Description

Software Building Blocks

MPLAB Harmony is a framework of software modules that serve as building blocks for your application. If this is the first time you've used MPLAB Harmony, the "First Time Users" section is the best place to start learning. If you're an experienced MPLAB Harmony developer, be sure to look at the "[Release Notes & Information](#)" section to find out what is in this release and what is new.

1.1 1. First Time Users

1.1.1 Before You Start

Before you start using MPLAB Harmony, be sure to install the MPLAB X IDE Plug-In modules.

Description

Before you start using MPLAB Harmony, you should install the following MPLAB X IDE plug in modules, included in the MPLAB Harmony installation.

1. The MPLAB Harmony "Help" plug-in module. (Located at: <install-root>/doc/org-microchip-harmony_help.nbm)
2. The MPLAB Harmony Configurator plug-in module. (Located at: <install-root>/utilities/configurator/com-microchip-harmonyconfigurator.nbm)

Installing the Plug In Modules

1. Start MPLAB X IDE and select "Plugins" from the "Tools" menu as shown below.

2. Click the "Add Plugins..." button, navigate to and open the "com-microchip-harmonyconfigurator.nbm" plug-in file, as shown below.

3. Ensure that the box under "Install" for the "MPLAB Harmony Configurator" plug-in is selected and click "Install" as shown below.

4. Follow the prompts from the installation and continue until the installation completes. (Do not worry if the version you're installing is "signed" but not "trusted". Just click "continue"). Once the installation has finished you can close the "Plugins" dialog box.

You should now see a "MPLAB Harmony Configurator" option under the "Tools" menu. This indicates that the project Configurator has been successfully installed.

1.1.2 What is MPLAB Harmony?

This topic provides an overview of key concepts necessary to understand the MPLAB Harmony architecture.

Description

Introduction

Microchip MPLAB® Harmony is the result of a holistic, aggregate approach to creating firmware solutions for embedded systems using Microchip microcontrollers.

MPLAB® Harmony Block Diagram

MPLAB Harmony Overview

Designed almost completely in the C language (with support for C++), MPLAB Harmony takes key elements of modular and object-oriented design, adds in the flexibility to use a Real-Time Operating System (RTOS) or work without one if you prefer, and provides a framework of software modules that are easy to use, configurable for your specific needs, and that work together in complete harmony.

Portability

Portability is a concern that is often overlooked when a silicon manufacturer provides software. However, breadth of solutions is a hallmark strength of Microchip, and MPLAB Harmony provides simple libraries to abstract away part-specific details and make Microchip microcontrollers easy to use, regardless of which part you choose. Any time you design a new product or update an existing one you have to balance capabilities against cost, but cost is more than just the bill of materials. It's also the Non-Refundable Engineering (NRE) cost to design and develop your solution. MPLAB Harmony provides peripheral libraries, device drivers, and other libraries that use clear and consistent interfaces, requiring little or no change in your application code and minimizing the engineering time and effort for each new design.

Device Drivers

The primary purpose of an MPLAB Harmony device driver (or "driver") is to provide a simple and highly abstracted interface to a peripheral, allowing your application (or other module in the system) to interact with a peripheral through a consistent set of functions. A device driver is responsible for managing access to a peripheral, so that requests from different modules do not conflict with each other, and for managing the state of that peripheral so that it always operates correctly.

Peripheral Libraries

A Peripheral Library (PLIB) is a simple access library that provides a consistent (but very low level) interface to a peripheral that is "on board" the microcontroller. PLIBs hide register details, making it easier to write drivers that support multiple microcontroller families, but they are not normally used by applications directly to interact with peripherals, as they provide little abstraction, and because they require the caller to manage the detailed operation of a peripheral (including preventing conflicting requests from other modules). Because of the lack of conflict protection in a PLIB, only one module in a system should directly access the PLIB for a peripheral. Therefore, PLIBs are primarily used to implement device drivers (and some system services) to make them portable.

Modularity

MPLAB Harmony libraries are modular software "building blocks" that allow you to divide-and-conquer your firmware design. The interface to each library consists of a highly cohesive set of functions (not globally accessible variables or shared registers), so that each module can manage its own resources. If one module needs to use the resources of another module, it calls that module's interface functions to do so. Interfaces between modules are kept simple with minimal inter-dependencies so that modules are loosely coupled to each other. This approach helps to eliminate conflicts between modules and allows them to be more easily used together like building blocks to create the solutions you need.

Middleware Libraries

The normal usage models of some of the more complex peripherals, (i.e., USB or network interfaces) requires interpreting complex protocols or may require substantial additional processing to produce useable results, such as drawing graphical images on an LCD screen with an LCD controller peripheral. Therefore, while a device driver may be completely sufficient for a simple peripheral like a UART, some peripherals require what is frequently called “middleware” (aptly named because it sits between your application and the hardware abstraction layer or “driver” layer). MPLAB Harmony provides several middleware library “stacks” to manage these more complex peripherals and provide the functionality you need and expect.

MPLAB Harmony middleware “stacks” are usually built upon device drivers and system services (explained below) so that they can be supported on any Microchip microcontroller for which the required driver or service is supported. However, special purpose implementations may be available that integrate the driver, certain services, and various modules within the “stack” for efficiency.

System Services

MPLAB Harmony system services are responsible for managing shared resources so that other modules (drivers, middleware, and applications) do not conflict on shared resources. For example, if the TCP/IP, USB, and Graphics stacks attempted to concurrently use the Timer2 peripheral to perform some periodic task, they would very likely interfere with each other. However, if instead they used a timer system service (as the following image illustrates), it is the responsibility of the system service to keep the separate requests from interfering with each other. The timer service can be configured as desired for a specific system (for example, you might decide to use Timer3 instead of Timer2) isolating the necessary changes to the configuration of a single module and preventing potential conflicts.

The use of a system service is very similar the use of a device driver, except that a driver normally requires the caller to “open” it to create unique client-to-driver association. A system service does not normally require the caller to open the service before using it because system services are frequently shared by many clients within the system.

Compatibility

MPLAB Harmony modules (drivers, system services, and middleware – excluding PLIBs) are “active”. This means when an application calls a module’s interface function, the call will usually return immediately and the module will continue working on its own to complete the operation. Most modules will then provide a notification mechanism so the caller (i.e., client) can determine when the operation has finished.

Harmony modules are implemented as cooperative state machines. The following image shows the basic idea of how this works. Each module has an “Initialize” function and each module has one (or more) “Tasks” function(s) to maintain its state machine(s). The state machines of all modules are initialized, shortly after the system comes out of reset in “main”. After that (in a polled

configuration, with no OS), the system drops into a “super loop” where each module’s state machine function is repeatedly called, one after the other, to allow it to do the next “task” necessary to keep its state machine running. This allows the system to keep all modules running using a cooperative or shared “multi-tasking” technique. Modules (under control of your application) interact with each other by calling the interface functions of other modules (as illustrated below) and the system-wide “super loop” keeps all modules in the system running so they stay “active” and do their jobs.

This method is not suitable for all needs; therefore, other configurations are possible. However, a polled configuration is the simplest to understand and it best illustrates the basic concept of how MPLAB Harmony modules work together, as shown below. It is also easy to implement, easy to understand, and easy to debug.

Flexibility

The basic MPLAB Harmony model of cooperating state-machine driven modules, when combined with a little configurability, becomes flexible enough to meet the needs of almost any embedded system. For example, if you're using multiple identical peripherals, MPLAB Harmony has “dynamic” driver implementations that can manage all instances of a peripheral with a single instance of the driver code. You might also have a need for multiple “client” modules to use the same instance of a peripheral at the same time (like the timer example, described previously). To manage this need, MPLAB Harmony has driver implementations that are intelligent enough to manage requests from multiple clients. On the other hand, your needs may be simpler than that. So, static and single client drivers are also available to help reduce the amount of code and data storage needed for your system.

Or, your system may need to combine several middleware stacks and multiple, potentially independent, applications. If that is the

case, the simple polling operation, using the “super loop” method frequently seen in simple embedded systems may not be sufficient. However, when you start adding more modules, it becomes more and more difficult to meet the timing requirements of all peripherals using a simple polled super loop.

Fortunately, MPLAB Harmony modules are written so that (where appropriate) their state machines can be run directly from an Interrupt Service Routine (ISR) or an RTOS thread. Using an ISR allows you to eliminate the latency of waiting for the execution of other modules in the loop to finish before a time-critical event is serviced, and it allows you to use the interrupt prioritization capabilities available on some Microchip devices to ensure that your system responds to events in the real world in real-time.

Additionally, the ability to schedule and prioritize different tasks for different modules can be obtained for modules that are not associated with a specific processor interrupt (such as many middleware modules and your application) using a Real-Time Operating System (RTOS). In fact, that is one of the main reasons to use an RTOS. When your system becomes complex enough that you start struggling to meet your timing requirements using the super loop method, it's time to use an RTOS.

Fortunately, the MPLAB Harmony module state machines functions can be called from a loop in an RTOS thread just as easily as they can be called from a polled “super loop” in a system without an RTOS. To allow this, modules are designed to be “thread safe” by calling semaphore and mutex operations (and a few others, as necessary) through an Operating System Abstraction Layer (OSAL). The OSAL provides a consistent set of functions to call, regardless of which RTOS is being used (or even if no RTOS is used). The choice of RTOS to use, if any, is a configuration option. MPLAB Harmony supports several OS and non-OS configurations and support for more operating systems is possible. All that is required is to implement the OSAL functions appropriately for the desired OS.

Configurability

Most MPLAB Harmony libraries support a variety of build-time configuration options.

- Selection of supported Microchip microcontroller
- Interrupt-driven or polled execution
- Static-or-dynamic peripheral instance selection (for drivers)
- Single-or-multi-client support (for drivers)
- Other library-specific options

The need for selection of the microcontroller and execution environment has been previously explained. In addition, most drivers and other library modules are designed to allow you to select a variety of configuration options to tailor them to your specific usage. For example, you may be able to select buffer sizes for data transfer modules or clock sources for timer modules. The set of configuration options for each module is identified and explained in the help documentation (along with the interface and usage information) and peripheral initializer (MPLAB Harmony “Pi”) and configuration tools are provided to help simplify the process of configuring your system exactly the way you want and to get you started with a set of initial source files for your project.

Project Structure

To facilitate configurability, MPLAB Harmony projects are normally structured in a way that isolates the code necessary to

configure a “system” from the library modules themselves and from your application code. The following illustrates this concept, while the second figure shows how the files might appear in an MPLAB X IDE project.

In an MPLAB Harmony project, the “main.c” file is kept very simple and consistent (containing primarily, just the super-loop previously discussed). The application files (app.c and app.h in the example to the left) are separate from the configuration files in the “system_config” folder, so it is possible for a single application to have more than one configuration. (Usage of this capability can be seen in example and demonstration projects included with the installation of MPLAB Harmony.) The library modules that make up the MPLAB Harmony framework (in the “framework” folder) use the definitions provided in the selected configuration header (system_config.h, highlighted in the illustration) to specify the configuration options you selected when you configured the project. Finally the processor-specific peripheral libraries (if used) are provided as both a prebuilt binary (“a” linker file) and as in-line source code to allow for maximum build efficiency for your firmware projects.

Conclusion

MPLAB Harmony provides a complete framework for developing your firmware solutions using Microchip microcontrollers and development tools. The firmware libraries and tools that make up the MPLAB Harmony framework are modular and compatible, making them simple to use. They’re flexible and configurable, making them easy to tailor to your specific needs. And, they’re portable across a wide range of Microchip microcontrollers so you’re sure to find a supported part that meets your needs.

1.1.3 Project Layout

This topic explains how an MPLAB Harmony project is organized.

Description

A sample project has been created to show you the structure of an MPLAB Harmony project. The "sample" project is available in the following folder, directly under your MPLAB Harmony installation root folder.

<installation-root>/apps/examples/sample/firmware/sample.X

You should open this project in MPLAB X IDE and follow along with this guide.

An MPLAB Harmony Project is organized as shown below within MPLAB X IDE.

This organization consists of a few key "logical" folders and C-language files, as described below.

The "app" folder, which contains:

- The "main.c" file
- The "app.c" file

The "app" (short for "application") folder holds all of the application's firmware source files for the project. In a simple project, the "app" folder will directly contain the "main.c" file and the "app.c" file. More complex projects will very likely contain additional files, as needed. In an MPLAB Harmony project, the "main.c" file normally contains the C-language "main" function and little or nothing else. This "main" logic is usually consistent across all MPLAB Harmony projects and should not need to be changed. The "app.c" file normally contains the logic of the application itself. This is where the desired over-all behavior of your system is usually implemented (although complex applications may have additional files).

The "system_config" folder

The "system_config" folder contains one or more subdirectories, each of which corresponds to a configuration of your application or, more accurately, "system". MPLAB Harmony projects may have multiple configuration. In each configuration, you can select a different set of libraries or modules, different build parameters for each module and different source files for your application. A configuration consists of a specific set of properties (tools settings) in MPLAB X IDE and a set of source files that define the build parameters and source code that control which modules are initialized and maintained in your system.

In MPLAB X IDE, the tools configuration can be selected by using a "pull down" menu in the tool bar at the top of the window or by "Right-clicking" on the project name and selecting "Properties". In most example and demo projects distributed with MPLAB Harmony, name of each MPLAB X IDE configuration will match the name of the associated folder under the "system_config" folder in the project (the "pic32mx_default" folder in the sample project). When a specific MPLAB X IDE configuration is selected, the configuration files for that configuration are included in the build and the configuration files in other configuration folders are excluded from the build.

Note: This is project convention used by example and demo projects provided with MPLAB Harmony. You, of course, may organize your own projects any way you wish. But, we recommend following this convention if you use multiple configurations in your projects. We think you'll appreciate the power and flexibility of it.

Configuration Files

- The "system_config.h" file
- The "system_init.c" file
- The "system_tasks.c" file
- The "system_int.c" file (optionally)

A set of three or four files normally make up a complete configuration of the system. The purpose of each of these files is described in more detail in the following sections. But, the basic idea is that you may want different configurations of your application for different physical hardware boards, different Microchip microcontrollers, or different feature sets, depending on your specific needs.

Allowing different configurations of the same application logic makes your application more flexible and provides a well-organized way to deal with the sort of variation that usually occurs in any project of sufficient size and complexity. This technique helps to eliminate the duplication of code (and labor) that would otherwise be necessary to manage multiple related projects. Of course, if you don't need or want that flexibility, all of these files are specifically created for your project and you can make any modifications to them that you like. The choice is always yours.

Important!

The relative path, from the MPLAB X IDE project folder to the configuration folder (containing the "system_config.h" file) for each project configuration must be placed in the "Includes directories" list in the compiler properties for each configuration of the MPLAB X IDE project.

The "framework" folder

The "framework" logical folder contains the source files for the MPLAB Harmony framework and libraries. Depending on your project configuration, there can be many, many files and sub folders under this folder. These files are for MPLAB Harmony libraries that you should not need to edit. In fact, the framework source files are not normally located in your project. Instead, these files are included in your project directly from the MPLAB Harmony installation (using relative directory paths). All of the actual files stay in the MPLAB Harmony installation folder, out of the way.

Notes

1. You always have the option of copying the framework files directly into your project's source folder, if desired. In fact, doing so is a good idea if you plan to move or distribute your project separately from the MPLAB Harmony installation.
2. In most cases, the "logical folder" organization within the MPLAB X IDE project matches exactly with the physical directory organization within the MPLAB Harmony installation (and within your project directory) on your disk drive. This is done to keep things simple and consistent so you only need to learn a single layout. But, there are a couple of notable exceptions.
 - MPLAB has a convention of splitting out "Header Files" (".h" files) and "Source Files" (".c" files), so the virtual folder organization in the MPLAB X IDE project separates the files in to these two groups and the physical directories on disk do not.
 - In an MPLAB Harmony example or demo project, the "app" folder will correspond to the "src" directory on disk under the application's main folder.

1.1.4 The Main File

This topic describes the logic of the "main.c" file and the C-language "main" function in an MPLAB Harmony project.

Description

The C-language entry point for an MPLAB Harmony embedded application is the "main" function. This function is defined in the "main.c" file, contained in the project's "app" folder (or "src" directory on disk). The "main" function (see example, below) implements a simple "super loop", commonly used in embedded applications that do not make use of an operating system.

Example "main" Function Logic

```
int main ( void )
{
    /* Initialize the system. */
    SYS_Initialize ( NULL );

    while ( true )
    {
        /* Perform system tasks. */
        SYS_Tasks ( );
    }

    /* Should not come here during normal operation. */
    SYS_ASSERT ( false , "Error! Exiting main" );
    return ( EXIT_FAILURE );
}
```

The "SYS_Initialize" Function

The first thing the main function does is call a function called "[SYS_Initialize](#)". The purpose of the "[SYS_Initialize](#)" function is to initialize every software module in the system. MPLAB Harmony is based upon a model of cooperating state machines. So, this function must ensure that every module's state machine is placed in a valid initial state. The implementation of this function is one of the things that must be done to configure an MPLAB Harmony system. This function's definition is normally located in the "system_init.c" file and is normally implemented by you since you're the only one who knows which software modules you want to include in your project. However, MPLAB Harmony provide a project Configurator to help you get started.

Note: The "[SYS_Initialize](#)" function signature has a "void *" input parameter. This is so that it may later be implemented in a library and an arbitrary initialization data structure may be passed into it. However, for a statically implemented "[SYS_Initialize](#)" function (which will normally be the case if you implement it yourself), this parameter is unnecessary and can be passed as "NULL". (Note: You could eliminate the parameter, but that may lead to future incompatibilities and the compiler will remove it automatically for you when optimizations are enabled.)

The "Super Loop"

After all of the modules in the system have been initialized, the "main" function executes an infinite loop to keep the system running. This is commonly called a "super loop" as it is the outer-most loop, within which the entire system operates. This loop never exits. So, the code that exists after the end of that loop should never be executed and is only included there for safety, clarity, and syntactical completeness.

The "[SYS_Tasks](#)" Function

Inside of the "super loop", the "main" function calls the "[SYS_Tasks](#)" function. The purpose of the "[SYS_Tasks](#)" function is to poll every module in the system to ensure that it continues to operate. This is how the system maintains the state machine of all polled modules. (Note that some modules may be interrupt driven and thus, not called from the "[SYS_Tasks](#)" function.) The implementation of the "[SYS_Tasks](#)" function is also one of the things that you must normally do as part of the system configuration, again because you are the only one who knows which modules you want to include in your project. You might also have guessed that this function's definition is normally located in the "system_tasks.c" file. Of course, the MPLAB Harmony project Configurator can help with this also.

1.1.5 The Application File(s)

This topic describes the normal structure of MPLAB Harmony application files.

Description

From the point of view of an MPLAB Harmony system, an application consists of two basic functions.

- APP_Initialize()
- APP_Tasks()

The application's initialization function (APP_Initialize) is normally called from the "[SYS_Initialize](#)" function, called from "main" before entering the top-level loop. The application's "tasks" function (APP_Tasks) is normally called from the "[SYS_Tasks](#)" function, called from "main" from inside the top-level loop. This is how the application's state machine is initialized and "polled" so that it can do its job. The "[SYS_Initialize](#)" function is normally implemented in the "system_init.c" file and the "[SYS_Tasks](#)" function is normally implemented in the "sys_tasks.c" file. That is the convention for example and demo projects distributed with MPLAB Harmony and that is the case for the sample project. You may do as you choose in your own projects, but we recommend following this convention as it will make it easier to manage multiple configurations if you need them and it will be consistent with the MPLAB Harmony project Configurator and other tools.

Application Initialization

An application's initialization function places the application's state machine in its initial state and may perform additional initialization if necessary. This function must not block and it should not call the routines of any other modules that may block. If

something needs to be initialized that may take time to complete, that initialization should be done in the application's state machine (i.e. in its "Tasks" function).

Sample Application Initialization Function:

```
void APP_Initialize( void )
{
    /* Copy the message string to a buffer. */
    strncpy(appData.buffer, APP_HELLO_STRING, APP_BUFFER_SIZE);

    /* Prepare a buffer object for transfer using the USART driver. */
    appData.bufferObject.buffer = appData.buffer;
    appData.bufferObject.bufferSize = min(APP_BUFFER_SIZE, strlen(appData.buffer));
    appData.bufferObject.flags = DRV_USART_BUFFER_FLAG_WRITE;

    /* Place the App state machine in it's initial state. */
    appData.state = APP_STATE_INIT;
}
```

The sample project's initialization function initializes an internal buffer to prepare a "Hello World" message for transmission on a USART and places the application's state machine in its initial state by assigning the "APP_STATE_INIT" enumeration value into the "state" member of the data structure that contains all of the data required by the application (appData). This structure is defined globally, but is only ever accessed by the application itself. The application's initialization function is called from the "SYS_Initialize" function (defined in "system_init.c") which is called from "main" after a system reset. Using this technique, the application is initialized (along with the rest of the system) whenever the system comes out of reset.

Application Tasks

The application's state machine breaks up the job that the application must do into several short "tasks" that it can complete quickly, but between which it must wait for some other module to complete some tasks of its own. (In this case the other module is the USART driver.) Once each short task has completed successfully, the application transitions to another state to perform the next short task.

Example Application Tasks Function:

```
void APP_Tasks( void )
{
    /* Status of USART driver */
    DRV_USART_CLIENT_STATUS usartStatus;

    /* Status of buffer submitted to USART */
    DRV_USART_BUFFER_STATUS bufferStatus;

    /* Check the application state*/
    switch ( appData.state )
    {
        /* Keep trying to open the driver until we succeed. */
        case APP_STATE_INIT:
        {
            /* open an instance of USART driver */
            appData.usartHandle = DRV_USART_Open(SYS_USART_DRIVER_INDEX,
            DRV_IO_INTENT_READWRITE);
            if (appData.usartHandle != DRV_HANDLE_INVALID )
            {
                /* Update the state */
                appData.state = APP_STATE_WAIT_FOR_READY;
            }
            break;
        }

        /* Send the message when the driver is ready. */
        case APP_STATE_WAIT_FOR_READY:
        {
```

```

    /* Get the USART driver status */
    usartStatus = DRV_USART_ClientStatus( appData.usartHandle );
    if ( usartStatus == DRV_USART_CLIENT_STATUS_READY )
    {
        /* Submit buffer to USART */
        appData.usartBufferHandle = DRV_USART_BufferAdd(appData.usartHandle,
&appData.bufferObject);
        if ( appData.usartBufferHandle != DRV_HANDLE_INVALID )
        {
            /* Buffer is accepted. Driver will transmit. */
            appData.state = APP_STATE_WAIT_FOR_DONE;
        }
    }
    break;
}

case APP_STATE_WAIT_FOR_DONE:
{
    bufferStatus = DRV_USART_BufferStatus(appData.usartHandle,
appData.usartBufferHandle);
    if ( DRV_USART_BUFFER_COMPLETED == bufferStatus )
    {
        /* Work is done, move to idle state. */
        appData.state = APP_STATE_IDLE;
    }
}

/* Idle state (do nothing) */
case APP_STATE_IDLE:
default:
    break;
}
}

```

Sample Application States

The sample application's "tasks" function breaks the operation of the application down in to the following states using a "switch" statement with the following "cases".

- APP_STATE_INIT
- APP_STATE_WAIT_FOR_READY
- APP_STATE_WAIT_FOR_DONE
- APP_STATE_IDLE

The sample application is placed into the "APP_STATE_INIT" state when by the application's initialization function before the "tasks" function is ever called. So, the first time the "APP_Tasks" function is called, the switch statement executes the code under this case and the first short "task" the sample application attempts to do is open the USART driver to obtain a handle so that it can transfer data over the USART. Notice that the application checks the value of the handle returned from the "[DRV_USART_Open](#)" function to ensure that it is valid before it transitions to the "APP_STATE_WAIT_FOR_READY" state. If the value of the handle returned by the driver's "open" function is invalid (equal to "[DRV_HANDLE_INVALID](#)"), then the application stays in the "APP_STATE_INIT" state and keeps trying to open the USART driver every time it's "tasks" function is called.

Once the application has a valid handle to the USART driver, it executes the code under the "APP_STATE_WAIT_FOR_READY" case the next time its "APP_Tasks" function is called. In this state, the application calls a USART driver status routine ([DRV_USART_ClientStatus](#)) to see if the driver is ready to transfer data. If the driver is ready, the application calls a USART driver data transfer routine ([DRV_USART_BufferAdd](#)) to [send](#) the data buffer it prepared in the "APP_Initiaize" function to the USART. Then, it checks the handle returned by the "[DRV_USART_BufferAdd](#)" routine to see if it is valid. If the buffer handle is valid, it indicates that the USART driver has accepted the buffer and will take responsibility for the

data transfer from that point forward. The application does not have to do anything else to cause the data transfer to occur, but it may want to know when the transfer has completed, so it transitions to the "APP_STATE_WAIT_FOR_DONE" state. However, if the buffer is not accepted by the driver (in which case the handle returned by the "[DRV_USART_BufferAdd](#)" function would be invalid), the application stays in the "APP_STATE_WAIT_FOR_READY" and tries again the next time the "APP_Tasks" function is called by the system (i.e. the "[SYS_Tasks](#)" function).

Once the application is in the "APP_STATE_WAIT_FOR_DONE" state, it calls a buffer status routine ([DRV_USART_BufferStatus](#)) to check and see if the buffer it sent has completed. Note that it passes the handle value returned from the "[DRV_USART_BufferAdd](#)" function (stored in the "usartBufferHandle" member of the global "appData" structure) into the buffer status function to identify the buffer on which it wishes to check status. If the buffer status routine returns "DRV_USART_BUFFER_COMPLETED", then the transfer has completed and the application transitions to the "APP_STATE_IDLE" state where it stays and does nothing any time its "tasks" function is called. It's job is done! A more complex application would go on to some other task or potentially begin the process again. But, this is a simple "Hello World" sample application.

Note:

The application is normally initialized last, after all other modules in the system have been initialized. But, it should never assume that any other module that it must call has completed its initialization when the application is initialized or when its "tasks" function is first called. Instead, it should always check the return value or status from any other module it calls to ensure that the call succeeded before moving on to the next state. Following this rule makes applications more robust and allows them to handle errors more effectively.

1.1.6 System Configurations

1.1.6.1 system_config.h

This topic describes the purpose of system configuration header file.

Description

System Configuration

In MPLAB Harmony, most library modules have a set of build time configuration options that define a variety of parameters (such as buffer sizes, maximum or minimum limits, and default behavior). These configuration options normally have acceptable default values. However, if you want to configure a library for your specific needs, its configuration options can be defined using C-language pre-processor "#define" statements. The set of configuration options supported is described for each library in the "Configuring the Library" section of its help document and most libraries provide a template and example configuration header files in a "config" sub-folder under their "src" folder.

To obtain its build configuration options, every library includes the same common top-level configuration file that must be called "system_config.h" and that must be defined as part of your application or, more specifically, as part of your system configuration. The relative directory path to configuration directory that contains this file must be defined in the build properties of your project so that the compiler can find it in its include file search path.

Example Configuration "system_config.h" Header

```
// *****
// *****
// Section: Application Configuration
// *****
// *****
```

```

/* Define the size of the application's message buffer. */
#define APP_BUFFER_SIZE    15
#define APP_UART_BAUDRATE  9600

/* Define the application's "hello world" message string. */
#define APP_HELLO_STRING   "Hello World\r\n"

// *****
// *****
// Section: System Services Configuration
// *****
// *****

/* Define the index for the driver we'll use. */
#define SYS_USART_DRIVER_INDEX    DRV_USART_INDEX_0

/* Define the hardware (PLIB) index associated with this instance of the driver. */
#define SYS_USART_ID              USART_ID_2

// *****
// *****
// Section: UART Driver Configuration
// *****
// *****
#define DRV_USART_INSTANCES_NUMBER    1
#define DRV_USART_CLIENTS_NUMBER      1
#define DRV_USART_INTERRUPT_MODE      false
#define DRV_USART_XFER_BUFFER_NUMBER  10
#define DRV_USART_INTERRUPT_SOURCE_TX  INT_SOURCE_USART_2_TRANSMIT
#define DRV_USART_CONFIG_BYTE_Q_SIZE_TX    1
#define DRV_USART_CONFIG_BYTE_Q_SIZE_RX    1
#define DRV_USART_CONFIG_BLOCK_DEVICE_MODE

#define DRV_USART_INTERRUPT_MODE      false

#define DRV_USART_INSTANCES_NUMBER    1

#define DRV_USART_CLIENTS_NUMBER      1

#define DRV_USART_INTERRUPT_SOURCE_TX  INT_SOURCE_USART_2_TRANSMIT

#define DRV_USART_INTERRUPT_SOURCE_RX  INT_SOURCE_USART_2_RECEIVE

```

The example above defines configuration options for the application, system services, and USART driver used in the "pic32mx_default" configuration of the sample project..

1.1.6.2 system_init.c

This topic describes the purpose of the system initialization file.

Description

In an MPLAB Harmony project, the "SYS_Initialization" function is called from the "main" function in order to initialize all modules in the system. This function is implemented as part of a system configuration, normally in a file called "system_init.c". This file may also include other necessary global system items that must be implemented in order to initialize a system such as processor configuration bits and system-wide global data structures.

Example "system_init.c" File

```

// *****

```

```

// *****
// Section: Configuration Bits
// *****
// *****

#pragma config FPLL0DIV = DIV_1, FPLLMUL = MUL_20, FPLLIDIV = DIV_2
#pragma config FWDTEN = OFF, FCKSM = CSECME, FPBDIV = DIV_1
#pragma config OSCIOFNC = ON, POSCMOD = XT, FSOSCEN = ON, FNOSC = PRIPLL
#pragma config CP = OFF, BWP = OFF, PWP = OFF
#pragma config ICESEL = ICS_PGx2

// *****
// *****
// Section: Driver Initialization Data
// *****
// *****

static DRV_USART_INIT uartInit =
{
    /* System module initialization */
    .moduleInit = {0} ,

    /* Identifies USART hardware module (PLIB-level) ID */
    .usartID = SYS_USART_ID ,

    /* Operation Modes of the driver */
    .operationMode = DRV_USART_OPERATION_MODE_RS232 ,

    /* Flags for the usart initialization */
    .initFlags = 0 ,

    /* Control the line control configuration */
    .lineControlMode = DRV_USART_LINE_CONTROL_MODE_8NONE1 ,

    /* Baud Rate value to be used, if not using auto baud */
    .brgValue = APP_UART_BAUDRATE ,

    /* Operation mode initialization data */
    .operationModeInit = {{0}},

    /* Handshake Mode */
    .handShakeMode = DRV_USART_HANDSHAKE_MODE_NONE ,

    /* Interrupt Source for TX Interrupt */
    .txInterruptSource = INT_SOURCE_USART_2_TRANSMIT ,

    /* Interrupt Source for RX Interrupt */
    .rxInterruptSource = INT_SOURCE_USART_2_RECEIVE ,

    /* Interrupt Source for Error Interrupt */
    .errorInterruptSource = INT_SOURCE_USART_2_ERROR,

    /* Receive Queue length */
    .rxQueueSize      = 3,

    /* Transmit Queue length */
    .txQueueSize      = 3
};

// *****
// *****
// Section: System Data
// *****
// *****

```

```

/* Structure to hold the sample application's system data. */
SAMPLE_SYSTEM_OBJECTS sysSample;

// *****
// *****
// Section: System Initialization
// *****
// *****

void SYS_Initialize ( void* data )
{
    /* Inialize the system */
    sysSample.usart = DRV_USART_Initialize(SYS_USART_DRIVER_INDEX, (SYS_MODULE_INIT
*)&uartInit );

    /* Initialize the Application */
    APP_Initialize ( );
}

```

In addition to the ["SYS_Initialize"](#) function implementation, the above example "system_init.c" file from the "pic32mx_default" configuration of the "sample" project defines the processor configuration bits, a data structure used to initialize the USART driver, and a global "sysSample" data structure used to hold a global handle to the USART driver object returned by the driver's initialization function.

Notice that the ["SYS_Initialize"](#) function initializes first the driver, then the application. These are the only two active modules in this system.

1.1.6.3 system_tasks.c

This topic describes the purpose of the system tasks file.

Description

Since MPLAB Harmony modules are state machine driven, they each have a "Tasks" function that must be called repeatedly (from the system-wide "super" loop in "main" or from an ISR or OS thread). The "Tasks" functions are all called from the top-level ["SYS_Initialize"](#) function that is normally implemented in a file called "system_tasks.c" that is part of a system configuration.

Example "system_tasks.c" File

```

void SYS_Tasks ( void )
{
    /* Call the "tasks" functions for any modules in the system. */
    DRV_USART_TasksTX(sysSample.usart);

    /* Call the application's tasks routine */
    APP_Tasks ( );
}

```

The "system_tasks.c" file for the "pic32mx_default" configuration of the "sample" project, contains only the implementation of the ["SYS_Tasks"](#) function for that configuration. This function calls the USART driver's transmitter tasks function ["DRV_USART_TasksTX"](#), passing in the driver's object handle returned from the driver's initialization routine, and it calls the application's tasks function "APP_Tasks" to keep both the driver and the application's state machines running.

1.1.6.4 system_int.c

This topic describes the purpose of the system interrupts file.

Description

In an interrupt-driven configuration, any modules (such as drivers or system services) that can be driven from an interrupt must have their interrupt-capable tasks function(s) called from an Interrupt Service Routine (ISR) "vector" function instead of from the "[SYS_Tasks](#)" function. The form of the definition of the ISR vector function is dependent on what type of PIC microcontroller on which the system is running. So, any vector functions required are normally implemented as part of the a specific system configuration in a file normally called "system_int.c"

Example "system_int.c" File

```
void __ISR ( _UART_2_VECTOR ) _InterruptHandler_USART_2_stub ( void )
{
    if ( SYS_INT_SourceStatusGet ( APP_USART_INT_SOURCE_TX ) )
    {
        /* Call the USART driver's "Tasks" routine */
        DRV_USART_TasksTX ( sysSample.usart );
    }
}
```

Notice that, in this example, the ISR function must determine if the interrupt occurred because of a transmitter (TX) interrupt because on the PIC32 part used by this configuration of the application, this interrupt vector is shared with other types of interrupts for this USART. Once it has determined that the interrupt is indeed a transmitter interrupt, the ISR calls the USART driver's TX tasks routine and passed in the USART object handle returned from the driver's initialization function.

Note: The USART driver's "[DRV_USART_TasksTX](#)" function is interrupt capable when the USART driver is built with the correct configuration options.

1.1.7 More Information

Describes what is available from the MPLAB Harmony web page.

Description

Information on MPLAB Harmony is available from microchip.com/harmony.

From this landing page, information on additional downloads, links to a MPLAB Harmony discussion forum, among others is available.

1.2 2. Creating Your Own Applications

This section describes the steps necessary to create your own MPLAB Harmony applications.

Description

To support the framework, the application (or MPLAB Harmony "system") is responsible for the following:

- 1. Create a New Project:** This can be accomplished by either running the MPLAB X IDE new project wizard or copying and using a basic template located in the <installation-root>/apps/examples/templates directory. If you copy the template to a new location, you may be required to modify your include paths. To use the project wizard, select *Microchip Embedded > Standalone Project*. Next, choose the device. The device you choose will determine what peripheral libraries are included in your MPLAB Harmony project. Continue in the new project Wizard, selecting your hardware and software tools. When you name and locate your project, there are two choices: 1) You can locate it in the 'apps' folder of the MPLAB Harmony installation or 2) You can locate it outside of the Harmony installation. Placing the project in the 'apps' folder of MPLAB Harmony will require you to copy it if you install a new version of MPLAB Harmony. Installing your project outside of the MPLAB Harmony installation will require you to modify your include paths when a new version of MPLAB Harmony is installed. It is recommended to use relative paths when installing in the 'apps' folder in MPLAB Harmony. Make sure that your new project is set to the main (active) project.
- 2. Determine which MPLAB Harmony Modules are needed for your Application:** Modules are divided into four categories; Peripheral Libraries, System Services, Device Drivers and other libraries (commonly called middleware). To determine your needs, read the [MPLAB Harmony Overview](#) and the Introductory sections for the modules of interest. Some modules have dependencies while others do not. Peripheral Libraries have no dependencies. Drivers depend on peripheral libraries. System Services depend on Peripheral Libraries and or Drivers. Your application or its middleware will typically use drivers or system services.
- 3. Add the required Module Source Files to your Project:** This can be accomplished by reading the help for each module to determine what source files you need and manually entering them into your project. Alternatively, the MPLAB Harmony Configurator can be used to select the modules from a list or tree and it will automatically insert the source files into your project and optionally generate a skeletal template for your project. Note that some modules have multiple implementations each optimized for different purposes. Others may implement optional features in multiple files. Be sure to select the source file right for your implementation and be sure to include the pre-built peripheral library binary ".a" file for the processor you selected in your project.
- 4. Configure The Modules:** With the exceptions of the Peripheral Libraries, every MPLAB Harmony module will require some set of build time configuration options implemented using 'c' language macros '#define'. Descriptions of the supported options are available in the "Configuring the Library" section in the help document for every MPLAB Harmony library. These options must be defined in the system_config.h header that is part of your project template generated by the MPLAB Harmony Configurator. Every MPLAB Harmony source file that supports build time configuration options will include this header. As such, this file must be part of every MPLAB Harmony Project.
- 5. Initialize System:** This task involves completing the system_init.c file. First add the necessary configuration bits for your processor. These are defined in the Special Features section of your device's data sheet. The next step is to complete the [SYS_Initialize](#) function. Finish any necessary processor initialization (wait states, cache control, etc.) MPLAB Harmony may provide services to accomplish this in the System Services Module. Initialize any features specific to the board that are not initialized by other modules such as drivers or system services. Next, initialize all library modules selected in step 2 above used by your application. To do this you must first define the initialization data structure for each module. This can be done statically in the system_init.c file and passed in by pointer to the appropriate initialization function for each library. Needed initialization structures can be found in the help section for each module. Add a call to the initialization function for each library module into the [SYS_Initialize](#) function. Each initialization function will return an object handle for the module instance. These should be captured so that they can be passed to the module task routine. Finally, add the call to APP_Initialize function into the [SYS_Initialize](#) function.
- 6. Call System State Machine Tasks:** The system must call the various task state machine functions at appropriate times. This is accomplished by either adding the call into the [SYS_Tasks](#) function for polled modules or adding the call to the interrupt handler for interrupt driven modules. The object handle saved during the initialization process is used as an argument for the various task state machine functions. The [SYS_Tasks](#) function is typically implemented in the system_tasks.c file while the interrupt handlers are defined in the system_int.c file.

7. **Develop Application State Machine:** You are now ready to develop your application. Since Harmony is based on cooperative state machines, your application should also be state machine driven. At minimum, the APP_Initialize function must put your application in its initial state. It may perform other initialization as long as it does not have to wait for other modules. Any initialization that depends on other modules should be implemented as part of the application state machine. Finally, complete your application functionality by implementing the APP_Tasks state machine function.

1.3 3. Release Notes & Information

This section contains release notes for this release and information on version numbers and release types.

1.3.1 Release Notes

Release notes for MPLAB Harmony v0.70b. Target Release Date: November 18, 2013.

Description

Please refer to [Release Contents](#) for a complete list of modules that are provided in this release.

MPLAB Harmony is a framework of system services, device drivers, and other libraries that are built upon a base of portable peripheral libraries to provide flexible, portable, and consistent software “building blocks” which you can use to develop your embedded PIC32 applications.

This is the first fully public release of MPLAB Harmony. Previous releases were internal to Microchip and had very limited external distribution.

A complete list of the contents of this release is provided in the [Release Contents](#) section. You can find these contents under the installation folder you selected in the following sub-folders:

- “apps” – Contains all demo and example applications provide with this installation.
- “bin” – Contains pre-built binary libraries (“.a” files) for the MPLAB Harmony peripheral libraries for each supported processor and for key libraries provided in binary form.
- “bsp” – Contains MPLAB Harmony board support packages provided for selected Microchip demo and development boards.
- “build” – Provides MPLAB X IDE projects that you can use to re-build the libraries provide under the “bin” folder (in case you want to use different build settings).
- “doc” – Contains the MPLAB Harmony help documentation in PDF and MPLAB X IDE “.nbm” plug-in formats.
- “framework” – Contains source code and API headers for all MPLAB Harmony libraries that are provided in source form.
- “third_party” – Contains MPLAB Harmony compatible libraries and Real-Time Operating Systems (RTOS) provided with this installation.
- “utilities” – Contains design and development utilities and MPLAB X IDE plug-in utilities provided with MPLAB Harmony.

Please review the following key help topics (and their subtopics) to gain an initial understanding of what MPLAB Harmony is and how to use it.

- Start Here > First Time Users
- [Start Here > Creating your Own Applications](#)
- [MPLAB Harmony Configurator Help](#)
- The “Introduction” sections of the individual help topics for the system services, drivers, and libraries that are of interest to you
- [Applications Help > Applications Overview](#)
- The “Introduction” sections of the individual applications help topics

Once you have a basic understanding of MPLAB Harmony, you can begin using the provided demo and example applications to explore it's capabilities and begin developing your own applications.

Before developing your own applications, be sure to look at the example “template” application provided in the “<install-dir>/apps/examples/templates” folder.

The following sections provide a brief overview of items that are new in this release and known issues at the time of the release. Refer to the “Release Notes” section under the help topic for each individual library, application, or utility for additional details.

Refer to the “Using the Library” section for each individual library for a description of how to use library functions to accomplish the tasks that the library was intended to support.

Refer to the “Library Interface” section for each individual library for a programmer’s reference or dictionary of functions and data types defined by that library’s interface.

New This Release:

- Significant SD Card Driver improvements.
- The SPI driver has had configuration and interoperability improvements.
- The NVM driver now handles sector erasing during writes.
- USB Driver demonstrations
- TCP/IP Stack updates (see the TCP/IP Stack Library Help)
- Graphics Library API has been updated
- File System Service Library has been updated
- The following System Services have been added: Clock and Device Control
- USART Driver has been updated
- USB Driver has been updated
- Peripheral Libraries now support PIC32MZ devices
- FreeRTOS now supports PIC32MZ devices
- CyaSSL Library has been added

Known Issues:

- The SD Card driver has had limited testing and is missing a few desired features
- The SPI driver does not support slave mode or DMA
- The NVM driver has only been tested in it’s current memory configuration
- NVM Driver demonstration has limited testing
- SPI Driver demonstration has limited testing and hardware support
- USART Driver demonstration does not support PIC32MZ devices
- USB demonstrations (see the related [Release Notes](#))
- USB Host Stack has limited testing and functional limitations (see the related [Release Notes](#))
- USB Device Stack has limited testing and functional limitations (see the related [Release Notes](#))
- No multi-display support for the Graphics Primitive Library
- File System Service Library does not support MIP16 mode, has limited testing and functional limitations (see the related [Release Notes](#))
- USART Driver has flow control and parity mode limitations and no multi-client support
- MRF24W Wi-Fi Driver Library has limited demonstration support and testing (see the related [Release Notes](#))

1.3.2 Release Contents

This topic lists the contents of this release and identifies the individual version numbers of each module.

Description

This table lists the contents of this release, including a brief description of each module.

Cryptographic Applications: <install-root>/apps/crypto/		
Crypto Demonstration	Crypto Library Demonstration	1.00
Example Applications: <install-root>/apps/examples/		
peripheral/blocking/pic32mz	Simple blocking PLIB examples.	1.00
peripheral/blocking/pic32mx	Simple blocking PLIB examples	1.00
state_driven	Simple MPLAB Harmony compliant state-driven Peripheral Library examples	1.00
sample	Sample "Hello World" demonstration used in "Getting Started" guide in Help system	N/A
DEMOS: Driver Application demos: <install-root>/apps/driver/		
nvm demo	NVM demonstration application	1.00
usart demo	USART demonstration application	1.00
spi demo	SPI demonstration application	1.00
DEMOS : RTOS Application demos: <install-root>/apps/rtos/		
freertos	FreeRTOS demonstration application	1.00
openrtos	OpenRTOS demonstration application	1.00
File System Applications: <install-root>/apps/fs/		
nvm_fat_single_disk	Single-disk Non-Volatile Memory FAT FS Demonstration	1.00
nvm_sdcard_fat_multi_disk	Multi-disk Non-Volatile Memory FAT FS Demonstration	1.00
sdcard_fat_single_disk	SD Card FAT Disk demonstration	1.00
nvm_mpfs_single_disk	Single-disk Non-Volatile Memory	1.00
nvm_sdcard_fat_mpfs_multi_disk	Multi-disk Non-Volatile Memory FAT MPFS Demostration	1.00
DEMOS: Graphics Applications: <install-root>/apps/gfx/		
lcc	Low-Cost Controllerless Graphics Demonstration	4.00b
object	Graphics Object Layer Demonstration	4.00b
primitive	Graphics Primitives Layer Demonstration	4.00b
s1d13517	Epson S1D13517 LCD Controller Demonstration	4.00b
ssd1926	Solomon Systech SSD1926 Controller Demonstration	4.00b

DEMOS: TCP/IP Applications & Utilities: <install-root>/apps/tcpip/		
tcpip_web_server	TCP/IP Web Server Demonstration	1.01
bsd_tcp_server	TCP/IP BSD Server Demonstration	1.00
bsd_tcp_client	TCP/IP BSD Client Demonstration	1.00
bsd_udp_server	TCP/IP BSD Server Demonstration	1.00
bsd_udp_client	TCP/IP BSD Client Demonstration	1.00
tcpip_tcp_server	TCP/IP TCP Server Demonstration	1.00
tcpip_tcp_client	TCP/IP TCP Client Demonstration	1.00
tcpip_udp_server	TCP/IP UDP Server Demonstration	1.00
tcpip_udp_client	TCP/IP UDP Client Demonstration	1.00
wolf_ssl	wolf ssl Demonstration	1.00
wifi_console	TCP/IP Wi-Fi Console Demonstration	
wifi_easyconf	TCP/IP Wi-Fi Easy Configuration Demonstration	
DEMOS: USB Device (Function) Applications: <install-root>/apps/usb/device/		
audio_speaker	USB Audio Device Speaker Demonstration	1.00
cdc_com_port_dual	CDC Dual Serial COM Ports Emulation Demonstration	1.00
cdc_com_port_single	CDC Single Serial COM Port Emulation Demonstration	1.00
generic_device	Microchip Generic USB Device Demonstration	1.00
hid_basic	Basic USB Human Interface Device (HID) Demonstration	1.00
hid_joystick	USB HID-Class Joystick Device Demonstration	1.00
hid_keyboard	USB HID-Class Keyboard Device Demonstration	1.00
hid_mouse	USB HID-Class Mouse Device Demonstration	1.00
msd_basic	USB Mass Storage Device Demonstration	1.00
cdc_serial_emulator	CDC Serial Emulation Demonstration	1.00
DEMOS: USB Host Applications: <install-root>/apps/usb/host/		
msd_simple_thumb_drive	USB MSD Host Simple Thumb Drive Demonstration	1.00
cdc_basic	USB CDC Basic Demonstration	1.00
cdc_serial	USB CDC Serial Demonstration	1.00
hid_keyboard	USB HID-Class Joystick Host Demonstration	1.00
hid_mouse	USB HID-Class Mouse Host Demonstration	1.00
generic_device	Microchip Generic USB Host Demonstration	1.00
Pre-built Binaries: <install-root>/bin/		
framework/peripheral	Pre-built Peripheral Libraries	1.00
framework/math/dsp	Pre-built DSP libraries for PIC32MZ devices	1.00
framework/math/libq	Pre-built fixed-point math libraries for PIC32MZ devices	1.00

Board Support Packages (BSPs): <install-root>/bsp/		
explorer16/pic32mx795f512l	Explorer 16 Development Board and PIC32MX795F512L PIM	1.00
sk_pic32_mx_usb	PIC32 USB Starter Kit	1.00
sk_pic32_mz	PIC32MZ Embedded Connectivity (EC) Starter Kit	1.00
usb_audio_pic32mx	PIC32 USB Starter Kit II	1.00
gfx	Graphics (GFX) boards	1.00
Documentation: <install-root>/doc		
doc/org-microchip-harmony_help.nbm	MPLAB Harmony Help MPLAB X IDE Plug-In	0.70b
doc/harmony_help.pdf	MPLAB Harmony Help	0.70b
Middleware & Libraries: <install-root>/framework/		
Crypto (Software)	Microchip Cryptographic Libraries	1.00
GFX	Graphics Library	4.00b
MATH/DSP	API header for PIC32MZ DSP Libraries	1.00
MATH/LIBQ	API header for PIC32MX fixed-point libraries	1.00
AAC/MP3	Audio Decoder Libraries	1.00
TCP/IP	TCP/IP Network Stack	7.10
USB Host	USB Host Stack	0.02b
USB Device	USB Device Stack	0.05b
Device Drivers: <install-root>/framework/driver/		
adc	Analog-to-Digital Converter Driver	0.01b
ethmac	Ethernet Media Access Controller Driver	7.10
ethphy	Ethernet Physical Interface Driver	7.10
gfx/gfx_lcc	Low-Cost Controllerless Graphics Driver	4.00b
gfx/gfx_otm2201a	OTM LCD Controller Driver	4.00b
gfx/gfx_s1d13517	Epson S1D13517 LCD Controller Driver	4.00b
gfx/gfx_ssd1926	Solomon Systech SSD1926 Controller Driver	4.00b
nvm	Non-Volatile Memory Driver	0.50b
pmp	Parallel Master Port Driver	0.50b
sdcard	SD Card Driver (Client of SPI Driver)	0.50b
spi	Serial Peripheral Interface (SPI) Driver	0.50b
tmr	Timer Driver	0.50b
usart	Universal Synchronous/Asynchronous Receiver/Transmitter (USART) Driver	0.50b
usb/usbhs	Universal Serial Bus (USB) Controller Driver	0.05b
wifi/mrf24w	Wi-Fi MAC driver for the MRF24W controller	3.0.0

Operating System Abstraction Layer (OSAL): <install-root>/framework/osal		
osal.h	OSAL Interface	0.52b
osal_freertos.h osal_freertos.c	OSAL Implementation for FreeRTOS	0.52b
osal_openrtos.h osal_openrtos.c	OSAL Implementation for OpenRTOS	0.52b
osal_impl_basic.h	OSAL “bare metal” (no OS) implementation	0.52b
osal_imple_none.h	OSAL implementation that removes the OSAL when not used	0.52b
osal_ucos3.h osal_ucos3.c	OSAL Implementation for Micrium μ COS-III	0.52b
osal_ucos2.h osal_ucos2.c	OSAL Implementation for Micrium μ COS-II	N/A
osal_threadx.h	OSAL Implementation for Express Logic ThreadX	N/A
osal_threadx.c		N/A
Peripheral Libraries: <install-root>/		
framework/peripheral	Peripheral Library Source Code for all Supported PIC32 Processors	0.70b
Build Framework: <install-root>/build/framework/

tmr	Software Timer Services Library	0.02a
wdt	Watchdog Timer Services Library	0.02b
Third-Party Software: <install-root>/third_party/		

rtos/FreeRTOSV7.5.2	FreeRTOS Source Distribution v7.5 with support for PIC32MZ devices	Yes (Vendor Version)
rtos/FreeRTOSVX.XX.XX	FreeRTOS Source Distribution v7.5 with support for PIC32MX devices	Yes (Vendor Version)
rtos/OpenRTOSVx.x.x	OpenRTOS Source Distribution vx.x.x with support for PIC32MZ devices	Yes (Vendor Version)
rtos/OpenRTOSVx.x.x	OpenRTOS Source Distribution vx.x.x with support for PIC32MX devices	Yes (Vendor Version)
uC/OS-III	Micrium uC/OS-III Binary Demonstration with support for PIC32MZ devices	Yes (Vendor Version)
uC/OS-III	Micrium uC/OS-III Binary Demonstration with support for PIC32MX devices	Maybe (Vendor Version)
uC/OS-II	Micrium uC/OS-II Binary Demonstration (PIC32MZ)	
uC/OS-II	Micrium uC/OS-II Binary Demonstration (PIC32MX)	
ThreadX	Express Logic (ThreadX) Demonstration with Support for PIC32MZ devices	
CyaSSL Embedded SSL Library	Open Source based demonstration	2.8.0 (Vendor Version)
CyaSSL Embedded SSL Library	Open Source based demonstration	Yes (Vendor Version)
InterNiche Technologies, Inc.	Suitable TCP/IP demonstrations	Yes (Vendor Version)
Utilities: <install-root>/utilities/		
MPLAB Configurator	MPLAB Harmony Project/Library Configurator MPLAB X IDE Plug-In	0.02a
gfx/gdd	Graphics Display Designer	2.00b
gfx/grc	Graphics Resource Compiler	4.00.39
mib2bib/mib2bib.jar	Compiles Custom Microchip MIB script (snmp.mib) to generate snmp.bib and mib.h	2.00
mpfs_generator/mpfs2.jar	TCP/IP MPFS File Generator and Upload Utility	2.02.06
tcpip_discoverer/tcpip_discoverer.jar	TCP/IP Microchip Node Discoverer Utility	2.00

1.3.3 Version Numbers

This section describes the version numbers and their meaning.

Description

MPLAB Harmony Version Numbering Scheme

Libraries released with MPLAB Harmony each have their own version number, using the following scheme.

<major>.<minor>[.<"dot">][<release type>]

- Major revision (architecture or paradigm shift)
- Minor revision (new features, regular releases)
- "Dot" release (bug fixes, unscheduled releases)
- Release Type ('a' = alpha, 'b' = beta, Full release versions 1.0 or above have no type letter)

Items in square brackets are only present when needed (see examples, below).

Examples:

- MPLAB Harmony USB Library v2.6 ("dot" of '0' implied)
- MPLAB Harmony Graphics Library v1.12.02

Note: The version number of the over all MPLAB Harmony release is not related to the version numbers of each individual library or module included in the release and has no bearing on the versions of any libraries it includes. It is merely a way to keep track of what libraries (and what versions of what libraries) are included in each release. Refer to the current release notes to identify what libraries are included and what their version numbers are.

1.3.4 Release Types

This section describes the release types and their meaning.

Description

MPLAB Harmony module releases can be of three different types, based on the version type.

Alpha Release

An alpha release version of a module is usually an initial release. Alpha releases will have complete implementations of their basic feature set, they are unit tested (usually by the original developer) and will build correctly in their basic configuration. An

alpha release is a great "preview" of what a new development Microchip is working on and it can be very helpful for exploring new features. However, it has not gone through a formal test process and it is almost certain that some of its interface will change before the full version is released. It is not recommended for production use.

Beta Release

A beta release version of a module has gone through the internal interface review process and has had formal testing of its functionality. Also, issues reported from the alpha release will have been fixed or documented. When a module is in a beta version, you can expect it to function correctly in normal circumstances and you can expect that its interface is very close to the final form (although changes can still be made if required). However, it has not had stress testing or been tested and it may not fail gracefully if used incorrectly. A beta release is not recommended for production use, but it can be used for development.

1.0+ Release

By the time a module is released as a 1.0 version or above, it is feature complete, fully tested, and its interface is "frozen". All known issues from previous releases will have been fixed or documented. The existing interface will not change in future releases. It may be expanded with additional features and additional interface functions, but existing interface functions will not change. This is stable code with a stable Application Program Interface (API) that you can rely on for production purposes.

1.4 4. Previous Releases

This topic contains information about past version(s) of MPLAB Harmony.

1.4.1 v0.51.03b

Release notes for MPLAB Harmony v0.51.03b.

Description

This topic contains the release notes for MPLAB Harmony v0.51.03b. Please refer to the [Release Contents](#) topic for a complete list modules that are provided in this release.

This release will support MPLAB X IDE v1.95 and XC32 v1.30 tc9 and above.

New this Release

- Updated the Documentation
- Updated Peripheral Pre-Built Binary Libraries (".a" files)
- Added IPv6 API for generation of the Unique Local Address (ULA)

Known Issues

1. No documentation available for the Crypto libraries and peripheral libraries example applications.
2. For TCP/IP stack running on PIC32MZ platforms the write-back mode is not supported yet. Write-through has to be used for now.
3. Early samples of the PIC32MZ silicon do not have a factory pre-programmed MAC address. This will cause the TCP/IP stack and related applications to not properly run in most network configuration. Manual update of the related "network_config.h" file with a valid MAC address is required.
4. The Wi-Fi driver for the TCP/IP stack and the supporting demos are not part of this release.

This table lists the contents of this release, gives a brief description

Module			Description	Version
File	System	Applications:		
<install-root>/apps/fs/				
nvm_fat_single_disk			Single-disk Non-Volatile Memory FAT FS Demonstration	0.02a
nvm_sdcard_fat_multi_disk			Multi-disk Non-Volatile Memory FAT FS Demonstration	0.02a
sdcard_fat_single_disk			SD-Card FAT Disk Demonstration	0.02a
nvm_mpfs_single_disk			Single-disk Non-Volatile Memory MPFS Demonstration	0.02a
nvm_sdcard_fat_mpfs_multi_disk			Multi-disk Non-Volatile Memory FAT MPFS Demonstration	0.02a
Graphics		Applications:		
<install-root>/apps/gfx/				
lcc			Low-Cost Controllerless Graphics Demonstration	0.51b
object			Graphics Object Layer Demonstration	0.51b

primitive	Graphics Primitives Layer Demonstration	0.51b
ssd1926	Solomon Systech SSD1926 Controller Demonstration	0.51b
TCP/IP Applications & Utilities: <install-root>/apps/tcpip/		
tcpip_web_server	TCPIP Web Server Demonstration	7.02a
utilities/mpfs_generator/mpfs2.jar	TCP/IP MPFS File Generator and Upload Utility	2.2.5
utilities/tcpip_discoverer/tcpip_discoverer.jar	TCP/IP Microchip Node Discoverer Utility	2.0
utilities/mib2bib/mib2bib.jar	Compiles Custom Microchip MIB script (snmp.mib) to generate snmp.bib and mib.h	2.0
USB Device (Function) Applications: <install-root>/apps/usb/device/		
audio_speaker	USB Audio Device - Speaker Demonstration	0.51b
cdc_com_port_dual	CDC Dual Serial COM Ports Emulation Demonstration	0.51b
cdc_com_port_single	CDC Single Serial COM Ports Emulation Demonstration	0.51b
generic_device	Generic USB Device Demonstration	0.51b
hid_basic	USB Human Interface Device (HID) Demonstration	0.51b
hid_joystick	USB HID Joystick Device Demonstration	0.51b
hid_keyboard	USB HID Keyboard Device Demonstration	0.51b
hid_mouse	USB HID Mouse Device Demonstration	0.51b
msd_basic	USB Mass Storage Device Demonstration	0.51b
USB Host Applications: <install-root>/apps/usb/host/		
cdc_serial	USB CDC Host Demonstration	0.51b
Crypto Applications: <install-root>/apps/		
crypto	Wolf SSL Cryptographic Demonstration	0.01a
PIC32MZ Applications: <install-root>/apps/		
pic32mz	PIC32MZ Device Demonstration	0.51.01b
Example Applications: <install-root>/apps/examples		
peripheral	Peripheral Demonstration	0.51b
sample	Sample Demonstration	0.51b
Board Support Packages (BSPs): <install-root>/bsp/		
explorer16/pic32mx795f512l	Explorer 16 Development Board and PIC32MX795F512L PIM	
pic32_sk/pic32_usb_sk	PIC32 USB Starter Kit	
pic32_sk/pic32mz_sk	PIC32MZ Starter Kit	
pic32mx_usb_audio	PIC32 USB Digital Audio Accessory Board	
Third Party Software: <install-root>/third_party/		
rtos/FreeRTOSV7.5.0	FreeRTOS Source Distribution v7.5.0	7.5.0
Middleware: <install-root>/framework/		

gfx	Graphics Library	0.51b
tcpip	TCP/IP Network Stack	7.02a
usb	USB Host & Device Stack	0.51b
Crypto Library: <install-root>/framework/		
crypto	Wolf SSL Cryptographic Libraries	0.01a
System Services: <install-root>/framework/system/		
clk	Clock Services Library	0.03a
debug	Debug Services Library	0.01a
fs	File System Services Library	0.02a
int	Interrupt Services Library	0.03a
msg	Message Services Library	0.01a
ports	Input-Output Ports Services Library	0.01a
reset	System Reset Services Library	0.01a
tmr	Software Timer Services Library	0.01a
wdt	Watchdog Timer Services Library	0.01a
Device Drivers: <install-root>/framework/driver/		
adc	Analog-to-Digital Converter Driver	0.01a
ethmac	Ethernet Media Access Controller Driver	0.03a
ethphy	Ethernet Physical Interface Driver	0.03a
gfx/gfx_lcc	Low-Cost Controllerless Graphics Driver	0.51b
gfx/gfx_s1d13517	Epson S1D13517 LCD Controller Driver	0.51b
gfx/gfx_ssd1926	Solomon Systech SSD1926 Controller Driver	0.51b
nvm	Non-Volatile Memory Driver	0.01a
pmp	Parallel Master Port Driver	0.01a
sdcard	SD Card Driver (Client of SPI Driver)	0.01a
spi	Serial Peripheral Interface (SPI) Driver	0.01a
tmr	Timer Driver	0.01a
uart	Universal Synchronous/Asynchronous Receiver/Transmitter (USART) Driver	0.01a
usb	Universal Serial Bus (USB) Controller Driver	0.51b
usbhs	Hi-Speed USB Controller Driver	0.51b
wifi	Wi-Fi Driver	0.01a
Peripheral Libraries (PLIBs): <install-root>/		
framework/peripheral	Peripheral Library Source Code	0.51b
bin/framework/peripheral	Peripheral Pre-Built Binary Libraries for all PIC32 Processors	0.51b
build/framework/peripheral	Project used for Peripheral Library Prebuilt Binary Libraries Creation	0.51b

Operating System Abstraction Layer (OSAL): <install-root>/framework/osal/		
osal.h osal.c	OSAL interface	0.51b
osal_impl_none.h	OSAL implementation that removes the OSAL when not used	0.51b
osal_impl_basic.h	OSAL "bare metal" (no OS) implemenrtation	0.51b
osal_freertos.h osal_freertos.c	OSAL implementation for FreeRTOS	0.51b
osal_ucos.h osal_ucos.c	OSAL implementation for Micrium uCOS-III	0.51b

1.5 5. Tips and Tricks

This topic provides a few helpful tips and tricks to keep in mind while developing your MPLAB Harmony projects.

Description

You may find the following MPLAB Harmony "tips" and "tricks" helpful when developing your own MPLAB Harmony projects.

1. After creating a new MPLAB X IDE project, use the project wizard to add MPLAB Harmony libraries to your project and create a set of initial files for your project. After that, your job is to ensure that the necessary initialization and configuration data and definitions are in place and to write your own application.
2. You can use MPLAB Harmony example and demo projects to put together a "first approximation" of your application.
 1. Copy the source files from the various example or demo apps to your project.
 2. Rename the "APP_Initialize" and "APP_Tasks" functions so that they are all different and will build in your application by simply appending a descriptive name to the end of the existing function names. (Note: you may also need to rename any global data "objects" that conflict with each other from the examples).
 3. Call the individual "APP_Initialize<new_name>" and "APP_Tasks<new_name>" functions from the "[SYS_Initialize](#)" and "[SYS_Tasks](#)" functions in your application's configuration files.
 4. Use the project wizard to add any required drivers, services, or middleware.
 5. At this point, you now have your application made out of several independent state machines. Now, you can begin to develop your own custom application code and modifying any of the code copied from the provided applications to behave as you desire.

1.6 6. Glossary

This section contains a glossary of general MPLAB Harmony terms.

Description

Glossary of Harmony Terms

Term	Definition
Application	One or more application modules define the over all behavior of an MPLAB Harmony system. Applications are either demonstrations or examples provided with the installation or are implemented by you, using MPLAB Harmony libraries to accomplish a desired task.
Client	A client module is any module that uses the services (calls the interface functions) of another module.
Configuration	An MPLAB Harmony configuration consists of static definitions (C-language "#define" statements), executable source code, and other definitions in a set of files that are necessary to create a working MPLAB Harmony system. (See Start Here for additional information.)
Configuration Options	Configuration options are the specific set of "#define" statements that are required by any specific MPLAB Harmony library to specify certain parameters (such as buffer sizes, minimum and maximum values, etc.) build that library. Configuration options are defined in the "system_config.h" system-wide configuration header.
Driver	A "driver" (AKA device driver) is an MPLAB Harmony software module designed to control and provide access to a specific peripheral, either built into the microcontroller or external to it.
Driver Index	Dynamic MPLAB Harmony drivers (and other dynamic modules) can manage the more than one instance of the peripheral (and other resources) that they control. The "driver index" is a static index number (0, 1, 2,...) that identifies which instance of the driver is to be used. Note: The driver index is not necessarily identical to the peripheral index. The association between these two is made when the driver is initialized.
Driver Instance	An instance of a driver (or other module) consists of a complete set of the memory (and other resources) controlled by the driver's code. Selection of which set of resources to control is made using a driver index. Note: Even though there may be multiple instances of the resources managed by a dynamic driver, there is only ever one instance of the actual object code. However, static drivers always maintain a 1:1 relationship between resource and code instances.
Framework	The MPLAB Harmony framework consists of a set of libraries (and the rules and conventions used to create those libraries) that can be used to create MPLAB Harmony systems.
Initialization Overrides	Initialization overrides are configuration options that can be defined to statically override (at build time) parameters that are normally passed into the "Initialize" function of a driver or other MPLAB Harmony module. This mechanism allows you to statically initialize a module, instead of dynamically initializing the module.
Interface	The interface to a module is the set of functions, data types, and other definitions that must be used to interact with that module.
Middleware	The term "middleware" is used to describe any software that fits between the application and the device drivers within an MPLAB Harmony system. It is something of a catch all term that is loosely used to describe libraries that use drivers to access peripheral and then implement communication protocols (such as TCP/IP, USB protocols, and graphics image processing) and other more complex processing that is required to use certain peripherals, but is not properly part of controlling the peripheral itself.
Module	An MPLAB Harmony software module is a closely related group of functions controlling a related set of resources (memory and registers) that can be initialized and maintained by the system. Most MPLAB Harmony modules provide an interface for client interaction. However, "headless" modules with no interface are possible.

Peripheral Index	A peripheral index is a static label (usually an C-language "enum" value) that is used to identify a specific instance of a peripheral. Note: Unlike a driver index, which always starts at '0', a peripheral index may be internally represented as any number, letter, or even a base address and the user should not rely on the value itself - only the label.
Peripheral Instance	An instance of a peripheral is a complete set of the registers (and internal physical resources) necessary to provide the core functionality of a given type of peripheral (either built into the microcontroller or external to it). Note: A specific peripheral instance is identified using a peripheral index.
System	An MPLAB Harmony system is a complete set of libraries, applications, and configuration items loaded and executing on a specific hardware platform (microcontroller, board, and external peripherals) or the source items necessary to build such a system. Note: Since a system can multiple configurations, one MPLAB Harmony project may support multiple systems through multiple supported configurations. See the demo applications included in the installation for examples.
System Service	A system service is an MPLAB Harmony module that provides access to and/or control of common system resources (memory and registers) with which other modules (drivers, middleware, libraries and application) may interact. Note: System services, much like drivers, manage sharing of resources so as to avoid conflicts between modules that would otherwise occur if each module attempted to manage the share resource itself. But, unlike drivers, system services do not normally need to be "opened" in order to use them.

2 MPLAB Harmony Configurator Help

2.1 MPLAB Harmony Configurator

2.1.1 Introduction

This topic provides an overview of the MPLAB Harmony Configurator.

Description

The MPLAB Harmony Configurator is a MPLAB X IDE plug-in. It must be installed into your MPLAB X IDE installation to be used.

2.1.2 Release Notes

MPLAB Harmony Version: v0.70b **Release Date:** 18Nov2013

Description

=====

Version 0.02a

MPLAB Harmony Configurator Plug-in

November 2013

=====

Operating System Support

MPLAB Harmony Configurator Plug-in was tested on the following operating systems:.

- Windows XP SP3 and Windows 7
- Linux OS - Ubuntu
- Mac OS v8

Supported Features:

- Provides a simple hierarchical way for users to select the MPLAB Harmony modules to be used in the project and adds the selected module source files with the necessary configuration and project settings (include path) into the created MPLAB X IDE project.
- Supports importing project related files from relative path.
- Adds predefined source and header template files to the MPLAB X IDE project.
- Library Configuration is supported only for the TCP/IP and USB libraries.

Unsupported Features:

- System-related API calls are not added automatically to the system_init.c, main.c, and system_tasks.c files. Only the standard C templates are added to the project. The application code must be added by the user in the application source and header

files for a successful compilation of the project.

- Library Configuration is not supported for the Graphics library, OSAL, Drivers and Third-Party libraries. However, the corresponding source and header files of the selected modules could be added to the created MPLAB X IDE project using this Configurator.

Notes for Users:

1. The terms "MPLAB Configurator" and "MPLAB Configuration Wizard" are used interchangeably throughout the MPLAB Harmony Help.
2. Check for "TODO" tags that are placed in added template files for directions on what sections in the code should be modified or code to be added by the user. Look for `system_config.h`, `system_init.c`, `system_int.c`, `system_tasks.c`, `app.c`, `app.h`, and `main.c` files.

Known Issues:

- The Configurator Plug-in generated template files are stored in the MPLAB X IDE project folder (inside the `MPLABX_Project.X` folder). Users need to add the current directory `'.'` Path in the MPLAB X Project "properties" > gcc > "include path settings" for removing "the template file not found error".
- The created project may compile but not work, as application and system related API calls are not added automatically to the `system_init.c`, `main.c` and `system_tasks.c`. Only the standard C templates are added to the project.
- The MPLAB Harmony Configurator version during installation or in the plug-in description is shown as 0.0.2 where as the actual version of the tool is "0.02a".
- Certain TCP/IP configuration files are getting modified from the default MPLAB Harmony installation directory if the TCP/IP stack is configured using the Configurator. It is recommended to backup these default configuration files: `tcpip_config.h`, `http_config.h`, `snmp_config.h`, `ssl_config.h`, and `telnet_config.h`, in case it is necessary to revert back to the default configuration.
- TCPIP `system_config.h` file is not modified in this release of the Configurator to add the configurations from `"* <tcpip module> *_config.h"`. As explained above, the specific module files get updated.
- The Configurator is not preserving the previous project configuration if the TCP/IP sub-modules are selected using the 'Select to add default modules' checkbox in the "TCPIP Stack -> tcpip" module tree.
- Warning message about 'template files getting overwritten (if already present)' is not shown if the USB library configuration is selected.

2.1.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

2.2 Using the Configurator

2.2.1 Installing the Configurator Plug-in

The MPLAB Harmony Configurator is a MPLAB X IDE plug-in. It must be installed into your MPLAB X IDE installation to be used.

Description

Location

The MPLAB Harmony Configurator (MPLAB X IDE plug-in) is located in the following folder in the MPLAB Harmony installation.

<install_root>\utilities\configurator\com-microchip-harmonyconfigurator.nbm

Installation

1. Start MPLAB X IDE and select "Plugins" from the "Tools" menu as shown below.

2. Select the "Downloaded" tab.
3. Click the "Add Plugins..." button, browse to <install_root>\utilities\configurator\ and open the plug in file "com-microchip-harmonyconfigurator.nbm" as shown below

4. Ensure that the Check box for the "MPLAB Harmony Configurator" plug-in is selected. Click "Install" as shown below.

5. Follow the prompts from the installation wizard and continue until the installation completes. Just click "continue". Once the installation wizard has finished you can close the "Plugins" dialog box.

You should now see a "MPLAB Harmony Configurator" option under the "Tools" menu. This indicates that the project wizard was successfully installed.

2.2.2 Running the Configurator Plug-in

This session describes how to run the MPLAB Harmony Configurator to add required files from selected modules into MPLAB X IDE project.

Note: This version of the Configurator provides Project Configuration (to add files into MPLAB X IDE project) and limited Library Configuration (only for configuring a few sub-modules of the TCP/IP and USB middleware) capability.

Description

1. To run the Configurator, select "MPLAB Harmony Configurator" from the "Tools" menu.
2. Browse to the root installation folder of the version of MPLAB Harmony that you're using. This folder must contain "manifest.xml". This file has the information and the path of various software modules available in the installed MPLAB Harmony version. manifest.xml file should not be moved or deleted from Root directory. Click "Next" when the root path is set.

Note: It is recommended that you create and maintain your MPLAB X IDE project under a subdirectory of the "<install_root>/apps" folder and use a relative path to this project.

3. In the Left-hand pane of the "Select Modules and Configurations" dialog, select the desired modules and respective sub-modules. The right-hand pane shows a brief introduction of the selected module. Click "Next" when the required modules for the project are selected.

The tool has two configuration sections.

- **Project Configuration:** All the required modules and Sub modules could be selected here. The respective files would be added into the MPLAB X IDE project. (example: Graphics, TCP/IP, USB CDC, USB HID selection)
- **Library Configuration:** The individual configuration of each module could be done here. (Configuration for selected module from the selected section.)

If the user is required to add their custom module into the MPLAB Harmony directory structure and add the files into the project through Configurator, the manifest.xml should be modified to accommodate the custom module files. This would allow the Project Configurator to add the files to the MPLAB X IDE project from the manifest.xml for the custom module. This would not provide custom configuration capability, however the files can be added to the MPLAB X IDE project.

4. If there are any XML modifications those can be reflected by reloading the tree. To reload the project tree structure, right-click on "harmony" tree node and click "Reload Tree".

5. To get back to default project configuration of MPLAB Harmony, right-click on "harmony" tree node and click "Load default".

Note: Next window pane is for individual library (Modules and Sub modules) configuration. Currently only TCP/IP and USB library configuration is supported.

Though all the sub-modules of TCP/IP can be enabled or disabled through project configuration window pane, the individual sub module configuration is supported only for HTTP, SSL, SNMP and Telnet server. For USB, only CDC and HID class configuration basic support is provided.

Library Configuration

1. In the "Project configuration" pane, to configure USB CDC select the respective modules and click "Next". Next window pane is Library Configuration window as shown below. Configure USB CDC as required, click "Next".

2. In the "Application Template" pane, select the "Include application template" check box and select "Finish" to add the module files and template files to the MPLAB X IDE project.

Note: The generate project may compile for PIC32MZ devices, but not necessarily work on the hardware.

The set of template files added to the MPLAB X IDE project would require to be modified with additional configuration information and the custom application code.

Later versions of the configuration tool may provide additional configuration options and sample application code for each library, to create a executable project.

2.2.3 Tutorial

This tutorial explains about creating a new MPLAB X IDE project and configuring this project using the MPLAB Harmony Configurator. The tutorial provides step by step instructions on how to create a MPLAB X IDE project for the TCP/IP Stack.

Description

This tutorial explains about creating a MPLAB X IDE project for TCP/IP library by adding required configurations and TCP/IP library files, template files and Peripheral Library modules to the selected MPLAB X IDE project using the Configurator.

In this tutorial user would,

1. Create a new project in MPLAB X IDE.
2. Add required source and header files with required configurations for TCP/IP application using MPLAB Harmony Configurator to the MPLAB X IDE project.
3. Add the required Peripheral header files and template files to the MPLAB X IDE project.

Creating an MPLAB X IDE Project

1. Open MPLAB X IDE, and select File > New Project to open a project explorer window.
2. In Categories, select "Microchip Embedded" and in Projects, select "Standalone Project". Click Next.

3. Select the PIC device.

4. Select optional Debug Header. Click Next.

5. Select a hardware tool and Click Next.

6. Select the appropriate compiler. Click Next.

7. Name the MPLAB X IDE project and specify its path.

For this tutorial, create a project by name "MyHarmonyConfDemoProject". Set the project as main project. Click Finish. Now the project MyHarmonyConfDemoProject" is created.

Note: It is recommended that you maintain your project under a subdirectory of the "<install_root>/apps" folder and use a relative path to your project.

Once the MPLAB X IDE project is created, you should see a screen similar to the picture as shown below.

Using MPLAB Harmony Configurator

1. After creating the MPLAB X IDE project, select "Tools -> MPALB Harmony Configuration wizard" to open this plug-in with MPLAB X IDE.

"MPLAB Harmony Configurator" will open in a new dialogue, as shown below.

2. Browse to the root directory path under "MPLAB Harmony Root Directory" option. This path is remembered by the Configurator for subsequent usage.

Check or uncheck the "Relative Path" check box as required. Once the path is set, click "Next".

3. Now configure required middleware modules and Peripheral Library modules.

Peripheral Library headers are selected by default by the tool. For this tutorial user will configure TCP/IP Library. Select the required configuration modules of TCP/IP modules and also other middleware modules in the Tree structure. Click "Next" once the selection is complete.

For this release, both the TCP/IP and USB module Library Configuration Pane will appear. For this Tutorial, the TCP/IP module is selected (default selection "tcpip "node) in tree, we get the Library Configuration as below.

4. Select the required configurable items of TCP/IP, and click next (Next button in "Library configuration navigation pane" which takes to next TCP/IP configuration pane, and continue until the last configuration pane. Once TCP/IP configuration is done, click Next (Next button at the bottom of TCP/IP Library configuration pane) which takes into the next window "Application Template" to include template files.

5. Select to Include MPLAB Harmony Application template files. Tool would add template files (main.c, app.c, system_init.c, system_tasks.c, system_int.c, system_config.h and app.h) to MPLAB X IDE project. Click "Finish".

6. Check for selected files being added in MPLAB X IDE project. The following figure shows the MPLAB X IDE project with the added files.

The "MPLAB Harmony Assembly Generator" window in MPLAB X IDE shows the list of files added from "MPLAB Harmony Configurator" to the MPLAB X IDE project.

3 Applications Help

3.1 Applications Overview

Applications use MPLAB Harmony libraries and define the behavior of a system.

Description

Applications determine how MPLAB Harmony libraries (device drivers, middleware, and system services) are used to do something useful. In an MPLAB Harmony system, there may be one main application, there may be multiple independent applications or there may be one or more Operating System (OS) specific applications. Applications interact with MPLAB Harmony libraries through well defined interfaces. Applications may operate in a strictly polling environment, they may be interrupt driven, they may be executed in OS-specific threads, or they may be written so as to be flexible and easily configured for any of these environments.

Applications generally fit into one of the following categories:

Demo Applications:

Demos applications are provided (with MPLAB Harmony or in separate installations) to demonstrate typical or interesting usage models of one or more MPLAB Harmony libraries. Demonstration applications can demonstrate realistic solutions to real-life problems.

Sample Applications:

Sample applications are extremely simple applications provided with MPLAB Harmony as examples of how to use individual features of a library. They will not normally accomplish anything useful on their own. They are provided primarily as "documentation" to show how to use a library.

Skeletal Applications:

Skeletal applications are provided as bare-bones "skeletons" (potentially targeted to a specific usage or market) that MPLAB Harmony developers can use as a starting point to for writing their own applications. Skeleton applications contain the necessary calls, configuration definitions and subroutine stubs with "To Do" items clearly marked for MPLAB Harmony developers to fill in as desired to create a working application.

Customer Applications:

Customer applications are (of course) not provide by Microchip. Rather, they are any applications developed by customers to suit specific hardware and software needs. Refer to the [Start Here](#) help topic for information on the structure and to learn how to develop your own MPLAB Harmony applications.

Application Directories

Applications are contained in the "<install-root>/apps" folder. Under the "apps" folder, they are grouped by technology, board, and/or market segment.

Examples:

Folder	Type of Demos
<install-root>/apps/examples/peripheral	Contains simple peripheral library example applications
<install-root>/apps/fs	Contains graphics library demonstration applications
<install-root>/apps/gfx	Contains TCP/IP networking stack demonstration applications
<install-root>/apps/tcpip	Contains USB device demonstration applications

<install-root>/apps/usb/device	Contains USB host demonstration applications

Additional Information

Refer to [Release Notes & Information](#) for a complete listing of applications included with this release.

Refer to the help documentation for each individual application for build instructions and information on required hardware and application usage.

3.1.1 System Overview

To support the framework, the application (or application developer) is responsible for the following:

- **Configuring the Framework** - Required, unless using a pre-built library. Each driver, middleware layer, and system service require build-time configuration options that must be defined for the specific application, board, and processor that is used by any particular demo or customer application. Please refer to the help file of that module on the list of configuration options, and how they apply to the application. The application can use the board support package configuration file or define its own configuration for the board.
- **Building the Framework Library** - Required, unless using a prebuilt library
- **Implementing the System Initialization service.** Please refer to the help file for the system initialization service for information on implementing it statically or dynamically
- **Implementing a Interrupt Service Routine (ISR)** - Required, unless polled. Please refer to the help file for system tasks service for examples on implementing ISRs.
- **Implementing the System Tasks routine** - Please refer to the help file for system tasks service for how to implement it statically or dynamically

3.2 File System Demonstrations

3.2.1 Introduction

MPLAB Harmony File System Demonstration Help

Description

This help file contains instructions and associated information about MPLAB Harmony File System demonstration applications, which are contained in the MPLAB Harmony Library distribution.

3.2.2 Release Notes

MPLAB Harmony Version: v0.70b **File System Demonstrations Version :** 0.01a **Release Date:** 18Nov2013

The interface can change in the beta and/or 1.0 release.

For the latest release information, please refer to the File System Service Library [Release Notes](#) section.

New This Release:

Nothing to report for this release.

Known Issues:

Nothing to report for this release.

3.2.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have

paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

3.2.4 Demonstrations

Provides instructions on how to run the demonstration applications.

Description

The following demonstration applications are available in this release of the MPLAB Harmony File System framework.

3.2.4.1 Overview

Provides an overview of how most of the File System Demonstration applications are structured.

Description

The MPLAB Harmony File System Demonstration Applications show example usage of the File System framework. These demonstration applications also contain example configurations of media drivers such as Internal Flash and SD Card, that can be used readily in the end application with the some changes to initialization parameters, if required. A demonstration application may have multiple MPLAB X IDE project configurations (for different demonstration hardware and microcontrollers). The relevant configuration should be selected in the MPLAB X IDE before compiling the demonstration. Figure 1 shows the dialog box in MPLAB X IDE that allows selection of different configurations.

Figure 1: Demonstration MPLAB X IDE Configurations

The project will contain files which are configuration specific. Wherever applicable, these configuration files are placed in separate MPLAB X IDE project logical folders. Figure 2 shows how the configuration dependant `nvm_disk_images.c` file is included in the project. In this case two configurations (`pic32mx_usb_sk_int_dyn` and `pic32mz_sk_int_dyn`) are supported in the project.

Figure 2: Configuration specific file in File System Demonstration Projects.

Note that some demonstration projects may not support all configurations. In general, the following the demonstration project contain the following MPLAB X IDE configurations:

- **pic32mx_usb_sk_int_dyn:** This configuration runs on the PIC32 USB Starter Kit. The media drivers are configured for interrupt and dynamic operation

- **pic32mz_sk_int_dyn:** This configuration runs on the PIC33MZ Embedded Connectivity (EC) Starter Kit. Some demonstration projects that support this configuration may need the Multimedia Expansion Board II (MEB II) to attached to the starter kit. The media drivers in this configuration are configured for interrupt and dynamic operation.

Unless specified, the File System demonstration application are structured as indicated in Figure 3.

Figure 3: File System Demonstration Application General Architecture

Here are some general notes while working with the demonstration applications:

1. The system and application is initialized in `SYS_Initialize()` function, implemented in `sys_init.c`. The `sys_init.c` file is configuration specific. The `SYS_Initialize()` function initializes the application (`APP_Initialize()` function) and the BSP (`BSP_Initialize()` function).
2. The application then calls `SYS_Tasks()` function in an infinite loop. This function updates the state machines of all system components in the demonstration application and also calls the `APP_Tasks()` function. The is implemented in file `sys_tasks.c` which is configuration specific.
3. All Interrupt service routines are implemented in `sys_interrupt.c`. This file is configuration specific.

3.2.4.2 nvm_fat_single_disk

This demonstration uses a FAT12 image of file on NVM flash memory and demonstrates the working of all file system functions.

Description

This demonstration shows an example of implementing a FAT12 disk in device Flash memory. The demonstration contains a FAT12 disk image consisting of a Master Boot Record (MBR) sector, Logical Boot Sector, File Allocation Table, Root Directory Area. The demonstration opens an existing file named "FILE.TXT" and performs all file system related function calls on the file viz. `SYS_FS_FileStat`, `SYS_FS_FileSize`, `SYS_FS_FileSeek`, `SYS_FS_FileEOF`. Finally, the string "Hello World" is written to this file. The file is then closed and reopend for read. The read string is then compared with the string which was written to the file. If the string compare is successful, LED indication is provided.

3.2.4.2.1 Supported Demonstration Boards

Lists supported demonstration and development hardware boards.

Description

Following board is supported for PIC32MX devices: -

Demonstration Board (click link for board information)	Notes
PIC32 USB Starter Kit II	-

Following board is supported for PIC32MZ devices: -

Demonstration Board (click link for board information)	Notes
PIC32MZ Embedded Connectivity (EC) Starter Kit	-

3.2.4.2.2 Configuring the Hardware

Describes how to configure the supported hardware.

Description

[PIC32 USB Starter Kit II](#)

No hardware related configuration or jumper setting changes are necessary.

[PIC32MZ Embedded Connectivity \(EC\) Starter Kit](#)

No hardware related configuration or jumper setting changes are necessary.

3.2.4.2.3 Running the Demonstration

Provides instructions on how to build and run the NVM FAT single disk demonstration.

Description

Select the MPLAB X IDE project configuration: -

- pic32mx_usb_sk_int_dyn -- For PIC32MX devices
- pic32mz_sk_int_dyn -- For PIC32MZ devices

Build the selected configuration in the MPLAB X IDE project and program the demonstration board. The execution status (pass/fail) of the demonstration is indicated by LEDs on the demonstration board.

Demonstration Board	Demonstration Successful	Demonstration Failure
PIC32 USB Starter Kit II	LED3	LED1
PIC32MZ Embedded Connectivity (EC) Starter Kit	Green LED	Red LED

About the demonstration:

This demonstration shows an example of

- implementing a FAT12 disk in device Flash memory.
- opening a file for read or write.
- implements all the file system functions.

- closing a file.

The demonstration contains a FAT12 disk image consisting of a Master Boot Record (MBR) sector, Logical Boot Sector, File Allocation Table, Root Directory Area. This image is implemented in the file `nvm_disk_images.c` (this is project configuration specific file and is contained in the `nvm_disk_images` logical folder in the MPLAB X IDE project). The image contains a single file named "FILE.TXT" which contains the string "Data".

The demonstration opens an existing file named "FILE.TXT" and performs all file system related function calls on the file viz. [SYS_FS_FileStat](#), [SYS_FS_FileSize](#), [SYS_FS_FileSeek](#), [SYS_FS_FileEOF](#). Finally, the string "Hello World" is written to this file. The file is then closed and reopened for read. The read string is then compared with the string which was written to the file. If the string compare is successful, LED indication is provided.

The demonstration application logic is implemented as a state machine in the `APP_Tasks()` function in the file `main.c`.

1. The disk is first mounted using the [SYS_FS_Mount\(\)](#) function. The `"/dev/nvma1"` path instructs the mount command to mount an internal flash volume. The volume is mounted against a FAT type file system and mounted at `"/mnt/myDrive/"`.
2. If the mount is successful, the application opens a file "FILE.TXT" for reading and writing (`SYS_FS_FILE_OPEN_READ_PLUS`) with a [SYS_FS_FileOpen\(\)](#) function. The valid file handle is received once a successful opening of file is performed.
3. If file open is successful, the status of file "FILE.TXT" is stored in the `appData.fileStatus` structure, using [SYS_FS_FileStat\(\)](#) function.
4. If the file status check is successful, the size of the "FILE.TXT" is checked by passing the file handle to the [SYS_FS_FileSize\(\)](#) function.
5. If the file size check is successful, the size of file is compared with the size element received earlier as a part of `appData.fileStatus` structure. If both value matches, then the code moves to the next step of file seek.
6. The file pointer is then moved by 4 bytes from the start of the file by calling the function [SYS_FS_FileSeek\(\)](#) and passing parameter as `SYS_FS_SEEK_SET` (seek from the beginning of the file).
7. If the file seek operation is successful, the file pointer should have reached the end of the file. This is because, the content of the FILE.TXT had only 4 byte string = "Data". The end of file is verified by calling the function [SYS_FS_FileEOF\(\)](#). If the function returns "true" (end of file reached), the next step is performed.
8. In the next step, the file pointer is moved again by `[(-1)*size of file]`, from the end of the file by calling the function [SYS_FS_FileSeek\(\)](#) and passing parameter `SYS_FS_SEEK_END` (seek from the end of the file).
9. If the file seek operation is successful, the file pointer should have reached the beginning of the file. 4 Bytes are read from the file using [SYS_FS_FileRead\(\)](#) function (into a buffer).
10. If the read is successful, the content of file (present in the buffer) is compared with the "Data" string. If the comparison passed, the code moves to the next step.
11. In the next step, the file pointer is moved again by `[(-1)*size of file]`, from the end of the file by calling the function [SYS_FS_FileSeek\(\)](#) and passing parameter `SYS_FS_SEEK_END` (seek from the end of the file).
12. If the file seek operation is successful, the string "Hello World" is written to the file using [SYS_FS_FileWrite\(\)](#) function.
13. If the write operation is successful, the file is closed.
14. The file "FILE.TXT" is opened again in read mode (`SYS_FS_FILE_OPEN_READ`).
15. If the file open is successful, the content of the file is read using [SYS_FS_FileRead\(\)](#) function (into a buffer).
16. If the read operation is successful, the content of the file (present in the buffer) is compared with the "Hello World" string using the `strcmp()` function. A LED indicates the success of the demonstration.

3.2.4.3 sd_card_fat_single_disk

This demonstration uses the SDTM Card with FAT file system as media and performs a read/ write / verify operation on the files using long file names (LFN).

Description

This demonstration shows an example of using the MPLAB Harmony File System to access and modify the contents of an SDTM Card. The demonstration opens a file "FILE_TOO_LONG_NAME_EXAMPLE_123.JPG" on the SD Card, reads the content of the file and writes the content into another file "FILE_TOO_LONG_NAME_EXAMPLE_123_1.JPG" (create a copy of one file into another file).

The input file "FILE_TOO_LONG_NAME_EXAMPLE_123.JPG" is not provided along with the release package. It could be any arbitrary JPG (picture) file chosen by user and then suitably renamed to "FILE_TOO_LONG_NAME_EXAMPLE_123.JPG". The reason for choosing a JPG file for test purpose is that the duplicate file "FILE_TOO_LONG_NAME_EXAMPLE_123_1.JPG" created by the FS demonstration could be easily verified for correctness by inserting the SD card in computer and opening the "FILE_TOO_LONG_NAME_EXAMPLE_123_1.JPG" file. If the file "FILE_TOO_LONG_NAME_EXAMPLE_123_1.JPG" opens for viewing on the computer, the test is deemed to have passed. Otherwise, if the "FILE_TOO_LONG_NAME_EXAMPLE_123_1.JPG" does not open (is corrupted), the test will be considered as failed.

3.2.4.3.1 Supported Demonstration Boards

Lists supported demonstration and development hardware boards.

Description

Following board is supported for PIC32MX devices: -

Demonstration Board (click link for board information)
PIC32MX795F512L Plug-In-Module (PIM)
PICtail Daughter Board for SD and MMC

Note: This board can not be used by itself. An [Explorer 16 Development Board](#) is required.

Following board is supported for PIC32MZ devices: -

Demonstration Board (click link for board information)	Notes
PIC32MZ Embedded Connectivity (EC) Starter Kit	-

Note: This board can not be used by itself. An [Multimedia Expansion Board II \(MEB II\)](#) is required to run the demonstration.

3.2.4.3.2 Configuring the Hardware

Describes how to configure the supported hardware.

Description

[Explorer 16 Development Board Based Demonstrations](#)

Use the following instructions for all Explorer 16 Development Board-based demonstration boards:

PIC32MX795F512L PIM

1. Insert the PIM into the Explorer 16 Development Board PIM connector.

2. Jumpers JP1, JP2 and JP3 on the SD Card PICTail Daughter Board should [connect](#) to points 2 and 3 on their respective connectors as shown [here](#).
3. Insert the SD Card PICTail Daughter Board into the PICTail Plus connector on the Explorer 16 Development Board.
4. Insert a SD card into the SD card connector on the SD Card PICTail Daughter Board.
5. Power up the board.

[Multimedia Expansion Board II \(MEB II\)](#)

No hardware setting change is required. Insert the micro SD card into the connector and power up the board.

3.2.4.3.3 Running the Demonstration

Provides instructions on how to build and run the SD card FAT single disk demonstration.

Description

Select the MPLAB X IDE project configuration: -

- exp16_32mx_int_dyn -- For PIC32MX devices
- pic32mz_sk_int_dyn -- For PIC32MZ devices

Insert the SD card, which contains the file "FILE_TOO_LONG_NAME_EXAMPLE_123.JPG". The file can be of any size.

Compile the selected configuration in the MPLAB X IDE project and run the code. After a few seconds, once the LED glows, remove the SD card from the SD Card PICTail Daughter Board (for PIC32MX) or MEB2 Board (for PIC32MZ) and insert it into the SD card reader on a PC. Examine the contents of the SD card and another file named "FILE_TOO_LONG_NAME_EXAMPLE_123_1.JPG" would have been created. "FILE_TOO_LONG_NAME_EXAMPLE_123_1.JPG" will be a copy of "FILE_TOO_LONG_NAME_EXAMPLE_123.JPG". Verify both the files opens for viewing on the PC.

Demonstration Board	Demonstration Successful	Demonstration Failure
Explorer 16 Development Board	LED5 (D5)	LED6 (D6)
PIC32MZ Embedded Connectivity (EC) Starter Kit	Green LED	Red LED

About the demonstration:

This demonstration shows an example of

- implementing a FAT File system (FAT16/ FAT32) on SD card.
- implementing long file name (LFN).
- opening a file for read or write.
- closing a file.

The demonstration opens a file "FILE_TOO_LONG_NAME_EXAMPLE_123.JPG" on the SD Card, reads the content of the file and writes the content into another file "FILE_TOO_LONG_NAME_EXAMPLE_123_1.JPG" (create a copy of one file into another file).

The demonstration application logic is implemented as a state machine in the APP_Tasks() function in the file main.c.

1. The disk is first mounted using the [SYS_FS_Mount\(\)](#) function. The "/dev/mmcblk1" path instructs the mount command to mount a SD card volume. The volume is mounted against a FAT type file system and mounted at "/mnt/myDrive/".
2. If mount is successful, the volume is unmounted by passing the mount name "/mnt/myDrive" to [SYS_FS_Unmount\(\)](#) function. This unmounting is done for demonstration purpose only. Real application do not need to unmount unless it is required for the application.

3. If unmount is successful, the mounting process is repeated.
4. If the mount is successful, the application opens a file "FILE_TOO_LONG_NAME_EXAMPLE_123.JPG" for reading with a [SYS_FS_FileOpen\(\)](#) function.
3. If the file open is successful, the application opens a file "FILE_TOO_LONG_NAME_EXAMPLE_123_1.JPG" for writing with [SYS_FS_FileOpen\(\)](#) function. The attributes for file write is selected as "SYS_FS_FILE_OPEN_WRITE". Hence, if the file does not exist on the drive, the file is created.
4. If the file open is successful, 512Bytes from the file "FILE_TOO_LONG_NAME_EXAMPLE_123.JPG" is read into application buffer using [SYS_FS_FileRead\(\)](#) function.
5. If the file read successful, the 512Bytes is written from the application buffer to the FILE_TOO_LONG_NAME_EXAMPLE_123_1.JPG file using [SYS_FS_FileWrite\(\)](#) function.
6. If the write operation is successful, the end of file for FILE_TOO_LONG_NAME_EXAMPLE_123.JPG is checked. If the end of file is not reached, the process of reading and writing continues (step - 4 and step - 5).
7. Once end of file is reached, both the files are closed with [SYS_FS_FileClose\(\)](#) function.
8. Finally, a LED indicates the success of the demonstration.

3.2.4.4 nvm_sdcard_fat_multi_disk

This demonstration uses NVM and SDTM Card as 2 media and reads files from one media and write onto another media.

Description

This demonstration shows an example of using the MPLAB Harmony File System to access files across multiple media. The demonstration contains a FAT12 disk image consisting of a Master Boot Record (MBR) sector, Logical Boot Sector, File Allocation Table, Root Directory Area, placed in the internal flash memory (NVM). Also, a SD card is used as another disk, which might have FAT16 or FAT32 implemented on it (depends on the formatting of SD card).The demonstration reads the contents of "FILE.TXT" in NVM and copies the contents to "FILE.TXT" in the SDTM Card. If the write operation is successful, LED indication is provided.

3.2.4.4.1 Supported Demonstration Boards

Lists supported demonstration and development hardware boards.

Description

Following board is supported for PIC32MX devices: -

Demonstration Board (click link for board information)
PIC32MX795F512L Plug-In-Module (PIM)
PICtail Daughter Board for SD and MMC

Note: This board can not be used by itself. An [Explorer 16 Development Board](#) is required.

Following board is supported for PIC32MZ devices: -

Demonstration Board (click link for board information)	Notes
PIC32MZ Embedded Connectivity (EC) Starter Kit	-

Note: This board can not be used by itself. An [Multimedia Expansion Board II \(MEB II\)](#) is required to run the demonstration.

3.2.4.4.2 Configuring the Hardware

Describes how to configure the supported hardware.

Description

Explorer 16 Development Board Based Demonstrations

Use the following instructions for all Explorer 16 Development Board-based demonstration boards:

PIC32MX795F512L PIM

1. Insert the PIM into the Explorer 16 Development Board PIM connector.
2. Jumpers JP1, JP2 and JP3 on the SD Card PICTail Daughter Board should **connect** to points 2 and 3 on their respective connectors as shown [here](#).
3. Insert the SD Card PICTail Daughter Board into the PICTail Plus connector on the Explorer 16 Development Board.
4. Insert a SD card into the SD card connector on the SD Card PICTail Daughter Board.
5. Power up the board.

Multimedia Expansion Board II (MEB II)

No hardware setting change is required. Insert the micro SD card into the connector and power up the board.

3.2.4.4.3 Running the Demonstration

Provides instructions on how to build and run the NVM SD card FAT multi disk demonstration.

Description

Select the MPLAB X IDE project configuration: -

- exp16_32mx_int_dyn -- For PIC32MX devices
- pic32mz_sk_int_dyn -- For PIC32MZ devices

Insert the SD card, which contains the file "FILE.TXT" and the file contains "abc" (some arbitrary existing content).

Compile the selected configuration in the MPLAB X IDE project and run the code. After a few seconds, once the LED glows, remove the SD card from the Board and insert it into the SD card reader on a PC. Examine the contents of the file named "FILE.TXT". The file should contain the string "This data is from NVM Disk".

Demonstration Board	Demonstration Successful	Demonstration Failure
Explorer 16 Development Board	LED5 (D5)	LED6 (D6)
PIC32MZ Embedded Connectivity (EC) Starter Kit	Green LED	Red LED

About the demonstration:

This demonstration shows an example of:

- implementing a multi disk demonstration with FAT12 on internal flash memory (NVM) and FAT File system (FAT16/ FAT32) on SD card.
- opening two files from two different disks, read content of file from first disk and write into the file of second disk.
- closing the files.

The demonstration contains a FAT12 disk image consisting of a Master Boot Record (MBR) sector, Logical Boot Sector, File Allocation Table, Root Directory Area, placed in the internal flash memory (NVM). Also, a SD card is used as another disk, which

might have FAT16 or FAT32 implemented on it (depends on the formatting of SD card).The demonstration reads the contents of "FILE.TXT" in NVM and copies the contents to "FILE.TXT" in the SDTM Card. If the write operation is successful, LED indication is provided.

The demonstration application logic is implemented as a state machine in the APP_Tasks() function in the file main.c.

1. The first disks is mounted using the [SYS_FS_Mount\(\)](#) function. The "/dev/nvma1" path instructs the mount command to mount a internal flash volume. The volume is mounted against a FAT type file system and mounted at "/mnt/myDrive1/".
2. If the mount is successful, the second disks is mounted using the [SYS_FS_Mount\(\)](#) function. The "/dev/mmcbk1a1" path instructs the mount command to mount a SD card volume. The volume is mounted against a FAT type file system and mounted at "/mnt/myDrive2/".
3. If the mount is successful, the application opens a file "FILE.TXT" from "/mnt/myDrive1/" for reading and "FILE.TXT" from "/mnt/myDrive2/" for writing with a [SYS_FS_FileOpen\(\)](#) function.
4. If the file open is successful, the application reads 27Bytes from "FILE.TXT" of internal flash volume using [SYS_FS_FileRead\(\)](#).
5. If the read is successful, the application closes the "FILE.TXT" from internal flash volume and then writes the 27Bytes into "FILE.TXT" of SD card volume using [SYS_FS_FileWrite\(\)](#).
6. If the write is successful, the application closes the "FILE.TXT" from SD card volume.
7. If file close is successful, LED indicates the success of the operation.

3.2.4.5 nmv_mpfs_single_disk

This demonstration uses a MPFS image of 3 files on NVM flash memory and demonstrates the working of all file system functions.

Description

This demonstration shows an example of implementing a MPFS disk in device Flash memory. The demonstration contains a MPFS disk image in the internal flash memory. The disk image contains 3 files named: -

"FILE.txt" , Size = 11Bytes. The content of the file is -- "Hello World".

"ABC.txt", Size = 31744Bytes. The content of the file is not important. Just a file of sufficiently big size.

"TEST.txt" , Size = 72Bytes. The content of the file is -- "This file contains a test string and it is meant for testing. 1234567890".

The demonstration performs all file system related function calls on the file viz. [SYS_FS_FileRead](#), [SYS_FS_FileStat](#), [SYS_FS_FileSize](#), [SYS_FS_FileSeek](#), [SYS_FS_FileEOF](#). If all the test succeeds, LED indication is provided.

3.2.4.5.1 Supported Demonstration Boards

Lists supported demonstration and development hardware boards.

Description

Following board is supported for PIC32MX devices: -

Demonstration Board (click link for board information)	Notes
PIC32 USB Starter Kit II	-

Following board is supported for PIC32MZ devices: -

Demonstration Board (click link for board information)	Notes
PIC32MZ Embedded Connectivity (EC) Starter Kit	-

3.2.4.5.2 Configuring the Hardware

Describes how to configure the supported hardware.

Description

[PIC32 USB Starter Kit II](#)

No hardware related configuration or jumper setting changes are necessary.

[PIC32MZ Embedded Connectivity \(EC\) Starter Kit](#)

No hardware related configuration or jumper setting changes are necessary.

3.2.4.5.3 Running the Demonstration

Provides instructions on how to build and run the NVM MPFS single disk demonstration.

Description

Select the MPLAB X IDE project configuration: -

- pic32mx_usb_sk_int_dyn -- For PIC32MX devices
- pic32mz_sk_int_dyn -- For PIC32MZ devices

Build the selected configuration in the MPLAB X IDE project and program the demonstration board. The execution status (pass/fail) of the demonstration is indicated by LEDs on the demo board.

Demonstration Board	Demonstration Successful	Demonstration Failure
PIC32 USB Starter Kit II	LED3	LED1
PIC32MZ Embedded Connectivity (EC) Starter Kit	Green LED	Red LED

About the demonstration:

This demonstration shows an example of

- implementing a MPFS disk in device Flash memory.
- opening a file for read.
- implements all the file system functions.
- closing a file.

This demonstration shows an example of implementing a MPFS disk in device Flash memory. The demonstration contains a MPFS disk image in the internal flash memory. The disk image contains 3 files named: -

"FILE.txt" , Size = 11Bytes. The content of the file is -- "Hello World".

"ABC.txt", Size = 31744Bytes. The content of the file is not important. Just a file of sufficiently big size.

"TEST.txt" , Size = 72Bytes. The content of the file is -- "This file contains a test string and it is meant for testing. 1234567890".

The demonstration application logic is implemented as a state machine in the APP_Tasks() function in the file main.c.

1. The disk is first mounted using the [SYS_FS_Mount\(\)](#) function. The "/dev/nvma1" path instructs the mount command to mount an internal flash volume. The volume is mounted against a MPFS2 type file system and mounted at "/mnt/myDrive/".
2. If the mount is successful, the application opens a file "FILE.txt" for reading with a [SYS_FS_FileOpen\(\)](#) function.
3. If the open is successful, the application opens another file "TEST.txt" for reading with [SYS_FS_FileOpen\(\)](#) function.
4. If open is successful, the application checks the status of another file "ABC.txt" using [SYS_FS_FileStat\(\)](#) function and stores the status of the file into the structure "appData.fileStatus".
5. If file status check is successful, the application compares the size of file (from "appData.fileStatus" structure) with the known value of 31744 (Bytes).
6. If the comparison is successful, the application checks for size of file "FILE.txt", by passing the handle obtained during file open, to the function [SYS_FS_FileSize\(\)](#).
7. If the file size matches the known value of 11 (Bytes), the application moves the file pointer for the file "TEST.txt" 10Bytes from the end of file, using the function [SYS_FS_FileSeek\(\)](#).
8. If file seek is successful, 10 Bytes of content of the file "TEST.txt" is read into the application buffer, using the function [SYS_FS_FileRead\(\)](#).
9. If read is successful, the application buffer content is compared with the known string of "1234567890" using the strcmp() function.
10. If the comparison is successful, the application checks if the file pointer for file "TEST.txt" has reached the end of file using the [SYS_FS_FileEOF\(\)](#) function.
11. If end of file is reached, a LED indicates the success of the demonstration.

3.2.4.6 nvm_sdcard_fat_mpfs_multi_disk

This demonstration uses NVM and SDTM Card with MPFS and FAT image of file and performs a read/ write/ verify operation from file of one media to another media.

Description

This demonstration shows an example of using the MPLAB Harmony File System to access files across multiple disks and multiple file system. The demonstration contains a MPFS disk image in the internal flash memory. The disk image contains a file named "abc.txt" with content "Hello World". Another disk is a SD card, which is formatted to FAT (FAT16 or FAT32). The demonstration reads the contents of "abc.txt" from the disk implemented on internal flash memory and writes the contents to "FILE.TXT" on the SDTM Card. A successful write is indicated by a LED glow.

3.2.4.6.1 Supported Demonstration Boards

Lists supported demonstration and development hardware boards.

Description

Following board is supported for PIC32MX devices: -

Demonstration Board (click link for board information)
PIC32MX795F512L Plug-In-Module (PIM)
PICtail Daughter Board for SD and MMC

Note: This board can not be used by itself. An [Explorer 16 Development Board](#) is required.

Following board is supported for PIC32MZ devices: -

Demonstration Board (click link for board information)	Notes
PIC32MZ Embedded Connectivity (EC) Starter Kit	-

Note: This board can not be used by itself. An [Multimedia Expansion Board II \(MEB II\)](#) is required to run the demonstration.

3.2.4.6.2 Configuring the Hardware

Describes how to configure the supported hardware.

Description

[Explorer 16 Development Board Based Demonstrations](#)

Use the following instructions for all Explorer 16 Development Board-based demonstration boards:

PIC32MX795F512L PIM

1. Insert the PIM into the Explorer 16 Development Board PIM connector.
2. Jumpers JP1, JP2 and JP3 on the SD Card PICTail Daughter Board should [connect](#) to points 2 and 3 on their respective connectors as shown [here](#).
3. Insert the SD Card PICTail Daughter Board into the PICTail Plus connector on the Explorer 16 Development Board.
4. Insert a SD card into the SD card connector on the SD Card PICTail Daughter Board.
5. Power up the board.

[Multimedia Expansion Board II \(MEB II\)](#)

No hardware setting change is required. Insert the micro SD card into the connector and power up the board.

3.2.4.6.3 Running the Demonstration

Provides instructions on how to build and run the NVM SD card FAT MPFS multi disk demonstration.

Description

Select the MPLAB X IDE project configuration: -

- exp16_32mx_int_dyn -- For PIC32MX devices
- pic32mz_sk_int_dyn -- For PIC32MZ devices

Insert the SD card, which contains the file "FILE.TXT" and the file contains "abc" (some arbitrary existing content).

Compile the selected configuration in the MPLAB X IDE project and run the code. After a few seconds, once the LED glows, remove the SD card from the SD Card PICTail Daughter Board and insert it into the SD card reader on a PC. Examine the contents of the file named "FILE.TXT". The file should contain the string "Hello World".

Demonstration Board	Demonstration Successful	Demonstration Failure
Explorer 16 Development Board	LED5 (D5)	LED6 (D6)
PIC32MZ Embedded Connectivity (EC) Starter Kit	Green LED	Red LED

About the demonstration:

This demonstration shows an example of

- implementing a multi disk demonstration with MPFS on internal flash memory (NVM) and FAT File system (FAT16/ FAT32) on

SD card.

- opening two files from two different disks, read content of file from first disk and write into the file of second disk.
- closing the files.

The demonstration contains a MPFS disk image in the internal flash memory. The disk image contains a file named "abc.txt" with content "Hello World". Another disk is a SD card, which is formatted to FAT (FAT16 or FAT32). The demonstration reads the contents of "abc.txt" from the disk implemented on internal flash memory and writes the contents to "FILE.TXT" on the SDTM Card. A successful write is indicated by a LED glow.

The demonstration application logic is implemented as a state machine in the APP_Tasks() function in the file main.c.

1. The first disks is mounted using the [SYS_FS_Mount\(\)](#) function. The "/dev/nvma1" path instructs the mount command to mount a internal flash volume. The volume is mounted against a MPFS2 type file system and mounted at "/mnt/myDrive1".
2. If the mount is successful, the second disks is mounted using the [SYS_FS_Mount\(\)](#) function. The "/dev/mmcblk1" path instructs the mount command to mount a SD card volume. The volume is mounted against a FAT type file system and mounted at "/mnt/myDrive2".
3. If the mount is successful, the application opens a file "abc.txt" from "/mnt/myDrive1/" for reading and "FILE.TXT" from "/mnt/myDrive2/" for writing with a [SYS_FS_FileOpen\(\)](#) function.
4. If the file open is successful, the application reads 13Bytes from "abc.txt" of internal flash volume using [SYS_FS_FileRead\(\)](#).
5. If the read is successful, the application closes the "abc.txt" from internal flash volume and then writes the 13Bytes into "FILE.TXT" of SD card volume using [SYS_FS_FileWrite\(\)](#).
6. If the write is successful, the application closes the "FILE.TXT" from SD card volume.
7. If file close is successful, LED indicates the success of the operation.

3.2.5 Demonstration Board Information

Information on Hardware used by the File System Demonstration Applications.

Description

The File System Library Demonstration Applications can be tried across different hardware boards. This section provide details on these hardware boards.

3.2.5.1 PIC32 USB Starter Kit II

Hardware Information:

SW1 - Application switch. Tied to RD6.

SW2 - Application switch. Tied to RD7.

SW3 - Application switch. Tied to RD13.

LED1 - Application LED. Tied to RD0.

LED2 - Application LED. Tied to RD1.

LED3 - Application LED. Tied to RD2.

More Information

[Product webpage](#)

3.2.5.2 Explorer 16 Development Board

Hardware Information:

S1 - Reset button (MCLR)

S2 - Processor switch. This switch determines which processor is running, the processor on the board or the processor on the Plug-In-Module (PIM).

S3, S4, S5, S6 - Application switches. For information about what pin is connected to this switch, please refer to the information for the PIM in use.

D3 through D10 - Application LEDs. For information about what pin is connected to this LED, please refer to the information for the PIM in use.

3.2.5.5 PIC32MZ Embedded Connectivity (EC) Starter Kit

Provides details information on the PIC32MZ Embedded Connectivity (EC) Starter Kit.

Description

Microchip Part Number: DM320006 (without Crypto) or DM320006-C (with Crypto)

The top assembly of the board includes these key features, as indicated in Figure 1:

1. PIC32MZ2048ECH144 32-bit microcontroller.
2. Green power indicator LED.
3. On-board crystal or oscillator for precision microcontroller clocking (12 MHz).
4. USB connectivity for on-board debugger communications.
5. Green debug indicator LED.
6. Three push button switches for user-defined inputs.
7. Three user-defined indicator LEDs.
8. USB Type A receptacle connectivity for PIC32 host-based applications.
9. HOST mode power jumper.
10. Daughter board connectors for flexible Ethernet PHY options.
11. 32 kHz oscillator for RTCC and Timer1 (optional).
12. External 2 GB SQI memory for expanded memory application.
13. Jumper for using or disconnecting the on-board debugger.

NOTE: When running self-powered USB device applications, open the jumper JP1 to prevent possibly back-feeding voltage onto the Vbus from one port on the host to another (or from one host to another).

Figure 1: PIC32MZ Embedded Connectivity (EC) Starter Kit Layout (Front)

The bottom assembly of the board includes these key features, as indicated in Figure 2:

1. PIC24FJ256GB106 USB microcontroller for on-board debugging.
2. Regulated +3.3V power supply for powering the starter kit via USB or expansion board.
3. Connector for various expansion boards.
4. USB Type micro-AB receptacle for OTG and USB device connectivity for PIC32 OTG/device-based applications.
5. 50 MHz Ethernet PHY oscillator.
6. USB Host and OTG power supply for powering PIC32 USB applications.

Figure 2: PIC32MZ Embedded Connectivity (EC) Starter Kit Layout (Back)

3.2.5.6 Multimedia Expansion Board II (MEB II)

Provides details information on the Multimedia Expansion Board II (MEB) II.

Description

Microchip Part Number: DM320005-2

[Product Page](#)

The front side of the MEB II includes these key features, as shown in Figure 1:

1. Display daughter board connector (60-pin Hirose board-to-board connector).
2. mTouch™ buttons.
3. Push Button.
4. Power LED.
5. User LEDs.
6. VGA Camera (OVM7690).
7. PICtail™ Connector.
8. Analog temperature sensor.

Figure 1: Multimedia Expansion Board II Layout (Front)

The underside of the MEB II includes these key features, as shown in Figure 2:

1. Regulated 5V and 3.3V power supply for powering the board via a 9-15V DC Adapter.
2. PIC32 Starter Kit connector (168-pin Hirose board-to-board connector).
3. 24-bit stereo audio codec (AK4953A).
4. Integrated 802.11bg wireless module (MRF24WG0MA).
5. Low-cost Bluetooth® HCI transceiver (BTM805).
6. EBI SRAM memory (IS61WV102416BLL).
7. microSD slot.

8. Analog accelerometer (ADXL325).

Figure 2: Multimedia Expansion Board II Layout (Back)

3.3 Graphics Demonstrations

3.3.1 Introduction

Graphics Library Demonstrations Applications Help

Description

This distribution package contains a variety of Graphics-related firmware projects that demonstrate the capabilities of the MPLAB Harmony Graphics library. This help file describes the hardware requirement and procedures to run these firmware projects on Microchip graphics boards.

To know more about MPLAB Harmony Graphics, configuring the library and the APIs provided; refer to the [Graphics Library](#) documentation.

Graphic Demonstration	Description
Primitive	Cyclically demonstrates various types of shapes and images, which include circles, lines, and rectangles that can be created from the Graphics Library.
Object	Touch interactive demonstration of various pages of objects that can be created from the Graphics Library.
ssd1926	Touch interactive demonstration of JPEG decoded images from an SD card utilizing the JPEG decoder of the Solomon Systech SSD1926 graphics controller.
lcc	Demonstrates the advanced capabilities of the Graphics Library utilizing the software graphics controller.

3.3.2 Release Notes

MPLAB Harmony Version: v0.70b **Graphics Demonstrations Version :** 4.00b **Release Date:** 18Nov2013

New This Release:

Nothing to report for this release.

Known Issues:

LCC Demonstration: For the PIC32MZ Embedded Connectivity (EC) Starter Kit, after programming, the application may not display the UI folders as expected. If this occurs, to activate the UI display, touch the screen in the folder icons area. This issue will be addressed in the next release of MPLAB Harmony.

3.3.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

3.3.4 Demonstrations

This topic provides information on how to run the Graphics Library demonstration applications included in this release.

Description

All demonstrations provided should be built using the MPLAB X IDE development environment tool supplied by Microchip.

The information that follows, communicate the general steps to building the graphics demos.

- Using MPLAB X IDE, click the File drop-down, select "Open Project...". Navigate to your Harmony installation folder. The default location on Windows will be: C:\Microchip\Harmony\<version>\apps\gfx.
- In the \app\gfx folder there will be the object, primitive, lcc, and ssd1926 demonstration applications.
- Within each demonstration folder, there will be a *firmware* folder. In the firmware folder will exist the MPLAB X IDE project specific to each demonstration.
- Select the project and click "Open Project"
- To configure the project specific to a preset board configuration, right click on the project and select "Set Configuration". This will set the build configuration to match the supported board configuration.

3.3.4.1 lcc_demo

Demonstrates the advanced capabilities of the Graphics Library utilizing the software graphics controller.

Description

This demonstration provides the ability to display alpha blend and gradient colors through the software graphics controller. The demonstration renders four folders for alpha blend, gradient, picture-in-picture (PIP), and performance for all PIC32 devices.

For PIC32MX devices, the demonstration runs on the PICtail Plus LCC Daughter Board, and on PIC32MZ devices, it runs on the Multimedia Expansion Board II (MEB II).

3.3.4.1.1 Supported Demonstration Boards

Lists supported demo and development hardware boards.

Description

Demo Board (click link for board information)	Notes
PIC32 USB Starter Kit II	-
Graphics PICTail LCC Board AC164144	-
WQVGA 480x272 Board AC164127-6	-
Multimedia Expansion Board II (MEB II)	-
PIC32MZ Embedded Connectivity (EC) Starter Kit	-

3.3.4.1.2 Configuring the Hardware

Describes how to configure the supported hardware.

Description

[PIC32MZ Embedded Connectivity \(EC\) Starter Kit](#)

No hardware related configuration or jumper setting changes are necessary.

[PIC32 USB Starter Kit II](#)

No hardware related configuration or jumper setting changes are necessary.

[Multimedia Expansion Board II \(MEB II\)](#)

The MEB II has two memory options: External or Internal. This demonstration requires External EBI memory, which is configured using the following J9 jumper settings:

- EBIOE and LCD_PCLK (jumper is closed)
- EBIWE (jumper is open)

3.3.4.1.3 Running the Demonstration

Provides instructions on how to build and run the LCC demo.

Description

Select one of the following build configurations to build the LCC demo:

- pic32mxusbsk_pictailcc_wqvga -- For PIC32MX devices
- pic32mzsk_meb2_wqvga -- For PIC32MZ devices

Build the selected configuration in the MPLAB X IDE project and program the demonstration board. The demonstration renders four folders for alpha blend, gradient, picture-in-picture (PIP), and performance. Touch one of the folders to activate the demonstration.

Short Name	Long Name
pic32mxusbsk	PIC32 USB Starter Kit II
pic32mzsk	PIC32MZ Embedded Connectivity (EC) Starter Kit
meb2	Multimedia Expansion Board II (MEB II)

wqvga	Graphics Display Powertip 4.3" 480 × 272 Board (AC164127-6)

3.3.4.2 primitive_demo

An example of primitive drawing capabilities of the Graphics Library.

Description

The Primitive example demonstrates the various types of shapes and images which include: circles, lines, rectangles that exist in the Graphics Library.

This example shows the following primitives:

- [GFX_LineDraw](#)
- [GFX_CircleDraw](#)
- [GFX_CircleFillDraw](#)
- [GFX_RectangleRoundDraw](#)
- [GFX_RectangleRoundFillDraw](#)
- [GFX_RectangleFillDraw](#)
- [GFX_ArcDraw](#)
- [GFX_PolygonDraw](#)
- [GFX_FontSet](#)
- [GFX_TextStringXYPut](#)
- [GFX_ImageDraw](#)
- [GFX_ScreenClear](#)

3.3.4.2.1 Supported Demonstration Boards

Lists supported demo and development hardware boards.

Description

Following boards are supported for PIC32MX devices:

Demo Board (click link for board information)	Notes
PIC32 USB Starter Kit II	-
Graphics LCD Controller PICtail Plus SSD1926 Board AC164127-5	-
QVGA 320x240 Board AC164127-4	-

Following board is supported for PIC32MZ devices:

Demo Board (click link for board information)	Notes
PIC32MZ Embedded Connectivity (EC) Starter Kit	-
Multimedia Expansion Board II (MEB II)	-

3.3.4.2.2 Configuring the Hardware

Describes how to configure the supported hardware.

Description

[PIC32 USB Starter Kit II](#)

No hardware related configuration or jumper setting changes are necessary.

[PIC32MZ Embedded Connectivity \(EC\) Starter Kit](#)

No hardware related configuration or jumper setting changes are necessary.

3.3.4.2.3 Running the Demonstration

Provides instructions on how to build and run the primitive demo.

Description

Navigate to the apps/gfx/primitive/firmware folder and open the primitive project, and then select one of the following build configurations to build the Primitive demo:

- pic32mxusbsk_pictails1d_wqvga -- For PIC32MX devices
- pic32mxusbsk_pictailssd_qvga -- For PIC32MX devices
- pic32mzsk_meb2_wqvga -- For PIC32MZ devices

Once the project is loaded and executed on the target board, a continuous display of primitive graphics will appear on the LCD.

Short Name	Long Name
pic32mxusbsk	PIC32 USB Starter Kit II
pic32mzsk	PIC32MZ Embedded Connectivity (EC) Starter Kit
pictails1d	Graphics LCD Controller PICTail Plus S1D1357 Board
pictailssd	Graphics LCD Controller PICTail Plus SSD1926 Board
meb2	Multimedia Expansion Board II (MEB II)
qvga	Graphics Display Truly 3.2" 240 × 320 Board (AC164127-4)
wqvga	Graphics Display Powertip 4.3" 480 × 272 Board (AC164127-6)

3.3.4.3 object_demo

An example of standard user-interface widgets of the Graphics Library.

Description

The Object example demonstrates the standard types of objects/widgets that exist in the Graphics Library Graphics Object Layer (GOL). The demonstration is composed of several pages of examples.

The demonstration requires that the user touch the screen to begin the demo. The user is expected to navigate to the next or previous page by selecting the buttons on the far right and left locations of the screen.

This example shows the following widgets:

- [GFX_GOL_ButtonCreate](#)

- [GFX_GOL_ButtonTextSet](#)
- [GFX_GOL_CheckboxCreate](#)
- [GFX_GOL_GroupboxCreate](#)
- [GFX_GOL_RadioButtonCreate](#)
- [GFX_GOL_GroupboxCreate](#)
- [GFX_GOL_StaticTextCreate](#)
- [GFX_GOL_ScrollBarCreate](#)
- [GFX_GOL_ProgressBarCreate](#)
- [GFX_GOL_ListboxCreate](#)
- [GFX_GOL_ScrollBarCreate](#)
- [GFX_GOL_Editbox_Create](#)
- [GFX_GOL_MeterCreate](#)
- [GFX_GOL_DigitalMeterCreate](#)
- [GFX_GOL_RoundDialCreate](#)
- [GFX_GOL_PictureCreate](#)
- [GFX_GOL_CustomControlCreate](#)

3.3.4.3.1 Supported Demonstration Boards

Lists supported demo and development hardware boards.

Description

Following boards are supported for PIC32MX devices:

Demo Board (click link for board information)	Notes
PIC32 USB Starter Kit II	-
Graphics LCD Controller PICtail Plus SSD1926 Board AC164127-5	-
QVGA 320x240 Board AC164127-4	-

Following board is supported for PIC32MZ devices:

Demo Board (click link for board information)	Notes
PIC32MZ Embedded Connectivity (EC) Starter Kit	-
Multimedia Expansion Board II (MEB II)	-

3.3.4.3.2 Configuring the Hardware

Describes how to configure the supported hardware.

Description

[PIC32 USB Starter Kit II](#)

No hardware related configuration or jumper setting changes are necessary.

[PIC32MZ Embedded Connectivity \(EC\) Starter Kit](#)

No hardware related configuration or jumper setting changes are necessary.

3.3.4.3.3 Running the Demonstration

Provides instructions on how to build and run the object demo.

Description

Navigate to the apps/gfx/object/firmware and open the object project, and then select one of the following build configurations to build the Object demo:

- pic32mxusbsk_pictailssd_qvga -- For PIC32MX devices
- pic32mzsk_meb2_wqvga -- For PIC32MZ devices

Once the project is loaded and executed on the target board, various objects are displayed. Touch the forward or back arrow to view additional objects.

Short Name	Long Name
pic32mxusbsk	PIC32 USB Starter Kit II
pic32mzsk	PIC32MZ Embedded Connectivity (EC) Starter Kit
pictailssd	Graphics LCD Controller PICtail Plus SSD1926 Board
meb2	Multimedia Expansion Board II (MEB II)
qvga	Graphics Display Truly 3.2" 240 × 320 Board (AC164127-4)

3.3.4.4 ssd_demo

Shows how to display JPEG images using the Solomon Systech (SSD1926) graphics controller that resides on the PICtail™ Plus SSD1926 Board.

Description

The SSD1926 demo shows how to decode of JPEG images from an SD card utilizing the JPEG decoder capabilities of the Solmon Systech SSD1926 graphics controller.

3.3.4.4.1 Supported Demonstration Boards

Lists supported demo and development hardware boards.

Description

Following board is supported for PIC32MX devices:

Demo Board (click link for board information)	Notes
PIC32 USB Starter Kit II	-
Graphics LCD Controller PICtail Plus SSD1926 Board AC164127-5	-
QVGA 320x240 Board AC164127-4	-

3.3.4.4.2 Configuring the Hardware

Describes how to configure the supported hardware.

Description

PIC32 USB Starter Kit II

No hardware related configuration or jumper setting changes are necessary.

3.3.4.4.3 Running the Demonstration

Provides instructions on how to build and run the SSD1926 demo.

Description

Navigate to the apps/gfx/ssd1926/firmware and open the ssd1926 project, and then select one of the following build configurations to build the SSD1926 demo:

- pic32mxusbsk_pictailssd_qvga -- For PIC32MX devices

Once the project is loaded and executed on the target board, various JPEG images, which are stored on a SD card are displayed.

Short Name	Long Name
pic32mxusbsk	PIC32 USB Starter Kit II
pictailssd	Graphics LCD Controller PICtail Plus SSD13517 Board
qvga	Graphics Display Truly 3.2" 240 × 320 Board (AC164127-4)

3.3.5 Demonstration Board Information

This topic provides specific information about the development boards available for the demonstration applications.

3.3.5.1 PIC32 USB Starter Kit II

Provides information on the PIC32 USB Starter II.

Description

SW1 - Application switch. Tied to RD6.

SW2 - Application switch. Tied to RD7.

SW3 - Application switch. Tied to RD13.

LED1 - Application LED. Tied to RD0.

LED2 - Application LED. Tied to RD1.

LED3 - Application LED. Tied to RD2.

This board supports the following USB Device demonstrations:

- CDC Single COM port ([cdc_com_port_single](#)).
- CDC Dual COM port ([cdc_com_port_dual](#))
- HID Basic ([hid_basic](#))
- HID Mouse ([hid_mouse](#))
- HID Keyboard ([hid_keyboard](#))
- HID Joystick ([hid_joystick](#))
- MSD Flash Drive ([msd_basic](#))
- Generic USB Device ([generic_device](#))

More Information

Microchip Part Number : DM320003-2

3.3.5.2 PIC32MZ Embedded Connectivity (EC) Starter Kit

Provides details information on the PIC32MZ Embedded Connectivity (EC) Starter Kit.

Description

Microchip Part Number: DM320006 (without Crypto) or DM320006-C (with Crypto)

The top assembly of the board includes these key features, as indicated in Figure 1:

1. PIC32MZ2048ECH144 32-bit microcontroller.
2. Green power indicator LED.
3. On-board crystal or oscillator for precision microcontroller clocking (12 MHz).
4. USB connectivity for on-board debugger communications.
5. Green debug indicator LED.
6. Three push button switches for user-defined inputs.
7. Three user-defined indicator LEDs.
8. USB Type A receptacle connectivity for PIC32 host-based applications.
9. HOST mode power jumper.
10. Daughter board connectors for flexible Ethernet PHY options.
11. 32 kHz oscillator for RTCC and Timer1 (optional).
12. External 2 GB SQI memory for expanded memory application.
13. Jumper for using or disconnecting the on-board debugger.

NOTE: When running self-powered USB device applications, open the jumper JP1 to prevent possibly back-feeding voltage onto the Vbus from one port on the host to another (or from one host to another).

Figure 1: PIC32MZ Embedded Connectivity (EC) Starter Kit Layout (Front)

The bottom assembly of the board includes these key features, as indicated in Figure 2:

1. PIC24FJ256GB106 USB microcontroller for on-board debugging.
2. Regulated +3.3V power supply for powering the starter kit via USB or expansion board.
3. Connector for various expansion boards.
4. USB Type micro-AB receptacle for OTG and USB device connectivity for PIC32 OTG/device-based applications.
5. 50 MHz Ethernet PHY oscillator.
6. USB Host and OTG power supply for powering PIC32 USB applications.

3.4 Peripheral Library Example Applications

This topic describes the peripheral library example applications.

3.4.1 Introduction

Peripheral Library Example Applications for MPLAB Harmony

The example applications for MPLAB peripheral libraries (PLIBs) provide very simple single-purpose examples of how to use MPLAB Harmony peripheral libraries.

Description

Peripheral libraries (PLIBs) are the lowest level libraries provided with MPLAB Harmony. They provide a functional abstraction of the peripherals available on Microchip microcontrollers to hide differences in register details that can exist from part to part. However, they do not maintain any state data (at least not any that isn't stored in the hardware registers) from call to call and they do not provide any protection of the peripheral's resources. As such, any code that calls the PLIB for a peripheral must take responsibility for ownership of that peripheral and is responsible for managing the behavior of that peripheral.

As such, PLIBs are normally only used by MPLAB Harmony device drivers or system services. However, there are some times when it is necessary and appropriate to interact with a PLIB directly from an application. So, simple examples are provided to show how to use the interfaces the peripheral libraries. These examples are available in the MPLAB Harmony installation in the following location.

Location of Example Applications

<installation-root>/apps/examples/peripheral

Examples are divided into two different groups:

- Blocking Examples
- State-Driven Examples

Most MPLAB Harmony applications use a state-machine driven structure. So, examples are provided that follow this structure in the "state_driven" subdirectory. However, it is sometimes easier to understand a simple blocking example (one that sits in a loop for ever or until its task is done). So, simple blocking examples are also provided in the "blocking" subdirectory.

Blocking examples are divided into PIC32MX and PIC32MZ variants. PIC32MX examples are written for the Explorer16 Development Board with a PIC32MX795F512L PIM. PIC32MZ examples are written for the PIC32MZ Embedded Connectivity (EC) Starter Kit. The state-driven examples are tested and working on the Explorer 16 Development Board, the PIC32 USB Starter Kit II, and the PIC32MZ Embedded Connectivity (EC) Starter Kit, and the appropriate board configuration for each project can be selected in MPLAB X IDE.

3.4.2 Release Notes

MPLAB Harmony Version: v0.70b **Peripheral Library Example Applications Version:** 0.01a **Release Date:** 18Nov2013

The interface can change in the beta and/or 1.0 release.

New This Release:

Nothing to report for this release.

Known Issues:

Nothing to report for this release.

3.4.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

3.4.4 Blocking Applications

This topic contains a list of the MPLAB Harmony blocking peripheral library (PLIB) example applications.

Description

The tables below list and summarizes the simple blocking peripheral library example applications.

Location

<installation-root>/apps/examples/peripheral/blocking/pic32mx

PIC32MX PLIB-based Applications

Name	Subdirectory	Description
ADC Potentiometer	adc/adc_pot	Repeatedly reads the Explorer 16 Development Board potentiometer and outputs a pattern on the LEDs corresponding to the potentiometer's position.
Memory Partition	bmx/mem_partition	Partitions flash memory and ram. Explorer 16 Development Board LEDs are turned on if the RAM partition sizes are correct and the partitioning completed successfully.
Simple Comparator	cmp/simple_comparator	Toggles the LEDs on the Explorer 16 Development Board, depending on which input of the comparator is at a higher voltage.
Triangle Wave	cvref/triangle_wave	This example will generate a triangular wave on the CVREF output pin.
LED Pattern	dma/led_pattern	Blinks LEDs on the Explorer 16 Development Board using a pattern stored in Flash memory. It uses the DMA controller to transfer data from flash to the I/O port controlling the LEDs.
Master-Slave	i2c/master_slave	The I2C1 module is setup to operate as the master, while the I2C2 module operates as the slave. The master sends a string to the slave, which stores the data into an array.
Simple Input-Capture	ic/simple_input_capture	When a rising edge is output to the Input Capture 1 pin (RD8), it triggers an interrupt, which then stores the captured timer value into the 'CaptureTime' variable.
Flash Modify	nvm/flash_modify	Reads, writes and erases data in the program Flash memory.
PWM Example	oc/oc_pwm	Generates a 40 kHz PWM with a 25% duty cycle on the OC1 output pin.
Oscillator Configuration	osc/osc_config	Demonstrates how to change the system clock source and PLL values during run-time.
LCD Example	pmp/pmp_lcd	Writes two lines of text to the LCD screen on the Explorer 16 Development Board.
Blinky Leds	ports/blinky_leds	Toggles the Explorer 16 Development Board LEDs in an infinite loop.
Change Notice	ports/cn_interrupt	When SW4 (the right most button on Explorer 16 Development Board) is pressed, it triggers a change notice interrupt, which then toggles the Explorer 16 Development Board LEDs.
Sleep Mode	power/sleep_mode	This example demonstrates how to put the device into Sleep mode and then awake the device using the Watchdog Timer.
Reset Handler	reset/reset_handler	This example does checks on various reset flags, assigning each one to an Explorer 16 Development Board LED. If the flag is set, the LED is turned on and the reset flag is cleared.
RTCC Alarm	rtcc/rtcc_alarm	Sets up the RTCC module to function as an alarm, which goes off at 6:00am every morning.
SPI Loopback	spi/spi_loopback	This example assumes that the SPI SDO (output) is connected to the SDI (input). Data is then transferred directly from the output to the input and the Explorer 16 Development Board LEDs are turned on if the data transfer is successful.
Timer Example	tmr/timer2_interrupt	Uses Timer2 in 32-bit mode to generate an interrupt every one second, blinking the LEDs on the Explorer 16 Development Board.
Simple UART	uart/simple_uart	When the Explorer 16 Development Board is connected to a PC with an RS-232 cable, the device will echo what characters the user types into a terminal program (e.g., Putty) and write the corresponding 8-bit character pattern to the Explorer 16 Development Board LEDs.
Simple WDT	wdt/simple_wdt	Demonstrates how to setup the Watchdog Timer and detect whether or not a time-out reset has occurred.

Location

<installation-root>/apps/examples/peripheral/blocking/pic32mz

PIC32MZ PLIB-based Applications

Name	Subdirectory	Description
Triangle Wave	cvref/triangle_wave	This example will generate a triangular wave on the CVref output pin.
LED Pattern	dma/led_pattern	Blinks LEDs on the PIC32MZ Starter-Kit using a pattern stored in flash memory. It uses the DMA controller to transfer data from flash to the I/O port controlling the LEDs.
Master-Slave	i2c/master_slave	The I2C1 module is setup to operate as the master, while the I2C2 module operates as the slave. The master sends a string to the slave, which stores the data into an array.
Flash Modify	nvm/flash_modify	Reads, writes and erases data in the program flash memory.
PWM Example	oc/oc_pwm	Generates a 40KHz PWM with a 25% duty cycle on the OC1 output pin.
Oscillator Configuration	osc/osc_config	Demonstrates how to change the system clock source and PLL values during run-time.
Blinky Leds	ports/blinky_leds	Toggles the PIC32MZ Starter-Kit LEDs in an infinite loop.
Change Notice	ports/cn_interrupt	When SW1 is pressed, it triggers a change notice interrupt, which then toggles the PIC32MZ Starter-Kit LEDs.
Sleep Mode	power/sleep_mode	This example demonstrates how to put the device into sleep mode and then awake the device using the watchdog timer.
Reset Handler	reset/reset_handler	This example does checks on various reset flags, assigning each one to an LED. If the flag is set, the LED is turned on and the reset flag is cleared.
RTCC Alarm	rtcc/rtcc_alarm	Sets up the RTCC module to function as an alarm, which goes off at 6:00am every morning.
SPI Loopback	spi/spi_loopback	This example assumes that the SPI SDO (output) is connected to the SDI (input). Data is then transferred directly from the output to the input and the LEDs are turned on if the data transfer is successful.
Timer Example	tmr/timer2_interrupt	Uses Timer 2 in 32-bit mode to generate an interrupt every one second, blinking the LEDs on the PIC32MZ Starter-Kit.
Simple UART	uart/simple_uart	When the PIC32MZ Starter-Kit is connected to a PC with an RS-232 cable, the device will echo what characters the user types into a terminal program (e.g. Putty).
Simple WDT	wdt/simple_wdt	Demonstrates how to setup the watchdog timer and detect whether or not a timeout reset has occurred.

3.4.5 State-Driven Applications

Note: This information was not available at time of release and will be added in a future release of MPLAB Harmony.

3.5 NVM Driver Demonstration

3.5.1 Introduction

This help file contains instructions and associated information about MPLAB Harmony NVM driver application demonstrations, which are contained in the MPLAB Harmony Library distribution.

Description

This application demonstrates the capabilities of the MPLAB Harmony NVM driver. This help file describes the hardware requirement and procedures to build, run the demo project on Microchip development tools. In this demo application, NVM driver is used to access the internal flash memory of PIC32 MX and PIC32 MZ Devices to perform Write and Read operations and indicates the result by LED display.

To know more about MPLAB Harmony NVM driver, configuring the NVM driver and API's provided by the NVM driver, refer to MPLAB Harmony [NVM Driver Library](#) documentation.

3.5.2 Release Notes

MPLAB Harmony Version: v0.70b **NVM Driver Demonstration Version:** 0.01a **Release Date:** 18Nov2013

New This release:

This is the first release of this NVM Driver demonstration application. This demonstration has been developed to support PIC32MX and PIC32MZ devices.

Known Issues:

- This Demo application is tested only up to 150 bytes in interrupt mode in PIC32MZ devices
- Changes in NVM driver interfaces will have impact on this demo application as well in subsequent releases

3.5.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO

YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

3.5.4 Hardware

This section describes how to select and use an appropriate development board and steps to configure the hardware to run this NVM driver demo.

3.5.4.1 Required Hardware

This section describes the overview of required hardware family and supported demonstration boards for running this NVM driver demo application.

Description

To run this demonstration project, you will require one of the following sets of hardware.

3.5.4.1.1 Supported Demonstration Boards

Lists supported demonstration and development hardware boards.

Description

Following board is supported for PIC32MX devices: -

Demo Board (click link for board information)	Notes
PIC32 USB Starter Kit II	-
Explorer 16 Development Board	-
PIC32MX795F512L Plug-in Module (PIM)	-

Following board is supported for PIC32MZ devices: -

Demo Board (click link for board information)	Notes
PIC32MZ Embedded Connectivity (EC) Starter Kit	-

3.5.4.1.2 Hardware Information

Information on hardware used by the NVM driver demo application.

Description

The NVM driver demo application can be tried on different hardware boards. This section provides details on the different hardware boards that this demo application supports.

3.5.4.1.2.1 PIC32 USB Starter Kit II

Provides information on the PIC32 USB Starter Kit II.

Description

SW1 - Application switch. Tied to RD6.

SW2 - Application switch. Tied to RD7.

SW3 - Application switch. Tied to RD13.

LED1 - Application LED. Tied to RD0.

LED2 - Application LED. Tied to RD1.

LED3 - Application LED. Tied to RD2.

More Information

Microchip Part Number : DM320003-2

3.5.4.1.2.2 Explorer 16 Development Board

Provides information on the Explorer 16 Development Board.

Description

S1 - Reset button (MCLR)

S2 - Processor switch. This switch determines which processor is running, the processor on the board or the processor on the Plug-In-Module (PIM).

S3, S4, S5, S6 - Application switches. For information about what pin is connected to this switch, please refer to the information for the PIM in use.

D3 through D10 - Application LEDs. For information about what pin is connected to this LED, please refer to the information for the PIM in use.

More Information:

Microchip Part Number: DM240001

3.5.4.1.2.3 PIC32MX795F512L Plug-in Module (PIM)

Provides information on the PIC32MX795F512L Plug-In-Module (PIM).

Description

This PIM is required while using the [Explorer 16 Development Board](#).

More Information

Microchip Part Number: MA320003

[microchipDIRECT Product Page](#)

3.5.4.1.2.4 PIC32MZ Embedded Connectivity (EC) Starter Kit

Provides information on the PIC32MZ Embedded Connectivity (EC) Starter Kit.

Description

Microchip Part Number: DM320006 (without Crypto) or DM320006-C (with Crypto)

The top assembly of the board includes these key features, as indicated in Figure 1:

1. PIC32MZ2048ECH144 32-bit microcontroller.
2. Green power indicator LED.
3. On-board crystal or oscillator for precision microcontroller clocking (12 MHz).
4. USB connectivity for on-board debugger communications.
5. Green debug indicator LED.
6. Three push button switches for user-defined inputs.
7. Three user-defined indicator LEDs.
8. USB Type A receptacle connectivity for PIC32 host-based applications.
9. HOST mode power jumper.
10. Daughter board connectors for flexible Ethernet PHY options.
11. 32 kHz oscillator for RTCC and Timer1 (optional).
12. External 2 GB SQI memory for expanded memory application.
13. Jumper for using or disconnecting the on-board debugger.

NOTE: When running self-powered USB device applications, open the jumper JP1 to prevent possibly back-feeding voltage onto the Vbus from one port on the host to another (or from one host to another).

Figure 1: PIC32MZ Embedded Connectivity (EC) Starter Kit Layout (Front)

The bottom assembly of the board includes these key features, as indicated in Figure 2:

1. PIC24FJ256GB106 USB microcontroller for on-board debugging.
2. Regulated +3.3V power supply for powering the starter kit via USB or expansion board.
3. Connector for various expansion boards.
4. USB Type micro-AB receptacle for OTG and USB device connectivity for PIC32 OTG/device-based applications.
5. 50 MHz Ethernet PHY oscillator.
6. USB Host and OTG power supply for powering PIC32 USB applications.

**Figure 2: PIC32MZ Embedded Connectivity (EC) Starter Kit Layout (Back)**

3.5.4.1.2.5 Multimedia Expansion Board II (MEB II)

Provides information on the Multimedia Expansion Board II (MEB II).

Description

Microchip Part Number: DM320005-2

[Product Page](#)

The front side of the MEB II includes these key features, as shown in Figure 1:

1. Display daughter board connector (60-pin Hirose board-to-board connector).
2. mTouch™ buttons.
3. Push Button.
4. Power LED.
5. User LEDs.
6. VGA Camera (OVM7690).
7. PICtail™ Connector.
8. Analog temperature sensor.

Figure 1: Multimedia Expansion Board II Layout (Front)

The underside of the MEB II includes these key features, as shown in Figure 2:

1. Regulated 5V and 3.3V power supply for powering the board via a 9-15V DC Adapter.
2. PIC32 Starter Kit connector (168-pin Hirose board-to-board connector).
3. 24-bit stereo audio codec (AK4953A).
4. Integrated 802.11bg wireless module (MRF24WG0MA).
5. Low-cost Bluetooth® HCI transceiver (BTM805).
6. EBI SRAM memory (IS61WV102416BLL).
7. microSD slot.
8. Analog accelerometer (ADXL325).

Figure 2: Multimedia Expansion Board II Layout (Back)

3.5.4.2 Configuring the Hardware

Describes how to configure the supported hardware.

Description

Explorer 16 Development Board

This demonstration application is demonstrated using Explorer 16 Development Board, PIC32 USB Starter Kit II and PIC32MZ Embedded Connectivity (EC) Starter Kit. The following hardware configuration should be set up before running this application.

1. Before attaching the PIC32MX795F512L PIM to the Explorer 16 Development Board, ensure that the processor select switch (S2) is in the PIM Position.
2. Short JP2 on the Explorer 16 Development Board to enable the LEDs.

PIC32 USB Starter Kit II

No hardware related configuration or jumper setting changes are necessary.

PIC32MZ Embedded Connectivity (EC) Starter Kit

No hardware related configuration or jumper setting changes are necessary.

3.5.5 Building the Application

This section describes how to build this demonstration project.

Description

Once the hardware is configured, you are ready to build this application.

Project Setup :

From the MPLAB X IDE, Select "open project" and browse to this demo location. This demo application is available in "<Install Path>/apps/driver/nvm/nvm_read_write/firmware/nvm_read_write.X". This directory contains all the application related source files, header files as well as MPLAB X IDE project related workspace files.

How to build this demonstration application:

To build this demo in debug mode, Go to "Run" menu in MPLAB X IDE and select "Build Main Project" or select "Build Main Project" in toolbar. Once the project gets compiled successfully, you can run this demonstration application.

For more information on how to compile and program projects, refer to the MPLAB X IDE help available through the help menu in MPLAB X IDE.

Note:The appropriate project configurations should be selected before building the project for the configured hardware.

3.5.5.1 Configuring the Application

This section describes the list of configuration options, build options, and how they are configured for this demonstration application.

Build options:

This application supports both PIC32MX and PIC32MZ devices. From project properties of MPLAB X IDE, select "pic32mx_usb_starterkit_II" configuration if the target hardware is a PIC32MX device, or select "pic32mz_sk" configuration if the

target hardware is a PIC32MZ device.

The default target device is "PIC32MX795F512L" for "pic32mx_usb_starterkit_II" configuration and "PIC32MZ2048ECH144" for "pic32mz_sk" configuration with optimization level as "0". The various optimization levels can be selected from the list to run this demonstration.

Note: If the target device is changed, the appropriate PIM needs to be used to run this demonstration application.

Configuration options:

All of the demonstration application related configuration options are available in "system_config.h" file. This file is available in the "<Install Path>apps/driver/nvm/nvm_read_write/firmware/src/system_config/pic32mx_usb_starterkit_II" or "<Install Path>apps/driver/nvm/nvm_read_write/firmware/src/system_config/pic32mz_sk" directory based on the configuration selected. This file has the following list of configurations:

- General System Clock Services
- NVM Driver
- Interrupt services

Note: Based on the configurations, the demo application behavior will be changed.

3.5.5.2 Configuring the Libraries

This section describes the configuration options provided by MPLAB Harmony Libraries used by the application.

Macro Name	Description
#define DRV_NVM_INSTANCES_NUMBER	This definition selects the maximum number of hardware instances that can be supported by the dynamic NVM driver
#define DRV_NVM_CLIENTS_NUMBER	This definition selects the maximum number of clients that the NVM driver can support at run time
#define DRV_NVM_INTERRUPT_MODE	This macro controls the operation of the driver in the interrupt mode of operation
#define DRV_NVM_ROW_SIZE	This macro defines the row size of target Flash
#define DRV_NVM_PAGE_SIZE	This macro selects the NVM page size size
#define NVM_BASE_ADDRESS	This macro defines the address to which the data is written and read

3.5.5.3 Customizing the Application

This section explains the steps involved in customizing the existing demonstration application.

Customizing Existing Demonstration Application:

In this demo application, the NVM driver operates in interrupt mode. Following are the steps to be used to customize this application in polling mode.

1. Change #define [DRV_NVM_INTERRUPT_MODE](#) as false in "system_config.h" file
2. Remove the NVM ISR routine from "system_int.c" file
3. Call the [DRV_NVM_Tasks](#) function in "system_task.c" file

After changing the above configurations, compile the customized application and program the target device.

3.5.6 Running the Application

This section demonstrates how to run the NVM Driver demonstration.

Description

This is a simple demonstration to show how to configure and make use of NVM driver API's to implement and access on-board Flash memory of PIC32MX and PIC32MZ devices.

How to run this demonstration application:

Once the demonstration application is compiled successfully, you are ready to program the firmware in the target device.

To run the demonstration in debug mode, below are the steps to be followed.

1. Select appropriate configuration from project properties based on the target hardware.
2. Select your device programmer from the "hardware tool" in MPLAB X IDE.
3. Select the "Debug Main Project" in "Debug" menu or select the "Debug Main Project" in toolbar.

Build the selected configuration in the MPLAB X IDE project and program the demonstration board. The execution status (pass/fail) of the demonstration is indicated by LEDs on the demonstration board.

Demonstration Board	Successful Indication	Failure Indication
PIC32 USB Starter Kit II	LED2	LED1
PIC32MZ Embedded Connectivity (EC) Starter Kit	Green LED	Red LED

This demonstration first reads the data from specific NVM address define in system_config.h header file and erases the entire sector, write 150 bytes of data and reads back. The Pass/Fail criteria is indicated using LEDs as defined above.

3.5.7 Files

This section provides a complete list of source files required by the application and describes the purpose of adding each files.

MPLAB Harmony installation follows a standard directory structure for all application solutions. In this directory structure, the driver, plib, system services related source files, header files for this demonstration application are available in "<Installed Path>/framework/". Below are the list of files added in this demonstration application.

Files	Description
driver.h	Driver Library Interface Header
drv_common.h	This file defines all common macros and definitions used by the driver
drv_nvm.h	NVM device driver interface file.
system.h	System Service Interface Headers
sys_common.h	This file contains system Common definitions and declarations
sys_module.h	This file contains system module definitions
system_config.h	This is file contains all the system configurations
system_definitions.h	This contains system prototypes and definitions

app.h	This file contains application related definitions and prototypes
config_performance.c	BSP file for Explorer 16 Development Board
drv_nvm_dynamic.c	This file contains NVM device driver dynamic implementation
plib_int_pic32.c	Interrupt Source implementation for PIC32 devices
sys_int_pic32.c	This file contains functions related to the Interrupt System Service for PIC32 devices
app.c	This file contains application related implementations
main.c	This file contains application's main entry point
system_init.c	This file contains source code necessary to initialize the system
system_int.c	This file contains a definitions of the raw ISRs required to support the interrupt sub-system
system_tasks.c	This file will contain any source code necessary to maintain various tasks in the system

3.6 RTOS Demonstrations

3.6.1 Introduction

RTOS Demonstration Applications Help

Description

This distribution package contains a variety of RTOS based firmware projects that demonstrate the capabilities of the MPLAB Harmony services and stacks integrated with RTOS running on PIC32 devices. This help file describes the hardware requirement and procedures to run these firmware projects on Microchip demonstration and development boards.

To learn more about MPLAB Harmony stacks and libraries refer to the related Framework help documentation.

3.6.2 Release Notes

MPLAB Harmony Version: v0.70b **RTOS Demonstrations Version:** 0.01a **Release Date:** 18Nov2013

New This Release:

This release contains the FreeRTOS basic project.

Known Issues:

Nothing to report for this release.

3.6.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

3.6.4 Demonstrations

This topic provides information on how to run the RTOS demonstration applications included in this release.

Description

All demonstrations provided should be built using the MPLAB X IDE development environment tool supplied by Microchip.

The following information communicates the general steps to building the demonstrations.

- Using MPLAB X IDE, click the File drop-down, select "Open Project...". Navigate to your Harmony installation folder. The default location on Windows will be: C:\Microchip\Harmony\<version>\apps\rtos
- In the \app\rtos folder there will be the demonstration applications.
- Within each demonstration folder, there will be a MPLAB X IDE project specific to each demonstration
- Select the project and click "Open Project"
- To configure the project specific to a preset board configuration, right click on the project and select "Set Configuration"

This will set the build configuration to match the supported board configuration.

3.6.4.1 FreeRTOS_basic_demo

3.6.4.1.1 Supported Demonstration Boards

Lists supported demonstration and development hardware boards.

Description

Demonstration Board (click link for board information)	Notes
PIC32 USB Starter Kit II	-
PIC32MZ Embedded Connectivity (EC) Starter Kit	-

3.6.4.1.2 Configuring the Hardware

Describes how to configure the supported hardware.

Description

PIC32 USB Starter Kit II

No hardware related configuration or jumper setting changes are necessary.

PIC32MZ Embedded Connectivity (EC) Starter Kit

No hardware related configuration or jumper setting changes are necessary.

3.6.4.1.3 Running the Demonstration

Provides instructions on how to build and run the FreeRTOS basic demonstration.

Description

Please use the following procedure to run the demonstration:

1. Load demonstration project into MPLAB X IDE.
2. Connect the mini-B debugger port on-board the PIC32MX or PIC32MZ Starter board to an USB port on the development computer using the USB cable provided in the kit.
3. Build, Download, and Run demonstration project on the target board.

The demonstration application features the following:

- Application creates one queue and four tasks. One task that sends the data using FreeRTOS queue to the two tasks that waits for the data in the queue. (QueueReceiveTask2 priority is higher than the QueueReceiveTask1 priority.)
- QueueReceiveTask2 receives the data first, toggles the LED, and then sleeps for the specified time
- QueueReceiveTask1 receives the next data since QueueReceiveTask2 is not in running state
- QueueReceiveTask1 receives the data, toggles the LED and waits for the data arrival

3.6.4.2 uC_OS_III_basic_demo

3.6.4.2.1 Supported Demonstration Boards

Lists supported demonstration and development hardware boards.

Description

Demonstration Board (click link for board information)	Notes
PIC32 USB Starter Kit II	-
PIC32MZ Embedded Connectivity (EC) Starter Kit	-

3.6.4.2.2 Configuring the Hardware

Describes how to configure the supported hardware.

Description

PIC32 USB Starter Kit II

No hardware related configuration or jumper setting changes are necessary.

PIC32MZ Embedded Connectivity (EC) Starter Kit

No hardware related configuration or jumper setting changes are necessary.

3.6.4.2.3 Running the Demonstration

Provides instructions on how to build and run the uC_OS_III basic demonstration.

Description

Demonstration applications are available in the following folders:

- \app\rtos\freeRTOS\gfx
- \app\rtos\uC_OS_III\gfx
- \app\rtos\freeRTOS\basic
- \app\rtos\uC_OS_III\basic

Within each demonstration folder, there will be a MPLAB X IDE project specific to each demonstration

Select the project and click "Open Project"

These demos will show the following:

- <gfx> The selected RTOS integrated in with the Harmony compliant Graphics stack.
- <basic> The basic blink LED demo showing the selected RTOS running with the hardware.

Once the demo is up running an LED will toggle every 500ms. This demo will show the RTOS running with the selected hardware.

3.6.4.3 FreeRTOS RTOS with Graphics

3.6.4.3.1 Supported Demonstration Boards

Lists supported demonstration and development hardware boards.

Description

Demonstration Board (click link for board information)	Notes
PIC32 USB Starter Kit II	-
PIC32MZ Embedded Connectivity (EC) Starter Kit	-

3.6.4.3.2 Configuring the Hardware

Describes how to configure the supported hardware.

Description**PIC32 USB Starter Kit II**

No hardware related configuration or jumper setting changes are necessary.

PIC32MZ Embedded Connectivity (EC) Starter Kit

No hardware related configuration or jumper setting changes are necessary.

3.6.4.3.3 Running the Demonstration

Provides instructions on how to build and run the FreeRTOS RTOS with Graphics demonstration.

Description

Demonstration applications are available in the following folders:

- \apps\rtos\freeRTOS\gfx
- \apps\rtos\uC_OS_III\gfx
- \apps\rtos\freeRTOS\basic
- \apps\rtos\uC_OS_III\basic

Within each demonstration folder, there will be a MPLAB X IDE project specific to each demonstration

Select the project and click "Open Project"

These demos will show the following:

- <gfx> The selected RTOS integrated in with the Harmony compliant Graphics stack.
- <basic> The basic blink LED demo showing the selected RTOS running with the hardware.

Once the demo is up running the screen color on the graphics display will change once every 500ms. A LED will toggle every 500ms.

The projects have been setup to use relative paths from the project folder and must remain under the apps\rtos\ root folders in order to build correctly.

3.6.4.4 Micrium uC_OS_III with Graphics

3.6.4.4.1 Supported Demonstration Boards

Lists supported demonstration and development hardware boards.

Description

Demonstration Board (click link for board information)	Notes
PIC32 USB Starter Kit II	-
PIC32MZ Embedded Connectivity (EC) Starter Kit	-

3.6.4.4.2 Configuring the Hardware

Describes how to configure the supported hardware.

Description**PIC32 USB Starter Kit II**

No hardware related configuration or jumper setting changes are necessary.

PIC32MZ Embedded Connectivity (EC) Starter Kit

No hardware related configuration or jumper setting changes are necessary.

3.6.4.4.3 Running the Demonstration

Provides instructions on how to build and run the Micrium uC_OS_III with Graphics demonstration.

Description

Demonstration applications are available in the following folders:

- \app\rtos\freeRTOS\gfx
- \app\rtos\uC_OS_III\gfx
- \app\rtos\freeRTOS\basic
- \app\rtos\uC_OS_III\basic

Within each demonstration folder, there will be a MPLAB X IDE project specific to each demonstration

Select the project and click "Open Project"

These demos will show the following:

- <gfx> The selected RTOS integrated in with the Harmony compliant Graphics stack.
- <basic> The basic blink LED demo showing the selected RTOS running with the hardware.

Once the demo is up running the screen color on the graphics display will change once every 500ms. A LED will toggle every 500ms.

The projects have been setup to use relative paths from the project folder and must remain under the apps\rtos\ root folders in order to build correctly.

Under the uC_OS_III\ folder, an extra step must be taken to build the project successfully. The RTOS source code and appropriate port for the selected hardware must be download from Micrium and installed into the follow folder, <harmony_install_path>\third_party\rtos\.

3.6.5 Demonstration Board Information

3.6.5.1 PIC32 USB Starter Kit II

Provides information on the PIC32 USB Starter II.

Description

SW1 - Application switch. Tied to RD6.

SW2 - Application switch. Tied to RD7.

SW3 - Application switch. Tied to RD13.

LED1 - Application LED. Tied to RD0.

LED2 - Application LED. Tied to RD1.

LED3 - Application LED. Tied to RD2.

More Information

Microchip Part Number : DM320003-2

3.6.5.2 PIC32MZ Embedded Connectivity (EC) Starter Kit

Provides details information on the PIC32MZ Embedded Connectivity (EC) Starter Kit.

Description

Microchip Part Number: DM320006 (without Crypto) or DM320006-C (with Crypto)

The top assembly of the board includes these key features, as indicated in Figure 1:

1. PIC32MZ2048ECH144 32-bit microcontroller.
2. Green power indicator LED.
3. On-board crystal or oscillator for precision microcontroller clocking (12 MHz).
4. USB connectivity for on-board debugger communications.
5. Green debug indicator LED.
6. Three push button switches for user-defined inputs.
7. Three user-defined indicator LEDs.
8. USB Type A receptacle connectivity for PIC32 host-based applications.
9. HOST mode power jumper.
10. Daughter board connectors for flexible Ethernet PHY options.
11. 32 kHz oscillator for RTCC and Timer1 (optional).
12. External 2 GB SQI memory for expanded memory application.

13. Jumper for using or disconnecting the on-board debugger.

NOTE: When running self-powered USB device applications, open the jumper JP1 to prevent possibly back-feeding voltage onto the Vbus from one port on the host to another (or from one host to another).

Figure 1: PIC32MZ Embedded Connectivity (EC) Starter Kit Layout (Front)

The bottom assembly of the board includes these key features, as indicated in Figure 2:

1. PIC24FJ256GB106 USB microcontroller for on-board debugging.
2. Regulated +3.3V power supply for powering the starter kit via USB or expansion board.
3. Connector for various expansion boards.
4. USB Type micro-AB receptacle for OTG and USB device connectivity for PIC32 OTG/device-based applications.
5. 50 MHz Ethernet PHY oscillator.
6. USB Host and OTG power supply for powering PIC32 USB applications.

Figure 2: PIC32MZ Embedded Connectivity (EC) Starter Kit Layout (Back)

Microchip Part Number: DM320006 (without Crypto) or DM320006-C (with Crypto)

The top assembly of the board includes these key features, as indicated in Figure 1:

1. PIC32MZ2048ECH144 32-bit microcontroller.
2. Green power indicator LED.
3. On-board crystal or oscillator for precision microcontroller clocking (12 MHz).
4. USB connectivity for on-board debugger communications.
5. Green debug indicator LED.
6. Three push button switches for user-defined inputs.
7. Three user-defined indicator LEDs.
8. USB Type A receptacle connectivity for PIC32 host-based applications.
9. HOST mode power jumper.
10. Daughter board connectors for flexible Ethernet PHY options.
11. 32 kHz oscillator for RTCC and Timer1 (optional).
12. External 2 GB SQI memory for expanded memory application.
13. Jumper for using or disconnecting the on-board debugger.

NOTE: When running self-powered USB device applications, open the jumper JP1 to prevent possibly back-feeding voltage onto the Vbus from one port on the host to another (or from one host to another).

Figure 1: PIC32MZ Embedded Connectivity (EC) Starter Kit Layout (Front)

3.7 SPI Driver Demonstrations

3.7.1 Introduction

This help file contains instructions and associated information about MPLAB Harmony SPI driver application demonstrations, which are contained in the MPLAB Harmony Library distribution.

Description

This application demonstrates the capabilities of the MPLAB Harmony SPI driver. This help file describes the hardware requirement and procedures to build, run the demo project on Microchip development tools. In this demo application, SPI driver is used to access the external EEPROM in the Explorer 16 Development Board to perform Write and Read operations and indicates the result by LED display.

To know more about MPLAB Harmony SPI driver, configuring the SPI driver and API's provided by the SPI driver, refer to the [SPI Driver Library](#) documentation.

3.7.2 Release Notes

MPLAB Harmony Version: v0.70b **SPI Driver Demonstrations Version:** 0.01a **Release Date:** 18Nov2013

New This release:

This is the first release of this SPI driver demonstration application. This demo has been developed to support PIC32MX devices only. The following demonstration shows the usage of the SPI driver:

- serial_eeprom

Limitations and Known Issues:

- Demo application is only developed and tested in Interrupt mode
- Changes in SPI driver interfaces will have impact on this demo application as well in subsequent releases
- This demo will support to run only on Explorer 16 Development Board

3.7.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY,

FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

3.7.4 Hardware

This section describes how to select and use an appropriate development board and steps to configure the hardware to run this SPI driver demo.

3.7.4.1 Required Hardware

This section describes the overview of required hardware family and supported demonstration boards for running this SPI driver demo application.

Description

To run this demonstration project, you will require one of the following sets of hardware.

3.7.4.1.1 Supported Demonstration Boards

The following demo boards are supported in this release.

Description

Demonstration Board	Notes
Explorer 16 Development board	-

3.7.4.1.2 Hardware Information

Information on hardware used by the SPI driver demo application.

Description

The SPI driver demo application can be tried across on hardware boards. This section provide details on the different hardware boards that are used by the demo application.

3.7.4.1.2.1 Explorer 16 Development Board

Provides information on the Explorer 16 Development Board .

Description

S1 - Reset button (MCLR)

S2 - Processor switch. This switch determines which processor is running, the processor on the board or the processor on the Plug-In-Module (PIM).

S3, S4, S5, S6 - Application switches. For information about what pin is connected to this switch, please refer to the information for the PIM in use.

D3 through D10 - Application LEDs. For information about what pin is connected to this LED, please refer to the information for the PIM in use.

More Information:

Microchip Part Number: DM240001

3.7.4.1.2.2 PIC32MX795F512L Plug-in Module (PIM)

Provides information on the PIC32MX795F512L Plug-In-Module (PIM).

Description

This PIM is required while using the [Explorer 16 Development Board](#).

More Information

Microchip Part Number: MA320003

[Information Sheet](#)

3.7.4.2 Configuring the Hardware

Describes how to configure the supported hardware.

Description**serial_eeprom demo**

This application is demonstrated using Explorer 16 Development Board. the following hardware configuration should be done before running this application.

1. Before attaching the PIC32MX795F512L PIM to the Explorer 16 Development Board, ensure that the processor select switch (S2) is in the PIM Position.
2. Short JP2 on the Explorer 16 Development Board to enable the LEDs.

Complete the previously described hardware configuration setup to to run this demo.

3.7.5 Building the Application

This section describes how to build this demo project.

Description

Once the hardware is configured, you are ready to build this application.

Project Setup :

From MPLAB X IDE, Select "open project" and browse to this demo location. This demo application is available in "<Install Path>/apps/driver/spi/serial_eeprom.X". This directory contains all the application related source files, header files as well as MPLAB X IDE project related workspace files.

How to build this demo application:

To build this demo in debug mode, Go to "Run" menu in MPLAB X IDE and select "Build Main Project" or select "Build Main Project" in toolbar. Once the project gets compiled successfully, you can run this demo application.

For more information on how to compile and program projects, refer to the MPLAB X IDE help available through the help menu in MPLAB X IDE.

Note: The appropriate project configurations should be selected before building the project for the configured hardware.

3.7.5.1 Customizing the Application

This section explains the steps involved in customizing the existing demo application.

Customizing Existing Demo Application:

In this demo application, the SPI driver is operates in interrupt mode. Below are the steps to be followed to customize this application in polling mode.

1. Change #define `DRV_SPI_INTERRUPT_MODE` as false in "system_config.h" file
2. Remove the SPI interrupt source Priority and sub priority set functions calls from "system_init.c" file
3. Remove the SPI ISR routine from "system_int.c" file
4. Call the `DRV_SPI_Tasks` function in "system_task.c" file

After changing the above configurations, compile the customized application and program the target device.

3.7.5.2 Configuring the Libraries

This section describes the configuration options provided by MPLAB Harmony Libraries used by the application.

#define <code>DRV_SPI_INSTANCES_NUMBER</code>	This definition selects the maximum number of hardware instances that can be supported by the dynamic SPI driver
#define <code>DRV_SPI_CLIENTS_NUMBER</code>	This definition selects the maximum number of clients that the SPI driver can support at run time
#define <code>DRV_SPI_INTERRUPT_MODE</code>	This macro controls the operation of the driver in the interrupt mode of operation
#define <code>DRV_SPI_PORTS_REMAP_USAGE</code>	This macro selects the SPI pins remap
#define <code>DRV_SPI_BUFFER_SIZE</code>	This macro selects the SPI buffer size
#define <code>DRV_SPI_FRAME_SYNC_PULSE_DIRECTION</code>	This macro selects the SPI frame sync pulse direction
#define <code>DRV_SPI_FRAME_SYNC_PULSE_POLARITY</code>	This macro selects the SPI frame sync pulse polarity
#define <code>DRV_SPI_FRAME_SYNC_PULSE_EDGE</code>	This macro selects the SPI frame sync pulse edge

3.7.5.3 Configuring the Application

This section describes the list of configuration options , build options and how they are configured for this demo application.

Build options:

This application supports only to demonstrate the SPI driver in master mode. This option "spi_master_explorer16" can be selected from the project properties in MPLAB X IDE or from the configuration drop down in toolbar.

The default target device is selected as "PIC32MX795F512L" with optimization level as "0". The various optimization levels can be selected from the list to run this demo.

Note: If the target device is changed, then appropriate PIM needs to be used to run this demo application

Configuration options:

All the demo application related configuration options are available in "system_config.h" file. This file is available in the "<Install Path>/apps/driver/spi/src/system_config/" directory based on the configured hardware. This file has the following configurations,

- General System Clock Services
- SPI Driver

Note: Based on the configurations, the demo application behavior will be changed.

3.7.6 Running the Application

This section demonstrates how to run the SPI driver demo.

Description

This is a simple demo to show how to configure and make use of SPI driver API's to implement and access on board EEPROM chip in the Explorer 16 Development Board.

How to run this demo application

Once the demo application is compiled successfully, you are ready to program the firmware in the target device.

To run the demo in debug mode, below are the steps to be followed.

1. Select your device programmer from the "hardware tool" in MPLAB X IDE.
2. Select the "Debug Main Project" in "Debug" menu or select the "Debug Main Project" in toolbar.

Once the device is successfully programmed, you can observe LED in the Explorer 16 Development Board will be turned ON. This shows the demo project has ran successfully and based on the LED "D4" or "D3" the demo application indicates the PASS/FAIL.

Notes:

If LED "D3" is turned ON, it indicates the EEPROM W/R functionality has failed.

If LED "D4" is turned ON, it indicates the EEPROM W/R functionality has passed.

3.7.7 Files

This section provides a complete list of source files required by the application and describes the purpose of adding each files.

MPLAB Harmony installation follows a standard directory structure for all application solutions. In this directory structure, the driver, plib, system services related source files, header files for this demo application are available in "<Installed Path>/framework/". Below are the list of files added in this demo application.

Files	Description
driver.h	Driver Library Interface Header
drv_common.h	This file defines all common macros and definitions used by the driver
drv_spi.h	SPI device driver interface file.
system.h	System Service Interface Headers
sys_common.h	This file contains system Common definitions and declarations
sys_module.h	This file contains system module definitions
system_config.h	This is file contains all the system configurations
system_definitions.h	This contains system prototypes and definitions
app.h	This file contains application related definitions and prototypes
config_performance.c	BSP file for Explorer 16 Development Board
drv_spi_dynamic.c	This file contains SPI device driver dynamic implementation

plib_int_pic32.c	Interrupt Source implementation for PIC32 devices
sys_clk.c	This file contains clock system service implementation
sys_clk_pic32.c	This file contains clock system service implementation specific to PIC32 devices
sys_queue.c	This file contains system queue services
sys_int_pic32.c	This file contains functions related to the Interrupt System Service for PIC32 devices
sys_ports.c	This file contains Ports System Service interface implementation.
app.c	This file contains application related implementations
main.c	This file contains application's main entry point
system_init.c	This file contains source code necessary to initialize the system
system_int.c	This file contains a definitions of the raw ISRs required to support the interrupt sub-system
system_tasks.c	This file will contain any source code necessary to maintain various tasks in the system

3.8 TCP/IP Demonstrations

3.8.1 Introduction

TCP/IP Web Server Demonstration Applications Help

Description

Note: This information was not available at time of release and will be added in a future release of MPLAB Harmony.

3.8.2 Release Notes

MPLAB Harmony Version: v0.70b **TCP/IP Demonstrations Version:** 0.01a **Release Date:** 18Nov2013

The interface can change in the beta and/or 1.0 release.

New This Release:

Nothing to report for this release.

Known Issues:

Nothing to report for this release.

3.8.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

3.8.4 Demonstrations

Description of TCP/IP Stack Library Demonstration Application

Description

This section describes Microchip's TCP/IP Demonstration projects, including information about demonstration-hardware compatibility and also provides the information about how to configure and run the demonstration.

3.8.4.1 web_server

3.8.4.1.1 pic32_ethernet_starter_kit

This section describes the steps necessary to begin using Microchip's TCP/IP Web server Demonstration Application.

Description

This section describes Microchip's TCP/IP Web Server Demonstration project, including information about demonstration-hardware compatibility and also provides the information about how to configure and run the demonstration.

3.8.4.1.1.1 Supported Hardware

Lists supported demonstration and development hardware boards.

Description

Demo Board (click link for board information)	Notes
PIC32 Ethernet Starter Kit	--
PIC32MZ Embedded Connectivity (EC) Starter Kit	--

3.8.4.1.1.2 Configuring the Hardware

Describes how to configure the supported hardware.

Description

No hardware related configuration or jumper setting changes are necessary.

3.8.4.1.1.3 Running the Demonstration

Provides instructions on how to build and run the TCP/IP Web Server demonstration.

Description

This demonstration hosts a HTTP server when connected to a network. To view the web page hosted by the demonstration application open a web browser, type `http://mchpboard` in the address bar and press the enter key.

Please use the following procedure to run the demonstration:

1. Load demonstration project into MPLAB X IDE.

2. Connect the mini-B debugger port on-board the PIC32MZ Embedded Connectivity (EC) Starter Kit or PIC32MZ Ethernet Starter Kit board to an USB port on the development computer using the USB cable provided in the kit.
3. Connect the RJ-45 Ethernet port on the PIC32MZ Embedded Connectivity (EC) Starter Kit or PIC32MZ Ethernet Starter Kit board to a network hub or an Ethernet port on the development computer using the Ethernet patch cord provided in the kit.
4. Build, Download, and Run demonstration project on the target board.
5. A HTTP server is hosted by the demonstration application. Open a web browser, type `http://mchpboard` in the address bar and press the enter key.

The demonstration application features following:

- a) Real-time hardware control and Dynamic Variables - On the Overview page the LEDs can be clicked to toggle LEDs on the Ethernet Starter Board. The buttons on Ethernet Starter Board can be pressed to see the Buttons on the webpage toggle. The dynamic variables can be updated in real time on the HTTP server.
- b) Form Processing - Input can be handled from the client by using GET and POST methods.
- c) Authentication - Shows an example to restricted access feature commonly used.
- d) File Uploads - Shows an example of file upload using POST method. The HTTP server can **accept** a user defined MPFS/MPFS2 image file for webpages.
- e) Board Configuration - MAC address, host name and IP address of the PIC32 Ethernet starter board can be viewed in the Network Configuration page and some configuration can be updated.

Note: LED functionality part of the demonstration is not implemented for PIC32MZ devices.

3.8.4.1.2 web_server_sdcard_fatfs

This section describes the steps necessary to begin using Microchip's TCP/IP Web server Demonstration Application.

Description

The TCP/IP SDCARD FATFS web server demo ('apps/tcpip/web_server_sdcard_fatfs/firmware/pic32_ethernet_starter_kit.X') exercises the HTTP web server running on PIC32 devices. SDCARD (Secure Digital Card) FATFS (File Allocation Table File System) web server demo has the web pages stored in external SD CARD and accessed through FATFS API. This demo currently only works with PIC32MZ using the Multimedia Expansion Board II (MEB II) Setup. PIC32MZ Testing and Fixes in progress.

3.8.4.1.2.1 Supported Hardware

Lists supported demonstration and development hardware boards.

Description

Demo Board (click link for board information)	Notes
PIC32MZ Embedded Connectivity (EC) Starter Kit	--
Multimedia Expansion Board II (MEB II)	--

3.8.4.1.2.2 Configuring the Hardware

Describes how to configure the supported hardware.

Description

- Plug the PIC32MZ Embedded Connectivity (EC) Starter Kit into application board connector on the MEB II
- Make sure a microSD card is formatted and loaded with the web pages provided under 'apps/tcpip/web_server_sdcard_fatfs/firmware/src/web_pages2_sdcard' directory
- Insert the microSD card with the web pages into the microSD card slot (J8) on the MEB II

3.8.4.1.2.3 Running the Demonstration

This section provides instructions on how to build and run the TCP/IP SD CARD FS Web Server demonstration.

Description

To view the web page hosted by the demonstration application open a web browser, type `http://mchpboard_e` in the address bar and press the Enter key.

Please use the following procedure to run the demonstration:

1. Load demonstration project into MPLAB X IDE.
2. Connect the mini-B debugger port on-board the PIC32MZ Embedded Connectivity (EC) Starter Kit or PIC32MZ Ethernet Starter Kit to a USB port on the Development computer using the USB cable provided in the kit.
3. Connect the RJ-45 Ethernet port on the PIC32MZ Embedded Connectivity (EC) Starter Kit or PIC32MZ Ethernet Starter Kit board to a network hub or an Ethernet port on the development computer using the Ethernet patch cord provided in the kit.
4. Make sure the microSD card with the web pages is inserted into the microSD card slot on the MEB II.
5. Build, Download, and Run demonstration project on the target board.
6. A HTTP server is hosted by the demonstration application. Open a web browser, type `http://mchpboard_e` in the address bar and press the Enter key. The demonstration application features following:

a. Real-time hardware control and Dynamic Variables - On the Overview page the LEDs can be clicked to toggle LEDs on the Ethernet Starter Board. The buttons on Ethernet Starter Board can be pressed to see the Buttons on the web page toggle. The dynamic variables can be updated in real time on the HTTP server.

Note: LED functionality part of the demonstration is somewhat limited due to errata items related to the functional multiplexing on GPIO and Ethernet pins.

b. Form Processing - Input can be handled from the client by using GET and POST methods.

c. Authentication - Shows an example to restricted access feature commonly used.

d. Cookies – Shows the example of storing small text strings on the client side.

e. File Uploads - Shows an example of file upload using POST method. The HTTP server can [accept](#) a user defined MPFS/MPFS2 image file for web pages.

f. Send E-mail – Shows a simple SMTP POST methods.

g. Dynamic DNS – Exercise Dynamic DNS capabilities.

h. Network Configuration - MAC address, host name and IP address of the PIC32 Ethernet starter board can be viewed in the Network Configuration page and some configuration can be updated.

3.8.4.1.3 web_server_nvm_mpfs

This section describes the steps necessary to begin using Microchip's TCP/IP Web server Demonstration Application.

Description

The TCP/IP NVM MPFS web server demo ('apps/tcpip/web_server_nvm_mpfs/firmware/pic32_ethernet_starter_kit.X') exercises the HTTP web server running on PIC32 devices. The Non-Volatile Memory (NVM) MPFS (Microchip Proprietary File System) web server demonstration has the web pages stored in internal Flash and accessed through the MPFS API.

3.8.4.1.3.1 Supported Hardware

Lists supported demonstration and development hardware boards.

Description

Demo Board (click link for board information)	Notes
PIC32 Ethernet Starter Kit	--
PIC32MZ Embedded Connectivity (EC) Starter Kit	--

3.8.4.1.3.2 Configuring the Hardware

Describes how to configure the supported hardware.

Description

No hardware related configuration or jumper setting changes are necessary.

3.8.4.1.3.3 Running the Demonstration

This section provides instructions on how to build and run the TCP/IP Web Server demonstration.

Description

To view the web page hosted by the demonstration application open a web browser, type `http://mchpboard_e` in the address bar and press the enter key.

Please use the following procedure to run the demonstration:

1. Load demonstration project into MPLAB X IDE.
2. Connect the mini-B debugger port on-board the PIC32MZ Embedded Connectivity (EC) Starter Kit or PIC32MZ Ethernet Starter Kit board to a USB port on the Development computer using the USB cable provided in the kit.
3. Connect the RJ-45 Ethernet port on the PIC32MZ Embedded Connectivity (EC) Starter Kit or PIC32MZ Ethernet Starter Kit board to a network hub or an Ethernet port on the development computer using the Ethernet patch cord provided in the kit.
4. Build, Download, and Run demonstration project on the target board.
5. A HTTP server is hosted by the demonstration application. Open a web browser, type `http://mchpboard_e` in the address bar and press the enter key. The demonstration application features following:
 - a. Real-time hardware control and Dynamic Variables - On the Overview page the LEDs can be clicked to toggle LEDs on the Ethernet Starter Board. The buttons on Ethernet Starter Board can be pressed to see the Buttons on the web page toggle. The dynamic variables can be updated in real time on the HTTP server.

Note: LED functionality part of the demonstration is somewhat limited due to errata items related to the functional multiplexing on GPIO and Ethernet pins.
 - b. Form Processing - Input can be handled from the client by using GET and POST methods.
 - c. Authentication - Shows an example to restricted access feature commonly used.
 - d. Cookies – Shows the example of storing small text strings on the client side.

- e. File Uploads - Shows an example of file upload using POST method. The HTTP server can accept a user defined MPFS/MPFS2 image file for web pages.
- f. Send E-mail – Shows a simple SMTP POST methods.
- g. Dynamic DNS – Exercise Dynamic DNS capabilities.
- h. Network Configuration - MAC address, host name and IP address of the PIC32 Ethernet starter board can be viewed in the Network Configuration page and some configuration can be updated.

3.8.5 Demonstration Board Information

Information on Hardware used by the TCP/IP Demonstration Applications.

Description

This section provide details on the different hardware boards that are used by the demonstration applications.

3.8.5.1 PIC32 Ethernet Starter Kit

Information on PIC32 Ethernet Starter Kit Hardware.

Description

This board provides a low-cost, modular development system for Microchip's line of 32-bit Microcontrollers (MCUs)

PIC32 Ethernet Starter Kit

More Information

Microchip Part Number: DM320004

[Microchip Product Page](#)

3.8.5.2 PIC32MZ Embedded Connectivity (EC) Starter Kit

Information on the PIC32MZ Embedded Connectivity (EC) Starter Kit.

Description

Microchip Part Number: DM320006 (without Crypto) or DM320006-C (with Crypto)

The top assembly of the board includes these key features, as indicated in Figure 1:

1. PIC32MZ2048ECH144 32-bit microcontroller.
2. Green power indicator LED.
3. On-board crystal or oscillator for precision microcontroller clocking (12 MHz).
4. USB connectivity for on-board debugger communications.
5. Green debug indicator LED.
6. Three push button switches for user-defined inputs.
7. Three user-defined indicator LEDs.
8. USB Type A receptacle connectivity for PIC32 host-based applications.
9. HOST mode power jumper.
10. Daughter board connectors for flexible Ethernet PHY options.
11. 32 kHz oscillator for RTCC and Timer1 (optional).
12. External 2 GB SQI memory for expanded memory application.
13. Jumper for using or disconnecting the on-board debugger.

NOTE: When running self-powered USB device applications, open the jumper JP1 to prevent possibly back-feeding voltage onto the Vbus from one port on the host to another (or from one host to another).

Figure 1: PIC32MZ Embedded Connectivity (EC) Starter Kit Layout (Front)

The bottom assembly of the board includes these key features, as indicated in Figure 2:

1. PIC24FJ256GB106 USB microcontroller for on-board debugging.
2. Regulated +3.3V power supply for powering the starter kit via USB or expansion board.
3. Connector for various expansion boards.
4. USB Type micro-AB receptacle for OTG and USB device connectivity for PIC32 OTG/device-based applications.
5. 50 MHz Ethernet PHY oscillator.
6. USB Host and OTG power supply for powering PIC32 USB applications.

Figure 2: PIC32MZ Embedded Connectivity (EC) Starter Kit Layout (Back)

Microchip Part Number: DM320006 (without Crypto) or DM320006-C (with Crypto)

The top assembly of the board includes these key features, as indicated in Figure 1:

1. PIC32MZ2048ECH144 32-bit microcontroller.
2. Green power indicator LED.
3. On-board crystal or oscillator for precision microcontroller clocking (12 MHz).
4. USB connectivity for on-board debugger communications.
5. Green debug indicator LED.
6. Three push button switches for user-defined inputs.
7. Three user-defined indicator LEDs.
8. USB Type A receptacle connectivity for PIC32 host-based applications.
9. HOST mode power jumper.
10. Daughter board connectors for flexible Ethernet PHY options.
11. 32 kHz oscillator for RTCC and Timer1 (optional).
12. External 2 GB SQI memory for expanded memory application.
13. Jumper for using or disconnecting the on-board debugger.

NOTE: When running self-powered USB device applications, open the jumper JP1 to prevent possibly back-feeding voltage onto the Vbus from one port on the host to another (or from one host to another).

Figure 1: PIC32MZ Embedded Connectivity (EC) Starter Kit Layout (Front)

The bottom assembly of the board includes these key features, as indicated in Figure 2:

1. PIC24FJ256GB106 USB microcontroller for on-board debugging.
2. Regulated +3.3V power supply for powering the starter kit via USB or expansion board.
3. Connector for various expansion boards.
4. USB Type micro-AB receptacle for OTG and USB device connectivity for PIC32 OTG/device-based applications.
5. 50 MHz Ethernet PHY oscillator.

6. USB Host and OTG power supply for powering PIC32 USB applications.

Figure 2: PIC32MZ Embedded Connectivity (EC) Starter Kit Layout (Back)

3.8.5.3 Multimedia Expansion Board II (MEB II)

Provides details information on the Multimedia Expansion Board II (MEB) II.

Description

Microchip Part Number: DM320005-2

[Product Page](#)

The front side of the MEB II includes these key features, as shown in Figure 1:

1. Display daughter board connector (60-pin Hirose board-to-board connector).
2. mTouch™ buttons.
3. Push Button.
4. Power LED.
5. User LEDs.
6. VGA Camera (OVM7690).
7. PICtail™ Connector.
8. Analog temperature sensor.

Figure 1: Multimedia Expansion Board II Layout (Front)

The underside of the MEB II includes these key features, as shown in Figure 2:

1. Regulated 5V and 3.3V power supply for powering the board via a 9-15V DC Adapter.
2. PIC32 Starter Kit connector (168-pin Hirose board-to-board connector).
3. 24-bit stereo audio codec (AK4953A).
4. Integrated 802.11bg wireless module (MRF24WG0MA).
5. Low-cost Bluetooth® HCI transceiver (BTM805).
6. EBI SRAM memory (IS61WV102416BLL).
7. microSD slot.
8. Analog accelerometer (ADXL325).

Figure 2: Multimedia Expansion Board II Layout (Back)

3.9 USART Driver Demonstration

3.9.1 Introduction

This help manual contains instructions and information about MPLAB Harmony USART driver demo application, which are contained in the MPLAB Harmony Library distribution.

Description

This application demonstrates how to use the MPLAB Harmony USART driver. This help manual describes the hardware requirement and procedures to build and execute the demo project on Microchip development tools. In this demo application, USART driver will initially transmit strings of data and then [accept](#) and characters received and transmit the data back. Error or success status is indicated by LED display.

To know more about MPLAB Harmony USART driver, configuring the USART driver and API's provided by the USART driver, refer to [USART Driver Library](#) documentation.

3.9.2 Release Notes

MPLAB Harmony Version: v0.70b **USART Driver Demonstration:** 0.01a **Release Date:** 18Nov2013

New This Release:

This is the first release of this USART driver demo application. This demo has been developed to support PIC32MX devices only.

Known Issues:

- Changes in USART driver interfaces will have impact on this demo application as well in subsequent releases
- This demo is has not been developed to run on PIC32MZ devices. Users must add a new configuration if intended to run on PIC32MZ devices.

3.9.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS

BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

3.9.4 Hardware

This section describes how to select and use an appropriate development board and steps to configure the hardware to run this USART driver demo.

3.9.4.1 Required Hardware

This section describes the overview of required device family and supported demonstration boards to run this USART driver demo application.

Description

This section describes the hardware required to execute the Harmony USART driver demo application.

3.9.4.1.1 Supported Demonstration Boards

Lists supported demonstration and hardware development boards.

Description

Demonstration Board	Notes
Explorer 16 Development Board	-

3.9.4.1.2 Hardware Information

Information on hardware used by the USART driver demo application.

Description

The USART driver demo application can be tried across on hardware boards. This section provide details on the different hardware boards that are used by the demo application.

3.9.4.1.2.1 Explorer 16 Development Board

Provides information on the Explorer 16 Development Board .

Description

S1 - Reset button (MCLR)

S2 - Processor switch. This switch determines which processor is running, the processor on the board or the processor on the Plug-In-Module (PIM).

S3, S4, S5, S6 - Application switches. For information about what pin is connected to this switch, please refer to the information for the PIM in use.

D3 through D10 - Application LEDs. For information about what pin is connected to this LED, please refer to the information for the PIM in use.

More Information:

Microchip Part Number: DM240001

3.9.4.1.2.2 PIC32MX795F512L Plug-in Module (PIM)

Provides information on the PIC32MX795F512L Plug-In-Module (PIM).

Description

This PIM is required while using the [Explorer 16 Development Board](#).

More Information

Microchip Part Number: MA320003

[Information Sheet](#)

3.9.4.2 Configuring the Hardware

This section describes how to configure the supported hardware.

Description

Explorer 16 Development Board

Below are the hardware configuration settings required to execute this demo

1. Before attaching the PIC32MX795F512L PIM to the Explorer 16 Development Board, ensure that the processor select switch (S2) is in the PIM Position.
2. Short JP2 on the Explorer 16 Development Board to enable the LEDs.

3.9.5 Building the Application

This section describes how to build this demo project.

Description

Once the hardware is configured, you are ready to build this application.

Project Setup:

From MPLAB X IDE, Select "open project" and browse to this demo project location. This demo application is available in "<Install Path>/apps/driver/usart/usart_echo/firmware/usart_echo.X". This directory contains all the application related source files, header files as well as MPLAB X IDE project related workspace files.

How to build this demo application:

To build this demo in debug mode, Go to "Run" menu in MPLAB X IDE and select "Build Main Project" or select "Build Main Project" in toolbar. Once the project gets compiled successfully, you can run this demo application.

For more information on how to compile and program projects, refer to the MPLAB X IDE help available through the help menu in MPLAB X IDE.

Note: The appropriate project configurations should be selected before building the project for the configured hardware.

3.9.5.1 Configuring the Application

This section describes the list of configuration options , build options and how they are configured for this demo application.

Build options:

The default target device is selected as "PIC32MX795F512L" with optimization level as "0". The various optimization levels can be selected from the list to run this demo.

Note: If the target device is changed, then appropriate PIM needs to be used to run this demo application

Configuration options:

All the demo application related configuration options are available in "system_config.h" file. This file is available in the "<Install Path>/apps/driver/usart/usart_echo/firmware/src/system_config/pic32mx_default" directory based on the configured hardware.

Note: Based on the configurations, the demo application behavior will be changed.

3.9.5.2 Configuring the Libraries

This section describes the configuration options provided by MPLAB Harmony Libraries used by the application. The below parameters are defined in "system_config.h" header file.

Parameter Name	Description
<code>#define DRV_USART_INSTANCES_NUMBER</code>	This macro defines the maximum number of hardware instances that will be used by the application. The USART driver will support a maximum of that many hardware instances.
<code>#define DRV_USART_CLIENTS_NUMBER</code>	This macro defines the maximum number of clients that will be used by the application. The USART driver will support a maximum of that many clients.
<code>#define DRV_USART_INTERRUPT_MODE</code>	If this macro is set to "true", the application will run in interrupt mode. If this macro is set to "false", the application will run in polling mode
<code>#define DRV_USART_INTERRUPT_SOURCE_TX</code>	This macro defines the transmit interrupt source
<code>#define DRV_USART_INTERRUPT_SOURCE_RX</code>	This macro defines the receive interrupt source

#define SYS_USART_ID	This macro defines the USART module number used in the application
#define DRV_USART_XFER_BUFFER_NUMBER	This macro defines the number of transfer buffers used in the application
#define APP_UART_BAUDRATE	This macro defines the baud rate to be used

3.9.5.3 Customizing the Application

This section explains the steps involved in customizing the existing demo application.

Customizing Existing Demo Application:

Changing the USART module

In system_config.h header file, modify the *SYS_USART_ID* macro to change the USART module number.

Changing the demo to interrupt mode

By default, the USART demo application will run in polling mode. Below are the steps to be followed to run the demo in interrupt mode.

1. Change #define *DRV_USART_INTERRUPT_MODE* to true in "system_config.h" file
2. Remove the DRV_USART_Tasks function call in sys_tasks in "system_task.c" file
3. Call the DRV_USART_Tasks function in ISR in "system_int.c" file

Changing USART settings

To change the USART related parameters such as baud rate, parity settings, number of stop bits, etc., select appropriate values in *drvUSARTInit* structure in system_init.c file

After changing the above configurations, compile the customized application and program the target device.

3.9.6 Running the Application

This section demonstrates how to run the USART driver demo.

Description

Once the demo application has been compiled successfully for the intended configuration, program the firmware into the target device.

Upon execution, the application will transmit the following strings through USART with settings as defined in the application.

```
/*****
```

```
Welcome to Microchip USART Echo Demo App.
```

```
Press any character. Data will be echoed back.
```

```
Press 'ESC' key to exit the application
```

```
*****/
```

After transmitting the above text, the firmware will read any characters received through USART and it will transmit back the same data. If the received character is "ESC" (0x1B), the program will enter into idle mode. Once in Idle mode, the firmware will neither transmit nor receive any data. If the application enters Idle mode, LED 5 of the Explorer 16 Development Board will

illuminate. If any error occurs, LED 9 of the Explorer 16 Development Board will illuminate.

3.9.7 Files

This section provides a complete list of source and header files used by the application and describes the purpose of adding each files.

MPLAB Harmony installation follows a standard directory structure for all application solutions. In this directory structure, the driver, plib, system services related source files, header files for this demo application are available in "<Installed Path>/framework/". Below are the list of files added in this demo application.

Files	Description
driver.h	Driver Library Interface Header
drv_common.h	This file defines all common macros and definitions used by the driver
drv_usart.h	USART device driver interface file.
system.h	System Service Interface Headers
sys_common.h	This file contains system Common definitions and declarations
sys_module.h	This file contains system module definitions
system_config.h	This is file contains all the system configurations
system_definitions.h	This contains system prototypes and definitions
app.h	This file contains application related definitions and prototypes
config_performance.c	BSP file for the Explorer 16 Development Board
drv_usart_dynamic.c	This file contains USART device driver dynamic implementation
plib_int_pic32.c	Interrupt Source implementation for PIC32 devices
sys_clk.c	This file contains clock system service implementation
sys_clk_pic32.c	This file contains clock system service implementation specific to PIC32 devices
sys_queue.c	This file contains system queue services
sys_int_pic32.c	This file contains functions related to the Interrupt System Service for PIC32 devices
sys_ports.c	This file contains Ports System Service interface implementation.
app.c	This file contains application related implementations
main.c	This file contains application's main entry point
system_init.c	This file contains source code necessary to initialize the system
system_int.c	This file contains a definitions of the raw ISRs required to support the interrupt sub-system
system_tasks.c	This file will contain any source code necessary to maintain various tasks in the system

3.10 USB Demonstrations

3.10.1 USB Demonstrations

3.10.1.1 Introduction

USB Library Demonstration Applications Help

Description

This distribution package contains a variety of USB-related firmware projects that demonstrate the capabilities of the MPLAB Harmony USB stack. This help file describes the hardware requirement and procedures to run these firmware projects on Microchip demonstration and development boards.

To know more about MPLAB Harmony USB stack and configuring the USB stack and the APIs provided by the USB stack, refer to the [USB Library](#) documentation.

3.10.1.2 Release Notes

MPLAB Harmony Version: v0.70b **USB Demonstration:** 0.01a **Release Date:** 18Nov2013

New This Release:

Nothing to report in this release.

Known Issues:

Device Stack Demonstration Applications:

All Device Stack Demonstration applications uses a custom Board Support Package (BSP) to access demonstration board switches and LEDs. The board support package does not use PORTS Peripheral Library. In the next release, all Device Stack Demonstration Applications will be updated to use the standard Harmony BSP. The demonstration application specific issues are listed here:

cdc_com_port_single:

Nothing to report in this release.

cdc_com_port_dual:

Nothing to report in this release.

cdc_serial emulator:

- This version of the demo does not support baud rate change. The supported baud rate is 9600bps, 1 stop bit and no parity.

- The application code accesses the UART2 peripheral SFR directly. This will be updated in the next release to use the USART driver and the System Clock Service.

hid_basic:

Nothing to report in this release.

hid_keyboard:

Nothing to report in this release.

hid_joystick:

Nothing to report in this release.

hid_mouse:

Nothing to report in this release.

audio_speaker:

While running the pic32mz_sk_meb2_int_dyn configuration, a periodic glitch is heard in the output audio. This is a known issue and will be fixed in the next release of the stack.

Host Stack Demonstration Applications:

All Host Stack Demonstration applications uses a custom Board Support Package (BSP) to access demonstration board switches and LEDs. The board support package does not use PORTS Peripheral Library. In the next release, all Host Stack Demonstration Applications will be updated to use the standard Harmony BSP.

cdc_basic:

This demo is not tested for the pic32mx_usb_sk_int_dyn configuration and may not function when built for this configuration.

msd_basic:

While running this demo, if the USB Flash drive already contains a file named "File.txt", the file contents may become corrupted.

3.10.1.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

3.10.1.4 Demonstration Application Configurations

This topic provides information on the USB demonstration project configuration that are available in MPLAB Harmony.

Description

The available USB Demonstration application MPLAB X IDE projects feature support for multiple configurations. Selecting these configurations allow for the demonstration projects to run across different PIC32 microcontrollers and development boards. The following project configurations are available:

- **pic32mx_usb_sk_int_dyn** – Selecting this configuration will set up the demonstration application to run on the [PIC32 USB Starter Kit II](#) development board, with the PIC32MX795F512L microcontroller. The system will be configured for interrupt mode operation and drivers will be configured for dynamic operation mode.
- **pic32mz_sk_int_dyn** – Selecting this configuration will set up the demonstration application to run on the [PIC32MZ Embedded Connectivity \(EC\) Starter Kit](#) development board, with the PIC32MZ2048ECH144 microcontroller. The system will be configured for interrupt mode operation and drivers will be configured for dynamic operation mode.
- **explorer16_pic32mx795f512l_int_dyn** – Selecting this configuration will set up the demonstration application to run on the [Explorer 16 Development Board](#) along with the PIC32MX795F512L microcontroller Plug In Module . The system will be configured for interrupt mode operation and drivers will be configured for dynamic operation mode.
- **pic32mx_usb_audio_int_dyn** - Selecting this configuration will set up the demonstration application to run on [PIC32 USB Digital Audio Accessory Board](#) along with the PIC32MX250F128B microcontroller. The system will be configured for interrupt mode operation and drivers will be configured for dynamic operation mode.
- **pic32mz_sk_meb2_int_dyn** – Selecting this configuration will set up the demonstration application to run on the PIC32MZ EC Starter Kit development board, with the PIC32MZ2048ECH144 microcontroller board attached to the [Multimedia Expansion Board II \(MEB II\)](#). The system will be configured for interrupt mode operation and drivers will be configured for dynamic operation mode.

The following figure shows how a configuration can be selected in MPLAB X IDE.

Alternatively, the active configuration can be selected in the Project Properties dialog box. The following table shows the availability of a configuration across available USB device demonstration applications. Green indicates support. Red indicates no support.

Configurations					
Demo Apps	pic32mx_usb_sk_int_dyn	pic32mz_sk_int_dyn	explorer16_pic32mx795f512l_int_dyn	pic32mx_usb_audio_int_dyn	pic32mz_sk_meb2_int_dyn

3.10.1.5 Demonstrations

Description of USB Demonstrations

Description

The USB Demonstrations are grouped into USB Device Stack and USB Host Stack Demonstrations.

3.10.1.5.1 Device

3.10.1.5.1.1 cdc_com_port_single

Demonstrates a USB CDC device, emulating a serial COM port.

Description

This demonstration application creates a USB CDC Device that enumerates as a single COM port on the host PC. The application demonstrates two-way communication between the USB device and the PC host.

3.10.1.5.1.1.1 Supported Demonstration Boards

Lists supported demonstration and development hardware boards.

Description

Demonstration Board (click link for board information)	Notes
PIC32 USB Starter Kit II	-
PIC32MZ Embedded Connectivity (EC) Starter Kit	-

3.10.1.5.1.1.2 Configuring the Hardware

Describes how to configure the supported hardware.

Description

[PIC32 USB Starter Kit II](#)

No hardware related configuration or jumper setting changes are necessary.

[PIC32MZ Embedded Connectivity \(EC\) Starter Kit](#)

No hardware related configuration or jumper setting changes are necessary.

3.10.1.5.1.1.3 Running the Demonstration

Provides instructions on how to build and run the CDC single COM port demonstration.

Description

This demonstration allows the device to appear like a serial (COM) port to the host. In order to run this demonstration first compile and program the target device. While compiling, select the pic32mx_usb_sk_XXX_XXX configurations for the PIC32M USB Starter Kit II or select the pic32mz_sk_XXX_XXX configurations for PIC32MZ Embedded Connectivity (EC) Starter Kit. Attach the device to the host. If the host is a PC and this is the first time you have plugged this device into the computer then you may be asked for a .inf file.

Select the “Install from a list or specific location (Advanced)” option. Point to the “<Install Directory>/apps/usb/device/cdc_com_port_single/inf” directory.

Once the device is successfully installed, open up a terminal program, such as HyperTerminal. Select the appropriate COM port. On most machines this will be COM5 or higher.

Once connected to the device, there are two ways to run this example project. Typing a key in the terminal window will result in the device echoing the key pressed. So if the user presses “b”, the device will echo “c”. If the pushbutton SW1 is pressed the device will echo “PUSH BUTTON PRESSED” to the terminal window.

Note: Some terminal programs, like HyperTerminal, require users to click the disconnect button before removing the device from the computer. Failing to do so may result in having to close and open the program again in order to reconnect to the device.

3.10.1.5.1.2 cdc_com_port_dual

Demonstrates a USB CDC device, emulating dual serial COM ports - one looping back into the other.

Description

This demonstration application creates a USB CDC Device that enumerates as 2 serial ports on USB Host PC. This application demonstrates the ability of the MPLAB Harmony USB stack to support multiple instances of the same device class.

3.10.1.5.1.2.1 Supported Demonstration Boards

Lists supported demonstration and development hardware boards.

Description

Demonstration Board (click link for board information)	Notes
PIC32 USB Starter Kit II	-
PIC32MZ Embedded Connectivity (EC) Starter Kit	-

3.10.1.5.1.2.2 Configuring the Hardware

Describes how to configure the supported hardware.

Description

[PIC32 USB Starter Kit II](#)

No hardware related configuration or jumper setting changes are necessary.

PIC32MZ Embedded Connectivity (EC) Starter Kit

No hardware related configuration or jumper setting changes are necessary.

3.10.1.5.1.2.3 Running the Demonstration

Provides instructions on how to build and run the CDC dual COM port demonstration.

Description

This demonstration allows the device to appear like dual serial (COM) ports to the host. In order to run this demonstration first compile and program the target device. While compiling, select the pic32mx_usb_sk_xxx_xxx configurations for the PIC32 USB Starter Kit II or select the pic32mz_sk_xxx_xxx configurations for PIC32MZ Embedded Connectivity (EC) Starter Kit. Attach the device to the host. If the host is a PC and this is the first time you have plugged this device into the computer then you may be asked for a .inf file.

Select the “Install from a list or specific location (Advanced)” option. Point to the “<Install Directory>\apps\usb\device\cdc_com_port_dual\inf” directory.

Once the device is successfully installed, open up two instances of a terminal program, such as HyperTerminal. Select the appropriate COM port for each of these terminal instance.

To run the demonstration, type a character or string in one terminal window. The same character or string appears on the second terminal window. Similarly, any character typed on second window appears on the first window.

Note: Some terminal programs, like HyperTerminal, require users to click the disconnect button before removing the device from the computer. Failing to do so may result in having to close and open the program again in order to reconnect to the device.

3.10.1.5.1.3 cdc_serial_emulator

This application demonstrates the use of the CDC device class in implementing a USB-to-Serial Dongle.

Description

This application demonstrates the use of the CDC device class in implementing a USB-to-Serial Dongle. The application enumerates a COM port on the PC. Data received through the CDC USB interface is forwarded to a UART. Data received on the UART is forwarded to the CDC USB interface. This emulates a USB-to-Serial Dongle.

3.10.1.5.1.3.1 Supported Demonstration Boards

Lists supported demonstration and development hardware boards.

Description

Demonstration Board (click link for board information)	Notes
PIC32 USB PIC32MX795F512L Plug-In Module (PIM)	1
Any commercially available USB-to-Serial dongle	-

Note 1: This board cannot be used by itself. It requires an Explorer 16 Development Board (DM240001) and a USB PICtail Plus Daughter Board (AC164131) in order to operate.

3.10.1.5.1.3.2 Configuring the Hardware

Describes how to configure the supported hardware.

Description

Explorer 16 Development Board Based Demonstrations

For all of the Explorer 16-based demonstration boards, please follow the following instructions:

1. Connect the USB PICtail Plus Daughter Board to the Explorer 16 Development Board.
2. Short JP2 and JP3 on the USB PICtail Plus Daughter Board
3. Open JP1 and JP4 on the USB PICtail Plus Daughter Board
4. Make sure that S2 on the Explorer 16 Development Board is switched to the "PIM" setting.
5. Short JP2 on the Explorer 16 Development Board to enable the LEDs.
6. Follow any processor specific instructions below. All instructions apply to the PIM unless otherwise stated:
PIC32MX795F512L PIM
7. Open J10.
8. Short pins 1 (marked "USB") and pin 2 (center) of jumpers J1 and J2.

3.10.1.5.1.3.3 Running the Demonstration

Provides instructions on how to build and run the CDC Serial Emulator Demonstration. Please refer to [Release Notes](#) for demonstration limitations, if any.

Description

This application demonstrates the use of the CDC device class in implementing a USB to Serial Dongle. The application enumerates a COM port on the PC. Data received through the CDC USB interface is forwarded to a UART. Data received on the UART is forwarded to the CDC USB interface. This emulates a USB-to-Serial Dongle.

1. Open the project in MPLAB X IDE. Make sure that exp16_pic32mx795f512l_int_dyn configuration is selected.
2. Build the code and program the device.
3. Connect the USB PICtail Plus Daughter Board to the Explorer 16 Development Board.
4. Power up the Explorer 16 Development Board and **connect** a debugger/programmer of your choice to the Explorer 16 Development Board.
5. Build the code and program the device.
6. Connect the mini-B device connector on the USB PICtail Plus Daughter Board to the PC. If the host is a PC and this is the first time you have plugged this device into the computer, you may be asked for a .inf file.

7. Select the “Install from a list or specific location (Advanced)” option. Point to the “<Install Directory>/apps/usb/device/cdc_serial_emulator/inf” directory.

- When enumerated successfully, LED D5 will be the only LED illuminated on the Explorer 16 Development board.
- Open a terminal emulation program of your choice and select the enumerated USB COM port.
 - Connect the USB-to-Serial Dongle to the same PC.
 - Open another instance of the terminal emulation program and select the USB-to-Serial Dongle.
 - Connect the serial connector of the USB-to-Serial Dongle to the UART connector (P1) on the Explorer 16 Development Board.
 - Choose a baud rate of 9600, 1 stop bit and no parity while opening both of the terminal emulation programs.
- The setup should be similar to the following diagram.

Any text entered into the terminal 1 program will be echoed on terminal 2 and vice versa.

3.10.1.5.1.4 hid_basic

This demonstration application creates a custom HID device that can be controlled by a PC based utility.

Description

This application creates a custom HID device that can be controlled by a PC based utility. The device allows the USB Host utility to control the LEDs on the board and query the status of a switch.

3.10.1.5.1.4.1 Supported Demonstration Boards

Lists supported demonstration and development hardware boards.

3.10.1.5.1.4.2 Configuring the Hardware

Describes how to configure the supported hardware.

Description

[PIC32 USB Starter Kit II](#)

No hardware related configuration or jumper setting changes are necessary.

PIC32MZ Embedded Connectivity (EC) Starter Kit

No hardware related configuration or jumper setting changes are necessary.

3.10.1.5.1.4.3 Running the Demonstration

Provides instructions on how to build and run the HID Basic demonstration.

Description

This demonstration uses the selected hardware platform as a HID class USB device, but uses the HID class for general purpose I/O operations. While compiling, select the `pic32mx_usb_sk_xxx_xxx` configurations for the PIC32 USB Starter Kit II or select the `pic32mz_sk_xxx_xxx` configurations for PIC32MZ Embedded Connectivity (EC) Starter Kit. Typically, the HID class is used to implement human interface products, such as mice and keyboards. The HID protocol is however quite flexible, and can be adapted and used to **send**/receive general purpose data to/from a USB device. Using the HID class for general purpose I/O operations is quite advantageous, in that it does not require any kind of custom driver installation process. HID class drivers are already provided by and are distributed with common operating systems. Therefore, upon plugging in a HID class device into a typical computer system, no user installation of drivers is required, the installation is fully automatic.

HID devices primarily communicate through one interrupt IN endpoint and one interrupt OUT endpoint. In most applications, this effectively limits the maximum achievable bandwidth for full speed HID devices to 64 kBytes/s of IN traffic, and 64 kBytes/s of OUT traffic (64 kB/s, but effectively “full duplex”).

The `GenericHIDSimpleDemo.exe` program, and the associated firmware demonstrate how to use the HID protocol for basic general purpose USB data transfer.

Before you can run the `GenericHIDSimpleDemo.exe` executable, you will need to have the Microsoft® .NET Framework Version 2.0 Redistributable Package (later versions probably okay, but not tested) installed on your computer. Programs which were built in the Visual Studio® .NET languages require the .NET redistributable package in order to run. The redistributable package can be freely downloaded from Microsoft's website. Users of Windows Vista® operating systems will not need to install the .NET framework, as it comes pre-installed as part of the operating system.

To launch the application, simply double click on the executable “`GenericHIDSimpleDemo.exe`” in the “<Install Directory>\apps\usb\device\hid_basic\bin” directory. A window like that shown below should appear:

If instead of this window, an error message pops up while trying to launch the application, it is likely the Microsoft .NET Framework Version 2.0 Redistributable Package has not yet been installed. Please install it and try again.

In order to begin sending/receiving packets to the device, you must first find and “**connect**” to the device. As configured by default, the application is looking for HID class USB devices with VID = 0x04D8 and PID = 0x003F. The device descriptor in the firmware project meant to be used with this demonstration uses the same VID/PID. If you plug in a USB device programmed with the correct pre-compiled .hex file, and hit the “Connect” button, the other push buttons should become enabled. If hitting the **connect** button has no effect, it is likely the USB device is either not connected, or has not been programmed with the correct firmware.

Hitting the Toggle LED(s) should **send** a single packet of general purpose generic data to the HID class USB peripheral device. The data will arrive on the interrupt OUT endpoint. The firmware has been configured to receive this generic data packet, parse the packet looking for the “Toggle LED(s)” command, and should respond appropriately by controlling the LED(s) on the demonstration board.

The “Get Pushbutton State” button will [send](#) one packet of data over the USB to the peripheral device (to the interrupt OUT endpoint) requesting the current pushbutton state. The firmware will process the received Get Pushbutton State command, and will prepare an appropriate response packet depending upon the pushbutton state.

Following table shows the button that has to be pressed on the demonstration board to see the push button state changing.

Demonstration Board	Button
PIC32 USB Starter Kit II	SW1

3.10.1.5.1.5 hid_mouse

Demonstrates a USB HID device, emulating a mouse pointing device.

Description

This demonstration application creates a USB HID based 2 button mouse device. When connected, the device emulates mouse operation by moving the cursor in a circular pattern.

3.10.1.5.1.5.1 Supported Demonstration Boards

Lists supported demonstration and development hardware boards.

Description

[PIC32 USB Starter Kit II](#)

No hardware related configuration or jumper setting changes are necessary.

[PIC32MZ Embedded Connectivity \(EC\) Starter Kit](#)

No hardware related configuration or jumper setting changes are necessary.

3.10.1.5.1.5.3 Running the Demonstration

Provides instructions on how to build and run the HID Mouse Demonstration.

Description

This demonstration uses the selected hardware platform as a USB mouse. While compiling, select the `pic32mx_usb_sk_xxx_xxx` configurations for the PIC32 USB Starter Kit II or select the `pic32mz_sk_xxx_xxx` configurations for PIC32MZ Embedded Connectivity (EC) Starter Kit. Before connecting the board to the computer through the USB cable please be aware that the device will start moving the mouse cursor around on the computer. There are two ways to stop the device from making the cursor to continue to move. The first way is to disconnect the device from the computer. The second is to press the correct button on the hardware platform. Pressing the button again will cause the mouse cursor to start moving in a circle again.

Following table shows the button that has to be pressed on the demonstration board to stop the circular motion:

Demonstration Board	Button
PIC32 USB Starter Kit II	SW1

3.10.1.5.1.6 hid_keyboard

Demonstrates a USB HID device, emulating a keyboard.

Description

This demonstration application creates a Generic HID keyboard. Pressing a key on the board emulates a keyboard key press.

3.10.1.5.1.6.1 Supported Demonstration Boards

Lists supported demonstration and development hardware boards.

Description

No hardware related configuration or jumper setting changes are necessary.

[PIC32MZ Embedded Connectivity \(EC\) Starter Kit](#)

No hardware related configuration or jumper setting changes are necessary.

3.10.1.5.1.6.3 Running the Demonstration

Provides instructions on how to build and run the USB HID Keyboard demonstration.

Description

This demonstration uses the selected hardware platform as a USB keyboard. While compiling, select the `pic32mx_usb_sk_XXX_XXX` configurations for the PIC32 USB Starter Kit II or select the `pic32mz_sk_XXX_XXX` configurations for PIC32MZ Embedded Connectivity (EC) Starter Kit. Before pressing the button, select a window in which it is safe to type text freely. Pressing the button on the demonstration board will cause the device to print a character on the screen.

Following table shows the button that has to be pressed on the demonstration board to print a character.

Demonstration Board	Button
PIC32 USB Starter Kit II	SW1

3.10.1.5.1.7 hid_joystick

Demonstrates a USB HID device emulating a joystick.

Description

This demonstration application creates a custom HID joystick. This application is only intended to demonstrate creation of Joystick HID Report descriptors and may not be a definite end solution. The end application requirements may need the report descriptor to be modified.

3.10.1.5.1.7.1 Supported Demonstration Boards

No hardware related configuration or jumper setting changes are necessary.

3.10.1.5.1.7.3 Running the Demonstration

Provides instructions on how to build and run the USB HID Joystick demonstration.

Description

This demonstration uses the selected hardware platform as a USB Joystick. While compiling, select the pic32mx_usb_sk_XXX_XXX configurations for the PIC32 USB Starter Kit II or select the pic32mz_sk_XXX_XXX configurations for PIC32MZ Embedded Connectivity (EC) Starter Kit. To test the joystick feature, go to the "<Install Directory>\apps\usb\device\hid_joystick\bin" directory and open the JoystickTester.exe:

Pressing the button will cause the device to:

- Indicate that the “x” button is pressed, but none others;
- Move the hat switch to the "east" position;
- Move the X and Y coordinates to the their extreme values;

Following table shows the button that has to be pressed on the demonstration board to emulate the joystick.

No hardware related configuration or jumper setting changes are necessary.

[PIC32MZ Embedded Connectivity \(EC\) Starter Kit](#)

No hardware related configuration or jumper setting changes are necessary.

3.10.1.5.1.9.3 Running the Demonstration

Provides instructions on how to build and run the Generic Device demonstration.

Description

This demonstration uses the selected hardware platform as a Libusb class USB device. Libusb-Win32 is a USB Library for the Windows operating systems. The library allows user space applications to access any USB device on Windows in a generic way without writing any line of kernel driver code. This driver allows users to have access to interrupt, bulk, and control transfers directly.

The SimpleLibUSBDemo.exe program and the associated firmware demonstrate how to use the Libusb device drivers for basic general purpose USB data transfer. To make the PC source code as easy to understand as possible, the demonstration has deliberately been made simple, and only sends/receives small amounts of data.

Before you can run the SimpleLibUSBDemo.exe executable, you will need to have the Microsoft® .NET Framework Version 3.5 Redistributable Package (later versions probably okay, but not tested) installed on your computer. Programs which were built in the Visual Studio® .NET languages require the .NET redistributable package in order to run. The redistributable package can be freely downloaded from Microsoft's website. Users of Windows Vista® operating systems will not need to install the .NET framework, as it comes pre-installed as part of the operating system.

To launch the application, simply double click on the executable "SimpleLibusbDemo.exe" in the "<Install Directory>\apps\usb\device\generic_device\bin" directory. A window like that shown below should appear:

If instead of this window, an error message pops up while trying to launch the application, it is likely the Microsoft .NET Framework Version 3.5 Redistributable Package has not yet been installed. Please install it and try again.

In order to begin sending/receiving packets to the device, you must first find and "**connect**" to the device. As configured by default, the application is looking for USB devices with VID = 0x04D8 and PID = 0x0204. The device descriptor in the firmware project meant to be used with this demonstration uses the same VID/PID. To run the demonstration program the USB device with the correct precompiled .hex file. If you are connecting the device for the first time, Windows pops up a window asking you

to install the driver for the device. When asked for the driver point it to the inf file provided along with the demonstration. Windows takes while to install the driver for the USB device that is just plugged in. Open the Device manager and ensure that the USB device is listed under the 'Libusb Demo Devices'. Once the driver is installed hit the "Connect" button, the other pushbuttons should become enabled. If hitting the [connect](#) button has no effect, it is likely the USB device is either not connected, or has not been programmed with the correct firmware.

If a different VID/PID combination from the default is desired, then the descriptors in the firmware must be changed as well as the inf file. The easiest way to change the inf file is to use the utility provided with the LibUSB download for windows on the LibUSB website. This utility can create a new inf file based on a connected device. So make sure to change the VID/PID combination first in the firmware, [connect](#) the device, and then run the inf file creator utility. After completing the utility, a new signed driver with inf file is created.

Once the driver is installed hit the "Connect" button, the other pushbuttons should become enabled. If hitting the [connect](#) button has no effect, it is likely the USB device is either not connected, or has not been programmed with the correct firmware.

Hitting the Toggle LED(s) should [send](#) a single packet of general purpose generic data to the Custom class USB peripheral device. The data will arrive on the Bulk OUT endpoint. The firmware has been configured to receive this generic data packet, parse the packet looking for the "Toggle LED(s)" command, and should respond appropriately by controlling the LED(s) on the demonstration board.

The "Get Pushbutton State" button will [send](#) one packet of data over the USB to the peripheral device (to the Bulk OUT endpoint) requesting the current pushbutton state. The firmware will process the received Get Pushbutton State command, and will prepare an appropriate response packet depending upon the pushbutton state.

The PC then requests a packet of data from the device (which will be taken from the Bulk IN endpoint). Once the PC application receives the response packet, it will update the pushbutton state label.

Try experimenting with the application by holding down the appropriate pushbutton on the demonstration board, and then simultaneously clicking on the "Get Pushbutton State" button. Then try to repeat the process, but this time without holding down the pushbutton on the demonstration board.

Following table shows the button that has to be pressed on the demonstration board to see the push button state changing.

Demonstration Board	Button
PIC32 USB Starter Kit II	SW1

3.10.1.5.1.10 audio_speaker

Demonstrates a USB Audio Device that emulates a USB speaker.

Description

This demonstration application creates uses the USB Audio Device class to implement a speaker.

Description

PIC32 USB Digital Audio Accessory Board

No hardware related configuration or jumper setting changes are necessary.

PIC32MZ Embedded Connectivity (EC) Starter Kit and Multimedia Expansion Board II (MEB II)

- 1) Fix the PIC32MZ Embedded Connectivity (EC) Starter Kit on the MEB II board.
- 2) Connect a Headphone to the HP OUT jack on the MEB II board.

3.10.1.5.1.10.3 Running the Demonstration

Provides instructions on how to build and run the Audio Speaker Demonstration.

Description

This demonstration functions as a speaker when plugged into a computer. Using any feature on the computer that normal produces sound on the speaker will work with this demonstration. The feature unit only supports the Mute control.

Please note that some applications lock into a sound source when they open or close (such as some web browsers or plug-ins), so that if you plug in the speaker with the web page or video already playing, the sound might not get redirected to the USB based speakers until you close and reopen the browser.

The audio device created in this demonstration has the following characteristics:

- Sampling rate of 48 kHz
- 2 Channel (Stereo)
- PCM Format - 16 bits per Sample
- Asynchronous Audio Endpoint

3.10.1.5.2 Host

3.10.1.5.2.1 cdc_basic

This application demonstrates the use of the CDC Host Class Driver to enumerate and operate a CDC Device.

Description

This application demonstrates the use of the CDC Host Class Driver to enumerate and operate a CDC Device. The application uses the USB Host layer and CDC class driver to enumerate a CDC USB device. The demonstration host application then operates and uses the functionality of the attached CDC Device.

3.10.1.5.2.1.1 Supported Demonstration Boards

Hardware required for USB Device CDC Serial Emulator Demonstration Application	-

3.10.1.5.2.1.2 Configuring the Hardware

Describes how to configure the supported hardware.

Description**PIC32MZ Embedded Connectivity (EC) Starter Kit**

This hardware does not require any configuration.

PIC32 Starter Kit USB II

This hardware does not require any configuration.

3.10.1.5.2.1.3 Running the Demonstration

Provides instructions on how to build and run the USB Host CDC Basic Demo. Please refer to the [Release Notes](#) for demonstration limitations, if any.

Description

This application demonstrates the use of the CDC Host Class Driver to enumerate and operate a CDC Device. The application uses the USB Host layer and CDC class driver to enumerate a CDC USB device. The demonstration host application then operates and uses the functionality of the attached CDC Device.

1. Open the project in MPLAB X IDE and select the desired project configuration.
2. Build the code and program the device.
3. Follow the directions for setting up and running the [cdc_serial_emulator](#) USB device demonstration.
4. Connect the UART (P1) port on the Explorer 16 Development Board (running the [cdc_serial_emulator](#) demonstration) to a USB Host PC via a commercially available Serial-to-USB Dongle.
5. Start a terminal program on the USB Host PC and select the Serial-to-USB Dongle as the communication port. Select the baud rate as 9600, no parity, 1 stop bit and no flow control.
6. Connect the mini – B connector on the USB PICtail Plus Daughter Board , of the [cdc_serial_emulator](#) demonstration setup, to the Type – A USB host connector on the starter kit.
7. A prompt ("LED : ") will be displayed immediately on the terminal emulation program.
8. Pressing either the 1, 2, or 3 key on the USB Host keyboard will cause LED 1, 2, or 3 on the PIC32 Starter kit (running the USB CDC Host application) to switch on, respectively.
9. The prompt will again be displayed on terminal emulation program, and step 8 can be repeated.

The setup should be similar to the following diagram.

The `cdc_serial_emulator` demonstration emulates a USB-to-Serial Dongle. The CDC Host (running the `cdc_basic` demonstration application) sends the prompt message to the CDC device. The CDC device forwards the prompt to the UART port from where it is transmitted to the PC USB Host through the USB-to-Serial Dongle. A key press on the PC USB Host is transmitted to the CDC device, which in turn presents the key press data to the CDC host. The `cdc_basic` demonstration then analyzes the key press data and switches on the respective LED.

3.10.1.5.2.2 msd_basic

This application demonstrates the use of the MSD Host Class Driver to write a file to USB Flash Drive.

Description

This application demonstrates the use of the MSD Host Class Driver to write a file to a USB Flash drive. The application uses the USB Host layer , MSD class driver and the MPLAB Harmony File System Framework to enumerate a USB Flash drive and to write a file to it.

3.10.1.5.2.2.1 Supported Demonstration Boards

Lists supported demonstration and development hardware boards.

Description

Demonstration Board (click link for board information)	Notes

Describes how to configure the supported hardware.

Description

PIC32MZ Embedded Connectivity (EC) Starter Kit

This hardware does not require any configuration.

PIC32 Starter Kit USB II

This hardware does not require any configuration.

3.10.1.5.2.2.3 Running the Demonstration

Provides instructions on how to build and run the USB Host MSD Basic demonstration. Please refer to the [Release Notes](#) for demonstration limitations, if any.

Description

This application demonstrates the use of the MSD Host Class Driver to write a file to USB Flash drive. The application uses the USB Host layer, MSD class driver and the MPLAB Harmony File System Framework to enumerate a USB Flash drive and to write a file to it.

1. Open the project in MPLAB X IDE and select the desired project configuration.
2. Build the code and program the device.
3. With the code running, attach a USB Flash drive to the Host connector on the starter kit.
4. The demonstration application will then create a file named "File.txt". It will then write the text "Hello World" to this file, and then close the file.
5. The demonstration will then move to Idle mode, which is indicated when LED 2 on the starter kit lights up.
6. The USB Flash drive can then be attached to a USB Host PC to verify the demonstration application operation.
7. Steps 3 through 6 can be repeated.
8. If the USB Flash drive already contains a file with the name "File.txt", the demonstration application will append the text "Hello World" to the end of the file name.

3.10.1.6 Demonstration Board Information

Information on Hardware used by the USB Library Demo Applications.

Description

The USB Library Demo Applications can be tried across on hardware boards. This section provide details on the different hardware boards that are used by the demo applications.

3.10.1.6.1 PIC32 USB Starter Kit II

Provides details information on the PIC32 USB Starter II.

Description

SW1 - Application switch. Tied to RD6.

SW2 - Application switch. Tied to RD7.

SW3 - Application switch. Tied to RD13.

LED1 - Application LED. Tied to RD0.

LED2 - Application LED. Tied to RD1.

LED3 - Application LED. Tied to RD2.

This board supports the following USB Device demonstrations:

- CDC Single COM port ([cdc_com_port_single](#)).
- CDC Dual COM port ([cdc_com_port_dual](#))
- HID Basic ([hid_basic](#))
- HID Mouse ([hid_mouse](#))
- HID Keyboard ([hid_keyboard](#))
- HID Joystick ([hid_joystick](#))
- MSD Flash Drive ([msd_basic](#))
- Generic USB Device ([generic_device](#))

More Information

Microchip Part Number : DM320003-2

3.10.1.6.2 Explorer 16 Development Board

Provides information on the Explorer 16 Development Board

Description

S1 - Reset button (MCLR)

S2 - Processor switch. This switch determines which processor is running, the processor on the board or the processor on the Plug-In-Module (PIM).

S3, S4, S5, S6 - Application switches. For information about what pin is connected to this switch, please refer to the information for the PIM in use.

D3 through D10 - Application LEDs. For information about what pin is connected to this LED, please refer to the information for the PIM in use.

This board support the following USB Host demos:

1. CDC Host (cdc_serial)

More Information:

Microchip Part Number: DM240001

3.10.1.6.3 PIC32MX795F512L Plug-In-Module (PIM)

Provides information on the PIC32MX795F512L Plug-In-Module (PIM).

Description

This PIM is required while using the [Explorer 16 Development Board](#).

More Information

Microchip Part Number: MA320003

[Information Sheet](#)

3.10.1.6.4 PIC32 USB Digital Audio Accessory Board

Provides information on the PIC32 USB Digital Audio Accessory Board

Description

This board support the following USB Device demonstration:

Audio Speaker ([audio_speaker](#))

More Information:

Microchip Part Number: DM320014

3.10.1.6.5 PIC32MZ Embedded Connectivity (EC) Starter Kit

Provides details information on the PIC32MZ Embedded Connectivity (EC) Starter Kit.

Description

Microchip Part Number: DM320006 (without Crypto) or DM320006-C (with Crypto)

The top assembly of the board includes these key features, as indicated in Figure 1:

1. PIC32MZ2048ECH144 32-bit microcontroller.
2. Green power indicator LED.
3. On-board crystal or oscillator for precision microcontroller clocking (12 MHz).
4. USB connectivity for on-board debugger communications.
5. Green debug indicator LED.
6. Three push button switches for user-defined inputs.
7. Three user-defined indicator LEDs.
8. USB Type A receptacle connectivity for PIC32 host-based applications.
9. HOST mode power jumper.
10. Daughter board connectors for flexible Ethernet PHY options.
11. 32 kHz oscillator for RTCC and Timer1 (optional).
12. External 2 GB SQI memory for expanded memory application.
13. Jumper for using or disconnecting the on-board debugger.

NOTE: When running self-powered USB device applications, open the jumper JP1 to prevent possibly back-feeding voltage onto the Vbus from one port on the host to another (or from one host to another).

Figure 1: PIC32MZ Embedded Connectivity (EC) Starter Kit Layout (Front)

The bottom assembly of the board includes these key features, as indicated in Figure 2:

1. PIC24FJ256GB106 USB microcontroller for on-board debugging.
2. Regulated +3.3V power supply for powering the starter kit via USB or expansion board.
3. Connector for various expansion boards.
4. USB Type micro-AB receptacle for OTG and USB device connectivity for PIC32 OTG/device-based applications.
5. 50 MHz Ethernet PHY oscillator.
6. USB Host and OTG power supply for powering PIC32 USB applications.

Figure 2: PIC32MZ Embedded Connectivity (EC) Starter Kit Layout (Back)

3.10.1.6.6 Multimedia Expansion Board II (MEB II)

Provides details information on the Multimedia Expansion Board II (MEB) II.

Description

Microchip Part Number: DM320005-2

[Product Page](#)

The front side of the MEB II includes these key features, as shown in Figure 1:

1. Display daughter board connector (60-pin Hirose board-to-board connector).
2. mTouch™ buttons.
3. Push Button.
4. Power LED.
5. User LEDs.
6. VGA Camera (OVM7690).
7. PICtail™ Connector.
8. Analog temperature sensor.

Figure 1: Multimedia Expansion Board II Layout (Front)

The underside of the MEB II includes these key features, as shown in Figure 2:

1. Regulated 5V and 3.3V power supply for powering the board via a 9-15V DC Adapter.
2. PIC32 Starter Kit connector (168-pin Hirose board-to-board connector).
3. 24-bit stereo audio codec (AK4953A).
4. Integrated 802.11bg wireless module (MRF24WG0MA).
5. Low-cost Bluetooth® HCI transceiver (BTM805).
6. EBI SRAM memory (IS61WV102416BLL).
7. microSD slot.

8. Analog accelerometer (ADXL325).

Figure 2: Multimedia Expansion Board II Layout (Back)

4 Building Projects Help

4.1 Building Projects

4.1.1 Introduction

This section describes the MPLAB X IDE projects that are provided to build binary (.a file) versions of key MPLAB Harmony libraries.

Description

The following MPLAB Harmony libraries are provided in prebuilt binary (".a" file) format because source code is not released or to provide optimal performance for users of the free version of the compiler. The MPLAB X IDE projects used to build these libraries are provided so that you can rebuild these libraries with different build parameters, optimization settings, and/or debug symbols if desired.

Note: Building these libraries with high optimization settings will require a fully licensed version of the necessary Microchip XC compiler.

Build Projects Folder: "<install-root>/build"

Library	Description
framework/crypto	MPLAB Harmony Encryption/Decryption Library
framework/zlib	MPLAB Harmony Compress/Decompression Library
framework/math/dsp	MPLAB Harmony Digital Signal Processing Library
framework/math/libq	MPLAB Harmony Fixed-point Math Library
framework/peripheral	MPLAB Harmony Peripheral Library Build Project

4.1.2 Release Notes

MPLAB Harmony Version: v0.70b **Building Projects:** 0.70b **Release Date:** 18Nov2013

New This Release:

Peripheral Libraries

- Nothing to report in this release

Known Issues:

Peripheral Libraries

- Build configurations were not created for all PIC32 devices. As a workaround, select any configuration and choose a different processor from the Project Properties dialog. This will require you to change the name of the output file to match the name of the selected processor.

4.1.3 Using the Build Projects

This section describes how to use the MPLAB Harmony build projects to generate binary (".a" file) libraries that can be linked into your project.

Description

The following information describes how to use the MPLAB Harmony build projects to generate binary (".a" file) libraries that can be linked into your project.

Prerequisites

To build MPLAB Harmony libraries, you must have the following installed on your development workstation:

- MPLAB X IDE (v1.95 or higher)
- MPLAB XC32 Compiler (v1.30 or higher)
- Appropriate compiler license for your desired optimization settings

Build Instructions

The following general instructions apply to all MPLAB Harmony library build projects. Refer to the related "Libraries" section for additional information about building specific libraries.

1. Start MPLAB X IDE.
2. Open the desired build project.

3. Set it as the "main" project.

4. Select the desired build configuration.

Note: Different libraries provide different build configurations, depending on the set of possible choices that are relevant to that library. For example, the build project for the PIC32MX peripheral libraries (shown above) allows you to select the desired PIC32MX processor. Other libraries may allow you to choose the desired optimization level or feature set. Refer to the related “Libraries” section for information on the configurations provided by the build project for the library you want to build.

5. If required, select the desired processor (or other project settings, if desired).

Note: Projects that provide processor-specific configurations will not require this step.

a. Open the “Project Properties” dialog box.

b. Select the desired processor.

6. Build the library.

7. Copy the binary “.a” library file to your project folder.

8. Add the binary “.a” library file to your project.

4.1.4 Supported Libraries

4.1.4.1 Crypto Library

This section describes MPLAB X IDE projects used to build the MPLAB Harmony Crypto libraries.

Description

The Crypto Library project is contained in the build/framework/crypto folder in the crypto.X project. The library contains functions for operations on blocks of data.

Encryption/decryption operations can be done using AES, RSA, DES, Triple DES, and ECC.

Authentication/hashing can be done using MD5, SHA-1, SHA-256, SHA-384, and SHA-512.

Password-based key derivation can be done with HMAC.

Compression and decompression can be done using Huffman Encoding.

Random numbers can be created either one at a time or in a block.

4.1.4.2 Compression Library

This section describes MPLAB X IDE projects used to build the MPLAB Harmony compression/decompression “zlib” libraries.

Description

The “zlib” libraries consists of routines for handling gzip (.gz) files, include compression and decompression.

The library also contains functions that provide the Huffman compression available in the Crypto library.

4.1.4.3 DSP Math Library

This section describes MPLAB X IDE projects used to build the MPLAB Harmony DSP math libraries.

Description

The DSP Math Library consists of routines that are optimized in assembly to take advantage of the microAptiv™ core of the PIC32MZ devices. The library operates on fixed point integers, which are scaled to represent floating point numbers. Many functions are available in both 16-bit and 32-bit numerical formats.

The library contains functions for mathematical operations on a vector (or array) of values, complex scalar values and matrixes.

Operations include add, subtract, multiply, power, data generation, and in the cases of vectors more complex functions including statistics.

The DSP Math Library also contains a full set of digital filtering functions which include FIR and IIR primitives, as well as more complex architectures (e.g., cascade and parallel bi-quad structures).

Finally the library contains a number of transform functions include FFT and inverse FFT, as well as a number of windowing functions.

Some functions in the DSP Math Library require the use of the LIBQ Fixed Point Math library as well. In those cases the LIBQ library must also be installed with your project. Details on dependent functions are found in the DSP Math Library help file under the remarks section for that specific function.

4.1.4.4 Fixed-Point Math Library

This section describes MPLAB X IDE projects used to build the MPLAB Harmony fixed-point math “libq” libraries.

Description

The Fixed-Point Math Library consists of routines in optimized assembly for performing advanced mathematical operations on a scalar. This is similar in construction to the floating point equivalent math.h file that is included with the compiler. All functions are performed using fixed-point integer operations and generally available in both high precision and low precision variants. Lower precision functions generally perform faster and may be suited for time critical operations.

4.1.4.5 Peripheral Libraries

This section describes MPLAB X IDE projects used to build the MPLAB Harmony peripheral libraries.

Description

The MPLAB Harmony peripheral libraries are implemented almost entirely using C-language inline functions. This is done for efficiency so that the compiler can generate a few simple instructions in place of multiple layers of function calls when function parameters are passed as constants. However, if the project that uses the peripheral library is built with low optimization settings, the compiler may generate a function call instead of “inlining” the function implementation. Unfortunately, this will cause an “undefined symbol” error at link time if the linker cannot find an actual implementation of the function to which it can link the “call”.

To satisfy the linker (and to provide optimized PLIB operation, even when low compiler optimization settings are used in your project), the MPLAB Harmony peripheral libraries must be prebuilt as ‘.a’ file, linkable libraries. The appropriate MPLAB X IDE peripheral library “.a” file for the processor in use must be added to the MPLAB X IDE project so that the linker can use them.

Note: Prebuilt binary “.a” files are provided for all supported processors in the MPLAB Harmony installation in the following folder: <install-dir>/bin/framework/peripheral.

The MPLAB Harmony peripheral library “.a” file build projects are provided so that you may rebuild the binary peripheral library “.a” files using any desired optimization settings. However, if you do this, you must have the appropriate xC compiler and you must copy the resultant “.a” file to your project folder and add it to your MPLAB X IDE project. (See the “Build Instructions” section for details of how to build the library.).

Build Configurations

Different MPLAB X IDE projects are provided for different processor families to build the peripheral libraries for MPLAB Harmony. Each project provides a set of MPLAB X IDE configurations, one for each supported processor. For example, the “mplab_pic32mx_plib.X” project provides configurations for each device in the PIC32MX family. To identify which devices are supported, open the MPLAB X IDE project that is named after the device family in which you are interested, select the MPLAB X IDE configuration named after the device you want to use, and look at the project properties to verify the device that is selected.

