OSC_AUX_MODE_HS	High speed crystal
OSC_AUX_DISABLE	AUX Oscillator disabled

Remarks

This enumeration is processor specific and is defined in the processor- specific header files.

5.6.14.6.13.7 OSC_AUXPLL_IN_DIV Enumeration

C

```
typedef enum {  
    OSC_AUXPLL_IN_DIV_1,  
    OSC_AUXPLL_IN_DIV_2,  
    OSC_AUXPLL_IN_DIV_3,  
    OSC_AUXPLL_IN_DIV_4,  
    OSC_AUXPLL_IN_DIV_5,  
    OSC_AUXPLL_IN_DIV_6,  
    OSC_AUXPLL_IN_DIV_10,  
    OSC_AUXPLL_IN_DIV_12  
} OSC_AUXPLL_IN_DIV;
```

Description

AUX PLL Input divider.

This enumeration lists the possible Auxiliary PLL input divider values.

Members

Members	Description
OSC_AUXPLL_IN_DIV_1	Input divided by 1
OSC_AUXPLL_IN_DIV_2	Input divided by 2
OSC_AUXPLL_IN_DIV_3	Input divided by 3
OSC_AUXPLL_IN_DIV_4	Input divided by 4
OSC_AUXPLL_IN_DIV_5	Input divided by 5
OSC_AUXPLL_IN_DIV_6	Input divided by 6
OSC_AUXPLL_IN_DIV_10	Input divided by 10
OSC_AUXPLL_IN_DIV_12	Input divided by 12

Remarks

This enumeration is processor specific and is defined in the processor- specific header files.

5.6.14.6.13.8 OSC_AUXPLL_MULTIPLIER Enumeration

C

```
typedef enum {  
    OSC_AUXPLL_MULTIPLIER_4  
} OSC_AUXPLL_MULTIPLIER;
```

Description

Aux PLL Multiplier

This enumeration lists the possible Auxiliary PLL multiplier

Members

Members	Description
OSC_AUXPLL_MULTIPLIER_4	Auxiliary PLL multiplier value is 1:4

Remarks

This enumeration is processor specific and is defined in the processor- specific header files.

5.6.14.6.13.9 OSC_AUXPLL_OUT_DIV Enumeration

C

```
typedef enum {  
    OSC_AUXPLL_OUT_DIV_1,  
    OSC_AUXPLL_OUT_DIV_2,  
    OSC_AUXPLL_OUT_DIV_4,  
    OSC_AUXPLL_OUT_DIV_8,  
    OSC_AUXPLL_OUT_DIV_16,  
    OSC_AUXPLL_OUT_DIV_32,  
    OSC_AUXPLL_OUT_DIV_64,  
    OSC_AUXPLL_OUT_DIV_256  
} OSC_AUXPLL_OUT_DIV;
```

Description

AUX PLL Output divider.

This enumeration lists the possible Auxiliary PLL output divider values.

Members

Members	Description
OSC_AUXPLL_OUT_DIV_1	output divided by 1
OSC_AUXPLL_OUT_DIV_2	output divided by 2
OSC_AUXPLL_OUT_DIV_4	output divided by 4
OSC_AUXPLL_OUT_DIV_8	output divided by 8
OSC_AUXPLL_OUT_DIV_16	output divided by 16
OSC_AUXPLL_OUT_DIV_32	output divided by 32
OSC_AUXPLL_OUT_DIV_64	output divided by 64
OSC_AUXPLL_OUT_DIV_256	output divided by 256

Remarks

This enumeration is processor specific and is defined in the processor- specific header files.

5.6.14.6.13.10 OSC_DOZE_RATIO Enumeration**C**

```
typedef enum {
    OSC_DOZE_RATIO_1,
    OSC_DOZE_RATIO_2,
    OSC_DOZE_RATIO_4,
    OSC_DOZE_RATIO_8,
    OSC_DOZE_RATIO_16,
    OSC_DOZE_RATIO_32,
    OSC_DOZE_RATIO_64,
    OSC_DOZE_RATIO_128
} OSC_DOZE_RATIO;
```

Description

DOZE bits(CPU peripheral clock ratio selection).

This enumeration lists the possible doze values(CPU clock to peripheral clock ratio).

Members

Members	Description
OSC_DOZE_RATIO_1	CPU peripheral clock ratio 1:1
OSC_DOZE_RATIO_2	CPU peripheral clock ratio 1:2
OSC_DOZE_RATIO_4	CPU peripheral clock ratio 1:4
OSC_DOZE_RATIO_8	CPU peripheral clock ratio 1:8
OSC_DOZE_RATIO_16	CPU peripheral clock ratio 1:16
OSC_DOZE_RATIO_32	CPU peripheral clock ratio 1:32
OSC_DOZE_RATIO_64	CPU peripheral clock ratio 1:64
OSC_DOZE_RATIO_128	CPU peripheral clock ratio 1:128

Remarks

This enumeration is processor specific and is defined in the processor- specific header files.

5.6.14.6.13.11 OSC_FRC_DIV Enumeration**C**

```
typedef enum {
    OSC_FRC_DIV_1,
```

```

OSC_FRC_DIV_2,
OSC_FRC_DIV_4,
OSC_FRC_DIV_8,
OSC_FRC_DIV_16,
OSC_FRC_DIV_32,
OSC_FRC_DIV_64,
OSC_FRC_DIV_256
} OSC_FRC_DIV;

```

Description

FRC divider.

This enumeration lists the possible FRC Oscillator divider values.

Members

Members	Description
OSC_FRC_DIV_1	Fast RC Oscillator output Divide by 1
OSC_FRC_DIV_2	Fast RC Oscillator output Divide by 2
OSC_FRC_DIV_4	Fast RC Oscillator output Divide by 4
OSC_FRC_DIV_8	Fast RC Oscillator output Divide by 8
OSC_FRC_DIV_16	Fast RC Oscillator output Divide by 16
OSC_FRC_DIV_32	Fast RC Oscillator output Divide by 32
OSC_FRC_DIV_64	Fast RC Oscillator output Divide by 64
OSC_FRC_DIV_256	Fast RC Oscillator output Divide by 256

Remarks

This enumeration is processor specific and is defined in the processor- specific header files.

5.6.14.6.13.12 OSC_FRC_TUNE Enumeration**C**

```

typedef enum {
    OSC_FRC_TUNE_PLUS_3_PERCENT,
    OSC_FRC_TUNE_PLUS_2_57_PERCENT,
    OSC_FRC_TUNE_PLUS_2_54_PERCENT,
    OSC_FRC_TUNE_PLUS_1_71_PERCENT,
    OSC_FRC_TUNE_PLUS_1_29_PERCENT,
    OSC_FRC_TUNE_PLUS_0_86_PERCENT,
    OSC_FRC_TUNE_PLUS_0_43_PERCENT,
    OSC_FRC_TUNE_CENTRAL_FREQ,
    OSC_FRC_TUNE_MINUS_0_375_PERCENT,
    OSC_FRC_TUNE_MINUS_0_75_PERCENT,
    OSC_FRC_TUNE_MINUS_1_125_PERCENT,
    OSC_FRC_TUNE_MINUS_1_5_PERCENT,
    OSC_FRC_TUNE_MINUS_1_875_PERCENT,
    OSC_FRC_TUNE_MINUS_2_25_PERCENT,
    OSC_FRC_TUNE_MINUS_2_625_PERCENT,
    OSC_FRC_TUNE_MINUS_3_PERCENT
} OSC_FRC_TUNE;

```

Description

Oscillator tuning value enumeration

This enumeration lists the possible oscillator tuning values, and is used by the [PLIB_OSC_FRCTuningSequenceValueSet](#) and [PLIB_OSC_FRCTuningSequenceValueGet](#) functions.

Members

Members	Description
OSC_FRC_TUNE_PLUS_3_PERCENT	OSC tune to Central frequency + 3
OSC_FRC_TUNE_PLUS_2_57_PERCENT	OSC tune to Central frequency + 2.57
OSC_FRC_TUNE_PLUS_2_54_PERCENT	OSC tune to Central frequency + 2.54
OSC_FRC_TUNE_PLUS_1_71_PERCENT	OSC tune to Central frequency + 1.71
OSC_FRC_TUNE_PLUS_1_29_PERCENT	OSC tune to Central frequency + 1.29
OSC_FRC_TUNE_PLUS_0_86_PERCENT	OSC tune to Central frequency + 0.86
OSC_FRC_TUNE_PLUS_0_43_PERCENT	OSC tune to Central frequency + 0.43
OSC_FRC_TUNE_CENTRAL_FREQ	OSC tune to Central frequency
OSC_FRC_TUNE_MINUS_0_375_PERCENT	OSC tune to Central frequency - 0.375
OSC_FRC_TUNE_MINUS_0_75_PERCENT	OSC tune to Central frequency - 0.75
OSC_FRC_TUNE_MINUS_1_125_PERCENT	OSC tune to Central frequency - 1.125
OSC_FRC_TUNE_MINUS_1_5_PERCENT	OSC tune to Central frequency - 1.5
OSC_FRC_TUNE_MINUS_1_875_PERCENT	OSC tune to Central frequency - 1.875
OSC_FRC_TUNE_MINUS_2_25_PERCENT	OSC tune to Central frequency - 2.25
OSC_FRC_TUNE_MINUS_2_625_PERCENT	OSC tune to Central frequency - 2.625
OSC_FRC_TUNE_MINUS_3_PERCENT	OSC tune to Central frequency - 3

Remarks

None.

5.6.14.6.13.13 OSC_GFX_CLOCK Enumeration**C**

```
typedef enum {
    OSC_GFX_CLOCK_96M,
    OSC_GFX_CLOCK_48M
} OSC_GFX_CLOCK;
```

Description

Graphics module clock values.

This enumeration lists the possible Graphics (display) module clock values.

Members

Members	Description
OSC_GFX_CLOCK_96M	Graphics module clock is 96 MHz
OSC_GFX_CLOCK_48M	Graphics module clock is 48 MHz

Remarks

This enumeration is processor specific and is defined in the processor- specific header files.

5.6.14.6.13.14 OSC_LFSR_TYPE Enumeration**C**

```
typedef enum {
    OSC_LFSR
} OSC_LFSR_TYPE;
```

Description

AUX PLL Input divider.

This enumeration lists the possible Auxiliary PLL input divider values.

Remarks

This enumeration is processor specific and is defined in the processor- specific header files.

5.6.14.6.13.15 OSC_MODULE_ID Enumeration**C**

```
typedef enum {  
    OSC_ID_0  
} OSC_MODULE_ID;
```

Description

OSC module ID

This data type defines the possible instances of the OSC module.

Members

Members	Description
OSC_ID_0	first instance of the OSC

Remarks

This enumeration is processor specific and is defined in the processor- specific header files.

5.6.14.6.13.16 OSC_OPERATION_ON_WAIT Enumeration**C**

```
typedef enum {  
    OSC_ON_WAIT_IDLE,  
    OSC_ON_WAIT_SLEEP  
} OSC_OPERATION_ON_WAIT;
```

Description

Oscillator Operation on wait.

This enumeration lists the possible device status when a WAIT instruction is executed.

Members

Members	Description
OSC_ON_WAIT_IDLE	Idle on Wait Instruction
OSC_ON_WAIT_SLEEP	Idle on Sleep Instruction

Remarks

This enumeration is processor specific and is defined in the processor- specific header files.

5.6.14.6.13.17 OSC_PERIPHERAL_BUS Enumeration**C**

```
typedef enum {  
    OSC_PERIPHERAL_BUS_1,  
    OSC_PERIPHERAL_BUS_2,
```

```
OSC_PERIPHERAL_BUS_3,  
OSC_PERIPHERAL_BUS_4,  
OSC_PERIPHERAL_BUS_5,  
OSC_PERIPHERAL_BUS_6,  
OSC_PERIPHERAL_BUS_7,  
OSC_PERIPHERAL_BUS_8  
} OSC_PERIPHERAL_BUS;
```

Description

Peripheral Buses

This enumeration lists the possible peripheral buses available in the device

Members

Members	Description
OSC_PERIPHERAL_BUS_1	Peripheral bus 1
OSC_PERIPHERAL_BUS_2	Peripheral bus 2
OSC_PERIPHERAL_BUS_3	Peripheral bus 3
OSC_PERIPHERAL_BUS_4	Peripheral bus 4
OSC_PERIPHERAL_BUS_5	Peripheral bus 5
OSC_PERIPHERAL_BUS_6	Peripheral bus 6
OSC_PERIPHERAL_BUS_7	Peripheral bus 7
OSC_PERIPHERAL_BUS_8	Peripheral bus 8

Remarks

This enumeration is processor specific and is defined in the processor- specific header files.

5.6.14.6.13.18 OSC_PLL_SELECT Enumeration**C**

```
typedef enum {  
    OSC_PLL_SYSTEM,  
    OSC_PLL_USB  
} OSC_PLL_SELECT;
```

Description

Oscillator PLL selection.

This enumeration lists the available PLLs in the Oscillator module.

Members

Members	Description
OSC_PLL_SYSTEM	Select system PLL
OSC_PLL_USB	Select USB PLL

Remarks

This enumeration is processor specific and is defined in the processor- specific header files.

5.6.14.6.13.19 OSC_PLLAUX_CLOCK_SOURCE Enumeration**C**

```
typedef enum {  
    OSC_PLLAUX_CLOCK  
} OSC_PLLAUX_CLOCK_SOURCE;
```

Description

Auxiliary PLL Clock Source

This enumeration lists the possible Auxiliary PLL clock source.

Members

Members	Description
OSC_PLLAUX_CLOCK	PLL Auxiliary clock

Remarks

This enumeration is processor specific and is defined in the processor- specific header files.

5.6.14.6.13.20 OSC_REF_BASECLOCK Enumeration

C

```
typedef enum {  
    OSC_REF_BASECLOCK_SYSCLK,  
    OSC_REF_BASECLOCK_PBCLK,  
    OSC_REF_BASECLOCK_PRIMARY,  
    OSC_REF_BASECLOCK_FRC,  
    OSC_REF_BASECLOCK_LPRC,  
    OSC_REF_BASECLOCK_SOSC,  
    OSC_REF_BASECLOCK_USBCLK,  
    OSC_REF_BASECLOCK_SYSPLLOUT,  
    OSC_REF_BASECLOCK_EXT  
} OSC_REF_BASECLOCK;
```

Description

Base clock for reference oscillator.

This enumeration lists the possible base clock values for the reference oscillator.

Members

Members	Description
OSC_REF_BASECLOCK_SYSCLK	The base clock for reference clock is System clock
OSC_REF_BASECLOCK_PBCLK	The base clock for reference clock is Peripheral clock
OSC_REF_BASECLOCK_PRIMARY	The base clock for reference clock is Primary oscillator
OSC_REF_BASECLOCK_FRC	The base clock for reference clock is FRC oscillator
OSC_REF_BASECLOCK_LPRC	The base clock for reference clock is internal low power RC
OSC_REF_BASECLOCK_SOSC	The base clock for reference clock is Secondary oscillator
OSC_REF_BASECLOCK_USBCLK	The base clock for reference clock is USB clock
OSC_REF_BASECLOCK_SYSPLLOUT	The base clock for reference clock is System PLL output
OSC_REF_BASECLOCK_EXT	The base clock for reference clock is clock from external pin

Remarks

This enumeration is processor specific and is defined in the processor- specific header files.

5.6.14.6.13.21 OSC_REF_DIV Enumeration

C

```
typedef enum {  
    OSC_REF_DIV_1,  
    OSC_REF_DIV_2,  
    OSC_REF_DIV_4,  
}
```

```

OSC_REF_DIV_8,
OSC_REF_DIV_16,
OSC_REF_DIV_32,
OSC_REF_DIV_64,
OSC_REF_DIV_128,
OSC_REF_DIV_256,
OSC_REF_DIV_512,
OSC_REF_DIV_1024,
OSC_REF_DIV_2048,
OSC_REF_DIV_4096,
OSC_REF_DIV_8192,
OSC_REF_DIV_16384,
OSC_REF_DIV_32768
} OSC_REF_DIV;

```

Description

Reference Oscillator divisor.

This enumeration lists the possible reference oscillator divisor values.

Members

Members	Description
OSC_REF_DIV_1	Reference clock is same as base clock
OSC_REF_DIV_2	Reference clock is base clock divided by 2
OSC_REF_DIV_4	Reference clock is base clock divided by 4
OSC_REF_DIV_8	Reference clock is base clock divided by 8
OSC_REF_DIV_16	Reference clock is base clock divided by 16
OSC_REF_DIV_32	Reference clock is base clock divided by 32
OSC_REF_DIV_64	Reference clock is base clock divided by 64
OSC_REF_DIV_128	Reference clock is base clock divided by 128
OSC_REF_DIV_256	Reference clock is base clock divided by 256
OSC_REF_DIV_512	Reference clock is base clock divided by 512
OSC_REF_DIV_1024	Reference clock is base clock divided by 1024
OSC_REF_DIV_2048	Reference clock is base clock divided by 2048
OSC_REF_DIV_4096	Reference clock is base clock divided by 4096
OSC_REF_DIV_8192	Reference clock is base clock divided by 8192
OSC_REF_DIV_16384	Reference clock is base clock divided by 16384
OSC_REF_DIV_32768	Reference clock is base clock divided by 32768

Remarks

This enumeration is processor specific and is defined in the processor- specific header files.

5.6.14.6.13.22 OSC_REFERENCE Enumeration**C**

```

typedef enum {
    OSC_REFERENCE_1,
    OSC_REFERENCE_2,
    OSC_REFERENCE_3,
    OSC_REFERENCE_4
} OSC_REFERENCE;

```

Description

Reference Oscillators

This enumeration lists the possible reference oscillator instances available in the device

Members

Members	Description
OSC_REFERENCE_1	Reference Oscillator 1
OSC_REFERENCE_2	Reference Oscillator 2
OSC_REFERENCE_3	Reference Oscillator 3
OSC_REFERENCE_4	Reference Oscillator 4

Remarks

This enumeration is processor specific and is defined in the processor- specific header files.

5.6.14.6.13.23 OSC_SYS_CLOCK_DIV Enumeration

C

```
typedef enum {
    OSC_SYS_CLOCK_DIV_1,
    OSC_SYS_CLOCK_DIV_2,
    OSC_SYS_CLOCK_DIV_4,
    OSC_SYS_CLOCK_DIV_8
} OSC_SYS_CLOCK_DIV;
```

Description

System Clock selection.

This enumeration lists the possible system clock divisor.

Members

Members	Description
OSC_SYS_CLOCK_DIV_1	System clock divide by 1
OSC_SYS_CLOCK_DIV_2	System clock divide by 2
OSC_SYS_CLOCK_DIV_4	System clock divide by 4
OSC_SYS_CLOCK_DIV_8	System clock divide by 8

Remarks

This enumeration is processor specific and is defined in the processor- specific header files.

5.6.14.6.13.24 OSC_SYS_TYPE Enumeration

C

```
typedef enum {
    OSC_FRC,
    OSC_FRC_WITH_PLL,
    OSC_PRIMARY,
    OSC_PRIMARY_WITH_PLL,
    OSC_SECONDARY,
    OSC_LPRC,
    OSC_FRC_DIV_BY_16,
    OSC_FRC_BY_FRCDIV
} OSC_SYS_TYPE;
```

Description

Oscillator type.

This enumeration lists the possible oscillator type values.

Members

Members	Description
OSC_FRC	Fast RC Oscillator. This includes the 8MHz oscillator
OSC_FRC_WITH_PLL	Fast RC Oscillator with PLL
OSC_PRIMARY	Primary Oscillator
OSC_PRIMARY_WITH_PLL	Fast RC Oscillator with PLL and PostScaler. Includes the 8MHz oscillator
OSC_SECONDARY	Secondary Oscillator
OSC_LPRC	Low Power RC Oscillator
OSC_FRC_DIV_BY_16	Low-Power Fast RC Oscillator with PostScaler
OSC_FRC_BY_FRCDIV	Fast RC Oscillator divided by FRCDIV bits

Remarks

This enumeration is processor specific and is defined in the processor- specific header files.

5.6.14.6.13.25 OSC_SYSPLL_FREQ_RANGE Enumeration**C**

```
typedef enum {
    OSC_SYSPLL_FREQ_RANGE_BYPASS,
    OSC_SYSPLL_FREQ_RANGE_5M_TO_10M,
    OSC_SYSPLL_FREQ_RANGE_8M_TO_16M,
    OSC_SYSPLL_FREQ_RANGE_13M_TO_26M,
    OSC_SYSPLL_FREQ_RANGE_21M_TO_42M,
    OSC_SYSPLL_FREQ_RANGE_34M_TO_68M
} OSC_SYSPLL_FREQ_RANGE;
```

Description

System PLL Frequency Range

This enumeration lists the possible frequency range for PLL module available in the device

Members

Members	Description
OSC_SYSPLL_FREQ_RANGE_BYPASS	PLL freq range bypass
OSC_SYSPLL_FREQ_RANGE_5M_TO_10M	PLL frequency range is 5MHz to 10MHz
OSC_SYSPLL_FREQ_RANGE_8M_TO_16M	PLL frequency range is 8MHz to 16MHz
OSC_SYSPLL_FREQ_RANGE_13M_TO_26M	PLL frequency range is 13MHz to 26MHz
OSC_SYSPLL_FREQ_RANGE_21M_TO_42M	PLL frequency range is 21MHz to 42MHz
OSC_SYSPLL_FREQ_RANGE_34M_TO_68M	PLL frequency range is 34MHz to 68MHz

Remarks

This enumeration is processor specific and is defined in the processor- specific header files.

5.6.14.6.13.26 OSC_SYSPLL_IN_CLK_SOURCE Enumeration**C**

```
typedef enum {
    OSC_SYSPLL_IN_CLK_SOURCE_FRC,
    OSC_SYSPLL_IN_CLK_SOURCE_PRIMARY
} OSC_SYSPLL_IN_CLK_SOURCE;
```

Description

System PLL Input Clock Source

This enumeration lists the possible input clock source for PLL module available in the device

Members

Members	Description
OSC_SYSPLL_IN_CLK_SOURCE_FRC	FRC is input clock source for PLL module
OSC_SYSPLL_IN_CLK_SOURCE_PRIMARY	Primary clock is the input clock source for PLL module

Remarks

This enumeration is processor specific and is defined in the processor- specific header files.

5.6.14.6.13.27 OSC_SYSPLL_IN_DIV Enumeration**C**

```
typedef enum {  
    OSC_SYSPLL_IN_DIV_1,  
    OSC_SYSPLL_IN_DIV_2,  
    OSC_SYSPLL_IN_DIV_3,  
    OSC_SYSPLL_IN_DIV_4,  
    OSC_SYSPLL_IN_DIV_5,  
    OSC_SYSPLL_IN_DIV_6,  
    OSC_SYSPLL_IN_DIV_7,  
    OSC_SYSPLL_IN_DIV_8  
} OSC_SYSPLL_IN_DIV;
```

Description

PLL Input divider.

This enumeration lists the possible PLL input divider values.

Members

Members	Description
OSC_SYSPLL_IN_DIV_1	Divide by 1
OSC_SYSPLL_IN_DIV_2	Divide by 2
OSC_SYSPLL_IN_DIV_3	Divide by 4
OSC_SYSPLL_IN_DIV_4	Divide by 8
OSC_SYSPLL_IN_DIV_5	Divide by 16
OSC_SYSPLL_IN_DIV_6	Divide by 32
OSC_SYSPLL_IN_DIV_7	Divide by 64
OSC_SYSPLL_IN_DIV_8	Divide by 256

Remarks

This enumeration is processor specific and is defined in the processor- specific header files.

5.6.14.6.13.28 OSC_SYSPLL_OUT_DIV Enumeration**C**

```
typedef enum {  
    OSC_SYSPLL_OUT_DIV_1,  
    OSC_SYSPLL_OUT_DIV_2,  
    OSC_SYSPLL_OUT_DIV_4,  
    OSC_SYSPLL_OUT_DIV_8,  
}
```

```

    OSC_SYSPLL_OUT_DIV_16,
    OSC_SYSPLL_OUT_DIV_32,
    OSC_SYSPLL_OUT_DIV_64,
    OSC_SYSPLL_OUT_DIV_256
} OSC_SYSPLL_OUT_DIV;

```

Description

PLL Output divider.

This enumeration lists the possible PLL output divider values.

Members

Members	Description
OSC_SYSPLL_OUT_DIV_1	Divide by 1
OSC_SYSPLL_OUT_DIV_2	Divide by 2
OSC_SYSPLL_OUT_DIV_4	Divide by 4
OSC_SYSPLL_OUT_DIV_8	Divide by 8
OSC_SYSPLL_OUT_DIV_16	Divide by 16
OSC_SYSPLL_OUT_DIV_32	Divide by 32
OSC_SYSPLL_OUT_DIV_64	Divide by 64
OSC_SYSPLL_OUT_DIV_256	Divide by 256

Remarks

This enumeration is processor specific and is defined in the processor- specific header files.

5.6.14.6.13.29 OSC_TUNING_MODE Enumeration

C

```

typedef enum {
    OSC_TUNING_USING_NUMBER,
    OSC_TUNING_SEQ_DITHER,
    OSC_TUNING_PSEUDO_RANDOM
} OSC_TUNING_MODE;

```

Description

Oscillator Tuning modes enumeration

This enumeration lists the possible oscillator tuning modes, and is used by the [PLIB_OSC_FRCTuningModeSet](#) and [PLIB_OSC_FRCTuningModeGet](#) functions.

Members

Members	Description
OSC_TUNING_USING_NUMBER	FRC tuning is based on the number specified by the software. Set the number using PLIB_OSC_FRCTuningModeSet function
OSC_TUNING_SEQ_DITHER	FRC tuning is based on PWM
OSC_TUNING_PSEUDO_RANDOM	FRC tuning is Pseudo-Random number generation.

Remarks

None.

5.6.14.6.13.30 OSC_TUNING_SEQUENCERS Enumeration

C

```

typedef enum {

```

```

OSC_TUNING_SEQUENCER_1,
OSC_TUNING_SEQUENCER_2,
OSC_TUNING_SEQUENCER_3,
OSC_TUNING_SEQUENCER_4,
OSC_TUNING_SEQUENCER_5,
OSC_TUNING_SEQUENCER_6,
OSC_TUNING_SEQUENCER_7
} OSC_TUNING_SEQUENCERS;

```

Description

Oscillator sequencer entries

This enumeration lists the possible oscillator sequencers that are used by the [PLIB_OSC_FRCTuningSequenceValueSet](#) and [PLIB_OSC_FRCTuningSequenceValueGet](#) functions to tune the FRC Oscillator.

Members

Members	Description
OSC_TUNING_SEQUENCER_1	OSC tuning sequencer 1
OSC_TUNING_SEQUENCER_2	OSC tuning sequencer 2
OSC_TUNING_SEQUENCER_3	OSC tuning sequencer 3
OSC_TUNING_SEQUENCER_4	OSC tuning sequencer 4
OSC_TUNING_SEQUENCER_5	OSC tuning sequencer 5
OSC_TUNING_SEQUENCER_6	OSC tuning sequencer 6
OSC_TUNING_SEQUENCER_7	OSC tuning sequencer 7

Remarks

None.

5.6.14.6.13.31 OSC_USBCLOCK_SOURCE Enumeration

C

```

typedef enum {
    SYS_OSC_USBCLK_PRIMARY,
    SYS_OSC_USBCLK_FRC
} OSC_USBCLOCK_SOURCE;

```

Description

USB clock sources.

This enumeration lists the the possible USB clock sources.

Members

Members	Description
SYS_OSC_USBCLK_PRIMARY	USB clock source is primary oscillator
SYS_OSC_USBCLK_FRC	USB clock source is FRC oscillator

Remarks

This enumeration is processor specific and is defined in the processor- specific header files.

5.6.14.6.14 Feature Existence Functions

5.6.14.6.14.1 PLIB_OSC_ExistsClockFail Function

C

```
bool PLIB_OSC_ExistsClockFail(  
    OSC_MODULE_ID index  
);
```

Description

This function identifies whether the ClockFail feature is available on the OSC module. When this function returns true, these functions are supported on the device:

- [PLIB_OSC_ClockHasFailed](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the ClockFail feature is supported on the device
- false - If the ClockFail feature is not supported on the device

Remarks

None.

5.6.14.6.14.2 PLIB_OSC_ExistsFRCDivisor Function

C

```
bool PLIB_OSC_ExistsFRCDivisor(  
    OSC_MODULE_ID index  
);
```

Description

This function identifies whether the FRCDivisor feature is available on the OSC module. When this function returns true, these functions are supported on the device:

- [PLIB_OSC_FRCDivisorSelect](#)
- [PLIB_OSC_FRCDivisorGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the FRCDivisor feature is supported on the device
- false - If the FRCDivisor feature is not supported on the device

Remarks

None.

5.6.14.6.14.3 PLIB_OSC_ExistsFRCTuning Function

C

```
bool PLIB_OSC_ExistsFRCTuning(  
    OSC_MODULE_ID index  
);
```

Description

This function identifies whether the FRCTuning feature is available on the OSC module. When this function returns true, these functions are supported on the device:

- [PLIB_OSC_FRCTuningSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the FRCTuning feature is supported on the device
- false - If the FRCTuning feature is not supported on the device

Remarks

None.

5.6.14.6.14.4 PLIB_OSC_ExistsOnWaitAction Function

C

```
bool PLIB_OSC_ExistsOnWaitAction(  
    OSC_MODULE_ID index  
);
```

Description

This function identifies whether the OnWaitAction feature is available on the OSC module. When this function returns true, these functions are supported on the device:

- [PLIB_OSC_OnWaitActionSet](#)
- [PLIB_OSC_OnWaitActionGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the OnWaitAction feature is supported on the device
- false - If the OnWaitAction feature is not supported on the device

Remarks

None.

5.6.14.6.14.5 PLIB_OSC_ExistsOscCurrentGet Function

C

```
bool PLIB_OSC_ExistsOscCurrentGet(  
    OSC_MODULE_ID index  
);
```

Description

This function identifies whether the OscCurrentGet feature is available on the OSC module. When this function returns true, these functions are supported on the device:

- [PLIB_OSC_CurrentSysClockGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the OscCurrentGet feature is supported on the device
- false - If the OscCurrentGet feature is not supported on the device

Remarks

None.

5.6.14.6.14.6 PLIB_OSC_ExistsOscSelect Function

C

```
bool PLIB_OSC_ExistsOscSelect(  
    OSC_MODULE_ID index  
);
```

Description

This function identifies whether the OscSelect feature is available on the OSC module. When this function returns true, these functions are supported on the device:

- [PLIB_OSC_SysClockSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the OscSelect feature is supported on the device
- false - If the OscSelect feature is not supported on the device

Remarks

None.

5.6.14.6.14.7 PLIB_OSC_ExistsOscSwitchInit Function

C

```
bool PLIB_OSC_ExistsOscSwitchInit(  
    OSC_MODULE_ID index  
);
```

Description

This function identifies whether the OscSwitchInit feature is available on the OSC module. When this function returns true, these functions are supported on the device:

- [PLIB_OSC_ClockSwitchingAbort](#)
- [PLIB_OSC_ClockSwitchingIsComplete](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the OscSwitchInit feature is supported on the device
- false - If the OscSwitchInit feature is not supported on the device

Remarks

None.

5.6.14.6.14.8 PLIB_OSC_ExistsPBClockDivisor Function

C

```
bool PLIB_OSC_ExistsPBClockDivisor(  
    OSC_MODULE_ID index  
);
```

Description

This function identifies whether the PBClockDivisor feature is available on the OSC module. When this function returns true, these functions are supported on the device:

- [PLIB_OSC_PBClockDivisorGet](#)
- [PLIB_OSC_PBClockDivisorSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the PBClockDivisor feature is supported on the device
- false - If the PBClockDivisor feature is not supported on the device

Remarks

None.

5.6.14.6.14.9 PLIB_OSC_ExistsPBClockOutputEnable Function**C**

```
bool PLIB_OSC_ExistsPBClockOutputEnable(  
    OSC_MODULE_ID index  
);
```

Description

This function identifies whether the PBClockOutputEnable feature is available on the OSC module. When this function returns true, these functions are supported on the device:

- [PLIB_OSC_PBClockOutputEnable](#)
- [PLIB_OSC_PBClockOutputDisable](#)
- [PLIB_OSC_PBClockOutputIsEnabled](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the PBClockOutputEnable feature is supported on the device
- false - If the PBClockOutputEnable feature is not supported on the device

Remarks

None.

5.6.14.6.14.10 PLIB_OSC_ExistsPBClockReady Function**C**

```
bool PLIB_OSC_ExistsPBClockReady(  
    OSC_MODULE_ID index  
);
```

Description

This function identifies whether the PBClockReady feature is available on the OSC module. When this function returns true, these functions are supported on the device:

- [PLIB_OSC_PBClockDivisorIsReady](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the PBClockReady feature is supported on the device
- false - If the PBClockReady feature is not supported on the device

Remarks

None.

5.6.14.6.14.11 PLIB_OSC_ExistsPLLClockLock Function**C**

```
bool PLIB_OSC_ExistsPLLClockLock(  
    OSC_MODULE_ID index  
);
```

Description

This function identifies whether the PLLClockLock feature is available on the OSC module. When this function returns true, these functions are supported on the device:

- [PLIB_OSC_PLLClockLock](#)
- [PLIB_OSC_PLLClockUnlock](#)
- [PLIB_OSC_PLLClockIsLocked](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the PLLClockLock feature is supported on the device
- false - If the PLLClockLock feature is not supported on the device

Remarks

None.

5.6.14.6.14.12 PLIB_OSC_ExistsPLLLockStatus Function**C**

```
bool PLIB_OSC_ExistsPLLLockStatus(  
    OSC_MODULE_ID index  
);
```

Description

This function identifies whether the PLLLockStatus feature is available on the OSC module. When this function returns true, these functions are supported on the device:

- [PLIB_OSC_PLLIsLocked](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the PLLLockStatus feature is supported on the device
- false - If the PLLLockStatus feature is not supported on the device

Remarks

None.

5.6.14.6.14.13 PLIB_OSC_ExistsReferenceOscBaseClock Function**C**

```
bool PLIB_OSC_ExistsReferenceOscBaseClock(  
    OSC_MODULE_ID index  
);
```

Description

This function identifies whether the ReferenceOscBaseClock feature is available on the OSC module. When this function returns true, these functions are supported on the device:

- [PLIB_OSC_ReferenceOscBaseClockSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the ReferenceOscBaseClock feature is supported on the device
- false - If the ReferenceOscBaseClock feature is not supported on the device

Remarks

None.

5.6.14.6.14.14 PLIB_OSC_ExistsReferenceOscChange Function**C**

```
bool PLIB_OSC_ExistsReferenceOscChange(  
    OSC_MODULE_ID index  
);
```

Description

This function identifies whether the ReferenceOscChange feature is available on the OSC module. When this function returns true, these functions are supported on the device:

- [PLIB_OSC_ReferenceOscSwitchIsComplete](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the ReferenceOscChange feature is supported on the device
- false - If the ReferenceOscChange feature is not supported on the device

Remarks

None.

5.6.14.6.14.15 PLIB_OSC_ExistsReferenceOscChangeActive Function**C**

```
bool PLIB_OSC_ExistsReferenceOscChangeActive(  
    OSC_MODULE_ID index  
);
```

Description

This function identifies whether the ReferenceOscChangeActive feature is available on the OSC module. When this function returns true, these functions are supported on the device:

- [PLIB_OSC_ReferenceOscSourceChangelsActive](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the ReferenceOscChangeActive feature is supported on the device
- false - If the ReferenceOscChangeActive feature is not supported on the device

Remarks

None.

5.6.14.6.14.16 PLIB_OSC_ExistsReferenceOscDivisor Function**C**

```
bool PLIB_OSC_ExistsReferenceOscDivisor(  
    OSC_MODULE_ID index  
);
```

Description

This function identifies whether the ReferenceOscDivisor feature is available on the OSC module. When this function returns true, these functions are supported on the device:

- [PLIB_OSC_ReferenceOscDivisorValueSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the ReferenceOscDivisor feature is supported on the device
- false - If the ReferenceOscDivisor feature is not supported on the device

Remarks

None.

5.6.14.6.14.17 PLIB_OSC_ExistsReferenceOscEnable Function**C**

```
bool PLIB_OSC_ExistsReferenceOscEnable(  
    OSC_MODULE_ID index  
);
```

Description

This function identifies whether the ReferenceOscEnable feature is available on the OSC module. When this function returns true, these functions are supported on the device:

- [PLIB_OSC_ReferenceOscEnable](#)
- [PLIB_OSC_ReferenceOscDisable](#)
- [PLIB_OSC_ReferenceOscIsEnabled](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the ReferenceOscEnable feature is supported on the device
- false - If the ReferenceOscEnable feature is not supported on the device

Remarks

None.

5.6.14.6.14.18 PLIB_OSC_ExistsReferenceOscStopInIdleEnable Function**C**

```
bool PLIB_OSC_ExistsReferenceOscStopInIdleEnable(  
    OSC_MODULE_ID index  
);
```

Description

This function identifies whether the ReferenceOscStopInIdleEnable feature is available on the OSC module. When this function returns true, these functions are supported on the device:

- [PLIB_OSC_ReferenceOscStopInIdleEnable](#)

- [PLIB_OSC_ReferenceOscStopInIdleDisable](#)
- [PLIB_OSC_ReferenceOscStopInIdleIsEnabled](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the ReferenceOscStopInIdleEnable feature is supported on the device
- false - If the ReferenceOscStopInIdleEnable feature is not supported on the device

Remarks

None.

5.6.14.6.14.19 PLIB_OSC_ExistsReferenceOscStopInSleep Function**C**

```
bool PLIB_OSC_ExistsReferenceOscStopInSleep(  
    OSC_MODULE_ID index  
);
```

Description

This function identifies whether the ReferenceOscStopInSleep feature is available on the OSC module. When this function returns true, these functions are supported on the device:

- [PLIB_OSC_ReferenceOscStopInSleepEnable](#)
- [PLIB_OSC_ReferenceOscStopInSleepDisable](#)
- [PLIB_OSC_ReferenceOscStopInSleepIsEnabled](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the ReferenceOscStopInSleep feature is supported on the device
- false - If the ReferenceOscStopInSleep feature is not supported on the device

Remarks

None.

5.6.14.6.14.20 PLIB_OSC_ExistsReferenceOscTrim Function**C**

```
bool PLIB_OSC_ExistsReferenceOscTrim(  
    OSC_MODULE_ID index  
);
```

Description

This function identifies whether the ReferenceOscTrim feature is available on the OSC module. When this function returns true, these functions are supported on the device:

- [PLIB_OSC_ReferenceOscTrimSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the ReferenceOscTrim feature is supported on the device
- false - If the ReferenceOscTrim feature is not supported on the device

Remarks

None.

5.6.14.6.14.21 PLIB_OSC_ExistsReferenceOutputEnable Function**C**

```
bool PLIB_OSC_ExistsReferenceOutputEnable(  
    OSC_MODULE_ID index  
);
```

Description

This function identifies whether the ReferenceOutputEnable feature is available on the OSC module. When this function returns true, these functions are supported on the device:

- [PLIB_OSC_ReferenceOutputEnable](#)
- [PLIB_OSC_ReferenceOutputDisable](#)
- [PLIB_OSC_ReferenceOutputIsEnabled](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the ReferenceOutputEnable feature is supported on the device
- false - If the ReferenceOutputEnable feature is not supported on the device

Remarks

None.

5.6.14.6.14.22 PLIB_OSC_ExistsSecondaryEnable Function

C

```
bool PLIB_OSC_ExistsSecondaryEnable(  
    OSC_MODULE_ID index  
);
```

Description

This function identifies whether the SecondaryEnable feature is available on the OSC module. When this function returns true, these functions are supported on the device:

- [PLIB_OSC_SecondaryEnable](#)
- [PLIB_OSC_SecondaryDisable](#)
- [PLIB_OSC_SecondaryIsEnabled](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the SecondaryEnable feature is supported on the device
- false - If the SecondaryEnable feature is not supported on the device

Remarks

None.

5.6.14.6.14.23 PLIB_OSC_ExistsSecondaryReady Function

C

```
bool PLIB_OSC_ExistsSecondaryReady(  
    OSC_MODULE_ID index  
);
```

Description

This function identifies whether the SecondaryReady feature is available on the OSC module. When this function returns true, these functions are supported on the device:

- [PLIB_OSC_SecondaryIsReady](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the SecondaryReady feature is supported on the device
- false - If the SecondaryReady feature is not supported on the device

Remarks

None.

5.6.14.6.14.24 PLIB_OSC_ExistsSysPLLFrequencyRange Function**C**

```
bool PLIB_OSC_ExistsSysPLLFrequencyRange(  
    OSC_MODULE_ID index  
);
```

Description

This function identifies whether the PLLFrequencyRange feature is available on the OSC module. When this function returns true, these functions are supported on the device:

- [PLIB_OSC_SysPLLFrequencyRangeSet](#)
- [PLIB_OSC_SysPLLFrequencyRangeGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the PLLFrequencyRange feature is supported on the device
- false - If the PLLFrequencyRange feature is not supported on the device

Remarks

None.

5.6.14.6.14.25 PLIB_OSC_ExistsSysPLLInputClockSource Function**C**

```
bool PLIB_OSC_ExistsSysPLLInputClockSource(  
    OSC_MODULE_ID index  
);
```

Description

This function identifies whether the PLLInputClockSource feature is available on the OSC module. When this function returns true, these functions are supported on the device:

- [PLIB_OSC_SysPLLInputClockSourceSet](#)
- [PLIB_OSC_SysPLLInputClockSourceGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the PLLInputClockSource feature is supported on the device
- false - If the PLLInputClockSource feature is not supported on the device

Remarks

None.

5.6.14.6.14.26 PLIB_OSC_ExistsSysPLLInputDivisor Function**C**

```
bool PLIB_OSC_ExistsSysPLLInputDivisor(  
    OSC_MODULE_ID index  
);
```

Description

This function identifies whether the PLLInputDivisor feature is available on the OSC module. When this function returns true, these functions are supported on the device:

- [PLIB_OSC_SysPLLInputDivisorSet](#)
- [PLIB_OSC_SysPLLInputDivisorGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the PLLInputDivisor feature is supported on the device
- false - If the PLLInputDivisor feature is not supported on the device

Remarks

None.

5.6.14.6.14.27 PLIB_OSC_ExistsSysPLLMultiplier Function**C**

```
bool PLIB_OSC_ExistsSysPLLMultiplier(  
    OSC_MODULE_ID index  
);
```

Description

This function identifies whether the PLLMultiplier feature is available on the OSC module. When this function returns true, these functions are supported on the device:

- [PLIB_OSC_SysPLLMultiplierSelect](#)
- [PLIB_OSC_SysPLLMultiplierGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the PLLMultiplier feature is supported on the device
- false - If the PLLMultiplier feature is not supported on the device

Remarks

None.

5.6.14.6.14.28 PLIB_OSC_ExistsSysPLLOutputDivisor Function**C**

```
bool PLIB_OSC_ExistsSysPLLOutputDivisor(  
    OSC_MODULE_ID index  
);
```

Description

This function identifies whether the PLLOutputDivisor feature is available on the OSC module. When this function returns true, these functions are supported on the device:

- [PLIB_OSC_SysPLLOutputDivisorSet](#)
- [PLIB_OSC_SysPLLOutputDivisorGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the PLLOutputDivisor feature is supported on the device
- false - If the PLLOutputDivisor feature is not supported on the device

Remarks

None.

5.6.14.6.14.29 PLIB_OSC_ExistsUsbClockSource Function**C**

```
bool PLIB_OSC_ExistsUsbClockSource(  
    OSC_MODULE_ID index  
);
```

Description

This function identifies whether the UsbClockSource feature is available on the OSC module. When this function returns true, these functions are supported on the device:

- [PLIB_OSC_UsbClockSourceSelect](#)
- [PLIB_OSC_UsbClockSourceGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the UsbClockSource feature is supported on the device
- false - If the UsbClockSource feature is not supported on the device

Remarks

None.

5.6.14.7 Files

Files

Name	Description
plib_osc.h	Defines the Oscillator (OSC) Peripheral Library interface.

Description

5.6.14.7.1 plib_osc.h

Oscillator Peripheral Library Interface Header

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the Oscillator (OSC) Peripheral Library for Microchip microcontrollers. The definitions in this file are for the Oscillator module.

Functions

	Name	Description
≡	PLIB_OSC_AuxClockSourceGet	Gets the clock source for the auxiliary clock.
≡	PLIB_OSC_AuxClockSourceSet	Sets the clock source for the auxiliary clock divisor.
≡	PLIB_OSC_AuxModeGet	Gets the selected Auxiliary Oscillator mode.
≡	PLIB_OSC_AuxModeSelect	Selects the Auxiliary Oscillator mode.
≡	PLIB_OSC_ClockHasFailed	Returns 'true' if the clock fails.
≡	PLIB_OSC_ClockSwitchingAbort	Aborts an oscillator switch.
≡	PLIB_OSC_ClockSwitchingIsComplete	Gets the oscillator switch progress status.
≡	PLIB_OSC_CurrentSysClockGet	Gets the current oscillator selected.
≡	PLIB_OSC_DozeModeDisable	Disables Doze mode.
≡	PLIB_OSC_DozeModeEnable	Enables Doze mode.
≡	PLIB_OSC_DozeRatioGet	Gets the ratio of the processor clock to the peripheral clock.
≡	PLIB_OSC_DozeRatioSelect	Selects the Doze ratio of the processor clock to the peripheral clock.
≡	PLIB_OSC_DozeRecoverOnInterruptDisable	Disables the recovery from Doze mode upon an interrupt.
≡	PLIB_OSC_DozeRecoverOnInterruptEnable	Enables recovery from Doze mode upon an interrupt.

	<u>PLIB_OSC_DozeRecoverOnInterruptIsEnabled</u>	Returns 'true' if recover from Doze mode on interrupt is enabled.
	<u>PLIB_OSC_ExistsClockFail</u>	Identifies whether the ClockFail feature exists on the OSC module
	<u>PLIB_OSC_ExistsFRCDivisor</u>	Identifies whether the FRCDivisor feature exists on the OSC module
	<u>PLIB_OSC_ExistsFRCTuning</u>	Identifies whether the FRCTuning feature exists on the OSC module
	<u>PLIB_OSC_ExistsOnWaitAction</u>	Identifies whether the OnWaitAction feature exists on the OSC module
	<u>PLIB_OSC_ExistsOscCurrentGet</u>	Identifies whether the OscCurrentGet feature exists on the OSC module
	<u>PLIB_OSC_ExistsOscSelect</u>	Identifies whether the OscSelect feature exists on the OSC module
	<u>PLIB_OSC_ExistsOscSwitchInit</u>	Identifies whether the OscSwitchInit feature exists on the OSC module
	<u>PLIB_OSC_ExistsPBClockDivisor</u>	Identifies whether the PBClockDivisor feature exists on the OSC module
	<u>PLIB_OSC_ExistsPBClockOutputEnable</u>	Identifies whether the PBClockOutputEnable feature exists on the OSC module
	<u>PLIB_OSC_ExistsPBClockReady</u>	Identifies whether the PBClockReady feature exists on the OSC module
	<u>PLIB_OSC_ExistsPLLClockLock</u>	Identifies whether the PLLClockLock feature exists on the OSC module
	<u>PLIB_OSC_ExistsPLLLockStatus</u>	Identifies whether the PLLLockStatus feature exists on the OSC module
	<u>PLIB_OSC_ExistsReferenceOscBaseClock</u>	Identifies whether the ReferenceOscBaseClock feature exists on the OSC module
	<u>PLIB_OSC_ExistsReferenceOscChange</u>	Identifies whether the ReferenceOscChange feature exists on the OSC module
	<u>PLIB_OSC_ExistsReferenceOscChangeActive</u>	Identifies whether the ReferenceOscChangeActive feature exists on the OSC module
	<u>PLIB_OSC_ExistsReferenceOscDivisor</u>	Identifies whether the ReferenceOscDivisor feature exists on the OSC module
	<u>PLIB_OSC_ExistsReferenceOscEnable</u>	Identifies whether the ReferenceOscEnable feature exists on the OSC module
	<u>PLIB_OSC_ExistsReferenceOscStopInIdleEnable</u>	Identifies whether the ReferenceOscStopInIdleEnable feature exists on the OSC module
	<u>PLIB_OSC_ExistsReferenceOscStopInSleep</u>	Identifies whether the ReferenceOscStopInSleep feature exists on the OSC module
	<u>PLIB_OSC_ExistsReferenceOscTrim</u>	Identifies whether the ReferenceOscTrim feature exists on the OSC module
	<u>PLIB_OSC_ExistsReferenceOutputEnable</u>	Identifies whether the ReferenceOutputEnable feature exists on the OSC module
	<u>PLIB_OSC_ExistsSecondaryEnable</u>	Identifies whether the SecondaryEnable feature exists on the OSC module
	<u>PLIB_OSC_ExistsSecondaryReady</u>	Identifies whether the SecondaryReady feature exists on the OSC module
	<u>PLIB_OSC_ExistsSysPLLFrequencyRange</u>	Identifies whether the PLLFrequencyRange feature exists on the OSC module
	<u>PLIB_OSC_ExistsSysPLLInputClockSource</u>	Identifies whether the PLLInputClockSource feature exists on the OSC module

	<u>PLIB_OSC_ExistsSysPLLInputDivisor</u>	Identifies whether the PLLInputDivisor feature exists on the OSC module
	<u>PLIB_OSC_ExistsSysPLLMultiplier</u>	Identifies whether the PLLMultiplier feature exists on the OSC module
	<u>PLIB_OSC_ExistsSysPLLOutputDivisor</u>	Identifies whether the PLLOutputDivisor feature exists on the OSC module
	<u>PLIB_OSC_ExistsUsbClockSource</u>	Identifies whether the UsbClockSource feature exists on the OSC module
	<u>PLIB_OSC_FRCDitherEnable</u>	Enables the FRC Oscillator clock dithering.
	<u>PLIB_OSC_FRCDivisorGet</u>	Gets the FRC clock divisor.
	<u>PLIB_OSC_FRCDivisorSelect</u>	Sets the FRC clock divisor to the specified value.
	<u>PLIB_OSC_FRCTuningModeGet</u>	Gets the FRC oscillator tuning mode.
	<u>PLIB_OSC_FRCTuningModeSet</u>	Selects the FRC oscillator tuning mode.
	<u>PLIB_OSC_FRCTuningSelect</u>	Sets the FRC tuning value.
	<u>PLIB_OSC_FRCTuningSequenceValueGet</u>	Gets the value set in the FRC tune sequencer.
	<u>PLIB_OSC_FRCTuningSequenceValueSet</u>	Sets the value in the FRC tune sequencer.
	<u>PLIB_OSC_GraphicsClockDivisorGet</u>	Gets the Graphics module clock divisor.
	<u>PLIB_OSC_GraphicsClockDivisorSet</u>	Sets the Graphics module clock divisor.
	<u>PLIB_OSC_GraphicsClockSourceGet</u>	Gets the Graphics Controller module clock frequency value.
	<u>PLIB_OSC_GraphicsClockSourceSelect</u>	Sets the Graphics Controller module clock.
	<u>PLIB_OSC_LinearFeedbackShiftRegGet</u>	Gets the value from linear feedback shift register.
	<u>PLIB_OSC_LinearFeedbackShiftRegSet</u>	Sets the linear feedback shift register.
	<u>PLIB_OSC_OnWaitActionGet</u>	Gets the configured operation to be performed when a WAIT instruction is executed.
	<u>PLIB_OSC_OnWaitActionSet</u>	Selects the operation to be performed when a WAIT instruction is executed.
	<u>PLIB_OSC_PBClockDivisorGet</u>	Gets the peripheral bus clock divisor.
	<u>PLIB_OSC_PBClockDivisorIsReady</u>	Checks whether the peripheral bus clock divisor is ready to be written.
	<u>PLIB_OSC_PBClockDivisorSet</u>	Sets the peripheral bus clock divisor to the specified value.
	<u>PLIB_OSC_PBOutputClockDisable</u>	Disables the peripheral bus output clock
	<u>PLIB_OSC_PBOutputClockEnable</u>	Enables the peripheral bus output clock
	<u>PLIB_OSC_PBOutputClockIsEnabled</u>	Checks whether the peripheral bus clock output is enabled or not
	<u>PLIB_OSC_PLLAuxClockSourceGet</u>	Returns the clock source selected for the Auxiliary PLL.
	<u>PLIB_OSC_PLLAuxClockSourceSelect</u>	Sets the Auxiliary PLL clock source.
	<u>PLIB_OSC_PLLAuxInputDivisorGet</u>	Gets the input divisor for the Auxiliary PLL.
	<u>PLIB_OSC_PLLAuxInputDivisorSelect</u>	Sets the input divisor for the Auxiliary PLL to the specified value.
	<u>PLIB_OSC_PLLAuxIsLocked</u>	Returns whether the Auxiliary PLL is locked.
	<u>PLIB_OSC_PLLAuxMultiplierGet</u>	Gets the Auxiliary PLL multiplier.
	<u>PLIB_OSC_PLLAuxMultiplierSelect</u>	Sets the Auxiliary PLL multiplier to the specified value.
	<u>PLIB_OSC_PLLAuxOutputDivisorGet</u>	Gets the output divisor for the Auxiliary PLL.
	<u>PLIB_OSC_PLLAuxOutputDivisorSet</u>	Sets the output divisor for the Auxiliary PLL to the specified value.
	<u>PLIB_OSC_PLLClockIsLocked</u>	Gets the lock status for the clock and PLL selections.
	<u>PLIB_OSC_PLLClockLock</u>	Locks the clock and PLL selections.
	<u>PLIB_OSC_PLLClockUnlock</u>	Unlocks the clock and PLL selections.

	PLIB_OSC_PLLODisable	Disables the specified PLL.
	PLIB_OSC_PLLEnable	Enables the specified PLL.
	PLIB_OSC_PLLOIsEnabled	Returns 'true' if the specified PLL is enabled.
	PLIB_OSC_PLLOIsLocked	Returns 'true' if the selected PLL is locked.
	PLIB_OSC_PrimaryOscInSleepModeDisable	The Primary Oscillator is disabled during Sleep mode.
	PLIB_OSC_PrimaryOscInSleepModeEnable	The Primary Oscillator continues to operate during Sleep mode.
	PLIB_OSC_PrimaryOscInSleepModeIsEnabled	Returns 'true' if the Primary Oscillator is disabled during Sleep mode.
	PLIB_OSC_ReferenceOscBaseClockSelect	Sets the base clock for the reference oscillator.
	PLIB_OSC_ReferenceOscDisable	Disables the reference oscillator output.
	PLIB_OSC_ReferenceOscDivisorValueSet	Selects the reference oscillator divisor value.
	PLIB_OSC_ReferenceOscEnable	Enables the reference oscillator.
	PLIB_OSC_ReferenceOscIsEnabled	Gets the enable status of the reference oscillator output.
	PLIB_OSC_ReferenceOscSourceChangeIsActive	Returns 'true' if a reference oscillator source change request is active.
	PLIB_OSC_ReferenceOscStopInIdleDisable	Enables the reference oscillator in Idle mode.
	PLIB_OSC_ReferenceOscStopInIdleEnable	Configures the reference oscillator to stop operating in Idle mode.
	PLIB_OSC_ReferenceOscStopInIdleIsEnabled	Returns 'true' if the reference oscillator is disabled in Idle mode.
	PLIB_OSC_ReferenceOscStopInSleepDisable	Enables the reference oscillator in Sleep mode.
	PLIB_OSC_ReferenceOscStopInSleepEnable	Configures the reference oscillator to stop operating in Sleep mode.
	PLIB_OSC_ReferenceOscStopInSleepIsEnabled	Returns 'true' if the reference oscillator is disabled in Sleep mode.
	PLIB_OSC_ReferenceOscSwitchIsComplete	Returns 'true' if the reference oscillator base clock switching is complete.
	PLIB_OSC_ReferenceOscTrimSet	Sets the reference oscillator divisor trim value.
	PLIB_OSC_ReferenceOutputDisable	Disables the reference oscillator output.
	PLIB_OSC_ReferenceOutputEnable	Enables the reference oscillator output.
	PLIB_OSC_ReferenceOutputIsEnabled	Returns 'true' if the reference oscillator output is enabled.
	PLIB_OSC_SecondaryDisable	Disables the Secondary Oscillator.
	PLIB_OSC_SecondaryEnable	Enables the Secondary Oscillator.
	PLIB_OSC_SecondaryIsEnabled	Returns 'true' if the Secondary Oscillator is enabled.
	PLIB_OSC_SecondaryIsReady	Returns 'true' if the Secondary Oscillator is ready.
	PLIB_OSC_StartupTimerHasExpired	Returns 'true' if the oscillator start-up time-out timer has expired.
	PLIB_OSC_SysClockSelect	Selects the new oscillator.
	PLIB_OSC_SysPLLFrequencyRangeGet	Returns the frequency range for PLL
	PLIB_OSC_SysPLLFrequencyRangeSet	Sets the frequency range for PLL
	PLIB_OSC_SysPLLInputClockSourceGet	Returns the input clock source for the PLL module
	PLIB_OSC_SysPLLInputClockSourceSet	Sets the input clock source for the PLL module
	PLIB_OSC_SysPLLInputDivisorGet	Gets the input divisor for the PLL.
	PLIB_OSC_SysPLLInputDivisorSet	Sets the input divider for the PLL to the specified value.
	PLIB_OSC_SysPLLMultiplierGet	Gets the PLL multiplier.
	PLIB_OSC_SysPLLMultiplierSelect	Sets the PLL multiplier to the specified value.
	PLIB_OSC_SysPLLOutputDivisorGet	Gets the output divisor for the PLL.
	PLIB_OSC_SysPLLOutputDivisorSet	Sets the output divider for the PLL to the specified value.
	PLIB_OSC_UsbClockSourceGet	Gets the USB module clock source.

	PLIB_OSC_UsbClockSourceSelect	Sets the USB module clock source.

5.6.15 Prefetch Cache Peripheral Library

5.6.15.1 Introduction

Prefetch Cache Module Peripheral Library

for

Microchip Microcontrollers

This library provides a low-level abstraction of the Prefetch Cache module on Microchip microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, thereby hiding differences from one microcontroller variant to another.

Description**Prefetch Cache Module Overview**

The Prefetch Cache module increases system performance for most applications by:

- Predictive prefetching of instructions ahead of the current program counter, hiding the access time of the Flash memory
- Instruction and data caching

The program Flash memory (PFM) contains a Prefetch module and a number of cache lines, each containing four words. Some of the cache lines may be allocated to data or peripherals. Each cache line has an associated tag. The tag contains the address of the data in the cache line, and a number of status bits. The number of cache lines and number and type of status bits may vary between devices. Refer to your specific device data sheet for details.

5.6.15.2 Release Notes

MPLAB Harmony Version: v0.70b **Prefetch Cache Peripheral Library Version :** 0.70b **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.6.15.3 SW License Agreement

© 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS." MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. 5.6.15.4 Using the Library

This topic describes the basic architecture of the Prefetch Cache Peripheral Library and provides information and examples on how to use it.

Interface Header File: peripheral.h

The interface to the Prefetch Cache Peripheral Library is defined in the "[plib_pcache.h](#)" header file, which is included by the "peripheral.h" peripheral library header file. Any C language source (.c) file that uses the Prefetch Cache Peripheral Library must include "peripheral.h".

Library File:

The Prefetch Cache Peripheral Library is part of the processor-specific peripheral library archive (.a) file installed with the compiler. Libraries in this archive are automatically available to the linker (in the default search path) for any project built using the Microchip compiler.

5.6.15.4.1 Library Architecture

The cache consists of two arrays: tag and data. The data array contains a number of lines of program instructions or data words.

The word size is the same as the processor data width.

The tag array contains a number of corresponding fields, each containing:

- Mask – address mask value
- Tag – tag address to match against
- Valid – indicates whether the data in the cache line is valid or not
- Lock – indicates the line is locked to hold its contents
- Type – instruction, data or peripheral

Note: Not all Tag fields are available on all devices. The number of cache lines may vary between devices. Refer to the specific device data sheet for details.

Example Cache Line

Tag Array					Data Array			
Mask	Tag	Valid	Lock	Type	Word 3	Word 2	Word 1	Word 0

This library allows the programmer to perform various operations on the cache tag and data arrays:

- Enable/Disable
- Set the Wait state
- Read, write, lock, invalidate

Note: Not all operations are available on all devices. Refer to the specific device data sheet for details.

5.6.15.4.2 Hardware Abstraction Model

This library provides a low-level abstraction of the Prefetch Cache module on Microchip family microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Description

Hardware Abstraction Model

The Prefetch Cache module is a performance enhancing module included in some microcontrollers. When running at high clock rates, wait states must be inserted into program Flash memory (PFM) read transactions to meet the access time of the PFM. Wait states can be hidden to the core by prefetching and storing instructions in a temporary holding area that the CPU can access quickly.

There are two main functions that the Prefetch Cache module performs: Caching instructions when they are accessed, and prefetching instructions from the PFM before they are needed.

The cache holds a subset of the cacheable memory in temporary holding spaces known as cache lines. Each cache line has a tag describing what it is currently holding, and the address where it is mapped. Normally, the cache lines just hold a copy of what is currently in memory to make data available to the CPU without wait states.

CPU-requested data may or may not be in the cache. A cache-miss occurs if the CPU requests cacheable data that is not in the cache. In this case, a read is performed to the PFM at the correct address, the data is supplied to the cache and to the CPU. A cache-hit occurs if the cache contains the data that the CPU requests. In the case of a cache-hit, data is supplied to the CPU without wait states.

The second main function of the Prefetch Cache module is to prefetch CPU instructions. The module calculates the address of the next cache line and performs a read of the PFM to get the next cache line. This line is placed into a prefetch cache buffer in anticipation of executing straight-line code.

Cache Control

This library provides a set of functions to control the behavior of the overall Cache Module. Those functions include:

- Setting or reading the number of clock wait cycles
- Setting or reading the number of cache lines allocated to data
- Controlling which cache lines are invalidated on a PFM write cycle

Cache Line Operations

This library provides a set of functions to read, write and control the behavior of individual Cache Lines. Operations on individual Cache Lines are performed using a two-step process:

1. Select the individual cache line with [PLIB_PCACHE_CacheLineSelect](#).
2. Perform the required cache line operation using any of the routines in the "**Cache Line Operations**" section. The operations available are:
 - Set the cache line to data or instruction type
 - Mark the cache line as valid or invalid
 - Lock or unlock the cache line
 - Read or write the Flash type (boot or program) associated with the cache line
 - Read or write the address associated with the cache line
 - Read or write the mask field to force a match between the cache line and multiple physical addresses
 - Read or write any individual word in the cache line data array

Once the operation is performed, the cache line remains selected until [PLIB_PCACHE_CacheLineDeselect](#) is performed. Only one cache line can be selected at a time.

Cache Status

The cache maintains a count of hits and misses for profiling purposes. The cache hit counter increments each time the processor issues an instruction fetch or load that hits the prefetch cache from a cacheable region. Similarly, the cache miss counter increments each time the processor issues an instruction fetch or load that misses the prefetch cache from a cacheable region. Accesses to non-cacheable regions do not affect the counters. These values can be read or written using the Cache Status routines.

The cache uses a Least Recently Used (LRU) algorithm to replace cache lines on a miss. The specific algorithm may vary between devices. In some devices, the state of the LRU algorithm encoding bits can be read with

[PLIB_PCACHE_LeastRecentlyUsedStateRead](#).

Prefetch Control

Predictive prefetch is controlled by the Prefetch Control routines. Devices with no L1 CPU cache can prefetch from cacheable or non-cacheable regions or both. Devices with L1 CPU cache can prefetch from any address, CPU instructions or CPU instructions and data. Predictive prefetch can be disabled for either type of device.

Prefetch Status

The Prefetch Cache module maintains a count of prefetch aborts for profiling purposes. The prefetch abort counter is incremented each time a prefetch is aborted due to a non-sequential instruction fetch, load or store. This value can be read or written using the Prefetch Status routines.

Flash ECC

On some devices, the Flash ECC module has the ability to detect single and double bit errors on PFM reads. When a single bit error is detected, the error is corrected and the Single Error Correction (SEC) counter is decremented. When the SEC counter reaches zero, an interrupt is generated to the CPU. The user has the ability to enable or disable the SEC interrupt. It is disabled by default. The user may set the SEC counter value at any time. The maximum counter value may be device-specific and is defined for each processor by the [PLIB_PCACHE_MAX_SEC_COUNT](#) constant.

When a double bit error is detected, the device will set the DED status to true and generate a bus exception to the initiator.

5.6.15.4.3 How the Library Works

This library can be used to optimize the performance of the processor while executing out of cacheable program Flash memory. This is done by implementing the following:

- Instruction caching
- Data caching
- Cache line control
- Predictive prefetching
- ECC detection

5.6.15.4.3.1 Cache Control Operations

Cache Wait States

When operating at high clock rates, the Prefetch Cache module must insert wait states into Program Flash Memory (PFM) read operations to meet PFM access time requirements. One Wait state is equivalent to one clock cycle delay. At reset, the Prefetch Cache Module is set to the maximum number of wait states for the device. The PFM read time can be optimized for the device by selecting the minimum number of wait states for the clock rate used. The number of wait states for a given clock frequency may vary between devices.

Note: Refer to the specific device data sheet for details on how to calculate the optimum number of wait states for your device.

Example: Setting the Number of PFM wait states based on the System Clock

This example assumes one wait state for every 20 MHz of system clock.

```
if (sysclk < 20000000)
{
    PLIB_PCACHE_WaitStateSet(0);
}
else if (sysclk < 40000000)
{
    PLIB_PCACHE_WaitStateSet(1);
}
```

```
}
...
```

Data Caching

Some Prefetch Cache modules allow the user to allocate cache lines to data. This is to provide improved CPU access to constant data stored in PFM. By default, data caching is disabled. The Prefetch Cache Peripheral Library allows the user to set the number of cache lines allocated to data. The number of lines available may vary among devices. The available settings are provided by the device-dependent [PLIB_PCACHE_DATA_ENABLE](#) enumeration.

Example: Allocating two Cache Lines to Data

```
PLIB_PCACHE_DataCacheEnableSet(PLIB_PCACHE_DATA_2LINE);
```

Cache Line Invalidating on PFM Write

It's not possible to execute out of cache while programming the PFM. The PFM controller stalls the cache during the programming sequence. Therefore, user code that initiates a programming sequence should not be located in a cacheable address region.

During program operation, the Prefetch Cache is flushed by invalidating some or all of the cache lines. To invalidate all of the cache lines on a PFM write operation, the function [PLIB_PCACHE_InvalidateOnPFMProgramAll](#) should be called prior to the PFM write. This will invalidate and unlock every cache line during the write operation. The cache tags and masks are also cleared for all lines.

If [PLIB_PCACHE_InvalidateOnPFMProgramUnlocked](#) is called before the PFM write, only lines that are not locked will be forced invalid.

By default, only unlocked cache lines are invalidated during a PFM write.

5.6.15.4.3.2 Cache Line Operations

Performing a cache line operation is a two-step process. Before calling a Cache Line operation function, the cache line must be selected and write-enabled. Once selected and write-enabled, any number of cache line operations may be performed on the selected line until the line is cleared or a different line is selected and write-enabled.

Cache lines are selected and write-enabled using [PLIB_PCACHE_CacheLineSelect](#). Cache lines are write-disabled using [PLIB_PCACHE_CacheLineDeselect](#).

The following example shows operations on two different cache lines. The code comments describe each operation.

Example: Cache Line Operations

```
uint32_t cacheLine[4] = {0x01234567, 0x12345678, 0x23456789, 0x34567890};

//Select Cache Line 4
PLIB_PCACHE_CacheLineSelect(4);

//Invalidate Cache Line 4
PLIB_PCACHE_CacheLineInvalid();

//Select Cache Line 6
PLIB_PCACHE_CacheLineSelect(6);

//Set Cache Line 6 to Data Type
PLIB_PCACHE_CacheLineData();

//Write Data to Cache Line 6
for (i=0; i<PLIB_PCACHE_NUM_WORDS_PER_LINE; i++)
{
    PLIB_PCACHE_WordWrite(i, cacheLine[i]);
}
```

```
//Lock Cache Line 6
PLIB_PCACHE_CacheLineLock();

//Disable Writes to Cache Line 6
PLIB_PCACHE_CacheLineDeselect();
```

5.6.15.4.3.3 Cache Status Operations

Cache Statistics Counters

It is often useful to gather statistics related to cache utilization for performance or profiling reasons. Some devices with a Prefetch Cache module maintain cache hit and miss counters for this purpose. This library provides routines to read and write the cache hit and miss counters.

The cache hit counter increments each time the processor issues an instruction fetch or load that hits the prefetch cache from a cacheable region. Non-cacheable accesses do not modify this value. This value can be read with [PLIB_PCACHE_CacheHitRead](#).

Similarly, the cache miss counter increments each time the processor issues an instruction fetch or load that misses the prefetch cache from a cacheable region. This value can be read with [PLIB_PCACHE_CacheMissRead](#).

Cache Replacement State

The Prefetch Cache module uses a pseudo-Least Recently Used (LRU) algorithm to replace cache lines. The specific algorithm may vary among devices.

Note: Refer to the specific device data sheet for details on a specific device.

Some devices maintain the state of the LRU algorithm for use by software. The state of the LRU algorithm can be read with [PLIB_PCACHE_LeastRecentlyUsedStateRead](#).

5.6.15.4.3.4 Prefetch Control Operations

The Prefetch Cache module is configured differently for different CPU configurations. For devices with a CPU L1 cache, the Prefetch Cache module holds one line of CPU instructions, one line of CPU data, and two lines of peripheral data. For devices without a CPU L1 cache, the Prefetch Cache module holds up to 16 lines of instructions and up to four lines of data. Control of either configuration is done using the [PLIB_PCACHE_PrefetchEnableSet](#) function.

Note: Refer to the specific device data sheet for the Prefetch Cache module configuration for a specific device.

For the CPU L1 configuration, the Prefetch Cache module can be configured to enable any address, CPU instructions and data, or CPU instructions only. For devices without a CPU L1 cache, predictive prefetch can be enabled for cacheable regions, uncachable regions, or both. In either configuration, predictive prefetch may be disabled entirely.

The [PLIB_PCACHE_PrefetchEnableSet](#) and [PLIB_PCACHE_PrefetchEnableGet](#) functions take or return the enumerated value [PLIB_PCACHE_PREFETCH_ENABLE](#). This enumeration will be defined differently for different CPU configurations.

Example: Enable Prefetch for Non-Cacheable Regions Only (no L1 configuration)

```
PLIB_PCACHE_PrefetchEnableSet(PLIB_PCACHE_PREFETCH_ENABLE_NONCACHED_REGIONS);
```

Example: Enable Prefetch for CPU Instructions and CPU Data (L1 configuration)

```
PLIB_PCACHE_PrefetchEnableSet(PLIB_PCACHE_PREFETCH_ENABLE_CPU_INST_DATA);
```

5.6.15.4.3.5 Prefetch Status Operations

Prefetch Abort Statistics Counter

Much like the cache hit/miss counters, the Prefetch Abort module maintains a prefetch abort counter. This counter is incremented each time an automatic prefetch is aborted due to a non-sequential instruction fetch, load or store. This value can

be read using the [PLIB_PCACHE_PrefetchAbortRead](#) function.

5.6.15.4.3.6 Flash ECC Operations

The Prefetch Cache module may handle and report information about two error types: ECC Double-bit Error Detected (DED) and ECC Single-bit Error Corrected (SEC).

A read from the Flash memory that results in a program Flash memory ECC DED causes the Prefetch Cache module to return a bus exception to the initiator. An ECC DED will also set the DED status bit. The state of the DED status bit may be read using the [PLIB_PCACHE_FlashDEDStatusGet](#) function.

A single-bit error read from the Flash memory is not a critical error, and as such is reported as an interrupt. The user has the option to enable or disable the SEC interrupt, and to set the number of SEC events that must occur before an SEC interrupt is generated. An SEC interrupt is generated when all of the following conditions are met:

- The Flash SEC counter is zero
- The Flash SEC interrupt is enabled
- An SEC event occurs

The Flash SEC counter is decremented once each time an SEC event occurs, and holds at zero. When a Flash SEC interrupt is triggered, the Flash SEC status bit is set. Once an SEC interrupt occurs, the Flash SEC status must be cleared by software and the Flash SEC counter must be reloaded by software.

Example: Set Flash SEC to Interrupt after three SEC events

```
PLIB_PCACHE_FlashSECStatusClear();
PLIB_PCACHE_FlashSECCountSet(3);
PLIB_PCACHE_FlashSECIntEnable();
```

It is possible to generate an SEC interrupt for testing purposes by enabling the Flash SEC interrupt and setting the Flash SEC status while the Flash SEC counter is zero.

Example: Generate an SEC Interrupt

```
PLIB_PCACHE_FlashSECStatusClear();
PLIB_PCACHE_FlashSECCountSet(0);
PLIB_PCACHE_FlashSECIntEnable();
PLIB_PCACHE_FlashSECStatusSet();
```

5.6.15.5 Configuring the Library

The library is configured for the supported processor when the processor is chosen in the MPLAB IDE.

5.6.15.6 Library Interface

Data Types and Constants

	Name	Description
	PLIB_PCACHE_MAX_SEC_COUNT	Defines the maximum value for single bit error counter.
	PLIB_PCACHE_NUM_LINES	Defines the number of Prefetch Cache Lines available
	PLIB_PCACHE_NUM_WORDS_PER_LINE	Defines the number of Words per Prefetch Cache Line
	PCACHE_MODULE_ID	Lists the possible Module IDs for the pcache.
	PLIB_PCACHE_DATA_ENABLE	Lists the possible predictive prefetch states for the Prefetch Cache
	PLIB_PCACHE_PREFETCH_ENABLE	Lists the possible predictive prefetch states for the Prefetch Cache

Cache Control Functions

	Name	Description
≡	PLIB_PCACHE_DataCacheEnableGet	Gets the data cache enable bits.
≡	PLIB_PCACHE_DataCacheEnableSet	Sets the data cache enable bits.
≡	PLIB_PCACHE_InvalidateOnPFMProgramAll	Sets prefetch cache to invalidate all data and instruction lines on a PFM program cycle.
≡	PLIB_PCACHE_InvalidateOnPFMProgramUnlocked	Sets prefetch cache to invalidate all unlocked data and instruction lines on a PFM program cycle.
≡	PLIB_PCACHE_WaitStateGet	Gets the prefetch cache access time.
≡	PLIB_PCACHE_WaitStateSet	Sets the prefetch cache access time.

Cache Line Functions

	Name	Description
≡	PLIB_PCACHE_CacheLineAddrGet	Gets the TAG address in the cache line previously write-enabled by PLIB_PCACHE_CacheLineSelect .
≡	PLIB_PCACHE_CacheLineAddrSet	Sets the TAG address in the cache line previously write-enabled by PLIB_PCACHE_CacheLineSelect .
≡	PLIB_PCACHE_CacheLineData	Sets cache line previously write-enabled by PLIB_PCACHE_CacheLineSelect to data type.
≡	PLIB_PCACHE_CacheLineDeselect	Disables write access to the cache line specified by cache_line.
≡	PLIB_PCACHE_CacheLineFlashTypeBoot	Set the cache line tag for the line previously write-enabled by PLIB_PCACHE_CacheLineSelect as residing in boot Flash.
≡	PLIB_PCACHE_CacheLineFlashTypeInst	Set the cache line tag for the line previously write-enabled by PLIB_PCACHE_CacheLineSelect as residing in instruction Flash.
≡	PLIB_PCACHE_CacheLineFlashTypeIsInst	Returns true if the cache line tag for the line previously write-enabled by PLIB_PCACHE_CacheLineSelect shows the line is residing in instruction Flash.
≡	PLIB_PCACHE_CacheLineInst	Sets cache line previously write-enabled by PLIB_PCACHE_CacheLineSelect to instruction type.
≡	PLIB_PCACHE_CacheLineInvalid	Invalidates cache line previously write-enabled by PLIB_PCACHE_CacheLineSelect .
≡	PLIB_PCACHE_CacheLineIsInst	Returns true if cache line previously write-enabled by PLIB_PCACHE_CacheLineSelect is set to instruction type.
≡	PLIB_PCACHE_CacheLineIsLocked	Returns true if cache line previously write-enabled by PLIB_PCACHE_CacheLineSelect is locked.
≡	PLIB_PCACHE_CacheLineIsValid	Returns true if cache line previously write-enabled by PLIB_PCACHE_CacheLineSelect is valid.
≡	PLIB_PCACHE_CacheLineLock	Locks cache line previously write-enabled by PLIB_PCACHE_CacheLineSelect .
≡	PLIB_PCACHE_CacheLineMaskGet	Returns the current state of the cache tag mask for the cache line previously write-enabled by PLIB_PCACHE_CacheLineSelect .
≡	PLIB_PCACHE_CacheLineMaskSet	Sets the cache tag mask to force a match on set bits on the cache line previously write-enabled by PLIB_PCACHE_CacheLineSelect .
≡	PLIB_PCACHE_CacheLineSelect	Enables write access to the cache line specified by cache_line.
≡	PLIB_PCACHE_CacheLineUnlock	Unlocks cache line previously write-enabled by PLIB_PCACHE_CacheLineSelect .
≡	PLIB_PCACHE_CacheLineValid	Validates cache line previously write-enabled by PLIB_PCACHE_CacheLineSelect .
≡	PLIB_PCACHE_WordRead	Reads the word specified by word from cache line previously write-enabled by PLIB_PCACHE_CacheLineSelect .

	PLIB_PCACHE_WordWrite	Writes the word (specified by word parameter) with data (specified by data parameter) to cache line previously write-enabled by PLIB_PCACHE_CacheLineSelect .

Cache Status Functions

	Name	Description
	PLIB_PCACHE_CacheHitRead	Reads the number of cache hits.
	PLIB_PCACHE_CacheHitWrite	Sets the number of cache hits.
	PLIB_PCACHE_CacheMissRead	Reads the number of cache misses.
	PLIB_PCACHE_CacheMissWrite	Sets the number of cache misses.
	PLIB_PCACHE_LeastRecentlyUsedStateRead	Reads the state of the cache least recently used encoding bits.

Feature Existence Functions

	Name	Description
	PLIB_PCACHE_ExistsCacheHit	Identifies that the CacheHit feature exists on the Prefetch Cache module.
	PLIB_PCACHE_ExistsCacheLine	Identifies that the CacheLineSelect feature exists on the Prefetch Cache module.
	PLIB_PCACHE_ExistsCacheLineAddr	Identifies that the CacheLineAddr feature exists on the Prefetch Cache module.
	PLIB_PCACHE_ExistsCacheLineFlashType	Identifies that the CacheLineFlashType feature exists on the Prefetch Cache module.
	PLIB_PCACHE_ExistsCacheLineLock	Identifies that the CacheLineLock feature exists on the Prefetch Cache module.
	PLIB_PCACHE_ExistsCacheLineMask	Identifies that the CacheLineMask feature exists on the Prefetch Cache module.
	PLIB_PCACHE_ExistsCacheLineType	Identifies that the CacheLineType feature exists on the Prefetch Cache module.
	PLIB_PCACHE_ExistsCacheLineValid	Identifies that the CacheLineValid feature exists on the Prefetch Cache module.
	PLIB_PCACHE_ExistsCacheMiss	Identifies that the CacheMiss feature exists on the Prefetch Cache module.
	PLIB_PCACHE_ExistsDataCacheEnable	Identifies that the DataCacheEnable feature exists on the Prefetch Cache module.
	PLIB_PCACHE_ExistsFlashDEDStatus	Identifies that the FlashDEDStatus feature exists on the Prefetch Cache module.
	PLIB_PCACHE_ExistsFlashSECCount	Identifies that the FlashSECCount feature exists on the Prefetch Cache module.
	PLIB_PCACHE_ExistsFlashSECInt	Identifies that the FlashSECInt feature exists on the Prefetch Cache module.
	PLIB_PCACHE_ExistsFlashSECStatus	Identifies that the FlashSECStatus feature exists on the Prefetch Cache module.
	PLIB_PCACHE_ExistsInvalidateOnPFMPProgram	Identifies that the InvalidateOnPFMPProgram feature exists on the Prefetch Cache module.
	PLIB_PCACHE_ExistsLeastRecentlyUsedState	Identifies that the LeastRecentlyUsedState feature exists on the Prefetch Cache module.
	PLIB_PCACHE_ExistsPrefetchAbort	Identifies that the PrefetchAbort feature exists on the Prefetch Cache module.
	PLIB_PCACHE_ExistsPrefetchEnable	Identifies that the PrefetchEnable feature exists on the Prefetch Cache module.

	PLIB_PCACHE_ExistsWaitState	Identifies that the WaitState feature exists on the Prefetch Cache module.
	PLIB_PCACHE_ExistsWord	Identifies that the Word feature exists on the Prefetch Cache module.

Flash ECC Functions

	Name	Description
	PLIB_PCACHE_FlashDEDStatusClear	Clears a bus exception caused by a double-bit error.
	PLIB_PCACHE_FlashDEDStatusGet	Determines if a bus exception was caused by a double-bit error.
	PLIB_PCACHE_FlashSECCountGet	Returns the current value of the Flash SEC counter.
	PLIB_PCACHE_FlashSECCountSet	Sets the number of single-bit error corrections that must occur before the SEC status is set to true.
	PLIB_PCACHE_FlashSECIntDisable	Disables an interrupt on SEC.
	PLIB_PCACHE_FlashSECIntEnable	Enables an interrupt on SEC.
	PLIB_PCACHE_FlashSECStatusClear	Sets the single-bit error corrected status to false.
	PLIB_PCACHE_FlashSECStatusGet	Determines if a SEC event triggered a Prefetch Cache interrupt.
	PLIB_PCACHE_FlashSECStatusSet	Sets the single-bit error corrected status to true.

Prefetch Control Functions

	Name	Description
	PLIB_PCACHE_PrefetchEnableGet	Gets the predictive prefetch state for the Prefetch Cache module.
	PLIB_PCACHE_PrefetchEnableSet	Sets the predictive prefetch state for the Prefetch Cache module.

Prefetch Status Functions

	Name	Description
	PLIB_PCACHE_PrefetchAbortRead	Reads the number of prefetch aborts.
	PLIB_PCACHE_PrefetchAbortWrite	Sets the number of prefetch aborts.

Description

This section provides detailed descriptions of the functions available in the Prefetch Cache Peripheral Library.

5.6.15.6.1 Cache Control Functions

5.6.15.6.1.1 PLIB_PCACHE_DataCacheEnableGet Function

C

```
PLIB_PCACHE_DATA_ENABLE PLIB_PCACHE_DataCacheEnableGet(
    PCACHE_MODULE_ID index
);
```

Description

This function gets the data cache enable bits.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be read

Returns

[PLIB_PCACHE_DATA_ENABLE](#)

Remarks

At reset, data caching is disabled, and this function will return `PLIB_PCACHE_DATA_DISABLE`.

This function implements an operation of the `DataCacheEnable` feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_RTCC_ExistsDataCacheEnable` in your application to automatically determine whether this feature is available.

Example

```
PLIB_PCACHE_DATA_ENABLE dcache_en;  
dcache_en = PLIB_PCACHE_DataCacheEnableGet(PCACHE_ID_0);
```

5.6.15.6.1.2 PLIB_PCACHE_DataCacheEnableSet Function

C

```
void PLIB_PCACHE_DataCacheEnableSet(  
    PCACHE_MODULE_ID index,  
    PLIB_PCACHE_DATA_ENABLE dcache_en  
);
```

Description

This function sets the data cache enable bits.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
dcache_en	PLIB_PCACHE_DATA_ENABLE

Returns

None.

Remarks

Data caching is disabled at reset.

This function implements an operation of the `DataCacheEnable` feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_RTCC_ExistsDataCacheEnable` in your application to automatically determine whether this feature is available.

Example

```
PLIB_PCACHE_DataCacheEnableSet(PCACHE_ID_0, PLIB_PCACHE_DATA_4LINE);
```

5.6.15.6.1.3 PLIB_PCACHE_InvalidateOnPFMProgramAll Function

C

```
void PLIB_PCACHE_InvalidateOnPFMProgramAll(  
    PCACHE_MODULE_ID index  
);
```

Description

This function sets the prefetch cache to invalidate all data and instruction lines on a PFM program cycle.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This function implements an operation of the InvalidateOnPFMProgram feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_RTCC_ExistsInvalidateOnPFMProgram` in your application to to automatically determine whether this feature is available.

Example

```
PLIB_PCACHE_InvalidateOnPFMProgramAll(PCACHE_ID_0);
```

5.6.15.6.1.4 PLIB_PCACHE_InvalidateOnPFMProgramUnlocked Function**C**

```
void PLIB_PCACHE_InvalidateOnPFMProgramUnlocked(  
    PCACHE_MODULE_ID index  
);
```

Description

This function sets the prefetch cache to invalidate all unlocked data and instruction lines on a PFM program cycle.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This is the default state at reset.

This function implements an operation of the InvalidateOnPFMProgram feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_RTCC_ExistsInvalidateOnPFMProgram` in your application to to automatically determine whether this feature is available.

Example

```
PLIB_PCACHE_InvalidateOnPFMProgramUnlocked(PCACHE_ID_0);
```

5.6.15.6.1.5 PLIB_PCACHE_WaitStateGet Function**C**

```
uint32_t PLIB_PCACHE_WaitStateGet(  
    PCACHE_MODULE_ID index  
);
```

Description

This function gets the prefetch cache access time in terms of SYSCLK wait. states.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be read

Returns

Number of clock cycles.

Remarks

At reset, this value is set to seven wait states.

This function implements an operation of the WaitState feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_RTCC_ExistsWaitState in your application to to automatically determine whether this feature is available.

Example

```
uint32_t wait;  
wait = PLIB_PCACHE_WaitStateGet(PCACHE_ID_0);
```

5.6.15.6.1.6 PLIB_PCACHE_WaitStateSet Function**C**

```
void PLIB_PCACHE_WaitStateSet(  
    PCACHE_MODULE_ID index,  
    uint32_t clocks  
);
```

Description

This function sets the prefetch cache access time in terms of SYSCLK wait. states.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
clocks	Identifies the wait state in terms of number of SYSCLK cycles

Returns

None.

Remarks

At reset, this value is set to seven wait states.

This function implements an operation of the WaitState feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_RTCC_ExistsWaitState in your application to to automatically determine whether this feature is available.

Example

```
PLIB_PCACHE_WaitStateSet(PCACHE_ID_0, 0);
```

5.6.15.6.2 Cache Line Functions

5.6.15.6.2.1 PLIB_PCACHE_CacheLineAddrGet Function

C

```
uint32_t PLIB_PCACHE_CacheLineAddrGet(  
    PCACHE_MODULE_ID index  
);
```

Description

This function gets the TAG address in the cache line previously write- enabled by [PLIB_PCACHE_CacheLineSelect](#).

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be read

Returns

Address in the cache line TAG register.

Remarks

This function implements an operation of the CacheLineAddr feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_RTCC_ExistsCacheLineAddr in your application to to automatically determine whether this feature is available.

Example

```
uint32_t addr;  
addr = PLIB_PCACHE_CacheLineAddrGet(PCACHE_ID_0);
```

5.6.15.6.2.2 PLIB_PCACHE_CacheLineAddrSet Function

C

```
void PLIB_PCACHE_CacheLineAddrSet(  
    PCACHE_MODULE_ID index,  
    uint32_t addr  
);
```

Description

This function Sets the TAG address in the cache line previously write- enabled by [PLIB_PCACHE_CacheLineSelect](#).

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
addr	Address to program into the cache line TAG register

Returns

None.

Remarks

This function implements an operation of the CacheLineAddr feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_RTCC_ExistsCacheLineAddr` in your application to automatically determine whether this feature is available.

Example

```
uint32_t addr = 0x1FC01234;
PLIB_PCACHE_CacheLineAddrSet(PCACHE_ID_0, addr);
```

5.6.15.6.2.3 PLIB_PCACHE_CacheLineData Function**C**

```
void PLIB_PCACHE_CacheLineData(
    PCACHE_MODULE_ID index
);
```

Description

This function sets the cache line previously enabled by [PLIB_PCACHE_CacheLineSelect](#) to data type.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This function implements an operation of the CacheLineType feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_RTCC_ExistsCacheLineType` in your application to automatically determine whether this feature is available.

Example

```
PLIB_PCACHE_CacheLineData(PCACHE_ID_0);
```

5.6.15.6.2.4 PLIB_PCACHE_CacheLineDeselect Function**C**

```
void PLIB_PCACHE_CacheLineDeselect(
    PCACHE_MODULE_ID index,
    uint32_t cache_line
);
```

Description

This function disables write access to the cache line specified by `cache_line`.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

cache_line	Specifies the cache line to disable write access

Returns

None.

Remarks

This function implements an operation of the CacheLineSelect feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_RTCC_ExistsCacheLineSelect` in your application to automatically determine whether this feature is available.

Example

```
PLIB_PCACHE_CacheLineDeselect(PCACHE_ID_0, 0);
```

5.6.15.6.2.5 PLIB_PCACHE_CacheLineFlashTypeBoot Function

C

```
void PLIB_PCACHE_CacheLineFlashTypeBoot(  
    PCACHE_MODULE_ID index  
);
```

Description

This function sets the cache line tag for the line previously write-enabled by [PLIB_PCACHE_CacheLineSelect](#) as residing in boot Flash.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This function implements an operation of the CacheLineFlashType feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_RTCC_ExistsCacheLineFlashType` in your application to automatically determine whether this feature is available.

Example

```
PLIB_PCACHE_CacheLineFlashTypeBoot(PCACHE_ID_0);
```

5.6.15.6.2.6 PLIB_PCACHE_CacheLineFlashTypeInst Function

C

```
void PLIB_PCACHE_CacheLineFlashTypeInst(  
    PCACHE_MODULE_ID index  
);
```

Description

This function sets the cache line tag for the line previously write-enabled by [PLIB_PCACHE_CacheLineSelect](#) as residing in instruction Flash.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This function implements an operation of the CacheLineFlashType feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_RTCC_ExistsCacheLineFlashType` in your application to automatically determine whether this feature is available.

Example

```
PLIB_PCACHE_CacheLineFlashTypeInst(PCACHE_ID_0);
```

5.6.15.6.2.7 PLIB_PCACHE_CacheLineFlashTypeIsInst Function**C**

```
bool PLIB_PCACHE_CacheLineFlashTypeIsInst(  
    PCACHE_MODULE_ID index  
);
```

Description

This function returns true if the cache line tag for the line previously write-enabled by `PLIB_PCACHE_CacheLineSelect` shows the line is residing in instruction Flash.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

- true - the cache line resides in instruction Flash
- false - the cache line resides in boot Flash

Remarks

This function implements an operation of the CacheLineFlashType feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_RTCC_ExistsCacheLineFlashType` in your application to automatically determine whether this feature is available.

Example

```
bool LineFlashType;  
LineFlashType = PLIB_PCACHE_CacheLineFlashTypeIsInst(PCACHE_ID_0);
```

5.6.15.6.2.8 PLIB_PCACHE_CacheLineInst Function**C**

```
void PLIB_PCACHE_CacheLineInst(  
    PCACHE_MODULE_ID index  
);
```

Description

This function sets the cache line previously write-enabled by [PLIB_PCACHE_CacheLineSelect](#) to instruction type.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This function implements an operation of the CacheLineType feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_RTCC_ExistsCacheLineType` in your application to to automatically determine whether this feature is available.

Example

```
PLIB_PCACHE_CacheLineInst(PCACHE_ID_0);
```

5.6.15.6.2.9 PLIB_PCACHE_CacheLineInvalid Function

C

```
void PLIB_PCACHE_CacheLineInvalid(  
    PCACHE_MODULE_ID index  
);
```

Description

This function invalidates the cache line previously write-enabled by [PLIB_PCACHE_CacheLineSelect](#).

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This function implements an operation of the CacheLineValid feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_RTCC_ExistsCacheLineValid` in your application to to automatically determine whether this feature is available.

Example

```
PLIB_PCACHE_CacheLineInvalid(PCACHE_ID_0);
```

5.6.15.6.2.10 PLIB_PCACHE_CacheLineIsInst Function

C

```
bool PLIB_PCACHE_CacheLineIsInst(  
    PCACHE_MODULE_ID index
```

```
);
```

Description

This function returns true if the cache line previously enabled by [PLIB_PCACHE_CacheLineSelect](#) is set to instruction type.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be read

Returns

- true - cache line is instruction
- false - cache line is data

Remarks

This function implements an operation of the CacheLineType feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_RTCC_ExistsCacheLineType` in your application to automatically determine whether this feature is available.

Example

```
bool CacheLineType;  
CacheLineType = PLIB_PCACHE_CacheLineIsInst(PCACHE_ID_0);
```

5.6.15.6.2.11 PLIB_PCACHE_CacheLineIsLocked Function

C

```
bool PLIB_PCACHE_CacheLineIsLocked(  
    PCACHE_MODULE_ID index  
);
```

Description

This function returns true if the cache line previously write-enabled by [PLIB_PCACHE_CacheLineSelect](#) is locked.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

- true - cache line is locked
- false - cache line is unlocked

Remarks

This function implements an operation of the CacheLineLock feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_RTCC_ExistsCacheLineLock` in your application to automatically determine whether this feature is available.

Example

```
bool CacheLineLocked;  
CacheLineLocked = PLIB_PCACHE_CacheLineIsLocked(PCACHE_ID_0);
```

5.6.15.6.2.12 PLIB_PCACHE_CacheLineIsValid Function

C

```
bool PLIB_PCACHE_CacheLineIsValid(  
    PCACHE_MODULE_ID index  
);
```

Description

This function returns true if the cache line previously write-enabled by [PLIB_PCACHE_CacheLineSelect](#) is valid.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

- true - cache line is valid
- false - cache line is invalid

Remarks

This function implements an operation of the CacheLineValid feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_RTCC_ExistsCacheLineValid` in your application to automatically determine whether this feature is available.

Example

```
bool CacheLineValid;  
CacheLineValid = PLIB_PCACHE_CacheLineIsValid(PCACHE_ID_0);
```

5.6.15.6.2.13 PLIB_PCACHE_CacheLineLock Function

C

```
void PLIB_PCACHE_CacheLineLock(  
    PCACHE_MODULE_ID index  
);
```

Description

This function locks the cache line previously write-enabled by [PLIB_PCACHE_CacheLineSelect](#).

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This function implements an operation of the CacheLineLock feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_RTCC_ExistsCacheLineLock` in your application to automatically determine whether this feature is available.

Example

```
PLIB_PCACHE_CacheLineLock(PCACHE_ID_0);
```

5.6.15.6.2.14 PLIB_PCACHE_CacheLineMaskGet Function**C**

```
uint32_t PLIB_PCACHE_CacheLineMaskGet(  
    PCACHE_MODULE_ID index  
);
```

Description

This function returns the current state of the cache tag mask for the cache line previously write-enabled by [PLIB_PCACHE_CacheLineSelect](#).

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be read

Returns

Address mask - Bits set to '1' will force a match (valid bits: <15:5>).

Remarks

This function implements an operation of the CacheLineMask feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_RTCC_ExistsCacheLineMask in your application to to automatically determine whether this feature is available.

Example

```
uint32_t mask;  
mask = PLIB_PCACHE_CacheLineMaskGet(PCACHE_ID_0);
```

5.6.15.6.2.15 PLIB_PCACHE_CacheLineMaskSet Function**C**

```
void PLIB_PCACHE_CacheLineMaskSet(  
    PCACHE_MODULE_ID index,  
    uint32_t mask  
);
```

Description

This function sets the cache tag mask to force a match on set bits on the cache line previously write-enabled by [PLIB_PCACHE_CacheLineSelect](#).

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
mask	Address mask (bits set to '1' will force a match - valid bits: <15:5>)

Returns

None.

Remarks

This function implements an operation of the CacheLineMask feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_RTCC_ExistsCacheLineMask` in your application to automatically determine whether this feature is available.

