on bidirectional I/O.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_PHY_PadReceiveEnable(DDR_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_DDR_PHY_PadReceiveEnable(DDR_MODULE_ID index);

PLIB_DDR_PHY_PreambleDlySet Function

Sets the length of the preamble for data writes.

File

plib_ddr.h

C

```
void PLIB_DDR_PHY_PreambleDlySet(DDR_MODULE_ID index, DDR_PHY_PREAMBLE_DLY preDly);
```

Returns

None.

Description

This function sets the length of the preamble for data writes.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_PHY_PreambleDlySet(DDR_ID_0, DDR_PHY_PREAMBLE_DLY_1_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
preDly	Preamble delay

Function

void PLIB_DDR_PHY_PreambleDlySet(DDR_MODULE_ID index, DDR_PHY_PREAMBLE_DLY preDly);

PLIB_DDR_PHY_ReadCASLatencySet Function

Sets the read CAS latency while running SCL test.

File

plib_ddr.h

C

```
void PLIB_DDR_PHY_ReadCASLatencySet(DDR_MODULE_ID index, uint8_t rLat);
```

Returns

None.

Description

This function sets the read CAS latency while running SCL test.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_PHY_ReadCASLatencySet(DDR_ID_0, 5);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
rLat	Read CAS latency (RL)

Function

void PLIB_DDR_PHY_ReadCASLatencySet(DDR_MODULE_ID index, uint8_t rLat);

PLIB_DDR_PHY_SCLDelay Function

Disables ODT on Chip Select while running SCL test.

File

plib_ddr.h

C

```
void PLIB_DDR_PHY_SCLDelay(DDR_MODULE_ID index, DDR_PHY_SCL_DELAY sclDly);
```

Returns

None.

Description

This function disables ODT on Chip Select while running SCL test.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_PHY_SCLDelay(DDR_ID_0, DDR_PHY_SCL_DELAY_SINGLE);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
sclDly	SCL delay

Function

void PLIB_DDR_PHY_SCLDelay(DDR_MODULE_ID index, DDR_PHY_SCL_DELAY sclDly);

PLIB_DDR_PHY_SCLEnable Function

Enables SCL on the Chip Select 'cs'.

File

plib_ddr.h

C

```
void PLIB_DDR_PHY_SCLEnable(DDR_MODULE_ID index, uint8_t cs);
```

Returns

None.

Description

This function enables SCL on the Chip Select 'cs'.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_PHY_SCLEnable(DDR_ID_0, 0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
cs	Chip select

Function

void PLIB_DDR_PHY_SCLEnable(DDR_MODULE_ID index, uint8_t cs);

PLIB_DDR_PHY_SCLTestBurstModeSet Function

Sets the burst mode of the DRAM while running SCL test.

File

plib_ddr.h

C

```
void PLIB_DDR_PHY_SCLTestBurstModeSet(DDR_MODULE_ID index, DDR_PHY_SCL_BURST_MODE brstMode);
```

Returns

None.

Description

This function sets the burst mode of the DRAM while running SCL test.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_PHY_SCLTestBurstModeSet(DDR_ID_0, DDR_PHY_SCL_BURST_MODE_8);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
brstMode	Burst mode of the DRAM

Function

void PLIB_DDR_PHY_SCLTestBurstModeSet(DDR_MODULE_ID index, DDR_PHY_SCL_BURST_MODE brstMode);

PLIB_DDR_PHY_WriteCASLatencySet Function

Sets the write CAS latency while running SCL test.

File

plib_ddr.h

C

```
void PLIB_DDR_PHY_WriteCASLatencySet(DDR_MODULE_ID index, uint8_t wLat);
```

Returns

None.

Description

This function sets the write CAS latency while running SCL test.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_PHY_WriteCASLatencySet(DDR_ID_0, 4);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
wLat	Write CAS latency (WL)

Function

void PLIB_DDR_PHY_WriteCASLatencySet(DDR_MODULE_ID index, uint8_t wLat);

PLIB_DDR_PHY_PadReceiveDisable Function

Disables pad receivers on bidirectional I/O.

File

plib_ddr.h

C

```
void PLIB_DDR_PHY_PadReceiveDisable(DDR_MODULE_ID index);
```

Returns

None.

Description

This function disables pad receivers on bidirectional I/O.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_PHY_PadReceiveDisable(DDR_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_DDR_PHY_PadReceiveDisable(DDR_MODULE_ID index);

PLIB_DDR_PHY_SCLCapClkDelaySet Function

Sets capture clock delay during SCL.

File

plib_ddr.h

C

```
void PLIB_DDR_PHY_SCLCapClkDelaySet(DDR_MODULE_ID index, uint8_t capDly);
```

Returns

None.

Description

This function sets capture clock delay during SCL.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_PHY_SCLCapClkDelaySet(DDR_ID_0, 4);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
capDly	Capture Clock delay

Function

void PLIB_DDR_PHY_SCLCapClkDelaySet(DDR_MODULE_ID index, uint8_t capDly);

PLIB_DDR_PHY_SCLDDRClkDelaySet Function

Sets DDR clock delay during SCL.

File

plib_ddr.h

C

```
void PLIB_DDR_PHY_SCLDDRClkDelaySet(DDR_MODULE_ID index, uint8_t ddrDly);
```

Returns

None.

Description

This function sets DDR clock delay during SCL.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_PHY_SCLDDRClkDelaySet(DDR_ID_0, 4);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
ddrDly	DDR Clock delay

Function

void PLIB_DDR_PHY_SCLDDRClkDelaySet(DDR_MODULE_ID index, uint8_t ddrDly);

PLIB_DDR_PHY_HalfRateSet Function

Sets the PHY to half rate mode.

File

plib_ddr.h

C

```
void PLIB_DDR_PHY_HalfRateSet(DDR_MODULE_ID index);
```

Returns

None.

Description

This function sets the PHY to half rate mode.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_PHY_HalfRateSet(DDR_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_DDR_PHY_HalfRateSet(DDR_MODULE_ID index);

PLIB_DDR_PHY_SCLStart Function

Runs PHY Self Calibration.

File

plib_ddr.h

C

```
void PLIB_DDR_PHY_SCLStart(DDR_MODULE_ID index);
```

Returns

None.

Description

This function runs PHY Self Calibration.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_PHY_SCLStart(DDR_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_DDR_PHY_SCLStart(DDR_MODULE_ID index);

PLIB_DDR_PHY_SCLStatus Function

Checks status of PHY Self Calibration.

File

plib_ddr.h

C

```
bool PLIB_DDR_PHY_SCLStatus(DDR_MODULE_ID index);
```

Returns

- true - The PHY SCL has passed
- false - The PHY SCL has not passed

Description

This function checks status of PHY Self Calibration.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_PHY_SCLStatus(DDR_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

bool PLIB_DDR_PHY_SCLStatus(DDR_MODULE_ID index);

PLIB_DDR_PHY_AddCtlDriveStrengthSet Function

Sets the drive strength for the PHY address and control pads.

File

plib_ddr.h

C

```
void PLIB_DDR_PHY_AddCtlDriveStrengthSet(DDR_MODULE_ID index, DDR_PHY_DRIVE_STRENGTH drvStr);
```

Returns

None.

Description

Sets the drive strength for the PHY address and control pads.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_PHY_AddCtlDriveStrengthSet(DDR_ID_0, DDR_PHY_DRIVE_STRENGTH_FULL);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
drvStr	Drive strength

Function

void PLIB_DDR_PHY_AddCtlDriveStrengthSet(DDR_MODULE_ID index, DDR_PHY_DRIVE_STRENGTH drvStr);

PLIB_DDR_PHY_DataDriveStrengthSet Function

Sets the drive strength for the PHY data pads.

File

plib_ddr.h

C

```
void PLIB_DDR_PHY_DataDriveStrengthSet(DDR_MODULE_ID index, DDR_PHY_DRIVE_STRENGTH drvStr);
```

Returns

None.

Description

Sets the drive strength for the PHY data pads.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_PHY_DataDriveStrengthSet(DDR_ID_0, DDR_PHY_DRIVE_STRENGTH_FULL);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
drvStr	Drive strength

Function

void PLIB_DDR_PHY_DataDriveStrengthSet(DDR_MODULE_ID index, DDR_PHY_DRIVE_STRENGTH drvStr);

PLIB_DDR_PHY_WriteCmdDelayDisable Function

Disables write command delay.

File

plib_ddr.h

C

```
void PLIB_DDR_PHY_WriteCmdDelayDisable(DDR_MODULE_ID index);
```

Returns

None.

Description

Disables write command delay.

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_PHY_WriteCmdDelayDisable(DDR_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_DDR_PHY_WriteCmdDelayDisable(DDR_MODULE_ID index);

PLIB_DDR_PHY_WriteCmdDelayEnable Function

Enables write command delay. The extra delay is needed for devices with even write latency (WL).

File

plib_ddr.h

C

```
void PLIB_DDR_PHY_WriteCmdDelayEnable(DDR_MODULE_ID index);
```

Returns

None.

Description

Enables write command delay. The extra delay is needed for devices with even write latency (WL).

Remarks

This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_DDR_PHY_WriteCmdDelayEnable(DDR_ID_0);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Function

void PLIB_DDR_PHY_WriteCmdDelayEnable(DDR_MODULE_ID index);

g) Feature Existence Functions

PLIB_DDR_ExistsAddressMapping Function

Identifies whether the AddressMapping feature exists on the DDR module.

File

plib_ddr.h

C

```
bool PLIB_DDR_ExistsAddressMapping(DDR_MODULE_ID index);
```

Returns

- true - The AddressMapping feature is supported on the device

- false - The AddressMapping feature is not supported on the device

Description

This function identifies whether the AddressMapping feature is available on the DDR module. When this function returns true, these functions are supported on the device:

- PLIB_DDR_RowAddressSet
- PLIB_DDR_ColumnAddressSet
- PLIB_DDR_BankAddressSet
- PLIB_DDR_ChipSelectAddressSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DDR_ExistsAddressMapping(DDR_MODULE_ID index)

PLIB_DDR_ExistsArbitrationControl Function

Identifies whether the ArbitrationControl feature exists on the DDR module.

File

plib_ddr.h

C

```
bool PLIB_DDR_ExistsArbitrationControl(DDR_MODULE_ID index);
```

Returns

- true - The ArbitrationControl feature is supported on the device
- false - The ArbitrationControl feature is not supported on the device

Description

This function identifies whether the ArbitrationControl feature is available on the DDR module. When this function returns true, these functions are supported on the device:

- PLIB_DDR_TargetSelect
- PLIB_DDR_MinLimit
- PLIB_DDR_ReqPeriod
- PLIB_DDR_MinCommand

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DDR_ExistsArbitrationControl(DDR_MODULE_ID index)

PLIB_DDR_ExistsAutoPowerDown Function

Identifies whether the AutoPowerDown feature exists on the DDR module.

File

plib_ddr.h

C

```
bool PLIB_DDR_ExistsAutoPowerDown(DDR_MODULE_ID index);
```

Returns

- true - The AutoPowerDown feature is supported on the device
- false - The AutoPowerDown feature is not supported on the device

Description

This function identifies whether the AutoPowerDown feature is available on the DDR module. When this function returns true, these functions are supported on the device:

- PLIB_DDR_AutoPowerDownEnable
- PLIB_DDR_AutoPowerDownDisable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DDR_ExistsAutoPowerDown(DDR_MODULE_ID index)

PLIB_DDR_ExistsAutoPrecharge Function

Identifies whether the AutoPrecharge feature exists on the DDR module.

File

plib_ddr.h

C

```
bool PLIB_DDR_ExistsAutoPrecharge(DDR_MODULE_ID index);
```

Returns

- true - The AutoPrecharge feature is supported on the device
- false - The AutoPrecharge feature is not supported on the device

Description

This function identifies whether the AutoPrecharge feature is available on the DDR module. When this function returns true, these functions are supported on the device:

- PLIB_DDR_AutoPchrgEnable
- PLIB_DDR_AutoPchrgDisable
- PLIB_DDR_AutoPchrgPowerDownEnable
- PLIB_DDR_AutoPchrgPowerDownDisable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DDR_ExistsAutoPrecharge(DDR_MODULE_ID index)

PLIB_DDR_ExistsAutoSelfRefresh Function

Identifies whether the AutoSelfRefresh feature exists on the DDR module.

File

plib_ddr.h

C

```
bool PLIB_DDR_ExistsAutoSelfRefresh(DDR_MODULE_ID index);
```

Returns

- true - The AutoSelfRefresh feature is supported on the device
- false - The AutoSelfRefresh feature is not supported on the device

Description

This function identifies whether the AutoSelfRefresh feature is available on the DDR module. When this function returns true, these functions are supported on the device:

- PLIB_DDR_AutoSelfRefreshEnable
- PLIB_DDR_AutoSelfRefreshDisable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DDR_ExistsAutoSelfRefresh(DDR_MODULE_ID index)

PLIB_DDR_ExistsDDRCommands Function

Identifies whether the DDRCommands feature exists on the DDR module.

File

plib_ddr.h

C

```
bool PLIB_DDR_ExistsDDRCommands(DDR_MODULE_ID index);
```

Returns

- true - The DDRCommands feature is supported on the device
- false - The DDRCommands feature is not supported on the device

Description

This function identifies whether the DDRCommands feature is available on the DDR module. When this function returns true, these functions are supported on the device:

- PLIB_DDR_MaxCmdBrstCntSet
- PLIB_DDR_NumHostCmdsSet
- PLIB_DDR_CmdDataWrite
- PLIB_DDR_CmdDataValid
- PLIB_DDR_CmdDataSend
- PLIB_DDR_CmdDataIsComplete
- PLIB_DDR_ControllerEnable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DDR_ExistsDDRCommands(DDR_MODULE_ID index)

PLIB_DDR_ExistsDDRControllerConfig Function

Identifies whether the DDRControllerConfig feature exists on the DDR module.

File

plib_ddr.h

C

```
bool PLIB_DDR_ExistsDDRControllerConfig(DDR_MODULE_ID index);
```

Returns

- true - The DDRControllerConfig feature is supported on the device
- false - The DDRControllerConfig feature is not supported on the device

Description

This function identifies whether the DDRControllerConfig feature is available on the DDR module. When this function returns true, these functions are supported on the device:

- PLIB_DDR_BigEndianSet
- PLIB_DDR_LittleEndianSet
- PLIB_DDR_FullRateSet
- PLIB_DDR_HalfRateSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DDR_ExistsDDRControllerConfig(DDR_MODULE_ID index)

PLIB_DDR_ExistsODTConfig Function

Identifies whether the ODTConfig feature exists on the DDR module.

File

plib_ddr.h

C

```
bool PLIB_DDR_ExistsODTConfig(DDR_MODULE_ID index);
```

Returns

- true - The ODTConfig feature is supported on the device

- false - The ODTConfig feature is not supported on the device

Description

This function identifies whether the ODTConfig feature is available on the DDR module. When this function returns true, these functions are supported on the device:

- PLIB_DDR_OdtReadEnable
- PLIB_DDR_OdtReadDisable
- PLIB_DDR_OdtWriteEnable
- PLIB_DDR_OdtWriteDisable
- PLIB_DDR_OdtWriteParamSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DDR_ExistsODTConfig(DDR_MODULE_ID index)

PLIB_DDR_ExistsPHY_DLLCalibration Function

Identifies whether the PHY_DLLCalibration feature exists on the DDR module.

File

plib_ddr.h

C

```
bool PLIB_DDR_ExistsPHY_DLLCalibration(DDR_MODULE_ID index);
```

Returns

- true - The PHY_DLLCalibration feature is supported on the device
- false - The PHY_DLLCalibration feature is not supported on the device

Description

This function identifies whether the PHY_DLLCalibration feature is available on the DDR module. When this function returns true, these functions are supported on the device:

- PLIB_DDR_PHY_DllRecalibEnable
- PLIB_DDR_PHY_DllRecalibDisable
- PLIB_DDR_PHY_DllMasterDelayStartSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DDR_ExistsPHY_DLLCalibration(DDR_MODULE_ID index)

PLIB_DDR_ExistsPHY_PadConfig Function

Identifies whether the PHY_PadConfig feature exists on the DDR module.

File

plib_ddr.h

C

```
bool PLIB_DDR_ExistsPHY_PadConfig(DDR_MODULE_ID index);
```

Returns

- true - The PHY_PadConfig feature is supported on the device
- false - The PHY_PadConfig feature is not supported on the device

Description

This function identifies whether the PHY_PadConfig feature is available on the DDR module. When this function returns true, these functions are supported on the device:

- PLIB_DDR_PHY_OdtEnable
- PLIB_DDR_PHY_OdtDisable
- PLIB_DDR_PHY_DriveStrengthSet
- PLIB_DDR_PHY_OdtCal
- PLIB_DDR_PHY_DrvStrgthCal
- PLIB_DDR_PHY_ExtraClockEnable
- PLIB_DDR_PHY_ExtraClockDisable
- PLIB_DDR_PHY_InternalDllEnable
- PLIB_DDR_PHY_ExternalDllEnable
- PLIB_DDR_PHY_PadReceiveEnable
- PLIB_DDR_PHY_PreambleDlySet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DDR_ExistsPHY_PadConfig(DDR_MODULE_ID index)

PLIB_DDR_ExistsPHY_SCLConfig Function

Identifies whether the PHY_SCLConfig feature exists on the DDR module

File

plib_ddr.h

C

```
bool PLIB_DDR_ExistsPHY_SCLConfig(DDR_MODULE_ID index);
```

Returns

- true - The PHY_SCLConfig feature is supported on the device
- false - The PHY_SCLConfig feature is not supported on the device

Description

This function identifies whether the PHY_SCLConfig feature is available on the DDR module. When this function returns true, these functions are supported on the device:

- PLIB_DDR_PHY_SCLTestBurstModeSet
- PLIB_DDR_PHY_DDRTypeSet
- PLIB_DDR_PHY_ReadCASLatencySet
- PLIB_DDR_PHY_WriteCASLatencySet
- PLIB_DDR_PHY_OdtCSEnable

- PLIB_DDR_PHY_OdtCSDisable
- PLIB_DDR_PHY_SCLDelay
- PLIB_DDR_PHY_SCLEnable
- PLIB_DDR_PHY_SCLDDRClkDelaySet
- PLIB_DDR_PHY_SCLCapClkDelaySet
- PLIB_DDR_PHY_SCLStart
- PLIB_DDR_PHY_SCLStatus

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DDR_ExistsPHY_SCLConfig(DDR_MODULE_ID index)

PLIB_DDR_ExistsRefreshConfig Function

Identifies whether the RefreshConfig feature exists on the DDR module.

File

plib_ddr.h

C

```
bool PLIB_DDR_ExistsRefreshConfig(DDR_MODULE_ID index);
```

Returns

- true - The RefreshConfig feature is supported on the device
- false - The RefreshConfig feature is not supported on the device

Description

This function identifies whether the RefreshConfig feature is available on the DDR module. When this function returns true, this function is supported on the device:

- PLIB_DDR_RefreshConfig

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DDR_ExistsRefreshConfig(DDR_MODULE_ID index)

PLIB_DDR_ExistsTimingDelays Function

Identifies whether the TimingDelays feature exists on the DDR module

File

plib_ddr.h

C

```
bool PLIB_DDR_ExistsTimingDelays(DDR_MODULE_ID index);
```

Returns

- true - The TimingDelays feature is supported on the device
- false - The TimingDelays feature is not supported on the device

Description

This function identifies whether the TimingDelays feature is available on the DDR module. When this function returns true, these functions are supported on the device:

- PLIB_DDR_ReadWriteDelaySet
- PLIB_DDR_SelfRefreshDelaySet
- PLIB_DDR_PowerDownDelaySet
- PLIB_DDR_PchrgDelaySet
- PLIB_DDR_AddressDelaySet
- PLIB_DDR_DataDelaySet
- PLIB_DDR_TfawDelaySet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_DDR_ExistsTimingDelays(DDR_MODULE_ID index)

h) Data Types and Constants

DDR_CMD_IDLE_NOP Macro

File

plib_ddr.h

C

```
#define DDR_CMD_IDLE_NOP 0x00FFFFFF
```

Section

Constants and Data Types

DDR_PHY_DDR_TYPE Enumeration

Defines the DDR type.

File

plib_ddr_help.h

C

```
typedef enum {
  DDR_PHY_DDR_TYPE_DDR2,
  DDR_PHY_DDR_TYPE_DDR3
} DDR_PHY_DDR_TYPE;
```

Description

DDR Type

This data type defines the DDR type.

Remarks

The actual definition of this enumeration is device-specific.

DDR_CMD_LOAD_MODE Macro

File

plib_ddr.h

C

```
#define DDR_CMD_LOAD_MODE 0x00FFF001
```

Description

This is macro DDR_CMD_LOAD_MODE.

DDR_PHY_DRIVE_STRENGTH Enumeration

Defines the PHY Pad drive strength value.

File

plib_ddr_help.h

C

```
typedef enum {
  DDR_PHY_DRIVE_STRENGTH_60,
  DDR_PHY_DRIVE_STRENGTH_FULL
} DDR_PHY_DRIVE_STRENGTH;
```

Description

PHY Pad Drive Strength Value

This data type defines the PHY Pad drive strength value.

Remarks

The actual definition of this enumeration is device-specific.

DDR_CMD_PRECHARGE_ALL Macro

File

plib_ddr.h

C

```
#define DDR_CMD_PRECHARGE_ALL 0x00FFF401
```

Description

This is macro DDR_CMD_PRECHARGE_ALL.

DDR_PHY_ODT Enumeration

Defines the ODT termination value.

File

plib_ddr_help.h

C

```
typedef enum {
  DDR_PHY_ODT_75_OHM,
  DDR_PHY_ODT_150_OHM
} DDR_PHY_ODT;
```

Description

On-Die-Termination Value

This data type defines the ODT termination value.

Remarks

The actual definition of this enumeration is device-specific.

DDR_CMD_REFRESH Macro

File

plib_ddr.h

C

```
#define DDR_CMD_REFRESH 0x00FFF801
```

Description

This is macro DDR_CMD_REFRESH.

DDR_PHY_PREAMBLE_DLY Enumeration

Defines the PHY preamble delay value.

File

plib_ddr_help.h

C

```
typedef enum {
  DDR_PHY_PREAMBLE_DLY_2_0,
  DDR_PHY_PREAMBLE_DLY_1_5,
  DDR_PHY_PREAMBLE_DLY_1_0
} DDR_PHY_PREAMBLE_DLY;
```

Description

PHY Preamble Delay

This data type defines the PHY preamble delay value.

Remarks

The actual definition of this enumeration is device-specific.

DDR_PHY_SCL_BURST_MODE Enumeration

Defines the burst mode for SCL.

File

plib_ddr_help.h

C

```
typedef enum {
  DDR_PHY_SCL_BURST_MODE_4,
  DDR_PHY_SCL_BURST_MODE_8
} DDR_PHY_SCL_BURST_MODE;
```

Description

PHY Preamble Delay

This data type defines the burst mode for SCL.

Remarks

The actual definition of this enumeration is device-specific.

DDR_PHY_SCL_DELAY Enumeration

Defines the SCL delay.

File

plib_ddr_help.h

C

```
typedef enum {
  DDR_PHY_SCL_DELAY_SINGLE,
  DDR_PHY_SCL_DELAY_DOUBLE
} DDR_PHY_SCL_DELAY;
```

Description

DDR Type

This data type defines the SCL delay.

Remarks

The actual definition of this enumeration is device-specific.

DDR_HOST_CMD_REG Enumeration

Defines the DDR host command register.

File

plib_ddr_help.h

C

```
typedef enum {
  DDR_HOST_CMD_REG_100,
  DDR_HOST_CMD_REG_101,
  DDR_HOST_CMD_REG_102,
  DDR_HOST_CMD_REG_103,
  DDR_HOST_CMD_REG_104,
  DDR_HOST_CMD_REG_105,
  DDR_HOST_CMD_REG_106,
  DDR_HOST_CMD_REG_107,
  DDR_HOST_CMD_REG_108,
  DDR_HOST_CMD_REG_109,
  DDR_HOST_CMD_REG_110,
  DDR_HOST_CMD_REG_111,
  DDR_HOST_CMD_REG_112,
  DDR_HOST_CMD_REG_113,
  DDR_HOST_CMD_REG_114,
  DDR_HOST_CMD_REG_115,
  DDR_HOST_CMD_REG_200,
  DDR_HOST_CMD_REG_201,
  DDR_HOST_CMD_REG_202,
  DDR_HOST_CMD_REG_203,
  DDR_HOST_CMD_REG_204,
  DDR_HOST_CMD_REG_205,
  DDR_HOST_CMD_REG_206,
  DDR_HOST_CMD_REG_207,
  DDR_HOST_CMD_REG_208,
  DDR_HOST_CMD_REG_209,
  DDR_HOST_CMD_REG_210,
  DDR_HOST_CMD_REG_211,
  DDR_HOST_CMD_REG_212,
  DDR_HOST_CMD_REG_213,
  DDR_HOST_CMD_REG_214,
  DDR_HOST_CMD_REG_215
} DDR_HOST_CMD_REG;
```

Description

DDR Host Command Register

this data type defines the DDR host command register.

Remarks

The actual definition of this enumeration is device-specific.

DDR_MODULE_ID Enumeration

File

plib_ddr_help.h

C

```
typedef enum {
  DDR_ID_1,
  DDR_NUMBER_OF_MODULES
} DDR_MODULE_ID;
```

Members

Members	Description
DDR_ID_1	DDR 1
DDR_NUMBER_OF_MODULES	Total number of DDR modules available

Description

Enumeration: DDR_MODULE_ID

This enumeration defines the number of modules that are available on the microcontroller. This is the superset of all of the possible instances that might be available on Microchip microcontrollers.

Refer to the data sheet to get the correct number of modules defined for desired microcontroller.

DDR_TARGET Enumeration

Defines the different targets to which the DDR controller is connected.

File

plib_ddr_help.h

C

```
typedef enum {
  DDR_TARGET_CPU,
  DDR_TARGET_GC_IN,
  DDR_TARGET_GC_OUT,
  DDR_TARGET_GPU_IN,
  DDR_TARGET_GPU_OUT
} DDR_TARGET;
```

Description

Targets

This data type defines the different targets to which the DDR controller is connected.

Remarks

The actual definition of this enumeration is device-specific.

Files

Files

Name	Description
plib_ddr.h	Defines the DDR Peripheral Library Interface.

Description

This section lists the source and header files used by the library.

plib_ddr.h

Defines the DDR Peripheral Library Interface.

Functions

	Name	Description
	PLIB_DDR_AutoPchrgDisable	Prevents the DDR controller from issuing an auto-precharge command to close the bank at the end of every user command.
	PLIB_DDR_AutoPchrgEnable	Enables the DDR controller to issue an auto-precharge command to close the bank at the end of every user command.
	PLIB_DDR_AutoPchrgPowerDownDisable	Prevents the DDR controller from automatically entering Precharge Power-down mode.
	PLIB_DDR_AutoPchrgPowerDownEnable	Enables the DDR controller to automatically enter Precharge Power-down mode.
	PLIB_DDR_AutoPowerDownDisable	Prevents the DDR controller from automatically entering Power-down mode.
	PLIB_DDR_AutoPowerDownEnable	Enables the DDR controller to automatically enter Power-down mode.
	PLIB_DDR_AutoSelfRefreshDisable	Prevents the DDR controller from automatically entering Self-refresh mode.
	PLIB_DDR_AutoSelfRefreshEnable	Enables the DDR controller to automatically enter Self-refresh mode.
	PLIB_DDR_BankAddressSet	Initializes the DDR controller memory configuration registers for bank address.
	PLIB_DDR_BigEndianSet	Sets the DDR data endianness to big.
	PLIB_DDR_ChipSelectAddressSet	Initializes the DDR controller memory configuration registers for Chip Select address.
	PLIB_DDR_CmdDataIsComplete	Returns the value of the valid bit in the DDR2CMDISSUE register. This bit is cleared by hardware, when the SDRAM initialization data has been transmitted.
	PLIB_DDR_CmdDataSend	Transmits the data in the command registers to the SDRAM.
	PLIB_DDR_CmdDataValid	Indicates to the controller that the data in the command registers is valid.
	PLIB_DDR_CmdDataWrite	Writes an SDRAM command word to a command register in the controller.
	PLIB_DDR_ColumnAddressSet	Initializes the DDR controller memory configuration registers for the column address.
	PLIB_DDR_ControllerEnable	Enables the controller for normal operations after SDRAM is initialized.
	PLIB_DDR_DataDelaySet	Initializes the DDR controller with the data delays needed for the specific DDR in use.
	PLIB_DDR_ExistsAddressMapping	Identifies whether the AddressMapping feature exists on the DDR module.
	PLIB_DDR_ExistsArbitrationControl	Identifies whether the ArbitrationControl feature exists on the DDR module.
	PLIB_DDR_ExistsAutoPowerDown	Identifies whether the AutoPowerDown feature exists on the DDR module.
	PLIB_DDR_ExistsAutoPrecharge	Identifies whether the AutoPrecharge feature exists on the DDR module.
	PLIB_DDR_ExistsAutoSelfRefresh	Identifies whether the AutoSelfRefresh feature exists on the DDR module.
	PLIB_DDR_ExistsDDRCommands	Identifies whether the DDRCommands feature exists on the DDR module.
	PLIB_DDR_ExistsDDRControllerConfig	Identifies whether the DDRControllerConfig feature exists on the DDR module.
	PLIB_DDR_ExistsODTConfig	Identifies whether the ODTConfig feature exists on the DDR module.
	PLIB_DDR_ExistsPHY_DLLCalibration	Identifies whether the PHY_DLLCalibration feature exists on the DDR module.
	PLIB_DDR_ExistsPHY_PadConfig	Identifies whether the PHY_PadConfig feature exists on the DDR module.
	PLIB_DDR_ExistsPHY_SCLConfig	Identifies whether the PHY_SCLConfig feature exists on the DDR module
	PLIB_DDR_ExistsRefreshConfig	Identifies whether the RefreshConfig feature exists on the DDR module.
	PLIB_DDR_ExistsTimingDelays	Identifies whether the TimingDelays feature exists on the DDR module
	PLIB_DDR_FullRateSet	Sets the DDR controller to Full-rate mode.
	PLIB_DDR_HalfRateSet	Sets the DDR controller to Half-rate mode.
	PLIB_DDR_LittleEndianSet	Sets the DDR data endianness to little.
	PLIB_DDR_MaxCmdBrstCntSet	Sets the maximum number of commands that can be written to the controller in Burst mode.
	PLIB_DDR_MaxPendingRefSet	Initializes the DDR controller refresh configuration.
	PLIB_DDR_MinCommand	Sets the minimum number of bursts to be serviced for a DDR target within (REQPER * 4) number of clocks.
	PLIB_DDR_MinLimit	Sets the minimum number of bursts for a DDR target.
	PLIB_DDR_NumHostCmdsSet	Sets the number of commands to be transmitted to the SDRAM.
	PLIB_DDR_OdtReadDisable	Selects which Chip Select to disable ODT for data reads.
	PLIB_DDR_OdtReadEnable	Selects which Chip Select to enable ODT for data reads.
	PLIB_DDR_OdtReadParamSet	Sets the ODT parameters for data reads.
	PLIB_DDR_OdtWriteDisable	Selects which Chip Select to disable ODT for data writes.
	PLIB_DDR_OdtWriteEnable	Selects which Chip Select to enable ODT for data writes.
	PLIB_DDR_OdtWriteParamSet	Sets the ODT parameters for data writes.
	PLIB_DDR_PHY_AddCtlDriveStrengthSet	Sets the drive strength for the PHY address and control pads.
	PLIB_DDR_PHY_DataDriveStrengthSet	Sets the drive strength for the PHY data pads.
	PLIB_DDR_PHY_DDRTypeSet	Sets the DRAM type for the PHY.

	PLIB_DDR_PHY_DllMasterDelayStartSet	Sets the start value of the digital DLL master delay line.
	PLIB_DDR_PHY_DllRecalibDisable	Disables periodic recalibration of the internal digital DLL.
	PLIB_DDR_PHY_DllRecalibEnable	Enables periodic recalibration of the internal digital DLL, and sets the recalibration period.
	PLIB_DDR_PHY_DriveStrengthSet	Disables On Die Termination.
	PLIB_DDR_PHY_DrvStrgthCal	Calibrates the pad NFET and PFET output impedance.
	PLIB_DDR_PHY_ExternalDllEnable	Enables the use of an external DLL.
	PLIB_DDR_PHY_ExtraClockDisable	Does not enable the drive pad for an extra clock cycle after a write burst.
	PLIB_DDR_PHY_ExtraClockEnable	Enables the drive pad for an extra clock cycle after a write burst.
	PLIB_DDR_PHY_HalfRateSet	Sets the PHY to half rate mode.
	PLIB_DDR_PHY_InternalDllEnable	Enables the use of the internal digital DLL.
	PLIB_DDR_PHY_OdtCal	Calibrates the pull-up and pull-down ODT impedance.
	PLIB_DDR_PHY_OdtCSDisable	Disables ODT on Chip Select while running SCL test.
	PLIB_DDR_PHY_OdtCSEnable	Enables ODT on Chip Select while running SCL test.
	PLIB_DDR_PHY_OdtDisable	Disables On Die Termination.
	PLIB_DDR_PHY_OdtEnable	Enables On Die Termination and sets the value.
	PLIB_DDR_PHY_PadReceiveDisable	Disables pad receivers on bidirectional I/O.
	PLIB_DDR_PHY_PadReceiveEnable	Enables pad receivers on bidirectional I/O.
	PLIB_DDR_PHY_PreambleDlySet	Sets the length of the preamble for data writes.
	PLIB_DDR_PHY_ReadCASLatencySet	Sets the read CAS latency while running SCL test.
	PLIB_DDR_PHY_SCLCapClkDelaySet	Sets capture clock delay during SCL.
	PLIB_DDR_PHY_SCLDDRClkDelaySet	Sets DDR clock delay during SCL.
	PLIB_DDR_PHY_SCLDelay	Disables ODT on Chip Select while running SCL test.
	PLIB_DDR_PHY_SCLEnable	Enables SCL on the Chip Select 'cs'.
	PLIB_DDR_PHY_SCLStart	Runs PHY Self Calibration.
	PLIB_DDR_PHY_SCLStatus	Checks status of PHY Self Calibration.
	PLIB_DDR_PHY_SCLTestBurstModeSet	Sets the burst mode of the DRAM while running SCL test.
	PLIB_DDR_PHY_WriteCASLatencySet	Sets the write CAS latency while running SCL test.
	PLIB_DDR_PHY_WriteCmdDelayDisable	Disables write command delay.
	PLIB_DDR_PHY_WriteCmdDelayEnable	Enables write command delay. The extra delay is needed for devices with even write latency (WL).
	PLIB_DDR_PowerDownDelaySet	Initializes the DDR controller with the power down delays needed for the specific DDR in use.
	PLIB_DDR_PrechargAllBanksSet	Initializes the DDR controller with the read/write precharge delays needed for the specific DDR in use.
	PLIB_DDR_PrechargeToRASDelaySet	Initializes the DDR controller with the read/write precharge delays needed for the specific DDR in use.
	PLIB_DDR_RASToCASDelaySet	Initializes the DDR controller with the row/column address delays needed for the specific DDR in use.
	PLIB_DDR_RASToPrechargeDelaySet	Initializes the DDR controller with the read/write precharge delays needed for the specific DDR in use.
	PLIB_DDR_RASToRASBankDelaySet	Initializes the DDR controller with the row/column address delays needed for the specific DDR in use.
	PLIB_DDR_RASToRASDelaySet	Initializes the DDR controller with the row/column address delays needed for the specific DDR in use.
	PLIB_DDR_ReadReadDelaySet	Initializes the DDR controller with the read/write delays needed for the specific DDR in use.
	PLIB_DDR_ReadToPrechargeDelaySet	Initializes the DDR controller with the read/write precharge delays needed for the specific DDR in use.
	PLIB_DDR_ReadWriteDelaySet	Initializes the DDR controller with the read/write delays needed for the specific DDR in use.
	PLIB_DDR_RefreshTimingSet	Initializes the DDR controller refresh configuration.
	PLIB_DDR_ReqPeriod	Sets the timeout for MINCMD number of bursts to be serviced for a DDR target.
	PLIB_DDR_RowAddressSet	Initializes the DDR controller memory configuration registers for row address.
	PLIB_DDR_SelfRefreshDelaySet	Initializes the DDR controller with the self-refresh delays needed for the specific DDR in use.
	PLIB_DDR_TfawDelaySet	Initializes the DDR controller with the four-bank activation window needed for the specific DDR in use.

	PLIB_DDR_WriteReadDelaySet	Initializes the DDR controller with the read/write delays needed for the specific DDR in use.
	PLIB_DDR_WriteToPrechargeDelaySet	Initializes the DDR controller with the read/write precharge delays needed for the specific DDR in use.
	PLIB_DDR_WriteWriteDelaySet	Initializes the DDR controller with the read/write delays needed for the specific DDR in use.

Macros

	Name	Description
	DDR_CMD_IDLE_NOP	
	DDR_CMD_LOAD_MODE	This is macro DDR_CMD_LOAD_MODE.
	DDR_CMD_PRECHARGE_ALL	This is macro DDR_CMD_PRECHARGE_ALL.
	DDR_CMD_REFRESH	This is macro DDR_CMD_REFRESH.

Description

Dual Data Rate (DDR) SDRAM Peripheral Library Interface Header

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the DDR Peripheral Library for Microchip microcontrollers. The definitions in this file are for the DDR module.

File Name

plib_ddr.h

Company

Microchip Technology Inc.

EBI Peripheral Library

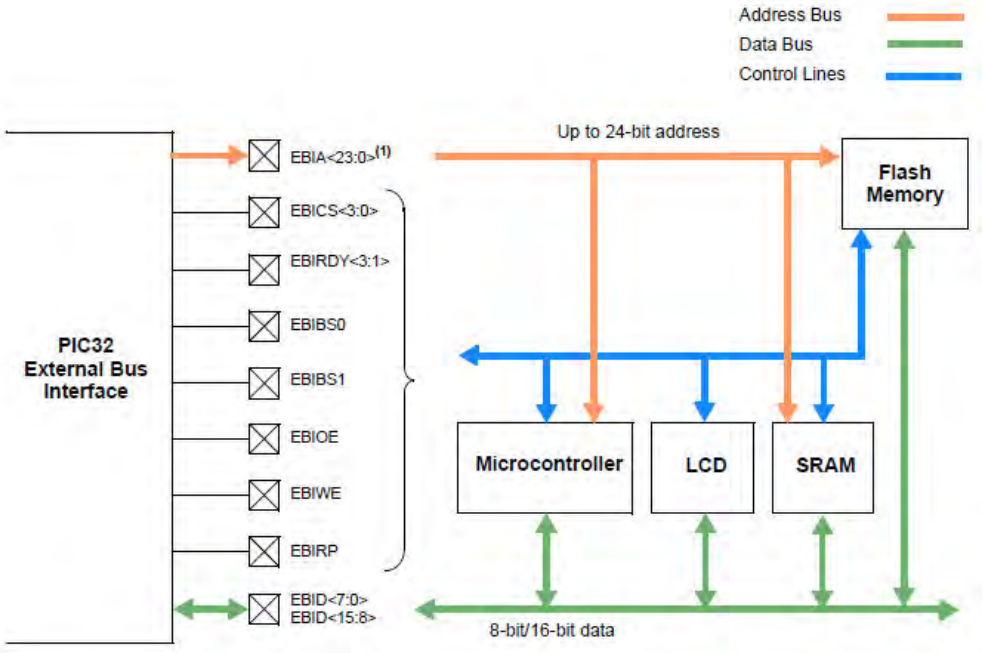
This section describes the External Bus Interface (EBI) Peripheral Library.

Introduction

This library provides a low-level abstraction of the EBI Peripheral Library that is available on the Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, there by hiding differences from one microcontroller variant to another.

Description

The External Bus Interface (EBI) allows for external physical memory to be mapped into the kernels virtual memory map. The External Bus Interface (EBI) module provides a high-speed, convenient way to interface external parallel memory devices to the PIC32 family device. With the EBI module, it is possible to connect asynchronous SRAM and NOR Flash devices, as well as non-memory devices such as camera sensors. The module also supports Low-Cost Controllerless (LCC) Graphics devices.



Note 1: No EBIA address pins are available on 64-pin devices and the EBIA<23:20> address pins are only available on 144-pin devices.

Using the Library

This topic describes the basic architecture of the EBI Peripheral Library and provides information and examples on its use.

Description

Interface Header File: `plib_ebi.h`

The interface to the EBI Peripheral library is defined in the plib_ebi.h header file, which is included by the peripheral library header file, `peripheral.h`. Any C language source (`.c`) file that uses the EBI Peripheral library must include `peripheral.h`.

Library File:

The EBI Peripheral library archive (`.a`) file is installed with MPLAB Harmony.

Please refer to the What is MPLAB Harmony? section for how the Peripheral interacts with the framework.

Library Overview

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the EBI module.

Library Interface Section	Description
Get Functions	These functions can be used to return the status of a feature.

Set Functions	These functions can be used to configure features.
Feature Existence Functions	Lists the interface routines that describe whether or not the feature is supported by the device.

How the Library Works

Before using the EBI module, it must be enabled by the application developer(s). To work correctly, the device characteristics of the attached Memory/Flash must be set with the functions in this library. The Characteristics of the Memory/Flash will be found in the specific device data sheet.

Note: Not all modes are available on all devices. Please refer to the specific device data sheet to determine the supported modes.

Configuring the Library

The library is configured for the supported EBI module when the processor is chosen in the MPLAB X IDE.

Library Interface

a) Get Functions

	Name	Description
	PLIB_EBI_AddressHoldTimeGet	Returns the address hold time.
	PLIB_EBI_AddressSetupTimeGet	Returns the setup hold time.
	PLIB_EBI_BaseAddressGet	Returns the base address set for each Chip Select.
	PLIB_EBI_ControlEnableGet	Returns the status of the EBI enable bit.
	PLIB_EBI_DataTurnAroundTimeGet	Returns the data turn-around time set for the EBI bus.
	PLIB_EBI_FlashPowerDownModeGet	Returns the set power-down state.
	PLIB_EBI_FlashResetPinGet	Sets the control use of Flash Reset pin.
	PLIB_EBI_PageModeGet	Returns the Paging mode settings.
	PLIB_EBI_PageReadCycleTimeGet	Returns the cycle time for a page read.
	PLIB_EBI_ReadCycleTimeGet	Returns the read time in the number of clock cycles.
	PLIB_EBI_ReadyModeGet	Returns whether or not Ready mode was set.
	PLIB_EBI_StaticMemoryWidthRegisterGet	Returns the set width of the data bus.
	PLIB_EBI_WritePulseWidthGet	Returns the set hold time in clock cycles.
	PLIB_EBI_MemoryPageSizeGet	Returns the Paging mode settings.
	PLIB_EBI_FlashTimingGet	Returns the set Flash timing for external Flash.

b) Set Functions

	Name	Description
	PLIB_EBI_AddressPinEnableBitsSet	Sets the address pins used for EBI.
	PLIB_EBI_BaseAddressSet	Sets the base address for physical memory at each Chip Select pin.
	PLIB_EBI_ByteSelectPinSet	Sets the data Byte Select High <15:8> and Low <7:0> enable pins for use.
	PLIB_EBI_ChipSelectEnableSet	Sets the Chip Select pins for use with the EBI or GPIO.
	PLIB_EBI_DataEnableSet	Sets the use of Data Byte Select Pins, High and Low, for control with EBI or GPIO.
	PLIB_EBI_FlashPowerDownModeSet	Sets the pin state for Flash devices on Power-down and Reset.
	PLIB_EBI_FlashResetPinSet	Sets the control use of the Flash Reset pin.
	PLIB_EBI_FlashTimingSet	Sets the timing for hold in reset for external Flash.
	PLIB_EBI_MemoryCharacteristicsSet	Sets the characteristics for memory or attached devices attached to the specified pin.
	PLIB_EBI_MemoryPagingSet	Sets the size of the memory page if paging is used.
	PLIB_EBI_MemoryTimingConfigSet	Sets the cycle time for page reading.
	PLIB_EBI_ReadyPin1ConfigSet	Sets the control use of ReadyPin1 and inverts the status.
	PLIB_EBI_ReadyPin2ConfigSet	Sets the control use of ReadyPin2 and inverts the status.
	PLIB_EBI_ReadyPin3ConfigSet	Sets the control use of ReadyPin3 and inverts the status.
	PLIB_EBI_ReadyPinSensSet	Sets the sensitivity of the Ready pin.
	PLIB_EBI_StaticMemoryWidthRegisterSet	Sets the data width of static memory.

	PLIB_EBI_WriteOutputControlSet	Sets the Write Enable and Output Enable control pins.
	PLIB_EBI_ControlEnableSet	Sets the EBI bus ON/OFF enable bit.
	PLIB_EBI_ReadyModeSet	Sets the use of Ready mode for each pin.

c) Feature Existence Functions

	Name	Description
	PLIB_EBI_ExistsAddressHoldTime	Identifies whether the AddressHoldTime feature exists on the EBI module.
	PLIB_EBI_ExistsAddressPinEnableBits	Identifies whether the AddressPinEnableBits feature exists on the EBI module.
	PLIB_EBI_ExistsAddressSetupTime	Identifies whether the AddressSetupTime feature exists on the EBI module.
	PLIB_EBI_ExistsBaseAddress	Identifies whether the Base_Address feature exists on the EBI module.
	PLIB_EBI_ExistsByteSelectPin	Identifies whether the ByteSelectPin feature exists on the EBI module.
	PLIB_EBI_ExistsChipSelectEnable	Identifies whether the ChipSelectEnable feature exists on the EBI module.
	PLIB_EBI_ExistsControlEnable	Identifies whether the ControlEnable feature exists on the EBI module.
	PLIB_EBI_ExistsDataEnable	Identifies whether the DataEnable feature exists on the EBI module.
	PLIB_EBI_ExistsDataTurnAroundTime	Identifies whether the DataTurnAroundTime feature exists on the EBI module.
	PLIB_EBI_ExistsFlashPowerDownMode	Identifies whether the FlashPowerDownMode feature exists on the EBI module.
	PLIB_EBI_ExistsFlashResetPin	Identifies whether the FlashResetPin feature exists on the EBI module.
	PLIB_EBI_ExistsFlashTiming	Identifies whether the FlashTiming feature exists on the EBI module.
	PLIB_EBI_ExistsMemoryCharacteristics	Identifies whether the MemoryCharacteristics feature exists on the EBI module.
	PLIB_EBI_ExistsMemoryPaging	Identifies whether the MemoryPaging feature exists on the EBI module.
	PLIB_EBI_ExistsMemoryTimingConfig	Identifies whether the MemoryTimingConfig feature exists on the EBI module.
	PLIB_EBI_ExistsPageMode	Identifies whether the PageMode feature exists on the EBI module.
	PLIB_EBI_ExistsPageReadTime	Identifies whether the PageReadTime feature exists on the EBI module.
	PLIB_EBI_ExistsReadCycleTime	Identifies whether the ReadCycleTime feature exists on the EBI module.
	PLIB_EBI_ExistsReadyMode	Identifies whether the ReadyMode feature exists on the EBI module.
	PLIB_EBI_ExistsReadyPin1Config	Identifies whether the ReadyPin1Config feature exists on the EBI module.
	PLIB_EBI_ExistsReadyPin2Config	Identifies whether the ReadyPin2Config feature exists on the EBI module.
	PLIB_EBI_ExistsReadyPin3Config	Identifies whether the ReadyPin3Config feature exists on the EBI module.
	PLIB_EBI_ExistsReadyPinSens	Identifies whether the ReadyPinSens feature exists on the EBI module
	PLIB_EBI_ExistsStaticMemoryWidthRegister	Identifies whether the StaticMemoryWidthRegister feature exists on the EBI module.
	PLIB_EBI_ExistsWriteOutputControl	Identifies whether the WriteOutputControl feature exists on the EBI module.
	PLIB_EBI_ExistsWritePulseWidth	Identifies whether the WritePulseWidth feature exists on the EBI module.

d) Data Types and Constants

	Name	Description
	EBI_ADDRESS_PORT	Selects the EBI address port.
	EBI_CS_TIMING	Selects the timing register set for Chip Select.
	EBI_MEMORY_SIZE	Selects the memory size for Chip Select.
	EBI_MEMORY_TYPE	Selects the memory type for Chip Select.
	EBI_MODULE_ID	Identifies the supported EBI modules.
	EBI_PAGE_SIZE	Selects the page size for the page mode device.
	EBI_STATIC_MEMORY_WIDTH	Selects the static memory width for the register EBISMTx.

Description

This section describes the Application Programming Interface (API) functions of the EBI Peripheral Library.

Refer to each section for a detailed description.

a) Get Functions

PLIB_EBI_AddressHoldTimeGet Function

Returns the address hold time.

File

plib_ebi.h

C

```
int PLIB_EBI_AddressHoldTimeGet(EBI_MODULE_ID index, int ChipSelectNumber);
```

Returns

Returns an integer, which is the Address and Data Hold time in the number of clocks.

Description

This function returns the address and data hold time.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
ChipSelectNumber	Identifies the specific Chip Select pin

Function

PLIB_EBI_AddressHoldTimeGet (EBI_MODULE_ID index,int ChipSelectNumber)

PLIB_EBI_AddressSetupTimeGet Function

Returns the setup hold time.

File

plib_ebi.h

C

```
int PLIB_EBI_AddressSetupTimeGet(EBI_MODULE_ID index, int ChipSelectNumber);
```

Returns

Returns an integer, which is the address setup time in the number of clocks.

Description

This function returns the setup hold time. A value of '0' is only valid in the case of SSRAM.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
ChipSelectNumber	Identifies the specific Chip Select pin

Function

PLIB_EBI_AddressSetupTimeGet (EBI_MODULE_ID index,int ChipSelectNumber)

PLIB_EBI_BaseAddressGet Function

Returns the base address set for each Chip Select.

File

plib_ebi.h

C

```
uint32_t PLIB_EBI_BaseAddressGet(EBI_MODULE_ID index, int ChipSelectNumber);
```

Returns

Returns an unsigned integer that is the physical address of the attached device.

Description

This function returns the base address for each Chip Select pin.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
ChipSelectNumber	Identifies which Chip Select address pin address is being read

Function

PLIB_EBI_BaseAddressGet (EBI_MODULE_ID index, int ChipSelectNumber)

PLIB_EBI_ControlEnableGet Function

Returns the status of the EBI enable bit.

File

plib_ebi.h

C

```
bool PLIB_EBI_ControlEnableGet(EBI_MODULE_ID index);
```

Returns

Boolean:

- 1 = The EBI module is ON
- 0 = The EBI module is OFF

Description

This function returns the status of the EBI enable bit.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_EBI_ControlEnableGet (EBI_MODULE_ID index)

PLIB_EBI_DataTurnAroundTimeGet Function

Returns the data turn-around time set for the EBI bus.

File

plib_ebi.h

C

```
int PLIB_EBI_DataTurnAroundTimeGet(EBI_MODULE_ID index, int ChipSelectNumber);
```

Returns

Returns an integer, which is the number of clock cycles that is set in the turn-around register.

Description

This function returns the data turn-around time set for the EBI Bus. Returns the clock cycles (0-7) for static memory between read-to-write, write-to-read, and read-to-read when Chip Select changes.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
ChipSelectNumber	Identifies the specific Chip Select pin

Function

PLIB_EBI_DataTurnAroundTimeGet (EBI_MODULE_ID index,int ChipSelectNumber)

PLIB_EBI_FlashPowerDownModeGet Function

Returns the set power-down state.

File

plib_ebi.h

C

```
bool PLIB_EBI_FlashPowerDownModeGet(EBI_MODULE_ID index);
```

Returns

A bool, depending on the setting of PLIB_EBI_FlashPowerDownModeSet.

Description

This function returns the set power-down state.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_EBI_FlashPowerDownModeGet (EBI_MODULE_ID index)

PLIB_EBI_FlashResetPinGet Function

Sets the control use of Flash Reset pin.

File

plib_ebi.h

C

```
bool PLIB_EBI_FlashResetPinGet(EBI_MODULE_ID index);
```

Returns

Returns a Boolean.

Description

This function set the control use of the Flash Reset pin.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_EBI_FlashResetPinGet (EBI_MODULE_ID index)

PLIB_EBI_PageModeGet Function

Returns the Paging mode settings.

File

plib_ebi.h

C

```
bool PLIB_EBI_PageModeGet(EBI_MODULE_ID index, int ChipSelectNumber);
```

Returns

- 1 = Page Mode is used
- 0 = Page Mode is not used

Description

This function returns the state of the register PAGEMODE.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
ChipSelectNumber	Identifies the specific Chip Select pin

Function

PLIB_EBI_PageModeGet (EBI_MODULE_ID index,int ChipSelectNumber)

PLIB_EBI_PageReadCycleTimeGet Function

Returns the cycle time for a page read.

File

plib_ebi.h

C

```
int PLIB_EBI_PageReadCycleTimeGet(EBI_MODULE_ID index, int ChipSelectNumber);
```

Returns

Returns an integer, which is the number of clock cycles used to read a memory page.

Description

This function returns the cycle time for a page read. Read cycle time = TPRC + 1cycle. The value set and return are the same, the controller performs the read on the next clock, which is why there is a +1.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
ChipSelectNumber	Identifies the specific Chip Select pin

Function

PLIB_EBI_PageReadCycleTimeGet (EBI_MODULE_ID index,int ChipSelectNumber)

PLIB_EBI_ReadCycleTimeGet Function

Returns the read time in the number of clock cycles.

File

plib_ebi.h

C

```
int PLIB_EBI_ReadCycleTimeGet(EBI_MODULE_ID index, int ChipSelectNumber);
```

Returns

Returns an integer, which is the read cycle time in system clocks.

Description

This function returns the read time in number of clock cycles. Read Cycle time = TRC +1 clock cycle. The controller will always take one extra clock (the next clock) for a Read Cycle. The return will be the time set by the user.

Setting a Read Cycle time to a '0' will return a '0' when read, but the controller will add '1' to that value for the next available clock.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

ChipSelectNumber	Identifies which Chip Select number to which the device is attached

Function

PLIB_EBI_ReadCycleTimeGet (EBI_MODULE_ID index, int ChipSelectNumber)

PLIB_EBI_ReadyModeGet Function

Returns whether or not Ready mode was set.

File

plib_ebi.h

C

```
bool PLIB_EBI_ReadyModeGet(EBI_MODULE_ID index, int ChipSelectNumber);
```

Returns

This function returns a bool.

- 1 = Ready input is used
- 0 = Ready input is not used

Description

This function returns the state of the register RDYMODE.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
ChipSelectNumber	Identifies the specific Chip Select pin

Function

PLIB_EBI_ReadyModeGet (EBI_MODULE_ID index, int ChipSelectNumber)

PLIB_EBI_StaticMemoryWidthRegisterGet Function

Returns the set width of the data bus.

File

plib_ebi.h

C

```
EBI_STATIC_MEMORY_WIDTH PLIB_EBI_StaticMemoryWidthRegisterGet(EBI_MODULE_ID index, int RegisterNumber);
```

Returns

An enum type, which is the bus mode in use.

Description

This function returns the set width of the data bus.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_EBI_StaticMemoryWidthRegisterGet (EBI_MODULE_ID index,
int RegisterNumber)

PLIB_EBI_WritePulseWidthGet Function

Returns the set hold time in clock cycles.

File

plib_ebi.h

C

```
int PLIB_EBI_WritePulseWidthGet(EBI_MODULE_ID index, int ChipSelectNumber);
```

Returns

Returns an integer, which is the number of clock cycles to which the write pulse width is set.

Description

This function returns the set hold time in clock cycles. Write Pulse with = TWP + 1 clock cycle.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
ChipSelectNumber	Identifies the specific Chip Select pin

Function

PLIB_EBI_WritePulseWidthGet (EBI_MODULE_ID index,int ChipSelectNumber)

PLIB_EBI_MemoryPageSizeGet Function

Returns the Paging mode settings.

File

plib_ebi.h

C

```
EBI_PAGE_SIZE PLIB_EBI_MemoryPageSizeGet(EBI_MODULE_ID index, int ChipSelectNumber);
```

Returns

Size of the memory page.

Description

This function returns the state of the register PAGESIZE.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
ChipSelectNumber	Identifies the specific Chip Select pin

Function

PLIB_EBI_MemoryPageSizeGet (EBI_MODULE_ID index, int ChipSelectNumber)

PLIB_EBI_FlashTimingGet Function

Returns the set Flash timing for external Flash.

File

plib_ebi.h

C

```
int PLIB_EBI_FlashTimingGet(EBI_MODULE_ID index);
```

Returns

Returns an integer, which is the number of clock cycles.

Description

This function returns the set number of clock cycles to hold the external Flash memory in reset.

Remarks

None.

Preconditions

MemoryType must be set to Flash.

Function

PLIB_EBI_FlashTimingGet (EBI_MODULE_ID index)

b) Set Functions

PLIB_EBI_AddressPinEnableBitsSet Function

Sets the address pins used for EBI.

File

plib_ebi.h

C

```
void PLIB_EBI_AddressPinEnableBitsSet(EBI_MODULE_ID index, EBI_ADDRESS_PORT AddressPort);
```

Returns

None.

Description

This function sets the address pins used for EBI.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
AddressPort	Identifies how many pins are used for addressing on the EBI bus

Function

PLIB_EBI_AddressPinEnableBitsSet (EBI_MODULE_ID index,
EBI_ADDRESS_PORT AddressPort)

PLIB_EBI_BaseAddressSet Function

Sets the base address for physical memory at each Chip Select pin.

File

plib_ebi.h

C

```
void PLIB_EBI_BaseAddressSet(EBI_MODULE_ID index, int ChipSelectNumber, uint32_t BaseAddress);
```

Returns

None.

Description

This function sets the base address for physical memory at each Chip Select pin.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
ChipSelectNumber	Identifies which Chip Select address pin is being assigned an address
BaseAddress	A physical address for memory

Function

PLIB_EBI_BaseAddressSet(EBI_MODULE_ID index, int ChipSelectNumber,
uint32_t BaseAddress)

PLIB_EBI_ByteSelectPinSet Function

Sets the data Byte Select High <15:8> and Low <7:0> enable pins for use.

File

plib_ebi.h

C

```
void PLIB_EBI_ByteSelectPinSet(EBI_MODULE_ID index, bool ByteSelect0, bool ByteSelect1);
```

Returns

None.

Description

This function sets the data Byte Select High <15:8> and Low <7:0> enable pins for use. If the system uses Byte Select High/Low pins for the data, the pins must be enabled for use in the EBI controller.

Remarks

None.

Preconditions

The EBIDEN0 and EBIDEN1 registers must first be enabled, which is done using the function PLIB_EBI_DataEnableSet.

Parameters

Parameters	Description
index	Identifier for the device instance
ByteSelect0	Identifies the Lower Byte Select Pin for enabling
ByteSelect1	Identifies the Upper Byte Select Pin for enabling

Function

PLIB_EBI_ByteSelectPinSet (EBI_MODULE_ID index, bool ByteSelect0, bool ByteSelect1)

PLIB_EBI_ChipSelectEnableSet Function

Sets the Chip Select pins for use with the EBI or GPIO.

File

plib_ebi.h

C

```
void PLIB_EBI_ChipSelectEnableSet(EBI_MODULE_ID index, bool ChipSelect0, bool ChipSelect1, bool
ChipSelect2, bool ChipSelect3);
```

Returns

None.

Description

This functions sets which Chip Select pins to use with the EBI or GPIO.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
ChipSelect0	Identifies control of Chip Select 0 for enabling
ChipSelect1	Identifies control of Chip Select 1 for enabling
ChipSelect2	Identifies control of Chip Select 2 for enabling
ChipSelect3	Identifies control of Chip Select 3 for enabling

Function

PLIB_EBI_ChipSelectEnableSet (EBI_MODULE_ID index, bool ChipSelect0,
bool ChipSelect1, bool ChipSelect2, bool ChipSelect3)

PLIB_EBI_DataEnableSet Function

Sets the use of Data Byte Select Pins, High and Low, for control with EBI or GPIO.

File

plib_ebi.h

C

```
void PLIB_EBI_DataEnableSet(EBI_MODULE_ID index, bool DataUpperByte, bool DataLowerByte);
```

Returns

None.

Description

This function sets the use of the Data Byte Select Pins, High and Low, for control with EBI or GPIO.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
DataUpperByte	Identifies control of Upper Data Byte for enabling
DataLowerByte	Identifies control of Lower Data Byte for enabling

Function

PLIB_EBI_DataEnableSet (EBI_MODULE_ID index, bool DataUpperByte, bool DataLowerByte)

PLIB_EBI_FlashPowerDownModeSet Function

Sets the pin state for Flash devices on Power-down and Reset.

File

plib_ebi.h

C

```
void PLIB_EBI_FlashPowerDownModeSet(EBI_MODULE_ID index, bool FlashPowerDownMode);
```

Returns

None.

Description

This function sets the pin state for Flash devices upon a Power-down and Reset.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
FlashPowerDownMode	A bool, which sets the power-down state for Flash memory

Function

PLIB_EBI_FlashPowerDownModeSet (EBI_MODULE_ID index, bool FlashPowerDownMode)

PLIB_EBI_FlashResetPinSet Function

Sets the control use of the Flash Reset pin.

File

plib_ebi.h

C

```
void PLIB_EBI_FlashResetPinSet(EBI_MODULE_ID index, bool FlashResetPin);
```

Returns

None.

Description

This function sets the control use of the Flash Reset pin.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
FlashReadPin	Flash Reset pin is used

Function

PLIB_EBI_FlashResetPinSet (EBI_MODULE_ID index, bool FlashReadPin)

PLIB_EBI_FlashTimingSet Function

Sets the timing for hold in reset for external Flash.

File

plib_ebi.h

C

```
void PLIB_EBI_FlashTimingSet(EBI_MODULE_ID index, int FlashTiming);
```

Returns

None.

Description

This function sets the number of clock cycles to hold the external Flash memory in reset.

Remarks

None.

Preconditions

NOR Flash must be used with EBI instead of SRAM.

Parameters

Parameters	Description
index	Identifier for the device instance
FlashTiming	An integer, which is the number of clock cycles

Function

PLIB_EBI_FlashTimingSet (EBI_MODULE_ID index, int FlashTiming)

PLIB_EBI_MemoryCharacteristicsSet Function

Sets the characteristics for memory or attached devices attached to the specified pin.

File

plib_ebi.h

C

```
void PLIB_EBI_MemoryCharacteristicsSet(EBI_MODULE_ID index, int ChipSelectNumber, EBI_MEMORY_TYPE
MemoryType, EBI_MEMORY_SIZE MemorySize, EBI_CS_TIMING TimingReg);
```

Returns

None.

Description

This function sets the characteristics for memory or attached devices attached to the specified pin.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
ChipSelectNumber	Identifies which Chip Select pin is used
MemoryType	Identifies which memory is used
MemorySize	An enum type, which sets the size of the attached memory device
TimingRegSet	Identifies the timing register

Function

PLIB_EBI_MemoryCharacteristicsSet(EBI_MODULE_ID index, int ChipSelectNumber,
EBI_MEMORY_TYPE MemoryType,
EBI_MEMORY_SIZE MemorySize,
EBI_CS_TIMING TimingReg)

PLIB_EBI_MemoryPagingSet Function

Sets the size of the memory page if paging is used.

File

plib_ebi.h

C

```
void PLIB_EBI_MemoryPagingSet(EBI_MODULE_ID index, int ChipSelectNumber, bool PageMode, EBI_PAGE_SIZE
MemoryPageSize);
```

Returns

- 1 = Device supports Page mode
- 0 = Device does not support Page mode

Description

This function sets the size of the memory page if paging is used.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
ChipSelectNumber	Sets for that Chip Select pin <3:0>
PageMode	Enable or disable Page mode
MemoryPageSize	Size of memory pages

Function

PLIB_EBI_MemoryPagingSet (EBI_MODULE_ID index, int ChipSelectNumber,
bool PageMode, EBI_PAGE_SIZE MemoryPageSize)

PLIB_EBI_MemoryTimingConfigSet Function

Sets the cycle time for page reading.

File

plib_ebi.h

C

```
void PLIB_EBI_MemoryTimingConfigSet(EBI_MODULE_ID index, int CS_Timing_Reg, int PageReadTime, int
DataTurnAroundTime, int WritePulseWidth, int AddressHoldTime, int AddressSetupTime, int ReadCycleTime);
```

Returns

None.

Description

This function sets the cycle time for page reading.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
CS_Timing_Reg	Identifies which Chip Select Timing register to use EBISMT<0:2>
PageReadTime	The clock cycle needed for a Memory Page read
DataTurnAroundTime	Time between read-to-write, write-to-read, and read-to-read when Chip Select changes state.
WritePulseWidth	The clock cycles needed for a memory write
AddressHoldTime	The clock time needed for the address bus to hold
AddressSetupTime	The time needed for the address to settle
ReadCycleTime	_nt_

Function

PLIB_EBI_MemoryTimingConfigSet(EBI_MODULE_ID index, int CS_Timing_Reg,
int PageReadTime,
int DataTurnAroundTime,
int WritePulseWidth,
int AddressHoldTime,
int AddressSetupTime,
int ReadCycleTime)

PLIB_EBI_ReadyPin1ConfigSet Function

Sets the control use of ReadyPin1 and inverts the status.

File

plib_ebi.h

C

```
void PLIB_EBI_ReadyPin1ConfigSet(EBI_MODULE_ID index, bool ReadyPin1Enable, bool ReadyPin1Invert);
```

Returns

None.

Description

This function sets the control use of ReadyPin1, and then inverts the status.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
ReadyPin1Invert	Identifies the ON/OFF for invert
ReadyPin1Enable	Identifies if this pin is used by the control part

Function

PLIB_EBI_ReadyPin1ConfigSet (EBI_MODULE_ID index, bool ReadyPin1Enable,
bool ReadyPin1Invert)

PLIB_EBI_ReadyPin2ConfigSet Function

Sets the control use of ReadyPin2 and inverts the status.

File

plib_ebi.h

C

```
void PLIB_EBI_ReadyPin2ConfigSet(EBI_MODULE_ID index, bool ReadyPin2Enable, bool ReadyPin2Invert);
```

Returns

None.

Description

This function sets the control use of ReadyPin2 and inverts the status.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
ReadyPin2Invert	Identifies the ON/OFF for invert
ReadyPin2Enable	Identifies if this pin is used by the control part

Function

PLIB_EBI_ReadyPin2ConfigSet (EBI_MODULE_ID index, bool ReadyPin2Enable,
bool ReadyPin2Invert)

PLIB_EBI_ReadyPin3ConfigSet Function

Sets the control use of ReadyPin3 and inverts the status.

File

plib_ebi.h

C

```
void PLIB_EBI_ReadyPin3ConfigSet(EBI_MODULE_ID index, bool ReadyPin3Enable, bool ReadyPin3Invert);
```

Returns

None.

Description

This function sets the control use of ReadyPin3, and then inverts the status.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
ReadyPin3Invert	Identifies the ON/OFF for invert
ReadyPin3Enable	Identifies if this pin is used by the control part

Function

PLIB_EBI_ReadyPin3ConfigSet (EBI_MODULE_ID index, bool ReadyPin3Enable,
bool ReadyPin3Invert)

PLIB_EBI_ReadyPinSensSet Function

Sets the sensitivity of the Ready pin.

File

plib_ebi.h

C

```
void PLIB_EBI_ReadyPinSensSet(EBI_MODULE_ID index, bool SensitivityControl);
```

Returns

None.

Description

This function sets the sensitivity of the Ready pin.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
SensitivityControl	Selection edge or level detection

Function

PLIB_EBI_ReadyPinSensSet (EBI_MODULE_ID index, bool SensitivityControl)

PLIB_EBI_StaticMemoryWidthRegisterSet Function

Sets the data width of static memory.

File

plib_ebi.h

C

```
void PLIB_EBI_StaticMemoryWidthRegisterSet(EBI_MODULE_ID index, int RegisterNumber, EBI_STATIC_MEMORY_WIDTH
StaticMemoryWidthRegister);
```

Returns

None.

Description

This function sets the data width of static memory.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
RegisterNumber	The ID for the register being set
StaticMemoryWidthRegister	Identifies a bus width of either 8 bits or 16 bits

Function

PLIB_EBI_StaticMemoryWidthRegisterSet (EBI_MODULE_ID index, int RegisterNumber,
EBI_STATIC_MEMORY_WIDTH StaticMemoryWidthRegister)

PLIB_EBI_WriteOutputControlSet Function

Sets the Write Enable and Output Enable control pins.

File

plib_ebi.h

C

```
void PLIB_EBI_WriteOutputControlSet(EBI_MODULE_ID index, bool WriteEnable, bool OutputEnable);
```

Returns

None.

Description

This function sets the Write Enable and Output Enable control pins.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
WriteEnable	Used for enabling Write Enable
OutputEnable	Used for enabling Output Enable

Function

PLIB_EBI_WriteOutputControlSet (EBI_MODULE_ID index, bool WriteEnable,
bool OutputEnable)

PLIB_EBI_ControlEnableSet Function

Sets the EBI bus ON/OFF enable bit.

File

plib_ebi.h

C

```
void PLIB_EBI_ControlEnableSet(EBI_MODULE_ID index, bool EnableBit);
```

Returns

None.

Description

This function sets the EBI bus ON/OFF enable bit.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
EnableBit	Identifies the enable bit

Function

PLIB_EBI_ControlEnableSet (EBI_MODULE_ID index, bool EnableBit)

PLIB_EBI_ReadyModeSet Function

Sets the use of Ready mode for each pin.

File

plib_ebi.h

C

```
void PLIB_EBI_ReadyModeSet(EBI_MODULE_ID index, bool ReadyPin0, bool ReadyPin1, bool ReadyPin2);
```

Returns

None.

Description

This function sets the use of Ready mode for each pin. The attached device will either pull the ready pin high or low.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance; ReadyPin0, ReadyPin1, ReadyPin2
ReadyPin(x)	Identifies the ready pin (1-3)

Function

PLIB_EBI_ReadyModeSet (EBI_MODULE_ID index, bool ReadyPin0, bool ReadyPin1,
bool ReadyPin2)

c) Feature Existence Functions

PLIB_EBI_ExistsAddressHoldTime Function

Identifies whether the AddressHoldTime feature exists on the EBI module.

File

plib_ebi.h

C

```
bool PLIB_EBI_ExistsAddressHoldTime(EBI_MODULE_ID index);
```

Returns

- true - The AddressHoldTime feature is supported on the device
- false - The AddressHoldTime feature is not supported on the device

Description

This function identifies whether the AddressHoldTime feature is available on the EBI module. When this function returns true, this function is supported on the device:

- PLIB_EBI_AddressHoldTimeGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_EBI_ExistsAddressHoldTime(EBI_MODULE_ID index)

PLIB_EBI_ExistsAddressPinEnableBits Function

Identifies whether the AddressPinEnableBits feature exists on the EBI module.

File

plib_ebi.h

C

```
bool PLIB_EBI_ExistsAddressPinEnableBits(EBI_MODULE_ID index);
```

Returns

- true - The AddressPinEnableBits feature is supported on the device
- false - The AddressPinEnableBits feature is not supported on the device

Description

This function identifies whether the AddressPinEnableBits feature is available on the EBI module. When this function returns true, these functions are supported on the device:

- PLIB_EBI_AddressPinEnableBitsSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_EBI_ExistsAddressPinEnableBits(EBI_MODULE_ID index)

PLIB_EBI_ExistsAddressSetupTime Function

Identifies whether the AddressSetupTime feature exists on the EBI module.

File

plib_ebi.h

C

```
bool PLIB_EBI_ExistsAddressSetupTime(EBI_MODULE_ID index);
```

Returns

- true - The AddressSetupTime feature is supported on the device
- false - The AddressSetupTime feature is not supported on the device

Description

This function identifies whether the AddressSetupTime feature is available on the EBI module. When this function returns true, this function is supported on the device:

- PLIB_EBI_AddressSetupTimeGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_EBI_ExistsAddressSetupTime(EBI_MODULE_ID index)

PLIB_EBI_ExistsBaseAddress Function

Identifies whether the Base_Address feature exists on the EBI module.

File

plib_ebi.h

C

```
bool PLIB_EBI_ExistsBaseAddress(EBI_MODULE_ID index);
```

Returns

- true - The Base_Address feature is supported on the device
- false - The Base_Address feature is not supported on the device

Description

This function identifies whether the Base_Address feature is available on the EBI module. When this function returns true, these functions are supported on the device:

- PLIB_EBI_BaseAddressSet
- PLIB_EBI_BaseAddressGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_EBI_ExistsBaseAddress(EBI_MODULE_ID index)

PLIB_EBI_ExistsByteSelectPin Function

Identifies whether the ByteSelectPin feature exists on the EBI module.

File

plib_ebi.h

C

```
bool PLIB_EBI_ExistsByteSelectPin(EBI_MODULE_ID index);
```

Returns

- true - The ByteSelectPin feature is supported on the device
- false - The ByteSelectPin feature is not supported on the device

Description

This function identifies whether the ByteSelectPin feature is available on the EBI module. When this function returns true, this function is supported on the device:

- PLIB_EBI_ByteSelectPinSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_EBI_ExistsByteSelectPin(EBI_MODULE_ID index)

PLIB_EBI_ExistsChipSelectEnable Function

Identifies whether the ChipSelectEnable feature exists on the EBI module.

File

plib_ebi.h

C

```
bool PLIB_EBI_ExistsChipSelectEnable(EBI_MODULE_ID index);
```

Returns

- true - The ChipSelectEnable feature is supported on the device
- false - The ChipSelectEnable feature is not supported on the device

Description

This function identifies whether the ChipSelectEnable feature is available on the EBI module. When this function returns true, this function is supported on the device:

- PLIB_EBI_ChipSelectEnableSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_EBI_ExistsChipSelectEnable(EBI_MODULE_ID index)

PLIB_EBI_ExistsControlEnable Function

Identifies whether the ControlEnable feature exists on the EBI module.

File

plib_ebi.h

C

```
bool PLIB_EBI_ExistsControlEnable(EBI_MODULE_ID index);
```

Returns

- true - The ControlEnable feature is supported on the device
- false - The ControlEnable feature is not supported on the device

Description

This function identifies whether the ControlEnable feature is available on the EBI module. When this function returns true, these functions are supported on the device:

- PLIB_EBI_ControlEnableSet
- PLIB_EBI_ControlEnableGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_EBI_ExistsControlEnable(EBI_MODULE_ID index)

PLIB_EBI_ExistsDataEnable Function

Identifies whether the DataEnable feature exists on the EBI module.

File

plib_ebi.h

C

```
bool PLIB_EBI_ExistsDataEnable(EBI_MODULE_ID index);
```

Returns

- true - The DataEnable feature is supported on the device
- false - The DataEnable feature is not supported on the device

Description

This function identifies whether the DataEnable feature is available on the EBI module. When this function returns true, this function is supported on the device:

- PLIB_EBI_DataEnableSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_EBI_ExistsDataEnable(EBI_MODULE_ID index)

PLIB_EBI_ExistsDataTurnAroundTime Function

Identifies whether the DataTurnAroundTime feature exists on the EBI module.

File

plib_ebi.h

C

```
bool PLIB_EBI_ExistsDataTurnAroundTime(EBI_MODULE_ID index);
```

Returns

- true - The DataTurnAroundTime feature is supported on the device
- false - The DataTurnAroundTime feature is not supported on the device

Description

This function identifies whether the DataTurnAroundTime feature is available on the EBI module. When this function returns true, this function is supported on the device:

- PLIB_EBI_DataTurnAroundTimeGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_EBI_ExistsDataTurnAroundTime(EBI_MODULE_ID index)

PLIB_EBI_ExistsFlashPowerDownMode Function

Identifies whether the FlashPowerDownMode feature exists on the EBI module.

File

plib_ebi.h

C

```
bool PLIB_EBI_ExistsFlashPowerDownMode(EBI_MODULE_ID index);
```

Returns

- true - The FlashPowerDownMode feature is supported on the device
- false - The FlashPowerDownMode feature is not supported on the device

Description

This function identifies whether the FlashPowerDownMode feature is available on the EBI module. When this function returns true, these functions are supported on the device:

- PLIB_EBI_FlashPowerDownModeSet
- PLIB_EBI_FlashPowerDownModeGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_EBI_ExistsFlashPowerDownMode(EBI_MODULE_ID index)

PLIB_EBI_ExistsFlashResetPin Function

Identifies whether the FlashResetPin feature exists on the EBI module.

File

plib_ebi.h

C

```
bool PLIB_EBI_ExistsFlashResetPin(EBI_MODULE_ID index);
```

Returns

- true - The FlashResetPin feature is supported on the device
- false - The FlashResetPin feature is not supported on the device

Description

This function identifies whether the FlashResetPin feature is available on the EBI module. When this function returns true, these functions are supported on the device:

- PLIB_EBI_FlashResetPinSet
- PLIB_EBI_FlashResetPinGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_EBI_ExistsFlashResetPin(EBI_MODULE_ID index)

PLIB_EBI_ExistsFlashTiming Function

Identifies whether the FlashTiming feature exists on the EBI module.

File

plib_ebi.h

C

```
bool PLIB_EBI_ExistsFlashTiming(EBI_MODULE_ID index);
```

Returns

- true - The FlashTiming feature is supported on the device
- false - The FlashTiming feature is not supported on the device

Description

This function identifies whether the FlashTiming feature is available on the EBI module. When this function returns true, these functions are supported on the device:

- PLIB_EBI_FlashTimingSet
- PLIB_EBI_FlashTimingGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_EBI_ExistsFlashTiming(EBI_MODULE_ID index)

PLIB_EBI_ExistsMemoryCharacteristics Function

Identifies whether the MemoryCharacteristics feature exists on the EBI module.

File

plib_ebi.h

C

```
bool PLIB_EBI_ExistsMemoryCharacteristics(EBI_MODULE_ID index);
```

Returns

- true - The MemoryCharacteristics feature is supported on the device

- false - The MemoryCharacteristics feature is not supported on the device

Description

This function identifies whether the MemoryCharacteristics feature is available on the EBI module. When this function returns true, this function is supported on the device:

- PLIB_EBI_MemoryCharacteristicsSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_EBI_ExistsMemoryCharacteristics(EBI_MODULE_ID index)

PLIB_EBI_ExistsMemoryPaging Function

Identifies whether the MemoryPaging feature exists on the EBI module.