Key Configuration Options

To build the peripheral library binary “.a” files, there are two key configuration options that must be defined, as follows:

```
#define INLINE_API extern  
#define INLINE static inline
```

These two configuration items are defined in the source file (“peripehral.c”), which then directly includes the peripheral library implementation headers.

Note: This has already been done for you. This information is provided strictly for reference.

During normal peripheral library use, both of these options are defined as “extern inline” so that the compiler can choose between generating a function call or generating inline code, directly in the calling function (as described above). However, to build the binary library “.a” files the peripheral library Application Program Interface (API) functions must be exposed as global “external” symbols. The “INLINE_API” attribute is placed as an attribute on all PLIB API function implementations. So, defining it as “extern” allows the compiler to expose these functions within the library “.a” file so that the linker can find them. The VREG and other “internal” functions prefixed by the “INLINE” attribute are then defined as “static inline” functions for efficiency.

5 Framework Help

5.1 Driver Library Help

5.1.1 Driver Library Overview

A device driver provides a simple well-defined interface to a hardware peripheral that can be used without operating system support or that can be easily ported to a variety of operating systems. The basic driver operations allow an application to interact with a device, reading and writing data, as if it was a simple file. More specific operations are present on most drivers and the kind of specific operations available depends on the peripheral whose functionality is being exposed by the driver. A driver has the following fundamental responsibilities:

1. Providing a highly-abstracted interface to a peripheral
2. Controlling access to a peripheral
3. Managing the state of a peripheral

The diagram below illustrates how a driver interacts with the other pieces of the system.

- The application calls the well defined driver interface to use the services provided by the driver.
- The driver calls various system services to perform the tasks that are possibly shared across other drivers.
- The driver also calls the peripheral library of the peripheral that its abstracting the interface to.
- Driver State machine can be invoked by the system task service (polling system) or the driver state machine can be invoked from an ISR.

The driver provides the interfaces which can be broken down into the following two categories : (*<mod>* is the abbreviation identifying the module)

- **System Operation** - The interfaces for the system operation should be called by the system. Each driver can support all of the system interfaces, or it can choose to not support the optional system interfaces. The system interfaces are
 - **DRV_<mod>_Initialize** - This routine initializes hardware for the index instance of the <module> module, using the hardware initialization given data. It also initializes any internal data structures. The DRV_<mod>_Status operation will return SYS_STATUS_READY when this operation has completed. Every driver module should define its own initialization

data structure type named "DRV_<mod>_INIT". This structure must be an extension of the [SYS_MODULE_INIT](#) structure (i.e. its first member must be the [SYS_MODULE_INIT](#) structure or equivalent). Any parameter that can change the power state of the module must be included in the data structure. Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again.

- **DRV_<mod>_Reinitialize** - This routine reinitializes and refreshes the hardware using the hardware initialization given data. The DRV_<mod>_Status operation will return SYS_STATUS_READY when this operation has completed. It does not clear or reinitialize internal data structures (although it may change the value of a few appropriate data items necessary to manage the new hardware state) and it does not disconnect or interrupt any ongoing client operations. This operation can be used to change the power state of the peripheral the module manages.
- **DRV_<mod>_Deinitialize** - This routine de-initializes the index instance of the <module> module, disabling its operation (and any hardware for driver modules). The DRV_<mod>_Status operation will return SYS_STATUS_READY when this operation has completed.
- **DRV_<mod>_Status** - The Status operation can be used to determine when any of the other three module operations has completed. If the Status operation returns SYS_STATUS_BUSY, the previous operation has not yet completed. Once the Status operation returns "SYS_STATUS_READY", any previous operations have completed.
 - The value of SYS_STATUS_READY is 1. Values between 1 and 10 are reserved for system defined "ready" states. A module may define module-specific "ready" or "run" states greater than or equal to 10 (SYS_STATUS_READY_EXTENDED).
 - The value of SYS_STATUS_ERROR is -1. Values between -1 and -10 are reserved for system-defined errors. A module may define module-specific error values of less than or equal to -10 (SYS_STATUS_ERROR_EXTENDED).
 - If the Status operation returns an error value, the error may be cleared by calling the reinitialize operation. If that fails, the deinitialize operation will need to be called, followed by the initialize operation to return to normal operations. (Remember to check the value returned by the Status routine after calling any of the module operations to find out when they have completed.)
- **DRV_<mod>_Tasks** - Used to maintain the driver's state machine and implement its ISR. It is normally only called by the system's tasks routine or by an Interrupt Service Routine (ISR).

The usage model of the system interfaces is demonstrated in the diagram below:

The system is also responsible for either calling the Tasks routine through an ISR or poll the Tasks routine in a polling environment.

- **Client Operation** - The interfaces provided by the driver for client operation, can be called by the application. Each driver can provide a set of client interfaces, which supports the operation model of the peripheral that the driver is supporting. The client interfaces can include

- **DRV_<mod>_Open** - This routine opens a driver for use by any client module and provides an “open-instance” handle that must be provided to any of the other driver operations to identify the caller and the instance of the driver/hardware module.
- **DRV_<mod>_Close** - This routine closes an opened-instance of a driver, invalidating the given handle. This routine is optional, if the driver is designed to never be closed.
- **DRV_<mod>_ClientStatus** - This routine provides the client, the status of the driver.
- **DRV_<mod>_<operation>** - This is the basic format of a driver interface routine. Driver interface routines (other than the system module routines and the basic device driver routines) should follow this format.

The general usage model of the client interfaces is demonstrated in the diagram below, each driver will document usage model specific to the driver in the driver help file.

Driver Configuration

A driver provides a set of configurations which can be divided into following categories:

1. **Build Configuration Selection Configurations** - The driver supports selecting the driver instance at build time (static configuration) or at run time (dynamic configuration). A driver also supports selecting the number of clients that can possibly connect to an hardware instance. All drivers will provide DRV_<mod>_DRIVER_OBJECTS_NUMBER, when this configuration macro is defined driver is built in dynamic driver configuration, else it is built in static driver configuration. The number assigned to DRV_<mod>_DRIVER_OBJECTS_NUMBER controls the maximum number of driver objects that can be used. If a driver supports multiple clients it will provide DRV_<mod>_CLIENT_OBJECTS_NUMBER, when this configuration macro is defined driver is built to support multiple clients, else the driver is built to support single client. The number assigned to DRV_<mod>_DRIVER_OBJECTS_NUMBER controls the maximum number of client objects that can be used.
2. **Initialization Overrides** - Initialization overrides are provided to enable configuration of the hardware statically and with low run time overhead. These override the parameters if also passed dynamically to Initialize or Reinitialize routine.
3. **Other operational configurations** - These can control the functionality of the driver or other setting of the driver that are required for support core or optional functionality.

A driver allows the application to use the dynamic interface for all the above configuration when the application chooses the appropriate configurations at build time. This is the preferred method of usage for the drivers.

As an exception, if the application wants to use multiple configurations in the same build for a driver type, or it needs to use multiple instances of the same driver type, it needs to directly use the static single - client configuration interfaces, or it needs to use the static multiple - client configuration interfaces.

While using the driver the static single client driver configuration, the application and system can choose to ignore the SYS_MODULE_INDEX, SYS_MODULE_OBJ and DRV_HANDLE passed and returned to the driver and system interfaces.

While using the driver the static multiple client driver configuration, the application and system can choose to ignore the

[SYS_MODULE_INDEX](#) and [SYS_MODULE_OBJ](#) passed and returned to the driver and system interfaces.

5.1.1.1 Data Types

Enumerations

	Name	Description
	DRV_CLIENT_STATUS	Identifies the current status/state of a client's connection to a driver.
	DRV_IO_BUFFER_TYPES	Identifies to which buffer a device operation will apply.
	DRV_IO_INTENT	Identifies the intended usage of the device when it is opened.

Types

	Name	Description
	DRV_HANDLE	Handle to an opened device driver.

Description

5.1.1.1.1 DRV_CLIENT_STATUS Enumeration

C

```
typedef enum {
    DRV_CLIENT_STATUS_ERROR_EXTENDED = -10,
    DRV_CLIENT_STATUS_ERROR = -1,
    DRV_CLIENT_STATUS_CLOSED = 0,
    DRV_CLIENT_STATUS_BUSY = 1,
    DRV_CLIENT_STATUS_READY = 2,
    DRV_CLIENT_STATUS_READY_EXTENDED = 10
} DRV_CLIENT_STATUS;
```

Description

Driver Client Status

This enumeration identifies the current status/state of a client's link to a driver.

Members

Members	Description
DRV_CLIENT_STATUS_ERROR_EXTENDED = -10	Indicates that a non-system defined error has occurred.
DRV_CLIENT_STATUS_ERROR = -1	An un-specified error has occurred.
DRV_CLIENT_STATUS_CLOSED = 0	An operation is currently in progress
DRV_CLIENT_STATUS_BUSY = 1	An operation is currently in progress
DRV_CLIENT_STATUS_READY = 2	Any previous operations have succeeded and the module is ready for additional operations
DRV_CLIENT_STATUS_READY_EXTENDED = 10	Indicates that the module is in a non-system defined ready/run state.

Remarks

The enumeration used as the return type for the client-level status routines defined by each device driver or system module (for example, [DRV_USART_ClientStatus](#)) must be based on the values in this enumeration.

5.1.1.1.2 DRV_HANDLE Type

C

```
typedef uintptr_t DRV_HANDLE;
```

Description

Device Handle

This handle identifies the open instance of a device driver. It must be passed to all other driver routines (except the initialization, deinitialization, or power routines) to identify the caller.

Remarks

Every application or module that wants to use a driver must first call the driver's open routine. This is the only routine that is absolutely required for every driver.

If a driver is unable to allow an additional module to use it, it must then return the special value `DRV_HANDLE_INVALID`. Callers should check the handle returned for this value to ensure this value was not returned before attempting to call any other driver routines using the handle.

5.1.1.1.3 DRV_IO_BUFFER_TYPES Enumeration

C

```
typedef enum {
    DRV_IO_BUFFER_TYPE_NONE = 0x00,
    DRV_IO_BUFFER_TYPE_READ = 0x01,
    DRV_IO_BUFFER_TYPE_WRITE = 0x02,
    DRV_IO_BUFFER_TYPE_RW = DRV_IO_BUFFER_TYPE_READ | DRV_IO_BUFFER_TYPE_WRITE
} DRV_IO_BUFFER_TYPES;
```

Description

Device Driver IO Buffer Identifier

This enumeration identifies to which buffer (read, write, both, or neither) a device operation will apply. This is used for "flush" (or similar) operations.

Members

Members	Description
DRV_IO_BUFFER_TYPE_NONE = 0x00	Operation does not apply to any buffer
DRV_IO_BUFFER_TYPE_READ = 0x01	Operation applies to read buffer
DRV_IO_BUFFER_TYPE_WRITE = 0x02	Operation applies to write buffer
DRV_IO_BUFFER_TYPE_RW = DRV_IO_BUFFER_TYPE_READ DRV_IO_BUFFER_TYPE_WRITE	Operation applies to both read and write buffers

5.1.1.1.4 DRV_IO_INTENT Enumeration

C

```
typedef enum {
    DRV_IO_INTENT_READ,
    DRV_IO_INTENT_WRITE,
    DRV_IO_INTENT_READWRITE,
    DRV_IO_INTENT_BLOCKING,
    DRV_IO_INTENT_NONBLOCKING,
    DRV_IO_INTENT_EXCLUSIVE,
    DRV_IO_INTENT_SHARED
}
```

```
} DRV_IO_INTENT;
```

Description

Device Driver I/O Intent

This enumeration identifies the intended usage of the device when the caller opens the device. It identifies the desired behavior of the device driver for the following:

- Blocking or non-blocking I/O behavior (do I/O calls such as read and write block until the operation is finished or do they return immediately and require the caller to call another routine to check the status of the operation)
- Support reading and/or writing of data from/to the device
- Identify the buffering behavior (sometimes called "double buffering" of the driver. Indicates if the driver should maintain its own read/write buffers and copy data to/from these buffers to/from the caller's buffers.
- Identify the DMA behavior of the peripheral

Members

Members	Description
DRV_IO_INTENT_READ	Read
DRV_IO_INTENT_WRITE	Write
DRV_IO_INTENT_READWRITE	Read and Write
DRV_IO_INTENT_BLOCKING	The driver will block and will return when the operation is complete
DRV_IO_INTENT_NONBLOCKING	The driver will return immediately
DRV_IO_INTENT_EXCLUSIVE	The driver will support only one client at a time
DRV_IO_INTENT_SHARED	The driver will support multiple clients at a time

Remarks

The buffer allocation method is not identified by this enumeration. Buffers can be allocated statically at build time, dynamically at run-time, or even allocated by the caller and passed to the driver for its own usage if a driver-specific routine is provided for such. This choice is left to the design of the individual driver and is considered part of its interface.

These values can be considered "flags". One selection from each of the groups below can be ORed together to create the complete value passed to the driver's open routine.

5.1.1.2 Constants

Macros

	Name	Description
	<u>DRV_CONFIG_NOT_SUPPORTED</u>	Not supported configuration.
	<u>DRV_HANDLE_INVALID</u>	Invalid device handle.
	<u>DRV_IO_ISBLOCKING</u>	Returns if the I/O intent provided is blocking
	<u>DRV_IO_ISEXCLUSIVE</u>	Returns if the I/O intent provided is non-blocking.
	<u>DRV_IO_ISNONBLOCKING</u>	Returns if the I/O intent provided is non-blocking.

Description**5.1.1.2.1 DRV_CONFIG_NOT_SUPPORTED Macro****C**

```
#define DRV_CONFIG_NOT_SUPPORTED (((unsigned short) -1))
```

Description

Not supported configuration

If the configuration option is not supported on an instance of the peripheral, use this macro to equate to that configuration. This option should be listed as a possible value in the description of that configuration option.

5.1.1.2.2 DRV_HANDLE_INVALID Macro**C**

```
#define DRV_HANDLE_INVALID (((DRV_HANDLE) -1))
```

Description

Invalid Device Handle

If a driver is unable to allow an additional module to use it, it must then return the special value DRV_HANDLE_INVALID. Callers should check the handle returned for this value to ensure this value was not returned before attempting to call any other driver routines using the handle.

Remarks

None.

5.1.1.2.3 DRV_IO_ISBLOCKING Macro**C**

```
#define DRV_IO_ISBLOCKING(intent) (intent & DRV_IO_INTENT_BLOCKING)
```

Description

Device Driver Blocking Status Macro

This macro returns if the I/O intent provided is blocking.

Remarks

None.

5.1.1.2.4 DRV_IO_ISEXCLUSIVE Macro**C**

```
#define DRV_IO_ISEXCLUSIVE(intent) (intent & DRV_IO_INTENT_EXCLUSIVE)
```

Description

Device Driver Exclusive Status Macro

This macro returns if the I/O intent provided is non-blocking.

Remarks

None.

5.1.1.2.5 DRV_IO_ISNONBLOCKING Macro

C

```
#define DRV_IO_ISNONBLOCKING(intent) (intent & DRV_IO_INTENT_NONBLOCKING )
```

Description

Device Driver Non Blocking Status Macro

This macro returns if the I/ intent provided is non-blocking.

Remarks

None.

5.1.1.3 Files

Files

Name	Description
driver.h	This file aggregates all of the driver library interface headers.
driver_common.h	This file defines the common macros and definitions used by the driver definition and implementation headers.

Description

5.1.1.3.1 driver.h

Driver Library Interface Header

This file aggregates all of the driver library interface headers so client code only needs to include this one single header to obtain prototypes and definitions for the interfaces to all driver libraries.

A device driver provides a simple well-defined interface to a hardware peripheral that can be used without operating system support or that can be easily ported to a variety of operating systems.

A driver has the fundamental responsibilities:

- Providing a highly-abstraced interface to a peripheral
- Controlling access to a peripheral
- Managing the state of a peripheral

Remarks

The directory in which this file resides should be added to the compiler's search path for header files.

5.1.2 ADC Driver Library

5.1.2.1 Introduction

ADC Driver for Microchip Microcontrollers

This Analog-to-Digital Converter (ADC) driver provides an interface to manage the ADC module on the Microchip family of microcontrollers.

Description

Overview

An ADC is a vital part of any system that interfaces to real-world signals. While there are many techniques for analog-to-digital

conversion, the Microchip family of microcontrollers uses Successive Approximation as one of its primary techniques.

5.1.2.2 Release Notes

MPLAB Harmony Version: v0.70b **ADC Driver Library Version :** 0.02a **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.1.2.3 SW License Agreement

© 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS." MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.1.2.4 Using the Library

This topic describes the basic architecture of the ADC Driver Library and provides information and examples on how to use it.

Interface Header File: drv_adc.h

The interface to the ADC Driver Library is defined in the "drv_adc.h" header file.

Please refer to the [MPLAB Harmony Overview](#) for how the driver interacts with the framework.

5.1.2.4.1 Library Overview

Refer to the section [Driver Overview](#) for how the driver operates in a system.

The following table lists the interface section and its brief description.

Section	Description
Configuring the Library	Provides macros for configuring the system. It is required that the system configures the driver to build correctly by choosing appropriate configuration options as listed in this section.

System Interaction Functions	Provides system module interfaces, Device initialization, deinitialization, reinitialization and status functions.
Client Core Configuration Functions	Provides interfaces for core functionality of the driver.

5.1.2.4.2 Abstraction Model

The ADC driver is modeled using the abstraction model, as shown in the following diagram.

- [DRV_ADC_InputsRegister](#) allows selection of inputs
- [DRV_ADC_SamplesRead](#) and [DRV_ADC_SamplesReadLatest](#) allow reading of the sample from the result buffer
- [DRV_ADC_Start](#) and [DRV_ADC_Stop](#) will control the operation of the ADC

5.1.2.4.3 How the Library Works

The library provides interfaces to support:

- System Interaction
- Client Core Functionality

5.1.2.4.3.1 System Initialization

This section describes the system initialization and reinitialization settings for the ADC Peripheral Library.

Description

System Initialization and Reinitialization

The system initialization and the reinitialization settings, effect only the instance of the peripheral that is being initialized or re-initialized. During system initialization configure each instance of the module with the following configuration settings that are supported by the specific ADC device hardware (refer to [DRV_ADC_INIT](#))

1. Device requested power state: One of the system module power states.
2. Acquisition time: If the hardware supports this feature, configure this variable from [DRV_ADC_ACQUISITION_TIME](#).
3. Voltage reference: If the hardware supports this feature, select the one from the available options(from [DRV_ADC_VOLTAGE_REFERENCE](#)).
4. Conversion clock: If the hardware supports this feature, select the conversion clock prescaler value (from [DRV_ADC_CONVERSION_CLOCK_PRESCALER](#)).
5. Conversion clock source: If the hardware supports this feature, select the conversion clock prescaler value (from [DRV_ADC_CONVERSION_CLOCK_SOURCE](#)).
6. Clock frequency: Peripheral clock frequency configured for the device.
7. Conversion trigger source: If the hardware supports this feature, select the conversion trigger source(from [DRV_ADC_CONVERSION_TRIGGER_SOURCE](#)).
8. Samples per interrupt: Configure the number of samples before to be generating interrupt(from

[DRV_ADC_SAMPLES_PER_INTERRUPT](#)).

9. Output data format: Select the output data format.

10. Interrupt source: Select the interrupt source.

Example: Auto Sampling Mode

```
#define MY_ADC_INSTANCE DRV_ADC_INDEX_0

SYS_MODULE_OBJ      myAdcObj;
DRV_ADC_INIT        adcInitData;
SYS_STATUS           adcStatus;

// Populate the adcInitData structure
adcInitData.plibModuleId = ADC_ID_1;
adcInitData.acquisitionTime = PLIB_ADC_ACQUISITION_TIME_20_TAD;
adcInitData.voltageReference = PLIB_ADC_VREF_POS_TO_VDD_VREF_NEG_TO_VSS;
adcInitData.clockFrequency = 4000000; //4MHz
adcInitData.conversionClock = PLIB_ADC_CONV_CLOCK_20_TCY;
adcInitData.conversionClockSource = PLIB_ADC_CLOCK_SRC_SYSTEM_CLOCK;
adcInitData.conversionTriggerSource = PLIB_ADC_CONVERSION_TRIGGER_INTERNAL_COUNT;
adcInitData.dataOutputFormat = PLIB_ADC_OUTPUT_FORMAT_INTEGER_16BIT;
adcInitData.initFlags = DRV_ADC_AUTO_SAMPLING;
adcInitData.interruptSource= PLIB_INT_SOURCE_ADC_1;
adcInitData.samplesPerInterrupt = PLIB_ADC_SAMPLE_PER_INTERRUPT_AT_EACH_SAMPLE;

myAdcObj = DRV_ADC_Initialize(MY_ADC_INSTANCE, (SYS_MODULE_INIT*)&adcInitData);

adcStatus = DRV_ADC_Status(myAdcObj);
if (SYS_STATUS_BUSY == adcStatus)
{
    // do something else and check back later
}
else if (SYS_STATUS_ERROR >= adcStatus)
{
    // Handle error
}
```

5.1.2.4.3.2 Client Core Functionality

Core functionality provides a basic interface for the driver operation.

Description

General Client Operation

Core functionality provides a basic interface for the driver operation.

Applications using the timer core functionality, need to perform the following:

1. The system should have completed necessary initialization and [DRV_ADC_Tasks](#) should either be running in a polled environment, or in an interrupt environment.
2. Open the driver using [DRV_ADC_Open](#) (the timer driver supports exclusive access only).
3. Registers the inputs to be used by the clients using [DRV_ADC_InputsRegister](#).

4. Start the driver using [DRV_ADC_Start](#).
5. Poll for the elapse status using [DRV_ADC_SamplesAvailable](#), and then read the samples using either [DRV_ADC_SamplesReadLatest](#) or [DRV_ADC_SamplesRead](#).
6. The client will be able to stop the started ADC instance using [DRV_ADC_Stop](#) at any point and will be able to close it using [DRV_ADC_Close](#) when it is no longer required.

Example:

```

DRV_HANDLE adcHandle;           //Handle returned by DRV_ADC_Open function.
uint16_t dataBuffer;           //Buffer to which the data will be written.

/*
Open a new client. The handle returned by the this function should be used
a passing parameter for all the specific client related operations.
*/
adcHandle = DRV_ADC_Open(MY_ADC_INSTANCE, DRV_IO_INTENT_NONBLOCKING);

DRV_ADC_InputsRegister ( adcHandle , PLIB_ADC_INPUT_AN1|PLIB_ADC_INPUT_AN2 );

/*
ADC is not yet enabled. Enable it once the inputset is registered. Starts automatically
since auto sample mode is enabled.
*/
DRV_ADC_Start(adcHandle);

if ( DRV_ADC_SamplesAvailable(adcHandle) )
{
    DRV_ADC_SamplesReadLatest ( adcHandle, &dataBuffer, 1);

    /*
    Once the above function returns success, the data is
    in 'dataBuffer'. Application can use this data.
    */
}

```

5.1.2.4.3.3 Code Examples**Example1**

//PIC32/PIC24 in auto sampling , Polling mode
#define MY_ADC_INSTANCE DRV_ADC_INDEX_0

```

DRV_HANDLE          adcHandle;           //Handle returned by DRV_ADC_Open function.
uint16_t dataBuffer;           //Buffer to which the data will be written.

/*
Open a new client. The handle returned by the this function should be used
a passing parameter for all the specific client related operations.
*/
adcHandle = DRV_ADC_Open(MY_ADC_INSTANCE, DRV_IO_INTENT_NONBLOCKING);

ipHandle = DRV_ADC_InputsRegister ( adcHandle ,inputSetConfig );

/*
ADC is not yet enabled. Enable it once the inputset is registered. Starts automatically
since auto sample mode is enabled.
*/
DRV_ADC_Start(adcHandle);

while (DRV_ADC_SampleAvailable(adcHandle))
{
    DRV_ADC_InputSetRead ( adcHandle, &dataBuffer, 1);
}

```

```

    /*
    Once the above function returns success, the data is
    in 'dataBuffer'. Application can use this data.
    */
}

```

Example 2:

//PIC32/PIC24 in Manual triggering , Polling mode

```
#define MY_ADC_INSTANCE DRV_ADC_INDEX_0
```

```

int main()
{
    SYS_MODULE_OBJ    myAdcObj;           //Object returned by DRV_ADC_Initialize function.
    DRV_ADC_INIT      adcInitData;        //Contains all the initialization values.
    DRV_HANDLE         adcHandle;          //Handle returned by DRV_ADC_Open function.
    DRV_ADC_INPUTSET_HANDLE ipHandle;      //Handle returned by DRV_ADC_InputSetRegister
function.
    DRV_ADC_INPUTSET_CONFIG inputSetConfig; //Contains all values to configure the inputset.
    uint16_t dataBuffer;                  //Buffer to which the data will be written.

    /*
    These initialization values should be based on the requirement of the
    application and the way it wants the hardware to be operating. Most of
    these values will be written directly to the hardware registers.
    */
    adcInitData.plibModuleId = ADC_ID_1;
    adcInitData.acquisitionTime = PLIB_ADC_ACQUISITION_TIME_15_TAD;
    adcInitData.voltageReference = PLIB_ADC_VREF_POS_TO_VDD_VREF_NEG_TO_VSS;
    adcInitData.clockFrequency = 4000000; //4MHz
    adcInitData.conversionClock = PLIB_ADC_CONV_CLOCK_5_TCY;
    adcInitData.conversionClockSource = PLIB_ADC_CLOCK_SRC_INTERNAL_RC;
    adcInitData.conversionTriggerSource = PLIB_ADC_CONVERSION_TRIGGER_INTERNAL_COUNT;
    adcInitData.dataOutputFormat = PLIB_ADC_OUTPUT_FORMAT_INTEGER_16BIT;

    adcInitData.interruptSource= PLIB_INT_SOURCE_ADC_1;
    adcInitData.samplesPerInterrupt = PLIB_ADC_SAMPLE_PER_INTERRUPT_AT_EACH_SAMPLE;

    myAdcObj = DRV_ADC_Initialize(MY_ADC_INSTANCE, (SYS_MODULE_INIT*)&adcInitData);

    /*
    Open a new client. The handle returned by the this function should be used
    a passing parameter for all the specific client related operations.
    */
    adcHandle = DRV_ADC_Open(MY_ADC_INSTANCE, DRV_IO_INTENT_NONBLOCKING);

    /*
    Driver invokes the registered callback function every successful data read.
    Application can perform an action or do a state change in the callback
    */
    inputSetConfig.callback = adcCallback;
    inputSetConfig.input = POTENTIOMETER_ANALOG_INPUT;
    inputSetConfig.errorTolerance = 10;
    inputSetConfig.samplingFrequency = 40000;

    ipHandle = DRV_ADC_InputSetRegister ( adcHandle ,inputSetConfig );

    /*
    ADC is not yet enabled. Enable it once the inputset is registered. Starts automatically
    since auto sample mode is enabled.
    */
    DRV_ADC_Start(adcHandle);

    while (1)
    {

}
```

5.1.2.5 Configuring the Library

The configuration of the ADC device driver is based on the file sys_config.h

This header file contains the configuration selection for the ADC device driver build. Based on the selections made here and the system setup the ADC device driver will support or not selected features. These configuration settings will apply to all instances of the device driver.

This header can be placed anywhere in the application specific folders and the path of this header needs to be presented to the include search for a successful build. Refer to the [Applications Overview](#) section for more details.

5.1.2.6 Building the Library

Files

Name	Description
drv_adc.c	ADC Driver source file.
drv_adc_client_multi.c	ADC Driver multiple client implementations.
drv_adc_client_single.c	ADC Driver single client implementations.
drv_adc_hw_dynamic.c	ADC Driver build variant implementation for the dynamic driver.
drv_adc_hw_static.c	ADC Driver build variant implementation for the static driver.

Description

5.1.2.6.1 drv_adc.c

ADC Driver Source File

This file implements the ADC Driver Interface routines. While building the driver from source, ALWAYS use this file in the build.

File Name

drv_adc.c

Company

Microchip Technology Inc.

5.1.2.6.2 drv_adc_client_multi.c

ADC Driver Multiple Client

This file implements the functions for the multiple client support. While building the driver from source, use this file in the build when `DRV_ADC_CLIENTS_NUMBER` is defined in the system configuration or when `DRV_ADC_INSTANCES_NUMBER` is defined in the system configuration.

File Name

drv_adc_client_multi.c

Company

Microchip Technology Inc.

5.1.2.6.3 drv_adc_client_single.c

ADC Driver Single Client

This file implements the functions for the single client support. While building the driver from source, use this file in the build when `DRV_ADC_CLIENTS_NUMBER` is not defined in system configuration.

File Name

drv_adc_client_single.c

Company

Microchip Technology Inc.

5.1.2.6.4 drv_adc_hw_dynamic.c

ADC Driver Build Variant implementation for dynamic driver

This file defines the build variant implementations for the dynamic driver. While building the driver from source, use this file in the build when `DRV_ADC_INSTANCES_NUMBER` is defined in the system configuration.

File Name

drv_adc_hw_dynamic.c

Company

Microchip Technology Inc.

5.1.2.6.5 drv_adc_hw_static.c

ADC Driver build variant implementation for static driver

This file defines the build variant implementations for the static driver. While building the driver from source, use this file in the build when `DRV_ADC_INSTANCES_NUMBER` is not defined in the system configuration.

File Name

drv_adc_hw_static.c

Company

Microchip Technology Inc.

5.1.2.7 Library Interface

Data Types and Constants

	Name	Description
	<u>DRV_ADC_CLIENT_STATUS</u>	Defines the client-specific status of the ADC driver.
	<u>DRV_ADC_INIT</u>	Defines the data required to initialize or reinitialize the ADC driver.
	<u>DRV_ADC_INIT_FLAGS</u>	Identifies the initialization flags of the ADC module.
	<u>DRV_ADC_ACQUISITION_TIME</u>	Defines the acquisition time.
	<u>DRV_ADC_ALTERNATE_INPUT_SAMPLING_ENABLE</u>	Enable the alternate input sampling feature of the ADC.
	<u>DRV_ADC_ANALOG_INPUT</u>	Defines the analog input channel.
	<u>DRV_ADC_AUTO_SAMPLING_ENABLE</u>	Enable the auto-sampling feature of the ADC.
	<u>DRV_ADC_CLIENTS_NUMBER</u>	Selects the maximum number of clients.
	<u>DRV_ADC_CONVERSION_CLOCK_PRESCALER</u>	Defines the conversion clock.
	<u>DRV_ADC_CONVERSION_CLOCK_SOURCE</u>	Defines the conversion clock source.
	<u>DRV_ADC_CONVERSION_TRIGGER_SOURCE</u>	Defines the conversion trigger source.
	<u>DRV_ADC_INDEX</u>	ADC static index selection.
	<u>DRV_ADC_INDEX_0</u>	ADC driver index definitions.
	<u>DRV_ADC_INDEX_1</u>	This is macro DRV_ADC_INDEX_1.
	<u>DRV_ADC_INDEX_2</u>	This is macro DRV_ADC_INDEX_2.
	<u>DRV_ADC_INDEX_COUNT</u>	Number of valid ADC driver indices.
	<u>DRV_ADC_INSTANCES_NUMBER</u>	Sets up the maximum number of hardware instances that can be supported.
	<u>DRV_ADC_INTERNAL_BUFFER_SIZE</u>	Define the internal buffer size.
	<u>DRV_ADC_INTERRUPT_MODE</u>	Controls operation of the driver in the interrupt or polled mode.
	<u>DRV_ADC_INTERRUPT_SOURCE</u>	Defines the interrupt source of the static driver.
	<u>DRV_ADC_PERIPHERAL_ID</u>	ADC PLIB ID Selection
	<u>DRV_ADC_POWER_STATE</u>	Controls the power state of the ADC.
	<u>DRV_ADC_RESULT_FORMAT</u>	Defines the data output format.
	<u>DRV_ADC_SAMPLES_PER_INTERRUPT</u>	Define the sample per interrupt.
	<u>DRV_ADC_STOP_ON_CONVERSION_ENABLE</u>	Enable the stop on conversion feature of the ADC.
	<u>DRV_ADC_VOLTAGE_REFERENCE</u>	Defines the voltage reference.

Client Core Configuration Functions

	Name	Description
	<u>DRV_ADC_ClientStatus</u>	Gets the current client-specific status the ADC driver.
	<u>DRV_ADC_Close</u>	Closes an opened-instance of the ADC driver.
	<u>DRV_ADC_InputsRegister</u>	Registers an input set with the driver for sampling.
	<u>DRV_ADC_Open</u>	Opens the specified ADC driver instance and returns a handle to it.
	<u>DRV_ADC_SamplesAvailable</u>	Identifies if any the ADC driver has any samples available to read.
	<u>DRV_ADC_Start</u>	Starts the ADC driver sampling and converting analog to digital values.
	<u>DRV_ADC_Stop</u>	Stops the ADC driver from sampling and converting analog to digital values.

Other Functions

	Name	Description
≡	DRV_ADC_SampleMaxGet	Gets the max sample value.
≡	DRV_ADC_SampleMinGet	Gets the min sample value.
≡	DRV_ADC_SamplesRead	Reads the converted sample data from the ADC driver.
≡	DRV_ADC_SamplesReadLatest	Reads the most recently converted sample data from the ADC driver.

System Interaction Functions

	Name	Description
≡	DRV_ADC_Deinitialize	Deinitializes the specified instance of the ADC driver module.
≡	DRV_ADC_Initialize	Initializes the ADC driver.
≡	DRV_ADC_Reinitialize	Reinitializes the ADC instance for the specified module ID.
≡	DRV_ADC_Status	Provides the current status of the ADC driver module.
≡	DRV_ADC_Tasks	Maintains the driver's state machine and implements its ISR.

Description**5.1.2.7.1 System Interaction Functions****5.1.2.7.1.1 DRV_ADC_Deinitialize Function****C**

```
void DRV_ADC_Deinitialize(
    SYS_MODULE_OBJ object
);
```

Description

This function deinitializes the specified instance of the ADC driver module, disabling its operation (and any hardware). Invalidates all the internal data.

Preconditions

The [DRV_ADC_Initialize](#) function should have been called before calling this function.

Parameters

Parameters	Description
object	Driver object handle, returned from DRV_ADC_Initialize

Returns

None.

Remarks

Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again.

This function will NEVER block waiting for hardware. If the operation requires time to allow the hardware to complete, this will be reported by the [DRV_ADC_Status](#) operation. The system has to use [DRV_ADC_Status](#) to find out when the module is in the ready state.

Example

```
SYS_MODULE_OBJ    object;    // Returned from DRV_ADC_Initialize
SYS_STATUS        status;

DRV_ADC_Deinitialize(object);

status = DRV_ADC_Status(object);
if (SYS_MODULE_DEINITIALIZED == status)
{
    // Check again later if you need to know
    // when the driver is deinitialized.
}
```

5.1.2.7.1.2 DRV_ADC_Initialize Function**C**

```
SYS_MODULE_OBJ DRV_ADC_Initialize(
    const SYS_MODULE_INDEX drvIndex,
    const SYS_MODULE_INIT * const init
);
```

Description

This function initializes the ADC driver, making it ready for clients to open and use it.

Preconditions

None.

Parameters

Parameters	Description
drvIndex	Index for the driver instance to be initialized
init	Pointer to a data structure containing any data necessary to initialize the driver. This pointer may be null if no data is required because static overrides have been provided.

Returns

If successful, returns a valid handle to a driver instance object. Otherwise, it returns [SYS_MODULE_OBJ_INVALID](#).

Remarks

This function must be called before any other ADC function is called.

This function should only be called once during system initialization unless [DRV_ADC_Deinitialize](#) is called to deinitialize the driver instance.

This function will NEVER block for hardware access. If the operation requires time to allow the hardware to re-initialize, it will be reported by the [DRV_ADC_Status](#) operation. The system must use [DRV_ADC_Status](#) to find out when the driver is in the ready state.

Build configuration options may be used to statically override options in the "init" structure and will take precedence over initialization data passed using this function.

Example

```
DRV_ADC_INIT    init;
SYS_MODULE_OBJ  objectHandle;

// Populate the init structure
init.moduleInit.value = SYS_MODULE_POWER_RUN_FULL;
init.adcID             = ADC_ID_1;
```

```

init.initFlags          = DRV_ADC_AUTO_SAMPLING;
init.clockFrequency     = 4000000; // 4MHz
init.acquisitionTime    = ADC_ACQUISITION_TIME_15_TAD;
init.voltageReference   = ADC_VREF_POS_TO_VDD_VREF_NEG_TO_VSS;
init.conversionClockPrescaler = ADC_CONV_CLOCK_5_TCY;
init.conversionClockSource = ADC_CLOCK_SRC_INTERNAL_RC;
init.conversionTriggerSource = ADC_CONVERSION_TRIGGER_INTERNAL_COUNT;
init.samplesPerInterrupt = ADC_SAMPLE_PER_INTERRUPT_AT_EACH_SAMPLE;
init.resultFormat       = ADC_RESULT_FORMAT_INTEGER_16BIT;
init.analogInput         = ADC_INPUT_AN2;
init.interruptSource     = INT_SOURCE_ADC_1;

// Initialize the ADC driver
objectHandle = DRV_ADC_Initialize(DRV_ADC_INDEX_0, (SYS_MODULE_INIT*)&init);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}

```

5.1.2.7.1.3 DRV_ADC_Reinitialize Function

C

```

void DRV_ADC_Reinitialize(
    SYS_MODULE_OBJ object,
    const SYS_MODULE_INIT * const init
);

```

Description

This function reinitializes and refreshes the hardware for the index instance of the ADC module using the hardware initialization given data. It does not clear or reinitialize internal data structures (although it may change the value of a few appropriate data items necessary to manage the new hardware state).

Preconditions

The [DRV_ADC_Initialize](#) function should have been called before calling this function.

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_ADC_Initialize

Returns

None.

Example

```

DRV_ADC_INIT    init;
SYS_MODULE_OBJ  objectHandle; // Returned from DRV_ADC_Initialize
SYS_STATUS      adcStatus;

// Populate the init structure
init.moduleInit.value = SYS_MODULE_POWER_RUN_FULL;
init.adcID            = ADC_ID_1;
init.initFlags        = DRV_ADC_AUTO_SAMPLING;
init.clockFrequency   = 4000000; // 4MHz
init.acquisitionTime  = ADC_ACQUISITION_TIME_15_TAD;
init.voltageReference = ADC_VREF_POS_TO_VDD_VREF_NEG_TO_VSS;
init.conversionClockPrescaler = ADC_CONV_CLOCK_5_TCY;
init.conversionClockSource = ADC_CLOCK_SRC_INTERNAL_RC;
init.conversionTriggerSource = ADC_CONVERSION_TRIGGER_INTERNAL_COUNT;
init.samplesPerInterrupt = ADC_SAMPLE_PER_INTERRUPT_AT_EACH_SAMPLE;
init.resultFormat     = ADC_RESULT_FORMAT_INTEGER_16BIT;
init.analogInput       = ADC_INPUT_AN2;
init.interruptSource   = INT_SOURCE_ADC_1;

```

```

// Reinitialize the ADC driver
DRV_ADC_Reinitialize(objectHandle, (SYS_MODULE_INIT*)&init);

// Check the status of the driver
adcStatus = DRV_ADC_Status(myAdcObj);
if (SYS_STATUS_BUSY == adcStatus)
{
    // do something else and check back later
}
else if (SYS_STATUS_ERROR >= adcStatus)
{
    // Handle error
}

```

Remarks: This function can be called multiple times to reinitialize the module.

This operation can be used to refresh any supported hardware registers as specified by the initialization data or to change the power state of the module.

This function will NEVER block **for** hardware access. If the operation requires time to allow the hardware to reinitialize, it will be reported by the DRV_ADC_Status operation. The system must use DRV_ADC_Status to find out when the driver is in the ready state.

Build configuration options may be used to statically override options in the "init" structure and will take precedence over initialization data passed **using this** function.

5.1.2.7.1.4 DRV_ADC_Status Function

C

```

SYS_STATUS DRV_ADC_Status(
    SYS_MODULE_OBJ object
);

```

Description

This function provides the current status of the ADC driver module.

Preconditions

The [DRV_ADC_Initialize](#) function must have been called before calling this function.

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_ADC_Initialize

Returns

SYS_STATUS_READY - Indicates that the driver is busy with a previous system level operation and cannot start another

Remarks

Any value greater than SYS_STATUS_READY is also a normal running state in which the driver is ready to [accept](#) new operations.

SYS_STATUS_BUSY - Indicates that the driver is busy with a previous system level operation and cannot start another

SYS_STATUS_ERROR - Indicates that the driver is in an error state

Any value less than SYS_STATUS_ERROR is also an error state.

SYS_MODULE_DEINITIALIZED - Indicates that the driver has been deinitialized

This value is less than SYS_STATUS_ERROR

The this operation can be used to determine when any of the driver's module level operations has completed.

If the status operation returns `SYS_STATUS_BUSY`, the a previous operation has not yet completed. Once the status operation returns `SYS_STATUS_READY`, any previous operations have completed.

The value of `SYS_STATUS_ERROR` is negative (-1). Any value less than that is also an error state.

This function will NEVER block waiting for hardware.

If the Status operation returns an error value, the error may be cleared by calling the reinitialize operation. If that fails, the deinitialize operation will need to be called, followed by the initialize operation to return to normal operations.

Example

```
SYS_MODULE_OBJ    object;    // Returned from DRV_TMR_Initialize
SYS_STATUS        status;

status = DRV_ADC_Status(object);
else if (SYS_STATUS_ERROR >= status)
{
    // Handle error
}
```

5.1.2.7.1.5 DRV_ADC_Tasks Function

C

```
void DRV_ADC_Tasks(
    SYS_MODULE_OBJ object
);
```

Description

This function is used to maintain the driver's internal state machine and implement its ISR for interrupt-driven implementations.

Preconditions

The [DRV_ADC_Initialize](#) function must have been called for the specified ADC driver instance.

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_ADC_Initialize)

Returns

None

Remarks

This function is normally not called directly by an application. It is called by the system's Tasks function ([SYS_Tasks](#)) or by the appropriate raw ISR.

This function may excute in an ISR context and will never block or access any resources that may cause it to block.

Example

```
SYS_MODULE_OBJ    object;    // Returned from DRV_ADC_Initialize

while (true)
{
    DRV_ADC_Tasks (object);

    // Do other tasks
}
```

5.1.2.7.2 Client Core Configuration Functions

5.1.2.7.2.1 DRV_ADC_ClientStatus Function

C

```
DRV_ADC_CLIENT_STATUS DRV_ADC_ClientStatus(  
    DRV_HANDLE handle  
)  
;
```

Description

This function gets the client-specific status of the ADC driver associated with the given handle.

Preconditions

The [DRV_ADC_Initialize](#) function must have been called.

[DRV_ADC_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Returns

A [DRV_ADC_CLIENT_STATUS](#) value describing the current status of the driver.

Remarks

This function will not block for hardware access and will immediately return the current status.

Example

```
DRV_HANDLE      handle; // Returned from DRV_ADC_Open  
DRV_ADC_CLIENT_STATUS status;  
  
status = DRV_ADC_ClientStatus(handle);  
if(DRV_ADC_CLIENT_STATUS_ERROR >= status)  
{  
    // Handle the error  
}
```

5.1.2.7.2.2 DRV_ADC_Close Function

C

```
void DRV_ADC_Close(  
    DRV_HANDLE handle  
)  
;
```

Description

This function closes an opened-instance of the ADC driver, invalidating the handle.

Preconditions

The [DRV_ADC_Initialize](#) function must have been called for the specified ADC driver instance.

[DRV_ADC_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Returns

None

Remarks

After calling this function, the handle passed in "handle" must not be used with any of the remaining driver functions. A new handle must be obtained by calling [DRV_ADC_Open](#) before the caller may use the driver again.

If DRV_IO_INTENT_BLOCKING was requested and the driver was built appropriately to support blocking behavior call may block until the operation is complete.

If DRV_IO_INTENT_NON_BLOCKING request the driver client can call the [DRV_ADC_Status](#) operation to find out when the module is in the ready state (the handle is no longer valid).

Usually there is no need for the driver client to verify that the Close operation has completed.

Example

```
DRV_HANDLE handle; // Returned from DRV_ADC_Open

DRV_ADC_Close(handle);
```

5.1.2.7.2.3 DRV_ADC_InputsRegister Function**C**

```
void DRV_ADC_InputsRegister(
    DRV_HANDLE handle,
    uint32_t inputsMask
);
```

Description

This function registers an input set with the driver for sampling.

Preconditions

The [DRV_ADC_Initialize](#) function must have been called for the specified ADC device instance and the [DRV_ADC_Status](#) must have returned SYS_STATUS_READY.

[DRV_ADC_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
inputsMask	Mask bits recognising the various Analog Channels

Returns

None.

Remarks

None.

Example

```
DRV_HANDLE handle; // Returned from DRV_ADC_Open

DRV_ADC_InputsRegister (handle, ADC_INPUT_AN2|ADC_INPUT_AN3);
```

5.1.2.7.2.4 DRV_ADC_Open Function**C**

```
DRV_HANDLE DRV_ADC_Open(
    const SYS_MODULE_INDEX drvIndex,
    const DRV_IO_INTENT intent
);
```

Description

This function opens the specified ADC driver instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver.

Preconditions

The [DRV_ADC_Initialize](#) function must have been called before calling this function.

Parameters

Parameters	Description
drvIndex	Identifier for the object instance to be opened
intent	Zero or more of the values from the enumeration DRV_IO_INTENT "ORed" together to indicate the intended use of the driver

Returns

If successful, the function returns a valid open-instance handle (a number identifying both the caller and the module instance).

If an error occurs, the return value is [DRV_HANDLE_INVALID](#).

Remarks

The handle returned is valid until the [DRV_ADC_Close](#) function is called.

This function will NEVER block waiting for hardware.

If the [DRV_IO_INTENT_BLOCKING](#) is requested and the driver was built appropriately to support blocking behavior, other client-level operations may block waiting on hardware until they are complete.

If [DRV_IO_INTENT_NON_BLOCKING](#) is requested the driver client can call the [DRV_ADC_ClientStatus](#) operation to find out when the module is in the ready state.

If the requested intent flags are not supported, the function will return [DRV_HANDLE_INVALID](#).

Example

```
DRV_HANDLE  handle;

handle = DRV_ADC_Open(DRV_ADC_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);
if (DRV_HANDLE_INVALID == handle)
{
    // Unable to open the driver
}
```

5.1.2.7.2.5 DRV_ADC_SamplesAvailable Function**C**

```
bool DRV_ADC_SamplesAvailable(
    DRV_HANDLE handle
);
```

Description

This function identifies if any the ADC driver has any samples available to read.

Preconditions

The [DRV_ADC_Initialize](#) function must have been called.

[DRV_ADC_Open](#) must have been called to obtain a valid opened device handle.

The desired analog input set must have been selected by calling [DRV_ADC_InputsRegister](#).

[DRV_ADC_Start](#) must have been called to start the driver sampling and converting analog input samples to digital values.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Returns

- true - If one or more samples are available for the registered input set
- false - If no samples are available

Remarks

None.

Example

```
DRV_HANDLE    handle; // Returned from DRV_ADC_Open
DRV_ADC_SAMPLE buffer;

// An input set must have been registered and the ADC started.

if (DRV_ADC_SamplesAvailable(handle))
{
    DRV_ADC_SamplesRead(handle, &buffer, sizeof(buffer));
}
```

5.1.2.7.2.6 DRV_ADC_Start Function**C**

```
void DRV_ADC_Start(
    DRV_HANDLE handle
);
```

Description

This function starts the ADC driver sampling the selected analog inputs and converting the samples to digital values.

Preconditions

The [DRV_ADC_Initialize](#) function must have been called.

[DRV_ADC_Open](#) must have been called to obtain a valid opened device handle.

The desired analog input set must have been selected by calling [DRV_ADC_InputsRegister](#).

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Returns

None.

Remarks

Call [DRV_ADC_SamplesAvailable](#) to find out when one or more samples is available.

Example

```
DRV_HANDLE handle; // Returned from DRV_ADC_Open

// Use DRV_ADC_InputsRegister to register the desired inputs.

DRV_ADC_Start(handle);
```

5.1.2.7.2.7 DRV_ADC_Stop Function

C

```
void DRV_ADC_Stop(  
    DRV_HANDLE handle  
);
```

Description

This function stops the ADC driver from sampling analog inputs and converting the samples to digital values.

Preconditions

The [DRV_ADC_Initialize](#) function must have been called.

[DRV_ADC_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Returns

None.

Remarks

Call [DRV_ADC_Start](#) to restart sampling and conversion of analog inputs to digital values.

Example

```
DRV_HANDLE handle; // Returned from DRV_ADC_Open  
  
DRV_ADC_Stop(handle);
```

5.1.2.7.3 Other Functions

5.1.2.7.3.1 DRV_ADC_SampleMaxGet Function

C

```
ADC_SAMPLE DRV_ADC_SampleMaxGet(  
    DRV_HANDLE handle  
);
```

Description

This function returns the max sample value.

Preconditions

The [DRV_ADC_Initialize](#) function must have been called.

[DRV_ADC_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Returns

Max sample value.

Remarks

None

Example

```
DRV_HANDLE      handle; // Returned from DRV_ADC_Open
ADC_SAMPLE      maxValue, minValue;

maxValue = DRV_ADC_SampleMaxGet(handle);
minValue = DRV_ADC_SampleMinGet(handle);
adcRange = maxValue - minValue;
```

5.1.2.7.3.2 DRV_ADC_SampleMinGet Function**C**

```
ADC_SAMPLE DRV_ADC_SampleMinGet(
    DRV_HANDLE handle
);
```

Description

This function returns the min sample value.

Preconditions

The [DRV_ADC_Initialize](#) function must have been called.

[DRV_ADC_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Returns

Min sample value.

Remarks

None

Example

```
DRV_HANDLE      handle; // Returned from DRV_ADC_Open
ADC_SAMPLE      maxValue, minValue;

maxValue = DRV_ADC_SampleMaxGet(handle);
minValue = DRV_ADC_SampleMinGet(handle);
adcRange = maxValue - minValue;
```

5.1.2.7.3.3 DRV_ADC_SamplesRead Function**C**

```
unsigned short DRV_ADC_SamplesRead(
    DRV_HANDLE handle,
    ADC_SAMPLE * buffer,
    unsigned short bufferSize
);
```

Description

This function reads converted sample data from the ADC driver into the given buffer. How many samples depends on how many samples are available and on the relative sizes of the samples and the buffer passed in.

Zero (0) samples are copied if the bufferSize is less than the size of a complete set of samples for the registered inputs.

N sets of samples where the bufferSize / size of a complete set of samples = N, unless less than N samples are currently available. Then, the number of samples currently available are copied.

Preconditions

The [DRV_ADC_Initialize](#) function must have been called.

[DRV_ADC_Open](#) must have been called to obtain a valid opened device handle.

The desired analog input set must have been selected by calling [DRV_ADC_InputsRegister](#).

[DRV_ADC_Start](#) must have been called to start the driver sampling and converting analog input samples to digital values.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
buffer	A pointer to the buffer to where the sample data will be copied
bufferSize	Size of the buffer (in bytes)

Returns

Number of bytes of sample data copied to the specified buffer.

Remarks

The [DRV_ADC_SamplesAvailable](#) function can be used to determine if any sample data is available.

Calling this function removes the samples from the driver's internal buffer queue of samples.

Example

```
DRV_HANDLE    handle; // Returned from DRV_ADC_Open
ADC_SAMPLE    buffer;

// An input set must have been registered and the ADC started.

if (DRV_ADC_SamplesAvailable(handle))
{
    DRV_ADC_SamplesRead(handle, &buffer, sizeof(buffer));
}
```

5.1.2.7.3.4 DRV_ADC_SamplesReadLatest Function

C

```
unsigned short DRV_ADC_SamplesReadLatest(
    DRV_HANDLE handle,
    ADC_SAMPLE * buffer,
    unsigned short bufferSize
);
```

Description

This function reads only the most recently converted sample data from the ADC driver into the given buffer. Only the data for a single set of samples for the registered inputs is copied to the caller's buffer. If the buffer size is less than the size of a complete set of samples for the registered inputs, no data is copied to the caller's buffer. Also, no sample data is copied to the caller's buffer if no sample data is currently available.

Preconditions

The [DRV_ADC_Initialize](#) function must have been called.

[DRV_ADC_Open](#) must have been called to obtain a valid opened device handle.

The desired analog input set must have been selected by calling [DRV_ADC_InputsRegister](#).

[DRV_ADC_Start](#) must have been called to start the driver sampling and converting analog input samples to digital values.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
buffer	A pointer to the buffer to where the sample data will be copied
bufferSize	Size of the buffer (in bytes)

Returns

Number of bytes of sample data copied to the specified buffer.

Remarks

The [DRV_ADC_SamplesAvailable](#) function can be used to determine if any sample data is available.

This function does not remove any data from the driver's internal buffer queue of sample data.

Example

```
DRV_HANDLE      handle; // Returned from DRV_ADC_Open
ADC_SAMPLE      buffer;

// An input set must have been registered and the ADC started.

if (DRV_ADC_SamplesAvailable(handle))
{
    DRV_ADC_SamplesReadLatest(handle, &buffer, sizeof(buffer));
}
```

5.1.2.7.4 Data Types and Constants

5.1.2.7.4.1 DRV_ADC_CLIENT_STATUS Enumeration

C

```
typedef enum {
    DRV_ADC_CLIENT_STATUS_STARTED,
    DRV_ADC_CLIENT_STATUS_STOPPED,
    DRV_ADC_CLIENT_STATUS_READY,
    DRV_ADC_CLIENT_STATUS_BUSY,
    DRV_ADC_CLIENT_STATUS_INVALID,
    DRV_ADC_CLIENT_STATUS_OVERFLOW,
    DRV_ADC_CLIENT_STATUS_BUFFER_TOO_SMALL
} DRV_ADC_CLIENT_STATUS;
```

Description

ADC Client Status

This enumeration defines the client-specific status codes of the ADC driver.

Members

Members	Description
DRV_ADC_CLIENT_STATUS_STARTED	ADC Started
DRV_ADC_CLIENT_STATUS_STOPPED	stopped on error
DRV_ADC_CLIENT_STATUS_READY	Driver OK, ready for client operations
DRV_ADC_CLIENT_STATUS_BUSY	An operation is currently in progress
DRV_ADC_CLIENT_STATUS_INVALID	Client in an invalid (or un-opened) state
DRV_ADC_CLIENT_STATUS_OVERFLOW	Driver Overflowed

DRV_ADC_CLIENT_STATUS_BUFFER_TOO_SMALL	Input Set Read Buffer Too Small

Remarks

Returned by the [DRV_ADC_ClientStatus](#) function.

5.1.2.7.4.2 DRV_ADC_INIT Structure**C**

```
typedef struct {
    SYS_MODULE_INIT moduleInit;
    ADC_MODULE_ID adcId;
    DRV_ADC_INIT_FLAGS initFlags;
    uint32_t clockFrequency;
    ADC_ACQUISITION_TIME acquisitionTime;
    ADC_VOLTAGE_REFERENCE voltageReference;
    ADC_CONVERSION_CLOCK conversionClockPrescaler;
    ADC_CLOCK_SOURCE conversionClockSource;
    ADC_CONVERSION_TRIGGER_SOURCE conversionTriggerSource;
    ADC_SAMPLES_PER_INTERRUPT samplesPerInterrupt;
    ADC_RESULT_FORMAT resultFormat;
    ADC_INPUTS_POSITIVE analogInput;
    INT_SOURCE interruptSource;
} DRV_ADC_INIT;
```

Description

ADC Driver Initialization Data

This structure defines the data required to initialize or reinitialize the ADC driver.

Members

Members	Description
SYS_MODULE_INIT moduleInit;	System module initialization
ADC_MODULE_ID adcId;	Identifies timer hardware module (PLIB-level) ID
DRV_ADC_INIT_FLAGS initFlags;	Initialization Flags
uint32_t clockFrequency;	Clock Frequency
ADC_ACQUISITION_TIME acquisitionTime;	Acquisition Time
ADC_VOLTAGE_REFERENCE voltageReference;	Voltage Reference Selection
ADC_CONVERSION_CLOCK conversionClockPrescaler;	Clock Setup for the Conversion
ADC_CLOCK_SOURCE conversionClockSource;	Clock Source for Conversion
ADC_CONVERSION_TRIGGER_SOURCE conversionTriggerSource;	Conversion Trigger Source
ADC_SAMPLES_PER_INTERRUPT samplesPerInterrupt;	Samples Per Interrupt valid values = 0- 15
ADC_RESULT_FORMAT resultFormat;	Result Format
ADC_INPUTS_POSITIVE analogInput;	Input Channel to convert
INT_SOURCE interruptSource;	Interrupt Source for the module

Remarks

Not all init features are available for all devices. Refer to the specific data sheet to determine availability.

5.1.2.7.4.3 DRV_ADC_INIT_FLAGS Enumeration

C

```
typedef enum {
    DRV_ADC_STOP_CONVERSION_ON_INTERRUPT,
    DRV_ADC_ALTERNATE_INPUT_SAMPLING,
    DRV_ADC_AUTO_SAMPLING,
    DRV_ADC_MANUAL_SAMPLING
} DRV_ADC_INIT_FLAGS;
```

Description

ADC Initialization Flags

This data type identifies the initialization flags of the ADC module.

Members

Members	Description
DRV_ADC_STOP_CONVERSION_ON_INTERRUPT	Stops the conversion on the interrupt
DRV_ADC_ALTERNATE_INPUT_SAMPLING	Alternate Input Sampling
DRV_ADC_AUTO_SAMPLING	Begin sampling automatically after previous conversion
DRV_ADC_MANUAL_SAMPLING	Manual Sampling

Remarks

Not all modes are available on all devices. Refer to the specific data sheet to determine availability.

5.1.2.7.4.4 DRV_ADC_ACQUISITION_TIME Macro

C

```
#define DRV_ADC_ACQUISITION_TIME ADC_ACQUISITION_TIME_4_TAD
```

Description

ADC Acquisition Time

This macro defines the acquisition time of the ADC driver. This provides static override of the dynamic selection of the acquisition time. If this macro is defined, this will be used for setting up the acquisition time and not the acquisition time value provided by [DRV_ADC_INIT](#).

Remarks

None.

5.1.2.7.4.5 DRV_ADC_ALTERNATE_INPUT_SAMPLING_ENABLE Macro

C

```
#define DRV_ADC_ALTERNATE_INPUT_SAMPLING_ENABLE false
```

Description

ADC Alternate Input Sampling Enable

This macro enables the alternate input sampling feature of the ADC. This macro can take the following values:

- true - Enables the alternate Input sampling feature of the ADC
- false - Disables the alternate Input sampling feature of the ADC
- [DRV_CONFIG_NOT_SUPPORTED](#) - When the feature is not supported on the instance

Remarks

None.

5.1.2.7.4.6 DRV_ADC_ANALOG_INPUT Macro**C**

```
#define DRV_ADC_ANALOG_INPUT ADC_INPUT_AN2
```

Description

ADC Analog input channel

This macro defines the analog input channel for the ADC driver. This provides static override of the dynamic selection of the analog input. If this macro is defined, this will be used for setting up the analog input and not the analog input value provided by [DRV_ADC_INIT](#).

Remarks

None.

5.1.2.7.4.7 DRV_ADC_AUTO_SAMPLING_ENABLE Macro**C**

```
#define DRV_ADC_AUTO_SAMPLING_ENABLE true
```

Description

ADC Auto Sampling Enable

This macro enables the auto-sampling feature of the ADC. This macro can take the following values:

- true - Enables the auto-sampling feature of the ADC
- false - Disables the auto-sampling feature of the ADC
- [DRV_CONFIG_NOT_SUPPORTED](#) - When the feature is not supported on the instance

Remarks

None.

5.1.2.7.4.8 DRV_ADC_CLIENTS_NUMBER Macro**C**

```
#define DRV_ADC_CLIENTS_NUMBER 1
```

Description

ADC Maximum Number of Clients

This definition selectd the maximum number of clients that the ADC driver can support at run time.

Remarks

None.

5.1.2.7.4.9 DRV_ADC_CONVERSION_CLOCK_PRESCALER Macro**C**

```
#define DRV_ADC_CONVERSION_CLOCK_PRESCALER ADC_CONV_CLOCK_4_TCY
```

Description

ADC Conversion Clock

This macro defines the conversion clock for the ADC driver. This provides static override of the dynamic selection of the conversion clock. If this macro is defined, this will be used for setting up the conversion clock and not the conversion clock value provided by [DRV_ADC_INIT](#).

Remarks

None.

5.1.2.7.4.10 DRV_ADC_CONVERSION_CLOCK_SOURCE Macro**C**

```
#define DRV_ADC_CONVERSION_CLOCK_SOURCE ADC_CLOCK_SRC_SYSTEM_CLOCK
```

Description

ADC Conversion Clock Source

This macro defines the conversion clock source for the ADC driver. This provides static override of the dynamic selection of the conversion clock source. If this macro is defined, this will be used for setting up the conversion clock source and not the conversion clock source value provided by [DRV_ADC_INIT](#).

Remarks

None.

5.1.2.7.4.11 DRV_ADC_CONVERSION_TRIGGER_SOURCE Macro**C**

```
#define DRV_ADC_CONVERSION_TRIGGER_SOURCE ADC_CONVERSION_TRIGGER_INTERNAL_COUNT
```

Description

Conversion Trigger Source

This macro defines the conversion trigger source for the ADC driver. This provides static override of the dynamic selection of the conversion trigger source. If this macro is defined, this will be used for setting up the conversion trigger source and not the conversion trigger source value provided by [DRV_ADC_INIT](#).

Remarks

None.

5.1.2.7.4.12 DRV_ADC_INDEX Macro**C**

```
#define DRV_ADC_INDEX DRV_ADC_INDEX_0
```

Description

ADC Static Index Selection

ADC static index selection for the driver object reference.

Remarks

This index is required to make a reference to the driver object.

5.1.2.7.4.13 DRV_ADC_INDEX_0 Macro

C

```
#define DRV_ADC_INDEX_0 0
```

Description

Driver ADC Module Index Numbers

These constants provide ADC driver index definitions.

Remarks

These constants should be used in place of hard-coded numeric literals.

These values should be passed into the [DRV_ADC_Initialize](#) function to identify the driver instance in use.

5.1.2.7.4.14 DRV_ADC_INDEX_1 Macro

C

```
#define DRV_ADC_INDEX_1 1
```

Description

This is macro DRV_ADC_INDEX_1.

5.1.2.7.4.15 DRV_ADC_INDEX_2 Macro

C

```
#define DRV_ADC_INDEX_2 2
```

Description

This is macro DRV_ADC_INDEX_2.

5.1.2.7.4.16 DRV_ADC_INDEX_COUNT Macro

C

```
#define DRV_ADC_INDEX_COUNT _ADC_EXISTS
```

Description

Driver ADC Driver Module Index Count

This constant identifies ADC driver index definitions.

Remarks

This constant should be used in place of hard-coded numeric literals.

This value is device-specific.

5.1.2.7.4.17 DRV_ADC_INSTANCES_NUMBER Macro

C

```
#define DRV_ADC_INSTANCES_NUMBER 1
```

Description

ADC hardware instance configuration

This macro sets up the maximum number of hardware instances that can be supported.

Remarks

None.

5.1.2.7.4.18 DRV_ADC_INTERNAL_BUFFER_SIZE Macro

C

```
#define DRV_ADC_INTERNAL_BUFFER_SIZE 2
```

Description

ADC Internal buffer size

This macro defines the internal buffer size.

Remarks

None.

5.1.2.7.4.19 DRV_ADC_INTERRUPT_MODE Macro

C

```
#define DRV_ADC_INTERRUPT_MODE true
```

Description

ADC Interrupt And Polled Mode Operation Control

This macro controls the operation of the driver in the interrupt mode of operation. The possible values of this macro are:

- true - Select if interrupt mode of adc operation is desired
- false - Select if polling mode of adc operation is desired

Not defining this option to true or false will result in a build error.

Remarks

None.

5.1.2.7.4.20 DRV_ADC_INTERRUPT_SOURCE Macro

C

```
#define DRV_ADC_INTERRUPT_SOURCE PLIB_INT_SOURCE_ADC_1
```

Description

ADC Interrupt Source

Macro to define the interrupt source of the static driver.

Remarks

Refer to the Interrupt Peripheral Library document for more information on the PLIB_INT_SOURCE enumeration.

5.1.2.7.4.21 DRV_ADC_PERIPHERAL_ID Macro

C

```
#define DRV_ADC_PERIPHERAL_ID ADC_ID_1
```

Description

ADC PLIB ID Selection

This macro selects the ADC PLIB ID Selection. This is an initialization override of the `adcID` member of the initialization configuration.

Remarks

None.

5.1.2.7.4.22 DRV_ADC_POWER_STATE Macro

C

```
#define DRV_ADC_POWER_STATE SYS_MODULE_POWER_IDLE_STOP
```

Description

ADC power state configuration

This macro controls the power state of the ADC.

Remarks

This feature may not be available in the device or the ADC module selected.

5.1.2.7.4.23 DRV_ADC_RESULT_FORMAT Macro

C

```
#define DRV_ADC_RESULT_FORMAT ADC_RESULT_FORMAT_INTEGER_16BIT
```

Description

ADC Data Output Format

This macro defines the data output format for the ADC driver. This provides static override of the dynamic selection of the data output format. If this macro is defined, this will be used for setting up the data output format and not the data output format value provided by [DRV_ADC_INIT](#).

Remarks

None.

5.1.2.7.4.24 DRV_ADC_SAMPLES_PER_INTERRUPT Macro

C

```
#define DRV_ADC_SAMPLES_PER_INTERRUPT 2
```

Description

Samples per Interrupt

This macro defines the samples per interrupt of the ADC driver. This provides static override of the dynamic selection of the sample per interrupt. If this macro is defined, this will be used for setting up the samples per interrupt and not the samples per interrupt value provided by [DRV_ADC_INIT](#).

Remarks

Select this size based on the device available and the number of samples that are required to form a set.

5.1.2.7.4.25 DRV_ADC_STOP_ON_CONVERSION_ENABLE Macro

C

```
#define DRV_ADC_STOP_ON_CONVERSION_ENABLE false
```

Description

ADC Stop on conversion Enable

This macro enables the stop on conversion feature of the ADC. This macro can take the following values:

- true - Enables the ADC to stop on conversion
- false - Disables the ADC to stop on conversion
- [DRV_CONFIG_NOT_SUPPORTED](#) - When the feature is not supported on the instance

Remarks

None.

5.1.2.7.4.26 DRV_ADC_VOLTAGE_REFERENCE Macro**C**

```
#define DRV_ADC_VOLTAGE_REFERENCE ADC_VREF_POS_TO_VDD_VREF_NEG_TO_VSS
```

Description

ADC Voltage Reference

This macro defines the voltage reference of the ADC driver. This provides static override of the dynamic selection of the voltage reference. If this macro is defined, this will be used for setting up the voltage reference and not the voltage reference value provided by [DRV_ADC_INIT](#).

Remarks

None.

5.1.2.8 Files**Files**

Name	Description
drv_adc.h	ADC Driver interface definition.

Description**5.1.2.8.1 drv_adc.h**

ADC Driver Interface Definition

The ADC device driver provides a simple interface to manage the ADC modules on Microchip microcontrollers. This file defines the interface definition for the ADC driver.

Enumerations

	Name	Description
	DRV_ADC_CLIENT_STATUS	Defines the client-specific status of the ADC driver.
	DRV_ADC_INIT_FLAGS	Identifies the initialization flags of the ADC module.

Functions

	Name	Description
≡	DRV_ADC_ClientStatus	Gets the current client-specific status the ADC driver.
≡	DRV_ADC_Close	Closes an opened-instance of the ADC driver.
≡	DRV_ADC_Deinitialize	Deinitializes the specified instance of the ADC driver module.
≡	DRV_ADC_Initialize	Initializes the ADC driver.
≡	DRV_ADC_InputsRegister	Registers an input set with the driver for sampling.
≡	DRV_ADC_Open	Opens the specified ADC driver instance and returns a handle to it.
≡	DRV_ADC_Reinitialize	Reinitializes the ADC instance for the specified module ID.
≡	DRV_ADC_SampleMaxGet	Gets the max sample value.
≡	DRV_ADC_SampleMinGet	Gets the min sample value.
≡	DRV_ADC_SamplesAvailable	Identifies if any the ADC driver has any samples available to read.
≡	DRV_ADC_SamplesRead	Reads the converted sample data from the ADC driver.
≡	DRV_ADC_SamplesReadLatest	Reads the most recently converted sample data from the ADC driver.
≡	DRV_ADC_Start	Starts the ADC driver sampling and converting analog to digital values.
≡	DRV_ADC_Status	Provides the current status of the ADC driver module.
≡	DRV_ADC_Stop	Stops the ADC driver from sampling and converting analog to digital values.
≡	DRV_ADC_Tasks	Maintains the driver's state machine and implements its ISR.

Macros

	Name	Description
≡	DRV_ADC_INDEX_0	ADC driver index definitions.
≡	DRV_ADC_INDEX_1	This is macro DRV_ADC_INDEX_1.
≡	DRV_ADC_INDEX_2	This is macro DRV_ADC_INDEX_2.
≡	DRV_ADC_INDEX_COUNT	Number of valid ADC driver indices.

Structures

	Name	Description
≡	DRV_ADC_INIT	Defines the data required to initialize or reinitialize the ADC driver.

5.1.3 Ethernet MAC Driver Library

5.1.3.1 Introduction

Ethernet (Media Access) Controller Driver Library

for

Microchip Microcontrollers

This library provides a driver-level abstraction of the on-chip Ethernet Controller found on many PIC32 devices.

The "Host-To-Network" layer of a TCP/IP stack organization covers the Data Link and Physical Layers of the standard OSI stack. The Ethernet Controller provides the Data Link or Media Access Control Layer, in addition to other functions discussed below. An external Ethernet "PHY" provides the Physical layer, providing conversion between the digital and analog.

Description

The PIC32 Ethernet Controller is a bus master module that interfaces with an off-chip PHY in order to implement a complete Ethernet node in a system. The following are some of the key features of this module:

- Supports 10/100 Ethernet
 - Full-Duplex and Half-Duplex operation
 - Broadcast, Multicast and Unicast packets
 - Manual and automatic flow control
 - Supports Auto-MDIX enabled PHYs
 - Reduced Media Independent Interface (RMII) and Media Independent Interface (MII) PHY data interfaces
 - Performance statistics metrics in hardware.
- RAM descriptor based DMA operation for both receive and transmit path
- Fully configurable interrupts
- Configurable receive packet filtering using:
 - 64-bit Hash Table
 - 64-byte Pattern Match
 - Magic Packet™ Filtering
 - Runt Packet Detection and Filtering
- Supports Packet Payload Checksum calculation
- CRC Check

Support for the Serial Management Interface (SMI) (also known as the MIIM interface) is provided by the Ethernet PHY Driver Library.

5.1.3.2 Release Notes

MPLAB Harmony Version: v0.70b **Ethernet MAC Library Version :** 7.10 **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.1.3.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its

licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.1.3.4 Using the Library

This topic describes the basic architecture of the Ethernet MAC Driver Library and provides information and examples on how to use it.

Interface Header File: [drv_ethmac.h](#)

The interface to the Ethernet MAC library is defined in the "[drv_ethmac.h](#)" header file. This file is included by the "[drv_ethmac.h](#)" file. Any C language source (.c) file that uses the Ethernet MAC Driver Library should include "drv.h".

Library File:

The Ethernet MAC Driver Library archive (.a) file is installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the library interacts with the framework.

5.1.3.4.1 Abstraction Model

The Ethernet Controller provides the modules needed to implement a 10/100 Mbps Ethernet node using an external Ethernet PHY chip. The PHY chip provides a digital-analog interface as part of the Physical Layer and the controller provides the Media Access Controller (MAC) layer above the PHY.

As shown in Figure 1, the Ethernet Controller consists of the following modules:

- Media Access Control (MAC) block: Responsible for implementing the MAC functions of the Ethernet IEEE 802.3 Specification
- Flow Control (FC) block: Responsible for control of the transmission of PAUSE frames. (Reception of PAUSE frames is handled within the MAC.)
- RX Filter (RXF) block: This module performs filtering on every receive packet to determine whether each packet should be accepted or rejected
- TX DMA/TX Buffer Management Engine: The TX DMA and TX Buffer Management engines perform data transfers from the memory (using descriptor tables) to the MAC Transmit Interface
- RX DMA/RX Buffer Management Engine: The RX DMA and RX Buffer Management engines transfer receive packets from the MAC to the memory (using descriptor tables)

Figure 1: Ethernet Controller Block Diagram

For completeness, we also need to look at the interface diagram of a representative Ethernet PHY. As shown in Figure 2, the PHY has two interfaces, one for configuring and managing the PHY (SMI/MIIM) and another for transmit and receive data (RMII or MII). The SMI/MIIM interface is the responsibility of the Ethernet PHY Driver Library. When setting up the Ethernet PHY this library calls primitives from the Ethernet PHY Driver library. The RMII/MII interface is the responsibility of the Ethernet MAC Driver Library (this library).

Figure 2: Ethernet PHY Interfaces

5.1.3.4.2 Library Overview

Refer to the section [Driver Overview](#) for how the driver operates in a system.

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the Ethernet MAC Driver Library.

Library Interface Section	Description
Client Level Functions	PIC32MACOpen, PIC32MACClose, and PIC32MACSetup to support the TCP/IP Stack. Plus link status and power options.
Get and Put Functions	Get/Put functions for bytes, byte arrays, and Ethernet headers.
Base Address and Buffer Size Functions	Base address and sizes for buffers.
Receive Functions	Receive routines.
Transmit Functions	Transmit routines.
Events	Ethernet event support routines.
Other Functions	Checksum support, memory copying, version support.
Data Types and Constants	Typedefs and #defines.

5.1.3.4.3 MPLAB Harmony vs. Unified Stack Functions

The following is a cross-reference linking MPLAB Harmony functions with functions from the legacy TCP/IP Stack:

MPLAB Harmony Function:	MCHP_tcpip_unified Function:
DRV_ETHMAC_BaseAddrTxGet	PIC32MACGetTxBaseAddr
DRV_ETHMAC_RxPacketDiscard	PIC32MACDiscardRx
DRV_ETHMAC_EventAck	PIC32MACEventAck
DRV_ETHMAC_EventDeInit	PIC32MACEventDeInit
DRV_ETHMAC_EventInit	PIC32MACEventInit
DRV_ETHMAC_EventNotifyClear	PIC32TCPIP_MAC_EventNotifyClear
DRV_ETHMAC_EventNotifyHandlerSet	PIC32MACEventSetNotifyHandler
DRV_ETHMAC_EventNotifySet	PIC32MACEventSetNotifyEvents
DRV_ETHMAC_EventPendingGet	PIC32MACEventGetPending
DRV_ETHMAC_ByteArrayGet	PIC32MACGetArray
DRV_ETHMAC_HeaderGet	PIC32MACGetHeader
DRV_ETHMAC_IPBufferChecksumCalc	PIC32MACCalcIPBufferChecksum
DRV_ETHMAC_LinkCheck	PIC32MACCheckLink
DRV_ETHMAC_MemoryCopyIsDone	PIC32MACIsMemCopyDone
DRV_ETHMAC_PIC32MACClose	PIC32MACClose
DRV_ETHMAC_PIC32MACOpen	PIC32MACOpen
DRV_ETHMAC_PIC32MACSetup	PIC32MACInitialize
DRV_ETHMAC_PIC32MACTearDown	PIC32MACDeinitialize
DRV_ETHMAC_PowerMode	PIC32MACPowerMode
DRV_ETHMAC_ByteArrayPut	PIC32MACPutArray
DRV_ETHMAC_HeaderPut	PIC32MACPutHeader
DRV_ETHMAC_ReadPointerBaseSet	PIC32MACSetBaseReadPtr
DRV_ETHMAC_ReadPointerSet	PIC32MACSetReadPtr
DRV_ETHMAC_RxChecksumCalc	PIC32MACCalcRxChecksum
DRV_ETHMAC_RxHashTableEntrySet	PIC32MACSetRXHashTableEntry
DRV_ETHMAC_RxReadPointerGet	PIC32MACGetReadPtrInRx
DRV_ETHMAC_RxReadPointerSet	PIC32MACSetReadPtrInRx
DRV_ETHMAC_TxBufferFlush	PIC32MACFlush
DRV_ETHMAC_TxIsReady	PIC32MACIsTxReady
DRV_ETHMAC_VersionGet	-none-
DRV_ETHMAC_VersionStrGet	-none-
DRV_ETHMAC_WritePointerSet	PIC32MACSetWritePtr

MCHP_tcpip_unified Function	MPLAB Harmony Function:
PIC32MACCalcIPBufferChecksum	DRV_ETHMAC_IPBufferChecksumCalc
PIC32MACCalcRxChecksum	DRV_ETHMAC_RxChecksumCalc
PIC32MACCheckLink	DRV_ETHMAC_LinkCheck
PIC32MACDeinitialize	DRV_ETHMAC_PIC32MACTeardown
PIC32MACDiscardRx	DRV_ETHMAC_RxPacketDiscard
PIC32MAEventAck	DRV_ETHMAC_EventAck
PIC32MAC_EventNotifyClear	DRV_ETHMAC_EventNotifyClear
PIC32MAEventDelInit	DRV_ETHMAC_EventDelInit
PIC32MAEventGetPending	DRV_ETHMAC_EventPendingGet
PIC32MAEventInit	DRV_ETHMAC_EventInit
PIC32MAEventSetNotifyEvents	DRV_ETHMAC_EventNotifySet
PIC32MAEventSetNotifyHandler	DRV_ETHMAC_EventNotifyHandlerSet
PIC32MACFlush	DRV_ETHMAC_TxBufferFlush
PIC32MACGetArray	DRV_ETHMAC_ByteArrayGet
PIC32MACGetHeader	DRV_ETHMAC_HeaderGet
PIC32MACGetReadPtrInRx	DRV_ETHMAC_RxReadPointerGet
PIC32MACGetTxBaseAddr	DRV_ETHMAC_BaseAddrTxGet
PIC32MACIsMemCopyDone	DRV_ETHMAC_MemoryCopyIsDone
PIC32MACIsTxReady	DRV_ETHMAC_TxIsReady
PIC32MACDeinitialize	DRV_ETHMAC_PIC32MACTeardown
PIC32MACInitialize	DRV_ETHMAC_PIC32MACSetup
PIC32MACOpen	DRV_ETHMAC_PIC32MACOpen
PIC32MACClose	DRV_ETHMAC_PIC32MACClose
PIC32MACPowerMode	DRV_ETHMAC_PowerMode
PIC32MACPutArray	DRV_ETHMAC_ByteArrayPut
PIC32MACPutHeader	DRV_ETHMAC_HeaderPut
PIC32MACSetBaseReadPtr	DRV_ETHMAC_ReadPointerBaseSet
PIC32MACSetRXHashTableEntry	DRV_ETHMAC_RxHashTableEntrySet
PIC32MACSetReadPtr	DRV_ETHMAC_ReadPointerSet
PIC32MACSetReadPtrInRx	DRV_ETHMAC_RxReadPointerSet
PIC32MACSetWritePtr	DRV_ETHMAC_WritePointerSet
	DRV_ETHMAC_VersionGet
	DRV_ETHMAC_VersionStrGet

5.1.3.4.4 Support for Legacy "Ethernet Controller Library"

These routines (DRV_ETHMAC_Legacy*) provide MPLAB Harmony support for applications that use the "Ethernet Controller Library for Microchip PIC32MX Microcontrollers" that is installed with XC32 compilers. (See Microchip\xc32\v1.20\docs\pic32-lib-help\hlpETH.chm for information on this legacy support.)

For some functions the argument list is the same, but for others the addition of an index value from the ETH_MODULE_ID enumeration has been added to make the function work from within the context of this MPLAB Harmony driver.

Legacy Controller Library	MPLAB Harmony
EthClose	DRV_ETHMAC_LegacyClose
EthDescriptorGetBuffer	DRV_ETHMAC_LegacyDescriptorGetBuffer
EthDescriptorsPoolAdd	DRV_ETHMAC_LegacyDescriptorsPoolAdd
EthDescriptorsPoolCleanUp	DRV_ETHMAC_LegacyDescriptorsPoolCleanUp

5.1.3.5 Configuring the Library

Macros

	Name	Description
	DRV_ETHMAC_CLIENTS_NUMBER	Selects the maximum number of clients.
	DRV_ETHMAC_INDEX	Ethernet MAC static index selection.
	DRV_ETHMAC_INSTANCES_NUMBER	Selects the maximum number of hardware instances that can be supported by the dynamic driver.
	DRV_ETHMAC_INTERRUPT_MODE	Controls operation of the driver in the interrupt or polled mode.
	DRV_ETHMAC_INTERRUPT_SOURCE	Defines an override of the interrupt source in case of static driver.
	DRV_ETHMAC_PERIPHERAL_ID	Defines an override of the peripheral ID.
	DRV_ETHMAC_POWER_STATE	Defines an override of the power state of the Ethernet MAC driver.

Description

The configuration of the Ethernet MAC Driver is based on the file `sys_config.h`

This header file contains the configuration selection for the Ethernet MAC Driver. Based on the selections made, the Ethernet MAC Driver will support or not support selected features. These configuration settings will apply to all instances of the Ethernet MAC Driver.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.1.3.5.1 DRV_ETHMAC_CLIENTS_NUMBER Macro

C

```
#define DRV_ETHMAC_CLIENTS_NUMBER 1
```

Description

Ethernet MAC Maximum Number of Clients

This definition select the maximum number of clients that the Ethernet MAC driver can support at run time. Not defining it means using a single client.

Remarks

None.

5.1.3.5.2 DRV_ETHMAC_INDEX Macro

C

```
#define DRV_ETHMAC_INDEX DRV_ETHMAC_INDEX_1
```

Description

Ethernet MAC Static Index Selection

This definition selects the Ethernet MAC static index for the driver object reference

Remarks

This index is required to make a reference to the driver object.

5.1.3.5.3 DRV_ETHMAC_INSTANCES_NUMBER Macro

C

```
#define DRV_ETHMAC_INSTANCES_NUMBER 1
```

Description

Ethernet MAC hardware instance configuration

This definition selects the maximum number of hardware instances that can be supported by the dynamic driver. Not defining it means using a static driver.

Remarks

None.

5.1.3.5.4 DRV_ETHMAC_INTERRUPT_MODE Macro

C

```
#define DRV_ETHMAC_INTERRUPT_MODE true
```

Description

Ethernet MAC Interrupt And Polled Mode Operation Control

This macro controls the operation of the driver in the interrupt mode of operation. The possible values of this macro are:

- true - Select if interrupt mode of timer operation is desired
- false - Select if polling mode of timer operation is desired

Not defining this option to true or false will result in a build error.

Remarks

None.

5.1.3.5.5 DRV_ETHMAC_INTERRUPT_SOURCE Macro

C

```
#define DRV_ETHMAC_INTERRUPT_SOURCE INT_SOURCE_ETH_1
```

Description

Ethernet MAC Interrupt Source

Defines an override of the interrupt source in case of static driver.

Remarks

Refer to the INT PLIB document for more information on [INT_SOURCE](#) enumeration.

5.1.3.5.6 DRV_ETHMAC_PERIPHERAL_ID Macro

C

```
#define DRV_ETHMAC_PERIPHERAL_ID ETHMAC_ID_1
```

Description

Ethernet MAC Peripheral ID Selection

Defines an override of the peripheral ID, using macros.

Remarks

Some devices also support ETHMAC_ID_0

5.1.3.5.7 DRV_ETHMAC_POWER_STATE Macro

C

```
#define DRV_ETHMAC_POWER_STATE SYS_MODULE_POWER_IDLE_STOP
```

Description

Ethernet MAC power state configuration

Defines an override of the power state of the Ethernet MAC driver.

Remarks

This feature may not be available in the device or the Ethernet MAC module selected.

5.1.3.6 Building the Library

This section list the files that are available in the \src of the Ethernet MAC Driver. It lists which files need to be included in the

build based on either a hardware feature present on the board or configuration option selected by the system.

5.1.3.7 Library Interface

Data Types and Constants

	Name	Description
	ETH_CLOSE_FLAGS	Defines the possible disable codes of Ethernet controller "DRV_ETHMAC_LegacyClose" call.
	ETH_LINK_STATUS	Defines the possible status flags of Ethernet link.
	ETH_MODULE_STATUS	Defines the possible status codes of the Ethernet controller.
	ETH_OPEN_FLAGS	Supported open configuration flags for the Ethernet module (EthMACOpen).
	ETH_PAUSE_TYPE	Defines the possible Ethernet MAC pause types.
	ETH_RESULT_CODE	Defines the possible results of Ethernet operations that can succeed or fail
	ETHPHY_CONFIG_FLAGS	flags for DRV_ETHPHY_Setup() call
	DRV_ETHMAC_INDEX_1	This is macro DRV_ETHMAC_INDEX_1.
	DRV_ETHPHY_INDEX_1	This is macro DRV_ETHPHY_INDEX_1.

Client Level Functions

	Name	Description
	DRV_ETHMAC_PIC32MACClose	Closes a client instance of the PIC32 MAC Driver.
	DRV_ETHMAC_PIC32MACGetConfig	Supports PIC32 Ethernet MAC by copying its configuration..
	DRV_ETHMAC_PIC32MACLinkCheck	Checks current link status.
	DRV_ETHMAC_PIC32MACOpen	Opens a client instance of the PIC32 MAC Driver.
	DRV_ETHMAC_PIC32MACSetup	Supports PIC32 Ethernet MAC setup.
	DRV_ETHMAC_PIC32MACTeardown	Supports PIC32 Ethernet MAC Teardown (opposite of setup).

Event Functions

	Name	Description
	DRV_ETHMAC_PIC32MACEventAcknowledge	This function acknowledges and re-enables processed events. Multiple events can be orr-ed together as they are processed together. The events acknowledged by this function should be the events that have been retrieved from the stack by calling DRV_ETHMAC_PIC32MACEventPendingGet() or have been passed to the user by the stack using the notification handler (PIC32MACEventSetNotifyHandler()) and have been processed and have to be re-enabled.
	DRV_ETHMAC_PIC32MACEventMaskSet	Enables the MAC events.
	DRV_ETHMAC_PIC32MACEventPendingGet	Returns the currently pending events.

Other Functions

	Name	Description
	DRV_ETHMAC_PIC32MACPowerMode	Powers down the Ethernet MAC.
	DRV_ETHMAC_PIC32MACProcess	MAC periodic processing function.

Receive Functions

	Name	Description
	DRV_ETHMAC_PIC32MACPacketRx	A packet is returned if such a pending packet exists.
	DRV_ETHMAC_PIC32MACPacketTx	A packet is submitted to the MAC driver for transmission.

Transmit Functions

	Name	Description
	DRV_ETHMAC_PIC32MACRxFilterHashTableEntrySet	Calculates a CRC-32 and sets the appropriate bit in the ETHHTx registers

Description

5.1.3.7.1 Client Level Functions

5.1.3.7.1.1 DRV_ETHMAC_PIC32MACClose Function

C

```
TCPIP_MAC_RES DRV_ETHMAC_PIC32MACClose(
    TCPIP_MAC_HANDLE hMac
);
```

Description

This function closes a client instance of the PIC32 MAC Driver.

Preconditions

[DRV_ETHMAC_PIC32MACOpen](#) should have been called.

Parameters

Parameters	Description
macId	MAC identification, from the TCPIP_STACK_MODULE enumeration

Returns

TCPIP_MAC_RES_OK if initialization completed; otherwise, the error enumeration value.

Example

5.1.3.7.1.2 DRV_ETHMAC_PIC32MACGetConfig Function

C

```
size_t DRV_ETHMAC_PIC32MACGetConfig(
    TCPIP_STACK_MODULE modId,
    void* configBuff,
    size_t buffSize,
    size_t* pConfigSize
);
```

Description

Supports PIC32 Ethernet MAC Teardown (opposite of Setup). Used by tcpip_module_manager.

Preconditions

Supports PIC32 Ethernet MAC by copying its configuration..

Parameters

Parameters	Description
modId	Module ID from TCPIP_STACK_MODULE enumeration, identifying MAC.
configBuff	Pointer to configuration buffer to be copied

buffSize	Size of configuration buffer provided by configBuff
pConfigSize	Pointer to size of configuration buffer copied.

Returns

Size of configuration buffer copied.

Remarks

This function deinitializes the Eth controller, the MAC and the associated PHY. It should be called to be able to schedule any Eth transmit or receive operation.

Example**5.1.3.7.1.3 DRV_ETHMAC_PIC32MACLinkCheck Function****C**

```
bool DRV_ETHMAC_PIC32MACLinkCheck(  
    TCPIP_MAC_HANDLE hMac  
);
```

Description

This function checks the link status, performing a MAC reconfiguration if the link went up after being down.

Preconditions

None.

Parameters

Parameters	Description
hMac	Ethernet MAC client handle

Returns

- true - If the link is up
- false - If the link is not up

Remarks

If auto negotiation is enabled the MAC we may have to be reconfigured.

Example**5.1.3.7.1.4 DRV_ETHMAC_PIC32MACOpen Function****C**

```
TCPIP_MAC_HANDLE DRV_ETHMAC_PIC32MACOpen(  
    TCPIP_STACK_MODULE macId  
);
```

Description

This function opens a client instance of the PIC32 MAC Driver. Used by tcpip_module_manager.

Preconditions

[DRV_ETHMAC_PIC32MACSetup](#) should have been called.

Parameters

Parameters	Description
macId	MAC identification, from the TCPIP_STACK_MODULE enumeration

Returns

[TCPIP_MAC_HANDLE](#) - handle (pointer) to MAC client

Example**5.1.3.7.1.5 DRV_ETHMAC_PIC32MACSetup Function****C**

```
TCPIP_MAC_RES DRV_ETHMAC_PIC32MACSetup(  
    TCPIP_MAC_MODULE_CTRL* const stackData,  
    const TCPIP_MODULE_MAC_PIC32INT_CONFIG* initData  
);
```

Description

This function supports setup of the PIC32 Ethernet MAC. Used by tcpip_module_manager.

Preconditions

DRV_ETHMAC_Open must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
pStackData	Pointer to stack data
initData	Pointer to initialization data

Returns

TCPIP_MAC_RES_OK if initialization completed; otherwise, error enumeration value.

Remarks

This function initializes the Ethernet controller, the MAC and the associated PHY. It should be called to be able to schedule any Ethernet transmit or receive operation.

Example**5.1.3.7.1.6 DRV_ETHMAC_PIC32MACTeardown Function****C**

```
TCPIP_MAC_RES DRV_ETHMAC_PIC32MACTeardown(  
    const TCPIP_MAC_MODULE_CTRL* const stackData  
);
```

Description

This function supports teardown of the PIC32 Ethernet MAC (opposite of setup). Used by tcpip_module_manager.

Preconditions

[DRV_ETHMAC_PIC32MACSetup](#) must have been called to setup the driver.

Parameters

Parameters	Description
pStackData	Pointer to Stack Data

Returns

TCPIP_MAC_RES_OK if initialization completed, error enumeration value otherwise.

Remarks

This function deinitializes the Ethernet controller, the MAC and the associated PHY. It should be called to be able to schedule any Ethernet transmit or receive operation.

Example**5.1.3.7.2 Get and Put Functions****5.1.3.7.3 Base Address and Buffer Size Functions****5.1.3.7.4 Receive Functions****5.1.3.7.4.1 DRV_ETHMAC_PIC32MACPacketRx Function****C**

```
TCPIP_MAC_PACKET* DRV_ETHMAC_PIC32MACPacketRx(
    TCPIP_MAC_HANDLE hMac,
    TCPIP_MAC_RES* pRes,
    const TCPIP_MAC_PACKET_RX_STAT** ppPktStat
);
```

Description

This is the MAC receive function.

Once a pending packet is available in the MAC driver internal RX queues this function will dequeue the packet and hand it over to the MAC driver's client - i.e. the stack - for further processing.

The flags for a RX packet have to be updated by the MAC driver:

- TCPIP_MAC_PKT_FLAG_RX has to be set If the MAC supports it, it should set:
 - TCPIP_MAC_PKT_FLAG_UNICAST has to be set if that packet is a unicast packet
 - TCPIP_MAC_PKT_FLAG_BCAST has to be set if that packet is a broadcast packet
 - TCPIP_MAC_PKT_FLAG_MCAST has to be set if that packet is a multicast packet
- TCPIP_MAC_PKT_FLAG_QUEUED has to be set
- TCPIP_MAC_PKT_FLAG_SPLIT has to be set if the packet has multiple data segments

Additional information about the packet is available by providing the pRes and ppPktStat fields.

Preconditions

[DRV_ETHMAC_PIC32MACSetup\(\)](#) should have been called.

Parameters

Parameters	Description
hMac	Ethernet MAC client handle
pRes	optional pointer to an address that will receive an additional result associated with the operation. Can be 0 if not needed.
ppPktStat	optional pointer to an address that will receive the received packet status. Note that this pointer cannot be used once the packet acknowledgement function was called. Can be 0 if not needed.

Returns

a valid pointer to an available RX packet 0 if no packet pending/available

Remarks

The MAC driver dequeues and return to the caller just one single packet.

Once the higher level layers in the stack are done with processing the RX packet, they have to call the corresponding packet acknowledgement function that tells the MAC driver that it can resume control of that packet.

Once the stack modules are done processing the RX packets and the acknowledge function is called the MAC driver will reuse the RX packets.

The MAC driver may use the [DRV_ETHMAC_PIC32MACProcess\(\)](#) for obtaining new RX packets if needed.

Example**5.1.3.7.4.2 DRV_ETHMAC_PIC32MACPacketTx Function****C**

```
TCPIP_MAC_RES DRV_ETHMAC_PIC32MACPacketTx(
    TCPIP_MAC_HANDLE hMac,
    TCPIP_MAC_PACKET * ptrPacket
);
```

Description

This is the MAC transmit function. The MAC driver has to support internal queueing! A packet is to be rejected only if it's not properly formatted. Otherwise it has to be scheduled for transmission in an internal queue!

Once the packet is scheduled for transmission the MAC driver has to set the TCPIP_MAC_PKT_FLAG_QUEUED flag so that the stack is aware that this packet is under processing and cannot be modified!

Once the packet is transmitted, the TCPIP_MAC_PKT_FLAG_QUEUED has to be cleared, the proper packet acknowledgement result (ackRes) has to be set and the packet acknowledgement function (ackFunc) has to be called. It is implementation dependant if all these steps are implemented as part of the ackFunc itself or as discrete steps.

Preconditions

[DRV_ETHMAC_PIC32MACSetup\(\)](#) should have been called.

Parameters

Parameters	Description
hMac	Ethernet MAC client handle
ptrPacket	pointer to a TCPIP_MAC_PACKET that's completely formatted and ready to be transmitted over the network

Returns

TCPIP_MAC_RES_OK if the packet transmitted, [TCPIP_MAC_RES](#) errorcode for not properly formatted packets, etc.

Example**5.1.3.7.5 Transmit Functions****5.1.3.7.5.1 DRV_ETHMAC_PIC32MACRxFilterHashTableEntrySet Function****C**

```
TCPIP_MAC_RES DRV_ETHMAC_PIC32MACRxFilterHashTableEntrySet(
```

```
TCPIP_MAC_HANDLE hMac,
TCPIP_MAC_ADDR* DestMACAddr
);
```

Description

This function calculates a CRC-32 using polynomial 0x4C11DB7 and then, using bits 28 through 23 of the CRC, sets the appropriate bit in the ETHHT0-ETHHT1 registers.

Preconditions

[DRV_ETHMAC_PIC32MACSetup\(\)](#) should have been called.

Parameters

Parameters	Description
hMac	Ethernet MAC client handle
DestMACAddr	6-byte group destination MAC address to allow through the Hash Table Filter. If DestMACAddr is set to '0000 0000 0000', the hash table will be cleared of all entries and the filter will be disabled.

Returns

TCPIP_MAC_RES_OK if success, an error code otherwise.

Remarks

Sets the appropriate bit in the ETHHT0/1 registers to allow packets sent to DestMACAddr to be received and enabled the Hash Table receive filter

There is no way to individually unset destination MAC addresses from the hash table since it is possible to have a hash collision and therefore multiple MAC addresses relying on the same hash table bit. The stack would have to individually store each 6 byte MAC address to support this feature, which would waste a lot of RAM and be unnecessary in most applications. As a simple compromise, you can call [DRV_ETHMAC_PIC32MACRxFilterHashTableEntrySet\(\)](#) using a 00-00-00-00-00-00 destination MAC address, which will clear the entire hash table and disable the hash table filter. This will allow you to then readd the necessary destination addresses.

Example

5.1.3.7.6 Event Functions

5.1.3.7.6.1 DRV_ETHMAC_PIC32MACTEventAcknowledge Function

C

```
bool DRV_ETHMAC_PIC32MACTEventAcknowledge(
    TCPIP_MAC_HANDLE hMac,
    TCPIP_MAC_EVENT tcpAckEv
);
```

Description

This function acknowledges and re-enables processed events. Multiple events can be orr-ed together as they are processed together. The events acknowledged by this function should be the events that have been retrieved from the stack by calling [DRV_ETHMAC_PIC32MACTEventPendingGet\(\)](#) or have been passed to the user by the stack using the notification handler ([PIC32MACTEventSetNotifyHandler\(\)](#)) and have been processed and have to be re-enabled.

Preconditions

[DRV_ETHMAC_PIC32MACSetup\(\)](#) should have been called.

Parameters

Parameters	Description
hMac	Ethernet MAC client handle
tcpAckEv	the events that the user processed and need to be re-enabled

Returns

true if events acknowledged false if no events to be acknowledged

Remarks

All events should be acknowledged, in order to be re-enabled.

Some events are fatal errors and should not be acknowledged (TCPIP_MAC_EV_RX_BUSERR, TCPIP_MAC_EV_TX_BUSERR). Stack re-initialization is needed under such circumstances.

Some events are just system/application behavior and they are intended only as simple info (TCPIP_MAC_EV_RX_OVFLOW, TCPIP_MAC_EV_RX_BUFNA, TCPIP_MAC_EV_TX_ABORT, TCPIP_MAC_EV_RX_ACT).

The TCPIP_MAC_EV_RX_FWMARK and TCPIP_MAC_EV_RX_EWMARK events are part of the normal flow control operation (if auto flow control was enabled). They should be enabled alternatively, if needed.

The events are persistent. They shouldn't be re-enabled unless they have been processed and the condition that generated them was removed. Re-enabling them immediately without proper processing will have dramatic effects on system performance.

Example

```
DRV_ETHMAC_PIC32MACEventAcknowledge( hMac, stackNewEvents );
```

5.1.3.7.6.2 DRV_ETHMAC_PIC32MACEventMaskSet Function**C**

```
bool DRV_ETHMAC_PIC32MACEventMaskSet(  
    TCPIP_MAC_HANDLE hMac,  
    TCPIP_MAC_EVENT macEvents,  
    bool enable  
);
```

Description

This function sets the enabled events. Multiple events can be orr-ed together. All events that are set will be added to the notification process. The old events will be disabled. The stack (or stack user) has to catch the events that are notified and process them:

- The stack should process the TCPIP_MAC_EV_RX_PKTEND/TCPIP_MAC_EV_RX_DONE, TCPIP_MAC_EV_TX_DONE transfer events
- Process the specific condition and acknowledge them calling [DRV_ETHMAC_PIC32MACEventAcknowledge\(\)](#) so that they can be re-enabled.

Preconditions

[DRV_ETHMAC_PIC32MACSetup\(\)](#) should have been called.

Parameters

Parameters	Description
hMac	Ethernet MAC client handle
macEvMask	events the user of the stack wants to add/delete for notification
enable	if true, the events will be enabled, else disabled

Returns

always true, operation succeeded.

Remarks

The event notification system enables the user of the TCPIP stack to call into the stack for processing only when there are relevant events rather than being forced to periodically call from within a loop.

If the notification events are null the interrupt processing will be disabled. Otherwise the event notification will be enabled and the interrupts relating to the requested events will be enabled.

Note that once an event has been caught by the stack ISR (and reported if a notification handler is in place) it will be disabled until the [DRV_ETHMAC_PIC32MACEventAcknowledge\(\)](#) is called.

Example

```
DRV_ETHMAC_PIC32MACEventMaskSet( hMac, TCPIP_MAC_EV_RX_OVFLOW | TCPIP_MAC_EV_RX_BUFNA,  
true );
```

5.1.3.7.6.3 DRV_ETHMAC_PIC32MACEventPendingGet Function**C**

```
TCPIP_MAC_EVENT DRV_ETHMAC_PIC32MACEventPendingGet(  
    TCPIP_MAC_HANDLE hMac  
);
```

Description

This function returns the currently pending events belonging to a group. Multiple events can be orr-ed together as they accumulate. The stack should be called for processing whenever a stack managed event (TCPIP_MAC_EV_RX_PKTEND, TCPIP_MAC_EV_TX_DONE) is present. The other, non critical events, may not be managed by the stack and passed to an user. They will have to be eventually acknowledged if re-enabling is needed.

Preconditions

[DRV_ETHMAC_PIC32MACSetup](#) should have been called.

Parameters

Parameters	Description
hMac	parameter identifying the intended MAC client

Returns

The currently stack pending events.

Remarks

This is the preferred method to get the current pending MAC events. The stack maintains a proper image of the events from their occurrence to their acknowledgement.

Even with a notification handler in place it's better to use this function to get the current pending events rather than using the events passed by the notification handler which could be stale.

The events are persistent. They shouldn't be re-enabled unless they have been processed and the condition that generated them was removed. Re-enabling them immediately without proper processing will have dramatic effects on system performance.

The returned value is just a momentary value. The pending events can change any time.

Example

```
TCPIP_MAC_EVENT currEvents = DRV_ETHMAC_PIC32MACEventPendingGet( hMac);
```

5.1.3.7.7 Library Functions

5.1.3.7.8 Other Functions

5.1.3.7.8.1 DRV_ETHMAC_PIC32MACPowerMode Function

C

```
bool DRV_ETHMAC_PIC32MACPowerMode(  
    TCPIP_MAC_HANDLE hMac,  
    TCPIP_MAC_POWER_MODE pwrMode  
);
```

Description

This function powers down the Ethernet MAC.

Preconditions

None.

Parameters

Parameters	Description
hMac	Ethernet MAC client handle
pwrMode	Power Mode (?)

Returns

None.

Example

5.1.3.7.8.2 DRV_ETHMAC_PIC32MACProcess Function

C

```
TCPIP_MAC_RES DRV_ETHMAC_PIC32MACProcess(  
    TCPIP_MAC_HANDLE hMac  
);
```

Description

This is a function that allows for internal processing by the MAC driver. It is meant for processing that cannot be done from within ISR.

Some of the processing that this is intended for:

- the MAC driver can process its pending TX queues (although it should do that preferably from within the TX ISR)
- RX buffers replenishing. If the number of packets in the RX queue falls below a specified limit, the MAC driver can use this function to allocate some extra RX packets. Similarly, if there are too many allocated RX packets, the MAC driver can free some of them.

Normally this function will be called in response to an TX and/or RX event signalled by the driver. This is specified by the MAC driver at initialization time using [TCPIP_MAC_MODULE_CTRL](#).

An alternative approach is that the MAC driver uses a system service to create a timer signal that will call the [TCPIP_MAC_Process](#) on a periodic basis.

Preconditions

[DRV_ETHMAC_PIC32MACSetup\(\)](#) should have been called.

Parameters

Parameters	Description
hMac	Ethernet MAC client handle

Returns

TCPIP_MAC_RES_OK if all processing went on OK a [TCPIP_MAC_RES](#) error code if processing failed for some reason

Remarks

The MAC driver may use the DRV_ETHMAC_PIC32MACProcess() for obtaining new RX packets if needed.

Example

5.1.3.7.9 Data Types and Constants

5.1.3.7.9.1 ETH_CLOSE_FLAGS Enumeration

C

```
typedef enum {  
    ETH_CLOSE_GRACEFUL,  
    ETH_CLOSE_DEFAULT = (0)  
} ETH_CLOSE_FLAGS;
```

Description

Ethernet Close Flags

This enumeration defines the close capabilities of the Ethernet module.

Members

Members	Description
ETH_CLOSE_GRACEFUL	Wait for the current TX/RX op to finish
ETH_CLOSE_DEFAULT = (0)	Default close options

5.1.3.7.9.2 ETH_LINK_STATUS Enumeration

C

```
typedef enum {  
    ETH_LINK_ST_DOWN,  
    ETH_LINK_ST_UP,  
    ETH_LINK_ST_LP_NEG_UNABLE,  
    ETH_LINK_ST_REMOTE_FAULT,  
    ETH_LINK_ST_PDF,  
    ETH_LINK_ST_LP_PAUSE,  
    ETH_LINK_ST_LP_ASM_DIR,  
    ETH_LINK_ST_NEG_TMO,  
    ETH_LINK_ST_NEG_FATAL_ERR  
} ETH_LINK_STATUS;
```

Description

Ethernet Link Status Codes

This enumeration defines the flags describing the status of the Ethernet link.

Members

Members	Description
ETH_LINK_ST_DOWN	No connection to the LinkPartner
ETH_LINK_ST_UP	Link is up
ETH_LINK_ST_LP_NEG_UNABLE	LP non negotiation able
ETH_LINK_ST_REMOTE_FAULT	LP fault during negotiation
ETH_LINK_ST_PDF	Parallel Detection Fault encountered (when ETH_LINK_ST_LP_NEG_UNABLE)
ETH_LINK_ST_LP_PAUSE	LP supports symmetric pause
ETH_LINK_ST_LP_ASM_DIR	LP supports asymmetric TX/RX pause operation
ETH_LINK_ST_NEG_TMO	LP not there
ETH_LINK_ST_NEG_FATAL_ERR	An unexpected fatal error occurred during the negotiation

Remarks

Multiple flags can be set.

5.1.3.7.9.3 ETH_MODULE_STATUS Enumeration

C

```
typedef enum {
    ETH_ST_RXBUSY,
    ETH_ST_TXBUSY,
    ETH_ST_BUSY
} ETH_MODULE_STATUS;
```

Description

Ethernet Controller Status Codes

This enumeration defines the flags describing the status of the Ethernet controller.

Members

Members	Description
ETH_ST_RXBUSY	A packet is currently received
ETH_ST_TXBUSY	A packet is currently transmitted
ETH_ST_BUSY	Module is on or completing a transaction

5.1.3.7.9.4 ETH_OPEN_FLAGS Enumeration

C

```
typedef enum {
    ETH_OPEN_AUTO,
    ETH_OPEN_FDUPLEX,
    ETH_OPEN_HDUPLEX,
    ETH_OPEN_100,
    ETH_OPEN_10,
    ETH_OPEN_HUGE_PKTS,
    ETH_OPEN_MAC_LOOPBACK,
    ETH_OPEN_PHY_LOOPBACK,
    ETH_OPEN_MDIX_AUTO,
    ETH_OPEN_MDIX_NORM,
    ETH_OPEN_MDIX_SWAP,
    ETH_OPEN_RMII,
    ETH_OPEN_MII,
    ETH_OPEN_DEFAULT = (ETH_OPEN_AUTO|ETH_OPEN_FDUPLEX|ETH_OPEN_HDUPLEX|
    ETH_OPEN_100|ETH_OPEN_10|ETH_OPEN_MDIX_AUTO)
```

```
} ETH_OPEN_FLAGS;
```

Description

Ethernet Open Configuration Settings

This enumeration defines the various configuration options for the Ethernet module. These values can be ORed together to create a configuration mask passed to the EthMACOpen routine.

Members

Members	Description
ETH_OPEN_AUTO	Use auto negotiation. set the following flags to specify your choices
ETH_OPEN_FDUPLEX	Use full duplex or full duplex negotiation capability needed
ETH_OPEN_HDUPLEX	Use half duplex or half duplex negotiation capability needed
ETH_OPEN_100	Use 100MBps or 100MBps negotiation capability needed
ETH_OPEN_10	Use 10MBps or 10MBps negotiation capability needed
ETH_OPEN_HUGE_PKTS	Allow huge packets RX/TX
ETH_OPEN_MAC_LOOPBACK	Loopbacked at the MAC level
ETH_OPEN_PHY_LOOPBACK	When PHY is loopback-ed, negotiation will be disabled!
ETH_OPEN_MDIX_AUTO	Use Auto MDIX
ETH_OPEN_MDIX_NORM	Use normal MDIX when Auto MDIX disabled
ETH_OPEN_MDIX_SWAP	Use swapped MDIX when Auto MDIX disabled
ETH_OPEN_RMII	RMII connection
ETH_OPEN_MII	MII connection
ETH_OPEN_DEFAULT = (ETH_OPEN_AUTO ETH_OPEN_FDUPLEX ETH_OPEN_HDUPLEX ETH_OPEN_100 ETH_OPEN_10 ETH_OPEN_MDIX_AUTO)	All capabilities default

Remarks

When Auto-negotiation is specified:

- If multiple capability flags are set (ETH_OPEN_FDUPLEX, ETH_OPEN_HDUPLEX, ETH_OPEN_100, ETH_OPEN_10) they are all advertised as this link side capabilities.
- If no setting is passed, the lowest one is taken, i.e., ETH_OPEN_HDUPLEX and ETH_OPEN_10.
- Auto-MDIX requires Auto-Negotiation; ETH_OPEN_MDIX_NORM or ETH_OPEN_MDIX_SWAP setting irrelevant.

When No Auto-negotiation is specified:

- If multiple settings, the highest priority setting is taken, i.e. ETH_OPEN_FDUPLEX over ETH_OPEN_HDUPLEX and ETH_OPEN_100 over ETH_OPEN_10.
- If no setting, the lowest setting is taken, i.e., ETH_OPEN_HDUPLEX and ETH_OPEN_10.
- The MDIX is set based on the ETH_OPEN_MDIX_NORM/ETH_OPEN_MDIX_SWAP setting.

5.1.3.7.9.5 ETH_PAUSE_TYPE Enumeration

C

```
typedef enum {
    ETH_MAC_PAUSE_TYPE_NONE,
    ETH_MAC_PAUSE_TYPE_PAUSE,
    ETH_MAC_PAUSE_TYPE_ASM_DIR,
```

```

    ETH_MAC_PAUSE_TYPE_EN_TX,
    ETH_MAC_PAUSE_TYPE_EN_RX,
    ETH_MAC_PAUSE_ALL = (ETH_MAC_PAUSE_TYPE_PAUSE|ETH_MAC_PAUSE_TYPE_ASM_DIR|
    ETH_MAC_PAUSE_TYPE_EN_TX|ETH_MAC_PAUSE_TYPE_EN_RX),
    ETH_MAC_PAUSE_CPBL_MASK = ETH_MAC_PAUSE_ALL
} ETH_PAUSE_TYPE;

```

Description

Ethernet MAC Pause Types

This enumeration defines the pause capabilities of the Ethernet MAC.

Members

Members	Description
ETH_MAC_PAUSE_TYPE_NONE	No PAUSE capabilities
ETH_MAC_PAUSE_TYPE_PAUSE	Supports symmetric PAUSE
ETH_MAC_PAUSE_TYPE_ASM_DIR	Supports ASM_DIR
ETH_MAC_PAUSE_TYPE_EN_TX	Enable MAC TX pause support
ETH_MAC_PAUSE_TYPE_EN_RX	Enable MAC RX pause support
ETH_MAC_PAUSE_ALL = (ETH_MAC_PAUSE_TYPE_PAUSE ETH_MAC_PAUSE_TYPE_ASM_DIR ETH_MAC_PAUSE_TYPE_EN_TX ETH_MAC_PAUSE_TYPE_EN_RX)	All types of pause
ETH_MAC_PAUSE_CPBL_MASK = ETH_MAC_PAUSE_ALL	All pause capabilities our MAC supports

5.1.3.7.9.6 ETH_RESULT_CODE Enumeration**C**

```

typedef enum {
    ETH_RES_OK,
    ETH_RES_NO_PACKET,
    ETH_RES_PACKET_QUEUED,
    ETH_RES_OUT_OF_MEMORY,
    ETH_RES_NO_DESCRIPTOR,
    ETH_RES_USPACE_ERR,
    ETH_RES_RX_SIZE_ERR,
    ETH_RES_RX_PKT_SPLIT_ERR,
    ETH_RES_NEGOTIATION_UNABLE,
    ETH_RES_NEGOTIATION_INACTIVE,
    ETH_RES_NEGOTIATION_NOT_STARTED,
    ETH_RES_NEGOTIATION_ACTIVE,
    ETH_RES_NEGOTIATION_LINKDOWN,
    ETH_RES_DTCT_ERR,
    ETH_RES_CPBL_ERR,
    ETH_RES_CFG_ERR
} ETH_RESULT_CODE;

```

Description

Ethernet Operation Result Codes

This enumeration defines the possible results of any of the Ethernet library operations that have the possibility of failing. This result should be checked to ensure that the operation achieved the desired result.

Members

Members	Description
ETH_RES_OK	Everything ok
ETH_RES_NO_PACKET	No such packet exist
ETH_RES_PACKET_QUEUED	Packet is queued (not transmitted or received and not processed)

ETH_RES_OUT_OF_MEMORY	Some memory allocation failed
ETH_RES_NO_DESCRIPTORs	Not enough descriptors available
ETH_RES_USPACE_ERR	We don't support user space buffers.
ETH_RES_RX_SIZE_ERR	The size of the receive buffers too small
ETH_RES_RX_PKT_SPLIT_ERR	A received packet spans more buffers/descriptors than supplied
ETH_RES_NEGOTIATION_UNABLE	No negotiation support
ETH_RES_NEGOTIATION_INACTIVE	No negotiation active
ETH_RES_NEGOTIATION_NOT_STARTED	Negotiation not started yet
ETH_RES_NEGOTIATION_ACTIVE	Negotiation active
ETH_RES_NEGOTIATION_LINKDOWN	Link down after negotiation, negotiation failed
ETH_RES_DTCT_ERR	No Phy was detected or it failed to respond to reset command
ETH_RES_CPBL_ERR	No match between the capabilities: the Phy supported and the open requested ones
ETH_RES_CFG_ERR	Hardware configuration doesn't match the requested open mode

5.1.3.7.9.7 ETHPHY_CONFIG_FLAGS Enumeration

C

```
typedef enum {
    ETH_PHY_CFG_RMII,
    ETH_PHY_CFG_MII,
    ETH_PHY_CFG_ALTERNATE,
    ETH_PHY_CFG_DEFAULT,
    ETH_PHY_CFG_AUTO
} ETHPHY_CONFIG_FLAGS;
```

Description

flags for [DRV_ETHPHY_Setup\(\)](#) call

Members

Members	Description
ETH_PHY_CFG_RMII	RMII data interface in configuration fuses.
ETH_PHY_CFG_MII	MII data interface in configuration fuses.
ETH_PHY_CFG_ALTERNATE	Configuration fuses is ALT
ETH_PHY_CFG_DEFAULT	Configuration fuses is DEFAULT
ETH_PHY_CFG_AUTO	Use the fuses configuration to detect if you are RMII/MII and ALT/DEFAULT configuration

5.1.3.7.9.8 DRV_ETHMAC_INDEX_1 Macro

C

```
#define DRV_ETHMAC_INDEX_1 1
```

Description

This is macro DRV_ETHMAC_INDEX_1.

5.1.3.7.9.9 DRV_ETHPHY_INDEX_1 Macro

C

```
#define DRV_ETHPHY_INDEX_1 1
```

Description

This is macro DRV_ETHPHY_INDEX_1.

5.1.3.8 Files

Files

Name	Description
drv_ethernet_flags.h	Ethernet driver configuration flags file.
drv_ethmac.h	Ethernet MAC device driver interface file.
drv_ethmac_config.h	Ethernet MAC driver configuration definitions template.

Description

5.1.3.8.1 drv_ethernet_flags.h

Ethernet Drivers Configuration Flags

This file provides the definition of commonly-used configuration enumerations for use with the Ethernet PHY and Ethernet MAC Drivers.

Enumerations

	Name	Description
	ETH_CLOSE_FLAGS	Defines the possible disable codes of Ethernet controller "DRV_ETHMAC_LegacyClose" call.
	ETH_LINK_STATUS	Defines the possible status flags of Ethernet link.
	ETH_OPEN_FLAGS	Supported open configuration flags for the Ethernet module (EthMACOpen).
	ETH_PAUSE_TYPE	Defines the possible Ethernet MAC pause types.
	ETH_RESULT_CODE	Defines the possible results of Ethernet operations that can succeed or fail
	ETHPHY_CONFIG_FLAGS	flags for DRV_ETHPHY_Setup() call

Company

Microchip Technology Inc.

FileName: drv_ethernet_flags.h

5.1.3.8.2 drv_ethmac.h

Ethernet MAC Device Driver Interface

The Ethernet MAC device driver provides a simple interface to manage the Ethernet peripheral. This file defines the interface definitions and prototypes for the Ethernet MAC driver.

Enumerations

	Name	Description
	ETH_MODULE_STATUS	Defines the possible status codes of the Ethernet controller.

Functions

	Name	Description
	<u>DRV_ETHMAC_PIC32MACClose</u>	Closes a client instance of the PIC32 MAC Driver.
	<u>DRV_ETHMAC_PIC32MACEventAcknowledge</u>	This function acknowledges and re-enables processed events. Multiple events can be orr-ed together as they are processed together. The events acknowledged by this function should be the events that have been retrieved from the stack by calling <u>DRV_ETHMAC_PIC32MACEventPendingGet()</u> or have been passed to the user by the stack using the notification handler (<u>PIC32MACEventSetNotifyHandler()</u>) and have been processed and have to be re-enabled.
	<u>DRV_ETHMAC_PIC32MACEventMaskSet</u>	Enables the MAC events.
	<u>DRV_ETHMAC_PIC32MACEventPendingGet</u>	Returns the currently pending events.
	<u>DRV_ETHMAC_PIC32MACGetConfig</u>	Supports PIC32 Ethernet MAC by copying its configuration..
	<u>DRV_ETHMAC_PIC32MACLinkCheck</u>	Checks current link status.
	<u>DRV_ETHMAC_PIC32MACOpen</u>	Opens a client instance of the PIC32 MAC Driver.
	<u>DRV_ETHMAC_PIC32MACPacketRx</u>	A packet is returned if such a pending packet exists.
	<u>DRV_ETHMAC_PIC32MACPacketTx</u>	A packet is submitted to the MAC driver for transmission.
	<u>DRV_ETHMAC_PIC32MACPowerMode</u>	Powers down the Ethernet MAC.
	<u>DRV_ETHMAC_PIC32MACProcess</u>	MAC periodic processing function.
	<u>DRV_ETHMAC_PIC32MACRxFilterHashTableEntrySet</u>	Calculates a CRC-32 and sets the appropriate bit in the ETHHTx registers
	<u>DRV_ETHMAC_PIC32MACSetup</u>	Supports PIC32 Ethernet MAC setup.
	<u>DRV_ETHMAC_PIC32MACTeardown</u>	Supports PIC32 Ethernet MAC Teardown (opposite of setup).

Macros

	Name	Description
	<u>DRV_ETHMAC_INDEX_0</u>	Ethernet driver index definitions.
	<u>DRV_ETHMAC_INDEX_1</u>	This is macro <u>DRV_ETHMAC_INDEX_1</u> .
	<u>DRV_ETHMAC_INDEX_COUNT</u>	Number of valid Ethernet driver indices.

Company

Microchip Technology Inc.

FileName: drv_ethmac.h

5.1.3.8.3 drv_ethmac_config.h

ETHMAC Driver Configuration Definitions for the template version

These definitions statically define the driver's mode of operation.

Macros

	Name	Description
	<u>DRV_ETHMAC_CLIENTS_NUMBER</u>	Selects the maximum number of clients.
	<u>DRV_ETHMAC_INDEX</u>	Ethernet MAC static index selection.

	<u>DRV_ETHMAC_INSTANCES_NUMBER</u>	Selects the maximum number of hardware instances that can be supported by the dynamic driver.
	<u>DRV_ETHMAC_INTERRUPT_MODE</u>	Controls operation of the driver in the interrupt or polled mode.
	<u>DRV_ETHMAC_INTERRUPT_SOURCE</u>	Defines an override of the interrupt source in case of static driver.
	<u>DRV_ETHMAC_PERIPHERAL_ID</u>	Defines an override of the peripheral ID.
	<u>DRV_ETHMAC_POWER_STATE</u>	Defines an override of the power state of the Ethernet MAC driver.

5.1.4 Ethernet PHY Driver Library

5.1.4.1 Introduction

Ethernet PHY Driver Library

for

Microchip Microcontrollers

This library provides a low-level abstraction of the Ethernet PHY Driver Library that is available on the Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, there by hiding differences from one microcontroller variant to another.

Description

This library provides a software abstraction for configuring external Ethernet PHY devices for use with the on-chip Ethernet Controller.

5.1.4.2 Release Notes

MPLAB Harmony Version: v0.70b **Ethernet PHY Driver Library Version :** 7.10 **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.1.4.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.1.4.4 Using the Library

This topic describes the basic architecture of the Ethernet PHY Driver Library and provides information and examples on how to use it.

Interface Header File: [drv_ethphy.h](#)

The interface to the Ethernet PHY Driver Library is defined in the "[drv_ethphy.h](#)" header file. This file is included by the "[drv_ethphy.h](#)" file. Any C language source (.c) file that uses the Ethernet PHY Driver Library should include "drv.h".

Library File:

The Ethernet PHY Driver Library archive (.a) file is installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the library interacts with the framework.

5.1.4.4.1 Abstraction Model

Overview

To understand how this library works you must first understand how an external Ethernet PHY interfaces with the Ethernet Controller. As shown in Figure 1, the PHY has two interfaces, one for managing the PHY, known as the Serial Management Interface (SMI), for configuring the device and a second, known as the Reduced Media Independent Interface (RMII), for transmit and receive data.

Figure 1: Typical External PHY Interface

The block diagram also shows an interrupt signal (nINT) going to a external interrupt pin on the host device and signals going to on-board LEDs to show link state and link activity.

The SMI interface is also known as the MII Management (MIIM) interface. This control interface is standardized for all PHY's by Clause 22 of the 802.3 standard. It provides up to 32 16-bit registers on the PHY. The table below provides a summary of all 32 registers. Consult the data sheet for the PHY device for the specific bit fields in each register.

Register Address	Register Name	Register Type
0	Control	Basic
1	Status	Basic
2,3	PHY Identifier	Extended
4	Auto-Negotiation Advertisement	Extended
5	Auto-Negotiation Link Partner Base Page Ability	Extended
6	Auto-Negotiation Expansion	Extended
7	Auto-Negotiation Next Page Transmit	Extended
8	Auto-Negotiation Link Partner Received Next Page	Extended

9	MASTER-SLAVE Control Register	Extended
10	MASTER-SLAVE Status Register	Extended
11-14	Reserved	Extended
15	Extended Status	Reserved
16-31	Vendor Specific	Extended

5.1.4.4.2 Library Overview

The Ethernet PHY Driver Library is divided into the following sections:

Library Interface Section	Description
System Level Functions	Routines that integrate the driver into the MPLAB Harmony system
Client Level Functions	Open, Close, Link Status, Auto Negotiation
SMI/MIIM Functions	SMI/MIIM Management Interface
External PHY Support Functions	Provides the API for PHY support routines that the driver will call when setting up the PHY. The driver library provides support for 4 PHYs.
Other Functions	Functions that provide software version information.
Data Types and Constants	C language typedefs and enums used by this library.

5.1.4.4.3 MPLAB Harmony vs. the Unified TCP/IP Stack

The following is a cross-reference of MPLAB Harmony functions and the equivalent Unified TCP/IP Stack function:

MPLAB Harmony Function:	Unified Stack Function:
DRV_ETHPHY_ClientStatus	-none-
DRV_ETHPHY_Close	-none-
DRV_ETHPHY_Deinitialize	-none-
DRV_ETHPHY_HWConfigFlagsGet	EthPhyGetHwConfigFlags
DRV_ETHPHY_Setup	EthPhyInit
DRV_ETHPHY_Initialize	-none-
DRV_ETHPHY_LinkScanRead	EthPhyScanLinkRead
DRV_ETHPHY_LinkScanStart	EthPhyScanLinkStart
DRV_ETHPHY_LinkScanStop	EthPhyScanLinkStop
DRV_ETHPHY_LinkStatusGet	EthPhyGetLinkStatus
DRV_ETHPHY_NegotiationIsComplete	EthPhyNegotiationComplete
DRV_ETHPHY_NegotiationResultGet	EthPhyGetNegotiationResult
DRV_ETHPHY_Open	-none-
DRV_ETHPHY_Reinitialize	-none-
DRV_ETHPHY_Reset	EthPhyReset

5.1.4.5 Configuring the Library

Macros

	Name	Description
	DRV_ETHPHY_CLIENTS_NUMBER	Selects the maximum number of clients.
	DRV_ETHPHY_INDEX	Ethernet PHY static index selection.
	DRV_ETHPHY_INDEX_0	Ethernet PHY driver index definitions.
	DRV_ETHPHY_INDEX_COUNT	Number of valid Ethernet PHY driver indices.
	DRV_ETHPHY_INSTANCES_NUMBER	Selects the maximum number of hardware instances that can be supported by the dynamic driver.
	DRV_ETHPHY_PERIPHERAL_ID	Defines an override of the peripheral ID.
	PHY_NEG_DONE_TMO	negotiation complete timeout, ms. based on IEEE 802.3 Clause 28 Table 28-9 autoneg_wait_timer value (max 1s)
	PHY_NEG_INIT_TMO	negotiation initiation timeout, ms.

	PHY_RESET_CLR_TMO	reset self clear timeout, ms. IEEE 802.3 Clause 22 Table 22-7 and paragraph "22.2.4.1.1 Reset" (max 0.5s)
	TCPIP_IF_PIC32INT	We have an internal PIC32 MAC

Description

The configuration of the Ethernet MAC Driver Library is based on the file sys_config.h

This header file contains the configuration selection for the Ethernet MAC Driver Library. Based on the selections made, the Ethernet MAC Driver Library will support or not support selected features. These configuration settings will apply to all instances of the Ethernet MAC Driver Library.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.1.4.5.1 DRV_ETHPHY_CLIENTS_NUMBER Macro**C**

```
#define DRV_ETHPHY_CLIENTS_NUMBER 1
```

Description

Ethernet PHY Maximum Number of Clients

This definition select the maximum number of clients that the Ethernet PHY driver can support at run time. Not defining it means using a single client.

Remarks

None.

5.1.4.5.2 DRV_ETHPHY_INDEX Macro**C**

```
#define DRV_ETHPHY_INDEX DRV_ETHPHY_INDEX_1
```

Description

Ethernet PHY Static Index Selection

This definition selects the Ethernet PHY static index for the driver object reference.

Remarks

This index is required to make a reference to the driver object.

5.1.4.5.3 DRV_ETHPHY_INDEX_0 Macro**C**

```
#define DRV_ETHPHY_INDEX_0 0
```

Description

Ethernet PHY Driver Module Index Numbers

These constants provide the Ethernet PHY driver index definitions.

Remarks

These constants should be used in place of hard-coded numeric literals.

These values should be passed into the [DRV_ETHPHY_Initialize](#) and [DRV_ETHPHY_Open](#) routines to identify the driver instance in use.

5.1.4.5.4 DRV_ETHPHY_INDEX_COUNT Macro

C

```
#define DRV_ETHPHY_INDEX_COUNT 1
```

Description

Ethernet PHY Driver Module Index Count

This constant identifies the number of valid Ethernet PHY driver indices.

Remarks

This constant should be used in place of hard-coded numeric literals.

This value is derived from part-specific header files defined as part of the peripheral libraries.

5.1.4.5.5 DRV_ETHPHY_INSTANCES_NUMBER Macro

C

```
#define DRV_ETHPHY_INSTANCES_NUMBER 1
```

Description

Ethernet PHY hardware instance configuration

This definition selects the maximum number of hardware instances that can be supported by the dynamic driver. Not defining it means using a static driver.

Remarks

None.

5.1.4.5.6 DRV_ETHPHY_PERIPHERAL_ID Macro

C

```
#define DRV_ETHPHY_PERIPHERAL_ID ETHPHY_ID_1
```

Description

Ethernet PHY Peripheral ID Selection

Defines an override of the peripheral ID, using macros.

Remarks

Some devices also support ETHPHY_ID_0

5.1.4.5.7 PHY_NEG_DONE_TMO Macro

C

```
#define PHY_NEG_DONE_TMO 2000 // negotiation complete timeout, ms.
```

Description

negotiation complete timeout, ms. based on IEEE 802.3 Clause 28 Table 28-9 autoneg_wait_timer value (max 1s)

5.1.4.5.8 PHY_NEG_INIT_TMO Macro

C

```
#define PHY_NEG_INIT_TMO 1 // negotiation initiation timeout, ms.
```

Description

negotiation initiation timeout, ms.

5.1.4.5.9 PHY_RESET_CLR_TMO Macro

C

```
#define PHY_RESET_CLR_TMO 500 // reset self clear timeout, ms.
```

Description

reset self clear timeout, ms. IEEE 802.3 Clause 22 Table 22-7 and paragraph "22.2.4.1.1 Reset" (max 0.5s)

5.1.4.5.10 TCPIP_IF_PIC32INT Macro

C

```
#define TCPIP_IF_PIC32INT
```

Description

We have an internal PIC32 MAC

5.1.4.6 Building the Library

This section list the files that are available in the \src of the Ethernet PHY Driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

5.1.4.7 Library Interface

Data Types and Constants

	Name	Description
	DRV_ETHPHY_CLIENT_STATUS	Identifies the client-specific status of the Ethernet PHY driver.
	DRV_ETHPHY_INIT	Contains all the data necessary to initialize the Ethernet PHY device.
	SMI_SCAN_DATA_STATUS	Returns the status of the SMI of the Ethernet PHY.
	SYS_OBJ_HANDLE_INVALID	This is macro SYS_OBJ_HANDLE_INVALID.
	SYS_OBJ_HANDLE_STATIC	This is macro SYS_OBJ_HANDLE_STATIC.
	SYS_OBJ_HANDLE	SYS_MODULE_OBJ is badly named. It should be SYS_MODULE_OBJ_HANDLE or something shorter. For brevity, it is renamed to SYS_OBJ_HANDLE.

Client Level Functions

	Name	Description
	DRV_ETHPHY_ClientStatus	Gets the current client-specific status the Ethernet PHY driver.
	DRV_ETHPHY_Close	Closes an opened instance of the Ethernet PHY driver.

	DRV_ETHPHY_HWConfigFlagsGet	Returns the current Ethernet PHY hardware MII/RMII and ALTERNATE/DEFAULT configuration flags.
	DRV_ETHPHY_LinkScanRead	Returns current link status.
	DRV_ETHPHY_LinkScanStart	Starts an SMI scan of the link status.
	DRV_ETHPHY_LinkScanStop	Stops the SMI scan of the link status.
	DRV_ETHPHY_LinkStatusGet	Returns the current link status.
	DRV_ETHPHY_NegotiationIsComplete	Returns the results of a previously initiated Ethernet PHY negotiation.
	DRV_ETHPHY_NegotiationResultGet	Returns the link status after a completed negotiation.
	DRV_ETHPHY_Open	Opens the specified Ethernet PHY driver instance and returns a handle to it.
	DRV_ETHPHY_Reset	Immediately resets the Ethernet PHY.
	DRV_ETHPHY_RestartNegotiation	Restarts auto-negotiation of the Ethernet PHY link.
	DRV_ETHPHY_Setup	Initializes Ethernet PHY communication.

External PHY Support Functions

	Name	Description
	EXTPHY_MDIXCONFIGURE	Configures the MDIX mode for the Ethernet PHY.
	EXTPHY_MIICONFIGURE	Configures the Ethernet PHY in one of the MII/RMII operation modes.
	EXTPHY_SMIADDRESSGET	Returns the SMI/MIIM address of the Ethernet PHY.
	EXTPHY_SMICLOCKGET	Returns the SMI/MIIM maximum clock speed in Hz of the Ethernet PHY.

Other Functions

	Name	Description
	DRV_ETHPHY_VersionGet	Gets the Ethernet PHY driver version in numerical format.
	DRV_ETHPHY_VersionStrGet	Gets the Ethernet PHY driver version in string format.

SMI/MIIM Functions

	Name	Description
	DRV_ETHPHY_SMIClockSet	Sets the SMI/MIIM interface clock.
	DRV_ETHPHY_SMIIsBusy	Returns a boolean 'true' if the SMI/MIIM interface is busy with a transaction.
	DRV_ETHPHY_SMIReadResultGet	Gets the result of the SMI/MIIM register read.
	DRV_ETHPHY_SMIReadStart	Initiates SMI/MIIM read transaction.
	DRV_ETHPHY_SMIScanDataGet	Gets the latest SMI/MIIM scan data result.
	DRV_ETHPHY_SMIScanStart	Starts the scan of the SMI/MIIM register.
	DRV_ETHPHY_SMIScanStatusGet	Gets the status of the SMI/MIIM scan data.
	DRV_ETHPHY_SMIScanStop	Stops the scan of the SMI/MIIM register.
	DRV_ETHPHY_SMIWriteStart	Initiates a SMI/MIIM write transaction.

System Level Functions

	Name	Description
	DRV_ETHPHY_Deinitialize	Deinitializes the specified instance of the Ethernet PHY driver module.
	DRV_ETHPHY_Initialize	Initializes the Ethernet PHY driver.
	DRV_ETHPHY_Reinitialize	Reinitializes the driver and refreshes any associated hardware settings.
	DRV_ETHPHY_Status	Provides the current status of the Ethernet PHY driver module.
	DRV_ETHPHY_Tasks	Maintains the driver's state machine and implements its ISR.

Description

This section describes the Application Programming Interface (API) functions of the Ethernet PHY Driver Library.

Refer to each section for a detailed description.

5.1.4.7.1 System Level Functions

5.1.4.7.1.1 DRV_ETHPHY_Deinitialize Function

C

```
void DRV_ETHPHY_Deinitialize(  
    SYS_OBJ_HANDLE object  
)  
;
```

Description

This function deinitializes the specified instance of the Ethernet PHY driver module, disabling its operation (and any hardware) and invalidates all of the internal data.

Preconditions

The [DRV_ETHPHY_Initialize](#) function must have been called before calling this routine and a valid [SYS_OBJ_HANDLE](#) must have been returned.

Parameters

Parameters	Description
object	Driver object handle, returned from DRV_ETHPHY_Initialize

Returns

None.

Remarks

Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again.

Example

```
SYS_OBJ_HANDLE    object;    // Returned from DRV_ETHPHY_Initialize  
SYS_STATUS        status;  
  
DRV_ETHPHY_Deinitialize(object);  
  
status = DRV_ETHPHY_Status(object);  
if (SYS_MODULE_DEINITIALIZED == status)  
{  
    // Check again later if you need to know  
    // when the driver is deinitialized.  
}
```

5.1.4.7.1.2 DRV_ETHPHY_Initialize Function

C

```
SYS_OBJ_HANDLE DRV_ETHPHY_Initialize(  
    const SYS_MODULE_INDEX index,  
    const SYS_MODULE_INIT * const init  
)  
;
```

Description

This function initializes the Ethernet PHY driver, making it ready for clients to open and use it.

Preconditions

None.

Parameters

Parameters	Description
drvIndex	Index for the driver instance to be initialized
init	Pointer to a data structure containing any data necessary to initialize the driver. This pointer may be null if no data is required because static overrides have been provided.

Returns

If successful, returns a valid handle to a driver object. Otherwise, it returns [SYS_OBJ_HANDLE_INVALID](#). The returned object must be passed as argument to [DRV_ETHPHY_Reinitialize](#), [DRV_ETHPHY_Deinitialize](#), [DRV_ETHPHY_Tasks](#) and [DRV_ETHPHY_Status](#) routines.

Remarks

This function must be called before any other Ethernet PHY routine is called.

This function should only be called once during system initialization unless [DRV_ETHPHY_Deinitialize](#) is called to de-initialize the driver instance.

Example

```
DRV_ETHPHY_INIT    init;
SYS_OBJ_HANDLE    objectHandle;

// Populate the Ethernet PHY initialization structure
init.phyId = ETHPHY_ID_0;

// Populate the Ethernet PHY initialization structure
init.phyId = ETHPHY_ID_2;
init.sExtPHYFunctions.MyPHYMIIConfigure = &SMSC8720_MIIConfigure;
init.sExtPHYFunctions.MyPHYMDIXConfigure = &SMSC8720_MDIXConfigure;
init.sExtPHYFunctions.MyPHYSMIAddressGet = &SMSC8720_SMIAddressGet;
init.sExtPHYFunctions.MyPHYSMIClockGet = &SMSC8720_SMIClockGet;

// Do something

objectHandle = DRV_ETHPHY_Initialize(DRV_ETHPHY_INDEX_0, (SYS_MODULE_INIT*)&init);
if (SYS_OBJ_HANDLE_INVALID == objectHandle)
{
    // Handle error
}
```

5.1.4.7.1.3 DRV_ETHPHY_Reinitialize Function**C**

```
void DRV_ETHPHY_Reinitialize(
    SYS_OBJ_HANDLE object,
    const SYS_MODULE_INIT * const init
);
```

Description

This function reinitializes the driver and refreshes any associated hardware settings using the initialization data given, but it will not interrupt any ongoing operations.

Preconditions

The [DRV_ETHPHY_Initialize](#) function must have been called before calling this routine and a valid [SYS_OBJ_HANDLE](#) must have been returned.

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_ETHPHY_Initialize routine
init	Pointer to the initialization data structure

Returns

None.

Remarks

This function can be called multiple times to reinitialize the module.

This operation can be used to refresh any supported hardware registers as specified by the initialization data or to change the power state of the module.

Example

```
DRV_ETHPHY_INIT    init;
SYS_OBJ_HANDLE     objectHandle;

// Populate the Ethernet PHY initialization structure
init.phyId = ETHPHY_ID_2;
init.sExtPHYFunctions.MyPHYMIIConfigure = &SMSC8720_MIIConfigure;
init.sExtPHYFunctions.MyPHYMDIXConfigure = &SMSC8720_MDIXConfigure;
init.sExtPHYFunctions.MyPHYSMIAddressGet = &SMSC8720_SMIAddressGet;
init.sExtPHYFunctions.MyPHYSMIClockGet = &SMSC8720_SMIClockGet;

DRV_ETHPHY_Reinitialize(objectHandle, (SYS_MODULE_INIT*)&init);

phyStatus = DRV_ETHPHY_Status(objectHandle);
if (SYS_STATUS_BUSY == phyStatus)
{
    // Check again later to ensure the driver is ready
}
else if (SYS_STATUS_ERROR >= phyStatus)
{
    // Handle error
}
```

5.1.4.7.1.4 DRV_ETHPHY_Status Function**C**

```
SYS_STATUS DRV_ETHPHY_Status(
    SYS_OBJ_HANDLE object
);
```

Description

This function provides the current status of the Ethernet PHY driver module.

Preconditions

The [DRV_ETHPHY_Initialize](#) function must have been called before calling this function.

Parameters

Parameters	Description
object	Driver object handle, returned from DRV_ETHPHY_Initialize

Returns

SYS_STATUS_READY - Indicates that the driver is busy with a previous system level operation and cannot start another

Remarks

Any value greater than SYS_STATUS_READY is also a normal running state in which the driver is ready to **accept** new operations.

SYS_STATUS_BUSY - Indicates that the driver is busy with a previous system level operation and cannot start another

SYS_STATUS_ERROR - Indicates that the driver is in an error state

Any value less than SYS_STATUS_ERROR is also an error state.

SYS_MODULE_DEINITIALIZED - Indicates that the driver has been de-initialized

This value is less than SYS_STATUS_ERROR.

The this operation can be used to determine when any of the driver's module level operations has completed.

If the status operation returns SYS_STATUS_BUSY, the a previous operation has not yet completed. Once the status operation returns SYS_STATUS_READY, any previous operations have completed.

The value of SYS_STATUS_ERROR is negative (-1). Any value less than that is also an error state.

This function will NEVER block waiting for hardware.

If the Status operation returns an error value, the error may be cleared by calling the reinitialize operation. If that fails, the deinitialize operation will need to be called, followed by the initialize operation to return to normal operations.

Example

```
SYS_OBJ_HANDLE    object;    // Returned from DRV_ETHPHY_Initialize
SYS_STATUS        status;

status = DRV_ETHPHY_Status(object);
else if (SYS_STATUS_ERROR >= status)
{
    // Handle error
}
```

5.1.4.7.1.5 DRV_ETHPHY_Tasks Function**C**

```
void DRV_ETHPHY_Tasks(
    SYS_OBJ_HANDLE object
);
```

Description

This function is used to maintain the driver's internal state machine and implement its ISR for interrupt-driven implementations.

Preconditions

The **DRV_ETHPHY_Initialize** routine must have been called for the specified Ethernet PHY driver instance.

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_ETHPHY_Initialize)

Returns

None

Remarks

This function is normally not called directly by an application. It is called by the system's Tasks routine (**SYS_Tasks**) or by the

appropriate raw ISR.

This function may execute in an ISR context and will never block or access any resources that may cause it to block.

Example

```
SYS_OBJ_HANDLE    object;    // Returned from DRV_ETHPHY_Initialize

while (true)
{
    DRV_ETHPHY_Tasks (object);

    // Do other tasks
}
```

5.1.4.7.2 Client Level Functions

5.1.4.7.2.1 DRV_ETHPHY_ClientStatus Function

C

```
DRV_ETHPHY_CLIENT_STATUS DRV_ETHPHY_ClientStatus(
    DRV_HANDLE handle
);
```

Description

This function gets the client-specific status of the Ethernet PHY driver associated with the given handle.

Preconditions

The [DRV_ETHPHY_Initialize](#) routine must have been called.

[DRV_ETHPHY_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Returns

A [DRV_ETHPHY_CLIENT_STATUS](#) value describing the current status of the driver.

Remarks

This function will not block for hardware access and will immediately return the current status.

Example

```
DRV_HANDLE phyHandle; // Returned from DRV_ETHPHY_Open
DRV_ETHPHY_CLIENT_STATUS phyClientStatus;

phyClientStatus = DRV_ETHPHY_ClientStatus(phyHandle);
if(DRV_ETHPHY_CLIENT_STATUS_ERROR >= phyClientStatus)
{
    // Handle the error
}
```

5.1.4.7.2.2 DRV_ETHPHY_Close Function

C

```
void DRV_ETHPHY_Close(
    DRV_HANDLE handle
);
```

Description

This function closes an opened instance of the Ethernet PHY driver, invalidating the handle.

Preconditions

The [DRV_ETHPHY_Initialize](#) routine must have been called for the specified Ethernet PHY driver instance.

[DRV_ETHPHY_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open instance handle, returned from the driver's open routine

Returns

None

Remarks

After calling this routine, the handle passed in "handle" must not be used with any of the remaining driver routines. A new handle must be obtained by calling [DRV_ETHPHY_Open](#) before the caller may use the driver again.

If DRV_IO_INTENT_BLOCKING was requested and the driver was built appropriately to support blocking behavior call may block until the operation is complete.

If DRV_IO_INTENT_NON_BLOCKING request the driver client can call the [DRV_ETHPHY_Status](#) operation to find out when the module is in the ready state (the handle is no longer valid).

Usually there is no need for the driver client to verify that the Close operation has completed.

Example

```
DRV_HANDLE handle; // Returned from DRV_ETHPHY_Open

DRV_ETHPHY_Close(handle);
```

5.1.4.7.2.3 DRV_ETHPHY_HWConfigFlagsGet Function**C**

```
ETHPHY_CONFIG_FLAGS DRV_ETHPHY_HWConfigFlagsGet(
    DRV_HANDLE handle
);
```

Description

This function returns the current Ethernet PHY hardware MII/RMII and ALTERNATE/DEFAULT configuration flags from the Device Configuration Fuse bits.

Preconditions

None.

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_ETHPHY_Open)

Returns

Ethernet PHY configuration flag, see [ETHPHY_CONFIG_FLAGS](#) enumeration for bit values.

Remarks

Please note,

- [ETHPHY_CONFIG_FLAGS](#) `DRV_ETHPHY_HWConfigFlagsGet( DRV\_HANDLE handle )`

replaces the legacy "Ethernet Controller Library" function:

- `eEthPhyCfgFlags EthPhyGetHwConfigFlags(void)`

Example

5.1.4.7.2.4 DRV_ETHPHY_LinkScanRead Function

C

```
ETH_LINK_STATUS DRV_ETHPHY_LinkScanRead(  
    DRV_HANDLE handle  
);
```

Description

This function returns the current link status.

Preconditions

[DRV_ETHPHY_LinkScanStart](#) must be called first.

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_ETHPHY_Open)

Returns

Current link status, see [ETH_LINK_STATUS](#) enumeration.

Remarks

See also [DRV_ETHPHY_LinkStatusGet](#).

Please note,

- [ETH_LINK_STATUS](#) `DRV_ETHPHY_LinkScanRead( DRV\_HANDLE handle )`

replaces the legacy "Ethernet Controller Library" function:

- `eEthLinkStat EthPhyScanLinkRead(void)`

Example

5.1.4.7.2.5 DRV_ETHPHY_LinkScanStart Function

C

```
void DRV_ETHPHY_LinkScanStart(  
    DRV_HANDLE handle  
);
```

Description

This function starts an SMI scan of the link status.

Preconditions

Communication with the Ethernet PHY was already established.

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_ETHPHY_Open)

Returns

None.

Remarks

This function starts an SMI scan of the Ethernet PHY link status register. It is a more efficient way of having access to the current link status, since the normal SMI frame read operation is slow.

Please note,

- void DRV_ETHPHY_LinkScanStart(DRV_HANDLE handle)
replaces the legacy "Ethernet Controller Library" function:
- void EthPhyScanLinkStart(void)

Example

5.1.4.7.2.6 DRV_ETHPHY_LinkScanStop Function

C

```
void DRV_ETHPHY_LinkScanStop(  
    DRV_HANDLE handle  
);
```

Description

This function stops the SMI scan of the ink status.

Preconditions

Communication with the Ethernet PHY was already established.

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_ETHPHY_Open)

Returns

None.

Remarks

Please note,

- void DRV_ETHPHY_LinkScanStop(DRV_HANDLE handle)
replaces the legacy "Ethernet Controller Library" function:
- void EthPhyScanLinkStop(void)

Example

5.1.4.7.2.7 DRV_ETHPHY_LinkStatusGet Function

C

```
ETH_LINK_STATUS DRV_ETHPHY_LinkStatusGet(  
    DRV_HANDLE handle,  
    bool refresh  
);
```

Description

This function returns the urrent link status.

Preconditions

[DRV_ETHPHY_Setup](#) should have been called.

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_ETHPHY_Open)
refresh	Boolean flag, true to specify that a double read is needed

Returns

Current link status, see [ETH_LINK_STATUS](#) enumeration.

Remarks

This function reads the Ethernet PHY to get current link status. If refresh is specified then, if the link is down a second read will be performed to return the current link status.

Please note,

- [ETH_LINK_STATUS](#) `DRV_ETHPHY_LinkStatusGet( DRV\_HANDLE handle, bool refresh )`

replaces the legacy "Ethernet Controller Library" function:

- `eEthLinkStat EthPhyGetLinkStatus(int refresh)`

Example**5.1.4.7.2.8 DRV_ETHPHY_NegotiationIsComplete Function****C**

```
ETH_RESULT_CODE DRV_ETHPHY_NegotiationIsComplete(
    DRV_HANDLE handle,
    bool waitComplete
);
```

Description

This function returns the results of a previously initiated Ethernet PHY negotiation.

Preconditions

[DRV_ETHPHY_Setup](#) (and [DRV_ETHPHY_RestartNegotiation](#)) should have been called.

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_ETHPHY_Open)
waitComplete	Boolean flag, true if wait for completion is required

Returns

`ETH_RES_OK` if negotiation is done, `ETH_RES_NEGOTIATION_INACTIVE` if no negotiation in progress, `ETH_RES_NEGOTIATION_NOT_STARTED` if negotiation not yet started yet (means tmo if waitComplete was requested), or `ETH_RES_NEGOTIATION_ACTIVE` if negotiation ongoing (means tmo if waitComplete was requested).

Remarks

See also [DRV_ETHPHY_NegotiationResultGet](#).

Please note,

- [ETH_RESULT_CODE](#) `DRV_ETHPHY_NegotiationIsComplete( DRV\_HANDLE handle, bool waitComplete )`

replaces the legacy "Ethernet Controller Library" function:

- eEthRes EthPhyNegotiationComplete(int waitComplete)

Example

5.1.4.7.2.9 DRV_ETHPHY_NegotiationResultGet Function

C

```
ETH_LINK_STATUS DRV_ETHPHY_NegotiationResultGet(
    DRV_HANDLE handle,
    ETH_OPEN_FLAGS* pFlags,
    ETH_PAUSE_TYPE* pPauseType
);
```

Description

This function returns the link status after a completed negotiation.

Preconditions

[DRV_ETHPHY_Setup](#), [DRV_ETHPHY_RestartNegotiation](#), and [DRV_ETHPHY_NegotiationIsComplete](#) should have been called.

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_ETHPHY_Open)
pFlags	Address to store the negotiation result
pPauseType	Address to store the pause type supported by the link partner

Returns

Link status after the (completed) negotiation, see [ETH_LINK_STATUS](#) enumeration.

Remarks

If no negotiation possible/active/failed, most likely the flags are invalid!

Please note,

- [ETH_LINK_STATUS](#) DRV_ETHPHY_NegotiationResultGet([DRV_HANDLE](#) handle, [ETH_OPEN_FLAGS](#)* pFlags, [ETH_PAUSE_TYPE](#)* pPauseType)

replaces the legacy "Ethernet Controller Library" function:

- eEthLinkStat EthPhyGetNegotiationResult(eEthOpenFlags* pFlags, eEthMacPauseType* pPauseType)

Example

5.1.4.7.2.10 DRV_ETHPHY_Open Function

C

```
DRV_HANDLE DRV_ETHPHY_Open(
    const SYS_MODULE_INDEX drvIndex,
    const DRV_IO_INTENT intent
);
```

Description

This function opens the specified Ethernet PHY driver instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver.

Preconditions

The [DRV_ETHPHY_Initialize](#) function must have been called before calling this function.

Parameters

Parameters	Description
drvIndex	Identifier for the object instance to be opened
intent	Zero or more of the values from the enumeration DRV_IO_INTENT ORed together to indicate the intended use of the driver

Returns

If successful, the routine returns a valid open-instance handle (a number identifying both the caller and the module instance).

If an error occurs, the return value is [DRV_HANDLE_INVALID](#).

Remarks

The handle returned is valid until the [DRV_ETHPHY_Close](#) routine is called.

This function will NEVER block waiting for hardware.

If the [DRV_IO_INTENT_BLOCKING](#) is requested and the driver was built appropriately to support blocking behavior, other client-level operations may block waiting on hardware until they are complete.

If [DRV_IO_INTENT_NON_BLOCKING](#) is requested the driver client can call the [DRV_ETHPHY_ClientStatus](#) operation to find out when the module is in the ready state.

If the requested intent flags are not supported, the function will return [DRV_HANDLE_INVALID](#).

Example

```
DRV_HANDLE  handle;

handle = DRV_ETHPHY_Open(DRV_ETHPHY_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);
if (DRV_HANDLE_INVALID == handle)
{
    // Unable to open the driver
}
```

5.1.4.7.2.11 DRV_ETHPHY_Reset Function**C**

```
bool DRV_ETHPHY_Reset(
    DRV_HANDLE handle,
    bool waitComplete
);
```

Description

This function immediately resets the Ethernet PHY, optionally waiting for a reset to complete.

Preconditions

Communication with the Ethernet PHY was already established.

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_ETHPHY_Open)
waitComplete	boolean flag, if true the procedure will wait for reset to complete

Returns

True - If PHY reset procedure completed (or completion not required) False - Otherwise

Remarks

Please note,

- bool DRV_ETHPHY_Reset([DRV_HANDLE](#) handle, bool waitComplete)

replaces the legacy "Ethernet Controller Library" function:

- int EthPhyReset(int waitComplete)

Example

5.1.4.7.2.12 DRV_ETHPHY_RestartNegotiation Function

C

```
void DRV_ETHPHY_RestartNegotiation(  
    DRV_HANDLE handle  
)  
;
```

Description

This function restarts auto-negotiation of the Ethernet PHY link.

Preconditions

The Ethernet PHY should have been initialized with the proper duplex/speed mode.

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_ETHPHY_Open)

Returns

None.

Remarks

Please note,

- void DRV_ETHPHY_RestartNegotiation([DRV_HANDLE](#) handle)

replaces the legacy "Ethernet Controller Library" function:

- eEthRes EthPhyRestartNegotiation(void)

Example

5.1.4.7.2.13 DRV_ETHPHY_Setup Function

C

```
ETH_RESULT_CODE DRV_ETHPHY_Setup(  
    DRV_HANDLE handle,  
    ETH_OPEN_FLAGS oFlags,  
    ETHPHY_CONFIG_FLAGS cFlags,  
    ETH_OPEN_FLAGS * pResFlags  
)  
;
```

Description

This function initializes the Ethernet PHY communication. It tries to detect the external Ethernet PHY, to read the capabilities and find a match with the requested features. Then it programs the Ethernet PHY accordingly.

Preconditions

DRV_ETHMAC_LegacyInit should have been called to initialize the Ethernet MAC.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
oFlags	The requested open flags
cFlags	Ethernet PHY MII/RMII configuration flags
pResFlags	Address to store the initialization results

Returns

ETH_RES_OK for success; otherwise, an error code.

Remarks

Please note,

- [ETH_RESULT_CODE](#) DRV_ETHPHY_Setup([DRV_HANDLE](#) handle, [ETH_OPEN_FLAGS](#) oFlags, [ETHPHY_CONFIG_FLAGS](#) cFlags, [ETH_OPEN_FLAGS](#)* pResFlags)

replaces the legacy "Ethernet Controller Library" function:

- eEthRes EthPhyInit(eEthOpenFlags oFlags, eEthPhyCfgFlags cFlags, eEthOpenFlags* pResFlags)

Example

5.1.4.7.3 SMI/MIIM Functions

5.1.4.7.3.1 DRV_ETHPHY_SMIClockSet Function

C

```
void DRV_ETHPHY_SMIClockSet(
    DRV_HANDLE handle,
    uint32_t hostClock,
    uint32_t maxSMIClock
);
```

Description

This function sets SMI/MIIM interface clock base on host clock and maximum supported SMI/MIIM interface clock speed.

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_ETHPHY_Open)
hostClock	Host clock speed in Hz
maxSMIClock	Maximum supported SMI/MIIM clock speed in Hz

Returns

None.

Remarks

Please note,

- void DRV_ETHPHY_SMIClockSet([DRV_HANDLE](#) handle, uint16_t hostClock, uint16_t maxSMIClock)

replaces the legacy "Ethernet Controller Library" function:

- void EthMIIMConfig(unsigned int hostClock, unsigned int miimClock)

Example

5.1.4.7.3.2 DRV_ETHPHY_SMIisBusy Function

C

```
bool DRV_ETHPHY_SMIisBusy(  
    DRV_HANDLE handle  
)  
;
```

Description

This function returns a boolean 'true' if the SMI/MIIM interface is busy with a transaction.

Preconditions

MyPHYSMIClockSet() called to setup SMI/MIIM clock.

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_ETHPHY_Open)

Returns

- true - If the SMI/MIIM is busy
- false - If the SMI/MIIM is not busy

Example

5.1.4.7.3.3 DRV_ETHPHY_SMIReadResultGet Function

C

```
uint16_t DRV_ETHPHY_SMIReadResultGet(  
    DRV_HANDLE handle  
)  
;
```

Description

This function gets the result of the SMI/MIIM register read.

Preconditions

MyPHYSMIClockSet was called to set up the SMI/MIIM clock and [DRV_ETHPHY_SMIReadStart](#) was called to initiate a SMI/MIIM register read. [DRV_ETHPHY_SMIisBusy](#) should return false.

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_ETHPHY_Open)

Returns

Result of the SMI/MIIM register read previously scheduled.

Remarks

Please note,

- uint16_t DRV_ETHPHY_SMIReadResultGet([DRV_HANDLE](#) handle)
replaces the legacy "Ethernet Controller Library" function:
 - unsigned short EthMIIMReadResult (void)

Example

5.1.4.7.3.4 DRV_ETHPHY_SMIReadStart Function

C

```
void DRV_ETHPHY_SMIReadStart(  
    DRV_HANDLE handle,  
    unsigned int rIx,  
    unsigned int phyAdd  
);
```

Description

This function initiates SMI/MIIM read transaction for a given PHY address and register.

Preconditions

MyPHYSMIClockSet was called to set up the SMI/MIIM clock.

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_ETHPHY_Open)
rlx	PHY register to be accessed
phyAdd	Address of PHY to be accessed

Returns

None.

Remarks

Please note,

- void DRV_ETHPHY_SMIReadStart([DRV_HANDLE](#) handle, unsigned int rIx, unsigned int phyAdd) replaces the legacy "Ethernet Controller Library" function:
- void EthMIIMReadStart(unsigned int rIx, unsigned int phyAdd)

Example

5.1.4.7.3.5 DRV_ETHPHY_SMIScanDataGet Function

C

```
uint16_t DRV_ETHPHY_SMIScanDataGet(  
    DRV_HANDLE handle  
);
```

Description

This function gets the latest SMI/MIIM scan data result.

Preconditions

[DRV_ETHPHY_SMIScanStart\(\)](#) has been called. [DRV_ETHPHY_SMIScanStatusGet\(\)](#) should return SMI_SCAN_DATA_VALID.

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_ETHPHY_Open)

Returns

Current scan result.

Remarks

Scan data status must be SMI_SCAN_DATA_VALID.

Please note,

- uint16_t DRV_ETHPHY_SMI ScanDataGet([DRV_HANDLE](#) handle)
replaces the legacy "Ethernet Controller Library" function:
- unsigned short EthMIIMScanResult(void)

Example**5.1.4.7.3.6 DRV_ETHPHY_SMI ScanStart Function****C**

```
void DRV_ETHPHY_SMI ScanStart(  
    DRV_HANDLE handle,  
    unsigned int rIx,  
    unsigned int phyAdd  
)  
;
```

Description

This function starts the scan of the SMI/MIIM register.

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_ETHPHY_Open)
rlx	PHY register to be accessed, 0-31
phyAdd	PHY address, 0-31

Returns

None.

Remarks

Please note,

- void DRV_ETHPHY_SMI ScanStart([DRV_HANDLE](#) handle, unsigned int rIx, unsigned int phyAdd)
replaces the legacy "Ethernet Controller Library" function:
- void EthMIIMScanStart(unsigned int rIx, unsigned int phyAdd)

Example**5.1.4.7.3.7 DRV_ETHPHY_SMI ScanStatusGet Function****C**

```
SMI_SCAN_DATA_STATUS DRV_ETHPHY_SMI ScanStatusGet(  
    DRV_HANDLE handle  
)  
;
```

Description

This function gets the status of the SMI/MIIM scan data.

Preconditions

[DRV_ETHPHY_SMI ScanStart\(\)](#) has been called.

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_ETHPHY_Open)

Returns

SMI_SCAN_DATA_NOTVALID or SMI_SCAN_DATA_VALID

Remarks

None.

Example**5.1.4.7.3.8 DRV_ETHPHY_SMIScanStop Function****C**

```
void DRV_ETHPHY_SMIScanStop(  
    DRV_HANDLE handle  
)  
;
```

Description

This function stops the scan of the SMI/MIIM register.

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_ETHPHY_Open)

Returns

None.

Remarks

Stops a scan transaction on the SMI interface.

Please note,

- void DRV_ETHPHY_SMIScanStop([DRV_HANDLE](#) handle)
replaces the legacy "Ethernet Controller Library" function:
- void EthMIIMScanStop (void)

Example**5.1.4.7.3.9 DRV_ETHPHY_SMIWriteStart Function****C**

```
void DRV_ETHPHY_SMIWriteStart(  
    DRV_HANDLE handle,  
    unsigned int rIx,  
    unsigned int phyAdd,  
    uint16_t wData  
)  
;
```

Description

This function initiates SMI/MIIM write transaction for a given PHY address and register.

Preconditions

MyPHYSMIClockSet was called to set up the SMI/MIIM clock.

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_ETHPHY_Open)
rlx	PHY register to be accessed
phyAdd	Address of PHY to be accessed
wData	Data to be written

Returns

None.

Remarks

Please note,

- void DRV_ETHPHY_SMIWriteStart([DRV_HANDLE](#) handle, unsigned int rlx, unsigned int phyAdd, uint16_t wData)
replaces the legacy "Ethernet Controller Library" function:
- void EthMIIMWriteStart(unsigned int rlx, unsigned int phyAdd, unsigned short wData)

Example

5.1.4.7.4 External PHY Support Functions

5.1.4.7.4.1 EXTPHY_MDIXCONFIGURE Type

C

```
typedef ETH_RESULT_CODE (* EXTPHY_MDIXCONFIGURE)(DRV_HANDLE handle, ETH_OPEN_FLAGS oFlags);
```

Description

Pointer To Function: [ETH_RESULT_CODE](#) EXTPHY_MDIXConfigure([DRV_HANDLE](#) handle, [ETH_OPEN_FLAGS](#) oFlags)

Configures the MDIX mode for the Ethernet PHY.

Preconditions

Communication to the PHY should have been established.

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_PHY_Open)
oFlags	Requested open flags: ETH_OPEN_MDIX_AUTO , ETH_OPEN_MDIX_NORM , or ETH_OPEN_MDIX_NORM ETH_OPEN_MDIX_SWAP

Returns

[ETH_RES_OK](#) - if success; otherwise, [ETH_RES_CFG_ERR](#).

Remarks

For some external PHYs, the MDIX configuration is set by pins on the device. In this case, the function will return [ETH_RES_OK](#) if the cFlags requests the already configured interface; otherwise, [ETH_RES_CFG_ERR](#).

5.1.4.7.4.2 EXTPHY_MIICONFIGURE Type

C

```
typedef ETH_RESULT_CODE (* EXTPHY_MIICONFIGURE)(DRV_HANDLE handle, EXTPHY_CONFIG_FLAGS cFlags);
```

Description

Pointer To Function: `ETH_RESULT_CODE` `EXTPHY_MIIConfigure( DRV_HANDLE handle, ETHPHY_CONFIG_FLAGS cFlags )`
 Configures the Ethernet PHY in one of the MII/RMII operation modes.

Preconditions

Communication to the PHY should have been established.

Parameters

Parameters	Description
handle	Client's driver handle (returned from <code>DRV_PHY_Open</code>)
cFlags	Requested configuration flags: <code>ETH_PHY_CFG_RMII</code> or <code>ETH_PHY_CFG_MII</code>

Returns

`ETH_RES_OK` - if success; otherwise, `ETH_RES_CFG_ERR`.

Remarks

For some external PHYs, the data interface is set by pins on the device or fuses in the host. In this case, the function will return `ETH_RES_OK` if the cFlags requests the already configured interface; otherwise, `ETH_RES_CFG_ERR`.

5.1.4.7.4.3 EXTPHY_SMIADDRESSGET Type**C**

```
typedef unsigned int (* EXTPHY_SMIADDRESSGET)(DRV_HANDLE handle);
```

Description

Pointer To Function: `uint16_t` `EXTPHY_SMIAddressGet( DRV_HANDLE handle );`
 Returns the SMI/MIIM address of the Ethernet PHY.

Preconditions

Communication to the PHY should have been established.

Parameters

Parameters	Description
handle	Client's driver handle (returned from <code>DRV_PHY_Open</code>)

Returns

The SMI/MIIM Ethernet PHY address as an unsigned 16-bit integer.

Remarks

For some external PHYs, the MDIX configuration is set by pins on the device. In this case, the function will return `ETH_RES_OK` if the cFlags requests the already configured interface; otherwise, `ETH_RES_CFG_ERR`.

5.1.4.7.4.4 EXTPHY_SMICLOCKGET Type**C**

```
typedef unsigned int (* EXTPHY_SMICLOCKGET)(DRV_HANDLE handle);
```

Description

Pointer to Function: `uint16_t` `EXTPHY_SMIClockGet( DRV_HANDLE handle );`
 Returns the SMI/MIIM maximum clock speed in Hz of the Ethernet PHY.

Preconditions

Communication to the PHY should have been established.

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_PHY_Open)

Returns

The maximum SMI/MIIM clock speed as an unsigned 16-bit integer.

Remarks

For some external PHYs, the MDIX configuration is set by pins on the device. In this case, the function will return ETH_RES_OK if the cFlags requests the already configured interface; otherwise, ETH_RES_CFG_ERR.

5.1.4.7.5 Other Functions

5.1.4.7.5.1 DRV_ETHPHY_VersionGet Function

C

```
unsigned int DRV_ETHPHY_VersionGet(  
    const SYS_MODULE_INDEX drvIndex  
);
```

Description

This function gets the Ethernet PHY driver version. The version is encoded as major * 10000 + minor * 100 + patch. The stringed version can be obtained using [DRV_ETHPHY_VersionStrGet\(\)](#)

Preconditions

None.

Parameters

Parameters	Description
drvIndex	Identifier for the object instance to get the version for

Returns

Current driver version in numerical format.

Remarks

None.

Example

```
unsigned int version;  
  
version = DRV_ETHPHY_VersionGet( DRV_ETHPHY_INDEX_1 );  
  
if(version < 110200)  
{  
    // Do Something  
}
```

5.1.4.7.5.2 DRV_ETHPHY_VersionStrGet Function

C

```
char * DRV_ETHPHY_VersionStrGet(  
    const SYS_MODULE_INDEX drvIndex  
);
```

Description

This function gets the Ethernet PHY driver version. The version is returned as major.minor.path[type], where type is optional. The numerical version can be obtained using [DRV_ETHPHY_VersionGet\(\)](#)

Preconditions

None.

Parameters

Parameters	Description
drvIndex	Identifier for the object instance to get the version for.

Returns

Current Ethernet PHY driver version in the string format.

Remarks

None.

Example

```
char *version;  
  
version = DRV_ETHPHY_VersionStrGet( DRV_ETHPHY_INDEX_1 );  
  
printf("%s", version);
```

5.1.4.7.6 Data Types and Constants

5.1.4.7.6.1 DRV_ETHPHY_CLIENT_STATUS Enumeration

C

```
typedef enum {  
    DRV_ETHPHY_CLIENT_STATUS_ERROR,  
    DRV_ETHPHY_CLIENT_STATUS_CLOSED,  
    DRV_ETHPHY_CLIENT_STATUS_BUSY,  
    DRV_ETHPHY_CLIENT_STATUS_READY  
} DRV_ETHPHY_CLIENT_STATUS;
```

Description

Ethernet PHY Driver Client Status

This enumeration identifies the client-specific status of the Ethernet PHY driver.

Members

Members	Description
DRV_ETHPHY_CLIENT_STATUS_ERROR	Unspecified error condition
DRV_ETHPHY_CLIENT_STATUS_CLOSED	Client is not open
DRV_ETHPHY_CLIENT_STATUS_BUSY	An operation is currently in progress
DRV_ETHPHY_CLIENT_STATUS_READY	Up and running, no operations running

Remarks

None.

5.1.4.7.6.2 DRV_ETHPHY_INIT Structure

C

```
typedef struct {
    SYS_MODULE_INIT moduleInit;
    ETH_MODULE_ID ethphyId;
    EXTPHY_MIICONFIGURE MyPHYMIIConfigure;
    EXTPHY_MDIXCONFIGURE MyPHYMDIXConfigure;
    EXTPHY_SMIADDRESSGET MyPHYSMIAAddressGet;
    EXTPHY_SMICLOCKGET MyPHYSMIClockGet;
} DRV_ETHPHY_INIT;
```

Description

Ethernet PHY Device Driver Initialization Data

This structure contains all the data necessary to initialize the Ethernet PHY device.

Members

Members	Description
SYS_MODULE_INIT moduleInit;	System module initialization
ETH_MODULE_ID ethphyId;	Identifies peripheral (PLIB-level) ID
EXTPHY_MIICONFIGURE MyPHYMIIConfigure;	Select MII or RMII data interface
EXTPHY_MDIXCONFIGURE MyPHYMDIXConfigure;	AutoMDIX or Manual MDIX
EXTPHY_SMIADDRESSGET MyPHYSMIAAddressGet;	Returns PHY's SMI Address
EXTPHY_SMICLOCKGET MyPHYSMIClockGet;	Returns PHY's clock speed

Remarks

A pointer to a structure of this format containing the desired initialization data must be passed into the [DRV_ETHPHY_Initialize](#) routine.

5.1.4.7.6.3 SMI_SCAN_DATA_STATUS Enumeration

C

```
typedef enum {
    SMI_SCAN_DATA_NOTVALID,
    SMI_SCAN_DATA_VALID
} SMI_SCAN_DATA_STATUS;
```

Description

SMI Interface Scan Data Status Enumeration

This enumeration returns the status of the SMI of the Ethernet PHY.

Members

Members	Description
SMI_SCAN_DATA_NOTVALID	SMI interface ready for new scan/read/write
SMI_SCAN_DATA_VALID	SMI interface ready for new scan/read/write

Remarks

None.

5.1.4.7.6.4 SYS_OBJ_HANDLE_INVALID Macro**C**

```
#define SYS_OBJ_HANDLE_INVALID ( (SYS_OBJ_HANDLE) -1 )
```

Description

This is macro SYS_OBJ_HANDLE_INVALID.

5.1.4.7.6.5 SYS_OBJ_HANDLE_STATIC Macro**C**

```
#define SYS_OBJ_HANDLE_STATIC ( (SYS_OBJ_HANDLE) 0 )
```

Description

This is macro SYS_OBJ_HANDLE_STATIC.

5.1.4.7.6.6 SYS_OBJ_HANDLE Type**C**

```
typedef uintptr_t SYS_OBJ_HANDLE;
```

Description

[SYS_MODULE_OBJ](#) Rename

[SYS_MODULE_OBJ](#) is badly named. It should be SYS_MODULE_OBJ_HANDLE or something shorter. For brevity, it is renamed to SYS_OBJ_HANDLE.

Remarks

None.

5.1.4.8 Files**Files**

Name	Description
drv_ethphy.h	Ethernet ETHPHY Device Driver Interface File
drv_ethphy_config.h	Ethernet PHY driver configuration definitions template.

Description**5.1.4.8.1 drv_ethphy.h**

Ethernet ETHPHY Device Driver Interface

The Ethernet ETHPHY device driver provides a simple interface to manage an Ethernet ETHPHY peripheral using MIIM (or SMI) interface. This file defines the interface definitions and prototypes for the Ethernet ETHPHY driver.

Enumerations

	Name	Description
	DRV_ETHPHY_CLIENT_STATUS	Identifies the client-specific status of the Ethernet PHY driver.
	SMI_SCAN_DATA_STATUS	Returns the status of the SMI of the Ethernet PHY.

Functions

	Name	Description
	DRV_ETHPHY_ClientStatus	Gets the current client-specific status the Ethernet PHY driver.
	DRV_ETHPHY_Close	Closes an opened instance of the Ethernet PHY driver.
	DRV_ETHPHY_Deinitialize	Deinitializes the specified instance of the Ethernet PHY driver module.
	DRV_ETHPHY_HWConfigFlagsGet	Returns the current Ethernet PHY hardware MII/RMII and ALTERNATE/DEFAULT configuration flags.
	DRV_ETHPHY_Initialize	Initializes the Ethernet PHY driver.
	DRV_ETHPHY_LinkScanRead	Returns current link status.
	DRV_ETHPHY_LinkScanStart	Starts an SMI scan of the link status.
	DRV_ETHPHY_LinkScanStop	Stops the SMI scan of the link status.
	DRV_ETHPHY_LinkStatusGet	Returns the current link status.
	DRV_ETHPHY_NegotiationIsComplete	Returns the results of a previously initiated Ethernet PHY negotiation.
	DRV_ETHPHY_NegotiationResultGet	Returns the link status after a completed negotiation.
	DRV_ETHPHY_Open	Opens the specified Ethernet PHY driver instance and returns a handle to it.
	DRV_ETHPHY_Reinitialize	Reinitializes the driver and refreshes any associated hardware settings.
	DRV_ETHPHY_Reset	Immediately resets the Ethernet PHY.
	DRV_ETHPHY_RestartNegotiation	Restarts auto-negotiation of the Ethernet PHY link.
	DRV_ETHPHY_Setup	Initializes Ethernet PHY communication.
	DRV_ETHPHY_SMIClockSet	Sets the SMI/MIIM interface clock.
	DRV_ETHPHY_SMIIsBusy	Returns a boolean 'true' if the SMI/MIIM interface is busy with a transaction.
	DRV_ETHPHY_SMIReadResultGet	Gets the result of the SMI/MIIM register read.
	DRV_ETHPHY_SMIReadStart	Initiates SMI/MIIM read transaction.
	DRV_ETHPHY_SMIScanDataGet	Gets the latest SMI/MIIM scan data result.
	DRV_ETHPHY_SMIScanStart	Starts the scan of the SMI/MIIM register.
	DRV_ETHPHY_SMIScanStatusGet	Gets the status of the SMI/MIIM scan data.
	DRV_ETHPHY_SMIScanStop	Stops the scan of the SMI/MIIM register.
	DRV_ETHPHY_SMIWriteStart	Initiates a SMI/MIIM write transaction.
	DRV_ETHPHY_Status	Provides the current status of the Ethernet PHY driver module.
	DRV_ETHPHY_Tasks	Maintains the driver's state machine and implements its ISR.
	DRV_ETHPHY_VersionGet	Gets the Ethernet PHY driver version in numerical format.
	DRV_ETHPHY_VersionStrGet	Gets the Ethernet PHY driver version in string format.

Macros

	Name	Description
	DRV_ETHPHY_INDEX_0	Ethernet PHY driver index definitions.
	DRV_ETHPHY_INDEX_1	This is macro DRV_ETHPHY_INDEX_1.
	DRV_ETHPHY_INDEX_COUNT	Number of valid Ethernet PHY driver indices.

Structures

	Name	Description
	DRV_ETHPHY_INIT	Contains all the data necessary to initialize the Ethernet PHY device.

Types

	Name	Description
	EXTPHY_MDIXCONFIGURE	Configures the MDIX mode for the Ethernet PHY.
	EXTPHY_MIICONFIGURE	Configures the Ethernet PHY in one of the MII/RMII operation modes.
	EXTPHY_SMIADDRESSGET	Returns the SMI/MIIM address of the Ethernet PHY.
	EXTPHY_SMICLOCKGET	Returns the SMI/MIIM maximum clock speed in Hz of the Ethernet PHY.

Company

Microchip Technology Incorporated

FileName: drv_ethphy.h

5.1.4.8.2 drv_ethphy_config.h

Ethernet PHY Driver Configuration Definitions for the Template Version

These definitions statically define the driver's mode of operation.

Macros

	Name	Description
	DRV_ETHPHY_CLIENTS_NUMBER	Selects the maximum number of clients.
	DRV_ETHPHY_INDEX	Ethernet PHY static index selection.
	DRV_ETHPHY_INSTANCES_NUMBER	Selects the maximum number of hardware instances that can be supported by the dynamic driver.
	DRV_ETHPHY_PERIPHERAL_ID	Defines an override of the peripheral ID.
	PHY_NEG_DONE_TMO	negotiation complete timeout, ms. based on IEEE 802.3 Clause 28 Table 28-9 autoneg_wait_timer value (max 1s)
	PHY_NEG_INIT_TMO	negotiation initiation timeout, ms.
	PHY_RESET_CLR_TMO	reset self clear timeout, ms. IEEE 802.3 Clause 22 Table 22-7 and paragraph "22.2.4.1.1 Reset" (max 0.5s)
	TCPIP_IF_PIC32INT	We have an internal PIC32 MAC

5.1.5 Graphics (GFX) Driver Library

5.1.5.1 Introduction

Graphics (GFX) Driver Library

for

Microchip Microcontrollers

The Graphics (GFX) Driver Layer Library is the GFX library stack available for the Microchip family of microcontrollers.

Description

The MPLAB Harmony Graphics (GFX) Library is highly modular and is optimized for Microchip's 32-bit microcontrollers. Additionally, the library is free for Microchip customers, easy to use, and has an open documented interface for new driver support, which requires creation of only one C file.

5.1.5.2 Release Notes

MPLAB Harmony Version: v0.70b **Graphics (GFX) Driver Layer Library Version :** 4.00b **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.1.5.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.1.5.4 Using the Library

5.1.5.4.1 Abstraction Model

The Graphics Driver Library structure consists of the following:

- Application Layer – This is the program that utilizes the Graphics Driver Library
- User Message Interface- This layer should be implemented by user to provide messages for the library
- Graphics Object Layer – This layer renders the widgets controls such as button, slider, window, and so on
- Graphics Primitives Layer – This layer implements the primitive drawing functions
- Device Display Driver – This layer is dependent on the display device being used
- Graphics Display Module – This is the display device being used

The library provides two configurations (Blocking and Non-Blocking).

For a Blocking configuration, all draw functions are blocking calls that delay the execution of program until rendering is done.

For a Non-Blocking configuration, draw functions do not wait for the drawing completion and release control to the program.

In this configuration, a draw function should be called repeatedly until the rendering of that particular draw function is complete. This allows efficient use of microcontroller CPU time since it can perform other tasks if the rendering is not yet done.

5.1.5.4.2 Library Overview

This layer informs the GFX library on which graphics controller is being used along with the LCD. It takes input only from the primitive layer. This layer contains all the hardware specific functions the primitive layer needs to render primitives onto the LCD. Each driver contained in the GFX library has a build time structure associated with it that informs the primitive layer which hardware specific functions are available. Thus when the primitive layer calls a specific rendering task it gets passed a pointer from the driver of that task. If the task does not exist the driver passes back a NULL and the primitive layer and either render the primitive without hardware support or let the application know that this feature is not available.

5.1.5.5 Configuring the Library

The configuration of the GFX driver is based on the file `drv_gfx_config.h`

This header file contains the configuration selection for the GFX Driver. Based on the selections made, the GFX Driver will support or not support selected features. These configuration settings will apply to all instances of the GFX Driver.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

The configuration of the GFX driver layer is mainly dependent on making sure the needed driver has the core driver functions inside of it. The main rendering one being a PixelPut type function for the GFX primitive layer.

Once the GFX driver structure ([GFX_DRV_DATA](#)) is defined along with its primitive function rendering structure ([GFX_DRV_FUNCTIONS](#)) it can be used by the GFX primitive layer.

5.1.5.6 Building the Library

This section lists the files that are available in the /src folder of the GFX driver. It lists which files need to be included in the build based on either a hardware feature present on the board or a configuration option selected by the system.

5.1.5.7 Library Interface

Data Types and Constants

	Name	Description
	GFX_DRV_DATA	Structure containing the driver graphics controller data.
	GFX_DRV_FUNCTIONS	Structure containing the driver functions used by the primitive layer.
	LAYER_TYPE	types of Layers supported by the GFX Library
	PAGE_TYPE	types of pages supported by the GFX Library
	NUM_ALPHA_LEVELS	Specific to device
	ALPHA_DELTA	This is macro ALPHA_DELTA.
	GFX_CONFIG_DRIVER_COUNT	This is macro GFX_CONFIG_DRIVER_COUNT.
	GFX_ALPHA_PARAMS	This is type GFX_ALPHA_PARAMS.
	GFX_LAYER_PARAMS	This is type GFX_LAYER_PARAMS.

System Functions

	Name	Description
	Percentage2Alpha	
	DriverInterfaceInit	This is function DriverInterfaceInit.

Description

All of the drivers in the GFX library must follow certain guidelines to be used by the GFX Primitive. These guidelines are defined in `gfx_gol_display_driver.h`.

The GFX primitive calls function pointers to reference a particular GFX driver function. If the function does not exist for a particular driver (ie Alpha Blending) then the driver defines the function as NULL at buildtime. The function structure for a driver file can be seen in "Basic Rendering Routines".

5.1.5.7.1 System Functions

5.1.5.7.1.1 Percentage2Alpha Function

C

```
inline uint8_t Percentage2Alpha(
    uint8_t alphaPercentage
);
```

5.1.5.7.1.2 DriverInterfaceInit Function

C

```
inline void DriverInterfaceInit(
    DRV_HANDLE * pmphandle,
    DRV_PMP_MODE_CONFIG * config
);
```

Description

This is function DriverInterfaceInit.

5.1.5.7.2 Data Types and Constants**5.1.5.7.2.1 GFX_DRV_DATA Structure**

C

```
typedef struct {
    uint16_t orientation;
    uint16_t horizontalResolution;
    uint16_t verticalResolution;
    uint16_t dataWidth;
    uint16_t horizontalPulseWidth;
    uint16_t horizontalBackPorch;
    uint16_t horizontalFrontPorch;
    uint16_t verticalPulseWidth;
    uint16_t verticalBackPorch;
    uint16_t verticalFrontPorch;
    uint8_t logicShift;
    enum {
        LCD_TFT = 1,
        LCD_MSTN,
        LCD_CSTN
    } LCDType;
    uint8_t colorType;
    uint8_t timingControl;
    GFX_DRV_FUNCTIONS PrimitiveFunction;
    uint8_t driverBusy;
    uint8_t ready;
    GFX_COLOR color;
    volatile uint8_t activePage;
    volatile uint8_t visualPage;
} GFX_DRV_DATA;
```

Description

Structure: GFX_DRV_DATA

Each driver in order to be registered with the primitive layer needs these values. they are mainly dependent on the chosen LCD.

Members

Members	Description
uint16_t orientation;	Orientation of the display (given in degrees of 0,90,180,270)
uint16_t horizontalResolution;	Horizontal Resolution of the displayed orientation in Pixels
uint16_t verticalResolution;	Vertical resolution of the displayed orientation in pixels
uint16_t horizontalPulseWidth;	Horizontal Pulse Width of the LCD
uint16_t horizontalBackPorch;	Horizontal BackPorch of the LCD
uint16_t horizontalFrontPorch;	Horizontal FrontPorch of the LCD
uint16_t verticalPulseWidth;	Vertical Pulse width of the LCD
uint16_t verticalBackPorch;	Vertical BackPorch of the LCD
uint16_t verticalFrontPorch;	Vertical FrontPorch of the LCD
uint8_t logicShift;	Rising/Falling edge indicator of the LCD pixel clock

enum { LCD_TFT = 1, LCD_MSTN, LCD_CSTN } LCDType;	LCD type
uint8_t colorType;	color depth (18BPP, 24BPP, 8BPP, palette)
uint8_t timingControl;	flag to
GFX_DRV_FUNCTIONS PrimitiveFunction;	List of Primitive Renderring functions available by the driver
uint8_t driverBusy;	Flag to indicate driver is currently busy
uint8_t ready;	Flag to indicate driver has been initialized and recognized by the primitive layer
GFX_COLOR color;	current Color set for the display driver
volatile uint8_t activePage;	current activepage set for the display driver
volatile uint8_t visualPage;	current visualPage set for the display driver

5.1.5.7.2.2 GFX_DRV_FUNCTIONS Structure

C

```
typedef struct {
    uint16_t (* PixelsPut)(short,short,uint16_t, uint16_t);
    uint16_t (* BarFill)(short,short,short,short);
    uint16_t* (* PixelArrayPut)(uint16_t*,short,short,uint16_t, uint16_t);
    uint16_t* (* PixelArrayGet)(uint16_t*,short,short,uint16_t);
    uint16_t (* PixelPut)(short,short);
    void (* ColorSet)(GFX_COLOR);
    void (* InstanceSet)(uint8_t);
    uint16_t (* PageSet)(uint8_t, uint8_t);
    uint16_t* (* Layer)(uint8_t, GFX_LAYER_PARAMS*);
    uint16_t (* PixelGet)(short,short);
    uint16_t* (* AlphaBlendWindow)(GFX_ALPHA_PARAMS*, uint16_t, uint16_t, uint8_t);
} GFX_DRV_FUNCTIONS;
```

Description

Structure: GFX_DRV_FUNCTIONS

This structure needs to be defined in the driver file to inform the primitive layer as to what functions are available.

Members

Members	Description
uint16_t (* PixelsPut)(short,short,uint16_t, uint16_t);	This function sends pixels of an X,Y location to the LCD controller of a given count and linecount.
uint16_t (* BarFill)(short,short,short,short);	This function sends a 2D accelerated Bar command to the LCD controller
uint16_t* (* PixelArrayPut)(uint16_t*,short,short,uint16_t, uint16_t);	This function sends an array of pixels at an X,Y location to the LCD controller of a given count and linecount from a memory location.
uint16_t* (* PixelArrayGet)(uint16_t*,short,short,uint16_t);	This function gets an array of pixels at an X,Y location to the LCD controller of a given count and linecount from a memory location.
uint16_t (* PixelPut)(short,short);	This function sends a pixel of an X,Y location to the LCD controller.
void (* ColorSet)(GFX_COLOR);	This function sets the global color for the display driver
void (* InstanceSet)(uint8_t);	This function sets the global color for the display driver
uint16_t (* PageSet)(uint8_t, uint8_t);	See Primitive PageSet Defition
uint16_t* (* Layer)(uint8_t, GFX_LAYER_PARAMS*);	See Primitive Layer Definition
uint16_t (* PixelGet)(short,short);	This function gets a pixel of an X,Y location to the LCD controller.

uint16_t* (*AlphaBlendWindow)(GFX_ALPHA_PARAMS*, uint16_t, uint16_t, uint8_t);	See Primitive AlphaBlendWindow Definition

5.1.5.7.2.3 LAYER_TYPE Enumeration

C

```
typedef enum {
    PIP1 = 0,
    PIP2
} LAYER_TYPE;
```

Description

Enumeration: LAYER_TYPE

5.1.5.7.2.4 PAGE_TYPE Enumeration

C

```
typedef enum {
    ACTIVE_PAGE = 0,
    VISUAL_PAGE,
    BACKGROUND_PAGE,
    FOREGROUND_PAGE,
    DESTINATION_PAGE,
    TRANSITION_PAGE
} PAGE_TYPE;
```

Description

Enumeration: PAGE_TYPE

Members

Members	Description
TRANSITION_PAGE	Page that displays the transition

5.1.5.7.2.5 NUM_ALPHA_LEVELS Macro

C

```
#define NUM_ALPHA_LEVELS 0x20 // Specific to device
```

Description

Specific to device

5.1.5.7.2.6 ALPHA_DELTA Macro

C

```
#define ALPHA_DELTA ((NUM_ALPHA_LEVELS) << 5)
```

Description

This is macro ALPHA_DELTA.

5.1.5.7.2.7 GFX_CONFIG_DRIVER_COUNT Macro

C

```
#define GFX_CONFIG_DRIVER_COUNT 1
```

Description

This is macro GFX_CONFIG_DRIVER_COUNT.

5.1.5.7.2.8 GFX_ALPHA_PARAMS Structure**C**

```
typedef struct {  
    uint8_t foregroundPage;  
    short foregroundLeft;  
    short foregroundTop;  
    uint8_t backgroundPage;  
    short backgroundLeft;  
    short backgroundTop;  
    uint8_t destinationPage;  
    short destinationLeft;  
    short destinationTop;  
    uint8_t alpha;  
    GFX_COLOR prevAlphaColor;  
} GFX_ALPHA_PARAMS;
```

Description

This is type GFX_ALPHA_PARAMS.

5.1.5.7.2.9 GFX_LAYER_PARAMS Structure**C**

```
typedef struct {  
    uint8_t type;  
    uint8_t on;  
    uint8_t page;  
    short left;  
    short top;  
    uint16_t width;  
    uint16_t height;  
    short layerLeft;  
    short layerTop;  
} GFX_LAYER_PARAMS;
```

Description

This is type GFX_LAYER_PARAMS.

5.1.5.8 Files**Files**

Name	Description
drv_gfx_display.h	GFX Display Driver definitions
drv_gfx_config_template.h	This is file drv_gfx_config_template.h.

Description**5.1.5.8.1 drv_gfx_display.h**

GFX Display Driver definitions

This file describes the GFX Display Driver specific definitions.

Enumerations

	Name	Description
	LAYER_TYPE	types of Layers supported by the GFX Library
	PAGE_TYPE	types of pages supported by the GFX Library

Files

Name	Description
drv_gfx_lcc.h	Interface for the graphics library where the primitives are rendered and sent to the graphics controller either external or internal
drv_gfx_s1d13517.h	Interface for the graphics library where the primitives are rendered and sent to the graphics controller either external or internal
drv_gfx_ssd1926.h	Interface for the graphics library where the primitives are rendered and sent to the graphics controller either external or internal

Functions

	Name	Description
	DriverInterfaceInit	This is function DriverInterfaceInit.
	Percentage2Alpha	

Macros

	Name	Description
	ALPHA_DELTA	This is macro ALPHA_DELTA.
	GFX_CONFIG_DRIVER_COUNT	This is macro GFX_CONFIG_DRIVER_COUNT.
	NUM_ALPHA_LEVELS	Specific to device

Structures

	Name	Description
	GFX_ALPHA_PARAMS	This is type GFX_ALPHA_PARAMS.
	GFX_DRV_DATA	Structure containing the driver graphics controller data.
	GFX_DRV_FUNCTIONS	Structure containing the driver functions used by the primitive layer.
	GFX_LAYER_PARAMS	This is type GFX_LAYER_PARAMS.

Company

Microchip Technology Incorporated

FileName: gfx_display_driver.h

None

Enumerations

	Name	Description
	DMA_ISR_TASK	This is type DMA_ISR_TASK.
	LCC_TASK	This is type LCC_TASK.

Functions

	Name	Description
	GFX_DRV_lcc_BrightnessSet	Sets the brightness of the display backlight.

	GFX_DRV_Icc_Close	closes an instance of the graphics controller
	GFX_DRV_Icc_Initialize	resets LCD, initializes PMP
	GFX_DRV_Icc_Layer	This is function GFX_DRV_Icc_Layer.
	GFX_DRV_Icc_Open	opens an instance of the graphics controller
	GFX_DRV_Icc_PixelArrayGet	gets an array of pixels of length count starting at *color
	GFX_DRV_Icc_PixelArrayPut	outputs an array of pixels of length count starting at *color
	GFX_DRV_Icc_PixelPut	outputs one pixel into the frame buffer at the x,y coordinate given
	GFX_DRV_Icc_PixelsPut	outputs one pixel into the frame buffer at the x,y coordinate given
	GFX_DRV_Icc_SetColor	Sets the color for the driver instance
	GFX_DRV_Icc_SetInstance	Sets the instance for the driver
	GFX_DRV_Icc_SetPage	This is function GFX_DRV_Icc_SetPage.
	GFX_DRV_Icc_Tasks	Task machine that renders the driver calls for the graphics library it must be called periodically to output the contents of its circular buffer
	GFX_PRIM_SetPIPWindow	This is function GFX_PRIM_SetPIPWindow.

Macros

	Name	Description
	GFX_DRV_Icc_COMMANDQUEUESIZE	This is macro GFX_DRV_Icc_COMMANDQUEUESIZE.
	PIP_BUFFER	This is macro PIP_BUFFER.
	USE_LCC_SCROLLING	This is macro USE_LCC_SCROLLING.
	USE_PIP	This is macro USE_PIP.

Structures

	Name	Description
	GFX_DRV_Icc_COMMAND	Structure for the commands in the driver queue.

5.1.5.9 Software Drivers

5.1.5.9.1 Low-Cost Controllerless (LCC) Graphics Driver Library

5.1.5.9.1.1 Introduction

**Low-Cost Controllerless Graphics Driver Library
for
Microchip Microcontrollers**

This library provides a low-level abstraction of the Low-Cost Controllerless Graphics Controller Driver Library that is available on the Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, there by hiding differences from one microcontroller variant to another.

Description

Note: This information was not available at time of release and will be added in a future release of MPLAB Harmony.

5.1.5.9.1.2 Release Notes

MPLAB Harmony Version: v0.70b **Low-Cost Controllerless Graphics Driver Library Version :** 4.00b **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

DMA Channel 1 is non-configurable. The LCC driver will require DMA Channel 1 and not allow configuration via Harmony system services.

5.1.5.9.1.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER

EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.1.5.9.1.4 Using the Library

This topic describes the basic architecture of the Low-Cost Controllerless (LCC) Graphics Driver Library and provides information and examples on how to use it.

Interface Header File: gfx_drv_lcc.h

The interface to the Low-Cost Controllerless (LCC) Graphics Driver library is defined in the "gfx_drv_lcc.h" header file. This file is included by the "gfx_drv_lcc.h" file. Any C language source (.c) file that uses the Low-Cost Controllerless (LCC) Graphics Driver Library should include "gfx_drv_lcc.h".

Library File:

The GFX Low-Cost Controller library archive (.a) file installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the Low-Cost Controllerless (LCC) Graphics Driver Library interacts with the framework.

5.1.5.9.1.4.1 Library Overview

Refer to the section Driver Overview for how the driver operates in a system.

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the Low-Cost Controllerless (LCC) Graphics Controller Driver module.

Library Interface Section	Description
Functions	This section lists the API functions available in the library.

5.1.5.9.1.4.2 Abstraction Model

This library provides the low-level abstraction of the Low-Cost Controllerless (LCC) Graphics Controller Driver module on the Microchip family of graphic display controllers with a convenient C language interface. This topic describes how that abstraction is modeled in the software and introduces the library interface.

Description

Low-Cost Controllerless (LCC) Graphics Controller Driver Abstraction Block Diagram

Note: This information was not available at time of release and will be added in a future release of MPLAB Harmony.

5.1.5.9.1.5 Configuring the Library

The configuration of the Low-Cost Controllerless (LCC) Graphics Driver Library is based on the file system_config.h.

This header file contains the configuration selection for the GFX Low-Cost Controller. Based on the selections made, the

Low-Cost Controllerless (LCC) Graphics Driver Library will support or not support selected features. These configuration settings will apply to all instances of the Low-Cost Controllerless (LCC) Graphics Driver Library.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.1.5.9.1.6 Building the Library

This section list the files that are available in the \src of the Low-Cost Controllerless (LCC) Graphics Driver Library. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

- gfx_drv_lcc.c

5.1.5.9.1.7 Library Interface

This section describes the Application Programming Interface (API) functions of the Low-Cost Controllerless (LCC) Graphics Driver Library.

Refer to each section for a detailed description.

5.1.5.9.1.7.1 Functions

Functions

	Name	Description
≡	GFX_DRV_lcc_Close	closes an instance of the graphics controller
≡	GFX_DRV_lcc_Initialize	resets LCD, initializes PMP
≡	GFX_DRV_lcc_Open	opens an instance of the graphics controller
≡	GFX_DRV_lcc_Tasks	Task machine that renders the driver calls for the graphics library it must be called periodically to output the contents of its circular buffer
≡	GFX_DRV_lcc_BrightnessSet	Sets the brightness of the display backlight.
≡	GFX_DRV_lcc_PixelArrayGet	gets an array of pixels of length count starting at *color
≡	GFX_DRV_lcc_PixelArrayPut	outputs an array of pixels of length count starting at *color
≡	GFX_DRV_lcc_PixelPut	outputs one pixel into the frame buffer at the x,y coordinate given
≡	GFX_DRV_lcc_PixelsPut	outputs one pixel into the frame buffer at the x,y coordinate given
≡	GFX_DRV_lcc_SetColor	Sets the color for the driver instance
≡	GFX_DRV_lcc_SetInstance	Sets the instance for the driver
≡	GFX_DRV_lcc_Layer	This is function GFX_DRV_lcc_Layer.
≡	GFX_DRV_lcc_SetPage	This is function GFX_DRV_lcc_SetPage.
≡	GFX_PRIM_SetPIPWindow	This is function GFX_PRIM_SetPIPWindow.

Description

5.1.5.9.1.7.1.1 GFX_DRV_lcc_Close Function

C

```
uint16_t GFX_DRV_lcc_Close(
    uint8_t instance
);
```

Description

none

Returns

0 - instance closed 2 - instance doesn't exist 3 - instance already closed

5.1.5.9.1.7.1.2 GFX_DRV_lcc_Initialize Function**C**

```
uint16_t GFX_DRV_lcc_Initialize(  
    uint8_t instance  
);
```

Description

none

Parameters

Parameters	Description
instance	driver instance

Returns

NULL - call not successful (PMP driver busy) !NULL - address of the display driver queue command

5.1.5.9.1.7.1.3 GFX_DRV_lcc_Open Function**C**

```
uint16_t GFX_DRV_lcc_Open(  
    uint8_t instance  
);
```

Description

none

Returns

1 - driver not initialised 2 - instance doesn't exist 3 - instance already open instance to driver when successful

5.1.5.9.1.7.1.4 GFX_DRV_lcc_Tasks Function**C**

```
void GFX_DRV_lcc_Tasks();
```

5.1.5.9.1.7.1.5 GFX_DRV_lcc_BrightnessSet Function**C**

```
void GFX_DRV_lcc_BrightnessSet(  
    uint8_t instance,  
    uint16_t level  
);
```

Description

none

Parameters

Parameters	Description

5.1.5.9.1.7.1.6 GFX_DRV_lcc_PixelArrayGet Function

C

```
uint16_t* GFX_DRV_lcc_PixelArrayGet(  
    uint16_t * color,  
    short x,  
    short y,  
    uint16_t count  
);
```

Description

none

Parameters

Parameters	Description
instance	driver instance
*color	start of the array
x	x coordinate of the start point.
y	y coordinate of the end point.
count	number of pixels

Returns

NULL - call not successful (lcc driver busy) !NULL - address of the display driver queue command

5.1.5.9.1.7.1.7 GFX_DRV_lcc_PixelArrayPut Function

C

```
uint16_t* GFX_DRV_lcc_PixelArrayPut(  
    uint16_t * color,  
    short x,  
    short y,  
    uint16_t count,  
    uint16_t lineCount  
);
```

Description

none

Parameters

Parameters	Description
instance	driver instance
*color	start of the array
x	x coordinate of the start point.
y	y coordinate of the end point.
count	number of pixels

Returns

NULL - call not successful !NULL - handle to the number of pixels remaining

5.1.5.9.1.7.1.8 GFX_DRV_lcc_PixelPut Function

C

```
uint16_t GFX_DRV_lcc_PixelPut(  
    short x,
```

```
    short y  
);
```

Description

none

Parameters

Parameters	Description
x,y	pixel coordinates

Returns

NULL - call not successful (lcc driver busy) !NULL - address of the display driver queue command

5.1.5.9.1.7.1.9 GFX_DRV_lcc_PixelsPut Function**C**

```
uint16_t GFX_DRV_lcc_PixelsPut(  
    short x,  
    short y,  
    uint16_t count,  
    uint16_t lineCount  
);
```

Description

none

Parameters

Parameters	Description
x,y	pixel coordinates

Returns

NULL - call not successful (lcc driver busy) !NULL - address of the display driver queue command

5.1.5.9.1.7.1.10 GFX_DRV_lcc_SetColor Function**C**

```
void GFX_DRV_lcc_SetColor(  
    GFX_COLOR color  
);
```

Returns

none

5.1.5.9.1.7.1.11 GFX_DRV_lcc_SetInstance Function**C**

```
void GFX_DRV_lcc_SetInstance(  
    uint8_t instance  
);
```

Returns

none

5.1.5.9.1.7.1.12 GFX_DRV_lcc_Layer Function**C**

```
uint16_t* GFX_DRV_lcc_Layer(
    uint8_t instance,
    GFX_LAYER_PARAMS* layer
);
```

Description

This is function GFX_DRV_lcc_Layer.

5.1.5.9.1.7.1.13 GFX_DRV_lcc_SetPage Function**C**

```
uint16_t GFX_DRV_lcc_SetPage(
    uint8_t pageType,
    uint8_t page
);
```

Description

This is function GFX_DRV_lcc_SetPage.

5.1.5.9.1.7.1.14 GFX_PRIM_SetPIPWindow Function**C**

```
void GFX_PRIM_SetPIPWindow(
    uint16_t left,
    uint16_t top,
    uint16_t hlength,
    uint16_t vlength,
    uint16_t pipx,
    uint16_t pipy
);
```

Description

This is function GFX_PRIM_SetPIPWindow.

5.1.5.9.1.7.2 Data Types and Constants**Enumerations**

	Name	Description
	LCC_TASK	This is type LCC_TASK.
	DMA_ISR_TASK	This is type DMA_ISR_TASK.

Macros

	Name	Description
	USE_LCC_SCROLLING	This is macro USE_LCC_SCROLLING.
	USE_PIP	This is macro USE_PIP.
	PIP_BUFFER	This is macro PIP_BUFFER.
	GFX_DRV_lcc_COMMANDQUEUESIZE	This is macro GFX_DRV_lcc_COMMANDQUEUESIZE.

Structures

	Name	Description
	GFX_DRV_lcc_COMMAND	Structure for the commands in the driver queue.

Description**5.1.5.9.1.7.2.1 USE_LCC_SCROLLING Macro****C****#define USE_LCC_SCROLLING****Description**

This is macro USE_LCC_SCROLLING.

5.1.5.9.1.7.2.2 USE_PIP Macro**C****#define USE_PIP****Description**

This is macro USE_PIP.

5.1.5.9.1.7.2.3 GFX_DRV_lcc_COMMAND Structure**C**

```
typedef struct {
    uint8_t instance;
    union {
        uint32_t Val;
        struct {
            uint8_t b0 : 1;
            uint8_t b1 : 1;
            uint8_t b2 : 1;
            uint8_t b3 : 1;
            uint8_t b4 : 1;
            uint8_t b5 : 1;
            uint8_t b6 : 1;
            uint8_t b7 : 1;
            uint8_t b8 : 1;
            uint8_t b9 : 1;
            uint8_t b10 : 1;
            uint8_t b11 : 1;
            uint8_t b12 : 1;
            uint8_t b13 : 1;
            uint8_t b14 : 1;
            uint8_t b15 : 1;
            uint8_t b16 : 1;
            uint8_t b17 : 1;
            uint8_t b18 : 1;
            uint8_t b19 : 1;
            uint8_t b20 : 1;
            uint8_t b21 : 1;
            uint8_t b22 : 1;
            uint8_t b23 : 1;
            uint8_t b24 : 1;
            uint8_t b25 : 1;
            uint8_t b26 : 1;
            uint8_t b27 : 1;
            uint8_t b28 : 1;
            uint8_t b29 : 1;
            uint8_t b30 : 1;
            uint8_t b31 : 1;
        } bits;
    }
};
```

```

    } address;
    uint16_t * array;
    uint16_t data;
    uint16_t count;
    uint16_t lineCount;
    uint8_t task;
} GFX_DRV_lcc_COMMAND;

```

Description

Structure: GFX_DRV_lcc_COMMAND

None

5.1.5.9.1.7.2.4 PIP_BUFFER Macro

C

```
#define PIP_BUFFER (3)
```

Description

This is macro PIP_BUFFER.

5.1.5.9.1.7.2.5 LCC_TASK Enumeration

C

```

typedef enum {
    UPDATE_CLOCK = 0,
    INITIALIZE,
    WAIT_TRANSMIT_PIXELS,
    FINISH_TRANSMIT_PIXELS,
    WAIT_TRANSMIT_ARRAY,
    FINISH_TRANSMIT_ARRAY,
    WAIT_RECEIVE,
    READ_RECEIVE,
    PUT_ARRAY,
    PUT_PIXELS,
    GET_PIXELS,
    COPY_PIXELS,
    PAGE,
    LAYERS
} LCC_TASK;

```

Description

This is type LCC_TASK.

5.1.5.9.1.7.2.6 GFX_DRV_lcc_COMMANDQUEUEUSIZE Macro

C

```
#define GFX_DRV_lcc_COMMANDQUEUEUSIZE 480
```

Description

This is macro GFX_DRV_lcc_COMMANDQUEUEUSIZE.

5.1.5.9.1.7.2.7 DMA_ISR_TASK Enumeration

C

```

typedef enum {
    ACTIVE_PERIOD = 0,
    BLANKING_PERIOD,
    FINISH_LINE,

```

```

OVERFLOW,
PIP,
SCROLL
} DMA_ISR_TASK;

```

Description

This is type DMA_ISR_TASK.

5.1.5.10 Hardware Drivers

5.1.5.10.1 OTM2201A Graphics Controller Driver Library

5.1.5.10.1.1 Introduction

OTM2201A Graphics Controller Driver Library for Microchip Microcontrollers

This library provides a low-level abstraction of the OTM2201A Graphics Controller Driver Library that is available on the Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, there by hiding differences from one microcontroller variant to another.

Description

Note: This information was not available at time of release and will be added in a future release of MPLAB Harmony.

5.1.5.10.1.2 Release Notes

MPLAB Harmony Version: v0.70b **OTM2201A Graphics Controller Driver Library Version :** 4.00b **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.1.5.10.1.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.1.5.10.1.4 Using the Library

This topic describes the basic architecture of the OTM2201A Graphics Controller Driver Library and provides information and examples on how to use it.

Interface Header File: [drv_gfx_otm2201a.h](#)

The interface to the OTM2201A Graphics Controller Driver library is defined in the "[drv_gfx_otm2201a.h](#)" header file. This file is included by the "[gfx_primitive.h](#)" file. Any C language source (.c) file that uses the OTM2201A Graphics Controller Driver library should include "[gfx_primitive.h](#)".

Library File:

The OTM2201A Graphics Controller Driver library archive (.a) file installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the OTM2201A Graphics Controller Driver interacts with the framework.

5.1.5.10.1.4.1 Abstraction Model

This library provides the low-level abstraction of the OTM2201A Graphics Controller Driver module on the Microchip family of microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in the software and introduces the library interface.

Description

OTM2201A Graphics Controller Driver Abstraction Block Diagram

Note: This information was not available at time of release and will be added in a future release of MPLAB Harmony.

5.1.5.10.1.4.2 Library Overview

Refer to the section Driver Overview for how the driver operates in a system.

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the OTM2201 Graphics Controller Driver module.

Library Interface Section	Description
Functions	This section lists the API functions available in the library.

5.1.5.10.1.5 Configuring the Driver Library

The configuration of the OTM2201 Graphics Controller Driver is based on the file sys_config.h

This header file contains the configuration selection for the OTM2201 Graphics Controller Driver. Based on the selections made, the OTM2201 Graphics Controller Driver will support or not support selected features. These configuration settings will apply to all instances of the OTM2201 Graphics Controller Driver.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.1.5.10.1.6 Building the Library

This section list the files that are available in the \src of the OTM2201A Graphics Controller Driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

- drv_gfx_otm2201a.c

5.1.5.10.1.7 Library Interface

This section describes the Application Programming Interface (API) functions of the OTM2201A Graphics Controller Driver Library.

Refer to each section for a detailed description.

5.1.5.10.1.7.1 Functions

Functions

	Name	Description
≡	GFX_DRV_OTM2201A_AddressSet	Sets the start GRAM address where pixel data to be written
≡	GFX_DRV_OTM2201A_BrightnessSet	Sets the brightness of the display backlight.
≡	GFX_DRV_OTM2201A_Busy	Returns non-zero value if LCD controller is busy (previous drawing operation is not completed).
≡	GFX_DRV_OTM2201A_Close	Closes an instance of the graphics controller
≡	GFX_DRV_OTM2201A_ColorSet	Sets the color for the driver instance
≡	GFX_DRV_OTM2201A_Initialize	Intialize OTM2201A device
≡	GFX_DRV_OTM2201A_InstanceSet	Sets the instance for the driver
≡	GFX_DRV_OTM2201A_Open	Opens an instance of the graphics controller
≡	GFX_DRV_OTM2201A_PixelArrayGet	Gets an array of pixels of length count into an array starting at *color
≡	GFX_DRV_OTM2201A_PixelArrayPut	Outputs an array of pixels of length count starting at *color
≡	GFX_DRV_OTM2201A_PixelPut	Outputs one pixel into the frame buffer at the x,y coordinate given
≡	GFX_DRV_OTM2201A_PixelsPut	Outputs count number of pixels into the frame buffer from the given x,y coordinate.
≡	GFX_DRV_OTM2201A_RegGet	Returns graphics controller register value (byte access)
≡	GFX_DRV_OTM2201A_RegSet	Updates graphics controller register value (byte access)
≡	GFX_DRV_OTM2201A_Tasks	Task machine that renders the driver calls for the graphics library it must be called peridically to output the contents of its circular buffer

Description

5.1.5.10.1.7.1.1 GFX_DRV_OTM2201A_AddressSet Function

C

```
uint16_t GFX_DRV_OTM2201A_AddressSet(  
    uint32_t address  
);
```

Description

Address consists of Lower 8 bit at Register REG_RAM_ADDR_LOW and Higher 8 bit at Register REG_RAM_ADDR_HIGH

Parameters

Parameters	Description
address	pixel address

Returns

DRV_OTM2201A_ERROR_PMP_WRITE - returns error during PMP Write, DRV_OTM2201A_ERROR_NO_ERROR - returns success without any error.

5.1.5.10.1.7.1.2 GFX_DRV_OTM2201A_BrightnessSet Function

C

```
void GFX_DRV_OTM2201A_BrightnessSet(  
    uint8_t instance,  
    uint16_t level  
);
```

Description

Sets the brightness of the display backlight.

Parameters

Parameters	Description
instance	instance of the driver
level	Brightness level. Valid values are 0 to 100. 0 = brightness level is zero or display is turned off. 100 = brightness level is maximum.

Returns

none

5.1.5.10.1.7.1.3 GFX_DRV_OTM2201A_Busy Function

C

```
uint16_t GFX_DRV_OTM2201A_Busy(  
    uint8_t instance  
);
```

Description

Returns non-zero value if LCD controller is busy (previous drawing operation is not completed).

Parameters

Parameters	Description
instance	driver instance

Returns

DRV_OTM2201A_ERROR_DEVICE_BUSY - Device is busy, DRV_OTM2201A_ERROR_NO_ERROR - Success, driver is not

busy.

5.1.5.10.1.7.1.4 GFX_DRV_OTM2201A_Close Function

C

```
uint16_t GFX_DRV_OTM2201A_Close(  
    uint8_t instance  
);
```

Description

Closes an instance if instance exists and not already closed

Parameters

Parameters	Description
instance	instance of the driver

Returns

DRV_OTM2201A_INSTANCE_CLOSED - instance closed, DRV_OTM2201A_INSTANCE_DOESNT_EXIST - instance doesn't exist, DRV_OTM2201A_INSTANCE_ALREADY_CLOSED - instance already closed.

5.1.5.10.1.7.1.5 GFX_DRV_OTM2201A_ColorSet Function

C

```
void GFX_DRV_OTM2201A_ColorSet(  
    GFX_COLOR color  
);
```

Description

Sets the color for the driver instance

Parameters

Parameters	Description
color	16 bit 565 format color value

Returns

none

5.1.5.10.1.7.1.6 GFX_DRV_OTM2201A_Initialize Function

C

```
uint16_t GFX_DRV_OTM2201A_Initialize(  
    uint8_t instance  
);
```

Description

Initialize OTM2201A device by initializing PMP interface, initializing command buffer for current instance initialize device registers

Parameters

Parameters	Description
instance	driver instance

Returns

DRV_OTM2201A_ERROR_QUEUE_FULL - OTM2201A command queue is full, DRV_OTM2201A_ERROR_REG_GET - OTM2201A Error while reading register, DRV_OTM2201A_ERROR_REG_SET - OTM2201A Error while writing register,

DRV_OTM2201A_ERROR_DEVICE_BUSY - OTM2201A device is busy, DRV_OTM2201A_ERROR_NO_ERROR - Success without any error.

5.1.5.10.1.7.1.7 GFX_DRV_OTM2201A_InstanceSet Function

C

```
void GFX_DRV_OTM2201A_InstanceSet(  
    uint8_t instance  
);
```

Description

Sets the instance for the driver

Parameters

Parameters	Description
instance	driver instance

Returns

none

5.1.5.10.1.7.1.8 GFX_DRV_OTM2201A_Open Function

C

```
uint16_t GFX_DRV_OTM2201A_Open(  
    uint8_t instance  
);
```

Description

Opens the instance of driver if instance is valid and not already opened

Parameters

Parameters	Description
instance	instance of the driver

Returns

DRV_OTM2201A_NEW_INSTANCE_OPEN - driver not initialised, DRV_OTM2201A_INSTANCE_DOESNT_EXIST - instance doesn't exist, DRV_OTM2201A_INSTANCE_ALREADY_OPEN - instance already open.

5.1.5.10.1.7.1.9 GFX_DRV_OTM2201A_PixelArrayGet Function

C

```
uint16_t* GFX_DRV_OTM2201A_PixelArrayGet(  
    uint16_t * color,  
    short x,  
    short y,  
    uint16_t count  
);
```

Description

Gets an array of pixels of length count into an array starting at *color

Parameters

Parameters	Description
color	Pointer to array where color data is to be loaded

x	pixel coordinate on x axis
y	pixel coordinate on y axis
count	count number of pixels

Returns

DRV_OTM2201A_ERROR_QUEUE_FULL - OTM2201A command queue is full, DRV_OTM2201A_ERROR_NO_ERROR - Success without any error.

5.1.5.10.1.7.1.10 GFX_DRV_OTM2201A_PixelArrayPut Function**C**

```
uint16_t* GFX_DRV_OTM2201A_PixelArrayPut(
    uint16_t * color,
    short x,
    short y,
    uint16_t count,
    uint16_t lineCount
);
```

Description

Outputs an array of pixels of length count starting at *color

Parameters

Parameters	Description
color	pointer to array of color of pixels
x	pixel coordinate on x axis.
y	pixel coordinate on y axis.
count	count number of pixels
lineCount	lineCount number of display lines

Returns

handle - handle to the number of pixels remaining, DRV_OTM2201A_ERROR_QUEUE_FULL - OTM2201A command queue is full.

5.1.5.10.1.7.1.11 GFX_DRV_OTM2201A_PixelPut Function**C**

```
uint16_t GFX_DRV_OTM2201A_PixelPut(
    short x,
    short y
);
```

Description

Outputs one pixel into the frame buffer at the x,y coordinate given

Parameters

Parameters	Description
x	pixel coordinate on x axis
y	pixel coordinate on y axis

Returns

DRV_OTM2201A_ERROR_QUEUE_FULL - OTM2201A command queue is full, DRV_OTM2201A_ERROR_NO_ERROR - Success without any error.

5.1.5.10.1.7.1.12 GFX_DRV_OTM2201A_PixelsPut Function

C

```
uint16_t GFX_DRV_OTM2201A_PixelsPut(  
    short x,  
    short y,  
    uint16_t count,  
    uint16_t lineCount  
);
```

Description

Outputs count number of pixels into the frame buffer from the given x,y coordinate.

Parameters

Parameters	Description
x	pixel coordinate on x axis
y	pixel coordinate on y axis
count	count number of pixels
lineCount	lineCount number of display lines

Returns

DRV_OTM2201A_ERROR_QUEUE_FULL - OTM2201A command queue is full, DRV_OTM2201A_ERROR_NO_ERROR - Success without any error.

5.1.5.10.1.7.1.13 GFX_DRV_OTM2201A_RegGet Function

C

```
uint8_t GFX_DRV_OTM2201A_RegGet(  
    uint16_t index,  
    uint16_t * data  
);
```

Description

Returns graphics controller register value (byte access)

Parameters

Parameters	Description
index	register number
*data	array to store register data

Returns

DRV_OTM2201A_ERROR_PMP_WRITE - returns error during PMP Write, DRV_OTM2201A_ERROR_PMP_READ - returns error during PMP Read, DRV_OTM2201A_ERROR_NO_ERROR - returns success without any error.

5.1.5.10.1.7.1.14 GFX_DRV_OTM2201A_RegSet Function

C

```
uint16_t GFX_DRV_OTM2201A_RegSet(  
    uint16_t index,  
    uint16_t value,  
    uint32_t repeatCount  
);
```

Description

This call can set "value" of the register accessed by its "index" and can repeat the same by number of times mentioned in "repeatCount"

Parameters

Parameters	Description
index	register number
value	value to write to register
repeatCount	repeatCount number of times value is to be written to the register.

Returns

DRV_OTM2201A_ERROR_PMP_WRITE - returns error during PMP Write, DRV_OTM2201A_ERROR_NO_ERROR - returns success without any error.

5.1.5.10.1.7.1.15 GFX_DRV_OTM2201A_Tasks Function**C**

```
void GFX_DRV_OTM2201A_Tasks();
```

Description

Task machine that renders the driver calls for the graphics library it must be called periodically to output the contents of its circular buffer.

5.1.5.10.1.7.2 Data Types and Constants**Enumerations**

	Name	Description
	OTM2201A_TASK	Enumeration for command type.

Structures

	Name	Description
	GFX_DRV_OTM2201A_COMMAND	Structure for the commands in the driver queue.

Description**5.1.5.10.1.7.2.1 GFX_DRV_OTM2201A_COMMAND Structure****C**

```
typedef struct {
    uint8_t instance;
    uint32_t address;
    uint16_t * array;
    uint16_t data;
    uint16_t count;
    uint16_t lineCount;
    OTM2201A_TASK task;
} GFX_DRV_OTM2201A_COMMAND;
```

Description

Structure: GFX_DRV_OTM2201A_COMMAND

Structure for the commands in the driver queue.

Parameters

Parameters	Description
instance	instance of the driver
address	pixel address
array	pointer to array of pixel data
data	pixel color
count	count number of pixels in one line
lineCount	lineCount number of lines of display
task	Type of task (OTM2201A_TASK enum)

5.1.5.10.1.7.2.2 OTM2201A_TASK Enumeration**C**

```
typedef enum {  
    INITIALIZE = 0,  
    BUSY,  
    PUT_ARRAY,  
    PUT_PIXELS  
} OTM2201A_TASK;
```

Description

Enum: OTM2201A_TASK

Enumeration for command type.

Parameters

Parameters	Description
INITIALIZE	driver initialization task
BUSY	driver busy task
PUT_ARRAY	driver put array task
PUT_PIXELS	driver put pixels task

5.1.5.10.1.7.3 Files**Files**

Name	Description
drv_gfx_otm2201a.h	Interface for the graphics library where the primitives are rendered and sent to the graphics controller either external or internal

Description**5.1.5.10.1.7.3.1 drv_gfx_otm2201a.h**

None

Enumerations

	Name	Description
	OTM2201A_TASK	Enumeration for command type.

Functions

	Name	Description
	GFX_DRV_OTM2201A_AddressSet	Sets the start GRAM address where pixel data to be written
	GFX_DRV_OTM2201A_BrightnessSet	Sets the brightness of the display backlight.
	GFX_DRV_OTM2201A_Busy	Returns non-zero value if LCD controller is busy (previous drawing operation is not completed).
	GFX_DRV_OTM2201A_Close	Closes an instance of the graphics controller
	GFX_DRV_OTM2201A_ColorSet	Sets the color for the driver instance
	GFX_DRV_OTM2201A_Initialize	Intialize OTM2201A device
	GFX_DRV_OTM2201A_InstanceSet	Sets the instance for the driver
	GFX_DRV_OTM2201A_Open	Opens an instance of the graphics controller
	GFX_DRV_OTM2201A_PixelArrayGet	Gets an array of pixels of length count into an array starting at *color
	GFX_DRV_OTM2201A_PixelArrayPut	Outputs an array of pixels of length count starting at *color
	GFX_DRV_OTM2201A_PixelPut	Outputs one pixel into the frame buffer at the x,y coordinate given
	GFX_DRV_OTM2201A_PixelsPut	Outputs count number of pixels into the frame buffer from the given x,y coordinate.
	GFX_DRV_OTM2201A_RegGet	Returns graphics controller register value (byte access)
	GFX_DRV_OTM2201A_RegSet	Updates graphics controller register value (byte access)
	GFX_DRV_OTM2201A_Tasks	Task machine that renders the driver calls for the graphics library it must be called peridically to output the contents of its circular buffer

Structures

	Name	Description
	GFX_DRV_OTM2201A_COMMAND	Structure for the commands in the driver queue.

5.1.5.10.2 S1D13517 Graphics Controller Driver Library

5.1.5.10.2.1 Introduction

S1D13517 Graphics Controller Driver Library

for

Microchip Microcontrollers

This library provides a low-level abstraction of the S1D13517 Graphics Controller Driver Library that is available on the Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, there by hiding differences from one microcontroller variant to another.

Description

Note: This information was not available at time of release and will be added in a future release of MPLAB Harmony.

5.1.5.10.2.2 Release Notes

MPLAB Harmony Version: v0.70b **S1D13517 Graphics Driver Library Version :** 4.00b **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.1.5.10.2.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.1.5.10.2.4 Using the Library

This topic describes the basic architecture of the S1D13517 Graphics Controller Driver Library and provides information and examples on how to use it.

Interface Header File: gfx_drv_s1d13517.h

The interface to the S1D13517 Graphics Controller Driver Library is defined in the "gfx_drv_s1d13517.h" header file. This file is included by the "gfx_drv_s1d13517.h" file. Any C language source (.c) file that uses the S1D13517 Graphics Controller Driver Library should include "gfx_drv_s1d13517.h".

Library File:

The S1D13517 Graphics Controller Driver Library archive (.a) file installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the GFX S1D13517 Controller Driver interacts with the framework.

5.1.5.10.2.4.1 Abstraction Model

This library provides the low-level abstraction of the S1D13517 Graphics Controller Driver module of the Microchip family of graphic display controllers with a convenient C language interface. This topic describes how that abstraction is modeled in the software and introduces the library interface.

Description

S1D13517 Graphics Controller Driver Abstraction Block Diagram

Note: This information was not available at time of release and will be added in a future release of MPLAB Harmony.

5.1.5.10.2.4.2 Library Overview

Refer to the section Driver Overview for how the driver operates in a system.

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the S1D13517 Graphics Controller Driver module.

Library Interface Section	Description
Functions	This section lists the API functions available in the library.

5.1.5.10.2.5 Configuring the Library

Macros

	Name	Description
	USE_ANALOGCLOCK	Enable Analog Clock Object.

5.1.5.10.2.5.1 USE_ANALOGCLOCK Macro

C

```
#define USE_ANALOGCLOCK
```

Description

Enable Analog Clock Object.

5.1.5.10.2.5.2 USE_BITMAP_FLASH Macro

C

```
#define USE_BITMAP_FLASH
```

Description

Similar to Font data bitmaps can also be placed in two locations. One is in FLASH memory and the other is from external memory. Defining one or both enables the support for bitmaps located in internal flash and external memory. Define this in GraphicsConfig.h

- USE_BITMAP_FLASH - Images located in internal flash memory.
- USE_BITMAP_EXTERNAL - Images located in external memory (including external memory mapped to EDS)..

5.1.5.10.2.5.3 USE_BUTTON Macro

C

```
#define USE_BUTTON
```

Description

Enable Button Object.

5.1.5.10.2.5.4 USE_CHART Macro

C

```
#define USE_CHART
```

Description

This is macro USE_CHART.

5.1.5.10.2.5.5 USE_CHECKBOX Macro

C

```
#define USE_CHECKBOX
```

Description

Enable Checkbox Object.

5.1.5.10.2.5.6 USE_COMP_RLE Macro

C

```
#define USE_COMP_RLE
```

Description

- Overview: To enable support for DEFLATE compressed images for PutImage().
 - When this macro is enabled, the PutImage() function will
 - be able to process images generated by the Graphics Resource
 - Converter (GRC) that are compressed using the DEFLATE algorithm.
 - PutImage() will need the IPU module of the Microchip Graphics
 - Module to decompress. Enable this feature only when the driver
 - features the IPU module (example: PIC24FJ2456DA210).
 - Define this in GraphicsConfig.h
- *

```
*****
```

```
#define USE_COMP_IPU
```

5.1.5.10.2.5.7 USE_CUSTOM Macro

C

```
#define USE_CUSTOM
```

Description

Enable Custom Control Object (an example to create customized Object).

5.1.5.10.2.5.8 USE_DIGITALMETER Macro

C

```
#define USE_DIGITALMETER
```

Description

Enable DigitalMeter Object.

5.1.5.10.2.5.9 USE_EDITBOX Macro**C****#define USE_EDITBOX****Description**

Enable Edit Box Object.

5.1.5.10.2.5.10 USE_FONT_FLASH Macro**C****#define USE_FONT_FLASH****5.1.5.10.2.5.11 USE_GOL Macro****C****#define USE_GOL****Description**

Enable Graphics Object Layer.

5.1.5.10.2.5.12 USE_GRADIENT Macro**C****#define USE_GRADIENT****Description**

To enable support for Gradient bars and bevel primitives. Define this in GraphicsConfig.h.

5.1.5.10.2.5.13 USE_GROUPBOX Macro**C****#define USE_GROUPBOX****Description**

Enable Group Box Object.

5.1.5.10.2.5.14 USE_LISTBOX Macro**C****#define USE_LISTBOX****Description**

Enable List Box Object.

5.1.5.10.2.5.15 USE_METER Macro**C****#define USE_METER****Description**

Enable Meter Object.

5.1.5.10.2.5.16 USE_MULTIBYTECHAR Macro

C

```
#define USE_MULTIBYTECHAR
```

Description

To enable support for unicode fonts, USE_MULTIBYTECHAR must be defined. This sets the XCHAR definition (0-2¹⁶ range). See XCHAR for details. Define this in GraphicsConfig.h

5.1.5.10.2.5.17 USE_PICTURE Macro

C

```
#define USE_PICTURE
```

Description

Enable Picture Object.

5.1.5.10.2.5.18 USE_PROGRESSBAR Macro

C

```
#define USE_PROGRESSBAR
```

Description

Enable Progress Bar Object.

5.1.5.10.2.5.19 USE_RADIOBUTTON Macro

C

```
#define USE_RADIOBUTTON
```

Description

Enable Radio Button Object.

5.1.5.10.2.5.20 USE_ROUNDIAL Macro

C

```
#define USE_ROUNDIAL
```

Description

Enable Dial Object.

5.1.5.10.2.5.21 USE_SLIDER Macro

C

```
#define USE_SLIDER
```

Description

Enable Slider or Scroll Bar Object.

5.1.5.10.2.5.22 USE_STATICTEXT Macro

C

```
#define USE_STATICTEXT
```

Description

Enable Static Text Object.

5.1.5.10.2.5.23 USE_TEXTENTRY Macro**C**

```
#define USE_TEXTENTRY
```

Description

Enable TextEntry Object.

5.1.5.10.2.5.24 USE_TOUCHSCREEN Macro**C**

```
#define USE_TOUCHSCREEN
```

5.1.5.10.2.5.25 USE_WINDOW Macro**C**

```
#define USE_WINDOW
```

Description

Enable Window Object.

5.1.5.10.2.5.26 COLOR_DEPTH Macro**C**

```
#define COLOR_DEPTH 16
```

Description

Specifies the color depth used in the application defined in GraphicsConfig.h.

5.1.5.10.2.5.27 DRIVER_COUNT Macro**C**

```
#define DRIVER_COUNT 1
```

Description

- Overview: For XC16 or C30 builds only: When placing fonts in internal
- data memory, there is a 32K limit for data space. The total
- data should not exceed 32K. When this is unavoidable, the macro
- USE_GFX_FONT_IN_PROGRAM_SECTION will relocate the font in
- program space. This will remove the 32K restriction but at
- the expense of slower access.
- Define this in GraphicsConfig.h to enable the font to be
- placed in program space.

*

```
*****
```

```
#define USE_GFX_FONT_IN_PROGRAM_SECTION
```

5.1.5.10.2.5.28 GFX_free Macro**C**

```
#define GFX_free(pobj) free(pobj)           // <COPY GFX_malloc>
```

Description

When using Operating Systems (OS), define the OS specific malloc() and free() functions for compatibility with the OS based systems. Define these in GraphicsConfig.h

5.1.5.10.2.5.29 GFX_malloc Macro**C**

```
#define GFX_malloc(size) malloc(size)
```

Description

When using Operating Systems (OS), define the OS specific malloc() and free() functions for compatibility with the OS based systems. Define these in GraphicsConfig.h

5.1.5.10.2.6 Building the Library

This section list the files that are available in the \src of the S1D13517 Graphics Controller Driver Library. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

- drv_gfx_s1d13517.c

5.1.5.10.2.7 Library Interface

This section describes the Application Programming Interface (API) functions of the S1D13517 Graphics Controller Driver Library.

Refer to each section for a detailed description.

5.1.5.10.2.7.1 Functions**Functions**

	Name	Description
≡	GFX_DRV_S1D13517_AlphaBlendWindow	SEE primitive layer alphablendWindow definition
≡	GFX_DRV_S1D13517_BrightnessSet	Sets the brightness of the display backlight.
≡	GFX_DRV_S1D13517_Close	closes an instance of the graphics controller
≡	GFX_DRV_S1D13517_GetReg	returns graphics controller register value (byte access)
≡	GFX_DRV_S1D13517_Initialize	resets LCD, initializes PMP
≡	GFX_DRV_S1D13517_Layer	Updates a Layer depending on the layer parameters.
≡	GFX_DRV_S1D13517_Open	opens an instance of the graphics controller
≡	GFX_DRV_S1D13517_PixelArrayPut	outputs an array of pixels of length count starting at *color
≡	GFX_DRV_S1D13517_PixelPut	outputs one pixel into the frame buffer at the x,y coordinate given
≡	GFX_DRV_S1D13517_PixelsPut	outputs one pixel into the frame buffer at the x,y coordinate given
≡	GFX_DRV_S1D13517_SetColor	Sets the color for the driver instance
≡	GFX_DRV_S1D13517_SetInstance	Sets the instance for the driver
≡	GFX_DRV_S1D13517_SetPage	Sets the page of a certain page type
≡	GFX_DRV_S1D13517_SetReg	updates graphics controller register value (byte access)

	GFX_DRV_S1D13517_Tasks	Task machine that renders the driver calls for the graphics library it must be called peridically to output the contents of its circular buffer

Description

5.1.5.10.2.7.1.1 GFX_DRV_S1D13517_AlphaBlendWindow Function

C

```
uint16_t* GFX_DRV_S1D13517_AlphaBlendWindow(  
    GFX_ALPHA_PARAMS* alphaParams,  
    uint16_t width,  
    uint16_t height,  
    uint8_t alpha  
);
```

5.1.5.10.2.7.1.2 GFX_DRV_S1D13517_BrightnessSet Function

C

```
void GFX_DRV_S1D13517_BrightnessSet(  
    uint8_t instance,  
    uint16_t level  
);
```

Description

none

Parameters

Parameters	Description

5.1.5.10.2.7.1.3 GFX_DRV_S1D13517_Close Function

C

```
uint16_t GFX_DRV_S1D13517_Close(  
    uint8_t instance  
);
```

Description

none

Returns

0 - instance closed 2 - instance doesn't exist 3 - instance already closed

5.1.5.10.2.7.1.4 GFX_DRV_S1D13517_GetReg Function

C

```
uint8_t GFX_DRV_S1D13517_GetReg(  
    uint8_t index  
);
```

Description

none

Parameters

Parameters	Description
index	register number

*data	array to store data

Returns

0 - when call was passed

5.1.5.10.2.7.1.5 GFX_DRV_S1D13517_Initialize Function**C**

```
uint16_t GFX_DRV_S1D13517_Initialize(  
    uint8_t instance  
);
```

Description

none

Parameters

Parameters	Description
instance	driver instance

Returns

NULL - call not successful (PMP driver busy) !NULL - address of the display driver queue command

5.1.5.10.2.7.1.6 GFX_DRV_S1D13517_Layer Function**C**

```
uint16_t* GFX_DRV_S1D13517_Layer(  
    uint8_t type,  
    GFX_LAYER_PARAMS* layer  
);
```

Description

none

Parameters

Parameters	Description
type	layer type
layer	parameters for Layer function call

Returns

NULL - call not successful (PMP driver busy) !NULL - address of the display driver queue command

5.1.5.10.2.7.1.7 GFX_DRV_S1D13517_Open Function**C**

```
uint16_t GFX_DRV_S1D13517_Open(  
    uint8_t instance  
);
```

Description

none

Returns

1 - driver not initialised 2 - instance doesn't exist 3 - instance already open instance to driver when successful

5.1.5.10.2.7.1.8 GFX_DRV_S1D13517_PixelArrayPut Function

C

```
uint16_t* GFX_DRV_S1D13517_PixelArrayPut(  
    uint16_t * color,  
    short x,  
    short y,  
    uint16_t count,  
    uint16_t lineCount  
);
```

Description

none

Parameters

Parameters	Description
*color	start of the array
x	x coordinate of the start point.
y	y coordinate of the end point.
count	number of pixels

Returns

NULL - call not successful (PMP driver busy) !NULL - address to the number of pixels yet to be serviced

5.1.5.10.2.7.1.9 GFX_DRV_S1D13517_PixelPut Function

C

```
uint16_t GFX_DRV_S1D13517_PixelPut(  
    short x,  
    short y  
);
```

Description

none

Parameters

Parameters	Description
instance	driver instance
color	color to output
x,y	pixel coordinates

Returns

NULL - call not successful (PMP driver busy) !NULL - address of the display driver queue command

5.1.5.10.2.7.1.10 GFX_DRV_S1D13517_PixelsPut Function

C

```
uint16_t GFX_DRV_S1D13517_PixelsPut(  
    short x,  
    short y,  
    uint16_t count,  
    uint16_t lineCount  
);
```

Description

none

Parameters

Parameters	Description
instance	driver instance
color	color to output
x,y	pixel coordinates

Returns

NULL - call not successful (PMP driver busy) !NULL - address of the display driver queue command

5.1.5.10.2.7.1.11 GFX_DRV_S1D13517_SetColor Function**C**

```
void GFX_DRV_S1D13517_SetColor(  
    GFX_COLOR color  
);
```

Returns

none

5.1.5.10.2.7.1.12 GFX_DRV_S1D13517_SetInstance Function**C**

```
void GFX_DRV_S1D13517_SetInstance(  
    uint8_t instance  
);
```

Returns

none

5.1.5.10.2.7.1.13 GFX_DRV_S1D13517_SetPage Function**C**

```
uint16_t GFX_DRV_S1D13517_SetPage(  
    uint8_t pageType,  
    uint8_t page  
);
```

Description

none

Parameters

Parameters	Description
instance	driver instance

Returns

NULL - call not successful (PMP driver busy) !NULL - address of the display driver queue command

5.1.5.10.2.7.1.14 GFX_DRV_S1D13517_SetReg Function**C**

```
uint16_t GFX_DRV_S1D13517_SetReg(
    uint8_t index,
    uint8_t value
);
```

Description

none

Parameters

Parameters	Description
index	register number
value	value to write to register

Returns

1 - call was not passed 0 - call was passed

5.1.5.10.2.7.1.15 GFX_DRV_S1D13517_Tasks Function**C**

```
void GFX_DRV_S1D13517_Tasks();
```

5.1.5.10.2.7.2 S1D13517 Data Types and Constants**Structures**

	Name	Description
	GFX_DRV_S1D13517_COMMAND	Structure for the commands in the driver queue.
	LAYER_REGISTERS	This structure is used to describe layer registers.