Example

```
uint32_t mask = 0x0C0;
PLIB_PCACHE_CacheLineMaskSet(PCACHE_ID_0, mask);
```

5.6.15.6.2.16 PLIB_PCACHE_CacheLineSelect Function**C**

```
void PLIB_PCACHE_CacheLineSelect(
    PCACHE_MODULE_ID index,
    uint32_t cache_line
);
```

Description

This function enables write access to the cache line specified by `cache_line`.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
cache_line	Specifies the cache line to enable write access

Returns

None.

Remarks

At reset, all cache lines are read-only.

This function implements an operation of the CacheLineSelect feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_RTCC_ExistsCacheLineSelect` in your application to automatically determine whether this feature is available.

Example

```
PLIB_PCACHE_CacheLineSelect(PCACHE_ID_0, 0);
```

5.6.15.6.2.17 PLIB_PCACHE_CacheLineUnlock Function**C**

```
void PLIB_PCACHE_CacheLineUnlock(
    PCACHE_MODULE_ID index
);
```

Description

This function unlocks the cache line previously write-enabled by [PLIB_PCACHE_CacheLineSelect](#).

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This function implements an operation of the CacheLineLock feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_RTCC_ExistsCacheLineLock` in your application to automatically determine whether this feature is available.

Example

```
PLIB_PCACHE_CacheLineUnlock(PCACHE_ID_0);
```

5.6.15.6.2.18 PLIB_PCACHE_CacheLineValid Function**C**

```
void PLIB_PCACHE_CacheLineValid(  
    PCACHE_MODULE_ID index  
);
```

Description

This function validates the cache line previously write-enabled by [PLIB_PCACHE_CacheLineSelect](#).

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This function implements an operation of the CacheLineValid feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_RTCC_ExistsCacheLineValid` in your application to automatically determine whether this feature is available.

Example

```
PLIB_PCACHE_CacheLineValid(PCACHE_ID_0);
```

5.6.15.6.2.19 PLIB_PCACHE_WordRead Function**C**

```
uint32_t PLIB_PCACHE_WordRead(  
    PCACHE_MODULE_ID index,  
    uint32_t word  
);
```

Description

This function reads the word specified by word from the cache line previously write-enabled by [PLIB_PCACHE_CacheLineSelect](#).

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be read
word	Location of the word in the data array to be read

Returns

32-bit unsigned word from cache data array.

Remarks

This function implements an operation of the Word feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_RTCC_ExistsWord in your application to to automatically determine whether this feature is available.

Example

```
uint32_t word;  
word = PLIB_PCACHE_WordRead(PCACHE_ID_0, 0);
```

5.6.15.6.2.20 PLIB_PCACHE_WordWrite Function**C**

```
void PLIB_PCACHE_WordWrite(  
    PCACHE_MODULE_ID index,  
    uint32_t word,  
    uint32_t data  
);
```

Description

This function writes the word (specified by word parameter) with data (specified by data parameter) to the cache line previously write-enabled by [PLIB_PCACHE_CacheLineSelect](#).

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be written.
word	Location of the word in the data array to be written
data	32-bit unsigned word to write to cache data array

Returns

None.

Remarks

This function implements an operation of the Word feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_RTCC_ExistsWord in your application to to automatically determine whether this feature is available.

Example

```
uint32_t word = 0;
uint32_t data = 0xDEADBEEF;
PLIB_PCACHE_WordWrite(PCACHE_ID_0, word, data);
```

5.6.15.6.3 Cache Status Functions

5.6.15.6.3.1 PLIB_PCACHE_CacheHitRead Function

C

```
uint32_t PLIB_PCACHE_CacheHitRead(
    PCACHE_MODULE_ID index
);
```

Description

This function reads the number of cache hits.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be read

Returns

Number of cache hits.

Remarks

This function implements an operation of the CacheHit feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_RTCC_ExistsCacheHit in your application to to automatically determine whether this feature is available.

Example

```
uint32_t cache_hits;
cache_hits = PLIB_PCACHE_CacheHitRead(PCACHE_ID_0);
```

5.6.15.6.3.2 PLIB_PCACHE_CacheHitWrite Function

C

```
void PLIB_PCACHE_CacheHitWrite(
    PCACHE_MODULE_ID index,
    uint32_t data
);
```

Description

This function sets the number of cache hits.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be written
data	Number of cache hits to write

Returns

None.

Remarks

This function implements an operation of the CacheHit feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_RTCC_ExistsCacheHit` in your application to to automatically determine whether this feature is available.

Example

```
PLIB_PCACHE_CacheHitWrite(PCACHE_ID_0, 0xF00);
```

5.6.15.6.3.3 PLIB_PCACHE_CacheMissRead Function**C**

```
uint32_t PLIB_PCACHE_CacheMissRead(  
    PCACHE_MODULE_ID index  
);
```

Description

This function reads the number of cache misses.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be read.

Returns

Number of cache misses.

Remarks

This function implements an operation of the CacheMiss feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_RTCC_ExistsCacheMiss` in your application to to automatically determine whether this feature is available.

Example

```
uint32_t cache_misses;  
cache_misses = PLIB_PCACHE_CacheMissRead(PCACHE_ID_0);
```

5.6.15.6.3.4 PLIB_PCACHE_CacheMissWrite Function**C**

```
void PLIB_PCACHE_CacheMissWrite(  
    PCACHE_MODULE_ID index,  
    uint32_t data  
);
```

Description

This function sets the number of cache misses.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be written
data	Number of cache misses to write

Returns

None.

Remarks

This function implements an operation of the CacheMiss feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_RTCC_ExistsCacheMiss` in your application to to automatically determine whether this feature is available.

Example

```
PLIB_PCACHE_CacheMissWrite(PCACHE_ID_0, 0xF00);
```

5.6.15.6.3.5 PLIB_PCACHE_LeastRecentlyUsedStateRead Function**C**

```
uint32_t PLIB_PCACHE_LeastRecentlyUsedStateRead(  
    PCACHE_MODULE_ID index  
);
```

Description

This function reads the state of the cache least recently used encoding bits.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be read.

Returns

State of Least Recently Used encoding bits represented as a 25-bit unsigned integer.

Remarks

This function implements an operation of the LeastRecentlyUsedState feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_RTCC_ExistsLeastRecentlyUsedState` in your application to to automatically determine whether this feature is available.

Example

```
uint32_t lru_state;  
lru_state = PLIB_PCACHE_LeastRecentlyUsedStateRead(PCACHE_ID_0);
```

5.6.15.6.4 Prefetch Control Functions**5.6.15.6.4.1 PLIB_PCACHE_PrefetchEnableGet Function****C**

```
PLIB_PCACHE_PREFETCH_ENABLE PLIB_PCACHE_PrefetchEnableGet(  
    PCACHE_MODULE_ID index  
);
```

Description

This function gets the predictive prefetch state for the Prefetch Cache module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be read

Returns

[PLIB_PCACHE_PREFETCH_ENABLE](#)

Remarks

At reset, the Pretch Cache module is disabled and this function will return PLIB_PCACHE_DISABLE.

This function implements an operation of the PrefetchEnable feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_RTCC_ExistsPrefetchEnable in your application to to automatically determine whether this feature is available.

Example

```
PLIB_PCACHE_PREFETCH_ENABLE region;  
region = PLIB_PCACHE_PrefetchEnableGet(PCACHE_ID_0);
```

5.6.15.6.4.2 PLIB_PCACHE_PrefetchEnableSet Function**C**

```
void PLIB_PCACHE_PrefetchEnableSet(  
    PCACHE_MODULE_ID index,  
    PLIB_PCACHE_PREFETCH_ENABLE region  
);
```

Description

This function sets the predictive prefetch state for the Prefetch Cache module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
region	PLIB_PCACHE_PREFETCH_ENABLE

Returns

None.

Remarks

At reset, the Pretch Cache module is disabled.

This function implements an operation of the PrefetchEnable feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_RTCC_ExistsPrefetchEnable in your application to to automatically determine whether this feature is available.

Example

```
PLIB_PCACHE_PrefetchEnableSet(PCACHE_ID_0,
```

```
PLIB_PCACHE_PREFETCH_ENABLE_ALL);
```

5.6.15.6.5 Prefetch Status Functions

5.6.15.6.5.1 PLIB_PCACHE_PrefetchAbortRead Function

C

```
uint32_t PLIB_PCACHE_PrefetchAbortRead(  
    PCACHE_MODULE_ID index  
);
```

Description

This function reads the number of prefetch aborts.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be read

Returns

Number of prefetch aborts.

Remarks

This function implements an operation of the PrefetchAbort feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_RTCC_ExistsPrefetchAbort in your application to automatically determine whether this feature is available.

Example

```
uint32_t pfabt;  
pfabt = PLIB_PCACHE_PrefetchAbortRead(PCACHE_ID_0);
```

5.6.15.6.5.2 PLIB_PCACHE_PrefetchAbortWrite Function

C

```
void PLIB_PCACHE_PrefetchAbortWrite(  
    PCACHE_MODULE_ID index,  
    uint32_t data  
);
```

Description

This function Sets the number of prefetch aborts.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be written
data	Number of prefetch aborts

Returns

None.

Remarks

This function implements an operation of the PrefetchAbort feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_RTCC_ExistsPrefetchAbort` in your application to automatically determine whether this feature is available.

Example

```
PLIB_PCACHE_PrefetchAbortWrite(PCACHE_ID_0, 0xF00);
```

5.6.15.6.6 Flash ECC Functions

5.6.15.6.6.1 PLIB_PCACHE_FlashDEDStatusClear Function

C

```
void PLIB_PCACHE_FlashDEDStatusClear(  
    PCACHE_MODULE_ID index  
);
```

Description

This function clears a bus exception caused by a double-bit error.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be cleared

Returns

None

Remarks

The DED status is set by hardware.

This function implements an operation of the FlashDEDStatus feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_RTCC_ExistsFlashDEDStatus` in your application to automatically determine whether this feature is available.

Example

```
PLIB_PCACHE_FlashDEDStatusClear(PCACHE_ID_0);
```

5.6.15.6.6.2 PLIB_PCACHE_FlashDEDStatusGet Function

C

```
bool PLIB_PCACHE_FlashDEDStatusGet(  
    PCACHE_MODULE_ID index  
);
```

Description

This function determines if a bus exception was caused by a double-bit error.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be read

Returns

- true - A double-bit error was detected
- false - A double-bit error was not detected

Remarks

The Double-bit Error Detected (DED) status is set by hardware.

This function implements an operation of the FlashDEDStatus feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_RTCC_ExistsFlashDEDStatus in your application to automatically determine whether this feature is available.

Example

```
bool dedStatus;  
dedStatus = PLIB_PCACHE_FlashDEDStatusGet(PCACHE_ID_0);
```

5.6.15.6.6.3 PLIB_PCACHE_FlashSECCountGet Function**C**

```
uint8_t PLIB_PCACHE_FlashSECCountGet(  
    PCACHE_MODULE_ID index  
);
```

Description

This function returns the current value of the Flash SEC counter.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be read

Returns

count - Number of SEC events to occur before the SEC status is set to true

Remarks

This function implements an operation of the FlashSECCount feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_RTCC_ExistsFlashSECCount in your application to automatically determine whether this feature is available.

Example

```
uint8_t count;  
count = PLIB_PCACHE_FlashSECCountGet(PCACHE_ID_0);
```

5.6.15.6.6.4 PLIB_PCACHE_FlashSECCountSet Function**C**

```
void PLIB_PCACHE_FlashSECCountSet(  
    PCACHE_MODULE_ID index,  
    uint8_t count  
);
```

Description

This function sets the number of single-bit error corrections that must occur before the SEC status is set to true.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
count	Number of SEC events to occur before SEC status is set to true

Returns

None

Remarks

This function implements an operation of the FlashSECCount feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_RTCC_ExistsFlashSECCount` in your application to automatically determine whether this feature is available.

Example

```
PLIB_PCACHE_FlashSECCountSet(PCACHE_ID_0, 255);
```

5.6.15.6.6.5 PLIB_PCACHE_FlashSECIntDisable Function**C**

```
void PLIB_PCACHE_FlashSECIntDisable(  
    PCACHE_MODULE_ID index  
);
```

Description

This function disables an interrupt on SEC.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be disabled

Returns

None

Remarks

At reset the SEC interrupt is disabled.

This function implements an operation of the FlashSECInt feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_RTCC_ExistsFlashSECInt` in your application to automatically determine whether this feature is available.

Example

```
PLIB_PCACHE_FlashSECIntDisable(PCACHE_ID_0);
```

5.6.15.6.6.6 PLIB_PCACHE_FlashSECIntEnable Function

C

```
void PLIB_PCACHE_FlashSECIntEnable(  
    PCACHE_MODULE_ID index  
);
```

Description

This function enables an interrupt on SEC.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be enabled

Returns

None

Remarks

At reset the SEC interrupt is disabled.

This function implements an operation of the FlashSECInt feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_RTCC_ExistsFlashSECInt in your application to automatically determine whether this feature is available.

Example

```
PLIB_PCACHE_FlashSECIntEnable(PCACHE_ID_0);
```

5.6.15.6.6.7 PLIB_PCACHE_FlashSECStatusClear Function

C

```
void PLIB_PCACHE_FlashSECStatusClear(  
    PCACHE_MODULE_ID index  
);
```

Description

This function sets the single-bit error corrected status to false.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be cleared

Returns

None

Remarks

The SEC status must be cleared in response to a Prefetch Cache SEC interrupt.

This function implements an operation of the FlashSECStatus feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_RTCC_ExistsFlashSECStatus in your application to

to automatically determine whether this feature is available.

Example

```
PLIB_PCACHE_FlashSECStatusClear(PCACHE_ID_0);
```

5.6.15.6.6.8 PLIB_PCACHE_FlashSECStatusGet Function

C

```
bool PLIB_PCACHE_FlashSECStatusGet(  
    PCACHE_MODULE_ID index  
);
```

Description

This function determines if a SEC event triggered a Prefetch Cache interrupt.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be read

Returns

- true - A single-bit error was corrected
- false - A double-bit error was not corrected

Remarks

The SEC bit is set when a single-bit error is corrected and the SEC counter is zero. If the Flash SEC interrupt is enabled, an error event is reported to the CPU by a Prefetch Cache interrupt event.

This function implements an operation of the FlashSECStatus feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_RTCC_ExistsFlashSECStatus in your application to automatically determine whether this feature is available.

Example

```
bool secStatus;  
secStatus = PLIB_PCACHE_FlashSECStatusGet(PCACHE_ID_0);
```

5.6.15.6.6.9 PLIB_PCACHE_FlashSECStatusSet Function

C

```
void PLIB_PCACHE_FlashSECStatusSet(  
    PCACHE_MODULE_ID index  
);
```

Description

This function sets the single-bit error corrected status to true.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None

Remarks

This function is provided for code testing and debug purposes. Setting the SEC status while the SEC count is zero and the SEC interrupt is enabled will trigger a Prefetch Cache interrupt to the CPU.

This function implements an operation of the FlashSECStatus feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_RTCC_ExistsFlashSECStatus` in your application to automatically determine whether this feature is available.

Example

```
PLIB_PCACHE_FlashSECStatusSet(PCACHE_ID_0);
```

5.6.15.6.7 Data Types and Constants

5.6.15.6.7.1 PLIB_PCACHE_MAX_SEC_COUNT Macro

C

```
#define PLIB_PCACHE_MAX_SEC_COUNT 255
```

Description

Maximum Value for Single Bit Error Counter

This definition specifies the maximum value for single bit error counter.

Remarks

The actual maximum value of the SEC counter is processor specific and is defined in the processor-specific header files (see `processor.h`).

5.6.15.6.7.2 PLIB_PCACHE_NUM_LINES Macro

C

```
#define PLIB_PCACHE_NUM_LINES
```

Description

Number of Cache Lines

This definition specifies the number of Prefetch Cache Lines available.

Remarks

The actual number of cache lines is processor specific and is defined in the processor-specific header files (see `processor.h`).

5.6.15.6.7.3 PLIB_PCACHE_NUM_WORDS_PER_LINE Macro

C

```
#define PLIB_PCACHE_NUM_WORDS_PER_LINE
```

Description

Number of Words per Cache Line

This definition specifies the number of Words per Prefetch Cache Line.

Remarks

The actual number of words per cache line is processor specific and is defined in the processor-specific header files (see processor.h).

5.6.15.6.7.4 PCACHE_MODULE_ID Enumeration**C**

```
typedef enum {
    PCACHE_ID_1,
    PCACHE_NUMBER_OF_MODULES
} PCACHE_MODULE_ID;
```

Description

Module ID

This enumeration lists the possible Module IDs for the pcache.

Remarks

Refer to the data sheet to get the correct number of modules defined for the desired device.

5.6.15.6.7.5 PLIB_PCACHE_DATA_ENABLE Enumeration**C**

```
typedef enum {
    PLIB_PCACHE_DATA_DISABLE,
    PLIB_PCACHE_DATA_1LINE,
    PLIB_PCACHE_DATA_2LINE,
    PLIB_PCACHE_DATA_4LINE
} PLIB_PCACHE_DATA_ENABLE;
```

Description

Data Cache Enable

This enumeration lists the possible predictive prefetch states for the Prefetch Cache.

Members

Members	Description
PLIB_PCACHE_DATA_DISABLE	Disable data caching
PLIB_PCACHE_DATA_1LINE	Enable data caching with a size of 1 Line
PLIB_PCACHE_DATA_2LINE	Enable data caching with a size of 2 Lines
PLIB_PCACHE_DATA_4LINE	Enable data caching with a size of 4 Lines

Remarks

Not all settings are available for all devices. See the device-specific data sheet for details. This enumeration is processor specific and is defined in the processor-specific header files (see processor.h).

5.6.15.6.7.6 PLIB_PCACHE_PREFETCH_ENABLE Enumeration**C**

```
typedef enum {
    PLIB_PCACHE_PREFETCH_DISABLE,
    PLIB_PCACHE_PREFETCH_ENABLE_CACHED_REGIONS,
    PLIB_PCACHE_PREFETCH_ENABLE_CPU_INST,
    PLIB_PCACHE_PREFETCH_ENABLE_NONCACHED_REGIONS,
    PLIB_PCACHE_PREFETCH_ENABLE_CPU_INST_DATA,
```

```
    PLIB_PCACHE_PREFETCH_ENABLE_ALL  
} PLIB_PCACHE_PREFETCH_ENABLE;
```

Description

Predictive Prefetch Cache Enable Bits

This enumeration lists the possible predictive prefetch states for the Prefetch Cache.

Members

Members	Description
PLIB_PCACHE_PREFETCH_DISABLE	Disable predictive prefetch enable
PLIB_PCACHE_PREFETCH_ENABLE_CACHED_REGIONS	Enable predictive prefetch cache for cacheable regions only
PLIB_PCACHE_PREFETCH_ENABLE_CPU_INST	Enable predictive prefetch cache for cacheable regions only
PLIB_PCACHE_PREFETCH_ENABLE_NONCACHED_REGIONS	Enable predictive prefetch cache for non-cacheable regions only
PLIB_PCACHE_PREFETCH_ENABLE_CPU_INST_DATA	Enable predictive prefetch cache for non-cacheable regions only
PLIB_PCACHE_PREFETCH_ENABLE_ALL	Enable predictive prefetch cache for cacheable and non-cacheable regions

Remarks

Not all settings are available for all devices. See the device-specific data sheet for details. This enumeration is processor specific and is defined in the processor-specific header files (see processor.h).

5.6.15.6.8 Feature Existence Functions

5.6.15.6.8.1 PLIB_PCACHE_ExistsCacheHit Function

C

```
bool PLIB_PCACHE_ExistsCacheHit(  
    PCACHE_MODULE_ID index  
);
```

Description

This interface identifies that the CacheHit feature is available on the Prefetch Cache module. When this interface returns true, these functions are supported on the device:

- [PLIB_PCACHE_CacheHitRead](#)
- [PLIB_PCACHE_CacheHitWrite](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The CacheHit feature is supported on the device
- false - The CacheHit feature is not supported on the device

Remarks

None.

5.6.15.6.8.2 PLIB_PCACHE_ExistsCacheLine Function

C

```
bool PLIB_PCACHE_ExistsCacheLine(  
    PCACHE_MODULE_ID index  
);
```

Description

This interface identifies that the CacheLineSelect feature is available on the Prefetch Cache module. When this interface returns true, these functions are supported on the device:

- [PLIB_PCACHE_CacheLineSelect](#)
- [PLIB_PCACHE_CacheLineDeselect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The CacheLineSelect feature is supported on the device
- false - The CacheLineSelect feature is not supported on the device

Remarks

None.

5.6.15.6.8.3 PLIB_PCACHE_ExistsCacheLineAddr Function

C

```
bool PLIB_PCACHE_ExistsCacheLineAddr(  
    PCACHE_MODULE_ID index  
);
```

Description

This interface identifies that the CacheLineAddr feature is available on the Prefetch Cache module. When this interface returns true, these functions are supported on the device:

- [PLIB_PCACHE_CacheLineAddrSet](#)
- [PLIB_PCACHE_CacheLineAddrGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The CacheLineAddr feature is supported on the device
- false - The CacheLineAddr feature is not supported on the device

Remarks

None.

5.6.15.6.8.4 PLIB_PCACHE_ExistsCacheLineFlashType Function

C

```
bool PLIB_PCACHE_ExistsCacheLineFlashType(
    PCACHE_MODULE_ID index
);
```

Description

This interface identifies that the CacheLineFlashType feature is available on the Prefetch Cache module. When this interface returns true, these functions are supported on the device:

- [PLIB_PCACHE_CacheLineFlashTypeBoot](#)
- [PLIB_PCACHE_CacheLineFlashTypeInst](#)
- [PLIB_PCACHE_CacheLineFlashTypeIsInst](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The CacheLineFlashType feature is supported on the device
- false - The CacheLineFlashType feature is not supported on the device

Remarks

None.

5.6.15.6.8.5 PLIB_PCACHE_ExistsCacheLineLock Function

C

```
bool PLIB_PCACHE_ExistsCacheLineLock(
    PCACHE_MODULE_ID index
);
```

Description

This interface identifies that the CacheLineLock feature is available on the Prefetch Cache module. When this interface returns true, these functions are supported on the device:

- [PLIB_PCACHE_CacheLineLock](#)
- [PLIB_PCACHE_CacheLineUnlock](#)
- [PLIB_PCACHE_CacheLineIsLocked](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The CacheLineLock feature is supported on the device
- false - The CacheLineLock feature is not supported on the device

Remarks

None.

5.6.15.6.8.6 PLIB_PCACHE_ExistsCacheLineMask Function**C**

```
bool PLIB_PCACHE_ExistsCacheLineMask(  
    PCACHE_MODULE_ID index  
);
```

Description

This interface identifies that the CacheLineMask feature is available on the Prefetch Cache module. When this interface returns true, these functions are supported on the device:

- [PLIB_PCACHE_CacheLineMaskSet](#)
- [PLIB_PCACHE_CacheLineMaskGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The CacheLineMask feature is supported on the device
- false - The CacheLineMask feature is not supported on the device

Remarks

None.

5.6.15.6.8.7 PLIB_PCACHE_ExistsCacheLineType Function**C**

```
bool PLIB_PCACHE_ExistsCacheLineType(  
    PCACHE_MODULE_ID index  
);
```

Description

This interface identifies that the CacheLineType feature is available on the Prefetch Cache module. When this interface returns true, these functions are supported on the device:

- [PLIB_PCACHE_CacheLineData](#)
- [PLIB_PCACHE_CacheLineInst](#)

- [PLIB_PCACHE_CacheLineIsInst](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The CacheLineType feature is supported on the device
- false - The CacheLineType feature is not supported on the device

Remarks

None.

5.6.15.6.8.8 PLIB_PCACHE_ExistsCacheLineValid Function

C

```
bool PLIB_PCACHE_ExistsCacheLineValid(  
    PCACHE_MODULE_ID index  
);
```

Description

This interface identifies that the CacheLineValid feature is available on the Prefetch Cache module. When this interface returns true, these functions are supported on the device:

- [PLIB_PCACHE_CacheLineValid](#)
- [PLIB_PCACHE_CacheLineInvalid](#)
- [PLIB_PCACHE_CacheLineIsValid](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The CacheLineValid feature is supported on the device
- false - The CacheLineValid feature is not supported on the device

Remarks

None.

5.6.15.6.8.9 PLIB_PCACHE_ExistsCacheMiss Function

C

```
bool PLIB_PCACHE_ExistsCacheMiss(  
    PCACHE_MODULE_ID index  
);
```

Description

This interface identifies that the CacheMiss feature is available on the Prefetch Cache module. When this interface returns true, these functions are supported on the device:

- [PLIB_PCACHE_CacheMissRead](#)
- [PLIB_PCACHE_CacheMissWrite](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The CacheMiss feature is supported on the device
- false - The CacheMiss feature is not supported on the device

Remarks

None.

5.6.15.6.8.10 PLIB_PCACHE_ExistsDataCacheEnable Function**C**

```
bool PLIB_PCACHE_ExistsDataCacheEnable(  
    PCACHE_MODULE_ID index  
);
```

Description

This interface identifies that the DataCacheEnable feature is available on the Prefetch Cache module. When this interface returns true, these functions are supported on the device:

- [PLIB_PCACHE_DataCacheEnableSet](#)
- [PLIB_PCACHE_DataCacheEnableGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The DataCacheEnable feature is supported on the device
- false - The DataCacheEnable feature is not supported on the device

Remarks

None.

5.6.15.6.8.11 PLIB_PCACHE_ExistsFlashDEDStatus Function

C

```
bool PLIB_PCACHE_ExistsFlashDEDStatus(  
    PCACHE_MODULE_ID index  
);
```

Description

This interface identifies that the FlashDEDStatus feature is available on the Prefetch Cache module. When this interface returns true, these functions are supported on the device:

- [PLIB_PCACHE_FlashDEDStatusGet](#)
- [PLIB_PCACHE_FlashDEDStatusClear](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The FlashDEDStatus feature is supported on the device
- false - The FlashDEDStatus feature is not supported on the device

Remarks

None.

5.6.15.6.8.12 PLIB_PCACHE_ExistsFlashSECCount Function

C

```
bool PLIB_PCACHE_ExistsFlashSECCount(  
    PCACHE_MODULE_ID index  
);
```

Description

This interface identifies that the FlashSECCount feature is available on the Prefetch Cache module. When this interface returns true, these functions are supported on the device:

- [PLIB_PCACHE_FlashSECCountSet](#)
- [PLIB_PCACHE_FlashSECCountGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The FlashSECCount feature is supported on the device
- false - The FlashSECCount feature is not supported on the device

Remarks

None.

5.6.15.6.8.13 PLIB_PCACHE_ExistsFlashSECInt Function**C**

```
bool PLIB_PCACHE_ExistsFlashSECInt(  
    PCACHE_MODULE_ID index  
);
```

Description

This interface identifies that the FlashSECInt feature is available on the Prefetch Cache module. When this interface returns true, these functions are supported on the device:

- [PLIB_PCACHE_FlashSECIntEnable](#)
- [PLIB_PCACHE_FlashSECIntDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The FlashSECInt feature is supported on the device
- false - The FlashSECInt feature is not supported on the device

Remarks

None.

5.6.15.6.8.14 PLIB_PCACHE_ExistsFlashSECStatus Function**C**

```
bool PLIB_PCACHE_ExistsFlashSECStatus(  
    PCACHE_MODULE_ID index  
);
```

Description

This interface identifies that the FlashSECStatus feature is available on the Prefetch Cache module. When this interface returns true, these functions are supported on the device:

- [PLIB_PCACHE_FlashSECStatusGet](#)
- [PLIB_PCACHE_FlashSECStatusSet](#)
- [PLIB_PCACHE_FlashSECStatusClear](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The FlashSECStatus feature is supported on the device
- false - The FlashSECStatus feature is not supported on the device

Remarks

None.

5.6.15.6.8.15 PLIB_PCACHE_ExistsInvalidateOnPFMProgram Function**C**

```
bool PLIB_PCACHE_ExistsInvalidateOnPFMProgram(  
    PCACHE_MODULE_ID index  
);
```

Description

This interface identifies that the InvalidateOnPFMProgram feature is available on the Prefetch Cache module. When this interface returns true, these functions are supported on the device:

- [PLIB_PCACHE_InvalidateOnPFMProgramAll](#)
- [PLIB_PCACHE_InvalidateOnPFMProgramUnlocked](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The InvalidateOnPFMProgram feature is supported on the device
- false - The InvalidateOnPFMProgram feature is not supported on the device

Remarks

None.

5.6.15.6.8.16 PLIB_PCACHE_ExistsLeastRecentlyUsedState Function**C**

```
bool PLIB_PCACHE_ExistsLeastRecentlyUsedState(  
    PCACHE_MODULE_ID index  
);
```

Description

This interface identifies that the LeastRecentlyUsedState feature is available on the Prefetch Cache module. When this interface returns true, this function is supported on the device:

- [PLIB_PCACHE_LeastRecentlyUsedStateRead](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The LeastRecentlyUsedState feature is supported on the device
- false - The LeastRecentlyUsedState feature is not supported on the device

Remarks

None.

5.6.15.6.8.17 PLIB_PCACHE_ExistsPrefetchAbort Function**C**

```
bool PLIB_PCACHE_ExistsPrefetchAbort(  
    PCACHE_MODULE_ID index  
);
```

Description

This interface identifies that the PrefetchAbort feature is available on the Prefetch Cache module. When this interface returns true, these functions are supported on the device:

- [PLIB_PCACHE_PrefetchAbortRead](#)
- [PLIB_PCACHE_PrefetchAbortWrite](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The PrefetchAbort feature is supported on the device
- false - The PrefetchAbort feature is not supported on the device

Remarks

None.

5.6.15.6.8.18 PLIB_PCACHE_ExistsPrefetchEnable Function**C**

```
bool PLIB_PCACHE_ExistsPrefetchEnable(  
    PCACHE_MODULE_ID index  
);
```

Description

This interface identifies that the PrefetchEnable feature is available on the Prefetch Cache module. When this interface returns true, these functions are supported on the device:

- [PLIB_PCACHE_PrefetchEnableSet](#)
- [PLIB_PCACHE_PrefetchEnableGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The PrefetchEnable feature is supported on the device
- false - The PrefetchEnable feature is not supported on the device

Remarks

None.

5.6.15.6.8.19 PLIB_PCACHE_ExistsWaitState Function**C**

```
bool PLIB_PCACHE_ExistsWaitState(  
    PCACHE_MODULE_ID index  
);
```

Description

This interface identifies that the WaitState feature is available on the Prefetch Cache module. When this interface returns true, these functions are supported on the device:

- [PLIB_PCACHE_WaitStateSet](#)
- [PLIB_PCACHE_WaitStateGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The WaitState feature is supported on the device
- false - The WaitState feature is not supported on the device

Remarks

None.

5.6.15.6.8.20 PLIB_PCACHE_ExistsWord Function**C**

```
bool PLIB_PCACHE_ExistsWord(  
    PCACHE_MODULE_ID index  
);
```

Description

This interface identifies that the Word feature is available on the Prefetch Cache module. When this interface returns true, these functions are supported on the device:

- [PLIB_PCACHE_WordRead](#)
- [PLIB_PCACHE_WordWrite](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The Word feature is supported on the device
- false - The Word feature is not supported on the device

Remarks

None.

5.6.15.7 Files

Files

Name	Description
plib_pcache.h	Defines the Prefetch Cache (PCACHE) Peripheral Library Interface

Description

5.6.15.7.1 plib_pcache.h

Prefetch Cache Peripheral Library Interface Header

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the Prefetch Cache (PCACHE) Peripheral Library for Microchip microcontrollers. The definitions in this file are for the Prefetch Cache module.

Functions

	Name	Description
≡	PLIB_PCACHE_CacheHitRead	Reads the number of cache hits.
≡	PLIB_PCACHE_CacheHitWrite	Sets the number of cache hits.
≡	PLIB_PCACHE_CacheLineAddrGet	Gets the TAG address in the cache line previously write-enabled by PLIB_PCACHE_CacheLineSelect .
≡	PLIB_PCACHE_CacheLineAddrSet	Sets the TAG address in the cache line previously write-enabled by PLIB_PCACHE_CacheLineSelect .
≡	PLIB_PCACHE_CacheLineData	Sets cache line previously write-enabled by PLIB_PCACHE_CacheLineSelect to data type.
≡	PLIB_PCACHE_CacheLineDeselect	Disables write access to the cache line specified by cache_line.
≡	PLIB_PCACHE_CacheLineFlashTypeBoot	Set the cache line tag for the line previously write-enabled by PLIB_PCACHE_CacheLineSelect as residing in boot Flash.

	PLIB_PCACHE_CacheLineFlashTypeInst	Set the cache line tag for the line previously write-enabled by PLIB_PCACHE_CacheLineSelect as residing in instruction Flash.
	PLIB_PCACHE_CacheLineFlashTypeIsInst	Returns true if the cache line tag for the line previously write-enabled by PLIB_PCACHE_CacheLineSelect shows the line is residing in instruction Flash.
	PLIB_PCACHE_CacheLineInst	Sets cache line previously write-enabled by PLIB_PCACHE_CacheLineSelect to instruction type.
	PLIB_PCACHE_CacheLineInvalid	Invalidates cache line previously write-enabled by PLIB_PCACHE_CacheLineSelect .
	PLIB_PCACHE_CacheLineIsInst	Returns true if cache line previously write-enabled by PLIB_PCACHE_CacheLineSelect is set to instruction type.
	PLIB_PCACHE_CacheLineIsLocked	Returns true if cache line previously write-enabled by PLIB_PCACHE_CacheLineSelect is locked.
	PLIB_PCACHE_CacheLineIsValid	Returns true if cache line previously write-enabled by PLIB_PCACHE_CacheLineSelect is valid.
	PLIB_PCACHE_CacheLineLock	Locks cache line previously write-enabled by PLIB_PCACHE_CacheLineSelect .
	PLIB_PCACHE_CacheLineMaskGet	Returns the current state of the cache tag mask for the cache line previously write-enabled by PLIB_PCACHE_CacheLineSelect .
	PLIB_PCACHE_CacheLineMaskSet	Sets the cache tag mask to force a match on set bits on the cache line previously write-enabled by PLIB_PCACHE_CacheLineSelect .
	PLIB_PCACHE_CacheLineSelect	Enables write access to the cache line specified by <code>cache_line</code> .
	PLIB_PCACHE_CacheLineUnlock	Unlocks cache line previously write-enabled by PLIB_PCACHE_CacheLineSelect .
	PLIB_PCACHE_CacheLineValid	Validates cache line previously write-enabled by PLIB_PCACHE_CacheLineSelect .
	PLIB_PCACHE_CacheMissRead	Reads the number of cache misses.
	PLIB_PCACHE_CacheMissWrite	Sets the number of cache misses.
	PLIB_PCACHE_DataCacheEnableGet	Gets the data cache enable bits.
	PLIB_PCACHE_DataCacheEnableSet	Sets the data cache enable bits.
	PLIB_PCACHE_ExistsCacheHit	Identifies that the CacheHit feature exists on the Prefetch Cache module.
	PLIB_PCACHE_ExistsCacheLine	Identifies that the CacheLineSelect feature exists on the Prefetch Cache module.
	PLIB_PCACHE_ExistsCacheLineAddr	Identifies that the CacheLineAddr feature exists on the Prefetch Cache module.
	PLIB_PCACHE_ExistsCacheLineFlashType	Identifies that the CacheLineFlashType feature exists on the Prefetch Cache module.
	PLIB_PCACHE_ExistsCacheLineLock	Identifies that the CacheLineLock feature exists on the Prefetch Cache module.
	PLIB_PCACHE_ExistsCacheLineMask	Identifies that the CacheLineMask feature exists on the Prefetch Cache module.
	PLIB_PCACHE_ExistsCacheLineType	Identifies that the CacheLineType feature exists on the Prefetch Cache module.
	PLIB_PCACHE_ExistsCacheLineValid	Identifies that the CacheLineValid feature exists on the Prefetch Cache module.
	PLIB_PCACHE_ExistsCacheMiss	Identifies that the CacheMiss feature exists on the Prefetch Cache module.

	PLIB_PCACHE_ExistsDataCacheEnable	Identifies that the DataCacheEnable feature exists on the Prefetch Cache module.
	PLIB_PCACHE_ExistsFlashDEDStatus	Identifies that the FlashDEDStatus feature exists on the Prefetch Cache module.
	PLIB_PCACHE_ExistsFlashSECCount	Identifies that the FlashSECCount feature exists on the Prefetch Cache module.
	PLIB_PCACHE_ExistsFlashSECInt	Identifies that the FlashSECInt feature exists on the Prefetch Cache module.
	PLIB_PCACHE_ExistsFlashSECStatus	Identifies that the FlashSECStatus feature exists on the Prefetch Cache module.
	PLIB_PCACHE_ExistsInvalidateOnPFMProgram	Identifies that the InvalidateOnPFMProgram feature exists on the Prefetch Cache module.
	PLIB_PCACHE_ExistsLeastRecentlyUsedState	Identifies that the LeastRecentlyUsedState feature exists on the Prefetch Cache module.
	PLIB_PCACHE_ExistsPrefetchAbort	Identifies that the PrefetchAbort feature exists on the Prefetch Cache module.
	PLIB_PCACHE_ExistsPrefetchEnable	Identifies that the PrefetchEnable feature exists on the Prefetch Cache module.
	PLIB_PCACHE_ExistsWaitState	Identifies that the WaitState feature exists on the Prefetch Cache module.
	PLIB_PCACHE_ExistsWord	Identifies that the Word feature exists on the Prefetch Cache module.
	PLIB_PCACHE_FlashDEDStatusClear	Clears a bus exception caused by a double-bit error.
	PLIB_PCACHE_FlashDEDStatusGet	Determines if a bus exception was caused by a double-bit error.
	PLIB_PCACHE_FlashSECCountGet	Returns the current value of the Flash SEC counter.
	PLIB_PCACHE_FlashSECCountSet	Sets the number of single-bit error corrections that must occur before the SEC status is set to true.
	PLIB_PCACHE_FlashSECIntDisable	Disables an interrupt on SEC.
	PLIB_PCACHE_FlashSECIntEnable	Enables an interrupt on SEC.
	PLIB_PCACHE_FlashSECStatusClear	Sets the single-bit error corrected status to false.
	PLIB_PCACHE_FlashSECStatusGet	Determines if a SEC event triggered a Prefetch Cache interrupt.
	PLIB_PCACHE_FlashSECStatusSet	Sets the single-bit error corrected status to true.
	PLIB_PCACHE_InvalidateOnPFMProgramAll	Sets prefetch cache to invalidate all data and instruction lines on a PFM program cycle.
	PLIB_PCACHE_InvalidateOnPFMProgramUnlocked	Sets prefetch cache to invalidate all unlocked data and instruction lines on a PFM program cycle.
	PLIB_PCACHE_LeastRecentlyUsedStateRead	Reads the state of the cache least recently used encoding bits.
	PLIB_PCACHE_PrefetchAbortRead	Reads the number of prefetch aborts.
	PLIB_PCACHE_PrefetchAbortWrite	Sets the number of prefetch aborts.
	PLIB_PCACHE_PrefetchEnableGet	Gets the predictive prefetch state for the Prefetch Cache module.
	PLIB_PCACHE_PrefetchEnableSet	Sets the predictive prefetch state for the Prefetch Cache module.
	PLIB_PCACHE_WaitStateGet	Gets the prefetch cache access time.
	PLIB_PCACHE_WaitStateSet	Sets the prefetch cache access time.
	PLIB_PCACHE_WordRead	Reads the word specified by word from cache line previously write-enabled by PLIB_PCACHE_CacheLineSelect .

	PLIB_PCACHE_WordWrite	Writes the word (specified by word parameter) with data (specified by data parameter) to cache line previously write-enabled by PLIB_PCACHE_CacheLineSelect .

5.6.16 PMP Peripheral Library

5.6.16.1 Introduction

Parallel Master Port (PMP) Peripheral Library for Microchip Microcontrollers

This library provides a low-level abstraction of the Parallel Master Port (PMP) module on Microchip microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, thereby hiding differences from one microcontroller variant to another.

Description

The following diagram shows a block diagram of the PMP module and how it interacts with other peripherals.

PMP Overview

5.6.16.2 Release Notes

MPLAB Harmony Version: v0.70b **PMP Peripheral Library Version :** 0.70b **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.6.16.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.6.16.4 Using the Library

Using the Library

This topic describes the basic architecture of the PMP Peripheral Library and provides information and examples on its use.

Interface Header File: [plib_pmp.h](#)

The interface to the PMP Peripheral library is defined in the "[plib_pmp.h](#)" header file, which is included by the "peripheral.h" peripheral library header file. Any C language source (.c) file that uses the PMP Peripheral Library must include "peripheral.h".

5.6.16.4.1 Hardware Abstraction Model

This library provides a low-level abstraction of the Parallel Master Port (PMP) module on Microchip's microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Description

Hardware Abstraction Model Description

The PMP module provides interface routines to interact with external peripherals such as LCD, EEPROM, Flash memory, etc., as shown in the following diagram. The diagram shows the PMP module acting as a master. The PMP module can be easily configured to act as a slave. The address and data lines can be multiplexed to suit the application. The address and data buffers are up to 2-byte (16-bit) buffers for data transmitted or received by the parallel interface to the PMP bus over the data and address lines synchronized with control logic including the read and write strobe.

PMP Hardware Abstraction Model Diagram

The desired timing wait states to suit different peripheral timings can also be programmed using the PMP module.

5.6.16.4.2 Library Usage Model

This section describes the library usage model for the PMP Peripheral Library.

Description

The following diagram shows the high level organization of the PMP PLIB usage model. The items in the diagram correspond to the groupings in the [Library Interface](#) section.

PMP Library Usage Model

Library Interface Section	Description

5.6.16.4.3 How the Library Works

How the Library Works

Before enabling the PMP module, the caller must initialize basic parameters such as wait states timings, and interrupt mode features (see the [Initialization](#) section).

After the module has been enabled, it can begin monitoring the bus as a slave device waiting to be addressed by an external master (see the [Operating as a Slave](#) section). A slave device only transfers data on the bus when it has been addressed by a master. If the module is used to start a transfer, it is operating as a master. A master addresses a slave and controls the transfer

of data by providing the clock (see the [Operating as a Master](#) section).

Some operations in the PMP peripheral library initiate actions on the PMP bus that require time to complete. Also, some events occur asynchronously on the bus. In each of these cases, the module causes either a "master", "slave", or "error" interrupt. The [State Machine](#) section describes the different states that can cause an interrupt and show what causes the transition from one state to another. The [Handling Errors](#) section describes the various errors that can occur and how to deal with them.

5.6.16.4.3.1 Initialization

This section describes the general initialization of the PMP module.

Description

The important configurations to look for are as follows.

Operating Mode

Depending on the device, the PMP module can function in Master modes 1 or 2, buffered/enhanced slave mode or the legacy slave mode. To set the PMP module in the appropriate mode, use [PLIB_PMP_OperationModeSelect](#).

Multiplexing Mode

Depending on the application requirement or hardware arrangement, the data lines can be used to multiplex the addressing information. Various multiplexing modes supported are listed by [PMP_MUX_MODE](#). Use [PLIB_PMP_MultiplexModeSelect](#) to select the appropriate multiplexing mode.

Chip Select Mode

As needed, the Chip Select lines can be made to function as Chip Select or as address lines. Use [PLIB_PMP_ChipSelectFunctionSelect](#) to select the required functionality of Chip Select lines.

Interrupt Mode

PMP generates interrupts based on the option selected for the interrupt mode. Interrupts can be enabled, disabled, generated at the end of a read or write cycle, or when other events occur. Use the [PLIB_PMP_InterruptModeSelect](#) to select these options.

Address Increment Mode

After every read/write cycle, the PMP module can be configured to automatically increment or decrement the address it is accessing. Use [PLIB_PMP_AddressIncrementModeSelect](#) to select this option.

To initialize the PMP module, perform the following sequence:

1. Select the desired initialization options using the General Initialization Functions to select the desired operation of the following features:
 - Operating mode
 - Multiplexing mode
 - Chip Select mode
 - Interrupt mode
 - Address Incrementing mode
 - Stop-in-Idle operation
2. Program the wait states of the PMP module. Refer to Wait States Initialization Functions for an example.
3. If operating in Master mode, set the desired address (8-bit in this case, the size may vary depending on the application) using [PLIB_PMP_AddressSet](#).
4. If running in an interrupt-driven environment, clear any pending interrupts and enable the appropriate (master, slave, and

error) PMP interrupts. (**Note:** Refer to the "Interrupt Controller" chapter in the specific device data sheet for details).

5. Enable the module for operation using `PLIB_PMP_Enable`.

Example

```
// Configure General PMP Options
// Select the PMP operation mode
PLIB_PMP_OperationModeSelect( PMP_ID_0, PMP_MASTER_READ_WRITE_STROBES_INDEPENDENT );
// Set the multiplexing to none. Address and data lines are not multiplexed.
PLIB_PMP_MultiplexModeSelect( PMP_ID_0, PMP_MUX_NONE );
// Select the function of chip-select lines
PLIB_PMP_ChipSelectFunctionSelect( PMP_ID_0, PMCS1_PMCS2_AS_ADDRESS_LINES );
// Select the interrupt mode
PLIB_PMP_InterruptModeSelect( PMP_ID_0, PMP_INTERRUPT_NONE );
// disable the auto increment/decrement of address after each read/write
PLIB_PMP_AddressIncrementModeSelect( PMP_ID_0, PMP_ADDRESS_INCREMENT_DECREMENT_DISABLE );
// Enable stop in Idle mode.
PLIB_PMP_StopInIdleEnable( PMP_ID_0 );
// Set Desired Wait State Values
// Set the data wait states
PLIB_PMP_WaitStatesDataSetUpSelect( PMP_ID_0, PMP_DATA_WAIT_FOUR );
// Set the strobe wait states
PLIB_PMP_WaitStatesStrobeSelect( PMP_ID_0, PMP_STROBE_WAIT_1 );
// Set the data hold wait states.
PLIB_PMP_WaitStatesDataHoldSelect( PMP_ID_0, PMP_DATA_HOLD_1 );
// Set the appropriate address (MASTER only)
PLIB_PMP_AddressSet ( PMP_ID_0, 0x12 );

// Optional: Clear and enable interrupts before enabling the PMP module.
// Enable the module
PLIB_PMP_Enable( PMP_ID_0 );
```

Note: Refer to the "Interrupt Controller" chapter in the specific device data sheet for details on how to clear and enable the PMP module interrupts.

5.6.16.4.3.2 Wait States Initialization

This section describes set up and initialization of the wait states for the PMP module.

Description

In Master mode, the user can control the duration of the read, write and address cycles by configuring the module Wait states. One Wait state period is equivalent to one peripheral bus clock cycles. The following figure shows an example of a Master Read operation using Wait states.

Wait states can be added to the beginning, middle and end of any read or write cycle using the corresponding bits in the PMP

Configuration. The wait states differ depending on which PMP mode you are in, but setting the wait states is the same per mode and device, as shown in the following example.

Initializing Wait States

The following sequence can be used to set up the wait states for the PMP Master mode.

Preconditions:

None.

Process:

1. Set the data hold time using [PLIB_PMP_WaitStatesDataHoldSelect](#).
2. Set the strobe wait time using [PLIB_PMP_WaitStatesStrobeSelect](#).
3. Set the data wait time using [PLIB_PMP_WaitStatesDataSetUpSelect](#).

Example

```
// Set the data wait states
PLIB_PMP_WaitStatesDataSetUpSelect( PMP_ID_0, PMP_DATA_WAIT_ONE );
// Set the strobe wait states
PLIB_PMP_WaitStatesStrobeSelect( PMP_ID_0, PMP_STROBE_WAIT_1 );
// Set the data hold wait states.
PLIB_PMP_WaitStatesDataHoldSelect( PMP_ID_0, PMP_DATA_HOLD_1 );
```

5.6.16.4.3.3 Operating as a Master

This section describes how to set up the PMP module to operate as a master.

Description

The PMP module, while acting as a master, waits for its input or output buffers to be read or written. Once the buffers have been manipulated, the appropriate action takes place.

A PMP bus transfer always begins with reading or writing to the appropriate PMP input/output buffers. A read from a PMP input buffer performs a PMP read. A write to a PMP output buffer performs a PMP write. The address pins associated with the transfer will have the value that is inside the address register of the PMP module. These steps are summarized as follows.

Summary of Steps

- Set up the proper PMP address
- Send or read data bytes

Each of these steps making up a transfer will take some time to complete. By monitoring the busy bit of the PMP module, the user application can determine whether the transfer is complete. The completion of each step can cause a PMP interrupt.

Sending a Data Byte

The following sequence can be used to [send](#) a data byte and repeated to [send](#) an arbitrary number of data bytes.

Preconditions:

- The address of the destination must be configured in the PMP module
- The proper control signals are configured for PMP operation
- The PMP module is configured for the desired Master mode
- The PMP module is enabled

Process:

1. Ensure that the PMP module is not busy by using [PLIB_PMP_PortIsBusy](#).

2. Write the output data buffer using `PLIB_PMP_MasterSend`.

Example:

```
uint8_t data = 'a';
// Set the destination address to be written
PLIB_PMP_AddressSet(PMP_ID_0, 0x1234 );
// Check to see if the PMP is busy, then send the byte
if(!PLIB_PMP_PortIsBusy( PMP_ID_0 ))
{
    // Send the data
    PLIB_PMP_MasterSend( PMP_ID_0, data );
}
```

Receiving a Data byte

The following sequence can be used to [send](#) a data byte and repeated to [send](#) an arbitrary number of data bytes.

Preconditions:

- The address of the destination must be configured in the PMP module.
- The proper control signal are configured for PMP operation.

Process:

1. Ensure that the PMP module is not busy by using `PLIB_PMP_PortIsBusy`.
2. Write the output data buffer using `PLIB_PMP_MasterReceive`.

Example:

```
uint8_t data;
// Set the source address
PLIB_PMP_AddressSet(PMP_ID_0, 0x1234 );
// Check to see the PMP is not busy, then read the data
if(!PLIB_PMP_PortIsBusy( PMP_ID_0 ))
{
    // receive the data
    data = PLIB_PMP_MasterReceive( PMP_ID_0 );
}
```

5.6.16.4.3.4 Operating as a Slave

This section describes how to set up the PMP module to operate as a slave.

Description

The PMP module while acting as a slave, waits for read or write strobes to occur. Once the buffers have been manipulated, the appropriate action takes place.

Summary of Steps

- Check to see if data is available to be read
- Prepare output buffer for slave read

Each of these steps making up a transfer will take some time to complete. By monitoring the busy bit of the PMP module, the user application can determine whether the transfer is complete. The completion of each step can cause a PMP interrupt.

Reading Available Data

The following sequence can be used to receive a data byte and repeated to receive an arbitrary number of data bytes.

Preconditions:

- The address of the destination must be set in the PMP module
- The proper control signals are initialized for PMP operation

Process:

1. Check to see if data is available using [PLIB_PMP_InputBufferXIsFull](#).
2. Read the available data using [PLIB_PMP_InputBufferXByteReceive](#).

Example:

```
uint8_t data;
// Check to see if data is available, then receive the byte
if(PLIB_PMP_InputBufferXIsFull( PMP_ID_0, 1))
{
    // Receive the data from buffer one.
    data = PLIB_PMP_InputBufferXByteReceive( PMP_ID_0, 1 );
}
```

Preparing Output Buffer for Slave Write

The following sequence can be used to [send](#) a data byte and repeated to [send](#) an arbitrary number of data bytes.

Preconditions:

The proper control signals are initialized for PMP operation.

Process:

1. Ensure that the output buffer to be written is empty by using [PLIB_PMP_OutputBufferXIsEmpty](#).
2. Write the output data buffer using [PLIB_PMP_OutputBufferXByteSend](#).

Example:

```
uint8_t data;
// Check to see if output buffer is available, then send the byte
if(PLIB_PMP_OutputBufferXIsEmpty( PMP_ID_0, 1))
{
    // Fill the output buffer-1 with the data to be sent
    PLIB_PMP_OutputBufferXByteSend( PMP_ID_0, 1, value);
}
```

5.6.16.4.3.5 State Machine

The PMP state machine can be used in either a polled or an interrupt-driven manner. However, in both cases, software must check the state of the master, slave, and error interrupt flags to identify when a state transition occurs.

Description

The PMP module has one basic interrupt that is triggered when data has been written or read. In Buffered Slave mode, this interrupt can be set to wait until an 'X' amount of buffers are written or read. This interrupt must be cleared in software, but can also be used in DMA transactions to trigger the next DMA transfer.

The PMP module will not start generating interrupts (setting the PMP interrupt flags, even if interrupts are disabled) until it is properly configured and enabled. After that, interrupts are generated as described in subsequent sections. Software has to respond appropriately once the interrupt has occurred (the flag has been set) to allow the state machine to advance to the next state. These actions are described in the following sections for the state machine diagram to which they refer.

Slave Mode State Machine

Slave-Mode State Transitions

In Slave mode, state transitions occur under hardware control automatically or in response to an interrupt. Software must respond appropriately to ensure that the PMP module continues to operate correctly. Basically, if a read/write strobe occurs, then the appropriate read/write happens, which in turn sets the interrupt.

Master Mode State Machine

Master-Mode State Transitions

In Master mode, state transitions occur under hardware control automatically or in response to an interrupt. Software must respond appropriately to ensure that the PMP module continues to operate correctly. Basically, if an input or output register is manipulated, the appropriate read/write happens, which in turn sets the interrupt. The PMP module can also be configured to have read/write strobes indicating whether a read/write has completed.

5.6.16.4.3.6 Handling Errors

There are two basic types of errors that can occur during various slave PMP operations:

- Input Buffer Overrun
- Output Buffer Underflow

This section provides information on handling these types of errors.

Description

Handling Input Buffer Overrun Errors

An input buffer overflow error occurs when the software is not reading or clearing the input buffers fast enough for the master PMP device attached to it. When this occurs, the master write is not allowed and the "input buffer overflow" status bit is set. This can be identified by calling [PLIB_PMP_InputOverflowHasOccurred](#). Additional attempts to write to the input buffer will not be allowed until the overflow error is cleared by calling [PLIB_PMP_InputOverflowClear](#). This type of error should be either avoided by having proper communication techniques with the PMP Master device or checked using [PLIB_PMP_InputBuffersAreFull](#), which informs the controller that no buffers have data in them (overflow) .

Interrupts: The input buffer overflow error does not trigger an interrupt.

Handling Output Buffer Underflow Errors

An output buffer underflow error occurs when the software is not writing to the output buffers fast enough for the master PMP device attached to it. When this occurs, the master read is not allowed and the "output buffer underflow" status bit is set. This can be identified by calling [PLIB_PMP_OutputUnderflowHasOccurred](#). Additional attempts to read from the output buffer will not be allowed until the overflow error is cleared by calling [PLIB_PMP_OutputUnderflowClear](#). This sort of error should be either avoided by having proper communication techniques with the PMP Master device, or checked using [PLIB_PMP_OutputBuffersAreEmpty](#), which informs the controller that buffers have data in them (underflow) .

Interrupts: The input buffer overflow error does not trigger an interrupt.

5.6.16.4.3.7 Other Features

This section provides information on additional features that may be available. These features are not available on all devices. Please refer to the **"Parallel Master Port (PMP)"** chapter in the specific device data sheet to determine which features are supported by your device.

Description

Operation During Sleep Mode

When the device enters Sleep mode, the system clock is disabled. The consequences of Sleep mode depend on which mode the PMP module is configured in at the time that Sleep mode is invoked.

Master

If the device enters Sleep mode while the PMP module is operating in Master mode, PMP operation will be suspended in its current state until clock execution resumes. As this may cause unexpected control pin timings, users should avoid invoking

Sleep mode when continuous use of the module is needed.

Slave

While the PMP module is inactive, but enabled for any Slave mode operation, any read or write operations occurring at that time will be able to complete without the use of the microcontroller clock. Once the operation is completed, the module will issue an interrupt.

This interrupt may be used to wake the device from Sleep or Idle modes, depending on the configuration and capabilities of the device. Refer to the specific device data sheet or the related peripheral section in the reference manual to determine the capabilities of your device.

Operation During Idle Mode

When the device enters Idle mode, the system clock sources remain functional and the CPU stops code execution. PMP operation during Idle mode can be controlled using the [PLIB_PMP_StopInIdleEnable](#) or the [PLIB_PMP_StopInIdleDisable](#). By default, the PMP module continues to operate in Idle mode and provide full functionality.

5.6.16.5 Configuring the Library

The library is configured for the supported PMP Peripheral Library is configured in the MPLAB IDE.

5.6.16.6 Library Interface

Data Types and Constants

	Name	Description
	PMP_ACK_MODE	Defines the different mode configurations in which the PMP can be enabled.
	PMP_ADDRESS_HOLD_LATCH_WAIT_STATES	PMP hold after address latch strobe wait states configuration.
	PMP_ADDRESS_LATCH	Address Latch Strobe configuration.
	PMP_ADDRESS_LATCH_WAIT_STATES	PMP address latch strobe wait states configuration.
	PMP_ADDRESS_PORT	Defines the different address lines that are available for configuration.
	PMP_ALTERNATE_MASTER_WAIT_STATES	PMP alternate master wait states.
	PMP_CHIP_SELECT	PMP Chip Select data type.
	PMP_CHIPSELECT_FUNCTION	Defines different functions available for the Chip Select lines multiplexed with address lines.
	PMP_DATA_HOLD_STATES	PMP Data Hold after strobe wait state.
	PMP_DATA_LENGTH	Possible data lengths handled by the PMP module.
	PMP_DATA_SIZE	PMP data size.
	PMP_DATA_WAIT_STATES	PMP data setup time configuration.
	PMP_INCREMENT_MODE	PMP address incrementing configuration.
	PMP_INPUT_BUFFER_TYPE	PMP Input Buffers type.
	PMP_INTERRUPT_MODE	PMP interrupt request mode data type.
	PMP_MASTER_MODE	Defines the different mode configurations in which the PMP can be enabled.
	PMP_MODULE_ID	Possible instances of the PMP module.
	PMP_MUX_MODE	Defines the different mode configurations in which the PMP can be enabled.

	PMP_OPERATION_MODE	Defines the different mode configurations in which the PMP can be enabled.
	PMP_PMBE_PORT	Defines the available Byte Enable ports.
	PMP_POLARITY_LEVEL	Possible polarity levels for the PMP pins.
	PMP_STROBE_WAIT_STATES	PMP strobe signal wait time configuration.

Address Handling Functions

	Name	Description
	PLIB_PMP_AddressGet	Gets the current address of the PMP module.
	PLIB_PMP_AddressLinesA0A1Get	Gets the value of the address lines PMA0 and PMA1.
	PLIB_PMP_AddressLinesA0A1Set	Sets the address lines PMA0 and PMA1 with the value specified.
	PLIB_PMP_AddressSet	Sets the current address of the PMP module to the specified address.

Data Read and Write Functions

	Name	Description
	PLIB_PMP_InputBuffersAreFull	Gets the state of the input buffers.
	PLIB_PMP_InputBufferXByteReceive	Data to be received in Byte mode.
	PLIB_PMP_InputBufferXIsFull	Gets the state of the identified input buffer.
	PLIB_PMP_IsDataReceived	Checks and returns if the data has been received in the specified buffer in Slave mode.
	PLIB_PMP_IsDataTransmitted	Checks and returns if the data has been transmitted from the specified buffer in Slave mode.
	PLIB_PMP_MasterReceive	Receives the data in the master mode.
	PLIB_PMP_MasterSend	Sends the specified data in Master mode.
	PLIB_PMP_OutputBuffersAreEmpty	Gets the state of the output buffers.
	PLIB_PMP_OutputBufferXByteSend	Data to be transmitted in Byte mode.
	PLIB_PMP_OutputBufferXIsEmpty	Gets the state of the input buffer.
	PLIB_PMP_SlaveReceive	Receives the data in Slave mode.
	PLIB_PMP_SlaveSend	Sends the specified data in Slave mode.

Enhanced Address Handling Functions

	Name	Description
	PLIB_PMP_ChipXBaseAddressSet	Sets the base address of the specified device.
	PLIB_PMP_ReservedAddressSpaceBitsSet	Sets the address bits of the reserved address space of the EPMP. The end address of the Chip Select-2 (if present).

Enhanced Error/Status Control Functions

	Name	Description
	PLIB_PMP_TransactionErrorClear	Clears the transaction error flag.
	PLIB_PMP_TransactionErrorHasOccurred	Returns the status of a transaction error.
	PLIB_PMP_TransactionHasTimedOut	Returns the time-out status.
	PLIB_PMP_TransactionTimeoutClear	Clears the time-out flag.

Enhanced General Initialization Functions

	Name	Description
	PLIB_PMP_BusKeeperDisable	Disables the bus keeper (high-impedance) state.
	PLIB_PMP_BusKeeperEnable	Enables the bus keeper (high-impedance) state.

	PLIB_PMP_ChipSelectXEnableStrobeDeSelect	Selects the read and write strobes. The enable strobe is not selected (not required).
	PLIB_PMP_ChipSelectXEnableStrobeSelect	Selects the read/write and enable strobes.
	PLIB_PMP_SmartAddressStrobeDisable	Disables "smart" address strobes.
	PLIB_PMP_SmartAddressStrobeEnable	Enables "smart" address strobes.
	PLIB_PMP_ChipXAckModeSelect	Selects the acknowledge mode for the PMP module.
	PLIB_PMP_ChipXDataSizeSelect	Enables data transfer size for the PMP for the specified device.
	PLIB_PMP_EnhancedMasterModeSelect	Selects Master mode for the PMP module.

Enhanced General Status Functions

	Name	Description
	PLIB_PMP_AlternateMasterHasAccess	Gets the status of which alternate masters have gained access to the PMP module.
	PLIB_PMP_AlternateMasterRequestStatus	Gets the status of the request from the alternate master.

Enhanced Polarity Configuration Functions

	Name	Description
	PLIB_PMP_ChipSelectXAckPolaritySelect	Sets the Chip Select acknowledge polarity.
	PLIB_PMP_ChipSelectXByteEnablePortPolaritySelect	Sets the nibble/byte enable polarity.
	PLIB_PMP_ChipSelectXReadWriteStrobePolaritySelect	Sets the read/write strobe polarity.
	PLIB_PMP_ChipSelectXWriteEnableStrobePolaritySelect	Sets the write/enable strobe polarity.

Enhanced Port Configuration Functions

	Name	Description
	PLIB_PMP_ChipSelectXPortDisable	Disables the specified Chip Select's port.
	PLIB_PMP_ChipSelectXPortEnable	Enables the specified Chip Select's port.

Enhanced Wait States Initialization Functions

	Name	Description
	PLIB_PMP_ChipXWaitStatesAlternateMasterSelect	Selects the wait states of the alternate master for Chip Select-X.
	PLIB_PMP_ChipXWaitStatesDataHoldSelect	Configures the data hold states (after data transfer) needed to be used with the PMP module for the specified device.
	PLIB_PMP_ChipXWaitStatesDataSetupSelect	Configures the data wait states (before the data transfer) needed to be used with the PMP module for the specified device.
	PLIB_PMP_ChipXWaitStatesStrobeSelect	Configures the strobe wait states (during the data transfer) needed to be used with the PMP module for the specified device.
	PLIB_PMP_WaitStatesAddressHoldStrobeSelect	Configures the address wait states needed to be used with the PMP module.
	PLIB_PMP_WaitStatesAddressLatchStrobeSelect	Configures the address wait states needed to be used with the PMP module.

Error Status/Control Functions

	Name	Description
	PLIB_PMP_InputOverflowClear	Clears a PMP Overflow error.
	PLIB_PMP_OutputUnderflowClear	Clears a PMP output underflow error.

Feature Existence Functions

	Name	Description
	<u>PLIB_PMP_ExistsAddressControl</u>	Identifies that the AddressControl feature exists on the PMP module.
	<u>PLIB_PMP_ExistsAddressLatchPolarity</u>	Identifies that the AddressLatchPolarity feature exists on the PMP module.
	<u>PLIB_PMP_ExistsAddressLatchStrobePortControl</u>	Identifies that the AddressLatchStrobePortControl feature exists on the PMP module.
	<u>PLIB_PMP_ExistsAddressPortPinControl</u>	Identifies that the AddressPortPinControl feature exists on the PMP module.
	<u>PLIB_PMP_ExistsAltMasterRequest</u>	Identifies that the AltMasterRequest feature exists on the PMP module.
	<u>PLIB_PMP_ExistsBufferOverFlow</u>	Identifies that the BufferOverFlow feature exists on the PMP module.
	<u>PLIB_PMP_ExistsBufferRead</u>	Identifies that the BufferRead feature exists on the PMP module.
	<u>PLIB_PMP_ExistsBufferType</u>	Identifies that the BufferType feature exists on the PMP module.
	<u>PLIB_PMP_ExistsBufferUnderFlow</u>	Identifies that the BufferUnderFlow feature exists on the PMP module.
	<u>PLIB_PMP_ExistsBufferWrite</u>	Identifies that the BufferWrite feature exists on the PMP module.
	<u>PLIB_PMP_ExistsBusKeeper</u>	Identifies that the BusKeeper feature exists on the PMP module.
	<u>PLIB_PMP_ExistsBusyStatus</u>	Identifies that the BusyStatus feature exists on the PMP module.
	<u>PLIB_PMP_ExistsByteEnablePolarity</u>	Identifies that the ByteEnablePolarity feature exists on the PMP module.
	<u>PLIB_PMP_ExistsByteEnablePortControl</u>	Identifies that the ByteEnablePortControl feature exists on the PMP module.
	<u>PLIB_PMP_ExistsChipSelectEnable</u>	Identifies that the ChipSelectEnable feature exists on the PMP module.
	<u>PLIB_PMP_ExistsChipSelectoperation</u>	Identifies that the ChipSelectoperation feature exists on the PMP module.
	<u>PLIB_PMP_ExistsChipXACKMode</u>	Identifies that the ChipXACKMode feature exists on the PMP module.
	<u>PLIB_PMP_ExistsChipXACKPolarity</u>	Identifies that the ChipXACKPolarity feature exists on the PMP module.
	<u>PLIB_PMP_ExistsChipXAltMasterWaitStates</u>	Identifies that the ChipXAltMasterWaitStates feature exists on the PMP module.
	<u>PLIB_PMP_ExistsChipXBaseAddress</u>	Identifies that the ChipXBaseAddress feature exists on the PMP module.
	<u>PLIB_PMP_ExistsChipXByteEnablePolarity</u>	Identifies that the ChipXByteEnablePolarity feature exists on the PMP module.
	<u>PLIB_PMP_ExistsChipXDataHoldWaitStates</u>	Identifies that the ChipXDataHoldWaitStates feature exists on the PMP module.
	<u>PLIB_PMP_ExistsChipXDataSetupWaitStates</u>	Identifies that the ChipXDataSetupWaitStates feature exists on the PMP module.
	<u>PLIB_PMP_ExistsChipXDataSize</u>	Identifies that the ChipXDataSize feature exists on the PMP module.
	<u>PLIB_PMP_ExistsChipXEnableStorbeSelect</u>	Identifies that the ChipXEnableStorbeSelect feature exists on the PMP module.

	<u>PLIB_PMP_ExistsChipXPolarity</u>	Identifies that the ChipXPolarity feature exists on the PMP module.
	<u>PLIB_PMP_ExistsChipXReadWritePolarity</u>	Identifies that the ChipXReadWritePolarity feature exists on the PMP module.
	<u>PLIB_PMP_ExistsChipXStrobeWaitStates</u>	Identifies that the ChipXStrobeWaitStates feature exists on the PMP module.
	<u>PLIB_PMP_ExistsChipXWriteEnablePolarity</u>	Identifies that the ChipXWriteEnablePolarity feature exists on the PMP module.
	<u>PLIB_PMP_ExistsCSXActiveStatus</u>	Identifies that the CSXActiveStatus feature exists on the PMP module.
	<u>PLIB_PMP_ExistsCSXPortControl</u>	Identifies that the CSXPortControl feature exists on the PMP module.
	<u>PLIB_PMP_ExistsCurrentMaster</u>	Identifies that the CurrentMaster feature exists on the PMP module.
	<u>PLIB_PMP_ExistsDataHoldWaitStates</u>	Identifies that the DataHoldWaitStates feature exists on the PMP module.
	<u>PLIB_PMP_ExistsDataSetUpWaitStates</u>	Identifies that the DataSetUpWaitStates feature exists on the PMP module.
	<u>PLIB_PMP_ExistsDataStrobeWaitStates</u>	Identifies that the DataStrobeWaitStates feature exists on the PMP module.
	<u>PLIB_PMP_ExistsDataTransferSize</u>	Identifies that the DataTransferSize feature exists on the PMP module.
	<u>PLIB_PMP_ExistsEnableControl</u>	Identifies that the EnableControl feature exists on the PMP module.
	<u>PLIB_PMP_ExistsEnhancedMasterMode</u>	Identifies that the EnhancedMasterMode feature exists on the PMP module.
	<u>PLIB_PMP_ExistsIncrementMode</u>	Identifies that the IncrementMode feature exists on the PMP module.
	<u>PLIB_PMP_ExistsInputBufferFull</u>	Identifies that the InputBufferFull feature exists on the PMP module.
	<u>PLIB_PMP_ExistsInputBufferXStatus</u>	Identifies that the InputBufferXStatus feature exists on the PMP module.
	<u>PLIB_PMP_ExistsInterruptMode</u>	Identifies that the InterruptMode feature exists on the PMP module.
	<u>PLIB_PMP_ExistsMasterRXTX</u>	Identifies that the MasterRXTX feature exists on the PMP module.
	<u>PLIB_PMP_ExistsMUXModeSelect</u>	Identifies that the MUXModeSelect feature exists on the PMP module.
	<u>PLIB_PMP_ExistsOperationMode</u>	Identifies that the OperationMode feature exists on the PMP module.
	<u>PLIB_PMP_ExistsOutPutBufferEmpty</u>	Identifies that the OutPutBufferEmpty feature exists on the PMP module.
	<u>PLIB_PMP_ExistsOutputBufferXStatus</u>	Identifies that the OutputBufferXStatus feature exists on the PMP module.
	<u>PLIB_PMP_ExistsReadWritePolarity</u>	Identifies that the ReadWritePolarity feature exists on the PMP module.
	<u>PLIB_PMP_ExistsReadWriteStrobePortControl</u>	Identifies that the ReadWriteStrobePortControl feature exists on the PMP module.
	<u>PLIB_PMP_ExistsReservedAddrSpace</u>	Identifies that the ReservedAddrSpace feature exists on the PMP module.
	<u>PLIB_PMP_ExistsSlaveRX</u>	Identifies that the SlaveRX feature exists on the PMP module.

	PLIB_PMP_ExistsSlaveTX	Identifies that the SlaveTX feature exists on the PMP module.
	PLIB_PMP_ExistsSmartAddress	Identifies that the SmartAddress feature exists on the PMP module.
	PLIB_PMP_ExistsStopInIdleControl	Identifies that the StopInIdleControl feature exists on the PMP module.
	PLIB_PMP_ExistsTransactionError	Identifies that the TransactionError feature exists on the PMP module.
	PLIB_PMP_ExistsTransactionTimeOut	Identifies that the TransactionTimeOut feature exists on the PMP module.
	PLIB_PMP_ExistsWaitStatesAddrHoldStrobe	Identifies that the WaitStatesAddrHoldStrobe feature exists on the PMP module.
	PLIB_PMP_ExistsWaitStatesAddrLatchStrobe	Identifies that the WaitStatesAddrLatchStrobe feature exists on the PMP module.
	PLIB_PMP_ExistsWriteEnablePolarity	Identifies that the WriteEnablePolarity feature exists on the PMP module.
	PLIB_PMP_ExistsWriteEnablePortControl	Identifies that the WriteEnablePortControl feature exists on the PMP module.

General Initialization Functions

	Name	Description
	PLIB_PMP_AddressIncrementModeGet	Gets the increment mode being used with the address of the PMP module.
	PLIB_PMP_AddressIncrementModeSelect	Configures the increment mode being used with the address of the PMP module.
	PLIB_PMP_AddressLatchStrobeDisable	Disables the specific address latch strobe.
	PLIB_PMP_AddressLatchStrobeEnable	Enables the specific address latch strobe.
	PLIB_PMP_ChipSelectFunctionSelect	Defines the functionality of the pins intended to be used as Chip Select.
	PLIB_PMP_ChipSelectXDisable	Configures the Chip Select.
	PLIB_PMP_ChipSelectXEnable	Configures the Chip Select.
	PLIB_PMP_ChipSelectXIsActive	Gets the current status of the specified Chip Select.
	PLIB_PMP_DataSizeSelect	Enables data transfer size for the PMP module.
	PLIB_PMP_Disable	Disables the specific PMP module.
	PLIB_PMP_Enable	Enables the specific PMP module.
	PLIB_PMP_InputBufferTypeSelect	Selects the input buffer based on the input passed.
	PLIB_PMP_InterruptModeGet	Gets the current configured interrupt mode being used with the PMP module.
	PLIB_PMP_InterruptModeSelect	Configures the interrupt request mode being used with the PMP module.
	PLIB_PMP_MultiplexModeGet	Gets the current multiplexing mode configured between the address and data of the PMP module.
	PLIB_PMP_MultiplexModeSelect	Configures the multiplexing between the address and data of the PMP module.
	PLIB_PMP_OperationModeGet	Gets the current operation mode of the PMP module.
	PLIB_PMP_OperationModeSelect	Configures the operation mode of the PMP module.
	PLIB_PMP_StopInIdleDisable	Enables the PMP module to continue operation in Idle mode.
	PLIB_PMP_StopInIdleEnable	Discontinues PMP module operation when the device enters Idle mode.

General Status Functions

	Name	Description
≡	PLIB_PMP_IsEnabled	Checks whether or not the PMP module is enabled.
≡	PLIB_PMP_PortsBusy	Identifies if the (Master mode) PMP port is busy.
≡	PLIB_PMP_InputOverflowHasOccurred	Identifies if there was a receiver overflow error.
≡	PLIB_PMP_OutputUnderflowHasOccurred	Identifies if there was an output buffer sent out with no data.

Polarity Configuration Functions

	Name	Description
≡	PLIB_PMP_AddressLatchPolaritySelect	Sets the address latch strobe polarity.
≡	PLIB_PMP_ByteEnablePolaritySelect	Sets the byte enable polarity.
≡	PLIB_PMP_ChipSelectXPolaritySelect	Sets the specified Chip Select polarity.
≡	PLIB_PMP_ReadWriteStrobePolaritySelect	Sets the polarity of the read strobe.
≡	PLIB_PMP_WriteEnableStrobePolaritySelect	Sets the polarity of the write enable strobe.

Port Configuration Functions

	Name	Description
≡	PLIB_PMP_AddressPortDisable	Disables the port lines specified as PMP address lines.
≡	PLIB_PMP_AddressPortEnable	Enables the port lines specified as PMP address lines.
≡	PLIB_PMP_ByteEnablePortDisable	Disables the byte enable port.
≡	PLIB_PMP_ByteEnablePortEnable	Enables the byte enable port.
≡	PLIB_PMP_ReadWriteStrobePortDisable	Disables the PMP module read strobe port.
≡	PLIB_PMP_ReadWriteStrobePortEnable	Enables the PMP module read strobe port.
≡	PLIB_PMP_WriteEnableStrobePortDisable	Disables the PMP module write strobe port.
≡	PLIB_PMP_WriteEnableStrobePortEnable	Enables the PMP module write strobe port.

Wait States Initialization Functions

	Name	Description
≡	PLIB_PMP_WaitStatesDataHoldSelect	Configures the data hold states (after data transfer) needed to be used with the PMP module.
≡	PLIB_PMP_WaitStatesDataSetUpSelect	Configures the data wait states (before the data transfer) needed to be used with the PMP module.
≡	PLIB_PMP_WaitStatesStrobeSelect	Configures the strobe wait states (during the data transfer) needed to be used with the PMP module.

Description

The PMP peripheral library consists of a set of interface routines, data types and constants, and macros provided by the [plib_pmp.h](#) header file. This section describes those items.

5.6.16.6.1 General Initialization Functions**5.6.16.6.1.1 PLIB_PMP_AddressIncrementModeGet Function****C**

```
PMP_INCREMENT_MODE PLIB_PMP_AddressIncrementModeGet (
    PMP_MODULE_ID index
);
```

Description

This function gets the pins used by the PMP module. Refer to the enumeration [PMP_INCREMENT_MODE](#) for the possible settings.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed

Returns

[PMP_INCREMENT_MODE](#) - One of the possible values from [PMP_INCREMENT_MODE](#)

Remarks

This function implements an operation of the IncrementMode feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsIncrementMode](#) in your application to automatically determine whether this feature is available.

Example

```
PMP_INCREMENT_MODE curAddressIncMode;  
curAddressIncMode = PLIB_PMP_AddressIncrementModeGet( PMP_ID_0 );
```

5.6.16.6.1.2 PLIB_PMP_AddressIncrementModeSelect Function**C**

```
void PLIB_PMP_AddressIncrementModeSelect(  
    PMP_MODULE_ID index,  
    PMP_INCREMENT_MODE incrementMode  
);
```

Description

This function configures the pins used by the PMP module. Refer to the enumeration [PMP_INCREMENT_MODE](#) for the possible settings.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
incrementMode	One of the possible values from PMP_INCREMENT_MODE

Returns

None.

Remarks

This function implements an operation of the IncrementMode feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsIncrementMode](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_PMP_AddressIncrementModeSelect( PMP_ID_0, PMP_ADDRESS_INCREMENT_DECREMENT_DISABLE );
```

5.6.16.6.1.3 PLIB_PMP_AddressLatchStrobeDisable Function

C

```
void PLIB_PMP_AddressLatchStrobeDisable(  
    PMP_MODULE_ID index,  
    PMP_ADDRESS_LATCH latch  
);
```

Description

This function disables the PMP module with a specific address latch strobe depending on which strobes are not needed.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
latch	Identifier for the latch to be disabled

Returns

None.

Remarks

This function implements an operation of the AddressLatchStrobePortControl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsAddressLatchStrobePortControl](#) in your application to to automatically determine whether this feature is available.

Example

```
PLIB_PMP_AddressLatchStrobeDisable( PMP_ID_0, PMP_ADDRESS_LATCH_UPPER );  
PLIB_PMP_AddressLatchStrobeDisable( PMP_ID_0, PMP_ADDRESS_LATCH_HIGH );  
PLIB_PMP_AddressLatchStrobeDisable( PMP_ID_0, PMP_ADDRESS_LATCH_LOW );
```

5.6.16.6.1.4 PLIB_PMP_AddressLatchStrobeEnable Function

C

```
void PLIB_PMP_AddressLatchStrobeEnable(  
    PMP_MODULE_ID index,  
    PMP_ADDRESS_LATCH latch  
);
```

Description

This function enables the PMP module with a specific address latch strobe depending on which strobes are needed.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
latch	Identifier for the latch to be enabled

Returns

None.

Remarks

This function implements an operation of the AddressLatchStrobePortControl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsAddressLatchStrobePortControl](#) in your application to to automatically determine whether this feature is available.

Example

```
PLIB_PMP_AddressLatchStrobeEnable( PMP_ID_0, PMP_ADDRESS_LATCH_UPPER );
PLIB_PMP_AddressLatchStrobeEnable( PMP_ID_0, PMP_ADDRESS_LATCH_HIGH );
PLIB_PMP_AddressLatchStrobeEnable( PMP_ID_0, PMP_ADDRESS_LATCH_LOW );
```

5.6.16.6.1.5 PLIB_PMP_ChipSelectFunctionSelect Function**C**

```
void PLIB_PMP_ChipSelectFunctionSelect(
    PMP_MODULE_ID index,
    PMP_CHIPSELECT_FUNCTION chipselectfunc
);
```

Description

This function selects the PMCS1/PMCS2 as either Chip Select or as address lines depending on the way these bits are programmed.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
chipselectfunc	One of the possible values from PMP_CHIPSELECT_FUNCTION

Returns

None.

Remarks

This function implements an operation of the ChipSelectoperation feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsChipSelectoperation](#) in your application to to automatically determine whether this feature is available.

Example

```
PLIB_PMP_ChipSelectFunctionSelect( PMP_ID_0, PMCS1_PMCS2_AS_ADDRESS_LINES );
```

5.6.16.6.1.6 PLIB_PMP_ChipSelectXDisable Function**C**

```
void PLIB_PMP_ChipSelectXDisable(
    PMP_MODULE_ID index,
    PMP_CHIP_SELECT chipSelect
);
```

Description

This function configures the Chip Select(s) being used by the PMP module. The specified Chip Select pin functions as the address pin.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
chipSelect	Identifier for which Chip Select to configure

Returns

None.

Remarks

This function implements an operation of the ChipSelectEnable feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsChipSelectEnable](#) in your application to automatically determine whether this feature is available.

Example

```
PMP_CHIP_SELECT chipSelect = PMP_CHIP_SELECT_ONE;  
PLIB_PMP_ChipSelectXDisable( PMP_ID_0, chipSelect );
```

5.6.16.6.1.7 PLIB_PMP_ChipSelectXEnable Function**C**

```
void PLIB_PMP_ChipSelectXEnable(  
    PMP_MODULE_ID index,  
    PMP_CHIP_SELECT chipSelect  
);
```

Description

This function configures the Chip Select(s) being used by the PMP module. The specified Chip Select pin functions as ChipSelect.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
chipSelect	Identifier for which Chip Select to configure

Returns

None.

Remarks

This function implements an operation of the ChipSelectEnable feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsChipSelectEnable](#) in your application to automatically determine whether this feature is available.

Example

```
PMP_CHIP_SELECT chipSelect = PMP_CHIP_SELECT_ONE;  
PLIB_PMP_ChipSelectXEnable( PMP_ID_0, chipSelect );
```

5.6.16.6.1.8 PLIB_PMP_ChipSelectXIsActive Function

C

```
bool PLIB_PMP_ChipSelectXIsActive(  
    PMP_MODULE_ID index,  
    PMP_CHIP_SELECT chipSelect  
);
```

Description

This function gets the current status of the specified Chip Select.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
chipSelect	Identifier for the Chip Select to be checked

Returns

- true - Chip Select is active
- false - Chip Select is not active

Remarks

This function implements an operation of the CSXActiveStatus feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsCSXActiveStatus](#) in your application to automatically determine whether this feature is available.

Example

```
PMP_CHIP_SELECT chipSelect = PMP_CHIP_SELECT_ONE;  
if(PLIB_PMP_ChipSelectXIsActive( PMP_ID_0, chipSelect ))  
{  
    //Do something useful  
}
```

5.6.16.6.1.9 PLIB_PMP_DataSizeSelect Function

C

```
void PLIB_PMP_DataSizeSelect(  
    PMP_MODULE_ID index,  
    PMP_DATA_SIZE size  
);
```

Description

This function enables 4-bit, 8-bit, or 16-bit data transfer for the PMP module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
size	Identifier for the data size to be used

Returns

None.

Remarks

This function implements an operation of the DataTransferSize feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsDataTransferSize](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_PMP_DataSizeSelect( PMP_ID_0, PMP_DATA_SIZE_8_BITS );
```

5.6.16.6.1.10 PLIB_PMP_Disable Function**C**

```
void PLIB_PMP_Disable(  
    PMP_MODULE_ID index  
);
```

Description

This function disables the specific PMP module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed

Returns

None.

Remarks

The default state after any reset for a PMP module is the disable state. If the PMP is disabled, all the related pins are in control of the general purpose I/O logic.

Disabling the PMP module resets the buffers to empty states. Any data characters in the buffers are lost. All error and status bits are also reset.

Disabling the PMP while the PMP is active, will abort all pending transmissions and receptions. Re-enabling the PMP will restart the module in the same configuration.

When disabled, the PMP power consumption is minimal.

This function implements an operation of the EnableControl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsEnableControl](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_PMP_Disable( PMP_ID_0 );
```

5.6.16.6.1.11 PLIB_PMP_Enable Function**C**

```
void PLIB_PMP_Enable(  
    PMP_MODULE_ID index  
);
```

Description

This function enables the specific PMP module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed

Returns

None.

Remarks

This function implements an operation of the EnableControl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsEnableControl](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_PMP_Enable( PMP_ID_0 );
```

5.6.16.6.1.12 PLIB_PMP_InputBufferTypeSelect Function**C**

```
void PLIB_PMP_InputBufferTypeSelect(  
    PMP_MODULE_ID index,  
    PMP_INPUT_BUFFER_TYPE inputBuffer  
);
```

Description

This function selects the input buffer based on the input passed. Either TTL or Schmitt Trigger input buffers are selected.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
inputBuffer	One of the possible input buffer types

Returns

None.

Remarks

This function implements an operation of the BufferType feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsBufferType](#) in your application to to automatically determine whether this feature is available.

Example

```
PLIB_PMP_InputBufferTypeSelect( PMP_ID_0, PMP_INPUT_BUFFER_TTL );
```

5.6.16.6.1.13 PLIB_PMP_InterruptModeGet Function

C

```
PMP_INTERRUPT_MODE PLIB_PMP_InterruptModeGet(  
    PMP_MODULE_ID index  
);
```

Description

This function gets the current configured interrupt mode being used with the PMP module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed

Returns

One of the possible values from [PMP_INTERRUPT_MODE](#).

Remarks

This function implements an operation of the InterruptMode feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsInterruptMode](#) in your application to to automatically determine whether this feature is available.

Example

```
PMP_INTERRUPT_MODE currentIntMode;  
currentIntMode = PLIB_PMP_InterruptModeGet ( PMP_ID_0 );
```

5.6.16.6.1.14 PLIB_PMP_InterruptModeSelect Function

C

```
void PLIB_PMP_InterruptModeSelect(  
    PMP_MODULE_ID index,  
    PMP_INTERRUPT_MODE interruptMode  
);
```

Description

This function configures the pins used by the PMP module. Refer to the enumeration [PMP_INTERRUPT_MODE](#) for the possible settings.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
interruptMode	One of the possible values from PMP_INTERRUPT_MODE

Returns

None.

Remarks

This function implements an operation of the InterruptMode feature. This feature may not be available on all devices. Please

refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsInterruptMode](#) in your application to to automatically determine whether this feature is available.

Example

```
PLIB_PMP_InterruptModeSelect( PMP_ID_0, PMP_INTERRUPT_NONE );
```

5.6.16.6.1.15 PLIB_PMP_MultiplexModeGet Function

C

```
PMP_MUX_MODE PLIB_PMP_MultiplexModeGet(
    PMP_MODULE_ID index
);
```

Description

This function gets the current multiplexing mode configured between the address and data of the PMP module.

Preconditions

None.

Returns

index - Identifier for the device instance to be addressed [PMP_MUX_MODE](#) - One of the possible values from [PMP_MUX_MODE](#)

Remarks

This function implements an operation of the MUXModeSelect feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsMUXModeSelect](#) in your application to to automatically determine whether this feature is available.

Example

```
PMP_MUX_MODE currentMuxMode;
currentMuxMode = PLIB_PMP_MultiplexModeGet( PMP_ID_0 );
```

5.6.16.6.1.16 PLIB_PMP_MultiplexModeSelect Function

C

```
void PLIB_PMP_MultiplexModeSelect(
    PMP_MODULE_ID index,
    PMP_MUX_MODE multiplexMode
);
```

Description

This function configures the pins used by the PMP module. Refer to the enumeration [PMP_MUX_MODE](#) for the possible settings.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
multiplexMode	One of the possible values from the PMP_MUX_MODE

Returns

None.

Remarks

This function implements an operation of the MUXModeSelect feature. This feature may not be available on all devices. Please

refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsMUXModeSelect](#) in your application to to automatically determine whether this feature is available.

Example

```
PLIB_PMP_MultiplexModeSelect( PMP_ID_0, PMP_MUX_NONE );
```

5.6.16.6.1.17 PLIB_PMP_OperationModeGet Function**C**

```
PMP_OPERATION_MODE PLIB_PMP_OperationModeGet(  
    PMP_MODULE_ID index  
);
```

Description

This function gets the current operation mode of the PMP module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed

Returns

[PMP_OPERATION_MODE](#) - One of the possible values from [PMP_OPERATION_MODE](#)

Remarks

This function implements an operation of the OperationMode feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsOperationMode](#) in your application to to automatically determine whether this feature is available.

Example

```
PMP_OPERATION_MODE curOpMode;  
curOpMode = PLIB_PMP_OperationModeGet( PMP_ID_0 );
```

5.6.16.6.1.18 PLIB_PMP_OperationModeSelect Function**C**

```
void PLIB_PMP_OperationModeSelect(  
    PMP_MODULE_ID index,  
    PMP_OPERATION_MODE operationMode  
);
```

Description

This function configures operation mode of the PMP module. Refer to the enumeration [PMP_OPERATION_MODE](#) for the possible settings.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
operationMode	One of the possible values from PMP_OPERATION_MODE

Returns

None.

Remarks

This function implements an operation of the OperationMode feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsOperationMode](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_PMP_OperationModeSelect( PMP_ID_0,  
                              PMP_MASTER_READ_WRITE_STROBES_MULTIPLEXED );
```

5.6.16.6.1.19 PLIB_PMP_StopInIdleDisable Function**C**

```
void PLIB_PMP_StopInIdleDisable(  
    PMP_MODULE_ID index  
);
```

Description

This function disables the stop in idle flag. The PMP module continues operation in Idle mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed

Returns

None.

Remarks

By default, the PMP module will continue operation in Idle mode.

This function implements an operation of the StopInIdleControl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsStopInIdleControl](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_PMP_StopInIdleDisable( PMP_ID_0 );
```

5.6.16.6.1.20 PLIB_PMP_StopInIdleEnable Function**C**

```
void PLIB_PMP_StopInIdleEnable(  
    PMP_MODULE_ID index  
);
```

Description

This function enables the PMP module to discontinue operation when the device enters Idle mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed

Returns

None.

Remarks

This function implements an operation of the StopInIdleControl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsStopInIdleControl](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_PMP_StopInIdleEnable( PMP_ID_0 );
```

5.6.16.6.2 Enhanced General Initialization Functions

5.6.16.6.2.1 PLIB_PMP_BusKeeperDisable Function

C

```
void PLIB_PMP_BusKeeperDisable(  
    PMP_MODULE_ID index  
);
```

Description

The data bus can be kept in a high-impedance state when not actively being driven. This function disables this "bus keeper" state.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed

Returns

None.

Remarks

This function implements an operation of the BusKeeper feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsBusKeeper](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_PMP_BusKeeperDisable ( PMP_ID_0 );
```

5.6.16.6.2.2 PLIB_PMP_BusKeeperEnable Function

C

```
void PLIB_PMP_BusKeeperEnable(  
    PMP_MODULE_ID index  
);
```

Description

The data bus can be kept in a high-impedance state when not actively being driven. This function enables this "bus keeper" state.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed

Returns

None.

Remarks

This function implements an operation of the BusKeeper feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsBusKeeper](#) in your application to to automatically determine whether this feature is available.

Example

```
PLIB_PMP_BusKeeperEnable ( PMP_ID_0 );
```

5.6.16.6.2.3 PLIB_PMP_ChipSelectXEnableStrobeDeSelect Function**C**

```
void PLIB_PMP_ChipSelectXEnableStrobeDeSelect(  
    PMP_MODULE_ID index,  
    PMP_CHIP_SELECT chipSelect  
);
```

Description

This function selects the read and write strobes. The read and write strobes have independent lines.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
chipSelect	One of the possible values from PMP_CHIP_SELECT

Returns

None.

Remarks

This function implements an operation of the ChipXEnableStorbeSelect feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsChipXEnableStorbeSelect](#) in your application to to automatically determine whether this feature is available.

Example

```
PLIB_PMP_ChipSelectXEnableStrobeDeSelect ( PMP_ID_0, PMP_CHIP_SELECT_ONE );
```

5.6.16.6.2.4 PLIB_PMP_ChipSelectXEnableStrobeSelect Function

C

```
void PLIB_PMP_ChipSelectXEnableStrobeSelect(  
    PMP_MODULE_ID index,  
    PMP_CHIP_SELECT chipSelect  
);
```

Description

This function selects the read/write and enable strobes. The read and write strobes share a common line. A separate enable line is provided to differentiate between read and write operations.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
chipSelect	One of the possible values from PMP_CHIP_SELECT

Returns

None.

Remarks

This function implements an operation of the ChipXEnableStrobeSelect feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsChipXEnableStrobeSelect](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_PMP_ChipSelectXEnableStrobeSelect ( PMP_ID_0, PMP_CHIP_SELECT_ONE );
```

5.6.16.6.2.5 PLIB_PMP_SmartAddressStrobeDisable Function

C

```
void PLIB_PMP_SmartAddressStrobeDisable(  
    PMP_MODULE_ID index  
);
```

Description

This function disables "smart" address strobes (each address phase is only present if the current access would cause a different address in the latch than the previous address).

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed

Returns

None.

Remarks

This function implements an operation of the SmartAddress feature. This feature may not be available on all devices. Please

refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsSmartAddress](#) in your application to to automatically determine whether this feature is available.

Example

```
PLIB_PMP_SmartAddressStrobeDisable ( PMP_ID_0 );
```

5.6.16.6.2.6 PLIB_PMP_SmartAddressStrobeEnable Function**C**

```
void PLIB_PMP_SmartAddressStrobeEnable(  
    PMP_MODULE_ID index  
);
```

Description

This function enables "smart" address strobes (each address phase is only present if the current access would cause a different address in the latch than the previous address).

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed

Returns

None.

Remarks

This function implements an operation of the SmartAddress feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsSmartAddress](#) in your application to to automatically determine whether this feature is available.

Example

```
PLIB_PMP_SmartAddressStrobeEnable ( PMP_ID_0 );
```

5.6.16.6.2.7 PLIB_PMP_ChipXAckModeSelect Function**C**

```
void PLIB_PMP_ChipXAckModeSelect(  
    PMP_MODULE_ID index,  
    PMP_CHIP_SELECT chipSelect,  
    PMP_ACK_MODE mode  
);
```

Description

This function sets the acknowledge for the PMP module. Either enables, disables, or enables it with time-out. See the [PMP_ACK_MODE](#) enumeration for additional information.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
mode	Identifier for the acknowledge mode to be selected

chipSelect	One of the possible values from PMP_CHIP_SELECT

Returns

None.

Remarks

This function implements an operation of the ChipXACKMode feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsChipXACKMode](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_PMP_ChipXAckModeSelect ( PMP_ID_0, PMP_CHIP_SELECT_ONE, PMP_ACK_DISABLED );
```

5.6.16.6.2.8 PLIB_PMP_ChipXDataSizeSelect Function

C

```
void PLIB_PMP_ChipXDataSizeSelect(
    PMP_MODULE_ID index,
    PMP_CHIP_SELECT chipSelect,
    PMP_DATA_SIZE size
);
```

Description

This function enables 4-bit, 8-bit, or 16-bit data transfer for the PMP for the specified device.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
size	Identifier for the data size to be used
chipSelect	One of the possible values from PMP_CHIP_SELECT

Returns

None.