File

plib_ebi.h

C

```
bool PLIB_EBI_ExistsMemoryPaging(EBI_MODULE_ID index);
```

Returns

- true - The MemoryPaging feature is supported on the device
- false - The MemoryPaging feature is not supported on the device

Description

This function identifies whether the MemoryPaging feature is available on the EBI module. When this function returns true, this function is supported on the device:

- PLIB_EBI_MemoryPagingSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_EBI_ExistsMemoryPaging(EBI_MODULE_ID index)

PLIB_EBI_ExistsMemoryTimingConfig Function

Identifies whether the MemoryTimingConfig feature exists on the EBI module.

File

plib_ebi.h

C

```
bool PLIB_EBI_ExistsMemoryTimingConfig(EBI_MODULE_ID index);
```

Returns

- true - The MemoryTimingConfig feature is supported on the device
- false - The MemoryTimingConfig feature is not supported on the device

Description

This function identifies whether the MemoryTimingConfig feature is available on the EBI module. When this function returns true, this function is supported on the device:

- PLIB_EBI_MemoryTimingConfigSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_EBI_ExistsMemoryTimingConfig(EBI_MODULE_ID index)

PLIB_EBI_ExistsPageMode Function

Identifies whether the PageMode feature exists on the EBI module.

File

plib_ebi.h

C

```
bool PLIB_EBI_ExistsPageMode(EBI_MODULE_ID index);
```

Returns

- true - The PageMode feature is supported on the device
- false - The PageMode feature is not supported on the device

Description

This function identifies whether the PageMode feature is available on the EBI module. When this function returns true, this function is supported on the device:

- PLIB_EBI_PageModeGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_EBI_ExistsPageMode(EBI_MODULE_ID index)

PLIB_EBI_ExistsPageReadTime Function

Identifies whether the PageReadTime feature exists on the EBI module.

File

plib_ebi.h

C

```
bool PLIB_EBI_ExistsPageReadTime(EBI_MODULE_ID index);
```

Returns

- true - The PageReadTime feature is supported on the device
- false - The PageReadTime feature is not supported on the device

Description

This function identifies whether the PageReadTime feature is available on the EBI module. When this function returns true, this function is supported on the device:

- PLIB_EBI_PageReadCycleTimeGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_EBI_ExistsPageReadTime(EBI_MODULE_ID index)

PLIB_EBI_ExistsReadCycleTime Function

Identifies whether the ReadCycleTime feature exists on the EBI module.

File

plib_ebi.h

C

```
bool PLIB_EBI_ExistsReadCycleTime(EBI_MODULE_ID index);
```

Returns

- true - The ReadCycleTime feature is supported on the device
- false - The ReadCycleTime feature is not supported on the device

Description

This function identifies whether the ReadCycleTime feature is available on the EBI module. When this function returns true, this function is supported on the device:

- PLIB_EBI_ReadCycleTimeGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_EBI_ExistsReadCycleTime(EBI_MODULE_ID index)

PLIB_EBI_ExistsReadyMode Function

Identifies whether the ReadyMode feature exists on the EBI module.

File

plib_ebi.h

C

```
bool PLIB_EBI_ExistsReadyMode(EBI_MODULE_ID index);
```

Returns

- true - The ReadyMode feature is supported on the device
- false - The ReadyMode feature is not supported on the device

Description

This function identifies whether the ReadyMode feature is available on the EBI module. When this function returns true, these functions are supported on the device:

- PLIB_EBI_ReadyModeSet
- PLIB_EBI_ReadyModeGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_EBI_ExistsReadyMode(EBI_MODULE_ID index)

PLIB_EBI_ExistsReadyPin1Config Function

Identifies whether the ReadyPin1Config feature exists on the EBI module.

File

plib_ebi.h

C

```
bool PLIB_EBI_ExistsReadyPin1Config(EBI_MODULE_ID index);
```

Returns

- true - The ReadyPin1Config feature is supported on the device
- false - The ReadyPin1Config feature is not supported on the device

Description

This function identifies whether the ReadyPin1Config feature is available on the EBI module. When this function returns true, this function is supported on the device:

- PLIB_EBI_ReadyPin1ConfigSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_EBI_ExistsReadyPin1Config(EBI_MODULE_ID index)

PLIB_EBI_ExistsReadyPin2Config Function

Identifies whether the ReadyPin2Config feature exists on the EBI module.

File

plib_ebi.h

C

```
bool PLIB_EBI_ExistsReadyPin2Config(EBI_MODULE_ID index);
```

Returns

- true - The ReadyPin2Config feature is supported on the device
- false - The ReadyPin2Config feature is not supported on the device

Description

This function identifies whether the ReadyPin2Config feature is available on the EBI module. When this function returns true, this function is supported on the device:

- PLIB_EBI_ReadyPin2ConfigSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_EBI_ExistsReadyPin2Config(EBI_MODULE_ID index)

PLIB_EBI_ExistsReadyPin3Config Function

Identifies whether the ReadyPin3Config feature exists on the EBI module.

File

plib_ebi.h

C

```
bool PLIB_EBI_ExistsReadyPin3Config(EBI_MODULE_ID index);
```

Returns

- true - The ReadyPin3Config feature is supported on the device
- false - The ReadyPin3Config feature is not supported on the device

Description

This function identifies whether the ReadyPin3Config feature is available on the EBI module. When this function returns true, this function is supported on the device:

- PLIB_EBI_ReadyPin3ConfigSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_EBI_ExistsReadyPin3Config(EBI_MODULE_ID index)

PLIB_EBI_ExistsReadyPinSens Function

Identifies whether the ReadyPinSens feature exists on the EBI module

File

plib_ebi.h

C

```
bool PLIB_EBI_ExistsReadyPinSens(EBI_MODULE_ID index);
```

Returns

- true - The ReadyPinSens feature is supported on the device
- false - The ReadyPinSens feature is not supported on the device

Description

This function identifies whether the ReadyPinSens feature is available on the EBI module. When this function returns true, this function is supported on the device:

- PLIB_EBI_ReadyPinSensSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_EBI_ExistsReadyPinSens(EBI_MODULE_ID index)

PLIB_EBI_ExistsStaticMemoryWidthRegister Function

Identifies whether the StaticMemoryWidthRegister feature exists on the EBI module.

File

plib_ebi.h

C

```
bool PLIB_EBI_ExistsStaticMemoryWidthRegister(EBI_MODULE_ID index);
```

Returns

- true - The StaticMemoryWidthRegister feature is supported on the device
- false - The StaticMemoryWidthRegister feature is not supported on the device

Description

This function identifies whether the StaticMemoryWidthRegister feature is available on the EBI module. When this function returns true, these functions are supported on the device:

- PLIB_EBI_StaticMemoryWidthRegisterSet
- PLIB_EBI_StaticMemoryWidthRegisterGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_EBI_ExistsStaticMemoryWidthRegister(EBI_MODULE_ID index)

PLIB_EBI_ExistsWriteOutputControl Function

Identifies whether the WriteOutputControl feature exists on the EBI module.

File

plib_ebi.h

C

```
bool PLIB_EBI_ExistsWriteOutputControl(EBI_MODULE_ID index);
```

Returns

- true - The WriteOutputControl feature is supported on the device
- false - The WriteOutputControl feature is not supported on the device

Description

This function identifies whether the WriteOutputControl feature is available on the EBI module. When this function returns true, this function is supported on the device:

- PLIB_EBI_WriteOutputControlSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_EBI_ExistsWriteOutputControl(EBI_MODULE_ID index)

PLIB_EBI_ExistsWritePulseWidth Function

Identifies whether the WritePulseWidth feature exists on the EBI module.

File

plib_ebi.h

C

```
bool PLIB_EBI_ExistsWritePulseWidth(EBI_MODULE_ID index);
```

Returns

- true - The WritePulseWidth feature is supported on the device
- false - The WritePulseWidth feature is not supported on the device

Description

This function identifies whether the WritePulseWidth feature is available on the EBI module. When this function returns true, this function is supported on the device:

- PLIB_EBI_WritePulseWidthGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_EBI_ExistsWritePulseWidth(EBI_MODULE_ID index)

d) Data Types and Constants

EBI_ADDRESS_PORT Enumeration

Selects the EBI address port.

File

plib_ebi_help.h

C

```
typedef enum {
  EBI_EBIADDR_PIN0,
  EBI_EBIADDR_PIN1,
  EBI_EBIADDR_PIN2,
  EBI_EBIADDR_PIN3,
  EBI_EBIADDR_PIN4,
  EBI_EBIADDR_PIN5,
  EBI_EBIADDR_PIN6,
  EBI_EBIADDR_PIN7,
  EBI_EBIADDR_PIN8,
  EBI_EBIADDR_PIN9,
  EBI_EBIADDR_PIN10,
  EBI_EBIADDR_PIN11,
  EBI_EBIADDR_PIN12,
  EBI_EBIADDR_PIN13,
  EBI_EBIADDR_PIN14,
  EBI_EBIADDR_PIN15,
  EBI_EBIADDR_PIN16,
  EBI_EBIADDR_PIN17,
  EBI_EBIADDR_PIN18,
  EBI_EBIADDR_PIN19,
  EBI_EBIADDR_PIN20,
  EBI_EBIADDR_PIN21,
  EBI_EBIADDR_PIN22,
  EBI_EBIADDR_PIN23,
  EBI_ADDR_PRESET8,
  EBI_ADDR_PRESET12,
  EBI_ADDR_PRESET16,
  EBI_ADDR_PRESET_ALL
} EBI_ADDRESS_PORT;
```

EBI_EBIADDR_PIN17	PIN 17
EBI_EBIADDR_PIN18	PIN 18
EBI_EBIADDR_PIN19	PIN 19
EBI_EBIADDR_PIN20	PIN 20
EBI_EBIADDR_PIN21	PIN 21
EBI_EBIADDR_PIN22	PIN 22
EBI_EBIADDR_PIN23	PIN 23
EBI_ADDR_PRESET8	Preset 8
EBI_ADDR_PRESET12	Preset 12
EBI_ADDR_PRESET16	Preset 16
EBI_ADDR_PRESET_ALL	Preset All

Description

EBI Address Port

This enumeration selects the EBI address port.

Remarks

The caller should not rely on the specific numbers assigned to any of these values as they may change from one processor to the next.

EBI_CS_TIMING Enumeration

Selects the timing register set for Chip Select.

File

plib_ebi_help.h

C

```
typedef enum {
  CS_TIMING_0,
  CS_TIMING_1,
  CS_TIMING_2
} EBI_CS_TIMING;
```

Members

Members	Description
CS_TIMING_0	Use EBISMT0
CS_TIMING_1	Use EBISMT1
CS_TIMING_2	Use EBISMT2

Description

Timing Register for Chip Select

This enumeration selects the timing register set for Chip Select

Remarks

The caller should not rely on the specific numbers assigned to any of these values as they may change from one processor to the next.

EBI_MEMORY_SIZE Enumeration

Selects the memory size for Chip Select.

File

plib_ebi_help.h

C

```
typedef enum {
  CSNOTUSED,
  MEMORY_SIZE_64KB,
  MEMORY_SIZE_128KB,
  MEMORY_SIZE_256KB,
  MEMORY_SIZE_512KB,
  MEMORY_SIZE_1MB,
  MEMORY_SIZE_2MB,
  MEMORY_SIZE_4MB,
  MEMORY_SIZE_8MB,
  MEMORY_SIZE_16MB
} EBI_MEMORY_SIZE;
```

Members

Members	Description
CSNOTUSED	Chip Select Not Used
MEMORY_SIZE_64KB	64 KB (smaller memories alias within this range)
MEMORY_SIZE_128KB	128 KB
MEMORY_SIZE_256KB	256 KB
MEMORY_SIZE_512KB	512 KB
MEMORY_SIZE_1MB	1 MB
MEMORY_SIZE_2MB	2 MB
MEMORY_SIZE_4MB	4 MB
MEMORY_SIZE_8MB	8 MB
MEMORY_SIZE_16MB	16 MB

Description

Memory Size for Chip Select

This enumeration selects memory size for Chip Select.

Remarks

The caller should not rely on the specific numbers assigned to any of these values as they may change from one processor to the next.

EBI_MEMORY_TYPE Enumeration

Selects the memory type for Chip Select.

File

plib_ebi_help.h

C

```
typedef enum {
  SRAM,
  NORFLASH
} EBI_MEMORY_TYPE;
```

Members

Members	Description
SRAM	SRAM
NORFLASH	NOR-Flash

Description

Memory Type for Chip Select

This enumeration selects the memory type for Chip Select.

Remarks

The caller should not rely on the specific numbers assigned to any of these values as they may change from one processor to the next.

EBI_MODULE_ID Enumeration

Identifies the supported EBI modules.

File

plib_ebi_help.h

C

```
typedef enum {
  EBI_ID_0,
  EBI_NUMBER_OF_MODULES
} EBI_MODULE_ID;
```

Members

Members	Description
EBI_ID_0	EBI Module 0 ID
EBI_NUMBER_OF_MODULES	Number of available WDT modules.

Description

EBI Module ID

This enumeration identifies the available EBI modules.

Remarks

The caller should not rely on the specific numbers assigned to any of these values as they may change from one processor to the next.

EBI_PAGE_SIZE Enumeration

Selects the page size for the page mode device.

File

plib_ebi_help.h

C

```
typedef enum {
  PAGE_WORD4,
  PAGE_WORD8,
  PAGE_WORD16,
  PAGE_WORD32
} EBI_PAGE_SIZE;
```

Members

Members	Description
PAGE_WORD4	4-word page
PAGE_WORD8	8-word page
PAGE_WORD16	16-word page
PAGE_WORD32	32-word page

Description

Page Size for page mode device

This enumeration selects the page size for the page mode device.

Remarks

The caller should not rely on the specific numbers assigned to any of these values as they may change from one processor to the next.

EBI_STATIC_MEMORY_WIDTH Enumeration

Selects the static memory width for the register EBISMTx.

File

plib_ebi_help.h

C

```
typedef enum {
  MEMORY_WIDTH_8BIT,
  MEMORY_WIDTH_16BIT
} EBI_STATIC_MEMORY_WIDTH;
```

Members

Members	Description
MEMORY_WIDTH_8BIT	8 bits
MEMORY_WIDTH_16BIT	16 bits

Description

Memory Width

This enumeration selects the static memory width for the register EBISMTx.

Remarks

The caller should not rely on the specific numbers assigned to any of these values as they may change from one processor to the next.

Functions

	Name	Description
	PLIB_EBI_AddressHoldTimeGet	Returns the address hold time.
	PLIB_EBI_AddressPinEnableBitsSet	Sets the address pins used for EBI.
	PLIB_EBI_AddressSetupTimeGet	Returns the setup hold time.
	PLIB_EBI_BaseAddressGet	Returns the base address set for each Chip Select.
	PLIB_EBI_BaseAddressSet	Sets the base address for physical memory at each Chip Select pin.
	PLIB_EBI_ByteSelectPinSet	Sets the data Byte Select High <15:8> and Low <7:0> enable pins for use.
	PLIB_EBI_ChipSelectEnableSet	Sets the Chip Select pins for use with the EBI or GPIO.
	PLIB_EBI_ControlEnableGet	Returns the status of the EBI enable bit.
	PLIB_EBI_ControlEnableSet	Sets the EBI bus ON/OFF enable bit.
	PLIB_EBI_DataEnableSet	Sets the use of Data Byte Select Pins, High and Low, for control with EBI or GPIO.
	PLIB_EBI_DataTurnAroundTimeGet	Returns the data turn-around time set for the EBI bus.
	PLIB_EBI_ExistsAddressHoldTime	Identifies whether the AddressHoldTime feature exists on the EBI module.
	PLIB_EBI_ExistsAddressPinEnableBits	Identifies whether the AddressPinEnableBits feature exists on the EBI module.
	PLIB_EBI_ExistsAddressSetupTime	Identifies whether the AddressSetupTime feature exists on the EBI module.
	PLIB_EBI_ExistsBaseAddress	Identifies whether the Base_Address feature exists on the EBI module.
	PLIB_EBI_ExistsByteSelectPin	Identifies whether the ByteSelectPin feature exists on the EBI module.
	PLIB_EBI_ExistsChipSelectEnable	Identifies whether the ChipSelectEnable feature exists on the EBI module.
	PLIB_EBI_ExistsControlEnable	Identifies whether the ControlEnable feature exists on the EBI module.
	PLIB_EBI_ExistsDataEnable	Identifies whether the DataEnable feature exists on the EBI module.
	PLIB_EBI_ExistsDataTurnAroundTime	Identifies whether the DataTurnAroundTime feature exists on the EBI module.
	PLIB_EBI_ExistsFlashPowerDownMode	Identifies whether the FlashPowerDownMode feature exists on the EBI module.
	PLIB_EBI_ExistsFlashResetPin	Identifies whether the FlashResetPin feature exists on the EBI module.

	PLIB_EBI_ExistsFlashTiming	Identifies whether the FlashTiming feature exists on the EBI module.
	PLIB_EBI_ExistsMemoryCharacteristics	Identifies whether the MemoryCharacteristics feature exists on the EBI module.
	PLIB_EBI_ExistsMemoryPaging	Identifies whether the MemoryPaging feature exists on the EBI module.
	PLIB_EBI_ExistsMemoryTimingConfig	Identifies whether the MemoryTimingConfig feature exists on the EBI module.
	PLIB_EBI_ExistsPageMode	Identifies whether the PageMode feature exists on the EBI module.
	PLIB_EBI_ExistsPageReadTime	Identifies whether the PageReadTime feature exists on the EBI module.
	PLIB_EBI_ExistsReadCycleTime	Identifies whether the ReadCycleTime feature exists on the EBI module.
	PLIB_EBI_ExistsReadyMode	Identifies whether the ReadyMode feature exists on the EBI module.
	PLIB_EBI_ExistsReadyPin1Config	Identifies whether the ReadyPin1Config feature exists on the EBI module.
	PLIB_EBI_ExistsReadyPin2Config	Identifies whether the ReadyPin2Config feature exists on the EBI module.
	PLIB_EBI_ExistsReadyPin3Config	Identifies whether the ReadyPin3Config feature exists on the EBI module.
	PLIB_EBI_ExistsReadyPinSens	Identifies whether the ReadyPinSens feature exists on the EBI module
	PLIB_EBI_ExistsStaticMemoryWidthRegister	Identifies whether the StaticMemoryWidthRegister feature exists on the EBI module.
	PLIB_EBI_ExistsWriteOutputControl	Identifies whether the WriteOutputControl feature exists on the EBI module.
	PLIB_EBI_ExistsWritePulseWidth	Identifies whether the WritePulseWidth feature exists on the EBI module.
	PLIB_EBI_FlashPowerDownModeGet	Returns the set power-down state.
	PLIB_EBI_FlashPowerDownModeSet	Sets the pin state for Flash devices on Power-down and Reset.
	PLIB_EBI_FlashResetPinGet	Sets the control use of Flash Reset pin.
	PLIB_EBI_FlashResetPinSet	Sets the control use of the Flash Reset pin.
	PLIB_EBI_FlashTimingGet	Returns the set Flash timing for external Flash.
	PLIB_EBI_FlashTimingSet	Sets the timing for hold in reset for external Flash.
	PLIB_EBI_MemoryCharacteristicsSet	Sets the characteristics for memory or attached devices attached to the specified pin.
	PLIB_EBI_MemoryPageSizeGet	Returns the Paging mode settings.
	PLIB_EBI_MemoryPagingSet	Sets the size of the memory page if paging is used.
	PLIB_EBI_MemoryTimingConfigSet	Sets the cycle time for page reading.
	PLIB_EBI_PageModeGet	Returns the Paging mode settings.
	PLIB_EBI_PageReadCycleTimeGet	Returns the cycle time for a page read.
	PLIB_EBI_ReadCycleTimeGet	Returns the read time in the number of clock cycles.
	PLIB_EBI_ReadyModeGet	Returns whether or not Ready mode was set.
	PLIB_EBI_ReadyModeSet	Sets the use of Ready mode for each pin.
	PLIB_EBI_ReadyPin1ConfigSet	Sets the control use of ReadyPin1 and inverts the status.
	PLIB_EBI_ReadyPin2ConfigSet	Sets the control use of ReadyPin2 and inverts the status.
	PLIB_EBI_ReadyPin3ConfigSet	Sets the control use of ReadyPin3 and inverts the status.
	PLIB_EBI_ReadyPinSensSet	Sets the sensitivity of the Ready pin.
	PLIB_EBI_StaticMemoryWidthRegisterGet	Returns the set width of the data bus.
	PLIB_EBI_StaticMemoryWidthRegisterSet	Sets the data width of static memory.
	PLIB_EBI_WriteOutputControlSet	Sets the Write Enable and Output Enable control pins.
	PLIB_EBI_WritePulseWidthGet	Returns the set hold time in clock cycles.

Data Types & Constants

Ethernet Peripheral Library

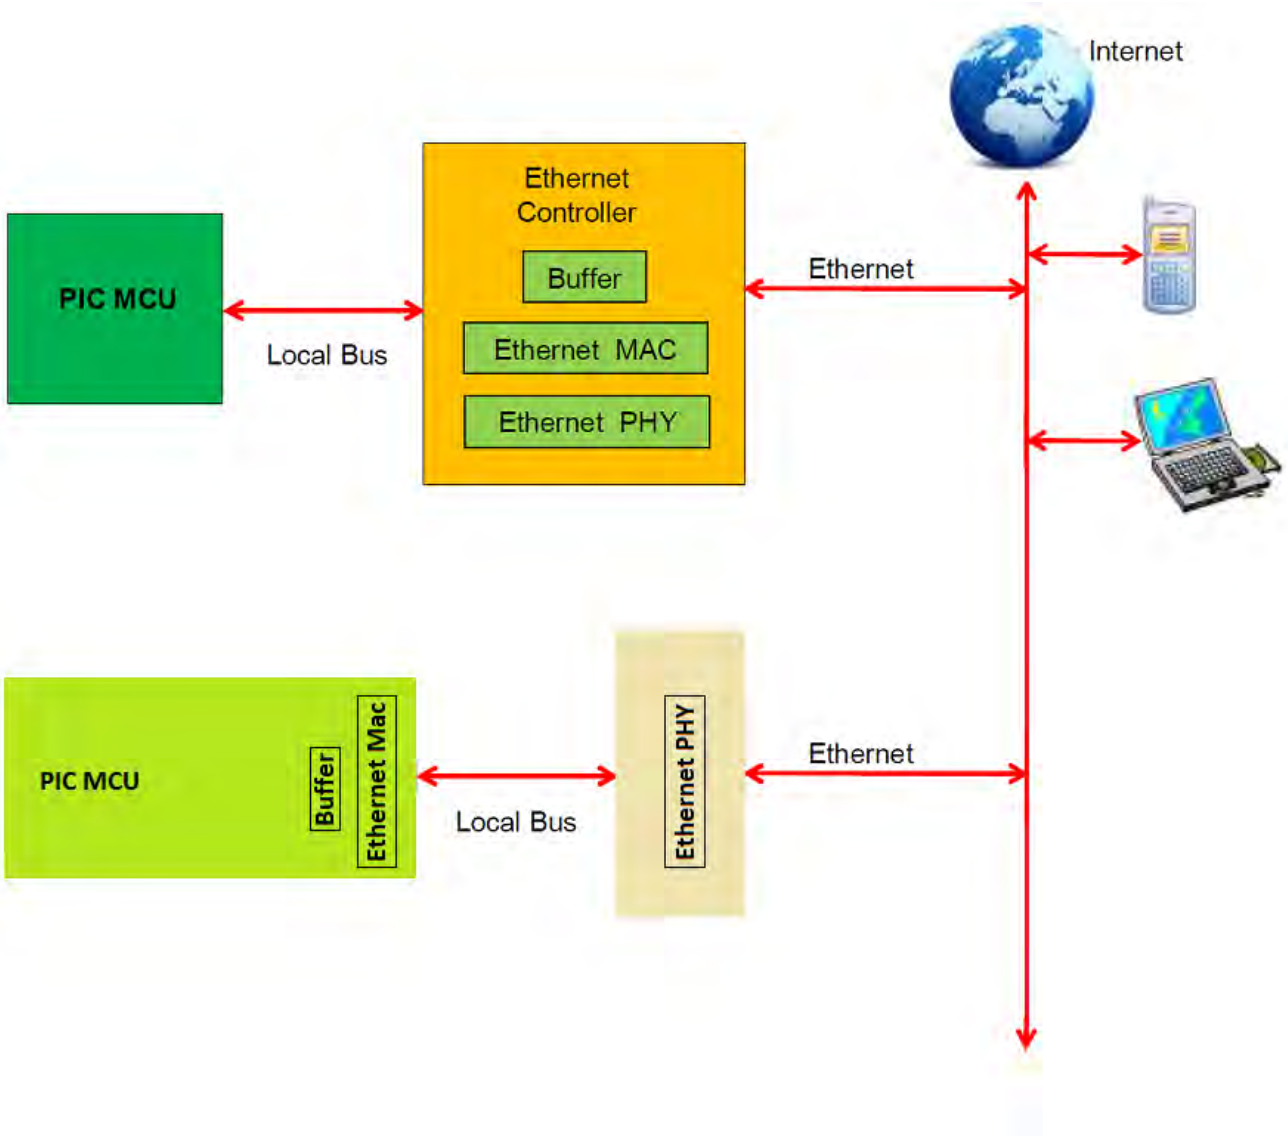
This section describes the Ethernet Peripheral Library.

Introduction

The Ethernet Peripheral Library provides a low-level abstraction of the Ethernet module in the Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without interacting directly with the module's registers, thereby hiding the differences in microcontroller variations.

Description

Ethernet is the most widely deployed network in offices and homes. Ethernet's infrastructure, interoperability, and scalability serve to ease development and facilitate communications to the device. Once equipment is connected to an Ethernet network, it can be monitored or controlled through the internet with low latency – "real time" remote delivery.



The Ethernet Controller is a bus master module that interfaces with an off-chip PHY to implement a complete Ethernet node in a system.

Following are some of the key features of this module:

- Supports 10/100 Mbps data transfer rates

- Supports Full-Duplex and Half-Duplex operation
- Supports Reduced Media Independent Interface (RMII) and Media Independent Interface (MII) PHY interface
- Supports MII Management (MIIM) PHY Management interface
- Supports both manual and automatic flow control
- Supports Auto-MDIX and enabled PHYs
- RAM descriptor based DMA operation for both receive and transmit path
- Fully configurable interrupts
- Configurable receive packet filtering:
  - CRC Check
  - 64-byte Pattern Match
  - Broadcast, Multicast and Unicast packets
  - Magic Packet™
  - 64-bit Hash Table
  - Runt Packet
- Supports Packet Payload Checksum calculation
- Supports various hardware statistics counters

Using the Library

This topic describes the basic architecture of the Ethernet Peripheral Library and provides information and examples on its use.

Description

Interface Header File: `plib_eth.h`

The interface to the Ethernet Peripheral Library is defined in the `plib_eth.h` header file., which is included by the peripheral library header file, `peripheral.h`. Any C language source (`.c`) file that uses the Ethernet Peripheral Library should include `peripheral.h`.

Library File:

The Ethernet Peripheral Library archive (`.a`) file is installed with MPLAB Harmony.

Please refer to the What is MPLAB Harmony? section for how the Peripheral interacts with the framework.

Hardware Abstraction Model

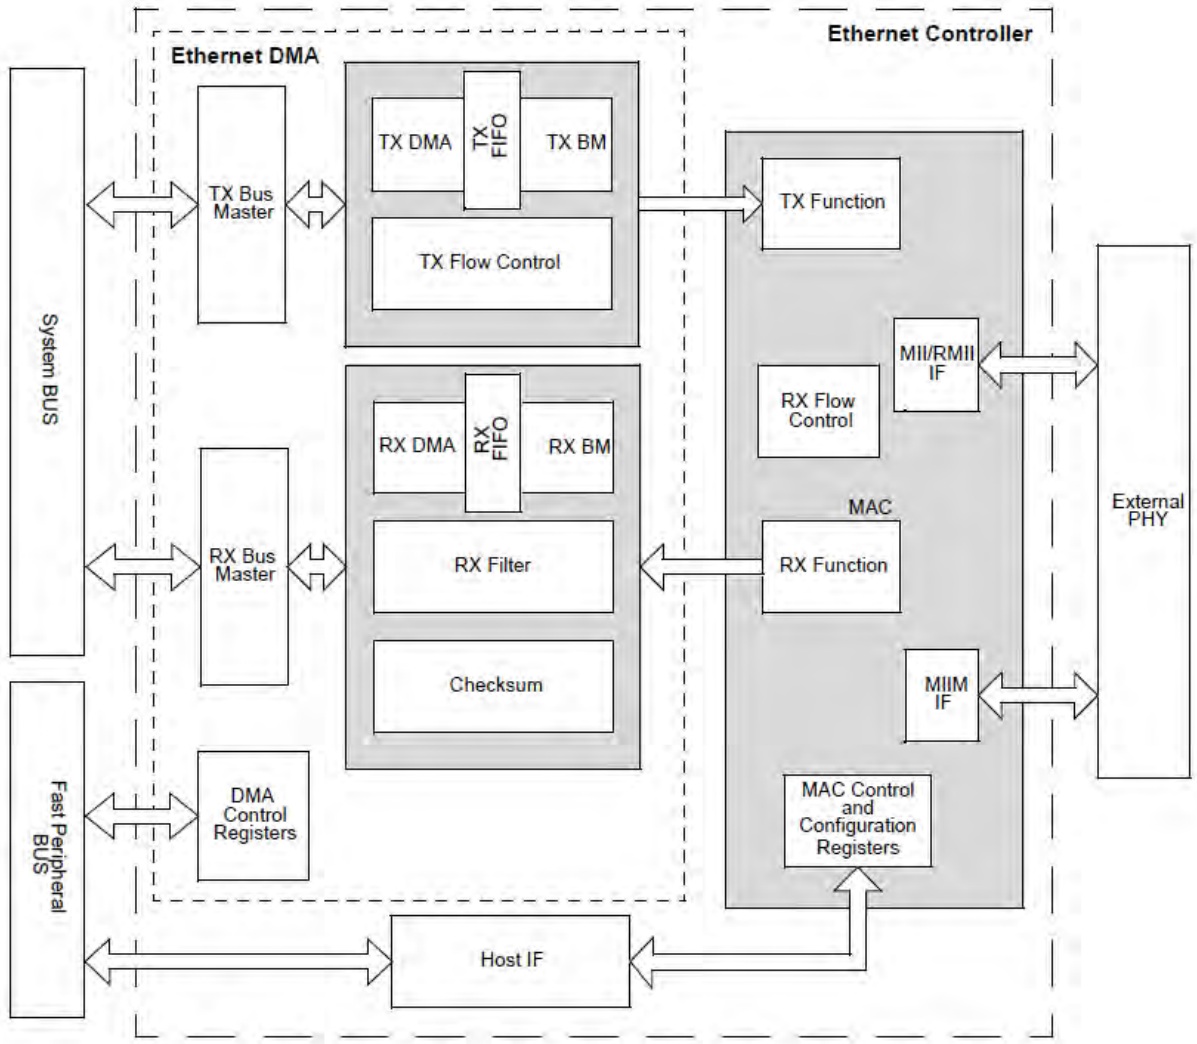
This section describes how the low-level abstraction is modeled in the software and introduces the library interface. The interface provided is a superset of all the functionality of the available Ethernet on the device. Refer to the specific data sheet or family reference manual to determine the set of functions that are supported for each Ethernet module on your device.

Description

Hardware Model

This library provides the low-level abstraction of the Ethernet module on Microchip family of microcontrollers with a convenient C language interface.

Ethernet Controller Block Diagram



Note: For information on off-chip options to provide Ethernet functionality, refer to the specific device data sheet.

Library Overview

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the Ethernet module.

Library Interface Section	Description
Initialization Functions	Provides setup and configuration routines.
Control Functions	Provides control routines.
Status Functions	Provides status routines.
Filtering Functions	Provides filtering routines.
Flow Control Functions	Provides flow control routines.
Interrupt Functions	Provides interrupt routines.
Statistics Functions	Provides statistics routines.
Feature Existence Functions	These functions can be used to determine whether or not a particular feature exists on the device.

How the Library Works

This section provides information on the operation of the Ethernet Peripheral Library.

Description

The Peripheral Library is an abstraction of hardware which can be used to control hardware and obtain status. It is intended to allow the programmer access to hardware registers without knowing the exact bit or register names which may vary on individual devices. For example, instead of turning on the Ethernet module using:

ETHCON1bits.EON = 1; the programmer can turn on the Ethernet module using: PLIB_ETH_Enable(moduleId);. This allows the programmer to use the same command for any device containing an Ethernet module without having to learn the individual device register names.

Basic Overview

The Ethernet Controller provides the modules needed to implement a 10/100 Mbps Ethernet node using an external PHY chip. To off-load the CPU from moving packet data to and from the module, internal descriptor-based DMA engines are included in the controller.

The Ethernet Controller consists of the following modules:

- Media Access Control (MAC) block: Responsible for implementing the MAC functions of the Ethernet IEEE 802.3 Specification
- Flow Control (FC) block, which provides:
  - Manual flow control
  - Automatic flow control
  - Transmission of PAUSE frames
  - Reception of PAUSE frame is handled within the MAC
- RX Filter (RXF) block: This module performs filtering on every receive packet to determine whether each packet should be accepted or rejected and includes:
  - CRC Check
  - 64-byte Pattern Match
  - Broadcast, Multicast and Unicast packets
  - Magic Packet™
  - 64-bit Hash Table
  - Runt Packet
- TX DMA/TX BM Engine: The TX DMA and TX Buffer Management engines perform data transfers from the memory (using descriptor tables) to the MAC Transmit Interface
- RX DMA/RX BM Engine: The RX DMA and RX Buffer Management engines transfer receive packets from the MAC to the memory (using descriptor tables)

Basic Ethernet Controller Operation

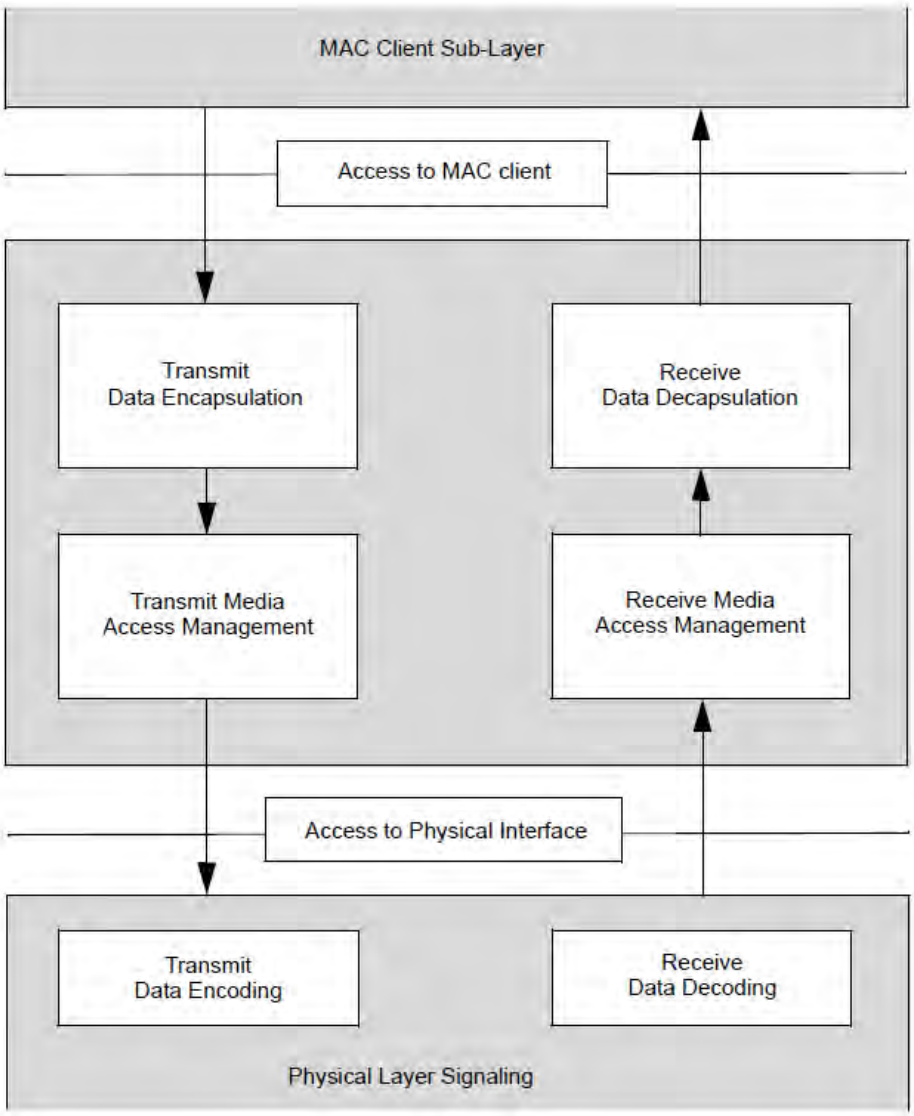
The Ethernet Controller is enabled using PLIB_ETH_Enable and is disabled using PLIB_ETH_Disable. The Ethernet Controller is disabled by default after any Reset. If the Ethernet Controller is disabled, all of the I/O pins used for the MII/RMII and MIIM interfaces operate as port pins and are under the control of the respective PORTx latch bit and TRISx bit.

Disabling the controller resets the internal DMA state machines and all transmit and receive operations are aborted. The Special Function Registers (SFRs) are still accessible and their values are preserved.

Clearing the ON bit while the Ethernet Controller is active will abort all pending operations and reset the peripheral as previously defined.

Re-enabling the ON bit will restart the Ethernet Controller in its clean reset state while preserving the SFR values.

Ethernet Controller Section Block Diagram



MAC Overview

The MAC sub-layer is part of the functionality described in the OSI model for the Data Link Layer. It defines a medium-independent facility, built on the medium-dependent physical facility provided by the Physical Layer, and under the access-layer-independent LLC sub-layer or other MAC client. It is applicable to a general class of local area broadcast media suitable for use with the Carrier Sense Multiple Access with Collision Detection (CSMA/CD).

The CSMA/CD MAC sub-layer provides services to the MAC client required for the transmission and reception of frames. The CSMA/CD MAC sub-layer makes a best effort to acquire the medium and transfer a serial stream of bits to the Physical Layer. Although certain errors are reported to the client, error recovery is not provided by the MAC.

The following is a summary of the functional capabilities of the CSMA/CD MAC sub-layer as shown in the previous diagram.

- For Frame Transmission:
  - Accepts data from the MAC client and constructs a frame
  - Presents a bit-serial data stream to the Physical Layer for transmission on the medium
  - In half-duplex mode, defers transmission of a bit-serial stream whenever the physical medium is busy
  - It can append proper Frame Check Sequence (FCS) value to outgoing frames and verifies full octet boundary alignment
  - Delays transmission of frame bit stream for specified inter-frame gap period
  - In half-duplex mode, halts transmission when collision is detected
  - In half-duplex mode, schedules retransmission after a collision until a specified retry limit is reached
  - In half-duplex mode, enforces collision to ensure propagation throughout network by sending jam message
  - Prepends preamble and Start Frame Delimiter and appends FCS to all frame Appends PAD field for frames whose data length is less than a minimum value
- For Frame Reception:

- Receives a bit-serial data stream from the Physical Layer
- Presents the received frames to the MAC client (broadcast, multicast, unicast frames, etc.)
- Checks incoming frames for transmission errors by way of FCS and verifies octet boundary alignment
- Removes preamble, Start Frame Delimiter and PAD field (if necessary) from received frames
- Implements the MII Management block that provides control/status connection to the external MII PHY

Note: Not all modes are available on all devices, please refer to the specific device data sheet to determine the set of modes supported for your device. In addition, refer to **Section 35. "Ethernet Controller"** (DS60001155) of the *"PIC32 Family Reference Manual"* or the Ethernet MAC Driver Library for more information.

Ethernet Frame Overview

Ethernet Frame Overview

IEEE 802.3-compliant Ethernet frames (packets) are between 64 and 1518 bytes long (Preamble and Start -of-Frame Delimiter not included). Frames containing less than 64 bytes are known as "runt" frames, while frames containing more than 1518 bytes are known as "huge" frames.

An Ethernet frame is made up of the following fields:

- Start-of-Stream/Preamble
- Start-of-Frame Delimiter (SFD)
- Destination MAC address (DA)
- Source MAC address (SA)
- Type/Length field
- Data Payload
- Optional Padding field
- Frame Check Sequence (FCS)
- Traffic on the actual physical cable

Please refer to the IEEE 802.3 Specification for detailed information about the Ethernet protocol.

Ethernet Controller Operation

Basic Ethernet Controller Operation

The Ethernet Controller is enabled using PLIB_ETH_Enable and is disabled using PLIB_ETH_Disable. The Ethernet Controller is disabled by default after any Reset. If the Ethernet Controller is disabled, all of the I/O pins used for the MII/RMII and MIIM interfaces operate as port pins and are under the control of the respective PORT latch bit and TRIS bit.

Disabling the controller resets the internal DMA state machines and all transmit and receive operations are aborted. The SFRs are still accessible and their values preserved.

Clearing the ON bit while the Ethernet Controller is active will abort all pending operations and reset the peripheral as previously defined.

Re-enabling the ON bit will restart the Ethernet Controller in its clean reset state while preserving the SFR values.

Media Independent Interface (MII)

This section describes the Media Independent Interface (MII).

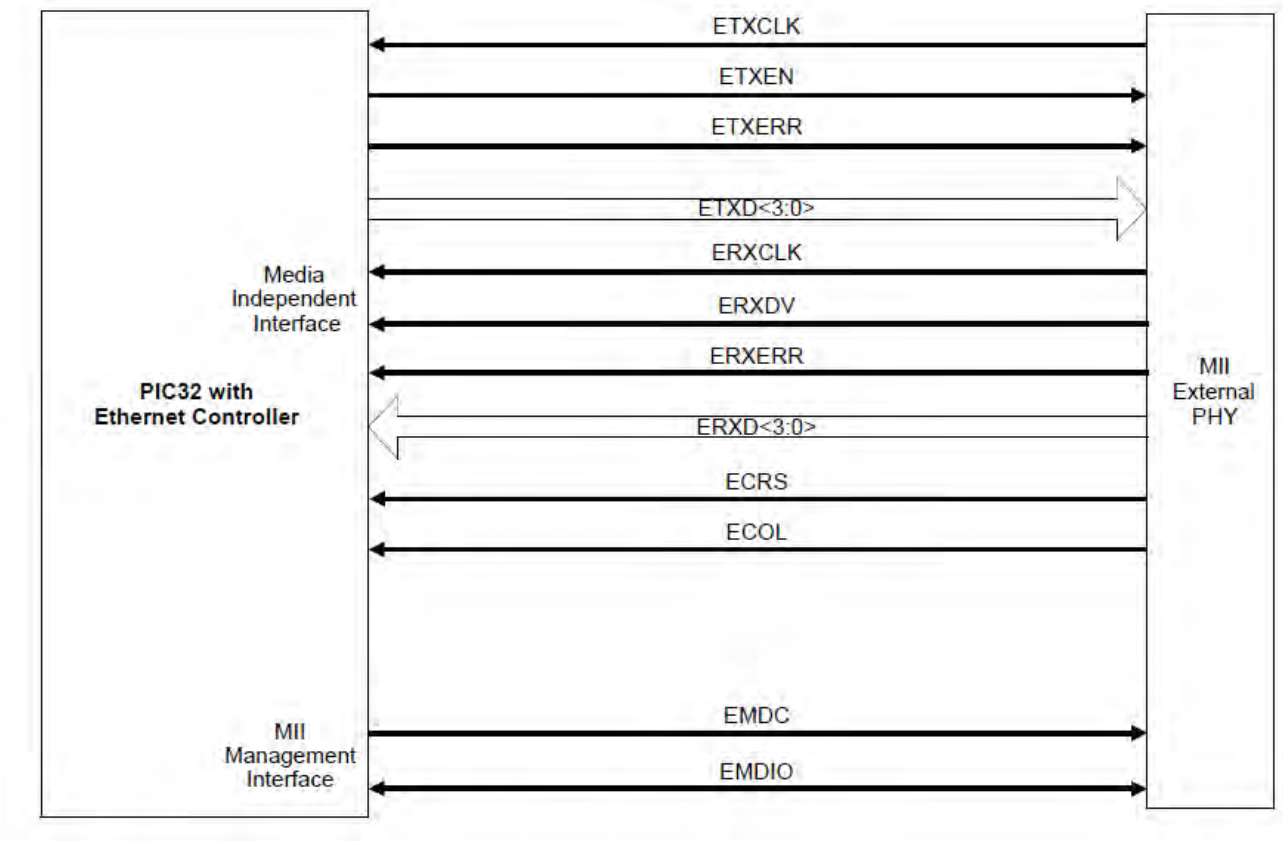
Description

Media Independent Interface (MII)

The Media Independent Interface (MII) is a standard interconnection between the MAC and the PHY for communicating TX and RX frame data. This MII has the following important characteristics:

- Capable of supporting 10/100 Mbps rates for data transfer, and offers support for management functions
- Provides independent four bit wide transmit and receive data paths
- Uses TTL signal levels, compatible with common digital CMOS processes
- Provides full-duplex operation

In 10 Mbps mode, the MII runs at 2.5 MHz; in 100 Mbps mode it runs at 25 MHz. PHYs that provide MII are not required to support both data rates, and may support either one or both.



Reduced Media Independent Interface (RMII)

This section describes the Reduced Media Independent Interface (RMII).

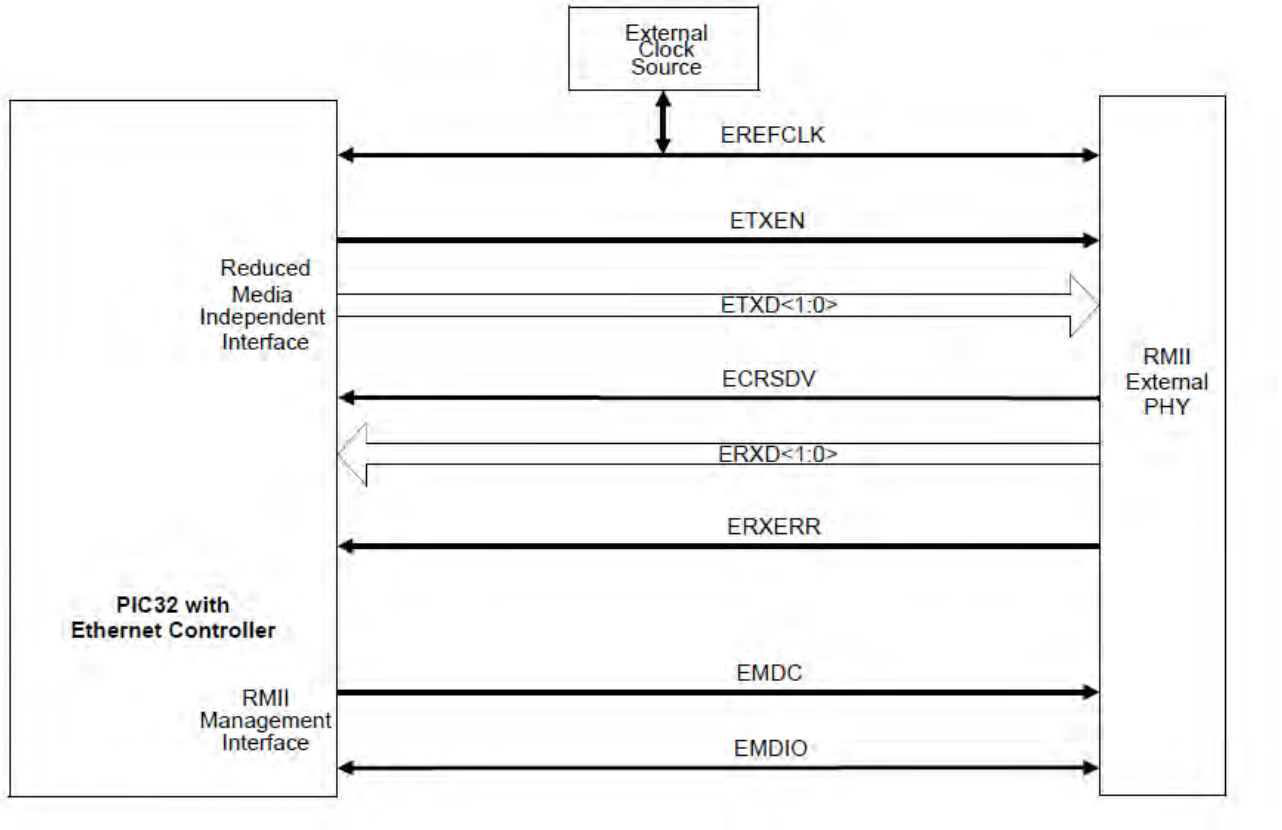
Description

Reduced Media Independent Interface (RMII)

The management interface (MDIO/MDC) is assumed to be identical to that defined in MII.

The RMII has the following characteristics:

- Capable of supporting 10 Mbps and 100 Mbps data rates
- Single clock reference for both MAC and the PHY (can be sourced from the MAC or from an external source)
- Provides independent 2 bit wide transmit and receive data paths
- Uses TTL signal levels, compatible with common digital CMOS processes
- Provides full-duplex operation
- The interface runs at 50 MHz



Flow Control Overview

Flow Control Overview

Ethernet flow control consists of the ability to send and receive PAUSE frames, which cause the receiving node to stop transmitting for a specific amount of time.

On the transmit side, the Flow Control (FC) block handles the hardware handshaking between the MAC and the CPU when the transmit flow control is enabled. Flow control for the received packets is part of the MAC functionality.

The PIC32 MAC supports both Symmetric PAUSE and Asymmetric PAUSE as described in Clause 28, Table 28B-2, and Clause 31 and Annex 31B of the IEEE 802.3 Specification.

The FC block supports two modes of operation: manual and automatic. In addition, the mode of transmission (Full-Duplex or Half-Duplex) programmed into the MAC registers, is used by the FC block.

Receive Filtering Overview

Receive Filtering Overview

The Receive Filter (RXF) block examines all incoming receive packets and accepts or rejects the packet, based on user-selectable filters. The following RX filters are supported:

- CRC Error Acceptance Filter
- Runt Error Acceptance Filter
- CRC Check Rejection Filter
- Runt Rejection Filter
- Unicast Acceptance Filter
- Not Me Unicast Acceptance Filter
- Multicast Acceptance Filter
- Broadcast Acceptance Filter
- Hash Table Acceptance Filter
- Magic Packet Acceptance Filter
- Pattern Match Acceptance Filter with logical inversion

Ethernet DMA and Buffer Management Engine

Ethernet DMA and Buffer Management Engines

To reduce the overhead on the CPU to move the packet data between data memory and the Ethernet controller, internal receive (RX) and transmit (TX) DMA engines are integrated into the module. The DMA engines are responsible for transferring data from system memory to the MAC for transmit packets and for transferring data from the MAC to system memory for receive packets. The DMA engines each have access to the system memory by acting as two different bus masters, one bus master for transmit and one for receive.

The DMA engines use separate Ethernet Descriptor Tables (EDTs) for TX and RX operations to determine where the TX/RX packet buffer resides in the system memory.

Both transmit and receive descriptors, called Ethernet Descriptors (EDs), used by the DMA engines have a similar format, with only the status word formats being different.

Refer to the **"Ethernet"** section in the family reference manual for more information.

Sample Code

This section provides information for initialization, transmit, and receive using code samples.

Description

Sample Code

The basic functionality of the Ethernet Peripheral Library is grouped into these sections:

- Initialization
- Transmit
- Receive

For a properly functioning Ethernet port, development of a data queue and use of interrupts will be necessary.

For this additional functionality, see the **"Ethernet"** section in the family reference manual or the Ethernet Driver Library for more information.

Initialization Sequence

The Ethernet Controller is enabled using PLIB_ETH_Enable and is disabled using PLIB_ETH_Disable. The Ethernet Controller is disabled by default after any Reset.

After being Enabled, disabling the controller resets the internal DMA state machines and all transmit and receive operations are aborted. All registers remain accessible and their values are preserved. It is important to reset the PHY and MII Management registers to ensure the PHY is in a known initialized state.

Before enabling the module for transmitting or receiving packets, there are several registers that must be initialized. To initialize the Ethernet Controller to receive and transmit, Microchip recommends the following sequence:

1. Begin with the module.
- Disable the CPU Ethernet interrupt
- Turn the Ethernet Controller off
- Disable receive
- Disable transmit
- Wait until the Ethernet module is no longer busy
- Disable all Ethernet Interrupts
- Clear the Ethernet Interrupt Pending Flag(s)
- Clear the transmit and receive start addresses

2. MAC initialize.
- Reset the MAC
- A configuration fuse (FETHIO) setting shows which pins will be used for connection to the PHY
- A configuration fuse (FMIIEN) settings shows whether MII or RMII will be used

3. PHY Initialize is PHY dependent. Common procedures (which may vary by PHY vender) include the following:
- Reset PHY (using Control Register 0)
- Set the MII/RMII operation mode
- Set the normal, swapped, or auto (preferred)MDIX
- Check the PY capabilities (using Status Register 1)
- Preferably the auto-negotiation should be selected if the PHY supports it.
  - Expose the supported capabilities (extended Register 4)
  - Start the negotiation (using Control Register 0)
  - wait for the negotiation to complete and get the link partner capabilities (extended Register 5)

- negotiation result (vendor-specific register)

- If auto-negotiation is not supported (or not selected)
  - update the PHY Duplex and speed settings (use Control Register 0 or vender-specific register)

4. MAC Configuration

- Enable MAC receive and pause both transmit and receive direction control frames.
- Select the desired auto-padding, duplex, huge frame, and CRC capabilities.
- Program back-to-back inter-packet gap and non-back-to-back interpacket gap.
- Program collision window and maximum retransmissions.
- Set Maximum frame length.
- Optionally set the station MAC address(es) (or let them default to the factory value).

5. Continue Ethernet Controller initialization:

- If planning to turn on flow control, update the Pause Timer Value
- If using auto-flow control, set up the full/empty watermarks and enable it
- Set the receive filters
- Set receive buffer size - using packets that are too small impacts performance
- Prepare the list/ring of transmit descriptors - refer to the device data sheet for more information
- Prepare the list of receive descriptors populated with valid buffers for messages to be received - refer to the device data sheet for more information
- Update the transmit buffer start address and the receive buffer start address
- Enable the Ethernet Controller and wait until the module is ready
- Enable Ethernet Receive.

Receive Loop

1. Wait until the receive buffer count has been incremented.
2. Inspect the receive descriptor to see whether it is still owned by the Ethernet Module.
3. If the receive descriptor is still owned by the Ethernet module, nothing has been received. Loop to 1.
4. Otherwise, a message was received and software has control of the memory where it is stored.
5. Extract a message and do something with it.
6. Reinitialize buffer descriptor and return receive buffer to list and decrement the receive packet buffer count.
7. Loop.

Transmit Loop

1. Software writes the packet data to packet data memory. A pointer to the packet data is inserted into the transmit buffer descriptor.
2. Update the necessary number of transmit descriptors, starting from the head of the list - setting the data buffer address (large packet fragmentation will impact performance).
3. Update the byte count for each descriptor with the number of bytes contained in each buffer.
4. Set the flag in each transmit descriptor that belongs to the packet to give the descriptor to the Ethernet module for transmission.
5. Enable the transmission.
6. Wait until the Ethernet module returns the transmit buffer descriptor ownership to software.
7. Insect the results of the transmission.
8. Loop.

The packet transmit process is as follows:

1. Software writes the packet data to a packet buffer in data memory and programs a buffer descriptor entry to point to the packet data buffer. The buffer descriptor is used to define the Transmission Packet data buffer location and length, and its address is written to the Ethernet Controller.
2. Software then calls the TransmitRequestToSendEnable function, which starts the TX DMA and TXBM logic.
3. After the TX DMA engine reads the DATA_BUFFER_ADDRESS value, the engine will begin reading the packet data from the location read from the descriptor.
4. The TXBM indicates the start-of-frame to the MAC and transmits the entire frame data from the transmit buffer, until the end address is reached. The TXBM simply transmits from the start address until the specified number of bytes has been transmitted to the MAC transmit interface.
5. The MAC can retry a transmission due to an early collision.
6. The MAC can abort a transmission due to a late collision, excessive collisions or excessive defers. This condition is signaled by TXABORT bit (ETHIRQ<2>).
7. Once transmission has completed, the TX DMA engine stores the relevant bits of the TSV into the first descriptor entry of the packet.
8. After the packet has been transmitted, all the descriptors used for the transmission are released to the software via the EOWN bits being cleared.
9. If more valid TX descriptors are available (EOWN = 1), the DMA engine will go back to step 3 to begin the next packet's transmission. Otherwise, if the next descriptor is still owned by hardware (EOWN = 0), transmission will halt and wait for the software to set the TXRTS bit again.

Note that any collision that occurs within the CWINDOW bit (EMAC1CLRT<8:14>) boundary is an early collision and results in a Retry operation. A

collision that happens beyond the CWINDOW boundary will be treated as a late collision and will cause an abort. The CWINDOW bit in the EMAC1CLRT register is typically set to 64 bytes. An abort condition can also result from reaching the maximum collision count RETX bit (EMAC1CLRT<0:3>) for a packet trying to be sent.

See the **"Ethernet"** section in the family reference manual or the Ethernet Driver Library for more information.

Initialization

```
#include "plib_eth.h"

/*****************************************************************************
*/
void my_ETH_Initialize(ETH_MODULE_ID id)
{

    //Disable System (CPU) Interrupt associated with Ethernet Peripheral
    // using the Interrupt Peripheral Library
    // Example: PLIB_INT_SourceDisable(PLIB_INT_SOURCE_ETH_1);

    //Disable Ethernet Peripheral in case it was previously enabled
    PLIB_ETH_Disable(ETH_MODULE_ID1);

    //Disable any Ethernet Controller interrupt generation:
    PLIB_ETH_InterruptSourceDisable(ETH_MODULE_ID1, ETH_ALL_INTERRUPT_SOURCES);

    PLIB_ETH_RxDisable(ETH_MODULE_ID1);
    PLIB_ETH_TxRTSDisable(ETH_MODULE_ID1);

    while (PLIB_ETH_EthernetIsBusy(ETH_MODULE_ID1)) {/*wait*/ }

    //Clear the System Interrupt Flag associated with Ethernet Peripheral
    // using the Interrupt Peripheral Library
    // Example:     PLIB_INT_SourceFlagClear(PLIB_INT_SOURCE_ETH_1);

Support for Legacy "Ethernet Controller Library"

These routines (PLIB_ETH_Legacy*) provide MPLAB Harmony support for applications that use the "Ethernet Controller Library for Microchip

PIC32MX Microcontrollers" that is installed with XC32 compilers. Refer to the related compiled Help, `hlpETH.chm`, which is located in the `../Microchip/xc32/<version>/docs/pic32-lib-help` folder of your XC32 compiler installation for legacy information.

An additional argument, an index value from the ETH_MODULE_ID enumeration, has been added to allow these functions to work from within the context of this MPLAB Harmony Peripheral Library.

Configuring the Library

The library is configured for the supported Ethernet module when the processor is chosen in the MPLAB X IDE.

Library Interface

a) Initialization Functions

	Name	Description
	PLIB_ETH_AutoDetectPadClear	Clears the EMAC Auto-Pad option.
	PLIB_ETH_AutoDetectPadGet	Gets the current EMAC Auto-Pad setting.
	PLIB_ETH_AutoDetectPadSet	Sets the EMAC Auto-Pad option.
	PLIB_ETH_BackToBackIPGGet	Gets the EMAC back-to-back interpacket gap.
	PLIB_ETH_BackToBackIPGSet	Sets the EMAC back-to-back interpacket gap.
	PLIB_ETH_CollisionWindowGet	Gets the EMAC collision window.
	PLIB_ETH_CollisionWindowSet	Sets the EMAC collision window.
	PLIB_ETH_DelayedCRCDisable	Disables EMAC delayed CRC.
	PLIB_ETH_DelayedCRCEnable	Enables EMAC delayed CRC.
	PLIB_ETH_DelayedCRCIsEnabled	Gets the EMAC delayed CRC enable status.
	PLIB_ETH_Disable	Disables the Ethernet module.
	PLIB_ETH_Enable	Enables the Ethernet module.
	PLIB_ETH_ExcessDeferDisable	Disables EMAC excess defer.
	PLIB_ETH_ExcessDeferEnable	Enables EMAC excess defer.
	PLIB_ETH_ExcessDeferIsEnabled	Gets the EMAC excess defer enable status.
	PLIB_ETH_FrameLengthCheckDisable	Disables the EMAC frame length check.
	PLIB_ETH_FrameLengthCheckEnable	Enables the EMAC frame length check.
	PLIB_ETH_FrameLengthCheckIsEnabled	Gets the EMAC frame length check status.
	PLIB_ETH_FullDuplexDisable	Disables the EMAC full duplex operation.
	PLIB_ETH_FullDuplexEnable	Enables the EMAC full duplex operation.

	PLIB_ETH_FullDuplexIsEnabled	Gets the EMAC full duplex enable status.
	PLIB_ETH_HugeFrameDisable	Disables the EMAC from receiving huge frames.
	PLIB_ETH_HugeFrameEnable	Enables the EMAC to receive huge frames.
	PLIB_ETH_HugeFrameIsEnabled	Gets the EMAC huge frame enable status.
	PLIB_ETH_IsEnabled	Gets the Ethernet module enable status.
	PLIB_ETH_LongPreambleDisable	Disables EMAC long preamble enforcement.
	PLIB_ETH_LongPreambleEnable	Enables EMAC long preamble enforcement.
	PLIB_ETH_LongPreambleIsEnabled	Gets the EMAC long preamble enforcement enable status.
	PLIB_ETH_LoopbackDisable	Disables the EMAC loopback logic.
	PLIB_ETH_LoopbackEnable	Enables the EMAC loopback logic.
	PLIB_ETH_LoopbackIsEnabled	Gets the EMAC Loopback interface enable status.
	PLIB_ETH_MaxFrameLengthGet	Gets the EMAC maximum frame length.
	PLIB_ETH_MaxFrameLengthSet	Sets the EMAC maximum frame length.
	PLIB_ETH_MIIMClockGet	Gets the current EMAC MIIM clock selection.
	PLIB_ETH_MIIMClockSet	Sets the EMAC MIM clock selection.
	PLIB_ETH_MIIMNoPreDisable	Disables EMAC No Preamble (allows preamble).
	PLIB_ETH_MIIMNoPreEnable	Enables EMAC MIIM No Preamble (suppresses preamble).
	PLIB_ETH_MIIMNoPreIsEnabled	Gets the EMAC MIIM No Preamble enable status.
	PLIB_ETH_NonBackToBackIPG1Get	Gets the EMAC non-back-to-back interpacket gap register 1.
	PLIB_ETH_NonBackToBackIPG1Set	Sets the EMAC non-back-to-back interpacket gap register 1.
	PLIB_ETH_NonBackToBackIPG2Get	Gets the EMAC non-back-to-back interpacket gap register 2.
	PLIB_ETH_NonBackToBackIPG2Set	Sets the EMAC non-back-to-back interpacket gap register 2.
	PLIB_ETH_PauseTimerGet	Gets the Pause Timer value used for flow control.
	PLIB_ETH_PauseTimerSet	Sets the Pause Timer value used for flow control.
	PLIB_ETH_ReceiveBufferSizeGet	Gets the Ethernet module receive buffer size.
	PLIB_ETH_ReceiveBufferSizeSet	Sets the Ethernet module receive buffer size.
	PLIB_ETH_ReceiveDisable	Disables the EMAC from receiving frames.
	PLIB_ETH_ReceiveEnable	Enables the EMAC to receive the frames.
	PLIB_ETH_ReceiveIsEnabled	Gets the Ethernet EMAC receive enable status.
	PLIB_ETH_ReTxMaxGet	Gets the EMAC maximum retransmissions.
	PLIB_ETH_ReTxMaxSet	Sets the EMAC maximum retransmissions.
	PLIB_ETH_RMIISpeedGet	Gets the current EMAC RMII speed.
	PLIB_ETH_RMIISpeedSet	Sets EMAC RMII Speed.
	PLIB_ETH_StopInIdleDisable	Ethernet module operation will continue when the device enters Idle mode.
	PLIB_ETH_StopInIdleEnable	Ethernet module operation will stop when the device enters Idle mode.
	PLIB_ETH_StopInIdleIsEnabled	Gets the Ethernet module Stop in Idle mode enable status.

b) Control Functions

	Name	Description
	PLIB_ETH_MCSRxResetDisable	Disables the reset EMAC Control Sub-layer/Receive domain logic.
	PLIB_ETH_MCSRxResetEnable	Enables the reset EMAC Control Sub-layer/Receive domain logic.
	PLIB_ETH_MCSRxResetIsEnabled	Gets the EMAC Control Sub-layer/Receive domain logic reset status.
	PLIB_ETH_MCSTxResetDisable	Disables the reset EMAC Control Sub-layer/Transmit domain logic.
	PLIB_ETH_MCSTxResetEnable	Enables the reset of EMAC Control Sub-layer/Transmit domain logic.
	PLIB_ETH_MCSTxResetIsEnabled	Gets the EMAC Control Sub-layer/Transmit domain logic reset status.
	PLIB_ETH_MIIMReadDataGet	Gets EMAC MIIM management read data after a MII read cycle has completed.
	PLIB_ETH_MIIMReadStart	Initiates an MII management read command.
	PLIB_ETH_MIIMResetDisable	Disables EMAC Reset MII Management.
	PLIB_ETH_MIIMResetEnable	Enables EMAC Reset Media Independent Interface (MII) Management.
	PLIB_ETH_MIIMResetIsEnabled	Gets the EMAC Reset MII Management enable status.
	PLIB_ETH_MIIMScanIncrEnable	Enables EMAC MIIM Scan Increment.
	PLIB_ETH_MIIMScanIncrDisable	Disables the EMAC MIIM Scan Increment.
	PLIB_ETH_MIIMScanIncrIsEnabled	Gets the EMAC MIIM scan increment enable status.
	PLIB_ETH_MIIMScanModeDisable	Disables MIIM scan mode.
	PLIB_ETH_MIIMScanModeEnable	Enables MIIM scan mode.

	PLIB_ETH_MIIMScanModeIsEnabled	Gets the MII management scan enable status.
	PLIB_ETH_MIIMWriteDataSet	Sets the EMAC MIIM write data before initiating an MII write cycle.
	PLIB_ETH_MIIMWriteStart	Initiates an MII management write command.
	PLIB_ETH_MIIResetDisable	Disables the EMAC Soft reset.
	PLIB_ETH_MIIResetEnable	Enables the EMAC MIIM Soft reset.
	PLIB_ETH_MIIResetIsEnabled	Gets EMAC MIIM Soft Reset enable status.
	PLIB_ETH_PHYAddressGet	Gets the EMAC MIIM management PHY address.
	PLIB_ETH_PHYAddressSet	Sets the EMAC MIIM PHY address.
	PLIB_ETH_RegisterAddressGet	Gets the EMAC MIIM management register address.
	PLIB_ETH_RegisterAddressSet	Sets EMAC MIIM register address.
	PLIB_ETH_RMIIResetDisable	Disables EMAC Reset RMII.
	PLIB_ETH_RMIIResetEnable	Enables EMAC Reset RMII.
	PLIB_ETH_RMIIResetIsEnabled	Gets the EMAC Reset RMII enable status.
	PLIB_ETH_RxBufferCountDecrement	Causes the Receive Descriptor Buffer Counter to decrement by 1.
	PLIB_ETH_RxDisable	Disables the Ethernet module receive logic.
	PLIB_ETH_RxEnable	Enables the Ethernet receive logic.
	PLIB_ETH_RxFuncResetDisable	Disables the EMAC reset receive function logic.
	PLIB_ETH_RxFuncResetEnable	Enables the EMAC reset receive function logic.
	PLIB_ETH_RxFuncResetIsEnabled	Gets the EMAC reset receive function status.
	PLIB_ETH_RxIsEnabled	Gets the Ethernet module receive enable status.
	PLIB_ETH_RxPacketDescAddrGet	Gets the address of the next receive descriptor.
	PLIB_ETH_RxPacketDescAddrSet	Sets the Ethernet module receive packet descriptor start address.
	PLIB_ETH_TestPauseDisable	Disables EMAC test pause.
	PLIB_ETH_TestPauseEnable	Enables EMAC test pause.
	PLIB_ETH_TestPauseIsEnabled	Gets the EMAC test pause enable status.
	PLIB_ETH_TxFuncResetDisable	Disables the EMAC Transmit function reset.
	PLIB_ETH_TxFuncResetEnable	Enables the EMAC transmit function reset.
	PLIB_ETH_TxFuncResetIsEnabled	Gets the EMAC Transmit function reset status.
	PLIB_ETH_TxPacketDescAddrGet	Gets the address of the next descriptor to be transmitted.
	PLIB_ETH_TxPacketDescAddrSet	Sets the Ethernet module transmit packet descriptor start address.
	PLIB_ETH_TxRTSDisable	Aborts an Ethernet module transmission.
	PLIB_ETH_TxRTSEnable	Enables the Ethernet transmit request to send.
	PLIB_ETH_TxRTSIsEnabled	Gets the Ethernet module transmit request to send status.
	PLIB_ETH_CRCDisable	Disables EMAC CRC.
	PLIB_ETH_CRCEnable	Enables EMAC CRC.
	PLIB_ETH_CRCIsEnabled	Gets the EMAC CRC enable status.

c) Status Functions

	Name	Description
	PLIB_ETH_DataNotValid	Gets the MII management read data not valid status.
	PLIB_ETH_EthernetIsBusy	Gets the status value of the Ethernet logic busy.
	PLIB_ETH_LinkHasFailed	Gets the MII management link fail status.
	PLIB_ETH_MIIMIsBusy	Gets the MII management busy status.
	PLIB_ETH_MIIMIsScanning	Gets the MII Management scanning status.
	PLIB_ETH_ReceiveIsBusy	Gets the Ethernet receive logic busy status.
	PLIB_ETH_TransmitIsBusy	Gets the status value of the Ethernet transmit logic busy status

d) Filtering Functions

	Name	Description
	PLIB_ETH_HashTableGet	Gets the value of the Hash table.
	PLIB_ETH_HashTableSet	Sets the Ethernet module Hash table with the new value.
	PLIB_ETH_PassAllDisable	Disables the EMAC PassAll.
	PLIB_ETH_PassAllEnable	Enables the EMAC PassAll.
	PLIB_ETH_PassAllIsEnabled	Gets the EMAC PassAll enable status.
	PLIB_ETH_PatternMatchChecksumGet	Gets the value of the pattern match checksum register.

	PLIB_ETH_PatternMatchChecksumSet	Sets the Ethernet module pattern match checksum register with the new value.
	PLIB_ETH_PatternMatchGet	Gets the value of the selected pattern match mask register.
	PLIB_ETH_PatternMatchModeGet	Gets the value of the selected pattern match mask register.
	PLIB_ETH_PatternMatchModeSet	Sets the Ethernet module pattern match mode.
	PLIB_ETH_PatternMatchOffsetGet	Gets the value of the patter match offset register.
	PLIB_ETH_PatternMatchOffsetSet	Sets the Ethernet module patter match offset register with the new value.
	PLIB_ETH_PatternMatchSet	Sets the Ethernet module pattern match mask register with the new value.
	PLIB_ETH_PurePreambleDisable	Disables EMAC pure preamble enforcement.
	PLIB_ETH_PurePreambleEnable	Enables EMAC pure preamble enforcement.
	PLIB_ETH_PurePreambleIsEnabled	Gets EMAC pure preamble enforcement enable status.
	PLIB_ETH_ReceiveFilterDisable	Disables the specified receive filter.
	PLIB_ETH_ReceiveFilterEnable	Enables the specified receive filter.
	PLIB_ETH_ReceiveFilterIsEnable	Disables the specified receive filter.
	PLIB_ETH_StationAddressGet	Gets the selected EMAC station address.
	PLIB_ETH_StationAddressSet	Sets the selected EMAC Station Address.

e) Flow Control Functions

	Name	Description
	PLIB_ETH_AutoFlowControlDisable	Disables the Ethernet module Automatic Flow Control logic.
	PLIB_ETH_AutoFlowControlEnable	Enables the Ethernet Automatic Flow Control logic.
	PLIB_ETH_AutoFlowControlIsEnabled	Gets the Ethernet module Automatic Flow Control status.
	PLIB_ETH_BackPresNoBackoffDisable	Disables EMAC backpressure/no back-off.
	PLIB_ETH_BackPresNoBackoffEnable	Enables EMAC back pressure/no back-off.
	PLIB_ETH_BackPresNoBackoffIsEnabled	Gets the EMAC backpressure/no back-off enable status.
	PLIB_ETH_ManualFlowControlDisable	Disable Ethernet module Manual Flow Control logic.
	PLIB_ETH_ManualFlowControlEnable	Enables the Ethernet Manual Flow Control logic.
	PLIB_ETH_ManualFlowControlIsEnabled	Gets the Ethernet module Manual Flow Control enable status.
	PLIB_ETH_NoBackoffDisable	Disables EMAC no back-offs.
	PLIB_ETH_NoBackoffEnable	Enables EMAC no back-off.
	PLIB_ETH_NoBackoffIsEnabled	Gets the EMAC no back-off enable status.
	PLIB_ETH_RxEmptyWmarkGet	Gets the Ethernet module receive empty watermark.
	PLIB_ETH_RxEmptyWmarkSet	Sets the Ethernet module receive empty water mark.
	PLIB_ETH_RxFullWmarkGet	Gets the Ethernet module to receive a full watermark.
	PLIB_ETH_RxFullWmarkSet	Sets the Ethernet module to receive a full watermark.
	PLIB_ETH_RxPauseDisable	Disables the EMAC receive flow control.
	PLIB_ETH_RxPauseEnable	Enables the EMAC receive flow control.
	PLIB_ETH_RxPauseIsEnabled	Gets the EMAC receive flow pause enable status.
	PLIB_ETH_ShortcutQuantaDisable	Disables EMAC shortcut pause quanta.
	PLIB_ETH_ShortcutQuantaEnable	Enables EMAC shortcut pause quanta.
	PLIB_ETH_ShortcutQuantaIsEnabled	Gets EMAC shortcut pause quanta enable status.
	PLIB_ETH_SimResetDisable	Disables the EMAC simulation reset.
	PLIB_ETH_SimResetEnable	Enables the EMAC simulation reset.
	PLIB_ETH_SimResetIsEnabled	Gets the EMAC simulation reset status.
	PLIB_ETH_TestBackPressDisable	Disables EMAC Test backpressure.
	PLIB_ETH_TestBackPressEnable	Enables EMAC Test backpressure.
	PLIB_ETH_TestBackPressIsEnabled	Gets the EMAC test backpressure enable status.
	PLIB_ETH_TxPauseDisable	Disables the transmission of Pause frames.
	PLIB_ETH_TxPauseEnable	Enables the transmission Pause frames.
	PLIB_ETH_TxPauseIsEnabled	Gets the Ethernet module enable status.

f) Interrupt Functions

	Name	Description
	PLIB_ETH_InterruptClear	Clears the Ethernet module interrupt source status as a group, using a mask.
	PLIB_ETH_InterruptSet	Sets the Ethernet module interrupt source status as a group, using a mask.
	PLIB_ETH_InterruptsGet	Gets the Ethernet module Interrupt Flag register as a group.

	PLIB_ETH_InterruptSourceDisable	Clears the Ethernet module Interrupt Enable register as a group, using a mask.
	PLIB_ETH_InterruptSourceEnable	Sets the Ethernet module Interrupt Enable register in a group, using a mask.
	PLIB_ETH_InterruptSourceIsEnabled	Gets the Ethernet module Interrupt Enable register singularly or as a group.
	PLIB_ETH_InterruptSourcesGet	Returns the entire interrupt enable register.
	PLIB_ETH_InterruptStatusGet	Gets the Ethernet module Interrupt Flag register as a group, using a mask.

g) Statistics Functions

	Name	Description
	PLIB_ETH_AlignErrorCountClear	Sets the count of Ethernet alignment errors to zero.
	PLIB_ETH_AlignErrorCountGet	Gets the count of Ethernet alignment errors.
	PLIB_ETH_FCSErrorCountClear	Sets the value of the Ethernet frame check sequence error to zero.
	PLIB_ETH_FCSErrorCountGet	Gets the count of the frame check sequence error.
	PLIB_ETH_FramesRxdOkCountClear	Sets the value of the Ethernet received frames 'OK' count to zero.
	PLIB_ETH_FramesRxdOkCountGet	Gets the count of the frames frames received successfully.
	PLIB_ETH_FramesTxdOkCountClear	Sets the count of Ethernet Control frames transmitted to zero.
	PLIB_ETH_FramesTxdOkCountGet	Gets the count of Ethernet Control Frames transmitted successfully.
	PLIB_ETH_MultipleCollisionCountClear	Sets the value of the Ethernet multiple collision frame count to zero.
	PLIB_ETH_MultipleCollisionCountGet	Gets the count of the frames transmitted successfully after there was more than one collision.
	PLIB_ETH_RxOverflowCountClear	Sets the value of the Ethernet receive overflow count to zero.
	PLIB_ETH_RxOverflowCountGet	Gets the count of the dropped Ethernet receive frames.
	PLIB_ETH_RxPacketCountGet	Gets the value of the receive packet buffer count.
	PLIB_ETH_SingleCollisionCountClear	Sets the value of the Ethernet single collision frame count to zero.
	PLIB_ETH_SingleCollisionCountGet	Gets the count of the frames transmitted successfully on a second attempt.

h) Feature Existence Functions

	Name	Description
	PLIB_ETH_ExistsAlignmentErrorCount	Identifies whether the AlignmentErrorCount feature exists on the Ethernet module.
	PLIB_ETH_ExistsAutoFlowControl	Identifies whether the AutoFlowControl feature exists on the Ethernet module.
	PLIB_ETH_ExistsCollisionCounts	Identifies whether the CollisionCounts feature exists on the Ethernet module.
	PLIB_ETH_ExistsCollisionWindow	Identifies whether the CollisionWindow feature exists on the Ethernet module.
	PLIB_ETH_ExistsEnable	Identifies whether the Enable feature exists on the Ethernet module.
	PLIB_ETH_ExistsEthernetControllerStatus	Identifies whether the EthernetControllerStatus feature exists on the Ethernet module.
	PLIB_ETH_ExistsFCSErrorCount	Identifies whether the FCSErrorCount feature exists on the Ethernet module.
	PLIB_ETH_ExistsFramesTransmittedOK	Identifies whether the FramesTransmittedOK feature exists on the Ethernet module.
	PLIB_ETH_ExistsFramexReceivedOK	Identifies whether the FramexReceivedOK feature exists on the Ethernet module.
	PLIB_ETH_ExistsHashTable	Identifies whether the HashTable feature exists on the Ethernet module.
	PLIB_ETH_ExistsInterPacketGaps	Identifies whether the InterPacketGaps feature exists on the Ethernet module.
	PLIB_ETH_ExistsInterrupt	Identifies whether the Interrupt feature exists on the Ethernet module.
	PLIB_ETH_ExistsMAC_Configuration	Identifies whether the MAC_Configuration feature exists on the Ethernet module.
	PLIB_ETH_ExistsMAC_Resets	Identifies whether the MAC_Resets feature exists on the Ethernet module.
	PLIB_ETH_ExistsMAC_Testing	Identifies whether the MAC_Testing feature exists on the Ethernet module.
	PLIB_ETH_ExistsManualFlowControl	Identifies whether the ManualFlowControl feature exists on the Ethernet module.
	PLIB_ETH_ExistsMaxFrameLength	Identifies whether the MaxFrameLength feature exists on the Ethernet module.
	PLIB_ETH_ExistsMIIM_Config	Identifies whether the MIIM_Config feature exists on the Ethernet module.
	PLIB_ETH_ExistsMIIM_Indicators	Identifies whether the MIIM_Indicators feature exists on the Ethernet module.
	PLIB_ETH_ExistsMIIMAddresses	Identifies whether the MIIMAddresses feature exists on the Ethernet module.
	PLIB_ETH_ExistsMIIMReadWrite	Identifies whether the MIIMReadWrite feature exists on the Ethernet module.
	PLIB_ETH_ExistsMIIMScanMode	Identifies whether the MIIMScanMode feature exists on the Ethernet module.
	PLIB_ETH_ExistsMIIWriteReadData	Identifies whether the MIIWriteReadData feature exists on the Ethernet module.
	PLIB_ETH_ExistsPatternMatch	Identifies whether the PatternMatch feature exists on the Ethernet module.
	PLIB_ETH_ExistsPauseTimer	Identifies whether the PauseTimer feature exists on the Ethernet module.
	PLIB_ETH_ExistsReceiveBufferSize	Identifies whether the ReceiveBufferSize feature exists on the Ethernet module.
	PLIB_ETH_ExistsReceiveFilters	Identifies whether the ReceiveFilters feature exists on the Ethernet module.
	PLIB_ETH_ExistsReceiveOverflowCount	Identifies whether the ReceiveOverflowCount feature exists on the Ethernet module.

	PLIB_ETH_ExistsReceiveWmarks	Identifies whether the ReceiveWmarks feature exists on the Ethernet module.
	PLIB_ETH_ExistsRetransmissionMaximum	Identifies whether the RetransmissionMaximum feature exists on the Ethernet module.
	PLIB_ETH_ExistsRMII_Support	Identifies whether the RMII_Support feature exists on the Ethernet module.
	PLIB_ETH_ExistsRxBufferCountDecrement	Identifies whether the RxBufferCountDecrement feature exists on the Ethernet module.
	PLIB_ETH_ExistsRxEnable	Identifies whether the ReceiveEnable feature exists on the Ethernet module.
	PLIB_ETH_ExistsRxPacketDescriptorAddress	Identifies whether the RxPacketDescriptorAddress feature exists on the Ethernet module.
	PLIB_ETH_ExistsStationAddress	Identifies whether the StationAddress feature exists on the Ethernet module.
	PLIB_ETH_ExistsStopInIdle	Identifies whether the StopInIdle feature exists on the Ethernet module.
	PLIB_ETH_ExistsTransmitRTS	Identifies whether the TransmitRTS feature exists on the Ethernet module.
	PLIB_ETH_ExistsTxPacketDescriptorAddress	Identifies whether the TxPacketDescriptorAddress feature exists on the Ethernet module.

i) Data Types and Constants

	Name	Description
	ETH_AUTOPAD_OPTION	Lists the possible automatic padding configurations.
	ETH_INTERRUPT_SOURCES	Lists the possible values of ETH_INTERRUPT_SOURCES.
	ETH_MIIM_CLK	Lists the possible speed selection for the Reduced Media Independent Interface (RMII).
	ETH_PATTERN_MATCH_MODE	Lists the possible pattern match values.
	_ETH_PATTERN_MATCH_MODE_	Lists the possible pattern match values.
	ETH_RECEIVE_FILTER	Lists the possible values of the receive filter.
	ETH_RMII_SPEED	Lists the possible speed selection for the Reduced Media Independent Interface (RMII).

Description

This section describes the Application Programming Interface (API) functions of the Ethernet Peripheral Library.

Refer to each section for a detailed description.

a) Initialization Functions

PLIB_ETH_AutoDetectPadClear Function

Clears the EMAC Auto-Pad option.

File

plib_eth.h

C

```
void PLIB_ETH_AutoDetectPadClear(ETH_MODULE_ID index, ETH_AUTOPAD_OPTION option);
```

Returns

None.

Description

This function sets the EMAC Auto-Pad option. If any auto-pad option other than ETH_AUTOPAD_DISABLED_CHECK_CRC is selected, the CRC must be enabled by PLIB_ETH_CRCEnable.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_AutoDetectPadClear(MY_ETH_INSTANCE, PAD_OPTION);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_AutoDetectPadClear(ETH_MODULE_ID index, ETH_AUTOPAD_OPTION option);

PLIB_ETH_AutoDetectPadGet Function

Gets the current EMAC Auto-Pad setting.

File

plib_eth.h

C

```
ETH_AUTOPAD_OPTION PLIB_ETH_AutoDetectPadGet(ETH_MODULE_ID index);
```

Returns

ETH_AUTOPAD_OPTION.

Description

This function gets the current EMAC Auto-Pad setting.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
autoPadOption = PLIB_ETH_AutoDetectPadGet(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

ETH_AUTOPAD_OPTION PLIB_ETH_AutoDetectPadGet(ETH_MODULE_ID index);

PLIB_ETH_AutoDetectPadSet Function

Sets the EMAC Auto-Pad option.

File

plib_eth.h

C

```
void PLIB_ETH_AutoDetectPadSet(ETH_MODULE_ID index, ETH_AUTOPAD_OPTION option);
```

Returns

None.

Description

This function sets the EMAC Auto-Pad option. If any auto-pad option other than ETH_AUTOPAD_DISABLED_CHECK_CRC is selected, the CRC must be enabled by PLIB_ETH_CRCEnable.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_AutoDetectPadSet(MY_ETH_INSTANCE, PAD_OPTION);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_AutoDetectPadSet(ETH_MODULE_ID index, ETH_AUTOPAD_OPTION option);

PLIB_ETH_BackToBackIPGGet Function

Gets the EMAC back-to-back interpacket gap.

File

plib_eth.h

C

```
uint8_t PLIB_ETH_BackToBackIPGGet(ETH_MODULE_ID index);
```

Returns

- backToBackIPGValue - Back-to-back interpacket gap (7 bits)

Description

This function gets the EMAC back-to-back interpacket gap.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
value = PLIB_ETH_BackToBackIPGGet(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

uint8_t PLIB_ETH_BackToBackIPGGet(ETH_MODULE_ID index)

PLIB_ETH_BackToBackIPGSet Function

Sets the EMAC back-to-back interpacket gap.

File

plib_eth.h

C

```
void PLIB_ETH_BackToBackIPGSet(ETH_MODULE_ID index, uint8_t backToBackIPGValue);
```

Returns

None.

Description

This function sets the EMAC back-to-back interpacket gap.

Remarks

In Full-Duplex mode, the register value should be the desired period in nibble times minus 3. In Full-Duplex, the recommended setting is 0x15.

In Half-Duplex mode, the register value should be the desired period in nibble times minus 6. n Half-Duplex, the recommended setting is 0x12.
This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_BackToBackIPGSet(MY_ETH_INSTANCE, backToBackIPGValue);
```

Parameters

Parameters	Description
index	Identifier for the device instance
backToBackIPGValue	Back-to-back interpacket gap

Function

void PLIB_ETH_BackToBackIPGSet(ETH_MODULE_ID index, uint8_t backToBackIPGValue)

PLIB_ETH_CollisionWindowGet Function

Gets the EMAC collision window.