Description**5.1.5.10.2.7.2.1 GFX_DRV_S1D13517_COMMAND Structure****C**

```
typedef struct {
    uint8_t instance;
    short x;
    short y;
    uint16_t * array;
    uint16_t data;
    uint16_t count;
    uint16_t lineCount;
    uint8_t task;
} GFX_DRV_S1D13517_COMMAND;
```

Description

Structure: GFX_DRV_S1D13517_COMMAND

None

5.1.5.10.2.7.2.2 LAYER_REGISTERS Structure

C

```
typedef struct {
    uint8_t XStart;
    uint8_t XEnd;
    uint8_t YStart0;
    uint8_t YStart1;
    uint8_t YEnd0;
    uint8_t YEnd1;
    uint8_t StartAddress0;
    uint8_t StartAddress1;
    uint8_t StartAddress2;
} LAYER_REGISTERS;
```

Description

This structure is used to describe layer registers.

5.1.5.10.3.4 Using the Library

This topic describes the basic architecture of the SSD1926 Graphics Controller Driver Library and provides information and examples on how to use it.

Interface Header File: [drv_gfx_ssd1926.h](#)

The interface to the SSD1926 Graphics Controller Driver Library is defined in the "[drv_gfx_ssd1926.h](#)" header file. This file is included by the "[gfx_primitive.h](#)" file. Any C language source (.c) file that uses the SSD1926 Graphics Controller Driver Library should include "[gfx_primitive.h](#)".

Library File:

The SSD1926 Graphics Controller Driver Library archive (.a) file installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the SSD1926 Graphics Controller Driver Library interacts with the framework.

5.1.5.10.3.4.1 Abstraction Model

This library provides the low-level abstraction of the SSD1926 Graphics Controller Driver module of the Microchip family of graphic display controllers with a convenient C language interface. This topic describes how that abstraction is modeled in the software and introduces the library interface.

Description

SSD1926 Graphics Controller Driver Abstraction Block Diagram

Note: This information was not available at time of release and will be added in a future release of MPLAB Harmony.

5.1.5.10.3.4.2 Library Overview

Refer to the section Driver Overview for how the driver operates in a system.

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the SSD1926 Graphics Controller Driver module.

Library Interface Section	Description
Functions	This section lists the API functions available in the library.

5.1.5.10.3.5 Configuring the Library

The configuration of the SSD1926 Graphics Controller Driver is based on the file `system_config.h`.

This header file contains the configuration selection for the SSD1926 Graphics Controller Driver. Based on the selections made, the SSD1926 Graphics Controller Driver will support or not support selected features. These configuration settings will apply to all instances of the SSD1926 Graphics Controller Driver.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.1.5.10.3.6 Building the Library

This section list the files that are available in the `\src` of the SSD1926 Graphics Controller Driver Library. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

- `drv_gfx_ssd1926.c`

5.1.5.10.3.7 Library Interface

This section describes the Application Programming Interface (API) functions of the SSD1926 Graphics Controller Driver Library.

Refer to each section for a detailed description.

5.1.5.10.3.7.1 Functions

Functions

	Name	Description
≡	GFX_DRV_SSD1926_BarFill	Hardware accelerated barfill function
≡	GFX_DRV_SSD1926_BrightnessSet	Sets the brightness of the display backlight.
≡	GFX_DRV_SSD1926_Busy	Returns non-zero if LCD controller is busy (previous drawing operation is not completed).
≡	GFX_DRV_SSD1926_Close	closes an instance of the graphics controller
≡	GFX_DRV_SSD1926_GetReg	returns graphics controller register value (byte access)
≡	GFX_DRV_SSD1926_Initialize	resets LCD, initializes PMP
≡	GFX_DRV_SSD1926_Open	opens an instance of the graphics controller
≡	GFX_DRV_SSD1926_PixelArrayGet	gets an array of pixels of length count starting at *color
≡	GFX_DRV_SSD1926_PixelArrayPut	outputs an array of pixels of length count starting at *color
≡	GFX_DRV_SSD1926_PixelPut	outputs one pixel into the frame buffer at the x,y coordinate given
≡	GFX_DRV_SSD1926_PixelsPut	outputs one pixel into the frame buffer at the x,y coordinate given
≡	GFX_DRV_SSD1926_SetColor	Sets the color for the driver instance
≡	GFX_DRV_SSD1926_SetInstance	Sets the instance for the driver
≡	GFX_DRV_SSD1926_SetReg	updates graphics controller register value (byte access)
≡	GFX_DRV_SSD1926_Tasks	Task machine that renders the driver calls for the graphics library it must be called periodically to output the contents of its circular buffer

Description

5.1.5.10.3.7.1.1 GFX_DRV_SSD1926_BarFill Function

```
C
uint16_t GFX_DRV_SSD1926_BarFill(
    short left,
    short top,
    short right,
    short bottom
);
```

Description

see primitive BarFill

Returns

1 - call not successful (PMP driver busy) 0 - call successful

5.1.5.10.3.7.1.2 GFX_DRV_SSD1926_BrightnessSet Function

```
C
void GFX_DRV_SSD1926_BrightnessSet(
    uint8_t instance,
    uint16_t level
);
```

Description

none

Parameters

Parameters	Description

5.1.5.10.3.7.1.3 GFX_DRV_SSD1926_Busy Function

```
C
uint16_t GFX_DRV_SSD1926_Busy(
    uint8_t instance
);
```

Description

none

Parameters

Parameters	Description
instance	driver instance

Returns

1 - busy 0 - not busy

5.1.5.10.3.7.1.4 GFX_DRV_SSD1926_Close Function

```
C
uint16_t GFX_DRV_SSD1926_Close(
    uint8_t instance
);
```

```
);
```

Description

none

Returns

0 - instance closed 2 - instance doesn't exist 3 - instance already closed

5.1.5.10.3.7.1.5 GFX_DRV_SSD1926_GetReg Function**C**

```
uint8_t GFX_DRV_SSD1926_GetReg(  
    uint16_t index,  
    uint8_t * data  
);
```

Description

none

Parameters

Parameters	Description
index	register number
*data	array to store data

Returns

0 - when call was passed

5.1.5.10.3.7.1.6 GFX_DRV_SSD1926_Initialize Function**C**

```
uint16_t GFX_DRV_SSD1926_Initialize(  
    uint8_t instance  
);
```

Description

none

Parameters

Parameters	Description
instance	driver instance

Returns

1 - call not successful (PMP driver busy) 0 - call successful

5.1.5.10.3.7.1.7 GFX_DRV_SSD1926_Open Function**C**

```
uint16_t GFX_DRV_SSD1926_Open(  
    uint8_t instance  
);
```

Description

none

Returns

1 - driver not initialised 2 - instance doesn't exist 3 - instance already open instance to driver when successful

5.1.5.10.3.7.1.8 GFX_DRV_SSD1926_PixelArrayGet Function**C**

```
uint16_t* GFX_DRV_SSD1926_PixelArrayGet(  
    uint16_t * color,  
    short x,  
    short y,  
    uint16_t count  
);
```

Description

none

Parameters

Parameters	Description
instance	driver instance
*color	start of the array
x	x coordinate of the start point.
y	y coordinate of the end point.
count	number of pixels

Returns

NULL - call not successful !NULL - address of the display driver queue command

5.1.5.10.3.7.1.9 GFX_DRV_SSD1926_PixelArrayPut Function**C**

```
uint16_t* GFX_DRV_SSD1926_PixelArrayPut(  
    uint16_t * color,  
    short x,  
    short y,  
    uint16_t count,  
    uint16_t lineCount  
);
```

Description

none

Parameters

Parameters	Description
instance	driver instance
*color	start of the array
x	x coordinate of the start point.
y	y coordinate of the end point.
count	number of pixels

Returns

NULL - call not successful !NULL - handle to the number of pixels remaining

5.1.5.10.3.7.1.10 GFX_DRV_SSD1926_PixelPut Function

C

```
uint16_t GFX_DRV_SSD1926_PixelPut(  
    short x,  
    short y  
);
```

Description

none

Parameters

Parameters	Description
instance	driver instance
color	color to output
x,y	pixel coordinates

Returns

NULL - call not successful !NULL - address of the display driver queue command

5.1.5.10.3.7.1.11 GFX_DRV_SSD1926_PixelsPut Function

C

```
uint16_t GFX_DRV_SSD1926_PixelsPut(  
    short x,  
    short y,  
    uint16_t count,  
    uint16_t lineCount  
);
```

Description

none

Parameters

Parameters	Description
x,y	pixel coordinates

5.1.5.10.3.7.1.12 GFX_DRV_SSD1926_SetColor Function

C

```
void GFX_DRV_SSD1926_SetColor(  
    GFX_COLOR color  
);
```

Returns

none

5.1.5.10.3.7.1.13 GFX_DRV_SSD1926_SetInstance Function

C

```
void GFX_DRV_SSD1926_SetInstance(  
    uint8_t instance  
);
```

Returns

none

5.1.5.10.3.7.1.14 GFX_DRV_SSD1926_SetReg Function**C**

```
uint16_t GFX_DRV_SSD1926_SetReg(
    uint16_t index,
    uint8_t value
);
```

Description

none

Parameters

Parameters	Description
index	register number
value	value to write to register

Returns

1 - call was not passed 0 - call was passed

5.1.5.10.3.7.1.15 GFX_DRV_SSD1926_Tasks Function**C**

```
void GFX_DRV_SSD1926_Tasks();
```

5.1.5.10.3.7.2 Data Types and Constants**Structures**

	Name	Description
	GFX_DRV_SSD1926_COMMAND	Structure for the commands in the driver queue.
	GFX_DRV_SSD1926_TASK	Structure for the task machine

Description**5.1.5.10.3.7.2.1 GFX_DRV_SSD1926_COMMAND Structure****C**

```
typedef struct {
    uint8_t instance;
    uint32_t address;
    uint16_t * array;
    uint16_t data;
    uint16_t count;
    uint16_t lineCount;
    SSD1926_TASK task;
} GFX_DRV_SSD1926_COMMAND;
```

Description

Structure: GFX_DRV_SSD1926_COMMAND

None

Members

Members	Description
uint32_t address;	wether the task is complete or not

5.1.5.10.3.7.2.2 GFX_DRV_SSD1926_TASK Structure**C**

```
typedef struct {
    uint8_t instance;
    uint32_t address;
    uint16_t color;
    uint8_t state;
} GFX_DRV_SSD1926_TASK;
```

Description

Structure: GFX_DRV_SSD1926_TASK

None

5.1.5.10.3.8 Files**Files**

5.1.6 Non-Volatile Memory (NVM) Driver Library

5.1.6.1 Introduction

Non-Volatile Memory (NVM) Driver Library

for

Microchip Microcontrollers

This library provides a low-level abstraction of the NVM Driver Library that is available on the Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, thereby hiding differences from one microcontroller variant to another.

Description

The functions provided in the NVM Driver Library also perform certain mandatory assembly language instructions specific for access and modification of memory, which are thus abstracted.

Memory Devices for PIC Microcontrollers

There are two primary forms of on-chip memory available for PIC microcontrollers: programmable Flash memory and data EEPROM memory. The access mechanism for both of these types are varied and different techniques are specified for the same.:

Flash Program Memory

The Flash program memory is readable, writeable, and erasable during normal operation over the entire operating voltage range.

A read from program memory is executed at one byte/word at a time depending on the width of the data bus.

A write to the program memory is executed in either blocks of specific sizes or a single word depending on the type of processor used.

An erase is performed in blocks. A bulk erase may be performed from user code depending on the type of processor supporting the operation.

Writing or erasing program memory will cease instruction fetches until the operation is complete, restricting memory access, and therefore preventing code execution. This is controlled by an internal programming timer.

There are three processor dependant methods for program memory modification.

- Run-Time Self Programming (RTSP)
- In-Circuit Serial Programming (ICSP)
- EJTAG programming

This section describes the RTSP techniques.

5.1.6.2 Release Notes

MPLAB Harmony Version: v0.70b **NVM Driver Library Version :** 0.01 **Release Date:** 18Nov2013

New This Release:

- Internal handling of erase feature for sector write function

Known Issues:

- Not tested by mapping the image to different parts of the memory

5.1.6.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED AS IS MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.1.6.4 Using the Library

This topic describes the basic architecture of the NVM Driver Library and provides information and examples on how to use it.

Interface Header File: [drv_nvm.h](#)

The interface to the NVM Driver Library is defined in the "[drv_nvm.h](#)" header file. Any C language source (.c) file that uses the NVM Driver library should include "drv.h".

Library File: The NVM Driver Library archive (.a) file installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the driver interacts with the framework.

5.1.6.4.1 Abstraction Model

This library provides a low-level abstraction of the NVM module on the Microchip family of microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Description

NVM Software Abstraction Block Diagram

Note 1: This feature is not available on all devices. Refer to the specific device data sheet to determine availability.

Abstraction Model

The NVM peripheral library provides interface routines to interact with the blocks shown in the diagram.

The **Flash Status and Control Logic** ensures that the Flash memory is configured appropriately for modification. It also provides the status of the different operations in progress as well as errors, if any. It also decides if the operation is for Flash program memory or the special device configuration registers.

The **Flash Read/Write** block ensures that the user data is written to/read from the program memory holding latches. It provides a layer of abstraction over the sequence of processor-specific instructions that are required to access this data. Depending on the processor type either block or Word programming options area available.

5.1.6.4.2 Library Overview

Refer to the section [Driver Overview](#) for how the driver operates in a system.

The library interface routines are divided into various subsections, each of the sub-sections addresses one of the blocks or the

overall operation of the NVM module.

Library Interface Section	Description
System Functions	Provides system module interfaces, device initialization, deinitialization, reinitialization, tasks and status functions.
Client Core Functions	Provides open, close, status and other setup functions.
Client Block Transfer Functions	Provides buffered data operation functions available in the core configuration.
Miscellaneous Functions	Provides driver miscellaneous functions related to versions and others.

5.1.6.4.3 How the Library Works

The library provides interfaces to support:

- System Functionality
- Client Functionality

Note: Not all modes are available on all devices. Please refer to the specific device data sheet to determine the modes supported for your device.

5.1.6.4.3.1 System Initialization

This section provides information for system initialization and reinitialization.

Description

System Initialization and Reinitialization

The system performs the initialization and the reinitialization of the device driver with settings that affect only the instance of the device that is being initialized or reinitialized. During system initialization each instance of the NVM module would be initialized with the following configuration settings (either passed dynamically at run time using [DRV_NVM_INIT](#) or by using initialization overrides) that are supported by the specific NVM device hardware:

- Device requested power state: One of the system module power states. For specific details please refer to the Data Types and Constants section.
- The actual peripheral ID enumerated as the PLIB level module ID (e.g., NVM_ID_0)
- Defining the respective interrupt sources for transmit (TX), receive (RX), and error interrupts

The [DRV_NVM_Initialize](#) function returns an object handle of the type [SYS_MODULE_OBJ](#). After this, the object handle returned by the initialize interface would be used by the other system interfaces, such as [DRV_NVM_Reinitialize](#), [DRV_NVM_Deinitialize](#), [DRV_NVM_Status](#), and [DRV_NVM_Tasks](#).

Note: The system initialization and the reinitialization settings, only effect the instance of the peripheral that is being initialized or reinitialized.

The [SYS_MODULE_INDEX](#) is passed to the [DRV_NVM_Initialize](#) function to determine which type of memory is selected using:

- [DRV_NVM_INDEX_0](#) - FLASH

Example:

```
// This code snippet shows an example  
// of initializing the NVM Driver.
```

```
DRV_NVM_INIT    NVMInitData;  
SYS_MODULE_OBJ  objectHandle;
```

```

NVMInitData.moduleInit.value      = SYS_MODULE_POWER_RUN_FULL;
NVMInitData.moduleId             = NVM_ID_0;
NVMInitData.flashInterruptSource = INT_SOURCE_FLASH_CONTROL;

//usage of DRV_NVM_INDEX_0 indicates usage of flash realted APIs
objectHandle = DRV_NVM_Initialize(DRV_NVM_INDEX_0, (SYS_MODULE_INIT*)NVMInitData);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}

```

Tasks Routine

The system will call [DRV_NVM_Tasks](#), from system task service (in a polled environment) or DRV_NVM_Task will be called from the Interrupt Service Routine (ISR) of the NVM.

5.1.6.4.3.2 Client Access Operation

This section provides information for general client operation.

Description

General Client Operation

For the application to start using an instance of the module, it must call the [DRV_NVM_Open](#) function. This provides the configuration required to open the NVM instance for operation. If the driver is deinitialized using the function [DRV_NVM_Deinitialize](#), the application must call the [DRV_NVM_Open](#) function again to set up the instance of the NVM. The function [DRV_NVM_Open](#) need not be called again if the system is reinitialized using the DRV_NVM_Reinitialize function.

For the various options available for I/O INTENT please refer to the Data Types and Constants section.

Example:

```

DRV_HANDLE handle;

handle = DRV_NVM_Open(DRV_NVM_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);
if (DRV_HANDLE_INVALID == handle)
{
    // Unable to open the driver
}

```

5.1.6.4.3.3 Client Basic Operation

This section provides information for client basic functionality.

Description

An extremely basic interface for the driver operation is provided through client basic functionality.

The NVM driver provides the word and row programming operations in the basic mode of operation. The type of memory on which these operations will be performed is provided as an index while initialization.

The [SYS_MODULE_INDEX](#) is passed to the [DRV_NVM_Initialize](#) function to determine which type of memory is selected using:

- [DRV_NVM_INDEX_0](#) - FLASH

Note: Not all devices support the word/row programming operations. It is the responsibility of the user to determine which devices support which mode of operation. The memory access method described in this document only refers to Real-Time Self-Programming (RTSP).

Word Programming Operations

Applications using the NVM word write functionality need to perform the following:

1. The system should have completed necessary initialization and [DRV_NVM_Tasks](#) should either be running in a polled environment, or in an interrupt environment.
2. Open the driver using [DRV_NVM_Open](#) with the necessary intent.
3. Provide the desired mode of operation using the operation mode.
4. Write a word using [DRV_NVM_WriteWord](#).
5. The client will be able to close itself using the [DRV_NVM_Close](#) when required.

```

DRV_HANDLE      handle;    // Returned from DRV_NVM_Open
char            myBuffer[MY_BUFFER_SIZE];
char*           nvmAddr = BASE_ADDRESS_OF_NVM_TO_WRITE_TO
DRV_NVM_OPERATION_STATUS myStatus = 0;

myStatus = DRV_NVM_WriteWord( handle, myBuffer, nvmAddr);

if(myStatus == DRV_NVM_STATUS_OPERATION_COMPLETE)
{
    //Write successful
}

```

Applications using the NVM word erase functionality need to perform the following:

1. The system should have completed necessary initialization and [DRV_NVM_Tasks](#) should either be running in a polled environment, or in an interrupt environment.
2. Open the driver using [DRV_NVM_Open](#) with the necessary intent.
3. Provide the desired mode of operation using the operation mode.
4. Erase a word using [DRV_NVM_EraseWord](#).
5. The client will be able to close itself using the [DRV_NVM_Close](#) when required.

```

DRV_HANDLE      handle;    // Returned from DRV_NVM_Open
char*           nvmAddr = BASE_ADDRESS_OF_NVM_TO_ERASE_FROM
DRV_NVM_OPERATION_STATUS myStatus = 0;

myStatus = DRV_NVM_EraseWord( handle, myBuffer, nvmAddr);

if(myStatus == DRV_NVM_STATUS_OPERATION_COMPLETE)
{
    //Erase successful
}

```

Row Programming Operations

Applications using the NVM row erase functionality needs to perform the following:

1. The system should have completed necessary initialization and [DRV_NVM_Tasks](#) should either be running in a polled environment, or in an interrupt environment.
2. Open the driver using [DRV_NVM_Open](#) with the necessary intent.
3. Provide the desired mode of operation using the operation mode.
4. Erase a word using [DRV_NVM_EraseROW](#).
5. The client will be able to close itself using the [DRV_NVM_Close](#) when required.

```

DRV_HANDLE      handle;    // Returned from DRV_NVM_Open
char*           nvmAddr = BASE_ADDRESS_OF_NVM_TO_ERASE_FROM
DRV_NVM_OPERATION_STATUS myStatus = 0;

myStatus = DRV_NVM_EraseROW( handle, nvmAddr);

if(myStatus == DRV_NVM_STATUS_OPERATION_COMPLETE)
{
    //Erase successful
}

```

```
}
```

5.1.6.4.3.4 Client Block Data Operation

Client Block Data functionality provides advanced interface for the driver operation.

These block data functions depend heavily on the block sizes and boundaries of individual devices and the APIs are responsible for keeping that information transparent from the application. These operations return the number of bytes of a successfully executed operation.

Block Operations

Applications using the NVM block write functionality need to perform the following:

1. The system should have completed necessary initialization and [DRV_NVM_Tasks](#) should either be running in a polled environment, or in an interrupt environment.
2. Open the driver using [DRV_NVM_Open](#) with the necessary intent.
3. Provide the desired mode of operation using the operation mode.
4. Provide the source and destination addresses and begin write using [DRV_NVM_Write](#).
5. The client will be able to close itself using the [DRV_NVM_Close](#) when required.

```
DRV_HANDLE      handle;    // Returned from DRV_NVM_Open
char            myBuffer[2 * DRV_NVM_ROW_SIZE];

// Destination address should be row aligned.
char            *destAddress = (char *)NVM_BASE_ADDRESS_TO_WRITE;

unsigned int     count = 2 * MY_BUFFER_SIZE;
DRV_NVM_BUFFER_HANDLE bufferHandle;

bufferHandle = DRV_NVM_Write(myNVMHandle, destAddress, &myBuffer[total], count);
if(DRV_NVM_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Do error handling here
}

// Wait till the buffer completes. This should not
// be a while loop if a part of cooperative multi-tasking
// routine. In that case, it should be invoked in task
// state machine.
while(DRV_NVM_BufferStatus(bufferHandle) != DRV_NVM_BUFFER_COMPLETED);
```

Applications using the NVM block Read functionality need to perform the following:

1. The system should have completed necessary initialization and [DRV_NVM_Tasks](#) should either be running in a polled environment, or in an interrupt environment.
2. Open the driver using [DRV_NVM_Open](#) with the necessary intent.
3. Provide the desired mode of operation using the operation mode.
4. Provide the source and destination addresses and begin write using [DRV_NVM_ReadBlock](#).
5. The client will be able to close itself using the [DRV_NVM_Close](#) when required.

```
DRV_HANDLE      handle;    // Returned from DRV_NVM_Open
char            myBuffer[MY_BUFFER_SIZE];
char            *srcAddress = NVM_BASE_ADDRESS_TO_READ_FROM;
unsigned int     count = MY_BUFFER_SIZE;
DRV_NVM_BUFFER_HANDLE bufferHandle;

bufferHandle = DRV_NVM_Read(myNVMHandle, &myBuffer[total], srcAddress, count);
if(DRV_NVM_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Do error handling here
}
```

```

}

// Wait till the buffer completes. This should not
// be a while loop if a part of cooperative multi-tasking
// routine. In that case, it should be invoked in task
// state machine.
while(DRV_NVM_BufferStatus(bufferHandle) != DRV_NVM_BUFFER_COMPLETED);

```

Internally, a buffer is maintained whose status can be obtained by calling API [DRV_NVM_BufferStatus](#).

5.1.6.5 Configuring the Library

Macros

	Name	Description
	DRV_NVM_BUFFER_OBJECT_NUMBER	Selects the maximum number of buffer objects
	DRV_NVM_CLIENTS_NUMBER	Selects the maximum number of clients
	DRV_NVM_ERASE_SIZE	Specifies the NVM Driver Erase Page Size in bytes.
	DRV_NVM_INSTANCES_NUMBER	Selects the maximum number of Driver instances that can be supported by the dynamic driver.
	DRV_NVM_INTERRUPT_MODE	Macro specifies operation of the driver to be in the interrupt mode or polled mode
	DRV_NVM_ROW_SIZE	Specifies the NVM Driver Program Row Size in bytes.
	DRV_NVM_UNLOCK_KEY1	Specifies the NVM Driver Program Unlock Key 1
	DRV_NVM_UNLOCK_KEY2	Specifies the NVM Driver Program Unlock Key 2

Description

The configuration of the NVM Driver is based on the file sys_config.h

This header file contains the configuration selection for the NVM Driver. Based on the selections made, the NVM Driver will support or not support selected features. These configuration settings will apply to all instances of the NVM Driver.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.1.6.5.1 DRV_NVM_BUFFER_OBJECT_NUMBER Macro

C

```
#define DRV_NVM_BUFFER_OBJECT_NUMBER 5
```

Description

NVM Driver maximum number of buffer objects

This definition selects the maximum number of buffer objects. This indirectly also specifies the queue depth. The NVM Driver can queue up [DRV_NVM_BUFFER_OBJECT_NUMBER](#) of read/write/erase requests before return a [DRV_NVM_BUFFER_HANDLE_INVALID](#) due to the queue being full. Increasing this number increases the RAM requirement of the driver.

Remarks

None.

5.1.6.5.2 DRV_NVM_CLIENTS_NUMBER Macro

C

```
#define DRV_NVM_CLIENTS_NUMBER 1
```

Description

NVM maximum number of clients

This definition selects the maximum number of clients that the NVM driver can supported at run time.

Remarks

None.

5.1.6.5.3 DRV_NVM_ERASE_SIZE Macro

C

```
#define DRV_NVM_ERASE_SIZE 4096
```

Description

NVM Driver Erase Page Size.

This definition specifies the NVM Driver Erase Page Size in bytes. This parameter is device specific and should be obtained from the device specific data sheet. The Erase Page Size is the minimum block size that can be erased in one erase operation.

Remarks

None.

5.1.6.5.4 DRV_NVM_INSTANCES_NUMBER Macro

C

```
#define DRV_NVM_INSTANCES_NUMBER 1
```

Description

NVM Driver instance configuration

This definition selects the maximum number of Driver instances that can be supported by the dynamic driver. In case of this driver, multiple instances of the driver could use the same hardware instance.

Remarks

None

5.1.6.5.5 DRV_NVM_INTERRUPT_MODE Macro

C

```
#define DRV_NVM_INTERRUPT_MODE false
```

Description

NVM interrupt and polled mode operation control

This macro specifies operation of the driver to be in the interrupt mode or polled mode

- true - Select if interrupt mode of NVM operation is desired
- false - Select if polling mode of NVM operation is desired

Not defining this option to true or false will result in build error.

Remarks

None.

5.1.6.5.6 DRV_NVM_ROW_SIZE Macro

C

```
#define DRV_NVM_ROW_SIZE 512
```

Description

NVM Driver Program Row Size.

This definition specifies the NVM Driver Program Row Size in bytes. This parameter is device specific and should be obtained from the device specific data sheet. The Program Row Size is the minimum block size that can be programmed in one program operation.

Remarks

None.

5.1.6.5.7 DRV_NVM_UNLOCK_KEY1 Macro

C

```
#define DRV_NVM_UNLOCK_KEY1 0xAA996655
```

Description

NVM Driver Program Unlock Key 1

This definition specifies the NVM Driver Program Unlock Key 1 parameter is device specific and should be obtained from the device specific data sheet.

Remarks

None.

5.1.6.5.8 DRV_NVM_UNLOCK_KEY2 Macro

C

```
#define DRV_NVM_UNLOCK_KEY2 0x556699AA
```

Description

NVM Driver Program Unlock Key 2

This definition specifies the NVM Driver Program Unlock Key 2 parameter is device specific and should be obtained from the device specific data sheet.

Remarks

None.

5.1.6.6 Building the Library

This section lists the files that are available in the \src of the NVM driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

5.1.6.7 Library Interface

Data Types and Constants

	Name	Description
	<u>DRV_NVM_BUFFER_HANDLE_INVALID</u>	This value defines the NVM Driver Buffer Invalid handle.
	<u>DRV_NVM_INDEX_0</u>	NVM driver index definitions
	<u>DRV_NVM_INDEX_COUNT</u>	Number of valid NVM driver indices
	<u>DRV_NVM_BUFFER_HANDLE</u>	This type defines the NVM Driver Buffer handle.
	<u>DRV_NVM_BUFFER_STATUS</u>	Specifies the status of the buffer for the read, write and erase operations.
	<u>DRV_NVM_CLIENT_STATUS</u>	Defines the client status
	<u>DRV_NVM_INIT</u>	Defines the data required to initialize or reinitialize the NVM driver
	<u>DRV_NVM_INDEX_1</u>	This is macro DRV_NVM_INDEX_1.

Client Block Data Functions

	Name	Description
	<u>DRV_NVM_Erase</u>	Erase the specified number of pages in flash memory.
	<u>DRV_NVM_Read</u>	Reads a block of data from the specified address in memory.
	<u>DRV_NVM_Tasks</u>	Maintains the driver's erase and write state machine and implements its ISR.
	<u>DRV_NVM_Write</u>	Write a block of data to a specified address in memory.

Client Core Functions

	Name	Description
	<u>DRV_NVM_ClientStatus</u>	Gets current client-specific status the NVM driver
	<u>DRV_NVM_Close</u>	Closes an opened-instance of the NVM driver
	<u>DRV_NVM_Open</u>	Opens the specified timer driver instance and returns a handle to it

Miscellaneous Functions

	Name	Description
	<u>DRV_NVM_BufferStatus</u>	Gets the current status of the buffer.

System Functions

	Name	Description
	<u>DRV_NVM_Deinitialize</u>	Deinitializes the specified instance of the NVM driver module
	<u>DRV_NVM_Initialize</u>	Initializes the NVM instance for the specified driver index
	<u>DRV_NVM_Status</u>	Gets the current status of the NVM driver module.

Description

This section describes the Application Programming Interface (API) functions of the NVM Driver Library.

Refer to each section for a detailed description.

5.1.6.7.1 System Functions

5.1.6.7.1.1 DRV_NVM_Deinitialize Function

C

```
void DRV_NVM_Deinitialize(  
    SYS_MODULE_OBJ object  
);
```

Description

Deinitializes the specified instance of the NVM driver module, disabling its operation (and any hardware). Invalidates all the internal data.

Preconditions

Function [DRV_NVM_Initialize](#) should have been called before calling this function.

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_NVM_Initialize routine

Returns

None.

Remarks

Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again.

This routine will NEVER block waiting for hardware. If the operation requires time to allow the hardware to complete, this will be reported by the [DRV_NVM_Status](#) operation. The system has to use [DRV_NVM_Status](#) to find out when the module is in the ready state.

Example

```
// This code snippet shows an example  
// of deinitializing the driver.  
  
SYS_MODULE_OBJ    object;    // Returned from DRV_NVM_Initialize  
SYS_STATUS        status;  
  
DRV_NVM_Deinitialize(object);  
  
status = DRV_NVM_Status(object);  
if (SYS_MODULE_DEINITIALIZED != status)  
{  
    // Check again later if you need to know  
    // when the driver is deinitialized.  
}
```

5.1.6.7.1.2 DRV_NVM_Initialize Function

C

```
SYS_MODULE_OBJ DRV_NVM_Initialize(  
    const SYS_MODULE_INDEX index,  
    const SYS_MODULE_INIT * const init  
);
```

Description

This routine initializes the NVM driver instance for the specified driver index, making it ready for clients to open and use it.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the instance to be initialized also the type of memory used
init	Pointer to a data structure containing any data necessary to initialize the driver.

Returns

If successful, returns a valid handle to a driver instance object. Otherwise, it returns `SYS_MODULE_OBJ_INVALID`.

Remarks

This routine must be called before any other NVM routine is called.

This routine should only be called once during system initialization unless `DRV_NVM_Deinitialize` is called to de-initialize the driver instance.

This routine will NEVER block for hardware access. If the operation requires time to allow the hardware to re-initialize, it will be reported by the `DRV_NVM_Status` operation. The system must use `DRV_NVM_Status` to find out when the driver is in the ready state.

Build configuration options may be used to statically override options in the "init" structure and will take precedence over initialization data passed using this routine.

Example

```
// This code snippet shows an example
// of initializing the NVM Driver.

DRV_NVM_INIT    NVMInitData;
SYS_MODULE_OBJ  objectHandle;

NVMInitData.moduleInit.value      = SYS_MODULE_POWER_RUN_FULL;
NVMInitData.moduleId              = NVM_ID_0;
NVMInitData.flashInterruptSource = INT_SOURCE_FLASH_CONTROL;

//usage of DRV_NVM_INDEX_0 indicates usage of flash realted APIs
objectHandle = DRV_NVM_Initialize(DRV_NVM_INDEX_0, (SYS_MODULE_INIT*)NVMInitData);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}
```

5.1.6.7.1.3 DRV_NVM_Status Function**C**

```
SYS_STATUS DRV_NVM_Status(
    SYS_MODULE_OBJ object
);
```

Description

This routine provides the current status of the NVM driver module.

Preconditions

Function `DRV_NVM_Initialize` should have been called before calling this function.

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_NVM_Initialize routine

Returns

SYS_STATUS_READY - Indicates that the driver is ready and [accept](#) requests for new operations.

Note Any value greater than SYS_STATUS_READY is also a normal running state in which the driver is ready to [accept](#) new operations.

SYS_STATUS_BUSY - Indicates that the driver is busy with a previous system level operation and cannot start another

SYS_STATUS_ERROR - Indicates that the driver is in an error state

Remarks

Any value less than SYS_STATUS_ERROR is also an error state.

SYS_MODULE_DEINITIALIZED - Indicates that the driver has been de-initialized

This value is less than SYS_STATUS_ERROR

The this operation can be used to determine when any of the driver's module level operations has completed.

If the status operation returns SYS_STATUS_BUSY, the a previous operation has not yet completed. Once the status operation returns SYS_STATUS_READY, any previous operations have completed.

The value of SYS_STATUS_ERROR is negative (-1). Any value less than that is also an error state.

This routine will NEVER block waiting for hardware.

If the Status operation returns an error value, the error may be cleared by calling the reinitialize operation. If that fails, the deinitialize operation will need to be called, followed by the initialize operation to return to normal operations.

Example

```

SYS_MODULE_OBJ    object;    // Returned from DRV_NVM_Initialize
SYS_STATUS        NVMStatus;

NVMStatus = DRV_NVM_Status(object);
else if (SYS_STATUS_ERROR >= NVMStatus)
{
    // Handle error
}

```

5.1.6.7.2 Client Core Functions

5.1.6.7.2.1 DRV_NVM_ClientStatus Function

C

```

DRV_NVM_CLIENT_STATUS DRV_NVM_ClientStatus(
    const DRV_HANDLE handle
);

```

Description

This routine gets the client-specific status of the NVM driver associated with the given handle.

Preconditions

The [DRV_NVM_Initialize](#) routine must have been called.

[DRV_NVM_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Returns

A [DRV_NVM_CLIENT_STATUS](#) value describing the current status of the driver

Remarks

This routine will not block for hardware access and will immediately return the current status.

Example

```
DRV_HANDLE          handle;           // Returned from DRV_NVM_Open
DRV_NVM_CLIENT_STATUS clientStatus;

clientStatus = DRV_NVM_ClientStatus(handle);
if(DRV_NVM_CLIENT_STATUS_ERROR >= clientStatus)
{
    // Handle the error
}
```

5.1.6.7.2.2 DRV_NVM_Close Function**C**

```
void DRV_NVM_Close(
    const DRV_HANDLE handle
);
```

Description

This routine closes an opened-instance of the NVM driver, invalidating the handle.

Preconditions

The [DRV_NVM_Initialize](#) routine must have been called for the specified NVM driver instance.

[DRV_NVM_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Returns

None

Remarks

After calling this routine, the handle passed in "handle" must not be used with any of the remaining driver routines. A new handle must be obtained by calling [DRV_NVM_Open](#) before the caller may use the driver again.

If DRV_IO_INTENT_BLOCKING was requested and the driver was built appropriately to support blocking behavior call may block until the operation is complete.

If DRV_IO_INTENT_NON_BLOCKING request the driver client can call the [DRV_NVM_Status](#) operation to find out when the module is in the ready state (the handle is no longer valid).

Usually there is no need for the driver client to verify that the Close operation has completed.

Example

```
DRV_HANDLE handle; // Returned from DRV_NVM_Open
```

```
DRV_NVM_Close(handle);
```

5.1.6.7.2.3 DRV_NVM_Open Function

C

```
DRV_HANDLE DRV_NVM_Open(
    const SYS_MODULE_INDEX index,
    const DRV_IO_INTENT ioIntent
);
```

Description

This routine opens the specified NVM driver instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver.

Preconditions

Function [DRV_NVM_Initialize](#) must have been called before calling this function.

Parameters

Parameters	Description
drvIndex	Identifier for the object instance to be opened
intent	Zero or more of the values from the enumeration DRV_IO_INTENT "or'd" together to indicate the intended use of the driver

Returns

If successful, the routine returns a valid open-instance handle (a number identifying both the caller and the module instance).

If an error occurs, the return value is [DRV_HANDLE_INVALID](#).

Remarks

The handle returned is valid until the [DRV_NVM_Close](#) routine is called.

This routine will NEVER block waiting for hardware.

If the DRV_IO_INTENT_BLOCKING is requested and the driver was built appropriately to support blocking behavior, then other client-level operations may block waiting on hardware until they are complete.

If DRV_IO_INTENT_NON_BLOCKING is requested the driver client can call the [DRV_NVM_ClientStatus](#) operation to find out when the module is in the ready state.

If the requested intent flags are not supported, the routine will return [DRV_HANDLE_INVALID](#).

Example

```
DRV_HANDLE handle;

handle = DRV_NVM_Open(DRV_NVM_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);
if (DRV_HANDLE_INVALID == handle)
{
    // Unable to open the driver
}
```

5.1.6.7.3 Client Block Data Functions

5.1.6.7.3.1 DRV_NVM_Erase Function

C

```
DRV_NVM_BUFFER_HANDLE DRV_NVM_Erase(
    const DRV_HANDLE handle,
```

```
uint8_t * targetbuffer,
const unsigned int numbytes
);
```

Description

This routine erases the specified number of pages in flash memory. It returns a buffer handle that can be queried by the [DRV_NVM_BufferStatus\(\)](#) function to check for completion of the operation. The target address should be aligned on a `DRV_NVM_PAGE_SIZE` byte boundary. The number of bytes to write should be equal to or should be multiples of `DRV_NVM_PAGE_SIZE`.

Preconditions

The [DRV_NVM_Initialize](#) routine must have been called for the specified NVM driver instance.

[DRV_NVM_Open](#) must have been called to obtain a valid opened device handle.

`DRV_IO_INTENT_READ` or `DRV_IO_INTENT_READWRITE` must have been specified in the [DRV_NVM_Open](#) call.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
targetBuffer	Start address in NVM memory from where the erase should begin. Should be aligned on a <code>DRV_NVM_PAGE_SIZE</code> byte boundary.
numbytes	Total number of pages to be erased expressed in bytes. This should be equal to or a multiple of <code>DRV_NVM_PAGE_SIZE</code> .

Returns

[DRV_NVM_BUFFER_HANDLE_INVALID](#) in case the operation was not successful. A valid handle otherwise.

Remarks

If the `DRV_IO_INTENT_BLOCKING` flag was given in the call to the [DRV_NVM_Open](#) routine and the driver was built to support blocking behavior the call will block until the operation is complete.

If the `DRV_IO_INTENT_NONBLOCKING` flag was given in the call to the [DRV_NVM_Open](#) routine or the driver was built to only support non-blocking behavior the call will return immediately.

Example

```
// Returned from DRV_NVM_Open
DRV_HANDLE    handle;

// Destination address should be row aligned.
char          *destAddress = (char *)NVM_BASE_ADDRESS_TO_ERASE;

unsigned int   count = 2 * DRV_NVM_PAGE_SIZE;
DRV_NVM_BUFFER_HANDLE bufferHandle;

bufferHandle = DRV_NVM_Write(myNVMHandle, destAddress, count);
if(DRV_NVM_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Do error handling here
}

// Wait till the buffer completes. This should not
// be a while loop if a part of cooperative multi-tasking
// routine. In that case, it should be invoked in task
// state machine.
while(DRV_NVM_BufferStatus(bufferHandle) != DRV_NVM_BUFFER_COMPLETED);
```

5.1.6.7.3.2 DRV_NVM_Read Function

C

```
DRV_NVM_BUFFER_HANDLE DRV_NVM_Read(
    const DRV_HANDLE handle,
    uint8_t * targetBuffer,
    uint8_t * srcAddress,
    const unsigned int numbytes
);
```

Description

This routine reads a block of data from the specified address in memory. It returns a buffer handle that can be queried by the [DRV_NVM_BufferStatus\(\)](#) function to check for completion of the operation.

Preconditions

The [DRV_NVM_Initialize](#) routine must have been called for the specified NVM driver instance.

[DRV_NVM_Open](#) must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_READ or DRV_IO_INTENT_READWRITE must have been specified in the [DRV_NVM_Open](#) call.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
targetBuffer	Buffer into which the data read from the NVM instance will be placed.
srcAddress	The base address in NVM memory from data read should begin
numbytes	Total number of bytes that need to be read from the module instance (must be equal to or less than the size of the buffer)

Returns

[DRV_NVM_BUFFER_HANDLE_INVALID](#) in case the operation was not successful. A valid handle otherwise.

Remarks

If the DRV_IO_INTENT_BLOCKING flag was given in the call to the [DRV_NVM_Open](#) routine and the driver was built to support blocking behavior the call will block until the operation is complete.

If the DRV_IO_INTENT_NONBLOCKING flag was given in the call to the [DRV_NVM_Open](#) routine or the driver was built to only support non-blocking behavior the call will return immediately, identifying how many bytes of data were actually copied into the client's buffer and the client must call DRV_NVM_Read again with adjusted parameters as shown in the example.

Example

```
DRV_HANDLE    handle;    // Returned from DRV_NVM_Open
char          myBuffer[MY_BUFFER_SIZE];
char          *srcAddress = NVM_BASE_ADDRESS_TO_READ_FROM;
unsigned int   count = MY_BUFFER_SIZE;
DRV_NVM_BUFFER_HANDLE bufferHandle;

bufferHandle = DRV_NVM_Read(myNVMHandle, &myBuffer[total], srcAddress, count);
if(DRV_NVM_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Do error handling here
}

// Wait till the buffer completes. This should not
// be a while loop if a part of cooperative multi-tasking
// routine. In that case, it should be invoked in task
// state machine.
while(DRV_NVM_BufferStatus(bufferHandle) != DRV_NVM_BUFFER_COMPLETED);
```

5.1.6.7.3.3 DRV_NVM_Tasks Function

C

```
void DRV_NVM_Tasks(
    SYS_MODULE_OBJ object
);
```

Description

This routine is used to maintain the driver's internal write and erase state machine and implement its ISR for interrupt-driven implementations.

Preconditions

The [DRV_NVM_Initialize](#) routine must have been called for the specified NVM driver instance.

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_NVM_Initialize)

Returns

None.

Remarks

This routine is normally not called directly by an application. It is called by the system's Tasks routine ([SYS_Tasks](#)) or by the appropriate raw ISR.

This routine may execute in an ISR context and will never block or access any resources that may cause it to block.

Example

```
SYS_MODULE_OBJ    object;    // Returned from DRV_NVM_Initialize

while (true)
{
    DRV_NVM_Tasks (object);

    // Do other tasks
}
```

5.1.6.7.3.4 DRV_NVM_Write Function

C

```
DRV_NVM_BUFFER_HANDLE DRV_NVM_Write(
    DRV_HANDLE handle,
    uint8_t * destination,
    uint8_t * source,
    const unsigned int nBytes
);
```

Description

This routine writes a block of data to a specified address in memory. It returns a buffer handle that can be queried by the [DRV_NVM_BufferStatus\(\)](#) function to check for completion of the operation. The contents of the source buffer should not be changed while the operation is in progress. The target address should be aligned on a [DRV_NVM_ROW_SIZE](#) byte boundary. The number of bytes to write should be equal to or should be multiples of [DRV_NVM_ROW_SIZE](#).

Preconditions

The [DRV_NVM_Initialize](#) routine must have been called for the specified NVM driver instance.

[DRV_NVM_Open](#) must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_READ or DRV_IO_INTENT_READWRITE must have been specified in the [DRV_NVM_Open](#) call.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
targetBuffer	Buffer in NVM memory where the data from srcAddress will be placed. Should be aligned on a DRV_NVM_ROW_SIZE byte boundary.
srcAddress	The source buffer containing data to programmed into NVM
numbytes	Total number of bytes that need to be written to the NVM. This should be equal to or a multiple of DRV_NVM_ROW_SIZE .

Returns

[DRV_NVM_BUFFER_HANDLE_INVALID](#) in case the operation was not successful. A valid handle otherwise.

Remarks

If the DRV_IO_INTENT_BLOCKING flag was given in the call to the [DRV_NVM_Open](#) routine and the driver was built to support blocking behavior the call will block until the operation is complete.

If the DRV_IO_INTENT_NONBLOCKING flag was given in the call to the [DRV_NVM_Open](#) routine or the driver was built to only support non-blocking behavior the call will return immediately.

Example

```
DRV_HANDLE    handle;    // Returned from DRV_NVM_Open
char          myBuffer[2 * DRV_NVM_ROW_SIZE];

// Destination address should be row aligned.
char          *destAddress = (char *)NVM_BASE_ADDRESS_TO_WRITE;

unsigned int   count = 2 * MY_BUFFER_SIZE;
DRV_NVM_BUFFER_HANDLE bufferHandle;

bufferHandle = DRV_NVM_Write(myNVMHandle, destAddress, &myBuffer[total], count);
if(DRV_NVM_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Do error handling here
}

// Wait till the buffer completes. This should not
// be a while loop if a part of cooperative multi-tasking
// routine. In that case, it should be invoked in task
// state machine.
while(DRV_NVM_BufferStatus(bufferHandle) != DRV_NVM_BUFFER_COMPLETED);
```

5.1.6.7.4 Client Basic Functions

5.1.6.7.5 Miscellaneous Functions

5.1.6.7.5.1 DRV_NVM_BufferStatus Function

C

```
DRV_NVM_BUFFER_STATUS DRV_NVM_BufferStatus(
    DRV_HANDLE handle,
    const DRV_HANDLE bufferHandle
);
```

Description

This routine gets the current status of the buffer. The application must use this routine in case a polling based implementation is desired.

Preconditions

The [DRV_NVM_Initialize](#) routine must have been called.

[DRV_NVM_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Returns

A [DRV_NVM_BUFFER_STATUS](#) value describing the current status of the buffer

Remarks

This routine will not block for hardware access and will immediately return the current status.

Example

```
DRV_HANDLE      handle;           // Returned from DRV_NVM_Open
DRV_HANDLE      bufferHandle;
DRV_NVM_BUFFER_STATUS status;

status = DRV_NVM_BufferStatus(handle, bufferHandle);
if(status == DRV_NVM_BUFFER_COMPLETED)
{
    // Operation Done
}
```

5.1.6.7.6 Data Types and Constants

5.1.6.7.6.1 DRV_NVM_BUFFER_HANDLE_INVALID Macro

C

```
#define DRV_NVM_BUFFER_HANDLE_INVALID
```

Description

NVM Driver Buffer Invalid Handle

This value defines the NVM Driver Buffer Invalid handle. This value is returned by read/write/erase routines when the desired operation could not be completed.

Remarks

None.

5.1.6.7.6.2 DRV_NVM_INDEX_0 Macro

C

```
#define DRV_NVM_INDEX_0 0
```

Description

Driver NVM Module Index reference

These constants provide NVM driver index definitions.

Remarks

These constants should be used in place of hard-coded numeric literals.

These values should be passed into the [DRV_NVM_Initialize](#) and [DRV_NVM_Open](#) routines to identify the driver instance in use.

5.1.6.7.6.3 DRV_NVM_INDEX_COUNT Macro**C**

```
#define DRV_NVM_INDEX_COUNT 1
```

Description

NVM Driver Module Index Count

This constant identifies NVM driver index definitions.

Remarks

This constant should be used in place of hard-coded numeric literals. This value is part-specific.

5.1.6.7.6.4 DRV_NVM_BUFFER_HANDLE Type**C**

```
typedef uintptr_t DRV_NVM_BUFFER_HANDLE;
```

Description

NVM Driver Buffer Handle

This type defines the NVM Driver Buffer handle.

Remarks

None.

5.1.6.7.6.5 DRV_NVM_BUFFER_STATUS Enumeration**C**

```
typedef enum {
    DRV_NVM_BUFFER_COMPLETED = 0,
    DRV_NVM_BUFFER_QUEUED = 1,
    DRV_NVM_BUFFER_IN_PROGRESS = 2,
    DRV_NVM_BUFFER_ERROR_UNKNOWN = -1
} DRV_NVM_BUFFER_STATUS;
```

Description

NVM Driver Buffer Status

This type specifies the status of the buffer for the read, write and erase operations.

Members

Members	Description
DRV_NVM_BUFFER_COMPLETED = 0	Done OK and ready
DRV_NVM_BUFFER_QUEUED = 1	Scheduled but not started
DRV_NVM_BUFFER_IN_PROGRESS = 2	Currently being in transfer
DRV_NVM_BUFFER_ERROR_UNKNOWN = -1	Unknown buffer

Remarks

None.

5.1.6.7.6.6 DRV_NVM_CLIENT_STATUS Enumeration

C

```
typedef enum {
    DRV_NVM_CLIENT_STATUS_READY,
    DRV_NVM_CLIENT_STATUS_BUSY,
    DRV_NVM_WRITE_TERMINATED,
    DRV_NVM_ERASE_TERMINATED,
    DRV_NVM_LOW_VOLTAGE_ERROR,
    DRV_NVM_LOW_VOLTAGE_DETECT_ERROR,
    DRV_NVM_STATUS_INVALID
} DRV_NVM_CLIENT_STATUS;
```

Description

NVM Client Status

Defines the various client status codes.

Members

Members	Description
DRV_NVM_CLIENT_STATUS_READY	Up and running, ready to start new operations
DRV_NVM_CLIENT_STATUS_BUSY	Operation in progress, unable to start a new one
DRV_NVM_WRITE_TERMINATED	Write operation terminated Occured
DRV_NVM_ERASE_TERMINATED	Erase operation terminated Occured
DRV_NVM_LOW_VOLTAGE_ERROR	Low voltage Error
DRV_NVM_LOW_VOLTAGE_DETECT_ERROR	Low voltage Error
DRV_NVM_STATUS_INVALID	Client Invalid

Remarks

None

5.1.6.7.6.7 DRV_NVM_INIT Structure

C

```
typedef struct {
    SYS_MODULE_INIT moduleInit;
    NVM_MODULE_ID nvmID;
    INT_SOURCE interruptSource;
} DRV_NVM_INIT;
```

Description

NVM Driver Initialization Data

This data type defines the data required to initialize or reinitialize the NVM driver.

Members

Members	Description
SYS_MODULE_INIT moduleInit;	System module initialization
NVM_MODULE_ID nvmID;	Identifies NVM hardware module (PLIB-level) ID
INT_SOURCE interruptSource;	Interrupt Source for Write Interrupt

Remarks

Not all the init features are available for all the microcontrollers

5.1.6.7.6.8 DRV_NVM_INDEX_1 Macro**C**

```
#define DRV_NVM_INDEX_1 1
```

Description

This is macro DRV_NVM_INDEX_1.

5.1.6.8 Files**Files**

Name	Description
drv_nvm.h	NVM Driver Interface Definition
drv_nvm_config_template.h	NVM driver configuration definitions template

Description**5.1.6.8.1 drv_nvm.h**

NVM Driver Interface Definition

The NVM device driver provides a simple interface to manage the NVM modules on Microchip microcontrollers. This file defines the interface definition for the NVM driver.

Enumerations

	Name	Description
	DRV_NVM_BUFFER_STATUS	Specifies the status of the buffer for the read, write and erase operations.
	DRV_NVM_CLIENT_STATUS	Defines the client status

Functions

	Name	Description
	DRV_NVM_BufferStatus	Gets the current status of the buffer.
	DRV_NVM_ClientStatus	Gets current client-specific status the NVM driver
	DRV_NVM_Close	Closes an opened-instance of the NVM driver
	DRV_NVM_Deinitialize	Deinitializes the specified instance of the NVM driver module
	DRV_NVM_Erase	Erase the specified number of pages in flash memory.
	DRV_NVM_Initialize	Initializes the NVM instance for the specified driver index
	DRV_NVM_Open	Opens the specified timer driver instance and returns a handle to it
	DRV_NVM_Read	Reads a block of data from the specified address in memory.
	DRV_NVM_Status	Gets the current status of the NVM driver module.
	DRV_NVM_Tasks	Maintains the driver's erase and write state machine and implements its ISR.
	DRV_NVM_Write	Write a block of data to a specified address in memory.

Macros

	Name	Description
	<u>DRV_NVM_BUFFER_HANDLE_INVALID</u>	This value defines the NVM Driver Buffer Invalid handle.
	<u>DRV_NVM_INDEX_0</u>	NVM driver index definitions
	<u>DRV_NVM_INDEX_1</u>	This is macro DRV_NVM_INDEX_1.
	<u>DRV_NVM_INDEX_COUNT</u>	Number of valid NVM driver indices

Structures

	Name	Description
	<u>DRV_NVM_INIT</u>	Defines the data required to initialize or reinitialize the NVM driver

Types

	Name	Description
	<u>DRV_NVM_BUFFER_HANDLE</u>	This type defines the NVM Driver Buffer handle.

File Name

drv_nvm.h

Company

Microchip Technology Incorporated

5.1.6.8.2 drv_nvm_config_template.h

NVM Driver Configuration Definitions for the template version

These definitions statically define the driver's mode of operation.

Macros

	Name	Description
	<u>DRV_NVM_BUFFER_OBJECT_NUMBER</u>	Selects the maximum number of buffer objects
	<u>DRV_NVM_CLIENTS_NUMBER</u>	Selects the maximum number of clients
	<u>DRV_NVM_ERASE_SIZE</u>	Specifies the NVM Driver Erase Page Size in bytes.
	<u>DRV_NVM_INSTANCES_NUMBER</u>	Selects the maximum number of Driver instances that can be supported by the dynamic driver.
	<u>DRV_NVM_INTERRUPT_MODE</u>	Macro specifies operation of the driver to be in the interrupt mode or polled mode
	<u>DRV_NVM_ROW_SIZE</u>	Specifies the NVM Driver Program Row Size in bytes.
	<u>DRV_NVM_UNLOCK_KEY1</u>	Specifies the NVM Driver Program Unlock Key 1
	<u>DRV_NVM_UNLOCK_KEY2</u>	Specifies the NVM Driver Program Unlock Key 2

5.1.7 Parallel Master Port (PMP) Driver Library

5.1.7.1 Introduction

PMP Driver Library
for
Microchip Microcontrollers

This library provides an interface to manage the Parallel Master Port (PMP) module on Microchip family of microcontrollers in different modes of operation.

Description

The Parallel Master Port (PMP) is a parallel 8-bit/16-bit I/O module specifically designed to communicate with a wide variety of parallel devices such as communications peripherals, LCDs, external memory devices and microcontrollers. Because the interfaces to parallel peripherals vary significantly, the PMP module is highly configurable.

The following figure shows a generic block diagram of the ways PMP module can be used:

PMP module can be used in different modes. Master and Slave are the two modes which can further have sub-modes depending on the different microcontroller families.

Master Mode: In master mode, the PMP module can provide a 8-bit or 16-bit data bus, up to 16 bits of address, and all the necessary control signals to operate a variety of external parallel devices such as memory devices, peripherals and slave microcontrollers. The PMP master modes provide a simple interface for reading and writing data, but not executing program instructions from external devices, such as SRAM or Flash memories.

Slave Mode: Slave modes support 8-bit data only and the module control pins are automatically dedicated when this mode is selected.

5.1.7.2 Release Notes

MPLAB Harmony Version: v0.70b **PMP Driver Library Version :** 0.01 **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.1.7.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.1.7.4 Using the Library

This topic describes the basic architecture of the PMP Driver Library and provides information and examples on how to use it.

Interface Header File: [drv_pmp.h](#)

The interface to the PMP Driver library is defined in the "[drv_pmp.h](#)" header file. This file is included by the "drv.h" file. Any C language source (.c) file that uses the PMP Driver Library should include "drv.h".

Library File: The PMP Driver Library archive (.a) file installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the driver interacts with the framework.

5.1.7.4.1 Abstraction Model

This library provides a low-level abstraction of the Parallel Master Port (PMP) module on Microchip's microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Description**Hardware Abstraction Model Description**

The PMP module provides interface routines to interact with external peripherals such as LCD, EEPROM, Flash memory, etc., as shown in the following diagram. The diagram shows the PMP module acting as a master. The PMP module can be easily configured to act as a slave. The address and data lines can be multiplexed to suit the application. The address and data buffers are up to 2-byte (16-bit) buffers for data transmitted or received by the parallel interface to the PMP bus over the data and address lines synchronized with control logic including the read and write strobe.

PMP Hardware Abstraction Model Diagram

The desired timing wait states to suit different peripheral timings can also be programmed using the PMP module.

5.1.7.4.2 Library Overview

Refer to the section [Driver Overview](#) for how the driver operates in a system.

The library interface routines are divided into various sub-sections, each sub-section addresses one of the blocks or the overall operation of the PMP module.

Library Interface Section	Description
System Functions	Provides system module interfaces, device initialization, deinitialization, re-initialization, tasks, and status functions.
Client Interaction Functions	Provides open, close, client status and client mode configuration functions.
Client Transfer Functions	Provides interface for data transfer in master and slave mode.
Miscellaneous	Provides driver miscellaneous functions, version identification functions etc.

5.1.7.4.3 How the Library Works

This section describes how the PMP Driver Library operates.

Description

Before the driver is ready for use, it should be configured (compile time configuration). Refer to the [Configuring the Library](#) section for more details on how to configure the driver.

There are few run-time configuration items that are done during initialization of the driver instance, and a few that are client-specific and are done using dedicated functions.

To use the PMP Driver, initialization and client functions should be invoked in a specific sequence to ensure correct operation.

The following is the sequence in which various routines should be called:

1. Call `DRV_PMP_Init` to initialize the PMP Driver. Note that this may be performed by the MPLAB Harmony system module. The `DRV_PMP_Status` function may be used to check the status of the initialization.
2. Once initialization for a particular driver instance is done, the client wanting to use the driver can open it using API `DRV_PMP_Open`.
3. The `DRV_PMP_ModeConfig` function should now be called, which will configure the driver for the exact mode of operation required by that client.

4. After configuring the mode, [DRV_PMP_Write](#) and/or [DRV_PMP_Read](#) can be called by the user application to Write/Read using the PMP module. Calling these functions does not start the PMP transfer immediately in non-interrupt mode. Instead, all of these transfer tasks are queued in an internal queue. Actual transfer starts only when the PMP Task function is called by the system/user. In interrupt mode, although transfer tasks are queued, the actual transfer starts immediately.
5. PMP Write and Read functions return an ID of that particular transfer, which should be saved by user to get the status of that transfer later.
6. The system will either call [DRV_PMP_Tasks](#) from the System Task Service (in a polled environment), or it will be called from interrupt service routine of the PMP.
7. At any time status of the transfer can be obtained by using [DRV_PMP_TransferStatus](#).

Note: Not all modes are available on all devices. Please refer to the specific device data sheet to determine the supported modes.

5.1.7.4.3.1 System Initialization

This section describes initialization and reinitialization features.

Description

Initialization and Reinitialization

The system performs the initialization and the reinitialization of the device driver with settings that affect only the instance of the device that is being initialized or reinitialized. During system initialization each instance of the PMP device will be initialized with the following configuration settings:

Initialization member	Description
moduleInit	System module initialization of the power state.
pmpId	PMP hardware module ID (peripheral library-level ID).
stopInIdle	Decide whether or not the module should be stopped in Idle mode.
muxMode	To select one of the different multiplexing modes possible for PMP module.
inputBuffer	Select the type of Input Buffer will be of TTL or Schmitt Trigger.
polarity	Select polarity of different PMP pins.
ports	Set the pins the user wants to use as port or PMP pins.

The [DRV_PMP_Initialize](#) function returns an object handle of the type [SYS_MODULE_OBJ](#). After this, the object handle returned by the initialize interface would be used by the other system interfaces, such as [DRV_PMP_Reinitialize](#), [DRV_PMP_Deinitialize](#), [DRV_PMP_Status](#), and [DRV_PMP_Tasks](#).

Example for PMP Initialization Through the [DRV_PMP_INIT](#) Structure

```

DRV_PMP_INIT    init;
SYS_MODULE_OBJ  object;
SYS_STATUS      pmpStatus;

// populate the PMP init configuration structure
init.inputBuffer = PMP_INPUT_BUFFER_TTL;
init.polarity.addressLatchPolarity = PMP_POLARITY_ACTIVE_HIGH;
init.polarity.rwStrobePolarity = PMP_POLARITY_ACTIVE_LOW;
init.polarity.writeEnableStrobePolarity = PMP_POLARITY_ACTIVE_LOW;
init.polarity.chipselect1Polarity = PMP_POLARITY_ACTIVE_HIGH;
init.polarity.chipselect2Polarity = PMP_POLARITY_ACTIVE_LOW;
init.ports.addressPortsMask = PMP_PMA0_PORT | PMP_PMA1_PORT | PMP_PMA2_TO_PMA13_PORTS |
PMP_PMA14_PORT;
init.ports.readWriteStrobe = PORT_ENABLE;
init.ports.writeEnableStrobe = PORT_ENABLE;

```

```

    init.moduleInit.value = SYS_MODULE_POWER_RUN_FULL;
    init.pmpID            = PMP_ID_0;
    init.stopInIdle       = false;
    init.muxMode          = PMP_MUX_NONE;

    object = DRV_PMP_Initialize (DRV_PMP_INDEX_0, (SYS_MODULE_INIT *)&init);

    pmpStatus = DRV_PMP_Status(object);

    if ( SYS_STATUS_READY != pmpStatus)
    {
        // Handle error
    }

```

Deinitialization

Once the initialize operation has been called, the deinitialize operation must be called before the initialize operation can be called again. This routine may block if the driver is running in an OS environment that supports blocking operations and the driver requires system resources access. However, the function will never block for hardware PMP access. If the operation requires time to allow the hardware to complete, which will be reported by [DRV_PMP_Status](#).

Status

PMP status is available to query the module state before, during and after initialization, deinitialization, and reinitialization.

Tasks Routine

The [DRV_PMP_Tasks](#) function will see the queue status and perform the task of transferring the data accordingly. In the Blocking mode when interrupts are disabled, it will finish one of the tasks completely (that means emptying one space in queue), and then return back. Whereas in Non-Blocking mode, it will return back just after starting one word (8-bit or 16-bit) of transfer (may not be emptying one space in the queue, as that task may not be completely finished).

The [DRV_PMP_Tasks](#) function can be called in two ways:

- By the system task service in a polled environment
- By the interrupt service routine of the PMP in an interrupt-based system

Example: Polling

```

int main( void )
{
    SYS_MODULE_OBJ object;
    object = DRV_PMP_Initialize( DRV_PMP_INDEX_0, (SYS_MODULE_INIT *) &initConf );

    if( SYS_STATUS_READY != DRV_PMP_Status( object ) )
        return 0;

    while (1)
    {
        DRV_PMP_Tasks (object);
    }
}

```

Example: Interrupt

```

int main( void )
{
    SYS_MODULE_OBJ object;
    object = DRV_PMP_Initialize( DRV_PMP_INDEX_0, (SYS_MODULE_INIT *) &initConf );

    if( SYS_STATUS_READY != DRV_PMP_Status( object ) )
        return 0;

    while (1);
}

```

```

}

/* Sample interrupt routine not specific to any device family */
void ISR PMPInterrupt(void)
{
    //Call the PMP Tasks routine
    DRV_PMP_Tasks(object);
}

```

Note: A PMP transfer in Blocking mode in an interrupt environment is not supported.

5.1.7.4.3.1.1 Transfer Operation

This section describes transfer operation.

Description

Once the PMP Driver is open and configured for a client, it is set to start Reading/Writing through [DRV_PMP_Read](#) and [DRV_PMP_Write](#). However, these functions will not directly start reading or writing. These will just put the relevant information in a queue in non-interrupt mode and return an ID that can be used later for checking the transfer status. In Interrupt mode, the Read/Write functions will trigger the transfer immediately after storing the transfer information in the queue.

The user must use a buffer pointing to character for data values.

The repeatCount parameter allows the user to repeatedly write the same nBytes of data into the slave devices.

Example:

```

unsigned char myReadBuffer[300], myWriteBuffer[100]; // has to be 'char' arrays
uint32_t deviceAddress, nBytes, repeatCount, i;
uint32_t writeID, readID;
DRV_HANDLE handle;

//initialize, open and configure the driver/client
/* ... */

deviceAddress = 0x0206;
nBytes = 100;
repeatCount = 0x01;
for (i=0; i<nBytes; i++)
{
    myWriteBuffer[i]=i*5+7;
}

/* it will write 100 bytes of data in the location starting from 0x0206 and then it will repeat
   writing the same set of data in next 100 location starting from 0x206+100 for 8 bit data mode
   and 50 location starting from 0x206+50 for 16 bit data mode. */
writeID = DRV_PMP_Write ( handle, deviceAddress, &myWriteBuffer[0], nBytes, repeatCount);

// it will read 300 locations starting from 0x0206 into myReadBuffer
readID = DRV_PMP_Read ( handle, deviceAddress, &myReadBuffer[0], nBytes);

```

Transfer Status

The status of the read/write transfers can be obtained using API [DRV_PMP_TransferStatus](#).

Example:

```

DRV_PMP_TRANSFER_STATUS writeStatus, readStatus;
uint32_t writeID, readID;

writeStatus = DRV_PMP_TransferStatus( DRV_PMP_INDEX_0, writeID);
readStatus = DRV_PMP_TransferStatus( DRV_PMP_INDEX_0, readID);

```

5.1.7.4.3.1.2 Client Operation

This section describes general client operation.

Description

General Client Operation

For the application to start using an instance of the module, it must call the [DRV_PMP_Open](#) function with a specific intent. This provides the configuration required to open the PMP instance for operation. If the driver is deinitialized using the function [DRV_PMP_Deinitialize](#), the application must call the [DRV_PMP_Open](#) function again to set up the instance of the PMP. The function [DRV_PMP_Open](#) need not be called again if the system is reinitialized using the [DRV_PMP_Reinitialize](#) function.

The PMP driver supports DRV_IO_INTENT_NONBLOCKING, DRV_IO_INTENT_BLOCKING, DRV_IO_INTENT_EXCLUSIVE, and DRV_IO_INTENT_SHARED IO.

Example:

```
DRV_HANDLE handle;

// Open the instance DRV_PMP_INDEX_0 with Non-blocking and Shared intent
handle = DRV_PMP_Open(DRV_PMP_INDEX_0, DRV_IO_INTENT_SHARED | DRV_IO_INTENT_NONBLOCKING);

if( handle == DRV_HANDLE_INVALID )
{
    // Client cannot open the instance.
}
```

The function [DRV_PMP_Close](#) closes an already opened instance of the PMP driver, invalidating the handle. [DRV_PMP_Open](#) must have been called to obtain a valid opened device handle.

Example:

```
DRV_HANDLE handle;

// Open the instance DRV_PMP_INDEX_0 with Non-blocking and Shared intent
handle = DRV_PMP_Open(DRV_PMP_INDEX_0, DRV_IO_INTENT_SHARED | DRV_IO_INTENT_NONBLOCKING);

/*...*/

DRV_PMP_Close( handle );
```

The client has the option to check the status through the function [DRV_PMP_ClientStatus](#).

Example:

```
DRV_HANDLE handle;

// Open the instance DRV_PMP_INDEX_0 with Non-blocking and Shared intent
handle = DRV_PMP_Open(DRV_PMP_INDEX_0, DRV_IO_INTENT_SHARED | DRV_IO_INTENT_NONBLOCKING);

if ( DRV_PMP_CLIENT_STATUS_OPEN != DRV_PMP_ClientStatus( handle ) )
    return 0;
```

Client Mode Setting

Any client-specific PMP configuration has to be done using a separate function, [DRV_PMP_ModeConfig](#). This function must be called after the client is open using [DRV_PMP_Open](#).

Following are the client-specific configuration parameters the user can set using this function:

Configuration Parameter	Description
pmpMode	Selects the PMP mode (master or slave) to use.

intMode	Selects the interrupt mode to use.
incrementMode	Sets up address for either auto-increment or decrement mode.
endianMode	Sets Little/Big endian mode.
portSize	Specifies the data width (8-bit or 16-bit).
waitStates	Selects the different wait states.
chipSelect	Selects the Chip Select line.

Example:

```

DRV_HANDLE handle;
DRV_PMP_MODE_CONFIG config;

config.chipSelect = PMCS1_AND_PMCS2_AS_CHIP_SELECT;
config.endianMode = LITTLE_ENDIAN;
config.incrementMode = PMP_ADDRESS_AUTO_INCREMENT;
config.intMode = PMP_INTERRUPT_NONE;
config.pmpMode = PMP_MASTER_READ_WRITE_STROBES_INDEPENDENT; //Master Mode 2
config.portSize = PMP_DATA_SIZE_8_BITS;
config.waitStates.dataHoldWait = PMP_DATA_HOLD_2;
config.waitStates.dataWait = PMP_DATA_WAIT_THREE;
config.waitStates.strobeWait = PMP_STROBE_WAIT_5;

// Open the instance DRV_PMP_INDEX_0 with Non-blocking and Shared intent
handle = DRV_PMP_Open(DRV_PMP_INDEX_0, DRV_IO_INTENT_SHARED | DRV_IO_INTENT_NONBLOCKING);

// Configure the client
DRV_PMP_ModeConfig ( handle, config );

```

5.1.7.4.3.1.3 Example Code for Complete Operation

A code example of complete operation is provided in this section.

Description

This example code will write 100 bytes of data twice (i.e., repeat once) in the memory location starting from 0x0206, and then it will be read in the buffer, myReadBuffer. The modes selected for this transfer are:

- Non-Blocking
- No Interrupt
- PMP Master Mode 2
- Address Auto-increment
- No Address/Data Lines Multiplexing
- 8-bit data

Example:

```

void main(void)
{
    DRV_PMP_INIT      init;
    SYS_MODULE_OBJ    object;
    SYS_STATUS        pmpStatus;
    DRV_HANDLE        handle;
    DRV_PMP_MODE_CONFIG config;
    unsigned char myReadBuffer[300], myWriteBuffer[100];
    uint32_t deviceAddress, nBytes, repeatCount, i;
    uint32_t writeID, readID;
    DRV_PMP_TRANSFER_STATUS writeStatus=0, readStatus=0;

```

```

// populate the PMP init configuration structure
init.inputBuffer = PMP_INPUT_BUFFER_TTL;
init.polarity.addressLatchPolarity = PMP_POLARITY_ACTIVE_HIGH;
init.polarity.rwStrobePolarity = PMP_POLARITY_ACTIVE_LOW;
init.polarity.writeEnableStrobePolarity = PMP_POLARITY_ACTIVE_LOW;
init.polarity.chipselect1Polarity = PMP_POLARITY_ACTIVE_HIGH;
init.polarity.chipselect2Polarity = PMP_POLARITY_ACTIVE_LOW;
init.ports.addressPortsMask = PMP_PMA0_PORT | PMP_PMA1_PORT | PMP_PMA2_TO_PMA13_PORTS;
init.ports.readWriteStrobe = PORT_ENABLE;
init.ports.writeEnableStrobe = PORT_ENABLE;
init.moduleInit.value = SYS_MODULE_POWER_RUN_FULL;
init.pmpID = PMP_ID_0;
init.stopInIdle = false;
init.muxMode = PMP_MUX_NONE;

object = DRV_PMP_Initialize (DRV_PMP_INDEX_0, (SYS_MODULE_INIT *)&init);

pmpStatus = DRV_PMP_Status(object);

if ( SYS_STATUS_READY != pmpStatus)
{
    // Handle error
}

// Open the instance DRV_PMP_INDEX_0 with Non-blocking and Shared intent
handle = DRV_PMP_Open(DRV_PMP_INDEX_0, DRV_IO_INTENT_SHARED | DRV_IO_INTENT_NONBLOCKING);

if( handle == DRV_HANDLE_INVALID )
{
    // Client cannot open the instance.
}

config.chipSelect = PMCS1_AND_PMCS2_AS_CHIP_SELECT;
config.endianMode = LITTLE_ENDIAN;
config.incrementMode = PMP_ADDRESS_AUTO_INCREMENT;
config.intMode = PMP_INTERRUPT_NONE;
config.pmpMode = PMP_MASTER_READ_WRITE_STROBES_INDEPENDENT; //Master Mode 2
config.portSize = PMP_DATA_SIZE_8_BITS;
config.waitStates.dataHoldWait = PMP_DATA_HOLD_2;
config.waitStates.dataWait = PMP_DATA_WAIT_THREE;
config.waitStates.strobeWait = PMP_STROBE_WAIT_5;

// Configure the client
DRV_PMP_ModeConfig ( handle, config );

deviceAddress = 0x0206;
nBytes = 100;
repeatCount = 0x01;
for (i=0; i<nBytes; i++)
{
    myWriteBuffer[i]=i*5+7;
}

writeID = DRV_PMP_Write ( handle, deviceAddress, &myWriteBuffer[0], nBytes, repeatCount);
readID = DRV_PMP_Read ( handle, deviceAddress, &myReadBuffer[0], nBytes*2);

while(!((writeStatus == PMP_TRANSFER_FINISHED)&&(readStatus == PMP_TRANSFER_FINISHED)))
{
    DRV_PMP_Tasks (object);

    writeStatus = DRV_PMP_TransferStatus( DRV_PMP_INDEX_0, writeID);
    readStatus = DRV_PMP_TransferStatus( DRV_PMP_INDEX_0, readID);
}

while(1);

```

```
}

```

5.1.7.5 Configuring the Library

Macros

	Name	Description
	DRV_PMP_CLIENTS_NUMBER	Selects the maximum number of clients.
	DRV_PMP_INSTANCES_NUMBER	Selects the maximum number of hardware instances that can be supported by the dynamic driver.
	DRV_PMP_QUEUE_SIZE	PMP queue size for different instances.

Description

The configuration of the PMP driver is based on the file [drv_pmp_config.h](#)

This header file contains the configuration selection for the PMP Driver. Based on the selections made, the PMP Driver will support or not support selected features. These configuration settings will apply to all instances of the PMP Driver.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.1.7.5.1 DRV_PMP_CLIENTS_NUMBER Macro

C

```
#define DRV_PMP_CLIENTS_NUMBER 2
```

Description

PMP maximum number of clients

This definition select the maximum number of clients that the PMP driver can support at run time.

Remarks

None.

5.1.7.5.2 DRV_PMP_INSTANCES_NUMBER Macro

C

```
#define DRV_PMP_INSTANCES_NUMBER 1
```

Description

PMP hardware instance configuration

This definition selects the maximum number of hardware instances that can be supported by the dynamic driver.

Remarks

None.

5.1.7.5.3 DRV_PMP_QUEUE_SIZE Macro

C

```
#define DRV_PMP_QUEUE_SIZE 8
```

Description

PMP queue size

The PMP queue size for a driver instances should be placed here. If more than one driver instance of PMP is present, then all takes the same queue size.

Remarks

All the transfers (Read/Write) first gets queued and gets completed sequentially when Task API is called in a loop. Therefore, the minimum value of this index should be 1.

5.1.7.6 Building the Library

This section list the files that are available in the \src of the PMP driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

5.1.7.7 Library Interface

Data Types and Constants

	Name	Description
	<u>DRV_PMP_INDEX_COUNT</u>	Number of valid PMP driver indices.
	<u>DRV_PMP_CHIPX_STROBE_MODE</u>	PMP writeEnable/ReadWrite strobes.
	<u>DRV_PMP_CLIENT_STATUS</u>	PMP client status definitions.
	<u>DRV_PMP_ENDIAN_MODE</u>	PMP endian modes.
	<u>DRV_PMP_INDEX</u>	PMP driver index definitions.
	<u>DRV_PMP_INIT</u>	Defines the PMP driver initialization data.
	<u>DRV_PMP_MODE_CONFIG</u>	PMP modes configuration.
	<u>DRV_PMP_POLARITY_OBJECT</u>	PMP polarity object.
	<u>DRV_PMP_PORT_CONTROL</u>	PMP port enable/disable definitions.
	<u>DRV_PMP_PORTS</u>	PMP port configuration.
	<u>DRV_PMP_QUEUE_ELEMENT_OBJ</u>	Defines the object for PMP queue element.
	<u>DRV_PMP_TRANSFER_STATUS</u>	Defines the PMP transfer status.
	<u>DRV_PMP_WAIT_STATES</u>	PMP wait states object.
	<u>QUEUE_ELEMENT_OBJECT</u>	Defines the structure required for maintaining the queue element.
	<u>MAX_NONBUFFERED_BYTE_COUNT</u>	After this number the PMP transfer should be polled to gurantee data trasnfer
	<u>DRV_PMP_TRANSFER_TYPE</u>	This is type DRV_PMP_TRANSFER_TYPE.

Client Interaction Functions

	Name	Description
	<u>DRV_PMP_ClientStatus</u>	Gets the current client-specific status of the PMP driver.
	<u>DRV_PMP_Close</u>	Closes an opened instance of the PMP driver.
	<u>DRV_PMP_ModeConfig</u>	Configure the PMP modes.
	<u>DRV_PMP_Open</u>	Opens the specified PMP driver instance and returns a handle to it.
	<u>DRV_PMP_Read</u>	Read the data from external device.
	<u>DRV_PMP_Write</u>	Transfers the data from the MCU to the external device.

Client Transfer Functions

	Name	Description
	DRV_PMP_TransferStatus	Returns the transfer status.

Miscellaneous Functions

	Name	Description
	DRV_PMP_VersionGet	Gets the PMP driver version in numerical format.
	DRV_PMP_VersionStrGet	Gets the PMP driver version in string format.

System Functions

	Name	Description
	DRV_PMP_Deinitialize	Deinitializes the specified instance of the PMP driver module
	DRV_PMP_Initialize	Initializes the PMP driver.
	DRV_PMP_Reinitialize	Reinitializes the driver and refreshes any associated hardware settings.
	DRV_PMP_Status	Provides the current status of the PMP driver module.
	DRV_PMP_Tasks	Maintains the driver's state machine and implements its ISR.

Description

This section describes the Application Programming Interface (API) functions of the PMP Driver.

Refer to each section for a detailed description.

5.1.7.7.1 System Functions**5.1.7.7.1.1 DRV_PMP_Deinitialize Function****C**

```
void DRV_PMP_Deinitialize(
    const SYS_MODULE_OBJ pmpDriverObject
);
```

Description

This function deinitializes the specified instance of the PMP driver module, disabling its operation (and any hardware). All internal data is invalidated.

Preconditions

The [DRV_PMP_Initialize](#) function must have been called before calling this routine and a valid [SYS_MODULE_OBJ](#) must have been returned.

Parameters

Parameters	Description
pmpDriverObject	Driver object handle, returned from the DRV_PMP_Initialize

Returns

None.

Remarks

Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again.

This function will NEVER block waiting for hardware. If the operation requires time to allow the hardware to complete, this will be

reported by the [DRV_PMP_Status](#) operation. The system has to use [DRV_PMP_Status](#) to find out when the module is in the ready state.

Example

```
SYS_MODULE_OBJ    pmpDriverObject;    // Returned from DRV_PMP_Initialize
SYS_STATUS        status;

DRV_PMP_Deinitialize(pmpDriverObject);

status = DRV_PMP_Status(pmpDriverObject);
if (SYS_MODULE_DEINITIALIZED == status)
{
    // Check again later if you need to know
    // when the driver is deinitialized.
}
```

5.1.7.7.1.2 DRV_PMP_Initialize Function**C**

```
SYS_MODULE_OBJ DRV_PMP_Initialize(
    const SYS_MODULE_INDEX drvIndex,
    const SYS_MODULE_INIT * const init
);
```

Description

This function initializes the PMP driver, making it ready for clients to open and use it.

Preconditions

None.

Parameters

Parameters	Description
drvIndex	Index for the driver instance to be initialized
init	Pointer to a data structure containing any data necessary to initialize the driver

Returns

If successful, it returns a valid handle to a driver object. Otherwise, it returns [SYS_MODULE_OBJ_INVALID](#). The returned object must be passed as argument to [DRV_PMP_Reinitialize](#), [DRV_PMP_Deinitialize](#), [DRV_PMP_Tasks](#) and [DRV_PMP_Status](#) routines.

Remarks

This function must be called before any other PMP function is called.

This function should only be called once during system initialization unless [DRV_PMP_Deinitialize](#) is called to deinitialize the driver instance.

This function will NEVER block for hardware access. If the operation requires time to allow the hardware to reinitialize, it will be reported by the [DRV_PMP_Status](#) operation. The system must use [DRV_PMP_Status](#) to find out when the driver is in the ready state.

Build configuration options may be used to statically override options in the "init" structure and will take precedence over initialization data passed using this function.

Example

```
DRV_PMP_INIT    init;
SYS_MODULE_OBJ  objectHandle;

// Populate the initialization structure
```

```

init.inputBuffer = PMP_INPUT_BUFFER_TTL;
init.polarity.addressLatchPolarity = PMP_POLARITY_ACTIVE_HIGH;
init.polarity.rwStrobePolarity = PMP_POLARITY_ACTIVE_LOW;
init.polarity.writeEnableStrobePolarity = PMP_POLARITY_ACTIVE_LOW;
init.polarity.chipselect1Polarity = PMP_POLARITY_ACTIVE_HIGH;
init.polarity.chipselect2Polarity = PMP_POLARITY_ACTIVE_LOW;
init.ports.addressPortsMask = PMP_PMA0_PORT | PMP_PMA1_PORT | PMP_PMA2_TO_PMA13_PORTS |
PMP_PMA14_PORT;
init.ports.readWriteStrobe = PORT_ENABLE;
init.ports.writeEnableStrobe = PORT_ENABLE;
init.moduleInit.value = SYS_MODULE_POWER_RUN_FULL;
init.pmpID = PMP_ID_0;
init.stopInIdle = false;
init.muxMode = PMP_MUX_NONE;

// Do something

objectHandle = DRV_PMP_Initialize(DRV_PMP_INDEX_0, (SYS_MODULE_INIT*)&init);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}

```

5.1.7.7.1.3 DRV_PMP_Reinitialize Function

C

```

void DRV_PMP_Reinitialize(
    const SYS_MODULE_OBJ pmpDriverObject,
    const SYS_MODULE_INIT * const init
);

```

Description

This function reinitializes the driver and refreshes any associated hardware settings using the specified initialization data, but it will not interrupt any ongoing operations.

Preconditions

The [DRV_PMP_Initialize](#) function must have been called before calling this function and a valid [SYS_MODULE_OBJ](#) must have been returned.

Parameters

Parameters	Description
pmpDriverObject	Driver object handle, returned from the DRV_PMP_Initialize

Returns

None.

Remarks

This function can be called multiple times to reinitialize the module.

This operation can be used to refresh any supported hardware registers as specified by the initialization data or to change the power state of the module.

This function will NEVER block for hardware access. If the operation requires time to allow the hardware to re-initialize, it will be reported by the [DRV_PMP_Status](#) operation. The system must use [DRV_PMP_Status](#) to find out when the driver is in the ready state.

Build configuration options may be used to statically override options in the "init" structure and will take precedence over initialization data passed using this function.

Example

```

DRV_PMP_INIT    init;
SYS_MODULE_OBJ  pmpDriverObject;
SYS_STATUS      pmpStatus;

// Populate the initialization structure
init.inputBuffer = PMP_INPUT_BUFFER_TTL;
init.polarity.addressLatchPolarity = PMP_POLARITY_ACTIVE_HIGH;
init.polarity.rwStrobePolarity = PMP_POLARITY_ACTIVE_LOW;
init.polarity.writeEnableStrobePolarity = PMP_POLARITY_ACTIVE_LOW;
init.polarity.chipselect1Polarity = PMP_POLARITY_ACTIVE_HIGH;
init.polarity.chipselect2Polarity = PMP_POLARITY_ACTIVE_LOW;
init.ports.addressPortsMask = PMP_PMA0_PORT | PMP_PMA1_PORT | PMP_PMA2_TO_PMA13_PORTS |
PMP_PMA14_PORT;
init.ports.readWriteStrobe = PORT_ENABLE;
init.ports.writeEnableStrobe = PORT_ENABLE;
init.moduleInit.value = SYS_MODULE_POWER_RUN_FULL;
init.pmpID             = PMP_ID_0;
init.stopInIdle        = false;
init.muxMode           = PMP_MUX_NONE;

DRV_PMP_Reinitialize(pmpDriverObject, (SYS_MODULE_INIT*)&init);

pmpStatus = DRV_PMP_Status(pmpDriverObject);
if (SYS_STATUS_BUSY == pmpStatus)
{
    // Check again later to ensure the driver is ready
}
else if (SYS_STATUS_ERROR >= pmpStatus)
{
    // Handle error
}

```

5.1.7.7.1.4 DRV_PMP_Status Function**C**

```

SYS_STATUS DRV_PMP_Status(
    const SYS_MODULE_OBJ pmpDriverObject
);

```

Description

This function provides the current status of the PMP driver module.

Preconditions

The [DRV_PMP_Initialize](#) function must have been called before calling this function.

Parameters

Parameters	Description
pmpDriverObject	Driver object handle, returned from the DRV_PMP_Initialize routine

Returns

SYS_STATUS_READY - Indicates that the driver is busy with a previous system level operation and cannot start another

Remarks

Any value greater than SYS_STATUS_READY is also a normal running state in which the driver is ready to [accept](#) new operations.

SYS_STATUS_BUSY - Indicates that the driver is busy with a previous system level operation and cannot start another

SYS_STATUS_ERROR - Indicates that the driver is in an error state

Any value less than `SYS_STATUS_ERROR` is also an error state.

`SYS_MODULE_DEINITIALIZED` - Indicates that the driver has been deinitialized

This value is less than `SYS_STATUS_ERROR`.

This operation can be used to determine when any of the driver's module level operations has completed.

If the status operation returns `SYS_STATUS_BUSY`, a previous operation has not yet completed. Once the status operation returns `SYS_STATUS_READY`, any previous operations have completed.

The value of `SYS_STATUS_ERROR` is negative (-1). Any value less than that is also an error state.

This function will NEVER block waiting for hardware.

If the Status operation returns an error value, the error may be cleared by calling the reinitialize operation. If that fails, the deinitialize operation will need to be called, followed by the initialize operation to return to normal operations.

Example

```
SYS_MODULE_OBJ    pmpDriverObject;    // Returned from DRV_PMP_Initialize
SYS_STATUS        status;

status = DRV_PMP_Status(pmpDriverObject);
else if (SYS_STATUS_ERROR >= status)
{
    // Handle error
}
```

5.1.7.7.1.5 DRV_PMP_Tasks Function

C

```
void DRV_PMP_Tasks(
    SYS_MODULE_OBJ pmpDriverObject
);
```

Description

This function is used to maintain the queue and execute the tasks stored in the queue. It resides in the ISR of the PMP for interrupt-driven implementations.

Preconditions

The [DRV_PMP_Initialize](#) function must have been called for the specified PMP driver instance.

Parameters

Parameters	Description
pmpDriverObject	Object handle for the specified driver instance (returned from DRV_PMP_Initialize)

Returns

None.

Remarks

This function is normally not called directly by an application. It is called by the system's Tasks routine ([SYS_Tasks](#)) or by the appropriate raw ISR.

This function may excute in an ISR context and will never block or access any resources that may cause it to block.

Example

```
SYS_MODULE_OBJ    pmpDriverObject;    // Returned from DRV_PMP_Initialize

while (true)
{
```

```
    DRV_PMP_Tasks (pmpDriverObject);  
  
    // Do other tasks  
}
```

5.1.7.7.2 Client Interaction Functions

5.1.7.7.2.1 DRV_PMP_ClientStatus Function

C

```
DRV_PMP_CLIENT_STATUS DRV_PMP_ClientStatus(  
    DRV_HANDLE hClient  
);
```

Description

This function gets the client-specific status of the PMP driver associated with the specified handle.

Preconditions

The [DRV_PMP_Initialize](#) routine must have been called.

[DRV_PMP_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
hClient	A valid open-instance handle, returned from the driver's open routine

Returns

A [DRV_PMP_CLIENT_STATUS](#) value describing the current status of the driver.

Remarks

This function will not block for hardware access and will immediately return the current status.

Example

```
DRV_HANDLE hClient; // Returned from DRV_PMP_Open  
DRV_PMP_CLIENT_STATUS pmpClientStatus;  
  
pmpClientStatus = DRV_PMP_ClientStatus(hClient);  
if(DRV_PMP_CLIENT_STATUS_ERROR >= pmpClientStatus)  
{  
    // Handle the error  
}
```

5.1.7.7.2.2 DRV_PMP_Close Function

C

```
void DRV_PMP_Close(  
    const DRV_HANDLE hClient  
);
```

Description

This function closes an opened instance of the PMP driver, invalidating the handle.

Preconditions

The [DRV_PMP_Initialize](#) routine must have been called for the specified PMP driver instance.

[DRV_PMP_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
hClient	A valid open instance handle, returned from the driver's open routine

Returns

None

Remarks

After calling this function, the handle passed in "handle" must not be used with any of the remaining driver routines. A new handle must be obtained by calling [DRV_PMP_Open](#) before the caller may use the driver again.

If DRV_IO_INTENT_BLOCKING was requested and the driver was built appropriately to support blocking behavior call may block until the operation is complete.

If DRV_IO_INTENT_NON_BLOCKING request the driver client can call the [DRV_PMP_Status](#) operation to find out when the module is in the ready state (the handle is no longer valid).

Usually there is no need for the driver client to verify that the Close operation has completed.

Example

```
DRV_HANDLE hClient; // Returned from DRV_PMP_Open

DRV_PMP_Close(hClient);
```

5.1.7.7.2.3 DRV_PMP_ModeConfig Function**C**

```
void DRV_PMP_ModeConfig(
    DRV_HANDLE hClient,
    DRV_PMP_MODE_CONFIG config
);
```

Description

This function configures the modes for client in which it wants to operate. Different master-slave modes, 8/16 data bits selection, address increment/decrement, interrupt mode, wait states, etc., can be configured through this function.

Preconditions

Function [DRV_PMP_Initialize](#) must have been called. [DRV_PMP_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
hClient	Client handle obtained from DRV_PMP_Open API
config	Structure which will have all the required PMP modes configuration

Returns

None.

Remarks

This function will NEVER block waiting for hardware. If this API is called more than once for a particular client handle, previous config setting of that client will be overwritten.

Example

```
DRV_HANDLE hClient;
DRV_PMP_MODE_CONFIG config;
```

```

config.chipSelect = PMCS1_AND_PMCS2_AS_CHIP_SELECT;
config.endianMode = LITTLE_ENDIAN;
config.incrementMode = PMP_ADDRESS_AUTO_INCREMENT;
config.intMode = PMP_INTERRUPT_NONE;
config.pmpMode = PMP_MASTER_READ_WRITE_STROBES_INDEPENDENT;
config.portSize = PMP_DATA_SIZE_8_BITS;
config.waitStates.dataHoldWait = PMP_DATA_HOLD_2;
config.waitStates.dataWait = PMP_DATA_WAIT_THREE;
config.waitStates.strobeWait = PMP_STROBE_WAIT_5;

DRV_PMP_ModeConfig ( hClient, config );

```

5.1.7.7.2.4 DRV_PMP_Open Function

C

```

DRV_HANDLE DRV_PMP_Open(
    const SYS_MODULE_INDEX index,
    const DRV_IO_INTENT intent
);

```

Description

This function opens the specified PMP driver instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver.

Preconditions

The [DRV_PMP_Initialize](#) function must have been called before calling this function.

Parameters

Parameters	Description
drvIndex	Identifier for the object instance to be opened
intent	Zero or more of the values from the enumeration DRV_IO_INTENT ORed together to indicate the intended use of the driver

Returns

If successful, the function returns a valid open-instance handle (a number identifying both the caller and the module instance).

If an error occurs, the return value is [DRV_HANDLE_INVALID](#).

Remarks

The handle returned is valid until the [DRV_PMP_Close](#) routine is called.

This function will NEVER block waiting for hardware.

If the [DRV_IO_INTENT_BLOCKING](#) is requested and the driver was built appropriately to support blocking behavior, other client-level operations may block waiting on hardware until they are complete.

If [DRV_IO_INTENT_NON_BLOCKING](#) is requested the driver client can call the [DRV_PMP_ClientStatus](#) operation to find out when the module is in the ready state.

If the requested intent flags are not supported, the routine will return [DRV_HANDLE_INVALID](#).

Example

```

DRV_HANDLE hClient;

hClient = DRV_PMP_Open(DRV_PMP_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);
if (DRV_HANDLE_INVALID == hClient)
{
    // Unable to open the driver
}

```

5.1.7.7.2.5 DRV_PMP_Read Function

C

```
QUEUE_ELEMENT_OBJECT* DRV_PMP_Read(
    DRV_HANDLE hClient,
    uint32_t address,
    uint16_t* buffer,
    uint32_t nBytes
);
```

Description

This function reads the given number of data bytes from the given address of the external device to the MCU buffer through the selected PMP instance. This function should be used for all the master and slave modes. Proper configuration should be done using [DRV_PMP_ModeConfig](#) before calling this function.

Preconditions

The [DRV_PMP_Initialize](#) routine must have been called. [DRV_PMP_Open](#) must have been called to obtain a valid opened device handle. [DRV_PMP_ModeConfig](#) must have been called to configure the desired mode

Parameters

Parameters	Description
hClient	A valid open-instance handle, returned from the driver's open routine
address	Starting address of the slave device from where data has to be read. It does not have any significance for legacy slave mode and buffer mode. In PMP enhanced slave mode i.e. addressable buffer slave mode, this parameter should be the buffer number to be used.
buffer	Pointer to the buffer into which the data read through the PMP instance will be placed. Even if only one word has to be transferred, pointer should be used.
nBytes	Number of bytes that need to be read through the PMP instance

Returns

Returns the position number of the queue, where the data element was stored. Returns '0' when there is no place in the queue to store the data.

Example

```
DRV_HANDLE hClient; // Returned from DRV_PMP_Open
uint32_t deviceAddress;
uint32_t nBytes;
unsigned char myBuffer[nBytes];
uint32_t transferID;

transferID = DRV_PMP_Read ( hClient, deviceAddress, &myBuffer, nBytes);
```

5.1.7.7.2.6 DRV_PMP_Write Function

C

```
QUEUE_ELEMENT_OBJECT* DRV_PMP_Write(
    DRV_HANDLE* hClient,
    bool address,
    uint32_t * buffer,
    uint32_t nBytes,
    uint32_t repeatCount
);
```

Description

This function transfer the given number of data bytes from the MCU buffer location to the defined address of the external device

through the selected PMP instance. It repeats the operation n (=repeatCount) number of times as well. This function should be used for all the master and slave modes. Proper configuration should be done using [DRV_PMP_ModeConfig](#) before calling this function.

Preconditions

The [DRV_PMP_Initialize](#) routine must have been called. [DRV_PMP_Open](#) must have been called to obtain a valid opened device handle. [DRV_PMP_ModeConfig](#) must have been called to configure the desired mode.

Parameters

Parameters	Description
hClient	A valid open-instance handle, returned from the driver's open routine
address	Starting address of the slave device where data has to be written. It does not have any significance for legacy slave mode and buffer mode. In PMP enhanced slave mode (i.e., addressable buffer slave mode), this parameter should be the buffer number to be used.
buffer	Pointer to MCU Buffer from which the data will be written through the PMP instance. even if only one word has to be tranferred, pointer should be used.
nBytes	Total number of bytes that need to be written through the PMP instance
repeatCount	Number of times the data set (nBytes of data) to be repetedly written. This value should be 0 if user does not want any repetation. If repeatCount is greater than 0, then after writing every nBytes of data, the buffer starts pointing to its first element. Ideally, PMP Address should be in auto increment/decrement mode for repeatCount greater than 0.

Returns

Returns a 32-bit ID with which status of the transfer can be checked later. Returns '0' when there is no place in the queue to store the data.

Example

```
DRV_HANDLE hClient; // Returned from DRV_PMP_Open
uint32_t deviceAddress;
uint32_t nBytes;
unsigned char myBuffer[nBytes];
uint32_t repeatCount;
uint32_t transferID;

transferID = DRV_PMP_MasterWrite ( hClient, deviceAddress, &myBuffer, nBytes, repeatCount);
```

5.1.7.7.3 Client Transfer Functions

5.1.7.7.3.1 DRV_PMP_TransferStatus Function

C

```
DRV_PMP_TRANSFER_STATUS DRV_PMP_TransferStatus(
    QUEUE_ELEMENT_OBJECT* queueObject
);
```

Description

This function returns the status of a particular transfer whose ID has been specified as input.

Parameters

Parameters	Description
drvIndex	Identifier for the object instance to be opened
seqID	A valid ID returned from read/write transfer functions

Returns

A [DRV_PMP_TRANSFER_STATUS](#) value describing the current status of the transfer.

Example

```
uint32_8 seqID;
DRV_PMP_TRANSFER_STATUS transferStatus;

transferStatus = DRV_PMP_TransferStatus( DRV_PMP_INDEX_0, seqID);
```

5.1.7.7.4 Data Types and Constants

5.1.7.7.4.1 DRV_PMP_INDEX_COUNT Macro

C

```
#define DRV_PMP_INDEX_COUNT _PMP_EXISTS
```

Description

PMP Driver Module Index Count

This constant identifies the number of valid PMP driver indices.

Remarks

The value of "_PMP_EXISTS" is derived from device-specific header files defined as part of the peripheral libraries.

5.1.7.7.4.2 DRV_PMP_CHIPX_STROBE_MODE Enumeration

C

```
typedef enum {
    PMP_RW_STROBE_WITH_ENABLE_STROBE,
    PMP_READ_AND_WRITE_STROBES
} DRV_PMP_CHIPX_STROBE_MODE;
```

Description

PMP writeEnable/ReadWrite strobes

This enumeration provides ReadWrite/WriteEnable Strobe definitions.

Members

Members	Description
PMP_RW_STROBE_WITH_ENABLE_STROBE	One strobe for read/write and another for enable
PMP_READ_AND_WRITE_STROBES	Separate strobes for read and write operations

5.1.7.7.4.3 DRV_PMP_CLIENT_STATUS Enumeration

C

```
typedef enum {
    DRV_PMP_CLIENT_STATUS_INVALID,
    PMP_CLIENT_STATUS_CLOSED,
    DRV_PMP_CLIENT_STATUS_OPEN
} DRV_PMP_CLIENT_STATUS;
```

Description

PMP Client Status

This enumeration provides various client status possibilities.

5.1.7.7.4.4 DRV_PMP_ENDIAN_MODE Enumeration

C

```
typedef enum {  
    LITTLE,  
    BIG  
} DRV_PMP_ENDIAN_MODE;
```

Description

PMP Endian modes

This enumeration holds the endian configuration options.

Members

Members	Description
LITTLE	Little Endian
BIG	Big Endian

5.1.7.7.4.5 DRV_PMP_INDEX Enumeration

C

```
typedef enum {  
    DRV_PMP_INDEX_0,  
    DRV_PMP_INDEX_1  
} DRV_PMP_INDEX;
```

Description

PMP Driver Module Index Numbers

These constants provide PMP driver index definitions.

Members

Members	Description
DRV_PMP_INDEX_0	First PMP instance
DRV_PMP_INDEX_1	Second PMP instance (not available for now)

Remarks

These values should be passed into the [DRV_PMP_Initialize](#) and [DRV_PMP_Open](#) functions to identify the driver instance in use.

5.1.7.7.4.6 DRV_PMP_INIT Structure

C

```
typedef struct {  
    SYS_MODULE_INIT moduleInit;  
    PMP_MODULE_ID pmpID;  
    bool stopInIdle;  
    PMP_MUX_MODE muxMode;  
    PMP_INPUT_BUFFER_TYPE inputBuffer;  
    DRV_PMP_POLARITY_OBJECT polarity;  
    DRV_PMP_PORTS ports;  
} DRV_PMP_INIT;
```

Description

PMP Driver Initialize Data

This data type defines data required to initialize or reinitialize the PMP driver.

Members

Members	Description
SYS_MODULE_INIT moduleInit;	module power state info
PMP_MODULE_ID pmpID;	module PLIB ID
bool stopInIdle;	Stop in Idle enable
PMP_MUX_MODE muxMode;	MUX mode
PMP_INPUT_BUFFER_TYPE inputBuffer;	Input buffer type to be used
DRV_PMP_POLARITY_OBJECT polarity;	Polarity settings
DRV_PMP_PORTS ports;	PMP port settings

Remarks

Not all the initialization features are available for all devices.

5.1.7.7.4.7 DRV_PMP_MODE_CONFIG Structure

C

```
typedef struct {
    PMP_OPERATION_MODE pmpMode;
    PMP_INTERRUPT_MODE intMode;
    PMP_INCREMENT_MODE incrementMode;
    DRV_PMP_ENDIAN_MODE endianMode;
    PMP_DATA_SIZE portSize;
    DRV_PMP_WAIT_STATES waitStates;
    PMP_CHIPSELECT_FUNCTION chipSelect;
} DRV_PMP_MODE_CONFIG;
```

Description

PMP modes configuration

This data type controls the configuration of PMP modes.

Members

Members	Description
PMP_OPERATION_MODE pmpMode;	PMP Usage Mode Type
PMP_INTERRUPT_MODE intMode;	Interrupt mode
PMP_INCREMENT_MODE incrementMode;	should be appropriately selected based on read/write requirements and operation mode setting */ address/buffer increment mode
DRV_PMP_ENDIAN_MODE endianMode;	it does not have any significance in PMP slave mode or 8bit data mode */ Endian modes
PMP_DATA_SIZE portSize;	Data Port Size
DRV_PMP_WAIT_STATES waitStates;	Wait states
PMP_CHIPSELECT_FUNCTION chipSelect;	use this when plib is fixed

5.1.7.7.4.8 DRV_PMP_POLARITY_OBJECT Structure

C

```
typedef struct {
    PMP_POLARITY_LEVEL addressLatchPolarity;
    PMP_POLARITY_LEVEL byteEnablePolarity;
    PMP_POLARITY_LEVEL rwStrobePolarity;
    PMP_POLARITY_LEVEL writeEnableStrobePolarity;
```

```

    PMP_POLARITY_LEVEL chipselect1Polarity;
    PMP_POLARITY_LEVEL chipselect2Polarity;
} DRV_PMP_POLARITY_OBJECT;

```

Description

PMP polarity object

This structure holds the polarities of different entities to be configured.

Members

Members	Description
PMP_POLARITY_LEVEL addressLatchPolarity;	Address latch polarity
PMP_POLARITY_LEVEL byteEnablePolarity;	ByteEnable port polarity
PMP_POLARITY_LEVEL rwStrobePolarity;	Read/Write strobe polarity
PMP_POLARITY_LEVEL writeEnableStrobePolarity;	Write/Enable strobe polarity
PMP_POLARITY_LEVEL chipselect1Polarity;	ChipSelect-1 Polarity
PMP_POLARITY_LEVEL chipselect2Polarity;	chipSelect-2 Polarity

5.1.7.7.4.9 DRV_PMP_PORT_CONTROL Enumeration

C

```

typedef enum {
    PORT_ENABLE,
    PORT_DISABLE
} DRV_PMP_PORT_CONTROL;

```

Description

PMP port enable/disable.

This enumeration provides port enable/disable values.

Members

Members	Description
PORT_ENABLE	Enable the given port
PORT_DISABLE	Disable the given port

5.1.7.7.4.10 DRV_PMP_PORTS Structure

C

```

typedef struct {
    PMP_ADDRESS_PORT addressPortsMask;
    PMP_PMBE_PORT byteEnablePort;
    DRV_PMP_PORT_CONTROL readWriteStrobe;
    DRV_PMP_PORT_CONTROL writeEnableStrobe;
} DRV_PMP_PORTS;

```

Description

PMP Ports

This structure holds the ports (including the address ports) to be configured by the application to function as general purpose I/O (GPIO) or part of the PMP.

Members

Members	Description
PMP_ADDRESS_PORT addressPortsMask;	User needs to put the address lines which he wants to use in OR'd fashion */ Address ports
PMP_PMBE_PORT byteEnablePort;	Byte enable ports
DRV_PMP_PORT_CONTROL readWriteStrobe;	READ/WRITE Strobe PORT
DRV_PMP_PORT_CONTROL writeEnableStrobe;	WRITE/ENABLE strobe port

5.1.7.7.4.11 DRV_PMP_QUEUE_ELEMENT_OBJ Type**C**

```
typedef struct _DRV_PMP_QUEUE_ELEMENT_OBJ DRV_PMP_QUEUE_ELEMENT_OBJ;
```

Description

PMP Driver Queue Element Object

This defines the object structure for each queue element of PMP. This object gets created for every Read/Write operations APIs.

Remarks

None

5.1.7.7.4.12 DRV_PMP_TRANSFER_STATUS Enumeration**C**

```
typedef enum {
    MASTER_8BIT_TRANSFER_IN_PROGRESS = PMP_DATA_SIZE_8_BITS,
    MASTER_16BIT_TRANSFER_IN_PROGRESS = PMP_DATA_SIZE_16_BITS,
    MASTER_8BIT_BUFFER_IN_PROGRESS,
    MASTER_16BIT_BUFFER_IN_PROGRESS,
    MASTER_8BIT_BUFFER_CONTINUE,
    QUEUED_BUT_PMP_TRANSFER_NOT_STARTED,
    PMP_TRANSFER_FINISHED
} DRV_PMP_TRANSFER_STATUS;
```

Description

Queue Element Transfer Status

This enumeration defines the PMP transfer status.

5.1.7.7.4.13 DRV_PMP_WAIT_STATES Structure**C**

```
typedef struct {
    PMP_DATA_HOLD_STATES dataHoldWait;
    PMP_STROBE_WAIT_STATES strobeWait;
    PMP_DATA_WAIT_STATES dataWait;
} DRV_PMP_WAIT_STATES;
```

Description

PMP wait states object

This structure holds the different wait states to be configured. Refer to the PMP PLIB help document for the possible values and meaning of the different wait states.

Members

Members	Description
PMP_DATA_HOLD_STATES dataHoldWait;	data hold wait states
PMP_STROBE_WAIT_STATES strobeWait;	read/write strobe wait states
PMP_DATA_WAIT_STATES dataWait;	data wait strobe wait sates

5.1.7.7.4.14 QUEUE_ELEMENT_OBJECT Type**C**

```
typedef struct _QUEUE_ELEMENT_OBJECT QUEUE_ELEMENT_OBJECT;
```

Description

Queue Element Object

This defines the structure required for maintaining the queue element.

Remarks

None

5.1.7.7.4.15 MAX_NONBUFFERED_BYTE_COUNT Macro**C**

```
#define MAX_NONBUFFERED_BYTE_COUNT 4 //After this number the PMP transfer should be polled to  
guarantee data transfer
```

Description

After this number the PMP transfer should be polled to guarantee data transfer

5.1.7.7.4.16 DRV_PMP_TRANSFER_TYPE Enumeration**C**

```
typedef enum {  
    ADDRESS,  
    READ,  
    WRITE,  
    BUFFERED_WRITE  
} DRV_PMP_TRANSFER_TYPE;
```

Description

This is type DRV_PMP_TRANSFER_TYPE.

Members

Members	Description
ADDRESS	PMP Address needs to be updated
READ	PMP Read Transfer
WRITE	PMP Write Transfer
BUFFERED_WRITE	PMP Array Write Transfer

5.1.7.7.5 Miscellaneous Functions

5.1.7.7.5.1 DRV_PMP_VersionGet Function

C

```
unsigned int DRV_PMP_VersionGet(  
    const SYS_MODULE_INDEX drvIndex  
);
```

Description

This function gets the PMP driver version. The version is encoded as major * 10000 + minor * 100 + patch. The stringed version can be obtained using [DRV_PMP_VersionStrGet\(\)](#).

Preconditions

None.

Parameters

Parameters	Description
drvIndex	Identifier for the driver instance to get the version for

Returns

Current driver version in numerical format.

Remarks

None.

Example

```
unsigned int version;  
  
version = DRV_PMP_VersionGet( DRV_PMP_INDEX_0 );  
  
if(version < 110200)  
{  
    // Do Something  
}
```

5.1.7.7.5.2 DRV_PMP_VersionStrGet Function

C

```
char * DRV_PMP_VersionStrGet(  
    const SYS_MODULE_INDEX drvIndex  
);
```

Description

This function gets the PMP driver version. The version is returned as major.minor.path[type], where type is optional. The numerical version can be obtained using [DRV_PMP_VersionGet\(\)](#).

Preconditions

None.

Parameters

Parameters	Description
drvIndex	Identifier for the driver instance to get the version for

Returns

Current PMP driver version in the string format.

Remarks

None.

Example

```
char *version;

version = DRV_PMP_VersionStrGet( DRV_PMP_INDEX_0 );

printf("%s", version);
```

5.1.7.8 Files

Files

Name	Description
drv_pmp.h	Parallel Master Port (PMP) device driver interface file.
drv_pmp_config.h	PMP driver configuration definitions template

Description

5.1.7.8.1 drv_pmp.h

PMP Device Driver Interface

The PMP device driver provides a simple interface to manage the Parallel Master and Slave ports. This file defines the interface definitions and prototypes for the PMP driver.

Enumerations

	Name	Description
	DRV_PMP_CHIPX_STROBE_MODE	PMP writeEnable/ReadWrite strobes.
	DRV_PMP_CLIENT_STATUS	PMP client status definitions.
	DRV_PMP_ENDIAN_MODE	PMP endian modes.
	DRV_PMP_INDEX	PMP driver index definitions.
	DRV_PMP_PORT_CONTROL	PMP port enable/disable definitions.
	DRV_PMP_TRANSFER_STATUS	Defines the PMP transfer status.
	DRV_PMP_TRANSFER_TYPE	This is type DRV_PMP_TRANSFER_TYPE.

Functions

	Name	Description
	DRV_PMP_ClientStatus	Gets the current client-specific status of the PMP driver.
	DRV_PMP_Close	Closes an opened instance of the PMP driver.
	DRV_PMP_Deinitialize	Deinitializes the specified instance of the PMP driver module
	DRV_PMP_Initialize	Initializes the PMP driver.
	DRV_PMP_ModeConfig	Configure the PMP modes.
	DRV_PMP_Open	Opens the specified PMP driver instance and returns a handle to it.
	DRV_PMP_Read	Read the data from external device.
	DRV_PMP_Reinitialize	Reinitializes the driver and refreshes any associated hardware settings.
	DRV_PMP_Status	Provides the current status of the PMP driver module.
	DRV_PMP_Tasks	Maintains the driver's state machine and implements its ISR.

	DRV_PMP_TransferStatus	Returns the transfer status.
	DRV_PMP_VersionGet	Gets the PMP driver version in numerical format.
	DRV_PMP_VersionStrGet	Gets the PMP driver version in string format.
	DRV_PMP_Write	Transfers the data from the MCU to the external device.

Macros

	Name	Description
	DRV_PMP_INDEX_COUNT	Number of valid PMP driver indices.
	MAX_NONBUFFERED_BYTE_COUNT	After this number the PMP transfer should be polled to gurantee data trasnfer

Structures

	Name	Description
	DRV_PMP_INIT	Defines the PMP driver initialization data.
	DRV_PMP_MODE_CONFIG	PMP modes configuration.
	DRV_PMP_POLARITY_OBJECT	PMP polarity object.
	DRV_PMP_PORTS	PMP port configuration.
	DRV_PMP_WAIT_STATES	PMP wait states object.

Types

	Name	Description
	DRV_PMP_QUEUE_ELEMENT_OBJ	Defines the object for PMP queue element.
	QUEUE_ELEMENT_OBJECT	Defines the structure required for maintaining the queue element.

Company

Microchip Technology Inc.

FileName: drv_pmp.h

5.1.7.8.2 drv_pmp_config.h

PMP Driver Configuration Definitions for the Template Version

These definitions statically define the driver's mode of operation.

Macros

	Name	Description
	DRV_PMP_CLIENTS_NUMBER	Selects the maximum number of clients.
	DRV_PMP_INSTANCES_NUMBER	Selects the maximum number of hardware instances that can be supported by the dynamic driver.
	DRV_PMP_QUEUE_SIZE	PMP queue size for different instances.

File Name

5.1.8 Secure Digital (SD) Card Driver Library

5.1.8.1 Introduction

The SD Card driver provides the necessary interfaces to interact with an SD card. It provides the necessary abstraction for the higher layer.

Description

A SD Card is a non-volatile memory (Flash memory) card designed to provide high-capacity memory in a small size. Its applications are like digital video camcorders, digital cameras, handheld computers, audio players and mobile phones.

5.1.8.2 Release Notes

MPLAB Harmony Version: v0.70b **SD Card Library Version :** **Release Date:** 18Nov2013

New This Release:

- Non-blocking operation
- Layered architecture
- Interoperability

Known Issues:

- Tested only with SDHC cards (Card memory more than 2 GB)
- CARD detection mechanism is not so fine-tuned
- Card maximum Frequency detection is not automatic. Different cards will have specific frequency of operation and that needs to be set in `system_config.h`
- Not tested the drivers operation with multiple SD cards
- Timeout and driver reset on failure case is not implemented

5.1.8.3 SW License Agreement

(c) 2013 Microchip Technology Inc. Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.1.8.4 Using the Library

This topic describes the basic architecture of the SD Card Driver Library and provides information and examples on how to use it.

Interface Header File: [drv_sdcard.h](#)

The interface to the SD Card Driver library is defined in the "drv_sdcard.h" header file. This file is included by the "drv.h" file. Any C language source (.c) file that uses the SD Card Driver library should include "drv.h".

Library File:

The SD Card Driver library archive (.a) file installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the Driver interacts with the framework.

5.1.8.4.1 Abstraction Model

SD Card Driver Software Abstraction Block Diagram

- SD Card driver comes in the layer below the Partition Manager in MPLAB Harmony file system architecture.
- It uses the SPI driver to interact with SD card.

5.1.8.4.2 Library Overview

Refer to the section [Driver Overview](#) for how the driver operates in a system.

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the SD Card module.

Library Interface Section	Description
System Level Functions	Includes functions for initialize the module.
Client Level Functions	Functions to open and close a client.
Operation Functions	Functions for read and write operations
Module Information Functions	Functions for information about the module.
Version Information Functions	Functions to get the software version.

5.1.8.4.3 How the Library Works

Note: Not all modes are available on all devices. Please refer to the specific device data sheet to determine the supported modes.

5.1.8.5 Configuring the Library

The configuration of the SD Card driver is based on the file `sys_config.h`.

This header file contains the configuration selection for the SD Card driver. Based on the selections made, the SD Card driver will support or not support selected features. These configuration settings will apply to all instances of the SD Card.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.1.8.6 Building the Library

This section lists the files that are available in the `\src` of the SD Card driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

5.1.8.7 Library Interface

Data Types and Constants

	Name	Description
	DRV_SDCARD_INDEX_0	SD Card driver index definitions
	DRV_SDCARD_INDEX_COUNT	Number of valid SD Card driver indices
	DRV_SDCARD_BUFFER_HANDLE	Handle to a buffer added to the process queue.
	DRV_SDCARD_CLIENT_STATUS	Identifies the client-specific status of the SD card driver
	DRV_SDCARD_INIT	Contains all the data necessary to initialize the SD Card device
	SYS_MEDIA_EVENT	Defines the buffer status
	SDCARD_MAX_LIMIT	Maximum allowed SD card instances
	DRV_SDCARD_INDEX_1	This is macro <code>DRV_SDCARD_INDEX_1</code> .
	DRV_SDCARD_INDEX_2	This is macro <code>DRV_SDCARD_INDEX_2</code> .
	DRV_SDCARD_INDEX_3	This is macro <code>DRV_SDCARD_INDEX_3</code> .

Client Level Functions

	Name	Description
	DRV_SDCARD_ClientStatus	Gets current client-specific status the SD Card driver
	DRV_SDCARD_Close	Closes an opened-instance of the SD Card driver
	DRV_SDCARD_Open	Opens the specified SD Card driver instance and returns a handle to it

Module Information Functions

	Name	Description
	DRV_SDCARD_SectorsCountGet	Gets the number of sectors present in the selected SD card device.
	DRV_SDCARD_SectorSizeGet	Gets the sector size of the selected SD card device.
	DRV_SDCARD_WriteProtectionIsEnabled	Gets the status of write protection.

Operation Functions

	Name	Description
	DRV_SDCARD_SectorRead	Reads data from the sectors of the SD card.
	DRV_SDCARD_SectorWrite	Writes sector(s) of data to an SD card.

	DRV_SDCARD_BufferStatusGet	Gets the status of an an SD card operation (read/write)
	DRV_SDCARD_MediaStatusGet	Gets the status of the device.

System Level Functions

	Name	Description
	DRV_SDCARD_Deinitialize	Deinitializes the specified instance of the SD Card driver module
	DRV_SDCARD_Initialize	Initializes the SD Card driver
	DRV_SDCARD_Reinitialize	Reinitializes the driver and refreshes any associated hardware settings
	DRV_SDCARD_Status	Provides the current status of the SD Card driver module
	DRV_SDCARD_Tasks	Maintains the driver's state machine

Version Information Functions

	Name	Description
	DRV_SDCARD_VersionGet	Gets SD card driver version in numerical format.
	DRV_SDCARD_VersionStrGet	Gets SD card driver version in string format.

Description

This section describes the Application Programming Interface (API) functions of the SD Card Driver.

Refer to each section for a detailed description.

5.1.8.7.1 System Level Functions

5.1.8.7.1.1 DRV_SDCARD_Deinitialize Function

C

```
void DRV_SDCARD_Deinitialize(
    SYS_MODULE_OBJ object
);
```

Description

Deinitializes the specified instance of the SD Card driver module, disabling its operation (and any hardware). Invalidates all the internal data.

Preconditions

Function [DRV_SDCARD_Initialize](#) must have been called before calling this routine and a valid [SYS_MODULE_OBJ](#) must have been returned.

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_SDCARD_Initialize routine.

Returns

None.

Remarks

Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again.

This routine will NEVER block waiting for hardware. If the operation requires time to allow the hardware to complete, this will be reported by the [DRV_SDCARD_Status](#) operation. The system has to use [DRV_SDCARD_Status](#) to find out when the module is

in the ready state.

Example

```
SYS_MODULE_OBJ    object;    // Returned from DRV_SDCARD_Initialize
SYS_STATUS        status;

DRV_SDCARD_Deinitialize(object);

status = DRV_SDCARD_Status(object);
if (SYS_MODULE_UNINITIALIZED == status)
{
    // Check again later if you need to know
    // when the driver is deinitialized.
}
```

5.1.8.7.1.2 DRV_SDCARD_Initialize Function

C

```
SYS_MODULE_OBJ DRV_SDCARD_Initialize(
    const SYS_MODULE_INDEX index,
    const SYS_MODULE_INIT * const init
);
```

Description

This routine initializes the SD Card driver, making it ready for clients to open and use it.

Preconditions

None.

Parameters

Parameters	Description
drvIndex	Index for the driver instance to be initialized
init	Pointer to a data structure containing any data necessary to initialize the driver. This pointer may be null if no data is required because static overrides have been provided.

Returns

If successful, returns a valid handle to a driver object. Otherwise, it returns [SYS_MODULE_OBJ_INVALID](#). The returned object must be passed as argument to [DRV_SDCARD_Reinitialize](#), [DRV_SDCARD_Deinitialize](#), [DRV_SDCARD_TaskRead](#), [DRV_SDCARD_TaskWrite](#) and [DRV_SDCARD_Status](#) routines.

Remarks

This routine must be called before any other SD Card routine is called.

This routine should only be called once during system initialization unless [DRV_SDCARD_Deinitialize](#) is called to de-initialize the driver instance.

This routine will NEVER block for hardware access. If the operation requires time to allow the hardware to re-initialize, it will be reported by the [DRV_SDCARD_Status](#) operation. The system must use [DRV_SDCARD_Status](#) to find out when the driver is in the ready state.

Build configuration options may be used to statically override options in the "init" structure and will take precedence over initialization data passed using this routine.

Example

```
DRV_SDCARD_INIT    init;
SYS_MODULE_OBJ     objectHandle;
```

```
// Populate the SD Card initialization structure
init.moduleInit.value = SYS_MODULE_POWER_RUN_FULL;
init.baudRate         = 100000;
init.spiId            = SPI_ID_1;

// Do something

objectHandle = DRV_SDCARD_Initialize(DRV_SDCARD_INDEX_0, (SYS_MODULE_INIT*)&init);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}
```

5.1.8.7.1.3 DRV_SDCARD_Reinitialize Function

C

```
void DRV_SDCARD_Reinitialize(
    SYS_MODULE_OBJ object,
    const SYS_MODULE_INIT * const init
);
```

Description

This routine reinitializes the driver and refreshes any associated hardware settings using the initialization data given, but it will not interrupt any ongoing operations.

Preconditions

Function [DRV_SDCARD_Initialize](#) must have been called before calling this routine and a valid [SYS_MODULE_OBJ](#) must have been returned.

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_SDCARD_Initialize routine
init	Pointer to the initialization data structure

Returns

None

Remarks

This function can be called multiple times to reinitialize the module.

This operation can be used to refresh any supported hardware registers as specified by the initialization data or to change the power state of the module.

This routine will NEVER block for hardware access. If the operation requires time to allow the hardware to re-initialize, it will be reported by the [DRV_SDCARD_Status](#) operation. The system must use [DRV_SDCARD_Status](#) to find out when the driver is in the ready state.

Build configuration options may be used to statically override options in the "init" structure and will take precedence over initialization data passed using this routine.

Example

```
DRV_SDCARD_INIT    init;
SYS_MODULE_OBJ     objectHandle;

// Populate the SD Card initialization structure
init.moduleInit.value = SYS_MODULE_POWER_RUN_FULL;
init.baudRate         = 100000;
init.spiId            = SPI_ID_1;
```

```
// Do something
```

5.1.8.7.1.4 DRV_SDCARD_Status Function

C

```
SYS_STATUS DRV_SDCARD_Status(  
    SYS_MODULE_OBJ object  
);
```

Description

This routine provides the current status of the SD Card driver module.

Preconditions

Function [DRV_SDCARD_Initialize](#) must have been called before calling this

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_SDCARD_Initialize routine

Returns

SYS_STATUS_READY - Indicates that the driver is busy with a previous system level operation and cannot start another

Note Any value greater than SYS_STATUS_READY is also a normal running state in which the driver is ready to [accept](#) new operations.

SYS_STATUS_BUSY - Indicates that the driver is busy with a previous system level operation and cannot start another

SYS_STATUS_ERROR - Indicates that the driver is in an error state

Remarks

Any value less than SYS_STATUS_ERROR is also an error state.

SYS_MODULE_DEINITIALIZED - Indicates that the driver has been de-initialized

This value is less than SYS_STATUS_ERROR

The this operation can be used to determine when any of the driver's module level operations has completed.

If the status operation returns SYS_STATUS_BUSY, the a previous operation has not yet completed. Once the status operation returns SYS_STATUS_READY, any previous operations have completed.

The value of SYS_STATUS_ERROR is negative (-1). Any value less than that is also an error state.

This routine will NEVER block waiting for hardware.

If the Status operation returns an error value, the error may be cleared by calling the reinitialize operation. If that fails, the deinitialize operation will need to be called, followed by the initialize operation to return to normal operations.

Example

```
SYS_MODULE_OBJ    object;    // Returned from DRV_SDCARD_Initialize  
SYS_STATUS        status;  
  
status = DRV_SDCARD_Status(object);  
else if (SYS_STATUS_ERROR >= status)  
{  
    // Handle error  
}
```

5.1.8.7.1.5 DRV_SDCARD_Tasks Function

C

```
void DRV_SDCARD_Tasks(  
    SYS_MODULE_OBJ object  
)  
;
```

Description

This routine is used to maintain the driver's internal state machine.

Preconditions

The [DRV_SDCARD_Initialize](#) routine must have been called for the specified SDCARD driver instance.

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_SDCARD_Initialize)

Returns

None

Remarks

This routine is normally not called directly by an application. It is called by the system's Tasks routine ([SYS_Tasks](#)) or by the appropriate raw ISR.

This routine may execute in an ISR context and will never block or access any resources that may cause it to block.

Example

```
SYS_MODULE_OBJ    object;    // Returned from DRV_SDCARD_Initialize  
  
while (true)  
{  
    DRV_SDCARD_Tasks (object);  
  
    // Do other tasks  
}
```

5.1.8.7.2 Client Level Functions

5.1.8.7.2.1 DRV_SDCARD_ClientStatus Function

C

```
DRV_SDCARD_CLIENT_STATUS DRV_SDCARD_ClientStatus(  
    DRV_HANDLE handle  
)  
;
```

Description

This routine gets the client-specific status of the SD Card driver associated with the given handle.

Preconditions

The [DRV_SDCARD_Initialize](#) routine must have been called.

[DRV_SDCARD_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Returns

A [DRV_SDCARD_CLIENT_STATUS](#) value describing the current status of the driver

Remarks

This routine will not block for hardware access and will immediately return the current status.

Example

```
DRV_HANDLE sdcardHandle; // Returned from DRV_SDCARD_Open
DRV_SDCARD_CLIENT_STATUS sdcardClientStatus;

sdcardClientStatus = DRV_SDCARD_ClientStatus ( sdcardHandle );
if ( DRV_SDCARD_CLIENT_STATUS_ERROR >= sdcardClientStatus )
{
    // Handle the error
}
```

5.1.8.7.2.2 DRV_SDCARD_Close Function**C**

```
void DRV_SDCARD_Close(
    DRV_HANDLE handle
);
```

Description

This routine closes an opened-instance of the SD Card driver, invalidating the handle.

Preconditions

The [DRV_SDCARD_Initialize](#) routine must have been called for the specified SD Card driver instance.

[DRV_SDCARD_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Returns

None

Remarks

After calling this routine, the handle passed in "handle" must not be used with any of the remaining driver routines. A new handle must be obtained by calling [DRV_SDCARD_Open](#) before the caller may use the driver again.

If DRV_IO_INTENT_BLOCKING was requested and the driver was built appropriately to support blocking behavior call may block until the operation is complete.

If DRV_IO_INTENT_NON_BLOCKING request the driver client can call the [DRV_SDCARD_Status](#) operation to find out when the module is in the ready state (the handle is no longer valid).

Usually there is no need for the driver client to verify that the Close operation has completed.

Example

```
DRV_HANDLE handle; // Returned from DRV_SDCARD_Open
```

```
DRV_SDCARD_Close ( handle );
```

5.1.8.7.2.3 DRV_SDCARD_Open Function

C

```
DRV_HANDLE DRV_SDCARD_Open(
    const SYS_MODULE_INDEX drvIndex,
    const DRV_IO_INTENT intent
);
```

Description

This routine opens the specified SD Card driver instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver.

Preconditions

Function [DRV_SDCARD_Initialize](#) must have been called before calling this function.

Parameters

Parameters	Description
drvIndex	Identifier for the object instance to be opened
intent	Zero or more of the values from the enumeration DRV_IO_INTENT "or'd" together to indicate the intended use of the driver

Returns

If successful, the routine returns a valid open-instance handle (a number identifying both the caller and the module instance).

If an error occurs, the return value is [DRV_HANDLE_INVALID](#).

Remarks

The handle returned is valid until the [DRV_SDCARD_Close](#) routine is called.

This routine will NEVER block waiting for hardware.

If the DRV_IO_INTENT_BLOCKING is requested and the driver was built appropriately to support blocking behavior, then other client-level operations may block waiting on hardware until they are complete.

If DRV_IO_INTENT_NON_BLOCKING is requested the driver client can call the [DRV_SDCARD_ClientStatus](#) operation to find out when the module is in the ready state.

If the requested intent flags are not supported, the routine will return [DRV_HANDLE_INVALID](#).

Example

```
DRV_HANDLE handle;

handle = DRV_SDCARD_Open ( DRV_SDCARD_INDEX_0, DRV_IO_INTENT_EXCLUSIVE );

if ( DRV_HANDLE_INVALID == handle )
{
    // Unable to open the driver
}
```

5.1.8.7.3 Operation Functions

5.1.8.7.3.1 DRV_SDCARD_SectorRead Function

C

```
SYS_FS_MEDIA_BUFFER_HANDLE DRV_SDCARD_SectorRead(
```

```

    DRV_HANDLE handle,
    uint8_t * buffer,
    uint32_t sector_addr,
    uint32_t sectorCount
);

```

Description

This function reads data from the sectors of the SD card starting from the sector address and stores it in the location pointed by 'buffer'.

Preconditions

The [DRV_SDCARD_Initialize](#) routine must have been called.

[DRV_SDCARD_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
sector_addr	The address of the sector on the card.
sectorCount	Number of sectors to be read.
buffer	The buffer where the retrieved data will be stored. If buffer is NULL, do not store the data anywhere.

Returns

SYS_FS_MEDIA_BUFFER_HANDLE - Buffer handle.

Remarks

This routine will not block for hardware access and will immediately return the current status.

Example

```

SYS_FS_MEDIA_BUFFER_HANDLE bufferHandle;

bufferHandle = DRV_SDCARD_SectorRead ( handle,
                                        , readData //buffer
                                        , 20 // Sector
                                        , 1 // Number of Sectors
                                        );

```

5.1.8.7.3.2 DRV_SDCARD_SectorWrite Function**C**

```

SYS_FS_MEDIA_BUFFER_HANDLE DRV_SDCARD_SectorWrite(
    DRV_HANDLE handle,
    uint32_t sector_addr,
    uint8_t * buffer,
    uint32_t sectorCount
);

```

Description

This function writes sector(s) of data (512 bytes) of data from the location pointed to by 'buffer' to the specified sector of the SD card.

Preconditions

The [DRV_SDCARD_Initialize](#) routine must have been called.

[DRV_SDCARD_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
sector_addr	The address of the sector on the card.
buffer	The buffer with the data to write.

Returns

SYS_FS_MEDIA_BUFFER_HANDLE - Buffer handle.

Remarks

The card expects the address field in the command packet to be a byte address. The sector_addr value is converted to a byte address by shifting it left nine times (multiplying by 512).

Example

```
SYS_FS_MEDIA_BUFFER_HANDLE bufferHandle;  
  
bufferHandle = DRV_SDCARD_SectorWrite ( handle,  
                                         , readData //buffer  
                                         , 20 // Sector  
                                         , 1 // Number of Sectors  
                                         );
```

5.1.8.7.3.3 DRV_SDCARD_BufferStatusGet Function**C**

```
SYS_FS_MEDIA_BUFFER_STATUS DRV_SDCARD_BufferStatusGet(  
    DRV_HANDLE handle,  
    SYS_FS_MEDIA_BUFFER_HANDLE bufferHandle  
);
```

Description

This function gets the status of an SD card operation (read/write). To be called only after a read or write is scheduled.

Preconditions

The [DRV_SDCARD_Initialize](#) routine must have been called.

[DRV_SDCARD_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
bufferHandle	Handle returned by a 'sector write' or a 'sector read' function.

Returns

SYS_FS_MEDIA_BUFFER_STATUS - Buffer status.

Remarks

None.

Example

```
int globalState = 0;  
SYS_FS_MEDIA_BUFFER_HANDLE bufferHandle;  
  
switch (globalState)  
{  
    case 0:
```

```

        bufferHandle = SYS_FS_MEDIA_MANAGER_SectorWrite ( handle,
                                                         , readData //buffer
                                                         , 20 // Sector
                                                         , 1 // Number of Sectors
                                                         );

        globalState++;
        break;
    case 1:
        if ( SYS_FS_MEDIA_MANAGER_BufferStatusGet(handle, bufferHandle) ==
            SYS_FS_MEDIA_BUFFER_COMPLETED)
        {
            //Write complete
        }
        break;

```

5.1.8.7.3.4 DRV_SDCARD_MediaStatusGet Function

C

```

SYS_FS_MEDIA_STATUS DRV_SDCARD_MediaStatusGet(
    DRV_HANDLE handle
);

```

Description

This function gets the status of the device (attached/detached).

Preconditions

The [DRV_SDCARD_Initialize](#) routine must have been called.

[DRV_SDCARD_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Returns

SYS_FS_MEDIA_STATUS - Status of the device.

Remarks

None.

Example

```

DRV_HANDLE sdcardHandle; // Returned from DRV_SDCARD_Open

if( DRV_SDCARD_MediaStatusGet ( handle ) == SYS_FS_MEDIA_ATTACHED )
{
    //Device is attached
}

```

5.1.8.7.4 Module Information Functions

5.1.8.7.4.1 DRV_SDCARD_SectorsCountGet Function

C

```

uint32_t DRV_SDCARD_SectorsCountGet(
    DRV_HANDLE handle
);

```

Description

This function gets the number of sectors present in the selected SD card device.

Preconditions

The [DRV_SDCARD_Initialize](#) routine must have been called.

[DRV_SDCARD_Open](#) must have been called to obtain a valid opened device handle.

SD Card must have been detected and initialized by the task routine.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Returns

The number of a sectors in the selected SD Card.

Remarks

This routine will not block for hardware access and will immediately return the current status.

Example

```
DRV_HANDLE sdcardHandle; // Returned from DRV_SDCARD_Open
DRV_SDCARD_CLIENT_STATUS sdcardClientStatus;
bool status;
```

5.1.8.7.4.2 DRV_SDCARD_SectorSizeGet Function**C**

```
uint32_t DRV_SDCARD_SectorSizeGet(
    DRV_HANDLE handle
);
```

Description

This function gets the card's sector size.

Preconditions

The [DRV_SDCARD_Initialize](#) routine must have been called.

[DRV_SDCARD_Open](#) must have been called to obtain a valid opened device handle.

SD Card must have been detected and initialized by the task routine.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Returns

The size of a sector in the selected SD Card.

Remarks

This routine will not block for hardware access and will immediately return the current status.

Example

```
DRV_HANDLE sdcardHandle; // Returned from DRV_SDCARD_Open
DRV_SDCARD_CLIENT_STATUS sdcardClientStatus;
bool status;
```

5.1.8.7.4.3 DRV_SDCARD_WriteProtectionIsEnabled Function

C

```
bool DRV_SDCARD_WriteProtectionIsEnabled(  
    DRV_HANDLE handle  
);
```

Description

This function returns 'true' if the write protection for the card is enabled.

Preconditions

The [DRV_SDCARD_Initialize](#) routine must have been called.

[DRV_SDCARD_Open](#) must have been called to obtain a valid opened device handle.

SD Card must have been detected and initialized by the task routine.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Returns

true - Write protection is enabled. false - Write protection is disabled.

Remarks

This routine will not block for hardware access and will immediately return the current status.

Example

```
DRV_HANDLE sdcardHandle; // Returned from DRV_SDCARD_Open  
bool writeProtectStatus;  
  
//Call DRV_SDCARD_Open  
writeProtectStatus = DRV_SDCARD_WriteProtectionIsEnabled(sdcardHandle);
```

5.1.8.7.5 Version Information Functions

5.1.8.7.5.1 DRV_SDCARD_VersionGet Function

C

```
unsigned int DRV_SDCARD_VersionGet(  
    const SYS_MODULE_INDEX drvIndex  
);
```

Description

This routine gets the SD card driver version. The version is encoded as major * 10000 + minor * 100 + patch. The stringized version can be obtained using [DRV_SDCARD_VersionStrGet\(\)](#)

Preconditions

None.

Parameters

Parameters	Description
drvIndex	Identifier for the object instance to get the version for.

Returns

Current driver version in numerical format.

Remarks

None.

Example

```
unsigned int version;

version = DRV_SDCARD_VersionGet( DRV_SDCARD_INDEX_1 );

if(version < 110200)
{
    // Do Something
}
```

5.1.8.7.5.2 DRV_SDCARD_VersionStrGet Function

C

```
char* DRV_SDCARD_VersionStrGet(
    const SYS_MODULE_INDEX drvIndex
);
```

Description

This routine gets the SD card driver version. The version is returned as major.minor.path[type], where type is optional. The numerical version can be obtained using [DRV_SDCARD_VersionGet\(\)](#)

Preconditions

None.

Parameters

Parameters	Description
drvIndex	Identifier for the object instance to get the version for.

Returns

Current SD card driver version in the string format.

Remarks

None.

Example

```
char *version;

version = DRV_SDCARD_VersionStrGet( DRV_SDCARD_INDEX_1 );

printf("%s", version);
```

5.1.8.7.6 Data Types and Constants

5.1.8.7.6.1 DRV_SDCARD_INDEX_0 Macro

C

```
#define DRV_SDCARD_INDEX_0 0
```

Description

SD Card Driver Module Index Numbers

These constants provide SD Card driver index definitions.

Remarks

These constants should be used in place of hard-coded numeric literals.

These values should be passed into the [DRV_SDCARD_Initialize](#) and [DRV_SDCARD_Open](#) routines to identify the driver instance in use.

5.1.8.7.6.2 DRV_SDCARD_INDEX_COUNT Macro

C

```
#define DRV_SDCARD_INDEX_COUNT DRV_SDCARD_INDEX_MAX
```

Description

SD Card Driver Module Index Count

This constant identifies number of valid SD Card driver indices.

Remarks

This constant should be used in place of hard-coded numeric literals.

This value is derived from part-specific header files defined as part of the peripheral libraries.

5.1.8.7.6.3 DRV_SDCARD_BUFFER_HANDLE Type

C

```
typedef uintptr_t DRV_SDCARD_BUFFER_HANDLE;
```

Description

SD Card Buffer Handle

This handle identifies the a buffer in the queue(read or write).

5.1.8.7.6.4 DRV_SDCARD_CLIENT_STATUS Enumeration

C

```
typedef enum {
    DRV_SDCARD_CLIENT_STATUS_INVALID,
    DRV_SDCARD_CLIENT_STATUS_ERROR,
    DRV_SDCARD_CLIENT_STATUS_CLOSED,
    DRV_SDCARD_CLIENT_STATUS_BUSY,
    DRV_SDCARD_CLIENT_STATUS_READY,
    DRV_SDCARD_CLIENT_STATUS_STOPPED
} DRV_SDCARD_CLIENT_STATUS;
```

Description

SD Card Driver Client Status

This enumeration identifies the client-specific status of the SD card driver.

Members

Members	Description
DRV_SDCARD_CLIENT_STATUS_INVALID	Client in an invalid state

DRV_SDCARD_CLIENT_STATUS_ERROR	Unspecified error condition
DRV_SDCARD_CLIENT_STATUS_CLOSED	Client is not open
DRV_SDCARD_CLIENT_STATUS_BUSY	An operation is currently in progress
DRV_SDCARD_CLIENT_STATUS_READY	Up and running, no operations running
DRV_SDCARD_CLIENT_STATUS_STOPPED	SD Card stopped (not running), but ready to accept commands

Remarks

None.

5.1.8.7.6.5 DRV_SDCARD_INIT Type

C

```
typedef struct _DRV_SDCARD_INIT DRV_SDCARD_INIT;
```

Description

SD Card Device Driver Initialization Data

This structure contains all the data necessary to initialize the SD Card device.

Remarks

A pointer to a structure of this format containing the desired initialization data must be passed into the [DRV_SDCARD_Initialize](#) routine.

5.1.8.7.6.6 SYS_MEDIA_EVENT Enumeration

C

```
typedef enum {
    SYS_MEDIA_EVENT_SDCARD_ATTACHED,
    SYS_MEDIA_EVENT_SDCARD_DETACHED
} SYS_MEDIA_EVENT;
```

Description

SD Card Buffer Status

Defines the states that an SD Card buffer can be in during its lifetime

Members

Members	Description
SYS_MEDIA_EVENT_SDCARD_ATTACHED	The media event is SD Card attach
SYS_MEDIA_EVENT_SDCARD_DETACHED	The media event is SD Card detach

Remarks

As buffers may have a limited life span, so too have the associated handles and status info. Once a buffer transfer is completed (and possibly notified and acknowledged) it will be discarded. The status of a discarded buffer is no longer maintained by the driver.

5.1.8.7.6.7 SDCARD_MAX_LIMIT Macro

C

```
#define SDCARD_MAX_LIMIT 2
```

Description

SD Card Driver Maximum allowed limit

This constant identifies number of valid SD Card driver indices.

Remarks

- This constant should be used in place of hard-coded numeric literals.
- This value is derived from part-specific header files defined as part of the peripheral libraries.

5.1.8.7.6.8 DRV_SDCARD_INDEX_1 Macro

C

```
#define DRV_SDCARD_INDEX_1 1
```

Description

This is macro DRV_SDCARD_INDEX_1.

5.1.8.7.6.9 DRV_SDCARD_INDEX_2 Macro

C

```
#define DRV_SDCARD_INDEX_2 2
```

Description

This is macro DRV_SDCARD_INDEX_2.

5.1.8.7.6.10 DRV_SDCARD_INDEX_3 Macro

C

```
#define DRV_SDCARD_INDEX_3 3
```

Description

This is macro DRV_SDCARD_INDEX_3.

5.1.8.8 Files

Files

Name	Description
drv_sdcard.h	SD Card Device Driver Interface File

Description

5.1.8.8.1 drv_sdcard.h

- SD Card Device Driver Interface
- The SD Card device driver provides a simple interface to manage the "SD Card" peripheral. This file defines the interface definitions and prototypes for the SD Card driver.

Enumerations

	Name	Description
	DRV_SDCARD_CLIENT_STATUS	Identifies the client-specific status of the SD card driver
	SYS_MEDIA_EVENT	Defines the buffer status

Functions

	Name	Description
≡	DRV_SDCARD_BufferStatusGet	Gets the status of an SD card operation (read/write)
≡	DRV_SDCARD_ClientStatus	Gets current client-specific status the SD Card driver
≡	DRV_SDCARD_Close	Closes an opened-instance of the SD Card driver
≡	DRV_SDCARD_Deinitialize	Deinitializes the specified instance of the SD Card driver module
≡	DRV_SDCARD_Initialize	Initializes the SD Card driver
≡	DRV_SDCARD_MediaStatusGet	Gets the status of the device.
≡	DRV_SDCARD_Open	Opens the specified SD Card driver instance and returns a handle to it
≡	DRV_SDCARD_Reinitialize	Reinitializes the driver and refreshes any associated hardware settings
≡	DRV_SDCARD_SectorRead	Reads data from the sectors of the SD card.
≡	DRV_SDCARD_SectorsCountGet	Gets the number of sectors present in the selected SD card device.
≡	DRV_SDCARD_SectorSizeGet	Gets the sector size of the selected SD card device.
≡	DRV_SDCARD_SectorWrite	Writes sector(s) of data to an SD card.
≡	DRV_SDCARD_Status	Provides the current status of the SD Card driver module
≡	DRV_SDCARD_Tasks	Maintains the driver's state machine
≡	DRV_SDCARD_VersionGet	Gets SD card driver version in numerical format.
≡	DRV_SDCARD_VersionStrGet	Gets SD card driver version in string format.
≡	DRV_SDCARD_WriteProtectionIsEnabled	Gets the status of write protection.

Macros

	Name	Description
≡	DRV_SDCARD_INDEX_0	SD Card driver index definitions
≡	DRV_SDCARD_INDEX_1	This is macro DRV_SDCARD_INDEX_1.
≡	DRV_SDCARD_INDEX_2	This is macro DRV_SDCARD_INDEX_2.
≡	DRV_SDCARD_INDEX_3	This is macro DRV_SDCARD_INDEX_3.
≡	DRV_SDCARD_INDEX_COUNT	Number of valid SD Card driver indices
≡	SDCARD_MAX_LIMIT	Maximum allowed SD card instances

Types

	Name	Description
≡	DRV_SDCARD_BUFFER_HANDLE	Handle to a buffer added to the process queue.
≡	DRV_SDCARD_INIT	Contains all the data necessary to initialize the SD Card device

5.1.9 SPI Driver Library

5.1.9.1 Introduction

SPI Driver Library

for

Microchip Microcontrollers

This library provides an interface to manage the Serial Peripheral Interface (SPI) module on the Microchip family of microcontrollers in different modes of operation.

Description

Overview

The SPI module is a full duplex synchronous serial interface useful for communicating with other peripherals or microcontrollers in master/slave relationship and it can transfer data over short distances at high speeds. The peripheral devices may be serial EEPROMs, shift registers, display drivers, analog-to-digital converters, etc. The SPI module is compatible with Motorola's SPI and SIOP interfaces.

During data transfer devices can work either in master or in Slave mode. The source of synchronization is the system clock, which is generated by the master. The SPI module allows to connect one or more slave devices to a single master device via the same bus.

The SPI serial interface consists of four pins, which are further sub-divided into data and control lines:

Data lines:

- MOSI – Master Data Output, Slave Data Input
- MISO – Master Data Input, Slave Data Output

Control lines:

- SCLK – Serial Clock
- /SS – Slave Select (no addressing)

SPI Master-Slave Relationship

The SPI module can be configured to operate using 2, 3 or 4 pins. In the 3-pin mode, slave select line is not used. In the 2-pin mode, both MOSI and SS lines are not used.

Note: Third-party trademarks are property of their respective owners.

5.1.9.2 Release Notes

MPLAB Harmony Version: v0.70b **SPI Driver Library Version :** 0.01 **Release Date:** 18Nov2013

New This Release:

- Configurable baud rate at client level
- Interoperability

Known Issues:

- Does not work in the Slave mode of operation
- DMA is not supported

5.1.9.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.1.9.4 Using the Library

This topic describes the basic architecture of the SPI Driver Library and provides information and examples on how to use it.

Interface Header File: [drv_spi.h](#)

The interface to the SPI Driver library is defined in the "[drv_spi.h](#)" header file. Any C language source (.c) file that uses the SPI Driver library should include this header.

Library File:

The SPI Driver library archive (.a) file installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the Driver interacts with the framework.

5.1.9.4.1 Abstraction Model

Different types of SPIs are available on Microchip microcontrollers. Some have an internal buffer mechanism and some do not.

The buffer depth varies across part families. The SPI driver abstracts out these differences and provides a unified model for data transfer across different types of SPIs available.

Both transmitter and receiver provides a buffer in the driver which transmits and receives data to/from the hardware. The SPI driver provides a set of interfaces to perform the read and the write.

The diagrams below illustrates the model used by the SPI driver for transmitter and receiver.

Receiver Abstraction Model

Transmitter Abstraction Model

5.1.9.4.2 Library Overview

Refer to the section [Driver Overview](#) for how the driver operates in a system.

The library interface routines are divided into various subsections, each of the sub section addresses one of the blocks or the overall operation of the SPI module.

Library Interface Section	Description
System Interaction Functions	Provides system module interfaces, device initialization, deinitialization, reinitialization, tasks and status functions.
Client Setup Functions	Provides open, close, status and other setup functions.
Chip Selects	Provides chip select functions available in the configuration.
Client Data Transfer - Core	Provides core data transfer functions available in the configuration. [Standard/Single buffer transfer]

Client Data Transfer - Advanced	Provides advanced data transfer functions available in the configuration. [Enhanced/Multi buffer transfers]
Miscellaneous	Provides driver miscellaneous functions, data transfer status function, version identification functions etc.

5.1.9.4.3 How the Library Works

The library provides interfaces to support:

- System Functionality
- Client Functionality

Note: Not all modes are available on all microcontrollers, please refer to the specific device data sheet to the modes that are supported for your device.

5.1.9.4.3.1 System Access

System Initialization and Re-initialization

The system performs the initialization and the re-initialization of the device driver with settings that affect only the instance of the device that is being initialized or re-initialized. During system initialization each instance of the SPI module would be initialized with the following configuration settings (either passed dynamically at run time using [DRV_SPI_INIT](#) or by using Initialization Overrides) that are supported by the specific SPI device hardware:

- Device requested power state: one of the System Module Power States. For specific details please refer to the Data Types section in this guide
- The actual peripheral ID enumerated as the PLIB level module ID. e.g SPI_ID_2.
- Defining the respective interrupt sources for Tx, Rx, and Error Interrupt.

The [DRV_SPI_Initialize](#) API returns an object handle of the type [SYS_MODULE_OBJ](#). There on, the object handle returned by the Initialize interface would be used by the other system interfaces like [DRV_SPI_Reinitialize](#), [DRV_SPI_Deinitialize](#), [DRV_SPI_Status](#) and [DRV_SPI_Tasks](#).

Note: The system initialization and the re-initialization settings, only effect the instance of the peripheral that is being initialized or re-initialized.

Example:

```

DRV_SPI_INIT          spiInitData;
SYS_MODULE_OBJ        objectHandle;

spiInitData.moduleInit.value = SYS_MODULE_POWER_RUN_FULL;
spiInitData.spiId           = SPI_ID_1;
spiInitData.spiMode         = DRV_SPI_MODE_MASTER;
spiInitData.spiProtocolType = DRV_SPI_PROTOCOL_TYPE_STANDARD;
spiInitData.commWidth       = SPI_COMMUNICATION_8BIT_WIDE;
spiInitData.baudRate        = 5000;
spiInitData.bufferType      = DRV_SPI_BUFFER_TYPE_STANDARD;
spiInitData.inputSamplePhase = SPI_INPUT_SAMPLING_PHASE_IN_MIDDLE;
spiInitData.clockMode       = DRV_SPI_CLOCK_MODE_IDLE_LOW_EDGE_RISE;
spiInitData.txInterruptSource = INT_SOURCE_SPI_1_TRANSMIT; // INT_SOURCE_SPI_1_EVENT
spiInitData.rxInterruptSource = INT_SOURCE_SPI_1_RECEIVE;  // INT_SOURCE_SPI_1_EVENT
spiInitData.errInterruptSource = INT_SOURCE_SPI_1_ERROR;
spiInitData.pinConfig.sdiPin  = PIN_6; // RPI38
spiInitData.pinConfig.sdoPin  = PIN_10; // RP21
spiInitData.pinConfig.sckPin  = PIN_11; // RP26

objectHandle = DRV_SPI_Initialize(DRV_SPI_INDEX_1, (SYS_MODULE_INIT*)&spiInitData);

```

```
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}
```

Tasks Routine

The system will either call [DRV_SPI_Tasks](#), from System Task Service (in a polled environment) or [DRV_SPI_Tasks](#) will be called from interrupt service routine of the SPI.

5.1.9.4.3.2 Client Access

General Client Operation

For the application to start using an instance of the module, it must call the [DRV_SPI_Open](#) function. This provides the configuration required to open the SPI instance for operation. If the driver is de-initialized using the function [DRV_SPI_Deinitialize](#), the application must call the [DRV_SPI_Open](#) function again to setup the instance of the SPI. The function [DRV_SPI_Open](#) need not be called again if the system is re-initialized using the [DRV_SPI_Reinitialize](#) function.

For the various options available for IO INTENT please refer to the Data Types section in this guide.

Example:

```
DRV_HANDLE handle;

// Configure the instance DRV_SPI_INDEX_1 with the configuration
handle = DRV_SPI_Open(DRV_SPI_INDEX_1, DRV_IO_INTENT_READWRITE);

if(handle == DRV_HANDLE_INVALID)
{
    // Client cannot open the instance.
}
```

Communication Setup:

Communication entities like the SPI modes, input clock frequency, baud rates, clock mode, ports setup etc. can be configured with the help of the driver function [DRV_SPI_CommunicationSetup](#). This is a mandatory setup before doing any data transfer. The callback function registered during the communication setup gets called after a successful data transfer.

Example:

```
DRV_HANDLE handle; // Returned from DRV_SPI_Open
DRV_SPI_COMM_CONFIG config;

// Populate the communication setup configuration structure
config.spiMode      = DRV_SPI_MODE_MASTER;
config.baudRate     = 5000;
config.inputSamplePhase = SPI_INPUT_SAMPLING_PHASE_IN_MIDDLE;
config.clockMode    = DRV_SPI_CLOCK_MODE_IDLE_LOW_EDGE_RISE;
config.callback      = &callbackFunction; // callback registered
DRV_SPI_CommunicationSetup( handle, &config );
```

Chip Select Control:

User can control the chip/slave select signals using the driver APIs [DRV_SPI_ChipSelectActivate](#) and [DRV_SPI_ChipSelectDeactivate](#) with appropriate parameters.

Example:

```
// Activates/Enables Slave Select connected to Port A, bit 1
DRV_SPI_ChipSelectActivate( handle, PORT_CHANNEL_A, PORTS_BIT_POS_1 );
...
...
...
// Deactivates/Disables Slave Select connected to Port A, bit 1
```

```
DRV_SPI_ChipSelectDeactivate( handle, PORT_CHANNEL_A, PORTS_BIT_POS_1 );
```

5.1.9.4.3.3 Client Transfer - Core

Client basic functionality provides a extremely basic interface for the driver operation.

This client transfer mechanism needs to be used for the devices which support the 'Standard' SPI mode of operation [Single Buffer]. This mechanism needs to be repeated in case of buffer based data transfers for transferring multi bytes/words.

The diagram below illustrates the byte/word model used for the data transfer.

Note: It is not necessary to close and re-open the client between multiple transfers.

Client Byte/Word transfer Functionality

Application using the SPI byte/word functionality, needs to perform the following:

1. The system should have completed necessary initialization and the [DRV_SPI_Tasks](#) should either be running in polled

environment, or in an interrupt environment.

2. Open the driver using [DRV_SPI_Open](#) with the necessary intent
3. Setup the communication using the driver function DRV_SPI_CommunicationSetup
4. Enable/activate the slave using the function DRV_SPI_ChipSelectActivate
5. Put/Write a byte using DRV_SPI_Put, dummy byte in case of read only
6. Check for the current transfer status using DRV_SPI_TransferStatus until the transfer is in progress
DRV_SPI_TRANSFER_STATUS_IN_PROGRESS, call the [DRV_SPI_Tasks](#) in case of a polled environment until the transfer is success
7. Get/Read the dummy/valid data using the function DRV_SPI_Get
8. Repeat from step 5 till 7 to handle buffer transmission and reception using standard mode
9. Disable/deactivate the slave using the function DRV_SPI_ChipSelectDeactivate
10. The client will be able to close the driver using the [DRV_SPI_Close](#) when required.

Example:

```

DRV_HANDLE          handle;      // Returned from DRV_SPI_Open
SPI_BUFFER           myBuffer[MY_BUFFER_SIZE];
unsigned int         numBytes;
DRV_SPI_COMM_CONFIG  config;

// Pre-initialize myBuffer with MY_BUFFER_SIZE bytes of valid data.

while( 1 )
{
    switch( state )
    {
        case APP_STATE_INIT:
            /* Initialize the SPI Driver */
            object = DRV_SPI_Initialize( sysIndex, ( SYS_MODULE_INIT * )&initConf );

            /* Check for the System Status */
            if( SYS_STATUS_READY != DRV_SPI_Status( object ) )
                return 0;

            /* Open the Driver */
            clHandle = DRV_SPI_Open( sysIndex, DRV_IO_INTENT_EXCLUSIVE );

            /* Check for the Client Open Status */
            if( DRV_SPI_CLIENT_STATUS_READY != DRV_SPI_ClientStatus( clHandle ) )
                return 0;

            /* Set up the communication medium */
            DRV_SPI_CommunicationSetup( clHandle, &commConf );

            /* Update the state to transfer data */
            state = APP_STATE_DATA_PUT;
            break;

        case APP_STATE_DATA_PUT:
            /* Enable/Activate the CS */
            DRV_SPI_ChipSelectActivate( handle, PORT_CHANNEL_A, PORTS_BIT_POS_1 );
            /* Initiate the data transfer */
            DRV_SPI_Put( clHandle, myBuffer[i++] );
            /* Deactivates/Disables CS */
            DRV_SPI_ChipSelectDeactivate( handle, PORT_CHANNEL_A, PORTS_BIT_POS_1 );
            /* Update the state to status check */
            state = APP_STATE_STATUS_CHECK;
            break;

        case APP_STATE_STATUS_CHECK:

```

```

    /* Check for the successful data transfer */
    if( DRV_SPI_TRANSFER_STATUS_IN_PROGRESS & DRV_SPI_TransferStatus( clHandle ) )
    {
        DRV_SPI_Tasks (object);
        /* Stay here until the data transfer is executed */
        state = APP_STATE_STATUS_CHECK;
    }
    else
    {
        /* Data transfer was successfull, get the data */
        state = APP_STATE_DATA_GET;
    }
    break;

case APP_STATE_DATA_GET:
    /* Read the data from the peripheral */
    rxd_data = DRV_SPI_Get( clHandle );
    /* Restart the process by jumping to the beginning state */
    state = APP_STATE_DATA_PUT;
    break;

default:
    break;
}
}

```

Note: 'bufferType' attribute of the initialization structure or the configuration macro '[DRV_SPI_BUFFER_USAGE_TYPE](#)' needs to be updated as DRV_SPI_BUFFER_TYPE_STANDARD

5.1.9.4.3.4 Client Transfer - Advanced

Client basic functionality provides a extremely basic interface for the driver operation.

This client transfer mechanism needs to be used for the devices which support the

'Enhanced' SPI mode of operation [Internal FIFO or buffer].

The diagram below illustrates the buffer model used for the data transfer.

Note: It is not necessary to close and re-open the client between multiple transfers.

Client Byte/Word transfer Functionality

Application using the SPI byte/word functionality, needs to perform the following:

1. The system should have completed necessary initialization and the [DRV_SPI_Tasks](#) should either be running in polled environment, or in an interrupt environment.
2. Open the driver using [DRV_SPI_Open](#) with the necessary intent
3. Setup the communication using the driver function [DRV_SPI_CommunicationSetup](#)
4. Enable/activate the slave using the function [DRV_SPI_ChipSelectActivate](#)
5. Put/Write a byte using [DRV_SPI_PutBuffer](#), dummy byte in case of read only
6. Check for the current transfer status using [DRV_SPI_TransferStatus](#) until the transfer is in progress [DRV_SPI_TRANSFER_STATUS_IN_PROGRESS](#), call the [DRV_SPI_Tasks](#) in case of a polled environment until the transfer is success
7. Get/Read the dummy/valid data using the function [DRV_SPI_GetBuffer](#)

8. Repeat from step 5 till 7 to handle multi buffer transmission and reception using enhanced mode
9. Disable/deactivate the slave using the function `DRV_SPI_ChipSelectDeactivate`
10. The client will be able to close the driver using the `DRV_SPI_Close` when required.

Example:

```

DRV_HANDLE    handle;    // Returned from DRV_SPI_Open
SPI_DATA_TYPE tx_buffer[DRV_SPI_BUFFER_SIZE] = { 0x0001, 0x0001, 0x0001, 0x0001 };
SPI_DATA_TYPE rx_buffer[DRV_SPI_BUFFER_SIZE];
unsigned int   numBytes;
DRV_SPI_COMM_CONFIG config;

// Pre-initialize tx_buffer with DRV_SPI_BUFFER_SIZE bytes of valid data.

while( 1 )
{
    switch( state )
    {
        case APP_STATE_INIT:
            /* Initialize the SPI Driver */
            object = DRV_SPI_Initialize( sysIndex, ( SYS_MODULE_INIT * )&initConf );

            /* Check for the System Status */
            if( SYS_STATUS_READY != DRV_SPI_Status( object ) )
                return 0;

            /* Open the Driver */
            clHandle = DRV_SPI_Open( sysIndex, DRV_IO_INTENT_EXCLUSIVE );

            /* Check for the Client Open Status */
            if( DRV_SPI_CLIENT_STATUS_READY != DRV_SPI_ClientStatus( clHandle ) )
                return 0;

            /* Set up the communication medium */
            DRV_SPI_CommunicationSetup( clHandle, &commConf );

            /* Update the state to transfer data */
            state = APP_STATE_BUFFER_PUT;
            break;

        case APP_STATE_BUFFER_PUT:
            /* Initiate the data transfer */
            DRV_SPI_PutBuffer( clHandle, &tx_buffer, sizeof( tx_buffer )/2 );
            /* Update the state to status check */
            state = APP_STATE_BUFFER_CHECK;
            break;

        case APP_STATE_BUFFER_CHECK:
            /* Check for the successful data transfer */
            if( DRV_SPI_TRANSFER_STATUS_IN_PROGRESS & DRV_SPI_TransferStatus( clHandle ) )
            {
                DRV_SPI_Tasks( object );
                /* Stay here until the data transfer is executed */
                state = APP_STATE_BUFFER_CHECK;
            }
            else
            {
                /* Data transfer was successfull, get the data */
                state = APP_STATE_BUFFER_GET;
            }
            break;

        case APP_STATE_BUFFER_GET:
            /* Read the data from the peripheral */
            DRV_SPI_GetBuffer( clHandle, &rx_buffer, sizeof( rx_buffer )/2 );

```

```

        /* Restart the process by jumping to the beginning state */
        state = APP_STATE_BUFFER_PUT;
        break;

    default:
        break;
}
}

```

Note: 'bufferType' attribute of the initialization structure or the configuration macro '[DRV_SPI_BUFFER_USAGE_TYPE](#)' needs to be updated as DRV_SPI_BUFFER_TYPE_ENHANCED

5.1.9.5 Configuring the Library

The configuration of the SPI driver is based on the file sys_config.h

This header file contains the configuration selection for the SPI driver. Based on the selections made, the SPI driver will support or not support selected features. These configuration settings will apply to all instances of the SPI driver.

This header can be placed anywhere, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.1.9.5.1 Client Configuration

5.1.9.5.2 System Configuration

5.1.9.5.3 Miscellaneous Configuration

5.1.9.6 Building the Library

This section list the files that are available in the \src of the SPI driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

5.1.9.7 Library Interface

Data Types and Constants

	Name	Description
	DRV_SPI_BAUD_RATE	Controls the baud rate value of the SPI driver.
	DRV_SPI_BAUD_RATE_CLOCK	Selects the SPI baud rate clock.
	DRV_SPI_BUFFER_HANDLE_INVALID	Definition of an invalid buffer handle.
	DRV_SPI_BUFFER_SIZE	This is macro DRV_SPI_BUFFER_SIZE.
	DRV_SPI_BUFFER_USAGE_TYPE	Controls the buffer type of the SPI driver.

	DRV_SPI_CLIENTS_NUMBER	Selects the maximum number of clients.
	DRV_SPI_CLOCK_OPERATION_MODE	Controls the clock mode of the SPI driver.
	DRV_SPI_COMMUNICATION_WIDTH	Controls the communication width of the SPI driver.
	DRV_SPI_FRAME_SYNC_PULSE_COUNT	Selects the SPI frame sync pulse count.
	DRV_SPI_FRAME_SYNC_PULSE_DIRECTION	Selects the SPI frame sync pulse direction.
	DRV_SPI_FRAME_SYNC_PULSE_EDGE	Selects the SPI frame sync pulse edge.
	DRV_SPI_FRAME_SYNC_PULSE_POLARITY	Selects the SPI frame sync pulse polarity.
	DRV_SPI_FRAME_SYNC_PULSE_WIDTH	Selects the SPI frame sync pulse width.
	DRV_SPI_INDEX	SPI static index selection.
	DRV_SPI_INDEX_0	SPI driver index definitions.
	DRV_SPI_INDEX_COUNT	Number of valid SPI driver indices.
	DRV_SPI_INPUT_SAMPLE_PHASE	Selects the SPI input sample phase.
	DRV_SPI_INSTANCES_NUMBER	Selects the maximum number of hardware instances that can be supported by the dynamic driver .
	DRV_SPI_INTERRUPT_MODE	Controls operation of the driver in the interrupt or polled mode.
	DRV_SPI_INTERRUPT_SOURCE_ERROR	Defines the error interrupt source in case of static driver
	DRV_SPI_INTERRUPT_SOURCE_RX	Defines the receive interrupt source in case of static driver.
	DRV_SPI_INTERRUPT_SOURCE_TX	Defines the transmit/receive or transmit alone interrupt source in case of static driver.
	DRV_SPI_PERIPHERAL_ID	SPI peripheral ID selection.
	DRV_SPI_PORTS_REMAP_USAGE	Selects the SPI pins remap.
	DRV_SPI_POWER_STATE	Controls the power state of the SPI driver.
	DRV_SPI_PROTOCOL	Controls the protocol type of the SPI driver.
	DRV_SPI_USAGE_MODE	Controls the usage mode of the SPI driver.
	DRV_SPI_BUFFER_EVENT	Identifies the possible events that can result from a buffer add request.
	DRV_SPI_BUFFER_EVENT_HANDLER	Pointer to a SPI Driver Buffer Event handler function
	DRV_SPI_BUFFER_HANDLE	Handle identifying a read or write buffer passed to the driver.
	DRV_SPI_BUFFER_TYPE	Identifies the various buffer types of the SPI module.
	DRV_SPI_CLIENT_SETUP	Defines the data required to initialize an SPI client.
	DRV_SPI_CLOCK_MODE	Identifies the various clock modes of the SPI module.
	DRV_SPI_INIT	Defines the data required to initialize or reinitialize the SPI driver
	DRV_SPI_MODE	Identifies the various usage modes of the SPI module.
	DRV_SPI_PROTOCOL_TYPE	Identifies the various protocols of the SPI module.

Client Setup Functions

	Name	Description
	DRV_SPI_BufferStatus	Returns the transmitter and receiver transfer status.
	DRV_SPI_ClientSetup	Initializes a client.
	DRV_SPI_Close	Closes an opened instance of the SPI driver
	DRV_SPI_Open	Opens the specified SPI driver instance and returns a handle to it.

Miscellaneous Functions

	Name	Description
	DRV_SPI_BufferAddRead	Registers a buffer for a read operation. Actual transfer will happen in the Task function.

	DRV_SPI_BufferAddWrite	Registers a buffer for a read operation. Actual transfer will happen in the Task function.
	DRV_SPI_BufferAddWriteRead	Registers a buffer for a read operation. Actual transfer will happen in the Task function.
	DRV_SPI_VersionGet	Gets the SPI driver version in numerical format.
	DRV_SPI_VersionStrGet	Gets the SPI driver version in string format.
	DRV_SPI_INDEX_1	This is macro DRV_SPI_INDEX_1.
	DRV_SPI_INDEX_2	This is macro DRV_SPI_INDEX_2.
	DRV_SPI_INDEX_3	This is macro DRV_SPI_INDEX_3.
	DRV_SPI_INDEX_4	This is macro DRV_SPI_INDEX_4.
	DRV_SPI_INDEX_5	This is macro DRV_SPI_INDEX_5.
	DRV_SPI_RX_FIFO_INTERRUPT_MODE	This is macro DRV_SPI_RX_FIFO_INTERRUPT_MODE.
	DRV_SPI_TX_FIFO_INTERRUPT_MODE	This is macro DRV_SPI_TX_FIFO_INTERRUPT_MODE.

System Interaction Functions

	Name	Description
	DRV_SPI_Deinitialize	De-initializes the specified instance of the SPI driver module.
	DRV_SPI_Initialize	Initializes the SPI driver.
	DRV_SPI_Status	Provides the current status of the SPI driver module.
	DRV_SPI_Tasks	Maintains the driver's state machine and implements its ISR.
	DRV_SPI_Read	Gets/Reads byte(s) from SPI. The function will wait until the specified number of bytes is received.
	DRV_SPI_Write	Writes the data to SPI. The function will wait until all the bytes are transmitted.

Description

This section describes the API functions of the SPI driver library.

Refer to each section for a detailed description.

5.1.9.7.1 System Interaction Functions

5.1.9.7.1.1 DRV_SPI_Deinitialize Function

C

```
void DRV_SPI_Deinitialize(
    SYS_MODULE_OBJ object
);
```

Description

De-initializes the specified instance of the SPI driver module, disabling its operation (and any hardware) and invalidates all of the internal data.

Preconditions

Function [DRV_SPI_Initialize](#) must have been called before calling this routine and a valid [SYS_MODULE_OBJ](#) must have been returned.

Parameters

Parameters	Description
object	Driver object handle, returned from DRV_SPI_Initialize

Returns

None.

Remarks

Once the Initialize operation has been called, the De-initialize operation must be called before the Initialize operation can be called again.

This function will NEVER block waiting for hardware. If the operation requires time to allow the hardware to complete, this will be reported by the [DRV_SPI_Status](#) operation. The system has to use [DRV_SPI_Status](#) to find out when the module is in the ready state.

Example

```
SYS_MODULE_OBJ    object;    // Returned from DRV_SPI_Initialize
SYS_STATUS        status;

DRV_SPI_Deinitialize ( object );

status = DRV_SPI_Status( object );
if( SYS_MODULE_UNINITIALIZED == status )
{
    // Check again later if you need to know
    // when the driver is de-initialized.
}
```

5.1.9.7.1.2 DRV_SPI_Initialize Function**C**

```
SYS_MODULE_OBJ DRV_SPI_Initialize(
    const SYS_MODULE_INDEX index,
    const SYS_MODULE_INIT * const init
);
```

Description

This function initializes the SPI driver, making it ready for clients to open and use.

Preconditions

None.

Parameters

Parameters	Description
drvIndex	Index for the driver instance to be initialized
init	Pointer to a data structure containing any data necessary to initialize the driver. This pointer may be null if no data is required because static overrides have been provided.

Returns

If successful, a valid handle to a driver object is returned. Otherwise, it returns [SYS_MODULE_OBJ_INVALID](#). The returned object must be passed as an argument to the [DRV_SPI_Reinitialize](#), [DRV_SPI_Deinitialize](#), [DRV_SPI_Tasks](#), and [DRV_SPI_Status](#) functions.

Remarks

This function must be called before any other SPI routine is called.

This function should only be called once during system initialization unless [DRV_SPI_Deinitialize](#) is called to de-initialize the driver instance.

This function will NEVER block for hardware access. If the operation requires time to allow the hardware to reinitialize, it will be

reported by the [DRV_SPI_Status](#) operation. The system must use [DRV_SPI_Status](#) to find out when the driver is in the ready state.

Build configuration options may be used to statically override options in the "init" structure and will take precedence over initialization data passed using this function.

Example

```
DRV_SPI_INIT      init;
SYS_MODULE_OBJ    objectHandle;

// Populate the SPI initialization structure
init.spiId        = SPI_ID_1;
init.spiMode      = DRV_SPI_MODE_MASTER;
init.spiProtocolType = DRV_SPI_PROTOCOL_TYPE_STANDARD;
init.commWidth    = SPI_COMMUNICATION_8BIT_WIDE;
init.baudRate     = 5000;
init.bufferType   = DRV_SPI_BUFFER_TYPE_STANDARD;
init.inputSamplePhase = SPI_INPUT_SAMPLING_PHASE_IN_MIDDLE;
init.clockMode    = DRV_SPI_CLOCK_MODE_IDLE_LOW_EDGE_RISE;
init.txInterruptSource = INT_SOURCE_SPI_1_TRANSMIT; // INT_SOURCE_SPI_1_EVENT
init.rxInterruptSource = INT_SOURCE_SPI_1_RECEIVE;  // INT_SOURCE_SPI_1_EVENT
init.errInterruptSource = INT_SOURCE_SPI_1_ERROR;

// Do something

objectHandle = DRV_SPI_Initialize( DRV_SPI_INDEX_0, (SYS_MODULE_INIT*)&init );
if( SYS_MODULE_OBJ_INVALID == objectHandle )
{
    // Handle error
}
```

5.1.9.7.1.3 DRV_SPI_Status Function

C

```
SYS_STATUS DRV_SPI_Status(
    SYS_MODULE_OBJ object
);
```

Description

This function provides the current status of the SPI driver module.

Preconditions

The [DRV_SPI_Initialize](#) function must have been called before calling this function.

Parameters

Parameters	Description
object	Driver object handle, returned from DRV_SPI_Initialize

Returns

SYS_STATUS_READY - Indicates that the driver is busy with a previous system level operation and cannot start another

Remarks

Any value greater than SYS_STATUS_READY is also a normal running state in which the driver is ready to [accept](#) new operations.

SYS_MODULE_DEINITIALIZED - Indicates that the driver has been de-initialized

This value is less than SYS_STATUS_ERROR.

This function can be used to determine when any of the driver's module level operations has completed.

If the status operation returns `SYS_STATUS_BUSY`, the previous operation has not yet completed. Once the status operation returns `SYS_STATUS_READY`, any previous operations have completed.

The value of `SYS_STATUS_ERROR` is negative (-1). Any value less than that is also an error state.

This function will NEVER block waiting for hardware.

If the Status operation returns an error value, the error may be cleared by calling the reinitialize operation. If that fails, the de-initialize operation will need to be called, followed by the initialize operation to return to normal operations.

Example

```
SYS_MODULE_OBJ    object;    // Returned from DRV_SPI_Initialize
SYS_STATUS        status;

status = DRV_SPI_Status( object );
if( SYS_STATUS_READY != status )
{
    // Handle error
}
```

5.1.9.7.1.4 DRV_SPI_Tasks Function

C

```
void DRV_SPI_Tasks(
    SYS_MODULE_OBJ object
);
```

Description

This routine is used to maintain the driver's internal state machine and implement its transmit ISR for interrupt-driven implementations. In polling mode, this function should be called from the `SYS_Tasks()` function. In interrupt mode, this function should be called in the transmit interrupt service routine of the USART that is associated with this USART driver hardware instance.

Preconditions

The `DRV_SPI_Initialize` routine must have been called for the specified SPI driver instance.

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from <code>DRV_SPI_Initialize</code>)

Returns

None.

Remarks

This function is normally not called directly by an application. It is called by the system's Tasks routine (`SYS_Tasks`) or by the appropriate raw ISR.

This function may execute in an ISR context and will never block or access any resources that may cause it to block.

Example

```
SYS_MODULE_OBJ    object;    // Returned from DRV_SPI_Initialize

while( true )
{
    DRV_SPI_Tasks ( object );

    // Do other tasks
}
```

5.1.9.7.1.5 DRV_SPI_Read Function

C

```
size_t DRV_SPI_Read(
    DRV_HANDLE handle,
    void* buffer,
    size_t noOfBytes
);
```

Description

This function gets/reads byte(s) from SPI. The function will wait until the specified number of bytes is received.

Preconditions

The [DRV_SPI_Initialize](#) routine must have been called for the specified SPI driver instance.

[DRV_SPI_Open](#) must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_READ or DRV_IO_INTENT_READWRITE must have been specified in the [DRV_SPI_Open](#) call.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
buffer	Buffer to which the data should be written to.
noOfBytes	Number of bytes to be received.

Returns

The number of bytes read.

Remarks

If the DRV_IO_INTENT_BLOCKING flag was given in the call to the [DRV_SPI_Open](#) function and the driver was built to support blocking behavior the call will block until the operation is complete.

If the DRV_IO_INTENT_NONBLOCKING flag was given in the call to the [DRV_SPI_Open](#) function or the driver was built to only support non-blocking behavior the call will return immediately. If data is not available, a zero ('0') value will be returned and an underrun error status will be captured. To ensure that valid data is returned, the caller must first check the return value to [DRV_SPI_BufferStatus](#), as shown in the example.

Example

```
DRV_HANDLE    handle;    // Returned from DRV_SPI_Open
SPI_DATA_TYPE myBuffer[MY_BUFFER_SIZE];
unsigned int  numberOfBytesRead;

numberOfBytesRead = DRV_SPI_Read ( handle, myBuffer, 10 );

if ( numberOfBytesWritten == 0 )
{
    // Check for the error...
}
```

5.1.9.7.1.6 DRV_SPI_Write Function

C

```
size_t DRV_SPI_Write(
    DRV_HANDLE handle,
    void* buffer,
    size_t noOfBytes
);
```

Description

This function Writes the data to SPI. The function will wait until all the bytes are transmitted.

Preconditions

The [DRV_SPI_Initialize](#) routine must have been called for the specified SPI driver instance.

[DRV_SPI_Open](#) must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_WRITE or DRV_IO_INTENT_READWRITE must have been specified in the [DRV_SPI_Open](#) call.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
buffer	Buffer which contains the data.
noOfBytes	Number of bytes to be transmitted.

Returns

The number of bytes written.

Remarks

If the DRV_IO_INTENT_BLOCKING flag was given in the call to the [DRV_SPI_Open](#) function and the driver was built to support blocking behavior the call will block until the operation is complete.

If the DRV_IO_INTENT_NONBLOCKING flag was given in the call to the [DRV_SPI_Open](#) function or the driver was built to only support non-blocking behavior the call will return immediately. If the driver was not able to [accept](#) the data, an overrun error status will be captured. To ensure that the driver is ready to [accept](#) data, the caller must first check the return value to [DRV_SPI_BufferStatus](#), as shown in the example.

Example

```

DRV_HANDLE      handle;      // Returned from DRV_SPI_Open
SPI_DATA_TYPE   myBuffer[MY_BUFFER_SIZE]; // fill the data
unsigned int    numberOfBytesWritten;

numberOfBytesWritten = DRV_SPI_Write ( handle, myBuffer, 10 );

if ( numberOfBytesWritten == 0 )
{
    // Check the error...
}

```

5.1.9.7.2 Client Setup Functions

5.1.9.7.2.1 DRV_SPI_BufferStatus Function

C

```

DRV_SPI_BUFFER_EVENT DRV_SPI_BufferStatus(
    DRV_SPI_BUFFER_HANDLE bufferHandle
);

```

Description

This returns the transmitter and receiver transfer status.

Preconditions

The [DRV_SPI_Initialize](#) routine must have been called for the specified SPI driver instance.

[DRV_SPI_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Returns

A DRV_SPI_BUFFER_STATUS value describing the current status of the transfer.

Remarks

The returned status may contain a value with more than one of the bits specified in the DRV_SPI_BUFFER_STATUS enumeration set. The caller should perform an AND with the bit of interest and verify if the result is non-zero (as shown in the example) to verify the desired status bit.

Example

```
DRV_HANDLE handle;    // Returned from DRV_SPI_Open

if( DRV_SPI_BUFFER_STATUS_SUCCESS & DRV_SPI_BufferStatus( handle ) )
{
    // All transmitter data has been sent.
}
```

5.1.9.7.2.2 DRV_SPI_ClientSetup Function**C**

```
void DRV_SPI_ClientSetup(
    DRV_HANDLE handle,
    const DRV_SPI_CLIENT_SETUP * const clientSetup
);
```

Description

This function sets up the device communication parameters. Using this API user can have configurations like chip select and baud rate specific to a client. The driver will be able to switch the between clients dynamically. 'DRV_SPI_CLIENT_SPECIFIC_CONTROL' must be defined in 'system_config.h'. This function is only useful for instance which has got multiple slaves.

Preconditions

The [DRV_SPI_Initialize](#) routine must have been called.

[DRV_SPI_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open instance handle, returned from the driver's open routine
clientSetup	Communication parameters identified by DRV_SPI_CLIENT_SETUP

Returns

None

Remarks

This is an optional call. It is necessary only two clients using needs different configurations.

Example

```
DRV_HANDLE handle;    // Returned from DRV_SPI_Open
DRV_SPI_CLIENT_SETUP clientSetup;

// Populate the communication setup configuration structure
```

```

clientSetup.baudRate      = 5000;
clientSetup.inputSamplePhase = SPI_INPUT_SAMPLING_PHASE_IN_MIDDLE;
clientSetup.clockMode      = DRV_SPI_CLOCK_MODE_IDLE_LOW_EDGE_RISE;
clientSetup.callback       = &callbackFunction; // callback registered

DRV_SPI_ClientSetup ( handle, &clientSetup );

```

5.1.9.7.2.3 DRV_SPI_Close Function

C

```

void DRV_SPI_Close(
    DRV_HANDLE handle
);

```

Description

This function closes an opened instance of the SPI driver, invalidating the handle.

Preconditions

The [DRV_SPI_Initialize](#) routine must have been called for the specified SPI driver instance.

[DRV_SPI_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Returns

None

Remarks

After calling this routine, the handle passed in "handle" must not be used with any of the remaining driver routines. A new handle must be obtained by calling [DRV_USART_Open](#) before the caller may use the driver again. This function is thread safe in a RTOS application.

Usually there is no need for the driver client to verify that the Close operation has completed.

Example

```

DRV_HANDLE handle; // Returned from DRV_SPI_Open

DRV_SPI_Close ( handle );

```

5.1.9.7.2.4 DRV_SPI_Open Function

C

```

DRV_HANDLE DRV_SPI_Open(
    const SYS_MODULE_INDEX drvIndex,
    const DRV_IO_INTENT intent
);

```

Description

This routine opens the specified USART driver instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver. The ioIntent parameter defines how the client interacts with this driver instance.

The DRV_IO_INTENT_BLOCKING and DRV_IO_INTENT_NONBLOCKING ioIntent options additionally affect the behavior of the [DRV_USART_Read\(\)](#) and [DRV_USART_Write\(\)](#) functions. If the ioIntent is DRV_IO_INTENT_NONBLOCKING, then these function will not block even if the required amount of data could not be processed. If the ioIntent is DRV_IO_INTENT_BLOCKING, these functions will block till the required amount of data is processed.

If `ioIntent` is `DRV_IO_INTENT_READ`, the client will only be read from the driver. If `ioIntent` is `DRV_IO_INTENT_WRITE`, the client will only be able to write to the driver. If the `ioIntent` is `DRV_IO_INTENT_READWRITE`, the client will be able to do both, read and write.

Specifying a `DRV_IO_INTENT_EXCLUSIVE` will cause the driver to provide exclusive access to this client. The driver cannot be opened by any other client.

Preconditions

The [DRV_SPI_Initialize](#) function must have been called before calling this function.

Parameters

Parameters	Description
<code>drvIndex</code>	Identifier for the object instance to be opened
<code>intent</code>	Zero or more of the values from the enumeration DRV_IO_INTENT ORed together to indicate the intended use of the driver

Returns

If successful, the routine returns a valid open-instance handle (a number identifying both the caller and the module instance).

If an error occurs, the return value is [DRV_HANDLE_INVALID](#). Error can occur

- if the number of client objects allocated via [DRV_USART_CLIENTS_NUMBER](#) is insufficient.
- if the client is trying to open the driver but driver has been opened exclusively by another client.
- if the driver hardware instance being opened is not initialized or is invalid.

Remarks

The handle returned is valid until the [DRV_USART_Close](#) routine is called. This routine will NEVER block waiting for hardware. If the requested intent flags are not supported, the routine will return [DRV_HANDLE_INVALID](#). This function is thread safe in a RTOS application. It should not be called in an ISR.

Example

```
DRV_HANDLE  handle;

handle = DRV_SPI_Open( DRV_SPI_INDEX_0, DRV_IO_INTENT_EXCLUSIVE );
if( DRV_HANDLE_INVALID == handle )
{
    // Unable to open the driver
}
```

5.1.9.7.3 Miscellaneous Functions

5.1.9.7.3.1 DRV_SPI_BufferAddRead Function

C

```
DRV_SPI_BUFFER_HANDLE DRV_SPI_BufferAddRead(
    DRV_HANDLE handle,
    void * rxBuffer,
    size_t size
);
```

Description

Registers a buffer for a read operation. Actual transfer will happen in the Task function. The status of this operation can be monitored using [DRV_SPI_BufferStatus](#) function.

Preconditions

The [DRV_SPI_Initialize](#) routine must have been called for the specified SPI driver instance.

[DRV_SPI_Open](#) must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_WRITE or DRV_IO_INTENT_READWRITE must have been specified in the [DRV_SPI_Open](#) call.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
rxBuffer	The buffer to which the data should be written to.
size	Number of bytes to be read.

Returns

None.

Remarks

If the DRV_IO_INTENT_BLOCKING flag was given in the call to the [DRV_SPI_Open](#) function and the driver was built to support blocking behavior the call will block until the operation is complete.

If the DRV_IO_INTENT_NONBLOCKING flag was given in the call to the [DRV_SPI_Open](#) function or the driver was built to only support non-blocking behavior the call will return immediately. If the driver was not able to [accept](#) the data, an overrun error status will be captured. To ensure that the driver is ready to [accept](#) data, the caller must first check the return value to [DRV_SPI_BufferStatus](#), as shown in the example.

Example

```
DRV_HANDLE    handle;    // Returned from DRV_SPI_Open
SPI_DATA_TYPE myBuffer[MY_BUFFER_SIZE];

// PUT API returns data in any case, upto the user to use it
DRV_SPI_BufferAddRead( handle, myBuffer, 10 );

if( DRV_SPI_BUFFER_STATUS_SUCCESS & DRV_SPI_BufferStatus( handle ) )
{
    // All transmitter data has been sent.
}
```

5.1.9.7.3.2 DRV_SPI_BufferAddWrite Function**C**

```
DRV_SPI_BUFFER_HANDLE DRV_SPI_BufferAddWrite(
    DRV_HANDLE handle,
    void * txBuffer,
    size_t size
);
```

Description

Registers a buffer for a read operation. Actual transfer will happen in the Task function. The status of this operation can be monitored using [DRV_SPI_BufferStatus](#) function.

Preconditions

The [DRV_SPI_Initialize](#) routine must have been called for the specified SPI driver instance.

[DRV_SPI_Open](#) must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_WRITE or DRV_IO_INTENT_READWRITE must have been specified in the [DRV_SPI_Open](#) call.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
rxBuffer	The buffer to which the data should be written to.
size	Number of bytes to be read.

Returns

None.

Remarks

If the DRV_IO_INTENT_BLOCKING flag was given in the call to the [DRV_SPI_Open](#) function and the driver was built to support blocking behavior the call will block until the operation is complete.

If the DRV_IO_INTENT_NONBLOCKING flag was given in the call to the [DRV_SPI_Open](#) function or the driver was built to only support non-blocking behavior the call will return immediately. If the driver was not able to [accept](#) the data, an overrun error status will be captured. To ensure that the driver is ready to [accept](#) data, the caller must first check the return value to [DRV_SPI_BufferStatus](#), as shown in the example.

Example

```
DRV_HANDLE    handle;    // Returned from DRV_SPI_Open
SPI_DATA_TYPE myBuffer[MY_BUFFER_SIZE];
unsigned int   numBytes;

// Pre-initialize myBuffer with MY_BUFFER_SIZE bytes of valid data.

numBytes = 0;

// PUT API returns data in any case, upto the user to use it
DRV_SPI_BufferAddRead( handle, myBuffer, 10 );

if( DRV_SPI_BUFFER_STATUS_SUCCESS & DRV_SPI_BufferStatus( handle ) )
{
    // All transmitter data has been sent.
}
```

5.1.9.7.3.3 DRV_SPI_BufferAddWriteRead Function

C

```
DRV_SPI_BUFFER_HANDLE DRV_SPI_BufferAddWriteRead(
    DRV_HANDLE handle,
    void * txBuffer,
    void * rxBuffer,
    size_t size
);
```

Description

Registers a buffer for a read operation. Actual transfer will happen in the Task function. The status of this operation can be monitored using [DRV_SPI_BufferStatus](#) function.

Preconditions

The [DRV_SPI_Initialize](#) routine must have been called for the specified SPI driver instance.

[DRV_SPI_Open](#) must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_WRITE or DRV_IO_INTENT_READWRITE must have been specified in the [DRV_SPI_Open](#) call.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
rxBuffer	The buffer to which the data should be written to.
size	Number of bytes to be read.

Returns

None.

Remarks

If the DRV_IO_INTENT_BLOCKING flag was given in the call to the [DRV_SPI_Open](#) function and the driver was built to support blocking behavior the call will block until the operation is complete.

If the DRV_IO_INTENT_NONBLOCKING flag was given in the call to the [DRV_SPI_Open](#) function or the driver was built to only support non-blocking behavior the call will return immediately. If the driver was not able to [accept](#) the data, an overrun error status will be captured. To ensure that the driver is ready to [accept](#) data, the caller must first check the return value to [DRV_SPI_BufferStatus](#), as shown in the example.

Example

```
DRV_HANDLE      handle;      // Returned from DRV_SPI_Open
SPI_DATA_TYPE   myBuffer[MY_BUFFER_SIZE];
unsigned int     numBytes;

// Pre-initialize myBuffer with MY_BUFFER_SIZE bytes of valid data.

numBytes = 0;

// PUT API returns data in any case, upto the user to use it
DRV_SPI_BufferAddWriteRead( handle, myTxBuffer, myRxBuffer, 10 );

if( DRV_SPI_BUFFER_STATUS_SUCCESS & DRV_SPI_BufferStatus( handle ) )
{
    // All transmitter data has been sent.
}
```

5.1.9.7.3.4 DRV_SPI_VersionGet Function**C**

```
unsigned int DRV_SPI_VersionGet(
    const SYS_MODULE_INDEX drvIndex
);
```

Description

This function gets the SPI driver version. The version is encoded as major * 10000 + minor * 100 + patch. The stringed version can be obtained using [DRV_SPI_VersionStrGet](#).

Preconditions

None.

Parameters

Parameters	Description
drvIndex	Identifier for the object instance to get the version for

Returns

Current driver version in numerical format.

Remarks

None.

Example

```
unsigned int version;

version = DRV_SPI_VersionGet( DRV_SPI_INDEX_0 );

if(version < 110200)
{
    // Do Something
}
```

5.1.9.7.3.5 DRV_SPI_VersionStrGet Function**C**

```
char * DRV_SPI_VersionStrGet(
    const SYS_MODULE_INDEX drvIndex
);
```

Description

This function gets the SPI driver version. The version is returned as major.minor.path[type], where type is optional. The numerical version can be obtained using [DRV_SPI_VersionGet](#).

Preconditions

None.

Parameters

Parameters	Description
drvIndex	Identifier for the object instance to get the version for

Returns

Current the SPI driver version in the string format.

Remarks

None.

Example

```
char *version;

version = DRV_SPI_VersionStrGet( DRV_SPI_INDEX_0 );

printf("%s", version);
```

5.1.9.7.3.6 DRV_SPI_INDEX_1 Macro**C**

```
#define DRV_SPI_INDEX_1 1
```

Description

This is macro DRV_SPI_INDEX_1.

5.1.9.7.3.7 DRV_SPI_INDEX_2 Macro**C**

```
#define DRV_SPI_INDEX_2 2
```

Description

This is macro DRV_SPI_INDEX_2.

5.1.9.7.3.8 DRV_SPI_INDEX_3 Macro

C

```
#define DRV_SPI_INDEX_3 3
```

Description

This is macro DRV_SPI_INDEX_3.

5.1.9.7.3.9 DRV_SPI_INDEX_4 Macro

C

```
#define DRV_SPI_INDEX_4 4
```

Description

This is macro DRV_SPI_INDEX_4.

5.1.9.7.3.10 DRV_SPI_INDEX_5 Macro

C

```
#define DRV_SPI_INDEX_5 5
```

Description

This is macro DRV_SPI_INDEX_5.

5.1.9.7.3.11 DRV_SPI_RX_FIFO_INTERRUPT_MODE Macro

C

```
#define DRV_SPI_RX_FIFO_INTERRUPT_MODE SPI_FIFO_INTERRUPT_WHEN_RECEIVE_BUFFER_IS_FULL
```

Description

This is macro DRV_SPI_RX_FIFO_INTERRUPT_MODE.

5.1.9.7.3.12 DRV_SPI_TX_FIFO_INTERRUPT_MODE Macro

C

```
#define DRV_SPI_TX_FIFO_INTERRUPT_MODE SPI_FIFO_INTERRUPT_WHEN_TRANSMISSION_IS_COMPLETE
```

Description

This is macro DRV_SPI_TX_FIFO_INTERRUPT_MODE.

5.1.9.7.4 Data Types and Constants**5.1.9.7.4.1 DRV_SPI_BAUD_RATE Macro**

C

```
#define DRV_SPI_BAUD_RATE 8000000
```

Description

SPI baud rate value configuration

This macro controls the baud rate value of the SPI driver.

Remarks

None.

5.1.9.7.4.2 DRV_SPI_BAUD_RATE_CLOCK Macro**C**

```
#define DRV_SPI_BAUD_RATE_CLOCK SPI_BAUD_RATE_CLOCK_MCLK
```

Description

SPI baud rate clock selection

This macro selects the SPI baud rate clock.

Remarks

None.

5.1.9.7.4.3 DRV_SPI_BUFFER_HANDLE_INVALID Macro**C**

```
#define DRV_SPI_BUFFER_HANDLE_INVALID ((DRV_SPI_BUFFER_HANDLE)(-1))
```

Description

SPI Driver Invalid Buffer Handle

This is the definition of an invalid buffer handle. An invalid buffer handle is returned by [DRV_SPI_BufferAddRead\(\)](#) and [DRV_SPI_BufferAddWrite\(\)](#) function if the buffer add request was not successful.

Remarks

None

5.1.9.7.4.4 DRV_SPI_BUFFER_SIZE Macro**C**

```
#define DRV_SPI_BUFFER_SIZE 8
```

Description

This is macro DRV_SPI_BUFFER_SIZE.

5.1.9.7.4.5 DRV_SPI_BUFFER_USAGE_TYPE Macro**C**

```
#define DRV_SPI_BUFFER_USAGE_TYPE DRV_SPI_BUFFER_TYPE_STANDARD
```

Description

SPI buffer type configuration

This macro controls the buffer type of the SPI driver.

Remarks

None.

5.1.9.7.4.6 DRV_SPI_CLIENTS_NUMBER Macro**C**

```
#define DRV_SPI_CLIENTS_NUMBER 1
```

Description

SPI maximum number of clients

This definition selects the maximum number of clients that the SPI driver can support at run time.

Remarks

None.

5.1.9.7.4.7 DRV_SPI_CLOCK_OPERATION_MODE Macro**C**

```
#define DRV_SPI_CLOCK_OPERATION_MODE DRV_SPI_CLOCK_MODE_IDLE_LOW_EDGE_RISE
```

Description

SPI clock mode configuration

This macro controls the clock mode of the SPI driver.

Remarks

None.

5.1.9.7.4.8 DRV_SPI_COMMUNICATION_WIDTH Macro**C**

```
#define DRV_SPI_COMMUNICATION_WIDTH SPI_COMMUNICATION_8BIT_WIDE
```

Description

SPI communication width configuration

This macro controls the communication width of the SPI driver.

Remarks

None.

5.1.9.7.4.9 DRV_SPI_FRAME_SYNC_PULSE_COUNT Macro**C**

```
#define DRV_SPI_FRAME_SYNC_PULSE_COUNT SPI_FRAME_SYNC_PULSE_16_CHAR
```

Description

SPI frame sync pulse count selection

This macro selects the SPI frame sync pulse count.

Remarks

None.

5.1.9.7.4.10 DRV_SPI_FRAME_SYNC_PULSE_DIRECTION Macro

C

```
#define DRV_SPI_FRAME_SYNC_PULSE_DIRECTION SPI_FRAME_PULSE_DIRECTION_INPUT
```

Description

SPI frame sync pulse direction selection

This macro selects the SPI frame sync pulse direction.

Remarks

None.

5.1.9.7.4.11 DRV_SPI_FRAME_SYNC_PULSE_EDGE Macro

C

```
#define DRV_SPI_FRAME_SYNC_PULSE_EDGE SPI_FRAME_PULSE_EDGE_PRECEDES_FIRST_CLOCK
```

Description

SPI frame sync pulse edge selection

This macro selects the SPI frame sync pulse edge.

Remarks

None.

5.1.9.7.4.12 DRV_SPI_FRAME_SYNC_PULSE_POLARITY Macro

C

```
#define DRV_SPI_FRAME_SYNC_PULSE_POLARITY SPI_FRAME_PULSE_POLARITY_ACTIVE_HIGH
```

Description

SPI frame sync pulse polarity selection

This macro selects the SPI frame sync pulse polarity.

Remarks

None.

5.1.9.7.4.13 DRV_SPI_FRAME_SYNC_PULSE_WIDTH Macro

C

```
#define DRV_SPI_FRAME_SYNC_PULSE_WIDTH SPI_FRAME_PULSE_WIDTH_TO_ONE_WORD
```

Description

SPI frame sync pulse width selection

This macro selects the SPI frame sync pulse width.

Remarks

None.

5.1.9.7.4.14 DRV_SPI_INDEX Macro

C

```
#define DRV_SPI_INDEX DRV_SPI_INDEX_2
```

Description

SPI static index selection

This definition selects the SPI static index for the driver object reference.

Remarks

This index is required to make a reference to the driver object.

5.1.9.7.4.15 DRV_SPI_INDEX_0 Macro

C

```
#define DRV_SPI_INDEX_0 0
```

Description

SPI Driver Module Index Numbers

These constants provide the SPI driver index definitions.

Remarks

These constants should be used in place of hard-coded numeric literals.

These values should be passed into the [DRV_SPI_Initialize](#) and [DRV_SPI_Open](#) functions to identify the driver instance in use.

5.1.9.7.4.16 DRV_SPI_INDEX_COUNT Macro

C

```
#define DRV_SPI_INDEX_COUNT SPI_NUMBER_OF_MODULES
```

Description

SPI Driver Module Index Count

This constant identifies the number of valid SPI driver indices.

Remarks

This constant should be used in place of hard-coded numeric literals.

This value is derived from device-specific header files defined as part of the peripheral libraries.

5.1.9.7.4.17 DRV_SPI_INPUT_SAMPLE_PHASE Macro

C

```
#define DRV_SPI_INPUT_SAMPLE_PHASE SPI_INPUT_SAMPLING_PHASE_IN_MIDDLE
```

Description

SPI input sample phase selection

This macro selects the SPI input sample phase.

Remarks

None.

5.1.9.7.4.18 DRV_SPI_INSTANCES_NUMBER Macro

C

```
#define DRV_SPI_INSTANCES_NUMBER 1
```

Description

SPI hardware instance configuration

This definition selects the maximum number of hardware instances that can be supported by the dynamic driver.

Remarks

None.

5.1.9.7.4.19 DRV_SPI_INTERRUPT_MODE Macro

C

```
#define DRV_SPI_INTERRUPT_MODE false
```

Description

SPI interrupt and polled mode operation control

This macro controls the operation of the driver in the interrupt mode of operation. The possible values of this macro are:

- true - Select if interrupt mode of SPI operation is desired
 - false - Select if polling mode of SPI operation is desired
- Not defining this option to true or false will result in build error.

Remarks

None.

5.1.9.7.4.20 DRV_SPI_INTERRUPT_SOURCE_ERROR Macro

C

```
#define DRV_SPI_INTERRUPT_SOURCE_ERROR INT_SOURCE_SPI_1_ERROR
```

Description

SPI error interrupt source

Macro to define the error interrupt source in case of static driver.

Remarks

Refer to the INT PLIB document for more information on [INT_SOURCE](#) enumeration

5.1.9.7.4.21 DRV_SPI_INTERRUPT_SOURCE_RX Macro

C

```
#define DRV_SPI_INTERRUPT_SOURCE_RX INT_SOURCE_SPI_1_EVENT
```

Description

SPI receive interrupt source

This macro defines the receive interrupt source of the static driver.

Remarks

Refer to the Interrupt Peripheral Library documentation for more information on [INT_SOURCE](#) enumeration.

This should be specified in case the device does not have a dedicated receive interrupt source.

5.1.9.7.4.22 DRV_SPI_INTERRUPT_SOURCE_TX Macro**C**

```
#define DRV_SPI_INTERRUPT_SOURCE_TX INT_SOURCE_SPI_1_EVENT
```

Description

SPI transmit/receive or transmit alone interrupt source

This macro defines the transmit/receive or transmit alone interrupt source of the static driver.

Remarks

Refer to the Interrupt Peripheral Library documentation for more information on the [INT_SOURCE](#) enumeration.

Some devices have a single interrupt source for both transmit and receive communication, while some have a dedicated transmit interrupt source. These are handled through the DRV_SPI_INTERRUPT_SOURCE configuration switch.

5.1.9.7.4.23 DRV_SPI_PERIPHERAL_ID Macro**C**

```
#define DRV_SPI_PERIPHERAL_ID SPI_ID_1
```

Description

SPI peripheral ID selection

This macro selects the SPI peripheral ID selection. This is an initialization override of the spiID member of the initialization configuration.

Remarks

Some devices also support SPI_ID_0.

5.1.9.7.4.24 DRV_SPI_PORTS_REMAP_USAGE Macro**C**

```
#define DRV_SPI_PORTS_REMAP_USAGE false
```

Description

SPI pins remap selection

This macro selects the SPI pins remap. The possible values of this macro are:

- true - Remap is required
- false - Remap is not required

Remarks

None.

5.1.9.7.4.25 DRV_SPI_POWER_STATE Macro

C

```
#define DRV_SPI_POWER_STATE SYS_MODULE_POWER_IDLE_STOP
```

Description

SPI power state configuration

This macro controls the power state of the SPI driver.

Remarks

This feature may not be available in the device or the SPI module selected.

5.1.9.7.4.26 DRV_SPI_PROTOCOL Macro

C

```
#define DRV_SPI_PROTOCOL DRV_SPI_PROTOCOL_TYPE_STANDARD
```

Description

SPI protocol type configuration

This macro controls the protocol type of the SPI driver.

Remarks

None.

5.1.9.7.4.27 DRV_SPI_USAGE_MODE Macro

C

```
#define DRV_SPI_USAGE_MODE DRV_SPI_MODE_MASTER
```

Description

SPI usage mode configuration

This macro controls the usage mode of the SPI driver.

Remarks

None.

5.1.9.7.4.28 DRV_SPI_BUFFER_EVENT Enumeration

C

```
typedef enum {  
    DRV_SPI_BUFFER_EVENT_PENDING,  
    DRV_SPI_BUFFER_EVENT_COMPLETE,  
    DRV_SPI_BUFFER_EVENT_ERROR  
} DRV_SPI_BUFFER_EVENT;
```

Description

SPI Driver Buffer Events

This enumeration identifies the possible events that can result from a buffer add request caused by the client calling either the DRV_NVM_BufferAddRead or DRV_NVM_BufferAddWrite functions.

Members

Members	Description
DRV_SPI_BUFFER_EVENT_PENDING	Buffer is pending to get processed
DRV_SPI_BUFFER_EVENT_COMPLETE	All data from or to the buffer was transferred successfully.
DRV_SPI_BUFFER_EVENT_ERROR	There was an error while processing the buffer transfer request.

Remarks

One of these values is passed in the "event" parameter of the event handling callback function that the client registered with the driver by calling the DRV_NVM_BufferEventHandlerSet function when a buffer transfer request is completed.

5.1.9.7.4.29 DRV_SPI_BUFFER_EVENT_HANDLER Type**C**

```
typedef void (* DRV_SPI_BUFFER_EVENT_HANDLER)(DRV_SPI_BUFFER_EVENT event,
DRV_SPI_BUFFER_HANDLE bufferHandle, uintptr_t context);
```

Description

SPI Driver Buffer Event Handler Function Pointer

This data type defines the required function signature for the SPI driver buffer event handling callback function. A client must register a pointer to a buffer event handling function whose function signature (parameter and return value types) match the types specified by this function pointer in order to receive buffer related event calls back from the driver.

The parameters and return values and return value are described here and a partial example implementation is provided.

Parameters

Parameters	Description
event	Identifies the type of event
bufferHandle	Handle identifying the buffer to which the event relates
context	Value identifying the context of the application that registered the event handling function.

Returns

None.

Remarks

If the event is DRV_SPI_BUFFER_EVENT_COMPLETE, it means that the data was transferred successfully.

If the event is DRV_SPI_BUFFER_EVENT_ERROR, it means that the data was not transferred successfully.

The bufferHandle parameter contains the buffer handle of the buffer that failed.

The context parameter contains the a handle to the client context, provided at the time the event handling function was registered using the DRV_SPI_BufferEventHandlerSet function. This context handle value is passed back to the client as the "context" parameter. It can be any value necessary to identify the client context or instance (such as a pointer to the client's data) instance of the client that made the buffer add request.

The event handler function executes in an interrupt context when the driver is configured for interrupt mode operation. It is recommended of the application to not perform process intensive operations within this function.

Example

```
void APP_MyBufferEventHandler( DRV_SPI_BUFFER_EVENT event,
                             DRV_SPI_BUFFER_HANDLE bufferHandle,
                             uintptr_t context )
{
```

```

MY_APP_DATA_STRUCT pAppData = (MY_APP_DATA_STRUCT) context;

switch(event)
{
    case DRV_SPI_BUFFER_EVENT_COMPLETE:

        // Handle the completed buffer.
        break;

    case DRV_SPI_BUFFER_EVENT_ERROR:
    default:

        // Handle error.
        break;
}
}

```

5.1.9.7.4.30 DRV_SPI_BUFFER_HANDLE Type

C

```
typedef uintptr_t DRV_SPI_BUFFER_HANDLE;
```

Description

SPI Driver Buffer Handle

A buffer handle value is returned by a call to the [DRV_SPI_BufferAddRead\(\)](#)/ [DRV_SPI_BufferAddWrite\(\)](#) or [DRV_SPI_BufferAddReadWrite\(\)](#) functions. This handle is associated with the buffer passed into the function and it allows the application to track the completion of the data from (or into) that buffer. The buffer handle value returned from the "buffer add" function is returned back to the client by the "callback" function registered with the driver.

The buffer handle assigned to a client request expires when the client has been notified of the completion of the buffer transfer (after event handler function that notifies the client returns) or after the buffer has been retired by the driver if no event handler callback was set.

Remarks

None

5.1.9.7.4.31 DRV_SPI_BUFFER_TYPE Enumeration

C

```
typedef enum {
    DRV_SPI_BUFFER_TYPE_STANDARD,
    DRV_SPI_BUFFER_TYPE_ENHANCED
} DRV_SPI_BUFFER_TYPE;
```

Description

SPI Buffer Type Selection

This enumeration identifies the various buffer types of the SPI module.

Members

Members	Description
DRV_SPI_BUFFER_TYPE_STANDARD	SPI Buffer Type Standard
DRV_SPI_BUFFER_TYPE_ENHANCED	SPI Enhanced Buffer Type

Remarks

None.

5.1.9.7.4.32 DRV_SPI_CLIENT_SETUP Type

C

```
typedef struct _DRV_SPI_CLIENT_SETUP DRV_SPI_CLIENT_SETUP;
```

Description

SPI Client Initialization Data

This structure lists the elements needed to set up an SPI client. Used by the function [DRV_SPI_ClientSetup](#) function. This data type defines the data required to initialize an SPI client.

Remarks

None.

5.1.9.7.4.33 DRV_SPI_CLOCK_MODE Enumeration

C

```
typedef enum {
    DRV_SPI_CLOCK_MODE_IDLE_LOW_EDGE_RISE,
    DRV_SPI_CLOCK_MODE_IDLE_LOW_EDGE_FALL,
    DRV_SPI_CLOCK_MODE_IDLE_HIGH_EDGE_FALL,
    DRV_SPI_CLOCK_MODE_IDLE_HIGH_EDGE_RISE
} DRV_SPI_CLOCK_MODE;
```

Description

SPI Clock Mode Selection

This enumeration identifies the various clock modes of the SPI module.

Members

Members	Description
DRV_SPI_CLOCK_MODE_IDLE_LOW_EDGE_RISE	SPI Clock Mode 0 - Idle State Low & Sampling on Rising Edge
DRV_SPI_CLOCK_MODE_IDLE_LOW_EDGE_FALL	SPI Clock Mode 1 - Idle State Low & Sampling on Falling Edge
DRV_SPI_CLOCK_MODE_IDLE_HIGH_EDGE_FALL	SPI Clock Mode 2 - Idle State High & Sampling on Falling Edge
DRV_SPI_CLOCK_MODE_IDLE_HIGH_EDGE_RISE	SPI Clock Mode 3 - Idle State High & Sampling on Rising Edge

Remarks

None.

5.1.9.7.4.34 DRV_SPI_INIT Type

C

```
typedef struct _DRV_SPI_INIT DRV_SPI_INIT;
```

Description

SPI Driver Initialization Data

This data type defines the data required to initialize or reinitialize the SPI driver. If the driver is built statically, the members of this data structure are statically over-ridden by static override definitions in the system_config.h file.

Remarks

None.

5.1.9.7.4.35 DRV_SPI_MODE Enumeration

C

```
typedef enum {  
    DRV_SPI_MODE_MASTER,  
    DRV_SPI_MODE_SLAVE  
} DRV_SPI_MODE;
```

Description

SPI Usage Modes Enumeration

This enumeration identifies the various usage modes of the SPI module.

Members

Members	Description
DRV_SPI_MODE_MASTER	SPI Mode Master
DRV_SPI_MODE_SLAVE	SPI Mode Slave

Remarks

None.

5.1.9.7.4.36 DRV_SPI_PROTOCOL_TYPE Enumeration

C

```
typedef enum {  
    DRV_SPI_PROTOCOL_TYPE_STANDARD,  
    DRV_SPI_PROTOCOL_TYPE_FRAMED,  
    DRV_SPI_PROTOCOL_TYPE_AUDIO  
} DRV_SPI_PROTOCOL_TYPE;
```

Description

SPI Protocols Enumeration

This enumeration identifies the various protocols of the SPI module.

Members

Members	Description
DRV_SPI_PROTOCOL_TYPE_STANDARD	SPI Protocol Type Standard
DRV_SPI_PROTOCOL_TYPE_FRAMED	SPI Protocol Type Framed
DRV_SPI_PROTOCOL_TYPE_AUDIO	SPi Protocol Type Audio

Remarks

None.

5.1.9.8 Files

Files

Name	Description
drv_spi.h	SPI device driver interface file.
drv_spi_config_template.h	SPI Driver configuration definitions template.

Description

5.1.9.8.1 drv_spi.h

SPI Driver Interface

The SPI driver provides a simple interface to manage the SPI module. This file defines the interface definitions and prototypes for the SPI driver.

Enumerations

	Name	Description
	<u>DRV_SPI_BUFFER_EVENT</u>	Identifies the possible events that can result from a buffer add request.
	<u>DRV_SPI_BUFFER_TYPE</u>	Identifies the various buffer types of the SPI module.
	<u>DRV_SPI_CLOCK_MODE</u>	Identifies the various clock modes of the SPI module.
	<u>DRV_SPI_MODE</u>	Identifies the various usage modes of the SPI module.
	<u>DRV_SPI_PROTOCOL_TYPE</u>	Identifies the various protocols of the SPI module.

Functions

	Name	Description
	<u>DRV_SPI_BufferAddRead</u>	Registers a buffer for a read operation. Actual transfer will happen in the Task function.
	<u>DRV_SPI_BufferAddWrite</u>	Registers a buffer for a read operation. Actual transfer will happen in the Task function.
	<u>DRV_SPI_BufferAddWriteRead</u>	Registers a buffer for a read operation. Actual transfer will happen in the Task function.
	<u>DRV_SPI_BufferStatus</u>	Returns the transmitter and receiver transfer status.
	<u>DRV_SPI_ClientSetup</u>	Initializes a client.
	<u>DRV_SPI_Close</u>	Closes an opened instance of the SPI driver
	<u>DRV_SPI_Deinitialize</u>	De-initializes the specified instance of the SPI driver module.
	<u>DRV_SPI_Initialize</u>	Initializes the SPI driver.
	<u>DRV_SPI_Open</u>	Opens the specified SPI driver instance and returns a handle to it.
	<u>DRV_SPI_Read</u>	Gets/Reads byte(s) from SPI. The function will wait until the specified number of bytes is received.
	<u>DRV_SPI_Status</u>	Provides the current status of the SPI driver module.
	<u>DRV_SPI_Tasks</u>	Maintains the driver's state machine and implements its ISR.
	<u>DRV_SPI_VersionGet</u>	Gets the SPI driver version in numerical format.
	<u>DRV_SPI_VersionStrGet</u>	Gets the SPI driver version in string format.
	<u>DRV_SPI_Write</u>	Writes the data to SPI. The function will wait until all the bytes are transmitted.

Macros

	Name	Description
	<u>DRV_SPI_BUFFER_HANDLE_INVALID</u>	Definition of an invalid buffer handle.
	<u>DRV_SPI_INDEX_0</u>	SPI driver index definitions.
	<u>DRV_SPI_INDEX_1</u>	This is macro DRV_SPI_INDEX_1.
	<u>DRV_SPI_INDEX_2</u>	This is macro DRV_SPI_INDEX_2.
	<u>DRV_SPI_INDEX_3</u>	This is macro DRV_SPI_INDEX_3.
	<u>DRV_SPI_INDEX_4</u>	This is macro DRV_SPI_INDEX_4.

	DRV_SPI_INDEX_5	This is macro DRV_SPI_INDEX_5.
	DRV_SPI_INDEX_COUNT	Number of valid SPI driver indices.

Types

	Name	Description
	DRV_SPI_BUFFER_EVENT_HANDLER	Pointer to a SPI Driver Buffer Event handler function
	DRV_SPI_BUFFER_HANDLE	Handle identifying a read or write buffer passed to the driver.
	DRV_SPI_CLIENT_SETUP	Defines the data required to initialize an SPI client.
	DRV_SPI_INIT	Defines the data required to initialize or reinitialize the SPI driver

File Name

drv_spi.h

Company

Microchip Technology Inc.

5.1.9.8.2 drv_spi_config_template.h

SPI Driver Configuration Definitions for the Template Version

These definitions statically define the driver's mode of operation.

Macros

	Name	Description
	DRV_SPI_BAUD_RATE	Controls the baud rate value of the SPI driver.
	DRV_SPI_BAUD_RATE_CLOCK	Selects the SPI baud rate clock.
	DRV_SPI_BUFFER_SIZE	This is macro DRV_SPI_BUFFER_SIZE.
	DRV_SPI_BUFFER_USAGE_TYPE	Controls the buffer type of the SPI driver.
	DRV_SPI_CLIENTS_NUMBER	Selects the maximum number of clients.
	DRV_SPI_CLOCK_OPERATION_MODE	Controls the clock mode of the SPI driver.
	DRV_SPI_COMMUNICATION_WIDTH	Controls the communication width of the SPI driver.
	DRV_SPI_FRAME_SYNC_PULSE_COUNT	Selects the SPI frame sync pulse count.
	DRV_SPI_FRAME_SYNC_PULSE_DIRECTION	Selects the SPI frame sync pulse direction.
	DRV_SPI_FRAME_SYNC_PULSE_EDGE	Selects the SPI frame sync pulse edge.
	DRV_SPI_FRAME_SYNC_PULSE_POLARITY	Selects the SPI frame sync pulse polarity.
	DRV_SPI_FRAME_SYNC_PULSE_WIDTH	Selects the SPI frame sync pulse width.
	DRV_SPI_INDEX	SPI static index selection.
	DRV_SPI_INPUT_SAMPLE_PHASE	Selects the SPI input sample phase.
	DRV_SPI_INSTANCES_NUMBER	Selects the maximum number of hardware instances that can be supported by the dynamic driver .
	DRV_SPI_INTERRUPT_MODE	Controls operation of the driver in the interrupt or polled mode.
	DRV_SPI_INTERRUPT_SOURCE_ERROR	Defines the error interrupt source in case of static driver
	DRV_SPI_INTERRUPT_SOURCE_RX	Defines the receive interrupt source in case of static driver.
	DRV_SPI_INTERRUPT_SOURCE_TX	Defines the transmit/receive or transmit alone interrupt source in case of static driver.
	DRV_SPI_PERIPHERAL_ID	SPI peripheral ID selection.
	DRV_SPI_PORTS_REMAP_USAGE	Selects the SPI pins remap.
	DRV_SPI_POWER_STATE	Controls the power state of the SPI driver.

	DRV_SPI_PROTOCOL	Controls the protocol type of the SPI driver.
	DRV_SPI_RX_FIFO_INTERRUPT_MODE	This is macro DRV_SPI_RX_FIFO_INTERRUPT_MODE.
	DRV_SPI_TX_FIFO_INTERRUPT_MODE	This is macro DRV_SPI_TX_FIFO_INTERRUPT_MODE.
	DRV_SPI_USAGE_MODE	Controls the usage mode of the SPI driver.

5.1.10 Timer Driver Library

5.1.10.1 Introduction

Timer Driver Library

for

Microchip Microcontrollers

This library provides an interface to manage the Timer module on the Microchip family of microcontrollers during different modes of operation.

Description**Overview**

Timers are useful for generating accurate time based periodic interrupts for software application or real time operating systems. Other uses include counting external pulses or accurate timing measurement of external events using the timer's gate functions and accurate hardware delays.

Please refer to the the Data Sheet for the part that is being used.

Note: Trademarks and Intellectual Property are property of their respective owners. Customers are responsible for obtaining appropriate licensing or rights before using this software.

5.1.10.2 Release Notes

MPLAB Harmony Version: v0.70b **Timer Driver Library Version :** 0.02 Alpha **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.1.10.3 SW License Agreement

© 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS." 5.1.10.4 Using the Library

This topic describes the basic architecture of the Timer Driver Library and provides information and examples on how to use it.

Interface Header File: [drv_tmr.h](#)

The interface to the Timer Driver Library is defined in the "[drv_tmr.h](#)" header file.

Please refer to the [MPLAB Harmony Overview](#) for how the driver interacts with the framework.

5.1.10.4.1 Abstraction Model

Microchip devices have two type of timers:

- Period-Match - When the counting timer matches the configured period, this timer is said to complete one iteration and an interrupt is set
- Overflow - When the counting timer overflows/rolls over, interrupt is set and restarts from its previously set counter value. In this case, the preset period value would be the maximum possible count value.

The Timer Driver abstracts this difference and provides a unified model for both of these types of timers.

Description

Abstraction Model

The abstraction model of the Timer Driver is explained in the following diagram:

The core functionality of the Timer allows access to both the counter and the period values.

The unified model allows user not to worry about whether the Timer currently being used is a overflow or period match-based. The user simply updates the period and the driver automatically takes care of adjusting the respective Timer's periodicity. In case a user needs any modification into the counter's initial value (i.e., to adjust for any errors in periodicity), they are allowed to do so using the counter control interfaces.

5.1.10.4.2 Library Overview

Refer to the section [Driver Overview](#) for how the driver operates in a system.

The table below lists the interface section and its brief description.

Library Interface Section	Description
Configuration	Provides macros for configuring the system. It is required that the system configures the driver to build correctly by choosing appropriate configuration options as listed in this section. These macros enable different features or modes of the timer peripheral.
System Interaction Functions	Provides interfaces to system layer to initialize, deinitialize and reinitialize the module. This section also describes functions to query the status of the module.
Core Functions	Provides interfaces for core functionality of the driver.
Alarm Functions	Provides interfaces to handle alarm features, if alarm functionality is enabled.
Period Functions	Provides interfaces to control the periodicity of the timers.
Counter Control Functions	Provides interfaces to update the counter values.
Miscellaneous Functions	Provides interfaces to get the version information, timer tick and operating frequencies.

5.1.10.4.3 How the Library Works

The library provides interfaces to support:

- System Interaction
- Sync Mode Setup
- Period Modification
- Counter Modification
- Client Core Functionality
- Client Alarm Functionality (optional function, enabled using configuration options)
- Other Optional Functionality (enabled using configuration options)

Note: Any code segment pertaining to the driver interfaces will work for both the static or dynamic configurations. It is not necessary to modify the code to move from one configuration to the other (i.e., from static or dynamic or static-multi).

5.1.10.4.3.1 System Interaction

This section describes Timer initialization and reinitialization.

Description

Initialization and Reinitialization

The system performs the initialization and the reinitialization of the device driver with settings that affect only the instance of the device that is being initialized or re-initialized. During system initialization, each instance of the Timer module will be initialized with the following configuration settings (either passed dynamically at run time using [DRV_TMR_INIT](#) or by using initialization overrides) that are supported by the specific Timer module hardware:

Initialization member	Configuration Name	Description
moduleInit	DRV_TMR_POWER_STATE	System module initialization of the power state.
tmrId	DRV_TMR_PERIPHERAL_ID	Timer hardware module ID (peripheral library-level ID).
clockSource	DRV_TMR_CLOCK_SOURCE	Clock Source Selection, Enables either the internal or the external clock, using one of the possible values from TMR_CLOCK_SOURCE .
timerPeriod	DRV_TMR_TIMER_PERIOD	Timer period value.
prescale	DRV_TMR_PRESCALE	Sets up the prescaler, using one of the possible values from TMR_PRESCALE .
sourceEdge	DRV_TMR_SOURCE_EDGE	Source edge selection, if supported by the hardware, selects either the rising or falling edge, using one of the possible values from TMR_CLOCK_SOURCE_EDGE .
postscale	DRV_TMR_POSTSCALE	Sets up the postscaler, if supported by the hardware, using one of the possible values from TMR_POSTSCALE .
syncMode	DRV_TMR_SYNCHRONIZATION_MODE	Selects the operation mode of the instance using one of the possible values from DRV_TMR_SYNC_MODE .
interruptSource	DRV_TMR_INTERRUPT_SOURCE	Interrupt source identifier for the Timer module being initialized, which is available from the respective device's processor headers.

The [DRV_TMR_Initialize](#) function returns an object handle of the type [SYS_MODULE_OBJ](#). After this, the object handle returned by the Initialize interface would be used by the other system interfaces like [DRV_TMR_Reinitialize](#), [DRV_TMR_Deinitialize](#), [DRV_TMR_Status](#) and [DRV_TMR_Tasks](#).

Example: Timer Initialization Through [DRV_TMR_INIT](#)

```

DRV_TMR_INIT      init;
SYS_MODULE_OBJ    object;
SYS_STATUS        tmrStatus;

// populate the TMR init configuration structure
init.moduleInit.value = SYS_MODULE_POWER_RUN_FULL;
init.tmrId            = TMR_ID_2;
init.clockSource      = TMR_CLOCK_SOURCE_PERIPHERAL_CLOCK;
init.prescale         = TMR_PRESCALE_TX_VALUE_256;
init.syncMode         = DRV_TMR_SYNC_MODE_SYNCHRONOUS_INTERNAL;
init.interruptSource  = INT_SOURCE_TIMER_2;
init.timerPeriod      = 0xABCD;

object = DRV_TMR_Initialize (DRV_TMR_INDEX_0, (SYS_MODULE_INIT *)&init);

tmrStatus = DRV_TMR_Status(object);

if ( SYS_STATUS_READY != tmrStatus)
{
    // Handle error
}

```

Example: Timer initialization Through Configuration

Source file:

```
SYS_MODULE_OBJ    object;
SYS_STATUS        tmrStatus;
```

```
int main( void )
{
    object = DRV_TMR_Initialize (DRV_TMR_INDEX_0, (SYS_MODULE_INIT *)NULL);

    tmrStatus = DRV_TMR_Status(object);

    if ( SYS_STATUS_READY != tmrStatus)
    {
        // Handle error
    }
}
```

Configuration file: sys_config.h

```
#define DRV_TMR_POWER_STATE          SYS_MODULE_POWER_RUN_FULL
#define DRV_TMR_PERIPHERAL_ID        TMR_ID_3 // TMR_MODULE_ID
#define DRV_TMR_CLOCK_SOURCE          TMR_CLOCK_SOURCE_PERIPHERAL_CLOCK
#define DRV_TMR_PRESCALE              TMR_PRESCALE_TX_VALUE_256
#define DRV_TMR_SYNCHRONIZATION_MODE DRV_TMR_SYNC_MODE_SYNCHRONOUS_INTERNAL
#define DRV_TMR_INTERRUPT_SOURCE      INT_SOURCE_TIMER_3
#define DRV_TMR_TIMER_PERIOD          0x0000F424 // 200ms
```

Deinitialization

Once the Initialize operation has been called, the Deinitialize operation must be called before the initialize operation can be called again. This routine may block if the driver is running in an OS environment that supports blocking operations and the driver requires system resources access. However, the routine will never block for hardware Timer access. If the operation requires time to allow the hardware to complete, this will be reported by the [DRV_TMR_Status](#) operation.

Status

Timer status is available to query the module state before, during, and after initialization, deinitialization, and reinitialization.

Tasks Routine

The interface [DRV_TMR_Tasks](#) can be called in two ways:

- By the system task service in a polled environment
- By the interrupt service routine of the timer in an interrupt based system

Example: Polling

```
int main( void )
{
    SYS_MODULE_OBJ object;
    object = DRV_TMR_Initialize( DRV_TMR_INDEX_0, (SYS_MODULE_INIT *) &initConf );

    if( SYS_STATUS_READY != DRV_TMR_Status( object ) )
        return 0;

    while (1)
    {
        DRV_TMR_Tasks (object);
    }
}
```

Example: Interrupt

```
int main( void )
{
```

```

SYS_MODULE_OBJ object;
object = DRV_TMR_Initialize( DRV_TMR_INDEX_0, (SYS_MODULE_INIT *) &initConf );

if( SYS_STATUS_READY != DRV_TMR_Status( object ) )
    return 0;

while (1);
}

/* Sample interrupt routine not specific to any device family */
void ISR T1Interrupt(void)
{
    //Call the Timer Tasks routine
    DRV_TMR_Tasks(object);
}

```

5.1.10.4.3.2 Client Interaction

This section describes general client operation.

Description

General Client Operation

For the application to begin using an instance of the Timer module, it must call the [DRV_TMR_Open](#) function. This provides the configuration required to open the Timer instance for operation. If the driver is deinitialized using the function [DRV_TMR_Deinitialize](#), the application must call the [DRV_TMR_Open](#) function again to set up the instance of the Timer. The function [DRV_TMR_Open](#) need not be called again if the system is reinitialized using the [DRV_TMR_Reinitialize](#) function.

The Timer Driver supports only the 'DRV_IO_INTENT_EXCLUSIVE' IO_INTENT.

Example:

```

DRV_HANDLE handle;

// Configure the instance DRV_TMR_INDEX_1 with the configuration
handle = DRV_TMR_Open(DRV_TMR_INDEX_1, DRV_IO_INTENT_EXCLUSIVE);

if( handle == DRV_HANDLE_INVALID )
{
    // Client cannot open the instance.
}

```

The function [DRV_TMR_Close](#) closes an already opened instance of the Timer Driver, invalidating the handle. [DRV_TMR_Open](#) must have been called to obtain a valid opened device handle.

Example:

```

DRV_HANDLE handle;

// Configure the instance DRV_TMR_INDEX_1 with the configuration
handle = DRV_TMR_Open(DRV_TMR_INDEX_1, DRV_IO_INTENT_EXCLUSIVE);

/*...*/

DRV_TMR_Close( handle );

```

The client has the option to check the status through the interface [DRV_TMR_ClientStatus](#).

Example:

```

DRV_HANDLE handle;

// Configure the instance DRV_TMR_INDEX_1 with the configuration
handle = DRV_TMR_Open(DRV_TMR_INDEX_1, DRV_IO_INTENT_EXCLUSIVE);

```

```
if ( DRV_TMR_CLIENT_STATUS_READY != DRV_TMR_ClientStatus( handle ) )
    return 0;
```

5.1.10.4.3.3 Sync Mode Selection

This section describes the Sync mode selection process.

Description

Sync Mode Selection

The Timer Driver can operate in various modes as described below. They can be changed using [DRV_TMR_SyncModeSet](#), and the current mode being using by the Timer can be retrieved using [DRV_TMR_SyncModeGet](#).

DRV_TMR_SYNC_MODE_SYNCHRONOUS_INTERNAL - Synchronous Internal Clock Counter

- This mode can be used to provide the following capabilities:
 - Create elapsed time measurements
 - Create time delays
 - Create periodic timer interrupts
- The input clock to the Timer is provided from the internal system clock
- The Timer increments in the effective delta time specified by the prescaler and the selected source clock

DRV_TMR_SYNC_MODE_SYNCHRONOUS_INTERNAL_GATED - Synchronous Internal Gated Counter

- In this mode, the operation is dependent on an external signal applied to a pin assigned as a gate. When the gate signal remains high, the Timer increments. When the gate signal goes low, the operation terminates.
- Input clock to the timer is provided from the internal system clock
- The Timer increments in the effective delta time specified by the prescaler and the selected source clock
- Gated Timer mode is not possible when the Timer is set to use external clock source

DRV_TMR_SYNC_MODE_SYNCHRONOUS_EXTERNAL_WITHOUT_CLKSYNC - Synchronous External Clock Counter

- The Synchronous External Clock Counter operation provides the following capabilities:
 - Counting periodic or non-periodic pulses
 - Uses the external clock as the time base for Timers
- The selected Timer increments on every rising edge of the clock input on the TxCK pin

DRV_TMR_SYNC_MODE_SYNCHRONOUS_EXTERNAL_WITH_CLKSYNC - Synchronous External Clock Counter

- The clock source for the Timer is provided externally
- The selected Timer increments on every rising edge of the input on the TxCK pin
- External Clock sync is enabled to operate in the Synchronous mode

DRV_TMR_SYNC_MODE_ASYNCHRONOUS_EXTERNAL_WITHOUT_CLKSYNC - Asynchronous External Clock Counter

- The Asynchronous Timer operation provides the following capabilities:
 - The Timer can operate during Sleep mode and can generate an interrupt on a period register match that will wake the processor from Sleep or Idle modes.
 - The Timer can be clocked from the secondary oscillator for real-time clock applications
- The clock source for the Timer is provided externally
- The selected Timer increments on every rising edge of the clock input on the TxCK pin
- Synchronization with the external clock is disabled

DRV_TMR_SYNC_MODE_ASYNCHRONOUS_EXTERNAL_WITH_CLKSYNC - Asynchronous External Clock Counter

- The clock source for the Timer is provided externally
- The selected Timer increments on every rising edge of the clock input on the TxCK pin
- Synchronization with the external clock is enabled

Changing the Sync Mode

Perform the following steps before changing the sync mode.

Preconditions: [DRV_TMR_Open](#) should have been called before calling this function and should have returned a valid handle.

1. Stop the TMR module using [DRV_TMR_Stop](#).
2. Change the sync mode using [DRV_TMR_SyncModeSet](#).
3. Update the counter using [DRV_TMR_Counter\[8Bit/16Bit/32Bit\]Set](#), if applicable.
4. Start the TMR module using [DRV_TMR_Start](#).

Example:

```
DRV_HANDLE handle;
/* Open the client */
handle = DRV_TMR_Open( DRV_TMR_INDEX_0, DRV_IO_INTENT_EXCLUSIVE );

/* Stop the timer */
DRV_TMR_Stop( handle );
/* Change the sync mode */
DRV_TMR_SyncModeSet( handle, DRV_TMR_SYNC_MODE_SYNCHRONOUS_INTERNAL );
/* Re-start the timer */
DRV_TMR_Start( handle );
```

Note: Not all modes are supported by all the Timer modules. Please refer the specific device data sheet to determine the supported modes for your device.

5.1.10.4.3.4 Period Modification

This section describes Period modification for the different types of Timers (i.e., 8-/16-/32-bit).

Description

These set of functions help modify the Timer periodicity at the client level, regardless of whether it is an overflow or a period match-based Timer.

This interface can be used to alter the already set periodicity at the system level interface [DRV_TMR_Initialize](#).

Period Modification

Periodicity for the type of Timer (8-/16-/32-bit) can be controlled as follows:

- 8-bit timer periodicity can be modified using [DRV_TMR_Period8BitSet](#) and the current period value can be obtained using [DRV_TMR_Period8BitGet](#)
- 16-bit timer periodicity can be modified using [DRV_TMR_Period16BitSet](#) and the current period value can be obtained using [DRV_TMR_Period16BitGet](#)
- 32-bit timer periodicity can be modified using [DRV_TMR_Period32BitSet](#) and the current period value can be obtained using [DRV_TMR_Period32BitGet](#)

Example:

```
DRV_HANDLE handle;
/* Open the client */
handle = DRV_TMR_Open( DRV_TMR_INDEX_0, DRV_IO_INTENT_EXCLUSIVE );

/* ... */
```

```
/* Update the new period */
DRV_TMR_Period16BitSet( handle, 0x0000C350);
```

5.1.10.4.3.5 Counter Modification

This section describes counter modification for the different types of Timers (i.e., 8-/16-/32-bit).

Description

These set of functions help modify the initial value of the Timer counters to help adjust any errors in the periodicity.

Counter Modification

Initial counter values can be controlled as follows:

- 8-bit timer initial value can be modified using [DRV_TMR_Counter8BitSet](#) and the current counter value can be obtained using [DRV_TMR_Counter8BitGet](#)
- 16-bit timer initial value can be modified using [DRV_TMR_Counter16BitSet](#) and the current counter value can be obtained using [DRV_TMR_Counter16BitGet](#)
- 32-bit timer initial value can be modified using [DRV_TMR_Counter32BitSet](#) and the current counter value can be obtained using [DRV_TMR_Counter32BitGet](#)

Example:

```
DRV_HANDLE handle;
/* Open the client */
handle = DRV_TMR_Open( DRV_TMR_INDEX_0, DRV_IO_INTENT_EXCLUSIVE );

/* ... */

/* Update the counter value */
/* Following code updates the initial value from 0x0000 to 0x0010
   to cover up any error in the previously set periodicity */

DRV_TMR_Counter16BitSet( handle, 0x0010);
```

5.1.10.4.3.6 Core Functionality

This section describes core functionality of the Timer Driver.

Description

Core functionality provides a extremely basic interface for the driver operation.

Applications using the core Timer core functionality, need to perform the following:

1. The system should have completed the necessary initialization and [DRV_TMR_Tasks](#) should either be running in a polled environment, or in an interrupt environment.
2. Open the driver using [DRV_TMR_Open](#). The Timer Driver supports exclusive access only.
3. The Timer period will have to be updated using [DRV_TMR_Period\[8Bit/16Bit/32Bit\]Set](#) if the client intends to override the already preset value during the initialization. The previously set value can be retrieved using [DRV_TMR_Period\[8Bit/16Bit/32Bit\]Get](#).
4. Start the driver using [DRV_TMR_Start](#).
5. Poll for the elapse status using [DRV_TMR_ElapsedStatusGetAndClear](#) and handle the rest of the processing based on the status.
6. The client will be able to stop the started Timer instance using [DRV_TMR_Stop](#) at any time and will be able to close it using [DRV_TMR_Close](#) when it is no longer required.

Example :

```
DRV_HANDLE handle;
```

```

/* Open the client */
handle = DRV_TMR_Open( DRV_TMR_INDEX_0, DRV_IO_INTENT_EXCLUSIVE );

while (1)
{
    // Interrupt mode & hence the DRV_TMR_Tasks not being called

    // client handle returned by the Open API
    if (true == DRV_TMR_ElapsedStatusGetAndClear(handle))
    {
        // Do something
    }
}

```

Notes:

1. The user needs to stop the Timer before any updates on the counter or period and restart it later.
2. The Timer elapsed status gets reset after any counter or period update.
3. The Timer elapse status remains unchanged if the user tries to stop and restart later.

5.1.10.4.3.7 Alarm Functionality

This section describes the Timer Driver alarm functionality.

Description

The Timer Driver provides alarm functionality. This is an optional advanced feature and needs to be enabled using the configuration macros.

Applications using the Timer alarm functionality, need to perform the following:

1. The system should have completed the necessary initialization and [DRV_TMR_Tasks](#) should either be running in a polled environment, or in an interrupt environment.
2. Open the driver using [DRV_TMR_Open](#). The Timer Driver supports exclusive access only.
3. Configure the alarm using [DRV_TMR_AlarmSet](#) with [DRV_TMR_ALARM_CONFIG](#).
4. Start the driver using [DRV_TMR_Start](#).
5. If a callback is configured, the Timer Driver will call the callback function when the alarm expires.
6. The client will be able to stop the started Timer module instance using [DRV_TMR_Stop](#) at any time and will be able to close it using [DRV_TMR_Close](#) when it is no longer required.

Precondition: For the callback to work, the switch [DRV_TMR_ALARM_ENABLE](#) needs to be defined in the configuration header.

Example:

```

DRV_HANDLE          handle;
DRV_TMR_ALARM_CONFIG alarmConfig;
uint32_t            alarmCount;

/* Open the client */
handle = DRV_TMR_Open (DRV_TMR_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);

/* Configure the timer alarm feature */
/* Callbacks are only allowed when the configuration switch
   DRV_TMR_ALARM_ENABLE is defined */
alarmConfig.type = DRV_TMR_ALARM_TYPE_PERIODIC;
alarmConfig.callback = &Callback;
DRV_TMR_AlarmSet (handle, &alarmConfig);

// Get all the alarm counters based on the number of alarm objects configured

```

```
alarmCount = DRV_TMR_AlarmCountGet (handle);

// Clear the Alarm counters associated with the HW instance
DRV_TMR_AlarmCountClear (handle);
```

The callback function in the application will look like:

```
void Callback (void)
{
    // Do something specific on an alarm event trigger
}
```

Note: The driver tasks function calls the client registered callback after the alarm expires.