Remarks

This function implements an operation of the ChipXDataSize feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsChipXDataSize](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_PMP_ChipXDataSizeSelect( PMP_ID_0,
                               PMP_CHIP_SELECT_ONE,
                               PMP_DATA_SIZE_8_BITS );
```

5.6.16.6.2.9 PLIB_PMP_EnhancedMasterModeSelect Function

C

```
void PLIB_PMP_EnhancedMasterModeSelect(
    PMP_MODULE_ID index,
    PMP_MASTER_MODE master
);
```

Description

This function sets the PMP module for Master mode (either CPU or alternate master). The alternate master can have direct I/O access.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
master	Identifier for the master to be selected

Returns

None.

Remarks

This function implements an operation of the EnhancedMasterMode feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsEnhancedMasterMode](#) in your application to to automatically determine whether this feature is available.

Example

```
PLIB_PMP_EnhancedMasterModeSelect ( PMP_ID_0, PMP_CPU_MASTER );
```

5.6.16.6.3 General Status Functions

5.6.16.6.3.1 PLIB_PMP_IsEnabled Function

C

```
bool PLIB_PMP_IsEnabled(  
    PMP_MODULE_ID index  
);
```

Description

This function checks whether or not the PMP module is enabled.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed

Returns

- true - If the PMP module is enabled
- false - if the PMP module is disabled

Remarks

This function implements an operation of the EnableControl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsEnableControl](#) in your application to to automatically determine whether this feature is available.

Example

```
bool pmpStatus;  
pmpStatus = PLIB_PMP_IsEnabled( PMP_ID_0 );
```

5.6.16.6.3.2 PLIB_PMP_PortIsBusy Function**C**

```
bool PLIB_PMP_PortIsBusy(  
    PMP_MODULE_ID index  
);
```

Description

This function identifies if the PMP port is busy (in Master mode).

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed

Returns

- true - If the port is busy
- false - If the port is not busy

Remarks

Works only in Master mode. This function implements an operation of the BusyStatus feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsBusyStatus](#) in your application to automatically determine whether this feature is available.

Example

```
bool status;  
status = PLIB_PMP_PortIsBusy( PMP_ID_0 );
```

5.6.16.6.3.3 PLIB_PMP_InputOverflowHasOccurred Function**C**

```
bool PLIB_PMP_InputOverflowHasOccurred(  
    PMP_MODULE_ID index  
);
```

Description

This function identifies if there was a receiver overflow error.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed

Returns

- true - If the input buffer has overflowed
- false - If the input buffer has not overflowed

Remarks

This function implements an operation of the BufferOverflow feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsBufferOverflow](#) in your application to automatically determine whether this feature is available.

Example

```
if(PLIB_PMP_InputOverflowHasOccurred( PMP_ID_0 ))
{
    PLIB_PMP_InputOverflowClear( PMP_ID_0 );
}
```

5.6.16.6.3.4 PLIB_PMP_OutputUnderflowHasOccurred Function**C**

```
bool PLIB_PMP_OutputUnderflowHasOccurred(
    PMP_MODULE_ID index
);
```

Description

This function identifies if there was a output buffer was sent out with no data.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed

Returns

- true - If the input buffer was empty when data was sent
- false - If the output buffer was not empty when data was sent

Remarks

This function implements an operation of the BufferUnderFlow feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsBufferUnderFlow](#) in your application to automatically determine whether this feature is available.

Example

```
if(PLIB_PMP_OutputUnderflowHasOccurred( PMP_ID_0 ))
{
    PLIB_PMP_OutputUnderflowClear( PMP_ID_0 );
}
```

5.6.16.6.4 Enhanced General Status Functions**5.6.16.6.4.1 PLIB_PMP_AlternateMasterHasAccess Function****C**

```
bool PLIB_PMP_AlternateMasterHasAccess(
    PMP_MODULE_ID index
);
```

Description

This function gets the status of the alternate masters that have gained access to the PMP module, whether or not the alternate

master has access to the PMP module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed

Returns

- true - If the alternate master has gained access to the PMP module
- false - If the CPU has gained access to the PMP module

Remarks

This function implements an operation of the CurrentMaster feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsCurrentMaster](#) in your application to automatically determine whether this feature is available.

Example

```
status = PLIB_PMP_AlternateMasterHasAccess ( PMP_ID_0 );
```

5.6.16.6.4.2 PLIB_PMP_AlternateMasterRequestStatus Function

C

```
bool PLIB_PMP_AlternateMasterRequestStatus(  
    PMP_MODULE_ID index  
);
```

Description

This function gets the status of the request from the alternate master, whether or not the master is requesting use of the PMP module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed

Returns

- true - If the alternate master is requesting use of the PMP module
- false - If the alternate master is not a making request for the PMP module

Remarks

This function implements an operation of the AltMasterRequest feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsAltMasterRequest](#) in your application to automatically determine whether this feature is available.

Example

```
status = PLIB_PMP_AlternateMasterRequestStatus ( PMP_ID_0 );
```

5.6.16.6.5 Error Status/Control Functions

5.6.16.6.5.1 PLIB_PMP_InputOverflowClear Function

C

```
void PLIB_PMP_InputOverflowClear(  
    PMP_MODULE_ID index  
);
```

Description

This function clears an overflow error. Clearing the error resets the receive buffer.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed

Returns

None.

Remarks

This function implements an operation of the BufferOverflow feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsBufferOverflow](#) in your application to automatically determine whether this feature is available.

Example

```
if(PLIB_PMP_InputOverflowHasOccurred( PMP_ID_0 ))  
{  
    PLIB_PMP_InputOverflowClear( PMP_ID_0 );  
}
```

5.6.16.6.5.2 PLIB_PMP_OutputUnderflowClear Function

C

```
void PLIB_PMP_OutputUnderflowClear(  
    PMP_MODULE_ID index  
);
```

Description

This function clears a PMP output underflow error.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed

Returns

None.

Remarks

This function implements an operation of the BufferUnderFlow feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsBufferUnderFlow](#) in your application to automatically determine whether this feature is available.

Example

```
if(PLIB_PMP_OutputUnderflowHasOccurred( PMP_ID_0 ))
{
    PLIB_PMP_OutputUnderflowClear( PMP_ID_0 );
}
```

5.6.16.6.6 Enhanced Error/Status Control Functions

5.6.16.6.6.1 PLIB_PMP_TransactionErrorClear Function

C

```
void PLIB_PMP_TransactionErrorClear(
    PMP_MODULE_ID index
);
```

Description

This function clears the transaction error flag.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed

Returns

None.

Remarks

This function implements an operation of the TransactionError feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsTransactionError](#) in your application to automatically determine whether this feature is available.

Example

```
if(PLIB_PMP_TransactionErrorHasOccurred ( PMP_ID_0 ) )
    PLIB_PMP_TransactionErrorClear ( PMP_ID_0 );
```

5.6.16.6.6.2 PLIB_PMP_TransactionErrorHasOccurred Function

C

```
bool PLIB_PMP_TransactionErrorHasOccurred(
    PMP_MODULE_ID index
);
```

Description

This function returns the status of a transaction error if an illegal transaction was requested.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed

Returns

- true - If illegal transaction was requested
- false - Transaction completed successfully

Remarks

This function implements an operation of the TransactionError feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsTransactionError](#) in your application to to automatically determine whether this feature is available.

Example

```
status = PLIB_PMP_TransactionErrorHasOccurred ( PMP_ID_0 );
```

5.6.16.6.6.3 PLIB_PMP_TransactionHasTimedOut Function**C**

```
bool PLIB_PMP_TransactionHasTimedOut(  
    PMP_MODULE_ID index  
);
```

Description

This function returns the time-out status of the PMP transaction.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed

Returns

- true - If the transaction timed out
- false - If the transaction completed successfully

Remarks

This function implements an operation of the TransactionTimeout feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsTransactionTimeout](#) in your application to to automatically determine whether this feature is available.

Example

```
status = PLIB_PMP_TransactionHasTimedOut ( PMP_ID_0 );
```

5.6.16.6.6.4 PLIB_PMP_TransactionTimeoutClear Function**C**

```
void PLIB_PMP_TransactionTimeoutClear(  
    PMP_MODULE_ID index  
);
```

Description

This function clears the time-out flag.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed

Returns

None.

Remarks

This function implements an operation of the TransactionTimeout feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsTransactionTimeout](#) in your application to to automatically determine whether this feature is available.

Example

```
if(PLIB_PMP_TransactionHasTimedOut ( PMP_ID_0 ))
    PLIB_PMP_TransactionTimeoutClear ( PMP_ID_0 );
```

5.6.16.6.7 Data Read and Write Functions

5.6.16.6.7.1 PLIB_PMP_InputBuffersAreFull Function

C

```
bool PLIB_PMP_InputBuffersAreFull(
    PMP_MODULE_ID index
);
```

Description

This function gets the state of the input buffers.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed

Returns

- true - If all input buffers are full
- false - If all input buffers are not full

Remarks

This function implements an operation of the InputBufferFull feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsInputBufferFull](#) in your application to to automatically determine whether this feature is available.

Example

```
uint8_t value;
if(PLIB_PMP_InputBuffersAreFull( PMP_ID_0 ))
{
    value = PLIB_PMP_InputBufferXByteReceive( PMP_ID_0, 1 );
}
```

5.6.16.6.7.2 PLIB_PMP_InputBufferXByteReceive Function

C

```
uint8_t PLIB_PMP_InputBufferXByteReceive(  
    PMP_MODULE_ID index,  
    uint8_t buffer  
);
```

Description

The data to be received in Byte mode from the specified PMP module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
buffer	One of the possible buffers (valid values are 0 to 3)

Returns

data - Data to be received

Remarks

This function implements an operation of the BufferRead feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsBufferRead](#) in your application to automatically determine whether this feature is available.

Example

```
uint8_t mydata;  
if(!PLIB_PMP_PortIsBusy( PMP_ID_0 ))  
{  
    // get data from buffer-1  
    mydata = PLIB_PMP_InputBufferXByteReceive( PMP_ID_0, 1 );  
}
```

5.6.16.6.7.3 PLIB_PMP_InputBufferXIsFull Function

C

```
bool PLIB_PMP_InputBufferXIsFull(  
    PMP_MODULE_ID index,  
    uint8_t buffer  
);
```

Description

This function gets the state of the identified input buffer.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
buffer	The input buffer number (valid values are 0 to 3)

Returns

- true - If all input buffers are full
- false - If all input buffers are not full

Remarks

This function implements an operation of the InputBufferXStatus feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsInputBufferXStatus](#) in your application to automatically determine whether this feature is available.

Example

```
uint8_t value;
// Check the status of buffer-2
if(PLIB_PMP_InputBufferXIsFull( PMP_ID_0, 2 ))
{
    // get data from buffer 2
    value = PLIB_PMP_InputBufferXByteReceive( PMP_ID_0, 2 );
}
```

5.6.16.6.7.4 PLIB_PMP_IsDataReceived Function**C**

```
bool PLIB_PMP_IsDataReceived(
    PMP_MODULE_ID index,
    uint8_t buffer
);
```

Description

This function checks and returns if the data has been received in the specified buffer in Slave mode.

Preconditions

The PMP module should be configured for Slave mode operation.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
buffer	One of the possible input buffers (valid values are 0 to 3)

Returns

- true - Data has been received in the specified buffer
- false - Data has not been received in the specified buffer

Remarks

This function implements an operation of the InputBufferXStatus feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsInputBufferXStatus](#) in your application to automatically determine whether this feature is available.

Example

```
int8_t data;
// Check if data is received on buffer-2
if(PLIB_PMP_IsDataReceived( PMP_ID_0, 2 ))
{
    // get data from buffer-2
    data = PLIB_PMP_InputBufferXByteReceive( PMP_ID_0, 2 );
}
```

5.6.16.6.7.5 PLIB_PMP_IsDataTransmitted Function

C

```
bool PLIB_PMP_IsDataTransmitted(  
    PMP_MODULE_ID index,  
    uint8_t buffer  
);
```

Description

Checks and returns if data has been transmitted from the specified buffer.

Preconditions

The PMP module should be configured for Slave mode operation.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
buffer	One of the possible output buffers (valid range is 0 to 3)

Returns

- true - If data has been transmitted from the specified buffer
- false - If data has not been transmitted from the specified buffer

Remarks

This function implements an operation of the OutputBufferXStatus feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsOutputBufferXStatus](#) in your application to automatically determine whether this feature is available.

Example

```
uint8_t data;  
if(PLIB_PMP_IsDataTransmitted( PMP_ID_0, 2 ))  
{  
    PLIB_PMP_OutputBufferXByteSend( PMP_ID_0, 2, data );  
}
```

5.6.16.6.7.6 PLIB_PMP_MasterReceive Function

C

```
uint16_t PLIB_PMP_MasterReceive(  
    PMP_MODULE_ID index  
);
```

Description

This function receives the data. The dataflow is from slave to master.

Preconditions

The PMP module is configured as master.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed.

Returns

uint16_t - Data received

Remarks

This function to be used only when the PMP is acting as master. This function implements an operation of the MasterRXTX feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsMasterRXTX](#) in your application to to automatically determine whether this feature is available.

Example

```
uint16_t data;
if(!PLIB_PMP_PortIsBusy( PMP_ID_0 ))
{
    data = PLIB_PMP_MasterReceive( PMP_ID_0 );
}
```

5.6.16.6.7.7 PLIB_PMP_MasterSend Function

C

```
void PLIB_PMP_MasterSend(
    PMP_MODULE_ID index,
    uint16_t data
);
```

Description

This function sends the specified data. The data flow is from master to slave.

Preconditions

The PMP module is configured for Master Mode.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
data	Data to be transmitted

Returns

None.

Remarks

This function to be used only when the PMP is acting as master. This function implements an operation of the MasterRXTX feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsMasterRXTX](#) in your application to to automatically determine whether this feature is available.

Example

```
uint16_t data = 'a';
if(!PLIB_PMP_PortIsBusy( PMP_ID_0 ))
{
    PLIB_PMP_MasterSend( PMP_ID_0, data );
}
```

5.6.16.6.7.8 PLIB_PMP_OutputBuffersAreEmpty Function

C

```
bool PLIB_PMP_OutputBuffersAreEmpty(
    PMP_MODULE_ID index
);
```

Description

This function gets the state of the output buffers.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed

Returns

- true - If all output buffers are empty
- false - If all output buffers are not empty

Remarks

This function implements an operation of the OutPutBufferEmpty feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsOutPutBufferEmpty](#) in your application to to automatically determine whether this feature is available.

Example

```
uint8_t value=0xEF;

if(PLIB_PMP_OutputBuffersAreEmpty( PMP_ID_0 ))
{
    PLIB_PMP_OutputBufferXByteSend( PMP_ID_0, 1, value);
}
```

5.6.16.6.7.9 PLIB_PMP_OutputBufferXByteSend Function**C**

```
void PLIB_PMP_OutputBufferXByteSend(
    PMP_MODULE_ID index,
    uint8_t buffer,
    uint8_t data
);
```

Description

The data is transmitted in Byte mode for the specified PMP module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
buffer	One of the possible output buffers (valid range is 0 to 3)
data	Data to be transmitted

Returns

None.

Remarks

This function implements an operation of the BufferWrite feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsBufferWrite](#) in your application to to automatically determine whether this feature is available.

Example

```
uint8_t data = 'a';
if(!PLIB_PMP_PortIsBusy( PMP_ID_0 ))
{
    PLIB_PMP_OutputBufferXByteSend( PMP_ID_0, 1, data );
}
```

5.6.16.6.7.10 PLIB_PMP_OutputBufferXIsEmpty Function**C**

```
bool PLIB_PMP_OutputBufferXIsEmpty(
    PMP_MODULE_ID index,
    uint8_t buffer
);
```

Description

This function gets the state of the input buffer.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
buffer	Output buffer number (valid range is 0 to 3)

Returns

- true - If the identified output buffer is empty
- false - If the identified output buffer is not empty

Remarks

This function implements an operation of the OutputBufferXStatus feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsOutputBufferXStatus](#) in your application to to automatically determine whether this feature is available.

Example

```
uint8_t value = 0xEF;

if(PLIB_PMP_OutputBufferXIsEmpty( PMP_ID_0, 1 ) )
{
    PLIB_PMP_OutputBufferXByteSend( PMP_ID_0,1, value);
}
```

5.6.16.6.7.11 PLIB_PMP_SlaveReceive Function**C**

```
uint16_t PLIB_PMP_SlaveReceive(
    PMP_MODULE_ID index
);
```

Description

This function receives the data. The dataflow is from master to slave.

Preconditions

The PMP module is configured as slave.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed.

Returns

uint16_t - Data received

Remarks

This function to be used only when the PMP is acting as slave. This function implements an operation of the SlaveRX feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsSlaveRX](#) in your application to to automatically determine whether this feature is available.

Example

```
uint16_t data;
if(!PLIB_PMP_PortIsBusy( PMP_ID_0 ))
{
    data = PLIB_PMP_SlaveReceive( PMP_ID_0 );
}
```

5.6.16.6.7.12 PLIB_PMP_SlaveSend Function**C**

```
void PLIB_PMP_SlaveSend(
    PMP_MODULE_ID index,
    uint16_t data
);
```

Description

This function sends the specified data. The data flow is from slave to master.

Preconditions

The PMP module is configured for Slave Mode.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
data	Data to be transmitted

Returns

None.

Remarks

This function to be used only when the PMP is acting as slave. This function implements an operation of the SlaveTX feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsSlaveTX](#) in your application to to automatically determine whether this feature is available.

Example

```
uint16_t data = 'a';
if(!PLIB_PMP_PortIsBusy( PMP_ID_0 ))
{
    PLIB_PMP_SlaveSend( PMP_ID_0, data );
}
```

5.6.16.6.8 Wait States Initialization Functions

5.6.16.6.8.1 PLIB_PMP_WaitStatesDataHoldSelect Function

C

```
void PLIB_PMP_WaitStatesDataHoldSelect(  
    PMP_MODULE_ID index,  
    PMP_DATA_HOLD_STATES dataHoldState  
);
```

Description

This function configures the number of peripheral bus clock cycles needed for wait states. Refer to the enumeration [PMP_DATA_HOLD_STATES](#) for the possible settings.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
dataHoldState	One of the possible values from PMP_DATA_HOLD_STATES

Returns

None.

Remarks

This function implements an operation of the DataHoldWaitStates feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsDataHoldWaitStates](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_PMP_WaitStatesDataHoldSelect( PMP_ID_0, PMP_DATA_HOLD_2 );
```

5.6.16.6.8.2 PLIB_PMP_WaitStatesDataSetUpSelect Function

C

```
void PLIB_PMP_WaitStatesDataSetUpSelect(  
    PMP_MODULE_ID index,  
    PMP_DATA_WAIT_STATES dataWaitState  
);
```

Description

This function configures the number of peripheral bus clock cycles needed for wait states. Refer to the enumeration [PMP_DATA_WAIT_STATES](#) for the possible settings.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
dataWaitState	One of the possible values from PMP_DATA_WAIT_STATES

Returns

None.

Remarks

This function implements an operation of the DataSetUpWaitStates feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsDataSetUpWaitStates](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_PMP_WaitStatesDataSetUpSelect( PMP_ID_0, PMP_DATA_WAIT_TWO );
```

5.6.16.6.8.3 PLIB_PMP_WaitStatesStrobeSelect Function**C**

```
void PLIB_PMP_WaitStatesStrobeSelect(
    PMP_MODULE_ID index,
    PMP_STROBE_WAIT_STATES strobeWaitState
);
```

Description

This function configures the number of peripheral bus clock cycles needed for wait states. Refer to the enumeration [PMP_STROBE_WAIT_STATES](#) for the possible settings.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
strobeWaitState	One of the possible values from PMP_STROBE_WAIT_STATES

Returns

None.

Remarks

This function implements an operation of the DataStrobeWaitStates feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsDataStrobeWaitStates](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_PMP_WaitStatesStrobeSelect( PMP_ID_0, PMP_STROBE_WAIT_2 );
```

5.6.16.6.9 Enhanced Wait States Initialization Functions**5.6.16.6.9.1 PLIB_PMP_ChipXWaitStatesAlternateMasterSelect Function****C**

```
void PLIB_PMP_ChipXWaitStatesAlternateMasterSelect(
    PMP_MODULE_ID index,
    PMP_CHIP_SELECT chipSelect,
    PMP_ALTERNATE_MASTER_WAIT_STATES waitStates
);
```

Description

Selects the wait states of the alternate master for Chip Select-X.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
waitStates	Identifier for wait states
chipSelect	One of the possible values from PMP_CHIP_SELECT

Returns

None.

Remarks

This function implements an operation of the ChipXAltMasterWaitStates feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsChipXAltMasterWaitStates](#) in your application to to automatically determine whether this feature is available.

Example

```
PLIB_PMP_ChipXWaitStatesAlternateMasterSelect ( PMP_ID_0,  
                                                PMP_CHIP_SELECT_ONE,  
                                                PMP_ALTERNATE_MASTER_WAIT_THREE );
```

5.6.16.6.9.2 PLIB_PMP_ChipXWaitStatesDataHoldSelect Function**C**

```
void PLIB_PMP_ChipXWaitStatesDataHoldSelect(  
    PMP_MODULE_ID index,  
    PMP_CHIP_SELECT chipselect,  
    PMP_DATA_HOLD_STATES dataHoldState  
);
```

Description

This function configures the number of peripheral bus clock cycles needed for wait states. Refer to the enumeration [PMP_DATA_HOLD_STATES](#) for the possible settings.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
chipselect	One of the possible values from PMP_CHIP_SELECT
dataHoldState	One of the possible values from PMP_DATA_HOLD_STATES

Returns

None.

Remarks

This function implements an operation of the ChipXDataHoldWaitStates feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsChipXDataHoldWaitStates](#) in your application to to automatically determine whether this feature is available.

Example

```
PLIB_PMP_ChipXWaitStatesDataHoldSelect( PMP_ID_0,
                                         PMP_CHIP_SELECT_ONE,
                                         PMP_DATA_HOLD_2 );
```

5.6.16.6.9.3 PLIB_PMP_ChipXWaitStatesDataSetupSelect Function**C**

```
void PLIB_PMP_ChipXWaitStatesDataSetupSelect(
    PMP_MODULE_ID index,
    PMP_CHIP_SELECT chipselect,
    PMP_DATA_WAIT_STATES dataWaitState
);
```

Description

This function configures the number of peripheral bus clock cycles needed for wait states for the specified device. Refer to the enumeration [PMP_DATA_WAIT_STATES](#) for the possible settings.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
chipselect	One of the possible values from PMP_CHIP_SELECT
dataWaitState	One of the possible values from PMP_DATA_WAIT_STATES

Returns

None.

Remarks

This function implements an operation of the ChipXDataSetupWaitStates feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsChipXDataSetupWaitStates](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_PMP_ChipXWaitStatesDataSetupSelect( PMP_ID_0,
                                         PMP_CHIP_SELECT_ONE,
                                         PMP_DATA_WAIT_ONE );
```

5.6.16.6.9.4 PLIB_PMP_ChipXWaitStatesStrobeSelect Function**C**

```
void PLIB_PMP_ChipXWaitStatesStrobeSelect(
    PMP_MODULE_ID index,
    PMP_CHIP_SELECT chipselect,
    PMP_STROBE_WAIT_STATES strobeWaitState
);
```

Description

This function configures the number of peripheral bus clock cycles needed for wait states for the specified device. Refer to the enumeration [PMP_STROBE_WAIT_STATES](#) for the possible settings.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
chipselect	One of the possible values from PMP_CHIP_SELECT
strobeWaitState	One of the possible values from PMP_STROBE_WAIT_STATES

Returns

None.

Remarks

This function implements an operation of the ChipXStrobeWaitStates feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsChipXStrobeWaitStates](#) in your application to to automatically determine whether this feature is available.

Example

```
PLIB_PMP_ChipXWaitStatesStrobeSelect( PMP_ID_0,  
                                      PMP_CHIP_SELECT_ONE,  
                                      PMP_STROBE_WAIT_3 );
```

5.6.16.6.9.5 PLIB_PMP_WaitStatesAddressHoldStrobeSelect Function**C**

```
void PLIB_PMP_WaitStatesAddressHoldStrobeSelect(  
    PMP_MODULE_ID index,  
    PMP_ADDRESS_HOLD_LATCH_WAIT_STATES waitState  
);
```

Description

This function configures the number of peripheral bus clock cycles needed for wait states. Refer to the enumeration [PMP_ADDRESS_HOLD_LATCH_WAIT_STATES](#) for the possible settings.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
waitState	One of the possible values from PMP_ADDRESS_HOLD_LATCH_WAIT_STATES

Returns

None.

Remarks

This function implements an operation of the WaitStatesAddrHoldStrobe feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsWaitStatesAddrHoldStrobe](#) in your application to to automatically determine whether this feature is available.

Example

```
PLIB_PMP_WaitStatesAddressHoldStrobeSelect( PMP_ID_0,  
                                             PMP_ADDRESS_HOLD_ONE_AND_ONE_QUARTER );
```

5.6.16.6.9.6 PLIB_PMP_WaitStatesAddressLatchStrobeSelect Function

C

```
void PLIB_PMP_WaitStatesAddressLatchStrobeSelect(  
    PMP_MODULE_ID index,  
    PMP_ADDRESS_LATCH_WAIT_STATES waitState  
);
```

Description

This function configures the number of peripheral bus clock cycles needed for wait states. Refer to the enumeration [PMP_ADDRESS_LATCH_WAIT_STATES](#) for the possible settings.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
waitState	One of the possible values from PMP_ADDRESS_LATCH_WAIT_STATES

Returns

None.

Remarks

This function implements an operation of the WaitStatesAddrLatchStrobe feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsWaitStatesAddrLatchStrobe](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_PMP_WaitStatesAddressLatchStrobeSelect( PMP_ID_0,  
                                              PMP_ADDRESS_WAIT_ONE_AND_HALF );
```

5.6.16.6.10 Address Handling Functions

5.6.16.6.10.1 PLIB_PMP_AddressGet Function

C

```
uint32_t PLIB_PMP_AddressGet(  
    PMP_MODULE_ID index  
);
```

Description

This function gets the current address of the PMP module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed

Returns

address - Device address to be set

Remarks

This function implements an operation of the AddressControl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsAddressControl](#) in your application to automatically determine whether this feature is available.

Example

```
uint32_t address;  
address = PLIB_PMP_AddressGet( PMP_ID_0 );
```

5.6.16.6.10.2 PLIB_PMP_AddressLinesA0A1Get Function**C**

```
uint8_t PLIB_PMP_AddressLinesA0A1Get(  
    PMP_MODULE_ID index  
);
```

Description

This function gets the value of the address lines PMA0 and PMA1. This function is used in the addressable parallel slave port mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed

Returns

uint8_t - The two-bit address

Remarks

This function implements an operation of the AddressControl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsAddressControl](#) in your application to automatically determine whether this feature is available.

Example

```
uint8_t bufferAddress;  
bufferAddress = PLIB_PMP_AddressLinesA0A1Get( PMP_ID_0 );
```

5.6.16.6.10.3 PLIB_PMP_AddressLinesA0A1Set Function**C**

```
void PLIB_PMP_AddressLinesA0A1Set(  
    PMP_MODULE_ID index,  
    uint8_t address  
);
```

Description

This function sets the address lines PMA0 and PMA1 with the value specified. This function is used in the addressable parallel slave port mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
address	The two-bit address

Returns

None.

Remarks

This function implements an operation of the AddressControl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsAddressControl](#) in your application to automatically determine whether this feature is available.

Example

```
uint8_t bufferAddress = 0x2;  
PLIB_PMP_AddressLinesA0A1Set( PMP_ID_0, bufferAddress );
```

5.6.16.6.10.4 PLIB_PMP_AddressSet Function**C**

```
void PLIB_PMP_AddressSet(  
    PMP_MODULE_ID index,  
    uint32_t address  
);
```

Description

This function sets the current address of the PMP module to the specified value.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
address	Device address to be set

Returns

None.

Remarks

This function implements an operation of the AddressControl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsAddressControl](#) in your application to automatically determine whether this feature is available.

Example

```
uint8_t no_of_addressLines = 8;  
PLIB_PMP_AddressSet( PMP_ID_0, 0xff );
```

5.6.16.6.11 Enhanced Address Handling Functions

5.6.16.6.11.1 PLIB_PMP_ChipXBaseAddressSet Function

C

```
void PLIB_PMP_ChipXBaseAddressSet(  
    PMP_MODULE_ID index,  
    PMP_CHIP_SELECT chipSelect,  
    uint16_t baseAddress  
);
```

Description

This function sets the base address of the specified device.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
baseAddress	Base address of the chip
chipSelect	One of the possible values from PMP_CHIP_SELECT

Returns

None.

Remarks

This function implements an operation of the ChipXBaseAddress feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsChipXBaseAddress](#) in your application to automatically determine whether this feature is available.

Example

```
uint16_t baseAddress = 0x00FF;  
PLIB_PMP_ChipXBaseAddressSet( PMP_ID_0, PMP_CHIP_SELECT_ONE, baseAddress );
```

5.6.16.6.11.2 PLIB_PMP_ReservedAddressSpaceBitsSet Function

C

```
void PLIB_PMP_ReservedAddressSpaceBitsSet(  
    PMP_MODULE_ID index,  
    uint8_t reservedAddress  
);
```

Description

This function sets the address bits of the reserved address space of the EPMP. The reserved address space determines the end address of the Chip Select-2 (if used). If the reserved address space is set to 0, the last EDS address for the Chip Select-2 will be 0xFFFFF. For the address range to be accessible for the Chip Select-2 set the reserved address space to a value higher than Chip Select-2 base address.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
reservedAddress	The reserved address bits

Returns

None.

Remarks

This function implements an operation of the ReservedAddrSpace feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsReservedAddrSpace](#) in your application to to automatically determine whether this feature is available.

Example

```
PLIB_PMP_ReservedAddressSpaceBitsSet ( PMP_ID_0, 0xDF );
```

5.6.16.6.12 Port Configuration Functions

5.6.16.6.12.1 PLIB_PMP_AddressPortDisable Function

C

```
void PLIB_PMP_AddressPortDisable(  
    PMP_MODULE_ID index,  
    PMP_ADDRESS_PORT portfunctions  
);
```

Description

This function disables the port lines specified as PMP address lines. They function as normal I/O lines.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
portfunctions	One of the possible values from PMP_ADDRESS_PORT

Returns

None.

Remarks

This function implements an operation of the AddressPortPinControl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsAddressPortPinControl](#) in your application to to automatically determine whether this feature is available.

Example

```
//Example-1  
PMP_ADDRESS_PORT portfunctions = PMP_PMA2_TO_PMA13_PORTS;  
PLIB_PMP_AddressPortDisable( PMP_ID_0, PMP_PMA2_TO_PMA13_PORTS );  
  
//Example-2  
PLIB_PMP_AddressPortDisable( PMP_ID_0,  
    ( PMP_PMA14_PORT | PMP_PMA15_PORT ) );
```

5.6.16.6.12.2 PLIB_PMP_AddressPortEnable Function

C

```
void PLIB_PMP_AddressPortEnable(  
    PMP_MODULE_ID index,
```

```
    PMP_ADDRESS_PORT portfunctions  
);
```

Description

This function enables the port lines specified as PMP address lines.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
portfunctions	One of the possible values from PMP_ADDRESS_PORT

Returns

None.

Remarks

This function implements an operation of the AddressPortPinControl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsAddressPortPinControl](#) in your application to automatically determine whether this feature is available.

Example

```
//Example-1  
PMP_ADDRESS_PORT portfunctions = PMP_PMA2_TO_PMA13_PORTS;  
PLIB_PMP_AddressPortEnable( PMP_ID_0, PMP_PMA2_TO_PMA13_PORTS );  
  
//Example-2  
PLIB_PMP_AddressPortEnable( PMP_ID_0,  
                             ( PMP_PMA14_PORT | PMP_PMA15_PORT ) );
```

5.6.16.6.12.3 PLIB_PMP_ByteEnablePortDisable Function

C

```
void PLIB_PMP_ByteEnablePortDisable(  
    PMP_MODULE_ID index,  
    PMP_PMBE_PORT pmbeInstance  
);
```

Description

This function disables the byte enable port.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
pmbeInstance	One of the possible values from PMP_PMBE_PORT

Returns

None.

Remarks

This function implements an operation of the ExistsByteEnablePortControl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use

PLIB_PMP_ExistsExistsByteEnablePortControl in your application to to automatically determine whether this feature is available.

Example

```
PLIB_PMP_ByteEnablePortDisable( PMP_ID_0, PMBE_0 );
```

5.6.16.6.12.4 PLIB_PMP_ByteEnablePortEnable Function**C**

```
void PLIB_PMP_ByteEnablePortEnable(  
    PMP_MODULE_ID index,  
    PMP_PMBE_PORT pmbeInstance  
);
```

Description

This function enables the byte enable port.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
pmbeInstance	One of the possible values from PMP_PMBE_PORT

Returns

None.

Remarks

This function implements an operation of the ExistsByteEnablePortControl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_PMP_ExistsExistsByteEnablePortControl in your application to to automatically determine whether this feature is available.

Example

```
PLIB_PMP_ByteEnablePortEnable( PMP_ID_0, PMBE_0 );
```

5.6.16.6.12.5 PLIB_PMP_ReadWriteStrobePortDisable Function**C**

```
void PLIB_PMP_ReadWriteStrobePortDisable(  
    PMP_MODULE_ID index  
);
```

Description

This function disables the read strobe port of the PMP module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed

Returns

None.

Remarks

This function implements an operation of the ReadWriteStrobePortControl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsReadWriteStrobePortControl](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_PMP_ReadWriteStrobePortDisable( PMP_ID_0 );
```

5.6.16.6.12.6 PLIB_PMP_ReadWriteStrobePortEnable Function**C**

```
void PLIB_PMP_ReadWriteStrobePortEnable(  
    PMP_MODULE_ID index  
);
```

Description

This function enables the read strobe port of the PMP module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed

Returns

None.

Remarks

This function implements an operation of the ReadWriteStrobePortControl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsReadWriteStrobePortControl](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_PMP_ReadWriteStrobePortEnable( PMP_ID_0 );
```

5.6.16.6.12.7 PLIB_PMP_WriteEnableStrobePortDisable Function**C**

```
void PLIB_PMP_WriteEnableStrobePortDisable(  
    PMP_MODULE_ID index  
);
```

Description

This function disables the write strobe port of the PMP module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed

Returns

None.

Remarks

This function implements an operation of the WriteEnablePortControl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsWriteEnablePortControl](#) in your application to to automatically determine whether this feature is available.

Example

```
PLIB_PMP_WriteEnableStrobePortDisable( PMP_ID_0 );
```

5.6.16.6.12.8 PLIB_PMP_WriteEnableStrobePortEnable Function**C**

```
void PLIB_PMP_WriteEnableStrobePortEnable(  
    PMP_MODULE_ID index  
);
```

Description

This function enables the write strobe port of the PMP module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed

Returns

None.

Remarks

This function implements an operation of the WriteEnablePortControl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsWriteEnablePortControl](#) in your application to to automatically determine whether this feature is available.

Example

```
PLIB_PMP_WriteEnableStrobePortEnable( PMP_ID_0 );
```

5.6.16.6.13 Enhanced Port Configuration Functions**5.6.16.6.13.1 PLIB_PMP_ChipSelectXPortDisable Function****C**

```
void PLIB_PMP_ChipSelectXPortDisable(  
    PMP_MODULE_ID index,  
    PMP_CHIP_SELECT chipSelect  
);
```

Description

This function disables the specified Chip Select's port.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
chipSelect	One of the possible values from PMP_CHIP_SELECT

Returns

None.

Remarks

This function implements an operation of the CSXPortControl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsCSXPortControl](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_PMP_ChipSelectXPortDisable ( PMP_ID_0, PMP_CHIP_SELECT_ONE );
```

5.6.16.6.13.2 PLIB_PMP_ChipSelectXPortEnable Function**C**

```
void PLIB_PMP_ChipSelectXPortEnable(  
    PMP_MODULE_ID index,  
    PMP_CHIP_SELECT chipSelect  
);
```

Description

This function enables the specified Chip Select's port.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
chipSelect	One of the possible values from PMP_CHIP_SELECT

Returns

None.

Remarks

This function implements an operation of the CSXPortControl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsCSXPortControl](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_PMP_ChipSelectXPortEnable ( PMP_ID_0, PMP_CHIP_SELECT_ONE );
```

5.6.16.6.14 Polarity Configuration Functions**5.6.16.6.14.1 PLIB_PMP_AddressLatchPolaritySelect Function****C**

```
void PLIB_PMP_AddressLatchPolaritySelect(  
    PMP_MODULE_ID index,
```

```
    PMP_POLARITY_LEVEL polarity
);
```

Description

This function sets the address latch polarity to the level specified.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
polarity	Possible polarity levels

Returns

None.

Remarks

This function implements an operation of the AddressLatchPolarity feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsAddressLatchPolarity](#) in your application to to automatically determine whether this feature is available.

Example

```
PLIB_PMP_AddressLatchPolaritySelect( PMP_ID_0, PMP_POLARITY_ACTIVE_HIGH );
```

5.6.16.6.14.2 PLIB_PMP_ByteEnablePolaritySelect Function

C

```
void PLIB_PMP_ByteEnablePolaritySelect(
    PMP_MODULE_ID index,
    PMP_POLARITY_LEVEL polarity
);
```

Description

This function sets the byte enable polarity to the level specified.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
polarity	Possible polarity levels

Returns

None.

Remarks

This function implements an operation of the ByteEnablePolarity feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsByteEnablePolarity](#) in your application to to automatically determine whether this feature is available.

Example

```
PLIB_PMP_ByteEnablePolaritySelect ( PMP_ID_0, PMP_POLARITY_ACTIVE_HIGH );
```

5.6.16.6.14.3 PLIB_PMP_ChipSelectXPolaritySelect Function

C

```
void PLIB_PMP_ChipSelectXPolaritySelect(  
    PMP_MODULE_ID index,  
    PMP_CHIP_SELECT chipSelect,  
    PMP_POLARITY_LEVEL polarity  
);
```

Description

This function sets the specified Chip Select polarity to the level specified.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
chipSelect	Identifier for Chip Select
polarity	Possible polarity levels

Returns

None.

Remarks

This function implements an operation of the ChipXPolarity feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsChipXPolarity](#) in your application to automatically determine whether this feature is available.

Example

```
PMP_CHIP_SELECT chipSelect = PMP_CHIP_SELECT_ONE;  
PLIB_PMP_ChipSelectXPolaritySelect( PMP_ID_0,  
                                     chipSelect,  
                                     PMP_POLARITY_ACTIVE_HIGH );
```

5.6.16.6.14.4 PLIB_PMP_ReadWriteStrobePolaritySelect Function

C

```
void PLIB_PMP_ReadWriteStrobePolaritySelect(  
    PMP_MODULE_ID index,  
    PMP_POLARITY_LEVEL polarity  
);
```

Description

This function sets polarity of the read strobe to the level specified.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
polarity	Possible polarity levels

Returns

None.

Remarks

This function implements an operation of the ReadWritePolarity feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsReadWritePolarity](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_PMP_ReadWriteStrobePolaritySelect( PMP_ID_0, PMP_POLARITY_ACTIVE_HIGH );
```

5.6.16.6.14.5 PLIB_PMP_WriteEnableStrobePolaritySelect Function**C**

```
void PLIB_PMP_WriteEnableStrobePolaritySelect(  
    PMP_MODULE_ID index,  
    PMP_POLARITY_LEVEL polarity  
);
```

Description

This function sets the polarity of the write enable strobe to the level specified.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
polarity	Possible polarity levels

Returns

None.

Remarks

This function implements an operation of the WriteEnablePolarity feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsWriteEnablePolarity](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_PMP_WriteEnableStrobePolaritySelect( PMP_ID_0, PMP_POLARITY_ACTIVE_HIGH );
```

5.6.16.6.15 Enhanced Polarity Configuration Functions**5.6.16.6.15.1 PLIB_PMP_ChipSelectXAckPolaritySelect Function****C**

```
void PLIB_PMP_ChipSelectXAckPolaritySelect(  
    PMP_MODULE_ID index,  
    PMP_CHIP_SELECT chipSelect,  
    PMP_POLARITY_LEVEL polarity  
);
```

Description

This function sets the Chip Select acknowledge polarity to the level specified.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
chipSelect	Identifier for the Chip Select
polarity	Possible polarity levels

Returns

None.

Remarks

This function implements an operation of the ChipXACKPolarity feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsChipXACKPolarity](#) in your application to automatically determine whether this feature is available.

Example

```
PMP_CHIP_SELECT chipSelect = PMP_CHIP_SELECT_ONE;
PLIB_PMP_ChipSelectXAckPolaritySelect( PMP_ID_0,
                                       chipSelect,
                                       PMP_POLARITY_ACTIVE_LOW );
```

5.6.16.6.15.2 PLIB_PMP_ChipSelectXByteEnablePortPolaritySelect Function**C**

```
void PLIB_PMP_ChipSelectXByteEnablePortPolaritySelect(
    PMP_MODULE_ID index,
    PMP_CHIP_SELECT chipSelect,
    PMP_POLARITY_LEVEL polarity
);
```

Description

This function sets the nibble/byte enable polarity to the level specified.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
chipSelect	One of the possible values from PMP_CHIP_SELECT
polarity	Possible polarity levels

Returns

None.

Remarks

This function implements an operation of the ChipXByteEnablePolarity feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsChipXByteEnablePolarity](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_PMP_ChipSelectXByteEnablePortPolaritySelect ( PMP_ID_0,
```

```
PMP_CHIP_SELECT_ONE,  
PMP_POLARITY_ACTIVE_LOW );
```

5.6.16.6.15.3 PLIB_PMP_ChipSelectXReadWriteStrobePolaritySelect Function

C

```
void PLIB_PMP_ChipSelectXReadWriteStrobePolaritySelect(  
    PMP_MODULE_ID index,  
    PMP_CHIP_SELECT chipSelect,  
    PMP_POLARITY_LEVEL polarity  
);
```

Description

This function sets the read/write strobe polarity to the level specified.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
chipSelect	One of the possible values from PMP_CHIP_SELECT
polarity	Possible polarity levels

Returns

None.

Remarks

This function implements an operation of the ChipXReadWritePolarity feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsChipXReadWritePolarity](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_PMP_ChipSelectXReadWriteStrobePolaritySelect ( PMP_ID_0,  
                                                    PMP_CHIP_SELECT_ONE,  
                                                    PMP_POLARITY_ACTIVE_LOW );
```

5.6.16.6.15.4 PLIB_PMP_ChipSelectXWriteEnableStrobePolaritySelect Function

C

```
void PLIB_PMP_ChipSelectXWriteEnableStrobePolaritySelect(  
    PMP_MODULE_ID index,  
    PMP_CHIP_SELECT chipSelect,  
    PMP_POLARITY_LEVEL polarity  
);
```

Description

This function sets the write/enable strobe polarity to the level specified.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be addressed
chipSelect	One of the possible values from PMP_CHIP_SELECT

polarity	Possible polarity levels

Returns

None.

Remarks

This function implements an operation of the ChipXWriteEnablePolarity feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PMP_ExistsChipXWriteEnablePolarity](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_PMP_ChipSelectXWriteEnableStrobePolaritySelect ( PMP_ID_0,
                                                    PMP_CHIP_SELECT_ONE,
                                                    PMP_POLARITY_ACTIVE_LOW );
```

5.6.16.6.16 Data Types and Constants

5.6.16.6.16.1 PMP_ACK_MODE Enumeration

C

```
typedef enum {
    PMP_USE_ACK_WITH_TIMEOUT,
    PMP_USE_ACK,
    PMP_ACK_DISABLED
} PMP_ACK_MODE;
```

Description

PMP Acknowledge Modes

This data type defines the different configurations by which the PMP can be enabled.

Members

Members	Description
PMP_USE_ACK_WITH_TIMEOUT	Acknowledge used with a timeout
PMP_USE_ACK	Acknowledge is used
PMP_ACK_DISABLED	Acknowledge is not used

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.16.6.16.2 PMP_ADDRESS_HOLD_LATCH_WAIT_STATES Enumeration

C

```
typedef enum {
    PMP_ADDRESS_HOLD_ONE_AND_ONE_QUARTER,
    PMP_ADDRESS_HOLD_ONE_QUARTER
} PMP_ADDRESS_HOLD_LATCH_WAIT_STATES;
```

Description

PMP Address Latch Strobe Wait States

This data type defines the different configurations by which the PMP holds after address latch strobe wait states can be configured. Refer to the specific device data sheet for the exact clock cycle timing.

Members

Members	Description
PMP_ADDRESS_HOLD_ONE_AND_ONE_QUARTER	Data Wait of 1 1/4 Peripheral Bus Clock Cycles
PMP_ADDRESS_HOLD_ONE_QUARTER	Data Wait of 1/4 Peripheral Bus Clock Cycles

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.16.6.16.3 PMP_ADDRESS_LATCH Enumeration**C**

```
typedef enum {
    PMP_ADDRESS_LATCH_UPPER,
    PMP_ADDRESS_LATCH_HIGH,
    PMP_ADDRESS_LATCH_LOW
} PMP_ADDRESS_LATCH;
```

Description

PMP Address Latch

This data type defines the different configurations by which the PMP address latch strobes can be configured.

Members

Members	Description
PMP_ADDRESS_LATCH_UPPER	Address latch upper
PMP_ADDRESS_LATCH_HIGH	Address latch high
PMP_ADDRESS_LATCH_LOW	Address latch low

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.16.6.16.4 PMP_ADDRESS_LATCH_WAIT_STATES Enumeration**C**

```
typedef enum {
    PMP_ADDRESS_WAIT_THREE_AND_HALF,
    PMP_ADDRESS_WAIT_TWO_AND_HALF,
    PMP_ADDRESS_WAIT_ONE_AND_HALF,
    PMP_ADDRESS_WAIT_HALF
} PMP_ADDRESS_LATCH_WAIT_STATES;
```

Description

PMP Address Latch Strobe Wait States

This data type defines the different configurations by which the PMP address latch strobe wait states can be configured. Refer to the specific device data sheet for the exact clock cycle timing.

Members

Members	Description
PMP_ADDRESS_WAIT_THREE_AND_HALF	Data Wait of 3 1/2 Peripheral Bus Clock Cycles
PMP_ADDRESS_WAIT_TWO_AND_HALF	Data Wait of 2 1/2 Peripheral Bus Clock Cycles
PMP_ADDRESS_WAIT_ONE_AND_HALF	Data Wait of 1 1/2 Peripheral Bus Clock Cycles
PMP_ADDRESS_WAIT_HALF	Data Wait of 1/2 Peripheral Bus Clock Cycles

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.16.6.16.5 PMP_ADDRESS_PORT Enumeration**C**

```
typedef enum {
    PMP_PMA0_PORT,
    PMP_PMA1_PORT,
    PMP_PMA2_TO_PMA13_PORTS,
    PMP_PMA2_PORT,
    PMP_PMA3_PORT,
    PMP_PMA4_PORT,
    PMP_PMA5_PORT,
    PMP_PMA6_PORT,
    PMP_PMA7_PORT,
    PMP_PMA8_PORT,
    PMP_PMA9_PORT,
    PMP_PMA10_PORT,
    PMP_PMA11_PORT,
    PMP_PMA12_PORT,
    PMP_PMA13_PORT,
    PMP_PMA14_PORT,
    PMP_PMA15_PORT,
    PMP_PMA16_TO_PMA22_PORTS
} PMP_ADDRESS_PORT;
```

Description

PMP Address Port Pins

This data type defines the different address that can be configured by the PMP module. The user application can make each pin as a general purpose I/O or part of PMP functionality.

Members

Members	Description
PMP_PMA0_PORT	Address line 0 port (make as general purpose I/O or PMP address line)
PMP_PMA1_PORT	Address line 1 port (make as general purpose I/O or PMP address line)
PMP_PMA2_TO_PMA13_PORTS	Address line 2 to 13 ports (make as general purpose I/O or PMP address lines)
PMP_PMA2_PORT	Address line 2 port (make as general purpose I/O or PMP address line)
PMP_PMA3_PORT	Address line 3 port (make as general purpose I/O or PMP address line)
PMP_PMA4_PORT	Address line 4 port (make as general purpose I/O or PMP address line)
PMP_PMA5_PORT	Address line 5 port (make as general purpose I/O or PMP address line)
PMP_PMA6_PORT	Address line 6 port (make as general purpose I/O or PMP address line)
PMP_PMA7_PORT	Address line 7 port (make as general purpose I/O or PMP address line)
PMP_PMA8_PORT	Address line 8 port (make as general purpose I/O or PMP address line)
PMP_PMA9_PORT	Address line 9 port (make as general purpose I/O or PMP address line)
PMP_PMA10_PORT	Address line 10 port (make as general purpose I/O or PMP address line)
PMP_PMA11_PORT	Address line 11 port (make as general purpose I/O or PMP address line)
PMP_PMA12_PORT	Address line 12 port (make as general purpose I/O or PMP address line)
PMP_PMA13_PORT	Address line 13 port (make as general purpose I/O or PMP address line)
PMP_PMA14_PORT	Address line 14 port (make as general purpose I/O or PMP address line)
PMP_PMA15_PORT	Address line 15 port (make as general purpose I/O or PMP address line)
PMP_PMA16_TO_PMA22_PORTS	Address line 16 to 22 ports (make as general purpose I/O or PMP address lines)

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h). These enumerator values can be passed in a bitwise ORed fashion to select multiple ports at a time.

5.6.16.6.16.6 PMP_ALTERNATE_MASTER_WAIT_STATES Enumeration**C**

```
typedef enum {  
    PMP_ALTERNATE_MASTER_WAIT_10,  
    PMP_ALTERNATE_MASTER_WAIT_9,  
    PMP_ALTERNATE_MASTER_WAIT_8,  
    PMP_ALTERNATE_MASTER_WAIT_7,  
    PMP_ALTERNATE_MASTER_WAIT_6,  
    PMP_ALTERNATE_MASTER_WAIT_5,  
    PMP_ALTERNATE_MASTER_WAIT_4,  
    PMP_ALTERNATE_MASTER_WAIT_3  
} PMP_ALTERNATE_MASTER_WAIT_STATES;
```

Description

PMP Alternate Master Wait States

This data type defines the different configurations by which the PMP alternate master wait states can be configured.

Members

Members	Description
PMP_ALTERNATE_MASTER_WAIT_10	Wait of 10 Alternate Master Cycles
PMP_ALTERNATE_MASTER_WAIT_9	Wait of 9 Alternate Master Cycles
PMP_ALTERNATE_MASTER_WAIT_8	Wait of 8 Alternate Master Cycles
PMP_ALTERNATE_MASTER_WAIT_7	Wait of 7 Alternate Master Cycles
PMP_ALTERNATE_MASTER_WAIT_6	Wait of 6 Alternate Master Cycles
PMP_ALTERNATE_MASTER_WAIT_5	Wait of 5 Alternate Master Cycles
PMP_ALTERNATE_MASTER_WAIT_4	Wait of 4 Alternate Master Cycles
PMP_ALTERNATE_MASTER_WAIT_3	Wait of 3 Alternate Master Cycles

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.16.6.16.7 PMP_CHIP_SELECT Enumeration**C**

```
typedef enum {  
    PMP_CHIP_SELECT_ONE,  
    PMP_CHIP_SELECT_TWO  
} PMP_CHIP_SELECT;
```

Description

PMP Chip Select

This data type defines the different Chip Select lines of the PMP module.

Members

Members	Description
PMP_CHIP_SELECT_ONE	chip select One

PMP_CHIP_SELECT_TWO	chip select Two

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.16.6.16.8 PMP_CHIPSELECT_FUNCTION Enumeration**C**

```
typedef enum {
    PMCS1_AS_CHIP_SELECT,
    PMCS1_AS_ADDRESS_LINE,
    PMCS1_PMCS2_AS_ADDRESS_LINES,
    PMCS1_AS_ADDRESS_LINE_PMCS2_AS_CHIP_SELECT,
    PMCS1_AND_PMCS2_AS_CHIP_SELECT
} PMP_CHIPSELECT_FUNCTION;
```

Description

PMP Chip Select pin functions

This data type defines different functions of Chip Select pins.

Members

Members	Description
PMCS1_AS_CHIP_SELECT	CS1 used as Chip Select
PMCS1_AS_ADDRESS_LINE	CS1 used as address line
PMCS1_PMCS2_AS_ADDRESS_LINES	CS1 and CS2 used as address lines
PMCS1_AS_ADDRESS_LINE_PMCS2_AS_CHIP_SELECT	CS1 used as address line and CS2 as Chip Select
PMCS1_AND_PMCS2_AS_CHIP_SELECT	Both CS1 and CS2 used as Chip Selects

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.16.6.16.9 PMP_DATA_HOLD_STATES Enumeration**C**

```
typedef enum {
    PMP_DATA_HOLD_FOUR,
    PMP_DATA_HOLD_THREE,
    PMP_DATA_HOLD_TWO,
    PMP_DATA_HOLD_ONE
} PMP_DATA_HOLD_STATES;
```

Description

PMP Data Hold after strobe wait state

This data type defines the different data Hold after strobe wait states.

Members

Members	Description
PMP_DATA_HOLD_FOUR	Data Hold of 4 Peripheral Bus Clock Cycles
PMP_DATA_HOLD_THREE	Data Hold of 3 Peripheral Bus Clock Cycles
PMP_DATA_HOLD_TWO	Data Hold of 2 Peripheral Bus Clock Cycles
PMP_DATA_HOLD_ONE	Data Hold of 1 Peripheral Bus Clock Cycles

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.16.6.16.10 PMP_DATA_LENGTH Enumeration**C**

```
typedef enum {  
    PMP_DATA_8_BITS,  
    PMP_DATA_16_BITS,  
    PMP_DATA_32_BITS  
} PMP_DATA_LENGTH;
```

Description

PMP data length

This data type defines the possible data lengths handled by the PMP module.

Members

Members	Description
PMP_DATA_8_BITS	8-bit data length
PMP_DATA_16_BITS	16-bit data length
PMP_DATA_32_BITS	32-bit data length

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.16.6.16.11 PMP_DATA_SIZE Enumeration**C**

```
typedef enum {  
    PMP_DATA_SIZE_SIXTEEN_BITS,  
    PMP_DATA_SIZE_EIGHT_BITS,  
    PMP_DATA_SIZE_FOUR_BITS  
} PMP_DATA_SIZE;
```

Description

PMP DATA Size

This data type defines the different configurations for the data lengths handled by the PMP module.

Members

Members	Description
PMP_DATA_SIZE_SIXTEEN_BITS	Data length of 16-bits
PMP_DATA_SIZE_EIGHT_BITS	Data length of 8-bits
PMP_DATA_SIZE_FOUR_BITS	Data length of 4-bits

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.16.6.16.12 PMP_DATA_WAIT_STATES Enumeration**C**

```
typedef enum {
```

```

PMP_DATA_WAIT_FOUR,
PMP_DATA_WAIT_THREE,
PMP_DATA_WAIT_TWO,
PMP_DATA_WAIT_ONE
} PMP_DATA_WAIT_STATES;

```

Description

PMP Data setup to read/write/address phase wait state configuration

This data type defines the different wait state configurations for setup to read/write/address phase.

Members

Members	Description
PMP_DATA_WAIT_FOUR	Data Wait of 4 Peripheral Bus Clock Cycles
PMP_DATA_WAIT_THREE	Data Wait of 3 Peripheral Bus Clock Cycles
PMP_DATA_WAIT_TWO	Data Wait of 2 Peripheral Bus Clock Cycles
PMP_DATA_WAIT_ONE	Data Wait of 1 Peripheral Bus Clock Cycles

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.16.6.16.13 PMP_INCREMENT_MODE Enumeration**C**

```

typedef enum {
    PMP_BUFFERS_AUTO_INCREMENT,
    PMP_ADDRESS_AUTO_DECREMENT,
    PMP_ADDRESS_AUTO_INCREMENT,
    PMP_ADDRESS_INCREMENT_DECREMENT_DISABLE
} PMP_INCREMENT_MODE;

```

Description

PMP Increment Modes

This data type defines the different configurations by which the PMP address incrementing can be configured.

Members

Members	Description
PMP_BUFFERS_AUTO_INCREMENT	Read and write buffers auto-increment
PMP_ADDRESS_AUTO_DECREMENT	Decrement PMP Address by one every read/write cycle
PMP_ADDRESS_AUTO_INCREMENT	Increment PMP Address by one every read/write cycle
PMP_ADDRESS_INCREMENT_DECREMENT_DISABLE	PMP Address does not change

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.16.6.16.14 PMP_INPUT_BUFFER_TYPE Enumeration**C**

```

typedef enum {
    PMP_INPUT_BUFFER_TTL,
    PMP_INPUT_BUFFER_SCHMITT
} PMP_INPUT_BUFFER_TYPE;

```

Description

PMP Input Buffers type

This data type defines the input buffer types.

Members

Members	Description
PMP_INPUT_BUFFER_TTL	TTL input buffer
PMP_INPUT_BUFFER_SCHMITT	schmitt trigger input buffer

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.16.6.16.15 PMP_INTERRUPT_MODE Enumeration**C**

```
typedef enum {
    PMP_INTERRUPT_BUFFER_3_IS_ACCESSED,
    PMP_INTERRUPT_EVERY_RW_CYCLE,
    PMP_INTERRUPT_NONE
} PMP_INTERRUPT_MODE;
```

Description

PMP Interrupt Mode

This data type defines the different configurations by which the PMP can be configured for interrupt requests.

Members

Members	Description
PMP_INTERRUPT_BUFFER_3_IS_ACCESSED	Interrupt generated when Read/Write Buffer 3 is read/written
PMP_INTERRUPT_EVERY_RW_CYCLE	Interupt Occurs Every Read/Write Cycle
PMP_INTERRUPT_NONE	No interrupt generated

Remarks

None.

5.6.16.6.16.16 PMP_MASTER_MODE Enumeration**C**

```
typedef enum {
    PMP_ALTERNATE_MASTER_DIRECT,
    PMP_ALTERNATE_MASTER,
    PMP_CPU_MASTER
} PMP_MASTER_MODE;
```

Description

PMP Master Modes

This data type defines the different configurations by which the PMP can be enabled.

Members

Members	Description
PMP_ALTERNATE_MASTER_DIRECT	Alternate Master has PMP control with Direct I/O access
PMP_ALTERNATE_MASTER	Alternate Master has PMP control

PMP_CPU_MASTER	CPU has PMP control

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.16.6.16.17 PMP_MODULE_ID Enumeration**C**

```
typedef enum {
    PMP_ID_0
} PMP_MODULE_ID;
```

Description

PMP module ID

This data type defines the possible instances of the PMP module.

Members

Members	Description
PMP_ID_0	first instance of the PMP

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.16.6.16.18 PMP_MUX_MODE Enumeration**C**

```
typedef enum {
    PMP_MUX_ADDRESS_PHASES_3,
    PMP_MUX_ADDRESS_PHASES_2,
    PMP_MUX_ADDRESS_PHASES_1,
    PMP_MUX_LINES_16_ADDRESS_16_DATA,
    PMP_MUX_LINES_16_ADDRESS_8_DATA,
    PMP_MUX_LINES_8_ADDRESS_8_DATA,
    PMP_MUX_NONE
} PMP_MUX_MODE;
```

Description

PMP Multiplex Modes

This data type defines the different configurations by which the PMP can be enabled.

Members

Members	Description
PMP_MUX_ADDRESS_PHASES_3	Lower address bits are multiplexed with data bits using 3 address phase
PMP_MUX_ADDRESS_PHASES_2	Lower address bits are multiplexed with data bits using 2 address phases
PMP_MUX_ADDRESS_PHASES_1	Lower address bits are multiplexed with data bits using 1 address phase
PMP_MUX_LINES_16_ADDRESS_16_DATA	16 address lines are multiplexed on 16 data lines
PMP_MUX_LINES_16_ADDRESS_8_DATA	16 address lines multiplexed on 8 data lines
PMP_MUX_LINES_8_ADDRESS_8_DATA	8 bits of address is multiplexed on 8 data lines
PMP_MUX_NONE	No multiplexing of address and data lines

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.16.6.16.19 PMP_OPERATION_MODE Enumeration

C

```
typedef enum {  
    PMP_MASTER_READ_WRITE_STROBES_MULTIPLEXED,  
    PMP_MASTER_READ_WRITE_STROBES_INDEPENDENT,  
    PMP_BUFFERED_SLAVE,  
    PMP_ENHANCED_SLAVE,  
    PMP_LEGACY_SLAVE  
} PMP_OPERATION_MODE;
```

Description

PMP Operation Modes

This data type defines the different configurations by which the PMP can be enabled.

Members

Members	Description
PMP_MASTER_READ_WRITE_STROBES_MULTIPLEXED	Master mode 1, the read and the write strobes share a single line. The enable strobe is used to decode the info sent on read/write strobe line
PMP_MASTER_READ_WRITE_STROBES_INDEPENDENT	Master mode 2, the read and write strobes are on independent lines
PMP_BUFFERED_SLAVE	Buffered Slave mode
PMP_ENHANCED_SLAVE	Enhanced Slave mode
PMP_LEGACY_SLAVE	Legacy Parallel Slave mode

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.16.6.16.20 PMP_PMBE_PORT Enumeration

C

```
typedef enum {  
    PMBE_0,  
    PMBE_1  
} PMP_PMBE_PORT;
```

Description

PMP Byte Enable port.

This data type defines the available Byte Enable ports.

Members

Members	Description
PMBE_0	Byte Enable Port-0
PMBE_1	Byte Enable Port-1

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.16.6.16.21 PMP_POLARITY_LEVEL Enumeration

C

```
typedef enum {
    PMP_POLARITY_ACTIVE_HIGH,
    PMP_POLARITY_ACTIVE_LOW
} PMP_POLARITY_LEVEL;
```

Description

PMP Pins Polarity

This data type defines the possible polarity levels for the PMP pins.

Members

Members	Description
PMP_POLARITY_ACTIVE_HIGH	Active high polarity
PMP_POLARITY_ACTIVE_LOW	Active low polarity

Remarks

None.

5.6.16.6.16.22 PMP_STROBE_WAIT_STATES Enumeration

C

```
typedef enum {
    PMP_STROBE_WAIT_FIFTEEN,
    PMP_STROBE_WAIT_FOURTEEN,
    PMP_STROBE_WAIT_THIRTEEN,
    PMP_STROBE_WAIT_TWELVE,
    PMP_STROBE_WAIT_ELEVEN,
    PMP_STROBE_WAIT_TEN,
    PMP_STROBE_WAIT_NINE,
    PMP_STROBE_WAIT_EIGHT,
    PMP_STROBE_WAIT_SEVEN,
    PMP_STROBE_WAIT_SIX,
    PMP_STROBE_WAIT_FIVE,
    PMP_STROBE_WAIT_FOUR,
    PMP_STROBE_WAIT_THREE,
    PMP_STROBE_WAIT_TWO,
    PMP_STROBE_WAIT_ONE,
    PMP_STROBE_WAIT_NONE
} PMP_STROBE_WAIT_STATES;
```

Description

PMP Read to Byte enable strobe configuration

This data type defines the different configurations by which the PMP strobe wait signal time can be configured.

Members

Members	Description
PMP_STROBE_WAIT_FIFTEEN	Strobe Wait of 15 Peripheral Bus Clock Cycles
PMP_STROBE_WAIT_FOURTEEN	Strobe Wait of 14 Peripheral Bus Clock Cycles
PMP_STROBE_WAIT_THIRTEEN	Strobe Wait of 13 Peripheral Bus Clock Cycles
PMP_STROBE_WAIT_TWELVE	Strobe Wait of 12 Peripheral Bus Clock Cycles
PMP_STROBE_WAIT_ELEVEN	Strobe Wait of 11 Peripheral Bus Clock Cycles
PMP_STROBE_WAIT_TEN	Strobe Wait of 10 Peripheral Bus Clock Cycles

PMP_STROBE_WAIT_NINE	Strobe Wait of 9 Peripheral Bus Clock Cycles
PMP_STROBE_WAIT_EIGHT	Strobe Wait of 8 Peripheral Bus Clock Cycles
PMP_STROBE_WAIT_SEVEN	Strobe Wait of 7 Peripheral Bus Clock Cycles
PMP_STROBE_WAIT_SIX	Strobe Wait of 6 Peripheral Bus Clock Cycles
PMP_STROBE_WAIT_FIVE	Strobe Wait of 5 Peripheral Bus Clock Cycles
PMP_STROBE_WAIT_FOUR	Strobe Wait of 4 Peripheral Bus Clock Cycles
PMP_STROBE_WAIT_THREE	Strobe Wait of 3 Peripheral Bus Clock Cycles
PMP_STROBE_WAIT_TWO	Strobe Wait of 2 Peripheral Bus Clock Cycles
PMP_STROBE_WAIT_ONE	Strobe Wait of 1 Peripheral Bus Clock Cycles
PMP_STROBE_WAIT_NONE	No wait states

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.16.6.17 Feature Existence Functions

5.6.16.6.17.1 PLIB_PMP_ExistsAddressControl Function

C

```
bool PLIB_PMP_ExistsAddressControl(
    PMP_MODULE_ID index
);
```

Description

This interface identifies that the AddressControl feature is available on the PMP module. When this interface returns true, these functions are supported on the device:

- [PLIB_PMP_AddressSet](#)
- [PLIB_PMP_AddressLinesA0A1Set](#)
- [PLIB_PMP_AddressLinesA0A1Get](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The AddressControl feature is supported on the device
- false - The AddressControl feature is not supported on the device

Remarks

None.

5.6.16.6.17.2 PLIB_PMP_ExistsAddressLatchPolarity Function

C

```
bool PLIB_PMP_ExistsAddressLatchPolarity(
    PMP_MODULE_ID index
);
```

```
);
```

Description

This interface identifies that the AddressLatchPolarity feature is available on the PMP module. When this interface returns true, this function is supported on the device:

- [PLIB_PMP_AddressLatchPolaritySelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The AddressLatchPolarity feature is supported on the device
- false - The AddressLatchPolarity feature is not supported on the device

Remarks

None.

5.6.16.6.17.3 PLIB_PMP_ExistsAddressLatchStrobePortControl Function

C

```
bool PLIB_PMP_ExistsAddressLatchStrobePortControl(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the AddressLatchStrobePortControl feature is available on the PMP module. When this interface returns true, these functions are supported on the device:

- [PLIB_PMP_AddressLatchStrobeEnable](#)
- [PLIB_PMP_AddressLatchStrobeDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The AddressLatchStrobePortControl feature is supported on the device
- false - The AddressLatchStrobePortControl feature is not supported on the device

Remarks

None.

5.6.16.6.17.4 PLIB_PMP_ExistsAddressPortPinControl Function

C

```
bool PLIB_PMP_ExistsAddressPortPinControl(  

```

```
    PMP_MODULE_ID index
);
```

Description

This interface identifies that the AddressPortPinControl feature is available on the PMP module. When this interface returns true, these functions are supported on the device:

- [PLIB_PMP_AddressPortEnable](#)
- [PLIB_PMP_AddressPortDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The AddressPortPinControl feature is supported on the device
- false - The AddressPortPinControl feature is not supported on the device

Remarks

None.

5.6.16.6.17.5 PLIB_PMP_ExistsAltMasterRequest Function

C

```
bool PLIB_PMP_ExistsAltMasterRequest(
    PMP_MODULE_ID index
);
```

Description

This interface identifies that the AltMasterRequest feature is available on the PMP module. When this interface returns true, these functions are supported on the device:

- [PLIB_PMP_AlternateMasterRequestStatus](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The AltMasterRequest feature is supported on the device
- false - The AltMasterRequest feature is not supported on the device

Remarks

None.

5.6.16.6.17.6 PLIB_PMP_ExistsBufferOverflow Function

C

```
bool PLIB_PMP_ExistsBufferOverflow(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the BufferOverflow feature is available on the PMP module. When this interface returns true, these functions are supported on the device:

- [PLIB_PMP_InputOverflowHasOccurred](#)
- [PLIB_PMP_InputOverflowClear](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The BufferOverflow feature is supported on the device
- false - The BufferOverflow feature is not supported on the device

Remarks

None.

5.6.16.6.17.7 PLIB_PMP_ExistsBufferRead Function

C

```
bool PLIB_PMP_ExistsBufferRead(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the BufferRead feature is available on the PMP module. When this interface returns true, this function is supported on the device:

- [PLIB_PMP_InputBufferXByteReceive](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The BufferRead feature is supported on the device
- false - The BufferRead feature is not supported on the device

Remarks

None.

5.6.16.6.17.8 PLIB_PMP_ExistsBufferType Function

C

```
bool PLIB_PMP_ExistsBufferType(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the BufferType feature is available on the PMP module. When this interface returns true, these functions are supported on the device:

- [PLIB_PMP_InputBufferTypeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The BufferType feature is supported on the device
- false - The BufferType feature is not supported on the device

Remarks

None.

5.6.16.6.17.9 PLIB_PMP_ExistsBufferUnderFlow Function

C

```
bool PLIB_PMP_ExistsBufferUnderFlow(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the BufferUnderFlow feature is available on the PMP module. When this interface returns true, these functions are supported on the device:

- [PLIB_PMP_OutputUnderflowHasOccurred](#)
- [PLIB_PMP_OutputUnderflowClear](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The BufferUnderFlow feature is supported on the device
- false - The BufferUnderFlow feature is not supported on the device

Remarks

None.

5.6.16.6.17.10 PLIB_PMP_ExistsBufferWrite Function

C

```
bool PLIB_PMP_ExistsBufferWrite(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the BufferWrite feature is available on the PMP module. When this interface returns true, these functions are supported on the device:

- [PLIB_PMP_OutputBufferXByteSend](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The BufferWrite feature is supported on the device
- false - The BufferWrite feature is not supported on the device

Remarks

None.

5.6.16.6.17.11 PLIB_PMP_ExistsBusKeeper Function

C

```
bool PLIB_PMP_ExistsBusKeeper(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the BusKeeper feature is available on the PMP module. When this interface returns true, these functions are supported on the device:

- [PLIB_PMP_BusKeeperEnable](#)
- [PLIB_PMP_BusKeeperDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The BusKeeper feature is supported on the device
- false - The BusKeeper feature is not supported on the device

Remarks

None.

5.6.16.6.17.12 PLIB_PMP_ExistsBusyStatus Function

C

```
bool PLIB_PMP_ExistsBusyStatus(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the BusyStatus feature is available on the PMP module. When this interface returns true, this function is supported on the device:

- [PLIB_PMP_PortsBusy](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The BusyStatus feature is supported on the device
- false - The BusyStatus feature is not supported on the device

Remarks

None.

5.6.16.6.17.13 PLIB_PMP_ExistsByteEnablePolarity Function

C

```
bool PLIB_PMP_ExistsByteEnablePolarity(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the ByteEnablePolarity feature is available on the PMP module. When this interface returns true, this function is supported on the device:

- [PLIB_PMP_ByteEnablePolaritySelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ByteEnablePolarity feature is supported on the device
- false - The ByteEnablePolarity feature is not supported on the device

Remarks

None.

5.6.16.6.17.14 PLIB_PMP_ExistsByteEnablePortControl Function

C

```
bool PLIB_PMP_ExistsByteEnablePortControl(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the ByteEnablePortControl feature is available on the PMP module. When this interface returns true, these functions are supported on the device:

- [PLIB_PMP_ByteEnablePortEnable](#)
- [PLIB_PMP_ByteEnablePortDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ByteEnablePortControl feature is supported on the device
- false - The ByteEnablePortControl feature is not supported on the device

Remarks

None.

5.6.16.6.17.15 PLIB_PMP_ExistsChipSelectEnable Function

C

```
bool PLIB_PMP_ExistsChipSelectEnable(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the ChipSelectEnable feature is available on the PMP module. When this interface returns true, these functions are supported on the device:

- [PLIB_PMP_ChipSelectXEnable](#)
- [PLIB_PMP_ChipSelectXDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChipSelectEnable feature is supported on the device
- false - The ChipSelectEnable feature is not supported on the device

Remarks

None.

5.6.16.6.17.16 PLIB_PMP_ExistsChipSelectoperation Function**C**

```
bool PLIB_PMP_ExistsChipSelectoperation(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the ChipSelectoperation feature is available on the PMP module. When this interface returns true, this function is supported on the device:

- [PLIB_PMP_ChipSelectFunctionSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChipSelectoperation feature is supported on the device
- false - The ChipSelectoperation feature is not supported on the device

Remarks

None.

5.6.16.6.17.17 PLIB_PMP_ExistsChipXACKMode Function**C**

```
bool PLIB_PMP_ExistsChipXACKMode(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the ChipXACKMode feature is available on the PMP module. When this interface returns true, this function is supported on the device:

- [PLIB_PMP_ChipXAckModeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChipXACKMode feature is supported on the device
- false - The ChipXACKMode feature is not supported on the device

Remarks

None.

5.6.16.6.17.18 PLIB_PMP_ExistsChipXACKPolarity Function**C**

```
bool PLIB_PMP_ExistsChipXACKPolarity(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the ChipXACKPolarity feature is available on the PMP module. When this interface returns true, this function is supported on the device:

- [PLIB_PMP_ChipSelectXAckPolaritySelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChipXACKPolarity feature is supported on the device
- false - The ChipXACKPolarity feature is not supported on the device

Remarks

None.

5.6.16.6.17.19 PLIB_PMP_ExistsChipXAltMasterWaitStates Function**C**

```
bool PLIB_PMP_ExistsChipXAltMasterWaitStates(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the ChipXAltMasterWaitStates feature is available on the PMP module. When this interface returns true, this function is supported on the device:

- [PLIB_PMP_ChipXWaitStatesAlternateMasterSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChipXAltMasterWaitStates feature is supported on the device
- false - The ChipXAltMasterWaitStates feature is not supported on the device

Remarks

None.

5.6.16.6.17.20 PLIB_PMP_ExistsChipXBaseAddress Function**C**

```
bool PLIB_PMP_ExistsChipXBaseAddress(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the ChipXBaseAddress feature is available on the PMP module. When this interface returns true, this function is supported on the device:

- [PLIB_PMP_ChipXBaseAddressSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChipXBaseAddress feature is supported on the device
- false - The ChipXBaseAddress feature is not supported on the device

Remarks

None.

5.6.16.6.17.21 PLIB_PMP_ExistsChipXByteEnablePolarity Function**C**

```
bool PLIB_PMP_ExistsChipXByteEnablePolarity(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the ChipXByteEnablePolarity feature is available on the PMP module. When this interface returns true, this function is supported on the device:

- [PLIB_PMP_ChipSelectXByteEnablePortPolaritySelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChipXByteEnablePolarity feature is supported on the device
- false - The ChipXByteEnablePolarity feature is not supported on the device

Remarks

None.

5.6.16.6.17.22 PLIB_PMP_ExistsChipXDataHoldWaitStates Function**C**

```
bool PLIB_PMP_ExistsChipXDataHoldWaitStates(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the ChipXDataHoldWaitStates feature is available on the PMP module. When this interface returns true, this function is supported on the device:

- [PLIB_PMP_ChipXWaitStatesDataHoldSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChipXDataHoldWaitStates feature is supported on the device
- false - The ChipXDataHoldWaitStates feature is not supported on the device

Remarks

None.

5.6.16.6.17.23 PLIB_PMP_ExistsChipXDataSetupWaitStates Function**C**

```
bool PLIB_PMP_ExistsChipXDataSetupWaitStates(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the ChipXDataSetupWaitStates feature is available on the PMP module. When this interface returns true, this function is supported on the device:

- [PLIB_PMP_ChipXWaitStatesDataSetupSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChipXDataSetupWaitStates feature is supported on the device
- false - The ChipXDataSetupWaitStates feature is not supported on the device

Remarks

None.

5.6.16.6.17.24 PLIB_PMP_ExistsChipXDataSize Function**C**

```
bool PLIB_PMP_ExistsChipXDataSize(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the ChipXDataSize feature is available on the PMP module. When this interface returns true, this function is supported on the device:

- [PLIB_PMP_ChipXDataSizeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChipXDataSize feature is supported on the device
- false - The ChipXDataSize feature is not supported on the device

Remarks

None.

5.6.16.6.17.25 PLIB_PMP_ExistsChipXEnableStrobeSelect Function**C**

```
bool PLIB_PMP_ExistsChipXEnableStrobeSelect(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the ChipXEnableStrobeSelect feature is available on the PMP module. When this interface returns true, these functions are supported on the device:

- [PLIB_PMP_ChipSelectXEnableStrobeSelect](#)
- [PLIB_PMP_ChipSelectXEnableStrobeDeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChipXEnableStrobeSelect feature is supported on the device

- false - The ChipXEnableStrobeSelect feature is not supported on the device

Remarks

None.

5.6.16.6.17.26 PLIB_PMP_ExistsChipXPolarity Function**C**

```
bool PLIB_PMP_ExistsChipXPolarity(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the ChipXPolarity feature is available on the PMP module. When this interface returns true, this function is supported on the device:

- [PLIB_PMP_ChipSelectXPolaritySelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChipXPolarity feature is supported on the device
- false - The ChipXPolarity feature is not supported on the device

Remarks

None.

5.6.16.6.17.27 PLIB_PMP_ExistsChipXReadWritePolarity Function**C**

```
bool PLIB_PMP_ExistsChipXReadWritePolarity(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the ChipXReadWritePolarity feature is available on the PMP module. When this interface returns true, this function is supported on the device:

- [PLIB_PMP_ChipSelectXReadWriteStrobePolaritySelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChipXReadWritePolarity feature is supported on the device
- false - The ChipXReadWritePolarity feature is not supported on the device

Remarks

None.

5.6.16.6.17.28 PLIB_PMP_ExistsChipXStrobeWaitStates Function**C**

```
bool PLIB_PMP_ExistsChipXStrobeWaitStates(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the ChipXStrobeWaitStates feature is available on the PMP module. When this interface returns true, this function is supported on the device:

- [PLIB_PMP_ChipXWaitStatesStrobeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChipXStrobeWaitStates feature is supported on the device
- false - The ChipXStrobeWaitStates feature is not supported on the device

Remarks

None.

5.6.16.6.17.29 PLIB_PMP_ExistsChipXWriteEnablePolarity Function**C**

```
bool PLIB_PMP_ExistsChipXWriteEnablePolarity(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the ChipXWriteEnablePolarity feature is available on the PMP module. When this interface returns true, this function is supported on the device:

- [PLIB_PMP_ChipSelectXWriteEnableStrobePolaritySelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChipXWriteEnablePolarity feature is supported on the device
- false - The ChipXWriteEnablePolarity feature is not supported on the device

Remarks

None.

5.6.16.6.17.30 PLIB_PMP_ExistsCSXActiveStatus Function**C**

```
bool PLIB_PMP_ExistsCSXActiveStatus(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the CSXActiveStatus feature is available on the PMP module. When this interface returns true, this function is supported on the device:

- [PLIB_PMP_ChipSelectXIsActive](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The CSXActiveStatus feature is supported on the device
- false - The CSXActiveStatus feature is not supported on the device

Remarks

None.

5.6.16.6.17.31 PLIB_PMP_ExistsCSXPortControl Function**C**

```
bool PLIB_PMP_ExistsCSXPortControl(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the CSXPortControl feature is available on the PMP module. When this interface returns true, these functions are supported on the device:

- [PLIB_PMP_ChipSelectXPortEnable](#)
- [PLIB_PMP_ChipSelectXPortDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The CSXPortControl feature is supported on the device

- false - The CSXPortControl feature is not supported on the device

Remarks

None.

5.6.16.6.17.32 PLIB_PMP_ExistsCurrentMaster Function**C**

```
bool PLIB_PMP_ExistsCurrentMaster(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the CurrentMaster feature is available on the PMP module. When this interface returns true, these functions are supported on the device:

- [PLIB_PMP_AlternateMasterHasAccess](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The CurrentMaster feature is supported on the device
- false - The CurrentMaster feature is not supported on the device

Remarks

None.

5.6.16.6.17.33 PLIB_PMP_ExistsDataHoldWaitStates Function**C**

```
bool PLIB_PMP_ExistsDataHoldWaitStates(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the DataHoldWaitStates feature is available on the PMP module. When this interface returns true, this function is supported on the device:

- [PLIB_PMP_WaitStatesDataHoldSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The DataHoldWaitStates feature is supported on the device
- false - The DataHoldWaitStates feature is not supported on the device

Remarks

None.

5.6.16.6.17.34 PLIB_PMP_ExistsDataSetUpWaitStates Function**C**

```
bool PLIB_PMP_ExistsDataSetUpWaitStates(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the DataSetUpWaitStates feature is available on the PMP module. When this interface returns true, this function is supported on the device:

- [PLIB_PMP_WaitStatesDataSetUpSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The DataSetUpWaitStates feature is supported on the device
- false - The DataSetUpWaitStates feature is not supported on the device

Remarks

None.

5.6.16.6.17.35 PLIB_PMP_ExistsDataStrobeWaitStates Function**C**

```
bool PLIB_PMP_ExistsDataStrobeWaitStates(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the DataStrobeWaitStates feature is available on the PMP module. When this interface returns true, this function is supported on the device:

- [PLIB_PMP_WaitStatesStrobeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The DataStrobeWaitStates feature is supported on the device
- false - The DataStrobeWaitStates feature is not supported on the device

Remarks

None.

5.6.16.6.17.36 PLIB_PMP_ExistsDataTransferSize Function**C**

```
bool PLIB_PMP_ExistsDataTransferSize(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the DataTransferSize feature is available on the PMP module. When this interface returns true, this function is supported on the device:

- [PLIB_PMP_DataSizeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The DataTransferSize feature is supported on the device
- false - The DataTransferSize feature is not supported on the device

Remarks

None.

5.6.16.6.17.37 PLIB_PMP_ExistsEnableControl Function**C**

```
bool PLIB_PMP_ExistsEnableControl(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the EnableControl feature is available on the PMP module. When this interface returns true, these functions are supported on the device:

- [PLIB_PMP_Disable](#)
- [PLIB_PMP_Enable](#)
- [PLIB_PMP_IsEnabled](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The EnableControl feature is supported on the device
- false - The EnableControl feature is not supported on the device

Remarks

None.

5.6.16.6.17.38 PLIB_PMP_ExistsEnhancedMasterMode Function**C**

```
bool PLIB_PMP_ExistsEnhancedMasterMode(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the EnhancedMasterMode feature is available on the PMP module. When this interface returns true, these functions are supported on the device:

- [PLIB_PMP_EnhancedMasterModeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The EnhancedMasterMode feature is supported on the device
- false - The EnhancedMasterMode feature is not supported on the device

Remarks

None.

5.6.16.6.17.39 PLIB_PMP_ExistsIncrementMode Function**C**

```
bool PLIB_PMP_ExistsIncrementMode(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the IncrementMode feature is available on the PMP module. When this interface returns true, these functions are supported on the device:

- [PLIB_PMP_AddressIncrementModeSelect](#)
- [PLIB_PMP_AddressIncrementModeGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The IncrementMode feature is supported on the device
- false - The IncrementMode feature is not supported on the device

Remarks

None.

5.6.16.6.17.40 PLIB_PMP_ExistsInputBufferFull Function**C**

```
bool PLIB_PMP_ExistsInputBufferFull(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the InputBufferFull feature is available on the PMP module. When this interface returns true, this function is supported on the device:

- [PLIB_PMP_InputBuffersAreFull](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The InputBufferFull feature is supported on the device
- false - The InputBufferFull feature is not supported on the device

Remarks

None.

5.6.16.6.17.41 PLIB_PMP_ExistsInputBufferXStatus Function**C**

```
bool PLIB_PMP_ExistsInputBufferXStatus(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the InputBufferXStatus feature is available on the PMP module. When this interface returns true, these functions are supported on the device:

- [PLIB_PMP_InputBufferXIsFull](#)
- [PLIB_PMP_IsDataReceived](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The InputBufferXStatus feature is supported on the device
- false - The InputBufferXStatus feature is not supported on the device

Remarks

None.

5.6.16.6.17.42 PLIB_PMP_ExistsInterruptMode Function**C**

```
bool PLIB_PMP_ExistsInterruptMode(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the InterruptMode feature is available on the PMP module. When this interface returns true, this function is supported on the device:

- [PLIB_PMP_InterruptModeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The InterruptMode feature is supported on the device
- false - The InterruptMode feature is not supported on the device

Remarks

None.

5.6.16.6.17.43 PLIB_PMP_ExistsMasterRXTX Function**C**

```
bool PLIB_PMP_ExistsMasterRXTX(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the MasterRXTX feature is available on the PMP module. When this interface returns true, these functions are supported on the device:

- [PLIB_PMP_MasterSend](#)

- [PLIB_PMP_MasterReceive](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The MasterRXTX feature is supported on the device
- false - The MasterRXTX feature is not supported on the device

Remarks

None.

5.6.16.6.17.44 PLIB_PMP_ExistsMUXModeSelect Function**C**

```
bool PLIB_PMP_ExistsMUXModeSelect(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the MUXModeSelect feature is available on the PMP module. When this interface returns true, these functions are supported on the device:

- [PLIB_PMP_MultiplexModeSelect](#)
- [PLIB_PMP_MultiplexModeGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The MUXModeSelect feature is supported on the device
- false - The MUXModeSelect feature is not supported on the device

Remarks

None.

5.6.16.6.17.45 PLIB_PMP_ExistsOperationMode Function**C**

```
bool PLIB_PMP_ExistsOperationMode(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the OperationMode feature is available on the PMP module. When this interface returns true, these functions are supported on the device:

- [PLIB_PMP_OperationModeSelect](#)
- [PLIB_PMP_OperationModeGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The OperationMode feature is supported on the device
- false - The OperationMode feature is not supported on the device

Remarks

None.

5.6.16.6.17.46 PLIB_PMP_ExistsOutPutBufferEmpty Function**C**

```
bool PLIB_PMP_ExistsOutPutBufferEmpty(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the OutPutBufferEmpty feature is available on the PMP module. When this interface returns true, this function is supported on the device:

- [PLIB_PMP_OutputBuffersAreEmpty](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The OutPutBufferEmpty feature is supported on the device
- false - The OutPutBufferEmpty feature is not supported on the device

Remarks

None.

5.6.16.6.17.47 PLIB_PMP_ExistsOutputBufferXStatus Function**C**

```
bool PLIB_PMP_ExistsOutputBufferXStatus(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the OutputBufferXStatus feature is available on the PMP module. When this interface returns true, these functions are supported on the device:

- [PLIB_PMP_OutputBufferXIsEmpty](#)
- [PLIB_PMP_IsDataTransmitted](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The OutputBufferXStatus feature is supported on the device
- false - The OutputBufferXStatus feature is not supported on the device

Remarks

None.

5.6.16.6.17.48 PLIB_PMP_ExistsReadWritePolarity Function

C

```
bool PLIB_PMP_ExistsReadWritePolarity(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the ReadWritePolarity feature is available on the PMP module. When this interface returns true, this function is supported on the device:

- [PLIB_PMP_ReadWriteStrobePolaritySelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ReadWritePolarity feature is supported on the device
- false - The ReadWritePolarity feature is not supported on the device

Remarks

None.

5.6.16.6.17.49 PLIB_PMP_ExistsReadWriteStrobePortControl Function

C

```
bool PLIB_PMP_ExistsReadWriteStrobePortControl(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the ReadWriteStrobePortControl feature is available on the PMP module. When this interface returns true, these functions are supported on the device:

- [PLIB_PMP_ReadWriteStrobePortEnable](#)
- [PLIB_PMP_ReadWriteStrobePortDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ReadWriteStrobePortControl feature is supported on the device
- false - The ReadWriteStrobePortControl feature is not supported on the device

Remarks

None.

5.6.16.6.17.50 PLIB_PMP_ExistsReservedAddrSpace Function**C**

```
bool PLIB_PMP_ExistsReservedAddrSpace(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the ReservedAddrSpace feature is available on the PMP module. When this interface returns true, these functions are supported on the device:

- [PLIB_PMP_ReservedAddressSpaceBitsSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ReservedAddrSpace feature is supported on the device
- false - The ReservedAddrSpace feature is not supported on the device

Remarks

None.

5.6.16.6.17.51 PLIB_PMP_ExistsSlaveRX Function**C**

```
bool PLIB_PMP_ExistsSlaveRX(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the SlaveRX feature is available on the PMP module. When this interface returns true, this function is supported on the device:

- [PLIB_PMP_SlaveReceive](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The SlaveRX feature is supported on the device
- false - The SlaveRX feature is not supported on the device

Remarks

None.

5.6.16.6.17.52 PLIB_PMP_ExistsSlaveTX Function**C**

```
bool PLIB_PMP_ExistsSlaveTX(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the SlaveTX feature is available on the PMP module. When this interface returns true, this function is supported on the device:

- [PLIB_PMP_SlaveSend](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The SlaveTX feature is supported on the device
- false - The SlaveTX feature is not supported on the device

Remarks

None.

5.6.16.6.17.53 PLIB_PMP_ExistsSmartAddress Function**C**

```
bool PLIB_PMP_ExistsSmartAddress(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the SmartAddress feature is available on the PMP module. When this interface returns true, these functions are supported on the device:

- [PLIB_PMP_SmartAddressStrobeEnable](#)

- [PLIB_PMP_SmartAddressStrobeDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The SmartAddress feature is supported on the device
- false - The SmartAddress feature is not supported on the device

Remarks

None.

5.6.16.6.17.54 PLIB_PMP_ExistsStopInIdleControl Function**C**

```
bool PLIB_PMP_ExistsStopInIdleControl(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the StopInIdleControl feature is available on the PMP module. When this interface returns true, these functions are supported on the device:

- [PLIB_PMP_StopInIdleEnable](#)
- [PLIB_PMP_StopInIdleDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The StopInIdleControl feature is supported on the device
- false - The StopInIdleControl feature is not supported on the device

Remarks

None.

5.6.16.6.17.55 PLIB_PMP_ExistsTransactionError Function**C**

```
bool PLIB_PMP_ExistsTransactionError(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the TransactionError feature is available on the PMP module. When this interface returns true, these functions are supported on the device:

- [PLIB_PMP_TransactionErrorHasOccurred](#)
- [PLIB_PMP_TransactionErrorClear](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The TransactionError feature is supported on the device
- false - The TransactionError feature is not supported on the device

Remarks

None.

5.6.16.6.17.56 PLIB_PMP_ExistsTransactionTimeOut Function**C**

```
bool PLIB_PMP_ExistsTransactionTimeOut(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the TransactionTimeOut feature is available on the PMP module. When this interface returns true, these functions are supported on the device:

- [PLIB_PMP_TransactionHasTimedOut](#)
- [PLIB_PMP_TransactionTimeoutClear](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The TransactionTimeOut feature is supported on the device
- false - The TransactionTimeOut feature is not supported on the device

Remarks

None.

5.6.16.6.17.57 PLIB_PMP_ExistsWaitStatesAddrHoldStrobe Function**C**

```
bool PLIB_PMP_ExistsWaitStatesAddrHoldStrobe(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the WaitStatesAddrHoldStrobe feature is available on the PMP module. When this interface returns true, these functions are supported on the device:

- [PLIB_PMP_WaitStatesAddressHoldStrobeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The WaitStatesAddrHoldStrobe feature is supported on the device
- false - The WaitStatesAddrHoldStrobe feature is not supported on the device

Remarks

None.

5.6.16.6.17.58 PLIB_PMP_ExistsWaitStatesAddrLatchStrobe Function**C**

```
bool PLIB_PMP_ExistsWaitStatesAddrLatchStrobe(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the WaitStatesAddrLatchStrobe feature is available on the PMP module. When this interface returns true, these functions are supported on the device:

- [PLIB_PMP_WaitStatesAddressLatchStrobeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The WaitStatesAddrLatchStrobe feature is supported on the device
- false - The WaitStatesAddrLatchStrobe feature is not supported on the device

Remarks

None.

5.6.16.6.17.59 PLIB_PMP_ExistsWriteEnablePolarity Function**C**

```
bool PLIB_PMP_ExistsWriteEnablePolarity(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the WriteEnablePolarity feature is available on the PMP module. When this interface returns true, this function is supported on the device:

- [PLIB_PMP_WriteEnableStrobePolaritySelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The WriteEnablePolarity feature is supported on the device
- false - The WriteEnablePolarity feature is not supported on the device

Remarks

None.

5.6.16.6.17.60 PLIB_PMP_ExistsWriteEnablePortControl Function**C**

```
bool PLIB_PMP_ExistsWriteEnablePortControl(  
    PMP_MODULE_ID index  
);
```

Description

This interface identifies that the WriteEnablePortControl feature is available on the PMP module. When this interface returns true, these functions are supported on the device:

- [PLIB_PMP_WriteEnableStrobePortEnable](#)
- [PLIB_PMP_WriteEnableStrobePortDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The WriteEnablePortControl feature is supported on the device
- false - The WriteEnablePortControl feature is not supported on the device

Remarks

None.

5.6.16.7 Files

Files

Name	Description
plib_pmp.h	Parallel Master Port (PMP) Peripheral Library Interface Header.

Description

5.6.16.7.1 [plib_pmp.h](#)

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the PMP Peripheral Library.

Functions

	Name	Description
≡	PLIB_PMP_AddressGet	Gets the current address of the PMP module.
≡	PLIB_PMP_AddressIncrementModeGet	Gets the increment mode being used with the address of the PMP module.
≡	PLIB_PMP_AddressIncrementModeSelect	Configures the increment mode being used with the address of the PMP module.
≡	PLIB_PMP_AddressLatchPolaritySelect	Sets the address latch strobe polarity.
≡	PLIB_PMP_AddressLatchStrobeDisable	Disables the specific address latch strobe.
≡	PLIB_PMP_AddressLatchStrobeEnable	Enables the specific address latch strobe.
≡	PLIB_PMP_AddressLinesA0A1Get	Gets the value of the address lines PMA0 and PMA1.
≡	PLIB_PMP_AddressLinesA0A1Set	Sets the address lines PMA0 and PMA1 with the value specified.
≡	PLIB_PMP_AddressPortDisable	Disables the port lines specified as PMP address lines.
≡	PLIB_PMP_AddressPortEnable	Enables the port lines specified as PMP address lines.
≡	PLIB_PMP_AddressSet	Sets the current address of the PMP module to the specified address.
≡	PLIB_PMP_AlternateMasterHasAccess	Gets the status of which alternate masters have gained access to the PMP module.
≡	PLIB_PMP_AlternateMasterRequestStatus	Gets the status of the request from the alternate master.
≡	PLIB_PMP_BusKeeperDisable	Disables the bus keeper (high-impedance) state.
≡	PLIB_PMP_BusKeeperEnable	Enables the bus keeper (high-impedance) state.
≡	PLIB_PMP_ByteEnablePolaritySelect	Sets the byte enable polarity.
≡	PLIB_PMP_ByteEnablePortDisable	Disables the byte enable port.
≡	PLIB_PMP_ByteEnablePortEnable	Enables the byte enable port.
≡	PLIB_PMP_ChipSelectFunctionSelect	Defines the functionality of the pins intended to be used as Chip Select.
≡	PLIB_PMP_ChipSelectXAckPolaritySelect	Sets the Chip Select acknowledge polarity.
≡	PLIB_PMP_ChipSelectXByteEnablePortPolaritySelect	Sets the nibble/byte enable polarity.
≡	PLIB_PMP_ChipSelectXDisable	Configures the Chip Select.
≡	PLIB_PMP_ChipSelectXEnable	Configures the Chip Select.
≡	PLIB_PMP_ChipSelectXEnableStrobeDeSelect	Selects the read and write strobes. The enable strobe is not selected (not required).

	PLIB_PMP_ChipSelectXEnableStrobeSelect	Selects the read/write and enable strobes.
	PLIB_PMP_ChipSelectXIsActive	Gets the current status of the specified Chip Select.
	PLIB_PMP_ChipSelectXPolaritySelect	Sets the specified Chip Select polarity.
	PLIB_PMP_ChipSelectXPortDisable	Disables the specified Chip Select's port.
	PLIB_PMP_ChipSelectXPortEnable	Enables the specified Chip Select's port.
	PLIB_PMP_ChipSelectXReadWriteStrobePolaritySelect	Sets the read/write strobe polarity.
	PLIB_PMP_ChipSelectXWriteEnableStrobePolaritySelect	Sets the write/enable strobe polarity.
	PLIB_PMP_ChipXAckModeSelect	Selects the acknowledge mode for the PMP module.
	PLIB_PMP_ChipXBaseAddressSet	Sets the base address of the specified device.
	PLIB_PMP_ChipXDataSizeSelect	Enables data transfer size for the PMP for the specified device.
	PLIB_PMP_ChipXWaitStatesAlternateMasterSelect	Selects the wait states of the alternate master for Chip Select-X.
	PLIB_PMP_ChipXWaitStatesDataHoldSelect	Configures the data hold states (after data transfer) needed to be used with the PMP module for the specified device.
	PLIB_PMP_ChipXWaitStatesDataSetupSelect	Configures the data wait states (before the data transfer) needed to be used with the PMP module for the specified device.
	PLIB_PMP_ChipXWaitStatesStrobeSelect	Configures the strobe wait states (during the data transfer) needed to be used with the PMP module for the specified device.
	PLIB_PMP_DataSizeSelect	Enables data transfer size for the PMP module.
	PLIB_PMP_Disable	Disables the specific PMP module.
	PLIB_PMP_Enable	Enables the specific PMP module.
	PLIB_PMP_EnhancedMasterModeSelect	Selects Master mode for the PMP module.
	PLIB_PMP_ExistsAddressControl	Identifies that the AddressControl feature exists on the PMP module.
	PLIB_PMP_ExistsAddressLatchPolarity	Identifies that the AddressLatchPolarity feature exists on the PMP module.
	PLIB_PMP_ExistsAddressLatchStrobePortControl	Identifies that the AddressLatchStrobePortControl feature exists on the PMP module.
	PLIB_PMP_ExistsAddressPortPinControl	Identifies that the AddressPortPinControl feature exists on the PMP module.
	PLIB_PMP_ExistsAltMasterRequest	Identifies that the AltMasterRequest feature exists on the PMP module.
	PLIB_PMP_ExistsBufferOverFlow	Identifies that the BufferOverFlow feature exists on the PMP module.
	PLIB_PMP_ExistsBufferRead	Identifies that the BufferRead feature exists on the PMP module.
	PLIB_PMP_ExistsBufferType	Identifies that the BufferType feature exists on the PMP module.
	PLIB_PMP_ExistsBufferUnderFlow	Identifies that the BufferUnderFlow feature exists on the PMP module.
	PLIB_PMP_ExistsBufferWrite	Identifies that the BufferWrite feature exists on the PMP module.
	PLIB_PMP_ExistsBusKeeper	Identifies that the BusKeeper feature exists on the PMP module.
	PLIB_PMP_ExistsBusyStatus	Identifies that the BusyStatus feature exists on the PMP module.