File

plib_eth.h

C

```
uint8_t PLIB_ETH_CollisionWindowGet(ETH_MODULE_ID index);
```

Returns

- collisionWindowValue - A uint8_t (6-bit) value.

Description

This function gets the EMAC collision window.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
value = PLIB_ETH_CollisionWindowGet(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

uint8_t PLIB_ETH_CollisionWindowGet(ETH_MODULE_ID index)

PLIB_ETH_CollisionWindowSet Function

Sets the EMAC collision window.

File

plib_eth.h

C

```
void PLIB_ETH_CollisionWindowSet(ETH_MODULE_ID index, uint8_t collisionWindowValue);
```

Returns

None.

Description

This function sets the EMAC collision window.

Remarks

This is a programmable field representing the slot time or collision window during which collisions occur in properly configured networks. Since the collision window starts at the beginning of transmission, the preamble and SFD is included. Its default of 0x37 (55d) corresponds to the count of frame bytes at the end of the window.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_CollisionWindowSet(MY_ETH_INSTANCE, collisionWindowValue);
```

Parameters

Parameters	Description
index	Identifier for the device instance
collisionWindowValue	Collision window

Function

void PLIB_ETH_CollisionWindowSet(ETH_MODULE_ID index, uint8_t collisionWindowValue)

PLIB_ETH_DelayedCRCDisable Function

Disables EMAC delayed CRC.

File

plib_eth.h

C

```
void PLIB_ETH_DelayedCRCDisable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function disables EMAC delayed CRC. No proprietary header exists.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_DelayedCRCDisable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_DelayedCRCDisable(ETH_MODULE_ID index)

PLIB_ETH_DelayedCRCEnable Function

Enables EMAC delayed CRC.

File

plib_eth.h

C

```
void PLIB_ETH_DelayedCRCEnable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function enables EMAC delayed CRC. A proprietary packet header exists. Four bytes of the packet header are ignored by the CRC function.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_DelayedCRCEnable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_DelayedCRCEnable(ETH_MODULE_ID index)

PLIB_ETH_DelayedCRCIsEnabled Function

Gets the EMAC delayed CRC enable status.

File

plib_eth.h

C

```
bool PLIB_ETH_DelayedCRCIsEnabled(ETH_MODULE_ID index);
```

Returns

- true - A proprietary header exists. Four bytes of packet header are ignored by the CRC function.
- false - No proprietary header

Description

This function returns the EMAC delayed CRC enable status.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
stat = PLIB_ETH_DelayedCRCIsEnabled(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

bool PLIB_ETH_DelayedCRCIsEnabled(ETH_MODULE_ID index)

PLIB_ETH_Disable Function

Disables the Ethernet module.

File

plib_eth.h

C

```
void PLIB_ETH_Disable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function disables the Ethernet module.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_Disable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_Disable(ETH_MODULE_ID index)

PLIB_ETH_Enable Function

Enables the Ethernet module.

File

plib_eth.h

C

```
void PLIB_ETH_Enable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function enables the Ethernet module.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_Enable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_Enable(ETH_MODULE_ID index)

PLIB_ETH_ExcessDeferDisable Function

Disables EMAC excess defer.

File

plib_eth.h

C

```
void PLIB_ETH_ExcessDeferDisable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function disables EMAC excess defer. The EMAC will abort when the excessive deferral limit is reached.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_ExcessDeferDisable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_ExcessDeferDisable(ETH_MODULE_ID index)

PLIB_ETH_ExcessDeferEnable Function

Enables EMAC excess defer.

File

plib_eth.h

C

```
void PLIB_ETH_ExcessDeferEnable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function enables EMAC excess defer. The EMAC will defer to the carrier indefinitely.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_ExcessDeferEnable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_ExcessDeferEnable(ETH_MODULE_ID index)

PLIB_ETH_ExcessDeferIsEnabled Function

Gets the EMAC excess defer enable status.

File

plib_eth.h

C

```
bool PLIB_ETH_ExcessDeferIsEnabled(ETH_MODULE_ID index);
```

Returns

- true - The EMAC will defer to carrier indefinitely as per the Standard
- false - The EMAC will abort when the excessive deferral limit is reached

Description

This function gets the EMAC excess defer enable status.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
stat = PLIB_ETH_ExcessDeferIsEnabled(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

bool PLIB_ETH_ExcessDeferIsEnabled(ETH_MODULE_ID index)

PLIB_ETH_FrameLengthCheckDisable Function

Disables the EMAC frame length check.

File

plib_eth.h

C

```
void PLIB_ETH_FrameLengthCheckDisable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function disables the EMAC frame length check.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_FrameLengthCheckDisable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_FrameLengthCheckDisable(ETH_MODULE_ID index)

PLIB_ETH_FrameLengthCheckEnable Function

Enables the EMAC frame length check.

File

plib_eth.h

C

```
void PLIB_ETH_FrameLengthCheckEnable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function enables the EMAC frame length check. Both transmit and receive frame lengths are compared to the Length/Type field. If the Length/Type field represents a length, the check is performed. Mismatches are reported on the transmit/receive statistics vector.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_FrameLengthCheckEnable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_FrameLengthCheckEnable(ETH_MODULE_ID index)

PLIB_ETH_FrameLengthCheckIsEnabled Function

Gets the EMAC frame length check status.

File

plib_eth.h

C

```
bool PLIB_ETH_FrameLengthCheckIsEnabled(ETH_MODULE_ID index);
```

Returns

- true - Both transmit and receive frame lengths are compared to the Length/Type field. If the Length/Type field represents a length then the check is performed. Mismatches are reported on the transmit/receive statistics vector.
- false - Length/Type field check is not performed

Description

This function returns the EMAC frame length check status.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
stat = PLIB_ETH_FrameLengthCheckIsEnabled(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

bool PLIB_ETH_FrameLengthCheckIsEnabled(ETH_MODULE_ID index)

PLIB_ETH_FullDuplexDisable Function

Disables the EMAC full duplex operation.

File

plib_eth.h

C

```
void PLIB_ETH_FullDuplexDisable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function disables the EMAC full-duplex operation, which results in the EMAC operating in half-duplex.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_FullDuplexDisable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_FullDuplexDisable(ETH_MODULE_ID index)

PLIB_ETH_FullDuplexEnable Function

Enables the EMAC full duplex operation.

File

plib_eth.h

C

```
void PLIB_ETH_FullDuplexEnable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function enables the EMAC full duplex operation.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_FullDuplexEnable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_FullDuplexEnable(ETH_MODULE_ID index)

PLIB_ETH_FullDuplexIsEnabled Function

Gets the EMAC full duplex enable status.

File

plib_eth.h

C

```
bool PLIB_ETH_FullDuplexIsEnabled(ETH_MODULE_ID index);
```

Returns

- true - The EMAC operates in Full-Duplex mode
- false - The EMAC operates in Half-Duplex mode

Description

This function returns the EMAC full duplex enable status.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
stat = PLIB_ETH_FullDuplexIsEnabled(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

bool PLIB_ETH_FullDuplexIsEnabled(ETH_MODULE_ID index)

PLIB_ETH_HugeFrameDisable Function

Disables the EMAC from receiving huge frames.

File

plib_eth.h

C

```
void PLIB_ETH_HugeFrameDisable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function disables the EMAC from receiving huge frames.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_HugeFrameDisable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_HugeFrameDisable(ETH_MODULE_ID index)

PLIB_ETH_HugeFrameEnable Function

Enables the EMAC to receive huge frames.

File

plib_eth.h

C

```
void PLIB_ETH_HugeFrameEnable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function enables the EMAC receiving the frames of any length.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_HugeFrameEnable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_HugeFrameEnable(ETH_MODULE_ID index)

PLIB_ETH_HugeFrameIsEnabled Function

Gets the EMAC huge frame enable status.

File

plib_eth.h

C

```
bool PLIB_ETH_HugeFrameIsEnabled(ETH_MODULE_ID index);
```

Returns

- true - Frames of any length are transmitted and received
- false - Huge frames are not allowed for receive or transmit

Description

This function returns the EMAC huge frame enable status.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
stat = PLIB_ETH_HugeFrameIsEnabled(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

bool PLIB_ETH_HugeFrameIsEnabled(ETH_MODULE_ID index)

PLIB_ETH_IsEnabled Function

Gets the Ethernet module enable status.

File

plib_eth.h

C

```
bool PLIB_ETH_IsEnabled(ETH_MODULE_ID index);
```

Returns

- true - Ethernet module is enabled
- false - Ethernet module is disabled

Description

This function returns the Ethernet module enable status.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
stat = PLIB_ETH_IsEnabled(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

bool PLIB_ETH_IsEnabled(ETH_MODULE_ID index)

PLIB_ETH_LongPreambleDisable Function

Disables EMAC long preamble enforcement.

File

plib_eth.h

C

```
void PLIB_ETH_LongPreambleDisable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function disables EMAC long preamble enforcement. The EMAC allows any length preamble.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_LongPreambleDisable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_LongPreambleDisable(ETH_MODULE_ID index)

PLIB_ETH_LongPreambleEnable Function

Enables EMAC long preamble enforcement.

File

plib_eth.h

C

```
void PLIB_ETH_LongPreambleEnable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function enables EMAC long preamble enforcement. The EMAC only allows receive packets which contain preamble fields less than 12 bytes in length.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_LongPreambleEnable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_LongPreambleEnable(ETH_MODULE_ID index)

PLIB_ETH_LongPreambleIsEnabled Function

Gets the EMAC long preamble enforcement enable status.

File

plib_eth.h

C

```
bool PLIB_ETH_LongPreambleIsEnabled(ETH_MODULE_ID index);
```

Returns

- true - The EMAC only allows receive packets, which contain preamble fields less than 12 bytes in length
- false - The EMAC allows any length preamble

Description

This function gets the EMAC long preamble enforcement enable status.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
stat = PLIB_ETH_LongPreambleIsEnabled(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

bool PLIB_ETH_LongPreambleIsEnabled(ETH_MODULE_ID index)

PLIB_ETH_LoopbackDisable Function

Disables the EMAC loopback logic.

File

plib_eth.h

C

```
void PLIB_ETH_LoopbackDisable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function disables the EMAC loopback. EMAC resumes normal operation.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_LoopbackDisable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_LoopbackDisable(ETH_MODULE_ID index)

PLIB_ETH_LoopbackEnable Function

Enables the EMAC loopback logic.

File

plib_eth.h

C

```
void PLIB_ETH_LoopbackEnable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function enables the EMAC loopback logic. The EMAC transmit interface is looped back to the EMAC receive interface.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_LoopbackEnable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_LoopbackEnable(ETH_MODULE_ID index)

PLIB_ETH_LoopbackIsEnabled Function

Gets the EMAC Loopback interface enable status.

File

plib_eth.h

C

```
bool PLIB_ETH_LoopbackIsEnabled(ETH_MODULE_ID index);
```

Returns

- true - EMAC transmit interface is looped back to the EMAC receive interface

- false - EMAC normal operation

Description

This function gets the EMAC Loopback interface enable status.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
stat = PLIB_ETH_LoopbackIsEnabled(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

bool PLIB_ETH_LoopbackIsEnabled(ETH_MODULE_ID index)

PLIB_ETH_MaxFrameLengthGet Function

Gets the EMAC maximum frame length.

File

plib_eth.h

C

```
uint16_t PLIB_ETH_MaxFrameLengthGet(ETH_MODULE_ID index);
```

Returns

- MaxFrameLength - Maximum frame length

Description

This function gets the EMAC maximum frame length.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
value = PLIB_ETH_MaxFrameLengthGet(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

uint16_t PLIB_ETH_MaxFrameLengthGet(ETH_MODULE_ID index)

PLIB_ETH_MaxFrameLengthSet Function

Sets the EMAC maximum frame length.

File

plib_eth.h

C

```
void PLIB_ETH_MaxFrameLengthSet(ETH_MODULE_ID index, uint16_t MaxFrameLength);
```

Returns

None.

Description

This function sets the EMAC maximum frame length.

Remarks

This field resets to 0x05EE, which represents a maximum receive frame of 1518 bytes. An untagged maximum size Ethernet frame is 1518 bytes. A tagged frame adds four octets for a total of 1522 bytes. If a shorter/longer maximum length restriction is desired, program this 16-bit field.

If a proprietary header is allowed, this field should be adjusted accordingly. For example, if 4-byte headers are prepended to frames, MACMAXF could be set to 1527 bytes. This would allow the maximum VLAN tagged frame plus the 4-byte header.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_MaxFrameLengthSet(MY_ETH_INSTANCE, MaxFrameLength);
```

Parameters

Parameters	Description
index	Identifier for the device instance
MaxFrameLength	Maximum frame length

Function

void PLIB_ETH_MaxFrameLengthSet(ETH_MODULE_ID index, uint16_t MaxFrameLength)

PLIB_ETH_MIIMClockGet Function

Gets the current EMAC MIIM clock selection.

File

plib_eth.h

C

```
ETH_MIIM_CLK PLIB_ETH_MIIMClockGet(ETH_MODULE_ID index);
```

Returns

- MIIMClock - Of type PLIB_ETH_MIIM_CLK

Description

This function returns the current EMAC MIIM clock selection.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
clkstat = PLIB_ETH_MIIMClockGet(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

ETH_MII_CLK PLIB_ETH_MIIMClockGet(ETH_MODULE_ID index)

PLIB_ETH_MIIMClockSet Function

Sets the EMAC MIM clock selection.

File

plib_eth.h

C

```
void PLIB_ETH_MIIMClockSet(ETH_MODULE_ID index, ETH_MIIM_CLK MIIMClock);
```

Returns

None.

Description

This function sets the EMAC MIIM clock selection.

Remarks

This field is used by the clock divide logic in creating the MII Management Clock (MDC), which the IEEE 802.3 Specification defines to be no faster than 2.5 MHz. Some PHYs support clock rates up to 12.5 MHz.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_MIIMClockSet(MY_ETH_INSTANCE, MIIMClock);
```

Parameters

Parameters	Description
index	Identifier for the device instance
MIIMClock	of type ETH_MIIM_CLK - the system clock divisor for MII

Function

void PLIB_ETH_MIIMClockSet(ETH_MODULE_ID index, ETH_MIIM_CLK MIIMClock)

PLIB_ETH_MIIMNoPreDisable Function

Disables EMAC No Preamble (allows preamble).

File

plib_eth.h

C

```
void PLIB_ETH_MIIMNoPreDisable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function disables EMAC No preamble (allows preamble). Normal read/write cycles are performed.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_MIIMNoPreDisable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_MIIMNoPreDisable(ETH_MODULE_ID index)

PLIB_ETH_MIIMNoPreEnable Function

Enables EMAC MIIM No Preamble (suppresses preamble).

File

plib_eth.h

C

```
void PLIB_ETH_MIIMNoPreEnable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function enables EMAC MIIM No Preamble (suppresses preamble). The MII Management will perform read/write cycles without the 32-bit preamble field. Some PHYs support suppressed preamble.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_MIIMNoPreEnable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_MIIMNoPreEnable(ETH_MODULE_ID index)

PLIB_ETH_MIIMNoPreIsEnabled Function

Gets the EMAC MIIM No Preamble enable status.

File

plib_eth.h

C

```
bool PLIB_ETH_MIIMNoPreIsEnabled(ETH_MODULE_ID index);
```

Returns

- true - The MII Management will perform read/write cycles without the 32-bit preamble field. Some PHYs support suppressed preamble.
- false - Normal read/write cycles are performed

Description

This function gets the EMAC MIIM No Preamble enable status.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
stat = PLIB_ETH_MIIMNoPreIsEnabled(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

bool PLIB_ETH_MIIMNoPreIsEnabled(ETH_MODULE_ID index)

PLIB_ETH_NonBackToBackIPG1Get Function

Gets the EMAC non-back-to-back interpacket gap register 1.

File

plib_eth.h

C

```
uint8_t PLIB_ETH_NonBackToBackIPG1Get(ETH_MODULE_ID index);
```

Returns

- nonBackToBackIPGValue - Non-back-to-back interpacket gap (7 bits)

Description

This function gets the EMAC non-back-to-back interpacket gap register 1.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
value = PLIB_ETH_NonBackToBackIPG1Get(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

uint8_t PLIB_ETH_NonBackToBackIPG1Get(ETH_MODULE_ID index)

PLIB_ETH_NonBackToBackIPG1Set Function

Sets the EMAC non-back-to-back interpacket gap register 1.

File

plib_eth.h

C

```
void PLIB_ETH_NonBackToBackIPG1Set(ETH_MODULE_ID index, uint8_t nonBackToBackIPGValue);
```

Returns

None.

Description

This function sets the EMAC non-back-to-back interpacket gap register 1. A value of 0x0C is recommended.

Remarks

This is a programmable field representing the optional carrierSense window referenced in the IEEE 802.3 Specification. If a carrier is detected during the timing of IPGR1, the MAC defers to the carrier. If, however, the carrier comes after IPGR1, the MAC continues timing IPGR2 and transmits, knowingly causing a collision, thereby ensuring fair access to the medium. Its range of values is 0x0 to IPGR2. Its recommended value is 0xC (12d).

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_NonBackToBackIPG1Set(MY_ETH_INSTANCE, nonBackToBackIPGValue);
```

Parameters

Parameters	Description
index	Identifier for the device instance
nonBackToBackIPGValue	Non-back-to-back interpacket gap

Function

void PLIB_ETH_NonBackToBackIPG1Set(ETH_MODULE_ID index, uint8_t nonBackToBackIPGValue)

PLIB_ETH_NonBackToBackIPG2Get Function

Gets the EMAC non-back-to-back interpacket gap register 2.

File

plib_eth.h

C

```
uint8_t PLIB_ETH_NonBackToBackIPG2Get(ETH_MODULE_ID index);
```

Returns

- nonBackToBackIPGValue - Non-back-to-back interpacket gap (7 bits)

Description

This function gets the EMAC non-back-to-back interpacket gap register 2.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
value = PLIB_ETH_NonBackToBackIPG2Get(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

uint8_t PLIB_ETH_NonBackToBackIPG2Get(ETH_MODULE_ID index)

PLIB_ETH_NonBackToBackIPG2Set Function

Sets the EMAC non-back-to-back interpacket gap register 2.

File

plib_eth.h

C

```
void PLIB_ETH_NonBackToBackIPG2Set(ETH_MODULE_ID index, uint8_t nonBackToBackIPGValue);
```

Returns

None.

Description

This function sets the EMAC non-back-to-back interpacket gap register 2. A value of 0x12 is recommended.

Remarks

This is a programmable field representing the non-back-to-back Inter-Packet-Gap. Its recommended value is 0x12 (18d), which represents the minimum IPG of 0.96 us (in 100 Mbps) or 9.6 us (in 10 Mbps).

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_NonBackToBackIPG2Set(MY_ETH_INSTANCE, nonBackToBackIPGValue);
```

Parameters

Parameters	Description
index	Identifier for the device instance
nonBackToBackIPGValue	Non-back-to-back interpacket gap

Function

void PLIB_ETH_NonBackToBackIPG2Set(ETH_MODULE_ID index, uint8_t nonBackToBackIPGValue)

PLIB_ETH_PauseTimerGet Function

Gets the Pause Timer value used for flow control.

File

plib_eth.h

C

```
uint16_t PLIB_ETH_PauseTimerGet(ETH_MODULE_ID index);
```

Returns

- PauseTimerValue - Pause Timer Value

Description

This function gets the Pause Timer value used for flow control.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PauseTimerValue = PLIB_ETH_PauseTimerGet(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

uint16_t PLIB_ETH_PauseTimerGet(ETH_MODULE_ID index)

PLIB_ETH_PauseTimerSet Function

Sets the Pause Timer value used for flow control.

File

plib_eth.h

C

```
void PLIB_ETH_PauseTimerSet(ETH_MODULE_ID index, uint16_t PauseTimerValue);
```

Returns

None.

Description

This function sets the Pause Timer value used for flow control.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

Write to the Pause Timer register before enabling the receiver. Call this function before calling PLIB_ETH_ReceiveEnable.

Example

```
PLIB_ETH_PauseTimerSet(MY_ETH_INSTANCE, PauseTimerValue);
```

Parameters

Parameters	Description
index	Identifier for the device instance
PauseTimerValue	used for Flow Control

Function

void PLIB_ETH_PauseTimerSet(ETH_MODULE_ID index, uint16_t PauseTimerValue)

PLIB_ETH_ReceiveBufferSizeGet Function

Gets the Ethernet module receive buffer size.

File

plib_eth.h

C

```
uint8_t PLIB_ETH_ReceiveBufferSizeGet(ETH_MODULE_ID index);
```

Returns

ReceiveBufferSize - receive buffer size divided by 16

Description

This function gets the Ethernet receive buffer size. The buffer size is set from 16 bytes up to 2032 bytes in increments of 16 bytes each.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
size = PLIB_ETH_ReceiveBufferSizeGet(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

uint8_t PLIB_ETH_ReceiveBufferSizeGet(ETH_MODULE_ID index)

PLIB_ETH_ReceiveBufferSizeSet Function

Sets the Ethernet module receive buffer size.

File

plib_eth.h

C

```
void PLIB_ETH_ReceiveBufferSizeSet(ETH_MODULE_ID index, uint8_t ReceiveBufferSize);
```

Returns

None.

Description

This function sets the Ethernet receive buffer size. The buffer size is set from 16 bytes up to 2032 bytes in increments of 16 bytes each.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_ReceiveBufferSizeSet(MY_ETH_INSTANCE, ReceiveBufferSize/16 );
```

Parameters

Parameters	Description
index	Identifier for the device instance
ReceiveBufferSize	In units of 16 bytes, must be a value of 0x01 to 0x7F, 0x00 is invalid

Function

void PLIB_ETH_ReceiveBufferSizeSet(ETH_MODULE_ID index, uint8_t ReceiveBufferSize)

PLIB_ETH_ReceiveDisable Function

Disables the EMAC from receiving frames.

File

plib_eth.h

C

```
void PLIB_ETH_ReceiveDisable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function disables the EMAC from receiving frames.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_ReceiveDisable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_ReceiveDisable(ETH_MODULE_ID index)

PLIB_ETH_ReceiveEnable Function

Enables the EMAC to receive the frames.

File

plib_eth.h

C

```
void PLIB_ETH_ReceiveEnable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function enables the EMAC to receive the frames.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_ReceiveEnable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_ReceiveEnable(ETH_MODULE_ID index)

PLIB_ETH_ReceiveIsEnabled Function

Gets the Ethernet EMAC receive enable status.

File

plib_eth.h

C

```
bool PLIB_ETH_ReceiveIsEnabled(ETH_MODULE_ID index);
```

Returns

- true - Enable the EMAC to receive frames
- false - Disable the EMAC to receive frames

Description

This function gets the Ethernet EMAC receive enable status.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
stat = PLIB_ETH_ReceiveIsEnabled(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

bool PLIB_ETH_ReceiveIsEnabled(ETH_MODULE_ID index)

PLIB_ETH_ReTxMaxGet Function

Gets the EMAC maximum retransmissions.

File

plib_eth.h

C

```
uint8_t PLIB_ETH_ReTxMaxGet(ETH_MODULE_ID index);
```

Returns

- retransmitMax - Maximum number of retransmissions

Description

This function gets the EMAC maximum retransmissions.

Remarks

The maximum number of attempts is limited to 0x0F.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
value = PLIB_ETH_ReTxMaxGet(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

uint8_t PLIB_ETH_ReTxMaxGet(ETH_MODULE_ID index)

PLIB_ETH_ReTxMaxSet Function

Sets the EMAC maximum retransmissions.

File

plib_eth.h

C

```
void PLIB_ETH_ReTxMaxSet(ETH_MODULE_ID index, uint16_t retransmitMax);
```

Returns

None.

Description

This function sets the EMAC maximum retransmissions.

Remarks

This is a programmable field specifying the number of retransmission attempts following a collision before aborting the packet due to excessive collisions. The IEEE 802.3 Specification standard specifies the maximum number of attempts (attemptLimit) to be 0xF (15d). Its default is 000.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_ReTxMaxSet(retransmitMax);
```

Parameters

Parameters	Description
index	Identifier for the device instance
retransmitMax	Maximum number of retransmissions

Function

void PLIB_ETH_ReTxMaxSet(ETH_MODULE_ID index, uint8_t retransmitMax)

PLIB_ETH_RMIISpeedGet Function

Gets the current EMAC RMII speed.

File

plib_eth.h

C

```
ETH_RMII_SPEED PLIB_ETH_RMIISpeedGet(ETH_MODULE_ID index);
```

Returns

- RMII_100Mbps - RMII running at 100 Mbps
- RMII_10Mbps - RMII running at 10 Mbps

Description

This function gets the current EMAC RMII speed.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_RMIISpeedGet(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

ETH_RMII_SPEED PLIB_ETH_RMIISpeedGet(ETH_MODULE_ID index)

PLIB_ETH_RMIISpeedSet Function

Sets EMAC RMII Speed.

File

plib_eth.h

C

```
void PLIB_ETH_RMIISpeedSet(ETH_MODULE_ID index, ETH_RMII_SPEED RMIISpeed);
```

Returns

None.

Description

This function sets EMAC RMII speed. RMII speed can be either RMII_100Mbps or RMII_10Mbps.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_RMIISpeedSet(MY_ETH_INSTANCE, ETH_RMII_SPEED RMIISpeed);
```

Parameters

Parameters	Description
index	Identifier for the device instance
RMIISpeed	RMII_100Mbps or RMII_10Mbps of type ETH_RMII_SPEED

Function

void PLIB_ETH_RMIISpeedSet(ETH_MODULE_ID index, ETH_RMII_SPEED RMIISpeed)

PLIB_ETH_StopInIdleDisable Function

Ethernet module operation will continue when the device enters Idle mode.

File

plib_eth.h

C

```
void PLIB_ETH_StopInIdleDisable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function directs the Ethernet module to continue operation when the device enters Idle mode.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_StopInIdleDisable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_StopInIdleDisable(ETH_MODULE_ID index)

PLIB_ETH_StopInIdleEnable Function

Ethernet module operation will stop when the device enters Idle mode.

File

plib_eth.h

C

```
void PLIB_ETH_StopInIdleEnable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function directs the Ethernet module to stop operation when the device enters Idle mode.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_StopInIdleEnable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_StopInIdleEnable(ETH_MODULE_ID index)

PLIB_ETH_StopInIdleIsEnabled Function

Gets the Ethernet module Stop in Idle mode enable status.

File

plib_eth.h

C

```
bool PLIB_ETH_StopInIdleIsEnabled(ETH_MODULE_ID index);
```

Returns

- true - Ethernet module transfers stop during Idle mode
- false - Ethernet module transfers continue to run during Idle mode

Description

This function returns the Ethernet module Stop in Idle mode enable status.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
stat = PLIB_ETH_StopInIdleIsEnabled(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

bool PLIB_ETH_StopInIdleIsEnabled(ETH_MODULE_ID index)

b) Control Functions

PLIB_ETH_MCSRxResetDisable Function

Disables the reset EMAC Control Sub-layer/Receive domain logic.

File

plib_eth.h

C

```
void PLIB_ETH_MCSRxResetDisable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function disables the reset EMAC Control Sub-layer/Receive domain logic. The MCS/Receive domain logic is released from reset.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_MCSRxResetDisable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_MCSRxResetDisable(ETH_MODULE_ID index)

PLIB_ETH_MCSRxResetEnable Function

Enables the reset EMAC Control Sub-layer/Receive domain logic.

File

plib_eth.h

C

```
void PLIB_ETH_MCSRxResetEnable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function enables the reset EMAC Control Sub-layer/Receive domain logic. The MCS/Receive domain logic is held in reset.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_MCSRxResetEnable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_MCSRxResetEnable(ETH_MODULE_ID index)

PLIB_ETH_MCSRxResetIsEnabled Function

Gets the EMAC Control Sub-layer/Receive domain logic reset status.

File

plib_eth.h

C

```
bool PLIB_ETH_MCSRxResetIsEnabled(ETH_MODULE_ID index);
```

Returns

- true - EMAC Control Sub-layer/Receive domain logic is in reset
- false - EMAC Control Sub-layer/Receive domain logic is not in reset

Description

This function gets the EMAC Control Sub-layer/Receive domain logic reset status.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
stat = PLIB_ETH_MCSRxResetIsEnabled(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

bool PLIB_ETH_MCSRxResetIsEnabled(ETH_MODULE_ID index)

PLIB_ETH_MCSTxResetDisable Function

Disables the reset EMAC Control Sub-layer/Transmit domain logic.

File

plib_eth.h

C

```
void PLIB_ETH_MCSTxResetDisable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function disables the reset EMAC Control Sub-layer/Transmit domain logic. The MCS/Transmit domain logic is released from reset.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_MCSTxResetDisable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_MCSTxResetDisable(ETH_MODULE_ID index)

PLIB_ETH_MCSTxResetEnable Function

Enables the reset of EMAC Control Sub-layer/Transmit domain logic.

File

plib_eth.h

C

```
void PLIB_ETH_MCSTxResetEnable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function resets the EMAC Control Sub-layer/Transmit domain logic. The MCS/Transmit domain logic is held in reset.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_MCSTxResetEnable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_MCSTxResetEnable(ETH_MODULE_ID index)

PLIB_ETH_MCSTxResetIsEnabled Function

Gets the EMAC Control Sub-layer/Transmit domain logic reset status.

File

plib_eth.h

C

```
bool PLIB_ETH_MCSTxResetIsEnabled(ETH_MODULE_ID index);
```

Returns

- true - EMAC Control Sub-layer/Transmit domain logic is held in reset
- false - EMAC Control Sub-layer/Transmit domain logic is not in reset

Description

This function gets the EMAC Control Sub-layer/Transmit domain logic reset status.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
stat = PLIB_ETH_MCSTxResetIsEnabled(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

bool PLIB_ETH_MCSTxResetIsEnabled(ETH_MODULE_ID index)

PLIB_ETH_MIIMReadDataGet Function

Gets EMAC MIIM management read data after a MII read cycle has completed.

File

plib_eth.h

C

```
uint16_t PLIB_ETH_MIIMReadDataGet(ETH_MODULE_ID index);
```

Returns

- readData - MII read data

Description

This function gets EMAC MIIM management read data after a MII read cycle has completed.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
readData = PLIB_ETH_MIIMReadDataGet(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

uint16_t PLIB_ETH_MIIMReadDataGet(ETH_MODULE_ID index)

PLIB_ETH_MIIMReadStart Function

Initiates an MII management read command.

File

plib_eth.h

C

```
void PLIB_ETH_MIIMReadStart(ETH_MODULE_ID index);
```

Returns

None.

Description

This function initiates an MII read command. The MII Management module will perform a single read cycle. To get data, use PLIB_ETH_MIIReadDataGet.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
while (PLIB_ETH_MIIMIsBusy(MY_ETH_INSTANCE))
{
    //Wait until MII Link is not busy
}
PLIB_ETH_MIIReadStart(MY_ETH_INSTANCE);
while (PLIB_ETH_MIIReadIsDataNotValid(MY_ETH_INSTANCE))
{
    //Wait until read is complete
}
data = PLIB_ETH_MIIReadDataGet(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_MIIMReadStart(ETH_MODULE_ID index)

PLIB_ETH_MIIMResetDisable Function

Disables EMAC Reset MII Management.

File

plib_eth.h

C

```
void PLIB_ETH_MIIMResetDisable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function disables EMAC Reset MII Management. EMAC will resume normal operation.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_MIIMResetDisable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_MIIMResetDisable(ETH_MODULE_ID index)

PLIB_ETH_MIIMResetEnable Function

Enables EMAC Reset Media Independent Interface (MII) Management.

File

plib_eth.h

C

```
void PLIB_ETH_MIIMResetEnable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function enables EMAC Reset MII Management and holds the MII Management module in reset while enabled.

Remarks

MII Management held in Reset after This function is called. Disable ResetMIIanagement to return to normal operation.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_MIIMResetEnable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_MIIMResetEnable(ETH_MODULE_ID index)

PLIB_ETH_MIIMResetIsEnabled Function

Gets the EMAC Reset MII Management enable status.

File

plib_eth.h

C

```
bool PLIB_ETH_MIIMResetIsEnabled(ETH_MODULE_ID index);
```

Returns

- true - Reset the MII Management module
- false - Normal operation

Description

This function gets the EMAC Reset MII Management enable status.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
stat = PLIB_ETH_MIIMResetIsEnabled(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

bool PLIB_ETH_MIIMResetIsEnabled(ETH_MODULE_ID index)

PLIB_ETH_MIIMScanIncrEnable Function

Enables EMAC MIIM Scan Increment.

File

plib_eth.h

C

```
void PLIB_ETH_MIIMScanIncrEnable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function enables EMAC MIIM Scan Increment. The MII Management module will perform read cycles across a range of PHYs. The read cycles will start from address 1 through the value set in the PHY address register.

Remarks

The read cycles will start at PHY address 1 and continue through the value set for as the PHY address register.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_MIIMScanIncrEnable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_MIIMScanIncrEnable(ETH_MODULE_ID index)

PLIB_ETH_MIIMScanIncrDisable Function

Disables the EMAC MIIM Scan Increment.

File

plib_eth.h

C

```
void PLIB_ETH_MIIMScanIncrDisable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function disables the EMAC MIIM Scan Increment. Allows continuous reads of the same PHY.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_MIIMScanIncrDisable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_MIIMScanIncrDisable(ETH_MODULE_ID index)

PLIB_ETH_MIIMScanIncrIsEnabled Function

Gets the EMAC MIIM scan increment enable status.

File

plib_eth.h

C

```
bool PLIB_ETH_MIIMScanIncrIsEnabled(ETH_MODULE_ID index);
```

Returns

- true - The MII Management module will perform read cycles across a range of PHYs. The read cycles will start from address 1 through the value set in the PHY address register.
- false - Continuous reads of the same PHY

Description

This function gets the EMAC MIIM scan increment enable status.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
ScanIncrement = PLIB_ETH_MIIMScanIncrIsEnabled(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

bool PLIB_ETH_MIIMScanIncrIsEnabled(ETH_MODULE_ID index)

PLIB_ETH_MIIMScanModeDisable Function

Disables MIIM scan mode.

File

plib_eth.h

C

```
void PLIB_ETH_MIIMScanModeDisable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function disables MIIM scan mode. Scan is disabled for Normal operation.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_MIIMScanModeDisable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_MIIMScanModeDisable(ETH_MODULE_ID index)

PLIB_ETH_MIIMScanModeEnable Function

Enables MIIM scan mode.

File

plib_eth.h

C

```
void PLIB_ETH_MIIMScanModeEnable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function enables MIIM scan mode. The MII Management module will perform read cycles continuously. (Useful for monitoring the Link Fail.)

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_MIIMScanModeEnable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_MIIMScanModeEnable(ETH_MODULE_ID index)

PLIB_ETH_MIIMScanModeIsEnabled Function

Gets the MII management scan enable status.

File

plib_eth.h

C

```
bool PLIB_ETH_MIIMScanModeIsEnabled(ETH_MODULE_ID index);
```

Returns

- true - The MII Management module will perform read cycles continuously (for example, useful for monitoring the Link Fail)
- false - Normal operation

Description

This function returns the MII management scan enable status.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
stat = PLIB_ETH_MIIMScanModeIsEnabled(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

bool PLIB_ETH_MIIMScanModeIsEnabled(ETH_MODULE_ID index)

PLIB_ETH_MIIMWriteDataSet Function

Sets the EMAC MIIM write data before initiating an MII write cycle.

File

plib_eth.h

C

```
void PLIB_ETH_MIIMWriteDataSet(ETH_MODULE_ID index, uint16_t writeData);
```

Returns

None.

Description

This function sets the EMAC MIIM write data before initiating write cycle.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

Prior to a call to this routine, the PHY and Register addresses should be set using PLIB_ETH_MIIPHYAddressSet and PLIB_ETH_MIIRegisterAddressSet.

Example

```
PLIB_ETH_MIIMWriteDataSet(MY_ETH_INSTANCE, WriteData);
```

Parameters

Parameters	Description
index	Identifier for the device instance
writeData	MII write data

Function

void PLIB_ETH_MIIMWriteDataSet(ETH_MODULE_ID index, uint16_t writeData)

PLIB_ETH_MIIMWriteStart Function

Initiates an MII management write command.

File

plib_eth.h

C

```
void PLIB_ETH_MIIMWriteStart(ETH_MODULE_ID index);
```

Returns

None.

Description

This function initiates an MII management read command. The MII Management module will perform a write cycle.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

The PHY address and MII register address must be configured before a write using PLIB_ETH_MIIPHYAddressSet(MY_ETH_INSTANCE, phyAddr) and PLIB_ETH_MIIRegisterAddressSet(MY_ETH_INSTANCE, regAddr)

Data to be written must be first loaded into the MII write register using PLIB_ETH_MIIMWriteDataSet(MY_ETH_INSTANCE, writeData)

Example

```
PLIB_ETH_MIIMWriteDataSet(MY_ETH_INSTANCE, dataToWrite);
PLIB_ETH_MIIMWriteStart(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_MIIMWriteStart(ETH_MODULE_ID index)

PLIB_ETH_MIIResetDisable Function

Disables the EMAC Soft reset.

File

plib_eth.h

C

```
void PLIB_ETH_MIIResetDisable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function disables the EMAC MIIM Soft reset.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_MIIResetDisable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_MIIResetDisable(ETH_MODULE_ID index)

PLIB_ETH_MIIResetEnable Function

Enables the EMAC MIIM Soft reset.

File

plib_eth.h

C

```
void PLIB_ETH_MIIResetEnable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function enables the EMAC MIIM soft reset.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_MIIResetEnable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_MIIResetEnable(ETH_MODULE_ID index)

PLIB_ETH_MIIResetIsEnabled Function

Gets EMAC MIIM Soft Reset enable status.

File

plib_eth.h

C

```
bool PLIB_ETH_MIIResetIsEnabled(ETH_MODULE_ID index);
```

Returns

- true - MAC MII is in reset

- false - MAC MII is not in reset

Description

This function gets EMAC MIIM Soft reset enable status. By default this bit is set to '1'.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
stat = PLIB_ETH_MIIResetIsEnabled(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

bool PLIB_ETH_MIIResetIsEnabled(ETH_MODULE_ID index)

PLIB_ETH_PHYAddressGet Function

Gets the EMAC MIIM management PHY address.

File

plib_eth.h

C

```
uint8_t PLIB_ETH_PHYAddressGet(ETH_MODULE_ID index);
```

Returns

- phyAddr - A 5-bit address of the PHY

Description

This function gets the EMAC MIIM management PHY address.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
phyAddr = PLIB_ETH_PHYAddressGet(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

uint8_t PLIB_ETH_PHYAddressGet(ETH_MODULE_ID index)

PLIB_ETH_PHYAddressSet Function

Sets the EMAC MIIM PHY address.

File

plib_eth.h

C

```
void PLIB_ETH_PHYAddressSet(ETH_MODULE_ID index, uint8_t phyAddr);
```

Returns

None.

Description

This function sets the EMAC MIIM PHY address. This field represents the 5-bit PHY Address field of Management cycles. Up to 31 PHYs can be addressed (0 is reserved).

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_PHYAddressSet(MY_ETH_INSTANCE, PhyAddr);
```

Parameters

Parameters	Description
index	Identifier for the device instance
phyAddr	A 5-bit address of the PHY

Function

void PLIB_ETH_PHYAddressSet(ETH_MODULE_ID index, uint8_t phyAddr)

PLIB_ETH_RegisterAddressGet Function

Gets the EMAC MIIM management register address.

File

plib_eth.h

C

```
uint8_t PLIB_ETH_RegisterAddressGet(ETH_MODULE_ID index);
```

Returns

- regAddr - The (5-bit) address of the MII Registers

Description

This function gets the EMAC MIIM management register address.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
regAddr = PLIB_ETH_RegisterAddressGet(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

uint8_t PLIB_ETH_RegisterAddressGet(ETH_MODULE_ID index)

PLIB_ETH_RegisterAddressSet Function

Sets EMAC MIIM register address.

File

plib_eth.h

C

```
void PLIB_ETH_RegisterAddressSet(ETH_MODULE_ID index, uint8_t regAddr);
```

Returns

None.

Description

This function sets the EMAC MIIM register address. Up to 32 registers may be accessed.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_RegisterAddressSet(MY_ETH_INSTANCE, regAddr);
```

Parameters

Parameters	Description
index	Identifier for the device instance
regAddr	The (5-bit) address of the MII Registers.

Function

void PLIB_ETH_RegisterAddressSet(ETH_MODULE_ID index, uint8_t regAddr)

PLIB_ETH_RMIIResetDisable Function

Disables EMAC Reset RMII.

File

plib_eth.h

C

```
void PLIB_ETH_RMIIResetDisable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function disables EMAC Reset RMII for normal operation.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_RMIIResetDisable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_RMIIResetDisable(ETH_MODULE_ID index)

PLIB_ETH_RMIIResetEnable Function

Enables EMAC Reset RMII.

File

plib_eth.h

C

```
void PLIB_ETH_RMIIResetEnable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function enables EMAC Reset RMII.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_RMIIResetEnable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_RMIIResetEnable(ETH_MODULE_ID index)

PLIB_ETH_RMIIResetIsEnabled Function

Gets the EMAC Reset RMII enable status.

File

plib_eth.h

C

```
bool PLIB_ETH_RMIIResetIsEnabled(ETH_MODULE_ID index);
```

Returns

- true - Reset the EMAC RMII module
- false - Normal operation

Description

This function gets the EMAC Reset RMII enable status.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
stat = PLIB_ETH_RMIIResetIsEnabled(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

bool PLIB_ETH_RMIIResetIsEnabled(ETH_MODULE_ID index)

PLIB_ETH_RxBufferCountDecrement Function

Causes the Receive Descriptor Buffer Counter to decrement by 1.

File

plib_eth.h

C

```
void PLIB_ETH_RxBufferCountDecrement(ETH_MODULE_ID index);
```

Returns

None.

Description

This function causes the Receive Descriptor Buffer Counter to decrement by 1.

Remarks

Hardware increments the receive buffer counter and software decrements it. If the receive buffer counter is incremented by the receive logic at the same time, the receive buffer counter will appear unchanged.

Always reads as '0', so there is no get value routine.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_RxBufferCountDecrement(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_RxBufferCountDecrement(ETH_MODULE_ID index)

PLIB_ETH_RxDisable Function

Disables the Ethernet module receive logic.

File

plib_eth.h

C

```
void PLIB_ETH_RxDisable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function disables the Ethernet receive logic.

Remarks

Disabling Ethernet receive is not recommended for making changes to any receive-related registers. After the receiver has been enabled, the

Ethernet module must be reinitialized to implement changes.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_RxDisable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_RxDisable(ETH_MODULE_ID index)

PLIB_ETH_RxEnable Function

Enables the Ethernet receive logic.

File

plib_eth.h

C

```
void PLIB_ETH_RxEnable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function enables the Ethernet receive logic. Packets are received and stored in the receive buffer as controlled by the filter configuration.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

All receive registers must be configured before calling this function.

Example

```
PLIB_ETH_RxEnable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_RxEnable(ETH_MODULE_ID index)

PLIB_ETH_RxFuncResetDisable Function

Disables the EMAC reset receive function logic.

File

plib_eth.h

C

```
void PLIB_ETH_RxFuncResetDisable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function disables the EMAC reset receive function logic. The reset receive function logic is released from reset.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_RxFuncResetDisable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_RxFuncResetDisable(ETH_MODULE_ID index)

PLIB_ETH_RxFuncResetEnable Function

Enables the EMAC reset receive function logic.

File

plib_eth.h

C

```
void PLIB_ETH_RxFuncResetEnable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function enables the EMAC reset receive function logic. The receive function logic is held in reset.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_RxFuncResetEnable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_RxFuncResetEnable(ETH_MODULE_ID index)

PLIB_ETH_RxFuncResetIsEnabled Function

Gets the EMAC reset receive function status.

File

plib_eth.h

C

```
bool PLIB_ETH_RxFuncResetIsEnabled(ETH_MODULE_ID index);
```

Returns

- true - EMAC Receive function logic is held in reset
- false - EMAC Receive function logic is not in reset

Description

This function gets the EMAC reset receive function status.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
stat = PLIB_ETH_RxFuncResetIsEnabled(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

bool PLIB_ETH_RxFuncResetIsEnabled(ETH_MODULE_ID index)

PLIB_ETH_RxIsEnabled Function

Gets the Ethernet module receive enable status.

File

plib_eth.h

C

```
bool PLIB_ETH_RxIsEnabled(ETH_MODULE_ID index);
```

Returns

- true - Ethernet module receive is enabled
- false - Ethernet module receive is disabled

Description

This function returns the Ethernet module receive enable status.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
stat = PLIB_ETH_ReceiveIsEnabled(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

bool PLIB_ETH_RxIsEnabled(ETH_MODULE_ID index)

PLIB_ETH_RxPacketDescAddrGet Function

Gets the address of the next receive descriptor.

File

plib_eth.h

C

```
uint8_t * PLIB_ETH_RxPacketDescAddrGet(ETH_MODULE_ID index);
```

Returns

- ReceivePacketDescriptorAddress - receive packet descriptor address

Description

This function gets the address of the next receive descriptor to be used.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
RxPacketDescAddr = PLIB_ETH_RxPacketDescAddrGet(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

uint8_t *PLIB_ETH_RxPacketDescAddrGet(ETH_MODULE_ID index)

PLIB_ETH_RxPacketDescAddrSet Function

Sets the Ethernet module receive packet descriptor start address.

File

plib_eth.h

C

```
void PLIB_ETH_RxPacketDescAddrSet(ETH_MODULE_ID index, uint8_t * rxPacketDescStartAddr);
```

Returns

None.

Description

This function sets the Ethernet receive packet descriptor start address.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

No transmit, receive, or DMA operations should be in progress when this function is called. Call this function before enabling transmit and receive.

Example

```
PLIB_ETH_RxPacketDescAddrSet(MY_ETH_INSTANCE, rxPacketDescStartAddr)
```

Parameters

Parameters	Description
index	Identifier for the device instance
rxPacketDescStartAddr	This address must be 4-byte aligned. (The least significant 2 bits must be '00'.)

Function

void PLIB_ETH_RxPacketDescAddrSet(ETH_MODULE_ID index, uint8_t *rxPacketDescStartAddr)

PLIB_ETH_TestPauseDisable Function

Disables EMAC test pause.

File

plib_eth.h

C

```
void PLIB_ETH_TestPauseDisable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function disables EMAC Test Pause. The EMAC will resume normal operation.

Remarks

This functionality is intended for testing only.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_TestPauseDisable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_TestPauseDisable(ETH_MODULE_ID index)

PLIB_ETH_TestPauseEnable Function

Enables EMAC test pause.

File

plib_eth.h

C

```
void PLIB_ETH_TestPauseEnable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function enables EMAC test pause. The EMAC Control sub-layer will inhibit transmissions, just as if a Pause Receive Control frame with a non-zero pause time parameter was received.

Remarks

This functionality is intended for testing only.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_TestPauseEnable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_TestPauseEnable(ETH_MODULE_ID index)

PLIB_ETH_TestPauseIsEnabled Function

Gets the EMAC test pause enable status.

File

plib_eth.h

C

```
bool PLIB_ETH_TestPauseIsEnabled(ETH_MODULE_ID index);
```

Returns

- true - The EMAC Control sub-layer will inhibit transmissions, just as if a Pause Receive Control frame with a non-zero pause time parameter was received
- false - Normal operation

Description

This function returns the EMAC test pause enable status.

Remarks

This functionality is intended for testing only.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
stat = PLIB_ETH_TestPauseIsEnabled(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

bool PLIB_ETH_TestPauseIsEnabled(ETH_MODULE_ID index)

PLIB_ETH_TxFuncResetDisable Function

Disables the EMAC Transmit function reset.

File

plib_eth.h

C

```
void PLIB_ETH_TxFuncResetDisable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function disables the EMAC Transmit function reset. The EMAC transmit function is released from reset for normal operation.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_TxFuncResetDisable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_TxFuncResetDisable(ETH_MODULE_ID index)

PLIB_ETH_TxFuncResetEnable Function

Enables the EMAC transmit function reset.

File

plib_eth.h

C

```
void PLIB_ETH_TxFuncResetEnable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function enables the EMAC transmit function reset. The transmit function is held in reset.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_TxFuncResetEnable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_TxFuncResetEnable(ETH_MODULE_ID index)

PLIB_ETH_TxFuncResetIsEnabled Function

Gets the EMAC Transmit function reset status.

File

plib_eth.h

C

```
bool PLIB_ETH_TxFuncResetIsEnabled(ETH_MODULE_ID index);
```

Returns

- true - EMAC transmit function logic is held in reset
- false - EMAC transmit function logic is not in reset

Description

This function gets the EMAC Transmit function reset status.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_TxFuncResetIsEnabled(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

bool PLIB_ETH_TxFuncResetIsEnabled(ETH_MODULE_ID index)

PLIB_ETH_TxPacketDescAddrGet Function

Gets the address of the next descriptor to be transmitted.

File

plib_eth.h

C

```
uint8_t * PLIB_ETH_TxPacketDescAddrGet(ETH_MODULE_ID index);
```

Returns

Transmit Packet Descriptor Start Address.

Description

This function gets the address of the next transmit descriptor.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
txPacketDescAddr = PLIB_ETH_TxPacketDescAddrGet(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

uint8_t *PLIB_ETH_TxPacketDescAddrGet(ETH_MODULE_ID index)

PLIB_ETH_TxPacketDescAddrSet Function

Sets the Ethernet module transmit packet descriptor start address.

File

plib_eth.h

C

```
void PLIB_ETH_TxPacketDescAddrSet(ETH_MODULE_ID index, uint8_t * txPacketDescStartAddr);
```

Returns

None.

Description

This function sets the Ethernet transmit packet descriptor start address.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

No transmit, receive, or DMA operations should be in progress when this function is called. Call this function before enabling transmit and receive.

Example

```
PLIB_ETH_TxPacketDescAddrSet(MY_ETH_INSTANCE, txPacketDescStartAddr)
```

Parameters

Parameters	Description
index	Identifier for the device instance
txPacketDescStartAddr	This address must be 4-byte aligned. (The least significant 2 bits must be '00'.)

Function

void PLIB_ETH_TxPacketDescAddrSet(ETH_MODULE_ID index, uint8_t *txPacketDescStartAddr)

PLIB_ETH_TxRTSDisable Function

Aborts an Ethernet module transmission.

File

plib_eth.h

C

```
void PLIB_ETH_TxRTSDisable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function aborts an Ethernet module transmission and disables the transmitter after the current packet has completed.

Remarks

When disabled by software, transmission stops after the current packet has been completed.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_TxRTSDisable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_TxRTSDisable(ETH_MODULE_ID index)

PLIB_ETH_TxRTSEnable Function

Enables the Ethernet transmit request to send.

File

plib_eth.h

C

```
void PLIB_ETH_TxRTSEnable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function enables the Ethernet request to send. Transmit logic is activated and any packets defined in the Ethernet descriptor table are transmitted.

Remarks

This status is cleared by hardware when the transmission is complete.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

The TX descriptor list and TX DMA must be initialized using PLIB_ETH_TransmitPacketDescStartAddrSet.

Example

```
PLIB_ETH_TxRTSEnable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_TxRTSEnable(ETH_MODULE_ID index)

PLIB_ETH_TxRTSIsEnabled Function

Gets the Ethernet module transmit request to send status.

File

plib_eth.h

C

```
bool PLIB_ETH_TxRTSIsEnabled(ETH_MODULE_ID index);
```

Returns

- true - Ethernet module transmit is active
- false - Ethernet module transmission has stopped or has completed

Description

This function returns the Ethernet module transmit request to send status.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
stat = PLIB_ETH_TransmitRTSIsEnabled(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

bool PLIB_ETH_TxRTSIsEnabled(ETH_MODULE_ID index)

PLIB_ETH_CRCDisable Function

Disables EMAC CRC.

File

plib_eth.h

C

```
void PLIB_ETH_CRCDisable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function disables EMAC CRC.

Remarks

The frames presented to the EMAC have a valid CRC

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_CRCDisable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_CRCDisable(ETH_MODULE_ID index)

PLIB_ETH_CRCEnable Function

Enables EMAC CRC.

File

plib_eth.h

C

```
void PLIB_ETH_CRCEnable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function enables EMAC CRC. The EMAC will append CRC whether padding is required or not. This must be enabled if auto-padding is enabled.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_CRCEnable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_CRCEnable(ETH_MODULE_ID index)

PLIB_ETH_CRCIsEnabled Function

Gets the EMAC CRC enable status.

File

plib_eth.h

C

```
bool PLIB_ETH_CRCIsEnabled(ETH_MODULE_ID index);
```

Returns

- true - The EMAC will append a CRC to every frame whether or not padding was required. Must be set if auto-padding is enabled.
- false - The frames presented to the EMAC have a valid CRC

Description

This function returns the EMAC CRC enable status.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
stat = PLIB_ETH_CRCIsEnabled(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

bool PLIB_ETH_CRCIsEnabled(ETH_MODULE_ID index)

c) Status Functions

PLIB_ETH_DataNotValid Function

Gets the MII management read data not valid status.

File

plib_eth.h

C

```
bool PLIB_ETH_DataNotValid(ETH_MODULE_ID index);
```

Returns

- true - The MII Management read cycle has not completed and the read data is not yet valid
- false - The MII Management read cycle is complete and the read data is valid

Description

This function gets the MII management read data not valid status.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
stat = PLIB_ETH_DataNotValid(MY_ETH_INSTANCE);
```

Also see the example for function: PLIB_ETH_MIIReadStart().

Parameters

Parameters	Description
index	Identifier for the device instance

Function

bool PLIB_ETH_DataNotValid(ETH_MODULE_ID index)

PLIB_ETH_EthernetIsBusy Function

Gets the status value of the Ethernet logic busy.

File

plib_eth.h

C

```
bool PLIB_ETH_EthernetIsBusy(ETH_MODULE_ID index);
```

Returns

- true - Ethernet logic has been turned ON or is completing a transaction
- false - Ethernet logic is idle

Description

This function sets the value of the Ethernet logic busy. A request indicates that the module has just been turned ON or is completing a transaction after being turned OFF.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
stat = PLIB_ETH_EthernetIsBusy(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

uint8_t PLIB_ETH_EthernetIsBusy(ETH_MODULE_ID index)

PLIB_ETH_LinkHasFailed Function

Gets the MII management link fail status.

File

plib_eth.h

C

```
bool PLIB_ETH_LinkHasFailed(ETH_MODULE_ID index);
```

Returns

- true - The MII Management module link fail has occurred
- false - The MII Management module link fail has not occurred

Description

This function returns the MII management link fail status. This value reflects the last read from the PHY status register.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
stat = PLIB_ETH_LinkHasFailed(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

bool PLIB_ETH_LinkHasFailed(ETH_MODULE_ID index)

PLIB_ETH_MIIMIsBusy Function

Gets the MII management busy status.

File

plib_eth.h

C

```
bool PLIB_ETH_MIIMIsBusy(ETH_MODULE_ID index);
```

Returns

- true - The MII Management module is currently performing an MII Management read or write cycle
- false - The MII Management is free

Description

This function returns the MII management busy status.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
stat = PLIB_ETH_MIIMIsBusy(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

bool PLIB_ETH_MIIMIsBusy(ETH_MODULE_ID index)

PLIB_ETH_MIIMIsScanning Function

Gets the MII Management scanning status.

File

plib_eth.h

C

```
bool PLIB_ETH_MIIMIsScanning(ETH_MODULE_ID index);
```

Returns

- true - The MII Management module scan operation (continuous MII Management Read cycles) is in progress
- false - The MII Management scan operation is not in progress

Description

This function gets the MII Management scanning status.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
stat = PLIB_ETH_MIIMIsScanning(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

bool PLIB_ETH_MIIMIsScanning(ETH_MODULE_ID index)

PLIB_ETH_ReceiveIsBusy Function

Gets the Ethernet receive logic busy status.

File

plib_eth.h

C

```
bool PLIB_ETH_ReceiveIsBusy(ETH_MODULE_ID index);
```

Returns

- true - Receive logic is receiving data
- false - Receive logic is idle

Description

This function gets the Ethernet receive logic busy status.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
stat = PLIB_ETH_ReceiveIsBusy(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

bool PLIB_ETH_ReceiveIsBusy(ETH_MODULE_ID index)

PLIB_ETH_TransmitIsBusy Function

Gets the status value of the Ethernet transmit logic busy status

File

plib_eth.h

C

```
bool PLIB_ETH_TransmitIsBusy(ETH_MODULE_ID index);
```

Returns

- true - Transmit logic is sending data
- false - Transmit logic is idle

Description

This function gets the value of the Ethernet transmit logic busy status.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
stat = PLIB_ETH_TransmitIsBusy(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

bool PLIB_ETH_TransmitIsBusy(ETH_MODULE_ID index)

d) Filtering Functions

PLIB_ETH_HashTableGet Function

Gets the value of the Hash table.

File

plib_eth.h

C

```
uint32_t PLIB_ETH_HashTableGet(ETH_MODULE_ID index);
```

Returns

- hashTable - Hash table value (64-bits)

Description

This function gets the value of the Hash table.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
value = PLIB_ETH_HashTableGet(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

uint64_t PLIB_ETH_HashTableGet(ETH_MODULE_ID index)

PLIB_ETH_HashTableSet Function

Sets the Ethernet module Hash table with the new value.

File

plib_eth.h

C

```
void PLIB_ETH_HashTableSet(ETH_MODULE_ID index, uint64_t hashTableValue);
```

Returns

None.

Description

This function sets the Hash table with the new value.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

Call PLIB_ETH_HashTableFilterDisable to disable the Hash table filter before changing the hash table, or set the Hash Table prior to calling PLIB_ETH_ReceiveEnable.

Example

```
PLIB_ETH_HashTableSet(MY_ETH_INSTANCE, hashTableValue);
```

Parameters

Parameters	Description
index	Identifier for the device instance
hashTableValue	hash table value (64-bits)

Function

void PLIB_ETH_HashTableSet(ETH_MODULE_ID index, uint64_t hashTableValue)

PLIB_ETH_PassAllDisable Function

Disables the EMAC PassAll.

File

plib_eth.h

C

```
void PLIB_ETH_PassAllDisable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function disables the EMAC PassAll. Control frames are ignored.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_PassAllDisable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_PassAllDisable(ETH_MODULE_ID index)

PLIB_ETH_PassAllEnable Function

Enables the EMAC PassAll.

File

plib_eth.h

C

```
void PLIB_ETH_PassAllEnable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function enables the EMAC PassAll, which enables both the normal and the control frames to be passed.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_PassAllEnable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_PassAllEnable(ETH_MODULE_ID index)

PLIB_ETH_PassAllIsEnabled Function

Gets the EMAC PassAll enable status.

File

plib_eth.h

C

```
bool PLIB_ETH_PassAllIsEnabled(ETH_MODULE_ID index);
```

Returns

- true - The EMAC will accept all frames regardless of type (normal vs. Control)
- false - The received Control frames are ignored

Description

This function gets the EMAC PassAll enable status.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
stat = PLIB_ETH_PassAllIsEnabled(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

bool PLIB_ETH_PassAllIsEnabled(ETH_MODULE_ID index)

PLIB_ETH_PatternMatchChecksumGet Function

Gets the value of the pattern match checksum register.

File

plib_eth.h

C

```
uint16_t PLIB_ETH_PatternMatchChecksumGet(ETH_MODULE_ID index);
```

Returns

The pattern match checksum.

Description

This function gets the value of the patter match checksum register.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
value = PLIB_ETH_PatternMatchChecksumGet(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

uint16_t PLIB_ETH_PatternMatchChecksumGet(ETH_MODULE_ID index)

PLIB_ETH_PatternMatchChecksumSet Function

Sets the Ethernet module pattern match checksum register with the new value.

File

plib_eth.h

C

```
void PLIB_ETH_PatternMatchChecksumSet(ETH_MODULE_ID index, uint16_t PatternMatchChecksumValue);
```

Returns

None.

Description

This function sets the pattern match checksum register with the new value.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

Call PLIB_ETH_PatternMatchModeSet(ETH_PATTERN_MATCH_DISABLED) to disable PatternMatch before changing the pattern match mask, or set the value before calling PLIB_ETH_ReceiveEnable.

Example

```
PLIB_ETH_PatternMatchChecksumSet(MY_ETH_INSTANCE, PatternMatchChecksumValue);
```

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
PatternMatchChecksumValue	Pattern match checksum value

Function

void PLIB_ETH_PatternMatchChecksumSet(ETH_MODULE_ID index, uint16_t PatternMatchChecksumValue)

PLIB_ETH_PatternMatchGet Function

Gets the value of the selected pattern match mask register.

File

plib_eth.h

C

```
uint64_t PLIB_ETH_PatternMatchGet(ETH_MODULE_ID index);
```

Returns

- patternMatchMaskValue - Pattern Match Mask Values

Description

This function gets the selected value of the patter match mask register.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
value = PLIB_ETH_PatternMatchGet(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

uint64_t PLIB_ETH_PatternMatchGet(ETH_MODULE_ID index)

PLIB_ETH_PatternMatchModeGet Function

Gets the value of the selected pattern match mask register.

File

plib_eth.h

C

```
ETH_PATTERN_MATCH_MODE PLIB_ETH_PatternMatchModeGet(ETH_MODULE_ID index);
```

Returns

- modeSel - The method of pattern matching from ETH_PATTERN_MATCH_DISABLED

Description

This function gets the selected value of the patter match mask register.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
value = PLIB_ETH_PatternMatchModeGet(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

ETH_PATTERN_MATCH_MODE PLIB_ETH_PatternMatchModeGet(ETH_MODULE_ID index)

PLIB_ETH_PatternMatchModeSet Function

Sets the Ethernet module pattern match mode.

File

plib_eth.h

C

```
void PLIB_ETH_PatternMatchModeSet(ETH_MODULE_ID index, ETH_PATTERN_MATCH_MODE modeSel);
```

Returns

None.

Description

This function sets the pattern match mode.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

Set the value before calling PLIB_ETH_ReceiveEnable().

Example

```
PLIB_ETH_PatternMatchModeSet(MY_ETH_INSTANCE, ETH_PATTERN_MATCH_DISABLED);
```

Parameters

Parameters	Description
index	Identifier for the device instance
modeSel	The method of pattern matching from ETH_PATTERN_MATCH_DISABLED

Function

void PLIB_ETH_PatternMatchModeSet(ETH_MODULE_ID index, ETH_PATTERN_MATCH_MODE modeSel)

PLIB_ETH_PatternMatchOffsetGet Function

Gets the value of the patter match offset register.

File

plib_eth.h

C

```
uint16_t PLIB_ETH_PatternMatchOffsetGet(ETH_MODULE_ID index);
```

Returns

- PatternMatchOffsetValue - Pattern match offset value

Description

This function gets the value of the patter match offset register.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
value = PLIB_ETH_PatternMatchOffsetGet(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

uint16_t PLIB_ETH_PatternMatchOffsetGet(ETH_MODULE_ID index)

PLIB_ETH_PatternMatchOffsetSet Function

Sets the Ethernet module patter match offset register with the new value.

File

plib_eth.h

C

```
void PLIB_ETH_PatternMatchOffsetSet(ETH_MODULE_ID index, uint16_t PatternMatchOffsetValue);
```

Returns

None.

Description

This function sets the pattern match offset register with the new value.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

Call PLIB_ETH_PatternMatchModeSet(ETH_PATTERN_MATCH_DISABLED) to disable PatternMatch before changing the pattern match mask, or set the value before calling PLIB_ETH_ReceiveEnable.

Example

```
PLIB_ETH_PatternMatchOffsetSet(MY_ETH_INSTANCE, PatternMatchOffsetValue);
```

Parameters

Parameters	Description
index	Identifier for the device instance

PatternMatchOffsetValue	Pattern match offset value

Function

void PLIB_ETH_PatternMatchOffsetSet(ETH_MODULE_ID index, uint16_t PatternMatchOffsetValue)

PLIB_ETH_PatternMatchSet Function

Sets the Ethernet module pattern match mask register with the new value.

File

plib_eth.h

C

```
void PLIB_ETH_PatternMatchSet(ETH_MODULE_ID index, uint64_t patternMatchMaskValue);
```

Returns

None.

Description

This function sets the pattern match mask register with the new value.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

Call PLIB_ETH_PatternMatchModeSet(index,ETH_PATTERN_MATCH_DISABLED) to disable PatternMatch before changing the pattern match mask, or set the value before calling PLIB_ETH_ReceiveEnable.

Example

```
PLIB_ETH_PatternMatchSet(MY_ETH_INSTANCE, patternMatchMaskValue);
```

Parameters

Parameters	Description
index	Identifier for the device instance
patternMatchMaskValue	Pattern Match Mask Values (64-bits)

Function

void PLIB_ETH_PatternMatchSet(ETH_MODULE_ID index, uint64_t patternMatchMaskValue)

PLIB_ETH_PurePreambleDisable Function

Disables EMAC pure preamble enforcement.

File

plib_eth.h

C

```
void PLIB_ETH_PurePreambleDisable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function disables the EMAC pure preamble enforcement. The EMAC does not perform any preamble checking.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_PurePreambleDisable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_PurePreambleDisable(ETH_MODULE_ID index)

PLIB_ETH_PurePreambleEnable Function

Enables EMAC pure preamble enforcement.

File

plib_eth.h

C

```
void PLIB_ETH_PurePreambleEnable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function enables EMAC pure preamble enforcement. The EMAC will verify the contents of the preamble and discard packets with errors in the preamble.

Remarks

The EMAC will verify the content of the preamble to ensure it contains 0x55 and is error-free. A packet with errors in its preamble is discarded.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_PurePreambleEnable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_PurePreambleEnable(ETH_MODULE_ID index)

PLIB_ETH_PurePreambleIsEnabled Function

Gets EMAC pure preamble enforcement enable status.

File

plib_eth.h

C

```
bool PLIB_ETH_PurePreambleIsEnabled(ETH_MODULE_ID index);
```

Returns

- true - The EMAC will verify the content of the preamble to ensure it contains 0x55 and is error-free. A packet with errors in its preamble is discarded.
- false - The EMAC does not perform any preamble checking

Description

This function gets the EMAC pure preamble enforcement enable status.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
stat = PLIB_ETH_PurePreambleIsEnabled(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

bool PLIB_ETH_PurePreambleIsEnabled(ETH_MODULE_ID index)

PLIB_ETH_ReceiveFilterDisable Function

Disables the specified receive filter.

File

plib_eth.h

C

```
void PLIB_ETH_ReceiveFilterDisable(ETH_MODULE_ID index, ETH_RECEIVE_FILTER filter);
```

Returns

None.

Description

This function disables the specified receive filter.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_ReceiveFilterDisable(index,
                              ETH_CRC_OK_FILTER      |
                              ETH_RUNT_ENABLE_FILTER |
                              ETH_UNICAST_FILTER     );
```

Parameters

Parameters	Description
index	Identifier for the device instance
filter	The selection of receive filters to be disabled from the enumerated selection ETH_RECEIVE_FILTER

Function

void PLIB_ETH_ReceiveFilterDisable(ETH_MODULE_ID index, ETH_RECEIVE_FILTER filter)

PLIB_ETH_ReceiveFilterEnable Function

Enables the specified receive filter.

File

plib_eth.h

C

```
void PLIB_ETH_ReceiveFilterEnable(ETH_MODULE_ID index, ETH_RECEIVE_FILTER filter);
```

Returns

None.

Description

This function enables the specified receive filter.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_ReceiveFilterEnable(index,
                             ETH_CRC_OK_FILTER      |
                             ETH_RUNT_ENABLE_FILTER |
                             ETH_UNICAST_FILTER     );
```

Parameters

Parameters	Description
index	Identifier for the device instance
filter	The selection of receive filters to be enabled from the enumerated selection ETH_RECEIVE_FILTER

Function

void PLIB_ETH_ReceiveFilterEnable(ETH_MODULE_ID index, ETH_RECEIVE_FILTER filter)

PLIB_ETH_ReceiveFilterIsEnable Function

Disables the specified receive filter.

File

plib_eth.h

C

```
bool PLIB_ETH_ReceiveFilterIsEnable(ETH_MODULE_ID index, ETH_RECEIVE_FILTER filter);
```

Returns

- true - If at least one of the specified filters is enabled
- false - If no specified filter is enabled

Description

This function disables the specified receive filter.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if (PLIB_ETH_ReceiveFilterIsEnable(index, ETH_UNICAST_FILTER))
{
    PLIB_ETH_ReceiveFilterDisable(MY_MODULE_ID, ETH_UNICAST_FILTER);
}
```

Parameters

Parameters	Description
index	Identifier for the device instance
filter	The selection of receive filters to be disabled from the enumerated selection ETH_RECEIVE_FILTER

Function

bool PLIB_ETH_ReceiveFilterIsEnable(ETH_MODULE_ID index, ETH_RECEIVE_FILTER filter)

PLIB_ETH_StationAddressGet Function

Gets the selected EMAC station address.

File

plib_eth.h

C

```
uint8_t PLIB_ETH_StationAddressGet(ETH_MODULE_ID index, uint8_t which);
```

Returns

- stationAddress1 - Station address

Description

This function gets the selected EMAC station address.

Remarks

On a reset, this register is loaded with the factory preprogrammed station address.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
stationAddr1 = PLIB_ETH_StationAddress1Get(MY_ETH_INSTANCE, which);
```

Parameters

Parameters	Description
index	Identifier for the device instance
which	Select station address to change. Valid values are 1,2,3,4,5,6.

Function

uint8_t PLIB_ETH_StationAddressGet(ETH_MODULE_ID index, uint8_t which)

PLIB_ETH_StationAddressSet Function

Sets the selected EMAC Station Address.