5.1.10.4.3.8 Optional Interfaces

This section describes additional/optional client interfaces.

Description

Additional/Optional client interfaces include the following.

Get Operating Frequency

The function [DRV_TMR_OperatingFrequencyGet](#) provides the client with the information on the Timer operating frequency.

Example:

```
DRV_HANDLE handle;
uint32_t freq;

/* Open the client */
handle = DRV_TMR_Open (DRV_TMR_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);

freq = DRV_TMR_OperatingFrequencyGet (handle);
```

Get Tick Frequency

The function [DRV_TMR_TickFrequencyGet](#) provides the client with the information on the Timer tick frequency.

Example:

```
DRV_HANDLE handle;
uint32_t freq;

/* Open the client */
handle = DRV_TMR_Open (DRV_TMR_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);

freq = DRV_TMR_TickFrequencyGet (handle);
```

5.1.10.4.3.9 Example Usage of the Timer Driver

This section describes typical usage of the Timer Driver for various Timer modules in polling/interrupt advanced/core modes.

Description

Notes:

1. The interface calls remain the same whether using dynamic or static drivers.
2. There is a possibility that the user can pass NULL to the driver initialize interface. However, the respective configurations matching the init [[DRV_TMR_INIT](#)] members need to be configured in the correct manner.

Example 1:

```
// Polling mode under 32-bit count mode for a PIC32 device using the alarm feature
```

```

SYS_MODULE_OBJ object;

// main
DRV_TMR_INIT init;
DRV_HANDLE handle;
DRV_TMR_ALARM_CONFIG alConf;

init.moduleInit.value = SYS_MODULE_POWER_RUN_FULL;
init.tmrId             = TMR_ID_2;
init.clockSource       = TMR_CLOCK_SOURCE_PERIPHERAL_CLOCK;
init.prescale          = TMR_PRESCALE_TX_VALUE_256;
init.syncMode          = DRV_TMR_SYNC_MODE_SYNCHRONOUS_INTERNAL;
init.interruptSource   = INT_SOURCE_TIMER_3;
init.timerPeriod       = 0xFF00;

object = DRV_TMR_Initialize (DRV_TMR_INDEX_0, (SYS_MODULE_INIT *)&init);
if ( SYS_STATUS_READY != DRV_TMR_Status(object))
    return 0;

handle = DRV_TMR_Open (DRV_TMR_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);
if ( DRV_TMR_STATUS_READY != DRV_TMR_ClientStatus(handle))
    return 0;

alConf.alType = DRV_TMR_ALARM_TYPE_PERIODIC;
alConf.alCallback = &TestAlarmCallback;
DRV_TMR_AlarmSet (handle, &alConf);

DRV_TMR_Start (handle);

while (1)
{
    DRV_TMR_Tasks (object);
}

DRV_TMR_Stop (handle);

DRV_TMR_Close (handle);
if ( DRV_TMR_STATUS_INVALID != DRV_TMR_ClientStatus(handle))
    return 0;

DRV_TMR_Deinitialize (object);
// end main

void TestAlarmCallback (void)
{
    // Do something specific on an alarm event trigger
}

```

Example 2:

// Polling mode under 16-bit count mode for a PIC32/PIC24 device using the alarm feature

```

SYS_MODULE_OBJ object;

// main
DRV_TMR_INIT init;
DRV_HANDLE handle;
DRV_TMR_ALARM_CONFIG alConf;

init.moduleInit.value = SYS_MODULE_POWER_RUN_FULL;
init.tmrId             = TMR_ID_3;
init.clockSource       = TMR_CLOCK_SOURCE_PERIPHERAL_CLOCK;
init.prescale          = TMR_PRESCALE_TX_VALUE_256;
init.syncMode          = DRV_TMR_SYNC_MODE_SYNCHRONOUS_INTERNAL;
init.interruptSource   = INT_SOURCE_TIMER_3;
init.timerPeriod       = 0xFF00;

```

```

object = DRV_TMR_Initialize (DRV_TMR_INDEX_0, (SYS_MODULE_INIT *)&init);
if ( SYS_STATUS_READY != DRV_TMR_Status(object))
    return 0;

handle = DRV_TMR_Open (DRV_TMR_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);
if ( DRV_TMR_STATUS_READY != DRV_TMR_ClientStatus(handle))
    return 0;

alConf.alType = DRV_TMR_ALARM_TYPE_PERIODIC;
alConf.alCallback = &TestAlarmCallback;
DRV_TMR_AlarmSet (handle, &alConf);

DRV_TMR_Start (handle);

while (1)
{
    DRV_TMR_Tasks (object);
}

DRV_TMR_Stop (handle);

DRV_TMR_Close (handle);
if ( DRV_TMR_STATUS_INVALID != DRV_TMR_ClientStatus(handle))
    return 0;

DRV_TMR_Deinitialize (object);
// end main

void TestAlarmCallback (void)
{
    // Do something specific on an alarm event trigger
}

```

Example 3:

// Polling mode under 16-bit count mode for a PIC18 device, with Timer3 using the alarm feature

```

SYS_MODULE_OBJ object;

// main
DRV_TMR_INIT init;
DRV_HANDLE handle;
DRV_TMR_ALARM_CONFIG alConf;

init.moduleInit.value = SYS_MODULE_POWER_RUN_FULL;
init.tmrId             = TMR_ID_3;
init.clockSource       = TMR_CLOCK_SOURCE_PERIPHERAL_CLOCK;
init.prescale          = TMR_PRESCALE_T1_VALUE_8;
init.syncMode          = DRV_TMR_SYNC_MODE_SYNCHRONOUS_INTERNAL;
init.interruptSource   = INT_SOURCE_TIMER_3;
init.timerPeriod       = 0xFF00;

object = DRV_TMR_Initialize (DRV_TMR_INDEX_0, (SYS_MODULE_INIT *)&init);
if ( SYS_STATUS_READY != DRV_TMR_Status(object))
    return 0;

handle = DRV_TMR_Open (DRV_TMR_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);
if ( DRV_TMR_STATUS_READY != DRV_TMR_ClientStatus(handle))
    return 0;

alConf.alType = DRV_TMR_ALARM_TYPE_PERIODIC;
alConf.alCallback = &TestAlarmCallback;
DRV_TMR_AlarmSet (handle, &alConf);

DRV_TMR_Start (handle);

while (1)

```

```

{
    DRV_TMR_Tasks (object);
}

DRV_TMR_Stop (handle);

DRV_TMR_Close (handle);
if ( DRV_TMR_STATUS_INVALID != DRV_TMR_ClientStatus(handle))
    return 0;

DRV_TMR_Deinitialize (object);
// end main

void TestAlarmCallback (void)
{
    // Do something specific on an alarm event trigger
}

```

Example 4:

// Interrupt mode under 32-bit count mode for a PIC32 device using the alarm feature

```

SYS_MODULE_OBJ object;

// main
DRV_TMR_INIT init;
DRV_HANDLE handle;
DRV_TMR_ALARM_CONFIG alConf;

SYS_INT_Initialize ();

init.moduleInit.value = SYS_MODULE_POWER_RUN_FULL;
init.tmrId             = TMR_ID_2;
init.clockSource       = TMR_CLOCK_SOURCE_PERIPHERAL_CLOCK;
init.prescale          = TMR_PRESCALE_TX_VALUE_256;
init.syncMode          = DRV_TMR_SYNC_MODE_SYNCHRONOUS_INTERNAL;
init.interruptSource   = INT_SOURCE_TIMER_3;
init.timerPeriod       = 0xFF00;

object = DRV_TMR_Initialize (DRV_TMR_INDEX_0, (SYS_MODULE_INIT *)&init);
if ( SYS_STATUS_READY != DRV_TMR_Status(object))
    return 0;

handle = DRV_TMR_Open (DRV_TMR_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);
if ( DRV_TMR_STATUS_READY != DRV_TMR_ClientStatus(handle))
    return 0;

alConf.alType = DRV_TMR_ALARM_TYPE_PERIODIC;
alConf.alCallback = &TestAlarmCallback;
DRV_TMR_AlarmSet (handle, &alConf);

SYS_INT_PrioritySet (PLIB_INT_SOURCE_TIMER_3, PLIB_INT_PRIORITY_LEVEL1);
SYS_INT_SubprioritySet (PLIB_INT_SOURCE_TIMER_3, PLIB_INT_SUBPRIORITY_LEVEL1);

DRV_TMR_Start (handle);

while (1);

DRV_TMR_Stop (handle);

DRV_TMR_Close (handle);
if ( DRV_TMR_STATUS_INVALID != DRV_TMR_ClientStatus(handle))
    return 0;

DRV_TMR_Deinitialize (object);
// end main

```

```

void TestAlarmCallback (void)
{
    // Do something specific on an alarm event trigger
}

```

Example 5:

// Interrupt mode under 16-bit count mode for a PIC24 device using the alarm feature

```

SYS_MODULE_OBJ object;

// main
DRV_TMR_INIT init;
DRV_HANDLE handle;
DRV_TMR_ALARM_CONFIG alConf;

    DRV_TMR_Tasks (object);
    if (true == DRV_TMR_ElapsedStatusGetAndClear(handle))
        Callback();
}

DRV_TMR_Stop (handle);

DRV_TMR_Close (handle);
if ( DRV_TMR_STATUS_INVALID != DRV_TMR_ClientStatus(handle))

```

```

    return 0;

DRV_TMR_Deinitialize (object);
// end main

void Callback (void)
{
    // Do something specific
}

```

5.1.10.5 Configuring the Library

The configuration of the Timer Device Library is based on the file sys_config.h

This header file contains the configuration selection for the Timer Driver Library build. Based on the selections made here and the system setup, the Timer Driver driver may or may not support selected features. These configuration settings will apply to all instances of the driver.

This header can be placed anywhere in the application-specific folders and the path of this header needs to be presented to the include search for a successful build. Refer to the [Applications Overview](#) section for more details.

5.1.10.5.1 Initialization Overrides

Macros

	Name	Description
	DRV_TMR_CLOCK_SOURCE	Timer module clock source selection.
	DRV_TMR_PERIPHERAL_ID	Timer peripheral ID selection.
	DRV_TMR_POSTSCALE	Macro controls post scale of the TMR
	DRV_TMR_PRESCALE	Timer module prescale value.
	DRV_TMR_SOURCE_EDGE	Timer module source edge.
	DRV_TMR_SYNCHRONIZATION_MODE	Controls Synchronization mode of the Timer.
	DRV_TMR_TIMER_PERIOD	Timer period value for an overflow or a period match-based Timer.

Description

This section provides initialization overrides for the run time options that can be selected using [DRV_TMR_INIT](#) when passed into [DRV_TMR_Initialize](#) and [DRV_TMR_Reinitialize](#). When any of these options are defined, the build time override will be used.

5.1.10.5.1.1 DRV_TMR_CLOCK_SOURCE Macro

C

```
#define DRV_TMR_CLOCK_SOURCE TMR_CLOCK_SOURCE_PERIPHERAL_CLOCK
```

Description

TMR Clock Source

This macro selects the Timer module clock source based on the enumeration.

Remarks

If defined in the configuration, this takes priority over the initialization option.

Refer to the processor peripheral header for more information.

5.1.10.5.1.2 DRV_TMR_PERIPHERAL_ID Macro

C

```
#define DRV_TMR_PERIPHERAL_ID TMR_ID_1
```

Description

TMR Peripheral ID Selection

This macro selects the Timer peripheral ID. This is an initialization override of the `tmrID` member of the initialization configuration.

Remarks

Some devices also support `TMR_ID_0`.

5.1.10.5.1.3 DRV_TMR_POSTSCALE Macro

C

```
#define DRV_TMR_POSTSCALE TMR_POSTSCALE_1_TO_1
```

Description

TMR post scale configuration

This macro controls the post scale of the TMR

Remarks

This feature is not available in all modules/devices. Refer to the specific device data sheet for more information.

5.1.10.5.1.4 DRV_TMR_PRESCALE Macro

C

```
#define DRV_TMR_PRESCALE TMR_PRESCALE_TX_1_TO_256
```

Description

TMR Prescale

This macro defines the Timer module prescale value.

Remarks

If defined in the configuration, this takes priority over the initialization option.

Refer to the processor peripheral header for more information.

5.1.10.5.1.5 DRV_TMR_SOURCE_EDGE Macro

C

```
#define DRV_TMR_SOURCE_EDGE TMR_SOURCE_EDGE_INCREMENT_ON_LOW_TO_HIGH
```

Description

TMR Source Edge

This macro defines the Timer module source edge.

Remarks

If defined in the configuration, this takes priority over the initialization option.

Refer to the processor peripheral header for more information.

5.1.10.5.1.6 DRV_TMR_SYNCHRONIZATION_MODE Macro

C

```
#define DRV_TMR_SYNCHRONIZATION_MODE DRV_TMR_SYNC_MODE_SYNCHRONOUS_INTERNAL
```

Description

TMR Synchronization mode configuration

This macro controls the Synchronization mode of the Timer. It accepts one of the possible values of the enumeration [DRV_TMR_SYNC_MODE](#).

Remarks

If defined in the configuration, this takes priority over the initialization option.

5.1.10.5.1.7 DRV_TMR_TIMER_PERIOD Macro

C

```
#define DRV_TMR_TIMER_PERIOD 0x4567
```

Description

TMR period value

This macro defines the Timer period value for an overflow or a period match-based Timer.

Remarks

If defined in the configuration, this macro takes priority over the initialization option. In addition, the limit is the maximum possible Timer count width.

The user is required to provide the count value. The driver will internally adjust the value as required for the Timer hardware based on the overflow or period match functionality

5.1.10.5.2 System Config

Macros

	Name	Description
	DRV_TMR_COUNT_WIDTH	Controls the mode of the Timer.
	DRV_TMR_INDEX	Timer static index selection.
	DRV_TMR_INDEX_0	Timer driver index definitions
	DRV_TMR_INDEX_1	This is macro DRV_TMR_INDEX_1.
	DRV_TMR_INDEX_2	This is macro DRV_TMR_INDEX_2.
	DRV_TMR_INDEX_3	This is macro DRV_TMR_INDEX_3.
	DRV_TMR_INDEX_4	This is macro DRV_TMR_INDEX_4.
	DRV_TMR_INDEX_5	This is macro DRV_TMR_INDEX_5.
	DRV_TMR_INDEX_COUNT	Number of valid Timer driver indices.
	DRV_TMR_INSTANCES_NUMBER	Sets up the maximum number of hardware instances that can be supported by the dynamic driver.
	DRV_TMR_INTERRUPT_MODE	Controls operation of the driver in the interrupt or polled mode.

Description

5.1.10.5.2.1 DRV_TMR_COUNT_WIDTH Macro

C

```
#define DRV_TMR_COUNT_WIDTH 16
```

Description

TMR mode configuration

This macro controls the mode of the Timer, and selects whether the timer is to support 8-bit, 16-bit or 32-bit mode. The acceptable values of this configuration are:

- 8, (Use this for 8-bit timers)
- 16 (Use this for 16-bit timers)
- 32 (Use this for 32-bit timers)

Remarks

This is a mandatory configuration option, which enables the Timer count width.

5.1.10.5.2.2 DRV_TMR_INDEX Macro

C

```
#define DRV_TMR_INDEX DRV_TMR_INDEX_2
```

Description

TMR Static Index Selection

This definition selects the Timer Static Index for the driver object reference.

Remarks

This index is required to make a reference to the driver object.

5.1.10.5.2.3 DRV_TMR_INDEX_0 Macro

C

```
#define DRV_TMR_INDEX_0 0
```

Description

Timer Driver Module Index Numbers

These constants provide Timer driver index definitions.

Remarks

These constants should be used in place of hard-coded numeric literals.

These values should be passed into the [DRV_TMR_Initialize](#) and [DRV_TMR_Open](#) functions to identify the driver instance in use.

5.1.10.5.2.4 DRV_TMR_INDEX_1 Macro

C

```
#define DRV_TMR_INDEX_1 1
```

Description

This is macro DRV_TMR_INDEX_1.

5.1.10.5.2.5 DRV_TMR_INDEX_2 Macro

C

```
#define DRV_TMR_INDEX_2 2
```

Description

This is macro DRV_TMR_INDEX_2.

5.1.10.5.2.6 DRV_TMR_INDEX_3 Macro

C

```
#define DRV_TMR_INDEX_3 3
```

Description

This is macro DRV_TMR_INDEX_3.

5.1.10.5.2.7 DRV_TMR_INDEX_4 Macro

C

```
#define DRV_TMR_INDEX_4 4
```

Description

This is macro DRV_TMR_INDEX_4.

5.1.10.5.2.8 DRV_TMR_INDEX_5 Macro

C

```
#define DRV_TMR_INDEX_5 5
```

Description

This is macro DRV_TMR_INDEX_5.

5.1.10.5.2.9 DRV_TMR_INDEX_COUNT Macro

C

```
#define DRV_TMR_INDEX_COUNT TMR_NUMBER_OF_MODULES
```

Description

Timer Driver Module Index Count

This constant identifies Timer driver index definitions.

Remarks

This constant should be used in place of hard-coded numeric literals.

This value is device-specific.

5.1.10.5.2.10 DRV_TMR_INSTANCES_NUMBER Macro

C

```
#define DRV_TMR_INSTANCES_NUMBER 1
```

Description

Hardware instances support

This definition sets up the maximum number of hardware instances that can be supported by the dynamic driver.

Remarks

None

5.1.10.5.2.11 DRV_TMR_INTERRUPT_MODE Macro**C**

```
#define DRV_TMR_INTERRUPT_MODE true
```

Description

TMR Interrupt And Polled Mode Operation Control

This macro controls the operation of the driver in the interrupt mode of operation. The possible values of this macro are:

- true - Select if interrupt mode of timer operation is desired
- false - Select if polling mode of timer operation is desired

Not defining this option to true or false will result in a build error.

Remarks

None.

5.1.10.5.3 Alarm Config**Macros**

	Name	Description
	DRV_TMR_ALARM_ENABLE	Enables alarm functionality.
	DRV_TMR_ALARM_PERIODIC	Alarm type configuration.

Description**5.1.10.5.3.1 DRV_TMR_ALARM_ENABLE Macro****C**

```
#define DRV_TMR_ALARM_ENABLE
```

Description

Alarm feature configuration option

This feature enables the alarm functionality inside the Timer driver.

Remarks

This is an optional feature. If the user wants to be called after a time elapse, alarm callback registration is mandatory.

5.1.10.5.3.2 DRV_TMR_ALARM_PERIODIC Macro

C

```
#define DRV_TMR_ALARM_PERIODIC true
```

Description

Alarm type configuration option

This macro if defined, makes the alarm periodic. This macro can [accept](#) the following values:

- true - Configures the alarm in periodic mode
- false - Configures the alarm in one shot mode

Remarks

This is an optional feature, which is enabled when using this configuration.

5.1.10.5.4 Client Config

Macros

	Name	Description
	DRV_TMR_CLIENTS_NUMBER	Selects the maximum number of clients

Description

5.1.10.5.4.1 DRV_TMR_CLIENTS_NUMBER Macro

C

```
#define DRV_TMR_CLIENTS_NUMBER 1
```

Description

Client support

This definition select the maximum number of clients that the Timer driver can support at run time.

Remarks

None.

5.1.10.5.5 Miscellaneous Config

Macros

	Name	Description
	DRV_TMR_ASYNC_WRITE_ENABLE	Controls Asynchronous Write mode of the Timer.
	DRV_TMR_PRESCALER_ENABLE	Controls prescaler assignment of the Timer.

Description

These configuration options control the functionality and setup of the Timer Driver.

5.1.10.5.5.1 DRV_TMR_ASYNC_WRITE_ENABLE Macro

C

```
#define DRV_TMR_ASYNC_WRITE_ENABLE false
```

Description

TMR Asynchronous write mode configuration

This macro controls the Asynchronous Write mode of the Timer. This macro accepts the following values:

- true - Configures the Timer to enable async write control
- false - Configures the Timer to disable async write control
- [DRV_CONFIG_NOT_SUPPORTED](#) - When the feature is not supported on the instance.

Remarks

This feature is not available in all modules/devices. Refer to the specific device data sheet for more information.

5.1.10.5.5.2 DRV_TMR_PRESCALER_ENABLE Macro

C

```
#define DRV_TMR_PRESCALER_ENABLE false
```

Description

TMR prescaler assignment configuration

This macro controls the prescaler assignment of the TMR. This macro accepts the following values:

- true - Configures the Timer for enable prescaler assignment
- false - Configures the Timer for disable prescaler assignment
- [DRV_CONFIG_NOT_SUPPORTED](#) - When the feature is not supported on the instance

Remarks

This feature is not available in all modules/devices. Refer to the specific device data sheet for more information.

5.1.10.5.6 Alarm Functionality Examples

Files

Name	Description
drv_tmr_config_alarm.h	Timer driver configuration definitions for the alarm feature.

Description

5.1.10.5.6.1 drv_tmr_config_alarm.h

TMR Driver Configuration Definitions for Alarm feature

These definitions set up the driver for the alarm feature.

File Name

drv_tmr_config_alarm.h

Company

Microchip Technology Inc.

5.1.10.6 Building the Library

This section list the files that are available in the \src of the timer driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

5.1.10.7 Library Interface

Data Types and Constants

	Name	Description
	DRV_TMR_ALARM_CONFIG	Timer module alarm configuration.
	DRV_TMR_ALARM_TYPE	Timer driver type enumeration.
	DRV_TMR_CALLBACK	Pointer to a Timer driver callback function data type.
	DRV_TMR_CLIENT_STATUS	Identifies the client-specific status of the Timer driver
	DRV_TMR_INIT	Defines the Timer driver initialization data.
	DRV_TMR_SYNC_MODE	Identifies the synchronous modes for the Timer driver.

Macros

	Name	Description
	DRV_TMR_INTERRUPT_SOURCE	Defines the interrupt source of the static driver.
	DRV_TMR_POWER_STATE	Controls the power state of the Timer.
	DRV_TMR_UNIFIED	Sets up the driver functionality in either split or the unified mode.

Alarm Functions

	Name	Description
	DRV_TMR_AlarmCountClear	Clears the alarm elapse counter.
	DRV_TMR_AlarmCountGet	Provides the number of times the alarm has elapsed since the last time it was cleared.
	DRV_TMR_AlarmSet	Initializes an alarm.

Core Functions

	Name	Description
	DRV_TMR_ClientStatus	Gets current client-specific status of the Timer driver.
	DRV_TMR_Close	Closes an opened instance of the Timer driver
	DRV_TMR_ElapsedStatusGetAndClear	Provides and clears the Timer's elapse count.
	DRV_TMR_Open	Opens the specified Timer driver instance and returns a handle to it.
	DRV_TMR_Start	Starts the Timer counting.
	DRV_TMR_Stop	Stops the Timer from counting.
	DRV_TMR_SyncModeGet	Provides the Timer's current synchronization mode.
	DRV_TMR_SyncModeSet	Changes the Timer's synchronization mode.

Counter Control Functions

	Name	Description
≡	DRV_TMR_Counter16BitGet	Provides the 16-bit Timer's current counter value.
≡	DRV_TMR_Counter16BitSet	Updates the 16-bit Timer's initial count value.
≡	DRV_TMR_Counter32BitGet	Provides the 32-bit Timer's current counter value.
≡	DRV_TMR_Counter32BitSet	Updates the 32-bit Timer's initial count value.
≡	DRV_TMR_Counter8BitGet	Provides the 8-bit Timer's current counter value.
≡	DRV_TMR_Counter8BitSet	Updates the 8-bit Timer's initial count value

Miscellaneous Functions

	Name	Description
≡	DRV_TMR_OperatingFrequencyGet	Provides the Timer operating frequency.
≡	DRV_TMR_TickFrequencyGet	Provides the Timer's counter "tick" frequency.
≡	DRV_TMR_VersionGet	Gets the Timer driver version in numerical format.
≡	DRV_TMR_VersionStrGet	Gets the Timer driver version in string format.

Period Functions

	Name	Description
≡	DRV_TMR_Period16BitGet	Provides the 16-bit Timer's period
≡	DRV_TMR_Period16BitSet	Updates the 16-bit Timer's period.
≡	DRV_TMR_Period32BitGet	Provides the 32-bit Timer's period
≡	DRV_TMR_Period32BitSet	Updates the 32-bit Timer's period.
≡	DRV_TMR_Period8BitGet	Provides the 8-bit Timer's period.
≡	DRV_TMR_Period8BitSet	Updates the 8-bit timer's period

System Interaction Functions

	Name	Description
≡	DRV_TMR_Deinitialize	Deinitializes the specified instance of the Timer driver.
≡	DRV_TMR_Initialize	Initializes the Timer driver .
≡	DRV_TMR_Reinitialize	Reinitializes the driver and refreshes any associated hardware settings.
≡	DRV_TMR_Status	Provides the current status of the Timer driver.
≡	DRV_TMR_Tasks	Maintains the driver's state machine and implements its ISR.

Description

This section describes the functions of the Timer Driver Library.

Refer to each section for a detailed description.

5.1.10.7.1 System Interaction Functions**5.1.10.7.1.1 DRV_TMR_Deinitialize Function****C**

```
void DRV_TMR_Deinitialize(
    SYS_MODULE_OBJ object
);
```

Description

Deinitializes the specified instance of the Timer driver, disabling its operation (and any hardware). All internal data is invalidated.

Preconditions

The [DRV_TMR_Initialize](#) function must have been called before calling this function and a valid [SYS_MODULE_OBJ](#) must have been returned.

Parameters

Parameters	Description
object	Driver object handle, returned from DRV_TMR_Initialize

Returns

None.

Remarks

Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again.

This function will NEVER block waiting for hardware. If the operation requires time to allow the hardware to complete, this will be reported by the [DRV_TMR_Status](#) operation. The system has to use [DRV_TMR_Status](#) to find out when the module is in the ready state.

Example

```
SYS_MODULE_OBJ    object;    // Returned from DRV_TMR_Initialize
SYS_STATUS        status;

DRV_TMR_Deinitialize(object);

status = DRV_TMR_Status(object);
if (SYS_MODULE_DEINITIALIZED == status)
{
    // Check again later if you need to know
    // when the driver is deinitialized.
}
```

5.1.10.7.1.2 DRV_TMR_Initialize Function**C**

```
SYS_MODULE_OBJ DRV_TMR_Initialize(
    const SYS_MODULE_INDEX drvIndex,
    const SYS_MODULE_INIT * const init
);
```

Description

This function initializes the Timer driver, making it ready for clients to open and use it.

Preconditions

None.

Parameters

Parameters	Description
drvIndex	Index for the driver instance to be initialized
init	Pointer to a data structure containing any data necessary to initialize the driver. This pointer may be null if the user wants to provide the information via the respective configuration macros.

Returns

If successful, returns a valid handle to a driver object. Otherwise, it returns `SYS_MODULE_OBJ_INVALID`. The returned object must be passed as argument to `DRV_TMR_Reinitialize`, `DRV_TMR_Deinitialize`, `DRV_TMR_Tasks` and `DRV_TMR_Status` functions.

Remarks

This function must be called before any other Timer function is called.

This function should only be called once during system initialization unless `DRV_TMR_Deinitialize` is called to deinitialize the driver instance.

This function will NEVER block for hardware access. If the operation requires time to allow the hardware to reinitialize, it will be reported by the `DRV_TMR_Status` operation. The system must use `DRV_TMR_Status` to find out when the driver is in the ready state.

Build configuration options may be used to statically override options in the "init" structure and will take precedence over initialization data passed using this function.

Example

```
DRV_TMR_INIT    init;
SYS_MODULE_OBJ  objectHandle;

// Populate the timer initialization structure
init.moduleInit.value = SYS_MODULE_POWER_RUN_FULL;
init.tmrId            = TMR_ID_2;
init.clockSource      = TMR_CLOCK_SOURCE_PERIPHERAL_CLOCK;
init.prescale         = TMR_PRESCALE_TX_VALUE_256;
init.syncMode         = DRV_TMR_SYNC_MODE_SYNCHRONOUS_INTERNAL;
init.interruptSource  = INT_SOURCE_TIMER_2;
init.timerPeriod      = 0xABCD;

// Do something

objectHandle = DRV_TMR_Initialize(DRV_TMR_INDEX_0, (SYS_MODULE_INIT*)&init);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}
```

5.1.10.7.1.3 DRV_TMR_Reinitialize Function

C

```
void DRV_TMR_Reinitialize(
    SYS_MODULE_OBJ object,
    const SYS_MODULE_INIT* const init
);
```

Description

This function reinitializes the driver and refreshes any associated hardware settings using the initialization data given, but it will not interrupt any ongoing operations.

Preconditions

The `DRV_TMR_Initialize` function must have been called before calling this function and a valid `SYS_MODULE_OBJ` must have been returned.

Parameters

Parameters	Description
object	Driver object handle, returned from <code>DRV_TMR_Initialize</code>

init	Pointer to the initialization data structure

Returns

None

Remarks

This function can be called multiple times to reinitialize the module.

This operation can be used to refresh any supported hardware registers as specified by the initialization data or to change the power state of the module.

This function will NEVER block for hardware access. If the operation requires time to allow the hardware to reinitialize, it will be reported by the [DRV_TMR_Status](#) operation. The system must use [DRV_TMR_Status](#) to find out when the driver is in the ready state.

Build configuration options may be used to statically override options in the "init" structure and will take precedence over initialization data passed using this function.

Example

```

DRV_TMR_INIT    init;
SYS_MODULE_OBJ  objectHandle;  // Returned from DRV_TMR_Initialize
SYS_STATUS      tmrStatus;

// Iopulate the timer initialization structure
init.moduleInit.value = SYS_MODULE_POWER_RUN_FULL;
init.tmrId             = TMR_ID_2;
init.clockSource       = TMR_CLOCK_SOURCE_PERIPHERAL_CLOCK;
init.prescale          = TMR_PRESCALE_TX_VALUE_256;
init.syncMode          = DRV_TMR_SYNC_MODE_SYNCHRONOUS_INTERNAL;
init.interruptSource    = INT_SOURCE_TIMER_3;
init.timerPeriod       = 0xABCD;

DRV_TMR_Reinitialize(objectHandle, (SYS_MODULE_INIT*)&init);

tmrStatus = DRV_TMR_Status(object);
if (SYS_STATUS_BUSY == tmrStatus)
{
    // Check again later to ensure the driver is ready
}
else if (SYS_STATUS_ERROR >= tmrStatus)
{
    // Handle error
}

```

5.1.10.7.1.4 DRV_TMR_Status Function**C**

```

SYS_STATUS DRV_TMR_Status(
    SYS_MODULE_OBJ object
);

```

Description

This function provides the current status of the Timer driver.

Preconditions

The [DRV_TMR_Initialize](#) function must have been called before calling this function.

Parameters

Parameters	Description
object	Driver object handle, returned from DRV_TMR_Initialize

Returns

SYS_STATUS_READY - Indicates that the driver is busy with a previous system level operation and cannot start another

Remarks

Any value greater than SYS_STATUS_READY is also a normal running state in which the driver is ready to [accept](#) new operations.

SYS_STATUS_BUSY - Indicates that the driver is busy with a previous system level operation and cannot start another

SYS_STATUS_ERROR - Indicates that the driver is in an error state

Any value less than SYS_STATUS_ERROR is also an error state.

SYS_MODULE_DEINITIALIZED - Indicates that the driver has been deinitialized

This value is less than SYS_STATUS_ERROR.

The this operation can be used to determine when any of the driver's module level operations has completed.

If the status operation returns SYS_STATUS_BUSY, the a previous operation has not yet completed. Once the status operation returns SYS_STATUS_READY, any previous operations have completed.

The value of SYS_STATUS_ERROR is negative (-1). Any value less than that is also an error state.

This function will NEVER block waiting for hardware.

If the Status operation returns an error value, the error may be cleared by calling the reinitialize operation. If that fails, the deinitialize operation will need to be called, followed by the initialize operation to return to normal operations.

Example

```

SYS_MODULE_OBJ    object;    // Returned from DRV_TMR_Initialize
SYS_STATUS        tmrStatus;

tmrStatus = DRV_TMR_Status(object);
else if (SYS_STATUS_ERROR >= tmrStatus)
{
    // Handle error
}

```

5.1.10.7.1.5 DRV_TMR_Tasks Function**C**

```

void DRV_TMR_Tasks(
    SYS_MODULE_OBJ object
);

```

Description

This function is used to maintain the driver's internal state machine and implement its ISR for interrupt-driven implementations.

Preconditions

The [DRV_TMR_Initialize](#) function must have been called for the specified Timer driver instance.

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_TMR_Initialize)

Returns

None

Remarks

This function is normally not called directly by an application. It is called by the system's Tasks routine ([SYS_Tasks](#)) or by the appropriate raw ISR.

This function may excute in an ISR context and will never block or access any resources that may cause it to block.

Example

```
SYS_MODULE_OBJ      object;      // Returned from DRV_TMR_Initialize

while (true)
{
    DRV_TMR_Tasks (object);

    // Do other tasks
}
```

5.1.10.7.2 Core Functions

5.1.10.7.2.1 DRV_TMR_ClientStatus Function

C

```
DRV_TMR_CLIENT_STATUS DRV_TMR_ClientStatus(
    DRV_HANDLE handle
);
```

Description

This function gets the client-specific status of the Timer driver associated with the specified handle.

Preconditions

The [DRV_TMR_Initialize](#) function must have been called.

[DRV_TMR_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Returns

A [DRV_TMR_CLIENT_STATUS](#) value describing the current status of the driver

Remarks

This function will not block for hardware access and will immediately return the current status.

Example

```
DRV_HANDLE handle; // Returned from DRV_TMR_Open
DRV_TMR_CLIENT_STATUS tmrClientStatus;

tmrClientStatus = DRV_TMR_ClientStatus(tmrHandle);
if(DRV_TMR_CLIENT_STATUS_ERROR >= tmrClientStatus)
{
    // Handle the error
}
```

5.1.10.7.2.2 DRV_TMR_Close Function

C

```
void DRV_TMR_Close(  
    DRV_HANDLE handle  
)  
;
```

Description

This function closes an opened instance of the Timer driver, invalidating the handle.

Preconditions

The [DRV_TMR_Initialize](#) function must have been called for the specified Timer driver instance.

[DRV_TMR_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Returns

None

Remarks

After calling this function, the handle passed in "handle" must not be used with any of the remaining driver functions. A new handle must be obtained by calling [DRV_TMR_Open](#) before the caller may use the driver again.

If DRV_IO_INTENT_BLOCKING was requested and the driver was built appropriately to support blocking behavior, the call may block until the operation is complete.

If DRV_IO_INTENT_NON_BLOCKING request the driver client can call the [DRV_TMR_Status](#) operation to find out when the module is in the ready state (the handle is no longer valid).

Usually there is no need for the driver client to verify that the Close operation has completed.

Example

```
DRV_HANDLE handle; // Returned from DRV_TMR_Open  
  
DRV_TMR_Close(handle);
```

5.1.10.7.2.3 DRV_TMR_ElapsedStatusGetAndClear Function

C

```
bool DRV_TMR_ElapsedStatusGetAndClear(  
    DRV_HANDLE handle  
)  
;
```

Description

This function provides the Timer's elapse count and resets it to zero (0).

Preconditions

The [DRV_TMR_Initialize](#) function must have been called.

[DRV_TMR_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid handle, returned from the DRV_TMR_Open

Returns

- true - The Timer has elapsed
- false - The Timer has not yet elapsed

Remarks

None.

Example

```
DRV_HANDLE    handle; // Returned from DRV_TMR_Open
bool          elapseStatus;

elapseStatus = DRV_TMR_ElapsedStatusGetAndClear(handle);
if (elapseStatus > 0)
{
    // The counter period has elapsed.
}
```

5.1.10.7.2.4 DRV_TMR_Open Function**C**

```
DRV_HANDLE DRV_TMR_Open(
    const SYS_MODULE_INDEX drvIndex,
    const DRV_IO_INTENT intent
);
```

Description

This function opens the specified Timer driver instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver.

Preconditions

The [DRV_TMR_Initialize](#) function must have been called before calling this function.

Parameters

Parameters	Description
drvIndex	Identifier for the object instance to be opened
intent	Zero or more of the values from the enumeration DRV_IO_INTENT ORed together to indicate the intended use of the driver

Returns

If successful, the function returns a valid open instance handle (a number identifying both the caller and the module instance).

If an error occurs, the return value is [DRV_HANDLE_INVALID](#).

Remarks

The handle returned is valid until the [DRV_TMR_Close](#) function is called.

This function will NEVER block waiting for hardware.

If the DRV_IO_INTENT_BLOCKING is requested and the driver was built appropriately to support blocking behavior, other client-level operations may block waiting on hardware until they are complete.

If DRV_IO_INTENT_NON_BLOCKING is requested the driver client can call the [DRV_TMR_ClientStatus](#) operation to find out

when the module is in the ready state.

If the requested intent flags are not supported, the function will return [DRV_HANDLE_INVALID](#).

The Timer driver does not support DRV_IO_INTENT_SHARED. It must be opened with DRV_IO_INTENT_EXCLUSIVE in the "intent" parameter.

Example

```
DRV_HANDLE handle;

handle = DRV_TMR_Open(DRV_TMR_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);
if (DRV_HANDLE_INVALID == handle)
{
    // Unable to open the driver
}
```

5.1.10.7.2.5 DRV_TMR_Start Function

C

```
void DRV_TMR_Start(
    DRV_HANDLE handle
);
```

Description

This function starts the Timer counting.

Preconditions

The [DRV_TMR_Initialize](#) function must have been called.

[DRV_TMR_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Returns

None.

Remarks

None.

Example

```
DRV_HANDLE handle; // Returned from DRV_TMR_Open

DRV_TMR_Start (handle);
```

5.1.10.7.2.6 DRV_TMR_Stop Function

C

```
void DRV_TMR_Stop(
    DRV_HANDLE handle
);
```

Description

This function stops the running Timer from counting.

Preconditions

The [DRV_TMR_Initialize](#) function must have been called.

[DRV_TMR_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Returns

None.

Remarks

None.

Example

```
DRV_HANDLE handle; // Returned from DRV_TMR_Open
DRV_TMR_Stop(handle);
```

5.1.10.7.2.7 DRV_TMR_SyncModeGet Function

C

```
DRV_TMR_SYNC_MODE DRV_TMR_SyncModeGet(
    DRV_HANDLE handle
);
```

Description

This function provides the Timer's current synchronization mode.

Preconditions

The [DRV_TMR_Initialize](#) function must have been called.

[DRV_TMR_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Returns

Possible values from the enumeration [DRV_TMR_SYNC_MODE](#).

Remarks

None.

Example

```
DRV_HANDLE handle; // Returned from DRV_TMR_Open
DRV_TMR_SYNC_MODE mode;

mode = DRV_TMR_SyncModeGet(handle);
```

5.1.10.7.2.8 DRV_TMR_SyncModeSet Function

C

```
void DRV_TMR_SyncModeSet(
    DRV_HANDLE handle,
    DRV_TMR_SYNC_MODE newMode
);
```

Description

This function changes the Timer's synchronization mode.

Preconditions

The [DRV_TMR_Initialize](#) function must have been called.

[DRV_TMR_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
mode	Possible values from the enumeration DRV_TMR_SYNC_MODE

Returns

None.

Remarks

The caller should stop the Timer/Counter before changing the synchronization mode and restart it afterward.

Example

```
DRV_HANDLE handle; // Returned from DRV_TMR_Open

DRV_TMR_Stop(handle);
DRV_TMR_SyncModeSet(handle, DRV_TMR_SYNC_MODE_SYNCHRONOUS_INTERNAL);
```

5.1.10.7.3 Alarm Functions

5.1.10.7.3.1 DRV_TMR_AlarmCountClear Function

C

```
void DRV_TMR_AlarmCountClear(
    DRV_HANDLE handle
);
```

Description

This function clears the alarm elapse counter.

Preconditions

The [DRV_TMR_Initialize](#) function must have been called.

[DRV_TMR_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid handle, returned from DRV_TMR_Open

Returns

None.

Remarks

None.

Example

```
DRV_HANDLE handle; // Returned from DRV_TMR_Open
```

```
DRV_TMR_AlarmCountClear(handle);
```

5.1.10.7.3.2 DRV_TMR_AlarmCountGet Function

C

```
unsigned int DRV_TMR_AlarmCountGet(  
    DRV_HANDLE handle  
);
```

Description

This function provides the number of times the alarm is generated since the last time it was cleared.

Preconditions

The [DRV_TMR_Initialize](#) function must have been called.

[DRV_TMR_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid handle, returned from DRV_TMR_Open

Returns

Alarm count value.

Remarks

None.

Example

```
DRV_HANDLE handle;           // Returned from DRV_TMR_Open  
unsigned int alarmCount;  
  
alarmCount = DRV_TMR_AlarmCountGet (handle);
```

5.1.10.7.3.3 DRV_TMR_AlarmSet Function

C

```
void DRV_TMR_AlarmSet(  
    DRV_HANDLE handle,  
    const DRV_TMR_ALARM_CONFIG * config  
);
```

Description

This function initializes an alarm, allowing the client to receive a callback from the driver when the counter period elapses. Alarms can be one-shot or periodic.

Preconditions

The [DRV_TMR_Initialize](#) function must have been called.

[DRV_TMR_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid handle, returned from DRV_TMR_Open
config	Pointer to the alarm configuration structure containing any data necessary to initialize timer alarms

Returns

None

Remarks

None.

Example

```
DRV_HANDLE      handle; // Returned from DRV_TMR_Open
DRV_TMR_ALARM_CONFIG  alarmConfig;

alarmConfig.type      = DRV_TMR_ALARM_TYPE_PERIODIC; // Periodic Alarm
alarmConfig.callback = &callBackFunction;           // callback registered

DRV_TMR_AlarmSet(handle, config);
```

5.1.10.7.4 Period Functions

5.1.10.7.4.1 DRV_TMR_Period16BitGet Function

C

```
uint16_t DRV_TMR_Period16BitGet(
    DRV_HANDLE handle
);
```

Description

This function provides the 16-bit tTmer's period.

Preconditions

The [DRV_TMR_Initialize](#) function must have been called.

[DRV_TMR_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Returns

16-bit timer period value

Remarks

None.

Example

```
DRV_HANDLE handle; // Returned from DRV_TMR_Open
uint16_t value;
value = DRV_TMR_Period16BitGet(handle);
```

5.1.10.7.4.2 DRV_TMR_Period16BitSet Function

C

```
void DRV_TMR_Period16BitSet(
    DRV_HANDLE handle,
    uint16_t value
);
```

Description

This function updates the 16-bit Timer's period.

Preconditions

The [DRV_TMR_Initialize](#) function must have been called.

[DRV_TMR_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
value	16-bit Period value

Returns

None.

Remarks

None.

Example

```
DRV_HANDLE handle; // Returned from DRV_TMR_Open

DRV_TMR_Period16BitSet(handle, 0x1000);
```

5.1.10.7.4.3 DRV_TMR_Period32BitGet Function**C**

```
uint32_t DRV_TMR_Period32BitGet(
    DRV_HANDLE handle
);
```

Description

This function provides the 32-bit Timer's period.

Preconditions

The [DRV_TMR_Initialize](#) function must have been called.

[DRV_TMR_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Returns

32-bit Timer period value.

Remarks

None.

Example

```
DRV_HANDLE handle; // Returned from DRV_TMR_Open
uint32_t value;
value = DRV_TMR_Period32BitGet(handle);
```

5.1.10.7.4.4 DRV_TMR_Period32BitSet Function

C

```
void DRV_TMR_Period32BitSet(  
    DRV_HANDLE handle,  
    uint32_t value  
);
```

Description

This function updates the 32-bit Timer's period.

Preconditions

The [DRV_TMR_Initialize](#) uncton must have been called.

[DRV_TMR_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
value	32-bit Period value

Returns

None.

Remarks

None.

Example

```
DRV_HANDLE handle; // Returned from DRV_TMR_Open  
  
DRV_TMR_Period32BitSet(handle, 0xFFFFFFFF);
```

5.1.10.7.4.5 DRV_TMR_Period8BitGet Function

C

```
uint8_t DRV_TMR_Period8BitGet(  
    DRV_HANDLE handle  
);
```

Description

This function provides the 8-bit Timer's period.

Preconditions

The [DRV_TMR_Initialize](#) function must have been called.

[DRV_TMR_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Returns

8-bit timer period value.

Remarks

None.

Example

```
DRV_HANDLE handle; // Returned from DRV_TMR_Open
uint8_t value;
value = DRV_TMR_Period8BitGet(handle);
```

5.1.10.7.4.6 DRV_TMR_Period8BitSet Function**C**

```
void DRV_TMR_Period8BitSet(
    DRV_HANDLE handle,
    uint8_t value
);
```

Description

This function updates the 8-bit timer's period.

Preconditions

The [DRV_TMR_Initialize](#) function must have been called.

[DRV_TMR_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
value	8-bit Period value

Returns

None.

Remarks

None.

Example

```
DRV_HANDLE handle; // Returned from DRV_TMR_Open

DRV_TMR_Period8BitSet(handle, 0x10);
```

5.1.10.7.5 Counter Control Functions**5.1.10.7.5.1 DRV_TMR_Counter16BitGet Function****C**

```
uint16_t DRV_TMR_Counter16BitGet(
    DRV_HANDLE handle
);
```

Description

This function provides the 16-bit Timer's current counter value.

Preconditions

The [DRV_TMR_Initialize](#) function must have been called.

[DRV_TMR_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Returns

16-bit Timer's current counter value

Remarks

None.

Example

```
DRV_HANDLE handle; // Returned from DRV_TMR_Open
uint16_t value;
value = DRV_TMR_Counter16BitGet(handle);
```

5.1.10.7.5.2 DRV_TMR_Counter16BitSet Function**C**

```
void DRV_TMR_Counter16BitSet(
    DRV_HANDLE handle,
    uint16_t value
);
```

Description

This function updates the 16-bit Timer's initial count value.

Preconditions

The [DRV_TMR_Initialize](#) function must have been called.

[DRV_TMR_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
value	16-bit Counter value

Returns

None.

Remarks

None.

Example

```
DRV_HANDLE handle; // Returned from DRV_TMR_Open

DRV_TMR_Counter16BitSet(handle, 0x1000);
```

5.1.10.7.5.3 DRV_TMR_Counter32BitGet Function**C**

```
uint32_t DRV_TMR_Counter32BitGet(
    DRV_HANDLE handle
);
```

Description

This function provides the 32-bit Timer's current counter value.

Preconditions

The [DRV_TMR_Initialize](#) function must have been called.

[DRV_TMR_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Returns

32-bit Timer's current counter value.

Remarks

None.

Example

```
DRV_HANDLE handle; // Returned from DRV_TMR_Open
uint32_t value;
value = DRV_TMR_Counter32BitGet(handle);
```

5.1.10.7.5.4 DRV_TMR_Counter32BitSet Function**C**

```
void DRV_TMR_Counter32BitSet(
    DRV_HANDLE handle,
    uint32_t value
);
```

Description

This function updates the 32-bit Timer's initial count value.

Preconditions

The [DRV_TMR_Initialize](#) function must have been called.

[DRV_TMR_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
value	32-bit Counter value

Returns

None.

Remarks

None.

Example

```
DRV_HANDLE handle; // Returned from DRV_TMR_Open

DRV_TMR_Counter32BitSet(handle, 0xFFFFFFFF);
```

5.1.10.7.5.5 DRV_TMR_Counter8BitGet Function**C**

```
uint8_t DRV_TMR_Counter8BitGet(
```

```
    DRV_HANDLE handle  
);
```

Description

This function provides the 8-bit Timer's current counter value.

Preconditions

The [DRV_TMR_Initialize](#) function must have been called.

[DRV_TMR_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Returns

8-bit Timer's current counter value.

Remarks

None.

Example

```
DRV_HANDLE handle; // Returned from DRV_TMR_Open  
uint8_t value;  
value = DRV_TMR_Counter8BitGet(handle);
```

5.1.10.7.5.6 DRV_TMR_Counter8BitSet Function

C

```
void DRV_TMR_Counter8BitSet(  
    DRV_HANDLE handle,  
    uint8_t value  
);
```

Description

This function updates the 8-bit Timer's initial count value.

Preconditions

The [DRV_TMR_Initialize](#) function must have been called.

[DRV_TMR_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
value	8-bit Counter value

Returns

None.

Remarks

None.

Example

```
DRV_HANDLE handle; // Returned from DRV_TMR_Open  
  
DRV_TMR_Counter8BitSet(handle, 0x10);
```

5.1.10.7.6 Miscellaneous Functions

5.1.10.7.6.1 DRV_TMR_OperatingFrequencyGet Function

C

```
uint32_t DRV_TMR_OperatingFrequencyGet(  
    DRV_HANDLE handle  
);
```

Description

This function provides the Timer operating frequency.

Preconditions

The [DRV_TMR_Initialize](#) function must have been called.

[DRV_TMR_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Returns

32-bit value corresponding to the running frequency.

Remarks

On most processors, the Timer's base frequency is the same as the peripheral bus clock.

Example

```
DRV_HANDLE handle; // Returned from DRV_TMR_Open  
uint32_t clkFreq;  
  
clkFreq = DRV_TMR_OperatingFrequencyGet(handle);
```

5.1.10.7.6.2 DRV_TMR_TickFrequencyGet Function

C

```
uint32_t DRV_TMR_TickFrequencyGet(  
    DRV_HANDLE handle  
);
```

Description

This function provides the Timer's counter "tick" frequency.

Preconditions

The [DRV_TMR_Initialize](#) function must have been called.

[DRV_TMR_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid handle, returned from the DRV_TMR_Open

Returns

Clock frequency value in cycles per second (Hertz).

Remarks

None.

Example

```
DRV_HANDLE handle; // Returned from DRV_TMR_Open
uint32_t clkFreq;

clkFreq = DRV_TMR_TickFrequencyGet(handle);
```

5.1.10.7.6.3 DRV_TMR_VersionGet Function**C**

```
unsigned int DRV_TMR_VersionGet(
    const SYS_MODULE_INDEX drvIndex
);
```

Description

This function gets the Timer driver version. The version is encoded as major * 10000 + minor * 100 + patch. The stringed version can be obtained using [DRV_TMR_VersionStrGet\(\)](#)

Preconditions

None.

Parameters

Parameters	Description
drvIndex	Identifier for the object instance to get the version for

Returns

Current driver version in numerical format.

Remarks

None.

Example

```
unsigned int version;

version = DRV_TMR_VersionGet( DRV_TMR_INDEX_0 );

if(version < 110200)
{
    // Do Something
}
```

5.1.10.7.6.4 DRV_TMR_VersionStrGet Function**C**

```
char * DRV_TMR_VersionStrGet(
    const SYS_MODULE_INDEX drvIndex
);
```

Description

This function gets the Timer driver version. The version is returned as major.minor.patch[type], where type is optional. The numerical version can be obtained using [DRV_TMR_VersionGet](#).

Preconditions

None.

Parameters

Parameters	Description
drvIndex	Identifier for the object instance to get the version for

Returns

Current Timer driver version in the string format.

Remarks

None.

Example

```
char *version;

version = DRV_TMR_VersionStrGet( DRV_TMR_INDEX_0 );

printf("%s", version);
```

5.1.10.7.7 Data Types and Constants

5.1.10.7.7.1 DRV_TMR_ALARM_CONFIG Structure

C

```
typedef struct {
    DRV_TMR_ALARM_TYPE type;
    DRV_TMR_CALLBACK callback;
} DRV_TMR_ALARM_CONFIG;
```

Description

TMR Alarm configuration

This data type controls the configuration of the alarm.

Members

Members	Description
DRV_TMR_ALARM_TYPE type;	Type of the alarm one shot or periodic
DRV_TMR_CALLBACK callback;	Alarm callback

Remarks

Not all modes are available on all devices.

5.1.10.7.7.2 DRV_TMR_ALARM_TYPE Enumeration

C

```
typedef enum {
    DRV_TMR_ALARM_TYPE_ONE_SHOT,
    DRV_TMR_ALARM_TYPE_PERIODIC
} DRV_TMR_ALARM_TYPE;
```

Description

Timer Alarm Type Enumeration

This data type identifies the Timer alarm type.

Members

Members	Description
DRV_TMR_ALARM_TYPE_ONE_SHOT	One Shot Alarm
DRV_TMR_ALARM_TYPE_PERIODIC	Periodic Alarm

Remarks

Not all modes are available on all devices.

5.1.10.7.7.3 DRV_TMR_CALLBACK Type**C**

```
typedef void (* DRV_TMR_CALLBACK)(void);
```

Description

Timer Driver Callback Function Pointer

This data type defines a pointer to a Timer driver callback function.

Remarks

Useful only when timer alarm callback support is enabled by defining the [DRV_TMR_ALARM_ENABLE](#) configuration option.

5.1.10.7.7.4 DRV_TMR_CLIENT_STATUS Enumeration**C**

```
typedef enum {
    DRV_TMR_CLIENT_STATUS_INVALID,
    DRV_TMR_CLIENT_STATUS_ERROR,
    DRV_TMR_CLIENT_STATUS_BUSY,
    DRV_TMR_CLIENT_STATUS_READY,
    DRV_TMR_CLIENT_STATUS_STOPPED,
    DRV_TMR_CLIENT_STATUS_STARTED
} DRV_TMR_CLIENT_STATUS;
```

Description

Timer Driver Client Status

This enumeration identifies the client-specific status of the Timer driver.

Members

Members	Description
DRV_TMR_CLIENT_STATUS_INVALID	Client in an invalid (or unopened) state
DRV_TMR_CLIENT_STATUS_ERROR	Unspecified error condition
DRV_TMR_CLIENT_STATUS_BUSY	An operation is currently in progress
DRV_TMR_CLIENT_STATUS_READY	Up and running, no operations running
DRV_TMR_CLIENT_STATUS_STOPPED	Timer stopped (not running), but ready to accept commands
DRV_TMR_CLIENT_STATUS_STARTED	Timer started and running, processing transactions

Remarks

None.

5.1.10.7.7.5 DRV_TMR_INIT Structure

C

```
typedef struct {
    SYS_MODULE_INIT moduleInit;
    TMR_MODULE_ID tmrId;
    TMR_CLOCK_SOURCE clockSource;
    uint32_t timerPeriod;
    TMR_PRESCALE prescale;
    TMR_CLOCK_SOURCE_EDGE sourceEdge;
    uint8_t postscale;
    DRV_TMR_SYNC_MODE syncMode;
    INT_SOURCE interruptSource;
} DRV_TMR_INIT;
```

Description

Timer Driver Initialize Data

This data type defines data required to initialize or reinitialize the Timer driver.

Members

Members	Description
SYS_MODULE_INIT moduleInit;	System module initialization
TMR_MODULE_ID tmrId;	Identifies timer hardware module (PLIB-level) ID
TMR_CLOCK_SOURCE clockSource;	Clock Source select enumeration
uint32_t timerPeriod;	Timer Period Value
TMR_PRESCALE prescale;	Prescaler Selection from the processor enumeration
TMR_CLOCK_SOURCE_EDGE sourceEdge;	TMR Source Edge Selection
uint8_t postscale;	Post Scale Selection
DRV_TMR_SYNC_MODE syncMode;	Timer Sync Mode
INT_SOURCE interruptSource;	Interrupt Source for TMR module

Remarks

Not all initialization features are available on all devices.

5.1.10.7.7.6 DRV_TMR_SYNC_MODE Enumeration

C

```
typedef enum {
    DRV_TMR_SYNC_MODE_SYNCHRONOUS_INTERNAL,
    DRV_TMR_SYNC_MODE_SYNCHRONOUS_INTERNAL_GATED,
    DRV_TMR_SYNC_MODE_SYNCHRONOUS_EXTERNAL_WITHOUT_CLKSYNC,
    DRV_TMR_SYNC_MODE_SYNCHRONOUS_EXTERNAL_WITH_CLKSYNC,
    DRV_TMR_SYNC_MODE_ASYNCHRONOUS_EXTERNAL_WITHOUT_CLKSYNC,
    DRV_TMR_SYNC_MODE_ASYNCHRONOUS_EXTERNAL_WITH_CLKSYNC,
    DRV_TMR_SYNC_MODE_IDLE
} DRV_TMR_SYNC_MODE;
```

Description

Timer Synchronous Modes

This data type identifies the synchronous modes for the Timer driver.

Members

Members	Description
DRV_TMR_SYNC_MODE_SYNCHRONOUS_INTERNAL	Synchronous Internal Clock Counter
DRV_TMR_SYNC_MODE_SYNCHRONOUS_INTERNAL_GATED	Synchronous Internal Gated Counter
DRV_TMR_SYNC_MODE_SYNCHRONOUS_EXTERNAL_WITHOUT_CLKSYNC	Synchronous External Clock Counter
DRV_TMR_SYNC_MODE_SYNCHRONOUS_EXTERNAL_WITH_CLKSYNC	Synchronous External Clock Counter
DRV_TMR_SYNC_MODE_ASYNCHRONOUS_EXTERNAL_WITHOUT_CLKSYNC	Asynchronous External Clock Counter
DRV_TMR_SYNC_MODE_ASYNCHRONOUS_EXTERNAL_WITH_CLKSYNC	Asynchronous External Clock Counter
DRV_TMR_SYNC_MODE_IDLE	Timer Idle Mode

Remarks

Not all modes are available on all devices.

5.1.10.7.8 Macros**5.1.10.7.8.1 DRV_TMR_INTERRUPT_SOURCE Macro**

C

```
#define DRV_TMR_INTERRUPT_SOURCE INT_SOURCE_TIMER_1
```

Description

TMR Interrupt Source

This macro defines the interrupt source of the static driver.

Remarks

Refer to the Interrupt Peripheral Library documentation for more information on the [INT_SOURCE](#) enumeration.

5.1.10.7.8.2 DRV_TMR_POWER_STATE Macro

C

```
#define DRV_TMR_POWER_STATE SYS_MODULE_POWER_IDLE_STOP
```

Description

TMR power state configuration

This macro controls the power state of the Timer.

Remarks

This feature is not available in all modules/devices. Refer to the specific device data sheet for more information.

5.1.10.7.8.3 DRV_TMR_UNIFIED Macro

C

```
#define DRV_TMR_UNIFIED false
```

Description

TMR driver configuration

This definition sts up the driver functionality in either split or the unified mode.

Remarks

None.

5.1.10.8 Files

Files

Name	Description
drv_tmr.h	Timer device driver interface header.
drv_tmr_config_template.h	Timer driver configuration definitions for the template version.

Description

5.1.10.8.1 drv_tmr.h

Timer Device Driver Interface Definition

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the Timer device driver.

Enumerations

	Name	Description
	DRV_TMR_ALARM_TYPE	Timer driver type enumeration.
	DRV_TMR_CLIENT_STATUS	Identifies the client-specific status of the Timer driver
	DRV_TMR_SYNC_MODE	Identifies the synchronous modes for the Timer driver.

Functions

	Name	Description
	DRV_TMR_AlarmCountClear	Clears the alarm elapse counter.
	DRV_TMR_AlarmCountGet	Provides the number of times the alarm has elapsed since the last time it was cleared.
	DRV_TMR_AlarmSet	Initializes an alarm.
	DRV_TMR_ClientStatus	Gets current client-specific status of the Timer driver.
	DRV_TMR_Close	Closes an opened instance of the Timer driver
	DRV_TMR_Counter16BitGet	Provides the 16-bit Timer's current counter value.
	DRV_TMR_Counter16BitSet	Updates the 16-bit Timer's initial count value.
	DRV_TMR_Counter32BitGet	Provides the 32-bit Timer's current counter value.
	DRV_TMR_Counter32BitSet	Updates the 32-bit Timer's initial count value.
	DRV_TMR_Counter8BitGet	Provides the 8-bit Timer's current counter value.
	DRV_TMR_Counter8BitSet	Updates the 8-bit Timer's initial count value
	DRV_TMR_Deinitialize	Deinitializes the specified instance of the Timer driver.
	DRV_TMR_ElapsedStatusGetAndClear	Provides and clears the Timer's elapse count.
	DRV_TMR_Initialize	Initializes the Timer driver .
	DRV_TMR_Open	Opens the specified Timer driver instance and returns a handle to it.
	DRV_TMR_OperatingFrequencyGet	Provides the Timer operating frequency.
	DRV_TMR_Period16BitGet	Provides the 16-bit Timer's period

	DRV_TMR_Period16BitSet	Updates the 16-bit Timer's period.
	DRV_TMR_Period32BitGet	Provides the 32-bit Timer's period
	DRV_TMR_Period32BitSet	Updates the 32-bit Timer's period.
	DRV_TMR_Period8BitGet	Provides the 8-bit Timer's period.
	DRV_TMR_Period8BitSet	Updates the 8-bit timer's period
	DRV_TMR_Reinitialize	Reinitializes the driver and refreshes any associated hardware settings.
	DRV_TMR_Start	Starts the Timer counting.
	DRV_TMR_Status	Provides the current status of the Timer driver.
	DRV_TMR_Stop	Stops the Timer from counting.
	DRV_TMR_SyncModeGet	Provides the Timer's current synchronization mode.
	DRV_TMR_SyncModeSet	Changes the Timer's synchronization mode.
	DRV_TMR_Tasks	Maintains the driver's state machine and implements its ISR.
	DRV_TMR_TickFrequencyGet	Provides the Timer's counter "tick" frequency.
	DRV_TMR_VersionGet	Gets the Timer driver version in numerical format.
	DRV_TMR_VersionStrGet	Gets the Timer driver version in string format.

Macros

	Name	Description
	DRV_TMR_INDEX_0	Timer driver index definitions
	DRV_TMR_INDEX_1	This is macro DRV_TMR_INDEX_1.
	DRV_TMR_INDEX_2	This is macro DRV_TMR_INDEX_2.
	DRV_TMR_INDEX_3	This is macro DRV_TMR_INDEX_3.
	DRV_TMR_INDEX_4	This is macro DRV_TMR_INDEX_4.
	DRV_TMR_INDEX_5	This is macro DRV_TMR_INDEX_5.
	DRV_TMR_INDEX_COUNT	Number of valid Timer driver indices.

Structures

	Name	Description
	DRV_TMR_ALARM_CONFIG	Timer module alarm configuration.
	DRV_TMR_INIT	Defines the Timer driver initialization data.

Types

	Name	Description
	DRV_TMR_CALLBACK	Pointer to a Timer driver callback function data type.

5.1.10.8.2 drv_tmr_config_template.h

Timer Driver Configuration Definitions for the Template Version

These definitions set up the driver for the default mode of operation of the driver.

Macros

	Name	Description
	<u>DRV_TMR_ALARM_ENABLE</u>	Enables alarm functionality.
	<u>DRV_TMR_ALARM_PERIODIC</u>	Alarm type configuration.
	<u>DRV_TMR_ASYNC_WRITE_ENABLE</u>	Controls Asynchronous Write mode of the Timer.
	<u>DRV_TMR_CLIENTS_NUMBER</u>	Selects the maximum number of clients
	<u>DRV_TMR_CLOCK_SOURCE</u>	Timer module clock source selection.
	<u>DRV_TMR_COUNT_WIDTH</u>	Controls the mode of the Timer.
	<u>DRV_TMR_INDEX</u>	Timer static index selection.
	<u>DRV_TMR_INSTANCES_NUMBER</u>	Sets up the maximum number of hardware instances that can be supported by the dynamic driver.
	<u>DRV_TMR_INTERRUPT_MODE</u>	Controls operation of the driver in the interrupt or polled mode.
	<u>DRV_TMR_INTERRUPT_SOURCE</u>	Defines the interrupt source of the static driver.
	<u>DRV_TMR_PERIPHERAL_ID</u>	Timer peripheral ID selection.
	<u>DRV_TMR_POSTSCALE</u>	Macro controls post scale of the TMR
	<u>DRV_TMR_POWER_STATE</u>	Controls the power state of the Timer.
	<u>DRV_TMR_PRESCALE</u>	Timer module prescale value.
	<u>DRV_TMR_PRESCALER_ENABLE</u>	Controls prescaler assignment of the Timer.
	<u>DRV_TMR_SOURCE_EDGE</u>	Timer module source edge.
	<u>DRV_TMR_SYNCHRONIZATION_MODE</u>	Controls Synchronization mode of the Timer.
	<u>DRV_TMR_TIMER_PERIOD</u>	Timer period value for an overflow or a period match-based Timer.
	<u>DRV_TMR_UNIFIED</u>	Sets up the driver functionality in either split or the unified mode.

5.1.11 USART Driver Library

5.1.11.1 Introduction

USART Driver Library

for

Microchip Microcontrollers

This library provides an interface to manage the USART module on Microchip family of micro controllers in different modes of operation.

Overview of USART

The Universal Synchronous Asynchronous Receiver/Transmitter (USART) controller is the key component of the serial

communications subsystem of many embedded systems.

The USART driver can support following modes of operation. (Refer to the Device Specific data sheet to determine which modes are supported on the part being used.)

1. RS232

RS232 is an asynchronous full duplex serial communication protocol. It uses separate lines for transmitting and receiving data, point-to-point, between a Data Terminal Equipment (DTE) item and a Data Communication Equipment (DCE) item at a maximum speed of 20 kbps with a maximum cable length of 50 feet.

2. RS485

RS485 is a multi-point communications network. It provides bi-directional, half-duplex, data transmission that allows multiple receivers and drivers in "bus" configurations. The standard specifies up to 32 drivers and 32 receivers on a single (2-wire) bus. With the introduction of "automatic" repeaters and high-impedance drivers and receivers this "limitation" can be extended to hundreds (or even thousands) of nodes on a network.

3. IrDA

Some Microchip micro controllers provide an Infrared (IR) encoder and decoder and can also interface with external IR encoders and decoders.

4. Interdevice Communication

USART module can be used for communication(without any external transceiver) between two devices. The maximum communication speed in this case is

determined by the maximum Baud supported by the device.

5. Synchronous Master/Slave

Synchronous serial transmission requires that the sender and receiver share a clock with one another or that the sender provide a strobe or other timing signal so that the receiver knows when to latch the next bit of the data. It is typically used in systems with a single master and one or more slaves. The master device contains the necessary circuitry for baud rate generation and supplies the clock for all devices in the system.

Note: if a USART does not support a synchronous mode, it is called UART. However, UARTs are still controlled by the USART driver.

5.1.11.2 Release Notes

MPLAB Harmony Version: v0.70b **USART Driver Library Version :** 0.050b **Alpha Release Date:** 18Nov2013

New This Release:

The USART Driver supports the following modes of operation.

Modes of operation

- Polling Mode
- Interrupt Mode

Configuration modes

- Asynchronous Transmit & Receive(i.e. RS232, RS485)
- IrDA Mode
- Loop Back Mode

Handshake modes

- Flow Control Mode
- No Handshake Mode

Line Control modes

- 8 bit, No Parity, 1 stop bit Mode
- 9 bit, No Parity, 1 stop bit Mode
- 8 bit, Even Parity, 1 stop bit Mode
- 8 bit, Even Parity, 2 stop bits Mode
- 8 bit, Odd Parity, 1 stop bit Mode
- 8 bit, Odd Parity, 2 stop bits Mode

Interrupt Modes

- Wakeup On Start Enable
- Auto Baud enable

Following demo shows how to use USART Driver

- `usart_echo` (<install drive:>\apps\driver\usart\drv_usart_demo)

Known Issues:

The following are the known issues in this release.

- Although implementation exists, the driver doesn't work in the following line control modes:
 - 8 bit, Even Parity, 1 stop bit Mode
 - 8 bit, Even Parity, 2 stop bits Mode
 - 8 bit, Odd Parity, 1 stop bit Mode
 - 8 bit, Odd Parity, 2 stop bits Mode
- Deinitialize API of the driver doesn't work. This means that the application cannot initialize the driver after deinitializing it.
- When UART driver is configured for 115200 baud rate, there could be no data received or received data is corrupted
- More than one client is not supported
- The USART Driver does not support "Odd" and "Even" parity settings

5.1.11.4 Using the Library

This topic describes the basic architecture of the USART Driver Library and provides information and examples on how to use it.

Interface Header File: `drv_usart.h`

The interface to the USART library is defined in the "drv_usart.h" header file

Please refer to the [MPLAB Harmony Overview](#) for how the driver interacts with the framework.

5.1.11.4.1 Abstraction Model

Different types of USARTs are available on Microchip microcontrollers. Some have a FIFO and some do not. The FIFO depth varies across part families. The USART driver abstracts out these differences and provides a unified model for data transfer across different types of USARTS available.

Both transmitter and receiver provide a buffer in the driver which transmits and receives data to/from the hardware. The USART driver provides a set of interfaces to perform the read and the write.

The diagrams below illustrates the model used by the USART driver for transmitter and receiver.

Receiver Abstraction Model

Transmitter Abstraction Model

5.1.11.4.2 Library Overview

Refer to the section [Driver Overview](#) for how the driver operates in a system.

The table below lists the interface section and its brief description.

Library Interface Section	Description
Data Types and Constants	Provides macros for configuring the system. It is required that the system configures the driver to build correctly by choosing appropriate configuration options as listed in this section.
System Initialization Functions	Provides system module interfaces, Device initialization, de-initialization, re-initialization and status functions.
Setup and Status Functions	Provides open, close and other setup functions
Data Transfer Functions	Provides data transfer functions available in the core configuration

5.1.11.4.3 How the Library Works

The library provides interfaces to support:

- System Interaction
- Client Core Functionality

5.1.11.4.3.1 System Initialization

System Initialization and Reinitialization

The system performs the initialization and the reinitialization of the device driver with settings that affect only the instance of the device that is being initialized or re-initialized. During system initialization each instance of the USART device will be initialized with the following configuration settings (either passed dynamically at run time using [DRV_USART_INIT](#) or by using Initialization Overrides) that are supported by the specific USART device hardware:

- Device requested power state: one of the System Module Power States. For specific details please refer to the Data Types section in this guide
- The actual peripheral ID enumerated as the PLIB level module ID. e.g USART_ID_2.
- Operation Mode: Select the operation mode of the instance using one of the possible values from [DRV_USART_OPERATION_MODES](#). Make sure that the operation mode support is enabled in the driver configuration setup. Also for RS485 operation mode, select the address to which the module instance should respond to.
- Line Control Mode: Setup the line control mode using one of the possible values from

DRV_USART_LINE_CONTROL_MODES

- Baud Rate Setup: Setup the baud rate by either providing the baud rate value or enabling the auto baud setup.
- Configuration of the RS485 mode if enabled.
- Enabling the handshake signals.e.g. Simplex, FlowControl. For specifics please refer the Data Types section in this guide.
- Defining the respective interrupt sources for Tx, Rx, and Error Interrupt.

The [DRV_USART_Initialize](#) API returns an object handle of the type [SYS_MODULE_OBJ](#). There on, the object handle returned by the Initialize interface would be used by the other system interfaces like [DRV_USART_Reinitialize](#), [DRV_USART_Deinitialize](#), [DRV_USART_Status](#) and [DRV_USART_TasksTX](#), [DRV_USART_TasksRX](#).

Note:The system initialization and the re-initialization settings, only effect the instance of the peripheral that is being initialized or re-initialized.

Example:

```
DRV_USART_INIT          usartInitData;
//Alternatively NULL can be passed to Initialize which then
//makes sure that static overrides as selected by the user
//will be used as default values
SYS_MODULE_OBJ          objectHandle;

usartInitData.moduleInit.value      = SYS_MODULE_POWER_RUN_FULL;
usartInitData.moduleId              = USART_ID_2;
usartInitData.operationMode        = DRV_USART_OPERATION_MODE_RS232;
usartInitData.initFlags             = 0;
usartInitData.lineControlMode       = DRV_USART_LINE_CONTROL_MODE_8NONE1;
usartInitData.brgClock              = 4000000;
usartInitData.brgValue              = 9600;
usartInitData.operationModeInit     = 0;
usartInitData.handShakeMode         = DRV_USART_HANDSHAKE_MODE_FLOWCONTROL;
usartInitData.txInterruptSource     = INT_SOURCE_USART_2_TRANSMIT;
usartInitData.rxInterruptSource     = INT_SOURCE_USART_2_RECEIVE;
usartInitData.errorInterruptSource  = INT_SOURCE_USART_2_ERROR;
usartInitData.txQueueSize           = 3;
usartInitData.rxQueueSize           = 3;

objectHandle = DRV_USART_Initialize(DRV_USART_INDEX_1, (SYS_MODULE_INIT*)usartInitData);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}
```

Tasks Routine

The system will either call [DRV_USART_TasksTX](#), [DRV_USART_TasksRX](#), from System Task Service (in a polled environment) or [DRV_USART_TasksTX](#), [DRV_USART_TasksRX](#) will be called from interrupt service routine of the USART.

5.1.11.4.3.2 Core Functionality

Core functionality provides a extremely basic interface for the driver operation.

Core Transmitter Functionality

Application using the USART core functionality, needs to perform the following:

1. The system should have completed necessary initialization and the [DRV_USART_TasksTX](#) should either be running in polled environment, or in an interrupt environment.
2. Open the driver using [DRV_USART_Open](#), timer driver supports exclusive access only.
3. Write a byte using [DRV_USART_WriteByte](#).
4. The client will be able to close itself using the [DRV_USART_Close](#) when required.

Example :

```

DRV_HANDLE      handle;    // Returned from DRV_USART_Open

bool            status;

// Pre-initialize myBuffer with MY_BUFFER_SIZE bytes of valid data.
    status = DRV_USART_WriteByte(handle, myBuffer[numBytes++]);

    // Do something else...
}

```

Core Receiver Functionality

Application using the USART core functionality, needs to perform the following:

1. The system should have completed necessary initialization and the [DRV_USART_TasksRX](#) should either be running in polled environment, or in an interrupt environment.
2. Open the driver using [DRV_USART_Open](#), timer driver supports exclusive access only.
3. Write a byte using [DRV_USART_ReadByte](#).
4. The client will be able to close itself using the [DRV_USART_Close](#) when required.

Example :

```

DRV_HANDLE      handle;    // Returned from DRV_USART_Open
bool            status;
char            byte;

bool = DRV_USART_ReadByte(handle, &byte);

// Do something else...

```

5.1.11.4.3.3 Client Access

For the application to start using an instance of the module, it must call the [DRV_USART_Open](#) function. This provides the configuration required to open the USART instance for operation. If the driver is de-initialized using the function [DRV_USART_Deinitialize](#), the application must call the [DRV_USART_Open](#) function again to setup the instance of the USART. The function [DRV_USART_Open](#) need not be called again if the system is re-initialized using the [DRV_USART_Reinitialize](#) function.

//This i have to mod

For the various options available for I/O INTENT please refer to the Data Types and Constants section.

Example:

```

DRV_HANDLE handle;

handle = DRV_USART_Open(DRV_USART_INDEX_1, DRV_IOINTENT_READWRITE); // Configure the instance
USART_ID_1 with the above configuration

if(handle == DRV_HANDLE_INVALID)
{
    // Client cannot open the instance.
}

```

5.1.11.4.3.4 Data Transfer

In the basic data transfer mode, the USART device driver allows the client to perform simple read or write operation on the USART. The client (who is this) has to provide a buffer where the transfer data is/will be stored.

Example : Read in the RS-232 mode

```

// USART is operating in RS-232 Mode
// Assume that DRV_USART_Open operation was called with DRV_IO_INTENT_NONBLOCKING parameter

char myBuffer[MY_BUFFER_SIZE];
size_t total;
size_t count;
DRV_HANDLE drvHandle; // device handle obtained by a call to DRV_USART_Open

// Start the transfer
total = 0;
do
{
    count = DRV_USART_Read(drvHandle, myBuffer, MY_BUFFER_SIZE - total);
    total += count;

    // Do something else...
} while(total < MY_BUFFER_SIZE);

```

Example : Write in the RS-485 mode

```

// USART is operating in RS-485 Mode
// Assume that DRV_USART_Open operation was called with DRV_IO_INTENT_NONBLOCKING parameter

char myBuffer[MY_BUFFER_SIZE];
size_t total;
size_t count;
DRV_HANDLE drvHandle; // device handle obtained by a call to DRV_USART_Open

// Start the transfer
total = 0;
do
{
    count = DRV_USART_WriteToAddress(drvHandle, 0x07, myBuffer, MY_BUFFER_SIZE - total); //
    // Write the string "writestring" to the communications channel

    total += count;

    // Do something else...
} while(total < MY_BUFFER_SIZE);

```

5.1.11.4.3.5 Advanced Data Transfer

USART device client transfer is composed of various buffers that are queued internally by the driver.

Each buffer is described by a buffer descriptor which contains the transfer buffer, size and an address

Each buffer has associated flags that specify the behavior that the device driver has to take once that particular segment reaches a particular stage of processing.

The client can add segments to the transfer by using [DRV_USART_BufferAdd](#) for adding the Read and write buffers.

The client can query the status of the buffer using the function [DRV_USART_BufferStatus](#) and also can query how many bytes of the buffer are read or written if the buffer is in progress using the function [DRV_USART_BufferTransferStatus](#).

The diagram below illustrates the buffer model used by the advanced data transfer.

**Example:**

```

void Callback(void);
uint8_t mybuffer[MY_BUFFER_SIZE];
uint8_t bytesWritten = 0;
DRV_BUFFER_HANDLE bufferHandle = NULL;
DRV_USART_IO_BUFFER buffer1;

void Callback(void)
{
    Nop();
}

buffer1.buffer      = writeBuffer2;
buffer1.bufferSize  = sizeof(writeBuffer2);
buffer1.xferCallback = Callback;
buffer1.flags       = DRV_USART_BUFFER_FLAG_WRITE;

// myUSARTHandle is the handle returned by the DRV_USART_Open function.

bufferHandle = DRV_USART_BufferAdd(myUSARTHandle, &buffer1);

bufferStatus = DRV_USART_BufferStatus ( uartHandle, uartBufferHandle );

if ( DRV_USART_BUFFER_COMPLETED == bufferStatus )
{
    // Handle Buffer Complete
}else
{
    // Handle other
}

```

Example:

```

void Callback(void);
uint8_t mybuffer[MY_BUFFER_SIZE];
uint8_t bytesWritten = 0;
DRV_BUFFER_HANDLE bufferHandle = NULL;
DRV_USART_IO_BUFFER buffer1;

void Callback(void)
{
    Nop();
}

buffer1.buffer      = readBuffer2;
buffer1.bufferSize  = sizeof(readBuffer2);
buffer1.xferCallback = Callback;
buffer1.flags       = DRV_USART_BUFFER_FLAG_READ;

```

```
// myUSARTHandle is the handle returned by the DRV_USART_Open function.

bufferHandle = DRV_USART_BufferAdd(myUSARTHandle, &buffer1);

bufferStatus = DRV_USART_BufferStatus ( uartHandle, uartBufferHandle );

if ( DRV_USART_BUFFER_COMPLETED == bufferStatus )
{
    // Handle Buffer Complete
}else
{
    // Handle other
}
```

5.1.11.5 Configuring the Library

The configuration of the USART device driver is based on the file sys_config.h

This header file contains the configuration selection for the USART device driver build. Based on the selections made here and the system setup the USART device driver will support or not selected features. These configuration settings will apply to all instances of the device driver.

This header can be placed anywhere in the application specific folders and the path of this header needs to be presented to the include search for a successful build. Refer to the [Applications Overview](#) section for more details.

Initialization overrides not supported in this version.

5.1.11.6 Building the Library

This section list the files that are available in the \src of the timer driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

5.1.11.7 Library Interface

Data Types and Constants

	Name	Description
	DRV_USART_AUTO_BAUD_ENABLE	Macro configures enabling the auto baud.
	DRV_USART_BAUD_RATE	Macro controls operation of the driver for Baud rate configuration
	DRV_USART_BYTE_Q_SIZE_RX	Macro controls operation of the driver for defining the size of the Rx buffer
	DRV_USART_BYTE_Q_SIZE_TX	Macro controls operation of the driver for defining the size of the Tx buffer
	DRV_USART_CLIENTS_NUMBER	Sets up the maximum number of clients that can be connected to any hardware instance.
	DRV_USART_HANDSHAKE_MODE	Configures the handshake mode
	DRV_USART_INDEX	USART Static Index selection
	DRV_USART_INDEX_0	USART driver index definitions
	DRV_USART_INDEX_1	This is macro DRV_USART_INDEX_1.
	DRV_USART_INDEX_2	This is macro DRV_USART_INDEX_2.
	DRV_USART_INDEX_3	This is macro DRV_USART_INDEX_3.
	DRV_USART_INDEX_4	This is macro DRV_USART_INDEX_4.

	<u>DRV_USART_INDEX_5</u>	This is macro DRV_USART_INDEX_5.
	<u>DRV_USART_INDEX_COUNT</u>	Number of valid USART driver indices
	<u>DRV_USART_INSTANCES_NUMBER</u>	Sets up the maximum number of hardware instances that can be supported
	<u>DRV_USART_INTERRUPT_MODE</u>	Macro controls operation of the driver in the interrupt mode
	<u>DRV_USART_INTERRUPT_SOURCE_ERROR</u>	Defines the interrupt source for the error interrupt
	<u>DRV_USART_INTERRUPT_SOURCE_RX</u>	Macro to define the Rx interrupt source in case of static driver
	<u>DRV_USART_INTERRUPT_SOURCE_TX</u>	Macro to define the Tx interrupt source in case of static driver
	<u>DRV_USART_LINE_CONTROL</u>	Macro defines the line control mode
	<u>DRV_USART_OPERATION_MODE</u>	Defines the mode to be used for the USART driver
	<u>DRV_USART_PERIPHERAL_ID</u>	Configures the PLIB id
	<u>DRV_USART_POLARITY_INVERTED_RX</u>	Defines the polarity of the RX pin.
	<u>DRV_USART_POLARITY_INVERTED_TX</u>	Defines the polarity of the TX pin.
	<u>DRV_USART_POWER_STATE</u>	Macro controls power state of the USART
	<u>DRV_USART_WAKE_ON_START_ENABLE</u>	Macro configures that the peripheral should wake up on start
	<u>DRV_USART_XFER_BUFFER_NUMBER</u>	Transfer buffer depth
	<u>DRV_USART_BUFFER_FLAGS</u>	Defines the IO types that can be serviced by the USART driver
	<u>DRV_USART_BUFFER_STATUS</u>	Defines the buffer status
	<u>DRV_USART_CALLBACK</u>	Pointer to a USART callback function
	<u>DRV_USART_CLIENT_STATUS</u>	Defines the client status
	<u>DRV_USART_HANDSHAKE_MODES</u>	Identifies the handshaking modes available on the USART
	<u>DRV_USART_INIT</u>	Defines the data required to initialize or reinitialize the USART driver
	<u>DRV_USART_INIT_FLAGS</u>	Defines specific initialization features
	<u>DRV_USART_IO_BUFFER</u>	IO buffer information structure
	<u>DRV_USART_LINE_CONTROL_MODES</u>	Identifies the line control modes available
	<u>DRV_USART_OPERATION_MODE_INIT</u>	Defines the initialization data required for different operation modes of USART
	<u>DRV_USART_OPERATION_MODES</u>	Identifies the modes of the operation of the USART module
	<u>DRV_USART_TRANSFER_STATUS</u>	Specifies the status of the receive or transmit
	<u>DRV_USART_XFER_HANDLE</u>	Handle for requested transfer..

Data Transfer Functions

	Name	Description
	<u>DRV_USART_BufferAdd</u>	Starts the writes to the communication channel.
	<u>DRV_USART_BufferStatus</u>	Provides the status of the given buffer
	<u>DRV_USART_Read</u>	Reads data from the USART
	<u>DRV_USART_ReadByte</u>	Reads a byte of data from the USART
	<u>DRV_USART_TransferStatus</u>	Returns the transmitter and receiver transfer status
	<u>DRV_USART_Write</u>	Writes data to the USART
	<u>DRV_USART_WriteByte</u>	Writes a byte of data to the USART

Setup and Status Functions

	Name	Description
	<u>DRV_USART_BufferTransferStatus</u>	Gets the number of bytes which are written or read
	<u>DRV_USART_ClientStatus</u>	Gets current client-specific status the USART driver
	<u>DRV_USART_Close</u>	Closes an opened-instance of the USART driver

	DRV_USART_Open	Opens the specified timer driver instance and returns a handle to it
	DRV_USART_Status	Gets the current status of the USART driver module.

System Initialization Functions

	Name	Description
	DRV_USART_Deinitialize	Deinitializes the specified instance of the USART driver module
	DRV_USART_Initialize	Initializes the USART instance for the specified driver index
	DRV_USART_Reinitialize	Reinitializes the USART driver and refreshes any associated hardware settings
	DRV_USART_TasksError	Maintains the driver's error-handling state machine and implements its ISR
	DRV_USART_TasksRX	Maintains the driver's receiver state machine and implements its ISR
	DRV_USART_TasksTX	Maintains the driver's transmitter state machine and implements its ISR

Description

This section describes the functions of the USART Driver Library.

Refer to each section for a detailed description.

5.1.11.7.1 System Initialization Functions

5.1.11.7.1.1 DRV_USART_Deinitialize Function

C

```
void DRV_USART_Deinitialize(
    SYS_MODULE_OBJ object
);
```

Description

Deinitializes the specified instance of the USART driver module, disabling its operation (and any hardware). Invalidates all the internal data.

Preconditions

Function [DRV_USART_Initialize](#) should have been called before calling this function.

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_USART_Initialize routine

Returns

None.

Remarks

Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again.

This routine will NEVER block waiting for hardware. If the operation requires time to allow the hardware to complete, this will be reported by the [DRV_USART_Status](#) operation. The system has to use [DRV_USART_Status](#) to find out when the module is in the ready state.

Example

```
SYS_MODULE_OBJ    object;    // Returned from DRV_USART_Initialize
SYS_STATUS        status;
```

```

DRV_USART_Deinitialize(object);

status = DRV_USART_Status(object);
if (SYS_MODULE_DEINITIALIZED != status)
{
    // Check again later if you need to know
    // when the driver is deinitialized.
}

```

5.1.11.7.1.2 DRV_USART_Initialize Function

C

```

SYS_MODULE_OBJ DRV_USART_Initialize(
    const SYS_MODULE_INDEX index,
    const SYS_MODULE_INIT * const init
);

```

Description

This routine initializes the USART driver instance for the specified driver index, making it ready for clients to open and use it.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the instance to be initialized
init	Pointer to a data structure containing any data necessary to initialize the driver. This pointer may be null if no data is required because static overrides have been provided.

Returns

If successful, returns a valid handle to a driver instance object. Otherwise, it returns [SYS_MODULE_OBJ_INVALID](#).

Remarks

This routine must be called before any other USART routine is called.

This routine should only be called once during system initialization unless [DRV_USART_Deinitialize](#) is called to de-initialize the driver instance.

This routine will NEVER block for hardware access. If the operation requires time to allow the hardware to re-initialize, it will be reported by the [DRV_USART_Status](#) operation. The system must use [DRV_USART_Status](#) to find out when the driver is in the ready state.

Build configuration options may be used to statically override options in the "init" structure and will take precedence over initialization data passed using this routine.

Example

```

DRV_USART_INIT          usartInitData;
//Alternatively NULL can be passed to Initialize which then
//makes sure that static overrides as selected by the user
//will be used as default values
SYS_MODULE_OBJ          objectHandle;

usartInitData.moduleInit.value    = SYS_MODULE_POWER_RUN_FULL;
usartInitData.moduleId           = USART_ID_2;
usartInitData.operationMode      = DRV_USART_OPERATION_MODE_RS232;
usartInitData.initFlags          = 0;
usartInitData.lineControlMode    = DRV_USART_LINE_CONTROL_MODE_8NONE1;
usartInitData.brgClock           = 4000000;

```

```

usartInitData.brgValue           = 9600;
usartInitData.operationModeInit  = 0;
usartInitData.handShakeMode      = DRV_USART_HANDSHAKE_MODE_FLOWCONTROL;
usartInitData.txInterruptSource   = INT_SOURCE_USART_2_TRANSMIT;
usartInitData.rxInterruptSource   = INT_SOURCE_USART_2_RECEIVE;
usartInitData.errorInterruptSource = INT_SOURCE_USART_2_ERROR;
usartInitData.txQueueSize        = 3;
usartInitData.rxQueueSize        = 3;

objectHandle = DRV_USART_Initialize(DRV_USART_INDEX_1, (SYS_MODULE_INIT*)usartInitData);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}

```

5.1.11.7.1.3 DRV_USART_Reinitialize Function

C

```

void DRV_USART_Reinitialize(
    SYS_MODULE_OBJ object,
    const SYS_MODULE_INIT * const init
);

```

Description

This routine reinitializes the driver and refreshes any associated hardware settings using the initialization data given, but it will not interrupt any ongoing operations.

Preconditions

Function [DRV_USART_Initialize](#) must have been called before calling this routine and a valid [SYS_MODULE_OBJ](#) must have been returned.

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_USART_Initialize routine
init	Pointer to the initialization data structure

Returns

None.

Remarks

This function can be called multiple times to reinitialize the module.

This operation can be used to refresh any supported hardware registers as specified by the initialization data or to change the power state of the module.

This routine will NEVER block for hardware access. If the operation requires time to allow the hardware to re-initialize, it will be reported by the [DRV_USART_Status](#) operation. The system must use [DRV_USART_Status](#) to find out when the driver is in the ready state.

Build configuration options may be used to statically override options in the "init" structure and will take precedence over initialization data passed using this routine.

Example

```

DRV_USART_INIT usartInitData;
//Alternatively NULL can be passed to Initialize which then
//makes sure that static overrides as selected by the user
//will be used as default values

SYS_STATUS usartStatus;

```

```

SYS_MODULE_OBJ  object;

usartInitData.moduleInit.value      = SYS_MODULE_POWER_RUN_FULL;
usartInitData.moduleId              = USART_ID_2;
usartInitData.operationMode         = DRV_USART_OPERATION_MODE_RS232;
usartInitData.initFlags              = 0;
usartInitData.lineControlMode        = DRV_USART_LINE_CONTROL_MODE_8NONE1;
usartInitData.brgClock               = 4000000;
usartInitData.brgValue               = 9600;
usartInitData.operationModeInit      = 0;
usartInitData.handShakeMode          = DRV_USART_HANDSHAKE_MODE_FLOWCONTROL;
usartInitData.txInterruptSource      = INT_SOURCE_USART_2_TRANSMIT;
usartInitData.rxInterruptSource      = INT_SOURCE_USART_2_RECEIVE;
usartInitData.errorInterruptSource   = INT_SOURCE_USART_2_ERROR;

DRV_USART_Reinitialize(object, (SYS_MODULE_INIT*)usartInitData);

usartStatus = DRV_USART_Status(object);
if (SYS_STATUS_BUSY == usartStatus)
{
    // Check again later to ensure the driver is ready
}
else if (SYS_STATUS_ERROR >= usartStatus)
{
    // Handle error
}

```

5.1.11.7.1.4 DRV_USART_TasksError Function

C

```

void DRV_USART_TasksError(
    SYS_MODULE_OBJ object
);

```

Description

This routine is used to maintain the driver's internal error-handling state machine and implement its ISR for interrupt-driven implementations.

Preconditions

The [DRV_USART_Initialize](#) routine must have been called for the specified USART driver instance.

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_USART_Initialize)

Returns

None.

Remarks

This routine is normally not called directly by an application. It is called by the system's Tasks routine ([SYS_Tasks](#)) or by the appropriate raw ISR.

This routine may execute in an ISR context and will never block or access any resources that may cause it to block.

Example

```

SYS_MODULE_OBJ  object;    // Returned from DRV_USART_Initialize

while (true)
{
    DRV_USART_TasksError (object);
}

```

```
    // Do other tasks  
}
```

5.1.11.7.1.5 DRV_USART_TasksRX Function

C

```
void DRV_USART_TasksRX(  
    SYS_MODULE_OBJ object  
);
```

Description

This routine is used to maintain the driver's internal receiver state machine and implement its ISR for interrupt-driven implementations.

Preconditions

The [DRV_USART_Initialize](#) routine must have been called for the specified USART driver instance.

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_USART_Initialize)

Returns

None.

Remarks

This routine is normally not called directly by an application. It is called by the system's Tasks routine ([SYS_Tasks](#)) or by the appropriate raw ISR.

This routine may execute in an ISR context and will never block or access any resources that may cause it to block.

Example

```
SYS_MODULE_OBJ    object;    // Returned from DRV_USART_Initialize  
  
while (true)  
{  
    DRV_USART_TasksRX (object);  
  
    // Do other tasks  
}
```

5.1.11.7.1.6 DRV_USART_TasksTX Function

C

```
void DRV_USART_TasksTX(  
    SYS_MODULE_OBJ object  
);
```

Description

This routine is used to maintain the driver's internal transmitter state machine and implement its ISR for interrupt-driven implementations.

Preconditions

The [DRV_USART_Initialize](#) routine must have been called for the specified USART driver instance.

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_USART_Initialize)

Returns

None.

Remarks

This routine is normally not called directly by an application. It is called by the system's Tasks routine ([SYS_Tasks](#)) or by the appropriate raw ISR.

This routine may excute in an ISR context and will never block or access any resources that may cause it to block.

Example

```
SYS_MODULE_OBJ    object;    // Returned from DRV_USART_Initialize

while (true)
{
    DRV_USART_TasksTX (object);

    // Do other tasks
}
```

5.1.11.7.2 Data Transfer Functions**5.1.11.7.2.1 DRV_USART_BufferAdd Function****C**

```
DRV_HANDLE DRV_USART_BufferAdd(
    const DRV_HANDLE handle,
    DRV_USART_IO_BUFFER * bufferObject
);
```

Description

Starts the writes to the communication channel.

Preconditions

The [DRV_USART_Initialize](#) routine must have been called for the specified USART device instance and the [DRV_USART_Status](#) must have returned SYS_STATUS_READY.

[DRV_USART_Open](#) must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_READ or DRV_IO_INTENT_WRITE or DRV_IO_INTENT_READWRITE must have been specified in the [DRV_USART_Open](#) call.

Parameters

Parameters	Description
handle	Handle of the communication channel as return by the DRV_USART_Open function.
bufferObject	Buffer Object that needs to be specified for the buffer that needs to be read or written.

Returns

The buffer handle, which should be used to query how many bytes have been written or read using the function

DRV_USART_OperationStatus

Remarks

If the DRV_IO_INTENT_BLOCKING is requested and the driver was built appropriately to support blocking behavior in an OS environment the call will block until the operation is complete.

For DRV_IO_INTENT_NONBLOCKING request the driver client can call the [DRV_USART_ClientStatus](#) operation to find out when the module is in the ready state.

In any circumstance, the client supplied buffer has to be non-volatile and it is not allowed to go out of scope until the operation completes.

Affected by the following configuration options:

- DRV_USART_CONFIG_SUPPORT_CLIENT_ACCESS_BLOCKING
- DRV_USART_CONFIG_BUFFER_QUEUE_SLOTS_MAX
- DRV_USART_CONFIG_SUPPORT_BUFFERQ

Example

```
void Callback(void);
uint8_t mybuffer[MY_BUFFER_SIZE];
int8_t bytesWritten = 0;
DRV_BUFFER_HANDLE bufferHandle = NULL;
DRV_USART_IO_BUFFER buffer1;
void Callback(void)
{
    Nop();
}

buffer1.buffer      = writeBuffer2;
buffer1.bufferSize  = sizeof(writeBuffer2);
buffer1.xferCallback = Callback;
buffer1.flags       = DRV_USART_BUFFER_FLAG_WRITE;

// myUSARTHandle is the handle returned by the DRV_USART_Open function.

bufferHandle = DRV_USART_BufferAdd(myUSARTHandle, &buffer1);

while(bytesWritten < MY_BUFFER_SIZE)
{
    bytesWritten = DRV_USART_BufferTransferStatus(handle, bufferHandle);
}
```

5.1.11.7.2.2 DRV_USART_BufferStatus Function

C

```
DRV_USART_BUFFER_STATUS DRV_USART_BufferStatus(
    DRV_HANDLE handle,
    const DRV_HANDLE bufferHandle
);
```

Description

This function provides the current status of the buffer identified by the given buffer handle.

Preconditions

The [DRV_USART_Initialize](#) routine must have been called for the specified USART device instance and the [DRV_USART_Status](#) must have returned SYS_STATUS_READY.

[DRV_USART_Open](#) must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_READ or DRV_IO_INTENT_WRITE or DRV_IO_INTENT_READWRITE must have been specified in the

[DRV_USART_Open](#) call.

The "bufferHandle" parameter must be the return value from a call to the "[DRV_USART_BufferAdd](#)" function.

Parameters

Parameters	Description
handle	Handle of the communication channel as return by the DRV_USART_Open function.
bufferHandle	Handle to the buffer in question. Must be the return value from a call to the " DRV_USART_BufferAdd " function.

Returns

The current status of the given buffer.

Remarks

See the definition of "[DRV_USART_BUFFER_STATUS](#)" for a complete description of all possible status values.

Example

```
DRV_USART_BUFFER_STATUS bufferStatus;

bufferStatus = DRV_USART_BufferStatus ( uartHandle, uartBufferHandle );
if ( DRV_USART_BUFFER_COMPLETED == bufferStatus )
{
    // Handle Buffer Complete
} else
{
    // Handle other
}
```

5.1.11.7.2.3 DRV_USART_Read Function

C

```
int DRV_USART_Read(
    const DRV_HANDLE handle,
    uint8_t * buffer,
    const unsigned int numbytes
);
```

Description

This routine reads data from the USART.

Preconditions

The [DRV_USART_Initialize](#) routine must have been called for the specified USART driver instance.

[DRV_USART_Open](#) must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_READ or DRV_IO_INTENT_READWRITE must have been specified in the [DRV_USART_Open](#) call.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
buffer	Buffer into which the data read from the USART instance will be placed.
numbytes	Total number of bytes that need to be read from the module instance (must be equal to or less than the size of the buffer)

Returns

Number of bytes actually copied into the caller's buffer or -1 if there is an error (call [DRV_USART_ClientStatus](#) to identify the error).

Remarks

If the DRV_IO_INTENT_BLOCKING flag was given in the call to the [DRV_USART_Open](#) routine and the driver was built to support blocking behavior the call will block until the operation is complete.

If the DRV_IO_INTENT_NONBLOCKING flag was given in the call to the [DRV_USART_Open](#) routine or the driver was built to only support non-blocking behavior the call will return immediately, identifying how many bytes of data were actually copied into the client's buffer and the client must call DRV_USART_Read again with adjusted parameters as shown in the example.

Example

```
DRV_HANDLE    handle;    // Returned from DRV_USART_Open
char          myBuffer[MY_BUFFER_SIZE];
unsigned int  count;
unsigned int  total;

total = 0;
do
{
    count = DRV_USART_Read(myUSARTHandle, &myBuffer[total], MY_BUFFER_SIZE - total);
    total += count;

    // Do something else...
} while( total < MY_BUFFER_SIZE );
```

5.1.11.7.2.4 DRV_USART_ReadByte Function**C**

```
bool DRV_USART_ReadByte(
    const DRV_HANDLE handle,
    char * byte
);
```

Description

This routine reads a byte of data from the USART.

Preconditions

The [DRV_USART_Initialize](#) routine must have been called for the specified USART driver instance.

[DRV_USART_Open](#) must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_READ or DRV_IO_INTENT_READWRITE must have been specified in the [DRV_USART_Open](#) call.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
byte	A variable in which data is read into

Returns

true - Read successful false - Read failed

Remarks

If the DRV_IO_INTENT_BLOCKING flag was given in the call to the [DRV_USART_Open](#) routine and the driver was built to support blocking behavior the call will block until the operation is complete.

If the DRV_IO_INTENT_NONBLOCKING flag was given in the call to the [DRV_USART_Open](#) routine or the driver was built to only support non-blocking behavior the call will return immediately. If data is not available, a zero (0) value will be returned and an underrun error status will be captured. To ensure that valid data is returned, the caller must first check the return value to [DRV_USART_TransferStatus](#) as shown in the example.

Example

```

DRV_HANDLE    handle;    // Returned from DRV_USART_Open
bool          status;
char          byte;

bool = DRV_USART_ReadByte(handle, &byte);

// Do something else...

```

5.1.11.7.2.5 DRV_USART_TransferStatus Function**C**

```

DRV_USART_TRANSFER_STATUS DRV_USART_TransferStatus(
    const DRV_HANDLE handle
);

```

Description

This returns the transmitter and receiver transfer status.

Preconditions

The [DRV_USART_Initialize](#) routine must have been called for the specified USART driver instance.

[DRV_USART_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Returns

A [DRV_USART_TRANSFER_STATUS](#) value describing the current status of the transfer.

Remarks

The returned status may contain a value with more than one of the bits specified in the [DRV_USART_TRANSFER_STATUS](#) enumeration set. The caller should perform an "AND" with the bit of interest and verify if the result is non-zero (as shown in the example) to verify the desired status bit.

Example

```

DRV_HANDLE handle;    // Returned from DRV_USART_Open

if (DRV_USART_TRANSFER_STATUS_TX_EMPTY & DRV_USART_TransferStatus(handle) )
{
    // All transmitter data has been sent.
}

```

5.1.11.7.2.6 DRV_USART_Write Function**C**

```

bool DRV_USART_Write(
    const DRV_HANDLE handle,
    const uint8_t * buffer,
    const uint32_t numbytes
);

```

Description

This routine writes data to the USART.

Preconditions

The [DRV_USART_Initialize](#) routine must have been called for the specified USART driver instance.

[DRV_USART_Open](#) must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_WRITE or DRV_IO_INTENT_READWRITE must have been specified in the [DRV_USART_Open](#) call.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
buffer	Buffer containing the data write to the USART instance
numbytes	Total number of bytes that to write to the USART instance (must be equal to or less than the size of the buffer)

Returns

Number of bytes actually written to the USART or -1 if there is an error (call [DRV_USART_ClientStatus](#) to identify the error)

Remarks

If the DRV_IO_INTENT_BLOCKING flag was given in the call to the [DRV_USART_Open](#) routine and the driver was built to support blocking behavior the call will block until the operation is complete.

If the DRV_IO_INTENT_NONBLOCKING flag was given in the call to the [DRV_USART_Open](#) routine or the driver was built to only support non-blocking behavior the call will return immediately, identifying how many bytes of data were actually written to the USART and the client must call DRV_USART_Write again with adjusted parameters as shown in the example.

Example

```

DRV_HANDLE    handle;    // Returned from DRV_USART_Open
char          myBuffer[MY_BUFFER_SIZE];
unsigned int   count;
unsigned int   total;

total = 0;
do
{
    count = DRV_USART_Write(myUSARTHandle, &myBuffer[total], MY_BUFFER_SIZE - total);
    total += count;

    // Do something else...
} while( total < MY_BUFFER_SIZE );

```

5.1.11.7.2.7 DRV_USART_WriteByte Function**C**

```

bool DRV_USART_WriteByte(
    const DRV_HANDLE handle,
    const uint8_t byte
);

```

Description

This routine writes a byte of data to the USART.

Preconditions

The [DRV_USART_Initialize](#) routine must have been called for the specified USART driver instance.

[DRV_USART_Open](#) must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_WRITE or DRV_IO_INTENT_READWRITE must have been specified in the [DRV_USART_Open](#) call.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
byte	Data byte to write to the USART

Returns

true - Write successful. false - Write failed.

Remarks

If the DRV_IO_INTENT_BLOCKING flag was given in the call to the [DRV_USART_Open](#) routine and the driver was built to support blocking behavior the call will block until the operation is complete.

If the DRV_IO_INTENT_NONBLOCKING flag was given in the call to the [DRV_USART_Open](#) routine or the driver was built to only support non-blocking behavior the call will return immediately. If the driver was not able to [accept](#) the data, an overrun error status will be captured. To ensure that the driver is ready to [accept](#) data, the caller must first check the return value to [DRV_USART_TransferStatus](#) as shown in the example.

Example

```
DRV_HANDLE    handle;    // Returned from DRV_USART_Open

bool          status;

// Pre-initialize myBuffer with MY_BUFFER_SIZE bytes of valid data.
    status =  DRV_USART_WriteByte(handle, myBuffer[numBytes++]);
    // Do something else...
}
```

5.1.11.7.3 Setup and Status Functions

5.1.11.7.3.1 DRV_USART_BufferTransferStatus Function

C

```
int8_t DRV_USART_BufferTransferStatus(
    const DRV_HANDLE handle,
    const DRV_HANDLE bufferHandle
);
```

Description

Gets the number of bytes which are written or read for the transaction handle

Preconditions

The [DRV_USART_Initialize](#) routine must have been called for the specified USART device instance and the [DRV_USART_Status](#) must have returned SYS_STATUS_READY.

[DRV_USART_Open](#) must have been called to obtain a valid opened device handle.

The function [DRV_USART_BufferAdd](#) should be called before calling this function and should have returned a valid buffer handle.

Parameters

Parameters	Description
handle	Handle of the communication channel as return by the DRV_USART_Open function.

bufferHandle	Handle of the buffer returned by the DRV_USART_BufferAdd

Returns

The number of bytes read if the buffer id is DRV_IO_BUFFER_READ or number of bytes written when the buffer id is DRV_IO_BUFFER_WRITE. If -1 is returned

Remarks

None.

Example

```
void Callback(void);
uint8_t mybuffer[MY_BUFFER_SIZE];
int8_t bytesWritten = 0;
DRV_BUFFER_HANDLE bufferHandle = NULL;
DRV_USART_IO_BUFFER buffer1;
void Callback(void)
{
    Nop();
}

buffer1.buffer      = writeBuffer2;
buffer1.bufferSize  = sizeof(writeBuffer2);
buffer1.xferCallback = Callback;
buffer1.flags       = DRV_USART_BUFFER_FLAG_WRITE;

// myUSARTHandle is the handle returned by the DRV_USART_Open function.

bufferHandle = DRV_USART_BufferAdd(myUSARTHandle, &buffer1);

while(bytesWritten < MY_BUFFER_SIZE)
{
    bytesWritten = DRV_USART_BufferTransferStatus(handle, bufferHandle);
}
```

5.1.11.7.3.2 DRV_USART_ClientStatus Function**C**

```
DRV_USART_CLIENT_STATUS DRV_USART_ClientStatus(
    const DRV_HANDLE handle
);
```

Description

This routine gets the client-specific status of the USART driver associated with the given handle.

Preconditions

The [DRV_USART_Initialize](#) routine must have been called.

[DRV_USART_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Returns

A [DRV_USART_CLIENT_STATUS](#) value describing the current status of the driver

Remarks

This routine will not block for hardware access and will immediately return the current status.

Example

```

DRV_HANDLE      handle;           // Returned from DRV_USART_Open
DRV_USART_CLIENT_STATUS clientStatus;

clientStatus = DRV_USART_ClientStatus(handle);
if(DRV_USART_CLIENT_STATUS_ERROR >= clientStatus)
{
    // Handle the error
}

```

5.1.11.7.3.3 DRV_USART_Close Function**C**

```

void DRV_USART_Close(
    const DRV_HANDLE handle
);

```

Description

This routine closes an opened-instance of the USART driver, invalidating the handle.

Preconditions

The [DRV_USART_Initialize](#) routine must have been called for the specified USART driver instance.

[DRV_USART_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Returns

None

Remarks

After calling this routine, the handle passed in "handle" must not be used with any of the remaining driver routines. A new handle must be obtained by calling [DRV_USART_Open](#) before the caller may use the driver again.

If DRV_IO_INTENT_BLOCKING was requested and the driver was built appropriately to support blocking behavior call may block until the operation is complete.

If DRV_IO_INTENT_NON_BLOCKING request the driver client can call the [DRV_USART_Status](#) operation to find out when the module is in the ready state (the handle is no longer valid).

Usually there is no need for the driver client to verify that the Close operation has completed.

Example

```

DRV_HANDLE handle; // Returned from DRV_USART_Open

DRV_USART_Close(handle);

```

5.1.11.7.3.4 DRV_USART_Open Function**C**

```

DRV_HANDLE DRV_USART_Open(
    const SYS_MODULE_INDEX index,
    const DRV_IO_INTENT ioIntent
);

```

Description

This routine opens the specified USART driver instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver.

Preconditions

Function [DRV_USART_Initialize](#) must have been called before calling this function.

Parameters

Parameters	Description
drvIndex	Identifier for the object instance to be opened
intent	Zero or more of the values from the enumeration DRV_IO_INTENT "or'd" together to indicate the intended use of the driver

Returns

If successful, the routine returns a valid open-instance handle (a number identifying both the caller and the module instance).

If an error occurs, the return value is [DRV_HANDLE_INVALID](#).

Remarks

The handle returned is valid until the [DRV_USART_Close](#) routine is called.

This routine will NEVER block waiting for hardware.

If the DRV_IO_INTENT_BLOCKING is requested and the driver was built appropriately to support blocking behavior, then other client-level operations may block waiting on hardware until they are complete.

If DRV_IO_INTENT_NON_BLOCKING is requested the driver client can call the [DRV_USART_ClientStatus](#) operation to find out when the module is in the ready state.

If the requested intent flags are not supported, the routine will return [DRV_HANDLE_INVALID](#).

Example

```
DRV_HANDLE handle;

handle = DRV_USART_Open(DRV_USART_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);
if (DRV_HANDLE_INVALID == handle)
{
    // Unable to open the driver
}
```

5.1.11.7.3.5 DRV_USART_Status Function

C

```
SYS_STATUS DRV_USART_Status(
    SYS_MODULE_OBJ object
);
```

Description

This routine provides the current status of the USART driver module.

Preconditions

Function [DRV_USART_Initialize](#) should have been called before calling this function.

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_USART_Initialize routine

Returns

SYS_STATUS_READY - Indicates that the driver is busy with a previous system level operation and cannot start another

Note Any value greater than SYS_STATUS_READY is also a normal running state in which the driver is ready to **accept** new operations.

SYS_STATUS_BUSY - Indicates that the driver is busy with a previous system level operation and cannot start another

SYS_STATUS_ERROR - Indicates that the driver is in an error state

Remarks

Any value less than SYS_STATUS_ERROR is also an error state.

SYS_MODULE_DEINITIALIZED - Indicates that the driver has been de-initialized

This value is less than SYS_STATUS_ERROR

The this operation can be used to determine when any of the driver's module level operations has completed.

If the status operation returns SYS_STATUS_BUSY, the a previous operation has not yet completed. Once the status operation returns SYS_STATUS_READY, any previous operations have completed.

The value of SYS_STATUS_ERROR is negative (-1). Any value less than that is also an error state.

This routine will NEVER block waiting for hardware.

If the Status operation returns an error value, the error may be cleared by calling the reinitialize operation. If that fails, the deinitialize operation will need to be called, followed by the initialize operation to return to normal operations.

Example

```
SYS_MODULE_OBJ    object;    // Returned from DRV_USART_Initialize
SYS_STATUS        usartStatus;

usartStatus = DRV_USART_Status(object);
else if (SYS_STATUS_ERROR >= usartStatus)
{
    // Handle error
}
```

5.1.11.7.4 Data Types and Constants**5.1.11.7.4.1 DRV_USART_AUTO_BAUD_ENABLE Macro****C**

```
#define DRV_USART_AUTO_BAUD_ENABLE true
```

Description

Auto Baud enable

This macro configures enabling the auto baud. This is a static override of initialization parameter. This is the static override of the dynamic initialization passed using **DRV_USART_INIT**. The possible values it can take:

- true - Enables Auto Baud
- false - Disable Auto Baud

5.1.11.7.4.2 DRV_USART_BAUD_RATE Macro

C

```
#define DRV_USART_BAUD_RATE
```

Description

USART Baud Rate configuration

This macro controls the operation of the driver for Baud rate configuration. This is the static override of the dynamic initialization passed using [DRV_USART_INIT](#).

5.1.11.7.4.3 DRV_USART_BYTE_Q_SIZE_RX Macro

C

```
#define DRV_USART_BYTE_Q_SIZE_RX 16
```

Description

USART Byte mode internal buffer Rx size configuration

This macro controls the operation of the driver for defining the size of the Rx buffer

5.1.11.7.4.4 DRV_USART_BYTE_Q_SIZE_TX Macro

C

```
#define DRV_USART_BYTE_Q_SIZE_TX 16
```

Description

USART Byte mode internal buffer Tx size configuration

This macro controls the operation of the driver for defining the size of the Tx buffer

5.1.11.7.4.5 DRV_USART_CLIENTS_NUMBER Macro

C

```
#define DRV_USART_CLIENTS_NUMBER 2
```

Description

USART Client Count Configuration

Sets up the maximum number of clients that can be connected to any hardware instance.

Remarks

None

5.1.11.7.4.6 DRV_USART_HANDSHAKE_MODE Macro

C

```
#define DRV_USART_HANDSHAKE_MODE
```

Description

Hand Shake Mode

This macro configures the handshake mode. This is the static override of the dynamic initialization passed using [DRV_USART_INIT](#). The possible values that it can take are

- DRV_USART_HANDSHAKE_MODE_FLOWCONTROL
- DRV_USART_HANDSHAKE_MODE_SIMPLEX
- DRV_USART_HANDSHAKE_MODE_NONE

5.1.11.7.4.7 DRV_USART_INDEX Macro

C

```
#define DRV_USART_INDEX DRV_USART_INDEX_2
```

Description

Index - Used for static drivers

USART Static Index selection for the driver object reference

Remarks

This index is required to make a reference to the driver object

5.1.11.7.4.8 DRV_USART_INDEX_0 Macro

C

```
#define DRV_USART_INDEX_0 0
```

Description

Driver USART Module Index reference

These constants provide timer driver index definitions.

Remarks

These constants should be used in place of hard-coded numeric literals.

These values should be passed into the [DRV_USART_Initialize](#) and [DRV_USART_Open](#) routines to identify the driver instance in use.

5.1.11.7.4.9 DRV_USART_INDEX_1 Macro

C

```
#define DRV_USART_INDEX_1 1
```

Description

This is macro DRV_USART_INDEX_1.

5.1.11.7.4.10 DRV_USART_INDEX_2 Macro

C

```
#define DRV_USART_INDEX_2 2
```

Description

This is macro DRV_USART_INDEX_2.

5.1.11.7.4.11 DRV_USART_INDEX_3 Macro

C

```
#define DRV_USART_INDEX_3 3
```

Description

This is macro DRV_USART_INDEX_3.

5.1.11.7.4.12 DRV_USART_INDEX_4 Macro

C

```
#define DRV_USART_INDEX_4 4
```

Description

This is macro DRV_USART_INDEX_4.

5.1.11.7.4.13 DRV_USART_INDEX_5 Macro

C

```
#define DRV_USART_INDEX_5 5
```

Description

This is macro DRV_USART_INDEX_5.

5.1.11.7.4.14 DRV_USART_INDEX_COUNT Macro

C

```
#define DRV_USART_INDEX_COUNT USART_NUMBER_OF_MODULES
```

Description

USART Driver Module Index Count

This constant identifies USART driver index definitions.

Remarks

This constant should be used in place of hard-coded numeric literals.

This value is part-specific.

5.1.11.7.4.15 DRV_USART_INSTANCES_NUMBER Macro

C

```
#define DRV_USART_INSTANCES_NUMBER 2
```

Description

USART driver objects configuration

Sets up the maximum number of hardware instances that can be supported

Remarks

None

5.1.11.7.4.16 DRV_USART_INTERRUPT_MODE Macro

C

```
#define DRV_USART_INTERRUPT_MODE
```

Description

USART Interrupt Mode Operation Control

This macro controls the operation of the driver in the interrupt mode of operation. The possible values it can take are

- true - Enables the interrupt mode
- false - Enables the polling mode

5.1.11.7.4.17 DRV_USART_INTERRUPT_SOURCE_ERROR Macro

C

```
#define DRV_USART_INTERRUPT_SOURCE_ERROR INT_SOURCE_USART_2_ERROR
```

Description

Error Interrupt Source

This macro defines the interrupt source for the error interrupt. This is the static override of the dynamic initialization passed using [DRV_USART_INIT](#).

5.1.11.7.4.18 DRV_USART_INTERRUPT_SOURCE_RX Macro

C

```
#define DRV_USART_INTERRUPT_SOURCE_RX INT_SOURCE_USART_2_RECEIVE
```

Description

RX Interrupt Source

Macro to define the Rx interrupt source in case of static driver

Remarks

Refer to the INT PLIB document for more information on [INT_SOURCE](#) enumeration

5.1.11.7.4.19 DRV_USART_INTERRUPT_SOURCE_TX Macro

C

```
#define DRV_USART_INTERRUPT_SOURCE_TX INT_SOURCE_USART_2_TRANSMIT
```

Description

TX Interrupt Source

Macro to define the Tx interrupt source in case of static driver

Remarks

Refer to the INT PLIB document for more information on [PLIB_INT_SOURCE](#) enumeration

5.1.11.7.4.20 DRV_USART_LINE_CONTROL Macro

C

```
#define DRV_USART_LINE_CONTROL DRV_USART_LINE_CONTROL_8N1
```

Description

Line Control Mode

This macro defines the line control mode as 8 data bits, even parity and 1 stop bit. It provides a static override of the initialization configuration of the line control mode. The possible values it can take are:

- DRV_USART_LINE_CONTROL_8E1
- DRV_USART_LINE_CONTROL_8E2
- DRV_USART_LINE_CONTROL_8O1
- DRV_USART_LINE_CONTROL_8O2
- DRV_USART_LINE_CONTROL_8N1
- DRV_USART_LINE_CONTROL_8N2
- DRV_USART_LINE_CONTROL_9N1

5.1.11.7.4.21 DRV_USART_OPERATION_MODE Macro

C

```
#define DRV_USART_OPERATION_MODE DRV_USART_OPERATION_MODE_RS232
```

Description

USART mode

This macro controls support modes of the USART driver . The possible values it can take are:

- DRV_USART_OPERATION_MODE_IRDA
- DRV_USART_OPERATION_MODE_RS232
- DRV_USART_OPERATION_MODE_RS485
- DRV_USART_OPERATION_MODE_SYNC_MASTER
- DRV_USART_OPERATION_MODE_SYNC_SLAVE
- DRV_USART_OPERATION_MODE_LOOPBACK

Remarks

None

5.1.11.7.4.22 DRV_USART_PERIPHERAL_ID Macro

C

```
#define DRV_USART_PERIPHERAL_ID
```

Description

Plib id

This macro configures the PLIB Id for the driver. This is the static override of the dynamic initialization passed using [DRV_USART_INIT](#).

5.1.11.7.4.23 DRV_USART_POLARITY_INVERTED_RX Macro

C

```
#define DRV_USART_POLARITY_INVERTED_RX true
```

Description

USART RX Polarity Mode.

This macro defines the polarity of the RX pin. The possible values it can take are

- true - polarity is inverted
- false - polarity is not inverted

Remarks

None.

5.1.11.7.4.24 DRV_USART_POLARITY_INVERTED_TX Macro

C

```
#define DRV_USART_POLARITY_INVERTED_TX true
```

Description

USART TX Polarity Mode.

This macro defines the polarity of the TX pin. The possible values it can take are

- true - polarity is inverted
- false - polarity is not inverted

Remarks

None

5.1.11.7.4.25 DRV_USART_POWER_STATE Macro

C

```
#define DRV_USART_POWER_STATE SYS_MODULE_POWER_IDLE_STOP
```

Description

USART power state configuration

This macro controls the power state of the USART

Remarks

This feature may not be available in the device or the USART module selected

5.1.11.7.4.26 DRV_USART_WAKE_ON_START_ENABLE Macro

C

```
#define DRV_USART_WAKE_ON_START_ENABLE
```

Description

Wake on start enable

This macro configures that the peripheral should wake up on start.

5.1.11.7.4.27 DRV_USART_XFER_BUFFER_NUMBER Macro

C

```
#define DRV_USART_XFER_BUFFER_NUMBER 10
```

Description

USART transfer buffer configuration

This macro controls the transfer buffer depth

Remarks

This feature may not be available in the device or the USART module selected

5.1.11.7.4.28 DRV_USART_BUFFER_FLAGS Enumeration

C

```
typedef enum {
    DRV_USART_BUFFER_FLAG_WRITE,
    DRV_USART_BUFFER_FLAG_WRITE_AFTER_BREAK,
    DRV_USART_BUFFER_FLAG_WRITE_TO_ADDRESS,
    DRV_USART_BUFFER_FLAG_READ_FROM_ADDRESS,
    DRV_USART_BUFFER_FLAG_READ,
    DRV_USART_BUFFER_FLAG_STOP_ON_ERROR
} DRV_USART_BUFFER_FLAGS;
```

Description

USART IO Types

This enumeration defines the IO types that can be serviced by the USART driver.

Members

Members	Description
DRV_USART_BUFFER_FLAG_WRITE	Write Buffer
DRV_USART_BUFFER_FLAG_WRITE_AFTER_BREAK	Write Buffer After Sending Break
DRV_USART_BUFFER_FLAG_WRITE_TO_ADDRESS	Write Buffer to the address
DRV_USART_BUFFER_FLAG_READ_FROM_ADDRESS	Read Buffer from the address
DRV_USART_BUFFER_FLAG_READ	Read Buffer
DRV_USART_BUFFER_FLAG_STOP_ON_ERROR	Instructs the driver to stop processing if error is encountered

Remarks

None

5.1.11.7.4.29 DRV_USART_BUFFER_STATUS Enumeration

C

```
typedef enum {
    DRV_USART_BUFFER_COMPLETED,
    DRV_USART_BUFFER_QUEUED,
    DRV_USART_BUFFER_IN_PROGRESS,
    DRV_USART_BUFFER_ERROR_UNKNOWN,
    DRV_USART_BUFFER_ERROR_RX_OVERFLOW
} DRV_USART_BUFFER_STATUS;
```

Description

USART Buffer Status

Defines the states that an USART buffer can be in during its lifetime

Members

Members	Description
DRV_USART_BUFFER_COMPLETED	Done OK and ready
DRV_USART_BUFFER_QUEUED	Scheduled but not started
DRV_USART_BUFFER_IN_PROGRESS	Currently being in transfer
DRV_USART_BUFFER_ERROR_UNKNOWN	Unknown buffer
DRV_USART_BUFFER_ERROR_RX_OVERFLOW	Read data lost: rx process not fast enough

Remarks

As buffers may have a limited life span, so too have the associated handles and status info. Once a buffer transfer is completed (and possibly notified and acknowledged) it will be discarded. The status of a discarded buffer is no longer maintained by the driver.

5.1.11.7.4.30 DRV_USART_CALLBACK Type**C**

```
typedef void (* DRV_USART_CALLBACK)(void);
```

Description

USART Callback Function

This data type defines a pointer callback function.

Remarks

A USART callback function must have the following function signature:

```
void MyCallBack ( DRV_USART_BUFFER_HANDLE *bufferHandle );
```

Where "MyCallBack" can be any name desired as the routine is called through the pointer.

A pointer of this type is passed into the DRV_USART_RegisterCallbacks routine.

5.1.11.7.4.31 DRV_USART_CLIENT_STATUS Enumeration**C**

```
typedef enum {
    DRV_USART_CLIENT_STATUS_READY,
    DRV_USART_CLIENT_STATUS_BUSY,
    DRV_USART_OVERRUN_ERROR,
    DRV_USART_PARITY_ERROR,
    DRV_USART_FRAMING_ERROR,
    DRV_USART_STATUS_INVALID
} DRV_USART_CLIENT_STATUS;
```

Description

USART Client Status

Defines the various client status codes.

Members

Members	Description
DRV_USART_CLIENT_STATUS_READY	Up and running, ready to start new operations
DRV_USART_CLIENT_STATUS_BUSY	Operation in progress, unable to start a new one
DRV_USART_OVERRUN_ERROR	Overrun Error Occured
DRV_USART_PARITY_ERROR	Parity Error
DRV_USART_FRAMING_ERROR	Framing Error
DRV_USART_STATUS_INVALID	client Invalid

Remarks

None

5.1.11.7.4.32 DRV_USART_HANDSHAKE_MODES Enumeration

C

```
typedef enum {
    DRV_USART_HANDSHAKE_MODE_FLOWCONTROL,
    DRV_USART_HANDSHAKE_MODE_SIMPLEX,
    DRV_USART_HANDSHAKE_MODE_NONE
} DRV_USART_HANDSHAKE_MODES;
```

Description

USART Handshake Modes

This data type identifies the handshaking modes available on the USART module.

Members

Members	Description
DRV_USART_HANDSHAKE_MODE_FLOWCONTROL	Handshaking occurs in Flow Control Mode
DRV_USART_HANDSHAKE_MODE_SIMPLEX	Handshaking occurs in Simplex Mode
DRV_USART_HANDSHAKE_MODE_NONE	No Handshaking

Remarks

Not all modes are available on all micro-controllers.

5.1.11.7.4.33 DRV_USART_INIT Structure

C

```
typedef struct {
    SYS_MODULE_INIT moduleInit;
    USART_MODULE_ID usartID;
    uint8_t operationMode;
    uint8_t initFlags;
    DRV_USART_LINE_CONTROL_MODES lineControlMode;
    uint32_t brgValue;
    DRV_USART_OPERATION_MODE_INIT operationModeInit;
    DRV_USART_HANDSHAKE_MODES handShakeMode;
    uint32_t txInterruptSource;
    uint32_t rxInterruptSource;
    uint32_t errorInterruptSource;
    uint32_t rxQueueSize;
    uint32_t txQueueSize;
} DRV_USART_INIT;
```

Description

USART Driver Initialization Data

This data type defines the data required to initialize or reinitialize the USART driver.

Members

Members	Description
SYS_MODULE_INIT moduleInit;	System module initialization
USART_MODULE_ID usartID;	Identifies USART hardware module (PLIB-level) ID
uint8_t operationMode;	Operation Modes of the driver
uint8_t initFlags;	Flags for the usart initialization
DRV_USART_LINE_CONTROL_MODES lineControlMode;	Control the line control configuration

uint32_t brgValue;	Baud Rate value to be used, if not using auto baud
DRV_USART_OPERATION_MODE_INIT operationModeInit;	Operation mode initialization data
DRV_USART_HANDSHAKE_MODES handShakeMode;	Handshake Mode
uint32_t txInterruptSource;	Interrupt Source for TX Interrupt INT_SOURCE txInterruptSource;
uint32_t rxInterruptSource;	Interrupt Source for RX Interrupt INT_SOURCE rxInterruptSource;
uint32_t errorInterruptSource;	Interrupt Source for Error Interrupt INT_SOURCE errorInterruptSource;

Remarks

Not all the init features are available for all the microcontrollers

5.1.11.7.4.34 DRV_USART_INIT_FLAGS Enumeration**C**

```
typedef enum {
    DRV_USART_INIT_FLAG_WAKE_ON_START_ENABLE,
    DRV_USART_INIT_FLAG_AUTO_BAUD_ENABLE
} DRV_USART_INIT_FLAGS;
```

Description

USART Initialization flags

Defines the various flags which determine specific modes

Members

Members	Description
DRV_USART_INIT_FLAG_WAKE_ON_START_ENABLE	Flag to setup Wake on Start Operation
DRV_USART_INIT_FLAG_AUTO_BAUD_ENABLE	Flag to enable auto baud detection enable.

Remarks

None

5.1.11.7.4.35 DRV_USART_IO_BUFFER Structure**C**

```
typedef struct {
    DRV_USART_BUFFER_FLAGS flags;
    char * buffer;
    uint32_t bufferSize;
    uint8_t address;
    DRV_USART_CALLBACK xferCallback;
} DRV_USART_IO_BUFFER;
```

Description

USART Driver IO Buffer

This structure holds information that the client must pass the driver to enqueue a buffer to be transferred by a read or write operation.

Members

Members	Description
DRV_USART_BUFFER_FLAGS flags;	Defines the IO Type this buffer is associated with
char * buffer;	The buffer which needs to be read or written

uint32_t bufferSize;	The size of the buffer which needs to be read or written
uint8_t address;	The address which needs to be written

Remarks

A pointer to an instance of this structure must be passed to the [DRV_USART_BufferAdd](#) routine.

5.1.11.7.4.36 DRV_USART_LINE_CONTROL_MODES Enumeration**C**

```
typedef enum {
    DRV_USART_LINE_CONTROL_MODE_8NONE1,
    DRV_USART_LINE_CONTROL_MODE_9NONE1,
    DRV_USART_LINE_CONTROL_MODE_8EVEN1,
    DRV_USART_LINE_CONTROL_MODE_8EVEN2,
    DRV_USART_LINE_CONTROL_MODE_8ODD1,
    DRV_USART_LINE_CONTROL_MODE_8ODD2,
} DRV_USART_LINE_CONTROL_MODES;
```

Description

USART Line Control Modes

This data type identifies the line control modes available

Members

Members	Description
DRV_USART_LINE_CONTROL_MODE_8NONE1	8 Data Bits, No Parity, 1 Stop Bits
DRV_USART_LINE_CONTROL_MODE_9NONE1	9 Data Bits, No Parity, 1 Stop Bits
DRV_USART_LINE_CONTROL_MODE_8EVEN1	8 Data Bits, Even Parity, 1 Stop Bits
DRV_USART_LINE_CONTROL_MODE_8EVEN2	8 Data Bits, Even Parity, 2 Stop Bits
DRV_USART_LINE_CONTROL_MODE_8ODD1	8 Data Bits, Odd Parity, 1 Stop Bits
DRV_USART_LINE_CONTROL_MODE_8ODD2	8 Data Bits, Odd Parity, 2 Stop Bits

Remarks

None

5.1.11.7.4.37 DRV_USART_OPERATION_MODE_INIT Union**C**

```
typedef union {
    struct {
        uint8_t address;
    } RS485Init;
} DRV_USART_OPERATION_MODE_INIT;
```

Description

Operation Mode Initialization

This data type defines the initialization data required for different operation modes of USART.

Members

Members	Description
struct { uint8_t address; } RS485Init;	Initialization for RS485 mode

uint8_t address;	Address of the device.

Remarks

None

5.1.11.7.4.38 DRV_USART_OPERATION_MODES Enumeration**C**

```
typedef enum {
    DRV_USART_OPERATION_MODE_IRDA = (1 << 0),
    DRV_USART_OPERATION_MODE_RS232,
    DRV_USART_OPERATION_MODE_RS485,
    DRV_USART_OPERATION_MODE_SYNCHRONOUS_MASTER,
    DRV_USART_OPERATION_MODE_SYNCHRONOUS_SLAVE,
    DRV_USART_OPERATION_MODE_LOOPBACK
} DRV_USART_OPERATION_MODES;
```

Description

USART Modes of Operation

This data type identifies the modes of the operation of the USART module.

Members

Members	Description
DRV_USART_OPERATION_MODE_RS232	RS232 Mode (Asynchronous Mode of Operation)
DRV_USART_OPERATION_MODE_RS485	RS485 Mode (Asynchronous Mode of Operation)
DRV_USART_OPERATION_MODE_SYNCHRONOUS_MASTER	Synchronous Master Mode
DRV_USART_OPERATION_MODE_SYNCHRONOUS_SLAVE	Synchronous Slave Mode
DRV_USART_OPERATION_MODE_LOOPBACK	Loopback Mode

Remarks

Not all modes are available on all microcontrollers. Refer to the data sheet for the microcontroller in use.

5.1.11.7.4.39 DRV_USART_TRANSFER_STATUS Enumeration**C**

```
typedef enum {
    DRV_USART_TRANSFER_STATUS_RX_FULL,
    DRV_USART_TRANSFER_STATUS_RX_DATA_PRESENT,
    DRV_USART_TRANSFER_STATUS_RX_EMPTY,
    DRV_USART_TRANSFER_STATUS_TX_FULL,
    DRV_USART_TRANSFER_STATUS_TX_EMPTY
} DRV_USART_TRANSFER_STATUS;
```

Description

USART Driver Transfer Flags

This type specifies the status of the receive or transmit operation.

Members

Members	Description
DRV_USART_TRANSFER_STATUS_RX_FULL	Indicates that the core driver buffer is full
DRV_USART_TRANSFER_STATUS_RX_DATA_PRESENT	Indicates that at least one byte of Data has been received
DRV_USART_TRANSFER_STATUS_RX_EMPTY	Indicates that the core driver receiver buffer is empty

DRV_USART_TRANSFER_STATUS_TX_FULL	Indicates that the core driver transmitter buffer is full
DRV_USART_TRANSFER_STATUS_TX_EMPTY	Indicates that the core driver transmitter buffer is empty

Remarks

More than one of these values may be OR'd together to create a complete status value. To test a value of this type, the bit of interest must be AND'ed with value and checked to see if the result is non-zero.

5.1.11.7.4.40 DRV_USART_XFER_HANDLE Type**C**

```
typedef uintptr_t DRV_USART_XFER_HANDLE;
```

Description

USART Transfer Handle

Handle for requested transfer..

Remarks

None

5.1.11.8 Files**Files**

Name	Description
drv_usart.h	USART Driver Interface Definition
drv_usart_config_template.h	USART Driver Configuration Template.

Description**5.1.11.8.1 drv_usart.h**

USART Driver Interface Definition

The USART device driver provides a simple interface to manage the USART or UART modules on Microchip microcontrollers. This file defines the interface definition for the USART driver.

Enumerations

	Name	Description
	DRV_USART_BUFFER_FLAGS	Defines the IO types that can be serviced by the USART driver
	DRV_USART_BUFFER_STATUS	Defines the buffer status
	DRV_USART_CLIENT_STATUS	Defines the client status
	DRV_USART_HANDSHAKE_MODES	Identifies the handshaking modes available on the USART
	DRV_USART_INIT_FLAGS	Defines specific initialization features
	DRV_USART_LINE_CONTROL_MODES	Identifies the line control modes available
	DRV_USART_OPERATION_MODES	Identifies the modes of the operation of the USART module
	DRV_USART_TRANSFER_STATUS	Specifies the status of the receive or transmit

Functions

	Name	Description
	DRV_USART_BufferAdd	Starts the writes to the communication channel.
	DRV_USART_BufferStatus	Provides the status of the given buffer
	DRV_USART_BufferTransferStatus	Gets the number of bytes which are written or read
	DRV_USART_ClientStatus	Gets current client-specific status the USART driver
	DRV_USART_Close	Closes an opened-instance of the USART driver
	DRV_USART_Deinitialize	Deinitializes the specified instance of the USART driver module
	DRV_USART_Initialize	Initializes the USART instance for the specified driver index
	DRV_USART_Open	Opens the specified timer driver instance and returns a handle to it
	DRV_USART_Read	Reads data from the USART
	DRV_USART_ReadByte	Reads a byte of data from the USART
	DRV_USART_Reinitialize	Reinitializes the USART driver and refreshes any associated hardware settings
	DRV_USART_Status	Gets the current status of the USART driver module.
	DRV_USART_TasksError	Maintains the driver's error-handling state machine and implements its ISR
	DRV_USART_TasksRX	Maintains the driver's receiver state machine and implements its ISR
	DRV_USART_TasksTX	Maintains the driver's transmitter state machine and implements its ISR
	DRV_USART_TransferStatus	Returns the transmitter and receiver transfer status
	DRV_USART_Write	Writes data to the USART
	DRV_USART_WriteByte	Writes a byte of data to the USART

Macros

	Name	Description
	DRV_USART_INDEX_0	USART driver index definitions
	DRV_USART_INDEX_1	This is macro DRV_USART_INDEX_1.
	DRV_USART_INDEX_2	This is macro DRV_USART_INDEX_2.
	DRV_USART_INDEX_3	This is macro DRV_USART_INDEX_3.
	DRV_USART_INDEX_4	This is macro DRV_USART_INDEX_4.
	DRV_USART_INDEX_5	This is macro DRV_USART_INDEX_5.
	DRV_USART_INDEX_COUNT	Number of valid USART driver indices

Structures

	Name	Description
	DRV_USART_INIT	Defines the data required to initialize or reinitialize the USART driver
	DRV_USART_IO_BUFFER	IO buffer information structure

Types

	Name	Description
	DRV_USART_CALLBACK	Pointer to a USART callback function
	DRV_USART_XFER_HANDLE	Handle for requested transfer..

Unions

	Name	Description
	DRV_USART_OPERATION_MODE_INIT	Defines the initialization data required for different operation modes of USART

File Name

drv_usart.h

Company

Microchip Technology Incorporated

5.1.11.8.2 drv_usart_config_template.h

USART Driver Configuration Template

These file provides the list of all the configurations that can be used with the driver. This file should not be included in the driver.

Macros

	Name	Description
	<u>DRV_USART_AUTO_BAUD_ENABLE</u>	Macro configures enabling the auto baud.
	<u>DRV_USART_BAUD_RATE</u>	Macro controls operation of the driver for Baud rate configuration
	<u>DRV_USART_BYTE_Q_SIZE_RX</u>	Macro controls operation of the driver for defining the size of the Rx buffer
	<u>DRV_USART_BYTE_Q_SIZE_TX</u>	Macro controls operation of the driver for defining the size of the Tx buffer
	<u>DRV_USART_CLIENTS_NUMBER</u>	Sets up the maximum number of clients that can be connected to any hardware instance.
	<u>DRV_USART_HANDSHAKE_MODE</u>	Configures the handshake mode
	<u>DRV_USART_INDEX</u>	USART Static Index selection
	<u>DRV_USART_INSTANCES_NUMBER</u>	Sets up the maximum number of hardware instances that can be supported
	<u>DRV_USART_INTERRUPT_MODE</u>	Macro controls operation of the driver in the interrupt mode
	<u>DRV_USART_INTERRUPT_SOURCE_ERROR</u>	Defines the interrupt source for the error interrupt
	<u>DRV_USART_INTERRUPT_SOURCE_RX</u>	Macro to define the Rx interrupt source in case of static driver
	<u>DRV_USART_INTERRUPT_SOURCE_TX</u>	Macro to define the Tx interrupt source in case of static driver
	<u>DRV_USART_LINE_CONTROL</u>	Macro defines the line control mode
	<u>DRV_USART_OPERATION_MODE</u>	Defines the mode to be used for the USART driver
	<u>DRV_USART_PERIPHERAL_ID</u>	Configures the PLIB id
	<u>DRV_USART_POLARITY_INVERTED_RX</u>	Defines the polarity of the RX pin.
	<u>DRV_USART_POLARITY_INVERTED_TX</u>	Defines the polarity of the TX pin.
	<u>DRV_USART_POWER_STATE</u>	Macro controls power state of the USART
	<u>DRV_USART_WAKE_ON_START_ENABLE</u>	Macro configures that the peripheral should wake up on start
	<u>DRV_USART_XFER_BUFFER_NUMBER</u>	Transfer buffer depth

5.1.12 USB Driver Library

5.1.12.1 Introduction

USB Device Driver Library

for

Microchip Microcontrollers

This library provides an interface to manage the USB module on Microchip family of micro controllers during different modes of operation.

Description

Overview of the USB Module

The USB module implements the physical layer in a USB based system. In that, it allows the USB stack software to access and control the USB. The USB module on Microchip's micro controllers are compliant with the USB 2.0 specification. This help file only provides relevant information about the operation of the USB. The reader is encouraged to refer to the USB 2.0 specification available at www.usb.org for complete information about the USB.

Not all Microchip microcontrollers feature a USB module. Among the ones that do, the supported features may vary. Please refer to the device specific data sheet for details on the availability of the USB module and the supported features.

Note: Trademarks and Intellectual Property are property of their respective owners. Customers are responsible for obtaining appropriate licensing or rights before using this software.

5.1.12.2 Release Notes

MPLAB Harmony Version: v0.70b **USB Driver Library Version :** 1.0 **Release Date:** 18Nov2013

New This Release:

- Supports all four (Control, Bulk, Interrupt and Isochronous) USB Transfers.
- Control transfers supported on endpoint 0 only.
- Endpoint 0 pipe is always bidirectional. All other endpoint pipes require Receive and Transmit pipes to be opened separately.
- Supports multiple clients. Device function drivers can communicate on the USB directly via the USB Driver.
- Setup packet reception is automatic and does not require client intervention or scheduling. Clients receive notification when a Setup packet is received.
- The static multi client version of the driver support one transfer object per Control, Bulk and Interrupt Pipe and supports 2 transfer objects per Isochronous Pipe.

Known Issues:

- Nothing to report in this release

5.1.12.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.1.12.4 Using the Library

This topic describes the basic architecture of the USB Driver Library and provides information and examples on how to use it.

Interface Header File: [drv_usb.h](#)

The interface to the USB Driver library is defined in the "[drv_usb.h](#)" header file.

Please refer to the [MPLAB Harmony Overview](#) for how the Driver interacts with the framework.

5.1.12.4.1 Library Overview

Refer to the section Driver Overview for how the driver operates in a system. The library interface routines are divided into various subsections, each of the sub section addresses one of the blocks or the overall operation of the USB module.

Library Interface Section	Description
System Functions	These routines are typically invoked by the MPLAB Harmony system module.
Client Functions	These routines are used by the driver clients to access driver functionality
Pipe Functions	These routines allow clients to manage pipes
Transfer Functions	These routines allow clients to manage transfers
Other Functions	These routines represent the rest of the driver functionality
Data Types and Constants	These data types and constants are required while interacting and configuring the driver

5.1.12.4.2 Abstraction Model

Figure 1: USB Driver Device Mode Model

Figure 1 shows the functioning of the USB Driver in device mode. In this mode, the driver offers services required to operate the

USB module as a USB device. The USB Driver supports multiple clients. Each client can receive notifications about USB events via callback functions. Typical clients could be the Device Layer firmware and one or more function drivers. The Device layer firmware and the function drivers communicate on the USB via pipes. A pipe is an association between the device's endpoint and host stack software. An Endpoint 0 Pipe is always bi-directional and is a message pipe. Communication on this pipe is defined by the USB specification. All other endpoints support stream pipes. The format of the data on a stream pipe is not specified by the USB specification. Stream pipes are uni-directional. Therefore, two pipes are required to transmit and receive data on a non-zero endpoint.

Clients schedule USB transfers through a pipe. Transfers on non-zero endpoint pipes can be queued. The USB driver manages the transactions required to complete the transfer. This is transparent to the clients. Clients can either get an event notification or can poll to check the completion status of a transfer. Clients can register callback functions to receive USB events notification. A Transfer complete callback function can be registered while requesting a transfer. This function will be called when the transfer is terminated. While operating in device mode, the first client of the USB Driver should always be the USB Device Stack Device layer. Only the first client can schedule control transfers on endpoint 0 (via a pipe) and receive the Setup Token and Setup Handshake events (along with the other events). Other clients may or may not register an event call back function.

The USB Driver uses configuration macros that control among other things, functional aspects such as maximum number of clients and maximum pipes.

5.1.12.4.3 How the Library Works

Before the driver is ready for use, its should be configured. Refer to the Configuring the Library section for more details on how to configure the driver.

To use the USB Driver, initialization and client functions should be invoked in a specific sequence to ensure correct operation. The following is the sequence in which various routines should be called:

1. Call the `DRV_USB_Init()` function to initialize the USB Driver. Note that this may be performed by the MPLAB Harmony system module.
2. In USB device mode operation, the first client should always be the USB Device Stack Device Layer. The Device Layer first opens the driver via the `DRV_USB_Open()` function.
3. The Device layer registers an event call back function via the `DRV_USB_Device_EventCallBackSet()` function.
4. The Device layer assigns a setup packet buffer by using the `DRV_USB_Device_SetupPacketBufferAssign()` function. The driver stores the received setup packet in this buffer. Calling this function also enables the USB Device Mode and at this point the device will attach to the host and be ready to receive setup tokens from the host.
5. The Device Layer waits for the Reset Event. In this event, the device layer creates an endpoint 0 pipe by using the `DRV_USB_Device_PipeSetup()` function. The Device layer can optionally register a transfer complete call back function. This function will be called when a transfer on the endpoint zero is complete.
6. Based on the device enumeration process and the selected configuration, other function drivers may open the driver by using the `DRV_USB_Open()` function.

It is strongly recommended that the above sequence be followed for correct operation on the driver.

Note: Not all modes are available on all the devices, please refer to the specific device data sheet for the set of modes supported.

5.1.12.4.3.1 Driver Initialization

At the time of initialization, the `DRV_USB_Initialize()` function requires `DRV_MODULE_INIT` data structure that provides information required for the function of the driver. The following data is needed:

1. Maximum number of endpoints to be supported by the driver. In case endpoints are skipped, the largest endpoint number

should be used. For example, if the application uses endpoints 0,1 and 2, then maximum number of endpoints should 3. If the application uses endpoints 0,1 and 5, then maximum number of endpoints should 6. The latter configuration is not recommended.

2. Maximum size of the endpoint 0. This should match the maximum size that is reported to the host during enumeration.
3. Pointer to byte array whose size is defined `DRV_USB_WORKING_BUFFER_SIZE(nEndpoint, maxEP0Size)`, where `nEndpoint` is the maximum number of endpoint as described in point 1 above and `maxEP0Size` is the maximum endpoint 0 size as described in point 2 above. These values should match `usbInitData.ep0MaxSize` and `usbInitData.nEndpoints`.
4. The PLIB peripheral ID of the USB module to associated with the driver object being initialized.
5. The operation mode of the driver (host, device or OTG). Refer to the [Release Notes](#) for supported modes.
5. The ping pong mode to be used by internal endpoint buffers. Refer to the device specific data sheet for supported ping pong modes.
6. Behavior of the USB module when the microcontroller device enters IDLE mode.
7. Behavior of the USB module when the microcontroller device enters SLEEP mode.
8. Power state of the USB module.
9. USB module interrupts to be enabled. These include the general, error and OTG interrupts. Refer to the USB PLIB documentation for available module interrupts.
10. The interrupt source of the USB module to be used with the driver instance. Refer to the USB PLIB documentation for available module interrupts.

The following code snippet shows an example initialization of the driver.

```
/* The following code snippet shows an example initialization of the
 * driver. The USB module to be used in USB1. The maximum number of
 * endpoints to be used is 3 i.e endpoint 0,1 and 2. Maximum size of
 * endpoint 0 is 64. The module should not automatically suspend when the
 * micro-controller enters Sleep mode. The module should continue
 * operation when the module enters Idle mode. The ping pong setting
 * is set to full ping pong (both RX and TX endpoints have ping
 * pong buffers). The power state is set to run at full clock speeds.*/

DRV_USB_INIT moduleInit;

uint8_t internalBuffer[[DRV_USB_WORKING_BUFFER_SIZE(3,64)]
                        __attribute__((aligned(512)))];

usbInitData.usbID = USB_ID_1;
usbInitData.usbModuleSetup.OpMode = USB_OPMODE_DEVICE;
usbInitData.usbModuleSetup.ppMode = USB_PING_PONG__FULL_PING_PONG;

usbInitData.usbModuleSetup.StopInIdle      = false;
usbInitData.usbModuleSetup.SuspendInSleep = false;

usbInitData.usbModuleSetup.otgInterruptEnables = ~USB_OTG_INT_ALL ;
usbInitData.usbModuleSetup.generalInterruptEnables = USB_INT_ALL & ~USB_INT_SOF ;
usbInitData.usbModuleSetup.errorInterruptEnables = USB_ERR_INT_ALL ;

usbInitData.workingBuffer = internalBuffer;
usbInitData.ep0MaxSize = 64;
usbInitData.nEndpoints = 3;
usbInitData.sysModuleInit.powerState = SYS_MODULE_POWER_RUN_FULL ;

usbInitData.interruptSource = INT_SOURCE_USB_1;

/* This is how this data structure is passed to the initialize
 * function. */
```

```
DRV_USB_Initialize(DRV_USB_INDEX_0, (SYS_MODULE_INIT *) &usbInitData);
```

5.1.12.4.3.2 Opening the Driver

Once the driver is initialized for device mode, it can be opened by clients. The client must specify which driver instance it wants to be a client to and IO mode in which the driver should be opened. The USB Device Driver while operating in USB device mode only supports non-blocking, read write and shared client access I/O intent mode. Trying to open the driver in any other mode will cause the open routine to fail.

The driver treats the first client that opens it, differently from the other clients. This first client must open a bi-directional pipe on endpoint zero. It must then register a Setup Packet Buffer with the driver. The driver uses this buffer to store the 8 byte Setup command details received during the Setup stage of a Control transfer. While all clients can register a USB event callback function, only the first client receives the USB_DEVICE_SETUP_TOKEN and the USB_DEVICE_SETUP_HANDSHAKE event in its callback routine.

Typically (and it is recommended that) the first client to open the driver should be the USB Device Stack Device Layer Firmware. The Device Layer firmware is responsible for enumerating the USB device and responding to host requests on the Endpoint 0 message pipe. The first client should register a USB event callback function (by using the DRV_USB_Device_EventCallbackSet() function) and Setup Packet Buffer (by using the DRV_USB_Device_SetupPacketBufferAssign() function) with the Driver. Both of these are essential for operation of the driver. Registering a Setup Packet Buffer via the DRV_USB_Device_SetupPacketBufferAssign() also enables the USB device (activates the USB module pull up resistors) for operation on the USB.

The following code snippet shows an example of how a USB Device Stack Device Layer should open the driver and perform other functions.

```
/* In this example, the USB Device Layer (myUSBDevice) opens
 * the USB Driver. It is assumed that the Driver is already
 * initialized */

myUSBDevice.usbDriverHandle = DRV_USB_Open(DRV_USB_INDEX_0,
                                           DRV_IO_INTENT_NONBLOCKING|DRV_IO_INTENT_READWRITE|DRV_IO_INTENT_SHARED );

if(DRV_HANDLE_INVALID == myUSBDevice.usbDriverHandle)
{
    /* The open function failed. We can find out why */
    if(USB_CLIENT_NOTAVAIL == DRV_USB_Device_DriverClientErrorGet(DRV_USB_INDEX_0))
    {
        /* This means that there is no space for another client.
         * The driver configuration needs to be modified to support
         * more clients. This can be done by increasing the value
         * of DRV_USB_CLIENTS_NUMBER */

        while(1);
    }
}

/* Set the client event callback for the Device Layer.
 * The USBDeviceLayerEventHandler() function is the event
 * handler. When this event handler is invoked by the
 * driver, the driver returns back the second argument
 * specified in the below function (which in this case
 * is the device layer data structure). This allows the
 * application firmware to identify, as an example, the
 * device layer object associated with this callback
 */

DRV_USB_Device_EventCallbackSet(myUSBDevice.usbDriverHandle, (void *)&myUSBDevice,
                               USBDeviceLayerEventHandler);

/* Device Layer register setup packet buffer. The Setup Packet Buffer
 * size is 8 bytes and is of the type uint8_t. Calling this function
```

```

    * enables the device and the device is ready to receive a Setup token
    * from the host. */

DRV_USB_Device_SetupPacketBufferAssign(myUSBDevice.usbDriverHandle, setupPacketBuffer);

/* Device Layer opens a endpoint 0 pipe. Refer to Setting
 * up a Pipe section for more details on how to set up the
 * pipe. This may be done in the reset event.*/

myUSBDevice.ep0Pipe = DRV_USB_Device_PipeSetup(myUSBDevice.usbDriverHandle, 0,
USB_EP_TX_RX,
                                     64, 1, USB_CONTROL_PIPE);

```

A function driver may open the driver for use based on the configuration set by the host. Function drivers may or may not require USB Event notification and so may not need to register a USB Event Callback function. The user application can also open the driver. This allows the user application to track USB events and also communicate directly on the bus. The following code snippet shows an example of how a function driver can open the USB Driver.

```

/* This code snippet shows an example of how the
 * a function driver, say CDC, could open the USB Driver.
 * Note that this should happen on a set configuration
 * event from the host. */

cdc.usbDriverHandle = DRV_USB_Open(DRV_USB_INDEX_0,
    DRV_IO_INTENT_NONBLOCKING|DRV_IO_INTENT_READWRITE );

if(DRV_HANDLE_INVALID == cdc.usbDriverHandle)
{
    /* The open function failed. We can find out why */
    if(USB_CLIENT_NOTAVAIL == DRV_USB_Device_DriverClientErrorGet(DRV_USB_INDEX_0))
    {
        /* This means that there is no space for another client.
         * The driver configuration needs to be modified to support
         * more clients. This can be done by increasing the value
         * of DRV_USB_CLIENTS_NUMBER */

        while(1);
    }
}

/* Set the USB Event handler for CDC. Note that
 * this optional and should be done only if the
 * function driver requires USB Events notification. */

DRV_USB_Device_EventCallbackSet(cdc.usbDriverHandle, (void *)&cdc,
    CDCDeviceUSBEventHandler);

/* CDC Function driver opens a TX and RX bulk pipe on
 * endpoint 1. */

cdc.bulkRxPipe = DRV_USB_Device_PipeSetup(cdc.usbDriverHandle, 1,
    USB_EP_RX, 64, 3, USB_BULK_PIPE);

cdc.bulkTxPipe = DRV_USB_Device_PipeSetup(cdc.usbDriverHandle, 1,
    USB_EP_TX, 64, 3, USB_BULK_PIPE);

```

5.1.12.4.3.3 Endpoint Pipes

A client must open a pipe in order to schedule transfers on the USB. This is done by using the DRV_USB_Device_PipeSetup() function. From a USB perspective, an endpoint 0 pipe is a message pipe (or a control pipe). The data flowing through this pipe has a structure which defined by the USB specification. Pipes on non-zero endpoints are stream pipes and need not follow a specific format. A Pipe connects a device's endpoint to a Host Driver software. Endpoint 0 pipe is always needed and must be created for the USB device to enumerate and hence operate correctly. Non-zero endpoint pipes are created based on the configuration set by the Host.

5.1.12.4.3.3.1 Pipe Setup

The DRV_USB_Device_PipeSetup() function creates a pipe. The following points should be noted while using this function to create a pipe.

1. The pipeDirection argument specifies the pipe direction. An endpoint 0 pipe is always bi-directional. So this parameter is ignored when the nEndpoint parameter is 0. All other pipes must be unidirectional. Specifying USB_EP_TX as the pipe direction sets up the pipe to **send** data from device to host (host Read transfers). Specifying USB_EP_RX as the pipe direction sets up the pipe to receive data from host (host Write transfers).
2. The nBytesMaxSize parameter specifies the maximum size of the data packet in a transaction on that pipe. It should not exceed the maximum endpoint size communicated to the host during enumeration. Depending on the type of the USB transfer that the pipe will handle and the speed of the USB, the maximum size of the data packet may vary. If the size of the read transfer (device to host) scheduled on the pipe is greater than nBytesMaxSize, the driver will respond correctly multiple transactions that are issued by the host to complete the transfer.
3. The nXferQueueSize parameter defines the size of the transfers that can be queued up this pipe. The minimum queue size should be 1. The control pipe (endpoint 0 pipe) always has queue size of 1. Control transfers on the endpoint 0 pipe cannot be queued. Refer to the Transfer Request section for more information on how transfers are scheduled. Other non-zero endpoint pipes can have a queue size greater than or equal to 1.
4. An endpoint and direction of communication cannot be shared between two pipes. For example if a client opens a RX pipe on endpoint 1, another RX pipe on endpoint 1 cannot be opened.
5. The pipeType parameter specified the type of transfers that this pipe will handle.

The client can check the return value of the DRV_USB_Device_PipeSetup() for the result. If the pipe was not setup successfully, the function returns **DRV_HANDLE_INVALID**. The client can then use the DRV_USB_Device_ClientPipeErrorGet() function to find out the reason for the failure.

The following code snippet shows how endpoint 0 pipe and non-zero endpoint pipes are created.

```
/* This is an example of how an endpoint 0 pipe is created.
 * Note that this pipe is always bi-directional and the
 * queue size is always 1. The maximum data packet size in this
 * case is 64. The pipe type is set to handle control transfers */

myUSBDevice.ep0Pipe = DRV_USB_Device_PipeSetup(myUSBDevice.usbDriverHandle, 0,
USB_EP_TX_RX,
                                           64, 1, USB_CONTROL_PIPE);

if(DRV_HANDLE_INVALID == myUSBDevice.ep0Pipe)
{
    switch(DRV_USB_Device_ClientPipeErrorGet(myUSBDevice.usbDriverHandle))
    {
        case USB_PIPE_QUEUE_NOT_AVAILABLE:
            /* This means that queue size is small. Increase
             * the value of DRV_USB_XFERS_NUMBER. */

            break;

        case USB_PIPE_BAD_ENDPT:
            /* The specified endpoint is greater than the
             * the maximum end points that driver is configured
             * to handle. */

            break;

        case USB_PIPE_TAKEN:
```

```

        /* The specified endpoint and direction are already
        * in use with another pipe. A non-zero endpoint
        * can have only one pipe in a direction. Endpoint
        * 0 can have one bi-directional pipe.*/

        break;

    case USB_PIPE_NOTAVAIL:

        /* No pipes are available. Increase the number of pipes
        * by increasing the value of DRV_USB_PIPES_NUMBER. */

        break;

    case USB_PIPE_BAD_DIRECTION:

        /* Non zero endpoint cannot be bi-directional. */

        break;
}

/* This is an example of how a client creates a non-zero endpoint pipe.
* In this case a TX and a RX pipe are opened on endpoint 1. The
* transfer schedule queue size is 4 and maximum data packet size
* is 64. Note that the maximum data packet size should match endpoint
* size specified in the endpoint configuration. */

cdc.bulkRxPipe = DRV_USB_Device_PipeSetup(cdc.usbDriverHandle, 1, USB_EP_RX, 64, 3,
                                           USB_BULK_PIPE);

/* Optionally check for error here by using the
* DRV_USB_Device_ClientPipeErrorGet() function */

cdc.bulkTxPipe = DRV_USB_Device_PipeSetup(cdc.usbDriverHandle, 1, USB_EP_TX, 64, 3,
                                           USB_BULK_PIPE);

/* Optionally check for error here by using the
* DRV_USB_Device_ClientPipeErrorGet() function */

/* The following usage of DRV_USB_Device_PipeSetup() is INCORRECT and
* will not work. The client must create separate TX and RX pipes for
* non-zero endpoints. This function will return DRV_HANDLE_INVALID
* and the DRV_USB_Device_ClientPipeErrorGet() function will return
* USB_PIPE_BAD_DIRECTION. */

someDevice.bulkPipe = DRV_USB_Device_PipeSetup(someDevice.usbDriverHandle, 1,
                                                USB_EP_TX_RX, 64, 3, USB_BULK_PIPE); // Will not work!

```

5.1.12.4.3.3.2 Pipe Status

The client can use the DRV_USB_Device_PipeStatusGet() function to obtain the status of the pipe. The client can use this information to find if a pipe is ready for transfers or if the pipe can be or is stalled. The following code snippet shows an example of the DRV_USB_Device_PipeStatusGet() function along with all the possible return values.

```

/* This code example assumes the DRV_USB_DevicePipeSetup() function
* was used to open a pipe */

DRV_USB_PIPE_HANDLE pipeHandle;
DRV_USB_PIPE_STATUS pipeStatus;

if(DRV_HANDLE_INVALID != pipeHandle)
{
    pipeStatus = DRV_USB_Device_PipeStatusGet(pipeHandle);
    switch (pipeStatus)
    {
        case USB_PIPE_CLOSED:

```

```

        /* The pipe was open and has been closed.
        * This pipe should not be used for transferring
        * data */
        break;
    case USB_PIPE_XFER_IN_PROGRESS:
        /* There is a transfer in progress on the USB
        * through this pipe.
        */
        break;
    case USB_PIPE_READY:
        /* Pipe is ready for transferring data. Also
        * indicates that there is no transfer in progress
        * on the USB through this pipe
        */
        break;
    case USB_PIPE_STALLED:
        /* Pipe is stalled. No transfers will take place.
        */
        break;
}
}

```

5.1.12.4.3.3.3 Pipe Close

An open pipe can be closed by using the DRV_USB_Device_PipeRelease() function. Calling this function performs the following function

1. It aborts all transfers that are in queue. If a transfer is in progress on the USB, it is cancelled.
2. It de-allocates its transfer queue and returns it to the driver.
3. It de-allocates the pipe and returns its to the driver.

The DRV_USB_Device_PipeRelease() may be called when the device stack detects detach from the host, or when a USB reset event had been detected. Because this function aborts transfers that are in progress on the USB, it is possible that calling this function while a transfer is in progress can cause the USB protocol to be violated. To avoid this, the client can use the DRV_USB_Device_PipeStatusGet() function to get the status of the pipe before closing it. In case of a USB reset event, the client can close the pipe without checking pipe status as the driver itself will cancel all transfer that are in progress.

The following code snippet shows example usage of the DRV_USB_Device_PipeRelease() function.

```

/* This code snippet assumes that this is not a reset
 * event. In such a case, it is recommended that any
 * transfers through the pipe be allowed to complete.
 */

while(DRV_USB_Device_PipeStatusGet(pipeHandle) == USB_PIPE_XFER_IN_PROGRESS);

/* Close the pipe */

DRV_USB_Device_PipeRelease(pipeHandle);

```

5.1.12.4.3.3.4 Pipe Transfer Queue

A pipe provides a queue for transfer requests. Clients can use the queue to reduce wait times and hence increase data throughput through the pipe. If the pipe queue size is greater than one, the transfer requests on the pipe will be added to the queue if a transfer is already in progress on the pipe. The size of queue is specified via the nXferQueueSize parameter in the DRV_USB_Device_PipeSetup() function. The queue contains transfer objects that hold information about the requested transfers. Multiple driver instance share one aggregate queue. The size of aggregate queue is defined by the DRV_USB_XFERS_NUMBER macro in the driver configuration. Pipe specific queues are formed from this aggregate queue. Figure 2 shows how this works.

Figure 2: Pipe Transfer Queues.

Figure 2a shows the aggregate driver queue. In this case, all the transfer objects in the queue are available for use. In figure 2b, the client creates a pipe (pipe 0) with a queue size of 1. This results in the first transfer object on the queue forming a single element queue for pipe 0. In figure 2c, the client creates a pipe (pipe 1) with a queue size of 3. This results in the next three transfer objects on the queue forming a 3 element queue for pipe 1. In figure 2d, the client creates a pipe (pipe 2) with a queue size of 4. This results in the next four transfer objects on the queue forming a 4 element queue for pipe 2. At this point, if a client tries to create another pipe with queue size of say 4, the pipe will not be created as there isn't enough space available in the queue.

The size of the aggregate queue should be decided in such a way as to meet the application's dynamic requirements while taking the memory availability into consideration.

5.1.12.4.3.3.5 Pipe Stall

The client can stall a pipe in response to USB events. When a pipe is stalled, it returns a STALL PID on the USB. The USB device firmware may stall endpoint 0 pipe when control requests from the host fail or are not supported. The driver automatically clears an endpoint 0 pipe stall when the host sends a SETUP packet. A non-zero endpoint pipe may be stalled when the endpoint's Halt feature is set. This is a functional stall. In this case the endpoint cannot [send](#) or receive data. Endpoint 0 pipe may not need to support functional stalls (although they can but this is rarely done). A pipe is stalled using the `DRV_USB_Device_PipeStall()` function and a pipe stall is cleared using the `DRV_USB_Device_PipeStallClear()` function.

There are 3 execution threads where the driver client can stall a pipe.

1. A pipe can be stalled in the client event handler.

The client can stall the pipe after receiving the `USB_DEVICE_SETUP_TOKEN` event. This is relevant to control transfer on endpoint 0 pipe. The firmware can stall the pipe if it does not support the command received in the Setup packet. It is recommended that both direction of the endpoint 0 pipe be stalled (this is possible because endpoint 0 pipe is always bi-directional). Figure 3 shows the transaction related to this case.

Figure 3: Stalling Endpoint 0 pipe on a Control Read Transfer. Pipe is stalled after `USB_DEVICE_SETUP_TOKEN` event.

The stall on the receive direction of the pipe will get cleared when the host issues a Setup token. The stall on the TX direction of the pipe needs to be cleared by using the `DRV_USB_Device_PipeStallClear()` function. For endpoint 0 pipe, it is recommended that the stall on both directions be cleared. Note that it is also possible to stall non-zero pipes in the `USB_DEVICE_SETUP_TOKEN` event. See code example below.

```
void USBEventHandler (void * referenceHandle,
```

```

        DRV_USB_EVENT  eventType, DRV_USB_EVENT_DATA * eventData )
{
    switch ( eventType )
    {
        /* There could be other events here as well. Only
         * the USB_DEVICE_SETUP_TOKEN is shown in this example
         * for the sake of clarity */

        case USB_DEVICE_SETUP_TOKEN:
            /* Setup token received from host */

            if(ProcessSetupPacket(eventData->setupEventData.pSetupPktBuffer) == false)
            {
                /* This means the command received in the setup packet is
                 * not supported. The endpoint should be stalled. While
                 * stalling endpoint 0, both directions should be stalled.
                 * This ensures that both data stage and handshake stage
                 * of the control transfer get stalled. */

                DRV_USB_Device_PipeStall(pipe0, USB_EP_TX_RX);
            }
            else
            {
                /* Setup packet command can be processed */
                if(DRV_USB_Device_PipeStatusGet(pipe0) == USB_PIPE_STALLED)
                {
                    /* Clear the pipe stall */
                    DRV_USB_Device_PipeStallClear(pipe0, USB_EP_TX_RX);
                }
            }
            break;
    }
}

```

2. A pipe can be stalled in the transfer complete event handler.

This is more relevant to Control Write transfers. In the case of Control Write transfers, the transfer complete event handler is called after the data stage of the control transfer. If the firmware does not support the contents of the data stage, it can stall the pipe. This will result in the handshake stage of the control write transfer getting stalled. Figure 4 shows the transactions related to this case.

Figure 4: Stalling Endpoint 0 pipe on a Control Write Transfer. Pipe is stalled in the Transfer Complete Callback Function.

The following code snippet shows an example of this:

```

void USBDeviceLayerXferCallback( void * referenceData,
                                DRV_USB_PIPE_HANDLE hPipe,
                                DRV_USB_XFER_HANDLE hTransfer,
                                unsigned short int transferByteCount ,
                                DRV_USB_DEVICE_XFER_STATUS statusTransfer )
{
    /* Note that the transfer call contains the pipe
     * handle. This pipe handle can be used to
     * stall the pipe */

    DRV_USB_Device_PipeStall(hPipe, USB_EP_TX_RX);
}

```

3. A pipe can be stalled asynchronous of driver events.

The client can stall a pipe based on device firmware logic. This is more applicable to non-zero endpoint pipes. Since these pipes are uni-directional, the client must specify the stall direction (USB_EP_TX or USB_EP_RX) while calling the DRV_USB_Device_PipeStall() function. Using the USB_EP_TX parameter will stall read transfers (IN tokens). Using the

USB_EP_RX parameter will stall write transfers (OUT tokens).

5.1.12.4.3.4 Event Handling

Any client that opens the driver can register to receive USB events. These USB events can be used by the clients to achieve the desired functionality of the USB device. The first client to open the driver (typically the USB Stack device layer firmware) will receive additional events. The client uses the DRV_USB_Device_EventCallBackSet() to set the client event call back function. The following code snippet shows a client event handler function.

```
/* This is the client event handler */
void ClientEventHandler (void * referenceHandle,
                        DRV_USB_EVENT eventType,
                        DRV_USB_EVENT_DATA * eventData )
{
    switch ( eventType )
    {
        case USB_ERROR:
            // Bus error occurred and was reported in error interrupts
            break;
        case USB_DEVICE_RESET:
            // Host has commanded a device reset
            break;
        case USB_DEVICE_RESUME:
            // Resume detected while USB in suspend mode
            break;
        case USB_IDLE_DETECT:
            // Idle detected
            break;
        case USB_STALL:
            // Stall handshake has occurred
            break;
        case USB_DEVICE_SETUP_TOKEN:
            // A Setup token was received
            break;
        case USB_DEVICE_SETUP_HANDSHAKE:
            // Handshake stage of the control
            // transfer is completed.
            break;
        case USB_DEVICE_GOT_SOF:
            // Device received a Start of Frame
            break;
        default:
            break;
    }
}

/* The client register the event handler
 * after it has opened the driver. referenceData
 * will be passed back to the event callback function
 * whenever it is invoked. */
```

DRV_USB_Device_EventCallBackSet(clientHandle, referenceData, ClientEventHandler);

The eventData argument in the event callback function should be interpreted according to the event. The following table shows all the possible events and the value of eventData for each event.

Event Type	Event Details	Interpretation of eventData
USB_ERROR	This event occurs when the USB module has detected an error on the bus	eventData.usbErrorData.errorType contains a bitmap of errors (defined by USB_ERROR_TYPE) that have occurred.
USB_DEVICE_RESET	This event occurs when the USB module has detected a USB Reset	NULL

USB_DEVICE_RESUME	This event occurs when the USB module has detected Resume Signalling	NULL
USB_IDLE_DETECT	This event occurs when the USB module has not detected any bus activity	NULL
USB_STALL	This event occurs when a stalled endpoint has received a token	eventData.stalledEndpoint.endpoint contains the stalled endpoint that received a token.
USB_DEVICE_SETUP_TOKEN	This event occurs when endpoint 0 has received a SETUP token	eventData.setupEventData.pSetupPktBuffer points to a 8 byte array that contains the setup command that was received.
USB_DEVICE_SETUP_HANDSHAKE	This event occurs when the handshake stage of a Control Write Transfer has completed.	NULL
USB_DEVICE_GOT_SOF	This event occurs when the USB module has received a start of frame.	NULL

The following code snippet shows the different USB errors that can occur

```
USB_ERROR_TYPE error = eventData.usbErrorData.errorType;
```

```
/* These are the possible errors that can occur.
 * Refer to the device specific data sheet for
 * more details on these errors. */

if (errorType & USB_ERR_INT_PID_CHECK_FAILURE)
{
    /* Invalid or unsupported PID received */
}
if ( errorType & USB_ERR_INT_BAD_CRC5)
{
    /* A CRC 5 error was encountered */
}
if ( errorType & USB_ERR_INT_BAD_CRC16)
{
    /* A CRC 16 error was encountered */
}
if ( errorType & USB_ERR_INT_BAD_DATA_FIELD_SIZE)
{
    /* Unsupported data field size was encountered */
}

if ( errorType & USB_ERR_INT_BUS_TURNAROUND_TIMEOUT)
{
    /* A bus turn around timeout was encountered */
}

if ( errorType & USB_ERR_INT_DMA_ERROR)
{
    /* A USB DMA error was encountered */
}

if ( errorType &= USB_ERR_INT_BUS_MATRIX_ERROR)
{
    /* A Bus matrix error was encountered */
}

if ( errorType & USB_ERR_INT_BIT_STUFF_ERROR)
{
    /* A bit stuffing error was encountered */
}
```

5.1.12.4.3.5 Transfer Requests

A USB Driver (operating in Device mode) client can receive and transmit data from the USB Host after creating a pipe. Data is transferred by using the `DRV_USB_Device_TransferRequest()` function. Four types of USB transfers are supported: Control, Bulk, Interrupt and Isochronous. The choice of transfer type depends on the nature of desired communication and the target functionality of the USB device. Requesting a transfer will cause the USB driver to schedule the transfer. The actual data communication takes place when the host has requested for the data. In cases where a transfer is already in progress and space is available on the pipe transfer queue, the transfer request is added to the queue and processed in turn. Transfers that are not in progress (pending in the queue) can be aborted by using the `DRV_USB_Device_TransferAbort()` function.

Depending on the size of the endpoint and the amount of data to be transferred, the host may complete the transfer through multiple transactions. This process is handled by the driver and is transparent to the client. The client can register a transfer complete event callback function for each transfer request. This function is called when the transfer is terminated, either because its completed or aborted. Optionally the client can call the `DRV_USB_Device_TransferStatusGet()` function to poll the status of the transfer. The transfer complete event callback function need not be registered in this case.

The `DRV_USB_Device_TransferRequest()` function also accepts flags that affect the processing of the transfer. The flag options are transfer type specific.

The following section provides more details on how the four different transfer types can be requested:

5.1.12.4.3.5.1 Control Transfers

The USB Driver supports Control Read and Write Transfers on a endpoint 0 pipe only. A control transfer (either read or write) occurs in stages:

1. The SETUP stage provides a setup command which among other things also defines if the transfer is a Control Read (data moves from device to host) or a Control Write transfer (data moves from host to device).
2. The DATA stage transports data related to the setup command in the SETUP stage. Depending on the size of the endpoint, the data stage could comprise of multiple IN or OUT transactions. A data stage may or may not be present in Control Write transfers.
3. The HANDSHAKE stage completes the Control transfer.

Control Transfers should only be requested in response to a setup packet from the host. The USB Driver notifies its first client (via the client event call back function) when a SETUP packet has been received. Only the first client receives this, `USB_DEVICE_SETUP_TOKEN`, event. The driver generates `USB_DEVICE_SETUP_HANDSHAKE` client event at the completion of the handshake stage of the control write transfer. Refer to Event Handling section on more details on handling events.

The client parses the 8-byte setup command available from the `USB_DEVICE_SETUP_TOKEN`, event. It then has the following options:

1. The client can request a control read transfer.
2. The client can request a control write transfer.
3. The client may not do anything and return from the event handler. In this case, the control transfer is treated as having no data stage and the transfer moves to the handshake stage. Note that a Control Read transfer must always have a data stage.
4. The client can stall the pipe.

These cases are described here in detail.

1. Requesting a Control Read Transfer:

The code snippet below shows an example of how a Control Read Transfer can be requested. In this transfer, data moves from the device to the host.

```

/* This is an example of a Control Read Transfer. A control read
 * or Write transfer should be requested in response to a
 * USB_DEVICE_SETUP_TOKEN event. The transfer request function is
 * called in the USB event handler. In this example, the amount of
 * data to be transferred is 18 bytes. The transfer is requested
 * over endpoint 0 pipe. The USBDeviceLayerXferCallback() function
 * will be called when the transfer is terminated. The myUSBDevice
 * object will be passed back to the USBDeviceLayerXferCallback()
 * function. The USB_XFER_REGULAR indicates to the driver that this
 * transfer does not need a data stage ZLP */

DRV_USB_XFER_HANDLE xferHandle;

void USBEventHandler (void * referenceHandle,
                     DRV_USB_EVENT eventType, DRV_USB_EVENT_DATA * eventData )
{
    switch ( eventType )
    {
        /* There could be other events here as well. Only
         * the USB_DEVICE_SETUP_TOKEN is shown in this example
         * for the sake of clarity */

        case USB_DEVICE_SETUP_TOKEN:
            // Setup token received from host

            ProcessSetupPacket(eventData->setupEventData.pSetupPktBuffer);
            xferHandle = DRV_USB_Device_TransferRequest(myUSBDevice.ep0Pipe,
                                                       USB_XFER_CONTROL_READ, deviceDescriptor,18,
                                                       USB_XFER_REGULAR, myUSBDevice,
                                                       USBDeviceLayerXferCallback);

            if(DRV_HANDLE_INVALID == xferHandle)
            {
                /* If the transfer request failed, the
                 * client can find out why. */

                switch(DRV_USB_Device_PipeXferErrorGet(myUSBDevice.ep0Pipe))
                {
                    case USB_XFER_WRONG_PIPE:
                        /* This means that either the transfer type or
                         * does not match the pipe type or direction */
                        break;
                    case USB_XFER_QUEUE_FULL:
                        /* This means that the transfer queue on this
                         * pipe is full. Either increase the queue size
                         * by increasing the value of DRV_USB_XFERS_NUMBER
                         * or wait for a slot on the queue to be available. */
                        break;
                    default:
                        break;
                }
            }
    }
}

```

In a case where the data to be transferred is more than the endpoint size reported to the host (also specified at the time when the control endpoint pipe is setup), the host will break up the data stage of the transfer into multiple transactions. This process is transparent to the client. If at any point a SETUP packet is received while the transfer was in progress, the transfer is aborted and client receives USB_DEVICE_SETUP_TOKEN event. If a transfer complete callback function was registered in the transfer request function, this callback function is called with transfer status as USB_XFER_ABORT. Figure 5 shows the generation of different events during the Control Read Transaction

Figure 5: Control Read Transfer. Data size is 18 bytes. Maximum Endpoint size is 64 bytes (> 18 bytes).

A Control read transfer must have a data stage. In cases of control read transfers where the amount of data to be transferred is less than that requested by the host, the `USB_XFER_SEND_ZLP` flag must be specified. The driver will then check if the transfer size is an exact multiple of the endpoint size and then **send** a data stage zero length packet (ZLP). This indicates to the host that the device does not have any more data. There are two cases where specifying the `USB_XFER_SEND_ZLP` flag does not cause the driver to **send** a ZLP.

- When the size of the transfer is less than requested size but is not an exact multiple of the maximum endpoint size.
- The size of the transfer is less than maximum endpoint size.

The following code snippet shows an example of a transfer request which sends a ZLP to the host.

```

/* This is an example of a Control Read Transfer with the ZLP
 * option. Endpoint 0 maximum size is 8 bytes. The host has
 * requested 32 bytes but the device has only 24 bytes to send.
 * Specifying the USB_XFER_SEND_ZLP flag will cause the driver
 * to send a ZLP to the host in the fourth data transaction.
 */

DRV_USB_XFER_HANDLE xferHandle;

xferHandle = DRV_USB_Device_TransferRequest(myUSBDevice.ep0Pipe, USB_XFER_CONTROL_READ,
                                           deviceDescriptor, 24, USB_XFER_SEND_ZLP,
                                           myUSBDevice, USBDeviceLayerXferCallback);
  
```

Figure 6 shows the generation of different events and the additional ZLP sent in data stage in a multi transaction Control Read Transfer.

Figure 6: Multi Transaction Control Read Transfer with ZLP. Data size is 24 bytes and maximum endpoint size is 8 bytes.

2. Requesting a Control Write Transfer:

The code snippet below shows an example of how a Control Write Transfer can be requested. In this transfer, data moves from the host to device. The code example below shows an example of how a control write transfer is requested. Figure 7 shows the generation of different events related to the control write transfer.

```

/* This is an example of a Control Write Transfer. A control read
 * or Write transfer should be requested in response to a
 * USB_DEVICE_SETUP_TOKEN event. The transfer request function is
 * called in the USB event handler. In this example, the amount of
 * data to be transferred is 32 bytes. The transfer is requested
 * over endpoint 0 pipe. The USBDeviceLayerXferCallback() function
 * will be called when the transfer is terminated. The myUSBDevice
 * object will be passed back to the USBDeviceLayerXferCallback()
 * function. The Control Write Transfer only supports the
 * USB_XFER_REGULAR flag. */

DRV_USB_XFER_HANDLE xferHandle;

void USBDeviceLayerXferCallback( void * referenceData,
                                DRV_USB_PIPE_HANDLE hPipe,
                                DRV_USB_XFER_HANDLE hTransfer,
                                unsigned short int transferByteCount ,
                                DRV_USB_DEVICE_XFER_STATUS statusTransfer )
{
    /* This function will be called when the transfer is complete.
     * In this case, the referenceData argument will point to the
     * myUSBDevice data object that was specified in the Transfer
     * request function. */
}

void USBEventHandler (void * referenceHandle,
                     DRV_USB_EVENT eventType, DRV_USB_EVENT_DATA * eventData )
{
    switch ( eventType )
    {
        /* There could be other events here as well. Only
         * the USB_DEVICE_SETUP_TOKEN is shown in this example
         * for the sake of clarity */

        case USB_DEVICE_SETUP_TOKEN:
            // Setup token received from host

            ProcessSetupPacket(eventData->setupEventData.pSetupPktBuffer);
            xferHandle = DRV_USB_Device_TransferRequest(myUSBDevice.ep0Pipe,
                                                         USB_XFER_CONTROL_WRITE, buffer,32,
                                                         USB_XFER_REGULAR, myUSBDevice,
                                                         USBDeviceLayerXferCallback);

            if(DRV_HANDLE_INVALID == xferHandle)
            {
                /* The DRV_USB_Device_PipeXferErrorGet() can be used to
                 * find the error cause */
            }

        }
    }
}

```

In addition to the USB_DEVICE_SETUP_TOKEN event, the driver generates the USB_DEVICE_SETUP_HANDSHAKE event when the Control Write Handshake stage is complete. This event is generated even when the Control Write transfer does not have a data stage.

Figure 7: Example of Control Write Transfer. Data size is 18 bytes and maximum endpoint size is 64 bytes (> 18 bytes).

3. Control Write Transfers with Zero Data Stage.

A control write transfer can have zero data stages. One example of this is the SET ADDRESS command that the USB host **send** to the device during enumeration. In cases where no data stages are needed, the client should not request any transfer and return from the USB event handler. This will cause the driver to move the control transfer to the handshake stage. The USB_DEVICE_SETUP_HANDSHAKE can be used to track when the handshake stage of the transfer completes. In case of the SET ADDRESS command, the device layer firmware can change the device USB address in response to this event. The code example below shows an example of how this is done.

```
/* This is an example of zero data stage Control Write transfer.
 * This is done by not issuing a transfer request after the
 * USB_DEVICE_SETUP_TOKEN event is received. */

DRV_USB_XFER_HANDLE xferHandle;

void USBEventHandler (void * referenceHandle,
                     DRV_USB_EVENT eventType, DRV_USB_EVENT_DATA * eventData )
{
    switch ( eventType )
    {
        /* There could be other events here as well. Only
         * the USB_DEVICE_SETUP_TOKEN is shown in this example
         * for the sake of clarity */

        case USB_DEVICE_SETUP_TOKEN:
            /* Setup token received from host. In this case we assume
             * that this is the SET ADDRESS command. This command does
             * not have a data stage. So the client does not do a
             * transfer request*/

            ProcessSetupPacket(eventData->setupEventData.pSetupPktBuffer);
            break;

        case USB_DEVICE_SETUP_HANDSHAKE:
            /* The last control write transfer request is complete.
             * In this example, the client can change the device USB address
             * now. */
            DRV_USB_Device_AddressSet(deviceLayer, address);
            break;

        default:
            break;
    }
}
```

Figure 8 shows the generation of different events related to the transfer.

Figure 8: Example of Zero data stage Control Write Transfer.

4. Stalling the Pipe:

Refer to Pipe Stall section for more details on how a pipe can be stalled.

5.1.12.4.3.5.2 Bulk and Interrupt Transfers

The driver can process Bulk and Interrupt transfers. On the USB, both Bulk and Interrupt transfers have the same packet structure. The following discussion therefore applies to both Bulk and Interrupt transfers. A client should use the `DRV_USB_Device_TransferRequest()` function to schedule Bulk and Interrupt transfers. The following sections describe Bulk/Interrupt Read Transfers and Bulk/Interrupt Write Transfers.

1. Bulk/Interrupt Read Transfers:

In this transfer, data moves from device to host. The client can request a bulk/interrupt read transfer with a byte size greater than the maximum endpoint size. In this case the driver will complete the transfer and invoke the transfer complete callback function if provided. If the `USB_XFER_SEND_ZLP` flag is specified, the driver sends a ZLP after the last transaction if the transfer size was an exact multiple of the endpoint size.

The following code snippet shows an example of a Bulk/Interrupt read transfer can be requested

```

/* This code snippet shows an example of how a Bulk/Interrupt
 * read transfer can be requested */

DRV_USB_XFER_HANDLE transferHandle;

transferHandle = DRV_USB_Device_TransferRequest(pipe1, USB_XFER_BULK_READ,
    data, 120, USB_XFER_REGULAR, someReferenceData, XferCompleteCallback);

/* This transfer directs the driver to send a ZLP
 * after the last transaction */

transferHandle = DRV_USB_Device_TransferRequest(pipe1, USB_XFER_BULK_READ,
    data, 128, USB_XFER_SEND_ZLP, someReferenceData, XferCompleteCallback);
  
```

Figure 9 shows a regular bulk/interrupt read transfer. Figure 10 shows a bulk/interrupt read transfer with a ZLP.

Figure 9: Example of Bulk/Interrupt Read Transfer. Requested transfer size is 120 bytes. Maximum endpoint size 64

Figure 10: Example of Bulk/Interrupt Read Transfer with ZLP. Requested transfer size is 128 bytes. Maximum endpoint

size 64**2. Bulk/Interrupt Write Transfers:**

In this transfer, data moves from host to device. These transfers only support USB_XFER_REGULAR flag. The client can request a bulk/interrupt write transfer with a byte size greater than the maximum endpoint size. . In this case however, the driver will invoke the transfer complete callback function when a transaction completes. The callback thus gets invoked whenever the host sends any amount of data. Since the amount of data that the host sends in one transaction will not exceed the maximum endpoint size, specifying a transfer size greater than maximum endpoint size will not have any effect. The client must schedule another transfer to receive more data from the host. The following code snippet shows an example of bulk/interrupt write transfer.

```
/* This code snippet shows an example of how a Bulk/Interrupt
 * write transfer can be requested. Note the data size is
 * equal the size of the endpoint. The client has queued up
 * multiple transfers.*/

DRV_USB_XFER_HANDLE transferHandle1;
DRV_USB_XFER_HANDLE transferHandle1;

transferHandle1 = DRV_USB_Device_TransferRequest(pipe2, USB_XFER_BULK_WRITE,
    data,64,USB_XFER_REGULAR, someReferenceData ,XferCompleteCallback);
transferHandle1 = DRV_USB_Device_TransferRequest(pipe2, USB_XFER_BULK_WRITE,
    data,64,USB_XFER_REGULAR, someReferenceData ,XferCompleteCallback);
```

Figure 11 shows a bulk/interrupt write transfer with related events

Figure 11: Example of Bulk/Interrupt Write Transfer. Client has scheduled two transfers Maximum endpoint size 64

5.1.12.4.3.5.3 Isochronous Transfers

A client can request Isochronous transfers by using the DRV_USB_Device_TransferRequest() function. On the USB, Isochronous transfers are characterized by the absence of the handshake stage. The driver supports USB_XFER_REGULAR and USB_XFER_PERSIST flags for Isochronous transfers. While using the USB_XFER_REGULAR flag, the transfer request behavior is similar to Bulk and Interrupt Read/Write Transfer Requests. In that, a new transfer will require the client to call the DRV_USB_Device_TransferRequest() function.

By using the USB_XFER_PERSIST flag, the driver will not discard the transfer after the transfer is complete. Instead, after the transfer is complete, the transfer is rescheduled in the queue. This way the client does not have to schedule another transfer. If the client has scheduled two Isochronous transfers with the USB_XFER_PERSIST flag, the driver will ping pong between these transfers. The transfer complete callback function is called when the transfer is completed.

The code snippet below shows an example of setting up two Isochronous read transfers to create a ping pong type of transfer system.

```
DRV_USB_XFER_HANDLE pingTransferHandle;
DRV_USB_XFER_HANDLE pongTransferHandle;

/* Request two transfers. Note how the USB_XFER_PERSIST flag
 * is specified. Note also how the pingData and pongData buffer
 * pointers are specified as reference data. This will make
 * processing in the transfer complete call back easier.. */

pingTransferHandle = DRV_USB_Device_TransferRequest(pipe0, USB_XFER_CONTROL_READ,
    pingData,64,USB_XFER_PERSIST, pingData ,PingXferCompleteCallback);

pongTransferHandle = DRV_USB_Device_TransferRequest(pipe0, USB_XFER_CONTROL_READ,
    pongData,40,USB_XFER_PERSIST, pongData ,PongXferCompleteCallback);

/* This is the Ping transfer Complete callback */
void PingCompleteCallback( void * referenceData,
    DRV_USB_PIPE_HANDLE hPipe,
    DRV_USB_XFER_HANDLE hTransfer,
```

```

        unsigned short int transferByteCount ,
        DRV_USB_DEVICE_XFER_STATUS statusTransfer )
{
    /* Note that we dont schedule one more request here.
    * We just add data to the buffer and return. This
    * same transfer will be processed again. The referenceData
    * points to the ping data buffer (as set in the transfer request
    * function. */

    void * data = referenceData;
    UpdateBuffer(data);
}

/* This is the Ping transfer Complete callback */
void PongCompleteCallback( void * referenceData,
        DRV_USB_PIPE_HANDLE hPipe,
        DRV_USB_XFER_HANDLE hTransfer,
        unsigned short int transferByteCount ,
        DRV_USB_DEVICE_XFER_STATUS statusTransfer )
{
    /* Note that we dont schedule one more request here.
    * We just add data to the buffer and return. This
    * same transfer will be processed again. The referenceData
    * points to the pong data buffer (as set in the transfer request
    * function. */

    void * data = referenceData;
    UpdateBuffer(data);
}

```

5.1.12.4.3.5.4 Transfer Status

The driver offers to different interface to track the status of a transfer, a polling interface and a callback interface. Both these interfaces can be invoked by the application. The two interfaces are discussed here:

1. Polling interface:

The client can access the polling interface by using the DRV_USB_Device_XferStatusGet() function. This interface does not provide information when a transfer is aborted. The following code snippet shows how DRV_USB_Device_XferStatusGet() is used.

```

/* This code snippet shows the different
 * values that the DRV_USB_Device_XferStatusGet()
 * function. This function implements the polling
 * interface for the transfer status.
 */

DRV_USB_DEVICE_XFER_STATUS transferStatus;

transferStatus = DRV_USB_Device_XferStatusGet(transferHandle);

switch(transferStatus)
{
    case USB_XFER_PENDING:
        /* This means the transfer is still in the transfer
        * queue. This transfer can be aborted.*/
    case USB_XFER_IN_PROGRESS:
        /* This means the transfers is currently in progress
        * on the bus. This transfer cannot be aborted. */
    case USB_XFER_COMPLETED:
        /* This means the transfer is complete */
    default:
        break;
}

```

2. Callback interface:

The callback interface to track the status of the transfer is implemented by using Transfer Complete Callback function. The client should specify the Transfer Complete Callback function when calling DRV_USB_Device_TransferRequest() function. The driver call this function when a transfer has terminated, either due to the transfer completing or the transfer aborting. The Transfer Complete Callback function should be of the type DRV_USB_XFER_COMPLETE_CALLBACK. The driver returns the following information while calling the Transfer Complete Callback function.

1. Handle to the pipe that contained this transfer
2. Handle to the transfer
3. Number of bytes read or written
4. A reference to a data object that was specified in the DRV_USB_Device_TransferRequest() for this transfer.
5. Transfer termination status

The following code snippet shows an example of how a Transfer Complete Callback function can be used.

```
/* This code snippet shows an example of how to use the
 * transfer complete callback */

DRV_USB_XFER_HANDLE transferHandle;

/* Request a transfer. Note that the reference data pointer is set
 * to dataBuffer and the transfer complete callback function
 * XferCompleteCallback is specified. */

transferHandle = DRV_USB_Device_TransferRequest(pipe0, USB_XFER_CONTROL_READ,
        dataBuffer,18,false, dataBuffer ,XferCompleteCallback);

/* This is the transfer Complete callback */
void XferCompleteCallback( void * referenceData,
        DRV_USB_PIPE_HANDLE hPipe,
        DRV_USB_XFER_HANDLE hTransfer,
        unsigned short int transferByteCount ,
        DRV_USB_DEVICE_XFER_STATUS statusTransfer )
{
    /* The referenceData variable (the value of which
     * is specified in the transfer request function)
     * points to the data buffer associate with the
     * transfer. */

    void * dataBuffer = referenceData;

    if(transferStatus == USB_XFER_COMPLETED)
    {
        ProcessDataBuffer(dataBuffer, transferByteCount);
    }
    else if(transferStatus == USB_XFER_ABORTED)
    {
        /* This transfer was not successful. Take any
         * remedial action as needed. */
    }
}
```

5.1.12.4.3.5.5 Transfer Abort

A client can abort a USB transfer that it requested. This is achieved by using the DRV_USB_Device_TransferAbort() function. A Control read or write transfer can automatically get aborted when the host issues a SETUP token out of turn. The DRV_USB_Device_TransferAbort() will not abort a transfer if it is already in progress. Closing the pipe will however abort transfers that are in progress.

When a transfer is aborted, the Transfer Complete Callback function associated with the transfer is not invoked. If the Control Read or Write transfer was aborted due to a out of turn SETUP token from the host, Transfer Complete Callback function will be called and transfer status will be USB_XFER_ABORTED.

5.1.12.5 Configuring the Library

The configuration of the USB Driver is based on the file sys_config.h

This header file contains the configuration selection for the USB Driver. Based on the selections made, the USB Driver will support or not support selected features. Some configuration settings will apply to all instances of the USB Driver while some configurations settings are applicable only if the driver is built for a static mode.

This header can be placed anywhere, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.1.12.5.1 Initialization Overrides

This section lists out the macros that need to be configured when building the static version of the driver. These values should be defined for correction operation of the driver, when the driver is built statically. Commenting the DRV_USB_INSTANCES_NUMBER macro will cause the driver to be built in a static mode.

5.1.12.5.2 Others

These macros affect all instances and all build types of the driver.

5.1.12.6 Building the Library

The following table lists the USB Driver files to be included in the project for the available features

Features	File Path	Comments
Needed for all features	driver/usb/drv_usb.h	Must be included in every source code file that access the driver API.
Dynamic Build	driver/usb/src/dynamic/drv_usb.c	Must be included when using the dynamic version of the driver
Static Multi-Client Build	driver/usb/src/static_multi/drv_usb_static_multi.c	Must be included when using the static multi client version of the driver

5.1.12.7 Library Interface

Data Types and Constants

	Name	Description
	DRV_USB_ENDPOINT_TABLE_ENTRY_SIZE	
	DRV_USB_HOST_PIPE_HANDLE_INVALID	Defines the USB Driver Host Pipe Invalid handle
	DRV_USB_INDEX	This is macro DRV_USB_INDEX.
	DRV_USB_INDEX_0	USB driver index definitions
	DRV_USB_INTERRUPT_SOURCE	This is macro DRV_USB_INTERRUPT_SOURCE.

	DRV_USB_PERIPHERAL_ID	This is macro DRV_USB_PERIPHERAL_ID.
	DRV_USB_EVENT	Identifies the different events that the USB Driver provides.
	DRV_USB_EVENT_CALLBACK	Type of the USB event callback function
	DRV_USB_HOST_PIPE_HANDLE	Defines the USB Driver Host Pipe handle type
	DRV_USB_INIT	Contains all the data necessary to initialize the USB device

Client Functions

	Name	Description
	DRV_USB_Close	Closes an opened-instance of the USB driver
	DRV_USB_Open	Opens the specified USB driver instance and returns a handle to it

Other Functions

	Name	Description
	DRV_USB_ClientEventCallBackSet	This function sets up the event callback function that is invoked by the USB controller driver to notify the a client of USB bus events.
	DRV_USB_DEVICE_AddressSet	This function will set the USB module address that is obtained from the host.
	DRV_USB_DEVICE_Attach	This function will attach the device to the USB.
	DRV_USB_DEVICE_CurrentSpeedGet	This function will return the USB speed at which device is operating.
	DRV_USB_DEVICE_Detach	This function will detach the device from the USB.
	DRV_USB_DEVICE_EndpointDisable	This function disables an endpoint.
	DRV_USB_DEVICE_EndpointDisableAll	This function disables all provisioned non-zero endpoints.
	DRV_USB_DEVICE_EndpointEnable	This function enables a endpoint for the specified direction and endpoint size.
	DRV_USB_DEVICE_EndpointIsEnabled	This function returns the enable/ disable status of the specified endpoint and direction.
	DRV_USB_DEVICE_EndpointIsStalled	This function returns the stall status of the specified endpoint and direction.
	DRV_USB_DEVICE_EndpointStall	This function stalls an endpoint in the specified direction.
	DRV_USB_DEVICE_EndpointStallClear	This function clears the stall on an endpoint in the specified direction.
	DRV_USB_DEVICE_IRPCancelAll	This function cancels all IRPs that are queued and in progress at the specified endpoint.
	DRV_USB_DEVICE_IRPSubmit	This function submits a I/O Request Packet (IRP) for processing to the USB Driver.
	DRV_USB_HOST_BusResetControl	This is function DRV_USB_HOST_BusResetControl.
	DRV_USB_HOST_DeviceCurrentSpeedGet	This is function DRV_USB_HOST_DeviceCurrentSpeedGet.
	DRV_USB_HOST_IRPCancel	This is function DRV_USB_HOST_IRPCancel.
	DRV_USB_HOST_IRPSubmit	This is function DRV_USB_HOST_IRPSubmit.
	DRV_USB_HOST_OperationEnable	This is function DRV_USB_HOST_OperationEnable.
	DRV_USB_HOST_StartOfFrameControl	This is function DRV_USB_HOST_StartOfFrameControl.
	DRV_USB_HOST_TimerIsComplete	This is function DRV_USB_HOST_TimerIsComplete.
	DRV_USB_HOST_TimerReset	This is function DRV_USB_HOST_TimerReset.
	DRV_USB_HOST_TimerStart	This is function DRV_USB_HOST_TimerStart.
	DRV_USB_Tasks	Maintains the driver's state machine when the driver is configured for polled mode.

Pipe Functions

	Name	Description
	DRV_USB_HOST_PipeSetup	This is function DRV_USB_HOST_PipeSetup.
	DRV_USB_HOST_PipeClose	This is function DRV_USB_HOST_PipeClose.

System Functions

	Name	Description
	DRV_USB_Initialize	Initializes the USB driver
	DRV_USB_Status	Provides the current status of the USB driver module
	DRV_USB_Tasks_ISR	Maintains the driver's state machine and implements its ISR
	DRV_USB_HOST_OperationIsEnabled	This is function DRV_USB_HOST_OperationIsEnabled.

Description

This section describes the APIs of the USB Driver. Refer to each section for a detailed description.

5.1.12.7.1 System Functions

5.1.12.7.1.1 DRV_USB_Initialize Function

C

```
SYS_MODULE_OBJ DRV_USB_Initialize(
    const SYS_MODULE_INDEX drvIndex,
    const SYS_MODULE_INIT * const init
);
```

Description

This routine initializes the USB driver, making it ready for clients to open and use it.

Preconditions

None.

Parameters

Parameters	Description
drvIndex	Ordinal number of driver instance to be initialized
init	Pointer to a data structure containing any data necessary to initialize the driver. This should be a DRV_USB_INIT structure reference type casted to SYS_MODULE_INIT reference.

Returns

If successful, returns a valid handle to a driver object. Otherwise, it returns [SYS_MODULE_OBJ_INVALID](#). The returned object must be passed as argument to [DRV_USB_Status](#) routines.

Remarks

This routine must be called before any other USB routine is called. This routine should only be called once during system initialization unless DRV_USB_Deinitialize is called to de-initialize the driver instance. If the driver is built for static mode, then the initialization data structure is ignored. The static overrides provided in system_config.h are considered instead.

Example

```
// The following code snippet shows an example initialization of the
// driver. The USB module to be used is USB1. The module should not
// automatically suspend when the microcontroller enters Sleep mode.
```

```

// The module should continue operation when the module enters Idle
// mode. The power state is set to run at full clock speeds. Device
// Mode operation should be at FULL speed.

DRV_USB_INIT moduleInit;

usbInitData.usbID           = USB_ID_1;
usbInitData.opMode          = DRV_USB_OPERATION_MODE_DEVICE;
usbInitData.pingpongMode    = USB_PING_PONG_FULL_PING_PONG;
usbInitData.stopInIdle      = false;
usbInitData.suspendInSleep  = false;
usbInitData.operationSpeed  = USB_SPEED_FULL;
usbInitData.interruptSource = INT_SOURCE_USB;

usbInitData.sysModuleInit.powerState = SYS_MODULE_POWER_RUN_FULL ;

// This is how this data structure is passed to the initialize
// function.

DRV_USB_Initialize(DRV_USB_INDEX_0, (SYS_MODULE_INIT *) &usbInitData);

```

5.1.12.7.1.2 DRV_USB_Status Function

C

```

SYS_STATUS DRV_USB_Status(
    SYS_MODULE_OBJ object
);

```

Description

This routine provides the current status of the USB driver module.

Preconditions

Function [DRV_USB_Initialize](#) must have been called before calling this

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_USB_Initialize routine

Returns

- SYS_STATUS_READY - Indicates that the driver is ready
- SYS_STATUS_UNINITIALIZED - Indicates that the driver has never been initialized

Remarks

None.

Example

```

SYS_MODULE_OBJ    object;    // Returned from DRV_USB_Initialize
SYS_STATUS         status;
DRV_USB_INIT      moduleInit;

usbInitData.usbID           = USB_ID_1;
usbInitData.opMode          = DRV_USB_OPERATION_MODE_DEVICE;
usbInitData.stopInIdle      = false;
usbInitData.suspendInSleep  = false;
usbInitData.operationSpeed  = USB_SPEED_FULL;
usbInitData.interruptSource = INT_SOURCE_USB;

usbInitData.sysModuleInit.powerState = SYS_MODULE_POWER_RUN_FULL ;

// This is how this data structure is passed to the initialize

```

```
// function.  
object = DRV_USB_Initialize(DRV_USB_INDEX_0,  
                           (SYS_MODULE_INIT *) &usbInitData);  
  
status = DRV_USB_Status(object);  
if(SYS_STATUS_READY == status)  
{  
    // Driver is ready to be opened.  
}
```

5.1.12.7.1.3 DRV_USB_Tasks_ISR Function

C

```
void DRV_USB_Tasks_ISR(  
    SYS_MODULE_OBJ object  
);
```

Description

This routine is used to maintain the driver's internal state machine and implement its ISR for interrupt-driven implementations.

Preconditions

The [DRV_USB_Initialize](#) routine must have been called for the specified USB driver instance.

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_USB_Initialize)

Returns

None

Remarks

This routine should be called from the USB interrupt service routine. In case of multiple USB modules, it should be ensured that the correct USB driver system module object is passed to the this routine.

Example

```
SYS_MODULE_OBJ    object;    // Returned from DRV_USB_Initialize  
  
while (true)  
{  
    DRV_USB_Tasks_ISR (object);  
  
    // Do other tasks  
}
```

5.1.12.7.1.4 DRV_USB_HOST_OperationIsEnabled Function

C

```
bool DRV_USB_HOST_OperationIsEnabled(  
    DRV_HANDLE hClient  
);
```

Description

This is function DRV_USB_HOST_OperationIsEnabled.

5.1.12.7.2 Client Functions

5.1.12.7.2.1 DRV_USB_Close Function

C

```
void DRV_USB_Close(  
    DRV_HANDLE handle  
)  
;
```

Description

This routine closes an opened-instance of the USB driver, invalidating the handle.

Preconditions

The [DRV_USB_Initialize](#) routine must have been called for the specified USB driver instance. [DRV_USB_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USB_Open)

Returns

None

Remarks

After calling this routine, the handle passed in "handle" must not be used with any of the remaining driver routines. A new handle must be obtained by calling [DRV_USB_Open](#) before the caller may use the driver again.

Example

```
DRV_HANDLE handle; // Returned from DRV_USB_Open  
  
DRV_USB_Close(handle);
```

5.1.12.7.2.2 DRV_USB_Open Function

C

```
DRV_HANDLE DRV_USB_Open(  
    const SYS_MODULE_INDEX drvIndex,  
    const DRV_IO_INTENT intent  
)  
;
```

Description

This routine opens the specified USB driver instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver. The intent flag should always be `DRV_IO_INTENT_EXCLUSIVE|DRV_IO_INTENT_READWRITE|DRV_IO_INTENT_NON_BLOCKING`. Anyother setting of the intent flag will return a invalid driver handle. A driver instance can only support one client. Trying to open a driver that has an existing client will result in an unsuccessful function call.

Preconditions

Function [DRV_USB_Initialize](#) must have been called before calling this function.

Parameters

Parameters	Description
drvIndex	Driver instance that client will use
intent	Should always be <code>DRV_IO_INTENT_EXCLUSIVE DRV_IO_INTENT_READWRITE DRV_IO_INTENT_NON_BLOCKING</code> .

Returns

If successful, valid driver handle for the client to use when interfacing with the driver. If an error occurs, the return value is [DRV_HANDLE_INVALID](#).

Remarks

The handle returned is valid until the [DRV_USB_Close](#) routine is called.

Example

```
// Shows an example of how to open the driver.
SYS_MODULE_OBJ    object;    // Returned from DRV_USB_Initialize
SYS_STATUS         status;
DRV_USB_INIT      moduleInit;
DRV_HANDLE        handle;

usbInitData.usbID          = USB_ID_1;
usbInitData.opMode         = DRV_USB_OPERATION_MODE_DEVICE;
usbInitData.stopInIdle    = false;
usbInitData.operationSpeed = USB_SPEED_FULL;
usbInitData.suspendInSleep = false;
usbInitData.interruptSource = INT_SOURCE_USB;

usbInitData.sysModuleInit.powerState = SYS_MODULE_POWER_RUN_FULL ;

// This is how this data structure is passed to the initialize
// function.

object = DRV_USB_Initialize(DRV_USB_INDEX_0,
                           (SYS_MODULE_INIT *) &usbInitData);

status = DRV_USB_Status(object);
if(SYS_STATUS_READY == status)
{
    // Driver is ready to be opened.
    handle = DRV_USB_Open(DRV_USB_INDEX_0,
                          DRV_IO_INTENT_EXCLUSIVE|
                          DRV_IO_INTENT_READWRITE|
                          DRV_IO_INTENT_NON_BLOCKING);
    SYS_ASSERT(DRV_HANDLE_INVALID != handle, "Bad handle returned");
}
```

5.1.12.7.3 Pipe Functions

5.1.12.7.3.1 DRV_USB_HOST_PipeSetup Function

C

```
DRV_USB_HOST_PIPE_HANDLE DRV_USB_HOST_PipeSetup(
    DRV_HANDLE client,
    uint8_t deviceAddress,
    USB_ENDPOINT endpointAndDirection,
    uint8_t hubAddress,
    uint8_t hubPort,
    USB_TRANSFER_TYPE pipeType,
    uint8_t bInterval,
    uint16_t wMaxPacketSize,
    USB_SPEED speed
);
```

Description

This is function DRV_USB_HOST_PipeSetup.

5.1.12.7.3.2 DRV_USB_HOST_PipeClose Function

C

```
void DRV_USB_HOST_PipeClose(  
    DRV_USB_HOST_PIPE_HANDLE pipeHandle  
)  
;
```

Description

This is function DRV_USB_HOST_PipeClose.

5.1.12.7.4 Transfer Functions

5.1.12.7.5 Other Functions

5.1.12.7.5.1 DRV_USB_ClientEventCallbackSet Function

C

```
void DRV_USB_ClientEventCallbackSet(  
    DRV_HANDLE handle,  
    uintptr_t hReferenceData,  
    DRV_USB_EVENT_CALLBACK myEventCallback  
)  
;
```

Description

This function sets up the event callback function that is invoked by the USB controller driver to notify the client of USB bus events. The call back is disabled by not calling this function after a USB_DRV_Open or by passing NULL for the myEventCallback argument. When the callback function is called, the hReferenceData argument is returned.

Preconditions

None.

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USB_Open)
hReferenceData	object (could be a pointer) that is returned with the callback.
myEventCallback	Call back function for all USB events.

Returns

None.

Remarks

Typical usage of the USB Driver requires a client to register a callback.

Example

```
// Set the client event callback for the Device Layer.  
// The USBDeviceLayerEventHandler() function is the event  
// handler. When this event handler is invoked by the  
// driver, the driver returns back the second argument  
// specified in the below function (which in this case  
// is the device layer data structure). This allows the  
// application firmware to identify, as an example, the  
// device layer object associated with this callback  
//
```

```
DRV_USB_ClientEventCallbackSet(myUSBDevice.usbDriverHandle,  
                               (uintptr_t)&myUSBDevice,  
                               USBDeviceLayerEventHandler);
```

5.1.12.7.5.2 DRV_USB_DEVICE_AddressSet Function

C

```
void DRV_USB_DEVICE_AddressSet(  
    DRV_HANDLE handle,  
    uint8_t address  
);
```

Description

This function will set the USB module address that is obtained from the host in a setup transaction. The address is obtained from the SET_ADDRESS command issued by the host. The primary (first) client of the driver uses this function to set the module's USB address after decoding the setup transaction from the host.

Preconditions

None.

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USB_Open)
address	The address of this module on the USB bus

Returns

None.

Remarks

None.

Example

```
// This function should be called by the first client of the driver,  
// which is typically the device layer. The address to set is obtained  
// from the host during enumeration.
```

```
DRV_USB_DEVICE_AddressSet(deviceLayer, 4);
```

5.1.12.7.5.3 DRV_USB_DEVICE_Attach Function

C

```
void DRV_USB_DEVICE_Attach(  
    DRV_HANDLE handle  
);
```

Description

This function will attach the device to the USB. It does this by enabling the pull up resistors on the D+ or D- lines. This function should be called when the driver client is ready to receive communication from the host (typically after all initialization is complete).

Preconditions

Client handle should be valid.

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USB_Open)

Returns

None.

Remarks

None.

Example

```
// Open the device driver and attach the device to the USB.
SYS_MODULE_OBJ    object;    // Returned from DRV_USB_Initialize
SYS_STATUS         status;
DRV_USB_INIT      moduleInit;
DRV_HANDLE         handle;

usbInitData.usbID          = USB_ID_1;
usbInitData.opMode         = DRV_USB_OPERATION_MODE_DEVICE;
usbInitData.stopInIdle     = false;
usbInitData.suspendInSleep = false;
usbInitData.operationSpeed = USB_SPEED_FULL;
usbInitData.interruptSource = INT_SOURCE_USB;

usbInitData.sysModuleInit.powerState = SYS_MODULE_POWER_RUN_FULL ;

// This is how this data structure is passed to the initialize
// function.

object = DRV_USB_Initialize(DRV_USB_INDEX_0,
                           (SYS_MODULE_INIT *) &usbInitData);

status = DRV_USB_Status(object);
if(SYS_STATUS_READY == status)
{
    // Driver is ready to be opened.
    handle = DRV_USB_Open(DRV_USB_INDEX_0,
                          DRV_IO_INTENT_EXCLUSIVE|
                          DRV_IO_INTENT_READWRITE|
                          DRV_IO_INTENT_NON_BLOCKING);
    SYS_ASSERT(DRV_HANDLE_INVALID != handle, "Bad handle returned");

    // Register a callback
    DRV_USB_ClientEventCallbackSet(handle, (uintptr_t)&myDeviceLayer,
                                    MyDeviceLayerEventCallback);

    // Perform any other initialization here and then attach the device
    // to the bus.
    DRV_USB_DEVICE_Attach(handle);
}
```

5.1.12.7.5.4 DRV_USB_DEVICE_CurrentSpeedGet Function**C**

```
USB_SPEED DRV_USB_DEVICE_CurrentSpeedGet(
    DRV_HANDLE handle
);
```

Description

This function will return the USB speed at which device is operating.

Preconditions

Only valid after device is attached to host.

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USB_Open)

Returns

Returns a member of the USB_SPEED type.

Remarks

None.

Example

```
// Get the current speed.
USB_SPEED deviceSpeed;

deviceSpeed = DRV_USB_DEVICE_CurrentSpeedGet(deviceLayer);

if(deviceLayer == USB_SPEED_HIGH)
{
    // Possibly adjust buffers for higher throughput.
}
```

5.1.12.7.5.5 DRV_USB_DEVICE_Detach Function**C**

```
void DRV_USB_DEVICE_Detach(
    DRV_HANDLE handle
);
```

Description

This function will detach the device from the USB. It does this by disabling the pull up resistors on the D+ or D- lines. This function should be called when the application wants to disconnect the device from the bus (typically to implement a soft detach or switch to host mode operation).

Preconditions

Client handle should be valid.

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USB_Open)

Returns

None.

Remarks

None.

Example

```
// Detach the device from the USB
DRV_USB_DEVICE_Detach(handle);
```

5.1.12.7.5.6 DRV_USB_DEVICE_EndpointDisable Function

C

```
USB_ERROR DRV_USB_DEVICE_EndpointDisable(  
    DRV_HANDLE handle,  
    USB_ENDPOINT endpointAndDirection  
);
```

Description

This function disables an endpoint. If the endpoint type is control type then both directions are disabled. For non-control endpoints, the function disables one direction at a time.

Preconditions

Client handle should be valid.

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USB_Open)
endpointAndDirection	Specifies the endpoint and direction.

Returns

USB_ERROR_NONE - The endpoint was successfully enabled. USB_ERROR_DEVICE_ENDPOINT_INVALID - If the endpoint that is being accessed is out of the valid endpoint defined for this driver instance.

Remarks

None.

Example

```
// This code snippet shows an example of how to disable  
// a control endpoint. Note that the direction parameter is ignored.  
// For a control endpoint, both the directions are disabled.  
  
USB_ENDPOINT ep;  
  
ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 0);  
  
DRV_USB_DEVICE_EndpointDisable(handle, ep );  
  
// This code snippet shows an example of how to disable a BULK IN  
// endpoint  
  
USB_ENDPOINT ep;  
  
ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 1);  
  
DRV_USB_DEVICE_EndpointDisable(handle, ep );
```

5.1.12.7.5.7 DRV_USB_DEVICE_EndpointDisableAll Function

C

```
USB_ERROR DRV_USB_DEVICE_EndpointDisableAll(  
    DRV_HANDLE handle  
);
```

Description

This function disables all provisioned endpoints in both directions.

Preconditions

Client handle should be valid.

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USB_Open)

Returns

None.

Remarks

This function is typically called by the USB Device Layer to disable all endpoints on detecting bus reset.

Example

```
// This code snippet shows an example of how to disable  
// all endpoints.
```

```
DRV_USB_DEVICE_EndpointDisableAll(handle);
```

5.1.12.7.5.8 DRV_USB_DEVICE_EndpointEnable Function**C**

```
USB_ERROR DRV_USB_DEVICE_EndpointEnable(  
    DRV_HANDLE handle,  
    USB_ENDPOINT endpointAndDirection,  
    USB_TRANSFER_TYPE transferType,  
    uint16_t endpointSize  
);
```

Description

This function enables a endpoint for the specified direction and endpoint size. The function will enable the endpoint for communication in one direction at a time. It must be called twice if the endpoint is required to communicate in both the directions, except for control endpoints. If the endpoint type is a control endpoint, the endpoint is always bi-directional and the function needs to be called only once. The size of the endpoint must match the wMaxPacketSize reported in the endpoint descriptor for this endpoint. The function does not check if the endpoint is already in use. It is the client's responsibility to make sure that a endpoint is not accidentally re-used.

Preconditions

Client handle should be valid.

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USB_Open)
endpointAndDirection	Specifies the endpoint and direction.
transferType	Should be USB_TRANSFER_TYPE_CONTROL for control endpoint, USB_TRANSFER_TYPE_BULK for bulk endpoint, USB_TRANSFER_TYPE_INTERRUPT for interrupt endpoint and USB_TRANSFER_TYPE_ISOCHRONOUS for isochronous endpoint.
endpointSize	Maximum size (in bytes) of the endpoint as reported in the endpoint descriptor.

Returns

USB_ERROR_NONE - The endpoint was successfully enabled. USB_ERROR_DEVICE_ENDPOINT_INVALID - If the endpoint that is being accessed is out of the valid endpoint defined for this driver instance.

Remarks

None.

Example

```
// This code snippet shows an example of how to enable endpoint  
// 0 for control transfers. Note that for a control endpoint, the  
// direction parameter is ignored. A control endpoint is always  
// bi-directional. Endpoint size is 64 bytes.  
  
uint8_t ep;  
  
ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 0);  
  
DRV_USB_DEVICE_EndpointEnable(handle, ep, USB_TRANSFER_TYPE_CONTROL, 64);  
  
// This code snippet shows an example of how to set up a endpoint  
// for BULK IN transfer. For an IN transfer, data moves from device  
// to host. In this example, endpoint 1 is enabled. The maximum  
// packet size is 64.  
  
uint8_t ep;  
  
ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 1);  
  
DRV_USB_DEVICE_EndpointEnable(handle, ep, USB_TRANSFER_TYPE_BULK, 64);  
  
// If endpoint 1 must also be set up for BULK OUT, then the enable  
// function must be called again, as shown here.  
  
ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_HOST_TO_DEVICE, 1);  
  
DRV_USB_DEVICE_EndpointEnable(handle, ep, USB_TRANSFER_TYPE_BULK, 64);
```

5.1.12.7.5.9 DRV_USB_DEVICE_EndpointIsEnabled Function**C**

```
bool DRV_USB_DEVICE_EndpointIsEnabled(  
    DRV_HANDLE client,  
    USB_ENDPOINT endpointAndDirection  
);
```

Description

This function returns the enable/ disable status of the specified endpoint and direction.

Preconditions

Client handle should be valid.

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USB_Open)
endpointAndDirection	Specifies the endpoint and direction.

Returns

Returns true if the endpoint is enabled, false otherwise.

Remarks

None.

Example

```
// This code snippet shows an example of how the
// DRV_USB_DEVICE_EndpointIsEnabled() function can be used to obtain the
// status of the endpoint 1 and IN direction.

USB_ENDPOINT ep;

ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 1);

if(DRV_USB_ENDPOINT_STATE_DISABLED ==
    DRV_USB_DEVICE_EndpointIsEnabled(handle, ep))
{
    // Endpoint is disabled. Enable endpoint.

    DRV_USB_DEVICE_EndpointEnable(handle, ep, USB_ENDPOINT_TYPE_BULK, 64);
}
```

5.1.12.7.5.10 DRV_USB_DEVICE_EndpointIsStalled Function**C**

```
bool DRV_USB_DEVICE_EndpointIsStalled(
    DRV_HANDLE client,
    USB_ENDPOINT endpoint
);
```

Description

This function returns the stall status of the specified endpoint and direction.

Preconditions

Client handle should be valid.

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USB_Open)
endpointAndDirection	Specifies the endpoint and direction.

Returns

Returns true if endpoint is stalled, false otherwise.

Remarks

None.

Example

```
// This code snippet shows an example of how the
// DRV_USB_DEVICE_EndpointIsStalled() function can be used to obtain the
// stall status of the endpoint 1 and IN direction.

USB_ENDPOINT ep;

ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 1);

if(true == DRV_USB_DEVICE_EndpointIsStalled (handle, ep))
{
    // Endpoint stall is enabled. Clear the stall.

    DRV_USB_DEVICE_EndpointStallClear(handle, ep);
}
```

5.1.12.7.5.11 DRV_USB_DEVICE_EndpointStall Function

C

```
USB_ERROR DRV_USB_DEVICE_EndpointStall(  
    DRV_HANDLE handle,  
    USB_ENDPOINT endpointAndDirection  
);
```

Description

This function stalls an endpoint in the specified direction.

Preconditions

Client handle should be valid.

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USB_Open)
endpointAndDirection	Specifies the endpoint and direction.

Returns

USB_ERROR_NONE - The endpoint was successfully enabled. USB_ERROR_DEVICE_ENDPOINT_INVALID - If the endpoint that is being accessed is out of the valid endpoint defined for this driver instance.

Remarks

None.

Example

```
// This code snippet shows an example of how to stall an endpoint. In  
// this case , endpoint 1 IN direction is stalled.  
  
USB_ENDPOINT ep;  
  
ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 1);  
  
DRV_USB_DEVICE_EndpointStall(handle, ep);
```

5.1.12.7.5.12 DRV_USB_DEVICE_EndpointStallClear Function

C

```
USB_ERROR DRV_USB_DEVICE_EndpointStallClear(  
    DRV_HANDLE handle,  
    USB_ENDPOINT endpointAndDirection  
);
```

Description

This function clears the stall on an endpoint in the specified direction.

Preconditions

Client handle should be valid.

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USB_Open)
endpointAndDirection	Specifies the endpoint and direction.

Returns

USB_ERROR_NONE - The endpoint was successfully enabled. USB_ERROR_DEVICE_ENDPOINT_INVALID - If the endpoint that is being accessed is out of the valid endpoint defined for this driver instance.

Remarks

None.

Example

```
// This code snippet shows an example of how to clear a stall. In this  
// example, the stall on endpoint 1 IN direction is cleared.
```

```
USB_ENDPOINT ep;  
  
ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 1);  
  
DRV_USB_DEVICE_EndpointStallClear(handle, ep);
```

5.1.12.7.5.13 DRV_USB_DEVICE_IRPCancelAll Function**C**

```
USB_ERROR DRV_USB_DEVICE_IRPCancelAll(  
    DRV_HANDLE client,  
    USB_ENDPOINT endpointAndDirection  
);
```

Description

This function cancels all IRPs that are queued and in progress at the specified endpoint.

Preconditions

Client handle should be valid.

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USB_Open)
endpointAndDirection	Specifies the endpoint and direction.

Returns

USB_ERROR_NONE - The endpoint was successfully enabled. USB_ERROR_DEVICE_ENDPOINT_INVALID - If the endpoint that is being accessed is out of the valid endpoint defined for this driver instance.

Remarks

None.

Example

```
// This code snippet shows an example of how to cancel all IRPs.
```

```
void MyIRPCallback(USB_DEVICE_IRP * irp)  
{  
    // Check if this is setup command  
  
    if(irp->status == USB_DEVICE_IRP_STATUS_SETUP)  
    {  
        if(IsSetupCommandSupported(irp->data) == false)  
        {  
            // This means that this setup command is not  
            // supported. Stall the endpoint.  
  
            DRV_USB_DEVICE_IRPCancelAll(handle, ep);  
        }  
    }  
}
```

```

        DRV_USB_DEVICE_EndpointStall(handle, ep);
    }
}

```

5.1.12.7.5.14 DRV_USB_DEVICE_IRPSubmit Function

C

```

USB_ERROR DRV_USB_DEVICE_IRPSubmit(
    DRV_HANDLE client,
    USB_ENDPOINT endpointAndDirection,
    USB_DEVICE_IRP * irp
);

```

Description

This function submits a I/O Request Packet (IRP) for processing to the USB Driver. The IRP allows a client to **send** and receive data from the USB Host. The data will sent or received through the specified endpoint. The direction of the data transfer is indicated by the direction flag in the endpointAndDirection structure. Submitting an IRP arms the endpoint to either **send** data to or receive data from the host. If an IRP is under progress on the endpoint, then the subsequent IRP submit operation will result in the IRPs getting queued. The contents of the IRP should not be changed till the IRP has been processed.

Particular attention should be paid to the size parameter of IRP. The following should be noted:

- The size parameter while sending data to the host can be less than, greater than, equal to or be an exact multiple of maximum packet size for the endpoint. The maximum packet size for the endpoint determines the number of transactions required to process the IRP.
- If the size parameter while sending data to the host is less than maximum packet size, the transfer will complete in one transaction.
- If the size parameter while sending data to the host is greater than maximum packet size, the IRP will be processed in multiple transactions.
- If the size parameter while sending data to the host is equal to or an exact multiple of the maximum packet size, the client can optionally ask the driver to **send** a Zero Length packet by specifying the USB_DEVICE_IRP_FLAG_DATA_COMPLETE flag as the flag parameter.
- The size parameter while receiving data from the host must be an exact multiple of the maximum packet size of the endpoint. If this is not the case, the driver will return a USB_ERROR_IRP_SIZE_INVALID result. If while processing the IRP, the driver receives less than maximum packet size or a ZLP from the host, the driver considers the IRP as processed. The size parameter at this point contains the actual amount of data received from the host. The IRP status is returned as USB_DEVICE_IRP_STATUS_COMPLETED_SHORT.
- If a ZLP needs to be sent to host, the IRP size should be specified as 0 and flag should be set as USB_DEVICE_IRP_FLAG_DATA_COMPLETE.
- If the IRP size is an exact multiple of endpoint size, the client can request the driver to not **send** a ZLP, by specifying the USB_DEVICE_IRP_FLAG_DATA_PENDING. This flag indicates that there is more data pending in this transfer.
- Specifying a size less than endpoint size along with the USB_DEVICE_IRP_FLAG_DATA_PENDING flag will cause the driver to return a USB_ERROR_IRP_SIZE_INVALID.
- If the size is greater than endpoint size, and the flag is specified as USB_DEVICE_IRP_FLAG_DATA_PENDING, the driver will **send** multiple of endpoint size data.

Preconditions

Client handle should be valid.

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USB_Open)
endpointAndDirection	Specifies the endpoint and direction.
irp	Pointer to the USB_DEVICE_IRP structure.

Returns

USB_ERROR_NONE - if the IRP was submitted successful. USB_ERROR_IRP_SIZE_INVALID - if the size parameter of the IRP is not correct. USB_ERROR_IRP_QUEUE_FULL - if the driver IRP queue is full.

Remarks

None.

Example

```
// The following code snippet shows an example of how to schedule a
// IRP to send data from device to host. Assume that max packet size
// is 64 and endpoint is 1. In this example, the transfer is
// processed as 3 transactions of 64, 64 and 2 bytes.
```

```
USB_ENDPOINT ep;
USB_DEVICE_IRP irp;

ep.direction = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 1);
```

```
irp.data = myDataBufferToSend;
irp.size = 130;
irp.flags = USB_DEVICE_IRP_FLAG_DATA_COMPLETE;
irp.callback = MyIRPCompletionCallback;
irp.referenceData = (uintptr_t)&myDeviceLayerObj;

if (DRV_USB_DEVICE_IRPSubmit(handle, ep, irp)
    != USB_ERROR_NONE)
{
    // This means there was an error.
}
else
{
    // The status of the IRP can be checked.
    while(irp.status != USB_DEVICE_IRP_STATUS_COMPLETED)
    {
        // Wait or run a task routine.
    }
}
```

```
// The following code snippet shows how the client can request
// the driver to send a ZLP when the size is an exact multiple of
// end point size.
```

```
irp.data = myDataBufferToSend;
irp.size = 128;
irp.flags = USB_DEVICE_IRP_FLAG_DATA_COMPLETE;
irp.callback = MyIRPCompletionCallback;
irp.referenceData = (uintptr_t)&myDeviceLayerObj;
```

```
// Note that while receiving data from the host, the size should
// be an exact multiple maximum packet size of the endpoint. In the
// example below, the DRV_USB_DEVICE_IRPSubmit() function will
// return a USB_DEVICE_IRP_SUBMIT_RESULT_INVALID_SIZE value.
```

```
ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_HOST_TO_DEVICE, 1);
```

```
irp.data = myDataBufferToSend;  
irp.size = 60; // THIS SIZE IS NOT CORRECT  
irp.flags = USB_DEVICE_IRP_FLAG_DATA_COMPLETE;  
irp.callback = MyIRPCompletionCallback;  
irp.referenceData = (uintptr_t)&myDeviceLayerObj;
```

5.1.12.7.5.15 DRV_USB_HOST_BusResetControl Function

C

```
void DRV_USB_HOST_BusResetControl(  
    DRV_HANDLE client,  
    bool control  
);
```

Description

This is function DRV_USB_HOST_BusResetControl.

5.1.12.7.5.16 DRV_USB_HOST_DeviceCurrentSpeedGet Function

C

```
USB_SPEED DRV_USB_HOST_DeviceCurrentSpeedGet(  
    DRV_HANDLE client  
);
```

Description

This is function DRV_USB_HOST_DeviceCurrentSpeedGet.

5.1.12.7.5.17 DRV_USB_HOST_IRPCancel Function

C

```
void DRV_USB_HOST_IRPCancel(  
    USB_HOST_IRP * inputIRP  
);
```

Description

This is function DRV_USB_HOST_IRPCancel.

5.1.12.7.5.18 DRV_USB_HOST_IRPSubmit Function

C

```
USB_ERROR DRV_USB_HOST_IRPSubmit(  
    DRV_USB_HOST_PIPE_HANDLE hPipe,  
    USB_HOST_IRP * inputIRP  
);
```

Description

This is function DRV_USB_HOST_IRPSubmit.

5.1.12.7.5.19 DRV_USB_HOST_OperationEnable Function

C

```
void DRV_USB_HOST_OperationEnable(  
    DRV_HANDLE hClient,  
    bool enable  
);
```

Description

This is function DRV_USB_HOST_OperationEnable.

5.1.12.7.5.20 DRV_USB_HOST_StartOfFrameControl Function**C**

```
void DRV_USB_HOST_StartOfFrameControl(  
    DRV_HANDLE client,  
    bool control  
);
```

Description

This is function DRV_USB_HOST_StartOfFrameControl.

5.1.12.7.5.21 DRV_USB_HOST_TimerIsComplete Function**C**

```
bool DRV_USB_HOST_TimerIsComplete(  
    DRV_HANDLE client  
);
```

Description

This is function DRV_USB_HOST_TimerIsComplete.

5.1.12.7.5.22 DRV_USB_HOST_TimerReset Function**C**

```
void DRV_USB_HOST_TimerReset(  
    DRV_HANDLE client  
);
```

Description

This is function DRV_USB_HOST_TimerReset.

5.1.12.7.5.23 DRV_USB_HOST_TimerStart Function**C**

```
bool DRV_USB_HOST_TimerStart(  
    DRV_HANDLE client,  
    uint32_t periodInMilliseconds  
);
```

Description

This is function DRV_USB_HOST_TimerStart.

5.1.12.7.5.24 DRV_USB_Tasks Function**C**

```
void DRV_USB_Tasks(  
    SYS_MODULE_OBJ object  
);
```

Description

Maintains the driver's state machine when the driver is configured for polled mode. This function should be called from the

system tasks routine.

Preconditions

The [DRV_USB_Initialize](#) routine must have been called for the specified USB driver instance.

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_USB_Initialize)

Returns

None

Remarks

This routine is normally not called directly by an application. It is called by the system's Tasks routine ([SYS_Tasks](#)). This function will never block.

Example

```
SYS_MODULE_OBJ    object;    // Returned from DRV_USB_Initialize

while (true)
{
    DRV_USB_Tasks(object);

    // Do other tasks
}
```

5.1.12.7.6 Data Types and Constants

5.1.12.7.6.1 DRV_USB_ENDPOINT_TABLE_ENTRY_SIZE Macro

C

```
#define DRV_USB_ENDPOINT_TABLE_ENTRY_SIZE
```

5.1.12.7.6.2 DRV_USB_HOST_PIPE_HANDLE_INVALID Macro

C

```
#define DRV_USB_HOST_PIPE_HANDLE_INVALID ((DRV_USB_HOST_PIPE_HANDLE)(-1))
```

Description

USB Driver Host Pipe Handle Invalid

Defines the USB Driver Host Pipe Invalid handle

Remarks

None.

5.1.12.7.6.3 DRV_USB_INDEX Macro

C

```
#define DRV_USB_INDEX 0
```

Description

This is macro DRV_USB_INDEX.

5.1.12.7.6.4 DRV_USB_INDEX_0 Macro

C

```
#define DRV_USB_INDEX_0 0
```

Description

USB Driver Module Index Numbers

These constants provide USB driver index definitions.

Remarks

These constants should be used in place of hard-coded numeric literals and should be passed into the [DRV_USB_Initialize](#) and [DRV_USB_Open](#) routines to identify the driver instance in use. These are not indicative of the number of modules that are actually supported by the microcontroller.

5.1.12.7.6.5 DRV_USB_INTERRUPT_SOURCE Macro

C

```
#define DRV_USB_INTERRUPT_SOURCE INT_SOURCE_USB_1
```

Description

This is macro DRV_USB_INTERRUPT_SOURCE.

5.1.12.7.6.6 DRV_USB_PERIPHERAL_ID Macro

C

```
#define DRV_USB_PERIPHERAL_ID USB_ID_1
```

Description

This is macro DRV_USB_PERIPHERAL_ID.

5.1.12.7.6.7 DRV_USB_EVENT Enumeration

C

```
typedef enum {
    DRV_USB_EVENT_ERROR = 1,
    DRV_USB_EVENT_RESET_DETECT,
    DRV_USB_EVENT_RESUME_DETECT,
    DRV_USB_EVENT_IDLE_DETECT,
    DRV_USB_EVENT_STALL,
    DRV_USB_EVENT_SOF_DETECT,
    DRV_USB_EVENT_HOST_ATTACH,
    DRV_USB_EVENT_HOST_DETACH
} DRV_USB_EVENT;
```

Description

USB Driver Events Enumeration

Identifies the different events that the USB Driver provides.

Members

Members	Description
DRV_USB_EVENT_ERROR = 1	Bus error occurred and was reported
DRV_USB_EVENT_RESET_DETECT	Host has issued a device reset

DRV_USB_EVENT_RESUME_DETECT	Resume detected while USB in suspend mode
DRV_USB_EVENT_IDLE_DETECT	Idle detected
DRV_USB_EVENT_STALL	Stall handshake has occurred

5.1.12.7.6.8 DRV_USB_EVENT_CALLBACK Type

C

```
typedef void (* DRV_USB_EVENT_CALLBACK)(uintptr_t hClient, DRV_USB_EVENT eventType, void * eventData);
```

Description

Type of the USB Event Callback Function

Type of the USB event callback function. The client should register an event callback function of this type when it intends to receive events from the USB driver. The event callback function is registered using the [DRV_USB_ClientEventCallBackSet\(\)](#) function.

Parameters

Parameters	Description
hClient	handle to driver client that registered this callback function.
eventType	Event type
eventData	Event relevant data.

Returns

None.

Remarks

None.

5.1.12.7.6.9 DRV_USB_HOST_PIPE_HANDLE Type

C

```
typedef uintptr_t DRV_USB_HOST_PIPE_HANDLE;
```

Description

USB Driver Host Pipe Handle

Defines the USB Driver Host Pipe handle type

Remarks

None.

5.1.12.7.6.10 DRV_USB_INIT Structure

C

```
typedef struct {
    SYS_MODULE_INIT moduleInit;
    USB_MODULE_ID usbID;
    bool stopInIdle;
    bool suspendInSleep;
    INT_SOURCE interruptSource;
    USB_SPEED operationSpeed;
    USB_OPMODES operationMode;
    void * endpointTable;
} DRV_USB_INIT;
```

Description

USB Device Driver Initialization Data

This structure contains all the data necessary to initialize the USB driver.

Members

Members	Description
SYS_MODULE_INIT moduleInit;	System module initialization
USB_MODULE_ID usbID;	Identifies peripheral (PLIB-level) ID
bool stopInIdle;	Boolean flag: true -> Stop USB module in Idle Mode
bool suspendInSleep;	Boolean flag: true -> Suspend USB in Sleep Mode
INT_SOURCE interruptSource;	Interrupt Source for USB module
USB_SPEED operationSpeed;	USB Operation speed
USB_OPMODES operationMode;	USB module operating mode
void * endpointTable;	Endpoint Descriptor Table buffer

Remarks

A pointer to a structure of this format containing the desired initialization data must be passed into the [DRV_USB_Initialize](#) routine.

5.1.12.8 Files

Files

Name	Description
drv_usb.h	USB Device Driver Interface File
drv_usb_config_template.h	USB driver configuration definitions template

Description

5.1.12.8.1 drv_usb.h

USB Device Driver Interface

The USB device driver provides a simple interface to manage the "USB" peripheral. This file defines the interface definitions and prototypes for the USB driver.

Enumerations

	Name	Description
	DRV_USB_EVENT	Identifies the different events that the USB Driver provides.

Functions

	Name	Description
	DRV_USB_ClientEventCallBackSet	This function sets up the event callback function that is invoked by the USB controller driver to notify the a client of USB bus events.
	DRV_USB_Close	Closes an opened-instance of the USB driver
	DRV_USB_DEVICE_AddressSet	This function will set the USB module address that is obtained from the host.