	<u>PLIB_PMP_ExistsByteEnablePolarity</u>	Identifies that the ByteEnablePolarity feature exists on the PMP module.
	<u>PLIB_PMP_ExistsByteEnablePortControl</u>	Identifies that the ByteEnablePortControl feature exists on the PMP module.
	<u>PLIB_PMP_ExistsChipSelectEnable</u>	Identifies that the ChipSelectEnable feature exists on the PMP module.
	<u>PLIB_PMP_ExistsChipSelectoperation</u>	Identifies that the ChipSelectoperation feature exists on the PMP module.
	<u>PLIB_PMP_ExistsChipXACKMode</u>	Identifies that the ChipXACKMode feature exists on the PMP module.
	<u>PLIB_PMP_ExistsChipXACKPolarity</u>	Identifies that the ChipXACKPolarity feature exists on the PMP module.
	<u>PLIB_PMP_ExistsChipXAltMasterWaitStates</u>	Identifies that the ChipXAltMasterWaitStates feature exists on the PMP module.
	<u>PLIB_PMP_ExistsChipXBaseAddress</u>	Identifies that the ChipXBaseAddress feature exists on the PMP module.
	<u>PLIB_PMP_ExistsChipXByteEnablePolarity</u>	Identifies that the ChipXByteEnablePolarity feature exists on the PMP module.
	<u>PLIB_PMP_ExistsChipXDataHoldWaitStates</u>	Identifies that the ChipXDataHoldWaitStates feature exists on the PMP module.
	<u>PLIB_PMP_ExistsChipXDataSetupWaitStates</u>	Identifies that the ChipXDataSetupWaitStates feature exists on the PMP module.
	<u>PLIB_PMP_ExistsChipXDataSize</u>	Identifies that the ChipXDataSize feature exists on the PMP module.
	<u>PLIB_PMP_ExistsChipXEnableStrobeSelect</u>	Identifies that the ChipXEnableStrobeSelect feature exists on the PMP module.
	<u>PLIB_PMP_ExistsChipXPolarity</u>	Identifies that the ChipXPolarity feature exists on the PMP module.
	<u>PLIB_PMP_ExistsChipXReadWritePolarity</u>	Identifies that the ChipXReadWritePolarity feature exists on the PMP module.
	<u>PLIB_PMP_ExistsChipXStrobeWaitStates</u>	Identifies that the ChipXStrobeWaitStates feature exists on the PMP module.
	<u>PLIB_PMP_ExistsChipXWriteEnablePolarity</u>	Identifies that the ChipXWriteEnablePolarity feature exists on the PMP module.
	<u>PLIB_PMP_ExistsCSXActiveStatus</u>	Identifies that the CSXActiveStatus feature exists on the PMP module.
	<u>PLIB_PMP_ExistsCSXPortControl</u>	Identifies that the CSXPortControl feature exists on the PMP module.
	<u>PLIB_PMP_ExistsCurrentMaster</u>	Identifies that the CurrentMaster feature exists on the PMP module.
	<u>PLIB_PMP_ExistsDataHoldWaitStates</u>	Identifies that the DataHoldWaitStates feature exists on the PMP module.
	<u>PLIB_PMP_ExistsDataSetUpWaitStates</u>	Identifies that the DataSetUpWaitStates feature exists on the PMP module.
	<u>PLIB_PMP_ExistsDataStrobeWaitStates</u>	Identifies that the DataStrobeWaitStates feature exists on the PMP module.
	<u>PLIB_PMP_ExistsDataTransferSize</u>	Identifies that the DataTransferSize feature exists on the PMP module.
	<u>PLIB_PMP_ExistsEnableControl</u>	Identifies that the EnableControl feature exists on the PMP module.
	<u>PLIB_PMP_ExistsEnhancedMasterMode</u>	Identifies that the EnhancedMasterMode feature exists on the PMP module.

	PLIB_PMP_ExistsIncrementMode	Identifies that the IncrementMode feature exists on the PMP module.
	PLIB_PMP_ExistsInputBufferFull	Identifies that the InputBufferFull feature exists on the PMP module.
	PLIB_PMP_ExistsInputBufferXStatus	Identifies that the InputBufferXStatus feature exists on the PMP module.
	PLIB_PMP_ExistsInterruptMode	Identifies that the InterruptMode feature exists on the PMP module.
	PLIB_PMP_ExistsMasterRXTX	Identifies that the MasterRXTX feature exists on the PMP module.
	PLIB_PMP_ExistsMUXModeSelect	Identifies that the MUXModeSelect feature exists on the PMP module.
	PLIB_PMP_ExistsOperationMode	Identifies that the OperationMode feature exists on the PMP module.
	PLIB_PMP_ExistsOutPutBufferEmpty	Identifies that the OutPutBufferEmpty feature exists on the PMP module.
	PLIB_PMP_ExistsOutputBufferXStatus	Identifies that the OutputBufferXStatus feature exists on the PMP module.
	PLIB_PMP_ExistsReadWritePolarity	Identifies that the ReadWritePolarity feature exists on the PMP module.
	PLIB_PMP_ExistsReadWriteStrobePortControl	Identifies that the ReadWriteStrobePortControl feature exists on the PMP module.
	PLIB_PMP_ExistsReservedAddrSpace	Identifies that the ReservedAddrSpace feature exists on the PMP module.
	PLIB_PMP_ExistsSlaveRX	Identifies that the SlaveRX feature exists on the PMP module.
	PLIB_PMP_ExistsSlaveTX	Identifies that the SlaveTX feature exists on the PMP module.
	PLIB_PMP_ExistsSmartAddress	Identifies that the SmartAddress feature exists on the PMP module.
	PLIB_PMP_ExistsStopInIdleControl	Identifies that the StopInIdleControl feature exists on the PMP module.
	PLIB_PMP_ExistsTransactionError	Identifies that the TransactionError feature exists on the PMP module.
	PLIB_PMP_ExistsTransactionTimeOut	Identifies that the TransactionTimeOut feature exists on the PMP module.
	PLIB_PMP_ExistsWaitStatesAddrHoldStrobe	Identifies that the WaitStatesAddrHoldStrobe feature exists on the PMP module.
	PLIB_PMP_ExistsWaitStatesAddrLatchStrobe	Identifies that the WaitStatesAddrLatchStrobe feature exists on the PMP module.
	PLIB_PMP_ExistsWriteEnablePolarity	Identifies that the WriteEnablePolarity feature exists on the PMP module.
	PLIB_PMP_ExistsWriteEnablePortControl	Identifies that the WriteEnablePortControl feature exists on the PMP module.
	PLIB_PMP_InputBuffersAreFull	Gets the state of the input buffers.
	PLIB_PMP_InputBufferTypeSelect	Selects the input buffer based on the input passed.
	PLIB_PMP_InputBufferXByteReceive	Data to be received in Byte mode.
	PLIB_PMP_InputBufferXIsFull	Gets the state of the identified input buffer.
	PLIB_PMP_InputOverflowClear	Clears a PMP Overflow error.
	PLIB_PMP_InputOverflowHasOccurred	Identifies if there was a receiver overflow error.

	PLIB_PMP_InterruptModeGet	Gets the current configured interrupt mode being used with the PMP module.
	PLIB_PMP_InterruptModeSelect	Configures the interrupt request mode being used with the PMP module.
	PLIB_PMP_IsDataReceived	Checks and returns if the data has been received in the specified buffer in Slave mode.
	PLIB_PMP_IsDataTransmitted	Checks and returns if the data has been transmitted from the specified buffer in Slave mode.
	PLIB_PMP_IsEnabled	Checks whether or not the PMP module is enabled.
	PLIB_PMP_MasterReceive	Receives the data in the master mode.
	PLIB_PMP_MasterSend	Sends the specified data in Master mode.
	PLIB_PMP_MultiplexModeGet	Gets the current multiplexing mode configured between the address and data of the PMP module.
	PLIB_PMP_MultiplexModeSelect	Configures the multiplexing between the address and data of the PMP module.
	PLIB_PMP_OperationModeGet	Gets the current operation mode of the PMP module.
	PLIB_PMP_OperationModeSelect	Configures the operation mode of the PMP module.
	PLIB_PMP_OutputBuffersAreEmpty	Gets the state of the output buffers.
	PLIB_PMP_OutputBufferXByteSend	Data to be transmitted in Byte mode.
	PLIB_PMP_OutputBufferXIsEmpty	Gets the state of the input buffer.
	PLIB_PMP_OutputUnderflowClear	Clears a PMP output underflow error.
	PLIB_PMP_OutputUnderflowHasOccurred	Identifies if there was an output buffer sent out with no data.
	PLIB_PMP_PortIsBusy	Identifies if the (Master mode) PMP port is busy.
	PLIB_PMP_ReadWriteStrobePolaritySelect	Sets the polarity of the read strobe.
	PLIB_PMP_ReadWriteStrobePortDisable	Disables the PMP module read strobe port.
	PLIB_PMP_ReadWriteStrobePortEnable	Enables the PMP module read strobe port.
	PLIB_PMP_ReservedAddressSpaceBitsSet	Sets the address bits of the reserved address space of the EPMP. The end address of the Chip Select-2 (if present).
	PLIB_PMP_SlaveReceive	Receives the data in Slave mode.
	PLIB_PMP_SlaveSend	Sends the specified data in Slave mode.
	PLIB_PMP_SmartAddressStrobeDisable	Disables "smart" address strobes.
	PLIB_PMP_SmartAddressStrobeEnable	Enables "smart" address strobes.
	PLIB_PMP_StopInIdleDisable	Enables the PMP module to continue operation in Idle mode.
	PLIB_PMP_StopInIdleEnable	Discontinues PMP module operation when the device enters Idle mode.
	PLIB_PMP_TransactionErrorClear	Clears the transaction error flag.
	PLIB_PMP_TransactionErrorHasOccurred	Returns the status of a transaction error.
	PLIB_PMP_TransactionHasTimedOut	Returns the time-out status.
	PLIB_PMP_TransactionTimeoutClear	Clears the time-out flag.
	PLIB_PMP_WaitStatesAddressHoldStrobeSelect	Configures the address wait states needed to be used with the PMP module.
	PLIB_PMP_WaitStatesAddressLatchStrobeSelect	Configures the address wait states needed to be used with the PMP module.
	PLIB_PMP_WaitStatesDataHoldSelect	Configures the data hold states (after data transfer) needed to be used with the PMP module.

	PLIB_PMP_WaitStatesDataSetUpSelect	Configures the data wait states (before the data transfer) needed to be used with the PMP module.
	PLIB_PMP_WaitStatesStrobeSelect	Configures the strobe wait states (during the data transfer) needed to be used with the PMP module.
	PLIB_PMP_WriteEnableStrobePolaritySelect	Sets the polarity of the write enable strobe.
	PLIB_PMP_WriteEnableStrobePortDisable	Disables the PMP module write strobe port.
	PLIB_PMP_WriteEnableStrobePortEnable	Enables the PMP module write strobe port.

5.6.17 Ports Peripheral Library

5.6.17.1 Introduction

This library provides a low-level abstraction of the I/O Ports module on the Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, thereby hiding differences from one microcontroller variant to another.

Description

Ports Peripheral Library
for
Microchip Microcontrollers

I/O Ports Overview

The general purpose I/O pins can be considered the simplest of peripherals. These I/O pins allow the microcontroller to monitor and control other devices. To add flexibility and functionality to a device, some pins are multiplexed with alternate function(s). These functions depend on which peripheral features are on the device. In general, when a peripheral is functioning, that pin may not be used as a general purpose I/O pin.

A major challenge in general purpose devices is providing the largest possible set of peripheral features while minimizing the conflict of features on I/O pins. The Peripheral Pin Select (PPS) feature simplifies this challenge by enabling the user's peripheral set selection and their placement on a wide range of I/O pins. By increasing the pin out options available on a particular device, users can better tailor the microcontroller to their entire application. The PPS feature operates over a fixed subset of digital I/O

pins. Users may independently map the input and/or output of any one of many digital peripherals to any one of these I/O pins. PPS is performed in software and generally does not require the device to be reprogrammed. Hardware safeguards are included that prevent accidental or spurious changes to the peripheral mapping once it has been established.

Note: Peripheral Pin Select is not available on all devices. Please refer to the specific device data sheet to determine availability of this feature.

Following are some of the key features of the I/O Ports module:

- Individual output pin/port open-drain control
- Individual input pin/port pull-up/down control
- Monitor select inputs and generate interrupt on mismatch condition (Change Notification)
- Operation during CPU Sleep and Idle modes
- Port line analog/digital selection
- Port slew rate control
- PPS peripheral function remapping

5.6.17.2 Release Notes

MPLAB Harmony Version: v0.70b **Ports Peripheral Library Version :** 0.70b **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

None to report at this time.

5.6.17.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED AS IS MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.6.17.4 Using the Library

This topic describes the basic architecture of the Ports Peripheral Library and provides information and examples on how to use it.

Description

Interface Header File: [plib_ports.h](#)

The interface to the Ports Peripheral Library is defined in the "[plib_ports.h](#)" header file, which is included by the "peripheral.h" peripheral library header file. Any C language source (.c) file that uses the Ports Peripheral Library must include "peripheral.h".

Library File:

The Ports Peripheral Library is part of the processor-specific peripheral library installed with the compiler. This library is automatically available (in the default search path) for any project built using the Microchip compilers.

5.6.17.4.1 Hardware Abstraction Model

This topic provides detailed information for general purpose I/O and pin mapping.

Description

General Purpose I/O

All port pins have three controls directly associated with their operation as digital I/O. The data direction control determines whether the pin is an input or an output. All port pins are defined as inputs after a Reset. Writes to a port are latched and, if programmed as an output, driven by a buffer to the pin. The value of pin can be read directly from an input buffer, (after it has been synchronized to the clock), regardless of whether the pin direction has been selected as input or output. Additionally, the value being driven by the latch before the output buffer, can also be read.

Internal pull-up resistors are available on selected port pins to eliminate the need to use external pull-up resistors. These pull-ups can be controlled by this library. The open-drain feature allows the generation of outputs higher than VDD on any desired digital-only pins by using external pull-up resistors.

Note: For detailed specifications on the maximum allowed open-drain voltage, refer to the "**Electrical Characteristics**" chapter in the specific device data sheet.

The input change notification feature of the I/O ports allows the microcontrollers to generate interrupt requests to the processor in response to a change of state on selected input pins. This feature is capable of detecting input change of states even in Sleep mode, when the clocks are disabled.

The alternate pin function selections are used to steer specific peripheral input and output functions between different pins.

The output slew rate of some port pins are programmable to select either the standard transition rate or a reduced transition rate of 'x' times the standard to minimize EMI.

Peripheral Pin Select

Remappable Input Example for USART 1 Receive**Output Mapping**

In contrast to inputs, the outputs of the peripheral pin select options are mapped on the basis of the pin. In this case, a control associated with a particular pin dictates the peripheral output to be mapped.

Multiplexing of Remappable Output for RPn**Mapping Limitations**

The control schema of the peripheral select pins is not limited to a small range of fixed peripheral configurations. There are no mutual-exclusion or hardware-enforced lockouts between any of the peripheral mapping SFRs. Literally any combination of peripheral mappings across any or all of the RPn pins is possible. This includes both many-to-one and one-to-many mappings of peripheral inputs and outputs to pins. While such mappings may be technically possible from a configuration point of view, they may not be supportable from an electrical point of view and may cause damage to the part.

Note 1: For detailed specifications on the mapping limitations, refer to the "I/O Ports" chapter in the specific device data sheet.

Note 2: Regarding pin priorities, the priority of the pins are assigned from left to right, left being the highest priority and the right most being the least priority.

5.6.17.4.2 Library Overview

The Ports Peripheral Library supports the following set of interface routines:

Library Interface Section	Description
Port Functions	Port access read/write/toggle/clear interfaces with 8-/16-/32-bit widths based on the selected device.
Port Pin Functions	Port bit/pin read/write/toggle/clear interfaces.
Change Notification Functions	Port change notification.
Peripheral Pin Select Functions	Interface routines for mapping the digital input/output to a specific the PPS remappable input/output pin.

5.6.17.4.3 How the Library Works

How the Library Works

The following topics discuss the processes involved while using a Ports module:

- [Ports Control](#)
- [Ports Function Remap](#)
- [Ports Change Notification](#)
- [Special Considerations](#)

5.6.17.4.3.1 Ports Control

Port Functions Usage:

- Port Read - Ports can be read at byte/word level using [PLIB_PORTS_Read](#), and at the bit/pin level using [PLIB_PORTS_PinGet](#)
- Port Write - Ports can be written to at byte/word level using [PLIB_PORTS_Write](#) and at the bit/pin level using [PLIB_PORTS_PinWrite](#). The function [PLIB_PORTS_PinSet](#) can be used to set a specific bit/pin of a port. A mask-based PORTx write can be accomplished using the function [PLIB_PORTS_Set](#) with the appropriate mask as a parameter along with the value.
- Port Clear - Ports can be cleared at byte/word level using [PLIB_PORTS_Clear](#) with appropriate mask as a parameter and at the bit/pin level using [PLIB_PORTS_PinClear](#)
- Port Direction - The ports read direction can be set at byte/word level using [PLIB_PORTS_DirectionInputSet](#) and at the bit/pin level using [PLIB_PORTS_PinDirectionInputSet](#). Similarly, the ports write direction can be set at the byte/word level using [PLIB_PORTS_DirectionOutputSet](#) and at the bit/pin level using [PLIB_PORTS_PinDirectionOutputSet](#). The direction information can be read using [PLIB_PORTS_DirectionGet](#).
- Port Toggle - Ports can be toggled at the byte/word level using [PLIB_PORTS_Toggle](#) with the appropriate mask as a parameter and at the bit/pin level using [PLIB_PORTS_PinToggle](#)
- Port Open Drain - Ports can be enabled for open-drain functionality at the byte/word level using the interface [PLIB_PORTS_OpenDrainEnable](#) and at the bit/pin level using [PLIB_PORTS_PinOpenDrainEnable](#). Similarly, the ports can be disabled for open-drain functionality at the byte/word level using [PLIB_PORTS_OpenDrainDisable](#) and at the bit/pin level using [PLIB_PORTS_PinOpenDrainDisable](#).
- Port Pull-up - Ports can be enabled for pull-up functionality at the byte/word level using [PLIB_PORTS_PullUpEnable](#) and at the bit/pin level using [PLIB_PORTS_PinPullUpEnable](#). Similarly, the ports can be disabled for pull-up functionality at the byte/word level using the interface [PLIB_PORTS_PullUpDisable](#) and at the bit/pin level using [PLIB_PORTS_PinPullUpDisable](#).

Example:

```

// PORT Direction setting for output
PLIB_PORTS_DirectionOutputSet(MY_PORTS_INSTANCE, MY_CHANNEL, (PORTS_DATA_MASK)0xFFFF);
// Writing a value into a PORT
PLIB_PORTS_Write(MY_PORTS_INSTANCE, MY_CHANNEL, (PORTS_DATA_TYPE)0x1234);
// PORT Direction setting for input
PLIB_PORTS_DirectionInputSet(MY_PORTS_INSTANCE, MY_CHANNEL, (PORTS_DATA_MASK)0xFFFF);
// Reading back the previously written value
PORTS_DATA_TYPE readData = PLIB_PORTS_Read(MY_PORTS_INSTANCE, MY_CHANNEL);
// Clearing the PORT
PLIB_PORTS_Clear(MY_PORTS_INSTANCE, MY_CHANNEL, (PORTS_DATA_MASK)0x00FF);
// Writing the value based on the mask, only 0x34 gets written to the PORT
PLIB_PORTS_Set(MY_PORTS_INSTANCE, MY_CHANNEL, 0x1234, (PORTS_DATA_MASK)0x00FF);
// Toggling a PORT
PLIB_PORTS_Toggle(MY_PORTS_INSTANCE, MY_CHANNEL, (PORTS_DATA_MASK)0x00FF);

```

Note: In certain devices, disabling pull-ups will enable the pull-down feature and vice-versa. For more information, refer to the "I/O Ports" chapter in the specific device data sheet or the related family reference manual section.

5.6.17.4.3.2 Ports Function Remap

Using the PPS Feature:

1. Ensure that any fixed digital peripherals on the pins to be used are disabled.
2. Ensure that pins with analog functionality are set to Digital mode.
3. Check if the Input/Output lock is active using `PLIB_PORTS_IOLockIsActive`.
4. Enable writing to the Input/Output control register using `PLIB_PORTS_IOLockDisable`.
5. Remap the input and/or output pins using the internal PPS module. This can be achieved with the function `PLIB_PORTS_RemapInputOutput` with the respective parameters defined in the processor specific headers.
6. Lock the Input/Output control register using `PLIB_PORTS_IOLockEnable`.
7. Configure and enable newly mapped PPS peripherals.

Example:

```

// Remapping input function 'Input Capture 1' to the Remappable input pin 'RPI1'
PLIB_PORTS_RemapInputOutput(MY_PORTS_INSTANCE, PORTS_REMAP_FUNCTION_IC1, PORTS_REMAP_PIN_RPI1);
// Remapping output function 'UART1 Transmit' to the Remappable output pin 'RP3'
PLIB_PORTS_RemapInputOutput(MY_PORTS_INSTANCE, PORTS_REMAP_FUNCTION_U1TX, PORTS_REMAP_PIN_RP3);

```

Note: For more information, refer to the "I/O Ports" chapter in the specific device data sheet or the related family reference manual section.

5.6.17.4.3.3 Ports Change Notification

Change Notification Feature Usage

1. Ensure that the change notify pin is configured as a digital input by setting the associated bit in the direction register using the `PLIB_PORTS_PinDirectionInputSet` or `PLIB_PORTS_DirectionInputSet` functions.
2. Select the desired change notification pin using `PLIB_PORTS_PinChangeNoticeEnable`.
3. Turn on the weak pull-up devices (if desired) for the selected change notification pins using `PLIB_PORTS_ChangeNoticePullUpEnable` (weak pull-ups can be disabled using `PLIB_PORTS_ChangeNoticePullUpDisable`).
4. Clear the selected change notification interrupt flag.
5. Select the desired interrupt priority for change notification pin.
6. Enable change notification interrupts.

7. Change notification can be disabled after the successful usage using [PLIB_PORTS_PinChangeNoticeDisable](#). Certain microcontrollers support the global control over the change notification feature using the following functions: [PLIB_PORTS_ChangeNoticeEnable](#) and [PLIB_PORTS_ChangeNoticeDisable](#). If there are any requirements to control the pull-downs, the following two functions could be used: [PLIB_PORTS_ChangeNoticePullDownEnable](#) and [PLIB_PORTS_ChangeNoticePullDownDisable](#).

Change Notification Operation in Sleep and Idle Modes

The change notification feature continues to operate during Sleep or Idle mode. Its operation can be enabled or disabled using [PLIB_PORTS_ChangeNoticeInIdleEnable](#) or [PLIB_PORTS_ChangeNoticeInIdleDisable](#). If one of the enabled change notification pins changes states, the respective status bit will be set, which can be monitored using [PLIB_PORTS_ChangeNoticeHasOccurred](#).

Example:

```
// Enabling the global change notification
PLIB_PORTS_ChangeNoticeEnable(MY_PORTS_INSTANCE);
// Enabling weak pull-ups for the change notification PIN 10
PLIB_PORTS_ChangeNoticePullUpEnable(MY_PORTS_INSTANCE, PORTS_CHANGE_NOTICE_PIN_10);
// Enabling change notification on PIN 10
PLIB_PORTS_GlobalChangeNoticeEnable(MY_PORTS_INSTANCE, PORTS_CHANGE_NOTICE_PIN_10);
```

Note: For more information, refer to the "I/O Ports" chapter in the specific device data sheet or the related family reference manual section.

5.6.17.4.3.4 Special Considerations

Considerations on Ports Usage

When reading a port register, all pins configured as analog input channels will read as cleared.

Pins configured as digital inputs will not operate correctly with analog peripherals. Analog levels on any pin that is defined as a digital input may cause the input buffer of analog peripherals to consume current that exceeds the device specifications.

Pull-ups and pull-downs on change notification pins should always be disabled when the port pin is configured as a digital output.

One instruction cycle is required between a port direction change or port write operation and a read operation of the same port. Typically, this instruction would be a NOP.

Considerations for PPS

The ability to control PPS options introduces several considerations into application design that could be overlooked. This is particularly true for several common peripherals that are available only as remappable peripherals.

The main consideration is that the peripheral pin selects are not available on default pins in the device's default (i.e., Reset) state, all PPS inputs are tied to VSS and all PPS outputs are disconnected. This condition requires the user to initialize the device with the proper peripheral configuration before any other application code is executed. For application safety, however, it is best to lock the configuration after writing to the PPS control.

The assignment of a peripheral signal to a particular pin does not automatically perform any other configuration of the pin's I/O circuitry. In theory, this means adding a pin-selectable output to a pin may mean inadvertently driving an existing peripheral input when the output is driven. Users must be familiar with the behavior of other fixed peripherals that share a remappable pin and know when to enable or disable them. To be safe, fixed digital peripherals that share the same pin should be disabled when not in use. In addition, configuring a remappable pin for a specific peripheral does not automatically turn on that feature. The peripheral must be specifically configured for operation and enabled, as if it were tied to a fixed pin. Where this occurs in the application code (immediately following a device Reset and peripheral configuration or inside the main application routine) depends on the peripheral and its use in the application.

A final consideration is that PPS functions neither override analog inputs, nor reconfigure pins with analog functions for digital I/O. If a pin is configured as an analog input on a device Reset, it must be explicitly reconfigured as a digital I/O when used with

PPS.

Note: For more information, refer to the "I/O Ports" chapter in the specific device data sheet or the related family reference manual section.

5.6.17.5 Configuring the Library

The library is configured for the supported Ports module when the supported processor is chosen in the MPLAB IDE.

5.6.17.6 Library Interface

Data Types and Constants

	Name	Description
	<u>PORTS_ANALOG_PIN</u>	Data type defining the different Analog input pins
	<u>PORTS_BIT_POS</u>	Lists the constants which holds different bit positions of PORTS.
	<u>PORTS_CHANGE_NOTICE_PIN</u>	Data type defining the different Change Notification Pins enumeration
	<u>PORTS_CHANNEL</u>	Identifies the PORT Channels Supported.
	<u>PORTS_DATA_MASK</u>	Data type defining the PORTS data mask
	<u>PORTS_DATA_TYPE</u>	Data type defining the PORTS data type.
	<u>PORTS_MODULE_ID</u>	Identifies the PORT Modules Supported.
	<u>PORTS_PERIPHERAL_OD</u>	Data type defining the different Peripherals available for Open drain Configuration
	<u>PORTS_PIN</u>	Data type defining the different PORTS IO Pins enumeration
	<u>PORTS_PIN_MODE</u>	Identifies the ports pin mode
	<u>PORTS_REMAP_FUNCTION</u>	Data type defining the different remap function enumeration
	<u>PORTS_REMAP_INPUT_FUNCTION</u>	Data type defining the different remap input function enumeration.
	<u>PORTS_REMAP_INPUT_PIN</u>	Data type defining the different Ports I/O input pins enumeration.
	<u>PORTS_REMAP_OUTPUT_FUNCTION</u>	Data type defining the different remap output function enumeration.
	<u>PORTS_REMAP_OUTPUT_PIN</u>	Data type defining the different Ports I/O output pins enumeration.
	<u>PORTS_REMAP_PIN</u>	Data type defining the different remappable input/output enumeration

Change Notification Functions

	Name	Description
	<u>PLIB_PORTS_ChangeNoticeDisable</u>	Global Change Notice disable.
	<u>PLIB_PORTS_ChangeNoticeEnable</u>	Global Change Notice enable.
	<u>PLIB_PORTS_ChangeNoticeInIdleDisable</u>	CPU Idle does not affect Change Notice operation.
	<u>PLIB_PORTS_ChangeNoticeInIdleEnable</u>	CPU Idle mode halts Change Notice operation.
	<u>PLIB_PORTS_ChangeNoticeInIdlePerPortDisable</u>	Enables the selected pin as analog or digital.
	<u>PLIB_PORTS_ChangeNoticeInIdlePerPortEnable</u>	Enables the selected pin as analog or digital.
	<u>PLIB_PORTS_ChangeNoticePerPortHasOccurred</u>	Enables the selected pin as analog or digital.
	<u>PLIB_PORTS_ChangeNoticePerPortTurnOff</u>	Enables the selected pin as analog or digital.
	<u>PLIB_PORTS_ChangeNoticePerPortTurnOn</u>	Enables the selected pin as analog or digital.
	<u>PLIB_PORTS_ChangeNoticePullDownPerPortDisable</u>	Enables the selected pin as analog or digital.
	<u>PLIB_PORTS_ChangeNoticePullDownPerPortEnable</u>	Enables the selected pin as analog or digital.
	<u>PLIB_PORTS_ChangeNoticePullUpDisable</u>	Disable pull-up on input change.
	<u>PLIB_PORTS_ChangeNoticePullUpEnable</u>	Enable pull-up on input change.

	PLIB_PORTS_ChangeNoticePullUpPerPortDisable	Enables the selected pin as analog or digital.
	PLIB_PORTS_ChangeNoticePullUpPerPortEnable	Enables the selected pin as analog or digital.
	PLIB_PORTS_PinChangeNoticeDisable	Port pin Change Notice disable.
	PLIB_PORTS_PinChangeNoticeEnable	Port pin Change Notice enable.
	PLIB_PORTS_PinChangeNoticePerPortDisable	Enables the selected pin as analog or digital.
	PLIB_PORTS_PinChangeNoticePerPortEnable	Enables the selected pin as analog or digital.

Feature Existence Functions

	Name	Description
	PLIB_PORTS_ExistsChangeNotice	Identifies whether the ChangeNotice feature exists on the PORTS module
	PLIB_PORTS_ExistsChangeNoticeInIdle	Identifies whether the ChangeNoticeInIdle feature exists on the PORTS module
	PLIB_PORTS_ExistsChangeNoticePerPortInIdle	Identifies whether the ChangeNoticeInIdlePerPort feature exists on the PORTS module
	PLIB_PORTS_ExistsChangeNoticePerPortStatus	Identifies whether the ChangeNoticePerPortStatus feature exists on the PORTS module
	PLIB_PORTS_ExistsChangeNoticePerPortTurnOn	Identifies whether the ChangeNoticePerPortTurnOn feature exists on the PORTS module
	PLIB_PORTS_ExistsChangeNoticePullDownPerPort	Identifies whether the ChangeNoticePullDownPerPort feature exists on the PORTS module
	PLIB_PORTS_ExistsChangeNoticePullUp	Identifies whether the ChangeNoticePullup feature exists on the PORTS module
	PLIB_PORTS_ExistsChangeNoticePullUpPerPort	Identifies whether the ChangeNoticePullUpPerPort feature exists on the PORTS module
	PLIB_PORTS_ExistsPinChangeNotice	Identifies whether the PinChangeNotice feature exists on the PORTS module
	PLIB_PORTS_ExistsPinChangeNoticePerPort	Identifies whether the PinChangeNoticePerPort feature exists on the PORTS module
	PLIB_PORTS_ExistsPinMode	Identifies whether the PinMode feature exists on the PORTS module
	PLIB_PORTS_ExistsPinModePerPort	Identifies whether the PinModePerPort feature exists on the PORTS module
	PLIB_PORTS_ExistsPortsDirection	Identifies whether the PortsDirection feature exists on the PORTS module
	PLIB_PORTS_ExistsPortsOpenDrain	Identifies whether the PortsOpenDrain feature exists on the PORTS module
	PLIB_PORTS_ExistsPortsRead	Identifies whether the PortsRead feature exists on the PORTS module
	PLIB_PORTS_ExistsPortsWrite	Identifies whether the PortsWrite feature exists on the PORTS module
	PLIB_PORTS_ExistsRemapInput	Identifies whether the RemapInput feature exists on the PORTS module
	PLIB_PORTS_ExistsRemapOutput	Identifies whether the RemapOutput feature exists on the PORTS module

Peripheral Pin Select Functions

	Name	Description
	PLIB_PORTS_RemapInput	Input/Output (I/O) function remapping.
	PLIB_PORTS_RemapOutput	Input/Output (I/O) function remapping.

Port Functions

	Name	Description
≡	PLIB_PORTS_Clear	Clears the selected digital port/latch.
≡	PLIB_PORTS_DirectionGet	Reads the direction of the selected digital port.
≡	PLIB_PORTS_DirectionInputSet	Enables the read (input) direction for the selected port.
≡	PLIB_PORTS_DirectionOutputSet	Enables the write (output) direction for the selected port.
≡	PLIB_PORTS_PinOpenDrainDisable	Disables the open drain functionality for the selected pin.
≡	PLIB_PORTS_PinOpenDrainEnable	Enables the open drain functionality for the selected pin.
≡	PLIB_PORTS_Read	Reads the selected digital port.
≡	PLIB_PORTS_Set	Writes the selected digital port/latch based on the mask.
≡	PLIB_PORTS_Toggle	Toggles the selected digital port/latch.
≡	PLIB_PORTS_Write	Writes the selected digital port/latch.
≡	PLIB_PORTS_OpenDrainDisable	Disables the open drain functionality for the selected port.
≡	PLIB_PORTS_OpenDrainEnable	Enables the open drain functionality for the selected port.

Port Pin Functions

	Name	Description
≡	PLIB_PORTS_PinClear	Clears the selected digital pin/latch.
≡	PLIB_PORTS_PinDirectionInputSet	Enables the read (input) direction for the selected pin.
≡	PLIB_PORTS_PinDirectionOutputSet	Enables the write (output) direction for the selected pin.
≡	PLIB_PORTS_PinGet	Reads/Gets data from the selected digital pin.
≡	PLIB_PORTS_PinModeSelect	Enables the selected pin as analog or digital.
≡	PLIB_PORTS_PinSet	Sets the selected digital pin/latch.
≡	PLIB_PORTS_PinToggle	Toggles the selected digital pin/latch.
≡	PLIB_PORTS_PinWrite	Writes the selected digital pin/latch.
≡	PLIB_PORTS_PinModePerPortSelect	Enables the selected pin as analog or digital.

Description

This section lists the interface routines, data types, constants, and macros required for the Ports Peripheral Library.

5.6.17.6.1 Port Pin Functions**5.6.17.6.1.1 PLIB_PORTS_PinClear Function****C**

```
void PLIB_PORTS_PinClear(
    PORTS_MODULE_ID index,
    PORTS_CHANNEL channel,
    PORTS_BIT_POS bitPos
);
```

Description

This function clears the selected digital pin/latch.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Identifier for the PORTS channel A, B, C, etc.
bitPos	Possible values of PORTS_BIT_POS

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PORTS_ExistsPortsWrite](#) in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the
// application developer.
// MY_PINNUM - PORTS_PIN_10
PLIB_PORTS_PinClear(MY_PORTS_INSTANCE, MY_CHANNEL, MY_PINNUM);
```

5.6.17.6.1.2 PLIB_PORTS_PinDirectionInputSet Function**C**

```
void PLIB_PORTS_PinDirectionInputSet(
    PORTS_MODULE_ID index,
    PORTS_CHANNEL channel,
    PORTS_BIT_POS bitPos
);
```

Description

This function enables the read (input) direction for the selected pin.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Identifier for the PORTS channel A, B, C, etc.
bitPos	Possible values of PORTS_BIT_POS

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PORTS_ExistsPortsDirection](#) in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the
// application developer.
// MY_PINNUM - PORTS_PIN_10
PLIB_PORTS_PinDirectionInputSet(MY_PORTS_INSTANCE, MY_CHANNEL, MY_PINNUM);
```

5.6.17.6.1.3 PLIB_PORTS_PinDirectionOutputSet Function

C

```
void PLIB_PORTS_PinDirectionOutputSet(  
    PORTS_MODULE_ID index,  
    PORTS_CHANNEL channel,  
    PORTS_BIT_POS bitPos  
);
```

Description

This function enables the write (output) direction for the selected pin.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Identifier for the PORTS channel A, B, C, etc.
bitPos	Possible values of PORTS_BIT_POS

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PORTS_ExistsPortsDirection](#) in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the  
// application developer.  
// MY_PINNUM - PORTS_PIN_10  
PLIB_PORTS_PinDirectionOutputSet(MY_PORTS_INSTANCE, MY_CHANNEL, MY_PINNUM);
```

5.6.17.6.1.4 PLIB_PORTS_PinGet Function

C

```
bool PLIB_PORTS_PinGet(  
    PORTS_MODULE_ID index,  
    PORTS_CHANNEL channel,  
    PORTS_BIT_POS bitPos  
);
```

Description

This function reads/gets data from the selected digital pin.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Identifier for the PORTS channel A, B, C, etc.
bitPos	Possible values of PORTS_BIT_POS

Returns

Port pin read data.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PORTS_ExistsPortsRead](#) in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the  
// application developer.  
// MY_PINNUM - PORTS_PIN_10  
bool bitStatus = PLIB_PORTS_PinGet(MY_PORTS_INSTANCE, MY_CHANNEL, MY_PINNUM);
```

5.6.17.6.1.5 PLIB_PORTS_PinModeSelect Function**C**

```
void PLIB_PORTS_PinModeSelect(  
    PORTS_MODULE_ID index,  
    PORTS_ANALOG_PIN pin,  
    PORTS_PIN_MODE mode  
);
```

Description

This function enables the selected pin as analog or digital.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
pin	Possible values of PORTS_ANALOG_PIN
mode	Possible values of PORTS_PIN_MODE

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PORTS_ExistsPinMode](#) in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the  
// application developer.  
// MY_PIN - PORTS_ANALOG_PIN_0  
// MY_PIN_MODE - PORTS_PIN_MODE_ANALOG  
PLIB_PORTS_PinModeSelect(MY_PORTS_INSTANCE, MY_PIN, MY_PIN_MODE);
```

5.6.17.6.1.6 PLIB_PORTS_PinSet Function**C**

```
void PLIB_PORTS_PinSet(  
    PORTS_MODULE_ID index,  
    PORTS_CHANNEL channel,  
    PORTS_BIT_POS bitPos  
);
```

Description

This function sets the selected digital pin/latch.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Identifier for the PORTS channel A, B, C, etc.
bitPos	Possible values of PORTS_BIT_POS

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PORTS_ExistsPortsWrite](#) in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the
// application developer.
// MY_PINNUM - PORTS_PIN_10
PLIB_PORTS_PinSet(MY_PORTS_INSTANCE, MY_CHANNEL, MY_PINNUM);
```

5.6.17.6.1.7 PLIB_PORTS_PinToggle Function**C**

```
void PLIB_PORTS_PinToggle(
    PORTS_MODULE_ID index,
    PORTS_CHANNEL channel,
    PORTS_BIT_POS bitPos
);
```

Description

This function toggles the selected digital pin/latch.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Identifier for the PORTS channel A, B, C, etc.
bitPos	Possible values of PORTS_BIT_POS

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PORTS_ExistsPortsWrite](#) in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the
// application developer.
// MY_PINNUM - PORTS_PIN_10
PLIB_PORTS_PinToggle(MY_PORTS_INSTANCE, MY_CHANNEL, MY_PINNUM);
```

5.6.17.6.1.8 PLIB_PORTS_PinWrite Function**C**

```
void PLIB_PORTS_PinWrite(
    PORTS_MODULE_ID index,
    PORTS_CHANNEL channel,
    PORTS_BIT_POS bitPos,
    bool value
);
```

Description

This function writes to the selected digital pin/latch.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Identifier for the PORTS channel A, B, C, etc.
bitPos	Possible values of PORTS_BIT_POS
value	Value to be written to the specific pin/latch
true	sets the bit, false - clears the bit

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PORTS_ExistsPortsWrite](#) in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the
// application developer.
// MY_PINNUM - PORTS_PIN_10
PLIB_PORTS_PinWrite(MY_PORTS_INSTANCE, MY_CHANNEL, MY_PINNUM);
```

5.6.17.6.1.9 PLIB_PORTS_PinModePerPortSelect Function**C**

```
void PLIB_PORTS_PinModePerPortSelect(
    PORTS_MODULE_ID index,
    PORTS_CHANNEL channel,
    PORTS_BIT_POS bitPos,
    PORTS_PIN_MODE mode
);
```

Description

This function enables the selected pin as analog or digital.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Port pin channel
bitPos	Position in the PORT pins
mode	Possible values of PORTS_PIN_MODE

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PORTS_ExistsPinMode](#) in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the
// application developer.
// MY_PIN      - PORTS_ANALOG_PIN_0
// MY_PIN_MODE - PORTS_PIN_MODE_ANALOG
PLIB_PORTS_PinModeSelect(MY_PORTS_INSTANCE, MY_PIN, MY_PIN_MODE);
```

5.6.17.6.2 Port Functions

5.6.17.6.2.1 PLIB_PORTS_Clear Function

C

```
void PLIB_PORTS_Clear(
    PORTS_MODULE_ID index,
    PORTS_CHANNEL channel,
    PORTS_DATA_MASK clearMask
);
```

Description

This function clears the selected digital port/latch.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Identifier for the PORTS channel A, B, C, etc.
clearMask	Identifies the bits to be cleared

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PORTS_ExistsPortsWrite](#) in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the
// application developer.
PORTS_DATA_MASK clearMask = (PORTS_DATA_MASK)0x00FF;
PLIB_PORTS_Clear(MY_PORTS_INSTANCE, MY_CHANNEL, clearMask);
```

5.6.17.6.2.2 PLIB_PORTS_DirectionGet Function**C**

```
PORTS_DATA_MASK PLIB_PORTS_DirectionGet(
    PORTS_MODULE_ID index,
    PORTS_CHANNEL channel
);
```

Description

This function reads the direction of the selected digital port.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Identifier for the PORTS channel A, B, C, etc.

Returns

Direction of the selected port of type [PORTS_DATA_MASK](#)

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PORTS_ExistsPortsDirection](#) in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the
// application developer.
PORTS_DATA_MASK readDir = PLIB_PORTS_DirectionGet(MY_PORTS_INSTANCE, MY_CHANNEL);
```

5.6.17.6.2.3 PLIB_PORTS_DirectionInputSet Function**C**

```
void PLIB_PORTS_DirectionInputSet(
    PORTS_MODULE_ID index,
    PORTS_CHANNEL channel,
    PORTS_DATA_MASK mask
);
```

Description

This function enables the read (input) direction for the selected port.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

channel	Identifier for the PORTS channel A, B, C, etc.
mask	mask for the direction of width PORTS_DATA_MASK

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PORTS_ExistsPortsDirection](#) in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the
// application developer.
PLIB_PORTS_DirectionInputSet(MY_PORTS_INSTANCE, MY_CHANNEL, (PORTS_DATA_MASK)0x00FF);
```

5.6.17.6.2.4 PLIB_PORTS_DirectionOutputSet Function**C**

```
void PLIB_PORTS_DirectionOutputSet(
    PORTS_MODULE_ID index,
    PORTS_CHANNEL channel,
    PORTS_DATA_MASK mask
);
```

Description

This function enables the write (output) direction for the selected port.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Identifier for the PORTS channel A, B, C, etc.
mask	mask for the direction of width PORTS_DATA_MASK

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PORTS_ExistsPortsDirection](#) in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the
// application developer.
PLIB_PORTS_DirectionOutputSet(MY_PORTS_INSTANCE, MY_CHANNEL, (PORTS_DATA_MASK)0x00FF);
```

5.6.17.6.2.5 PLIB_PORTS_PinOpenDrainDisable Function**C**

```
void PLIB_PORTS_PinOpenDrainDisable(
    PORTS_MODULE_ID index,
    PORTS_CHANNEL channel,
    PORTS_BIT_POS bitPos
);
```

Description

This function disables the open drain functionality for the selected pin.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Identifier for the PORTS channel A, B, C, etc.
bitPos	Possible values of PORTS_BIT_POS

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PORTS_ExistsPortsOpenDrain](#) in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the
// application developer.
// MY_PINNUM - PORTS_PIN_10
PLIB_PORTS_PinOpenDrainDisable(MY_PORTS_INSTANCE, MY_CHANNEL, MY_PINNUM);
```

5.6.17.6.2.6 PLIB_PORTS_PinOpenDrainEnable Function**C**

```
void PLIB_PORTS_PinOpenDrainEnable(
    PORTS_MODULE_ID index,
    PORTS_CHANNEL channel,
    PORTS_BIT_POS bitPos
);
```

Description

This function enables the open drain functionality for the selected pin.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Identifier for the PORTS channel A, B, C, etc.
bitPos	Possible values of PORTS_BIT_POS

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PORTS_ExistsPortsOpenDrain](#) in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the  
// application developer.  
// MY_PINNUM - PORTS_PIN_10  
PLIB_PORTS_PinOpenDrainEnable(MY_PORTS_INSTANCE, MY_CHANNEL, MY_PINNUM);
```

5.6.17.6.2.7 PLIB_PORTS_Read Function**C**

```
PORTS_DATA_TYPE PLIB_PORTS_Read(  
    PORTS_MODULE_ID index,  
    PORTS_CHANNEL channel  
);
```

Description

This function reads from the selected digital port.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Identifier for the PORTS channel A, B, C, etc.

Returns

data on a port with width [PORTS_DATA_TYPE](#)

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PORTS_ExistsPortsRead](#) in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the  
// application developer.  
PORTS_DATA_TYPE readData = PLIB_PORTS_Read(MY_PORTS_INSTANCE, MY_CHANNEL);
```

5.6.17.6.2.8 PLIB_PORTS_Set Function**C**

```
void PLIB_PORTS_Set(  
    PORTS_MODULE_ID index,  
    PORTS_CHANNEL channel,  
    PORTS_DATA_TYPE value,  
    PORTS_DATA_MASK mask  
);
```

Description

This function writes to the selected digital port/latch relative to the mask.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

channel	Identifier for the PORTS channel A, B, C, etc.
value	Value to be written into a port of width PORTS_DATA_TYPE
mask	Identifies the bits to be written to

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PORTS_ExistsPortsWrite](#) in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the
// application developer.
// MY_VALUE - 0x1234
PORTS_DATA_MASK myMask = (PORTS_DATA_MASK)0x00FF;
PLIB_PORTS_Set(MY_PORTS_INSTANCE, MY_CHANNEL, MY_VALUE, myMask);
```

5.6.17.6.2.9 PLIB_PORTS_Toggle Function**C**

```
void PLIB_PORTS_Toggle(
    PORTS_MODULE_ID index,
    PORTS_CHANNEL channel,
    PORTS_DATA_MASK toggleMask
);
```

Description

This function toggles the selected digital port/latch.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Identifier for the PORTS channel A, B, C, etc.
toggleMask	Identifies the bits to be toggled

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PORTS_ExistsPortsWrite](#) in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the
// application developer.
PORTS_DATA_MASK toggleMask = (PORTS_DATA_MASK)0x00FF;
PLIB_PORTS_Toggle(MY_PORTS_INSTANCE, MY_CHANNEL, toggleMask);
```

5.6.17.6.2.10 PLIB_PORTS_Write Function**C**

```
void PLIB_PORTS_Write(
```

```
    PORTS_MODULE_ID index,  
    PORTS_CHANNEL channel,  
    PORTS_DATA_TYPE value  
);
```

Description

This function writes to the selected digital port/latch.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Identifier for the PORTS channel A, B, C, etc.
value	Value to be written into a port of width PORTS_DATA_TYPE

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PORTS_ExistsPortsWrite](#) in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the  
// application developer.  
// MY_VALUE - 0x1234  
PLIB_PORTS_Write(MY_PORTS_INSTANCE, MY_CHANNEL, MY_VALUE);
```

5.6.17.6.2.11 PLIB_PORTS_OpenDrainDisable Function

C

```
void PLIB_PORTS_OpenDrainDisable(  
    PORTS_MODULE_ID index,  
    PORTS_CHANNEL channel,  
    PORTS_DATA_MASK mask  
);
```

Description

This function disables the open drain functionality for the selected port.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Identifier for the PORTS channel A, B, C, etc.
mask	mask of type PORTS_DATA_MASK

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use

[PLIB_PORTS_ExistsPortsOpenDrain](#) in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the
// application developer.
PLIB_PORTS_OpenDrainDisable(MY_PORTS_INSTANCE, MY_CHANNEL, (PORTS_DATA_MASK)0x00FF);
```

5.6.17.6.2.12 PLIB_PORTS_OpenDrainEnable Function

C

```
void PLIB_PORTS_OpenDrainEnable(
    PORTS_MODULE_ID index,
    PORTS_CHANNEL channel,
    PORTS_DATA_MASK mask
);
```

Description

This function enables the open drain functionality for the selected port.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Identifier for the PORTS channel A, B, C, etc.
mask	mask of type PORTS_DATA_MASK

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PORTS_ExistsPortsOpenDrain](#) in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the
// application developer.
PLIB_PORTS_OpenDrainEnable(MY_PORTS_INSTANCE, MY_CHANNEL, (PORTS_DATA_MASK)0x00FF);
```

5.6.17.6.3 Peripheral Pin Select Functions

5.6.17.6.3.1 PLIB_PORTS_RemapInput Function

C

```
void PLIB_PORTS_RemapInput(
    PORTS_MODULE_ID index,
    PORTS_REMAP_INPUT_FUNCTION function,
    PORTS_REMAP_INPUT_PIN remapPin
);
```

Description

This function controls the I/O function remapping.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_PORTS_ExistsRemapInputOutput` in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the  
// application developer.  
// Remapping input function 'Input Capture 1' to the Remappable pin 'RPD2'  
PLIB_PORTS_RemapInput(MY_PORTS_INSTANCE, INPUT_FUNC_IC1, INPUT_PIN_RPD2 );
```

5.6.17.6.3.2 PLIB_PORTS_RemapOutput Function**C**

```
void PLIB_PORTS_RemapOutput(  
    PORTS_MODULE_ID index,  
    PORTS_REMAP_OUTPUT_FUNCTION function,  
    PORTS_REMAP_OUTPUT_PIN remapPin  
);
```

Description

This function controls the I/O function remapping.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_PORTS_ExistsRemapInputOutput` in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the  
// application developer.  
// Remapping output function 'UART3 Transmit' to the Remappable pin 'RPA14'  
PLIB_PORTS_RemapInputOutput(MY_PORTS_INSTANCE, OUTPUT_FUNC_U3TX, OUTPUT_PIN_RPA14);
```

5.6.17.6.4 Change Notification Functions

5.6.17.6.4.1 PLIB_PORTS_ChangeNoticeDisable Function

C

```
void PLIB_PORTS_ChangeNoticeDisable(  
    PORTS_MODULE_ID index  
);
```

Description

This function disables the global Change Notice feature.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PORTS_ExistsChangeNotice](#) in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the  
// application developer.  
PLIB_PORTS_ChangeNoticeDisable(MY_PORTS_INSTANCE);
```

5.6.17.6.4.2 PLIB_PORTS_ChangeNoticeEnable Function

C

```
void PLIB_PORTS_ChangeNoticeEnable(  
    PORTS_MODULE_ID index  
);
```

Description

This function enables the global Change Notice feature.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PORTS_ExistsChangeNotice](#) in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the
```

```
// application developer.  
PLIB_PORTS_ChangeNoticeEnable(MY_PORTS_INSTANCE);
```

5.6.17.6.4.3 PLIB_PORTS_ChangeNoticeInIdleDisable Function

C

```
void PLIB_PORTS_ChangeNoticeInIdleDisable(  
    PORTS_MODULE_ID index  
);
```

Description

This function allows change notice operation to continue upon CPU Idle mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PORTS_ExistsChangeNoticeInIdle](#) in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the  
// application developer.  
PLIB_PORTS_ChangeNoticeInIdleDisable(MY_PORTS_INSTANCE);
```

5.6.17.6.4.4 PLIB_PORTS_ChangeNoticeInIdleEnable Function

C

```
void PLIB_PORTS_ChangeNoticeInIdleEnable(  
    PORTS_MODULE_ID index  
);
```

Description

This function halts Change Notice operation on CPU Idle mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PORTS_ExistsChangeNoticeInIdle](#) in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the  
// application developer.  
PLIB_PORTS_ChangeNoticeInIdleEnable(MY_PORTS_INSTANCE);
```

5.6.17.6.4.5 PLIB_PORTS_ChangeNoticeInIdlePerPortDisable Function**C**

```
void PLIB_PORTS_ChangeNoticeInIdlePerPortDisable(  
    PORTS_MODULE_ID index,  
    PORTS_CHANNEL channel  
);
```

Description

This function enables the selected pin as analog or digital.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Port pin channel
bitPos	Position in the PORT pins
mode	Possible values of PORTS_PIN_MODE

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PORTS_ExistsPinMode](#) in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the  
// application developer.  
// MY_PIN - PORTS_ANALOG_PIN_0  
// MY_PIN_MODE - PORTS_PIN_MODE_ANALOG  
PLIB_PORTS_PinModeSelect(MY_PORTS_INSTANCE, MY_PIN, MY_PIN_MODE);
```

5.6.17.6.4.6 PLIB_PORTS_ChangeNoticeInIdlePerPortEnable Function**C**

```
void PLIB_PORTS_ChangeNoticeInIdlePerPortEnable(  
    PORTS_MODULE_ID index,  
    PORTS_CHANNEL channel  
);
```

Description

This function enables the selected pin as analog or digital.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Port pin channel
bitPos	Position in the PORT pins
mode	Possible values of PORTS_PIN_MODE

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PORTS_ExistsPinMode](#) in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the
// application developer.
// MY_PIN          - PORTS_ANALOG_PIN_0
// MY_PIN_MODE     - PORTS_PIN_MODE_ANALOG
PLIB_PORTS_PinModeSelect(MY_PORTS_INSTANCE, MY_PIN, MY_PIN_MODE);
```

5.6.17.6.4.7 PLIB_PORTS_ChangeNoticePerPortHasOccured Function**C**

```
bool PLIB_PORTS_ChangeNoticePerPortHasOccured(
    PORTS_MODULE_ID index,
    PORTS_CHANNEL channel,
    PORTS_BIT_POS bitPos
);
```

Description

This function enables the selected pin as analog or digital.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Port pin channel
bitPos	Position in the PORT pins
mode	Possible values of PORTS_PIN_MODE

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PORTS_ExistsPinMode](#) in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the
// application developer.
// MY_PIN          - PORTS_ANALOG_PIN_0
```

```
// MY_PIN_MODE - PORTS_PIN_MODE_ANALOG
PLIB_PORTS_PinModeSelect(MY_PORTS_INSTANCE, MY_PIN, MY_PIN_MODE);
```

5.6.17.6.4.8 PLIB_PORTS_ChangeNoticePerPortTurnOff Function

C

```
void PLIB_PORTS_ChangeNoticePerPortTurnOff(
    PORTS_MODULE_ID index,
    PORTS_CHANNEL channel
);
```

Description

This function enables the selected pin as analog or digital.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Port pin channel
bitPos	Position in the PORT pins
mode	Possible values of PORTS_PIN_MODE

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PORTS_ExistsPinMode](#) in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the
// application developer.
// MY_PIN - PORTS_ANALOG_PIN_0
// MY_PIN_MODE - PORTS_PIN_MODE_ANALOG
PLIB_PORTS_PinModeSelect(MY_PORTS_INSTANCE, MY_PIN, MY_PIN_MODE);
```

5.6.17.6.4.9 PLIB_PORTS_ChangeNoticePerPortTurnOn Function

C

```
void PLIB_PORTS_ChangeNoticePerPortTurnOn(
    PORTS_MODULE_ID index,
    PORTS_CHANNEL channel
);
```

Description

This function enables the selected pin as analog or digital.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Port pin channel

bitPos	Position in the PORT pins
mode	Possible values of PORTS_PIN_MODE

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PORTS_ExistsPinMode](#) in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the
// application developer.
// MY_PIN          - PORTS_ANALOG_PIN_0
// MY_PIN_MODE     - PORTS_PIN_MODE_ANALOG
PLIB_PORTS_PinModeSelect(MY_PORTS_INSTANCE, MY_PIN, MY_PIN_MODE);
```

5.6.17.6.4.10 PLIB_PORTS_ChangeNoticePullDownPerPortDisable Function**C**

```
void PLIB_PORTS_ChangeNoticePullDownPerPortDisable(
    PORTS_MODULE_ID index,
    PORTS_CHANNEL channel,
    PORTS_BIT_POS bitPos
);
```

Description

This function enables the selected pin as analog or digital.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Port pin channel
bitPos	Position in the PORT pins
mode	Possible values of PORTS_PIN_MODE

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PORTS_ExistsPinMode](#) in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the
// application developer.
// MY_PIN          - PORTS_ANALOG_PIN_0
// MY_PIN_MODE     - PORTS_PIN_MODE_ANALOG
PLIB_PORTS_PinModeSelect(MY_PORTS_INSTANCE, MY_PIN, MY_PIN_MODE);
```

5.6.17.6.4.11 PLIB_PORTS_ChangeNoticePullDownPerPortEnable Function

C

```
void PLIB_PORTS_ChangeNoticePullDownPerPortEnable(  
    PORTS_MODULE_ID index,  
    PORTS_CHANNEL channel,  
    PORTS_BIT_POS bitPos  
);
```

Description

This function enables the selected pin as analog or digital.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Port pin channel
bitPos	Position in the PORT pins
mode	Possible values of PORTS_PIN_MODE

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PORTS_ExistsPinMode](#) in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the  
// application developer.  
// MY_PIN - PORTS_ANALOG_PIN_0  
// MY_PIN_MODE - PORTS_PIN_MODE_ANALOG  
PLIB_PORTS_PinModeSelect(MY_PORTS_INSTANCE, MY_PIN, MY_PIN_MODE);
```

5.6.17.6.4.12 PLIB_PORTS_ChangeNoticePullUpDisable Function

C

```
void PLIB_PORTS_ChangeNoticePullUpDisable(  
    PORTS_MODULE_ID index,  
    PORTS_CHANGE_NOTICE_PIN pinNum  
);
```

Description

This function disables pull-up on input change.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
pinNum	Possible values of PORTS_CHANGE_NOTICE_PIN

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PORTS_ExistsChangeNoticePullUp](#) in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the
// application developer.
// MY_PINNUM - PORTS_CHANGE_NOTICE_PIN_10
PLIB_PORTS_ChangeNoticePullUpDisable(MY_PORTS_INSTANCE, MY_PINNUM);
```

5.6.17.6.4.13 PLIB_PORTS_ChangeNoticePullUpEnable Function**C**

```
void PLIB_PORTS_ChangeNoticePullUpEnable(
    PORTS_MODULE_ID index,
    PORTS_CHANGE_NOTICE_PIN pinNum
);
```

Description

This function enables pull-up on input change.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
pinNum	Possible values of PORTS_CHANGE_NOTICE_PIN

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PORTS_ExistsChangeNoticePullUp](#) in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the
// application developer.
// MY_PINNUM - PORTS_CHANGE_NOTICE_PIN_10
PLIB_PORTS_ChangeNoticePullUpEnable(MY_PORTS_INSTANCE, MY_PINNUM);
```

5.6.17.6.4.14 PLIB_PORTS_ChangeNoticePullUpPerPortDisable Function**C**

```
void PLIB_PORTS_ChangeNoticePullUpPerPortDisable(
    PORTS_MODULE_ID index,
    PORTS_CHANNEL channel,
    PORTS_BIT_POS bitPos
);
```

Description

This function enables the selected pin as analog or digital.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Port pin channel
bitPos	Position in the PORT pins
mode	Possible values of PORTS_PIN_MODE

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PORTS_ExistsPinMode](#) in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the
// application developer.
// MY_PIN          - PORTS_ANALOG_PIN_0
// MY_PIN_MODE     - PORTS_PIN_MODE_ANALOG
PLIB_PORTS_PinModeSelect(MY_PORTS_INSTANCE, MY_PIN, MY_PIN_MODE);
```

5.6.17.6.4.15 PLIB_PORTS_ChangeNoticePullUpPerPortEnable Function**C**

```
void PLIB_PORTS_ChangeNoticePullUpPerPortEnable(
    PORTS_MODULE_ID index,
    PORTS_CHANNEL channel,
    PORTS_BIT_POS bitPos
);
```

Description

This function enables the selected pin as analog or digital.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Port pin channel
bitPos	Position in the PORT pins
mode	Possible values of PORTS_PIN_MODE

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PORTS_ExistsPinMode](#) in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the
// application developer.
// MY_PIN - PORTS_ANALOG_PIN_0
// MY_PIN_MODE - PORTS_PIN_MODE_ANALOG
PLIB_PORTS_PinModeSelect(MY_PORTS_INSTANCE, MY_PIN, MY_PIN_MODE);
```

5.6.17.6.4.16 PLIB_PORTS_PinChangeNoticeDisable Function**C**

```
void PLIB_PORTS_PinChangeNoticeDisable(
    PORTS_MODULE_ID index,
    PORTS_CHANGE_NOTICE_PIN pinNum
);
```

Description

This function disables the port pin Change Notice feature.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
pinNum	Possible values of PORTS_CHANGE_NOTICE_PIN

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PORTS_ExistsPinChangeNotice](#) in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the
// application developer.
// MY_PINNUM - PORTS_CHANGE_NOTICE_PIN_10
PLIB_PORTS_PinChangeNoticeDisable(MY_PORTS_INSTANCE, MY_PINNUM);
```

5.6.17.6.4.17 PLIB_PORTS_PinChangeNoticeEnable Function**C**

```
void PLIB_PORTS_PinChangeNoticeEnable(
    PORTS_MODULE_ID index,
    PORTS_CHANGE_NOTICE_PIN pinNum
);
```

Description

This function enables the port pin Change Notice feature.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

pinNum	Possible values of PORTS_CHANGE_NOTICE_PIN

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PORTS_ExistsPinChangeNotice](#) in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the
// application developer.
// MY_PINNUM - PORTS_CHANGE_NOTICE_PIN_10
PLIB_PORTS_PinChangeNoticeEnable(MY_PORTS_INSTANCE, MY_PINNUM);
```

5.6.17.6.4.18 PLIB_PORTS_PinChangeNoticePerPortDisable Function**C**

```
void PLIB_PORTS_PinChangeNoticePerPortDisable(
    PORTS_MODULE_ID index,
    PORTS_CHANNEL channel,
    PORTS_BIT_POS bitPos
);
```

Description

This function enables the selected pin as analog or digital.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Port pin channel
bitPos	Position in the PORT pins
mode	Possible values of PORTS_PIN_MODE

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PORTS_ExistsPinMode](#) in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the
// application developer.
// MY_PIN - PORTS_ANALOG_PIN_0
// MY_PIN_MODE - PORTS_PIN_MODE_ANALOG
PLIB_PORTS_PinModeSelect(MY_PORTS_INSTANCE, MY_PIN, MY_PIN_MODE);
```

5.6.17.6.4.19 PLIB_PORTS_PinChangeNoticePerPortEnable Function**C**

```
void PLIB_PORTS_PinChangeNoticePerPortEnable(
    PORTS_MODULE_ID index,
```

```
    PORTS_CHANNEL channel,  
    PORTS_BIT_POS bitPos  
);
```

Description

This function enables the selected pin as analog or digital.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Port pin channel
bitPos	Position in the PORT pins
mode	Possible values of PORTS_PIN_MODE

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_PORTS_ExistsPinMode](#) in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the  
// application developer.  
// MY_PIN      - PORTS_ANALOG_PIN_0  
// MY_PIN_MODE - PORTS_PIN_MODE_ANALOG  
PLIB_PORTS_PinModeSelect(MY_PORTS_INSTANCE, MY_PIN, MY_PIN_MODE);
```

5.6.17.6.5 Data Types and Constants

5.6.17.6.5.1 PORTS_ANALOG_PIN Enumeration

C

```
typedef enum {  
    PORTS_ANALOG_PIN_0,  
    PORTS_ANALOG_PIN_1,  
    PORTS_ANALOG_PIN_2,  
    PORTS_ANALOG_PIN_3,  
    PORTS_ANALOG_PIN_4,

PORTS_ANALOG_PINS_ALL
} PORTS_ANALOG_PIN;

```

Description

PORTS Analog input pins

This data type defines the different Analog input pins

Members

Members	Description
PORTS_ANALOG_PIN_0	Analog Input Pin 0
PORTS_ANALOG_PIN_1	Analog Input Pin 1
PORTS_ANALOG_PIN_2	Analog Input Pin 2
PORTS_ANALOG_PIN_3	Analog Input Pin 3
PORTS_ANALOG_PIN_4	Analog Input Pin 4
PORTS_ANALOG_PIN_5	Analog Input Pin 5
PORTS_ANALOG_PIN_6	Analog Input Pin 6
PORTS_ANALOG_PIN_7	Analog Input Pin 7
PORTS_ANALOG_PIN_8	Analog Input Pin 8
PORTS_ANALOG_PIN_9	Analog Input Pin 9
PORTS_ANALOG_PIN_10	Analog Input Pin 10
PORTS_ANALOG_PIN_11	Analog Input Pin 11
PORTS_ANALOG_PIN_12	Analog Input Pin 12
PORTS_ANALOG_PIN_13	Analog Input Pin 13
PORTS_ANALOG_PIN_14	Analog Input Pin 14
PORTS_ANALOG_PIN_15	Analog Input Pin 15
PORTS_ANALOG_PIN_16	Analog Input Pin 16
PORTS_ANALOG_PIN_17	Analog Input Pin 17
PORTS_ANALOG_PIN_18	Analog Input Pin 18
PORTS_ANALOG_PIN_19	Analog Input Pin 19
PORTS_ANALOG_PIN_20	Analog Input Pin 20
PORTS_ANALOG_PIN_21	Analog Input Pin 21
PORTS_ANALOG_PIN_22	Analog Input Pin 22
PORTS_ANALOG_PIN_23	Analog Input Pin 23
PORTS_ANALOG_PIN_24	Analog Input Pin 8
PORTS_ANALOG_PIN_25	Analog Input Pin 9
PORTS_ANALOG_PIN_26	Analog Input Pin 10
PORTS_ANALOG_PIN_27	Analog Input Pin 11
PORTS_ANALOG_PIN_28	Analog Input Pin 12
PORTS_ANALOG_PIN_29	Analog Input Pin 13

PORTS_ANALOG_PIN_30	Analog Input Pin 14
PORTS_ANALOG_PIN_31	Analog Input Pin 15
PORTS_ANALOG_PINS_ALL	All Analog Pins

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all parts

5.6.17.6.5.2 PORTS_BIT_POS Enumeration**C**

```
typedef enum {
    PORTS_BIT_POS_0,
    PORTS_BIT_POS_1,
    PORTS_BIT_POS_2,
    PORTS_BIT_POS_3,
    PORTS_BIT_POS_4,
    PORTS_BIT_POS_5,
    PORTS_BIT_POS_6,
    PORTS_BIT_POS_7,
    PORTS_BIT_POS_8,
    PORTS_BIT_POS_9,
    PORTS_BIT_POS_10,
    PORTS_BIT_POS_11,
    PORTS_BIT_POS_12,
    PORTS_BIT_POS_13,
    PORTS_BIT_POS_14,
    PORTS_BIT_POS_15
} PORTS_BIT_POS;
```

Description

PORTS bit positions

Lists the constants which hold different bit positions of PORTS.

Members

Members	Description
PORTS_BIT_POS_0	PORT bit position 0
PORTS_BIT_POS_1	PORT bit position 1
PORTS_BIT_POS_2	PORT bit position 2
PORTS_BIT_POS_3	PORT bit position 3
PORTS_BIT_POS_4	PORT bit position 4
PORTS_BIT_POS_5	PORT bit position 5
PORTS_BIT_POS_6	PORT bit position 6
PORTS_BIT_POS_7	PORT bit position 7
PORTS_BIT_POS_8	PORT bit position 8
PORTS_BIT_POS_9	PORT bit position 9
PORTS_BIT_POS_10	PORT bit position 10
PORTS_BIT_POS_11	PORT bit position 11
PORTS_BIT_POS_12	PORT bit position 12
PORTS_BIT_POS_13	PORT bit position 13
PORTS_BIT_POS_14	PORT bit position 14
PORTS_BIT_POS_15	PORT bit position 15

Remarks

These are the superset enumerations provided for documentation, not all constants are available on all devices.

5.6.17.6.5.3 PORTS_CHANGE_NOTICE_PIN Enumeration**C**

```
typedef enum {  
    PORTS_CHANGE_NOTICE_PIN_0,

Description

Change Notification Pins enumeration

This data type defines the different Change Notification Pins enumeration

Members

Members	Description
PORTS_CHANGE_NOTICE_PIN_0	Change Notification Pin 0
PORTS_CHANGE_NOTICE_PIN_1	Change Notification Pin 1
PORTS_CHANGE_NOTICE_PIN_2	Change Notification Pin 2
PORTS_CHANGE_NOTICE_PIN_3	Change Notification Pin 3
PORTS_CHANGE_NOTICE_PIN_4	Change Notification Pin 4
PORTS_CHANGE_NOTICE_PIN_5	Change Notification Pin 5
PORTS_CHANGE_NOTICE_PIN_6	Change Notification Pin 6
PORTS_CHANGE_NOTICE_PIN_7	Change Notification Pin 7
PORTS_CHANGE_NOTICE_PIN_8	Change Notification Pin 8
PORTS_CHANGE_NOTICE_PIN_9	Change Notification Pin 9
PORTS_CHANGE_NOTICE_PIN_10	Change Notification Pin 10
PORTS_CHANGE_NOTICE_PIN_11	Change Notification Pin 11
PORTS_CHANGE_NOTICE_PIN_12	Change Notification Pin 12
PORTS_CHANGE_NOTICE_PIN_13	Change Notification Pin 13
PORTS_CHANGE_NOTICE_PIN_14	Change Notification Pin 14
PORTS_CHANGE_NOTICE_PIN_15	Change Notification Pin 15
PORTS_CHANGE_NOTICE_PIN_16	Change Notification Pin 16
PORTS_CHANGE_NOTICE_PIN_17	Change Notification Pin 17

PORTS_CHANGE_NOTICE_PIN_18	Change Notification Pin 18
PORTS_CHANGE_NOTICE_PIN_19	Change Notification Pin 19
PORTS_CHANGE_NOTICE_PIN_20	Change Notification Pin 20
PORTS_CHANGE_NOTICE_PIN_21	Change Notification Pin 21
PORTS_CHANGE_NOTICE_PIN_22	Change Notification Pin 22
PORTS_CHANGE_NOTICE_PIN_23	Change Notification Pin 23
PORTS_CHANGE_NOTICE_PIN_24	Change Notification Pin 24
PORTS_CHANGE_NOTICE_PIN_25	Change Notification Pin 25
PORTS_CHANGE_NOTICE_PIN_26	Change Notification Pin 26
PORTS_CHANGE_NOTICE_PIN_27	Change Notification Pin 27
PORTS_CHANGE_NOTICE_PIN_28	Change Notification Pin 28
PORTS_CHANGE_NOTICE_PIN_29	Change Notification Pin 29
PORTS_CHANGE_NOTICE_PIN_30	Change Notification Pin 30
PORTS_CHANGE_NOTICE_PIN_31	Change Notification Pin 31
PORTS_CHANGE_NOTICE_PIN_32	Change Notification Pin 32
PORTS_CHANGE_NOTICE_PIN_33	Change Notification Pin 33
PORTS_CHANGE_NOTICE_PIN_34	Change Notification Pin 34
PORTS_CHANGE_NOTICE_PIN_35	Change Notification Pin 35
PORTS_CHANGE_NOTICE_PIN_36	Change Notification Pin 36
PORTS_CHANGE_NOTICE_PIN_37	Change Notification Pin 37
PORTS_CHANGE_NOTICE_PIN_38	Change Notification Pin 38
PORTS_CHANGE_NOTICE_PIN_39	Change Notification Pin 39
PORTS_CHANGE_NOTICE_PIN_40	Change Notification Pin 40
PORTS_CHANGE_NOTICE_PIN_41	Change Notification Pin 41
PORTS_CHANGE_NOTICE_PIN_42	Change Notification Pin 42
PORTS_CHANGE_NOTICE_PIN_43	Change Notification Pin 43
PORTS_CHANGE_NOTICE_PIN_44	Change Notification Pin 44
PORTS_CHANGE_NOTICE_PIN_45	Change Notification Pin 45
PORTS_CHANGE_NOTICE_PIN_46	Change Notification Pin 46
PORTS_CHANGE_NOTICE_PIN_47	Change Notification Pin 47
PORTS_CHANGE_NOTICE_PIN_48	Change Notification Pin 48
PORTS_CHANGE_NOTICE_PIN_49	Change Notification Pin 49
PORTS_CHANGE_NOTICE_PIN_50	Change Notification Pin 50
PORTS_CHANGE_NOTICE_PIN_51	Change Notification Pin 51
PORTS_CHANGE_NOTICE_PIN_52	Change Notification Pin 52
PORTS_CHANGE_NOTICE_PIN_53	Change Notification Pin 53
PORTS_CHANGE_NOTICE_PIN_54	Change Notification Pin 54
PORTS_CHANGE_NOTICE_PIN_55	Change Notification Pin 55
PORTS_CHANGE_NOTICE_PIN_56	Change Notification Pin 56
PORTS_CHANGE_NOTICE_PIN_57	Change Notification Pin 57
PORTS_CHANGE_NOTICE_PIN_58	Change Notification Pin 58
PORTS_CHANGE_NOTICE_PIN_59	Change Notification Pin 59
PORTS_CHANGE_NOTICE_PIN_60	Change Notification Pin 60
PORTS_CHANGE_NOTICE_PIN_61	Change Notification Pin 61
PORTS_CHANGE_NOTICE_PIN_62	Change Notification Pin 62

PORTS_CHANGE_NOTICE_PIN_63	Change Notification Pin 63
PORTS_CHANGE_NOTICE_PIN_64	Change Notification Pin 64
PORTS_CHANGE_NOTICE_PIN_65	Change Notification Pin 65
PORTS_CHANGE_NOTICE_PIN_66	Change Notification Pin 66
PORTS_CHANGE_NOTICE_PIN_67	Change Notification Pin 67
PORTS_CHANGE_NOTICE_PIN_68	Change Notification Pin 68
PORTS_CHANGE_NOTICE_PIN_69	Change Notification Pin 69
PORTS_CHANGE_NOTICE_PIN_70	Change Notification Pin 70
PORTS_CHANGE_NOTICE_PIN_71	Change Notification Pin 71
PORTS_CHANGE_NOTICE_PIN_72	Change Notification Pin 72
PORTS_CHANGE_NOTICE_PIN_73	Change Notification Pin 73
PORTS_CHANGE_NOTICE_PIN_74	Change Notification Pin 74
PORTS_CHANGE_NOTICE_PIN_75	Change Notification Pin 75
PORTS_CHANGE_NOTICE_PIN_76	Change Notification Pin 76
PORTS_CHANGE_NOTICE_PIN_77	Change Notification Pin 77
PORTS_CHANGE_NOTICE_PIN_78	Change Notification Pin 78
PORTS_CHANGE_NOTICE_PIN_79	Change Notification Pin 79
PORTS_CHANGE_NOTICE_PIN_80	Change Notification Pin 8
PORTS_CHANGE_NOTICE_PIN_81	Change Notification Pin 81
PORTS_CHANGE_NOTICE_PIN_82	Change Notification Pin 82
PORTS_CHANGE_NOTICE_PIN_83	Change Notification Pin 83
PORTS_CHANGE_NOTICE_PIN_84	Change Notification Pin 84

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all parts

5.6.17.6.5.4 PORTS_CHANNEL Enumeration**C**

```
typedef enum {
    PORTS_CHANNEL_A,
    PORTS_CHANNEL_B,
    PORTS_CHANNEL_C,
    PORTS_CHANNEL_D,
    PORTS_CHANNEL_E,
    PORTS_CHANNEL_F,
    PORTS_CHANNEL_G,
    PORTS_CHANNEL_H,
    PORTS_CHANNEL_J,
    PORTS_NUMBER_OF_CHANNELS
} PORTS_CHANNEL;
```

Description

PORT Channel ID

This enumeration identifies the available PORT Channels.

Members

Members	Description
PORTS_CHANNEL_A	Port A
PORTS_CHANNEL_B	Port B

PORTS_CHANNEL_C	Port C
PORTS_CHANNEL_D	Port D
PORTS_CHANNEL_E	Port E
PORTS_CHANNEL_F	Port F
PORTS_CHANNEL_G	Port G
PORTS_CHANNEL_H	Port H
PORTS_CHANNEL_J	Port J
PORTS_NUMBER_OF_CHANNELS	Max number of Ports

Remarks

The caller should not rely on the specific numbers assigned to any of these values as they may change from one processor to the next.

Not all modules will be available on all microcontrollers. Refer to the data sheet for the specific controller in use to determine which modules are supported. The numbers used in the enumeration values will match the numbers given in the data sheet.

5.6.17.6.5.5 PORTS_DATA_MASK Type**C**

```
typedef uint16_t PORTS_DATA_MASK;
```

Description

PORTS data mask definition

This data type defines the PORTS data mask

Remarks

This data type changes sizes, depending on if it is being used on an 8- 16- or 32-bit part.

5.6.17.6.5.6 PORTS_DATA_TYPE Type**C**

```
typedef uint32_t PORTS_DATA_TYPE;
```

Description

PORTS data type definition

This data type defines the PORTS data type.

Remarks

This data type changes sizes, depending on if it is being used on an 8-, 16-, or 32-bit device.

5.6.17.6.5.7 PORTS_MODULE_ID Enumeration**C**

```
typedef enum {
    PORTS_ID_0,
    PORT_NUMBER_OF_MODULES
} PORTS_MODULE_ID;
```

Description

PORT Module ID

This enumeration identifies the available PORT modules.

Members

Members	Description
PORT_NUMBER_OF_MODULES	Max number of Instances

Remarks

Not all modules will be available on all microcontrollers. Refer to the data sheet for the specific controller in use to determine which modules are supported. The numbers used in the enumeration values will match the numbers given in the data sheet.

5.6.17.6.5.8 PORTS_PERIPHERAL_OD Enumeration**C**

```
typedef enum {
    PORTS_PERIPHERAL_OD_MSSP1,
    PORTS_PERIPHERAL_OD_MSSP2,
    PORTS_PERIPHERAL_OD_ECCP1,
    PORTS_PERIPHERAL_OD_ECCP2,
    PORTS_PERIPHERAL_OD_ECCP3,
    PORTS_PERIPHERAL_OD_CCP10,
    PORTS_PERIPHERAL_OD_CCP9,
    PORTS_PERIPHERAL_OD_CCP8,
    PORTS_PERIPHERAL_OD_CCP7,
    PORTS_PERIPHERAL_OD_CCP6,
    PORTS_PERIPHERAL_OD_CCP5,
    PORTS_PERIPHERAL_OD_CCP4,
    PORTS_PERIPHERAL_OD_EUSART2,
    PORTS_PERIPHERAL_OD_EUSART1
} PORTS_PERIPHERAL_OD;
```

Description

Peripherals available for Open drain Configuration

This data type defines the different Peripherals available for Open drain Configuration

Members

Members	Description
PORTS_PERIPHERAL_OD_MSSP1	Peripheral Open Drain for MSSP1
PORTS_PERIPHERAL_OD_MSSP2	Peripheral Open Drain for MSSP2
PORTS_PERIPHERAL_OD_ECCP1	Peripheral Open Drain for ECCP1
PORTS_PERIPHERAL_OD_ECCP2	Peripheral Open Drain for ECCP2
PORTS_PERIPHERAL_OD_ECCP3	Peripheral Open Drain for ECCP3
PORTS_PERIPHERAL_OD_CCP10	Peripheral Open Drain for CCP10
PORTS_PERIPHERAL_OD_CCP9	Peripheral Open Drain for CCP9
PORTS_PERIPHERAL_OD_CCP8	Peripheral Open Drain for CCP8
PORTS_PERIPHERAL_OD_CCP7	Peripheral Open Drain for CCP7
PORTS_PERIPHERAL_OD_CCP6	Peripheral Open Drain for CCP6
PORTS_PERIPHERAL_OD_CCP5	Peripheral Open Drain for CCP5
PORTS_PERIPHERAL_OD_CCP4	Peripheral Open Drain for CCP4
PORTS_PERIPHERAL_OD_EUSART2	Peripheral Open Drain for EUSART2
PORTS_PERIPHERAL_OD_EUSART1	Peripheral Open Drain for EUSART1

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all parts

5.6.17.6.5.9 PORTS_PIN Enumeration

C

```
typedef enum {
    PORTS_PIN_0,
    PORTS_PIN_1,
    PORTS_PIN_2,
    PORTS_PIN_3,
    PORTS_PIN_4,
    PORTS_PIN_5,
    PORTS_PIN_6,
    PORTS_PIN_7,
    PORTS_PIN_8,
    PORTS_PIN_9,
    PORTS_PIN_10,
    PORTS_PIN_11,
    PORTS_PIN_12,
    PORTS_PIN_13,
    PORTS_PIN_14,
    PORTS_PIN_15
} PORTS_PIN;
```

Description

PORTS IO Pins enumeration

This data type defines the different PORTS IO Pins enumeration

Members

Members	Description
PORTS_PIN_0	PORT Bit Position 0
PORTS_PIN_1	PORT Bit Position 1
PORTS_PIN_2	PORT Bit Position 2
PORTS_PIN_3	PORT Bit Position 3
PORTS_PIN_4	PORT Bit Position 4
PORTS_PIN_5	PORT Bit Position 5
PORTS_PIN_6	PORT Bit Position 6
PORTS_PIN_7	PORT Bit Position 7
PORTS_PIN_8	PORT Bit Position 8
PORTS_PIN_9	PORT Bit Position 9
PORTS_PIN_10	PORT Bit Position 10
PORTS_PIN_11	PORT Bit Position 11
PORTS_PIN_12	PORT Bit Position 12
PORTS_PIN_13	PORT Bit Position 13
PORTS_PIN_14	PORT Bit Position 14
PORTS_PIN_15	PORT Bit Position 15

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all parts

5.6.17.6.5.10 PORTS_PIN_MODE Enumeration

C

```
typedef enum {
    PORTS_PIN_MODE_ANALOG,
```

```

    PORTS_PIN_MODE_DIGITAL
} PORTS_PIN_MODE;

```

Description

PORTs Pin Mode

This enumeration identifies the available pin modes.

Members

Members	Description
PORTS_PIN_MODE_ANALOG	Port Pin is in Analog Mode
PORTS_PIN_MODE_DIGITAL	Port pin is in Digital Mode

Remarks

Not all modules are available on all devices. Refer to the specific device data sheet to determine which modules are supported.

5.6.17.6.5.11 PORTS_REMAP_FUNCTION Enumeration

C

```

typedef enum {
    PORTS_REMAP_FUNCTION_EXT_INT1,
    PORTS_REMAP_FUNCTION_EXT_INT2,
    PORTS_REMAP_FUNCTION_EXT_INT3,
    PORTS_REMAP_FUNCTION_EXT_INT4,
    PORTS_REMAP_FUNCTION_IC1,
    PORTS_REMAP_FUNCTION_IC2,
    PORTS_REMAP_FUNCTION_IC3,
    PORTS_REMAP_FUNCTION_IC4,
    PORTS_REMAP_FUNCTION_IC5,
    PORTS_REMAP_FUNCTION_IC6,
    PORTS_REMAP_FUNCTION_IC7,
    PORTS_REMAP_FUNCTION_IC8,
    PORTS_REMAP_FUNCTION_IC9,
    PORTS_REMAP_FUNCTION_OC_FAULTA,
    PORTS_REMAP_FUNCTION_OC_FAULTB,
    PORTS_REMAP_FUNCTION_SPI1_CLOCK,
    PORTS_REMAP_FUNCTION_SPI1_DATA,
    PORTS_REMAP_FUNCTION_SPI1_SLAVE_SEL,
    PORTS_REMAP_FUNCTION_SPI2_CLOCK,
    PORTS_REMAP_FUNCTION_SPI2_DATA,
    PORTS_REMAP_FUNCTION_SPI2_SLAVE_SEL,
    PORTS_REMAP_FUNCTION_SPI3_CLOCK,
    PORTS_REMAP_FUNCTION_SPI3_DATA,
    PORTS_REMAP_FUNCTION_SPI3_SLAVE_SEL,
    PORTS_REMAP_FUNCTION_TMR2_EXT_CLOCK,
    PORTS_REMAP_FUNCTION_TMR3_EXT_CLOCK,
    PORTS_REMAP_FUNCTION_TMR4_EXT_CLOCK,
    PORTS_REMAP_FUNCTION_TMR5_EXT_CLOCK,
    PORTS_REMAP_FUNCTION_USART1_CTS,
    PORTS_REMAP_FUNCTION_USART1_RX,
    PORTS_REMAP_FUNCTION_USART2_CTS,
    PORTS_REMAP_FUNCTION_USART2_RX,
    PORTS_REMAP_FUNCTION_USART3_CTS,
    PORTS_REMAP_FUNCTION_USART3_RX,
    PORTS_REMAP_FUNCTION_USART4_CTS,
    PORTS_REMAP_FUNCTION_USART4_RX,
    PORTS_REMAP_FUNCTION_NULL,
    PORTS_REMAP_FUNCTION_C10OUT,
    PORTS_REMAP_FUNCTION_C20OUT,
    PORTS_REMAP_FUNCTION_U1TX,
    PORTS_REMAP_FUNCTION_U1RTS,
    PORTS_REMAP_FUNCTION_U2TX,

```

```

PORTS_REMAP_FUNCTION_U2RTS,
PORTS_REMAP_FUNCTION_SD01,
PORTS_REMAP_FUNCTION_SCK10UT,
PORTS_REMAP_FUNCTION_SS10UT,
PORTS_REMAP_FUNCTION_SD02,
PORTS_REMAP_FUNCTION_SCK20UT,
PORTS_REMAP_FUNCTION_SS20UT,
PORTS_REMAP_FUNCTION_OC1,
PORTS_REMAP_FUNCTION_OC2,

PORTS_REMAP_FUNCTION_U4TX,
PORTS_REMAP_FUNCTION_U4RTS,
PORTS_REMAP_FUNCTION_SD03,
PORTS_REMAP_FUNCTION_SCK30UT,
PORTS_REMAP_FUNCTION_SS30UT,
PORTS_REMAP_FUNCTION_OC9,
PORTS_REMAP_FUNCTION_C30OUT
} PORTS_REMAP_FUNCTION;

```

Description

Remap Function Enumeration

This data type defines the different remap function enumeration

Members

Members	Description
PORTS_REMAP_FUNCTION_EXT_INT1	Input Function Name - External Interrupt 1
PORTS_REMAP_FUNCTION_EXT_INT2	Input Function Name - External Interrupt 2
PORTS_REMAP_FUNCTION_EXT_INT3	Input Function Name - External Interrupt 3
PORTS_REMAP_FUNCTION_EXT_INT4	Input Function Name - External Interrupt 4
PORTS_REMAP_FUNCTION_IC1	Input Function Name - Input Capture 1
PORTS_REMAP_FUNCTION_IC2	Input Function Name - Input Capture 2
PORTS_REMAP_FUNCTION_IC3	Input Function Name - Input Capture 3
PORTS_REMAP_FUNCTION_IC4	Input Function Name - Input Capture 4
PORTS_REMAP_FUNCTION_IC5	Input Function Name - Input Capture 5
PORTS_REMAP_FUNCTION_IC6	Input Function Name - Input Capture 6
PORTS_REMAP_FUNCTION_IC7	Input Function Name - Input Capture 7
PORTS_REMAP_FUNCTION_IC8	Input Function Name - Input Capture 8
PORTS_REMAP_FUNCTION_IC9	Input Function Name - Input Capture 9
PORTS_REMAP_FUNCTION_OC_FAULTA	Input Function Name - Output Compare Fault A
PORTS_REMAP_FUNCTION_OC_FAULTB	Input Function Name - Output Compare Fault B
PORTS_REMAP_FUNCTION_SPI1_CLOCK	Input Function Name - SPI 1 Clock
PORTS_REMAP_FUNCTION_SPI1_DATA	Input Function Name - SPI1 Data
PORTS_REMAP_FUNCTION_SPI1_SLAVE_SEL	Input Function Name - SPI1 Slave Select
PORTS_REMAP_FUNCTION_SPI2_CLOCK	Input Function Name - SPI2 Clock
PORTS_REMAP_FUNCTION_SPI2_DATA	Input Function Name - SPI2 Data
PORTS_REMAP_FUNCTION_SPI2_SLAVE_SEL	Input Function Name - SPI2 Slave Select
PORTS_REMAP_FUNCTION_SPI3_CLOCK	Input Function Name - SPI3 Clock

PORTS_REMAP_FUNCTION_SPI3_DATA	Input Function Name - SPI3 Data
PORTS_REMAP_FUNCTION_SPI3_SLAVE_SEL	Input Function Name - SPI3 Slave Select
PORTS_REMAP_FUNCTION_TMR2_EXT_CLOCK	Input Function Name - Timer 2 External Clock
PORTS_REMAP_FUNCTION_TMR3_EXT_CLOCK	Input Function Name - Timer 3 External Clock
PORTS_REMAP_FUNCTION_TMR4_EXT_CLOCK	Input Function Name - Timer 4 External Clock
PORTS_REMAP_FUNCTION_TMR5_EXT_CLOCK	Input Function Name - Timer5 External Clock
PORTS_REMAP_FUNCTION_USART1_CTS	Input Function Name - USART 1 Clear To Send
PORTS_REMAP_FUNCTION_USART1_RX	Input Function Name - USART 1 Receive
PORTS_REMAP_FUNCTION_USART2_CTS	Input Function Name - USART 2 Clear To Send
PORTS_REMAP_FUNCTION_USART2_RX	Input Function Name - USART 2 Receive
PORTS_REMAP_FUNCTION_USART3_CTS	Input Function Name - USART 3 Clear To Send
PORTS_REMAP_FUNCTION_USART3_RX	Input Function Name - USART 3 Receive
PORTS_REMAP_FUNCTION_USART4_CTS	Input Function Name - USART 4 Clear To Send
PORTS_REMAP_FUNCTION_USART4_RX	Input Function Name - USART 4 Receive
PORTS_REMAP_FUNCTION_NULL	Output Function Name - Null
PORTS_REMAP_FUNCTION_C1OUT	Output Function Name - Comparator 1 Output
PORTS_REMAP_FUNCTION_C2OUT	Output Function Name - Comparator 2 Output
PORTS_REMAP_FUNCTION_U1TX	Output Function Name - UART1 Transmit
PORTS_REMAP_FUNCTION_U1RTS	Output Function Name - UART1 Request To Send
PORTS_REMAP_FUNCTION_U2TX	Output Function Name - UART2 Transmit
PORTS_REMAP_FUNCTION_U2RTS	Output Function Name - UART2 Request To Send
PORTS_REMAP_FUNCTION_SDO1	Output Function Name - SPI1 Data Output
PORTS_REMAP_FUNCTION_SCK1OUT	Output Function Name - SPI1 Clock Output
PORTS_REMAP_FUNCTION_SS1OUT	Output Function Name - SPI1 Slave Select Output
PORTS_REMAP_FUNCTION_SDO2	Output Function Name - SPI2 Data Output
PORTS_REMAP_FUNCTION_SCK2OUT	Output Function Name - SPI2 Clock Output
PORTS_REMAP_FUNCTION_SS2OUT	Output Function Name - SPI2 Slave Select Output
PORTS_REMAP_FUNCTION_OC1	Output Function Name - Output Compare 1
PORTS_REMAP_FUNCTION_OC2	Output Function Name - Output Compare 2
PORTS_REMAP_FUNCTION_OC3	Output Function Name - Output Compare 3
PORTS_REMAP_FUNCTION_OC4	Output Function Name - Output Compare 4
PORTS_REMAP_FUNCTION_OC5	Output Function Name - Output Compare 5
PORTS_REMAP_FUNCTION_OC6	Output Function Name - Output Compare 6
PORTS_REMAP_FUNCTION_OC7	Output Function Name - Output Compare 7
PORTS_REMAP_FUNCTION_OC8	Output Function Name - Output Compare 8
PORTS_REMAP_FUNCTION_U3TX	Output Function Name - UART3 Transmit
PORTS_REMAP_FUNCTION_U3RTS	Output Function Name - UART3 Request To Send
PORTS_REMAP_FUNCTION_U4TX	Output Function Name - UART4 Transmit
PORTS_REMAP_FUNCTION_U4RTS	Output Function Name - UART4 Request To Send
PORTS_REMAP_FUNCTION_SDO3	Output Function Name - SPI3 Data Output
PORTS_REMAP_FUNCTION_SCK3OUT	Output Function Name - SPI3 Clock Output
PORTS_REMAP_FUNCTION_SS3OUT	Output Function Name - SPI3 Slave Select Output
PORTS_REMAP_FUNCTION_OC9	Output Function Name - Output Compare 9
PORTS_REMAP_FUNCTION_C3OUT	Output Function Name - Comparator 3 Output

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all parts

5.6.17.6.5.12 PORTS_REMAP_INPUT_FUNCTION Enumeration**C**

```
typedef enum {  
    INPUT_FUNC_INT1,

5.6.17.6.6 Feature Existence Functions

5.6.17.6.6.1 PLIB_PORTS_ExistsChangeNotice Function

C

```
bool PLIB_PORTS_ExistsChangeNotice(  
    PORTS_MODULE_ID index  
);
```

Description

This function identifies whether the ChangeNotice feature is available on the PORTS module. When this function returns true, these functions are supported on the device:

- [PLIB_PORTS_ChangeNoticeEnable](#)
- [PLIB_PORTS_ChangeNoticeDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChangeNotice feature is supported on the device
- false - The ChangeNotice feature is not supported on the device

Remarks

None.

5.6.17.6.6.2 PLIB_PORTS_ExistsChangeNoticeInIdle Function

C

```
bool PLIB_PORTS_ExistsChangeNoticeInIdle(  
    PORTS_MODULE_ID index  
);
```

Description

This function identifies whether the ChangeNoticeInIdle feature is available on the PORTS module. When this function returns true, these functions are supported on the device:

- [PLIB_PORTS_ChangeNoticeInIdleEnable](#)
- [PLIB_PORTS_ChangeNoticeInIdleDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChangeNoticeInIdle feature is supported on the device
- false - The ChangeNoticeInIdle feature is not supported on the device

Remarks

None.

5.6.17.6.6.3 PLIB_PORTS_ExistsChangeNoticePerPortInIdle Function**C**

```
bool PLIB_PORTS_ExistsChangeNoticePerPortInIdle(  
    PORTS_MODULE_ID index  
);
```

Description

This function identifies whether the ChangeNoticeInIdlePerPort feature is available on the PORTS module. When this function returns true, these functions are supported on the device:

- [PLIB_PORTS_ChangeNoticeInIdlePerPortEnable](#)
- [PLIB_PORTS_ChangeNoticeInIdlePerPortDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChangeNoticeInIdlePerPort feature is supported on the device
- false - The ChangeNoticeInIdlePerPort feature is not supported on the device

Remarks

None.