File

plib_eth.h

C

```
void PLIB_ETH_StationAddressSet(ETH_MODULE_ID index, uint8_t which, uint8_t stationAddress);
```

Returns

None.

Description

This function sets the selected EMAC Station Address.

Remarks

On a reset, this register is loaded with the factory preprogrammed station address.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_StationAddressSet(MY_ETH_INSTANCE, which, stationAddress);
```

Parameters

Parameters	Description
index	Identifier for the device instance
which	Select station address to change. Valid values are 1,2,3,4,5,6.
stationAddress	Station Address.

Function

void PLIB_ETH_StationAddressSet(ETH_MODULE_ID index, uint8_t which, uint8_t stationAddress)

e) Flow Control Functions

PLIB_ETH_AutoFlowControlDisable Function

Disables the Ethernet module Automatic Flow Control logic.

File

plib_eth.h

C

```
void PLIB_ETH_AutoFlowControlDisable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function disables the Ethernet Automatic Flow Control logic.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_AutoFlowControlDisable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_AutoFlowControlDisable(ETH_MODULE_ID index)

PLIB_ETH_AutoFlowControlEnable Function

Enables the Ethernet Automatic Flow Control logic.

File

plib_eth.h

C

```
void PLIB_ETH_AutoFlowControlEnable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function enables Ethernet Automatic Flow Control logic.

Remarks

The full and empty watermarks are used to automatically enable and disable flow control, respectively. When the number of received buffers rises to the full watermark, flow control is automatically enabled. When the receive buffer count falls to the empty watermark, flow control is automatically disabled.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_AutoFlowControlEnable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_AutoFlowControlEnable(ETH_MODULE_ID index)

PLIB_ETH_AutoFlowControlIsEnabled Function

Gets the Ethernet module Automatic Flow Control status.

File

plib_eth.h

C

```
bool PLIB_ETH_AutoFlowControlIsEnabled(ETH_MODULE_ID index);
```

Returns

- true - Ethernet module Automatic Flow Control is enabled
- false - Ethernet module Automatic Flow Control is disabled

Description

This function gets the Ethernet Automatic Flow Control enable status.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
stat = PLIB_ETH_AutoFlowControlIsEnabled(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

bool PLIB_ETH_AutoFlowControlIsEnabled(ETH_MODULE_ID index)

PLIB_ETH_BackPresNoBackoffDisable Function

Disables EMAC backpressure/no back-off.

File

plib_eth.h

C

```
void PLIB_ETH_BackPresNoBackoffDisable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function disables EMAC backpressure/no back-off. The EMAC will back-off when there is backpressure and collisions occur.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_BackPresNoBackoffDisable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_BackPresNoBackoffDisable(ETH_MODULE_ID index)

PLIB_ETH_BackPresNoBackoffEnable Function

Enables EMAC back pressure/no back-off.

File

plib_eth.h

C

```
void PLIB_ETH_BackPresNoBackoffEnable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function enables EMAC backpressure/no back-off. The EMAC will not back-off when there is backpressure and collisions occur.

Remarks

The EMAC after incidentally causing a collision during backpressure will immediately retransmit without back-off reducing the chance of further collisions and ensuring transmit packets get sent.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_BackPresNoBackoffEnable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_BackPresNoBackoffEnable(ETH_MODULE_ID index)

PLIB_ETH_BackPresNoBackoffIsEnabled Function

Gets the EMAC backpressure/no back-off enable status.

File

plib_eth.h

C

```
bool PLIB_ETH_BackPresNoBackoffIsEnabled(ETH_MODULE_ID index);
```

Returns

- true - The EMAC after incidentally causing a collision during backpressure will immediately retransmit without back-off reducing the chance of further collisions and ensuring transmit packets get sent
- false - The EMAC will not remove the back-off

Description

This function gets the EMAC backpressure/no back-off enable status.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
stat = PLIB_ETH_BackPresNoBackoffIsEnabled(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

bool PLIB_ETH_BackPresNoBackoffIsEnabled(ETH_MODULE_ID index)

PLIB_ETH_ManualFlowControlDisable Function

Disable Ethernet module Manual Flow Control logic.

File

plib_eth.h

C

```
void PLIB_ETH_ManualFlowControlDisable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function disables the Ethernet Manual Flow Control logic and automatically sends a Pause frame with a 0x0000 Pause Timer value. This function affects both transmit and receive operations.

Remarks

Disabling Manual Flow Control will automatically send a Pause frame with a 0x0000 Pause Timer value to disable flow control.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_ManualFlowControlDisable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_ManualFlowControlDisable(ETH_MODULE_ID index)

PLIB_ETH_ManualFlowControlEnable Function

Enables the Ethernet Manual Flow Control logic.

File

plib_eth.h

C

```
void PLIB_ETH_ManualFlowControlEnable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function enables the Ethernet Manual Flow Control logic. Enabling Manual Flow Control will send a Pause frame using the Pause Timer value. While enabled, a Pause frame is repeated every 128 x (Pause timer value)/2 transmit clock cycles.

Affects both transmit and receive operations.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_ManualFlowControlEnable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_ManualFlowControlEnable(ETH_MODULE_ID index)

PLIB_ETH_ManualFlowControlIsEnabled Function

Gets the Ethernet module Manual Flow Control enable status.

File

plib_eth.h

C

```
bool PLIB_ETH_ManualFlowControlIsEnabled(ETH_MODULE_ID index);
```

Returns

- true - Ethernet module Manual Flow Control is enabled
- false - Ethernet module Manual Flow Control is disabled

Description

This function returns the Ethernet module Manual Flow Control enable status.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
stat = PLIB_ETH_ManualFlowControlIsEnabled(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

bool PLIB_ETH_ManualFlowControlIsEnabled(ETH_MODULE_ID index)

PLIB_ETH_NoBackoffDisable Function

Disables EMAC no back-offs.

File

plib_eth.h

C

```
void PLIB_ETH_NoBackoffDisable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function disables EMAC no back-off. The EMAC will back-off when a collision occurs.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_NoBackoffDisable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_NoBackoffDisable(ETH_MODULE_ID index)

PLIB_ETH_NoBackoffEnable Function

Enables EMAC no back-off.

File

plib_eth.h

C

```
void PLIB_ETH_NoBackoffEnable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function enables EMAC no back-off. The EMAC will not back-off when a collision occurs.

Remarks

Following a collision, the EMAC will immediately retransmit rather than using the Binary Exponential Back-off algorithm as specified in the Standard.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_NoBackoffEnable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_NoBackoffEnable(ETH_MODULE_ID index)

PLIB_ETH_NoBackoffIsEnabled Function

Gets the EMAC no back-off enable status.

File

plib_eth.h

C

```
bool PLIB_ETH_NoBackoffIsEnabled(ETH_MODULE_ID index);
```

Returns

- true - Following a collision, the EMAC will immediately retransmit
- false - Following a collision, the EMAC will use the Binary Exponential Back-off algorithm

Description

This function gets the EMAC no back-off enable status.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
stat = PLIB_ETH_NoBackoffIsEnabled(MY_ETsH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

bool PLIB_ETH_NoBackoffIsEnabled(ETH_MODULE_ID index)

PLIB_ETH_RxEmptyWmarkGet Function

Gets the Ethernet module receive empty watermark.

File

plib_eth.h

C

```
uint8_t PLIB_ETH_RxEmptyWmarkGet(ETH_MODULE_ID index);
```

Returns

- receiveEmptyWmark - Empty watermark value

Description

This function gets the Ethernet receive empty watermark.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
watermarkValue = PLIB_ETH_RxEmptyWmarkGet(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

uint8_t PLIB_ETH_RxEmptyWmarkGet(ETH_MODULE_ID index)

PLIB_ETH_RxEmptyWmarkSet Function

Sets the Ethernet module receive empty water mark.

File

plib_eth.h

C

```
void PLIB_ETH_RxEmptyWmarkSet(ETH_MODULE_ID index, uint8_t watermarkValue);
```

Returns

None.

Description

This function sets the Ethernet receive empty water mark with a new value. The software controlled Receive Buffer Empty Wmark is compared against the receive buffer count to determine the empty watermark condition for the empty watermark interrupt and for disabling flow control if Auto Flow Control is enabled.

The Full Wmark value should always be greater than the Empty Wmark value.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_RxEmptyWmarkSet(MY_ETH_INSTANCE, watermarkValue);
```

Parameters

Parameters	Description
index	Identifier for the device instance
watermarkValue	Empty watermark value

Function

void PLIB_ETH_RxEmptyWmarkSet(ETH_MODULE_ID index, uint8_t watermarkValue)

PLIB_ETH_RxFullWmarkGet Function

Gets the Ethernet module to receive a full watermark.

File

plib_eth.h

C

```
uint8_t PLIB_ETH_RxFullWmarkGet(ETH_MODULE_ID index);
```

Returns

- receiveFullWmark - Full watermark value

Description

This function gets the Ethernet to receive a full watermark.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
watermarkValue = PLIB_ETH_RxFullWmarkGet(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

uint8_t PLIB_ETH_RxFullWmarkGet(ETH_MODULE_ID index)

PLIB_ETH_RxFullWmarkSet Function

Sets the Ethernet module to receive a full watermark.

File

plib_eth.h

C

```
void PLIB_ETH_RxFullWmarkSet(ETH_MODULE_ID index, uint8_t watermarkValue);
```

Returns

None.

Description

This function sets the Ethernet to receive a full watermark with a new value.

The software controlled RX Buffer Full Watermark (Wmark) Pointer is compared against the receive buffer count to determine the full watermark condition for the full watermark interrupt and for enabling flow control if Auto Flow Control is enabled.

The Full Wmark value should always be greater than the Empty Wmark value.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_RxFullWmarkSet(MY_ETH_INSTANCE, watermarkValue);
```

Parameters

Parameters	Description
index	Identifier for the device instance
watermarkValue	Full watermark value

Function

void PLIB_ETH_RxFullWmarkSet(ETH_MODULE_ID index, uint8_t watermarkValue)

PLIB_ETH_RxPauseDisable Function

Disables the EMAC receive flow control.

File

plib_eth.h

C

```
void PLIB_ETH_RxPauseDisable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function disables the EMAC receive flow control. The received Pause Flow control frames are ignored.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_RxPauseDisable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_RxPauseDisable(ETH_MODULE_ID index)

PLIB_ETH_RxPauseEnable Function

Enables the EMAC receive flow control.

File

plib_eth.h

C

```
void PLIB_ETH_RxPauseEnable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function enables the EMAC receive flow control. The EMAC will act upon the received Pause frames.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_RxPauseEnable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_RxPauseEnable(ETH_MODULE_ID index)

PLIB_ETH_RxPauseIsEnabled Function

Gets the EMAC receive flow pause enable status.

File

plib_eth.h

C

```
bool PLIB_ETH_RxPauseIsEnabled(ETH_MODULE_ID index);
```

Returns

- true - The EMAC acts upon received Pause Flow Control frames
- false - Received Pause Flow Control frames are ignored

Description

This function gets the EMAC receive flow pause enable status.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
status = PLIB_ETH_RxPauseIsEnabled(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

bool PLIB_ETH_RxPauseIsEnabled(ETH_MODULE_ID index)

PLIB_ETH_ShortcutQuantaDisable Function

Disables EMAC shortcut pause quanta.

File

plib_eth.h

C

```
void PLIB_ETH_ShortcutQuantaDisable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function disables EMAC shortcut pause quanta. The EMAC will resume normal operation.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_ShortcutQuantaDisable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_ShortcutQuantaDisable(ETH_MODULE_ID index)

PLIB_ETH_ShortcutQuantaEnable Function

Enables EMAC shortcut pause quanta.

File

plib_eth.h

C

```
void PLIB_ETH_ShortcutQuantaEnable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function enables EMAC shortcut pause quanta. The EMAC reduces the effective pause quanta from 64 byte-times to 1 byte-time.

Remarks

This functionality is intended for testing only.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_ShortcutQuantaEnable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_ShortcutQuantaEnable(ETH_MODULE_ID index)

PLIB_ETH_ShortcutQuantaIsEnabled Function

Gets EMAC shortcut pause quanta enable status.

File

plib_eth.h

C

```
bool PLIB_ETH_ShortcutQuantaIsEnabled(ETH_MODULE_ID index);
```

Returns

- true - The EMAC reduces the effective Pause Quanta from 64 byte-times to 1 byte-time
- false - Normal operation

Description

This function returns EMAC shortcut pause quanta enable status.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
stat = PLIB_ETH_ShortcutQuantaIsEnabled(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

bool PLIB_ETH_ShortcutQuantaIsEnabled(ETH_MODULE_ID index)

PLIB_ETH_SimResetDisable Function

Disables the EMAC simulation reset.

File

plib_eth.h

C

```
void PLIB_ETH_SimResetDisable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function disables the EMAC simulation reset.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_SimResetDisable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_SimResetDisable(ETH_MODULE_ID index)

PLIB_ETH_SimResetEnable Function

Enables the EMAC simulation reset.

File

plib_eth.h

C

```
void PLIB_ETH_SimResetEnable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function enables the EMAC simulation reset and resets the random number generator within the transmit (TX) function.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_SimResetEnable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_SimResetEnable(ETH_MODULE_ID index)

PLIB_ETH_SimResetIsEnabled Function

Gets the EMAC simulation reset status.

File

plib_eth.h

C

```
bool PLIB_ETH_SimResetIsEnabled(ETH_MODULE_ID index);
```

Returns

- true - Simulation Reset is enabled
- false - Simulation Reset is disabled

Description

This function returns the EMAC simulation reset status.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
stat = PLIB_ETH_SimResetIsEnabled(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

bool PLIB_ETH_SimResetIsEnabled(ETH_MODULE_ID index)

PLIB_ETH_TestBackPressDisable Function

Disables EMAC Test backpressure.

File

plib_eth.h

C

```
void PLIB_ETH_TestBackPressDisable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function disables EMAC Test backpressure. The EMAC will resume normal operation.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_TestBackPressDisable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_TestBackPressDisable(ETH_MODULE_ID index)

PLIB_ETH_TestBackPressEnable Function

Enables EMAC Test backpressure.

File

plib_eth.h

C

```
void PLIB_ETH_TestBackPressEnable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function enables EMAC Test backpressure. The EMAC will assert backpressure on the link. Backpressure causes preamble to be transmitted, raising carrier sense. A transmit packet from the system will be sent during backpressure.

Remarks

This functionality is intended for testing only.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_TestBackPressEnable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_TestBackPressEnable(ETH_MODULE_ID index)

PLIB_ETH_TestBackPressIsEnabled Function

Gets the EMAC test backpressure enable status.

File

plib_eth.h

C

```
bool PLIB_ETH_TestBackPressIsEnabled(ETH_MODULE_ID index);
```

Returns

- true - The EMAC will assert backpressure on the link. Backpressure causes the preamble to be transmitted, raising the carrier sense. A transmit packet from the system will be sent during backpressure.
- false - Normal operation

Description

This function gets the EMAC test backpressure enable status.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_TestBackPressIsEnabled(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

bool PLIB_ETH_TestBackPressIsEnabled(ETH_MODULE_ID index)

PLIB_ETH_TxPauseDisable Function

Disables the transmission of Pause frames.

File

plib_eth.h

C

```
void PLIB_ETH_TxPauseDisable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function disables the transmit Pause frames. The Pause frames are blocked from being transmitted.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_TxPauseDisable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_TxPauseDisable(ETH_MODULE_ID index)

PLIB_ETH_TxPauseEnable Function

Enables the transmission Pause frames.

File

plib_eth.h

C

```
void PLIB_ETH_TxPauseEnable(ETH_MODULE_ID index);
```

Returns

None.

Description

This function enables the transmission Pause frames. The Pause frames are allowed for transmission.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_TxPauseEnable(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_TxPauseEnable(ETH_MODULE_ID index)

PLIB_ETH_TxPauseIsEnabled Function

Gets the Ethernet module enable status.

File

plib_eth.h

C

```
bool PLIB_ETH_TxPauseIsEnabled(ETH_MODULE_ID index);
```

Returns

- true - Pause Flow Control frames are allowed to be transmitted
- false - Pause Flow Control frames are blocked

Description

This function gets the Ethernet module enable status.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
status = PLIB_ETH_TxPauseIsEnabled(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

bool PLIB_ETH_TxPauseIsEnabled(ETH_MODULE_ID index)

f) Interrupt Functions

PLIB_ETH_InterruptClear Function

Clears the Ethernet module interrupt source status as a group, using a mask.

File

plib_eth.h

C

```
void PLIB_ETH_InterruptClear(ETH_MODULE_ID index, ETH_INTERRUPT_SOURCES intmask);
```

Returns

None.

Description

This function clears the Ethernet module interrupt source status using a mask. Logically 'OR' the masks together. Any masks not ORed with the others will be disabled.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
// To clear several interrupts with one command, execute the following:
PLIB_ETH_InterruptClear(MY_ETH_INSTANCE,
                                    ETH_EMPTY_WATERMARK_INTERRUPT      |
                                    ETH_FULL_WATERMARK_INTERRUPT       |
                                    ETH_RX_FIFO_OVERFLOW_ERROR_INTERRUPT );
```

Parameters

Parameters	Description
index	Identifier for the device instance
intmask	Members of ETH_INTERRUPT_SOURCES logically ORed together

Function

void PLIB_ETH_InterruptClear(ETH_MODULE_ID index, ETH_INTERRUPT_SOURCES intmask)

PLIB_ETH_InterruptSet Function

Sets the Ethernet module interrupt source status as a group, using a mask.

File

plib_eth.h

C

```
void PLIB_ETH_InterruptSet(ETH_MODULE_ID index, ETH_INTERRUPT_SOURCES intmask);
```

Returns

None.

Description

This function sets the Ethernet module interrupt source status using a mask. Logically 'OR' the masks together. Any masks not OR'd with the others will be disabled.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
// To set several interrupt flags with one command, execute the following:
PLIB_ETH_InterruptSet(MY_ETH_INSTANCE,
                                    ETH_EMPTY_WATERMARK_INTERRUPT      |
                                    ETH_FULL_WATERMARK_INTERRUPT       |
                                    ETH_RX_FIFO_OVERFLOW_ERROR_INTERRUPT );
```

Parameters

Parameters	Description
index	Identifier for the device instance
intmask	Members of ETH_INTERRUPT_SOURCES logically ORed together

Function

void PLIB_ETH_InterruptSet(ETH_MODULE_ID index, ETH_INTERRUPT_SOURCES intmask)

PLIB_ETH_InterruptsGet Function

Gets the Ethernet module Interrupt Flag register as a group.

File

plib_eth.h

C

```
ETH_INTERRUPT_SOURCES PLIB_ETH_InterruptsGet(ETH_MODULE_ID index);
```

Returns

Interrupt bit map, as defined in ETH_INTERRUPT_SOURCES, showing which interrupts have fired.

Description

Gets the Ethernet module Interrupt Flag register as a group.

Remarks

none.

Preconditions

None.

Example

Parameters

Parameters	Description
index	Identifier for the device instance

Function

ETH_INTERRUPT_SOURCES PLIB_ETH_InterruptsGet(ETH_MODULE_ID index)

PLIB_ETH_InterruptSourceDisable Function

Clears the Ethernet module Interrupt Enable register as a group, using a mask.

File

plib_eth.h

C

```
void PLIB_ETH_InterruptSourceDisable(ETH_MODULE_ID index, ETH_INTERRUPT_SOURCES intmask);
```

Returns

None.

Description

This function disables the Ethernet module interrupts by using a mask to select one or multiple interrupts to disable. Logically 'OR' elements of ETH_INTERRUPT_SOURCES together.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
// To disable some interrupts with one command, execute the following:
PLIB_ETH_InterruptSourceDisble(MY_ETH_INSTANCE,
                                ETH_TRANSMIT_DONE_INTERRUPT                |
                                ETH_TRANSMIT_ABORT_INTERRUPT               |
                                ETH_RECEIVE_BUFFER_NOT_AVAILABLE_INTERRUPT |
                                ETH_RECEIVE_FIFO_OVERFLOW_ERROR_INTERRUPT );

// Or to disable one interrupt with one command, execute the following:
PLIB_ETH_InterruptSourceDisble(MY_ETH_INSTANCE, ETH_TRANSMIT_DONE_INTERRUPT);

// Or to disable all interrupts with one command, execute the following:
PLIB_ETH_InterruptSourceDisble(MY_ETH_INSTANCE, ETH_ALL_ETH_INTERRUPTS);
```

Parameters

Parameters	Description
index	Identifier for the device instance
intmask	Members of ETH_INTERRUPT_SOURCES logically ORed together

Function

void PLIB_ETH_InterruptSourceDisable(ETH_MODULE_ID index, ETH_INTERRUPT_SOURCES intmask)

PLIB_ETH_InterruptSourceEnable Function

Sets the Ethernet module Interrupt Enable register in a group, using a mask.

File

plib_eth.h

C

```
void PLIB_ETH_InterruptSourceEnable(ETH_MODULE_ID index, ETH_INTERRUPT_SOURCES intmask);
```

Returns

None.

Description

This function enables the Ethernet module interrupts by using a mask to enable one or multiple interrupt enables. Logically 'OR' elements of ETH_INTERRUPT_SOURCES together.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
// To enable some interrupts with one command, execute the following:
PLIB_ETH_InterruptSourceEnable(MY_ETH_INSTANCE,
                                    ETH_TRANSMIT_DONE_INTERRUPT                |
                                    ETH_TRANSMIT_ABORT_INTERRUPT               |
                                    ETH_RECEIVE_BUFFER_NOT_AVAILABLE_INTERRUPT |
                                    ETH_RECEIVE_FIFO_OVERFLOW_ERROR_INTERRUPT);

// Or to enable one interrupt with one command, execute the following:
PLIB_ETH_InterruptSourceEnable(MY_ETH_INSTANCE, ETH_TRANSMIT_DONE_INTERRUPT);

// Or to enable all interrupts with one command, execute the following:
PLIB_ETH_InterruptSourceEnable(MY_ETH_INSTANCE, ETH_ALL_ETH_INTERRUPTS);
```

Parameters

Parameters	Description
index	Identifier for the device instance
intmask	Members of ETH_INTERRUPT_SOURCES logically ORed together

Function

void PLIB_ETH_InterruptSourceEnable(ETH_MODULE_ID index, ETH_INTERRUPT_SOURCES intmask)

PLIB_ETH_InterruptSourceIsEnabled Function

Gets the Ethernet module Interrupt Enable register singularly or as a group.

File

plib_eth.h

C

```
bool PLIB_ETH_InterruptSourceIsEnabled(ETH_MODULE_ID index, ETH_INTERRUPT_SOURCES intmask);
```

Returns

- true - If any of the specified sources are enabled
- false - If none of the specified sources are enabled

Description

This function returns a true if any of the specified interrupt sources are enabled.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if ( PLIB_ETH_InterruptSourceIsEnabled(index, ETH_TRANSMIT_DONE_INTERRUPT))
{
    //If the interrupt is enabled, disable it...
    PLIB_ETH_InterruptSourceDisable(index, ETH_TRANSMIT_DONE_INTERRUPT);
}
```

Parameters

Parameters	Description
index	Identifier for the device instance
mask	The interrupt mask(s) to be checked

Function

bool PLIB_ETH_InterruptSourceIsEnabled(ETH_MODULE_ID index, ETH_INTERRUPT_SOURCES intmask)

PLIB_ETH_InterruptSourcesGet Function

Returns the entire interrupt enable register.

File

plib_eth.h

C

```
ETH_INTERRUPT_SOURCES PLIB_ETH_InterruptSourcesGet(ETH_MODULE_ID index);
```

Returns

Bit map of interrupt sources, all ORed together, as defined by ETH_INTERRUPT_SOURCES.

Description

This function returns the entire interrupt enable register.

Remarks

None.

Preconditions

None.

Example

Parameters

Parameters	Description
index	Identifier for the device instance

Function

ETH_INTERRUPT_SOURCES PLIB_ETH_InterruptSourcesGet(ETH_MODULE_ID index)

PLIB_ETH_InterruptStatusGet Function

Gets the Ethernet module Interrupt Flag register as a group, using a mask.

File

plib_eth.h

C

```
bool PLIB_ETH_InterruptStatusGet(ETH_MODULE_ID index, ETH_INTERRUPT_SOURCES intmask);
```

Returns

- true - If any of the specified source statuses are enabled

- false - If none of the specified source statuses are enabled

Description

This function gets the Ethernet module Interrupt Flag register using a mask.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if (PLIB_ETH_InterruptStatusGet(index, ETH_TRANSMIT_DONE_INTERRUPT))
{
    PLIB_ETH_InterruptClear(index, ETH_TRANSMIT_DONE_INTERRUPT);
}
```

Parameters

Parameters	Description
index	Identifier for the device instance
intmask	Members of ETH_INTERRUPT_SOURCES logically ORed together

Function

bool PLIB_ETH_InterruptStatusGet(ETH_MODULE_ID index, ETH_INTERRUPT_SOURCES intmask);

g) Statistics Functions

PLIB_ETH_AlignErrorCountClear Function

Sets the count of Ethernet alignment errors to zero.

File

plib_eth.h

C

```
void PLIB_ETH_AlignErrorCountClear(ETH_MODULE_ID index);
```

Returns

None.

Description

This function sets the count of Ethernet alignment errors to zero.

Remarks

Setting or clearing any bits in this register should be done for debug/test purposes only.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_AlignErrorCountClear(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance
value	count of alignment errors

Function

void PLIB_ETH_AlignErrorCountClear(ETH_MODULE_ID index)

PLIB_ETH_AlignErrorCountGet Function

Gets the count of Ethernet alignment errors.

File

plib_eth.h

C

```
uint16_t PLIB_ETH_AlignErrorCountGet(ETH_MODULE_ID index);
```

Returns

- value - Count of alignment errors

Description

This function gets the count of Ethernet alignment errors.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
count = PLIB_ETH_AlignErrorCountGet(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

uint16_t PLIB_ETH_AlignErrorCountGet(ETH_MODULE_ID index)

PLIB_ETH_FCSErrorCountClear Function

Sets the value of the Ethernet frame check sequence error to zero.

File

plib_eth.h

C

```
void PLIB_ETH_FCSErrorCountClear(ETH_MODULE_ID index);
```

Returns

None.

Description

This function sets the value of the Ethernet frame check sequence error to zero.

Remarks

Setting or clearing any bits in this register should be done for debug/test purposes only.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_FCSErrorCountClear(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance
value	Count of FCS Errors

Function

void PLIB_ETH_FCSErrorCountClear(ETH_MODULE_ID index)

PLIB_ETH_FCSErrorCountGet Function

Gets the count of the frame check sequence error.

File

plib_eth.h

C

```
uint16_t PLIB_ETH_FCSErrorCountGet(ETH_MODULE_ID index);
```

Returns

- value - Count of FCS Errors

Description

This function gets the count of the frame check sequence error.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
count = PLIB_ETH_FCSErrorCountGet(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

uint16_t PLIB_ETH_FCSErrorCountGet(ETH_MODULE_ID index)

PLIB_ETH_FramesRxdOkCountClear Function

Sets the value of the Ethernet received frames 'OK' count to zero.

File

plib_eth.h

C

```
void PLIB_ETH_FramesRxdOkCountClear(ETH_MODULE_ID index);
```

Returns

None.

Description

This function sets the value of the Ethernet frames 'OK' count to zero.

Remarks

Changing the value of this register should be done for debug/test purposes only.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_FramesRxdOkCountClear(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance
value	Count of frames received correctly

Function

void PLIB_ETH_FramesRxdOkCountClear(ETH_MODULE_ID index)

PLIB_ETH_FramesRxdOkCountGet Function

Gets the count of the frames frames received successfully.

File

plib_eth.h

C

```
uint16_t PLIB_ETH_FramesRxdOkCountGet(ETH_MODULE_ID index);
```

Returns

- value - Count of frames received correctly

Description

This function gets the count of the frames received successfully. Increment count for frames received successfully by the RX Filter. This count will not be incremented if there is a Frame Check Sequence (FCS) or Alignment error.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
count = PLIB_ETH_FramesRxdOkCountGet(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

uint16_t PLIB_ETH_FramesRxdOkCountGet(ETH_MODULE_ID index)

PLIB_ETH_FramesTxdOkCountClear Function

Sets the count of Ethernet Control frames transmitted to zero.

File

plib_eth.h

C

```
void PLIB_ETH_FramesTxdOkCountClear(ETH_MODULE_ID index);
```

Returns

None.

Description

This function sets the count of Ethernet Control frames transmitted to zero.

Remarks

Setting or clearing any bits in this register should be done for debug/test purposes only.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_FramesTxdOkCountClear(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance
value	Count of control frames transmitted correctly

Function

void PLIB_ETH_FramesTxdOkCountClear(ETH_MODULE_ID index)

PLIB_ETH_FramesTxdOkCountGet Function

Gets the count of Ethernet Control Frames transmitted successfully.

File

plib_eth.h

C

```
uint16_t PLIB_ETH_FramesTxdOkCountGet(ETH_MODULE_ID index);
```

Returns

- count - count of control frames transmitted correctly

Description

This function gets the count of Ethernet Control Frames transmitted successfully.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
count = PLIB_ETH_FramesTxdOkCountGet(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

uint16_t PLIB_ETH_FramesTxdOkCountGet(ETH_MODULE_ID index)

PLIB_ETH_MultipleCollisionCountClear Function

Sets the value of the Ethernet multiple collision frame count to zero.

File

plib_eth.h

C

```
void PLIB_ETH_MultipleCollisionCountClear(ETH_MODULE_ID index);
```

Returns

None.

Description

This function sets the value of the Ethernet multiple collision frame count to zero.

Remarks

Setting or clearing any bits in this register should be done for debug/test purposes only.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_MultipleCollisionCountClear(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance
value	Count of multiple collision frames

Function

void PLIB_ETH_MultipleCollisionCountClear(ETH_MODULE_ID index)

PLIB_ETH_MultipleCollisionCountGet Function

Gets the count of the frames transmitted successfully after there was more than one collision.

File

plib_eth.h

C

```
uint16_t PLIB_ETH_MultipleCollisionCountGet(ETH_MODULE_ID index);
```

Returns

- count - Count of multiple collision frames

Description

This function gets the count of the frames transmitted successfully after there was more than one collision.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
count = PLIB_ETH_MultipleCollisionCountGet(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

uint16_t PLIB_ETH_MultipleCollisionCountGet(ETH_MODULE_ID index)

PLIB_ETH_RxOverflowCountClear Function

Sets the value of the Ethernet receive overflow count to zero.

File

plib_eth.h

C

```
void PLIB_ETH_RxOverflowCountClear(ETH_MODULE_ID index);
```

Returns

None.

Description

This function sets the value of the Ethernet receive overflow count to zero. Increment counter for frames accepted by the RX filter and subsequently dropped due to internal receive error. This event also sets the receive overflow interrupt flag.

Remarks

Setting or clearing any bits in this register should be done for debug/test purposes only.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_RxOverflowCountClear(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

void PLIB_ETH_RxOverflowCountClear(ETH_MODULE_ID index)

PLIB_ETH_RxOverflowCountGet Function

Gets the count of the dropped Ethernet receive frames.

File

plib_eth.h

C

```
uint16_t PLIB_ETH_RxOverflowCountGet(ETH_MODULE_ID index);
```

Returns

- count - uint16_t receiver overflow counts

Description

This function gets the count of the dropped Ethernet receive frames.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
count = PLIB_ETH_RxOverflowCountGet(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

uint16_t PLIB_ETH_RxOverflowCountGet(ETH_MODULE_ID index)

PLIB_ETH_RxPacketCountGet Function

Gets the value of the receive packet buffer count.

File

plib_eth.h

C

```
uint8_t PLIB_ETH_RxPacketCountGet(ETH_MODULE_ID index);
```

Returns

- RxPacketCount - Number of received packets in memory

Description

This function gets the value of the receive packet buffer count. When a packet has been successfully received, this value is incremented by hardware. Software decrements the counter after a packet has been read. Call PLIB_ETH_ReceiveBufferCountDecrement(ETH_MODULE_ID index) to decrement.

Remarks

Receive Packet Buffer Counter cannot be decremented below 0x00 Cleared when the Ethernet module is reset.

The Receive Packet Buffer Count is not set to '0' when the Ethernet module is turned OFF. This allows software to continue to utilize and decrement the count.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
count = PLIB_ETH_RxPacketCountGet(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

uint8_t PLIB_ETH_RxPacketCountGet(ETH_MODULE_ID index)

PLIB_ETH_SingleCollisionCountClear Function

Sets the value of the Ethernet single collision frame count to zero.

File

plib_eth.h

C

```
void PLIB_ETH_SingleCollisionCountClear(ETH_MODULE_ID index);
```

Returns

None.

Description

This function sets the value of the Ethernet single collision frame count to zero.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_ETH_SingleCollisionCountClear(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance
value	Count of single collision frames

Function

void PLIB_ETH_SingleCollisionCountClear(ETH_MODULE_ID index)

PLIB_ETH_SingleCollisionCountGet Function

Gets the count of the frames transmitted successfully on a second attempt.

File

plib_eth.h

C

```
uint16_t PLIB_ETH_SingleCollisionCountGet(ETH_MODULE_ID index);
```

Returns

- count - Count of frames transmitted successfully on second attempt

Description

This function gets the count of the frames transmitted successfully on a second attempt.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
count = PLIB_ETH_SingleCollisionCountGet(MY_ETH_INSTANCE);
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

uint16_t PLIB_ETH_SingleCollisionCountGet(ETH_MODULE_ID index)

h) Feature Existence Functions

PLIB_ETH_ExistsAlignmentErrorCount Function

Identifies whether the AlignmentErrorCount feature exists on the Ethernet module.

File

plib_eth.h

C

```
bool PLIB_ETH_ExistsAlignmentErrorCount(ETH_MODULE_ID index);
```

Returns

- true - The AlignmentErrorCount feature is supported on the device
- false - The AlignmentErrorCount feature is not supported on the device

Description

This function identifies whether the AlignmentErrorCount feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- PLIB_ETH_AlignErrorCountClear
- PLIB_ETH_AlignErrorCountGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ETH_ExistsAlignmentErrorCount(ETH_MODULE_ID index)

PLIB_ETH_ExistsAutoFlowControl Function

Identifies whether the AutoFlowControl feature exists on the Ethernet module.

File

plib_eth.h

C

```
bool PLIB_ETH_ExistsAutoFlowControl(ETH_MODULE_ID index);
```

Returns

- true - The AutoFlowControl feature is supported on the device
- false - The AutoFlowControl feature is not supported on the device

Description

This function identifies whether the AutoFlowControl feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- PLIB_ETH_AutoFlowControlEnable
- PLIB_ETH_AutoFlowControlDisable
- PLIB_ETH_AutoFlowControlIsEnabled

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ETH_ExistsAutoFlowControl(ETH_MODULE_ID index)

PLIB_ETH_ExistsCollisionCounts Function

Identifies whether the CollisionCounts feature exists on the Ethernet module.

File

plib_eth.h

C

```
bool PLIB_ETH_ExistsCollisionCounts(ETH_MODULE_ID index);
```

Returns

- true - The CollisionCounts feature is supported on the device
- false - The CollisionCounts feature is not supported on the device

Description

This function identifies whether the CollisionCounts feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- PLIB_ETH_SingleCollisionCountClear
- PLIB_ETH_SingleCollisionCountGet
- PLIB_ETH_MultipleCollisionCountClear
- PLIB_ETH_MultipleCollisionCountGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ETH_ExistsCollisionCounts(ETH_MODULE_ID index)

PLIB_ETH_ExistsCollisionWindow Function

Identifies whether the CollisionWindow feature exists on the Ethernet module.

File

plib_eth.h

C

```
bool PLIB_ETH_ExistsCollisionWindow(ETH_MODULE_ID index);
```

Returns

- true - The CollisionWindow feature is supported on the device
- false - The CollisionWindow feature is not supported on the device

Description

This function identifies whether the CollisionWindow feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- PLIB_ETH_CollisionWindowGet
- PLIB_ETH_CollisionWindowSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ETH_ExistsCollisionWindow(ETH_MODULE_ID index)

PLIB_ETH_ExistsEnable Function

Identifies whether the Enable feature exists on the Ethernet module.

File

plib_eth.h

C

```
bool PLIB_ETH_ExistsEnable(ETH_MODULE_ID index);
```

Returns

- true - The Enable feature is supported on the device
- false - The Enable feature is not supported on the device

Description

This function identifies whether the Enable feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- PLIB_ETH_Enable
- PLIB_ETH_Disable
- PLIB_ETH_IsEnabled

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ETH_ExistsEnable(ETH_MODULE_ID index)

PLIB_ETH_ExistsEthernetControllerStatus Function

Identifies whether the EthernetControllerStatus feature exists on the Ethernet module.

File

plib_eth.h

C

```
bool PLIB_ETH_ExistsEthernetControllerStatus(ETH_MODULE_ID index);
```

Returns

- true - The EthernetControllerStatus feature is supported on the device
- false - The EthernetControllerStatus feature is not supported on the device

Description

This function identifies whether the EthernetControllerStatus feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- PLIB_ETH_RxPacketCountGet
- PLIB_ETH_EthernetIsBus

- PLIB_ETH_TransmitIsBusy
- PLIB_ETH_ReceiveIsBusy

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ETH_ExistsEthernetControllerStatus(ETH_MODULE_ID index)

PLIB_ETH_ExistsFCSErrorCount Function

Identifies whether the FCSErrorCount feature exists on the Ethernet module.

File

plib_eth.h

C

```
bool PLIB_ETH_ExistsFCSErrorCount(ETH_MODULE_ID index);
```

Returns

- true - The FCSErrorCount feature is supported on the device
- false - The FCSErrorCount feature is not supported on the device

Description

This function identifies whether the FCSErrorCount feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- PLIB_ETH_FCSErrorCountClear
- PLIB_ETH_FCSErrorCountGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ETH_ExistsFCSErrorCount(ETH_MODULE_ID index)

PLIB_ETH_ExistsFramesTransmittedOK Function

Identifies whether the FramesTransmittedOK feature exists on the Ethernet module.

File

plib_eth.h

C

```
bool PLIB_ETH_ExistsFramesTransmittedOK(ETH_MODULE_ID index);
```

Returns

- true - The FramesTransmittedOK feature is supported on the device

- false - The FramesTransmittedOK feature is not supported on the device

Description

This function identifies whether the FramesTransmittedOK feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- PLIB_ETH_FramesTxdOkCountClear
- PLIB_ETH_FramesTxdOkCountGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ETH_ExistsFramesTransmittedOK(ETH_MODULE_ID index)

PLIB_ETH_ExistsFramexReceivedOK Function

Identifies whether the FramexReceivedOK feature exists on the Ethernet module.

File

plib_eth.h

C

```
bool PLIB_ETH_ExistsFramexReceivedOK(ETH_MODULE_ID index);
```

Returns

- true - The FramexReceivedOK feature is supported on the device
- false - The FramexReceivedOK feature is not supported on the device

Description

This function identifies whether the FramexReceivedOK feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- PLIB_ETH_FramesRxdOkCountClear
- PLIB_ETH_FramesRxdOkCountGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ETH_ExistsFramexReceivedOK(ETH_MODULE_ID index)

PLIB_ETH_ExistsHashTable Function

Identifies whether the HashTable feature exists on the Ethernet module.

File

plib_eth.h

C

```
bool PLIB_ETH_ExistsHashTable(ETH_MODULE_ID index);
```

Returns

- true - The HashTable feature is supported on the device
- false - The HashTable feature is not supported on the device

Description

This function identifies whether the HashTable feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- PLIB_ETH_HashTableSet
- PLIB_ETH_HashTableGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ETH_ExistsHashTable(ETH_MODULE_ID index)

PLIB_ETH_ExistsInterPacketGaps Function

Identifies whether the InterPacketGaps feature exists on the Ethernet module.

File

plib_eth.h

C

```
bool PLIB_ETH_ExistsInterPacketGaps(ETH_MODULE_ID index);
```

Returns

- true - The InterPacketGaps feature is supported on the device
- false - The InterPacketGaps feature is not supported on the device

Description

This function identifies whether the InterPacketGaps feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- PLIB_ETH_BackToBackIPGGet
- PLIB_ETH_BackToBackIPGSet
- PLIB_ETH_NonBackToBackIPG1Get
- PLIB_ETH_NonBackToBackIPG1Set
- PLIB_ETH_NonBackToBackIPG2Get
- PLIB_ETH_NonBackToBackIPG2Set

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ETH_ExistsInterPacketGaps(ETH_MODULE_ID index)

PLIB_ETH_ExistsInterrupt Function

Identifies whether the Interrupt feature exists on the Ethernet module.

File

plib_eth.h

C

```
bool PLIB_ETH_ExistsInterrupt(ETH_MODULE_ID index);
```

Returns

- true - The Interrupt feature is supported on the device
- false - The Interrupt feature is not supported on the device

Description

This function identifies whether the Interrupt feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- PLIB_ETH_InterruptSourceEnable
- PLIB_ETH_InterruptSourceDisable
- PLIB_ETH_InterruptSourceIsEnabled
- PLIB_ETH_InterruptSet
- PLIB_ETH_InterruptClear
- PLIB_ETH_InterruptStatusGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ETH_ExistsInterrupt(ETH_MODULE_ID index)

PLIB_ETH_ExistsMAC_Configuration Function

Identifies whether the MAC_Configuration feature exists on the Ethernet module.

File

plib_eth.h

C

```
bool PLIB_ETH_ExistsMAC_Configuration(ETH_MODULE_ID index);
```

Returns

- true - The MAC_Configuration feature is supported on the device
- false - The MAC_Configuration feature is not supported on the device

Description

This function identifies whether the MAC_Configuration feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- PLIB_ETH_LoopbackEnable
- PLIB_ETH_LoopbackDisable
- PLIB_ETH_LoopbackIsEnabled

- PLIB_ETH_TxPauseEnable
- PLIB_ETH_TxPauseDisable
- PLIB_ETH_TxPauseIsEnabled
- PLIB_ETH_RxPauseEnable
- PLIB_ETH_RxPauseDisable
- PLIB_ETH_RxPauseIsEnabled
- PLIB_ETH_PassAllEnable
- PLIB_ETH_PassAllDisable
- PLIB_ETH_PassAllIsEnabled
- PLIB_ETH_ReceiveEnable
- PLIB_ETH_ReceiveDisable
- PLIB_ETH_ReceiveIsEnabled
- PLIB_ETH_ExcessDeferEnable
- PLIB_ETH_ExcessDeferDisable
- PLIB_ETH_ExcessDeferIsEnabled
- PLIB_ETH_BackPresNoBackoffEnable
- PLIB_ETH_BackPresNoBackoffDisable
- PLIB_ETH_BackPresNoBackoffIsEnabled
- PLIB_ETH_NoBackoffEnable
- PLIB_ETH_NoBackoffDisable
- PLIB_ETH_NoBackoffIsEnabled
- PLIB_ETH_LongPreambleEnable
- PLIB_ETH_LongPreambleDisable
- PLIB_ETH_LongPreambleIsEnabled
- PLIB_ETH_PurePreambleEnable
- PLIB_ETH_PurePreambleDisable
- PLIB_ETH_PurePreambleIsEnabled
- PLIB_ETH_AutoDetectPadGet
- PLIB_ETH_AutoDetectPadSet
- PLIB_ETH_AutoDetectPadClear
- PLIB_ETH_CRCEnable
- PLIB_ETH_CRCDisable
- PLIB_ETH_CRCIsEnabled
- PLIB_ETH_DelayedCRCEnable
- PLIB_ETH_DelayedCRCDisable
- PLIB_ETH_DelayedCRCIsEnabled
- PLIB_ETH_HugeFrameEnable
- PLIB_ETH_HugeFrameDisable
- PLIB_ETH_HugeFrameIsEnabled
- PLIB_ETH_FrameLengthCheckEnable
- PLIB_ETH_FrameLengthCheckDisable
- PLIB_ETH_FrameLengthCheckIsEnabled
- PLIB_ETH_FullDuplexEnable
- PLIB_ETH_FullDuplexDisable
- PLIB_ETH_FullDuplexIsEnabled

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ETH_ExistsMAC_Configuration(ETH_MODULE_ID index)

PLIB_ETH_ExistsMAC_Resets Function

Identifies whether the MAC_Resets feature exists on the Ethernet module.

File

plib_eth.h

C

```
bool PLIB_ETH_ExistsMAC_Resets(ETH_MODULE_ID index);
```

Returns

- true - The MAC_Resets feature is supported on the device
- false - The MAC_Resets feature is not supported on the device

Description

This function identifies whether the MAC_Resets feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- PLIB_ETH_MIIResetEnable
- PLIB_ETH_MIIResetDisable
- PLIB_ETH_MIIResetIsEnabled
- PLIB_ETH_SimResetEnable
- PLIB_ETH_SimResetDisable
- PLIB_ETH_SimResetIsEnabled
- PLIB_ETH_MCSRxResetEnable
- PLIB_ETH_MCSRxResetDisable
- PLIB_ETH_MCSRxResetIsEnabled
- PLIB_ETH_RxFuncResetEnable
- PLIB_ETH_RxFuncResetDisable
- PLIB_ETH_RxFuncResetIsEnabled
- PLIB_ETH_MCSTxResetEnable
- PLIB_ETH_MCSTxResetDisable
- PLIB_ETH_MCSTxResetIsEnabled
- PLIB_ETH_TxFuncResetEnable
- PLIB_ETH_TxFuncResetDisable
- PLIB_ETH_TxFuncResetIsEnabled

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ETH_ExistsMAC_Resets(ETH_MODULE_ID index)

PLIB_ETH_ExistsMAC_Testing Function

Identifies whether the MAC_Testing feature exists on the Ethernet module.

File

plib_eth.h

C

```
bool PLIB_ETH_ExistsMAC_Testing(ETH_MODULE_ID index);
```

Returns

- true - The MAC_Testing feature is supported on the device
- false - The MAC_Testing feature is not supported on the device

Description

This function identifies whether the MAC_Testing feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- PLIB_ETH_TestBackPressEnable
- PLIB_ETH_TestBackPressDisable
- PLIB_ETH_TestBackPressIsEnabled
- PLIB_ETH_TestPauseEnable
- PLIB_ETH_TestPauseDisable
- PLIB_ETH_TestPauseIsEnabled
- PLIB_ETH_ShortcutQuantaEnable
- PLIB_ETH_ShortcutQuantaDisable
- PLIB_ETH_ShortcutQuantaIsEnabled

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ETH_ExistsMAC_Testing(ETH_MODULE_ID index)

PLIB_ETH_ExistsManualFlowControl Function

Identifies whether the ManualFlowControl feature exists on the Ethernet module.

File

plib_eth.h

C

```
bool PLIB_ETH_ExistsManualFlowControl(ETH_MODULE_ID index);
```

Returns

- true - The ManualFlowControl feature is supported on the device
- false - The ManualFlowControl feature is not supported on the device

Description

This function identifies whether the ManualFlowControl feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- PLIB_ETH_ManualFlowControlEnable
- PLIB_ETH_ManualFlowControlDisable
- PLIB_ETH_ManualFlowControlIsEnabled

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ETH_ExistsManualFlowControl(ETH_MODULE_ID index)

PLIB_ETH_ExistsMaxFrameLength Function

Identifies whether the MaxFrameLength feature exists on the Ethernet module.

File

plib_eth.h

C

```
bool PLIB_ETH_ExistsMaxFrameLength(ETH_MODULE_ID index);
```

Returns

- true - The MaxFrameLength feature is supported on the device
- false - The MaxFrameLength feature is not supported on the device

Description

This function identifies whether the MaxFrameLength feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- PLIB_ETH_MaxFrameLengthGet
- PLIB_ETH_MaxFrameLengthSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ETH_ExistsMaxFrameLength(ETH_MODULE_ID index)

PLIB_ETH_ExistsMIIM_Config Function

Identifies whether the MIIM_Config feature exists on the Ethernet module.

File

plib_eth.h

C

```
bool PLIB_ETH_ExistsMIIM_Config(ETH_MODULE_ID index);
```

Returns

- true - The MIIM_Config feature is supported on the device
- false - The MIIM_Config feature is not supported on the device

Description

This function identifies whether the MIIM_Config feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- PLIB_ETH_MIIMResetEnable
- PLIB_ETH_MIIMResetDisable
- PLIB_ETH_MIIMResetIsEnabled
- PLIB_ETH_MIIMClockGet
- PLIB_ETH_MIIMClockSet
- PLIB_ETH_MIIMNoPreEnable
- PLIB_ETH_MIIMNoPreDisable

- PLIB_ETH_MIIMNoPreIsEnabled
- PLIB_ETH_MIIMScanIncrEnable
- PLIB_ETH_MIIMScanIncrDisable
- PLIB_ETH_MIIMScanIncrIsEnabled

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ETH_ExistsMIIM_Config(ETH_MODULE_ID index)

PLIB_ETH_ExistsMIIM_Indicators Function

Identifies whether the MIIM_Indicators feature exists on the Ethernet module.

File

plib_eth.h

C

```
bool PLIB_ETH_ExistsMIIM_Indicators(ETH_MODULE_ID index);
```

Returns

- true - The MIIM_Indicators feature is supported on the device
- false - The MIIM_Indicators feature is not supported on the device

Description

This function identifies whether the MIIM_Indicators feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- PLIB_ETH_LinkHasFailed
- PLIB_ETH_DataNotValid
- PLIB_ETH_MIIMIsScanning
- PLIB_ETH_MIIMIsBusy

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ETH_ExistsMIIM_Indicators(ETH_MODULE_ID index)

PLIB_ETH_ExistsMIIMAddresses Function

Identifies whether the MIIMAddresses feature exists on the Ethernet module.

File

plib_eth.h

C

```
bool PLIB_ETH_ExistsMIIMAddresses(ETH_MODULE_ID index);
```

Returns

- true - The MIIMAddresses feature is supported on the device
- false - The MIIMAddresses feature is not supported on the device

Description

This function identifies whether the MIIMAddresses feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- PLIB_ETH_PHYAddressGet
- PLIB_ETH_PHYAddressSet
- PLIB_ETH_RegisterAddressGet
- PLIB_ETH_RegisterAddressSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ETH_ExistsMIIMAddresses(ETH_MODULE_ID index)

PLIB_ETH_ExistsMIIMReadWrite Function

Identifies whether the MIIMReadWrite feature exists on the Ethernet module.

File

plib_eth.h

C

```
bool PLIB_ETH_ExistsMIIMReadWrite(ETH_MODULE_ID index);
```

Returns

- true - The MIIMReadWrite feature is supported on the device
- false - The MIIMReadWrite feature is not supported on the device

Description

This function identifies whether the MIIMReadWrite feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- PLIB_ETH_MIIMReadStart
- PLIB_ETH_MIIMWriteStart

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ETH_ExistsMIIMReadWrite(ETH_MODULE_ID index)

PLIB_ETH_ExistsMIIMScanMode Function

Identifies whether the MIIMScanMode feature exists on the Ethernet module.

File

plib_eth.h

C

```
bool PLIB_ETH_ExistsMIIMScanMode(ETH_MODULE_ID index);
```

Returns

- true - The MIIMScanMode feature is supported on the device
- false - The MIIMScanMode feature is not supported on the device

Description

This function identifies whether the MIIMScanMode feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- PLIB_ETH_MIIMScanModeEnable
- PLIB_ETH_MIIMScanModeDisable
- PLIB_ETH_MIIMScanModeIsEnabled

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ETH_ExistsMIIMScanMode(ETH_MODULE_ID index)

PLIB_ETH_ExistsMIIWriteReadData Function

Identifies whether the MIIWriteReadData feature exists on the Ethernet module.

File

plib_eth.h

C

```
bool PLIB_ETH_ExistsMIIWriteReadData(ETH_MODULE_ID index);
```

Returns

- true - The MIIWriteReadData feature is supported on the device
- false - The MIIWriteReadData feature is not supported on the device

Description

This function identifies whether the MIIWriteReadData feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- PLIB_ETH_MIIMWriteDataSet
- PLIB_ETH_MIIMReadDataGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ETH_ExistsMIIWriteReadData(ETH_MODULE_ID index)

PLIB_ETH_ExistsPatternMatch Function

Identifies whether the PatternMatch feature exists on the Ethernet module.

File

plib_eth.h

C

```
bool PLIB_ETH_ExistsPatternMatch(ETH_MODULE_ID index);
```

Returns

- true - The PatternMatch feature is supported on the device
- false - The PatternMatch feature is not supported on the device

Description

This function identifies whether the PatternMatch feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- PLIB_ETH_PatternMatchSet
- PLIB_ETH_PatternMatchGet
- PLIB_ETH_PatternMatchChecksumSet
- PLIB_ETH_PatternMatchChecksumGet
- PLIB_ETH_PatternMatchOffsetSet
- PLIB_ETH_PatternMatchOffsetGet
- PLIB_ETH_PatternMatchModeSet
- PLIB_ETH_PatternMatchModeGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ETH_ExistsPatternMatch(ETH_MODULE_ID index)

PLIB_ETH_ExistsPauseTimer Function

Identifies whether the PauseTimer feature exists on the Ethernet module.

File

plib_eth.h

C

```
bool PLIB_ETH_ExistsPauseTimer(ETH_MODULE_ID index);
```

Returns

- true - The PauseTimer feature is supported on the device
- false - The PauseTimer feature is not supported on the device

Description

This function identifies whether the PauseTimer feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- PLIB_ETH_PauseTimerSet
- PLIB_ETH_PauseTimerGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ETH_ExistsPauseTimer(ETH_MODULE_ID index)

PLIB_ETH_ExistsReceiveBufferSize Function

Identifies whether the ReceiveBufferSize feature exists on the Ethernet module.

File

plib_eth.h

C

```
bool PLIB_ETH_ExistsReceiveBufferSize(ETH_MODULE_ID index);
```

Returns

- true - The ReceiveBufferSize feature is supported on the device
- false - The ReceiveBufferSize feature is not supported on the device

Description

This function identifies whether the ReceiveBufferSize feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- PLIB_ETH_ReceiveBufferSizeGet
- PLIB_ETH_ReceiveBufferSizeSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ETH_ExistsReceiveBufferSize(ETH_MODULE_ID index)

PLIB_ETH_ExistsReceiveFilters Function

Identifies whether the ReceiveFilters feature exists on the Ethernet module.

File

plib_eth.h

C

```
bool PLIB_ETH_ExistsReceiveFilters(ETH_MODULE_ID index);
```

Returns

- true - The ReceiveFilters feature is supported on the device
- false - The ReceiveFilters feature is not supported on the device

Description

This function identifies whether the ReceiveFilters feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- PLIB_ETH_ReceiveFilterEnable
- PLIB_ETH_ReceiveFilterDisable
- PLIB_ETH_ReceiveFilterIsEnable

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ETH_ExistsReceiveFilters(ETH_MODULE_ID index)

PLIB_ETH_ExistsReceiveOverflowCount Function

Identifies whether the ReceiveOverflowCount feature exists on the Ethernet module.

File

plib_eth.h

C

```
bool PLIB_ETH_ExistsReceiveOverflowCount(ETH_MODULE_ID index);
```

Returns

- true - The ReceiveOverflowCount feature is supported on the device
- false - The ReceiveOverflowCount feature is not supported on the device

Description

This function identifies whether the ReceiveOverflowCount feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- PLIB_ETH_RxOverflowCountClear
- PLIB_ETH_RxOverflowCountGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ETH_ExistsReceiveOverflowCount(ETH_MODULE_ID index)

PLIB_ETH_ExistsReceiveWmarks Function

Identifies whether the ReceiveWmarks feature exists on the Ethernet module.

File

plib_eth.h

C

```
bool PLIB_ETH_ExistsReceiveWmarks(ETH_MODULE_ID index);
```

Returns

- true - The ReceiveWmarks feature is supported on the device
- false - The ReceiveWmarks feature is not supported on the device

Description

This function identifies whether the ReceiveWmarks feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- PLIB_ETH_RxFullWmarkSet
- PLIB_ETH_RxFullWmarkGet
- PLIB_ETH_RxEmptyWmarkSet
- PLIB_ETH_RxEmptyWmarkGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ETH_ExistsReceiveWmarks(ETH_MODULE_ID index)

PLIB_ETH_ExistsRetransmissionMaximum Function

Identifies whether the RetransmissionMaximum feature exists on the Ethernet module.

File

plib_eth.h

C

```
bool PLIB_ETH_ExistsRetransmissionMaximum(ETH_MODULE_ID index);
```

Returns

- true - The RetransmissionMaximum feature is supported on the device
- false - The RetransmissionMaximum feature is not supported on the device

Description

This function identifies whether the RetransmissionMaximum feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- PLIB_ETH_ReTxMaxGet
- PLIB_ETH_ReTxMaxSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ETH_ExistsRetransmissionMaximum(ETH_MODULE_ID index)

PLIB_ETH_ExistsRMII_Support Function

Identifies whether the RMII_Support feature exists on the Ethernet module.

File

plib_eth.h

C

```
bool PLIB_ETH_ExistsRMII_Support(ETH_MODULE_ID index);
```

Returns

- true - The RMII_Support feature is supported on the device
- false - The RMII_Support feature is not supported on the device

Description

This function identifies whether the RMII_Support feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- PLIB_ETH_RMIIResetEnable
- PLIB_ETH_RMIIResetDisable
- PLIB_ETH_RMIIResetIsEnabled
- PLIB_ETH_RMIISpeedGet
- PLIB_ETH_RMIISpeedSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ETH_ExistsRMII_Support(ETH_MODULE_ID index)

PLIB_ETH_ExistsRxBufferCountDecrement Function

Identifies whether the RxBufferCountDecrement feature exists on the Ethernet module.

File

plib_eth.h

C

```
bool PLIB_ETH_ExistsRxBufferCountDecrement(ETH_MODULE_ID index);
```

Returns

- true - The RxBufferCountDecrement feature is supported on the device
- false - The RxBufferCountDecrement feature is not supported on the device

Description

This function identifies whether the RxBufferCountDecrement feature is available on the Ethernet module. When this function returns true, this function is supported on the device:

- PLIB_ETH_RxBufferCountDecrement

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ETH_ExistsRxBufferCountDecrement(ETH_MODULE_ID index)

PLIB_ETH_ExistsRxEnable Function

Identifies whether the ReceiveEnable feature exists on the Ethernet module.

File

plib_eth.h

C

```
bool PLIB_ETH_ExistsRxEnable(ETH_MODULE_ID index);
```

Returns

- true - The ReceiveEnable feature is supported on the device
- false - The ReceiveEnable feature is not supported on the device

Description

This function identifies whether the ReceiveEnable feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- PLIB_ETH_RxEnable
- PLIB_ETH_RxDisable
- PLIB_ETH_RxIsEnabled

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ETH_ExistsRxEnable(ETH_MODULE_ID index)

PLIB_ETH_ExistsRxPacketDescriptorAddress Function

Identifies whether the RxPacketDescriptorAddress feature exists on the Ethernet module.

File

plib_eth.h

C

```
bool PLIB_ETH_ExistsRxPacketDescriptorAddress(ETH_MODULE_ID index);
```

Returns

- true - The RxPacketDescriptorAddress feature is supported on the device

- false - The RxPacketDescriptorAddress feature is not supported on the device

Description

This function identifies whether the RxPacketDescriptorAddress feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- PLIB_ETH_RxPacketDescAddrSet
- PLIB_ETH_RxPacketDescAddrGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ETH_ExistsRxPacketDescriptorAddress(ETH_MODULE_ID index)

PLIB_ETH_ExistsStationAddress Function

Identifies whether the StationAddress feature exists on the Ethernet module.

File

plib_eth.h

C

```
bool PLIB_ETH_ExistsStationAddress(ETH_MODULE_ID index);
```

Returns

- true - The StationAddress feature is supported on the device
- false - The StationAddress feature is not supported on the device

Description

This function identifies whether the StationAddress feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- PLIB_ETH_StationAddressGet
- PLIB_ETH_StationAddressSet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ETH_ExistsStationAddress(ETH_MODULE_ID index)

PLIB_ETH_ExistsStopInIdle Function

Identifies whether the StopInIdle feature exists on the Ethernet module.

File

plib_eth.h

C

```
bool PLIB_ETH_ExistsStopInIdle(ETH_MODULE_ID index);
```

Returns

- true - The StopInIdle feature is supported on the device
- false - The StopInIdle feature is not supported on the device

Description

This function identifies whether the StopInIdle feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- PLIB_ETH_StopInIdleEnable
- PLIB_ETH_StopInIdleDisable
- PLIB_ETH_StopInIdleIsEnabled

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ETH_ExistsStopInIdle(ETH_MODULE_ID index)

PLIB_ETH_ExistsTransmitRTS Function

Identifies whether the TransmitRTS feature exists on the Ethernet module.

File

plib_eth.h

C

```
bool PLIB_ETH_ExistsTransmitRTS(ETH_MODULE_ID index);
```

Returns

- true - The TransmitRTS feature is supported on the device
- false - The TransmitRTS feature is not supported on the device

Description

This function identifies whether the TransmitRTS feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- PLIB_ETH_TxRTSEnable
- PLIB_ETH_TxRTSDisable
- PLIB_ETH_TxRTSIsEnabled

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ETH_ExistsTransmitRTS(ETH_MODULE_ID index)

PLIB_ETH_ExistsTxPacketDescriptorAddress Function

Identifies whether the TxPacketDescriptorAddress feature exists on the Ethernet module.

File

plib_eth.h

C

```
bool PLIB_ETH_ExistsTxPacketDescriptorAddress(ETH_MODULE_ID index);
```

Returns

- true - The TxPacketDescriptorAddress feature is supported on the device
- false - The TxPacketDescriptorAddress feature is not supported on the device

Description

This function identifies whether the TxPacketDescriptorAddress feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- PLIB_ETH_TxPacketDescAddrSet
- PLIB_ETH_TxPacketDescAddrGet

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Function

PLIB_ETH_ExistsTxPacketDescriptorAddress(ETH_MODULE_ID index)

i) Data Types and Constants

ETH_AUTOPAD_OPTION Enumeration

Lists the possible automatic padding configurations.

File

plib_eth.h

C

```
typedef enum {
  ETH_AUTOPAD_DISABLED_CHECK_CRC,
  ETH_AUTOPAD_TO_60BYTES_ADD_CRC,
  ETH_AUTOPAD_TO_64BYTES_ADD_CRC,
  ETH_AUTOPAD_BY_PKT_TYPE_ADD_CRC
} ETH_AUTOPAD_OPTION;
```

Description

AutoDetectPad Selection

This enumeration lists the possible automatic padding configurations.

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

ETH_INTERRUPT_SOURCES Enumeration

Lists the possible values of ETH_INTERRUPT_SOURCES.

File

plib_eth.h

C

```
typedef enum {
  ETH_TRANSMIT_BVCI_BUS_ERROR_INTERRUPT,
  ETH_RECEIVE_BVCI_BUS_ERROR_INTERRUPT,
  ETH_EMPTY_WATERMARK_INTERRUPT,
  ETH_FULL_WATERMARK_INTERRUPT,
  ETH_RECEIVE_DONE_INTERRUPT,
  ETH_PACKET_PENDING_INTERRUPT,
  ETH_RECEIVE_ACTIVITY_INTERRUPT,
  ETH_TRANSMIT_DONE_INTERRUPT,
  ETH_TRANSMIT_ABORT_INTERRUPT,
  ETH_RECEIVE_BUFFER_NOT_AVAILABLE_INTERRUPT,
  ETH_RECEIVE_FIFO_OVERFLOW_ERROR_INTERRUPT,
  ETH_ALL_INTERRUPT_SOURCES
} ETH_INTERRUPT_SOURCES;
```

Description

ETH Module Interrupt Mask

This enumeration lists the possible values of ETH_INTERRUPT_SOURCES.

Remarks

See also PLIB_ETH_EVENTS in plib_eth_lib.h.

ETH_MIIM_CLK Enumeration

Lists the possible speed selection for the Reduced Media Independent Interface (RMII).

File

plib_eth.h

C

```
typedef enum {
  ETH_MIIM_SYSCLK_DIV_BY_4,
  ETH_MIIM_SYSCLK_DIV_RSVD,
  ETH_MIIM_SYSCLK_DIV_BY_6,
  ETH_MIIM_SYSCLK_DIV_BY_8,
  ETH_MIIM_SYSCLK_DIV_BY_10,
  ETH_MIIM_SYSCLK_DIV_BY_14,
  ETH_MIIM_SYSCLK_DIV_BY_20,
  ETH_MIIM_SYSCLK_DIV_BY_28,
  ETH_MIIM_SYSCLK_DIV_BY_40
} ETH_MIIM_CLK;
```

Description

MII Clock Selection

This enumeration lists the possible speed selection for RMII. The body contains only two states: RMII_10Mbps or RMII_100Mbps.

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

ETH_PATTERN_MATCH_MODE Enumeration

Lists the possible pattern match values.

File

plib_eth.h

C

```
typedef enum _ETH_PATTERN_MATCH_MODE_ {
  ETH_PATTERN_MATCH_DISABLED,
  ETH_PATTERN_MATCH_MODE_CHECKSUM_MATCH,
  ETH_PATTERN_MATCH_MODE_STATION_ADDR,
```

```
  ETH_PATTERN_MATCH_MODE_UNICAST_ADDR,
  ETH_PATTERN_MATCH_MODE_BROADCAST_ADDR,
  ETH_PATTERN_MATCH_MODE_HASH_MATCH,
  ETH_PATTERN_MATCH_MODE_MAGIC_PACKET
} ETH_PATTERN_MATCH_MODE;
```

Members

Members	Description
ETH_PATTERN_MATCH_DISABLED	Pattern Match is disabled; pattern match is always unsuccessful
ETH_PATTERN_MATCH_MODE_CHECKSUM_MATCH	Pattern match if (NOTPM = 1 XOR Pattern Match Checksum matches)
ETH_PATTERN_MATCH_MODE_STATION_ADDR	Pattern match if (NOTPM = 1 XOR Pattern Match Checksum matches) AND (Destination Address = Station Address)
ETH_PATTERN_MATCH_MODE_UNICAST_ADDR	Pattern match if (NOTPM = 1 XOR Pattern Match Checksum matches) AND (Destination Address = Unicast Address)
ETH_PATTERN_MATCH_MODE_BROADCAST_ADDR	Pattern match if (NOTPM = 1 XOR Pattern Match Checksum matches) AND (Destination Address = Broadcast Address)
ETH_PATTERN_MATCH_MODE_HASH_MATCH	Pattern match if (NOTPM = 1 XOR Pattern Match Checksum matches) AND (Hash Table Filter match)
ETH_PATTERN_MATCH_MODE_MAGIC_PACKET	Pattern match if (NOTPM = 1 XOR Pattern Match Checksum matches) AND (Packet = Magic Packet)

Description

Pattern Match Modes

This enumeration lists the pattern match mode values.

Remarks

In all pattern match enabled cases, it is the pattern match inversion XOR pattern match checksum AND .

Some states were omitted from the enumeration since they were duplicates.

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

ETH_RECEIVE_FILTER Enumeration

Lists the possible values of the receive filter.

File

plib_eth.h

C

```
typedef enum {
  ETH_HASH_FILTER,
  ETH_MAGIC_PACKET_FILTER,
  ETH_PATTERN_MATCH_INVERSION,
  ETH_CRC_ERROR_FILTER,
  ETH_CRC_OK_FILTER,
  ETH_RUNT_ERROR_FILTER,
  ETH_RUNT_ENABLE_FILTER,
  ETH_UNICAST_FILTER,
  ETH_NOT_ME_UNICAST_FILTER,
  ETH_MULTICAST_FILTER,
  ETH_BROADCAST_FILTER,
  ETH_ENABLE_ALL_FILTER
} ETH_RECEIVE_FILTER;
```

Members

Members	Description
ETH_HASH_FILTER	Enable: Hash Table Filtering.
ETH_MAGIC_PACKET_FILTER	Enable: Magic Packet Filtering.
ETH_PATTERN_MATCH_INVERSION	Enable: Pattern Match Checksum must not match to be accepted.
ETH_CRC_ERROR_FILTER	Enable: Received packet CRC must be invalid to be accepted.
ETH_CRC_OK_FILTER	Enable: Received packet CRC must be valid to be accepted.
ETH_RUNT_ERROR_FILTER	Enable: Received packet must be runt packet to be accepted.
ETH_RUNT_ENABLE_FILTER	Enable: Received packet must not be a runt packet to be accepted.

ETH_UNICAST_FILTER	Enable: Unicast Packets whose destination address matches the station address are accepted.
ETH_NOT_ME_UNICAST_FILTER	Enable: Unicast Packets whose destination address do NOT match the station address are accepted.
ETH_MULTICAST_FILTER	Enable: Multicast Address Packets are accepted.
ETH_BROADCAST_FILTER	Enable: Broadcast Address Packets are accepted.
ETH_ENABLE_ALL_FILTER	Enable: All of the above packets are accepted.

Description

ETH Module Receive Filter Mask

This enumeration lists the possible values of the receive filter.

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

ETH_RMII_SPEED Enumeration

Lists the possible speed selection for the Reduced Media Independent Interface (RMII).

File

plib_eth.h

C

```
typedef enum {
  ETH_RMII_10Mbps,
  ETH_RMII_100Mps
} ETH_RMII_SPEED;
```

Description

RMII Speed Selection

This enumeration lists the possible speed selection for RMII. The body contains only two states: RMII_10Mbps or RMII_100Mbps.

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

Files

Files

Name	Description
plib_eth.h	Defines the Ethernet Peripheral Library Interface.

Description

This section lists the source and header files used by the library.

plib_eth.h

Defines the Ethernet Peripheral Library Interface.

Enumerations

	Name	Description
	_ETH_PATTERN_MATCH_MODE_	Lists the possible pattern match values.
	ETH_AUTOPAD_OPTION	Lists the possible automatic padding configurations.
	ETH_INTERRUPT_SOURCES	Lists the possible values of ETH_INTERRUPT_SOURCES.
	ETH_MIIM_CLK	Lists the possible speed selection for the Reduced Media Independent Interface (RMII).
	ETH_PATTERN_MATCH_MODE	Lists the possible pattern match values.
	ETH_RECEIVE_FILTER	Lists the possible values of the receive filter.
	ETH_RMII_SPEED	Lists the possible speed selection for the Reduced Media Independent Interface (RMII).

Functions

	Name	Description
	PLIB_ETH_AlignErrorCountClear	Sets the count of Ethernet alignment errors to zero.
	PLIB_ETH_AlignErrorCountGet	Gets the count of Ethernet alignment errors.
	PLIB_ETH_AutoDetectPadClear	Clears the EMAC Auto-Pad option.
	PLIB_ETH_AutoDetectPadGet	Gets the current EMAC Auto-Pad setting.
	PLIB_ETH_AutoDetectPadSet	Sets the EMAC Auto-Pad option.
	PLIB_ETH_AutoFlowControlDisable	Disables the Ethernet module Automatic Flow Control logic.
	PLIB_ETH_AutoFlowControlEnable	Enables the Ethernet Automatic Flow Control logic.
	PLIB_ETH_AutoFlowControlIsEnabled	Gets the Ethernet module Automatic Flow Control status.
	PLIB_ETH_BackPresNoBackoffDisable	Disables EMAC backpressure/no back-off.
	PLIB_ETH_BackPresNoBackoffEnable	Enables EMAC back pressure/no back-off.
	PLIB_ETH_BackPresNoBackoffIsEnabled	Gets the EMAC backpressure/no back-off enable status.
	PLIB_ETH_BackToBackIPGGet	Gets the EMAC back-to-back interpacket gap.
	PLIB_ETH_BackToBackIPGSet	Sets the EMAC back-to-back interpacket gap.
	PLIB_ETH_CollisionWindowGet	Gets the EMAC collision window.
	PLIB_ETH_CollisionWindowSet	Sets the EMAC collision window.
	PLIB_ETH_CRCDisable	Disables EMAC CRC.
	PLIB_ETH_CRCEnable	Enables EMAC CRC.
	PLIB_ETH_CRCIsEnabled	Gets the EMAC CRC enable status.
	PLIB_ETH_DataNotValid	Gets the MII management read data not valid status.
	PLIB_ETH_DelayedCRCDisable	Disables EMAC delayed CRC.
	PLIB_ETH_DelayedCRCEnable	Enables EMAC delayed CRC.
	PLIB_ETH_DelayedCRCIsEnabled	Gets the EMAC delayed CRC enable status.
	PLIB_ETH_Disable	Disables the Ethernet module.
	PLIB_ETH_Enable	Enables the Ethernet module.
	PLIB_ETH_EthernetIsBusy	Gets the status value of the Ethernet logic busy.
	PLIB_ETH_ExcessDeferDisable	Disables EMAC excess defer.
	PLIB_ETH_ExcessDeferEnable	Enables EMAC excess defer.
	PLIB_ETH_ExcessDeferIsEnabled	Gets the EMAC excess defer enable status.
	PLIB_ETH_ExistsAlignmentErrorCount	Identifies whether the AlignmentErrorCount feature exists on the Ethernet module.
	PLIB_ETH_ExistsAutoFlowControl	Identifies whether the AutoFlowControl feature exists on the Ethernet module.
	PLIB_ETH_ExistsCollisionCounts	Identifies whether the CollisionCounts feature exists on the Ethernet module.
	PLIB_ETH_ExistsCollisionWindow	Identifies whether the CollisionWindow feature exists on the Ethernet module.
	PLIB_ETH_ExistsEnable	Identifies whether the Enable feature exists on the Ethernet module.
	PLIB_ETH_ExistsEthernetControllerStatus	Identifies whether the EthernetControllerStatus feature exists on the Ethernet module.
	PLIB_ETH_ExistsFCSErrorCount	Identifies whether the FCSErrorCount feature exists on the Ethernet module.
	PLIB_ETH_ExistsFramesTransmittedOK	Identifies whether the FramesTransmittedOK feature exists on the Ethernet module.
	PLIB_ETH_ExistsFramexReceivedOK	Identifies whether the FramexReceivedOK feature exists on the Ethernet module.
	PLIB_ETH_ExistsHashTable	Identifies whether the HashTable feature exists on the Ethernet module.
	PLIB_ETH_ExistsInterPacketGaps	Identifies whether the InterPacketGaps feature exists on the Ethernet module.
	PLIB_ETH_ExistsInterrupt	Identifies whether the Interrupt feature exists on the Ethernet module.
	PLIB_ETH_ExistsMAC_Configuration	Identifies whether the MAC_Configuration feature exists on the Ethernet module.
	PLIB_ETH_ExistsMAC_Resets	Identifies whether the MAC_Resets feature exists on the Ethernet module.
	PLIB_ETH_ExistsMAC_Testing	Identifies whether the MAC_Testing feature exists on the Ethernet module.
	PLIB_ETH_ExistsManualFlowControl	Identifies whether the ManualFlowControl feature exists on the Ethernet module.
	PLIB_ETH_ExistsMaxFrameLength	Identifies whether the MaxFrameLength feature exists on the Ethernet module.
	PLIB_ETH_ExistsMIIM_Config	Identifies whether the MIIM_Config feature exists on the Ethernet module.
	PLIB_ETH_ExistsMIIM_Indicators	Identifies whether the MIIM_Indicators feature exists on the Ethernet module.
	PLIB_ETH_ExistsMIIMAddresses	Identifies whether the MIIMAddresses feature exists on the Ethernet module.
	PLIB_ETH_ExistsMIIMReadWrite	Identifies whether the MIIMReadWrite feature exists on the Ethernet module.
	PLIB_ETH_ExistsMIIMScanMode	Identifies whether the MIIMScanMode feature exists on the Ethernet module.
	PLIB_ETH_ExistsMIIWriteReadData	Identifies whether the MIIWriteReadData feature exists on the Ethernet module.