	DRV_USB_DEVICE_Attach	This function will attach the device to the USB.
	DRV_USB_DEVICE_CurrentSpeedGet	This function will return the USB speed at which device is operating.
	DRV_USB_DEVICE_Detach	This function will detach the device from the USB.
	DRV_USB_DEVICE_EndpointDisable	This function disables an endpoint.
	DRV_USB_DEVICE_EndpointDisableAll	This function disables all provisioned non-zero endpoints.
	DRV_USB_DEVICE_EndpointEnable	This function enables a endpoint for the specified direction and endpoint size.
	DRV_USB_DEVICE_EndpointIsEnabled	This function returns the enable/ disable status of the specified endpoint and direction.
	DRV_USB_DEVICE_EndpointIsStalled	This function returns the stall status of the specified endpoint and direction.
	DRV_USB_DEVICE_EndpointStall	This function stalls an endpoint in the specified direction.
	DRV_USB_DEVICE_EndpointStallClear	This function clears the stall on an endpoint in the specified direction.
	DRV_USB_DEVICE_IRPCancelAll	This function cancels all IRPs that are queued and in progress at the specified endpoint.
	DRV_USB_DEVICE_IRPSubmit	This function submits a I/O Request Packet (IRP) for processing to the USB Driver.
	DRV_USB_HOST_BusResetControl	This is function DRV_USB_HOST_BusResetControl.
	DRV_USB_HOST_DeviceCurrentSpeedGet	This is function DRV_USB_HOST_DeviceCurrentSpeedGet.
	DRV_USB_HOST_IRPCancel	This is function DRV_USB_HOST_IRPCancel.
	DRV_USB_HOST_IRPSubmit	This is function DRV_USB_HOST_IRPSubmit.
	DRV_USB_HOST_OperationEnable	This is function DRV_USB_HOST_OperationEnable.
	DRV_USB_HOST_OperationIsEnabled	This is function DRV_USB_HOST_OperationIsEnabled.
	DRV_USB_HOST_PipeClose	This is function DRV_USB_HOST_PipeClose.
	DRV_USB_HOST_PipeSetup	This is function DRV_USB_HOST_PipeSetup.
	DRV_USB_HOST_StartOfFrameControl	This is function DRV_USB_HOST_StartOfFrameControl.
	DRV_USB_HOST_TimerIsComplete	This is function DRV_USB_HOST_TimerIsComplete.
	DRV_USB_HOST_TimerReset	This is function DRV_USB_HOST_TimerReset.
	DRV_USB_HOST_TimerStart	This is function DRV_USB_HOST_TimerStart.
	DRV_USB_Initialize	Initializes the USB driver
	DRV_USB_Open	Opens the specified USB driver instance and returns a handle to it
	DRV_USB_Status	Provides the current status of the USB driver module
	DRV_USB_Tasks	Maintains the driver's state machine when the driver is configured for polled mode.
	DRV_USB_Tasks_ISR	Maintains the driver's state machine and implements its ISR

Macros

	Name	Description
	DRV_USB_ENDPOINT_TABLE_ENTRY_SIZE	
	DRV_USB_HOST_PIPE_HANDLE_INVALID	Defines the USB Driver Host Pipe Invalid handle
	DRV_USB_INDEX_0	USB driver index definitions

Structures

	Name	Description
	DRV_USB_INIT	Contains all the data necessary to initialize the USB device

Types

	Name	Description
	DRV_USB_EVENT_CALLBACK	Type of the USB event callback function
	DRV_USB_HOST_PIPE_HANDLE	Defines the USB Driver Host Pipe handle type

5.1.13 MRF24W Wi-Fi Driver Library

MRF24W Wi-Fi Driver Library

for

Microchip Microcontrollers

This library provides an interface to manage the Wi-Fi module on the MRF24W family of Microchip microcontrollers in different modes of operation.

Description

Content pending.

5.1.13.1 Introduction

MRF24W Wi-Fi Driver Library

for

Microchip Microcontrollers

This library provides a low-level abstraction of the MRF24W Wi-Fi Driver Library that is available on the Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, there by hiding differences from one microcontroller variant to another.

Description

Note: This information was not available at time of release and will be added in a future release of MPLAB Harmony.

5.1.13.2 Release Notes

MPLAB Harmony Version: v0.70b **MRF24W Wi-Fi Driver Library Version :** 3.0.0 **Release Date:** 18Nov2013

New This Release:

Nothing to report in this release.

Known Issues:

- No W-iFi demonstrations are available for PIC32MZ
- Webserver demonstration:
 - Mpfupload of image requires system boot upon completion
- EasyConfig Demonstration (Explorer 16 Development Board and PIC32 Ethernet Starter Kit)
 - Mpfupload of image requires system boot upon completion
 - Ad-Hoc mode – cannot retrieve scan info/cannot redirect network
- Security (minor problem)
 - WEP Shared Key is not supported
- Stack
 - Heap memory leak
 - TCP network traffic (Max TX Packet error detect)
 - Heap allocation failure
- Services not verified
 - DNS Server
 - DNS Client
 - Dynamic DNS
 - Zero Conf
 - IPv6
 - SNMPv1, SNMP2, SNMP3
 - FTP
- Data throughput in open air (throughput is still lower than v5 stack)
 - IPerf TCP RX/TX (320/102 Kbps)
 - IPerf UDP RX/TX (570/468 Kbps)

5.1.13.2.1 v0.51.01b

Release notes for MRF24WG Wi-Fi Driver v0.51.01b

Description

Due to a special circumstance for this release the MRF24WG Wi-Fi driver will compile and work with legacy peripheral drivers (plib.h), and not with the MPLAB Harmony peripheral (peripheral.h). This MRF24WG Wi-Fi driver compiling issue will be fixed in a future release. Applications can still take advantage of the V6 stack features and services in this B1U dot release, along with Wi-Fi connectivity.

Known Issues:

- 1) Stack ASSERT condition while waiting for RAW_MOVE_TO_COMPLETE
- 2) Web Server Demo hang or irresponsive to HTTP query

Software Requirements:

- (1) MPLAB X IDE 1.80
- (2) XC32 compiler v1.21 and later

Applicable Product:

- (1) MRF24WG

Supported Application Demos:*(1) Web Server Demo*

- a. SNMPv3, multi-port connection (Ethernet + Wi-Fi)
- b. Network type supported: Infrastructure (Client STA)
- c. Security mode supported: Open , WEP 64/128 Open, WPS, WPA/WPA2 PSK TKIP/AES

Project Files:

To run with Explorer 16 Development Board (EX16)

Directory folder - ".\apps\tcpip\web_server\firmware\pic32_ex16.X"

To run with PIC32 IO Expansion Board with Ethernet Starter Kit (ESK)

Directory folder - ".\apps\tcpip\web_server\firmware\pic32_esk_mrf24w.X"

(2) Console Demo

- a. Network benchmark debug/test support such as iPerf, etc via system command line access.
- b. Network type supported: Infrastructure (Client STA), Ad-Hoc, Wi-Fi Direct

If testing Wifi-Direct, use RF module FW version 0x3107.

RF module FW version 0x3108 does NOT have support for Wi-Fi Direct.

Project File:

To run with Explorer 16 Development Board (EX16)

Directory

".\apps\tcpip\wifi_console\firmware\pic32_ex16_mrf24w.X"

(3) EasyConfig Demo

- a. Network provision allowing configurations of an embedded device on a wireless network. (SoftAP, Ad-Hoc)
- b. Network type supported: SoftAP, Ad-Hoc

Project File:

To run with Explorer 16 Development Board (EX16)

Directory

“.\apps\tcpip\wifi_easyconf\firmware\pic32_ex16.X”

Key Features:**Verified:**

- (1) SNMPv3
 - (2) DHCP Server/Client - server supports up to max 4 IPs
 - (3) SoftAP is able to support up to max 4 clients (STAs)
- Requires RF module FW version 0x3108.
- RF module FW version 0x3107 only supports 1 client for SoftAP.
- (4) Ad-Hoc network with support for up to max 4 STAs
 - (5) Multi-Ethernet ports (Ethernet and Wi-Fi)
 - (6) Serial console 115,200 baud

Supported:

- (1) ZeroConfig/Bonjour (with mDNS)
 - (2) SNMP v1, 2c, v3
 - (3) SMTP
 - (4) SSL (512, 1024, 2048-bit)
 - (5) HTTP2
 - (6) ICMP
 - (7) DNS
 - (8) NBNS
 - (9) Iperf
 - (10) TCP/UDP modules
 - (11) TCPIP Network Commands
 - (12) TCPIP Storage Service
 - (13) Announce
 - (14) ARP (Gratuitous)
 - (15) Berkeley API
 - (16) ZeroConfig/Bonjour (with mDNS)
 - (17) Power management / Power Save
- Active mode (Known as normal mode in v5 stack)

- Doze mode (Known as PS-Polling mode in v5 stack)

Supported But Not Verified:

- (1) Telnet
- (2) TFTP
- (3) SNTP
- (4) Reboot Server
- (5) IPV6 : This is currently not supported due to a defect of software multicast filter of MRF24WG 3107 or the older FW. The problem will be fixed with upcoming 3108 FW, and thereby the IPv6 will get supported for Wi-Fi.
- (6) FTP

To test ESK board:

- Ethernet Starter Kit (ESK) is valid for Web server demo
- ESK + MRF24WG
 - Please note that in order to use the MRF24WG module with the PIC32ESK you need to use an I/O Expansion board (DM320002) and insert the MRF24WG module in one of the PICTail Plus slots (SPI1 position is the default).
 - You need to [connect](#) the J10/PMPA4/56 and J10/INT1/37 pins on the I/O Expansion board so that the MRF24WG interrupt signal reaches the PIC32 processor. For this configuration the MRF24WG driver uses a CN (change notice) interrupt.

5.1.13.2.2 v0.51b

Release notes for MRF24WG Wi-Fi driver v0.51b.

Description

V6 MPLAB Harmony (v0.51b) Beta Release is limited release to demonstrate V6 stack capabilities, and was verified on one Development Board:

- (1) Explorer16 Development Board, with PIC32MX795F512L PIM, and MRF24WG PICTail (FW 0x3108 only)

There are two Application Demos included to demonstrate some Stack services:

- (1) Web Server Demo (Infrastructure mode)
- (2) EasyConfig Demo (SoftAP and Ad-Hoc modes)

a. Over-air system configuration

For development work and running the above Demos, will require:

- (1) MPLAB X IDE v1.85
- (2) XC32 compiler v1.21 or later
- (3) MPLAB ICD 3
- (4) Windows XP SP3 or 7 PC with serial port, USB port.
- (5) Development boards mentioned above.
- (6) And MLA Stack V6 Harmony (MPLAB Harmony v0_51b) Beta Release package.

Specific V6 Beta Stack features supported and demonstration included: (verified)

- (1) SoftAP with support for 4 STA Clients.
- (2) DHCP Server/Client. DHCP Server supports up to 4 clients.

(3) Ad-Hoc network with support for up to 4 STAs (joiners).

(4) Wi-Fi over-air system configuration

(5) MRF24G supporting 802.11b/g mixed

(6) 115,200 baud SPI interface

(7) MPLAB X IDE and X32C compiler

(8) ZeroConfig/Bonjour (with mDNS)

Other V6 Stack services: (included, verified)

(1) IPV4

(2) IPV6 (with Ping only)

(3) SMTP

(4) SSL (512, 1024, 2048-bit)

(5) HTTP

(6) ICMP

(7) NBNS

(8) IPerf

(9) ARP (Gratuitous)

(10) TCP/UDP modules

(11) TCPIP Network Commands

(12) TCPIP Storage Service

Other V6 Stack services: (included, NOT VERIFIED)

(1) SNMP v1, 2c

(2) SNMPv3

(3) SNTP

(4) DNS Client/Server

(5) Telnet

(6) FTP

(7) TFTP

(8) Announce

(9) AutoIP

(10) Berkeley API

(11) Reboot Server

Specific Stack/Wi-Fi Connection Agent supports:

(1) Wi-Fi Specific Features:

a. ENABLE_SOFTWARE_MULTICAST_FILTER

- b. RETRIEVE_BINARY_KEY (not support in Beta)
 - c. SAVE_WPS_CONFIDENTIALS (not support in Beta)
 - d. DISABLE_MODULE_FW_CONNECT_MANAGER_IN_INFRASTRUCTURE
 - e. DERIVE_KEY_FROM_PASSPHRASE_IN_HOST
 - f. MY_DEFAULT_MAC_ADDRESS
- (2) Network Type:
- a. 802.11 b/g mixed
 - b. 802.11 b-only
 - c. 802.11 legacy
- (3) Network Mode:
- a. Infrastructure (Open , WEP 64/128 Open/Shared Key), WPS, WPA/WPA2 PSK TKIP/AES)
 - b. Ad-Hoc (Open, WEP 64/128 Open/Shared Key)
 - c. SoftAP (Open, WEP 64/128 Open Key)
- (4) Power Save
- a. Normal
 - b. PS-Poll

MLA STACK V6 MPLAB Harmony (v0.51b) Beta Release PACKAGE

DEMO APPLICATION & MICROCHIP DEVELOPMENT BOARD

Single Port (Wi-Fi only) - WEB Server and EasyConfig Demos

Development Board Configuration:

Explorer16 Development Board

MRF24WG PICtail (FW 0x3108 only)

PIC32MX795F512L PIM

WEB Server Demo project:

"...\software\isp_root\apps\tcpip\tcpip_web_server_demo_app\firmware\pic32_ex16.X"

EasyConfig Demo project:

"...\software\isp_root\apps\tcpip\tcpip_wifi_easyconfig_app\firmware\pic32_ex16.X"

DEMO CONFIGURATION

Refer to WF_Config.h and TCPIP_Config.h files in respective MPLAB X IDE demo project for network configuration and setup information.

5.1.13.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its

licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.1.13.4 Using the Library

This topic describes the basic architecture of the MRF24W Wi-Fi Driver Library and provides information and examples on how to use it.

Interface Header File: [drv_wifi.h](#)

The interface to the ADC Driver Library is defined in the "[drv_wifi.h](#)" header file.

Please refer to the [MPLAB Harmony Overview](#) for how the driver interacts with the framework.

5.1.13.4.1 Abstraction Model

This library provides a low-level abstraction of the Wi-Fi module on Microchip's microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Description

Content pending.

5.1.13.4.2 Library Overview

Refer to the section [Driver Overview](#) for how the driver operates in a system.

The library interface routines are divided into various sub-sections, each sub-section addresses one of the blocks or the overall operation of the Wi-Fi module.

Library Interface Section	Description
System Functions and System Configuration Functions	Provides system module interfaces, device initialization, deinitialization, re-initialization, tasks, and status functions.
Miscellaneous	Provides driver miscellaneous functions, version identification functions etc.

5.1.13.4.3 How the Library Works

This section describes how the Wi-Fi Driver Library operates.

Description

Before the driver is ready for use, its should be configured (compile time configuration). Refer to the [Configuring the Library](#) section for more details on how to configure the driver.

There are few run-time configuration items that are done during initialization of the driver instance, and a few that are client-specific and are done using dedicated functions.

To use the Wi-Fi Driver, initialization and client functions should be invoked in a specific sequence to ensure correct operation.

The following is the sequence in which various routines should be called:

Content pending.

5.1.13.4.3.1 System Initialization

This section describes initialization and reinitialization features.

Description

Content pending.

5.1.13.4.3.2 Client Functionality

This section describes core operation.

Description

Content pending.

5.1.13.4.3.3 Other Functionality

This section describes other functionality.

Description

Content pending.

5.1.13.5 Configuring the Library

The configuration of the MRF24W Wi-Fi driver is based on the file `drv_wifi_config.h`

This header file contains the configuration selection for the Wi-Fi Driver. Based on the selections made, the Wi-Fi Driver will support or not support selected features. These configuration settings will apply to all instances of the Wi-Fi Driver.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.1.13.5.1 Initialization Overrides

[Drag and Drop Initialization overrides](#)

5.1.13.5.2 Files

5.1.13.5.3 Others

[Drag and Drop other configuration options](#)

5.1.13.5.4 Examples - Sample Functionality

[Drag the example configuration header file.](#)

5.1.13.6 Building the Library

This section list the files that are available in the \src of the MRF24W Wi-Fi driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

5.1.13.7 Library Interface

Data Types and Constants

	Name	Description
	DRV_WIFI_BSSID_LENGTH	This is macro DRV_WIFI_BSSID_LENGTH.
	DRV_WIFI_DEAUTH_REASONCODE_MASK	This is macro DRV_WIFI_DEAUTH_REASONCODE_MASK.
	DRV_WIFI_DEFAULT_ADHOC_BEACON_PERIOD	ms
	DRV_WIFI_DEFAULT_ADHOC_HIDDEN_SSID	Default values for WiFi AdHoc settings
	DRV_WIFI_DEFAULT_ADHOC_MODE	This is macro DRV_WIFI_DEFAULT_ADHOC_MODE.
	DRV_WIFI_DEFAULT_PS_DTIM_ENABLED	DTIM wake-up enabled (normally the case)
	DRV_WIFI_DEFAULT_PS_DTIM_INTERVAL	number of beacon periods
	DRV_WIFI_DEFAULT_PS_LISTEN_INTERVAL	100ms multiplier, e.g. 1 * 100ms = 100ms
	DRV_WIFI_DEFAULT_SCAN_COUNT	Default values for WiFi scan context
	DRV_WIFI_DEFAULT_SCAN_MAX_CHANNEL_TIME	ms
	DRV_WIFI_DEFAULT_SCAN_MIN_CHANNEL_TIME	ms
	DRV_WIFI_DEFAULT_SCAN_PROBE_DELAY	us
	DRV_WIFI_DEFAULT_WEP_KEY_TYPE	see DRV_WIFI_SecurityWepSet() and DRV_WIFI_WEP_CONTEXT
	DRV_WIFI_DISABLED	Do not make this an enumerated type!
	DRV_WIFI_DISASSOC_REASONCODE_MASK	This is macro DRV_WIFI_DISASSOC_REASONCODE_MASK.
	DRV_WIFI_ENABLED	This is macro DRV_WIFI_ENABLED.
	DRV_WIFI_MAX_CHANNEL_LIST_LENGTH	This is macro DRV_WIFI_MAX_CHANNEL_LIST_LENGTH.
	DRV_WIFI_MAX_NUM_RATES	This is macro DRV_WIFI_MAX_NUM_RATES.
	DRV_WIFI_MAX_SECURITY_KEY_LENGTH	This is macro DRV_WIFI_MAX_SECURITY_KEY_LENGTH.
	DRV_WIFI_MAX_SSID_LENGTH	This is macro DRV_WIFI_MAX_SSID_LENGTH.
	DRV_WIFI_MAX_WEP_KEY_LENGTH	This is macro DRV_WIFI_MAX_WEP_KEY_LENGTH.

	DRV_WIFI_MAX_WPA_PASS_PHRASE_LENGTH	must include string terminator
	DRV_WIFI_MAX_WPA2_PASS_PHRASE_LENGTH	This is macro DRV_WIFI_MAX_WPA2_PASS_PHRASE_LENGTH.
	DRV_WIFI_MIN_WPA_PASS_PHRASE_LENGTH	Key size defines
	DRV_WIFI_NETWORK_TYPE_ADHOC	This is macro DRV_WIFI_NETWORK_TYPE_ADHOC.
	DRV_WIFI_NETWORK_TYPE_INFRASTRUCTURE	Selection of different WiFi network types
	DRV_WIFI_NETWORK_TYPE_P2P	not supported
	DRV_WIFI_NETWORK_TYPE_SOFT_AP	This is macro DRV_WIFI_NETWORK_TYPE_SOFT_AP.
	DRV_WIFI_NO_ADDITIONAL_INFO	eventInfo define for DRV_WIFI_ProcessEvent() when no additional info is supplied
	DRV_WIFI_RETRY_ADHOC	This is macro DRV_WIFI_RETRY_ADHOC.
	DRV_WIFI_RETRY_FOREVER	This is macro DRV_WIFI_RETRY_FOREVER.
	DRV_WIFI_RTS_THRESHOLD_MAX	maximum RTS threshold size in bytes
	DRV_WIFI_SECURITY_EAP	This is macro DRV_WIFI_SECURITY_EAP.
	DRV_WIFI_SECURITY_OPEN	Selection of different WiFi security types
	DRV_WIFI_SECURITY_WEP_104	This is macro DRV_WIFI_SECURITY_WEP_104.
	DRV_WIFI_SECURITY_WEP_40	This is macro DRV_WIFI_SECURITY_WEP_40.
	DRV_WIFI_SECURITY_WPA_AUTO_WITH_KEY	This is macro DRV_WIFI_SECURITY_WPA_AUTO_WITH_KEY.
	DRV_WIFI_SECURITY_WPA_AUTO_WITH_PASS_PHRASE	This is macro DRV_WIFI_SECURITY_WPA_AUTO_WITH_PASS_PHRASE.
	DRV_WIFI_SECURITY_WPA_WITH_KEY	This is macro DRV_WIFI_SECURITY_WPA_WITH_KEY.
	DRV_WIFI_SECURITY_WPA_WITH_PASS_PHRASE	This is macro DRV_WIFI_SECURITY_WPA_WITH_PASS_PHRASE.
	DRV_WIFI_SECURITY_WPA2_WITH_KEY	This is macro DRV_WIFI_SECURITY_WPA2_WITH_KEY.
	DRV_WIFI_SECURITY_WPA2_WITH_PASS_PHRASE	This is macro DRV_WIFI_SECURITY_WPA2_WITH_PASS_PHRASE.
	DRV_WIFI_SECURITY_WPS_PIN	This is macro DRV_WIFI_SECURITY_WPS_PIN.
	DRV_WIFI_SECURITY_WPS_PUSH_BUTTON	This is macro DRV_WIFI_SECURITY_WPS_PUSH_BUTTON.
	DRV_WIFI_VERSION_NUMBER	WiFi Driver Version Number
	DRV_WIFI_WEP104_KEY_LENGTH	4 keys of 13 bytes each
	DRV_WIFI_WEP40_KEY_LENGTH	4 keys of 5 bytes each
	DRV_WIFI_WPA_KEY_LENGTH	This is macro DRV_WIFI_WPA_KEY_LENGTH.
	DRV_WIFI_WPA2_KEY_LENGTH	This is macro DRV_WIFI_WPA2_KEY_LENGTH.
	DRV_WIFI_WPS_PIN_LENGTH	7 digits + checksum byte
	DRV_WIFI_ADHOC_MODES	Selection of different AdHoc connection modes
	DRV_WIFI_ADHOC_NETWORK_CONTEXT	Contains data pertaining to WiFi AdHoc context
	DRV_WIFI_CONNECTION_CONTEXT	Contains data pertaining to MRF24WG connection context
	DRV_WIFI_CONNECTION_STATES	Wifi Connection states

	DRV_WIFI_DEVICE_INFO	Contains data pertaining to MRF24WG device type and version number
	DRV_WIFI_DEVICE_TYPES	Codes for WiFi device types
	DRV_WIFI_DOMAIN_CODES	Regional domain codes.
	DRV_WIFI_EVENT_CONN_TEMP_LOST_CODES	Selection of different codes when WiFi connection is temporarily lost.
	DRV_WIFI_EVENT_INFO	Selection of different EventInfo types
	DRV_WIFI_EVENTS	Selections for events that can occur.
	DRV_WIFI_GENERAL_ERRORS	This is type DRV_WIFI_GENERAL_ERRORS.
	DRV_WIFI_HIBERNATE_STATE	This is type DRV_WIFI_HIBERNATE_STATE.
	DRV_WIFI_HIBERNATE_STATES	Wifi Hibernate states
	DRV_WIFI_MAC_STATS	Wifi MIB states
	DRV_WIFI_MGMT_ERRORS	Error codes returned when a mgmt message is sent to the MRF24W
	DRV_WIFI_MGMT_INDICATE_SOFT_AP_EVENT	Contains data pertaining to WiFi Soft AP event
	DRV_WIFI_MULTICAST_FILTER_IDS	Selections for software Multicast filter ID's
	DRV_WIFI_MULTICAST_FILTERS	Selections for Software Multicast Filters.
	DRV_WIFI_POWER_SAVE_STATES	Wifi Power Save states
	DRV_WIFI_PS_POLL_CONTEXT	Contains data pertaining to WiFi PS-Poll context
	DRV_WIFI_REASON_CODES	Selection of different codes when a deauth or disassociation event has occurred.
	DRV_WIFI_RECONNECT_MODES	Selection of different Reconnection modes
	DRV_WIFI_SCAN_CONTEXT	Contains data pertaining to WiFi scan context
	DRV_WIFI_SCAN_RESULT	Contains data pertaining to WiFi scan results
	DRV_WIFI_SCAN_TYPES	Selection of different WiFi scan types
	DRV_WIFI_SECURITY_CONTEXT	Contains data pertaining to WiFi security.
	DRV_WIFI_SOFT_AP_EVENT_REASON_CODES	This is type DRV_WIFI_SOFT_AP_EVENT_REASON_CODES.
	DRV_WIFI_SOFT_AP_STATES	This is type DRV_WIFI_SOFT_AP_STATES.
	DRV_WIFI_STATUS_CODES	Selection of different codes when WiFi connection fails due to association or authentication failure.
	DRV_WIFI_SWMULTICAST_CONFIG	Contains data pertaining to WiFi software multicast filter configuration
	DRV_WIFI_TX_MODES	Selections for WiFi Tx mode
	DRV_WIFI_WEP_CONTEXT	Contains data pertaining to WiFi WEP context
	DRV_WIFI_WEP_KEY_TYPE	Selections for WEP key type when using WEP security.
	DRV_WIFI_WPA_CONTEXT	Contains data pertaining to WiFi WPA.
	DRV_WIFI_WPA_KEY_INFO	Contains data pertaining to WiFi WPA Key
	DRV_WIFI_WPS_AUTH_TYPES	This is type DRV_WIFI_WPS_AUTH_TYPES.
	DRV_WIFI_WPS_CONTEXT	Contains data pertaining to WiFi WPS security.
	DRV_WIFI_WPS_CREDENTIAL	Contains data pertaining to WiFi WPS Credentials
	DRV_WIFI_WPS_ENCODE_TYPES	This is type DRV_WIFI_WPS_ENCODE_TYPES.
	adhocMode	Selection of different AdHoc connection modes
	ENABLE_P2P_PRINTS	not supported
	ENABLE_WPS_PRINTS	This is macro ENABLE_WPS_PRINTS.
	PA6_IO	debug, remove later

	PA6_TRISTATE	This is macro PA6_TRISTATE.
	SET_PA6_AS_OUTPUT	This is macro SET_PA6_AS_OUTPUT.
	WF_WPS_PIN_LENGTH	WPS PIN Length

Miscellaneous Functions

	Name	Description
	DRV_WIFI_ConfigDataErase	Erases configuration data from the board EEPROM.
	DRV_WIFI_ConfigDataLoad	Loads configuration data from the board EEPROM.
	DRV_WIFI_ConfigDataPrint	Outputs to console the configuration data from the board EEPROM.
	DRV_WIFI_ConfigDataSave	Save configuration data to the board EEPROM.
	DRV_WIFI_ProcessEvent	Processes WiFi event
	DRV_WIFI_ScanGetResult	Read selected scan results back from MRF24W.
	DRV_WIFI_SetLinkDownThreshold	Sets number of consecutive WiFi Tx failures before link is considered down.
	DRV_WIFI_SetPSK	Sets the binary WPA PSK code in WPS.
	DRV_WIFI_SWMultiCastFilterEnable	Forces the MRF24WG to use software multicast filters instead of hardware multicast filters.
	DRV_WIFI_YieldPassphraseToHost	Allows host to get WPS WPA-PSK passphrase and convert to binary key.

System Configuration Functions

	Name	Description
	DRV_WIFI_Connect	Directs the MRF24WG to connect to a WiFi network.
	DRV_WIFI_Deinitialize	Initializes the MRF24WG WiFi driver.
	DRV_WIFI_Disconnect	Directs the MRF24WG to disconnect from a WiFi network.
	DRV_WIFI_Initialize	Initializes the MRF24WG WiFi driver.
	DRV_WIFI_Scan	Commands the MRF24W to start a scan operation. This will generate the WF_EVENT_SCAN_RESULTS_READY event.

System Functions

	Name	Description
	DRV_WIFI_BssidGet	Sets the the BSSID set in DRV_WIFI_BssidSet() .
	DRV_WIFI_BssidSet	Sets the the Basic Service Set Identifier (BSSID).
	DRV_WIFI_ChannelListGet	Gets the the channel list.
	DRV_WIFI_ChannelListSet	Sets the the channel list.
	DRV_WIFI_ConnectContextGet	Gets the current WiFi connection context
	DRV_WIFI_ConnectionStateGet	Gets the current WiFi connection state
	DRV_WIFI_DeviceInfoGet	Retrieves MRF24WG device information
	DRV_WIFI_HWMulticastFilterGet	Gets a multicast address filter from one of the two multicast filters.
	DRV_WIFI_HWMulticastFilterSet	Sets a multicast address filter using one of the two hardware multicast filters.
	DRV_WIFI_MacAddressGet	Retrieves the MRF24WG MAC address
	DRV_WIFI_MacAddressSet	Uses a different MAC address for the MRF24W
	DRV_WIFI_MacStatsGet	Gets MAC statistics.
	DRV_WIFI_NetworkTypeGet	Gets the WiFi network type
	DRV_WIFI_NetworkTypeSet	Sets the WiFi network type
	DRV_WIFI_PowerSaveStateGet	Gets the current power-save state.
	DRV_WIFI_ReconnectModeGet	Gets the WiFi reconnection mode.
	DRV_WIFI_ReconnectModeSet	Sets the WiFi reconnection mode.
	DRV_WIFI_RegionalDomainGet	Retrieves the MRF24WG Regional domain

◆	DRV_WIFI_RtsThresholdGet	Gets the RTS Threshold
◆	DRV_WIFI_RtsThresholdSet	Sets the RTS Threshold.
◆	DRV_WIFI_ScanContextGet	Gets the WiFi scan context.
◆	DRV_WIFI_ScanContextSet	Sets the WiFi scan context.
◆	DRV_WIFI_SecurityGet	Gets the current WiFi security setting
◆	DRV_WIFI_SecurityOpenSet	Sets WiFi security to open (no security)
◆	DRV_WIFI_SecurityWepSet	Sets WiFi security to use WEP.
◆	DRV_WIFI_SecurityWpaSet	Sets WiFi security to use WPA or WPA2
◆	DRV_WIFI_SecurityWpsSet	Sets WiFi security to use WPS
◆	DRV_WIFI_SoftApEventInfoGet	Gets the stored Soft AP event info
◆	DRV_WIFI_SsidGet	Sets the SSID
◆	DRV_WIFI_SsidSet	Sets the SSID
◆	DRV_WIFI_SWMulticastFilterSet	Sets a multicast address filter using one of the software multicast filters.
◆	DRV_WIFI_TxModeGet	Gets 802.11 Tx mode
◆	DRV_WIFI_TxModeSet	Configures 802.11 Tx mode
◆	DRV_WIFI_TxPowerFactoryMaxGet	Retrieves the factory-set max Tx power from the MRF24W.
◆	DRV_WIFI_TxPowerMaxGet	Gets the Tx max power on the MRF24WG0M.
◆	DRV_WIFI_TxPowerMaxSet	Sets the Tx max power on the MRF24WG0M.
◆	DRV_WIFI_WepKeyTypeGet	Gets the Wep Key type
◆	DRV_WIFI_WPSCredentialsGet	Gets the WPS credentials
◆	DRV_WIFI_AdhocContextSet	Sets the AdHoc context.
◆	DRV_WIFI_RssiGet	Gets RSSI value set in DRV_WIFI_RssiSet()
◆	DRV_WIFI_RssiSet	Sets RSSI restrictions when connecting
◆	DRV_WIFI_GratuitousArpStart	Starts a periodic gratuitous ARP response
◆	DRV_WIFI_GratuitousArpStop	Stops a periodic gratuitous ARP.
◆	DRV_WIFI_HibernateEnable	Puts the MRF24WG into hibernate mode.
◆	DRV_WIFI_isHibernateEnable	Checks if MRF24W is in hibernate mode
◆	DRV_WIFI_PsPollDisable	Disables PS-Poll mode.
◆	DRV_WIFI_PsPollEnable	Enables PS Poll mode.

Description

This section describes the Application Programming Interface (API) functions of the MRF24W Wi-Fi Driver.

Refer to each section for a detailed description.

5.1.13.7.1 System Functions

5.1.13.7.1.1 DRV_WIFI_BssidGet Function

C

```
void DRV_WIFI_BssidGet(
    uint8_t * p_bssid
);
```

Description

Retrieves the BSSID set in the previous call to [DRV_WIFI_BssidSet\(\)](#).

Preconditions

WiFi initialization must be complete.

Parameters

Parameters	Description
p_context	pointer to where BSSID will be written.

Returns

None

Remarks

None

Example

```
uint8_t bssid[6];  
DRV_WIFI_BssidGet(bssid);
```

5.1.13.7.1.2 DRV_WIFI_BssidSet Function**C**

```
void DRV_WIFI_BssidSet(  
    uint8_t * p_bssid  
);
```

Description

This sets 6 byte (48-bit) MAC address of the Access Point that is being scanned for. It is optional to use this. Where it is useful is if there are two AP's with the same ID; the BSSID is used to [connect](#) to the specified AP. This setting can be used in lieu of the SSID. Set each byte to 0xFF (default) if the BSSID is not being used. Not typically needed.

Preconditions

WiFi initialization must be complete.

Parameters

Parameters	Description
p_context	pointer to BSSID

Returns

None

Remarks

None

Example

```
uint8_t bssid[6];  
  
bssid[0] = 0x00;  
bssid[1] = 0xe8;  
bssid[2] = 0xc0;  
bssid[3] = 0x11;  
bssid[4] = 0x22;  
bssid[5] = 0x33;  
  
DRV_WIFI_BssidSet(bssid);
```

5.1.13.7.1.3 DRV_WIFI_ChannelListGet Function

C

```
void DRV_WIFI_ChannelListGet(  
    uint8_t * p_channelList,  
    uint8_t * p_numChannels  
);
```

Description

This function gets the current channel list.

Preconditions

WiFi initialization must be complete.

Parameters

Parameters	Description
p_channelList	pointer to where channel list will be written
numChannels	pointer to where number of channels in the list will be written.

Returns

None

Remarks

None

Example

```
uint8_t channelList[DRV_WIFI_MAX_CHANNEL_LIST_LENGTH];  
uint8_t numChannels;  
  
DRV_WIFI_ChannelListGet(channelList, &numChannels);
```

5.1.13.7.1.4 DRV_WIFI_ChannelListSet Function

C

```
void DRV_WIFI_ChannelListSet(  
    uint8_t * p_channelList,  
    uint8_t numChannels  
);
```

Description

This function sets the channel list that the MRF24WG will use when scanning or connecting.

Preconditions

WiFi initialization must be complete.

Parameters

Parameters	Description
p_channelList	list of channels
numChannels	number of channels in list; if set to 0, then MRF24WG will set its channel list to all valid channels in its regional domain.

Returns

None

Remarks

None

Example

```
uint8_t channelList[1,6,11];  
  
DRV_WIFI_ChannelListSet(channelList, sizeof(channelList));
```

5.1.13.7.1.5 DRV_WIFI_ConnectContextGet Function

C

```
void DRV_WIFI_ConnectContextGet(  
    DRV_WIFI_CONNECTION_CONTEXT * p_ctx  
);
```

Description

This function gets the current WiFi connection context.

Preconditions

WiFi initialization must be complete

Parameters

Parameters	Description
p_ctx	pointer to where connection context is written. See DRV_WIFI_CONNECTION_CONTEXT structure.

Returns

None

Remarks

None

Example

```
DRV_WIFI_CONNECTION_CONTEXT ctx;  
  
DRV_WIFI_ConnectContextGet(&ctx);
```

5.1.13.7.1.6 DRV_WIFI_ConnectionStateGet Function

C

```
void DRV_WIFI_ConnectionStateGet(  
    uint8_t * p_state  
);
```

Description

This function gets the current WiFi connection state.

*p_state	Description
DRV_WIFI_CSTATE_NOT_CONNECTED	No WiFi connection exists
DRV_WIFI_CSTATE_CONNECTION_IN_PROGRESS	WiFi connection in progress
DRV_WIFI_CSTATE_CONNECTED_INFRASTRUCTURE	WiFi connected in infrastructure mode
DRV_WIFI_CSTATE_CONNECTED_ADHOC	WiFi connected in adhoc mode

DRV_WIFI_CSTATE_RECONNECTION_IN_PROGRESS	WiFi in process of reconnecting
DRV_WIFI_CSTATE_CONNECTION_PERMANENTLY_LOST	WiFi connection permanently lost

Preconditions

WiFi initialization must be complete

Parameters

Parameters	Description
p_state	pointer to where state is written (see description)

Returns

None

Remarks

None

Example

```
uint8_t state;

DRV_WIFI_ConnectionStateGet(&state);
```

5.1.13.7.1.7 DRV_WIFI_DeviceInfoGet Function**C**

```
void DRV_WIFI_DeviceInfoGet(
    DRV_WIFI_DEVICE_INFO * p_deviceInfo
);
```

Description

This function retrieves MRF24WG device information. See [DRV_WIFI_DEVICE_INFO](#) structure.

Preconditions

WiFi initialization must be complete.

Parameters

Parameters	Description
p_deviceInfo	Pointer where device info will be written

Returns

None.

Remarks

None.

Example

```
DRV_WIFI_DEVICE_INFO    info;

DRV_WIFI_DeviceInfoGet(&info);
```

5.1.13.7.1.8 DRV_WIFI_HWMulticastFilterGet Function**C**

```
void DRV_WIFI_HWMulticastFilterGet(
    uint8_t multicastFilterId,
```

```
    uint8_t multicastAddress[6]
);
```

Description

Gets the current state of the specified Multicast Filter.

Preconditions

WiFi initialization must be complete.

Parameters

Parameters	Description
multicastFilterId	DRV_WIFI_MULTICAST_FILTER_1 or DRV_WIFI_MULTICAST_FILTER_2
multicastAddress	pointer to where 6-byte multicast filter is written.

Returns

None.

Remarks

None.

Example

```
uint8_t filterAddress[6];

DRV_WIFI_HWMulticastFilterGet(DRV_WIFI_MULTICAST_FILTER_1, filterAddress);
```

5.1.13.7.1.9 DRV_WIFI_HWMulticastFilterSet Function**C**

```
void DRV_WIFI_HWMulticastFilterSet(
    uint8_t multicastFilterId,
    uint8_t multicastAddress[6]
);
```

Description

This function allows the application to configure up to two hardware Multicast Address Filters on the MRF24W. If two active multicast filters are set up they are OR'd together – the MRF24W will receive and pass to the Host CPU received packets from either multicast address. The allowable values for the multicast filter are:

- DRV_WIFI_MULTICAST_FILTER_1
- DRV_WIFI_MULTICAST_FILTER_2

By default, both Multicast Filters are inactive.

Preconditions

WiFi initialization must be complete.

Parameters

Parameters	Description
multicastFilterId	DRV_WIFI_MULTICAST_FILTER_1 or DRV_WIFI_MULTICAST_FILTER_2
multicastAddress	6-byte address (all 0xFF will inactivate the filter)

Returns

None.

Remarks

Cannot mix hardware and software multicast filters.

Example

```
uint8_t multicastFilterId = DRV_WIFI_MULTICAST_FILTER_1;
uint8_t filterAddress[6] = {0x00, 0x01, 0x5e, 0x11, 0x22, 0x33};

DRV_WIFI_HWMulticastFilterSet(multicastFilterId, filterAddress);
```

5.1.13.7.1.10 DRV_WIFI_MacAddressGet Function**C**

```
void DRV_WIFI_MacAddressGet(
    uint8_t * p_mac
);
```

Description

This function retrieves the MRF24WG MAC address.

Preconditions

WiFi initialization must be complete.

Parameters

Parameters	Description
p_mac	Pointer where mac address will be written (must point to a 6-byte buffer)

Returns

None.

Remarks

None.

Example

```
uint8_t mac[6];

DRV_WIFI_MacAddressGet(mac);
```

5.1.13.7.1.11 DRV_WIFI_MacAddressSet Function**C**

```
void DRV_WIFI_MacAddressSet(
    uint8_t * p_mac
);
```

Description

Directs the MRF24W to use the input MAC address instead of its factory-default MAC address. This function does not overwrite the factory default, which is in FLASH memory.

Preconditions

WiFi initialization must be complete. Cannot be called when the MRF24W is in a connected state.

Parameters

Parameters	Description
p_mac	Pointer to 6-byte MAC that will be sent to MRF24WG

Returns

None.

Remarks

None.

Example

```
uint8_t mac[6] = {0x00, 0x1e, 0xc0, 0x11, 0x22, 0x33};

DRV_WIFI_MacAddressSet(mac);
```

5.1.13.7.1.12 DRV_WIFI_MacStatsGet Function

C

```
void DRV_WIFI_MacStatsGet(
    DRV_WIFI_MAC_STATS * p_macStats
);
```

Description

This function gets the various MAC layer stats as maintained by the MRF24WG.

Preconditions

WiFi initialization must be complete.

Parameters

Parameters	Description
p_macStats	Pointer to where MAC statistics are written. See DRV_WIFI_MAC_STATS structure.

Returns

None.

Remarks

None.

Example

```
DRV_WIFI_MAC_STATS macStats;

DRV_WIFI_MacStatsGet(&macStats);
```

5.1.13.7.1.13 DRV_WIFI_NetworkTypeGet Function

C

```
void DRV_WIFI_NetworkTypeGet(
    uint8_t * p_networkType
);
```

Description

This function gets the WiFi network type.

Preconditions

WiFi initialization must be complete.

Parameters

Parameters	Description
p_networkType	Pointer to where the network type will be written.
One of the following	DRV_WIFI_NETWORK_TYPE_INFRASTRUCTURE DRV_WIFI_NETWORK_TYPE_ADHOC

DRV_WIFI_NETWORK_TYPE_P2P	not supported DRV_WIFI_NETWORK_TYPE_SOFT_AP

Returns

None

Remarks

None

Example

```
uint8_t networkType;

DRV_WIFI_NetworkTypeGet(&networkType);
```

5.1.13.7.1.14 DRV_WIFI_NetworkTypeSet Function

C

```
void DRV_WIFI_NetworkTypeSet(
    uint8_t networkType
);
```

Description

This function selects the WiFi network type.

Preconditions

WiFi initialization must be complete.

Parameters

Parameters	Description
networkType	One of the following: DRV_WIFI_NETWORK_TYPE_INFRASTRUCTURE DRV_WIFI_NETWORK_TYPE_ADHOC
DRV_WIFI_NETWORK_TYPE_P2P	not supported DRV_WIFI_NETWORK_TYPE_SOFT_AP

Returns

None

Remarks

None

Example

```
DRV_WIFI_NetworkTypeSet(DRV_WIFI_NETWORK_TYPE_INFRASTRUCTURE);
```

5.1.13.7.1.15 DRV_WIFI_PowerSaveStateGet Function

C

```
void DRV_WIFI_PowerSaveStateGet(
    uint8_t * p_powerSaveState
);
```

Description

This function gets the current MRF24WG power save state.

powerSaveState	Definition
DRV_WIFI_PS_HIBERNATE	MRF24W in hibernate state

DRV_WIFI_PS_PS_POLL_DTIM_ENABLED	MRF24W in PS-Poll mode with DTIM enabled
DRV_WIFI_PS_PS_POLL_DTIM_DISABLED	MRF24W in PS-Poll mode with DTIM disabled
DRV_WIFI_PS_POLL_OFF	MRF24W is not in any power-save state

Preconditions

WiFi initialization must be complete.

Parameters

Parameters	Description
p_powerSaveState	Pointer to where power state is written (see description)

Returns

None.

Remarks

None.

Example

```
uint8_t state;

DRV_WIFI_PowerSaveStateGet(&state);
```

5.1.13.7.1.16 DRV_WIFI_ReconnectModeGet Function**C**

```
void DRV_WIFI_ReconnectModeGet(
    uint8_t * p_retryCount,
    uint8_t * p_deauthAction,
    uint8_t * p_beaconTimeout,
    uint8_t * p_beaconTimeoutAction
);
```

Description

This function gets the reconnection mode parameters set in DRV_WIFI_ReconnectModeGet().

Preconditions

WiFi initialization must be complete.

Parameters

Parameters	Description
p_retryCount	Pointer where retry count is written
p_deauthAction	Pointer where deauth action is written
p_beaconTimeout	Pointer where beacon timeout is written
p_beaconTimeoutAction	Pointer where beacon timeout action is written.

Returns

None

Remarks

None

Example

```
uint8_t retryCount, deauthAction, beaconTimeout, beaconTimeoutAction;
```

```
DRV_WIFI_ReconnectModeGet(&retryCount,  
                           &deauthAction,  
                           &beaconTimeout,  
                           &beaconTimeoutAction);
```

5.1.13.7.1.17 DRV_WIFI_ReconnectModeSet Function

C

```
void DRV_WIFI_ReconnectModeSet(  
    uint8_t retryCount,  
    uint8_t deauthAction,  
    uint8_t beaconTimeout,  
    uint8_t beaconTimeoutAction  
);
```

Description

This function controls how the MRF24WG behaves when an existing WiFi connection is lost. The MRF24WG can lose an existing connection in one of two ways: 1) Beacon timeout 2) Deauth received from AP

There are two options with respect to regaining a lost WiFi connection: 1) MRF24WG informs the host that the connection was temporarily lost and then the MRF24WG retries N times (or forever) to regain the connection. 2) MRF24WG simply informs the host application that the connection is lost, and it is up to the host to regain the connection via the API.

Preconditions

WiFi initialization must be complete.

Parameters

Parameters	Description
retryCount	Number of times the MRF24WG should try to regain the connection (see description)
deauthAction	In the event of a deauth from the AP, the action the MRF24WG should take (see description)
beaconTimeout	Number of missed beacons before the MRF24WG designates the connection as lost (see description)
beaconTimeoutAction	In the event of a beacon timeout, the action the MRF24WG should take (see description)

Returns

None

Remarks

The retryCount parameter also applies when initially connecting. That is, the retryCount tells the MRF24WG how many time to try to **connect** to a WiFi network before giving up and generating the DRV_WIFI_EVENT_CONNECTION_FAILED event.

'retryCount' field	Description
0	Do not try to regain a connection (simply report event to host)
1:254	Number of times MRF24WG should try to regain the connection
255	MRF24WG will retry forever (do not use for AdHoc connections)

'deathAction' field	Description
DRV_WIFI_DO_NOT_ATTEMPT_TO_RECONNECT	Do not attempt to reconnect after a death
DRV_WIFI_ATTEMPT_TO_RECONNECT	Attempt to reconnect after a death

'beaconTimeout' field	Description
0	MRF24WG will not monitor the beacon timeout condition
1:255	Number of missed beacons before designating the connection as lost.

'beaconTimeoutAction' field	Description
DRV_WIFI_DO_NOT_ATTEMPT_TO_RECONNECT	Do not attempt to reconnect after a beacon timeout
DRV_WIFI_ATTEMPT_TO_RECONNECT	Attempt to reconnect after a beacon timeout

None

Example

```
// Example 1: MRF24WG should retry forever if either a death or beacon
// timeout occurs (beacon timeout is 3 beacon periods).
DRV_WIFI_ReconnectModeSet(WF_RETRY_FOREVER,
                          WF_ATTEMPT_TO_RECONNECT,
                          3,
                          WF_ATTEMPT_TO_RECONNECT);

// Example 2: MRF24WG should not do any connection retries and only report
// death events to the host.
DRV_WIFI_ReconnectModeSet(0,
                          WF_DO_NOT_ATTEMPT_TO_RECONNECT,
                          0,
                          WF_DO_NOT_ATTEMPT_TO_RECONNECT);

// Example 3: MRF24WG should not do any connection retries, but report death
// and beacon timeout events to host. Beacon timeout should be 5 beacon periods.
DRV_WIFI_ReconnectModeSet(0,
                          WF_DO_NOT_ATTEMPT_TO_RECONNECT,
                          5,
                          WF_DO_NOT_ATTEMPT_TO_RECONNECT);

// Example 4: MRF24WG should ignore beacon timeouts, but attempt to
// reconnect 3 times if a death occurs.
DRV_WIFI_ReconnectModeSet(3,
                          WF_ATTEMPT_TO_RECONNECT,
                          0,
                          WF_DO_NOT_ATTEMPT_TO_RECONNECT);
```

5.1.13.7.1.18 DRV_WIFI_RegionalDomainGet Function

C

```
void DRV_WIFI_RegionalDomainGet(
    uint8_t * p_regionalDomain
);
```

Description

Gets the regional domain on the MRF24W. Values are:

- DRV_WIFI_DOMAIN_FCC
- DRV_WIFI_DOMAIN_ETSI
- DRV_WIFI_DOMAIN_JAPAN
- DRV_WIFI_DOMAIN_OTHER

Preconditions

WiFi initialization must be complete.

Parameters

Parameters	Description
p_regionalDomain	Pointer where the regional domain value will be written

Returns

None.

Remarks

None.

Example

```
uint8_t domain;  
DRV_WIFI_RegionalDomainGet(&domain);
```

5.1.13.7.1.19 DRV_WIFI_RtsThresholdGet Function**C**

```
void DRV_WIFI_RtsThresholdGet(  
    uint16_t * p_rtsThreshold  
);
```

Description

Gets the RTS/CTS packet size threshold.

Preconditions

WiFi initialization must be complete.

Parameters

Parameters	Description
p_rtsThreshold	Pointer to where RTS threshold is written

Returns

None.

Remarks

None.

Example

```
uint16_t threshold;  
DRV_WIFI_RtsThresholdGet(&threshold);
```

5.1.13.7.1.20 DRV_WIFI_RtsThresholdSet Function**C**

```
void DRV_WIFI_RtsThresholdSet(  
    uint16_t rtsThreshold  
);
```

```
uint16_t rtsThreshold  
);
```

Description

Sets the RTS/CTS packet size threshold for when RTS/CTS frame will be sent. The default is 2347 bytes – the maximum for 802.11. It is recommended that the user leave the default at 2347 until they understand the performance and power ramifications of setting it smaller. Valid values are from 0 to [DRV_WIFI_RTS_THRESHOLD_MAX](#) (2347).

Preconditions

WiFi initialization must be complete.

Parameters

Parameters	Description
rtsThreshold	Value of the packet size threshold

Returns

None.

Remarks

None.

Example

```
DRV_WIFI_RtsThresholdSet(DRV_WIFI_RTS_THRESHOLD_MAX);
```

5.1.13.7.1.21 DRV_WIFI_ScanContextGet Function**C**

```
void DRV_WIFI_ScanContextGet(  
    DRV_WIFI_SCAN_CONTEXT * p_context  
);
```

Description

This function gets the WiFi scan context.

Preconditions

WiFi initialization must be complete.

Parameters

Parameters	Description
p_context	Pointer to where scan context will be written. See DRV_WIFI_SCAN_CONTEXT structure.

Returns

None.

Remarks

None.

Example

```
DRV_WIFI_SCAN_CONTEXT context;  
DRV_WIFI_ScanContextSet(&context);
```

5.1.13.7.1.22 DRV_WIFI_ScanContextSet Function

C

```
void DRV_WIFI_ScanContextSet(
    DRV_WIFI_SCAN_CONTEXT * p_context
);
```

Description

This function sets the WiFi scan context. The MRF24WG defaults are fine for most applications, but they can be changed by this function.

Preconditions

WiFi initialization must be complete.

Parameters

Parameters	Description
p_context	Pointer to scan context. See DRV_WIFI_SCAN_CONTEXT structure.

Returns

None.

Remarks

None.

Example

```
DRV_WIFI_SCAN_CONTEXT context;

context.scantype = DRV_WIFI_ACTIVE_SCAN;
context.scanCount = 1;
context.minChannelTime = 200;    // ms
context.maxChannelTime = 400;    // ms
context.probeDelay = 20;         // uS

DRV_WIFI_ScanContextSet(&context);
```

5.1.13.7.1.23 DRV_WIFI_SecurityGet Function

C

```
void DRV_WIFI_SecurityGet(
    uint8_t * p_securityType,
    uint8_t * p_securityKey,
    uint8_t * p_securityKeyLength
);
```

Description

This function gets the current WiFi security setting.

'securityType' Field	Key	Length
DRV_WIFI_SECURITY_OPEN	N/A	N/A
DRV_WIFI_SECURITY_WEP_40	binary	4 keys, 5 bytes each (total of 20 bytes)
DRV_WIFI_SECURITY_WEP_104	binary	4 keys, 13 bytes each (total of 52 bytes)
DRV_WIFI_SECURITY_WPA_WITH_KEY	binary	32 bytes
DRV_WIFI_SECURITY_WPA_WITH_PASS_PHRASE	ascii	8-63 ascii characters

DRV_WIFI_SECURITY_WPA2_WITH_KEY	binary	32 bytes
DRV_WIFI_SECURITY_WPA2_WITH_PASS_PHRASE	ascii	8-63 ascii characters
DRV_WIFI_SECURITY_WPA_AUTO_WITH_KEY	binary	32 bytes
DRV_WIFI_SECURITY_WPA_AUTO_WITH_PASS_PHRASE	ascii	8-63 ascii characters

Preconditions

WiFi initialization must be complete.

Parameters

Parameters	Description
p_securityType	Value corresponding to the security type desired (see description)
p_securityKey	Binary key or passphrase (not used if security is DRV_WIFI_SECURITY_OPEN)
p_securityKeyLength	Number of bytes in p_securityKey (not used if security is DRV_WIFI_SECURITY_OPEN)

Returns

None.

Remarks

If security was initially set with a passphrase that the MRF24WG used to generate a binary key, this function returns the binary key, not the passphrase.

Example

```
uint8_t securityType;
uint8_t securityKey[DRV_WIFI_MAX_SECURITY_KEY_LENGTH];
uint8_t keyLength;

DRV_WIFI_SecurityGet(&securityType, securityKey, &keyLength);
```

5.1.13.7.1.24 DRV_WIFI_SecurityOpenSet Function

C

```
void DRV_WIFI_SecurityOpenSet();
```

Description

This function sets the WiFi security to open. One can only [connect](#) to an AP that is running in open mode.

Preconditions

WiFi initialization must be complete. Must be in an unconnected state.

Returns

None

Remarks

None

Example

```
DRV_WIFI_SecurityOpenSet();
```

5.1.13.7.1.25 DRV_WIFI_SecurityWepSet Function

C

```
void DRV_WIFI_SecurityWepSet(
```

```
    DRV_WIFI_WEP_CONTEXT* p_context  
);
```

Description

This function sets the WiFi security to WEP. One can only [connect](#) to an AP that is running the same WEP mode.

Preconditions

WiFi initialization must be complete. Must be in an unconnected state.

Parameters

Parameters	Description
p_context	desired WEP context. See DRV_WIFI_WEP_CONTEXT structure.

Returns

None

Remarks

None

Example

```
DRV_WIFI_WEP_CONTEXT context;  
  
context.wepSecurityType = DRV_WIFI_SECURITY_WEP_40;  
context.wepKey[] = {0x5a, 0xfb, 0x6c, 0x8e, 0x77,  
                   0xc1, 0x04, 0x49, 0xfd, 0x4e,  
                   0x43, 0x18, 0x2b, 0x33, 0x88,  
                   0xb0, 0x73, 0x69, 0xf4, 0x78};  
  
context.wepKeyLength = 20;  
context.wepKeyType = DRV_WIFI_SECURITY_WEP_OPENKEY;  
DRV_WIFI_SecurityOpenSet(&context);
```

5.1.13.7.1.26 DRV_WIFI_SecurityWpaSet Function

C

```
void DRV_WIFI_SecurityWpaSet(  
    DRV_WIFI_WPA_CONTEXT* p_context  
);
```

Description

This function sets the WiFi security to WPA or WPA2. One can only [connect](#) to an AP that is running the same WPA mode.

Preconditions

WiFi initialization must be complete. Must be in an unconnected state.

Parameters

Parameters	Description
p_context	desired WPA context. See DRV_WIFI_WPA_CONTEXT structure.

Returns

None

Remarks

None

Example

```
DRV_WIFI_WPA_CONTEXT context;
```

```
context.wpaSecurityType = DRV_WIFI_SECURITY_WPA2_WITH_PASS_PHRASE;
context.keyInfo.key[] = "MySecretWPA2PassPhrase";
context.keyInfo.keyLenth = strlen(context.keyInfo.key);
DRV_WIFI_SecurityWpaSet(&context);
```

5.1.13.7.1.27 DRV_WIFI_SecurityWpsSet Function

C

```
void DRV_WIFI_SecurityWpsSet(
    DRV_WIFI_WPS_CONTEXT * p_context
);
```

Description

This function sets the WiFi security to WPS. One can only [connect](#) to an AP that supports WPS.

Preconditions

WiFi initialization must be complete. Must be in an unconnected state.

Parameters

Parameters	Description
p_context	desired WPA context. See DRV_WIFI_WPS_CONTEXT structure.

Returns

None

Remarks

None

Example

```
DRV_WIFI_WPS_CONTEXT context;
uint8_t wpsPin[8] = {1, 2, 3, 9, 0, 2, 1, 2};

context.wpsSecurityType = DRV_WIFI_SECURITY_WPS_PUSH_BUTTON;
memcpy(context.wpsPin, wpsPin, sizeof(wpsPin));
context.wpsPinLength = 8;
DRV_WIFI_SecurityWpsSet(&context);
```

5.1.13.7.1.28 DRV_WIFI_SoftApEventInfoGet Function

C

```
DRV_WIFI_MGMT_INDICATE_SOFT_AP_EVENT * DRV_WIFI_SoftApEventInfoGet();
```

Description

This function retrieves the additional event info after a Soft AP event has occurred.

Preconditions

Soft AP event must have occurred

Returns

None.

Remarks

None.

Example

```
DRV_WIFI_MGMT_INDICATE_SOFT_AP_EVENT info;;
```

```
DRV_WIFI_WPSCredentialsGet(&info);
```

5.1.13.7.1.29 DRV_WIFI_SsidGet Function

C

```
void DRV_WIFI_SsidGet(  
    uint8_t * p_ssid,  
    uint8_t * p_ssidLength  
);
```

Description

Gets the SSID and SSID Length.

Preconditions

WiFi initialization must be complete.

Parameters

Parameters	Description
p_ssid	Pointer to buffer where SSID will be written
ssidLength	number of bytes in SSID

Returns

None

Remarks

None

Example

```
uint8_t ssid[DRV_WIFI_MAX_SSID_LENGTH];  
uint8_t ssidLength;  
  
DRV_WIFI_SsidGet(ssid, &ssidLength);
```

5.1.13.7.1.30 DRV_WIFI_SsidSet Function

C

```
void DRV_WIFI_SsidSet(  
    uint8_t * p_ssid,  
    uint8_t ssidLength  
);
```

Description

Sets the SSID and SSID Length. Note that an Access Point can have either a visible or hidden SSID. If an Access Point uses a hidden SSID then an active scan must be used.

Preconditions

WiFi initialization must be complete.

Parameters

Parameters	Description
p_ssid	Pointer to SSID buffer
ssidLength	number of bytes in SSID

Returns

None

Remarks

Do not include a string terminator in the SSID length. SSID's are case- sensitive. SSID length must be less than or equal to [DRV_WIFI_MAX_SSID_LENGTH](#).

Example

```
uint8_t ssid[] = "MySSIDName";
uint8_t ssidLength = strlen(ssid);

DRV_WIFI_SsidSet(ssid, ssidLength);
```

5.1.13.7.1.31 DRV_WIFI_SWMulticastFilterSet Function**C**

```
void DRV_WIFI_SWMulticastFilterSet(
    DRV_WIFI_SWMULTICAST_CONFIG * p_config
);
```

Description

This function allows the application to configure up to two Multicast Address Filters on the MRF24W. If two active multicast filters are set up they are OR'd together – the MRF24W will receive and pass to the Host CPU received packets from either multicast address. The allowable values in p_config are:

filterId -- DRV_WIFI_MULTICAST_FILTER_1 thru DRV_WIFI_MULTICAST_FILTER_16

action -- DRV_WIFI_MULTICAST_DISABLE_ALL (default) The Multicast Filter discards all received multicast messages – they will not be forwarded to the Host PIC. The remaining fields in this structure are ignored.

DRV_WIFI_MULTICAST_ENABLE_ALL The Multicast Filter forwards all received multicast messages to the Host PIC. The remaining fields in this structure are ignored.

DRV_WIFI_MULTICAST_USE_FILTERS The MAC filter will be used and the remaining fields in this structure configure which Multicast messages are forwarded to the Host PIC.

macBytes -- Array containing the MAC address to filter on (using the destination address of each incoming 802.11 frame). Specific bytes with the MAC address can be designated as 'don't care' bytes. See macBitMask. This field is only used if action = DRV_WIFI_MULTICAST_USE_FILTERS.

macBitMask -- A byte where bits 5:0 correspond to macBytes[5:0]. If the bit is zero then the corresponding MAC byte must be an exact match for the frame to be forwarded to the Host PIC. If the bit is one then the corresponding MAC byte is a 'don't care' and not used in the Multicast filtering process. This field is only used if action = DRV_WIFI_MULTICAST_USE_FILTERS.

Preconditions

WiFi initialization must be complete. [DRV_WIFI_SWMultiCastFilterEnable\(\)](#) must have been called previously.

Returns

None.

Remarks

Cannot mix hardware and software multicast filters..

Example

```
DRV_WIFI_SWMULTICAST_CONFIG config;
uint8_t macMask[] = {01, 00, 5e, ff, ff, ff}; // (0xff are the don't care bytes)

// configure software multicast filter 1 to filter multicast addresses that
// start with 01:00:5e
config.action = DRV_WIFI_MULTICAST_USE_FILTERS;
config->filterId = DRV_WIFI_MULTICAST_FILTER_1;
```

```

memcpy(config->macBytes, macMask, 6);
config->macBitMask = 0x38;           // bits 5:3 = 1 (don't care on bytes 3,4,5)
                                     // bits 2:0 = 0 (exact match required on bytes
0,1,2)

```

5.1.13.7.1.32 DRV_WIFI_TxModeGet Function

C

```

void DRV_WIFI_TxModeGet(
    uint8_t * p_mode
);

```

Description

This function gets the MRF24WG Tx mode.

Preconditions

WiFi initialization must be complete

Returns

None.

Remarks

None.

Example

```

uint8_t mode;

DRV_WIFI_TxModeGet(&mode);

```

5.1.13.7.1.33 DRV_WIFI_TxModeSet Function

C

```

void DRV_WIFI_TxModeSet(
    uint8_t mode
);

```

Description

This function sets the MRF24WG Tx mode.

mode	Description
DRV_WIFI_TXMODE_G_RATES	Use all 802.11g rates (default)
DRV_WIFI_TXMODE_B_RATES	Use only 802.11b rates
DRV_WIFI_TXMODE_LEGACY_RATES	Use only 1 and 2 mbps rates

Preconditions

WiFi initialization must be complete

Parameters

Parameters	Description
mode	Tx mode value (see description)

Returns

None.

Remarks

None.

Example

```
DRV_WIFI_TxModeSet(DRV_WIFI_TXMODE_G_RATES);
```

5.1.13.7.1.34 DRV_WIFI_TxPowerFactoryMaxGet Function**C**

```
void DRV_WIFI_TxPowerFactoryMaxGet(  
    int8_t * p_factoryMaxTxPower  
);
```

Description

This function retrieves the factory-set max tx power from the MRF24WG.

Preconditions

WiFi initialization must be complete.

Parameters

Parameters	Description
p_factoryMaxTxPower	pointer to where factory max power is written (dbM)

Returns

None.

Remarks

None.

Example

```
int8_t maxPower;  
  
DRV_WIFI_TxPowerFactoryMaxGet(&maxPower);
```

5.1.13.7.1.35 DRV_WIFI_TxPowerMaxGet Function**C**

```
void DRV_WIFI_TxPowerMaxGet(  
    int8_t * p_maxTxPower  
);
```

Description

Gets the Tx max power setting from the MRF24WG.

Preconditions

WiFi initialization must be complete.

Parameters

Parameters	Description
p_maxTxPower	pointer to where max power setting is written (dBm).

Returns

None.

Remarks

None

Example

```
int8_t maxPower;  
  
DRV_WIFI_TxPowerMaxGet(&maxPower);
```

5.1.13.7.1.36 DRV_WIFI_TxPowerMaxSet Function**C**

```
void DRV_WIFI_TxPowerMaxSet(  
    int8_t maxTxPower  
);
```

Description

After initialization the MRF24WG0M max Tx power is determined by a factory-set value. This function can set a different maximum Tx power levels. However, this function can never set a maximum Tx power greater than the factory-set value, which can be read via [DRV_WIFI_TxPowerFactoryMaxGet\(\)](#).

Preconditions

WiFi initialization must be complete.

Parameters

Parameters	Description
maxTxPower	valid range (0 to 17 dBm)

Returns

None.

Remarks

No conversion of units needed, input to MRF24WG0M is in dBm.

Example

```
DRV_WIFI_TxPowerMaxSet(8); // set max Tx power to 8dBm
```

5.1.13.7.1.37 DRV_WIFI_WepKeyTypeGet Function**C**

```
void DRV_WIFI_WepKeyTypeGet(  
    uint8_t * p_wepKeyType  
);
```

Description

This function gets the WEP key type:

- DRV_WIFI_SECURITY_WEP_SHAREDKEY
- DRV_WIFI_SECURITY_WEP_OPENKEY

Preconditions

WiFi initialization must be complete.

Returns

None.

Remarks

None.

Example

```
uint8_t wepKeyType;

DRV_WIFI_WepKeyTypeGet (&wepKeyType);
```

5.1.13.7.1.38 DRV_WIFI_WPSCredentialsGet Function

C

```
void DRV_WIFI_WPSCredentialsGet(
    DRV_WIFI_WPS_CREDENTIAL * p_cred
);
```

Description

This function gets the WPS credentials from the MRF24WG

Preconditions

WiFi initialization must be complete.

Returns

None.

Remarks

None.

Example

```
DRV_WIFI_WPS_CREDENTIAL cred;;

DRV_WIFI_WPSCredentialsGet(&cred);
```

5.1.13.7.1.39 DRV_WIFI_AdhocContextSet Function

C

```
void DRV_WIFI_AdhocContextSet(
    DRV_WIFI_ADHOC_NETWORK_CONTEXT * p_context
);
```

Description

This function sets the AdHoc context. It is only applicable when the [DRV_WIFI_NETWORK_TYPE_ADHOC](#) has been selected in [DRV_WIFI_NetworkTypeSet\(\)](#).

Preconditions

WiFi initialization must be complete.

Parameters

Parameters	Description
p_context	pointer to AdHoc context data; see definition for the DRV_WIFI_ADHOC_NETWORK_CONTEXT structure.

Returns

None

Remarks

None

Example

```
DRV_WIFI_ADHOC_NETWORK_CONTEXT adHocContext;

adHocContext.mode           = DRV_WIFI_ADHOC_CONNECT_THEN_START;
adHocContext.hiddenSsid     = false;
adHocContext.beaconPeriod  = DRV_WIFI_DEFAULT_ADHOC_BEACON_PERIOD;

DRV_WIFI_AdhocContextSet(&adHocContext);
```

5.1.13.7.1.40 DRV_WIFI_RssiGet Function

C

```
void DRV_WIFI_RssiGet(
    uint8_t * p_rssi
);
```

Description

This function retrieves the value set in Gets RSSI value set in [DRV_WIFI_RssiSet\(\)](#). It does not retrieve the current connection RSSI value. The scan result will yield the current RSSI.

Preconditions

WiFi initialization must be complete

Parameters

Parameters	Description
p_rssi	pointer where rssi value is written

Returns

None

Remarks

None

Example

```
uint8_t rssi;

DRV_WIFI_RssiGet(&rssi);
```

5.1.13.7.1.41 DRV_WIFI_RssiSet Function

C

```
void DRV_WIFI_RssiSet(
    uint8_t rssi
);
```

Description

This setting is only used if: 1) Neither an SSID or BSSID has been configured or 2) An SSID is defined and multiple AP's are discovered with the same SSID

rssi	Description
0	Connect to first network found
1-254	Only connect to network if the RSSI is greater or equal to this value
255	Connect to the highest RSSI found (default)

Preconditions

WiFi initialization must be complete

Parameters

Parameters	Description
rss	See description

Returns

None

Remarks

Rarely needed

Example

```
DRV_WIFI_RssiSet(255);
```

5.1.13.7.1.42 DRV_WIFI_GratuitousArpStart Function**C**

```
void DRV_WIFI_GratuitousArpStart(  
    uint8_t period  
);
```

Description

This function starts a gratuitous ARP response to be periodically transmitted.

Preconditions

WiFi initialization must be complete. Connection process must be complete.

Parameters

Parameters	Description
period	period between gratuitous ARP, in seconds

Returns

None.

Remarks

None.

Example

```
DRV_WIFI_GratuitousArpStart(10); // begin sending gratuitous ARP's every  
                                // 10 seconds.
```

5.1.13.7.1.43 DRV_WIFI_GratuitousArpStop Function**C**

```
void DRV_WIFI_GratuitousArpStop();
```

Description

This function stops a gratuitous ARP.

Preconditions

WiFi initialization must be complete.

Returns

None.

Remarks

None.

Example

```
DRV_WIFI_GratuitousArpStop();
```

5.1.13.7.1.44 DRV_WIFI_HibernateEnable Function**C**

```
void DRV_WIFI_HibernateEnable();
```

Description

Enables Hibernate mode on the MRF24W, which effectively turns off the device for maximum power savings.

MRF24W state is not maintained when it transitions to hibernate mode.

Preconditions

WiFi initialization must be complete.

Returns

None.

Remarks

None

Example

```
DRV_WIFI_HibernateEnable();
```

5.1.13.7.1.45 DRV_WIFI_isHibernateEnable Function**C**

```
bool DRV_WIFI_isHibernateEnable();
```

Description

Checks if MRF24W is in hibernate mode

Preconditions

WiFi initialization must be complete.

Returns

true or false

Remarks

None

Example

```
bool flag;  
  
flag = DRV_WIFI_isHibernateEnable();
```

5.1.13.7.1.46 DRV_WIFI_PsPollDisable Function

C

```
void DRV_WIFI_PsPollDisable();
```

Description

Disables PS Poll mode. The MRF24W will stay active and not go sleep.

Preconditions

WiFi initialization must be complete.

Returns

None.

Remarks

None.

Example

```
DRV_WIFI_PsPollDisable(&context);
```

5.1.13.7.1.47 DRV_WIFI_PsPollEnable Function

C

```
void DRV_WIFI_PsPollEnable(  
    DRV_WIFI_PS_POLL_CONTEXT * p_context  
);
```

Description

Enables PS Poll mode. PS-Poll (Power-Save Poll) is a mode allowing for longer battery life. The MRF24W coordinates with the Access Point to go to sleep and wake up at periodic intervals to check for data messages, which the Access Point will buffer. The listenInterval in the Connection Algorithm defines the sleep interval. By default, PS-Poll mode is disabled.

When PS Poll is enabled, the WF Host Driver will automatically force the MRF24W to wake up each time the Host sends Tx data or a control message to the MRF24W. When the Host message transaction is complete the MRF24W driver will automatically re-enable PS Poll mode.

When the application is likely to experience a high volume of data traffic then PS-Poll mode should be disabled for two reasons:

- 1. No power savings will be realized in the presence of heavy data traffic.
- 2. Performance will be impacted adversely as the WiFi Host Driver continually activates and deactivates PS-Poll mode via SPI messages.

Preconditions

WiFi initialization must be complete.

Parameters

Parameters	Description
p_context	Pointer to ps poll context. See DRV_WIFI_PS_POLL_CONTEXT structure.

Returns

None.

Remarks

None.

Example

```
DRV_WIFI_PS_POLL_CONTEXT context;  
  
context.listenInterval = DRV_WIFI_DEFAULT_PS_LISTEN_INTERVAL;  
context.dtimInterval  = DRV_WIFI_DEFAULT_PS_DTIM_INTERVAL;  
context.useDtim       = DRV_WIFI_DEFAULT_PS_DTIM_ENABLED;  
  
DRV_WIFI_PsPollEnable(&context);
```

5.1.13.7.2 System Configuration Functions

5.1.13.7.2.1 DRV_WIFI_Connect Function

C

```
void DRV_WIFI_Connect();
```

Description

This function causes the MRF24WG to [connect](#) to a WiFi network. Upon connection, or a failure to [connect](#), an event will be generated.

Preconditions

WiFi initialization must be complete and relevant connection parameters must have been set.

Returns

None

Remarks

None

Example

```
DRV_WIFI_Connect();
```

5.1.13.7.2.2 DRV_WIFI_Deinitialize Function

C

```
bool DRV_WIFI_Deinitialize();
```

Description

This function deinitializes the MRF24WG driver. It also saves the WiFi parameters in non-volatile storage.

Preconditions

None.

Returns

If successful returns true, else false.

Remarks

None

5.1.13.7.2.3 DRV_WIFI_Disconnect Function

C

```
uint16_t DRV_WIFI_Disconnect();
```

Description

This function causes the MRF24WG to disconnect from a WiFi network. No event is generated when a connection is terminated via the function call.

Preconditions

WiFi initialization must be complete and a connection must be in progress.

Returns

DRV_WIFI_SUCCESS or DRV_WIFI_ERROR_DISCONNECT_FAILED

Remarks

None

Example

```
DRV_WIFI_Disconnect();
```

5.1.13.7.2.4 DRV_WIFI_Initialize Function

C

```
bool DRV_WIFI_Initialize(
    void* pNetIf
);
```

Description

Initialization Functions

This function initializes the MRF24WG driver, making it ready for clients to use.

Preconditions

None.

Parameters

Parameters	Description
pNetIf	Pointer to network interface

Returns

If successful returns true, else false.

Remarks

This function must be called before any other WiFi routine is called. Currently, this function performs no work, but that may change in the future. The WiFi initialization takes place in a state machine called by MRF24W_MACInit().

5.1.13.7.2.5 DRV_WIFI_Scan Function

C

```
uint16_t DRV_WIFI_Scan(
    bool scanAll
);
```

Description

Directs the MRF24W to initiate a scan operation. The Host Application will be notified that the scan results are ready when it

receives the `WF_EVENT_SCAN_RESULTS_READY` event. The `eventInfo` field for this event will contain the number of scan results. Once the scan results are ready they can be retrieved with [DRV_WIFI_ScanGetResult\(\)](#).

Scan results are retained on the MRF24W until:

1. Calling `DRV_WIFI_Scan()` again (after scan results returned from previous call).
2. MRF24W reset.

Preconditions

WiFi initialization must be complete.

Parameters

Parameters	Description

5.1.13.7.3 Miscellaneous Functions

5.1.13.7.3.1 DRV_WIFI_ConfigDataErase Function

C

```
bool DRV_WIFI_ConfigDataErase();
```

Description

This function erases configuration data from the board EEPROM.

Preconditions

TCPIP stack should be initialized.

Returns

None

Remarks

None.

5.1.13.7.3.2 DRV_WIFI_ConfigDataLoad Function

C

```
bool DRV_WIFI_ConfigDataLoad();
```

Description

This function loads configuration data from the board EEPROM. If not present or corrupted then default values will be used.

Preconditions

TCPIP stack should be initialized.

Returns

None

Remarks

None.

5.1.13.7.3.3 DRV_WIFI_ConfigDataPrint Function

C

```
void DRV_WIFI_ConfigDataPrint();
```

Description

This function outputs configuration data from the board EEPROM.

Preconditions

TCPIP stack should be initialized.

Returns

None

Remarks

None.

5.1.13.7.3.4 DRV_WIFI_ConfigDataSave Function

C

```
bool DRV_WIFI_ConfigDataSave();
```

Description

This function saves configuration data to the board EEPROM.

Preconditions

TCPIP stack should be initialized.

Returns

None

Remarks

None.

5.1.13.7.3.5 DRV_WIFI_ProcessEvent Function

C

```
void DRV_WIFI_ProcessEvent(  
    uint16_t event,  
    uint16_t eventInfo  
);
```

Description

This function is called to process a WiFi event,

Preconditions

TCPIP stack should be initialized.

Parameters

Parameters	Description
event	event code
eventInfo	additional information about the event. Not all events have associated info, in which case this value will be set to DRV_WIFI_NO_ADDITIONAL_INFO (0xff)

Returns

None

Remarks

None.

5.1.13.7.3.6 DRV_WIFI_ScanGetResult Function

C

```
void DRV_WIFI_ScanGetResult(
    uint8_t listIndex,
    DRV_WIFI_SCAN_RESULT * p_scanResult
);
```

Description

After a scan has completed this function is used to read one scan result at a time from the MRF24WG.

Preconditions

WiFi initialization must be complete. WF_EVENT_SCAN_RESULTS_READY event must have already occurred.

Parameters

Parameters	Description
listIndex	Index (0-based list) of the scan entry to retrieve.
p_scanResult	Pointer to where scan result is written. See DRV_WIFI_SCAN_RESULT structure.

Returns

None.

Remarks

None.

Example

```
DRV_WIFI_SCAN_RESULT scanResult;

DRV_WIFI_ScanGetResult(0, &scanResult); // get first scan result in list
```

5.1.13.7.3.7 DRV_WIFI_SetLinkDownThreshold Function

C

```
void DRV_WIFI_SetLinkDownThreshold(
    uint8_t threshold
);
```

Description

This function allows the application to set the number of MRF24W consecutive Tx failures before the connection failure event (DRV_WIFI_LINK_LOST) is reported to the host application.

Preconditions

WiFi initialization must be complete

Parameters

Parameters	Description
threshold -- 0	disabled (default)
1-255	number of consecutive Tx failures before connection failure event is reported

Returns

None.

Remarks

None.

Example

```
DRV_WIFI_SetLinkDownThreshold(0); // disable link down threshold
```

5.1.13.7.3.8 DRV_WIFI_SetPSK Function**C**

```
void DRV_WIFI_SetPSK(  
    uint8_t * p_psk  
);
```

Description

This function is used in conjunction with [DRV_WIFI_YieldPassphraseToHost\(\)](#). It sends the binary key to the MRF24WG after the host has converted an ASCII passphrase to a binary key.

Preconditions

WiFi initialization must be complete.

Parameters

Parameters	Description
p_psk	pointer to the binary key

Returns

None.

Remarks

None.

Example

```
DRV_WIFI_YieldPassphraseToHost(&info);
```

5.1.13.7.3.9 DRV_WIFI_SWMultiCastFilterEnable Function**C**

```
void DRV_WIFI_SWMultiCastFilterEnable();
```

Description

This function allows the application to configure up to max 16 software multicast address Filters on the MRF24WG0MA/B.

Preconditions

WiFi initialization must be complete.

Returns

None.

Remarks

Cannot mix hardware and software multicast filters..

Example

```
DRV_WIFI_SWMultiCastFilterEnable();
```

5.1.13.7.3.10 DRV_WIFI_YieldPassphraseToHost Function

C

```
void DRV_WIFI_YieldPassphraseToHost();
```

Description

During WPS the MRF24WG will receive a passphrase. That passphrase must be converted to a binary key. The MRF24WG can do this, but it will take 20-30 seconds. The host MCU will be able to convert the passphrase to a binary key much faster. If that is desired, then this function should be called to request the MRF24WG to signal the DRV_WIFI_EVENT_KEY_CALCULATION_REQUEST event when the passphrase is ready. Then the host can retrieve the passphrase (see [DRV_WIFI_WPSCredentialsGet\(\)](#)), convert to a binary key (see [DRV_WIFI_ConvPassphraseToKey\(\)](#)), and [send](#) it back to the MRF24WG via the [DRV_WIFI_SetPSK\(\)](#) function.

Preconditions

WiFi initialization must be complete.

Returns

None.

Remarks

None.

Example

```
DRV_WIFI_YieldPassphraseToHost(&info);
```

5.1.13.7.4 Data Types and Constants

5.1.13.7.4.1 DRV_WIFI_BSSID_LENGTH Macro

C

```
#define DRV_WIFI_BSSID_LENGTH (6)
```

Description

This is macro DRV_WIFI_BSSID_LENGTH.

5.1.13.7.4.2 DRV_WIFI_DEAUTH_REASONCODE_MASK Macro

C

```
#define DRV_WIFI_DEAUTH_REASONCODE_MASK ((uint8_t)0x80)
```

Description

This is macro DRV_WIFI_DEAUTH_REASONCODE_MASK.

5.1.13.7.4.3 DRV_WIFI_DEFAULT_ADHOC_BEACON_PERIOD Macro

C

```
#define DRV_WIFI_DEFAULT_ADHOC_BEACON_PERIOD (100) // ms
```

Description

ms

5.1.13.7.4.4 DRV_WIFI_DEFAULT_ADHOC_HIDDEN_SSID Macro

C

```
#define DRV_WIFI_DEFAULT_ADHOC_HIDDEN_SSID false
```

Description

WiFi AdHoc default settings

These defines identify various default WiFi AdHoc settings that can be used in the [DRV_WIFI_ADHOC_NETWORK_CONTEXT](#) structure.

5.1.13.7.4.5 DRV_WIFI_DEFAULT_ADHOC_MODE Macro

C

```
#define DRV_WIFI_DEFAULT_ADHOC_MODE DRV_WIFI_ADHOC_CONNECT_THEN_START
```

Description

This is macro DRV_WIFI_DEFAULT_ADHOC_MODE.

5.1.13.7.4.6 DRV_WIFI_DEFAULT_PS_DTIM_ENABLED Macro

C

```
#define DRV_WIFI_DEFAULT_PS_DTIM_ENABLED true           // DTIM wake-up enabled (normally  
the case)
```

Description

DTIM wake-up enabled (normally the case)

5.1.13.7.4.7 DRV_WIFI_DEFAULT_PS_DTIM_INTERVAL Macro

C

```
#define DRV_WIFI_DEFAULT_PS_DTIM_INTERVAL ((uint16_t)2) // number of beacon periods
```

Description

number of beacon periods

5.1.13.7.4.8 DRV_WIFI_DEFAULT_PS_LISTEN_INTERVAL Macro

C

```
#define DRV_WIFI_DEFAULT_PS_LISTEN_INTERVAL ((uint16_t)1) // 100ms multiplier, e.g. 1 *  
100ms = 100ms
```

Description

100ms multiplier, e.g. 1 * 100ms = 100ms

5.1.13.7.4.9 DRV_WIFI_DEFAULT_SCAN_COUNT Macro

C

```
#define DRV_WIFI_DEFAULT_SCAN_COUNT (1)
```

Description

WiFi Scan Context default settings

This enumeration identifies the default WiFi scan context values that can be used in the [DRV_WIFI_SCAN_CONTEXT](#) structure.

5.1.13.7.4.10 DRV_WIFI_DEFAULT_SCAN_MAX_CHANNEL_TIME Macro

C

```
#define DRV_WIFI_DEFAULT_SCAN_MAX_CHANNEL_TIME (400) // ms
```

Description

ms

5.1.13.7.4.11 DRV_WIFI_DEFAULT_SCAN_MIN_CHANNEL_TIME Macro

C

```
#define DRV_WIFI_DEFAULT_SCAN_MIN_CHANNEL_TIME (200) // ms
```

Description

ms

5.1.13.7.4.12 DRV_WIFI_DEFAULT_SCAN_PROBE_DELAY Macro

C

```
#define DRV_WIFI_DEFAULT_SCAN_PROBE_DELAY (20) // us
```

Description

us

5.1.13.7.4.13 DRV_WIFI_DEFAULT_WEP_KEY_TYPE Macro

C

```
#define DRV_WIFI_DEFAULT_WEP_KEY_TYPE DRV_WIFI_SECURITY_WEP_OPENKEY
```

Description

see [DRV_WIFI_SecurityWepSet\(\)](#) and [DRV_WIFI_WEP_CONTEXT](#)

5.1.13.7.4.14 DRV_WIFI_DISABLED Macro

C

```
#define DRV_WIFI_DISABLED (0)
```

Description

Do not make this an enumerated type!

5.1.13.7.4.15 DRV_WIFI_DISASSOC_REASONCODE_MASK Macro

C

```
#define DRV_WIFI_DISASSOC_REASONCODE_MASK ((uint8_t)0x40)
```

Description

This is macro DRV_WIFI_DISASSOC_REASONCODE_MASK.

5.1.13.7.4.16 DRV_WIFI_ENABLED Macro

C

```
#define DRV_WIFI_ENABLED (1)
```

Description

This is macro DRV_WIFI_ENABLED.

5.1.13.7.4.17 DRV_WIFI_MAX_CHANNEL_LIST_LENGTH Macro

C

```
#define DRV_WIFI_MAX_CHANNEL_LIST_LENGTH (14)
```

Description

This is macro DRV_WIFI_MAX_CHANNEL_LIST_LENGTH.

5.1.13.7.4.18 DRV_WIFI_MAX_NUM_RATES Macro

C

```
#define DRV_WIFI_MAX_NUM_RATES (8)
```

Description

This is macro DRV_WIFI_MAX_NUM_RATES.

5.1.13.7.4.19 DRV_WIFI_MAX_SECURITY_KEY_LENGTH Macro

C

```
#define DRV_WIFI_MAX_SECURITY_KEY_LENGTH (64)
```

Description

This is macro DRV_WIFI_MAX_SECURITY_KEY_LENGTH.

5.1.13.7.4.20 DRV_WIFI_MAX_SSID_LENGTH Macro

C

```
#define DRV_WIFI_MAX_SSID_LENGTH (32)
```

Description

This is macro DRV_WIFI_MAX_SSID_LENGTH.

5.1.13.7.4.21 DRV_WIFI_MAX_WEP_KEY_LENGTH Macro

C

```
#define DRV_WIFI_MAX_WEP_KEY_LENGTH (DRV_WIFI_WEP104_KEY_LENGTH)
```

Description

This is macro DRV_WIFI_MAX_WEP_KEY_LENGTH.

5.1.13.7.4.22 DRV_WIFI_MAX_WPA_PASS_PHRASE_LENGTH Macro

C

```
#define DRV_WIFI_MAX_WPA_PASS_PHRASE_LENGTH (64) // must include string terminator
```

Description

must include string terminator

5.1.13.7.4.23 DRV_WIFI_MAX_WPA2_PASS_PHRASE_LENGTH Macro**C**

```
#define DRV_WIFI_MAX_WPA2_PASS_PHRASE_LENGTH (64)
```

Description

This is macro DRV_WIFI_MAX_WPA2_PASS_PHRASE_LENGTH.

5.1.13.7.4.24 DRV_WIFI_MIN_WPA_PASS_PHRASE_LENGTH Macro**C**

```
#define DRV_WIFI_MIN_WPA_PASS_PHRASE_LENGTH (8)
```

Description

Key size defines

5.1.13.7.4.25 DRV_WIFI_NETWORK_TYPE_ADHOC Macro**C**

```
#define DRV_WIFI_NETWORK_TYPE_ADHOC (2)
```

Description

This is macro DRV_WIFI_NETWORK_TYPE_ADHOC.

5.1.13.7.4.26 DRV_WIFI_NETWORK_TYPE_INFRASTRUCTURE Macro**C**

```
#define DRV_WIFI_NETWORK_TYPE_INFRASTRUCTURE (1)
```

Description

WiFi Network Types

This enumeration identifies the WiFi network types that can be selected. Do NOT make these an enumerated type as they are used as a compile switch.

5.1.13.7.4.27 DRV_WIFI_NETWORK_TYPE_P2P Macro**C**

```
#define DRV_WIFI_NETWORK_TYPE_P2P (3)    /* not supported */
```

Description

not supported

5.1.13.7.4.28 DRV_WIFI_NETWORK_TYPE_SOFT_AP Macro**C**

```
#define DRV_WIFI_NETWORK_TYPE_SOFT_AP (4)
```

Description

This is macro DRV_WIFI_NETWORK_TYPE_SOFT_AP.

5.1.13.7.4.29 DRV_WIFI_NO_ADDITIONAL_INFO Macro

C

```
#define DRV_WIFI_NO_ADDITIONAL_INFO ((uint16_t)0xffff)
```

Description

eventInfo define for [DRV_WIFI_ProcessEvent\(\)](#) when no additional info is supplied

5.1.13.7.4.30 DRV_WIFI_RETRY_ADHOC Macro

C

```
#define DRV_WIFI_RETRY_ADHOC (3)
```

Description

This is macro DRV_WIFI_RETRY_ADHOC.

5.1.13.7.4.31 DRV_WIFI_RETRY_FOREVER Macro

C

```
#define DRV_WIFI_RETRY_FOREVER (255)
```

Description

This is macro DRV_WIFI_RETRY_FOREVER.

5.1.13.7.4.32 DRV_WIFI_RTS_THRESHOLD_MAX Macro

C

```
#define DRV_WIFI_RTS_THRESHOLD_MAX (2347) /* maximum RTS threshold size in bytes */
```

Description

maximum RTS threshold size in bytes

5.1.13.7.4.33 DRV_WIFI_SECURITY_EAP Macro

C

```
#define DRV_WIFI_SECURITY_EAP (11)
```

Description

This is macro DRV_WIFI_SECURITY_EAP.

5.1.13.7.4.34 DRV_WIFI_SECURITY_OPEN Macro

C

```
#define DRV_WIFI_SECURITY_OPEN (0)
```

Description

WiFi Security Types

This enumeration identifies the WiFi security types that can be selected. Do NOT make these an enumerated type as they are

used as a compile switch.

5.1.13.7.4.35 DRV_WIFI_SECURITY_WEP_104 Macro

C

```
#define DRV_WIFI_SECURITY_WEP_104 (2)
```

Description

This is macro DRV_WIFI_SECURITY_WEP_104.

5.1.13.7.4.36 DRV_WIFI_SECURITY_WEP_40 Macro

C

```
#define DRV_WIFI_SECURITY_WEP_40 (1)
```

Description

This is macro DRV_WIFI_SECURITY_WEP_40.

5.1.13.7.4.37 DRV_WIFI_SECURITY_WPA_AUTO_WITH_KEY Macro

C

```
#define DRV_WIFI_SECURITY_WPA_AUTO_WITH_KEY (7)
```

Description

This is macro DRV_WIFI_SECURITY_WPA_AUTO_WITH_KEY.

5.1.13.7.4.38 DRV_WIFI_SECURITY_WPA_AUTO_WITH_PASS_PHRASE Macro

C

```
#define DRV_WIFI_SECURITY_WPA_AUTO_WITH_PASS_PHRASE (8)
```

Description

This is macro DRV_WIFI_SECURITY_WPA_AUTO_WITH_PASS_PHRASE.

5.1.13.7.4.39 DRV_WIFI_SECURITY_WPA_WITH_KEY Macro

C

```
#define DRV_WIFI_SECURITY_WPA_WITH_KEY (3)
```

Description

This is macro DRV_WIFI_SECURITY_WPA_WITH_KEY.

5.1.13.7.4.40 DRV_WIFI_SECURITY_WPA_WITH_PASS_PHRASE Macro

C

```
#define DRV_WIFI_SECURITY_WPA_WITH_PASS_PHRASE (4)
```

Description

This is macro DRV_WIFI_SECURITY_WPA_WITH_PASS_PHRASE.

5.1.13.7.4.41 DRV_WIFI_SECURITY_WPA2_WITH_KEY Macro

C

```
#define DRV_WIFI_SECURITY_WPA2_WITH_KEY (5)
```

Description

This is macro DRV_WIFI_SECURITY_WPA2_WITH_KEY.

5.1.13.7.4.42 DRV_WIFI_SECURITY_WPA2_WITH_PASS_PHRASE Macro

C

```
#define DRV_WIFI_SECURITY_WPA2_WITH_PASS_PHRASE (6)
```

Description

This is macro DRV_WIFI_SECURITY_WPA2_WITH_PASS_PHRASE.

5.1.13.7.4.43 DRV_WIFI_SECURITY_WPS_PIN Macro

C

```
#define DRV_WIFI_SECURITY_WPS_PIN (10)
```

Description

This is macro DRV_WIFI_SECURITY_WPS_PIN.

5.1.13.7.4.44 DRV_WIFI_SECURITY_WPS_PUSH_BUTTON Macro

C

```
#define DRV_WIFI_SECURITY_WPS_PUSH_BUTTON (9)
```

Description

This is macro DRV_WIFI_SECURITY_WPS_PUSH_BUTTON.

5.1.13.7.4.45 DRV_WIFI_VERSION_NUMBER Macro

C

```
#define DRV_WIFI_VERSION_NUMBER "3.0.0"
```

Description

WiFi Driver Version Number

5.1.13.7.4.46 DRV_WIFI_WEP104_KEY_LENGTH Macro

C

```
#define DRV_WIFI_WEP104_KEY_LENGTH (52)           // 4 keys of 13 bytes each
```

Description

4 keys of 13 bytes each

5.1.13.7.4.47 DRV_WIFI_WEP40_KEY_LENGTH Macro

C

```
#define DRV_WIFI_WEP40_KEY_LENGTH (20)           // 4 keys of 5 bytes each
```

Description

4 keys of 5 bytes each

5.1.13.7.4.48 DRV_WIFI_WPA_KEY_LENGTH Macro

C

```
#define DRV_WIFI_WPA_KEY_LENGTH (32)
```

Description

This is macro DRV_WIFI_WPA_KEY_LENGTH.

5.1.13.7.4.49 DRV_WIFI_WPA2_KEY_LENGTH Macro

C

```
#define DRV_WIFI_WPA2_KEY_LENGTH (32)
```

Description

This is macro DRV_WIFI_WPA2_KEY_LENGTH.

5.1.13.7.4.50 DRV_WIFI_WPS_PIN_LENGTH Macro

C

```
#define DRV_WIFI_WPS_PIN_LENGTH (8)           // 7 digits + checksum byte
```

Description

7 digits + checksum byte

5.1.13.7.4.51 DRV_WIFI_ADHOC_MODES Enumeration

C

```
typedef enum adhocMode {
    DRV_WIFI_ADHOC_CONNECT_THEN_START = 0,
    DRV_WIFI_ADHOC_CONNECT_ONLY = 1,
    DRV_WIFI_ADHOC_START_ONLY = 2
} DRV_WIFI_ADHOC_MODES;
```

Description

AdHoc Modes

This enumeration identifies the AdHoc modes that can be selected when connecting in AdHoc mode.

Members

Members	Description
DRV_WIFI_ADHOC_CONNECT_THEN_START = 0	try to connect existing AdHoc network, if not found then start network
DRV_WIFI_ADHOC_CONNECT_ONLY = 1	only connect to existing AdHoc network
DRV_WIFI_ADHOC_START_ONLY = 2	only start a new AdHoc network

5.1.13.7.4.52 DRV_WIFI_ADHOC_NETWORK_CONTEXT Structure

C

```
typedef struct {
    uint8_t mode;
```

```

    bool hiddenSsid;
    uint16_t beaconPeriod;
} DRV_WIFI_ADHOC_NETWORK_CONTEXT;

```

Description

WiFi AdHoc Context

This structure contains MRF24WG AdHoc context data. See [DRV_WIFI_AdhocContextSet\(\)](#).

Members

Members	Description
uint8_t mode;	Defines how to start the AdHoc network. See DRV_WIFI_ADHOC_MODE. Default is DRV_WIFI_ADHOC_CONNECT_THEN_START.
bool hiddenSsid;	When starting an AdHoc network, the SSID can be hidden in the beacons. Set true to hide the SSID, else false. Default is false.
uint16_t beaconPeriod;	Sets the beacon period, in ms. Default is 100ms

5.1.13.7.4.53 DRV_WIFI_CONNECTION_CONTEXT Structure

C

```

typedef struct {
    uint8_t channel;
    uint8_t bssid[6];
} DRV_WIFI_CONNECTION_CONTEXT;

```

Description

WiFi Connection Context

This structure contains MRF24WG connection context data. See [DRV_WIFI_ConnectContextGet\(\)](#).

Members

Members	Description
uint8_t channel;	channel number of current connection
uint8_t bssid[6];	bssid of connected AP

5.1.13.7.4.54 DRV_WIFI_CONNECTION_STATES Enumeration

C

```

typedef enum {
    DRV_WIFI_CSTATE_NOT_CONNECTED = 1,
    DRV_WIFI_CSTATE_CONNECTION_IN_PROGRESS = 2,
    DRV_WIFI_CSTATE_CONNECTED_INFRASTRUCTURE = 3,
    DRV_WIFI_CSTATE_CONNECTED_ADHOC = 4,
    DRV_WIFI_CSTATE_RECONNECTION_IN_PROGRESS = 5,
    DRV_WIFI_CSTATE_CONNECTION_PERMANENTLY_LOST = 6
} DRV_WIFI_CONNECTION_STATES;

```

Description

WiFi Connection States

This enumeration identifies WiFi Connection states states. See [DRV_WIFI_ConnectionStateGet\(\)](#).

Members

Members	Description
DRV_WIFI_CSTATE_NOT_CONNECTED = 1	No WiFi connection exists

DRV_WIFI_CSTATE_CONNECTION_IN_PROGRESS = 2	WiFi connection in progress
DRV_WIFI_CSTATE_CONNECTED_INFRASTRUCTURE = 3	WiFi connected in infrastructure mode
DRV_WIFI_CSTATE_CONNECTED_ADHOC = 4	WiFi connected in adhoc mode
DRV_WIFI_CSTATE_RECONNECTION_IN_PROGRESS = 5	WiFi in process of reconnecting
DRV_WIFI_CSTATE_CONNECTION_PERMANENTLY_LOST = 6	WiFi connection permanently lost

5.1.13.7.4.55 DRV_WIFI_DEVICE_INFO Structure

C

```
typedef struct {
    uint8_t deviceType;
    uint8_t romVersion;
    uint8_t patchVersion;
} DRV_WIFI_DEVICE_INFO;
```

Description

WiFi Device Type/Version

This structure contains MRF24WG device type and version number. See [DRV_WIFI_DeviceInfoGet\(\)](#).

Members

Members	Description
uint8_t deviceType;	MRF24W_DEVICE_TYPE
uint8_t romVersion;	MRF24WG ROM version number
uint8_t patchVersion;	MRF24WG patch version number

5.1.13.7.4.56 DRV_WIFI_DEVICE_TYPES Enumeration

C

```
typedef enum {
    DRV_WIFI_MRF24WB0M_DEVICE = 1,
    DRV_WIFI_MRF24WG0M_DEVICE = 2
} DRV_WIFI_DEVICE_TYPES;
```

Description

WiFi devices types

This enumeration identifies WiFi device types. The only device supported with this driver is DRV_WIFI_MRF24WG0M_DEVICE

5.1.13.7.4.57 DRV_WIFI_DOMAIN_CODES Enumeration

C

```
typedef enum {
    DRV_WIFI_DOMAIN_FCC = 0,
    DRV_WIFI_DOMAIN_ETSI = 2,
    DRV_WIFI_DOMAIN_JAPAN = 7,
    DRV_WIFI_DOMAIN_OTHER = 7
} DRV_WIFI_DOMAIN_CODES;
```

Description

WiFi regional domain codes

This enumeration identifies WiFi regional domain codes. The regional domain can be determined by calling [DRV_WIFI_RegionalDomainGet\(\)](#).

Members

Members	Description
DRV_WIFI_DOMAIN_FCC = 0	FCC, available channels: 1 - 11
DRV_WIFI_DOMAIN_ETSI = 2	ETSI, available Channels: 1 - 13
DRV_WIFI_DOMAIN_JAPAN = 7	Japan, available Channels: 1 - 14
DRV_WIFI_DOMAIN_OTHER = 7	Other, available Channels: 1 - 14

5.1.13.7.4.58 DRV_WIFI_EVENT_CONN_TEMP_LOST_CODES Enumeration

C

```
typedef enum {
    DRV_WIFI_BEACON_TIMEOUT = 1,
    DRV_WIFI_DEAUTH_RECEIVED = 2,
    DRV_WIFI_DISASSOCIATE_RECEIVED = 3
} DRV_WIFI_EVENT_CONN_TEMP_LOST_CODES;
```

Description

'Connection Temporarily Lost' event codes

This enumeration identifies the codes for a connection temporarily lost. These codes are used in [DRV_WIFI_ProcessEvent\(\)](#), case DRV_WIFI_EVENT_CONNECTION_TEMPORARILY_LOST.

Members

Members	Description
DRV_WIFI_BEACON_TIMEOUT = 1	connection temporarily lost due to beacon timeout
DRV_WIFI_DEAUTH_RECEIVED = 2	connection temporarily lost due to deauth received from AP
DRV_WIFI_DISASSOCIATE_RECEIVED = 3	connection temporarily lost due to disassociation received from AP

5.1.13.7.4.59 DRV_WIFI_EVENT_INFO Enumeration

C

```
typedef enum {
    DRV_WIFI_JOIN_FAILURE = 2,
    DRV_WIFI_AUTHENTICATION_FAILURE = 3,
    DRV_WIFI_ASSOCIATION_FAILURE = 4,
    DRV_WIFI_WEP_HANDSHAKE_FAILURE = 5,
    DRV_WIFI_PSK_CALCULATION_FAILURE = 6,
    DRV_WIFI_PSK_HANDSHAKE_FAILURE = 7,
    DRV_WIFI_ADHOC_JOIN_FAILURE = 8,
    DRV_WIFI_SECURITY_MISMATCH_FAILURE = 9,
    DRV_WIFI_NO_SUITABLE_AP_FOUND_FAILURE = 10,
    DRV_WIFI_RETRY_FOREVER_NOT_SUPPORTED_FAILURE = 11,
    DRV_WIFI_LINK_LOST = 12,
    DRV_WIFI_TKIP_MIC_FAILURE = 13,
    DRV_WIFI_RSN_MIXED_MODE_NOT_SUPPORTED = 14,
    DRV_WIFI_RECV_DEAUTH = 15,
    DRV_WIFI_RECV_DISASSOC = 16,
    DRV_WIFI_WPS_FAILURE = 17,
    DRV_WIFI_P2P_FAILURE = 18
} DRV_WIFI_EVENT_INFO;
```

Description

EventInfo types

This enumeration identifies the eventInfo types used in [DRV_WIFI_ProcessEvent\(\)](#), case DRV_WIFI_EVENT_CONNECTION_FAILED.

Members

Members	Description
DRV_WIFI_P2P_FAILURE = 18	not supported

5.1.13.7.4.60 DRV_WIFI_EVENTS Enumeration

C

```
typedef enum {
    DRV_WIFI_EVENT_NONE = 0,
    DRV_WIFI_EVENT_CONNECTION_SUCCESSFUL = 1,
    DRV_WIFI_EVENT_CONNECTION_FAILED = 2,
    DRV_WIFI_EVENT_CONNECTION_TEMPORARILY_LOST = 3,
    DRV_WIFI_EVENT_CONNECTION_PERMANENTLY_LOST = 4,
    DRV_WIFI_EVENT_CONNECTION_REESTABLISHED = 5,
    DRV_WIFI_EVENT_FLASH_UPDATE_SUCCESSFUL = 6,
    DRV_WIFI_EVENT_FLASH_UPDATE_FAILED = 7,
    DRV_WIFI_EVENT_KEY_CALCULATION_REQUEST = 8,
    DRV_WIFI_EVENT_SCAN_RESULTS_READY = 9,
    DRV_WIFI_EVENT_IE_RESULTS_READY = 10,
    DRV_WIFI_EVENT_INVALID_WPS_PIN = 12,
    DRV_WIFI_EVENT_SOFT_AP = 13,
    DRV_WIFI_EVENT_DISCONNECT_DONE = 14,
    DRV_WIFI_EVENT_ERROR = 15
} DRV_WIFI_EVENTS;
```

Description

WiFi Events

This enumeration identifies the WiFi events that can occur and will be sent to [DRV_WIFI_ProcessEvent\(\)](#).

Members

Members	Description
DRV_WIFI_EVENT_NONE = 0	No event has occurred
DRV_WIFI_EVENT_CONNECTION_SUCCESSFUL = 1	Connection attempt to network successful
DRV_WIFI_EVENT_CONNECTION_FAILED = 2	Connection attempt failed
DRV_WIFI_EVENT_CONNECTION_TEMPORARILY_LOST = 3	Connection lost; MRF24W attempting to reconnect
DRV_WIFI_EVENT_CONNECTION_PERMANENTLY_LOST = 4	Connection lost; MRF24W no longer trying to connect
DRV_WIFI_EVENT_CONNECTION_REESTABLISHED = 5	Connection has been reestablished
DRV_WIFI_EVENT_FLASH_UPDATE_SUCCESSFUL = 6	Update to FLASH successful
DRV_WIFI_EVENT_FLASH_UPDATE_FAILED = 7	Update to FLASH failed
DRV_WIFI_EVENT_KEY_CALCULATION_REQUEST = 8	Key calculation is required
DRV_WIFI_EVENT_SCAN_RESULTS_READY = 9	scan results are ready
DRV_WIFI_EVENT_IE_RESULTS_READY = 10	IE data ready
DRV_WIFI_EVENT_INVALID_WPS_PIN = 12	Invalid WPS pin was entered
DRV_WIFI_EVENT_SOFT_AP = 13	Client connection events
DRV_WIFI_EVENT_DISCONNECT_DONE = 14	Disconnect done event
DRV_WIFI_EVENT_ERROR = 15	WiFi error event occurred

5.1.13.7.4.61 DRV_WIFI_GENERAL_ERRORS Enumeration

C

```
typedef enum {
    DRV_WIFI_ERROR_IN_HIBERNATE_MODE = 100
} DRV_WIFI_GENERAL_ERRORS;
```

Description

This is type DRV_WIFI_GENERAL_ERRORS.

Members

Members	Description
DRV_WIFI_ERROR_IN_HIBERNATE_MODE = 100	invalid operation while MRF24WG is in hibernate mode

5.1.13.7.4.62 DRV_WIFI_HIBERNATE_STATE Structure

C

```
typedef struct {
    uint8_t state;
    uint8_t wakeup_notice;
} DRV_WIFI_HIBERNATE_STATE;
```

Description

This is type DRV_WIFI_HIBERNATE_STATE.

5.1.13.7.4.63 DRV_WIFI_HIBERNATE_STATES Enumeration

C

```
typedef enum {
    DRV_WIFI_HB_NO_SLEEP = 0,
    DRV_WIFI_HB_ENTER_SLEEP = 1,
    DRV_WIFI_HB_WAIT_WAKEUP = 2
} DRV_WIFI_HIBERNATE_STATES;
```

Description

WiFi Hibernate states

This enumeration identifies WiFi hibernate states.

5.1.13.7.4.64 DRV_WIFI_MAC_STATS Structure

C

```
typedef struct {
    uint32_t MibWEPExcludeCtr;
    uint32_t MibTxBytesCtr;
    uint32_t MibTxMulticastCtr;
    uint32_t MibTxFailedCtr;
    uint32_t MibTxRtryCtr;
    uint32_t MibTxMultRtryCtr;
    uint32_t MibTxSuccessCtr;
    uint32_t MibRxDupCtr;
    uint32_t MibRxCtsSuccCtr;
    uint32_t MibRxCtsFailCtr;
    uint32_t MibRxAckFailCtr;
    uint32_t MibRxBytesCtr;
    uint32_t MibRxFragCtr;
```

```

uint32_t MibRxMultCtr;
uint32_t MibRxFCSErrCtr;
uint32_t MibRxWEPUndecryptCtr;
uint32_t MibRxFragAgedCtr;
uint32_t MibRxMICFailureCtr;
} DRV_WIFI_MAC_STATS;

```

Description

WiFi MIB states

This structure contains all the MIB data returned from the MRF24WG when [DRV_WIFI_MacStatsGet\(\)](#) is called.

Members

Members	Description
uint32_t MibWEPExcludeCtr;	Number of frames received with the Protected Frame subfield of the Frame Control field set to zero and the value of dot11ExcludeUnencrypted causes that frame to be discarded.
uint32_t MibTxBytesCtr;	Total number of Tx bytes that have been transmitted
uint32_t MibTxMulticastCtr;	Number of frames successfully transmitted that had the multicast bit set in the destination MAC address
uint32_t MibTxFailedCtr;	Number of Tx frames that failed due to the number of transmits exceeding the retry count
uint32_t MibTxRtryCtr;	Number of times a transmitted frame needed to be retried
uint32_t MibTxMultRtryCtr;	Number of times a frame was successfully transmitted after more than one retransmission.
uint32_t MibTxSuccessCtr;	Number of Tx frames successfully transmitted.
uint32_t MibRxDupCtr;	Number of frames received where the Sequence Control field indicates a duplicate.
uint32_t MibRxCTSuccCtr;	Number of CTS frames received in response to an RTS frame.
uint32_t MibRxCTSFailCtr;	Number of times an RTS frame was not received in response to a CTS frame.
uint32_t MibRxAckFailCtr;	Number of times an Ack was not received in response to a Tx frame.
uint32_t MibRxBytesCtr;	Total number of Rx bytes received.
uint32_t MibRxFragCtr;	Number of successful received frames (management or data)
uint32_t MibRxMultCtr;	Number of frames received with the multicast bit set in the destination MAC address.
uint32_t MibRxFCSErrCtr;	Number of frames received with an invalid Frame Checksum (FCS).
uint32_t MibRxWEPUndecryptCtr;	Number of frames received where the Protected Frame subfield of the Frame Control Field is set to one and the WEPOn value for the key mapped to the transmitter's MAC address indicates the frame should not have been encrypted.
uint32_t MibRxFragAgedCtr;	Number of times that fragments aged out, or were not received in the allowable time.
uint32_t MibRxMICFailureCtr;	Number of MIC failures that have occurred.

5.1.13.7.4.65 DRV_WIFI_MGMT_ERRORS Enumeration

C

```

typedef enum {
    DRV_WIFI_SUCCESS = 1,
    DRV_WIFI_ERROR_INVALID_SUBTYPE = 2,

DRV_WIFI_ERROR_HOST_SCAN_NOT_ALLOWED = 42,
DRV_WIFI_ERROR_INVALID_WPS_PIN = 44
} DRV_WIFI_MGMT_ERRORS;

```

Description

Mgmt Msg Error Codes

This enumeration identifies the errors that can occur when a DRV_WIFI API function call results in a mgmt message being sent, via SPI, to the MRF24W.

Members

Members	Description
DRV_WIFI_ERROR_DISCONNECT_FAILED = 38	Disconnect failed. Disconnect is allowed only when module is in connected state
DRV_WIFI_ERROR_NO_STORED_BSS_DESCRIPTOR = 39	No stored scan results
DRV_WIFI_ERROR_HOST_SCAN_NOT_ALLOWED = 42	Host Scan Failed. Host scan is allowed only in idle or connected state
DRV_WIFI_ERROR_INVALID_WPS_PIN = 44	WPS pin was invalid

5.1.13.7.4.66 DRV_WIFI_MGMT_INDICATE_SOFT_AP_EVENT Structure

C

```

typedef struct {
    uint8_t reason;
    uint8_t address[6];
} DRV_WIFI_MGMT_INDICATE_SOFT_AP_EVENT;

```

Description

WiFi Soft AP Event Information

This structure contains data pertaining to Soft AP event. See [DRV_WIFI_SoftApEventInfoGet\(\)](#).

Members

Members	Description
uint8_t reason;	reason code
uint8_t address[6];	MAC address

5.1.13.7.4.67 DRV_WIFI_MULTICAST_FILTER_IDS Enumeration

C

```
typedef enum {
    DRV_WIFI_MULTICAST_FILTER_1 = 4,
    DRV_WIFI_MULTICAST_FILTER_2 = 5,
    DRV_WIFI_MULTICAST_FILTER_3 = 6,
    DRV_WIFI_MULTICAST_FILTER_4 = 7,
    DRV_WIFI_MULTICAST_FILTER_5 = 8,
    DRV_WIFI_MULTICAST_FILTER_6 = 9,
    DRV_WIFI_MULTICAST_FILTER_7 = 10,
    DRV_WIFI_MULTICAST_FILTER_8 = 11,
    DRV_WIFI_MULTICAST_FILTER_9 = 12,
    DRV_WIFI_MULTICAST_FILTER_10 = 13,
    DRV_WIFI_MULTICAST_FILTER_11 = 14,
    DRV_WIFI_MULTICAST_FILTER_12 = 15,

    DRV_WIFI_MULTICAST_FILTER_14 = 17,
    DRV_WIFI_MULTICAST_FILTER_15 = 18,
    DRV_WIFI_MULTICAST_FILTER_16 = 19
} DRV_WIFI_MULTICAST_FILTER_IDS;
```

Description

Multicast Filter ID's

This enumeration identifies the multicast filters that can be selected. See [DRV_WIFI_SWMulticastFilterSet\(\)](#).

5.1.13.7.4.68 DRV_WIFI_MULTICAST_FILTERS Enumeration

C

```
typedef enum {
    DRV_WIFI_MULTICAST_DISABLE_ALL = 0,
    DRV_WIFI_MULTICAST_ENABLE_ALL = 1,
    DRV_WIFI_MULTICAST_USE_FILTERS = 2
} DRV_WIFI_MULTICAST_FILTERS;
```

Description

Multicast Filter Modes

This enumeration identifies the mode of multicast filters that can be selected. See [DRV_WIFI_SWMulticastFilterSet\(\)](#).

Members

Members	Description
DRV_WIFI_MULTICAST_DISABLE_ALL = 0	Discard all received multicast messages
DRV_WIFI_MULTICAST_ENABLE_ALL = 1	forward all multicast messages to host MCU

DRV_WIFI_MULTICAST_USE_FILTERS = 2	Use the MAC filtering capability for multicast messages

5.1.13.7.4.69 DRV_WIFI_POWER_SAVE_STATES Enumeration

C

```
typedef enum {
    DRV_WIFI_PS_HIBERNATE = 1,
    DRV_WIFI_PS_PS_POLL_DTIM_ENABLED = 2,
    DRV_WIFI_PS_PS_POLL_DTIM_DISABLED = 3,
    DRV_WIFI_PS_OFF = 4
} DRV_WIFI_POWER_SAVE_STATES;
```

Description

WiFi Power Save states

This enumeration identifies WiFi Power save states. See [DRV_WIFI_PsPollEnable\(\)](#).

Members

Members	Description
DRV_WIFI_PS_HIBERNATE = 1	enable hibernate mode
DRV_WIFI_PS_PS_POLL_DTIM_ENABLED = 2	enable power save mode with DTIM enabled
DRV_WIFI_PS_PS_POLL_DTIM_DISABLED = 3	enable power save mode with DTIM disabled
DRV_WIFI_PS_OFF = 4	disable Power Save mode

5.1.13.7.4.70 DRV_WIFI_PS_POLL_CONTEXT Structure

C

```
typedef struct {
    uint16_t listenInterval;
    uint16_t dtimInterval;
    bool useDtim;
} DRV_WIFI_PS_POLL_CONTEXT;
```

Description

WiFi PS-Poll Context

This structure contains MRF24WG PS-Poll context data. See [DRV_WIFI_PsPollEnable\(\)](#).

Members

Members	Description
uint16_t listenInterval;	Number of 100ms intervals between instances when the MRF24WG wakes up to received buffered messages from the network. Each count represents 100ms. For example, 1 = 100ms, 2 = 200ms, etc. The default is 1 (100ms).
uint16_t dtimInterval;	Only used if useDtim is true. The DTIM period indicates how often clients serviced by the access point should check for buffered multicast or broadcast messages awaiting pickup on the access point. The DTIM interval is measured in number of beacon periods. Default for DTIM period is 2.
bool useDtim;	True: (default) check for buffered multicast or broadcast messages on the dtimInterval. False: check for buffered multicast or broadcast messages on the listenInterval

5.1.13.7.4.71 DRV_WIFI_REASON_CODES Enumeration

C

```
typedef enum {
    DRV_WIFI_UNSPECIFIED = 1,
    DRV_WIFI_REASON_PREV_AUTH_NOT_VALID = 2,
    DRV_WIFI_DEAUTH_LEAVING = 3,
    DRV_WIFI_DISASSOC_DUE_TO_INACTIVITY = 4,
    DRV_WIFI_DISASSOC_AP_BUSY = 5,
    DRV_WIFI_CLASS2_FRAME_FROM_NONAUTH_STA = 6,
    DRV_WIFI_CLASS3_FRAME_FROM_NONASSOC_STA = 7,
    DRV_WIFI_DISASSOC_STA_HAS_LEFT = 8,
    DRV_WIFI_STA_REQ_ASSOC_WITHOUT_AUTH = 9,
    DRV_WIFI_INVALID_IE = 13,
    DRV_WIFI_MIC_FAILURE = 14,
    DRV_WIFI_4WAY_HANDSHAKE_TIMEOUT = 15,
    DRV_WIFI_GROUP_KEY_HANDSHAKE_TIMEOUT = 16,
    DRV_WIFI_IE_DIFFERENT = 17,
    DRV_WIFI_INVALID_GROUP_CIPHER = 18,
    DRV_WIFI_INVALID_PAIRWISE_CIPHER = 19,
    DRV_WIFI_INVALID_AKMP = 20,
    DRV_WIFI_UNSUPP_RSN_VERSION = 21,
    DRV_WIFI_INVALID_RSN_IE_CAP = 22,
    DRV_WIFI_IEEE8021X_FAILED = 23,
    DRV_WIFI_CIPHER_SUITE_REJECTED = 24
} DRV_WIFI_REASON_CODES;
```

Description

Deauth/Disassociate Reason Codes

This enumeration identifies the reason codes for a connection lost due to a deauthorization or disassociation from the AP.

5.1.13.7.4.72 DRV_WIFI_RECONNECT_MODES Enumeration

C

```
typedef enum {
    DRV_WIFI_DO_NOT_ATTEMPT_TO_RECONNECT = 0,
    DRV_WIFI_ATTEMPT_TO_RECONNECT = 1
} DRV_WIFI_RECONNECT_MODES;
```

Description

WiFi Reconnect Modes

This enumeration identifies the reconnection modes that can be used in [DRV_WIFI_ReconnectModeSet\(\)](#).

5.1.13.7.4.73 DRV_WIFI_SCAN_CONTEXT Structure

C

```
typedef struct {
    uint8_t scanType;
    uint8_t scanCount;
    uint16_t minChannelTime;
    uint16_t maxChannelTime;
    uint16_t probeDelay;
} DRV_WIFI_SCAN_CONTEXT;
```

Description

WiFi Scan Context

This structure contains MRF24WG scan context data. See [DRV_WIFI_ScanContextSet\(\)](#).

Members

Members	Description
uint8_t scanType;	802.11 allows for active scanning, where the device sends out a broadcast probe request seeking an access point. Also allowed is passive scanning where the device only listens to beacons being broadcast from access points. Set to DRV_WIFI_ACTIVE_SCAN (default) or DRV_WIFI_PASSIVE_SCAN
uint8_t scanCount;	The number of times to scan a channel while attempting to find a particular access point. Default is 1
uint16_t minChannelTime;	The minimum time (in milliseconds) the MRF24WG will wait for a probe response after sending a probe request. If no probe responses are received in minChannelTime then the MRF24WG will go on to the next channel, if any are left to scan, or quit. Default is 200ms.
uint16_t maxChannelTime;	If a probe response is received within minChannelTime then the MRF24WG will continue to collect any additional probe responses up to maxChannelTime before going to the next channel in the channelList. Units are in milliseconds. Default is 400ms.
uint16_t probeDelay;	The number of microseconds to delay before transmitting a probe request following the channel change during scanning. Default is 20uS.

5.1.13.7.4.74 DRV_WIFI_SCAN_RESULT Structure**C**

```
typedef struct {
    uint8_t bssid[DRV_WIFI_BSSID_LENGTH];
    uint8_t ssid[DRV_WIFI_MAX_SSID_LENGTH];
    uint8_t apConfig;
    uint8_t reserved;
    uint16_t beaconPeriod;
    uint16_t atimWindow;
    uint8_t basicRateSet[DRV_WIFI_MAX_NUM_RATES];
    uint8_t rssi;
    uint8_t numRates;
    uint8_t DtimPeriod;
    uint8_t bssType;
    uint8_t channel;
    uint8_t ssidLen;
} DRV_WIFI_SCAN_RESULT;
```

Description

WiFi Scan Results

This structure contains the result of WiFi scan operation. See [DRV_WIFI_ScanGetResult\(\)](#).

apConfig Bit Mask

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
WPA2	WPA	Preamble	Privacy	Reserved	Reserved	Reserved	IE

IE	1 if AP broadcasting one or more Information Elements, else 0
Privacy	0 : AP is open (no security) 1: AP using security, if neither WPA and WPA2 set then security is WEP.
Preamble	0: AP transmitting with short preamble 1: AP transmitting with long preamble
WPA	Only valid if Privacy is 1. 0: AP does not support WPA 1: AP supports WPA
WPA2	Only valid if Privacy is 1. 0: AP does not support WPA2 1: AP supports WPA2

Members

Members	Description
uint8_t bssid[DRV_WIFI_BSSID_LENGTH];	Network BSSID value
uint8_t ssid[DRV_WIFI_MAX_SSID_LENGTH];	Network SSID value
uint8_t apConfig;	Access Point config (see description)
uint8_t reserved;	not used
uint16_t beaconPeriod;	Network beacon interval
uint16_t atimWindow;	Only valid if bssType = DRV_WIFI_NETWORK_TYPE_INFRASTRUCTURE

5.1.13.7.4.75 DRV_WIFI_SCAN_TYPES Enumeration**C**

```
typedef enum {
    DRV_WIFI_ACTIVE_SCAN = 1,
    DRV_WIFI_PASSIVE_SCAN = 2
} DRV_WIFI_SCAN_TYPES;
```

Description

WiFi Scan Types

This enumeration identifies the WiFi scan types that can be selected.

5.1.13.7.4.76 DRV_WIFI_SECURITY_CONTEXT Union**C**

```
typedef union {
    DRV_WIFI_WEP_CONTEXT wepContext;
    DRV_WIFI_WPA_CONTEXT wpaContext;
    DRV_WIFI_WPS_CONTEXT wpsContext;
} DRV_WIFI_SECURITY_CONTEXT;
```

Description

WiFi security context

Structure/union can be used in functions [DRV_WIFI_SecurityWepSet](#), [DRV_WIFI_SecurityWpaSet](#), and [DRV_WIFI_SecurityWpsSet](#)

Members

Members	Description
DRV_WIFI_WEP_CONTEXT wepContext;	set WEP security context
DRV_WIFI_WPA_CONTEXT wpaContext;	set WPA security context
DRV_WIFI_WPS_CONTEXT wpsContext;	set WPS security context

5.1.13.7.4.77 DRV_WIFI_SOFT_AP_EVENT_REASON_CODES Enumeration**C**

```
typedef enum {
    DRV_WIFI_SOFTAP_EVENT_LINK_LOST = 0,
    DRV_WIFI_SOFTAP_EVENT_RECEIVED_DEAUTH = 1
} DRV_WIFI_SOFT_AP_EVENT_REASON_CODES;
```

Description

This is type DRV_WIFI_SOFT_AP_EVENT_REASON_CODES.

5.1.13.7.4.78 DRV_WIFI_SOFT_AP_STATES Enumeration

C

```
typedef enum {
    DRV_WIFI_SOFTAP_EVENT_CONNECTED = 0,
    DRV_WIFI_SOFTAP_EVENT_DISCONNECTED = 1
} DRV_WIFI_SOFT_AP_STATES;
```

Description

This is type DRV_WIFI_SOFT_AP_STATES.

5.1.13.7.4.79 DRV_WIFI_STATUS_CODES Enumeration

C

```
typedef enum {
    DRV_WIFI_UNSPECIFIED_FAILURE = 1,
    DRV_WIFI_CAPS_UNSUPPORTED = 10,
    DRV_WIFI_REASSOC_NO_ASSOC = 11,
    DRV_WIFI_ASSOC_DENIED_UNSPEC = 12,
    DRV_WIFI_NOT_SUPPORTED_AUTH_ALG = 13,
    DRV_WIFI_UNKNOWN_AUTH_TRANSACTION = 14,
    DRV_WIFI_CHALLENGE_FAIL = 15,
    DRV_WIFI_AUTH_TIMEOUT = 16,
    DRV_WIFI_AP_UNABLE_TO_HANDLE_NEW_STA = 17,
    DRV_WIFI_ASSOC_DENIED_RATES = 18,
    DRV_WIFI_ASSOC_DENIED_NOSHORTPREAMBLE = 19,
    DRV_WIFI_ASSOC_DENIED_NOPBCC = 20,
    DRV_WIFI_ASSOC_DENIED_NOAGILITY = 21,
    DRV_WIFI_ASSOC_DENIED_NOSHORTTIME = 25,
    DRV_WIFI_ASSOC_DENIED_NODSSSOFDMA = 26,
    DRV_WIFI_S_INVALID_IE = 40,
    DRV_WIFI_S_INVALID_GROUPCIPHER = 41,
    DRV_WIFI_S_INVALID_PAIRWISE_CIPHER = 42,
    DRV_WIFI_S_INVALID_AKMP = 43,
    DRV_WIFI_UNSUPPORTED_RSN_VERSION = 44,
    DRV_WIFI_S_INVALID_RSN_IE_CAP = 45,
    DRV_WIFI_S_CIPHER_SUITE_REJECTED = 46,
    DRV_WIFI_TIMEOUT = 47
} DRV_WIFI_STATUS_CODES;
```

Description

status codes for connection for association or authentication failure

This enumeration identifies the codes for a connection failure due to association or authentication failure. These codes are used in [DRV_WIFI_ProcessEvent\(\)](#), case DRV_WIFI_EVENT_CONNECTION_FAILED.

5.1.13.7.4.80 DRV_WIFI_SWMULTICAST_CONFIG Structure

C

```
typedef struct {
    uint8_t filterId;
    uint8_t action;
    uint8_t macBytes[6];
    uint8_t macBitMask;
} DRV_WIFI_SWMULTICAST_CONFIG;
```

Description

WiFi SW Multicast Filter Config

This structure contains data pertaining to the configuration of the software multicast config filter.

'action' Field	Description
DRV_WIFI_MULTICAST_DISABLE_ALL	Multicast filter discards all received multicast messages.
DRV_WIFI_MULTICAST_ENABLE_ALL	Multicast filter forwards all received multicast messages to host.
DRV_WIFI_MULTICAST_USE_FILTERS	The MAC filter will be used and the remaining fields define the filter.

Members

Members	Description
uint8_t filterId;	DRV_WIFI_MULTICAST_FILTER_1 thru DRV_WIFI_MULTICAST_FILTER_16
uint8_t action;	configures the multicast filter (see description)
uint8_t macBytes[6];	Array containing the MAC address to filter on (using the destination address of each incoming 802.11 frame). Specific bytes within the MAC address can be designated as 'don't care' bytes. See macBitMask. This field is only used if action = WF_MULTICAST_USE_FILTERS.
uint8_t macBitMask;	A byte where bits 5:0 correspond to macBytes[5:0]. If the bit is zero then the corresponding MAC byte must be an exact match for the frame to be forwarded to the Host PIC. If the bit is one then the corresponding MAC byte is a 'don't care' and not used in the Multicast filtering process. This field is only used if action = WF_MULTICAST_USE_FILTERS.

5.1.13.7.4.81 DRV_WIFI_TX_MODES Enumeration

C

```
typedef enum {
    DRV_WIFI_TXMODE_G_RATES = 0,
    DRV_WIFI_TXMODE_B_RATES = 1,
    DRV_WIFI_TXMODE_LEGACY_RATES = 2
} DRV_WIFI_TX_MODES;
```

Description

Tx Modes

This enumeration identifies the choices the MRF24W Tx mode. It is recommended to use the DRV_WIFI_TXMODE_G_RATES for best performance. See [DRV_WIFI_TxModeSet\(\)](#).

Members

Members	Description
DRV_WIFI_TXMODE_G_RATES = 0	Use 802.11 'g' rates
DRV_WIFI_TXMODE_B_RATES = 1	Use only 802.11 'b' rates
DRV_WIFI_TXMODE_LEGACY_RATES = 2	Use only 1 and 2 mbps rates

5.1.13.7.4.82 DRV_WIFI_WEP_CONTEXT Structure

C

```
typedef struct {
    uint8_t wepSecurityType;
    uint8_t wepKey[DRV_WIFI_MAX_WEP_KEY_LENGTH];
    uint8_t wepKeyLength;
    uint8_t wepKeyType;
} DRV_WIFI_WEP_CONTEXT;
```

Description

WiFi Wep Security Context

This structure contains MRF24WG WEP context. See [DRV_WIFI_SecurityWepSet\(\)](#).

Members

Members	Description
uint8_t wepSecurityType;	DRV_WIFI_SECURITY_WEP_40 or DRV_WIFI_SECURITY_WEP_104
uint8_t wepKey[DRV_WIFI_MAX_WEP_KEY_LENGTH];	Array containing four WEP binary keys. This will be four, 5-byte keys for WEP-40 or four, thirteen-byte keys for WEP-104.
uint8_t wepKeyLength;	number of bytes pointed to by p_wepKey
uint8_t wepKeyType;	DRV_WIFI_SECURITY_WEP_OPENKEY (default) or DRV_WIFI_SECURITY_WEP_SHAREDKEY

5.1.13.7.4.83 DRV_WIFI_WEP_KEY_TYPE Enumeration

C

```
typedef enum {
    DRV_WIFI_SECURITY_WEP_SHAREDKEY = 0,
    DRV_WIFI_SECURITY_WEP_OPENKEY = 1
} DRV_WIFI_WEP_KEY_TYPE;
```

Description

WEP Key Types

This enumeration identifies the choices for the WEP key type when using WEP security. The recommended key type (and default) is Open key.

Members

Members	Description
DRV_WIFI_SECURITY_WEP_SHAREDKEY = 0	use WEP shared key
DRV_WIFI_SECURITY_WEP_OPENKEY = 1	use WEP open key (default)

5.1.13.7.4.84 DRV_WIFI_WPA_CONTEXT Structure

C

```
typedef struct {
    uint8_t wpaSecurityType;
    DRV_WIFI_WPA_KEY_INFO keyInfo;
} DRV_WIFI_WPA_CONTEXT;
```

Description

WiFi WPA context

This structure contains MRF24WG WPA context. See [DRV_WIFI_SecurityWpaSet\(\)](#).

wpaSecurityType	Description
DRV_WIFI_SECURITY_WPA_WITH_KEY	WPA binary key
DRV_WIFI_SECURITY_WPA_WITH_PASS_PHRASE	WPA passphrase
DRV_WIFI_SECURITY_WPA2_WITH_KEY	WPA2 binary key

DRV_WIFI_SECURITY_WPA2_WITH_PASS_PHRASE	WPA2 passphrase
DRV_WIFI_SECURITY_WPA_AUTO_WITH_KEY	Auto-select between WPA/WPA2 with binary key
DRV_WIFI_SECURITY_WPA_AUTO_WITH_PASS_PHRASE	Auto-select between WPA/WPA2 with passphrase

Members

Members	Description
uint8_t wpaSecurityType;	desired security type (see description)
DRV_WIFI_WPA_KEY_INFO keyInfo;	see DRV_WIFI_WPA_KEY_INFO

5.1.13.7.4.85 DRV_WIFI_WPA_KEY_INFO Structure**C**

```
typedef struct {
    uint8_t key[DRV_WIFI_MAX_WPA2_PASS_PHRASE_LENGTH];
    uint8_t keyLength;
} DRV_WIFI_WPA_KEY_INFO;
```

Description

WiFi WPA Key context

This structure contains MRF24WG WPA key info. This structure is used in the [DRV_WIFI_WPA_CONTEXT](#) and [DRV_WIFI_WPS_CONTEXT](#) structures.

Members

Members	Description
uint8_t key[DRV_WIFI_MAX_WPA2_PASS_PHRASE_LENGTH];	binary key or passphrase
uint8_t keyLength;	number of bytes in binary key (always 32) or passphrase

5.1.13.7.4.86 DRV_WIFI_WPS_AUTH_TYPES Enumeration**C**

```
typedef enum {
    DRV_WIFI_WPS_AUTH_OPEN = 0x01,
    DRV_WIFI_WPS_AUTH_WPA_PSK = 0x02,
    DRV_WIFI_WPS_AUTH_SHARED = 0x04,
    DRV_WIFI_WPS_AUTH_WPA = 0x08,
    DRV_WIFI_WPS_AUTH_WPA2 = 0x10,
    DRV_WIFI_WPS_AUTH_WPA2_PSK = 0x20
} DRV_WIFI_WPS_AUTH_TYPES;
```

Description

This is type DRV_WIFI_WPS_AUTH_TYPES.

5.1.13.7.4.87 DRV_WIFI_WPS_CONTEXT Structure**C**

```
typedef struct {
    uint8_t wpsSecurityType;
    uint8_t wpsPin[DRV_WIFI_WPS_PIN_LENGTH];
    uint8_t wpsPinLength;
    bool getPassPhrase;
    DRV_WIFI_WPA_KEY_INFO * p_keyInfo;
} DRV_WIFI_WPS_CONTEXT;
```

Description

WiFi WPS security context

This structure contains MRF24WG WPS security context. See [DRV_WIFI_SecurityWpsSet\(\)](#).

Members

Members	Description
uint8_t wpsSecurityType;	DRV_WIFI_SECURITY_WPS_PUSH_BUTTON or DRV_WIFI_SECURITY_WPS_PIN
uint8_t wpsPin[DRV_WIFI_WPS_PIN_LENGTH];	if using DRV_WIFI_SECURITY_WPS_PIN then pointer to 8-digit pin
uint8_t wpsPinLength;	should always be 8
bool getPassPhrase;	True if ASCII passphrase should be sent back to host so host can (more quickly) calculate binary key. False if the MRF24WG should calculate the binary key
DRV_WIFI_WPA_KEY_INFO * p_keyInfo;	pointer to where the WiFi driver will store passphrase info (must be global memory)

5.1.13.7.4.88 DRV_WIFI_WPS_CREDENTIAL Structure**C**

```
typedef struct {
    uint8_t ssid[32];
    uint8_t netKey[64];
    uint16_t authType;
    uint16_t encType;
    uint8_t netIdx;
    uint8_t ssidLen;
    uint8_t keyIdx;
    uint8_t keyLen;
    uint8_t bssid[6];
} DRV_WIFI_WPS_CREDENTIAL;
```

Description

WiFi WPS Credentials

This structure contains data pertaining to the configuration of the WiFi WPS credentials.

'authType' Field	Description
DRV_WIFI_WPS_AUTH_OPEN	open security
DRV_WIFI_WPS_AUTH_WPA_PSK	WPA with PSK
DRV_WIFI_WPS_AUTH_SHARED	Shared key
DRV_WIFI_WPS_AUTH_WPA	WPA
DRV_WIFI_WPS_AUTH_WPA2	WPA2
DRV_WIFI_WPS_AUTH_WPA2_PSK	WPA2 with PSK

'encType' Field	Description
DRV_WIFI_WPS_ENC_NONE	No encoding
DRV_WIFI_WPS_ENC_WEP	WEP encoding
DRV_WIFI_WPS_ENC_TKIP	WPS/TKIP encodingShared key

DRV_WIFI_ENC_AES

AES encoding

Members

Members	Description
uint8_t ssid[32];	network SSID
uint8_t netKey[64];	binary security key (not used if security is open)
uint16_t authType;	WPS authorization type (see description)
uint16_t encType;	Encoding type (see description)
uint8_t netIdx;	not used
uint8_t ssidLen;	number of bytes in SSID
uint8_t keyIdx;	Only valid encType = WF_ENC_WEP. This is the index of the WEP key being used.
uint8_t keyLen;	number of bytes in netKey
uint8_t bssid[6];	MAC address of AP

5.1.13.7.4.89 DRV_WIFI_WPS_ENCODE_TYPES Enumeration**C**

```
typedef enum {
    DRV_WIFI_WPS_ENC_NONE = 0x01,
    DRV_WIFI_WPS_ENC_WEP = 0x02,
    DRV_WIFI_WPS_ENC_TKIP = 0x04,
    DRV_WIFI_ENC_AES = 0x08
} DRV_WIFI_WPS_ENCODE_TYPES;
```

Description

This is type DRV_WIFI_WPS_ENCODE_TYPES.

5.1.13.7.4.90 ENABLE_P2P_PRINTS Macro**C**

```
#define ENABLE_P2P_PRINTS ((uint8_t)(1 << 1))    /* not supported */
```

Description

not supported

5.1.13.7.4.91 ENABLE_WPS_PRINTS Macro**C**

```
#define ENABLE_WPS_PRINTS ((uint8_t)(1 << 0))
```

Description

This is macro ENABLE_WPS_PRINTS.

5.1.13.7.4.92 PA6_IO Macro**C**

```
#define PA6_IO LATAbits.LATA6
```

Description

debug, remove later

5.1.13.7.4.93 PA6_TRISTATE Macro

C

```
#define PA6_TRISTATE TRISAbits.TRISA6
```

Description

This is macro PA6_TRISTATE.

5.1.13.7.4.94 SET_PA6_AS_OUTPUT Macro

C

```
#define SET_PA6_AS_OUTPUT TRISAbits.TRISA6 = 0
```

Description

This is macro SET_PA6_AS_OUTPUT.

5.1.13.7.4.95 WF_WPS_PIN_LENGTH Macro

C

```
#define WF_WPS_PIN_LENGTH 8
```

Description

WPS PIN Length

5.1.13.8 Files

Files

Name	Description
drv_wifi.h	WiFi-specific MAC function prototypes called by TCP/IP stack.

Description

5.1.13.8.1 drv_wifi.h

WiFi MAC interface functions

The functions in this header file are accessed by the TCP/IP stack via function pointers.

Enumerations

	Name	Description
	adhocMode	Selection of different AdHoc connection modes
	DRV_WIFI_ADHOC_MODES	Selection of different AdHoc connection modes
	DRV_WIFI_CONNECTION_STATES	Wifi Connection states
	DRV_WIFI_DEVICE_TYPES	Codes for WiFi device types
	DRV_WIFI_DOMAIN_CODES	Regional domain codes.
	DRV_WIFI_EVENT_CONN_TEMP_LOST_CODES	Selection of different codes when WiFi connection is temporarily lost.
	DRV_WIFI_EVENT_INFO	Selection of different EventInfo types

	DRV_WIFI_EVENTS	Selections for events that can occur.
	DRV_WIFI_GENERAL_ERRORS	This is type DRV_WIFI_GENERAL_ERRORS.
	DRV_WIFI_HIBERNATE_STATES	Wifi Hibernate states
	DRV_WIFI_MGMT_ERRORS	Error codes returned when a mgmt message is sent to the MRF24W
	DRV_WIFI_MULTICAST_FILTER_IDS	Selections for software Multicast filter ID's
	DRV_WIFI_MULTICAST_FILTERS	Selections for Software Multicast Filters.
	DRV_WIFI_POWER_SAVE_STATES	Wifi Power Save states
	DRV_WIFI_REASON_CODES	Selection of different codes when a deauth or disassociation event has occurred.
	DRV_WIFI_RECONNECT_MODES	Selection of different Reconnection modes
	DRV_WIFI_SCAN_TYPES	Selection of different WiFi scan types
	DRV_WIFI_SOFT_AP_EVENT_REASON_CODES	This is type DRV_WIFI_SOFT_AP_EVENT_REASON_CODES.
	DRV_WIFI_SOFT_AP_STATES	This is type DRV_WIFI_SOFT_AP_STATES.
	DRV_WIFI_STATUS_CODES	Selection of different codes when WiFi connection fails due to association or authentication failure.
	DRV_WIFI_TX_MODES	Selections for WiFi Tx mode
	DRV_WIFI_WEP_KEY_TYPE	Selections for WEP key type when using WEP security.
	DRV_WIFI_WPS_AUTH_TYPES	This is type DRV_WIFI_WPS_AUTH_TYPES.
	DRV_WIFI_WPS_ENCODE_TYPES	This is type DRV_WIFI_WPS_ENCODE_TYPES.

Functions

	Name	Description
	DRV_WIFI_AdhocContextSet	Sets the AdHoc context.
	DRV_WIFI_BssidGet	Sets the the BSSID set in DRV_WIFI_BssidSet() .
	DRV_WIFI_BssidSet	Sets the the Basic Service Set Identifier (BSSID).
	DRV_WIFI_ChannelListGet	Gets the the channel list.
	DRV_WIFI_ChannelListSet	Sets the the channel list.
	DRV_WIFI_ConfigDataErase	Erases configuration data from the board EEPROM.
	DRV_WIFI_ConfigDataLoad	Loads configuration data from the board EEPROM.
	DRV_WIFI_ConfigDataPrint	Outputs to console the configuration data from the board EEPROM.
	DRV_WIFI_ConfigDataSave	Save configuration data to the board EEPROM.
	DRV_WIFI_Connect	Directs the MRF24WG to connect to a WiFi network.
	DRV_WIFI_ConnectContextGet	Gets the current WiFi connection context
	DRV_WIFI_ConnectionStateGet	Gets the current WiFi connection state
	DRV_WIFI_Deinitialize	Initializes the MRF24WG WiFi driver.
	DRV_WIFI_DeviceInfoGet	Retrieves MRF24WG device information
	DRV_WIFI_Disconnect	Directs the MRF24WG to disconnect from a WiFi network.
	DRV_WIFI_GratuitousArpStart	Starts a periodic gratuitous ARP response
	DRV_WIFI_GratuitousArpStop	Stops a periodic gratuitous ARP.
	DRV_WIFI_HibernateEnable	Puts the MRF24WG into hibernate mode.
	DRV_WIFI_HWMulticastFilterGet	Gets a multicast address filter from one of the two multicast filters.
	DRV_WIFI_HWMulticastFilterSet	Sets a multicast address filter using one of the two hardware multicast filters.
	DRV_WIFI_Initialize	Initializes the MRF24WG WiFi driver.
	DRV_WIFI_IsHibernateEnable	Checks if MRF24W is in hibernate mode
	DRV_WIFI_MacAddressGet	Retrieves the MRF24WG MAC address

	DRV_WIFI_MacAddressSet	Uses a different MAC address for the MRF24W
	DRV_WIFI_MacStatsGet	Gets MAC statistics.
	DRV_WIFI_NetworkTypeGet	Gets the WiFi network type
	DRV_WIFI_NetworkTypeSet	Sets the WiFi network type
	DRV_WIFI_PowerSaveStateGet	Gets the current power-save state.
	DRV_WIFI_ProcessEvent	Processes WiFi event
	DRV_WIFI_PsPollDisable	Disables PS-Poll mode.
	DRV_WIFI_PsPollEnable	Enables PS Poll mode.
	DRV_WIFI_ReconnectModeGet	Gets the WiFi reconnection mode.
	DRV_WIFI_ReconnectModeSet	Sets the WiFi reconnection mode.
	DRV_WIFI_RegionalDomainGet	Retrieves the MRF24WG Regional domain
	DRV_WIFI_RssiGet	Gets RSSI value set in DRV_WIFI_RssiSet()
	DRV_WIFI_RssiSet	Sets RSSI restrictions when connecting
	DRV_WIFI_RtsThresholdGet	Gets the RTS Threshold
	DRV_WIFI_RtsThresholdSet	Sets the RTS Threshold.
	DRV_WIFI_Scan	Commands the MRF24W to start a scan operation. This will generate the WF_EVENT_SCAN_RESULTS_READY event.
	DRV_WIFI_ScanContextGet	Gets the WiFi scan context.
	DRV_WIFI_ScanContextSet	Sets the WiFi scan context.
	DRV_WIFI_ScanGetResult	Read selected scan results back from MRF24W.
	DRV_WIFI_SecurityGet	Gets the current WiFi security setting
	DRV_WIFI_SecurityOpenSet	Sets WiFi security to open (no security)
	DRV_WIFI_SecurityWepSet	Sets WiFi security to use WEP.
	DRV_WIFI_SecurityWpaSet	Sets WiFi security to use WPA or WPA2
	DRV_WIFI_SecurityWpsSet	Sets WiFi security to use WPS
	DRV_WIFI_SetLinkDownThreshold	Sets number of consecutive WiFi Tx failures before link is considered down.
	DRV_WIFI_SetPSK	Sets the binary WPA PSK code in WPS.
	DRV_WIFI_SoftApEventInfoGet	Gets the stored Soft AP event info
	DRV_WIFI_SsidGet	Sets the SSID
	DRV_WIFI_SsidSet	Sets the SSID
	DRV_WIFI_SWMultiCastFilterEnable	Forces the MRF24WG to use software multicast filters instead of hardware multicast filters.
	DRV_WIFI_SWMulticastFilterSet	Sets a multicast address filter using one of the software multicast filters.
	DRV_WIFI_TxModeGet	Gets 802.11 Tx mode
	DRV_WIFI_TxModeSet	Configures 802.11 Tx mode
	DRV_WIFI_TxPowerFactoryMaxGet	Retrieves the factory-set max Tx power from the MRF24W.
	DRV_WIFI_TxPowerMaxGet	Gets the Tx max power on the MRF24WG0M.
	DRV_WIFI_TxPowerMaxSet	Sets the Tx max power on the MRF24WG0M.
	DRV_WIFI_WepKeyTypeGet	Gets the Wep Key type
	DRV_WIFI_WPSCredentialsGet	Gets the WPS credentials
	DRV_WIFI_YieldPassphraseToHost	Allows host to get WPS WPA-PSK passphrase and convert to binary key.

Macros

	Name	Description
	DRV_WIFI_BSSID_LENGTH	This is macro DRV_WIFI_BSSID_LENGTH.

	DRV_WIFI_DEAUTH_REASONCODE_MASK	This is macro DRV_WIFI_DEAUTH_REASONCODE_MASK.
	DRV_WIFI_DEFAULT_ADHOC_BEACON_PERIOD	ms
	DRV_WIFI_DEFAULT_ADHOC_HIDDEN_SSID	Default values for WiFi AdHoc settings
	DRV_WIFI_DEFAULT_ADHOC_MODE	This is macro DRV_WIFI_DEFAULT_ADHOC_MODE.
	DRV_WIFI_DEFAULT_PS_DTIM_ENABLED	DTIM wake-up enabled (normally the case)
	DRV_WIFI_DEFAULT_PS_DTIM_INTERVAL	number of beacon periods
	DRV_WIFI_DEFAULT_PS_LISTEN_INTERVAL	100ms multiplier, e.g. 1 * 100ms = 100ms
	DRV_WIFI_DEFAULT_SCAN_COUNT	Default values for WiFi scan context
	DRV_WIFI_DEFAULT_SCAN_MAX_CHANNEL_TIME	ms
	DRV_WIFI_DEFAULT_SCAN_MIN_CHANNEL_TIME	ms
	DRV_WIFI_DEFAULT_SCAN_PROBE_DELAY	us
	DRV_WIFI_DEFAULT_WEP_KEY_TYPE	see DRV_WIFI_SecurityWepSet() and DRV_WIFI_WEP_CONTEXT
	DRV_WIFI_DISABLED	Do not make this an enumerated type!
	DRV_WIFI_DISASSOC_REASONCODE_MASK	This is macro DRV_WIFI_DISASSOC_REASONCODE_MASK.
	DRV_WIFI_ENABLED	This is macro DRV_WIFI_ENABLED.
	DRV_WIFI_MAX_CHANNEL_LIST_LENGTH	This is macro DRV_WIFI_MAX_CHANNEL_LIST_LENGTH.
	DRV_WIFI_MAX_NUM_RATES	This is macro DRV_WIFI_MAX_NUM_RATES.
	DRV_WIFI_MAX_SECURITY_KEY_LENGTH	This is macro DRV_WIFI_MAX_SECURITY_KEY_LENGTH.
	DRV_WIFI_MAX_SSID_LENGTH	This is macro DRV_WIFI_MAX_SSID_LENGTH.
	DRV_WIFI_MAX_WEP_KEY_LENGTH	This is macro DRV_WIFI_MAX_WEP_KEY_LENGTH.
	DRV_WIFI_MAX_WPA_PASS_PHRASE_LENGTH	must include string terminator
	DRV_WIFI_MAX_WPA2_PASS_PHRASE_LENGTH	This is macro DRV_WIFI_MAX_WPA2_PASS_PHRASE_LENGTH. H.
	DRV_WIFI_MIN_WPA_PASS_PHRASE_LENGTH	Key size defines
	DRV_WIFI_NETWORK_TYPE_ADHOC	This is macro DRV_WIFI_NETWORK_TYPE_ADHOC.
	DRV_WIFI_NETWORK_TYPE_INFRASTRUCTURE	Selection of different WiFi network types
	DRV_WIFI_NETWORK_TYPE_P2P	not supported
	DRV_WIFI_NETWORK_TYPE_SOFT_AP	This is macro DRV_WIFI_NETWORK_TYPE_SOFT_AP.
	DRV_WIFI_NO_ADDITIONAL_INFO	eventInfo define for DRV_WIFI_ProcessEvent() when no additional info is supplied
	DRV_WIFI_RETRY_ADHOC	This is macro DRV_WIFI_RETRY_ADHOC.
	DRV_WIFI_RETRY_FOREVER	This is macro DRV_WIFI_RETRY_FOREVER.
	DRV_WIFI_RTS_THRESHOLD_MAX	maximum RTS threshold size in bytes
	DRV_WIFI_SECURITY_EAP	This is macro DRV_WIFI_SECURITY_EAP.
	DRV_WIFI_SECURITY_OPEN	Selection of different WiFi security types
	DRV_WIFI_SECURITY_WEP_104	This is macro DRV_WIFI_SECURITY_WEP_104.
	DRV_WIFI_SECURITY_WEP_40	This is macro DRV_WIFI_SECURITY_WEP_40.

	<u>DRV_WIFI_SECURITY_WPA_AUTO_WITH_KEY</u>	This is macro DRV_WIFI_SECURITY_WPA_AUTO_WITH_KEY.
	<u>DRV_WIFI_SECURITY_WPA_AUTO_WITH_PASS_PHRASE</u>	This is macro DRV_WIFI_SECURITY_WPA_AUTO_WITH_PASS_PHRASE.
	<u>DRV_WIFI_SECURITY_WPA_WITH_KEY</u>	This is macro DRV_WIFI_SECURITY_WPA_WITH_KEY.
	<u>DRV_WIFI_SECURITY_WPA_WITH_PASS_PHRASE</u>	This is macro DRV_WIFI_SECURITY_WPA_WITH_PASS_PHRASE.
	<u>DRV_WIFI_SECURITY_WPA2_WITH_KEY</u>	This is macro DRV_WIFI_SECURITY_WPA2_WITH_KEY.
	<u>DRV_WIFI_SECURITY_WPA2_WITH_PASS_PHRASE</u>	This is macro DRV_WIFI_SECURITY_WPA2_WITH_PASS_PHRASE.
	<u>DRV_WIFI_SECURITY_WPS_PIN</u>	This is macro DRV_WIFI_SECURITY_WPS_PIN.
	<u>DRV_WIFI_SECURITY_WPS_PUSH_BUTTON</u>	This is macro DRV_WIFI_SECURITY_WPS_PUSH_BUTTON.
	<u>DRV_WIFI_VERSION_NUMBER</u>	WiFi Driver Version Number
	<u>DRV_WIFI_WEP104_KEY_LENGTH</u>	4 keys of 13 bytes each
	<u>DRV_WIFI_WEP40_KEY_LENGTH</u>	4 keys of 5 bytes each
	<u>DRV_WIFI_WPA_KEY_LENGTH</u>	This is macro DRV_WIFI_WPA_KEY_LENGTH.
	<u>DRV_WIFI_WPA2_KEY_LENGTH</u>	This is macro DRV_WIFI_WPA2_KEY_LENGTH.
	<u>DRV_WIFI_WPS_PIN_LENGTH</u>	7 digits + checksum byte
	<u>ENABLE_P2P_PRINTS</u>	not supported
	<u>ENABLE_WPS_PRINTS</u>	This is macro ENABLE_WPS_PRINTS.
	<u>PA6_IO</u>	debug, remove later
	<u>PA6_TRISTATE</u>	This is macro PA6_TRISTATE.
	<u>SET_PA6_AS_OUTPUT</u>	This is macro SET_PA6_AS_OUTPUT.
	<u>WF_WPS_PIN_LENGTH</u>	WPS PIN Length

Structures

	Name	Description
	<u>DRV_WIFI_ADHOC_NETWORK_CONTEXT</u>	Contains data pertaining to WiFi AdHoc context
	<u>DRV_WIFI_CONNECTION_CONTEXT</u>	Contains data pertaining to MRF24WG connection context
	<u>DRV_WIFI_DEVICE_INFO</u>	Contains data pertaining to MRF24WG device type and version number
	<u>DRV_WIFI_HIBERNATE_STATE</u>	This is type DRV_WIFI_HIBERNATE_STATE.
	<u>DRV_WIFI_MAC_STATS</u>	Wifi MIB states
	<u>DRV_WIFI_MGMT_INDICATE_SOFT_AP_EVENT</u>	Contains data pertaining to WiFi Soft AP event
	<u>DRV_WIFI_PS_POLL_CONTEXT</u>	Contains data pertaining to WiFi PS-Poll context
	<u>DRV_WIFI_SCAN_CONTEXT</u>	Contains data pertaining to WiFi scan context
	<u>DRV_WIFI_SCAN_RESULT</u>	Contains data pertaining to WiFi scan results
	<u>DRV_WIFI_SWMULTICAST_CONFIG</u>	Contains data pertaining to WiFi software multicast filter configuration
	<u>DRV_WIFI_WEP_CONTEXT</u>	Contains data pertaining to WiFi WEP context
	<u>DRV_WIFI_WPA_CONTEXT</u>	Contains data pertaining to WiFi WPA.
	<u>DRV_WIFI_WPA_KEY_INFO</u>	Contains data pertaining to WiFi WPA Key
	<u>DRV_WIFI_WPS_CONTEXT</u>	Contains data pertaining to WiFi WPS security.

	DRV_WIFI_WPS_CREDENTIAL	Contains data pertaining to WiFi WPS Credentials

Unions

	Name	Description
	DRV_WIFI_SECURITY_CONTEXT	Contains data pertaining to WiFi security.

File Name

drv_wifi_mac.h

5.2 Graphics Library Help

5.2.1 Graphics Library Porting Guide

5.2.1.1 Introduction

Porting to the MPLAB Harmony Graphics Library

This help file provides information for porting from the Microchip Library of Applications (MLA) version of the Graphics Library to the Graphics Library within MPLAB Harmony.

5.2.1.2 Release Notes

MPLAB Harmony Version: v0.70b **Release Date:** Graphics Library: 4.00 18Nov2013

New This Release:

This is the first release of the library.

Known Issues:

Nothing to report in this release.

5.2.1.3 SW License Agreement

© 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS." MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.2.1.4 Upgrading from the MLA Graphics Library to the MPLAB Harmony Graphics Library

The MPLAB Harmony Graphics Library is a completely new distribution, which is included as part of the MPLAB Harmony installation. No files need to be maintained from an existing MLA Graphics Library installation.

5.2.1.4.1 MPLAB Harmony Graphics Library Key Features

This topic provides a description of the key features of the MPLAB Harmony Graphics Library.

Description

Note: The MPLAB Harmony Graphics Library *does not* support any Microchip 16-bit family devices.

The following are the key features of the MPLAB Harmony Graphics Library:

- Multiple interfaces
- Fully dynamic:
 - Stack initialization/deinitialization
 - Resource management
 - Configurable
- Improved modularity and stack layout
- Interrupt driven operation
- RTOS friendly, with easy RTOS integration

5.2.1.4.2 MPLAB Harmony Graphics Library Structure

This topic describes the structure of the MPLAB Harmony Graphics Library.

Description

The MPLAB Harmony Graphics Library consists of a graphic widget and primitive library, a display layer, a graphics driver, and demonstration applications, all of which support the following structure:

- Lowercase file names
- Underscores are used
- System services are used instead of direct access to peripherals
- Interrupts
- Drivers
- Timer Services
- File System
- Board Support Package (BSP)

By default, the Graphics Library and its corresponding display drivers and demonstration applications are placed into the following locations during installation of MPLAB Harmony:

- `./microchip/harmony/<version>/framework/gfx`
- `./microchip/harmony/<version>/framework/driver/gfx`

- `./microchip/harmony/<version>/apps/gfx`

5.2.1.4.3 MPLAB Harmony Graphics Library Design

This topic discusses the design of the MPLAB Harmony Graphics Library.

Description

The MPLAB Harmony Graphics Library is designed as a part of a system running other applications, middleware, etc. Therefore, it makes use of the system services that are available to other modules in the system or to the application, such as:

- File system
- System interrupts
- System driver services
- System timers
- System device drivers
- System command processor
- System console
- System debug services

Refer to the `./framework/gfx/src/system` folder for the header files that expose the system wide available API.

5.2.1.4.4 MPLAB Harmony Graphics Library API Changes

This topic discusses the reasons behind the API changes to the MPLAB Harmony Graphics Library.

Description

The API is backward compatible in functionality only. All function names and type definitions have changed to reflect the MPLAB Harmony philosophy.

The changes in the library API have been minimized so that the porting process is straightforward and integration with other dependents is made simple. New functionality has been added because of new features, such as dynamic configuration and non-block of the library. Other than these new features, the changes to the API were also made to support commonality between the MPLAB Harmony Graphics Library and the 16-bit Graphics Library.

The API changes are at all layers of the Graphics Library which include the GOL, Primitive, and Driver layers.

5.2.1.4.5 MPLAB Harmony Graphics Library Access Changes

This topic describes the stack access updates that were made to the MPLAB Harmony Graphics Library.

Description

The Graphics Library no longer initializes the display driver, but requires the application to initialize the driver before calling any Graphics Library functions. For example: `GFX_DRV_lcc_Initialize()`

Direct access to the Graphics Driver has been removed.

5.2.1.4.5.1 Graphic Primitive Layer Changes

This topic discusses the changes made to the MLA Graphics Library `primitive.h` file to produce the equivalent MPLAB Harmony Graphics Library `gfx_primitive.h` file.

Description

Changes

The changes are as follows:

- *Prefix:*
 - GFX_ is the generic prefix for functions
 - gfx_ is the generic prefix for primitive level files
- *Non-blocking support* - A task queue has been added to ensure that functions do not block execution of other non-graphics time-critical tasks
- **GFX_Initialize** - This function replaces the InitGraph function. The **GFX_Initialize** function does the following:
 - Sets the line type to SOLID_LINE
 - Sets the current drawing color to **WHITE**
 - Sets the graphic cursor position to the upper left corner of the screen
 - Sets active and visual pages to page 0
 - Clears the active page and disables clipping

The **GFX_Initialize** function should be called before using the Graphics Primitive Layer.

5.2.1.4.5.2 Graphic Object Layer (GOL) Changes

This topic discusses the changes made to the MLA Graphics Library GOL.h file to produce the equivalent MPLAB Harmony Graphics Library **gfx_gol.h** file.

Description

Changes

The changes are as follows.

- *Prefix:*
 - GFX_GOL_ is the generic prefix for all Graphic Object Level functions
 - gfx_gol_ is the generic prefix for all Graphic Object Level files
- *Non-blocking support* – a task queue has been added to ensure that functions do not block execution of other non-graphics time-critical tasks
- **GFX_Initialize** – This function replaces the MLA GOL_Init function, which overrides the equivalent primitive function. This function initializes the graphics library and creates a default style scheme with default settings referenced by the global scheme pointer. **GFX_Initialize** must be called before GOL functions can be used.

5.2.1.4.5.3 Graphic Display Driver Layer Changes

This topic discusses the changes made to the DisplayDriver.h file.

This topic discusses the changes made to the MLA Graphics Library DisplayDriver.h file to produce the equivalent MPLAB Harmony Graphics Library **drv_gfx_display.h** file.

Description

Changes

The changes are as follows:

- *Prefix:*

- DRV_GFX is the generic prefix for all Graphics Driver level functions
- drv_gfx is the generic prefix for all Graphics Driver level files
- *Common API Interface* – This interface establishes the basic set of driver functions and parameters required by the Graphics Primitive Layer to display graphics content on a Liquid Crystal Display. It also lists the initialization and deinitialization functions and parameters required by the application to establish a driver.

5.2.1.4.6 MPLAB Harmony Graphics Library Initialization Changes

This topic describes the initialization updates to the MPLAB Harmony Graphics Library.

Description

The Graphics Library include header files, [gfx_gol.h](#) and [gfx_primitive.h](#), have been updated as follows.

To initialize the library the call is now: [GFX_Initialize\(\)](#)

The default Graphics Library configuration is provided with the library distribution and consists of:

- drv_gfx_<driver>_config_template.h
- [gfx_config_template.h](#)

An example of the graphics initialization can be observed in each of the graphics demonstration distributions.

Note: Both the GOL and primitive layers implement the [GFX_Initialize\(\)](#) function; however, the primitive layer function will be over-ridden and not used if [gfx_gol.c](#) is compiled.

5.2.1.4.7 New MPLAB Harmony Graphics Library API Functions

This topic describes some of the important new API functions in the MPLAB Harmony Graphics Library.

Description

There are many new functions available that have been introduced to support the MPLAB Harmony philosophy. However, there is no concern for the porting process regarding the new API calls as the previous library implementation did not support this kind of service.

Existing applications will not port without using the new APIs:

- Initialization
- Steady-State

5.2.1.4.7.1 Main Program Changes

This topic describes the main program changes in the MPLAB Harmony Graphics Library.

Description

Main Program Changes

There are few changes that must be taken care of by the main program loop. A full working example is given with the file, [main.c](#), which is provided in all of the Graphics Library demonstrations.

The main program should call the following functions:

- [SYS_Initialize\(\)](#)
- [SYS_Tasks\(\)](#)
- [GFX_GOL_ObjectListDraw\(\)](#)

5.2.1.4.8 MPLAB Harmony Graphics Library Configuration Changes

This topic describes the configuration changes in the MPLAB Harmony Graphics Library.

Description

The stack configuration has a completely *new* structure. Each project has its own configuration folder that stores multiple configurations based on CPU platforms and hardware boards.

Note: The `MLA Hardware_Profile.h` file *cannot* be reused in the MPLAB Harmony Graphics Library.

The following is a list of the most important features:

- `system_config.h` – This file contains the working set of configuration definitions
- [gfx_config_template.h](#) – This file lists the entire possible graphics configuration definitions
- `bsp` – This is the parent directory that contains hardware configuration settings for particular Microchip development boards

5.2.1.4.8.1 MPLAB Harmony Graphics Library Configuration

This topic provides information on the configuration of the MPLAB Harmony Graphics Library.

Description

MPLAB Harmony Graphics Library Configuration

Note: This content was not available at time of release and will be added in a future release of MPLAB Harmony.

5.2.1.4.8.2 MPLAB Harmony Graphics Library BSP Configuration

This topic provides information on the BSP configuration of the MPLAB Harmony Graphics Library.

Description

MPLAB Harmony Graphics Library BSP Configuration

The MPLAB Harmony Graphics Library references the following BSP configurations:

- `bsp/meb` - contains board support content for the Multimedia Expansion Board and the Multimedia Expansion Board II (MEB II)
- `bsp/pcap` - contains board support content for the PIC32 mTouch Capacitive Touch Evaluation Board
- `bsp/pictail` - contains board support content for PICTail and subtending connectable liquid crystal displays (LCDs)

5.2.1.4.9 MPLAB Harmony Graphics Library Utilities

This topic describes the MPLAB Harmony Graphics Library utilities.

Description

The MPLAB Harmony Graphics Library includes the following utilities:

- Graphics Display Designer X (GDDX) - This utility can be used for designing and building graphical user interfaces (GUIs) from graphics objects
- Graphics Resource Converter (GRC) - This utility can be used for converting data into logically deployable entities that can be used in a graphics application

5.2.1.5 Porting Applications from the MLA Graphics Library to the MPLAB Harmony Graphics Library

Porting an application from the MLA Graphics Library into the Graphics Library within MPLAB Harmony consists of updating existing Graphics Library function names in your application to the new MPLAB Harmony function names.

5.2.1.5.1 MPLAB Harmony Graphics Library File Name Compliance

This topic provides header file name mapping tables that show the MLA Graphics Library file name and the compliant name within the MPLAB Harmony Graphics Library.

Description

The replacement names chosen to make existing Graphics Library functions compliant with MPLAB Harmony are shown in individual tables per header file name.

The files listed in the tables are located in the following two MPLAB Harmony installation folders:

. \harmony\<version>\framework\gfx

. \harmony\<version>\framework\gfx\src

The following table shows the original and new names used. Note that other than name changes, no other modifications were made to the middleware functions.

MLA Graphics Library File Name	MPLAB Harmony Graphics Library File Name
AnalogClock.h	gfx_gol_analog_clock.h
Button.h	gfx_gol_button.h
Chart.h	gfx_gol_chart.h
CheckBox.h	gfx_gol_check_box.h
DigitalMeter.h	gfx_gol_digital_meter.h
EditBox.h	gfx_gol_edit_box.h
GOL.h	gfx_gol.h
Graphics.h	gfx.h
Grid.h	gfx_gol_grid.h (not supported in this release)
GroupBox.h	gfx_gol_group_box.h
ListBox.h	gfx_gol_list_box.h
Meter.h	gfx_gol_meter.h
Palette.h	gfx_palette.h
Picture.h	gfx_picture.h
Primitive.h	gfx_primitive.h
ProgressBar.h	gfx_gol_progress_bar.h
Radiobutton.h	gfx_gol_radio_button.h
RoundDial.h	gfx_gol_round_dial.h
Slider.h	gfx_gol_scrollbar.h
StaticText.h	gfx_gol_static_text.h

TextEntry.h	gfx_gol_text_entry.h
Transitions.h	gfx_transitions.h
Window.h	gfx_gol_window.h

5.2.1.5.2 MPLAB Harmony Graphics Library Function Name Compliance

This topic provides header file function mapping tables that show the MLA Graphics Library function name and the compliant name within the MPLAB Harmony Graphics Library.

Description

The replacement function names chosen to make the existing MLA Graphics Library function compliant with MPLAB Harmony are shown in individual tables per header file name.

The files listed in the tables are located in the following MPLAB Harmony installation folder:
 .\harmony\<version>\framework\gfx.

Header File: [gfx_display_driver.h](#)

MLA Graphics Library Function Name	MPLAB Harmony Graphics Library Function Name
InitGraph()	GFX_PixelsPut()
PutPixel	GFX_BarFill()

5.2.2 Graphics Object Library

5.2.2.1 Introduction

Graphics Object Library

for

Microchip Microcontrollers

This library provides the API of the Graphics Object Library that is available on the Microchip family of microcontrollers with a convenient C language interface.

Description

This document explains how to get started with Microchip Graphics Library solution. It presents the available resources and where to obtain these resources. It also includes the Application Programming Interface (API) of the Microchip Graphics Library.

The Microchip %LibraryName% is highly modular and is optimized for Microchip's microcontrollers. Additionally, the library is free for Microchip customers, easy to use, and has an open documented interface for new driver support, which requires creation of only one C file.

The Microchip %LibraryName% Software %LibraryVersion% supports the following features:

- Configurable graphic resolution
- Up to 24-bit or 65K colors
- 2D objects such as line, circle, text, rectangle, polygon, bar
- 3D objects such as buttons, meter, dial, list box, edit box, check box, radio buttons, window, group box, slider.
- Image, animation
- Variety of user input device such as touch screen, keypad etc...

- Multiple fonts
- Unicode fonts
- PIC24 support, PIC32 support

5.2.2.2 Release Notes

MPLAB Harmony Version: v0.70b **Graphics Object Library Version :** 4.00 **Release Date:** 18Nov2013

New This Release:

This is the first release of the library.

Known Issues:

Nothing to report in this release.

5.2.2.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.2.2.4 Using the Library

This topic describes the basic architecture of the Graphics Object Library and provides information and examples on how to use it.

Interface Header File: gfx.h

The interface to the Graphics Object library is defined in the "gfx.h" header file. This file is included by the "app.h" file. Any C language source (.c) file that uses the Graphics Object library should include "gfx.h".

5.2.2.4.1 Abstraction Model

This library provides the API of the Graphics Object Library that is available on the Microchip family of microcontrollers with a convenient C language interface.

Description

Object Layer Software Abstraction Block Diagram

The Graphics Object Layer organization is shown on the figure below:

5.2.2.4.2 Library Overview

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the Object module.

- General Object Layer Functions
- Analog Clock Object Functions
- Button Object Functions
- Check Box Object Functions
- Chart Object Functions
- Custom Control Object Functions
- Digital Meter Object Functions
- Edit Box Object Functions
- Grid Object Functions
- Group Box Object Functions
- List Box Object Functions
- Meter Object Functions
- Progress Bar Object Functions
- Picture Object Functions
- Radio Button Object Functions
- Round Dial Object Functions
- Scrollbar Object Functions
- Static Text Object Functions
- Text Entry Object Functions
- Window Object Functions
- Draw Functions
- Image Functions

- Palette Functions
- Style Scheme Functions
- Global Variables
- Data Types and Constants

5.2.2.4.3 How the Library Works

5.2.2.4.3.1 Objects Functionality

5.2.2.4.3.1.1 Widget Objects

All the GOL objects that will be shown in the display have a corresponding data structure that keeps and maintains its parameters.

Each object type has a set of functions that enables the user to change the state of the object.

Each GOL object type uses a style scheme. The style scheme defines the font and color settings. User can create new style schemes and assign it to objects. Multiple style schemes can be used for different objects.

To efficiently manage the different objects the first 9 fields of the structure for each object are defined the same. Collectively they are referred to as the object header structure (GFX_OBJ_HEADER). Defining the GFX_OBJ_HEADER enables the common APIs to manage the objects of different types in the same manner.

The GOL operation is centered on two major processes. First is the rendering process and second is the messaging process. These processes make use of linked list objects. The field pNxtObj in GFX_OBJ_HEADER makes this possible. To manage the list a global pointer _pGoObjects is utilized. It defines the current active linked list. Newly created objects are automatically added to the end of this list. The active linked list is the list that the messaging and rendering operation parses to evaluate if the messages received affect the objects and if objects need to be redrawn.

The use of the _pGoObjects pointer also provides a way to easily manage objects. In applications where multiple pages are displayed on the screen, objects can be grouped according to pages. The pointer can be manipulated to switch from one page to another depending on the page currently shown on the screen.

Users can remove an object from a list by pointer manipulation. Objects that are removed from the list are not accessible by the rendering and messaging processes.

5.2.2.4.3.1.2 States

The GOL objects follow two types of states, the Property States and the Drawing States. Property States defines action and appearance of objects. Drawing States on the other hand indicate if the object needs to be hidden, partially redrawn, or fully redrawn in the display. To store the states, the field state defined in GFX_OBJ_HEADER structure is used. Six most significant bits are allocated for Drawing States and the rest is allocated for the Property States. Some common Property States and Drawing States are shown below.

- GFX_OBJ_STATE_FOCUSED
- GFX_OBJ_STATE_DISABLED
- GFX_OBJ_STATE_DRAW_FOCUS
- GFX_OBJ_STATE_DRAW
- GFX_OBJ_STATE_HIDE

Individual Object drawing function (e.g. BtnDraw(), SldDraw(), etc...) does not reset the draw states instead use GFX_OBJ_Draw() to automatically reset and manage the draw states. If the call to individual drawing function cannot be avoided, draw states must be reset manually after the drawing functions returns a 1.

5.2.2.4.3.1.3 Rendering

The library renders objects in a Non-Blocking manner. The Non-Blocking configuration is implemented by the use of drawing state machine. Each drawing functions groups the rendering steps into states. Every time a rendering step is executed, the drawing state is updated. Before each step is executed, the display device is checked if it is still busy with the previous rendering operation. If it is busy it returns a non-zero value. This indicates that the draw function must be called again to complete the

rendering. The drawing function can be called several times until rendering is completed.

The GOL level uses the active object linked list for drawing of objects. Each object's state in the list is parsed to determine if the object needs to be redrawn or not. The drawing order is from the head to the tail of the list. This sequence is executed by `GFX_OBJ_Draw()` function. The figure below explains the rendering loop of the `GFX_OBJ_Draw()` function.

The loop shows two exit points in the sequence. First is when the end of the list is reached and the second is when an `GFX_OBJ_Draw()` returns a NOT DONE status. Reaching the end of the list is a normal exit. This means that all the state

machines of the draw functions of each object have reset to default. Exiting with a NOT DONE status means that the latest executed draw function was pended and the object is not yet fully rendered. To complete the rendering, `GFX_OBJ_Draw()` function should be called again. The next call to `GFX_OBJ_Draw()` will pickup the rendering on the last object that returned a not DONE status. This operation makes the rendering functions non-blocking and gives opportunity to release control to program without waiting for the rendering completion.

When all objects in the active object linked list are drawn `GFX_OBJ_Draw()` calls user defined `GFX_OBJ_DrawCallback()` function. User drawing can be done in this callback function. If the function returns a zero, drawing of GOL objects in the active list is suspended. In this case color, clipping region, line type and graphic cursor will not be modified by GOL. If it returns a 1 drawing control is returned to GOL. `GFX_OBJ_Draw()` resume rendering of objects in the current active list. Inside the `GFX_OBJ_DrawCallback()` function, the active object list is not used by `GFX_OBJ_Draw()`. It is safe to perform modification of the list. Please refer to Configuration Settings to set Blocking or Non-Blocking configuration.

5.2.2.4.3.2 Messaging Functionality

To facilitate the processing of user actions on the objects, messaging are used.

User passes messages from the input devices to GOL using the GOL message structure. (See: `GFX_OBJ_MESSAGE` for structure information)

`GFX_OBJ_Message()` function accepts this structure and processes the message for all objects in the active list.

The messaging mechanism follows this flow:

1. User Interface Module (touch screen, keypad) sends a GOL message (the `GFX_OBJ_MESSAGE` structure).
2. A loop evaluates which object is affected by the message. This is done inside `GFX_OBJ_Message()` function.
3. Affected object returns the translated message based on the GOL message parameters.

4. User can change default action with the callback function. If the call back function returns a non-zero value message will be processed by default.
5. Object should be redrawn to reflect new state.

The translated message is a set of actions unique to each object type. Please refer to each object translated message ID for details.

Objects that are disabled will not [accept](#) any messages. `GFX_OBJ_Message()` function must be called when GOL drawing is completed. In this case all objects have been drawn and it is safe to change objects states. `GFX_OBJ_Message()` call can be done if `GFX_OBJ_Draw()` function returns non-zero or inside `GFX_OBJ_DrawCallback()` function.

5.2.2.4.3.3 Scheme Functionality

All objects uses a style scheme structure that defines the font and colors used. Upon the object's creation a user defined style scheme can be assigned to the object. In the absence of the user defined scheme, the default scheme is used.

(See: [GFX_GOL_OBJ_SCHEME](#) for structure information)

`TextColorDisabled` and `ColorDisabled` are used when the object is in the disabled state. Otherwise, `TextColor0`, `TextColor1`, `Color0` and `Color1` are used. When object Draw state is set to `GFX_OBJ_STATE_HIDE`, the `CommonBkColor` is used to fill area occupied by object.

Style scheme can be created with `GFX_OBJ_SchemeCreate()` function that returns a pointer to the newly created [GFX_GOL_OBJ_SCHEME](#) structure with default values automatically assigned.

The default values can be changed in the `gfx_gol_scheme_default.c` file.

The application code can define its own default style scheme by defining the macro `GFX_SCHEMEDEFAULT` in the `GraphicsConfig.h`.

Then, [GFX_GOL_OBJ_SCHEME](#) `GFX_OBJECT_SchemeDefault` must be defined in the application code with each structure member initialized to the desired values. See `GOLSchemeDefault.c` file for an example on how to initialize the style scheme.

5.2.2.5 Configuring the Library

The configuration of the Graphics Object Layer is based on the file `system_config.h`

This header file contains the configuration selection for the Graphics Object Layer. Based on the selections made, the Graphics Object Layer will support or not support selected features. These configuration settings will apply to all instances of the Graphics Object Layer.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.2.2.6 Building the Library

This section list the files that are available in the `\src` of the object driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

5.2.2.7 Library Interface

Data Types and Constants

	Name	Description
	CHARTPARAM	Defines the parameters for the CHART object.
	DATASERIES	Defines a variable for the CHART object. It specifies the number of samples, pointer to the array of samples for the data series and pointer to the next data series. A member of this structure (show) is used as a flag to determine if the series is to be drawn or not. Together with the smplStart and smplEnd it will determine what kind of chart will be drawn.
	FileFeof	This is type FileFeof.
	FileRead	Typedefs of the used File System APIs
	FileSeek	This is type FileSeek.
	FileTell	This is type FileTell.
	FONT_ORIENTATION	Types of orientation
	GFX_ALIGNMENT	Defines the types of text alignment. The text alignment is used in GFX_TextStringBoxDraw() .

5.2.2.7.1 General Object Layer Functions

5.2.2.7.1.1 GFX_GOL_DrawCallbackSet Function

C

```
void GFX_GOL_DrawCallbackSet(
    GFX_GOL_DRAW_CALLBACK_FUNC pFunc
);
```

Description

This function sets the draw callback function that the application will use to call primitive function to implement application specific shapes. See [GFX_GOL_DRAW_CALLBACK_FUNC](#) definition for details on the draw callback function.

Preconditions

None.

Parameters

Parameters	Description
pFunc	pointer to the draw callback function.

Returns

None.

Example

None.

5.2.2.7.1.2 GFX_GOL_MessageCallbackSet Function

C

```
void GFX_GOL_MessageCallbackSet(
    GFX_GOL_MESSAGE_CALLBACK_FUNC pFunc
)
```

```
);
```

Description

This function sets the message callback function that the application will use to evaluate user inputs that affects the objects and application behavior. The callback function location is specified by the function pointer supplied in the call. See GFX_GOL_MESSAGE_CALLBACK_FUNC definition for details on the message callback function.

Preconditions

None.

Parameters

Parameters	Description
pFunc	pointer to the message callback function.

Returns

None.

Example

None.

5.2.2.7.1.3 GFX_GOL_ObjectAdd Function

C

```
void GFX_GOL_ObjectAdd(
    GFX_GOL_OBJ_HEADER * pObject
);
```

Description

This function adds an object to the tail of the currently active list. The new list tail is set to point to NULL after the new object is added.

Preconditions

None.

Returns

None.

Example

```
void MoveObject(    GFX_GOL_OBJ_HEADER *pSrcList,
                   GFX_GOL_OBJ_HEADER *pDstList,
                   GFX_GOL_OBJ_HEADER *pObjtoMove)
{
    GFX_GOL_OBJ_HEADER *pTemp = pSrcList;

    if(pTemp != pObjtoMove)
    {
        while(pTemp->pNxtObj != pObjtoMove)
            pTemp = pTemp->pNxtObj;
    }

    pTemp->pNxtObj = pObjtoMove->pNxt; // remove object from list
    GFX_GOL_ObjectListSet(pDstList); // destination as active list
    GFX_GOL_ObjectAdd(pObjtoMove);   // add object to active list
}
```

5.2.2.7.1.4 GFX_GOL_ObjectBackGroundSet Function

C

```
void GFX_GOL_ObjectBackGroundSet(  
    GFX_GOL_OBJ_HEADER * pObjectHeader  
)  
;
```

Description

This function sets the background information. This is an internal function and should not be called by the application. This function is used by object's drawing functions to set the background information.

Preconditions

None.

Returns

None.

Example

None.

5.2.2.7.1.5 GFX_GOL_ObjectByIDDelete Function

C

```
GFX_STATUS GFX_GOL_ObjectByIDDelete(  
    uint16_t id  
)  
;
```

Description

This function removes an object with the given user defined ID from the currently active list. Aside from the removal of the object from the list, the RAM resources consumed by the object is also freed.

If there is no object with the given ID, the function exits with GFX_STATUS_FAILURE.

Preconditions

None.

Returns

GFX_STATUS_SUCCESS - is returned if the removal was successful. GFX_STATUS_FAILURE - is returned if the removal was not successful.

Example

TODO:Add example code

5.2.2.7.1.6 GFX_GOL_ObjectCanBeFocused Function

C

```
GFX_STATUS GFX_GOL_ObjectCanBeFocused(  
    GFX_GOL_OBJ_HEADER * pObject  
)  
;
```

Description

This function checks if the object can be focused or not. If the object can be focused, it returns GFX_STATUS_SUCCESS. If it cannot be focused, it returns GFX_STATUS_FAILURE. Selected objects have the focus feature. Refer to the object documentation for details.

Objects that do not support focus feature will ignore any focus settings.

If the object is disabled it cannot be set to focused state.

Preconditions

None.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

GFX_STATUS_SUCCESS - when the object can be focused GFX_STATUS_FAILURE - when the object cannot be focused or do not support the focus feature.

Example

TODO:Add example code here

5.2.2.7.1.7 GFX_GOL_ObjectDelete Function**C**

```
GFX_STATUS GFX_GOL_ObjectDelete(  
    GFX_GOL_OBJ_HEADER * pObject  
);
```

Description

This function removes an object from the currently active list. Aside from the removal of the object from the list, the RAM resources consumed by the object is also freed.

Preconditions

None.

Returns

GFX_STATUS_SUCCESS - is returned if the removal was successful. GFX_STATUS_FAILURE - is returned if the removal was not successful.

Example

TODO:Add example code

5.2.2.7.1.8 GFX_GOL_ObjectDrawDisable Function**C**

```
void GFX_GOL_ObjectDrawDisable(  
    GFX_GOL_OBJ_HEADER * pObject  
);
```

Description

This function resets the drawing state bits of the object. This function can be called to cancel any drawing state bits that has been set or clears all the drawing state bits after the object has been redrawn.

Preconditions

None.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

None.

Example

None.

5.2.2.7.1.9 GFX_GOL_ObjectDrawEnable Function**C**

```
void GFX_GOL_ObjectDrawEnable(
    GFX_GOL_OBJ_HEADER * pObject
);
```

Description

This function sets the object to be redrawn. For the redraw to be effective, the object must be in the current active list. If not, the redraw action will not be performed until the list where the object is currently inserted will be set as the active list.

Preconditions

None.

Parameters

Parameters	Description
pObject	pointer to the object that will be redrawn.

Returns

None.

Example

```
void GOLRedrawRec(uint16_t left, uint16_t top,
                  uint16_t right, uint16_t bottom)
{
    GFX_GOL_OBJ_HEADER *pCurrentObj;
    int overlapX, overlapY;

    pCurrentObj = _pGolObjects;
    while(pCurrentObj != NULL)
    {
        overlapX = overlapY = 0;

        // check overlaps in x direction
        if (((pCurrentObj->left <= left) && (pCurrentObj->right >= left)) ||
            ((pCurrentObj->left <= right) && (pCurrentObj->right >= right)) ||
            ((pCurrentObj->left <= left) && (pCurrentObj->right >= right)) ||
            ((pCurrentObj->left >= left) && (pCurrentObj->right <= right))
        )
            overlapX = 1;

        // check overlaps in y direction
        if (((pCurrentObj->top <= top) && (pCurrentObj->bottom >= top)) ||
            ((pCurrentObj->top <= bottom) && (pCurrentObj->bottom >= bottom)) ||
            ((pCurrentObj->top <= top) && (pCurrentObj->bottom >= bottom)) ||
            ((pCurrentObj->top >= top) && (pCurrentObj->bottom <= bottom))
        )
            overlapY = 1;
    }
}
```

```

        ((pCurrentObj->top >= top)    && (pCurrentObj->bottom <= bottom))
    )
    overlapY = 1;

    // when any portion of the widget is touched by the defined rectangle the
    // x and y overlaps will exist.
    if (overlapX & overlapY) {
        GFX_GOL_ObjectRedraw(pCurrentObj);
    }

    pCurrentObj = (GFX_GOL_OBJ_HEADER *)pCurrentObj->pNxtObj;
    //end of while
}
}

```

5.2.2.7.1.10 GFX_GOL_ObjectFind Function

C

```

GFX_GOL_OBJ_HEADER * GFX_GOL_ObjectFind(
    uint16_t ID
);

```

Description

This function returns the pointer to object in the list with the user defined ID assigned to it.

Preconditions

None.

Returns

The pointer to the object in the list with the given ID.

Example

```

void CopyObject(GFX_GOL_OBJ_HEADER *pSrcList,
                GFX_GOL_OBJ_HEADER *pDstList,
                uint16_t ID)
{
    GFX_GOL_OBJ_HEADER *pTemp;

    // find the object
    pTemp = GFX_GOL_ObjectFind(ID);

    if (pTemp != NULL)
    {
        // destination as active list
        GFX_GOL_ObjectSetList(pDstList);

        // add object to active list
        GFX_GOL_ObjectAdd(pTemp);
    }
}

```

5.2.2.7.1.11 GFX_GOL_ObjectFocusGet Function

C

```

GFX_GOL_OBJ_HEADER * GFX_GOL_ObjectFocusGet();

```

Description

This function returns the pointer to the object that is currently receiving keyboard input (or focused).

If there are no object that can **accept** keyboard messages, then the function will return NULL.

Objects that can be focused are those objects that can receive keyboard inputs.

Preconditions

None.

Returns

The pointer the currently focused object. Returns NULL if there is no object currently set.

Example

TODO:Add example code here

5.2.2.7.1.12 GFX_GOL_ObjectFocusNextGet Function**C**

```
GFX_GOL_OBJ_HEADER * GFX_GOL_ObjectFocusNextGet();
```

Description

This function returns the pointer to the next object in the active list of objects which can be focused.

The reference point is the currently focused object. If there is no currently focused object, the searched starts from the beginning of the active list of objects.

Objects that can be focused are those objects that can receive keyboard inputs.

If there is no object capable of receiving keyboard inputs (i.e. none can be focused) NULL is returned.

Preconditions

None.

Returns

The pointer to the object that can be focused.

Example

TODO:Add example code here

5.2.2.7.1.13 GFX_GOL_ObjectFocusPrevGet Function**C**

```
GFX_GOL_OBJ_HEADER * GFX_GOL_ObjectFocusPrevGet();
```

Description

This function returns the pointer to the previous object in the active list of objects which can be focused.

The reference point is the currently focused object. If there is no currently focused object, the searched starts from the beginning of the active list of objects.

Objects that can be focused are those objects that can receive keyboard inputs.

If there is no object capable of receiving keyboard inputs (i.e. none can be focused) NULL is returned.

Preconditions

None.

Returns

The pointer to the object that can be focused.

Example

TODO:Add example code here

5.2.2.7.1.14 GFX_GOL_ObjectFocusSet Function

C

```
GFX_STATUS GFX_GOL_ObjectFocusSet(  
    GFX_GOL_OBJ_HEADER * pObject  
);
```

Description

This function sets the specified object to be focused.

If the object cannot [accept](#) keyboard messages, the object will not be set to focused state. If the object can [accept](#) keyboard messages, then the focus state will be set and will be marked to be redrawn to show the focus when the focus feature is enabled.

Objects that can be focused are those objects that can receive keyboard inputs.

Preconditions

None.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

GFX_STATUS_SUCCESS - when the object can be focused
GFX_STATUS_FAILURE - when the object cannot be focused or do not support the focus feature.

Example

TODO:Add example code here

5.2.2.7.1.15 GFX_GOL_ObjectHideDraw Function

C

```
GFX_STATUS GFX_GOL_ObjectHideDraw(  
    GFX_GOL_OBJ_HEADER * pObject  
);
```

Description

This is function GFX_GOL_ObjectHideDraw.

5.2.2.7.1.16 GFX_GOL_ObjectIDGet Function

C

```
uint16_t GFX_GOL_ObjectIDGet(  
    GFX_GOL_OBJ_HEADER * pObject  
);
```

Description

This function returns the user defined ID assigned to the object.

Preconditions

None.

Returns

The user defined ID of the object.

Example

```

void ExampleUsageOfGettingID(GFX_GOL_OBJ_HEADER *pObject)
{
    uint16_t id;

    switch(id = GFX_GOL_ObjectIDGet(pObject))
    {
        case ID_WINDOW1:
            // do something
        case ID_WINDOW2:
            // do something else
        case ID_WINDOW3:
            // do something else
        default:
            // do something else
    }
}

```

5.2.2.7.1.17 GFX_GOL_ObjectIsRedrawSet Function**C**

```

bool GFX_GOL_ObjectIsRedrawSet(
    GFX_GOL_OBJ_HEADER * pObject
);

```

Description

This function checks if the object needs to be redrawn or not. The function returns true if it is to be redrawn or false if it is not to be redrawn.

Preconditions

None.

Parameters

Parameters	Description
pObject	pointer to the object that will be checked.

Returns

true - when the object needs to be redrawn. false - when the object does not need to be redrawn.

Example

```

int DrawButtonWindowOnly()
{
    static GFX_GOL_OBJ_HEADER *pCurrentObj = NULL;
    uint16_t done = 0;

    if (pCurrentObj == NULL)
    {
        // get current list
        pCurrentObj = GFX_GOL_ObjectListGet();
    }

    while(pCurrentObj != NULL)
    {
        if(GFX_GOL_ObjectIsRedrawSet(pCurrentObj) == true)
        {
            done = pCurrentObj->draw(pCurrentObj);

            // reset state of object if done
            if (done)
                GOLDrawComplete(pCurrentObj)
        }
    }
}

```

```

        // Return if not done. This means that Button Draw function
        // was not able to finish redrawing the object
        // and must be called again to finish rendering of
        // objects in the list that have new states.
    else
        return 0;
    }
    // go to the next object in the list
    pCurrentObj = pCurrentObj->pNxtObj;
}
return 1;
}

```

5.2.2.7.1.18 GFX_GOL_ObjectListDraw Function

C

```
GFX_STATUS GFX_GOL_ObjectListDraw();
```

Description

This function loops through the active list and redraws objects that need to be redrawn. Partial redrawing or full redraw is performed depending on the drawing states of the objects.

GFX_GOL_ObjectDrawCallback() function is called by GFX_GOL_ObjectListDraw() when drawing of objects in the active list is completed. GFX_GOL_ObjectDrawCallback() is an application implemented function that allows the application the opportunity to insert application specific rendering using Primitive Layer rendering functions.

The GFX_GOL_ObjectListDraw() function can return with GFX_STATUS_BUSY. In this case, it indicates that the currently redrawn object is not able to continue. Application needs to call GFX_GOL_ObjectListDraw() again to continue the redraw of the objects in the list.

Preconditions

None.

Returns

GFX_STATUS_SUCCESS - is returned when the active list is completely parsed and redrawn. GFX_STATUS_BUSY - is returned when the active list is not completely parsed and redrawn.

Example

```

// Assume objects are created & states are set to draw objects
while(1)
{
    // parse active list and redraw objects
    // that needs to be redrawn
    if( GFX_GOL_ObjectListDraw() == GFX_STATUS_SUCCESS)
    {
        // at this point drawing is completed
        // it is safe to modify objects states and linked list

        // evaluate messages from touch screen device
        TouchGetMsg(&msg);

        // evaluate each object is affected by the message
        GFX_GOL_ObjectMessage(&msg);
    }
}

```

5.2.2.7.1.19 GFX_GOL_ObjectListFree Function

C

```
GFX_STATUS GFX_GOL_ObjectListFree();
```

Description

This function frees all the memory used by objects in the active list and initializes the active list pointer to NULL to start a new empty list. This function must be called only inside the `GFX_GOL_ObjectDrawCallback()` function when using `GFX_GOL_ObjectListDraw()` and `GFX_GOL_ObjectMessage()` functions. This requirement assures that primitive rendering settings are not altered by the rendering state machines of the objects.

Preconditions

None.

Returns

`GFX_STATUS_SUCCESS` - is returned if the free was successful. `GFX_STATUS_FAILURE` - is returned if the free was not successful.

Example

```
void DeletePage(GFX_GOL_OBJ_HEADER *pPage)
{
    GFX_GOL_OBJ_HEADER *pTemp;

    // assuming pPage is different from the current active list
    // save the active list
    pTemp = GFX_GOL_ObjectListGet();

    // set list as active list
    GFX_GOL_ObjectListSet(pPage);

    // pPage objects are deleted
    GFX_GOL_ObjectListFree();

    // restore the active list
    GFX_GOL_ObjectListSet(pTemp);
}
```

5.2.2.7.1.20 GFX_GOL_ObjectListGet Function**C**

```
GFX_GOL_OBJ_HEADER * GFX_GOL_ObjectListGet();
```

Description

This function returns the pointer to the current active.

Preconditions

None.

Returns

Pointer (type `GFX_GOL_OBJ_HEADER`) to the current active list.

Example

See `GFX_GOL_ObjectListNew()` for example code.

5.2.2.7.1.21 GFX_GOL_ObjectListNew Function**C**

```
GFX_STATUS GFX_GOL_ObjectListNew();
```

Description

This function starts a new linked list of objects and resets the keyboard focus to none. This function assigns the current active list

and current focused object (receiving keyboard inputs) object pointers to NULL. Any keyboard inputs at this point will be ignored.

This function does not erase the objects in the previous list. Application must save the previous list to another pointer if to be referenced later. If not needed anymore, memory used by that list should be freed by [GFX_GOL_ObjectListFree\(\)](#) function. In this case, freeing the list with [GFX_GOL_ObjectListFree\(\)](#) function has the same effect as [GFX_GOL_ObjectListNew\(\)](#) where the current active list is empty.

Preconditions

None.

Returns

GFX_STATUS_SUCCESS - is returned if the new list start was successful. GFX_STATUS_FAILURE - is returned if the new list start was not successful.

Example

```
// assume pointers to objects (pButton, pWindow and pSlider
// are initialized to objects already created
// GFX_GOL_OBJ_HEADER *pButton;
// GFX_GOL_OBJ_HEADER *pWindow;
// GFX_GOL_OBJ_HEADER *pSlider;

GFX_GOL_OBJ_HEADER *pSave;

// save current list
pSave = GFX_GOL_ObjectListGet();

// start the new list, after the start of the list, the
// current active list is empty.
GFX_GOL_ObjectListNew();

// assume that objects are already created
// you can now add objects to the new list
GFX_GOL_ObjectAdd(pButton);
GFX_GOL_ObjectAdd(pWindow);
GFX_GOL_ObjectAdd(pSlider);
```

5.2.2.7.1.22 GFX_GOL_ObjectListSet Function

C

```
GFX_STATUS GFX_GOL_ObjectListSet(
    GFX_GOL_OBJ_HEADER * pList
);
```

Description

This function sets the active list to the new list. The previous list will still exist in memory. Application must save the previous list before the set is called if the previous list will be referenced later. If the previous list is not needed anymore, then the list must be removed from memory by [GFX_GOL_ObjectListFree\(\)](#) function.

Setting the active list to the new list will reset the focused pointer object to NULL.

Preconditions

None.

Returns

GFX_STATUS_SUCCESS - is returned if the set was successful. GFX_STATUS_FAILURE - is returned if the set was not successful.

Example

```
GFX_GOL_OBJ_HEADER *pSave;
```

```

// save current list
pSave = GFX_GOL_ObjectListSet();

// start the new list
GFX_GOL_ObjectListNew();

// you can now add objects to the current list
// assume that objects are already created
GFX_GOL_ObjectAdd(pButton);
GFX_GOL_ObjectAdd(pWindow);
GFX_GOL_ObjectAdd(pSlider);

// do something here on the new list

// return the old list
GOLSetList(pSave);

```

5.2.2.7.1.23 GFX_GOL_ObjectMessage Function

C

```

void GFX_GOL_ObjectMessage(
    GFX_GOL_MESSAGE * pMsg
);

```

Description

This function receives a [GFX_GOL_MESSAGE](#) message from user and loops through the active list of objects to check which object is affected by the message. For affected objects the message is translated and `GFX_GOL_ObjectMessageCallback()` is called. In the call back function, user has the ability to implement action for the message. If the call back function returns non-zero, `OBJMsgDefault()` is called to process message for the object by default. If zero is returned `OBJMsgDefault()` is not called. Please refer to GOL Messages section for details.

Preconditions

None.

Parameters

Parameters	Description
pMessage	Pointer to the message from user.

Returns

None.

Example

```

// Assume objects are created & states are set to draw objects
while (1)
{
    if(GOLDDraw())
    {
        // GOL drawing is completed here
        // it is safe to change objects

        // from user interface module
        TouchGetMsg(&msg);
        // process the message
        GFX_GOL_ObjectMessage(&msg);
    }
}

```

5.2.2.7.1.24 GFX_GOL_ObjectNextGet Function

C

```
GFX_GOL_OBJ_HEADER * GFX_GOL_ObjectNextGet(
    GFX_GOL_OBJ_HEADER * pObject
);
```

Description

This function returns the pointer to next object in the list after the specified object.

Preconditions

None.

Returns

The pointer to the next object in the list.

Example

```
void RedrawButtons(void)
{
    GFX_GOL_OBJ_HEADER *pCurr;

    // get active list
    pCurr = GFX_GOL_ObjectListGet();

    while(pCurr->pNxtObj != NULL)
    {
        // just select button objects and redraw them
        if (GFX_GOL_ObjectTypeGet(pCurr) == BUTTON)
        {
            // set to be redrawn
            pCurr->state = BTN_DRAW;
        }
        pCurr = GFX_GOL_ObjectNextGet(pCurr);
    }
    // redraw all buttons in the active list
    GFX_GOL_ObjectListDraw();
}
```

5.2.2.7.1.25 GFX_GOL_ObjectRectangleRedraw Function

C

```
void GFX_GOL_ObjectRectangleRedraw(
    uint16_t left,
    uint16_t top,
    uint16_t right,
    uint16_t bottom
);
```

Description

This function marks all objects in the active list intersected by the given rectangular area to be redrawn.

After calling this function, the next call to [GFX_GOL_ObjectListDraw\(\)](#) will redraw all objects that are marked for redraw.

Preconditions

None.

Parameters

Parameters	Description
left	Defines the left most border of the rectangle area.
top	Defines the top most border of the rectangle area.
right	Defines the right most border of the rectangle area.
bottom	Defines the bottom most border of the rectangle area.

Returns

None.

Example

```

GFX_GOL_OBJ_HEADER *pTemp;
GFX_GOL_OBJ_HEADER *pAllObjects;

// assume *pAllObjects points to a list of all existing objects
// created and initialized

// mark all objects inside the rectangle to be redrawn
GOLRedrawRec(10,10,100,100);

// save the current active list
pTemp = pAllObjects;

// reset active list
GFX_GOL_ObjectListNew();

// build the new active list with only those objects that
// are marked to be redrawn
while(pTemp->pNxtObj != NULL)
{
    if (pTemp->state&0x7C00)
        GFX_GOL_ObjectAdd(pTemp);

    pTemp = pTemp->pNxtObj;
}

// redraw active list
GFX_GOL_ObjectListDraw();

```

5.2.2.7.1.26 GFX_GOL_ObjectTypeGet Function**C**

```

GFX_GOL_OBJ_TYPE GFX_GOL_ObjectTypeGet(
    GFX_GOL_OBJ_HEADER * pObject
);

```

Description

This function returns the object type. The object type is one of the defined enumerated types of [GFX_GOL_OBJ_TYPE](#).

Preconditions

None.

Returns

The type of the object. The type is one of the defined enumerated types of [GFX_GOL_OBJ_TYPE](#).

Example

TODO:Add example code here

5.2.2.7.1.27 GFX_GOL_PanelAlphaParameterSet Function

C

```
void GFX_GOL_PanelAlphaParameterSet(  
    uint16_t alphaValue  
)  
;
```

Description

This is function GFX_GOL_PanelAlphaParameterSet.

5.2.2.7.1.28 GFX_GOL_PanelBackgroundSet Function

C

```
void GFX_GOL_PanelBackgroundSet(  
    GFX_GOL_OBJ_HEADER * pObjectHeader  
)  
;
```

Description

This is function GFX_GOL_PanelBackgroundSet.

5.2.2.7.1.29 GFX_GOL_PanelDraw Function

C

```
GFX_STATUS GFX_GOL_PanelDraw();
```

Description

This is function GFX_GOL_PanelDraw.

5.2.2.7.1.30 GFX_GOL_PanelGradientParameterSet Function

C

```
void GFX_GOL_PanelGradientParameterSet(  
    GFX_COLOR startColor,  
    GFX_COLOR endColor  
)  
;
```

Description

This is function GFX_GOL_PanelGradientParameterSet.

5.2.2.7.1.31 GFX_GOL_PanelParameterSet Function

C

```
void GFX_GOL_PanelParameterSet(  
    uint16_t left,  
    uint16_t top,  
    uint16_t right,  
    uint16_t bottom,  
    uint16_t radius,  
    GFX_COLOR faceClr,  
    GFX_COLOR embossLtClr,  
    GFX_COLOR embossDkClr,  
    GFX_RESOURCE_HDR * pBitmap,  
    GFX_FILL_STYLE fillStyle,  
    uint16_t embossSize  
)  
;
```

Description

This is function GFX_GOL_PanelParameterSet.

5.2.2.7.1.32 GFX_GOL_TwoTonePanelDraw Function**C**

```
GFX_STATUS GFX_GOL_TwoTonePanelDraw();
```

Description

This is function GFX_GOL_TwoTonePanelDraw.

5.2.2.7.2 Analog Clock Object Functions**5.2.2.7.2.1 GFX_AnalogClockCreate Function****C**

```
GFX_GOL_ANALOGCLOCK * GFX_AnalogClockCreate(
    uint16_t ID,
    short left,
    short top,
    short right,
    short bottom,
    short hour,
    short minute,
    short radius,
    bool sechand,
    uint16_t state,
    void * pBitmap,
    GFX_GOL_OBJ_SCHEME * pScheme
);
```

Description

This function creates a analog clock at the given position using state, radius, pBitmap, pText, and pScheme.

Preconditions

None.

Parameters

Parameters	Description
ID	Unique user defined ID for the object instance.
left	Left most position of the object.
top	Top most position of the object.
right	Right most position of the object.
bottom	Bottom most position of the object.
hour	Initial hour value.
minute	Initial minute value.
radius	Sets the radius of the clock.
sechand	Flag to indicate if the second hand will be drawn or not.
state	Sets the initial state of the object.
pBitmap	Pointer to the bitmap used on the face of the analog clock dimension of the image must match the dimension of the widget.
pScheme	Pointer to the style scheme used

Returns

Returns a pointer to the digital meter.

Example

```
GFX_GOL_SCHEME *pScheme;
uint16_t state;

pScheme = GFX_GOL_SCHEMECreate();
state = AC_DRAW;

AnalogClock = GFX_AnalogClock_Create(ANALOGCLOCK_ID, 20, 64, 50, 118,
1, 20, 30, FALSE, state, NULL, pScheme);
```

Remarks:

5.2.2.7.2.2 GFX_GOL_AnalogClockDraw Function**C**

```
GFX_STATUS GFX_GOL_AnalogClockDraw(
    void * pAc
);
```

Description

This function renders the object on the screen using the current parameter settings. Location of the object is determined by the left, top, right and bottom parameters. The colors used are dependent on the state of the object. The font used is determined by the style scheme set.

Preconditions

Object must be created before this function is called.

Parameters

Parameters	Description
pAc	Pointer to the object to be rendered.

Returns

Returns the status of the drawing

- 1 - If the rendering was completed and
- 0 - If the rendering is not yet finished.

Next call to the function will resume the rendering on the pending drawing state.

Side Effects

none

Example

```
void MyGOLDraw(){
    static GFX_OBJ_HEADER *pCurrentObj = NULL;
    int done;

    // There are no objects
    if(GFX_OBJ_ListGet() == NULL)
        return;

    // If it's last object jump to head
    if(pCurrentObj == NULL)
        pCurrentObj = GFX_OBJ_ListGet();
```

```

done = 0;

// this only process Button and Window
while(pCurrentObj != NULL){
    // check if object state indicates redrawing
    if(pCurrentObj->state&0xFC00) {
        switch(pCurrentObj->type){
            case OBJ_ANALOGCLOCK:
                done = AcDraw((ANALOGCLOCK*)pCurrentObj);
                break;
            case OBJ_WINDOW:
                done = WndDraw((WINDOW*)pCurrentObj);
                break;
            default:
                done = 1;
                break;
        }
        if(done){
            // reset only the state if drawing was finished
            pCurrentObj->state = 0;
        }else{
            // done processing the list
            return;
        }
    }
    // go to next object
    pCurrentObj = pCurrentObj->pNxtObj;
}
}

```

5.2.2.7.2.3 GFX_GOL_AnalogClockHandsDraw Function

C

```

GFX_STATUS GFX_GOL_AnalogClockHandsDraw(
    GFX_GOL_ANALOGCLOCK * pAc,
    short hand,
    short thickness,
    GFX_COLOR color
);

```

Description

Draws the current position of the clock hands with the given thickness and color.

Preconditions

none

Parameters

Parameters	Description
pAc	The pointer to the object whose hands will be modified.
hand	which hand to be drawn (second, minute, hour)
thickness	thickness to draw the hand
color	color to draw the hand
*pBitmap	bitmap background to be redrawn

Returns

none

Side Effects

none

5.2.2.7.2.4 GFX_GOL_AnalogClockHourSet Function

C

```
void GFX_GOL_AnalogClockHourSet(  
    GFX_GOL_ANALOGCLOCK * pAc,  
    short hour  
);
```

Description

Sets the hour value of the analog clock.

Preconditions

none

Parameters

Parameters	Description
pAc	The pointer to the object whose hands will be modified.
hour	New hour time.

Returns

none

Side Effects

none

5.2.2.7.2.5 GFX_GOL_AnalogClockMinuteSet Function

C

```
void GFX_GOL_AnalogClockMinuteSet(  
    GFX_GOL_ANALOGCLOCK * pAc,  
    short minute  
);
```

Description

Sets the minute value of the analog clock.

Preconditions

none

Parameters

Parameters	Description
pAc	The pointer to the object whose hands will be modified.
minute	New minute time.

Returns

none

Side Effects

none

5.2.2.7.2.6 GFX_GOL_AnalogClockSecondSet Function

C

```
void GFX_GOL_AnalogClockSecondSet(
    GFX_GOL_ANALOGCLOCK * pAc,
    short second
);
```

Description

Sets the second value of the analog clock.

Preconditions

none

Parameters

Parameters	Description
pAc	The pointer to the object whose hands will be modified.
second	New second time.

Returns

none

Side Effects

none

5.2.2.7.3 Button Object Functions

5.2.2.7.3.1 GFX_GOL_ButtonActionGet Function

C

```
GFX_GOL_TRANSLATED_ACTION GFX_GOL_ButtonActionGet(
    void * pObject,
    GFX_GOL_MESSAGE * pMessage
);
```

Description

This function evaluates the message from a user if the message will affect the object or not. The table below enumerates the action for each event of the touch screen and keyboard inputs.

Translated Message	Input Source	Set/Clear State Bit	Description
GFX_GOL_BUTTON_ACTION_PRESSED	Touch Screen	EVENT_PRESS, EVENT_MOVE	If events occurs and the x,y position falls in the face of the GFX_GOL_BUTTON while the GFX_GOL_BUTTON is not pressed.
	Keyboard	EVENT_KEYSCAN	If event occurs and parameter1 passed matches the object's ID and parameter 2 passed matches SCAN_CR_PRESSED or SCAN_SPACE_PRESSED while the GFX_GOL_BUTTON is not pressed.

GFX_GOL_BUTTON_ACTION_STILLPRESSED	Touch Screen	EVENT_STILLPRESS	If event occurs and the x,y position does not change from the previous press position in the face of the GFX_GOL_BUTTON .
GFX_GOL_BUTTON_ACTION_RELEASED	Touch Screen	EVENT_RELEASE	If the event occurs and the x,y position falls in the face of the GFX_GOL_BUTTON while the GFX_GOL_BUTTON is pressed.
	Keyboard	EVENT_KEYSCAN	If event occurs and parameter1 passed matches the object's ID and parameter 2 passed matches SCAN_CR_RELEASED or SCAN_SPACE_RELEASED while the GFX_GOL_BUTTON is pressed.
GFX_GOL_BUTTON_ACTION_CANCELPRESS	Touch Screen	EVENT_MOVE	If the event occurs outside the face of the GFX_GOL_BUTTON and the GFX_GOL_BUTTON is currently pressed.
GFX_GOL_OBJECT_ACTION_INVALID	Any	Any	If the message did not affect the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	The pointer to the object where the message will be evaluated to check if the message will affect the object.
pMessage	Pointer to the the message from the user interface.

Returns

- GFX_GOL_BUTTON_ACTION_PRESSED â€œ Object is pressed
- GFX_GOL_BUTTON_ACTION_RELEASED â€œ Object is released
- GFX_GOL_BUTTON_ACTION_CANCELPRESS â€œ Object will be released, user cancels press action on the [GFX_GOL_BUTTON](#)
- GFX_GOL_OBJECT_ACTION_INVALID â€œ Object is not affected

Example

None.

5.2.2.7.3.2 GFX_GOL_ButtonActionSet Function**C**

```
void GFX_GOL_ButtonActionSet(
    GFX_GOL_TRANSLATED_ACTION translatedMsg,
    void * pObject,
    GFX_GOL_MESSAGE * pMessage
);
```

Description

This function performs the state change of the object based on the translated action. This change can be overridden by the application using the application defined GFX_GOL_MESSAGE_CALLBACK_FUNC. When the user message is determined to affect the object, application can perform the state change in the message callback function. The following state changes are supported:

Translated Message	Input Source	Set/Clear State Bit	Description
GFX_GOL_BUTTON_ACTION_PRESSED	Touch Screen,	Set GFX_GOL_BUTTON_PRESSED_STATE	Button will be redrawn in the pressed state.
	Keyboard		
GFX_GOL_BUTTON_ACTION_RELEASED	Touch Screen,	Clear GFX_GOL_BUTTON_PRESSED_STATE	Button will be redrawn in the released state.
	Keyboard		
GFX_GOL_BUTTON_ACTION_CANCELPRESS	Touch Screen,	Clear GFX_GOL_BUTTON_PRESSED_STATE	Button will be redrawn in the released state.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
translatedMsg	The action of the object based on the message.
pObject	The pointer to the object whose state will be modified.
pMessage	The pointer to the original message.

Returns

None.

Example

None.

5.2.2.7.3.3 GFX_GOL_ButtonCreate Function**C**

```
GFX_GOL_BUTTON * GFX_GOL_ButtonCreate(
    uint16_t ID,
    uint16_t left,
    uint16_t top,
    uint16_t right,
    uint16_t bottom,
    uint16_t radius,
    uint16_t state,
    GFX_RESOURCE_HDR * pPressImage,
    GFX_RESOURCE_HDR * pReleaseImage,
    GFX_XCHAR * pText,
    GFX_ALIGNMENT alignment,
    GFX_GOL_OBJ_SCHEME * pScheme
);
```

Description

This function creates a [GFX_GOL_BUTTON](#) object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

This function returns the pointer to the newly created object. If the object is not successfully created, it returns NULL.

The object allows setting two images. One for the pressed state and the other for the release state. If no image is to be used for the object set both pointers to NULL.

If only one image is used for both pressed and released state, set both pPressImage and pReleaseImage to the same image.

The behavior of GFX_GOL_ButtonCreate() will be undefined if one of the following is true:

- left >= right
- top >= bottom
- pScheme is not pointing to a [GFX_GOL_OBJ_SCHEME](#)
- pPressImage and pReleaseImage is not pointing to a [GFX_RESOURCE_HDR](#).
- pText is an unterminated string

Preconditions

None.

Parameters

Parameters	Description
ID	Unique user defined ID for the object instance.
left	Left most position of the object.
top	Top most position of the object.
right	Right most position of the object.
bottom	Bottom most position of the object.
radius	Radius of the rounded edge. When using gradient buttons and radius != 0, emboss size <= radius. If this is not met, the the GFX_GOL_BUTTON face will not have gradient effect.
state	Sets the initial state of the object.
pPressImage	Pointer to the image used on the face of the object when it is in the pressed state.
pReleaseImage	Pointer to the image used on the face of the object when it is in the pressed state.
pText	Pointer to the text of the object.
alignment	text alignment of the text used in the object.
pScheme	Pointer to the style scheme used.

Returns

Pointer to the newly created object.

Example

```
GFX_GOL_OBJ_SCHEME *pScheme;
GFX_GOL_BUTTON *buttons[3];
GFX_GOL_BUTTON_STATE state;

// assume pScheme is initialized to a scheme in memory.
state = GFX_GOL_BUTTON_DRAW_STATE;

buttons[0] = GFX_GOL_ButtonCreate(
    1, 20, 64, 50, 118, 0,
    state, NULL, NULL, "ON",
    GFX_ALIGN_HCENTER | GFX_ALIGN_VCENTER,
    pScheme);
// check if GFX_GOL_BUTTON 0 is created
if (buttons[0] == NULL)
    return 0;

buttons[1] = GFX_GOL_ButtonCreate(
    2, 52, 64, 82, 118, 0,
    state, NULL, NULL, "OFF",
    GFX_ALIGN_LEFT | GFX_ALIGN_VCENTER,
    pScheme);
// check if GFX_GOL_BUTTON 1 is created
```

```
if (buttons[1] == NULL)
    return 0;

buttons[2] = GFX_GOL_ButtonCreate(
    3, 84, 64, 114, 118, 0,
    state, NULL, NULL, "HI",
    GFX_ALIGN_RIGHT | GFX_ALIGN_VCENTER,
    pScheme);
// check if GFX_GOL_BUTTON 2 is created
if (buttons[2] == NULL)
    return 0;

return 1;
```

5.2.2.7.3.4 GFX_GOL_ButtonDraw Function

C

```
GFX_STATUS GFX_GOL_ButtonDraw(
    void * pObject
);
```

Description

This function renders the object on the screen based on the current state of the object. Location of the object is determined by the left, top, right and bottom parameters. The colors used are dependent on the state of the object. The font used is determined by the style scheme set.

The text on the face of the [GFX_GOL_BUTTON](#) is drawn on top of the bitmap. Text alignment based on the alignment parameter set on the object.

When rendering objects of the same type, each object must be rendered completely before the rendering of the next object is started. This is to avoid incomplete object rendering.

Normally, application will just call [GFX_GOL_ObjectListDraw\(\)](#) to allow the Graphics Library to manage all object rendering. See [GFX_GOL_ObjectListDraw\(\)](#) for more information on object rendering.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	Pointer to the object.

Returns

GFX_STATUS_SUCCESS - When the object rendering is finished. GFX_STATUS_FAILURE - When the object rendering is not yet finished. Application needs to call this rendering function again to continue the rendering.

Example

None.

5.2.2.7.3.5 GFX_GOL_ButtonTextAlignmentGet Function

C

```
GFX_ALIGNMENT GFX_GOL_ButtonTextAlignmentGet(
    GFX_GOL_BUTTON * pObject
);
```

Description

This function returns the text alignment of the text string used by the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

The text alignment set in the object. See [GFX_ALIGNMENT](#) for more details.

Example

None.

5.2.2.7.3.6 GFX_GOL_ButtonTextAlignmentSet Function**C**

```
void GFX_GOL_ButtonTextAlignmentSet(  
    GFX_GOL_BUTTON * pObject,  
    GFX_ALIGNMENT align  
);
```

Description

This function sets the text alignment of the text string used by the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	Pointer to the object.
align	The alignment set for the text in the object. See GFX_ALIGNMENT for more details.

Returns

None.

Example

None.

5.2.2.7.3.7 GFX_GOL_ButtonTextSet Function**C**

```
void GFX_GOL_ButtonTextSet(  
    GFX_GOL_BUTTON * pObject,  
    GFX_XCHAR * pText  
);
```

Description

This function sets the address of the current text string used by the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.
pText	pointer to the text string to be used.

Returns

None.

Example

```
GFX_XCHAR Label0[] = "ON";
GFX_XCHAR Label1[] = "OFF";
GFX_GOL_BUTTON GFX_GOL_BUTTON[2];

GFX_GOL_ButtonTextSet(GFX_GOL_BUTTON[0], Label0);
GFX_GOL_ButtonTextSet(GFX_GOL_BUTTON[1], Label1);
```

5.2.2.7.4 Check Box Object Functions

5.2.2.7.4.1 GFX_GOL_CheckBoxActionGet Function

C

```
GFX_GOL_TRANSLATED_ACTION GFX_GOL_CheckBoxActionGet(
    void * pObject,
    GFX_GOL_MESSAGE * pMessage
);
```

Description

This function evaluates the message from a user if the message will affect the object or not. The table below enumerates the action for each event of the touch screen and keyboard inputs.

Translated Message	Input Source	Set/Clear State Bit	Description
GFX_GOL_CHECKBOX_ACTION_CHECKED	Touch Screen	EVENT_RELEASE	If events occurs and the x,y position falls in the area of the check box while the check box is unchecked.
	Keyboard	EVENT_KEYSCAN	If event occurs and parameter1 passed matches the object's ID and parameter 2 passed matches SCAN_CR_PRESSED or SCAN_SPACE_PRESSED while the check box is unchecked.
GFX_GOL_CHECKBOX_ACTION_UNCHECKED	Touch Screen	EVENT_RELEASE	If events occurs and the x,y position falls in the area of the check box while the check box is checked.
	Keyboard	EVENT_KEYSCAN	If event occurs and parameter1 passed matches the object's ID and parameter 2 passed matches SCAN_CR_PRESSED or SCAN_SPACE_PRESSED while the check box is checked.
GFX_GOL_OBJECT_ACTION_INVALID	Any	Any	If the message did not affect the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	The pointer to the object where the message will be evaluated to check if the message will affect the object.
pMessage	Pointer to the the message from the user interface.

Returns

- GFX_GOL_CHECKBOX_ACTION_CHECKED - Check box is checked
- GFX_GOL_CHECKBOX_ACTION_UNCHECKED - Check box is unchecked
- GFX_GOL_OBJECT_ACTION_INVALID - Object is not affected

Example

None.

5.2.2.7.4.2 GFX_GOL_CheckBoxActionSet Function**C**

```
void GFX_GOL_CheckBoxActionSet(
    GFX_GOL_TRANSLATED_ACTION translatedMsg,
    void * pObject,
    GFX_GOL_MESSAGE * pMessage
);
```

Description

This function performs the state change of the object based on the translated action. This change can be overridden by the application using the application defined GFX_GOL_MESSAGE_CALLBACK_FUNC. When the user message is determined to affect the object, application can perform the state change in the message callback function. The following state changes are supported:

Translated Message	Input Source	Set/Clear State Bit	Description
GFX_GOL_CHECKBOX_ACTION_CHECKED	Touch Screen,	Set GFX_GOL_CHECKBOX_CHECKED_STATE	Check Box will be redrawn in checked state.
	Keyboard		
GFX_GOL_CHECKBOX_ACTION_UNCHECKED	Touch Screen,	Clear GFX_GOL_CHECKBOX_CHECKED_STATE	Check Box will be redrawn in un-checked state.
	Keyboard		

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
translatedMsg	The action of the object based on the message.
pObject	The pointer to the object whose state will be modified.
pMessage	The pointer to the original message.

Returns

None.

Example

None.

5.2.2.7.4.3 GFX_GOL_CheckBoxCreate Function**C**

```
GFX_GOL_CHECKBOX * GFX_GOL_CheckBoxCreate(
    uint16_t ID,
    uint16_t left,
    uint16_t top,
    uint16_t right,
    uint16_t bottom,
    uint16_t state,
    GFX_XCHAR * pText,
    GFX_ALIGNMENT alignment,
    GFX_GOL_OBJ_SCHEME * pScheme
);
```

Description

This function creates a [GFX_GOL_CHECKBOX](#) object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

This function returns the pointer to the newly created object. If the object is not successfully created, it returns NULL.

The behavior of `GFX_GOL_CheckBoxCreate()` will be undefined if one of the following is true:

- left >= right
- top >= bottom
- pScheme is not pointing to a [GFX_GOL_OBJ_SCHEME](#)
- pText is an unterminated string

Preconditions

None.

Parameters

Parameters	Description
ID	Unique user defined ID for the object instance.
left	Left most position of the object.
top	Top most position of the object.
right	Right most position of the object.
bottom	Bottom most position of the object.
state	Sets the initial state of the object.
pText	Pointer to the text of the object.
alignment	text alignment of the text used in the object.

pScheme	Pointer to the style scheme used.

Returns

Pointer to the newly created object.

Example

```
GFX_GOL_OBJ_SCHEME *pScheme;
GFX_GOL_CHECKBOX *pCb[2];

pCb[0] = GFX_GOL_CheckBoxCreate(
    ID_CHECKBOX1,           // ID
    20,135,150,175,        // dimension
    GFX_GOL_CHECKBOX_DRAW_STATE, // Draw the object
    "Scale",               // text
    GFX_ALIGN_CENTER,      // text alignment
    pScheme);              // use this scheme

pCb[1] = GFX_GOL_CheckBoxCreate(
    ID_CHECKBOX2,           // ID
    170,135,300,175,       // dimension
    GFX_GOL_CHECKBOX_DRAW_STATE, // Draw the object
    "Animate",             // text
    GFX_ALIGN_LEFT | GFX_ALIGN_VCENTER, // text alignment
    pScheme);              // use this scheme
```

5.2.2.7.4.4 GFX_GOL_CheckBoxDraw Function**C**

```
GFX_STATUS GFX_GOL_CheckBoxDraw(
    void * pobject
);
```

Description

This function renders the object on the screen based on the current state of the object. Location of the object is determined by the left, top, right and bottom parameters. The colors used are dependent on the state of the object. The font used is determined by the style scheme set.

The text on the [GFX_GOL_CHECKBOX](#) is drawn with the text alignment based on the alignment parameter set on the object.

When rendering objects of the same type, each object must be rendered completely before the rendering of the next object is started. This is to avoid incomplete object rendering.

Normally, application will just call [GFX_GOL_ObjectListDraw\(\)](#) to allow the Graphics Library to manage all object rendering. See [GFX_GOL_ObjectListDraw\(\)](#) for more information on object rendering.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	Pointer to the object.

Returns

GFX_STATUS_SUCCESS - When the object rendering is finished. GFX_STATUS_FAILURE - When the object rendering is not yet finished. Application needs to call this rendering function again to continue the rendering.

Example

None.

5.2.2.7.4.5 GFX_GOL_CheckBoxTextAlignmentGet Function

C

```
GFX_ALIGNMENT GFX_GOL_CheckBoxTextAlignmentGet(  
    GFX_GOL_CHECKBOX * pObject  
);
```

Description

This function returns the text alignment of the text string used by the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

The text alignment set in the object. See [GFX_ALIGNMENT](#) for more details.

Example

None.

5.2.2.7.4.6 GFX_GOL_CheckBoxTextAlignmentSet Function

C

```
void GFX_GOL_CheckBoxTextAlignmentSet(  
    GFX_GOL_CHECKBOX * pObject,  
    GFX_ALIGNMENT align  
);
```

Description

This function sets the text alignment of the text string used by the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	Pointer to the object.
align	The alignment set for the text in the object. See GFX_ALIGNMENT for more details.

Returns

None.

Example

None.

5.2.2.7.4.7 GFX_GOL_CheckBoxTextSet Function

C

```
void GFX_GOL_CheckBoxTextSet(  

```

```

    GFX_GOL_CHECKBOX * pObj,
    GFX_XCHAR * pText
);

```

Description

This function sets the address of the current text string used by the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.
pText	pointer to the text string to be used.

Returns

None.

Example

```

GFX_XCHAR Label0[] = "Enabled";
GFX_XCHAR Label1[] = "Disabled";
GFX_GOL_CHECKBOX GFX_GOL_CHECKBOX[2];

GFX_GOL_CheckBoxTextSet(GFX_GOL_CHECKBOX[0], Label0);
GFX_GOL_CheckBoxTextSet(GFX_GOL_CHECKBOX[1], Label1);

```

5.2.2.7.5 Chart Object Functions

5.2.2.7.5.1 GFX_GOL_ChartActionGet Function

C

```

uint16_t GFX_GOL_ChartActionGet(
    void * pObj,
    GFX_GOL_MESSAGE * pMsg
);

```

Description

This function evaluates the message from a user if the message will affect the object or not. The table below enumerates the translated messages for each event of the touch screen and keyboard inputs.

Translated Message	Input Source	Events	Description
CH_MSG_SELECTED	Touch Screen	EVENT_PRESS, EVENT_RELEASE, EVENT_MOVE	If events occurs and the x,y position falls in the area of the chart.
OBJ_MSG_INVALID	Any	Any	If the message did not affect the object.

Preconditions

none

Parameters

Parameters	Description
pCh	The pointer to the object where the message will be evaluated to check if the message will affect the object.
pMsg	Pointer to the message struct containing the message from the user interface.

Returns

Returns the translated message depending on the received GOL message:

- CH_MSG_SELECTED – Chart area is selected
- OBJ_MSG_INVALID – Chart is not affected

none.

Side Effects

none

5.2.2.7.5.2 GFX_GOL_ChartCreate Function**C**

```
GFX_GOL_CHART * GFX_GOL_ChartCreate(
    uint16_t ID,
    short left,
    short top,
    short right,
    short bottom,
    uint16_t state,
    DATASERIES * pData,
    CHARTPARAM * pParam,
    GFX_GOL_OBJ_SCHEME * pScheme
);
```

Description

This function creates a CHART object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

Preconditions

none

Parameters

Parameters	Description
ID	Unique user defined ID for the object instance.
left	Left most position of the object.
top	Top most position of the object.
right	Right most position of the object.
bottom	Bottom most position of the object.
state	Sets the initial state of the object.
pData	Pointer to the data for the contents of the chart. NULL can be assigned initially when creating the object.
pParam	Pointer to the chart parameters. NULL can be assigned initially when creating the object and the chart parameters can be populated using the API provided.
pScheme	Pointer to the style scheme used. When set to NULL, the default style scheme will be used.

Returns

Returns the pointer to the object created.

Side Effects

none

Example

```
extern const FONT_FLASH GOLSmallFont;
extern const FONT_FLASH GOLMediumFont;

// Note that strings are declared as such to cover cases
// where XCHAR type is declared as short (2 bytes).
XCHAR ChTitle[] = {'E', 'x', 'a', 'm', 'p', 'l', 'e', 0};
XCHAR SampleName[] = {'C', 'a', 't', 'e', 'g', 'o', 'r', 'y', 0};
XCHAR ValueName[] = {'#', 'H', 'i', 't', 's', 0};
XCHAR SeriesName[2] = {
    {'V', '1', 0},
    {'V', '2', 0},
};

V1Data[2] = { 50, 100};
V2Data[2] = { 5, 10};

GFX_OBJ_SCHEME *pScheme;
CHART *pChart;
CHARTPARAM Contents;
uint16_t state;

pScheme = GFX_OBJ_SchemeCreate();
state = CH_BAR|CH_DRAW|CH_BAR_HOR; // GFX_PRIM_BarDraw Chart to be drawn with horizontal
orientation

pChart = ChCreate(0x01, // ID
    0, 0, // dimensions
    GFX_PRIM_GetMaxX(),
    GFX_PRIM_GetMaxY(),
    state, // state of the chart
    NULL, // data not initialized yet
    NULL, // no parameters yet
    pScheme); // style scheme used

if (pMyChart == NULL) // check if chart was allocated memory
    return 0;

ChSetTitleFont(pChart, (void*)&GOLMediumFont);
ChSetTitle(pChart, ChTitle); // set the title

// set the grid labels and axis labels font
ChSetGridLabelFont(pChart, (void*)&GOLSmallFont);
ChSetAxisLabelFont(pChart, (void*)&GOLSmallFont);

// set the labels for the X and Y axis
ChSetSampleLabel(pChart, (XCHAR*)SampleName);
ChSetValueLabel(pChart, (XCHAR*)ValueName);

ChAddDataSeries(pChart, 2, V1Data, (XCHAR*)SeriesName[0]);
ChAddDataSeries(pChart, 2, V2Data, (XCHAR*)SeriesName[1]);

// set the range of the sample values
ChSetValueRange(pChart, 0, 100);

// show all two samples to be displayed (start = 1, end = 2)
ChSetSampleRange(pChart, 1, 2);
```

```
GFX_OBJ_Draw();           // draw the chart
```

5.2.2.7.5.3 GFX_GOL_ChartDataSeriesAdd Function

C

```
DATASERIES * GFX_GOL_ChartDataSeriesAdd(
    GFX_GOL_CHART * pCh,
    uint16_t nSamples,
    uint16_t * pData,
    XCHAR * pName
);
```

Description

This function creates a [DATASERIES](#) object and populates the structure with the given parameters.

Preconditions

none

Parameters

Parameters	Description
pCh	Pointer to the chart object.
nSamples	The number of samples or data points.
pData	Pointer to the array of samples or data points.
pName	Pointer to the string used to label the data series.

Returns

Returns the pointer to the data variable ([DATASERIES](#)) object created. If NULL is returned, the addition of the new object failed due to not enough memory for the object.

Side Effects

Appends to the list of [DATASERIES](#) that the chart is operating on. By default, the show flag of the newly added data series is set to [SHOW_DATA](#) or enabled.

Example

See ChCreate() example.

5.2.2.7.5.4 GFX_GOL_ChartDataSeriesFree Function

C

```
void GFX_GOL_ChartDataSeriesFree(
    void * pObjj
);
```

Description

This function removes [DATASERIES](#) object from the list of [DATASERIES](#) objects and frees the memory used of that removed object.

Preconditions

none

Parameters

Parameters	Description
pCh	Pointer to the chart object.

Returns

none.

Side Effects

none.

Example

```
void ClearChartData(CHART *pCh) {
    if(pCh->pChData != NULL)
        // remove the all data series
        ChFreeDataSeries(pCh;
}
```

5.2.2.7.5.5 GFX_GOL_ChartDataSeriesRemove Function

C

```
void GFX_GOL_ChartDataSeriesRemove(
    GFX_GOL_CHART * pCh,
    uint16_t number
);
```

Description

This function removes DATASERIES object from the list of DATASERIES objects and frees the memory used of that removed object. The position of the object to be removed is specified by the number parameter. If the list has only one member, it removes the member regardless of the number given.

Preconditions

none

Parameters

Parameters	Description
pCh	Pointer to the chart object.
number	The position of the object to be removed in the list where the first object in the list is assigned a value of 1. If this parameter is set to zero, the whole list of DATA_SERIES is removed.

Returns

none.

Side Effects

none.

Example

```
void ClearChartData(CHART *pCh) {
    if(pCh->pChData != NULL)
        // remove the all data series
        ChRemoveDataSeries(pCh, 0);
}
```

5.2.2.7.5.6 GFX_GOL_ChartDataSeriesSet Function

C

```
short GFX_GOL_ChartDataSeriesSet(
    GFX_GOL_CHART * pCh,
    uint16_t seriesNum,
    BYTE status
);
```

Description

This is function GFX_GOL_ChartDataSeriesSet.

5.2.2.7.5.7 GFX_GOL_ChartDraw Function**C**

```
uint16_t GFX_GOL_ChartDraw(  
    void * pObj  
);
```

Description

This function renders the object on the screen using the current parameter settings. Location of the object is determined by the left, top, right and bottom parameters. The colors used are dependent on the state of the object. The font used is determined by the style scheme set.

The colors of the bars of the bar chart or sectors of the pie chart can be the default color table or user defined color table set by ChSetColorTable() function.

When rendering objects of the same type, each object must be rendered completely before the rendering of the next object is started. This is to avoid incomplete object rendering.

Preconditions

Object must be created before this function is called.

Parameters

Parameters	Description
pCh	Pointer to the object to be rendered.

Returns

Returns the status of the drawing

- 1 - If the rendering was completed and
- 0 - If the rendering is not yet finished.

Next call to the function will resume the rendering on the pending drawing state.

Side Effects

none.

5.2.2.7.5.8 GFX_GOL_ChartPercentRangeSet Function**C**

```
void GFX_GOL_ChartPercentRangeSet(  
    GFX_GOL_CHART * pCh,  
    uint16_t min,  
    uint16_t max  
);
```

Description

This function sets the minimum and maximum range of percentage that the bar chart will show. The criteria is that min <= max. This affects bar charts only and CH_PERCENTAGE bit state is set.

Preconditions

none

Parameters

Parameters	Description
pCh	Pointer to the chart object.
min	Minimum percentage value that will be displayed in the bar chart.
max	Maximum percentage value that will be displayed in the bar chart.

Returns

none.

Side Effects

none.

5.2.2.7.5.9 GFX_GOL_ChartSampleRangeSet Function**C**

```
void GFX_GOL_ChartSampleRangeSet(
    GFX_GOL_CHART * pCh,
    uint16_t start,
    uint16_t end
);
```

Description

This function sets the sample start and sample end when drawing the chart. Together with the data series' [SHOW_DATA](#) flags the different way of displaying the chart data is achieved.

Start & End Value	The # of Data Series Flag Set	Chart Description
Start <= End	1	Show the data indicated by Start and End points of the DATASERIES with the flag set
Start = End	1	Show the data indicated by Start or End points of the DATASERIES with the flag set
Start, End = don't care	> 1	Show the data indicated by Start point of the DATASERIES with the flag set. Each samples of all checked data series are grouped together according to sample number.

Preconditions

none

Parameters

Parameters	Description
pCh	Pointer to the chart object.
start	Start point of the data samples to be displayed.
end	End point of the data samples to be displayed.

Returns

none.

Side Effects

none.

Example

See ChCreate() example.

5.2.2.7.5.10 GFX_GOL_ChartValueRangeSet Function**C**

```
void GFX_GOL_ChartValueRangeSet(  
    GFX_GOL_CHART * pCh,  
    uint16_t min,  
    uint16_t max  
);
```

Description

This function sets the minimum and maximum range of values that the bar chart will show. The criteria is that min <= max.

Preconditions

none

Parameters

Parameters	Description
pCh	Pointer to the chart object.
min	Minimum value that will be displayed in the bar chart.
max	Maximum value that will be displayed in the bar chart.

Returns

none.

Side Effects

none.

5.2.2.7.6 Custom Control Object Functions**5.2.2.7.6.1 GFX_GOL_CustomControlActionGet Function****C**

```
GFX_GOL_TRANSLATED_ACTION GFX_GOL_CustomControlActionGet(  
    void * pObj,  
    GFX_GOL_MESSAGE * pMsg  
);
```

Description

translates the GOL message for the custom control

Preconditions

none

Parameters

Parameters	Description
pMsg	pointer to the GOL message
pCc	the pointer to the custom control

Returns

translated message for the custom control

Side Effects

none

Remarks

none

5.2.2.7.6.2 GFX_GOL_CustomControlActionSet Function

C

```
void GFX_GOL_CustomControlActionSet(
    GFX_GOL_TRANSLATED_ACTION translatedMsg,
    void * pObj,
    GFX_GOL_MESSAGE * pMsg
);
```

Description

changes the state of the object

Preconditions

none

Parameters

Parameters	Description
pMsg	pointer to the GOL message
pCc	the pointer to the custom control

Returns

none

Side Effects

none

Remarks

none

5.2.2.7.6.3 GFX_GOL_CustomControlCreate Function

C

```
GFX_GOL_CUSTOMCONTROL * GFX_GOL_CustomControlCreate(
    uint16_t ID,
    uint16_t left,
    uint16_t top,
    uint16_t right,
    uint16_t bottom,
    uint16_t state,
    GFX_GOL_OBJ_SCHEME * pScheme
);
```

Description

creates the custom control

Preconditions

none

Parameters

Parameters	Description
ID	instance unique ID
left, top, right, bottom	dimensions of the object
state	state of the object
pScheme	pointer to the style scheme

Returns

returns the pointer to the object created

Side Effects

none

Remarks

none

5.2.2.7.6.4 GFX_GOL_CustomControlDraw Function

C

```
GFX_STATUS GFX_GOL_CustomControlDraw(  
    void * pObj  
);
```

Description

draws custom control

Preconditions

none

Parameters

Parameters	Description
pCc	pointer to the custom control

Returns

returns the status of the drawing 0 - not completed 1 - done

Side Effects

none

Remarks

none

5.2.2.7.7 Digital Meter Object Functions

5.2.2.7.7.1 GFX_GOL_DigitalMeterActionGet Function

C

```
GFX_GOL_TRANSLATED_ACTION GFX_GOL_DigitalMeterActionGet(  

```

```

    void * pObject,
    GFX_GOL_MESSAGE * pMessage
);

```

Description

This function evaluates the message from a user if the message will affect the object or not. The table below enumerates the action for each event of the touch screen and keyboard inputs.