5.6.17.6.6.4 PLIB_PORTS_ExistsChangeNoticePerPortStatus Function**C**

```
bool PLIB_PORTS_ExistsChangeNoticePerPortStatus(  
    PORTS_MODULE_ID index  
);
```

Description

This function identifies whether the ChangeNoticePerPortStatus feature is available on the PORTS module. When this function returns true, these functions are supported on the device:

- [PLIB_PORTS_ChangeNoticePerPortHasOccured](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChangeNoticePerPortStatus feature is supported on the device

- false - The ChangeNoticePerPortStatus feature is not supported on the device

Remarks

None.

5.6.17.6.6.5 PLIB_PORTS_ExistsChangeNoticePerPortTurnOn Function**C**

```
bool PLIB_PORTS_ExistsChangeNoticePerPortTurnOn(  
    PORTS_MODULE_ID index  
);
```

Description

This function identifies whether the ChangeNoticePerPortTurnOn feature is available on the PORTS module. When this function returns true, these functions are supported on the device:

- [PLIB_PORTS_ChangeNoticePerPortTurnOn](#)
- [PLIB_PORTS_ChangeNoticePerPortTurnOff](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChangeNoticePerPortTurnOn feature is supported on the device
- false - The ChangeNoticePerPortTurnOn feature is not supported on the device

Remarks

None.

5.6.17.6.6.6 PLIB_PORTS_ExistsChangeNoticePullDownPerPort Function**C**

```
bool PLIB_PORTS_ExistsChangeNoticePullDownPerPort(  
    PORTS_MODULE_ID index  
);
```

Description

This function identifies whether the ChangeNoticePullDownPerPort feature is available on the PORTS module. When this function returns true, these functions are supported on the device:

- [PLIB_PORTS_ChangeNoticePullDownPerPortEnable](#)
- [PLIB_PORTS_ChangeNoticePullDownPerPortDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChangeNoticePullDownPerPort feature is supported on the device
- false - The ChangeNoticePullDownPerPort feature is not supported on the device

Remarks

None.

5.6.17.6.6.7 PLIB_PORTS_ExistsChangeNoticePullUp Function**C**

```
bool PLIB_PORTS_ExistsChangeNoticePullUp(  
    PORTS_MODULE_ID index  
);
```

Description

This function identifies whether the ChangeNoticePullup feature is available on the PORTS module. When this function returns true, these functions are supported on the device:

- [PLIB_PORTS_ChangeNoticePullUpEnable](#)
- [PLIB_PORTS_ChangeNoticePullUpDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChangeNoticePullup feature is supported on the device
- false - The ChangeNoticePullup feature is not supported on the device

Remarks

None.

5.6.17.6.6.8 PLIB_PORTS_ExistsChangeNoticePullUpPerPort Function**C**

```
bool PLIB_PORTS_ExistsChangeNoticePullUpPerPort(  
    PORTS_MODULE_ID index  
);
```

Description

This function identifies whether the ChangeNoticePullUpPerPort feature is available on the PORTS module. When this function returns true, these functions are supported on the device:

- [PLIB_PORTS_ChangeNoticePullUpPerPortEnable](#)
- [PLIB_PORTS_ChangeNoticePullUpPerPortDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChangeNoticePullUpPerPort feature is supported on the device
- false - The ChangeNoticePullUpPerPort feature is not supported on the device

Remarks

None.

5.6.17.6.6.9 PLIB_PORTS_ExistsPinChangeNotice Function**C**

```
bool PLIB_PORTS_ExistsPinChangeNotice(  
    PORTS_MODULE_ID index  
);
```

Description

This function identifies whether the PinChangeNotice feature is available on the PORTS module. When this function returns true, these functions are supported on the device:

- [PLIB_PORTS_PinChangeNoticeEnable](#)
- [PLIB_PORTS_PinChangeNoticeDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The PinChangeNotice feature is supported on the device
- false - The PinChangeNotice feature is not supported on the device

Remarks

None.

5.6.17.6.6.10 PLIB_PORTS_ExistsPinChangeNoticePerPort Function**C**

```
bool PLIB_PORTS_ExistsPinChangeNoticePerPort(  
    PORTS_MODULE_ID index  
);
```

Description

This function identifies whether the PinChangeNoticePerPort feature is available on the PORTS module. When this function returns true, these functions are supported on the device:

- [PLIB_PORTS_PinChangeNoticePerPortEnable](#)
- [PLIB_PORTS_PinChangeNoticePerPortDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The PinChangeNoticePerPort feature is supported on the device
- false - The PinChangeNoticePerPort feature is not supported on the device

Remarks

None.

5.6.17.6.6.11 PLIB_PORTS_ExistsPinMode Function**C**

```
bool PLIB_PORTS_ExistsPinMode(  
    PORTS_MODULE_ID index  
);
```

Description

This function identifies whether the PinMode feature is available on the PORTS module. When this function returns true, these functions are supported on the device:

- [PLIB_PORTS_PinModeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The PinMode feature is supported on the device
- false - The PinMode feature is not supported on the device

Remarks

None.

5.6.17.6.6.12 PLIB_PORTS_ExistsPinModePerPort Function**C**

```
bool PLIB_PORTS_ExistsPinModePerPort(  
    PORTS_MODULE_ID index  
);
```

Description

This function identifies whether the PinModePerPort feature is available on the PORTS module. When this function returns true, these functions are supported on the device:

- [PLIB_PORTS_PinModePerPortSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The PinModePerPort feature is supported on the device
- false - The PinModePerPort feature is not supported on the device

Remarks

None.

5.6.17.6.6.13 PLIB_PORTS_ExistsPortsDirection Function**C**

```
bool PLIB_PORTS_ExistsPortsDirection(  
    PORTS_MODULE_ID index  
);
```

Description

This function identifies whether the PortsDirection feature is available on the PORTS module. When this function returns true, these functions are supported on the device:

- [PLIB_PORTS_PinDirectionInputSet](#)
- [PLIB_PORTS_PinDirectionOutputSet](#)
- [PLIB_PORTS_DirectionInputSet](#)
- [PLIB_PORTS_DirectionOutputSet](#)
- [PLIB_PORTS_DirectionGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The PortsDirection feature is supported on the device
- false - The PortsDirection feature is not supported on the device

Remarks

None.

5.6.17.6.6.14 PLIB_PORTS_ExistsPortsOpenDrain Function**C**

```
bool PLIB_PORTS_ExistsPortsOpenDrain(  
    PORTS_MODULE_ID index  
);
```

Description

This function identifies whether the PortsOpenDrain feature is available on the PORTS module. When this function returns true, these functions are supported on the device:

- [PLIB_PORTS_PinOpenDrainEnable](#)
- [PLIB_PORTS_PinOpenDrainDisable](#)
- [PLIB_PORTS_OpenDrainEnable](#)
- [PLIB_PORTS_OpenDrainDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The PortsOpenDrain feature is supported on the device
- false - The PortsOpenDrain feature is not supported on the device

Remarks

None.

5.6.17.6.6.15 PLIB_PORTS_ExistsPortsRead Function**C**

```
bool PLIB_PORTS_ExistsPortsRead(  
    PORTS_MODULE_ID index  
);
```

Description

This function identifies whether the PortsRead feature is available on the PORTS module. When this function returns true, these functions are supported on the device:

- [PLIB_PORTS_PinGet](#)
- [PLIB_PORTS_Read](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The PortsRead feature is supported on the device
- false - The PortsRead feature is not supported on the device

Remarks

None.

5.6.17.6.6.16 PLIB_PORTS_ExistsPortsWrite Function

C

```
bool PLIB_PORTS_ExistsPortsWrite(  
    PORTS_MODULE_ID index  
);
```

Description

This function identifies whether the PortsWrite feature is available on the PORTS module. When this function returns true, these functions are supported on the device:

- [PLIB_PORTS_PinWrite](#)
- [PLIB_PORTS_PinSet](#)
- [PLIB_PORTS_PinClear](#)
- [PLIB_PORTS_PinToggle](#)
- [PLIB_PORTS_Write](#)
- [PLIB_PORTS_Set](#)
- [PLIB_PORTS_Toggle](#)
- [PLIB_PORTS_Clear](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The PortsWrite feature is supported on the device
- false - The PortsWrite feature is not supported on the device

Remarks

None.

5.6.17.6.6.17 PLIB_PORTS_ExistsRemapInput Function

C

```
bool PLIB_PORTS_ExistsRemapInput(  
    PORTS_MODULE_ID index  
);
```

Description

This function identifies whether the RemapInput feature is available on the PORTS module. When this function returns true, these functions are supported on the device:

- [PLIB_PORTS_RemapInput](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The RemapInput feature is supported on the device
- false - The RemapInput feature is not supported on the device

Remarks

None.

5.6.17.6.6.18 PLIB_PORTS_ExistsRemapOutput Function

C

```
bool PLIB_PORTS_ExistsRemapOutput(  
    PORTS_MODULE_ID index  
);
```

Description

This function identifies whether the RemapOutput feature is available on the PORTS module. When this function returns true, these functions are supported on the device:

- [PLIB_PORTS_RemapOutput](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The RemapOutput feature is supported on the device
- false - The RemapOutput feature is not supported on the device

Remarks

None.

5.6.17.7 Files

Files

Name	Description
plib_ports.h	Ports Peripheral Library Interface header for Ports function definitions.

Description

5.6.17.7.1 plib_ports.h

Ports Peripheral Library Interface Header

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the Ports Peripheral Library for all families of Microchip microcontrollers. The definitions in this file are common to the Ports peripheral.

Functions

	Name	Description
≡	<u>PLIB_PORTS_ChangeNoticeDisable</u>	Global Change Notice disable.
≡	<u>PLIB_PORTS_ChangeNoticeEnable</u>	Global Change Notice enable.
≡	<u>PLIB_PORTS_ChangeNoticeInIdleDisable</u>	CPU Idle does not affect Change Notice operation.
≡	<u>PLIB_PORTS_ChangeNoticeInIdleEnable</u>	CPU Idle mode halts Change Notice operation.
≡	<u>PLIB_PORTS_ChangeNoticeInIdlePerPortDisable</u>	Enables the selected pin as analog or digital.
≡	<u>PLIB_PORTS_ChangeNoticeInIdlePerPortEnable</u>	Enables the selected pin as analog or digital.
≡	<u>PLIB_PORTS_ChangeNoticePerPortHasOccured</u>	Enables the selected pin as analog or digital.
≡	<u>PLIB_PORTS_ChangeNoticePerPortTurnOff</u>	Enables the selected pin as analog or digital.
≡	<u>PLIB_PORTS_ChangeNoticePerPortTurnOn</u>	Enables the selected pin as analog or digital.
≡	<u>PLIB_PORTS_ChangeNoticePullDownPerPortDisable</u>	Enables the selected pin as analog or digital.
≡	<u>PLIB_PORTS_ChangeNoticePullDownPerPortEnable</u>	Enables the selected pin as analog or digital.
≡	<u>PLIB_PORTS_ChangeNoticePullUpDisable</u>	Disable pull-up on input change.
≡	<u>PLIB_PORTS_ChangeNoticePullUpEnable</u>	Enable pull-up on input change.
≡	<u>PLIB_PORTS_ChangeNoticePullUpPerPortDisable</u>	Enables the selected pin as analog or digital.
≡	<u>PLIB_PORTS_ChangeNoticePullUpPerPortEnable</u>	Enables the selected pin as analog or digital.
≡	<u>PLIB_PORTS_Clear</u>	Clears the selected digital port/latch.
≡	<u>PLIB_PORTS_DirectionGet</u>	Reads the direction of the selected digital port.
≡	<u>PLIB_PORTS_DirectionInputSet</u>	Enables the read (input) direction for the selected port.
≡	<u>PLIB_PORTS_DirectionOutputSet</u>	Enables the write (output) direction for the selected port.
≡	<u>PLIB_PORTS_ExistsChangeNotice</u>	Identifies whether the ChangeNotice feature exists on the PORTS module
≡	<u>PLIB_PORTS_ExistsChangeNoticeInIdle</u>	Identifies whether the ChangeNoticeInIdle feature exists on the PORTS module
≡	<u>PLIB_PORTS_ExistsChangeNoticePerPortInIdle</u>	Identifies whether the ChangeNoticeInIdlePerPort feature exists on the PORTS module
≡	<u>PLIB_PORTS_ExistsChangeNoticePerPortStatus</u>	Identifies whether the ChangeNoticePerPortStatus feature exists on the PORTS module
≡	<u>PLIB_PORTS_ExistsChangeNoticePerPortTurnOn</u>	Identifies whether the ChangeNoticePerPortTurnOn feature exists on the PORTS module
≡	<u>PLIB_PORTS_ExistsChangeNoticePullDownPerPort</u>	Identifies whether the ChangeNoticePullDownPerPort feature exists on the PORTS module
≡	<u>PLIB_PORTS_ExistsChangeNoticePullUp</u>	Identifies whether the ChangeNoticePullup feature exists on the PORTS module
≡	<u>PLIB_PORTS_ExistsChangeNoticePullUpPerPort</u>	Identifies whether the ChangeNoticePullUpPerPort feature exists on the PORTS module
≡	<u>PLIB_PORTS_ExistsPinChangeNotice</u>	Identifies whether the PinChangeNotice feature exists on the PORTS module
≡	<u>PLIB_PORTS_ExistsPinChangeNoticePerPort</u>	Identifies whether the PinChangeNoticePerPort feature exists on the PORTS module
≡	<u>PLIB_PORTS_ExistsPinMode</u>	Identifies whether the PinMode feature exists on the PORTS module
≡	<u>PLIB_PORTS_ExistsPinModePerPort</u>	Identifies whether the PinModePerPort feature exists on the PORTS module

	PLIB_PORTS_ExistsPortsDirection	Identifies whether the PortsDirection feature exists on the PORTS module
	PLIB_PORTS_ExistsPortsOpenDrain	Identifies whether the PortsOpenDrain feature exists on the PORTS module
	PLIB_PORTS_ExistsPortsRead	Identifies whether the PortsRead feature exists on the PORTS module
	PLIB_PORTS_ExistsPortsWrite	Identifies whether the PortsWrite feature exists on the PORTS module
	PLIB_PORTS_ExistsRemapInput	Identifies whether the RemapInput feature exists on the PORTS module
	PLIB_PORTS_ExistsRemapOutput	Identifies whether the RemapOutput feature exists on the PORTS module
	PLIB_PORTS_OpenDrainDisable	Disables the open drain functionality for the selected port.
	PLIB_PORTS_OpenDrainEnable	Enables the open drain functionality for the selected port.
	PLIB_PORTS_PinChangeNoticeDisable	Port pin Change Notice disable.
	PLIB_PORTS_PinChangeNoticeEnable	Port pin Change Notice enable.
	PLIB_PORTS_PinChangeNoticePerPortDisable	Enables the selected pin as analog or digital.
	PLIB_PORTS_PinChangeNoticePerPortEnable	Enables the selected pin as analog or digital.
	PLIB_PORTS_PinClear	Clears the selected digital pin/latch.
	PLIB_PORTS_PinDirectionInputSet	Enables the read (input) direction for the selected pin.
	PLIB_PORTS_PinDirectionOutputSet	Enables the write (output) direction for the selected pin.
	PLIB_PORTS_PinGet	Reads/Gets data from the selected digital pin.
	PLIB_PORTS_PinModePerPortSelect	Enables the selected pin as analog or digital.
	PLIB_PORTS_PinModeSelect	Enables the selected pin as analog or digital.
	PLIB_PORTS_PinOpenDrainDisable	Disables the open drain functionality for the selected pin.
	PLIB_PORTS_PinOpenDrainEnable	Enables the open drain functionality for the selected pin.
	PLIB_PORTS_PinSet	Sets the selected digital pin/latch.
	PLIB_PORTS_PinToggle	Toggles the selected digital pin/latch.
	PLIB_PORTS_PinWrite	Writes the selected digital pin/latch.
	PLIB_PORTS_Read	Reads the selected digital port.
	PLIB_PORTS_RemapInput	Input/Output (I/O) function remapping.
	PLIB_PORTS_RemapOutput	Input/Output (I/O) function remapping.
	PLIB_PORTS_Set	Writes the selected digital port/latch based on the mask.
	PLIB_PORTS_Toggle	Toggles the selected digital port/latch.
	PLIB_PORTS_Write	Writes the selected digital port/latch.

Types

	Name	Description
	PORTS_DATA_MASK	Data type defining the PORTS data mask
	PORTS_DATA_TYPE	Data type defining the PORTS data type.

5.6.18 Power Peripheral Library

5.6.18.1 Introduction

Power Peripheral Library

for

Microchip Microcontrollers

This library provides a low-level abstraction of the Power Controller modules on Microchip microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, thereby hiding differences from one microcontroller variant to another.

Description

Power Controller Overview

The Power Controller is a key component of a microcontroller. Power control features allow the user to obtain the balance of power consumption and performance that is best suited to their application.

The features provided in this library discuss specific software commands that are used dynamically to place the device in low-power (i.e., power-saving) modes, which disable power and clocking of selected features. When implementing a system to achieve the lowest possible power consumption while maintain the needed performance, the oscillator configuration and clocking of all peripherals must also be considered. Oscillator configuration and peripheral clocking are addressed in the Oscillator Peripheral Library. In addition, each peripheral may have its own low-power mode settings that are controlled by the library of that peripheral. The user is advised to refer to the libraries of the peripherals used for their particular application.

Key features present on a power controller include (a microcontroller can support one or more of these power features):

- **Power Source Configuration:** Provides the ability to enable and disable a source that may regulate the power consumption in the device
- **Power Status Flags:** Indicate the status of the particular power feature in the device

Note: Please refer to the the specific device data sheet to determine the exact set of supported features.

5.6.18.2 Release Notes

MPLAB Harmony Version: v0.70b **Power Peripheral Library Version :** 0.70b **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.6.18.3 SW License Agreement

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS." MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.6.18.4 Using the Library

Using the Library

This topic describes the basic architecture of the Power Peripheral Library and provides information and examples on how to use it.

Interface Header File: [plib_power.h](#)

The interface to the Power Peripheral Library is defined in the "[plib_power.h](#)" header file, which is included by the "peripheral.h" peripheral library header file. Any C language source (.c) file that uses the Power Peripheral Library must include "peripheral.h".

Peripheral Module IDs

Peripheral libraries are indexed to allow a single library to control any number of instances of a peripheral in a single microcontroller. To support this, the first parameter to each operation in a peripheral library is the module instance ID. The module instance ID is defined by an enumeration that is defined in the processor-specific header files (included by the library's interface header). Not all microcontrollers will have all instances of the module listed in this enumeration. Please refer to the specific data sheet to determine availability.

5.6.18.4.1 Hardware Abstraction Model

This library provides a low-level abstraction of the Power Controller module on Microchip microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Description

Hardware Abstraction Block Diagram

This section discusses the various power-saving features implemented in hardware. Combinations of these methods can be used to selectively tailor an application's power consumption, while still maintaining critical or timing-sensitive application features.

Note: Not all devices support all of the features discussed in this section. Please refer to specific device data sheet to determine the supported features for your device.

Instruction-based Power-Saving Modes

In addition to full-power operation, otherwise known as Run mode, PIC microcontrollers also provide other instruction-based power-saving modes. By powering down to different modes, different functional areas of the microcontroller allow progressive reductions of operating and idle power consumption. In addition, these modes can be tailored for more power reduction, but at a trade-off of some operating features.

- **Idle Mode:** In Idle mode, the CPU is halted, but the System Clock (SYSCLK) source is still enabled. This allows peripherals to continue to operate when the CPU is halted. Peripherals can be individually configured to halt when entering Idle mode by setting their respective SIDL bit. Latency when exiting Idle mode is very low due to the CPU oscillator source remaining active.
- **Sleep Mode:** The CPU, SYSCLK source and any peripherals that operate on the system clock source are disabled
- **Deep Sleep Mode:** The CPU SYSCLK source, and all the peripherals, with the exception of the Real-Time Clock and Calendar (RTCC) and the Deep Sleep Watchdog Timer (DSWDT), are disabled. This is the lowest power mode for the device. The power to RAM and Flash is also disabled. Deep Sleep mode represents the lowest power mode available without removing power from the application.

The instruction-based power-saving modes are exited as a result of several different hardware triggers. When the device exits one of these three operating modes, it is said to 'wake-up'.

Hardware-based Power-Saving Mode

VBAT mode is a hardware-based power-saving mode that maintains only the most critical operations when a power loss occurs on VDD. The mode does this by powering the systems from a back-up power source connected to the VBAT pin. In this mode, the RTCC can run even when there is no power on VDD.

VBAT mode is entered whenever power is removed from VDD. An on-chip power switch detects the power loss from VDD and connects the VBAT pin to the low-voltage regulator. Entering VBAT mode requires that a power source, distinct from the main VDD power source, be available on the VBAT pin and that VDD be completely removed from the VDD pin(s). Removing VDD can be either unintentional, as in a power failure, or as part of a deliberate power reduction strategy.

Note: Not all devices support all of the features discussed in this section. Please refer to specific device data sheet to determine the supported features for your device.

Selective Peripheral Power Control

Sleep and Idle modes allow users to substantially reduce power consumption by slowing or stopping the CPU clock. Even so, peripheral modules may still remain clocked, and thus, consume some amount of power. There may be cases where the application needs what these modes do not provide: the ability to allocate limited power resources to the CPU while eliminating power consumption from the peripherals. PIC microcontrollers address this requirement by allowing peripheral modules to be selectively enabled or disabled, reducing or eliminating their power consumption.

In addition to the selective peripheral power control implemented as part of this library, devices will also include power saving features that are implemented in their specific libraries. These features include the ability to stop (shutdown) automatically when entering idle mode. On some peripherals the ability to continue operation in Sleep mode is available. Always review the libraries for the peripherals used by your application for specific and unique features that will help minimize power consumption.

Disabling Peripheral Modules

Most of the peripheral modules in the PIC microcontroller family architecture can be selectively disabled, reducing or essentially eliminating their power consumption during all operating modes.

All peripheral modules (except for I/O ports) also have a Control bit that can disable their functionality. These bits, known as the Peripheral Module Disable (PMD) bits, are generically named: "xxMD". These bits are located in the PMDx Special Function Registers (SFRs). In contrast to the module enable bits, the xxMD bit must be set to a '1' to disable the module.

While the PMD and module enable bits both disable a peripheral's functionality, the PMD bit completely shuts down the peripheral, effectively powering down all circuits and removing all clock sources. This has the additional effect of making any of the module's control and buffer registers, mapped in the SFR space, unavailable for operations. In other words, when the PMD bit is used to disable a module, the peripheral ceases to exist until the PMD bit is cleared.

The PMD bit is most useful in highly power-sensitive applications, where even tiny savings in power consumption can determine the ability of an application to function. In these cases, the bits can be set before the main body of the application to remove those peripherals that will not be needed.

5.6.18.4.2 Library Usage Model

Note: The interface provided is a superset of all power functionality available on the device. Refer to the "**Power-Saving Features**" chapter in the specific device data sheet for availability.

This library provides the low-level abstraction of the Power Controller module available on the Microchip family of microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in the software and introduces the library interface.

The library interface routines are divided into various subsections, each of the sub-sections addresses one of the blocks or the

overall operation of the Power Controller module.

Library Interface Section	Description
Initialization Functions	This section provides a set of functions for configuring the Power-Saving features and enabling or disabling the particular power feature.
Status Functions	This section provides a function to read the status of a particular power feature.

Note: Not all modes are available on all devices. Refer to the "Power-Saving Features" chapter in the specific device data sheet for availability.

5.6.18.4.3 How the Library Works

Usage of this library is partitioned into two major sections.

Initialization

The steps that are required to initialize the Power Controller module vary for different microcontrollers. Refer to the specific device data sheet to determine the correct initialization sequence. The following information provides a general overview.

Power Source Setup

- A module can be disabled for the microcontroller to be able to save power. Use the function `PLIB_POWER_ModuleDisable` to disable the particular module. `POWER_MODULE_DISABLE` provides a list of possible modules sources.
- On most microcontrollers, the voltage regulator can be controlled during Sleep mode. It can be enabled (turned on) using [PLIB_POWER_VoltageRegulatorEnable](#) and disabled (turned off) using [PLIB_POWER_VoltageRegulatorDisable](#).
- On some microcontrollers, Deep Sleep mode is enabled using [PLIB_POWER_DeepSleepModeEnable](#) and Brown-out Reset in Deep Sleep mode is enabled using [PLIB_POWER_DeepSleepBOREnable](#). The Deep Sleep mode is disabled using [PLIB_POWER_DeepSleepModeDisable](#) and Brown-out Reset in Deep Sleep mode is disabled using [PLIB_POWER_DeepSleepBORDisable](#).

Power Status

Status of the particular power feature indicates the previous status of that feature. This feature can be used to determine whether the device was in Sleep or Idle mode before waking up. It also allows software to clear the previous status of the device.

5.6.18.5 Configuring the Library

The library is configured for the supported Power Controller modules when the processor is chosen in the MPLAB IDE.

5.6.18.6 Library Interface

Data Types and Constants

	Name	Description
	POWER_MODULE	List of the modules whose power can be controlled.
	POWER_MODULE_ID	Identifies the supported Power modules.

Feature Existence Functions

	Name	Description
	PLIB_POWER_ExistsDeepSleepBOR	Identifies whether the DeepSleepBORControl feature exists on the POWER module

	PLIB_POWER_ExistsDeepSleepFaultDetect	Identifies whether the DeepSleepFaultDetectStatus feature exists on the POWER module
	PLIB_POWER_ExistsDeepSleepInterruptOnChange	Identifies whether the DeepSleepIOCStatus feature exists on the POWER module
	PLIB_POWER_ExistsDeepSleepMCLREvent	Identifies whether the DeepSleepMCLRStatus feature exists on the POWER module
	PLIB_POWER_ExistsDeepSleepMode	Identifies whether the DeepSleepModeControl feature exists on the POWER module
	PLIB_POWER_ExistsDeepSleepPowerOnReset	Identifies whether the DeepSleepPORStatus feature exists on the POWER module
	PLIB_POWER_ExistsIdleStatus	Identifies whether the IdleStatus feature exists on the POWER module
	PLIB_POWER_ExistsPeripheralModuleControl	Identifies whether the PeripheralModuleControl feature exists on the POWER module
	PLIB_POWER_ExistsSleepStatus	Identifies whether the SleepStatus feature exists on the POWER module
	PLIB_POWER_ExistsVoltageRegulatorControl	Identifies whether the VoltageRegulatorControl feature exists on the POWER module

Initialization Functions

	Name	Description
	PLIB_POWER_DeepSleepBORDisable	Disables the Deep Sleep BOR.
	PLIB_POWER_DeepSleepBOREnable	Enables the Deep Sleep BOR mode.
	PLIB_POWER_DeepSleepModeDisable	Disables the Deep Sleep mode.
	PLIB_POWER_DeepSleepModeEnable	Enables the Deep Sleep mode.
	PLIB_POWER_PeripheralModuleDisable	Disable the power supply for the module selected in the source.
	PLIB_POWER_PeripheralModuleEnable	Enable the power supply for the module selected in the source.
	PLIB_POWER_PeripheralModuleIsEnabled	Check if selected peripheral is enabled or not
	PLIB_POWER_VoltageRegulatorDisable	Disables the voltage regulator during Sleep mode.
	PLIB_POWER_VoltageRegulatorEnable	Enable the voltage regulator during Sleep mode.

Status Functions

	Name	Description
	PLIB_POWER_ClearIdleStatus	Clears the Idle mode status of the device.
	PLIB_POWER_ClearSleepStatus	Clear the Sleep mode status bit of the device.
	PLIB_POWER_DeepSleepFaultDetectStatus	Returns the status of Deep Sleep Fault Detect bit.
	PLIB_POWER_DeepSleepInterruptOnChangeStatus	Returns the status of the Deep Sleep Interrupt-on-Change bit.
	PLIB_POWER_DeepSleepMCLREventStatus	Returns the status of the Deep Sleep MCLR Event bit.
	PLIB_POWER_DeepSleepPowerOnResetStatus	Returns the status of Deep Sleep Power-on Reset bit.
	PLIB_POWER_DeviceWasInIdleMode	Returns the Idle mode status of the device.
	PLIB_POWER_DeviceWasInSleepMode	Returns the Sleep mode status of the device.
	PLIB_POWER_VoltageRegulatorIsEnabled	Provides the status of the voltage regulator during Sleep mode.

Description

This section lists and describes the functions, data types, and constants provided in the Power Peripheral Library.

5.6.18.6.1 Initialization Functions

5.6.18.6.1.1 PLIB_POWER_DeepSleepBORDisable Function

C

```
void PLIB_POWER_DeepSleepBORDisable(  
    POWER_MODULE_ID index  
);
```

Description

This function disables the Deep Sleep BOR. The Deep Sleep BOR is independent of the standard BOR and a Deep Sleep BOR event will not cause a wake-up from Deep Sleep.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_POWER_ExistsDeepSleepBOR](#) in your application to determine whether this feature is available.

Example

```
PLIB_POWER_DeepSleepBORDisable(POWER_ID_0);
```

5.6.18.6.1.2 PLIB_POWER_DeepSleepBOREnable Function

C

```
void PLIB_POWER_DeepSleepBOREnable(  
    POWER_MODULE_ID index  
);
```

Description

This function enables the Deep Sleep BOR mode. The Deep Sleep BOR is independent of the standard BOR and a Deep Sleep BOR event will not cause a wake-up from Deep Sleep.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_POWER_ExistsDeepSleepBOR](#) in your application to determine whether this feature is available.

Example

```
PLIB_POWER_DeepSleepBOREnable(POWER_ID_0);
```

5.6.18.6.1.3 PLIB_POWER_DeepSleepModeDisable Function**C**

```
void PLIB_POWER_DeepSleepModeDisable(  
    POWER_MODULE_ID index  
);
```

Description

This function disables the Deep Sleep mode. Deep Sleep mode is intended to provide the lowest levels of power consumption available without requiring the use of external switches to completely remove all power from the device.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_POWER_ExistsDeepSleepMode](#) in your application to determine whether this feature is available.

Example

```
PLIB_POWER_DeepSleepModeDisable(POWER_ID_0);
```

5.6.18.6.1.4 PLIB_POWER_DeepSleepModeEnable Function**C**

```
void PLIB_POWER_DeepSleepModeEnable(  
    POWER_MODULE_ID index  
);
```

Description

This function enables the Deep Sleep mode. Deep Sleep mode is intended to provide the lowest levels of power consumption available without requiring the use of external switches to completely remove all power from the device.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use

[PLIB_POWER_ExistsDeepSleepMode](#) in your application to determine whether this feature is available.

Example

```
PLIB_POWER_DeepSleepModeEnable(POWER_ID_0);
```

5.6.18.6.1.5 PLIB_POWER_PeripheralModuleDisable Function**C**

```
void PLIB_POWER_PeripheralModuleDisable(  
    POWER_MODULE_ID index,  
    POWER_MODULE source  
);
```

Description

This function completely shuts down the selected peripheral, effectively powering down all circuits and removing all clock sources. This has the additional effect of making any of the module's control and buffer registers, which are mapped in the SFR space, unavailable for operations.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
source	Select the module to be disabled from POWER_MODULE enum

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_POWER_ExistsPeripheralModuleControl](#) in your application to determine whether this feature is available.

Example

```
PLIB_POWER_PeripheralModuleDisable (POWER_ID_0, POWER_MODULE_ADC);
```

5.6.18.6.1.6 PLIB_POWER_PeripheralModuleEnable Function**C**

```
void PLIB_POWER_PeripheralModuleEnable(  
    POWER_MODULE_ID index,  
    POWER_MODULE source  
);
```

Description

This function enables the power supply back to the selected module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
source	Select the module to be enabled from POWER_MODULE enum

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_POWER_ExistsPeripheralModuleControl](#) in your application to determine whether this feature is available.

Example

```
PLIB_POWER_PeripheralModuleEnable (POWER_ID_0, POWER_MODULE_ADC);
```

5.6.18.6.1.7 PLIB_POWER_PeripheralModuleIsEnabled Function**C**

```
bool PLIB_POWER_PeripheralModuleIsEnabled(  
    POWER_MODULE_ID index,  
    POWER_MODULE source  
);
```

Description

This function checks if selected peripheral is enabled or not.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
source	Select the module to be enabled from POWER_MODULE enum

Returns

- true - Power of the selected peripheral is enabled
- false - Power of the selected peripheral is disabled

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_POWER_ExistsPeripheralModuleControl](#) in your application to determine whether this feature is available.

Example

```
if (PLIB_POWER_PeripheralModuleIsEnabled ( POWER_MODULE_0, POWER_MODULE_ADC ))  
{  
  
}
```

5.6.18.6.1.8 PLIB_POWER_VoltageRegulatorDisable Function**C**

```
void PLIB_POWER_VoltageRegulatorDisable(  
    POWER_MODULE_ID index  
);
```

Description

This function disables the voltage regulator into during Sleep mode for the selected device.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_POWER_ExistsVoltageRegulatorControl](#) in your application to determine whether this feature is available.

Example

```
PLIB_POWER_VoltageRegulatorDisable(POWER_ID_0);
```

5.6.18.6.1.9 PLIB_POWER_VoltageRegulatorEnable Function

C

```
void PLIB_POWER_VoltageRegulatorEnable(  
    POWER_MODULE_ID index  
);
```

Description

This function enables the voltage regulator during Sleep mode for the selected device.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_POWER_ExistsVoltageRegulatorControl](#) in your application to determine whether this feature is available.

Example

```
PLIB_POWER_VoltageRegulatorEnable(POWER_ID_0);
```

5.6.18.6.2 Status Functions

5.6.18.6.2.1 PLIB_POWER_ClearIdleStatus Function

C

```
void PLIB_POWER_ClearIdleStatus(  
    POWER_MODULE_ID index  
);
```

Description

This function clears the Idle status bit of the device if it was previously in Idle mode. However, it does not mean that it wakes up the device from Idle.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_POWER_ExistsIdleStatus](#) in your application to determine whether this feature is available.

Example

```
if(PLIB_POWER_DeviceWasInIdleMode(POWER_ID_0))
{
    PLIB_POWER_ClearIdleStatus (POWER_ID_0);
}
```

5.6.18.6.2.2 PLIB_POWER_ClearSleepStatus Function**C**

```
void PLIB_POWER_ClearSleepStatus(
    POWER_MODULE_ID index
);
```

Description

This function clears the Sleep status bit of the device if it was previously in Sleep mode. However, it does not mean that it wakes up the device from sleep.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_POWER_ExistsSleepStatus](#) in your application to determine whether this feature is available.

Example

```
if(PLIB_POWER_DeviceWasInSleepMode(POWER_ID_0))
{
    PLIB_POWER_ClearSleepStatus (POWER_ID_0);
}
```

5.6.18.6.2.3 PLIB_POWER_DeepSleepFaultDetectStatus Function**C**

```
bool PLIB_POWER_DeepSleepFaultDetectStatus(
```

```
    POWER_MODULE_ID index
);
```

Description

This function returns the status of the Deep Sleep Fault Detect bit.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

true - A Fault occurred during Deep Sleep, and some Deep Sleep configuration settings may have been corrupted
false - No Fault was detected during Deep Sleep

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_POWER_ExistsDeepSleepFaultDetect](#) in your application to determine whether this feature is available.

Example

```
if(PLIB_POWER_DeepSleepFaultDetectStatus(POWER_ID_0))
{
}
}
```

5.6.18.6.2.4 PLIB_POWER_DeepSleepInterruptOnChangeStatus Function

C

```
bool PLIB_POWER_DeepSleepInterruptOnChangeStatus(
    POWER_MODULE_ID index
);
```

Description

This function returns the status of the Deep Sleep Interrupt-on-Change bit.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

- true - Interrupt-on-Change was asserted during Deep Sleep
- false - Interrupt-on-Change was not asserted during Deep Sleep

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_POWER_ExistsDeepSleepInterruptOnChange](#) in your application to determine whether this feature is available.

Example

```
if(PLIB_POWER_DeepSleepInterruptOnChangeStatus(POWER_ID_0))
{
}
```

```
}
```

5.6.18.6.2.5 PLIB_POWER_DeepSleepMCLREventStatus Function

C

```
bool PLIB_POWER_DeepSleepMCLREventStatus(  
    POWER_MODULE_ID index  
);
```

Description

This function returns the status of the Deep Sleep MCLR Event bit.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

- true - The MCLR pin was active and was asserted during Deep Sleep
- false - The MCLR pin was not active, or was active, but not asserted during Deep Sleep

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_POWER_ExistsDeepSleepMCLREvent](#) in your application to determine whether this feature is available.

Example

```
if(PLIB_POWER_DeepSleepMCLREventStatus(POWER_ID_0))  
{  
  
}
```

5.6.18.6.2.6 PLIB_POWER_DeepSleepPowerOnResetStatus Function

C

```
bool PLIB_POWER_DeepSleepPowerOnResetStatus(  
    POWER_MODULE_ID index  
);
```

Description

This function returns the status of the Deep Sleep Power-on Reset bit.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

- true - The VDD supply POR circuit was active and a POR event was detected
- false - The VDD supply POR circuit was not active, or was active but did not detect a POR event

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use

[PLIB_POWER_ExistsDeepSleepPowerOnReset](#) in your application to determine whether this feature is available.

Example

```
if(PLIB_POWER_DeepSleepPowerOnResetStatus(POWER_ID_0))
{
}
```

5.6.18.6.2.7 PLIB_POWER_DeviceWasInIdleMode Function**C**

```
bool PLIB_POWER_DeviceWasInIdleMode(
    POWER_MODULE_ID index
);
```

Description

This function returns the Idle mode status of the device. It tells whether or not the device was in Idle mode before waking up.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

- true - The device was in Idle mode before waking up
- false - The device was not in Idle mode

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_POWER_ExistsIdleStatus](#) in your application to determine whether this feature is available.

Example

```
if(PLIB_POWER_DeviceWasInIdleMode(POWER_ID_0))
{
}
```

5.6.18.6.2.8 PLIB_POWER_DeviceWasInSleepMode Function**C**

```
bool PLIB_POWER_DeviceWasInSleepMode(
    POWER_MODULE_ID index
);
```

Description

This function returns the Sleep mode status of the device. It tells whether or not the device was in Sleep mode before waking up.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

- true - The device was in Sleep mode before waking up
- false - The device was not in Sleep mode

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_POWER_ExistsSleepStatus](#) in your application to determine whether this feature is available.

Example

```
if(PLIB_POWER_DeviceWasInSleepMode(POWER_ID_0))
{
}
```

5.6.18.6.2.9 PLIB_POWER_VoltageRegulatorIsEnabled Function**C**

```
bool PLIB_POWER_VoltageRegulatorIsEnabled(
    POWER_MODULE_ID index
);
```

Description

This function provides the status of the voltage regulator during Sleep mode for the selected device.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

- true - The voltage regulator will be enabled in Sleep mode
- false - The voltage regulator will be disabled in Sleep mode

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_POWER_ExistsVoltageRegulatorControl](#) in your application to determine whether this feature is available.

Example

```
if (PLIB_POWER_VoltageRegulatorIsEnabled(POWER_ID_0))
{
}
```

5.6.18.6.3 Data Types and Constants**5.6.18.6.3.1 POWER_MODULE Enumeration****C**

```
typedef enum {
    POWER_MODULE_ADC1,
    POWER_MODULE_CTMU,
    POWER_MODULE_CVR,
```

```

POWER_MODULE_DMA,  
POWER_MODULE_RANDOM_NUM_GENERATOR,  
POWER_MODULE_CRYPT0  
} POWER_MODULE;
```

Description

POWER module enumeration

This enumeration lists the modules whose power can be controlled by PMD registers

Members

Members	Description
POWER_MODULE_ADC1	ADC module
POWER_MODULE_CTMU	Charge Time Measurement Unit module
POWER_MODULE_CVR	Comparator Voltage Reference module
POWER_MODULE_CMP1	Comparator module 1
POWER_MODULE_CMP2	Comparator module 2
POWER_MODULE_CMP3	Comparator module 3
POWER_MODULE_IC1	Input Capture 1 module
POWER_MODULE_IC2	Input Capture 2 module
POWER_MODULE_IC3	Input Capture 3 module
POWER_MODULE_IC4	Input Capture 4 module
POWER_MODULE_IC5	Input Capture 5 module
POWER_MODULE_IC6	Input Capture 6 module
POWER_MODULE_IC7	Input Capture 7 module
POWER_MODULE_IC8	Input Capture 8 module
POWER_MODULE_IC9	Input Capture 9 module
POWER_MODULE_OC1	Output Compare 1 module
POWER_MODULE_OC2	Output Compare 2 module
POWER_MODULE_OC3	Output Compare 3 module
POWER_MODULE_OC4	Output Compare 4 module
POWER_MODULE_OC5	Output Compare 5 module
POWER_MODULE_OC6	Output Compare 6 module
POWER_MODULE_OC7	Output Compare 7 module
POWER_MODULE_OC8	Output Compare 8 module
POWER_MODULE_OC9	Output Compare 9 module
POWER_MODULE_TMR1	Timer1 module
POWER_MODULE_TMR2	Timer2 module
POWER_MODULE_TMR3	Timer3 module
POWER_MODULE_TMR4	Timer4 module
POWER_MODULE_TMR5	Timer5 module
POWER_MODULE_TMR6	Timer6 module
POWER_MODULE_TMR7	Timer7 module
POWER_MODULE_TMR8	Timer8 module
POWER_MODULE_TMR9	Timer9 module
POWER_MODULE_UART1	UART1 module
POWER_MODULE_UART2	UART2 module
POWER_MODULE_UART3	UART3 module
POWER_MODULE_UART4	UART4 module
POWER_MODULE_UART5	UART5 module
POWER_MODULE_UART6	UART6 module

POWER_MODULE_SPI1	SPI1 module
POWER_MODULE_SPI2	SPI2 module
POWER_MODULE_SPI3	SPI3 module
POWER_MODULE_SPI4	SPI4 module
POWER_MODULE_SPI5	SPI5 module
POWER_MODULE_SPI6	SPI6 module
POWER_MODULE_I2C1	I2C1 module
POWER_MODULE_I2C2	I2C2 module
POWER_MODULE_I2C3	I2C3 module
POWER_MODULE_I2C4	I2C4 module
POWER_MODULE_I2C5	I2C5 module
POWER_MODULE_USB	USB module
POWER_MODULE_CAN1	CAN1 module
POWER_MODULE_CAN2	CAN2 module
POWER_MODULE_RTCC	RealTime Clock and Calender module
POWER_MODULE_REF_CLK_OUTPUT	Reference Clock Output module
POWER_MODULE_REF_CLK_OUTPUT1	Reference Clock Output module 1
POWER_MODULE_REF_CLK_OUTPUT2	Reference Clock Output module 2
POWER_MODULE_REF_CLK_OUTPUT3	Reference Clock Output module 3
POWER_MODULE_REF_CLK_OUTPUT4	Reference Clock Output module 4
POWER_MODULE_PMP	Parallel Master Port module
POWER_MODULE_EBI	External Bus Interface module
POWER_MODULE_SQI	Serial Quad Interface module
POWER_MODULE_ETHERNET	Ethernet module
POWER_MODULE_DMA	Data Memory Access module
POWER_MODULE_RANDOM_NUM_GENERATOR	Random Number Generator module
POWER_MODULE_CRYPT0	Cryptographic module

Remarks

Not all modules exist in all devices. Please refer to the specific device data sheet for availability.

5.6.18.6.3.2 POWER_MODULE_ID Enumeration**C**

```
typedef enum {
    POWER_ID_0,
    POWER_NUMBER_OF_MODULES
} POWER_MODULE_ID;
```

Description

Power Module ID

This enumeration identifies the Power modules that are available on the microcontroller. This is the superset of all the possible instances that might be available on a Microchip microcontroller.

Members

Members	Description
POWER_ID_0	POWER Module ID
POWER_NUMBER_OF_MODULES	Number of available POWER modules.

Remarks

The caller should not rely on the specific numbers assigned to any of these values as they may change from one processor to the next.

Not all modules will be available on all microcontrollers. Refer to the "Power-Saving Features" chapter in the specific device data sheet to determine which modules are supported. The numbers used in the enumeration values will match the numbers provided in the data sheet.

5.6.18.6.4 Feature Existence Functions

5.6.18.6.4.1 PLIB_POWER_ExistsDeepSleepBOR Function

C

```
bool PLIB_POWER_ExistsDeepSleepBOR(  
    POWER_MODULE_ID index  
);
```

Description

This function identifies whether the DeepSleepBORControl feature is available on the POWER module. When this function returns true, these functions are supported on the device:

- [PLIB_POWER_DeepSleepBOREnable](#)
- [PLIB_POWER_DeepSleepBORDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The DeepSleepBORControl feature is supported on the device
- false - The DeepSleepBORControl feature is not supported on the device

Remarks

None.

5.6.18.6.4.2 PLIB_POWER_ExistsDeepSleepFaultDetect Function

C

```
bool PLIB_POWER_ExistsDeepSleepFaultDetect(  
    POWER_MODULE_ID index  
);
```

Description

This function identifies whether the DeepSleepFaultDetectStatus feature is available on the POWER module. When this function returns true, these functions are supported on the device:

- [PLIB_POWER_DeepSleepFaultDetectStatus](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The DeepSleepFaultDetectStatus feature is supported on the device
- false - The DeepSleepFaultDetectStatus feature is not supported on the device

Remarks

None.

5.6.18.6.4.3 PLIB_POWER_ExistsDeepSleepInterruptOnChange Function**C**

```
bool PLIB_POWER_ExistsDeepSleepInterruptOnChange(  
    POWER_MODULE_ID index  
);
```

Description

This function identifies whether the DeepSleepIOCStatus feature is available on the POWER module. When this function returns true, these functions are supported on the device:

- [PLIB_POWER_DeepSleepInterruptOnChangeStatus](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The DeepSleepIOCStatus feature is supported on the device
- false - The DeepSleepIOCStatus feature is not supported on the device

Remarks

None.

5.6.18.6.4.4 PLIB_POWER_ExistsDeepSleepMCLREvent Function**C**

```
bool PLIB_POWER_ExistsDeepSleepMCLREvent(  
    POWER_MODULE_ID index  
);
```

Description

This function identifies whether the DeepSleepMCLRStatus feature is available on the POWER module. When this function returns true, these functions are supported on the device:

- [PLIB_POWER_DeepSleepMCLREventStatus](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The DeepSleepMCLRStatus feature is supported on the device
- false - The DeepSleepMCLRStatus feature is not supported on the device

Remarks

None.

5.6.18.6.4.5 PLIB_POWER_ExistsDeepSleepMode Function**C**

```
bool PLIB_POWER_ExistsDeepSleepMode(  
    POWER_MODULE_ID index  
);
```

Description

This function identifies whether the DeepSleepModeControl feature is available on the POWER module. When this function returns true, these functions are supported on the device:

- [PLIB_POWER_DeepSleepModeEnable](#)
- [PLIB_POWER_DeepSleepModeDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The DeepSleepModeControl feature is supported on the device
- false - The DeepSleepModeControl feature is not supported on the device

Remarks

None.

5.6.18.6.4.6 PLIB_POWER_ExistsDeepSleepPowerOnReset Function**C**

```
bool PLIB_POWER_ExistsDeepSleepPowerOnReset(  
    POWER_MODULE_ID index  
);
```

Description

This function identifies whether the DeepSleepPORStatus feature is available on the POWER module. When this function returns true, these functions are supported on the device:

- [PLIB_POWER_DeepSleepPowerOnResetStatus](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The DeepSleepPORStatus feature is supported on the device
- false - The DeepSleepPORStatus feature is not supported on the device

Remarks

None.

5.6.18.6.4.7 PLIB_POWER_ExistsIdleStatus Function**C**

```
bool PLIB_POWER_ExistsIdleStatus(  
    POWER_MODULE_ID index  
);
```

Description

This function identifies whether the IdleStatus feature is available on the POWER module. When this function returns true, these functions are supported on the device:

- [PLIB_POWER_DeviceWasInIdleMode](#)
- [PLIB_POWER_ClearIdleStatus](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The IdleStatus feature is supported on the device
- false - The IdleStatus feature is not supported on the device

Remarks

None.

5.6.18.6.4.8 PLIB_POWER_ExistsPeripheralModuleControl Function**C**

```
bool PLIB_POWER_ExistsPeripheralModuleControl(  
    POWER_MODULE_ID index  
);
```

Description

This function identifies whether the PeripheralModuleControl feature is available on the POWER module. When this function returns true, these functions are supported on the device:

- [PLIB_POWER_PeripheralModuleDisable](#)
- [PLIB_POWER_PeripheralModuleEnable](#)
- [PLIB_POWER_PeripheralModuleIsEnabled](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The PeripheralModuleControl feature is supported on the device
- false - The PeripheralModuleControl feature is not supported on the device

Remarks

None.

5.6.18.6.4.9 PLIB_POWER_ExistsSleepStatus Function**C**

```
bool PLIB_POWER_ExistsSleepStatus(  
    POWER_MODULE_ID index  
);
```

Description

This function identifies whether the SleepStatus feature is available on the POWER module. When this function returns true, these functions are supported on the device:

- [PLIB_POWER_DeviceWasInSleepMode](#)
- [PLIB_POWER_ClearSleepStatus](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The SleepStatus feature is supported on the device
- false - The SleepStatus feature is not supported on the device

Remarks

None.

5.6.18.6.4.10 PLIB_POWER_ExistsVoltageRegulatorControl Function**C**

```
bool PLIB_POWER_ExistsVoltageRegulatorControl(  
    POWER_MODULE_ID index  
);
```

Description

This function identifies whether the VoltageRegulatorControl feature is available on the POWER module. When this function returns true, these functions are supported on the device:

- [PLIB_POWER_VoltageRegulatorEnable](#)
- [PLIB_POWER_VoltageRegulatorDisable](#)
- [PLIB_POWER_VoltageRegulatorIsEnabled](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The VoltageRegulatorControl feature is supported on the device
- false - The VoltageRegulatorControl feature is not supported on the device

Remarks

None.

5.6.18.7 Files

Files

Name	Description
plib_power.h	Defines the Power Peripheral Library interface.

Description

5.6.18.7.1 plib_power.h

Power Peripheral Library Interface Header

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the Power Peripheral Library for Microchip microcontrollers. The definitions in this file are for the Power Controller module.

Functions

	Name	Description
≡	PLIB_POWER_ClearIdleStatus	Clears the Idle mode status of the device.
≡	PLIB_POWER_ClearSleepStatus	Clear the Sleep mode status bit of the device.
≡	PLIB_POWER_DeepSleepBORDisable	Disables the Deep Sleep BOR.
≡	PLIB_POWER_DeepSleepBOREnable	Enables the Deep Sleep BOR mode.
≡	PLIB_POWER_DeepSleepFaultDetectStatus	Returns the status of Deep Sleep Fault Detect bit.
≡	PLIB_POWER_DeepSleepInterruptOnChangeStatus	Returns the status of the Deep Sleep Interrupt-on-Change bit.
≡	PLIB_POWER_DeepSleepMCLREventStatus	Returns the status of the Deep Sleep MCLR Event bit.
≡	PLIB_POWER_DeepSleepModeDisable	Disables the Deep Sleep mode.

	PLIB_POWER_DeepSleepModeEnable	Enables the Deep Sleep mode.
	PLIB_POWER_DeepSleepPowerOnResetStatus	Returns the status of Deep Sleep Power-on Reset bit.
	PLIB_POWER_DeviceWasInIdleMode	Returns the Idle mode status of the device.
	PLIB_POWER_DeviceWasInSleepMode	Returns the Sleep mode status of the device.
	PLIB_POWER_ExistsDeepSleepBOR	Identifies whether the DeepSleepBORControl feature exists on the POWER module
	PLIB_POWER_ExistsDeepSleepFaultDetect	Identifies whether the DeepSleepFaultDetectStatus feature exists on the POWER module
	PLIB_POWER_ExistsDeepSleepInterruptOnChange	Identifies whether the DeepSleepIOCStatus feature exists on the POWER module
	PLIB_POWER_ExistsDeepSleepMCLREvent	Identifies whether the DeepSleepMCLRStatus feature exists on the POWER module
	PLIB_POWER_ExistsDeepSleepMode	Identifies whether the DeepSleepModeControl feature exists on the POWER module
	PLIB_POWER_ExistsDeepSleepPowerOnReset	Identifies whether the DeepSleepPORStatus feature exists on the POWER module
	PLIB_POWER_ExistsIdleStatus	Identifies whether the IdleStatus feature exists on the POWER module
	PLIB_POWER_ExistsPeripheralModuleControl	Identifies whether the PeripheralModuleControl feature exists on the POWER module
	PLIB_POWER_ExistsSleepStatus	Identifies whether the SleepStatus feature exists on the POWER module
	PLIB_POWER_ExistsVoltageRegulatorControl	Identifies whether the VoltageRegulatorControl feature exists on the POWER module
	PLIB_POWER_PeripheralModuleDisable	Disable the power supply for the module selected in the source.
	PLIB_POWER_PeripheralModuleEnable	Enable the power supply for the module selected in the source.
	PLIB_POWER_PeripheralModuleIsEnabled	Check if selected peripheral is enabled or not
	PLIB_POWER_VoltageRegulatorDisable	Disables the voltage regulator during Sleep mode.
	PLIB_POWER_VoltageRegulatorEnable	Enable the voltage regulator during Sleep mode.
	PLIB_POWER_VoltageRegulatorIsEnabled	Provides the status of the voltage regulator during Sleep mode.

5.6.19 Reset Peripheral Library

5.6.19.1 Introduction

Reset Peripheral Library

for

Microchip Microcontrollers

This library provides a low-level abstraction of the Reset Controller modules on Microchip microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, thereby hiding differences from one microcontroller variant to another.

Description

Reset Controller Overview

The Reset Controller is a key component of a microcontroller. The Reset Controller gives the reset status of the device at any point of time.

The following are the key features present on a Reset Controller:

- **Reset Source Configuration:** Provides the ability to enable and disable a source that may reset the device
- **Reset Status:** Identifies the source of a reset and clears it

A microcontroller can support one or more of the above reset modes.

Please refer to the the "Resets" chapter in the specific device data sheet to determine the exact set of supported features.

5.6.19.2 Release Notes

MPLAB Harmony Version: v0.70b **Reset Peripheral Library Version :** 0.70b **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.6.19.3 SW License Agreement

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.6.19.4 Using the Library

This topic describes the basic architecture of the Reset Peripheral Library and provides information and examples on how to use it.

Description

Interface Header File: [plib_reset.h](#)

The interface to the Reset Peripheral Library is defined in the "[plib_reset.h](#)" header file, which is included by the "peripheral.h" peripheral library header file. Any C language source (.c) file that uses the Reset Peripheral Library must include "peripheral.h".

Peripheral Module IDs

Peripheral libraries are indexed to allow a single library to control any number of instances of a peripheral in a single microcontroller. To support this, the first parameter to each operation in a peripheral library is the module instance ID. The module instance ID is defined by an enumeration that is defined in the processor-specific header files (included by the library's interface header). Not all microcontrollers will have all instances of the module listed in this enumeration. Please refer to the "**Resets**" chapter in the specific device data sheet for availability.

5.6.19.4.1 Hardware Abstraction Model

This library provides a low-level abstraction of the Reset Controller module on Microchip PIC microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Description

The following figure illustrates the hardware abstraction model for the Reset Peripheral Library.

The **Reset Controller** receives requests from multiple **Reset Sources**. The **Reset Controller** controls the overall operation of the reset controller.

Source Enable Configuration enables or disables a particular source of reset. Some of the reset sources such as Traps are not

controlled by the users, whereas others can be user controlled.

Note: Not all features are available on all devices. Refer to the **"Resets"** chapter in the specific device data sheet for availability

5.6.19.4.2 Library Architecture

This library provides the low-level abstraction of the Reset module available on the Microchip family of microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in the software and introduces the library interface.

The library interface routines are divided into various subsections, each of the subsection addresses one of the blocks or the overall operation of the Reset Controller module.

Library Interface Section	Description
Initialization Functions	This section provides a set of functions for configuring and enabling a reset.
Status Functions	This section provides a function to read the status of a particular reset.

Note: Not all modes are available on all devices. Refer to the **"Resets"** chapter in the specific device data sheet for availability.

5.6.19.4.3 How the Library Works

Initialization

The steps that are required to initialize the Reset Controller module vary for different microcontrollers. Refer to the **"Resets"** chapter in the specific device data sheet for the correct initialization sequence. The following information provides a general overview.

Description

Reset Source Setup

Some reset sources need to be enabled for it to be able to Reset the device. Use the function [PLIB_RESET_SoftwareResetEnable](#) to enable the reset source.

Reset Status

The status of the reset indicates which source generated the reset. The status of the reset source can be obtained using the function [PLIB_RESET_ReasonGet](#). The reason for the reset can be cleared using the function [PLIB_RESET_ReasonClear](#).

5.6.19.5 Configuring the Library

The library is configured for the supported Reset Controller modules when the processor is chosen in the MPLAB IDE.

5.6.19.6 Library Interface

Data Types and Constants

	Name	Description
	RESET_MODULE_ID	Identifies the supported Reset modules.
	RESET_CONFIG_REG_READ_ERROR	Lists the reset sources.
	RESET_NMI_COUNT_TYPE	Defines NMI counter data type
	RESET_NMI_REASON	Lists the NMI reasons.

Feature Existence Functions

	Name	Description
	PLIB_RESET_ExistsResetReasonStatus	Identifies whether the ResetReasonStatus feature exists on the RESET module
	PLIB_RESET_ExistsSoftwareResetTrigger	Identifies whether the SoftwareResetTrigger feature exists on the RESET module
	PLIB_RESET_ExistsConfigRegReadError	Identifies whether the ConfigRegReadError feature exists on the RESET module
	PLIB_RESET_ExistsNmiControl	Identifies whether the NmiControl feature exists on the RESET module
	PLIB_RESET_ExistsNmiCounter	Identifies whether the NmiCounter feature exists on the RESET module
	PLIB_RESET_ExistsWdtInSleep	Identifies whether the WdtInSleep feature exists on the RESET module

Initialization Functions

	Name	Description
	PLIB_RESET_SoftwareResetEnable	Enables the software reset.

Status Functions

	Name	Description
	PLIB_RESET_ReasonClear	Clears the RCON register.
	PLIB_RESET_ReasonGet	Returns the reason for a reset.
	PLIB_RESET_ConfigRegReadErrorGet	Get the Configuration Register Read Error
	PLIB_RESET_WdtTimeOutHasOccurredInSleep	Returns the state of the device when WDT time-out occurred

Description

This section lists and describes the functions, data types, and constants provided in the Reset Peripheral Library.

5.6.19.6.1 Initialization Functions**5.6.19.6.1.1 PLIB_RESET_SoftwareResetEnable Function****C**

```
void PLIB_RESET_SoftwareResetEnable(
    RESET_MODULE_ID index
);
```

Description

This function enables the software reset. The system unlock sequence, which must be performed to enable this feature, is done internally in this function.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This function implements an operation of the SoftwareResetTrigger feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or include the [PLIB_RESET_ExistsSoftwareResetTrigger](#) function in your application to determine whether this feature is available.

Example

```
PLIB_RESET_SoftwareResetEnable( RESET_ID_0 );
```

5.6.19.6.2 Status Functions

5.6.19.6.2.1 PLIB_RESET_ReasonClear Function

C

```
void PLIB_RESET_ReasonClear(
    RESET_MODULE_ID index,
    RESET_REASON reason
);
```

Description

This function clears the particular reset bit in the RCON register. Multiple reasons for a reset can be ORed together and given as an input parameter to clear them simultaneously.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
reason	Select the reset type from enum RESET_REASON

Returns

None

Remarks

This function implements an operation of the ResetReasonStatus feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or include the [PLIB_RESET_ExistsResetReasonStatus](#) function in your application to determine whether this feature is available.

Example

```
PLIB_RESET_ReasonClear( RESET_ID_0, RESET_REASON_MCLR | RESET_REASON_POWERON );
```

5.6.19.6.2.2 PLIB_RESET_ReasonGet Function

C

```
RESET_REASON PLIB_RESET_ReasonGet(
    RESET_MODULE_ID index
);
```

Description

This function returns the reason a reset has occurred for the selected device.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

RESET_REASON - Type of reset (when there is more than one reason for a reset, this function will logically OR (bitwise) the reasons and return the value.

Remarks

This function implements an operation of the ResetReasonStatus feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or include the [PLIB_RESET_ExistsResetReasonStatus](#) function in your application to determine whether this feature is available.

Example

```
RESET_REASON type;  
  
type = PLIB_RESET_ReasonGet ( RESET_ID_0 );
```

5.6.19.6.2.3 PLIB_RESET_ConfigRegReadErrorGet Function**C**

```
RESET_CONFIG_REG_READ_ERROR PLIB_RESET_ConfigRegReadErrorGet(  
    RESET_MODULE_ID index  
);
```

Description

This function gets the Configuration register read error, if any, after the reset

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

[RESET_CONFIG_REG_READ_ERROR](#) - Type of Config Register Read Error

Remarks

This function implements an operation of the ConfigRegReadError feature. This feature may not be available on all devices. Refer to the specific device data sheet to determine availability or include the [PLIB_RESET_ExistsConfigRegReadError](#) function in your application to determine whether this feature is available.

Example

```
if (PLIB_RESET_ConfigRegReadErrorGet( RESET_ID_0 )== PRIMARY_CONFIG_REG_READ_ERROR )  
{  
    //Do Something  
}
```

5.6.19.6.2.4 PLIB_RESET_WdtTimeOutHasOccurredInSleep Function**C**

```
bool PLIB_RESET_WdtTimeOutHasOccurredInSleep(  
    RESET_MODULE_ID index  
);
```

Description

This function returns if device was in sleep or not when WDT time-out event occurred.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

True - device was in sleep mode when WDT time-out occurred
False - device was not in sleep mode when WDT time-out occurred

Remarks

This function implements an operation of the WdtInSleep feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or include the [PLIB_RESET_ExistsWdtInSleep](#) function in your application to determine whether this feature is available.

Example

```
if (PLIB_RESET_WdtTimeOutHasOccurredInSleep( RESET_ID_0 ))
{
    //Do Something
}
```

5.6.19.6.3 Data Types and Constants

5.6.19.6.3.1 RESET_MODULE_ID Enumeration

C

```
typedef enum {
    RESET_ID_0
} RESET_MODULE_ID;
```

Description

Reset Module ID

This enumeration identifies the Reset modules that are available on the microcontroller. This is the superset of all the possible instances that might be available on a Microchip microcontroller.

Members

Members	Description
RESET_ID_0	RESET Module ID 0

Remarks

Caller should not rely on the specific numbers assigned to any of these values as they may change from one processor to the next.

Not all modules are available on all devices. Refer to the "Resets" chapter in the specific device data sheet to determine which modules are supported. The numbers used in the enumeration values will match the numbers given in the data sheet.

5.6.19.6.3.2 RESET_CONFIG_REG_READ_ERROR Enumeration

C

```
typedef enum {
    RESET_REASON_POWERON,
    RESET_REASON_BROWNOUT,
    RESET_REASON_WDT_TIMEOUT,
    RESET_REASON_SOFTWARE,
    RESET_REASON_MCLR,
    RESET_REASON_CONFIG_MISMATCH,
    RESET_REASON_HIGH_VOLTAGE_DETECT,
    PRIMARY_CONFIG_REG_READ_ERROR,
    PRIMARY_AND_ALTERNATIVE_CONFIG_REG_READ_ERROR,
    NO_CONFIG_REG_READ_ERROR
} RESET_CONFIG_REG_READ_ERROR;
```

Description

RESET source select enumeration

This enumeration lists the possible reset sources.

Members

Members	Description
RESET_REASON_POWERON	The last reset was a power on reset
RESET_REASON_BROWNOUT	The last reset was a brown out reset
RESET_REASON_WDT_TIMEOUT	The last reset was a watch dog timer time-out reset
RESET_REASON_SOFTWARE	The last reset was a software reset
RESET_REASON_MCLR	The last reset was a master clear(MCLR) reset
RESET_REASON_CONFIG_MISMATCH	The last reset was a configuration mismatch reset
RESET_REASON_HIGH_VOLTAGE_DETECT	The last reset was high voltage detect reset
PRIMARY_CONFIG_REG_READ_ERROR	An error occurred during the read of primary configuration registers
PRIMARY_AND_ALTERNATIVE_CONFIG_REG_READ_ERROR	An error occurred during the read of primary and alternate configuration register
NO_CONFIG_REG_READ_ERROR	No error occurred during the read of configuration registers

Remarks

Not all reset sources exist on all devices. Please refer to the specific device data sheet for availability.

5.6.19.6.3.3 RESET_NMI_COUNT_TYPE Type

C

```
typedef unsigned char RESET_NMI_COUNT_TYPE;
```

Description

RESET_NMI_COUNT_TYPE data type

It defines NMI counter data type

5.6.19.6.3.4 RESET_NMI_REASON Enumeration

C

```
typedef enum {
    WDTO_NMI,
```

```
DMTO_NMI,  
SOFTWARE_NMI,  
CF_NMI,  
WDTS_NMI  
} RESET_NMI_REASON;
```

Description

NMI Reason enumeration

This enumeration lists the possible NMI sources.

Members

Members	Description
WDTO_NMI	Watch Dog Timer time-out has caused NMI
DMTO_NMI	Deadman Timer time-out has caused NMI
SOFTWARE_NMI	Software trigger has caused NMI
CF_NMI	Clock Failure has caused NMI
WDTS_NMI	Watch Dog Timer in Sleep has caused NMI

Remarks

Not all NMI sources exist on all devices. Please refer to the specific device data sheet for availability.

5.6.19.6.4 Feature Existence Functions

5.6.19.6.4.1 PLIB_RESET_ExistsResetReasonStatus Function

C

```
bool PLIB_RESET_ExistsResetReasonStatus(  
    RESET_MODULE_ID index  
);
```

Description

This function identifies whether the ResetReasonStatus feature is available on the RESET module. When this function returns true, these functions are supported on the device:

- [PLIB_RESET_ReasonGet](#)
- [PLIB_RESET_ReasonClear](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ResetReasonStatus feature is supported on the device
- false - The ResetReasonStatus feature is not supported on the device

Remarks

None.

5.6.19.6.4.2 PLIB_RESET_ExistsSoftwareResetTrigger Function

C

```
bool PLIB_RESET_ExistsSoftwareResetTrigger(  
    RESET_MODULE_ID index  
);
```

Description

This function identifies whether the SoftwareResetTrigger feature is available on the RESET module. When this function returns true, these functions are supported on the device:

- [PLIB_RESET_SoftwareResetEnable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The SoftwareResetTrigger feature is supported on the device
- false - The SoftwareResetTrigger feature is not supported on the device

Remarks

None.

5.6.19.6.4.3 PLIB_RESET_ExistsConfigRegReadError Function

C

```
bool PLIB_RESET_ExistsConfigRegReadError(  
    RESET_MODULE_ID index  
);
```

Description

This function identifies whether the ConfigRegReadError feature is available on the RESET module. When this function returns true, these functions are supported on the device:

- [PLIB_RESET_ConfigRegReadErrorGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ConfigRegReadError feature is supported on the device
- false - The ConfigRegReadError feature is not supported on the device

Remarks

None.

5.6.19.6.4.4 PLIB_RESET_ExistsNmiControl Function

C

```
bool PLIB_RESET_ExistsNmiControl(  
    RESET_MODULE_ID index  
);
```

Description

This function identifies whether the NmiControl feature is available on the RESET module. When this function returns true, these functions are supported on the device:

- [PLIB_RESET_NmiReasonGet](#)
- [PLIB_RESET_NmiEventTrigger](#)
- [PLIB_RESET_NmiEventClear](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The NmiControl feature is supported on the device
- false - The NmiControl feature is not supported on the device

Remarks

None.

5.6.19.6.4.5 PLIB_RESET_ExistsNmiCounter Function

C

```
bool PLIB_RESET_ExistsNmiCounter(  
    RESET_MODULE_ID index  
);
```

Description

This function identifies whether the NmiCounter feature is available on the RESET module. When this function returns true, these functions are supported on the device:

- [PLIB_RESET_NmiCounterValueSet](#)
- [PLIB_RESET_NmiCounterValueGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The NmiCounter feature is supported on the device
- false - The NmiCounter feature is not supported on the device

Remarks

None.

5.6.19.6.4.6 PLIB_RESET_ExistsWdtInSleep Function**C**

```
bool PLIB_RESET_ExistsWdtInSleep(
    RESET_MODULE_ID index
);
```

Description

This function identifies whether the WdtInSleep feature is available on the RESET module. When this function returns true, these functions are supported on the device:

- [PLIB_RESET_WdtTimeOutHasOccurredInSleep](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The WdtInSleep feature is supported on the device
- false - The WdtInSleep feature is not supported on the device

Remarks

None.

5.6.19.6.5 NMI Events Functions**Functions**

	Name	Description
	PLIB_RESET_NmiCounterValueGet	Gets the NMI counter value
	PLIB_RESET_NmiCounterValueSet	Sets the NMI counter
	PLIB_RESET_NmiEventClear	Clears the NMI event
	PLIB_RESET_NmiEventTrigger	Triggers the NMI event
	PLIB_RESET_NmiReasonGet	Returns the reason for NMI

Description**5.6.19.6.5.1 PLIB_RESET_NmiCounterValueGet Function****C**

```
RESET_NMI_COUNT_TYPE PLIB_RESET_NmiCounterValueGet(
    RESET_MODULE_ID index
);
```

Description

This function returns the NMI Reset counter value

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

nmi_count - NMI counter value

Remarks

This function implements an operation of the NmiCounter feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or include the [PLIB_RESET_ExistsNmiCounter](#) function in your application to determine whether this feature is available.

Example

```
RESET_NMI_COUNT_TYPE nmi_count;  
nmi_count = PLIB_RESET_NmiCounterValueGet( RESET_ID_0);
```

5.6.19.6.5.2 PLIB_RESET_NmiCounterValueSet Function**C**

```
void PLIB_RESET_NmiCounterValueSet(  
    RESET_MODULE_ID index,  
    RESET_NMI_COUNT_TYPE nmi_count  
);
```

Description

This function sets the NMI counter which needs to be expired for WDT or DMT reset

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured nmi_count -NMI counter value

Returns

None

Remarks

This function implements an operation of the NmiCounter feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or include the [PLIB_RESET_ExistsNmiCounter](#) function in your application to determine whether this feature is available.

Example

```
PLIB_RESET_NmiCounterValueSet( RESET_ID_0, 0x54);
```

5.6.19.6.5.3 PLIB_RESET_NmiEventClear Function

C

```
void PLIB_RESET_NmiEventClear(  
    RESET_MODULE_ID index,  
    RESET_NMI_REASON nmi_reason  
);
```

Description

This function clears the Non-Maskable-Interrupt (NMI) event. if WDTO or DMT0 NMI event is cleared before NMI counter reaches zero, then no device reset is asserted.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
nmi_reason	sets of reasons which can cause NMI

Returns

None

Remarks

This function implements an operation of the NmiControl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or include the [PLIB_RESET_ExistsNmiControl](#) function in your application to determine whether this feature is available.

Example

```
PLIB_RESET_NmiEventClear( RESET_ID_0, WDTO_NMI );
```

5.6.19.6.5.4 PLIB_RESET_NmiEventTrigger Function

C

```
void PLIB_RESET_NmiEventTrigger(  
    RESET_MODULE_ID index,  
    RESET_NMI_REASON nmi_reason  
);
```

Description

This function triggers the Non-Maskable-Interrupt (NMI). In case of DMT or WDT NMI event, it will also trigger NMI counter to start the count down.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
nmi_reason	sets of reasons which can cause NMI

Returns

None

Remarks

This function implements an operation of the NmiControl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or include the [PLIB_RESET_ExistsNmiControl](#) function in your application to determine whether this feature is available.

Example

```
PLIB_RESET_NmiEventTrigger( RESET_ID_0, WDTO_NMI );
```

5.6.19.6.5.5 PLIB_RESET_NmiReasonGet Function**C**

```
RESET_NMI_REASON PLIB_RESET_NmiReasonGet(  
    RESET_MODULE_ID index  
);
```

Description

This function returns the reason which caused the Non-Maskable-Interrupt (NMI)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

[RESET_NMI_REASON](#) - sets of reasons which can cause NMI

Remarks

This function implements an operation of the NmiControl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or include the [PLIB_RESET_ExistsNmiControl](#) function in your application to determine whether this feature is available.

Example

```
if (PLIB_RESET_NmiReasonGet( RESET_ID_0 )== WDTO_NMI )  
{  
    //Do Something  
}
```

5.6.19.7 Files**Files**

Name	Description
plib_reset.h	Defines the Reset Peripheral Library interface.

Description**5.6.19.7.1 plib_reset.h**

Reset Peripheral Library Interface Header

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the

Reset Peripheral Library for Microchip microcontrollers. The definitions in this file are for the Reset Controller module.

Functions

	Name	Description
≡	PLIB_RESET_ConfigRegReadErrorGet	Get the Configuration Register Read Error
≡	PLIB_RESET_ExistsConfigRegReadError	Identifies whether the ConfigRegReadError feature exists on the RESET module
≡	PLIB_RESET_ExistsNmiControl	Identifies whether the NmiControl feature exists on the RESET module
≡	PLIB_RESET_ExistsNmiCounter	Identifies whether the NmiCounter feature exists on the RESET module
≡	PLIB_RESET_ExistsResetReasonStatus	Identifies whether the ResetReasonStatus feature exists on the RESET module
≡	PLIB_RESET_ExistsSoftwareResetTrigger	Identifies whether the SoftwareResetTrigger feature exists on the RESET module
≡	PLIB_RESET_ExistsWdtInSleep	Identifies whether the WdtInSleep feature exists on the RESET module
≡	PLIB_RESET_NmiCounterValueGet	Gets the NMI counter value
≡	PLIB_RESET_NmiCounterValueSet	Sets the NMI counter
≡	PLIB_RESET_NmiEventClear	Clears the NMI event
≡	PLIB_RESET_NmiEventTrigger	Triggers the NMI event
≡	PLIB_RESET_NmiReasonGet	Returns the reason for NMI
≡	PLIB_RESET_ReasonClear	Clears the RCON register.
≡	PLIB_RESET_ReasonGet	Returns the reason for a reset.
≡	PLIB_RESET_SoftwareResetEnable	Enables the software reset.
≡	PLIB_RESET_WdtTimeOutHasOccurredInSleep	Returns the state of the device when WDT time-out occurred

Types

	Name	Description

5.6.20 RTCC Peripheral Library

5.6.20.1 Introduction

Real-Time Clock and Calendar (RTCC) Peripheral Library

for

Microchip Microcontrollers

This module provides real-time clock and calendar functions. The RTCC is intended for applications where accurate time must be maintained for extended periods with minimum to no intervention from the CPU. The module is optimized for low-power usage to provide extended battery life while keeping track of time.

Description

The RTCC module is a 100-year clock and calendar with automatic leap year detection. The range of the clock is from 00:00:00 (midnight) on January 1, 2000 to 23:59:59 on December 31, 2099. The hours are available in 24-hour (military time) format. The clock provides a granularity of one second with half-second visibility to the user.

RTCC Block Diagram

Operating Modes

RTCC Mode

The RTCC module is intended to be clocked by an external real-time clock crystal oscillating at 32.768 kHz. The prescaler divides the crystal oscillator frequency to produce a 1 Hz frequency for the clock and calendar. The current Date and Time are stored in a BCD counter. Please refer to the "RTCC" chapter in the specific device data sheet and the related family reference manual section to learn more about the counter rolls, overflows and carryovers.

Alarm Mode

The RTCC module provides an alarm function that is configurable from a half-second to one year. After the alarm is enabled, the RTCC module can be configured to repeat the alarm at preconfigured intervals. The indefinite repetition of the alarm is provided through the Chime feature.

Note: Not all functionality is available on all devices. Please refer the specific device data sheet to determine availability.

5.6.20.2 Release Notes

MPLAB Harmony Version: v0.70b **RTCC Peripheral Library Version :** 0.70b **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.6.20.3 SW License Agreement

© 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS." MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.6.20.4 Using the Library

This topic describes the basic architecture of the RTCC Peripheral Library and provides information and examples on how to use it.

Interface Header File: [plib_rtcc.h](#)

The interface to the RTCC Peripheral Library is defined in the "[plib_rtcc.h](#)" header file. Any C language source (.c) file that uses the RTCC Peripheral Library should include "[plib_rtcc.h](#)".

Library File: The RTCC Peripheral Library archive (.a) file is installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for information on how the peripheral interacts with the framework.

5.6.20.4.1 Hardware Abstraction Model

This library provides a low-level abstraction of the RTCC module on the Microchip family of microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Description

The RTCC peripheral library provides interface routines to interact with the blocks shown in the following diagram.

Hardware Abstraction Model

The **RTCC Control Logic** provides the capability to operate the RTCC module in the RTCC and Alarm modes. The control logic also handles the comparison and the counter increments, which in turn control the alarm generation. This module is also responsible for the generation of a square wave at the RTCC output pin. In addition, the RTCC module provides the RTCC drift calibration.

The **RTCC Interrupt Logic** is primarily used in alarm generation. The various configurations of the alarm and their repetition period may be defined.

The **RTCC Registers** store the actual date and time. Separate registers are present for RTCC and alarm functionality.

5.6.20.4.2 Library Usage Model

This section provides an overview of the usage model for the RTCC Peripheral Library.

Description

The following diagram describes the major components of the usage model.

Each of the blocks in the diagram correspond to the library interface section.

Library Interface Section	Description
General Functions	Provides the setup and configuration of general functionalities in the RTCC module. This section also covers the drift calibration.
RTCC Mode Functions	Provides configuration of the RTCC-related registers. Updating the Date and Time registers along with reading them accurately is performed.

Alarm Mode Functions	Provides configuration of the Alarm-related registers. Updating the Date and Time registers along with reading them accurately is performed. In addition, the rate at which an alarm occurs and the frequency is also configured in this mode.

5.6.20.4.3 How the Library Works

The usage model for this library is explained in the following sections.

5.6.20.4.3.1 State Machine

This RTCC state machine is provided to give a general idea of the usage model of the peripheral library. Refer to the usage model for more detailed steps for the scenario that is being used.

Description

The following state machine diagram is for RTCC mode and Alarm Mode during normal operation.

State	Associated Function
Setup and Initialization	Refer to mode of RTCC for detailed instructions of setup.
Enable Write via Key Sequence	For RTCC to perform any function, the module has to be enabled via a series of commands in a special sequence. This is abstracted and is achieved using PLIB_RTCC_WriteEnable .
Enable Access of RTC	These include the functions needed to set up the RTCC/Alarm, which will be explained in detail in the following sections.
Wait for Safe Sync Window	To update the RTCC on-the-fly, a safe window period is available, corresponding to 32 clock cycles called RTSYNC. Further sections will explain the functionality in greater detail.
Write/Read Date and Time	The application may read or write the date and time using PLIB_RTCC_WriteRTCCDateValueRegister , PLIB_RTCC_ReadRTCCDateValueRegister , among other. These functions are device-specific and may not exist for all devices.

5.6.20.4.3.2 RTCC Mode Operations

This section describes the RTCC mode of operation of the RTCC module.

Note: Please refer to the "RTCC" chapter in the specific device data sheet or the related family reference manual to determine which features are supported by your device.

Description

Enabling the RTCC Module for Write Operations

To perform a write to any of the RTCC timer registers the RTCWREN bit must be set. It is recommended that this bit be reset unless a write operation is specifically required.

A sequence of commands, each varying across processor families must be executed to set the RTCWREN.

Example: Enabling a Write

```
// Assume Interrupts are disabled.
// Assume the DMA controller is suspended

PLIB_RTCC_WriteEnable(MY_RTCC_INSTANCE);

// where, MY_RTCC_INSTANCE - is a specific instance of the hardware peripheral.

// This API performs the writing of the sequence
// 0xaa996655 and 0x556699aa to the SYSKET in MCU32
// and 0x55 and 0xaa in case of MCU 16 and MCU 8
// This API then sets the RTCWREN.
```

Updating RTCC Time and Date

1. Turn off the RTCC using the API [PLIB_RTCC_Disable](#).
2. Wait for the sync clock to turn off by reading the status of [PLIB_RTCC_ValueRegistersReadSyncBit](#) (This operation may not be required on all devices).
3. Update the Date and Time registers using [PLIB_RTCC_WriteRTCTimeValueRegister](#) and [PLIB_RTCC_WriteRTCCDateValueRegister](#).
4. Turn on the RTCC module using [PLIB_RTCC_Enable](#).

Example: Updating RTCC Time and Date

```
// Assume Write Enable has been performed correctly
unsigned long time = 0x04153300; // Set time 04 hrs 15 mins and 33 sec
unsigned long date = 0x06102705; // Set date to Friday 27 Oct 2006
```

```

    PLIB_RTCC_Disable(MY_RTCC_INSTANCE);

    // where, MY_RTCC_INSTANCE - is a specific instance of the hardware peripheral.
    while(PLIB_RTCC_ValueRegistersReadSyncBit(MY_RTCC_INSTANCE)); // Wait for clock to turn
off
    PLIB_RTCC_WriteRTCTimeValueRegister(MY_RTCC_INSTANCE, time); // Update the Time
    PLIB_RTCC_WriteRTCCDateValueRegister(MY_RTCC_INSTANCE, date); // Update the Date
    PLIB_RTCC_Enable(MY_RTCC_INSTANCE);

```

Updating RTCC Time and Date using RTSYNC Window

1. Wait for the sync clock to turn off by reading the status of `PLIB_RTCC_ValueRegistersReadSyncBit`.
2. Update the RTC Date and Time registers using `PLIB_RTCC_WriteRTCCDateValueRegister` and `PLIB_RTCC_WriteRTCTimeValueRegister`.

Example: Updating RTCC Time and Date Using RTSYNC Window

```

    // Assume Write Enable has been performed correctly
    unsigned long time = 0x04153300; // Set time 04 hrs 15 mins and 33 sec
    unsigned long date = 0x06102705; // Set date to Friday 27 Oct 2006

    // where, MY_RTCC_INSTANCE - is a specific instance of the hardware peripheral.
    //Disable Critical Interrupts here ....
    while(PLIB_RTCC_ValueRegistersReadSyncBit(MY_RTCC_INSTANCE)); // Wait for clock to turn
off
    PLIB_RTCC_WriteRTCTimeValueRegister(MY_RTCC_INSTANCE, time); // Update the Time
    PLIB_RTCC_WriteRTCCDateValueRegister(MY_RTCC_INSTANCE, date); // Update the Date
    //Enable Critical Interrupts here ....

```

Updating RTCC Time and Date Using Register Pointers

1. Turn off the RTCC using `PLIB_RTCC_Disable`.
2. Update the register pointer to point to the accurate registers using `PLIB_RTCC_ValueRegisterPointer`.
3. Update the RTC Date and Time registers using `PLIB_RTCC_ValueWrite`.
4. Turn on the RTCC module using `PLIB_RTCC_Enable`.

Example: Updating RTCC Time and Date Using Register Pointers

```

    // Assume Write Enable has been performed correctly
    PLIB_RTCC_Disable(MY_RTCC_INSTANCE);

    // where, MY_RTCC_INSTANCE - is a specific instance of the hardware peripheral.
    PLIB_RTCC_ValueRegisterPointer(MY_RTCC_INSTANCE, RTCC_REG_YEAR);
    PLIB_RTCC_ValueWrite(MY_RTCC_INSTANCE, 0x0007); // Update the Year
    PLIB_RTCC_ValueWrite(MY_RTCC_INSTANCE, 0x1028); // Update the Month and Day
    PLIB_RTCC_ValueWrite(MY_RTCC_INSTANCE, 0x0110); // Update the Weekday and Hour
    PLIB_RTCC_ValueWrite(MY_RTCC_INSTANCE, 0x0000); // Set the minute and second

```

```
PLIB_RTCC_Enable(MY_RTCC_INSTANCE);
```

5.6.20.4.3.3 Alarm Mode Operations

This section describes the Alarm mode of operation of the RTCC module.

Note: Please refer to the "RTCC" chapter in the specific device data sheet or the related family reference manual to determine which features are supported by your device.

Description

Configuring the One-Time-Per-Day Alarm

1. Turn off the Alarm and also the chime, alarm repeats, and masks using [PLIB_RTCC_AlarmDisable](#).
2. Wait for the sync clock to turn off by reading the status of PLIB_RTCC_AlarmValueRegistersReadSyncBit (This operation may not be required on all devices).
3. Update the Alarm Date and Time registers using PLIB_RTCC_WriteAlarmTimeValueRegister and PLIB_RTCC_WriteAlarmDateValueRegister.
4. Set the alarm mask to every half-second and the repeat counter to zero using [PLIB_RTCC_AlarmMaskModeSelect](#) and [PLIB_RTCC_AlarmRepeatCountSet](#), respectively.
5. Turn on the RTCC Alarm module using [PLIB_RTCC_AlarmEnable](#).

Example: Configuring the One-Time-Per-Day Alarm

```
// Assume Write Enable has been performed correctly
unsigned long time = 0x04153300; // Set time 04 hrs 15 mins and 33 sec
unsigned long date = 0x06102705; // Set date to Friday 27 Oct 2006

PLIB_RTCC_AlarmDisable(MY_RTCC_INSTANCE);

// where, MY_RTCC_INSTANCE - is a specific instance of the hardware peripheral.

while(PLIB_RTCC_AlarmValueRegistersReadSyncBit(MY_RTCC_INSTANCE)); // Wait for clock to
turn off

PLIB_RTCC_WriteAlarmTimeValueRegister(MY_RTCC_INSTANCE, time); // Update the Time
PLIB_RTCC_WriteAlarmDateValueRegister(MY_RTCC_INSTANCE, date); // Update the Date
PLIB_RTCC_AlarmMaskModeSelect(MY_RTCC_INSTANCE, RTCC_ALARM_EVERY_HALF_SECOND);
PLIB_RTCC_AlarmRepeatCountSet(MY_RTCC_INSTANCE, 0 /*No of repetitions*/ );
PLIB_RTCC_AlarmEnable(MY_RTCC_INSTANCE);
```

Configuring the Repeat Alarm

1. Turn off the Alarm and also the Chime, alarm repeats, and masks using [PLIB_RTCC_AlarmDisable](#).
2. Wait for the sync clock to turn off by reading the status of PLIB_RTCC_AlarmValueRegistersReadSyncBit (This operation may not be required on all devices).
3. Update the Alarm Date and Time registers using PLIB_RTCC_WriteAlarmTimeValueRegister and PLIB_RTCC_WriteAlarmDateValueRegister.
4. Set the alarm mask to every half-second and the repeat counter to 10 using [PLIB_RTCC_AlarmMaskModeSelect](#) and [PLIB_RTCC_AlarmRepeatCountSet](#), respectively.
5. Turn on the RTCC Alarm module using [PLIB_RTCC_AlarmEnable](#).

Example: Configuring the Repeat Alarm

```
// Assume Write Enable has been performed correctly
unsigned long time = 0x04153300; // Set time 04 hrs 15 mins and 33 sec
unsigned long date = 0x06102705; // Set date to Friday 27 Oct 2006
```

```

    PLIB_RTCC_AlarmDisable(MY_RTCC_INSTANCE);

    // where, MY_RTCC_INSTANCE - is a specific instance of the hardware peripheral.

    while(PLIB_RTCC_AlarmValueRegistersReadSyncBit(MY_RTCC_INSTANCE)); // Wait for clock to
    turn off

    PLIB_RTCC_WriteAlarmTimeValueRegister(MY_RTCC_INSTANCE, time); // Update the Time
    PLIB_RTCC_WriteAlarmDateValueRegister(MY_RTCC_INSTANCE, date); // Update the Date
    PLIB_RTCC_AlarmMaskModeSelect(MY_RTCC_INSTANCE, RTCC_ALARM_EVERY_HALF_SECOND);
    PLIB_RTCC_AlarmRepeatCountSet(MY_RTCC_INSTANCE, 10 /*No of repetitions*/ );
    PLIB_RTCC_AlarmEnable(MY_RTCC_INSTANCE);

```

Configuring the Indefinite One-Per-Day Alarm

1. Turn off the Alarm and also the Chime, alarm repeats and masks using [PLIB_RTCC_AlarmDisable](#).
2. Wait for the sync clock to turn off by reading the status of `PLIB_RTCC_AlarmValueRegistersReadSyncBit` (This operation may not be required on all devices).
3. Update the Alarm Date and Time registers using `PLIB_RTCC_WriteAlarmTimeValueRegister` and `PLIB_RTCC_WriteAlarmDateValueRegister`.
4. Set the alarm mask to every half-second and the repeat counter to 0 using [PLIB_RTCC_AlarmMaskModeSelect](#) and [PLIB_RTCC_AlarmRepeatCountSet](#), respectively.
5. Turn on the RTCC Alarm module using [PLIB_RTCC_AlarmEnable](#) and enable chime using [PLIB_RTCC_AlarmChimeEnable](#).

Example: Configuring the Indefinite One-Per-Day Alarm

```

    // Assume Write Enable has been performed correctly
    unsigned long time = 0x04153300; // Set time 04 hrs 15 mins and 33 sec
    unsigned long date = 0x06102705; // Set date to Friday 27 Oct 2006

    PLIB_RTCC_AlarmDisable(MY_RTCC_INSTANCE);

    // where, MY_RTCC_INSTANCE - is a specific instance of the hardware peripheral.

    while(PLIB_RTCC_AlarmValueRegistersReadSyncBit(MY_RTCC_INSTANCE)); // Wait for clock to
    turn off

    PLIB_RTCC_WriteAlarmTimeValueRegister(MY_RTCC_INSTANCE, time); // Update the Time
    PLIB_RTCC_WriteAlarmDateValueRegister(MY_RTCC_INSTANCE, date); // Update the Date
    PLIB_RTCC_AlarmMaskModeSelect(MY_RTCC_INSTANCE, RTCC_ALARM_EVERY_HALF_SECOND);
    PLIB_RTCC_AlarmRepeatCountSet(MY_RTCC_INSTANCE, 0 /*No of repetitions*/ );
    PLIB_RTCC_AlarmEnable(MY_RTCC_INSTANCE);
    PLIB_RTCC_AlarmChimeEnable(MY_RTCC_INSTANCE);

```

5.6.20.4.3.4 Other Functionality

This section describes the Drift Calibration mode of operation of the RTCC module.

Note: Please refer to the "RTCC" chapter in the specific device data sheet or the related family reference manual to determine which features are supported by your device.

Description

The real-time crystal input can be calibrated using the periodic auto-adjust feature. When properly calibrated, the RTCC module

can provide an error of less than 0.66 seconds per month. Calibration has the ability to eliminate an error of up to 260 ppm.

The calibration is accomplished by finding the number of error clock pulses and writing this value into the calibration bit fields using `PLIB_RTCC_DriftCalibrate`.

Drift Calibration

1. Using another timer resource, the user must find the error of the 32.768 kHz crystal.
2. Once the error is known, it must be converted to the number of error clock pulses per minute, as shown by ***(Ideal Frequency(32,758) - Measured Frequency) * 60 = Error Clocks Per Minute***.
3. If the error is negative, the input to `PLIB_RTCC_DriftCalibrate` is negative. Likewise, if the error is positive, the input is positive. The negative and positive values are the actual number of clock pulses to be added or subtracted from the timer counter per minute.

Example: Configuring the One-Time-Per-Day Alarm

```
// Assume Write Enable has been performed correctly
// Assume steps 1 and 2 are performed and the error is determined.

int driftValue = 0x3FD    // 10 bits Adjustment, -3 in value
int T0,T1;

do
{
    T0 = PLIB_RTCC_ReadRTCTimeValueRegister(MY_RTCC_INSTANCE);
    T1 = PLIB_RTCC_ReadRTCTimeValueRegister(MY_RTCC_INSTANCE);

    // where, MY_RTCC_INSTANCE - is a specific instance of the hardware peripheral.
}while(T0!=T1)    //Read Valid Time Value

if((T0 & 0xFF) == 0) // we are at seconds exactly 00, wait for auto adjust
{
    while(!PLIB_RTCC_HalfSecondStatusBit(MY_RTCC_INSTANCE));; Wait for the second Half
}

PLIB_RTCC_DriftCalibrate(MY_RTCC_INSTANCE, 0x00); //Clear the calibration
PLIB_RTCC_DriftCalibrate(MY_RTCC_INSTANCE, 0xdriftValue);
```

5.6.20.4.4 Configuring the Library

The library is configured for the supported RTCC modules when the processor is chosen in the MPLAB IDE.

5.6.20.5 Library Interface

Data Types and Constants

	Name	Description
	<u>RTCC_ALARM_MASK_CONFIGURATION</u>	Data type defining the different configurations for the alarm mask bits.
	<u>RTCC_MODULE_ID</u>	Enumeration: <code>RTCC_MODULE_ID</code> This enumeration defines number of modules which are available on the microcontroller. This is the superset of all of the possible instances that may be available on the Microchip microcontrollers. Refer to the data sheet to get the correct number of modules defined for desired microcontroller.
	<u>RTCC_VALUE_REGISTER_POINTER</u>	Data type defining the different configurations by which the RTCC Date and Time Registers can be accessed.

Alarm Mode Functions

	Name	Description
≡	PLIB_RTCC_AlarmChimeDisable	Disables the specific RTCC module's chime.
≡	PLIB_RTCC_AlarmChimeEnable	Enables the specific RTCC module's chime.
≡	PLIB_RTCC_AlarmDateGet	Returns the contents of the specific RTCC module's Alarm Date register.
≡	PLIB_RTCC_AlarmDateSet	Writes to the specific RTCC module's Alarm Date register.
≡	PLIB_RTCC_AlarmDayGet	Returns the contents of the Day bits in the specific RTCC module's Alarm Date register.
≡	PLIB_RTCC_AlarmDaySet	Writes to the specific RTCC module's Alarm Date value register.
≡	PLIB_RTCC_AlarmDisable	Disables the specific RTCC module's alarm.
≡	PLIB_RTCC_AlarmEnable	Enables the specific RTCC module's alarm.
≡	PLIB_RTCC_AlarmHourGet	Returns the contents of Hours bits in the specific RTCC module's Alarm Time register.
≡	PLIB_RTCC_AlarmHourSet	The function returns the contents of Hours bits in the specific RTCC module's Alarm Time register.
≡	PLIB_RTCC_AlarmMaskModeSelect	Sets the specific RTCC module's alarm mask Configuration bits.
≡	PLIB_RTCC_AlarmMinuteGet	Returns the contents of Minutes bits in the specific RTCC module's Alarm Time register.
≡	PLIB_RTCC_AlarmMinuteSet	Returns the contents of the Minutes bits in the specific RTCC module's Alarm Time register.
≡	PLIB_RTCC_AlarmMonthGet	Returns the contents of the Month bits in the specific RTCC module's Alarm Date register.
≡	PLIB_RTCC_AlarmMonthSet	Writes to the specific RTCC module's Alarm Date register.
≡	PLIB_RTCC_AlarmPulseInitialGet	Returns the state of the initial alarm pulse.
≡	PLIB_RTCC_AlarmPulseInitialSet	Enables the determination of the initial alarm pulse.
≡	PLIB_RTCC_AlarmRepeatCountGet	Reads the specific RTCC module's alarm repeat counter.
≡	PLIB_RTCC_AlarmRepeatCountSet	Sets the specific RTCC module's alarm repeat counter.
≡	PLIB_RTCC_AlarmSecondGet	Returns the contents of the Seconds bits in the specific RTCC module's Alarm Time register.
≡	PLIB_RTCC_AlarmSecondSet	Returns the contents of Seconds bits in the specific RTCC module's Alarm Time register.
≡	PLIB_RTCC_AlarmTimeGet	Returns the contents of the specific RTCC module's Alarm Time register.
≡	PLIB_RTCC_AlarmTimeSet	Writes to the specific RTCC module's Alarm Time register.
≡	PLIB_RTCC_AlarmValueRegisterPointer	Sets the specific RTCC module's Alarm register pointer.
≡	PLIB_RTCC_AlarmWeekDayGet	Returns the contents of the WeekDay bits in the specific RTCC module's Alarm Date register.
≡	PLIB_RTCC_AlarmWeekDaySet	Writes to the specific RTCC module's Alarm Date register.

Feature Existence Functions

	Name	Description
≡	PLIB_RTCC_ExistsAlarmChimeControl	Identifies whether the AlarmChimeControl feature exists on the RTCC module.
≡	PLIB_RTCC_ExistsAlarmControl	Identifies whether the AlarmControl feature exists on the RTCC module.
≡	PLIB_RTCC_ExistsAlarmDate	Identifies whether the AlarmDate feature exists on the RTCC module.
≡	PLIB_RTCC_ExistsAlarmMaskControl	Identifies whether the AlarmMaskControl feature exists on the RTCC module.
≡	PLIB_RTCC_ExistsAlarmPulseInitial	Identifies whether the AlarmPulseInitial feature exists on the RTCC module.