	PLIB_ETH_ExistsPatternMatch	Identifies whether the PatternMatch feature exists on the Ethernet module.
	PLIB_ETH_ExistsPauseTimer	Identifies whether the PauseTimer feature exists on the Ethernet module.
	PLIB_ETH_ExistsReceiveBufferSize	Identifies whether the ReceiveBufferSize feature exists on the Ethernet module.
	PLIB_ETH_ExistsReceiveFilters	Identifies whether the ReceiveFilters feature exists on the Ethernet module.
	PLIB_ETH_ExistsReceiveOverflowCount	Identifies whether the ReceiveOverflowCount feature exists on the Ethernet module.
	PLIB_ETH_ExistsReceiveWmarks	Identifies whether the ReceiveWmarks feature exists on the Ethernet module.
	PLIB_ETH_ExistsRetransmissionMaximum	Identifies whether the RetransmissionMaximum feature exists on the Ethernet module.
	PLIB_ETH_ExistsRMII_Support	Identifies whether the RMII_Support feature exists on the Ethernet module.
	PLIB_ETH_ExistsRxBufferCountDecrement	Identifies whether the RxBufferCountDecrement feature exists on the Ethernet module.
	PLIB_ETH_ExistsRxEnable	Identifies whether the ReceiveEnable feature exists on the Ethernet module.
	PLIB_ETH_ExistsRxPacketDescriptorAddress	Identifies whether the RxPacketDescriptorAddress feature exists on the Ethernet module.
	PLIB_ETH_ExistsStationAddress	Identifies whether the StationAddress feature exists on the Ethernet module.
	PLIB_ETH_ExistsStopInIdle	Identifies whether the StopInIdle feature exists on the Ethernet module.
	PLIB_ETH_ExistsTransmitRTS	Identifies whether the TransmitRTS feature exists on the Ethernet module.
	PLIB_ETH_ExistsTxPacketDescriptorAddress	Identifies whether the TxPacketDescriptorAddress feature exists on the Ethernet module.
	PLIB_ETH_FCSErrorCountClear	Sets the value of the Ethernet frame check sequence error to zero.
	PLIB_ETH_FCSErrorCountGet	Gets the count of the frame check sequence error.
	PLIB_ETH_FrameLengthCheckDisable	Disables the EMAC frame length check.
	PLIB_ETH_FrameLengthCheckEnable	Enables the EMAC frame length check.
	PLIB_ETH_FrameLengthCheckIsEnabled	Gets the EMAC frame length check status.
	PLIB_ETH_FramesRxdOkCountClear	Sets the value of the Ethernet received frames 'OK' count to zero.
	PLIB_ETH_FramesRxdOkCountGet	Gets the count of the frames frames received successfully.
	PLIB_ETH_FramesTxdOkCountClear	Sets the count of Ethernet Control frames transmitted to zero.
	PLIB_ETH_FramesTxdOkCountGet	Gets the count of Ethernet Control Frames transmitted successfully.
	PLIB_ETH_FullDuplexDisable	Disables the EMAC full duplex operation.
	PLIB_ETH_FullDuplexEnable	Enables the EMAC full duplex operation.
	PLIB_ETH_FullDuplexIsEnabled	Gets the EMAC full duplex enable status.
	PLIB_ETH_HashTableGet	Gets the value of the Hash table.
	PLIB_ETH_HashTableSet	Sets the Ethernet module Hash table with the new value.
	PLIB_ETH_HugeFrameDisable	Disables the EMAC from receiving huge frames.
	PLIB_ETH_HugeFrameEnable	Enables the EMAC to receive huge frames.
	PLIB_ETH_HugeFrameIsEnabled	Gets the EMAC huge frame enable status.
	PLIB_ETH_InterruptClear	Clears the Ethernet module interrupt source status as a group, using a mask.
	PLIB_ETH_InterruptSet	Sets the Ethernet module interrupt source status as a group, using a mask.
	PLIB_ETH_InterruptsGet	Gets the Ethernet module Interrupt Flag register as a group.
	PLIB_ETH_InterruptSourceDisable	Clears the Ethernet module Interrupt Enable register as a group, using a mask.
	PLIB_ETH_InterruptSourceEnable	Sets the Ethernet module Interrupt Enable register in a group, using a mask.
	PLIB_ETH_InterruptSourceIsEnabled	Gets the Ethernet module Interrupt Enable register singularly or as a group.
	PLIB_ETH_InterruptSourcesGet	Returns the entire interrupt enable register.
	PLIB_ETH_InterruptStatusGet	Gets the Ethernet module Interrupt Flag register as a group, using a mask.
	PLIB_ETH_IsEnabled	Gets the Ethernet module enable status.
	PLIB_ETH_LinkHasFailed	Gets the MII management link fail status.
	PLIB_ETH_LongPreambleDisable	Disables EMAC long preamble enforcement.
	PLIB_ETH_LongPreambleEnable	Enables EMAC long preamble enforcement.
	PLIB_ETH_LongPreambleIsEnabled	Gets the EMAC long preamble enforcement enable status.
	PLIB_ETH_LoopbackDisable	Disables the EMAC loopback logic.
	PLIB_ETH_LoopbackEnable	Enables the EMAC loopback logic.
	PLIB_ETH_LoopbackIsEnabled	Gets the EMAC Loopback interface enable status.
	PLIB_ETH_ManualFlowControlDisable	Disable Ethernet module Manual Flow Control logic.
	PLIB_ETH_ManualFlowControlEnable	Enables the Ethernet Manual Flow Control logic.
	PLIB_ETH_ManualFlowControlIsEnabled	Gets the Ethernet module Manual Flow Control enable status.
	PLIB_ETH_MaxFrameLengthGet	Gets the EMAC maximum frame length.

	PLIB_ETH_MaxFrameLengthSet	Sets the EMAC maximum frame length.
	PLIB_ETH_MCSRxResetDisable	Disables the reset EMAC Control Sub-layer/Receive domain logic.
	PLIB_ETH_MCSRxResetEnable	Enables the reset EMAC Control Sub-layer/Receive domain logic.
	PLIB_ETH_MCSRxResetIsEnabled	Gets the EMAC Control Sub-layer/Receive domain logic reset status.
	PLIB_ETH_MCSTxResetDisable	Disables the reset EMAC Control Sub-layer/Transmit domain logic.
	PLIB_ETH_MCSTxResetEnable	Enables the reset of EMAC Control Sub-layer/Transmit domain logic.
	PLIB_ETH_MCSTxResetIsEnabled	Gets the EMAC Control Sub-layer/Transmit domain logic reset status.
	PLIB_ETH_MIIMClockGet	Gets the current EMAC MIIM clock selection.
	PLIB_ETH_MIIMClockSet	Sets the EMAC MIM clock selection.
	PLIB_ETH_MIIMIsBusy	Gets the MII management busy status.
	PLIB_ETH_MIIMIsScanning	Gets the MII Management scanning status.
	PLIB_ETH_MIIMNoPreDisable	Disables EMAC No Preamble (allows preamble).
	PLIB_ETH_MIIMNoPreEnable	Enables EMAC MIIM No Preamble (suppresses preamble).
	PLIB_ETH_MIIMNoPreIsEnabled	Gets the EMAC MIIM No Preamble enable status.
	PLIB_ETH_MIIMReadDataGet	Gets EMAC MIIM management read data after a MII read cycle has completed.
	PLIB_ETH_MIIMReadStart	Initiates an MII management read command.
	PLIB_ETH_MIIMResetDisable	Disables EMAC Reset MII Management.
	PLIB_ETH_MIIMResetEnable	Enables EMAC Reset Media Independent Interface (MII) Management.
	PLIB_ETH_MIIMResetIsEnabled	Gets the EMAC Reset MII Management enable status.
	PLIB_ETH_MIIMScanIncrDisable	Disables the EMAC MIIM Scan Increment.
	PLIB_ETH_MIIMScanIncrEnable	Enables EMAC MIIM Scan Increment.
	PLIB_ETH_MIIMScanIncrIsEnabled	Gets the EMAC MIIM scan increment enable status.
	PLIB_ETH_MIIMScanModeDisable	Disables MIIM scan mode.
	PLIB_ETH_MIIMScanModeEnable	Enables MIIM scan mode.
	PLIB_ETH_MIIMScanModeIsEnabled	Gets the MII management scan enable status.
	PLIB_ETH_MIIMWriteDataSet	Sets the EMAC MIIM write data before initiating an MII write cycle.
	PLIB_ETH_MIIMWriteStart	Initiates an MII management write command.
	PLIB_ETH_MIIResetDisable	Disables the EMAC Soft reset.
	PLIB_ETH_MIIResetEnable	Enables the EMAC MIIM Soft reset.
	PLIB_ETH_MIIResetIsEnabled	Gets EMAC MIIM Soft Reset enable status.
	PLIB_ETH_MultipleCollisionCountClear	Sets the value of the Ethernet multiple collision frame count to zero.
	PLIB_ETH_MultipleCollisionCountGet	Gets the count of the frames transmitted successfully after there was more than one collision.
	PLIB_ETH_NoBackoffDisable	Disables EMAC no back-offs.
	PLIB_ETH_NoBackoffEnable	Enables EMAC no back-off.
	PLIB_ETH_NoBackoffIsEnabled	Gets the EMAC no back-off enable status.
	PLIB_ETH_NonBackToBackIPG1Get	Gets the EMAC non-back-to-back interpacket gap register 1.
	PLIB_ETH_NonBackToBackIPG1Set	Sets the EMAC non-back-to-back interpacket gap register 1.
	PLIB_ETH_NonBackToBackIPG2Get	Gets the EMAC non-back-to-back interpacket gap register 2.
	PLIB_ETH_NonBackToBackIPG2Set	Sets the EMAC non-back-to-back interpacket gap register 2.
	PLIB_ETH_PassAllDisable	Disables the EMAC PassAll.
	PLIB_ETH_PassAllEnable	Enables the EMAC PassAll.
	PLIB_ETH_PassAllIsEnabled	Gets the EMAC PassAll enable status.
	PLIB_ETH_PatternMatchChecksumGet	Gets the value of the pattern match checksum register.
	PLIB_ETH_PatternMatchChecksumSet	Sets the Ethernet module pattern match checksum register with the new value.
	PLIB_ETH_PatternMatchGet	Gets the value of the selected pattern match mask register.
	PLIB_ETH_PatternMatchModeGet	Gets the value of the selected pattern match mask register.
	PLIB_ETH_PatternMatchModeSet	Sets the Ethernet module pattern match mode.
	PLIB_ETH_PatternMatchOffsetGet	Gets the value of the patter match offset register.
	PLIB_ETH_PatternMatchOffsetSet	Sets the Ethernet module patter match offset register with the new value.
	PLIB_ETH_PatternMatchSet	Sets the Ethernet module pattern match mask register with the new value.
	PLIB_ETH_PauseTimerGet	Gets the Pause Timer value used for flow control.
	PLIB_ETH_PauseTimerSet	Sets the Pause Timer value used for flow control.
	PLIB_ETH_PHYAddressGet	Gets the EMAC MIIM management PHY address.
	PLIB_ETH_PHYAddressSet	Sets the EMAC MIIM PHY address.

	PLIB_ETH_PurePreambleDisable	Disables EMAC pure preamble enforcement.
	PLIB_ETH_PurePreambleEnable	Enables EMAC pure preamble enforcement.
	PLIB_ETH_PurePreambleIsEnabled	Gets EMAC pure preamble enforcement enable status.
	PLIB_ETH_ReceiveBufferSizeGet	Gets the Ethernet module receive buffer size.
	PLIB_ETH_ReceiveBufferSizeSet	Sets the Ethernet module receive buffer size.
	PLIB_ETH_ReceiveDisable	Disables the EMAC from receiving frames.
	PLIB_ETH_ReceiveEnable	Enables the EMAC to receive the frames.
	PLIB_ETH_ReceiveFilterDisable	Disables the specified receive filter.
	PLIB_ETH_ReceiveFilterEnable	Enables the specified receive filter.
	PLIB_ETH_ReceiveFilterIsEnable	Disables the specified receive filter.
	PLIB_ETH_ReceiveIsBusy	Gets the Ethernet receive logic busy status.
	PLIB_ETH_ReceiveIsEnabled	Gets the Ethernet EMAC receive enable status.
	PLIB_ETH_RegisterAddressGet	Gets the EMAC MIIM management register address.
	PLIB_ETH_RegisterAddressSet	Sets EMAC MIIM register address.
	PLIB_ETH_ReTxMaxGet	Gets the EMAC maximum retransmissions.
	PLIB_ETH_ReTxMaxSet	Sets the EMAC maximum retransmissions.
	PLIB_ETH_RMIIResetDisable	Disables EMAC Reset RMII.
	PLIB_ETH_RMIIResetEnable	Enables EMAC Reset RMII.
	PLIB_ETH_RMIIResetIsEnabled	Gets the EMAC Reset RMII enable status.
	PLIB_ETH_RMIISpeedGet	Gets the current EMAC RMII speed.
	PLIB_ETH_RMIISpeedSet	Sets EMAC RMII Speed.
	PLIB_ETH_RxBufferCountDecrement	Causes the Receive Descriptor Buffer Counter to decrement by 1.
	PLIB_ETH_RxDisable	Disables the Ethernet module receive logic.
	PLIB_ETH_RxEmptyWmarkGet	Gets the Ethernet module receive empty watermark.
	PLIB_ETH_RxEmptyWmarkSet	Sets the Ethernet module receive empty water mark.
	PLIB_ETH_RxEnable	Enables the Ethernet receive logic.
	PLIB_ETH_RxFullWmarkGet	Gets the Ethernet module to receive a full watermark.
	PLIB_ETH_RxFullWmarkSet	Sets the Ethernet module to receive a full watermark.
	PLIB_ETH_RxFuncResetDisable	Disables the EMAC reset receive function logic.
	PLIB_ETH_RxFuncResetEnable	Enables the EMAC reset receive function logic.
	PLIB_ETH_RxFuncResetIsEnabled	Gets the EMAC reset receive function status.
	PLIB_ETH_RxIsEnabled	Gets the Ethernet module receive enable status.
	PLIB_ETH_RxOverflowCountClear	Sets the value of the Ethernet receive overflow count to zero.
	PLIB_ETH_RxOverflowCountGet	Gets the count of the dropped Ethernet receive frames.
	PLIB_ETH_RxPacketCountGet	Gets the value of the receive packet buffer count.
	PLIB_ETH_RxPacketDescAddrGet	Gets the address of the next receive descriptor.
	PLIB_ETH_RxPacketDescAddrSet	Sets the Ethernet module receive packet descriptor start address.
	PLIB_ETH_RxPauseDisable	Disables the EMAC receive flow control.
	PLIB_ETH_RxPauseEnable	Enables the EMAC receive flow control.
	PLIB_ETH_RxPauseIsEnabled	Gets the EMAC receive flow pause enable status.
	PLIB_ETH_ShortcutQuantaDisable	Disables EMAC shortcut pause quanta.
	PLIB_ETH_ShortcutQuantaEnable	Enables EMAC shortcut pause quanta.
	PLIB_ETH_ShortcutQuantaIsEnabled	Gets EMAC shortcut pause quanta enable status.
	PLIB_ETH_SimResetDisable	Disables the EMAC simulation reset.
	PLIB_ETH_SimResetEnable	Enables the EMAC simulation reset.
	PLIB_ETH_SimResetIsEnabled	Gets the EMAC simulation reset status.
	PLIB_ETH_SingleCollisionCountClear	Sets the value of the Ethernet single collision frame count to zero.
	PLIB_ETH_SingleCollisionCountGet	Gets the count of the frames transmitted successfully on a second attempt.
	PLIB_ETH_StationAddressGet	Gets the selected EMAC station address.
	PLIB_ETH_StationAddressSet	Sets the selected EMAC Station Address.
	PLIB_ETH_StopInIdleDisable	Ethernet module operation will continue when the device enters Idle mode.
	PLIB_ETH_StopInIdleEnable	Ethernet module operation will stop when the device enters Idle mode.
	PLIB_ETH_StopInIdleIsEnabled	Gets the Ethernet module Stop in Idle mode enable status.
	PLIB_ETH_TestBackPressDisable	Disables EMAC Test backpressure.
	PLIB_ETH_TestBackPressEnable	Enables EMAC Test backpressure.

	PLIB_ETH_TestBackPressIsEnabled	Gets the EMAC test backpressure enable status.
	PLIB_ETH_TestPauseDisable	Disables EMAC test pause.
	PLIB_ETH_TestPauseEnable	Enables EMAC test pause.
	PLIB_ETH_TestPauseIsEnabled	Gets the EMAC test pause enable status.
	PLIB_ETH_TransmitIsBusy	Gets the status value of the Ethernet transmit logic busy status
	PLIB_ETH_TxFuncResetDisable	Disables the EMAC Transmit function reset.
	PLIB_ETH_TxFuncResetEnable	Enables the EMAC transmit function reset.
	PLIB_ETH_TxFuncResetIsEnabled	Gets the EMAC Transmit function reset status.
	PLIB_ETH_TxPacketDescAddrGet	Gets the address of the next descriptor to be transmitted.
	PLIB_ETH_TxPacketDescAddrSet	Sets the Ethernet module transmit packet descriptor start address.
	PLIB_ETH_TxPauseDisable	Disables the transmission of Pause frames.
	PLIB_ETH_TxPauseEnable	Enables the transmission Pause frames.
	PLIB_ETH_TxPauseIsEnabled	Gets the Ethernet module enable status.
	PLIB_ETH_TxRTSDisable	Aborts an Ethernet module transmission.
	PLIB_ETH_TxRTSEnable	Enables the Ethernet transmit request to send.
	PLIB_ETH_TxRTSIsEnabled	Gets the Ethernet module transmit request to send status.

Description

Ethernet Peripheral Library Interface Header

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the Ethernet Peripheral Library for Microchip microcontrollers. The definitions in this file are for the Ethernet module.

File Name

plib_eth.h

Company

Microchip Technology Inc.

GLCD Controller Peripheral Library

This section describes the GLCD Controller (GLCD Controller) Peripheral Library.

Introduction

This library provides a low-level abstraction of the GLCD Controller Peripheral Library that is available on the Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, there by abstracting differences from one microcontroller variant to another.

Description

The primary function of the Graphics LCD (GLCD) controller is to directly interface with display glasses and to control pixels on a screen. The GLCD controller transfers display data from a memory device and formats it for a display device. It also provides accelerated on-the-fly rendering of vertical and horizontal lines, rectangles, and copying of a rectangular area between different locations on the screen.

After initialization, the GLCD controller will perform rendering through DMA, thereby off-loading the CPU.

The GLCD controller can support three rendering layers. Each layer supports the configurable stride and alpha blending feature. Each layer supports different input pixel formats such as RGBA8888, ARGB8888, RGB888, RGB565, RGBA5551, YUYV, RGB232, LUT8 and grayscale. These layers can be combined together into a single layer with a configurable output format. The output format can be RGB888, RGB666, RGB323, YUYV, Serial 3-beat (RGB), Serial 4-beat (RGBA), Two-phase 12-bit mode, and BT656. For the LUT8 input format, the Look-up Table (LUT) resides within the device and is configurable.

The device supports a programmable cursor and the cursor data can be set in the device memory. The polarity of signals HSYNC, VSYNC, DE, and PCLK is configurable.

Using the Library

This topic describes the basic architecture of the GLCD Controller Peripheral Library and provides information and examples on its use.

Description

Interface Header File: `plib_glcd.h`

The interface to the GLCD Controller Peripheral Library is defined in the `plib_glcd.h` header file, which is included by the peripheral library header file, `peripheral.h`. Any C language source (`.c`) file that uses the GLCD Controller Peripheral Library must include `peripheral.h`.

Library File:

The GLCD Controller Peripheral Library archive (`.a`) file is installed with MPLAB Harmony.

Please refer to the What is MPLAB Harmony? section for how the library interacts with the framework.

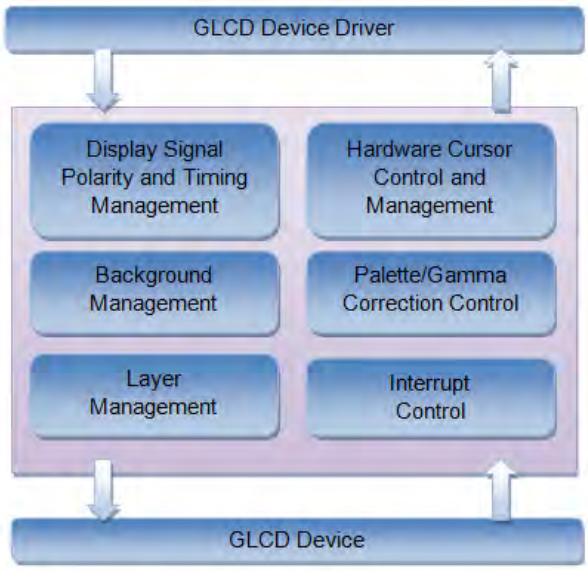
Hardware Abstraction Model

This library provides the low-level abstraction of the GLCD Controller module on the Microchip family of microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in the software and introduces the library interface.

Description

The GLCD Peripheral Library software is depicted by the following block diagram:

GLCD Controller Software Abstraction Block Diagram



Library Overview

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the Deadman Timer module.

Library Interface Section	Description
General Configuration Functions	Functions that enable/disable the GLCD and set the RGB Sequential mode.
Display Signal Polarity and Timing Management Functions	Functions that handles polarity and timing of display signals such as VSYNC, HSYNC, DE, and PCLK.
Background Management Functions	Functions that handle setting the background color.
Layer Management	Functions that manage layer configuration and overlay.
Hardware Cursor Control and Management Functions	Functions that handle cursor data settings and cursor drawing position control.
Palette and Gamma Correction Control Functions	Functions that control hardware color palette/gamma table data settings.
Interrupt Control Functions	Functions that control device interrupt settings.
Miscellaneous Control Functions	Functions that control miscellaneous GLCD features.
Feature Existence Functions	Functions that determine existence of certain features.

How the Library Works

This section provides information on how the GLCD Controller Peripheral Library works.

General Configuration

Provides general configuration information.

Description

General configuration of the GLCD Controller includes enabling and disabling the GLCD module globally.

Enable/Disable GLCD

Enabling and disabling the GLCD are the basic routines that may be called during initialization and exit routines of the application.

Example:

```
// Enable the GLCD controller
PLIB_GLCD_Enable ( GLCD_ID_0 );
// Disable the GLCD
PLIB_GLCD_Disable ( GLCD_ID_0 );
// Check the enable status of the GLCD controller.
```

```
if(PLIB_GLCD_IsEnabled( GLCD_ID_0 ))
{
// application code
}
```

GLCD RGB Sequential Mode Set

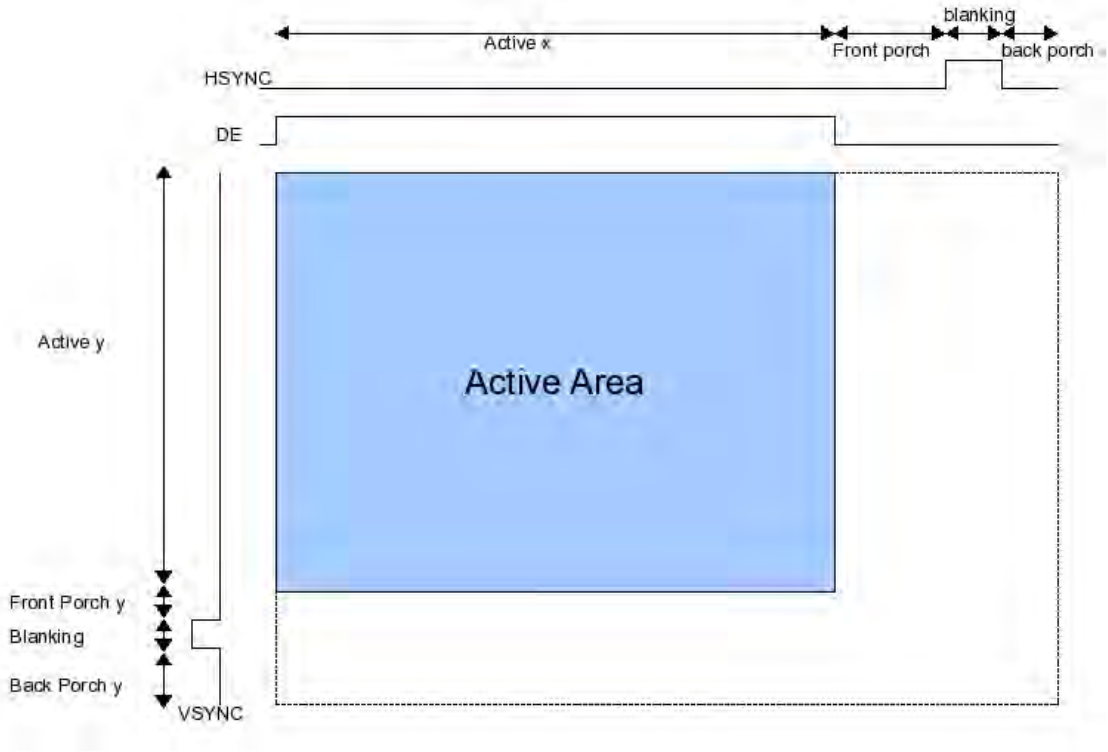
The GLCD RGB Sequential mode controls the GLCD output pins. The function used to set the RGB sequential mode is PLIB_GLCD_RGBSequentialModeSet. This basic function may be called during initialization and exit routines of the application.

Display Signal Polarity and Timing Management

Provides information on display signal polarity.

Description

A GLCD controller peripheral is connected the display using the following pins: HSYNC, VSYNC, GCLK, GEN and GD<23:0>. The HSYNC, VSYNC, GCLK and GEN polarity can be set using the PLIB_GLCD_SignalPolaritySet function. The signal polarity can be either positive or negative based on the display requirements. The GLCD source clock and pixel clock frequency can be controlled using the PLIB_GLCD_FormattingClockDivideEnable and PLIB_GLCD_ClockDividerSet functions. The timing of the signals, HSYNC, VSYNC, and GEN, is based on the display requirements and can be programmed to suit different display resolutions. The functions used to modify the HSYNC, VSYNC and GEN timing parameters are PLIB_GLCD_ResolutionXYSet, PLIB_GLCD_BlankingXYSet PLIB_GLCD_FrontPorchXYSet, and PLIB_GLCD_BackPorchXYSet.

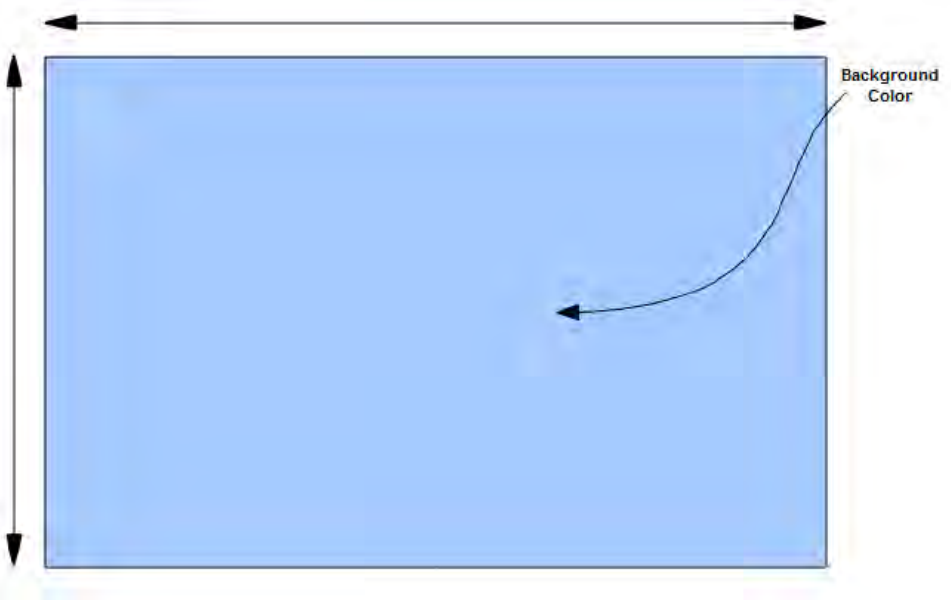


Display Background Management

Provides information on display background management.

Description

The GLCD Controller supports three layers and a background layer. A background layer is a basic layer that can be filled with one color of format RGBA8888 using the PLIB_GLCD_BackgroundColorSet function. The other layers will be applied on top of the background layer with a requested blending mode.

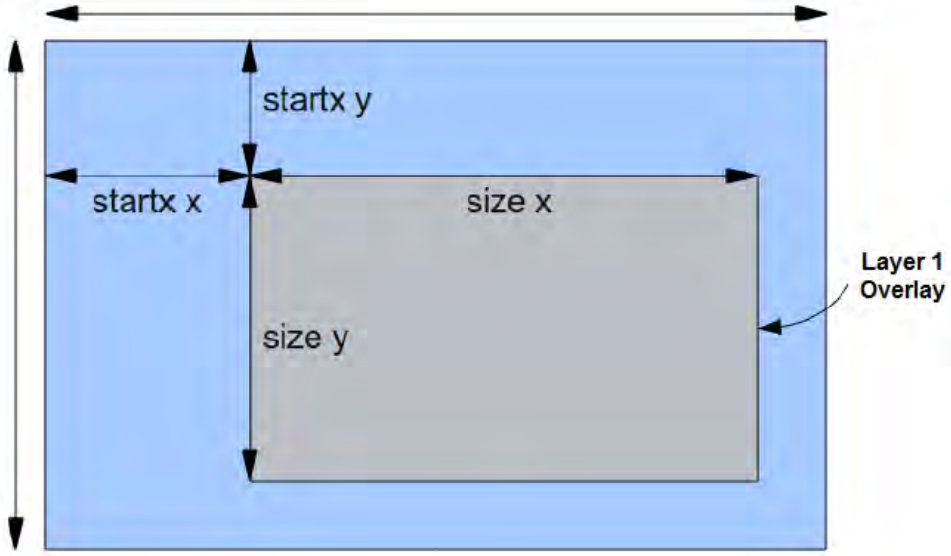


Layer Management

Provides information on layer management.

Description

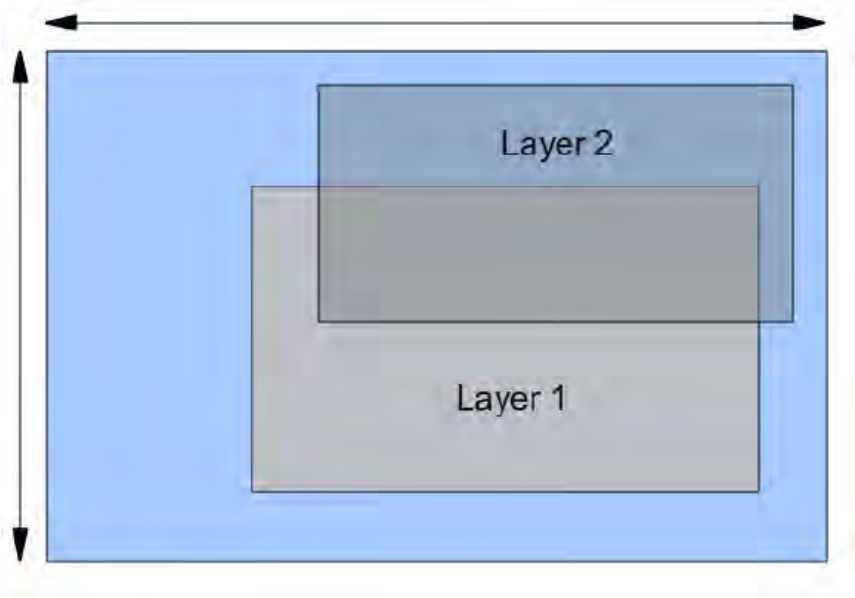
The GLCD Controller supports three drawing layers. Each layer can be enabled or disabled using the PLIB_GLCD_LayerEnable or PLIB_GLCD_LayerDisable functions, respectively. Each layer's start location, start (x, y), can be set using the PLIB_GLCD_LayerStartXYSet function and the size, size(x, y), can be set using the PLIB_GLCD_LayerSizeXYSet function.



Layer resolution and stride can be set using the PLIB_GLCD_LayerResXYSet and PLIB_GLCD_LayerStrideSet functions, respectively. A bi-linear filter can be applied to each layer using the PLIB_GLCD_LayerBilinearFilterEnable function.

Each layer supports different color formats and the color format can be set using the PLIB_GLCD_LayerColorModeSet function. Each Layer can have a different global alpha value, which can be set using the PLIB_GLCD_LayerGlobalAlphaSet function. Each Layer alpha can be premultiplied by global alpha using the PLIB_GLCD_LayerPreMultiplyImageAlphaEnable function; otherwise, the PLIB_GLCD_LayerPreMultiplyImageAlphaDisable function is used. To force global alpha value as the layer alpha the PLIB_GLCD_LayerForceWithGlobalAlphaEnable function is called; otherwise, the PLIB_GLCD_LayerForceWithGlobalAlphaDisble function is called.

The next layer is overlayed on a previous layer. Two layers can be blended based on source and destination layer blending functions. The source and destination blending functions can be set using the PLIB_GLCD_LayerSrcBlendFuncSet and PLIB_GLCD_LayerDestBlendFuncSet functions, respectively. The layer overlay and blending is not restricted by the layer color format. Two layers with a different color format can be blended together.



With the exception of the background layer, the other three layers have no memory space allocated on its own into GLCD device. The application must allocate GLCD accessible memory into the controller RAM and pass the address of the allocated memory to the GLCD. The address of the allocated memory for the layer can be set into the GLCD using the PLIB_GLCD_LayerBaseAddressSet function.

Hardware Cursor Control and Management

Provides information on hardware cursor control and management.

Description

The GLCD Controller supports a fully programmable 32 x 32 16-color hardware cursor. The cursor can be enabled or disabled using the PLIB_GLCD_CursorEnable or PLIB_GLCD_CursorDisbale functions, respectively.

The position of the cursor is set using the PLIB_GLCD_CursorXYSet function. Each pixel value of the cursor bitmap is represented by 4 bits. The first 32-bit word contains 8 pixels of the cursor bitmap data starting from pixel position (0, 7) to pixel (0, 0). The remainder of the cursor bitmap data continues similarly to the first 32-bit word. The complete cursor bitmap data is represented by 128 x 32 bit words.

This cursor data is set using the PLIB_GLCD_CursorDataSet function. The 4-bit value representing the pixel in the cursor bitmap data is used as the index of the cursor Color Look-up Table (CLUT). The cursor CLUT is set using the PLIB_GLCD_CursorLUTSet function. The color format of the cursor CLUT is XRGB, where 'X' = unimplemented. The size of cursor CLUT is 16 colors.

Palette and Gamma Correction Control

Provides information on palette/gamma correction control.

Description

For a layer with a source format set to 8-bit color palette look-up table (LUT8), the global CLUT can be set in the GLCD using the PLIB_GLCD_GlobalColorLUTSet function. The format of each color in the CLUT is XRGB8888, where 'X' = unimplemented. The size of the CLUT is 256 colors. The same global CLUT is used to map RGB values to new RGB values for the purpose of gamma correction. The PLIB_GLCD_PaletteGammaRampEnable or PLIB_GLCD_PaletteGammaRampDisable function can be used to enable or disable the Palette/Gamma correction feature.

Interrupt Control

Provides information interrupt control

Description

The GLCD Controller can trigger an interrupt on HSYNC and VSYNC. To enable or disable interrupt on HSYNC the PLIB_GLCD_HSyncInterruptEnable or PLIB_GLCD_HSyncInterruptDisable functions is used, respectively. To enable or disable interrupt on VSYNC the PLIB_GLCD_VSyncInterruptEnable or PLIB_GLCD_VSyncInterruptDisable function is used, respectively. The interrupt trigger can be set to either level or edge triggered using the PLIB_GLCD_IRQTriggerControlSet function.

Miscellaneous Control

Provides information on miscellaneous control features.

Description

The other GLCD feature controls that were not covered in the previous sections are: dithering, VSYNC for single cycle per line, force output blank, and YUV output.

The dithering feature can be enabled or disabled using the PLIB_GLCD_DitheringEnable or PLIB_GLCD_DitheringDisable functions, respectively.

VSYNC for single cycle per line is enabled or disabled using the PLIB_GLCD_SingleCyclePerLineVsyncEnable or PLIB_GLCD_SingleCyclePerLineVsyncDisable functions, respectively.

The forcing of GLCD output to blank is enabled or disabled using the PLIB_GLCD_ForceOutputBlankEnable or PLIB_GLCD_ForceOutputBlankDisable functions, respectively.

If the GLCD RGB Sequential mode is set to YUYU or BT656 format, the function, PLIB_GLCD_YUVOutputEnable, must be called; otherwise, the PLIB_GLCD_YUVOutputDisable function must be called.

The GLCD Peripheral Library also provides access to various GLCD status flags. To verify if the last row is currently displayed, the function, PLIB_GLCD_IsLastRowm is called. To determine the signal level of DE, HSYNC and VSYNC, the functions, PLIB_GLCD_DESignalLevelGet, PLIB_GLCD_HSyncSignalLevelGet, and PLIB_GLCD_VSyncSignalLevelGet are called, respectively. To know whether GLCD is in active vertical blanking state the PLIB_GLCD_IsVerticalBlankingActive function is called.

Configuring the Library

The library is configured for the supported GLCD Controller module when the processor is chosen in the MPLAB X IDE.

Library Interface

a) General Configuration Functions

	Name	Description
	PLIB_GLCD_Disable	Disables the Graphics LCD Controller.
	PLIB_GLCD_Enable	Enables the Graphics LCD Controller.
	PLIB_GLCD_RGBSequentialModeSet	Sets the RGB output sequential mode.

b) Display Signal Polarity and Timing Management Functions

	Name	Description
	PLIB_GLCD_SignalPolarityGet	Gets the polarity of the pixel clock, DE, HSync and VSync pin of the Graphics LCD Controller.
	PLIB_GLCD_SignalPolaritySet	Sets the polarity of the pixel clock, DE, HSync and VSync pin of the Graphics LCD Controller.
	PLIB_GLCD_BackPorchXGet	Gets X Axis Back Porch.
	PLIB_GLCD_BackPorchXYSet	Sets the back porch on the x and y axis for the Graphics LCD Controller.
	PLIB_GLCD_BackPorchYGet	Gets Y Axis Back Porch.
	PLIB_GLCD_BlankingXYSet	Sets the blanking period on the x and y axis of the Graphics LCD Controller.
	PLIB_GLCD_FormattingClockDivideDisable	Disbale the Clock Formatting feature.
	PLIB_GLCD_FormattingClockDivideEnable	Enable the Clock Formatting feature.
	PLIB_GLCD_FormattingClockDivideIsEnabled	Verify whether Clock Formatting feature is enabled.
	PLIB_GLCD_FrontPorchXGet	Gets X Axis Front Porch.
	PLIB_GLCD_FrontPorchXYSet	Sets the front porch on the x and y axis for the Graphics LCD Controller.
	PLIB_GLCD_FrontPorchYGet	Gets Y Axis Front Porch.
	PLIB_GLCD_LinesPrefetchGet	Gets value of lines to be prefetched.
	PLIB_GLCD_ResolutionXGet	Gets X Axis Resolution.
	PLIB_GLCD_ResolutionYGet	Gets Y Axis Resolution.
	PLIB_GLCD_BlankingXGet	Gets the X Axis Blanking Period.
	PLIB_GLCD_BlankingYGet	Gets the Y Axis Blanking Period.
	PLIB_GLCD_LinesPrefetchSet	Sets the clock controls of the Graphics LCD Controller.
	PLIB_GLCD_ClockDividerSet	Sets clock controls of the Graphics LCD Controller.
	PLIB_GLCD_ClockDividerGet	Gets Clock Divider value.
	PLIB_GLCD_ResolutionXYSet	Sets the display resolution for the Graphics LCD Controller.

c) Background Management Functions

	Name	Description
	PLIB_GLCD_BackgroundColorGet	Gets the value of the Background Color.

	PLIB_GLCD_BackgroundColorSet	Sets the background color.

d) Layer Management Functions

	Name	Description
	PLIB_GLCD_LayerBaseAddressGet	Gets the Layer Base Address.
	PLIB_GLCD_LayerBaseAddressSet	Sets the base address of layer surface of the Graphics LCD Controller.
	PLIB_GLCD_LayerBilinearFilterDisable	Disables the layer Bilinear filter of the Graphics LCD Controller.
	PLIB_GLCD_LayerBilinearFilterEnable	Enables the layer Bilinear filter of the Graphics LCD Controller.
	PLIB_GLCD_LayerBilinearFilterIsEnabled	Verify whether Layer Bilinear Filter is enabled.
	PLIB_GLCD_LayerColorModeGet	Gets the Layer Color Mode.
	PLIB_GLCD_LayerColorModeSet	Sets the layer color mode of the Graphics LCD Controller.
	PLIB_GLCD_LayerDestBlendFuncGet	Gets the Layer Destination Blend Function.
	PLIB_GLCD_LayerDestBlendFuncSet	Sets the layer destination blend function of the Graphics LCD Controller.
	PLIB_GLCD_LayerDisable	Disables the layer of the Graphics LCD Controller.
	PLIB_GLCD_LayerEnable	Enables the layer of the Graphics LCD Controller.
	PLIB_GLCD_LayerForceWithGlobalAlphaDisable	Disables the Layer Force Global Alpha feature.
	PLIB_GLCD_LayerForceWithGlobalAlphaEnable	Enable the Layer Force Global Alpha feature.
	PLIB_GLCD_LayerForceWithGlobalAlphaIsEnabled	Verify whether Layer Force with Global Alpha Feature is enabled.
	PLIB_GLCD_LayerGlobalAlphaGet	Gets the Layer Global Alpha value.
	PLIB_GLCD_LayerGlobalAlphaSet	Sets the layer global alpha of the Graphics LCD Controller.
	PLIB_GLCD_LayerIsEnabled	Verify whether Layer is enabled.
	PLIB_GLCD_LayerPreMultiplyImageAlphaDisable	Disable Layer Pre-Multiply Image Alpha Feature.
	PLIB_GLCD_LayerPreMultiplyImageAlphaEnable	Enable Layer Pre-Multiply Image Alpha Feature.
	PLIB_GLCD_LayerPreMultiplyImageAlphaIsEnabled	Verify whether the Layer Pre-Multiply Image Alpha Feature is enabled.
	PLIB_GLCD_LayerResXGet	Gets the Layer X Axis Resolution.
	PLIB_GLCD_LayerResXYSet	Sets the layer resolution in pixels.
	PLIB_GLCD_LayerResYGet	Gets the Layer Y Axis Resolution.
	PLIB_GLCD_LayerSizeXGet	Gets the Layer X Axis Size.
	PLIB_GLCD_LayerSizeXYSet	Sets the layer size x and size y of the Graphics LCD Controller.
	PLIB_GLCD_LayerSizeYGet	Gets the Layer Y Axis Size.
	PLIB_GLCD_LayerSrcBlendFuncGet	Gets the Layer Source Blend Function.
	PLIB_GLCD_LayerSrcBlendFuncSet	Sets the layer source blend function of the Graphics LCD Controller.
	PLIB_GLCD_LayerStartXGet	Gets the Layer X Axis Start Position.
	PLIB_GLCD_LayerStartXYSet	Sets the layer start x and start y of the Graphics LCD Controller.
	PLIB_GLCD_LayerStartYGet	Gets the Layer Y Axis Start Position.
	PLIB_GLCD_LayerStrideGet	Gets the Layer Stride value.
	PLIB_GLCD_LayerStrideSet	Sets the layer surface stride of the Graphics LCD Controller.

e) Hardware Cursor Control and Management Functions

	Name	Description
	PLIB_GLCD_CursorDataGet	Gets the Cursor Data at given Index.
	PLIB_GLCD_CursorDataSet	Sets the cursor image data.
	PLIB_GLCD_CursorDisable	Disables the cursor of the Graphics LCD Controller.
	PLIB_GLCD_CursorEnable	Enables the cursor of the Graphics LCD Controller.
	PLIB_GLCD_CursorIsEnabled	Verifies whether the cursor is enabled.
	PLIB_GLCD_CursorLUTGet	Gets the color from Cursor LUT at given Index.
	PLIB_GLCD_CursorLUTSet	Sets the cursor color look-up table (LUT) in XRGB8888 format.
	PLIB_GLCD_CursorXGet	Gets the cursor X Axis Position.
	PLIB_GLCD_CursorXYSet	Sets the x and y coordinates of the Graphics LCD Controller cursor.
	PLIB_GLCD_CursorYGet	Gets the Cursor Y Axis Position.

f) Palette and Gamma Correction Control Functions

	Name	Description
	PLIB_GLCD_GlobalColorLUTGet	Gets the Color from Global Color LUT at given Index.
	PLIB_GLCD_GlobalColorLUTSet	Set Global Color LUT.

	PLIB_GLCD_PaletteGammaRampDisable	Disables the palette / gamma ramp of the Graphics LCD Controller.
	PLIB_GLCD_PaletteGammaRampEnable	Enables the palette / gamma ramp of the Graphics LCD Controller.
	PLIB_GLCD_PaletteGammaRampIsEnabled	Verify whether Palette / Gamma Ramp feature is enabled.

g) Interrupt Control Functions

	Name	Description
	PLIB_GLCD_HSyncInterruptDisable	Disables interrupts at Hsync.
	PLIB_GLCD_HSyncInterruptEnable	Enables interrupts at Hsync.
	PLIB_GLCD_HSyncInterruptIsEnabled	Verify whether HSYNC Interrupt is enabled.
	PLIB_GLCD_HSyncSignalLevelGet	Gets the Hsync signal level.
	PLIB_GLCD_IRQTriggerControlGet	Gets the IRQ Trigger Control value.
	PLIB_GLCD_IRQTriggerControlSet	Sets the IRQ trigger control.
	PLIB_GLCD_VSyncInterruptDisable	Disables interrupts at Vsync.
	PLIB_GLCD_VSyncInterruptEnable	Enables interrupts at Vsync.
	PLIB_GLCD_VSyncInterruptIsEnabled	Verify whether VSYNC Interrupt is enabled.
	PLIB_GLCD_VSyncSignalLevelGet	Gets the Vsync signal level.

h) Miscellaneous Control Functions

	Name	Description
	PLIB_GLCD_DitheringDisable	Disables the Dithering feature of the Graphics LCD Controller.
	PLIB_GLCD_DitheringEnable	Enables the Dithering feature of the Graphics LCD Controller.
	PLIB_GLCD_ForceOutputBlankDisable	Disable Force Output Blank feature.
	PLIB_GLCD_ForceOutputBlankEnable	Enable Force Output Blank feature.
	PLIB_GLCD_SingleCyclePerLineVsyncDisable	Clears VSYNC on single cycle per line.
	PLIB_GLCD_SingleCyclePerLineVsyncEnable	Sets VSYNC on single cycle per line.
	PLIB_GLCD_SingleCyclePerLineVsyncIsEnabled	Verify whether VSYNC on Single Cycle Per Line feature is enabled.
	PLIB_GLCD_YUVOutputDisable	Disables the output of the Graphics LCD Controller in YUV format.
	PLIB_GLCD_YUVOutputEnable	Enables the output of the Graphics LCD Controller in YUV format.
	PLIB_GLCD_DESignalLevelGet	Gets the display enable signal level.
	PLIB_GLCD_DitheringIsEnabled	Verifies whether Dithering is enabled.
	PLIB_GLCD_ForceOutputBlankIsEnabled	Verify whether the Force Output Blank feature is enabled.
	PLIB_GLCD_IsEnabled	Verifies whether the Graphics LCD Controller is Enabled.
	PLIB_GLCD_IsLastRow	Gets the status indicating whether a last row is currently displayed by the Graphics Display Controller.
	PLIB_GLCD_IsVerticalBlankingActive	Get the active status.
	PLIB_GLCD_RGBSequentialModeGet	Get the RGB Sequential Mode already set.
	PLIB_GLCD_YUVOutputIsEnabled	Verify whether the YUV Output feature is enabled.

i) Feature Existence Functions

	Name	Description
	PLIB_GLCD_ExistsBackgroundColor	Verify whether the Background Color Feature is supported.
	PLIB_GLCD_ExistsBackPorchXY	Verify whether Back Porch Feature is supported.
	PLIB_GLCD_ExistsBlankingXY	Verify whether Blanking Period Feature is supported.
	PLIB_GLCD_ExistsClockDivider	Verify whether the Clock Divider feature is supported.
	PLIB_GLCD_ExistsCursor	Verifies whether the cursor feature exists.
	PLIB_GLCD_ExistsCursorData	
	PLIB_GLCD_ExistsCursorLUT	Verify whether Cursor LUT feature is supported.
	PLIB_GLCD_ExistsCursorXY	Verify whether Cursor XY Position feature is supported.
	PLIB_GLCD_ExistsDESignalLevel	Verify whether DE Signal Level feature is supported.
	PLIB_GLCD_ExistsDithering	Verifies whether the Dithering feature exists.
	PLIB_GLCD_ExistsEnable	Identifies whether the GLCD Enable feature exists on the GLCD module.
	PLIB_GLCD_ExistsForceOutputBlank	Verify whether Force Output Blank feature is supported.
	PLIB_GLCD_ExistsFormattingClockDivide	Verify whether Clock Formatting feature is available.
	PLIB_GLCD_ExistsFrontPorchXY	Verify whether Front Porch Feature is supported.
	PLIB_GLCD_ExistsGlobalColorLUT	Verify whether Global Color LUT feature is supported.

	PLIB_GLCD_ExistsHSyncInterruptEnable	Verify whether the HSYNC Interrupt Enable feature is supported.
	PLIB_GLCD_ExistsHSyncSignalLevel	Verify whether HSYNC Signal Level feature is supported.
	PLIB_GLCD_ExistsIRQTriggerControl	Verify whether the IRQ Trigger Control feature is supported.
	PLIB_GLCD_ExistsIsLastRow	Verify whether Is Last Row Feature is supported.
	PLIB_GLCD_ExistsIsVerticalBlankingActive	Verify whether Is Vertical Blanking Active feature is supported.
	PLIB_GLCD_ExistsLayerBaseAddress	Verify whether the Layer Base Address feature is supported.
	PLIB_GLCD_ExistsLayerBilinearFilterEnable	Enable Layer Bilinear Filter Feature.
	PLIB_GLCD_ExistsLayerColorMode	Verify whether Layer Color Mode is supported.
	PLIB_GLCD_ExistsLayerDestBlendFunc	Verify whether Layer Destination Blend Function Feature is supported.
	PLIB_GLCD_ExistsLayerEnable	Verify whether Layer Enable Feature is supported.
	PLIB_GLCD_ExistsLayerForceWithGlobalAlpha	Verify whether Layer Force with Global Alpha Feature is supported.
	PLIB_GLCD_ExistsLayerGlobalAlpha	Verify whether Layer Global Alpha Feature is supported.
	PLIB_GLCD_ExistsLayerPreMultiplyImageAlpha	Verify whether Layer Pre-Multiply Image Alpha Feature is supported.
	PLIB_GLCD_ExistsLayerResXY	
	PLIB_GLCD_ExistsLayerSizeXY	Verify whether Layer X Axis and Y Axis Size feature is supported.
	PLIB_GLCD_ExistsLayerSrcBlendFunc	Verify whether Layer Source Blend Function Feature is supported.
	PLIB_GLCD_ExistsLayerStartXY	Verify whether Layer Start XY Position feature is supported.
	PLIB_GLCD_ExistsLayerStride	Verify whether the Layer Stride Feature is supported.
	PLIB_GLCD_ExistsLinesPrefetch	Verify whether Lines Prefetch Set Feature supported.
	PLIB_GLCD_ExistsPaletteGammaRamp	Verifies whether the palette / gamma ramp feature is supported.
	PLIB_GLCD_ExistsResolutionXY	Verify whether YUV Output feature is supported.
	PLIB_GLCD_ExistsRGBSequentialMode	Verify whether RGB Sequential Mode feature is supported.
	PLIB_GLCD_ExistsSignalPolarity	Verifies whether the Signal Polarity Selection feature exists.
	PLIB_GLCD_ExistsSingleCyclePerLineVsync	Verifies whether VSYNC on Single cycle Per Line Feature exists.
	PLIB_GLCD_ExistsVSyncInterruptEnable	Verify whether VSYNC Interrupt Enable feature is supported.
	PLIB_GLCD_ExistsVSyncSignalLevel	Verify whether VSYNC Signal Level feature is supported.
	PLIB_GLCD_ExistsYUVOutput	Verify whether YUV output feature is supported.

j) Data Types and Constants

	Name	Description
	GLCD_IRQ_TRIGGER_CONTROL	Possible values of GLCD Interrupt Trigger Mode.
	GLCD_LAYER_COLOR_MODE	Possible values of GLCD color Mode.
	GLCD_LAYER_DEST_BLEND_FUNC	Possible values of GLCD Layer Destination Blend Functions.
	GLCD_LAYER_ID	Possible values of GLCD Layer Ids
	GLCD_LAYER_SRC_BLEND_FUNC	Possible values of GLCD Layer Source Blend Functions.
	GLCD_MODULE_ID	Possible instances of the GLCD module
	GLCD_RGB_MODE	GLCD RGB Sequential Mode
	GLCD_SIGNAL_POLARITY	Polarity values of different output signals.

Description

This section describes the Application Programming Interface (API) functions of the GLCD Controller Peripheral Library.

Refer to each section for a detailed description.

a) General Configuration Functions

PLIB_GLCD_Disable Function

Disables the Graphics LCD Controller.

File

plib_glcd.h

C

```
void PLIB_GLCD_Disable(GLCD_MODULE_ID index);
```

Returns

None.

Description

This function disables the Graphics LCD Controller.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_GLCD_Disable( GLCD_MODULE_ID_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

void PLIB_GLCD_Disable(GLCD_MODULE_ID index)

PLIB_GLCD_Enable Function

Enables the Graphics LCD Controller.

File

plib_glcd.h

C

```
void PLIB_GLCD_Enable(GLCD_MODULE_ID index);
```

Returns

None.

Description

This function enables the Graphics LCD Controller.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_GLCD_Enable( GLCD_MODULE_ID_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

void PLIB_GLCD_Enable(GLCD_MODULE_ID index)

PLIB_GLCD_RGBSequentialModeSet Function

Sets the RGB output sequential mode.

File

plib_glcd.h

C

```
void PLIB_GLCD_RGBSequentialModeSet(GLCD_MODULE_ID index, GLCD_RGB_MODE mode);
```

Returns

None.

Description

This function sets the RGB output sequential mode.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_GLCD_RGBSequentialModeSet( GLCD_MODULE_ID_0,
                                GLCD_RGB_MODE_PARALLEL );
```

Parameters

Parameters	Description
index	Identifier of the device instance.
mode	RGB sequential mode defined by GLCD_RGB_MODE.

Function

void PLIB_GLCD_RGBSequentialModeSet(GLCD_MODULE_ID index, GLCD_RGB_MODE mode)

b) Display Signal Polarity and Timing Management Functions

PLIB_GLCD_SignalPolarityGet Function

Gets the polarity of the pixel clock, DE, HSync and VSync pin of the Graphics LCD Controller.

File

plib_glcd.h

C

```
GLCD_SIGNAL_POLARITY PLIB_GLCD_SignalPolarityGet(GLCD_MODULE_ID index);
```

Returns

None.

Description

This function gets the polarity of the pixel clock, DE, HSync and VSync pin of the Graphics LCD Controller.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
uint32_t signalPolarity = GLCD_POLARITY_POSITIVE;

signalPolarity = PLIB_GLCD_VSyncPolarityGet( GLCD_MODULE_ID_0 );

if( signalPolarity & GLCD_DE_POLARITY_NEGATIVE )
{
    // DE Polarity Negative
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

GLCD_SIGNAL_POLARITY PLIB_GLCD_SignalPolarityGet(GLCD_MODULE_ID index)

PLIB_GLCD_SignalPolaritySet Function

Sets the polarity of the pixel clock, DE, HSync and VSync pin of the Graphics LCD Controller.

File

plib_glcd.h

C

```
void PLIB_GLCD_SignalPolaritySet(GLCD_MODULE_ID index, GLCD_SIGNAL_POLARITY polarity);
```

Returns

None.

Description

This function sets the polarity of the pixel clock, DE, HSync and VSync pin of the Graphics LCD Controller.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_GLCD_SignalPolaritySet( GLCD_MODULE_ID_0,
                             GLCD_POLARITY_POSITIVE |
                             GLCD_DE_POLARITY_NEGATIVE );
```

Parameters

Parameters	Description
index	Identifier of the device instance.
polarity	Enum variable specifying polarity.

Function

void PLIB_GLCD_SignalPolaritySet(GLCD_MODULE_ID index,
GLCD_SIGNAL_POLARITY polarity)

PLIB_GLCD_BackPorchXGet Function

Gets X Axis Back Porch.

File

plib_glcd.h

C

```
uint32_t PLIB_GLCD_BackPorchXGet(GLCD_MODULE_ID index);
```

Returns

- value of X Axis Back Porch.

Description

This function gets X Axis Back Porch.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
uint32_t backPorchX;

backPorchX = PLIB_GLCD_BackPorchXGet( GLCD_MODULE_ID_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

uint32_t PLIB_GLCD_BackPorchXGet(GLCD_MODULE_ID index)

PLIB_GLCD_BackPorchXYSet Function

Sets the back porch on the x and y axis for the Graphics LCD Controller.

File

plib_glcd.h

C

```
void PLIB_GLCD_BackPorchXYSet(GLCD_MODULE_ID index, uint32_t backPorchX, uint32_t backPorchY);
```

Returns

None.

Description

This function sets the back porch on the x and y axis for the Graphics LCD Controller.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
// set back porch as: on x axis: 40 and on y axis: 20
PLIB_GLCD_BackPorchXYSet( GLCD_MODULE_ID_0, 40, 20 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.
backPorchX	Back porch pulse width on x axis.
backPorchY	Back porch pulse width on y axis.

Function

void PLIB_GLCD_BackPorchXYSet(GLCD_MODULE_ID index,
uint32_t backPorchX
uint32_t backPorchY)

PLIB_GLCD_BackPorchYGet Function

Gets Y Axis Back Porch.

File

plib_glcd.h

C

```
uint32_t PLIB_GLCD_BackPorchYGet(GLCD_MODULE_ID index);
```

Returns

- value of Y Axis Back Porch.

Description

This function gets Y Axis Back Porch.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
uint32_t backPorchY;

backPorchY = PLIB_GLCD_BackPorchYGet( GLCD_MODULE_ID_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

uint32_t PLIB_GLCD_BackPorchYGet(GLCD_MODULE_ID index)

PLIB_GLCD_BlankingXYSet Function

Sets the blanking period on the x and y axis of the Graphics LCD Controller.

File

plib_glcd.h

C

```
void PLIB_GLCD_BlankingXYSet(GLCD_MODULE_ID index, uint32_t blankingX, uint32_t blankingY);
```

Returns

None.

Description

This function sets the blanking period on the x and y axis of the Graphics LCD Controller.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
// Set blanking period: on x axis: 10 and on y axis: 10
PLIB_GLCD_BlankingXY_Set( GLCD_MODULE_ID_0, 10, 10 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.
blankingX	Blanking period on x axis.
blankingY	Blanking period on y axis.

Function

void PLIB_GLCD_BlankingXYSet(GLCD_MODULE_ID index,
uint32_t blankingX
uint32_t blankingY)

PLIB_GLCD_FormattingClockDivideDisable Function

Disbale the Clock Formatting feature.

File

plib_glcd.h

C

```
void PLIB_GLCD_FormattingClockDivideDisable(GLCD_MODULE_ID index);
```

Returns

None.

Description

This function disbales the Clock Formatting feature.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_GLCD_FormattingClockDivideDisable( GLCD_MODULE_ID_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

void PLIB_GLCD_FormattingClockDivideDisable(GLCD_MODULE_ID index)

PLIB_GLCD_FormattingClockDivideEnable Function

Enable the Clock Formatting feature.

File

plib_glcd.h

C

```
void PLIB_GLCD_FormattingClockDivideEnable(GLCD_MODULE_ID index);
```

Returns

None.

Description

This function Enables the Clock Formatting feature.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_GLCD_FormattingClockDivideEnable( GLCD_MODULE_ID_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

void PLIB_GLCD_FormattingClockDivideEnable(GLCD_MODULE_ID index)

PLIB_GLCD_FormattingClockDivideIsEnabled Function

Verify whether Clock Formatting feature is enabled.

File

plib_glcd.h

C

```
bool PLIB_GLCD_FormattingClockDivideIsEnabled(GLCD_MODULE_ID index);
```

Returns

- true - The Clock Formatting feature is enabled.
- false - The Clock Formatting feature is disabled.

Description

This function verifies if the Clock Formatting feature is enabled.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if ( PLIB_GLCD_FormattingClockDivideIsEnabled( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_FormattingClockDivideDisable( GLCD_MODULE_ID_0 );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_FormattingClockDivideIsEnabled(GLCD_MODULE_ID index)

PLIB_GLCD_FrontPorchXGet Function

Gets X Axis Front Porch.

File

plib_glcd.h

C

```
uint32_t PLIB_GLCD_FrontPorchXGet(GLCD_MODULE_ID index);
```

Returns

- value of X Axis Front Porch.

Description

This Function gets X Axis Front Porch.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
uint32_t porchX;

porchX = PLIB_GLCD_FrontPorchXGet( GLCD_MODULE_ID_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

uint32_t PLIB_GLCD_FrontPorchXGet(GLCD_MODULE_ID index)

PLIB_GLCD_FrontPorchXYSet Function

Sets the front porch on the x and y axis for the Graphics LCD Controller.

File

plib_glcd.h

C

```
void PLIB_GLCD_FrontPorchXYSet(GLCD_MODULE_ID index, uint32_t frontPorchX, uint32_t frontPorchY);
```

Returns

None.

Description

This function sets the front porch on the x and y axis for the Graphics LCD Controller.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
// set front porch as: on x axis: 40 and on y axis: 20
PLIB_GLCD_FrontPorchXYSet( GLCD_MODULE_ID_0, 40, 20 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.
frontPorchX	Front porch pulse width on x axis.
frontPorchY	Front porch pulse width on y axis.

Function

void PLIB_GLCD_FrontPorchXYSet(GLCD_MODULE_ID index,
uint32_t frontPorchX,
uint32_t frontPorchY)

PLIB_GLCD_FrontPorchYGet Function

Gets Y Axis Front Porch.

File

plib_glcd.h

C

```
uint32_t PLIB_GLCD_FrontPorchYGet(GLCD_MODULE_ID index);
```

Returns

- value of y axis front porch.

Description

This function gets Y Axis Front Porch.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
uint32_t porchY;

porchY = PLIB_GLCD_FrontPorchYGet( GLCD_MODULE_ID_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

uint32_t PLIB_GLCD_FrontPorchYGet(GLCD_MODULE_ID index)

PLIB_GLCD_LinesPrefetchGet Function

Gets value of lines to be prefetched.

File

plib_glcd.h

C

```
uint32_t PLIB_GLCD_LinesPrefetchGet(GLCD_MODULE_ID index);
```

Returns

- value of lines to be prefetched.

Description

This function gets the value of lines to be prefetched.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
uint32_t linesPrefetch;

linesPrefetch = PLIB_GLCD_LinesPrefetchGet( GLCD_MODULE_ID_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

uint32_t PLIB_GLCD_LinesPrefetchGet(GLCD_MODULE_ID index)

PLIB_GLCD_ResolutionXGet Function

Gets X Axis Resolution.

File

plib_glcd.h

C

```
uint32_t PLIB_GLCD_ResolutionXGet(GLCD_MODULE_ID index);
```

Returns

- value of x axis resolution.

Description

This function gets the X Axis resolution.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
uint32_t resolutionX;

resolutionX = PLIB_GLCD_ResolutionXGet( GLCD_MODULE_ID_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

uint32_t PLIB_GLCD_ResolutionXGet(GLCD_MODULE_ID index)

PLIB_GLCD_ResolutionYGet Function

Gets Y Axis Resolution.

File

plib_glcd.h

C

```
uint32_t PLIB_GLCD_ResolutionYGet(GLCD_MODULE_ID index);
```

Returns

- Value of Y Axis Resolution.

Description

This function gets the Y Axis Resolution.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
uint32_t resolutionY;

resolutionY = PLIB_GLCD_ResolutionYGet( GLCD_MODULE_ID_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

uint32_t PLIB_GLCD_ResolutionYGet(GLCD_MODULE_ID index)

PLIB_GLCD_BlankingXGet Function

Gets the X Axis Blanking Period.

File

plib_glcd.h

C

```
uint32_t PLIB_GLCD_BlankingXGet(GLCD_MODULE_ID index);
```

Returns

- value of X Axis Blanking Period.

Description

This function gets the X Axis Blanking Period.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
uint32_t blankingX;

blankingX = PLIB_GLCD_BlankingXGet( GLCD_MODULE_ID_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

uint32_t PLIB_GLCD_BlankingXGet(GLCD_MODULE_ID index)

PLIB_GLCD_BlankingYGet Function

Gets the Y Axis Blanking Period.

File

plib_glcd.h

C

```
uint32_t PLIB_GLCD_BlankingYGet(GLCD_MODULE_ID index);
```

Returns

- value of Y Axis Blanking Period.

Description

This function gets the Y Axis Blanking Period.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
uint32_t blankingY;

blankingY = PLIB_GLCD_BlankingYGet( GLCD_MODULE_ID_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

uint32_t PLIB_GLCD_BlankingYGet(GLCD_MODULE_ID index)

PLIB_GLCD_LinesPrefetchSet Function

Sets the clock controls of the Graphics LCD Controller.

File

plib_glcd.h

C

```
void PLIB_GLCD_LinesPrefetchSet(GLCD_MODULE_ID index, uint32_t linesPrefetch);
```

Returns

None.

Description

This function sets the clock controls of the Graphics LCD Controller.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_GLCD_LinesPrefetchSet( GLCD_MODULE_ID_0,
                            MY_LINES_PREFETCH_VALUE );
```

Parameters

Parameters	Description
index	Identifier of the device instance
linesPrefetch	clock lines prefetch

Function

void PLIB_GLCD_LinesPrefetchSet(GLCD_MODULE_ID index, uint32_t linesPrefetch)

PLIB_GLCD_ClockDividerSet Function

Sets clock controls of the Graphics LCD Controller.

File

plib_glcd.h

C

```
void PLIB_GLCD_ClockDividerSet(GLCD_MODULE_ID index, uint32_t clockDivider);
```

Returns

None.

Description

This function sets clock controls of the Graphics LCD Controller.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_GLCD_ClockDividerSet( GLCD_MODULE_ID_0, MY_CLOCK_DIVIDER_VALUE );
```

Parameters

Parameters	Description
index	Identifier of the device instance.
clockDivider	Factor dividing the GLCD clock.

Function

void PLIB_GLCD_ClockDividerSet(GLCD_MODULE_ID index, uint32_t clockDivider)

PLIB_GLCD_ClockDividerGet Function

Gets Clock Divider value.

File

plib_glcd.h

C

```
uint32_t PLIB_GLCD_ClockDividerGet(GLCD_MODULE_ID index);
```

Returns

- value of clock divider.

Description

This function gets the Clock Divider value.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
uint32_t dividerValue;

dividerValue = PLIB_GLCD_ClockDividerGet( GLCD_MODULE_ID_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

uint32_t PLIB_GLCD_ClockDividerGet(GLCD_MODULE_ID index)

PLIB_GLCD_ResolutionXYSet Function

Sets the display resolution for the Graphics LCD Controller.

File

plib_glcd.h

C

```
void PLIB_GLCD_ResolutionXYSet(GLCD_MODULE_ID index, uint32_t resolutionX, uint32_t resolutionY);
```

Returns

None.

Description

This function sets the display resolution for the Graphics LCD Controller.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
// set display resolution as: width: 640 pixels and height: 480 pixels
PLIB_GLCD_ResolutionXYSet( GLCD_MODULE_ID_0, 640, 480 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.
resolutionX	Display resolution on x axis in terms of number of pixels.
resolutionY	Display resolution on y axis in terms of number of pixels.

Function

void PLIB_GLCD_ResolutionXYSet(GLCD_MODULE_ID index,
uint32_t resolutionX,
uint32_t resolutionY)

c) Background Management Functions

PLIB_GLCD_BackgroundColorGet Function

Gets the value of the Background Color.

File

plib_glcd.h

C

```
uint32_t PLIB_GLCD_BackgroundColorGet(GLCD_MODULE_ID index);
```

Returns

- value of the Background Color.

Description

This function gets the value of the Background Color.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
uint32_t backgroundColor;

backgroundColor = PLIB_GLCD_BackgroundColorGet( GLCD_MODULE_ID_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

uint32_t PLIB_GLCD_BackgroundColorGet(GLCD_MODULE_ID index);

PLIB_GLCD_BackgroundColorSet Function

Sets the background color.

File

plib_glcd.h

C

```
void PLIB_GLCD_BackgroundColorSet(GLCD_MODULE_ID index, uint32_t bgColor);
```

Returns

None.

Description

This function sets the background color of the Graphics LCD Controller.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_GLCD_BGColorSet( GLCD_MODULE_ID_0, 0x000000FF );
```

Parameters

Parameters	Description
index	Identifier of the device instance.
bgColor	Background color.

Function

void ExistsBackgroundColor(GLCD_MODULE_ID index)

d) Layer Management Functions

PLIB_GLCD_LayerBaseAddressGet Function

Gets the Layer Base Address.

File

plib_glcd.h

C

```
uint32_t PLIB_GLCD_LayerBaseAddressGet(GLCD_MODULE_ID index, GLCD_LAYER_ID layerId);
```

Returns

- Layer base address value.

Description

This function sets the Layer Base Address.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
uint32_t layerBaseAddress;

layerBaseAddress = PLIB_GLCD_LayerBaseAddressGet( GLCD_MODULE_ID_0
                                                  GLCD_LAYER_0  );
```

Parameters

Parameters	Description
index	Identifier of the device instance.
layerId	Identifier of the Graphics rendering layer.

Function

uint32_t PLIB_GLCD_LayerBaseAddressGet(GLCD_MODULE_ID index,
GLCD_LAYER_ID layerId)

PLIB_GLCD_LayerBaseAddressSet Function

Sets the base address of layer surface of the Graphics LCD Controller.

File

plib_glcd.h

C

```
void PLIB_GLCD_LayerBaseAddressSet(GLCD_MODULE_ID index, GLCD_LAYER_ID layerId, uint32_t baseAddress);
```

Returns

None.

Description

This function sets the layer base address of the Graphics LCD Controller.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
// Set layer 0 surface base address as 0x20000000
PLIB_GLCD_LayerBaseAddressSet( GLCD_MODULE_ID_0, GLCD_LAYER_0, 0x20000000 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.
layerId	Identifier of the Graphics rendering layer.
baseAddress	baseAddress of layer surface.

Function

void PLIB_GLCD_LayerBaseAddressSet(GLCD_MODULE_ID index,
GLCD_LAYER_ID layerId,
uint32_t baseAddress)

PLIB_GLCD_LayerBilinearFilterDisable Function

Disables the layer Bilinear filter of the Graphics LCD Controller.

File

plib_glcd.h

C

```
void PLIB_GLCD_LayerBilinearFilterDisable(GLCD_MODULE_ID index, GLCD_LAYER_ID layerId);
```

Returns

None.

Description

This function disables the layer Bilinear filter of the Graphics LCD Controller.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_GLCD_LayerBilinearFilterDisable( GLCD_MODULE_ID_0, GLCD_LAYER_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.
layerId	Identifier of the Graphics rendering layer.

Function

void PLIB_GLCD_LayerBilinearFilterDisable (GLCD_MODULE_ID index,
GLCD_LAYER_ID layerId)

PLIB_GLCD_LayerBilinearFilterEnable Function

Enables the layer Bilinear filter of the Graphics LCD Controller.

File

plib_glcd.h

C

```
void PLIB_GLCD_LayerBilinearFilterEnable(GLCD_MODULE_ID index, GLCD_LAYER_ID layerId);
```

Returns

None.

Description

This function enables the layer Bilinear filter of the Graphics LCD Controller.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_GLCD_LayerBilinearFilterEnable( GLCD_MODULE_ID_0, GLCD_LAYER_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.
layerId	Identifier of the Graphics rendering layer.

Function

void PLIB_GLCD_LayerBilinearFilterEnable (GLCD_MODULE_ID index,
GLCD_LAYER_ID layerId)

PLIB_GLCD_LayerBilinearFilterIsEnabled Function

Verify whether Layer Bilinear Filter is enabled.

File

plib_glcd.h

C

```
bool PLIB_GLCD_LayerBilinearFilterIsEnabled(GLCD_MODULE_ID index, GLCD_LAYER_ID layerId);
```

Returns

- true - The Layer Bilinear feature is enabled.
- false - The Layer Bilinear feature is disabled.

Description

This function verifies whether Layer Bilinear Filter is enabled.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if ( PLIB_GLCD_LayerBilinearFilterIsEnabled( GLCD_MODULE_ID_0,
                                             GLCD_LAYER_0 ) )
{
    PLIB_GLCD_LayerBilinearFilterDisable( GLCD_MODULE_ID_0,
                                          GLCD_LAYER_0 );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.
layerId	Identifier of the Graphics rendering layer.

Function

bool PLIB_GLCD_LayerBilinearFilterIsEnabled (GLCD_MODULE_ID index,
GLCD_LAYER_ID layerId)

PLIB_GLCD_LayerColorModeGet Function

Gets the Layer Color Mode.

File

plib_glcd.h

C

```
GLCD_LAYER_COLOR_MODE PLIB_GLCD_LayerColorModeGet(GLCD_MODULE_ID index, GLCD_LAYER_ID layerId);
```

Returns

- GLCD_LAYER_COLOR_MODE_LUT8 - Layer Color Mode set to LUT8
- GLCD_LAYER_COLOR_MODE_RGBA5551 - Layer Color Mode set to RGBA5551
- GLCD_LAYER_COLOR_MODE_RGBA8888 - Layer Color Mode set to RGBA8888
- GLCD_LAYER_COLOR_MODE_RGB332 - Layer Color Mode set to RGB 332
- GLCD_LAYER_COLOR_MODE_RGB565 - Layer Color Mode set to RGB565
- GLCD_LAYER_COLOR_MODE_ARGB8888 - Layer Color Mode set to ARGB8888
- GLCD_LAYER_COLOR_MODE_L8 - Layer Color Mode set to L8
- GLCD_LAYER_COLOR_MODE_L1 - Layer Color Mode set to L1
- GLCD_LAYER_COLOR_MODE_L4 - Layer Color Mode set to L4
- GLCD_LAYER_COLOR_MODE_YUYV - Layer Color Mode set to YUYV
- GLCD_LAYER_COLOR_MODE_RGB888 - Layer Color Mode set to RGB888

Description

This function gets the Layer Color Mode

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
uint32_t colorMode;

colorMode = PLIB_GLCD_LayerColorModeGet( GLCD_MODULE_ID_0
                                         GLCD_LAYER_0   );
```

Parameters

Parameters	Description
index	Identifier of the device instance.
layerId	Identifier of the Graphics rendering layer.

Function

```
GLCD_LAYER_COLOR_MODE PLIB_GLCD_LayerColorModeGet( GLCD_MODULE_ID index,
                                                   GLCD_LAYER_ID  layerId );
```

PLIB_GLCD_LayerColorModeSet Function

Sets the layer color mode of the Graphics LCD Controller.

File

plib_glcd.h

C

```
void PLIB_GLCD_LayerColorModeSet(GLCD_MODULE_ID index, GLCD_LAYER_ID layerId, GLCD_LAYER_COLOR_MODE
colorMode);
```

Returns

None.

Description

This function sets the layer color mode of the Graphics LCD Controller.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
// Set layer color mode to RGB232
PLIB_GLCD_LayerColorModeSet( GLCD_MODULE_ID_0, GLCD_LAYER_0,
                             GLCD_LAYER_COLOR_MODE_RGB232 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.
layerId	Identifier of the Graphics rendering layer.
colorMode	Color mode defined by GLCD_LAYER_COLOR_MODE.

Function

```
void PLIB_GLCD_LayerColorModeSet( GLCD_MODULE_ID       index,
                                  GLCD_LAYER_ID        layerId,
                                  GLCD_LAYER_COLOR_MODE colorMode )
```

PLIB_GLCD_LayerDestBlendFuncGet Function

Gets the Layer Destination Blend Function.

File

plib_glcd.h

C

```
GLCD_LAYER_DEST_BLEND_FUNC PLIB_GLCD_LayerDestBlendFuncGet(GLCD_MODULE_ID index, GLCD_LAYER_ID layerId);
```

Returns

- GLCD_LAYER_DEST_BLEND_BLACK - Destination Blend function set to Black = 0.
- GLCD_LAYER_DEST_BLEND_WHITE - Destination Blend function set to White = 255.
- GLCD_LAYER_DEST_BLEND_ALPHA_SRC - Destination Blend function set to Source Alpha.
- GLCD_LAYER_DEST_BLEND_ALPHA_GBL - Destination Blend function set to Global Alpha.
- GLCD_LAYER_DEST_BLEND_ALPHA_SRCGBL - Destination Blend function set to (Source * Global Alpha)
- GLCD_LAYER_DEST_BLEND_INV_SRC - Destination Blend function set to (1 - Source Alpha)
- GLCD_LAYER_DEST_BLEND_INV_GBL - Destination Blend function set to (1 - Global Alpha)
- GLCD_LAYER_DEST_BLEND_INV_SRCGBL - Destination Blend function set to (1 - (Source Alpha * Global Alpha)).
- GLCD_LAYER_DEST_BLEND_ALPHA_DST - Destination Blend function set to Destination Alpha.
- GLCD_LAYER_DEST_BLEND_INV_DST - Destination Blend function set to (1 - Destination Alpha)

Description

This function gets the Layer Destination Blend Function.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
uint32_t destBlendFunc;

destBlendFunc = PLIB_GLCD_LayerDestBlendFuncGet( GLCD_MODULE_ID_0
                                                 GLCD_LAYER_0    );
```

Parameters

Parameters	Description
index	Identifier of the device instance.
layerId	Identifier of the Graphics rendering layer.

Function

```
GLCD_LAYER_DEST_BLEND_FUNC PLIB_GLCD_LayerDestBlendFuncGet( GLCD_MODULE_ID index,
```

GLCD_LAYER_ID layerId)

PLIB_GLCD_LayerDestBlendFuncSet Function

Sets the layer destination blend function of the Graphics LCD Controller.

File

plib_glcd.h

C

```
void PLIB_GLCD_LayerDestBlendFuncSet(GLCD_MODULE_ID index, GLCD_LAYER_ID layerId,
GLCD_LAYER_DEST_BLEND_FUNC blendFunc);
```

Returns

None.

Description

This function sets the layer destination blend function of the Graphics LCD Controller.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_GLCD_LayerDestBlendFuncSet( GLCD_MODULE_ID_0, GLCD_LAYER_0,
                                 GLCD_BLEND_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.
layerId	Identifier of the Graphics rendering layer.
blendFunc	Blend function defined by GLCD_LAYER_BLEND_FUNCTION.

Function

void PLIB_GLCD_LayerDestBlendFuncSet(GLCD_MODULE_ID index,
GLCD_LAYER_ID layerId,
GLCD_LAYER_DEST_BLEND_FUNC blendFunc)

PLIB_GLCD_LayerDisable Function

Disables the layer of the Graphics LCD Controller.

File

plib_glcd.h

C

```
void PLIB_GLCD_LayerDisable(GLCD_MODULE_ID index, GLCD_LAYER_ID layerId);
```

Returns

None.

Description

This function disables the layer of the Graphics LCD Controller.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_GLCD_LayerDisable( GLCD_MODULE_ID_0, GLCD_LAYER_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.
layerId	Identifier of the Graphics rendering layer.

Function

void PLIB_GLCD_LayerDisable(GLCD_MODULE_ID index, GLCD_LAYER_ID layerId)

PLIB_GLCD_LayerEnable Function

Enables the layer of the Graphics LCD Controller.

File

plib_glcd.h

C

```
void PLIB_GLCD_LayerEnable(GLCD_MODULE_ID index, GLCD_LAYER_ID layerId);
```

Returns

None.

Description

This function enables the layer of the Graphics LCD Controller.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_GLCD_LayerEnable( GLCD_MODULE_ID_0, GLCD_LAYER_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.
layerId	Identifier of the Graphics rendering layer.

Function

void PLIB_GLCD_LayerEnable(GLCD_MODULE_ID index, GLCD_LAYER_ID layerId)

PLIB_GLCD_LayerForceWithGlobalAlphaDisable Function

Disables the Layer Force Global Alpha feature.

File

plib_glcd.h

C

```
void PLIB_GLCD_LayerForceWithGlobalAlphaDisable(GLCD_MODULE_ID index, GLCD_LAYER_ID layerId);
```

Returns

None.