Translated Message	Input Source	Set/Clear State Bit	Description
GFX_GOL_DIGITALMETER_ACTION_SELECTED	Touch Screen	EVENT_PRESS, EVENT_RELEASE	If events occurs and the x,y position falls in the area of the Digital Meter.
GFX_GOL_OBJECT_ACTION_INVALID	Any	Any	If the message did not affect the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	The pointer to the object where the message will be evaluated to check if the message will affect the object.
pMessage	Pointer to the the message from the user interface.

Returns

- GFX_GOL_DIGITALMETER_ACTION_SELECTED ? Object is selected.
- GFX_GOL_OBJECT_ACTION_INVALID ? Object is not affected

Example

None.

5.2.2.7.2 GFX_GOL_DigitalMeterCreate Function

C

```

GFX_GOL_DIGITALMETER * GFX_GOL_DigitalMeterCreate(
    uint16_t ID,
    uint16_t left,
    uint16_t top,
    uint16_t right,
    uint16_t bottom,
    uint16_t state,
    uint32_t value,
    uint8_t NoOfDigits,
    uint8_t DotPos,
    GFX_ALIGNMENT alignment,
    GFX_GOL_OBJ_SCHEME * pScheme
);

```

Description

This function creates a **GFX_GOL_DIGITALMETER** object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

This function returns the pointer to the newly created object. If the object is not successfully created, it returns NULL.

Preconditions

None.

Parameters

Parameters	Description
instance	Device instance
ID	Unique user defined ID for the object instance.
left	Left most position of the object.
top	Top most position of the object.
right	Right most position of the object.
bottom	Bottom most position of the object.
state	Sets the initial state of the object.
value	Sets the initial value to be displayed
NoOfDigits	Sets the number of digits to be displayed
DotPos	Sets the position of decimal point in the display
alignment	text alignment of the text used in the object.
pScheme	Pointer to the style scheme. Set to NULL if default style scheme is used.

Returns

Pointer to the newly created object.

Example

```
GFX_GOL_OBJ_SCHEME *pScheme;
GFX_GOL_DIGITALMETER *pDm;

pScheme = GFX_GOL_SchemeCreate();
state = GFX_GOL_DIGITALMETER_DRAW_STATE |
        GFX_GOL_DIGITALMETER_FRAME_STATE;
GFX_GOL_DigitalMeterCreate(
    ID_DIGITALMETER1,    // ID
    30,80,235,160,       // dimension
    state,               // has frame and center aligned
    789,4,1,             // to display 078.9
    GFX_ALIGN_CENTER,
    pScheme);           // use given scheme

// draw the objects
while(GFX_GOL_ObjectListDraw() != GFX_STATUS_SUCCESS);
```

5.2.2.7.3 GFX_GOL_DigitalMeterDecrement Function**C**

```
void GFX_GOL_DigitalMeterDecrement(
    GFX_GOL_DIGITALMETER * pObject,
    uint16_t delta
);
```

Description

This function decrements the meter value by the given delta value set. If the delta given is less than the minimum value of the meter, the value will remain to be at minimum.

Object must be redrawn after this function is called to reflect the changes to the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

None.

Example

See [GFX_GOL_DigitalMeterIncrement\(\)](#).

5.2.2.7.7.4 GFX_GOL_DigitalMeterDraw Function**C**

```
GFX_STATUS GFX_GOL_DigitalMeterDraw(  
    void * pobject  
);
```

Description

This function renders the object on the screen based on the current state of the object. Location of the object is determined by the left, top, right and bottom parameters. The colors used are dependent on the state of the object. The font used is determined by the style scheme set.

When rendering objects of the same type, each object must be rendered completely before the rendering of the next object is started. This is to avoid incomplete object rendering.

Normally, application will just call [GFX_GOL_ObjectListDraw\(\)](#) to allow the Graphics Library to manage all object rendering. See [GFX_GOL_ObjectListDraw\(\)](#) for more information on object rendering.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	Pointer to the object.

Returns

GFX_STATUS_SUCCESS - When the object rendering is finished. GFX_STATUS_FAILURE - When the object rendering is not yet finished. Application needs to call this rendering function again to continue the rendering.

Example

None.

5.2.2.7.7.5 GFX_GOL_DigitalMeterIncrement Function**C**

```
void GFX_GOL_DigitalMeterIncrement(  
    GFX_GOL_DIGITALMETER * pobject,  
    uint16_t delta  
);
```

Description

This function increments the scroll bar position by the given delta value set. If the delta given exceeds the maximum value of the meter, the value will remain to be at maximum.

Object must be redrawn after this function is called to reflect the changes to the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

None.

Example

```
void ControlSpeed( GFX_GOL_DIGITALMETER* pObj,
                  int setSpeed,
                  int curSpeed)
{
    // set page size to 1
    GFX_GOL_DigitalMeterValueSet(pObj, 1);

    if (setSpeed < curSpeed)
    {
        while(GFX_GOL_DigitalMeterValueGet(pObj) < SetSpeed)
        {
            // increment by 1
            GFX_GOL_DigitalMeterIncrement(pObj, 1);
        }
    }
    else if (setSpeed > curSpeed)
    {
        while(GFX_GOL_DigitalMeterValueGet(pObj) > SetSpeed)
        {
            // decrement by 1
            GFX_GOL_DigitalMeterDecrement(pObj, 1);
        }
    }
}
```

5.2.2.7.7.6 GFX_GOL_DigitalMeterValueSet Function

C

```
void GFX_GOL_DigitalMeterValueSet(
    GFX_GOL_DIGITALMETER * pObj,
    int16_t value
);
```

Description

This function sets the value of the meter. The value used should be within the range set for the object. The new value is checked to be in the minimum and maximum value range. If the value set is less than the minimum value, the value that will be set is the minimum value. If the value set is more than the maximum value, then the value that will be set is the maximum value.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.
value	the new value of the object.

Returns

None.

Example

```

GFX_GOL_DIGITALMETER *pMeter;
uint16_t ctr = 0;

// create slider here and initialize parameters
GFX_GOL_ObjectStateSet(pMeter, GFX_GOL_DIGITALMETER_DRAW_STATE);
GFX_GOL_ObjectListDraw();

while("some condition")
{
    GFX_GOL_DigitalMeterValueSet(pMeter, ctr);
    GFX_GOL_ObjectStateSet( pMeter,
                           GFX_GOL_DIGITALMETER_UPDATE_STATE);

    // redraw the scroll bar
    GFX_GOL_ObjectListDraw();

    // update ctr here
    ctr = "some source of value";
}

```

5.2.2.7.8 Edit Box Object Functions**5.2.2.7.8.1 GFX_GOL_EditBoxActionGet Function****C**

```

GFX_GOL_TRANSLATED_ACTION GFX_GOL_EditBoxActionGet(
    void * pObject,
    GFX_GOL_MESSAGE * pMessage
);

```

Description

This function evaluates the message from a user if the message will affect the object or not. The table below enumerates the action for each event of the touch screen and keyboard inputs.

Translated Message	Input Source	Set/Clear State Bit	Description
GFX_GOL_EDITBOX_ACTION_ADD_CHAR	Keyboard	EVENT_CHARCODE	New character should be added.
GFX_GOL_EDITBOX_ACTION_DEL_CHAR	Keyboard	EVENT_KEYPRESS	Last character should be removed.
GFX_GOL_EDITBOX_ACTION_TOUCHSCREEN	Touch Screen	GFX_GOL_EDITBOX_FOCUSED_STATE	Focus will be drawn, caret displayed when enabled.
GFX_GOL_OBJECT_ACTION_INVALID	Any	Any	If the message did not affect the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	The pointer to the object where the message will be evaluated to check if the message will affect the object.
pMessage	Pointer to the the message from the user interface.

Returns

- GFX_GOL_EDITBOX_ACTION_ADD_CHAR - New character should be added
- GFX_GOL_EDITBOX_ACTION_DEL_CHAR - Last character should be removed.
- GFX_GOL_EDITBOX_ACTION_TOUCHSCREEN - focus will be drawn when enabled. Careet will be drawn when enabled.
- GFX_GOL_OBJECT_ACTION_INVALID - Object is not affected

Example

None.

5.2.2.7.8.2 GFX_GOL_EditBoxActionSet Function**C**

```
void GFX_GOL_EditBoxActionSet(
    GFX_GOL_TRANSLATED_ACTION translatedMsg,
    void * pObject,
    GFX_GOL_MESSAGE * pMessage
);
```

Description

This function performs the state change of the object based on the translated action. This change can be overridden by the application using the application defined GFX_GOL_MESSAGE_CALLBACK_FUNC. When the user message is determined to affect the object, application can perform the state change in the message callback function. The following state changes are supported:

Translated Message	Input Source	Set/Clear State Bit Description
GFX_GOL_EDITBOX_ACTION_ADD_CHAR	Keyboard	Set GFX_GOL_EDITBOX_DRAW_STATE New character is added and Edit Box will be redrawn.
GFX_GOL_EDITBOX_ACTION_DEL_CHAR	KeyBoard	Set GFX_GOL_EDITBOX_DRAW_STATE Last character is removed and Edit Box will be redrawn.
GFX_GOL_EDITBOX_ACTION_TOUCHSCREEN	Touch Screen	Set GFX_GOL_EDITBOX_FOCUSED_STATE When enabled, focus will be redrawn, caret will also be redrawn if enabled.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
translatedMsg	The action of the object based on the message.
pObject	The pointer to the object whose state will be modified.
pMessage	The pointer to the original message.

Returns

None.

Example

None.

5.2.2.7.8.3 GFX_GOL_EditBoxCharAdd Function**C**

```
GFX_STATUS GFX_GOL_EditBoxCharAdd(  
    GFX_GOL_EDITBOX * pObject,  
    GFX_XCHAR ch  
);
```

Description

This function adds a character at the end of the text used by the object. When the object contains the maximum number of characters any addition call to this function will not affect the text in the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	Pointer to the object.
ch	The character to be added.

Returns

The status of the addition.

- GFX_STATUS_SUCCESS - when the addition was successful.
- GFX_STATUS_FAILURE - when the addition was not successful.

Example

None.

5.2.2.7.8.4 GFX_GOL_EditBoxCharRemove Function**C**

```
GFX_STATUS GFX_GOL_EditBoxCharRemove(  
    GFX_GOL_EDITBOX * pObject  
);
```

Description

This function removes a character at the end of the text used by the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	Pointer to the object.

Returns

The status of the addition.

- GFX_STATUS_SUCCESS - when the removal was successful.

- GFX_STATUS_FAILURE - when the removal has no effect and the buffer is empty.

Example

None.

5.2.2.7.8.5 GFX_GOL_EditBoxCreate Function

C

```
GFX_GOL_EDITBOX * GFX_GOL_EditBoxCreate(
    uint16_t ID,
    uint16_t left,
    uint16_t top,
    uint16_t right,
    uint16_t bottom,
    uint16_t state,
    GFX_XCHAR * pText,
    uint16_t charMax,
    GFX_ALIGNMENT alignment,
    GFX_GOL_OBJ_SCHEME * pScheme
);
```

Description

This function creates a [GFX_GOL_EDITBOX](#) object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

This function returns the pointer to the newly created object. If the object is not successfully created, it returns NULL.

The behavior of [GFX_GOL_ListBoxCreate\(\)](#) will be undefined if one of the following is true:

- left >= right
- top >= bottom
- pScheme is not pointing to a [GFX_GOL_OBJ_SCHEME](#)
- pText is an unterminated string

Preconditions

None.

Parameters

Parameters	Description
ID	Unique user defined ID for the object instance.
left	Left most position of the object.
top	Top most position of the object.
right	Right most position of the object.
bottom	Bottom most position of the object.
state	Sets the initial state of the object.
pText	Pointer to the text of the object.
charMax	Defines the maximum number of characters in the edit box.
alignment	text alignment of the text used in the object.
pScheme	Pointer to the style scheme used.

Returns

Pointer to the newly created object.

Example

```
// assume pScheme to be initialized with the style scheme
```

```

#define MAX_CHAR_COUNT 15

GFX_GOL_OBJ_SCHEME      *pScheme;
GFX_GOL_EDITBOX         *pEb;
GFX_GOL_EDITBOX_STATE   state;

GFX_XCHAR                TextBuffer[MAX_CHAR_COUNT + 1];

// assume pScheme is initialized to a scheme in memory.
state = GFX_GOL_EDITBOX_DRAW_STATE;

pEb = GFX_GOL_EditBoxCreate(
    1, 20, 64, 50, 118,
    state, TextBuffer, MAX_CHAR_COUNT
    GFX_ALIGN_CENTER,
    pScheme);

// check if object is not created
if (pEb == NULL)
    return 0;

```

5.2.2.7.8.6 GFX_GOL_EditBoxDraw Function

C

```

GFX_STATUS GFX_GOL_EditBoxDraw(
    void * pObject
);

```

Description

This function renders the object on the screen based on the current state of the object. Location of the object is determined by the left, top, right and bottom parameters. The colors used are dependent on the state of the object. The font used is determined by the style scheme set.

When rendering objects of the same type, each object must be rendered completely before the rendering of the next object is started. This is to avoid incomplete object rendering.

Normally, application will just call [GFX_GOL_ObjectListDraw\(\)](#) to allow the Graphics Library to manage all object rendering. See [GFX_GOL_ObjectListDraw\(\)](#) for more information on object rendering.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	Pointer to the object.

Returns

GFX_STATUS_SUCCESS - When the object rendering is finished. GFX_STATUS_FAILURE - When the object rendering is not yet finished. Application needs to call this rendering function again to continue the rendering.

Example

None.

5.2.2.7.8.7 GFX_GOL_EditBoxTextSet Function

C

```

void GFX_GOL_EditBoxTextSet(
    GFX_GOL_EDITBOX * pObject,

```

```
GFX_XCHAR* pText
);
```

Description

This function sets the text in the object. This function copies the text located in the address pointed to by pText to the object text buffer.

The string length must be less than or equal to the maximum characters allowed in the object. The object will truncate the string once it reaches the maximum length.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.
pText	pointer to the text string to be copied.

Returns

None.

Example

```
#define MAX_EDITBOX_CHAR_LENGTH 20
GFX_XCHAR Label0[] = "This is really a long string";

// assume pEb is a pointer initialized to an edit box that
// as a buffer with 20 characters allowed.

GFX_GOL_EditBoxTextSet(pEb, Label0);

// at this point the edit box contains
// This is really a lon" - truncated to only 20 characters.
```

5.2.2.7.9 Grid Object Functions

5.2.2.7.9.1 GridClearCellState Function

C

```
void GridClearCellState(
    GRID * pGrid,
    short column,
    short row,
    uint16_t state
);
```

Description

This function clears the state of the cell (or Grid Item) specified by the column and row.

Preconditions

none

Parameters

Parameters	Description
pGrid	Pointer to the object.
column	column index of the cell
row	row index of the cell

atate	specifies the state to be cleared. See Grid Item State.

Returns

none.

Side Effects

none

5.2.2.7.9.2 GridCreate Function

C

```
GRID * GridCreate(
    uint16_t ID,
    short left,
    short top,
    short right,
    short bottom,
    uint16_t state,
    short numColumns,
    short numRows,
    short cellWidth,
    short cellHeight,
    GFX_GOL_OBJ_SCHEME * pScheme
);
```

Description

This function creates a [GRID](#) object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

Preconditions

none

Parameters

Parameters	Description
ID	Unique user defined ID for the object instance.
left	Left most position of the Object.
top	Top most position of the Object.
right	Right most position of the Object.
bottom	Bottom most position of the object.
state	Sets the initial state of the object.
numColumns	Sets the number of columns for the grid.
numRows	Sets the number of rows for the grid.
cellWidth	Sets the width of each cell of the grid.
cellHeight	Sets the height of each cell of the grid.
pScheme	Pointer to the style scheme used for the object. Set to NULL if default style scheme is used.

Returns

Returns the pointer to the object created.

Side Effects

none

5.2.2.7.9.3 GridDraw Function

C

```
uint16_t GridDraw(  
    void * pObj  
);
```

Description

This function renders the object on the screen using the current parameter settings. Location of the object is determined by the left, top, right and bottom parameters. The colors used are dependent on the state of the object. The font used is determined by the style scheme set.

When rendering objects of the same type, each object must be rendered completely before the rendering of the next object is started. This is to avoid incomplete object rendering.

Preconditions

Object must be created before this function is called.

Parameters

Parameters	Description
pGb	Pointer to the object to be rendered.

Returns

Returns the status of the drawing

- 1 - If the rendering was completed and
- 0 - If the rendering is not yet finished.

Next call to the function will resume the rendering on the pending drawing state.

Side Effects

none

5.2.2.7.9.4 GridFreeItems Function

C

```
void GridFreeItems(  
    void * pObj  
);
```

Description

This function removes all grid items for the given Grid and frees the memory used.

Preconditions

Object must be created before this function is called.

Parameters

Parameters	Description
pGrid	The pointer to the Grid object.

Returns

none.

Side Effects

none

5.2.2.7.9.5 GridGetCell Function**C**

```
void * GridGetCell(
    GRID * pGrid,
    short column,
    short row,
    uint16_t * cellType
);
```

Description

This function removes all grid items for the given Grid and frees the memory used.

Preconditions

Object must be created before this function is called.

Parameters

Parameters	Description
pGrid	The pointer to the Grid object.
column	the column index of the cell
row	the row index of the cell
cellType	pointer that will receive the type of grid item or cell (GRIDITEM_IS_TEXT or GRIDITEM_IS_BITMAP).

Returns

Returns a pointer to the grid item or cell data.

Side Effects

none

5.2.2.7.9.6 GridMsgDefault Function**C**

```
void GridMsgDefault(
    uint16_t translatedMsg,
    void * pObj,
    GFX_GOL_MESSAGE * pMsg
);
```

Description

This function performs the actual state change based on the translated message given. The following state changes are supported:

Translated Message	Input Source	Set/Clear State Bit	Description
GRID_MSG_TOUCHED	Touch Screen	none	Grid will have no state change because of this event.
GRID_MSG_ITEM_SELECTED	Keyboard	Set GRIDITEM_SELECTED , GRID_DRAW_ITEMS	Grid Item selected will be redrawn.

GRID_MSG_UP	Keyboard	Set GRIDITEM_DRAW ,	Grid Item above the currently focused item will be redrawn.
		GRID_DRAW_ITEMS	
GRID_MSG_DOWN	Keyboard	Set GRIDITEM_DRAW ,	Grid Item below the currently focused item will be redrawn.
		GRID_DRAW_ITEMS	
GRID_MSG_LEFT	Keyboard	Set GRIDITEM_DRAW ,	Grid Item to the left of the currently focused item will be redrawn.
		GRID_DRAW_ITEMS	
GRID_MSG_RIGHT	Keyboard	Set GRIDITEM_DRAW ,	Grid Item to the right of the currently focused item will be redrawn.
		GRID_DRAW_ITEMS	

Preconditions

none

Parameters

Parameters	Description
translatedMsg	The translated message.
pGrid	The pointer to the object whose state will be modified.
pMsg	The pointer to the GOL message.

Returns

none

Side Effects

none

5.2.2.7.9.7 GridSetCell Function**C**

```
uint16_t GridSetCell(
    GRID * pGrid,
    short column,
    short row,
    uint16_t state,
    void * data
);
```

Description

This function sets the Grid Item state and data.

Preconditions

Object must be created before this function is called.

Parameters

Parameters	Description
pGrid	The pointer to the Grid object.
column	the column index of the cell
row	the row index of the cell

state	sets the state of the Grid Item specified.
data	pointer to the data used for the Grid Item.

Returns

Returns the status of the operation

- [GRID_SUCCESS](#) - if the set succeeded
- [GRID_OUT_OF_BOUNDS](#) - if the row and column given results in an out of bounds location.

Side Effects

none

5.2.2.7.9.8 GridSetCellState Function

C

```
void GridSetCellState(  
    GRID * pGrid,  
    short column,  
    short row,  
    uint16_t state  
);
```

Description

This function sets the state of the Grid Item or cell.

Preconditions

Object must be created before this function is called.

Parameters

Parameters	Description
pGrid	The pointer to the Grid object.
column	the column index of the cell
row	the row index of the cell
state	sets the state of the Grid Item specified.

Returns

none.

Side Effects

none

5.2.2.7.9.9 GridSetFocus Function

C

```
void GridSetFocus(  
    GRID * pGrid,  
    short column,  
    short row  
);
```

Description

This function sets the focus of the specified Grid Item or cell.

Preconditions

Object must be created before this function is called.

Parameters

Parameters	Description
pGrid	The pointer to the Grid object.
column	the column index of the cell
row	the row index of the cell

Returns

none.

Side Effects

none

5.2.2.7.9.10 GridTranslateMsg Function**C**

```
uint16_t GridTranslateMsg(
    void * pObj,
    GFX_GOL_MESSAGE * pMsg
);
```

Description

This function evaluates the message from a user if the message will affect the object or not. The table below enumerates the translated messages for each event of the touch screen and keyboard inputs.

Translated Message	Input Source	Set/Clear State Bit	Description
GRID_MSG_TOUCHED	Touch Screen	none	If any touch events occurs and the x,y position falls in the face of the grid.
GRID_MSG_ITEM_SELECTED	Keyboard	EVENT_KEYSCAN	If event occurs and parameter1 passed matches the object's ID and parameter 2 passed matches SCAN_SPACE_PRESSED or SCAN_CR_PRESSED .
GRID_MSG_UP	Keyboard	EVENT_KEYSCAN	If event occurs and parameter1 passed matches the object's ID and parameter 2 passed matches SCAN_UP_PRESSED .
GRID_MSG_DOWN	Keyboard	EVENT_KEYSCAN	If event occurs and parameter1 passed matches the object's ID and parameter 2 passed matches SCAN_DOWN_PRESSED .
GRID_MSG_LEFT	Keyboard	EVENT_KEYSCAN	If event occurs and parameter1 passed matches the object's ID and parameter 2 passed matches SCAN_LEFT_PRESSED .
GRID_MSG_RIGHT	Keyboard	EVENT_KEYSCAN	If event occurs and parameter1 passed matches the object's ID and parameter 2 passed matches SCAN_RIGHT_PRESSED .
OBJ_MSG_INVALID	Any	Any	If the message did not affect the object.

Preconditions

none

Parameters

Parameters	Description
pGrid	The pointer to the object where the message will be evaluated to check if the message will affect the object.
pMsg	Pointer to the message struct containing the message from the user interface.

Returns

Returns the translated message depending on the received GOL message:

- GRID_MSG_TOUCHED - when the grid object is touched.
- GRID_MSG_ITEM_SELECTED – when key scan [SCAN_SPACE_PRESSED](#) or [SCAN_CR_PRESSED](#) are detected.
- GRID_MSG_UP – when key scan [SCAN_UP_PRESSED](#) is detected.
- GRID_MSG_DOWN – when key scan [SCAN_DOWN_PRESSED](#) is detected.
- GRID_MSG_LEFT – when key scan [SCAN_LEFT_PRESSED](#) is detected.
- GRID_MSG_RIGHT – when key scan [SCAN_RIGHT_PRESSED](#) is detected.
- OBJ_MSG_INVALID – Button is not affected

Side Effects

none

5.2.2.7.10 Group Box Object Functions

5.2.2.7.10.1 GFX_GOL_GroupboxActionGet Function

C

```
GFX_GOL_TRANSLATED_ACTION GFX_GOL_GroupboxActionGet(
    void * pObject,
    GFX_GOL_MESSAGE * pMessage
);
```

Description

This function evaluates the message from a user if the message will affect the object or not. The table below enumerates the action for each event of the touch screen and keyboard inputs.

Translated Message	Input Source Events	Description
GFX_GOL_GROUPBOX_ACTION_SELECTED	Touch Screen EVENT_PRESS, EVENT_RELEASE	If events occurs and the x,y position falls in the area of the group box.
GFX_GOL_OBJECT_ACTION_INVALID	Any Any	If the message did not affect the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	The pointer to the object where the message will be evaluated to check if the message will affect the object.

pMessage	Pointer to the the message from the user interface.

Returns

- GFX_GOL_GROUPBOX_ACTION_SELECTED // Groupbox area selected action ID.

Example

None.

5.2.2.7.10.2 GFX_GOL_GroupboxCreate Function**C**

```
GFX_GOL_GROUPBOX * GFX_GOL_GroupboxCreate(
    uint16_t ID,
    uint16_t left,
    uint16_t top,
    uint16_t right,
    uint16_t bottom,
    uint16_t state,
    GFX_XCHAR * pText,
    GFX_ALIGNMENT alignment,
    GFX_GOL_OBJ_SCHEME * pScheme
);
```

Description

This function creates a [GFX_GOL_GROUPBOX](#) object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

This function returns the pointer to the newly created object. If the object is not successfully created, it returns NULL.

Preconditions

None.

Parameters

Parameters	Description
ID	Unique user defined ID for the object instance.
left	Left most position of the object.
top	Top most position of the object.
right	Right most position of the object.
bottom	Bottom most position of the object.
state	Sets the initial state of the object.
pImage	Pointer to the image used on the face of the object.
pText	Pointer to the text of the object.
alignment	text alignment of the text used in the object.
pScheme	Pointer to the style scheme used.

Returns

Pointer to the newly created object.

Example

```
GFX_GOL_OBJ_SCHEME *pScheme;
GFX_GOL_GROUPBOX *pGroupbox;
GFX_GOL_GROUPBOX_STATE state;

// assume pScheme is initialized to a scheme in memory.
state = GFX_GOL_GROUPBOX_DRAW_STATE;
```

```

pGroupBox = GFX_GOL_GroupboxCreate(1,           // ID
0,0,GFX_Primitive_MaxXGet(),GFX_Primitive_MaxYGet(), // whole screen dimension
state,           // set state to draw all
(char*)myIcon,   // icon
"Place Title Here.", // text
NULL);          // use default GOL scheme

if (pwindow == NULL)
    return 0;

return 1;

```

5.2.2.7.10.3 GFX_GOL_GroupboxDraw Function

C

```

GFX_STATUS GFX_GOL_GroupboxDraw(
    void * pObject
);

```

Description

This function renders the object on the screen based on the current state of the object. Location of the object is determined by the left, top, right and bottom parameters. The colors used are dependent on the state of the object. The font used is determined by the style scheme set.

The text on the face of the [GFX_GOL_GROUPBOX](#) is drawn on top of the bitmap. Text alignment based on the alignment parameter set on the object.

When rendering objects of the same type, each object must be rendered completely before the rendering of the next object is started. This is to avoid incomplete object rendering.

Normally, application will just call [GFX_GOL_ObjectListDraw\(\)](#) to allow the Graphics Library to manage all object rendering. See [GFX_GOL_ObjectListDraw\(\)](#) for more information on object rendering.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	Pointer to the object.

Returns

GFX_STATUS_SUCCESS - When the object rendering is finished. GFX_STATUS_FAILURE - When the object rendering is not yet finished. Application needs to call this rendering function again to continue the rendering.

Example

None.

5.2.2.7.10.4 GFX_GOL_GroupboxTextAlignmentGet Function

C

```

GFX_ALIGNMENT GFX_GOL_GroupboxTextAlignmentGet(
    GFX_GOL_GROUPBOX * pObject
);

```

Description

This function returns the text alignment of the text string used by the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

The text alignment set in the object. See [GFX_ALIGNMENT](#) for more details.

Example

None.

5.2.2.7.10.5 GFX_GOL_GroupboxTextAlignmentSet Function**C**

```
void GFX_GOL_GroupboxTextAlignmentSet(  
    GFX_GOL_GROUPBOX * pObject,  
    GFX_ALIGNMENT align  
);
```

Description

This function sets the text alignment of the text string used by the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	Pointer to the object.
align	The alignment set for the text in the object. See GFX_ALIGNMENT for more details.

Returns

None.

Example

None.

5.2.2.7.10.6 GFX_GOL_GroupboxTextSet Function**C**

```
void GFX_GOL_GroupboxTextSet(  
    GFX_GOL_GROUPBOX * pObject,  
    GFX_XCHAR * pText  
);
```

Description

This function sets the address of the current text string used by the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.
pText	pointer to the text string to be used.

Returns

None.

Example

```
GFX_XCHAR Label0[] = ?Group One?;
GFX_XCHAR Label1[] = ?Group Two?;
GFX_GOL_GROUPBOX pGroupbox;

GFX_GOL_GroupboxTextSet(pGroupbox, Label0);
GFX_GOL_GroupboxTextSet(pGroupbox, Label1);
```

5.2.2.7.11 List Box Object Functions**5.2.2.7.11.1 GFX_GOL_ListBoxActionGet Function****C**

```
GFX_GOL_TRANSLATED_ACTION GFX_GOL_ListBoxActionGet(
    void * pObject,
    GFX_GOL_MESSAGE * pMessage
);
```

Description

This function evaluates the message from a user if the message will affect the object or not. The table below enumerates the action for each event of the touch screen and keyboard inputs.

Translated Message	Input Source	Set/Clear State Bit	Description
GFX_GOL_LISTBOX_ACTION_TOUCHSCREEN	Touch Screen	Any	Item is selected using touch screen.
GFX_GOL_LISTBOX_ACTION_MOVE	Keyboard	EVENT_KEYSCAN	Focus is moved to the next item depending on the key pressed (UP or DOWN key).
GFX_GOL_LISTBOX_ACTION_SELECTED	Keyboard	EVENT_KEYSCAN	Selection status (GFX_GOL_LISTBOX_ITEM_STATUS_SELECTED) is set to the currently focused item.
GFX_GOL_OBJECT_ACTION_INVALID	Any	Any	If the message did not affect the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	The pointer to the object where the message will be evaluated to check if the message will affect the object.
pMessage	Pointer to the the message from the user interface.

Returns

- GFX_GOL_LISTBOX_ACTION_TOUCHSCREEN â€” Item is selected using touch screen
- GFX_GOL_LISTBOX_ACTION_MOVE â€” Focus is moved to the next item depending on the key pressed (UP or DOWN key).
- GFX_GOL_LISTBOX_ACTION_SELECTED â€” Selection is set to the currently focused item
- GFX_GOL_OBJECT_ACTION_INVALID â€” Object is not affected

Example

None.

5.2.2.7.11.2 GFX_GOL_ListBoxActionSet Function**C**

```
void GFX_GOL_ListBoxActionSet(
    GFX_GOL_TRANSLATED_ACTION translatedMsg,
    void * pObject,
    GFX_GOL_MESSAGE * pMessage
);
```

Description

This function performs the state change of the object based on the translated action. This change can be overridden by the application using the application defined GFX_GOL_MESSAGE_CALLBACK_FUNC. When the user message is determined to affect the object, application can perform the state change in the message callback function. The following state changes are supported:

Translated Message	Input Source	Set/Clear State Bit Description
GFX_GOL_LISTBOX_ACTION_TOUCHSCREEN	Touch Screen	Set GFX_GOL_LISTBOX_FOCUSED_STATE, If focus is enabled, the focus state bit GFX_GOL_LISTBOX_FOCUSED_STATE will be set.
		Set GFX_GOL_LISTBOX_DRAW_FOCUS_STATE GFX_GOL_LISTBOX_DRAW_FOCUS_STATE draw state bit will force the List Box to be redrawn with focus.
		Set GFX_GOL_LISTBOX_DRAW_ITEMS_STATE List Box will be redrawn with selected item(s).
GFX_GOL_LISTBOX_ACTION_MOVE	KeyBoard	Set GFX_GOL_LISTBOX_DRAW_ITEMS_STATE List Box will be redrawn with focus on one item.
GFX_GOL_LISTBOX_ACTION_SELECTED	KeyBoard	Set GFX_GOL_LISTBOX_DRAW_ITEMS_STATE List Box will be redrawn with selection on the current item focused.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
translatedMsg	The action of the object based on the message.
pObject	The pointer to the object whose state will be modified.
pMessage	The pointer to the original message.

Returns

None.

Example

None.

5.2.2.7.11.3 GFX_GOL_ListBoxCreate Function**C**

```
GFX_GOL_LISTBOX * GFX_GOL_ListBoxCreate(
    uint16_t ID,
    uint16_t left,
    uint16_t top,
    uint16_t right,
    uint16_t bottom,
    uint16_t state,
    GFX_XCHAR * pText,
    GFX_ALIGNMENT alignment,
    GFX_GOL_OBJ_SCHEME * pScheme
);
```

Description

This function creates a [GFX_GOL_LISTBOX](#) object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

This function returns the pointer to the newly created object. If the object is not successfully created, it returns NULL.

The behavior of `GFX_GOL_ListBoxCreate()` will be undefined if one of the following is true:

- left >= right
- top >= bottom
- pScheme is not pointing to a [GFX_GOL_OBJ_SCHEME](#)
- pText is an unterminated string

Preconditions

None.

Parameters

Parameters	Description
ID	Unique user defined ID for the object instance.
left	Left most position of the object.
top	Top most position of the object.
right	Right most position of the object.
bottom	Bottom most position of the object.
state	Sets the initial state of the object.
pText	Pointer to the text of the object. This is used for the items of the object.
alignment	text alignment of the text used in the object.
pScheme	Pointer to the style scheme used.

Returns

Pointer to the newly created object.

Example

```
#define LISTBOX_ID 10
const XCHAR ItemList[] = "Line1n" "Line2n";

GFX_GOL_OBJ_SCHEME *pScheme;
```

```

GFX_GOL_LISTBOX    *pLb;
GFX_XCHAR          *pTemp;
uint16_t           state, counter;

//assume scheme is a valid style scheme in memory
pScheme = &scheme;
state = GFX_GOL_LISTBOX_DRAW_STATE;

// create an empty listbox with default style scheme
pLb = GFX_GOL_ListBoxCreate(    LISTBOX_ID,    // ID number
                                10,10,150,200,   // dimension
                                state,          // initial state
                                NULL,          // set items to be empty
                                GFX_ALIGN_CENTER,
                                NULL);          // use default style scheme

// check if Listbox was created
if (pLb == NULL)
    return 0;

// create the list of items to be placed in the listbox
// Add items (each line will become one item,
// lines must be separated by 'n' character)
pTemp = ItemList;
counter = 0;

while(*pTemp)
{
    // since each item is appended NULL is assigned to
    // GFX_GOL_LISTITEM pointer.
    if(NULL == GFX_GOL_ListBoxItemAdd(
        pLb,
        NULL,
        pTemp,
        NULL,
        0,
        counter))
    {
        break;
    }

    while(*pTemp++ > (unsigned GFX_XCHAR)31);

    if(*(pTemp-1) == 0)
        break;
    counter++;
}

```

5.2.2.7.11.4 GFX_GOL_ListBoxDraw Function

C

```

GFX_STATUS GFX_GOL_ListBoxDraw(
    void * pObject
);

```

Description

This function renders the object on the screen based on the current state of the object. Location of the object is determined by the left, top, right and bottom parameters. The colors used are dependent on the state of the object. The font used is determined by the style scheme set.

Text alignment based on the alignment parameter set on the object.

When rendering objects of the same type, each object must be rendered completely before the rendering of the next object is started. This is to avoid incomplete object rendering.

Normally, application will just call [GFX_GOL_ObjectListDraw\(\)](#) to allow the Graphics Library to manage all object rendering. See [GFX_GOL_ObjectListDraw\(\)](#) for more information on object rendering.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	Pointer to the object.

Returns

GFX_STATUS_SUCCESS - When the object rendering is finished. GFX_STATUS_FAILURE - When the object rendering is not yet finished. Application needs to call this rendering function again to continue the rendering.

Example

None.

5.2.2.7.11.5 GFX_GOL_ListBoxItemAdd Function

C

```
GFX_GOL_LISTITEM * GFX_GOL_ListBoxItemAdd(
    GFX_GOL_LISTBOX * pObject,
    GFX_GOL_LISTITEM * pPrevItem,
    GFX_XCHAR * pText,
    GFX_RESOURCE_HDR * pImage,
    uint16_t status,
    uint16_t data
);
```

Description

This function adds an item to the list box. This function allocates the memory needed for the [GFX_GOL_LISTITEM](#) and adds it to the list box. The newly created [GFX_GOL_LISTITEM](#) will store the location of pText, pImage and other parameters describing the added item.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	Pointer to the object.
pPrevItem	Pointer to the item after which a new item must be inserted, if this pointer is NULL, the item will be appended at the end of the items list.
pText	Pointer to the text that will be inserted. Text must persist in memory for as long as it is referenced by an item in the list box.
pImage	Pointer to the image for the item. Image must persist in memory for as long as it is referenced by the an item in the list box.
status	This parameter specifies if the item being added will be selected or redrawn (LB_STS_SELECTED or LB_STS_REDRAW). Refer to LISTITEM structure for details.
data	User assigned data associated with the item.

Returns

The pointer to the created item.

Example

```

const GFX_XCHAR ItemList[] = "Line1n" "Line2n" "Line3n";

extern GFX_RESOURCE_HDR myIcon;
GFX_GOL_LISTBOX      *pLb;
GFX_GOL_LISTITEM     *pItem, *pItemList;
GFX_XCHAR            *pTemp;

// Assume that pLb is pointing to an existing list box in memory
// that is empty (no list).

// Create the list of the list box

// Initialize this to NULL to indicate that items will be added
// at the end of the list if the list exist on the list box or
// start a new list if the list box is empty.
pItem = NULL;
pTemp = ItemList;
pItem = GFX_GOL_ListBoxItemAdd(
    pLb,
    pItem,
    pTemp,
    NULL,
    LB_STS_SELECTED,
    1);
if(pItem == NULL)
    return 0;
GFX_GOL_ListBoxImageSet(pItem, &myIcon);

// Adjust pTemp to point to the next line
while((uint16_t)*pTemp++ > (uint16_t)31);

// add the next item
pItem = GFX_GOL_ListBoxItemAdd(
    pLb,
    pItem,
    pTemp,
    NULL,
    0,
    2)
if(pItem == NULL)
    return 0;
GFX_GOL_ListBoxImageSet(pItem, &myIcon);

// Adjust pTemp to point to the next line
while((uint16_t)*pTemp++ > (uint16_t)31);

// this time insert the next item after the first item on the list
pItem = LbGetItemList(pLb);
pItem = GFX_GOL_ListBoxItemAdd(
    pLb,
    pItem,
    pTemp,
    NULL,
    0,
    3)
if(pItem == NULL)
    return 0;
GFX_GOL_ListBoxImageSet(pItem, &myIcon);

```

5.2.2.7.11.6 GFX_GOL_ListBoxItemFocusGet Function**C**

```

int16_t GFX_GOL_ListBoxItemFocusGet(

```

```
    GFX_GOL_LISTBOX * pObject
);
```

Description

This function returns the index of the focused item in the list box. First item on the list is always indexed 0. If none of the items in the list is focused, -1 is returned.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	The pointer to the object.

Returns

The index of the focused item in the list box.

Example

None.

5.2.2.7.11.7 GFX_GOL_ListBoxItemFocusSet Function

C

```
void GFX_GOL_ListBoxItemFocusSet(
    GFX_GOL_LISTBOX * pObject,
    uint16_t index
);
```

Description

This function sets the focus of the item with the index number specified by index. First item on the list is always indexed 0.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	The pointer to the object.
index	The index number of the item to be focused.

Returns

None.

Example

None.

5.2.2.7.11.8 GFX_GOL_ListBoxItemListRemove Function

C

```
void GFX_GOL_ListBoxItemListRemove(
    void * pObject
);
```

Description

This function removes the entire items list of the list box and free the memory used. The memory freed is the memory used for

the list box. The actual text or image used for the item are not removed from memory.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

None.

Example

None.

5.2.2.7.11.9 GFX_GOL_ListBoxItemRemove Function

C

```
void GFX_GOL_ListBoxItemRemove(  
    GFX_GOL_LISTBOX * pObject,  
    GFX_GOL_LISTITEM * pItem  
);
```

Description

This function removes an item from the list box and free the memory used. The memory freed is the memory used for the list box. The actual text or image used for the item are not removed from memory.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.
pltem	pointer to the list box item that will be removed.

Returns

None.

Example

None.

5.2.2.7.11.10 GFX_GOL_ListBoxSelectionChange Function

C

```
void GFX_GOL_ListBoxSelectionChange(  
    GFX_GOL_LISTBOX * pObject,  
    GFX_GOL_LISTITEM * pItem  
);
```

Description

This function changes the selection status of the given item in the list box. There are two cases that this function checks Case 1: The list box is set to multiple selection.

- The item pointed to by pltem will toggle the selection status.

Case 2: The list box is set to single selection.

- If the currently selected item is not the item pointed to by pItem, the currently selected item will toggle to not selected. The item pointed to by pItem will then be set to selected.
- If the currently selected item is the same item pointed to by pItem, the selection status of that item will be set to not selected.

The change in the item's selection status should be redrawn to reflect the changes.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	The pointer to the object.
pItem	The pointer to the item that will have the selection status changed.

Returns

None.

Example

None.

5.2.2.7.11.11 GFX_GOL_ListBoxSelectionGet Function

C

```
GFX_GOL_LISTITEM * GFX_GOL_ListBoxSelectionGet(  
    GFX_GOL_LISTBOX * pObject,  
    GFX_GOL_LISTITEM * pFromItem  
);
```

Description

This function searches for selected items from the list box. A starting position can optionally be given. If starting position is set to NULL, search will begin from the first item on the item list.

The function returns the pointer to the first selected item found or NULL if there are no items selected.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	The pointer to the object.
pFromItem	The starting point of the search. If this is set to NULL, the search will start at the beginning of the item list.

Returns

The pointer to the first selected item found. NULL if there are no items selected.

Example

None.

5.2.2.7.11.12 GFX_GOL_ListBoxVisibleItemCountGet Function

C

```
uint16_t GFX_GOL_ListBoxVisibleItemCountGet(
    GFX_GOL_LISTBOX * pObject
);
```

Description

This function returns the count of items visible in the list box.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	The pointer to the object.

Returns

The number of visible items in the list box.

Example

None.

5.2.2.7.12 Meter Object Functions

5.2.2.7.12.1 GFX_GOL_MeterActionGet Function

C

```
GFX_GOL_TRANSLATED_ACTION GFX_GOL_MeterActionGet(
    void * pObject,
    GFX_GOL_MESSAGE * pMessage
);
```

Description

This function evaluates the message from a user if the message will affect the object or not. The table below enumerates the action for each event of the touch screen and keyboard inputs.

Translated Message	Input Source	Set/Clear State Bit	Description
GFX_GOL_METER_ACTION_SET	System	EVENT_SET	If event set occurs and the meter id is sent in parameter 1.
GFX_GOL_OBJECT_ACTION_INVALID	Any	Any	If the message did not affect the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	The pointer to the object where the message will be evaluated to check if the message will affect the object.
pMessage	Pointer to the the message from the user interface.

Returns

- GFX_GOL_METER_ACTION_SET â€” Meter id is given in parameter 1 for a TYPE_SYSTEM message.
- GFX_GOL_OBJECT_ACTION_INVALID â€” Object is not affected

Example

None.

5.2.2.7.12.2 GFX_GOL_MeterActionSet Function**C**

```
void GFX_GOL_MeterActionSet(
    GFX_GOL_TRANSLATED_ACTION translatedMsg,
    void * pObject,
    GFX_GOL_MESSAGE * pMessage
);
```

Description

This function performs the state change of the object based on the translated action. This change can be overridden by the application using the application defined GFX_GOL_MESSAGE_CALLBACK_FUNC. When the user message is determined to affect the object, application can perform the state change in the message callback function. The following state changes are supported:

Translated Message	Input Source	Set/Clear State Bit	Description
GFX_GOL_METER_ACTION_SET	System	Set GFX_GOL_METER_DRAW_STATE	Meter will be redrawn to update the needle position and value displayed.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
translatedMsg	The action of the object based on the message.
pObject	The pointer to the object whose state will be modified.
pMessage	The pointer to the original message.

Returns

None.

Example

None.

5.2.2.7.12.3 GFX_GOL_MeterCreate Function**C**

```
GFX_GOL_METER * GFX_GOL_MeterCreate(
    uint16_t ID,
    uint16_t left,
    uint16_t top,
    uint16_t right,
    uint16_t bottom,
    uint16_t state,
    GFX_GOL_METER_DRAW_TYPE type,
```

```

    int16_t value,
    int16_t minValue,
    int16_t maxValue,
    GFX_RESOURCE_HDR * pTitleFont,
    GFX_RESOURCE_HDR * pValueFont,
    GFX_XCHAR * pText,
    GFX_GOL_OBJ_SCHEME * pScheme
);

```

Description

This function creates a [GFX_GOL_METER](#) object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

This function returns the pointer to the newly created object. If the object is not successfully created, it returns NULL.

The behavior of `GFX_GOL_MeterCreate()` will be undefined if one of the following is true:

- left >= right
- top >= bottom
- type is not one of the defined types
- pTitleFont and pValueFont is not defined to a valid font `GFX_RESOURCE_HDR`
- pScheme is not pointing to a [GFX_GOL_OBJ_SCHEME](#)
- pText is an unterminated string

Preconditions

None.

Parameters

Parameters	Description
ID	Unique user defined ID for the object instance.
left	Left most position of the object.
top	Top most position of the object.
right	Right most position of the object.
bottom	Bottom most position of the object.
state	Sets the initial state of the object.
type	Specifies the type of Meter to be drawn (see <code>GFX_GOL_METER_TYPE</code>).
value	Initial value set to the meter.
minValue	The minimum value the meter will display.
maxValue	The maximum value the meter will display.
pTitleFont	Pointer to the font used for the Title.
pValueFont	Pointer to the font used for the value.
pText	Pointer to the text label of the meter.
pScheme	Pointer to the style scheme used.

Returns

Pointer to the newly created object.

Example

```

#define ID_METER 101

extern const FONT_FLASH GOLMediumFont;    // medium font
extern const FONT_FLASH GOLSmallFont;    // small font

```

```

GFX_GOL_OBJ_SCHEME *pMeterScheme;
GFX_GOL_METER *pMtr;

// assume pMeterScheme is initialized to a scheme in memory.

// draw object after creation
state = GFX_GOL_METER_DRAW_STATE | GFX_GOL_METER_RING_STATE;

pMtr = GFX_GOL_MeterCreate(
    ID_METER,                // assign ID
    30, 50, 150, 180,        // set dimension
    state,                   // type of meter
    GFX_GOL_METER_WHOLE_TYPE, // set initial value
    0,                       // set min and max value
    0, 100,                  // set title font
    &GOLMediumFont,          // set value font
    &GOLSmallFont,           // Text Label
    "Speed",                 // style scheme
    pMeterScheme);

// check if meter was created
if (pMtr == NULL)
    return 0;

// Change range colors: Normal values to WHITE
//                      Critical values to BLUE
//                      Danger values to RED
// assume that WHITE, GREEN, YELLOW and RED have been defined.
GFX_GOL_MeterScaleColorSet(pMtr, WHITE, WHITE, WHITE,
                           GREEN, YELLOW, RED);

// use GOLDraw() to draw the meter created
while(!GOLDraw());

```

5.2.2.7.12.4 GFX_GOL_MeterDecrement Function

C

```

void GFX_GOL_MeterDecrement(
    GFX_GOL_METER * pObject,
    uint16_t delta
);

```

Description

This function decrements the meter value by the given delta value set. If the delta given is less than the minimum value of the meter, the value will remain to be at minimum.

Object must be redrawn after this function is called to reflect the changes to the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

None.

Example

See [GFX_GOL_MeterIncrement\(\)](#).

5.2.2.7.12.5 GFX_GOL_MeterDraw Function

C

```
GFX_STATUS GFX_GOL_MeterDraw(  
    void * pObject  
);
```

Description

This function renders the object on the screen based on the current state of the object. Location of the object is determined by the left, top, right and bottom parameters. The colors used are dependent on the state of the object. The font used is determined by the style scheme set.

When rendering objects of the same type, each object must be rendered completely before the rendering of the next object is started. This is to avoid incomplete object rendering.

Normally, application will just call [GFX_GOL_ObjectListDraw\(\)](#) to allow the Graphics Library to manage all object rendering. See [GFX_GOL_ObjectListDraw\(\)](#) for more information on object rendering.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	Pointer to the object.

Returns

GFX_STATUS_SUCCESS - When the object rendering is finished. GFX_STATUS_FAILURE - When the object rendering is not yet finished. Application needs to call this rendering function again to continue the rendering.

Example

None.

5.2.2.7.12.6 GFX_GOL_MeterIncrement Function

C

```
void GFX_GOL_MeterIncrement(  
    GFX_GOL_METER * pObject,  
    uint16_t delta  
);
```

Description

This function increments the scroll bar position by the given delta value set. If the delta given exceeds the maximum value of the meter, the value will remain to be at maximum.

Object must be redrawn after this function is called to reflect the changes to the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

None.

Example

```

void ControlSpeed( GFX_GOL_METER* pObj,
                  int setSpeed,
                  int curSpeed)
{
    // set page size to 1
    GFX_GOL_MeterValueSet(pObj, 1);

    if (setSpeed < curSpeed)
    {
        while(GFX_GOL_MeterValueGet(pObj) < SetSpeed)
            GFX_GOL_MeterIncrement(pObj, 1); // increment by 1
    }
    else if (setSpeed > curSpeed)
    {
        while(GFX_GOL_MeterValueGet(pObj) > SetSpeed)
            GFX_GOL_MeterDecrement(pObj, 1); // decrement by 1
    }
}

```

5.2.2.7.12.7 GFX_GOL_MeterRangeSet Function**C**

```

void GFX_GOL_MeterRangeSet(
    GFX_GOL_METER * pObj,
    int16_t minValue,
    int16_t maxValue
);

```

Description

This function sets the range of the meter. When the range is modified, object must be completely redrawn to reflect the change. minValue should always be less than maxValue.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.
minValue	new minimum value of the object.
maxValue	new maximum value of the object.

Returns

None.

Example

None.

5.2.2.7.12.8 GFX_GOL_MeterScaleColorsSet Function**C**

```

void GFX_GOL_MeterScaleColorsSet(
    GFX_GOL_METER * pObj,
    GFX_COLOR color1,
    GFX_COLOR color2,
    GFX_COLOR color3,
    GFX_COLOR color4,
    GFX_COLOR color5,

```

```
GFX_COLOR color6
);
```

Description

After the object is created, this function must be called to set the arc colors of the object.

Scale colors can be used to highlight values of the meter. User can set these colors to define the arc colors and scale colors. This also sets the color of the meter value when displayed. The color settings are set to the following angles:

Color Boundaries	Type Whole	Type Half	Type Quarter
Arc 6	225 to 180	not used	not used
Arc 5	179 to 135	179 to 135	not used
Arc 4	134 to 90	134 to 90	not used
Arc 3	89 to 45	89 to 45	89 to 45
Arc 2	44 to 0	44 to 0	44 to 0
Arc 1	-45 to -1	not used	not used

As the meter is drawn colors are changed depending on the angle of the scale and label being drawn.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.
color1	color assigned to Arc 1 and Scale 1.
color2	color assigned to Arc 2 and Scale 2.
color3	color assigned to Arc 3 and Scale 3.
color4	color assigned to Arc 4 and Scale 4.
color5	color assigned to Arc 5 and Scale 5.
color6	color assigned to Arc 6 and Scale 6.

Returns

None.

Example

None.

5.2.2.7.12.9 GFX_GOL_MeterValueSet Function

C

```
void GFX_GOL_MeterValueSet(
    GFX_GOL_METER * pObject,
    int16_t value
);
```

Description

This function sets the value of the meter. The value used should be within the range set for the object. The new value is checked to be in the minimum and maximum value range. If the value set is less than the minimum value, the value that will be set is the minimum value. If the value set is more than the maximum value, then the value that will be set is the maximum value.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.
value	the new value of the object.

Returns

None.

Example

```
GFX_GOL_METER *pMeter;
uint16_t ctr = 0;

// create slider here and initialize parameters
GFX_GOL_ObjectStateSet(pMeter, GFX_GOL_METER_DRAW_STATE);
GFX_GOL_ObjectListDraw();

while("some condition")
{
    GFX_GOL_MeterValueSet(pMeter, ctr);
    GFX_GOL_ObjectStateSet( pMeter,
                           GFX_GOL_METER_UPDATE_DRAW_STATE);

    // redraw the scroll bar
    GFX_GOL_ObjectListDraw();

    // update ctr here
    ctr = "some source of value";
}
```

5.2.2.7.13 Progress Bar Object Functions**5.2.2.7.13.1 GFX_GOL_ProgressBarActionGet Function****C**

```
GFX_GOL_TRANSLATED_ACTION GFX_GOL_ProgressBarActionGet(
    void * pObject,
    GFX_GOL_MESSAGE * pMessage
);
```

Description

This function evaluates the message from a user if the message will affect the object or not. The table below enumerates the action for each event of the touch screen and keyboard inputs.

Translated Message	Input Source	Set/Clear State Bit Description
GFX_GOL_PROGRESSBAR_ACTION_SELECTED	Touch Screen	EVENT_PRESS, EVENT_RELEASE, If events occurs and the x,y position falls in the area of the object.
		EVENT_MOVE
GFX_GOL_OBJECT_ACTION_INVALID	Any	Any If the message did not affect the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	The pointer to the object where the message will be evaluated to check if the message will affect the object.
pMessage	Pointer to the the message from the user interface.

Returns

- GFX_GOL_PROGRESSBAR_ACTION_SELECTED “Object is selected”
- GFX_GOL_OBJECT_ACTION_INVALID “Object is not affected”

Example

None.

5.2.2.7.13.2 GFX_GOL_ProgressBarCreate Function**C**

```
GFX_GOL_PROGRESSBAR * GFX_GOL_ProgressBarCreate(
    uint16_t ID,
    uint16_t left,
    uint16_t top,
    uint16_t right,
    uint16_t bottom,
    uint16_t state,
    uint16_t pos,
    uint16_t range,
    GFX_GOL_OBJ_SCHEME * pScheme
);
```

Description

This function creates a [GFX_GOL_PROGRESSBAR](#) object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

This function returns the pointer to the newly created object. If the object is not successfully created, it returns NULL.

The behavior of [GFX_GOL_RadioButtonCreate\(\)](#) will be undefined if one of the following is true:

- left >= right
- top >= bottom
- pos > range
- range = 0
- pScheme is not pointing to a [GFX_GOL_OBJ_SCHEME](#)
- pText is an unterminated string

Preconditions

None.

Parameters

Parameters	Description
ID	Unique user defined ID for the object instance.
left	Left most position of the object.

top	Top most position of the object.
right	Right most position of the object.
bottom	Bottom most position of the object.
state	Sets the initial state of the object.
pos	Defines the initial position of the progress.
range	This specifies the maximum value of the progress bar when the progress bar is at 100% position.
pScheme	Pointer to the style scheme used.

Returns

Pointer to the newly created object.

Example

```

GFX_GOL_PROGRESSBAR *pPBar;
void CreateProgressBar()
{
    pPBar = PbCreate(ID_PROGRESSBAR1,    // ID
                    50,90,270,140,       // dimension
                    PB_DRAW,             // Draw the object
                    25,                  // position
                    50,                  // set the range
                    NULL);               // use default GOL scheme
}

```

5.2.2.7.13.3 GFX_GOL_ProgressBarDraw Function**C**

```

GFX_STATUS GFX_GOL_ProgressBarDraw(
    void * pObject
);

```

Description

This function renders the object on the screen based on the current state of the object. Location of the object is determined by the left, top, right and bottom parameters. The colors used are dependent on the state of the object. The font used is determined by the style scheme set.

When rendering objects of the same type, each object must be rendered completely before the rendering of the next object is started. This is to avoid incomplete object rendering.

Normally, application will just call [GFX_GOL_ObjectListDraw\(\)](#) to allow the Graphics Library to manage all object rendering. See [GFX_GOL_ObjectListDraw\(\)](#) for more information on object rendering.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	Pointer to the object.

Returns

GFX_STATUS_SUCCESS - When the object rendering is finished. GFX_STATUS_FAILURE - When the object rendering is not yet finished. Application needs to call this rendering function again to continue the rendering.

Example

None.

5.2.2.7.13.4 GFX_GOL_ProgressBarPositionSet Function

C

```
void GFX_GOL_ProgressBarPositionSet(
    GFX_GOL_PROGRESSBAR * pobject,
    uint16_t position
);
```

Description

This function sets the position of the progress bar.

The value used for the position should be within the range set for the object.

Function will have an undefined behavior if the position is outside the range.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.
position	the new position of the scroll bar thumb.

Returns

None.

Example

```
GFX_GOL_PROGRESSBAR *pPb;
uint8_t direction = 1;

// this code increments and decrements the progress bar by 1
// assume progress bar was created and initialized before
while (1)
{
    if(direction)
    {
        if(pPb ->pos == pPb ->range)
            direction = 0;
        else
            GFX_GOL_ProgressBarPositionSet(
                pPb,
                GFX_GOL_ProgressBarPositionGet(pPb)+1);
    }
    else
    {
        if(pPb ->pos == 0)
            direction = 1;
        else
            GFX_GOL_ProgressBarPositionSet(
                pPb,
                GFX_GOL_ProgressBarPositionGet(pPb)-1);
    }
}
```

5.2.2.7.13.5 GFX_GOL_ProgressBarRangeSet Function

C

```
void GFX_GOL_ProgressBarRangeSet(
    GFX_GOL_PROGRESSBAR * pobject,
    uint16_t range
);
```

```
);
```

Description

This function sets the range of the progress bar. When the range is modified, object must be completely redrawn to reflect the change.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.
range	new range of the object.

Returns

None.

Example

None.

5.2.2.7.14 Picture Object Functions

5.2.2.7.14.1 GFX_GOL_PictureControlActionGet Function

C

```
GFX_GOL_TRANSLATED_ACTION GFX_GOL_PictureControlActionGet(
    void * pObject,
    GFX_GOL_MESSAGE * pMessage
);
```

Description

This function evaluates the message from a user if the message will affect the object or not. The table below enumerates the action for each event of the touch screen and keyboard inputs.

Translated Message	Input Source	Set/Clear State Bit	Description
GFX_GOL_PICTURECONTROL_ACTION_SELECTED	Touch Screen	EVENT_PRESS, EVENT_RELEASE, EVENT_MOVE	If events occurs and the x,y position falls in the area of the picture.
GFX_GOL_OBJECT_ACTION_INVALID	Any	Any	If the message did not affect the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	The pointer to the object where the message will be evaluated to check if the message will affect the object.
pMessage	Pointer to the the message from the user interface.

Returns

- GFX_GOL_PICTURECONTROL_ACTION_SELECTED “Object is selected”
- GFX_GOL_OBJECT_ACTION_INVALID “Object is not affected”

Example

None.

5.2.2.7.14.2 GFX_GOL_PictureControlCreate Function**C**

```
GFX_GOL_PICTURECONTROL * GFX_GOL_PictureControlCreate(
    uint16_t ID,
    uint16_t left,
    uint16_t top,
    uint16_t right,
    uint16_t bottom,
    uint16_t state,
    int8_t scaleFactor,
    GFX_RESOURCE_HDR * pImage,
    GFX_GOL_OBJ_SCHEME * pScheme
);
```

Description

This function creates a [GFX_GOL_PICTURECONTROL](#) object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

This function returns the pointer to the newly created object. If the object is not successfully created, it returns NULL.

The object allows creation with the image set to NULL. In this case, nothing will be drawn when the object is set to be drawn and the frame is not enabled (See [GFX_GOL_PICTURECONTROL_FRAME_STATE](#)). If the frame is enabled, then only the frame will be drawn.

When the assigned image's dimension is larger than the dimension of the object, partial image parameters will be set in such a way that the upper left most corner of the image that has the same dimension as the object will be used in the object. This is the default behavior.

The partial parameters can be modified by calling the [GFX_GOL_PictureControlPartialSet\(\)](#) function with the desired partial image parameters. See [GFX_ImagePartialDraw\(\)](#) for details on the partial image rendering.

The behavior of [GFX_GOL_PictureControlCreate\(\)](#) will be undefined if one of the following is true:

- left >= right
- top >= bottom
- pScheme is not pointing to a [GFX_GOL_OBJ_SCHEME](#)
- pImage is not pointing to a [GFX_RESOURCE_HDR](#).

Preconditions

None.

Parameters

Parameters	Description
ID	Unique user defined ID for the object instance.
left	Left most position of the object.
top	Top most position of the object.
right	Right most position of the object.

bottom	Bottom most position of the object.
state	Sets the initial state of the object.
pImage	Pointer to the image by the object
pScheme	Pointer to the style scheme used.

Returns

Pointer to the newly created object.

Example

None.

5.2.2.7.14.3 GFX_GOL_PictureControlDraw Function**C**

```
GFX_STATUS GFX_GOL_PictureControlDraw(
    void * pObject
);
```

Description

This function renders the object on the screen based on the current state of the object. Location of the object is determined by the left, top, right and bottom parameters. The colors used are dependent on the state of the object. The font used is determined by the style scheme set.

When the image size The text on the face of the [GFX_GOL_PICTURECONTROL](#) is drawn on top of the bitmap. Text alignment based on the alignment parameter set on the object.

When rendering objects of the same type, each object must be rendered completely before the rendering of the next object is started. This is to avoid incomplete object rendering.

Normally, application will just call [GFX_GOL_ObjectListDraw\(\)](#) to allow the Graphics Library to manage all object rendering. See [GFX_GOL_ObjectListDraw\(\)](#) for more information on object rendering.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	Pointer to the object.

Returns

GFX_STATUS_SUCCESS - When the object rendering is finished. GFX_STATUS_FAILURE - When the object rendering is not yet finished. Application needs to call this rendering function again to continue the rendering.

Example

None.

5.2.2.7.14.4 GFX_GOL_PictureControlPartialSet Function**C**

```
void GFX_GOL_PictureControlPartialSet(
    GFX_GOL_PICTURECONTROL * pObject,
    uint16_t xOffset,
    uint16_t yOffset,
    uint16_t partialWidth,
    uint16_t partialHeight
);
```

```
);
```

Description

This function sets the partial image parameters to be used in the object. This function allows usage of the object to specify a rectangular area of an image to be drawn as part of the object. This is useful when an image is already included in a larger image. To save memory, a separate image is not necessary for the picture object. The location of the smaller image in the larger image can be specified to show up in the picture object.

This function will result in an undefined behavior when one of the following is true:

- xOffset - value must not be greater than the image width.
- yOffset - value must not be greater than the image height.
- partialWidth - value must not be greater than image width - xoffset + 1. Value must also be less than the actual image width.
- partialHeight - value must not be greater than image height - yoffset + 1. Value must also be less than the actual image height.

Preconditions

Object must exist in memory. The image pointer of the object must be initialized properly.

Parameters

Parameters	Description
xOffset	x offset of the smaller portion of a large image
yOffset	y offset of the smaller portion of a large image
partialWidth	width of the selected portion of the image
partialHeight	height of the selected portion of the image

Returns

None.

Example

```
// assume pLargeImage is a valid GFX_RESOURCE_HDR
// assume BigImage has a height and width of 100 pixels.

GFX_RESOURCE_HDR *pLargeImage = &BigImage;
GFX_GOL_PICTURECONTROL *pPicture;
uint16_t          width, height;
uint16_t          xOffset, yOffset;
uint16_t          objectWidth, objectHeight;

objectWidth = 60 - 50; // 10 pixels
objectHeight = 120 - 90; // 30 pixels

// -1 is needed since the object dimension is inclusive
pPicture = GFX_GOL_PictureControlCreate(
    10,
    50, 90,
    50 + objectWidth - 1,
    90 + objectHeight - 1,
    GFX_GOL_PICTURECONTROL_DRAW_STATE,
    largeImage,
    NULL);

// set the parameters of the partial image to be
// shown on the image

// get the large image dimensions
width = GFX_ImageWidthGet(pLargeImage);
height = GFX_ImageHeightGet(pLargeImage);

// get the offset so the middle of the large image with
```

```
// the width and height matching the object will be used.
xOffset = (width - objectWidth) >> 1;
yOffset = (height - objectHeight) >> 1;

GFX_GOL_PictureControlPartialSet( pPicture,
                                   xOffset, yOffset,
                                   objectWidth, objectHeight);
```

5.2.2.7.15 Radio Button Object Functions

5.2.2.7.15.1 GFX_GOL_RadioButtonActionGet Function

C

```
GFX_GOL_TRANSLATED_ACTION GFX_GOL_RadioButtonActionGet(
    void * pObject,
    GFX_GOL_MESSAGE * pMessage
);
```

Description

This function evaluates the message from a user if the message will affect the object or not. The table below enumerates the action for each event of the touch screen and keyboard inputs.

Translated Message	Input Source	Set/Clear State Bit	Description
GFX_GOL_RADIOBUTTON_ACTION_CHECKED	Touch Screen	EVENT_PRESS	If event occurs and the x,y position falls in the area of the Radio Button while the Radio Button is not checked.
	Keyboard	EVENT_KEYSCAN	If event occurs and parameter1 passed matches the object's ID and parameter 2 passed matches <u>SCAN_CR_PRESSED</u> or <u>SCAN_SPACE_PRESSED</u> while the Radio Button is not checked.
GFX_GOL_OBJECT_ACTION_INVALID	Any	Any	If the message did not affect the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	The pointer to the object where the message will be evaluated to check if the message will affect the object.
pMessage	Pointer to the the message from the user interface.

Returns

- GFX_GOL_RADIOBUTTON_ACTION_CHECKED - Radio Button is checked
- GFX_GOL_OBJECT_ACTION_INVALID - object is not affected

Example

None.

5.2.2.7.15.2 GFX_GOL_RadioButtonActionSet Function

C

```
void GFX_GOL_RadioButtonActionSet(
    GFX_GOL_TRANSLATED_ACTION translatedMsg,
    void * pObject,
    GFX_GOL_MESSAGE * pMessage
);
```

Description

This function performs the state change of the object based on the translated action. This change can be overridden by the application using the application defined GFX_GOL_MESSAGE_CALLBACK_FUNC. When the user message is determined to affect the object, application can perform the state change in the message callback function. The following state changes are supported:

Translated Message	Input Source	Set/Clear State Bit Description
GFX_GOL_RADIOBUTTON_ACTION_CHECKED	Touch Screen,	Set GFX_GOL_RADIOBUTTON_DRAW_STATE, Depending on the current value of RB_CHECKED Check Box will be redrawn.
	Keyboard	Set/Clear GFX_GOL_RADIOBUTTON_CHECKED_STATE

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
translatedMsg	The action of the object based on the message.
pObject	The pointer to the object whose state will be modified.
pMessage	The pointer to the original message.

Returns

None.

Example

None.

5.2.2.7.15.3 GFX_GOL_RadioButtonCheckGet Function

C

```
uint16_t GFX_GOL_RadioButtonCheckGet(
    GFX_GOL_RADIOBUTTON * pObject
);
```

Description

This function returns the ID of the currently checked radio button in the group. When there is only one member of the group, then that member will have the check.

When no member of the group is checked, then the id returned is (-1 or 0xFFFF).

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

The ID of the member of the group with the check.

Example

```

static GFX_XCHAR  label0[] = "RB1";
static GFX_XCHAR  label1[] = "RB2";
static GFX_XCHAR  label2[] = "RB3";
uint16_t          state;
GFX_GOL_OBJ_SCHEME *pScheme;
RADIOBUTTON *pRb[3];
uint16_t          ID;

pScheme = GFX_GOL_ObjectSchemeCreate();

// Object will be drawn after creation
// Object will be first button in the group
state = GFX_GOL_RADIOBUTTON_DRAW_STATE |
        GFX_GOL_RADIOBUTTON_CHECKED_STATE;

pRb[0] = GFX_GOL_RadioButtonCreate(ID_RADIOBUTTON1,
                                   255, 40, 310, 80,
                                   state,
                                   label0,
                                   GFX_ALIGN_CENTER,
                                   pScheme);

// Object will be drawn after creation
state = GFX_GOL_RADIOBUTTON_DRAW_STATE;

pRb[1] = GFX_GOL_RadioButtonCreate(ID_RADIOBUTTON2,
                                   255, 85, 310, 125,
                                   state,
                                   label1,
                                   GFX_ALIGN_CENTER,
                                   pScheme);

// Object will be drawn after creation
state = GFX_GOL_RADIOBUTTON_DRAW_STATE;

pRb[2] = GFX_GOL_RadioButtonCreate(ID_RADIOBUTTON3,
                                   255, 130, 310, 170,
                                   state,
                                   label2,
                                   GFX_ALIGN_CENTER,
                                   pScheme);

// draw the objects
while(GFX_GOL_ObjectListDraw() != GFX_STATUS_SUCCESS);

// can also use pRb[1] or pRb[0] to search the checked
// radio button of the group. ID here should be ID_RADIOBUTTON1
ID = GFX_GOL_RadioButtonCheckGet(pRb[2]);

if (ID == ID_RADIOBUTTON1)
{
    // do something here then clear the check
    GFX_GOL_ObjectStateClear(pRb[0], RB_CHECKED);
    // Change the checked object. Pointer used is

```

```

        // any of the three. The ID used will find the
        // correct object to be checked
GFX_GOL_RadioButtonCheckSet(pRb[3], ID_RADIOBUTTON2);
}

```

5.2.2.7.15.4 GFX_GOL_RadioButtonCheckSet Function

C

```

void GFX_GOL_RadioButtonCheckSet(
    GFX_GOL_RADIOBUTTON * pObject,
    uint16_t id
);

```

Description

This function sets the ID of the currently checked radio button in the group. When there is only one member of the group, then that member will have the check.

When the id given does not exist in the group, the function will do nothing.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.
id	id of the member of the group.

Returns

None.

Example

See [GFX_GOL_RadioButtonCheckGet\(\)](#) example.

5.2.2.7.15.5 GFX_GOL_RadioButtonCreate Function

C

```

GFX_GOL_RADIOBUTTON * GFX_GOL_RadioButtonCreate(
    uint16_t ID,
    uint16_t left,
    uint16_t top,
    uint16_t right,
    uint16_t bottom,
    uint16_t state,
    GFX_XCHAR * pText,
    GFX_ALIGNMENT alignment,
    GFX_GOL_OBJ_SCHEME * pScheme
);

```

Description

This function creates a [GFX_GOL_RADIOBUTTON](#) object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

This function returns the pointer to the newly created object. If the object is not successfully created, it returns NULL.

The behavior of `GFX_GOL_RadioButtonCreate()` will be undefined if one of the following is true:

- left >= right
- top >= bottom

- pScheme is not pointing to a [GFX_GOL_OBJ_SCHEME](#)
- pText is an unterminated string

Preconditions

None.

Parameters

Parameters	Description
ID	Unique user defined ID for the object instance.
left	Left most position of the object.
top	Top most position of the object.
right	Right most position of the object.
bottom	Bottom most position of the object.
state	Sets the initial state of the object.
pText	Pointer to the text of the object.
alignment	text alignment of the text used in the object.
pScheme	Pointer to the style scheme used.

Returns

Pointer to the newly created object.

Example

```

static GFX_XCHAR  label0[] = "RB1";
static GFX_XCHAR  label1[] = "RB2";
static GFX_XCHAR  label2[] = "RB3";
uint16_t          state;
GFX_GOL_OBJ_SCHEME *pScheme;
RADIOBUTTON *pRb[3];

pScheme = GFX_GOL_ObjectSchemeCreate();

// Object will be drawn after creation
// Object will be first button in the group
state = GFX_GOL_RADIOBUTTON_DRAW_STATE |
        GFX_GOL_RADIOBUTTON_CHECKED_STATE;

pRb[0] = GFX_GOL_RadioButtonCreate(ID_RADIOBUTTON1,
                                   255, 40, 310, 80,
                                   state,
                                   label0,
                                   GFX_ALIGN_CENTER,
                                   pScheme);

// Object will be drawn after creation
state = GFX_GOL_RADIOBUTTON_DRAW_STATE;

pRb[1] = GFX_GOL_RadioButtonCreate(ID_RADIOBUTTON2,
                                   255, 85, 310, 125,
                                   state,
                                   label1,
                                   GFX_ALIGN_CENTER,
                                   pScheme);

// Object will be drawn after creation
state = GFX_GOL_RADIOBUTTON_DRAW_STATE;

pRb[2] = GFX_GOL_RadioButtonCreate(ID_RADIOBUTTON3,
                                   255, 130, 310, 170,
                                   state,
```

```
        label2,  
        GFX_ALIGN_CENTER,  
        pScheme);  
  
    // draw the objects  
    while(GFX_GOL_ObjectListDraw() != GFX_STATUS_SUCCESS);
```

5.2.2.7.15.6 GFX_GOL_RadioButtonDraw Function

C

```
GFX_STATUS GFX_GOL_RadioButtonDraw(  
    void * pObject  
);
```

Description

This function renders the object on the screen based on the current state of the object. Location of the object is determined by the left, top, right and bottom parameters. The colors used are dependent on the state of the object. The font used is determined by the style scheme set.

The text on the [GFX_GOL_RADIOBUTTON](#) is drawn with the text alignment based on the alignment parameter set on the object.

When rendering objects of the same type, each object must be rendered completely before the rendering of the next object is started. This is to avoid incomplete object rendering.

Normally, application will just call [GFX_GOL_ObjectListDraw\(\)](#) to allow the Graphics Library to manage all object rendering. See [GFX_GOL_ObjectListDraw\(\)](#) for more information on object rendering.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	Pointer to the object.

Returns

GFX_STATUS_SUCCESS - When the object rendering is finished. GFX_STATUS_FAILURE - When the object rendering is not yet finished. Application needs to call this rendering function again to continue the rendering.

Example

None.

5.2.2.7.15.7 GFX_GOL_RadioButtonTextAlignmentGet Function

C

```
GFX_ALIGNMENT GFX_GOL_RadioButtonTextAlignmentGet(  
    GFX_GOL_RADIOBUTTON * pObject  
);
```

Description

This function returns the text alignment of the text string used by the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

The text alignment set in the object. See [GFX_ALIGNMENT](#) for more details.

Example

None.

5.2.2.7.15.8 GFX_GOL_RadioButtonTextAlignmentSet Function**C**

```
void GFX_GOL_RadioButtonTextAlignmentSet(  
    GFX_GOL_RADIOBUTTON * pObject,  
    GFX_ALIGNMENT align  
);
```

Description

This function sets the text alignment of the text string used by the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	Pointer to the object.
align	The alignment set for the text in the object. See GFX_ALIGNMENT for more details.

Returns

None.

Example

None.

5.2.2.7.15.9 GFX_GOL_RadioButtonTextSet Function**C**

```
void GFX_GOL_RadioButtonTextSet(  
    GFX_GOL_RADIOBUTTON * pObject,  
    GFX_XCHAR * pText  
);
```

Description

This function sets the address of the current text string used by the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

pText	pointer to the text string to be used.

Returns

None.

Example

```
GFX_XCHAR Label0[] = "ON";
GFX_XCHAR Label1[] = "OFF";
GFX_GOL_RADIOBUTTON GFX_GOL_RADIOBUTTON[2];

GFX_GOL_RadioButtonTextSet(GFX_GOL_RADIOBUTTON[0], Label0);
GFX_GOL_RadioButtonTextSet(GFX_GOL_RADIOBUTTON[1], Label1);
```

5.2.2.7.16 Round Dial Object Functions

5.2.2.7.16.1 GFX_GOL_RoundDialActionGet Function

C

```
uint16_t GFX_GOL_RoundDialActionGet(
    void * pObj,
    GFX_GOL_MESSAGE * pMsg
);
```

Description

This function evaluates the message from a user if the message will affect the object or not. The table below enumerates the translated messages for each event of the touch screen inputs.

Translated Message	Input Source	Events	Description
RD_MSG_CLOCKWISE	Touch Screen	EVENT_MOVE	If events occurs and the x,y position falls in the face of the Dial and moving in the clockwise rotation.
RD_MSG_CTR_CLOCKWISE	Touch Screen	EVENT_MOVE	If events occurs and the x,y position falls in the face of the Dial and moving in the counter clockwise rotation.
OBJ_MSG_INVALID	Any	Any	If the message did not affect the object.

Preconditions

none

Parameters

Parameters	Description
pDia	The pointer to the object where the message will be evaluated to check if the message will affect the object.
pMsg	Pointer to the message struct containing the message from the user interface.

Returns

Returns the translated message depending on the received GOL message:

- RD_MSG_CLOCKWISE – Dial is moved in a clockwise direction.
- RD_MSG_CTR_CLOCKWISE – Dial is moved in a counter clockwise direction.
- GFX_GOL_MSG_INVALID – Dial is not affected

Side Effects

none

Example

```

void MyGOLMsg(GFX_GOL_MESSAGE *pMsg){
    GFX_OBJ_HEADER *pCurrentObj;
    uint16_t objMsg;

    if(pMsg->event == EVENT_INVALID)
        return;
    pCurrentObj = GFX_OBJ_ListGet();

    while(pCurrentObj != NULL){
        // Process only ROUND DIAL
        if(!GFX_OBJ_IsUpdatePending(pCurrentObj)){
            switch(pCurrentObj->type){
                case OBJ_ROUND DIAL:
                    objMsg = RdiaTranslateMsg((ROUND DIAL*)pCurrentObj, pMsg);
                    if(objMsg == OBJ_MSG_INVALID)
                        break;
                    if(GFX_GOL_MESSAGECallback(objMsg,pCurrentObj,pMsg))
                        RdiaMsgDefault(objMsg,(ROUND DIAL*)pCurrentObj);
                    break;
                default: break;
            }
        }
        pCurrentObj = pCurrentObj->pNxtObj;
    }
}

```

5.2.2.7.16.2 GFX_GOL_RoundDailActionSet Function**C**

```

void GFX_GOL_RoundDailActionSet(
    uint16_t translatedMsg,
    void * pObj,
    GFX_GOL_MESSAGE * pMsg
);

```

Description

This function performs the actual state change based on the translated message given. The following state changes are supported:

Translated Message	Input Source	Set/Clear State Bit Description
#####	#####	#####
RD_MSG_CLOCKWISE	Touch Screen	Set GFX_GOL_ROUND DIAL_ROT_CW , Dial will be redrawn with clockwise update. Set GFX_GOL_ROUND DIAL_DRAW
RD_MSG_CTR_CLOCKWISE	Touch Screen	Set GFX_GOL_ROUND DIAL_ROT_CCW , Dial will be redrawn with counter clockwise update. Set GFX_GOL_ROUND DIAL_DRAW

Preconditions

none

Parameters

Parameters	Description
translatedMsg	The translated message
pDia	The pointer to the object whose state will be modified
pMsg	The pointer to the GOL message

Returns

none

Side Effects

none

Example

See RdiaTranslateMsg() example.

5.2.2.7.16.3 GFX_GOL_RoundDialCreate Function**C**

```
GFX_GOL_ROUNDIAL * GFX_GOL_RoundDialCreate(
    uint16_t ID,
    uint16_t x,
    uint16_t y,
    uint16_t radius,
    uint16_t state,
    uint16_t res,
    uint16_t value,
    uint16_t max,
    GFX_GOL_OBJ_SCHEME * pScheme
);
```

Description

It automatically attaches the new object into a global linked list of objects and returns the address of the object.

Preconditions

none

Parameters

Parameters	Description
ID	Unique user defined ID for the object instance.
x	Location of the center of the dial in the x coordinate.
y	Location of the center of the dial in the y coordinate.
radius	Defines the radius of the dial.
state	Sets the initial state of the object.
res	Sets the resolution of the dial when rotating clockwise or counter clockwise.
value	Sets the initial value of the dial.
max	Sets the maximum value of the dial.
pScheme	Pointer to the style scheme used.

Returns

Returns the pointer to the object created.

Remarks

none

Example

```
GFX_GOL_OBJ_SCHEME *pScheme;
GFX_GOL_ROUNDIAL *pDial;
uint16_t state;

pScheme = GFX_GOL_SchemeCreate();
state = GFX_GOL_ROUNDIAL_DRAW;

// creates a dial at (50,50) x,y location, with an initial value
// of 50, a resolution of 2 and maximum value of 100.
pDial = GFX_GOL_RoundDial_Create(1,50,50,25,118,0, state, 2, 50, 100, pScheme);
// check if dial was created
if (pDial == NULL)
    return 0;

return 1;
```

5.2.2.7.16.4 GFX_GOL_RoundDialDraw Function**C**

```
uint16_t GFX_GOL_RoundDialDraw(
    void * pObj
);
```

Description

This function renders the object on the screen using the current parameter settings. Location of the object is determined by the center (x,y) position and the radius parameters. The colors used are dependent on the state of the object.

When rendering objects of the same type, each object must be rendered completely before the rendering of the next object is started. This is to avoid incomplete object rendering.

Preconditions

Object must be created before this function is called.

Parameters

Parameters	Description
pDia	Pointer to the object

Returns

Returns the status of the drawing

- 1 - If the rendering was completed and
- 0 - If the rendering is not yet finished.

Side Effects

none

5.2.2.7.16.5 RdiaCosine Function**C**

```
short RdiaCosine(
    short v
);
```

Description

This is function RdiaCosine.

5.2.2.7.16.6 RdiaSine Function**C**

```
short RdiaSine(
    short v
);
```

Description

This is function RdiaSine.

5.2.2.7.17 Scrollbar Object Functions**5.2.2.7.17.1 GFX_GOL_ScrollBarActionGet Function****C**

```
GFX_GOL_TRANSLATED_ACTION GFX_GOL_ScrollBarActionGet(
    void * pObject,
    GFX_GOL_MESSAGE * pMessage
);
```

Description

This function evaluates the message from a user if the message will affect the object or not. The table below enumerates the action for each event of the touch screen and keyboard inputs.

Translated Message	Input Source	Set/Clear State Bit	Description
GFX_GOL_SCROLLBAR_ACTION_INC	Touch Screen	EVENT_PRESS, EVENT_MOVE	If events occurs and the x,y position falls in the area of the slider and the slider position is to the LEFT of the x,y position for a horizontal slider or BELOW the x,y position for a vertical slider.
	Keyboard	EVENT_KEYSCAN	If event occurs and parameter1 passed matches the object's ID and parameter 2 passed matches SCAN_UP_PRESSED or SCAN_LEFT_PRESSED .
GFX_GOL_SCROLLBAR_ACTION_DEC	Touch Screen	EVENT_PRESS, EVENT_MOVE	If events occurs and the x,y position falls in the area of the slider and the slider position is to the RIGHT of the x,y position for a horizontal slider or ABOVE the x,y position for a vertical slider.
	Keyboard	EVENT_KEYSCAN	If event occurs and parameter1 passed matches the object's ID and parameter 2 passed matches SCAN_DOWN_PRESSED or SCAN_RIGHT_PRESSED .
GFX_GOL_OBJECT_ACTION_PASSIVE	Touch Screen	EVENT_RELEASE	If events occurs and the x,y position falls in the area of the slider.
GFX_GOL_OBJECT_ACTION_INVALID	Any	Any	If the message did not affect the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	The pointer to the object where the message will be evaluated to check if the message will affect the object.
pMessage	Pointer to the the message from the user interface.

Returns

- GFX_GOL_SCROLLBAR_ACTION_INC â€œ Increment scroll bar position.
- GFX_GOL_SCROLLBAR_ACTION_DEC â€œ Decrement scroll bar position.
- GFX_GOL_OBJECT_ACTION_PASSIVE â€œ Object bar is not affected
- GFX_GOL_OBJECT_ACTION_INVALID â€œ Object is not affected

Example

None.

5.2.2.7.17.2 GFX_GOL_ScrollBarActionSet Function**C**

```
void GFX_GOL_ScrollBarActionSet(
    GFX_GOL_TRANSLATED_ACTION translatedMsg,
    void * pObject,
    GFX_GOL_MESSAGE * pMessage
);
```

Description

This function performs the state change of the object based on the translated action. This change can be overridden by the application using the application defined GFX_GOL_MESSAGE_CALLBACK_FUNC. When the user message is determined to affect the object, application can perform the state change in the message callback function. The following state changes are supported:

Translated Message	Input Source	Set/Clear State Bit	Description
GFX_GOL_SCROLLBAR_ACTION_INC	Touch Screen,	Set GFX_GOL_SCROLLBAR_DRAW_THUMB_STATE	Scroll Bar will be redrawn with thumb in the incremented position.
	Keyboard		
GFX_GOL_SCROLLBAR_ACTION_DEC	Touch Screen,	Set GFX_GOL_SCROLLBAR_DRAW_THUMB_STATE	Scroll Bar will be redrawn with thumb in the decremented position.
	Keyboard		

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
translatedMsg	The action of the object based on the message.
pObject	The pointer to the object whose state will be modified.
pMessage	The pointer to the original message.

Returns

None.

Example

None.

5.2.2.7.17.3 GFX_GOL_ScrollBarCreate Function**C**

```
GFX_GOL_SCROLLBAR * GFX_GOL_ScrollBarCreate(
    uint16_t ID,
    uint16_t left,
    uint16_t top,
    uint16_t right,
    uint16_t bottom,
    uint16_t state,
    uint16_t range,
    uint16_t page,
    uint16_t pos,
    GFX_GOL_OBJ_SCHEME * pScheme
);
```

Description

This function creates a [GFX_GOL_SCROLLBAR](#) object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

This function returns the pointer to the newly created object. If the object is not successfully created, it returns NULL.

The object can be configured as a scroll bar or a slider. Use the state bit [GFX_GOL_SCROLLBAR_SLIDER_MODE_STATE](#) to enable the usage of the object as a slider. If this state bit is not enabled, the object is set up as a scroll bar.

The object can also be configured with vertical orientation. Use the state bit [GFX_GOL_SCROLLBAR_VERTICAL_STATE](#) to set up the object with vertical orientation. If this state bit is not set, the object is used with horizontal orientation.

The behavior of [GFX_GOL_ScrollBarCreate\(\)](#) will be undefined if one of the following is true:

- left >= right
- top >= bottom
- pScheme is not pointing to a [GFX_GOL_OBJ_SCHEME](#)
- page is set to zero.
- range is set to zero.
- page > range.

Preconditions

None.

Parameters

Parameters	Description
ID	Unique user defined ID for the object instance.
left	Left most position of the object.
top	Top most position of the object.
right	Right most position of the object.
bottom	Bottom most position of the object.
state	Sets the initial state of the object.
range	This specifies the maximum value of the slider when the thumb is on the rightmost position for a horizontal orientation and bottom most position for the vertical orientation. Minimum value is always at zero.
page	This is the incremental change of the slider when user action requests to move the slider thumb. This value is added or subtracted to the current position of the thumb.
pos	This defines the initial position of the thumb.
pScheme	The pointer to the style scheme used for the Object. Set to NULL if default style scheme is used.

Returns

Pointer to the newly created object.

Example

```

GFX_GOL_OBJ_SCHEME *pScheme;
GFX_GOL_SCROLLBAR *scrollBarArray[3];
uint16_t          state;

pScheme = GFX_GOL_ObjectSchemeCreate();

// create a slider with
// range = [0 - 50000]
// delta = 500
// initial position = 25000
state = GFX_GOL_SCROLLBAR_DRAW_STATE;
scrollBarArray[0] = GFX_GOL_ScrollBarCreate( 5,
                                             150, 145, 285, 181,
                                             state,
                                             50000, 500, 25000,
                                             pScheme);

if (slider[0] == NULL)
    return 0;

// create a slider with
// range = [0 - 100]
// delta = 20
// initial position = 0
state = GFX_GOL_SCROLLBAR_DRAW_STATE |
        GFX_GOL_SCROLLBAR_SLIDER_MODE_STATE;
scrollBarArray[1] = GFX_GOL_ScrollBarCreate( 6,
                                             150, 190, 285, 220,
                                             state,
                                             100, 20, 0,
                                             pScheme);

if (slider[1] == NULL)
    return 0;

// create a vertical scroll bars with
// range = [0 - 30]
// delta = 2
// initial position = 20

```

```

state = GFX_GOL_SCROLLBAR_DRAW_STATE |
        GFX_GOL_SCROLLBAR_VERTICAL_STATE;
scrollBarArray[2] = GFX_GOL_ScrollBarCreate( 7,
                                             120, 145, 140, 220,
                                             state,
                                             30, 2, 20,
                                             pScheme);

if (slider[2] == NULL)
    return 0;

// draw the sliders
while (GFX_GOL_ObjectListDraw() == 0);

return 1;

```

5.2.2.7.17.4 GFX_GOL_ScrollBarDraw Function

C

```

GFX_STATUS GFX_GOL_ScrollBarDraw(
    void * pobject
);

```

Description

This function renders the object on the screen based on the current state of the object. Location of the object is determined by the left, top, right and bottom parameters. The colors used are dependent on the state of the object. The font used is determined by the style scheme set.

The text on the face of the [GFX_GOL_SCROLLBAR](#) is drawn on top of the bitmap. Text alignment based on the alignment parameter set on the object.

When rendering objects of the same type, each object must be rendered completely before the rendering of the next object is started. This is to avoid incomplete object rendering.

Normally, application will just call [GFX_GOL_ObjectListDraw\(\)](#) to allow the Graphics Library to manage all object rendering. See [GFX_GOL_ObjectListDraw\(\)](#) for more information on object rendering.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	Pointer to the object.

Returns

GFX_STATUS_SUCCESS - When the object rendering is finished. GFX_STATUS_FAILURE - When the object rendering is not yet finished. Application needs to call this rendering function again to continue the rendering.

Example

None.

5.2.2.7.17.5 GFX_GOL_ScrollBarPageGet Function

C

```

uint16_t GFX_GOL_ScrollBarPageGet(
    GFX_GOL_SCROLLBAR * pObject
);

```

Description

This function returns the page size of the object. Page size defines the delta change of the thumb position when incremented via [GFX_GOL_ScrollBarPositionIncrement\(\)](#) or decremented via [GFX_GOL_ScrollBarPositionDecrement\(\)](#). Page size minimum value is 1. Maximum value is range/2.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

The page size of the object.

Example

```
uint16_t page;
GFX_GOL_SCROLLBAR *pScrollBar;

// assume pScrollBar is initialized to a scroll bar in memory
page = GFX_GOL_ScrollBarPageGet(pScrollBar);
```

5.2.2.7.17.6 GFX_GOL_ScrollBarPageSet Function**C**

```
void GFX_GOL_ScrollBarPageSet(
    GFX_GOL_SCROLLBAR * pObject,
    uint16_t page
);
```

Description

This function sets the page size of the object. Page size defines the delta change of the thumb position when incremented via [GFX_GOL_ScrollBarPositionIncrement\(\)](#) or decremented via [GFX_GOL_ScrollBarPositionDecrement\(\)](#). Page size minimum value is 1. Maximum value is range/2.

Modifying the page size at run time may require a redraw of the object to show the visual effect of the change.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.
page	value of the page size of the object.

Returns

None.

Example

See [GFX_GOL_ScrollBarPositionIncrement\(\)](#) for code example.

5.2.2.7.17.7 GFX_GOL_ScrollBarPositionDecrement Function

C

```
void GFX_GOL_ScrollBarPositionDecrement(
    GFX_GOL_SCROLLBAR * pObj
);
```

Description

This function decrements the scroll bar position by the delta change (page) value set. Object must be redrawn after this function is called to reflect the changes to the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObj	pointer to the object.

Returns

None.

Example

```
void ControlSpeed(  GFX_GOL_SCROLLBAR* pObj,
                    int  setSpeed,
                    int  curSpeed)
{
    // set page size to 1
    GFX_GOL_ScrollBarPageSet(pObj, 1);

    if (setSpeed < curSpeed)
    {
        while(GFX_GOL_ScrollBarPositionGet(pObj) < SetSpeed)
        {
            // increment by 1
            GFX_GOL_ScrollBarPositionIncrement(pObj);
        }
    }
    else if (setSpeed > curSpeed)
    {
        while(GFX_GOL_ScrollBarPositionGet(pObj) > SetSpeed)
        {
            // decrement by 1
            GFX_GOL_ScrollBarPositionDecrement(pObj);
        }
    }
}
```

5.2.2.7.17.8 GFX_GOL_ScrollBarPositionGet Function

C

```
uint16_t GFX_GOL_ScrollBarPositionGet(
    GFX_GOL_SCROLLBAR * pObj
);
```

Description

This function returns the current position of the scroll bar thumb. The thumb is the rectangular area that slides left or right (for horizontal orientation) or slides up or down (for vertical orientation).

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

The current position of the scroll bar thumb.

Example

```
#define MAXVALUE 100;

GFX_GOL_SCROLLBAR *pScrollBar;
uint32_t ctr = 0;

// create scroll bar here and initialize parameters
pScrollBar = GFX_GOL_ScrollBarCreate(...)
GFX_GOL_ObjectStateSet(pScrollBar, GFX_GOL_SCROLLBAR_DRAW_STATE);

// draw the scroll bar
GFX_GOL_ObjectListDraw();

// a routine that updates the position of the thumb through some
// conditions
while("some condition")
{
    GFX_GOL_ScrollBarPositionSet(pScrollBar, ctr);
    GFX_GOL_ObjectStateSet( pScrollBar,
                           GFX_GOL_SCROLLBAR_DRAW_THUMB_STATE);

    // update the screen
    GFX_GOL_ObjectListDraw();

    // update ctr here
    ctr = "some source of value";
}

if (GFX_GOL_ScrollBarPositionGet(pScrollBar) > MAXVALUE)
    return 0;
else
    "do something else"
```

5.2.2.7.17.9 GFX_GOL_ScrollBarPositionIncrement Function**C**

```
void GFX_GOL_ScrollBarPositionIncrement(
    GFX_GOL_SCROLLBAR * pObject
);
```

Description

This function increments the scroll bar position by the delta change (page) value set. Object must be redrawn after this function is called to reflect the changes to the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

None.

Example

```
void ControlSpeed( GFX_GOL_SCROLLBAR* pObj,
                  int setSpeed,
                  int curSpeed)
{
    // set page size to 1
    GFX_GOL_ScrollBarPageSet(pObj, 1);

    if (setSpeed < curSpeed)
    {
        while(GFX_GOL_ScrollBarPositionGet(pObj) < SetSpeed)
            GFX_GOL_ScrollBarPositionIncrement(pObj); // increment by 1
    }
    else if (setSpeed > curSpeed)
    {
        while(GFX_GOL_ScrollBarPositionGet(pObj) > SetSpeed)
            GFX_GOL_ScrollBarPositionDecrement(pObj); // decrement by 1
    }
}
```

5.2.2.7.17.10 GFX_GOL_ScrollBarPositionSet Function**C**

```
void GFX_GOL_ScrollBarPositionSet(
    GFX_GOL_SCROLLBAR * pObj,
    uint16_t position
);
```

Description

This function sets the position of the scroll bar thumb. The thumb is the rectangular area that slides left or right (for horizontal orientation) or slides up or down (for vertical orientation).

The value used for the position should be within the range set for the object.

Function will have an undefined behavior if the position is outside the range.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.
position	the new position of the scroll bar thumb.

Returns

None.

Example

```
GFX_GOL_SCROLLBAR *pScrollBar;
uint16_t ctr = 0;
```

```
// create slider here and initialize parameters
GFX_GOL_ObjectStateSet(pScrollBar, GFX_GOL_SCROLLBAR_DRAW_STATE);
GFX_GOL_ObjectListDraw();

while("some condition")
{
    GFX_GOL_ScrollBarPositionSet(pScrollBar, ctr);
    GFX_GOL_ObjectStateSet( pScrollBar,
                           GFX_GOL_SCROLLBAR_DRAW_THUMB_STATE);

    // redraw the scroll bar
    GFX_GOL_ObjectListDraw();

    // update ctr here
    ctr = "some source of value";
}
```

5.2.2.7.17.11 GFX_GOL_ScrollBarRangeGet Function

C

```
uint16_t GFX_GOL_ScrollBarRangeGet(
    GFX_GOL_SCROLLBAR * pObject
);
```

Description

This function returns the range of the thumb of the scroll bar.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

The range of the scroll bar.

Example

```
GFX_GOL_SCROLLBAR *pSld;
uint16_t range;

range = GFX_GOL_ScrollBarRangeGet(pSld);
```

5.2.2.7.17.12 GFX_GOL_ScrollBarRangeSet Function

C

```
void GFX_GOL_ScrollBarRangeSet(
    GFX_GOL_SCROLLBAR * pObject,
    uint16_t range
);
```

Description

This function sets the range of the thumb of the scroll bar. When the range is modified, object must be completely redrawn to reflect the change.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.
range	new range of the scroll bar.

Returns

None.

Example

```
GFX_GOL_SCROLLBAR *pSld;

GFX_GOL_ScrollBarRangeSet(pSld, 100);

// to completely redraw the object when
// GFX_GOL_ObjectListDraw() is executed.
GFX_GOL_ObjectStateSet(pSld, SLD_DRAW);
```

5.2.2.7.18 Static Text Object Functions**5.2.2.7.18.1 GFX_GOL_StaticTextActionGet Function****C**

```
GFX_GOL_TRANSLATED_ACTION GFX_GOL_StaticTextActionGet(
    void * pObject,
    GFX_GOL_MESSAGE * pMessage
);
```

Description

This function evaluates the message from a user if the message will affect the object or not. The table below enumerates the action for each event of the touch screen inputs.

Translated Message	Input Source	Events	Description
GFX_GOL_STATICTEXT_ACTION_SELECTED	Touch Screen	EVENT_PRESS, EVENT_RELEASE	If events occurs and the x,y position falls in the area of the static text.
GFX_GOL_OBJECT_ACTION_INVALID	Any	Any	If the message did not affect the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	The pointer to the object where the message will be evaluated to check if the message will affect the object.
pMessage	Pointer to the the message from the user interface.

Returns

- GFX_GOL_STATICTEXT_ACTION_SELECTED â€œ Object is selected
- GFX_GOL_OBJECT_ACTION_INVALID â€œ Object is not affected

Example

None.

5.2.2.7.18.2 GFX_GOL_StaticTextAlignmentGet Function

```
C
GFX_ALIGNMENT GFX_GOL_StaticTextAlignmentGet(
    GFX_GOL_STATICTEXT * pObject
);
```

Description

This function returns the text alignment of the text string used by the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

The text alignment set in the object. See [GFX_ALIGNMENT](#) for more details.

Example

None.

5.2.2.7.18.3 GFX_GOL_StaticTextAlignmentSet Function

```
C
void GFX_GOL_StaticTextAlignmentSet(
    GFX_GOL_STATICTEXT * pObject,
    GFX_ALIGNMENT align
);
```

Description

This function sets the text alignment of the text string used by the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	Pointer to the object.
align	The alignment set for the text in the object. See GFX_ALIGNMENT for more details.

Returns

None.

Example

None.

5.2.2.7.18.4 GFX_GOL_StaticTextCreate Function

C

```
GFX_GOL_STATICTEXT * GFX_GOL_StaticTextCreate(
    uint16_t ID,
    uint16_t left,
    uint16_t top,
    uint16_t right,
    uint16_t bottom,
    uint16_t state,
    GFX_XCHAR * pText,
    GFX_ALIGNMENT alignment,
    GFX_GOL_OBJ_SCHEME * pScheme
);
```

Description

This function creates a [GFX_GOL_STATICTEXT](#) object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

This function returns the pointer to the newly created object. If the object is not successfully created, it returns NULL.

The text can be configured to have text aligned. See [GFX_ALIGNMENT](#) for details. Text can also have multiple lines by inserting the new line character to the text string supplied to the object. Any string that exceeds the dimension of the object will be clipped.

When the object is used with no background, application must manage the object when text is modified and redrawn. i.e. the previous text must be removed. Use [GFX_GOL_STATICTEXT_NOBACKGROUND_STATE](#) state bit to disable the background.

The behavior of [GFX_GOL_StaticTextCreate\(\)](#) will be undefined if one of the following is true:

- left >= right
- top >= bottom
- pScheme is not pointing to a [GFX_GOL_OBJ_SCHEME](#)
- pText is an unterminated string

Preconditions

None.

Parameters

Parameters	Description
ID	Unique user defined ID for the object instance.
left	Left most position of the object.
top	Top most position of the object.
right	Right most position of the object.
bottom	Bottom most position of the object.
state	Sets the initial state of the object.
pText	Pointer to the text of the object.
alignment	text alignment of the text used in the object.
pScheme	Pointer to the style scheme used.

Returns

Pointer to the newly created object.

Example

```
// assume pScheme is initialized
GFX_GOL_OBJ_SCHEME *pScheme;
```

```
GFX_GOL_STATICTEXT *pSt;  
  
pScheme = GOLCreateScheme();  
StCreate(  
    ID_STATICTEXT1,           // ID  
    30,80,235,160,           // dimension  
    GFX_GOL_STATICTEXT_DRAW_STATE, // draw the object  
    "Static Textn Example",    // 2 lines of text  
    GFX_ALIGN_CENTER,        // align text on the center  
    pScheme);                // use given scheme
```

5.2.2.7.18.5 GFX_GOL_StaticTextDraw Function

C

```
GFX_STATUS GFX_GOL_StaticTextDraw(  
    void * pObject  
);
```

Description

This function renders the object on the screen based on the current state of the object. Location of the object is determined by the left, top, right and bottom parameters. The colors used are dependent on the state of the object. The font used is determined by the style scheme set.

Text alignment based on the alignment parameter set on the object.

When rendering objects of the same type, each object must be rendered completely before the rendering of the next object is started. This is to avoid incomplete object rendering.

Normally, application will just call [GFX_GOL_ObjectListDraw\(\)](#) to allow the Graphics Library to manage all object rendering. See [GFX_GOL_ObjectListDraw\(\)](#) for more information on object rendering.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	Pointer to the object.

Returns

GFX_STATUS_SUCCESS - When the object rendering is finished. GFX_STATUS_FAILURE - When the object rendering is not yet finished. Application needs to call this rendering function again to continue the rendering.

Example

None.

5.2.2.7.18.6 GFX_GOL_StaticTextGet Function

C

```
GFX_XCHAR * GFX_GOL_StaticTextGet(  
    GFX_GOL_STATICTEXT * pObject  
);
```

Description

This function returns the address of the current text string used by the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

Pointer to text string.

Example

```
GFX_XCHAR *pChar;
GFX_GOL_STATICTEXT OBJECT_ARRAY[2];

pChar = GFX_GOL_StaticTextGet(OBJECT_ARRAY[0]);
```

5.2.2.7.18.7 GFX_GOL_StaticTextSet Function**C**

```
void GFX_GOL_StaticTextSet(
    GFX_GOL_STATICTEXT * pObject,
    GFX_XCHAR * pText
);
```

Description

This function sets the address of the current text string used by the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.
pText	pointer to the text string to be used.

Returns

None.

Example

None.

5.2.2.7.19 Text Entry Object Functions**5.2.2.7.19.1 GFX_GOL_TextEntryActionGet Function****C**

```
GFX_GOL_TRANSLATED_ACTION GFX_GOL_TextEntryActionGet(
    void * pObject,
    GFX_GOL_MESSAGE * pMessage
);
```

Description

This function evaluates the message from a user if the message will affect the object or not. The table below enumerates the action for each event of the touch screen and keyboard inputs.

Translated Message	Input Source	Set/Clear State Bit	Description
GFX_GOL_TEXTENTRY_ACTION_PRESS	Touch Screen	EVENT_PRESS, EVENT_MOVE	If the event occurs and the x,y position falls in the face of one of the keys of the object while the key is unpressed.
GFX_GOL_TEXTENTRY_ACTION_RELEASED	Touch Screen	EVENT_MOVE	If the event occurs and the x,y position falls outside the face of one of the keys of the object while the key is pressed.
GFX_GOL_TEXTENTRY_ACTION_RELEASED	Touch Screen	EVENT_RELEASE	If the event occurs and the x,y position falls does not falls inside any of the faces of the keys of the object.
GFX_GOL_TEXTENTRY_ACTION_ADD_CHAR	Touch Screen	EVENT_RELEASE, EVENT_MOVE	If the event occurs and the x,y position falls in the face of one of the keys of the object while the key is unpressed and the key is associated with no commands.
GFX_GOL_TEXTENTRY_ACTION_DELETE	Touch Screen	EVENT_RELEASE, EVENT_MOVE	If the event occurs and the x,y position falls in the face of one of the keys of the object while the key is unpressed and the key is associated with delete command.
GFX_GOL_TEXTENTRY_ACTION_SPACE	Touch Screen	EVENT_RELEASE, EVENT_MOVE	If the event occurs and the x,y position falls in the face of one of the keys of the object while the key is unpressed and the key is associated with space command.
GFX_GOL_TEXTENTRY_ACTION_ENTER	Touch Screen	EVENT_RELEASE, EVENT_MOVE	If the event occurs and the x,y position falls in the face of one of the keys of the object while the key is unpressed and the key is associated with enter command.
GFX_GOL_OBJECT_ACTION_INVALID	Any	Any	If the message did not affect the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	The pointer to the object where the message will be evaluated to check if the message will affect the object.
pMessage	Pointer to the the message from the user interface.

Returns

- GFX_GOL_TEXTENTRY_ACTION_PRESS - A key is pressed
- GFX_GOL_TEXTENTRY_ACTION_RELEASED - A key was released (generic for keys with no commands or characters assigned)
- GFX_GOL_TEXTENTRY_ACTION_ADD_CHAR - A key was released with character assigned
- GFX_GOL_TEXTENTRY_ACTION_DELETE - A key was released with delete command assigned
- GFX_GOL_TEXTENTRY_ACTION_SPACE - A key was released with space command assigned
- GFX_GOL_TEXTENTRY_ACTION_ENTER - A key was released with enter command assigned
- GFX_GOL_OBJECT_ACTION_INVALID - Text Entry is not affected

Example

None.

5.2.2.7.19.2 GFX_GOL_TextEntryActionSet Function**C**

```
void GFX_GOL_TextEntryActionSet(
    uint16_t translatedMsg,
    void * pObject,
    GFX_GOL_MESSAGE * pMessage
);
```

Description

This function performs the state change of the object based on the translated action. This change can be overridden by the application using the application defined `GFX_GOL_MESSAGE_CALLBACK_FUNC`. When the user message is determined to affect the object, application can perform the state change in the message callback function. The following state changes are supported:

Translated Message Input Source	Set/Clear State Bit	Description
GFX_GOL_TEXTENTRY_ACTION_ADD_CHAR Touch Screen,	Set GFX_GOL_TEXTENTRY_UPDATE_TEXT_STATE,	Add a character in the buffer and update the text displayed.
GFX_GOL_TEXTENTRY_UPDATE_KEY_STATE,	Clear GFX_GOL_TEXTENTRY_KEY_PRESSED_STATE	
GFX_GOL_TEXTENTRY_ACTION_SPACE Touch Screen,	Set GFX_GOL_TEXTENTRY_UPDATE_TEXT_STATE,	Insert a space character in the buffer and update the text displayed.
GFX_GOL_TEXTENTRY_UPDATE_KEY_STATE,	Clear GFX_GOL_TEXTENTRY_KEY_PRESSED_STATE	
GFX_GOL_TEXTENTRY_ACTION_DELETE Touch Screen,	Set GFX_GOL_TEXTENTRY_UPDATE_TEXT_STATE,	Delete the most recent character in the buffer and update the text displayed.
GFX_GOL_TEXTENTRY_UPDATE_KEY_STATE,	Clear GFX_GOL_TEXTENTRY_KEY_PRESSED_STATE	
GFX_GOL_TEXTENTRY_ACTION_ENTER Touch Screen,	Set GFX_GOL_TEXTENTRY_UPDATE_TEXT_STATE,	User can define the use of this event in the message callback. Object will just update the key.
GFX_GOL_TEXTENTRY_UPDATE_KEY_STATE,	Clear GFX_GOL_TEXTENTRY_KEY_PRESSED_STATE	
GFX_GOL_TEXTENTRY_ACTION_RELEASED Touch Screen,	Clear GFX_GOL_TEXTENTRY_KEY_PRESSED_STATE	A Key in the object will be redrawn in the unpressed state.
	Set GFX_GOL_TEXTENTRY_UPDATE_KEY_STATE	
GFX_GOL_TEXTENTRY_ACTION_PRESSED Touch Screen,	Set GFX_GOL_TEXTENTRY_KEY_PRESSED_STATE	A Key in the object will be redrawn in the pressed state.

GFX_GOL_TEXTENTRY_UPDATE_KEY_STATE		

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
translatedMsg	The action of the object based on the message.
pObject	The pointer to the object whose state will be modified.
pMessage	The pointer to the original message.

Returns

None.

Example

None.

5.2.2.7.19.3 GFX_GOL_TextEntryBufferClear Function**C**

```
void GFX_GOL_TextEntryBufferClear(  
    GFX_GOL_TEXTENTRY * pObject  
)  
;
```

Description

This function will clear the data in the display. Object must be redrawn to reflect the change in the buffer. Use the drawing state bit GFX_GOL_TEXTENTRY_UPDATE_TEXT_STATE to update the text on the screen.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

None.

Example

None.

5.2.2.7.19.4 GFX_GOL_TextEntryBufferGet Function**C**

```
GFX_XCHAR * GFX_GOL_TextEntryBufferGet(  
    GFX_GOL_TEXTENTRY * pObject  
)  
;
```

Description

This function returns the buffer used to display text.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

The pointer to the text buffer used to display text.

Example

None.

5.2.2.7.19.5 GFX_GOL_TextEntryBufferSet Function**C**

```
void GFX_GOL_TextEntryBufferSet(  
    GFX_GOL_TEXTENTRY * pObject,  
    GFX_XCHAR * pText,  
    uint16_t MaxSize  
);
```

Description

This function sets the buffer used to display text. If the buffer is initialized with a string, the string must be a null terminated string. If the string length is greater than MaxSize, string will be truncated to MaxSize. pText must point to a valid memory location with size equal to MaxSize. The total number of characters that will be displayed on the object will be MaxSize - 1 since the last character will be the string terminator character.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.
pText	pointer to the new text buffer to be displayed.
maxSize	maximum length of the new buffer to be used.

Returns

None.

Example

None.

5.2.2.7.19.6 GFX_GOL_TextEntryCharAdd Function**C**

```
void GFX_GOL_TextEntryCharAdd(  
    GFX_GOL_TEXTENTRY * pObject  
);
```

Description

This function will insert a character to the end of the buffer. Drawing states GFX_GOL_TEXTENTRY_UPDATE_TEXT_STATE or GFX_GOL_TEXTENTRY_DRAW_STATE must be set to see the effect of the addition.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

None.

Example

None.

5.2.2.7.19.7 GFX_GOL_TextEntryCreate Function**C**

```
GFX_GOL_TEXTENTRY * GFX_GOL_TextEntryCreate(  
    uint16_t ID,  
    uint16_t left,  
    uint16_t top,  
    uint16_t right,  
    uint16_t bottom,  
    uint16_t state,  
    uint16_t horizontalKeys,  
    uint16_t verticalKeys,  
    GFX_XCHAR * pText[],  
    GFX_XCHAR * pBuffer,  
    GFX_ALIGNMENT alignment,  
    uint16_t bufferLength,  
    GFX_RESOURCE_HDR * pDisplayFont,  
    GFX_GOL_OBJ_SCHEME * pScheme  
);
```

Description

This function creates a [GFX_GOL_TEXTENTRY](#) object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

This function returns the pointer to the newly created object. If the object is not successfully created, it returns NULL.

The behavior of `GFX_GOL_TextEntryCreate()` will be undefined if one of the following is true:

- left >= right
- top >= bottom
- pScheme is not pointing to a [GFX_GOL_OBJ_SCHEME](#)
- horizontal key or vertical key count is 0
- pText is an unterminated string
- pBuffer is initialized to an allocated memory.

Preconditions

None.

Parameters

Parameters	Description
ID	Unique user defined ID for the object instance.

left	Left most position of the object.
top	Top most position of the object.
right	Right most position of the object.
bottom	Bottom most position of the object.
radius	Radius of the rounded edge. When using gradient buttons and radius != 0, emboss size <= radius. If this is not met, the the GFX_GOL_BUTTON face will not have gradient effect.
state	Sets the initial state of the object.
horizontalKeys	Number of horizontal keys
verticalKeys	Number of vertical keys
pText	array of pointer to the custom "text" assigned by the user.
pBuffer	pointer to the buffer that holds the text to be displayed.
alignment	text alignment of the text used in the object.
bufferLength	length of the buffer assigned by the user. The choice of the length should include the string null terminator.
For example	if the bufferLength is set to 3, only two characters can be shown on the object since the last character will be the string terminator character.
pDisplayFont	pointer to the font image to be used on the edit box section of the object.
pScheme	Pointer to the style scheme used.

Returns

Pointer to the newly created object.

Example

TODO:Add example code.

5.2.2.7.19.8 GFX_GOL_TextEntryDraw Function**C**

```
GFX_STATUS GFX_GOL_TextEntryDraw(
    void * pObject
);
```

Description

This function renders the object on the screen based on the current state of the object. Location of the object is determined by the left, top, right and bottom parameters. The colors used are dependent on the state of the object. The font used is determined by the style scheme set.

When rendering objects of the same type, each object must be rendered completely before the rendering of the next object is started. This is to avoid incomplete object rendering.

Normally, application will just call [GFX_GOL_ObjectListDraw\(\)](#) to allow the Graphics Library to manage all object rendering. See [GFX_GOL_ObjectListDraw\(\)](#) for more information on object rendering.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	Pointer to the object.

Returns

GFX_STATUS_SUCCESS - When the object rendering is finished. GFX_STATUS_FAILURE - When the object rendering is not

yet finished. Application needs to call this rendering function again to continue the rendering.

Example

None.

5.2.2.7.19.9 GFX_GOL_TextEntryKeyCommandGet Function

C

```
GFX_GOL_TEXTENTRY_KEY_COMMAND_TYPE GFX_GOL_TextEntryKeyCommandGet(  
    GFX_GOL_TEXTENTRY * pObject,  
    uint16_t index  
);
```

Description

This function will return the currently assigned command to the key with the given index. (See [GFX_GOL_TEXTENTRY_KEY_COMMAND_TYPE](#))

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.
index	index or position of the key.

Returns

Command assigned to the key (See [GFX_GOL_TEXTENTRY_KEY_COMMAND_TYPE](#)).

Example

None.

5.2.2.7.19.10 GFX_GOL_TextEntryKeyCommandSet Function

C

```
bool GFX_GOL_TextEntryKeyCommandSet(  
    GFX_GOL_TEXTENTRY * pObject,  
    uint16_t index,  
    GFX_GOL_TEXTENTRY_KEY_COMMAND_TYPE command  
);
```

Description

This function will assign a command to a key with the given index. (See [GFX_GOL_TEXTENTRY_KEY_COMMAND_TYPE](#))

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.
index	index or position of the key.
command	command assigned for the key.

Returns

TRUE - if the assignment was a success. FALSE - if the assignment was not successful.

Example

None.

5.2.2.7.19.11 GFX_GOL_TextEntryKeyIsPressed Function**C**

```
bool GFX_GOL_TextEntryKeyIsPressed(  
    GFX_GOL_TEXTENTRY * pObject,  
    uint16_t index  
);
```

Description

This function will test if a key given by its index in the object is pressed.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.
index	index or position of key that is being tested.

Returns

TRUE - if the key is pressed. FALSE - if the key is not pressed.

Example

None.

5.2.2.7.19.12 GFX_GOL_TextEntryKeyListCreate Function**C**

```
KEYMEMBER * GFX_GOL_TextEntryKeyListCreate(  
    GFX_GOL_TEXTENTRY * pObject,  
    GFX_XCHAR * pText[]  
);
```

Description

This function will create the list of KEYMEMBERS that holds the information on each key. The number of keys is determined by the equation ($\text{keycount} = \text{verticalKeys} * \text{horizontalKeys}$). The object creates the information holder for each key automatically and assigns each entry in the *pText[] array with the first entry automatically assigned to the key with an index of 1.

The number of entries to *pText[] must be at least equal to keycount. The last key is assigned with an index of $\text{keycount}-1$.

No checking is performed on the length of *pText[] entries to match ($\text{verticalKeys} * \text{horizontalKeys}$).

The function behavior is undefined if the pText[] array is less than the keycount value.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.
pText	pointer to the text defined by the application.

Returns

Returns the pointer to the newly created [KEYMEMBER](#) list. A NULL is returned if the list is not created successfully.

Example

None.

5.2.2.7.19.13 GFX_GOL_TextEntryKeyMemberListDelete Function**C**

```
void GFX_GOL_TextEntryKeyMemberListDelete(  
    void * pObject  
);
```

Description

This function will delete the [KEYMEMBER](#) list assigned to the object from memory. Pointer to the [KEYMEMBER](#) list is then initialized to NULL. All memory resources allocated to the key member list is freed.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

None.

Example

None.

5.2.2.7.19.14 GFX_GOL_TextEntryKeyTextSet Function**C**

```
bool GFX_GOL_TextEntryKeyTextSet(  
    GFX_GOL_TEXTENTRY * pObject,  
    uint16_t index,  
    GFX_XCHAR * pText  
);
```

Description

This function will set the text assigned to a key with the given index.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.
index	index or position of the key.
pText	pointer to the text that will be assigned to the key.

Returns

TRUE - if the assignment was a success. FALSE - if the assignment was not successful.

Example

None.

5.2.2.7.19.15 GFX_GOL_TextEntryLastCharDelete Function**C**

```
void GFX_GOL_TextEntryLastCharDelete(  
    GFX_GOL_TEXTENTRY * pObject  
);
```

Description

This function will remove the last character of the buffer and replace it with a string terminator. Drawing states `GFX_GOL_TEXTENTRY_UPDATE_TEXT_STATE` or `GFX_GOL_TEXTENTRY_DRAW_STATE` must be set to see the effect of the addition.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

None.

Example

None.

5.2.2.7.19.16 GFX_GOL_TextEntrySpaceCharAdd Function**C**

```
void GFX_GOL_TextEntrySpaceCharAdd(  
    GFX_GOL_TEXTENTRY * pObject  
);
```

Description

This function will insert a space character to the end of the buffer. Drawing states `GFX_GOL_TEXTENTRY_UPDATE_TEXT_STATE` or `GFX_GOL_TEXTENTRY_DRAW_STATE` must be set to see the effect of the addition.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

None.

Example

None.

5.2.2.7.20 Window Object Functions

5.2.2.7.20.1 GFX_GOL_WindowActionGet Function

C

```
GFX_GOL_TRANSLATED_ACTION GFX_GOL_WindowActionGet(
    void * pObject,
    GFX_GOL_MESSAGE * pMessage
);
```

Description

This function evaluates the message from a user if the message will affect the object or not. The table below enumerates the action for each event of the touch screen and keyboard inputs.

Translated Message	Input Source Events Description
GFX_GOL_WINDOW_ACTION_TITLE	Touch Screen EVENT_PRESS, EVENT_RELEASE, EVENT_MOVE If events occurs and the x,y position falls in the TITLE area of the window
GFX_GOL_WINDOW_ACTION_CLIENT	Touch Screen EVENT_PRESS, EVENT_RELEASE, EVENT_MOVE If events occurs and the x,y position falls in the CLIENT area of the window
GFX_GOL_OBJECT_ACTION_INVALID	Any Any If the message did not affect the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	The pointer to the object where the message will be evaluated to check if the message will affect the object.
pMessage	Pointer to the the message from the user interface.

Returns

- GFX_GOL_WINDOW_ACTION_CLIENT // Window client area selected action ID.
- GFX_GOL_WINDOW_ACTION_TITLE // Window title bar selected action ID.

Example

None.

5.2.2.7.20.2 GFX_GOL_WindowCreate Function

C

```
GFX_GOL_WINDOW * GFX_GOL_WindowCreate(
    uint16_t ID,
    uint16_t left,
    uint16_t top,
    uint16_t right,
    uint16_t bottom,
    uint16_t state,
    void * pBitmap,
    GFX_XCHAR * pText,
    GFX_ALIGNMENT alignment,
    GFX_GOL_OBJ_SCHEME * pScheme
);
```

```
);
```

Description

This function creates a `GFX_GOL_WINDOW` object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

This function returns the pointer to the newly created object. If the object is not successfully created, it returns NULL.

Preconditions

None.

Parameters

Parameters	Description
ID	Unique user defined ID for the object instance.
left	Left most position of the object.
top	Top most position of the object.
right	Right most position of the object.
bottom	Bottom most position of the object.
state	Sets the initial state of the object.
pImage	Pointer to the image used on the face of the object.
pText	Pointer to the text of the object.
alignment	text alignment of the text used in the object.
pScheme	Pointer to the style scheme used.

Returns

Pointer to the newly created object.

Example

```
GFX_GOL_OBJ_SCHEME *pScheme;
GFX_GOL_WINDOW *pWindow;
GFX_GOL_WINDOW_STATE state;

// assume pScheme is initialized to a scheme in memory.
state = GFX_GOL_WINDOW_DRAW_STATE;

pWindow = GFX_GOL_WindowCreate(1,           // ID
                                0,0,GFX_Primitive_MaxXGet(),GFX_Primitive_MaxYGet(), // whole screen dimension
                                state,       // set state to draw all
                                (char*)myIcon, // icon
                                "Place Title Here.", // text
                                NULL);         // use default GOL scheme

if (pWindow == NULL)
    return 0;

return 1;
```

5.2.2.7.20.3 GFX_GOL_WindowDraw Function

C

```
GFX_STATUS GFX_GOL_WindowDraw(
    void * pobject
);
```

Description

This function renders the object on the screen based on the current state of the object. Location of the object is determined by

the left, top, right and bottom parameters. The colors used are dependent on the state of the object. The font used is determined by the style scheme set.

The text on the face of the [GFX_GOL_WINDOW](#) is drawn on top of the bitmap. Text alignment based on the alignment parameter set on the object.

When rendering objects of the same type, each object must be rendered completely before the rendering of the next object is started. This is to avoid incomplete object rendering.

Normally, application will just call [GFX_GOL_ObjectListDraw\(\)](#) to allow the Graphics Library to manage all object rendering. See [GFX_GOL_ObjectListDraw\(\)](#) for more information on object rendering.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	Pointer to the object.

Returns

GFX_STATUS_SUCCESS - When the object rendering is finished. GFX_STATUS_FAILURE - When the object rendering is not yet finished. Application needs to call this rendering function again to continue the rendering.

Example

None.

5.2.2.7.20.4 GFX_GOL_WindowTextAlignmentGet Function

C

```
GFX_ALIGNMENT GFX_GOL_WindowTextAlignmentGet(  
    GFX_GOL_WINDOW * pObject  
);
```

Description

This function returns the text alignment of the text string used by the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

The text alignment set in the object. See [GFX_ALIGNMENT](#) for more details.

Example

None.

5.2.2.7.20.5 GFX_GOL_WindowTextAlignmentSet Function

C

```
void GFX_GOL_WindowTextAlignmentSet(  
    GFX_GOL_WINDOW * pObject,  
    GFX_ALIGNMENT align
```

```
);
```

Description

This function sets the text alignment of the text string used by the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	Pointer to the object.
align	The alignment set for the text in the object. See GFX_ALIGNMENT for more details.

Returns

None.

Example

None.

5.2.2.7.20.6 GFX_GOL_WindowTextSet Function

C

```
void GFX_GOL_WindowTextSet(  
    GFX_GOL_WINDOW * pObject,  
    GFX_XCHAR * pText  
);
```

Description

This function sets the address of the current text string used by the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.
pText	pointer to the text string to be used.

Returns

None.

Example

```
GFX_XCHAR Label0[] = ?ON?;  
GFX_XCHAR Label1[] = ?OFF?;  
GFX_GOL_WINDOW pWindow;  
  
GFX_GOL_WindowTextSet(pWindow, Label0);  
GFX_GOL_WindowTextSet(pWindow, Label1);
```

5.2.2.7.21 Draw Functions

5.2.2.7.21.1 ClearPaletteChangeError Function

C

```
void ClearPaletteChangeError();
```

Description

Clears the Palette change error status

Preconditions

none

Returns

none

Side Effects

none

5.2.2.7.21.2 DisablePalette Function

C

```
void DisablePalette();
```

Description

Disables the Palette mode.

Preconditions

none

Returns

none

5.2.2.7.21.3 DrawArc Function

C

```
uint16_t DrawArc(
    int16_t cx,
    int16_t cy,
    int16_t r1,
    int16_t r2,
    int16_t startAngle,
    int16_t endAngle
);
```

Description

This renders an arc with from startAngle to endAngle with the thickness of r2-r1. The function returns 1 when the arc is rendered successfully and returns a 0 when it is not yet finished. The next call to the function will continue the rendering.

Preconditions

none

Parameters

Parameters	Description
cx	the location of the center of the arc in the x direction.
cy	the location of the center of the arc in the y direction.

r1	the smaller radius of the arc.
r2	the larger radius of the arc.
startAngle	start angle of the arc.
endAngle	end angle of the arc.

Returns

Returns 1 if the rendering is done, 0 if not yet done.

Side Effects

none

Remarks

none

5.2.2.7.21.4 EnablePalette Function

C

```
void EnablePalette();
```

Description

Enables the Palette mode.

Preconditions

none

Returns

none

5.2.2.7.21.5 GetPaletteChangeError Function

C

```
BYTE GetPaletteChangeError();
```

Description

Returns the Palette change error status

Preconditions

none

Returns

Returns the palette change status. 1 - If the palette change error occurred 0 - If no palette change error occurred

Side Effects

none

5.2.2.7.21.6 GFX_AlphaBlendingValueGet Function

C

```
uint16_t GFX_AlphaBlendingValueGet();
```

Description

This function returns the current alpha value set for alpha blending rendering. See [GFX_AlphaBlendingValueSet\(\)](#) for details of alpha blending values.

Preconditions

None.

Returns

The alpha blending value.

Example

TODO:Add example code

5.2.2.7.21.7 GFX_AlphaBlendingValueSet Function**C**

```
GFX_STATUS GFX_AlphaBlendingValueSet(  
    uint16_t alpha  
);
```

Description

This function sets the alpha value for alpha blending rendering. Accepted values are dependent on the used alpha blending routines at build time. When using the software routines in the Primitive Layer, accepted values are 0, 25, 50, 75 and 100.

If using a specific implementation in the display driver used, implementation may support the full range (0-100). When this is the case, refer to the driver alpha blending solution for details.

Function operation will ignore unsupported values of alpha.

Preconditions

None.

Parameters

Parameters	Description
alpha	Defines the alpha blending percentage to be used for alpha blending routines. Accepted values are dependent on the alpha blending routines used. For Primitive Layer

5.2.2.7.21.8 GFX_AlphaBlendWindow Function**C**

```
GFX_STATUS GFX_AlphaBlendWindow(  
    GFX_ALPHA_PARAMS * alphaParams,  
    uint16_t width,  
    uint16_t height,  
    uint8_t alphaPercent  
);
```

Description

None

Preconditions

None

Parameters

Parameters	Description
None	None

Returns

None

Example

None

5.2.2.7.21.9 GFX_BackgroundColorGet Function**C**

```
GFX_COLOR GFX_BackgroundColorGet();
```

Description

This function returns the color used in the current background.

Preconditions

None.

Returns

The color used in the current background.

Example

None.

5.2.2.7.21.10 GFX_BackgroundImageGet Function**C**

```
GFX_RESOURCE_HDR * GFX_BackgroundImageGet();
```

Description

This function returns the pointer to the image used in the current background.

Preconditions

None.

Returns

The pointer to the image used in the current background.

Example

None.

5.2.2.7.21.11 GFX_BackgroundImageLeftGet Function**C**

```
uint16_t GFX_BackgroundImageLeftGet();
```

Description

This function returns the horizontal starting position of the current background. This position defines the x position of the upper left corner of the background.

Preconditions

None.

Returns

The horizontal starting position of the current background.

Example

None.

5.2.2.7.21.12 GFX_BackgroundImageTopGet Function

C

```
uint16_t GFX_BackgroundImageTopGet();
```

Description

This function returns the vertical starting position of the current background. This position defines the y position of the upper left corner of the background.

Preconditions

None.

Returns

The vertical starting position of the current background.

Example

None.

5.2.2.7.21.13 GFX_BackgroundSet Function

C

```
void GFX_BackgroundSet(
    uint16_t left,
    uint16_t top,
    GFX_RESOURCE_HDR * pImage,
    GFX_COLOR color
);
```

Description

This function sets the background information. Note that the width and height of the background is only needed when the background is an image. When the background is a color (image pointer is NULL), the width and height is not needed here since the purpose of the background information is to record only the color used.

Preconditions

None.

Parameters

Parameters	Description
left	Horizontal starting position of the background.
top	Vertical starting position of the background.
pImage	Pointer to the background image used. Set this to NULL if not used.
color	If the background image is NULL, background is assumed to be this color.

Returns

None.

Example

None.

5.2.2.7.21.14 GFX_BackgroundTypeGet Function**C**

```
GFX_BACKGROUND_TYPE GFX_BackgroundTypeGet();
```

Description

This function returns the type of the current background.

Preconditions

None.

Returns

The type of the current background set.

Example

None.

5.2.2.7.21.15 GFX_BackgroundTypeSet Function**C**

```
void GFX_BackgroundTypeSet(  
    GFX_BACKGROUND_TYPE type  
);
```

Description

This function sets the background type.

Preconditions

None.

Parameters

Parameters	Description
type	Type of background that will be used.

Returns

None.

Example

None.

5.2.2.7.21.16 GFX_BarAlphaDraw Function**C**

```
uint16_t GFX_BarAlphaDraw(  
    uint16_t left,  
    uint16_t top,  
    uint16_t right,  
    uint16_t bottom  
);
```

Description

This function renders an alpha blended bar shape with the currently set color and the currently set background type (see [GFX_BACKGROUND_TYPE](#)).

The parameters left, top, right bottom will define the shape dimension.

The rendering of this shape becomes undefined when any one of the following is true:

- Any of the following pixel locations left,top or right,bottom falls outside the frame buffer.
- Colors are not set before this function is called.
- When right < left
- When bottom < top
- When pixel locations defined by left, top and/or right, bottom are not on the frame buffer.

Preconditions

Color must be set by [GFX_ColorSet\(\)](#). Alpha blending value must be set by [GFX_AlphaBlendingValueSet\(\)](#).

Parameters

Parameters	Description
left	defines the left most pixel of the shape.
top	defines the top most pixel of the shape.
right	defines the right most pixel of the shape.
bottom	defines the bottom most pixel of the shape.

Returns

TBA (see [GFX_STATUS](#)).

Example

```
// assume RED is a macro that define GFX_COLOR types
GFX_STATUS status;
// assume BackGroundImage is a valid image already draw
// on the screen
GFX_RESOURCE_HDR *pMyBackgroundImage = &BackGroundImage;

// render an alpha blended bar with
// the current contents of the frame buffer
GFX_AlphaBlendingValueSet(50);
GFX_BackgroundTypeSet(GFX_BACKGROUND_DISPLAY_BUFFER);
GFX_ColorSet(RED);
status = GFX_BarAlphaDraw(10, 110, 100, 200);

// render an alpha blended bar with a background image
GFX_AlphaBlendingValueSet(75);
GFX_FillStyleSet(GFX_FILL_STYLE_ALPHA_COLOR);

// color value here has no effect since the background set
// is type GFX_BACKGROUND_IMAGE
GFX_BackgroundSet(0, 0, pMyBackgroundImage, 0);

GFX_BackgroundTypeSet(GFX_BACKGROUND_IMAGE);
GFX_ColorSet(RED);
status = GFX_BarAlphaDraw(10, 110, 100, 200);
```

5.2.2.7.21.17 GFX_BarDraw Function**C**

GFX_STATUS **GFX_BarDraw**(

```

uint16_t left,
uint16_t top,
uint16_t right,
uint16_t bottom
);

```

Description

This function renders a bar shape with:

- solid color - when the fill style is set to `GFX_FILL_STYLE_COLOR`
- alpha blended fill - when the fill style is set to `GFX_FILL_STYLE_ALPHA_COLOR`.

Any other selected fill style will be ignored and will assume a solid color fill will be used. The parameters left, top, right bottom will define the shape dimension.

When fill style is set to `GFX_FILL_STYLE_ALPHA_COLOR`, the bar can also be rendered with an option to select the type of background.

Preconditions

Fill style must be set by [GFX_FillStyleSet\(\)](#) when alpha blended fill is desired. Color must be set by [GFX_ColorSet\(\)](#).

Parameters

Parameters	Description
left	defines the left most pixel of the shape.
top	defines the top most pixel of the shape.
right	defines the right most pixel of the shape.
bottom	defines the bottom most pixel of the shape.

Returns

TBA (see [GFX_STATUS](#)).

Example

```

// assume RED is a macro that define GFX_COLOR types
GFX_STATUS status;
// assume BackgroundImage is a valid image already draw
// on the screen
GFX_RESOURCE_HDR *pMyBackgroundImage = &BackgroundImage;

// render a RED bar
GFX_FillStyleSet(GFX_FILL_STYLE_COLOR);
GFX_ColorSet(RED);
status = GFX_BarDraw(10, 110, 100, 200);

// render an alpha blended bar with
// the current contents of the frame buffer
GFX_FillStyleSet(GFX_FILL_STYLE_ALPHA_COLOR);
GFX_BackgroundTypeSet(GFX_BACKGROUND_DISPLAY_BUFFER);
GFX_ColorSet(RED);
status = GFX_BarDraw(10, 110, 100, 200);

// render an alpha blended bar with a background image
GFX_FillStyleSet(GFX_FILL_STYLE_ALPHA_COLOR);

// color value here has no effect since the background set
// is type GFX_BACKGROUND_IMAGE
GFX_BackgroundSet(0, 0, pMyBackgroundImage, 0);

GFX_BackgroundTypeSet(GFX_BACKGROUND_IMAGE);
GFX_ColorSet(RED);
status = GFX_BarDraw(10, 110, 100, 200);

```

5.2.2.7.21.18 GFX_BarGradientDraw Function

C

```
GFX_STATUS GFX_BarGradientDraw(  
    uint16_t left,  
    uint16_t top,  
    uint16_t right,  
    uint16_t bottom  
);
```

Description

This renders a bar onto the screen, but instead of one color, a gradient is drawn depending on the direction (GFX_GRADIENT_TYPE), length, and colors chosen. This function is a blocking call.

Preconditions

Gradient feature must be enabled.

Parameters

Parameters	Description
left	x position of the left top corner.
top	y position of the left top corner.
right	x position of the right bottom corner.
bottom	y position of the right bottom corner.
color1	start color for the gradient
color2	end color for the gradient
length	From 0-100%. How much of a gradient is wanted
direction	Gradient Direction

Returns

Always returns a 1 since it is a blocking function.

Side Effects

none

Remarks

none

Example

```

// draw a full screen gradient background
// with color transitioning from BRIGHTRED to
// BLACK in the upward direction.

GFX_GRADIENT_STYLE gradScheme;

gradScheme.gradientType      = GFX_GRADIENT_TYPE_UP;
gradScheme.gradientStartColor = BRIGHTRED;
gradScheme.gradientEndColor   = BLACK;

BarGradient(0,                                //left position
             0,                                //top position
             GetMaxX(),                       //right position
             GetMaxY(),                       //bottom position
             gradScheme.gradientStartColor,
             gradScheme.gradientEndColor,
             50,                                // at the halfway point (50%) of the
rectangular area                               // defined by the first 4 parameters
(full screen),                               // the color becomes BLACK and BLACK
color is used until                           // the rectangle defined is filled up
                                               // see GFX_GRADIENT_TYPE

             gradScheme.gradientType);

```

5.2.2.7.21.19 GFX_BevelDraw Function**C**

```

GFX_STATUS GFX_BevelDraw(
    uint16_t x1,
    uint16_t y1,
    uint16_t x2,
    uint16_t y2,
    uint16_t rad
);

```

Description

This is function GFX_BevelDraw.

5.2.2.7.21.20 GFX_BevelDrawTypeGet Function**C**

```

GFX_BEVEL_RENDER_TYPE GFX_BevelDrawTypeGet();

```

5.2.2.7.21.21 GFX_BevelDrawTypeSet Function**C**

```

void GFX_BevelDrawTypeSet(
    GFX_BEVEL_RENDER_TYPE type
);

```

5.2.2.7.21.22 GFX_BevelGradientDraw Function**C**

```

GFX_STATUS GFX_BevelGradientDraw(
    uint16_t left,
    uint16_t top,
    uint16_t right,
    uint16_t bottom,

```

```
uint16_t rad
);
```

Description

This renders a filled bevel with gradient color on the fill. It works the same as the fillbevel function, except a gradient out of color1 and color2 is drawn depending on the direction (GFX_GRADIENT_TYPE). This function is a blocking call.

Preconditions

Gradient feature must be enabled.

Parameters

Parameters	Description
left	x coordinate position of the upper left center of the circle that draws the rounded corners.
top	y coordinate position of the upper left center of the circle that draws the rounded corners.
right	x coordinate position of the lower right center of the circle that draws the rounded corners.
bottom	y coordinate position of the lower right center of the circle that draws the rounded corners.
rad	defines the radius of the circle, that draws the rounded corners. When rad = 0, the object drawn is a rectangular gradient.
color1	start color for the gradient
color2	end color for the gradient
length	From 0-100%. How much of a gradient is wanted
direction	see GFX_GRADIENT_TYPE

Returns

Always returns a 1 since it is a blocking function.

Side Effects

none

Remarks

none

5.2.2.7.21.23 GFX_CircleDraw Function

C

```
GFX_STATUS GFX_CircleDraw(  
    uint16_t x,  
    uint16_t y,  
    uint16_t radius  
);
```

Description

This function renders a circular shape using the center (x,y) and radius. The shape is rendered using the currently set line style by [GFX_LineStyleSet\(\)](#). The color used is the color set by the last call to [GFX_ColorSet\(\)](#).

When x,y falls outside the buffer, the behavior is undefined. When color is not set before this function is called, the behavior is undefined. When any of the following x+radius, x-radius, y+radius and y-radius falls outside the buffer, the behavior is undefined.

Preconditions

Color must be set by [GFX_ColorSet\(\)](#). Line style must be set by [GFX_LineStyleSet\(\)](#).

Parameters

Parameters	Description
x	defines the x-coordinate position of the center of the circle.
y	defines the y-coordinate position of the center of the circle.
radius	defines the radius of the circle.

Returns

TBA (see [GFX_STATUS](#)).

Example

TBA

5.2.2.7.21.24 GFX_CircleFillDraw Function

C

```
GFX_STATUS GFX_CircleFillDraw(  
    uint16_t x,  
    uint16_t y,  
    uint16_t radius  
);
```

Description

This function renders a filled circle shape with the currently set fill style (see [GFX_FILL_STYLE](#)) with the given left, top, right and bottom parameters to define the shape dimension. The shape is rendered depending on the fill style. If a flat color is used, color must be set (see [GFX_ColorSet\(\)](#)) before calling this function. If gradient color is used, gradient start and end color must be set (see [GFX_GradientColorSet\(\)](#)) before calling this function. After the fill style and colors are set, multiple calls to this function can be performed.

The rendering of this shape becomes undefined when any one of the following is true:

- Any of the following pixel locations left,top or right,bottom falls outside the frame buffer.
- Fill style is not set ([GFX_FillStyleSet\(\)](#)), before this function is called.
- Colors are not set before this function is called.
- When the center defined by x,y is not on the frame buffer.

Preconditions

Fill style must be set by [GFX_FillStyleSet\(\)](#). Color must be set by [GFX_ColorSet\(\)](#).

Parameters

Parameters	Description
x	defines the x-coordinate position of the center of the circle.
y	defines the y-coordinate position of the center of the circle.
radius	defines the radius of the circle.

Returns

TBA (see [GFX_STATUS](#)).

Example

```
// assume BLUE and RED are macros that define GFX_COLOR types
GFX_STATUS status;

APP_TEST_FillStyleSet(GFX_FILL_STYLE_GRADIENT_UP);
GFX_GradientColorSet(BLUE, RED);
status = GFX_CircleFillDraw(50, 110, 150, 200, 20);
if (status == GFX_STATUS_SUCCESS)
    // Filled circle was drawn.
else
    // Filled circle is not drawn or not yet
    // finished rendering. To finish the rendering call the
    // function again with the same parameters.
```

5.2.2.7.21.25 GFX_ColorGet Function**C**

```
GFX_COLOR GFX_ColorGet();
```

Description

This function returns the color currently set to render primitive shapes and text (See [GFX_ColorSet\(\)](#) for more information).

Preconditions

None.

Returns

The currently set color.

Example

TBA

5.2.2.7.21.26 GFX_ColorSet Function**C**

```
void GFX_ColorSet(
    GFX_COLOR newColor
);
```

Description

This function sets the color to be used to render primitive shapes and text. Any primitive shape that is set to any of the following:
[GFX_LINE_STYLE](#)

- [GFX_LINE_STYLE_THIN_SOLID](#)
- [GFX_LINE_STYLE_THIN_DOTTED](#)

- GFX_LINE_STYLE_THIN_DASHED
- GFX_LINE_STYLE_THICK_SOLID
- GFX_LINE_STYLE_THICK_DOTTED
- GFX_LINE_STYLE_THICK_DASHED

[GFX_FILL_STYLE](#)

- GFX_FILL_STYLE_COLOR

will be rendered using the set color.

Rendering text using the [GFX_TextCharDraw\(\)](#), [GFX_TextStringDraw\(\)](#) and [GFX_TextStringBoxDraw\(\)](#) will also use the set color.

Preconditions

None.

Parameters

Parameters	Description
color	the rendering color set to render primitive shapes.

Returns

None.

Example

TBA

5.2.2.7.21.27 GFX_DoubleBufferAreaGet Function

C

```
GFX_RECTANGULAR_AREA * GFX_DoubleBufferAreaGet(
    uint16_t count
);
```

5.2.2.7.21.28 GFX_DoubleBufferAreaMark Function

C

```
void GFX_DoubleBufferAreaMark(
    uint16_t left,
    uint16_t top,
    uint16_t right,
    uint16_t bottom
);
```

5.2.2.7.21.29 GFX_DoubleBufferDisable Function

C

```
GFX_STATUS GFX_DoubleBufferDisable();
```

5.2.2.7.21.30 GFX_DoubleBufferEnable Function

C

```
GFX_STATUS GFX_DoubleBufferEnable();

GFX_FEATURE_STATUS GFX_DoubleBufferSynchronizeStatusGet();
```

5.2.2.7.21.42 GFX_DoubleBufferVisualPageUpdate Function

C

```
GFX_STATUS GFX_DoubleBufferVisualPageUpdate();
```

Description

None

Preconditions

None

Parameters

Parameters	Description
None	None

Returns

None

Example

None

5.2.2.7.21.43 GFX_DrawBufferGet Function

C

```
int GFX_DrawBufferGet();
```

5.2.2.7.21.44 GFX_DrawBufferSelect Function

C

```
GFX_STATUS GFX_DrawBufferSelect(  
    int index  
);
```

5.2.2.7.21.45 GFX_DrawBufferSet Function

C

```
GFX_STATUS GFX_DrawBufferSet(  
    int index,  
    uint32_t address  
);
```

5.2.2.7.21.46 GFX_DRV_FontSet Function

C

```
void GFX_DRV_FontSet(  
    GFX_RESOURCE_HDR * pFont  
);
```

Description

This is function GFX_DRV_FontSet.

5.2.2.7.21.47 GFX_DRV_TextStringWidthGet Function

C

```
uint16_t GFX_DRV_TextStringWidthGet(  
    const char * pText,  
    uint16_t x,  
    uint16_t y,  
    uint16_t width,  
    uint16_t height,  
    uint16_t * pWidth,  
    uint16_t * pHeight  
);
```

```
GFX_XCHAR* textString,
GFX_RESOURCE_HDR * pFont
);
```

Description

This is function GFX_DRV_TextStringWidthGet.

5.2.2.7.21.48 GFX_ExternalCharInfoGet Function**C**

```
void GFX_ExternalCharInfoGet(
    GFX_XCHAR ch,
    GFX_FONT_OUTCHAR * pParam
);
```

Description

This is function GFX_ExternalCharInfoGet.

5.2.2.7.21.49 GFX_ExternalResourceCallback Function**C**

```
GFX_STATUS GFX_ExternalResourceCallback(
    GFX_RESOURCE_HDR * pResource,
    uint32_t offset,
    uint16_t nCount,
    void * pBuffer
);
```

Description

This function must be implemented in the application. The library will call this function each time when the external memory data will be required. The application must copy requested uint8_ts quantity into the buffer provided. Data start address in external memory is a sum of the address in GFX_EXTDATA structure and offset.

Parameters

Parameters	Description
memory	Pointer to the external memory bitmap or font structures (FONT_EXTERNAL or BITMAP_EXTERNAL).
offset	Data offset.
nCount	Number of uint8_ts to be transferred into the buffer.
buffer	Pointer to the buffer.

Returns

Returns the number of uint8_ts were transferred.

Side Effects

none

Example

```
// If there are several memories in the system they can be selected by IDs.
// In this example, ID for memory device used is assumed to be 0.
#define X_MEMORY 0

uint16_t ExternalMemoryCallback(GFX_IMAGE_HEADER* memory, int32_t offset, uint16_t nCount,
void* buffer) {
    int i;
    long address;
```

```

    // Address of the requested data is a start address of the object referred by GFX_EXTDATA
    // structure plus offset
    address = memory->address+offset;

    if(memory->ID == X_MEMORY){
        // MemoryXReaduint8_t() is some function implemented to access external memory.
        // Implementation will be specific to the memory used. In this example
        // it reads uint8_t each time it is called.
        i = 0;
        while (i < nCount) {
            (uint8_t*)buffer = MemoryXReaduint8_t(address++);
            i++;
        }
        // return the actual number of uint8_ts retrieved
        return (i);
    }
}

```

5.2.2.7.21.50 GFX_FillStyleGet Function

C

```
GFX_FILL_STYLE GFX_FillStyleGet();
```

Description

This function returns the fill style used (see [GFX_FILL_STYLE](#)) when rendering filled shapes.

Preconditions

None.

Returns

The current fill style used (see [GFX_FILL_STYLE](#)).

Example

TBA

5.2.2.7.21.51 GFX_FillStyleSet Function

C

```
GFX_STATUS GFX_FillStyleSet(
    GFX_FILL_STYLE style
);
```

Description

This function sets the fill style to be used (see [GFX_FILL_STYLE](#)) when rendering filled shapes. All calls to the following:

- [GFX_RectangleFillDraw\(\)](#)
- [GFX_RectangleRoundFillDraw\(\)](#)
- [GFX_CircleFillDraw\(\)](#)

will use the fill style set by this function.

Preconditions

None.

Parameters

Parameters	Description
style	The specified fill style to be used.

Returns

TBA (see [GFX_STATUS](#)).

Example

TBA

5.2.2.7.21.52 GFX_FlashCharInfoGet Function

C

```
void GFX_FlashCharInfoGet(  
    GFX_XCHAR ch,  
    GFX_FONT_OUTCHAR * pParam  
);
```

Description

This is function GFX_FlashCharInfoGet.

5.2.2.7.21.53 GFX_FontAntiAliasGet Function

C

```
GFX_FONT_ANTIALIAS_TYPE GFX_FontAntiAliasGet();
```

Description

This function returns the font anti-aliasing mode used when rendering anti-aliased strings and characters. Default setting at initialization is GFX_FONT_ANTIALIAS_OPAQUE.

Preconditions

None.

Returns

The font anti-aliasing mode used.

Example

TBA

5.2.2.7.21.54 GFX_FontAntiAliasSet Function

C

```
GFX_STATUS GFX_FontAntiAliasSet(  
    GFX_FONT_ANTIALIAS_TYPE type  
);
```

Description

This function sets the font anti-aliasing mode used when rendering anti-aliased strings and characters.

Preconditions

None.

Parameters

Parameters	Description
type	anti-aliasing mode selected. See GFX_FONT_ANTIALIAS_TYPE for details.

Returns

The status of the set anti-aliasing mode action.

Example

TBA

5.2.2.7.21.55 GFX_FontGet Function

C

```
GFX_RESOURCE_HDR* GFX_FontGet();
```

Description

This function returns the current font used to render strings and characters.

Preconditions

[GFX_FontSet\(\)](#) must be called prior to any call to this function. If this function is called first, the returned value is undefined.

Returns

The pointer to the current font used in rendering strings and characters.

Example

TBA

5.2.2.7.21.56 GFX_FontSet Function

C

```
GFX_STATUS GFX_FontSet(  
    GFX_RESOURCE_HDR * pFont  
);
```

Description

This function sets the current font used to render strings and characters.

Preconditions

None.

Parameters

Parameters	Description
pFont	pointer to the font to be used.

Returns

The status of the set font action.

Example

TBA

5.2.2.7.21.57 GFX_FrameBufferGet Function

C

```
int GFX_FrameBufferGet();
```

5.2.2.7.21.58 GFX_FrameBufferSelect Function

C

```
GFX_STATUS GFX_FrameBufferSelect(  
    int index  
);
```

5.2.2.7.21.59 GFX_GradientColorSet Function

```
C
GFX_STATUS GFX_GradientColorSet(
    GFX_COLOR startColor,
    GFX_COLOR endColor
);
```

Description

This function sets the gradient fill start and end colors (see [GFX_FILL_STYLE](#)) when rendering gradient filled shapes. All subsequent calls to the following using gradient fills:

- [GFX_RectangleFillDraw\(\)](#)
- [GFX_RectangleRoundFillDraw\(\)](#)
- [GFX_CircleFillDraw\(\)](#)

will use the start and end colors set by this function.

Preconditions

None.

Parameters

Parameters	Description
startColor	Gradient start color to be used.
endColor	Gradient end color to be used.

Returns

TBA (see [GFX_STATUS](#)).

Example

TBA

5.2.2.7.21.60 GFX_GradientEndColorGet Function

```
C
GFX_COLOR GFX_GradientEndColorGet();
```

Description

This function returns the end color used when rendering gradient filled shapes.

Preconditions

None.

Returns

The current gradient end color used.

Example

TBA

5.2.2.7.21.61 GFX_GradientStartColorGet Function

```
C
GFX_COLOR GFX_GradientStartColorGet();
```

Description

This function returns the start color used when rendering gradient filled shapes.

Preconditions

None.

Returns

The current gradient start color used.

Example

TBA

5.2.2.7.21.62 GFX_ImageDraw Function

C

```
GFX_STATUS GFX_ImageDraw(
    uint16_t left,
    uint16_t top,
    GFX_RESOURCE_HDR * pImage
);
```

Description

This function renders an image to the frame buffer with the left-top corner of the image located at given left, top parameters.

The rendering of this shape becomes undefined when any one of the following is true:

- left, top pixel position falls outside the frame buffer.
- pointer is not properly initialized to a [GFX_RESOURCE_HDR](#) object.

Preconditions

None.

Parameters

Parameters	Description
left	Horizontal starting position of the image.
top	Vertical starting position of the image.
pImage	Pointer to the image to be rendered.

Returns

TBA (see [GFX_STATUS](#)).

Example

TBA

5.2.2.7.21.63 GFX_ImageHeaderGet Function

C

```
inline void GFX_ImageHeaderGet(
    GFX_RESOURCE_HDR * pImage,
    GFX_MCHP_BITMAP_HEADER * pBitmapHdr
);
```

Description

This function fills the given bitmap header with the image's header information. This function results in an undefined behavior if the pointer to the image is invalid.

Preconditions

None.

Parameters

Parameters	Description
pImage	Pointer to the image.
pBitmap	Pointer to the destination of the header information.

Returns

None.

Example

TBA

5.2.2.7.21.64 GFX_ImageHeightGet Function**C**

```
inline int16_t GFX_ImageHeightGet(  
    GFX_RESOURCE_HDR * pImage  
)  
;
```

Description

This function returns the height of the given image in pixels. This function results in an undefined behavior if the pointer to the image is invalid.

This function return value is undefined if the given pointer does not point to a valid image resource.

Preconditions

None.

Parameters

Parameters	Description
pImage	Pointer to the image.

Returns

The image height in pixels.

Example

TBA

5.2.2.7.21.65 GFX_ImageOffsetAddressGet Function**C**

```
uint32_t GFX_ImageOffsetAddressGet(  
    uint32_t address,  
    uint16_t xOffset,  
    uint16_t yOffset,  
    uint16_t width  
)  
;
```

Description

This is function GFX_ImageOffsetAddressGet.

5.2.2.7.21.66 GFX_ImagePartialDraw Function

C

```
GFX_STATUS GFX_ImagePartialDraw(
    uint16_t destination_x,
    uint16_t destination_y,
    uint16_t source_x_offset,
    uint16_t source_y_offset,
    uint16_t source_width,
    uint16_t source_height,
    GFX_RESOURCE_HDR * pImage
);
```

Description

This function renders an image or a portion of an image to the frame buffer with the top, left corner of the image located at `destination_x`, `destination_y`. To render a full image, `source_x_offset`, `source_y_offset`, width and height are set to all 0. Using the actual image's width and height will also work if these are known. If they are not known, avoid the extra extra step to get the image's width and height by assigning 0 to the parameters. Another way to render a full image is to use the [GFX_ImageDraw\(\)](#). The image to be rendered is defined by the pointer `pImage`.

The rendering of this shape becomes undefined when any one of the following is true:

- destination_x, destination_y pixel position falls outside the frame buffer.
- source_x_offset, source_y_offset results in a starting position beyond the image's dimension.
- source_width and/or source_height is larger than the actual image's width and height.
- pointer is not properly initialized to a [GFX_RESOURCE_HDR](#) object.

Preconditions

None.

Parameters

Parameters	Description
destination_x	Horizontal starting position of the image.
destination_y	Vertical starting position of the image.
source_x_offset	Horizontal offset in pixels of the starting position of the partial area of the image to be rendered. Set to 0 along with source_y_offset when rendering the full image.
source_y_offset	Vertical offset in pixels of the starting position of the partial area of the image to be rendered. Set to 0 along with source_x_offset when rendering the full image.
source_width	The width of the partial area of the image to be rendered. Set to 0 along with source_height when rendering the full image.
source_height	The height of the partial area of the image to be rendered. Set to 0 along with source_width when rendering the full image.
pImage	Pointer to the image to be rendered.

Returns

TBA (see [GFX_STATUS](#)).

Example

TBA

5.2.2.7.21.67 GFX_ImageWidthGet Function**C**

```
inline int16_t GFX_ImageWidthGet(
    GFX_RESOURCE_HDR * pImage
);
```

Description

This function returns the width of the given image in pixels. This function results in an undefined behavior if the pointer to the image is invalid.

This function return value is undefined if the given pointer does not point to a valid image resource.

Preconditions

None.

Parameters

Parameters	Description
pImage	Pointer to the image.

Returns

The image width in pixels.

Example

TBA

5.2.2.7.21.68 GFX_Initialize Function

C

```
void GFX_Initialize();
```

Description

This function initialize the Graphics Library primitive layer and Graphics Object Layer if it is enabled. The following default settings are set when this function is called.

1. font - Set to NULL. [GFX_FontSet\(\)](#) must be called prior to any text rendering.
2. line type - Set to GFX_LINE_TYPE_THIN_SOLID (see [GFX_LINE_STYLE](#)).
3. fill type - Set to GFX_FILL_TYPE_COLOR (see [GFX_FILL_STYLE](#)).
4. text anti-alias type - Set to GFX_FONT_ANTIALIAS_OPAQUE (see [GFX_FONT_ANTIALIAS_TYPE](#)). This only affects fonts with anti-aliasing enabled.

This function does not clear the screen and does not assign any color to the currently set color. Application should set the color and clear the screen.

Preconditions

None.

Returns

None.

Example

TBA

5.2.2.7.21.69 GFX_Layer Function

C

```
GFX_STATUS GFX_Layer(  
    uint8_t layer,  
    uint8_t action,  
    uint16_t param1,  
    uint16_t param2  
);
```

Description

None

Preconditions

None

Parameters

Parameters	Description
None	None

Returns

None

Example

None

5.2.2.7.21.70 GFX_LineDraw Function

C

```
GFX_STATUS GFX_LineDraw(  
    uint16_t x1,  
    uint16_t y1,  
    uint16_t x2,  
    uint16_t y2  
);
```

Description

This function renders a line from x1,y1 to x2,y2 using the currently set line style set by [GFX_LineStyleSet\(\)](#). The color used is the color set by the last call to [GFX_ColorSet\(\)](#).

If x1,y1 and/or x2,y2 is not on the frame buffer, then the behavior is undefined. If color is not set, before this function is called, the output is undefined.

Preconditions

Color must be set by [GFX_ColorSet\(\)](#). Line style must be set by [GFX_LineStyleSet\(\)](#).

Parameters

Parameters	Description
x1	x coordinate of the line start point.
y1	y coordinate of the line start point.
x2	x coordinate of the line end point.
y2	y coordinate of the line end point.

Returns

TBA (see [GFX_STATUS](#)).

Example

TBA

5.2.2.7.21.71 GFX_LinePositionRelativeSet Function

C

```
GFX_STATUS GFX_LinePositionRelativeSet(  
    int16_t x,  
    int16_t y  
);
```

Description

This function sets the line cursor to a new (x,y) position relative to the current cursor position. The new position is calculated by (x+dX, y + dY).

Line cursor is used as a starting point of the line rendered by the [GFX_LineToDraw\(\)](#) and [GFX_LineToRelativeDraw\(\)](#) functions. Note that the parameters dX and dY are signed integers. This allows the new line cursor position to be placed to any direction from the current line cursor position.

If (x+dX) and/or (y+dY) results in a position that is not on the frame buffer, then the behavior of [GFX_LineToDraw\(\)](#) and [GFX_LineToRelativeDraw\(\)](#) functions are undefined. If color is not set, before this function is called, the output is undefined.

Preconditions

None.

Parameters

Parameters	Description
dX	the offset for the x position that will define the new x-coordinate position of the line cursor.
dY	the offset for the y position that will define the new y-coordinate position of the line cursor.

Returns

TBA (see [GFX_STATUS](#)).

Example

TBA

5.2.2.7.21.72 GFX_LinePositionSet Function**C**

```
GFX_STATUS GFX_LinePositionSet(  
    uint16_t x,  
    uint16_t y  
);
```

Description

This function sets the line cursor to a new (x,y) position. Line cursor is used as a starting point of the line rendered by the [GFX_LineToDraw\(\)](#) and [GFX_LineToRelativeDraw\(\)](#) functions.

If x and/or y does not lie on the frame buffer, then the behavior of [GFX_LineToDraw\(\)](#) and [GFX_LineToRelativeDraw\(\)](#) functions are undefined.

Preconditions

None.

Parameters

Parameters	Description
x	new x coordinate position of the line cursor.
y	new y coordinate position of the line cursor.

Returns

TBA (see [GFX_STATUS](#)).

Example

TBA

5.2.2.7.21.73 GFX_LinePositionXGet Function**C**

```
int16_t GFX_LinePositionXGet();
```

Description

This function returns the current x position of the line cursor. Line cursor is used as a starting point of the line rendered by the [GFX_LineToDraw\(\)](#) and [GFX_LineToRelativeDraw\(\)](#) functions.

Preconditions

None.

Returns

The current line cursor x position.

Example

TBA

5.2.2.7.21.74 GFX_LinePositionYGet Function**C**

```
int16_t GFX_LinePositionYGet();
```

Description

This function returns the current y position of the line cursor. Line cursor is used as a starting point of the line rendered by the [GFX_LineToDraw\(\)](#) and [GFX_LineToRelativeDraw\(\)](#) functions.

Preconditions

None.

Returns

The current line cursor y position.

Example

TBA

5.2.2.7.21.75 GFX_LineStyleGet Function**C**

```
GFX_LINE_STYLE GFX_LineStyleGet();
```

Description

This function returns the line style used (see [GFX_LINE_STYLE](#)) when rendering lines.

Preconditions

None.

Returns

The current line style used (see [GFX_LINE_STYLE](#)).

Example

TBA

5.2.2.7.21.76 GFX_LineStyleSet Function**C**

```
GFX_STATUS GFX_LineStyleSet(  
    GFX_LINE_STYLE style  
);
```

Description

This function sets the line style to be used (see [GFX_LINE_STYLE](#)) when rendering lines. All calls to the following functions

- [GFX_LineDraw\(\)](#)
- [GFX_LineToDraw\(\)](#)
- [GFX_LineToRelativeDraw\(\)](#)

- [GFX_CircleDraw\(\)](#)
- [GFX_RectangleDraw\(\)](#)
- [GFX_PolygonDraw\(\)](#)

will use the line style set by this function. In addition, all unfilled shapes that does specify the line style to be used will use the line style specified by this function.

Preconditions

None.

Parameters

Parameters	Description
style	The specified line style to be used.

Returns

TBA (see [GFX_STATUS](#)).

Example

TBA

5.2.2.7.21.77 GFX_LineToDraw Function**C**

```
GFX_STATUS GFX_LineToDraw(  
    int16_t x2,  
    int16_t y2  
);
```

Description

This function renders a line from current line cursor position (x,y) to (x2,y2) using the currently set line style set by [GFX_LineStyleSet\(\)](#). The color used is the color set by the last call to [GFX_ColorSet\(\)](#).

If x2 and/or y2 does not lie on the frame buffer, then the behavior is undefined. If color is not set, before this function is called, the output is undefined.

Preconditions

Color must be set by [GFX_ColorSet\(\)](#). Line style must be set by [GFX_LineStyleSet\(\)](#).

Parameters

Parameters	Description
x2	x coordinate of the line end point.
y2	y coordinate of the line end point.

Returns

TBA (see [GFX_STATUS](#)).

Example

TBA

5.2.2.7.21.78 GFX_LineToRelativeDraw Function**C**

```
GFX_STATUS GFX_LineToRelativeDraw(  
    int16_t dX,  
    int16_t dY
```

```
);
```

Description

This function renders a line from current line cursor position (x,y) to (x+dX,y+dY) using the currently set line style set by [GFX_LineStyleSet\(\)](#). The color used is the color set by the last call to [GFX_ColorSet\(\)](#). Note that the parameters dX and dY are signed integers. This allows the line to be drawn from the line cursor to any direction.

If (x+dX) and/or (y+dY) results in a position that is not on the frame buffer, then the behavior is undefined. If color is not set, before this function is called, the output is undefined.

Preconditions

Color must be set by [GFX_ColorSet\(\)](#). Line style must be set by [GFX_LineStyleSet\(\)](#).

Parameters

Parameters	Description
dX	the offset for the x starting position that will define the x-coordinate of the end of the line.
dY	the offset for the y starting position that will define the y-coordinate of the end of the line.

Returns

TBA (see [GFX_STATUS](#)).

Example

TBA

5.2.2.7.21.79 GFX_PageSet Function

C

```
GFX_STATUS GFX_PageSet(
    uint8_t  pageType,
    uint8_t  page
);
```

Example

Remarks:

5.2.2.7.21.80 GFX_PolygonDraw Function

C

```
GFX_STATUS GFX_PolygonDraw(
    uint16_t numPoints,
    uint16_t * polyPoints
);
```

Description

This function renders a polygon using the currently set line style (see [GFX_LineStyleSet\(\)](#)) and color (see [GFX_ColorSet\(\)](#)). The shape of the polygon is determined by the polygon points (an ordered array of x,y pairs) where the pair count is equal to the parameter sides.

If any of the x,y pairs do not lie on the frame buffer, then the behavior is undefined. If color is not set, before this function is called, the output is undefined.

Preconditions

Color must be set by [GFX_ColorSet\(\)](#). Line style must be set by [GFX_LineStyleSet\(\)](#).

Parameters

Parameters	Description
sides	the number of sides of the polygon.
pPoints	Pointer to the array of polygon points. The array defines the x,y points of the polygon. The sequence should be x0, y0, x1, y1, x2, y2, ... xn, yn where n is the # of polygon sides.

Returns

TBA (see [GFX_STATUS](#)).

Example

```
uint16_t OpenShapeXYPoints[6] = {10, 10, 20, 10, 20, 20};
uint16_t ClosedShapeXYPoints[8] = {10, 10, 20, 10, 20, 20, 10, 10};

GFX_ColorSet(WHITE);                // set color
SetLineType(GFX_LINE_STYLE_THIN_DOTTED); // set line style
GFX_PolygonDraw(3, OpenShapeXYPoints); // draw an open shape
GFX_PolygonDraw(4, ClosedShapeXYPoints); // draw a closed shape
```

5.2.2.7.21.81 GFX_Primitive_Initialize Function**C**

```
inline void GFX_Primitive_Initialize();
```

Description

This is function `GFX_Primitive_Initialize`.

5.2.2.7.21.82 GFX_RectangleDraw Function**C**

```
GFX_STATUS GFX_RectangleDraw(
    uint16_t left,
    uint16_t top,
    uint16_t right,
    uint16_t bottom
);
```

Description

This function renders a rectangular shape using the given left, top, right and bottom parameters to define the shape dimension. The shape is rendered using the currently set line style by [GFX_LineStyleSet\(\)](#). The color used is the color set by the last call to [GFX_ColorSet\(\)](#).

The rendering of this shape becomes undefined when any one of the following is true:

- Any of the following pixel locations left,top, right,bottom falls outside the frame buffer.
- Color is not set, before this function is called.
- right < left
- bottom < top

Preconditions

Color must be set by [GFX_ColorSet\(\)](#). Line style must be set by [GFX_LineStyleSet\(\)](#).

Parameters

Parameters	Description
left	defines the left most pixel of the shape.

top	defines the top most pixel of the shape.
right	defines the right most pixel of the shape.
bottom	defines the bottom most pixel of the shape.

Returns

TBA (see [GFX_STATUS](#)).

Example

TBA

5.2.2.7.21.83 GFX_RectangleFillDraw Function**C**

```
GFX_STATUS GFX_RectangleFillDraw(
    uint16_t left,
    uint16_t top,
    uint16_t right,
    uint16_t bottom
);
```

Description

This function renders a filled rectangular shape with the currently set fill style (see [GFX_FILL_STYLE](#)) with the given left, top, right, and bottom parameters to define the shape dimension. The shape is rendered depending on the fill style. If a flat color is used, color must be set (see [GFX_ColorSet\(\)](#)) before calling this function. If gradient color is used, gradient start and end color must be set (see [GFX_GradientColorSet\(\)](#)) before calling this function. After the fill style and colors are set, multiple calls to this function can be performed.

The rendering of this shape becomes undefined when any one of the following is true:

- Any of the following pixel locations left,top or right,bottom falls outside the frame buffer.
- Fill style is not set ([GFX_FillStyleSet\(\)](#)), before this function is called.
- Colors are not set before this function is called.
- When right < left
- When bottom < top
- When pixel locations defined by left, top and/or right, bottom are not on the frame buffer.

Preconditions

Fill style must be set by [GFX_FillStyleSet\(\)](#). Color must be set by [GFX_ColorSet\(\)](#).

Parameters

Parameters	Description
left	defines the left most pixel of the shape.
top	defines the top most pixel of the shape.
right	defines the right most pixel of the shape.
bottom	defines the bottom most pixel of the shape.

Returns

TBA (see [GFX_STATUS](#)).

Example

```
// assume BLUE and RED are macros that define GFX_COLOR types
GFX_STATUS status;

// render a rectangle with gradient colors from BLUE to RED
```

```

GFX_FillStyleSet(GFX_FILL_STYLE_GRADIENT_LEFT);
GFX_GradientColorSet(BLUE, RED);
status = GFX_RectangleFillDraw(10, 110, 100, 200);

// render an alpha blended rounded rectangle with
// the current contents of the frame buffer
GFX_FillStyleSet(GFX_FILL_STYLE_ALPHA_COLOR);
GFX_AlphaBlendingValueSet(50);
GFX_BackgroundTypeSet(GFX_BACKGROUND_DISPLAY_BUFFER);
GFX_ColorSet(RED);
status = GFX_RectangleRoundFillDraw(10, 110, 100, 200);

// render an alpha blended rectangle with an image
GFX_FillStyleSet(GFX_FILL_STYLE_ALPHA_COLOR);
GFX_AlphaBlendingValueSet(50);
GFX_BackgroundTypeSet(GFX_BACKGROUND_IMAGE);
GFX_ColorSet(RED);
status = GFX_RectangleFillDraw(10, 110, 100, 200);

// render a plain RED rounded rectangle
GFX_FillStyleSet(GFX_FILL_STYLE_COLOR);
GFX_ColorSet(RED);
status = GFX_RectangleFillDraw(10, 110, 100, 200);

```

5.2.2.7.21.84 GFX_RectangleRoundDraw Function

C

```

GFX_STATUS GFX_RectangleRoundDraw(
    uint16_t left,
    uint16_t top,
    uint16_t right,
    uint16_t bottom,
    uint16_t radius
);

```

Description

This function renders a rectangular shape with rounded corner using the given left, top, right, bottom and radius parameters to define the shape dimension. radius defines the rounded corner shape. The shape is rendered using the currently set line style by [GFX_LineStyleSet\(\)](#). The color used is the color set by the last call to [GFX_ColorSet\(\)](#).

Left most pixel location is defined by left - radius. Top most pixel location is defined by top - radius. Right most pixel location is defined by right + radius. Bottom most pixel location is defined by bottom + radius. When radius = 0, there are no rounded corners. In this case (left,top) will define the left, top corner and (right,bottom) will define the right, bottom corner of the shape.

When left = right and top = bottom, with radius > 0, a circular object is drawn. When left < right and top < bottom and radius = 0, a rectangular object is drawn.

The rendering of this shape becomes undefined when any one of the following is true:

- Any of the following pixel locations left-rad , top-rad, right+rad, bottom+rad falls outside the frame buffer.
- Color is not set, before this function is called.
- right < left
- bottom < top

Preconditions

Color must be set by [GFX_ColorSet\(\)](#). Line style must be set by [GFX_LineStyleSet\(\)](#).

Parameters

Parameters	Description
left	Along with rad (left - rad), defines the left most pixel of the shape.

top	Along with rad (top - rad), defines the top most pixel of the shape.
right	Along with rad (right + rad), defines the right most pixel of the shape.
bottom	Along with rad (bottom + rad), defines the bottom most pixel of the shape.
radius	defines the rounded corners. When this is set to zero, there will be no rounded corners.

Returns

TBA (see [GFX_STATUS](#)).

Example

TBA

5.2.2.7.21.85 GFX_RectangleRoundFillDraw Function**C**

```
GFX_STATUS GFX_RectangleRoundFillDraw(
    uint16_t left,
    uint16_t top,
    uint16_t right,
    uint16_t bottom,
    uint16_t radius
);
```

Description

This function renders a filled rounded rectangular shape with the currently set fill style (see [GFX_FILL_STYLE](#)) with the given left, top, right, bottom and radius parameters to define the shape dimension. The shape is rendered depending on the fill style. If a flat color is used, color must be set (see [GFX_ColorSet\(\)](#)) before calling this function. If gradient color is used, gradient start and end color must be set (see [GFX_GradientColorSet\(\)](#)) before calling this function. After the fill style and colors are set, multiple calls to this function can be performed.

The rendering of this shape becomes undefined when any one of the following is true:

- Any of the following pixel locations left,top or right,bottom falls outside the frame buffer.
- Fill style is not set ([GFX_FillStyleSet\(\)](#)), before this function is called.
- Colors are not set before this function is called.
- When right < left
- When bottom < top
- When pixel locations defined by left, top and/or right, bottom are not on the frame buffer.

Preconditions

Fill style must be set by [GFX_FillStyleSet\(\)](#). Color must be set by [GFX_ColorSet\(\)](#).

Parameters

Parameters	Description
left	defines the left most pixel of the shape.
top	defines the top most pixel of the shape.
right	defines the right most pixel of the shape.
bottom	defines the bottom most pixel of the shape.
radius	defines the radius of the rounded corner. A zero value will result in a rectangular shape drawn.

Returns

TBA (see [GFX_STATUS](#)).

Example

```
// assume BLUE and RED are macros that define GFX_COLOR types
GFX_STATUS status;

APP_TEST_FillStyleSet(GFX_FILL_STYLE_GRADIENT_DOUBLE_VER);
GFX_GradientColorSet(BLUE, RED);
status = GFX_RectangleFillDraw(50, 110, 150, 200, 20);
if (status == GFX_STATUS_SUCCESS)
    // Filled rounded rectangle shape was drawn.
else
    // Filled rounded rectangle shape is not drawn or not yet
    // finished rendering. To finish the rendering call the
    // function again with the same parameters.
```

5.2.2.7.21.86 GFX_RenderingBufferGet Function**C**

```
GFX_COLOR * GFX_RenderingBufferGet();
```

Description

Returns the location of the internal rendering buffer used in rendering images and filled objects with alpha blending.

Preconditions

None.

Returns

The address of the rendering buffer.

Example

None.

5.2.2.7.21.87 GFX_RenderToDisplayBufferDisable Function**C**

```
void GFX_RenderToDisplayBufferDisable();
```

Description

This is function GFX_RenderToDisplayBufferDisable.

5.2.2.7.21.88 GFX_RenderToDisplayBufferDisableFlagGet Function**C**

```
uint16_t GFX_RenderToDisplayBufferDisableFlagGet();
```

Description

This is function GFX_RenderToDisplayBufferDisableFlagGet.

5.2.2.7.21.89 GFX_RenderToDisplayBufferEnable Function**C**

```
void GFX_RenderToDisplayBufferEnable();
```

Description

This is function GFX_RenderToDisplayBufferEnable.

5.2.2.7.21.90 GFX_ScreenClear Function

C

```
GFX_STATUS GFX_ScreenClear();
```

Description

This function clears the screen with the current color and sets the line cursor position to (0, 0).

If color is not set, before this function is called, the output is undefined.

If the function returns GFX_STATUS_FAILURE, clearing is not yet finished. Application must call the function again to continue the clearing.

Preconditions

Color must be set by [GFX_ColorSet\(\)](#).

None.

Returns

The status of the screen clearing.

- GFX_STATUS_SUCCESS - screen was cleared.
- GFX_STATUS_FAILURE - screen is not yet cleared

Example

TBA

5.2.2.7.21.91 GFX_SetTransitionParameters Function

C

```
uint8_t GFX_SetTransitionParameters(
    short left,
    short top,
    GFX_TRANSITION_TYPE type,
    uint8_t sourcePage,
    uint8_t destinationPage,
    uint16_t delay_ms,
    uint16_t param1,
    uint16_t param2
);
```

Description

This sets up the transition effect using the [GFX_TRANSITION_TYPE](#) and the given parameters. The actual transition execution will occur when `GFXExecutePendingTransition()` is called. When `DOUBLE_BUFFERING` is enabled, `GFXExecutePendingTransition()` is executed after the current screen is fully rendered.

Parameters

Parameters	Description
left	left x coordinate
top	top y coordinate
right	right x coordinate
bottom	bottom y coordinate
type	Transition type
delay_ms	Delay in milli seconds between redraws in the screen while executing the transition
param1	Transition-type specific parameter

param2	Transition-type specific parameter

Returns

Returns success of the setup

- 0 : Parameters successfully saved for the new transition
- -1 : Parameters not saved, there is a pending transition

5.2.2.7.21.92 GFX_SolidLineDraw Function**C**

```
GFX_STATUS GFX_SolidLineDraw(  
    uint16_t x1,  
    uint16_t y1,  
    uint16_t x2,  
    uint16_t y2  
);
```

Description

This is function GFX_SolidLineDraw.

5.2.2.7.21.93 GFX_StyledLineDraw Function**C**

```
GFX_STATUS GFX_StyledLineDraw(  
    uint16_t x1,  
    uint16_t y1,  
    uint16_t x2,  
    uint16_t y2  
);
```

Description

This is function GFX_StyledLineDraw.

5.2.2.7.21.94 GFX_TextAreaBottomGet Function**C**

```
uint16_t GFX_TextAreaBottomGet();
```

Description

This is function GFX_TextAreaBottomGet.

5.2.2.7.21.95 GFX_TextAreaBottomSet Function**C**

```
void GFX_TextAreaBottomSet(  
    uint16_t bottom  
);
```

Description

This is function GFX_TextAreaBottomSet.

5.2.2.7.21.96 GFX_TextAreaLeftGet Function

C

```
uint16_t GFX_TextAreaLeftGet();
```

Description

This is function GFX_TextAreaLeftGet.

5.2.2.7.21.97 GFX_TextAreaLeftSet Function

C

```
void GFX_TextAreaLeftSet(  
    uint16_t left  
);
```

Description

This is function GFX_TextAreaLeftSet.

5.2.2.7.21.98 GFX_TextAreaRightGet Function

C

```
uint16_t GFX_TextAreaRightGet();
```

Description

This is function GFX_TextAreaRightGet.

5.2.2.7.21.99 GFX_TextAreaRightSet Function

C

```
void GFX_TextAreaRightSet(  
    uint16_t right  
);
```

Description

This is function GFX_TextAreaRightSet.

5.2.2.7.21.100 GFX_TextAreaTopGet Function

C

```
uint16_t GFX_TextAreaTopGet();
```

Description

This is function GFX_TextAreaTopGet.

5.2.2.7.21.101 GFX_TextAreaTopSet Function

C

```
void GFX_TextAreaTopSet(  
    uint16_t top  
);
```

Description

This is function GFX_TextAreaTopSet.

5.2.2.7.21.102 GFX_TextCharDraw Function

C

```
GFX_STATUS GFX_TextCharDraw(
    GFX_XCHAR ch
);
```

Description

This function renders the given character using the currently set font, and color to the location defined by the text cursor position. The color is set by [GFX_ColorSet\(\)](#) while the font is set by [GFX_FontSet\(\)](#). The text cursor position is set by [GFX_TextCursorPositionSet\(\)](#)

The rendering of the character becomes undefined when any one of the following is true:

- Text cursor position is set to locations outside the frame buffer.
- Color is not set, before this function is called.
- Font is not set, before this function is called.

Preconditions

Color must be set by [GFX_ColorSet\(\)](#). Font must be set by [GFX_FontSet\(\)](#). Text cursor position must be set by [GFX_TextCursorPositionSet\(\)](#).

Parameters

Parameters	Description
ch	character ID that of the character that will be rendered.

Returns

The status of the character rendering.

- GFX_STATUS_SUCCESS - the character was rendered
- GFX_STATUS_FAILURE - the character was not rendered, function must be called again to render the character.
- GFX_STATUS_ERROR - the character ID passed is not a valid or points to the character glyph that does not exist on the font table.

Example

```
// assume textString is a string of characters
static uint16_t counter = 0;
GFX_XCHAR ch;
GFX_STATUS status;

// render characters until null character
while((GFX_XCHAR)(ch = *(textString + counter)) != 0)
{
    status = GFX_TextCharDraw(ch);
    if (status != GFX_STATUS_SUCCESS)
        return (GFX_STATUS_FAILURE);
    counter++;
}
```

5.2.2.7.21.103 GFX_TextCursorPositionSet Function

C

```
GFX_STATUS GFX_TextCursorPositionSet(
    int16_t x,
    int16_t y
);
```

Description

This function sets the text cursor to a new (x,y) position. Text cursor is used as a starting point of the character rendered by the [GFX_TextCharDraw\(\)](#) function.

If x and/or y does not lie on the frame buffer, then the behavior of [GFX_TextCharDraw\(\)](#) function is undefined.

Preconditions

None.

Parameters

Parameters	Description
x	new x coordinate position of the text cursor.
y	new y coordinate position of the text cursor.

Returns

TBA (see [GFX_STATUS](#)).

Example

TBA

5.2.2.7.21.104 GFX_TextCursorPositionXGet Function**C**

```
int16_t GFX_TextCursorPositionXGet();
```

Description

This function returns the current x position of the text cursor. Text cursor is used as a starting point of the line rendered by the [GFX_TextCharDraw\(\)](#) function.

Preconditions

None.

Returns

The current text cursor x position.

Example

TBA

5.2.2.7.21.105 GFX_TextCursorPositionYGet Function**C**

```
int16_t GFX_TextCursorPositionYGet();
```

Description

This function returns the current y position of the text cursor. Text cursor is used as a starting point of the line rendered by the [GFX_TextCharDraw\(\)](#) function.

Preconditions

None.

Returns

The current text cursor y position.

Example

TBA

5.2.2.7.21.106 GFX_TextStringBoxDraw Function

C

```
GFX_STATUS GFX_TextStringBoxDraw(  
    uint16_t x,  
    uint16_t y,  
    uint16_t width,  
    uint16_t height,  
    GFX_XCHAR * pString,  
    GFX_ALIGNMENT align  
);
```

Description

This function renders the given string using the currently color and font into the rectangular area defined by the given parameters x,y, width and height. The x,y parameters defines the left, top pixel position of the rectangular area. The width and height defines the size of the rectangular area. The rectangular area will define the area where the text will be rendered. Meaning all pixels EXCLUSIVE of the defined rectangle will be the rendering area for the text. If the given string exceeds the rectangular area, any pixels falling outside and along the defined rectangle (INCLUSIVE of the rectangle) will not be drawn.

The color is set by [GFX_ColorSet\(\)](#) while the font is set by [GFX_FontSet\(\)](#).

Multiple lines of strings can be rendered. To define string composed of multiple lines, end each line with a new line character (character ID 0x0A). Each line will be rendered according to the text alignment (See GFX_TEXT_ALIGNMENT).

The rendering of the character becomes undefined when any one of the following is true:

- x, y, width and height defines an area partially or fully outside outside the frame buffer.
- Color is not set, before this function is called.
- Font is not set, before this function is called.

Preconditions

Color must be set by [GFX_ColorSet\(\)](#). Font must be set by [GFX_FontSet\(\)](#).

Parameters

Parameters	Description
x	Horizontal starting position of the rectangular area.
y	Vertical position position of the rectangular area.
width	Defines the width of the rectangular area.
height	Defines the height of the rectangular area.
pString	Pointer to the location of the string that will be rendered. String can have multiple lines where each line is terminated by a new line character.

Returns

The status of the string rendering.

- GFX_STATUS_SUCCESS - the string was rendered
- GFX_STATUS_FAILURE - the string was not rendered, or is not yet finished. The function must be called again to render the remaining characters or lines.

Example

TODO :need to add example code

5.2.2.7.21.107 GFX_TextStringDraw Function

C

```
GFX_STATUS GFX_TextStringDraw(
    uint16_t x,
    uint16_t y,
    GFX_XCHAR * textString
);
```

Description

This function renders the given string of character using the currently set font, and color to the location defined by the given x,y position. The color is set by [GFX_ColorSet\(\)](#) while the font is set by [GFX_FontSet\(\)](#).

The rendering of the character becomes undefined when any one of the following is true:

- x,y position is set to locations outside the frame buffer.
- Color is not set, before this function is called.
- Font is not set, before this function is called.

Preconditions

Color must be set by [GFX_ColorSet\(\)](#). Font must be set by [GFX_FontSet\(\)](#).

Parameters

Parameters	Description
x	Horizontal starting position of the string.
y	Vertical position position of the string.
pString	Pointer to the location of the string that will be rendered.

Returns

The status of the string rendering.

- GFX_STATUS_SUCCESS - the string was rendered
- GFX_STATUS_FAILURE - the string was not rendered, or is not yet finished. The function must be called again to render the remaining characters.

Example

```
// assume textString is a string of characters
static uint16_t counter = 0;
GFX_XCHAR ch;
GFX_STATUS status;

// render characters until null character
while((GFX_XCHAR)(ch = *(textString + counter)) != 0)
{
    status = GFX_TextCharDraw(ch);
    if (status != GFX_STATUS_SUCCESS)
        return (GFX_STATUS_FAILURE);
    counter++;
}
```

5.2.2.7.21.108 GFX_TextStringHeightGet Function

C

```
inline uint16_t GFX_TextStringHeightGet(
    GFX_RESOURCE_HDR * pFont
);
```

Description

This function returns the height of the given font in pixels. The given font must be present in the system.

This function return value is undefined if the given pointer does not point to a valid font.

Preconditions

None.

Parameters

Parameters	Description
pFont	Pointer to the specified font.

Returns

The height of the specified font in pixels.

Example

```
// assume pMyFont is a pointer initialized to a valid font
uint16_t height, x, y;

// center the text on the screen

height = GFX_TextStringHeightGet(pMyFont);
width  = GFX_TextStringWidthGet ( (GFX_XCHAR *)"Hello World",
                                  pMyFont
                                );
y = (GFX_MaxYGet() - height) >> 1;
x = (GFX_MaxXGet() - width) >> 1;
GFX_TextStringDraw(x, y, (GFX_XCHAR *)"Hello World");

GFX_TextStringDraw(x, y, (GFX_XCHAR *)"Hello World");
```

5.2.2.7.21.109 GFX_TextStringWidthGet Function**C**

```
uint16_t GFX_TextStringWidthGet(
    GFX_XCHAR * textString,
    GFX_RESOURCE_HDR * pFont
);
```

Description

This function returns the width of the given string using the given font in pixels. The given font must be present in the system.

This function return value is undefined if the given pointer does not point to a valid font or one or more characters in the given string does not exist on the given font.

Preconditions

None.

Parameters

Parameters	Description
pString	Pointer to the specified string.
pFont	Pointer to the specified font.

Returns

The width of the specified string using the specified font in pixels.

Example

```
// assume pMyFont is a pointer initialized to a valid font
uint16_t height, x, y;

// center the text on the screen

height = GFX_TextStringHeightGet(pMyFont);
width  = GFX_TextStringWidthGet (    (GFX_XCHAR *)"Hello World",
                                     pMyFont
                                   );
y = (GFX_MaxYGet() - height) >> 1;
x = (GFX_MaxXGet() - width) >> 1;
GFX_TextStringDraw(x, y, (GFX_XCHAR *)"Hello World");
```

5.2.2.7.21.110 GFX_ThickBevelDraw Function**C**

```
uint16_t GFX_ThickBevelDraw(
    uint16_t xL,
    uint16_t yT,
    uint16_t xR,
    uint16_t yB,
    uint16_t r1,
    uint16_t r2,
    uint8_t octant
);
```

Description

This is function `GFX_ThickBevelDraw`.

5.2.2.7.21.111 GFX_Transition Function**C**

```
GFX_STATUS GFX_Transition(
    GFX_TRANSITION_PARAMS* transitionParams,
    short width,
    short height
);
```

Description

This immediately executes the transition effect using the [GFX_TRANSITION_TYPE](#) and the given parameters.

Returns

Returns status of transition

- 0 : Transition executed successfully
- -1 : Transition not executed

5.2.2.7.21.112 GFX_TransparentColorDisable Function**C**

```
GFX_STATUS GFX_TransparentColorDisable();
```

Description

This function disables the transparent color feature used in [GFX_ImageDraw\(\)](#) and [GFX_ImagePartialDraw\(\)](#) functions.

The transparent color feature can only be enabled when the color depth used is 24 or 16 bpp.

Preconditions

Transparent color feature must be enabled at build time. This is enabled by default and can be disabled by defining the macro `GFX_CONFIG_TRANSPARENT_COLOR_DISABLE` in the system.

Returns

The status of the transparent color disable action.

Example

```
// assume ScreenBackground and RibbonIcon are valid
// image resources
// assume BLACK is a valid GFX_COLOR value

GFX_TransparentColorEnable(BLACK);
GFX_ImageDraw(0,0, (void*)&ScreenBackground);
GFX_ImageDraw(50,50, (void*)&RibbonIcon);

// disable the transparent color feature since the
// next image to render contains black pixels that
// we want to render
GFX_TransparentColorDisable();
GFX_ImageDraw(50,50, (void*)&OverlayImage);
```

5.2.2.7.21.113 GFX_TransparentColorEnable Function

C

```
GFX_STATUS GFX_TransparentColorEnable(
    GFX_COLOR color
);
```

Description

This function sets the transparent color used in [GFX_ImageDraw\(\)](#) functions and enables the transparent color feature.

When [GFX_ImageDraw\(\)](#) or [GFX_ImagePartialDraw\(\)](#) is called, any pixels in the image that matches the color value will not be rendered to the frame buffer.

The transparent color feature can only be enabled when the color depth used is 24 or 16 bpp.

Preconditions

Transparent color feature must be enabled at build time. This is enabled by default and can be disabled by defining the macro `GFX_CONFIG_TRANSPARENT_COLOR_DISABLE` in the system.

Parameters

Parameters	Description
color	the color value selected as the transparent color.

Returns

The status of the transparent color set action.

Example

```
// assume ScreenBackground and RibbonIcon are valid
// image resources
// assume BLACK is a valid GFX_COLOR value

GFX_TransparentColorEnable(BLACK);
GFX_ImageDraw(0,0, (void*)&ScreenBackground);
GFX_ImageDraw(0,0, (void*)&RibbonIcon);
```

5.2.2.7.21.114 GFX_TransparentColorGet Function

C

```
GFX_COLOR GFX_TransparentColorGet();
```

Description

This returns the current transparent color set for the transparent color feature used in [GFX_ImageDraw\(\)](#) and [GFX_ImagePartialDraw\(\)](#) functions.

The transparent color feature can only be enabled when the color depth used is 24 or 16 bpp.

Preconditions

Transparent color feature must be enabled at build time. This is enabled by default and can be disabled by defining the macro `GFX_CONFIG_TRANSPARENT_COLOR_DISABLE` in the system.

Returns

The current transparent color used.

Example

```
// assume ScreenBackground and RibbonIcon are valid
// image resources
// assume BLACK is a valid GFX_COLOR value

GFX_TransparentColorEnable(BLACK);
GFX_ImageDraw(0,0, (void*)&ScreenBackground);
GFX_ImageDraw(50,50, (void*)&RibbonIcon);

// disable the transparent color feature since the
// next image to render contains black pixels that
// we want to render
if (GFX_TransparentColorGet == BLACK)
    GFX_TransparentColorDisable();
GFX_ImageDraw(50,50, (void*)&OverlayImage);
```

5.2.2.7.21.115 GFX_TransparentColorStatusGet Function

C

```
GFX_FEATURE_STATUS GFX_TransparentColorStatusGet();
```

Description

This returns the current transparent color set for the transparent color feature used in [GFX_ImageDraw\(\)](#) and [GFX_ImagePartialDraw\(\)](#) functions.

The transparent color feature can only be enabled when the color depth used is 24 or 16 bpp.

Preconditions

Transparent color feature must be enabled at build time. This is enabled by default and can be disabled by defining the macro `GFX_CONFIG_TRANSPARENT_COLOR_DISABLE` in the system.

Returns

The current transparent feature status (see [GFX_FEATURE_STATUS](#) for details).

Example

```
// assume ScreenBackground and RibbonIcon are valid
// image resources
// assume BLACK is a valid GFX_COLOR value

if (GFX_TransparentColorStatusGet == GFX_FEATURE_DISABLED)
```

```
GFX_TransparentColorEnable(BLACK);
GFX_ImageDraw(0,0, (void*)&ScreenBackground);
GFX_ImageDraw(50,50, (void*)&RibbonIcon);

// disable the transparent color feature since the
// next image to render contains black pixels that
// we want to render
if (GFX_TransparentColorGet == BLACK)
    GFX_TransparentColorDisable();
GFX_ImageDraw(50,50, (void*)&OverlayImage);
```

5.2.2.7.22 Image Functions

5.2.2.7.22.1 ImageDecoderInit Function

C

```
void ImageDecoderInit();
```

Description

This function initializes the global variables to 0 and then initializes the driver. This must be called once before any other function of the library is called

Returns

None

Side Effects

The graphics driver will be reset

Example

```
void main(void)
{
    ImageInit();
    ...
}
```

5.2.2.7.22.2 ImageDecodeTask Function

C

```
uint8_t ImageDecodeTask();
```

Description

This function completes one small part of the image decode function

Returns

Status code - '1' means decoding is completed

- '0' means decoding is not yet completed, call this function again

Side Effects

None

Example

```
IMG_bFullScreenDecode(pImageFile, IMG_JPEG, NULL, NULL);
while(!ImageDecodeTask());
```

5.2.2.7.22.3 ImageLoopCallbackRegister Function

C

```
void ImageLoopCallbackRegister(  
    IMG_LOOP_CALLBACK pFn  
);
```

Description

This function registers the loop callback function so that the decoder calls this function in every decoding loop. This can be used by the application program to do maintenance activities such as fetching data, updating the display, etc...

Returns

None

Side Effects

The graphics driver will be reset

Example

```
void Mainantance(void)  
{  
    ...  
}  
  
void main(void)  
{  
    ImageInit();  
    ImageLoopCallbackRegister(Mainantance);  
    ...  
}
```

5.2.2.7.22.4 IMG_vSetboundaries Function

C

```
void IMG_vSetboundaries();
```

Description

***** This is not for the user *****

This is used by the individual decoders

5.2.2.7.23 Palette Functions

5.2.2.7.23.1 IsPaletteEnabled Function

C

```
BYTE IsPaletteEnabled();
```

Description

Returns if the Palette mode is enabled or not.

Preconditions

none

Returns

Returns the palette mode status. 1 - If the palette mode is enabled 0 - If the palette mode is disabled

5.2.2.7.23.2 PaletteInit Function

C

```
void PaletteInit();
```

Description

Initializes the color look up table (CLUT).

Preconditions

none

Returns

none

Side Effects

All rendering will use the new palette entries.

5.2.2.7.23.3 RequestPaletteChange Function

C

```
void RequestPaletteChange(
    void * pPalette,
    uint16_t startEntry,
    uint16_t length
);
```

Description

Loads the palettes from the flash during vertical blanking period if possible, otherwise loads immediately.

Preconditions

Palette must be initialized by [PaletteInit\(\)](#).

Parameters

Parameters	Description
pPalette	Pointer to the palette structure
startEntry	Start entry to load (inclusive)
length	Number of entries

Returns

none

Side Effects

There may be a slight flicker when the Palette entries are getting loaded one by one.

5.2.2.7.23.4 SetPalette Function

C

```
BYTE SetPalette(
    void * pPalette,
    uint16_t startEntry,
```

```
    uint16_t length
);
```

Description

Programs a block of palette entries starting from startEntry and until startEntry + length from the flash immediately.

Preconditions

Palette must be initialized by [PaletteInit\(\)](#).

Parameters

Parameters	Description
pPalette	Pointer to the palette structure
startEntry	Start entry to load (inclusive)
length	Number of entries

Returns

Returns the status of the palette set. 0 - Set was successful 1 - Set was not successful

Side Effects

There may be a slight flicker when the Palette entries are getting loaded one by one.

5.2.2.7.23.5 SetPaletteBpp Function

C

```
BYTE SetPaletteBpp(
    uint8_t bpp
);
```

Description

Sets the color look up table (CLUT) number of valid entries.

Preconditions

Palette must be initialized by [PaletteInit\(\)](#).

Parameters

Parameters	Description
bpp	Bits per pixel

Returns

Returns the status of the change. 0 - Change was successful 1 - Change was not successful

Side Effects

none

5.2.2.7.23.6 SetPaletteFlash Function

C

```
BYTE SetPaletteFlash(
    PALETTE_ENTRY * pPaletteEntry,
    uint16_t startEntry,
    uint16_t length
);
```

Description

Loads the palettes from the flash immediately.

Preconditions

Palette must be initialized by [PaletteInit\(\)](#).

Parameters

Parameters	Description
pPaletteEntry	Pointer to the palette table in ROM
startEntry	Start entry to load (inclusive)
length	Number of entries

Returns

Returns the status of the palette set. 0 - Set was successful 1 - Set was not successful

Side Effects

There may be a slight flicker when the Palette entries are getting loaded one by one.

5.2.2.7.24 Style Scheme Functions

5.2.2.7.24.1 GFX_GOL_SchemeAlphaPrecentSet Function

C

```
inline void GFX_GOL_SchemeAlphaPrecentSet(
    GFX_GOL_OBJ_SCHEME * pScheme,
    uint16_t percent
);
```

Description

This is function GFX_GOL_SchemeAlphaPrecentSet.

5.2.2.7.24.2 GFX_GOL_SchemeBackgroundColorGet Function

C

```
inline GFX_COLOR GFX_GOL_SchemeBackgroundColorGet(
    GFX_GOL_OBJ_SCHEME * pScheme
);
```

Description

This is function GFX_GOL_SchemeBackgroundColorGet.

5.2.2.7.24.3 GFX_GOL_SchemeBackgroundColorSet Function

C

```
inline void GFX_GOL_SchemeBackgroundColorSet(
    GFX_GOL_OBJ_SCHEME * pScheme,
    GFX_COLOR color
);
```

Description

This is function GFX_GOL_SchemeBackgroundColorSet.

5.2.2.7.24.4 GFX_GOL_SchemeBackgroundImageSet Function

C

```
inline void GFX_GOL_SchemeBackgroundImageSet(  
    GFX_GOL_OBJ_SCHEME * pScheme,  
    uint16_t left,  
    uint16_t top,  
    GFX_RESOURCE_HDR * image  
);
```

Description

This is function GFX_GOL_SchemeBackgroundImageSet.

5.2.2.7.24.5 GFX_GOL_SchemeBackgroundTypeGet Function

C

```
inline GFX_BACKGROUND_TYPE GFX_GOL_SchemeBackgroundTypeGet(  
    GFX_GOL_OBJ_SCHEME * pScheme  
);
```

Description

This is function GFX_GOL_SchemeBackgroundTypeGet.

5.2.2.7.24.6 GFX_GOL_SchemeBackgroundTypeSet Function

C

```
inline void GFX_GOL_SchemeBackgroundTypeSet(  
    GFX_GOL_OBJ_SCHEME * pScheme,  
    GFX_BACKGROUND_TYPE type  
);
```

Description

This is function GFX_GOL_SchemeBackgroundTypeSet.

5.2.2.7.24.7 GFX_GOL_SchemeColor0Get Function

C

```
inline GFX_COLOR GFX_GOL_SchemeColor0Get(  
    GFX_GOL_OBJ_SCHEME * pScheme  
);
```

Description

This is function GFX_GOL_SchemeColor0Get.

5.2.2.7.24.8 GFX_GOL_SchemeColor0Set Function

C

```
inline void GFX_GOL_SchemeColor0Set(  
    GFX_GOL_OBJ_SCHEME * pScheme,  
    GFX_COLOR color  
);
```

Description

This is function GFX_GOL_SchemeColor0Set.

5.2.2.7.24.9 GFX_GOL_SchemeColor1Get Function

C

```
inline GFX_COLOR GFX_GOL_SchemeColor1Get(  
    GFX_GOL_OBJ_SCHEME * pScheme  
)  
;
```

Description

This is function GFX_GOL_SchemeColor1Get.

5.2.2.7.24.10 GFX_GOL_SchemeColor1Set Function

C

```
inline void GFX_GOL_SchemeColor1Set(  
    GFX_GOL_OBJ_SCHEME * pScheme,  
    GFX_COLOR color  
)  
;
```

Description

This is function GFX_GOL_SchemeColor1Set.

5.2.2.7.24.11 GFX_GOL_SchemeColorDisabledGet Function

C

```
inline GFX_COLOR GFX_GOL_SchemeColorDisabledGet(  
    GFX_GOL_OBJ_SCHEME * pScheme  
)  
;
```

Description

This is function GFX_GOL_SchemeColorDisabledGet.

5.2.2.7.24.12 GFX_GOL_SchemeColorDisabledSet Function

C

```
inline void GFX_GOL_SchemeColorDisabledSet(  
    GFX_GOL_OBJ_SCHEME * pScheme,  
    GFX_COLOR disableColor  
)  
;
```

Description

This is function GFX_GOL_SchemeColorDisabledSet.

5.2.2.7.24.13 GFX_GOL_SchemeColorSet Function

C

```
inline void GFX_GOL_SchemeColorSet(  
    GFX_GOL_OBJ_SCHEME * pScheme,  
    GFX_COLOR color0,  
    GFX_COLOR color1,  
    GFX_COLOR disableColor  
)  
;
```

Description

This is function GFX_GOL_SchemeColorSet.

5.2.2.7.24.14 GFX_GOL_SchemeEmbossDarkColorGet Function

C

```
inline GFX_COLOR GFX_GOL_SchemeEmbossDarkColorGet(  
    GFX_GOL_OBJ_SCHEME * pScheme  
)  
;
```

Description

This is function GFX_GOL_SchemeEmbossDarkColorGet.

5.2.2.7.24.15 GFX_GOL_SchemeEmbossDarkColorSet Function

C

```
inline void GFX_GOL_SchemeEmbossDarkColorSet(  
    GFX_GOL_OBJ_SCHEME * pScheme,  
    GFX_COLOR darkColor  
)  
;
```

Description

This is function GFX_GOL_SchemeEmbossDarkColorSet.

5.2.2.7.24.16 GFX_GOL_SchemeEmbossLightColorGet Function

C

```
inline GFX_COLOR GFX_GOL_SchemeEmbossLightColorGet(  
    GFX_GOL_OBJ_SCHEME * pScheme  
)  
;
```

Description

This is function GFX_GOL_SchemeEmbossLightColorGet.

5.2.2.7.24.17 GFX_GOL_SchemeEmbossLightColorSet Function

C

```
inline void GFX_GOL_SchemeEmbossLightColorSet(  
    GFX_GOL_OBJ_SCHEME * pScheme,  
    GFX_COLOR lightColor  
)  
;
```

Description

This is function GFX_GOL_SchemeEmbossLightColorSet.

5.2.2.7.24.18 GFX_GOL_SchemeEmbossSet Function

C

```
inline void GFX_GOL_SchemeEmbossSet(  
    GFX_GOL_OBJ_SCHEME * pScheme,  
    GFX_COLOR darkColor,  
    GFX_COLOR lightColor,  
    uint16_t size  
)  
;
```

Description

This is function GFX_GOL_SchemeEmbossSet.

5.2.2.7.24.19 GFX_GOL_SchemeEmbossSizeGet Function

C

```
inline uint16_t GFX_GOL_SchemeEmbossSizeGet(  
    GFX_GOL_OBJ_SCHEME * pScheme  
)  
;
```

Description

This is function GFX_GOL_SchemeEmbossSizeGet.

5.2.2.7.24.20 GFX_GOL_SchemeEmbossSizeSet Function

C

```
inline void GFX_GOL_SchemeEmbossSizeSet(  
    GFX_GOL_OBJ_SCHEME * pScheme,  
    uint16_t size  
)  
;
```

Description

This is function GFX_GOL_SchemeEmbossSizeSet.

5.2.2.7.24.21 GFX_GOL_SchemeFillStyleGet Function

C

```
inline GFX_FILL_STYLE GFX_GOL_SchemeFillStyleGet(  
    GFX_GOL_OBJ_SCHEME * pScheme  
)  
;
```

Description

This is function GFX_GOL_SchemeFillStyleGet.

5.2.2.7.24.22 GFX_GOL_SchemeFillStyleSet Function

C

```
inline void GFX_GOL_SchemeFillStyleSet(  
    GFX_GOL_OBJ_SCHEME * pScheme,  
    GFX_FILL_STYLE style  
)  
;
```

Description

This is function GFX_GOL_SchemeFillStyleSet.

5.2.2.7.24.23 GFX_GOL_SchemeFontGet Function

C

```
inline GFX_RESOURCE_HDR* GFX_GOL_SchemeFontGet(  
    GFX_GOL_OBJ_SCHEME * pScheme  
)  
;
```

Description

This is function GFX_GOL_SchemeFontGet.

5.2.2.7.24.24 GFX_GOL_SchemeFontSet Function

C

```
inline void GFX_GOL_SchemeFontSet(  
    GFX_GOL_OBJ_SCHEME * pScheme,  
    GFX_RESOURCE_HDR * font  
)  
;
```

Description

This is function GFX_GOL_SchemeFontSet.

5.2.2.7.24.25 GFX_GOL_SchemeGradientColorSet Function

C

```
inline void GFX_GOL_SchemeGradientColorSet(  
    GFX_GOL_OBJ_SCHEME * pScheme,  
    GFX_COLOR startColor,  
    GFX_COLOR endColor  
)  
;
```

Description

This is function GFX_GOL_SchemeGradientColorSet.

5.2.2.7.24.26 GFX_GOL_SchemeGradientEndColorGet Function

C

```
inline GFX_COLOR GFX_GOL_SchemeGradientEndColorGet(  
    GFX_GOL_OBJ_SCHEME * pScheme  
)  
;
```

Description

This is function GFX_GOL_SchemeGradientEndColorGet.

5.2.2.7.24.27 GFX_GOL_SchemeGradientEndColorSet Function

C

```
inline void GFX_GOL_SchemeGradientEndColorSet(  
    GFX_GOL_OBJ_SCHEME * pScheme,  
    GFX_COLOR endColor  
)  
;
```

Description

This is function GFX_GOL_SchemeGradientEndColorSet.

5.2.2.7.24.28 GFX_GOL_SchemeGradientStartColorGet Function

C

```
inline GFX_COLOR GFX_GOL_SchemeGradientStartColorGet(  
    GFX_GOL_OBJ_SCHEME * pScheme  
)  
;
```

Description

This is function GFX_GOL_SchemeGradientStartColorGet.

5.2.2.7.24.29 GFX_GOL_SchemeGradientStartColorSet Function

C

```
inline void GFX_GOL_SchemeGradientStartColorSet(  
    GFX_GOL_OBJ_SCHEME * pScheme,  
    GFX_COLOR startColor  
)  
;
```

Description

This is function GFX_GOL_SchemeGradientStartColorSet.

5.2.2.7.24.30 GFX_GOL_SchemeTextColor0Get Function

C

```
inline GFX_COLOR GFX_GOL_SchemeTextColor0Get(  
    GFX_GOL_OBJ_SCHEME * pScheme  
)  
;
```

Description

This is function GFX_GOL_SchemeTextColor0Get.

5.2.2.7.24.31 GFX_GOL_SchemeTextColor0Set Function

C

```
inline void GFX_GOL_SchemeTextColor0Set(  
    GFX_GOL_OBJ_SCHEME * pScheme,  
    GFX_COLOR textColor  
)  
;
```

Description

This is function GFX_GOL_SchemeTextColor0Set.

5.2.2.7.24.32 GFX_GOL_SchemeTextColor1Get Function

C

```
inline GFX_COLOR GFX_GOL_SchemeTextColor1Get(  
    GFX_GOL_OBJ_SCHEME * pScheme  
)  
;
```

Description

This is function GFX_GOL_SchemeTextColor1Get.

5.2.2.7.24.33 GFX_GOL_SchemeTextColor1Set Function

C

```
inline void GFX_GOL_SchemeTextColor1Set(  
    GFX_GOL_OBJ_SCHEME * pScheme,  
    GFX_COLOR textColor  
)  
;
```

Description

This is function GFX_GOL_SchemeTextColor1Set.

5.2.2.7.24.34 GFX_GOL_SchemeTextColorDisableGet Function

C

```
inline GFX_COLOR GFX_GOL_SchemeTextColorDisableGet(  
    GFX_GOL_OBJ_SCHEME * pScheme  
)  
;
```

Description

This is function GFX_GOL_SchemeTextColorDisableGet.

5.2.2.7.24.35 GFX_GOL_SchemeTextColorDisableSet Function

C

```
inline void GFX_GOL_SchemeTextColorDisableSet(  
    GFX_GOL_OBJ_SCHEME * pScheme,  
    GFX_COLOR disableColor  
)  
;
```

Description

This is function GFX_GOL_SchemeTextColorDisableSet.

5.2.2.7.24.36 GFX_GOL_SchemeTextColorSet Function

C

```
inline void GFX_GOL_SchemeTextColorSet(  
    GFX_GOL_OBJ_SCHEME * pScheme,  
    GFX_COLOR textColor0,  
    GFX_COLOR textColor1,  
    GFX_COLOR disableColor  
)  
;
```

Description

This is function GFX_GOL_SchemeTextColorSet.

5.2.2.7.25 Global Variables

5.2.2.7.25.1 IMG_bAlignCenter Variable

C

```
uint8_t IMG_bAlignCenter;
```

Description

This is variable IMG_bAlignCenter.

5.2.2.7.25.2 IMG_bDownScalingFactor Variable

C

```
uint8_t IMG_bDownScalingFactor;
```

Description

This is variable IMG_bDownScalingFactor.

5.2.2.7.25.3 IMG_bIAbortImageDecoding Variable

C

```
uint8_t IMG_bIAbortImageDecoding;
```

Description

The global variables which define the image position and size

5.2.2.7.25.4 IMG_pCurrentFile Variable

C

```
IMG_FILE * IMG_pCurrentFile;
```

Description

This is variable IMG_pCurrentFile.

5.2.2.7.25.5 IMG_pFileAPIs Variable

C

```
IMG_FILE_SYSTEM_API * IMG_pFileAPIs;
```

Description

This is variable IMG_pFileAPIs.

5.2.2.7.25.6 IMG_PixelXYColor Variable

C

```
IMG_PIXEL_XY_RGB_888 IMG_PixelXYColor;
```

Description

This is variable IMG_PixelXYColor.

5.2.2.7.25.7 IMG_pLoopCallbackFn Variable

C

```
IMG_LOOP_CALLBACK IMG_pLoopCallbackFn;
```

Description

This is variable IMG_pLoopCallbackFn.

5.2.2.7.25.8 IMG_pPixelOutput Variable

C

```
IMG_PIXEL_OUTPUT IMG_pPixelOutput;
```

Description

This is variable IMG_pPixelOutput.

5.2.2.7.25.9 IMG_wHeight Variable

C

```
uint16_t IMG_wHeight;
```

Description

This is variable IMG_wHeight.

5.2.2.7.25.10 IMG_wImageHeight Variable**C**

```
uint16_t IMG_wImageHeight;
```

Description

This is variable IMG_wImageHeight.

5.2.2.7.25.11 IMG_wImageWidth Variable**C**

```
uint16_t IMG_wImageWidth;
```

Description

This is variable IMG_wImageWidth.

5.2.2.7.25.12 IMG_wStartX Variable**C**

```
uint16_t IMG_wStartX;
```

Description

This is variable IMG_wStartX.

5.2.2.7.25.13 IMG_wStartY Variable**C**

```
uint16_t IMG_wStartY;
```

Description

This is variable IMG_wStartY.

5.2.2.7.25.14 IMG_wWidth Variable**C**

```
uint16_t IMG_wWidth;
```

Description

This is variable IMG_wWidth.

5.2.2.7.25.15 DisplayUpdatePending Variable**C**

```
volatile uint8_t DisplayUpdatePending;
```

Description

This is variable DisplayUpdatePending.

5.2.2.7.25.16 doubleBuffEnabled Variable

C

```
uint8_t doubleBuffEnabled;
```

Description

This is variable doubleBuffEnabled.

5.2.2.7.25.17 GFX_Primitive_instance Variable

C

```
GFX_Primitive_DATA GFX_Primitive_instance;
```

Description

structure to store the primitive driver structures

5.2.2.7.25.18 primitiveTaskImage Variable

C

```
PUTIMAGE_PARAM primitiveTaskImage;
```

Description

This is variable primitiveTaskImage.

5.2.2.7.26 Data Types and Constants

5.2.2.7.26.1 CHARTPARAM Structure

C

```
typedef struct {
    XCHAR * pTitle;
    XCHAR * pSmplLabel;
    XCHAR * pValLabel;
    short seriesCount;
    uint16_t smplStart;
    uint16_t smplEnd;
    uint16_t valMax;
    uint16_t valMin;
    uint16_t perMax;
    uint16_t perMin;
    GFX_COLOR * pColor;
    void * pTitleFont;
    void * pAxisLabelsFont;
    void * pGridLabelsFont;
} CHARTPARAM;
```

Description

Defines the parameters for the CHART object.

Members

Members	Description
XCHAR * pTitle;	Pointer to the Title of the chart.
XCHAR * pSmplLabel;	Pointer to the bar chart sample axis label. Depending

XCHAR * pValLabel;	Pointer to the bar chart value axis label. Depending
short seriesCount;	Number of data series that will be displayed when chart is drawn.
uint16_t smplStart;	Start point of data sample range to be displayed (minimum/default value = 1)
uint16_t smplEnd;	End point of data sample range to be displayed.
uint16_t valMax;	Maximum value of a sample that can be displayed.
uint16_t valMin;	Minimum value of a sample that can be displayed.
uint16_t perMax;	Maximum value of the percentage range that can be displayed.
uint16_t perMin;	Minimum value of the percentage range that can be displayed.
GFX_COLOR * pColor;	Pointer to the color table used to draw the chart data.
void * pTitleFont;	Pointer to the font used for the title label of the chart.
void * pAxisLabelsFont;	Pointer to the font used for X and Y axis labels.
void * pGridLabelsFont;	Pointer to the font used for X and Y axis grid labels.

5.2.2.7.26.2 DATASERIES Structure

C

```
typedef struct {
    XCHAR * pSData;
    uint16_t samples;
    BYTE show;
    uint16_t * pData;
    void * pNextData;
} DATASERIES;
```

Description

Defines a variable for the CHART object. It specifies the number of samples, pointer to the array of samples for the data series and pointer to the next data series. A member of this structure (show) is used as a flag to determine if the series is to be drawn or not. Together with the smplStart and smplEnd it will determine what kind of chart will be drawn.

Members

Members	Description
XCHAR * pSData;	Pointer to the data series name.
uint16_t samples;	Indicates the number of data samples (or data points) contained in the array specified by pData.
BYTE show;	The flag to indicate if the data series will be shown or not. If this flag is set to SHOW_DATA , the data series will be shown. If HIDE_DATA , the data series will not be shown.
uint16_t * pData;	Pointer to the array of data samples.
void * pNextData;	Pointer to the next data series. NULL if no other data series follows.

5.2.2.7.26.3 FileFeof Type

C

```
typedef bool (* FileFeof)(void *stream);
```

Description

This is type FileFeof.

5.2.2.7.26.4 FileRead Type

C

```
typedef size_t (* FileRead)(void *ptr, size_t size, size_t n, void *stream);
```

Description

Typedefs of the used File System APIs

5.2.2.7.26.5 FileSeek Type

C

```
typedef bool (* FileSeek)(void *stream, long offset, int whence);
```

Description

This is type FileSeek.

5.2.2.7.26.6 FileTell Type

C

```
typedef long (* FileTell)(void *fo);
```

Description

This is type FileTell.

5.2.2.7.26.7 FONT_ORIENTATION Enumeration

C

```
typedef enum {  
    ORIENT_HOR = 0,  
    ORIENT_VER = 1  
} FONT_ORIENTATION;
```

Description

GFX font orientation

Remarks

None.

5.2.2.7.26.8 GFX_ALIGNMENT Enumeration

C

```
typedef enum {  
    GFX_ALIGN_LEFT = 0x0C01,  
    GFX_ALIGN_HCENTER = 0x0C02,  
    GFX_ALIGN_RIGHT = 0x0C04,  
    GFX_ALIGN_TOP = 0x0C10,  
    GFX_ALIGN_VCENTER = 0x0C20,  
    GFX_ALIGN_BOTTOM = 0x0C40,  
    GFX_ALIGN_CENTER = 0x0C22,  
    GFX_ALIGN_HORIZONTAL_MASK = 0x0C07,  
    GFX_ALIGN_VERTICAL_MASK = 0x0C70  
} GFX_ALIGNMENT;
```

Description

Defines the types of text alignment. The text alignment is used in [GFX_TextStringBoxDraw\(\)](#).

Members

Members	Description
GFX_ALIGN_LEFT = 0x0C01	left aligned text
GFX_ALIGN_HCENTER = 0x0C02	horizontal center aligned text
GFX_ALIGN_RIGHT = 0x0C04	right aligned text
GFX_ALIGN_TOP = 0x0C10	top aligned text
GFX_ALIGN_VCENTER = 0x0C20	vertical center aligned text
GFX_ALIGN_BOTTOM = 0x0C40	bottom aligned text
GFX_ALIGN_CENTER = 0x0C22	vertical & horizontal center aligned text
GFX_ALIGN_HORIZONTAL_MASK = 0x0C07	horizontal mask, DO NOT document this item
GFX_ALIGN_VERTICAL_MASK = 0x0C70	vertical mask, DO NOT document this item DOM-IGNORE-END

5.2.2.7.26.9 GFX_BACKGROUND Structure**C**

```
typedef struct {
    uint16_t left;
    uint16_t top;
    GFX_BACKGROUND_TYPE type;
    GFX_RESOURCE_HDR * pImage;
    GFX_COLOR color;
} GFX_BACKGROUND;
```

Description

Structure describing the background information. Useful in refreshing the whole screen or an area of the screen. The background information, when used, can be one of the enumerated types in [GFX_BACKGROUND_TYPE](#).

- pBackGroundImage - pointer to a GFX_RESOURCE_HEADER with the type GFX_RESOURCE_TYPE_MCHP_MBITMAP.
- backGroundColor - value of the background color used when pBackGroundImage is NULL.

The pBackGroundImage has the high priority and will assume an image is used as a background when the pointer is initialized. If this is NULL the backGroundColor is assumed to be the background.

Members

Members	Description
uint16_t left;	Horizontal starting position of the background.
uint16_t top;	Horizontal starting position of the background.
GFX_BACKGROUND_TYPE type;	Specifies the type of background to use.
GFX_RESOURCE_HDR * pImage;	Pointer to the background image used. Set this to NULL if not used.
GFX_COLOR color;	If the background image is NULL, background is assumed to be this color.

5.2.2.7.26.10 GFX_BACKGROUND_TYPE Enumeration**C**

```
typedef enum {
    GFX_BACKGROUND_NONE = 0x00,
    GFX_BACKGROUND_COLOR = 0x01,
    GFX_BACKGROUND_IMAGE = 0x02,
    GFX_BACKGROUND_DISPLAY_BUFFER = 0x03
} GFX_BACKGROUND_TYPE;
```

Description

Defines the types of background information. Knowing the background information allows easier refresh of an area on the display buffer.

Members

Members	Description
GFX_BACKGROUND_NONE = 0x00	No background information set.
GFX_BACKGROUND_COLOR = 0x01	Background is set to a color.
GFX_BACKGROUND_IMAGE = 0x02	Background is set to an image.
GFX_BACKGROUND_DISPLAY_BUFFER = 0x03	Background is set to the current content of the display buffer. This requires support of GFX_PixelArrayGet().

5.2.2.7.26.11 GFX_BEVEL_RENDER_TYPE Enumeration**C**

```
typedef enum {
    GFX_DRAW_FULLBEVEL = 0xFF,
    GFX_DRAW_TOPBEVEL = 0xF0,
    GFX_DRAW_BOTTOMBEVEL = 0x0F
} GFX_BEVEL_RENDER_TYPE;
```

Description

Bevel shapes can be rendered in full or half size. The following types defines the full, top and bottom halves.

Members

Members	Description
GFX_DRAW_FULLBEVEL = 0xFF	render full bevel shape
GFX_DRAW_TOPBEVEL = 0xF0	render top bevel shape
GFX_DRAW_BOTTOMBEVEL = 0x0F	render bottom half bevel shape

5.2.2.7.26.12 GFX_COLOR Type**C**

```
typedef uint32_t GFX_COLOR;
```

Description

Data type that defines the color data. This type is dependent on the [COLOR_DEPTH](#) setting. See [COLOR_DEPTH](#).

- GFX_COLOR is type uint8_t if [COLOR_DEPTH](#) <= 8
- GFX_COLOR is type uint16_t if [COLOR_DEPTH](#) = 16
- GFX_COLOR is type uint32_t if [COLOR_DEPTH](#) = 24

5.2.2.7.26.13 GFX_DOUBLE_BUFFERING_MODE Structure**C**

```
typedef struct {
    GFX_FEATURE_STATUS gfxDoubleBufferFeature;
    GFX_FEATURE_STATUS gfxDoubleBufferRequestSync;
    GFX_FEATURE_STATUS gfxDoubleBufferFullSync;
    GFX_RECTANGULAR_AREA gfxDoubleBufferAreas[GFX_MAX_INVALIDATE_AREAS];
    uint16_t gfxUnsyncedAreaCount;
} GFX_DOUBLE_BUFFERING_MODE;
```

Description

Structure used to manage double buffering feature.

5.2.2.7.26.14 GFX_FEATURE_STATUS Enumeration

C

```
typedef enum {
    GFX_FEATURE_ENABLED = 1,
    GFX_FEATURE_DISABLED = 0
} GFX_FEATURE_STATUS;
```

Description

Defines the states of a Graphics Library feature that can nbe enabled/disabled at run time.

5.2.2.7.26.15 GFX_FILL_STYLE Enumeration

C

```
typedef enum {
    GFX_FILL_STYLE_NONE = 0x0B00,
    GFX_FILL_STYLE_COLOR,
    GFX_FILL_STYLE_ALPHA_COLOR,
    GFX_FILL_STYLE_GRADIENT_DOWN,
    GFX_FILL_STYLE_GRADIENT_UP,
    GFX_FILL_STYLE_GRADIENT_RIGHT,
    GFX_FILL_STYLE_GRADIENT_LEFT,
    GFX_FILL_STYLE_GRADIENT_DOUBLE_VER,
    GFX_FILL_STYLE_GRADIENT_DOUBLE_HOR
} GFX_FILL_STYLE;
```

Description

Defines the types of fill styles.

Members

Members	Description
GFX_FILL_STYLE_NONE = 0x0B00	no fill
GFX_FILL_STYLE_COLOR	color fill
GFX_FILL_STYLE_ALPHA_COLOR	color fill with alpha blending
GFX_FILL_STYLE_GRADIENT_DOWN	gradient, vertical-down direction
GFX_FILL_STYLE_GRADIENT_UP	gradient, vertical-up direction
GFX_FILL_STYLE_GRADIENT_RIGHT	gradient, horizontal-right direction
GFX_FILL_STYLE_GRADIENT_LEFT	gradient, horizontal-left direction
GFX_FILL_STYLE_GRADIENT_DOUBLE_VER	gradient, vertical-up/down direction
GFX_FILL_STYLE_GRADIENT_DOUBLE_HOR	gradient, horizontal-left/right direction

5.2.2.7.26.16 GFX_FONT_ANTIALIAS_TYPE Enumeration

C

```
typedef enum {
    GFX_FONT_ANTIALIAS_OPAQUE = 0,
    GFX_FONT_ANTIALIAS_TRANSLUCENT = 1
} GFX_FONT_ANTIALIAS_TYPE;
```

Description

Transparency type when rendering characters with anti-aliasing.

Members

Members	Description
GFX_FONT_ANTIALIAS_OPAQUE = 0	Mid colors are calculated only once while rendering each character. This is ideal for rendering text over a constant background.
GFX_FONT_ANTIALIAS_TRANSLUCENT = 1	Mid colors are calculated for every necessary pixel. This feature is useful when rendering text over an image or when the background is not one flat color.

5.2.2.7.26.17 GFX_FONT_CURRENT Structure**C**

```
typedef struct {
    GFX_RESOURCE_HDR * pFont;
    GFX_FONT_HEADER header;
    GFX_ALIGNMENT alignment;
    FONT_ORIENTATION orientation;
    uint8_t antiAliasType;
} GFX_FONT_CURRENT;
```

Description

GFX current font

Members

Members	Description
GFX_RESOURCE_HDR * pFont;	pointer to the currently set font
GFX_FONT_HEADER header;	copy of the currently set font header
GFX_ALIGNMENT alignment;	alignment of the font
FONT_ORIENTATION orientation;	orientation of the font
uint8_t antiAliasType;	anti-alias type set

Remarks

None.

5.2.2.7.26.18 GFX_FONT_GLYPH_ENTRY Structure**C**

```
typedef struct {
    uint8_t width;
    uint8_t offsetLSB;
    uint16_t offsetMSB;
} GFX_FONT_GLYPH_ENTRY;
```

Description

Structures describing the glyph entry.

Members

Members	Description
uint8_t width;	width of the glyph
uint8_t offsetLSB;	Least Significant uint8_t of the glyph location offset
uint16_t offsetMSB;	Most Significant (2) uint8_ts of the glyph location offset

5.2.2.7.26.19 GFX_FONT_GLYPH_ENTRY_EXTENDED Structure

C

```
typedef struct {
    uint32_t offset;
    uint16_t cursorAdvance;
    uint16_t glyphWidth;
    int16_t xAdjust;
    int16_t yAdjust;
} GFX_FONT_GLYPH_ENTRY_EXTENDED;
```

Description

This is type GFX_FONT_GLYPH_ENTRY_EXTENDED.

Members

Members	Description
uint32_t offset;	Offset Order: LSW_LSB LSW_MSB MSW_MSB MSW_MSB
uint16_t cursorAdvance;	x-value by which cursor has to advance after rendering the glyph
uint16_t glyphWidth;	width of the glyph
int16_t xAdjust;	x-position is adjusted as per this signed number
int16_t yAdjust;	y-position is adjusted as per this signed number

5.2.2.7.26.20 GFX_FONT_HEADER Structure

C

```
typedef struct {
    uint8_t fontID;
    uint8_t extendedGlyphEntry : 1;
    uint8_t res1 : 1;
    uint8_t bpp : 2;
    uint8_t orientation : 2;
    uint8_t res2 : 2;
    uint16_t firstChar;
    uint16_t lastChar;
    uint16_t height;
} GFX_FONT_HEADER;
```

Description

Structure describing the font header.

Members

Members	Description
uint8_t fontID;	User assigned value
uint8_t extendedGlyphEntry : 1;	Extended Glyph entry flag. When set font has extended glyph feature enabled.
uint8_t res1 : 1;	Reserved for future use (must be set to 0)

5.2.2.7.26.21 GFX_FONT_OUTCHAR Structure

C

```
typedef struct {
    GFX_FONT_SPACE GFX_FONT_GLYPH_ENTRY * pChTable;
    GFX_FONT_SPACE GFX_FONT_GLYPH_ENTRY_EXTENDED * pChTableExtended;
    uint8_t chImage[GFX_EXTERNAL_FONT_RASTER_BUFFER_SIZE];
    int16_t chEffectiveGlyphWidth;
    uint8_t bpp;
    int16_t chGlyphWidth;
```

```

    GFX_FONT_SPACE uint8_t * pChImage;
    int16_t xAdjust;
    int16_t yAdjust;
    int16_t xWidthAdjust;
    int16_t heightOvershoot;
} GFX_FONT_OUTCHAR;

```

Description

Structure for character information when rendering the character.

5.2.2.7.26.22 GFX_GOL_ANALOGCLOCK Structure

C

```

typedef struct {
    GFX_GOL_OBJ_HEADER hdr;
    short radius;
    short centerx;
    short centery;
    short valueS;
    short prev_valueS;
    short valueM;
    short prev_valueM;
    short valueH;
    short prev_valueH;
    void * pBitmap;
} GFX_GOL_ANALOGCLOCK;

```

Description

Defines the parameters required for a clock Object. The following relationships of the parameters determines the general shape of the clock:

1. centerx and centery determine the middle of the clock.
2. radius defines the radius of the clock.
4. *pBitmap points to the background image for the analog clock.

Members

Members	Description
GFX_GOL_OBJ_HEADER hdr;	Generic header for all Objects (see GFX_OBJ_HEADER).
short radius;	Radius of the clock.
short centerx;	center location in X-axis.
short centery;	center location in Y-axis.
short valueS;	time in Second
short prev_valueS;	previous time in Second
short valueM;	time in Minute
short prev_valueM;	previous time in Minute
short valueH;	time in Hour
short prev_valueH;	previous time in Hour
void * pBitmap;	Pointer to bitmap used.

5.2.2.7.26.23 GFX_GOL_BUTTON Structure

C

```

typedef struct {
    GFX_GOL_OBJ_HEADER hdr;
    uint16_t radius;

```

```

uint16_t textWidth;
uint16_t textHeight;
GFX_XCHAR * pText;
GFX_ALIGNMENT alignment;
GFX_RESOURCE_HDR * pPressImage;
GFX_RESOURCE_HDR * pReleaseImage;
GFX_COLOR previousAlphaColor;
} GFX_GOL_BUTTON;

```

Description

Defines the parameters required for a GFX_GOL_BUTTON Object. The following relationships of the parameters determines the general shape of the GFX_GOL_BUTTON:

1. Width is determined by right - left.
2. Height is determined by top - bottom.
3. Radius - specifies if the GFX_GOL_BUTTON will have a rounded edge. If zero then the GFX_GOL_BUTTON will have sharp (cornered) edge.
4. If $2 * \text{radius} = \text{height} = \text{width}$, the GFX_GOL_BUTTON is a circular GFX_GOL_BUTTON.

Members

Members	Description
GFX_GOL_OBJ_HEADER hdr;	Generic header for all Objects (see GFX_GOL_OBJ_HEADER).
uint16_t radius;	Radius for rounded buttons.
uint16_t textWidth;	Computed text width, done at creation.
uint16_t textHeight;	Computed text height, done at creation.
GFX_XCHAR * pText;	Pointer to the text used.
GFX_ALIGNMENT alignment;	text alignment
GFX_RESOURCE_HDR * pPressImage;	Pointer to bitmap used.
GFX_RESOURCE_HDR * pReleaseImage;	Pointer to bitmap used.

5.2.2.7.26.24 GFX_GOL_BUTTON_STATE Enumeration

C

```

typedef enum {
    GFX_GOL_BUTTON_FOCUSED_STATE = 0x0001,
    GFX_GOL_BUTTON_DISABLED_STATE = 0x0002,
    GFX_GOL_BUTTON_PRESSED_STATE = 0x0004,
    GFX_GOL_BUTTON_TOGGLE_STATE = 0x0008,
    GFX_GOL_BUTTON_TWOTONE_STATE = 0x0100,
    GFX_GOL_BUTTON_NOPANEL_STATE = 0x0200,
    GFX_GOL_BUTTON_DRAW_FOCUS_STATE = 0x2000,
    GFX_GOL_BUTTON_DRAW_STATE = 0x4000,
    GFX_GOL_BUTTON_HIDE_STATE = 0x8000
} GFX_GOL_BUTTON_STATE;

```

Description

Object States Definition:

Members

Members	Description
GFX_GOL_BUTTON_FOCUSED_STATE = 0x0001	Bit for focus state.
GFX_GOL_BUTTON_DISABLED_STATE = 0x0002	Bit for disabled state.

GFX_GOL_BUTTON_PRESSED_STATE = 0x0004	Bit for press state.
GFX_GOL_BUTTON_TOGGLE_STATE = 0x0008	Bit to indicate object will have a toggle behavior.
GFX_GOL_BUTTON_TWOTONE_STATE = 0x0100	Bit to indicate the object is a two tone type.
GFX_GOL_BUTTON_NOPANEL_STATE = 0x0200	Bit to indicate the object will be drawn without a panel (for faster drawing when the object image used is larger than the object's panel).
GFX_GOL_BUTTON_DRAW_FOCUS_STATE = 0x2000	Bit to indicate focus must be redrawn.
GFX_GOL_BUTTON_DRAW_STATE = 0x4000	Bit to indicate object must be redrawn.
GFX_GOL_BUTTON_HIDE_STATE = 0x8000	Bit to indicate object must be removed from screen.

5.2.2.7.26.25 GFX_GOL_CHART Structure

C

```
typedef struct {
    GFX_GOL_OBJ_HEADER hdr;
    CHARTPARAM prm;
    DATASERIES * pChData;
} GFX_GOL_CHART;
```

Description

Defines the parameters required for a chart Object.

Members

Members	Description
GFX_GOL_OBJ_HEADER hdr;	Generic header for all Objects (see GFX_OBJ_HEADER).
CHARTPARAM prm;	Structure for the parameters of the chart.
DATASERIES * pChData;	Pointer to the first chart data series in the link list of data series.

5.2.2.7.26.26 GFX_GOL_CHECKBOX Structure

C

```
typedef struct {
    GFX_GOL_OBJ_HEADER hdr;
    uint16_t textHeight;
    GFX_XCHAR * pText;
    GFX_ALIGNMENT alignment;
} GFX_GOL_CHECKBOX;
```

Description

The structure contains check box data

Members

Members	Description
GFX_GOL_OBJ_HEADER hdr;	Generic header for all Objects (see GFX_GOL_OBJ_HEADER).
uint16_t textHeight;	Pre-computed text height
GFX_XCHAR * pText;	Pointer to text
GFX_ALIGNMENT alignment;	text alignment

5.2.2.7.26.27 GFX_GOL_CHECKBOX_STATE Enumeration

C

```
typedef enum {
    GFX_GOL_CHECKBOX_FOCUSED_STATE = 0x0001,
    GFX_GOL_CHECKBOX_DISABLED_STATE = 0x0002,
    GFX_GOL_CHECKBOX_CHECKED_STATE = 0x0004,
    GFX_GOL_CHECKBOX_DRAW_CHECK_STATE = 0x1000,
    GFX_GOL_CHECKBOX_DRAW_FOCUS_STATE = 0x2000,
    GFX_GOL_CHECKBOX_DRAW_STATE = 0x4000,
    GFX_GOL_CHECKBOX_HIDE_STATE = 0x8000
} GFX_GOL_CHECKBOX_STATE;
```

Description

- Object States Definition:

```
#define      GFX_GOL_CHECKBOX_FOCUSED_STATE      0x0001      //      Focus      state      #define
GFX_GOL_CHECKBOX_DISABLED_STATE 0x0002 // Disabled state #define GFX_GOL_CHECKBOX_CHECKED_STATE
0x0004 // Checked state #define GFX_GOL_CHECKBOX_HIDE_STATE 0x8000 // Check box must be removed from screen
#define      GFX_GOL_CHECKBOX_DRAW_FOCUS_STATE  0x2000      //      Focus      must      be      redrawn      #define
GFX_GOL_CHECKBOX_DRAW_STATE    0x4000      //      Whole      check      box      must      be      redrawn      #define
GFX_GOL_CHECKBOX_DRAW_CHECK_STATE 0x1000 // Check box mark should be redrawn
```

Members

Members	Description
GFX_GOL_CHECKBOX_FOCUSED_STATE = 0x0001	Bit for focus state.
GFX_GOL_CHECKBOX_DISABLED_STATE = 0x0002	Bit to indicate object is disabled
GFX_GOL_CHECKBOX_CHECKED_STATE = 0x0004	Bit to indicate object is checked
GFX_GOL_CHECKBOX_DRAW_CHECK_STATE = 0x1000	Bit to indicate the check must be redrawn.
GFX_GOL_CHECKBOX_DRAW_FOCUS_STATE = 0x2000	Bit to indicate focus must be redrawn.
GFX_GOL_CHECKBOX_DRAW_STATE = 0x4000	Bit to indicate object must be redrawn.
GFX_GOL_CHECKBOX_HIDE_STATE = 0x8000	Bit to indicate object must be removed from screen.

5.2.2.7.26.28 GFX_GOL_CUSTOMCONTROL Structure

C

```
typedef struct {
    GFX_GOL_OBJ_HEADER hdr;
    uint8_t instance;
    uint16_t ID;
    void * pNxtObj;
    GFX_GOL_OBJ_TYPE type;
    uint16_t state;
    uint16_t left;
    uint16_t top;
    uint16_t right;
    uint16_t bottom;
    GFX_GOL_OBJ_SCHEME * pGolScheme;
```

```

DRAW_FUNC draw;
FREE_FUNC FreeObj;
ACTIONGET_FUNC actionGet;
ACTIONSET_FUNC actionSet;
uint16_t pos;
uint16_t prevPos;
} GFX_GOL_CUSTOMCONTROL;

```

Description

The structure contains data for the control

Members

Members	Description
GFX_GOL_OBJ_HEADER hdr;	Generic header for all Objects (see GFX_OBJ_HEADER).
uint16_t ID;	instance unique ID
void * pNxtObj;	a pointer to the next object in the linked list
GFX_GOL_OBJ_TYPE type;	must be set to OBJ_CUSTOM
uint16_t state;	state
uint16_t left;	left border
uint16_t top;	top border
uint16_t right;	right border
uint16_t bottom;	bottom border
GFX_GOL_OBJ_SCHEME * pGolScheme;	the style scheme used
FREE_FUNC FreeObj;	function pointer to the object free function
ACTIONGET_FUNC actionGet;	function pointer to the object message function
ACTIONSET_FUNC actionSet;	function pointer to the object default message function
uint16_t pos;	current position
uint16_t prevPos;	previous position

5.2.2.7.26.29 GFX_GOL_DIGITALMETER Structure

C

```

typedef struct {
    GFX_GOL_OBJ_HEADER hdr;
    uint16_t textHeight;
    uint32_t Cvalue;
    uint32_t Pvalue;
    uint8_t NoOfDigits;
    uint8_t DotPos;
    GFX_ALIGNMENT alignment;
} GFX_GOL_DIGITALMETER;

```

Description

Digital meter parameters

DigitalMeter properties.