◆	PLIB_RTCC_ExistsAlarmRepeatControl	Identifies whether the AlarmRepeatControl feature exists on the RTCC module.
◆	PLIB_RTCC_ExistsAlarmSynchronization	Identifies whether the AlarmSynchronization feature exists on the RTCC module.
◆	PLIB_RTCC_ExistsAlarmTime	Identifies whether the AlarmTime feature exists on the RTCC module.
◆	PLIB_RTCC_ExistsCalibration	Identifies whether the Calibration feature exists on the RTCC module.
◆	PLIB_RTCC_ExistsClockRunning	Identifies whether the ClockRunning feature exists on the RTCC module.
◆	PLIB_RTCC_ExistsClockSelect	Identifies whether the ClockSelect feature exists on the RTCC module.
◆	PLIB_RTCC_ExistsEnableControl	Identifies whether the EnableControl feature exists on the RTCC module.
◆	PLIB_RTCC_ExistsHalfSecond	Identifies whether the HalfSecond feature exists on the RTCC module.
◆	PLIB_RTCC_ExistsOutputControl	Identifies whether the OutputControl feature exists on the RTCC module.
◆	PLIB_RTCC_ExistsOutputSelect	Identifies whether the OutputSelect feature exists on the RTCC module.
◆	PLIB_RTCC_ExistsRTCDate	Identifies whether the RTCDateValue feature exists on the RTCC module.
◆	PLIB_RTCC_ExistsRTCTime	Identifies whether the RTCTimeValue feature exists on the RTCC module.
◆	PLIB_RTCC_ExistsStopInIdleControl	Identifies whether the StopInIdle feature exists on the RTCC module.
◆	PLIB_RTCC_ExistsSynchronization	Identifies whether the Synchronization feature exists on the RTCC module.
◆	PLIB_RTCC_ExistsWriteEnable	Identifies whether the WriteEnable feature exists on the RTCC module.

General Functions

	Name	Description
◆	PLIB_RTCC_ClockOutputDisable	Disables the specific RTCC module's output pin.
◆	PLIB_RTCC_ClockOutputEnable	Enables the specific RTCC module's output pin.
◆	PLIB_RTCC_ClockRunningStatus	Provides the status of the RTCC clock.

Other Functions

	Name	Description
◆	PLIB_RTCC_ClockSourceSelect	Selects the clock source for the RTCC module.
◆	PLIB_RTCC_DriftCalibrateGet	Reads the specific RTCC module's drift calibration bits.
◆	PLIB_RTCC_DriftCalibrateSet	Sets the specific RTCC module's drift calibration bits.
◆	PLIB_RTCC_HalfSecondStatusGet	The function returns the half second status bit.
◆	PLIB_RTCC_OutputSelect	Selects which signal will be presented on the RTCC pin
◆	PLIB_RTCC_StopInIdleDisable	Continues normal RTCC operation when the device enters Idle mode.
◆	PLIB_RTCC_StopInIdleEnable	Disables access to the RTCC module by the Peripheral Bus Clock (PBCLK) when the CPU enters Idle mode.

RTCC Mode Functions

	Name	Description
◆	PLIB_RTCC_Disable	Disables the specific RTCC module on the device.
◆	PLIB_RTCC_Enable	Enables the specific RTCC module on the device.
◆	PLIB_RTCC_WriteDisable	Disables writing to the specific RTCC module's value registers.
◆	PLIB_RTCC_WriteEnable	Enables writing to the specific RTCC module's value registers.
◆	PLIB_RTCC_RTCDateGet	Returns the contents of the specific RTCC module's Date register.
◆	PLIB_RTCC_RTCDateSet	Writes to the specific RTCC module's Date register.
◆	PLIB_RTCC_RTCTimeGet	Returns the contents of the Days bits in the specific RTCC module's Date register.
◆	PLIB_RTCC_RTCTimeSet	Writes to the specific RTCC module's Date register.
◆	PLIB_RTCC_RTCHourGet	Returns the contents of the Hours bits in the specific RTCC module's Time register.

	PLIB_RTCC_RTCHourSet	Writes the contents of the Hours bits in the specific RTCC module's Time register.
	PLIB_RTCC_RTCMinuteGet	Returns the contents of the Minutes bits in the specific RTCC module's Time register.
	PLIB_RTCC_RTCMinuteSet	Writes the contents of Minutes bits in the specific RTCC module's Time register.
	PLIB_RTCC_RTCMonthGet	Returns the contents of the Months bits in the specific RTCC module's Date register.
	PLIB_RTCC_RTCMonthSet	Writes to the specific RTCC module's Date register.
	PLIB_RTCC_RTCSecondGet	The function returns the contents of the Seconds bits in the specific RTCC device's Time register.
	PLIB_RTCC_RTCSecondSet	Writes the contents of Seconds bits in the specific RTCC module's Time register.
	PLIB_RTCC_RTCTimeGet	Returns the contents of the specific RTCC module's Time register.
	PLIB_RTCC_RTCTimeSet	Writes to the specific RTCC module's Time register.
	PLIB_RTCC_RTCWeekDayGet	Returns the contents of the WeekDay bits in the specific RTCC module's Date register.
	PLIB_RTCC_RTCWeekDaySet	Writes to the specific RTCC module's Date register.
	PLIB_RTCC_RTCYearGet	Returns the contents of the Year bits in the specific RTCC module's Date register.
	PLIB_RTCC_RTCYearSet	Writes to the specific RTCC module's Date register.

Description

This section lists and describes the functions, data types, and constants included in the RTCC Peripheral Library.

5.6.20.5.1 General Functions**5.6.20.5.1.1 PLIB_RTCC_ClockOutputDisable Function****C**

```
void PLIB_RTCC_ClockOutputDisable(
    RTCC_MODULE_ID index
);
```

Description

This function disables the specific RTCC module's output pin.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This function implements an operation of the OutputControl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsOutputControl](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_RTCC_ClockOutputDisable(RTCC_ID_0);
```

5.6.20.5.1.2 PLIB_RTCC_ClockOutputEnable Function

C

```
void PLIB_RTCC_ClockOutputEnable(  
    RTCC_MODULE_ID index  
);
```

Description

This function enables the specific RTCC module's output and generates a square wave using either the alarm or the 1 Hz clock output on the RTCC pin.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This function implements an operation of the OutputControl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsOutputControl](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_RTCC_ClockOutputEnable(RTCC_ID_0);
```

5.6.20.5.1.3 PLIB_RTCC_ClockRunningStatus Function

C

```
bool PLIB_RTCC_ClockRunningStatus(  
    RTCC_MODULE_ID index  
);
```

Description

This function provides the status of the RTCC clock.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

The status of the RTCC clock.

Remarks

This function implements an operation of the ClockRunning feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsClockRunning](#) in your application to automatically determine whether this feature is available.

Example

```
bool status;  
status = PLIB_RTCC_ClockRunningStatus(RTCC_ID_0);
```

5.6.20.5.2 RTCC Mode Functions

5.6.20.5.2.1 PLIB_RTCC_Disable Function

C

```
void PLIB_RTCC_Disable(  
    RTCC_MODULE_ID index  
);
```

Description

This function disables the specific RTCC module on the device.

Preconditions

The RTCC module should be unlocked for writing using the function [PLIB_RTCC_WriteEnable](#) before this function is called.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This function implements an operation of the EnableControl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsEnableControl](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_RTCC_Disable(RTCC_ID_0);
```

5.6.20.5.2.2 PLIB_RTCC_Enable Function

C

```
void PLIB_RTCC_Enable(  
    RTCC_MODULE_ID index  
);
```

Description

This function enables the specific RTCC module on the device.

Preconditions

The RTCC module should be unlocked for writing using the function [PLIB_RTCC_WriteEnable](#) before this function is called.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

By calling this function, the RTCC pins are controlled by the RTCC module. The RTCC module will continue to function when the device is held in reset.

This function implements an operation of the EnableControl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsEnableControl](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_RTCC_Enable(RTCC_ID_0);
```

5.6.20.5.2.3 PLIB_RTCC_WriteDisable Function**C**

```
void PLIB_RTCC_WriteDisable(  
    RTCC_MODULE_ID index  
);
```

Description

This function disables writing to the specific RTCC module's value registers.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This function implements an operation of the WriteEnable feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsWriteEnable](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_RTCC_WriteDisable(RTCC_ID_0);
```

5.6.20.5.2.4 PLIB_RTCC_WriteEnable Function**C**

```
void PLIB_RTCC_WriteEnable(  
    RTCC_MODULE_ID index  
);
```

Description

This function enables writing to the specific RTCC module's value registers.

Preconditions

The SYSLOCK unlock sequence must be executed prior to calling this function by calling the PLIB_CORE_SysUnlock function.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This function implements an operation of the WriteEnable feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsWriteEnable](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_RTCC_WriteEnable(RTCC_ID_0);
```

5.6.20.5.2.5 PLIB_RTCC_RTCCDateGet Function**C**

```
uint32_t PLIB_RTCC_RTCCDateGet(  
    RTCC_MODULE_ID index  
);
```

Description

The function returns the contents of the specific RTCC module's Date register. Please refer to the specific device data sheet for the exact sequence of digits.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

Date register contents.

Remarks

This function implements an operation of the RTCCDate feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsRTCCDate](#) in your application to automatically determine whether this feature is available.

Example

```
uint32_t Date;  
Date = PLIB_RTCC_RTCCDateGet(RTCC_ID_0);
```

5.6.20.5.2.6 PLIB_RTCC_RTCCDateSet Function**C**

```
void PLIB_RTCC_RTCCDateSet(  
    RTCC_MODULE_ID index,  
    uint32_t data  
);
```

Description

The function writes to the specific RTCC module's Date register. Please refer to the specific device data sheet for the exact sequence of digits.

Preconditions

Prior to writing to the Date register, an RTCC write must be enabled using the exact sequences required by the device.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

A write to this register is only allowed when access is allowed by using the [PLIB_RTCC_WriteEnable](#) function.

This function implements an operation of the RTCCDate feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsRTCCDate](#) in your application to automatically determine whether this feature is available.

Example

```
uint32_t data = 0x06102705;    //Date = 27 Oct 2006 Friday
PLIB_RTCC_RTCCDateSet(RTCC_ID_0, data);
```

5.6.20.5.2.7 PLIB_RTCC_RTCCDayGet Function

C

```
uint32_t PLIB_RTCC_RTCCDayGet(
    RTCC_MODULE_ID index
);
```

Description

The function returns the contents of the Days bits in the specific RTCC module's Date register. Please refer to the specific device data sheet for the exact sequence of digits.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

Days bits in the Date register.

Remarks

This function implements an operation of the RTCCDate feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsRTCCDate](#) in your application to automatically determine whether this feature is available.

Example

```
uint32_t Day;
Day = PLIB_RTCC_RTCCDayGet(RTCC_ID_0);
```

5.6.20.5.2.8 PLIB_RTCC_RTCCDaySet Function

C

```
void PLIB_RTCC_RTCCDaySet(
    RTCC_MODULE_ID index,
    uint32_t day
);
```

Description

The function writes to the specific RTCC module's Date register. Please refer to the specific device data sheet for the exact sequence of digits.

Preconditions

Prior to writing to the Date register, an RTCC write must be enabled using the exact sequences required by the device.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
day	The BCD value of the day to set in the Date register

Returns

None.

Remarks

A write to this register is only allowed when access is allowed by using the [PLIB_RTCC_WriteEnable](#) function.

This function implements an operation of the RTCCDate feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsRTCCDate](#) in your application to automatically determine whether this feature is available.

Example

```
uint32_t Day = 0x27;           //Day = 27th of the month
PLIB_RTCC_RTCCDaySet(RTCC_ID_0, Day);
```

5.6.20.5.2.9 PLIB_RTCC_RTCHourGet Function

C

```
uint32_t PLIB_RTCC_RTCHourGet(
    RTCC_MODULE_ID index
);
```

Description

The function returns the contents of the Hours bits in the specific RTCC module's Time register. Please refer to the specific device data sheet for the exact sequence of digits.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

BCD value of the Hours bits in the Time register.

Remarks

This function implements an operation of the RTCTime feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsRTCTime](#) in your application to automatically determine whether this feature is available.

Example

```
uint32_t Hour;
Hour = PLIB_RTCC_RTCHourGet(RTCC_ID_0);
```

5.6.20.5.2.10 PLIB_RTCC_RTCHourSet Function

C

```
void PLIB_RTCC_RTCHourSet(  
    RTCC_MODULE_ID index,  
    uint32_t hour  
);
```

Description

The function writes the contents of the Hours bits in the specific RTCC module's Time register. Please refer to the specific device data sheet for the exact sequence of digits.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
hour	BCD value to be written to the Hours bits in the Time register

Returns

None

Remarks

This function implements an operation of the RTCTime feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsRTCTime](#) in your application to automatically determine whether this feature is available.

Example

```
uint32_t Hour = 0x04;  
PLIB_RTCC_RTCHourSet(RTCC_ID_0, Hour);
```

5.6.20.5.2.11 PLIB_RTCC_RTCMinuteGet Function

C

```
uint32_t PLIB_RTCC_RTCMinuteGet(  
    RTCC_MODULE_ID index  
);
```

Description

The function returns the contents of the Minutes bits in the specific RTCC module's Time register. Please refer to the specific device data sheet for the exact sequence of digits.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

BCD value of the Minutes bits in the Time register.

Remarks

This function implements an operation of the RTCTime feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsRTCTime](#) in your application to automatically determine whether this feature is available.

Example

```
uint32_t Minute;
```

```
Minute = PLIB_RTCC_RTCMinuteGet(RTCC_ID_0);
```

5.6.20.5.2.12 PLIB_RTCC_RTCMinuteSet Function

C

```
void PLIB_RTCC_RTCMinuteSet(  
    RTCC_MODULE_ID index,  
    uint32_t minute  
);
```

Description

The function writes the contents of these bits in the specific RTCC module's Time register. Please refer to the specific device data sheet for the exact sequence of digits.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
minute	BCD value to be written to the Minutes bits in the Time register

Returns

None

Remarks

This function implements an operation of the RTCTime feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsRTCTime](#) in your application to automatically determine whether this feature is available.

Example

```
uint32_t Minute = 0x15;  
PLIB_RTCC_RTCMinuteSet(RTCC_ID_0, Minute);
```

5.6.20.5.2.13 PLIB_RTCC_RTCMonthGet Function

C

```
uint32_t PLIB_RTCC_RTCMonthGet(  
    RTCC_MODULE_ID index  
);
```

Description

The function returns the contents of the Months bits in the specific RTCC module's Date register. Please refer to the specific device data sheet for the exact sequence of digits.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

Months bits in the Date register.

Remarks

This function implements an operation of the RTCTime feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsRTCTime](#) in your application to automatically determine whether this feature is available.

Example

```
uint32_t Month;  
Month = PLIB_RTCC_RTCMonthGet(RTCC_ID_0);
```

5.6.20.5.2.14 PLIB_RTCC_RTCMonthSet Function**C**

```
void PLIB_RTCC_RTCMonthSet(  
    RTCC_MODULE_ID index,  
    uint32_t month  
);
```

Description

The function writes to the specific RTCC module's Date register. Please refer to the specific device data sheet for the exact sequence of digits.

Preconditions

Prior to writing to the Date register, an RTCC write must be enabled using the exact sequences required by the device.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
month	The BCD value of the month to set in the Date register

Returns

None.

Remarks

A write to this register is only allowed when access is allowed by using the [PLIB_RTCC_WriteEnable](#) function.

This function implements an operation of the RTCCDate feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsRTCCDate](#) in your application to automatically determine whether this feature is available.

Example

```
uint32_t Month = 0x10;    //Month = October  
PLIB_RTCC_RTCMonthSet(RTCC_ID_0, Month);
```

5.6.20.5.2.15 PLIB_RTCC_RTCSecondGet Function**C**

```
uint32_t PLIB_RTCC_RTCSecondGet(  
    RTCC_MODULE_ID index  
);
```

Description

The function returns the contents of the Seconds bits in the specific RTCC module's Time register. Please refer to the specific device data sheet for the exact sequence of digits.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

BCD value of the Seconds bits in the Time register.

Remarks

This function implements an operation of the RTCTime feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsRTCTime](#) in your application to automatically determine whether this feature is available.

Example

```
uint32_t Second;  
Second = PLIB_RTCC_RTCSecondGet(RTCC_ID_0);
```

5.6.20.5.2.16 PLIB_RTCC_RTCSecondSet Function**C**

```
void PLIB_RTCC_RTCSecondSet(  
    RTCC_MODULE_ID index,  
    uint32_t second  
);
```

Description

The function writes the contents of the Seconds bits in the specific RTCC module's Time register. Please refer to the specific device data sheet for the exact sequence of digits.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
second	BCD value to be written to the Seconds bits in the Time register

Returns

None.

Remarks

This function implements an operation of the RTCTime feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsRTCTime](#) in your application to automatically determine whether this feature is available.

Example

```
uint32_t Second = 0x33;  
PLIB_RTCC_RTCSecondSet(RTCC_ID_0, Second);
```

5.6.20.5.2.17 PLIB_RTCC_RTCTimeGet Function**C**

```
uint32_t PLIB_RTCC_RTCTimeGet(  
    RTCC_MODULE_ID index  
);
```

Description

The function returns the contents of the specific RTCC module's Time register. Please refer to the specific device data sheet for the exact sequence of digits.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

Time register contents.

Remarks

This function implements an operation of the RTCTime feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsRTCTime](#) in your application to automatically determine whether this feature is available.

Example

```
uint32_t time;
time = PLIB_RTCC_RTCTimeGet(RTCC_ID_0);
```

5.6.20.5.2.18 PLIB_RTCC_RTCTimeSet Function**C**

```
void PLIB_RTCC_RTCTimeSet(
    RTCC_MODULE_ID index,
    uint32_t data
);
```

Description

The function writes to the specific RTCC module's Time register. Please refer to the specific device data sheet for the exact sequence of digits.

Preconditions

Prior to writing to the Time register, an RTCC write must be enabled using the exact sequences required by the device.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

A write to this register is only allowed when access is allowed by using the [PLIB_RTCC_WriteEnable](#) function.

This function implements an operation of the RTCTime feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsRTCTime](#) in your application to automatically determine whether this feature is available.

Example

```
uint32_t data = 0x04153300;    //Time = 4 hrs 15 mins 33 sec
PLIB_RTCC_RTCTimeSet(RTCC_ID_0, data);
```

5.6.20.5.2.19 PLIB_RTCC_RTCWeekDayGet Function**C**

```
uint32_t PLIB_RTCC_RTCWeekDayGet(
    RTCC_MODULE_ID index
);
```

Description

The function returns the contents of the WeekDay bits in the specific RTCC module's Date register. Please refer to the specific device data sheet for the exact sequence of digits.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

WeekDay field in the Date register.

Remarks

This function implements an operation of the RTCCDate feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsRTCCDate](#) in your application to automatically determine whether this feature is available.

Example

```
uint32_t WeekDay;  
WeekDay = PLIB_RTCC_RTCWeekDayGet(RTCC_ID_0);
```

5.6.20.5.2.20 PLIB_RTCC_RTCWeekDaySet Function**C**

```
void PLIB_RTCC_RTCWeekDaySet(  
    RTCC_MODULE_ID index,  
    uint32_t weekday  
);
```

Description

The function writes to the specific RTCC module's Date register. Please refer to the specific device data sheet for the exact sequence of digits.

Preconditions

Prior to writing to the Date register, an RTCC write must be enabled using the exact sequences required by the device.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
weekday	The BCD value of the weekday to set in the Date register

Returns

None.

Remarks

A write to this register is only allowed when access is allowed by using the [PLIB_RTCC_WriteEnable](#) function.

This function implements an operation of the RTCCDate feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsRTCCDate](#) in your application to automatically determine whether this feature is available.

Example

```
uint32_t WeekDay = 0x05;           //WeekDay = Friday  
PLIB_RTCC_RTCWeekDaySet(RTCC_ID_0, WeekDay);
```

5.6.20.5.2.21 PLIB_RTCC_RTCYearGet Function**C**

```
uint32_t PLIB_RTCC_RTCYearGet(  
    RTCC_MODULE_ID index
```

```
);
```

Description

The function returns the contents of the specific RTCC module's Date register. Please refer to the specific device data sheet for the exact sequence of digits.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

Year bits in the Date register.

Remarks

This function implements an operation of the RTCCDate feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsRTCCDate](#) in your application to automatically determine whether this feature is available.

Example

```
uint32_t Year;  
Year = PLIB_RTCC_RTCYearGet(RTCC_ID_0);
```

5.6.20.5.2.22 PLIB_RTCC_RTCYearSet Function**C**

```
void PLIB_RTCC_RTCYearSet(  
    RTCC_MODULE_ID index,  
    uint32_t year  
);
```

Description

The function writes to the specific RTCC module's Date register. Please refer to the specific device data sheet for the exact sequence of digits.

Preconditions

Prior to writing to the Date register, an RTCC write must be enabled using the exact sequences required by the device.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
year	The BCD value of the year to set in the Date register

Returns

None.

Remarks

A write to this register is only allowed when access is allowed by using the [PLIB_RTCC_WriteEnable](#) function.

This function implements an operation of the RTCCDate feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsRTCCDate](#) in your application to automatically determine whether this feature is available.

Example

```
uint32_t Year = 0x06;    //Year = 2006  
PLIB_RTCC_RTCYearSet(RTCC_ID_0, Year);
```

5.6.20.5.3 Alarm Mode Functions

5.6.20.5.3.1 PLIB_RTCC_AlarmChimeDisable Function

C

```
void PLIB_RTCC_AlarmChimeDisable(  
    RTCC_MODULE_ID index  
);
```

Description

This function disables the specific RTCC module's chime. The alarm repeat count value bits stop once they reach zero.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This function implements an operation of the AlarmChimeControl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsAlarmChimeControl](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_RTCC_AlarmChimeDisable(RTCC_ID_0);
```

5.6.20.5.3.2 PLIB_RTCC_AlarmChimeEnable Function

C

```
void PLIB_RTCC_AlarmChimeEnable(  
    RTCC_MODULE_ID index  
);
```

Description

This function enables the specific RTCC module's chime. The alarm repeat count bits are allowed to rollover.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This function implements an operation of the AlarmChimeControl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsAlarmChimeControl](#) in your

application to automatically determine whether this feature is available.

Example

```
PLIB_RTCC_AlarmChimeEnable(RTCC_ID_0);
```

5.6.20.5.3.3 PLIB_RTCC_AlarmDateGet Function

C

```
uint32_t PLIB_RTCC_AlarmDateGet(  
    RTCC_MODULE_ID index  
);
```

Description

The function returns the contents of the specific RTCC module's Alarm Date register. Please refer to the specific device data sheet for the exact sequence of digits.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

Value register.

Remarks

This function implements an operation of the AlarmDate feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsAlarmDate](#) in your application to automatically determine whether this feature is available.

Example

```
uint32_t Date;  
Date = PLIB_RTCC_AlarmDateGet(RTCC_ID_0);
```

5.6.20.5.3.4 PLIB_RTCC_AlarmDateSet Function

C

```
void PLIB_RTCC_AlarmDateSet(  
    RTCC_MODULE_ID index,  
    uint32_t data  
);
```

Description

The function writes to the specific RTCC module's Alarm Date register. Please refer to the specific device data sheet for the exact sequence of digits.

Preconditions

Prior to writing to the Alarm Date register, an RTCC write must be enabled using the exact sequences required by the device.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
data	The value to set the Alarm Date register to, in BCD format

Returns

None.

Remarks

A write to this register is only allowed when access is allowed by using the [PLIB_RTCC_WriteEnable](#) function.

This function implements an operation of the AlarmDate feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsAlarmDate](#) in your application to automatically determine whether this feature is available.

Example

```
uint32_t data = 0x06102705;    //Date = 27 Oct 2006 Friday
PLIB_RTCC_AlarmDateSet(RTCC_ID_0, data);
```

5.6.20.5.3.5 PLIB_RTCC_AlarmDayGet Function**C**

```
uint32_t PLIB_RTCC_AlarmDayGet(
    RTCC_MODULE_ID index
);
```

Description

The function returns the contents of Day bits in the specific RTCC module's Alarm Date register. Please refer to the specific device data sheet for the exact sequence of digits.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

Days bits in the Alarm Date register.

Remarks

This function implements an operation of the AlarmDate feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsAlarmDate](#) in your application to automatically determine whether this feature is available.

Example

```
uint32_t Day;
Day = PLIB_RTCC_AlarmDayGet(RTCC_ID_0);
```

5.6.20.5.3.6 PLIB_RTCC_AlarmDaySet Function**C**

```
void PLIB_RTCC_AlarmDaySet(
    RTCC_MODULE_ID index,
    uint32_t day
);
```

Description

The function writes to the specific RTCC module's Alarm Date register. Please refer to the specific device data sheet for the exact sequence of digits.

Preconditions

Prior to writing to the Alarm Date register, an RTCC write must be enabled using the exact sequences required by the device.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
day	The BCD value of the day to set in the Alarm Date register

Returns

None.

Remarks

A write to this register is only allowed when access is allowed by using the [PLIB_RTCC_WriteEnable](#) function.

This function implements an operation of the AlarmDate feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsAlarmDate](#) in your application to automatically determine whether this feature is available.

Example

```
uint32_t Day = 0x27;           //Day = 27th of the month
PLIB_RTCC_AlarmDaySet(RTCC_ID_0, Day);
```

5.6.20.5.3.7 PLIB_RTCC_AlarmDisable Function**C**

```
void PLIB_RTCC_AlarmDisable(
    RTCC_MODULE_ID index
);
```

Description

This function disables the specific RTCC module's alarm.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This function implements an operation of the AlarmControl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsAlarmControl](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_RTCC_AlarmDisable(RTCC_ID_0);
```

5.6.20.5.3.8 PLIB_RTCC_AlarmEnable Function**C**

```
void PLIB_RTCC_AlarmEnable(
    RTCC_MODULE_ID index
);
```

Description

This function enables the specific RTCC module's alarm.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

The alarm enable bit is cleared automatically after an alarm event whenever the alarm is not set up to repeat, and chime is disabled.

This function implements an operation of the AlarmControl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsAlarmControl](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_RTCC_AlarmEnable(RTCC_ID_0);
```

5.6.20.5.3.9 PLIB_RTCC_AlarmHourGet Function**C**

```
uint32_t PLIB_RTCC_AlarmHourGet(  
    RTCC_MODULE_ID index  
);
```

Description

The function returns the contents of the Hours bits in the specific RTCC module's Alarm Time register. Please refer to the specific device data sheet for the exact sequence of digits.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

BCD value of the Hours bits in the Alarm Time register.

Remarks

This function implements an operation of the AlarmTime feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsAlarmTime](#) in your application to automatically determine whether this feature is available.

Example

```
uint32_t Hour;  
Hour = PLIB_RTCC_AlarmHourGet(RTCC_ID_0);
```

5.6.20.5.3.10 PLIB_RTCC_AlarmHourSet Function

C

```
void PLIB_RTCC_AlarmHourSet(  
    RTCC_MODULE_ID index,  
    uint32_t hour  
);
```

Description

Returns the contents of the Hours bits in the specific RTCC module's Alarm Time register. Please refer to the specific device data sheet for the exact sequence of digits.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
hour	BCD value to be written to the Hours bits in the Alarm Time register

Returns

None

Remarks

This function implements an operation of the AlarmTime feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsAlarmTime](#) in your application to automatically determine whether this feature is available.

Example

```
uint32_t Hour = 0x04;  
PLIB_RTCC_AlarmHourSet(RTCC_ID_0, Hour);
```

5.6.20.5.3.11 PLIB_RTCC_AlarmMaskModeSelect Function

C

```
void PLIB_RTCC_AlarmMaskModeSelect(  
    RTCC_MODULE_ID index,  
    RTCC_ALARM_MASK_CONFIGURATION data  
);
```

Description

This function sets the specific RTCC module's alarm mask Configuration bits.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
data	Alarm mask Configuration bits

Returns

None.

Remarks

The actual definition of this enumeration is device-specific.

This function implements an operation of the AlarmMaskControl feature. This feature may not be available on all devices. Please

refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsAlarmMaskControl](#) in your application to automatically determine whether this feature is available.

Example

```
uint8_t data = 0;
PLIB_RTCC_AlarmMaskModeSelect(RTCC_ID_0, RTCC_ALARM_EVERY_HALF_SECOND);
```

5.6.20.5.3.12 PLIB_RTCC_AlarmMinuteGet Function**C**

```
uint32_t PLIB_RTCC_AlarmMinuteGet(
    RTCC_MODULE_ID index
);
```

Description

The function returns the contents of the field in the specific RTCC module's Alarm Time register. Please refer to the specific device data sheet for the exact sequence of digits.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

BCD value of the Minutes bits in the Alarm Time register.

Remarks

This function implements an operation of the AlarmTime feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsAlarmTime](#) in your application to automatically determine whether this feature is available.

Example

```
uint32_t Minute;
Minute = PLIB_RTCC_AlarmMinuteGet(RTCC_ID_0);
```

5.6.20.5.3.13 PLIB_RTCC_AlarmMinuteSet Function**C**

```
void PLIB_RTCC_AlarmMinuteSet(
    RTCC_MODULE_ID index,
    uint32_t minute
);
```

Description

The function returns the contents of the Minutes bits in the specific RTCC module's Alarm Time register. Please refer to the specific device data sheet for the exact sequence of digits.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
minute	BCD value to be written to the Minutes bits in the Alarm Time register

Returns

None

Remarks

This function implements an operation of the AlarmTime feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsAlarmTime](#) in your application to automatically determine whether this feature is available.

Example

```
uint32_t Minute = 0x15;
PLIB_RTCC_AlarmMinuteSet(RTCC_ID_0, Minute);
```

5.6.20.5.3.14 PLIB_RTCC_AlarmMonthGet Function**C**

```
uint32_t PLIB_RTCC_AlarmMonthGet(
    RTCC_MODULE_ID index
);
```

Description

The function returns the contents of the Months bits in the specific RTCC module's Alarm Date register. Please refer to the specific device data sheet for the exact sequence of digits.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

Months bits in the Date register.

Remarks

This function implements an operation of the AlarmDate feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsAlarmDate](#) in your application to automatically determine whether this feature is available.

Example

```
uint32_t Month;
Month = PLIB_RTCC_AlarmMonthGet(RTCC_ID_0);
```

5.6.20.5.3.15 PLIB_RTCC_AlarmMonthSet Function**C**

```
void PLIB_RTCC_AlarmMonthSet(
    RTCC_MODULE_ID index,
    uint32_t month
);
```

Description

The function writes to the specific RTCC module's Alarm Date register. Please refer to the specific device data sheet for the exact sequence of digits.

Preconditions

Prior to writing to the Alarm Date register, an RTCC write must be enabled using the exact sequences required by the device.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

month	The BCD value of the month to set in the Alarm Date register

Returns

None.

Remarks

A write to this register is only allowed when access is allowed by using the [PLIB_RTCC_WriteEnable](#) function.

This function implements an operation of the AlarmDate feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsAlarmDate](#) in your application to automatically determine whether this feature is available.

Example

```
uint32_t Month = 0x10;           //Month = October
PLIB_RTCC_AlarmMonthSet(RTCC_ID_0, Month);
```

5.6.20.5.3.16 PLIB_RTCC_AlarmPulseInitialGet Function**C**

```
bool PLIB_RTCC_AlarmPulseInitialGet(
    RTCC_MODULE_ID index
);
```

Description

This function returns the state of the initial alarm pulse.

Preconditions

The ALRMEN bit should be '1' indicating the [PLIB_RTCC_AlarmEnable](#) function was called.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

1 - Logical High 0 - Logical Low

Remarks

This function implements an operation of the AlarmPulseInitial feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsAlarmPulseInitial](#) in your application to automatically determine whether this feature is available.

Example

```
bool PulseValue;
PulseValue = PLIB_RTCC_AlarmPulseInitialGet(RTCC_ID_0);
```

5.6.20.5.3.17 PLIB_RTCC_AlarmPulseInitialSet Function**C**

```
void PLIB_RTCC_AlarmPulseInitialSet(
    RTCC_MODULE_ID index,
    bool data
);
```

Description

This function enables the determination of initial alarm pulse.

Preconditions

The ALRMEN bit should be '0' indicating the [PLIB_RTCC_AlarmDisable](#) was called. This function must not be called when the RTCC is ON and the Alarm Sync is 1.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This function implements an operation of the AlarmPulseInitial feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsAlarmPulseInitial](#) in your application to automatically determine whether this feature is available.

Example

```
bool data = 0;
PLIB_RTCC_AlarmPulseInitialSet(RTCC_ID_0, data);
```

5.6.20.5.3.18 PLIB_RTCC_AlarmRepeatCountGet Function**C**

```
uint8_t PLIB_RTCC_AlarmRepeatCountGet(
    RTCC_MODULE_ID index
);
```

Description

This function reads the specific RTCC module's alarm repeat counter.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

uint8_t - The current value of the alarm repeat counter

Remarks

The counter decrements on any alarm event. The counter is prevented from rolling over unless chime is enabled.

This function implements an operation of the AlarmRepeatControl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsAlarmRepeatControl](#) in your application to automatically determine whether this feature is available.

Example

```
uint8_t currentCount;
currentCount = PLIB_RTCC_AlarmRepeatCountGet(RTCC_ID_0);
```

5.6.20.5.3.19 PLIB_RTCC_AlarmRepeatCountSet Function

C

```
void PLIB_RTCC_AlarmRepeatCountSet(  
    RTCC_MODULE_ID index,  
    uint8_t data  
);
```

Description

This function sets the specific RTCC module's alarm repeat counter.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
data	Alarm repeat counter bits

Returns

None.

Remarks

The counter decrements on any alarm event. The counter is prevented from rolling over unless chime is enabled.

This function implements an operation of the AlarmRepeatControl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsAlarmRepeatControl](#) in your application to automatically determine whether this feature is available.

Example

```
uint8_t data = 0xFF;  
PLIB_RTCC_AlarmRepeatCountSet(RTCC_ID_0, data);
```

5.6.20.5.3.20 PLIB_RTCC_AlarmSecondGet Function

C

```
uint32_t PLIB_RTCC_AlarmSecondGet(  
    RTCC_MODULE_ID index  
);
```

Description

The function returns the contents of the Seconds bits in the specific RTCC module's Alarm Time register. Please refer to the specific device data sheet for the exact sequence of digits.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

BCD value of the Seconds bits in the Alarm Time register.

Remarks

This function implements an operation of the AlarmTime feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsAlarmTime](#) in your application to automatically

determine whether this feature is available.

Example

```
uint32_t Second;  
Second = PLIB_RTCC_AlarmSecondGet(RTCC_ID_0);
```

5.6.20.5.3.21 PLIB_RTCC_AlarmSecondSet Function**C**

```
void PLIB_RTCC_AlarmSecondSet(  
    RTCC_MODULE_ID index,  
    uint32_t second  
);
```

Description

The function returns the contents of the field in the specific RTCC module's Alarm Time register. Please refer to the specific device data sheet for the exact sequence of digits.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
second	BCD value to be written to the Seconds bits in the Alarm Time register

Returns

None

Remarks

This function implements an operation of the AlarmTime feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsAlarmTime](#) in your application to automatically determine whether this feature is available.

Example

```
uint32_t Second = 0x33;  
PLIB_RTCC_AlarmSecondSet(RTCC_ID_0, Second);
```

5.6.20.5.3.22 PLIB_RTCC_AlarmTimeGet Function**C**

```
uint32_t PLIB_RTCC_AlarmTimeGet(  
    RTCC_MODULE_ID index  
);
```

Description

The function returns the contents of the specific RTCC module's Alarm Time register. Please refer to the specific device data sheet for the exact sequence of digits.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

Value register.

Remarks

This function implements an operation of the AlarmTime feature. This feature may not be available on all devices. Please refer to

the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsAlarmTime](#) in your application to automatically determine whether this feature is available.

Example

```
uint32_t time;  
time = PLIB_RTCC_AlarmTimeGet(RTCC_ID_0);
```

5.6.20.5.3.23 PLIB_RTCC_AlarmTimeSet Function**C**

```
void PLIB_RTCC_AlarmTimeSet(  
    RTCC_MODULE_ID index,  
    uint32_t data  
);
```

Description

The function writes to the specific RTCC module's Alarm Time register. Please refer to the specific device data sheet for the exact sequence of digits.

Preconditions

Prior to writing to the Alarm Time register, an RTCC write must be enabled using the exact sequences required by the device.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

A write to this register is only allowed when access is allowed by using the [PLIB_RTCC_WriteEnable](#) function.

This function implements an operation of the AlarmTime feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsAlarmTime](#) in your application to automatically determine whether this feature is available.

Example

```
uint32_t data = 0x04153300;    //Time = 4 hrs 15 mins 33 sec  
PLIB_RTCC_AlarmTimeSet(RTCC_ID_0, data);
```

5.6.20.5.3.24 PLIB_RTCC_AlarmValueRegisterPointer Function**C**

```
void PLIB_RTCC_AlarmValueRegisterPointer(  
    RTCC_MODULE_ID index,  
    uint8_t data  
);
```

Description

This function sets the specific RTCC module's Alarm register pointer.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
data	Alarm register pointer

Returns

None.

Remarks

None.

Example

```
uint8_t data = 2;
PLIB_RTCC_AlarmValueRegisterPointer(RTCC_ID_0, data);
```

5.6.20.5.3.25 PLIB_RTCC_AlarmWeekDayGet Function**C**

```
uint32_t PLIB_RTCC_AlarmWeekDayGet(
    RTCC_MODULE_ID index
);
```

Description

The function returns the contents of Weekday bits in the specific RTCC module's Alarm Date register. Please refer to the specific device data sheet for the exact sequence of digits.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

WeekDay bits in the Alarm Date register.

Remarks

This function implements an operation of the AlarmDate feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsAlarmDate](#) in your application to automatically determine whether this feature is available.

Example

```
uint32_t WeekDay;
WeekDay = PLIB_RTCC_AlarmWeekDayGet(RTCC_ID_0);
```

5.6.20.5.3.26 PLIB_RTCC_AlarmWeekDaySet Function**C**

```
void PLIB_RTCC_AlarmWeekDaySet(
    RTCC_MODULE_ID index,
    uint32_t weekday
);
```

Description

The function writes to the specific RTCC module's Alarm Date register. Please refer to the specific device data sheet for the exact sequence of digits.

Preconditions

Prior to writing to the Alarm Date register, an RTCC write must be enabled using the exact sequences required by the device.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
weekday	The BCD value of the weekday to set in the field of the Alarm Date register

Returns

None.

Remarks

A write to this register is only allowed when access is allowed by using the [PLIB_RTCC_WriteEnable](#) function.

This function implements an operation of the AlarmDate feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsAlarmDate](#) in your application to automatically determine whether this feature is available.

Example

```
uint32_t WeekDay = 0x05;           //WeekDay = Friday
PLIB_RTCC_AlarmWeekDaySet(RTCC_ID_0, WeekDay);
```

5.6.20.5.4 Other Functions

5.6.20.5.4.1 PLIB_RTCC_ClockSourceSelect Function

C

```
void PLIB_RTCC_ClockSourceSelect(
    RTCC_MODULE_ID index,
    RTCC_CLOCK_SOURCE_SELECT source
);
```

Description

This function determines which clock source the RTCC module will use depending on the features of the device.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
source	Which clock source will be used

Returns

None.

Remarks

This function implements an operation of the ClockSelect feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsClockSelect](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_RTCC_ClockSourceSelect(RTCC_ID_0, RTCC_CLOCK_SOURCE_SELECT_NONE);
```

5.6.20.5.4.2 PLIB_RTCC_DriftCalibrateGet Function

C

```
uint16_t PLIB_RTCC_DriftCalibrateGet(  
    RTCC_MODULE_ID index  
);
```

Description

This function reads the specific RTCC module's drift calibration bits.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

uint16_t - The current drift calibration value

Remarks

This function implements an operation of the Calibration feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsCalibration](#) in your application to automatically determine whether this feature is available.

Example

```
uint16_t calibrationbits;  
calibrationbits = PLIB_RTCC_DriftCalibrateGet(RTCC_ID_0);
```

5.6.20.5.4.3 PLIB_RTCC_DriftCalibrateSet Function

C

```
void PLIB_RTCC_DriftCalibrateSet(  
    RTCC_MODULE_ID index,  
    uint16_t calibrationbits  
);
```

Description

This function sets the specific RTCC module's drift calibration bits. The error between the system clock and the external clock has to be computed and calibration input must be provided to this function.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
calibrationbits	Drift calibration bits

Returns

None.

Remarks

This function implements an operation of the Calibration feature. This feature may not be available on all devices. Please refer to

the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsCalibration](#) in your application to automatically determine whether this feature is available.

Example

```
uint16_t calibrationbits = 3; //Positive 3 adjustment derived from the formula  
                                // Error = (Ideal Freq(32758) - Measured)*60;  
PLIB_RTCC_DriftCalibrateSet(RTCC_ID_0, calibrationbits);
```

5.6.20.5.4.4 PLIB_RTCC_HalfSecondStatusGet Function**C**

```
bool PLIB_RTCC_HalfSecondStatusGet(  
    RTCC_MODULE_ID index  
);
```

Description

The function returns the half second status bit, which is used in the calibration procedure. When the seconds byte is zero, the calibration value must be updated when the half second bit becomes '1'.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

- true - Second half period of a second
- false - First half period of a second

Remarks

This bit is read-only. It is cleared to '0' on a write to the seconds value. This function implements an operation of the HalfSecond feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsHalfSecond](#) in your application to automatically determine whether this feature is available.

Example

```
// Wait for the half second status bit to be '1'.  
while(PLIB_RTCC_HalfSecondStatusGet(RTCC_ID_0));
```

5.6.20.5.4.5 PLIB_RTCC_OutputSelect Function**C**

```
void PLIB_RTCC_OutputSelect(  
    RTCC_MODULE_ID index,  
    RTCC_OUTPUT_SELECT data  
);
```

Description

This function selects which signal will be presented on the RTCC pin.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
data	Enumerated value of which signal to present

Returns

None.

Remarks

The RTCC module's output pin should be enabled using the function `PLIB_RTCC_OutputEnable`.

This function implements an operation of the OutputSelect feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_RTCC_ExistsOutputSelect](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_RTCC_OutputSelect(RTCC_ID_0, RTCC_OUTPUT_SECONDS_CLOCK);
```

5.6.20.5.4.6 PLIB_RTCC_StopInIdleDisable Function**C**

```
void PLIB_RTCC_StopInIdleDisable(  
    RTCC_MODULE_ID index  
);
```

Description

This function continues normal RTCC operation when the device enters Idle mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

None.

This function implements an operation of the StopInIdle feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_RTCC_ExistsStopInIdle` in your application to automatically determine whether this feature is available.

Example

```
PLIB_RTCC_StopInIdleDisable(RTCC_ID_0);
```

5.6.20.5.4.7 PLIB_RTCC_StopInIdleEnable Function**C**

```
void PLIB_RTCC_StopInIdleEnable(  
    RTCC_MODULE_ID index  
);
```

Description

This function disables access to the RTCC module by the PBCLK when the CPU is in Idle mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This function implements an operation of the StopInIdle feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_RTCC_ExistsStopInIdle` in your application to automatically determine whether this feature is available.

Example

```
PLIB_RTCC_StopInIdleEnable(RTCC_ID_0);
```

5.6.20.5.5 Data Types and Constants

5.6.20.5.5.1 RTCC_ALARM_MASK_CONFIGURATION Enumeration

C

```
typedef enum {  
    RTCC_ALARM_EVERY_HALF_SECOND,  
    RTCC_ALARM_EVERY_SECOND,  
    RTCC_ALARM_EVERY_10_SECONDS,  
    RTCC_ALARM_EVERY_MINUTE,  
    RTCC_ALARM_EVERY_10_MINUTES,  
    RTCC_ALARM_EVERY_HOUR,  
    RTCC_ALARM_ONCE_A_DAY,  
    RTCC_ALARM_ONCE_A_WEEK,  
    RTCC_ALARM_ONCE_A_MONTH,  
    RTCC_ALARM_ONCE_A_YEAR  
} RTCC_ALARM_MASK_CONFIGURATION;
```

Description

Alarm Mask Configuration

This data type defines the different configurations for accessing the alarm mask Configuration bits.

Members

Members	Description
RTCC_ALARM_EVERY_HALF_SECOND	Alarm every half second
RTCC_ALARM_EVERY_SECOND	Alarm every second
RTCC_ALARM_EVERY_10_SECONDS	Alarm every 10 seconds
RTCC_ALARM_EVERY_MINUTE	Alarm every minute
RTCC_ALARM_EVERY_10_MINUTES	Alarm every 10 minutes
RTCC_ALARM_EVERY_HOUR	Alarm every hour
RTCC_ALARM_ONCE_A_DAY	Alarm every day

RTCC_ALARM_ONCE_A_WEEK	Alarm every week
RTCC_ALARM_ONCE_A_MONTH	Alarm every month
RTCC_ALARM_ONCE_A_YEAR	Alarm every year

Remarks

The actual definition of this enumeration is device-specific.

5.6.20.5.5.2 RTCC_MODULE_ID Enumeration**C**

```
typedef enum {
    RTCC_ID_1,
    RTCC_NUMBER_OF_MODULES
} RTCC_MODULE_ID;
```

Description

Enumeration: RTCC_MODULE_ID

This enumeration defines number of modules which are available on the microcontroller. This is the superset of all of the possible instances that may be available on the Microchip microcontrollers.

Refer to the data sheet to get the correct number of modules defined for desired microcontroller.

Members

Members	Description
RTCC_NUMBER_OF_MODULES	The total number of modules available.

5.6.20.5.5.3 RTCC_VALUE_REGISTER_POINTER Enumeration**C**

```
typedef enum {
    RTCC_REG_YEAR,
    RTCC_REG_DAY_MONTH,
    RTCC_REG_HOURS_WEEKDAY,
    RTCC_REG_MINUTES_SECONDS
} RTCC_VALUE_REGISTER_POINTER;
```

Description

Value Register Pointer

This data type defines the different configurations by which the RTCC Date and Time Registers can be accessed.

Members

Members	Description
RTCC_REG_YEAR	The year register is being pointed
RTCC_REG_DAY_MONTH	The day and month register is being pointed
RTCC_REG_HOURS_WEEKDAY	The hours and weekday register is being pointed
RTCC_REG_MINUTES_SECONDS	The minutes and seconds register is being pointed

Remarks

The actual definition of this enumeration is device-specific.

5.6.20.5.6 Feature Existence Functions

5.6.20.5.6.1 PLIB_RTCC_ExistsAlarmChimeControl Function

C

```
bool PLIB_RTCC_ExistsAlarmChimeControl(  
    RTCC_MODULE_ID index  
);
```

Description

This function identifies whether the AlarmChimeControl feature is available on the RTCC module. When this interface returns true, these functions are supported on the device:

- [PLIB_RTCC_AlarmChimeEnable](#)
- [PLIB_RTCC_AlarmChimeDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The AlarmChimeControl feature is supported on the device
- false - The AlarmChimeControl feature is not supported on the device

Remarks

None.

5.6.20.5.6.2 PLIB_RTCC_ExistsAlarmControl Function

C

```
bool PLIB_RTCC_ExistsAlarmControl(  
    RTCC_MODULE_ID index  
);
```

Description

This function identifies whether the AlarmControl feature is available on the RTCC module. When this interface returns true, these functions are supported on the device:

- [PLIB_RTCC_AlarmEnable](#)
- [PLIB_RTCC_AlarmDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The AlarmControl feature is supported on the device
- false - The AlarmControl feature is not supported on the device

Remarks

None.

5.6.20.5.6.3 PLIB_RTCC_ExistsAlarmDate Function**C**

```
bool PLIB_RTCC_ExistsAlarmDate(  
    RTCC_MODULE_ID index  
);
```

Description

This function identifies whether the AlarmDate feature is available on the RTCC module. When this interface returns true, these functions are supported on the device:

- [PLIB_RTCC_AlarmDateGet](#)
- [PLIB_RTCC_AlarmDateSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The AlarmDate feature is supported on the device
- false - The AlarmDate feature is not supported on the device

Remarks

None.

5.6.20.5.6.4 PLIB_RTCC_ExistsAlarmMaskControl Function**C**

```
bool PLIB_RTCC_ExistsAlarmMaskControl(  
    RTCC_MODULE_ID index  
);
```

Description

This function identifies whether the AlarmMaskControl feature is available on the RTCC module. When this interface returns true, these functions are supported on the device:

- [PLIB_RTCC_AlarmMaskModeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The AlarmMaskControl feature is supported on the device

- false - The AlarmMaskControl feature is not supported on the device

Remarks

None.

5.6.20.5.6.5 PLIB_RTCC_ExistsAlarmPulseInitial Function**C**

```
bool PLIB_RTCC_ExistsAlarmPulseInitial(  
    RTCC_MODULE_ID index  
);
```

Description

This function identifies whether the AlarmPulseInitialValue feature is available on the RTCC module. When this interface returns true, these functions are supported on the device:

- [PLIB_RTCC_AlarmPulseInitialSet](#)
- [PLIB_RTCC_AlarmPulseInitialGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The AlarmPulseInitial feature is supported on the device
- false - The AlarmPulseInitial feature is not supported on the device

Remarks

None.

5.6.20.5.6.6 PLIB_RTCC_ExistsAlarmRepeatControl Function**C**

```
bool PLIB_RTCC_ExistsAlarmRepeatControl(  
    RTCC_MODULE_ID index  
);
```

Description

This function identifies whether the AlarmRepeatControl feature is available on the RTCC module. When this interface returns true, these functions are supported on the device:

- [PLIB_RTCC_AlarmRepeatCountSet](#)
- [PLIB_RTCC_AlarmRepeatCountRead](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The AlarmRepeatControl feature is supported on the device
- false - The AlarmRepeatControl feature is not supported on the device

Remarks

None.

5.6.20.5.6.7 PLIB_RTCC_ExistsAlarmSynchronization Function**C**

```
bool PLIB_RTCC_ExistsAlarmSynchronization(  
    RTCC_MODULE_ID index  
);
```

Description

This function identifies whether the AlarmSynchronization feature is available on the RTCC module. When this interface returns true, these functions are supported on the device:

- PLIB_RTCC_AlarmReadSyncBit

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The AlarmSynchronization feature is supported on the device
- false - The AlarmSynchronization feature is not supported on the device

Remarks

None.

5.6.20.5.6.8 PLIB_RTCC_ExistsAlarmTime Function**C**

```
bool PLIB_RTCC_ExistsAlarmTime(  
    RTCC_MODULE_ID index  
);
```

Description

This function identifies whether the AlarmTime feature is available on the RTCC module. When this interface returns true, these functions are supported on the device:

- [PLIB_RTCC_AlarmTimeGet](#)
- [PLIB_RTCC_AlarmTimeSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The AlarmTime feature is supported on the device
- false - The AlarmTime feature is not supported on the device

Remarks

None.

5.6.20.5.6.9 PLIB_RTCC_ExistsCalibration Function**C**

```
bool PLIB_RTCC_ExistsCalibration(  
    RTCC_MODULE_ID index  
);
```

Description

This function identifies whether the Calibration feature is available on the RTCC module. When this interface returns true, this function is supported on the device:

- PLIB_RTCC_DriftCalibrate

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The Calibration feature is supported on the device
- false - The Calibration feature is not supported on the device

Remarks

None.

5.6.20.5.6.10 PLIB_RTCC_ExistsClockRunning Function**C**

```
bool PLIB_RTCC_ExistsClockRunning(  
    RTCC_MODULE_ID index  
);
```

Description

This function identifies whether the ClockRunning feature is available on the RTCC module. When this interface returns true, this function is supported on the device:

- [PLIB_RTCC_ClockRunningStatus](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ClockRunning feature is supported on the device
- false - The ClockRunning feature is not supported on the device

Remarks

None.

5.6.20.5.6.11 PLIB_RTCC_ExistsClockSelect Function**C**

```
bool PLIB_RTCC_ExistsClockSelect(  
    RTCC_MODULE_ID index  
);
```

Description

This function identifies whether the ClockSelect feature is available on the RTCC module. When this interface returns true, this function is supported on the device:

- PLIB_RTCC_SourceClockSelect

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ClockSelect feature is supported on the device
- false - The ClockSelect feature is not supported on the device

Remarks

None.

5.6.20.5.6.12 PLIB_RTCC_ExistsEnableControl Function**C**

```
bool PLIB_RTCC_ExistsEnableControl(  
    RTCC_MODULE_ID index  
);
```

Description

This function identifies whether the EnableControl feature is available on the RTCC module. When this interface returns true, these functions are supported on the device:

- [PLIB_RTCC_Enable](#)
- [PLIB_RTCC_Disable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The EnableControl feature is supported on the device
- false - The EnableControl feature is not supported on the device

Remarks

None.

5.6.20.5.6.13 PLIB_RTCC_ExistsHalfSecond Function**C**

```
bool PLIB_RTCC_ExistsHalfSecond(  
    RTCC_MODULE_ID index  
);
```

Description

This function identifies whether the HalfSecond feature is available on the RTCC module. When this interface returns true, this function is supported on the device:

- PLIB_RTCC_HalfSecondStatusBit

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The HalfSecond feature is supported on the device
- false - The HalfSecond feature is not supported on the device

Remarks

None.

5.6.20.5.6.14 PLIB_RTCC_ExistsOutputControl Function**C**

```
bool PLIB_RTCC_ExistsOutputControl(  
    RTCC_MODULE_ID index  
);
```

Description

This function identifies whether the OutputControl feature is available on the RTCC module. When this interface returns true, this function is supported on the device:

- [PLIB_RTCC_ClockOutputEnable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The OutputControl feature is supported on the device
- false - The OutputControl feature is not supported on the device

Remarks

None.

5.6.20.5.6.15 PLIB_RTCC_ExistsOutputSelect Function**C**

```
bool PLIB_RTCC_ExistsOutputSelect(  
    RTCC_MODULE_ID index  
);
```

Description

This function identifies whether the OutputSelect feature is available on the RTCC module. When this interface returns true, these functions are supported on the device:

- PLIB_RTCC_SecondsClockOutputSelect
- PLIB_RTCC_AlarmPulseOutputSelect

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The OutputSelect feature is supported on the device
- false - The OutputSelect feature is not supported on the device

Remarks

None.

5.6.20.5.6.16 PLIB_RTCC_ExistsRTCDate Function**C**

```
bool PLIB_RTCC_ExistsRTCDate(  
    RTCC_MODULE_ID index  
);
```

Description

This function identifies whether the RTCDateValue feature is available on the RTCC module. When this interface returns true, these functions are supported on the device:

- [PLIB_RTCC_RTCDateGet](#)
- [PLIB_RTCC_RTCDateSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The RTCDate feature is supported on the device
- false - The RTCDate feature is not supported on the device

Remarks

None.

5.6.20.5.6.17 PLIB_RTCC_ExistsRTCTime Function

C

```
bool PLIB_RTCC_ExistsRTCTime(  
    RTCC_MODULE_ID index  
);
```

Description

This function identifies whether the RTCTimeValue feature is available on the RTCC module. When this interface returns true, these functions are supported on the device:

- [PLIB_RTCC_RTCTimeGet](#)
- [PLIB_RTCC_RTCTimeSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The RTCTime feature is supported on the device
- false - The RTCTime feature is not supported on the device

Remarks

None.

5.6.20.5.6.18 PLIB_RTCC_ExistsStopInIdleControl Function

C

```
bool PLIB_RTCC_ExistsStopInIdleControl(  
    RTCC_MODULE_ID index  
);
```

Description

This function identifies whether the StopInIdle feature is available on the RTCC module. When this interface returns true, these functions are supported on the device:

- [PLIB_RTCC_StopInIdleEnable](#)
- [PLIB_RTCC_StopInIdleDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The StopInIdle feature is supported on the device
- false - The StopInIdle feature is not supported on the device

Remarks

None.

5.6.20.5.6.19 PLIB_RTCC_ExistsSynchronization Function**C**

```
bool PLIB_RTCC_ExistsSynchronization(  
    RTCC_MODULE_ID index  
);
```

Description

This function identifies whether the Synchronization feature is available on the RTCC module. When this interface returns true, this function is supported on the device:

- PLIB_RTCC_ValueRegistersReadSyncBit

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The Synchronization feature is supported on the device
- false - The Synchronization feature is not supported on the device

Remarks

None.

5.6.20.5.6.20 PLIB_RTCC_ExistsWriteEnable Function**C**

```
bool PLIB_RTCC_ExistsWriteEnable(  
    RTCC_MODULE_ID index
```

```
);
```

Description

This function identifies whether the WriteEnable feature is available on the RTCC module. When this interface returns true, these functions are supported on the device:

- [PLIB_RTCC_WriteEnable](#)
- [PLIB_RTCC_WriteDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The WriteEnable feature is supported on the device
- false - The WriteEnable feature is not supported on the device

Remarks

None.

5.6.20.6 Files

Files

Name	Description
plib_rtcc.h	Real-Time Clock and Calendar (RTCC) Peripheral Library interface header for RTCC common definitions.

Description

5.6.20.6.1 plib_rtcc.h

RTCC Peripheral Library Interface Header

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the RTCC Peripheral Library for all families of Microchip microcontrollers. The definitions in this file are common to the RTCC peripheral.

Functions

	Name	Description
≡	PLIB_RTCC_AlarmChimeDisable	Disables the specific RTCC module's chime.
≡	PLIB_RTCC_AlarmChimeEnable	Enables the specific RTCC module's chime.
≡	PLIB_RTCC_AlarmDateGet	Returns the contents of the specific RTCC module's Alarm Date register.
≡	PLIB_RTCC_AlarmDateSet	Writes to the specific RTCC module's Alarm Date register.
≡	PLIB_RTCC_AlarmDayGet	Returns the contents of the Day bits in the specific RTCC module's Alarm Date register.
≡	PLIB_RTCC_AlarmDaySet	Writes to the specific RTCC module's Alarm Date value register.

	PLIB_RTCC_AlarmDisable	Disables the specific RTCC module's alarm.
	PLIB_RTCC_AlarmEnable	Enables the specific RTCC module's alarm.
	PLIB_RTCC_AlarmHourGet	Returns the contents of Hours bits in the specific RTCC module's Alarm Time register.
	PLIB_RTCC_AlarmHourSet	The function returns the contents of Hours bits in the specific RTCC module's Alarm Time register.
	PLIB_RTCC_AlarmMaskModeSelect	Sets the specific RTCC module's alarm mask Configuration bits.
	PLIB_RTCC_AlarmMinuteGet	Returns the contents of Minutes bits in the specific RTCC module's Alarm Time register.
	PLIB_RTCC_AlarmMinuteSet	Returns the contents of the Minutes bits in the specific RTCC module's Alarm Time register.
	PLIB_RTCC_AlarmMonthGet	Returns the contents of the Month bits in the specific RTCC module's Alarm Date register.
	PLIB_RTCC_AlarmMonthSet	Writes to the specific RTCC module's Alarm Date register.
	PLIB_RTCC_AlarmPulseInitialGet	Returns the state of the initial alarm pulse.
	PLIB_RTCC_AlarmPulseInitialSet	Enables the determination of the initial alarm pulse.
	PLIB_RTCC_AlarmRepeatCountGet	Reads the specific RTCC module's alarm repeat counter.
	PLIB_RTCC_AlarmRepeatCountSet	Sets the specific RTCC module's alarm repeat counter.
	PLIB_RTCC_AlarmSecondGet	Returns the contents of the Seconds bits in the specific RTCC module's Alarm Time register.
	PLIB_RTCC_AlarmSecondSet	Returns the contents of Seconds bits in the specific RTCC module's Alarm Time register.
	PLIB_RTCC_AlarmTimeGet	Returns the contents of the specific RTCC module's Alarm Time register.
	PLIB_RTCC_AlarmTimeSet	Writes to the specific RTCC module's Alarm Time register.
	PLIB_RTCC_AlarmValueRegisterPointer	Sets the specific RTCC module's Alarm register pointer.
	PLIB_RTCC_AlarmWeekDayGet	Returns the contents of the WeekDay bits in the specific RTCC module's Alarm Date register.
	PLIB_RTCC_AlarmWeekDaySet	Writes to the specific RTCC module's Alarm Date register.
	PLIB_RTCC_ClockOutputDisable	Disables the specific RTCC module's output pin.
	PLIB_RTCC_ClockOutputEnable	Enables the specific RTCC module's output pin.
	PLIB_RTCC_ClockRunningStatus	Provides the status of the RTCC clock.
	PLIB_RTCC_ClockSourceSelect	Selects the clock source for the RTCC module.
	PLIB_RTCC_Disable	Disables the specific RTCC module on the device.
	PLIB_RTCC_DriftCalibrateGet	Reads the specific RTCC module's drift calibration bits.
	PLIB_RTCC_DriftCalibrateSet	Sets the specific RTCC module's drift calibration bits.
	PLIB_RTCC_Enable	Enables the specific RTCC module on the device.
	PLIB_RTCC_ExistsAlarmChimeControl	Identifies whether the AlarmChimeControl feature exists on the RTCC module.
	PLIB_RTCC_ExistsAlarmControl	Identifies whether the AlarmControl feature exists on the RTCC module.
	PLIB_RTCC_ExistsAlarmDate	Identifies whether the AlarmDate feature exists on the RTCC module.
	PLIB_RTCC_ExistsAlarmMaskControl	Identifies whether the AlarmMaskControl feature exists on the RTCC module.
	PLIB_RTCC_ExistsAlarmPulseInitial	Identifies whether the AlarmPulseInitial feature exists on the RTCC module.
	PLIB_RTCC_ExistsAlarmRepeatControl	Identifies whether the AlarmRepeatControl feature exists on the RTCC module.
	PLIB_RTCC_ExistsAlarmSynchronization	Identifies whether the AlarmSynchronization feature exists on the RTCC module.

	PLIB_RTCC_ExistsAlarmTime	Identifies whether the AlarmTime feature exists on the RTCC module.
	PLIB_RTCC_ExistsCalibration	Identifies whether the Calibration feature exists on the RTCC module.
	PLIB_RTCC_ExistsClockRunning	Identifies whether the ClockRunning feature exists on the RTCC module.
	PLIB_RTCC_ExistsClockSelect	Identifies whether the ClockSelect feature exists on the RTCC module.
	PLIB_RTCC_ExistsEnableControl	Identifies whether the EnableControl feature exists on the RTCC module.
	PLIB_RTCC_ExistsHalfSecond	Identifies whether the HalfSecond feature exists on the RTCC module.
	PLIB_RTCC_ExistsOutputControl	Identifies whether the OutputControl feature exists on the RTCC module.
	PLIB_RTCC_ExistsOutputSelect	Identifies whether the OutputSelect feature exists on the RTCC module.
	PLIB_RTCC_ExistsRTCDate	Identifies whether the RTCDateValue feature exists on the RTCC module.
	PLIB_RTCC_ExistsRTCTime	Identifies whether the RTCTimeValue feature exists on the RTCC module.
	PLIB_RTCC_ExistsStopInIdleControl	Identifies whether the StopInIdle feature exists on the RTCC module.
	PLIB_RTCC_ExistsSynchronization	Identifies whether the Synchronization feature exists on the RTCC module.
	PLIB_RTCC_ExistsWriteEnable	Identifies whether the WriteEnable feature exists on the RTCC module.
	PLIB_RTCC_HalfSecondStatusGet	The function returns the half second status bit.
	PLIB_RTCC_OutputSelect	Selects which signal will be presented on the RTCC pin
	PLIB_RTCC_RTCDateGet	Returns the contents of the specific RTCC module's Date register.
	PLIB_RTCC_RTCDateSet	Writes to the specific RTCC module's Date register.
	PLIB_RTCC_RTCDayGet	Returns the contents of the Days bits in the specific RTCC module's Date register.
	PLIB_RTCC_RTCDaySet	Writes to the specific RTCC module's Date register.
	PLIB_RTCC_RTCHourGet	Returns the contents of the Hours bits in the specific RTCC module's Time register.
	PLIB_RTCC_RTCHourSet	Writes the contents of the Hours bits in the specific RTCC module's Time register.
	PLIB_RTCC_RTCMinuteGet	Returns the contents of the Minutes bits in the specific RTCC module's Time register.
	PLIB_RTCC_RTCMinuteSet	Writes the contents of Minutes bits in the specific RTCC module's Time register.
	PLIB_RTCC_RTCMonthGet	Returns the contents of the Months bits in the specific RTCC module's Date register.
	PLIB_RTCC_RTCMonthSet	Writes to the specific RTCC module's Date register.
	PLIB_RTCC_RTCSecondGet	The function returns the contents of the Seconds bits in the specific RTCC device's Time register.
	PLIB_RTCC_RTCSecondSet	Writes the contents of Seconds bits in the specific RTCC module's Time register.
	PLIB_RTCC_RTCTimeGet	Returns the contents of the specific RTCC module's Time register.
	PLIB_RTCC_RTCTimeSet	Writes to the specific RTCC module's Time register.
	PLIB_RTCC_RTCWeekDayGet	Returns the contents of the WeekDay bits in the specific RTCC module's Date register.
	PLIB_RTCC_RTCWeekDaySet	Writes to the specific RTCC module's Date register.
	PLIB_RTCC_RTCYearGet	Returns the contents of the Year bits in the specific RTCC module's Date register.
	PLIB_RTCC_RTCYearSet	Writes to the specific RTCC module's Date register.
	PLIB_RTCC_StopInIdleDisable	Continues normal RTCC operation when the device enters Idle mode.
	PLIB_RTCC_StopInIdleEnable	Disables access to the RTCC module by the Peripheral Bus Clock (PBCLK) when the CPU enters Idle mode.

	PLIB_RTCC_WriteDisable	Disables writing to the specific RTCC module's value registers.
	PLIB_RTCC_WriteEnable	Enables writing to the specific RTCC module's value registers.

Microchip Technology Inc.

5.6.21 System Bus Peripheral Library

5.6.21.1 Introduction

System Bus Peripheral Library

for

Microchip Microcontrollers

This library provides a low-level abstraction of the System Bus on Microchip microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, thus hiding differences from one microcontroller variant to another.

Description

The System Bus is a multi-layer crossbar switching matrix that connects initiators to targets. An initiator is a device or peripheral that initiates a data transfer to or from a target. Examples of initiators include the CPU, DMA and Ethernet controller. A target is a memory, bus or peripheral that sends or receives data to/from an initiator.

The System Bus allows the system programmer to control which initiators can access each target by defining permission groups for each initiator. Each target has one or more regions (physical address spaces) that can be individually programmed to allow access to different permission groups. By setting initiator permission groups and target region read/write permissions, the system programmer can allow or deny task or program access to system resources.

5.6.21.2 Release Notes

MPLAB Harmony Version: v0.70b **System Bus Peripheral Library Version :** 0.70b **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.6.21.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.6.21.4 Using the Library

This topic describes the basic architecture of the System Bus Peripheral Library and provides information and examples on how to use it.

Interface Header File: [plib_sb.h](#)

The interface to the System Bus Peripheral library is defined in the "[plib_sb.h](#)" header file. This file is included by the "peripheral.h" file. Any C language source (.c) file that uses the System Bus Peripheral library should include "peripheral.h".

Library File:

The System Bus Peripheral library archive (.a) file installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the peripheral interacts with the framework.

5.6.21.4.1 Hardware Abstraction Model

This library provides the low-level abstraction of the System Bus on the Microchip family of microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in the software and introduces the library interface.

Description

System Bus Software Abstraction Block Diagram

Hardware Abstraction Model

The System Bus Peripheral Library provides interface routines to initialize the bus matrix such that:

- Initiator permission groups are assigned
- Target regions are defined and given read/write access permissions
- Errors are identified, logged and cleared when a permission group violation occurs
- CPU and DMA priorities are set

5.6.21.4.2 How the Library Works

The System Bus is a crossbar interconnect matrix that provides for simultaneous data transfer between the CPU, memory, and various peripherals on the PIC32 device. In addition, it provides a protection mechanism that allows trusted code to define and restrict access to memory regions and peripherals. A typical application would be a secure bootloader that prevents a third party or untrusted application from accessing regions of Flash memory that contain privileged code or information. The protection mechanism works by dividing the target physical address space into regions, each of which may be accessed by one or more initiators. Individual targets may have one or more regions. Each region can be individually programmed to allow read or write access to one or more permission groups. Each initiator is assigned to a permission group.

This library provides interface routines to initialize the System Bus and initiator permission groups. On reset or NMI, the CPU is assigned to permission group 0 (full access).

Note: Please refer to the PIC32 Family Reference Manual and specific device data sheet for information on target region mapping and initiator permission groups for a specific device.

5.6.21.4.2.1 Initiator Initialization

Initializing the initiators for the System Bus is a two-step process:

- Set CPU and DMA priorities (if needed)
- Assign permission groups to each initiator

Priority assignments for CPU and DMA

By default, the System Bus uses a least-recently-served (LRS) priority arbitration scheme for most initiators, including the CPU and DMA. For applications that require low latency, the user may set the CPU and/or DMA arbitration to fixed high priority. For the CPU, fixed high priority means that the CPU gets arbitration preference while servicing an interrupt over all initiators using LRS arbitration.

Priority is set using the `PLIB_SB_CPUPrioritySet()` and `PLIB_SB_DMAPrioritySet()` library functions. These functions write to a register that must be unlocked first. The `PLIB_SB_PriorityUnlock()` is provided for this purpose.

Initiator permission groups

At reset, all initiators default to permission group 0. Each target region can be individually programmed to allow read or write access to any or all permission groups. By assigning permission groups to initiators and restricting target region read/write access based on permission group, it is possible to restrict initiator access to target regions during normal operations.

Permission groups are assigned using the library function `PLIB_SB_InitPermGrpSet()`.

5.6.21.4.2.2 Target Initialization

Each System Bus target resides in a physical address space that contains one or more regions. Regions are used to provide separate access permissions for different areas within a target address space. Region 0 for any target is defined as the entire address space for that target. At reset, region 0 for all targets is accessible by any initiator with group 0 permissions.

Target regions are defined by base (physical) address and size. Read and write permissions are programmed individually for each region. The number of regions for each target varies, depending on the target. Some regions have fixed addresses, sizes and/or permissions. For example, region 0 for all targets encompasses the entire address space for the target, so the address and size are pre-programmed. Similarly, write permission for PFM is disabled for all initiators except the Flash controller.

Target region initialization is a four step process:

1. Set the base address of a region using `PLIB_SB_PGRegionAddrSet()`. This function takes an enumerated value for the target region. Only valid target regions should be enumerated for any specific device.
2. Set the size of the region using `PLIB_SB_PGRegionSizeSet()`.
3. Set the read permissions using `PLIB_SB_PGRegionReadPermSet()`.
4. Set the write permissions using `PLIB_SB_PGRegionWritePermSet()`.

Note: Please refer to the Memory Organization Family Reference Manual section and the specific device data sheet for information on target region mapping and initiator permission groups.

5.6.21.4.2.3 PGV Error Handling

A permission group violation (PGV) occurs when an initiator attempts to access a target without the proper permissions. Any permission group violation will trigger an interrupt to the CPU. If enabled, the System Bus will report a PGV to the error log registers in the System Bus. The PGV interrupt handler can then use this library to retrieve information about the violation and act accordingly.

By default, error reporting is disabled in the System Bus and must be enabled during the startup or boot code. Errors are divided into two categories: primary and secondary. Primary errors are errors arising from secure accesses, such as trying to access a target region without the proper permissions. Secondary errors are errors arising from non-secure accesses, such as trying to access a memory location outside of a target region.

PIC32 devices support logging of primary errors only. Primary error logging is enabled using the library function `PLIB_SB_PGVErrorReportPrimaryEnable()`. Primary error reporting can be disabled using the library function

[PLIB_SB_PGVErrorReportPrimaryDisable\(\)](#). Error logging must be enabled or disabled separately for each target.

Once a permission group violation error is logged, the user can use this library to retrieve information from the System Bus error log registers. Each target has its own set of error log registers. The error information available and the library API used to retrieve it are shown in the table below.

Error Log Data	System Bus Peripheral Library Function
Has the specified target reported an error?	PLIB_SB_PGVErrorStatus()
Has the specified target reported more than one error since last cleared?	PLIB_SB_PGVErrorMulti()
Type of error.	PLIB_SB_PGVErrorCode()
Initiator ID.	PLIB_SB_PGVErrorInitiatorID()
OCP command code of the transaction.	PLIB_SB_PGVErrorCommandCode()
The region number of the specified target accessed during the violation.	PLIB_SB_PGVErrorRegion()
Permission group of initiator that caused the violation.	PLIB_SB_PGVErrorPermissionGroup()

Once an error is logged, it needs to be cleared by software before any data for a subsequent violation can be logged (for the same target). This is typically done in the exception handler that reads the data. Which function is used depends on whether a single or multiple error violation occurred. Single violations are cleared with [PLIB_SB_PGVErrorClearSingle\(\)](#), and multiple violations are cleared with [PLIB_SB_PGVErrorClearMulti\(\)](#).

5.6.21.5 Configuring the Library

The library is configured for the supported System Bus module when the processor is chosen in the MPLAB IDE.

5.6.21.6 Library Interface

Data Types and Constants

	Name	Description
	PLIB_SB_ARB_POLICY	This enumeration lists the possible arbitration policies that can be assigned to the CPU and DMA for SRAM access.
	PLIB_SB_ERROR	Lists the possible SB Transaction Error Codes
	PLIB_SB_INIT_ID	Lists the possible SB Initiator IDs.
	PLIB_SB_INIT_PG	Lists the possible Initiator permission groups
	PLIB_SB_OCP_CMD_CODE	Lists the possible OCP Command codes.
	PLIB_SB_PG_INITIATOR	Lists the possible permission group Initiators
	PLIB_SB_REGION_PG	This enumeration lists the possible permission groups assigned to a region for read and/or write access.
	PLIB_SB_TGT_ID	Lists the possible SB Target IDs
	PLIB_SB_TGT_REGION	Lists the programmable target regions
	SB_MODULE_ID	Lists the possible Module IDs for the system bus.

Feature Existence Functions

	Name	Description
	PLIB_SB_ExistsCPUPriority	Identifies whether the CPUPriority feature exists on the SB module

	PLIB_SB_ExistsDMAPriority	Identifies whether the DMAPriority feature exists on the SB module
	PLIB_SB_ExistsInitPermGrp	Identifies whether the InitPermGrp feature exists on the SB module
	PLIB_SB_ExistsPGRegAddr	Identifies whether the PGRegAddr feature exists on the SB module
	PLIB_SB_ExistsPGRegRdPerm	Identifies whether the PGRegRdPerm feature exists on the SB module
	PLIB_SB_ExistsPGRegSize	Identifies whether the PGRegSize feature exists on the SB module
	PLIB_SB_ExistsPGRegWrPerm	Identifies whether the PGRegWrPerm feature exists on the SB module
	PLIB_SB_ExistsPGVErrClear	Identifies whether the PGVErrClear feature exists on the SB module
	PLIB_SB_ExistsPGVErrClrMulti	Identifies whether the PGVErrClrMulti feature exists on the SB module
	PLIB_SB_ExistsPGVErrClrSingle	Identifies whether the PGVErrClrSingle feature exists on the SB module
	PLIB_SB_ExistsPGVErrCmdCode	Identifies whether the PGVErrCmdCode feature exists on the SB module
	PLIB_SB_ExistsPGVErrInitID	Identifies whether the PGVErrInitID feature exists on the SB module
	PLIB_SB_ExistsPGVErrPG	Identifies whether the PGVErrPG feature exists on the SB module
	PLIB_SB_ExistsPGVErrRegion	Identifies whether the PGVErrRegion feature exists on the SB module
	PLIB_SB_ExistsPGVErrRptPri	Identifies whether the PGVErrRptPri feature exists on the SB module
	PLIB_SB_ExistsPGVErrStatus	Identifies whether the PGVErrStatus feature exists on the SB module

Other Functions

	Name	Description
	PLIB_SB_CPUPrioritySet	Sets the CPU arbitration policy to SRAM when servicing an interrupt
	PLIB_SB_DMAPrioritySet	Sets the DMA arbitration policy
	PLIB_SB_InitPermGrpSet	Sets the read/write permission group(s) for an initiator. The region must also allow read/write access for the permission group for a read/write to occur.

PGV Error Functions

	Name	Description
	PLIB_SB_PGVErrorClearMulti	Clears multiple permission group errors for the specified target.
	PLIB_SB_PGVErrorClearSingle	Clears a single permission group error for the specified target.
	PLIB_SB_PGVErrorCode	Returns a value corresponding to the type of error logged for the specified target.
	PLIB_SB_PGVErrorCommandCode	Returns the OCP command code of the transaction that caused the protection violation for the specified target.
	PLIB_SB_PGVErrorInitiatorID	Returns the ID of the Initiator that caused the protection violation
	PLIB_SB_PGVErrorLogClearMulti	Clears a multiple protection group violations error from the specified target error log register.
	PLIB_SB_PGVErrorLogClearSingle	Clears a single protection group violation error from the specified target error log register.
	PLIB_SB_PGVErrorMulti	Indicates if more than one permission group violation has occurred since last cleared.
	PLIB_SB_PGVErrorPermissionGroup	Returns the permission group of the protection region in a target address space that caused the protection violation for the specified target.
	PLIB_SB_PGVErrorRegion	Returns the number of the protection region in the specified target address space that caused the protection violation.
	PLIB_SB_PGVErrorReportPrimaryDisable	Disables primary permission group error reporting for the specified target to the SB flag register.
	PLIB_SB_PGVErrorReportPrimaryEnable	Enables primary permission group error reporting for the specified target to the SB flag register.
	PLIB_SB_PGVErrorStatus	Identifies whether a permission group violation has been reported for the specified target.

Target Initialization Functions

	Name	Description
	PLIB_SB_PGRegionAddrGet	Returns the base address for a permission group region within a target's physical address space.
	PLIB_SB_PGRegionAddrSet	Sets the base address for a permission group region within a target's physical address space. Not all regions are programmable.
	PLIB_SB_PGRegionReadPermClear	Clears the permission bit(s) corresponding to the requested read permissions for a permission group region within a target's physical address space. Not all regions are programmable.
	PLIB_SB_PGRegionReadPermSet	Sets the permission bit(s) corresponding to the requested read permissions for a permission group region within a target's physical address space. Not all regions are programmable.
	PLIB_SB_PGRegionSizeGet	Returns the size for a permission group region within a target's physical address space.
	PLIB_SB_PGRegionSizeSet	Sets the size for a permission group region within a target's physical address space. Not all regions are programmable.
	PLIB_SB_PGRegionWritePermClear	Clears the permission bit(s) corresponding to the requested write permissions for a permission group region within a target's physical address space. Not all regions are programmable.
	PLIB_SB_PGRegionWritePermSet	Sets the permission bit(s) corresponding to the requested write permissions for a permission group region within a target's physical address space. Not all regions are programmable.

Description

This section describes the Application Programming Interface (API) functions of the System Bus Peripheral Library.

Refer to each section for a detailed description.

5.6.21.6.1 Target Initialization Functions**5.6.21.6.1.1 PLIB_SB_PGRegionAddrGet Function****C**

```
uint32_t PLIB_SB_PGRegionAddrGet(
    SB_MODULE_ID index,
    PLIB_SB_TGT_REGION region
);
```

Description

This function returns the base address for a permission group region within a target's physical address space.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.
region	The region for which the address is returned.

Returns

uint32_t - The base address of the region.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
uint32_t T1R6BaseAddress;
T1R6BaseAddress = PLIB_SB_PGRegionAddrGet(SB_ID_1, PLIB_T1_REGION_6);
```

5.6.21.6.1.2 PLIB_SB_PGRegionAddrSet Function**C**

```
void PLIB_SB_PGRegionAddrSet(
    SB_MODULE_ID index,
    PLIB_SB_TGT_REGION region,
    uint32_t phys_addr
);
```

Description

This function sets the base address for a permission group region within a target's physical address space. Not all regions are programmable.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.
region	The region for which the base address is set.
phys_addr	The base address of the region. Must be aligned to the intended size of the region.

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Region 0 of all targets have a defined start address which may not be changed. Some regions (such as those containing peripheral SFRs) are fixed and may not be changed. Please refer to the specific device data sheet for details.

Example

```
// Set up two regions in PFM with full read and write permission
#define REGION_5_BASE_ADDR 0x1D000000
#define REGION_6_BASE_ADDR (REGION5_BASE_ADDR + (32*1024))
#define REGION_5_SIZE      0x06 // 32KB
#define REGION_6_SIZE      0x05 // 16KB
#define FULL_PERM          (REGION_PG_0 | REGION_PG_1 | REGION_PG_2 | REGION_PG_3)

PLIB_SB_PGRegionAddrSet(SB_ID_1, PLIB_SB_T1_REGION_5, REGION_5_BASE_ADDR);
PLIB_SB_PGRegionAddrSet(SB_ID_1, PLIB_SB_T1_REGION_6, REGION_6_BASE_ADDR);

PLIB_SB_PGRegionSizeSet(SB_ID_1, PLIB_SB_T1_REGION_5, REGION_5_SIZE);
PLIB_SB_PGRegionSizeSet(SB_ID_1, PLIB_SB_T1_REGION_6, REGION_6_SIZE);

PLIB_SB_PGRegionReadPermSet(SB_ID_1, PLIB_T1_REGION_5, FULL_PERM);
PLIB_SB_PGRegionReadPermSet(SB_ID_1, PLIB_T1_REGION_6, FULL_PERM);

PLIB_SB_PGRegionWritePermSet(SB_ID_1, PLIB_T1_REGION_5, FULL_PERM);
PLIB_SB_PGRegionWritePermSet(SB_ID_1, PLIB_T1_REGION_6, FULL_PERM);
```

5.6.21.6.1.3 PLIB_SB_PGRegionReadPermClear Function

C

```
void PLIB_SB_PGRegionReadPermClear(  
    SB_MODULE_ID index,  
    PLIB_SB_TGT_REGION region,  
    PLIB_SB_REGION_PG readPerm  
);
```

Description

This function clears the permission bit(s) corresponding to the requested read permissions for a permission group region within a target's physical address space. Not all regions are programmable.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.
region	The region number within the target's address space to be given permissions. Not all regions are programmable.
readPerm	Bitwise OR of the groups given read permission for the region.

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Default reset value for all programmable regions is read permission for all groups.

Example

See code example for [PLIB_SB_PGRegionAddrSet\(\)](#).

5.6.21.6.1.4 PLIB_SB_PGRegionReadPermSet Function

C

```
void PLIB_SB_PGRegionReadPermSet(  
    SB_MODULE_ID index,  
    PLIB_SB_TGT_REGION region,  
    PLIB_SB_REGION_PG readPerm  
);
```

Description

This function sets the permission bit(s) corresponding to the requested read permissions for a permission group region within a target's physical address space. Not all regions are programmable.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.

region	The region number within the target's address space to be given permissions. Not all regions are programmable.
readPerm	Bitwise OR of the groups given read permission for the region.

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Default reset value for all programmable regions is read permission for all groups.

Example

See code example for [PLIB_SB_PGRegionAddrSet\(\)](#).

5.6.21.6.1.5 PLIB_SB_PGRegionSizeGet Function

C

```
uint32_t PLIB_SB_PGRegionSizeGet(  
    SB_MODULE_ID index,  
    PLIB_SB_TGT_REGION region  
);
```

Description

This function returns the size for a permission group region within a target's physical address space. Not all regions are programmable.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.
region	The region for which the size is to be set. Not all regions are programmable.

Returns

The size of the region.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Region 0 of all targets encompasses the entire address range of the target, and may not be changed. Some regions (such as those containing peripheral SFRs) may not be changed. Please refer to the specific device data sheet for details.

Example

```
uint32_t T1R6Size;  
T1R6Size = PLIB_SB_PGRegionSizeGet(SB_ID_1, PLIB_T1_REGION_6);
```

5.6.21.6.1.6 PLIB_SB_PGRegionSizeSet Function

C

```
void PLIB_SB_PGRegionSizeSet(  
    SB_MODULE_ID index,  
    PLIB_SB_TGT_REGION region,  
    uint32_t size  
);
```

Description

This function sets the size for a permission group region within a target's physical address space. Not all regions are programmable.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.
region	The region for which the size is to be set. Not all regions are programmable.
size	The actual size of the region being programmed is calculated as
follows	$2^{(size-1)} \times 1024$ bytes

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Region 0 of all targets encompasses the entire address range of the target, and may not be changed. Some regions (such as those containing peripheral SFRs) may not be changed. Please refer to the specific device data sheet for details.

Example

See code example for [PLIB_SB_PGRegionAddrSet\(\)](#).

5.6.21.6.1.7 PLIB_SB_PGRegionWritePermClear Function**C**

```
void PLIB_SB_PGRegionWritePermClear(  
    SB_MODULE_ID index,  
    PLIB_SB_TGT_REGION region,  
    PLIB_SB_REGION_PG writePerm  
);
```

Description

This function clears the permission bit(s) corresponding to the requested write permissions for a permission group region within a target's physical address space. Not all regions are programmable.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.
region	The region number within the target's address space to be given permissions. Not all regions are programmable.
writePerm	Bitwise OR of the groups given read permission for the region.

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Default reset value for all programmable regions is write permission for all groups. Some regions may not be programmable by all initiators (flash, for example). Please refer to the specific device data sheet for details.

Example

See code example for [PLIB_SB_PGRegionAddrSet\(\)](#).

5.6.21.6.1.8 PLIB_SB_PGRegionWritePermSet Function**C**

```
void PLIB_SB_PGRegionWritePermSet(  
    SB_MODULE_ID index,  
    PLIB_SB_TGT_REGION region,  
    PLIB_SB_REGION_PG writePerm  
);
```

Description

This function sets the permission bit(s) corresponding to the requested write permissions for a permission group region within a target's physical address space. Not all regions are programmable.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.
region	The region number within the target's address space to be given permissions. Not all regions are programmable.
writePerm	Bitwise OR of the groups given read permission for the region.

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Default reset value for all programmable regions is write permission for all groups. Some regions may not be programmable by all initiators (flash, for example). Please refer to the specific device data sheet for details.

Example

See code example for [PLIB_SB_PGRegionAddrSet\(\)](#).

5.6.21.6.2 PGV Error Functions**5.6.21.6.2.1 PLIB_SB_PGVErrorClearMulti Function****C**

```
bool PLIB_SB_PGVErrorClearMulti(  
    SB_MODULE_ID index,  
    PLIB_SB_TGT_ID target  
);
```

Description

This function clears multiple permission group errors for the specified target.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.
target	The target.

Returns

mult - Returns the value of the CLEAR bit in the SBTxECLRM register for the specified target. The act of reading this bit clears the error.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
bool mult;  
mult = PLIB_SB_PGVErrClearMulti(SB_ID_1, PLIB_SB_TGT_ID_T0);
```

5.6.21.6.2.2 PLIB_SB_PGVErrClearSingle Function**C**

```
bool PLIB_SB_PGVErrClearSingle(  
    SB_MODULE_ID index,  
    PLIB_SB_TGT_ID target  
);
```

Description

This function clears a single permission group error for the specified target.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.
target	The target.

Returns

sing - Returns the value of the CLEAR bit in the SBTxECLRM register for the specified target. The act of reading this bit clears the error.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
bool sing;  
sing = PLIB_SB_PGVErrClearSingle(SB_ID_1, PLIB_SB_TGT_ID_T0);
```

5.6.21.6.2.3 PLIB_SB_PGVErrrorCode Function

C

```
PLIB_SB_ERROR PLIB_SB_PGVErrrorCode(  
    SB_MODULE_ID index,  
    PLIB_SB_TGT_ID target  
);
```

Description

This function returns a value corresponding to the type of error logged for the specified target.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.
target	The target to be read.

Returns

[PLIB_SB_ERROR](#) enumeration representing the type of SB error logged states.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
PLIB_SB_ERROR error;  
error = PLIB_SB_ERROR PLIB_SB_PGVErrrorCode(SB_ID_1, PLIB_SB_TGT_ID_T0);
```

5.6.21.6.2.4 PLIB_SB_PGVErrrorCommandCode Function

C

```
PLIB_SB_OCP_CMD_CODE PLIB_SB_PGVErrrorCommandCode(  
    SB_MODULE_ID index,  
    PLIB_SB_TGT_ID target  
);
```

Description

This function returns the OCP command code of the transaction that caused the protection violation for the specified target.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.
target	The target.

Returns

OCP command code

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
PLIB_SB_OCP_CMD_CODE commandCode;  
commandCode = PLIB_SB_PGVErrorCommandCode(SB_ID_1, PLIB_SB_TGT_ID_T0);
```

5.6.21.6.2.5 PLIB_SB_PGVErrorInitiatorID Function**C**

```
PLIB_SB_INIT_ID PLIB_SB_PGVErrorInitiatorID(  
    SB_MODULE_ID index,  
    PLIB_SB_TGT_ID target  
);
```

Description

This function returns the ID of the Initiator that caused the protection violation.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.
target	The target.

Returns

An enumerated value representing the ID of the initiator that caused the protection violation.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
PLIB_SB_INIT_ID id;  
id = PLIB_SB_PGVErrorInitiatorID(SB_ID_1, PLIB_SB_TGT_ID_T0);
```

5.6.21.6.2.6 PLIB_SB_PGVErrorLogClearMulti Function**C**

```
void PLIB_SB_PGVErrorLogClearMulti(  
    SB_MODULE_ID index,  
    PLIB_SB_TGT_ID target  
);
```

Description

This function clears a multiple protection group violations error from the specified target error log register. Multiple errors are cleared by writing a '1' to both the MULTI and CODE fields of the SBTxELOG1 register for the specified target.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.
target	The target to be cleared.

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
PLIB_SB_PGVErrorLogClearMulti(SB_ID_1, PLIB_SB_TGT_ID_T0);
```

5.6.21.6.2.7 PLIB_SB_PGVErrorLogClearSingle Function**C**

```
void PLIB_SB_PGVErrorLogClearSingle(  
    SB_MODULE_ID index,  
    PLIB_SB_TGT_ID target  
);
```

Description

This function clears a single protection group violation error from the specified target error log register. Single errors are cleared by writing a '1' to the CODE field of the SBTxELOG1 register for the specified target.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.
target	The target to be cleared.

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
PLIB_SB_PGVErrorLogClearSingle(SB_ID_1, PLIB_SB_TGT_ID_T0);
```

5.6.21.6.2.8 PLIB_SB_PGVErrorMulti Function**C**

```
bool PLIB_SB_PGVErrorMulti(  
    SB_MODULE_ID index,  
    PLIB_SB_TGT_ID target  
);
```

Description

This function indicates if more than one permission group violation has occurred since last cleared.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.
target	The target to be read.

Returns

true - Multiple permission group violations. false - Single or no permission group violations.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
bool multiPGV;  
multiPGV = PLIB_SB_PGVErrorMulti(SB_ID_1, PLIB_SB_TGT_ID_T0);
```

5.6.21.6.2.9 PLIB_SB_PGVErrorPermissionGroup Function**C**

```
int PLIB_SB_PGVErrorPermissionGroup(  
    SB_MODULE_ID index,  
    PLIB_SB_TGT_ID target  
);
```

Description

This function returns the permission group of the protection region in a target address space that caused the protection violation for the specified target.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.
target	The target.

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
int pg;  
pg = PLIB_SB_PGVErrorPermissionGroup(SB_ID_1, PLIB_SB_TGT_ID_T0);
```

5.6.21.6.2.10 PLIB_SB_PGVErrorRegion Function**C**

```
int PLIB_SB_PGVErrorRegion(  
    SB_MODULE_ID index,  
    PLIB_SB_TGT_ID target  
);
```

Description

This function returns the number of the protection region in the specified target address space that caused the protection violation. Note that if there are no other region matches, region 0 (the default region that spans the entire target address space) will always match, and this function will return 0.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.
target	The target.

Returns

Region number in target address space or -1 on unrecognized target.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
int region;  
region = PLIB_SB_PGVErrorRegion(SB_ID_1, PLIB_SB_TGT_ID_T0);
```

5.6.21.6.2.11 PLIB_SB_PGVErrorReportPrimaryDisable Function**C**

```
void PLIB_SB_PGVErrorReportPrimaryDisable(  
    SB_MODULE_ID index,  
    PLIB_SB_TGT_ID target  
);
```

Description

This function disables primary permission group error reporting for the specified target to the SB flag register.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.
target	The target.

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Reporting of primary errors is disabled at reset.

Example

```
PLIB_SB_PGVErrorReportPrimaryDisable(SB_ID_1, PLIB_SB_TGT_ID_T0);
```

5.6.21.6.2.12 PLIB_SB_PGVErrorReportPrimaryEnable Function**C**

```
void PLIB_SB_PGVErrorReportPrimaryEnable(  
    SB_MODULE_ID index,  
    PLIB_SB_TGT_ID target  
);
```

Description

This function enables primary permission group error reporting for the specified target to the SB flag register.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.
target	The target.

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Reporting of primary errors is disabled at reset.

Example

```
PLIB_SB_PGVErrorReportPrimaryEnable(SB_ID_1, PLIB_SB_TGT_ID_T0);
```

5.6.21.6.2.13 PLIB_SB_PGVErrorStatus Function**C**

```
bool PLIB_SB_PGVErrorStatus(  
    SB_MODULE_ID index,  
    PLIB_SB_TGT_ID target  
);
```

Description

This function identifies whether a permission group violation has been reported for the specified target.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance.
target	Target to be checked.