Description

This function disables the Layer Force Global Alpha feature.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_GLCD_LayerForceWithGlobalAlphaDisable ( GLCD_MODULE_ID_0,
                                             GLCD_LAYER_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.
layerId	Identifier of the Graphics rendering layer.

Function

void PLIB_GLCD_LayerForceWithGlobalAlphaDisable (GLCD_MODULE_ID index,
GLCD_LAYER_ID layerId)

PLIB_GLCD_LayerForceWithGlobalAlphaEnable Function

Enable the Layer Force Global Alpha feature.

File

plib_glcd.h

C

```
void PLIB_GLCD_LayerForceWithGlobalAlphaEnable(GLCD_MODULE_ID index, GLCD_LAYER_ID layerId);
```

Returns

None.

Description

This function enables the Layer Force Global Alpha feature.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_GLCD_LayerForceWithGlobalAlphaEnable ( GLCD_MODULE_ID_0,
                                            GLCD_LAYER_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.
layerId	Identifier of the Graphics rendering layer.

Function

void PLIB_GLCD_LayerForceWithGlobalAlphaEnable (GLCD_MODULE_ID index,
GLCD_LAYER_ID layerId)

PLIB_GLCD_LayerForceWithGlobalAlphaIsEnabled Function

Verify whether Layer Force with Global Alpha Feature is enabled.

File

plib_glcd.h

C

```
bool PLIB_GLCD_LayerForceWithGlobalAlphaIsEnabled(GLCD_MODULE_ID index, GLCD_LAYER_ID layerId);
```

Returns

- true - The Layer Force Global Alpha feature is enabled.
- false - The Layer Force Global Alpha feature is disabled.

Description

This function verifies whether Layer Force with Global Alpha Feature is enabled.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if ( PLIB_GLCD_LayerForceWithGlobalAlphaIsEnabled( GLCD_MODULE_ID_0,
                                                   GLCD_LAYER_0 ) )
{
    PLIB_GLCD_LayerForceWithGlobalAlphaDisable( GLCD_MODULE_ID_0,
                                                GLCD_LAYER_0 );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.
layerId	Identifier of the Graphics rendering layer.

Function

bool PLIB_GLCD_LayerForceWithGlobalAlphaIsEnabled (GLCD_MODULE_ID index,
GLCD_LAYER_ID layerId)

PLIB_GLCD_LayerGlobalAlphaGet Function

Gets the Layer Global Alpha value.

File

plib_glcd.h

C

```
uint8_t PLIB_GLCD_LayerGlobalAlphaGet(GLCD_MODULE_ID index, GLCD_LAYER_ID layerId);
```

Returns

- Layer Alpha value

Description

This function gets the Layer Global Alpha value.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
uint8_t layerAlpha;

layerAlpha = PLIB_GLCD_LayerGlobalAlphaGet( GLCD_MODULE_ID_0
                                            GLCD_LAYER_0    );
```

Parameters

Parameters	Description
index	Identifier of the device instance.
layerId	Identifier of the Graphics rendering layer.

Function

uint8_t PLIB_GLCD_LayerGlobalAlphaGet(GLCD_MODULE_ID index,
GLCD_LAYER_ID layerId)

PLIB_GLCD_LayerGlobalAlphaSet Function

Sets the layer global alpha of the Graphics LCD Controller.

File

plib_glcd.h

C

```
void PLIB_GLCD_LayerGlobalAlphaSet(GLCD_MODULE_ID index, GLCD_LAYER_ID layerId, uint8_t value);
```

Returns

None.

Description

This function sets the layer global alpha of the Graphics LCD Controller.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
// set global alpha value of layer 0 to 255
PLIB_GLCD_Layer_GlobalAlpha_Set( GLCD_MODULE_ID_0, GLCD_LAYER_0, 255 )
```

Parameters

Parameters	Description
index	Identifier of the device instance.
layerId	Identifier of the Graphics rendering layer.
value	Global alpha value.

Function

void PLIB_GLCD_LayerGlobalAlphaSet(GLCD_MODULE_ID index,
GLCD_LAYER_ID layerId,
uint8_t value)

PLIB_GLCD_LayerIsEnabled Function

Verify whether Layer is enabled.

File

plib_glcd.h

C

```
bool PLIB_GLCD_LayerIsEnabled(GLCD_MODULE_ID index, GLCD_LAYER_ID layerId);
```

Returns

- true - The given Layer is enabled.
- false - The given Layer is disabled.

Description

This function verifies whether a given Layer is enabled.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if ( PLIB_GLCD_LayerIsEnabled( GLCD_MODULE_ID_0, GLCD_LAYER_0 ) )
{
    PLIB_GLCD_LayerDisable( GLCD_MODULE_ID_0, GLCD_LAYER_0 );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_LayerIsEnabled (GLCD_MODULE_ID index, GLCD_LAYER_ID layerId)

PLIB_GLCD_LayerPreMultiplyImageAlphaDisable Function

Disable Layer Pre-Multiply Image Alpha Feature.

File

plib_glcd.h

C

```
void PLIB_GLCD_LayerPreMultiplyImageAlphaDisable(GLCD_MODULE_ID index, GLCD_LAYER_ID layerId);
```

Returns

None.

Description

This function disables Layer Pre-Multiply Image Alpha Feature.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_GLCD_LayerPreMultiplyImageAlphaDisable( GLCD_MODULE_ID_0,
                                             GLCD_LAYER_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.
layerId	Identifier of the Graphics rendering layer.

Function

void PLIB_GLCD_LayerPreMultiplyImageAlphaDisable (GLCD_MODULE_ID index,
GLCD_LAYER_ID layerId)

PLIB_GLCD_LayerPreMultiplyImageAlphaEnable Function

Enable Layer Pre-Multiply Image Alpha Feature.

File

plib_glcd.h

C

```
void PLIB_GLCD_LayerPreMultiplyImageAlphaEnable(GLCD_MODULE_ID index, GLCD_LAYER_ID layerId);
```

Returns

None.

Description

This function enables the Layer Pre-Multiply Image Alpha Feature.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_GLCD_LayerPreMultiplyImageAlphaEnable( GLCD_MODULE_ID_0,
                                            GLCD_LAYER_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.
layerId	Identifier of the Graphics rendering layer.

Function

void PLIB_GLCD_LayerPreMultiplyImageAlphaEnable (GLCD_MODULE_ID index,
GLCD_LAYER_ID layerId)

PLIB_GLCD_LayerPreMultiplyImageAlphaIsEnabled Function

Verify whether the Layer Pre-Multiply Image Alpha Feature is enabled.

File

plib_glcd.h

C

```
bool PLIB_GLCD_LayerPreMultiplyImageAlphaIsEnabled(GLCD_MODULE_ID index, GLCD_LAYER_ID layerId);
```

Returns

- true - The Layer Pre-Multiply Image Alpha feature is enabled
- false - The Layer Pre-Multiply Image Alpha feature is disabled.

Description

This function verifies whether the Layer Pre-Multiply Image Alpha Feature is enabled.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if ( PLIB_GLCD_LayerPreMultiplyImageAlphaIsEnabled( GLCD_MODULE_ID_0,
                                                    GLCD_LAYER_0 ) )
{
    PLIB_GLCD_LayerPreMultiplyImageAlphaDisable( GLCD_MODULE_ID_0,
                                                 GLCD_LAYER_0 );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.
layerId	Identifier of the Graphics rendering layer.

Function

bool PLIB_GLCD_LayerPreMultiplyImageAlphaIsEnabled (GLCD_MODULE_ID index,
GLCD_LAYER_ID layerId)

PLIB_GLCD_LayerResXGet Function

Gets the Layer X Axis Resolution.

File

plib_glcd.h

C

```
uint32_t PLIB_GLCD_LayerResXGet(GLCD_MODULE_ID index, GLCD_LAYER_ID layerId);
```

Returns

- value of layer x axis resolution.

Description

This function gets the Layer X Axis Resolution.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
uint32_t resolutionX;

resolutionX = PLIB_GLCD_LayerResXGet( GLCD_MODULE_ID_0
                                      GLCD_LAYER_0  );
```

Parameters

Parameters	Description
index	Identifier of the device instance.
layerId	Identifier of the Graphics rendering layer.

Function

uint32_t PLIB_GLCD_LayerResXGet(GLCD_MODULE_ID index, GLCD_LAYER_ID layerId)

PLIB_GLCD_LayerResXYSet Function

Sets the layer resolution in pixels.

File

plib_glcd.h

C

```
void PLIB_GLCD_LayerResXYSet(GLCD_MODULE_ID index, GLCD_LAYER_ID layerId, uint32_t resolutionX, uint32_t
resolutionY);
```

Returns

None.

Description

This function sets the layer resolution in pixels. The resolution is defined as the number of pixels on the x axis and the number of pixels on the y

axis.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
// Layer resolution set to x = 320 pixels and y = 240 pixels
PLIB_GLCD_Layer_ResXY_Set( GLCD_MODULE_ID_0, GLCD_LAYER_0, 320, 240);
```

Parameters

Parameters	Description
index	Identifier of the device instance.
layerId	Identifier of the Graphics rendering layer.
resolutionX	resolution on x axis in terms of pixels.
resolutionY	resolution on y axis in terms of pixels.

Function

void PLIB_GLCD_LayerResXYSet(GLCD_MODULE_ID index,
GLCD_LAYER_ID layerId,
uint32_t resolutionX,
uint32_t resolutionY)

PLIB_GLCD_LayerResYGet Function

Gets the Layer Y Axis Resolution.

File

plib_glcd.h

C

```
uint32_t PLIB_GLCD_LayerResYGet(GLCD_MODULE_ID index, GLCD_LAYER_ID layerId);
```

Returns

- value of layer y axis resolution.

Description

This function gets the Layer Y Axis Resolution.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
uint32_t resolutionY;

resolutionY = PLIB_GLCD_LayerResYGet( GLCD_MODULE_ID_0
                                      GLCD_LAYER_0  );
```

Parameters

Parameters	Description
index	Identifier of the device instance.
layerId	Identifier of the Graphics rendering layer.

Function

uint32_t PLIB_GLCD_LayerResYGet(GLCD_MODULE_ID index, GLCD_LAYER_ID layerId)

PLIB_GLCD_LayerSizeXGet Function

Gets the Layer X Axis Size.

File

plib_glcd.h

C

```
uint32_t PLIB_GLCD_LayerSizeXGet(GLCD_MODULE_ID index, GLCD_LAYER_ID layerId);
```

Returns

- Layer Size X value.

Description

This function gets the Layer X Axis Size.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
uint32_t sizeX;

startX  = PLIB_GLCD_LayerSizeXGet( GLCD_MODULE_ID_0
                                   GLCD_LAYER_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.
layerId	Identifier of the Graphics rendering layer.

Function

uint32_t PLIB_GLCD_LayerSizeXGet(GLCD_MODULE_ID index, GLCD_LAYER_ID layerId)

PLIB_GLCD_LayerSizeXYSet Function

Sets the layer size x and size y of the Graphics LCD Controller.

File

plib_glcd.h

C

```
void PLIB_GLCD_LayerSizeXYSet(GLCD_MODULE_ID index, GLCD_LAYER_ID layerId, uint32_t sizeX, uint32_t sizeY);
```

Returns

None.

Description

This function sets the layer start x and start y of the Graphics LCD Controller.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
// set layer size to (640, 480)
PLIB_GLCD_LayerSizeXYSet( GLCD_MODULE_ID_0, GLCD_LAYER_0, 640, 480);
```

Parameters

Parameters	Description
index	Identifier of the device instance.
layerId	Identifier of the Graphics rendering layer.
sizeX	Layer size on x axis in terms of pixels.
sizeY	Layer size on y axis in terms of pixels.

Function

void PLIB_GLCD_LayerSizeXYSet(GLCD_MODULE_ID index,
GLCD_LAYER_ID layerId,
uint32_t sizeX,
uint32_t sizeY)

PLIB_GLCD_LayerSizeYGet Function

Gets the Layer Y Axis Size.

File

plib_glcd.h

C

```
uint32_t PLIB_GLCD_LayerSizeYGet(GLCD_MODULE_ID index, GLCD_LAYER_ID layerId);
```

Returns

- Layer Size Y value.

Description

This function gets the Layer Y Axis Size.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
uint32_t sizeY;

sizeY   = PLIB_GLCD_LayerSizeYGet( GLCD_MODULE_ID_0
                                   GLCD_LAYER_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.
layerId	Identifier of the Graphics rendering layer.

Function

uint32_t PLIB_GLCD_LayerSizeYGet(GLCD_MODULE_ID index, GLCD_LAYER_ID layerId)

PLIB_GLCD_LayerSrcBlendFuncGet Function

Gets the Layer Source Blend Function.

File

plib_glcd.h

C

```
GLCD_LAYER_SRC_BLEND_FUNC PLIB_GLCD_LayerSrcBlendFuncGet(GLCD_MODULE_ID index, GLCD_LAYER_ID layerId);
```

Returns

- GLCD_LAYER_SRC_BLEND_BLACK - Source Blend Function set to Black = 0.
- GLCD_LAYER_SRC_BLEND_WHITE - Source Blend Function set to White = 255.
- GLCD_LAYER_SRC_BLEND_ALPHA_SRC - Source Blend Function set to Source Alpha.
- GLCD_LAYER_SRC_BLEND_ALPHA_GBL - Source Blend Function set to Global Alpha.
- GLCD_LAYER_SRC_BLEND_ALPHA_SRCGBL - Source Blend Function set to (Source Alpha * Global Alpha).
- GLCD_LAYER_SRC_BLEND_INV_SRC - Source Blend Function set to (1 - Source Alpha).
- GLCD_LAYER_SRC_BLEND_INV_GBL - Source Blend Function set to (1 - Global Alpha).
- GLCD_LAYER_SRC_BLEND_INV_SRCGBL - Source Blend Function set to (1 - (Source Alpha * Global Alpha))
- GLCD_LAYER_SRC_BLEND_ALPHA_DST - Source Blend Function set to Destination Alpha
- GLCD_LAYER_SRC_BLEND_INV_DST - Source Blend Function set to (1 - Destination Alpha)

Description

This function gets the Layer Source Blend Function.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
uint32_t srcBlendFunc;

srcBlendFunc = PLIB_GLCD_LayerSrcBlendFuncGet( GLCD_MODULE_ID_0
                                               GLCD_LAYER_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.
layerId	Identifier of the Graphics rendering layer.

Function

GLCD_LAYER_SRC_BLEND_FUNC PLIB_GLCD_LayerSrcBlendFuncGet(GLCD_MODULE_ID index,
GLCD_LAYER_ID layerId)

PLIB_GLCD_LayerSrcBlendFuncSet Function

Sets the layer source blend function of the Graphics LCD Controller.

File

plib_glcd.h

C

```
void PLIB_GLCD_LayerSrcBlendFuncSet(GLCD_MODULE_ID index, GLCD_LAYER_ID layerId, GLCD_LAYER_SRC_BLEND_FUNC
blendFunc);
```

Returns

None.

Description

This function sets the layer source blend function of the Graphics LCD Controller.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_GLCD_LayerSrcBlendFuncSet( GLCD_MODULE_ID_0, GLCD_LAYER_0,
```

```
                                    GLCD_BLEND_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.
layerId	Identifier of the Graphics rendering layer.
blendFunc	Blend function defined by GLCD_LAYER_BLEND_FUNCTION.

Function

```
void PLIB_GLCD_LayerSrcBlendFuncSet(  GLCD_MODULE_ID          index,
                                      GLCD_LAYER_ID           layerId,
                                      GLCD_LAYER_SRC_BLEND_FUNC  blendFunc )
```

PLIB_GLCD_LayerStartXGet Function

Gets the Layer X Axis Start Position.

File

plib_glcd.h

C

```
uint32_t PLIB_GLCD_LayerStartXGet(GLCD_MODULE_ID index, GLCD_LAYER_ID layerId);
```

Returns

- Layer Start X value.

Description

This function gets the Layer X Axis Start Position.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
uint32_t startX;

startX  = PLIB_GLCD_LayerStartXGet( GLCD_MODULE_ID_0
                                    GLCD_LAYER_0    );
```

Parameters

Parameters	Description
index	Identifier of the device instance.
layerId	Identifier of the Graphics rendering layer.

Function

```
uint32_t PLIB_GLCD_LayerStartXGet(  GLCD_MODULE_ID index,
                                    GLCD_LAYER_ID  layerId );
```

PLIB_GLCD_LayerStartXYSet Function

Sets the layer start x and start y of the Graphics LCD Controller.

File

plib_glcd.h

C

```
void PLIB_GLCD_LayerStartXYSet(GLCD_MODULE_ID index, GLCD_LAYER_ID layerId, uint32_t startX, uint32_t
startY);
```

Returns

None.

Description

This function sets the layer start x and start y of the Graphics LCD Controller.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None

Example

```
// set layer start to (20, 20)
PLIB_GLCD_LayerStartXYSet( GLCD_MODULE_ID_0, GLCD_LAYER_0, 20, 20);
```

Parameters

Parameters	Description
index	Identifier of the device instance.
layerId	Identifier of the Graphics rendering layer.
startX	Layer start on x axis in terms of pixels.
startY	Layer start on y axis in terms of pixels.

Function

```
void PLIB_GLCD_LayerStartXYSet(    GLCD_MODULE_ID index,
                                   GLCD_LAYER_ID  layerId,
uint32_t      startX,
uint32_t      startY )
```

PLIB_GLCD_LayerStartYGet Function

Gets the Layer Y Axis Start Position.

File

plib_glcd.h

C

```
uint32_t PLIB_GLCD_LayerStartYGet(GLCD_MODULE_ID index, GLCD_LAYER_ID layerId);
```

Returns

- Layer Start Y value.

Description

This function gets the Layer Y Axis Start Position.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
uint32_t startY;

startY  = PLIB_GLCD_LayerStartYGet( GLCD_MODULE_ID_0
                                    GLCD_LAYER_0    );
```

Parameters

Parameters	Description
index	Identifier of the device instance.

layerId	Identifier of the Graphics rendering layer.

Function

uint32_t PLIB_GLCD_LayerStartYGet(GLCD_MODULE_ID index,
GLCD_LAYER_ID layerId);

PLIB_GLCD_LayerStrideGet Function

Gets the Layer Stride value.

File

plib_glcd.h

C

```
uint32_t PLIB_GLCD_LayerStrideGet(GLCD_MODULE_ID index, GLCD_LAYER_ID layerId);
```

Returns

- value of the stride.

Description

This function gets the Layer Stride value.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
uint32_t layerStride;

layerStride = PLIB_GLCD_LayerStrideGet( GLCD_MODULE_ID_0
                                        GLCD_LAYER_0    );
```

Parameters

Parameters	Description
index	Identifier of the device instance.
layerId	Identifier of the Graphics rendering layer.

Function

uint32_t PLIB_GLCD_LayerStrideGet(GLCD_MODULE_ID index, GLCD_LAYER_ID layerId)

PLIB_GLCD_LayerStrideSet Function

Sets the layer surface stride of the Graphics LCD Controller.

File

plib_glcd.h

C

```
void PLIB_GLCD_LayerStrideSet(GLCD_MODULE_ID index, GLCD_LAYER_ID layerId, uint32_t stride);
```

Returns

None.

Description

This function sets the layer surface stride of the Graphics LCD Controller.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
uint32_t imageStride = IMAGE_WIDTH * IMAGE_BYTES_PER_PIXEL;

// To make stride 4 byte aligned
imageStride += ( imageStride % 4 );

PLIB_GLCD_LayerStrideSet( GLCD_MODULE_ID_0, GLCD_LAYER_0,
                          imageStride );
```

Parameters

Parameters	Description
index	Identifier of the device instance.
layerId	Identifier of the Graphics rendering layer.
stride	line width in bytes including padding.

Function

void PLIB_GLCD_LayerStrideSet(GLCD_MODULE_ID index,
GLCD_LAYER_ID layerId,
uint32_t stride)

e) Hardware Cursor Control and Management Functions

PLIB_GLCD_CursorDataGet Function

Gets the Cursor Data at given Index.

File

plib_glcd.h

C

```
uint32_t PLIB_GLCD_CursorDataGet(GLCD_MODULE_ID index, uint32_t dataIndex);
```

Returns

- value of the 8 pixels of the cursor at given index.

Description

This function gets the Cursor Data at given Index.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
uint32_t cursorData;

cursorData = PLIB_GLCD_CursorDataGet( GLCD_MODULE_ID_0,
                                      MY_CURSOR_DATA_INDEX );
```

Parameters

Parameters	Description
index	Identifier of the device instance.
dataIndex	Index of the Cursor data.

Function

uint32_t PLIB_GLCD_CursorDataGet(GLCD_MODULE_ID index, uint32_t dataIndex)

PLIB_GLCD_CursorDataSet Function

Sets the cursor image data.

File

plib_glcd.h

C

```
void PLIB_GLCD_CursorDataSet(GLCD_MODULE_ID index, uint32_t * cursorData);
```

Returns

None.

Description

This function sets the cursor image data. The image data format is 4-bit black, white and 50 percent gray color.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
uint32_t *cursorData = cursorDataAddress;

// Set cursor data in the format: 4-bit CLUT Index
PLIB_GLCD_CursorDataSet( GLCD_MODULE_ID_0, cursorData );
```

Parameters

Parameters	Description
index	Identifier of the device instance.
cursorData	pointer to cursor data in the format 4-bit CLUT Index.

Function

void PLIB_GLCD_CursorDataSet(GLCD_MODULE_ID index, uint32_t * cursorData)

PLIB_GLCD_CursorDisable Function

Disables the cursor of the Graphics LCD Controller.

File

plib_glcd.h

C

```
void PLIB_GLCD_CursorDisable(GLCD_MODULE_ID index);
```

Returns

None.

Description

This function disables the cursor of the Graphics LCD Controller.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if ( PLIB_GLCD_ExistsCursor( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_CursorDisable( GLCD_MODULE_ID_0 );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

void PLIB_GLCD_CursorDisable(GLCD_MODULE_ID index)

PLIB_GLCD_CursorEnable Function

Enables the cursor of the Graphics LCD Controller.

File

plib_glcd.h

C

```
void PLIB_GLCD_CursorEnable(GLCD_MODULE_ID index);
```

Returns

None.

Description

This function enables the cursor of the Graphics LCD Controller.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if ( PLIB_GLCD_ExistsCursor( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_CursorEnable( GLCD_MODULE_ID_0 );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

void PLIB_GLCD_CursorEnable(GLCD_MODULE_ID index)

PLIB_GLCD_CursorIsEnabled Function

Verifies whether the cursor is enabled.

File

plib_glcd.h

C

```
bool PLIB_GLCD_CursorIsEnabled(GLCD_MODULE_ID index);
```

Returns

- true - Cursor is enabled.
- false - Cursor is disabled.

Description

This function verifies whether the cursor is enabled.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if ( PLIB_GLCD_CursorIsEnabled( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_CursorDisable( GLCD_MODULE_ID_0 );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_CursorIsEnabled (GLCD_MODULE_ID index)

PLIB_GLCD_CursorLUTGet Function

Gets the color from Cursor LUT at given Index.

File

plib_glcd.h

C

```
uint32_t PLIB_GLCD_CursorLUTGet(GLCD_MODULE_ID index, uint32_t lutIndex);
```

Returns

- value of color from color LUT at given index.

Description

This function gets the color from Cursor LUT at given Index.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
uint32_t cursorLUTColor;

cursorLUTColor = PLIB_GLCD_CursorLUTGet( GLCD_MODULE_ID_0,
                                         MY_CURSOR_CLUT_INDEX );
```

Parameters

Parameters	Description
index	Identifier of the device instance.
lutIndex	Cursor Color LUT index.

Function

uint32_t PLIB_GLCD_CursorLUTGet(GLCD_MODULE_ID index, uint32_t lutIndex)

PLIB_GLCD_CursorLUTSet Function

Sets the cursor color look-up table (LUT) in XRGB8888 format.

File

plib_glcd.h

C

```
void PLIB_GLCD_CursorLUTSet(GLCD_MODULE_ID index, uint32_t * cursorLUT);
```

Returns

None.

Description

This function sets the cursor color LUT of the Graphics LCD Controller in XRGB8888 format.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
uint32_t * cursorLUTColors = cursorLUTAddress;

PLIB_GLCD_CursorLUTSet( GLCD_MODULE_ID_0, cursorLUTColors );
```

Parameters

Parameters	Description
index	Identifier of the device instance.
cursorLUT	Pointer to the cursor color LUT in XRGB8888 format.

Function

void PLIB_GLCD_CursorLUTSet(GLCD_MODULE_ID index, uint32_t * cursorLUT)

PLIB_GLCD_CursorXGet Function

Gets the cursor X Axis Position.

File

plib_glcd.h

C

```
uint32_t PLIB_GLCD_CursorXGet(GLCD_MODULE_ID index);
```

Returns

- Cursor X Axis Position.

Description

This function gets the cursor X Axis Position.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
uint32_t cursorX;

cursorX = PLIB_GLCD_CursorXGet( GLCD_MODULE_ID_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

uint32_t PLIB_GLCD_CursorXGet(GLCD_MODULE_ID index)

PLIB_GLCD_CursorXYSet Function

Sets the x and y coordinates of the Graphics LCD Controller cursor.

File

plib_glcd.h

C

```
void PLIB_GLCD_CursorXYSet(GLCD_MODULE_ID index, uint32_t cursorX, uint32_t cursorY);
```

Returns

None.

Description

This function sets the x and y coordinates of the Graphics Display Controller cursor.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
// update cursor position at x:20 pixels and y:20 pixels
PLIB_GLCD_CursorXYSet( GLCD_MODULE_ID_0, 20, 20 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.
cursorX	cursor coordinate on x axis in terms of pixels.
cursorY	cursor coordinate on y axis in terms of pixels.

Function

void PLIB_GLCD_CursorXYSet(GLCD_MODULE_ID index,
uint32_t cursorX,
uint32_t cursorY)

PLIB_GLCD_CursorYGet Function

Gets the Cursor Y Axis Position.

File

plib_glcd.h

C

```
uint32_t PLIB_GLCD_CursorYGet(GLCD_MODULE_ID index);
```

Returns

- Cursor Y Axis Position.

Description

This function gets the Cursor Y Axis Position.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
uint32_t cursorY;

cursorY = PLIB_GLCD_CursorYGet( GLCD_MODULE_ID_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

uint32_t PLIB_GLCD_CursorYGet(GLCD_MODULE_ID index)

f) Palette and Gamma Correction Control Functions

PLIB_GLCD_GlobalColorLUTGet Function

Gets the Color from Global Color LUT at given Index.

File

plib_glcd.h

C

```
uint32_t PLIB_GLCD_GlobalColorLUTGet(GLCD_MODULE_ID index, uint32_t lutIndex);
```

Returns

- value of Color from the Color Lookup Table.

Description

This function gets the Color from Global Color LUT at given Index.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
uint32_t lutColor;

lutColor = PLIB_GLCD_GlobalColorLUTGet( GLCD_MODULE_ID_0,
                                        MY_LUT_COLOR_INDEX );
```

Parameters

Parameters	Description
index	Identifier of the device instance.
lutIndex	Color Lookup table index.

Function

uint32_t PLIB_GLCD_GlobalColorLUTGet(GLCD_MODULE_ID index, uint32_t lutIndex)

PLIB_GLCD_GlobalColorLUTSet Function

Set Global Color LUT.

File

plib_glcd.h

C

```
void PLIB_GLCD_GlobalColorLUTSet(GLCD_MODULE_ID index, uint32_t * globalLUT);
```

Returns

None.

Description

This function sets the Global Color LUT.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
uint32_t globalColorLUT[256] = { // Initial values
                               };
PLIB_GLCD_GlobalColorLUTSet( GLCD_MODULE_ID_0, globalColorLUT );
```

Parameters

Parameters	Description
index	Identifier of the device instance.
globalLUT	pointer of the Global Color Lookup table data array.

Function

void PLIB_GLCD_GlobalColorLUTSet(GLCD_MODULE_ID index, uint32_t *globalLUT)

PLIB_GLCD_PaletteGammaRampDisable Function

Disables the palette / gamma ramp of the Graphics LCD Controller.

File

plib_glcd.h

C

```
void PLIB_GLCD_PaletteGammaRampDisable(GLCD_MODULE_ID index);
```

Returns

None.

Description

This function disables the palette / gamma ramp of the Graphics LCD Controller.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_GLCD_PaletteGammaRampDisable( GLCD_MODULE_ID_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

void PLIB_GLCD_PaletteGammaRampDisable(GLCD_MODULE_ID index)

PLIB_GLCD_PaletteGammaRampEnable Function

Enables the palette / gamma ramp of the Graphics LCD Controller.

File

plib_glcd.h

C

```
void PLIB_GLCD_PaletteGammaRampEnable(GLCD_MODULE_ID index);
```

Returns

None.

Description

This function enables the palette / gamma ramp of the Graphics LCD Controller.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_GLCD_PaletteGammaRampEnable( GLCD_MODULE_ID_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

void PLIB_GLCD_PaletteGammaRampEnable(GLCD_MODULE_ID index)

PLIB_GLCD_PaletteGammaRampIsEnabled Function

Verify whether Palette / Gamma Ramp feature is enabled.

File

plib_glcd.h

C

```
bool PLIB_GLCD_PaletteGammaRampIsEnabled(GLCD_MODULE_ID index);
```

Returns

- true - The palette / gamma ramp feature is enabled.
- false - The palette / gamma ramp feature is disabled.

Description

This function verifies whether Palette / Gamma Ramp feature is enabled.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if( PLIB_GLCD_PaletteGammaRampIsEnabled( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_PaletteGammaRampDisable( GLCD_MODULE_ID_0 );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_PaletteGammaRampIsEnabled(GLCD_MODULE_ID index)

g) Interrupt Control Functions

PLIB_GLCD_HSyncInterruptDisable Function

Disables interrupts at Hsync.

File

plib_glcd.h

C

```
void PLIB_GLCD_HSyncInterruptDisable(GLCD_MODULE_ID index);
```

Returns

None.

Description

This function disables interrupts at Hsync.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_GLCD_HsyncInterruptDisable( GLCD_MODULE_ID_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

void PLIB_GLCD_HSyncInterruptDisable(GLCD_MODULE_ID index)

PLIB_GLCD_HSyncInterruptEnable Function

Enables interrupts at Hsync.

File

plib_glcd.h

C

```
void PLIB_GLCD_HSyncInterruptEnable(GLCD_MODULE_ID index);
```

Returns

None.

Description

This function enables interrupts at Hsync.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_GLCD_HSyncInterruptEnable( GLCD_MODULE_ID_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

void PLIB_GLCD_HSyncInterruptEnable(GLCD_MODULE_ID index)

PLIB_GLCD_HSyncInterruptIsEnabled Function

Verify whether HSYNC Interrupt is enabled.

File

plib_glcd.h

C

```
bool PLIB_GLCD_HSyncInterruptIsEnabled(GLCD_MODULE_ID index);
```

Returns

- true - The HSYNC Interrupt feature is enabled.
- false - The HSYNC Interrupt feature is disabled.

Description

This function verifies whether HSYNC Interrupt is enabled.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if ( PLIB_GLCD_HSyncInterruptIsEnabled( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_HSyncInterruptDisable( GLCD_MODULE_ID_0 );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_HSyncInterruptIsEnabled(GLCD_MODULE_ID index)

PLIB_GLCD_HSyncSignalLevelGet Function

Gets the Hsync signal level.

File

plib_glcd.h

C

```
bool PLIB_GLCD_HSyncSignalLevelGet(GLCD_MODULE_ID index);
```

Returns

- true - The Hsync signal level is high.

- false - The Hsync signal level is low.

Description

This function returns the Hsync signal level.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if(!PLIB_GLCD_HSyncSignalLevelGet( GLCD_MODULE_ID_0 ));
{
    //Hsync signal level is low
    return;
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_HSyncSignalLevelGet(GLCD_MODULE_ID index)

PLIB_GLCD_IRQTriggerControlGet Function

Gets the IRQ Trigger Control value.

File

plib_glcd.h

C

```
GLCD_IRQ_TRIGGER_CONTROL PLIB_GLCD_IRQTriggerControlGet(GLCD_MODULE_ID index);
```

Returns

- GLCD_IRQ_TRIGGER_LEVEL - IRQ is Level Triggered.
- GLCD_IRQ_TRIGGER_EDGE - IRQ is edge Triggered.

Description

This function gets the IRQ Trigger Control value.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
uint32_t irqTrigger;

irqTrigger = PLIB_GLCD_IRQTriggerControlGet( GLCD_MODULE_ID_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

GLCD_IRQ_TRIGGER_CONTROL PLIB_GLCD_IRQTriggerControlGet(GLCD_MODULE_ID index)

PLIB_GLCD_IRQTriggerControlSet Function

Sets the IRQ trigger control.

File

plib_glcd.h

C

```
void PLIB_GLCD_IRQTriggerControlSet(GLCD_MODULE_ID index, GLCD_IRQ_TRIGGER_CONTROL irqControl);
```

Returns

None.

Description

This function sets the IRQ trigger control. IRQ trigger detection is defined at the edge or level of the trigger pulse.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
// Set trigger detection at edge
PLIB_GLCD_IRQTriggerControlSet( GLCD_MODULE_ID_0, GLCD_IRQ_TRIGGER_EDGE );
```

Parameters

Parameters	Description
index	Identifier of the device instance.
control	Trigger control defined by GLCD_IRQ_TRIGGER_CONTROL.

Function

void PLIB_GLCD_IRQTriggerControlSet(GLCD_MODULE_ID index,
GLCD_IRQ_TRIGGER_CONTROL irqControl)

PLIB_GLCD_VSyncInterruptDisable Function

Disables interrupts at Vsync.

File

plib_glcd.h

C

```
void PLIB_GLCD_VSyncInterruptDisable(GLCD_MODULE_ID index);
```

Returns

None.

Description

This function disables interrupts at Vsync.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_GLCD_VsyncInterruptDisable( GLCD_MODULE_ID_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

void PLIB_GLCD_VSyncInterruptDisable(GLCD_MODULE_ID index)

PLIB_GLCD_VSyncInterruptEnable Function

Enables interrupts at Vsync.

File

plib_glcd.h

C

```
void PLIB_GLCD_VSyncInterruptEnable(GLCD_MODULE_ID index);
```

Returns

None.

Description

This function enables interrupts at Vsync.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None

Example

```
PLIB_GLCD_VSyncInterruptEnable( GLCD_MODULE_ID_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

void PLIB_GLCD_VSyncInterruptEnable(GLCD_MODULE_ID index)

PLIB_GLCD_VSyncInterruptIsEnabled Function

Verify whether VSYNC Interrupt is enabled.

File

plib_glcd.h

C

```
bool PLIB_GLCD_VSyncInterruptIsEnabled(GLCD_MODULE_ID index);
```

Returns

- true - The VSYNC Interrupt feature is enabled.
- false - The VSYNC Interrupt feature is disabled.

Description

This function verifies whether the VSYNC Interrupt is enabled.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if ( PLIB_GLCD_VSyncInterruptIsEnabled( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_VSyncInterruptDisable( GLCD_MODULE_ID_0 );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_VSyncInterruptIsEnabled(GLCD_MODULE_ID index)

PLIB_GLCD_VSyncSignalLevelGet Function

Gets the Vsync signal level.

File

plib_glcd.h

C

```
bool PLIB_GLCD_VSyncSignalLevelGet(GLCD_MODULE_ID index);
```

Returns

- true - The Vsync signal level is high.
- false - The Vsync signal level is low.

Description

This function returns the Vsync signal level.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if(!PLIB_GLCD_VSyncSignalLevelGet( GLCD_MODULE_ID_0 ));
{
    //Vsync signal level is low
    return;
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_VSyncSignalLevelGet(GLCD_MODULE_ID index)

h) Miscellaneous Control Functions

PLIB_GLCD_DitheringDisable Function

Disables the Dithering feature of the Graphics LCD Controller.

File

plib_glcd.h

C

```
void PLIB_GLCD_DitheringDisable(GLCD_MODULE_ID index);
```

Returns

None.

Description

This function disables the Dithering feature of the Graphics LCD Controller.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_GLCD_DitheringDisable( GLCD_MODULE_ID_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

void PLIB_GLCD_DitheringDisable(GLCD_MODULE_ID index)

PLIB_GLCD_DitheringEnable Function

Enables the Dithering feature of the Graphics LCD Controller.

File

plib_glcd.h

C

```
void PLIB_GLCD_DitheringEnable(GLCD_MODULE_ID index);
```

Returns

None.

Description

This function enables the Dithering feature of the Graphics LCD Controller.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_GLCD_DitheringEnable( GLCD_MODULE_ID_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

void PLIB_GLCD_DitheringEnable(GLCD_MODULE_ID index)

PLIB_GLCD_ForceOutputBlankDisable Function

Disable Force Output Blank feature.

File

plib_glcd.h

C

```
void PLIB_GLCD_ForceOutputBlankDisable(GLCD_MODULE_ID index);
```

Returns

None.

Description

This function disables the Force Output Blank feature.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_GLCD_ForceOutputBlankDisable( GLCD_MODULE_ID_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

void PLIB_GLCD_ForceOutputBlankDisable(GLCD_MODULE_ID index)

PLIB_GLCD_ForceOutputBlankEnable Function

Enable Force Output Blank feature.

File

plib_glcd.h

C

```
void PLIB_GLCD_ForceOutputBlankEnable(GLCD_MODULE_ID index);
```

Returns

None.

Description

This function enables the Force Output Blank feature.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_GLCD_ForceOutputBlankEnable( GLCD_MODULE_ID_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

void PLIB_GLCD_ForceOutputBlankEnable(GLCD_MODULE_ID index)

PLIB_GLCD_SingleCyclePerLineVsyncDisable Function

Clears VSYNC on single cycle per line.

File

plib_glcd.h

C

```
void PLIB_GLCD_SingleCyclePerLineVsyncDisable(GLCD_MODULE_ID index);
```

Returns

None.

Description

This function clears VSYNC on single cycle per line.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_GLCD_SingleCyclePerLineVsyncClear( GLCD_MODULE_ID_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

void PLIB_GLCD_SingleCyclePerLineVsyncClear(GLCD_MODULE_ID index)

PLIB_GLCD_SingleCyclePerLineVsyncEnable Function

Sets VSYNC on single cycle per line.

File

plib_glcd.h

C

```
void PLIB_GLCD_SingleCyclePerLineVsyncEnable(GLCD_MODULE_ID index);
```

Returns

None.

Description

This function sets VSYNC on single cycle per line.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_GLCD_SingleCyclePerLineVsyncEnable( GLCD_MODULE_ID_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

void PLIB_GLCD_SingleCyclePerLineVsyncSet(GLCD_MODULE_ID index)

PLIB_GLCD_SingleCyclePerLineVsyncIsEnabled Function

Verify whether VSYNC on Single Cycle Per Line feature is enabled.

File

plib_glcd.h

C

```
bool PLIB_GLCD_SingleCyclePerLineVsyncIsEnabled(GLCD_MODULE_ID index);
```

Returns

- true - VSYNC on Single Cycle Per Line is enabled.
- false - VSYNC on Single Cycle Per Line is disabled.

Description

This function verifies whether VSYNC on Single Cycle Per Line feature is enabled.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if(PLIB_GLCD_SingleCyclePerLineVsyncIsEnabled(GLCD_MODULE_ID_0))
{
    PLIB_GLCD_SingleCyclePerLineVsyncDisable(GLCD_MODULE_ID_0);
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_SingleCyclePerLineVsyncIsEnabled(GLCD_MODULE_ID index)

PLIB_GLCD_YUVOutputDisable Function

Disables the output of the Graphics LCD Controller in YUV format.

File

plib_glcd.h

C

```
void PLIB_GLCD_YUVOutputDisable(GLCD_MODULE_ID index);
```

Returns

None.

Description

This function Disables the output of the Graphics LCD Controller in YUV format.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_GLCD_YUVOutputDisable( GLCD_MODULE_ID_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

void PLIB_GLCD_YUVOutputDisable(GLCD_MODULE_ID index)

PLIB_GLCD_YUVOutputEnable Function

Enables the output of the Graphics LCD Controller in YUV format.

File

plib_glcd.h

C

```
void PLIB_GLCD_YUVOutputEnable(GLCD_MODULE_ID index);
```

Returns

None.

Description

This function enables the output of the Graphics LCD Controller in YUV format.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
PLIB_GLCD_YUVOutputEnable( GLCD_MODULE_ID_0 );
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

void PLIB_GLCD_YUVOutputEnable(GLCD_MODULE_ID index)

PLIB_GLCD_DESignalLevelGet Function

Gets the display enable signal level.

File

plib_glcd.h

C

```
bool PLIB_GLCD_DESignalLevelGet(GLCD_MODULE_ID index);
```

Returns

- true - The DE signal level high.
- false - The DE signal level low.

Description

This function returns the display enable (DE) signal of the Graphics LCD Controller.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if(!PLIB_GLCD_DESignalLevelGet( GLCD_MODULE_ID_0 ));
{
    //DE signal low
    return;
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_DESignalLevelGet(GLCD_MODULE_ID index)

PLIB_GLCD_DitheringIsEnabled Function

Verifies whether Dithering is enabled.

File

plib_glcd.h

C

```
bool PLIB_GLCD_DitheringIsEnabled(GLCD_MODULE_ID index);
```

Returns

- true - The Dithering feature is enabled.
- false - The Dithering feature is disabled.

Description

This function verifies whether Dithering is enabled.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if(PLIB_GLCD_DitheringIsEnabled(GLCD_MODULE_ID_0 ))
{
    PLIB_GLCD_DitheringDisable( GLCD_MODULE_ID_0 );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_DitheringIsEnabled(GLCD_MODULE_ID index)

PLIB_GLCD_ForceOutputBlankIsEnabled Function

Verify whether the Force Output Blank feature is enabled.

File

plib_glcd.h

C

```
bool PLIB_GLCD_ForceOutputBlankIsEnabled(GLCD_MODULE_ID index);
```

Returns

- true - The Force Output Blank feature is enabled.
- false - The Force Output Blank feature is disabled.

Description

This function verifies whether the Force Output Blank feature is enabled.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if ( PLIB_GLCD_ForceOutputBlankIsEnabled( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_ForceOutputBlankDisable( GLCD_MODULE_ID_0 );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_ForceOutputBlankIsEnabled(GLCD_MODULE_ID index)

PLIB_GLCD_IsEnabled Function

Verifies whether the Graphics LCD Controller is Enabled.

File

plib_glcd.h

C

```
bool PLIB_GLCD_IsEnabled(GLCD_MODULE_ID index);
```

Returns

- true - Graphics LCD Controller is Enabled
- false - Graphics LCD Controller is Disabled

Description

This function verifies whether the Graphics LCD Controller is Enabled.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if ( PLIB_GLCD_IsEnabled( GLCD_MODULE_ID_0 ) )
```

```
{
    PLIB_GLCD_Disable( GLCD_MODULE_ID_0 );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_IsEnabled (GLCD_MODULE_ID index)

PLIB_GLCD_IsLastRow Function

Gets the status indicating whether a last row is currently displayed by the Graphics Display Controller.

File

plib_glcd.h

C

```
bool PLIB_GLCD_IsLastRow(GLCD_MODULE_ID index);
```

Returns

- true - The last row is currently displayed.
- false - The last row is not currently displayed.

Description

This function returns the status indicating whether a last row is currently displayed by the Graphics LCD Controller.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if(!PLIB_GLCD_IsLastRow( GLCD_MODULE_ID_0 ));
{
    // The last row is not currently displayed
    return;
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_IsLastRow(GLCD_MODULE_ID index)

PLIB_GLCD_IsVerticalBlankingActive Function

Get the active status.

File

plib_glcd.h

C

```
bool PLIB_GLCD_IsVerticalBlankingActive(GLCD_MODULE_ID index);
```

Returns

- true - The Vertical Blanking is active.
- false - The Vertical Blanking is inactive.

Description

This function returns the active status of the Graphics LCD Controller.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if( PLIB_GLCD_IsVerticalBlankingActive( GLCD_MODULE_ID_0 ) )
{
    //GLCD Vertical Blanking active
    return;
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_IsVerticalBlankingActive(GLCD_MODULE_ID index)

PLIB_GLCD_RGBSequentialModeGet Function

Get the RGB Sequential Mode already set.

File

plib_glcd.h

C

```
GLCD_RGB_MODE PLIB_GLCD_RGBSequentialModeGet(GLCD_MODULE_ID index);
```

Returns

- GLCD_RGB_MODE_PARALLEL_RGB565 - Parallel RGB 565 Mode
- GLCD_RGB_MODE_PARALLEL_RGB888 - Parallel RGB 888 Mode
- GLCD_RGB_MODE_SERIAL_RGB_3 - Byte Serial RGB 3 Mode
- GLCD_RGB_MODE_SERIAL_RGBA_4 - Byte Serial RGB 4 Mode
- GLCD_RGB_MODE_SERIAL_12BIT - Byte Two-Phase 12-bit Mode
- GLCD_RGB_MODE_YUYV_16BIT - YUYV 16 bit Mode
- GLCD_RGB_MODE_BT_656 - BT 656 Mode

Description

This function gets the RGB Sequential Mode already set.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
uint32_t rgbMode;

rgbMode = PLIB_GLCD_RGBSequentialModeGet( GLCD_MODULE_ID_0 );

if( rgbMode == GLCD_RGB_MODE_PARALLEL_RGB565 )
{
    // RGB Mode set to RGB 565 format
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

GLCD_RGB_MODE PLIB_GLCD_RGBSequentialModeGet(GLCD_MODULE_ID index)

PLIB_GLCD_YUVOutputIsEnabled Function

Verify whether the YUV Output feature is enabled.

File

plib_glcd.h

C

```
bool PLIB_GLCD_YUVOutputIsEnabled(GLCD_MODULE_ID index);
```

Returns

- true - The YUV output feature is enabled.
- false - The YUV output feature is disabled.

Description

This function verifies whether the YUV Output feature is enabled.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if ( PLIB_GLCD_YUVOutputIsEnabled( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_YUVOutputDisable( GLCD_MODULE_ID_0 );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_YUVOutputIsEnabled(GLCD_MODULE_ID index)

i) Feature Existence Functions

PLIB_GLCD_ExistsBackgroundColor Function

Verify whether the Background Color Feature is supported.

File

plib_glcd.h

C

```
bool PLIB_GLCD_ExistsBackgroundColor(GLCD_MODULE_ID index);
```

Returns

- true - The Background Color feature is supported.
- false - The Background Color feature is not supported.

Description

This function verifies whether the Background Color Feature is supported.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if( PLIB_GLCD_ExistsBackgroundColor( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_BackgroundColorSet( GLCD_MODULE_ID_0,
                                  MY_BACKGROUND_COLOR_VALUE );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_ExistsBackgroundColor(GLCD_MODULE_ID index)

PLIB_GLCD_ExistsBackPorchXY Function

Verify whether Back Porch Feature is supported.

File

plib_glcd.h

C

```
bool PLIB_GLCD_ExistsBackPorchXY(GLCD_MODULE_ID index);
```

Returns

- true - The Back Porch feature is supported.
- false - The Back Porch feature is not supported.

Description

This function verifies whether Back Porch Feature is supported.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if( PLIB_GLCD_ExistsBackPorchXY( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_BackPorchXYSet( GLCD_MODULE_ID_0,
                              MY_BACK_PORCH_X_VALUE,
                              MY_BACK_PORCH_Y_VALUE );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_ExistsBackPorchXY(GLCD_MODULE_ID index)

PLIB_GLCD_ExistsBlankingXY Function

Verify whether Blanking Period Feature is supported.

File

plib_glcd.h

C

```
bool PLIB_GLCD_ExistsBlankingXY(GLCD_MODULE_ID index);
```

Returns

- true - The Blanking feature is supported.
- false - The Blanking feature is not supported.

Description

This function verifies whether Blanking Period Feature is supported.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if( PLIB_GLCD_ExistsBlankingXY( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_BlankingXYSet( GLCD_MODULE_ID_0,
                             MY_BLANKING_PERIOD_X_VALUE,
                             MY_BLANKING_PERIOD_Y_VALUE );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_ExistsBlankingXY(GLCD_MODULE_ID index)

PLIB_GLCD_ExistsClockDivider Function

Verify whether the Clock Divider feature is supported.

File

plib_glcd.h

C

```
bool PLIB_GLCD_ExistsClockDivider(GLCD_MODULE_ID index);
```

Returns

- true - The Clock divide feature is supported.
- false - The Clock divide feature is not supported.

Description

This function verifies whether the Clock Divider feature is supported.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if( PLIB_GLCD_ExistsClockDivider( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_ClockDividerSet( GLCD_MODULE_ID_0, MY_CLOCK_DIVIDER_VALUE );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_ExistsClockDivider(GLCD_MODULE_ID index)

PLIB_GLCD_ExistsCursor Function

Verifies whether the cursor feature exists.

File

plib_glcd.h

C

```
bool PLIB_GLCD_ExistsCursor(GLCD_MODULE_ID index);
```

Returns

- true - Cursor feature exists.
- false - Cursor feature does not exits.

Description

This function verifies whether the cursor feature exists.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if ( PLIB_GLCD_ExistsCursor( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_CursorEnable( GLCD_MODULE_ID_0 );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_ExistsCursor(GLCD_MODULE_ID index)

PLIB_GLCD_ExistsCursorData Function

File

plib_glcd.h

C

```
bool PLIB_GLCD_ExistsCursorData(GLCD_MODULE_ID index);
```

Returns

- true - The Cursor Data feature is supported.
- false - The Cursor Data feature is not supported.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if( PLIB_GLCD_ExistsCursorData( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_CursorDataSet( GLCD_MODULE_ID_0,
                             MY_CURSOR_DATA_POINTER_VALUE );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_ExistsCursorData(GLCD_MODULE_ID index)

PLIB_GLCD_ExistsCursorLUT Function

Verify whether Cursor LUT feature is supported.

File

plib_glcd.h

C

```
bool PLIB_GLCD_ExistsCursorLUT(GLCD_MODULE_ID index);
```

Returns

- true - The Cursor LUT feature is supported.
- false - The Cursor LUT feature is not supported.

Description

This function verifies whether Cursor LUT feature is supported.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if( PLIB_GLCD_ExistsCursorLUT( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_CursorLUTSet( GLCD_MODULE_ID_0,
                            MY_CURSOR_LUT_DATA_POINTER_VALUE );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_ExistsCursorLUT(GLCD_MODULE_ID index)

PLIB_GLCD_ExistsCursorXY Function

Verify whether Cursor XY Position feature is supported.

File

plib_glcd.h

C

```
bool PLIB_GLCD_ExistsCursorXY(GLCD_MODULE_ID index);
```

Returns

- true - The Cursor Position feature is supported.
- false - The Cursor Position feature is not supported.

Description

This function verifies whether Cursor XY Position feature is supported.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if( PLIB_GLCD_ExistsCursorXY( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_CursorXYSet( GLCD_MODULE_ID_0,
                           MY_CURSOR_POSITION_X_VALUE,
                           MY_CURSOR_POSITION_Y_VALUE );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_ExistsCursorXY(GLCD_MODULE_ID index)

PLIB_GLCD_ExistsDESignalLevel Function

Verify whether DE Signal Level feature is supported.

File

plib_glcd.h

C

```
bool PLIB_GLCD_ExistsDESignalLevel(GLCD_MODULE_ID index);
```

Returns

- true - The DE Signal Level feature is supported.
- false - The DE Signal Level feature is not supported.

Description

This function verifies whether DE Signal Level feature is supported.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if( PLIB_GLCD_ExistsDESignalLevel( GLCD_MODULE_ID_0 ) )
{
    if( PLIB_GLCD_DESignalLevelGet( GLCD_MODULE_ID_0 ) )
    {
```

```
            // DE Signal Level High
        }
    }
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_ExistsDESignalLevel(GLCD_MODULE_ID index)

PLIB_GLCD_ExistsDithering Function

Verifies whether the Dithering feature exists.

File

plib_glcd.h

C

```
bool PLIB_GLCD_ExistsDithering(GLCD_MODULE_ID index);
```

Returns

- true - The Dithering feature is supported on the device
- false - The Dithering feature is not supported on the device

Description

This function verifies whether the Dithering feature exists.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if ( PLIB_GLCD_ExistsDithering( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_DitheringEnable( GLCD_MODULE_ID_0 );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_ExistsDithering(GLCD_MODULE_ID index)

PLIB_GLCD_ExistsEnable Function

Identifies whether the GLCD Enable feature exists on the GLCD module.

File

plib_glcd.h

C

```
bool PLIB_GLCD_ExistsEnable(GLCD_MODULE_ID index);
```

Returns

- true - The GLCD Enable feature is supported on the device
- false - The GLCD Enable feature is not supported on the device

Description

This function identifies whether the GLCD Enable feature is available on the GLCD module. When this function returns true, these functions are supported on the device:

- PLIB_GLCD_Enable
- PLIB_GLCD_Disable

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if ( PLIB_GLCD_ExistsEnable( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_Enable( GLCD_MODULE_ID_0 );
}
```

Parameters

Parameters	Description
index	Identifier for the device instance

Function

bool PLIB_GLCD_ExistsEnable (GLCD_MODULE_ID index)

PLIB_GLCD_ExistsForceOutputBlank Function

Verify whether Force Output Blank feature is supported.

File

plib_glcd.h

C

```
bool PLIB_GLCD_ExistsForceOutputBlank(GLCD_MODULE_ID index);
```

Returns

- true - The force output blank feature supported
- false - The force output blank feature not supported

Description

This function verifies whether Force Output Blank feature is supported.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if( PLIB_GLCD_ExistsForceOutputBlank( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_ForceOutputBlankEnable( GLCD_MODULE_ID_0 );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_ExistsForceOutputBlank(GLCD_MODULE_ID index)

PLIB_GLCD_ExistsFormattingClockDivide Function

Verify whether Clock Formatting feature is available.

File

plib_glcd.h

C

```
bool PLIB_GLCD_ExistsFormattingClockDivide(GLCD_MODULE_ID index);
```

Returns

- true - The Clock formatting feature is supported.
- false - The Clock formatting feature is not supported.

Description

This function verifies whether Clock formatting feature is available.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if( PLIB_GLCD_ExistsFormattingClockDivide( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_FormattingClockDivideEnable( GLCD_MODULE_ID_0 );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_ExistsFormattingClockDivide(GLCD_MODULE_ID index)

PLIB_GLCD_ExistsFrontPorchXY Function

Verify whether Front Porch Feature is supported.

File

plib_glcd.h

C

```
bool PLIB_GLCD_ExistsFrontPorchXY(GLCD_MODULE_ID index);
```

Returns

- true - The Front Porch feature is supported.
- false - The Front Porch feature is not supported.

Description

This funtion verifies whether Front Porch Feature is supported.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if( PLIB_GLCD_ExistsFrontPorchXY( GLCD_MODULE_ID_0 ) )
```

```
{
    PLIB_GLCD_FrontPorchXYSet( GLCD_MODULE_ID_0,
                               MY_FRONT_PORCH_X_VALUE,
                               MY_FRONT_PORCH_Y_VALUE );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_ExistsFrontPorchXY(GLCD_MODULE_ID index)

PLIB_GLCD_ExistsGlobalColorLUT Function

Verify whether Global Color LUT feature is supported.

File

plib_glcd.h

C

```
bool PLIB_GLCD_ExistsGlobalColorLUT(GLCD_MODULE_ID index);
```

Returns

- true - The Global Color LUT feature is supported.
- false - The Global Color LUT feature is not supported.

Description

This function verifies whether Global Color LUT feature is supported.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if( PLIB_GLCD_ExistsGlobalColorLUT( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_GlobalColorLUTSet( GLCD_MODULE_ID_0,
                                 MY_GLOBAL_LUT_POINTER_VALUE );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_ExistsGlobalColorLUT(GLCD_MODULE_ID index)

PLIB_GLCD_ExistsHSyncInterruptEnable Function

Verify whether the HSYNC Interrupt Enable feature is supported.

File

plib_glcd.h

C

```
bool PLIB_GLCD_ExistsHSyncInterruptEnable(GLCD_MODULE_ID index);
```

Returns

- true - The HSYNC Interrupt Enable feature is supported.

- false - The HSYNC Interrupt Enable feature is not supported.

Description

This function verifies whether the HSYNC Interrupt Enable feature is supported.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if( PLIB_GLCD_ExistsHSyncInterruptEnable( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_HSyncInterruptEnable( GLCD_MODULE_ID_0 );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_ExistsHSyncInterruptEnable(GLCD_MODULE_ID index)

PLIB_GLCD_ExistsHSyncSignalLevel Function

Verify whether HSYNC Signal Level feature is supported.

File

plib_glcd.h

C

```
bool PLIB_GLCD_ExistsHSyncSignalLevel(GLCD_MODULE_ID index);
```

Returns

- true - The HSYNC Signal Level feature is supported.
- false - The HSYNC Signal Level feature is not supported.

Description

This function verifies whether the HSYNC Signal Level feature is supported.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if( PLIB_GLCD_ExistsHSyncSignalLevel( GLCD_MODULE_ID_0 ) )
{
    if( PLIB_GLCD_HSyncSignalLevelGet( GLCD_MODULE_ID_0 ) )
    {
       // HSYNC Signal Level High
    }
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_ExistsHSyncSignalLevel(GLCD_MODULE_ID index)

PLIB_GLCD_ExistsIRQTriggerControl Function

Verify whether the IRQ Trigger Control feature is supported.

File

plib_glcd.h

C

```
bool PLIB_GLCD_ExistsIRQTriggerControl(GLCD_MODULE_ID index);
```

Returns

- true - The IRQ Trigger Control feature is supported.
- false - The IRQ Trigger Control feature is not supported.

Description

This function verifies whether the IRQ Trigger Control feature is supported.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if( PLIB_GLCD_ExistsIRQTriggerControl( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_IRQTriggerControlSet( GLCD_MODULE_ID_0,
                                    MY_IRQ_TRIGGER_CONTROL );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_ExistsIRQTriggerControl(GLCD_MODULE_ID index)

PLIB_GLCD_ExistsIsLastRow Function

Verify whether Is Last Row Feature is supported.

File

plib_glcd.h

C

```
bool PLIB_GLCD_ExistsIsLastRow(GLCD_MODULE_ID index);
```

Returns

- true - The Is Last Row feature is supported.
- false - The Is Last Row feature is not supported.

Description

This function verifies whether Is Last Row Feature is supported.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if( PLIB_GLCD_ExistsIsLastRow( GLCD_MODULE_ID_0 ) )
{
    if( PLIB_GLCD_IsLastRow( GLCD_MODULE_ID_0 ) )
    {
       // Last row currently displayed
    }
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_ExistsIsLastRow(GLCD_MODULE_ID index)

PLIB_GLCD_ExistsIsVerticalBlankingActive Function

Verify whether Is Vertical Blanking Active feature is supported.

File

plib_glcd.h

C

```
bool PLIB_GLCD_ExistsIsVerticalBlankingActive(GLCD_MODULE_ID index);
```

Returns

- true - The Is Vertical Blanking feature is supported.
- false - The Is Vertical Blanking feature is not supported.

Description

This function verifies whether Is Vertical Blanking Active feature is supported.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if( PLIB_GLCD_ExistsIsVerticalBlankingActive( GLCD_MODULE_ID_0 ) )
{
    if( PLIB_GLCD_IsVerticalBlankingActive( GLCD_MODULE_ID_0 ) )
    {
       // Vertical Blanking Active
    }
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_ExistsIsVerticalBlankingActive(GLCD_MODULE_ID index)

PLIB_GLCD_ExistsLayerBaseAddress Function

Verify whether the Layer Base Address feature is supported.

File

plib_glcd.h

C

```
bool PLIB_GLCD_ExistsLayerBaseAddress(GLCD_MODULE_ID index);
```

Returns

- true - The Layer Base Address feature is supported.
- false - The Layer Base Address feature is not supported.

Description

This function verifies whether the Layer Base Address feature is supported.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if( PLIB_GLCD_ExistsLayerBaseAddress( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_LayerBaseAddressSet( GLCD_MODULE_ID_0,
                                   GLCD_LAYER_0,
                                   MY_LAYER_BASE_ADDRESS_VALUE );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_ExistsLayerBaseAddress (GLCD_MODULE_ID index)

PLIB_GLCD_ExistsLayerBilinearFilterEnable Function

Enable Layer Bilinear Filter Feature.

File

plib_glcd.h

C

```
bool PLIB_GLCD_ExistsLayerBilinearFilterEnable(GLCD_MODULE_ID index);
```

Returns

- true - The Layer Bilinear Filter feature is supported.
- false - The Layer Bilinear Filter feature is not supported.

Description

This function enables the Layer Bilinear Filter Feature.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if( PLIB_GLCD_ExistsLayerBilinearFilterEnable( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_LayerBilinearFilterEnable( GLCD_MODULE_ID_0,
                                         GLCD_LAYER_0 );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_ExistsLayerBilinearFilterEnable (GLCD_MODULE_ID index)

PLIB_GLCD_ExistsLayerColorMode Function

Verify whether Layer Color Mode is supported.

File

plib_glcd.h

C

```
bool PLIB_GLCD_ExistsLayerColorMode(GLCD_MODULE_ID index);
```

Returns

- true - The Layer Color Mode feature is supported.
- false - The Layer Color Mode feature is not supported.

Description

This function verifies whether Layer Color Mode is supported.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if( PLIB_GLCD_ExistsLayerColorMode( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_LayerColorModeSet( GLCD_MODULE_ID_0,
                                 GLCD_LAYER_0,
                                 MY_LAYER_COLOR_MODE_VALUE );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_ExistsLayerColorMode (GLCD_MODULE_ID index)

PLIB_GLCD_ExistsLayerDestBlendFunc Function

Verify whether Layer Destination Blend Function Feature is supported.

File

plib_glcd.h

C

```
bool PLIB_GLCD_ExistsLayerDestBlendFunc(GLCD_MODULE_ID index);
```

Returns

- true - The Layer Destination Blend Function feature is supported.
- false - The Layer Destination Blend Function feature is not supported.

Description

This function verifies whether Layer Destination Blend Function Feature is supported.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if( PLIB_GLCD_ExistsLayerDestBlendFunc( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_LayerDestBlendFuncSet( GLCD_MODULE_ID_0,
                                     GLCD_LAYER_0,
                                     MY_LAYER_DEST_BLEND_FUNC_VALUE );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_ExistsLayerDestBlendFunc (GLCD_MODULE_ID index)

PLIB_GLCD_ExistsLayerEnable Function

Verify whether Layer Enable Feature is supported.

File

plib_glcd.h

C

```
bool PLIB_GLCD_ExistsLayerEnable(GLCD_MODULE_ID index);
```

Returns

- true - The Layer Enable feature is supported.
- false - The Layer Enable feature is not supported.

Description

This function verifies whether Layer enable Feature is supported.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if( PLIB_GLCD_ExistsLayerEnable( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_LayerEnable( GLCD_MODULE_ID_0, GLCD_LAYER_0 );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_ExistsLayerEnable (GLCD_MODULE_ID index)

PLIB_GLCD_ExistsLayerForceWithGlobalAlpha Function

Verify whether Layer Force with Global Alpha Feature is supported.

File

plib_glcd.h

C

```
bool PLIB_GLCD_ExistsLayerForceWithGlobalAlpha(GLCD_MODULE_ID index);
```

Returns

- true - The Layer Force Global Alpha feature is supported.
- false - The Layer Force Global Alpha feature is not supported.

Description

This function verifies whether Layer Force with Global Alpha Feature is supported.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if( PLIB_GLCD_ExistsLayerForceWithGlobalAlpha( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_LayerForceWithGlobalAlphaEnable( GLCD_MODULE_ID_0,
                                               GLCD_LAYER_0 );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_ExistsLayerForceWithGlobalAlpha (GLCD_MODULE_ID index)

PLIB_GLCD_ExistsLayerGlobalAlpha Function

Verify whether Layer Global Alpha Feature is supported.

File

plib_glcd.h

C

```
bool PLIB_GLCD_ExistsLayerGlobalAlpha(GLCD_MODULE_ID index);
```

Returns

- true - The Layer Global Alpha feature is supported.
- false - The Layer Global Alpha feature is not supported.

Description

This function verifies whether Layer Global Alpha Feature is supported.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if( PLIB_GLCD_ExistsLayerGlobalAlpha( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_LayerGlobalAlphaSet( GLCD_MODULE_ID_0,
                                   GLCD_LAYER_0,
                                   MY_LAYER_GLOBAL_ALPHA_VALUE );
```

```
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_ExistsLayerGlobalAlpha(GLCD_MODULE_ID index)

PLIB_GLCD_ExistsLayerPreMultiplyImageAlpha Function

Verify whether Layer Pre-Multiply Image Alpha Feature is supported.

File

plib_glcd.h

C

```
bool PLIB_GLCD_ExistsLayerPreMultiplyImageAlpha(GLCD_MODULE_ID index);
```

Returns

- true - The Layer Pre-Multiply Image Alpha feature is supported.
- false - The Layer Pre-Multiply Image Alpha feature is not supported.

Description

This function verifies whether Layer Pre-Multiply Image Alpha Feature is supported.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if( PLIB_GLCD_ExistsLayerPreMultiplyImageAlpha( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_LayerPreMultiplyImageAlphaEnable( GLCD_MODULE_ID_0,
                                                GLCD_LAYER_0 );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_ExistsLayerPreMultiplyImageAlpha (GLCD_MODULE_ID index)

PLIB_GLCD_ExistsLayerResXY Function

File

plib_glcd.h

C

```
bool PLIB_GLCD_ExistsLayerResXY(GLCD_MODULE_ID index);
```

Returns

- true - The Layer Resolution feature is supported.
- false - The Layer Resolution feature is not supported.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if( PLIB_GLCD_ExistsLayerResXY( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_LayerResXYSet( GLCD_MODULE_ID_0,
                             GLCD_LAYER_0,
                             MY_LAYER_RES_X_VALUE,
                             MY_LAYER_RES_Y_VALUE );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_ExistsLayerResXY(GLCD_MODULE_ID index)

PLIB_GLCD_ExistsLayerSizeXY Function

Verify whether Layer X Axis and Y Axis Size feature is supported.

File

plib_glcd.h

C

```
bool PLIB_GLCD_ExistsLayerSizeXY(GLCD_MODULE_ID index);
```

Returns

- true - The Layer Size feature is supported.
- false - The Layer Size feature is not supported.

Description

This function verifies whether Layer X Axis and Y Axis Size feature is supported.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if( PLIB_GLCD_ExistsLayerSizeXY( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_LayerSizeXYSet( GLCD_MODULE_ID_0,
                              GLCD_LAYER_0,
                              MY_LAYER_SIZE_X_VALUE,
                              MY_LAYER_SIZE_Y_VALUE );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_ExistsLayerSizeXY (GLCD_MODULE_ID index)

PLIB_GLCD_ExistsLayerSrcBlendFunc Function

Verify whether Layer Source Blend Function Feature is supported.

File

plib_glcd.h

C

```
bool PLIB_GLCD_ExistsLayerSrcBlendFunc(GLCD_MODULE_ID index);
```

Returns

- true - The Layer Source Blend Function feature is supported.
- false - The Layer Source Blend Function feature is not supported.

Description

This function verifies whether Layer Source Blend Function Feature is supported.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if( PLIB_GLCD_ExistsLayerSrcBlendFunc( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_LayerSrcBlendFuncSet( GLCD_MODULE_ID_0,
                                    GLCD_LAYER_0,
                                    MY_LAYER_SRC_BLEND_FUNC_VALUE );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_ExistsLayerSrcBlendFunc (GLCD_MODULE_ID index)

PLIB_GLCD_ExistsLayerStartXY Function

Verify whether Layer Start XY Position feature is supported.

File

plib_glcd.h

C

```
bool PLIB_GLCD_ExistsLayerStartXY(GLCD_MODULE_ID index);
```

Returns

- true - The Layer Start feature is supported.
- false - The Layer Start feature is not supported.

Description

This function verifies whether Layer Start XY Position feature is supported.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if( PLIB_GLCD_ExistsLayerStartXY( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_LayerStartXYSet( GLCD_MODULE_ID_0,
                               GLCD_LAYER_0,
```

```
                                MY_LAYER_START_X_VALUE,
                                MY_LAYER_START_Y_VALUE );
    }
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_ExistsLayerStartXY (GLCD_MODULE_ID index)

PLIB_GLCD_ExistsLayerStride Function

Verify whether the Layer Stride Feature is supported.

File

plib_glcd.h

C

```
bool PLIB_GLCD_ExistsLayerStride(GLCD_MODULE_ID index);
```

Returns

- true - The Layer Stride feature is supported.
- false - The Layer Stride feature is not supported.

Description

This function verifies whether the Layer Stride Feature is supported.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
    if( PLIB_GLCD_ExistsLayerStride( GLCD_MODULE_ID_0 ) )
    {
        PLIB_GLCD_LayerStrideSet( GLCD_MODULE_ID_0,
                                  GLCD_LAYER_0,
                                  MY_LAYER_STRIDE_VALUE );
    }
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_ExistsLayerStride(GLCD_MODULE_ID index)

PLIB_GLCD_ExistsLinesPrefetch Function

Verify whether Lines Prefetch Set Feature supported.

File

plib_glcd.h

C

```
bool PLIB_GLCD_ExistsLinesPrefetch(GLCD_MODULE_ID index);
```

Returns

- true - The Lines Prefetch feature is supported.
- false - The Lines Prefetch feature is not supported.

Description

This function verifies whether Lines Prefetch Set Feature supported.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if( PLIB_GLCD_ExistsLinesPrefetch( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_LinesPrefetchSet( GLCD_MODULE_ID_0,
                                MY_LINES_PREFETCH_VALUE );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_ExistsLinesPrefetch(GLCD_MODULE_ID index)

PLIB_GLCD_ExistsPaletteGammaRamp Function

Verifies whether the palette / gamma ramp feature is supported.

File

plib_glcd.h

C

```
bool PLIB_GLCD_ExistsPaletteGammaRamp(GLCD_MODULE_ID index);
```

Returns

- true - The palette / gamma ramp enable feature supported.
- false - The palette / gamma ramp enable feature not supported.

Description

This function verifies whether the palette / gamma ramp feature is supported.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if( PLIB_GLCD_ExistsPaletteGammaRamp( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_PaletteGammaRampEnable( GLCD_MODULE_ID_0 );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_ExistsPaletteGammaRamp(GLCD_MODULE_ID index)

PLIB_GLCD_ExistsResolutionXY Function

Verify whether YUV Output feature is supported.

File

plib_glcd.h

C

```
bool PLIB_GLCD_ExistsResolutionXY(GLCD_MODULE_ID index);
```

Returns

- true - The Resolution feature is supported.
- false - The Resolution feature is not supported.

Description

This function verifies whether YUV Output feature is supported.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if( PLIB_GLCD_ExistsResolutionXY( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_ResolutionXYSet( GLCD_MODULE_ID_0,
                               MY_RESOLUTION_X_VALUE,
                               MY_RESOLUTION_Y_VALUE );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_ExistsYUVOutput(GLCD_MODULE_ID index)

PLIB_GLCD_ExistsRGBSequentialMode Function

Verify whether RGB Sequential Mode feature is supported.

File

plib_glcd.h

C

```
bool PLIB_GLCD_ExistsRGBSequentialMode(GLCD_MODULE_ID index);
```

Returns

- true - The RGB Sequential Mode feature is supported.
- false - The RGB Sequential Mode feature is not supported.

Description

This function verifies whether RGB Sequential Mode feature is supported.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if( PLIB_GLCD_ExistsRGBSequentialMode( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_RGBSequentialModeSet( GLCD_MODULE_ID_0,
                                    GLCD_RGB_MODE_PARALLEL );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_ExistsRGBSequentialMode(GLCD_MODULE_ID index)

PLIB_GLCD_ExistsSignalPolarity Function

Verifies whether the Signal Polarity Selection feature exists.

File

plib_glcd.h

C

```
bool PLIB_GLCD_ExistsSignalPolarity(GLCD_MODULE_ID index);
```

Returns

- true - Feature exists
- false - Feature does not exist

Description

This function verifies whether the Signal Polarity Selection feature exists.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if ( PLIB_GLCD_ExistsSignalPolarity( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_SignalPolaritySet( GLCD_MODULE_ID_0,
                                 GLCD_POLARITY_POSITIVE |
                                 GLCD_DE_POLARITY_NEGATIVE );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_ExistsSignalPolarity(GLCD_MODULE_ID index)

PLIB_GLCD_ExistsSingleCyclePerLineVsync Function

Verifies whether VSYNC on Single cycle Per Line Feature exists.

File

plib_glcd.h

C

```
bool PLIB_GLCD_ExistsSingleCyclePerLineVsync(GLCD_MODULE_ID index);
```

Returns

- true - The feature: VSYNC on Single Cycle Per Line is supported on the device.
- false - The feature: VSYNC on Single Cycle Per Line is not supported on the device.

Description

This function verifies whether VSYNC on Single cycle Per Line Feature exists.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if(PLIB_GLCD_ExistsSingleCyclePerLineVsync( GLCD_MODULE_ID_0))
{
    PLIB_GLCD_SingleCyclePerLineVsyncEnable( GLCD_MODULE_ID_0 );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_ExistsSingleCycleVsync(GLCD_MODULE_ID index)

PLIB_GLCD_ExistsVSyncInterruptEnable Function

Verify whether VSYNC Interrupt Enable feature is supported.

File

plib_glcd.h

C

```
bool PLIB_GLCD_ExistsVSyncInterruptEnable(GLCD_MODULE_ID index);
```

Returns

- true - The VSYNC Interrupt Enable feature is supported.
- false - The VSYNC Interrupt Enable feature is not supported.

Description

This function verifies whether VSYNC Interrupt Enable feature is supported.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if( PLIB_GLCD_ExistsVSyncInterruptEnable( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_VSyncInterruptEnable( GLCD_MODULE_ID_0 );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_ExistsVSyncInterruptEnable(GLCD_MODULE_ID index)

PLIB_GLCD_ExistsVSyncSignalLevel Function

Verify whether VSYNC Signal Level feature is supported.

File

plib_glcd.h

C

```
bool PLIB_GLCD_ExistsVSyncSignalLevel(GLCD_MODULE_ID index);
```

Returns

- true - The VSYNC Signal Level feature is supported.
- false - The VSYNC Signal Level feature is not supported.

Description

This function verifies whether VSYNC Signal Level feature is supported.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if( PLIB_GLCD_ExistsVSyncSignalLevel( GLCD_MODULE_ID_0 ) )
{
    if( PLIB_GLCD_VSyncSignalLevelGet( GLCD_MODULE_ID_0 ) )
    {
       // VSYNC Signal Level High
    }
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_ExistsVSyncSignalLevel(GLCD_MODULE_ID index)

PLIB_GLCD_ExistsYUVOutput Function

Verify whether YUV output feature is supported.

File

plib_glcd.h

C

```
bool PLIB_GLCD_ExistsYUVOutput(GLCD_MODULE_ID index);
```

Returns

- true - The YUV output feature is supported.
- false - The YUV output feature is not supported.

Description

This function verifies whether YUV output feature is supported.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Preconditions

None.

Example

```
if( PLIB_GLCD_ExistsYUVOutput( GLCD_MODULE_ID_0 ) )
{
    PLIB_GLCD_YUVOutputEnable( GLCD_MODULE_ID_0 );
}
```

Parameters

Parameters	Description
index	Identifier of the device instance.

Function

bool PLIB_GLCD_ExistsYUVOutput(GLCD_MODULE_ID index)

j) Data Types and Constants

GLCD_IRQ_TRIGGER_CONTROL Enumeration

Possible values of GLCD Interrupt Trigger Mode.

File

plib_glcd_help.h

C

```
typedef enum {
  GLCD_IRQ_TRIGGER_LEVEL = 0x00000000,
  GLCD_IRQ_TRIGGER_EDGE = 0x80000000
} GLCD_IRQ_TRIGGER_CONTROL;
```

Members

Members	Description
GLCD_IRQ_TRIGGER_LEVEL = 0x00000000	Interrupt Level Triggered
GLCD_IRQ_TRIGGER_EDGE = 0x80000000	Interrupt Edge Triggered

Description

GLCD Interrupt Trigger Mode

This data type defines the possible values of GLCD Interrupt Trigger modes.

Remarks

This enumeration is processor specific and is defined in the processor-specific header files (see processor.h).

GLCD_LAYER_COLOR_MODE Enumeration

Possible values of GLCD color Mode.

File

plib_glcd_help.h

C

```
typedef enum {
  GLCD_LAYER_COLOR_MODE_LUT8 = 0x0,
  GLCD_LAYER_COLOR_MODE_RGBA5551 = 0x1,
  GLCD_LAYER_COLOR_MODE_RGBA8888 = 0x2,
  GLCD_LAYER_COLOR_MODE_RGB332 = 0x4,
  GLCD_LAYER_COLOR_MODE_RGB565 = 0x5,
  GLCD_LAYER_COLOR_MODE_ARGB8888 = 0x6,
  GLCD_LAYER_COLOR_MODE_L8 = 0x7,
  GLCD_LAYER_COLOR_MODE_L1 = 0x8,
  GLCD_LAYER_COLOR_MODE_L4 = 0x9,
  GLCD_LAYER_COLOR_MODE_YUYV = 0xA,
  GLCD_LAYER_COLOR_MODE_RGB888 = 0xB
} GLCD_LAYER_COLOR_MODE;
```

Members

Members	Description
GLCD_LAYER_COLOR_MODE_LUT8 = 0x0	GLCD Layer color mode LUT 8
GLCD_LAYER_COLOR_MODE_RGBA5551 = 0x1	GLCD Layer color mode RGBA 5551
GLCD_LAYER_COLOR_MODE_RGBA8888 = 0x2	GLCD Layer color mode RGBA 8888
GLCD_LAYER_COLOR_MODE_RGB332 = 0x4	GLCD Layer color mode RGB 332
GLCD_LAYER_COLOR_MODE_RGB565 = 0x5	GLCD Layer color mode RGB 565
GLCD_LAYER_COLOR_MODE_ARGB8888 = 0x6	GLCD Layer color mode ARGB 8888
GLCD_LAYER_COLOR_MODE_L8 = 0x7	GLCD Layer color mode L8
GLCD_LAYER_COLOR_MODE_L1 = 0x8	GLCD Layer color mode L1
GLCD_LAYER_COLOR_MODE_L4 = 0x9	GLCD Layer color mode L4
GLCD_LAYER_COLOR_MODE_YUYV = 0xA	GLCD Layer color mode YUYV
GLCD_LAYER_COLOR_MODE_RGB888 = 0xB	GLCD Layer color mode RGB888

Description

GLCD Layer color Mode

This data type defines the possible values of GLCD Layer color modes.

Remarks

This enumeration is processor specific and is defined in the processor-specific header files (see processor.h).

GLCD_LAYER_DEST_BLEND_FUNC Enumeration

Possible values of GLCD Layer Destination Blend Functions.

File

plib_glcd_help.h

C