Members

Members	Description
GFX_GOL_OBJ_HEADER hdr;	Generic header for all Objects (see GFX_OBJ_HEADER).
uint16_t textHeight;	Pre-computed text height
uint32_t Cvalue;	Current value
uint32_t Pvalue;	Previous value

uint8_t NoOfDigits;	Number of digits to be displayed
uint8_t DotPos;	Position of decimal point
GFX_ALIGNMENT alignment;	text alignment

Remarks

None.

5.2.2.7.26.30 GFX_GOL_DIGITALMETER_STATE Enumeration

C

```
typedef enum {
    GFX_GOL_DIGITALMETER_DISABLED_STATE = 0x0002,
    GFX_GOL_DIGITALMETER_FRAME_STATE = 0x0010,
    GFX_GOL_DIGITALMETER_DRAW_STATE = 0x4000,
    GFX_GOL_DIGITALMETER_UPDATE_STATE = 0x2000,
    GFX_GOL_DIGITALMETER_HIDE_STATE = 0x8000
} GFX_GOL_DIGITALMETER_STATE;
```

Description

Object States Definition:

Members

Members	Description
GFX_GOL_DIGITALMETER_DISABLED_STATE = 0x0002	Bit for disabled state.
GFX_GOL_DIGITALMETER_FRAME_STATE = 0x0010	Bit to indicate frame is displayed.
GFX_GOL_DIGITALMETER_DRAW_STATE = 0x4000	Bit to indicate object must be redrawn.
GFX_GOL_DIGITALMETER_UPDATE_STATE = 0x2000	Bit to indicate that only text must be redrawn.
GFX_GOL_DIGITALMETER_HIDE_STATE = 0x8000	Bit to remove object from screen.

5.2.2.7.26.31 GFX_GOL_DRAW_CALLBACK_FUNC Type

C

```
typedef bool (* GFX_GOL_DRAW_CALLBACK_FUNC)(void);
```

Description

This callback function is implemented by the application. This is called inside the [GFX_GOL_ObjectListDraw\(\)](#) function when the drawing of objects in the active list is completed.

Any application specific rendering must be performed on this callback function so no object rendering will be affected by the application calls to primitive rendering functions. Application setting the drawing color, line style, fill style, text string cursor position and current font will not affect the object rendering. This is also the safe place to modify the active list.

When the application has performed its own primitive rendering calls, this function must return true to inform the [GFX_GOL_ObjectListDraw\(\)](#) that it is done rendering and checking for object drawing or redrawing can continue.

Preconditions

None.

Returns

true - is returned when application rendering is done. false - is returned when application rendering is not yet finished.

Example

None.

5.2.2.7.26.32 GFX_GOL_EDITBOX Structure**C**

```
typedef struct {
    GFX_GOL_OBJ_HEADER hdr;
    uint16_t textHeight;
    GFX_XCHAR * pText;
    GFX_ALIGNMENT alignment;
    uint16_t charMax;
    uint16_t length;
} GFX_GOL_EDITBOX;
```

Description

Defines the parameters required for a Edit Box Object.

Members

Members	Description
GFX_GOL_OBJ_HEADER hdr;	Generic header for all Objects (see GFX_GOL_OBJ_HEADER).
uint16_t textHeight;	Pre-computed text height.
GFX_XCHAR * pText;	Pointer to text buffer.
GFX_ALIGNMENT alignment;	text alignment
uint16_t charMax;	Maximum number of characters in the edit box.
uint16_t length;	Current text length.

5.2.2.7.26.33 GFX_GOL_GROUPBOX Structure**C**

```
typedef struct {
    GFX_GOL_OBJ_HEADER hdr;
    uint16_t textWidth;
    uint16_t textHeight;
    GFX_XCHAR * pText;
    GFX_ALIGNMENT alignment;
} GFX_GOL_GROUPBOX;
```

Description

Defines the parameters required for a group box Object. The textwidth and textHeight is not checked with the actual dimension of the object. Clipping is not supported in group box object. It is possible for the text to exceed the dimension of the Object.

Members

Members	Description
GFX_GOL_OBJ_HEADER hdr;	Generic header for all Objects (see GFX_OBJ_HEADER).
uint16_t textWidth;	Pre-computed text width.
uint16_t textHeight;	Pre-computed text height.
GFX_XCHAR * pText;	Text string used.
GFX_ALIGNMENT alignment;	text alignment

5.2.2.7.26.34 GFX_GOL_GROUPBOX_STATE Enumeration

C

```
typedef enum {
    GFX_GOL_GROUPBOX_DISABLED_STATE = 0x0002,
    GFX_GOL_GROUPBOX_DRAW_STATE = 0x4000,
    GFX_GOL_GROUPBOX_HIDE_STATE = 0x8000
} GFX_GOL_GROUPBOX_STATE;
```

Description

Object States Definition:

Members

Members	Description
GFX_GOL_GROUPBOX_DISABLED_STATE = 0x0002	Bit for disabled state
GFX_GOL_GROUPBOX_DRAW_STATE = 0x4000	Bit to indicate group box must be redrawn
GFX_GOL_GROUPBOX_HIDE_STATE = 0x8000	Bit to remove object from screen

5.2.2.7.26.35 GFX_GOL_LISTBOX Structure

C

```
typedef struct {
    GFX_GOL_OBJ_HEADER hdr;
    GFX_GOL_LISTITEM * pItemList;
    GFX_GOL_LISTITEM * pFocusItem;
    uint16_t itemsNumber;
    int16_t scrolly;
    int16_t textHeight;
    GFX_ALIGNMENT alignment;
} GFX_GOL_LISTBOX;
```

Description

Defines the parameters required for a list box Object.

Members

Members	Description
GFX_GOL_OBJ_HEADER hdr;	Generic header for all Objects (see GFX_GOL_OBJ_HEADER).
GFX_GOL_LISTITEM * pItemList;	Pointer to the list of items.
GFX_GOL_LISTITEM * pFocusItem;	Pointer to the focused item.
uint16_t itemsNumber;	Number of items in the list box.
int16_t scrolly;	Scroll displacement for the list.
int16_t textHeight;	Pre-computed text height.
GFX_ALIGNMENT alignment;	items alignment

5.2.2.7.26.36 GFX_GOL_LISTBOX_ITEM_STATUS Enumeration

C

```
typedef enum {
    GFX_GOL_LISTBOX_ITEM_STATUS_SELECTED = 0x0001,
    GFX_GOL_LISTBOX_ITEM_STATUS_REDRAW = 0x0002
} GFX_GOL_LISTBOX_ITEM_STATUS;
```

Description

Bit definitions for the status of an item

Members

Members	Description
GFX_GOL_LISTBOX_ITEM_STATUS_SELECTED = 0x0001	define LB_STS_SELECTED 0x0001 // Item is selected.
GFX_GOL_LISTBOX_ITEM_STATUS_REDRAW = 0x0002	define LB_STS_REDRAW 0x0002 // Item is to be redrawn.

5.2.2.7.26.37 GFX_GOL_LISTBOX_STATE Enumeration

C

```
typedef enum {
    GFX_GOL_LISTBOX_FOCUSED_STATE = 0x0001,
    GFX_GOL_LISTBOX_DISABLED_STATE = 0x0002,
    GFX_GOL_LISTBOX_SINGLE_SELECT_STATE = 0x0010,
    GFX_GOL_LISTBOX_DRAW_ITEMS_STATE = 0x1000,
    GFX_GOL_LISTBOX_DRAW_FOCUS_STATE = 0x2000,
    GFX_GOL_LISTBOX_DRAW_STATE = 0x4000,
    GFX_GOL_LISTBOX_HIDE_STATE = 0x8000
} GFX_GOL_LISTBOX_STATE;
```

Description

This is type GFX_GOL_LISTBOX_STATE.

Members

Members	Description
GFX_GOL_LISTBOX_FOCUSED_STATE = 0x0001	Bit for focus state.
GFX_GOL_LISTBOX_DISABLED_STATE = 0x0002	Bit for disabled state.
GFX_GOL_LISTBOX_SINGLE_SELECT_STATE = 0x0010	Bit to indicate only one item can be selected.
GFX_GOL_LISTBOX_DRAW_ITEMS_STATE = 0x1000	Bit to indicate selected items of the object must be redrawn.
GFX_GOL_LISTBOX_DRAW_FOCUS_STATE = 0x2000	Bit to indicate focus must be redrawn.
GFX_GOL_LISTBOX_DRAW_STATE = 0x4000	Bit to indicate object must be redrawn.
GFX_GOL_LISTBOX_HIDE_STATE = 0x8000	Bit to indicate object must be removed from screen.

5.2.2.7.26.38 GFX_GOL_LISTITEM Structure

C

```
typedef struct {
    void * pPrevItem;
    void * pNextItem;
    GFX_GOL_LISTBOX_ITEM_STATUS status;
    GFX_XCHAR * pText;
    GFX_RESOURCE_HDR * pImage;
    uint16_t data;
} GFX_GOL_LISTITEM;
```

Description

Defines the parameters required for a list item used in list box.

Members

Members	Description
void * pPrevItem;	Pointer to the next item
void * pNextItem;	Pointer to the next item
GFX_GOL_LISTBOX_ITEM_STATUS status;	Specifies the status of the item.
GFX_XCHAR * pText;	Pointer to the text for the item
GFX_RESOURCE_HDR * pImage;	Pointer to the image used
uint16_t data;	Some data associated with the item

5.2.2.7.26.39 GFX_GOL_MESSAGE Structure**C**

```
typedef struct {
    uint8_t type;
    uint8_t uiEvent;
    int16_t param1;
    int16_t param2;
} GFX_GOL_MESSAGE;
```

Description

GFX_GOL_MESSAGE

Specifies message structure used in the library.

- The types must be one of the [INPUT_DEVICE_TYPE](#):
 - TYPE_UNKNOWN
 - TYPE_KEYBOARD
 - TYPE_TOUCHSCREEN
 - TYPE_MOUSE
- uiEvent must be one of the [INPUT_DEVICE_EVENT](#).
 - for touch screen:
 - EVENT_INVALID
 - EVENT_MOVE
 - EVENT_PRESS
 - EVENT_STILLPRESS
 - EVENT_RELEASE
 - for keyboard:
 - EVENT_KEYSCAN (param2 contains scan code)
 - EVENT_KEYCODE (param2 contains character code)
- param1:
 - for touch screen is the x position
 - for keyboard ID of object receiving the message
- param2
 - for touch screen y position
 - for keyboard scan or key code

Members

Members	Description
uint8_t type;	Type of input device.
uint8_t uiEvent;	The generic events for input device.
int16_t param1;	Parameter 1, definition and usage is dependent on the type of input device.
int16_t param2;	Parameter 2, definition and usage is dependent on the type of input device.

Remarks

None.

5.2.2.7.26.40 GFX_GOL_METER Structure**C**

```
typedef struct {
    GFX_GOL_OBJ_HEADER hdr;
    GFX_XCHAR * pText;
    GFX_GOL_METER_DRAW_TYPE type;
    int16_t value;
    int16_t minValue;
    int16_t maxValue;
    int16_t xCenter;
    int16_t yCenter;
    int16_t radius;
    int16_t xPos;
    int16_t yPos;
    GFX_COLOR color1;
    GFX_COLOR color2;
    GFX_COLOR color3;
    GFX_COLOR color4;
    GFX_COLOR color5;
    GFX_COLOR color6;
    GFX_RESOURCE_HDR * pTitleFont;
    GFX_RESOURCE_HDR * pValueFont;
} GFX_GOL_METER;
```

Description

Defines the parameters required for a meter Object. Depending on the type selected the meter is drawn with the defined shape parameters and values set on the given fields.

Members

Members	Description
GFX_GOL_OBJ_HEADER hdr;	Generic header for all Objects (see OBJ_HEADER).
GFX_XCHAR * pText;	The text label of the meter.
GFX_GOL_METER_DRAW_TYPE type;	sets the type of the meter
int16_t value;	Current value of the meter.
int16_t minValue;	minimum value the meter can display
int16_t maxValue;	maximum value the meter can display (range is maxValue - minValue)
int16_t xCenter;	The x coordinate center position. This is computed automatically.
int16_t yCenter;	The y coordinate center position. This is computed automatically.
int16_t radius;	Radius of the meter, also defines the needle length.
int16_t xPos;	The current x position of the needle. This is computed automatically.
int16_t yPos;	The current y position of the needle. This is computed automatically.
GFX_COLOR color1;	Arc1 and scale1 color parameter.

GFX_COLOR color2;	Arc2 and scale2 color parameter
GFX_COLOR color3;	Arc3 and scale3 color parameter
GFX_COLOR color4;	Arc4 and scale4 color parameter
GFX_COLOR color5;	Arc5 and scale5 color parameter
GFX_COLOR color6;	Arc6 and scale6 color parameter
GFX_RESOURCE_HDR * pTitleFont;	Pointer to the font used in the title of the meter
GFX_RESOURCE_HDR * pValueFont;	Pointer to the font used in the current reading (if displayed) of the meter

5.2.2.7.26.41 GFX_GOL_METER_DRAW_TYPE Enumeration

C

```
typedef enum {
    GFX_GOL_METER_WHOLE_TYPE = 0,
    GFX_GOL_METER_HALF_TYPE = 1,
    GFX_GOL_METER_QUARTER_TYPE = 2
} GFX_GOL_METER_DRAW_TYPE;
```

Description

- Meter Types Definition: MTR_WHOLE_TYPE will use all the arc colors (color1 to color6) MTR_HALF_TYPE will use arc colors (color5, color4, color3, color2) MTR_QUARTER_TYPE will use arc colors (color3, color2)

Members

Members	Description
GFX_GOL_METER_WHOLE_TYPE = 0	draw circular meter
GFX_GOL_METER_HALF_TYPE = 1	draw semi circle meter
GFX_GOL_METER_QUARTER_TYPE = 2	draw quarter of a circle meter

5.2.2.7.26.42 GFX_GOL_METER_STATE Enumeration

C

```
typedef enum {
    GFX_GOL_METER_DISABLED_STATE = 0x0002,
    GFX_GOL_METER_RING_STATE = 0x0004,
    GFX_GOL_METER_ACCURACY_STATE = 0x0008,
    GFX_GOL_METER_UPDATE_DRAW_STATE = 0x1000,
    GFX_GOL_METER_DRAW_STATE = 0x4000,
    GFX_GOL_METER_HIDE_STATE = 0x8000
} GFX_GOL_METER_STATE;
```

Description

Object States Definition:

Members

Members	Description
GFX_GOL_METER_DISABLED_STATE = 0x0002	Bit for disabled state.
GFX_GOL_METER_RING_STATE = 0x0004	Bit for press state.
GFX_GOL_METER_ACCURACY_STATE = 0x0008	Bit to indicate object will have a toggle behavior.
GFX_GOL_METER_UPDATE_DRAW_STATE = 0x1000	Bit to indicate hand update only.
GFX_GOL_METER_DRAW_STATE = 0x4000	Bit to indicate object must be redrawn.

GFX_GOL_METER_HIDE_STATE = 0x8000	Bit to indicate object must be removed from screen.

5.2.2.7.26.43 GFX_GOL_OBJ_HEADER Structure

C

```
typedef struct {
    uint16_t ID;
    void * pNxtObj;
    GFX_GOL_OBJ_TYPE type;
    uint16_t state;
    uint16_t left;
    uint16_t top;
    uint16_t right;
    uint16_t bottom;
    GFX_GOL_OBJ_SCHEME * pGolScheme;
    DRAW_FUNC DrawObj;
    FREE_FUNC FreeObj;
    ACTIONGET_FUNC actionGet;
    ACTIONSET_FUNC actionSet;
    bool imageStored;
} GFX_GOL_OBJ_HEADER;
```

Description

GFX_GOL_OBJ_HEADER

This structure defines the Graphics Object Layer header used in all objects in the Graphics Library.

Members

Members	Description
uint16_t ID;	Unique id assigned for referencing.
void * pNxtObj;	A pointer to the next object.
GFX_GOL_OBJ_TYPE type;	Identifies the type of GOL object.
uint16_t state;	State of object.
uint16_t left;	Left position of the Object.
uint16_t top;	Top position of the Object.
uint16_t right;	Right position of the Object.
uint16_t bottom;	Bottom position of the Object.
GFX_GOL_OBJ_SCHEME * pGolScheme;	Pointer to the scheme used.
DRAW_FUNC DrawObj;	function pointer to the object's draw function.
FREE_FUNC FreeObj;	function pointer to the object's free function.
ACTIONGET_FUNC actionGet;	function pointer to the object's action get function.
ACTIONSET_FUNC actionSet;	function pointer to the object's action set function.
bool imageStored;	Used for alpha blending

Remarks

None.

5.2.2.7.26.44 GFX_GOL_OBJ_SCHEME Structure

C

```
typedef struct {
    GFX_COLOR EmbossDkColor;
    GFX_COLOR EmbossLtColor;
    GFX_COLOR TextColor0;
    GFX_COLOR TextColor1;
```

```

GFX_COLOR TextColorDisabled;
GFX_COLOR Color0;
GFX_COLOR Color1;
GFX_COLOR ColorDisabled;
GFX_RESOURCE_HDR * pFont;
GFX_FILL_STYLE fillStyle;
GFX_COLOR CommonBkColor;
uint16_t CommonBkLeft;
uint16_t CommonBkTop;
GFX_BACKGROUND_TYPE CommonBkType;
GFX_RESOURCE_HDR * pCommonBkImage;
uint16_t AlphaValue;
GFX_COLOR gradientStartColor;
GFX_COLOR gradientEndColor;
uint16_t EmbossSize;
} GFX_GOL_OBJ_SCHEME;

```

Description

GFX_GOL_OBJ_SCHEME

This structure specifies the style scheme components of an object. All objects will use the style scheme when rendering. Refer to specific object documentation on how the style scheme colors are utilized by the object.

The style scheme allows objects to show 3D effects as well as feedback to users. For example, in Button objects, a press and release effect on the Buttons are easily shown by manipulating the colors when the object is drawn with a pressed state and released state. The style scheme also allows effects such as gradients and alpha blending. When using alpha blending, the style scheme requires objects to be associated with background information.

A background can be a flat color background or an image. The usage of a background requires the background dimension to be larger than the object. In other words, the object should be drawn within the background dimension. Multiple objects can share a common background. As long as all the objects are drawn within the dimension of the background they can share a common background.

The supported background types are (See [GFX_BACKGROUND_TYPE](#)):

- **GFX_BACKGROUND_COLOR** - this type will set the common background to be a flat color. The color used is specified by CommonBkType.
- **GFX_BACKGROUND_IMAGE** - this type will set the common background to be an image. The image used is specified by pCommonBkImage.

When an object is associated with a background, it can be easily hidden or redrawn with some effects (for example alpha blending with the background). The background information allows the redrawing of the background with the object without the need to manually refreshing the background using primitive calls by the application.

Members

Members	Description
GFX_COLOR EmbossDkColor;	Emboss dark color used for 3d effect.
GFX_COLOR EmbossLtColor;	Emboss light color used for 3d effect.
GFX_COLOR TextColor0;	Character color 0 used for objects that supports text.
GFX_COLOR TextColor1;	Character color 1 used for objects that supports text.
GFX_COLOR TextColorDisabled;	Character color used when object is in a disabled state.
GFX_COLOR Color0;	Color 0 usually assigned to an Object state.
GFX_COLOR Color1;	Color 1 usually assigned to an Object state.
GFX_COLOR ColorDisabled;	Color used when an Object is in a disabled state.
GFX_RESOURCE_HDR * pFont;	Font selected for the scheme.
GFX_FILL_STYLE fillStyle;	must be set to a gradient type when using gradient
GFX_COLOR CommonBkColor;	Background color used to hide Objects.

uint16_t CommonBkLeft;	Horizontal starting position of the background.
uint16_t CommonBkTop;	Horizontal starting position of the background.
GFX_BACKGROUND_TYPE CommonBkType;	Specifies the type of background to use.
GFX_RESOURCE_HDR * pCommonBkImage;	Pointer to the background image used. Set this
uint16_t AlphaValue;	Alpha value used for alpha blending
GFX_COLOR gradientStartColor;	start color of the gradient fill
GFX_COLOR gradientEndColor;	end color of the gradient fill
uint16_t EmbossSize;	Emboss size of the panel for 3-D effect. Set to zero if not used.

Remarks

None.

5.2.2.7.26.45 GFX_GOL_OBJ_TYPE Enumeration

C

```
typedef enum {
    GFX_GOL_ANALOGCLOCK_TYPE,
    GFX_GOL_BUTTON_TYPE,
    GFX_GOL_CHART_TYPE,
    GFX_GOL_CHECKBOX_TYPE,
    GFX_GOL_DIGITALMETER_TYPE,
    GFX_GOL_EDITBOX_TYPE,
    GFX_GOL_GRID_TYPE,
    GFX_GOL_GROUPBOX_TYPE,
    GFX_GOL_LISTBOX_TYPE,
    GFX_GOL_METER_TYPE,
    GFX_GOL_PICTURECONTROL_TYPE,
    GFX_GOL_PROGRESSBAR_TYPE,
    GFX_GOL_RADIOBUTTON_TYPE,
    GFX_GOL_SCROLLBAR_TYPE,
    GFX_GOL_STATICTEXT_TYPE,
    GFX_GOL_TEXTENTRY_TYPE,
    GFX_GOL_WINDOW_TYPE,
    GFX_GOL_CUSTOM_TYPE,
    GFX_GOL_UNKNOWN_TYPE
} GFX_GOL_OBJ_TYPE;
```

Description

GFX_GOL_OBJ_TYPE

This enumeration specifies the different object types used in the library.

Members

Members	Description
GFX_GOL_ANALOGCLOCK_TYPE	Type defined for Analog Clock Object.
GFX_GOL_BUTTON_TYPE	Type defined for Button Object.
GFX_GOL_CHART_TYPE	Type defined for Chart Object.
GFX_GOL_CHECKBOX_TYPE	Type defined for Check Box Object.
GFX_GOL_DIGITALMETER_TYPE	Type defined for Digital Meter Object.
GFX_GOL_EDITBOX_TYPE	Type defined for Edit Box Object.
GFX_GOL_GRID_TYPE	Type defined for Grid Object.
GFX_GOL_GROUPBOX_TYPE	Type defined for Group Box Object.
GFX_GOL_LISTBOX_TYPE	Type defined for List Box Object.

GFX_GOL_METER_TYPE	Type defined for Meter Object.
GFX_GOL_PICTURECONTROL_TYPE	Type defined for Picture Control Object.
GFX_GOL_PROGRESSBAR_TYPE	Type defined for Progress Bar Object.
GFX_GOL_RADIOBUTTON_TYPE	Type defined for Radio Button Object.
GFX_GOL_SCROLLBAR_TYPE	Type defined for Slider or Scroll Bar Object.
GFX_GOL_STATICTEXT_TYPE	Type defined for Static Text Object.
GFX_GOL_TEXTENTRY_TYPE	Type defined for Text-Entry Object.
GFX_GOL_WINDOW_TYPE	Type defined for Window Object.
GFX_GOL_CUSTOM_TYPE	Type defined for Custom Object.
GFX_GOL_UNKNOWN_TYPE	Type is undefined and not supported by the library.

Remarks

None.

5.2.2.7.26.46 GFX_GOL_PROGRESSBAR Structure**C**

```
typedef struct {
    GFX_GOL_OBJ_HEADER hdr;
    uint16_t pos;
    uint16_t prevPos;
    uint16_t range;
} GFX_GOL_PROGRESSBAR;
```

Description

The structure contains data for the progress bar

Members

Members	Description
GFX_GOL_OBJ_HEADER hdr;	Generic header for all Objects (see GFX_GOL_OBJ_HEADER).
uint16_t pos;	Current progress position.
uint16_t prevPos;	Previous progress position.
uint16_t range;	Sets the range of the object.

5.2.2.7.26.47 GFX_GOL_PROGRESSBAR_STATE Enumeration**C**

```
typedef enum {
    GFX_GOL_PROGRESSBAR_DISABLED_STATE = 0x0002,
    GFX_GOL_PROGRESSBAR_VERTICAL_STATE = 0x0004,
    GFX_GOL_PROGRESSBAR_NOPROGRESS_STATE = 0x0008,
    GFX_GOL_PROGRESSBAR_DRAW_BAR_STATE = 0x2000,
    GFX_GOL_PROGRESSBAR_DRAW_STATE = 0x4000,
    GFX_GOL_PROGRESSBAR_HIDE_STATE = 0x8000
} GFX_GOL_PROGRESSBAR_STATE;
```

Description

Object States Definition:

Members

Members	Description
GFX_GOL_PROGRESSBAR_DISABLED_STATE = 0x0002	Bit for disabled state.

GFX_GOL_PROGRESSBAR_VERTICAL_STATE = 0x0004	Bit for orientation (0- horizontal, 1 - vertical).
GFX_GOL_PROGRESSBAR_NOPROGRESS_STATE = 0x0008	Bit suppress rendering of progress in text.
GFX_GOL_PROGRESSBAR_DRAW_BAR_STATE = 0x2000	Bit to indicate object must be redrawn.
GFX_GOL_PROGRESSBAR_DRAW_STATE = 0x4000	Bit to indicate object must be redrawn.
GFX_GOL_PROGRESSBAR_HIDE_STATE = 0x8000	Bit to indicate object must be removed from screen.

5.2.2.7.26.48 GFX_GOL_RADIOBUTTON Structure

C

```
typedef struct {
    GFX_GOL_OBJ_HEADER hdr;
    GFX_GOL_OBJ_HEADER * pHead;
    GFX_GOL_OBJ_HEADER * pNext;
    uint16_t textHeight;
    GFX_XCHAR * pText;
    GFX_ALIGNMENT alignment;
} GFX_GOL_RADIOBUTTON;
```

Description

the structure contains data for the Radio Button

Members

Members	Description
GFX_GOL_OBJ_HEADER hdr;	Generic header for all Objects (see OBJ_HEADER).
GFX_GOL_OBJ_HEADER * pHead;	Pointer to the first Radio Button in the group
GFX_GOL_OBJ_HEADER * pNext;	Pointer to the next Radio Button in the group
uint16_t textHeight;	Pre-computed text height
GFX_XCHAR * pText;	Pointer to the text
GFX_ALIGNMENT alignment;	text alignment

5.2.2.7.26.49 GFX_GOL_RADIOBUTTON_STATE Enumeration

C

```
typedef enum {
    GFX_GOL_RADIOBUTTON_FOCUSED_STATE = 0x0001,
    GFX_GOL_RADIOBUTTON_DISABLED_STATE = 0x0002,
    GFX_GOL_RADIOBUTTON_CHECKED_STATE = 0x0004,
    GFX_GOL_RADIOBUTTON_GROUP_STATE = 0x0008,
    GFX_GOL_RADIOBUTTON_DRAW_CHECK_STATE = 0x1000,
    GFX_GOL_RADIOBUTTON_DRAW_FOCUS_STATE = 0x2000,
    GFX_GOL_RADIOBUTTON_DRAW_STATE = 0x4000,
    GFX_GOL_RADIOBUTTON_HIDE_STATE = 0x8000
} GFX_GOL_RADIOBUTTON_STATE;
```

Description

Object States Definition:

Members

Members	Description
GFX_GOL_RADIOBUTTON_FOCUSED_STATE = 0x0001	Bit for focus state.

GFX_GOL_RADIOBUTTON_DISABLED_STATE = 0x0002	Bit for disabled state.
GFX_GOL_RADIOBUTTON_CHECKED_STATE = 0x0004	Bit to indicate Radio Button is checked.
GFX_GOL_RADIOBUTTON_GROUP_STATE = 0x0008	Bit to indicate the first Radio Button in the group. Each group MUST have this bit set for its first member even for a single member group. This means that any independent or stand alone Radio Button, the RB_GROUP bit must be always set. or alone in the group.
GFX_GOL_RADIOBUTTON_DRAW_CHECK_STATE = 0x1000	Bit to indicate check mark should be redrawn.
GFX_GOL_RADIOBUTTON_DRAW_FOCUS_STATE = 0x2000	Bit to indicate focus must be redrawn.
GFX_GOL_RADIOBUTTON_DRAW_STATE = 0x4000	Bit to indicate object must be redrawn.
GFX_GOL_RADIOBUTTON_HIDE_STATE = 0x8000	Bit to indicate object must be removed from screen.

5.2.2.7.26.50 GFX_GOL_ROUNDIAL Structure

C

```
typedef struct {
    GFX_GOL_OBJ_HEADER hdr;
    uint16_t xCenter;
    uint16_t yCenter;
    uint16_t radius;
    uint16_t value;
    uint16_t max;
    uint16_t res;
    uint16_t curr_xPos;
    uint16_t curr_yPos;
    uint16_t new_xPos;
    uint16_t new_yPos;
    short vAngle;
} GFX_GOL_ROUNDIAL;
```

Description

The curr_xPos, curr_yPos, new_xPos and new_yPos parameters are internally generated to aid in the redrawing of the dial. User must avoid modifying these values.

Members

Members	Description
GFX_GOL_OBJ_HEADER hdr;	Generic header for all Objects (see GFX_OBJ_HEADER).
uint16_t xCenter;	x coordinate center position.
uint16_t yCenter;	y coordinate center position.
uint16_t radius;	Radius of the dial.
uint16_t value;	Initial value of the dial.
uint16_t max;	Maximum value of variable value (maximum = 65535).
uint16_t res;	Resolution of movement.
uint16_t curr_xPos;	Current x position.
uint16_t curr_yPos;	Current y position.
uint16_t new_xPos;	New x position.
uint16_t new_yPos;	New y position.

5.2.2.7.26.51 GFX_GOL_SCROLLBAR Structure

C

```
typedef struct {
    GFX_GOL_OBJ_HEADER hdr;
    int16_t currPos;
    uint16_t prevPos;
    uint16_t range;
    int16_t pos;
    uint16_t page;
    uint16_t thWidth;
    uint16_t thHeight;
} GFX_GOL_SCROLLBAR;
```

Description

Defines the parameters required for a slider/scrollbar Object. Depending on the GFX_GOL_SCROLLBAR_SLIDER_MODE_STATE state bit slider or scrollbar mode is set. If GFX_GOL_SCROLLBAR_SLIDER_MODE_STATE is set, mode is slider; if not set mode is scroll bar. For scrollbar mode, focus rectangle is not drawn.

Members

Members	Description
GFX_GOL_OBJ_HEADER hdr;	Generic header for all Objects (see GFX_GOL_OBJ_HEADER).
int16_t currPos;	Position of the slider relative to minimum.
uint16_t prevPos;	Previous position of the slider relative to minimum.
uint16_t range;	User defined range of the slider. Minimum value at 0 and maximum at 0x7FFF.
int16_t pos;	Position of the slider in range domain.
uint16_t page;	User specified resolution to incrementally change the position in range domain.
uint16_t thWidth;	Thumb width. This is computed internally. User must not change this value.
uint16_t thHeight;	Thumb width. This is computed internally. User must not change this value.

5.2.2.7.26.52 GFX_GOL_SCROLLBAR_STATE Enumeration

C

```
typedef enum {
    GFX_GOL_SCROLLBAR_FOCUSED_STATE = 0x0001,
    GFX_GOL_SCROLLBAR_DISABLED_STATE = 0x0002,
    GFX_GOL_SCROLLBAR_VERTICAL_STATE = 0x0004,
    GFX_GOL_SCROLLBAR_SLIDER_MODE_STATE = 0x0010,
    GFX_GOL_SCROLLBAR_DRAW_THUMB_STATE = 0x1000,
    GFX_GOL_SCROLLBAR_DRAW_FOCUS_STATE = 0x2000,
    GFX_GOL_SCROLLBAR_DRAW_STATE = 0x4000,
    GFX_GOL_SCROLLBAR_HIDE_STATE = 0x8000
} GFX_GOL_SCROLLBAR_STATE;
```

Description

Object States Definition:

Members

Members	Description
GFX_GOL_SCROLLBAR_FOCUSED_STATE = 0x0001	Bit for focus state.
GFX_GOL_SCROLLBAR_DISABLED_STATE = 0x0002	Bit for disabled state.

GFX_GOL_SCROLLBAR_VERTICAL_STATE = 0x0004	Bit to indicate the scroll bar is drawn with vertical orientation
GFX_GOL_SCROLLBAR_SLIDER_MODE_STATE = 0x0010	Bit to indicate the scroll bar is in slider mode.
GFX_GOL_SCROLLBAR_DRAW_THUMB_STATE = 0x1000	Bit to indicate that only the thumb area will be redrawn
GFX_GOL_SCROLLBAR_DRAW_FOCUS_STATE = 0x2000	Bit to indicate focus must be redrawn.
GFX_GOL_SCROLLBAR_DRAW_STATE = 0x4000	Bit to indicate object must be redrawn.
GFX_GOL_SCROLLBAR_HIDE_STATE = 0x8000	Bit to indicate object must be removed from screen.

5.2.2.7.26.53 GFX_GOL_STATICTEXT Structure

C

```
typedef struct {
    GFX_GOL_OBJ_HEADER hdr;
    GFX_XCHAR * pText;
    GFX_ALIGNMENT alignment;
} GFX_GOL_STATICTEXT;
```

Description

Defines the parameters required for a Static Text Object.

Members

Members	Description
GFX_GOL_OBJ_HEADER hdr;	Generic header for all Objects (see OBJ_HEADER).
GFX_XCHAR * pText;	The pointer to text used.
GFX_ALIGNMENT alignment;	text alignment

5.2.2.7.26.54 GFX_GOL_STATICTEXT_STATE Enumeration

C

```
typedef enum {
    GFX_GOL_STATICTEXT_DISABLED_STATE = 0x0002,
    GFX_GOL_STATICTEXT_FRAME_STATE = 0x0010,
    GFX_GOL_STATICTEXT_NOBACKGROUND_STATE = 0x0020,
    GFX_GOL_STATICTEXT_DRAW_UPDATE = 0x2000,
    GFX_GOL_STATICTEXT_DRAW_STATE = 0x4000,
    GFX_GOL_STATICTEXT_HIDE_STATE = 0x8000
} GFX_GOL_STATICTEXT_STATE;
```

Description

Object States Definition:

Members

Members	Description
GFX_GOL_STATICTEXT_DISABLED_STATE = 0x0002	Bit for disabled state.
GFX_GOL_STATICTEXT_FRAME_STATE = 0x0010	Bit to indicate frame is enabled.
GFX_GOL_STATICTEXT_NOBACKGROUND_STATE = 0x0020	Bit to indicate background is enabled.
GFX_GOL_STATICTEXT_DRAW_UPDATE = 0x2000	Bit to indicate object must be redrawn.

GFX_GOL_STATICTEXT_DRAW_STATE = 0x4000	Bit to indicate object must be redrawn.
GFX_GOL_STATICTEXT_HIDE_STATE = 0x8000	Bit to indicate object must be removed from screen.

5.2.2.7.26.55 GFX_GOL_TEXTENTRY Structure

C

```
typedef struct {
    GFX_GOL_OBJ_HEADER hdr;
    uint16_t horizontalKeys;
    uint16_t verticalKeys;
    GFX_XCHAR * pTeOutput;
    GFX_ALIGNMENT alignment;
    uint16_t CurrentLength;
    uint16_t outputLenMax;
    KEYMEMBER * pActiveKey;
    KEYMEMBER * pHeadOfList;
    GFX_RESOURCE_HDR * pDisplayFont;
} GFX_GOL_TEXTENTRY;
```

Description

Defines the parameters required for a TextEntry Object.

Members

Members	Description
GFX_GOL_OBJ_HEADER hdr;	Generic header for all objects (see GFX_GOL_OBJ_HEADER).
uint16_t horizontalKeys;	Number of horizontal keys
uint16_t verticalKeys;	Number of vertical keys
GFX_XCHAR * pTeOutput;	Pointer to the buffer assigned by the user which holds the text shown in the editbox.
GFX_ALIGNMENT alignment;	text alignment
uint16_t CurrentLength;	Current length of the string in the buffer. The maximum value of this is equal to outputLenMax.
uint16_t outputLenMax;	Maximum expected length of output buffer pTeOutput
KEYMEMBER * pActiveKey;	Pointer to the active key KEYMEMBER . This is only used by the Widget. User must not change the value of this parameter directly.
KEYMEMBER * pHeadOfList;	Pointer to head of the list
GFX_RESOURCE_HDR * pDisplayFont;	Pointer to the font used in displaying the text.

5.2.2.7.26.56 GFX_GOL_TEXTENTRY_KEY_COMMAND_TYPE Enumeration

C

```
typedef enum {
    GFX_GOL_TEXTENTRY_NONE_COM = 0x00,
    GFX_GOL_TEXTENTRY_DELETE_COM = 0x01,
    GFX_GOL_TEXTENTRY_SPACE_COM = 0x02,
    GFX_GOL_TEXTENTRY_ENTER_COM = 0x03
} GFX_GOL_TEXTENTRY_KEY_COMMAND_TYPE;
```

Description

Optional COMMANDS assigned to keys

Members

Members	Description
GFX_GOL_TEXTENTRY_NONE_COM = 0x00	This type is used when the key is not assigned to any command.
GFX_GOL_TEXTENTRY_DELETE_COM = 0x01	This type is used to assign a "delete" command on a key.
GFX_GOL_TEXTENTRY_SPACE_COM = 0x02	This type is used to assign an insert "space" command on a key.
GFX_GOL_TEXTENTRY_ENTER_COM = 0x03	This type is used to assign an "enter" (carriage return) command on a key.

5.2.2.7.26.57 GFX_GOL_TEXTENTRY_STATE Enumeration**C**

```
typedef enum {
    GFX_GOL_TEXTENTRY_DISABLED_STATE = 0x0002,
    GFX_GOL_TEXTENTRY_KEY_PRESSED_STATE = 0x0004,
    GFX_GOL_TEXTENTRY_ECHO_HIDE_STATE = 0x0008,
    GFX_GOL_TEXTENTRY_DRAW_STATE = 0x4000,
    GFX_GOL_TEXTENTRY_HIDE_STATE = 0x8000,
    GFX_GOL_TEXTENTRY_UPDATE_KEY_STATE = 0x2000,
    GFX_GOL_TEXTENTRY_UPDATE_TEXT_STATE = 0x1000
} GFX_GOL_TEXTENTRY_STATE;
```

Description

Object States Definition:

Members

Members	Description
GFX_GOL_TEXTENTRY_DISABLED_STATE = 0x0002	Bit for disabled state.
GFX_GOL_TEXTENTRY_KEY_PRESSED_STATE = 0x0004	Bit for press state.
GFX_GOL_TEXTENTRY_ECHO_HIDE_STATE = 0x0008	Bit to hide the entered characters and instead echo "*" characters to the display.
GFX_GOL_TEXTENTRY_DRAW_STATE = 0x4000	Bit to indicate object must be redrawn.
GFX_GOL_TEXTENTRY_HIDE_STATE = 0x8000	Bit to indicate object must be removed from screen.
GFX_GOL_TEXTENTRY_UPDATE_KEY_STATE = 0x2000	Bit to indicate redraw of a key is needed
GFX_GOL_TEXTENTRY_UPDATE_TEXT_STATE = 0x1000	Bit to indicate redraw of the text displayed is needed.

5.2.2.7.26.58 GFX_GOL_TRANSLATED_ACTION Enumeration**C**

```
typedef enum {
    GFX_GOL_OBJECT_ACTION_INVALID = 0x3500,
    GFX_GOL_OBJECT_ACTION_PASSIVE,
    GFX_GOL_ANALOGCLOCK_ACTION_PRESSED,
    GFX_GOL_ANALOGCLOCK_ACTION_RELEASED,
    GFX_GOL_BUTTON_ACTION_PRESSED,
    GFX_GOL_BUTTON_ACTION_STILLPRESSED,
    GFX_GOL_BUTTON_ACTION_RELEASED,
    GFX_GOL_BUTTON_ACTION_CANCELPRESS,
    GFX_GOL_CHART_ACTION_SELECTED,
```

```

GFX_GOL_CHECKBOX_ACTION_CHECKED,
GFX_GOL_CHECKBOX_ACTION_UNCHECKED,
GFX_GOL_CUSTOMCONTROL_ACTION_SELECTED,
GFX_GOL_DIGITALMETER_ACTION_SELECTED,
GFX_GOL_EDITBOX_ACTION_ADD_CHAR,
GFX_GOL_EDITBOX_ACTION_DEL_CHAR,
GFX_GOL_EDITBOX_ACTION_TOUCHSCREEN,
GFX_GOL_GRID_ACTION_TOUCHED,
GFX_GOL_GRID_ACTION_ITEM_SELECTED,
GFX_GOL_GRID_ACTION_UP,
GFX_GOL_GRID_ACTION_DOWN,
GFX_GOL_GRID_ACTION_LEFT,
GFX_GOL_GRID_ACTION_RIGHT,
GFX_GOL_GROUPBOX_ACTION_SELECTED,
GFX_GOL_LISTBOX_ACTION_SELECTED,
GFX_GOL_LISTBOX_ACTION_MOVE,
GFX_GOL_LISTBOX_ACTION_TOUCHSCREEN,
GFX_GOL_METER_ACTION_SET,
GFX_GOL_PICTURECONTROL_ACTION_SELECTED,
GFX_GOL_PROGRESSBAR_ACTION_SELECTED,
GFX_GOL_RADIOBUTTON_ACTION_CHECKED,
GFX_GOL_SCROLLBAR_ACTION_INC,
GFX_GOL_SCROLLBAR_ACTION_DEC,
GFX_GOL_STATICTEXT_ACTION_SELECTED,
GFX_GOL_TEXTENTRY_ACTION_RELEASED,
GFX_GOL_TEXTENTRY_ACTION_PRESSED,
GFX_GOL_TEXTENTRY_ACTION_ADD_CHAR,
GFX_GOL_TEXTENTRY_ACTION_DELETE,
GFX_GOL_TEXTENTRY_ACTION_SPACE,
GFX_GOL_TEXTENTRY_ACTION_ENTER,
GFX_GOL_WINDOW_ACTION_CLIENT,
GFX_GOL_WINDOW_ACTION_TITLE
} GFX_GOL_TRANSLATED_ACTION;

```

Description

GFX_GOL_TRANSLATED_ACTION

This enumeration specifies the different object actions supported in the library.

Members

Members	Description
GFX_GOL_OBJECT_ACTION_INVALID = 0x3500	Invalid message response.
GFX_GOL_OBJECT_ACTION_PASSIVE	Passive message response. No change in object needed.
GFX_GOL_ANALOGCLOCK_ACTION_PRESSED	Analog Clock Pressed Action
GFX_GOL_ANALOGCLOCK_ACTION_RELEASED	Analog Clock Released Action
GFX_GOL_BUTTON_ACTION_PRESSED	Button pressed action ID.
GFX_GOL_BUTTON_ACTION_STILLPRESSED	Button is continuously pressed ID.
GFX_GOL_BUTTON_ACTION_RELEASED	Button released action ID.
GFX_GOL_BUTTON_ACTION_CANCELPRESS	Button released action ID with button press canceled.
GFX_GOL_CHART_ACTION_SELECTED	Chart selected action ID
GFX_GOL_CHECKBOX_ACTION_CHECKED	Check Box check action ID.
GFX_GOL_CHECKBOX_ACTION_UNCHECKED	Check Box un-check action ID.
GFX_GOL_CUSTOMCONTROL_ACTION_SELECTED	Custom Control selected action ID.
GFX_GOL_DIGITALMETER_ACTION_SELECTED	Digital Meter selected action ID.
GFX_GOL_EDITBOX_ACTION_ADD_CHAR	Edit Box insert character action ID.
GFX_GOL_EDITBOX_ACTION_DEL_CHAR	Edit Box remove character action ID.
GFX_GOL_EDITBOX_ACTION_TOUCHSCREEN	Edit Box touchscreen selected action ID.

GFX_GOL_GRID_ACTION_TOUCHED	Grid item touched action ID.
GFX_GOL_GRID_ACTION_ITEM_SELECTED	Grid item selected action ID.
GFX_GOL_GRID_ACTION_UP	Grid up action ID.
GFX_GOL_GRID_ACTION_DOWN	Grid down action ID.
GFX_GOL_GRID_ACTION_LEFT	Grid left action ID.
GFX_GOL_GRID_ACTION_RIGHT	Grid right action ID.
GFX_GOL_GROUPBOX_ACTION_SELECTED	Group Box selected action ID.
GFX_GOL_LISTBOX_ACTION_SELECTED	List Box item select action ID.
GFX_GOL_LISTBOX_ACTION_MOVE	List Box item move action ID.
GFX_GOL_LISTBOX_ACTION_TOUCHSCREEN	List Box touchscreen selected action ID.
GFX_GOL_METER_ACTION_SET	Meter set value action ID.
GFX_GOL_PICTURECONTROL_ACTION_SELECTED	Picture selected action ID.
GFX_GOL_PROGRESSBAR_ACTION_SELECTED	Progress Bar selected action ID.
GFX_GOL_RADIOBUTTON_ACTION_CHECKED	Radio Button check action ID.
GFX_GOL_SCROLLBAR_ACTION_INC	Slider or Scroll Bar increment action ID.
GFX_GOL_SCROLLBAR_ACTION_DEC	Slider or Scroll Bar decrement action ID.
GFX_GOL_STATICTEXT_ACTION_SELECTED	Static Text selected action ID.
GFX_GOL_TEXTENTRY_ACTION_RELEASED	TextEntry released action ID
GFX_GOL_TEXTENTRY_ACTION_PRESSED	TextEntry pressed action ID
GFX_GOL_TEXTENTRY_ACTION_ADD_CHAR	TextEntry add character action ID
GFX_GOL_TEXTENTRY_ACTION_DELETE	TextEntry delete character action ID
GFX_GOL_TEXTENTRY_ACTION_SPACE	TextEntry add space character action ID
GFX_GOL_TEXTENTRY_ACTION_ENTER	TextEntry enter action ID
GFX_GOL_WINDOW_ACTION_CLIENT	Window client area selected action ID.
GFX_GOL_WINDOW_ACTION_TITLE	Window title bar selected action ID.

Remarks

None.

5.2.2.7.26.59 GFX_GOL_TRANSLATED_ACTION, \ GFX_GOL_OBJ_HEADER *, \ GFX_GOL_MESSAGE * \) Type

C

```
typedef (bool)GFX_GOL_MESSAGE_CALLBACK_FUNC GFX_GOL_TRANSLATED_ACTION, \ GFX_GOL_OBJ_HEADER *,
\ GFX_GOL_MESSAGE * \ )();
```

Description

This application defined function is called by the [GFX_GOL_ObjectMessage\(\)](#) function allowing the application the opportunity to process the user messages and customize object behavior as well as application controlled functions.

[GFX_GOL_ObjectMessage\(\)](#) calls this function when a valid message for an object in the active list is received. Application implements any action for the message in this callback function. If this callback function returns true, the message for the object will be processed using the default action of the object. If false is returned, the default action will not be performed. In this case, it is assumed that this callback function has performed the appropriate changes to the states of the objects.

Preconditions

None.

Parameters

Parameters	Description
GFX_GOL_TRANSLATED_ACTION	Translated message for the object
GFX_GOL_OBJ_HEADER *	Pointer to the object that processed the message.
GFX_GOL_MESSAGE *	Pointer to the message from user.

Returns

true - When true is returned, the object will set its state depending on the translated messages. false - When false is returned, the object will not process the translated message and will assume the application has performed necessary action on the message.

Example

None.

5.2.2.7.26.60 GFX_GOL_WINDOW Structure

C

```
typedef struct {
    GFX_GOL_OBJ_HEADER hdr;
    uint16_t textHeight;
    GFX_XCHAR * pText;
    GFX_ALIGNMENT alignment;
    GFX_RESOURCE_HDR * pBitmap;
} GFX_GOL_WINDOW;
```

Members

Members	Description
GFX_GOL_OBJ_HEADER hdr;	Generic header for all Objects (see GFX_GOL_OBJ_HEADER).
uint16_t textHeight;	Pre-computed text height
GFX_XCHAR * pText;	Pointer to the title text
GFX_ALIGNMENT alignment;	text alignment
GFX_RESOURCE_HDR * pBitmap;	Pointer to the bitmap for the title bar

5.2.2.7.26.61 GFX_GOL_WINDOW_STATE Enumeration

C

```
typedef enum {
    GFX_GOL_WINDOW_FOCUSED_STATE = 0x0001,
    GFX_GOL_WINDOW_DISABLED_STATE = 0x0002,
    GFX_GOL_WINDOW_TITLECENTER_STATE = 0x0004,
    GFX_GOL_WINDOW_HIDE_STATE = 0x8000,
    GFX_GOL_WINDOW_DRAW_CLIENT_STATE = 0x4000,
    GFX_GOL_WINDOW_DRAW_TITLE_STATE = 0x2000,
    GFX_GOL_WINDOW_DRAW_STATE = 0x6000
} GFX_GOL_WINDOW_STATE;
```

Description

Object States Definition:

Members

Members	Description
GFX_GOL_WINDOW_FOCUSED_STATE = 0x0001	Bit for focus state

GFX_GOL_WINDOW_DISABLED_STATE = 0x0002	Bit for disabled state
GFX_GOL_WINDOW_TITLECENTER_STATE = 0x0004	Bit to center the text on the Title Area
GFX_GOL_WINDOW_HIDE_STATE = 0x8000	Bit to indicate window must be removed from screen
GFX_GOL_WINDOW_DRAW_CLIENT_STATE = 0x4000	Bit to indicate client area must be redrawn
GFX_GOL_WINDOW_DRAW_TITLE_STATE = 0x2000	Bit to indicate title area must be redrawn
GFX_GOL_WINDOW_DRAW_STATE = 0x6000	Bits to indicate whole window must be redrawn

5.2.2.7.26.62 GFX_GRADIENT_STYLE Structure

C

```
typedef struct {
    GFX_FILL_STYLE type;
    GFX_COLOR startColor;
    GFX_COLOR endColor;
    uint8_t length;
} GFX_GRADIENT_STYLE;
```

Description

This structure is used to describe the gradient style.

Members

Members	Description
GFX_FILL_STYLE type;	selected the gradient type
GFX_COLOR startColor;	sets the starting color of gradient transition
GFX_COLOR endColor;	sets the ending color of gradient transition
uint8_t length;	defines the length of the gradient transition in pixels

5.2.2.7.26.63 GFX_LINE_STYLE Enumeration

C

```
typedef enum {
    GFX_LINE_TYPE_MASK = 0x0007,
    GFX_LINE_THICKNESS_MASK = 0x0010,
    GFX_LINE_STYLE_THIN_SOLID = 0x0A00,
    GFX_LINE_STYLE_THIN_DOTTED = 0x0A01,
    GFX_LINE_STYLE_THIN_DASHED = 0x0A04,
    GFX_LINE_STYLE_THICK_SOLID = 0x0A10,
    GFX_LINE_STYLE_THICK_DOTTED = 0x0A11,
    GFX_LINE_STYLE_THICK_DASHED = 0x0A14,
    GFX_LINE_STYLE_ANTI_ALIASED = 0x0A20
} GFX_LINE_STYLE;
```

Description

Defines the types of line styles.

Members

Members	Description
GFX_LINE_TYPE_MASK = 0x0007	DO NOT document, mask for line type
GFX_LINE_THICKNESS_MASK = 0x0010	DO NOT document, mask for thickness

GFX_LINE_STYLE_THIN_SOLID = 0x0A00	solid line, 1 pixel wide (default)
GFX_LINE_STYLE_THIN_DOTTED = 0x0A01	dotted line, 1 pixel wide
GFX_LINE_STYLE_THIN_DASHED = 0x0A04	dashed line, , 1 pixel wide
GFX_LINE_STYLE_THICK_SOLID = 0x0A10	solid line, 3 pixel wide
GFX_LINE_STYLE_THICK_DOTTED = 0x0A11	dotted line, 3 pixel wide
GFX_LINE_STYLE_THICK_DASHED = 0x0A14	dashed line, 3 pixel wide
GFX_LINE_STYLE_ANTI_ALIASED = 0x0A20	anti-aliased line (future feature)

5.2.2.7.26.64 GFX_MCHP_BITMAP_HEADER Structure

C

```
typedef struct {
    uint8_t bitmapType;
    uint8_t colorDepth;
    int16_t height;
    int16_t width;
} GFX_MCHP_BITMAP_HEADER;
```

Description

Structure describing the bitmap header.

Members

Members	Description
uint8_t bitmapType;	type of image, information on how to render the image 0 - no compression, palette is present for color depth = 8, 4 and 1 BPP 1 - palette is provided as a separate object (see PALETTE_HEADER) for color depth = 8, 4, and 1 BPP, ID to the palette is embedded in the bitmap.
uint8_t colorDepth;	Color depth used
int16_t height;	Image height
int16_t width;	Image width

5.2.2.7.26.65 GFX_PALETTE_ENTRY Union

C

```
typedef union {
    uint16_t value;
    struct {
        uint16_t r : 5;
        uint16_t g : 6;
        uint16_t b : 5;
    } color;
    struct {
        uint16_t reserved : 12;
        uint16_t luma : 4;
    } monochrome;
} GFX_PALETTE_ENTRY;
```

Description

Structure used for the palette entries.

- For TFT: color is defined as 5-6-5 RGB format (5-bits for **RED**, 6-bits for **GREEN** and 5-bits for **BLUE**).
- For Monochrome: 4 bits are used to represent the luma.

Members

Members	Description
uint16_t value;	a 16-bit value representing a color or palette entry
struct { uint16_t r : 5; uint16_t g : 6; uint16_t b : 5; } color;	color value in 5-6-5 RGB format
uint16_t r : 5;	represents the RED component
uint16_t g : 6;	represents the GREEN component
uint16_t b : 5;	represents the BLUE component
struct { uint16_t reserved : 12; uint16_t luma : 4; } monochrome;	monochrome LUMA value
uint16_t reserved : 12;	reserved, used as a filler
uint16_t luma : 4;	monochrome LUMA value

5.2.2.7.26.66 GFX_PARTIAL_IMAGE_PARAM Structure**C**

```
typedef struct {
    uint16_t width;
    uint16_t height;
    uint16_t xoffset;
    uint16_t yoffset;
} GFX_PARTIAL_IMAGE_PARAM;
```

Description

Structure describing the partial image area to render.

Members

Members	Description
uint16_t width;	Partial Image width
uint16_t height;	Partial Image height
uint16_t xoffset;	xoffset of the partial image (with respect to the image horizontal origin)
uint16_t yoffset;	yoffset of the partial image (with respect to the image vertical origin)

5.2.2.7.26.67 GFX_Primitive_DATA Structure**C**

```
typedef struct {
    volatile uint8_t activePage;
    volatile uint8_t visualPage;
    uint8_t transitionPage;
    uint8_t foregroundPage;
    uint8_t backgroundPage;
    uint8_t destinationPage;
    GFX_LINE_STYLE lineType;
    uint16_t cursorX;
    uint16_t cursorY;
```

```
GFX_BEVEL_RENDER_TYPE bevelDrawType;
GFX_COLOR currentColor;
GFX_FONT_CURRENT currentFont;
GFX_RESOURCE_HDR * pResource;
GFX_ALPHA_PARAMS alphaArea;
GFX_TRANSITION_PARAMS transitionParams;
GFX_COLOR line[480];
GFX_COLOR alphaLine[480];
uint8_t InvalidatedRectangleCount;
GFX_GRADIENT_STYLE gradientStyle;
} GFX_Primitive_DATA;
```

Description

GFX primitive data

Members

Members	Description
uint8_t foregroundPage;	Initialize Alpha Values
GFX_COLOR currentColor;	Current Color for the instance
GFX_COLOR line[480];	Storage for line data
GFX_COLOR alphaLine[480];	Storage for alpha line data
uint8_t InvalidatedRectangleCount;	Double Buffer Variable

Remarks

None.

5.2.2.7.26.68 GFX_RECTANGULAR_AREA Structure

C

```
typedef struct {
    uint16_t left;
    uint16_t top;
    uint16_t right;
    uint16_t bottom;
} GFX_RECTANGULAR_AREA;
```

Description

Structure describing a rectangular area in the frame buffer.

5.2.2.7.26.69 GFX_RESOURCE Enumeration

C

```
typedef enum {
    GFX_RESOURCE_MEMORY_FLASH = 0x0000,
    GFX_RESOURCE_MEMORY_EXTERNAL = 0x0001,
    GFX_RESOURCE_MEMORY_RAM = 0x0004,
    GFX_RESOURCE_MEMORY_EDS_EPMP = 0x0005,

GFX_RESOURCE_MEMORY_EXTERNAL | GFX_RESOURCE_COMP_NONE),
    GFX_RESOURCE_PALETTE_RAM_NONE = (GFX_RESOURCE_TYPE_PALETTE | GFX_RESOURCE_MEMORY_RAM |
GFX_RESOURCE_COMP_NONE)
} GFX_RESOURCE;

```

Description

Memory type enumeration to determine the source of data. Used in interpreting images, fonts and palette from different memory sources.

Members

Members	Description
GFX_RESOURCE_MEMORY_FLASH = 0x0000	internal flash
GFX_RESOURCE_MEMORY_EXTERNAL = 0x0001	external memory
GFX_RESOURCE_MEMORY_RAM = 0x0004	RAM

GFX_RESOURCE_MEMORY_EDS_EPMP = 0x0005	memory in EPMP, base addresses are set in the hardware profile
GFX_RESOURCE_TYPE_MCHP_MBITMAP = 0x0000	data resource is type Microchip bitmap
GFX_RESOURCE_TYPE_JPEG = 0x0100	data resource is type JPEG
GFX_RESOURCE_TYPE_BINARY = 0x0200	data resource is type binary
GFX_RESOURCE_TYPE_FONT = 0x0300	data resource is type font
GFX_RESOURCE_TYPE_PALETTE = 0x0400	data resource is type palette
GFX_RESOURCE_COMP_NONE = 0x0000	data resource has no compression
GFX_RESOURCE_COMP_RLE = 0x1000	data resource is compressed with RLE
GFX_RESOURCE_COMP_IPU = 0x2000	data resource compressed with DEFLATE (for IPU)
GFX_RESOURCE_MCHP_MBITMAP_FLASH_NONE = (GFX_RESOURCE_TYPE_MCHP_MBITMAP GFX_RESOURCE_MEMORY_FLASH GFX_RESOURCE_COMP_NONE)	These are common resource combinations used by the graphics library Bitmaps
GFX_RESOURCE_JPEG_FLASH_NONE = (GFX_RESOURCE_TYPE_JPEG GFX_RESOURCE_MEMORY_FLASH GFX_RESOURCE_COMP_NONE)	JPEGS
GFX_RESOURCE_BINARY_FLASH_NONE = (GFX_RESOURCE_TYPE_BINARY GFX_RESOURCE_MEMORY_FLASH GFX_RESOURCE_COMP_NONE)	Binary
GFX_RESOURCE_FONT_FLASH_NONE = (GFX_RESOURCE_TYPE_FONT GFX_RESOURCE_MEMORY_FLASH GFX_RESOURCE_COMP_NONE)	Fonts
GFX_RESOURCE_PALETTE_FLASH_NONE = (GFX_RESOURCE_TYPE_PALETTE GFX_RESOURCE_MEMORY_FLASH GFX_RESOURCE_COMP_NONE)	Palettes

5.2.2.7.26.70 GFX_RESOURCE_BINARY Structure

C

```
typedef struct {
    union {
        uint32_t extAddress;
        uint8_gfx_image_prog * progByteAddress;
        uint16_gfx_image_prog * progWordAddress;
        const char * constAddress;
        char * ramAddress;
        __eds__ char * edsAddress;
    } location;
    uint32_t size;
    uint32_t param1;
    uint32_t param2;
} GFX_RESOURCE_BINARY;
```

Description

Structure for Graphics Resource - binary data.

Members

Members	Description
uint32_t extAddress;	generic address
uint8_gfx_image_prog * progByteAddress;	for addresses in program section
uint16_gfx_image_prog * progWordAddress;	for addresses in program section
const char * constAddress;	for addresses in FLASH
char * ramAddress;	for addresses in RAM
__eds__ char * edsAddress;	for addresses in EDS
uint32_t param1;	Parameters used for the GFX_RESOURCE . Depending on the GFX_RESOURCE type definition of param1 can change. For IPU and RLE compressed images, param1 indicates the compressed size of the image.
uint32_t param2;	Parameters used for the GFX_RESOURCE . Depending on the GFX_RESOURCE type

5.2.2.7.26.71 GFX_RESOURCE_FONT Structure**C**

```
typedef struct {
    union {
        uint32_t extAddress;
        GFX_FONT_SPACE char * progByteAddress;
        char * ramAddress;
        __eds__ char * edsAddress;
    } location;
    GFX_FONT_HEADER header;
} GFX_RESOURCE_FONT;
```

Description

Structure for Graphics Resource - Fonts.

Members

Members	Description
__eds__ char * edsAddress;	for addresses in EDS

5.2.2.7.26.72 GFX_RESOURCE_HDR Structure**C**

```
typedef struct {
    GFX_RESOURCE type;
    uint16_t ID;
    union {
        GFX_RESOURCE_IMAGE image;
        GFX_RESOURCE_FONT font;
        GFX_RESOURCE_BINARY binary;
        GFX_RESOURCE_PALETTE palette;
    } resource;
} GFX_RESOURCE_HDR;
```

Description

Structure for Graphics Resource Header. This is the common header for all Graphics Resources.

Members

Members	Description
GFX_RESOURCE type;	Graphics resource type, determines the type and location of data
uint16_t ID;	memory ID, user defined value to differentiate between graphics resources of the same type When using EDS_EPMP the following ID values are reserved and used by the Microchip display driver 0 - reserved (do not use) 1 - reserved for base address of EPMP CS1 2 - reserved for base address of EPMP CS2

5.2.2.7.26.73 GFX_RESOURCE_IMAGE Structure**C**

```
typedef struct {
    union {
        uint32_t extAddress;
        uint8_gfx_image_prog * progByteAddress;
        uint16_gfx_image_prog * progWordAddress;
        const char * constAddress;
        char * ramAddress;
        __eds__ char * edsAddress;
    } location;
    uint16_t width;
    uint16_t height;
    union {
        uint32_t compressedSize;
        uint32_t reserved;
    } parameter1;
    union {
        uint32_t rawSize;
        uint32_t reserved;
    } parameter2;
    uint8_t colorDepth;
    uint8_t type;
    uint16_t paletteID;
} GFX_RESOURCE_IMAGE;
```

Description

Structure for Graphics Resource - image.

Members

Members	Description
uint32_t extAddress;	generic address
uint8_gfx_image_prog * progByteAddress;	for addresses in program section
uint16_gfx_image_prog * progWordAddress;	for addresses in program section
const char * constAddress;	for addresses in FLASH
char * ramAddress;	for addresses in RAM
__eds__ char * edsAddress;	for addresses in EDS
uint16_t width;	width of the image
uint16_t height;	height of the image
uint32_t compressedSize;	Parameters used for the GFX_RESOURCE . Depending on the GFX_RESOURCE type definition of param1 can change. For IPU and RLE compressed images, param1 indicates the compressed size of the image.
uint32_t rawSize;	Parameters used for the GFX_RESOURCE . Depending on the GFX_RESOURCE type definition of param2 can change. For IPU and RLE compressed images, param2 indicates the uncompressed size of the image.

uint8_t colorDepth;	color depth of the image
uint8_t type;	type of image, information on how to render the image 0x00 - no compression, palette is present for color depth = 8, 4 and 1 BPP 0x10 - palette is provided as a separate object (see PALETTE_HEADER) for color depth = 8, 4, and 1 BPP, ID to the palette is embedded color depth = 8, 4, and 1 BPP, in the bitmap. 0xYY - reserved
uint16_t paletteID;	if type == MCHP_BITMAP_PALETTE_STR (0x10), this represents the unique ID of the palette being used

5.2.2.7.26.74 GFX_RESOURCE_PALETTE Structure

C

```
typedef struct {
    union {
        uint32_t extAddress;
        const GFX_PALETTE_ENTRY * constByteAddress;
        GFX_PALETTE_ENTRY * ramAddress;
    } location;
    uint16_t numberOfEntries;
    uint16_t paletteID;
} GFX_RESOURCE_PALETTE;
```

Description

Structure for Graphics Resource - Palette.

Members

Members	Description
uint16_t paletteID;	Unique ID of the palette that will match the ID in the GFX_RESOURCE_HDR if the image has palette removed and supplied as a separate object.

5.2.2.7.26.75 GFX_STATUS Enumeration

C

```
typedef enum {
    GFX_STATUS_FAILURE = 0,
    GFX_STATUS_SUCCESS = 1
} GFX_STATUS;
```

Description

Status types for rendering.

5.2.2.7.26.76 GFX_STATUS_BIT Enumeration

C

```
typedef enum {
    GFX_STATUS_FAILURE_BIT = 0,
    GFX_STATUS_SUCCESS_BIT = 1,
    GFX_STATUS_ERROR_BIT = 2,
    GFX_STATUS_BUSY_BIT = 4,
    GFX_STATUS_READY_BIT = 8
} GFX_STATUS_BIT;
```

Description

Bit masks for additional status information.

5.2.2.7.26.77 GFX_TRANSITION_DIRECTION Enumeration

C

```
typedef enum {
    LEFT_TO_RIGHT = 0,
    RIGHT_TO_LEFT,
    TOP_TO_BOTTOM,
    BOTTOM_TO_TOP,
    HORIZONTAL,
    VERTICAL
} GFX_TRANSITION_DIRECTION;
```

Description

Direction enumeration to determine the direction of the selected [GFX_TRANSITION_TYPE](#).

Members

Members	Description
LEFT_TO_RIGHT = 0	option used in SLIDE, PUSH transition type (GFX_TRANSITION_TYPE)
RIGHT_TO_LEFT	option used in SLIDE, PUSH transition type (GFX_TRANSITION_TYPE)
TOP_TO_BOTTOM	option used in SLIDE, PUSH transition type (GFX_TRANSITION_TYPE)
BOTTOM_TO_TOP	option used in SLIDE, PUSH transition type (GFX_TRANSITION_TYPE)
HORIZONTAL	option used in EXPANDING_LINE and CONTRACTING_LINE transition type (GFX_TRANSITION_TYPE)
VERTICAL	option used in EXPANDING_LINE and CONTRACTING_LINE transition type (GFX_TRANSITION_TYPE)

5.2.2.7.26.78 GFX_TRANSITION_PARAMS Structure

C

```
typedef struct {
    uint16_t left;
    uint16_t top;
    uint16_t delay_ms;
    uint8_t sourcePage;
    uint8_t destinationPage;
    uint8_t type;
    uint8_t param1;
    uint8_t param2;
} GFX_TRANSITION_PARAMS;
```

Description

GFX transition parameters

Remarks

None.

5.2.2.7.26.79 GFX_TRANSITION_TYPE Enumeration

C

```
typedef enum {
    EXPANDING_RECTANGLE = 0,
    CONTRACTING_RECTANGLE,
    SLIDE,
    PUSH,
    EXPANDING_LINE,
    CONTRACTING_LINE
}
```

```
} GFX_TRANSITION_TYPE;
```

Description

Transition type enumeration to determine the type of the transition. Each type will require specific parameters when setting up the transition operation (GFXSetupTransition() or GFXTransition()).

GFX_TRANSITION_TYPE	param1	param2 (sets the direction of transition)
PLAIN	pixel block size	not used
EXPANDING_RECTANGLE	pixel block size	not used
CONTRACTING_RECTANGLE	pixel block size	not used
SLIDE	pixel block size	LEFT_TO_RIGHT, RIGHT_TO_LEFT, TOP_TO_BOTTOM, BOTTOM_TO_TOP
PUSH	pixel block size	LEFT_TO_RIGHT, RIGHT_TO_LEFT, TOP_TO_BOTTOM, BOTTOM_TO_TOP
EXPANDING_LINE	pixel block size	HORIZONTAL, VERTICAL
CONTRACTING_LINE	pixel block size	HORIZONTAL, VERTICAL

Members

Members	Description
EXPANDING_RECTANGLE = 0	param1 -> Pixel-block size
CONTRACTING_RECTANGLE	param1 -> Pixel-block size
SLIDE	param1 -> Pixel-block size, param2 -> Sliding direction LEFT_TO_RIGHT/RIGHT_TO_LEFT/TOP_TO_BOTTOM/BOTTOM_TO_TOP
PUSH	param1 -> Pixel-block size, param2 -> Sliding direction LEFT_TO_RIGHT/RIGHT_TO_LEFT/TOP_TO_BOTTOM/BOTTOM_TO_TOP
EXPANDING_LINE	param1 -> Pixel-block size, param2 -> direction HORIZONTAL/VERTICAL
CONTRACTING_LINE	param1 -> Pixel-block size, param2 -> direction HORIZONTAL/VERTICAL

5.2.2.7.26.80 GFX_TRIG_FUNCTION_TYPE Enumeration

C

```
typedef enum {
    GFX_TRIG_SINE_TYPE = 0,
    GFX_TRIG_COSINE_TYPE = 1
} GFX_TRIG_FUNCTION_TYPE;
```

Description

DOM-IGNORE-START

- Overview: Graphics Library helper function for trigonometric sine
- cosine angles are defined in a sine/cosine table.
- This type enumeration specifies if the value retrieved
- from that look up table is for a sine(angle) or
- cosine(angle) value.

5.2.2.7.26.81 GOL_PANEL_PARAM Structure

C

```
typedef struct {
    int16_t panelLeft;
    int16_t panelTop;
    int16_t panelRight;
    int16_t panelBottom;
    GFX_COLOR panelFaceColor;
    GFX_COLOR panelEmbossLtColor;
    GFX_COLOR panelEmbossDkColor;
    uint16_t panelEmbossSize;
    uint16_t panelRadius;
    GFX_RESOURCE_HDR * pPanelImage;
    GFX_FILL_STYLE panelFillStyle;
    GFX_COLOR panelGradientStartColor;
    GFX_COLOR panelGradientEndColor;
    uint16_t panelAlpha;
} GOL_PANEL_PARAM;
```

Description

GOL_PANEL_PARAM

This structure defines the panel parameters when rendering a panel.

Remarks

None.

5.2.2.7.26.82 GRID Structure

C

```
typedef struct {
    GFX_GOL_OBJ_HEADER hdr;
    short numColumns;
    short numRows;
    short cellHeight;
    short cellWidth;
    short focusX;
    short focusY;
    GRIDITEM * gridObjects;
} GRID;
```

Description

Defines the parameters required for a grid Object. Clipping is not supported in grid object.

Members

Members	Description
GFX_GOL_OBJ_HEADER hdr;	Generic header for all Objects (see GFX_OBJ_HEADER).
short numColumns;	Number of columns drawn for the Grid.
short numRows;	Number of rows drawn for the Grid.
short cellHeight;	The height of each cell in pixels.
short cellWidth;	The width of each cell in pixels.
short focusX;	The x position of the cell to be focused.
short focusY;	The y position of the cell to be focused.
GRIDITEM * gridObjects;	The pointer to grid items

5.2.2.7.26.83 GRIDITEM Structure

C

```
typedef struct {  
    void * data;  
    uint16_t status;  
} GRIDITEM;
```

Description

Defines the grid item.

Members

Members	Description
void * data;	Indicates if the Grid Item is type GRIDITEM_IS_TEXT or GRIDITEM_IS_BITMAP
uint16_t status;	indicates the status of the Grid Item

5.2.2.7.26.84 IMAGE_STRETCH Enumeration

C

```
typedef enum {  
    IMAGE_NORMAL = 1,  
    IMAGE_X2 = 2  
} IMAGE_STRETCH;
```

Description

GFX image stretch

Remarks

None.

5.2.2.7.26.85 IMG_FILE_FORMAT Type

C

```
typedef enum _IMG_FILE_FORMAT IMG_FILE_FORMAT;
```

Description

IMG_ImageFileFormat specifies all the supported image file formats

5.2.2.7.26.86 IMG_FILE_SYSTEM_API Type

C

```
typedef struct _IMG_FILE_SYSTEM_API IMG_FILE_SYSTEM_API;
```

Description

IMG_FileSystemAPI holds function pointers to the used File System APIs

5.2.2.7.26.87 IMG_LOOP_CALLBACK Type

C

```
typedef void (* IMG_LOOP_CALLBACK)(void);
```

Description

IMG_LoopCallback is a callback function which is called in every loop of the decoding cycle so that user application can do some

maintainance activities

5.2.2.7.26.88 IMG_PIXEL_OUTPUT Type

C

```
typedef void (* IMG_PIXEL_OUTPUT)(IMG_PIXEL_XY_RGB_888 *pPix);
```

Description

IMG_PixelOutput is a callback function which receives the color information of the output pixel

5.2.2.7.26.89 IMG_PIXEL_XY_RGB_888 Type

C

```
typedef struct _IMG_PIXEL_XY_RGB_888 IMG_PIXEL_XY_RGB_888;
```

Description

IMG_PixelRgb holds the RGB information of a pixel in BYTES

5.2.2.7.26.90 INPUT_DEVICE_EVENT Enumeration

C

```
typedef enum {
    EVENT_INVALID = 0,
    EVENT_MOVE,
    EVENT_PRESS,
    EVENT_STILLPRESS,
    EVENT_RELEASE,
    EVENT_KEYSCAN,
    EVENT_CHARCODE,
    EVENT_SET,
    EVENT_SET_STATE,
    EVENT_CLR_STATE
} INPUT_DEVICE_EVENT;
```

Description

INPUT_DEVICE_EVENT

This enumeration specifies the different user input device events supported in the library.

Members

Members	Description
EVENT_INVALID = 0	An invalid event.
EVENT_MOVE	A move event.
EVENT_PRESS	A press event.
EVENT_STILLPRESS	A continuous press event.
EVENT_RELEASE	A release event.
EVENT_KEYSCAN	A keyscan event, parameters has the object ID keyboard scan code.
EVENT_CHARCODE	Character code is presented at the parameters.
EVENT_SET	A generic set event.
EVENT_SET_STATE	A set state event.
EVENT_CLR_STATE	A clear state event.

Remarks

None.

5.2.2.7.26.91 INPUT_DEVICE_TYPE Enumeration

C

```
typedef enum {
    TYPE_UNKNOWN = 0,
    TYPE_KEYBOARD,
    TYPE_TOUCHSCREEN,
    TYPE_MOUSE,
    TYPE_TIMER,
    TYPE_SYSTEM
} INPUT_DEVICE_TYPE;
```

Description

INPUT_DEVICE_TYPE

This enumeration specifies the different user input devices supported in the library.

Members

Members	Description
TYPE_UNKNOWN = 0	Unknown device.
TYPE_KEYBOARD	Keyboard.
TYPE_TOUCHSCREEN	Touchscreen.
TYPE_MOUSE	Mouse.
TYPE_TIMER	Timer.
TYPE_SYSTEM	System Messages.

Remarks

None.

5.2.2.7.26.92 int16_gfx_image_prog Type

C

```
typedef int16_prog_pack int16_gfx_image_prog;
```

Description

This is type int16_gfx_image_prog.

5.2.2.7.26.93 int16_prog Type

C

```
typedef __prog__ int16_t int16_prog;
```

Description

This is type int16_prog.

5.2.2.7.26.94 int16_prog_pack Type

C

```
typedef __pack_upper_byte int16_t int16_prog_pack;
```

Description

This is type int16_prog_pack.

5.2.2.7.26.95 int32_gfx_image_prog Type

C

```
typedef int32_prog_pack int32_gfx_image_prog;
```

Description

This is type int32_gfx_image_prog.

5.2.2.7.26.96 int32_prog Type

C

```
typedef __prog__ int32_t int32_prog;
```

Description

This is type int32_prog.

5.2.2.7.26.97 int32_prog_pack Type

C

```
typedef __pack_upper_byte int32_t int32_prog_pack;
```

Description

This is type int32_prog_pack.

5.2.2.7.26.98 int8_gfx_image_prog Type

C

```
typedef int8_prog_pack int8_gfx_image_prog;
```

Description

This is type int8_gfx_image_prog.

5.2.2.7.26.99 int8_prog Type

C

```
typedef __prog__ int8_t int8_prog;
```

Description

This is type int8_prog.

5.2.2.7.26.100 int8_prog_pack Type

C

```
typedef __pack_upper_byte int8_t int8_prog_pack;
```

Description

This is type int8_prog_pack.

5.2.2.7.26.101 KEYMEMBER Structure

C

```
typedef struct {
```

```

uint16_t left;
uint16_t top;
uint16_t right;
uint16_t bottom;
uint16_t index;
uint16_t state;
bool update;
GFX_GOL_TEXTENTRY_KEY_COMMAND_TYPE command;
GFX_XCHAR * pKeyName;
int16_t textWidth;
int16_t textHeight;
void * pNextKey;
} KEYMEMBER;

```

Description

Defines the parameters and the strings assigned for each key.

Members

Members	Description
uint16_t left;	Left position of the key
uint16_t top;	Top position of the key
uint16_t right;	Right position of the key
uint16_t bottom;	Bottom position of the key
uint16_t index;	Index of the key in the list
uint16_t state;	State of the key. Either Pressed (GFX_GOL_TEXTENTRY_KEY_PRESSED_STATE) or Released (0)
bool update;	flag to indicate key is to be redrawn with the current state
GFX_GOL_TEXTENTRY_KEY_COMMAND_TYPE command;	Command of the key. Either TE_DELETE_COM, TE_SPACE_COM or TE_ENTER_COM.
GFX_XCHAR * pKeyName;	Pointer to the custom text assigned to the key. This is displayed over the face of the key.
int16_t textWidth;	Computed text width, done at creation. Used to predict size and position of text on the key face.
int16_t textHeight;	Computed text height, done at creation. Used to predict size and position of text on the key face.
void * pNextKey;	Pointer to the next key parameters.

5.2.2.7.26.102 LAYER_ACTIONS Enumeration

C

```

typedef enum {
    ENABLE = 0x80,
    DISABLE = 0,
    UPDATE,
    SET_SIZE,
    SET_PAGE,
    SET_PAGE_START,
    SET_LAYER_START
} LAYER_ACTIONS;

```

Description

GFX layering actions

Remarks

None.

5.2.2.7.26.103 PALETTE_ENTRY Union

C

```
typedef union {
    uint16_t value;
    struct {
        uint16_t r : 5;
        uint16_t g : 6;
        uint16_t b : 5;
    } color;
    struct {
        uint16_t reserved : 12;
        uint16_t luma : 4;
    } monochrome;
} PALETTE_ENTRY;
```

Description

Structure used for the palette entries.

- For TFT: color is defined as 5-6-5 RGB format (5-bits for RED, 6-bits for GREEN and 5-bits for BLUE.
- For Monochrome: 4 bits are used to represent the luma.

Members

Members	Description
uint16_t value;	a 16-bit value representing a color or palette entry
struct { uint16_t r : 5; uint16_t g : 6; uint16_t b : 5; } color;	color value in 5-6-5 RGB format
uint16_t r : 5;	represents the RED component
uint16_t g : 6;	represents the GREEN component
uint16_t b : 5;	represents the BLUE component
struct { uint16_t reserved : 12; uint16_t luma : 4; } monochrome;	monochrome LUMA value
uint16_t reserved : 12;	reserved, used as a filler
uint16_t luma : 4;	monochrome LUMA value

5.2.2.7.26.104 PALETTE_EXTERNAL Type

C

```
typedef GFX_EXTDATA PALETTE_EXTERNAL;
```

Description

Structure for palette stored in EXTERNAL memory space. (example: External SPI or parallel Flash, EDS_EPMP)

5.2.2.7.26.105 PALETTE_FLASH Structure

C

```
typedef struct {
    short type;
    PALETTE_HEADER header;
```

```

    PALETTE_ENTRY * pPaletteEntry;
} PALETTE_FLASH;

```

Description

Structure for the palette stored in FLASH memory.

Members

Members	Description
short type;	Type must be FLASH
PALETTE_HEADER header;	Contains information on the palette
PALETTE_ENTRY * pPaletteEntry;	Pointer to the palette. Number of entries is determined by the header.

5.2.2.7.26.106 PALETTE_HEADER Structure**C**

```

typedef struct {
    uint16_t id;
    uint16_t length;
} PALETTE_HEADER;

```

Description

Structure for the palette header.

Members

Members	Description
uint16_t id;	User defined ID
uint16_t length;	number of palette entries (number of colors in the palette)

5.2.2.7.26.107 PUTIMAGE_PARAM Structure**C**

```

typedef struct {
    uint16_t width;
    uint16_t height;
    uint16_t xoffset;
    uint16_t yoffset;
    IMAGE_STRETCH stretch;
    uint8_t transparentFlag;
    GFX_COLOR transparentColor;
    uint8_gfx_image_prog* image;
    GFX_COLOR palette[256];
} PUTIMAGE_PARAM;

```

Description

GFX put image param

Members

Members	Description
uint16_t width;	Partial Image width
uint16_t height;	Partial Image height
uint16_t xoffset;	xoffset of image
uint16_t yoffset;	yoffset of image
IMAGE_STRETCH stretch;	stretch of the image
uint8_t transparentFlag;	transparent Color flag

GFX_COLOR transparentColor;	transparent Color
uint8_gfx_image_prog* image;	pointer to the image
GFX_COLOR palette[256];	palette used for <8BPP images

Remarks

None.

5.2.2.7.26.108 uint16_gfx_image_prog Type**C**

```
typedef uint16_prog_pack uint16_gfx_image_prog;
```

Description

This is type uint16_gfx_image_prog.

5.2.2.7.26.109 uint16_prog Type**C**

```
typedef __prog__ uint16_t uint16_prog;
```

Description

This is type uint16_prog.

5.2.2.7.26.110 uint16_prog_pack Type**C**

```
typedef __pack_upper_byte uint16_t uint16_prog_pack;
```

Description

This is type uint16_prog_pack.

5.2.2.7.26.111 uint32_gfx_image_prog Type**C**

```
typedef uint32_prog_pack uint32_gfx_image_prog;
```

Description

This is type uint32_gfx_image_prog.

5.2.2.7.26.112 uint32_prog Type**C**

```
typedef __prog__ uint32_t uint32_prog;
```

Description

This is type uint32_prog.

5.2.2.7.26.113 uint32_prog_pack Type**C**

```
typedef __pack_upper_byte uint32_t uint32_prog_pack;
```

Description

This is type uint32_prog_pack.

5.2.2.7.26.114 uint8_gfx_image_prog Type

C

```
typedef uint8_prog_pack uint8_gfx_image_prog;
```

Description

GFX Image data Types

5.2.2.7.26.115 uint8_prog Type

C

```
typedef __prog__ uint8_t uint8_prog;
```

Description

General program space data types

5.2.2.7.26.116 uint8_prog_pack Type

C

```
typedef __pack_upper_byte uint8_t uint8_prog_pack;
```

Description

This is type uint8_prog_pack.

5.2.2.7.26.117 BLACK Macro

C

```
#define BLACK GFX_RGBConvert(0, 0, 0)
```

Description

This is macro BLACK.

5.2.2.7.26.118 BLUE Macro

C

```
#define BLUE GFX_RGBConvert(0, 0, 128)
```

Description

This is macro BLUE.

5.2.2.7.26.119 BRIGHTBLUE Macro

C

```
#define BRIGHTBLUE GFX_RGBConvert(0, 0, 255)
```

Description

This is macro BRIGHTBLUE.

5.2.2.7.26.120 BRIGHTCYAN Macro

C

```
#define BRIGHTCYAN GFX_RGBConvert(0, 255, 255)
```

Description

This is macro BRIGHTCYAN.

5.2.2.7.26.121 BRIGHTGREEN Macro

C

```
#define BRIGHTGREEN GFX_RGBConvert(0, 255, 0)
```

Description

This is macro BRIGHTGREEN.

5.2.2.7.26.122 BRIGHTMAGENTA Macro

C

```
#define BRIGHTMAGENTA GFX_RGBConvert(255, 0, 255)
```

Description

This is macro BRIGHTMAGENTA.

5.2.2.7.26.123 BRIGHTRED Macro

C

```
#define BRIGHTRED GFX_RGBConvert(255, 0, 0)
```

Description

This is macro BRIGHTRED.

5.2.2.7.26.124 BRIGHTYELLOW Macro

C

```
#define BRIGHTYELLOW GFX_RGBConvert(255, 255, 0)
```

Description

This is macro BRIGHTYELLOW.

5.2.2.7.26.125 BROWN Macro

C

```
#define BROWN GFX_RGBConvert(255, 128, 0)
```

Description

This is macro BROWN.

5.2.2.7.26.126 BURLYWOOD Macro

C

```
#define BURLYWOOD GFX_RGBConvert(222, 184, 135)
```

Description

This is macro BURLYWOOD.

5.2.2.7.26.127 CH_CLR0 Macro**C**

```
#define CH_CLR0 WHITE( )
```

Description

Bright Blue

5.2.2.7.26.128 CH_CLR1 Macro**C**

```
#define CH_CLR1 BLACK( )
```

Description

Bright Red

5.2.2.7.26.129 CH_CLR10 Macro**C**

```
#define CH_CLR10 WHITE( )
```

Description

Light Blue

5.2.2.7.26.130 CH_CLR11 Macro**C**

```
#define CH_CLR11 BLACK( )
```

Description

Light Red

5.2.2.7.26.131 CH_CLR12 Macro**C**

```
#define CH_CLR12 WHITE( )
```

Description

Light Green

5.2.2.7.26.132 CH_CLR13 Macro**C**

```
#define CH_CLR13 BLACK( )
```

Description

Light Yellow

5.2.2.7.26.133 CH_CLR14 Macro

C

```
#define CH_CLR14 WHITE()
```

Description

Light Orange

5.2.2.7.26.134 CH_CLR15 Macro

C

```
#define CH_CLR15 BLACK()
```

Description

Gold

5.2.2.7.26.135 CH_CLR2 Macro

C

```
#define CH_CLR2 WHITE()
```

Description

Bright Green

5.2.2.7.26.136 CH_CLR3 Macro

C

```
#define CH_CLR3 BLACK()
```

Description

Bright Yellow

5.2.2.7.26.137 CH_CLR4 Macro

C

```
#define CH_CLR4 WHITE()
```

Description

Orange

5.2.2.7.26.138 CH_CLR5 Macro

C

```
#define CH_CLR5 BLACK()
```

Description

Blue

5.2.2.7.26.139 CH_CLR6 Macro

C

```
#define CH_CLR6 WHITE()
```

Description

Red

5.2.2.7.26.140 CH_CLR7 Macro

C

```
#define CH_CLR7 BLACK( )
```

Description

Green

5.2.2.7.26.141 CH_CLR8 Macro

C

```
#define CH_CLR8 WHITE( )
```

Description

Yellow

5.2.2.7.26.142 CH_CLR9 Macro

C

```
#define CH_CLR9 BLACK( )
```

Description

Dark Orange

5.2.2.7.26.143 CHART_MARGIN Macro

C

```
#define CHART_MARGIN 2           // Margin from the edges.
```

Description

Margin from the edges.

5.2.2.7.26.144 CHART_YGRIDCOUNT Macro

C

```
#define CHART_YGRIDCOUNT 6           // defines the number of grids to be drawn on the y-axis  
(includes the origin at y).
```

Description

defines the number of grids to be drawn on the y-axis (includes the origin at y).

5.2.2.7.26.145 ConvertColor25 Macro

C

```
#define ConvertColor25(color) (GFX_COLOR)((color & (0x00FCFCFCul))>>2)
```

Description

This is macro ConvertColor25.

5.2.2.7.26.146 ConvertColor50 Macro

C

```
#define ConvertColor50(color) (GFX_COLOR)((color & (0x00FEFEFEul))>>1)
```

Description

75, 50, 25 percentage color conversion macros. Used in converting colors to these percentages when performing alpha blending of colors using software alpha blending operation.

5.2.2.7.26.147 ConvertColor75 Macro

C

```
#define ConvertColor75(color) (GFX_COLOR)(ConvertColor50(color) + ConvertColor25(color))
```

Description

This is macro ConvertColor75.

5.2.2.7.26.148 CopyPageWindow Macro

C

```
#define CopyPageWindow(alphaArea, width, height) \
    GFX_AlphaBlendWindow(alphaArea,width,height,100)
```

Description

None

Preconditions

None

Parameters

Parameters	Description
None	None

Returns

None

Example

None

5.2.2.7.26.149 CYAN Macro

C

```
#define CYAN GFX_RGBConvert(0, 128, 128)
```

Description

This is macro CYAN.

5.2.2.7.26.150 DARKGRAY Macro

C

```
#define DARKGRAY GFX_RGBConvert(64, 64, 64)
```

Description

This is macro DARKGRAY.

5.2.2.7.26.151 DARKORANGE Macro**C**

```
#define DARKORANGE GFX_RGBConvert(255, 140, 0)
```

Description

This is macro DARKORANGE.

5.2.2.7.26.152 GFX_ActivePageGet Macro**C**

```
#define GFX_ActivePageGet GFX_Primitive_instance.activePage
```

Preconditions

None.

Returns

None.

Example

Remarks:

5.2.2.7.26.153 GFX_AlphaParamsSet Macro**C**

```
#define GFX_AlphaParamsSet(fArea, fLeft, fTop, bArea, bLeft, bTop, dArea, dLeft, dTop) \
                                                                    GFX_Primitive_instance.alphaArea.foregroundPage
= fArea;\                                                                    GFX_Primitive_instance.alphaArea.foregroundLeft
= fLeft;\                                                                    GFX_Primitive_instance.alphaArea.foregroundTop
= fTop;\                                                                    GFX_Primitive_instance.alphaArea.backgroundPage
= bArea;\                                                                    GFX_Primitive_instance.alphaArea.backgroundLeft
= bLeft;\                                                                    GFX_Primitive_instance.alphaArea.backgroundTop
= bTop;\                                                                    GFX_Primitive_instance.alphaArea.destinationPag
e                                                                    GFX_Primitive_instance.alphaArea.destinationLef
t                                                                    GFX_Primitive_instance.alphaArea.destinationTop
= dArea;\
= dLeft;\
= dTop
```

5.2.2.7.26.154 GFX_BUFFER1 Macro**C**

```
#define GFX_BUFFER1 (0)
```

Description

This is macro GFX_BUFFER1.

5.2.2.7.26.155 GFX_BUFFER2 Macro**C**

```
#define GFX_BUFFER2 (1)
```

Description

This is macro GFX_BUFFER2.

5.2.2.7.26.156 GFX_COMP_MASK Macro**C**

```
#define GFX_COMP_MASK 0xF000
```

Description

This is macro GFX_COMP_MASK.

5.2.2.7.26.157 GFX_CONFIG_OBJECT_METER_DEGREECOUNT Macro**C**

```
#define GFX_CONFIG_OBJECT_METER_DEGREECOUNT 9
```

Description

This is a Meter compile time option to define how many degrees per scale, computed per octant

Example

for 5 division per octant $45/5 = 9$. So every 9 degrees a scale is drawn for a 5 scale division per octant.

5.2.2.7.26.158 GFX_CONFIG_OBJECT_METER_RESOLUTION Macro**C**

```
#define GFX_CONFIG_OBJECT_METER_RESOLUTION 10
```

Description

This is a Meter compile time option to define the factor that the meter widget will divide min**Value**, max**Value**

5.2.2.7.26.159 GFX_CONFIG_OBJECT_METER_SCALE_COUNT Macro**C**

```
#define GFX_CONFIG_OBJECT_METER_SCALE_COUNT 4
```

Description

This is a Meter compile time option to define how many characters will be allocated for the scale labels. Use this define in accordance to the max**Value**-min**Value**.

Example

if max**Value**-min**Value** = 500, SCALECHARCOUNT should be 3. if max**Value**-min**Value** = 90, SCALECHARCOUNT = 2 You must include the decimal point if this feature is enabled (see MTR_ACCURACY state bit).

5.2.2.7.26.160 GFX_FONT_SPACE Macro**C**

```
#define GFX_FONT_SPACE const
```

Description

Font space section. The fonts can be located in ps**v** (constant) or program space in PIC24/dsPIC MCUs. This define allows for switching of the pointer type used to access the font structure in memory See: GraphicsConfig.h for the application define.

5.2.2.7.26.161 GFX_FontAlignmentSet Macro**C**

```
#define GFX_FontAlignmentSet(align) GFX_Primitive_instance.currentFont.alignment = align;
```

Description

- 1 when font orientation is vertical
- 0 when font orientation is horizontal

Preconditions

None.

Returns

None.

Example**5.2.2.7.26.162 GFX_GOL_ANALOGCLOCK_DISABLED Macro****C**

```
#define GFX_GOL_ANALOGCLOCK_DISABLED 0x0002 // Bit for disabled state.
```

Description

Bit for disabled state.

5.2.2.7.26.163 GFX_GOL_ANALOGCLOCK_DRAW Macro

C

```
#define GFX_GOL_ANALOGCLOCK_DRAW 0x4000 // Bit to indicate button must be redrawn.
```

Description

Bit to indicate button must be redrawn.

5.2.2.7.26.164 GFX_GOL_ANALOGCLOCK_HIDE Macro

C

```
#define GFX_GOL_ANALOGCLOCK_HIDE 0x8000 // Bit to indicate button must be removed from screen.
```

Description

Bit to indicate button must be removed from screen.

5.2.2.7.26.165 GFX_GOL_ANALOGCLOCK_PRESSED Macro

C

```
#define GFX_GOL_ANALOGCLOCK_PRESSED 0x0004 // Bit for press state.
```

Description

Bit for press state.

5.2.2.7.26.166 GFX_GOL_ANALOGCLOCK_TICK Macro

C

```
#define GFX_GOL_ANALOGCLOCK_TICK 0x1000 // Bit to tick second hand
```

Description

Bit to tick second hand

5.2.2.7.26.167 GFX_GOL_ANALOGCLOCK_UPDATE_HOUR Macro

C

```
#define GFX_GOL_ANALOGCLOCK_UPDATE_HOUR 0x2000 // Bit to indicate hour hand must be redrawn
```

Description

Bit to indicate hour hand must be redrawn

5.2.2.7.26.168 GFX_GOL_ANALOGCLOCK_UPDATE_MINUTE Macro

C

```
#define GFX_GOL_ANALOGCLOCK_UPDATE_MINUTE 0x0100 // Bit to indicate minute hand must be redrawn
```

Description

Bit to indicate minute hand must be redrawn

5.2.2.7.26.169 GFX_GOL_ANALOGCLOCK_UPDATE_SECOND Macro

C

```
#define GFX_GOL_ANALOGCLOCK_UPDATE_SECOND 0x0200 // Bit to indicate minute hand must be redrawn
```

Description

Bit to indicate minute hand must be redrawn

5.2.2.7.26.170 GFX_GOL_ButtonPressStateImageGet Macro

C

```
#define GFX_GOL_ButtonPressStateImageGet(pObject, pImage) \
(((GFX_GOL_BUTTON *)pObject)->pPressImage)
```

Description

This function gets the image used when in the pressed state.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

Pointer to the image resource.

Example

None.

5.2.2.7.26.171 GFX_GOL_ButtonPressStateImageSet Macro

C

```
#define GFX_GOL_ButtonPressStateImageSet(pObject, pImage) \
(((GFX_GOL_BUTTON *)pObject)->pPressImage = pImage)
```

Description

This function sets the image to be used when in the pressed state.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.
pImage	pointer to the image resource.

Returns

None.

Example

```
// assume ImageIcon is a valid GFX_RESOURCE_HDR
```

```
GFX_RESOURCE_HDR *pMyIcon = &ImageIcon;  
GFX_GOL_BUTTON *pButton;  
  
GFX_GOL_ButtonPressStateImageSet(pButton , pMyIcon);
```

5.2.2.7.26.172 GFX_GOL_ButtonReleaseStateImageGet Macro

C

```
#define GFX_GOL_ButtonReleaseStateImageGet(pObject, pImage) \  
(((GFX_GOL_BUTTON *)pObject)->pReleaseImage)
```

Description

This function gets the image used when in the released state.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

Pointer to the image resource.

Example

None.

5.2.2.7.26.173 GFX_GOL_ButtonReleaseStateImageSet Macro

C

```
#define GFX_GOL_ButtonReleaseStateImageSet(pObject, pImage) \  
(((GFX_GOL_BUTTON *)pObject)->pReleaseImage = pImage)
```

Description

This function sets the image to be used when in the released state.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.
pImage	pointer to the image resource.

Returns

None.

Example

```
// assume ImageIcon is a valid GFX_RESOURCE_HDR  
  
GFX_RESOURCE_HDR *pMyIcon = &ImageIcon;  
GFX_GOL_BUTTON *pButton;  
  
GFX_GOL_ButtonReleaseStateImageSet(pButton , pMyIcon);
```

5.2.2.7.26.174 GFX_GOL_ButtonTextGet Macro**C**

```
#define GFX_GOL_ButtonTextGet(pObject) (((GFX_GOL_BUTTON *)pObject)->pText)
```

Description

This function returns the address of the current text string used by the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

Pointer to text string.

Example

```
GFX_XCHAR *pChar;
GFX_GOL_BUTTON GFX_GOL_BUTTON[2];

pChar = GFX_GOL_ButtonTextGet(GFX_GOL_BUTTON[0]);
```

5.2.2.7.26.175 GFX_GOL_CHART_3D_ENABLE Macro**C**

```
#define GFX_GOL_CHART_3D_ENABLE 0x0008 // Bit to indicate that bar charts are to be drawn
with 3-D effect
```

Description

Bit to indicate that bar charts are to be drawn with 3-D effect

5.2.2.7.26.176 GFX_GOL_CHART_BAR Macro**C**

```
#define GFX_GOL_CHART_BAR 0x0200 // Bit to indicate the chart is type bar. If both PIE
and BAR types are set BAR type has higher priority.
```

Description

Bit to indicate the chart is type bar. If both PIE and BAR types are set BAR type has higher priority.

5.2.2.7.26.177 GFX_GOL_CHART_BAR_HOR Macro**C**

```
#define GFX_GOL_CHART_BAR_HOR 0x0240 // These bits (with CH_BAR bit set), sets the bar
chart to be drawn horizontally.
```

Description

These bits (with CH_BAR bit set), sets the bar chart to be drawn horizontally.

5.2.2.7.26.178 GFX_GOL_CHART_DISABLED Macro

C

```
#define GFX_GOL_CHART_DISABLED 0x0002    // Bit for disabled state.
```

Description

Bit for disabled state.

5.2.2.7.26.179 GFX_GOL_CHART_DONUT Macro

C

```
#define GFX_GOL_CHART_DONUT 0x0140    // These bits (with CH_PIE bit set), sets the pie  
chart to be drawn in a donut shape.
```

Description

These bits (with CH_PIE bit set), sets the pie chart to be drawn in a donut shape.

5.2.2.7.26.180 GFX_GOL_CHART_DRAW Macro

C

```
#define GFX_GOL_CHART_DRAW 0x4000    // Bit to indicate chart must be redrawn.
```

Description

Bit to indicate chart must be redrawn.

5.2.2.7.26.181 GFX_GOL_CHART_DRAW_DATA Macro

C

```
#define GFX_GOL_CHART_DRAW_DATA 0x2000    // Bit to indicate data portion of the chart must  
be redrawn.
```

Description

Bit to indicate data portion of the chart must be redrawn.

5.2.2.7.26.182 GFX_GOL_CHART_HIDE Macro

C

```
#define GFX_GOL_CHART_HIDE 0x8000    // Bit to indicate chart must be removed from screen.
```

Description

Bit to indicate chart must be removed from screen.

5.2.2.7.26.183 GFX_GOL_CHART_LEGEND Macro

C

```
#define GFX_GOL_CHART_LEGEND 0x0001    // Bit to indicate that legend is to be shown. Usable  
only when seriesCount > 1.
```

Description

Bit to indicate that legend is to be shown. Usable only when seriesCount > 1.

5.2.2.7.26.184 GFX_GOL_CHART_NUMERIC Macro

C

```
#define GFX_GOL_CHART_NUMERIC 0x0080 // This bit is used only for bar charts. If this bit is set, it indicates that the
```

Description

This bit is used only for bar charts. If this bit is set, it indicates that the bar chart labels for variables are numeric. If this bit is not set, it indicates that the bar chart labels for variables are alphabets.

5.2.2.7.26.185 GFX_GOL_CHART_PERCENT Macro

C

```
#define GFX_GOL_CHART_PERCENT 0x0010 // Bit to indicate that the pie chart will be drawn with percentage values shown for the sample data.
```

Description

Bit to indicate that the pie chart will be drawn with percentage values shown for the sample data. For bar chart, if CH_VALUE is set, it toggles the value shown to percentage.

5.2.2.7.26.186 GFX_GOL_CHART_PIE Macro

C

```
#define GFX_GOL_CHART_PIE 0x0100 // Bit to indicate the chart is type pie. If both PIE and BAR types are set BAR type has higher priority.
```

Description

Bit to indicate the chart is type pie. If both PIE and BAR types are set BAR type has higher priority.

5.2.2.7.26.187 GFX_GOL_CHART_VALUE Macro

C

```
#define GFX_GOL_CHART_VALUE 0x0004 // Bit to indicate that the values of the bar chart data or pie chart data are to be shown
```

Description

Bit to indicate that the values of the bar chart data or pie chart data are to be shown

5.2.2.7.26.188 GFX_GOL_ChartAxisLabelFontGet Macro

C

```
#define GFX_GOL_ChartAxisLabelFontGet(pCh) (((GFX_GOL_CHART *)pCh)->prm.pAxisLabelsFont)
```

Description

Macros: GFX_GOL_ChartAxisLabelFontGet(pCh)

This macro returns the location of the font used for the X and Y axis labels of the chart.

Preconditions

none

Parameters

Parameters	Description
pCh	Pointer to the object.

Returns

Returns the address of the current font used for the title text.

Side Effects

none

5.2.2.7.26.189 GFX_GOL_ChartAxisLabelFontSet Macro**C**

```
#define GFX_GOL_ChartAxisLabelFontSet(pCh, pNewFont) (((GFX_GOL_CHART *)pCh)->prm.pAxisLabelsFont = pNewFont)
```

Description

Macros: GFX_GOL_ChartAxisLabelFontSet(pCh, pNewFont)

This macro sets the location of the font used for the X and Y axis labels of the chart.

Preconditions

none

Parameters

Parameters	Description
pCh	Pointer to the object.
pNewFont	Pointer to the font used.

Returns

none.

Side Effects

none

Example

See ChCreate() example.

5.2.2.7.26.190 GFX_GOL_ChartColorTableGet Macro**C**

```
#define GFX_GOL_ChartColorTableGet(pCh) (((GFX_GOL_CHART *)pCh)->prm.pColor)
```

Description

Macros: GFX_GOL_ChartColorTableGet(pCh)

This macro returns the current color table used for the pie and bar charts.

Preconditions

none

Parameters

Parameters	Description
pCh	Pointer to the object.

Returns

Returns the address of the color table used.

Side Effects

none

5.2.2.7.26.191 GFX_GOL_ChartColorTableSet Macro**C**

```
#define GFX_GOL_ChartColorTableSet(pCh, pNewTable) (((GFX_GOL_CHART *)pCh)->prm.pColor) = pNewTable)
```

Description

Macros: GFX_GOL_ChartColorTableSet(pCh, pNewTable)

This macro sets the color table used to draw the data in pie and bar charts.

Preconditions

none

Parameters

Parameters	Description
pCh	Pointer to the object.
pNewTable	Pointer to the color table that will be used.

Returns

none.

Side Effects

none

5.2.2.7.26.192 GFX_GOL_ChartGridLabelFontGet Macro**C**

```
#define GFX_GOL_ChartGridLabelFontGet(pCh) (((GFX_GOL_CHART *)pCh)->prm.pGridLabelsFont)
```

Description

Macros: GFX_GOL_ChartGridLabelFontGet(pCh)

This macro returns the location of the font used for the X and Y axis grid labels of the chart.

Preconditions

none

Parameters

Parameters	Description
pCh	Pointer to the object.

Returns

Returns the address of the current font used for the title text.

Side Effects

none

5.2.2.7.26.193 GFX_GOL_ChartGridLabelFontSet Macro**C**

```
#define GFX_GOL_ChartGridLabelFontSet(pCh, pNewFont) (((GFX_GOL_CHART *)pCh)->prm.pGridLabelsFont = pNewFont)
```

Description

Macros: GFX_GOL_ChartGridLabelFontSet(pCh, pNewFont)

This macro sets the location of the font used for the X and Y axis grid labels of the chart.

Preconditions

none

Parameters

Parameters	Description
pCh	Pointer to the object.
pNewFont	Pointer to the font used.

Returns

none.

Side Effects

none

Example

See ChCreate() example.

5.2.2.7.26.194 GFX_GOL_ChartPercentMaxGet Macro**C**

```
#define GFX_GOL_ChartPercentMaxGet(pCh) (pCh->prm.perMax)
```

Description

Macros: ChGetPercentMax(pCh)

This macro returns the current maximum value of the percentage range that will be drawn for bar charts when CH_PERCENTAGE bit state is set.

Preconditions

none

Parameters

Parameters	Description
pCh	Pointer to the object.

Returns

Returns the maximum percentage value set when bar charts are drawn.

Side Effects

none

5.2.2.7.26.195 GFX_GOL_ChartPercentMinGet Macro**C**

```
#define GFX_GOL_ChartPercentMinGet(pCh) (pCh->prm.perMin)
```

Description

Macros: ChGetPercentMin(pCh)

This macro returns the current minimum value of the percentage range that will be drawn for bar charts when CH_PERCENTAGE bit state is set.

Preconditions

none

Parameters

Parameters	Description
pCh	Pointer to the object.

Returns

Returns the minimum percentage value when bar charts are drawn.

Side Effects

none

5.2.2.7.26.196 GFX_GOL_ChartPercentRangeGet Macro**C**

```
#define GFX_GOL_ChartPercentRangeGet(pCh) (pCh->prm.perMax - pCh->prm.perMin)
```

Description

This macro gets the percentage range for bar charts. The value returned is calculated from percentage max - min. To get the minimum use ChGetPercentMin() and to get the maximum use ChGetPercentMax().

Preconditions

none

Parameters

Parameters	Description
pCh	Pointer to the chart object.

Returns

Percentage range computed from max-min.

Side Effects

none.

5.2.2.7.26.197 GFX_GOL_ChartSampleEndGet Macro

C

```
#define GFX_GOL_ChartSampleEndGet(pCh) (((GFX_GOL_CHART *)pCh)->prm.smpLEnd
```

Description

Macros: GFX_GOL_ChartSampleEndGet(pCh)

This macro returns the sampling end value.

Preconditions

none

Parameters

Parameters	Description
pCh	Pointer to the object.

Returns

Returns the sample end point.

Side Effects

none

5.2.2.7.26.198 GFX_GOL_ChartSampleLabelGet Macro

C

```
#define GFX_GOL_ChartSampleLabelGet(pCh) (((GFX_GOL_CHART *)pCh)->prm.pSmpLLabel)
```

Description

Macros: GFX_GOL_ChartSampleLabelGet(pCh)

This macro returns the address of the current text string used for the sample axis label of the bar chart.

Preconditions

none

Parameters

Parameters	Description
pCh	Pointer to the object.

Returns

Returns the pointer to the current sample axis label text of the bar chart.

Side Effects

none

5.2.2.7.26.199 GFX_GOL_ChartSampleLabelSet Macro

C

```
#define GFX_GOL_ChartSampleLabelSet(pCh, pNewXLabel) (((GFX_GOL_CHART *)pCh)->prm.pSmpLLabel =  
pNewXLabel)
```

Description

Macros: GFX_GOL_ChartSampleLabelSet(pCh, pNewXLabel)

This macro sets the address of the current text string used for the sample axis label of the bar chart.

Preconditions

none

Parameters

Parameters	Description
pCh	Pointer to the object.
pNewXLabel	pointer to the string to be used as an sample axis label of the bar chart.

Returns

none.

Side Effects

none

Example

See ChCreate() example.

5.2.2.7.26.200 GFX_GOL_ChartSampleRangeGet Macro**C**

```
#define GFX_GOL_ChartSampleRangeGet(pCh) (GFX_GOL_ChartSampleEndGet(pCh) -  
GFX_GOL_ChartSampleStartGet(pCh))
```

Description

This macro gets the sample range for pie or bar charts. The value returned is calculated from smplEnd - smplStart.

Preconditions

none

Parameters

Parameters	Description
pCh	Pointer to the chart object.

Returns

Sample range computed from smplEnd - smplStart.

Side Effects

none.

5.2.2.7.26.201 GFX_GOL_ChartSampleStartGet Macro**C**

```
#define GFX_GOL_ChartSampleStartGet(pCh) (((GFX_GOL_CHART *)pCh)->prm.smplStart)
```

Description

Macros: GFX_GOL_ChartSampleStartGet(pCh)

This macro returns the sampling start value.

Preconditions

none

Parameters

Parameters	Description
pCh	Pointer to the object.

Returns

Returns the sample start point.

Side Effects

none

5.2.2.7.26.202 GFX_GOL_ChartSeriesHide Macro**C**

```
#define GFX_GOL_ChartSeriesHide(pCh, seriesNum) (GFX_GOL_ChartDataSet(pCh, seriesNum, HIDE_DATA))
```

Description

Macros: GFX_GOL_ChartSeriesHide(CHART *pCh, uint16_t seriesNum)

This macro sets the specified data series number show flag to be set to **HIDE_DATA**.

Preconditions

none

Parameters

Parameters	Description
pCh	Pointer to the chart object.
seriesNum	The data series number that will be modified. If this number is zero, all the entries' flag in the list will be set to HIDE_DATA .

Returns

Returns the same passed number if successful otherwise -1 if unsuccessful.

Side Effects

none

Example

See ChShowSeries() example.

5.2.2.7.26.203 GFX_GOL_ChartShowSeriesCountGet Macro**C**

```
#define GFX_GOL_ChartShowSeriesCountGet(pCh) (pCh->prm.seriesCount)
```

Description

Macros: GFX_GOL_ChartShowSeriesCountGet(pCh)

This macro shows the number of data series that has its show flag set to **SHOW_DATA**

Preconditions

none

Parameters

Parameters	Description
pCh	Pointer to the object.

Returns

Returns the number of data series with its show flag set to [SHOW_DATA](#).

Side Effects

none

5.2.2.7.26.204 GFX_GOL_ChartShowSeriesSet Macro**C**

```
#define GFX_GOL_ChartShowSeriesSet(pCh, seriesNum) (GFX_GOL_ChartDataSeriesSet(pCh, seriesNum, SHOW_DATA))
```

Description

Macros: short GFX_GOL_ChartShowSeriesSet(CHART *pCh, uint16_t seriesNum)

This macro sets the specified data series number show flag to be set to [SHOW_DATA](#).

Preconditions

none

Parameters

Parameters	Description
pCh	Pointer to the chart object.
seriesNum	The data series number that will be modified. If this number is zero, all the entries' flag in the list will be set to SHOW_DATA .

Returns

Returns the same passed number if successful otherwise -1 if unsuccessful.

Side Effects

none

Example

```
// from the example in ChCreate() we change the items to be shown when
// GFX_OBJ_Draw() is called.

// reset all data series to be HIDE_DATA
ChHideSeries(pMyChart, 0);
// set data series 1 (V1Data) to be shown
ChShowSeries(pMyChart, 1);
// draw the chart
GFX_OBJ_Draw();
.....
*
```

5.2.2.7.26.205 GFX_GOL_ChartShowSeriesStatusGet Macro**C**

```
#define GFX_GOL_ChartShowSeriesStatusGet(pDSeries) (pDSeries->show)
```

Description

Macros: GFX_GOL_ChartShowSeriesStatusGet(pDSeries)

This macro returns the show ID status of the [DATASERIES](#).

Preconditions

none

Parameters

Parameters	Description
pDSeries	Pointer to the data series(DATASERIES) that is being checked.

Returns

Returns the status of the show flag. 1 - ([SHOW_DATA](#)) means that the show status flag is set. 0 - ([HIDE_DATA](#)) means that the show status flag is not set.

Side Effects

none

5.2.2.7.26.206 GFX_GOL_ChartTitleFontGet Macro**C**

```
#define GFX_GOL_ChartTitleFontGet(pCh) (((GFX_GOL_CHART *)pCh)->prm.pTitleFont)
```

Description

Macros: GFX_GOL_ChartTitleFontGet(pCh)

This macro returns the location of the font used for the title of the chart.

Preconditions

none

Parameters

Parameters	Description
pCh	Pointer to the object.

Returns

Returns the address of the current font used for the title text.

Side Effects

none

5.2.2.7.26.207 GFX_GOL_ChartTitleFontSet Macro**C**

```
#define GFX_GOL_ChartTitleFontSet(pCh, pNewFont) (((GFX_GOL_CHART *)pCh)->prm.pTitleFont = pNewFont)
```

Description

Macros: GFX_GOL_ChartTitleFontSet(pCh, pNewFont)

This macro sets the location of the font used for the title of the chart.

Preconditions

none

Parameters

Parameters	Description
pCh	Pointer to the object.
pNewFont	Pointer to the font used.

Returns

none.

Side Effects

none

Example

See ChCreate() example.

5.2.2.7.26.208 GFX_GOL_ChartTitleGet Macro**C**

```
#define GFX_GOL_ChartTitleGet(pCh) (((GFX_GOL_CHART *)pCh)->prm.pTitle)
```

Description

Macros: GFX_GOL_ChartTitleGet(pCh)

This macro returns the address of the current text string used for the title of the chart.

Preconditions

none

Parameters

Parameters	Description
pCh	Pointer to the object.

Returns

Returns the pointer to the current title text used.

Side Effects

none

5.2.2.7.26.209 GFX_GOL_ChartTitleSet Macro**C**

```
#define GFX_GOL_ChartTitleSet(pCh, pNewTitle) (((GFX_GOL_CHART *)pCh)->prm.pTitle = pNewTitle)
```

Description

Macros: GFX_GOL_ChartTitleSet(pCh, pNewTitle)

This macro sets the address of the current text string used for the title of the chart.

Preconditions

none

Parameters

Parameters	Description
pCh	Pointer to the object.
pNewTitle	pointer to the string to be used as a title of the chart.

Returns

none.

Side Effects

none

Example

See ChCreate() example.

5.2.2.7.26.210 GFX_GOL_ChartValueLabelGet Macro**C**

```
#define GFX_GOL_ChartValueLabelGet(pCh) (((GFX_GOL_CHART *)pCh)->prm.pValLabel)
```

Description

Macros: GFX_GOL_ChartValueLabelGet(pCh)

This macro returns the address of the current text string used for the value axis label of the bar chart.

Preconditions

none

Parameters

Parameters	Description
pCh	Pointer to the object.

Returns

Returns the pointer to the current value axis label text of the bar chart.

Side Effects

none

5.2.2.7.26.211 GFX_GOL_ChartValueLabelSet Macro**C**

```
#define GFX_GOL_ChartValueLabelSet(pCh, pNewValueLabel) (((GFX_GOL_CHART *)pCh)->prm.pValLabel = pNewValueLabel)
```

Description

Macros: GFX_GOL_ChartValueLabelSet(pCh, pNewYLabel)

This macro sets the address of the current text string used for the value axis label of the bar chart.

Preconditions

none

Parameters

Parameters	Description
pCh	Pointer to the object.
pNewYLabel	pointer to the string to be used as an value axis label of the bar chart.

Returns

none.

Side Effects

none

Example

See ChCreate() example.

5.2.2.7.26.212 GFX_GOL_ChartValueMaxGet Macro**C**

```
#define GFX_GOL_ChartValueMaxGet(pCh) (pCh->prm.valMax)
```

Description

Macros: GFX_GOL_ChartValueMaxGet(pCh)

This macro returns the current maximum value that will be drawn for bar charts.

Preconditions

none

Parameters

Parameters	Description
pCh	Pointer to the object.

Returns

Returns the maximum value set when bar charts are drawn.

Side Effects

none

5.2.2.7.26.213 GFX_GOL_ChartValueMinGet Macro**C**

```
#define GFX_GOL_ChartValueMinGet(pCh) (pCh->prm.valMin)
```

Description

Macros: GFX_GOL_ChartValueMinGet(pCh)

This macro returns the current minimum value that will be drawn for bar charts.

Preconditions

none

Parameters

Parameters	Description
pCh	Pointer to the object.

Returns

Returns the minimum value set when bar charts are drawn.

Side Effects

none

5.2.2.7.26.214 GFX_GOL_ChartValueRangeGet Macro**C**

```
#define GFX_GOL_ChartValueRangeGet(pCh) (pCh->prm.valMax - pCh->prm.valMin)
```

Description

This macro gets the current range for bar charts. The value returned is calculated from the current (valMax - valMin) set. To get the minimum use ChGetValueMin() and to get the maximum use ChGetValueMax().

Preconditions

none

Parameters

Parameters	Description
pCh	Pointer to the chart object.

Returns

Value range computed from valMax-valMin.

Side Effects

none.

5.2.2.7.26.215 GFX_GOL_CheckBoxTextGet Macro**C**

```
#define GFX_GOL_CheckBoxTextGet(pObject) (((GFX_GOL_CHECKBOX *)pObject)->pText)
```

Description

This function returns the address of the current text string used by the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

Pointer to text string.

Example

```
// assume CHECK_BOX_OBJECT is a radio button that exists
GFX_XCHAR *pChar;
GFX_GOL_CHECKBOX *pObject = &CHECK_BOX_OBJECT;

pChar = GFX_GOL_CheckBoxTextGet(pObject);
```

5.2.2.7.26.216 GFX_GOL_CUSTOMCONTROL_DISABLED Macro

C

```
#define GFX_GOL_CUSTOMCONTROL_DISABLED 0x0002 // disabled
```

Description

disabled

5.2.2.7.26.217 GFX_GOL_CUSTOMCONTROL_DRAW Macro

C

```
#define GFX_GOL_CUSTOMCONTROL_DRAW 0x4000 // whole control must be redrawn
```

Description

whole control must be redrawn

5.2.2.7.26.218 GFX_GOL_CUSTOMCONTROL_DRAW_BAR Macro

C

```
#define GFX_GOL_CUSTOMCONTROL_DRAW_BAR 0x2000 // control bar should be redrawn
```

Description

control bar should be redrawn

5.2.2.7.26.219 GFX_GOL_CUSTOMCONTROL_HIDE Macro

C

```
#define GFX_GOL_CUSTOMCONTROL_HIDE 0x8000 // must be removed from screen
```

Description

must be removed from screen

5.2.2.7.26.220 GFX_GOL_CustomControlGetPos Macro

C

```
#define GFX_GOL_CustomControlGetPos(pCc) pCc->pos
```

Description

Macros: GFX_GOL_CustomControlGetPos(pCc)

returns position

Preconditions

none

Parameters

Parameters	Description
pCc	pointer to the object

Returns

current position

Side Effects

none

Remarks

none

5.2.2.7.26.221 GFX_GOL_CustomControlSetPos Macro

C

```
#define GFX_GOL_CustomControlSetPos(pCc, position) pCc->pos = position
```

Description

Macros: GFX_GOL_CustomControlSetPos(pCc,position)

sets the current position of the control

Preconditions

none

Parameters

Parameters	Description
pCc	the pointer to the object
position	new position

Returns

none

Remarks

none

5.2.2.7.26.222 GFX_GOL_DIGITALMETER_INDENT Macro

C

```
#define GFX_GOL_DIGITALMETER_INDENT 0x02
```

Description

This is a DigitalMeter compile time option to define the indent constant for the text used in the frame.

5.2.2.7.26.223 GFX_GOL_DIGITALMETER_WIDTH Macro

C

```
#define GFX_GOL_DIGITALMETER_WIDTH 16
```

Description

This is a DigitalMeter compile time option to define the user should change this value depending on the number of digits he wants to display.

5.2.2.7.26.224 GFX_GOL_DigitalMeterValueGet Macro

C

```
#define GFX_GOL_DigitalMeterValueGet(pObject) \
(((GFX_GOL_DIGITALMETER*)pObject)->value)
```

Description

This function returns the current value of the digital meter.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

The current value of the object.

Example

```
#define MAXVALUE 100;

GFX_GOL_DIGITALMETER *pMeter;
uint32_t ctr = 0;

// create scroll bar here and initialize parameters
pMeter = GFX_GOL_DigitalMeterCreate(...)
GFX_GOL_ObjectStateSet(pMeter, GFX_GOL_DIGITALMETER_DRAW_STATE);

// draw the scroll bar
GFX_GOL_ObjectListDraw();

// a routine that updates the position of the thumb through some
// conditions
while("some condition")
{
    GFX_GOL_DigitalMeterValueSet(pMeter, ctr);
    GFX_GOL_ObjectStateSet( pMeter,
                           GFX_GOL_DIGITALMETER_UPDATE_STATE);

    // update the screen
    GFX_GOL_ObjectListDraw();

    // update ctr here
    ctr = "some source of value";
}

if (GFX_GOL_DigitalMeterValueGet(pScrollBar) > MAXVALUE)
    return 0;
else
    "do something else"
```

5.2.2.7.26.225 GFX_GOL_FONT_DEFAULT_H_FILE Macro

C

```
#define GFX_GOL_FONT_DEFAULT_H_FILE
```

5.2.2.7.26.226 GFX_GOL_GroupboxTextGet Macro

C

```
#define GFX_GOL_GroupboxTextGet(pObject) (((GFX_GOL_GROUPBOX *)pObject)->pText)
```

Description

This function returns the address of the current text string used by the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

Pointer to text string.

Example

```
GFX_XCHAR *pChar;  
GFX_GOL_GROUPBOX pGroupbox;  
  
pChar = GFX_GOL_GroupboxTextGet(pGroupbox);
```

5.2.2.7.26.227 GFX_GOL_ListBoxItemCountGet Macro**C**

```
#define GFX_GOL_ListBoxItemCountGet(pObject) \  
(((GFX_GOL_LISTBOX *)pObject)->itemsNumber)
```

Description

This function returns the count of items in the list box.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	The pointer to the object.

Returns

The number of items in the list box.

Example

None.

5.2.2.7.26.228 GFX_GOL_ListBoxItemImageGet Macro**C**

```
#define GFX_GOL_ListBoxItemImageGet(pItem) (((GFX_GOL_LISTITEM *)pItem)->pImage)
```

Description

This function gets the image set for a list box item.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pltem	pointer to the list box item.

Returns

Pointer to the image used for the item.

Example

See [GFX_GOL_ListBoxItemListGet\(\)](#) example.

5.2.2.7.26.229 GFX_GOL_ListBoxItemImageSet Macro**C**

```
#define GFX_GOL_ListBoxItemImageSet(pItem, pImage) (((GFX_GOL_LISTITEM *)pItem)->pImage = pImage)
```

Description

This function sets the image for a list box item.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pltem	pointer to the list box item.
pImage	pointer to the image resource.

Returns

None.

Example

See [GFX_GOL_ListBoxItemAdd\(\)](#) and [GFX_GOL_ListBoxItemListGet\(\)](#) example.

5.2.2.7.26.230 GFX_GOL_ListBoxItemListGet Macro**C**

```
#define GFX_GOL_ListBoxItemListGet(pObject) \
    (((GFX_GOL_LISTITEM *)((GFX_GOL_LISTBOX *)pObject)->pItemList)
```

Description

This function returns the pointer to the item list of the list box.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	Pointer to the object.

Returns

The pointer to the item list of the list box.

Example

```
// assume:  
// pLb is a initialized to a list box in memory  
// myIcon is a valid image in memory
```

```

GFX_GOL_LISTITEM *pList, *pItem;
GFX_RESOURCE_HDR *pMyIcon = &myIcon;

pList = GFX_GOL_ListBoxItemListGet(pLb);
pItem = pList;

// set the image for all the items to myIcon
// set the last item image to NULL

do
{
    GFX_GOL_ListBoxImageSet(pItem, &myIcon);
}
while(pItem->pNextItem != NULL);

// get the last item's image and set to null if not null
if (GFX_GOL_ListBoxItemImageGet(pItem) != NULL)
    GFX_GOL_ListBoxImageSet(pItem, NULL);

```

5.2.2.7.26.231 GFX_GOL_ListBoxItemSelectStatusClear Macro

C

```

#define GFX_GOL_ListBoxItemSelectStatusClear(pObject, pItem) \
    if(pItem->status & GFX_GOL_LISTBOX_ITEM_STATUS_SELECTED) \
        GFX_GOL_ListBoxSelectionChange((LISTBOX *)pObject, pItem);

```

Description

This function clears the selection status of the item.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	The pointer to the object.
pItem	The pointer the item that will have the selected status cleared.

Returns

None.

Example

None.

5.2.2.7.26.232 GFX_GOL_ListBoxItemSelectStatusSet Macro

C

```

#define GFX_GOL_ListBoxItemSelectStatusSet(pObject, pItem) \
    if(!(pItem->status & GFX_GOL_LISTBOX_ITEM_STATUS_SELECTED)) \
        GFX_GOL_ListBoxSelectionChange((LISTBOX *)pObject, pItem);

```

Description

This function sets the selection status of the item to selected.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	The pointer to the object.
pltem	The pointer the item that will have the selected status set to selected.

Returns

None.

Example

None.

5.2.2.7.26.233 GFX_GOL_MeterMaximumValueGet Macro**C**

```
#define GFX_GOL_MeterMaximumValueGet(pObject) (((GFX_GOL_METER *)pObject)->maxValue)
```

Description

This function returns the maximum value set for the meter.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

The current maximum value set for the object.

Example

None.

5.2.2.7.26.234 GFX_GOL_MeterMinimumValueGet Macro**C**

```
#define GFX_GOL_MeterMinimumValueGet(pObject) (((GFX_GOL_METER *)pObject)->minValue)
```

Description

This function returns the minimum value set for the meter.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

The current minimum value set for the object.

Example

None.

5.2.2.7.26.235 GFX_GOL_MeterTitleFontSet Macro

C

```
#define GFX_GOL_MeterTitleFontSet(pObject, pNewFont) (((GFX_GOL_METER *)pObject)->pTitleFont = pNewFont)
```

Description

This function sets the meter title font used. Font pointer must be initialized to a valid [GFX_RESOURCE_HDR](#).

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.
pNewFont	pointer to the selected font.

Returns

None.

Example

None.

5.2.2.7.26.236 GFX_GOL_MeterTypeSet Macro

C

```
#define GFX_GOL_MeterTypeSet(pObject, type) (((GFX_GOL_METER *)pObject)->type = type)
```

Description

This function sets the meter draw type.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.
type	the draw type selected (see GFX_GOL_METER_DRAW_TYPE for more information).

Returns

None.

Example

None.

5.2.2.7.26.237 GFX_GOL_MeterValueFontSet Macro

C

```
#define GFX_GOL_MeterValueFontSet(pObject, pNewFont) (((GFX_GOL_METER *)pObject)->pValueFont = pNewFont)
```

Description

This function sets the meter's displayed value font used. Font pointer must be initialized to a valid [GFX_RESOURCE_HDR](#).

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.
pNewFont	pointer to the selected font.

Returns

None.

Example

None.

5.2.2.7.26.238 GFX_GOL_MeterValueGet Macro**C**

```
#define GFX_GOL_MeterValueGet(pMtr) (((GFX_GOL_METER*)pMtr)->value)
```

Description

This function returns the current value of the meter.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

The current value of the object.

Example

```
#define MAXVALUE 100;

GFX_GOL_METER *pMeter;
uint32_t ctr = 0;

// create scroll bar here and initialize parameters
pMeter = GFX_GOL_MeterCreate(...)
GFX_GOL_ObjectStateSet(pMeter, GFX_GOL_METER_DRAW_STATE);

// draw the scroll bar
GFX_GOL_ObjectListDraw();

// a routine that updates the position of the thumb through some
// conditions
while("some condition")
{
    GFX_GOL_MeterValueSet(pMeter, ctr);
    GFX_GOL_ObjectStateSet( pMeter,
                           GFX_GOL_METER_UPDATE_DRAW_STATE);
}
```

```

    // update the screen
    GFX_GOL_ObjectListDraw();

    // update ctr here
    ctr = "some source of value";
}

if (GFX_GOL_MeterValueGet(pScrollBar) > MAXVALUE)
    return 0;
else
    "do something else"

```

5.2.2.7.26.239 GFX_GOL_ObjectStateClear Macro

C

```

#define GFX_GOL_ObjectStateClear(pObject, stateBits) \
    (((GFX_GOL_OBJ_HEADER*)pObject)->state) &= (~(stateBits))

```

Description

This function clears the state bits of the given object. Object must be redrawn to display the changes. It is possible to set several state bits with this function.

Preconditions

None.

Parameters

Parameters	Description
pObject	Pointer to the object.
stateBits	Defines which state bits are to be cleared. Please refer to specific objects for object state bits definition for details

Returns

GFX_STATUS_SUCCESS - is returned if the clear was successful. GFX_STATUS_FAILURE - is returned if the clear was not successful.

Example

See [GFX_GOL_ObjectStateSet\(\)](#) for code example.

5.2.2.7.26.240 GFX_GOL_ObjectStateGet Macro

C

```

#define GFX_GOL_ObjectStateGet(pObject, stateBits) \
    (((GFX_GOL_OBJ_HEADER*)pObject)->state & stateBits)

```

Description

This function retrieves the current value of the state bits of an object. It is possible to get several state bits.

Preconditions

None.

Parameters

Parameters	Description
pObject	Pointer to the object.
stateBits	Defines which state bits are to be retrieved. Please refer to specific objects for object state bits definition for details

Returns

The current status of the specified state bits.

Example

```
#define BTN_HIDE 0x8000

GFX_GOL_BUTTON *pB;
// pB is created and initialized
// do something here to set state

// Hide the button (remove from screen)
if (GFX_GOL_ObjectStateGet(pB, GFX_GOL_BUTTON_HIDE_STATE))
{
    GFX_ColorSet(pB->pGolScheme->CommonBkColor);
    GFX_BarDraw(pB->left, pB->top, pB->right, pB->bottom);
}
```

5.2.2.7.26.241 GFX_GOL_ObjectStateSet Macro**C**

```
#define GFX_GOL_ObjectStateSet(pObject, stateBits) \
    (((GFX_GOL_OBJ_HEADER*)pObject)->state) |= stateBits
```

Description

This function sets the state bits of the given object. Object must be redrawn to display the changes. It is possible to set several state bits with this function.

Preconditions

None.

Parameters

Parameters	Description
pObject	Pointer to the object.
stateBits	Defines which state bits are to be cleared. Please refer to specific objects for object state bits definition for details

Returns

GFX_STATUS_SUCCESS - is returned if the set was successful. GFX_STATUS_FAILURE - is returned if the set was not successful.

Example

```
void SetMessage(uint16_t msg, GFX_GOL_BUTTON* pB)
{
    switch(msg)
    {
        case GFX_GOL_BUTTON_ACTION_PRESSED:
            // set pressed and redraw
            GFX_GOL_ObjectStateSet(pB, BTN_PRESSED|BTN_DRAW);
            break;
        case GFX_GOL_BUTTON_ACTION_RELEASED:
            // reset pressed
            GFX_GOL_ObjectStateClear(pB, BTN_PRESSED);
            // redraw
            GFX_GOL_ObjectStateSet(pB, BTN_DRAW);
            break;
        default:
            break;
    }
}
```

5.2.2.7.26.242 GFX_GOL_ProgressBarPositionGet Macro

C

```
#define GFX_GOL_ProgressBarPositionGet(pObject) (((GFX_GOL_PROGRESSBAR*)pObject)->pos)
```

Description

This function returns the current position of the progress bar.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

The current position of the scroll bar thumb.

Example

See [GFX_GOL_ProgressBarPositionSet\(\)](#) example.

5.2.2.7.26.243 GFX_GOL_ProgressBarRangeGet Macro

C

```
#define GFX_GOL_ProgressBarRangeGet(pObject) (pObject->range)
```

Description

This function returns the range of the progress bar.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

The current range used by the object.

Example

None.

5.2.2.7.26.244 GFX_GOL_RadioButtonTextGet Macro

C

```
#define GFX_GOL_RadioButtonTextGet(pObject) (((GFX_GOL_RADIOBUTTON *)pObject)->pText)
```

Description

This function returns the address of the current text string used by the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

Pointer to text string.

Example

```
// assume RADIO_BUTTON_OBJECT is a radio button that exists
GFX_XCHAR *pChar;
GFX_GOL_RADIOBUTTON *pRadioButton = &RADIO_BUTTON_OBJECT;

pChar = GFX_GOL_ButtonRadioTextGet(pRadioButton);
```

5.2.2.7.26.245 GFX_GOL_ROUNDIAL_DISABLED Macro

C

```
#define GFX_GOL_ROUNDIAL_DISABLED 0x0002 // Bit for disabled state.
```

Description

Bit for disabled state.

5.2.2.7.26.246 GFX_GOL_ROUNDIAL_DRAW Macro

C

```
#define GFX_GOL_ROUNDIAL_DRAW 0x4000 // Bit to indicate object must be redrawn.
```

Description

Bit to indicate object must be redrawn.

5.2.2.7.26.247 GFX_GOL_ROUNDIAL_HIDE Macro

C

```
#define GFX_GOL_ROUNDIAL_HIDE 0x8000 // Bit to indicate object must be removed from screen.
```

Description

Bit to indicate object must be removed from screen.

5.2.2.7.26.248 GFX_GOL_ROUNDIAL_MAX_POSITIONS Macro

C

```
#define GFX_GOL_ROUNDIAL_MAX_POSITIONS 24
```

Description

This is macro GFX_GOL_ROUNDIAL_MAX_POSITIONS.

5.2.2.7.26.249 GFX_GOL_ROUNDIAL_QUADRANT_POSITIONS Macro

C

```
#define GFX_GOL_ROUNDIAL_QUADRANT_POSITIONS 6
```

Description

This is macro GFX_GOL_ROUNDIAL_QUADRANT_POSITIONS.

5.2.2.7.26.250 GFX_GOL_ROUNDIAL_ROT_CCW Macro

C

```
#define GFX_GOL_ROUNDIAL_ROT_CCW 0x0008 // Bit for rotate counter clockwise state.
```

Description

Bit for rotate counter clockwise state.

5.2.2.7.26.251 GFX_GOL_ROUNDIAL_ROT_CW Macro

C

```
#define GFX_GOL_ROUNDIAL_ROT_CW 0x0004 // Bit for rotate clockwise state.
```

Description

Bit for rotate clockwise state.

5.2.2.7.26.252 GFX_GOL_RoundDialValueDecrement Macro

C

```
#define GFX_GOL_RoundDialValueDecrement(pDia) GFX_GOL_RoundDial_ValSet(pDia, (pDia->pos - pDia->res))
```

Description

Macros: GFX_GOL_RoundDialValueDecrement(pDia)

Preconditions

none

Parameters

Parameters	Description
pDia	Pointer to the object.

Returns

none

Remarks

none

Example

Refer to [GFX_GOL_RoundDialValueIncrement\(\)](#) example.

5.2.2.7.26.253 GFX_GOL_RoundDialValueGet Macro

C

```
#define GFX_GOL_RoundDialValueGet(pDia) (pDia->value
```

Description

Macros: GFX_GOL_RoundDialValueGet(pDia)

Preconditions

none

Parameters

Parameters	Description
pDia	Pointer to the object.

Returns

Returns the current value of the dial.

Remarks

none

Example

```
uint16_t currVal;
GFX_GOL_ROUNDIAL *pDia;

// assuming pDia is initialized to an existing dial Object
currVal = GFX_GOL_RoundDial_ValGet(pDia);
```

5.2.2.7.26.254 GFX_GOL_RoundDialValueIncrement Macro**C**

```
#define GFX_GOL_RoundDialValueIncrement(pDia) GFX_GOL_RoundDial_ValSet(pDia, (pDia->val + pDia->res))
```

Description

Macros: GFX_GOL_RoundDialValueIncrement(pDia)

Preconditions

none

Parameters

Parameters	Description
pDia	Pointer to the object.

Returns

none

none

Example

```
uint16_t updatedVal, prevVal;
GFX_GOL_ROUNDIAL *pDia;

// assuming pDia is initialized to an existing dial Object
// assume GetInput() is a function that retrieves source data
prevVal = GFX_GOL_RoundDial_ValGet(pDia);
updatedVal = GetInput();
if (updatedVal > prevVal)
    GFX_GOL_RoundDial_ValInc(pDia);
if (updatedVal < prevVal)
    GFX_GOL_RoundDial_ValDec(pDia);
```

5.2.2.7.26.255 GFX_GOL_RoundDialValueSet Macro**C**

```
#define GFX_GOL_RoundDialValueSet(pDia, newVal) (pDia)->value = newVal
```

Description

Macros: GFX_GOL_RoundDialValueSet(pDia, newVal)

Preconditions

none

Parameters

Parameters	Description
pDia	Pointer to the object.
newVal	New dial value.

Returns

none

Remarks

none

Example

```
uint16_t updatedVal;
GFX_GOL_ROUNDIAL *pDia;

// assuming pDia is initialized to an existing dial Object
// assume GetInput() is a function that retrieves source data
updatedVal = GetInput();
GFX_GOL_RoundDialValueSet(pDia, updatedVal);
```

5.2.2.7.26.256 GFX_GOL_WindowImageGet Macro**C**

```
#define GFX_GOL_WindowImageGet(pObject, pImage) \
(((GFX_GOL_WINDOW *)pObject)->pImage)
```

Description

This function gets the image used.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

Pointer to the image resource.

Example

None.

5.2.2.7.26.257 GFX_GOL_WindowTextGet Macro**C**

```
#define GFX_GOL_WindowTextGet(pObject) (((GFX_GOL_WINDOW *)pObject)->pText)
```

Description

This function returns the address of the current text string used by the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

Pointer to text string.

Example

```
GFX_XCHAR *pChar;  
GFX_GOL_WINDOW pWindow;  
  
pChar = GFX_GOL_WindowTextGet(pWindow);
```

5.2.2.7.26.258 GFX_ImageStretchSet Macro**C**

```
#define GFX_ImageStretchSet(value) primitiveTaskImage.stretch = value
```

Description

This is macro GFX_ImageStretchSet.

5.2.2.7.26.259 GFX_MAX_INVALIDATE_AREAS Macro**C**

```
#define GFX_MAX_INVALIDATE_AREAS 5
```

Description

This is macro GFX_MAX_INVALIDATE_AREAS.

5.2.2.7.26.260 GFX_MaxXGet Macro**C**

```
#define GFX_MaxXGet (GFX_DRV_instance[0].horizontalResolution-1)
```

Example

Remarks:

5.2.2.7.26.261 GFX_MaxYGet Macro**C**

```
#define GFX_MaxYGet (GFX_DRV_instance[0].verticalResolution-1)
```

Example

Remarks:

5.2.2.7.26.262 GFX_MEM_MASK Macro

C

```
#define GFX_MEM_MASK 0x000F
```

Description

This is macro GFX_MEM_MASK.

5.2.2.7.26.263 GFX_PixelPut Macro

C

```
#define GFX_PixelPut(x, y) GFX_PixelsPut(x, y, 1, 1)
```

Description

This is macro GFX_PixelPut.

5.2.2.7.26.264 GFX_PixelsPut Macro

C

```
#define GFX_PixelsPut(x, y, count, lineCount) GFX_RectangleFillDraw(x, y, x+count, y+lineCount)
```

Description

None

Preconditions

None

Parameters

Parameters	Description
instance	primitive instance
x	x position of the left top corner.
y	y position of the left top corner.
count	number of pixels

Returns

Queue handle once the primitive has been place in queue

Example

None

5.2.2.7.26.265 GFX_PrevAlphaColorGet Macro

C

```
#define GFX_PrevAlphaColorGet GFX_Primitive_instance.alphaArea.prevAlphaColor
```

Example

Remarks:

5.2.2.7.26.266 GFX_PrevAlphaColorSet Macro

C

```
#define GFX_PrevAlphaColorSet(color) GFX_Primitive_instance.alphaArea.prevAlphaColor = color
```

Example

Remarks:

5.2.2.7.26.267 GFX_RGBConvert Macro**C**

```
#define GFX_RGBConvert(red, green, blue) (GFX_COLOR) (((GFX_COLOR)(red) << 16) |  
((GFX_COLOR)(green) << 8) | (GFX_COLOR)(blue))
```

Description

Macros: GFX_RGBConvert(red, green, blue)

This macro converts the color data to the selected **COLOR_DEPTH**. This macro is only valid when **COLOR_DEPTH** is 8, 16, or 24.

COLOR_DEPTH	Conversion
8	8-8-8 to 3-3-2 conversion
16	8-8-8 to 5-6-5 conversion
24	8-8-8 to 8-8-8 conversion or no conversion

Preconditions

none

Parameters

Parameters	Description
red	red component of the color.
green	green component of the color.
blue	blue component of the color.

Returns

none

Side Effects

none

5.2.2.7.26.268 GFX_SetFontOrientation Macro**C**

```
#define GFX_SetFontOrientation(orient) GFX_Primitive_instance.currentFont.orientation = orient;
```

Preconditions

None.

Parameters

Parameters	Description
orient	sets font orientation when rendering characters and strings.

Returns

None.

Example

5.2.2.7.26.269 GFX_TYPE_MASK Macro

C

```
#define GFX_TYPE_MASK 0x0F00
```

Description

This is macro GFX_TYPE_MASK.

5.2.2.7.26.270 GFX_TYPES_FONTS_H Macro

C

```
#define GFX_TYPES_FONTS_H
```

Description

This is macro GFX_TYPES_FONTS_H.

5.2.2.7.26.271 GFX_TYPES_IMAGE_H Macro

C

```
#define GFX_TYPES_IMAGE_H
```

Description

This is macro GFX_TYPES_IMAGE_H.

5.2.2.7.26.272 GFX_TYPES_PALETTE_H Macro

C

```
#define GFX_TYPES_PALETTE_H
```

Description

This is macro GFX_TYPES_PALETTE_H.

5.2.2.7.26.273 GFX_TYPES_RESOURCE_H Macro

C

```
#define GFX_TYPES_RESOURCE_H
```

Description

This is macro GFX_TYPES_RESOURCE_H.

5.2.2.7.26.274 GFX_UXCHAR Macro

C

```
#define GFX_UXCHAR uint8_t
```

Description

This is macro GFX_UXCHAR.

5.2.2.7.26.275 GFX_VisualPageGet Macro

C

```
#define GFX_VisualPageGet GFX_Primitive_instance.visualPage
```

Preconditions

None.

Returns

None.

Example

Remarks:

5.2.2.7.26.276 GFX_W3_ALICEBLUE Macro

C

```
#define GFX_W3_ALICEBLUE GFX_RGBConvert(240, 248, 255)
```

Description

This is macro GFX_W3_ALICEBLUE.

5.2.2.7.26.277 GFX_W3_ANTIQUWHITE Macro

C

```
#define GFX_W3_ANTIQUWHITE GFX_RGBConvert(250, 235, 215)
```

Description

This is macro GFX_W3_ANTIQUWHITE.

5.2.2.7.26.278 GFX_W3_AQUA Macro

C

```
#define GFX_W3_AQUA GFX_RGBConvert( 0, 255, 255)
```

Description

This is macro GFX_W3_AQUA.

5.2.2.7.26.279 GFX_W3_AQUAMARINE Macro

C

```
#define GFX_W3_AQUAMARINE GFX_RGBConvert(127, 255, 212)
```

Description

This is macro GFX_W3_AQUAMARINE.

5.2.2.7.26.280 GFX_W3_AZURE Macro

C

```
#define GFX_W3_AZURE GFX_RGBConvert(240, 255, 255)
```

Description

This is macro GFX_W3_AZURE.

5.2.2.7.26.281 GFX_W3_BEIGE Macro

C

```
#define GFX_W3_BEIGE GFX_RGBConvert(245, 245, 220)
```

Description

This is macro GFX_W3_BEIGE.

5.2.2.7.26.282 GFX_W3_BISQUE Macro

C

```
#define GFX_W3_BISQUE GFX_RGBConvert(255, 228, 196)
```

Description

This is macro GFX_W3_BISQUE.

5.2.2.7.26.283 GFX_W3_BLACK Macro

C

```
#define GFX_W3_BLACK GFX_RGBConvert( 0, 0, 0)
```

Description

This is macro GFX_W3_BLACK.

5.2.2.7.26.284 GFX_W3_BLANCHEDALMOND Macro

C

```
#define GFX_W3_BLANCHEDALMOND GFX_RGBConvert(255, 235, 205)
```

Description

This is macro GFX_W3_BLANCHEDALMOND.

5.2.2.7.26.285 GFX_W3_BLUE Macro

C

```
#define GFX_W3_BLUE GFX_RGBConvert( 0, 0, 255)
```

Description

This is macro GFX_W3_BLUE.

5.2.2.7.26.286 GFX_W3_BLUEVIOLET Macro

C

```
#define GFX_W3_BLUEVIOLET GFX_RGBConvert(138, 43, 226)
```

Description

This is macro GFX_W3_BLUEVIOLET.

5.2.2.7.26.287 GFX_W3_BROWN Macro

C

```
#define GFX_W3_BROWN GFX_RGBConvert(165, 42, 42)
```

Description

This is macro GFX_W3_BROWN.

5.2.2.7.26.288 GFX_W3_BURLYWOOD Macro

C

```
#define GFX_W3_BURLYWOOD GFX_RGBConvert(222, 184, 135)
```

Description

This is macro GFX_W3_BURLYWOOD.

5.2.2.7.26.289 GFX_W3_CADETBLUE Macro

C

```
#define GFX_W3_CADETBLUE GFX_RGBConvert( 95, 158, 160)
```

Description

This is macro GFX_W3_CADETBLUE.

5.2.2.7.26.290 GFX_W3_CHARTREUSE Macro

C

```
#define GFX_W3_CHARTREUSE GFX_RGBConvert(127, 255, 0)
```

Description

This is macro GFX_W3_CHARTREUSE.

5.2.2.7.26.291 GFX_W3_CHOCOLATE Macro

C

```
#define GFX_W3_CHOCOLATE GFX_RGBConvert(210, 105, 30)
```

Description

This is macro GFX_W3_CHOCOLATE.

5.2.2.7.26.292 GFX_W3_CORAL Macro

C

```
#define GFX_W3_CORAL GFX_RGBConvert(255, 127, 80)
```

Description

This is macro GFX_W3_CORAL.

5.2.2.7.26.293 GFX_W3_CORNFLOWERBLUE Macro

C

```
#define GFX_W3_CORNFLOWERBLUE GFX_RGBConvert(100, 149, 237)
```

Description

This is macro GFX_W3_CORNFLOWERBLUE.

5.2.2.7.26.294 GFX_W3_CORNSILK Macro

C

```
#define GFX_W3_CORNSILK GFX_RGBConvert(255, 248, 220)
```

Description

This is macro GFX_W3_CORNSILK.

5.2.2.7.26.295 GFX_W3_CRIMSON Macro

C

```
#define GFX_W3_CRIMSON GFX_RGBConvert(220, 20, 60)
```

Description

This is macro GFX_W3_CRIMSON.

5.2.2.7.26.296 GFX_W3_CYAN Macro

C

```
#define GFX_W3_CYAN GFX_RGBConvert( 0, 255, 255)
```

Description

This is macro GFX_W3_CYAN.

5.2.2.7.26.297 GFX_W3_DARKBLUE Macro

C

```
#define GFX_W3_DARKBLUE GFX_RGBConvert( 0, 0, 139)
```

Description

This is macro GFX_W3_DARKBLUE.

5.2.2.7.26.298 GFX_W3_DARKCYAN Macro

C

```
#define GFX_W3_DARKCYAN GFX_RGBConvert( 0, 139, 139)
```

Description

This is macro GFX_W3_DARKCYAN.

5.2.2.7.26.299 GFX_W3_darkgoldenrod Macro

C

```
#define GFX_W3_darkgoldenrod GFX_RGBConvert(184, 134, 11)
```

Description

This is macro GFX_W3_darkgoldenrod.

5.2.2.7.26.300 GFX_W3_DARKGRAY Macro

C

```
#define GFX_W3_DARKGRAY GFX_RGBConvert(169, 169, 169)
```

Description

This is macro GFX_W3_DARKGRAY.

5.2.2.7.26.301 GFX_W3_DARKGREEN Macro

C

```
#define GFX_W3_DARKGREEN GFX_RGBConvert( 0, 100, 0)
```

Description

This is macro GFX_W3_DARKGREEN.

5.2.2.7.26.302 GFX_W3_DARKGREY Macro

C

```
#define GFX_W3_DARKGREY GFX_RGBConvert(169, 169, 169)
```

Description

Description

This is macro GFX_X11_LIGHT_CYAN.

5.2.2.7.26.488 GFX_X11_LIGHT_GOLDENROD_YELLOW Macro

C

```
#define GFX_X11_LIGHT_GOLDENROD_YELLOW GFX_RGBConvert(0xFA, 0xFA, 0xD2)
```

Description

This is macro GFX_X11_LIGHT_GOLDENROD_YELLOW.

5.2.2.7.26.489 GFX_X11_LIGHT_GRAY Macro

C

```
#define GFX_X11_LIGHT_GRAY GFX_RGBConvert(0xD3, 0xD3, 0xD3)
```

Description

This is macro GFX_X11_LIGHT_GRAY.

5.2.2.7.26.490 GFX_X11_LIGHT_GREEN Macro

C

```
#define GFX_X11_LIGHT_GREEN GFX_RGBConvert(0x90, 0xEE, 0x90)
```

Description

This is macro GFX_X11_LIGHT_GREEN.

5.2.2.7.26.491 GFX_X11_LIGHT_PINK Macro

C

```
#define GFX_X11_LIGHT_PINK GFX_RGBConvert(0xFF, 0xB6, 0xC1)
```

Description

This is macro GFX_X11_LIGHT_PINK.

5.2.2.7.26.492 GFX_X11_LIGHT_SALMON Macro

C

```
#define GFX_X11_LIGHT_SALMON GFX_RGBConvert(0xFF, 0xA0, 0x7A)
```

Description

X11: Red Colors

5.2.2.7.26.493 GFX_X11_LIGHT_SEA_GREEN Macro

C

```
#define GFX_X11_LIGHT_SEA_GREEN GFX_RGBConvert(0x20, 0xB2, 0xAA)
```

Description

This is macro GFX_X11_LIGHT_SEA_GREEN.

5.2.2.7.26.494 GFX_X11_LIGHT_SKY_BLUE Macro

C

```
#define GFX_X11_LIGHT_SKY_BLUE GFX_RGBConvert(0x87, 0xCE, 0xFA)
```

Description

This is macro GFX_X11_LIGHT_SKY_BLUE.

5.2.2.7.26.495 GFX_X11_LIGHT_SLATE_GREY Macro

C

```
#define GFX_X11_LIGHT_SLATE_GREY GFX_RGBConvert(0x77, 0x88, 0x99)
```

Description

This is macro GFX_X11_LIGHT_SLATE_GREY.

5.2.2.7.26.496 GFX_X11_LIGHT_STEEL_BLUE Macro**C**

```
#define GFX_X11_LIGHT_STEEL_BLUE GFX_RGBConvert(0xB0, 0xC4, 0xDE)
```

Description

X11: [BLUE](#) COLORS

5.2.2.7.26.497 GFX_X11_LIGHT_YELLOW Macro**C**

```
#define GFX_X11_LIGHT_YELLOW GFX_RGBConvert(0xFF, 0xFF, 0xE0)
```

Description

This is macro GFX_X11_LIGHT_YELLOW.

5.2.2.7.26.498 GFX_X11_LIME Macro**C**

```
#define GFX_X11_LIME GFX_RGBConvert(0x00, 0xFF, 0x00)
```

Description

This is macro GFX_X11_LIME.

5.2.2.7.26.499 GFX_X11_LIME_GREEN Macro**C**

```
#define GFX_X11_LIME_GREEN GFX_RGBConvert(0x32, 0xCD, 0x32)
```

Description

This is macro GFX_X11_LIME_GREEN.

5.2.2.7.26.500 GFX_X11_LINEN Macro**C**

```
#define GFX_X11_LINEN GFX_RGBConvert(0xFA, 0xF0, 0xE6)
```

Description

This is macro GFX_X11_LINEN.

5.2.2.7.26.501 GFX_X11_MAGENTA Macro**C**

```
#define GFX_X11_MAGENTA GFX_RGBConvert(0xFF, 0x00, 0xFF)
```

Description

This is macro GFX_X11_MAGENTA.

5.2.2.7.26.502 GFX_X11_MARRON Macro

C

```
#define GFX_X11_MARRON GFX_RGBConvert(0x80, 0x00, 0x00)
```

Description

This is macro GFX_X11_MARRON.

5.2.2.7.26.503 GFX_X11_MEDIUM_AQUAMARINE Macro

C

```
#define GFX_X11_MEDIUM_AQUAMARINE GFX_RGBConvert(0x66, 0xCD, 0xAA)
```

Description

X11: [CYAN](#) COLORS

5.2.2.7.26.504 GFX_X11_MEDIUM_BLUE Macro

C

```
#define GFX_X11_MEDIUM_BLUE GFX_RGBConvert(0x00, 0x00, 0xCD)
```

Description

This is macro GFX_X11_MEDIUM_BLUE.

5.2.2.7.26.505 GFX_X11_MEDIUM_ORCHID Macro

C

```
#define GFX_X11_MEDIUM_ORCHID GFX_RGBConvert(0xBA, 0x55, 0xD3)
```

Description

This is macro GFX_X11_MEDIUM_ORCHID.

5.2.2.7.26.506 GFX_X11_MEDIUM_PURPLE Macro

C

```
#define GFX_X11_MEDIUM_PURPLE GFX_RGBConvert(0x93, 0x70, 0xDB)
```

Description

This is macro GFX_X11_MEDIUM_PURPLE.

5.2.2.7.26.507 GFX_X11_MEDIUM_SEA_GREEN Macro

C

```
#define GFX_X11_MEDIUM_SEA_GREEN GFX_RGBConvert(0x3C, 0xB3, 0x71)
```

Description

This is macro GFX_X11_MEDIUM_SEA_GREEN.

5.2.2.7.26.508 GFX_X11_MEDIUM_SLATE_BLUE Macro

C

```
#define GFX_X11_MEDIUM_SLATE_BLUE GFX_RGBConvert(0x7B, 0x68, 0xEE)
```

Description

This is macro GFX_X11_MEDIUM_SLATE_BLUE.

5.2.2.7.26.509 GFX_X11_MEDIUM_SPRING_GREEN Macro**C**

```
#define GFX_X11_MEDIUM_SPRING_GREEN GFX_RGBConvert(0x00, 0xFA, 0x9A)
```

Description

This is macro GFX_X11_MEDIUM_SPRING_GREEN.

5.2.2.7.26.510 GFX_X11_MEDIUM_TURQUOISE Macro**C**

```
#define GFX_X11_MEDIUM_TURQUOISE GFX_RGBConvert(0x48, 0xD1, 0xCC)
```

Description

This is macro GFX_X11_MEDIUM_TURQUOISE.

5.2.2.7.26.511 GFX_X11_MEDIUM_VIOLET_RED Macro**C**

```
#define GFX_X11_MEDIUM_VIOLET_RED GFX_RGBConvert(0xC7, 0x15, 0x85)
```

Description

This is macro GFX_X11_MEDIUM_VIOLET_RED.

5.2.2.7.26.512 GFX_X11_MIDNIGHT_BLUE Macro**C**

```
#define GFX_X11_MIDNIGHT_BLUE GFX_RGBConvert(0x19, 0x19, 0x70)
```

Description

This is macro GFX_X11_MIDNIGHT_BLUE.

5.2.2.7.26.513 GFX_X11_MINT_CREAM Macro**C**

```
#define GFX_X11_MINT_CREAM GFX_RGBConvert(0xF5, 0xFF, 0xFA)
```

Description

This is macro GFX_X11_MINT_CREAM.

5.2.2.7.26.514 GFX_X11_MISTY_ROSE Macro**C**

```
#define GFX_X11_MISTY_ROSE GFX_RGBConvert(0xFF, 0xE4, 0xE1)
```

Description

This is macro GFX_X11_MISTY_ROSE.

5.2.2.7.26.515 GFX_X11_MOCCASIN Macro

C

```
#define GFX_X11_MOCCASIN GFX_RGBConvert(0xFF, 0xE4, 0xB5)
```

Description

This is macro GFX_X11_MOCCASIN.

5.2.2.7.26.516 GFX_X11_NAVAJO_WHITE Macro

C

```
#define GFX_X11_NAVAJO_WHITE GFX_RGBConvert(0xFF, 0xDE, 0xAD)
```

Description

This is macro GFX_X11_NAVAJO_WHITE.

5.2.2.7.26.517 GFX_X11_NAVY Macro

C

```
#define GFX_X11_NAVY GFX_RGBConvert(0x00, 0x00, 0x80)
```

Description

This is macro GFX_X11_NAVY.

5.2.2.7.26.518 GFX_X11_OLD_LACE Macro

C

```
#define GFX_X11_OLD_LACE GFX_RGBConvert(0xFD, 0xF5, 0xE6)
```

Description

This is macro GFX_X11_OLD_LACE.

5.2.2.7.26.519 GFX_X11_OLIVE Macro

C

```
#define GFX_X11_OLIVE GFX_RGBConvert(0x80, 0x80, 0x00)
```

Description

This is macro GFX_X11_OLIVE.

5.2.2.7.26.520 GFX_X11_OLIVE_DRAB Macro

C

```
#define GFX_X11_OLIVE_DRAB GFX_RGBConvert(0x6B, 0x8E, 0x23)
```

Description

This is macro GFX_X11_OLIVE_DRAB.

5.2.2.7.26.521 GFX_X11_ORANGE Macro

C

```
#define GFX_X11_ORANGE GFX_RGBConvert(0xFF, 0xA5, 0x00)
```

Description

This is macro GFX_X11_ORANGE.

5.2.2.7.26.522 GFX_X11_ORANGE_RED Macro

C

```
#define GFX_X11_ORANGE_RED GFX_RGBConvert(0xFF, 0x45, 0x00)
```

Description

X11: Orange Colors

5.2.2.7.26.523 GFX_X11_ORCHID Macro

C

```
#define GFX_X11_ORCHID GFX_RGBConvert(0xDA, 0x70, 0xD6)
```

Description

This is macro GFX_X11_ORCHID.

5.2.2.7.26.524 GFX_X11_PALE_GOLDENROD Macro

C

```
#define GFX_X11_PALE_GOLDENROD GFX_RGBConvert(0xEE, 0xE8, 0xAA)
```

Description

This is macro GFX_X11_PALE_GOLDENROD.

5.2.2.7.26.525 GFX_X11_PALE_GREEN Macro

C

```
#define GFX_X11_PALE_GREEN GFX_RGBConvert(0x98, 0xFB, 0x98)
```

Description

This is macro GFX_X11_PALE_GREEN.

5.2.2.7.26.526 GFX_X11_PALE_TURQUOISE Macro

C

```
#define GFX_X11_PALE_TURQUOISE GFX_RGBConvert(0xAF, 0xEE, 0xEE)
```

Description

This is macro GFX_X11_PALE_TURQUOISE.

5.2.2.7.26.527 GFX_X11_PALE_VIOLET_RED Macro

C

```
#define GFX_X11_PALE_VIOLET_RED GFX_RGBConvert(0xDB, 0x70, 0x93)
```

Description

This is macro GFX_X11_PALE_VIOLET_RED.

5.2.2.7.26.528 GFX_X11_PAPAYA_WHIP Macro

C

```
#define GFX_X11_PAPAYA_WHIP GFX_RGBConvert(0xFF, 0xEF, 0xD5)
```

Description

This is macro GFX_X11_PAPAYA_WHIP.

5.2.2.7.26.529 GFX_X11_PEACH_PUFF Macro

C

```
#define GFX_X11_PEACH_PUFF GFX_RGBConvert(0xFF, 0xDA, 0xB9)
```

Description

This is macro GFX_X11_PEACH_PUFF.

5.2.2.7.26.530 GFX_X11_PERU Macro

C

```
#define GFX_X11_PERU GFX_RGBConvert(0xCD, 0x85, 0x3F)
```

Description

This is macro GFX_X11_PERU.

5.2.2.7.26.531 GFX_X11_PINK Macro

C

```
#define GFX_X11_PINK GFX_RGBConvert(0xFF, 0xC0, 0xCB)
```

Description

X11: Pink Colors

5.2.2.7.26.532 GFX_X11_PLUM Macro

C

```
#define GFX_X11_PLUM GFX_RGBConvert(0xDD, 0xA0, 0xDD)
```

Description

This is macro GFX_X11_PLUM.

5.2.2.7.26.533 GFX_X11_POWDER_BLUE Macro

C

```
#define GFX_X11_POWDER_BLUE GFX_RGBConvert(0xB0, 0xE0, 0xE6)
```

Description

This is macro GFX_X11_POWDER_BLUE.

5.2.2.7.26.534 GFX_X11_PURPLE Macro

C

```
#define GFX_X11_PURPLE GFX_RGBConvert(0x80, 0x00, 0x80)
```

Description

This is macro GFX_X11_PURPLE.

5.2.2.7.26.535 GFX_X11_RED Macro

C

```
#define GFX_X11_RED GFX_RGBConvert(0xFF, 0x00, 0x00)
```

Description

This is macro GFX_X11_RED.

5.2.2.7.26.536 GFX_X11_ROSY_BROWN Macro

C

```
#define GFX_X11_ROSY_BROWN GFX_RGBConvert(0xBc, 0x8F, 0x8F)
```

Description

This is macro GFX_X11_ROSY_BROWN.

5.2.2.7.26.537 GFX_X11_ROYAL_BLUE Macro

C

```
#define GFX_X11_ROYAL_BLUE GFX_RGBConvert(0x41, 0x69, 0xE1)
```

Description

This is macro GFX_X11_ROYAL_BLUE.

5.2.2.7.26.538 GFX_X11_SADDLE_BROWN Macro

C

```
#define GFX_X11_SADDLE_BROWN GFX_RGBConvert(0x8B, 0x45, 0x13)
```

Description

This is macro GFX_X11_SADDLE_BROWN.

5.2.2.7.26.539 GFX_X11_SALMON Macro

C

```
#define GFX_X11_SALMON GFX_RGBConvert(0xFA, 0x80, 0x72)
```

Description

This is macro GFX_X11_SALMON.

5.2.2.7.26.540 GFX_X11_SANDY_BROWN Macro

C

```
#define GFX_X11_SANDY_BROWN GFX_RGBConvert(0xF4, 0xA4, 0x60)
```

Description

This is macro GFX_X11_SANDY_BROWN.

5.2.2.7.26.541 GFX_X11_SEA_GREEN Macro

C

```
#define GFX_X11_SEA_GREEN GFX_RGBConvert(0x2E, 0x8B, 0x57)
```

Description

This is macro GFX_X11_SEA_GREEN.

5.2.2.7.26.542 GFX_X11_SEASHELL Macro

C

```
#define GFX_X11_SEASHELL GFX_RGBConvert(0xFF, 0xF5, 0xEE)
```

Description

This is macro GFX_X11_SEASHELL.

5.2.2.7.26.543 GFX_X11_SIENNA Macro

C

```
#define GFX_X11_SIENNA GFX_RGBConvert(0xA0, 0x52, 0x2D)
```

Description

This is macro GFX_X11_SIENNA.

5.2.2.7.26.544 GFX_X11_SILVER Macro

C

```
#define GFX_X11_SILVER GFX_RGBConvert(0xC0, 0xC0, 0xC0)
```

Description

This is macro GFX_X11_SILVER.

5.2.2.7.26.545 GFX_X11_SKY_BLUE Macro

C

```
#define GFX_X11_SKY_BLUE GFX_RGBConvert(0x87, 0xCE, 0xEB)
```

Description

This is macro GFX_X11_SKY_BLUE.

5.2.2.7.26.546 GFX_X11_SLATE_BLUE Macro

C

```
#define GFX_X11_SLATE_BLUE GFX_RGBConvert(0x6A, 0x5A, 0xCD)
```

Description

This is macro GFX_X11_SLATE_BLUE.

5.2.2.7.26.547 GFX_X11_SLATE_GREY Macro

C

```
#define GFX_X11_SLATE_GREY GFX_RGBConvert(0x70, 0x80, 0x90)
```

Description

This is macro GFX_X11_SLATE_GREY.

5.2.2.7.26.548 GFX_X11_SNOW Macro

C

```
#define GFX_X11_SNOW GFX_RGBConvert(0xFF, 0xFA, 0xFA)
```

Description

This is macro GFX_X11_SNOW.

5.2.2.7.26.549 GFX_X11_SPRING_GREEN Macro

C

```
#define GFX_X11_SPRING_GREEN GFX_RGBConvert(0x00, 0xFF, 0x7F)
```

Description

This is macro GFX_X11_SPRING_GREEN.

5.2.2.7.26.550 GFX_X11_STEEL_BLUE Macro

C

```
#define GFX_X11_STEEL_BLUE GFX_RGBConvert(0x46, 0x82, 0xB4)
```

Description

This is macro GFX_X11_STEEL_BLUE.

5.2.2.7.26.551 GFX_X11_TAN Macro

C

```
#define GFX_X11_TAN GFX_RGBConvert(0xD2, 0xB4, 0x8C)
```

Description

This is macro GFX_X11_TAN.

5.2.2.7.26.552 GFX_X11_TEAL Macro

C

```
#define GFX_X11_TEAL GFX_RGBConvert(0x00, 0x80, 0x80)
```

Description

This is macro GFX_X11_TEAL.

5.2.2.7.26.553 GFX_X11_THISTLE Macro

C

```
#define GFX_X11_THISTLE GFX_RGBConvert(0xD8, 0xBF, 0xD8)
```

Description

This is macro GFX_X11_THISTLE.

5.2.2.7.26.554 GFX_X11_TOMATO Macro

C

```
#define GFX_X11_TOMATO GFX_RGBConvert(0xFF, 0x63, 0x47)
```

Description

This is macro GFX_X11_TOMATO.

5.2.2.7.26.555 GFX_X11_TURQUOISE Macro

C

```
#define GFX_X11_TURQUOISE GFX_RGBConvert(0x40, 0xE0, 0xD0)
```

Description

This is macro GFX_X11_TURQUOISE.

5.2.2.7.26.556 GFX_X11_VIOLET Macro

C

```
#define GFX_X11_VIOLET GFX_RGBConvert(0xEE, 0x82, 0xEE)
```

Description

This is macro GFX_X11_VIOLET.

5.2.2.7.26.557 GFX_X11_WHEAT Macro

C

```
#define GFX_X11_WHEAT GFX_RGBConvert(0xF5, 0xDE, 0xB3)
```

Description

This is macro GFX_X11_WHEAT.

5.2.2.7.26.558 GFX_X11_WHITE Macro

C

```
#define GFX_X11_WHITE GFX_RGBConvert(0xFF, 0xFF, 0xFF)
```

Description

X11: [WHITE](#)/GRAY/[BLACK](#) COLORS

5.2.2.7.26.559 GFX_X11_WHITE_SMOKE Macro

C

```
#define GFX_X11_WHITE_SMOKE GFX_RGBConvert(0xF5, 0xF5, 0xF5)
```

Description

This is macro GFX_X11_WHITE_SMOKE.

5.2.2.7.26.560 GFX_X11_YELLOW Macro

C

```
#define GFX_X11_YELLOW GFX_RGBConvert(0xFF, 0xFF, 0x00)
```

Description

X11: Yellow Colors

5.2.2.7.26.561 GFX_X11_YELLOW_GREEN Macro

C

```
#define GFX_X11_YELLOW_GREEN GFX_RGBConvert(0x9A, 0xCD, 0x32)
```

Description

This is macro GFX_X11_YELLOW_GREEN.

5.2.2.7.26.562 GFX_XCHAR Macro

C

```
#define GFX_XCHAR char
```

Description

GFX_CONFIG_FONT_CHAR_SIZE

This configuration sets the text character size used in the library.

To enable support for unicode fonts, GFX_CONFIG_FONT_CHAR_SIZE must be defined as 16 (size is 16 bits). For standard ascii fonts, this can be defined as 8. This changes the GFX_XCHAR definition. See GFX_XCHAR for details.

Set in configuration	GFX_XCHAR	Description
#define GFX_CONFIG_FONT_CHAR_SIZE 16	#define GFX_XCHAR uint16_t	Use multiuint8_t characters (0-2^16 range).
#define GFX_CONFIG_FONT_CHAR_SIZE 8	#define GFX_XCHAR uint8_t	Use multiuint8_t characters (0-255 range).

Remarks

None.

5.2.2.7.26.563 GOLD Macro

C

```
#define GOLD GFX_RGBConvert(255, 215, 0)
```

Description

This is macro GOLD.

5.2.2.7.26.564 GRAPHICS_LIBRARY_VERSION Macro

C

```
#define GRAPHICS_LIBRARY_VERSION 0x0400
```

Description

////////// GRAPHICS_LIBRARY_VERSION ////////// MSB is version, LSB is subversion

C

```
#define GRAY096 GFX_RGBConvert(96, 96, 96)
```

Description

This is macro GRAY096.

5.2.2.7.26.583 GRAY128 Macro

C

```
#define GRAY128 GFX_RGBConvert(128, 128, 128)
```

Description

This is macro GRAY128.

5.2.2.7.26.584 GRAY160 Macro

C

```
#define GRAY160 GFX_RGBConvert(160, 160, 160)
```

Description

This is macro GRAY160.

5.2.2.7.26.585 GRAY192 Macro

C

```
#define GRAY192 GFX_RGBConvert(192, 192, 192)
```

Description

This is macro GRAY192.

5.2.2.7.26.586 GRAY204 Macro

C

```
#define GRAY204 GFX_RGBConvert(204, 204, 204)
```

Description

This is macro GRAY204.

5.2.2.7.26.587 GRAY224 Macro

C

```
#define GRAY224 GFX_RGBConvert(224, 224, 224)
```

Description

This is macro GRAY224.

5.2.2.7.26.588 GRAY229 Macro

C

```
#define GRAY229 GFX_RGBConvert(229, 229, 229)
```

Description

This is macro GRAY229.

5.2.2.7.26.589 GRAY242 Macro

C

```
#define GRAY242 GFX_RGBConvert(242, 242, 242)
```

Description

This is macro GRAY242.

5.2.2.7.26.590 GREEN Macro

C

```
#define GREEN GFX_RGBConvert(0, 128, 0)
```

Description

This is macro GREEN.

5.2.2.7.26.591 GRID_DISABLED Macro

C

```
#define GRID_DISABLED 0x0002 // Bit for disabled state
```

Description

Bit for disabled state

5.2.2.7.26.592 GRID_DRAW_ALL Macro

C

```
#define GRID_DRAW_ALL 0x4000 // Bit to indicate whole edit box must be redrawn
```

Description

Bit to indicate whole edit box must be redrawn

5.2.2.7.26.593 GRID_DRAW_ITEMS Macro

C

```
#define GRID_DRAW_ITEMS 0x1000 // Bit to indicate that at least one item must be redrawn, but not the entire grid.
```

Description

Bit to indicate that at least one item must be redrawn, but not the entire grid.

5.2.2.7.26.594 GRID_FOCUSED Macro

C

```
#define GRID_FOCUSED 0x0001 // Bit for focused state
```

Description

Bit for focused state

5.2.2.7.26.595 GRID_HEIGHT Macro

C

```
#define GRID_HEIGHT(r, ch) ((GFX_OBJ_EMOSS_SIZE * 2) + (r * (ch + 1)) - 1)
```

Description

This is macro GRID_HEIGHT.

5.2.2.7.26.596 GRID_HIDE Macro

C

```
#define GRID_HIDE 0x8000 // Bit to remove object from screen
```

Description

Bit to remove object from screen

5.2.2.7.26.597 GRID_MAX_COLUMNS Macro

C

```
#define GRID_MAX_COLUMNS(rw, cw) ((rw - (GFX_OBJ_EMOSS_SIZE * 2) + 1) / (cw + 1))
```

Description

This is macro GRID_MAX_COLUMNS.

5.2.2.7.26.598 GRID_MAX_ROWS Macro

C

```
#define GRID_MAX_ROWS(rh, ch) ((rh - (GFX_OBJ_EMOSS_SIZE * 2) + 1) / (ch + 1))
```

Description

This is macro GRID_MAX_ROWS.

5.2.2.7.26.599 GRID_OUT_OF_BOUNDS Macro

C

```
#define GRID_OUT_OF_BOUNDS 0x0001 // Status of an out of bounds cell GridSetCell() operation.
```

Description

Status of an out of bounds cell [GridSetCell\(\)](#) operation.

5.2.2.7.26.600 GRID_SHOW_BORDER_ONLY Macro

C

```
#define GRID_SHOW_BORDER_ONLY 0x0010 // Draw only the outside border of the grid.
```

Description

Draw only the outside border of the grid.

5.2.2.7.26.601 GRID_SHOW_FOCUS Macro

C

```
#define GRID_SHOW_FOCUS 0x0008 // Highlight the focused cell.
```

Description

Highlight the focused cell.

5.2.2.7.26.602 GRID_SHOW_LINES Macro

C

```
#define GRID_SHOW_LINES 0x0004 // Display grid lines
```

Description

Display grid lines

5.2.2.7.26.603 GRID_SHOW_SEPARATORS_ONLY Macro

C

```
#define GRID_SHOW_SEPARATORS_ONLY 0x0020 // Draw only the lines between cells (like
```

Tic-tac-toe)

Description

Draw only the lines between cells (like Tic-tac-toe)

5.2.2.7.26.604 GRID_SUCCESS Macro

```
C
#define GRID_SUCCESS 0x0000    // Status of a successful GridSetCell() operation.
```

Description

Status of a successful [GridSetCell\(\)](#) operation.

5.2.2.7.26.605 GRID_TYPE_MASK Macro

```
C
#define GRID_TYPE_MASK (0x0C)
```

Description

This is macro GRID_TYPE_MASK.

5.2.2.7.26.606 GRID_WIDTH Macro

```
C
#define GRID_WIDTH(c, cw) ((GFX_OBJ_EMOSS_SIZE * 2) + (c * (cw + 1)) - 1)
```

Description

This is macro GRID_WIDTH.

5.2.2.7.26.607 GridGetFocusX Macro

```
C
#define GridGetFocusX(pGrid) pGrid->focusX
```

Description

Macros: GridGetFocusX(pGrid)

This macro returns the x position of the focused cell.

Preconditions

none

Parameters

Parameters	Description
pGrid	Pointer to the object.

Returns

Returns the x position of the focused cell.

Side Effects

none

5.2.2.7.26.608 GridGetFocusY Macro

C

```
#define GridGetFocusY(pGrid) pGrid->focusY
```

Description

Macros: GridGetFocusY(pGrid)

This macro returns the y position of the focused cell.

Preconditions

none

Parameters

Parameters	Description
pGrid	Pointer to the object.

Returns

Returns the y position of the focused cell.

Side Effects

none

5.2.2.7.26.609 GRIDITEM_DRAW Macro

C

```
#define GRIDITEM_DRAW 0x0100 // Draw this cell
```

Description

Draw this cell

5.2.2.7.26.610 GRIDITEM_IS_BITMAP Macro

C

```
#define GRIDITEM_IS_BITMAP 0x0008 // The grid item is a bitmap.
```

Description

The grid item is a bitmap.

5.2.2.7.26.611 GRIDITEM_IS_TEXT Macro

C

```
#define GRIDITEM_IS_TEXT 0x0000 // The grid item is a text string.
```

Description

The grid item is a text string.

5.2.2.7.26.612 GRIDITEM_SELECTED Macro

C

```
#define GRIDITEM_SELECTED 0x0001 // The cell is selected.
```

Description

The cell is selected.

5.2.2.7.26.613 GRIDITEM_TEXTBOTTOM Macro

C

```
#define GRIDITEM_TEXTBOTTOM 0x0040 // Bit to indicate text is top aligned.
```

Description

Bit to indicate text is top aligned.

5.2.2.7.26.614 GRIDITEM_TEXTLEFT Macro

C

```
#define GRIDITEM_TEXTLEFT 0x0020 // Text in the cell is left aligned.
```

Description

Text in the cell is left aligned.

5.2.2.7.26.615 GRIDITEM_TEXTRIGHT Macro

C

```
#define GRIDITEM_TEXTRIGHT 0x0010 // Text in the cell is right aligned.
```

Description

Text in the cell is right aligned.

5.2.2.7.26.616 GRIDITEM_TEXTTOP Macro

C

```
#define GRIDITEM_TEXTTOP 0x0080 // Bit to indicate text is bottom aligned.
```

Description

Bit to indicate text is bottom aligned.

5.2.2.7.26.617 HIDE_DATA Macro

C

```
#define HIDE_DATA 0 // Macro used to reset the data series show flag or indicate  
that the data series will be not be shown when the chart is drawn.
```

Description

Macro used to reset the data series show flag or indicate that the data series will be not be shown when the chart is drawn.

5.2.2.7.26.618 ImageAbort Macro

C

```
#define ImageAbort IMG_bAbortImageDecoding = 1;
```

Description

This function sets the Image Decoder's Abort flag so that decoding aborts in the next decoding loop.

Returns

None

Side Effects

None

Example

```

void callback(void);
void main(void)
{
    IMG_FILE pImageFile;
    IMG_vInitialize();
    ImageLoopCallbackRegister(callback);
    pImageFile = IMG_FOPEN("Image.jpg", "r");
    if(pImageFile == NULL)
    {
        <- Error handling ->
    }
    IMG_bFullScreenDecode(pImageFile, IMG_JPEG, NULL, NULL);
    IMG_FCLOSE(pImageFile);
    while(1);
}

void callback(void)
{
    if(<- check for abort condition ->)
    {
        ImageAbort();
    }
}

```

5.2.2.7.26.619 ImageFullScreenDecode Macro**C**

```

#define ImageFullScreenDecode(pImageFile, eImgFormat, pFileAPIs, pPixelFormat) \
    ImageDecode(pImageFile, eImgFormat, 0, 0, IMG_SCREEN_WIDTH, IMG_SCREEN_HEIGHT,
    (IMG_ALIGN_CENTER | IMG_DOWN_SCALE), pFileAPIs, pPixelFormat)

```

Description

This function decodes and displays the image on the screen in fullscreen mode with center aligned and downscaled if required

Returns

Error code -> 0 means no error

Side Effects

None

Example

```

void main(void)
{
    IMG_FILE pImageFile;
    IMG_vInitialize();
    pImageFile = IMG_FOPEN("Image.jpg", "r");
    if(pImageFile == NULL)
    {
        <- Error handling ->
    }
}

```

```
    IMG_bFullScreenDecode(plmageFile, IMG_JPEG, NULL, NULL);  
    IMG_FCLOSE(plmageFile);  
    while(1);  
}
```

5.2.2.7.26.620 IMG_ALIGN_CENTER Macro

C

```
#define IMG_ALIGN_CENTER 0x0001
```

Description

Flags

5.2.2.7.26.621 IMG_DECODE_ABORTED Macro

C

```
#define IMG_DECODE_ABORTED 0xFF
```

Description

This is macro IMG_DECODE_ABORTED.

5.2.2.7.26.622 IMG_DOWN_SCALE Macro

C

```
#define IMG_DOWN_SCALE 0x0002
```

Description

This is macro IMG_DOWN_SCALE.

5.2.2.7.26.623 IMG_FCLOSE Macro

C

```
#define IMG_FCLOSE FSfclose
```

Description

This is macro IMG_FCLOSE.

5.2.2.7.26.624 IMG_FEOF Macro

C

```
#define IMG_FEOF IMG_pFileAPIs->pFeof
```

Description

This is macro IMG_FEOF.

5.2.2.7.26.625 IMG_FILE Macro

C

```
#define IMG_FILE void
```

Description

This is macro IMG_FILE.

5.2.2.7.26.626 IMG_FOPEN Macro

C

```
#define IMG_FOPEN FSfopen
```

Description

added by Paolo 9/10/08 for MultiApp Demo

5.2.2.7.26.627 IMG_FREAD Macro

C

```
#define IMG_FREAD IMG_pFileAPIs->pFread
```

Description

This is macro IMG_FREAD.

5.2.2.7.26.628 IMG_FSEEK Macro

C

```
#define IMG_FSEEK IMG_pFileAPIs->pFseek
```

Description

This is macro IMG_FSEEK.

5.2.2.7.26.629 IMG_FTELL Macro

C

```
#define IMG_FTELL IMG_pFileAPIs->pFtell
```

Description

This is macro IMG_FTELL.

5.2.2.7.26.630 IMG_SCREEN_HEIGHT Macro

C

```
#define IMG_SCREEN_HEIGHT (GetMaxY()+1)
```

Description

This is macro IMG_SCREEN_HEIGHT.

5.2.2.7.26.631 IMG_SCREEN_WIDTH Macro

C

```
#define IMG_SCREEN_WIDTH (GetMaxX()+1)
```

Description

The individual image decoders use these defines instead of directly using those provided in the Display driver file

5.2.2.7.26.632 IMG_vCheckAndAbort Macro

C

```
#define IMG_vCheckAndAbort \
```

```

    if(IMG_bAbortImageDecoding == 1) \
    {
        IMG_bAbortImageDecoding = 0; \
        return IMG_DECODE_ABORTED; \
    }

```

Description

This is macro IMG_vCheckAndAbort.

5.2.2.7.26.633 IMG_vLoopCallback Macro

C

```
#define IMG_vLoopCallback
```

Description

This is macro IMG_vLoopCallback.

5.2.2.7.26.634 IMG_vPutPixel Macro

C

```

#define IMG_vPutPixel(x, y) if(IMG_bDownScalingFactor <= 1)\
    {
        if((x) < IMG_wImageWidth && (y) < IMG_wImageHeight) {
            _PutPixel(IMG_wStartX + (x), IMG_wStartY + (y)); }\
        }
        else if((x)%IMG_bDownScalingFactor == 0 &&
            (y)%IMG_bDownScalingFactor == 0) \
        {
            if((x) < IMG_wImageWidth && (y) < IMG_wImageHeight) {
                _PutPixel(IMG_wStartX + ((x)/IMG_bDownScalingFactor), IMG_wStartY +
                    ((y)/IMG_bDownScalingFactor)); }\
            }
        }

```

Description

This is macro IMG_vPutPixel.

5.2.2.7.26.635 IMG_vSetColor Macro

C

```
#define IMG_vSetColor(handle, r, g, b) GFX_PRIM_SetColor(handle, RGBConvert((r), (g), (b)))
```

Description

This is macro IMG_vSetColor.

5.2.2.7.26.636 KHAKI Macro

C

```
#define KHAKI GFX_RGBConvert(240, 230, 140)
```

Description

This is macro KHAKI.

5.2.2.7.26.637 LIGHTBLUE Macro

C

```
#define LIGHTBLUE GFX_RGBConvert(128, 128, 255)
```

Description

This is macro LIGHTBLUE.

5.2.2.7.26.638 LIGHTCYAN Macro

C

```
#define LIGHTCYAN GFX_RGBConvert(128, 255, 255)
```

Description

This is macro LIGHTCYAN.

5.2.2.7.26.639 LIGHTGRAY Macro

C

```
#define LIGHTGRAY GFX_RGBConvert(128, 128, 128)
```

Description

This is macro LIGHTGRAY.

5.2.2.7.26.640 LIGHTGREEN Macro

C

```
#define LIGHTGREEN GFX_RGBConvert(128, 255, 128)
```

Description

This is macro LIGHTGREEN.

5.2.2.7.26.641 LIGHTMAGENTA Macro

C

```
#define LIGHTMAGENTA GFX_RGBConvert(255, 128, 255)
```

Description

This is macro LIGHTMAGENTA.

5.2.2.7.26.642 LIGHTORANGE Macro

C

```
#define LIGHTORANGE GFX_RGBConvert(255, 200, 0)
```

Description

This is macro LIGHTORANGE.

5.2.2.7.26.643 LIGHTRED Macro

C

```
#define LIGHTRED GFX_RGBConvert(255, 128, 128)
```

Description

This is macro LIGHTRED.

5.2.2.7.26.644 LIGHTYELLOW Macro

C

```
#define LIGHTYELLOW GFX_RGBConvert(255, 255, 150)
```

Description

This is macro LIGHTYELLOW.

5.2.2.7.26.645 MAGENTA Macro

C

```
#define MAGENTA GFX_RGBConvert(128, 0, 128)
```

Description

This is macro MAGENTA.

5.2.2.7.26.646 MCHP_BITMAP_NORMAL Macro

C

```
#define MCHP_BITMAP_NORMAL 0x00 // no compression, palette is present
```

Description

no compression, palette is present for color depth = 8, 4 and 1 BPP

5.2.2.7.26.647 MCHP_BITMAP_PALETTE_STR Macro

C

```
#define MCHP_BITMAP_PALETTE_STR 0x10 // palette is provided as a separate
```

Description

palette is provided as a separate object (see [PALETTE_HEADER](#)) for color depth = 8, 4, and 1 BPP, ID to the palette is embedded in the bitmap.

5.2.2.7.26.648 ONEP25 Macro

C

```
#define ONEP25 81920 // 1.25 * 2^16
```

Description

1.25 * 2¹⁶

5.2.2.7.26.649 ORANGE Macro

C

```
#define ORANGE GFX_RGBConvert(255, 187, 76)
```

Description

This is macro ORANGE.

5.2.2.7.26.650 PERU Macro

C

```
#define PERU GFX_RGBConvert(205, 133, 63)
```

Description

This is macro PERU.

5.2.2.7.26.651 RED Macro

C

```
#define RED GFX_RGBConvert(128, 0, 0)
```

Description

This is macro RED.

5.2.2.7.26.652 RequestEntirePaletteChange Macro

C

```
#define RequestEntirePaletteChange(pPalette) RequestPaletteChange(pPalette, 0, 256)
```

Description

Macro: RequestEntirePaletteChange(pPalette)

Loads all the palette entries from the flash during vertical blanking period if possible, otherwise loads immediately.

Preconditions

PPalette must be initialized by [PaletteInit\(\)](#).

Parameters

Parameters	Description
pPalette	Pointer to the palette structure

Returns

none

Side Effects

There may be a slight flicker when the Palette entries are getting loaded one by one.

5.2.2.7.26.653 SADDLEBROWN Macro

C

```
#define SADDLEBROWN GFX_RGBConvert(139, 69, 19)
```

Description

This is macro SADDLEBROWN.

5.2.2.7.26.654 SCAN_BS_PRESSED Macro

C

```
#define SCAN_BS_PRESSED 0x0E
```

Description

Back space key pressed.

5.2.2.7.26.655 SCAN_BS_RELEASED Macro**C**

```
#define SCAN_BS_RELEASED 0x8E
```

Description

Back space key released.

5.2.2.7.26.656 SCAN_CR_PRESSED Macro**C**

```
#define SCAN_CR_PRESSED 0x1C
```

Description

Carriage return pressed.

5.2.2.7.26.657 SCAN_CR_RELEASED Macro**C**

```
#define SCAN_CR_RELEASED 0x9C
```

Description

Carriage return released.

5.2.2.7.26.658 SCAN_CRA_PRESSED Macro**C**

```
#define SCAN_CRA_PRESSED 0x2C
```

Description

Carriage return alternate pressed.

5.2.2.7.26.659 SCAN_CRA_RELEASED Macro**C**

```
#define SCAN_CRA_RELEASED 0xAC
```

Description

Carriage return alternate released.

5.2.2.7.26.660 SCAN_DEL_PRESSED Macro**C**

```
#define SCAN_DEL_PRESSED 0x53
```

Description

Delete key pressed.

5.2.2.7.26.661 SCAN_DEL_RELEASED Macro

C

```
#define SCAN_DEL_RELEASED 0xD3
```

Description

Delete key released.

5.2.2.7.26.662 SCAN_DOWN_PRESSED Macro

C

```
#define SCAN_DOWN_PRESSED 0x50
```

Description

Down key pressed.

5.2.2.7.26.663 SCAN_DOWN_RELEASED Macro

C

```
#define SCAN_DOWN_RELEASED 0xD0
```

Description

Down key released.

5.2.2.7.26.664 SCAN_END_PRESSED Macro

C

```
#define SCAN_END_PRESSED 0x4F
```

Description

End key pressed.

5.2.2.7.26.665 SCAN_END_RELEASED Macro

C

```
#define SCAN_END_RELEASED 0xCF
```

Description

End key released.

5.2.2.7.26.666 SCAN_HOME_PRESSED Macro

C

```
#define SCAN_HOME_PRESSED 0x47
```

Description

Home key pressed.

5.2.2.7.26.667 SCAN_HOME_RELEASED Macro

C

```
#define SCAN_HOME_RELEASED 0xC7
```

Description

Home key released.

5.2.2.7.26.668 SCAN_LEFT_PRESSED Macro

C

```
#define SCAN_LEFT_PRESSED 0x4B
```

Description

Left key pressed.

5.2.2.7.26.669 SCAN_LEFT_RELEASED Macro

C

```
#define SCAN_LEFT_RELEASED 0xCB
```

Description

Left key released.

5.2.2.7.26.670 SCAN_PGDOWN_PRESSED Macro

C

```
#define SCAN_PGDOWN_PRESSED 0x51
```

Description

Page down key pressed.

5.2.2.7.26.671 SCAN_PGDOWN_RELEASED Macro

C

```
#define SCAN_PGDOWN_RELEASED 0xD1
```

Description

Page down key released.

5.2.2.7.26.672 SCAN_PGUP_PRESSED Macro

C

```
#define SCAN_PGUP_PRESSED 0x49
```

Description

Page up key pressed.

5.2.2.7.26.673 SCAN_PGUP_RELEASED Macro

C

```
#define SCAN_PGUP_RELEASED 0xC9
```

Description

Page up key released.

5.2.2.7.26.674 SCAN_RIGHT_PRESSED Macro

C

```
#define SCAN_RIGHT_PRESSED 0x4D
```

Description

Right key pressed.

5.2.2.7.26.675 SCAN_RIGHT_RELEASED Macro

C

```
#define SCAN_RIGHT_RELEASED 0xCD
```

Description

Right key released.

5.2.2.7.26.676 SCAN_SPACE_PRESSED Macro

C

```
#define SCAN_SPACE_PRESSED 0x39
```

Description

Space key pressed.

5.2.2.7.26.677 SCAN_SPACE_RELEASED Macro

C

```
#define SCAN_SPACE_RELEASED 0xB9
```

Description

Space key released.

5.2.2.7.26.678 SCAN_TAB_PRESSED Macro

C

```
#define SCAN_TAB_PRESSED 0x0F
```

Description

Tab key pressed.

5.2.2.7.26.679 SCAN_TAB_RELEASED Macro

C

```
#define SCAN_TAB_RELEASED 0x8F
```

Description

Tab key released.

5.2.2.7.26.680 SCAN_UP_PRESSED Macro

C

```
#define SCAN_UP_PRESSED 0x48
```

Description

Up key pressed.

5.2.2.7.26.681 SCAN_UP_RELEASED Macro**C**

```
#define SCAN_UP_RELEASED 0xC8
```

Description

Up key released.

5.2.2.7.26.682 SetEntirePalette Macro**C**

```
#define SetEntirePalette(pPalette) SetPalette(pPalette, 0, 256)
```

Description

Macro: SetEntirePalette(pPalette)

Programs the whole 256 entry palette with new color values from flash.

Preconditions

Palette must be initialized by [PaletteInit\(\)](#).

Parameters

Parameters	Description
pPalette	Pointer to the palette structure

Returns

Returns the status of the palette set. 0 - Set was successful 1 - Set was not successful

Side Effects

There may be a slight flicker when the Palette entries are getting loaded one by one.

5.2.2.7.26.683 SHOW_DATA Macro**C**

```
#define SHOW_DATA 1 // Macro used to set the data series show flag or indicate  
that the data series will be shown when the chart is drawn.
```

Description

Macro used to set the data series show flag or indicate that the data series will be shown when the chart is drawn.

5.2.2.7.26.684 SIENNA Macro**C**

```
#define SIENNA GFX_RGBConvert(160, 82, 45)
```

Description

This is macro SIENNA.

5.2.2.7.26.685 SIN45 Macro

C

```
#define SIN45 46341 // sin(45) * 2^16)
```

Description

$\sin(45) * 2^{16}$

5.2.2.7.26.686 TAN Macro

C

```
#define TAN GFX_RGBConvert(210, 180, 140)
```

Description

This is macro TAN.

5.2.2.7.26.687 TE_ROUNDEDBUTTON_RADIUS Macro

C

```
#define TE_ROUNDEDBUTTON_RADIUS 0
```

Description

Optional settings Set this parameter in the GraphicsConfig.h

5.2.2.7.26.688 USE_HORZ_ASCENDING_ORDER Macro

C

```
#define USE_HORZ_ASCENDING_ORDER
```

Description

use ascending order when displaying variables on horizontal mode (bar chart only)

5.2.2.7.26.689 USE_PIE_ENABLE_LABEL Macro

C

```
#define USE_PIE_ENABLE_LABEL
```

Description

use labels: A:10%,30 where each sample is labeled A-Z followed by a colon.

5.2.2.7.26.690 WHEAT Macro

C

```
#define WHEAT GFX_RGBConvert(245, 245, 220)
```

Description

This is macro WHEAT.

5.2.2.7.26.691 WHITE Macro

C

```
#define WHITE GFX_RGBConvert(255, 255, 255)
```

Description

This is macro WHITE.

5.2.2.7.26.692 YELLOW Macro**C**

```
#define YELLOW GFX_RGBConvert(255, 255, 128)
```

Description

This is macro YELLOW.

5.2.2.7.26.693 GFX_GOL_EDITBOX_STATE Enumeration**C**

```
typedef enum {
    GFX_GOL_EDITBOX_FOCUSED_STATE = 0x0001,
    GFX_GOL_EDITBOX_DISABLED_STATE = 0x0002,
    GFX_GOL_EDITBOX_ENABLE_CARET_STATE = 0x0004,
    GFX_GOL_EDITBOX_DRAW_CARET_STATE = 0x1000,
    GFX_GOL_EDITBOX_DRAW_FOCUS_STATE = 0x2000,
    GFX_GOL_EDITBOX_DRAW_STATE = 0x4000,
    GFX_GOL_EDITBOX_HIDE_STATE = 0x8000
} GFX_GOL_EDITBOX_STATE;
```

Description

Object States Definition:

Members

Members	Description
GFX_GOL_EDITBOX_FOCUSED_STATE = 0x0001	Bit for focus state. Cursor caret will be drawn when GFX_GOL_EDITBOX_ENABLE_CARET_STATE is also set.
GFX_GOL_EDITBOX_DISABLED_STATE = 0x0002	Bit for disabled state.
GFX_GOL_EDITBOX_ENABLE_CARET_STATE = 0x0004	Bit to indicate cursor caret will always be shown.
GFX_GOL_EDITBOX_DRAW_CARET_STATE = 0x1000	Bit to indicate the cursor caret will be drawn if GFX_GOL_EDITBOX_FOCUSED_STATE state bit is set and erase when GFX_GOL_EDITBOX_FOCUSED_STATE state bit is not set.
GFX_GOL_EDITBOX_DRAW_FOCUS_STATE = 0x2000	Bit to indicate focus must be redrawn.
GFX_GOL_EDITBOX_DRAW_STATE = 0x4000	Bit to indicate object must be redrawn.
GFX_GOL_EDITBOX_HIDE_STATE = 0x8000	Bit to indicate object must be removed from screen.

5.2.2.7.26.694 GFX_GOL_PICTURECONTROL Structure**C**

```
typedef struct {
    GFX_GOL_OBJ_HEADER hdr;
    GFX_RESOURCE_HDR * pImage;
    int8_t scaleFactor;
    uint16_t imageLeft;
    uint16_t imageTop;
    uint16_t imageRight;
    uint32_t * stream;
    uint8_t count;
```

```

uint8_t delay;
uint16_t imageBottom;
GFX_PARTIAL_IMAGE_PARAM partial;
} GFX_GOL_PICTURECONTROL;

```

Description

The structure contains data for picture control

Members

Members	Description
GFX_GOL_OBJ_HEADER hdr;	Generic header for all Objects (see GFX_GOL_OBJ_HEADER).
GFX_RESOURCE_HDR * pImage;	Pointer to the image
int8_t scaleFactor;	Scale factor for the bitmap
uint16_t imageLeft;	image left position when drawn
uint16_t imageTop;	image top position when drawn
uint16_t imageRight;	image right position when drawn
uint8_t count;	Count for the number of bitmaps to be streamed
uint8_t delay;	Delay in between the streaming of bitmaps
uint16_t imageBottom;	image bottom position when drawn
GFX_PARTIAL_IMAGE_PARAM partial;	structure containing partial image data

5.2.2.7.26.695 GFX_GOL_PICTURECONTROLCONTROL_STATE Enumeration

C

```

typedef enum {
    GFX_GOL_PICTURECONTROL_DISABLED_STATE = 0x0002,
    GFX_GOL_PICTURECONTROL_FRAME_STATE = 0x0004,
    GFX_GOL_PICTURECONTROL_STREAM_STATE = 0x0008,
    GFX_GOL_PICTURECONTROL_DRAW_STATE = 0x4000,
    GFX_GOL_PICTURECONTROL_HIDE_STATE = 0x8000
} GFX_GOL_PICTURECONTROLCONTROL_STATE;

```

Description

Object States Definition:

Members

Members	Description
GFX_GOL_PICTURECONTROL_DISABLED_STATE = 0x0002	Bit for disabled state.
GFX_GOL_PICTURECONTROL_FRAME_STATE = 0x0004	Bit for state with frame.
GFX_GOL_PICTURECONTROL_STREAM_STATE = 0x0008	Bit to indicate Picture is streaming
GFX_GOL_PICTURECONTROL_DRAW_STATE = 0x4000	Bit to indicate object must be redrawn.
GFX_GOL_PICTURECONTROL_HIDE_STATE = 0x8000	Bit to indicate object must be removed from screen.

5.2.2.7.26.696 GFX_GOL_DigitalMeterTextAlignmentGet Macro

C

```

#define GFX_GOL_DigitalMeterTextAlignmentGet(pObject) \
    (((GFX_GOL_DIGITALMETER *)pObject)->alignment)

```

Description

This function returns the text alignment of the text string used by the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

The text alignment set in the object. See [GFX_ALIGNMENT](#) for more details.

Example

None.

5.2.2.7.26.697 GFX_GOL_DigitalMeterTextAlignmentSet Macro**C**

```
#define GFX_GOL_DigitalMeterTextAlignmentSet(pObject, align) \  
(((GFX_GOL_DIGITALMETER *)pObject)->alignment = align)
```

Description

This function sets the text alignment of the text string used by the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	Pointer to the object.
align	The alignment set for the text in the object. See GFX_ALIGNMENT for more details.

Returns

None.

Example

None.

5.2.2.7.26.698 GFX_GOL_EditBoxTextAlignmentGet Macro**C**

```
#define GFX_GOL_EditBoxTextAlignmentGet(pObject) \  
(((GFX_GOL_EDITBOX *)pObject)->alignment)
```

Description

This function returns the text alignment of the text string used by the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

The text alignment set in the object. See [GFX_ALIGNMENT](#) for more details.

Example

None.

5.2.2.7.26.699 GFX_GOL_EditBoxTextAlignmentSet Macro**C**

```
#define GFX_GOL_EditBoxTextAlignmentSet(pObject, align) \
    (((GFX_GOL_EDITBOX *)pObject)->alignment = align)
```

Description

This function sets the text alignment of the text string used by the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	Pointer to the object.
align	The alignment set for the text in the object. See GFX_ALIGNMENT for more details.

Returns

None.

Example

None.

5.2.2.7.26.700 GFX_GOL_EditBoxTextGet Macro**C**

```
#define GFX_GOL_EditBoxTextGet(pObject) (((GFX_GOL_EDITBOX *)pObject)->pText)
```

Description

This function returns the address of the current text string used by the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

Pointer to text string.

Example

None.

5.2.2.7.26.701 GFX_GOL_ListBoxTextAlignmentGet Macro**C**

```
#define GFX_GOL_ListBoxTextAlignmentGet(pObject) \
    (((GFX_GOL_LISTBOX *)pObject)->alignment)
```

Description

This function returns the text alignment of the text string used by the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

The text alignment set in the object. See [GFX_ALIGNMENT](#) for more details.

Example

None.

5.2.2.7.26.702 GFX_GOL_ListBoxTextAlignmentSet Macro**C**

```
#define GFX_GOL_ListBoxTextAlignmentSet(pObject, align) \
    (((GFX_GOL_LISTBOX *)pObject)->alignment = align)
```

Description

This function sets the text alignment of the text string used by the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	Pointer to the object.
align	The alignment set for the text in the object. See GFX_ALIGNMENT for more details.

Returns

None.

Example

None.

5.2.2.7.26.703 GFX_GOL_PictureControlImageGet Macro

C

```
#define GFX_GOL_PictureControlImageGet(pObject) \
    (((GFX_GOL_PICTURECONTROL*)pObject)->pImage)
```

Description

This function gets the image used when in the pressed state.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.

Returns

Pointer to the image resource.

Example

None.

5.2.2.7.26.704 GFX_GOL_PictureControlImageSet Macro

C

```
#define GFX_GOL_PictureControlImageSet(pObject, pImage) \
    (((GFX_GOL_PICTURECONTROL*)pObject)->pImage = pImage)
```

Description

This function sets the image to be in the object.

Preconditions

Object must exist in memory.

Parameters

Parameters	Description
pObject	pointer to the object.
pImage	pointer to the image resource.

Returns

None.

Example

```
// assume OrigImage and NewImage are valid GFX_RESOURCE_HDR  
// pointers for images
```

```
GFX_RESOURCE_HDR *pOrigIcon = &OrigImage;  
GFX_RESOURCE_HDR *pNewIcon = &NewImage;  
GFX_GOL_PICTURECONTROL *pPicture;  
  
pPicture = GFX_GOL_PictureControlCreate(  
    10,  
    0, 0,  
    GFX_MaxXGet(), GFX_MaxYGet(),  
    GFX_GOL_PICTURECONTROL_DRAW_STATE,
```

```
        pOrigIcon,
        NULL);

// change the image used
GFX_GOL_PictureControlImageSet(pPicture , pNewIcon);
```

5.2.2.7.26.705 GFX_GOL_PictureControlScaleSet Macro

```
C
#define GFX_GOL_PictureControlScaleSet(pPict, scl) pPict->scaleFactor = scl
```

Description
This function sets the scale factor used to render the bitmap used in the object using scl.

Preconditions
None.

Parameters

Parameters	Description
pPict	Pointer to the object
scl	The scale factor that will be used to display the bitmap.

Returns
None.

Remarks
None.

Example
None.

5.2.2.8 Files

Files

Name	Description
gfx.h	The header file joins all header files used in the graphics library and contains compile options and defaults.
gfx_colors.h	The header file contains default color definitions for each color depth.
gfx_colors_w3.h	The header file contains W3 color definitions.
gfx_colors_x11.h	The header file contains X11 color definitions.

5.2.2.8.1 gfx.h

Module for Microchip Graphics Library

This header file includes all the header files required to use the Microchip Graphics Library. Library features and options defined in the Graphics Library configurations will be included in each build.

Macros

	Name	Description
	GRAPHICS_LIBRARY_VERSION	////////////////// GRAPHICS_LIBRARY_VERSION //////////////////// MSB is version, LSB is subversion

File Name

gfx.h

Company

Microchip Technology Inc.

5.2.2.8.2 gfx_colors.h

Module for Microchip Graphics Library

This header file provides default color definitions as well as color conversion macros. Application may or may not use this file. Application may replace this file with new color definitions that fits the application needs.

Macros

	Name	Description
	BLACK	This is macro BLACK.

	GFX_X11_MIDNIGHT_BLUE	This is macro GFX_X11_MIDNIGHT_BLUE.
	GFX_X11_MINT_CREAM	This is macro GFX_X11_MINT_CREAM.
	GFX_X11_MISTY_ROSE	This is macro GFX_X11_MISTY_ROSE.
	GFX_X11_MOCCASIN	This is macro GFX_X11_MOCCASIN.
	GFX_X11_NAVAJO_WHITE	This is macro GFX_X11_NAVAJO_WHITE.
	GFX_X11_NAVY	This is macro GFX_X11_NAVY.
	GFX_X11_OLD_LACE	This is macro GFX_X11_OLD_LACE.
	GFX_X11_OLIVE	This is macro GFX_X11_OLIVE.
	GFX_X11_OLIVE_DRAB	This is macro GFX_X11_OLIVE_DRAB.
	GFX_X11_ORANGE	This is macro GFX_X11_ORANGE.
	GFX_X11_ORANGE_RED	X11: Orange Colors
	GFX_X11_ORCHID	This is macro GFX_X11_ORCHID.
	GFX_X11_PALE_GOLDENROD	This is macro GFX_X11_PALE_GOLDENROD.
	GFX_X11_PALE_GREEN	This is macro GFX_X11_PALE_GREEN.
	GFX_X11_PALE_TURQUOISE	This is macro GFX_X11_PALE_TURQUOISE.
	GFX_X11_PALE_VIOLET_RED	This is macro GFX_X11_PALE_VIOLET_RED.
	GFX_X11_PAPAYA_WHIP	This is macro GFX_X11_PAPAYA_WHIP.
	GFX_X11_PEACH_PUFF	This is macro GFX_X11_PEACH_PUFF.
	GFX_X11_PERU	This is macro GFX_X11_PERU.
	GFX_X11_PINK	X11: Pink Colors
	GFX_X11_PLUM	This is macro GFX_X11_PLUM.
	GFX_X11_POWDER_BLUE	This is macro GFX_X11_POWDER_BLUE.
	GFX_X11_PURPLE	This is macro GFX_X11_PURPLE.
	GFX_X11_RED	This is macro GFX_X11_RED.

	GFX_X11_ROSY_BROWN	This is macro GFX_X11_ROSY_BROWN.
	GFX_X11_ROYAL_BLUE	This is macro GFX_X11_ROYAL_BLUE.
	GFX_X11_SADDLE_BROWN	This is macro GFX_X11_SADDLE_BROWN.
	GFX_X11_SALMON	This is macro GFX_X11_SALMON.
	GFX_X11_SANDY_BROWN	This is macro GFX_X11_SANDY_BROWN.
	GFX_X11_SEA_GREEN	This is macro GFX_X11_SEA_GREEN.
	GFX_X11_SEASHELL	This is macro GFX_X11_SEASHELL.
	GFX_X11_SIENNA	This is macro GFX_X11_SIENNA.
	GFX_X11_SILVER	This is macro GFX_X11_SILVER.
	GFX_X11_SKY_BLUE	This is macro GFX_X11_SKY_BLUE.
	GFX_X11_SLATE_BLUE	This is macro GFX_X11_SLATE_BLUE.
	GFX_X11_SLATE_GREY	This is macro GFX_X11_SLATE_GREY.
	GFX_X11_SNOW	This is macro GFX_X11_SNOW.
	GFX_X11_SPRING_GREEN	This is macro GFX_X11_SPRING_GREEN.
	GFX_X11_STEEL_BLUE	This is macro GFX_X11_STEEL_BLUE.
	GFX_X11_TAN	This is macro GFX_X11_TAN.
	GFX_X11_TEAL	This is macro GFX_X11_TEAL.
	GFX_X11_THISTLE	This is macro GFX_X11_THISTLE.
	GFX_X11_TOMATO	This is macro GFX_X11_TOMATO.
	GFX_X11_TURQUOISE	This is macro GFX_X11_TURQUOISE.
	GFX_X11_VIOLET	This is macro GFX_X11_VIOLET.
	GFX_X11_WHEAT	This is macro GFX_X11_WHEAT.
	GFX_X11_WHITE	X11: WHITE /GRAY/ BLACK COLORS
	GFX_X11_WHITE_SMOKE	This is macro GFX_X11_WHITE_SMOKE.
	GFX_X11_YELLOW	X11: Yellow Colors
	GFX_X11_YELLOW_GREEN	This is macro GFX_X11_YELLOW_GREEN.

- moved to DisplayConfig.h

Macros

	Name	Description
	COLOR_DEPTH	Specifies the color depth used in the application defined in GraphicsConfig.h.

5.2.2.8.6 gfx_gol.h

Module for Microchip Graphics Library - Graphic Object Layer

This module implements the common routines for the Graphics Object Layer of the Microchip Graphics Library. The routines are independent of the Display Driver Layer and should be compatible with any Display Driver that is compliant with the requirements of the Display Driver Layer of the Graphics Library. The module utilizes the Graphics Primitive Layer to render the objects.

Enumerations

	Name	Description
	<u>GFX_GOL_OBJ_TYPE</u>	Specifies the different object types used in the library.
	<u>GFX_GOL_TRANSLATED_ACTION</u>	Specifies the different object actions supported in the library.
	<u>INPUT_DEVICE_EVENT</u>	Specifies the different user input device events supported in the library.
	<u>INPUT_DEVICE_TYPE</u>	Specifies the different user input devices supported in the library.

Functions

	Name	Description
	<u>GFX_GOL_DrawCallbackSet</u>	This function sets the draw callback function that the application will use to render application specific rendering.
	<u>GFX_GOL_MessageCallbackSet</u>	This function sets the message callback function that the application will use to evaluate user inputs that affects the objects and application behavior.
	<u>GFX_GOL_ObjectAdd</u>	This function adds an object to the tail of the currently active list.
	<u>GFX_GOL_ObjectBackGroundSet</u>	This function sets the background information.
	<u>GFX_GOL_ObjectByIDDelete</u>	This function removes an object with the given user defined ID from the currently active list.
	<u>GFX_GOL_ObjectCanBeFocused</u>	Checks if the object can be focused.
	<u>GFX_GOL_ObjectDelete</u>	This function removes an object from the currently active list.
	<u>GFX_GOL_ObjectDrawDisable</u>	This function resets the drawing state bits of the object.
	<u>GFX_GOL_ObjectDrawEnable</u>	This function sets the object to be redraw.
	<u>GFX_GOL_ObjectFind</u>	This function returns the pointer to object in the list with the user defined ID assigned to it.
	<u>GFX_GOL_ObjectFocusGet</u>	This function returns the pointer to the object that is currently receiving keyboard input (or focused).
	<u>GFX_GOL_ObjectFocusNextGet</u>	This function returns the pointer to the next object in the active list of objects which can be focused.
	<u>GFX_GOL_ObjectFocusPrevGet</u>	This function returns the pointer to the previous object in the active list of objects which can be focused.
	<u>GFX_GOL_ObjectFocusSet</u>	This function sets the object to be focused.
	<u>GFX_GOL_ObjectHideDraw</u>	This is function <u>GFX_GOL_ObjectHideDraw</u> .
	<u>GFX_GOL_ObjectIDGet</u>	This function returns the object ID.
	<u>GFX_GOL_ObjectIsRedrawSet</u>	This function checks if the object needs to be redrawn or not.
	<u>GFX_GOL_ObjectListDraw</u>	This function redraws all objects in the current active list that has the rendering state bits set.
	<u>GFX_GOL_ObjectListFree</u>	This function sets the active list to the new list.
	<u>GFX_GOL_ObjectListGet</u>	This function returns the current active list.
	<u>GFX_GOL_ObjectListNew</u>	This function removes an object with the given user defined ID from the currently active list.
	<u>GFX_GOL_ObjectListSet</u>	This function sets the active list to the new list.
	<u>GFX_GOL_ObjectMessage</u>	This function process the received message from the user to determine the affected objects. Depending on the message and the affected objects, object states are modified based on the default behaviour or user defined behaviour.
	<u>GFX_GOL_ObjectNextGet</u>	This function returns the pointer to next object in the list after the specified object.
	<u>GFX_GOL_ObjectRectangleRedraw</u>	This function marks all objects in the active list intersected by the given rectangular area to be redrawn.

	GFX_GOL_ObjectTypeGet	This function returns the object type.
	GFX_GOL_PanelAlphaParameterSet	This is function GFX_GOL_PanelAlphaParameterSet.
	GFX_GOL_PanelBackgroundSet	This is function GFX_GOL_PanelBackgroundSet.
	GFX_GOL_PanelDraw	This is function GFX_GOL_PanelDraw.
	GFX_GOL_PanelGradientParameterSet	This is function GFX_GOL_PanelGradientParameterSet.
	GFX_GOL_PanelParameterSet	This is function GFX_GOL_PanelParameterSet.
	GFX_GOL_TwoTonePanelDraw	This is function GFX_GOL_TwoTonePanelDraw.

Macros

	Name	Description
	GFX_GOL_ObjectStateClear	This function clears the state bits of the given object.
	GFX_GOL_ObjectStateGet	This function retrieves the current value of the state bits of an object.
	GFX_GOL_ObjectStateSet	This function sets the state bits of the given object.

Structures

	Name	Description
	GFX_GOL_MESSAGE	Specifies message structure used in the library.
	GFX_GOL_OBJ_HEADER	Specifies Graphics Object Layer structure used in objects.
	GOL_PANEL_PARAM	Specifies panel parameters.

Types

	Name	Description
	GFX_GOL_DRAW_CALLBACK_FUNC	Draw callback function definition. This application defined function allows the application to perform application specific rendering.
	GFX_GOL_TRANSLATED_ACTION, \ GFX_GOL_OBJ_HEADER *, \ GFX_GOL_MESSAGE * \)	Message callback function definition. This application defined function allows the application to perform application specific processing of user messages.

File Name

gfx_gol.h

Company

Microchip Technology Inc.

5.2.2.8.7 gfx_gol_analog_clock.h

Graphics Library Implementation

Refer to Microchip Graphics Library for complete documentation of the AnalogClock Object.

Functions

	Name	Description
	GFX_AnalogClockCreate	Creates a analog clock object.
	GFX_GOL_AnalogClockDraw	This function renders the object on the screen using the current parameter settings. Location of the object is determined by the left, top, right and bottom parameters. The colors used are dependent on the state of the object. The font used is determined by the style scheme set.
	GFX_GOL_AnalogClockHandsDraw	Draws the current position of the clock hands with the given thickness and color.
	GFX_GOL_AnalogClockHourSet	Sets the hour value of the analog clock.

	GFX_GOL_AnalogClockMinuteSet	Sets the minute value of the analog clock.
	GFX_GOL_AnalogClockSecondSet	Sets the second value of the analog clock.

Macros

	Name	Description
	GFX_GOL_ANALOGCLOCK_DISABLED	Bit for disabled state.
	GFX_GOL_ANALOGCLOCK_DRAW	Bit to indicate button must be redrawn.
	GFX_GOL_ANALOGCLOCK_HIDE	Bit to indicate button must be removed from screen.
	GFX_GOL_ANALOGCLOCK_PRESSED	Bit for press state.
	GFX_GOL_ANALOGCLOCK_TICK	Bit to tick second hand
	GFX_GOL_ANALOGCLOCK_UPDATE_HOUR	Bit to indicate hour hand must be redrawn
	GFX_GOL_ANALOGCLOCK_UPDATE_MINUTE	Bit to indicate minute hand must be redrawn
	GFX_GOL_ANALOGCLOCK_UPDATE_SECOND	Bit to indicate minute hand must be redrawn

Structures

	Name	Description

5.2.2.8.8 gfx_gol_button.h

Module for Microchip Graphics Library - Graphic Object Layer

Refer to Microchip Graphics Library for complete documentation of the [GFX_GOL_BUTTON](#) Object.

Enumerations

	Name	Description
	GFX_GOL_BUTTON_STATE	Object States Definition:

Functions

	Name	Description
	GFX_GOL_ButtonActionGet	This function evaluates the message from a user if the message will affect the object or not.
	GFX_GOL_ButtonActionSet	This function performs the state change of the object based on the translated action.
	GFX_GOL_ButtonCreate	This function creates a GFX_GOL_BUTTON object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	GFX_GOL_ButtonDraw	This function renders the object on the screen based on the current state of the object.
	GFX_GOL_ButtonTextAlignmentGet	This function returns the text alignment of the text string used by the object.
	GFX_GOL_ButtonTextAlignmentSet	This function sets the text alignment of the text string used by the object.
	GFX_GOL_ButtonTextSet	This function sets the address of the current text string used by the object.

Macros

	Name	Description
	GFX_GOL_ButtonPressStateImageGet	This function gets the image used when in the pressed state.
	GFX_GOL_ButtonPressStateImageSet	This function sets the image to be used when in the pressed state.
	GFX_GOL_ButtonReleaseStateImageGet	This function gets the image used when in the released state.
	GFX_GOL_ButtonReleaseStateImageSet	This function sets the image to be used when in the released state.
	GFX_GOL_ButtonTextGet	This function returns the address of the current text string used by the object.

Functions

	Name	Description
	GFX_GOL_ChartActionGet	This function evaluates the message from a user if the message will affect the object or not. The table below enumerates the translated messages for each event of the touch screen and keyboard inputs.
	GFX_GOL_ChartCreate	This function creates a CHART object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	GFX_GOL_ChartDataSeriesAdd	This function creates a DATASERIES object and populates the structure with the given parameters.
	GFX_GOL_ChartDataSeriesFree	This function removes DATASERIES object from the list of DATASERIES objects and frees the memory used of that removed object.
	GFX_GOL_ChartDataSeriesRemove	This function removes DATASERIES object from the list of DATASERIES objects and frees the memory used of that removed object. The position of the object to be removed is specified by the number parameter. If the list has only one member, it removes the member regardless of the number given.
	GFX_GOL_ChartDataSeriesSet	This is function GFX_GOL_ChartDataSeriesSet .
	GFX_GOL_ChartDraw	This function renders the object on the screen using the current parameter settings. Location of the object is determined by the left, top, right and bottom parameters. The colors used are dependent on the state of the object. The font used is determined by the style scheme set. The colors of the bars of the bar chart or sectors of the pie chart can be the default color table or user defined color table set by ChSetColorTable() function. When rendering objects of the same type, each object must be rendered completely before the rendering of the next object is started.... more
	GFX_GOL_ChartPercentRangeSet	This function sets the minimum and maximum range of percentage that the bar chart will show. The criteria is that min <= max. This affects bar charts only and CH_PERCENTAGE bit state is set.
	GFX_GOL_ChartSampleRangeSet	This function sets the sample start and sample end when drawing the chart. Together with the data series' SHOW_DATA flags the different way of displaying the chart data is achieved.
	GFX_GOL_ChartValueRangeSet	This function sets the minimum and maximum range of values that the bar chart will show. The criteria is that min <= max.

Macros

	Name	Description
	CH_CLR0	Bright Blue
	CH_CLR1	Bright Red
	CH_CLR10	Light Blue
	CH_CLR11	Light Red
	CH_CLR12	Light Green
	CH_CLR13	Light Yellow
	CH_CLR14	Light Orange
	CH_CLR15	Gold
	CH_CLR2	Bright Green

	CH_CLR3	Bright Yellow
	CH_CLR4	Orange
	CH_CLR5	Blue
	CH_CLR6	Red
	CH_CLR7	Green
	CH_CLR8	Yellow
	CH_CLR9	Dark Orange
	CHART_MARGIN	Margin from the edges.
	CHART_YGRIDCOUNT	defines the number of grids to be drawn on the y-axis (includes the origin at y).
	GFX_GOL_CHART_3D_ENABLE	Bit to indicate that bar charts are to be drawn with 3-D effect
	GFX_GOL_CHART_BAR	Bit to indicate the chart is type bar. If both PIE and BAR types are set BAR type has higher priority.
	GFX_GOL_CHART_BAR_HOR	These bits (with CH_BAR bit set), sets the bar chart to be drawn horizontally.
	GFX_GOL_CHART_DISABLED	Bit for disabled state.
	GFX_GOL_CHART_DONUT	These bits (with CH_PIE bit set), sets the pie chart to be drawn in a donut shape.
	GFX_GOL_CHART_DRAW	Bit to indicate chart must be redrawn.
	GFX_GOL_CHART_DRAW_DATA	Bit to indicate data portion of the chart must be redrawn.
	GFX_GOL_CHART_HIDE	Bit to indicate chart must be removed from screen.
	GFX_GOL_CHART_LEGEND	Bit to indicate that legend is to be shown. Usable only when seriesCount > 1.
	GFX_GOL_CHART_NUMERIC	This bit is used only for bar charts. If this bit is set, it indicates that the bar chart labels for variables are numeric. If this bit is not set, it indicates that the bar chart labels for variables are alphabets.
	GFX_GOL_CHART_PERCENT	Bit to indicate that the pie chart will be drawn with percentage values shown for the sample data. For bar chart, if CH_VALUE is set, it toggles the value shown to percentage.
	GFX_GOL_CHART_PIE	Bit to indicate the chart is type pie. If both PIE and BAR types are set BAR type has higher priority.
	GFX_GOL_CHART_VALUE	Bit to indicate that the values of the bar chart data or pie chart data are to be shown
	GFX_GOL_ChartAxisLabelFontGet	Macros: GFX_GOL_ChartAxisLabelFontGet(pCh) This macro returns the location of the font used for the X and Y axis labels of the chart.
	GFX_GOL_ChartAxisLabelFontSet	Macros: GFX_GOL_ChartAxisLabelFontSet(pCh, pNewFont) This macro sets the location of the font used for the X and Y axis labels of the chart.
	GFX_GOL_ChartColorTableGet	Macros: GFX_GOL_ChartColorTableGet(pCh) This macro returns the current color table used for the pie and bar charts.
	GFX_GOL_ChartColorTableSet	Macros: GFX_GOL_ChartColorTableSet(pCh, pNewTable) This macro sets the color table used to draw the data in pie and bar charts.
	GFX_GOL_ChartGridLabelFontGet	Macros: GFX_GOL_ChartGridLabelFontGet(pCh) This macro returns the location of the font used for the X and Y axis grid labels of the chart.
	GFX_GOL_ChartGridLabelFontSet	Macros: GFX_GOL_ChartGridLabelFontSet(pCh, pNewFont) This macro sets the location of the font used for the X and Y axis grid labels of the chart.

	GFX_GOL_ChartPercentMaxGet	Macros: ChGetPercentMax(pCh) This macro returns the current maximum value of the percentage range that will be drawn for bar charts when CH_PERCENTAGE bit state is set.
	GFX_GOL_ChartPercentMinGet	Macros: ChGetPercentMin(pCh) This macro returns the current minimum value of the percentage range that will be drawn for bar charts when CH_PERCENTAGE bit state is set.
	GFX_GOL_ChartPercentRangeGet	This macro gets the percentage range for bar charts. The value returned is calculated from percentage max - min. To get the minimum use ChGetPercentMin() and to get the maximum use ChGetPercentMax().
	GFX_GOL_ChartSampleEndGet	Macros: GFX_GOL_ChartSampleEndGet(pCh) This macro returns the sampling end value.
	GFX_GOL_ChartSampleLabelGet	Macros: GFX_GOL_ChartSampleLabelGet(pCh) This macro returns the address of the current text string used for the sample axis label of the bar chart.
	GFX_GOL_ChartSampleLabelSet	Macros: GFX_GOL_ChartSampleLabelSet(pCh, pNewXLabel) This macro sets the address of the current text string used for the sample axis label of the bar chart.
	GFX_GOL_ChartSampleRangeGet	This macro gets the sample range for pie or bar charts. The value returned is calculated from smplEnd - smplStart.
	GFX_GOL_ChartSampleStartGet	Macros: GFX_GOL_ChartSampleStartGet(pCh) This macro returns the sampling start value.
	GFX_GOL_ChartSeriesHide	Macros: GFX_GOL_ChartSeriesHide(CHART *pCh, uint16_t seriesNum) This macro sets the specified data series number show flag to be set to HIDE_DATA .
	GFX_GOL_ChartShowSeriesCountGet	Macros: GFX_GOL_ChartShowSeriesCountGet(pCh) This macro shows the number of data series that has its show flag set to SHOW_DATA .
	GFX_GOL_ChartShowSeriesSet	Macros: short GFX_GOL_ChartShowSeriesSet(CHART *pCh, uint16_t seriesNum) This macro sets the specified data series number show flag to be set to SHOW_DATA .
	GFX_GOL_ChartShowSeriesStatusGet	Macros: GFX_GOL_ChartShowSeriesStatusGet(pDSeries) This macro returns the show ID status of the DATASERIES .
	GFX_GOL_ChartTitleFontGet	Macros: GFX_GOL_ChartTitleFontGet(pCh) This macro returns the location of the font used for the title of the chart.
	GFX_GOL_ChartTitleFontSet	Macros: GFX_GOL_ChartTitleFontSet(pCh, pNewFont) This macro sets the location of the font used for the title of the chart.
	GFX_GOL_ChartTitleGet	Macros: GFX_GOL_ChartTitleGet(pCh) This macro returns the address of the current text string used for the title of the chart.
	GFX_GOL_ChartTitleSet	Macros: GFX_GOL_ChartTitleSet(pCh, pNewTitle) This macro sets the address of the current text string used for the title of the chart.
	GFX_GOL_ChartValueLabelGet	Macros: GFX_GOL_ChartValueLabelGet(pCh) This macro returns the address of the current text string used for the value axis label of the bar chart.
	GFX_GOL_ChartValueLabelSet	Macros: GFX_GOL_ChartValueLabelSet(pCh, pNewYLabel) This macro sets the address of the current text string used for the value axis label of the bar chart.

	GFX_GOL_ChartValueMaxGet	Macros: GFX_GOL_ChartValueMaxGet(pCh) This macro returns the current maximum value that will be drawn for bar charts.
	GFX_GOL_ChartValueMinGet	Macros: GFX_GOL_ChartValueMinGet(pCh) This macro returns the current minimum value that will be drawn for bar charts.
	GFX_GOL_ChartValueRangeGet	This macro gets the current range for bar charts. The value returned is calculated from the current (valMax - valMin) set. To get the minimum use ChGetValueMin() and to get the maximum use ChGetValueMax().
	HIDE_DATA	Macro used to reset the data series show flag or indicate that the data series will be not be shown when the chart is drawn.
	SHOW_DATA	Macro used to set the data series show flag or indicate that the data series will be shown when the chart is drawn.
	USE_HORZ_ASCENDING_ORDER	use ascending order when displaying variables on horizontal mode (bar chart only)
	USE_PIE_ENABLE_LABEL	use labels: A:10%,30 where each sample is labeled A-Z followed by a colon.

Structures

	Name	Description
	CHARTPARAM	Defines the parameters for the CHART object.
	DATASERIES	Defines a variable for the CHART object. It specifies the number of samples, pointer to the array of samples for the data series and pointer to the next data series. A member of this structure (show) is used as a flag to determine if the series is to be drawn or not. Together with the smplStart and smplEnd it will determine what kind of chart will be drawn.
	GFX_GOL_CHART	Defines the parameters required for a chart Object.

5.2.2.8.10 gfx_gol_check_box.h

Module for Microchip Graphics Library - Graphic Object Layer

Refer to Microchip Graphics Library for complete documentation of the CheckBox Object.

Enumerations

	Name	Description

5.2.2.8.11 gfx_gol_custom_control.h

Graphics Library Implementation

Refer to Microchip Graphics Library for complete documentation of the CustomControl Object.

Functions

	Name	Description
	GFX_GOL_CustomControlActionGet	translates the GOL message for the custom control
	GFX_GOL_CustomControlActionSet	changes the state of the object
	GFX_GOL_CustomControlCreate	creates the custom control
	GFX_GOL_CustomControlDraw	draws custom control

Macros

	Name	Description
	GFX_GOL_CUSTOMCONTROL_DISABLED	disabled
	GFX_GOL_CUSTOMCONTROL_DRAW	whole control must be redrawn
	GFX_GOL_CUSTOMCONTROL_DRAW_BAR	control bar should be redrawn
	GFX_GOL_CUSTOMCONTROL_HIDE	must be removed from screen
	GFX_GOL_CustomControlGetPos	Macros: GFX_GOL_CustomControlGetPos(pCc) returns position
	GFX_GOL_CustomControlSetPos	Macros: GFX_GOL_CustomControlSetPos(pCc,position) sets the current position of the control

Structures

	Name	Description
	GFX_GOL_CUSTOMCONTROL	The structure contains data for the control

Company

Microchip Technology Inc.

FileName: gfx_gol_custom_control.c

5.2.2.8.12 gfx_gol_digital_meter.h

Module for Microchip Graphics Library - Graphic Object Layer

Refer to Microchip Graphics Library for complete documentation of the Digital Meter Object.

Enumerations

	Name	Description
	GFX_GOL_DIGITALMETER_STATE	Object States Definition:

Functions

	Name	Description
	GFX_GOL_DigitalMeterActionGet	This function evaluates the message from a user if the message will affect the object or not.
	GFX_GOL_DigitalMeterCreate	This function creates a GFX_GOL_DIGITALMETER object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	GFX_GOL_DigitalMeterDecrement	This function decrements the meter value by the delta value set.
	GFX_GOL_DigitalMeterDraw	This function renders the object on the screen based on the current state of the object.
	GFX_GOL_DigitalMeterIncrement	This function increments the meter value by the delta value set.
	GFX_GOL_DigitalMeterValueSet	This function sets the value of the meter.

Macros

	Name	Description
	GFX_GOL_DIGITALMETER_INDENT	This is a DigitalMeter compile time option to define the indent constant for the text used in the frame.
	GFX_GOL_DIGITALMETER_WIDTH	This is a DigitalMeter compile time option to define the user should change this value depending on the number of digits he wants to display.

	GFX_GOL_DigitalMeterTextAlignmentGet	This function returns the text alignment of the text string used by the object.
	GFX_GOL_DigitalMeterTextAlignmentSet	This function sets the text alignment of the text string used by the object.
	GFX_GOL_DigitalMeterValueGet	This function returns the current value of the digital meter.

Structures

	Name	Description
	GFX_GOL_DIGITALMETER	Properties for a digital meter.

File Name

gfx_gol_digital_meter.h

Company

Microchip Technology Inc.

5.2.2.8.13 gfx_gol_edit_box.h

Module for Microchip Graphics Library - Graphic Object Layer

Refer to Microchip Graphics Library for complete documentation of the Edit Box Object.

Enumerations

	Name	Description
	GFX_GOL_EDITBOX_STATE	Object States Definition:

Functions

	Name	Description
	GFX_GOL_EditBoxActionGet	This function evaluates the message from a user if the message will affect the object or not.
	GFX_GOL_EditBoxActionSet	This function performs the state change of the object based on the translated action.
	GFX_GOL_EditBoxCharAdd	This function adds a character at the end of the text used by the object.
	GFX_GOL_EditBoxCharRemove	This function removes a character at the end of the text used by the object.
	GFX_GOL_EditBoxCreate	This function creates a GFX_GOL_EDITBOX object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	GFX_GOL_EditBoxDraw	This function renders the object on the screen based on the current state of the object.
	GFX_GOL_EditBoxTextSet	This function sets the text in the object.

Macros

	Name	Description
	GFX_GOL_EditBoxTextAlignmentGet	This function returns the text alignment of the text string used by the object.
	GFX_GOL_EditBoxTextAlignmentSet	This function sets the text alignment of the text string used by the object.
	GFX_GOL_EditBoxTextGet	This function returns the address of the current text string used by the object.

Structures

	Name	Description
	GFX_GOL_EDITBOX	Defines the parameters required for a Edit Box Object.

- 02/29/08 ...
- 04/16/10 Added Grid Item as text.

Functions

	Name	Description
	<u>GridClearCellState</u>	This function clears the state of the cell (or Grid Item) specified by the column and row.
	<u>GridCreate</u>	This function creates a <u>GRID</u> object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	<u>GridDraw</u>	This function renders the object on the screen using the current parameter settings. Location of the object is determined by the left, top, right and bottom parameters. The colors used are dependent on the state of the object. The font used is determined by the style scheme set. When rendering objects of the same type, each object must be rendered completely before the rendering of the next object is started. This is to avoid incomplete object rendering.
	<u>GridFreeItems</u>	This function removes all grid items for the given Grid and frees the memory used.
	<u>GridGetCell</u>	This function removes all grid items for the given Grid and frees the memory used.
	<u>GridMsgDefault</u>	This function performs the actual state change based on the translated message given. The following state changes are supported:
	<u>GridSetCell</u>	This function sets the Grid Item state and data.
	<u>GridSetCellState</u>	This function sets the state of the Grid Item or cell.
	<u>GridSetFocus</u>	This function sets the focus of the specified Grid Item or cell.
	<u>GridTranslateMsg</u>	This function evaluates the message from a user if the message will affect the object or not. The table below enumerates the translated messages for each event of the touch screen and keyboard inputs.

Macros

	Name	Description
	<u>GRID_DISABLED</u>	Bit for disabled state
	<u>GRID_DRAW_ALL</u>	Bit to indicate whole edit box must be redrawn
	<u>GRID_DRAW_ITEMS</u>	Bit to indicate that at least one item must be redrawn, but not the entire grid.
	<u>GRID_FOCUSED</u>	Bit for focused state
	<u>GRID_HEIGHT</u>	This is macro GRID_HEIGHT.
	<u>GRID_HIDE</u>	Bit to remove object from screen
	<u>GRID_MAX_COLUMNS</u>	This is macro GRID_MAX_COLUMNS.
	<u>GRID_MAX_ROWS</u>	This is macro GRID_MAX_ROWS.
	<u>GRID_OUT_OF_BOUNDS</u>	Status of an out of bounds cell <u>GridSetCell()</u> operation.
	<u>GRID_SHOW_BORDER_ONLY</u>	Draw only the outside border of the grid.
	<u>GRID_SHOW_FOCUS</u>	Highlight the focused cell.
	<u>GRID_SHOW_LINES</u>	Display grid lines
	<u>GRID_SHOW_SEPARATORS_ONLY</u>	Draw only the lines between cells (like Tic-tac-toe)
	<u>GRID_SUCCESS</u>	Status of a successful <u>GridSetCell()</u> operation.
	<u>GRID_TYPE_MASK</u>	This is macro GRID_TYPE_MASK.
	<u>GRID_WIDTH</u>	This is macro GRID_WIDTH.
	<u>GridGetFocusX</u>	Macros: GridGetFocusX(pGrid) This macro returns the x position of the focused cell.
	<u>GridGetFocusY</u>	Macros: GridGetFocusY(pGrid) This macro returns the y position of the focused cell.
	<u>GRIDITEM_DRAW</u>	Draw this cell
	<u>GRIDITEM_IS_BITMAP</u>	The grid item is a bitmap.
	<u>GRIDITEM_IS_TEXT</u>	The grid item is a text string.
	<u>GRIDITEM_SELECTED</u>	The cell is selected.
	<u>GRIDITEM_TEXTBOTTOM</u>	Bit to indicate text is top aligned.
	<u>GRIDITEM_TEXTLEFT</u>	Text in the cell is left aligned.
	<u>GRIDITEM_TEXTRIGHT</u>	Text in the cell is right aligned.
	<u>GRIDITEM_TEXTTOP</u>	Bit to indicate text is bottom aligned.

Structures

	Name	Description
	<u>GRID</u>	Defines the parameters required for a grid Object. Clipping is not supported in grid object.
	<u>GRIDITEM</u>	Defines the grid item.