Returns

true - Target is reporting a permission group violation. false - Target is not reporting a permission group violation.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
bool sbPgv;  
sbPgv = PLIB_SB_PGVErrorStatus(SB_ID_1, PLIB_SB_TGT_ID_T0);
```

5.6.21.6.3 Data Types and Constants

5.6.21.6.3.1 PLIB_SB_ARB_POLICY Enumeration

C

```
typedef enum {
    PRIORITY_LRS,
    PRIORITY_HI
} PLIB_SB_ARB_POLICY;
```

Description

SB Arbitration Policy

This enumeration lists the possible arbitration policies that can be assigned to the CPU and DMA for SRAM access.

Members

Members	Description
PRIORITY_LRS	Least Recently Serviced Arbitration
PRIORITY_HI	High Priority

5.6.21.6.3.2 PLIB_SB_ERROR Enumeration

C

```
typedef enum {
    PLIB_SB_ERROR_NONE,
    PLIB_SB_ERROR_PGV
} PLIB_SB_ERROR;
```

Description

PG Error Code

This enumeration lists the possible transaction error codes for the SB.

Members

Members	Description
PLIB_SB_ERROR_NONE	No Error
PLIB_SB_ERROR_PGV	Permission Group Violation

5.6.21.6.3.3 PLIB_SB_INIT_ID Enumeration

C

```
typedef enum {
    PLIB_SB_INIT_ID_NONE,
    PLIB_SB_INIT_ID_CPU_LRS,
    PLIB_SB_INIT_ID_CPU_HI,
    PLIB_SB_INIT_ID_DMA1_RD_LRS,
    PLIB_SB_INIT_ID_DMA1_RD_HI,
    PLIB_SB_INIT_ID_DMA1_WR_LRS,
    PLIB_SB_INIT_ID_DMA1_WR_HI,
    PLIB_SB_INIT_ID_USB1,
    PLIB_SB_INIT_ID_ETH1_RD,
    PLIB_SB_INIT_ID_ETH1_WR,
    PLIB_SB_INIT_ID_CAN1,
    PLIB_SB_INIT_ID_CAN2,
    PLIB_SB_INIT_ID_SQI1,
    PLIB_SB_INIT_ID_FLASH_CTL,
    PLIB_SB_INIT_ID_CRYPT0
} PLIB_SB_INIT_ID;
```

Description

SB Initiator ID

This enumeration lists the possible SB Initiator IDs. This ID is used for self-reporting and error logging. LRS and HI are SB arbitration schemes set by the soft configuration register CFGCON.

5.6.21.6.3.4 PLIB_SB_INIT_PG Enumeration

C

```
typedef enum {
    PLIB_SB_INIT_PG_0,
    PLIB_SB_INIT_PG_1,
    PLIB_SB_INIT_PG_2,
    PLIB_SB_INIT_PG_3
} PLIB_SB_INIT_PG;
```

Description

SB Initiator Permission Groups

This enumeration lists the possible initiator permission groups for the SB.

Members

Members	Description
PLIB_SB_INIT_PG_0	Privilege Group 0
PLIB_SB_INIT_PG_1	Privilege Group 1
PLIB_SB_INIT_PG_2	Privilege Group 2
PLIB_SB_INIT_PG_3	Privilege Group 3

Remarks

These values are used to program the CFGPG soft configuration register, which is not part of the SB. This should be done by the boot code to set up the desired initiator permissions prior to programming the SB.

5.6.21.6.3.5 PLIB_SB_OCP_CMD_CODE Enumeration

C

```
typedef enum {
    PLIB_SB_OCP_CMD_IDLE,
    PLIB_SB_OCP_CMD_WRITE,
    PLIB_SB_OCP_CMD_READ,
    PLIB_SB_OCP_CMD_READEX,
    PLIB_SB_OCP_CMD_WRITE_NON_POST,
    PLIB_SB_OCP_CMD_BROADCAST
} PLIB_SB_OCP_CMD_CODE;
```

Description

OCF Command Codes

This enumeration lists the possible OCP command codes. An OCP command code is logged when a transaction violation occurs. The command code of the offending command can then be read.

5.6.21.6.3.6 PLIB_SB_PG_INITIATOR Enumeration

C

```
typedef enum {
    PLIB_SB_PG_INITIATOR_CPU,
```

```

    PLIB_SB_PG_INITIATOR_DMA1,
    PLIB_SB_PG_INITIATOR_USB1,
    PLIB_SB_PG_INITIATOR_CAN1,

    PLIB_SB_PG_INITIATOR_FLASH_CTL,
    PLIB_SB_PG_INITIATOR_CRYPTO
} PLIB_SB_PG_INITIATOR;

```

Description

SB Initators

This enumeration lists the possible permission group Initiators

5.6.21.6.3.7 PLIB_SB_REGION_PG Enumeration

C

```

typedef enum {
    REGION_PG_0,
    REGION_PG_1,
    REGION_PG_2,
    REGION_PG_3
} PLIB_SB_REGION_PG;

```

Description

SB Region Permission Groups

Lists the possible permission groups assigned to a region for read and/or write access.

Members

Members	Description
REGION_PG_0	Privilege Group 0 has read/write permission
REGION_PG_1	Privilege Group 1 has read/write permission
REGION_PG_2	Privilege Group 2 has read/write permission
REGION_PG_3	Privilege Group 3 has read/write permission

5.6.21.6.3.8 PLIB_SB_TGT_ID Enumeration

C

```

typedef enum {
    PLIB_SB_TGT_ID_T0,
    PLIB_SB_TGT_ID_T1,
    PLIB_SB_TGT_ID_T2,
    PLIB_SB_TGT_ID_T3,
    PLIB_SB_TGT_ID_T4,
    PLIB_SB_TGT_ID_T5,
    PLIB_SB_TGT_ID_T6,
    PLIB_SB_TGT_ID_T7,
    PLIB_SB_TGT_ID_T8,
    PLIB_SB_TGT_ID_T9,
    PLIB_SB_TGT_ID_T10,
    PLIB_SB_TGT_ID_T11,
    PLIB_SB_TGT_ID_T12,
    PLIB_SB_TGT_ID_T13
} PLIB_SB_TGT_ID;

```

Description

SB Target ID

This enumeration lists the possible SB Target IDs

Members

Members	Description
PLIB_SB_TGT_ID_T0	System Bus
PLIB_SB_TGT_ID_T1	Prefetch Module
PLIB_SB_TGT_ID_T2	Data RAM 1

PLIB_SB_T3_REGION_2	Data RAM 2 Region 2
PLIB_SB_T4_REGION_0	External Bus Interface Region 0
PLIB_SB_T4_REGION_1	External Bus Interface Region 1
PLIB_SB_T4_REGION_2	External Bus Interface Region 2
PLIB_SB_T5_REGION_0	Peripheral Bus 1 Region 0
PLIB_SB_T5_REGION_1	Peripheral Bus 1 Region 1
PLIB_SB_T5_REGION_2	Peripheral Bus 1 Region 2
PLIB_SB_T6_REGION_0	Peripheral Bus 2 Region 0
PLIB_SB_T6_REGION_1	Peripheral Bus 2 Region 1
PLIB_SB_T7_REGION_0	Peripheral Bus 3 Region 0
PLIB_SB_T7_REGION_1	Peripheral Bus 3 Region 1
PLIB_SB_T8_REGION_0	Peripheral Bus 4 Region 0
PLIB_SB_T8_REGION_1	Peripheral Bus 4 Region 1
PLIB_SB_T9_REGION_0	Peripheral Bus 5 Region 0
PLIB_SB_T9_REGION_1	Peripheral Bus 5 Region 1
PLIB_SB_T10_REGION_0	USB Region 0
PLIB_SB_T11_REGION_0	Serial Quad Interface Region 0
PLIB_SB_T11_REGION_1	Serial Quad Interface Region 1
PLIB_SB_T12_REGION_0	Crypto Region 9
PLIB_SB_T13_REGION_0	Random Number Generator 0

5.6.21.6.3.10 SB_MODULE_ID Enumeration

C

```
typedef enum {
    SB_ID_1,
    SB_NUMBER_OF_MODULES
} SB_MODULE_ID;
```

Description

Module ID

This enumeration lists the possible Module IDs for the system bus.

Remarks

Refer to the data sheet to get the correct number of modules defined for the desired device.

5.6.21.6.4 Other Functions

5.6.21.6.4.1 PLIB_SB_CPUPrioritySet Function

C

```
void PLIB_SB_CPUPrioritySet(
    SB_MODULE_ID index,
    PLIB_SB_ARB_POLICY priority
);
```

Description

This function sets the CPU arbitration policy to SRAM when servicing an interrupt.

Preconditions

System must be unlocked before the priority can be set.

Parameters

Parameters	Description
priority	Use either high priority or least-recently-served algorithm.

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

This function writes to the soft configuration register CFGCON, which is not part of the SB. This should be done by the boot code prior to programming the SB. Note that the system must be unlocked before the priority can be set.

Default at reset is PRIORITY_LRS.

Example

```
PLIB_SB_PriorityUnlock();
PLIB_SB_CPUPrioritySet(SB_ID_1, PRIORITY_HI);
```

5.6.21.6.4.2 PLIB_SB_DMAPrioritySet Function

C

```
void PLIB_SB_DMAPrioritySet(
```

```
    SB_MODULE_ID index,  
    PLIB_SB_ARB_POLICY priority  
);
```

Description

This function sets the DMA arbitration.

Preconditions

System must be unlocked before the priority can be set.

Parameters

Parameters	Description
priority	Use either high priority or least-recently-served algorithm.

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

This function writes to the soft configuration register CFGCON, which is not part of the SB. This should be done by the boot code prior to programming the SB. Note that the system must be unlocked before the priority can be set.

Default at reset is PRIORITY_LRS.

Example

```
PLIB_SB_PriorityUnlock();  
void PLIB_SB_DMAPrioritySet(SB_ID_1, PRIORITY_HI);
```

5.6.21.6.4.3 PLIB_SB_InitPermGrpSet Function**C**

```
void PLIB_SB_InitPermGrpSet(  
    SB_MODULE_ID index,  
    PLIB_SB_PG_INITIATOR initiator,  
    PLIB_SB_INIT_PG pg  
);
```

Description

This function sets the read/write permission group(s) for an initiator. The region must also allow read/write access for the permission group for a read/write to occur.

Preconditions

None.

Parameters

Parameters	Description
initiator	The initiator for which permission groups are assigned.
pg	The permission group(s) to which the initiator is assigned.

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

This function writes to the soft configuration register CFGPG, which is not part of the SB. Permission groups should be assigned

by the boot code prior to programming the SB.

Default permission group at reset for all initiators is 0.

After an NMI, the CPU permission group reverts to 0. All other initiator permission groups remain unchanged.

The effective CPU permission group value in debug mode is controlled by boot configuration value DBGPER[2:0]. If DBGPER denies access to the group CPU1PG selects, the effective value selects group 3.

Example

```
PLIB_SB_InitPermGrpSet(SB_ID_1, PLIB_SB_PG_INITIATOR_CPU, PLIB_SB_INIT_PG_1);
```

5.6.21.6.5 Feature Existence Functions

5.6.21.6.5.1 PLIB_SB_ExistsCPUPriority Function

```
C
bool PLIB_SB_ExistsCPUPriority(
    SB_MODULE_ID index
);
```

Description

This function identifies whether the CPUPriority feature is available on the SB module. When this function returns true, these functions are supported on the device:

- [PLIB_SB_CPUPrioritySet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The CPUPriority feature is supported on the device
- false - The CPUPriority feature is not supported on the device

Remarks

None.

5.6.21.6.5.2 PLIB_SB_ExistsDMAPriority Function

```
C
bool PLIB_SB_ExistsDMAPriority(
    SB_MODULE_ID index
);
```

Description

This function identifies whether the DMAPriority feature is available on the SB module. When this function returns true, these functions are supported on the device:

- [PLIB_SB_DMAPrioritySet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The DMAPriority feature is supported on the device
- false - The DMAPriority feature is not supported on the device

Remarks

None.

5.6.21.6.5.3 PLIB_SB_ExistsInitPermGrp Function**C**

```
bool PLIB_SB_ExistsInitPermGrp(  
    SB_MODULE_ID index  
);
```

Description

This function identifies whether the InitPermGrp feature is available on the SB module. When this function returns true, these functions are supported on the device:

- [PLIB_SB_InitPermGrpSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The InitPermGrp feature is supported on the device
- false - The InitPermGrp feature is not supported on the device

Remarks

None.

5.6.21.6.5.4 PLIB_SB_ExistsPGRegAddr Function**C**

```
bool PLIB_SB_ExistsPGRegAddr(  
    SB_MODULE_ID index  
);
```

Description

This function identifies whether the PGRegAddr feature is available on the SB module. When this function returns true, these functions are supported on the device:

- [PLIB_SB_PGRegionAddrSet](#)
- [PLIB_SB_PGRegionAddrGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The PGRRegAddr feature is supported on the device
- false - The PGRRegAddr feature is not supported on the device

Remarks

None.

5.6.21.6.5.5 PLIB_SB_ExistsPGRRegRdPerm Function**C**

```
bool PLIB_SB_ExistsPGRRegRdPerm(  
    SB_MODULE_ID index  
);
```

Description

This function identifies whether the PGRRegRdPerm feature is available on the SB module. When this function returns true, these functions are supported on the device:

- [PLIB_SB_PGRegionReadPermSet](#)
- [PLIB_SB_PGRegionReadPermClear](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The PGRRegRdPerm feature is supported on the device
- false - The PGRRegRdPerm feature is not supported on the device

Remarks

None.

5.6.21.6.5.6 PLIB_SB_ExistsPGRRegSize Function**C**

```
bool PLIB_SB_ExistsPGRRegSize(  
    SB_MODULE_ID index  
);
```

Description

This function identifies whether the PGRRegSize feature is available on the SB module. When this function returns true, these functions are supported on the device:

- [PLIB_SB_PGRegionSizeSet](#)
- [PLIB_SB_PGRegionSizeGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The PGRegSize feature is supported on the device
- false - The PGRegSize feature is not supported on the device

Remarks

None.

5.6.21.6.5.7 PLIB_SB_ExistsPGRegWrPerm Function

C

```
bool PLIB_SB_ExistsPGRegWrPerm(  
    SB_MODULE_ID index  
);
```

Description

This function identifies whether the PGRegWrPerm feature is available on the SB module. When this function returns true, these functions are supported on the device:

- [PLIB_SB_PGRegionWritePermSet](#)
- [PLIB_SB_PGRegionWritePermClear](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The PGRegWrPerm feature is supported on the device
- false - The PGRegWrPerm feature is not supported on the device

Remarks

None.

5.6.21.6.5.8 PLIB_SB_ExistsPGVErrClear Function

C

```
bool PLIB_SB_ExistsPGVErrClear(  
    SB_MODULE_ID index  
);
```

Description

This function identifies whether the PGVErrClear feature is available on the SB module. When this function returns true, these functions are supported on the device:

- [PLIB_SB_PGVErrorMulti](#)
- [PLIB_SB_PGVErrorCode](#)
- [PLIB_SB_PGVErrorLogClearSingle](#)
- [PLIB_SB_PGVErrorLogClearMulti](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The PGVErrClear feature is supported on the device
- false - The PGVErrClear feature is not supported on the device

Remarks

None.

5.6.21.6.5.9 PLIB_SB_ExistsPGVErrClrMulti Function**C**

```
bool PLIB_SB_ExistsPGVErrClrMulti(  
    SB_MODULE_ID index  
);
```

Description

This function identifies whether the PGVErrClrMulti feature is available on the SB module. When this function returns true, these functions are supported on the device:

- [PLIB_SB_PGVErrorClearMulti](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The PGVErrClrMulti feature is supported on the device
- false - The PGVErrClrMulti feature is not supported on the device

Remarks

None.

5.6.21.6.5.10 PLIB_SB_ExistsPGVErrClrSingle Function

C

```
bool PLIB_SB_ExistsPGVErrClrSingle(  
    SB_MODULE_ID index  
);
```

Description

This function identifies whether the PGVErrClrSingle feature is available on the SB module. When this function returns true, these functions are supported on the device:

- [PLIB_SB_PGVErrorClearSingle](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The PGVErrClrSingle feature is supported on the device
- false - The PGVErrClrSingle feature is not supported on the device

Remarks

None.

5.6.21.6.5.11 PLIB_SB_ExistsPGVErrCmdCode Function

C

```
bool PLIB_SB_ExistsPGVErrCmdCode(  
    SB_MODULE_ID index  
);
```

Description

This function identifies whether the PGVErrCmdCode feature is available on the SB module. When this function returns true, these functions are supported on the device:

- [PLIB_SB_PGVErrorCommandCode](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The PGVErrCmdCode feature is supported on the device
- false - The PGVErrCmdCode feature is not supported on the device

Remarks

None.

5.6.21.6.5.12 PLIB_SB_ExistsPGVErrInitID Function

C

```
bool PLIB_SB_ExistsPGVErrInitID(  
    SB_MODULE_ID index  
);
```

Description

This function identifies whether the PGVErrInitID feature is available on the SB module. When this function returns true, these functions are supported on the device:

- [PLIB_SB_PGVErrorInitiatorID](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The PGVErrInitID feature is supported on the device
- false - The PGVErrInitID feature is not supported on the device

Remarks

None.

5.6.21.6.5.13 PLIB_SB_ExistsPGVErrPG Function

C

```
bool PLIB_SB_ExistsPGVErrPG(  
    SB_MODULE_ID index  
);
```

Description

This function identifies whether the PGVErrPG feature is available on the SB module. When this function returns true, these functions are supported on the device:

- [PLIB_SB_PGVErrorPermissionGroup](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The PGVErrPG feature is supported on the device
- false - The PGVErrPG feature is not supported on the device

Remarks

None.

5.6.21.6.5.14 PLIB_SB_ExistsPGVErrRegion Function

C

```
bool PLIB_SB_ExistsPGVErrRegion(  
    SB_MODULE_ID index  
);
```

Description

This function identifies whether the PGVErrRegion feature is available on the SB module. When this function returns true, these functions are supported on the device:

- [PLIB_SB_PGVErrorRegion](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The PGVErrRegion feature is supported on the device
- false - The PGVErrRegion feature is not supported on the device

Remarks

None.

5.6.21.6.5.15 PLIB_SB_ExistsPGVErrRptPri Function

C

```
bool PLIB_SB_ExistsPGVErrRptPri(  
    SB_MODULE_ID index  
);
```

Description

This function identifies whether the PGVErrRptPri feature is available on the SB module. When this function returns true, these functions are supported on the device:

- [PLIB_SB_PGVErrorReportPrimaryEnable](#)
- [PLIB_SB_PGVErrorReportPrimaryDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The PGVErrRptPri feature is supported on the device
- false - The PGVErrRptPri feature is not supported on the device

Remarks

None.

5.6.21.6.5.16 PLIB_SB_ExistsPGVErrStatus Function

C

```
bool PLIB_SB_ExistsPGVErrStatus(  
    SB_MODULE_ID index  
);
```

Description

This function identifies whether the PGVErrStatus feature is available on the SB module. When this function returns true, these functions are supported on the device:

- [PLIB_SB_PGVErrorStatus](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The PGVErrStatus feature is supported on the device
- false - The PGVErrStatus feature is not supported on the device

Remarks

None.

5.6.21.7 Files

Files

Name	Description
plib_sb.h	Defines the System Bus (SB) Peripheral Library interface

Description

5.6.21.7.1 plib_sb.h

System Bus Peripheral Library Interface Header

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the system bus (SB) peripheral library (PLIB) for Microchip microcontrollers. The definitions in this file are for the SB controller module.

Functions

	Name	Description
≡	PLIB_SB_CPUPrioritySet	Sets the CPU arbitration policy to SRAM when servicing an interrupt
≡	PLIB_SB_DMAMPrioritySet	Sets the DMA arbitration policy
≡	PLIB_SB_ExistsCPUPriority	Identifies whether the CPUPriority feature exists on the SB module
≡	PLIB_SB_ExistsDMAMPriority	Identifies whether the DMAMPriority feature exists on the SB module

	PLIB_SB_ExistsInitPermGrp	Identifies whether the InitPermGrp feature exists on the SB module
	PLIB_SB_ExistsPGRegAddr	Identifies whether the PGRegAddr feature exists on the SB module
	PLIB_SB_ExistsPGRegRdPerm	Identifies whether the PGRegRdPerm feature exists on the SB module
	PLIB_SB_ExistsPGRegSize	Identifies whether the PGRegSize feature exists on the SB module
	PLIB_SB_ExistsPGRegWrPerm	Identifies whether the PGRegWrPerm feature exists on the SB module
	PLIB_SB_ExistsPGVErrClear	Identifies whether the PGVErrClear feature exists on the SB module
	PLIB_SB_ExistsPGVErrClrMulti	Identifies whether the PGVErrClrMulti feature exists on the SB module
	PLIB_SB_ExistsPGVErrClrSingle	Identifies whether the PGVErrClrSingle feature exists on the SB module
	PLIB_SB_ExistsPGVErrCmdCode	Identifies whether the PGVErrCmdCode feature exists on the SB module
	PLIB_SB_ExistsPGVErrInitID	Identifies whether the PGVErrInitID feature exists on the SB module
	PLIB_SB_ExistsPGVErrPG	Identifies whether the PGVErrPG feature exists on the SB module
	PLIB_SB_ExistsPGVErrRegion	Identifies whether the PGVErrRegion feature exists on the SB module
	PLIB_SB_ExistsPGVErrRptPri	Identifies whether the PGVErrRptPri feature exists on the SB module
	PLIB_SB_ExistsPGVErrStatus	Identifies whether the PGVErrStatus feature exists on the SB module
	PLIB_SB_InitPermGrpSet	Sets the read/write permission group(s) for an initiator. The region must also allow read/write access for the permission group for a read/write to occur.
	PLIB_SB_PGRegionAddrGet	Returns the base address for a permission group region within a target's physical address space.
	PLIB_SB_PGRegionAddrSet	Sets the base address for a permission group region within a target's physical address space. Not all regions are programmable.
	PLIB_SB_PGRegionReadPermClear	Clears the permission bit(s) corresponding to the requested read permissions for a permission group region within a target's physical address space. Not all regions are programmable.
	PLIB_SB_PGRegionReadPermSet	Sets the permission bit(s) corresponding to the requested read permissions for a permission group region within a target's physical address space. Not all regions are programmable.
	PLIB_SB_PGRegionSizeGet	Returns the size for a permission group region within a target's physical address space.
	PLIB_SB_PGRegionSizeSet	Sets the size for a permission group region within a target's physical address space. Not all regions are programmable.
	PLIB_SB_PGRegionWritePermClear	Clears the permission bit(s) corresponding to the requested write permissions for a permission group region within a target's physical address space. Not all regions are programmable.
	PLIB_SB_PGRegionWritePermSet	Sets the permission bit(s) corresponding to the requested write permissions for a permission group region within a target's physical address space. Not all regions are programmable.
	PLIB_SB_PGVErrorClearMulti	Clears multiple permission group errors for the specified target.
	PLIB_SB_PGVErrorClearSingle	Clears a single permission group error for the specified target.
	PLIB_SB_PGVErrorCode	Returns a value corresponding to the type of error logged for the specified target.
	PLIB_SB_PGVErrorCommandCode	Returns the OCP command code of the transaction that caused the protection violation for the specified target.
	PLIB_SB_PGVErrorInitiatorID	Returns the ID of the Initiator that caused the protection violation
	PLIB_SB_PGVErrorLogClearMulti	Clears a multiple protection group violations error from the specified target error log register.
	PLIB_SB_PGVErrorLogClearSingle	Clears a single protection group violation error from the specified target error log register.

	PLIB_SB_PGVErrorMulti	Indicates if more than one perimission group violation has occurred since last cleared.
	PLIB_SB_PGVErrorPermissionGroup	Returns the permission group of the protection region in a target address space that caused the protection violation for the specified target.
	PLIB_SB_PGVErrorRegion	Returns the number of the protection region in the specified target address space that caused the protection violation.
	PLIB_SB_PGVErrorReportPrimaryDisable	Disables primary permission group error reporting for the specified target to the SB flag register.
	PLIB_SB_PGVErrorReportPrimaryEnable	Enables primary permission group error reporting for the specified target to the SB flag register.
	PLIB_SB_PGVErrorStatus	Identifies whether a permission group violation has been reported for the specified target.

5.6.22 SPI Peripheral Library

5.6.22.1 Introduction

SPI Peripheral Library

for

Microchip Microcontrollers

This library provides a low-level abstraction of the Serial Peripheral Interface (SPI) module that is available on the Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, there by hiding differences from one microcontroller variant to another.

Description

The Serial Peripheral Interface (SPI) module is a synchronous serial interface useful for communicating with other peripherals or microcontroller device. These peripheral devices may be serial EEPROMs, shift registers, display drivers, analog-to-digital converters, etc.

SPI is a synchronous serial data link operating at full duplex Master/slave relationship.

Two data lines:

- MOSI – Master Data Output, Slave Data Onput
- MISO – Master Data Input, Slave Data Output

Two control lines:

- SCLK – Clock
- /SS – Slave Select (no addressing)

Devices communicate in Master/Slave mode where the master device initiates the data frame. Multiple slave devices are allowed with individual slave select (Chip Select) lines. The SPI is sometimes referred to as a "four-wire" serial bus, contrasting with three-, two-, and one-wire serial buses.

5.6.22.2 Release Notes

MPLAB Harmony Version: v0.70b **SPI Peripheral Library Version :** 0.70b **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.6.22.3 SW License Agreement

© 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS." 5.6.22.4 Using the Library

This topic describes the basic architecture of the SPI Peripheral Library and provides information and examples on how to use it.

Interface Header File: [plib_spi.h](#)

The interface to the SPI Peripheral Library is defined in the "[plib_spi.h](#)" header file, which is included by the "peripheral.h" peripheral library header file. Any C language source (.c) file that uses the SPI Peripheral library must include "peripheral.h".

Library File:

The SPI Peripheral Library is part of the processor-specific peripheral library archive (.a) file installed with the compiler. Libraries in this archive are automatically available to the linker (in the default search path) for any project built using the Microchip compiler.

5.6.22.4.1 Library Architecture

This library provides the low level abstraction of the SPI module available on the Microchip family of microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in the software and introduces the library interface.

Note: The interface provided is a superset of all SPI functionality available on the device. Refer to the "**Serial Peripheral Interface (SPI)**" chapter in the specific device data sheet for availability.

Description

The following diagram shows the general architecture of the SPI Peripheral Library.

The library interface routines are divided into various subsections, each of the subsection addresses one of the blocks or the overall operation of the SPI module.

Library Interface Section	Description
General Configuration and Status Functions	This section provides a set of functions and data types for configuring the SPI and to read the status of the SPI.
Data Transfer Functions	This section provides a set of functions and data types for Reading and Writing the SPI buffer values.
Transmitter Functions	This section provides a set of functions for transmitter.
Receiver Functions	This section provides a set of functions for receiver.
Framed Mode Functions	Provides control, status, and data transfer routines for Framed SPI mode.
Audio Mode Functions	Provides control, status routines to support audio protocol functionality.

Note: Not all modes are available on all devices. Refer to the "**Serial Peripheral Interface (SPI)**" chapter in the specific device data sheet for availability.

5.6.22.4.2 Hardware Abstraction Model

This library provides a low-level abstraction of the SPI module on the Microchip family microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Description

The SPI Peripheral Library provides interface routines to interact with the blocks shown in the following diagram.

Hardware Abstraction Model

The Serial Peripheral Interface (SPI) module is a synchronous serial interface useful for communicating with external peripherals and other microcontroller devices.

The SPI bus specifies four logic signals:

- SCLK: serial clock (output from master)
- MOSI: master output, slave input (output from master)
- MISO: master input, slave output (output from slave)
- /SS: slave select (active low, output from master); on certain devices, this pin is implemented using general purpose I/O (GPIO)

The SPI bus can operate with a single master device and with one or more slave devices. To begin a communication, the master first configures the clock, using a frequency less than or equal to the maximum frequency the slave device supports. In addition to setting the clock frequency, the master must also configure the clock polarity and phase with respect to the data.

The master then transmits the appropriate chip select bit for the desired chip to a logic '0'. A logic '0' is transmitted because the Chip Select line (/SS) is active low, meaning its off state is a logic '1'; the on state is asserted with a logic 0. The master issues the clock cycles.

During each SPI clock cycle, a full duplex data transmission occurs:

- The master sends a bit on the MOSI line; the slave reads it from that same line
- The slave sends a bit on the MISO line; the master reads it from that same line

Transmissions may involve any number of clock cycles. When there are no more data to be transmitted, the master stops toggling its clock. Normally, it then deselects the slave.

The **Baud Rate Generator/Prescaler** controls the timing, the desired baud rate can be programmed in the baud rate controller.

In the Master mode, the **clock** becomes the serial clock and is provided to external devices via the SCK pin (the clock can be prescaled by the primary prescaler and the secondary prescaler if device supports).

The **Buffers** are for data transmitted or received by the SPI module over the MISO and MOSI line synchronized with the SCK line by the clock control logic.

The **Status and Control logic**, provide the capability to control different ways of enabling or disabling the master and slave. It also can provides status about the transmitter and receiver.

Active-Low **Slave Select** or Frame Synchronization I/O Pulse allows for a Synchronous Slave mode.

The SPI module supports the following four SPI modes.

- **Standard Mode:** In this mode of operation, data can be thought of as taking a direct path between the Most Significant bit (MSb) of one module's shift register and the Least Significant bit (LSb) of the other, and then into the appropriate Transmit or Receive Buffer. The master provides the serial clock and synchronization signals required to the slave device.
- **Enhanced Buffer Mode:** The operation of this mode is very similar to that of Standard mode. The difference is that data can be thought of as moving from the Shift register to a receive FIFO buffer and moving from the transmit FIFO buffer to the Shift register.
- **Framed Mode:** In this mode of operation, the Frame Master controls the generation of the frame synchronization pulse and provides this pulse to other devices at the Slave Select (/SS) pin. The SPI clock is generated by the SPI Master and is continuously running. The SPI slave module uses a frame synchronization pulse received at the SS pin.
- **Audio Protocol Mode:** The SPI module provides support to the audio protocol modes; with this mode, the SPI module can be interfaced to most codec devices available today to provide PIC microcontroller-based audio solutions

Note: Not all features are available on all devices. Refer to the "**Serial Peripheral Interface (SPI)**" chapter in the specific device data sheet for availability.

5.6.22.4.3 How the Library Works

The SPI module has the following operating modes:

- Standard SPI
- Enhanced Buffer SPI
- Framed SPI
- Audio Protocol Interface

Note: Not all modes are available on all devices. Refer to the "**Serial Peripheral Interface (SPI)**" chapter in the specific device data sheet for availability.

5.6.22.4.3.1 State Machine

This state machine is provided to give a general idea of the usage model of the peripheral library. Refer to the usage model for more detailed steps for the scenario that is being used.

Description

SPI State Machine

The following state machine diagrams shows the transmission and reception during normal operation.

SPI Routines

State	Associated Function
Setup and Initialization	Initialize the SPI by setting prescalar/ baud rate generator, interrupt modes.
Enable Master	Once the SPI has been appropriately set up and initialized, the state machine enables Master mode (PLIB_SPI_MasterEnable).
Select Slave	Select slave by pulling the /SSx pin low to transmit the data.
Write Data To Transfer	Write data to the buffer to transmit using PLIB_SPI_BufferWrite .
Wait for Transmit Buffer to Clear	Buffer Data will be transmitted to transmit buffer and transmit buffer flag will be full. The state machine waits for transmit buffer to clear. Check for status by calling PLIB_SPI_TransmitBufferIsFull .
Wait for Receive Buffer Full to Set	Slave sends received data back to master. Upon data received receive buffer flag will set. The state machine waits for Receive buffer to clear. Check for status by calling PLIB_SPI_ReceiveBufferIsFull .
Read Buffer	Read the buffer using PLIB_SPI_BufferRead .
Enable Slave Select	Enable slave select by calling PLIB_SPI_PinEnable .

Note: Not all features are available on all devices. Refer to the "Serial Peripheral Interface (SPI)" chapter in the specific device data sheet for availability.

5.6.22.4.3.2 Standard SPI Mode

In Standard (legacy) Master and Slave modes, data can be thought of as taking a direct path between the Most Significant bit (MSb) of one module's shift register and the Least Significant bit (LSb) of the other, and then into the appropriate Transmit or Receive buffer. The module configured as the master module provides the serial clock and synchronization signals (as required) to the slave device.

5.6.22.4.3.2.1 Standard Master Mode

In Standard Master mode, the input clock is used as the serial clock. The serial clock is output via the SCK pin to slave devices. Clock pulses are only generated when there is data to be transmitted.

Setup

1. Select on which edge of the clock data transmission occurs, using [PLIB_SPI_OutputDataPhaseSelect](#) and [PLIB_SPI_ClockPolaritySelect](#).
2. The clock is prescaled using [PLIB_SPI_PrescalePrimarySelect/PLIB_SPI_PrescaleSecondarySelect](#), if supported by the device.
3. If the module needs to operate as a Master, use [PLIB_SPI_MasterEnable](#).

Example: Standard Master Mode Communication Setup

```
#define MY_SPI_ID    SPI_ID_1

//Disable SPI
PLIB_SPI_Disable(MY_SPI_ID);

// Optional: Clear SPI interrupts and status flag.

//clear SPI buffer
PLIB_SPI_BufferClear (MY_SPI_ID);

// Configure General SPI Options
PLIB_SPI_StopInIdleDisable(MY_SPI_ID);
PLIB_SPI_PinEnable(MY_SPI_ID, SPI_PIN_SLAVE_SELECT|SPI_PIN_DATA_OUT);
PLIB_SPI_CommunicationWidthSelect(MY_SPI_ID, SPI_COMMUNICATION_WIDTH_16BITS);
PLIB_SPI_InputSamplePhaseSelect(MY_SPI_ID, SPI_INPUT_SAMPLING_PHASE_IN_MIDDLE);
PLIB_SPI_ClockPolaritySelect(MY_SPI_ID, SPI_CLOCK_POLARITY_IDLE_HIGH);
PLIB_SPI_OutputDataPhaseSelect(MY_SPI_ID, SPI_OUTPUT_DATA_PHASE_ON_ACTIVE_TO_IDLE_CLOCK);
PLIB_SPI_MasterEnable(MY_SPI_ID);
PLIB_SPI_FramedCommunicationDisable(MY_SPI_ID);

// Optional: Enable interrupts.

// Enable the module
PLIB_SPI_Enable(MY_SPI_ID);
```

Transmission and Receive

Both data to be transmitted and data that is received are respectively written into, or read from, the SPI buffer.

1. Data to be transmitted is written to the SPI buffer([PLIB_SPI_BufferWrite](#)).
2. When contents of buffer are moved to the shift register, the SPI transmit buffer full flag is cleared (this can be verified using [PLIB_SPI_TransmitBufferIsFull](#)).
3. A series of 8/16/32 clock pulses shifts out 8/16/32 bits of transmit data from the shift register to the data out (SDO) pin and simultaneously shifts in the data at the data in (SDI) pin into the shift register.
4. When the transfer is complete, the following events occur:
 - The SPI interrupt flag is set. Interrupts will occur if SPI interrupts are enabled. The SPI interrupt flag is not cleared automatically by the hardware.

- Also, when the ongoing transmit and receive operation is completed, the contents of the shift register are moved to the SPI receive register.
 - The SPI receive buffer full flag (`PLIB_SPI_ReceiveBufferIsFull`) is set by the module, indicating that the receive buffer is full. Once the SPI buffer is read by the user application using `PLIB_SPI_BufferRead`, the hardware clears the SPI receive buffer full flag.
5. If the SPI receive buffer full flag is set when the SPI module needs to transfer data from SPI shift register to SPI receive buffer, the module will set the SPI receive overflow flag (`PLIB_SPI_ReceiverHasOverflowed`), indicating an overflow condition.
 6. Data to be transmitted can be written to SPI buffer (`PLIB_SPI_BufferWrite`) by the user software at any time as long as the SPI Transmit buffer full flag is clear (`PLIB_SPI_TransmitBufferIsFull`). The write can occur while SPI shift register is shifting out the previously written data, allowing continuous transmission.

Example: Standard Master Mode Communication Transfer

```
#define MY_SPI_ID    SPI_ID_1

uint16_t data;

data = 0x00ac;

// write to buffer for TX
PLIB_SPI_BufferWrite (MY_SPI_ID,data);

// Either Poll for Receiver buffer to be full using
// PLIB_SPI_ReceiveBufferIsFull or wait for the interrupt

// Read the received value
data = PLIB_SPI_BufferRead (MY_SPI_ID);
```

Notes:

1. Refer to the **"Interrupts"** section in the related family reference manual or device data sheet for details on how to clear and enable the SPI module interrupts and flags.
2. `MY_SPI_ID` is the SPI instance selected for use by the application developer.
3. Not all features are available on all devices. Refer to the **"Serial Peripheral Interface (SPI)"** chapter in the specific device data sheet for availability.

5.6.22.4.3.2.2 Standard Slave Mode

Slave Select Synchronization

The Slave Select pin (/SS) allows for Synchronous Slave mode. If the slave select is enabled (`PLIB_SPI_PinEnable`), transmission and reception are enabled in Slave mode only if the /SS pin is driven to a low state. The port output or other peripheral outputs must not be driven in order to allow the /SS pin to function as an input. If the slave select is enabled and the /SS pin is driven high, the data output (SDO) pin is no longer driven and will tri-state even if the module is in the middle of a transmission. An aborted transmission will be retried the next time the /SS pin is driven low, using the data held in the SPI Transmit buffer. If slave select is not enabled, the /SS pin does not affect the module operation in Slave mode.

SPI Transmit Buffer Full Status Operation

The function of the SPI Transmit buffer full (`PLIB_SPI_TransmitBufferIsFull`) is different in the Slave mode of operation. If slave select is disabled (`PLIB_SPI_PinDisable`), the `PLIB_SPI_TransmitBufferIsFull` returns a '1' when the SPI buffer is loaded by the user application. It is cleared when the module transfers data from SPI transmit buffer to SPI shift register. This is similar to the SPI Transmit buffer full function in Master mode.

If slave select is enabled (`PLIB_SPI_PinEnable`), `PLIB_SPI_TransmitBufferIsFull` returns a '1' when the SPI buffer is loaded by the user application. However, `PLIB_SPI_TransmitBufferIsFull` returns zero only when the SPI module completes data transmission. A transmission will be aborted when the Slave Select pin goes high and may be retried at a later time. Each data word is held in SPI transmit buffer until all bits are transmitted to the receiver.

Setup

In Standard Slave mode, data is transmitted and received as the external clock pulses appear on the SCK pin. The clock polarity and clock edge ([PLIB_SPI_ClockPolaritySelect](#)) determine upon which edge of the clock data transmission occurs.

Example: Standard Slave Mode Communication Setup

```
#define MY_SPI_ID    SPI_ID_1

//Disable SPI
PLIB_SPI_Disable(MY_SPI_ID);

// Optional: Clear SPI interrupts and status flag.

//clear SPI buffer
PLIB_SPI_BufferClear (MY_SPI_ID);

// Configure General SPI Options
PLIB_SPI_StopInIdleDisable(MY_SPI_ID);
PLIB_SPI_PinEnable(MY_SPI_ID, SPI_PIN_DATA_OUT|SPI_PIN_SLAVE_SELECT);
PLIB_SPI_CommunicationWidthSelect(MY_SPI_ID, SPI_COMMUNICATION_WIDTH_16BITS);

// SMP must be cleared when SPI is used in Slave mode
PLIB_SPI_InputSamplePhaseSelect(MY_SPI_ID, SPI_INPUT_SAMPLING_PHASE_IN_MIDDLE);
PLIB_SPI_ClockPolaritySelect(MY_SPI_ID, SPI_CLOCK_POLARITY_IDLE_HIGH);//clock polarity and
edge is subject to change ...
PLIB_SPI_OutputDataPhaseSelect(MY_SPI_ID, SPI_OUTPUT_DATA_PHASE_ON_ACTIVE_TO_IDLE_CLOCK);//
... based on your communication mode.

PLIB_SPI_SlaveEnable(MY_SPI_ID);

PLIB_SPI_FramedCommunicationDisable(MY_SPI_ID);

// Optional: Enable interrupts.

// Enable the module
PLIB_SPI_Enable(MY_SPI_ID);
```

Transmission and Receive

Both data to be transmitted and data that is received are respectively written into, or read from, the SPI buffer ([PLIB_SPI_BufferWrite](#)/ [PLIB_SPI_BufferRead](#)). The remainder of the operation of the module is identical to that of Standard Master mode.

Example: Standard Slave Mode Communication Receive

```
#define MY_SPI_ID    SPI_ID_1

uint16_t data;

if(PLIB_SPI_ReceiverHasOverflown(MY_SPI_ID))
{
    // error
    PLIB_SPI_ReceiverOverflowClear(MY_SPI_ID);// clear overflow
    data = PLIB_SPI_BufferRead (MY_SPI_ID);
}
else if (!PLIB_SPI_ReceiverBufferIsFull(MY_SPI_ID))
{
    // error
}
else
{
    data = PLIB_SPI_BufferRead (MY_SPI_ID); // read data
    while(PLIB_SPI_TransmitBufferIsFull(MY_SPI_ID));
    PLIB_SPI_BufferWrite(MY_SPI_ID, data); // send back
}
```

```
}
```

Notes:

1. Refer to the **"Interrupts"** section in the related family reference manual or device data sheet for details on how to clear and enable the SPI module interrupts and flags.
2. MY_SPI_ID is the SPI instance selected for use by the application developer.
3. Not all features are available on all devices. Refer to the **"Serial Peripheral Interface (SPI)"** chapter in the specific device data sheet for availability.

5.6.22.4.3.3 Enhanced Buffer SPI Mode

The operation of Enhanced Buffer Master and Slave modes is very similar to Standard Master and Slave modes. The difference is that data can be thought of as moving from the Shift register to a receive FIFO buffer and moving from the transmit FIFO buffer to the Shift register.

5.6.22.4.3.3.1 Enhanced Buffer Master Mode

In Enhanced Buffer Master mode (referred to as a FIFO), the input clock used as the serial clock. The serial clock is output via the SCK pin to slave devices. Clock pulses are only generated when there is data to be transmitted.

Setup

1. Select on which edge of the clock data transmission occurs, using [PLIB_SPI_OutputDataPhaseSelect](#) and [PLIB_SPI_ClockPolaritySelect](#).
2. The clock is prescaled using [PLIB_SPI_PrescalePrimarySelect/PLIB_SPI_PrescaleSecondarySelect](#), or the clock is generated using [PLIB_SPI_BaudRateClockSelect](#), if supported by the device.
3. If the module needs to operate as a Master, use [PLIB_SPI_MasterEnable](#).

Example: Enhanced Master Mode Communication Setup

```
#define MY_SPI_ID    SPI_ID_1

//Disable SPI
PLIB_SPI_Disable(MY_SPI_ID);

// Optional: Clear SPI interrupts and status flag.

//clear SPI buffer
PLIB_SPI_BufferClear (MY_SPI_ID);

// Configure General SPI Options
PLIB_SPI_StopInIdleDisable(MY_SPI_ID);
PLIB_SPI_PinEnable(MY_SPI_ID, SPI_PIN_SLAVE_SELECT|SPI_PIN_DATA_OUT);
PLIB_SPI_CommunicationWidthSelect(MY_SPI_ID, SPI_COMMUNICATION_WIDTH_16BITS);
PLIB_SPI_InputSamplePhaseSelect(MY_SPI_ID, SPI_INPUT_SAMPLING_PHASE_IN_MIDDLE);
PLIB_SPI_ClockPolaritySelect(MY_SPI_ID, SPI_CLOCK_POLARITY_IDLE_HIGH);
PLIB_SPI_OutputDataPhaseSelect(MY_SPI_ID, SPI_OUTPUT_DATA_PHASE_ON_ACTIVE_TO_IDLE_CLOCK);
PLIB_SPI_MasterEnable(MY_SPI_ID);

PLIB_SPI_FramedCommunicationDisable(MY_SPI_ID);
PLIB_SPI_FIFOEnable(MY_SPI_ID);

// Optional: Enable interrupts.

// Enable the module
PLIB_SPI_Enable(MY_SPI_ID);
```

The CPU loads data to be transmitted into the transmit buffer by writing the SPI buffer ([PLIB_SPI_BufferWrite](#)). An SPI transmission begins after the first buffer write. Up to all pending transmissions can be loaded. The number of pending transfers is indicated by the Buffer Element Count bits through [PLIB_SPI_FIFOCountGet](#).

In Master mode, this count reflects the number of transfers pending in the transmit buffer. In Slave mode, it reflects the number of unread receptions in the receive buffer. If the Shift register is empty, the first write will immediately load the Shift register, leaving all transmit buffer locations available.

After an SPI transfer completes, the receive buffer location is updated with the received data. The CPU accesses the received data by reading the SPI buffer. After each CPU read, the SPI buffer points to the next buffer location. SPI transfers continue until all pending data transfers have completed.

Transmission and Receive

Both data to be transmitted and data that is received are respectively written into, or read from, the SPI buffer.

1. Data to be transmitted is written to the SPI buffer([PLIB_SPI_BufferWrite](#)) and is loaded into the next available transmit buffer location.
2. The SPI transmit buffer full flag ([PLIB_SPI_TransmitBufferIsFull](#)) and SPI interrupt flag are set after pending transfers are loaded.
3. The current buffer location's contents are moved to the Shift register. The SPI transmit buffer is cleared by the module if a buffer location is available for a CPU write.
4. A series of 8/16/32 clock pulses shifts out 8/16/32 bits of transmit data from the shift register to the data out (SDO) pin and simultaneously shifts in the data at the data in (SDI) pin into the shift register.
5. When the transfer is complete, the following events occur:
 - The contents of the SPI shift register are moved into the next available location in the receive buffer.
 - If the last unread location is written by the SPI module, the SPI receive buffer full flag ([PLIB_SPI_ReceiveBufferIsFull](#)) is set, indicating that all buffer locations are full. Enable the SPI interrupts. The SPI interrupt flag is not cleared automatically by the hardware.
 - Once the SPI buffer is read ([PLIB_SPI_BufferRead](#)) by the user application, the hardware clears the SPI receive buffer full flag ([PLIB_SPI_ReceiveBufferIsFull](#)) and the SPI Buffer increments to the next unread receive buffer location. SPI buffer reads beyond the last unread location will not increment the buffer location.
6. When [PLIB_SPI_ReceiveBufferIsFull](#) is set, if the SPI module needs to transfer one more data from SPI shift register to the buffer, the module will enable the receive overflow flag ([PLIB_SPI_ReceiverHasOverflowed](#)) indicating an overflow condition.
7. Data to be transmitted can be written to the SPI buffer ([PLIB_SPI_BufferWrite](#)) by the user application at any time as long as the SPI transmit buffer full flag is clear ([PLIB_SPI_TransmitBufferIsFull](#)). Up to all pending transfers can be loaded into the buffer allowing continuous transmission.

Example: Enhanced Master Mode communication Transfer

```
#define MY_SPI_ID    SPI_ID_1

uint16_t data;

data = 0x00ac;

// write to buffer for TX
PLIB_SPI_BufferWrite (MY_SPI_ID,data);

// Either Poll for Receiver buffer to be full using
// PLIB_SPI_ReceiveBufferIsFull or wait for the interrupt

// Read the received value
data = PLIB_SPI_BufferRead (MY_SPI_ID);
```

Notes:

1. Refer to the **"Interrupts"** section in the related family reference manual or device data sheet for details on how to clear and enable the SPI module interrupts and flags.
2. MY_SPI_ID is the SPI instance selected for use by the application developer.
3. Not all features are available on all devices. Refer to the **"Serial Peripheral Interface (SPI)"** chapter in the specific device

data sheet for availability.

5.6.22.4.3.3.2 Enhanced Buffer Slave Mode

Slave Select Synchronization

The Slave Select pin allows a Synchronous Slave mode. If the slave select enabled ([PLIB_SPI_PinEnable](#)), transmission and reception is enabled in Slave mode only if the /SS pin is driven to a low state. The port output or other peripheral outputs must not be driven in order to allow the /SS pin to function as an input. If the slave select is enabled and the /SS pin is driven high, the SDO pin is no longer driven and will tri-state even if the module is in the middle of a transmission. An aborted transmission will be retried the next time the /SS pin is driven low using the data held in the SPI transmit buffer. If the Slave select is disabled ([PLIB_SPI_PinDisable](#)), the /SS pin does not affect the module operation in Slave mode.

SPI Transmit Buffer Full Operation

The function of the SPI transmit buffer full flag ([PLIB_SPI_TransmitBufferIsFull](#)) is different in the Slave mode of operation. If Slave select is disabled ([PLIB_SPI_PinDisable](#)), the SPI Transmit Buffer Full flag ([PLIB_SPI_TransmitBufferIsFull](#)) is set when the last available buffer location is loaded by the user application. It is cleared when the module transfers data from the buffer to SPI status register and a buffer location is available for a CPU write. This is similar to the SPI transmit buffer in Master mode.

If Slave select is enabled ([PLIB_SPI_PinEnable](#)), the SPI transmit buffer is set when the last available buffer location is loaded by the user application. However, it is cleared only when the SPI module completes data transmission, leaving a buffer location available for a CPU write. A transmission will be aborted when the /SS pin goes high and may be retried at a later time. Each data word is held in the buffer until all bits are transmitted to the receiver.

Setup

In Slave mode, data is transmitted and received as the external clock pulses appear on the SCK pin. [PLIB_SPI_OutputDataPhaseSelect](#) and [PLIB_SPI_ClockPolaritySelect](#) determine upon which edge of the clock data transmission occurs. The rest of the operation of the module is identical to that of Enhanced Buffer Master mode.

Example: Enhanced Slave Mode communication Setup

```
#define MY_SPI_ID    SPI_ID_1

//Disable SPI
PLIB_SPI_Disable(MY_SPI_ID);

// Optional: Clear SPI interrupts and status flag.

//clear SPI buffer
PLIB_SPI_BufferClear (MY_SPI_ID);

// Configure General SPI Options
PLIB_SPI_StopInIdleDisable(MY_SPI_ID);
PLIB_SPI_CommunicationWidthSelect(MY_SPI_ID, SPI_COMMUNICATION_WIDTH_16BITS);

// SMP must be cleared when SPI is used in Slave mode
PLIB_SPI_PinEnable(MY_SPI_ID, SPI_PIN_DATA_OUT|SPI_PIN_SLAVE_SELECT);
PLIB_SPI_InputSamplePhaseSelect(MY_SPI_ID, SPI_INPUT_SAMPLING_PHASE_IN_MIDDLE);
PLIB_SPI_ClockPolaritySelect(MY_SPI_ID, SPI_INPUT_SAMPLING_PHASE_AT_END); //clock polarity and
edge is subject to change ...
PLIB_SPI_OutputDataPhaseSelect(MY_SPI_ID, SPI_OUTPUT_DATA_PHASE_ON_ACTIVE_TO_IDLE_CLOCK); //
... based on your communication mode.

PLIB_SPI_SlaveEnable(MY_SPI_ID);
PLIB_SPI_FramedCommunicationDisable(MY_SPI_ID);
PLIB_SPI_FIFOEnable(MY_SPI_ID);

// Optional: Enable interrupts.
```

```
// Enable the module
PLIB_SPI_Enable(MY_SPI_ID);
```

Transmission and Receive:

Both data to be transmitted and data that is received are respectively written into, or read from, the SPI buffer ([PLIB_SPI_BufferWrite](#)/ [PLIB_SPI_BufferRead](#)). The remainder of the operation of the module is identical to that of Enhanced Buffer Master mode.

Example: Enhanced Slave Mode communication Receive

```
#define MY_SPI_ID    SPI_ID_1

uint16_t data;

if(PLIB_SPI_ReceiverHasOverflowed(MY_SPI_ID))
{
    // error
    PLIB_SPI_ReceiverOverflowClear(MY_SPI_ID); // clear overflow
    data = PLIB_SPI_BufferRead (MY_SPI_ID);
}
else if (!PLIB_SPI_ReceiverBufferIsFull(MY_SPI_ID))
{
    // error
}
else
{
    data = PLIB_SPI_BufferRead (MY_SPI_ID); // read data
    while(PLIB_SPI_TransmitBufferIsFull(MY_SPI_ID));
    PLIB_SPI_BufferWrite(MY_SPI_ID, data); // send back
}
```

Notes:

1. Refer to the "**Interrupts**" section in the related family reference manual or device data sheet for details on how to clear and enable the SPI module interrupts and flags.
2. MY_SPI_ID is the SPI instance selected for use by the application developer.
3. Not all features are available on all devices. Refer to the "**Serial Peripheral Interface (SPI)**" chapter in the specific device data sheet for availability.

5.6.22.4.3.4 Framed SPI Modes

The SPI module supports a basic framed SPI protocol while operating in either Master or Slave modes.

Description

The SPI module supports two framed modes of operation. In Frame Master mode, the SPI module generates the frame synchronization pulse and provides this pulse to other devices at the /SS pin. In Frame Slave mode, the SPI module uses a frame synchronization pulse received at the /SS pin.

Note 1: In Framed SPI modes, the $\overline{SSx}$ pin is used to transmit/receive the frame synchronization pulse.
 2: Framed SPI modes require the use of all four pins (i.e., using the $\overline{SSx}$ pin is not optional).

The framed SPI modes are supported in conjunction with the unframed Master and Slave modes. This makes four framed SPI configurations:

- SPI Master mode and Frame Master mode
- SPI Master mode and Frame Slave mode
- SPI Slave mode and Frame Master mode
- SPI Slave mode and Frame Slave mode

These modes determine whether or not the SPI module generates the serial clock and the frame synchronization pulse.

5.6.22.4.3.4.1 SPI Master Mode and Frame Master Mode

In Master/Frame Master mode, the SPI module generates both the clock and frame synchronization signals, as shown in the following figure.

In this mode, the serial clock is output continuously at the SCK pin, regardless of whether the module is transmitting. When the SPI buffer is written ([PLIB_SPI_BufferWrite](#)), the $\overline{SS}$ pin will be driven to its active state on the appropriate transmit edge of the SCK clock, and remain active for one data frame. If the [PLIB_SPI_FrameSyncPulseEdgeSelect](#) function decides whether sync pulse precedes the data transmission or coincides with the beginning of the data transmission. The module starts transmitting data on the next transmit edge of the SCK.

Setup

The mode is enabled by calling [PLIB_SPI_MasterEnable](#), [PLIB_SPI_FramedCommunicationEnable](#) and [PLIB_SPI_FrameSyncPulseDirectionSelect](#) (as output).

Example: SPI Master Mode and Frame Master Mode Communication Setup

```

#define MY_SPI_ID    SPI_ID_1

//Disable SPI
PLIB_SPI_Disable(MY_SPI_ID);

// Optional: Clear SPI interrupts and status flag.

//clear SPI buffer
PLIB_SPI_BufferClear (MY_SPI_ID);

// Configure General SPI Options
PLIB_SPI_StopInIdleDisable(MY_SPI_ID);
PLIB_SPI_PinEnable(MY_SPI_ID, SPI_PIN_SLAVE_SELECT|SPI_PIN_DATA_OUT);
PLIB_SPI_CommunicationWidthSelect(MY_SPI_ID, SPI_COMMUNICATION_WIDTH_16BITS);
PLIB_SPI_InputSamplePhaseSelect(MY_SPI_ID, SPI_INPUT_SAMPLING_PHASE_IN_MIDDLE);
PLIB_SPI_ClockPolaritySelect(MY_SPI_ID, SPI_CLOCK_POLARITY_IDLE_HIGH);
PLIB_SPI_OutputDataPhaseSelect(MY_SPI_ID, SPI_OUTPUT_DATA_PHASE_ON_ACTIVE_TO_IDLE_CLOCK);
PLIB_SPI_MasterEnable(MY_SPI_ID);

PLIB_SPI_FramedCommunicationEnable(MY_SPI_ID);
PLIB_SPI_FrameSyncPulseDirectionSelect(MY_SPI_ID, SPI_FRAME_PULSE_DIRECTION_INPUT);

// Optional: Enable interrupts.

// Enable the module
PLIB_SPI_Enable(MY_SPI_ID);

```

Transmission and Receive

Both data to be transmitted and data that is received are respectively written into, or read from, the SPI buffer.

Example: SPI Master Mode and Frame Master Mode Communication Transfer

```

#define MY_SPI_ID    SPI_ID_1

uint16_t data;

data = 0x00ac;

// write to buffer for TX
PLIB_SPI_BufferWrite (MY_SPI_ID,data);

// Either Poll for Receiver buffer to be full using
// PLIB_SPI_ReceiveBufferIsFull or wait for the interrupt

// Read the received value
data = PLIB_SPI_BufferRead (MY_SPI_ID);

```

Notes:

1. Refer to the **"Interrupts"** section in the related family reference manual or device data sheet for details on how to clear and enable the SPI module interrupts and flags.
2. MY_SPI_ID is the SPI instance selected for use by the application developer.
3. Not all features are available on all devices. Refer to the **"Serial Peripheral Interface (SPI)"** chapter in the specific device data sheet for availability.

5.6.22.4.3.4.2 SPI Master Mode and Frame Slave Mode

In Master/Frame Slave mode, the module generates the clock signal but uses the slave module's frame synchronization signal for data transmission, as shown in the following figure.

In this mode, the /SS pin is an input and it is sampled on the sample edge of the SPI clock. When it is sampled in its active state, data will be transmitted on the subsequent transmit edge of the SPI clock. The SPI interrupt flag is set when the transmission is complete. The user application must make sure that the correct data is loaded into the SPI buffer for transmission before the signal is received at the /SS pin.

Setup

The mode is enabled by calling [PLIB_SPI_MasterEnable](#), [PLIB_SPI_FramedCommunicationEnable](#), and [PLIB_SPI_FrameSyncPulseDirectionSelect](#).

Example: SPI Master Mode and Frame Slave Mode Communication Setup

```
#define MY_SPI_ID    SPI_ID_1

//Disable SPI
PLIB_SPI_Disable(MY_SPI_ID);

// Optional: Clear SPI interrupts and status flag.

//clear SPI buffer
PLIB_SPI_BufferClear (MY_SPI_ID);

// Configure General SPI Options
PLIB_SPI_StopInIdleDisable(MY_SPI_ID);
PLIB_SPI_PinEnable(MY_SPI_ID, SPI_PIN_SLAVE_SELECT|SPI_PIN_DATA_OUT);
PLIB_SPI_CommunicationWidthSelect(MY_SPI_ID, SPI_COMMUNICATION_WIDTH_16BITS);
PLIB_SPI_InputSamplePhaseSelect(MY_SPI_ID, SPI_INPUT_SAMPLING_PHASE_IN_MIDDLE);
PLIB_SPI_ClockPolaritySelect(MY_SPI_ID, SPI_CLOCK_POLARITY_IDLE_HIGH);
PLIB_SPI_OutputDataPhaseSelect(MY_SPI_ID, SPI_OUTPUT_DATA_PHASE_ON_ACTIVE_TO_IDLE_CLOCK);
PLIB_SPI_FrameSyncPulseCounterSelect(MY_SPI_ID, SPI_FRAME_SYNC_PULSE_ON_EVERY_8_DATA_CHARACTER);
PLIB_SPI_MasterEnable(MY_SPI_ID);

PLIB_SPI_FramedCommunicationEnable(MY_SPI_ID);
PLIB_SPI_FrameSyncPulseDirectionSelect(MY_SPI_ID, SPI_FRAME_PULSE_DIRECTION_INPUT);

// Optional: Enable interrupts.

// Enable the module
PLIB_SPI_Enable(MY_SPI_ID);
```

Transmission and Receive

Both data to be transmitted and data that is received are respectively written into, or read from, the SPI buffer.

Example: SPI Master Mode and Frame Slave Mode Communication Transfer

```
#define MY_SPI_ID    SPI_ID_1

uint16_t data;

data = 0x00ac;

// write to buffer for TX
PLIB_SPI_BufferWrite (MY_SPI_ID, data);

// Either Poll for Receiver buffer to be full using
```

```
// PLIB_SPI_ReceiveBufferIsFull or wait for the interrupt
```

```
// Read the received value
```

```
data = PLIB_SPI_BufferRead (MY_SPI_ID);
```

Notes:

1. Refer to the **"Interrupts"** section in the related family reference manual or device data sheet for details on how to clear and enable the SPI module interrupts and flags.
2. MY_SPI_ID is the SPI instance selected for use by the application developer.
3. Not all features are available on all devices. Refer to the **"Serial Peripheral Interface (SPI)"** chapter in the specific device data sheet for availability.

5.6.22.4.3.4.3 SPI Slave Mode and Frame Master Mode

In Slave/Frame Master mode, the module acts as the SPI slave and takes its clock from the other SPI module; however, it produces frame synchronization signals to control data transmission, as shown in the following figure.

The input SPI clock will be continuous in Slave mode. The /SS pin will be an output when the Frame sync pulse is output. Therefore, when the SPI buffer is written, the module drives the /SS pin to the active state on the appropriate transmit edge of the SPI clock for one SPI clock cycle. Data will start transmitting on the appropriate SPI clock transmit edge.

Setup

The mode is enabled by calling [PLIB_SPI_SlaveEnable](#), [PLIB_SPI_FramedCommunicationEnable](#), and [PLIB_SPI_FrameSyncPulseDirectionSelect](#).

Example: SPI Slave Mode and Frame Master Mode Communication Setup

```
#define MY_SPI_ID    SPI_ID_1

//Disable SPI
PLIB_SPI_Disable(MY_SPI_ID);

// Optional: Clear SPI interrupts and status flag.

//clear SPI buffer
PLIB_SPI_BufferClear (MY_SPI_ID);

// Configure General SPI Options
PLIB_SPI_StopInIdleDisable(MY_SPI_ID);
PLIB_SPI_PinEnable(MY_SPI_ID, SPI_PIN_DATA_OUT|SPI_PIN_SLAVE_SELECT);
PLIB_SPI_CommunicationWidthSelect(MY_SPI_ID, SPI_COMMUNICATION_WIDTH_16BITS);

// SMP must be cleared when SPI is used in Slave mode
PLIB_SPI_InputSamplePhaseSelect(MY_SPI_ID, SPI_INPUT_SAMPLING_PHASE_IN_MIDDLE);
PLIB_SPI_ClockPolaritySelect(MY_SPI_ID, SPI_CLOCK_POLARITY_IDLE_HIGH); //clock polarity and edge is subject to change ...
PLIB_SPI_OutputDataPhaseSelect(MY_SPI_ID, SPI_OUTPUT_DATA_PHASE_ON_ACTIVE_TO_IDLE_CLOCK); // ... based on your communication mode.
PLIB_SPI_FrameSyncPulseCounterSelect(MY_SPI_ID, SPI_FRAME_SYNC_PULSE_ON_EVERY_8_DATA_CHARACTER);

PLIB_SPI_SlaveEnable(MY_SPI_ID);
PLIB_SPI_FramedCommunicationEnable(MY_SPI_ID);
```

```

PLIB_SPI_FrameSyncPulseDirectionSelect(MY_SPI_ID, SPI_FRAME_PULSE_DIRECTION_INPUT);

// Optional: Enable interrupts.

// Enable the module
PLIB_SPI_Enable(MY_SPI_ID);

```

Transmission and Receive

Both data to be transmitted and data that is received are respectively written into, or read from, the SPI buffer.

Example: SPI Slave Mode and Frame Master Mode Communication Receive

```

#define MY_SPI_ID    SPI_ID_1

uint16_t data;

if(PLIB_SPI_ReceiverHasOverflowed(MY_SPI_ID))
{
    // error
    PLIB_SPI_ReceiverOverflowClear(MY_SPI_ID); // clear overflow
    data = PLIB_SPI_BufferRead (MY_SPI_ID);
}
else if (!PLIB_SPI_ReceiverBufferIsFull(MY_SPI_ID))
{
    // error
}
else
{
    data = PLIB_SPI_BufferRead (MY_SPI_ID); // read data
    while(PLIB_SPI_TransmitBufferIsFull(MY_SPI_ID));
    PLIB_SPI_BufferWrite(MY_SPI_ID, data); // send back
}

```

Notes:

1. Refer to the "Interrupts" section in the related family reference manual or device data sheet for details on how to clear and enable the SPI module interrupts and flags.
2. MY_SPI_ID is the SPI instance selected for use by the application developer.
3. Not all features are available on all devices. Refer to the "Serial Peripheral Interface (SPI)" chapter in the specific device data sheet for availability.

5.6.22.4.3.4.4 SPI Slave Mode and Frame Master Mode

In Slave/Frame Slave mode, the module obtains both its clock and frame synchronization signal from the master module, as shown in the following figure.

In this mode, both the clock and Slave Select pins will be inputs. The /SS pin is sampled on the sample edge of the SPI clock. When /SS is sampled at its active state, data will be transmitted on the appropriate transmit edge of SCK.

Setup

The mode is enabled by calling [PLIB_SPI_SlaveEnable](#), [PLIB_SPI_FramedCommunicationEnable](#) and [PLIB_SPI_FrameSyncPulseDirectionSelect](#) (as input).

Example: SPI Slave Mode and Frame Slave Mode Communication Setup

```

#define MY_SPI_ID    SPI_ID_1

//Disable SPI
PLIB_SPI_Disable(MY_SPI_ID);

// Optional: Clear SPI interrupts and status flag.

//clear SPI buffer
PLIB_SPI_BufferClear (MY_SPI_ID);

// Configure General SPI Options
PLIB_SPI_StopInIdleDisable(MY_SPI_ID);
PLIB_SPI_PinEnable(MY_SPI_ID, SPI_PIN_DATA_OUT|SPI_PIN_SLAVE_SELECT);
PLIB_SPI_CommunicationWidthSelect(MY_SPI_ID, SPI_COMMUNICATION_WIDTH_16BITS);

// SMP must be cleared when SPI is used in Slave mode
PLIB_SPI_InputSamplePhaseSelect(MY_SPI_ID, SPI_INPUT_SAMPLING_PHASE_IN_MIDDLE);
PLIB_SPI_ClockPolaritySelect(MY_SPI_ID, SPI_CLOCK_POLARITY_IDLE_HIGH);//clock polarity and
edge is subject to change ...
PLIB_SPI_OutputDataPhaseSelect(MY_SPI_ID, SPI_OUTPUT_DATA_PHASE_ON_ACTIVE_TO_IDLE_CLOCK);//
... based on your communication mode.
PLIB_SPI_FrameSyncPulseCounterSelect(MY_SPI_ID, SPI_FRAME_SYNC_PULSE_ON_EVERY_8_DATA_CHARACTER);

PLIB_SPI_SlaveEnable(MY_SPI_ID);

PLIB_SPI_FramedCommunicationEnable(MY_SPI_ID);
PLIB_SPI_FrameSyncPulseDirectionSelect(MY_SPI_ID, SPI_FRAME_PULSE_DIRECTION_INPUT);

// Optional: Enable interrupts.

// Enable the module
PLIB_SPI_Enable(MY_SPI_ID);

```

Transmission and Receive

Both data to be transmitted and data that is received are respectively written into, or read from, the SPI buffer.

Example: SPI Slave Mode and Frame Slave Mode Communication Receive

```

#define MY_SPI_ID    SPI_ID_1

uint16_t data;

if(PLIB_SPI_ReceiverHasOverflowed(MY_SPI_ID))
{
    // error
    PLIB_SPI_ReceiverOverflowClear(MY_SPI_ID);// clear overflow
    data = PLIB_SPI_BufferRead (MY_SPI_ID);
}
else if (!PLIB_SPI_ReceiverBufferIsFull(MY_SPI_ID))
{
    // error
}
else
{
    data = PLIB_SPI_BufferRead (MY_SPI_ID);           // read data
    while(PLIB_SPI_TransmitBufferIsFull(MY_SPI_ID));
    PLIB_SPI_BufferWrite(MY_SPI_ID, data);           // send back
}

```

Notes:

1. Refer to the **"Interrupts"** section in the related family reference manual or device data sheet for details on how to clear and enable the SPI module interrupts and flags.

2. MY_SPI_ID is the SPI instance selected for use by the application developer.
3. Not all features are available on all devices. Refer to the **"Serial Peripheral Interface (SPI)"** chapter in the specific device data sheet for availability.

5.6.22.4.3.5 Audio Protocol Interface Mode

The SPI module can be interfaced to most codec devices available today to provide PIC microcontroller-based audio solutions.

Description

The SPI module provides support to the audio protocol functionality via four standard I/O pins. The four pins that make up the audio protocol interface modes are:

- SDIx: Serial Data Input for receiving sample digital audio data
- SDOx: Serial Data Output for transmitting digital audio data
- SCKx: Serial Clock (also known as bit clock)
- /SSx: Left/Right Channel Clock

The SPI module supports four audio protocol modes and can be operated in any one of these modes:

Note: Each of the modes can additionally support some or all of the features listed below. Please refer to the **"Serial Peripheral Interface (SPI)"** chapter in the specific device data sheet for more information.

I²S Mode

The Inter-IC Sound (I²S) protocol enables transmission of two channels of digital audio data over a single serial interface. The I²S specification defines a half-duplex interface that supports transmit or receive, but not both at the same time. With both SDO and SDI available, full-duplex operation is supported by this peripheral, as shown in the following figure.

Data Transmit and Clocking:

- The transmitter shifts the audio sample data's Most Significant bit (MSb) on the first falling edge of SCK after an LRCK transition
- The receiver samples the MSB on the second rising edge of SCK
- The left channel data shifts out while LRCK is low and right channel data is shifted out while LRCK is high
- The data in the left and right channel consists of a single frame

To set the module to I²S mode, the following bits must be set:

- Set SPI to I²S Mode by calling [PLIB_SPI_AudioProtocolModeSelect](#)
- Select [PLIB_SPI_FrameSyncPulsePolaritySelect](#) (as active low)
- Select [PLIB_SPI_ClockPolaritySelect](#) (as active low)

Setting these bits enables the SDO and LRCK (/SSx) transitions to occur on the falling edge of SCK (BCLK) and sampling of SDI to occur on the rising edge of SCK.

Left-Justified Mode

The Left-Justified mode is similar to I²S mode; however, in this mode, the SPI shifts the audio data's MSb on the first SCK edge that is coincident with an LRCK transition. On the receiver side, the SPI module samples the MSb on the next SCK edge.

In general, a codec using justified protocols defaults to transmitting data on the rising edge of SCK and receiving data on the falling edge of SCK.

To set the module to Left-Justified mode, the following bits must be set

- Set SPI to Left Justified Mode by calling [PLIB_SPI_AudioProtocolModeSelect](#)
- Select [PLIB_SPI_FrameSyncPulsePolaritySelect](#) (as active high)
- Select [PLIB_SPI_ClockPolaritySelect](#) (as active high)

This enables the SDO and LRCK transitions to occur on the rising edge of SCK. Refer to the following sample waveform diagrams for 16-, 24-, and 32-bit audio data transfers.

Right-Justified Mode

In Right-Justified mode, the SPI module shifts the audio sample data's MSb after aligning the data to the last clock cycle. The bits preceding the audio sample data can be driven to logic level 0.

To set the module to Right-Justified mode, the following bits must be set:

- Set SPI to Right Justified Mode by calling [PLIB_SPI_AudioProtocolModeSelect](#)
- Select [PLIB_SPI_FrameSyncPulsePolaritySelect](#) (as active high)
- Select [PLIB_SPI_ClockPolaritySelect](#) (as active high)

This enables the SDO and LRCK transitions to occur on the rising edge of SCK after the Least Significant bit (LSb) being aligned to the last clock cycle. Refer to the following sample waveform diagrams for 16-, 24-, and 32-bit audio data transfers.

PCM/DSP Mode

This mode modifies the behavior of LRCK and audio data spacing. In PCM/DSP mode, the LRCK can be a single bit wide (i.e., 1 SCK) or as wide as the audio data (16-, 24-, and 32-bits). The audio data is packed in the frame with the left channel data immediately followed by the right channel data. The frame length is still either 32 or 64 clocks when this device is the master.

In PCM/DSP mode, the transmitter drives the audio data's (left channel) MSb on the first or second transmit edge of SCK (after an LRCK transition). Immediately after the (left channel) LSB, the transmitter drives the (right channel) MSb.

To set the module to Left-Justified mode, the following bit must to be set:

- Set the SPI module to Right-Justified Mode by calling [PLIB_SPI_AudioProtocolModeSelect](#)

Refer to the following sample waveform for 16-, 24-, and 32-bit audio data transfers.

Mono Mode Versus Stereo Mode

The SPI module enables the audio data transmission in Mono or Stereo mode by setting [PLIB_SPI_AudioTransmitModeSelect](#). In Stereo mode, the shift register uses each FIFO location once, which gives each channel a unique stream of data for stereo data. In Mono mode, the shift register uses each FIFO location twice, to give each channel the same mono stream of audio data.

5.6.22.4.3.5.1 Master Mode

A few characteristics of Master mode are:

- This mode enables the device to generate SCK and LRCK pulses as long as the master mode enabled
- The SPI module generates LRCK and SCK continuously in all the cases, regardless of the transmit data while in Master mode
- The SPI module drives the leading edge of LRCK and SCK within 1 SCK period and the serial data shifts in and out continuously even when the Transmit FIFO is empty

The following figure shows a typical interface between the master and slave while in Master mode.

Setup

To configure the device in Audio Protocol Master, enable master mode through [PLIB_SPI_MasterEnable](#) and enable audio mode through [PLIB_SPI_AudioProtocolEnable](#).

Example: Audio Mode Communication Setup

```
#define MY_SPI_ID    SPI_ID_1

//Disable SPI
PLIB_SPI_Disable(MY_SPI_ID);

// Optional: Clear SPI interrupts and status flag.

//clear SPI buffer
PLIB_SPI_BufferClear (MY_SPI_ID);

// Configure General SPI Options
PLIB_SPI_StopInIdleDisable(MY_SPI_ID);
PLIB_SPI_PinEnable(MY_SPI_ID, SPI_PIN_DATA_IN|SPI_PIN_DATA_OUT);
PLIB_SPI_CommunicationWidthSelect(MY_SPI_ID, SPI_COMMUNICATION_WIDTH_16BITS);
PLIB_SPI_InputSamplePhaseSelect(MY_SPI_ID, SPI_INPUT_SAMPLING_PHASE_IN_MIDDLE);
PLIB_SPI_ClockPolaritySelect(MY_SPI_ID, SPI_CLOCK_POLARITY_IDLE_HIGH);
PLIB_SPI_OutputDataPhaseSelect(MY_SPI_ID, SPI_OUTPUT_DATA_PHASE_ON_ACTIVE_TO_IDLE_CLOCK);
PLIB_SPI_MasterEnable(MY_SPI_ID);
PLIB_SPI_AudioProtocolModeSelect(MY_SPI_ID, SPI_AUDIO_PROTOCOL_RIGHT_JUSTIFIED );

PLIB_SPI_FramedCommunicationDisable(MY_SPI_ID);
PLIB_SPI_AudioProtocolEnable(MY_SPI_ID);

// Optional: Enable interrupts.

// Enable the module
PLIB_SPI_Enable(MY_SPI_ID);
```

Transmission and Receive

Both data to be transmitted and data that is received are respectively written into, or read from, the SPI buffer.

Example: Audio Mode Communication Transfer

```
#define MY_SPI_ID    SPI_ID_1

uint16_t data;
data = 0x00ac;

// write to buffer for TX
PLIB_SPI_BufferWrite (MY_SPI_ID, data);

// wait for transfer to complete
while(!PLIB_SPI_ReceiverBufferIsFull(MY_SPI_ID));

// Read the received value
data = PLIB_SPI_BufferRead (MY_SPI_ID);
```

Notes:

1. Refer to the **"Interrupts"** section in the related family reference manual or device data sheet for details on how to clear and enable the SPI module interrupts and flags.
2. MY_SPI_ID is the SPI instance selected for use by the application developer.
3. Not all features are available on all devices. Refer to the **"Serial Peripheral Interface (SPI)"** chapter in the specific device data sheet for availability.

5.6.22.4.3.5.2 Slave Mode

A few characteristics of Slave mode are:

- This mode enables the device to receive SCK and LRCK pulses as long as slave mode is enabled
- The SPI module drives zeros out of SDO, but does not shift data out or in (SDI) until the module receives the LRCK (i.e., the edge that precedes the left channel)
- Once the module receives the leading edge of LRCK, it starts receiving data if `PLIB_SPI_PinEnable` (enables data in) is selected and the serial data shifts out continuously even when the TX FIFO is empty

The following figure shows the interface between a SPI module in Audio Slave Interface mode to a codec master device.

Setup

The SPI module can be configured in Audio Protocol Slave mode by setting `PLIB_SPI_SlaveEnable` and enabling the audio protocol through `PLIB_SPI_AudioProtocolEnable`.

Example: Slave Mode communication Setup

```
#define MY_SPI_ID    SPI_ID_1

//Diabile SPI
PLIB_SPI_Disable(MY_SPI_ID);

// Optional: Clear SPI interrupts and status flag.

//clear SPI buffer
PLIB_SPI_BufferClear(MY_SPI_ID);

// Configure General SPI Options
// Configure General SPI Options
PLIB_SPI_StopInIdleDisable(MY_SPI_ID);
PLIB_SPI_PinEnable(MY_SPI_ID, SPI_PIN_DATA_OUT|SPI_PIN_SLAVE_SELECT);
PLIB_SPI_CommunicationWidthSelect(MY_SPI_ID, SPI_COMMUNICATION_WIDTH_16BITS);

// SMP must be cleared when SPI is used in Slave mode
PLIB_SPI_InputSamplePhaseSelect(MY_SPI_ID, SPI_INPUT_SAMPLING_PHASE_IN_MIDDLE);
PLIB_SPI_ClockPolaritySelect(MY_SPI_ID, SPI_CLOCK_POLARITY_IDLE_HIGH); //clock polarity and
edge is subject to change ...
PLIB_SPI_OutputDataPhaseSelect(MY_SPI_ID, SPI_OUTPUT_DATA_PHASE_ON_ACTIVE_TO_IDLE_CLOCK); //
... based on your communication mode.

PLIB_SPI_SlaveEnable(MY_SPI_ID);
PLIB_SPI_AudioProtocolModeSelect(MY_SPI_ID, SPI_AUDIO_PROTOCOL_RIGHT_JUSTIFIED );

PLIB_SPI_FramedCommunicationDisable(MY_SPI_ID);
PLIB_SPI_AudioProtocolEnable(MY_SPI_ID);

// Optional: Enable interrupts.

// Enable the module
PLIB_SPI_Enable(MY_SPI_ID);
```

Transmission and Receive

Both data to be transmitted and data that is received are respectively written into, or read from, the SPI buffer

([PLIB_SPI_BufferWrite](#)/ [PLIB_SPI_BufferRead](#)).

Example: Slave Mode communication Receive

```
#define MY_SPI_ID    SPI_ID_1

uint16_t data;

if(PLIB_SPI_ReceiverHasOverflown(MY_SPI_ID))
{
    // error
    PLIB_SPI_ReceiverOverflowClear(MY_SPI_ID); // clear overflow
    data = PLIB_SPI_BufferRead (MY_SPI_ID);
}
else if (!PLIB_SPI_ReceiverBufferIsFull(MY_SPI_ID))
{
    // error
}
else
{
    data = PLIB_SPI_BufferRead (MY_SPI_ID); // read data
    while(PLIB_SPI_TransmitBufferIsFull(MY_SPI_ID));
    PLIB_SPI_BufferWrite(MY_SPI_ID, data); // send back
}
```

Notes:

1. Refer to the **"Interrupts"** section in the related family reference manual or device data sheet for details on how to clear and enable the SPI module interrupts and flags.
2. MY_SPI_ID is the SPI instance selected for use by the application developer.
3. Not all features are available on all devices. Refer to the **"Serial Peripheral Interface (SPI)"** chapter in the specific device data sheet for availability.

5.6.22.4.3.6 Other Features

This topic describes the additional features available in the SPI Peripheral Library.

5.6.22.4.3.6.1 Communication Mode

The SPI module allows three types of data widths when transmitting and receiving data over a SPI bus. The selection of data width determines the minimum length of the SPI data. The user application should select the appropriate data width to maximize its data throughput. To change the mode of operation on the fly, the SPI module must be idle. If the SPI module is switched off, the new mode will be available when the module is switched on again.

The macro, `PLIB_SPI_CommunicationWidthSet`, allows the module to communicate in either 8-/16-/32-bit modes. The functionality will be the same for each mode, except for the number of bits that are received and transmitted.

Note: Not all features are available on all devices. Refer to the **"Serial Peripheral Interface (SPI)"** chapter in the specific device data sheet for availability.

5.6.22.4.3.6.2 Power-Saving Modes

Note: Each of the following modes can additionally support some or all of the features listed below. Please refer to the **"Power-Saving Features"** chapter in the specific data sheet or the **"Power-Saving Modes"** family reference manual section for more information.

Sleep Mode

When the device enters Sleep mode, the device clock source and the entire device is shut down. The consequences of entering Sleep depend upon which mode (Master or Slave) the module is configured in at the time that Sleep mode is invoked.

Idle Mode

When the device enters Idle mode, the device clock is operational, but the CPU and selected peripherals are shut down.

The SPI module can continue to operate in Idle mode by calling [PLIB_SPI_StopInIdleDisable](#), or can stop operation in Idle mode by calling [PLIB_SPI_StopInIdleEnable](#).

Note: Not all features are available on all devices. Refer to the "Serial Peripheral Interface (SPI)" chapter in the specific device data sheet for availability.

5.6.22.4.3.6.3 SPI Receive-only Operation

Calling [PLIB_SPI_PinDisable](#) (data in pin) disables the transmission at the SDO pin. This allows the SPI module to be configured for a receive-only mode of operation. This function is applicable to all SPI operating modes.

Note: Not all features are available on all devices. Refer to the "Serial Peripheral Interface (SPI)" chapter in the specific device data sheet for availability.

5.6.22.4.3.6.4 SPI Error Handling

If a new data word has been shifted and the previous buffer contents have not been read, the status can be read by calling [PLIB_SPI_ReceiverHasOverflowed](#). Any received data is not transferred, and further data reception is disabled until the buffer is cleared by calling [PLIB_SPI_ReceiverOverflowClear](#).

Note: Not all features are available on all devices. Refer to the "Serial Peripheral Interface (SPI)" chapter in the specific device data sheet for availability.

5.6.22.4.3.6.5 SPI Master Mode Clock Frequency

In the SPI Master mode, the clock provided to the SPI module is the system cycle (TCY). This clock will then be prescaled by the primary prescaler ([PLIB_SPI_PrescaleSelectPrimary](#)), and the secondary prescaler ([PLIB_SPI_PrescaleSelectSecondary](#)). The prescaled instruction clock becomes the serial clock and is provided to external devices via the SCKx pin.

Note: Not all features are available on all devices. Refer to the "Serial Peripheral Interface (SPI)" chapter in the specific device data sheet for availability.

5.6.22.4.3.6.6 Interrupts

The SPI module has the ability to generate interrupts reflecting the events that occur during the data communication. Interrupts can be enabled or disabled using [PLIB_SPI_ErrorInterruptEnable/PLIB_SPI_ErrorInterruptDisable](#).

The following types of interrupts can be generated:

- Receive data available interrupts are signalled by SPI receive and transmit flag. This event occurs when there is new data assembled in the SPI receive buffer.
- Transmit buffer empty interrupts are signalled by SPI receive and transmit flag. This event occurs when there is space available in the SPI transmit buffer and new data can be written.
- Error interrupts are signalled by SPI receive and transmit flag. This event occurs when there is an overflow condition for the receive buffer when there is an underrun of the transmit buffer, or when a frame error event occurs.

Note: Not all features are available on all devices. Refer to the "Serial Peripheral Interface (SPI)" chapter in the specific device data sheet for availability.

5.6.22.4.4 Configuring the Library

The library is configured for the supported SPI modules when the processor is chosen in the MPLAB IDE.

5.6.22.5 Library Interface

Data Types and Constants

	Name	Description
	<u>SPI_AUDIO_COMMUNICATION_WIDTH</u>	Defines the list of SPI audio communication width.
	<u>SPI_AUDIO_ERROR</u>	Defines the list of SPI audio error.
	<u>SPI_AUDIO_PROTOCOL</u>	Data type defining the audio protocol mode.
	<u>SPI_AUDIO_TRANSMIT_MODE</u>	Defines the list of SPI transmit audio mode format.
	<u>SPI_BAUD_RATE_CLOCK</u>	Defines the list of SPI Baud Rate Generator (BRG).
	<u>SPI_CLOCK_POLARITY</u>	Defines the list of SPI clock polarity.
	<u>SPI_COMMUNICATION_WIDTH</u>	Defines the list of SPI communication width.
	<u>SPI_DATA_TYPE</u>	Data type defining the SPI data size.
	<u>SPI_ERROR_INTERRUPT</u>	Defines the list of SPI error interrupts.
	<u>SPI_FIFO_INTERRUPT</u>	Defines the list of SPI Buffer Interrupt mode.
	<u>SPI_FIFO_TYPE</u>	Defines the list of SPI buffer mode.
	<u>SPI_FRAME_PULSE_DIRECTION</u>	Defines the list of SPI frame sync pulse direction.
	<u>SPI_FRAME_PULSE_EDGE</u>	Defines the list of SPI frame sync pulse edge.
	<u>SPI_FRAME_PULSE_POLARITY</u>	Defines the list of SPI frame sync pulse polarity.
	<u>SPI_FRAME_PULSE_WIDTH</u>	Defines the list of SPI frame sync pulse width.
	<u>SPI_FRAME_SYNC_PULSE</u>	Data type defining the frame sync pulse counter values.
	<u>SPI_INPUT_SAMPLING_PHASE</u>	Defines the list of SPI data input sample phase.
	<u>SPI_MODULE_ID</u>	Identifies the supported SPI modules.
	<u>SPI_OUTPUT_DATA_PHASE</u>	Defines the list of SPI serial output data changes.
	<u>SPI_PIN</u>	Data type defining the SPI pin.
	<u>SPI_PRESCALE_PRIMARY</u>	Defines the list of possible primary prescaler values.
	<u>SPI_PRESCALE_SECONDARY</u>	Defines the list of possible secondary prescaler values.

Audio Mode Functions

	Name	Description
	<u>PLIB_SPI_AudioCommunicationWidthSelect</u>	Selects the data width for the SPI audio communication.
	<u>PLIB_SPI_AudioErrorDisable</u>	Disables the SPI error.
	<u>PLIB_SPI_AudioErrorEnable</u>	Enables the SPI error.
	<u>PLIB_SPI_AudioProtocolDisable</u>	Audio protocol is disabled.
	<u>PLIB_SPI_AudioProtocolEnable</u>	Audio protocol is enabled.
	<u>PLIB_SPI_AudioProtocolModeSelect</u>	Selects the Audio Protocol mode.
	<u>PLIB_SPI_AudioTransmitModeSelect</u>	Selects the transmit audio data format.

Data Transfer Functions

	Name	Description
	<u>PLIB_SPI_BufferClear</u>	Clears the SPI buffer.
	<u>PLIB_SPI_BufferRead</u>	Returns the SPI buffer value.
	<u>PLIB_SPI_BufferWrite</u>	Write the data to the SPI buffer.

Feature Existence Functions

	Name	Description
	PLIB_SPI_ExistsAudioCommunicationWidth	Identifies whether the AudioCommunicationWidth feature exists on the SPI module.
	PLIB_SPI_ExistsAudioErrorControl	Identifies whether the AudioErrorControl feature exists on the SPI module.
	PLIB_SPI_ExistsAudioProtocolControl	Identifies whether the AudioProtocolControl feature exists on the SPI module.
	PLIB_SPI_ExistsAudioProtocolMode	Identifies whether the AudioProtocolMode feature exists on the SPI module.
	PLIB_SPI_ExistsAudioTransmitMode	Identifies whether the AudioTransmitMode feature exists on the SPI module.
	PLIB_SPI_ExistsBaudRate	Identifies whether the BaudRate feature exists on the SPI module.
	PLIB_SPI_ExistsBaudRateClock	Identifies whether the BaudRateClock feature exists on the SPI module.
	PLIB_SPI_ExistsBuffer	Identifies whether the Buffer feature exists on the SPI module.
	PLIB_SPI_ExistsBusStatus	Identifies whether the BusStatus feature exists on the SPI module.
	PLIB_SPI_ExistsClockPolarity	Identifies whether the ClockPolarity feature exists on the SPI module.
	PLIB_SPI_ExistsCommunicationWidth	Identifies whether the CommunicationWidth feature exists on the SPI module.
	PLIB_SPI_ExistsEnableControl	Identifies whether the EnableControl feature exists on the SPI module.
	PLIB_SPI_ExistsErrorInterruptControl	Identifies whether the ErrorInterruptControl feature exists on the SPI module.
	PLIB_SPI_ExistsFIFOControl	Identifies whether the FIFOControl feature exists on the SPI module.
	PLIB_SPI_ExistsFIFOCount	Identifies whether the FIFOCount feature exists on the SPI module.
	PLIB_SPI_ExistsFIFOInterruptMode	Identifies whether the FIFOInterruptMode feature exists on the SPI module.
	PLIB_SPI_ExistsFIFOShiftRegisterEmptyStatus	Identifies whether the FIFOShiftRegisterEmptyStatus feature exists on the SPI module.
	PLIB_SPI_ExistsFramedCommunication	Identifies whether the FramedCommunication feature exists on the SPI module.
	PLIB_SPI_ExistsFrameErrorStatus	Identifies whether the FrameErrorStatus feature exists on the SPI module.
	PLIB_SPI_ExistsFrameSyncPulseCounter	Identifies whether the FrameSyncPulseCounter feature exists on the SPI module.
	PLIB_SPI_ExistsFrameSyncPulseDirection	Identifies whether the FrameSyncPulseDirection feature exists on the SPI module.
	PLIB_SPI_ExistsFrameSyncPulseEdge	Identifies whether the FrameSyncPulseEdge feature exists on the SPI module.
	PLIB_SPI_ExistsFrameSyncPulsePolarity	Identifies whether the FrameSyncPulsePolarity feature exists on the SPI module.
	PLIB_SPI_ExistsFrameSyncPulseWidth	Identifies whether the FrameSyncPulseWidth feature exists on the SPI module.
	PLIB_SPI_ExistsInputSamplePhase	Identifies whether the InputSamplePhase feature exists on the SPI module.

	PLIB_SPI_ExistsMasterControl	Identifies whether the MasterControl feature exists on the SPI module.
	PLIB_SPI_ExistsOutputDataPhase	Identifies whether the OutputDataPhase feature exists on the SPI module.
	PLIB_SPI_ExistsPinControl	Identifies whether the PinControl feature exists on the SPI module.
	PLIB_SPI_ExistsPrimaryPrescale	Identifies whether the PrimaryPrescale feature exists on the SPI module.
	PLIB_SPI_ExistsReadDataSignStatus	Identifies whether the ReadDataSignStatus feature exists on the SPI module.
	PLIB_SPI_ExistsReceiveBufferStatus	Identifies whether the ReceiveBufferStatus feature exists on the SPI module.
	PLIB_SPI_ExistsReceiveFIFOStatus	Identifies whether the ReceiveFIFOStatus feature exists on the SPI module.
	PLIB_SPI_ExistsReceiverOverflow	Identifies whether the ReceiverOverflow feature exists on the SPI module.
	PLIB_SPI_ExistsSecondaryPrescale	Identifies whether the SecondaryPrescale feature exists on the SPI module.
	PLIB_SPI_ExistsSlaveSelectControl	Identifies whether the SlaveSelectControl feature exists on the SPI module.
	PLIB_SPI_ExistsStopInIdleControl	Identifies whether the StopInIdle feature exists on the SPI module.
	PLIB_SPI_ExistsTransmitBufferEmptyStatus	Identifies whether the TransmitBufferEmptyStatus feature exists on the SPI module.
	PLIB_SPI_ExistsTransmitBufferFullStatus	Identifies whether the TransmitBufferFullStatus feature exists on the SPI module.
	PLIB_SPI_ExistsTransmitUnderRunStatus	Identifies whether the TransmitUnderRunStatus feature exists on the SPI module.

Framed Mode Functions

	Name	Description
	PLIB_SPI_FramedCommunicationDisable	Disables framed SPI support.
	PLIB_SPI_FramedCommunicationEnable	Enables framed SPI support.
	PLIB_SPI_FrameErrorStatusGet	Returns the current status of the SPI frame error.
	PLIB_SPI_FrameSyncPulseCounterSelect	Selects at which character the SPI frame sync pulse is generated.
	PLIB_SPI_FrameSyncPulseDirectionSelect	Selects the frame sync pulse direction.
	PLIB_SPI_FrameSyncPulseEdgeSelect	Selects the frame sync pulse edge.
	PLIB_SPI_FrameSyncPulsePolaritySelect	Selects the frame sync pulse polarity.
	PLIB_SPI_FrameSyncPulseWidthSelect	Sets the frame sync pulse width.

General Configuration and Status Functions

	Name	Description
	PLIB_SPI_BaudRateClockSelect	Selects the type of clock is used by the Baud Rate Generator.
	PLIB_SPI_BaudRateSet	Sets the baud rate to the desired value.
	PLIB_SPI_ClockPolaritySelect	Enables clock polarity.
	PLIB_SPI_CommunicationWidthSelect	Selects the data width for the SPI communication.
	PLIB_SPI_Disable	Disables the SPI module.
	PLIB_SPI_Enable	Enables the SPI module.
	PLIB_SPI_ErrorInterruptDisable	Enables SPI error interrupts.
	PLIB_SPI_ErrorInterruptEnable	Enables SPI error interrupts
	PLIB_SPI_FIFOCountGet	Reads the SPI Buffer Element Count bits for either receive or transmit.

	PLIB_SPI_FIFODisable	Disables the SPI enhanced buffer.
	PLIB_SPI_FIFOEnable	Enables the SPI enhanced buffer.
	PLIB_SPI_FIFOInterruptModeSelect	Selects the SPI buffer interrupt mode.
	PLIB_SPI_FIFOShiftRegisterIsEmpty	Returns the current status of the SPI shift register.
	PLIB_SPI_InputSamplePhaseSelect	Selects the SPI data input sample phase.
	PLIB_SPI_IsBusy	Returns the current SPI module activity status.
	PLIB_SPI_MasterEnable	Enables the SPI in Master mode.
	PLIB_SPI_OutputDataPhaseSelect	Selects serial output data change.
	PLIB_SPI_PinDisable	Enables the selected SPI pins.
	PLIB_SPI_PinEnable	Enables the selected SPI pins.
	PLIB_SPI_PrescalePrimarySelect	Selects the primary prescale for SPI Master mode.
	PLIB_SPI_PrescaleSecondarySelect	Selects the secondary prescale for SPI Master mode.
	PLIB_SPI_ReadDataIsSignExtended	Returns the current status of the receive (RX) FIFO sign-extended data.
	PLIB_SPI_SlaveEnable	Enables the SPI in Slave mode.
	PLIB_SPI_SlaveSelectDisable	Disables Master mode slave select.
	PLIB_SPI_SlaveSelectEnable	Enables Master mode slave select.
	PLIB_SPI_StopInIdleDisable	Continues module operation when the device enters Idle mode.
	PLIB_SPI_StopInIdleEnable	Discontinues module operation when the device enters Idle mode.

Receiver Functions

	Name	Description
	PLIB_SPI_ReceiverBufferIsFull	Returns the current status of the SPI receive buffer.
	PLIB_SPI_ReceiverFIFOIsEmpty	Returns the current status of the SPI receive FIFO.
	PLIB_SPI_ReceiverHasOverflowed	Returns the current status of the SPI receiver overflow.
	PLIB_SPI_ReceiverOverflowClear	Clears the SPI receive overflow flag.

Transmitter Functions

	Name	Description
	PLIB_SPI_TransmitBufferIsEmpty	Returns the current status of the transmit buffer.
	PLIB_SPI_TransmitBufferIsFull	Returns the current transmit buffer status of the SPI module.
	PLIB_SPI_TransmitUnderRunStatusGet	Returns the current status of the transmit underrun.

Description

This section lists and describes the functions, data types, and constants provided in the SPI Peripheral Library.

5.6.22.5.1 General Configuration and Status Functions

5.6.22.5.1.1 PLIB_SPI_BaudRateClockSelect Function

C

```
void PLIB_SPI_BaudRateClockSelect(
    SPI_MODULE_ID index,
    SPI_BAUD_RATE_CLOCK type
);
```

Description

This function selects the type of clock is used by the Baud Rate Generator.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
type	One of the SPI_BAUD_RATE_CLOCK enumeration values as the SPI baud clock

Returns

None.

Remarks

This function implements an operation of the baud rate clock control feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsBaudRateClock](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the
// application developer.
PLIB_SPI_BaudRateClockSelect (MY_SPI_INSTANCE, SPI_BAUD_RATE_MCLK_CLOCK);
```

5.6.22.5.1.2 PLIB_SPI_BaudRateSet Function**C**

```
void PLIB_SPI_BaudRateSet(
    SPI_MODULE_ID index,
    uint32_t clockFrequency,
    uint32_t baudRate
);
```

Description

This function sets the baud rate to the desired value.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
clockFrequency	Clock frequency
baudrate	Baud rate value

Returns

None.

Remarks

Setting a new baud rate value causes the baud rate timer to reset. This ensures that the baud rate timer does not have to overflow before outputting the new baud rate.

If the system clock is changed during an active receive operation, a receive error or data loss may result. To avoid this issue, verify that no receptions are in progress before changing the system clock.

This function implements an operation of the baud rate set feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsBaudRate](#)" in your application to automatically

determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the  
// application developer.  
PLIB_SPI_BaudRateSet(MY_SPI_INSTANCE, MY_CLOCK_FREQUENCY, 9600);
```

5.6.22.5.1.3 PLIB_SPI_ClockPolaritySelect Function**C**

```
void PLIB_SPI_ClockPolaritySelect(  
    SPI_MODULE_ID index,  
    SPI_CLOCK_POLARITY polarity  
);
```

Description

This function enables clock polarity.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
polarity	One of the SPI_CLOCK_POLARITY enumeration values as the SPI clock polarity

Returns

None.

Remarks

This function implements an operation of the clock polarity feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsClockPolarity](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the  
// application developer.  
PLIB_SPI_ClockPolaritySelect(MY_SPI_INSTANCE, SPI_CLOCK_POLARITY_IDLE_HIGH );
```

5.6.22.5.1.4 PLIB_SPI_CommunicationWidthSelect Function**C**

```
void PLIB_SPI_CommunicationWidthSelect(  
    SPI_MODULE_ID index,  
    SPI_COMMUNICATION_WIDTH width  
);
```

Description

This function selects the data width for the SPI communication.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

width	One of the SPI_COMMUNICATION_WIDTH enumeration values as the SPI buffer width

Returns

None.