```
typedef enum {
  GLCD_LAYER_DEST_BLEND_BLACK = 0x0000,
  GLCD_LAYER_DEST_BLEND_WHITE = 0x1000,
  GLCD_LAYER_DEST_BLEND_ALPHA_SRC = 0x2000,
  GLCD_LAYER_DEST_BLEND_ALPHA_GBL = 0x3000,
  GLCD_LAYER_DEST_BLEND_ALPHA_SRCGBL = 0x4000,
  GLCD_LAYER_DEST_BLEND_INV_SRC = 0x5000,
  GLCD_LAYER_DEST_BLEND_INV_GBL = 0x6000,
  GLCD_LAYER_DEST_BLEND_INV_SRCGBL = 0x7000,
  GLCD_LAYER_DEST_BLEND_ALPHA_DST = 0xA000,
  GLCD_LAYER_DEST_BLEND_INV_DST = 0xD000
} GLCD_LAYER_DEST_BLEND_FUNC;
```

Members

Members	Description
GLCD_LAYER_DEST_BLEND_BLACK = 0x0000	Layer Destination Blend Function: Black, Destination Alpha = 0
GLCD_LAYER_DEST_BLEND_WHITE = 0x1000	Layer Destination Blend Function: White, Destination Alpha = 255
GLCD_LAYER_DEST_BLEND_ALPHA_SRC = 0x2000	Layer Destination Blend Function: Source Alpha
GLCD_LAYER_DEST_BLEND_ALPHA_GBL = 0x3000	Layer Destination Blend Function: Global Alpha
GLCD_LAYER_DEST_BLEND_ALPHA_SRCGBL = 0x4000	Layer Destination Blend Function: (Source Alpha * Global Alpha)
GLCD_LAYER_DEST_BLEND_INV_SRC = 0x5000	Layer Destination Blend Function: (1 - Source Alpha)
GLCD_LAYER_DEST_BLEND_INV_GBL = 0x6000	Layer Destination Blend Function: (1 - Global Alpha)
GLCD_LAYER_DEST_BLEND_INV_SRCGBL = 0x7000	Layer Destination Blend Function: (1 - (Source Alpha * Global Alpha))

GLCD_LAYER_DEST_BLEND_ALPHA_DST = 0xA000	Layer Destination Blend Function: Destination Alpha
GLCD_LAYER_DEST_BLEND_INV_DST = 0xD000	Layer Destination Blend Function: (1 - Destination Alpha)

Description

GLCD Layer Destination Blend Function

This data type defines the possible values of GLCD Layer Destination Blend Functions.

Remarks

This enumeration is processor specific and is defined in the processor-specific header files (see processor.h).

GLCD_LAYER_ID Enumeration

Possible values of GLCD Layer Ids

File

plib_glcd_help.h

C

```
typedef enum {
  GLCD_LAYER_ID_0 = 0x0,
  GLCD_LAYER_ID_1 = 0x1,
  GLCD_LAYER_ID_2 = 0x2,
  GLCD_LAYER_ID_MAX = 0x3
} GLCD_LAYER_ID;
```

Members

Members	Description
GLCD_LAYER_ID_0 = 0x0	GLCD Layer 0 Id
GLCD_LAYER_ID_1 = 0x1	GLCD Layer 1 Id
GLCD_LAYER_ID_2 = 0x2	GLCD Layer 2 Id
GLCD_LAYER_ID_MAX = 0x3	Maximum number of Layers supported by GLCD

Description

GLCD Layer Ids

This data type defines the possible values of GLCD Layer Ids.

Remarks

This enumeration is processor specific and is defined in the processor-specific header files (see processor.h).

GLCD_LAYER_SRC_BLEND_FUNC Enumeration

Possible values of GLCD Layer Source Blend Functions.

File

plib_glcd_help.h

C

```
typedef enum {
  GLCD_LAYER_SRC_BLEND_BLACK = 0x0000,
  GLCD_LAYER_SRC_BLEND_WHITE = 0x0100,
  GLCD_LAYER_SRC_BLEND_ALPHA_SRC = 0x0200,
  GLCD_LAYER_SRC_BLEND_ALPHA_GBL = 0x0300,
  GLCD_LAYER_SRC_BLEND_ALPHA_SRCGBL = 0x0400,
  GLCD_LAYER_SRC_BLEND_INV_SRC = 0x0500,
  GLCD_LAYER_SRC_BLEND_INV_GBL = 0x0600,
  GLCD_LAYER_SRC_BLEND_INV_SRCGBL = 0x0700,
  GLCD_LAYER_SRC_BLEND_ALPHA_DST = 0x0A00,
  GLCD_LAYER_SRC_BLEND_INV_DST = 0x0D00
} GLCD_LAYER_SRC_BLEND_FUNC;
```

Members

Members	Description
GLCD_LAYER_SRC_BLEND_BLACK = 0x0000	Layer Source Blend Function: Black, Source Alpha = 0
GLCD_LAYER_SRC_BLEND_WHITE = 0x0100	Layer Source Blend Function: White, Source Alpha = 255
GLCD_LAYER_SRC_BLEND_ALPHA_SRC = 0x0200	Layer Source Blend Function: Source Alpha
GLCD_LAYER_SRC_BLEND_ALPHA_GBL = 0x0300	Layer Source Blend Function: Global Alpha
GLCD_LAYER_SRC_BLEND_ALPHA_SRCGBL = 0x0400	Layer Source Blend Function: (Source Alpha * Global Alpha)
GLCD_LAYER_SRC_BLEND_INV_SRC = 0x0500	Layer Source Blend Function: (1 - Source Alpha)
GLCD_LAYER_SRC_BLEND_INV_GBL = 0x0600	Layer Source Blend Function: (1 - Global Alpha)
GLCD_LAYER_SRC_BLEND_INV_SRCGBL = 0x0700	Layer Source Blend Function: (1 - (Source Alpha * Global Alpha))
GLCD_LAYER_SRC_BLEND_ALPHA_DST = 0x0A00	Layer Source Blend Function: Destination Alpha
GLCD_LAYER_SRC_BLEND_INV_DST = 0x0D00	Layer Source Blend Function: (1 - Destination Alpha)

Description

GLCD Layer Source Blend Function

This data type defines the possible values of GLCD Layer Source Blend Functions.

Remarks

This enumeration is processor specific and is defined in the processor-specific header files (see processor.h).

GLCD_MODULE_ID Enumeration

Possible instances of the GLCD module

File

plib_glcd_help.h

C

```
typedef enum {
  GLCD_ID_0 = 0,
  GLCD_NUMBER_OF_MODULES
} GLCD_MODULE_ID;
```

Members

Members	Description
GLCD_ID_0 = 0	first instance of the GLCD
GLCD_NUMBER_OF_MODULES	number of GLCD modules

Description

GLCD module ID

This data type defines the possible instances of the GLCD module.

Remarks

This enumeration is processor specific and is defined in the processor-specific header files (see processor.h).

GLCD_RGB_MODE Enumeration

GLCD RGB Sequential Mode

File

plib_glcd_help.h

C

```
typedef enum {
  GLCD_RGB_MODE_PARALLEL_RGB565 = 0x00000000,
  GLCD_RGB_MODE_PARALLEL_RGB888 = 0x00000001,
  GLCD_RGB_MODE_SERIAL_RGB_3 = 0x00000002,
  GLCD_RGB_MODE_SERIAL_RGBA_4 = 0x00000003,
  GLCD_RGB_MODE_SERIAL_12BIT = 0x00000004,
  GLCD_RGB_MODE_YUYV_16BIT = 0x00000005,
  GLCD_RGB_MODE_BT_656 = 0x00000006
} GLCD_RGB_MODE;
```

Members

Members	Description
GLCD_RGB_MODE_PARALLEL_RGB565 = 0x00000000	Parallel RGB 565 Mode
GLCD_RGB_MODE_PARALLEL_RGB888 = 0x00000001	Parallel RGB 888 Mode
GLCD_RGB_MODE_SERIAL_RGB_3 = 0x00000002	Byte Serial RGB 3 Mode
GLCD_RGB_MODE_SERIAL_RGBA_4 = 0x00000003	Byte Serial RGB 4 Mode
GLCD_RGB_MODE_SERIAL_12BIT = 0x00000004	Byte Two-Phase 12-bit Mode
GLCD_RGB_MODE_YUYV_16BIT = 0x00000005	YUYV 16 bit Mode
GLCD_RGB_MODE_BT_656 = 0x00000006	BT 656 Mode

Description

GLCD RGB Sequential Mode

This data type defines the possible RGB Sequential Mode of GLCD.

Remarks

This enumeration is processor specific and is defined in the processor-specific header files (see processor.h).

GLCD_SIGNAL_POLARITY Enumeration

Polarity values of different output signals.

File

plib_glcd_help.h

C

```
typedef enum {
  GLCD_POLARITY_POSITIVE = 0x00000000,
  GLCD_PIXEL_CLOCK_POLARITY_NEGATIVE = 0x00400000,
  GLCD_DE_POLARITY_NEGATIVE = 0x04000000,
  GLCD_HSYNC_POLARITY_NEGATIVE = 0x08000000,
  GLCD_VSYNC_POLARITY_NEGATIVE = 0x10000000
} GLCD_SIGNAL_POLARITY;
```

Members

Members	Description
GLCD_POLARITY_POSITIVE = 0x00000000	Positive polarity of PCLK, DE, HSYNC and VSYNC pins
GLCD_PIXEL_CLOCK_POLARITY_NEGATIVE = 0x00400000	Negative Pixel Clock Pin Polarity
GLCD_DE_POLARITY_NEGATIVE = 0x04000000	Negative DE Pin Polarity
GLCD_HSYNC_POLARITY_NEGATIVE = 0x08000000	Negative HSYNC Pin Polarity
GLCD_VSYNC_POLARITY_NEGATIVE = 0x10000000	Negative VSYNC Pin Polarity

Description

GLCD Output Signal Polarity

This data type defines the polarity values of different output signals.

Remarks

This enumeration is processor specific and is defined in the processor-specific header files (see processor.h).

Functions

	Name	Description
	PLIB_GLCD_BackgroundColorGet	Gets the value of the Background Color.
	PLIB_GLCD_BackgroundColorSet	Sets the background color.
	PLIB_GLCD_BackPorchXGet	Gets X Axis Back Porch.
	PLIB_GLCD_BackPorchXYSet	Sets the back porch on the x and y axis for the Graphics LCD Controller.
	PLIB_GLCD_BackPorchYGet	Gets Y Axis Back Porch.
	PLIB_GLCD_BlankingXGet	Gets the X Axis Blanking Period.
	PLIB_GLCD_BlankingXYSet	Sets the blanking period on the x and y axis of the Graphics LCD Controller.
	PLIB_GLCD_BlankingYGet	Gets the Y Axis Blanking Period.
	PLIB_GLCD_ClockDividerGet	Gets Clock Divider value.
	PLIB_GLCD_ClockDividerSet	Sets clock controls of the Graphics LCD Controller.
	PLIB_GLCD_CursorDataGet	Gets the Cursor Data at given Index.
	PLIB_GLCD_CursorDataSet	Sets the cursor image data.
	PLIB_GLCD_CursorDisable	Disables the cursor of the Graphics LCD Controller.
	PLIB_GLCD_CursorEnable	Enables the cursor of the Graphics LCD Controller.
	PLIB_GLCD_CursorIsEnabled	Verifies whether the cursor is enabled.
	PLIB_GLCD_CursorLUTGet	Gets the color from Cursor LUT at given Index.
	PLIB_GLCD_CursorLUTSet	Sets the cursor color look-up table (LUT) in XRGB8888 format.
	PLIB_GLCD_CursorXGet	Gets the cursor X Axis Position.
	PLIB_GLCD_CursorXYSet	Sets the x and y coordinates of the Graphics LCD Controller cursor.
	PLIB_GLCD_CursorYGet	Gets the Cursor Y Axis Position.
	PLIB_GLCD_DESignalLevelGet	Gets the display enable signal level.
	PLIB_GLCD_Disable	Disables the Graphics LCD Controller.
	PLIB_GLCD_DitheringDisable	Disables the Dithering feature of the Graphics LCD Controller.
	PLIB_GLCD_DitheringEnable	Enables the Dithering feature of the Graphics LCD Controller.
	PLIB_GLCD_DitheringIsEnabled	Verifies whether Dithering is enabled.
	PLIB_GLCD_Enable	Enables the Graphics LCD Controller.
	PLIB_GLCD_ExistsBackgroundColor	Verify whether the Background Color Feature is supported.
	PLIB_GLCD_ExistsBackPorchXY	Verify whether Back Porch Feature is supported.
	PLIB_GLCD_ExistsBlankingXY	Verify whether Blanking Period Feature is supported.
	PLIB_GLCD_ExistsClockDivider	Verify whether the Clock Divider feature is supported.
	PLIB_GLCD_ExistsCursor	Verifies whether the cursor feature exists.
	PLIB_GLCD_ExistsCursorData	
	PLIB_GLCD_ExistsCursorLUT	Verify whether Cursor LUT feature is supported.
	PLIB_GLCD_ExistsCursorXY	Verify whether Cursor XY Position feature is supported.
	PLIB_GLCD_ExistsDESignalLevel	Verify whether DE Signal Level feature is supported.
	PLIB_GLCD_ExistsDithering	Verifies whether the Dithering feature exists.

	PLIB_GLCD_ExistsEnable	Identifies whether the GLCD Enable feature exists on the GLCD module.
	PLIB_GLCD_ExistsForceOutputBlank	Verify whether Force Output Blank feature is supported.
	PLIB_GLCD_ExistsFormattingClockDivide	Verify whether Clock Formatting feature is available.
	PLIB_GLCD_ExistsFrontPorchXY	Verify whether Front Porch Feature is supported.
	PLIB_GLCD_ExistsGlobalColorLUT	Verify whether Global Color LUT feature is supported.
	PLIB_GLCD_ExistsHSyncInterruptEnable	Verify whether the HSYNC Interrupt Enable feature is supported.
	PLIB_GLCD_ExistsHSyncSignalLevel	Verify whether HSYNC Signal Level feature is supported.
	PLIB_GLCD_ExistsIRQTriggerControl	Verify whether the IRQ Trigger Control feature is supported.
	PLIB_GLCD_ExistsIsLastRow	Verify whether Is Last Row Feature is supported.
	PLIB_GLCD_ExistsIsVerticalBlankingActive	Verify whether Is Vertical Blanking Active feature is supported.
	PLIB_GLCD_ExistsLayerBaseAddress	Verify whether the Layer Base Address feature is supported.
	PLIB_GLCD_ExistsLayerBilinearFilterEnable	Enable Layer Bilinear Filter Feature.
	PLIB_GLCD_ExistsLayerColorMode	Verify whether Layer Color Mode is supported.
	PLIB_GLCD_ExistsLayerDestBlendFunc	Verify whether Layer Destination Blend Function Feature is supported.
	PLIB_GLCD_ExistsLayerEnable	Verify whether Layer Enable Feature is supported.
	PLIB_GLCD_ExistsLayerForceWithGlobalAlpha	Verify whether Layer Force with Global Alpha Feature is supported.
	PLIB_GLCD_ExistsLayerGlobalAlpha	Verify whether Layer Global Alpha Feature is supported.
	PLIB_GLCD_ExistsLayerPreMultiplyImageAlpha	Verify whether Layer Pre-Multiply Image Alpha Feature is supported.
	PLIB_GLCD_ExistsLayerResXY	
	PLIB_GLCD_ExistsLayerSizeXY	Verify whether Layer X Axis and Y Axis Size feature is supported.
	PLIB_GLCD_ExistsLayerSrcBlendFunc	Verify whether Layer Source Blend Function Feature is supported.
	PLIB_GLCD_ExistsLayerStartXY	Verify whether Layer Start XY Position feature is supported.
	PLIB_GLCD_ExistsLayerStride	Verify whether the Layer Stride Feature is supported.
	PLIB_GLCD_ExistsLinesPrefetch	Verify whether Lines Prefetch Set Feature supported.
	PLIB_GLCD_ExistsPaletteGammaRamp	Verifies whether the palette / gamma ramp feature is supported.
	PLIB_GLCD_ExistsResolutionXY	Verify whether YUV Output feature is supported.
	PLIB_GLCD_ExistsRGBSequentialMode	Verify whether RGB Sequential Mode feature is supported.
	PLIB_GLCD_ExistsSignalPolarity	Verifies whether the Signal Polarity Selection feature exists.
	PLIB_GLCD_ExistsSingleCyclePerLineVsync	Verifies whether VSYNC on Single cycle Per Line Feature exists.
	PLIB_GLCD_ExistsVSyncInterruptEnable	Verify whether VSYNC Interrupt Enable feature is supported.
	PLIB_GLCD_ExistsVSyncSignalLevel	Verify whether VSYNC Signal Level feature is supported.
	PLIB_GLCD_ExistsYUVOutput	Verify whether YUV output feature is supported.
	PLIB_GLCD_ForceOutputBlankDisable	Disable Force Output Blank feature.
	PLIB_GLCD_ForceOutputBlankEnable	Enable Force Output Blank feature.
	PLIB_GLCD_ForceOutputBlankIsEnabled	Verify whether the Force Output Blank feature is enabled.
	PLIB_GLCD_FormattingClockDivideDisable	Disbale the Clock Formatting feature.
	PLIB_GLCD_FormattingClockDivideEnable	Enable the Clock Formatting feature.
	PLIB_GLCD_FormattingClockDivideIsEnabled	Verify whether Clock Formatting feature is enabled.
	PLIB_GLCD_FrontPorchXGet	Gets X Axis Front Porch.
	PLIB_GLCD_FrontPorchXYSet	Sets the front porch on the x and y axis for the Graphics LCD Controller.
	PLIB_GLCD_FrontPorchYGet	Gets Y Axis Front Porch.
	PLIB_GLCD_GlobalColorLUTGet	Gets the Color from Global Color LUT at given Index.
	PLIB_GLCD_GlobalColorLUTSet	Set Global Color LUT.
	PLIB_GLCD_HSyncInterruptDisable	Disables interrupts at Hsync.
	PLIB_GLCD_HSyncInterruptEnable	Enables interrupts at Hsync.
	PLIB_GLCD_HSyncInterruptIsEnabled	Verify whether HSYNC Interrupt is enabled.
	PLIB_GLCD_HSyncSignalLevelGet	Gets the Hsync signal level.
	PLIB_GLCD_IRQTriggerControlGet	Gets the IRQ Trigger Control value.
	PLIB_GLCD_IRQTriggerControlSet	Sets the IRQ trigger control.
	PLIB_GLCD_IsEnabled	Verifies whether the Graphics LCD Controller is Enabled.
	PLIB_GLCD_IsLastRow	Gets the status indicating whether a last row is currently displayed by the Graphics Display Controller.
	PLIB_GLCD_IsVerticalBlankingActive	Get the active status.
	PLIB_GLCD_LayerBaseAddressGet	Gets the Layer Base Address.
	PLIB_GLCD_LayerBaseAddressSet	Sets the base address of layer surface of the Graphics LCD Controller.

	PLIB_GLCD_LayerBilinearFilterDisable	Disables the layer Bilinear filter of the Graphics LCD Controller.
	PLIB_GLCD_LayerBilinearFilterEnable	Enables the layer Bilinear filter of the Graphics LCD Controller.
	PLIB_GLCD_LayerBilinearFilterIsEnabled	Verify whether Layer Bilinear Filter is enabled.
	PLIB_GLCD_LayerColorModeGet	Gets the Layer Color Mode.
	PLIB_GLCD_LayerColorModeSet	Sets the layer color mode of the Graphics LCD Controller.
	PLIB_GLCD_LayerDestBlendFuncGet	Gets the Layer Destination Blend Function.
	PLIB_GLCD_LayerDestBlendFuncSet	Sets the layer destination blend function of the Graphics LCD Controller.
	PLIB_GLCD_LayerDisable	Disables the layer of the Graphics LCD Controller.
	PLIB_GLCD_LayerEnable	Enables the layer of the Graphics LCD Controller.
	PLIB_GLCD_LayerForceWithGlobalAlphaDisable	Disables the Layer Force Global Alpha feature.
	PLIB_GLCD_LayerForceWithGlobalAlphaEnable	Enable the Layer Force Global Alpha feature.
	PLIB_GLCD_LayerForceWithGlobalAlphaIsEnabled	Verify whether Layer Force with Global Alpha Feature is enabled.
	PLIB_GLCD_LayerGlobalAlphaGet	Gets the Layer Global Alpha value.
	PLIB_GLCD_LayerGlobalAlphaSet	Sets the layer global alpha of the Graphics LCD Controller.
	PLIB_GLCD_LayerIsEnabled	Verify whether Layer is enabled.
	PLIB_GLCD_LayerPreMultiplyImageAlphaDisable	Disable Layer Pre-Multiply Image Alpha Feature.
	PLIB_GLCD_LayerPreMultiplyImageAlphaEnable	Enable Layer Pre-Multiply Image Alpha Feature.
	PLIB_GLCD_LayerPreMultiplyImageAlphaIsEnabled	Verify whether the Layer Pre-Multiply Image Alpha Feature is enabled.
	PLIB_GLCD_LayerResXGet	Gets the Layer X Axis Resolution.
	PLIB_GLCD_LayerResXYSet	Sets the layer resolution in pixels.
	PLIB_GLCD_LayerResYGet	Gets the Layer Y Axis Resolution.
	PLIB_GLCD_LayerSizeXGet	Gets the Layer X Axis Size.
	PLIB_GLCD_LayerSizeXYSet	Sets the layer size x and size y of the Graphics LCD Controller.
	PLIB_GLCD_LayerSizeYGet	Gets the Layer Y Axis Size.
	PLIB_GLCD_LayerSrcBlendFuncGet	Gets the Layer Source Blend Function.
	PLIB_GLCD_LayerSrcBlendFuncSet	Sets the layer source blend function of the Graphics LCD Controller.
	PLIB_GLCD_LayerStartXGet	Gets the Layer X Axis Start Position.
	PLIB_GLCD_LayerStartXYSet	Sets the layer start x and start y of the Graphics LCD Controller.
	PLIB_GLCD_LayerStartYGet	Gets the Layer Y Axis Start Position.
	PLIB_GLCD_LayerStrideGet	Gets the Layer Stride value.
	PLIB_GLCD_LayerStrideSet	Sets the layer surface stride of the Graphics LCD Controller.
	PLIB_GLCD_LinesPrefetchGet	Gets value of lines to be prefetched.
	PLIB_GLCD_LinesPrefetchSet	Sets the clock controls of the Graphics LCD Controller.
	PLIB_GLCD_PaletteGammaRampDisable	Disables the palette / gamma ramp of the Graphics LCD Controller.
	PLIB_GLCD_PaletteGammaRampEnable	Enables the palette / gamma ramp of the Graphics LCD Controller.
	PLIB_GLCD_PaletteGammaRampIsEnabled	Verify whether Palette / Gamma Ramp feature is enabled.
	PLIB_GLCD_ResolutionXGet	Gets X Axis Resolution.
	PLIB_GLCD_ResolutionXYSet	Sets the display resolution for the Graphics LCD Controller.
	PLIB_GLCD_ResolutionYGet	Gets Y Axis Resolution.
	PLIB_GLCD_RGBSequentialModeGet	Get the RGB Sequential Mode already set.
	PLIB_GLCD_RGBSequentialModeSet	Sets the RGB output sequential mode.
	PLIB_GLCD_SignalPolarityGet	Gets the polarity of the pixel clock, DE, HSync and VSync pin of the Graphics LCD Controller.
	PLIB_GLCD_SignalPolaritySet	Sets the polarity of the pixel clock, DE, HSync and VSync pin of the Graphics LCD Controller.
	PLIB_GLCD_SingleCyclePerLineVsyncDisable	Clears VSYNC on single cycle per line.
	PLIB_GLCD_SingleCyclePerLineVsyncEnable	Sets VSYNC on single cycle per line.
	PLIB_GLCD_SingleCyclePerLineVsyncIsEnabled	Verify whether VSYNC on Single Cycle Per Line feature is enabled.
	PLIB_GLCD_VSyncInterruptDisable	Disables interrupts at Vsync.
	PLIB_GLCD_VSyncInterruptEnable	Enables interrupts at Vsync.
	PLIB_GLCD_VSyncInterruptIsEnabled	Verify whether VSYNC Interrupt is enabled.
	PLIB_GLCD_VSyncSignalLevelGet	Gets the Vsync signal level.
	PLIB_GLCD_YUVOutputDisable	Disables the output of the Graphics LCD Controller in YUV format.
	PLIB_GLCD_YUVOutputEnable	Enables the output of the Graphics LCD Controller in YUV format.
	PLIB_GLCD_YUVOutputIsEnabled	Verify whether the YUV Output feature is enabled.

Description

Graphics LCD Controller (GLCD) Peripheral Library Interface Header.

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the Graphics LCD Controller Peripheral Library for Microchip micro-controllers. The definitions in this file are only for the directly addressable memory mapped Graphics LCD Controller module.

File Name

plib_glcd.h

Company

Microchip Technology Inc.

I2C Peripheral Library

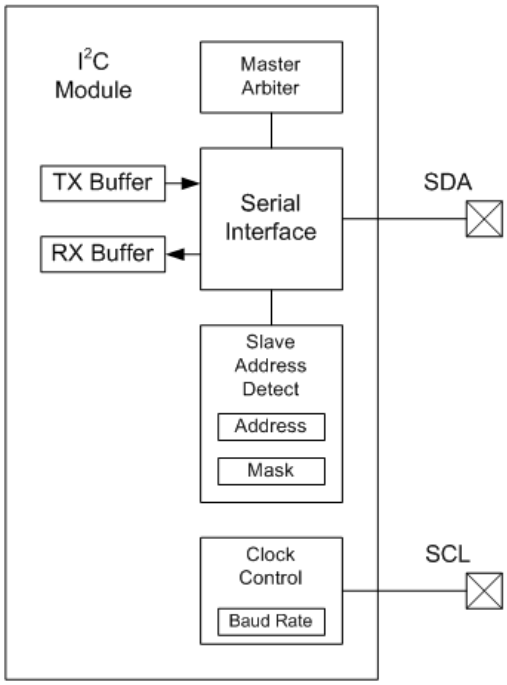
This section describes the Inter-Integrated Circuit (I2C) Peripheral Library.

Introduction

This library provides a low-level abstraction of the Inter-Integrated Circuit (I2C) module on Microchip microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, thus hiding differences from one microcontroller variant to another.

Description

The I2C module is a serial interface useful for communicating with other peripheral or microcontroller devices. These peripheral devices may be serial EEPROMs, display drivers, analog-to-digital converters, etc.



Please refer to the I2C-Bus Specification (v2.1), available from Philips Semiconductor (see the following **Note**) for complete details on the operation and requirements for the I2C bus.

Note: Trademarks and Intellectual Property are property of their respective owners. Customers are responsible for obtaining appropriate licensing or rights before using this software. Refer to the MPLAB Harmony *Software License Agreement* for complete licensing information. A copy of this agreement is available in the `<install-dir>/doc` folder of your MPLAB Harmony installation.

Using the Library

This topic describes the basic architecture of the I2C Peripheral Library and provides information and examples on its use.

Description

Interface Header File: `plib_i2c.h`

The interface to the I2C library is defined in the `plib_i2c.h` header file, which is included by the peripheral library header file,`peripheral.h`. Any C language source (`.c`) file that uses the I2C library must include `peripheral.h`.

Peripheral Module IDs

Peripheral libraries are indexed to allow a single library to control any number of instances of a peripheral in a single microcontroller. To support this, the first parameter to each operation in a peripheral library is the module instance ID. The module instance ID is defined by an enumeration that is defined in the processor-specific header files (included by the library's interface header). For the I2C Peripheral Library, the module instance IDs are defined by the I2C_MODULE_ID enumeration. Not all microcontrollers will have all instances of the module listed in this enumeration. Please refer to the specific device data sheet for more information.

Please refer to the What is MPLAB Harmony? section for information on how the library interacts with the framework.

Hardware Abstraction Model

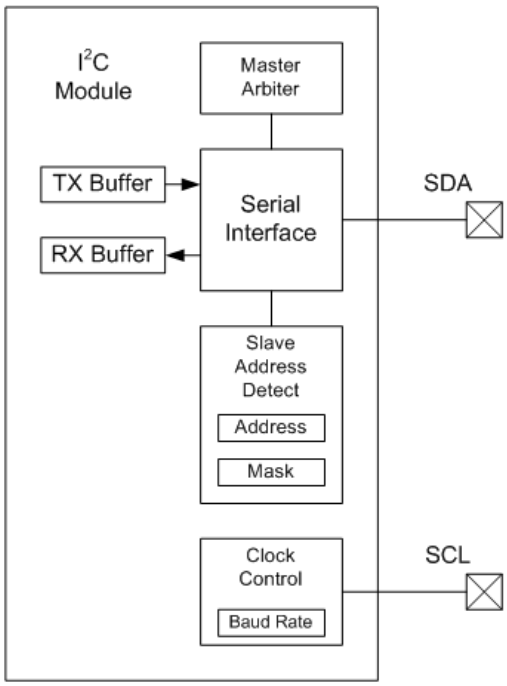
This library provides a low-level abstraction of the Inter-Integrated Circuit (I2C) module on Microchip PIC microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Description

Hardware Abstraction Model Description

The I2C Peripheral Library provides interface routines to interact with the blocks shown in the following diagram.

Hardware Abstraction Model Diagram



The **TX Buffer** and **RX Buffer** are 1-byte (8-bit) buffers for data transmitted (TX) or received (RX) by the **Serial Interface** to the I2C bus over the **SDA** line synchronized with the **SCL** line by the **Clock Control** logic.

The desired baud rate frequency can be programmed in the **Clock Control** logic (within I2C bus specifications of 0-100 kHz for Low-to-Fast I2C mode and up to 3.4 MHz for High-Speed I2C mode) by setting the **Baud Rate** value. However, the nature of the I2C bus allows slower targets to stretch the clock to slower rates as required, in real time.

The I2C bus is a transfer-based multi-master bus, allowing multiple masters to initiate transfers at any time the bus is not currently busy. The **Master Arbiter** logic monitors transfers and determines if arbitration has been lost. There is no loss of data for the winning master. However, the losing master must retry the entire transfer again later, when the bus is idle. Slave devices are identified by either 7- or-10 bit addresses. The I2C module can act as either a bus master that can initiate transfers or as a slave, responding to transfers initiated by other masters on the bus.

The **Slave Address Detect** logic monitors transfers initiated by other masters to recognize when other masters have addressed this module when it is acting as a slave. The Slave **Address** is programmed into the I2C module by the software along with an (optional) address **Mask**, specifying bits in the address that can be ignored. This ability to "mask off" certain bits in the address allows the I2C module to identify multiple addresses and respond as if it were more than one slave device.

Library Overview

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the I2C module.

Library Interface Section	Description
General Initialization Functions	Provides configuration routines for: • Slave Mode Clock Stretching • General Call and Other Reserved Address Support • System Management Bus (SMBus) support • High Frequency Support • Stop-in-Idle Control • Module Enable/Disable Control

General Status Functions	Provides status routines for I2C bus conditions.
Baud Rate Generator Control Functions	Provides configuration and access routines for baud rate control.
Slave Address Control Functions	Provides configuration, access, and status routines for control of the slave address to which the I2C module will respond when operating in Slave mode.
Slave Mask Control Functions	Provides configuration and access routines for control of the "ignore" bit mask for slave addressing. The "ignore" mask determines which bits in the incoming transfer's address are ignored, allowing the module to respond to multiple I2C addresses when operating in slave mode. **Note:** This feature is not available on all devices. Refer to the specific device data sheet determine whether slave address masking is supported for your device.
Slave Control Functions	Provides status and control routines for operating in slave mode (either as a receiver or as a transmitter).
Master Control Functions	Provides routines for control of the module when operating in master mode (either as a receiver or as a transmitter). **Note:** The necessary status routines are either part of the general, transmitter, or receiver groups depending on their purpose.
Transmitter Control Functions	Provides control, status, and data transfer routines for transmitting data (either as a master or a slave).
Receiver Control Functions	Provides control, status, and data transfer routines for receiving data (either as a master or a slave).
Feature Existence Functions	Determine whether particular features exist on a device.

How the Library Works

Provides information on how the library works.

Description

Before enabling the I2C module the caller must initialize basic configuration, clock frequency, and Slave address recognition features (see Initializing the I2C).

After the module has been enabled, it can begin monitoring the bus as a slave device waiting to be addressed by an external master (see Operating as a Slave Receiver). A slave device only transfers data on the bus when it has been addressed by a master (see Operating as a Slave Transmitter). If the module is used to start a transfer, it is operating as a master. A master addresses a slave and controls the transfer of data by providing the clock (see Operating as a Master Transmitter and Operating as a Master Receiver).

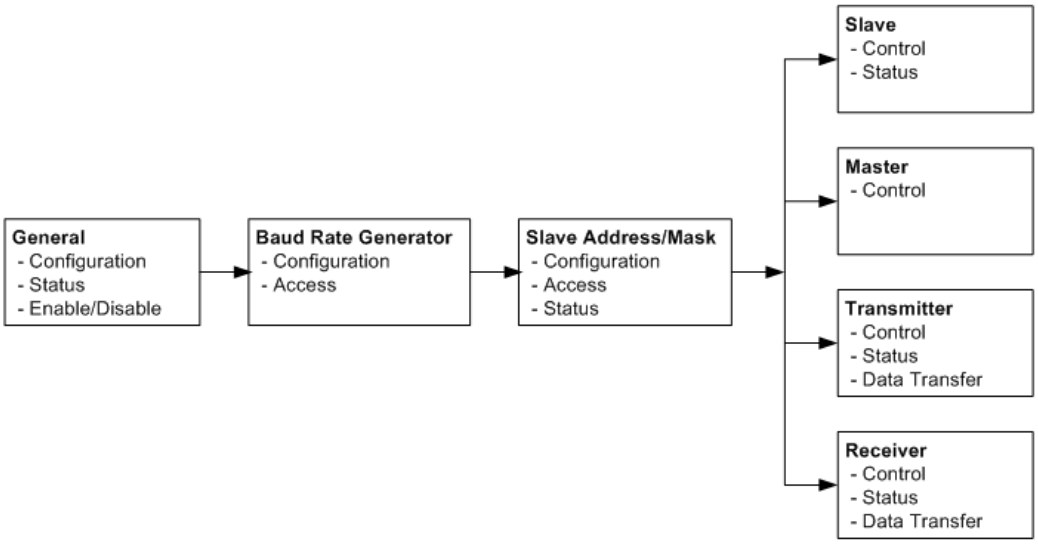
Some operations in the I2C library initiate actions on the I2C bus that require time to complete. Also, some events occur asynchronously on the bus. In each of these cases, the module causes either a "master", "slave", or "error" interrupt. Interrupt State Machine describes the different states that can cause an interrupt and show what causes the transition from one state to another. Handling Errors describes the various errors that can occur and how to deal with them.

Data transfers on the I2C bus must follow specific formats defined by the I2C bus protocol. (Refer to Forming Transfers for details)

Note: The I2C peripheral library does not directly respond to interrupts. The client software (usually a driver, middleware layer, or application) should implement the Interrupt Service Routine (ISR) and call the I2C library's interface routines from that ISR to manage the state of the I2C module.

Usage Model

The following diagram illustrates the library usage model for the I2C Peripheral Library.



Initializing the I2C

To initialize the I2C module, perform the following sequence:

1. Select the desired general configuration options using General Initialization Functions (see the Library Interface section) to select the desired operation of the following features:
   - Slave Clock Stretching
   - General Call Address Recognition
   - System Management Bus (SMBus) Support
   - High Frequency Operation
   - Reserved Address Protection
   - Stop-in-Idle Operation
2. Program the Baud Rate Generator to set the desired baud rate using the PLIB_I2C_BaudRateSet function.
3. If operating in slave mode, set the desired slave address using the PLIB_I2C_SlaveAddress7BitSet function (for 7-bit mode operation) or PLIB_I2C_SlaveAddress10BitSet function (for 10-bit mode operation).
4. If running in an interrupt-driven environment, clear any pending interrupts and enable the appropriate (master, slave, and error) I2C interrupts.

Note: Refer to the **"Interrupts"** chapter in the specific device data sheet or the family reference manual section specified in that chapter for more information.

5. Enable the module for operation using the PLIB_I2C_Enable function.

Example

```
#define MY_I2C_ID  I2C_ID_1
uint32_t  actualClock;

// Configure General I2C Options
PLIB_I2C_SlaveClockStretchingEnable(MY_I2C_ID);
PLIB_I2C_GeneralCallEnable(MY_I2C_ID);
PLIB_I2C_SMBDisable(MY_I2C_ID);
PLIB_I2C_HighFrequencyDisable(MY_I2C_ID);
PLIB_I2C_ReservedAddressProtectEnable(MY_I2C_ID);
PLIB_I2C_StopInIdleEnable(MY_I2C_ID);

// Set Desired baud rate
PLIB_I2C_BaudRateSet ( MY_I2C_ID, MY_PERIPHEAL_CLOCK_FREQ, MY_I2C_BAUD_RATE);

// Set the appropriate slave address (slave only)
PLIB_I2C_SlaveAddress7BitSet(MY_I2C_ID, MY_SLAVE_ADDRESS);

// Optional:  Clear and enable interrupts before enabling the I2C module.

// Enable the module
PLIB_I2C_Enable(MY_I2C_ID);
```

Note: Refer to the **"Interrupts"** chapter in the specific device data sheet or the family reference manual section referenced by that chapter for more information.

The previous example uses the following constants:

Symbol	Description
I2C_ID_1	Defined as the selected I2C module value from the I2C Module enumeration. Example: `#define MY_I2C_ID I2C_ID_1`
MY_I2C_PERIPHERAL_CLOCK	Defined as the peripheral clock frequency (in Hz) of the I2C module. Example: `#define MY_I2C_PERIPHERAL_CLOCK 80000000`
MY_I2C_BAUD_RATE	Defined as desired I2C baud rate. Example: #define MY_I2C_BAUD_RATE 100000
MY_SLAVE_ADDRESS	Defined as the desired 7-bit I2C slave address. Example: `#define 0x1A // Slave address 0011010` in binary **Note:** If '0' is passed as the mask value, the I2C module will only respond to single slave address passed in the second parameter.

Operating as a Slave Receiver

Before enabling the module, the module's "local" slave address and mask should be programmed using the PLIB_I2C_SlaveAddress7BitSet function or the PLIB_I2C_SlaveAddress10BitSet function, depending on the desired address width. If slave address masking is supported on the chosen processor the "don't care bits" mask can be set using the PLIB_I2C_SlaveMask7BitSet function or the PLIB_I2C_SlaveMask10BitSet function, also depending on the desired address width. Once the I2C module has been enabled, it will begin waiting for an I2C master to address it. When the programmed local slave address is recognized (ignoring any bits in the programmed mask value, if supported), the module will ACK the address and notify software that it has received an address byte. If the R/W bit of the address is 0, the module enters receive mode automatically. As additional bytes are received, the module will automatically ACK them if the previous byte has been read from the RX buffer before the new byte has been completely received and notify software of the newly available byte. Both address and data bytes received must be read from the RX buffer by software.

Preconditions

1. The module must have had its basic options and clock frequency initialized and have been enabled (see Initializing the I2C).
2. An external master must have started a transfer.
3. The address of the transfer must have matched with the address (ignoring any bits in the mask) programmed into the module by software.

Process

Software must follow this sequence:

1. Ensure that a byte has been received either by polling the PLIB_I2C_ReceivedByteIsAvailable function or by waiting for a slave interrupt (at which time, this function should still be checked).
2. Identify if the byte is a data byte or an address byte using the PLIB_I2C_SlaveAddressIsDetected function.
3. If the byte is an address byte, software must identify if it is starting a read or write operation using the PLIB_I2C_SlaveReadIsRequested function.
4. Software must read the byte from the RX buffer using the PLIB_I2C_ReceivedByteGet function, even if it was an address byte.
5. If clock stretching was enabled during initialization, software must call the PLIB_I2C_SlaveClockRelease function to release the SCL line.

Example

```
#define MY_I2C_ID  I2C_ID_1
uint8_t data;

if ( PLIB_I2C_ReceivedByteIsAvailable(MY_I2C_ID) )
{
    // Check to see if the byte is data or an address
    if (PLIB_I2C_SlaveAddressWasDetected(MY_I2C_ID))
    {
        if ( PLIB_I2C_SlaveReadWasRequested(MY_I2C_ID) )
        {
            // Beginning a slave receive sequence
        }
        else
        {
            // Beginning a slave transmit sequence
        }
    }
    else
    {
        // Data Byte Received
    }
    // Read the data or address from the RX buffer
    data = PLIB_I2C_ReceivedByteGet(MY_I2C_ID);
```

```
    // Free the SCL line (only if clock stretching was enabled)
    PLIB_I2C_SlaveClockRelease(MY_I2C_ID);
}
```

The previous example uses the following constants and variables:

Symbol	Description
MY_I2C_ID	Defined as the selected I2C module value from the I2C_MODULE_ID enumeration. Example: `#define MY_I2C_ID I2C_ID_1`
data	This is the variable used to hold the byte received.

Operating as a Slave Transmitter

Once an external master has addressed the I2C module (see Operating as a Slave Receiver) with the read-write bit set (as determined by calling the PLIB_I2C_SlaveReadIsRequested function), software can begin transmitting data to the master.

Preconditions

1. The module must have had its basic options and clock frequency initialized and have been enabled(see Initializing the I2C)
2. An external master must have started a transfer.
3. The address of the transfer must have matched with the address slave programmed into the I2C module (see Managing Slave Addresses).
4. A slave read must have been requested (as previously described).

Note: When the address has been received and matched the programmed local slave address, a slave interrupt will occur if it has been enabled.

Transmitting a Byte

When operating as a slave transmitter on the I2C bus, the software must use the following sequence to transmit data bytes.

1. Ensure that the TX buffer is currently ready to accept a byte to be transmitted using the PLIB_I2C_TransmitterIsReady function.
2. Write the byte to be transmitted to the TX buffer using the PLIB_I2C_TransmitterByteSend function.
3. If clock stretching was enabled (using the PLIB_I2C_SlaveClockStretchingEnable function) and the previous byte was ACKed, the PLIB_I2C_SlaveClockRelease function must be called to release the SCL line (it is safe to call this even if the previous byte was NAKed.)

Example

```
#define MY_I2C_ID  I2C_ID_1
uint8_t         data;

// Assign the desired byte value into the "data" variable

if (PLIB_I2C_TransmitterIsReady(MY_I2C_ID))
{
    // Write the byte to the TX buffer
    PLIB_I2C_TransmitterByteSend(MY_I2C_ID, data);

     // Free the SCL line (only if clock stretching was enabled)
    PLIB_I2C_SlaveClockRelease(MY_I2C_ID);
}
```

Checking Acknowledgement

After a byte has been transmitted, the module latches the ACK/NAK response from the master so that software may use the following sequence to verify it and causes another slave interrupt (if it has been enabled).

1. Ensure that the byte has been completely transmitted using the PLIB_I2C_TransmitterByteHasCompleted function (and/or by responding to the slave interrupt).
2. Determine if the byte was ACKed or NAKed using the PLIB_I2C_TransmitterByteWasAcknowledged function.

Example

```
#define MY_I2C_ID  I2C_ID_1

if (PLIB_I2C_TransmitterByteHasCompleted(MY_I2C_ID))
{
    if (PLIB_I2C_TransmitterByteWasAcknowledged(MY_I2C_ID))
    {
        // Transmission successful
    }
    else
    {
        // Transmission was not successful
    }
}
```

The previous examples use the following constants and variables:

Symbol	Description
MY_I2C_ID	Defined as the selected I2C module value from the I2C_MODULE_ID enumeration. Example: `#define MY_I2C_ID I2C_ID_1`
data	This is the buffer containing byte of data to transmit.

Operating as a Master Transmitter

Whenever the I2C module initiates a transfer on the bus, it is acting as master. A transfer can be initiated any time the bus is idle. If two masters attempt to initiate transfers at nearly the same time, one of them will lose arbitration at some point during the transfer and must retry the transfer later when the bus becomes idle. The winner of arbitration can continue, without any data loss.

An I2C bus transfer always begins with a Start condition, followed by one or two properly formatted bytes containing the 7-bit or 10-bit target slave address (address of the slave device that is the target of the transfer). The direction of the remainder of transfers (after the address has been sent) is indicated by bit 0 of the address (0 = write/transmitting, 1 = read/receiving, from the point of view of the master). After that, any amount of data may be transferred and a repeated Start condition (followed by another properly formatted address) can occur to change the direction of the transfer or even the target slave device. See Forming Transfers for details of the possible transfer formats. When the master is finished, an I2C bus transfer always ends with a Stop condition. These steps are summarized as follows:

Summary of Steps

1. Send a Start condition.
2. Send a 7-bit or 10-bit address (one or two bytes with a write transfer indication in bit 0).
3. Send data bytes.
4. Send a Stop condition.

Each of these steps making up a transfer will take some time to complete. The completion of each step will cause an I2C master interrupt. The software must always keep track of which state it was in, check the I2C status, and respond to the interrupt by performing the next appropriate step.

Notes:

1. Arbitration loss can occur after each step has completed. Software should check for arbitration loss by calling the PLIB_I2C_ArbitrationLossHasOccurred function. If arbitration loss occurs, it must be cleared by calling the PLIB_I2C_ArbitrationLossClear function.
2. After any step completes, but before sending the Stop condition (see step 4), the master may send a repeated Start condition and start over at step 2 to change slave targets and/or transfer direction.

Sending a Start Condition

To start a master transfer, the software must do the following:

Preconditions

The module must have had its basic options and clock frequency initialized and have been enabled (see Initializing the I2C).

Process

1. Verify that the bus is idle using the PLIB_I2C_BusIsIdle function.
2. Send the start signal using the PLIB_I2C_MasterStart function.
3. Check for arbitration loss after the start condition has completed using the PLIB_I2C_ArbitrationLossHasOccurred function.

Example: Sending a Start Condition

```
#define MY_I2C_ID  I2C_ID_1

if (PLIB_I2C_BusIsIdle(MY_I2C_ID))
{
    PLIB_I2C_MasterStart(MY_I2C_ID);
}
```

The Start condition must be allowed to complete before any additional steps can be taken. The only way to determine this is to wait for a master interrupt to occur after the Start condition has been initiated. Even if the bus is verified to be idle before sending the start condition, a bus collision can still occur while the Start condition is being transmitted. To verify that arbitration has not been lost during transmission of the Start condition, the software should check the PLIB_I2C_ArbitrationLossHasOccurred function after the Start condition has completed.

Example: Checking for Arbitration Loss

```
#define MY_I2C_ID  I2C_ID_1

if (PLIB_I2C_ArbitrationLossHasOccurred(MY_I2C_ID))
{
    // Abort transfer, retry later

    PLIB_I2C_ArbitrationLossClear(MY_I2C_ID);
}
```

Sending a 7-bit Address

To send a 7-bit address, the software must do the following:

Preconditions

The Start condition must have been sent and completed as previously described.

Process

1. Write the address byte to the TX buffer using the PLIB_I2C_TransmitterByteSend function. The address byte that is supplied as the parameter to PLIB_I2C_TransmitterByteSend should also include the R/W bit.

Note: A master interrupt will occur once the address byte has been transmitted and ACKed or NAKed by the targeted slave device. (If the slave device does not answer, an implicit NAK will occur.)

2. Once the address byte has been ACKed or NAKed by the slave target, software must verify the result and respond appropriately. The Acknowledgement and Arbitration process is described in a subsequent section, just before the description of how to send a Stop condition.)

Example: Sending a 7-bit Address

```
#define MY_I2C_ID I2C_ID_1
#define SLAVE_TARGET_ADDRESS 0x22
uint8_t slaveAddress = 0;

// Format the 7-bit address byte with the write indication in bit 0
slaveAddress = SLAVE_TARGET_ADDRESS;

// Send the address byte
if (PLIB_I2C_TransmitterIsReady(MY_I2C_ID))
{
    PLIB_I2C_TransmitterByteSend(MY_I2C_ID, slaveAddress);
}
```

Note: Bits 7-1 contain the 7-bit target slave address. Bit 0 indicates read or write direction for the remainder of the transfer.

Sending a 10-bit Target Slave Address

To send a 10-bit address, the software must do the following:

Preconditions

The Start condition must have been sent and completed as previously described.

Process

1. Format the two address bytes correctly with the 10-bit address and the read/write bit appropriately set (for a read transfer) or cleared (for a write transfer).
2. Ensure that the TX buffer is currently ready to accept a byte to be transmitted using the PLIB_I2C_TransmitterIsReady function.
3. Write the first address byte to the TX buffer using the PLIB_I2C_TransmitterByteSend function.

Note: After the first byte has been sent and ACKed or NAKed by the slave, a master interrupt will occur (or you can poll the PLIB_I2C_TransmitterByteHasCompleted function).

4. Ensure that the first address byte was ACKed by the slave target (to do this, follow the Acknowledgement process described in a following section.
5. Write the second address byte to the TX buffer using the PLIB_I2C_TransmitterIsReady function and the PLIB_I2C_TransmitterByteSend function.

Note: After the second byte has been sent and ACKed or NAKed by the slave, a master interrupt will occur (or you can poll the PLIB_I2C_TransmitterByteHasCompleted function).

6. Ensure that the second address byte was ACKed by the slave target (to do this, follow the process in the Acknowledgement and Arbitration, which is described later in this section).

Example: Formatting the 10-bit Address in Two Bytes

```
/* first byte of 10-bit address which is inclusive of R/W bit */
#define SLAVE_TARGET_10BIT_ADDRESS_BYTE1 0xF6

/* second byte of 10-bit address */
#define SLAVE_TARGET_10BIT_ADDRESS_BYTE2 0x22

uint8_t slaveAddressByte1 = 0;
uint8_t slaveAddressByte2 = 0;

/* include the R/W in bit 0 of the first byte */
slaveAddressByte1 = SLAVE_TARGET_10BIT_ADDRESS_BYTE1;
slaveAddressByte2 = SLAVE_TARGET_10BIT_ADDRESS_BYTE2;
```

Example: Sending the First Byte of a 10-bit Address

```
#define MY_I2C_ID I2C_ID_1

if (PLIB_I2C_TransmitterIsReady(MY_I2C_ID))
{
    PLIB_I2C_TransmitterByteSend(MY_I2C_ID, slaveAddressByte1);
}
```

Wait for transmission to complete and check for acknowledgement and/or arbitration loss.

Example: Sending the Second Byte of a 10-bit Address

```
#define MY_I2C_ID I2C_ID_1

if (PLIB_I2C_TransmitterIsReady(MY_I2C_ID))
{
    PLIB_I2C_TransmitterByteSend(MY_I2C_ID, slaveAddressByte2);
}
```

Wait for transmission to complete and check for acknowledgement and/or arbitration loss.

Sending a Data Byte

The following sequence can be used to send a data byte and repeated to send an arbitrary number of data bytes.

Preconditions

- The Start condition must have been sent and completed as previously described
- The target slave address has been fully transmitted (with the write indication in bit 0) and ACKed by the targeted slave device

Process

1. Ensure that the TX buffer is currently ready to accept a byte to be transmitted using the PLIB_I2C_TransmitterIsReady Function.
2. Write the byte to be transmitted to the TX buffer using the PLIB_I2C_TransmitterByteSend Function.

Note: After the byte has been sent and ACKed or NAKed by the slave, a master interrupt will occur (or poll the PLIB_I2C_TransmitterByteHasCompleted function).

3. Check for arbitration loss or an ACK or NAK from the slave as described in the next section, Acknowledgement and Arbitration.

Example

```
#define MY_I2C_ID I2C_ID_1
uint8_t         data;

// Assign the data value into the "data" variable

if (PLIB_I2C_TransmitterIsReady(MY_I2C_ID))
{
    PLIB_I2C_TransmitterByteSend(MY_I2C_ID, data);
}
```

Wait for transmission to complete and check for acknowledgement and/or arbitration loss.

Acknowledgement and Arbitration

After sending a data or address byte (as previously described), the master transmitter must check to see if arbitration was lost and if the byte was ACKed or NAKed. If the byte was ACKed, the slave receiver is ready to receive more bytes. If the byte was NAKed, the slave receiver cannot accept any more bytes at this time.

Preconditions

- The start condition must have been sent and completed as previously described
- A byte (address or data) must have been transmitted, using one of the previous processes

Process

1. Ensure that the byte has been completely transmitted using the PLIB_I2C_TransmitterByteHasCompleted function (and/or by waiting for the master interrupt)
2. Determine if arbitration loss has occurred using the PLIB_I2C_ArbitrationLossHasOccurred function.
3. Determine if the byte was ACKed or NAKed using the PLIB_I2C_TransmitterByteWasAcknowledged function.

Example

```
#define MY_I2C_ID I2C_ID_1

if (PLIB_I2C_TransmitterByteHasCompleted(MY_I2C_ID))
{
    if (PLIB_I2C_ArbitrationLossHasOccurred(MY_I2C_ID))
    {
        // Handle arbitration loss

        PLIB_I2C_ArbitrationLossClear(MY_I2C_ID);
    }
    else
```

```
    {
        if (PLIB_I2C_TransmitterByteWasAcknowledged(MY_I2C_ID))
        {
            // Transmission successful
        }
        else
        {
            // Transmission was not successful
        }
    }
}
```

To handle arbitration loss, the master transmitter must stop the transfer process and retry the entire transfer again at a later time when the bus is not busy.

Sending a Repeated Start Condition

If the master wants to change slave targets or transfer directions, it can send a repeated Start condition followed by a new address at any time after the previous target slave address has been acknowledged (and before the Stop condition has been sent).

Preconditions

- The Start condition must have been sent and completed as previously described
- A target slave address must have been transmitted and ACKed
- Zero or more data bytes may also have been sent and ACKed

Process

Send the repeated Start condition using the PLIB_I2C_MasterStartRepeat function.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_MasterStartRepeat(MY_I2C_ID);
```

The Start condition must be allowed to complete before any additional steps can be taken. The only way to determine this is to wait for a master interrupt to occur after the Start condition has been initiated.

The repeated Start must be followed by another target slave address (either 7-bit or 10-bit, as appropriate).

Sending a Stop Condition

When the master transmitter has finished sending data, it must end the transfer with a stop condition.

Preconditions

- The Start condition must have been sent and completed as previously described
- A target slave address must have been transmitted and ACKed
- Zero or more data bytes may also have been sent and ACKed

Note: At least one address byte must be transmitted between the Start and Stop conditions. Following a Start condition immediately with a Stop condition is a protocol error and can cause some slave devices to lock up and stop responding to the bus.

Process

Send a stop condition using the PLIB_I2C_MasterStop function.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_MasterStop(MY_I2C_ID);
```

The Stop condition must be allowed to complete before any additional steps can be taken. The only way to determine this is to wait for a master interrupt to occur after the Stop condition has been initiated.

After a Stop condition, the bus should be idle unless a master immediately starts a new transfer. Strictly speaking, a bus collision can still occur while the Stop condition is being transmitted. Although the transfer is already completed when the Stop condition has been sent, software does not have to abort the transfer; however, it should still check for and clear the arbitration loss condition if it occurs.

Example: Checking for Arbitration Loss

```
#define MY_I2C_ID I2C_ID_1

if (PLIB_I2C_ArbitrationLossHasOccurred(MY_I2C_ID))
{
    PLIB_I2C_ArbitrationLossClear(MY_I2C_ID);
}
```

The previous examples use the following constants and variables:

Symbol	Description
MY_I2C_ID	Defined as the selected I^2C module value from the I2C Module enumeration. Example: `#define MY_I2C_ID I2C_ID_1`

`data`	This is the buffer containing byte of data to transmit.
`slaveTargetAddress7Bit`	This variable is used to demonstrate how to properly format and access a 7-bit target slave address
`SLAVE_TARGET_7BIT_ADDRESS`	This constant is used as a placeholder for the actual 7-bit target slave address that must be defined by the client code.
`slaveAddress10Bit`	This variable is used to demonstrate how to properly format and access a 10-bit slave address.
`SLAVE_TARGET_10BIT_ADDRESS`	This constant is used as a placeholder for the actual 10-bit slave address that must be defined by the client code.

Operating as a Master Receiver

Any time the I2C module initiates a transfer on the bus, it is acting as a master. A transfer can be initiated any time the bus is idle. If two masters attempt to initiate transfers at nearly the same time, one of them will lose arbitration and must retry the transfer later when the bus becomes idle. The winner of arbitration can continue, without any data loss.

An I2C bus transfer always begins with a Start condition, followed by a 7-bit or 10-bit (1-byte or 2-byte) target slave address. Therefore, every master transfer starts off transmitting at least one byte. The direction of transfer of subsequent bytes (after the first byte has been sent) is indicated by bit 0 of the first address byte (0 = write/transmitting, 1 = read/receiving, from the point of view of the master). If 10-bit addressing is used or additional data (such as an internal address) is to be transmitted after the first address byte, the first address byte must indicate a write transfer. To change the direction after transmitting more than just a single address byte, a repeated Start condition (followed by another single address byte) must be sent (see Forming Transfers for details of the possible transfer formats). When the master is finished, an I2C bus transfer always ends with a Stop condition. This results in two basic formats for receiving data as a master, summarized as follows:

Summary of Steps: Read Only

1. Send a Start condition.
2. Send a 7-bit address with a read transfer indication in bit 0.
3. Receive data bytes.
4. Send a Stop condition.

Summary of Steps: Combined Read-Write

1. Send a Start condition.
2. Send a 7-bit address (or the first byte of a 10-bit address) with a write transfer indication in bit 0.
3. Send the second byte of a 10-bit address (and/or any additional data to be transmitted).
4. Send a repeated Start condition.
5. Resend the first byte of the 10-bit address (or a 7-bit address) with a read indication in bit 0.
6. Receive data bytes.
7. Send a Stop condition.

Each of these steps making up a transfer will take some time to complete. The completion of each step will cause an I2C master interrupt. The software must always keep track of which state it was in and respond to the interrupt by performing the next appropriate step.

Sending a Start Condition

To start a master transfer, the software must do the following:

Preconditions

The module must have had its basic options and clock frequency initialized and have been enabled (see Initializing the I2C).

Process

1. Verify that the bus is idle using the PLIB_I2C_BusIsIdle function.
2. Send the start signal using the PLIB_I2C_MasterStart function.

Example

```
#define MY_I2C_ID  I2C_ID_1
if (PLIB_I2C_BusIsIdle(MY_I2C_ID))
{
    PLIB_I2C_MasterStart(MY_I2C_ID);
}
```

The Start condition must be allowed to complete before any additional steps can be taken. The only way to determine this is to wait for a master interrupt to occur after the Start condition has been initiated. Even if the bus is verified to be idle before sending the Start condition, a bus collision can still occur while the Start condition is being transmitted. To verify that arbitration has not been lost during transmission of the Start condition, the software should check the PLIB_I2C_ArbitrationLossHasOccurred function after the Start condition has completed.

Example: Checking for Arbitration Loss

```
#define MY_I2C_ID  I2C_ID_1
if (PLIB_I2C_ArbitrationLossHasOccurred(MY_I2C_ID))
{
    // Abort transfer, retry later
    PLIB_I2C_ArbitrationLossClear(MY_I2C_ID);
```

```
}
```

Sending a 7-bit Address

To send a 7-bit address (or the first byte of a 10-bit address), the software must do the following:

Preconditions

The Start condition must have been sent and completed as previously described.

Process

1. Ensure that the TX buffer is currently ready to accept a byte to be transmitted using the PLIB_I2C_TransmitterIsReady function.
2. Format the address byte correctly with the 7-bit address and the read/write bit appropriately set (for a read transfer) or cleared (for a write transfer).
3. Write the address byte to the TX buffer using the PLIB_I2C_TransmitterByteSend function.

Note: A master interrupt will occur once the address byte has been transmitted and ACKed or NAKed by the targeted slave device (or if arbitration was lost). If the slave device does not answer, an implicit NAK will occur.

4. Once the address byte has been ACKed or NAKed by the slave target (or if arbitration was lost), software must verify the result and respond appropriately. The Acknowledgement and Arbitration process is described in a subsequent section, just before the description of how to send a Stop condition.)

Example: Sending a 7-bit Address

```
#define MY_I2C_ID  I2C_ID_1
#define SLAVE_TARGET_ADDRESS 0x22
uint8_t slaveAddress = 0;

// Format the 7-bit address byte with the read indication in bit 0
slaveAddress = (SLAVE_TARGET_ADDRESS | 0x01);

// Send the address byte
if (PLIB_I2C_TransmitterIsReady(MY_I2C_ID))
{
    PLIB_I2C_TransmitterByteSend(MY_I2C_ID, slaveAddress);
}
```

Note: Bits 7-1 contain the 7-bit target slave address. Bit 0 indicates read or write direction for the remainder of the transfer.

Sending a 10-bit Target Slave Address

To send a 10-bit address, the software must do the following:

Preconditions

The Start condition must have been sent and completed as previously described.

Process

1. Format the two address bytes correctly with the 10-bit address and the read/write bit cleared, indicating a write transfer.
2. Ensure that the TX buffer is currently ready to accept a byte to be transmitted using the PLIB_I2C_TransmitterIsReady function.
3. Write the first address byte to the TX buffer using the PLIB_I2C_TransmitterByteSend function.

Note: After the first byte has been sent and ACKed or NAKed by the slave, a master interrupt will occur (or poll the PLIB_I2C_TransmitterByteHasCompleted function).

4. Ensure that the first address byte was ACKed by the slave target and check for arbitration loss. To do this, use the Acknowledgement and Arbitration process, which described in the next section.
5. Write the second address byte to the TX buffer using the PLIB_I2C_TransmitterIsReady function and the PLIB_I2C_TransmitterByteSend function.

Note: After the second byte has been sent and ACKed or NAKed by the slave, a master interrupt will occur (or you can poll the PLIB_I2C_TransmitterByteHasCompleted function).

6. Ensure that the second address byte was ACKed by the slave target and that arbitration was not lost. To do this, use the Acknowledgement and Arbitration process, which described in the next section.

Example: Formatting the 10-bit Address in Two Bytes

```
#define MY_I2C_ID I2C_ID_1

/* first byte of 10-bit address which is inclusive of R/W bit */
#define SLAVE_TARGET_10BIT_ADDRESS_BYTE1 0xF6

/* second byte of 10-bit address */
#define SLAVE_TARGET_10BIT_ADDRESS_BYTE2 0x22

uint8_t slaveAddressByte1 = 0;
```

```
uint8_t slaveAddressByte2 = 0;

/* including the R/W bit in byte-1 of 10-bit address */
slaveAddressByte1 = (SLAVE_TARGET_10BIT_ADDRESS_BYTE1 | 0x01);

/* the second byte is included as is */
slaveAddressByte2 = SLAVE_TARGET_10BIT_ADDRESS_BYTE2;
```

Example: Sending the First Byte of a 10-bit Address

```
#define MY_I2C_ID I2C_ID_1
if (PLIB_I2C_TransmitterIsReady(MY_I2C_ID))
{
    PLIB_I2C_TransmitterByteSend(MY_I2C_ID, slaveAddressByte1);
}
```

Wait for transmission to complete and check for acknowledgement and/or arbitration loss.

Example: Sending the Second Byte of a 10-bit Address

```
#define MY_I2C_ID I2C_ID_1

if (PLIB_I2C_TransmitterIsReady(MY_I2C_ID))
{
    PLIB_I2C_TransmitterByteSend(MY_I2C_ID, slaveAddressByte2);
}
```

Wait for transmission to complete and check for acknowledgement and/or arbitration loss.

Acknowledgement and Arbitration

After sending a data or address byte (as previously described), the master transmitter must check to see if arbitration was lost and if the byte was ACKed or NAKed. If the byte was ACKed, the slave receiver is ready to receive more bytes. If the byte was NAKed, the slave receiver cannot accept any more bytes at this time.

Preconditions

- The Start condition must have been sent and completed as previously described
- A byte (address or data) must have been transmitted, using one of the previous processes

Process

1. Ensure that the byte has been completely transmitted using the PLIB_I2C_TransmitterByteHasCompleted function (and/or by waiting for the master interrupt).
2. Determine if arbitration loss has occurred using the PLIB_I2C_ArbitrationLossHasOccurred function.
3. Determine if the byte was ACKed or NAKed using the PLIB_I2C_TransmitterByteWasAcknowledged function.

```
#define MY_I2C_ID I2C_ID_1
if (PLIB_I2C_TransmitterByteHasCompleted(MY_I2C_ID))
{
    if (PLIB_I2C_ArbitrationLossHasOccurred(MY_I2C_ID))
    {
        // Handle arbitration loss
        PLIB_I2C_ArbitrationLossClear(MY_I2C_ID);
    }
    else
    {
        if (PLIB_I2C_TransmitterByteWasAcknowledged(MY_I2C_ID))
        {
            // Transmission successful
        }
        else
        {
            // Transmission was not successful
        }
    }
}
```

To handle arbitration loss, the master must stop the transfer process and retry the entire transfer again at a later time when the bus is not busy.

Sending a Repeated Start Condition

If the master wants to change slave targets or transfer directions, it must send a repeated Start condition followed by a new address at any time after the previous target slave address has been acknowledged (and before the Stop condition has been sent).

Preconditions

- The Start condition must have been sent and completed as previously described
- A target slave address must have been transmitted and ACKed.
- Zero or more data bytes may also have been sent or received and ACKed as appropriate.

Process

Send the repeated Start condition using the PLIB_I2C_MasterStartRepeat function.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_MasterStartRepeat(MY_I2C_ID);
```

The repeated Start condition must be allowed to complete before any additional steps can be taken. The only way to determine this is to wait for a master interrupt to occur after the Start condition has been initiated. It must then be followed by another target slave address (either 7-bit or 10-bit, as appropriate). Strictly speaking, a bus collision can still occur while the repeated start condition is being transmitted. To verify that arbitration has not been lost during transmission of the repeated Start condition, the software should check the PLIB_I2C_ArbitrationLossHasOccurred function after the repeated Start condition has completed.

Example: Checking for Arbitration Loss

```
#define MY_I2C_ID I2C_ID_1

if (PLIB_I2C_ArbitrationLossHasOccurred(MY_I2C_ID))
{
    // Abort transfer, retry later

    PLIB_I2C_ArbitrationLossClear(MY_I2C_ID);
}
```

Receiving a Data Byte

The following sequence can be used to receive a data byte and repeated to receive an arbitrary number of data bytes.

Preconditions

- The Start condition must have been sent and completed as previously described
- The target slave address must have been fully transmitted (with the read indication in bit 0) and ACKed by the targeted slave device

Process

1. Start the I2C module cycling the clock line to receive one byte by calling the PLIB_I2C_MasterReceiverClock1Byte function. The I2C module will generate a master interrupt once the eighth clock cycle has completed, but before the ninth cycle has started.
2. Ensure that a byte was received and is available in the RX buffer using the PLIB_I2C_ReceivedByteIsAvailable function.
3. If a byte is available, get it from the RX buffer using the PLIB_I2C_ReceivedByteGet function.
4. ACK or NAK the byte (as determined by software) using the PLIB_I2C_ReceivedByteAcknowledge function. The master receiver indicates to the slave transmitter that it wants to terminate the transfer by NAKing the last byte. All other bytes should be ACKed after reception.
5. Ensure that the ACK/NAK signal has completed using the PLIB_I2C_ReceiverByteAcknowledgeHasCompleted function or by waiting for the master interrupt.

Note: Arbitration loss cannot occur during a master reception (only during transmission).

Example: Enabling the Receiver

```
#define MY_I2C_ID I2C_ID_1
PLIB_I2C_MasterReceiverClock1Byte(MY_I2C_ID);
```

Wait for reception to complete before attempting to get the byte from the receiver.

Example: Reading a Byte from the RX Buffer

```
#define MY_I2C_ID I2C_ID_1
#define MY_MAX_COUNT  10
uint8_t data;
int     count;

if ( PLIB_I2C_ReceivedByteIsAvailable(MY_I2C_ID) )
{
    data = PLIB_I2C_ReceivedByteGet(MY_I2C_ID);
    count++;

    // Determine if the data should be ACKed or NAKed
    if (count < MY_MAX_COUNT)
    {
        PLIB_I2C_ReceivedByteAcknowledge(MY_I2C_ID, true);
    }
    else
    {
        PLIB_I2C_ReceivedByteAcknowledge(MY_I2C_ID, false);
    }
}
```

Wait for the ACK/NAK to complete by waiting for the next master interrupt.

Example: Verifying ACK/NAK Signal is Complete

```
#define MY_I2C_ID I2C_ID_1
```

```
if (PLIB_I2C_ReceiverByteAcknowledgeHasCompleted(MY_I2C_ID))
{
    // Byte reception sequence complete
}
```

Sending a Stop Condition

When the master transmitter has finished sending data, it must end the transfer with a Stop condition.

Preconditions

- The Start condition must have been sent and completed as previously described
- A target slave address must have been transmitted and ACKed.
- Zero or more data bytes may also have been sent or received and ACKed as appropriate

Note: At least one address byte must be transmitted between the Start and Stop conditions. Following a Start condition immediately with a Stop condition is a protocol error and can cause some slave devices to lock up and stop responding to the bus.