5.2.2.8.16 gfx_gol_group_box.h

Graphics Library Implementation

Refer to Microchip Graphics Library for complete documentation of the Group Box Object.

Enumerations

	Name	Description
	<u>GFX_GOL_GROUPBOX_STATE</u>	Object States Definition:

Functions

	Name	Description
	GFX_GOL_GroupboxActionGet	This function evaluates the message from a user if the message will affect the object or not.
	GFX_GOL_GroupboxCreate	This function creates a GFX_GOL_GROUPBOX object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	GFX_GOL_GroupboxDraw	This function renders the object on the screen based on the current state of the object.
	GFX_GOL_GroupboxTextAlignmentGet	This function returns the text alignment of the text string used by the object.
	GFX_GOL_GroupboxTextAlignmentSet	This function sets the text alignment of the text string used by the object.
	GFX_GOL_GroupboxTextSet	This function sets the address of the current text string used by the object.

Macros

	Name	Description
	GFX_GOL_GroupboxTextGet	This function returns the address of the current text string used by the object.

Structures

	Name	Description
	GFX_GOL_GROUPBOX	Defines the parameters required for a group box Object. The textwidth and textHeight is not checked with the actual dimension of the object. Clipping is not supported in group box object. It is possible for the text to exceed the dimension of the Object.

Company

Microchip Technology Inc.

FileName: gfx_gol_group_box.h

5.2.2.8.17 gfx_gol_list_box.h

Module for Microchip Graphics Library - Graphic Object Layer

Refer to Microchip Graphics Library for complete documentation of the ListBox Object.

Enumerations

	Name	Description
	GFX_GOL_LISTBOX_ITEM_STATUS	Bit definitions for the status of an item
	GFX_GOL_LISTBOX_STATE	This is type GFX_GOL_LISTBOX_STATE.

Functions

	Name	Description
	GFX_GOL_ListBoxActionGet	This function evaluates the message from a user if the message will affect the object or not.
	GFX_GOL_ListBoxActionSet	This function performs the state change of the object based on the translated action.
	GFX_GOL_ListBoxCreate	This function creates a GFX_GOL_LISTBOX object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

	GFX_GOL_ListBoxDraw	This function renders the object on the screen based on the current state of the object.
	GFX_GOL_ListBoxItemAdd	This function adds an item to the list box.
	GFX_GOL_ListBoxItemFocusGet	This function returns the index of the focused item in the list box.
	GFX_GOL_ListBoxItemFocusSet	This function sets the focus of the item with the index number specified by index.
	GFX_GOL_ListBoxItemListRemove	This function removes the entire items list of the list box and free the memory used.
	GFX_GOL_ListBoxItemRemove	This function removes an item from the list box and free the memory used.
	GFX_GOL_ListBoxSelectionChange	This function changes the selection status of the given item in the list box.
	GFX_GOL_ListBoxSelectionGet	This function searches for selected items from the list box.
	GFX_GOL_ListBoxVisibleItemCountGet	This function returns the count of items visible in the list box.

Macros

	Name	Description
	GFX_GOL_ListBoxItemCountGet	This function returns the count of items in the list box.
	GFX_GOL_ListBoxItemImageGet	This function gets the image set for a list box item.
	GFX_GOL_ListBoxItemImageSet	This function sets the image for a list box item.
	GFX_GOL_ListBoxItemListGet	This function returns the pointer to the item list of the list box.
	GFX_GOL_ListBoxItemSelectStatusClear	This function clears the selection status of the item.
	GFX_GOL_ListBoxItemSelectStatusSet	This function sets the selection status of the item to selected.
	GFX_GOL_ListBoxTextAlignmentGet	This function returns the text alignment of the text string used by the object.
	GFX_GOL_ListBoxTextAlignmentSet	This function sets the text alignment of the text string used by the object.

Structures

	Name	Description
	GFX_GOL_LISTBOX	Defines the parameters required for a list box Object.
	GFX_GOL_LISTITEM	Defines the parameters required for a list item used in list box.

Company

Microchip Technology Inc.

5.2.2.8.18 gfx_gol_meter.h

Module for Microchip Graphics Library - Graphic Object Layer

Refer to Microchip Graphics Library for complete documentation of the Meter Object.

Enumerations

	Name	Description

5.2.2.8.19 gfx_gol_picture.h

Module for Microchip Graphics Library - Graphic Object Layer

Refer to Microchip Graphics Library for complete documentation of the Picture Object.

Enumerations

	Name	Description
	GFX_GOL_PICTURECONTROLCONTROL_STATE	Object States Definition:

Functions

	Name	Description
	GFX_GOL_PictureControlActionGet	This function evaluates the message from a user if the message will affect the object or not.
	GFX_GOL_PictureControlCreate	This function creates a GFX_GOL_PICTURECONTROL object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	GFX_GOL_PictureControlDraw	This function renders the object on the screen based on the current state of the object.
	GFX_GOL_PictureControlPartialSet	This function sets the partial image parameters to be in the object.

Macros

	Name	Description
	GFX_GOL_PictureControlImageGet	This function gets the image used when in the pressed state.
	GFX_GOL_PictureControlImageSet	This function sets the image to be in the object.
	GFX_GOL_PictureControlScaleSet	Sets the scale factor used to render the bitmap used in the object.

Structures

	Name	Description
	GFX_GOL_PICTURECONTROL	The structure contains data for picture control

File Name

gfx_gol_picture.h

Company

Microchip Technology Inc.

5.2.2.8.20 gfx_gol_progress_bar.h

Module for Microchip Graphics Library - Graphic Object Layer

Refer to Microchip Graphics Library for complete documentation of the ProgressBar Object.

Enumerations

	Name	Description
	GFX_GOL_PROGRESSBAR_STATE	Object States Definition:

Functions

	Name	Description
	GFX_GOL_ProgressBarActionGet	This function evaluates the message from a user if the message will affect the object or not.
	GFX_GOL_ProgressBarCreate	This function creates a GFX_GOL_PROGRESSBAR object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	GFX_GOL_ProgressBarDraw	This function renders the object on the screen based on the current state of the object.

	GFX_GOL_ProgressBarPositionSet	This function sets the position of the progress bar.
	GFX_GOL_ProgressBarRangeSet	This function sets the range of the progress bar.

Macros

	Name	Description
	GFX_GOL_ProgressBarPositionGet	This function returns the current position of the progress bar.
	GFX_GOL_ProgressBarRangeGet	This function returns the range of the progress bar.

Structures

	Name	Description
	GFX_GOL_PROGRESSBAR	The structure contains data for the progress bar

File Name

gfx_gol_progress_bar.h

Company

Microchip Technology Inc.

5.2.2.8.21 gfx_gol_radio_button.h

Module for Microchip Graphics Library - Graphic Object Layer

Refer to Microchip Graphics Library for complete documentation of the RadioButton Object.

Enumerations

	Name	Description
	GFX_GOL_RADIOBUTTON_STATE	Object States Definition:

Functions

	Name	Description
	GFX_GOL_RadioButtonActionGet	This function evaluates the message from a user if the message will affect the object or not.
	GFX_GOL_RadioButtonActionSet	This function performs the state change of the object based on the translated action.
	GFX_GOL_RadioButtonCheckGet	This function returns the ID of the currently checked radio button in the group.
	GFX_GOL_RadioButtonCheckSet	This function sets the ID of the currently checked radio button in the group.
	GFX_GOL_RadioButtonCreate	This function creates a GFX_GOL_RADIOBUTTON object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	GFX_GOL_RadioButtonDraw	This function renders the object on the screen based on the current state of the object.
	GFX_GOL_RadioButtonTextAlignmentGet	This function returns the text alignment of the text string used by the object.
	GFX_GOL_RadioButtonTextAlignmentSet	This function sets the text alignment of the text string used by the object.
	GFX_GOL_RadioButtonTextSet	This function sets the address of the current text string used by the object.

Macros

	Name	Description
	GFX_GOL_RadioButtonTextGet	This function returns the address of the current text string used by the object.

Structures

	Name	Description
	GFX_GOL_RADIOBUTTON	the structure contains data for the Radio Button

File Name

gfx_gol_radio_button.h

Company

Microchip Technology Inc.

5.2.2.8.22 gfx_gol_round_dial.h

Module for Microchip Graphics Library - Graphic Object Layer

Refer to Microchip Graphics Library for complete documentation of the Round dial Object.

Functions

	Name	Description
	GFX_GOL_RoundDialActionGet	This function evaluates the message from a user if the message will affect the object or not. The table below enumerates the translated messages for each event of the touch screen inputs.
	GFX_GOL_RoundDialActionSet	This function performs the actual state change based on the translated message given. The following state changes are supported:
	GFX_GOL_RoundDialCreate	This function creates a ROUNDDIAL object with the parameters given.
	GFX_GOL_RoundDialDraw	This function renders the object on the screen using the current parameter settings. Location of the object is determined by the center (x,y) position and the radius parameters. The colors used are dependent on the state of the object. When rendering objects of the same type, each object must be rendered completely before the rendering of the next object is started. This is to avoid incomplete object rendering.
	RdiaCosine	This is function RdiaCosine.
	RdiaSine	This is function RdiaSine.

Macros

	Name	Description
	GFX_GOL_ROUNDIAL_DISABLED	Bit for disabled state.
	GFX_GOL_ROUNDIAL_DRAW	Bit to indicate object must be redrawn.
	GFX_GOL_ROUNDIAL_HIDE	Bit to indicate object must be removed from screen.
	GFX_GOL_ROUNDIAL_MAX_POSITIONS	This is macro GFX_GOL_ROUNDIAL_MAX_POSITIONS.
	GFX_GOL_ROUNDIAL_QUADRANT_POSITIONS	This is macro GFX_GOL_ROUNDIAL_QUADRANT_POSITIONS.
	GFX_GOL_ROUNDIAL_ROT_CCW	Bit for rotate counter clockwise state.
	GFX_GOL_ROUNDIAL_ROT_CW	Bit for rotate clockwise state.
	GFX_GOL_RoundDialValueDecrement	Used to directly decrement the value. The delta change used is the resolution setting (res).

	<u>GFX_GOL_RoundDialValueGet</u>	Returns the current dial value. Value is always in the 0-max range inclusive.
	<u>GFX_GOL_RoundDialValueIncrement</u>	Used to directly increment the value. The delta change used is the resolution setting (res).
	<u>GFX_GOL_RoundDialValueSet</u>	Sets the value to the given new value. Value set must be in 0-max range inclusive.

Structures

	Name	Description
	<u>GFX_GOL_ROUNDIAL</u>	Defines the parameters required for a dial Object.

Company

Microchip Technology Inc.

FileName: gfx_gol_round_dial.h

5.2.2.8.23 gfx_gol_scan_codes.h

Module for Microchip Graphics Library - Graphic Object Layer

This header file contains scan codes for the standard AT keyboard that can be used to process user action in GOL messages.

Macros

	Name	Description
	<u>SCAN_BS_PRESSED</u>	Back space key pressed.
	<u>SCAN_BS_RELEASED</u>	Back space key released.
	<u>SCAN_CR_PRESSED</u>	Carriage return pressed.
	<u>SCAN_CR_RELEASED</u>	Carriage return released.
	<u>SCAN_CRA_PRESSED</u>	Carriage return alternate pressed.
	<u>SCAN_CRA_RELEASED</u>	Carriage return alternate released.
	<u>SCAN_DEL_PRESSED</u>	Delete key pressed.
	<u>SCAN_DEL_RELEASED</u>	Delete key released.
	<u>SCAN_DOWN_PRESSED</u>	Down key pressed.
	<u>SCAN_DOWN_RELEASED</u>	Down key released.
	<u>SCAN_END_PRESSED</u>	End key pressed.
	<u>SCAN_END_RELEASED</u>	End key released.
	<u>SCAN_HOME_PRESSED</u>	Home key pressed.
	<u>SCAN_HOME_RELEASED</u>	Home key released.
	<u>SCAN_LEFT_PRESSED</u>	Left key pressed.
	<u>SCAN_LEFT_RELEASED</u>	Left key released.
	<u>SCAN_PGDOWN_PRESSED</u>	Page down key pressed.
	<u>SCAN_PGDOWN_RELEASED</u>	Page down key released.
	<u>SCAN_PGUP_PRESSED</u>	Page up key pressed.
	<u>SCAN_PGUP_RELEASED</u>	Page up key released.
	<u>SCAN_RIGHT_PRESSED</u>	Right key pressed.
	<u>SCAN_RIGHT_RELEASED</u>	Right key released.
	<u>SCAN_SPACE_PRESSED</u>	Space key pressed.
	<u>SCAN_SPACE_RELEASED</u>	Space key released.
	<u>SCAN_TAB_PRESSED</u>	Tab key pressed.

	SCAN_TAB_RELEASED	Tab key released.
	SCAN_UP_PRESSED	Up key pressed.
	SCAN_UP_RELEASED	Up key released.

5.2.2.8.24 gfx_gol_scheme.h

Module for Microchip Graphics Library - Graphic Object Layer Scheme

This module implements the common routines for the Graphics Object Layer of the Microchip Graphics Library. The routines are independent of the Display Driver Layer and should be compatible with any Display Driver that is compliant with the requirements of the Display Driver Layer of the Graphics Library. The module utilizes the Graphics Primitive Layer to render the objects.

Functions

	Name	Description
	GFX_GOL_SchemeAlphaPrecentSet	This is function GFX_GOL_SchemeAlphaPrecentSet.
	GFX_GOL_SchemeBackgroundColorGet	This is function GFX_GOL_SchemeBackgroundColorGet.
	GFX_GOL_SchemeBackgroundColorSet	This is function GFX_GOL_SchemeBackgroundColorSet.
	GFX_GOL_SchemeBackgroundImageSet	This is function GFX_GOL_SchemeBackgroundImageSet.
	GFX_GOL_SchemeBackgroundTypeGet	This is function GFX_GOL_SchemeBackgroundTypeGet.
	GFX_GOL_SchemeBackgroundTypeSet	This is function GFX_GOL_SchemeBackgroundTypeSet.
	GFX_GOL_SchemeColor0Get	This is function GFX_GOL_SchemeColor0Get.
	GFX_GOL_SchemeColor0Set	This is function GFX_GOL_SchemeColor0Set.
	GFX_GOL_SchemeColor1Get	This is function GFX_GOL_SchemeColor1Get.
	GFX_GOL_SchemeColor1Set	This is function GFX_GOL_SchemeColor1Set.
	GFX_GOL_SchemeColorDisabledGet	This is function GFX_GOL_SchemeColorDisabledGet.
	GFX_GOL_SchemeColorDisabledSet	This is function GFX_GOL_SchemeColorDisabledSet.
	GFX_GOL_SchemeColorSet	This is function GFX_GOL_SchemeColorSet.
	GFX_GOL_SchemeEmbossDarkColorGet	This is function GFX_GOL_SchemeEmbossDarkColorGet.
	GFX_GOL_SchemeEmbossDarkColorSet	This is function GFX_GOL_SchemeEmbossDarkColorSet.
	GFX_GOL_SchemeEmbossLightColorGet	This is function GFX_GOL_SchemeEmbossLightColorGet.
	GFX_GOL_SchemeEmbossLightColorSet	This is function GFX_GOL_SchemeEmbossLightColorSet.
	GFX_GOL_SchemeEmbossSet	This is function GFX_GOL_SchemeEmbossSet.
	GFX_GOL_SchemeEmbossSizeGet	This is function GFX_GOL_SchemeEmbossSizeGet.
	GFX_GOL_SchemeEmbossSizeSet	This is function GFX_GOL_SchemeEmbossSizeSet.
	GFX_GOL_SchemeFillStyleGet	This is function GFX_GOL_SchemeFillStyleGet.
	GFX_GOL_SchemeFillStyleSet	This is function GFX_GOL_SchemeFillStyleSet.
	GFX_GOL_SchemeFontGet	This is function GFX_GOL_SchemeFontGet.
	GFX_GOL_SchemeFontSet	This is function GFX_GOL_SchemeFontSet.
	GFX_GOL_SchemeGradientColorSet	This is function GFX_GOL_SchemeGradientColorSet.
	GFX_GOL_SchemeGradientEndColorGet	This is function GFX_GOL_SchemeGradientEndColorGet.
	GFX_GOL_SchemeGradientEndColorSet	This is function GFX_GOL_SchemeGradientEndColorSet.

	GFX_GOL_SchemeGradientStartColorGet	This is function GFX_GOL_SchemeGradientStartColorGet.
	GFX_GOL_SchemeGradientStartColorSet	This is function GFX_GOL_SchemeGradientStartColorSet.
	GFX_GOL_SchemeTextColor0Get	This is function GFX_GOL_SchemeTextColor0Get.
	GFX_GOL_SchemeTextColor0Set	This is function GFX_GOL_SchemeTextColor0Set.
	GFX_GOL_SchemeTextColor1Get	This is function GFX_GOL_SchemeTextColor1Get.
	GFX_GOL_SchemeTextColor1Set	This is function GFX_GOL_SchemeTextColor1Set.
	GFX_GOL_SchemeTextColorDisableGet	This is function GFX_GOL_SchemeTextColorDisableGet.
	GFX_GOL_SchemeTextColorDisableSet	This is function GFX_GOL_SchemeTextColorDisableSet.
	GFX_GOL_SchemeTextColorSet	This is function GFX_GOL_SchemeTextColorSet.

Structures

	Name	Description
	GFX_GOL_OBJ_SCHEME	This structure specifies the style scheme components of an object.

File Name

gfx_gol_scheme.h

Company

Microchip Technology Inc.

5.2.2.8.25 gfx_gol_scroll_bar.h

Module for Microchip Graphics Library - Graphic Object Layer

Refer to Microchip Graphics Library for complete documentation of the Slider Object.

Enumerations

	Name	Description
	GFX_GOL_SCROLLBAR_STATE	Object States Definition:

Functions

	Name	Description
	GFX_GOL_ScrollBarActionGet	This function evaluates the message from a user if the message will affect the object or not.
	GFX_GOL_ScrollBarActionSet	This function performs the state change of the object based on the translated action.
	GFX_GOL_ScrollBarCreate	This function creates a GFX_GOL_SCROLLBAR object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	GFX_GOL_ScrollBarDraw	This function renders the object on the screen based on the current state of the object.
	GFX_GOL_ScrollBarPageGet	This function returns the page size of the object.
	GFX_GOL_ScrollBarPageSet	This function sets the page size of the object.
	GFX_GOL_ScrollBarPositionDecrement	This function decrements the scroll bar position by the delta change (page) value set.
	GFX_GOL_ScrollBarPositionGet	This function returns the current position of the scroll bar thumb.
	GFX_GOL_ScrollBarPositionIncrement	This function increments the scroll bar position by the delta change (page) value set.
	GFX_GOL_ScrollBarPositionSet	This function sets the position of the scroll bar thumb.
	GFX_GOL_ScrollBarRangeGet	This function returns the range of the thumb of the scroll bar.

	GFX_GOL_ScrollBarRangeSet	This function sets the range of the thumb of the scroll bar.

Structures

	Name	Description
	GFX_GOL_SCROLLBAR	Defines the parameters required for a slider/scrollbar Object. Depending on the GFX_GOL_SCROLLBAR_SLIDER_MODE_STATE state bit slider or scrollbar mode is set. If GFX_GOL_SCROLLBAR_SLIDER_MODE_STATE is set, mode is slider; if not set mode is scroll bar. For scrollbar mode, focus rectangle is not drawn.

File Name

gfx_gol_scroll_bar.h

Company

Microchip Technology Inc.

5.2.2.8.26 gfx_gol_static_text.h

Module for Microchip Graphics Library - Graphic Object Layer

Refer to Microchip Graphics Library for complete documentation of the Static Text Object.

Enumerations

	Name	Description
	GFX_GOL_STATICTEXT_STATE	Object States Definition:

Functions

	Name	Description
	GFX_GOL_StaticTextActionGet	This function sets the text alignment of the text string used by the object.
	GFX_GOL_StaticTextAlignmentGet	This function returns the text alignment of the text string used by the object.
	GFX_GOL_StaticTextAlignmentSet	This function sets the text alignment of the text string used by the object.
	GFX_GOL_StaticTextCreate	This function creates a GFX_GOL_STATICTEXT object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	GFX_GOL_StaticTextDraw	This function renders the object on the screen based on the current state of the object.
	GFX_GOL_StaticTextGet	This function returns the address of the current text string used by the object.
	GFX_GOL_StaticTextSet	This function sets the address of the current text string used by the object.

Structures

	Name	Description
	GFX_GOL_STATICTEXT	Defines the parameters required for a Static Text Object.

File Name

gfx_gol_static_text.h

Company

Microchip Technology Inc.

5.2.2.8.27 gfx_gol_text_entry.h

Module for Microchip Graphics Library - Graphic Object Layer

Refer to Microchip Graphics Library for complete documentation of the Text Entry Object.

Enumerations

	Name	Description
	GFX_GOL_TEXTENTRY_KEY_COMMAND_TYPE	Optional COMMANDS assigned to keys
	GFX_GOL_TEXTENTRY_STATE	Object States Definition:

Functions

	Name	Description
	GFX_GOL_TextEntryActionGet	This function evaluates the message from a user if the message will affect the object or not.
	GFX_GOL_TextEntryActionSet	This function performs the state change of the object based on the translated action.
	GFX_GOL_TextEntryBufferClear	This function will clear the data in the display.
	GFX_GOL_TextEntryBufferGet	This function returns the buffer used to display text.
	GFX_GOL_TextEntryBufferSet	This function sets the buffer used to display text.
	GFX_GOL_TextEntryCharAdd	This function will insert a character to the end of the buffer.
	GFX_GOL_TextEntryCreate	This function creates a GFX_GOL_TEXTENTRY object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	GFX_GOL_TextEntryDraw	This function renders the object on the screen based on the current state of the object.
	GFX_GOL_TextEntryKeyCommandGet	This function will return the currently assigned command to the key with the given index.
	GFX_GOL_TextEntryKeyCommandSet	This function will assign a command to a key with the given index.
	GFX_GOL_TextEntryKeysPressed	This function will test if a key given by its index in the object is pressed.
	GFX_GOL_TextEntryKeyListCreate	This function will create the list of KEYMEMBERS that holds the information on each key.
	GFX_GOL_TextEntryKeyMemberListDelete	This function will delete the KEYMEMBER list assigned to the object.
	GFX_GOL_TextEntryKeyTextSet	This function will set the text assigned to a key with the given index.
	GFX_GOL_TextEntryLastCharDelete	This function will remove the last character of the buffer and replace it with a string terminator.
	GFX_GOL_TextEntrySpaceCharAdd	This function will insert a space character to the end of the buffer.

Macros

	Name	Description
	TE_ROUNDEDBUTTON_RADIUS	Optional settings Set this parameter in the GraphicsConfig.h

Structures

	Name	Description
	GFX_GOL_TEXTENTRY	Defines the parameters required for a TextEntry Object.
	KEYMEMBER	Defines the parameters and the strings assigned for each key.

File Name

gfx_gol_text_entry.h

Company

Microchip Technology Inc.

5.2.2.8.28 gfx_gol_window.h

Module for Microchip Graphics Library - Graphic Object Layer

Refer to Microchip Graphics Library for complete documentation of the Window Object.

Enumerations

	Name	Description
	<u>GFX_GOL_WINDOW_STATE</u>	Object States Definition:

Functions

	Name	Description
	<u>GFX_GOL_WindowActionGet</u>	This function evaluates the message from a user if the message will affect the object or not.
	<u>GFX_GOL_WindowCreate</u>	This function creates a <u>GFX_GOL_WINDOW</u> object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	<u>GFX_GOL_WindowDraw</u>	This function renders the object on the screen based on the current state of the object.
	<u>GFX_GOL_WindowTextAlignmentGet</u>	This function returns the text alignment of the text string used by the object.
	<u>GFX_GOL_WindowTextAlignmentSet</u>	This function sets the text alignment of the text string used by the object.
	<u>GFX_GOL_WindowTextSet</u>	This function sets the address of the current text string used by the object.

Macros

	Name	Description
	<u>GFX_GOL_WindowImageGet</u>	This function gets the image used.
	<u>GFX_GOL_WindowTextGet</u>	This function returns the address of the current text string used by the object.

Structures

	Name	Description
	<u>GFX_GOL_WINDOW</u>	The structure contains data for the window

Company

Microchip Technology Inc.

FileName: gfx_gol_window.h

5.2.2.8.29 gfx_imageDecoder.h

This is file gfx_imageDecoder.h.

Functions

	Name	Description
	<u>ImageDecoderInit</u>	This function initializes the global variables to 0 and then initializes the driver. This must be called once before any other function of the library is called
	<u>ImageDecodeTask</u>	This function completes one small part of the image decode function

	ImageLoopCallbackRegister	This function registers the loop callback function so that the decoder calls this function in every decoding loop. This can be used by the application program to do maintainance activities such as fetching data, updating the display, etc...
	IMG_vSetboundaries	

Macros

	Name	Description
	ImageAbort	This function sets the Image Decoder's Abort flag so that decoding aborts in the next decoding loop.
	ImageFullScreenDecode	This function decodes and displays the image on the screen in fullscreen mode with center aligned and downscaled if required
	IMG_ALIGN_CENTER	Flags
	IMG_DECODE_ABORTED	This is macro IMG_DECODE_ABORTED.
	IMG_DOWN_SCALE	This is macro IMG_DOWN_SCALE.
	IMG_FCLOSE	This is macro IMG_FCLOSE.
	IMG_FEOF	This is macro IMG_FEOF.
	IMG_FILE	This is macro IMG_FILE.
	IMG_FOPEN	added by Paolo 9/10/08 for MultiApp Demo
	IMG_FREAD	This is macro IMG_FREAD.
	IMG_FSEEK	This is macro IMG_FSEEK.
	IMG_FTELL	This is macro IMG_FTELL.
	IMG_SCREEN_HEIGHT	This is macro IMG_SCREEN_HEIGHT.
	IMG_SCREEN_WIDTH	The individual image decoders use these defines instead of directly using those provided in the Display driver file
	IMG_vCheckAndAbort	This is macro IMG_vCheckAndAbort.
	IMG_vLoopCallback	This is macro IMG_vLoopCallback.
	IMG_vPutPixel	This is macro IMG_vPutPixel.
	IMG_vSetColor	This is macro IMG_vSetColor.

Types

	Name	Description
	FileFeof	This is type FileFeof.
	FileRead	Typedefs of the used File System APIs
	FileSeek	This is type FileSeek.
	FileTell	This is type FileTell.
	IMG_FILE_FORMAT	IMG_ImageFileFormat specifies all the supported image file formats
	IMG_FILE_SYSTEM_API	IMG_FileSystemAPI holds function pointers to the used File System APIs
	IMG_LOOP_CALLBACK	IMG_LoopCallback is a callback function which is called in every loop of the decoding cycle so that user application can do some maintainance activities
	IMG_PIXEL_OUTPUT	IMG_PixelOutput is a callback function which receives the color information of the output pixel
	IMG_PIXEL_XY_RGB_888	IMG_PixelRgb holds the RGB information of a pixel in BYTES

Variables

	Name	Description
	IMG_bAlignCenter	This is variable IMG_bAlignCenter.
	IMG_bDownScalingFactor	This is variable IMG_bDownScalingFactor.
	IMG_bIAbortImageDecoding	The global variables which define the image position and size

	IMG_pCurrentFile	This is variable IMG_pCurrentFile.
	IMG_pFileAPIs	This is variable IMG_pFileAPIs.
	IMG_PixelXYColor	This is variable IMG_PixelXYColor.
	IMG_pLoopCallbackFn	This is variable IMG_pLoopCallbackFn.
	IMG_pPixelOutput	This is variable IMG_pPixelOutput.
	IMG_wHeight	This is variable IMG_wHeight.
	IMG_wImageHeight	This is variable IMG_wImageHeight.
	IMG_wImageWidth	This is variable IMG_wImageWidth.
	IMG_wStartX	This is variable IMG_wStartX.
	IMG_wStartY	This is variable IMG_wStartY.
	IMG_wWidth	This is variable IMG_wWidth.

- 11/06/09 Initial Release
- 08/20/10 Modified `PALETTE_EXTERNAL` to be of type `GFX_EXTDATA`.
- 03/20/12 Modified `PALETTE_ENTRY` structure to have packed attribute.

Functions

	Name	Description
	<u>ClearPaletteChangeError</u>	Clears the Palette change error status
	<u>DisablePalette</u>	Disables the Palette mode.
	<u>EnablePalette</u>	Enables the Palette mode.
	<u>GetPaletteChangeError</u>	Returns the Palette change error status
	<u>IsPaletteEnabled</u>	Returns if the Palette mode is enabled or not.
	<u>PaletteInit</u>	Initializes the color look up table (CLUT).
	<u>RequestPaletteChange</u>	Loads the palettes from the flash during vertical blanking period if possible, otherwise loads immediately.
	<u>SetPalette</u>	Programs a block of palette entries starting from startEntry and until startEntry + length from the flash immediately.
	<u>SetPaletteBpp</u>	Sets the color look up table (CLUT) number of valid entries.
	<u>SetPaletteFlash</u>	Loads the palettes from the flash immediately.

Macros

	Name	Description
	<u>RequestEntirePaletteChange</u>	Macro: RequestEntirePaletteChange(pPalette) Loads all the palette entries from the flash during vertical blanking period if possible, otherwise loads immediately.
	<u>SetEntirePalette</u>	Macro: SetEntirePalette(pPalette) Programs the whole 256 entry palette with new color values from flash.

Structures

	Name	Description
	<u>PALETTE_FLASH</u>	Structure for the palette stored in FLASH memory.
	<u>PALETTE_HEADER</u>	Structure for the palette header.

Types

	Name	Description
	<u>PALETTE_EXTERNAL</u>	Structure for palette stored in EXTERNAL memory space. (example: External SPI or parallel Flash, EDS_EPMP)

Unions

	Name	Description

5.2.2.8.31 gfx_primitive.h

Module for Microchip Graphics Library - Graphic Primitive Layer

This module implements the primitive rendering routines of the Microchip Graphics Library. The routines are independent of the Display Driver Layer and should be compatible with any Display Driver that is compliant with the requirements of the Display Driver Layer of the Graphics Library.

Enumerations

	Name	Description
	GFX_TRIG_FUNCTION_TYPE	DOM-IGNORE-START

Functions

	Name	Description
	DrawArc	This renders an arc with from startAngle to endAngle with the thickness of r2-r1. The function returns 1 when the arc is rendered successfully and returns a 0 when it is not yet finished. The next call to the function will continue the rendering.
	GFX_AlphaBlendingValueGet	This function returns the current alpha value set for alpha blending rendering.
	GFX_AlphaBlendingValueSet	This function sets the alpha value for alpha blending rendering.
	GFX_BackgroundColorGet	This function returns the color used in the current background.
	GFX_BackgroundImageGet	This function returns the image used in the current background.
	GFX_BackgroundImageLeftGet	This function returns the horizontal starting position of the current background.
	GFX_BackgroundImageTopGet	This function returns the vertical starting position of the current background.
	GFX_BackgroundSet	This function sets the background information.
	GFX_BackgroundTypeGet	This function returns the type of the current background.
	GFX_BackgroundTypeSet	This function sets the background type.
	GFX_BarAlphaDraw	This function renders a alpha blended bar shape using the currently set fill style and color.
	GFX_BarDraw	This function renders a bar shape using the currently set fill style and color.

	GFX_BarGradientDraw	This renders a bar onto the screen, but instead of one color, a gradient is drawn depending on the direction (GFX_GRADIENT_TYPE), length, and colors chosen. This function is a blocking call. 
	GFX_BevelDraw	This is function GFX_BevelDraw.
	GFX_BevelDrawTypeGet	
	GFX_BevelDrawTypeSet	
	GFX_BevelGradientDraw	This renders a filled bevel with gradient color on the fill. It works the same as the fillbevel function, except a gradient out of color1 and color2 is drawn depending on the direction (GFX_GRADIENT_TYPE). This function is a blocking call. 
	GFX_CircleDraw	This function renders a circular shape using the currently set line style and color.
	GFX_CircleFillDraw	This function renders a filled circle shape using the currently set fill style and colors.
	GFX_ColorGet	This function returns the color currently set to render primitive shapes and text.
	GFX_ColorSet	This function sets the color to be used in rendering primitive shapes and text.
	GFX_DoubleBufferAreaGet	
	GFX_DoubleBufferAreaMark	
	GFX_DoubleBufferDisable	
	GFX_DoubleBufferEnable	
	GFX_DoubleBufferStatusGet	

	GFX_DoubleBufferSyncAllStatusClear	
	GFX_DoubleBufferSyncAllStatusGet	
	GFX_DoubleBufferSyncAllStatusSet	
	GFX_DoubleBufferSyncAreaCountGet	
	GFX_DoubleBufferSyncAreaCountSet	
	GFX_DoubleBufferSynchronize	
	GFX_DoubleBufferSynchronizeCancel	
	GFX_DoubleBufferSynchronizeRequest	
	GFX_DoubleBufferSynchronizeSet	
	GFX_DoubleBufferSynchronizeStatusGet	
	GFX_DrawBufferGet	
	GFX_DrawBufferSelect	
	GFX_DrawBufferSet	
	GFX_DRV_FontSet	This is function GFX_DRV_FontSet.
	GFX_DRV_TextStringWidthGet	This is function GFX_DRV_TextStringWidthGet.
	GFX_ExternalCharInfoGet	This is function GFX_ExternalCharInfoGet.
	GFX_ExternalResourceCallback	This function must be implemented in the application. The library will call this function each time when the external memory data will be required. The application must copy requested uint8_ts quantity into the buffer provided. Data start address in external memory is a sum of the address in GFX_EXTDATA structure and offset.
	GFX_FillStyleGet	Return the fill style used when rendering filled shapes.
	GFX_FillStyleSet	Set the fill style to be used when rendering filled shapes.
	GFX_FlashCharInfoGet	This is function GFX_FlashCharInfoGet.
	GFX_FontAntiAliasGet	This function returns the current font anti-aliasing mode.
	GFX_FontAntiAliasSet	This function sets the font anti-aliasing mode.
	GFX_FontGet	This function returns the current font used when rendering strings and characters.
	GFX_FontSet	This function sets the current font used when rendering strings and characters.
	GFX_FrameBufferGet	
	GFX_FrameBufferSelect	
	GFX_GradientColorSet	Sets the gradient fill start and end color.
	GFX_GradientEndColorGet	Return the gradient end color when rendering gradient filled shapes.
	GFX_GradientStartColorGet	Return the gradient start color when rendering gradient filled shapes.
	GFX_ImageDraw	This function renders an image to the frame buffer.
	GFX_ImageHeaderGet	This function fills the given bitmap header with the image's header information.
	GFX_ImageHeightGet	This function returns the height of the given image.
	GFX_ImageOffsetAddressGet	This is function GFX_ImageOffsetAddressGet.
	GFX_ImagePartialDraw	This function renders a portion of an image to the frame buffer.
	GFX_ImageWidthGet	This function returns the width of the given image.
	GFX_Initialize	Initialize the Graphics Library.
	GFX_LineDraw	This function renders a line from x1,y1 to x2,y2 using the currently set line style (see GFX_LineStyleSet()).
	GFX_LinePositionRelativeSet	This function sets the line cursor to a new position relative to the current position.

	GFX_LinePositionSet	This function sets the line cursor to a new position.
	GFX_LinePositionXGet	This function returns the current x position of the line cursor.
	GFX_LinePositionYGet	This function returns the current y position of the line cursor.
	GFX_LineStyleGet	Return the line style used when rendering lines.
	GFX_LineStyleSet	Set the line style to be used when rendering lines.
	GFX_LineToDraw	This function renders a line from current line cursor position (x,y) to (x2,y2) using the currently set line style (see GFX_LineStyleSet()).
	GFX_LineToRelativeDraw	This function renders a line from current line cursor position (x,y) to (x+dX,y+dY) using the currently set line style (see GFX_LineStyleSet()).
	GFX_PolygonDraw	This function renders a polygon using the currently set line style (see GFX_LineStyleSet()) and color (see GFX_ColorSet()).
	GFX_Primitive_Initialize	This is function GFX_Primitive_Initialize.
	GFX_RectangleDraw	This function renders a rectangular shape using the currently set line style and color.
	GFX_RectangleFillDraw	This function renders a filled rectangular shape using the currently set fill style and colors.
	GFX_RectangleRoundDraw	This function renders a rounded corner rectangular shape using the currently set line style and color.
	GFX_RectangleRoundFillDraw	This function renders a filled rectangular shape with round corners using the currently set fill style and colors.
	GFX_RenderingBufferGet	This function is an internal function and should not be called by the application.
	GFX_RenderToDisplayBufferDisable	This is function GFX_RenderToDisplayBufferDisable.
	GFX_RenderToDisplayBufferDisableFlagGet	This is function GFX_RenderToDisplayBufferDisableFlagGet.
	GFX_RenderToDisplayBufferEnable	This is function GFX_RenderToDisplayBufferEnable.
	GFX_ScreenClear	Clears the screen to the currently set color (GFX_ColorSet()).
	GFX_SineCosineGet	This is function GFX_SineCosineGet.
	GFX_SolidLineDraw	This is function GFX_SolidLineDraw.
	GFX_StyledLineDraw	This is function GFX_StyledLineDraw.
	GFX_TextAreaBottomGet	This is function GFX_TextAreaBottomGet.
	GFX_TextAreaBottomSet	This is function GFX_TextAreaBottomSet.
	GFX_TextAreaLeftGet	This is function GFX_TextAreaLeftGet.
	GFX_TextAreaLeftSet	This is function GFX_TextAreaLeftSet.
	GFX_TextAreaRightGet	This is function GFX_TextAreaRightGet.
	GFX_TextAreaRightSet	This is function GFX_TextAreaRightSet.
	GFX_TextAreaTopGet	This is function GFX_TextAreaTopGet.
	GFX_TextAreaTopSet	This is function GFX_TextAreaTopSet.
	GFX_TextCharDraw	This function renders the given character using the currently set color using the currently set font.
	GFX_TextCursorPositionSet	This function sets the text cursor to a new position.
	GFX_TextCursorPositionXGet	This function returns the current x position of the text cursor.
	GFX_TextCursorPositionYGet	This function returns the current y position of the text cursor.
	GFX_TextStringBoxDraw	This function renders the given string using the currently set color and font into a rectangular area.
	GFX_TextStringDraw	This function renders the given string of character using the currently set color using the currently set font.
	GFX_TextStringHeightGet	This function returns the height of the given font.

	GFX_TextStringWidthGet	This function returns the width of the given string using the given font.
	GFX_ThickBevelDraw	This is function GFX_ThickBevelDraw.
	GFX_TransparentColorDisable	This function disables the transparent color feature used in GFX_ImageDraw() and GFX_ImagePartialDraw() functions.
	GFX_TransparentColorEnable	This function sets the transparent color used in GFX_ImageDraw() functions and enables the transparent color feature.
	GFX_TransparentColorGet	This returns the current transparent color set for the transparent color feature used in GFX_ImageDraw() and GFX_ImagePartialDraw() functions.
	GFX_TransparentColorStatusGet	This returns the current state of the transparent color feature used in GFX_ImageDraw() and GFX_ImagePartialDraw() functions.
	GFXCirclePointGet	This is function GFXCirclePointGet.

Macros

	Name	Description
	GFX_CosineGet	This is macro GFX_CosineGet.
	GFX_SineGet	This is macro GFX_SineGet.
	ONEP25	$1.25 * 2^{16}$
	SIN45	$\sin(45) * 2^{16}$

Enumerations

	Name	Description
	FONT_ORIENTATION	Types of orientation
	IMAGE_STRETCH	Types of image stretching
	LAYER_ACTIONS	

Functions

	Name	Description
	GFX_AlphaBlendWindow	
	GFX_DoubleBufferVisualPageUpdate	
	GFX_Layer	
	GFX_PageSet	

Macros

	Name	Description
	CopyPageWindow	
	GFX_ActivePageGet	Returns the active page.
	GFX_AlphaParamsSet	

	GFX_BUFFER1	This is macro GFX_BUFFER1.
	GFX_BUFFER2	This is macro GFX_BUFFER2.
	GFX_FontAlignmentSet	Sets font orientation vertical or horizontal.
	GFX_GradientTypeSet	This is macro GFX_GradientTypeSet.
	GFX_ImageStretchSet	This is macro GFX_ImageStretchSet.
	GFX_MaxXGet	
	GFX_MaxYGet	
	GFX_PixelPut	This is macro GFX_PixelPut.
	GFX_PixelsPut	This function renders one line of pixels of a given length
	GFX_PrevAlphaColorGet	
	GFX_PrevAlphaColorSet	
	GFX_SetFontOrientation	Sets font orientation vertical or horizontal.
	GFX_VisualPageGet	Returns the visual page.

Structures

	Name	Description
	GFX_FONT_CURRENT	Internal structure for currently set font.
	GFX_GRADIENT_STYLE	This structure is used to describe the gradient style.
	GFX_Primitive_DATA	
	GFX_TRANSITION_PARAMS	
	PUTIMAGE_PARAM	Partial image area to render.

Variables

	Name	Description
	DisplayUpdatePending	This is variable DisplayUpdatePending.
	doubleBuffEnabled	This is variable doubleBuffEnabled.
	GFX_Primitive_instance	structure to store the primitive driver structures
	primitiveTaskImage	This is variable primitiveTaskImage.

Enumerations

	Name	Description
	<u>GFX_TRANSITION_DIRECTION</u>	Direction enumeration to determine the direction of the selected <u>GFX_TRANSITION_TYPE</u> .
	<u>GFX_TRANSITION_TYPE</u>	Transition type enumeration to determine the type of the transition. Each type will require specific parameters when setting up the transition operation (GFXSetupTransition() or GFXTransition()).

Functions

	Name	Description
	GFX_SetTransitionParameters	This sets up the transition effect using the GFX_TRANSITION_TYPE and the given parameters. The actual transition execution will occur when <code>GFXExecutePendingTransition()</code> is called. When <code>DOUBLE_BUFFERING</code> is enabled, <code>GFXExecutePendingTransition()</code> is executed after the current screen is fully rendered.
	GFX_Transition	This immediately executes the transition effect using the GFX_TRANSITION_TYPE and the given parameters.

Graphics Resource Types Header for Microchip Graphics Library

This header defines the different structures used for fonts resources in the Microchip Graphics Library.

Macros

	Name	Description
	GFX_FONT_SPACE	Font space section. The fonts can be located in psv (constant) or program space in PIC24/dsPIC MCUs. This define allows for switching of the pointer type used to access the font structure in memory See: <code>GraphicsConfig.h</code> for the application define.
	GFX_TYPES_FONTS_H	This is macro <code>GFX_TYPES_FONTS_H</code> .
	GFX_UXCHAR	This is macro <code>GFX_UXCHAR</code> .
	GFX_XCHAR	Configuration for the text character size.

Structures

	Name	Description
	GFX_FONT_GLYPH_ENTRY	Structures describing the glyph entry.
	GFX_FONT_GLYPH_ENTRY_EXTENDED	This is type <code>GFX_FONT_GLYPH_ENTRY_EXTENDED</code> .
	GFX_FONT_HEADER	Structure describing the font header.
	GFX_FONT_OUTCHAR	Structure for character information when rendering the character.

Module for Microchip Graphics Library

This module defines the data types used in the Microchip Graphics Library for use of Primitive and Driver Layers.

Enumerations

	Name	Description
	GFX_ALIGNMENT	Defines the types of text alignment. The text alignment is used in GFX_TextStringBoxDraw() .
	GFX_BACKGROUND_TYPE	Defines the types of background information. Knowing the background information allows easier refresh of an area on the display buffer.
	GFX_BEVEL_RENDER_TYPE	Bevel shapes can be rendered in full or half size. The following types defines the full, top and bottom halves.
	GFX_FEATURE_STATUS	Defines the states of a Graphics Library feature that can nbe enabled/disabled at run time.
	GFX_FILL_STYLE	Defines the types of fill styles.

	GFX_FONT_ANTIALIAS_TYPE	Transparency type when rendering characters with anti-aliasing.
	GFX_LINE_STYLE	Defines the types of line styles.
	GFX_STATUS	Status types for rendering.
	GFX_STATUS_BIT	Bit masks for additional status information.

Macros

	Name	Description
	ConvertColor25	This is macro ConvertColor25.
	ConvertColor50	75, 50, 25 percentage color conversion macros. Used in converting colors to these percentages when performing alpha blending of colors using software alpha blending operation.
	ConvertColor75	This is macro ConvertColor75.
	GFX_MAX_INVALIDATE_AREAS	This is macro GFX_MAX_INVALIDATE_AREAS.
	GFX_RGBConvert	Macros: GFX_RGBConvert(red, green, blue) This macro converts the color data to the selected COLOR_DEPTH . This macro is only valid when COLOR_DEPTH is 8, 16, or 24.

Structures

	Name	Description

5.2.2.8.37 gfx_types_palette.h

FileName: gfx_palette_types.h Dependencies: See Includes Section Processor: PIC24, PIC32 Compiler: XC16/XC32 Linker: XC16/XC32

Macros

Graphics Resource Types Header for Microchip Graphics Library

This header defines the different structures used for the Graphics Resources used in the Graphics Library. This also contains helpful macros as well as data types used.

Enumerations

	Name	Description
	GFX_RESOURCE	Memory type enumeration to determine the source of data. Used in interpreting images, fonts and palette from different memory sources.

Macros

	Name	Description
	GFX_COMP_MASK	This is macro GFX_COMP_MASK.
	GFX_MEM_MASK	This is macro GFX_MEM_MASK.
	GFX_TYPE_MASK	This is macro GFX_TYPE_MASK.
	GFX_TYPES_RESOURCE_H	This is macro GFX_TYPES_RESOURCE_H.

	MCHP_BITMAP_NORMAL	no compression, palette is present for color depth = 8, 4 and 1 BPP
	MCHP_BITMAP_PALETTE_STR	palette is provided as a separate object (see PALETTE_HEADER) for color depth = 8, 4, and 1 BPP, ID to the palette is embedded in the bitmap.

Structures

	Name	Description
	GFX_RESOURCE_BINARY	Structure for Graphics Resource - binary data.
	GFX_RESOURCE_FONT	Structure for Graphics Resource - Fonts.
	GFX_RESOURCE_HDR	Structure for Graphics Resource Header. This is the common header for all Graphics Resources.
	GFX_RESOURCE_IMAGE	Structure for Graphics Resource - image.
	GFX_RESOURCE_PALETTE	Structure for Graphics Resource - Palette.

5.2.3 Graphics Primitive Library

5.2.3.1 Introduction

Graphics Primitive Library

for

Microchip Microcontrollers

This library provides a low-level abstraction of the Graphics Primitive Library that is available on the Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the library without the necessity of interacting directly with a graphics controller, there by hiding differences from one graphics controller variant to another.

Description

This module is part of a larger Graphics Library. The Primitive Layer is used to [send](#) rendered shape data to the appropriate graphics controller driver. The primitive layer is also a scheduler to make sure that shapes are rendered in the proper order. This helps ensure a widget appears on the screen correctly. Shapes (Bars, Lines, Bevels, etc.) also include text and images.

5.2.3.2 Release Notes

MPLAB Harmony Version: v0.70b **Graphics Primitive Library Version :** 4.00b **Release Date:** 18Nov2013

Contents:

This release consists of the Graphics Primitive Layer.

Graphic Layer	Description
Primitive	The primitive layer sends rendered shape and image data to the appropriate graphics controller driver

New This Release:

A summary of the new features is as follows:

- Renamed Primitive API functions
- Remove instance argument from APIs

Feature	Description	Comments
Multi-Display support	Only one LCD display is supported in this release.	Support available in upcoming release.

Known Issues:

- No multi-display support

Feature	Category	Description	Work-around
Multi-Display support	Driver	Only one LCD display is supported in this release.	Support available in upcoming release.

5.2.3.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.2.3.4 Using the Library

This topic describes the basic architecture of the Graphics Primitive Library and provides information and examples on how to use it.

Interface Header File: [gfx_primitive.h](#)

The interface to the Graphics Primitive library is defined in the "primitive.h" header file. This file is included by the "[gfx.h](#)" file. Any C language source (.c) file that uses the Graphics Primitive library should include "primitive.h".

5.2.3.4.1 Abstraction Model

The Primitive Layer provide a set of low level drawing functions. These functions include drawing lines, rectangles, circles, text, and bitmap images.

5.2.3.4.2 Library Overview

Refer to the section [Driver Overview](#) for how the driver operates in a system.

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the Graphics module.

Library Interface Section	Description
Setup and Management Functions	Contains the APIs for setting up primitive rendering functions and managing the primitive layer
Text Functions	Contains the APIs for rendering text
Shape Functions	Contains the APIs for shapes that can be rendered
Image Functions	Contains the APIs for rendering images
Color Functions	Contains the APIs for setting/getting colors
Double Buffering Functions	Contains the APIs for setting double buffering

5.2.3.4.3 How the Library Works

The primitive layer is defined as the mediator between the graphics object layer and the graphics controller driver layer. Once the primitive layer is initialized the application just has to make calls to which specific primitive it is rendering. This layers serves other purposes:

- Schedules primitive tasks to ensure proper primitive rendering. This feature makes it possible to know that when an object is called to be drawn on a screen before another object that the order of these calls will be kept intact. This is important when using features where the image on the LCD matters before making the function call.
- In the case of multiple graphics controller drivers, it organizes which driver to make the primitive update to.

Below is a flow chart showing how the primitive layer works in conjunction with the driver layer and the object layer.

<FlowChart>

5.2.3.4.3.1 Core Functionality

The primitive layer consists of a command based circular buffer. Primitives are scheduled in the buffer and the commands are serviced each time `primitivetasks()` function is called.

Description

The library relies on a graphics controller driver to render images to an LCD panel. Below shows how the primitive layer files interact with the driver layer files.

<PrimitiveLayerOrg>

5.2.3.4.4 Using Primitive Rendering Functions

Basic rendering functions such as `LineDraw()`, `BarDraw()`, `CircleDraw()` etc are referred to as functions in the Graphics Primitive

Layer. These functions can also be implemented in the device driver layer if the display device supports hardware acceleration of the function. Applications that directly calls these functions can take advantage of the hardware accelerated primitives. How these functions are used will depend on the configuration.

Description

All primitive rendering functions returns a handle to their location in the queue.

```
// all primitives are non-blocking calls
while(GFX_PRIM_LineDraw(instance,a,b) == NULL);
while(GFX_PRIM_BarDraw(instance,c,d,e,f) == NULL);
while(GFX_PRIM_BarFill(instance,c+2, d+2, e-2, f-2) == NULL);
```

If the while check is not in place, it possible that the only primitive that you will see in the screen is the GFX_PRIM_LineDraw().

For case 2, one can also be creative in the application code and implement some form of non-blocking scheme and make use of the time while waiting for the primitives to render.

Another example for case 2:

```
uint16_t DrawMyFigure(instance, a, b, c, d, e, f)
{
    typedef enum {
        DRAW_LINE,
        DRAW_RECT,
        DRAW_BAR,
    } DRAW_MYFIGURE_STATES;
    static DRAW_MYFIGURE_STATES state = DRAW_LINE;

    switch(state){
        case DRAW_LINE:
            if (GFX_PRIM_LineDraw(instance, a, b) == NULL)
                return 0;
            state = DRAW_RECT;
        case DRAW_RECT:
            if(GFX_PRIM_BarDraw(instance,c,d,e,f) == NULL)
                return 0;
            state = DRAW_BAR;
        case DRAW_BAR:
            if(GFX_PRIM_BarFill(instance, c+2, d+2, e-2, f-2) == NULL);
                return 0;
            state = DRAW_LINE;
            return 1;
    }
}
```

This non-blocking code can be used in the application and the application can do other tasks whenever DrawMyFigure() returns 0. Application should call DrawMyFigure() again until it return a 1 signifying that the Line, Rectangle and GFX_PRIM_BarDraw were drawn successfully.

5.2.3.4.4.1 Arcs

5.2.3.4.4.2 Gradients

Below is an image that helps describe the `GFX_PRIM_BarGradient()` function in more detail.

Below is an image that helps describe the `GFX_PRIM_BevelGradient()` function in more detail.

5.2.3.4.4.3 Bevels

5.2.3.4.4 Alpha Blending

This section helps describe how alpha blending works in the primitive layer.

Description

Alpha-Blend support are two levels. `USE_ALPHABLEND_LITE` and `USE_ALPHA_BLEND`.

Alpha Blend Lite is a "desructive" alpha blend where the blending happens in one frame or window. Once the colors are blending the original color data in the visual page is lost. This method only requires one frame and `GetPixel` type functionality to work.

The other Alpha Blending uses blocks of pixels in the memory called Windows. A window can be any rectangular area in a display buffer. The display buffer is also considered as a page. For a QVGA display buffer a page would be 320x240 pixels. A window is a certain width and height contained inside a page.

Alpha blending equation:

$$\text{OutPut Window} = \text{Foreground Window} * (\text{Alpha}) + \text{Background Window} * (1-\text{Alpha})$$

when done in software requires a lot of CPU bandwidth. Epson Controller implements alpha blending in hardware which offloads the CPU.

The Display Driver Layer of the Graphics Library utilizes the Epson Controller alpha blending through the `AlphaBlendWindow()` function. Three windows are specified with equal widths and heights. An alpha parameter is passed to define the level of alpha blending. The logical flow of the operation is shown below:

An icon image with a given width (w) and height (h) is needed to be alpha blended into the display buffer.

- Buffer A is allocated in memory and its location set by `foregroundWindowAddr`
- Buffer B is allocated in memory and its location set by `backgroundWindowAddr` and
- Buffer C is allocated in memory and its location set by `destinationWindowAddr`. Note that the destination window can be located within the display buffer. Doing this removes an intermediate step after `AlphaBlendWindow()` call to put the result of alpha blend in the display buffer.

The final location of the icon on the Display Buffer is used to locate the affected pixels in the Display Buffer. These affected pixels are copied into Buffer B while Buffer A is filled up with the Icon Image. Once Buffers A and B are ready they are alpha blended to Buffer C. Buffer C is then copied to the Display Buffer.

Note that the Icon Image has a background color of **ORANGE**. To have the effect of the final output Display Buffer, set the Epson Controllers transparent color to **ORANGE**. This is set in the `TRANSPARENTCOLOR` macro defined in the Epson S1D13517 Driver. This `TRANSPARENTCOLOR` macro is not to be confused with the `TransparentColorEnable()` function of the Display Device Driver Level Primitives. `TRANSPARENTCOLOR` is set at build time. In the future release of the Epson driver, this will be converted to use the `TransparentColorEnable()` function.

5.2.3.4.4.5 Images

The image support on the primitive layer can be done "partially" to achieve more functionality in where a background can be updated more efficiently. More details are below:

5.2.3.4.5 Defining Colors

In most cases, the application will define its own set of colors and not use the default colors that comes with the Graphics Library. This section shows an example on how to do it.

Description

To override or define a new set of colors follow this steps:

1. Create a new color header file. The color values and data types will depend on the `GFX_COLOR` type used. This data type is defined by the `COLOR_DEPTH` macro. See `COLOR_DEPTH` for details.
2. In the application code, include the created color header file ahead of the `#include "Graphics/Graphics.h"`. When `Graphics.h` includes the `gfxcolors.h` it will ignore color macros that has been defined already in the new color header file.

In the GOL Palette Demo, there is an example on how it is done. In that project there is a file in the application (or project directory) named `PaletteColorDefines.h`. This file contains all the color definition used in the demo. The main header file of the demo (`Main.h`) includes the `PaletteColorDefines.h` file ahead of the Graphics Library header files. Since the `PaletteColorDefines.h` declared the color values, the macros redefined in `gfxcolors.h` will be ignored. How is this done? If you look at the `gfxcolors.h` file you will notice that all colors defined have a check (for example `BLACK()`):

```
#ifndef BLACK()
```

```
#define BLACK() 0
#endif
```

So if `BLACK()` is defined previously, the definition in `gfxcolors.h` will not take effect.

5.2.3.4.6 Changing the Default Font

The library comes with the default font (Gentium 18). This font can be changed in two ways.

This instructions assumes that you have performed the conversion of your raster font or True Type font into C file. For the conversion of your raster font please see the help file of the Graphics Resource Converter utility that comes with the Graphics Library.

There are two ways to replace the default font in the Graphics Library.

Renaming User Font to GOLFontDefault:

1. Open the generated font file (generated by the "Graphics Resource Converter" utility) and change the font structure name to **GOLFontDefault** (see figure below).

```
extern const char L1191258975[] __attribute__((aligned(2)));
//FONT STRUCTURE. FONT NAME CAN BE CHANGED HERE.
const struct{short mem; const char* ptr;} GOLFontDefault =
{0,L1191258975};
const char L1191258975[] __attribute__((aligned(2))) = {
```

2. Remove the file **GOLFONTDefault.c** in the project and replace it with your own font file that contains the **GOLFontDefault**.
3. Build and test your new font.

Replacing the GOLFontDefault with any user defined fonts

1. Open the **GraphicsConfig.h** file and add the following lines:

```
#define FONTDEFAULT yourFontName
```

2. In the project, add the generated font file (generated by the "Graphics Resource Converter" utility).
3. Build and test your new font.

In this method, `GOL.h` and `GOLFontDefault.c` files checks if `FONTDEFAULT` is defined. If it is, it skips the declaration of the `GOLFontDefault` and uses the user defined font.

5.2.3.4.7 Advanced Font Features

This topic explains anti aliasing, glyphs, and advanced font features.

Description

Fonts used in the library can be configured to use anti-aliasing and extended glyph support.

Font Anti-Aliasing

Anti-aliasing is a technique used to make the edges of text appear smooth. This is useful especially with characters like 'A', 'O', etc which has slant or curved lines. Since the pixels of the display are arranged in rectangular fashion, slant edges can't be represented smoothly. To make them appear smooth, a pixel adjacent to the pixels is painted with an average of the foreground and background colors as depicted in Figure 1.

Figure 1: Font with Anti-Aliasing

Figure 2: Font with No Anti-Aliasing

When anti-aliasing is turned off, the pixels abruptly changes from background color to foreground color shown in Figure 2. To implement anti-aliasing, adjacent pixels transitions from background to foreground color using 25% or 75% mid-color values from background to foreground colors. This feature in fonts will require roughly twice the size of memory storage required for font glyphs with no anti-aliasing.

Since the average of foreground and background colors needs to be calculated at runtime, the rendering of anti-aliased fonts take more time than rendering normal fonts. To optimize the rendering speed, a macro named `GFX_Font_SetAntiAliasType()` is available where anti-alias type can be set to `ANTIALIAS_OPAQUE` or `ANTIALIAS_TRANSLUCENT`.

- `ANTIALIAS_OPAQUE` (default after initialization of graphics) - mid colors are calculated once while rendering each character which is ideal for rendering text over a constant background.
- `ANTIALIAS_TRANSLUCENT` - the mid values are calculated for every necessary pixel and this feature is useful while rendering text over an image or on a non-constant color background.

As a result, rendering anti-aliased text takes longer with `ANTIALIAS_TRANSLUCENT` type than compared to `ANTIALIAS_OPAQUE` type.

To use anti-aliasing, enable the compiler switch `#define USE_ANTIALIASED_FONTS` in the `GraphicsConfig.h` file and enable the anti-alias checkbox in the Graphics Resource Converter (GRC) tool while selecting the font.

Note: Even when anti-aliasing is enabled, normal fonts can be used without the antialias effect.

Extended Glyphs

Extended glyphs are needed to render characters of certain languages which use more than one byte to represent a single character. For example: Asian languages like Thai, Hindi, etc. In these character set, more than one glyph overlaps each other to form a single character of that language as shown in Figure 3. To use this feature, enable the Extended Glyph checkbox in the Graphics Resource Converter (GRC) tool while selecting the font.

Figure 3: Example of a Character that is Formed by Two Overlapping Glyphs

Note: The fonts used with extended glyphs are normal ANSI fonts and not Unicode fonts.

5.2.3.4.8 Double Buffering

In the Microchip Graphics Library, if double-buffering is enabled, the frame buffer and draw buffer are exchanged after the changes of all the widgets on a screen are done (i.e., the new screen appears after the whole screen is updated and not after updating an individual widget). This feature is enabled only on the following drivers:

- Microchip Graphics Display Driver - customizable driver for RGB Glass. Currently used in PIC24FJ256DA210 device family.
- Microchip Low-Cost Controllerless (LCC) Graphics Display Driver - customizable driver for RGB Glass. Currently used for selected PIC32MX device families.

Description

Manipulating pixels on the screen requires direct writes to the frame buffer. While these changes are being executed, the screen is also refreshed. This means that the changes are displayed immediately as the frame buffer is being updated. This is not a suitable scheme when the changes are slow, for example, decoding an image or having a large number of widgets on a screen. The display may appear slow in that case. One solution to this problem is to use a double-buffering scheme supported by the Microchip Graphics Library. In this scheme, the changes are not directly written to the frame buffer, but instead, they are written to a separate buffer, called the 'Draw Buffer'. After all the changes are made, the draw buffer and frame buffer are exchanged. Now the draw buffer becomes the frame buffer, and because of all the changes drawn there, the changes appear spontaneous to the user. Of course, there will be a delay, as all the changes have to be written to the draw buffer before displaying it. This delay is generally more tolerable than displaying the changes slowly. After exchanging of the buffers, the latest buffer (which is now the frame buffer) is copied to the new draw buffer in the background and then the new draw buffer is in sync with what is being displayed. New changes are then written to the draw buffer and the cycle continues. As the double-buffering scheme uses two buffers, the RAM requirement will double.

In the Microchip Graphics Library, if double-buffering is enabled, the frame buffer and draw buffer are exchanged after the changes of all the widgets on a screen are done (i.e., the new screen appears after the whole screen is updated and not after updating an individual widget).

The work flow of double-buffering is graphically explained along with tips on deciding when to use double buffering in the APPENDIX B of the Application note AN1368: Developing Embedded Graphics Applications using PIC® Microcontrollers with Integrated Graphics Controller.

To use double buffering in an application, follow the steps described below:

1. Enable the option `USE_DOUBLE_BUFFERING` in `GraphicsConfig.h`
2. Update `GFX_DISPLAY_BUFFER_LENGTH` to include both the buffers in `HardwareProfile.h`. Note that when using external memory the `GFX_DISPLAY_BUFFER_LENGTH` must fit into the external memory size. For example in PIC24FJ256DA210 external memory can be added using EPMP. External memory mapped to the EPMP must be big enough to accommodate the display buffers required by double buffering. See Set Up Display Interface for more information on memory requirements.

3. Check the jumper settings to enable the required RAM address space on the development board

If Graphics Objects Layer (GOL) is used in the application, the switching of buffers is handled automatically in order to keep the switching task transparent to the users. If double buffering is enabled in applications using only the Primitive layer, then the switching of buffers has to be handled by the application itself as explained in the following steps.

Steps required for manually handling the switching of buffers:

1. After `InitGraph()` is called, call the APIs `InvalidateAll()` followed by `UpdateDisplayNow()`. The two buffers are properly setup after these calls and from this point onwards, the drawing happens on the draw-buffer.
2. When a shape is drawn on the draw buffer, that rectangular area has to be marked as invalid by using the API `InvalidateRectangle(left, top, right, bottom)`. Only the invalidated rectangular areas are copied to the frame buffer in order to reduce the copy operations thereby reducing the overall time and energy required to sync the two buffers. Hence, it is important to invalidate the changed rectangular areas failing which the change doesn't show up on the display.
3. Call either `RequestDisplayUpdate()` or `UpdateDisplayNow()` to sync the two buffers and as a result the changes appear on the display. The former API exchanges the buffers during the next display blanking period on TFT LCDs causing the change to appear smooth and immediate whereas the latter API exchanges the two buffers at the time of the API call probably causing a slight flicker on the display. On displays which doesn't support blanking periods (e.g. CSTN LCDs), the effect of `RequestDisplayUpdate()` is same as that of `UpdateDisplayNow()`.

Even if double buffering is enabled at compile time, it can be switched off and on at run time using APIs `SwitchOffDoubleBuffering()` and `SwitchOnDoubleBuffering()`. Switching double buffering on/off at runtime is useful in applications which need some screens having fast updates like waveform or animation which requires double buffering to be switched off and some other screens where double buffering is beneficial.

Note: In applications using Graphics Objects Layer and double buffering, the double buffering is not immediately enabled after the API `GFX_OBJ_Initialize()` is called in order to support hassles splash screens but is automatically enabled from the second screen update onwards. If double buffering is needed from the first screen itself, then follow step 1 immediately after calling `GFX_OBJ_Initialize()`.

5.2.3.4.9 Transitions

This section describes screen transition effect when changing screens.

Description

Applications often require some transition effects while changing screens in order to enhance the look and feel which can be achieved by using Transition APIs provided with the Microchip Graphics Library. Refer to Appendix C of the application note [AN1368: Developing Embedded Graphics Applications using PIC® Microcontrollers with Integrated Graphics Controller](#) for a graphical illustration of how transitions can be achieved.

In order to translate a new screen, the new screen has to be developed in a separate buffer and has to be copied to the frame buffer (visible display buffer) part by part. The way the new screen data is copied into the frame buffer determines the transition effect. A number of transition effects can be achieved by using the API: `GFXTransition(left, top, right, bottom, type, srcpageaddr, destpageaddr, delay_ms, param1, param2)`. This API copies the rectangular area defined by left, top, right and bottom from address defined by `srcpageaddr` to the `destpageaddr` as per the transition defined by type, param1 and param2. The

srcpageaddr should contain the new screen data and the destpageaddr must be the frame buffer address. The speed of the transition can be configured by the parameter delay_ms which determines the delay between each copy operations. Note that this API must be called only at the end of GFX_OBJ_DrawCallback() function in order to ensure that the new screen is fully created in the RAM.

If double buffering is enabled, then using transitions is made easier by another API: GFXSetupTransition(left, top, right, bottom, type, delay_ms, param1, param2). This API can be called immediately after creating the new screen and the graphics library will store the request and initiate the transition after the new screen is fully created in the RAM. Note that this API doesn't have address parameters as the address of draw-buffer is already known to the double buffering subsystem of the graphics engine.

5.2.3.5 Configuring the Library

The configuration of the Graphics Primitive Library is based on the file system_config.h

This header file contains the configuration selection for the Graphics Primitive Library. Based on the selections made, the Graphics Primitive Library will support or not support selected features. These configuration settings will apply to all instances of the Graphics Primitive Library.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.2.3.5.1 Fonts

This compile option selects if the support for unicode fonts, unsigned char or the default signed char type fonts.

There are three types of font (characters) that can be used in the Graphics Library. This gives the user the option to implement multi-language application or use the default signed char type.

Define in GraphicsConfig.h	XCHAR type	Description
#define USE_MULTIBYTECHAR	#define XCHAR unsigned short	Enable support for multi-byte fonts such as Unicode fonts.
#define USE_UNSIGNED_XCHAR	#define XCHAR unsigned char	Enable support for character range of 0-255.
none of the two are defined	#define XCHAR char	Character range is set to 0-127.

Note: Only one of the two or none at all are defined in GraphicsConfig.h.

- #define [USE_MULTIBYTECHAR](#)

- #define USE_UNSIGNED_XCHAR

- when none are defined, XCHAR defaults to type char.

See XCHAR for details.

5.2.3.5.2 Alpha Blending

This compile option enables the Alpha-Blend feature in Primitive Layer.

5.2.3.5.3 Colors

Defines the color depth of the system

5.2.3.5.4 Images

5.2.3.6 Building the Library

This section list the files that are available in the \src of the primitive driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

5.2.3.7 Library Interface

Data Types and Constants

	Name	Description
	GFX_CosineGet	This is macro GFX_CosineGet.
	GFX_GradientTypeSet	This is macro GFX_GradientTypeSet.
	GFX_SineGet	This is macro GFX_SineGet.

Setup and Management Functions

	Name	Description
	GFX_SineCosineGet	This is function GFX_SineCosineGet.

Shape Functions

	Name	Description
	GFXCirclePointGet	This is function GFXCirclePointGet.

Description

This section describes the Application Programming Interface (API) functions of the Graphics Primitive Library.

5.2.3.7.1 Setup and Management Functions

5.2.3.7.1.1 GFX_SineCosineGet Function

C

```
int16_t GFX_SineCosineGet(
    int16_t v,
    GFX_TRIG_FUNCTION_TYPE type
);
```

Description

This is function GFX_SineCosineGet.

5.2.3.7.2 Text Functions

5.2.3.7.3 Shape Functions

5.2.3.7.3.1 GFXCirclePointGet Function

C

```
void GFXCirclePointGet(  
    int16_t radius,  
    int16_t angle,  
    int16_t * x,  
    int16_t * y  
);
```

Description

This is function GFXCirclePointGet.

5.2.3.7.4 Color Functions

5.2.3.7.5 Draw Functions

5.2.3.7.6 Image Functions

5.2.3.7.7 Double Buffering Functions

5.2.3.7.8 Data Types and Constants

5.2.3.7.8.1 GFX_CosineGet Macro

C

```
#define GFX_CosineGet(angle) GFX_SineCosineGet(angle, GFX_TRIG_COSINE_TYPE)
```

Description

This is macro GFX_CosineGet.

5.2.3.7.8.2 GFX_GradientTypeSet Macro

C

```
#define GFX_GradientTypeSet(value) GFX_Primitive_instance.gradientStyle.type = value
```

Description

This is macro GFX_GradientTypeSet.

5.2.3.7.8.3 GFX_SineGet Macro

C

```
#define GFX_SineGet(angle) GFX_SineCosineGet(angle, GFX_TRIG_SINE_TYPE)
```

Description

This is macro GFX_SineGet.

5.2.3.8 Files

The Graphics Primitive Library files include:

- [gfx_colors.h](#)
- [gfx_primitive.h](#)
- [gfx_transitions.h](#)
- [gfx_types_palette.h](#)
- [gfx_config_template.h](#)

5.3 Cryptographic (Crypto) Library

5.3.1 Introduction

Cryptographic Library for Microchip Microcontrollers

This library provides a software Cryptographic Library that is available on the Microchip family of microcontrollers with a convenient C language interface.

Description

The Cryptographic Library includes functions to perform encryption, decryption, hashing, authentication, and compression within the embedded application. Random number generation (RNG) functions are also provided.

Block Ciphers

The library provides DES, 3DES, and AES for block cipher needs. Depending on the algorithm in use, CBC and CTR modes are supported.

Public Key Cryptography

The library provides RSA and Elliptic Curve Cryptography (ECC) for Public Key Cryptography, and Diffie-Hellman (DH) for key agreement arrangements.

Hash Functions

The library provides MD5, SHA, SHA-256, SHA-384, and SHA-512 for hashing. These functions do not require keys or initialization vectors (IV).

Random Number Generation Functions

The library provides functions to generate either a single pseudo-random number, or a block of such numbers.

5.3.2 Release Notes

MPLAB Harmony Version: v0.70b **Cryptographic Library:** 1.00 **Release Date:** 18Nov2013

New This Release:

Cryptographic Library

- Provides cryptographic, authentication, compression, and random number routines for use on PIC32MX and PIC32MZ families
- Authentication capabilities:

- MD5
- SHA-1
- SHA-256
- SHA-384
- SHA-512
- HMAC
- Cryptographic capabilities:
 - AES:
 - 128-, 192-, 256-bit key lengths
 - CBC, CTR, GCM, and CCM-8 modes
 - RSA
 - DES/Triple DES
 - Elliptic Curve Cryptography (ECC)
- Random Number capabilities:
 - Single random number
 - Block of random numbers
- Compression capabilities:
 - Huffman Encoding

Compression/Decompression "zlib" Library

The library includes the following new features:

- The library is a general purpose data compression library.
- Read and write gzip (.gz) format with an interface similar to that of stdio
- Huffman Encoding algorithms

Known Issues:

Cryptographic Library

- Nothing to report in this release.

Compression/Decompression "zlib" Library

- Nothing to report in this release

5.3.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO

YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.3.4 Using the Library

This topic describes the basic architecture of the Cryptographic (Crypto) Library and provides information and examples on how to use it.

Interface Header File: [crypto.h](#)

The interface to the Cryptographic (Crypto) Library is defined in the "crypto.h.h" header file. This file is included by the "crypto.h.h" file. Any C language source (.c) file that uses the Cryptographic (Crypto) Library should include "crypto.h.h".

Library File:

The Cryptographic (Crypto) Library archive (.a) file installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the Cryptographic (Crypto) Library interacts with the framework.

5.3.4.1 Abstraction Model

This library provides the low-level abstraction of the Cryptographic Library module on the Microchip family of microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in the software and introduces the library interface.

Description

Cryptographic (Crypto) Software Abstraction Block Diagram

5.3.4.2 Library Overview

The [Library Interface](#) routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the Cryptographic (Crypto) Library module.

5.3.5 Configuring the Library

The configuration of the Cryptographic Library is based on the file `sys_config.h`.

This header file contains the configuration selection for the Cryptographic Library. Based on the selections made, the Cryptographic Library will support or not support selected features. These configuration settings will apply to all instances of the Cryptographic Library.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.3.6 Building the Library

This section lists the files that are available in the `\src` of the Cryptographic Library driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

5.3.7 Library Interface

Data Types and Constants

	Name	Description
	CRYPT_AES_CTX	AES
	CRYPT_ECC_CTX	ECC
	CRYPT_HMAC_CTX	HMAC
	CRYPT_MD5_CTX	MD5
	CRYPT_RNG_CTX	RNG
	CRYPT_RSA_CTX	RSA
	CRYPT_SHA_CTX	SHA
	CRYPT_SHA256_CTX	SHA-256
	CRYPT_SHA384_CTX	SHA-384
	CRYPT_SHA512_CTX	SHA-512
	CRYPT_TDES_CTX	TDES
	MC_CRYPT_API_H	Defines Microchip CRYPTO API layer

AES Encryption/Decryption Functions

	Name	Description
	CRYPT_AES_CBC_Decrypt	
	CRYPT_AES_CBC_Encrypt	
	CRYPT_AES_CTR_Encrypt	
	CRYPT_AES_DIRECT_Decrypt	Direct encryption of one block of data.
	CRYPT_AES_DIRECT_Encrypt	Direct encryption of one block of data.
	CRYPT_AES_IvSet	

	CRYPT_AES_KeySet	

Compression Functions

	Name	Description
	CRYPT_HUFFMAN_Compress	Compress a block of data.
	CRYPT_HUFFMAN_DeCompress	Decompress a block of data.

ECC Encryption/Decryption Functions

	Name	Description
	CRYPT_ECC_DHE_KeyMake	
	CRYPT_ECC_DHE_SharedSecretMake	
	CRYPT_ECC_DSA_HashSign	
	CRYPT_ECC_DSA_HashVerify	
	CRYPT_ECC_Free	
	CRYPT_ECC_Initialize	
	CRYPT_ECC_KeySizeGet	
	CRYPT_ECC_PrivateImport	
	CRYPT_ECC_PublicExport	
	CRYPT_ECC_PublicImport	
	CRYPT_ECC_SignatureSizeGet	

General Functions

	Name	Description
	CRYPT_ERROR_StringGet	

HMAC Hash Functions

	Name	Description
	CRYPT_HMAC_DataAdd	Add data to the HMAC calculation.
	CRYPT_HMAC_Finalize	Complete the HMAC calculation and get the results.
	CRYPT_HMAC_SetKey	Initialize the HMAC context and set the key for the hash.

MD5 Functions

	Name	Description
	CRYPT_MD5_DataAdd	Updates the hash with the data provided.
	CRYPT_MD5_Finalize	Finalizes the hash and puts the result into digest.
	CRYPT_MD5_Initialize	Initializes the internal structures necessary for MD5 hash calculations.

Random Number Generator Functions

	Name	Description
	CRYPT_RNG_BlockGenerate	Create several random numbers.
	CRYPT_RNG_Get	Get one random number.
	CRYPT_RNG_Initialize	Initialize random number generator.

RSA Encryption/Decryption Functions

	Name	Description
	CRYPT_RSA_EncryptSizeGet	
	CRYPT_RSA_Free	
	CRYPT_RSA_Initialize	

	CRYPT_RSA_PrivateDecrypt	
	CRYPT_RSA_PrivateKeyDecode	
	CRYPT_RSA_PublicEncrypt	
	CRYPT_RSA_PublicKeyDecode	

SHA Hash functions

	Name	Description
	CRYPT_SHA_DataAdd	Updates the hash with the data provided.
	CRYPT_SHA_Finalize	Finalizes the hash and puts the result into digest.
	CRYPT_SHA_Initialize	Initializes the internal structures necessary for SHA hash calculations.

SHA256 Hash Functions

	Name	Description
	CRYPT_SHA256_DataAdd	Updates the hash with the data provided.
	CRYPT_SHA256_Finalize	Finalizes the hash and puts the result into digest.
	CRYPT_SHA256_Initialize	Initializes the internal structures necessary for SHA256 hash calculations.

SHA384 Hash Functions

	Name	Description
	CRYPT_SHA384_DataAdd	Updates the hash with the data provided.
	CRYPT_SHA384_Finalize	Finalizes the hash and puts the result into digest.
	CRYPT_SHA384_Initialize	Initializes the internal structures necessary for SHA384 hash calculations.

SHA512 Hash Functions

	Name	Description
	CRYPT_SHA512_DataAdd	Updates the hash with the data provided.
	CRYPT_SHA512_Finalize	Finalizes the hash and puts the result into digest.
	CRYPT_SHA512_Initialize	Initializes the internal structures necessary for SHA512 hash calculations.

Triple DES (3DES) Encryption/Decryption Functions

	Name	Description
	CRYPT_TDES_CBC_Decrypt	Decrypt a data block using Triple DES.
	CRYPT_TDES_CBC_Encrypt	Encrypt a data block using Triple DES.
	CRYPT_TDES_IvSet	Set the Initialization Vector (IV) for a Triple DES operation.
	CRYPT_TDES_KeySet	Initialization of Triple DES context.

Description

This section describes the Application Programming Interface (API) functions of the Cryptographic Library.

Refer to each section for a detailed description.

5.3.7.1 General Functions

5.3.7.1.1 CRYPT_ERROR_StringGet Function

C

```
int CRYPT_ERROR_StringGet(
```

```
    int,  
    char*  
);
```

Parameters

Parameters	Description
Param1	Pointer to context which saves state between calls.
Param2	Param3 -
Param4	Param5 -

Returns

*BAD_FUNC_ARG - An invalid pointer was passed to the function. *0 - Otherwise.

Remarks

String needs to be >= 80 chars.

Example

5.3.7.2 SHA512 Hash Functions

5.3.7.2.1 CRYPT_SHA512_DataAdd Function

C

```
int CRYPT_SHA512_DataAdd(  
    CRYPT_SHA512_CTX*,  
    const unsigned char*,  
    unsigned int  
);
```

Description

This function updates the hash with the data provided.

Preconditions

The SHA512 context must be initialized prior to the first call of this function. The context must not be modified by code outside of this function.

Parameters

Parameters	Description
sha512	Pointer to CRYPT_SHA512_CTX structure which holds the hash values.
input	Pointer to the data to use to update the hash.
sz	Size of the data (in bytes) of the data to use to update the hash.

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function, either in sha512 or input.
- 0 - Otherwise.

Remarks

In order to preserve the validity of the SHA512 hash, nothing must modify the context holding variable between calls to CRYPT_SHA512_DataAdd.

Example

```
CRYPT_SHA512_CTX sha512;
```

```
uint8_t buffer[1024];
uint8_t sha512Sum[SHA512_DIGEST_SIZE];

CRYPT_SHA512_Initialize(&sha512);
CRYPT_SHA512_DataAdd(&sha512, buffer, sizeof(buffer));
CRYPT_SHA512_Finalize(&sha512, sha512Sum);
```

5.3.7.2.2 CRYPT_SHA512_Finalize Function

C

```
int CRYPT_SHA512_Finalize(
    CRYPT_SHA512_CTX*,
    unsigned char*
);
```

Description

This function finalizes the hash and puts the result into digest.

Preconditions

The SHA512 context must be initialized prior to calling this function. The context must not be modified by code outside of this function.

Parameters

Parameters	Description
sha512	Pointer to CRYPT_SHA512_CTX structure which holds the hash values.
digest	Pointer to byte array to store hash result.

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function, either in sha512 or digest.
- 0 - Otherwise.

Remarks

In order to preserve the validity of the SHA512 hash, nothing must modify the context holding variable between calls to [CRYPT_SHA512_DataAdd](#) and [CRYPT_SHA512_Finalize](#).

Example

```
CRYPT_SHA512_CTX sha512;
uint8_t buffer[1024];
uint8_t sha512Sum[SHA512_DIGEST_SIZE];

CRYPT_SHA512_Initialize(&sha512);
CRYPT_SHA512_DataAdd(&sha512, buffer, sizeof(buffer));
CRYPT_SHA512_Finalize(&sha512, sha512Sum);
```

5.3.7.2.3 CRYPT_SHA512_Initialize Function

C

```
int CRYPT_SHA512_Initialize(
    CRYPT_SHA512_CTX*
);
```

Description

This function initializes the internal structures necessary for SHA512 hash calculations.

Preconditions

None.

Parameters

Parameters	Description
sha512	Pointer to CRYPT_SHA512_CTX strucure which holds the hash values.

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- 0 - Otherwise.

Remarks

All SHA512 hashes have to start at a particular value before adding new data to it. This function sets the necessary values for the structure.

Example

```
CRYPT_SHA512_CTX sha512;
uint8_t sha512Sum[SHA512_DIGEST_SIZE];

CRYPT_SHA512_Initialize(&sha512);
CRYPT_SHA512_DataAdd(&sha512, buffer, sizeof(buffer));
CRYPT_SHA512_Finalize(&sha512, sha512Sum);
```

5.3.7.3 HMAC Hash Functions

5.3.7.3.1 CRYPT_HMAC_DataAdd Function

C

```
int CRYPT_HMAC_DataAdd(
    CRYPT_HMAC_CTX*,
    const unsigned char*,
    unsigned int
);
```

Description

This function adds data to the HMAC so that multiple blocks of data can be processed.

Preconditions

The [CRYPT_HMAC_CTX](#) context must be initialized using the [CRYPT_HMAC_SetKey](#) function prior to any call to this function.

Parameters

Parameters	Description
hmac	Pointer to context which saves state between calls.
input	Pointer to the data to use to update the hash.
sz	Size of the input data in bytes.

Returns

*BAD_FUNC_ARG - An invalid pointer was passed to the function. *0 - Otherwise.

Remarks**Example**

```
CRYPT_HMAC_CTX mCHmac;
byte          mcDigest[CRYPT_SHA512_DIGEST_SIZE];
```

```
CRYPT_HMAC_SetKey(&mcHmac, CRYPT_HMAC_SHA, key, 4);  
CRYPT_HMAC_DataAdd(&mcHmac, ourData, OUR_DATA_SIZE);  
CRYPT_HMAC_Finalize(&mcHmac, mcDigest);
```

5.3.7.3.2 CRYPT_HMAC_Finalize Function

C

```
int CRYPT_HMAC_Finalize(  
    CRYPT_HMAC_CTX*,  
    unsigned char*  
);
```

Description

This function completes the HMAC calculations. The results are placed in the location pointed to by digest.

Preconditions

The [CRYPT_HMAC_CTX](#) context must be initialized using the [CRYPT_HMAC_SetKey](#) function prior to any call to this function.

Parameters

Parameters	Description
hmac	Pointer to context which saves state between calls.
digest	Pointer to place to put the final HMAC digest results.

Returns

*BAD_FUNC_ARG - An invalid pointer was passed to the function. *0 - Otherwise.

Remarks

The area pointed to by digest must be large enough to hold the results.

Example

```
CRYPT_HMAC_CTX mcHmac;  
byte mcDigest[CRYPT_SHA512_DIGEST_SIZE];  
  
CRYPT_HMAC_SetKey(&mcHmac, CRYPT_HMAC_SHA, key, 4);  
CRYPT_HMAC_DataAdd(&mcHmac, ourData, OUR_DATA_SIZE);  
CRYPT_HMAC_Finalize(&mcHmac, mcDigest);
```

5.3.7.3.3 CRYPT_HMAC_SetKey Function

C

```
int CRYPT_HMAC_SetKey(  
    CRYPT_HMAC_CTX*,  
    int,  
    const unsigned char*,  
    unsigned int  
);
```

Description

This function initializes the HMAC context and set the key for the hash.

Preconditions

None.

Parameters

Parameters	Description
hmac	Pointer to context which saves state between calls.

5.3.7.4 SHA384 Hash Functions

5.3.7.4.1 CRYPT_SHA384_DataAdd Function

C

```
int CRYPT_SHA384_DataAdd(  
    CRYPT_SHA384_CTX*,  
    const unsigned char*,  
    unsigned int  
);
```

Description

This function updates the hash with the data provided.

Preconditions

The SHA384 context must be initialized prior to the first call of this function. The context must not be modified by code outside of this function.

Parameters

Parameters	Description
sha384	Pointer to CRYPT_SHA384_CTX structure which holds the hash values.
input	Pointer to the data to use to update the hash.
sz	Size of the data (in bytes) of the data to use to update the hash.

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function, either in sha384 or input.
- 0 - Otherwise.

Remarks

In order to preserve the validity of the SHA384 hash, nothing must modify the context holding variable between calls to CRYPT_SHA384_DataAdd.

Example

```
CRYPT_SHA384_CTX sha384;  
uint8_t buffer[1024];  
uint8_t shaSum[SHA384_DIGEST_SIZE];  
  
CRYPT_SHA384_Initialize(&sha384);  
CRYPT_SHA384_DataAdd(&sha384, buffer, sizeof(buffer));  
CRYPT_SHA384_Finalize(&sha384, shaSum);
```

5.3.7.4.2 CRYPT_SHA384_Finalize Function

C

```
int CRYPT_SHA384_Finalize(  
    CRYPT_SHA384_CTX*,  
    unsigned char*  
);
```

Description

This function finalizes the hash and puts the result into digest.

Preconditions

The SHA384 context must be initialized prior to calling this function. The context must not be modified by code outside of this function.

Parameters

Parameters	Description
sha384	Pointer to CRYPT_SHA384_CTX strucure which holds the hash values.
digest	Pointer to byte array to store hash result.

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function, either in sha384 or digest.
- 0 - Otherwise.

Remarks

In order to preserve the validity of the SHA384 hash, nothing must modify the context holding variable between calls to [CRYPT_SHA384_DataAdd](#) and [CRYPT_SHA384_Finalize](#).

Example

```
CRYPT_SHA384_CTX sha384;
uint8_t buffer[1024];
uint8_t shaSum[SHA384_DIGEST_SIZE];

CRYPT_SHA384_Initialize(&sha384);
CRYPT_SHA384_DataAdd(&sha384, buffer, sizeof(buffer));
CRYPT_SHA384_Finalize(&sha384, shaSum);
```

5.3.7.4.3 CRYPT_SHA384_Initialize Function

C

```
int CRYPT_SHA384_Initialize(
    CRYPT_SHA384_CTX*
```

```
);
```

Description

This function initializes the internal structures necessary for SHA384 hash calculations.

Preconditions

None.

Parameters

Parameters	Description
sha384	Pointer to CRYPT_SHA384_CTX strucure which holds the hash values.

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- 0 - Otherwise.

Remarks

All SHA384 hashes have to start at a particular value before adding new data to it. This function sets the necessary values for the structure.

Example

```
CRYPT_SHA384_CTX sha384;
uint8_t shaSum[SHA384_DIGEST_SIZE];

CRYPT_SHA384_Initialize(&sha384);
CRYPT_SHA384_DataAdd(&sha384, buffer, sizeof(buffer));
CRYPT_SHA384_Finalize(&sha384, shaSum);
```

5.3.7.5 SHA256 Hash Functions

5.3.7.5.1 CRYPT_SHA256_DataAdd Function

C

```
int CRYPT_SHA256_DataAdd(
    CRYPT_SHA256_CTX*,
    const unsigned char*,
    unsigned int
);
```

Description

This function updates the hash with the data provided.

Preconditions

The SHA256 context must be initialized prior to the first call of this function. The context must not be modified by code outside of this function.

Parameters

Parameters	Description
sha256	Pointer to CRYPT_SHA256_CTX strucure which holds the hash values.
input	Pointer to the data to use to update the hash.
sz	Size of the data (in bytes) of the data to use to update the hash.

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function, either in sha256 or input.
- 0 - Otherwise.

Remarks

In order to preserve the validity of the SHA256 hash, nothing must modify the context holding variable between calls to CRYPT_SHA256_DataAdd.

Example

```
CRYPT_SHA256_CTX sha256;
uint8_t buffer[1024];
uint8_t shaSum[SHA256_DIGEST_SIZE];

CRYPT_SHA256_Initialize(&sha256);
CRYPT_SHA256_DataAdd(&sha256, buffer, sizeof(buffer));
CRYPT_SHA256_Finalize(&sha256, shaSum);
```

5.3.7.5.2 CRYPT_SHA256_Finalize Function

C

```
int CRYPT_SHA256_Finalize(
```

```
    CRYPT_SHA256_CTX*,  
    unsigned char*  
);
```

Description

This function finalizes the hash and puts the result into digest.

Preconditions

The SHA256 context must be initialized prior to calling this function. The context must not be modified by code outside of this function.

Parameters

Parameters	Description
sha256	Pointer to CRYPT_SHA256_CTX structure which holds the hash values.
digest	Pointer to byte array to store hash result.

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function, either in sha or digest.
- 0 - Otherwise.

Remarks

In order to preserve the validity of the SHA256 hash, nothing must modify the context holding variable between calls to [CRYPT_SHA256_DataAdd](#) and [CRYPT_SHA256_Finalize](#).

Example

```
CRYPT_SHA256_CTX sha256;  
uint8_t buffer[1024];  
uint8_t shaSum[SHA256_DIGEST_SIZE];  
  
CRYPT_SHA256_Initialize(&sha256);  
CRYPT_SHA256_DataAdd(&sha256, buffer, sizeof(buffer));  
CRYPT_SHA256_Finalize(&sha256, shaSum);
```

5.3.7.5.3 CRYPT_SHA256_Initialize Function

C

```
int CRYPT_SHA256_Initialize(  
    CRYPT_SHA256_CTX*  
);
```

Description

This function initializes the internal structures necessary for SHA256 hash calculations.

Preconditions

None.

Parameters

Parameters	Description
sha256	Pointer to context which saves state between calls.

Returns

*BAD_FUNC_ARG - An invalid pointer was passed to the function. *0 - Otherwise.

Remarks

All SHA hashes have to start at a particular value before adding new data to it. This function sets the necessary values for the

structure.

Example

```
CRYPT_SHA256_CTX sha;
uint8_t shaSum[SHA256_DIGEST_SIZE];

CRYPT_SHA256_Initialize(&sha);
CRYPT_SHA256_DataAdd(&sha, buffer, sizeof(buffer));
CRYPT_SHA256_Finalize(&sha, shaSum);
```

5.3.7.6 SHA Hash functions

5.3.7.6.1 CRYPT_SHA_DataAdd Function

C

```
int CRYPT_SHA_DataAdd(
    CRYPT_SHA_CTX*,
    const unsigned char*,
    unsigned int
);
```

Description

This function updates the hash with the data provided.

Preconditions

The SHA context must be initialized prior to the first call of this function. The context must not be modified by code outside of this function.

Parameters

Parameters	Description
sha	Pointer to CRYPT_SHA_CTX strucure which holds the hash values.
input	Pointer to the data to use to update the hash.
sz	Size of the data (in bytes) of the data to use to update the hash.

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function, either in sha or input.
- 0 - Otherwise.

Remarks

In order to preserve the validity of the SHA hash, nothing must modify the context holding variable between calls to CRYPT_SHA_DataAdd.

Example

```
CRYPT_SHA_CTX sha;
uint8_t buffer[1024];
uint8_t shaSum[SHA_DIGEST_SIZE];

CRYPT_SHA_Initialize(&sha);
CRYPT_SHA_DataAdd(&sha, buffer, sizeof(buffer));
CRYPT_SHA_Finalize(&sha, shaSum);
```

5.3.7.6.2 CRYPT_SHA_Finalize Function

C

```
int CRYPT_SHA_Finalize(  
    CRYPT_SHA_CTX*,  
    unsigned char*  
);
```

Description

This function finalizes the hash and puts the result into digest.

Preconditions

The SHA context must be initialized prior to calling this function. The context must not be modified by code outside of this function.

Parameters

Parameters	Description
sha	Pointer to CRYPT_SHA_CTX structure which holds the hash values.
digest	Pointer to byte array to store hash result.

Returns

BAD_FUNC_ARG - An invalid pointer was passed to the function, either in sha or digest. 0 - Otherwise.

Remarks

In order to preserve the validity of the SHA hash, nothing must modify the context holding variable between calls to [CRYPT_SHA_DataAdd](#) and [CRYPT_SHA_Finalize](#).

Example

```
CRYPT_SHA_CTX sha;  
uint8_t buffer[1024];  
uint8_t shaSum[SHA_DIGEST_SIZE];  
  
CRYPT_SHA_Initialize(&sha);  
CRYPT_SHA_DataAdd(&sha, buffer, sizeof(buffer));  
CRYPT_SHA_Finalize(&sha, shaSum);
```

5.3.7.6.3 CRYPT_SHA_Initialize Function

C

```
int CRYPT_SHA_Initialize(  
    CRYPT_SHA_CTX*  
);
```

Description

This function initializes the internal structures necessary for SHA hash calculations.

Preconditions

None.

Parameters

Parameters	Description
sha	Pointer to CRYPT_SHA_CTX structure which holds the hash values.

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- 0 - Otherwise.

Remarks

All SHA hashes have to start at a particular value before adding new data to it. This function sets the necessary values for the structure.

Example

```
CRYPT_SHA_CTX sha;
uint8_t shaSum[SHA_DIGEST_SIZE];

CRYPT_SHA_Initialize(&sha);
CRYPT_SHA_DataAdd(&sha, buffer, sizeof(buffer));
CRYPT_SHA_Finalize(&sha, shaSum);
```

5.3.7.7 Random Number Generator Functions

5.3.7.7.1 CRYPT_RNG_BlockGenerate Function

C

```
int CRYPT_RNG_BlockGenerate(
    CRYPT_RNG_CTX*,
    unsigned char*,
    unsigned int
);
```

Description

This function generates several random numbers and places them in the space allocated.

Preconditions

RNG context was initialized using the [CRYPT_RNG_Initialize](#) function.

Parameters

Parameters	Description
rng	Pointer to context which saves state between calls.
b	Pointer to buffer to store the random numbers.
sz	Number of 8-bit random numbers to generate.

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- 0 - Otherwise.

Example

```
#define RANDOM_BYTE_SZ 32

int ret;
CRYPT_RNG_CTX mcRng;
byte out[RANDOM_BYTE_SZ];

ret = CRYPT_RNG_Initialize(&mcRng);

ret = CRYPT_RNG_Get(&mcRng, &out[0]);
```

```
ret = CRYPT_RNG_BlockGenerate(&mcRng, out, RANDOM_BYTE_SZ);
```

5.3.7.7.2 CRYPT_RNG_Get Function

C

```
int CRYPT_RNG_Get(  
    CRYPT_RNG_CTX*,  
    unsigned char*  
);
```

Description

This function gets one random number from the random number generator.

Preconditions

RNG context was initialized using the [CRYPT_RNG_Initialize](#) function.

Parameters

Parameters	Description
rng	Pointer to context which saves state between calls.
b	Pointer to 8-bit location to store the result.

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- <0 - An error occurred.
- 0 or positive - Success.

Example

```
#define RANDOM_BYTE_SZ 32  
  
int      ret;  
CRYPT_RNG_CTX mcRng;  
byte      out[RANDOM_BYTE_SZ];  
  
ret = CRYPT_RNG_Initialize(&mcRng);  
  
ret = CRYPT_RNG_Get(&mcRng, &out[0]);  
  
ret = CRYPT_RNG_BlockGenerate(&mcRng, out, RANDOM_BYTE_SZ);
```

5.3.7.7.3 CRYPT_RNG_Initialize Function

C

```
int CRYPT_RNG_Initialize(  
    CRYPT_RNG_CTX*  
);
```

Description

This function initializes the context that stores information relative to random number generation.

Preconditions

None.

Parameters

Parameters	Description
rng	Pointer to random number generator context.

Returns

- negative - An error occurred setting up the random number generator.
- 0 - Otherwise.

Example

```
#define RANDOM_BYTE_SZ 32

int          ret;
CRYPT_RNG_CTX mcRng;
byte         out[RANDOM_BYTE_SZ];

ret = CRYPT_RNG_Initialize(&mcRng);

ret = CRYPT_RNG_Get(&mcRng, &out[0]);

ret = CRYPT_RNG_BlockGenerate(&mcRng, out, RANDOM_BYTE_SZ);
```

5.3.7.8 Compression Functions

5.3.7.8.1 CRYPT_HUFFMAN_Compress Function

C

```
int CRYPT_HUFFMAN_Compress(
    unsigned char*,
    unsigned int,
    const unsigned char*,
    unsigned int,
    unsigned int
);
```

Description

This function compresses a block of data using Huffman encoding.

Preconditions

None.

Parameters

Parameters	Description
out	Pointer to location to store the compressed data.
outSz	Maximum size of the output data in bytes.
in	Point to location of source data.
inSz	Size of the input data in bytes.
flags	Flags to control how compress operates

Returns

- negative - error code
- positive - bytes stored in out buffer

Remarks

Output buffer must be large enough to hold the contents of the operation.

Example

```
const unsigned char text[] = "...";
```

```
unsigned int inSz = sizeof(text);
unsigned int outSz;
unsigned char cBuffer[1024];

int ret;

ret = CRYPT_HUFFMAN_COMPRESS(cBuffer, sizeof(cBuffer), text, inSz, 0);
```

5.3.7.8.2 CRYPT_HUFFMAN_DeCompress Function

C

```
int CRYPT_HUFFMAN_DeCompress(
    unsigned char*,
    unsigned int,
    const unsigned char*,
    unsigned int
);
```

Description

This function decompresses a block of data using Huffman encoding.

Preconditions

None.

Parameters

Parameters	Description
out	Pointer to destination buffer
outSz	Size of destination buffer
in	Pointer to source buffer to decompress
inSz	Size of source buffer to decompress

Returns

- negative - Error code
- positive - Bytes stored in out buffer

Remarks

Output buffer must be large enough to hold the contents of the operation.

Example

```
unsigned char cBuffer[1024];
unsigned char dBuffer[1024];

int ret

ret = CRYPT_HUFFMAN_DeCompress(dBuffer, sizeof(dBuffer), cBuffer, msglen);
```

5.3.7.9 ECC Encryption/Decryption Functions

5.3.7.9.1 CRYPT_ECC_DHE_KeyMake Function

C

```
int CRYPT_ECC_DHE_KeyMake(
    CRYPT_ECC_CTX*,
    CRYPT_RNG_CTX*,
```

```
    int  
);
```

Parameters

Parameters	Description
Param1	Pointer to context which saves state between calls.
Param2	Param3 -
Param4	Param5 -

Returns

*BAD_FUNC_ARG - An invalid pointer was passed to the function. *0 - Otherwise.

Example

5.3.7.9.2 CRYPT_ECC_DHE_SharedSecretMake Function

C

```
int CRYPT_ECC_DHE_SharedSecretMake(  
    CRYPT_ECC_CTX*,  
    CRYPT_ECC_CTX*,  
    unsigned char*,  
    unsigned int,  
    unsigned int*  
);
```

Parameters

Parameters	Description
Param1	Pointer to context which saves state between calls.
Param2	Param3 -
Param4	Param5 -

Returns

*BAD_FUNC_ARG - An invalid pointer was passed to the function. *0 - Otherwise.

Example

5.3.7.9.3 CRYPT_ECC_DSA_HashSign Function

C

```
int CRYPT_ECC_DSA_HashSign(  
    CRYPT_ECC_CTX*,  
    CRYPT_RNG_CTX*,  
    unsigned char*,  
    unsigned int,  
    unsigned int*,  
    const unsigned char*,  
    unsigned int  
);
```

Parameters

Parameters	Description
Param1	Pointer to context which saves state between calls.
Param2	Param3 -
Param4	Param5 -

Returns

*BAD_FUNC_ARG - An invalid pointer was passed to the function. *0 - Otherwise.

Example

5.3.7.9.4 CRYPT_ECC_DSA_HashVerify Function

C

```
int CRYPT_ECC_DSA_HashVerify(  
    CRYPT_ECC_CTX*,  
    const unsigned char*,  
    unsigned int,  
    unsigned char*,  
    unsigned int,  
    int*  
);
```

Parameters

Parameters	Description
Param1	Pointer to context which saves state between calls.
Param2	Param3 -
Param4	Param5 -

Returns

*BAD_FUNC_ARG - An invalid pointer was passed to the function. *0 - Otherwise.

Example

5.3.7.9.5 CRYPT_ECC_Free Function

C

```
int CRYPT_ECC_Free(  
    CRYPT_ECC_CTX*  
);
```

Parameters

Parameters	Description
Param1	Pointer to context which saves state between calls.
Param2	Param3 -
Param4	Param5 -

Returns

*BAD_FUNC_ARG - An invalid pointer was passed to the function. *0 - Otherwise.

Example

5.3.7.9.6 CRYPT_ECC_Initialize Function

C

```
int CRYPT_ECC_Initialize(  
    CRYPT_ECC_CTX*  
);
```

Parameters

Parameters	Description
Param1	Pointer to context which saves state between calls.
Param2	Param3 -
Param4	Param5 -

Returns

*BAD_FUNC_ARG - An invalid pointer was passed to the function. *0 - Otherwise.

Example

5.3.7.9.7 CRYPT_ECC_KeySizeGet Function

C

```
int CRYPT_ECC_KeySizeGet(  
    CRYPT_ECC_CTX*  
);
```

Parameters

Parameters	Description
Param1	Pointer to context which saves state between calls.
Param2	Param3 -
Param4	Param5 -

Returns

*BAD_FUNC_ARG - An invalid pointer was passed to the function. *0 - Otherwise.

Example

5.3.7.9.8 CRYPT_ECC_PrivateImport Function

C

```
int CRYPT_ECC_PrivateImport(  
    CRYPT_ECC_CTX*,  
    const unsigned char*,  
    unsigned int,  
    const unsigned char*,  
    unsigned int  
);
```

Parameters

Parameters	Description
Param1	Pointer to context which saves state between calls.
Param2	Param3 -
Param4	Param5 -

Returns

*BAD_FUNC_ARG - An invalid pointer was passed to the function. *0 - Otherwise.

Example

5.3.7.9.9 CRYPT_ECC_PublicExport Function

C

```
int CRYPT_ECC_PublicExport(  
    CRYPT_ECC_CTX*,  
    unsigned char*,  
    unsigned int,  
    unsigned int*  
);
```

Parameters

Parameters	Description
Param1	Pointer to context which saves state between calls.
Param2	Param3 -
Param4	Param5 -

Returns

*BAD_FUNC_ARG - An invalid pointer was passed to the function. *0 - Otherwise.

Example

5.3.7.9.10 CRYPT_ECC_PublicImport Function

C

```
int CRYPT_ECC_PublicImport(  
    CRYPT_ECC_CTX*,  
    const unsigned char*,  
    unsigned int  
);
```

Parameters

Parameters	Description
Param1	Pointer to context which saves state between calls.
Param2	Param3 -
Param4	Param5 -

Returns

*BAD_FUNC_ARG - An invalid pointer was passed to the function. *0 - Otherwise.

Example

5.3.7.9.11 CRYPT_ECC_SignatureSizeGet Function

C

```
int CRYPT_ECC_SignatureSizeGet(  
    CRYPT_ECC_CTX*  
);
```

Parameters

Parameters	Description
Param1	Pointer to context which saves state between calls.
Param2	Param3 -

Param4	Param5 -

Returns

*BAD_FUNC_ARG - An invalid pointer was passed to the function. *0 - Otherwise.

Example

5.3.7.10 Triple DES (3DES) Encryption/Decryption Functions

5.3.7.10.1 CRYPT_TDES_CBC_Decrypt Function

C

```
int CRYPT_TDES_CBC_Decrypt(  
    CRYPT_TDES_CTX*,  
    unsigned char*,  
    const unsigned char*,  
    unsigned int  
);
```

Description

This function decrypts a block of data using a Triple DES algorithm.

Preconditions

The context tdes must be set earlier using [CRYPT_TDES_KeySet](#). The input block must be a multiple of 8 bytes long.

Parameters

Parameters	Description
tdes	Pointer to context which saves state between calls.
out	Pointer to output buffer to store the results.
in	Pointer to input buffer for the source of the data.
inSz	Size of the input data buffer.

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- 0 - Otherwise.

Remarks

Input data must have a length a multiple of 8 bytes. Output data will be zero-padded at the end if the original data was not a multiple of 8 bytes long.

Example

```
CRYPT_TDES_CTX mcDes3;  
int ret;  
byte out1[TDES_SIZE];  
byte out2[TDES_SIZE];  
  
strncpy((char*)key, "1234567890abcdefghijklmnopqrstuvwxyz", 24);  
strncpy((char*)iv, "12345678", 8);  
  
ret = CRYPT_TDES_KeySet(&mcDes3, key, iv, CRYPT_TDES_ENCRYPTION);  
  
ret = CRYPT_TDES_CBC_Encrypt(&mcDes3, out1, ourData, TDES_SIZE);  
  
ret = CRYPT_TDES_KeySet(&mcDes3, key, iv, CRYPT_TDES_DECRYPTION);
```

```
ret = CRYPT_TDES_CBC_Decrypt(&mcDes3, out2, out1, TDES_TEST_SIZE);
```

5.3.7.10.2 CRYPT_TDES_CBC_Encrypt Function

C

```
int CRYPT_TDES_CBC_Encrypt(
    CRYPT_TDES_CTX*,
    unsigned char*,
    const unsigned char*,
    unsigned int
);
```

Description

This function encrypts a block of data using a Triple DES algorithm.

Preconditions

The context tdes must be set earlier using [CRYPT_TDES_KeySet](#). The input block must be a multiple of 8 bytes long.

Parameters

Parameters	Description
tdes	Pointer to context which saves state between calls.
out	Pointer to output buffer to store the results.
in	Pointer to input buffer for the source of the data.
inSz	Size of the input data buffer.

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- 0 - Otherwise.

Remarks

The input data must be padded at the end with zeros to make the length a multiple of 8.

Example

```
CRYPT_TDES_CTX mcDes3;
int ret;
byte out1[TDES_SIZE];
byte out2[TDES_SIZE];

strncpy((char*)key, "1234567890abcdefghijklmnopqrstuvwxyz", 24);
strncpy((char*)iv, "12345678", 8);

ret = CRYPT_TDES_KeySet(&mcDes3, key, iv, CRYPT_TDES_ENCRYPTION);
ret = CRYPT_TDES_CBC_Encrypt(&mcDes3, out1, ourData, TDES_SIZE);
ret = CRYPT_TDES_KeySet(&mcDes3, key, iv, CRYPT_TDES_DECRYPTION);
ret = CRYPT_TDES_CBC_Decrypt(&mcDes3, out2, out1, TDES_TEST_SIZE);
```

5.3.7.10.3 CRYPT_TDES_IvSet Function

C

```
int CRYPT_TDES_IvSet(
    CRYPT_TDES_CTX*,
    const unsigned char*
);
```

Description

This function changes the IV of a TDES context, but leaves the Key alone.

Preconditions

None.

Parameters

Parameters	Description
tdes	Pointer to context which saves state between calls.
iv	Pointer to buffer holding the initialization vector. Must be 8 bytes in size.

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- 0 - Otherwise.

Remarks

The IV must be 8 bytes long.

Example

```
CRYPT_TDES_CTX mcDes3;
int          ret;
byte         out1[TDES_SIZE];
byte         out2[TDES_SIZE];

strncpy((char*)key, "1234567890abcdefghijklmnopqrstuvwxyz", 24);
strncpy((char*)iv, "12345678", 8);

ret = CRYPT_TDES_KeySet(&mcDes3, key, iv, CRYPT_TDES_ENCRYPTION);
ret = CRYPT_TDES_IvSet(&mcDes3, iv);
ret = CRYPT_TDES_CBC_Encrypt(&mcDes3, out1, ourData, TDES_SIZE);
ret = CRYPT_TDES_KeySet(&mcDes3, key, iv, CRYPT_TDES_DECRYPTION);
ret = CRYPT_TDES_CBC_Decrypt(&mcDes3, out2, out1, TDES_TEST_SIZE);
```

5.3.7.10.4 CRYPT_TDES_KeySet Function

C

```
int CRYPT_TDES_KeySet(
    CRYPT_TDES_CTX*,
    const unsigned char*,
    const unsigned char*,
    int
);
```

Description

This function sets the key and initialization vector (IV) for a set of Triple-DES operations.

Preconditions

None.

Parameters

Parameters	Description
tdes	Pointer to context which saves state between calls.

key	Pointer to buffer holding the key. Must be 24 bytes in size.
iv	Pointer to buffer holding the initialization vector. Must be 8 bytes in size.

5.3.7.11 RSA Encryption/Decryption Functions

5.3.7.11.1 CRYPT_RSA_EncryptSizeGet Function

C

```
int CRYPT_RSA_EncryptSizeGet(  
    CRYPT_RSA_CTX*  
);
```

Parameters

Parameters	Description
Param1	Pointer to context which saves state between calls.
Param2	Param3 -
Param4	Param5 -

Returns

*BAD_FUNC_ARG - An invalid pointer was passed to the function. *0 - Otherwise.

Example

5.3.7.11.2 CRYPT_RSA_Free Function

C

```
int CRYPT_RSA_Free(  
    CRYPT_RSA_CTX*  
);
```

Parameters

Parameters	Description
Param1	Pointer to context which saves state between calls.
Param2	Param3 -
Param4	Param5 -

Returns

*BAD_FUNC_ARG - An invalid pointer was passed to the function. *0 - Otherwise.

Example

5.3.7.11.3 CRYPT_RSA_Initialize Function

C

```
int CRYPT_RSA_Initialize(  
    CRYPT_RSA_CTX*  
);
```

Parameters

Parameters	Description
Param1	Pointer to context which saves state between calls.
Param2	Param3 -
Param4	Param5 -

Returns

*BAD_FUNC_ARG - An invalid pointer was passed to the function. *0 - Otherwise.

Example**5.3.7.11.4 CRYPT_RSA_PrivateDecrypt Function****C**

```
int CRYPT_RSA_PrivateDecrypt(  
    CRYPT_RSA_CTX*,  
    unsigned char*,  
    unsigned int,  
    const unsigned char*,  
    unsigned int  
);
```

Parameters

Parameters	Description
Param1	Pointer to context which saves state between calls.
Param2	Param3 -
Param4	Param5 -

Returns

*BAD_FUNC_ARG - An invalid pointer was passed to the function. *0 - Otherwise.

Example**5.3.7.11.5 CRYPT_RSA_PrivateKeyDecode Function****C**

```
int CRYPT_RSA_PrivateKeyDecode(  
    CRYPT_RSA_CTX*,  
    const unsigned char*,  
    unsigned int  
);
```

Parameters

Parameters	Description
Param1	Pointer to context which saves state between calls.
Param2	Param3 -
Param4	Param5 -

Returns

*BAD_FUNC_ARG - An invalid pointer was passed to the function. *0 - Otherwise.

Example

5.3.7.11.6 CRYPT_RSA_PublicEncrypt Function

C

```
int CRYPT_RSA_PublicEncrypt(  
    CRYPT_RSA_CTX*,  
    unsigned char*,  
    unsigned int,  
    const unsigned char*,  
    unsigned int,  
    CRYPT_RNG_CTX*  
);
```

Parameters

Parameters	Description
Param1	Pointer to context which saves state between calls.
Param2	Param3 -
Param4	Param5 -

Returns

*BAD_FUNC_ARG - An invalid pointer was passed to the function. *0 - Otherwise.

Example

5.3.7.11.7 CRYPT_RSA_PublicKeyDecode Function

C

```
int CRYPT_RSA_PublicKeyDecode(  
    CRYPT_RSA_CTX*,  
    const unsigned char*,  
    unsigned int  
);
```

Parameters

Parameters	Description
Param1	Pointer to context which saves state between calls.
Param2	Param3 -
Param4	Param5 -

Returns

*BAD_FUNC_ARG - An invalid pointer was passed to the function. *0 - Otherwise.

Example

5.3.7.12 AES Encryption/Decryption Functions

5.3.7.12.1 CRYPT_AES_CBC_Decrypt Function

C

```
int CRYPT_AES_CBC_Decrypt(  
    CRYPT_AES_CTX*,  
    unsigned char*,  
    const unsigned char*,  

```

```
    unsigned int  
);
```

Parameters

Parameters	Description
Param1	Pointer to context which saves state between calls.
Param2	Param3 -
Param4	Param5 -

Returns

*BAD_FUNC_ARG - An invalid pointer was passed to the function. *0 - Otherwise.

Example

5.3.7.12.2 CRYPT_AES_CBC_Encrypt Function

C

```
int CRYPT_AES_CBC_Encrypt(  
    CRYPT_AES_CTX*,  
    unsigned char*,  
    const unsigned char*,  
    unsigned int  
);
```

Parameters

Parameters	Description
Param1	Pointer to context which saves state between calls.
Param2	Param3 -
Param4	Param5 -

Returns

*BAD_FUNC_ARG - An invalid pointer was passed to the function. *0 - Otherwise.

Example

5.3.7.12.3 CRYPT_AES_CTR_Encrypt Function

C

```
int CRYPT_AES_CTR_Encrypt(  
    CRYPT_AES_CTX*,  
    unsigned char*,  
    const unsigned char*,  
    unsigned int  
);
```

Parameters

Parameters	Description
Param1	Pointer to context which saves state between calls.
Param2	Param3 -
Param4	Param5 -

Returns

*BAD_FUNC_ARG - An invalid pointer was passed to the function. *0 - Otherwise.

Remarks

ctr (counter), use Encrypt both ways with ENCRYPT key setup

Example

5.3.7.12.4 CRYPT_AES_DIRECT_Decrypt Function

C

```
int CRYPT_AES_DIRECT_Decrypt(  
    CRYPT_AES_CTX*,  
    unsigned char*,  
    const unsigned char*  
);
```

Parameters

Parameters	Description
Param1	Pointer to context which saves state between calls.
Param2	Param3 -
Param4	Param5 -

Returns

*BAD_FUNC_ARG - An invalid pointer was passed to the function. *0 - Otherwise.

Example

5.3.7.12.5 CRYPT_AES_DIRECT_Encrypt Function

C

```
int CRYPT_AES_DIRECT_Encrypt(  
    CRYPT_AES_CTX*,  
    unsigned char*,  
    const unsigned char*  
);
```

Parameters

Parameters	Description
Param1	Pointer to context which saves state between calls.
Param2	Param3 -
Param4	Param5 -

Returns

*BAD_FUNC_ARG - An invalid pointer was passed to the function. *0 - Otherwise.

Example

5.3.7.12.6 CRYPT_AES_IvSet Function

C

```
int CRYPT_AES_IvSet(  
    CRYPT_AES_CTX*,  
    const unsigned char*  
);
```

Parameters

Parameters	Description
Param1	Pointer to context which saves state between calls.
Param2	Param3 -
Param4	Param5 -

Returns

*BAD_FUNC_ARG - An invalid pointer was passed to the function. *0 - Otherwise.

Example

5.3.7.12.7 CRYPT_AES_KeySet Function

C

```
int CRYPT_AES_KeySet(  
    CRYPT_AES_CTX*,  
    const unsigned char*,  
    unsigned int,  
    const unsigned char*,  
    int  
);
```

Parameters

Parameters	Description
aes	Pointer to context which saves state between calls.
key	keyLen -
iv	dir -

Returns

*BAD_FUNC_ARG - An invalid pointer was passed to the function. *0 - Otherwise.

Example

5.3.7.13 MD5 Functions

5.3.7.13.1 CRYPT_MD5_DataAdd Function

C

```
int CRYPT_MD5_DataAdd(  
    CRYPT_MD5_CTX*,  
    const unsigned char*,  
    unsigned int  
);
```

Description

This function updates the hash with the data provided.

Preconditions

The MD5 context must be initialized prior to the first call of this function. The context must not be modified by code outside of this function.

Parameters

Parameters	Description
md5	Pointer to CRYPT_MD5_CTX strucure which holds the hash values.
input	Pointer to the data to use to update the hash.
sz	Size of the data (in bytes) of the data to use to update the hash.

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function, either in md5 or input.
- 0 - Otherwise.

Remarks

In order to preserve the validity of the MD5 hash, nothing must modify the context holding variable between calls to [CRYPT_MD5_DataAdd](#).

Example

```
CRYPT_MD5_CTX md5;
uint8_t buffer[1024];
uint8_t md5sum[MD5_DIGEST_SIZE];

CRYPT_MD5_Initialize(&md5);
CRYPT_MD5_DataAdd(&md5, buffer, sizeof(buffer));
CRYPT_MD5_Finalize(&md5, md5sum);
```

5.3.7.13.2 CRYPT_MD5_Finalize Function

C

```
int CRYPT_MD5_Finalize(
    CRYPT_MD5_CTX*,
    unsigned char*
);
```

Description

This function finalizes the hash and puts the result into digest.

Preconditions

The MD5 context must be initialized prior to calling this function. The context must not be modified by code outside of this function.

Parameters

Parameters	Description
md5	Pointer to CRYPT_MD5_CTX strucure which holds the hash values.
digest	Pointer to byte array to store hash result.

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function, either in md5 or digest.
- 0 - Otherwise.

Remarks

In order to preserve the validity of the MD5 hash, nothing must modify the context holding variable between calls to [CRYPT_MD5_DataAdd](#) and [CRYPT_MD5_Finalize](#).

Example

```
CRYPT_MD5_CTX md5;
```

```
uint8_t buffer[1024];
uint8_t md5sum[MD5_DIGEST_SIZE];

CRYPT_MD5_Initialize(&md5);
CRYPT_MD5_DataAdd(&md5, buffer, sizeof(buffer));
CRYPT_MD5_Finalize(&md5, md5sum);
```

5.3.7.13.3 CRYPT_MD5_Initialize Function

C

```
int CRYPT_MD5_Initialize(
    CRYPT_MD5_CTX* md5
);
```

Description

This function initializes the internal structures necessary for MD5 hash calculations.

Preconditions

None.

Parameters

Parameters	Description
md5	Pointer to CRYPT_MD5_CTX structure which holds the hash values.

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- 0 - Otherwise.

Remarks

All MD5 hashes have to start at a particular value before adding new data to it. This function sets the necessary values for the structure.

Example

```
CRYPT_MD5_CTX md5;
uint8_t buffer[1024];
uint8_t md5sum[MD5_DIGEST_SIZE];

CRYPT_MD5_Initialize(&md5);
CRYPT_MD5_DataAdd(&md5, buffer, sizeof(buffer));
CRYPT_MD5_Finalize(&md5, md5sum);
```

5.3.7.14 Data Types and Constants

5.3.7.14.1 CRYPT_AES_CTX Structure

C

```
struct CRYPT_AES_CTX {
    int holder[69];
};
```

Description

    int holder[100];  
};
```

Description

TDES

Members

Members	Description
int holder[100];	big enough to hold internal, but check on init

5.3.7.14.12 MC_CRYPT_API_H Macro**C**

```
#define MC_CRYPT_API_H
```

Description

Defines Microchip CRYPTO API layer

5.3.8 Files**Files**

Name	Description
crypto.h	Crypto Framework Library header for cryptographic functions.

Description

5.3.8.1 crypto.h

Crypto Framework Library Header

This header file contains function prototypes and definitions of the data types and constants that make up the Cryptographic Framework Library for PIC32 families of Microchip microcontrollers.

Functions

	Name	Description
≡	CRYPT_AES_CBC_Decrypt	
≡	CRYPT_AES_CBC_Encrypt	
≡	CRYPT_AES_CTR_Encrypt	
≡	CRYPT_AES_DIRECT_Decrypt	Direct encryption of one block of data.
≡	CRYPT_AES_DIRECT_Encrypt	Direct encryption of one block of data.
≡	CRYPT_AES_IvSet	
≡	CRYPT_AES_KeySet	
≡	CRYPT_ECC_DHE_KeyMake	
≡	CRYPT_ECC_DHE_SharedSecretMake	
≡	CRYPT_ECC_DSA_HashSign	
≡	CRYPT_ECC_DSA_HashVerify	
≡	CRYPT_ECC_Free	
≡	CRYPT_ECC_Initialize	
≡	CRYPT_ECC_KeySizeGet	
≡	CRYPT_ECC_PrivateImport	
≡	CRYPT_ECC_PublicExport	
≡	CRYPT_ECC_PublicImport	
≡	CRYPT_ECC_SignatureSizeGet	
≡	CRYPT_ERROR_StringGet	
≡	CRYPT_HMAC_DataAdd	Add data to the HMAC calculation.
≡	CRYPT_HMAC_Finalize	Complete the HMAC calculation and get the results.
≡	CRYPT_HMAC_SetKey	Initialize the HMAC context and set the key for the hash.
≡	CRYPT_HUFFMAN_Compress	Compress a block of data.
≡	CRYPT_HUFFMAN_DeCompress	Decompress a block of data.
≡	CRYPT_MD5_DataAdd	Updates the hash with the data provided.
≡	CRYPT_MD5_Finalize	Finalizes the hash and puts the result into digest.
≡	CRYPT_MD5_Initialize	Initializes the internal structures necessary for MD5 hash calculations.
≡	CRYPT_RNG_BlockGenerate	Create several random numbers.
≡	CRYPT_RNG_Get	Get one random number.
≡	CRYPT_RNG_Initialize	Initialize random number generator.
≡	CRYPT_RSA_EncryptSizeGet	
≡	CRYPT_RSA_Free	
≡	CRYPT_RSA_Initialize	
≡	CRYPT_RSA_PrivateDecrypt	
≡	CRYPT_RSA_PrivateKeyDecode	
≡	CRYPT_RSA_PublicEncrypt	

	CRYPT_RSA_PublicKeyDecode	
	CRYPT_SHA_DataAdd	Updates the hash with the data provided.
	CRYPT_SHA_Finalize	Finalizes the hash and puts the result into digest.
	CRYPT_SHA_Initialize	Initializes the internal structures necessary for SHA hash calculations.
	CRYPT_SHA256_DataAdd	Updates the hash with the data provided.
	CRYPT_SHA256_Finalize	Finalizes the hash and puts the result into digest.
	CRYPT_SHA256_Initialize	Initializes the internal structures necessary for SHA256 hash calculations.
	CRYPT_SHA384_DataAdd	Updates the hash with the data provided.
	CRYPT_SHA384_Finalize	Finalizes the hash and puts the result into digest.
	CRYPT_SHA384_Initialize	Initializes the internal structures necessary for SHA384 hash calculations.
	CRYPT_SHA512_DataAdd	Updates the hash with the data provided.
	CRYPT_SHA512_Finalize	Finalizes the hash and puts the result into digest.
	CRYPT_SHA512_Initialize	Initializes the internal structures necessary for SHA512 hash calculations.
	CRYPT_TDES_CBC_Decrypt	Decrypt a data block using Triple DES.
	CRYPT_TDES_CBC_Encrypt	Encrypt a data block using Triple DES.
	CRYPT_TDES_IvSet	Set the Initialization Vector (IV) for a Triple DES operation.
	CRYPT_TDES_KeySet	Initialization of Triple DES context.

5.4 Math Library Help

5.4.1 DSP Fixed-Point Library

5.4.1.1 Introduction

DSP Fixed-Point Library

for

Microchip Microcontrollers

The DSP Fixed-Point Library is available for the PIC32MZ family of microcontrollers. This library was created from optimized assembly routines written specifically for the microAptiv™ core.

Description

The DSP Fixed-Point Library contains building block functions for developing digital signal processing algorithms. The library supports the Q15 and Q31 fractional data formats. The functions are implemented in efficient assembly specifically targeted at the DSP extensions in this core family. The library makes these functions available in a simple C-callable structure.

Functions included in the DSP Fixed-Point Library include complex math, vector math, matrix math, digital filters, and transforms. In many cases, these functions require specific data structures to operate, which are detailed in the header file and examples.

5.4.1.2 Release Notes

MPLAB Harmony Version: v0.70b **DSP Fixed-Point Library Version :** 1.0 **Release Date:** 18Nov2013

New This Release:

- 98 functions:
 - Vector math
 - Complex math
 - Transforms
 - Digital Filters
 - Matrix math
- 16-bit and 32-bit fixed-point integer functions
- Optimized in high performance assembly

Known Issues:

- Optimized for PIC32MZ microAptiv™ core only
- Will not function with `_Fract` data type

5.4.1.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.4.1.4 Using the Library

This topic describes the basic architecture of the DSP Fixed-Point Library and provides information and examples on how to use it.

Interface Header File: [dsp.h](#), [libq.h](#)

The interface to the DSP Fixed-Point library is defined in the "[dsp.h](#)" header file. Any C language source (.c) file that uses the DSP Fixed-Point library must include "[dsp.h](#)".

Some functions make special use of the optimized fixed-point math library [libq.h](#). For use of those functions, the [libq.h](#) file must also be included in a project. The [libq.h](#) file is also installed with MPLAB Harmony. Specific notes within each function will describe if the function is dependent on the libq library.

Library File: [dsp.a](#), [libq.a](#)

The DSP Fixed-Point library archive (.a) file installed with MPLAB Harmony.

This library is only available in binary form, with prototypes for each function described in the [dsp.h](#) file.

In the case of functions that are supported by libq, the fixed-point math function library, the [libq.a](#) library must also be installed. This library is also available in binary form and is installed with MPLAB Harmony.

5.4.1.4.1 Library Overview

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the DSP Fixed-Point Library.

Library Interface Section	Description
Complex Math Functions	General mathematical operations using a complex structure with the form (a + bi)
Vector Math Functions	Mathematical operations on a array of numbers or vector
Matrix Math Functions	Mathematical operations on a matrix
Digital Filtering Functions	FIR and IIR filtering functions with various architectures
Digital Transform Functions	FFT, Windows and related transform elements
Support Functions	Quick support functions for numerical transform

The DSP Fixed-Point Library uses fixed-point fractional functions to optimize execution speed. These functions limit the accuracy of the calculations to the bits specified for the function. Due to parallelism in some operations, the 16-bit version of the functions are more efficient than their 32-bit counterparts. In many cases both 16-bit and 32-bit functions are available to give the user the choice of balance between speed and functional resolution.

Fractional representation of a real number is given by:

$Qn.m$

where:

- n is the number of data bits to the left of the radix point
- m is the number of data bits to the right of the radix point
- a signed bit is implied, and takes one bit of resolution
- Shorthand may eliminate the leading 0, such as in Q0.15, which may be shortened to Q15, and similarly Q0.31, which is shortened to Q31

$Qn.m$ numerical values are used by the library processing data as integers. In this format the n represents the number of integer bits, and the m represents the number of fractional bits. All values assume a sign bit in the most significant bit. Therefore, the range of the numerical value is:

$$-2^{(n-1)} \text{ to } [2^{(n-1)} - 2^{(-m)}]; \text{ with a resolution of } 2^{(-m)}.$$

A Q16 format number (Q15.16) would range from -32768.0 (0x8000 0000) to 32767.99998474 with a precision of 0.000015259 (or 2^{-16}).

For example, a numerical representation of the number 3.14159 in Q2.13 notation would be:

$$3.14159 * 2^{13} = 25735.9 \Rightarrow 0x6488$$

And converting from the Q7.8 format with the value 0x1D89 would be:

$$0x1D89 / 2^8 = 7561 / 256 \Rightarrow 29.5316, \text{ accurate to } 0.00391$$

A majority of the DSP Fixed-Point Library uses functions with variables in Q15 or Q31 format. Representations of these numbers are given in the Types section of this document, and generally are `int16_t` (for Q15 fractional representation) and `int32_t` (for Q31 fractional representation). This limits the equivalent numerical range to roughly -1.0 to 0.999999999. It is possible to represent other number ranges, but scaling before and after the function call are necessary.

All library functions will saturate the output if the value exceeds the maximum or is lower than the minimum allowable value for that resolution. Some pre-scaling may be necessary to prevent unwanted saturation in functions that may otherwise create calculation errors.

5.4.1.4.2 Table of Library Functions

Family	Function	Definition
Complex Math	Addition	DSP_ComplexAdd32
	Conjugate	DSP_ComplexConj32
	Dot Product	DSP_ComplexDotProd32
	Multiplication	DSP_ComplexMult32
	Scalar Multiplication	DSP_ComplexScalarMult32
	Subtraction	DSP_ComplexSub32
Digital Filter	FIR	DSP_FilterFIR32
	FIR Decimation	DSP_FilterFIRDecim32
	FIR Interpolation	DSP_FilterFIRInterp32
	FIR LMS	DSP_FilterLMS16
	IIR	DSP_FilterIIR16 ; DSP_FilterIIRSetup16
	IIR Biquad	DSP_FilterIIRBQ16 ; DSP_FilterIIRBQ16_fast ; DSP_FilterIIRBQ32
	IIR Biquad Cascade	DSP_FilterIIRBQ16_cascade8 ; DSP_FilterIIRBQ16_cascade8_fast
	IIR Biquad Parallel	DSP_FilterIIRBQ16_parallel8 ; DSP_FilterIIRBQ16_parallel8_fast
Matrix Math	Addition	DSP_MatrixAdd32
	Equality	DSP_MatrixEqual32
	Initialization	DSP_MatrixInit32
	Multiplication	DSP_MatrixMul32
	Scale	DSP_MatrixScale32
	Subtraction	DSP_MatrixSub32
	Transpose	DSP_MatrixTranspose32
Transform	FFT	DSP_TransformFFT16 ; DSP_TransformFFT32
	Setup factors	DSP_TransformFFT16_setup ; DSP_TransformFFT32_setup
	inverse FFT	DSP_TransformIFFT16
	Windows	DSP_TransformWindow_Bart16 ; DSP_TransformWindow_Bart32 ; DSP_TransformWindow_Black16 ; DSP_TransformWindow_Black32 ; DSP_TransformWindow_Cosine16 ; DSP_TransformWindow_Cosine32 ; DSP_TransformWindow_Hamm16 ; DSP_TransformWindow_Hamm32 ; DSP_TransformWindow_Hann16 ; DSP_TransformWindow_Hann32 ; DSP_TransformWindow_Kaiser16 ; DSP_TransformWindow_Kaiser32 ;
	Window Initialization	DSP_TransformWinInit_Bart16 ; DSP_TransformWinInit_Bart32 ; DSP_TransformWinInit_Black16 ; DSP_TransformWinInit_Black32 ; DSP_TransformWinInit_Cosine16 ; DSP_TransformWinInit_Cosine32 ; DSP_TransformWinInit_Hamm16 ; DSP_TransformWinInit_Hamm32 ; DSP_TransformWinInit_Hann16 ; DSP_TransformWinInit_Hann32 ; DSP_TransformWinInit_Kaiser16 ; DSP_TransformWinInit_Kaiser32
Vector Math	Absolute value	DSP_VectorAbs16 ; DSP_VectorAbs32

	Addition	DSP_VectorAdd16 ; DSP_VectorAdd32
	Addition w/ constant	DSP_VectorAddc16 ; DSP_VectorAddc32
	Binary exponent	DSP_VectorBexp16 ; DSP_VectorBexp32
	Log, Exponent, Square root	DSP_VectorExp ; DSP_VectorLog10 ; DSP_VectorLog2 ; DSP_VectorLn ; DSP_VectorSqrt ;
	Multiplication & Division	DSP_VectorMul16 ; DSP_VectorMul32 ; DSP_VectorDotp16 ; DSP_VectorDotp32 ; DSP_VectorMulc16 ; DSP_VectorMulc32 ; DSP_VectorDivC ; DSP_VectorRecip
	Subtraction	DSP_VectorSub16 ; DSP_VectorSub32
	Power (sum of squares)	DSP_VectorSumSquares16 ; DSP_VectorSumSquares32
	Equality check	DSP_VectorChkEqu32
	Maximum	DSP_VectorMax32 ; DSP_VectorMaxIndex32
	Minimum	DSP_VectorMin32 ; DSP_VectorMinIndex32
	Copy & Fill	DSP_VectorCopy ; DSP_VectorFill ; DSP_VectorZeroPad
	Shift	DSP_VectorShift ; DSP_VectorCopyReverse32
	Negate	DSP_VectorNegate
	Statistics	DSP_VectorAutocorr16 ; DSP_VectorMean32 ; DSP_VectorRMS16 ; DSP_VectorStdDev16 ; DSP_VectorVari16 ; DSP_VectorVariance

5.4.1.5 Library Interface

Data Types and Constants

	Name	Description
	biquad16	Q15 biquad
	int16c	Q15 complex number (a + bi)
	int32c	Q31 complex number (a + bi)
	matrix32	Q31 matrix
	PARM_EQUAL_FILTER	IIR BQ filter structure Q15 data, Q31 storage
	PARM_EQUAL_FILTER_16	IIR BQ filter structure Q15
	PARM_EQUAL_FILTER_32	IIR BQ filter structure Q31
	PARM_FILTER_GAIN	filter gain structure
	_PARM_EQUAL_FILTER	IIR BQ filter structure Q15 data, Q31 storage
	_PARM_EQUAL_FILTER_16	IIR BQ filter structure Q15
	_PARM_EQUAL_FILTER_32	IIR BQ filter structure Q31
	MAX16	maximum Q15
	MAX32	maximum Q31
	MIN16	minimum Q15
	MIN32	minimum Q31

Complex Math Functions

	Name	Description
≡	DSP_ComplexAdd32	Calculates the sum of two complex numbers.
≡	DSP_ComplexConj16	Calculates the complex conjugate of a complex number.
≡	DSP_ComplexConj32	Calculates the complex conjugate of a complex number.
≡	DSP_ComplexDotProd32	Calculates the dot product of two complex numbers.
≡	DSP_ComplexMult32	Multiplies two complex numbers.
≡	DSP_ComplexScalarMult32	Multiplies a complex number and a scalar number.
≡	DSP_ComplexSub32	Calculates the difference of two complex numbers.

Digital Filter Functions

	Name	Description
≡	DSP_FilterFIR32	Performs a Finite Impulse Response filter on a vector.
≡	DSP_FilterFIRDecim32	Performs a decimating FIR filter on the input array.
≡	DSP_FilterFIRInterp32	Performs an interpolating FIR filter on the input array.
≡	DSP_FilterIIR16	Performs a single-sample cascaded biquad Infinite Impulse Response (IIR) filter.
≡	DSP_FilterIIRBQ16	Performs a single-pass IIR Biquad Filter.
≡	DSP_FilterIIRBQ16_cascade8	Performs a single IIR Biquad Filter as a cascade of 8 series filters.
≡	DSP_FilterIIRBQ16_cascade8_fast	Performs a single IIR Biquad Filter as a cascade of 8 series filters.
≡	DSP_FilterIIRBQ16_fast	Performs a single-pass IIR Biquad Filter.
≡	DSP_FilterIIRBQ16_parallel8	Performs a 8 parallel single-pass IIR Biquad Filters, and sums the result.
≡	DSP_FilterIIRBQ16_parallel8_fast	Performs a 8 parallel single-pass IIR Biquad Filters, and sums the result.
≡	DSP_FilterIIRBQ32	Performs a high resolution single-pass IIR Biquad Filter.
≡	DSP_FilterIIRSetup16	Converts biquad structure to coeffs array to set up IIR filter.
≡	DSP_FilterLMS16	Performs a single sample Least Mean Squares FIR Filter.

Matrix Math Functions

	Name	Description
≡	DSP_MatrixAdd32	Addition of two matrices $C = (A + B)$.
≡	DSP_MatrixEqual32	Equality of two matrices $C = (A)$.
≡	DSP_MatrixInit32	Initializes the first N elements of a Matrix to the value num.
≡	DSP_MatrixMul32	Multiplication of two matrices $C = A \times B$.
≡	DSP_MatrixScale32	Scales each element of an input buffer (matrix) by a fixed number.
≡	DSP_MatrixSub32	Subtraction of two matrices $C = (A - B)$.
≡	DSP_MatrixTranspose32	Transpose of a Matrix $C = A (T)$.

Support Functions

	Name	Description
≡	mul16	multiply and shift integer
≡	mul16r	multiply and shift Q15
≡	mul32	multiply and shift Q31
≡	SAT16	saturate both positive and negative Q15
≡	SAT16N	saturate negative Q15
≡	SAT16P	saturate positive Q15

Transform Functions

	Name	Description
	DSP_TransformFFT16	Creates an Fast Fourier Transform (FFT) from a time domain input.
	DSP_TransformFFT16_setup	Creates FFT coefficients for use in the FFT16 function.
	DSP_TransformFFT32	Creates an Fast Fourier Transform (FFT) from a time domain input.
	DSP_TransformFFT32_setup	Creates FFT coefficients for use in the FFT32 function.
	DSP_TransformIFFT16	Creates an Inverse Fast Fourier Transform (FFT) from a frequency domain input.
	DSP_TransformWindow_Bart16	Perform a Bartlett window on a vector.
	DSP_TransformWindow_Bart32	Perform a Bartlett window on a vector.
	DSP_TransformWindow_Black16	Perform a Blackman window on a vector.
	DSP_TransformWindow_Black32	Perform a Blackman window on a vector.
	DSP_TransformWindow_Cosine16	Perform a Cosine (Sine) window on a vector.
	DSP_TransformWindow_Cosine32	Perform a Cosine (Sine) window on a vector.
	DSP_TransformWindow_Hamm16	Perform a Hamming window on a vector.
	DSP_TransformWindow_Hamm32	Perform a Hamming window on a vector.
	DSP_TransformWindow_Hann16	Perform a Hanning window on a vector.
	DSP_TransformWindow_Hann32	Perform a Hanning window on a vector.
	DSP_TransformWindow_Kaiser16	Perform a Kaiser window on a vector.
	DSP_TransformWindow_Kaiser32	Perform a Kaiser window on a vector.
	DSP_TransformWinInit_Bart16	Create a Bartlett window.
	DSP_TransformWinInit_Bart32	Create a Bartlett window.
	DSP_TransformWinInit_Black16	Create a Blackman window.
	DSP_TransformWinInit_Black32	Create a Blackman window.
	DSP_TransformWinInit_Cosine16	Create a Cosine (Sine) window.
	DSP_TransformWinInit_Cosine32	Create a Cosine (Sine) window.
	DSP_TransformWinInit_Hamm16	Create a Hamming window.
	DSP_TransformWinInit_Hamm32	Create a Hamming window.
	DSP_TransformWinInit_Hann16	Create a Hanning window.
	DSP_TransformWinInit_Hann32	Create a Hanning window.
	DSP_TransformWinInit_Kaiser16	Create a Kaiser window.
	DSP_TransformWinInit_Kaiser32	Create a Kaiser window.

Vector Math Functions

	Name	Description
	DSP_VectorAbs16	Calculate the absolute value of a vector.
	DSP_VectorAbs32	Calculate the absolute value of a vector.
	DSP_VectorAdd16	Calculate the sum of two vectors.
	DSP_VectorAdd32	Calculate the sum of two vectors.
	DSP_VectorAddc16	Calculate the sum of two vectors.
	DSP_VectorAddc32	Calculate the sum of two vectors.
	DSP_VectorAutocorr16	Computes the Autocorrelation of a Vector.
	DSP_VectorBexp16	Computes the maximum binary exponent of a vector.
	DSP_VectorBexp32	Computes the maximum binary exponent of a vector.
	DSP_VectorChkEqu32	Compares two input vectors, returns an integer '1' if equal, and '0' if not equal.

	DSP_VectorCopy	Copies the elements of one vector to another.
	DSP_VectorCopyReverse32	Reverses the order of elements in one vector and copies them into another.
	DSP_VectorDivC	Divides the first N elements of inVector by a constant divisor, and stores the result in outVector.
	DSP_VectorDotp16	Computes the dot product of two vectors, and scales the output by a binary factor.
	DSP_VectorDotp32	Computes the dot product of two vectors, and scales the output by a binary factor.
	DSP_VectorExp	Computes the EXP (e^x) of the first N elements of inVector, and stores the result in outVector.
	DSP_VectorFill	Fills an input vector with scalar data.
	DSP_VectorLn	Computes the Natural Log, $\ln(x)$, of the first N elements of inVector, and stores the result in outVector.
	DSP_VectorLog10	Computes the $\log_{10}(x)$, of the first N elements of inVector, and stores the result in outVector.
	DSP_VectorLog2	Computes the $\log_2(x)$ of the first N elements of inVector, and stores the result in outVector.
	DSP_VectorMax32	Returns the maximum value of a vector.
	DSP_VectorMaxIndex32	Returns the index of the maximum value of a vector.
	DSP_VectorMean32	Calculates the mean average of an input vector.
	DSP_VectorMin32	Returns the minimum value of a vector.
	DSP_VectorMinIndex32	Returns the index of the minimum value of a vector.
	DSP_VectorMul16	Multiplication of a series of numbers in one vector to another vector.
	DSP_VectorMul32	Multiplication of a series of numbers in one vector to another vector.
	DSP_VectorMulc16	Multiplication of a series of numbers in one vector to a scalar value.
	DSP_VectorMulc32	Multiplication of a series of numbers in one vector to a scalar value.
	DSP_VectorNegate	Inverses the sign (negates) the elements of a vector.
	DSP_VectorRecip	Computes the reciprocal ($1/x$) of the first N elements of inVector, and stores the result in outVector.
	DSP_VectorRMS16	Computes the root mean square (RMS) value of a vector.
	DSP_VectorShift	Shifts the data index of an input data vector.
	DSP_VectorSqrt	Computes the square root of the first N elements of inVector, and stores the result in outVector.
	DSP_VectorStdDev16	Computes the Standard Deviation of a Vector.
	DSP_VectorSub16	Calculate the difference of two vectors.
	DSP_VectorSub32	Calculate the difference of two vectors.
	DSP_VectorSumSquares16	Computes the sum of squares of a vector, and scales the output by a binary factor.
	DSP_VectorSumSquares32	Computes the sum of squares of a vector, and scales the output by a binary factor.
	DSP_VectorVari16	Computes the variance of N elements of a Vector.
	DSP_VectorVariance	Computes the variance of N elements of inVector.
	DSP_VectorZeroPad	Fills an input vector with zeros.

Description

This section describes the Application Programming Interface (API) functions of the DSP Fixed-Point Library.

Refer to each section for a detailed description.

5.4.1.5.1 Complex Math Functions

5.4.1.5.1.1 DSP_ComplexAdd32 Function

C

```
void DSP_ComplexAdd32(
    int32c * indata1,
    int32c * indata2,
    int32c * Output
);
```

Description

Function DSP_ComplexAdd32:

```
void DSP_ComplexAdd32(int32c *indata1, int32c *indata2, int32c *Output);
```

Calculates the sum of two complex numbers, indata1 and indata2, and stores the complex result in Output. Complex numbers must be in the structural form that includes real and imaginary components. The function saturates the output values if maximum or minimum are exceeded. All values are in Q31 fractional data format. $(a + bi) + (c + di) \Rightarrow (a + c) + (b + d)i$

Preconditions

Complex numbers must be in the [int32c](#) format.

Parameters

Parameters	Description
indata1	pointer to input complex number (int32c)
indata2	pointer to input complex number (int32c)

Returns

pointer to result complex numbers ([int32c](#))

None.

Remarks

None.

Example

```
int32c *res, result;
int32c *input1, *input2;
int32c test_complex_1 = {0x40000000, 0x0CCCCCCC};
// (0.5 + 0.1i)
int32c test_complex_2 = {0x73333333, 0xB3333334};
// (0.9 - 0.6i)
res=&result;
input1=&test_complex_1;
input2=&test_complex_2;

DSP_ComplexAdd32(input1, input2, res);

// result = {0x73333333, 0xC0000000} = (0.9 - 0.5i)
```

5.4.1.5.1.2 DSP_ComplexConj16 Function

C

```
void DSP_ComplexConj16(
    int16c * indata,
    int16c * Output
);
```

Description

DSP_ComplexConj16:

```
void DSP_ComplexConj16(int16c *indata, int16c *Output);
```

Calculates the complex conjugate of Indata, and stores the result in Outdata. Both numbers must be in the complex number data structure which includes real and imaginary components. Values are in Q15 fractional data format. The function will saturate the output if maximum or minimum values are exceeded. $(a + bi) \Rightarrow (a - bi)$

Preconditions

Complex numbers must be in the [int32c](#) format.

Parameters

Parameters	Description
indata	pointer to input complex number (int16c)

Returns

pointer to result complex numbers ([int16c](#))

None.

Remarks

None.

Example

```
int16c *res, result;
int16c *input1;
int16c test_complex_1 = {0x4000, 0x0CCC};
//                      (0.5 + 0.1i)

res=&result;
input1=&test_complex_1;

DSP_ComplexConj16(input1, res);

// result = {0x4000, 0xF334} = (0.5 - 0.1i)
```

5.4.1.5.1.3 DSP_ComplexConj32 Function**C**

```
void DSP_ComplexConj32(
    int32c * indata,
    int32c * Output
);
```

Description

Function DSP_ComplexConj32:

```
void DSP_ComplexConj32(int32c *indata, int32c *Output);
```

Calculates the complex conjugate of indata, and stores the result in Output. Both numbers must be in the complex number data structure, which includes real and imaginary components. Values are in Q31 fractional data format. The function will saturate the output if maximum or minimum values are exceeded. $(a + bi) \Rightarrow (a - bi)$

Preconditions

Complex numbers must be in the [int32c](#) format.

Parameters

Parameters	Description
indata1	pointer to input complex number (int32c)

Returns

pointer to result complex numbers ([int32c](#))

None.

Remarks

None.

Example

```
int32c *res, result;
int32c *input1;
int32c test_complex_1 = {0x40000000, 0x0CCCCC};
//                      (0.5 + 0.1i)

res=&result;
input1=&test_complex_1;

DSP_ComplexConj32(input1, res);

// result = {0x40000000, 0xF3333334} = (0.5 - 0.1i)
```

5.4.1.5.1.4 DSP_ComplexDotProd32 Function**C**

```
void DSP_ComplexDotProd32(
    int32c * indata1,
    int32c * indata2,
    int32c * Output
);
```

Description

Function DSP_ComplexDotProd32:

```
void DSP_ComplexDotProd32(int32c *indata1, int32c *indata2, int32c *Output);
```

Calculates the dot product of two complex numbers, indata1 and indata2, and stores the result in Output. All numbers must be in complex structural format that includes real and imaginary components, and the numbers are in fractional Q31 format. The function will saturate the output if it exceeds maximum or minimum ratings. The formula for the dot product is as follows:
 Output(real) = (Input1.re * Input2.re) + (Input1.im * Input2.im); Output(img) = [(Input1.re * Input2.im) - (Input1.im * Input2.re)]i (a + bi) dot (c + di) => (a * c + b * d) + (a * d - b * c)i

Preconditions

Complex numbers must be in the [int32c](#) format.

Parameters

Parameters	Description
indata1	pointer to input complex number (int32c)
indata2	pointer to input complex number (int32c)

Returns

pointer to result complex numbers ([int32c](#))

None.

Remarks

None.

Example

```
int32c *res, result;
int32c *input1, *input2;
int32c test_complex_1 = {0x40000000, 0x0CCCCCCC};
//                      (0.5 + 0.1i)
int32c test_complex_2 = {0x73333333, 0xB3333334};
//                      (0.9 - 0.6i)
res=&result;
input1=&test_complex_1;
input2=&test_complex_2;

DSP_ComplexDotProd32(input1, input2, res);

// result = {0x31EB851E, 0xCE147AE3} = (0.39 - 0.39i)
```

5.4.1.5.1.5 DSP_ComplexMult32 Function**C**

```
void DSP_ComplexMult32(
    int32c * indata1,
    int32c * indata2,
    int32c * Output
);
```

Description

Function DSP_ComplexMult32:

```
void DSP_ComplexMult32(int32c *indata1, int32c *indata2, int32c *Output);
```

Multiplies two complex numbers, indata1 and indata2, and stores the complex result in Output. All numbers must be in the [int32c](#) complex data structure. All data is in Q31 fractional format. The function will saturate if maximum or minimum values are exceeded. $\text{Output}(\text{real}) = (\text{Input1.re} * \text{Input2.re}) - (\text{Input1.im} * \text{Input2.im})$; $\text{Output}(\text{img}) = [(\text{Input1.re} * \text{Input2.im}) + (\text{Input1.im} * \text{Input2.re})]i$ $(a + bi) \times (c + di) \Rightarrow (a * c - b * d) + (a * d + b * c)i$

Preconditions

Complex numbers must be in the [int32c](#) format.

Parameters

Parameters	Description
indata1	pointer to input complex number (int32c)
indata2	pointer to input complex number (int32c)

Returns

pointer to result complex numbers ([int32c](#))

None.

Remarks

None.

Example

```
int32c *res, result;
int32c *input1, *input2;
int32c test_complex_1 = {0x40000000, 0x0CCCCCCC};
//                      (0.5 + 0.1i)
```

```
int32c test_complex_2 = {0x73333333, 0xB3333334};
//                               (0.9 - 0.6i)
res=&result;
input1=&test_complex_1;
input2=&test_complex_2;

DSP_ComplexMult32(input1, input2, res);

// result = {0x4147AE14, 0xE51EB8551} = (0.51 - 0.21i)
```

5.4.1.5.1.6 DSP_ComplexScalarMult32 Function

C

```
void DSP_ComplexScalarMult32(
    int32c * indata,
    int32_t Scalar,
    int32c * Output
);
```

Description

Function DSP_ComplexScalarMult32:

```
void DSP_ComplexScalarMult32(int32c *indata, int32_t Scalar, int32c *Output);
```

Multiplies a complex number, indata, by a scalar number, Scalar, and stores the result in Output. indata and Output must be in [int32c](#) structure with real and imaginary components. All data must be in the fractional Q31 format. The function will saturate if maximum or minimum values are exceeded. Output(real) = (Input1.re * Scalar); Output(img) = [(Input1.im * Scalar)]i (a + bi) * C => (a * C + b * Ci)

Preconditions

Complex numbers must be in the [int32c](#) format.

Parameters

Parameters	Description
indata	pointer to input complex number (int32c)
Scalar	fractional scalar input value (int32_t)

Returns

pointer to result complex numbers ([int32c](#))

None.

Remarks

None.

Example

```
int32c *res, result;
int32c *input1;
int32_t scalarInput = 0x20000000; // 0.25
int32c test_complex_1 = {0x40000000, 0x0CCCCCCC};
//                               (0.5 + 0.1i)

res=&result;
input1=&test_complex_1;

DSP_ComplexScalarMult32(input1, scalarInput, res);

// result = {0x10000000, 0x03333333} = (0.125 + 0.025i)
```

5.4.1.5.1.7 DSP_ComplexSub32 Function

C

```
void DSP_ComplexSub32(
    int32c * indata1,
    int32c * indata2,
    int32c * Output
);
```

Description

Function DSP_ComplexSub32:

```
void DSP_ComplexSub32(int32c *indata1, int32c *indata2, int32c *Output);
```

Calculates the difference of two complex numbers, indata1 less indata2, and stores the complex result in Output. Both numbers must be in a complex data structure, which includes real and imaginary components. The function saturates the output values if maximum or minimum are exceeded. Real and imaginary components are in the Q31 fractional data format. $(a + bi) - (c + di) \Rightarrow (a - c) + (b - d)i$

Preconditions

Complex numbers must be in the `int32c` format.

Parameters

Parameters	Description
indata1	pointer to input complex number (<code>int32c</code>)
indata2	pointer to input complex number (<code>int32c</code>)

Returns

pointer to result complex numbers (`int32c`)

None.

Remarks

None.

Example

```
int32c *res, result;
int32c *input1, *input2;
int32c test_complex_1 = {0x40000000, 0x0CCCCCCC};
//          (0.5 + 0.1i)
int32c test_complex_2 = {0x73333333, 0xB3333334};
//          (0.9 - 0.6i)
res=&result;
input1=&test_complex_1;
input2=&test_complex_2;

DSP_ComplexSub32(input1, input2, res);

// result = {0xCCCCCCCC, 0x59999998} = (-0.4 + 0.7i)
```

5.4.1.5.2 Digital Filter Functions

5.4.1.5.2.1 DSP_FilterFIR32 Function

C

```
void DSP_FilterFIR32(
```

```

int32_t * outdata,
int32_t * indata,
int32_t * coeffs2x,
int32_t * delayline,
int N,
int K,
int scale
);

```

Description

Function DSP_FilterFIR32:

```
void DSP_FilterFIR32(int32_t *outdata, int32_t *indata, int32_t *coeffs2x, int32_t *delayline, int N, int K, int scale);
```

Performs an FIR filter on the vector indata, and stores the output in the vector outdata. The number of samples processed in the array is given by N. The number of filter taps is given by K. The values are scaled upon input by the binary scaling factor (right shift), scale. The array of 2*K coefficients is contained in the array coeffs2x, where the values are in order b0, b1, b2... and repeated. Lastly the delayline is an array of K values that are initialized to zero and represent previous values. All values are in fractional Q31 data format. The function will saturate results if minimum or maximum values are exceeded.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to four and a multiple of four. K must be greater than 2 and a multiple of 2. delayline must have K elements, and be initialized to zero. coeffs2x must have 2*K elements.

Parameters

Parameters	Description
outdata	pointer to destination array of elements (int32_t)
indata	pointer to source array of elements (int32_t)
coeffs2x	pointer to an array of coefficients (int32_t)
delayline	pointer to an array of delay variables (int32_t)
N	number of points in the array to process (int) number of samples (int)
K	number of filter taps
scale	binary scaler divisor ($1 / 2^{\text{scale}}$) (int)

Returns

None.

Remarks

Filter coefs must be repeated within the array. The array is twice as large as the number of taps, and the values are repeated in order b0, b1, b2,...bn, b0, b1, b2,... bn. The function updates the delayline array, which must be K elements long. The array should be initialized to zero prior to the first processing. It will contain values for processing cascaded filters within a loop.

Example

```

#define TAPS 4
#define numPOINTS 256

int filterN = numPOINTS;
int filterK = TAPS;
int filterScale = 1; // scale output by 1/2^1 => output * 0.5
int32_t FilterCoefs[TAPS*2] = {0x40000000, 0x20000000, 0x20000000, 0x20000000,
                                0x40000000, 0x20000000, 0x20000000, 0x20000000};
// note repeated filter coefs, A B C D A B C D
//      0.5, 0.25, 0.25, 0.25, 0.5, 0.25, 0.25, 0.25

int32_t outFilterData[numPOINTS]={0};
int32_t inFilterData[numPOINTS];

```

```

int filterDelayLine[TAPS]={0};

while(true)
{
    // put some data into input array, inFilterData, here //
    DSP_FilterFIR32(outFilterData, inFilterData, FilterCoefs, filterDelayLine,
                    filterN, filterK, filterScale);
}

```

5.4.1.5.2.2 DSP_FilterFIRDecim32 Function

C

```

void DSP_FilterFIRDecim32(
    int32_t * outdata,
    int32_t * indata,
    int32_t * coeffs,
    int32_t * delayline,
    int N,
    int K,
    int scale,
    int rate
);

```

Description

Function DSP_FilterFIRDecim32:

```
void DSP_FilterFIRDecim32(int32_t *outdata, int32_t *indata, int32_t *coeffs, int32_t *delayline, int N, int K, int scale, int rate);
```

Compute a FIR decimation filter on the input vector indata, and store the results to the vector outdata. The total number of output elements is set by N, and therefore the outdata array must be at least N in length. The decimation ratio is given by rate. The input is sampled every integer value of rate, skipping every (rate-1) input samples. The input array must therefore be (rate*N) samples long. The amount of filter taps is specified by K. Coeffs specifies the coefficients array. The delayline array holds delay inputs for calculation, and must be initialized to zero prior to calling the filter. Both coeffs and delayline must be K in length. Scale divides the input by a scaling factor by right shifting the number of bits ($1/2^{\text{scale}}$). All values of input, output, and coeffs are given in Q31 fractional data format. The function will saturate if the output value exceeds the maximum or minimum value.

$$Y = b_0 * X_0 + (b_1 * X(-1)) + (b_2 * X(-2))$$

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. delayline must have K elements, and be initialized to zero. coeffs must have K elements. outdata must have N elements indata must have (N*rate) elements

Parameters

Parameters	Description
outdata	pointer to output array of elements (int32_t)
indata	pointer to input array of elements (int32_t)
coeffs	pointer to an array of coefficients (int32_t)
delayline	pointer to an array of delay variables (int32_t)
N	number of output elements to be processed (int)
K	number of filter taps and coeffs (int)
scale	binary scaler divisor ($1 / 2^{\text{scale}}$) (int)
rate	decimation ratio (int)

Returns

None.

Remarks

Coefs are loaded into the array with corresponding to the least delay first (C0, C(-1), C(-2)). K must be greater than rate. Even while decimating the input stream, every input passes through the delayline. So FIR filters of arbitrary length will give the same output as a non-decimating FIR, just with fewer responses.

Example

```
#define N 8           // number of output samples
#define TAPS 5
#define SKIP 3

int testFilterN = N;      // number of output elements
int testFilterK = TAPS;   // number of taps
int testFilterRate = SKIP; // decimation rate R
int32_t outFiltDataDec[N]={0};
int32_t *inTestFilter[N*SKIP];
int filtScaleNum = 1;      // scale output (1 / 2^n) => Y * 0.5

int32_t filtDelayTest[8]={0}; // always initialize to zero

// get pointer to input buffer here //
inTestFilter = &inputBuffer;

DSP_FilterFIRDecim32(outFiltDataDec, inTestFilter, inTestCoefs,
    filtDelayTest, testFilterN, testFilterK, filtScaleNum, testFilterRate);
```

5.4.1.5.2.3 DSP_FilterFIRInterp32 Function**C**

```
void DSP_FilterFIRInterp32(
    int32_t * outdata,
    int32_t * indata,
    int32_t * coeffs,
    int32_t * delayline,
    int N,
    int K,
    int scale,
    int rate
);
```

Description

Function DSP_FilterFIRInterp32:

```
void DSP_FilterFIRInterp32(int32_t *outdata, int32_t *indata, int32_t *coeffs, int32_t *delayline, int N, int K, int scale, int rate);
```

Perform an interpolating FIR filter on the first N samples of indata, and stores the result in outdata. The number of output elements is N*rate. The number of filter taps, K, must be an even multiple of N. The coefficients array, Coeffs, must be K elements long. The delay line array, delayline, must be K/R elements long, and be initialized to zero. All data elements must be in Q31 fractional data format. Scaling is performed via binary shift on the input equivalent to (1/2^shift). The function will saturate the output if it exceeds maximum or minimum values. The function creates R output values for each input value processed. The delayline of previous values is processed with R elements of the coefficient array. Numerically:

$$Y(1,0) = X(0)*C(0) + X(-1)*C(\text{rate}) + X(-2)*C(2*\text{rate}) \dots Y(1,1) = X(0)*C(1) + X(-1)*C(\text{rate}+1) + X(-2)*C(2*\text{rate} + 1) \dots Y(1,\text{rate}) = X(0)*C(N) + X(-1)*C(\text{rate}+N) + X(-2)*C(2*\text{rate} + N) \dots$$

where output Y corresponds to (input,rate) different outputs, input X has (M/rate) sample delays and C is the coefficient array.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. delayline must have (K/R) elements, and be initialized to zero. K (taps) must be an even multiple of R (rate). outdata must have R*N elements.

Parameters

Parameters	Description
outdata	pointer to output array of elements (int32_t)
indata	pointer to input array of elements (int32_t)
coeffs	pointer to an array of coefficients (int32_t)
delayline	pointer to an array of delay variables (int32_t)
N	number of output elements to be processed (int)
K	number of filter taps and coeffs (int)
scale	binary scaler divisor ($1 / 2^{\text{scale}}$) (int)
rate	decimation ratio (int)

Returns

None.

Remarks

The function processes each input (rate) times. With each pass, coefficients are offset so that (K/rate) multiply accumulate cycles occur.

Example

```
// interpret evenly 1/3 spaced values
#define N 4           // number of output samples
#define TAPS 6
#define INTERP 3

int ifiltN = N;
int ifiltK = TAPS; // k must be an even multiple of R
int ifiltR = INTERP;

int32_t ifiltOut[N*INTERP]={0};
int32_t ifiltDelay[2]={0}; // must be initialized to zero
int ifiltScale = 0;        // no scaling

int32_t ifiltCoefsThirds[TAPS]={0x2AAAAAA9, 0x55555555,0x7FFFFFFE,
                                0x55555555,0x2AAAAAA9,0x00000000};
//                                0.333333, 0.6666667, 0.9999999, 0.6666667, 0.3333333, 0

int32_t ifiltInput[N]={0x0CCCCCD, 0x19999999, 0x26666666, 0x33333333};
//                                0.1, 0.2, 0.3, 0.4

DSP_FilterFIRInterp32(ifiltOut, ifiltInput, ifiltCoefsThirds, ifiltDelay,
                    ifiltN, ifiltK, ifiltScale, ifiltR);

// ifiltOut = {0x04444444, 0x08888889, 0x0CCCCCD, 0x11111111, 0x15555555, 0x19999999,
//             0x1DDDDDDD, 0x22222221, 0x26666665, 0x2AAAAAA9,0x2EEEEEEE, 0x33333332}
// = 0.0333, 0.0667, 0.1, 0.1333, 0.1667, 0.2, 0.2333, 0.2667, 0.3, 0.3333, 0.3667, 0.4
```

5.4.1.5.2.4 DSP_FilterIIR16 Function**C**

```
int16_t DSP_FilterIIR16(
    int16_t in,
    int16_t * coeffs,
    int16_t * delayline,
    int B,
    int scale
);
```

Description

Function DSP_FilterIIR16:

```
int16_t DSP_FilterIIR16(int16_t in, int16_t *coeffs, int16_t *delayline, int B, int scale);
```

Performs a single element cascaded biquad IIR filter on the input, in. The filter contains B number of biquad sections, and cascades the output of one to the input of the next. B must be greater than 2 and a multiple of 2. The int16_t output generated by the function is the computation from the final biquad stage. Delay pipeline array delayline must contain 2*B values and be initialized to zero prior to use. The coefficient array must contain 4*B elements, and must be set up in order of biquad a1, a2, b1, b2. A binary (right shift) factor, scale, will scale the output equivalent to $(1/2^{\text{scale}})$. All numerical values must be in Q15 fractional data format. The function will saturate values if maximum or minimum values are exceeded.

$$Y = X_0 + (b_1 * X(-1)) + (b_2 * X(-2)) + (a_1 * Y(-1)) + (a_2 * Y(-2))$$

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. B must be greater than 2 and a multiple of 2. delayline must have 2*B elements, and be initialized to zero. coeffs must have 4*B elements.

Parameters

Parameters	Description
in	input data element X (int16_t)
coeffs	pointer to an array of coefficients (int16_t)
delayline	pointer to an array of delay variables (int16_t)
B	number of cascaded biquad filter groups to process (int)
scale	binary scaler divisor ($1 / 2^{\text{scale}}$) (int)

Returns

Sample output Y (int16_t)

Example

```
#define B 8           // use * biquad filters in cascade

int dataSamples = 256;
int i, j;
biquad16 bquad[B];
int16_t coeffs[4*B]= {0};
int16_t delaylines[2*B]= {0};
int16_t Y, X;
int scaleBquad = 1; // scale output (1 / 2^n) => Y * 0.5

// do something to set up coeffs, for instance this example //

for (j=0; jRemarks:Filter coeffs must be stored within the array as a1, a2, b1, b2, a1, a2, b1,
b2, in order of biquads form input to output. A function to translate the coeffs from biquad
structure to coeffs is available in DSP_FilterIIRSetup16. The function updates the delayline
array, which must be 2*B elements long. The array should be initialized to zero prior to the
first processing. It will contain values for processing cascaded filters within a loop.
```

5.4.1.5.2.5 DSP_FilterIIRBQ16 Function**C**

```
int16_t DSP_FilterIIRBQ16(
    int16_t Xin,
    PARM_EQUAL_FILTER * pFilter
);
```

Description

Function DSP_FilterIIRBQ16:

```
int16_t DSP_FilterIIRBQ16(int16_t Xin, PARM_EQUAL_FILTER *pFilter);
```

Calculates a single pass IIR biquad filter on Xin, and delivers the result as a 16-bit output. All math is performed using 32 bit instructions, with results truncated to 16-bits for the output. The delay register is stored as a 32-bit value for subsequent functions. All values are fractional Q15 and Q31, see data structure for specifics.

$$Y = X(0)*b_0 + (b_1 * X(-1)) + (b_2 * X(-2)) - (a_1 * Y(-1)) - (a_2 * Y(-2))$$

Preconditions

Delay register values should be initialized to zero.

Parameters

Parameters	Description
Xin	input data element X (int16_t)
pFilter	pointer to filter coef and delay structure

Returns

Sample output Y (int16_t)

Remarks

The delay register values should be initialized to zero prior to the first call to the function, they are updated each pass. A gain of 2 has been hard coded into the function. This implies that all coefs should be input at half value. This is purposeful, since many filter designs need a div2 to have each coef between the required -1

Example

```
PARM_EQUAL_FILTER *ptrFilterEQ;
PARM_EQUAL_FILTER FilterEQ;
uint16_t DataIn, DataOut;
ptrFilterEQ = &FilterEQ;

// 48KHz sampling; 1 KHz bandpass filter; Q=0.9
// divide by 2 and convert to Q15
// b0 = 0.06761171785499065
// b1 = 0
// b2 = -0.06761171785499065
// a1 = -1.848823142275648
// a2 = 0.8647765642900187

// note all coefs are half value of original design, gain handled in algorithm
ptrFiltEQ32->b[0]=0x0453;      // feed forward b0 coef
ptrFiltEQ32->b[1]=0;           // feed forward b1 coef
ptrFiltEQ32->b[2]=0xFBAD;      // feed forward b2 coef

// note all coefs are half value of original design, gain handled in algorithm
// note subtract is handled in algorithm, so coefs go in at actual value
ptrFiltEQ32->a[0]=0x89AD;      // feedback a1 coef
ptrFiltEQ32->a[1]=0x3758;      // feedback a2 coef

for (i=0;i<256;i++)
{
    // *** get some input data here
    DataIn32 = three_hundred_hz[i];

    DataOut = DSP_FilterIIRBQ16(DataIn, ptrFilterEQ);

    // *** do something with the DataOut here
}
```

5.4.1.5.2.6 DSP_FilterIIRBQ16_cascade8 Function

C

```
int16_t DSP_FilterIIRBQ16_cascade8(
    int16_t Xin,
    PARM_EQUAL_FILTER * pFilter_Array
);
```

Description

Function DSP_FilterIIRBQ16_cascade8:

```
int16_t DSP_FilterIIRBQ16_cascade8(int16_t Xin, PARM_EQUAL_FILTER *pFilter_Array);
```

Calculates a single pass IIR biquad cascade filter on Xin, and delivers the result as a 16-bit output. The cascade of filters is 8 unique biquad filters arranged in series such that the output of one is provided as the input to the next. A unique filter coefficient set is provided to each, and 32 bit delay lines are maintained for each. All math is performed using 32 bit instructions, which results truncated to 16-bits for the output. Global gain values are available on the output. Fracgain is a Q15 fractional gain value and expgain is a binary shift gain value. The combination of the two can be utilized to normalize the output as desired. All values are fractional Q15 and Q31, see data structure for specifics.

$Y = Y7 <- Y6 <- Y5 <- Y4 <- Y3 <- Y2 <- Y1 <- Y0$ where each Y_n filter element represents a unique IIR biquad: $Y_n = Y(n-1)*b_0 + (b_1 * Y(n-2)) + (b_2 * Y(n-3)) - (a_1 * Y_n(-1)) - (a_2 * Y_n(-2))$ and: for Y_0 ; $Y(n-1) = Xin(0)$

Preconditions

Delay register values should be initialized to zero.

Parameters

Parameters	Description
Xin	input data element X (int16_t)
pFilter	pointer to filter coef and delay structure

Returns

Sample output Y (int16_t)

Remarks

The delay register values should be initialized to zero prior to the first call to the function, they are updated each pass. A gain of 2 has been hard coded into the function. This implies that all coefs should be input at half value. This is purposeful, since many filter designs need a div2 to have each coef between the required -1

Example

```
PARM_EQUAL_FILTER filtArray[8];
uint16_t dataY, dataX;

// example to use 2 filter blocks as notch filters
// fill entire Filter Array with coefs
for (i=0;i<8;i++)
{
    filtArray[i].Z[0]=0;
    filtArray[i].Z[1]=0;

    // note all coefs are half value of original design, gain handled in algorithm
    // all pass
    filtArray[i].b[0]=0x4000;
    filtArray[i].b[1]=0;           // feed forward b1 coef
    filtArray[i].b[2]=0;         // feed forward b2 coef

    filtArray[i].a[0]=0;         // feedback a1 coef
    filtArray[i].a[1]=0;         // feedback a2 coef
}
```

```

}
// Unique filters for example
// 10KHz notch filter -- divide coefs by 2
b0 = 0.5883783602332997
b1 = -0.17124071441396285

a2 = 0.8175108129889816

// note all coefs are half value of original design, gain handled in algorithm
filtArray[7].b[0]=0x3a29;           // feed forward b0 coef
filtArray[7].b[1]=0x8cdc;           // feed forward b1 coef
filtArray[7].b[2]=0x3a29;           // feed forward b2 coef

// note all coefs are half value of original design, gain handled in algorithm
// note subtract is handled in algorithm, so coefs go in at actual value
filtArray[7].a[0]=0x8cdc;           // feedback a1 coef
filtArray[7].a[1]=0x3452;           // feedback a2 coef

for (i=0;i<256;i++)
{
    // *** get input data here
    dataX = compound_300_1K_hz16[i];

    dataY = DSP_FilterIIRBQ16_cascade8(dataX, filtArray);

    // *** do something with the DataY here
}

```

5.4.1.5.2.7 DSP_FilterIIRBQ16_cascade8_fast Function

C

```

int16_t DSP_FilterIIRBQ16_cascade8_fast(
    int16_t Xin,
    PARM_EQUAL_FILTER_16 * pFilter_Array
);

```

Description

Function DSP_FilterIIRBQ16_cascade8_fast:

```
int16_t DSP_FilterIIRBQ16_cascade8_fast(int16_t Xin, PARM\_EQUAL\_FILTER\_16 *pFilter_Array);
```

Calculates a single pass IIR biquad cascade filter on Xin, and delivers the result as a 16-bit output. The cascade of filters is 8 unique biquad filters arranged in series such that the output of one is provided as the input to the next. A unique filter coefficient set is provided to each, and 16 bit delay lines are maintained for each. All math is performed using 16 bit instructions, which results rounded to 16-bits for the output. All values are fractional Q15, see data structure for specifics. The function will saturate the output should it exceed maximum or minimum values.

$Y = Y7 <- Y6 <- Y5 <- Y4 <- Y3 <- Y2 <- Y1 <- Y0$ where each Y_n filter element represents a unique IIR biquad: $Y_n = Y(n-1)*b0 + (b1 * Y(n-2)) + (b2 * Y(n-3)) - (a1 * Y_n(-1)) - (a2 * Y_n(-2))$ and: for $Y0$; $Y(n-1) = X_{in}(0)$

Preconditions

Delay register values should be initialized to zero.

Parameters

Parameters	Description
Xin	input data element X (int16_t)
pFilter	pointer to filter coef and delay structure

Returns

Sample output Y (int16_t)

Remarks

The delay register values should be initialized to zero prior to the first call to the function, they are updated each pass. A gain of 2 has been hard coded into the function. This implies that all coefs should be input at half value. This is purposeful, since many filter designs need a div2 to have each coef between the required -1

Example

```

PARM_EQUAL_FILTER_16 filtArray[8];

```

5.4.1.5.2.8 DSP_FilterIIRBQ16_fast Function

C

```

int16_t DSP_FilterIIRBQ16_fast(
    int16_t Xin,
    PARM_EQUAL_FILTER_16 * pFilter
);

```

Description

Function DSP_FilterIIRBQ16_fast:

int16_t DSP_FilterIIRBQ16_fast(int16_t Xin, [PARM_EQUAL_FILTER_16](#) *pFilter);

Calculates a single pass IIR biquad filter on Xin, and delivers the result as a 16-bit output. All math is performed using 16 bit instructions, with results rounded to 16-bits for the output. The delay register is stored as a 16-bit value for subsequent functions. The function will saturate the results if maximum or minimum fractional values are exceeded. All values are fractional Q15 format.

$$Y = X(0)*b_0 + (b_1 * X(-1)) + (b_2 * X(-2)) - (a_1 * Y(-1)) - (a_2 * Y(-2))$$

Preconditions

Delay register values should be initialized to zero.

Parameters

Parameters	Description
Xin	input data element X (int16_t)
pFilter	pointer to filter coef and delay structure

Returns

Sample output Y (int16_t)

Remarks

The delay register values should be initialized to zero prior to the first call to the function, they are updated each pass. A gain of 2 has been hard coded into the function. This implies that all coefs should be input at half value. This is purposeful, since many filter designs need a div2 to have each coef between the required -1

Example

```
PARM_EQUAL_FILTER_16 *ptrFilterEQ;
```

```

PARM_EQUAL_FILTER_16 FilterEQ;
uint16_t DataIn, DataOut;
ptrFilterEQ = &FilterEQ;

// 48KHz sampling; 1 KHz bandpass filter; Q=0.9
// divide by 2 and convert to Q15
// b0 = 0.06761171785499065
// b1 = 0
// b2 = -0.06761171785499065
// a1 = -1.848823142275648
// a2 = 0.8647765642900187

// note all coefs are half value of original design, gain handled in algorithm
ptrFiltEQ32->b[0]=0x0453;      // feed forward b0 coef
ptrFiltEQ32->b[1]=0;          // feed forward b1 coef
ptrFiltEQ32->b[2]=0xFBAD;     // feed forward b2 coef

// note all coefs are half value of original design, gain handled in algorithm
// note subtract is handled in algorithm, so coefs go in at actual value
ptrFiltEQ32->a[0]=0x89AD;     // feedback a1 coef
ptrFiltEQ32->a[1]=0x3758;     // feedback a2 coef

for (i=0;i<256;i++)
{
    // *** get some input data here
    DataIn32 = three_hundred_hz[i];

    DataOut = DSP_FilterIIRBQ16_fast(DataIn, ptrFilterEQ);

    // *** do something with the DataOut here
}

```

5.4.1.5.2.9 DSP_FilterIIRBQ16_parallel8 Function

C

```

int16_t DSP_FilterIIRBQ16_parallel8(
    int16_t Xin,
    PARM_EQUAL_FILTER * pFilter
);

```

Description

Function DSP_FilterIIRBQ16_parallel8:

int16_t DSP_FilterIIRBQ16_parallel8(int16_t Xin, [PARM_EQUAL_FILTER](#) *pFilter);

Calculates a 8 parallel, single pass IIR biquad filters on Xin, sums the result and delivers the result as a 16-bit output. All math is performed using 32 bit instructions, which results truncated to 16-bits for the output. The delay register is stored as a 32-bit value for subsequent functions. Output is tuned by 2 multiplier factors. First each parallel section has a fractional gain (attenuation) that enables individual scaling of that section. Second, a global binary (log2N) gain is applied to the result. The combination of gain factors enable both gain and attenuation. All values are fractional Q15 and Q31, see data structure for specifics.

$Y = Y7/8 + Y6/8 + Y5/8 + Y4/8 + Y3/8 + Y2/8 + Y1/8 + Y0/8$ where each Y_n filter element represents a unique IIR biquad: $Y_n = X(0)*b0 + (b1 * X(n-1)) + (b2 * X(n-2)) - (a1 * Yn(-1)) - (a2 * Yn(-2))$

Preconditions

Delay register values should be initialized to zero. The sum of all fracgain should be ≤ 1

Parameters

Parameters	Description
Xin	input data element X (int16_t)
pFilter	pointer to filter coef and delay structure

Returns

Sample output Y (int16_t)

Remarks

The delay register values should be initialized to zero prior to the first call to the function, they are updated each pass. A gain of 2 has been hard coded into the function. This implies that all coefs should be input at half value. This is purposeful, since many filter designs need a div2 to have each coef between the required -1

Example

```

PARAM_EQUAL_FILTER filtArrayPara[8];
uint16_t dataY, dataX;

// fill entire Filter Array with coefs
for (i=0;i<8;i++)
{
    filtArrayPara[i].Z[0]=0;
    filtArrayPara[i].Z[1]=0;

    filtArrayPara[i].G.fracGain = 0x7FFF;           // gain = 1 default
    filtArrayPara[i].G.expGain = 1;                // == 2^N; gain of 2

    // note all coefs are half value of original design, gain handled in algorithm
    // none pass -- default
    filtArrayPara[i].b[0]=0;           // feed forward b0 coef
    filtArrayPara[i].b[1]=0;           // feed forward b1 coef
    filtArrayPara[i].b[2]=0;           // feed forward b2 coef

    // note all coefs are half value of original design, gain handled in algorithm
    // note subtract is handled in algorithm, so coefs go in at actual value
    filtArrayPara[i].a[0]=0;           // feedback a1 coef
    filtArrayPara[i].a[1]=0;           // feedback a2 coef
}

// 1K bandpass Q=0.9
filtArrayPara[7].G.fracGain = 0x4000; // gain = 0.5 because using 2 outputs
// note all coefs are half value of original design, gain handled in algorithm
filtArrayPara[7].b[0]=0x04ad;
filtArrayPara[7].b[1]=0;           // feed forward b1 coef
filtArrayPara[7].b[2]=0xfb53;      // feed forward b2 coef

// note all coefs are half value of original design, gain handled in algorithm
// note subtract is handled in algorithm, so coefs go in at actual value
filtArrayPara[7].a[0]=0x8a90;      // feedback a1 coef
filtArrayPara[7].a[1]=0x36a4;      // feedback a2 coef

// 300 Hz bandpass Q=0.9
filtArrayPara[6].G.fracGain = 0x1000; // gain = 0.125 as an example
// note all coefs are half value of original design, gain handled in algorithm
filtArrayPara[6].b[0]=0x017b;      // feed forward b0 coef
filtArrayPara[6].b[1]=0;           // feed forward b1 coef
filtArrayPara[6].b[2]=0xfe85;      // feed forward b2 coef

// note all coefs are half value of original design, gain handled in algorithm
// note subtract is handled in algorithm, so coefs go in at actual value
filtArrayPara[6].a[0]=0x8316;      // feedback a1 coef
filtArrayPara[6].a[1]=0x3d08;      // feedback a2 coef

for (i=0;i<256;i++)
{
    // *** get input data here
    dataX = compound_300_1K_hz16[i];

    dataY = DSP_FilterIIRBQ16_cascade8_fast(dataX, filtArray);
}

```

```
// *** do something with the DataY here
}
```

5.4.1.5.2.10 DSP_FilterIIRBQ16_parallel8_fast Function

C

```
int16_t DSP_FilterIIRBQ16_parallel8_fast(
    int16_t Xin,
    PARM_EQUAL_FILTER_16 * pFilter
);
```

Description

Function DSP_FilterIIRBQ16_parallel8_fast:

```
int16_t DSP_FilterIIRBQ16_parallel8_fast(int16_t Xin, PARM_EQUAL_FILTER_16 *pFilter);
```

Calculates a 8 parallel, single pass IIR biquad filters on Xin, sums the result and delivers the result as a 16-bit output. All math is performed using 16 bit instructions, which results rounded to 16-bits for the output. The delay register is stored as a 16-bit value for subsequent functions. Output is tuned by 2 multiplier factors. First each parallel section has a fractional gain (attenuation) that enables individual scaling of that section. Second, a global binary (log2N) gain is applied to the result. The combination of gain factors enable both gain and attenuation. All values are fractional Q15. The function will round outputs and saturate if maximum or minimum values are exceeded.

$Y = Y7/8 + Y6/8 + Y5/8 + Y4/8 + Y3/8 + Y2/8 + Y1/8 + Y0/8$ where each Y_n filter element represents a unique IIR biquad: $Y_n = X(0)*b_0 + (b_1 * X(n-1)) + (b_2 * X(n-2)) - (a_1 * Y_n(-1)) - (a_2 * Y_n(-2))$

Preconditions

Delay register values should be initialized to zero. The sum of all fracgain should be ≤ 1

Parameters

Parameters	Description
Xin	input data element X (int16_t)
pFilter	pointer to filter coef and delay structure

Returns

Sample output Y (int16_t)

Remarks

The delay register values should be initialized to zero prior to the first call to the function, they are updated each pass. A gain of 2 has been hard coded into the function. This implies that all coefs should be input at half value. This is purposeful, since many filter designs need a div2 to have each coef between the required -1

Example

```
PARM_EQUAL_FILTER_16 filtArrayPara[8]; // note change in data structure
uint16_t dataY, dataX;

// fill entire Filter Array with coefs
for (i=0;i<8;i++)
{
    filtArrayPara[i].Z[0]=0;
    filtArrayPara[i].Z[1]=0;

    filtArrayPara[i].G.fracGain = 0x7FFF; // gain = 1 default
    filtArrayPara[i].G.expGain = 1;       // log2N; gain of 2

    // note all coefs are half value of original design, gain handled in algorithm
    // none pass -- default
    filtArrayPara[i].b[0]=0; // feed forward b0 coef
```

```

    filtArrayPara[i].b[1]=0;           // feed forward b1 coef
    filtArrayPara[i].b[2]=0;           // feed forward b2 coef

    // note all coefs are half value of original design, gain handled in algorithm
    // note subtract is handled in algorithm, so coefs go in at actual value
    filtArrayPara[i].a[0]=0;           // feedback a1 coef
    filtArrayPara[i].a[1]=0;           // feedback a2 coef
}

// 1K bandpass Q=0.9
filtArrayPara[7].G.fracGain = 0x4000; // gain = 0.5 because using 2 outputs
// note all coefs are half value of original design, gain handled in algorithm
filtArrayPara[7].b[0]=0x04ad;
filtArrayPara[7].b[1]=0;               // feed forward b1 coef
filtArrayPara[7].b[2]=0xfb53;          // feed forward b2 coef

// note all coefs are half value of original design, gain handled in algorithm
// note subtract is handled in algorithm, so coefs go in at actual value
filtArrayPara[7].a[0]=0x8a90;          // feedback a1 coef
filtArrayPara[7].a[1]=0x36a4;          // feedback a2 coef

// 300 Hz bandpass Q=0.9
filtArrayPara[6].G.fracGain = 0x1000; // gain = 0.125 as an example
// note all coefs are half value of original design, gain handled in algorithm
filtArrayPara[6].b[0]=0x017b;          // feed forward b0 coef
filtArrayPara[6].b[1]=0;               // feed forward b1 coef
filtArrayPara[6].b[2]=0xfe85;          // feed forward b2 coef

// note all coefs are half value of original design, gain handled in algorithm
// note subtract is handled in algorithm, so coefs go in at actual value
filtArrayPara[6].a[0]=0x8316;          // feedback a1 coef
filtArrayPara[6].a[1]=0x3d08;          // feedback a2 coef

for (i=0;i<256;i++)
{
    // *** get input data here
    dataX = compound_300_1K_hz16[i];

    dataY = DSP_FilterIIRBQ16_cascade8_fast(dataX, filtArray);

    // *** do something with the DataY here
}

```

5.4.1.5.2.11 DSP_FilterIIRBQ32 Function

C

```

int32_t DSP_FilterIIRBQ32(
    int32_t Xin,
    PARM_EQUAL_FILTER_32 * pFilter
);

```

Description

Function DSP_FilterIIRBQ32:

```
int32_t DSP_FilterIIRBQ32(int32_t Xin, PARM_EQUAL_FILTER_32 *pFilter);
```

Calculates a single pass IIR biquad filter on Xin, and delivers the result as a 16-bit output. All math is performed using 32 bit instructions, with results truncated to 32-bits for the output. The delay register is stored as a 32-bit value for subsequent functions. All values are fractional Q31, see data structure for specifics.

$$Y = X(0)*b_0 + (b_1 * X(-1)) + (b_2 * X(-2)) - (a_1 * Y(-1)) - (a_2 * Y(-2))$$

Preconditions

Delay register values should be initialized to zero.

Parameters

Parameters	Description
Xin	input data element X (int32_t)
pFilter	pointer to high resolution filter coef and delay structure

Returns

Sample output Y (int32_t)

Remarks

The delay register values should be initialized to zero prior to the first call to the function, they are updated each pass. A gain of 2 has been hard coded into the function. This implies that all coefs should be input at half value. This is purposeful, since many filter designs need a div2 to have each coef between the required -1

Example

```

PARAM_EQUAL_FILTER_32 *ptrFiltEQ32;
PARAM_EQUAL_FILTER_32 FilterEQ32;
int32_t DataIn32, DataOut32;

ptrFiltEQ32 = &FilterEQ32;

ptrFiltEQ32->Z[0]=0;
ptrFiltEQ32->Z[1]=0;

// 1000 Hz Q= 0.9 BP filter design, 44.1K sampling
//
// b0 = 0.07311778239751009 forward
// b1 = 0
// b2 = -0.07311778239751009
// a1 = -1.8349811166056893 back
// a2 = 0.8537644352049799

// note all coefs are half value of original design, gain handled in algorithm
ptrFiltEQ32->b[0]=0x04ADF635; // feed forward b0 coef
ptrFiltEQ32->b[1]=0; // feed forward b1 coef
ptrFiltEQ32->b[2]=0xFB5209CB; // feed forward b2 coef

// note all coefs are half value of original design, gain handled in algorithm
// note subtract is handled in algorithm, so coefs go in at actual value
ptrFiltEQ32->a[0]=0x8A8FAB5D; // feedback a1 coef
ptrFiltEQ32->a[1]=0x36A41395; // feedback a2 coef

for (i=0;i<256;i++)
{
    // *** get input data here
    DataIn32 = three_hundred_hz[i];

    DataOut32 = DSP_FilterIIRBQ32(DataIn32, ptrFiltEQ32);

    // *** do something with the DataOut32 here
}

```

5.4.1.5.2.12 DSP_FilterIIRSetup16 Function**C**

```

void DSP_FilterIIRSetup16(
    int16_t * coeffs,
    biquad16 * bq,
    int B
);

```

Description

Function DSP_FilterIIRSetup16:

```
void DSP_FilterIIRSetup16(int16_t *coeffs, biquad16 *bq, int B);
```

Converts an array of biquad coefficients, bq, into an linear array of coefficients, coeffs. The output array must be 4*B elements long. The number of biquads in the resulting factor is given by B. All numerical values must be in Q15 fractional data format.

Preconditions

coeffs must have 4*B elements.

Parameters

Parameters	Description
coeffs	pointer to an array of coefficients (int16_t)
bq	pointer to array of biquad structure filter coefs (biquad16)
B	number of cascaded biquad filter groups to process (int)

Returns

None.

Remarks

None.

Example

see DSP_FilterIIR16 [for](#) example.

5.4.1.5.2.13 DSP_FilterLMS16 Function**C**

```
int16_t DSP_FilterLMS16(
    int16_t in,
    int16_t ref,
    int16_t * coeffs,
    int16_t * delayline,
    int16_t * error,
    int K,
    int16_t mu
);
```

Description

Function DSP_FilterLMS16:

```
int16_t DSP_FilterLMS16(int16_t in, int16_t ref, int16_t *coeffs, int16_t *delayline, int16_t *error, int K, int16_t mu);
```

Computes an LMS adaptive filter on the input in. Filter output of the FIR is given as a 16 bit value. The filter target is ref, and the calculation difference between the output and the target is error. The filter adapts its coefficients, coefs, on each pass. The number of coefficients (filter taps) is given by the value K. The delayline array should be initialized to zero prior to calling the filter for the first time, and have K elements. The value mu is the rate at which the filter adapts. All values are Q15 fractional numbers. The function will saturate the output if it exceeds maximum or minimum values. The LMS will adapt its coefs to attempt to drive the output value toward the ref value. The rate of adaption on each pass depends on mu and the error from the previous calculation.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. delayline must have (K) elements, and be initialized to zero. K (taps) must be a multiple of 4, and >= 8. mu must be positive.

Parameters

Parameters	Description
in	input data value (int16_t)
ref	target output value (int16_t)
coeffs	pointer to an array of coefficients (int16_t)
delayline	pointer to an array of delay variables (int16_t)
error	output minus reference (int16_t)
K	number of filter taps and coeffs (int)
mu	adaption rate (int16_t)

Returns

(int16_t) - FIR filter output

Remarks

Filter coefs may start at random or zero value, but convergence is dependent on the amount of update required.

Example

```
#define lmsTAPS 8

int16_t lmsOut;
int lmsTaps = lmsTAPS;

int16_t lmsCoefs[lmsTAPS]={0x5000, 0x4000,0x3000, 0x2000,0x1000, 0x0000,0xF000, 0xE000};
int16_t lmsDelay[lmsTAPS]={0};
int16_t *ptrLMSError;
int16_t lmsError = 0x0200;
int16_t inVal=0;

int16_t refVal = 0x0CCC; // some target value = 0.1
int16_t lmsAdapt = 0x3000;

ptrLMSError = &lmsError;

for (i=0;i<200;i++)
{
    // get some input value here //
    if (i < 100)
    {
        inVal = 0x4233;
    }
    else
    {
        inVal = 0xCF10;
    }

    lmsOut = DSP_FilterLMS16(inVal, refVal, lmsCoefs, lmsDelay,
        ptrLMSError, lmsTaps, lmsAdapt);
}
```

5.4.1.5.3 Matrix Math Functions**5.4.1.5.3.1 DSP_MatrixAdd32 Function****C**

```
void DSP_MatrixAdd32(
    matrix32 * resMat,
    matrix32 * srcMat1,
```

```
    matrix32 * srcMat2
);
```

Description

Function DSP_MatrixAdd32:

```
void DSP_MatrixAdd32(matrix32 *resMat, matrix32 *srcMat1, matrix32 *srcMat2);
```

Vector summation of two matrices, where both have 32-bit integer elements. The resulting output will saturate if element addition exceeds **MAX32** or **MIN32**.

Preconditions

Both matrices must be equivalent in rows and columns. Both Matrices must be set into structure (ROWS, COLUMNS, vector_pointer).

Parameters

Parameters	Description
resMat	pointer to new sum Matrix C (*int32_t)
srcMat1	pointer to the Matrix A structure (*int32_t)
srcMat2	pointer to the Matrix B structure (*int32_t)

Returns

None.

Remarks

Execution Time (cycles): 225 cycles + 23 / matrix_element. The function will saturate the output value if it exceeds maximum limits per element.

Example

```
#define ROW 2
#define COL 2

matrix32 *resMat, *srcMat1, *srcMat2;
int32_t result[ROW*COL];

int32_t matA[ROW*COL] = {1,2,3,4};
int32_t matB[ROW*COL] = {2,4,6,8};

matrix32 mat, mat2, mat3;
resMat=&mat;
srcMat1=&mat2;
srcMat2=&mat3;

srcMat1->row=ROW;
srcMat1->col=COL;
srcMat1->pMatrix=matA;

srcMat2->col=COL;
srcMat2->row=ROW;
srcMat2->pMatrix=matB;

resMat->row=ROW;
resMat->col=COL;
resMat->pMatrix=result;

DSP_MatrixAdd32(resMat, srcMat1, srcMat2);

// result[i] = matA[i] + matB[i] = {3,6,9,0xA}
```

5.4.1.5.3.2 DSP_MatrixEqual32 Function

C

```
void DSP_MatrixEqual32(
    matrix32 * resMat,
    matrix32 * srcMat
);
```

Description

Function DSP_MatrixEqual32:

```
void DSP_MatrixEqual32(matrix32 *resMat, matrix32 *srcMat);
```

Vector copy of all elements from one matrix to another. C is a duplicate of A.

Preconditions

None.

Parameters

Parameters	Description
resMat	pointer to completed new Matrix C (*int32_t)
srcMat	pointer to the Matrix A structure (*int32_t)

Returns

None.

Remarks

Execution Time (cycles): 163 cycles + 12 / matrix_element.

Example

```
#define ROW 2
#define COL 2

matrix32 *resMat, *srcMat1, *srcMat2;
int32_t result[ROW*COL];

int32_t matA[ROW*COL] = {5,2,-3,8};

matrix32 mat, mat2;
resMat=&mat;
srcMat1=&mat2;

srcMat1->row=ROW;
srcMat1->col=COL;
srcMat1->pMatrix=matA;

resMat->row=ROW;
resMat->col=COL;
resMat->pMatrix=result;

DSP_MatrixEqual32(resMat, srcMat1, srcMat2);

// result[i] = matA[i] = {5, 2, -3, 8}
```

5.4.1.5.3.3 DSP_MatrixInit32 Function

C

```
void DSP_MatrixInit32(
    int32_t * data_buffer,
```

```

    int N,
    int32_t num
);

```

Description

Function DSP_MatrixInit32:

```
void DSP_MatrixInit32(int32_t *data_buffer, int N, int32_t num);
```

Copy the value num into the first N Matrix elements of data_buffer.

Preconditions

data_buffer must be predefined to be equal to or greater than N elements. N must be a factor of four, or it will truncate to the nearest factor of four.

Parameters

Parameters	Description
data_buffer	pointer to the Matrix to be initialized (int32_t[M*N])
N	number of elements to be initialized (int32_t)
num	value to be initialized into the matrix (int32_t)

Returns

None.

Remarks

None.

Example

```

#define ROW 3
#define COL 3

int32_t numElements = 4; // multiple of 4
int valueElements = -1;

int32_t matA[ROW*COL] = {5,2,-3,8,4,2,-6,8,9};

DSP_MatrixInit32(matA, numElements, valueElements);

// matA[i] = {-1,-1,-1,-1,4,2,-6,8,9}

```

5.4.1.5.3.4 DSP_MatrixMul32 Function

C

```

void DSP_MatrixMul32(
    matrix32 * resMat,
    matrix32 * srcMat1,
    matrix32 * srcMat2
);

```

Description

Function DSP_MatrixMul32:

```
void DSP_MatrixMul32(matrix32 *resMat, matrix32 *srcMat1, matrix32 *srcMat2);
```

Multiplication of two matrices, with inputs and outputs being in fractional Q31 numerical format. The output elements will saturate if the dot product exceeds maximum or minimum fractional values.

Preconditions

Matrices must be aligned such that columns of A = rows of B. resMat must have the format of rows of A, columns of B. All

Matrices must be set into structure (ROWS, COLUMNS, vector_pointer).

Parameters

Parameters	Description
resMat	pointer to different Matrix C structure (*int32_t)
srcMat1	pointer to the Matrix A structure (*int32_t)
srcMat2	pointer to the Matrix B structure (*int32_t)

Returns

None.

Remarks

Execution Time (cycles): 319 cycles + 38 / output matrix_element. The function will saturate the output value if it exceeds maximum limits per element.

Example

```
#define ROW1 3
#define COL1 2
#define ROW2 2
#define COL2 2

matrix32 *resMat, *srcMat1, *srcMat2;
int32_t result[ROW1*COL2];

int32_t test_MatrixA[ROW1*COL1]=
{
    0x40000000,0x20000000,    // 0.5,  0.25
    0xD999999A,0x4CCCCCCC,    // -0.3, 0.6
    0xC0000000,0x0CCCCCDD    // -0.5  0.1
};

int32_t test_MatrixB[ROW2*COL2]=
{
    0x40000000,0x20000000,    // 0.5,  0.25
    0x0CCCCCDD,0xCCCCCDD    // 0.1, -0.4
};

matrix32 mat, mat2, mat3;
resMat=&mat;
srcMat1=&mat2;
srcMat2=&mat3;

srcMat1->row=ROW1;
srcMat1->col=COL1;
srcMat1->pMatrix=test_MatrixA;

srcMat2->col=COL2;
srcMat2->row=ROW2;
srcMat2->pMatrix=test_MatrixB;

resMat->row=ROW1; // note resulting matrix MUST have ROW1 & COL2 format
resMat->col=COL2;
resMat->pMatrix=result;

DSP_MatrixMul32(resMat, srcMat1, srcMat2);

// result[] = matA[] x matB[] =
// { 0x23333333, 0x03333333 // 0.275, 0.025
//   0xF47AE147, 0xD7AE147B // -0.9, -0.315
//   0xE147AE14, 0xEAE147AE } // -0.24, -0.165
```

5.4.1.5.3.5 DSP_MatrixScale32 Function

C

```
void DSP_MatrixScale32(
    int32_t * data_buffer,
    int N,
    int32_t num
);
```

Description

Function DSP_MatrixScale32:

```
void DSP_MatrixScale32(int32_t *data_buffer, int N, int32_t num);
```

Multiply the first N elements of an input buffer by a fixed scalar num. The resulting value is stored back into the input buffer. N number total samples of the input buffer are processed. All values are in Q31 fractional integer format. The result of calculations is saturated to the [MAX32](#) or [MIN32](#) value if exceeded.

Preconditions

data_buffer must be predefined to be equal to or greater than N elements. N must be a factor of four, or will truncate to the nearest factor of four.

Parameters

Parameters	Description
data_buffer	pointer to the Matrix to be initialized (int32_t[M*N])
N	number of elements to be initialized (int)
num	value to be initialized into the matrix (int32_t)

Returns

None.

Remarks

Execution time (cycles): 190 + 9 cycles / element, typical.

Example

```
int32_t numScale = 0x40000000; // 0.5
int valN = 12;
int32_t inputBufScale[12] = {0x40000000, 0x40000000, 0x20000000, 0x20000000,
    0x19999999, 0xCCCCCCCD, 0xF3333333, 0x80000000,
    0x7FFFFFFF, 0x00000000, 0x40000000, 0x70000000 };
// 0.5, 0.5, 0.25, 0.25, 0.25, 0.2, -0.4, -0.1, -1, 1, 0, 0.5, 0.875

DSP_MatrixScale32(inputBufScale, valN, numScale);

// inputBufScale[i] = {0x20000000, 0x20000000, 0x10000000, 0x10000000,
// 0x0CCCCCCC, 0xE6666666, 0xF9999999, 0xC0000000,
// 0x3FFFFFFF, 0x00000000, 0x20000000, 0x38000000}
// 0.25, 0.25, 0.125, 0.125, 0.1, -0.2, -0.05, -0.5, 0.5, 0, 0.25, 0.4375
```

5.4.1.5.3.6 DSP_MatrixSub32 Function

C

```
void DSP_MatrixSub32(
    matrix32 * resMat,
    matrix32 * srcMat1,
    matrix32 * srcMat2
);
```

Description

Function DSP_MatrixSub32:

```
void DSP_MatrixSub32(matrix32 *resMat, matrix32 *srcMat1, matrix32 *srcMat2);
```

Vector subtraction of two matrices, where both have 32-bit integer elements. The resulting output will saturate if element addition exceeds **MAX32** or **MIN32**.

Preconditions

Both matrices must be equivalent in rows and columns. All Matrices must be set into structure (ROWS, COLUMNS, vector_pointer)

Parameters

Parameters	Description
resMat	pointer to different Matrix C structure (*int32_t)
srcMat1	pointer to the Matrix A structure (*int32_t)
srcMat2	pointer to the Matrix B structure (*int32_t)

Returns

None.

Remarks

Execution Time (cycles): 222 cycles + 21 / matrix_element. The function will saturate the output value if it exceeds maximum limits per element.

Example

```
#define ROW 2
#define COL 2

matrix32 *resMat, *srcMat1, *srcMat2;
int32_t result[ROW*COL];

int32_t matA[ROW*COL] = {5, 2, -3, 8};
int32_t matB[ROW*COL] = {2, 2, 2, 2};

matrix32 mat, mat2, mat3;
resMat=&mat;
srcMat1=&mat2;
srcMat2=&mat3;

srcMat1->row=ROW;
srcMat1->col=COL;
srcMat1->pMatrix=matA;

srcMat2->col=COL;
srcMat2->row=ROW;
srcMat2->pMatrix=matB;

resMat->row=ROW;
resMat->col=COL;
resMat->pMatrix=result;

DSP_MatrixSub32(resMat, srcMat1, srcMat2);

// result[i] = matA[i] - matB[i] = {3, 0, -5, 6}
```

5.4.1.5.3.7 DSP_MatrixTranspose32 Function

C

```
void DSP_MatrixTranspose32(
    matrix32 * desMat,
    matrix32 * srcMat
);
```

Description

Function DSP_MatrixTranspose32:

```
void DSP_MatrixTranspose32(matrix32 *desMat, matrix32 *srcMat);
```

Transpose of rows and columns of a matrix.

Preconditions

Matrix definitions for ROWS and COLS must be transposed prior to the function call.

Parameters

Parameters	Description
desMat	pointer to transposed new Matrix C (*int32_t)
srcMat	pointer to the Matrix A structure (*int32_t)

Returns

None.

Remarks

Execution Time (cycles): 210 cycles + 10 / matrix_element.

Example

```
#define ROW 3
#define COL 4

matrix32 *resMat, *srcMat1;
int32_t result[ROW*COL];

int32_t matA[ROW*COL] = { 1,  2,  3,  4,
                          5,  6,  7,  8,
                          -1, -3, -5, -7};

matrix32 mat, mat2;
resMat=&mat;
srcMat1=&mat2;

srcMat1->row=ROW;
srcMat1->col=COL;
srcMat1->pMatrix=matA;

resMat->row=COL; // note the shift in columns and rows
resMat->col=ROW;
resMat->pMatrix=result;

DSP_MatrixTranspose32(resMat, srcMat1);

// result[] = matA(T)[] = {  1,  5, -1,
//                           2,  6, -3,
//                           3,  7, -5,
//                           4,  8, -7}
```

5.4.1.5.4 Transform Functions

5.4.1.5.4.1 DSP_TransformFFT16 Function

C

```
void DSP_TransformFFT16(
    int16c * dout,
    int16c * din,
    int16c * twiddles,
    int16c * scratch,
    int log2N
);
```

Description

Function DSP_TransformFFT16:

```
void DSP_TransformFFT16(int16c *dout, int16c *din, int16c *twiddles, int16c *scratch, int log2N);
```

Performs an complex FFT on the input, din, and stores the complex result in dout. Performs $2^{\log_2 N}$ point calculation, and the working buffer scratch as well as the input and output must be $2^{\log_2 N}$ in length. Coefficient twiddle factors come from twiddles, and may be loaded with the use of [DSP_TransformFFT16_setup](#). All values are 16 bit (Q15) fractional.

Preconditions

din, dout, twiddles and scratch must have N elements N is calculated as $2^{\log_2 N}$ $\log_2 N$ must be ≥ 3 FFT factors must be calculated in advance, use [DSP_TransformFFT16_setup](#)

Parameters

Parameters	Description
dout	pointer to complex output array (int16c)
din	pointer to complex input array (int16c)
twiddles	pointer to an complex array of factors (int16c)
scratch	pointer to a complex scratch pad buffer (int16c)
log2N	binary exponent of number of samples (int)

Returns

None.

Remarks

Scratch must be declared but need not be initialized. Din may be aided with a window function prior to calling the FFT, but is not required. Din is a complex number array, but may be loaded solely with real numbers if no phase information is available.

Example

```
int log2N = 8; // log2(256) = 8
int fftSamples = 256;

int16c *fftDin;
int16c fftDout[fftSamples];
int16c scratch[fftSamples];
int16c fftCoefs[fftSamples];

int16c *fftc;
fftc = &fftCoefs;

DSP_TransformFFT16_setup(fftc, log2N); // call setup function

while (1)
```

```

{
    fftDin = &ffftin_8Khz_long_window16;  // get 256 point complex data

    DSP_TransformFFT16(fftDout, fftDin, fftc, scratch, log2N);

    // do something with the output, fftDout
};

```

5.4.1.5.4.2 DSP_TransformFFT16_setup Function

C

```

void DSP_TransformFFT16_setup(
    int16c * twiddles,
    int log2N
);

```

Description

Function DSP_TransformFFT16_setup:

```
void DSP_TransformFFT16_setup(int16c *twiddles, int log2N);
```

Calculates the N twiddle factors required to operate the FFT16 function. These factors are done in serial fashion, and require considerable processing power. Ideally this function would be run only once prior to an ongoing FFT, and the results held in a buffer.

Preconditions

twiddles must be N in length N is calculated ($2^{\log 2N}$)

Parameters

Parameters	Description
twiddles	pointer to a complex array of factors (int16c)
log2N	binary exponent of number of data points (int)

Returns

None.

Remarks

This function is of considerable length and executed in C. It is recommended it only be called once for any given FFT length in time sensitive applications.

Example

see DSP_TransformFFT16 [for](#) example.

5.4.1.5.4.3 DSP_TransformFFT32 Function

C

```

void DSP_TransformFFT32(
    int32c * dout,
    int32c * din,
    int32c * twiddles,
    int32c * scratch,
    int log2N
);

```

Description

Function DSP_TransformFFT32:

```
void DSP_TransformFFT32(int32c *dout, int32c *din, int32c *twiddles, int32c *scratch, int log2N);
```

Performs an complex FFT on the input, din, and stores the complex result in dout. Performs $2^{\log_2 N}$ point calculation, and the working buffer scratch as well as the input and output must be $2^{\log_2 N}$ in length. Coefficient twiddle factors come from twiddles, and may be loaded with the use of [DSP_TransformFFT16_setup](#). All values are 16 bit (Q31) fractional.

Preconditions

din, dout, twiddles and scratch must have N elements N is calculated as $2^{(\log_2 N)}$ $\log_2 N$ must be ≥ 3 FFT factors must be calculated in advance, use [DSP_TransformFFT32_setup](#)

Parameters

Parameters	Description
dout	pointer to complex output array (int32c)
din	pointer to complex input array (int32c)
twiddles	pointer to an complex array of FFT factors (int32c)
scratch	pointer to a complex scratch pad buffer (int32c)
log2N	binary exponent of number of samples (int)

Returns

None.

Remarks

Scratch must be declared but need not be initialized. Din may be aided with a window function prior to calling the FFT, but is not required. Din is a complex number array, but may be loaded solely with real numbers if no phase information is available.

Example

```
int log2N = 8; // log2(256) = 8
int fftSamples = 256;

int32c *fftDin;
int32c  fftDout[fftSamples];
int32c  scratch[fftSamples];
int32c  fftCoefs[fftSamples];

int32c *fftc;
fftc = &fftCoefs;

DSP_TransformFFT32_setup(fftc, log2N); // call setup function

while (1)
{
    fftDin = &fftin_5Khz_long_window32; // get 256 point complex data

    DSP_TransformFFT32(fftDout, fftDin, fftc, scratch, log2N);

    // do something with the output, fftDout
};
```

5.4.1.5.4.4 DSP_TransformFFT32_setup Function

C

```
void DSP_TransformFFT32_setup(
    int32c * twiddles,
    int log2N
);
```

Description

Function DSP_TransformFFT32_setup:

```
void DSP_TransformFFT32_setup(int32c *twiddles, int log2N);
```

Calculates the N FFT twiddle factors required to operate the FFT32 function. These factors are done in serial fashion, and require considerable processing power. Ideally this function would be run only once prior to an ongoing FFT, and the results held in a buffer.

Preconditions

twiddles must be N in length N is calculated ($2^{\log_2 N}$)

Parameters

Parameters	Description
twiddles	pointer to a complex array of coefficients (int32c)
log2N	binary exponent of number of data points (int)

Returns

None.

Remarks

This function is of considerable length and executed in C. It is recommended it only be called once for any given FFT length in time sensitive applications.

Example

see `DSP_TransformFFT32` [for](#) example.

5.4.1.5.4.5 DSP_TransformIFFT16 Function

C

```
void DSP_TransformIFFT16(
    int16c * dout,
    int16c * din,
    int16c * twiddles,
    int16c * scratch,
    int log2N
);
```

Description

Function DSP_TransformIFFT16:

```
void DSP_TransformIFFT16(int16c *dout, int16c *din, int16c *twiddles, int16c *scratch, int log2N);
```

Performs an complex Inverse FFT on the input, din, and stores the complex result in dout. Performs $2^{\log_2 N}$ point calculation, and the working buffer scratch as well as the input and output must be $2^{\log_2 N}$ in length. Coefficient twiddle factors come from twiddles, and may be loaded with the use of [DSP_TransformFFT16_setup](#). All values are 16 bit (Q15) fractional.

Preconditions

din, dout, twiddles and scratch must have N elements N is calculated as $2^{(\log_2 N)}$ $\log_2 N$ must be ≥ 3 FFT factors must be calculated in advance, use [DSP_TransformFFT16_setup](#)

Parameters

Parameters	Description
dout	pointer to complex output array (int16c)
din	pointer to complex input array (int16c)
twiddles	pointer to an complex array of factors (int16c)
scratch	pointer to a complex scratch pad buffer (int16c)
log2N	binary exponent of number of samples (int)

Returns

None.

Remarks

Scratch must be declared but need not be initialized. Din may be aided with a window function prior to calling the FFT, but is not required. A very similar function to the FFT is executed for the inverse FFT. This requires twiddle factors set in advance with the same method as used in the FFT. Complex conjugate and scaling are handled within the algorithm. The output is scaled using binary shifting based on log2N. Since the algorithm reduces the output by a scale factor of log2N, the resolution is reduced proportionally to the number of data points.

Example

```
int ilog2N = 10; // log2(64) = 6; log2(256) = 8; log2(1024) = 10;
int ifftSamples = pow(2,ilog2N);

int16c *ifftDin;
int16c ifftDout[ifftSamples];
int16c iscratch[ifftSamples];
int16c ifftCoefs[ifftSamples];
int16c ifftTimeOut[ifftSamples];

// set up twiddle factors, these are used for both FFT and iFFT

int16c *ifftc;
ifftc = &ifftCoefs;
DSP_TransformFFT16_setup( ifftc, ilog2N); // call to coef setup

// in this example, we take an FFT of an original time domain (sine wave)
// the output of the FFT is used as the input of the iFFT for comparison

ifftDin = &fftin_800hz_verylong16;
DSP_TransformFFT16(ifftDout, ifftDin, ifftc, iscratch, ilog2N);

// ifftDout = frequency domain output, complex number array

DSP_TransformIFFT16(ifftTimeOut, ifftDout, ifftc, iscratch, ilog2N);

// do something with the output, fftTimeOut, time domain
```

5.4.1.5.4.6 DSP_TransformWindow_Bart16 Function**C**

```
void DSP_TransformWindow_Bart16(
    int16_t * OutVector,
    int16_t * InVector,
    int N
);
```

Description

Function DSP_TransformWindow_Bart16:

```
void DSP_TransformWindow_Bart16(int16_t *OutVector, int16_t *InVector, int N);
```

Compute a Bartlett (Triangle) Window on the first N samples of the input vector, InVector. The output is stored in OutVector. Operations are performed at higher resolution and rounded for the most accuracy possible. Input and output values are in Q15 fractional format. The Bartlett Window follows the equation:

Window(n) = 1 - (abs(2*n - N)/N) where n is the window sample number N is the total number of samples The functional output computes WinVector(n) = Window(n) * InVector(n)

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int16_t)
N	number of samples (int)

Returns

None.

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library.

Example

```
int16_t OutVector16[8]={0};
int WindowN = 8;

for (i=0;i<WindowN;i++)
{
    InVector16[i]= 0x4000; // constant 0.5 for functional testing
}

DSP_TransformWindow_Bart16(OutVector16, InVector16, WindowN);
// OutWindow = 0x0000, 0x1000, 0x2000, 0x3000, 0x4000, 0x3000, 0x2000, 0x1000
```

5.4.1.5.4.7 DSP_TransformWindow_Bart32 Function**C**

```
void DSP_TransformWindow_Bart32(
    int32_t * OutVector,
    int32_t * InVector,
    int N
);
```

Description

Function DSP_TransformWindow_Bart32:

```
void DSP_TransformWindow_Bart32(int32_t *OutVector, int32_t *InVector, int N);
```

Compute a Bartlett (Triangle) Window on the first N samples of the input vector, InVector. The output is stored in OutVector. Operations are performed at higher resolution and rounded for the most accuracy possible. Input and output values are in Q31 fractional format. The Bartlett Window follows the equation:

$Window(n) = 1 - (abs(2*n - N)/N)$ where n is the window sample number N is the total number of samples The functional output computes $WinVector(n) = Window(n) * InVector(n)$

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int32_t)
N	number of samples (int)

Returns

None.

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library.

Example

```
int32_t OutVector32[8]={0};
int WindowN = 8;

for (i=0;i<WindowN;i++)
{
    InVector32[i]= 0x40000000; // constant 0.5 for functional testing
}

DSP_TransformWindow_Bart32(OutVector32, InVector32, WindowN);
// OutWindow = 0x0, 0x10000000, 0x20000000, 0x30000000, 0x40000000,
//              0x30000000, 0x20000000, 0x10000000
```

5.4.1.5.4.8 DSP_TransformWindow_Black16 Function**C**

```
void DSP_TransformWindow_Black16(
    int16_t * OutVector,
    int16_t * InVector,
    int N
);
```

Description

Function DSP_TransformWindow_Black16:

```
void DSP_TransformWindow_Black16(int16_t *OutVector, int16_t *InVector, int N);
```

Compute a Blackman Window on the first N samples of the input vector, InVector. The output is stored in OutVector. Operations are performed at higher resolution and rounded for the most accuracy possible. Input and output values are in Q15 fractional format. The Blackman Window follows the equation:

$Window(n) = 0.42659 - 0.49656 * \cos(2\pi n/(N-1)) + 0.076849 * \cos(4\pi n/(N-1))$ where n is the window sample number N is the total number of samples The functional output computes $WinVector(n) = Window(n) * InVector(n)$

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int16_t)
N	number of samples (int)

Returns

None.

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library.

Example

```
int16_t OutVector16[8]={0};
int WindowN = 8;
```

```

for (i=0;i<WindowN;i++)
{
    InVector16[i]= 0x4000; // constant 0.5 for functional testing
}

DSP_TransformWindow_Black16(OutVector16, InVector16, WindowN);
// OutWindow = 0x0071, 0x0665, 0x1DF1, 0x3B00, 0x3B00, 0x1DF1, 0x0665, 0x0071

```

5.4.1.5.4.9 DSP_TransformWindow_Black32 Function

C

```

void DSP_TransformWindow_Black32(
    int32_t * OutVector,
    int32_t * InVector,
    int N
);

```

Description

Function DSP_TransformWindow_Black32:

```
void DSP_TransformWindow_Black32(int32_t *OutVector, int32_t *InVector, int N);
```

Compute a Blackman Window on the first N samples of the input vector, InVector. The output is stored in OutVector. Operations are performed at higher resolution and rounded for the most accuracy possible. Input and output values are in Q31 fractional format. The Blackman Window follows the equation:

Window(n) = 0.42659 - 0.49656 * COS(2*Pi*n/(N-1)) + 0.076849 * COS(4*Pi*n/(N-1)) where n is the window sample number N is the total number of samples The functional output computes WinVector(n) = Window(n) * InVector(n)

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int32_t)
N	number of samples (int)

Returns

None.

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library.

Example

```

int32_t OutVector32[8]={0};
int WindowN = 8;

for (i=0;i<WindowN;i++)
{
    InVector32[i]= 0x40000000; // constant 0.5 for functional testing
}

DSP_TransformWindow_Black32(OutVector32, InVector32, WindowN);
// OutWindow = 0x0070B490, 0x06649680, 0x1DF13240, 0x3B003D80, 0x3B003D80,
//              0x1DF13240, 0x06649680, 0x0070B490

```

5.4.1.5.4.10 DSP_TransformWindow_Cosine16 Function

C

```
void DSP_TransformWindow_Cosine16(
    int16_t * OutVector,
    int16_t * InVector,
    int N
);
```

Description

Function DSP_TransformWindow_Cosine16:

```
void DSP_TransformWindow_Cosine16(int16_t *OutVector, int16_t *InVector, int N);
```

Compute a Cosine Window on the first N samples of the input vector, InVector. The output is stored in OutWindow. Operations are performed at higher resolution and rounded for the most accuracy possible. Input and output values are in Q15 fractional format. The Cosine Window follows the equation:

Window(n) = SIN(Pi*n/(N-1)) where n is the window sample number N is the total number of samples The functional output computes WinVector(n) = Window(n) * InVector(n)

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int16_t)
N	number of samples (int)

Returns

None.

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library.

Example

```
int16_t OutVector16[8]={0};
int WindowN = 8;

for (i=0;i<WindowN;i++)
{
    InVector16[i]= 0x4000; // constant 0.5 for functional testing
}

DSP_TransformWindow_Cosine16(OutVector16, InVector16, WindowN);
// OutWindow = 0x0000, 0x1BC5, 0x320A, 0x3E65, 0x3E65, 0x320A, 0x1BC5, 0x0071
```

5.4.1.5.4.11 DSP_TransformWindow_Cosine32 Function

C

```
void DSP_TransformWindow_Cosine32(
    int32_t * OutVector,
    int32_t * InVector,
    int N
);
```

Description

Function DSP_TransformWindow_Cosine32:

```
void DSP_TransformWindow_Cosine32(int32_t *OutVector, int32_t *InVector, int N);
```

Compute a Cosine Window on the first N samples of the input vector, InVector. The output is stored in OutWindow. Operations are performed at higher resolution and rounded for the most accuracy possible. Input and output values are in Q31 fractional format. The Cosine Window follows the equation:

$Window(n) = \sin(\pi n / (N-1))$ where n is the window sample number N is the total number of samples The functional output computes $WinVector(n) = Window(n) * InVector(n)$

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int32_t)
N	number of samples (int)

Returns

None.

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library.

Example

```
int32_t OutVector32[8]={0};
int WindowN = 8;

for (i=0;i<WindowN;i++)
{
    InVector32[i]= 0x40000000; // constant 0.5 for functional testing
}

DSP_TransformWindow_Cosine32(OutVector32, InVector32, WindowN);
// OutWindow = 0x00000000, 0x1BC4C060, 0x32098700, 0x3E653800, 0x3E653800,
//              0x32098700, 0x1BC4C060, 0x00000000
```

5.4.1.5.4.12 DSP_TransformWindow_Hamm16 Function

C

```
void DSP_TransformWindow_Hamm16(
    int16_t * OutVector,
    int16_t * InVector,
    int N
);
```

Description

Function DSP_TransformWindow_Hamm16:

```
void DSP_TransformWindow_Hamm16(int16_t *OutVector, int16_t *InVector, int N);
```

Compute a Hamming Window on the first N samples of the input vector, InVector. The output is stored in OutVector. Operations are performed at higher resolution and rounded for the most accuracy possible. Input and output values are in Q15 fractional format. The Hamming Window follows the equation:

$Window(n) = 0.54 - 0.46 * \cos(2 * \pi * n / N)$ where n is the window sample number N is the total number of samples The functional output computes $WinVector(n) = Window(n) * InVector(n)$

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int16_t)
N	number of samples (int)

Returns

None.

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library.

Example

```
int16_t OutVector16[8]={0};
int WindowN = 8;

for (i=0;i<WindowN;i++)
{
    InVector16[i]= 0x4000; // constant 0.5 for functional testing
}

DSP_TransformWindow_Hamm16(OutVector16, InVector16, WindowN);
// OutWindow = 0x051F, 0x0DBE, 0x228F, 0x3761, 0x4000, 0x3761, 0x228F, 0x0DBE
```

5.4.1.5.4.13 DSP_TransformWindow_Hamm32 Function**C**

```
void DSP_TransformWindow_Hamm32(
    int32_t * OutVector,
    int32_t * InVector,
    int N
);
```

Description

Function DSP_TransformWindow_Hamm32:

```
void DSP_TransformWindow_Hamm32(int32_t *OutVector, int32_t *InVector, int N);
```

Compute a Hamming Window on the first N samples of the input vector, InVector. The output is stored in OutVector. Operations are performed at higher resolution and rounded for the most accuracy possible. Input and output values are in Q31 fractional format. The Hamming Window follows the equation:

$Window(n) = 0.54 - 0.46 * \cos(2 * \pi * n / N)$ where n is the window sample number N is the total number of samples The functional output computes $WinVector(n) = Window(n) * InVector(n)$

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int32_t)
N	number of samples (int)

Returns

None.

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library.

Example

```
int32_t OutVector32[8]={0};
int WindowN = 8;

for (i=0;i<WindowN;i++)
{
    InVector32[i]= 0x40000000; // constant 0.5 for functional testing
}

DSP_TransformWindow_Hamm32(OutVector32, InVector32, WindowN);
// OutWindow = 0x051EB860, 0x0DBE26C0, 0x228F5C40, 0x37609200, 0x40000000,
//              0x37609200, 0x228F5C40, 0x0DBE26C0
```

5.4.1.5.4.14 DSP_TransformWindow_Hann16 Function**C**

```
void DSP_TransformWindow_Hann16(
    int16_t * OutVector,
    int16_t * InVector,
    int N
);
```

Description

Function DSP_TransformWindow_Hann16:

```
void DSP_TransformWindow_Hann16(int16_t *OutVector, int16_t *InVector, int N);
```

Compute a Hanning Window on the first N samples of the input vector, InVector. The output is stored in OutVector. Operations are performed at higher resolution and rounded for the most accuracy possible. Input and output values are in Q15 fractional format. The Hanning Window follows the equation:

Window(n) = 0.5 - 0.5 * COS(2*Pi*n/N) where n is the window sample number N is the total number of samples The functional output computes WinVector(n) = Window(n) * InVector(n)

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int16_t)
N	number of samples (int)

Returns

None.

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library.

Example

```
int16_t OutVector16[8]={0};
int WindowN = 8;

for (i=0;i<WindowN;i++)
{
    InVector16[i]= 0x4000; // constant 0.5 for functional testing
}
```

```

}

    DSP_TransformWindow_Hann16(OutVector16, InVector16, WindowN);
    // OutWindow = 0x0000, 0x095F, 0x2000, 0x36A1, 0x4000, 0x36A1, 0x2000, 0x095F

```

5.4.1.5.4.15 DSP_TransformWindow_Hann32 Function

C

```

void DSP_TransformWindow_Hann32(
    int32_t * OutVector,
    int32_t * InVector,
    int N
);

```

Description

Function DSP_TransformWindow_Hann32:

```
void DSP_TransformWindow_Hann32(int32_t *OutVector, int32_t *InVector, int N);
```

Compute a Hanning Window on the first N samples of the input vector, InVector. The output is stored in OutVector. Operations are performed at higher resolution and rounded for the most accuracy possible. Input and output values are in Q31 fractional format. The Hanning Window follows the equation:

Window(n) = 0.5 - 0.5 * COS(2*Pi*n/N) where n is the window sample number N is the total number of samples The functional output computes WinVector(n) = Window(n) * InVector(n)

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int32_t)
N	number of samples (int)

Returns

None.

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library.

Example

```

int32_t OutVector32[8]={0};
int WindowN = 8;

for (i=0;i<WindowN;i++)
{
    InVector32[i]= 0x40000000; // constant 0.5 for functional testing
}

    DSP_TransformWindow_Hann32(OutVector32, InVector32, WindowN);
    // OutWindow = 0x00000000, 0x095F61C0, 0x20000000, 0x36A09E80, 0x40000000,
    //              0x36A09E80, 0x20000000, 0x095F61C0

```

5.4.1.5.4.16 DSP_TransformWindow_Kaiser16 Function

C

```

void DSP_TransformWindow_Kaiser16(
    int16_t * OutVector,
    int16_t * InVector,

```

```
    int N
);
```

Description

Function DSP_TransformWindow_Kaiser16:

```
void DSP_TransformWindow_Kaiser16(int16_t *OutVector, int16_t *InVector, int N);
```

Compute a Kaiser Window on the first N samples of the input vector, InVector. The output is stored in OutVector. Operations are performed at higher resolution and rounded for the most accuracy possible. Input and output values are in Q15 fractional format. The Hanning Window follows the equation:

Window(n) = 0.402 - 0.498 * COS(2*Pi*n/N) + 0.098 * cos(4*Pi*n/N) + 0.001 * cos(6*Pi*n/N) where n is the window sample number N is the total number of samples The functional output computes WinVector(n) = Window(n) * InVector(n)

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int16_t)
N	number of samples (int)

Returns

None.

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library.

Example

```
int16_t OutVector16[8]={0};
int WindowN = 8;

for (i=0;i<WindowN;i++)
{
    InVector16[i]= 0x4000; // constant 0.5 for functional testing
}

DSP_TransformWindow_Kaiser16(OutVector16, InVector16, WindowN);
// OutWindow = 0x0031, 0x0325, 0x1375, 0x304F, 0x3FCF, 0x304F, 0x1375, 0x0325
```

5.4.1.5.4.17 DSP_TransformWindow_Kaiser32 Function

C

```
void DSP_TransformWindow_Kaiser32(
    int32_t * OutVector,
    int32_t * InVector,
    int N
);
```

Description

Function DSP_TransformWindow_Kaiser32:

```
void DSP_TransformWindow_Kaiser32(int32_t *OutVector, int32_t *InVector, int N);
```

Compute a Kaiser Window on the first N samples of the input vector, InVector. The output is stored in OutVector. Operations are performed at higher resolution and rounded for the most accuracy possible. Input and output values are in Q31 fractional format. The Hanning Window follows the equation:

$\text{Window}(n) = 0.402 - 0.498 * \cos(2\pi n/N) + 0.098 * \cos(4\pi n/N) + 0.001 * \cos(6\pi n/N)$ where n is the window sample number N is the total number of samples The functional output computes $\text{WinVector}(n) = \text{Window}(n) * \text{InVector}(n)$

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int32_t)
N	number of samples (int)

Returns

None.

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library.

Example

```
int32_t OutVector32[8]={0};
int WindowN = 8;

for (i=0;i<WindowN;i++)
{
    InVector32[i]= 0x40000000; // constant 0.5 for functional testing
}

DSP_TransformWindow_Kaiser32(OutVector32, InVector32, WindowN);
// OutWindow = 0x003126F6, 0x032555C8, 0x1374BCA0, 0x304F66C0, 0x3FCED900,
//              0x304F66C0, 0x1374BCA0, 0x032555C8
```

5.4.1.5.4.18 DSP_TransformWinInit_Bart16 Function

C

```
void DSP_TransformWinInit_Bart16(
    int16_t * OutWindow,
    int N
);
```

Description

Function DSP_TransformWinInit_Bart16:

```
void DSP_TransformWinInit_Bart16(int16_t *OutWindow, int N);
```

Create a N -element Bartlett (Triangle) Window, and store the output to OutWindow. Operations are performed at higher resolution floating point, and rounded for the most accuracy possible. Output values are in Q15 fractional format. The Bartlett Window follows the equation:

$\text{Window}(n) = 1 - (\text{abs}(2*n - N)/N)$ where n is the window sample number N is the total number of samples

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int16_t)
N	number of samples (int)

Returns

None.

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library. The functional window is an intermediate result that needs to be multiplied by an input vector prior to FFT processing. Because of significant processing time the window need only be computed once and the multiply of the (window * input) vector done during recurring loop processing.

Example**5.4.1.5.4.19 DSP_TransformWinInit_Bart32 Function****C**

```
void DSP_TransformWinInit_Bart32(
    int32_t * OutWindow,
    int N
);
```

Description

Function DSP_TransformWinInit_Bart32:

```
void DSP_TransformWinInit_Bart32(int32_t *OutWindow, int N);
```

Create a N-element Bartlett (Triangle) Window, and store the output to OutWindow. Operations are performed at higher resolution floating point, and rounded for the most accuracy possible. Output values Q31 fractional format. The Bartlett Window follows the equation:

Window(n) = 1 - (abs(2*n - N)/N) where n is the window sample number N is the total number of samples

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int32_t)
N	number of samples (int)

Returns

None.

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library. The functional window is an intermediate result that needs to be multiplied by an input vector prior to FFT processing. Because of significant processing time the window need only be computed once and the multiply of the (window * input) vector done during recurring loop processing.

Example**5.4.1.5.4.20 DSP_TransformWinInit_Black16 Function****C**

```
void DSP_TransformWinInit_Black16(
```

```

    int16_t * OutWindow,
    int N
);

```

Description

Function DSP_TransformWinInit_Black16:

```
void DSP_TransformWinInit_Black16(int16_t *OutWindow, int N);
```

Create a N-element Blackman Window, and store the output to OutWindow. Operations are performed at higher resolution floating point, and rounded for the most accuracy possible. Output values are Q16 fractional format. The Blackman Window follows the equation:

Window(n) = 0.42659 - 0.49656 * COS(2*Pi*n/(N-1)) + 0.076849 * COS(4*Pi*n/(N-1)) where n is the window sample number N is the total number of samples

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int16_t)
N	number of samples (int)

Returns

None.

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library. The functional window is an intermediate result that needs to be multiplied by an input vector prior to FFT processing. Because of significant processing time the window need only be computed once and the multiply of the (window * input) vector done during recurring loop processing.

Example

5.4.1.5.4.21 DSP_TransformWinInit_Black32 Function

C

```

void DSP_TransformWinInit_Black32(
    int32_t * OutWindow,
    int N
);

```

Description

Function DSP_TransformWinInit_Black32:

```
void DSP_TransformWinInit_Black32(int32_t *OutWindow, int N);
```

Create a N-element Blackman Window, and store the output to OutWindow. Operations are performed at higher resolution floating point, and rounded for the most accuracy possible. Output values are Q31 fractional format. The Blackman Window follows the equation:

Window(n) = 0.42659 - 0.49656 * COS(2*Pi*n/(N-1)) + 0.076849 * COS(4*Pi*n/(N-1)) where n is the window sample number N is the total number of samples

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int32_t)
N	number of samples (int)

Returns

None.

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library. The functional window is an intermediate result that needs to be multiplied by an input vector prior to FFT processing. Because of significant processing time the window need only be computed once and the multiply of the (window * input) vector done during recurring loop processing.

Example**5.4.1.5.4.22 DSP_TransformWinInit_Cosine16 Function****C**

```
void DSP_TransformWinInit_Cosine16(
    int16_t * OutWindow,
    int N
);
```

Description

Function DSP_TransformWinInit_Cosine16:

```
void DSP_TransformWinInit_Cosine16(int16_t *OutWindow, int N);
```

Create a N-element Cosine Window, and store the output to OutWindow. Operations are performed at higher resolution floating point, and rounded for the most accuracy possible. Output values are in Q15 fractional format. The Cosine Window follows the equation:

Window(n) = SIN(Pi*n/(N-1)) where n is the window sample number N is the total number of samples

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int16_t)
N	number of samples (int)

Returns

None.

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library. The functional window is an intermediate result that needs to be multiplied by an input vector prior to FFT processing. Because of significant processing time the window need only be computed once and the multiply of the (window * input) vector done

during recurring loop processing.

Example

5.4.1.5.4.23 DSP_TransformWinInit_Cosine32 Function

C

```
void DSP_TransformWinInit_Cosine32(
    int32_t * OutWindow,
    int N
);
```

Description

Function DSP_TransformWinInit_Cosine32:

```
void DSP_TransformWinInit_Cosine32(int32_t *OutWindow, int N);
```

Create a N-element Cosine Window, and store the output to OutWindow. Operations are performed at higher resolution floating point, and rounded for the most accuracy possible. Output values are in Q31 fractional format. The Cosine Window follows the equation:

Window(n) = SIN(Pi*n/(N-1)) where n is the window sample number N is the total number of samples

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int32_t)
N	number of samples (int)

Returns

None.

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library. The functional window is an intermediate result that needs to be multiplied by an input vector prior to FFT processing. Because of significant processing time the window need only be computed once and the multiply of the (window * input) vector done during recurring loop processing.

Example

5.4.1.5.4.24 DSP_TransformWinInit_Hamm16 Function

C

```
void DSP_TransformWinInit_Hamm16(
    int16_t * OutWindow,
    int N
);
```

Description

Function DSP_TransformWinInit_Hamm16:

```
void DSP_TransformWinInit_Hamm16(int16_t *OutWindow, int N);
```

Create a N-element Hamming Window, and store the output to OutWindow. Operations are performed at higher resolution

floating point, and rounded for the most accuracy possible. Output values are in Q15 fractional format. The Hamming Window follows the equation:

$\text{Window}(n) = 0.54 - 0.46 * \cos(2\pi n/N)$ where n is the window sample number N is the total number of samples

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int16_t)
N	number of samples (int)

Returns

None.

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library. The functional window is an intermediate result that needs to be multiplied by an input vector prior to FFT processing. Because of significant processing time the window need only be computed once and the multiply of the (window * input) vector done during recurring loop processing.

Example

5.4.1.5.4.25 DSP_TransformWinInit_Hamm32 Function

C

```
void DSP_TransformWinInit_Hamm32(
    int32_t * OutWindow,
    int N
);
```

Description

Function DSP_TransformWinInit_Hamm32:

```
void DSP_TransformWinInit_Hamm32(int32_t *OutWindow, int N);
```

Create a N -element Hamming Window, and store the output to OutWindow. Operations are performed at higher resolution floating point, and rounded for the most accuracy possible. Output values are in Q31 fractional format. The Hamming Window follows the equation:

$\text{Window}(n) = 0.54 - 0.46 * \cos(2\pi n/N)$ where n is the window sample number N is the total number of samples

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int32_t)
N	number of samples (int)

Returns

None.

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library. The functional window is an intermediate result that needs to be multiplied by an input vector prior to FFT processing. Because of significant processing time the window need only be computed once and the multiply of the (window * input) vector done during recurring loop processing.

Example**5.4.1.5.4.26 DSP_TransformWinInit_Hann16 Function****C**

```
void DSP_TransformWinInit_Hann16(
    int16_t * OutWindow,
    int N
);
```

Description

Function DSP_TransformWinInit_Hann16:

```
void DSP_TransformWinInit_Hann16(int16_t *OutWindow, int N);
```

Create a N-element Hanning Window, and store the output to OutWindow. Operations are performed at higher resolution floating point, and rounded for the most accuracy possible. Output values are in Q15 fractional format. The Hanning Window follows the equation:

Window(n) = 0.5 - 0.5 * COS(2*Pi*n/N) where n is the window sample number N is the total number of samples

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int16_t)
N	number of samples (int)

Returns

None.

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library. The functional window is an intermediate result that needs to be multiplied by an input vector prior to FFT processing. Because of significant processing time the window need only be computed once and the multiply of the (window * input) vector done during recurring loop processing.

Example**5.4.1.5.4.27 DSP_TransformWinInit_Hann32 Function****C**

```
void DSP_TransformWinInit_Hann32(
    int32_t * OutWindow,
    int N
);
```

Description

Function DSP_TransformWinInit_Hann32:

```
void DSP_TransformWinInit_Hann32(int32_t *OutWindow, int N);
```

Create a N-element Hanning Window, and store the output to OutWindow. Operations are performed at higher resolution floating point, and rounded for the most accuracy possible. Output values are in Q31 fractional format. The Hanning Window follows the equation:

Window(n) = 0.5 - 0.5 * COS(2*Pi*n/N) where n is the window sample number N is the total number of samples

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int32_t)
N	number of samples (int)

Returns

None.

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library. The functional window is an intermediate result that needs to be multiplied by an input vector prior to FFT processing. Because of significant processing time the window need only be computed once and the multiply of the (window * input) vector done during recurring loop processing.

Example**5.4.1.5.4.28 DSP_TransformWinInit_Kaiser16 Function****C**

```
void DSP_TransformWinInit_Kaiser16(
    int16_t * OutWindow,
    int N
);
```

Description

Function DSP_TransformWinInit_Kaiser16:

```
void DSP_TransformWinInit_Kaiser16(int16_t *OutWindow, int N);
```