Process

Send a Stop condition using the PLIB_I2C_MasterStop function.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_MasterStop(MY_I2C_ID);
```

The Stop condition must be allowed to complete before any additional steps can be taken. The only way to determine this is to wait for a master interrupt to occur after the Stop condition has been initiated.

After a Stop condition, the bus should be idle unless a master immediately starts a new transfer. Strictly speaking, a bus collision can still occur while the stop condition is being transmitted. Although the transfer is already completed when the Stop condition has been sent, software does not have to abort the transfer; however, it should still check for and clear the arbitration loss condition if it occurs.

Example: Checking for Arbitration Loss

```
#define MY_I2C_ID I2C_ID_1

if (PLIB_I2C_ArbitrationLossHasOccurred(MY_I2C_ID))
{
    PLIB_I2C_ArbitrationLossClear(MY_I2C_ID);
}
```

The previous example uses the following constants and variables:

Symbol	Description
MY_I2C_ID	Defined as the selected I2C module value from the I2C Module enumeration. Example: `#define MY_I2C_ID I2C_ID_1`
data	This is the buffer to hold byte of data received.
`slaveTargetAddress7Bit`	This variable is used to demonstrate how to properly format and access a 7-bit target slave address
`SLAVE_TARGET_7BIT_ADDRESS`	This constant is used as a place holder for the actual 7-bit target slave address that must be defined by the client code.
`slaveAddress10Bit`	This variable is used to demonstrate how to properly format and access a 10-bit target slave address
`SLAVE_TARGET_10BIT_ADDRESS`	This constant is used as a place holder for the actual 10-bit target slave address that must be defined by the client code.

Interrupt State Machine

The I2C state machine can be used in either a polled or an interrupt-driven manner. However, even when polled, software must check the state of the master, slave, and error interrupt flags to identify when a state transition occurs.

The I2C module can cause three different interrupts:

- Slave Interrupt - A byte was sent or received in Slave mode
- Master Interrupt - A bus action has completed in Master mode
- Error Interrupt - An error has occurred in any mode (see Handling Errors)

Note: Refer to the **"Interrupts"** chapter in the specific device data sheet or the family reference manual section specified in that chapter for more information.

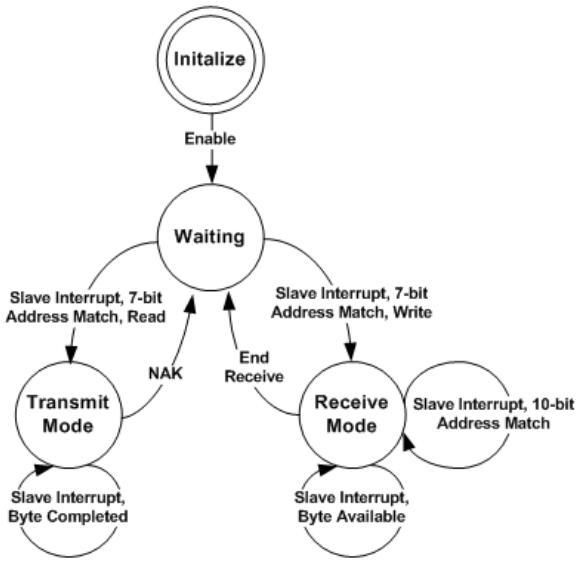
The I2C module will not start generating interrupts (setting the I2C interrupt flags, even if interrupts are disabled) until it is properly configured and enabled. After that, interrupts are generated as described in the following section. Software has to respond appropriately once the interrupt has

occurred (the flag has been set) to allow the state machine to advance to the next state. These actions are described following the state machine diagram to which they refer.

Notes:

1. These state machine diagrams show the normal operations. Error and exception cases are explained in the Handling Errors section and are not shown in the diagrams.
2. The transition labels sometimes represent hardware interrupts (or the setting of an interrupt flag) and sometimes represent software actions. Refer to the transition tables to understand the transitions.
3. The Wait state is shared between all state machines (i.e., while in the Wait state, the I2C module can start a new master-mode transfer or be addressed by an external master).
4. The Start state is shared between both read and write master transfer state machines (i.e., when starting a new transfer, software can choose start either a read or a write transfer).

Slave Mode State Machine



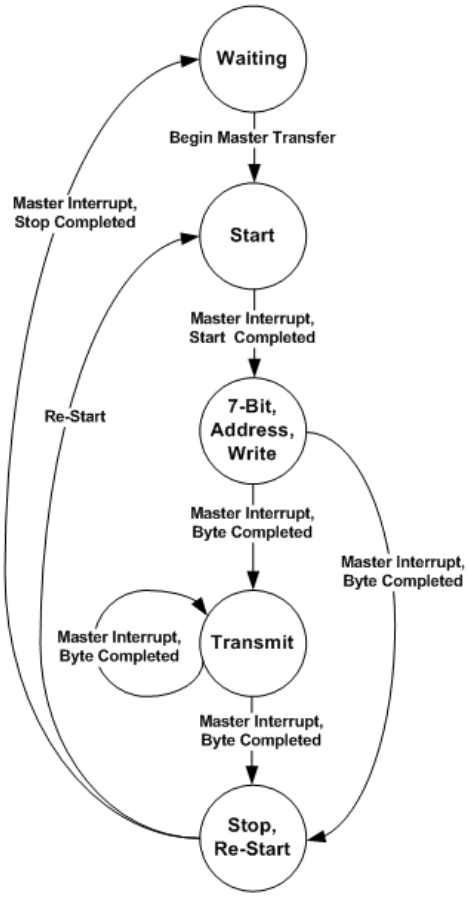
Slave Mode State Transitions

In Slave mode, state transitions occur under hardware control automatically or in response to an interrupt. Software must respond appropriately to ensure that the module continues to operate correctly.

Transition	From State	To State	Software Actions
Enable	Initialize	Wait	Enable the module, using the PLIB_I2C_Enable function
Slave Interrupt, 7-bit Address Match, Write	Wait	Receive mode	Software should call the PLIB_I2C_ReceivedByteIsAvailable function to verify that a byte has been received and the PLIB_I2C_SlaveAddressWasDetected function to verify that a 7-bit address (or the first byte of a 10-bit address) has been received. Then, software must get the address byte from the receiver buffer (the byte is automatically ACKed), using the PLIB_I2C_ReceivedByteGet function. Software must also release the clock by calling PLIB_I2C_SlaveClockRelease function to allow reception of the next byte. **Note:** This transition occurs on a write transfer with either a 7-bit or 10-bit address (for the first of two address bytes).
Slave Interrupt, Byte Received	Receive mode	Receive mode	Software should call the PLIB_I2C_ReceivedByteIsAvailable function to verify that a byte has been received and, if one has, get the byte from the receiver buffer by calling PLIB_I2C_ReceivedByteGet function. Then, software must release the clock by calling PLIB_I2C_SlaveClockRelease function to allow reception of the next byte.
Slave Interrupt, 10-bit Address Match	Receive mode	Receive mode	Software should call the PLIB_I2C_ReceivedByteIsAvailable function to verify that a byte has been received and (if 10-bit addressing is being used) call the PLIB_I2C_SlaveAddress10BitWasDetected function to verify that the second byte of the 10-bit address matched the low-order 8-bits of the local-slave 10-bit address. Next, software must get the address byte received from the receiver buffer (the byte is automatically ACKed), using the PLIB_I2C_ReceivedByteGet function. **Note:** This transition occurs on write transfer when using 10-bit (2-byte) addressing when the second address byte is received.
End Receive	Receive mode	Wait	None. Software is not aware of this transition. A receive transfer can end with a stop condition, a repeated start, or if the second-half of a 10-bit slave address does not match the programmed local slave address (and possibly the optional mask).

Slave Interrupt, 7-bit Address Match, Read	Wait	Transmit mode	Software should call the PLIB_I2C_ReceivedByteIsAvailable function to verify that a byte has been received and the PLIB_I2C_SlaveAddressWasDetected function to verify that an address has been received. Then, software must get the address byte from the receiver buffer (the byte is automatically ACKed), using the PLIB_I2C_ReceivedByteGet function. **Notes:** 1. This transition occurs on a read transfer with a 7-bit (1-byte) address or after a repeated-start with a 10-bit slave address. 2. The second byte of a 10-bit address is not sent after a repeated-start condition, only the first byte. The 10-bit slave device must remember if it was addressed at the beginning of this transfer. 3. After handling the address byte received, software should call the PLIB_I2C_TransmitterIsReady function to make sure that the transmitter buffer is able to accept a byte and, if it is, call the PLIB_I2C_TransmitterByteSend function to send the requested byte.
Slave Interrupt, Byte Completed	Transmit mode	Transmit mode	Software must call the PLIB_I2C_TransmitterByteWasAcknowledged function to check to see if the byte was ACKed or NAKed. If the byte was ACKed, software must send the next byte by calling the PLIB_I2C_TransmitterIsReady function to make sure that the transmitter buffer is able to accept a byte and, if it is, call the PLIB_I2C_TransmitterByteSend function to send the next byte.
NAK	Transmit mode	Wait	Software must call the PLIB_I2C_TransmitterByteWasAcknowledged function to check to see if the byte was ACKed or NAKed. The master will NAK the last byte it wants to receive. At that point, the transfer is effectively over and software must not attempt to send any more bytes. The module automatically transitions back to the Wait state when the Stop condition occurs, but software does not receive an interrupt at that point.

Master Mode Write Transfer State Machine

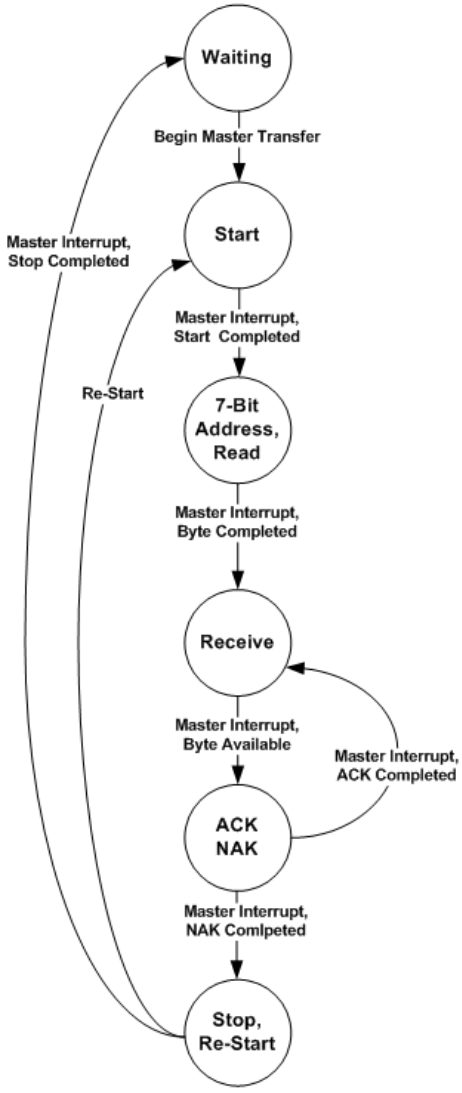


Master-Mode Write-Transfer State Transitions

Transition	From State	To State	Software Actions
Begin Master Transfer	Wait	Start	This state transition occurs when software initiates transmission of the start condition. Software should call the PLIB_I2C_BusIsIdle function to verify that the bus is not currently in use by another master. Then it must call the PLIB_I2C_MasterStart function (or PLIB_I2C_MasterStartRepeat function) to send the start (or repeated start) condition.

Master Interrupt, Start Completed	Start	7-Bit Address, Write	After the start condition has completed, software should check for a possible collision by calling the PLIB_I2C_ArbitrationLossHasOccurred function. Then, it must send an appropriately formatted 7-bit address byte (or the first byte of the 10-bit address) to the I^2C bus to address a slave target. To do this, it should first call the PLIB_I2C_TransmitterIsReadyfunction to verify that the transmitter buffer is ready to accept a byte and then call the PLIB_I2C_TransmitterByteSend function to send the byte.
Master Interrupt, Byte Completed	7-bit Address, Write	Transmit	When the master interrupt occurs (or the PLIB_I2C_TransmitterByteHasCompleted function returns true) to indicate that the last byte sent has completed, software must check to ensure that the slave device ACKed the byte by calling the PLIB_I2C_TransmitterByteWasAcknowledged function. Software should also call the PLIB_I2C_ArbitrationLossHasOccurred function to determine if a collision occurred. If all is well, software may then send another byte to the slave using the PLIB_I2C_TransmitterIsReady function and the PLIB_I2C_TransmitterByteSend function. If 10-bit addressing is being used for this transfer, the start condition and first byte of the 10-bit address must be followed by the second byte of the 10-bit address. Multiple slaves may respond to the first byte of the 10-bit address. It requires the second byte to uniquely identify the 10-bit slave. However, this is sent using the same process as if it were a data byte.
Master Interrupt, Byte Completed	Transmit	Transmit	Software must call the PLIB_I2C_TransmitterByteWasAcknowledged function check to ensure that the slave device ACKed the byte and the PLIB_I2C_ArbitrationLossHasOccurred function to determine if a collision occurred. If all is well, software may call the PLIB_I2C_TransmitterIsReady function and PLIB_I2C_TransmitterByteSendfunction to send another byte to the slave and remain in the Transmit state. If not, software should abort the transfer by sending a Stop condition and transition to the Stop, repeated Start state.
Master Interrupt, Byte Completed	7-bit Address, Write	Stop, repeated Start	If the slave NAKed any byte sent or if software wants to end or restart the transfer (perhaps to change direction) it can do so by sending a stop condition (using the PLIB_I2C_MasterStop function) or repeated Start condition (using the PLIB_I2C_MasterStartRepeat function).
Master Interrupt, Byte Completed	Transmit	Stop, repeated Start	Software must call the PLIB_I2C_TransmitterByteWasAcknowledged function check to check to see if the slave ACKed or NAKed the byte. If the slave NAKed the byte or if software wants to end or restart the transfer (perhaps to change direction) it can do so by sending a Stop condition (using the PLIB_I2C_MasterStop function) or repeated Start condition (using the PLIB_I2C_MasterStartRepeat function).
Restart	Stop, repeated Start	Start	Immediately after initiating the repeated Start condition, software transitions back to the Start state where it must decide what sort of transfer it will start next. **Note:** Read transfers will transition to the Start state in the Master Mode Read Transfer state machine.
Master Interrupt, Stop Completed	Stop, repeated Start	Wait	When the master interrupt occurs, indicating that the Stop condition has completed, software transitions back to the Wait state (which is actually part of the Slave Mode state machine).

Master-Mode Read-Transfer State Machine



Master Mode Read Transfer State Transitions

In Master mode, transitions are initiated under software control and interrupts occur (the master interrupt flag is set, even when interrupts are disabled) when the action initiated has completed.

If at any point, an address or data byte is NAKed by the slave or an error occurs, usually the safest thing for the master to do is to end the transfer with a Stop condition and release the bus.

Transition	From State	To State	Software Actions
Begin Master Transfer	Wait	Start	This state transition occurs when software initiates transmission of the start condition. Software should call the PLIB_I2C_BusIsIdle function to verify that the bus is not currently in use by another master. Then it must call the PLIB_I2C_MasterStart function (or PLIB_I2C_MasterStartRepeat function) to send the start (or repeated Start) condition.
Master Interrupt, Start Completed	Start	7-Bit Address, Read	After the start condition has completed, software should check for a possible collision by calling the PLIB_I2C_ArbitrationLossHasOccurred function. Then, it must send an appropriately formatted 7-bit address byte (or the first byte of the 10-bit address) to the I2C bus to address a slave target. To do this, it should first call the PLIB_I2C_TransmitterIsReady function to verify that the transmitter buffer is ready to accept a byte and then call the PLIB_I2C_TransmitterByteSend function to send the byte. **Note:** If using 10-bit addressing, this is a repeated transmission of the first byte of the 10-bit address since all 10-bit transfers must start off as write transfers (so both address bytes can be sent) then be restarted to become read transfers.
Master Interrupt, Byte Completed	7-Bit Address, Read	Receive	Software must initiate the "Clock1Byte" operation (using the PLIB_I2C_MasterReceiverClock1Byte function) so that the I2C module will cycle the SCL line eight times causing the slave to send the requested byte of data.

Master Interrupt, Byte Available	Receive	ACK NAK	When a byte has been received (which software can verify using the PLIB_I2C_ReceivedByteIsAvailable function), software must get the received byte from the RX buffer (using the PLIB_I2C_ReceivedByteGet function) and initiate transmission of the ACK/NAK bit (using the PLIB_I2C_ReceivedByteAcknowledge function). If it intends to receive another byte, software must ACK the byte just received. If it does not intend to receive another byte, software must NAK the byte just received.
Master Interrupt, ACK Completed	ACK, NAK	Receive	Software can verify that the ACK signal has completed using the PLIB_I2C_ReceiverByteAcknowledgeHasCompleted function. If software ACKed the previously received byte, it must initiate the "Clock1Byte" operation (using the PLIB_I2C_MasterReceiverClock1Byte function) so that the I2C module will cycle the SCL line eight times so that the slave can send the requested byte. Otherwise, software must have NAKed the previous byte to end the transfer.
Master Interrupt, NAK Completed	ACK, NAK	Stop, Restart	Software can verify that the NAK signal has completed using the PLIB_I2C_ReceiverByteAcknowledgeHasCompleted function. If software intends to continue the transfer without allowing the bus to go idle, it must initiate a repeated-start (using the PLIB_I2C_MasterStartRepeat function) and transition immediately to the Start state. If software intends to end the transfer and allow the bus to go idle, it must initiate a Stop condition using the PLIB_I2C_MasterStop function.
Restart	Stop, repeated Start	Start	Immediately after initiating the repeated Start condition, software automatically transitions back to the "Start" state where it must decide if it will restart with a read or write transfer. **Note:** Write transfers will transition to the Start state in the Master Mode Write Transfer state machine.
Master Interrupt, Stop Completed	Stop, repeated Start	Wait	When the master interrupt occurs, indicating that the Stop condition has completed, software transitions back to the waiting state (which is actually part of the Slave Mode state machine).

Managing Slave Addresses

An I2C address identifies which slave device is being targeted by a master device on a transfer-by-transfer basis. I2C addresses can be either 7-bits or 10-bits, as shown in the following sections, 7-Bit Slave Addresses and 10-Bit Slave Addresses.

Addresses that are 7-bits long are sent in a single byte where bit 0 identifies the direction of the remaining data in the transfer. Addresses that are 10-bits long are sent in two bytes using a reserved range in the 7-bit address space (addresses 0x78 through 0x7C) to encode the two high-order bits (bits A9 and A8) in the first byte. The second byte encodes the eight low-order bites (A7 through A0). These formats are in the following two sections.

7-Bit Slave Addresses

When using 7-bit slave addressing, the address byte is the first byte sent by any I2C master device immediately following a "Start" condition. The 7-bit address is shifted left by 1 bit to fill bits 7-to-1 in the address byte. Bit 0 in the 7-bit address byte indicates the transfer direction, as follows.

7-Bit Address Format

A6	A5	A4	A3	A2	A1	A0	R/$\overline{W}$

Bits	Usage
A6:A0	Bits 7 through 1 of the address byte contain the 7-bit slave address.
R/W	Bit 0 of the address byte is the read/write bit (0 = Read, 1 = Write).

See Operating as a Master Transmitter and Operating as a Master Receiver for examples.

10-Bit Slave Addresses

When using 10-bit slave addresses, the first address byte must be sent immediately following a start or repeated Start condition. The second byte must immediately follow the first byte when performing a write transfer. Read transfers must begin as write transfers so that both bytes may be sent. Immediately after sending the second address byte, the master will issue a repeated Start condition and resend the first address byte only (with the read/write bit cleared, indicating a read transfer. The second byte is not retransmitted. Since the transfer has been restarted, all listening 10-bit slave devices know that they will not be address again until the transfer has been ended with a Stop condition. However, devices that respond to 7-bit addresses might respond, so the first byte of the 10-bit address must be repeated to prevent that. The format of the 10-bit address is shown as follows.

10-Bit Address Format

1st Byte								2nd Byte							
1	1	1	1	0	A9	A8	R/$\overline{W}$	A7	A6	A5	A4	A3	A2	A1	A0

Bits	Usage
11110	Bits 7 through 3 of the first byte are constants. This guarantees that the first byte of the 10-bit address will fall within the reserved range of the 7-bit addresses.
A9:A8	Bits 2 through 1 of the first byte are the two high-order bits of the 10-bit address.

R/W	Bit 0 of the first byte is the Read/Write bit (0 = Read, 1 = Write).
A7:A0	The second byte contains the 8 low-order bits of the 10-bit address.

See Operating as a Master Transmitter and Operating as a Master Receiver for examples.

Operating in Slave Mode

In Slave mode, the "slave address" refers to the address (and optional mask) programmed into the I2C module to determine to which address or addresses the module will respond when addressed by an external master. The "raw" (unformatted) address is passed to or returned from the Managing Slave Addresses routines (without being formatted as previously shown). Likewise, the mask passed to or returned from the Slave Mask Control Functions (see the Library Interface section) is unformatted.

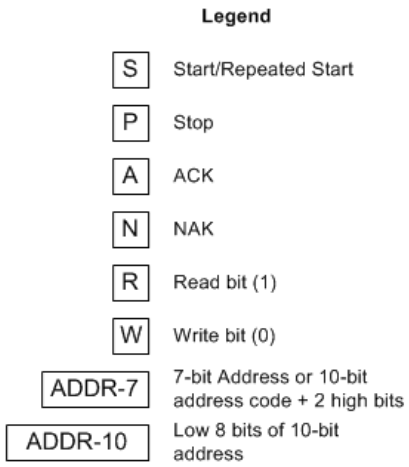
Operating in Master Mode

In Master mode, the "slave address" refers to the address transmitted on the I2C bus to identify the slave target of the transfer. In these cases, the slave address must be correctly formatted (as previously shown) and sent on the bus one byte at a time.

Forming Transfers

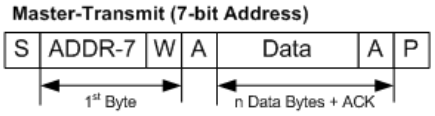
Forming Transfers

Transfers are formed by chaining the basic "building blocks" shown in the following transfer format legend.

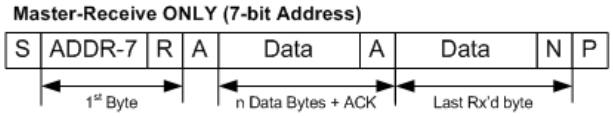


The following are all valid I2C transfer formats:

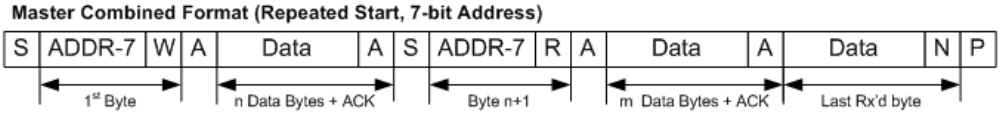
- This format allows a master to transmit *n* bytes of data to an I2C slave supporting a 7-bit address.



- This format allows a master to receive *n*+1 bytes of data from a "streaming" slave. Such a slave has no internal addressing capability. That is, it has no internal registers or addresses. It can only "stream" data to a master that reads from it.



- This format allows a master to write *n* bytes of data to a slave, followed immediately by reading *n*+1 bytes of data from a slave by sending a repeated Start condition after the first transfer. This format is useful for specifying an internal address to a device, and then reading data from that address. A repeated Start condition can also be used to chain transfers together without letting the bus go idle and potentially losing arbitration.

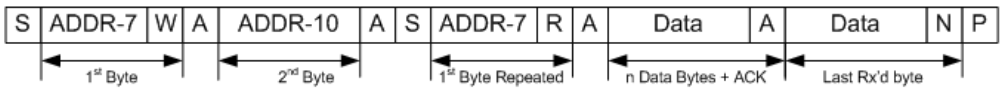


- The following format allows a master to send *n* bytes of data to a target supporting a 10-bit address.

Master Transmit (10-bit Address)

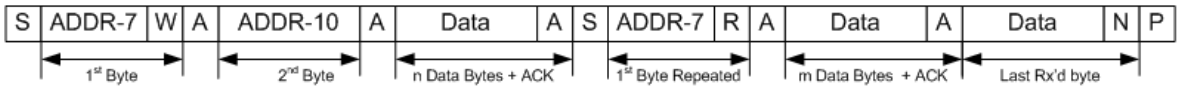
- This format is used to receive *n*+1 bytes of data from a slave supporting a 10-bit address. The repeated Start condition must be used because the second byte of the 10-bit address must be sent after the first byte of the 10-bit address. Then, the direction of the transfer must be switched to a "read". To do this, after the repeated Start, the master repeats the first byte of the 10-bit address with a "read" indication in the low-order bit and 10-bit slave devices must "remember" if they were being addressed once the transfer has started.

Master Receive (10-bit Address)



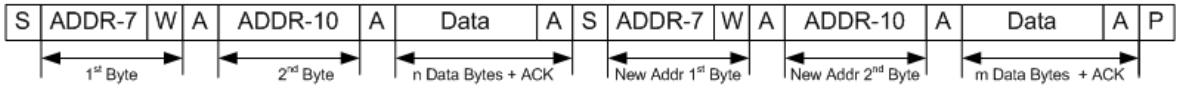
- This format allows a master to send *n* bytes of data to a slave device supporting a 10-bit address and immediately read *n*+1 bytes of data from the same device using the repeated Start and resending the first byte of the 10-bit address technique as shown in the previous format. This format is useful when the master needs to read data from a specific address within a device and it needs to send that address before performing the read.

Master Combined Format (10-bit write, 10-bit read)



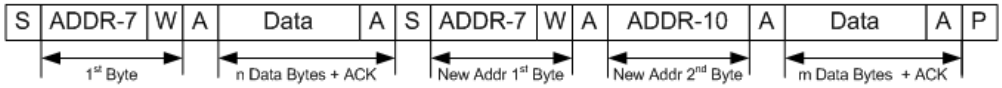
- This format allows a master to chain writes to multiple slaves supporting 10-bit addresses.

Master Combined Format (10-bit write, 10-bit write)



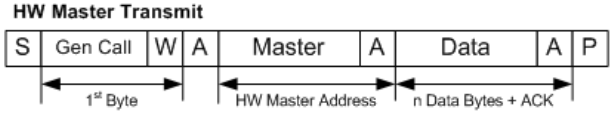
- This format allows a master to chain multiple writes to different slaves. Note that only the first write can be to a slave supporting a 7-bit address. The second (and any subsequent) writes must be to slaves with 10-bit addresses once any 10-bit device has been addressed.

Master Combined Format (7-bit write, 10-bit write)



- This format can be used by a "hardware" master that does not have a programmable address. This allows the hardware master to broadcast to all slaves on the bus using the "General Call" address, followed by the master's address. (The master address is generally the same as the device's slave address if it can also act as a slave device.) This format is not normally used by a microcontroller acting as a master. However, it may be received by a microcontroller if such a hardware master exists on the bus.

HW Master Transmit



Handling Errors

There are three basic types of errors that can occur during various I2C operations:

- Transmitter Overflow
- Receiver Overflow
- Arbitration Loss

Handling Transmitter Overflow Errors

A transmitter overflow error occurs when the software attempts to write to the TX buffer (by calling the PLIB_I2C_TransmitterByteSend function) while the transmitter is busy. When this occurs, the write is not allowed and the transmitter overflow status bit is set. This can be identified by calling the PLIB_I2C_TransmitterOverflowHasOccurred function. Additional attempts to write to the TX buffer will not be allowed until the transmitter overflow error is cleared by calling the PLIB_I2C_TransmitterOverflowClear function. This sort of error should be either avoided by checking the PLIB_I2C_TransmitterIsReady function before attempting to send a byte or by checking for the error after attempting to send a byte.

Interrupts: The transmitter overflow error does not trigger an interrupt.

Handling Receiver Overflow Errors

A receiver overflow error occurs when an incoming byte has been completely received and is ready to be transferred to the RX buffer, but software has not yet gotten the previous byte from the RX buffer. When this happens the receiver overflow status bit is set and the incoming byte will be lost. This can happen when software does not respond quickly enough to a slave or master interrupt when receiving data. Software should check for this error before calling the PLIB_I2C_ReceivedByteGet function to get a byte from the RX buffer to determine if any data has been lost. This error can be identified by calling the PLIB_I2C_ReceiverOverflowHasOccurred function. This error must be cleared by calling the PLIB_I2C_ReceiverOverflowClear function or no additional data will be received.

Interrupts: The receiver overflow error does not trigger an interrupt (although the incoming data byte does, even though it is lost.)

Handling Arbitration Loss Errors

Strictly speaking, arbitration loss is not an error. Rather it is a normal part of bus operation in a multi-master environment. Arbitration loss occurs when more than one master attempts to transmit on the bus at the same (or nearly the same) time. When this happens, at some point one of the masters will attempt to transmit a binary one ('1') when the other attempts to transmit a binary zero ('0'). At that point, the master transmitting the zero will win the transmission, because the zero transmission will dominate on the bus. The master detecting that the bus signals a zero when it attempted to transmit a one will lose arbitration and must immediately stop transmitting on the bus (which happens automatically).

Arbitration loss can be detected during any of the following actions:

- Transmission of a Start condition
- Transmission of a repeated Start condition
- Transmission of an address or data byte
- Transmission of an acknowledge bit
- Transmission of a Stop condition

Arbitration loss can be identified by calling the PLIB_I2C_ArbitrationLossHasOccurred function. The arbitration loss condition can be cleared by calling the PLIB_I2C_ArbitrationLossClear function. Once arbitration loss occurs, the losing master must wait until the bus is once again idle (at which time a master interrupt will occur if arbitration loss has occurred) and retransmit the transfer from the beginning.

Interrupts: The I2C module will trigger an error interrupt when arbitration loss occurs.

Other Features

Other Features

Note: The following features are not available on all devices. Please refer to the specific device data sheet to determine which features are supported by your device.

General Call Address Support

The I2C General Call address (reserved address 0) allows a master to address all slave devices on the bus. During slave operation the module can be made to respond to or ignore the general call address using the PLIB_I2C_GeneralCallEnable function or the PLIB_I2C_GeneralCallDisable function. When a slave address byte is received, software can identify if it was the general call address using the PLIB_I2C_SlaveAddressIsGeneralCall function (or by checking the value of the address byte received).

Note: The general call address is always 7-bits.

SMBus Support

The I2C module can support communication on a System Management Bus (SMBus) by calling the PLIB_I2C_SMBEnable function to adjust the electrical characteristics of the SMBus.

Operation During Sleep Mode

When the device enters Sleep mode, all clock sources supplied to the I2C modules are shut down. If the device enters Sleep mode in the middle of an I2C master transmission or reception operation, the operation is aborted. If the device enters Sleep mode when the module is operating in slave mode, the external master's clock will continue run the slave state machine. If a slave address match occurs, an interrupt will be provided to wake up the device.

Note: Indeterminate results can occur if an error occurs during Sleep mode.

Operation During Idle Mode

When the device enters Idle mode, the system clock sources remain functional and the CPU stops code execution.

I2C operation during Idle mode can be controlled using the PLIB_I2C_StopInIdleEnable function or the PLIB_I2C_StopInIdleDisable function.

By default, the I2C module continues to operate in Idle mode and provide full functionality.

Operation with DMA

Software activity must occur between the transfer of each byte, making DMA inappropriate for use with the I2C module.

Configuring the Library

This library is appropriate for microcontrollers with a dedicated I2C module (not an SSP or MSSP module). The library is configured for the supported I2C module when the processor is chosen in the MPLAB X IDE.

Library Interface

a) General Initialization Functions

	Name	Description
	PLIB_I2C_Disable	Disables the specified I2C module.
	PLIB_I2C_Enable	Enables the specified I2C module.
	PLIB_I2C_GeneralCallDisable	Disables the I2C module from recognizing the general call address.
	PLIB_I2C_GeneralCallEnable	Enables the I2C module to recognize the general call address.
	PLIB_I2C_HighFrequencyDisable	Disables the I2C module from using high frequency (400 kHz or 1 MHz) signaling.
	PLIB_I2C_HighFrequencyEnable	Enables the I2C module to use high frequency (400 kHz or 1 MHz) signaling.
	PLIB_I2C_IPMIDisable	Disables the I2C module's support for the IPMI specification
	PLIB_I2C_IPMIEnable	Enables the I2C module to support the Intelligent Platform Management Interface (IPMI) specification (see Remarks).
	PLIB_I2C_ReservedAddressProtectDisable	Disables the I2C module from protecting reserved addresses, allowing it to respond to them.
	PLIB_I2C_ReservedAddressProtectEnable	Enables the I2C module to protect (not respond to) reserved addresses.
	PLIB_I2C_SlaveClockStretchingDisable	Disables the I2C module from stretching the slave clock.
	PLIB_I2C_SlaveClockStretchingEnable	Enables the I2C module to stretch the slave clock.
	PLIB_I2C_SMBDisable	Disable the I2C module support for SMBus electrical signaling levels.
	PLIB_I2C_SMBEnable	Enables the I2C module to support System Management Bus (SMBus) electrical signaling levels.
	PLIB_I2C_StopInIdleDisable	Disables the Stop-in-Idle feature.
	PLIB_I2C_StopInIdleEnable	Enables the I2C module to stop when the processor enters Idle mode

b) General Status Functions

	Name	Description
	PLIB_I2C_ArbitrationLossClear	Clears the arbitration loss status flag
	PLIB_I2C_ArbitrationLossHasOccurred	Identifies if bus arbitration has been lost.
	PLIB_I2C_BusIsIdle	Determines whether the I2C bus is idle or busy.
	PLIB_I2C_StartClear	Clears the start status flag
	PLIB_I2C_StartWasDetected	Identifies when a Start condition has been detected.
	PLIB_I2C_StopClear	Clears the stop status flag
	PLIB_I2C_StopWasDetected	Identifies when a Stop condition has been detected

c) Baud Rate Generator Control Functions

	Name	Description
	PLIB_I2C_BaudRateGet	Calculates the I2C module's current SCL clock frequency.
	PLIB_I2C_BaudRateSet	Sets the desired baud rate.

d) Slave Address Control Functions

	Name	Description
	PLIB_I2C_SlaveAddress10BitGet	Identifies the current 10-bit Slave mode address.
	PLIB_I2C_SlaveAddress10BitSet	Selects 10-bit Slave mode addressing and sets the address value.
	PLIB_I2C_SlaveAddress10BitWasDetected	Detects reception of the second byte of a 10-bit slave address.
	PLIB_I2C_SlaveAddress7BitGet	Identifies the current 7-bit Slave mode address.
	PLIB_I2C_SlaveAddress7BitSet	Selects 7-bit Slave mode addressing and sets the slave address value.
	PLIB_I2C_SlaveAddressHoldDisable	Disables Address holding.
	PLIB_I2C_SlaveAddressHoldEnable	Enables address holding.
	PLIB_I2C_SlaveAddressIsDetected	Detects if the most recent byte received is a data or an address byte.
	PLIB_I2C_SlaveAddressIsGeneralCall	Identifies if the current slave address received is the general call address.

	PLIB_I2C_SlaveAddressModeIs10Bits	Identifies if the current slave address mode is 7-bits or 10-bits.
	PLIB_I2C_SlaveDataIsDetected	Detects if the most recent byte received is a data or an address byte.
	PLIB_I2C_SlaveReadIsRequested	Detects if the request from the master was a read or write.

e) Slave Mask Control Functions

	Name	Description
	PLIB_I2C_SlaveMask10BitGet	Identifies the current 10-bit Slave mode address mask.
	PLIB_I2C_SlaveMask10BitSet	Sets the 10-bit mask for Slave mode addressing.
	PLIB_I2C_SlaveMask7BitGet	Identifies the current 7-bit Slave mode address mask.
	PLIB_I2C_SlaveMask7BitSet	Sets the 7-bit mask for Slave mode addressing .

f) Slave Control Functions

	Name	Description
	PLIB_I2C_AcksequenceIsInProgress	Checks whether the acknowledge sequence is in progress or it is completed.
	PLIB_I2C_DataLineHoldTimeSet	Sets the data line hold time.
	PLIB_I2C_SlaveBufferOverwriteDisable	Disables buffer overwrite.
	PLIB_I2C_SlaveBufferOverwriteEnable	Enables buffer overwrite.
	PLIB_I2C_SlaveBusCollisionDetectDisable	Disables bus collision detect interrupts.
	PLIB_I2C_SlaveBusCollisionDetectEnable	Enables slave bus collision interrupts.
	PLIB_I2C_SlaveClockHold	Holds the SCL clock line low after receiving a byte.
	PLIB_I2C_SlaveClockRelease	Releases a previously held SCL clock line.
	PLIB_I2C_SlaveDataHoldDisable	Disables data holding.
	PLIB_I2C_SlaveDataHoldEnable	Enables data holding.
	PLIB_I2C_SlaveInterruptOnStartDisable	Disables the feature of generating interrupt on start condition.
	PLIB_I2C_SlaveInterruptOnStartEnable	Enables the feature of generating interrupt on start condition.
	PLIB_I2C_SlaveInterruptOnStopDisable	Disables the feature of generating interrupt on stop condition.
	PLIB_I2C_SlaveInterruptOnStopEnable	Enables the feature of generating interrupt on stop condition.

g) Master Control Functions

	Name	Description
	PLIB_I2C_MasterReceiverClock1Byte	Drives the bus clock to receive 1 byte of data from a slave device.
	PLIB_I2C_MasterStart	Sends an I2C Start condition on the I2C bus in Master mode.
	PLIB_I2C_MasterStartRepeat	Sends a repeated Start condition during an ongoing transfer in Master mode.
	PLIB_I2C_MasterStop	Sends an I2C Stop condition to terminate a transfer in Master mode.

h) Transmitter Control Functions

	Name	Description
	PLIB_I2C_TransmitterByteHasCompleted	Detects whether the module has finished transmitting the most recent byte.
	PLIB_I2C_TransmitterByteSend	Sends a byte of data on the I2C bus.
	PLIB_I2C_TransmitterByteWasAcknowledged	Determines whether the most recently sent byte was acknowledged.
	PLIB_I2C_TransmitterIsBusy	Identifies if the transmitter of the specified I2C module is currently busy (unable to accept more data).
	PLIB_I2C_TransmitterIsReady	Detects if the transmitter is ready to accept data to transmit.
	PLIB_I2C_TransmitterOverflowClear	Clears the transmitter overflow status flag.
	PLIB_I2C_TransmitterOverflowHasOccurred	Identifies if a transmitter overflow error has occurred.

i) Receiver Control Functions

	Name	Description
	PLIB_I2C_ReceivedByteAcknowledge	Allows a receiver to acknowledge a that a byte of data has been received.
	PLIB_I2C_ReceivedByteGet	Gets a byte of data received from the I2C bus interface.
	PLIB_I2C_ReceivedByteIsAvailable	Detects whether the receiver has data available.
	PLIB_I2C_ReceiverByteAcknowledgeHasCompleted	Determines if the previous acknowledge has completed.
	PLIB_I2C_ReceiverOverflowClear	Clears the receiver overflow status flag.
	PLIB_I2C_ReceiverOverflowHasOccurred	Identifies if a receiver overflow error has occurred.
	PLIB_I2C_MasterReceiverReadyToAcknowledge	Checks whether the hardware is ready to acknowledge.

j) Feature Existence Functions

	Name	Description
	PLIB_I2C_ExistsAcksequenceProgress	Identifies whether the AcksequenceIsInProgress feature exists on the I2C module.
	PLIB_I2C_ExistsArbitrationLoss	Identifies whether the ArbitrationLoss feature exists on the I2C module.
	PLIB_I2C_ExistsBaudRate	Identifies whether the BaudRate feature exists on the I2C module.
	PLIB_I2C_ExistsBusIsIdle	Identifies whether the BusIdle feature exists on the I2C module.
	PLIB_I2C_ExistsClockStretching	Identifies whether the ClockStretching feature exists on the I2C module.
	PLIB_I2C_ExistsDataLineHoldTime	Identifies whether the DataLineHoldTime feature exists on the I2C module.
	PLIB_I2C_ExistsGeneralCall	Identifies whether the GeneralCall feature exists on the I2C module.
	PLIB_I2C_ExistsGeneralCallAddressDetect	Identifies whether the GeneralCallAddressDetect feature exists on the I2C module.
	PLIB_I2C_ExistsHighFrequency	Identifies whether the HighFrequency feature exists on the I2C module.
	PLIB_I2C_ExistsIPMI	Identifies whether the IPMI feature exists on the I2C module.
	PLIB_I2C_ExistsMasterReceiverClock1Byte	Identifies whether the MasterReceiverClock1Byte feature exists on the I2C module.
	PLIB_I2C_ExistsMasterStart	Identifies whether the MasterStart feature exists on the I2C module.
	PLIB_I2C_ExistsMasterStartRepeat	Identifies whether the MasterStartRepeat feature exists on the I2C module.
	PLIB_I2C_ExistsMasterStop	Identifies whether the MasterStop feature exists on the I2C module.
	PLIB_I2C_ExistsModuleEnable	Identifies whether the ModuleEnable feature exists on the I2C module.
	PLIB_I2C_ExistsReceivedByteAcknowledge	Identifies whether the ReceivedByteAcknowledge feature exists on the I2C module.
	PLIB_I2C_ExistsReceivedByteAvailable	Identifies whether the ReceivedByteAvailable feature exists on the I2C module
	PLIB_I2C_ExistsReceivedByteGet	Identifies whether the ReceivedByteGet feature exists on the I2C module
	PLIB_I2C_ExistsReceiverOverflow	Identifies whether the ReceiverOverflow feature exists on the I2C module.
	PLIB_I2C_ExistsReservedAddressProtect	Identifies whether the ReservedAddressProtect feature exists on the I2C module.
	PLIB_I2C_ExistsSlaveAddress10Bit	Identifies whether the SlaveAddress10Bit feature exists on the I2C module.
	PLIB_I2C_ExistsSlaveAddress7Bit	Identifies whether the SlaveAddress7Bit feature exists on the I2C module.
	PLIB_I2C_ExistsSlaveAddressDetect	Identifies whether the SlaveAddressDetect feature exists on the I2C module.
	PLIB_I2C_ExistsSlaveAddressHoldEnable	Identifies whether the SlaveAddressHoldEnable feature exists on the I2C module.
	PLIB_I2C_ExistsSlaveBufferOverwrite	Identifies whether the SlaveBufferOverwrite feature exists on the I2C module.
	PLIB_I2C_ExistsSlaveBusCollisionDetect	Identifies whether the SlaveBusCollisionDetect feature exists on the I2C module.
	PLIB_I2C_ExistsSlaveClockHold	Identifies whether the SlaveClockHold feature exists on the I2C module.
	PLIB_I2C_ExistsSlaveDataDetect	Identifies whether the SlaveDataDetect feature exists on the I2C module.
	PLIB_I2C_ExistsSlaveInterruptOnStart	Identifies whether the SlaveInterruptOnStart feature exists on the I2C module.
	PLIB_I2C_ExistsSlaveInterruptOnStop	Identifies whether the SlaveInterruptOnStop feature exists on the I2C module.
	PLIB_I2C_ExistsSlaveMask	Identifies whether the SlaveMask feature exists on the I2C module.
	PLIB_I2C_ExistsSlaveReadRequest	Identifies whether the SlaveReadRequest feature exists on the I2C module.
	PLIB_I2C_ExistsSMBus	Identifies whether the SMBus feature exists on the I2C module.
	PLIB_I2C_ExistsStartDetect	Identifies whether the StartDetect feature exists on the I2C module.
	PLIB_I2C_ExistsStopDetect	Identifies whether the StopDetect feature exists on the I2C module.
	PLIB_I2C_ExistsStopInIdle	Identifies whether the StopInIdle feature exists on the I2C module.
	PLIB_I2C_ExistsTransmitterByteAcknowledge	Identifies whether the TransmitterByteAcknowledge feature exists on the I2C module.
	PLIB_I2C_ExistsTransmitterByteComplete	Identifies whether the TransmitterByteComplete feature exists on the I2C module.
	PLIB_I2C_ExistsTransmitterByteSend	Identifies whether the TransmitterByteSend feature exists on the I2C module.
	PLIB_I2C_ExistsTransmitterIsBusy	Identifies whether the TransmitterBusy feature exists on the I2C module.
	PLIB_I2C_ExistsTransmitterOverflow	Identifies whether the TransmitterOverflow feature exists on the I2C module.
	PLIB_I2C_ExistsSlaveDataHoldEnable	Identifies whether the SlaveDataHoldEnable feature exists on the I2C module.

k) Data Types and Constants

	Name	Description
	I2C_MODULE_ID	This is type I2C_MODULE_ID.

Description

This section describes the Application Programming Interface (API) functions of the I2C Peripheral Library.

Refer to each section for a detailed description.

a) General Initialization Functions

PLIB_I2C_Disable Function

Disables the specified I2C module.

File

plib_i2c.h

C

```
void PLIB_I2C_Disable(I2C_MODULE_ID index);
```

Returns

None.

Description

This function disables the specified I2C module.

Remarks

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific I2C_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_I2C_ExistsModuleEnable in your application to determine whether this feature is available.

Preconditions

None.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_Disable( MY_I2C_ID );
```

Parameters

Parameters	Description
index	Identifies the desired I2C module

Function

void PLIB_I2C_Disable(I2C_MODULE_ID index)

PLIB_I2C_Enable Function

Enables the specified I2C module.

File

plib_i2c.h

C

```
void PLIB_I2C_Enable(I2C_MODULE_ID index);
```

Returns

None.

Description

This function enables the specified I2C module.

Remarks

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific I2C_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_I2C_ExistsModuleEnable in your application to determine whether this feature is available.

Preconditions

The module should be appropriately configured before being enabled.

Example

```
#define MY_I2C_ID               I2C_ID_1
#define MY_CLOCK_FREQUENCY      80000000
#define MY_BAUD_RATE            10000
#define MY_SLAVE_ADDRESS        0x23

PLIB_I2C_SlaveClockStretchingEnable ( MY_I2C_ID );
PLIB_I2C_SMBDisable ( MY_I2C_ID );
PLIB_I2C_HighFrequencyDisable ( MY_I2C_ID );
PLIB_I2C_ReservedAddressProtectEnable ( MY_I2C_ID );
PLIB_I2C_StopInIdleDisable ( MY_I2C_ID );
PLIB_I2C_BaudRateSet ( MY_I2C_ID, MY_CLOCK_FREQUENCY, MY_BAUD_RATE );

PLIB_I2C_SlaveAddress7BitSet( MY_I2C_ID, MY_SLAVE_ADDRESS );
PLIB_I2C_Enable ( MY_I2C_ID );
```

Parameters

Parameters	Description
index	Identifies the desired I2C module

Function

void PLIB_I2C_Enable(I2C_MODULE_ID index)

PLIB_I2C_GeneralCallDisable Function

Disables the I2C module from recognizing the general call address.

File

plib_i2c.h

C

```
void PLIB_I2C_GeneralCallDisable(I2C_MODULE_ID index);
```

Returns

None.

Description

This function disables the I2C module from recognizing the general call address when operating as a slave receiver.

Remarks

The General-call feature can be re-enabled by calling the PLIB_I2C_GeneralCallEnable function.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific I2C_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_I2C_ExistsGeneralCall in your application to determine whether this feature is available.

Preconditions

None.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_GeneralCallDisable(MY_I2C_ID);
```

Parameters

Parameters	Description
index	Identifies the desired I2C module

Function

void PLIB_I2C_GeneralCallDisable (I2C_MODULE_ID index)

PLIB_I2C_GeneralCallEnable Function

Enables the I2C module to recognize the general call address.

File

plib_i2c.h

C

```
void PLIB_I2C_GeneralCallEnable(I2C_MODULE_ID index);
```

Returns

None.

Description

This function enables the I2C module to recognize the general call address when operating as a slave receiver.

Remarks

The General-call feature can be disabled by calling the PLIB_I2C_GeneralCallDisable function.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific I2C_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_I2C_ExistsGeneralCall in your application to determine whether this feature is available.

Preconditions

None.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_GeneralCallEnable ( MY_I2C_ID );
```

Parameters

Parameters	Description
index	Identifies the desired I2C module

Function

void PLIB_I2C_GeneralCallEnable (I2C_MODULE_ID index)

PLIB_I2C_HighFrequencyDisable Function

Disables the I2C module from using high frequency (400 kHz or 1 MHz) signaling.

File

plib_i2c.h

C

```
void PLIB_I2C_HighFrequencyDisable(I2C_MODULE_ID index);
```

Returns

None.

Description

This function disables the I2C module from using high-frequency signaling, preventing it from using the 400 kHz and 1 MHz signaling rates.

Remarks

The high-frequency feature can be re-enabled by calling the PLIB_I2C_HighFrequencyEnable function.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific I2C_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_I2C_ExistsHighFrequency in your application to determine whether this feature is available.

Preconditions

None.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_HighFrequencyDisable ( MY_I2C_ID );
```

Parameters

Parameters	Description
index	Identifies the desired I2C module

Function

void PLIB_I2C_HighFrequencyDisable (I2C_MODULE_ID index)

PLIB_I2C_HighFrequencyEnable Function

Enables the I2C module to use high frequency (400 kHz or 1 MHz) signaling.

File

plib_i2c.h

C

```
void PLIB_I2C_HighFrequencyEnable(I2C_MODULE_ID index);
```

Returns

None.

Description

This function enables the I2C module to use high-frequency signaling, allowing it to use the 400 kHz and 1 MHz signaling rates.

Remarks

The high-speed feature can be disabled by calling the PLIB_I2C_HighSpeedEnable function.

This feature must be enabled if frequencies higher than 100 kHz programmed using the PLIB_I2C_BaudRateSet function.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific I2C_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_I2C_ExistsHighFrequency in your application to determine whether this feature is available.

Preconditions

None.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_HighFrequencyEnable ( MY_I2C_ID );
```

Parameters

Parameters	Description
index	Identifies the desired I2C module

Function

void PLIB_I2C_HighFrequencyEnable (I2C_MODULE_ID index)

PLIB_I2C_IPMIDisable Function

Disables the I2C module's support for the IPMI specification

File

plib_i2c.h

C

```
void PLIB_I2C_IPMIDisable(I2C_MODULE_ID index);
```

Returns

None.

Description

This function disables the I2C module's support for the IPMI specification.

Remarks

Please refer to the IPMI specification for details of the Intelligent Platform Management Interface. The IPMI specification is the property of Intel Corporation, Hewlett-Packard Company, NEC Corporation, and Dell Inc.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific I2C_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_I2C_ExistsIPMI in your application to determine whether this feature is available.

Preconditions

None.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_IPMIDisable ( MY_I2C_ID );
```

Parameters

Parameters	Description
index	Identifies the desired I2C module

Function

void PLIB_I2C_IPMIDisable (I2C_MODULE_ID index)

PLIB_I2C_IPMIEnable Function

Enables the I2C module to support the Intelligent Platform Management Interface (IPMI) specification (see Remarks).

File

plib_i2c.h

C

```
void PLIB_I2C_IPMIEnable(I2C_MODULE_ID index);
```

Returns

None.

Description

This function enables the I2C module to support the IPMI specification.

Remarks

Please refer to the IPMI specification for details of the Intelligent Platform Management Interface. The IPMI specification is the property of Intel Corporation, Hewlett-Packard Company, NEC Corporation, and Dell Inc.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific I2C_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_I2C_ExistsIPMI in your application to determine whether this feature is available.

Preconditions

None.

Example

```
#define MY_I2C_ID I2C_ID_1
```

```
PLIB_I2C_IPMIEnable ( MY_I2C_ID );
```

Parameters

Parameters	Description
index	Identifies the desired I2C module

Function

void PLIB_I2C_IPMIEnable (I2C_MODULE_ID index)

PLIB_I2C_ReservedAddressProtectDisable Function

Disables the I2C module from protecting reserved addresses, allowing it to respond to them.

File

plib_i2c.h

C

```
void PLIB_I2C_ReservedAddressProtectDisable(I2C_MODULE_ID index);
```

Returns

None.

Description

This function disables the I2C module from protecting reserved addresses, allowing it to respond to them when they match the module's slave address and mask.

Remarks

The reserved-address-protect feature can be re-enabled by calling the PLIB_I2C_ReservedAddressProtectEnable function.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific I2C_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_I2C_ExistsReservedAddressProtect in your application to determine whether this feature is available.

Preconditions

None.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_ReservedAddressProtectDisable ( MY_I2C_ID );
```

Parameters

Parameters	Description
index	Identifies the desired I2C module

Function

void PLIB_I2C_ReservedAddressProtectDisable (I2C_MODULE_ID index)

PLIB_I2C_ReservedAddressProtectEnable Function

Enables the I2C module to protect (not respond to) reserved addresses.

File

plib_i2c.h

C

```
void PLIB_I2C_ReservedAddressProtectEnable(I2C_MODULE_ID index);
```

Returns

None.

Description

This function enables the I2C module to protect reserved addresses by not responding to them, even if they match the module's slave address and mask.

Remarks

The reserved-address-protect feature can be disabled by calling the PLIB_I2C_ReservedAddressProtectDisable function.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific I2C_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_I2C_ExistsReservedAddressProtect in your application to determine whether this feature is available.

Preconditions

None.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_ReservedAddressProtectEnable(MY_I2C_ID);
```

Parameters

Parameters	Description
index	Identifies the desired I2C module

Function

void PLIB_I2C_ReservedAddressProtectEnable (I2C_MODULE_ID index)

PLIB_I2C_SlaveClockStretchingDisable Function

Disables the I2C module from stretching the slave clock.

File

plib_i2c.h

C

```
void PLIB_I2C_SlaveClockStretchingDisable(I2C_MODULE_ID index);
```

Returns

None.

Description

This function disables the I2C module from stretching the slave clock to allow time for software to respond to bytes received from the master.

Remarks

The clock stretching feature can be re-enabled by calling the PLIB_I2C_SlaveClockStretchingEnable function.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific I2C_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_I2C_ExistsClockStretching in your application to determine whether this feature is available.

Preconditions

None.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_SlaveClockStretchingDisable ( MY_I2C_ID );
```

Parameters

Parameters	Description
index	Identifies the desired I2C module

Function

void PLIB_I2C_SlaveClockStretchingDisable (I2C_MODULE_ID index)

PLIB_I2C_SlaveClockStretchingEnable Function

Enables the I2C module to stretch the slave clock.

File

plib_i2c.h

C

```
void PLIB_I2C_SlaveClockStretchingEnable(I2C_MODULE_ID index);
```

Returns

None.

Description

This function enables the I2C module to stretch the slave clock to allow time for software to respond to bytes received from the master.

Remarks

The clock stretching feature can be disabled by calling the PLIB_I2C_SlaveClockStretchingDisable function.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific I2C_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_I2C_ExistsClockStretching in your application to determine whether this feature is available.

Preconditions

None.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_SlaveClockStretchingEnable ( MY_I2C_ID );
```

Parameters

Parameters	Description
index	Identifies the desired I2C module

Function

void PLIB_I2C_SlaveClockStretchingEnable (I2C_MODULE_ID index)

PLIB_I2C_SMBDisable Function

Disable the I2C module support for SMBus electrical signaling levels.

File

plib_i2c.h

C

```
void PLIB_I2C_SMBDisable(I2C_MODULE_ID index);
```

Returns

None.

Description

This function disables the I2C module support for SMBus electrical signaling levels.

Remarks

The SMB feature can be re-enabled by calling the PLIB_I2C_SMBEnable function.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific I2C_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_I2C_ExistsSMBus in your application to determine whether this feature is available.

Preconditions

None.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_SMBDisable ( MY_I2C_ID );
```

Parameters

Parameters	Description
index	Identifies the desired I2C module

Function

void PLIB_I2C_SMBDisable (I2C_MODULE_ID index)

PLIB_I2C_SMBEnable Function

Enables the I2C module to support System Management Bus (SMBus) electrical signaling levels.

File

plib_i2c.h

C

```
void PLIB_I2C_SMBEnable(I2C_MODULE_ID index);
```

Returns

None.

Description

This function enables the I2C module to support SMBus electrical signaling levels.

Remarks

The SMB feature can be disabled by calling the PLIB_I2C_SMBDisable function.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific I2C_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_I2C_ExistsSMBus in your application to determine whether this feature is available.

Preconditions

None.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_SMBEnable ( MY_I2C_ID );
```

Parameters

Parameters	Description
index	Identifies the desired I2C module

Function

void PLIB_I2C_SMBEnable (I2C_MODULE_ID index)

PLIB_I2C_StopInIdleDisable Function

Disables the Stop-in-Idle feature.

File

plib_i2c.h

C

```
void PLIB_I2C_StopInIdleDisable(I2C_MODULE_ID index);
```

Returns

None.

Description

This function disables the Stop-in-Idle feature, preventing the I2C module from stopping when the processor enters Idle mode.

Remarks

The Stop-in-Idle feature can be re-enabled by calling the PLIB_I2C_StopInIdleEnable function.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific I2C_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_I2C_ExistsStopInIdle in your application to determine whether this feature is available.

Preconditions

None.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_StopInIdleDisable ( MY_I2C_ID );
```

Parameters

Parameters	Description
index	Identifies the desired I2C module

Function

void PLIB_I2C_StopInIdleDisable (I2C_MODULE_ID index)

PLIB_I2C_StopInIdleEnable Function

Enables the I2C module to stop when the processor enters Idle mode

File

plib_i2c.h

C

```
void PLIB_I2C_StopInIdleEnable(I2C_MODULE_ID index);
```

Returns

None.

Description

This function enables the I2C module to stop when the processor enters Idle mode.

Remarks

The Stop-in-Idle feature can be disabled by calling the PLIB_I2C_StopInIdleDisable function.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific I2C_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_I2C_ExistsStopInIdle in your application to determine whether this feature is available.

Preconditions

None.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_StopInIdleEnable ( MY_I2C_ID );
```

Parameters

Parameters	Description
index	Identifies the desired I2C module

Function

void PLIB_I2C_StopInIdleEnable (I2C_MODULE_ID index)

b) General Status Functions

PLIB_I2C_ArbitrationLossClear Function

Clears the arbitration loss status flag

File

plib_i2c.h

C

```
void PLIB_I2C_ArbitrationLossClear(I2C_MODULE_ID index);
```

Returns

None.

Description

This function clears the arbitration loss status flag.

Remarks

This flag is set by hardware when bus arbitration loss occurs. Its status can be tested using the PLIB_I2C_ArbitrationLossHasOccurred function. This flag should be cleared by software after the arbitration loss has been handled. To handle the error, the entire transmission (from the Start condition to the Stop or restart condition) must be retried later when the bus becomes idle.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific I2C_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_I2C_ExistsArbitrationLoss in your application to determine whether this feature is available.

Preconditions

None.

Example

```
#define MY_I2C_ID I2C_ID_1

if ( PLIB_I2C_ArbitrationLossHasOccurred ( MY_I2C_ID ) )
{
    // Handle bus collision

    PLIB_I2C_ArbitrationLossClear ( MY_I2C_ID );
}
```

Parameters

Parameters	Description
index	Identifies the desired I2C module

Function

void PLIB_I2C_ArbitrationLossClear (I2C_MODULE_ID index)

PLIB_I2C_ArbitrationLossHasOccurred Function

Identifies if bus arbitration has been lost.

File

plib_i2c.h

C

```
bool PLIB_I2C_ArbitrationLossHasOccurred(I2C_MODULE_ID index);
```

Returns

- true - If software if a bus collision occurred, resulting in loss of bus arbitration
- false - If no bus collision occurred

Description

This function identifies if bus arbitration has been lost.

Remarks

The arbitration status should be checked after any Master mode transmission or if an error interrupt occurs. If a bus collision occurs, the entire transmission (from the Start condition to the Stop or restart condition) must be retried later when the bus becomes idle.

This flag should be cleared by software using the PLIB_I2C_ArbitrationLossClear function.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific I2C_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_I2C_ExistsArbitrationLoss in your application to determine whether this feature is available.

Preconditions

Bus collisions can occur during any master-mode transmission including:

- Sending a Start condition
- Sending a repeated Start condition
- Sending an address or data byte
- sending an ACK/NAK bit
- Sending a Stop condition

Example

```
#define MY_I2C_ID I2C_ID_1

if ( PLIB_I2C_ArbitrationLossHasOccurred ( MY_I2C_ID ) )
{
    // Handle bus collision

    PLIB_I2C_ArbitrationLossClear( MY_I2C_ID );
}
```

Parameters

Parameters	Description
index	Identifies the desired I2C module

Function

bool PLIB_I2C_ArbitrationLossHasOccurred (I2C_MODULE_ID index)

PLIB_I2C_BusIsIdle Function

Determines whether the I2C bus is idle or busy.

File

plib_i2c.h

C

```
bool PLIB_I2C_BusIsIdle(I2C_MODULE_ID index);
```

Returns

- true - The bus is currently idle. It is safe to start a master transfer.
- false - The bus is currently busy. Do not start a master transfer.

Description

This function checks to see if the I2C bus is currently idle or if there is some activity currently taking place.

Remarks

When this function returns true it does not guarantee that a bus arbitration loss cannot occur. Two or more masters can start a transfer within the minimum start signal hold time. (Refer to the I2C specification for a definition of the minimum Start condition hold time.)

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific I2C_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_I2C_ExistsBusIsIdle in your application to determine whether this feature is available.

Preconditions

The module must be configured appropriately and enabled.

Example

```
#define MY_I2C_ID I2C_ID_1

if (PLIB_I2C_BusIsIdle ( MY_I2C_ID ))
{
    PLIB_I2C_MasterStart ( MY_I2C_ID );
}
```

Parameters

Parameters	Description
index	Identifies the desired I2C module

Function

bool PLIB_I2C_BusIsIdle (I2C_MODULE_ID index)

PLIB_I2C_StartClear Function

Clears the start status flag

File

plib_i2c.h

C

```
void PLIB_I2C_StartClear(I2C_MODULE_ID index);
```

Returns

None.

Description

This function clears the start status flag.

Remarks

This flag is cleared automatically by the hardware when a Stop condition is detected, but it can also be cleared by software.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific I2C_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_I2C_ExistsStartDetect in your application to determine whether this feature is available.

Preconditions

None.

Example

```
#define MY_I2C_ID I2C_ID_1

if ( PLIB_I2C_StartWasDetected( MY_I2C_ID ) )
{
    // Handle Start condition

    PLIB_I2C_StartClear(MY_I2C_ID);
}
```

Parameters

Parameters	Description
index	Identifies the desired I2C module

Function

void PLIB_I2C_StartClear (I2C_MODULE_ID index)

PLIB_I2C_StartWasDetected Function

Identifies when a Start condition has been detected.

File

plib_i2c.h

C

```
bool PLIB_I2C_StartWasDetected(I2C_MODULE_ID index);
```

Returns

- true - A Start Condition has been detected
- false - No Start condition has been detected since the last time a Stop condition was detected (or the module was initialized)

Description

This function identifies when a Start condition has been detected.

Remarks

This flag is cleared automatically by the hardware when a stop condition is detected, but it can also be cleared by software using PLIB_I2C_StartClear function.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific I2C_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_I2C_ExistsStartDetect in your application to determine whether this feature is available.

Preconditions

None.

Example

```
#define MY_I2C_ID I2C_ID_1

if ( PLIB_I2C_StartWasDetected ( MY_I2C_ID ) )
{
    // Handle Start condition
}
```

Parameters

Parameters	Description
index	Identifies the desired I2C module

Function

bool PLIB_I2C_StartWasDetected (I2C_MODULE_ID index)

PLIB_I2C_StopClear Function

Clears the stop status flag

File

plib_i2c.h

C

```
void PLIB_I2C_StopClear(I2C_MODULE_ID index);
```

Returns

None.

Description

This function clears the stop status flag.

Remarks

This flag is cleared automatically by the hardware when a Start condition is detected, but it can also be cleared by software.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific I2C_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_I2C_ExistsStopDetect in your application to determine whether this feature is available.

Preconditions

None.

Example

```
#define MY_I2C_ID I2C_ID_1

if ( PLIB_I2C_StopWasDetected ( MY_I2C_ID ) )
{
    // Handle stop condition

    PLIB_I2C_StopClear ( MY_I2C_ID );
}
```

Parameters

Parameters	Description
index	Identifies the desired I2C module

Function

void PLIB_I2C_StopClear (I2C_MODULE_ID index)

PLIB_I2C_StopWasDetected Function

Identifies when a Stop condition has been detected

File

plib_i2c.h

C

```
bool PLIB_I2C_StopWasDetected(I2C_MODULE_ID index);
```

Returns

- true - A Stop condition has been detected
- false - No Stop condition has been detected since the last time a Start condition was detected (or the module was initialized)

Description

This function identifies when a Stop condition has been detected.

Remarks

This flag is cleared automatically by the hardware when a Start condition is detected, but it can also be cleared by software using the PLIB_I2C_StopClear function.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific I2C_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_I2C_ExistsStopDetect in your application to determine whether this feature is available.

Preconditions

None.

Example

```
#define MY_I2C_ID I2C_ID_1

if ( PLIB_I2C_StopWasDetected ( MY_I2C_ID ) )
{
    // Handle stop condition
}
```

Parameters

Parameters	Description
index	Identifies the desired I2C module

Function

bool PLIB_I2C_StopWasDetected (I2C_MODULE_ID index)

c) Baud Rate Generator Control Functions

PLIB_I2C_BaudRateGet Function

Calculates the I2C module's current SCL clock frequency.

File

plib_i2c.h

C

```
I2C_BAUD_RATE PLIB_I2C_BaudRateGet(I2C_MODULE_ID index, uint32_t clockFrequencyHz);
```

Returns

SCL frequency currently used

Description

This function calculates the I2C module's current SCL clock frequency.

Remarks

The actual frequency provided may be slightly different than the frequency requested due to truncation errors. The actual frequency observed on the SCL line may be lower due to clock stretching.

The MY_CLOCK_FREQUENCY macro in the example is used as placeholder for the actual clock frequency.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific I2C_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_I2C_ExistsBaudRate in your application to determine whether this feature is available.

Preconditions

The returned value may not be valid if PLIB_I2C_BaudRateSet has not been previously called to set the SCL clock frequency.

Example

```
#define MY_I2C_ID I2C_ID_1
#define MY_CLOCK_FREQ_INPUT     80000000
uint32_t myBaudRate;

myBaudRate = PLIB_I2C_BaudRateGet ( MY_I2C_ID, MY_CLOCK_FREQ_INPUT );
```

Parameters

Parameters	Description
index	Identifies the desired I2C module
clockFrequencyHz	Clock Frequency (Hz) provided for the I2C module

Function

I2C_BAUD_RATE PLIB_I2C_BaudRateGet (I2C_MODULE_ID index, uint32_t clockFrequencyHz)

PLIB_I2C_BaudRateSet Function

Sets the desired baud rate.

File

plib_i2c.h

C

```
void PLIB_I2C_BaudRateSet(I2C_MODULE_ID index, uint32_t clockFrequencyHz, I2C_BAUD_RATE baudRate);
```

Returns

None.

Description

This function sets the desired baud rate so that the I2C module will operate at the desired clock frequency (on the SCL line of the bus.)

Remarks

IMPORTANT: The I2C module's high-frequency mode must be enabled for frequencies higher than 100 kHz using the PLIB_I2C_HighFrequencyEnable function. Otherwise, the high-frequency mode must be disabled using the PLIB_I2C_HighFrequencyDisable function.

The actual frequency selected may be slightly different than the frequency requested due to truncation errors. Use the PLIB_I2C_BaudRateGet function to obtain the actual baud rate value that has been programmed.

The actual frequency observed on the SCL line may be lower due to clock stretching.

If the system clock is changed during an active receive operation, a receiver error or data loss may result. To avoid this issue, verify that no receptions are in progress before changing the system clock.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific I2C_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_I2C_ExistsBaudRate in your application to determine whether this feature is available.

Preconditions

The source clock, being sent to the I2C module (internal to the microcontroller) must be operating at the frequency passed.

Example

```
#define MY_I2C_ID I2C_ID_1
#define MY_CLOCK_FREQUENCY_INPUT 80000000

PLIB_I2C_HighFrequencyDisable ( MY_I2C_ID );
PLIB_I2C_BaudRateSet ( MY_I2C_ID, MY_CLOCK_FREQUENCY_INPUT, 40000 );
```

Parameters

Parameters	Description
index	Identifies the desired I2C module
clockFrequencyHz	Clock Frequency (Hz)
baudRate	The desired baud rate value. This should be an appropriate value for the frequency and microcontroller in use.

Function

void PLIB_I2C_BaudRateSet (I2C_MODULE_ID index, uint32_t clockFrequencyHz,

I2C_BAUD_RATE baudRate)

d) Slave Address Control Functions

PLIB_I2C_SlaveAddress10BitGet Function

Identifies the current 10-bit Slave mode address.

File

plib_i2c.h

C

```
uint16_t PLIB_I2C_SlaveAddress10BitGet(I2C_MODULE_ID index);
```

Returns

The 10-bit slave address to which the module is currently set to respond.

Description

This function identifies the 10-bit slave address to which the module will currently respond.

Remarks

The 16-bit address will be right-aligned in the 16-bit return value.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific I2C_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_I2C_ExistsSlaveAddress10Bit in your application to determine whether this feature is available.

Preconditions

The address provided may not be valid if it has not been previously set.

Example

```
#define MY_I2C_ID I2C_ID_1
uint16_t slaveAddress;

if (PLIB_I2C_SlaveAddressModeIs10Bits ( MY_I2C_ID ) )
{
    slaveAddress = PLIB_I2C_SlaveAddress10BitGet ( MY_I2C_ID );
}
```

Parameters

Parameters	Description
index	Identifies the desired I2C module

Function

uint16_t PLIB_I2C_SlaveAddress10BitGet (I2C_MODULE_ID index)

PLIB_I2C_SlaveAddress10BitSet Function

Selects 10-bit Slave mode addressing and sets the address value.

File

plib_i2c.h

C

```
void PLIB_I2C_SlaveAddress10BitSet(I2C_MODULE_ID index, uint16_t address);
```

Returns

None.

Description

This function selects 10-bit Slave mode addressing sets the slave address to which the module will respond when operating in Slave mode.

Remarks

I2C modules on some microcontroller families may also support an address mask (to allow the module to respond to multiple addresses. When using these microcontrollers, the PLIB_I2C_SlaveAddress10BitSetMasked may be used to support the mask feature. Refer to the specific device data sheet to determine whether this feature is supported for your device.

The MY_SLAVE_ADDRESS_10_BIT macro in the example is used as a placeholder for the actual desired slave address.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific I2C_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_I2C_ExistsSlaveAddress10Bit in your application to determine whether this feature is available.

Preconditions

None

Example

```
#define MY_I2C_ID I2C_ID_1
#define MY_SLAVE_ADDR_10_BIT    0x23

PLIB_I2C_SlaveAddress10BitSet ( MY_I2C_ID, MY_SLAVE_ADDR_10_BIT );
```

Parameters

Parameters	Description
index	Identifies the desired I2C module
address	The 10-bit slave address to which the module will respond (The address should be right-aligned in the 16-bit parameter, without any read/write bit in the 0 position)

Function

void PLIB_I2C_SlaveAddress10BitSet (I2C_MODULE_ID index, uint16_t address)

PLIB_I2C_SlaveAddress10BitWasDetected Function

Detects reception of the second byte of a 10-bit slave address.

File

plib_i2c.h

C

```
bool PLIB_I2C_SlaveAddress10BitWasDetected(I2C_MODULE_ID index);
```

Returns

- true - If the second byte of the local 10-bit address has been received
- false - If the second byte of the local 10-bit address has not been received

Description

This function detects if the second byte of a 10-bit slave address (containing the low-order 8 bits) matching the local address has been received.

Remarks

This function should only be used by slave receivers.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_I2C_ExistsSlaveAddressDetect in your application to determine whether this feature is available.

Preconditions

The module must have been configured for 10-bit addressing in Slave mode, enabled, and the first byte of the 10-bit local slave address must have already been received and matched.

Example

```
#define MY_I2C_ID I2C_ID_1
uint8_t  i2cReadData;

if ( PLIB_I2C_SlaveAddress10BitWasDetected ( MY_I2C_ID ) )
{
    i2cReadData = PLIB_I2C_ReceivedByteGet ( MY_I2C_ID );
}
```

Parameters

Parameters	Description
index	Identifies the desired I2C module

Function

bool PLIB_I2C_SlaveAddress10BitWasDetected (I2C_MODULE_ID index)

PLIB_I2C_SlaveAddress7BitGet Function

Identifies the current 7-bit Slave mode address.

File

plib_i2c.h

C

```
uint8_t PLIB_I2C_SlaveAddress7BitGet(I2C_MODULE_ID index);
```

Returns

The 7-bit slave address to which the module is currently set to respond.

Description

This function identifies the 7-bit slave address to which the module will currently respond.

Remarks

The 7-bit address will be right-aligned in the 8-bit return value.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific I2C_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_I2C_ExistsSlaveAddress7Bit in your application to determine whether this feature is available.

Preconditions

The address provided may not be valid if it has not been previously set.

Example

```
#define MY_I2C_ID I2C_ID_1
uint8_t slave_address7bit;

if (!PLIB_I2C_SlaveAddressModeIs10Bits ( MY_I2C_ID ) )
{
    slave_address7bit = PLIB_I2C_SlaveAddress7BitGet ( MY_I2C_ID );
}
```

Parameters

Parameters	Description
index	Identifies the desired I2C module

Function

uint8_t PLIB_I2C_SlaveAddress7BitGet (I2C_MODULE_ID index)

PLIB_I2C_SlaveAddress7BitSet Function

Selects 7-bit Slave mode addressing and sets the slave address value.

File

plib_i2c.h

C

```
void PLIB_I2C_SlaveAddress7BitSet(I2C_MODULE_ID index, uint8_t address);
```

Returns

None.

Description

This function selects 7-bit Slave mode addressing sets the address to which the module will respond when operating in Slave mode.

Remarks

I2C modules on some microcontroller families may also support an address mask (to allow the module to respond to multiple addresses. When using these microcontrollers, the PLIB_I2C_SlaveAddress7BitSetMasked may be used to support the mask feature. Refer to the specific device

data sheet to determine whether this feature is supported for your device.

The MY_SLAVE_ADDRESS_7_BIT macro in the example is used as a placeholder for the actual desired slave address.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific I2C_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_I2C_ExistsSlaveAddress7Bit in your application to determine whether this feature is available.

Preconditions

None

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_SlaveAddress7BitSet ( MY_I2C_ID, MY_SLAVE_ADDRESS_7_BIT );
```

Parameters

Parameters	Description
index	Identifies the desired I2C module
address	The 7-bit slave address to which the module will respond (The address should be right-aligned in the 8-bit parameter, without any read/write bit in the 0 position)

Function

void PLIB_I2C_SlaveAddress7BitSet (I2C_MODULE_ID index, uint8_t address)

PLIB_I2C_SlaveAddressHoldDisable Function

Disables Address holding.

File

plib_i2c.h

C

```
void PLIB_I2C_SlaveAddressHoldDisable(I2C_MODULE_ID index);
```

Returns

None.

Description

This function disables address holding.

Remarks

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific I2C_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_I2C_SlaveAddressHoldEnable in your application to determine whether this feature is available.

Preconditions

None.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_SlaveAddressHoldDisable ( MY_I2C_ID );
```

Parameters

Parameters	Description
index	Identifies the desired I2C module

Function

void PLIB_I2C_SlaveAddressHoldDisable (I2C_MODULE_ID index)

PLIB_I2C_SlaveAddressHoldEnable Function

Enables address holding.

File

plib_i2c.h

C

```
void PLIB_I2C_SlaveAddressHoldEnable(I2C_MODULE_ID index);
```

Returns

None.

Description

This function enables address holding. If address byte is received, following the 8th falling edge of clock for a clock line will be held low.

Remarks

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific I2C_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_I2C_SlaveAddressHoldEnable in your application to determine whether this feature is available.

This API is applicable only in I2C slave mode.

Preconditions

None.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_SlaveAddressHoldEnable ( MY_I2C_ID );
```

Parameters

Parameters	Description
index	Identifies the desired I2C module

Function

void PLIB_I2C_SlaveAddressHoldEnable (I2C_MODULE_ID index)

PLIB_I2C_SlaveAddressIsDetected Function

Detects if the most recent byte received is a data or an address byte.

File

plib_i2c.h

C

```
bool PLIB_I2C_SlaveAddressIsDetected(I2C_MODULE_ID index);
```

Returns

- true - If the byte received is an address byte
- false - If the byte received is a data byte

Description

This function identifies if the most recent byte received was a data byte or an address byte.

Remarks

This function should only be used by slave receivers.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_I2C_ExistsSlaveReadRequest in your application to determine whether this feature is available.

Preconditions

The module must have been configured appropriately and enabled, and a transfer must have been previously started.

Example

```
#define MY_I2C_ID I2C_ID_1
uint8_t getData;

if ( PLIB_I2C_ReceivedByteIsAvailable ( MY_I2C_ID ) )
{
    if ( PLIB_I2C_SlaveAddressIsDetected ( MY_I2C_ID ) )
    {
        if ( PLIB_I2C_SlaveReadIsRequested ( MY_I2C_ID ) )
        {
            // Begin slave transmit mode
        }
        else
        {
            // Begin slave receive mode
        }
    }

    // Read the data and release the bus
    getData = PLIB_I2C_ReceivedByteGet ( MY_I2C_ID );
    PLIB_I2C_SlaveClockRelease ( MY_I2C_ID );
}
```

Parameters

Parameters	Description
index	Identifies the desired I2C module

Function

bool PLIB_I2C_SlaveAddressIsDetected (I2C_MODULE_ID index)

PLIB_I2C_SlaveAddressIsGeneralCall Function

Identifies if the current slave address received is the general call address.

File

plib_i2c.h

C

```
bool PLIB_I2C_SlaveAddressIsGeneralCall(I2C_MODULE_ID index);
```

Returns

- true - If the slave address received is the general call address
- false - if the slave address received is not the general call address

Description

This function identifies if the current slave address received is the general call address.

Remarks

This bit is set when the general call address has been received.

This bit is automatically cleared by hardware when a Stop condition occurs and cannot be cleared by software.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific I2C_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_I2C_ExistsGeneralCallAddressDetect in your application to determine whether this feature is available.

Preconditions

A slave address must have been received.

Example

```
#define MY_I2C_ID I2C_ID_1
```

```
uint8_t  slaveAddress7Bit;

if ( !PLIB_I2C_SlaveAddressModeIs10Bits ( MY_I2C_ID ) )
{
    if ( PLIB_I2C_SlaveAddressIsGeneralCall( MY_I2C_ID ) )
    {
        // Handle general call address
    }

    slaveAddress7Bit = PLIB_I2C_SlaveAddress7BitGet ( MY_I2C_ID );
}
```

Parameters

Parameters	Description
index	Identifies the desired I2C module

Function

bool PLIB_I2C_SlaveAddressIsGeneralCall (I2C_MODULE_ID index)

PLIB_I2C_SlaveAddressModeIs10Bits Function

Identifies if the current slave address mode is 7-bits or 10-bits.

File

plib_i2c.h

C

```
bool PLIB_I2C_SlaveAddressModeIs10Bits(I2C_MODULE_ID index);
```

Returns

- true - If the current slave addressing mode is 10-bits
- false - if the current slave addressing mode is 7-bits

Description

This function identifies if the current slave addressing mode is 7-bits or 10-bits.

Remarks

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific I2C_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_I2C_ExistsSlaveAddress10Bit in your application to determine whether this feature is available.

Preconditions

The mode provided may not be valid if the address mode has not been previously set.

Example

```
uint8_t  slave_address7Bit;
uint16_t slave_address10Bit;

if ( PLIB_I2C_SlaveAddressModeIs10Bits ( MY_I2C_ID ) )
{
    slave_address10Bit = PLIB_I2C_SlaveAddress10BitGet ( MY_I2C_ID );
}
else
{
    slave_address7Bit = PLIB_I2C_SlaveAddress7BitGet ( MY_I2C_ID );
}
```

Parameters

Parameters	Description
index	Identifies the desired I2C module

Function

bool PLIB_I2C_SlaveAddressModeIs10Bits (I2C_MODULE_ID index)

PLIB_I2C_SlaveDataIsDetected Function

Detects if the most recent byte received is a data or an address byte.

File

plib_i2c.h

C

```
bool PLIB_I2C_SlaveDataIsDetected(I2C_MODULE_ID index);
```

Returns

- true - If the byte received is a data byte
- false - If the byte received is an address byte

Description

This function identifies if the most recent byte received was a data byte or an address byte.

Remarks

This function should only be used by slave receivers.

This function returns the opposite of the PLIB_I2C_SlaveAddressIsDetected function.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific I2C_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_I2C_ExistsSlaveDataDetect in your application to determine whether this feature is available.

Preconditions

The module must have been configured appropriately and enabled, and a transfer must have been previously started.

Example

```
#define MY_I2C_ID I2C_ID_1
uint8_t dataReceived;

if ( PLIB_I2C_ReceivedByteIsAvailable ( MY_I2C_ID ) )
{
    if ( PLIB_I2C_SlaveDataIsDetected( MY_I2C_ID ) )
    {
        // Read the data and release the bus
        dataReceived = PLIB_I2C_ReceivedByteGet ( MY_I2C_ID );
        PLIB_I2C_SlaveClockRelease ( MY_I2C_ID );
    }
}
```

Parameters

Parameters	Description
index	Identifies the desired I2C module.

Function

bool PLIB_I2C_SlaveDataIsDetected (I2C_MODULE_ID index)

PLIB_I2C_SlaveReadIsRequested Function

Detects if the request from the master was a read or write.

File

plib_i2c.h

C

```
bool PLIB_I2C_SlaveReadIsRequested(I2C_MODULE_ID index);
```

Returns

- true - If an external master is requesting data (slave read/transmit)

- false - If an external master is sending data (slave write/receive)

Description

This function identifies if a slave read (transmit) or a slave write (receive) was requested by the master that addressed the module.

Remarks

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific I2C_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_I2C_ExistsSlaveReadRequest in your application to determine whether this feature is available.

Preconditions

The module must have been configured appropriately and enabled, and a transfer must have been previously started.

Example

```
#define MY_I2C_ID I2C_ID_1
uint8_t slaveTxData;
uint8_t slaveRxData;

if ( PLIB_I2C_SlaveReadIsRequested ( MY_I2C_ID ) )
{
    if ( PLIB_I2C_TransmitterIsReady ( MY_I2C_ID ) )
    {
        PLIB_I2C_TransmitterByteSend ( MY_I2C_ID, slaveTxData );
    }
}
else
{
    slaveRxData = PLIB_I2C_ReceivedByteGet ( MY_I2C_ID );
}
```

Parameters

Parameters	Description
index	Identifies the desired I2C module

Function

bool PLIB_I2C_SlaveReadIsRequested (I2C_MODULE_ID index)

e) Slave Mask Control Functions

PLIB_I2C_SlaveMask10BitGet Function

Identifies the current 10-bit Slave mode address mask.

File

plib_i2c.h

C

```
uint16_t PLIB_I2C_SlaveMask10BitGet(I2C_MODULE_ID index);
```

Returns

The 10-bit slave address mask that the module is currently using to determine to which addresses the module will respond.

Description

This function identifies the 10-bit slave address mask that is currently being used to determine which slave addresses the module will respond.

Remarks

The 10-bit address mask will be Right-aligned in the 16-bit return value.

This function is not supported on microcontrollers with I2C modules that do not support the slave address mask feature. Refer to the specific device data sheet to determine whether this feature is supported for your device.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific I2C_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_I2C_ExistsSlaveMask in your application to determine whether this feature is available.

Preconditions

The address mask provided may not be valid if it has not been previously been set.

Example

```
#define MY_I2C_ID I2C_ID_1

uint16_t slave_address;
uint16_t slave_addressMask;

if ( PLIB_I2C_SlaveAddressModeIs10Bits ( MY_I2C_ID ) )
{
    slave_address     = PLIB_I2C_SlaveAddress10BitGet ( MY_I2C_ID );
    slave_addressMask = PLIB_I2C_SlaveMask10BitGet ( MY_I2C_ID );
}
```

Parameters

Parameters	Description
index	Identifies the desired I2C module

Function

uint16_t PLIB_I2C_SlaveMask10BitGet (I2C_MODULE_ID index)

PLIB_I2C_SlaveMask10BitSet Function

Sets the 10-bit mask for Slave mode addressing.

File

plib_i2c.h

C

```
void PLIB_I2C_SlaveMask10BitSet(I2C_MODULE_ID index, uint16_t mask);
```

Returns

None.

Description

This function sets the 10-bit mask for Slave mode addressing. The address mask (if supported) is used, along with the slave address to identify to which addresses the module will respond when operating in Slave mode. It acts as an "ignore" mask, allowing the module to ignore bits within the slave address and thus respond to multiple slave addresses on microcontrollers with I2C modules that support the mask feature.

Remarks

I2C modules on some microcontroller families may not support the mask feature, in which case the PLIB_I2C_SlaveMask10BitSet function will not be supported. Refer to the specific device data sheet to determine whether this feature is supported for your device.

The MY_SLAVE_ADDRESS_10_BIT and MY_SLAVE_ADDRESS_MASK_10_BIT macros in the example code are used as placeholders for the actual desired slave address and mask that must be filled in by the caller.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific I2C_MODULE_ID enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_I2C_ExistsSlaveMask in your application to determine whether this feature is available.

Preconditions

None

Example

```
#define MY_I2C_ID                       I2C_ID_1
#define MY_SLAVE_ADDR_10_BIT            0x23
#define MY_SLAVE_ADDR_MASK_10_BIT       0x12

PLIB_I2C_SlaveAddress10BitSet ( MY_I2C_ID, MY_SLAVE_ADDR_10_BIT );
PLIB_I2C_SlaveMask10BitSet ( MY_I2C_ID, MY_SLAVE_ADDR_MASK_10_BIT );
```

Parameters

Parameters	Description
index	Identifies the desired I2C module
mask	This parameter identifies bits in the address that are "don't care" bits. These bits will be ignored when attempting to match the address, effectively allowing the module to recognize multiple slave addresses. (To match an address exactly, this
value must be zero (0).) (This value must also be right	aligned in the 16-bit parameter.)

Function

void PLIB_I2C_SlaveMask10BitSet (I2C_MODULE_ID index, uint16_t mask)

PLIB_I2C_SlaveMask7BitGet Function

Identifies the current 7-bit Slave mode address mask.

File

plib_i2c.h

C

```
uint8_t PLIB_I2C_SlaveMask7BitGet(I2C_MODULE_ID index);
```

Returns

The 7-bit Slave mode address mask that the module is currently using to determine to which addresses the module will respond.

Description