Remarks

This function implements an operation of the communication width feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsCommunicationWidth](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the  
// application developer.  
PLIB_SPI_CommunicationWidthSelect(MY_SPI_INSTANCE, SPI_COMMUNICATION_WIDTH_8BITS);
```

5.6.22.5.1.5 PLIB_SPI_Disable Function

C

```
void PLIB_SPI_Disable(  
    SPI_MODULE_ID index  
);
```

Description

This function disables the SPI module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This function implements an operation of the enable control feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsEnableControl](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the  
// application developer.  
PLIB_SPI_Disable(MY_SPI_INSTANCE);
```

5.6.22.5.1.6 PLIB_SPI_Enable Function

C

```
void PLIB_SPI_Enable(  
    SPI_MODULE_ID index  
);
```

Description

This function enables the SPI module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

The SCKx, SDOx, SDIx and SSx pins must be assigned to available RPn pins before use.

This function implements an operation of the enable control feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsEnableControl](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the
// application developer.
PLIB_SPI_Enable(MY_SPI_INSTANCE);
```

5.6.22.5.1.7 PLIB_SPI_ErrorInterruptDisable Function**C**

```
void PLIB_SPI_ErrorInterruptDisable(
    SPI_MODULE_ID index,
    SPI_ERROR_INTERRUPT error
);
```

Description

This function enables SPI error interrupts.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
error	One of the SPI_ERROR_INTERRUPT enumeration values as the SPI interrupt error

Returns

None.

Remarks

This function implements an operation of the error interrupt control feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsErrorInterruptControl](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the
// application developer.
PLIB_SPI_ErrorInterruptDisable (MY_SPI_INSTANCE, SPI_ERROR_INTERRUPT_FRAME_ERROR_OVERFLOW);
```

5.6.22.5.1.8 PLIB_SPI_ErrorInterruptEnable Function

C

```
void PLIB_SPI_ErrorInterruptEnable(  
    SPI_MODULE_ID index,  
    SPI_ERROR_INTERRUPT error  
);
```

Description

This function enables SPI error interrupts.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
type	One of the SPI_ERROR_INTERRUPT enumeration values as the SPI interrupt error

Returns

None.

Remarks

This function implements an operation of the error interrupt control feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsErrorInterruptControl](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the  
// application developer.  
PLIB_SPI_ErrorInterruptEnable (MY_SPI_INSTANCE, SPI_ERROR_INTERRUPT_FRAME_ERROR_OVERFLOW);
```

5.6.22.5.1.9 PLIB_SPI_FIFOCountGet Function

C

```
uint8_t PLIB_SPI_FIFOCountGet(  
    SPI_MODULE_ID index,  
    SPI_FIFO_TYPE type  
);
```

Description

This function reads the number of SPI transfers pending for Master mode and the number of unread SPI transfers for Slave mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
type	One of the SPI_FIFO_TYPE enumeration values

Returns

CountValue - Buffer element count bits

Remarks

Valid in Enhanced Buffer mode.

This function implements an operation of the FIFO control feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsFIFOCount](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the
// application developer.
uint8_t count = PLIB_SPI_FIFOCountGet(MY_SPI_INSTANCE, SPI_FIFO_TYPE_TRANSMIT);
```

5.6.22.5.1.10 PLIB_SPI_FIFODisable Function**C**

```
void PLIB_SPI_FIFODisable(
    SPI_MODULE_ID index
);
```

Description

This function disables the SPI enhanced buffer.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

Enables the legacy standard single buffer mode.

This function implements an operation of the FIFO control feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsFIFOControl](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the
// application developer.
PLIB_SPI_FIFODisable(MY_SPI_INSTANCE);
```

5.6.22.5.1.11 PLIB_SPI_FIFOEnable Function**C**

```
void PLIB_SPI_FIFOEnable(
    SPI_MODULE_ID index
);
```

Description

This function enables the SPI enhanced buffer.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This enables the enhanced buffer mode.

This function implements an operation of the FIFO control feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsFIFOControl](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the
// application developer.
PLIB_SPI_FIFOEnable(MY_SPI_INSTANCE);
```

5.6.22.5.1.12 PLIB_SPI_FIFOInterruptModeSelect Function**C**

```
void PLIB_SPI_FIFOInterruptModeSelect(
    SPI_MODULE_ID index,
    SPI_FIFO_INTERRUPT mode
);
```

Description

This function selects the SPI buffer interrupt mode from [SPI_FIFO_INTERRUPT](#).

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
mode	One of the SPI_FIFO_INTERRUPT enumeration values as the SPI buffer interrupt mode

Returns

None.

Remarks

Valid in Enhanced Buffer mode.

This function implements an operation of the FIFO interrupt feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsFIFOInterruptMode](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the
// application developer.
```

```
PLIB_SPI_FIFOInterruptModeSelect(MY_SPI_INSTANCE,  
    SPI_FIFO_INTERRUPT_WHEN_TRANSMIT_BUFFER_IS_NOT_FULL);
```

5.6.22.5.1.13 PLIB_SPI_FIFOShiftRegisterIsEmpty Function

C

```
bool PLIB_SPI_FIFOShiftRegisterIsEmpty(  
    SPI_MODULE_ID index  
);
```

Description

This function returns the current status of the SPI shift register.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

- true - SPI shift register is empty and ready to [send](#) or receive
- false - SPI shift register is not empty

Remarks

Valid in Enhanced Buffer mode.

This function implements an operation of the FIFO status feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsFIFOShiftRegisterEmptyStatus](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the  
// application developer.  
bool Status = PLIB_SPI_FIFOShiftRegisterIsEmpty(MY_SPI_INSTANCE);
```

5.6.22.5.1.14 PLIB_SPI_InputSamplePhaseSelect Function

C

```
void PLIB_SPI_InputSamplePhaseSelect(  
    SPI_MODULE_ID index,  
    SPI_INPUT_SAMPLING_PHASE phase  
);
```

Description

This function selects the input sampling phase in Master mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
phase	One of the SPI_INPUT_SAMPLING_PHASE as the SPI input sampling phase

Returns

None.

Remarks

This function implements an operation of the input sample phase feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsInputSamplePhase](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the  
// application developer.  
PLIB_SPI_InputSamplePhaseSelect(MY_SPI_INSTANCE, SPI_INPUT_SAMPLING_PHASE_IN_MIDDLE);
```

5.6.22.5.1.15 PLIB_SPI_IsBusy Function**C**

```
bool PLIB_SPI_IsBusy(  
    SPI_MODULE_ID index  
);
```

Description

This function returns the current SPI module activity status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

- true - SPI module is currently busy with some transactions
- false - SPI module is currently idle

Remarks

This function implements an operation of the bus status feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsBusStatus](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the  
// application developer.  
bool status = PLIB_SPI_IsBusy(MY_SPI_INSTANCE);
```

5.6.22.5.1.16 PLIB_SPI_MasterEnable Function**C**

```
void PLIB_SPI_MasterEnable(  
    SPI_MODULE_ID index  
);
```

Description

This function enables the SPI in Master mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This function implements an operation of the master enable control feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsMasterControl](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the
// application developer.
PLIB_SPI_MasterEnable(MY_SPI_INSTANCE);
```

5.6.22.5.1.17 PLIB_SPI_OutputDataPhaseSelect Function**C**

```
void PLIB_SPI_OutputDataPhaseSelect(
    SPI_MODULE_ID index,
    SPI_OUTPUT_DATA_PHASE phase
);
```

Description

This function selects serial output data change.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
data	One of the SPI_OUTPUT_DATA_PHASE enumeration values as the SPI serial output data change

Returns

None.

Remarks

This function implements an operation of the output data phase feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsOutputDataPhase](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the
// application developer.
PLIB_SPI_OutputDataPhaseSelect(MY_SPI_INSTANCE, SPI_OUTPUT_DATA_PHASE_ON_ACTIVE_TO_IDLE_CLOCK);
```

5.6.22.5.1.18 PLIB_SPI_PinDisable Function

C

```
void PLIB_SPI_PinDisable(  
    SPI_MODULE_ID index,  
    SPI_PIN pin  
);
```

Description

This function enables the selected SPI pins.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
pin	One of the SPI_PIN enumeration values as the SPI pin

Returns

None.

Remarks

This function implements an operation of the pin control feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsPinControl](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the  
// application developer.  
PLIB_SPI_PinDisable(MY_SPI_INSTANCE, SPI_PIN_SLAVE_SELECT);
```

5.6.22.5.1.19 PLIB_SPI_PinEnable Function

C

```
void PLIB_SPI_PinEnable(  
    SPI_MODULE_ID index,  
    SPI_PIN pin  
);
```

Description

This function enables the selected SPI pins.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
pin	One of the SPI_PIN enumeration values as the SPI pin

Returns

None.

Remarks

This function implements an operation of the pin control feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsPinControl](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the
// application developer.
PLIB_SPI_PinEnable(MY_SPI_INSTANCE, SPI_PIN_SLAVE_SELECT);
```

5.6.22.5.1.20 PLIB_SPI_PrescalePrimarySelect Function**C**

```
void PLIB_SPI_PrescalePrimarySelect(
    SPI_MODULE_ID index,
    SPI_PRESCALE_PRIMARY prescale
);
```

Description

This function selects the primary prescale for SPI Master mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
prescale	One of the SPI_PRIMARY_PRESCALE enumeration values as the SPI master primary prescale

Returns

None.

Remarks

This function implements an operation of the primary prescale select feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsPrimaryPrescale](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the
// application developer.
PLIB_SPI_PrescalePrimarySelect(MY_SPI_INSTANCE,
                                SPI_PRIMARY_PRESCALE_4);
```

5.6.22.5.1.21 PLIB_SPI_PrescaleSecondarySelect Function**C**

```
void PLIB_SPI_PrescaleSecondarySelect(
    SPI_MODULE_ID index,
    SPI_PRESCALE_SECONDARY prescale
);
```

Description

This function selects the secondary prescale for SPI Master mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
prescale	One of the SPI_SECONDARY_PRESCALE enumeration values as the SPI master secondary prescale

Returns

None.

Remarks

This function implements an operation of the secondary prescale select feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsSecondaryPrescale](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the
// application developer.
PLIB_SPI_PrescaleSecondarySelect( MY_SPI_INSTANCE,
                                  SPI_SECONDARY_PRESCALE_3);
```

5.6.22.5.1.22 PLIB_SPI_ReadDataIsSignExtended Function**C**

```
bool PLIB_SPI_ReadDataIsSignExtended(
    SPI_MODULE_ID index
);
```

Description

This function returns the current status of the receive (RX) FIFO sign-extended data.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

- true - Data from RX FIFO is sign-extended.
- false - Data from RX FIFO is not sign-extended

Remarks

This function implements an operation of the data sign feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsReadDataSignStatus](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the
// application developer.
bool Status = PLIB_SPI_ReadDataIsSignExtended(MY_SPI_INSTANCE);
```

5.6.22.5.1.23 PLIB_SPI_SlaveEnable Function

C

```
void PLIB_SPI_SlaveEnable(  
    SPI_MODULE_ID index  
);
```

Description

This function enables the SPI in Slave mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This function implements an operation of the master enable control feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsMasterControl](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the  
// application developer.  
PLIB_SPI_SlaveEnable(MY_SPI_INSTANCE);
```

5.6.22.5.1.24 PLIB_SPI_SlaveSelectDisable Function

C

```
void PLIB_SPI_SlaveSelectDisable(  
    SPI_MODULE_ID index  
);
```

Description

This function disables Master mode slave select.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature does not support Framed SPI mode.

This function implements an operation of the slave select feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsSlaveSelectControl](#)" in your application to

automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the  
// application developer.  
PLIB_SPI_SlaveSelectDisable(MY_SPI_INSTANCE);
```

5.6.22.5.1.25 PLIB_SPI_SlaveSelectEnable Function**C**

```
void PLIB_SPI_SlaveSelectEnable(  
    SPI_MODULE_ID index  
);
```

Description

This function enables Master mode slave select.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature does not support Framed SPI mode.

This function implements an operation of the slave select feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsSlaveSelectControl](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the  
// application developer.  
PLIB_SPI_SlaveSelectEnable(MY_SPI_INSTANCE);
```

5.6.22.5.1.26 PLIB_SPI_StopInIdleDisable Function**C**

```
void PLIB_SPI_StopInIdleDisable(  
    SPI_MODULE_ID index  
);
```

Description

This function sets up the SPI module such that module operation is continued when the device enters Idle mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This function implements an operation of the stop in idle control feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsStopInIdleControl](#)" in your application to determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the
// application developer.
PLIB_SPI_StopInIdleDisable(MY_SPI_INSTANCE);
```

5.6.22.5.1.27 PLIB_SPI_StopInIdleEnable Function**C**

```
void PLIB_SPI_StopInIdleEnable(
    SPI_MODULE_ID index
);
```

Description

This function sets up the SPI module such that module operation is disabled when the device enters Idle mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This function implements an operation of the stop in idle control feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsStopInIdleControl](#)" in your application to automatically determine if this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the
// application developer.
PLIB_SPI_StopInIdleEnable(MY_SPI_INSTANCE);
```

5.6.22.5.2 Data Transfer Functions**5.6.22.5.2.1 PLIB_SPI_BufferClear Function****C**

```
void PLIB_SPI_BufferClear(
    SPI_MODULE_ID index
);
```

Description

This function clears the SPI buffer.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This function implements an operation of the buffer control feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsBuffer](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the  
// application developer.  
PLIB_SPI_BufferClear(MY_SPI_INSTANCE);
```

5.6.22.5.2.2 PLIB_SPI_BufferRead Function**C**

```
SPI_DATA_TYPE PLIB_SPI_BufferRead(  
    SPI_MODULE_ID index  
);
```

Description

This function returns the SPI buffer value.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

Returns the [SPI_DATA_TYPE](#) enumeration value.

Remarks

This function implements an operation of the buffer control feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsBuffer](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the  
// application developer.  
uint8_t bufferValue = PLIB_SPI_BufferRead(MY_SPI_INSTANCE);
```

5.6.22.5.2.3 PLIB_SPI_BufferWrite Function**C**

```
void PLIB_SPI_BufferWrite(  
    SPI_MODULE_ID index,
```

```
    SPI_DATA_TYPE data  
);
```

Description

This function writes data to the SPI buffer.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
data	Data of the type SPI_DATA_TYPE to written to the SPI buffer

Returns

None.

Remarks

This function implements an operation of the buffer control feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsBuffer](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the  
// application developer.  
PLIB_SPI_BufferWrite (MY_SPI_INSTANCE, 0xFF);
```

5.6.22.5.3 Framed Mode Functions

5.6.22.5.3.1 PLIB_SPI_FramedCommunicationDisable Function

C

```
void PLIB_SPI_FramedCommunicationDisable(  
    SPI_MODULE_ID index  
);
```

Description

This function disables framed SPI support.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This function implements an operation of the framed communication feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsFramedCommunication](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the  
// application developer.  
PLIB_SPI_FramedCommunicationDisable(MY_SPI_INSTANCE);
```

5.6.22.5.3.2 PLIB_SPI_FramedCommunicationEnable Function**C**

```
void PLIB_SPI_FramedCommunicationEnable(  
    SPI_MODULE_ID index  
);
```

Description

This function enables framed SPI support.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This function implements an operation of the framed communication feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsFramedCommunication](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the  
// application developer.  
PLIB_SPI_FramedCommunicationEnable(MY_SPI_INSTANCE);
```

5.6.22.5.3.3 PLIB_SPI_FrameErrorStatusGet Function**C**

```
bool PLIB_SPI_FrameErrorStatusGet(  
    SPI_MODULE_ID index  
);
```

Description

This function returns the current status of the SPI frame error.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

- true - Frame error detected
- false - No frame error detected

Remarks

Valid only if Frame mode is enabled.

This function implements an operation of the framed communication feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsFrameErrorStatus](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the  
// application developer.  
bool status = PLIB_SPI_FrameErrorStatusGet(MY_SPI_INSTANCE);
```

5.6.22.5.3.4 PLIB_SPI_FrameSyncPulseCounterSelect Function**C**

```
void PLIB_SPI_FrameSyncPulseCounterSelect(  
    SPI_MODULE_ID index,  
    SPI_FRAME_SYNC_PULSE pulse  
);
```

Description

This function selects at which character the SPI frame sync pulse is generated.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
pulse	One of the SPI_FRAME_SYNC_PULSE enumeration values as the SPI frame sync pulse count

Returns

None.

Remarks

This is valid only when [PLIB_SPI_FramedCommunicationEnable](#) is enabled.

This function implements an operation of the framed communication feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsFrameSyncPulseCounter](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the  
// application developer.  
PLIB_SPI_FrameSyncPulseCounterSelect(MY_SPI_INSTANCE,  
    SPI_FRAME_SYNC_PULSE_ON_EVERY_32_DATA_CHARACTER );
```

5.6.22.5.3.5 PLIB_SPI_FrameSyncPulseDirectionSelect Function**C**

```
void PLIB_SPI_FrameSyncPulseDirectionSelect(  
    SPI_MODULE_ID index,  
    SPI_FRAME_PULSE_DIRECTION direction  
);
```

Description

This function selects the frame sync pulse direction.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
direction	One of the SPI_FRAME_PULSE_DIRECTION enumeration values as the SPI frame sync pulse polarity

Returns

None.

Remarks

This function implements an operation of the framed communication feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsFrameSyncPulseDirection](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the  
// application developer.  
PLIB_SPI_FrameSyncPulseDirectionSelect(MY_SPI_INSTANCE, SPI_FRAME_PULSE_DIRECTION_INPUT );
```

5.6.22.5.3.6 PLIB_SPI_FrameSyncPulseEdgeSelect Function**C**

```
void PLIB_SPI_FrameSyncPulseEdgeSelect(  
    SPI_MODULE_ID index,  
    SPI_FRAME_PULSE_EDGE edge  
);
```

Description

This function selects the frame sync pulse edge.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
edge	One of the SPI_FRAME_PULSE_EDGE enumeration values as the SPI frame sync pulse edge

Returns

None.

Remarks

This function implements an operation of the framed communication feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsFrameSyncPulseEdge](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the  
// application developer.  
PLIB_SPI_FrameSyncPulseEdgeSelect(MY_SPI_INSTANCE,  
    SPI_FRAME_PULSE_EDGE_COINCIDES_FIRST_BIT_CLOCK);
```

5.6.22.5.3.7 PLIB_SPI_FrameSyncPulsePolaritySelect Function**C**

```
void PLIB_SPI_FrameSyncPulsePolaritySelect(  
    SPI_MODULE_ID index,  
    SPI_FRAME_PULSE_POLARITY polarity  
);
```

Description

This function selects the frame sync pulse polarity.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
polarity	One of the SPI_FRAME_PULSE_POLARITY enumeration values as the SPI frame sync pulse polarity

Returns

None.

Remarks

Available only for Frame mode.

This function implements an operation of the framed communication feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsFrameSyncPulsePolarity](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the  
// application developer.  
PLIB_SPI_FrameSyncPulsePolaritySelect(MY_SPI_INSTANCE, SPI_FRAME_PULSE_POLARITY_ACTIVE_HIGH );
```

5.6.22.5.3.8 PLIB_SPI_FrameSyncPulseWidthSelect Function**C**

```
void PLIB_SPI_FrameSyncPulseWidthSelect(  
    SPI_MODULE_ID index,  
    SPI_FRAME_PULSE_WIDTH width  
);
```

Description

This function sets the frame sync pulse width.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
edge	One of the SPI_FRAME_PULSE_WIDTH enumeration values as the SPI frame sync pulse width.

Returns

None.

Remarks

Length of the word is dependent on the communication mode.

This function implements an operation of the framed communication feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsFrameSyncPulseWidth](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the  
// application developer.  
PLIB_SPI_FrameSyncPulseWidthSelect (MY_SPI_INSTANCE, SPI_FRAME_PULSE_WIDTH_ONE_WORD_LENGTH);
```

5.6.22.5.4 Audio Mode Functions

5.6.22.5.4.1 PLIB_SPI_AudioCommunicationWidthSelect Function

C

```
void PLIB_SPI_AudioCommunicationWidthSelect(  
    SPI_MODULE_ID index,  
    SPI_AUDIO_COMMUNICATION_WIDTH mode  
);
```

Description

This function selects the data width for the SPI audio communication.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
width	One of the SPI_AUDIO_COMMUNICATION_WIDTH enumeration values as the SPI buffer width

Returns

None.

Remarks

This mode is available only when [PLIB_SPI_AudioProtocolEnable](#) is enabled.

This function implements an operation of the audio communication width feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsAudioCommunicationWidth](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the  
// application developer.  
PLIB_SPI_AudioCommunicationWidthSelect(MY_SPI_INSTANCE,  
                                         SPI_AUDIO_COMMUNICATION_32DATA_32FIFO_32CHANNEL);
```

5.6.22.5.4.2 PLIB_SPI_AudioErrorDisable Function**C**

```
void PLIB_SPI_AudioErrorDisable(  
    SPI_MODULE_ID index,  
    SPI_AUDIO_ERROR error  
);
```

Description

This function disables the SPI error.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
error	One of the SPI_AUDIO_ERROR enumeration values as the SPI error

Returns

None.

Remarks

This function implements an operation of the audio error control feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsAudioErrorControl](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the  
// application developer.  
PLIB_SPI_AudioErrorDisable (MY_SPI_INSTANCE, SPI_AUDIO_ERROR_RECEIVE_OVERFLOW);
```

5.6.22.5.4.3 PLIB_SPI_AudioErrorEnable Function**C**

```
void PLIB_SPI_AudioErrorEnable(  
    SPI_MODULE_ID index,  
    SPI_AUDIO_ERROR error  
);
```

Description

This function enables the SPI error.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

error	One of the SPI_AUDIO_ERROR enumeration values as the SPI error

Returns

None.

Remarks

This function implements an operation of the audio error control feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsAudioErrorControl](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the  
// application developer.  
PLIB_SPI_AudioErrorEnable (MY_SPI_INSTANCE, SPI_AUDIO_ERROR_RECEIVE_OVERFLOW);
```

5.6.22.5.4.4 PLIB_SPI_AudioProtocolDisable Function

C

```
void PLIB_SPI_AudioProtocolDisable(  
    SPI_MODULE_ID index  
);
```

Description

This function disables the audio protocol.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This function implements an operation of the audio protocol control feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsAudioProtocolControl](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the  
// application developer.  
PLIB_SPI_AudioProtocolDisable(MY_SPI_INSTANCE);
```

5.6.22.5.4.5 PLIB_SPI_AudioProtocolEnable Function

C

```
void PLIB_SPI_AudioProtocolEnable(  
    SPI_MODULE_ID index  
);
```

Description

This function enables the audio protocol.

Preconditions

Disable the SPI module by calling [PLIB_SPI_Disable](#).

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This function implements an operation of the audio protocol control feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsAudioProtocolControl](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the  
// application developer.  
PLIB_SPI_AudioProtocolEnable(MY_SPI_INSTANCE);
```

5.6.22.5.4.6 PLIB_SPI_AudioProtocolModeSelect Function**C**

```
void PLIB_SPI_AudioProtocolModeSelect(  
    SPI_MODULE_ID index,  
    SPI_AUDIO_PROTOCOL mode  
);
```

Description

This function selects the Audio Protocol mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
mode	One of the SPI_AUDIO_PROTOCOL enumeration values as the audio protocol

Returns

None.

Remarks

This function implements an operation of the audio protocol mode feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsAudioProtocolMode](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the  
// application developer.  
PLIB_SPI_AudioProtocolModeSelect(MY_SPI_INSTANCE, SPI_AUDIO_PROTOCOL_RIGHT_JUSTIFIED );
```

5.6.22.5.4.7 PLIB_SPI_AudioTransmitModeSelect Function

C

```
void PLIB_SPI_AudioTransmitModeSelect(  
    SPI_MODULE_ID index,  
    SPI_AUDIO_TRANSMIT_MODE mode  
);
```

Description

This function selects the transmit audio data format.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
mode	One of the SPI_TRANSMIT_AUDIO_MODE enumeration values as the transmit audio format

Returns

None.

Remarks

This function implements an operation of the audio transmit mode feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsAudioTransmitMode](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the  
// application developer.  
PLIB_SPI_AudioTransmitModeSelect (MY_SPI_INSTANCE, SPI_AUDIO_TRANSMIT_MONO);
```

5.6.22.5.5 Transmitter Functions

5.6.22.5.5.1 PLIB_SPI_TransmitBufferIsEmpty Function

C

```
bool PLIB_SPI_TransmitBufferIsEmpty(  
    SPI_MODULE_ID index  
);
```

Description

This function returns the current status of the transmit buffer.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

- true - Transmit buffer is empty
- false - Transmit buffer is not empty

Remarks

This function implements an operation of the transmit buffer empty status feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsTransmitBufferEmptyStatus](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the
// application developer.
bool Status = PLIB_SPI_TransmitBufferIsEmpty(MY_SPI_INSTANCE);
```

5.6.22.5.5.2 PLIB_SPI_TransmitBufferIsFull Function**C**

```
bool PLIB_SPI_TransmitBufferIsFull(
    SPI_MODULE_ID index
);
```

Description

This function returns the current transmit buffer status of the SPI module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

- true - Transmit not yet started, transmit buffer is full
- false - Transmit started, transmit buffer is empty/not full

Remarks

In Standard Buffer mode - automatically set in hardware when SPI buffer writes occur, loading the transmit buffer. Automatically cleared in hardware when the SPI module transfers data from the transmit buffer to the shift register.

In Enhanced Buffer mode - automatically set in hardware when SPI buffer writes occur, loading the last available buffer. Automatically cleared in hardware when the buffer is available for writing.

This function implements an operation of the transmit buffer status feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsTransmitBufferFullStatus](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the
// application developer.
bool buffullstate = PLIB_SPI_TransmitBufferIsFull (MY_SPI_INSTANCE);
```

5.6.22.5.5.3 PLIB_SPI_TransmitUnderRunStatusGet Function**C**

```
bool PLIB_SPI_TransmitUnderRunStatusGet(
```

```
SPI_MODULE_ID index  
);
```

Description

This function returns the current status of the transmit underrun.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

- true - Transmit buffer has encountered an underrun condition
- false - Transmit buffer run has not encountered an underrun condition

Remarks

Valid in Framed Sync mode.

This function implements an operation of the transmit underrun status feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsTransmitUnderRunStatus](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the  
// application developer.  
bool Status = PLIB_SPI_TransmitUnderRunStatusGet(MY_SPI_INSTANCE);
```

5.6.22.5.6 Receiver Functions

5.6.22.5.6.1 PLIB_SPI_ReceiverBufferIsFull Function

C

```
bool PLIB_SPI_ReceiverBufferIsFull(  
    SPI_MODULE_ID index  
);
```

Description

This function returns the current status of the SPI receive buffer.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

Status - Receiver Buffer Full Status true - Receive complete, receive buffer is full false - Receive is not complete, receive buffer is empty

Remarks

In Standard Buffer mode - automatically set in hardware when the SPI module transfers data from the shift register to the receive

buffer. Automatically cleared in hardware when the core reads the SPI buffer, read in the receive buffer.

In Enhanced Buffer mode - automatically set in hardware when the SPI module transfers data from the shift register to the receive buffer, filling the last unread buffer. Automatically cleared in hardware when a buffer is available for a transfer from the shift register.

This function implements an operation of the receiver buffer status feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsReceiveBufferStatus](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the  
// application developer.  
bool receivefullstate = PLIB_SPI_ReceiverBufferIsFull (MY_SPI_INSTANCE);
```

5.6.22.5.6.2 PLIB_SPI_ReceiverFIFOIsEmpty Function

C

```
bool PLIB_SPI_ReceiverFIFOIsEmpty(  
    SPI_MODULE_ID index  
);
```

Description

This function returns the current status of the SPI receive FIFO.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

- true - Receive FIFO is empty
- false - Receive FIFO is not empty

Remarks

Valid in Enhanced Buffer mode.

This function implements an operation of the FIFO status feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsReceiveFIFOStatus](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the  
// application developer.  
bool fifostate = PLIB_SPI_ReceiverFIFOIsEmpty (MY_SPI_INSTANCE);
```

5.6.22.5.6.3 PLIB_SPI_ReceiverHasOverflowed Function

C

```
bool PLIB_SPI_ReceiverHasOverflowed(  
    SPI_MODULE_ID index  
);
```

Description

This function returns the current status of the SPI receiver overflow.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

Status - SPI receiver overflow status true - A new byte/word is completely received and discarded. The user software has not read the previous data in the SPI buffer register. false - No Overflow has occurred

Remarks

This function implements an operation of the receiver overflow status feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsReceiverOverflow](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the
// application developer.
bool overflowstate = PLIB_SPI_ReceiverHasOverflowed(MY_SPI_INSTANCE);
```

5.6.22.5.6.4 PLIB_SPI_ReceiverOverflowClear Function**C**

```
void PLIB_SPI_ReceiverOverflowClear(
    SPI_MODULE_ID index
);
```

Description

This function clears the SPI receive overflow flag.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This function implements an operation of the receiver overflow status feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use "[PLIB_SPI_ExistsReceiverOverflow](#)" in your application to automatically determine whether this feature is available.

Example

```
// Where MY_SPI_INSTANCE, is the SPI instance selected for use by the
// application developer.
PLIB_SPI_ReceiverOverflowClear(MY_SPI_INSTANCE);
```

5.6.22.5.7 Data Types and Constants

5.6.22.5.7.1 SPI_AUDIO_COMMUNICATION_WIDTH Enumeration

C

```
typedef enum {
    SPI_AUDIO_COMMUNICATION_24DATA_32FIFO_32CHANNEL,
    SPI_AUDIO_COMMUNICATION_32DATA_32FIFO_32CHANNEL,
    SPI_AUDIO_COMMUNICATION_16DATA_16FIFO_32CHANNEL,
    SPI_AUDIO_COMMUNICATION_16DATA_16FIFO_16CHANNEL
} SPI_AUDIO_COMMUNICATION_WIDTH;
```

Description

SPI Audio Communication Width

This macro defines the list of SPI audio communication width.

Members

Members	Description
SPI_AUDIO_COMMUNICATION_24DATA_32FIFO_32CHANNEL	Communication is 24-bit Data,32-bit FIFO,32-bit Channel/64-bit Frame
SPI_AUDIO_COMMUNICATION_32DATA_32FIFO_32CHANNEL	Communication is 32-bit Data,32-bit FIFO,32-bit Channel/64-bit Frame
SPI_AUDIO_COMMUNICATION_16DATA_16FIFO_32CHANNEL	Communication is 16-bit Data,16-bit FIFO,32-bit Channel/64-bit Frame
SPI_AUDIO_COMMUNICATION_16DATA_16FIFO_16CHANNEL	Communication is 16-bit Data,16-bit FIFO,16-bit Channel/64-bit Frame

5.6.22.5.7.2 SPI_AUDIO_ERROR Enumeration

C

```
typedef enum {
    SPI_AUDIO_ERROR_RECEIVE_OVERFLOW,
    SPI_AUDIO_ERROR_TRANSMIT_UNDERRUN
} SPI_AUDIO_ERROR;
```

Description

SPI Audio Error

This macro defines the list of SPI audio error.

Members

Members	Description
SPI_AUDIO_ERROR_RECEIVE_OVERFLOW	SPI error for receive overflow
SPI_AUDIO_ERROR_TRANSMIT_UNDERRUN	SPI error for transmit underrun

5.6.22.5.7.3 SPI_AUDIO_PROTOCOL Enumeration

C

```
typedef enum {
    SPI_AUDIO_PROTOCOL_PCM_DSP,
    SPI_AUDIO_PROTOCOL_RIGHT_JUSTIFIED,
    SPI_AUDIO_PROTOCOL_LEFT_JUSTIFIED,
    SPI_AUDIO_PROTOCOL_I2S
} SPI_AUDIO_PROTOCOL;
```

Description

Audio Protocol Mode enumeration

This data type defining the audio protocol mode.

Members

Members	Description
SPI_AUDIO_PROTOCOL_PCM_DSP	Audio protocol set to PCM/DSP mode
SPI_AUDIO_PROTOCOL_RIGHT_JUSTIFIED	Audio protocol set to Right-Justified mode
SPI_AUDIO_PROTOCOL_LEFT_JUSTIFIED	Audio protocol set to Left-Justified mode
SPI_AUDIO_PROTOCOL_I2S	Audio protocol set to I2C mode

Remarks

This enumeration is processor specific.

5.6.22.5.7.4 SPI_AUDIO_TRANSMIT_MODE Enumeration

C

```
typedef enum {
    SPI_AUDIO_TRANSMIT_MONO,
    SPI_AUDIO_TRANSMIT_STEREO
} SPI_AUDIO_TRANSMIT_MODE;
```

Description

Audio Transmit mode format

This macro defines the list of SPI transmit audio mode format.

Members

Members	Description
SPI_AUDIO_TRANSMIT_MONO	SPI Transmit Audio Data Format is Mono
SPI_AUDIO_TRANSMIT_STEREO	SPI Transmit Audio Data Format is Stereo

5.6.22.5.7.5 SPI_BAUD_RATE_CLOCK Enumeration

C

```
typedef enum {
    SPI_BAUD_RATE_MCLK_CLOCK,
    SPI_BAUD_RATE_PBCLK_CLOCK
} SPI_BAUD_RATE_CLOCK;
```

Description

SPI Baudrate generator

This macro defines the list of the SPI Baud Rate Generator.

Members

Members	Description
SPI_BAUD_RATE_MCLK_CLOCK	MCLK is used by the Baud Rate Generator
SPI_BAUD_RATE_PBCLK_CLOCK	Peripheral bus clock is used by the Baud Rate Generator

5.6.22.5.7.6 SPI_CLOCK_POLARITY Enumeration

C

```
typedef enum {
    SPI_CLOCK_POLARITY_IDLE_HIGH,
    SPI_CLOCK_POLARITY_IDLE_LOW
}
```

```
} SPI_CLOCK_POLARITY;
```

Description

SPI Clock polarity

This macro defines the list of SPI clock polarity.

Members

Members	Description
SPI_CLOCK_POLARITY_IDLE_HIGH	Idle state for clock is a high level;active state is a low level
SPI_CLOCK_POLARITY_IDLE_LOW	Idle state for clock is a low level;active state is a high level

5.6.22.5.7.7 SPI_COMMUNICATION_WIDTH Enumeration

C

```
typedef enum {  
    SPI_COMMUNICATION_WIDTH_32BITS,  
    SPI_COMMUNICATION_WIDTH_16BITS,  
    SPI_COMMUNICATION_WIDTH_8BITS  
} SPI_COMMUNICATION_WIDTH;
```

Description

SPI Communication Width

This macro defines the list of SPI communication width.

Members

Members	Description
SPI_COMMUNICATION_WIDTH_32BITS	Communication is 32-bit-wide
SPI_COMMUNICATION_WIDTH_16BITS	Communication is word-wide
SPI_COMMUNICATION_WIDTH_8BITS	Communication is byte-wide

5.6.22.5.7.8 SPI_DATA_TYPE Type

C

```
typedef unsigned char SPI_DATA_TYPE;
```

Description

SPI Data Type definition

This data type defines the SPI data size.

Remarks

None

5.6.22.5.7.9 SPI_ERROR_INTERRUPT Enumeration

C

```
typedef enum {  
    SPI_ERROR_INTERRUPT_FRAME_ERROR_OVERFLOW,  
    SPI_ERROR_INTERRUPT_RECEIVE_OVERFLOW,  
    SPI_ERROR_INTERRUPT_TRANSMIT_UNDERRUN  
} SPI_ERROR_INTERRUPT;
```

Description

SPI Error Interrupt

This macro defines the list of SPI error interrupts.

Members

Members	Description
SPI_ERROR_INTERRUPT_FRAME_ERROR_OVERFLOW	SPI interrupt for fram error
SPI_ERROR_INTERRUPT_RECEIVE_OVERFLOW	SPI interrupt for receive overflow error
SPI_ERROR_INTERRUPT_TRANSMIT_UNDERRUN	SPI interrupt for transmit underrun error

5.6.22.5.7.10 SPI_FIFO_INTERRUPT Enumeration

C

```
typedef enum {
    SPI_FIFO_INTERRUPT_WHEN_TRANSMIT_BUFFER_IS_NOT_FULL,
    SPI_FIFO_INTERRUPT_WHEN_TRANSMIT_BUFFER_IS_1HALF_EMPTY_OR_MORE,
    SPI_FIFO_INTERRUPT_WHEN_TRANSMIT_BUFFER_IS_COMPLETELY_EMPTY,
    SPI_FIFO_INTERRUPT_WHEN_RECEIVE_BUFFER_IS_1HALF_FULL_OR_MORE,
    SPI_FIFO_INTERRUPT_WHEN_RECEIVE_BUFFER_IS_NOT_EMPTY,
    SPI_FIFO_INTERRUPT_WHEN_TRANSMIT_BUFFER_IS_FULL,
    SPI_FIFO_INTERRUPT_WHEN_TRANSMIT_FIFO_IS_EMPTY,
    SPI_FIFO_INTERRUPT_WHEN_TRANSMISSION_IS_COMPLETE,
    SPI_FIFO_INTERRUPT_WHEN_TRANSMIT_FIFO_HAS_ONE_SLOT,
    SPI_FIFO_INTERRUPT_WHEN_RECEIVE_BUFFER_IS_FULL,
    SPI_FIFO_INTERRUPT_WHEN_RECEIVE_BUFFER_IS_3FOURTH_OR_MORE_FULL,
    SPI_FIFO_INTERRUPT_WHEN_DATA_IS_IN_RECEIVE_BUFFER,
    SPI_FIFO_INTERRUPT_WHEN_BUFFER_IS_EMPTY
} SPI_FIFO_INTERRUPT;
```

Description

SPI Buffer Interrupt Mode

This macro defines the list of SPI Buffer Interrupt mode.

Members

Members	Description
SPI_FIFO_INTERRUPT_WHEN_TRANSMIT_BUFFER_IS_NOT_FULL	Interrupt when the transmit buffer is not full
SPI_FIFO_INTERRUPT_WHEN_TRANSMIT_BUFFER_IS_1HALF_EMPTY_OR_MORE	Interrupt when the transmit buffer is half empty
SPI_FIFO_INTERRUPT_WHEN_TRANSMIT_BUFFER_IS_COMPLETELY_EMPTY	Interrupt when the transmit buffer is empty
SPI_FIFO_INTERRUPT_WHEN_RECEIVE_BUFFER_IS_1HALF_FULL_OR_MORE	Interrupt when the receive buffer half full or more
SPI_FIFO_INTERRUPT_WHEN_RECEIVE_BUFFER_IS_NOT_EMPTY	Interrupt when the receive buffer is not empty
SPI_FIFO_INTERRUPT_WHEN_TRANSMIT_BUFFER_IS_FULL	Interrupt when transmit buffer is full
SPI_FIFO_INTERRUPT_WHEN_TRANSMIT_FIFO_IS_EMPTY	Interrupt when transmit buffer is empty
SPI_FIFO_INTERRUPT_WHEN_TRANSMISSION_IS_COMPLETE	Interrupt when transmission is complete
SPI_FIFO_INTERRUPT_WHEN_TRANSMIT_FIFO_HAS_ONE_SLOT	Interrupt when one slot is left in transmit buffer
SPI_FIFO_INTERRUPT_WHEN_RECEIVE_BUFFER_IS_FULL	Interrupt when receive buffer is full
SPI_FIFO_INTERRUPT_WHEN_RECEIVE_BUFFER_IS_3FOURTH_OR_MORE_FULL	Interrupt when receive buffer is 3/4 or more full
SPI_FIFO_INTERRUPT_WHEN_DATA_IS_IN_RECEIVE_BUFFER	Interrupt when data is available in receive buffer

SPI_FIFO_INTERRUPT_WHEN_BUFFER_IS_EMPTY	Interrupt when the receive buffer is empty

5.6.22.5.7.11 SPI_FIFO_TYPE Enumeration

C

```
typedef enum {
    SPI_FIFO_TYPE_COMMON,
    SPI_FIFO_TYPE_TRANSMIT,
    SPI_FIFO_TYPE_RECEIVE
} SPI_FIFO_TYPE;
```

Description

SPI Buffer Mode

This macro defines the list of SPI buffer mode.

Members

Members	Description
SPI_FIFO_TYPE_COMMON	Buffer type is common type
SPI_FIFO_TYPE_TRANSMIT	Buffer type is transmit
SPI_FIFO_TYPE_RECEIVE	Buffer type is receive

5.6.22.5.7.12 SPI_FRAME_PULSE_DIRECTION Enumeration

C

```
typedef enum {
    SPI_FRAME_PULSE_DIRECTION_OUTPUT,
    SPI_FRAME_PULSE_DIRECTION_INPUT
} SPI_FRAME_PULSE_DIRECTION;
```

Description

SPI Frame sync pulse direction

This macro defines the list of SPI frame sync pulse direction.

Members

Members	Description
SPI_FRAME_PULSE_DIRECTION_OUTPUT	Frame sync pulse direction is output
SPI_FRAME_PULSE_DIRECTION_INPUT	Frame sync pulse direction is input

5.6.22.5.7.13 SPI_FRAME_PULSE_EDGE Enumeration

C

```
typedef enum {
    SPI_FRAME_PULSE_EDGE_COINCIDES_FIRST_BIT_CLOCK,
    SPI_FRAME_PULSE_EDGE_PRECEDES_FIRST_BIT_CLOCK
} SPI_FRAME_PULSE_EDGE;
```

Description

SPI Frame sync pulse edge

This macro defines the list of SPI frame sync pulse edge.

Members

Members	Description
SPI_FRAME_PULSE_EDGE_COINCIDES_FIRST_BIT_CLOCK	Frame sync pulse coincides with first bit clock
SPI_FRAME_PULSE_EDGE_PRECEDES_FIRST_BIT_CLOCK	Frame sync pulse precedes first bit clock

5.6.22.5.7.14 SPI_FRAME_PULSE_POLARITY Enumeration**C**

```
typedef enum {
    SPI_FRAME_PULSE_POLARITY_ACTIVE_HIGH,
    SPI_FRAME_PULSE_POLARITY_ACTIVE_LOW
} SPI_FRAME_PULSE_POLARITY;
```

Description

SPI Frame sync pulse polarity

This macro defines the list of SPI frame sync pulse polarity.

Members

Members	Description
SPI_FRAME_PULSE_POLARITY_ACTIVE_HIGH	Frame sync pulse is active high
SPI_FRAME_PULSE_POLARITY_ACTIVE_LOW	Frame sync pulse is active low

5.6.22.5.7.15 SPI_FRAME_PULSE_WIDTH Enumeration**C**

```
typedef enum {
    SPI_FRAME_PULSE_WIDTH_ONE_WORD_LENGTH,
    SPI_FRAME_PULSE_WIDTH_ONE_CLOCK_WIDE
} SPI_FRAME_PULSE_WIDTH;
```

Description

SPI Frame sync pulse width

This macro defines the list of SPI frame sync pulse width.

Members

Members	Description
SPI_FRAME_PULSE_WIDTH_ONE_WORD_LENGTH	Frame sync Pulse width as one word length wide
SPI_FRAME_PULSE_WIDTH_ONE_CLOCK_WIDE	Frame sync Pulse width as one clock wide

5.6.22.5.7.16 SPI_FRAME_SYNC_PULSE Enumeration**C**

```
typedef enum {
    SPI_FRAME_SYNC_PULSE_ON_EVERY_32_DATA_CHARACTER,
    SPI_FRAME_SYNC_PULSE_ON_EVERY_16_DATA_CHARACTER,
    SPI_FRAME_SYNC_PULSE_ON_EVERY_8_DATA_CHARACTER,
    SPI_FRAME_SYNC_PULSE_ON_EVERY_4_DATA_CHARACTER,
    SPI_FRAME_SYNC_PULSE_ON_EVERY_2_DATA_CHARACTER,
    SPI_FRAME_SYNC_PULSE_ON_EVERY_DATA_CHARACTER
} SPI_FRAME_SYNC_PULSE;
```

Description

Frame Sync Pulse Counter enumeration

This data type defining the frame sync pulse counter values.

Members

Members	Description
SPI_FRAME_SYNC_PULSE_ON_EVERY_32_DATA_CHARACTER	Generate a fram sync pulse on every 32 data character
SPI_FRAME_SYNC_PULSE_ON_EVERY_16_DATA_CHARACTER	Generate a fram sync pulse on every 16 data character
SPI_FRAME_SYNC_PULSE_ON_EVERY_8_DATA_CHARACTER	Generate a fram sync pulse on every 8 data character
SPI_FRAME_SYNC_PULSE_ON_EVERY_4_DATA_CHARACTER	Generate a fram sync pulse on every 4 data character
SPI_FRAME_SYNC_PULSE_ON_EVERY_2_DATA_CHARACTER	Generate a fram sync pulse on every 2 data character
SPI_FRAME_SYNC_PULSE_ON_EVERY_DATA_CHARACTER	Generate a fram sync pulse on every data character

5.6.22.5.7.17 SPI_INPUT_SAMPLING_PHASE Enumeration

C

```
typedef enum {
    SPI_INPUT_SAMPLING_PHASE_IN_MIDDLE,
    SPI_INPUT_SAMPLING_PHASE_AT_END
} SPI_INPUT_SAMPLING_PHASE;
```

Description

SPI Data Input Sample Phase

This macro defines the list of SPI data input sample phase.

Members

Members	Description
SPI_INPUT_SAMPLING_PHASE_IN_MIDDLE	SPI Data Input Sample phase in middle
SPI_INPUT_SAMPLING_PHASE_AT_END	SPI Data Input Sample phase at end

5.6.22.5.7.18 SPI_MODULE_ID Enumeration

C

```
typedef enum {
    SPI_ID_1,
    SPI_ID_2,
    SPI_ID_3,
    SPI_ID_4,
    SPI_NUMBER_OF_MODULES
} SPI_MODULE_ID;
```

Description

SPI Module ID

This enumeration identifies the SPI modules that are available on a microcontroller. This is the superset of all the possible instances that might be available on Microchip microcontrollers.

Members

Members	Description
SPI_ID_1	SPI Module 1 ID
SPI_ID_2	SPI Module 2 ID
SPI_ID_3	SPI Module 3 ID
SPI_ID_4	SPI Module 4 ID
SPI_NUMBER_OF_MODULES	Number of available SPI modules.

Remarks

The caller should not rely on the specific numbers assigned to any of these values as they may change from one processor to the next.

Not all modules will be available on all microcontrollers. Refer to the data sheet for the specific controller in use to determine which modules are supported. The numbers used in the enumeration values will match the numbers given in the data sheet.

5.6.22.5.7.19 SPI_OUTPUT_DATA_PHASE Enumeration**C**

```
typedef enum {
    SPI_OUTPUT_DATA_PHASE_ON_ACTIVE_TO_IDLE_CLOCK,
    SPI_OUTPUT_DATA_PHASE_ON_IDLE_TO_ACTIVE_CLOCK
} SPI_OUTPUT_DATA_PHASE;
```

Description

SPI Output Data Phase

This macro defines the list of SPI serial output data changes.

Members

Members	Description
SPI_OUTPUT_DATA_PHASE_ON_ACTIVE_TO_IDLE_CLOCK	Serial output data changes on transition from active clock state to idle clock state
SPI_OUTPUT_DATA_PHASE_ON_IDLE_TO_ACTIVE_CLOCK	Serial output data changes on transition from idle clock state to active clock state.

5.6.22.5.7.20 SPI_PIN Enumeration**C**

```
typedef enum {
    SPI_PIN_SERIAL_CLOCK,
    SPI_PIN_DATA_OUT,
    SPI_PIN_DATA_IN,
    SPI_PIN_SLAVE_SELECT
} SPI_PIN;
```

Description

SPI pin

This data type defining the SPI pin.

Members

Members	Description
SPI_PIN_SERIAL_CLOCK	SPI clock pin
SPI_PIN_DATA_OUT	SPI data output pin
SPI_PIN_DATA_IN	SPI data input pin
SPI_PIN_SLAVE_SELECT	SPI slave select pin

Remarks

This enumeration is processor specific.

5.6.22.5.7.21 SPI_PRESCALE_PRIMARY Enumeration

C

```
typedef enum {
    SPI_PRESCALE_PRIMARY_1,
    SPI_PRESCALE_PRIMARY_4,
    SPI_PRESCALE_PRIMARY_16,
    SPI_PRESCALE_PRIMARY_64
} SPI_PRESCALE_PRIMARY;
```

Description

Primary Prescaler Values

This macro defines the list of possible primary prescaler values.

Members

Members	Description
SPI_PRESCALE_PRIMARY_1	SPI Primary Prescaler Value 1:1
SPI_PRESCALE_PRIMARY_4	SPI Primary Prescaler Value 4:1
SPI_PRESCALE_PRIMARY_16	SPI Primary Prescaler Value 16:1
SPI_PRESCALE_PRIMARY_64	SPI Primary Prescaler Value 64:1

5.6.22.5.7.22 SPI_PRESCALE_SECONDARY Enumeration

C

```
typedef enum {
    SPI_PRESCALE_SECONDARY_1,
    SPI_PRESCALE_SECONDARY_2,
    SPI_PRESCALE_SECONDARY_3,
    SPI_PRESCALE_SECONDARY_4,
    SPI_PRESCALE_SECONDARY_5,
    SPI_PRESCALE_SECONDARY_6,
    SPI_PRESCALE_SECONDARY_7,
    SPI_PRESCALE_SECONDARY_8
} SPI_PRESCALE_SECONDARY;
```

Description

Secondary Prescaler Values

This macro defines the list of possible secondary prescaler values.

Members

Members	Description
SPI_PRESCALE_SECONDARY_1	SPI Secondary Prescaler Value 1:1
SPI_PRESCALE_SECONDARY_2	SPI Secondary Prescaler Value 2:1
SPI_PRESCALE_SECONDARY_3	SPI Secondary Prescaler Value 3:1
SPI_PRESCALE_SECONDARY_4	SPI Secondary Prescaler Value 4:1
SPI_PRESCALE_SECONDARY_5	SPI Secondary Prescaler Value 5:1
SPI_PRESCALE_SECONDARY_6	SPI Secondary Prescaler Value 6:1
SPI_PRESCALE_SECONDARY_7	SPI Secondary Prescaler Value 7:1
SPI_PRESCALE_SECONDARY_8	SPI Secondary Prescaler Value 8:1

5.6.22.5.8 Feature Existence Functions

5.6.22.5.8.1 PLIB_SPI_ExistsAudioCommunicationWidth Function

C

```
bool PLIB_SPI_ExistsAudioCommunicationWidth(  
    SPI_MODULE_ID index  
);
```

Description

This function identifies whether the AudioCommunicationWidth feature is available on the SPI module. When this function returns true, this function is supported on the device:

- [PLIB_SPI_AudioCommunicationWidthSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The AudioCommunicationWidth feature is supported on the device
- false - The AudioCommunicationWidth feature is not supported on the device

Remarks

None.

5.6.22.5.8.2 PLIB_SPI_ExistsAudioErrorControl Function

C

```
bool PLIB_SPI_ExistsAudioErrorControl(  
    SPI_MODULE_ID index  
);
```

Description

This function identifies whether the AudioErrorControl feature is available on the SPI module. When this function returns true, these functions are supported on the device:

- [PLIB_SPI_AudioErrorEnable](#)
- [PLIB_SPI_AudioErrorDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The AudioErrorControl feature is supported on the device
- false - The AudioErrorControl feature is not supported on the device

Remarks

None.

5.6.22.5.8.3 PLIB_SPI_ExistsAudioProtocolControl Function

C

```
bool PLIB_SPI_ExistsAudioProtocolControl(  
    SPI_MODULE_ID index  
);
```

Description

This function identifies whether the AudioProtocolControl feature is available on the SPI module. When this function returns true, these functions are supported on the device:

- [PLIB_SPI_AudioProtocolEnable](#)
- [PLIB_SPI_AudioProtocolDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The AudioProtocolControl feature is supported on the device
- false - The AudioProtocolControl feature is not supported on the device

Remarks

None.

5.6.22.5.8.4 PLIB_SPI_ExistsAudioProtocolMode Function

C

```
bool PLIB_SPI_ExistsAudioProtocolMode(  
    SPI_MODULE_ID index  
);
```

Description

This function identifies whether the AudioProtocolMode feature is available on the SPI module. When this function returns true, this function is supported on the device:

- [PLIB_SPI_AudioProtocolModeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The AudioProtocolMode feature is supported on the device
- false - The AudioProtocolMode feature is not supported on the device

Remarks

None.

5.6.22.5.8.5 PLIB_SPI_ExistsAudioTransmitMode Function

C

```
bool PLIB_SPI_ExistsAudioTransmitMode(  
    SPI_MODULE_ID index  
);
```

Description

This function identifies whether the AudioTransmitMode feature is available on the SPI module. When this function returns true, this function is supported on the device:

- [PLIB_SPI_AudioTransmitModeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The AudioTransmitMode feature is supported on the device
- false - The AudioTransmitMode feature is not supported on the device

Remarks

None.

5.6.22.5.8.6 PLIB_SPI_ExistsBaudRate Function

C

```
bool PLIB_SPI_ExistsBaudRate(  
    SPI_MODULE_ID index  
);
```

Description

This function identifies whether the BaudRate feature is available on the SPI module. When this function returns true, this function is supported on the device:

- [PLIB_SPI_BaudRateSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The BaudRate feature is supported on the device
- false - The BaudRate feature is not supported on the device

Remarks

None.

5.6.22.5.8.7 PLIB_SPI_ExistsBaudRateClock Function

C

```
bool PLIB_SPI_ExistsBaudRateClock(  
    SPI_MODULE_ID index  
);
```

Description

This function identifies whether the BaudRateClock feature is available on the SPI module. When this function returns true, this function is supported on the device:

- [PLIB_SPI_BaudRateClockSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The BaudRateClock feature is supported on the device
- false - The BaudRateClock feature is not supported on the device

Remarks

None.

5.6.22.5.8.8 PLIB_SPI_ExistsBuffer Function

C

```
bool PLIB_SPI_ExistsBuffer(  
    SPI_MODULE_ID index  
);
```

Description

This function identifies whether the Buffer feature is available on the SPI module. When this function returns true, these functions are supported on the device:

- [PLIB_SPI_BufferClear](#)
- [PLIB_SPI_BufferRead](#)
- [PLIB_SPI_BufferWrite](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The Buffer feature is supported on the device
- false - The Buffer feature is not supported on the device

Remarks

None.

5.6.22.5.8.9 PLIB_SPI_ExistsBusStatus Function**C**

```
bool PLIB_SPI_ExistsBusStatus(  
    SPI_MODULE_ID index  
);
```

Description

This function identifies whether the BusStatus feature is available on the SPI module. When this function returns true, this function is supported on the device:

- [PLIB_SPI_IsBusy](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The BusStatus feature is supported on the device
- false - The BusStatus feature is not supported on the device

Remarks

None.

5.6.22.5.8.10 PLIB_SPI_ExistsClockPolarity Function**C**

```
bool PLIB_SPI_ExistsClockPolarity(  
    SPI_MODULE_ID index  
);
```

Description

This function identifies whether the ClockPolarity feature is available on the SPI module. When this function returns true, this function is supported on the device:

- [PLIB_SPI_ClockPolaritySelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ClockPolarity feature is supported on the device
- false - The ClockPolarity feature is not supported on the device

Remarks

None.

5.6.22.5.8.11 PLIB_SPI_ExistsCommunicationWidth Function**C**

```
bool PLIB_SPI_ExistsCommunicationWidth(  
    SPI_MODULE_ID index  
);
```

Description

This function identifies whether the CommunicationWidth feature is available on the SPI module. When this function returns true, this function is supported on the device:

- [PLIB_SPI_CommunicationWidthSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The CommunicationWidth feature is supported on the device
- false - The CommunicationWidth feature is not supported on the device

Remarks

None.

5.6.22.5.8.12 PLIB_SPI_ExistsEnableControl Function**C**

```
bool PLIB_SPI_ExistsEnableControl(  
    SPI_MODULE_ID index  
);
```

Description

This function identifies whether the EnableControl feature is available on the SPI module. When this function returns true, these functions are supported on the device:

- [PLIB_SPI_Enable](#)
- [PLIB_SPI_Disable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The EnableControl feature is supported on the device

- false - The EnableControl feature is not supported on the device

Remarks

None.

5.6.22.5.8.13 PLIB_SPI_ExistsErrorInterruptControl Function**C**

```
bool PLIB_SPI_ExistsErrorInterruptControl(  
    SPI_MODULE_ID index  
);
```

Description

This function identifies whether the ErrorInterruptControl feature is available on the SPI module. When this function returns true, these functions are supported on the device:

- [PLIB_SPI_ErrorInterruptEnable](#)
- [PLIB_SPI_ErrorInterruptDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ErrorInterruptControl feature is supported on the device
- false - The ErrorInterruptControl feature is not supported on the device

Remarks

None.

5.6.22.5.8.14 PLIB_SPI_ExistsFIFOControl Function**C**

```
bool PLIB_SPI_ExistsFIFOControl(  
    SPI_MODULE_ID index  
);
```

Description

This function identifies whether the FIFOControl feature is available on the SPI module. When this function returns true, these functions are supported on the device:

- [PLIB_SPI_FIFOEnable](#)
- [PLIB_SPI_FIFODisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The FIFOControl feature is supported on the device
- false - The FIFOControl feature is not supported on the device

Remarks

None.

5.6.22.5.8.15 PLIB_SPI_ExistsFIFOCount Function**C**

```
bool PLIB_SPI_ExistsFIFOCount(  
    SPI_MODULE_ID index  
);
```

Description

This function identifies whether the FIFOCount feature is available on the SPI module. When this function returns true, this function is supported on the device:

- [PLIB_SPI_FIFOCountGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The FIFOCount feature is supported on the device
- false - The FIFOCount feature is not supported on the device

Remarks

None.

5.6.22.5.8.16 PLIB_SPI_ExistsFIFOInterruptMode Function**C**

```
bool PLIB_SPI_ExistsFIFOInterruptMode(  
    SPI_MODULE_ID index  
);
```

Description

This function identifies whether the FIFOInterruptMode feature is available on the SPI module. When this function returns true, this function is supported on the device:

- [PLIB_SPI_FIFOInterruptModeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The FIFOInterruptMode feature is supported on the device
- false - The FIFOInterruptMode feature is not supported on the device

Remarks

None.

5.6.22.5.8.17 PLIB_SPI_ExistsFIFOShiftRegisterEmptyStatus Function**C**

```
bool PLIB_SPI_ExistsFIFOShiftRegisterEmptyStatus(  
    SPI_MODULE_ID index  
);
```

Description

This function identifies whether the FIFOShiftRegisterEmptyStatus feature is available on the SPI module. When this function returns true, this function is supported on the device:

- [PLIB_SPI_FIFOShiftRegisterIsEmpty](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The FIFOShiftRegisterEmptyStatus feature is supported on the device
- false - The FIFOShiftRegisterEmptyStatus feature is not supported on the device

Remarks

None.

5.6.22.5.8.18 PLIB_SPI_ExistsFramedCommunication Function**C**

```
bool PLIB_SPI_ExistsFramedCommunication(  
    SPI_MODULE_ID index  
);
```

Description

This function identifies whether the FramedCommunication feature is available on the SPI module. When this function returns true, these functions are supported on the device:

- [PLIB_SPI_FramedCommunicationEnable](#)
- [PLIB_SPI_FramedCommunicationDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The FramedCommunication feature is supported on the device
- false - The FramedCommunication feature is not supported on the device

Remarks

None.

5.6.22.5.8.19 PLIB_SPI_ExistsFrameErrorStatus Function**C**

```
bool PLIB_SPI_ExistsFrameErrorStatus(  
    SPI_MODULE_ID index  
);
```

Description

This function identifies whether the FrameErrorStatus feature is available on the SPI module. When this function returns true, this function is supported on the device:

- [PLIB_SPI_FrameErrorStatusGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The FrameErrorStatus feature is supported on the device
- false - The FrameErrorStatus feature is not supported on the device

Remarks

None.

5.6.22.5.8.20 PLIB_SPI_ExistsFrameSyncPulseCounter Function**C**

```
bool PLIB_SPI_ExistsFrameSyncPulseCounter(  
    SPI_MODULE_ID index  
);
```

Description

This function identifies whether the FrameSyncPulseCounter feature is available on the SPI module. When this function returns true, this function is supported on the device:

- [PLIB_SPI_FrameSyncPulseCounterSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The FrameSyncPulseCounter feature is supported on the device
- false - The FrameSyncPulseCounter feature is not supported on the device

Remarks

None.

5.6.22.5.8.21 PLIB_SPI_ExistsFrameSyncPulseDirection Function**C**

```
bool PLIB_SPI_ExistsFrameSyncPulseDirection(  
    SPI_MODULE_ID index  
);
```

Description

This function identifies whether the FrameSyncPulseDirection feature is available on the SPI module. When this function returns true, this function is supported on the device:

- [PLIB_SPI_FrameSyncPulseDirectionSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The FrameSyncPulseDirection feature is supported on the device
- false - The FrameSyncPulseDirection feature is not supported on the device

Remarks

None.

5.6.22.5.8.22 PLIB_SPI_ExistsFrameSyncPulseEdge Function**C**

```
bool PLIB_SPI_ExistsFrameSyncPulseEdge(  
    SPI_MODULE_ID index  
);
```

Description

This function identifies whether the FrameSyncPulseEdge feature is available on the SPI module. When this function returns true, this function is supported on the device:

- [PLIB_SPI_FrameSyncPulseEdgeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The FrameSyncPulseEdge feature is supported on the device
- false - The FrameSyncPulseEdge feature is not supported on the device

Remarks

None.

5.6.22.5.8.23 PLIB_SPI_ExistsFrameSyncPulsePolarity Function**C**

```
bool PLIB_SPI_ExistsFrameSyncPulsePolarity(  
    SPI_MODULE_ID index  
);
```

Description

This function identifies whether the FrameSyncPulsePolarity feature is available on the SPI module. When this function returns true, this function is supported on the device:

- [PLIB_SPI_FrameSyncPulsePolaritySelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The FrameSyncPulsePolarity feature is supported on the device
- false - The FrameSyncPulsePolarity feature is not supported on the device

Remarks

None.

5.6.22.5.8.24 PLIB_SPI_ExistsFrameSyncPulseWidth Function**C**

```
bool PLIB_SPI_ExistsFrameSyncPulseWidth(  
    SPI_MODULE_ID index  
);
```

Description

This function identifies whether the FrameSyncPulseWidth feature is available on the SPI module. When this function returns true, this function is supported on the device:

- [PLIB_SPI_FrameSyncPulseWidthSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The FrameSyncPulseWidth feature is supported on the device
- false - The FrameSyncPulseWidth feature is not supported on the device

Remarks

None.

5.6.22.5.8.25 PLIB_SPI_ExistsInputSamplePhase Function**C**

```
bool PLIB_SPI_ExistsInputSamplePhase(  
    SPI_MODULE_ID index  
);
```

Description

This function identifies whether the InputSamplePhase feature is available on the SPI module. When this function returns true, this function is supported on the device:

- [PLIB_SPI_InputSamplePhaseSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The InputSamplePhase feature is supported on the device
- false - The InputSamplePhase feature is not supported on the device

Remarks

None.

5.6.22.5.8.26 PLIB_SPI_ExistsMasterControl Function**C**

```
bool PLIB_SPI_ExistsMasterControl(  
    SPI_MODULE_ID index  
);
```

Description

This function identifies whether the MasterControl feature is available on the SPI module. When this function returns true, these functions are supported on the device:

- [PLIB_SPI_MasterEnable](#)
- [PLIB_SPI_SlaveEnable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The MasterControl feature is supported on the device
- false - The MasterControl feature is not supported on the device

Remarks

None.

5.6.22.5.8.27 PLIB_SPI_ExistsOutputDataPhase Function**C**

```
bool PLIB_SPI_ExistsOutputDataPhase(  
    SPI_MODULE_ID index  
);
```

Description

This function identifies whether the OutputDataPhase feature is available on the SPI module. When this function returns true, this function is supported on the device:

- [PLIB_SPI_OutputDataPhaseSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The OutputDataPhase feature is supported on the device
- false - The OutputDataPhase feature is not supported on the device

Remarks

None.

5.6.22.5.8.28 PLIB_SPI_ExistsPinControl Function**C**

```
bool PLIB_SPI_ExistsPinControl(  
    SPI_MODULE_ID index  
);
```

Description

This function identifies whether the PinControl feature is available on the SPI module. When this function returns true, these functions are supported on the device:

- [PLIB_SPI_PinEnable](#)

- [PLIB_SPI_PinDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The PinControl feature is supported on the device
- false - The PinControl feature is not supported on the device

Remarks

None.

5.6.22.5.8.29 PLIB_SPI_ExistsPrimaryPrescale Function

C

```
bool PLIB_SPI_ExistsPrimaryPrescale(  
    SPI_MODULE_ID index  
);
```

Description

This function identifies whether the PrimaryPrescale feature is available on the SPI module. When this function returns true, this function is supported on the device:

- [PLIB_SPI_PrescalePrimarySelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The PrimaryPrescale feature is supported on the device
- false - The PrimaryPrescale feature is not supported on the device

Remarks

None.

5.6.22.5.8.30 PLIB_SPI_ExistsReadDataSignStatus Function

C

```
bool PLIB_SPI_ExistsReadDataSignStatus(  
    SPI_MODULE_ID index  
);
```

Description

This function identifies whether the ReadDataSignStatus feature is available on the SPI module. When this function returns true, this function is supported on the device:

- [PLIB_SPI_ReadDataIsSignExtended](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ReadDataSignStatus feature is supported on the device
- false - The ReadDataSignStatus feature is not supported on the device

Remarks

None.

5.6.22.5.8.31 PLIB_SPI_ExistsReceiveBufferStatus Function**C**

```
bool PLIB_SPI_ExistsReceiveBufferStatus(  
    SPI_MODULE_ID index  
);
```

Description

This function identifies whether the ReceiveBufferStatus feature is available on the SPI module. When this function returns true, this function is supported on the device:

- [PLIB_SPI_ReceiverBufferIsFull](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ReceiveBufferStatus feature is supported on the device
- false - The ReceiveBufferStatus feature is not supported on the device

Remarks

None.

5.6.22.5.8.32 PLIB_SPI_ExistsReceiveFIFOStatus Function**C**

```
bool PLIB_SPI_ExistsReceiveFIFOStatus(  
    SPI_MODULE_ID index  
);
```

Description

This function identifies whether the ReceiveFIFOStatus feature is available on the SPI module. When this function returns true, this function is supported on the device:

- [PLIB_SPI_ReceiverFIFOIsEmpty](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ReceiveFIFOStatus feature is supported on the device
- false - The ReceiveFIFOStatus feature is not supported on the device

Remarks

None.

5.6.22.5.8.33 PLIB_SPI_ExistsReceiverOverflow Function**C**

```
bool PLIB_SPI_ExistsReceiverOverflow(  
    SPI_MODULE_ID index  
);
```

Description

This function identifies whether the ReceiverOverflow feature is available on the SPI module. When this function returns true, these functions are supported on the device:

- [PLIB_SPI_ReceiverHasOverflowed](#)
- [PLIB_SPI_ReceiverOverflowClear](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ReceiverOverflow feature is supported on the device
- false - The ReceiverOverflow feature is not supported on the device

Remarks

None.

5.6.22.5.8.34 PLIB_SPI_ExistsSecondaryPrescale Function**C**

```
bool PLIB_SPI_ExistsSecondaryPrescale(  
    SPI_MODULE_ID index  
);
```

Description

This function identifies whether the SecondaryPrescale feature is available on the SPI module. When this function returns true, this function is supported on the device:

- [PLIB_SPI_PrescaleSecondarySelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The SecondaryPrescale feature is supported on the device
- false - The SecondaryPrescale feature is not supported on the device

Remarks

None.

5.6.22.5.8.35 PLIB_SPI_ExistsSlaveSelectControl Function

C

```
bool PLIB_SPI_ExistsSlaveSelectControl(  
    SPI_MODULE_ID index  
);
```

Description

This function identifies whether the SlaveSelectControl feature is available on the SPI module. When this function returns true, these functions are supported on the device:

- [PLIB_SPI_SlaveSelectEnable](#)
- [PLIB_SPI_SlaveSelectDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The SlaveSelectControl feature is supported on the device
- false - The SlaveSelectControl feature is not supported on the device

Remarks

None.

5.6.22.5.8.36 PLIB_SPI_ExistsStopInIdleControl Function

C

```
bool PLIB_SPI_ExistsStopInIdleControl(  
    SPI_MODULE_ID index  
);
```

Description

This function identifies whether the StopInIdle feature is available on the SPI module. When this function returns true, these functions are supported on the device:

- [PLIB_SPI_StopInIdleEnable](#)
- [PLIB_SPI_StopInIdleDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The StopInIdle feature is supported on the device
- false - The StopInIdle feature is not supported on the device

Remarks

None.

5.6.22.5.8.37 PLIB_SPI_ExistsTransmitBufferEmptyStatus Function

C

```
bool PLIB_SPI_ExistsTransmitBufferEmptyStatus(  
    SPI_MODULE_ID index  
);
```

Description

This function identifies whether the TransmitBufferEmptyStatus feature is available on the SPI module. When this function returns true, this function is supported on the device:

- [PLIB_SPI_TransmitBufferIsEmpty](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The TransmitBufferEmptyStatus feature is supported on the device
- false - The TransmitBufferEmptyStatus feature is not supported on the device

Remarks

None.

5.6.22.5.8.38 PLIB_SPI_ExistsTransmitBufferFullStatus Function

C

```
bool PLIB_SPI_ExistsTransmitBufferFullStatus(  
    SPI_MODULE_ID index  
);
```

Description

This function identifies whether the TransmitBufferFullStatus feature is available on the SPI module. When this function returns true, this function is supported on the device:

- [PLIB_SPI_TransmitBufferIsFull](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The TransmitBufferFullStatus feature is supported on the device
- false - The TransmitBufferFullStatus feature is not supported on the device

Remarks

None.

5.6.22.5.8.39 PLIB_SPI_ExistsTransmitUnderRunStatus Function

C

```
bool PLIB_SPI_ExistsTransmitUnderRunStatus(  
    SPI_MODULE_ID index  
);
```

Description

This function identifies whether the TransmitUnderRunStatus feature is available on the SPI module. When this function returns true, this function is supported on the device:

- [PLIB_SPI_TransmitUnderRunStatusGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The TransmitUnderRunStatus feature is supported on the device
- false - The TransmitUnderRunStatus feature is not supported on the device

Remarks

None.

5.6.22.6 Files

Files

Name	Description
plib_spi.h	SPI PLIB Interface Header for common definitions

Description

5.6.22.6.1 plib_spi.h

SPI Peripheral Library Interface Header

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the SPI PLIB.

Functions

	Name	Description
≡	<u>PLIB_SPI_AudioCommunicationWidthSelect</u>	Selects the data width for the SPI audio communication.
≡	<u>PLIB_SPI_AudioErrorDisable</u>	Disables the SPI error.
≡	<u>PLIB_SPI_AudioErrorEnable</u>	Enables the SPI error.
≡	<u>PLIB_SPI_AudioProtocolDisable</u>	Audio protocol is disabled.
≡	<u>PLIB_SPI_AudioProtocolEnable</u>	Audio protocol is enabled.
≡	<u>PLIB_SPI_AudioProtocolModeSelect</u>	Selects the Audio Protocol mode.
≡	<u>PLIB_SPI_AudioTransmitModeSelect</u>	Selects the transmit audio data format.
≡	<u>PLIB_SPI_BaudRateClockSelect</u>	Selects the type of clock is used by the Baud Rate Generator.
≡	<u>PLIB_SPI_BaudRateSet</u>	Sets the baud rate to the desired value.
≡	<u>PLIB_SPI_BufferClear</u>	Clears the SPI buffer.
≡	<u>PLIB_SPI_BufferRead</u>	Returns the SPI buffer value.
≡	<u>PLIB_SPI_BufferWrite</u>	Write the data to the SPI buffer.
≡	<u>PLIB_SPI_ClockPolaritySelect</u>	Enables clock polarity.
≡	<u>PLIB_SPI_CommunicationWidthSelect</u>	Selects the data width for the SPI communication.
≡	<u>PLIB_SPI_Disable</u>	Disables the SPI module.
≡	<u>PLIB_SPI_Enable</u>	Enables the SPI module.
≡	<u>PLIB_SPI_ErrorInterruptDisable</u>	Enables SPI error interrupts.
≡	<u>PLIB_SPI_ErrorInterruptEnable</u>	Enables SPI error interrupts
≡	<u>PLIB_SPI_ExistsAudioCommunicationWidth</u>	Identifies whether the AudioCommunicationWidth feature exists on the SPI module.
≡	<u>PLIB_SPI_ExistsAudioErrorControl</u>	Identifies whether the AudioErrorControl feature exists on the SPI module.
≡	<u>PLIB_SPI_ExistsAudioProtocolControl</u>	Identifies whether the AudioProtocolControl feature exists on the SPI module.
≡	<u>PLIB_SPI_ExistsAudioProtocolMode</u>	Identifies whether the AudioProtocolMode feature exists on the SPI module.
≡	<u>PLIB_SPI_ExistsAudioTransmitMode</u>	Identifies whether the AudioTransmitMode feature exists on the SPI module.
≡	<u>PLIB_SPI_ExistsBaudRate</u>	Identifies whether the BaudRate feature exists on the SPI module.
≡	<u>PLIB_SPI_ExistsBaudRateClock</u>	Identifies whether the BaudRateClock feature exists on the SPI module.
≡	<u>PLIB_SPI_ExistsBuffer</u>	Identifies whether the Buffer feature exists on the SPI module.
≡	<u>PLIB_SPI_ExistsBusStatus</u>	Identifies whether the BusStatus feature exists on the SPI module.
≡	<u>PLIB_SPI_ExistsClockPolarity</u>	Identifies whether the ClockPolarity feature exists on the SPI module.
≡	<u>PLIB_SPI_ExistsCommunicationWidth</u>	Identifies whether the CommunicationWidth feature exists on the SPI module.
≡	<u>PLIB_SPI_ExistsEnableControl</u>	Identifies whether the EnableControl feature exists on the SPI module.

	<u>PLIB_SPI_ExistsErrorInterruptControl</u>	Identifies whether the ErrorInterruptControl feature exists on the SPI module.
	<u>PLIB_SPI_ExistsFIFOControl</u>	Identifies whether the FIFOControl feature exists on the SPI module.
	<u>PLIB_SPI_ExistsFIFOCount</u>	Identifies whether the FIFOCount feature exists on the SPI module.
	<u>PLIB_SPI_ExistsFIFOInterruptMode</u>	Identifies whether the FIFOInterruptMode feature exists on the SPI module.
	<u>PLIB_SPI_ExistsFIFOShiftRegisterEmptyStatus</u>	Identifies whether the FIFOShiftRegisterEmptyStatus feature exists on the SPI module.
	<u>PLIB_SPI_ExistsFramedCommunication</u>	Identifies whether the FramedCommunication feature exists on the SPI module.
	<u>PLIB_SPI_ExistsFrameErrorStatus</u>	Identifies whether the FrameErrorStatus feature exists on the SPI module.
	<u>PLIB_SPI_ExistsFrameSyncPulseCounter</u>	Identifies whether the FrameSyncPulseCounter feature exists on the SPI module.
	<u>PLIB_SPI_ExistsFrameSyncPulseDirection</u>	Identifies whether the FrameSyncPulseDirection feature exists on the SPI module.
	<u>PLIB_SPI_ExistsFrameSyncPulseEdge</u>	Identifies whether the FrameSyncPulseEdge feature exists on the SPI module.
	<u>PLIB_SPI_ExistsFrameSyncPulsePolarity</u>	Identifies whether the FrameSyncPulsePolarity feature exists on the SPI module.
	<u>PLIB_SPI_ExistsFrameSyncPulseWidth</u>	Identifies whether the FrameSyncPulseWidth feature exists on the SPI module.
	<u>PLIB_SPI_ExistsInputSamplePhase</u>	Identifies whether the InputSamplePhase feature exists on the SPI module.
	<u>PLIB_SPI_ExistsMasterControl</u>	Identifies whether the MasterControl feature exists on the SPI module.
	<u>PLIB_SPI_ExistsOutputDataPhase</u>	Identifies whether the OutputDataPhase feature exists on the SPI module.
	<u>PLIB_SPI_ExistsPinControl</u>	Identifies whether the PinControl feature exists on the SPI module.
	<u>PLIB_SPI_ExistsPrimaryPrescale</u>	Identifies whether the PrimaryPrescale feature exists on the SPI module.
	<u>PLIB_SPI_ExistsReadDataSignStatus</u>	Identifies whether the ReadDataSignStatus feature exists on the SPI module.
	<u>PLIB_SPI_ExistsReceiveBufferStatus</u>	Identifies whether the ReceiveBufferStatus feature exists on the SPI module.
	<u>PLIB_SPI_ExistsReceiveFIFOStatus</u>	Identifies whether the ReceiveFIFOStatus feature exists on the SPI module.
	<u>PLIB_SPI_ExistsReceiverOverflow</u>	Identifies whether the ReceiverOverflow feature exists on the SPI module.
	<u>PLIB_SPI_ExistsSecondaryPrescale</u>	Identifies whether the SecondaryPrescale feature exists on the SPI module.
	<u>PLIB_SPI_ExistsSlaveSelectControl</u>	Identifies whether the SlaveSelectControl feature exists on the SPI module.
	<u>PLIB_SPI_ExistsStopInIdleControl</u>	Identifies whether the StopInIdle feature exists on the SPI module.
	<u>PLIB_SPI_ExistsTransmitBufferEmptyStatus</u>	Identifies whether the TransmitBufferEmptyStatus feature exists on the SPI module.
	<u>PLIB_SPI_ExistsTransmitBufferFullStatus</u>	Identifies whether the TransmitBufferFullStatus feature exists on the SPI module.

	PLIB_SPI_ExistsTransmitUnderRunStatus	Identifies whether the TransmitUnderRunStatus feature exists on the SPI module.
	PLIB_SPI_FIFOCountGet	Reads the SPI Buffer Element Count bits for either receive or transmit.
	PLIB_SPI_FIFODisable	Disables the SPI enhanced buffer.
	PLIB_SPI_FIFOEnable	Enables the SPI enhanced buffer.
	PLIB_SPI_FIFOInterruptModeSelect	Selects the SPI buffer interrupt mode.
	PLIB_SPI_FIFOShiftRegisterIsEmpty	Returns the current status of the SPI shift register.
	PLIB_SPI_FramedCommunicationDisable	Disables framed SPI support.
	PLIB_SPI_FramedCommunicationEnable	Enables framed SPI support.
	PLIB_SPI_FrameErrorStatusGet	Returns the current status of the SPI frame error.
	PLIB_SPI_FrameSyncPulseCounterSelect	Selects at which character the SPI frame sync pulse is generated.
	PLIB_SPI_FrameSyncPulseDirectionSelect	Selects the frame sync pulse direction.
	PLIB_SPI_FrameSyncPulseEdgeSelect	Selects the frame sync pulse edge.
	PLIB_SPI_FrameSyncPulsePolaritySelect	Selects the frame sync pulse polarity.
	PLIB_SPI_FrameSyncPulseWidthSelect	Sets the frame sync pulse width.
	PLIB_SPI_InputSamplePhaseSelect	Selects the SPI data input sample phase.
	PLIB_SPI_IsBusy	Returns the current SPI module activity status.
	PLIB_SPI_MasterEnable	Enables the SPI in Master mode.
	PLIB_SPI_OutputDataPhaseSelect	Selects serial output data change.
	PLIB_SPI_PinDisable	Enables the selected SPI pins.
	PLIB_SPI_PinEnable	Enables the selected SPI pins.
	PLIB_SPI_PrescalePrimarySelect	Selects the primary prescale for SPI Master mode.
	PLIB_SPI_PrescaleSecondarySelect	Selects the secondary prescale for SPI Master mode.
	PLIB_SPI_ReadDataIsSignExtended	Returns the current status of the receive (RX) FIFO sign-extended data.
	PLIB_SPI_ReceiverBufferIsFull	Returns the current status of the SPI receive buffer.
	PLIB_SPI_ReceiverFIFOIsEmpty	Returns the current status of the SPI receive FIFO.
	PLIB_SPI_ReceiverHasOverflowed	Returns the current status of the SPI receiver overflow.
	PLIB_SPI_ReceiverOverflowClear	Clears the SPI receive overflow flag.
	PLIB_SPI_SlaveEnable	Enables the SPI in Slave mode.
	PLIB_SPI_SlaveSelectDisable	Disables Master mode slave select.
	PLIB_SPI_SlaveSelectEnable	Enables Master mode slave select.
	PLIB_SPI_StopInIdleDisable	Continues module operation when the device enters Idle mode.
	PLIB_SPI_StopInIdleEnable	Discontinues module operation when the device enters Idle mode.
	PLIB_SPI_TransmitBufferIsEmpty	Returns the current status of the transmit buffer.
	PLIB_SPI_TransmitBufferIsFull	Returns the current transmit buffer status of the SPI module.
	PLIB_SPI_TransmitUnderRunStatusGet	Returns the current status of the transmit underrun.

Types

	Name	Description
	SPI_DATA_TYPE	Data type defining the SPI data size.

5.6.23 SQI Peripheral Library

5.6.23.1 Introduction

SQI Peripheral Library for Microchip Microcontrollers

This [library](#) provides a low-level abstraction of the Serial Quad Interface (SQI) Peripheral that is available on the Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the SQI module without the necessity of interacting directly with the module's registers, there by hiding differences from one microcontroller variant to another.

Description

The SQI module is a synchronous serial interface that provides access to serial Flash memories and other serial devices. The SQI bus interface consists of four data lines (SQID3-SQID0), a clock line (SQICLK), two select lines (SQICS0 and SQICS1) and the module supports single Lane (identical to SPI), dual Lane, and quad Lane interface modes. SQI operates in only master mode. The SQI module has configurable transmit and receive buffers, programmable baud rates through the internal clock divider, clock phase, and clock polarity control for efficient data operations. Transmit and receive buffers can be accessed through SQITXDATA and SQIRXDATA registers. Similarly, the control buffer can be accessed through the SQI1CON register and is mainly used to pipeline the operations.

The SQI module operates in three transfer modes: DMA, PIO, and XIP using three data flow modes: SPI Mode 0 and Mode 3, and a high-speed Serial Flash mode . All three modes use the control buffer to pipeline the command/data sequences on the SQI bus. Following diagrams describe typical SQI hardware interface and software flow. Figure 1 shows the typical hardware interface of SQI module:

Figure 1: Hardware Interface Diagram

Refer to SQI Family Reference Manual section, which is available on [Microchip website](#) for additional details on control register information and operation.

5.6.23.2 Release Notes

MPLAB Harmony Version: v0.70b **SQI Peripheral Library Version :**0.70b **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.6.23.3 SW License Agreement

5.6.23.4 Using the Library

This topic describes the basic architecture of the SQI Peripheral Library and provides information and examples on how to use it.

Interface Header File: [plib_sqi.h](#)

The interface to the SQI peripheral library is defined in the "[plib_sqi.h](#)" header file. This file is included by the "peripheral.h" file. Any C language source (.c) file that uses the SQI peripheral library should include "peripheral.h".

Library File:

The SQI peripheral library archive (.a) file is installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the library interacts with the framework.

5.6.23.4.1 Hardware Abstraction Model

This library provides the low-level abstraction of the SQI module on the Microchip family of microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in the software and introduces the library interface.

Description

Before jumping into the software abstraction, it is important to understand the SQI hardware a little more in detail.

Figure 2 provides a glimpse of SQI hardware block diagram. As shown the diagram the features of SQI are divided into multiple logic blocks and the SQI peripheral library provides APIs to configure the various logic block thus the features.

The control and status SFRs block contains all the registers that are used to configure the SQI in a specific mode of operation. The PIO mode of operation of SQI requires a set of registers to be configured by the Host processor and writing to/ reading from the TXDATA and RXDATA registers. The XIP logic facilitates the SQI modules eXecute-In-Place mode of operation, where Host processor programs the set of registers that configure the XIP mode and the engine automatically reads the external flash and the read data gets mapped into a direct memory region. Where as DMA mode requires the Host processor to program a set of buffer descriptors and instructs SQI to point to the address of those buffer descriptors for the reads and writes. As mentioned earlier there are 3 buffers; transmit, receive and control that are accessed through SQIXTXDATA, SQIXRXDATA and SQIXCON registers respectively.

Figure 2: SQI Hardware Block Diagram

The SQI Peripheral Library takes requests from application software or the SQI device driver and controls the SQI hardware as per the inputs passed to the [Library Interface](#). Figure 3 provides the SQI peripheral library software abstraction layer diagram.

Figure 3: SQI Software Abstraction Model

The major components are SQI Peripheral Library are:

- Configuration Management
- Interrupt Control and Status Management
- DMA Mode Management

5.6.23.4.2 Library Usage Model

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the SQI module.

Library Interface Section	Description
Mode Configuration Management Functions	These functions are used to setup transfer mode (DMA/XIP/PIO), data mode (SPI Mode 0/Mode 3/ Serial Flash), lane mode (single/dual/quad) and XIP control registers.
Clock Configuration Management Functions	These functions are used to enable the clock, setup a clock divider and check the status of the clock to see if it's stable.
XIP Configuration Management Functions	These functions are used to setup parameters for XIP mode of operation.
PIO Mode Transfer Management Functions	These functions are used to setup TXDATA, RXDATA registers and status checks.
Interrupt Control and Status Management Functions	These functions are used to control the interrupts. SQI supports only status type of interrupts (no error interrupts).
DMA Buffer Address Management Functions	These functions are used to setup the address of the base descriptor, check the address of the current descriptor

DMA Buffer Descriptor Management Functions	These functions are used to setup and control 4 words (BD_CTRL, BD_STATUS (reserved), BD_BUF_ADDR and BD_NEXT_PTR)
DMA Control and Status Management Functions	These functions are used to control the buffer descriptor fetch process and check the status during the buffer descriptor fetches.

5.6.23.4.3 How the Library Works

Note: Not all modes are available on all devices. Please refer to the specific device data sheet to determine the supported modes.

5.6.23.4.3.1 Core Functionality

SQI modules core functionality is to transfer data between the serial device (mostly quad flash) attached and the PIC microcontroller. In order to achieve this, SQI module uses 3 transfer modes: DMA, PIO and XIP. Each transfer mode can be configured to use any of the 3 available data flow modes (Mode 0, Mode 3 and Serial Flash Mode) to achieve the transfers. DMA and PIO modes are typically used to transfer data and XIP mode is used for code execution.

Each mode of operation requires setting-up the clock, selecting data flow mode and selecting lane mode and other parameters as required by the device driver or application. SQI peripheral library includes complete set of API necessary to perform these operations.

The following sections describe the SQI core functionality in each mode of operation.

5.6.23.4.3.1.1 XIP Mode

XIP (eXecute-In-Place) mode is mostly used to execute the code out of the attached serial flash device. However, this mode can also be used to transfer data as deemed necessary. In order for SQI to operate in XIP mode, host processor would have to setup the two SFRs dedicated to the XIP mode in addition to SQI configuration and clock control SFRs. Please refer to the specific data sheet and family reference manual for the configuration details.

Please note that all the XIP configuration values depend on the parameters of the interfaced serial flash memory device. In XIP mode, reading values of any other SFRs return the contents of the serial flash device, the way it is mapped.

Figure 4 provides the XIP mode software flow.

Note 1: This step configures SQI configuration fields (SQIEN, CSEN and DATAEN) except the MODE<1:0>
 Note 2: There are two XIP control registers

Figure 4: XIP Mode Flow Diagram

Example:

```

// Example is written to access SST26VF032 flash device
// Example assumes the Flash Device is connected to Chip Select 0

//Global defines
#define SST26VF_HS_READ    0x0B
#define SST26VF_MODE_CODE  0x0
#define SST26VF_MODE_BYTES 0x0

// Setup SQI Configuration Bits
PLIB_SQI_Enable(SQI_ID_1);
PLIB_SQI_CSOutputEnableSelect(SQI_ID_1, SQI_CS_OEN_0);
PLIB_SQI_DataOutputEnableSelect(SQI_ID_1, SQI_DATA_OEN_QUAD);

// Disable All Interrupts
PLIB_SQI_InterruptDisable(SQI_ID_1, SQI_ALL_INT);
PLIB_SQI_InterruptSignalDisable(SQI_ID_1, SQI_ALL_INT);

// Setup SQI Transfer Clock
PLIB_SQI_ClockDividerSet(SQI_ID_1, CLK_DIV_1);
PLIB_SQI_ClockEnable(SQI_ID_1);
while (!PLIB_SQI_ClockIsStable(SQI_ID_1));
// Configure XIP Control 1 SFR
PLIB_SQI_XIPControlWord1Set (SQI_ID_1,

```

```
        SQI_LANE_QUAD,  
        SQI_LANE_QUAD,  
        SQI_LANE_QUAD,  
        SQI_LANE_QUAD,  
        SQI_LANE_QUAD,  
        SST26VF_HS_READ,  
        ADDR_BYTES_3,  
        DUMMY_BYTES_2  
    );  
  
    // Configure XIP Control 2 SFR  
    PLIB_SQI_XIPControlWord2Set (SQI_ID_1,  
        SST26VF_MODE_CODE,  
        MODE_BYTES_0,  
        SQI_CS_0  
    );  
  
    // Set Transfer Mode to XIP  
    PLIB_SQI_TransferModeSet(SQI_ID_1, SQI_XFER_MODE_XIP);  
  
    // The SQI is now in XIP mode and should start fetching the code
```

5.6.23.4.3.1.2 DMA Mode

DMA mode is used for higher throughput data transfers. In DMA mode, the SQI DMA engine controls the data transfers off-loading the host processor. However, the host processor would have to configure the buffer descriptor and some SQI control SFRs to initiate the DMA process. Once the transactions are in progress, the DMA will be in control and the host processor can get the control through the interrupts or by disabling the DMA.

Figure 5 provides the DMA mode software flow.

Note 1: Buffer descriptor is a data structure in memory containing 4 words (BD_CTRL, BD_STAT, BD_BUFADDR and BD_NXTPTR).

Note 2: Base address register points to first buffer descriptor in the chain.

Figure 5: DMA Mode Flow Diagram

Example:

```

// Example is written to access SST26VF032 flash device
// Example assumes the Flash Device is connected to Chip Select 0

//Global defines
#define SST26VF_EQIO      0x38
#define SST26VF_HS_READ   0x0B
#define SST26VF_MODE_CODE 0x0
#define SST26VF_MODE_BYTES 0x0
#define NUMBER_OF_BDs     5
#define POLL_CON_VALUE    10

{

// Setup the Buffer Descriptors
for ( i=0; i <(NUMBER_OF_BDs-1); i++)
{
// Setup Buffer Descriptors. Handle structures as application
  
```

```

// needs.

// Configure SQI Control Fields
PLIB_SQI_Enable(SQI_ID_1);
PLIB_SQI_CSOutputEnableSelect(SQI_ID_1, SQI_CS_OEN_0);
PLIB_SQI_DataOutputEnableSelect(SQI_ID_1, SQI_DATA_OEN_2);
PLIB_SQI_BurstEnable(SQI_ID_1);
PLIB_SQI_SerialModeSet(SQI_ID_1);
PLIB_SQI_TransferModeSet(SQI_ID_1, SQI_XFER_MODE_PIO);

// Configure the SQI Transfer Clock
PLIB_SQI_ClockDividerSet(SQI_ID_1, CLK_DIV_4);
PLIB_SQI_ClockEnable(SQI_ID_1);
while (!PLIB_SQI_ClockIsStable(SQI_ID_1));

//Enable Buffer Descriptor Done and Packet Done Interrupts
PLIB_SQI_InterruptEnable(SQI_ID_1, BDDONE);
PLIB_SQI_InterruptSignalEnable(SQI_ID_1, BDDONE);
PLIB_SQI_InterruptEnable(SQI_ID_1, PKTCOMP);
PLIB_SQI_InterruptSignalEnable(SQI_ID_1, PKTCOMP);

// Send EQIO(0x38) Command to SST26VF032 to Enable Quad Lane Mode
// Note: These steps are not in the flow as these are specific to
// one Flash Device (SST26VF032)
PLIB_SQI_ChipSelectSet(SQI_ID_1, SQI_CS_0);
PLIB_SQI_LaneModeSet(SQI_ID_1, SQI_SINGLE_LANE);
PLIB_SQI_TransferCommandSet(SQI_ID_1, SQI_CMD_TRANSMIT);
// Transfers 1 Command Byte, No Address/Dummy Bytes
PLIB_SQI_TransferCountSet(SQI_ID_1, 0x1);
PLIB_SQI_TransmitterDataSend(SQI_ID_1, SST26VF_EQIO);

// Set the SQI in DMA Mode
PLIB_SQI_TransferModeSet(SQI_ID_1, SQI_XFER_MODE_DMA);

// Setup the Base Buffer Descriptor Address
if (!PLIB_SQI_DMAIsActive(SQI_ID_1))
    PLIB_SQI_DMABDBaseAddressSet(SQI_ID_1, (void *) (&MY_BASE_BD_STRUCT));

//Setup DMA Control Register
PLIB_SQI_DMABDEnable(SQI_ID_1);
PLIB_SQI_DMABDPollEnable(SQI_ID_1);

// Setup DMA Polling
If (PLIB_SQI_DMABDPollIsEnabled(SQI_ID_1))
    // Poll DMA every 10 cycles
    PLIB_SQI_PollControlSet(SQI_ID_1, MY_POLL_CONTROL_VALUE);

// Start the DMA Process - DMA Engine is now in Control
If (PLIB_SQI_DMAIsEnabled(SQI_ID_1))
{
    if (!PLIB_SQI_DMAIsActive(MY_SQI_INSTANCE))
        PLIB_SQI_DMABDFetchStart(SQI_ID_1);
}
}

```

5.6.23.4.3.1.3 PIO Mode

PIO mode is mostly used for data transfers. In PIO mode, the SQI module is entirely under the control of host processor. For the SQI module to operate in PIO mode, the host processor would have to set up the configuration, control, and clock control SFRs. Once the transactions are in progress, the host processor can use interrupts and status flags to control the operation. Please refer to the specific device data sheet and family reference manual for the configuration details.

Figure 6 provides the PIO mode software flow.

Figure 6: PIO Mode Flow Diagram

Example:

*// Example is written to access SST26VF032 flash device
 // Example assumes the Flash Device is connected to Chip Select 0
 // Example reads the device ID of the SST26VF032*

//Global defines

```

#define FALSE 0
#define TRUE 1
#define SST26VF_EQIO 0x38
#define SST26VF_HS_READ 0x0B
#define SST26VF_QJEDID_READ 0x9F
#define SST26VF_JEDEC_ID 0xBF2602
  
```

```

{

        jedecID = PLIB_SQI_ReceiveData(SQI_ID_1);

    if (jedecID == SST26VF_JEDEC_ID)
        return TRUE;
    else
        return FALSE;
}

```

5.6.23.4.4 Configuring the Library

The library is configured for the supported processor when the processor is chosen in the MPLAB IDE.

5.6.23.5 Library Interface

Data Types and Constants

	Name	Description
	<u>SQI_ADDR_BYTES</u>	Defines the list of SQI Address Bytes
	<u>SQI_BD_CTRL_WORD</u>	Defines the list of SQI Buffer Descriptor Control Word
	<u>SQI_BD_STATE</u>	Defines the list of SQI Buffer Descriptor State
	<u>SQI_CLK_DIV</u>	Defines the list of SQI Clock Divider Values
	<u>SQI_CS_NUM</u>	Defines the list of SQI Chip Selects
	<u>SQI_CS_OEN</u>	Defines the list of SQI Chip Selects on which output is enabled
	<u>SQI_DATA_FORMAT</u>	Defines the Data Format Options available (LSBF/MSBF)
	<u>SQI_DATA_MODE</u>	Defines the list of SQI Data Modes
	<u>SQI_DATA_OEN</u>	Defines the list of SQI Data pins on which output is enabled
	<u>SQI_DATA_TYPE</u>	Data type defining the SQI Data size.
	<u>SQI_DUMMY_BYTES</u>	Defines the list of SQI Dummy Bytes
	<u>SQI_INTERRUPTS</u>	Defines the list of SQI Interrupts
	<u>SQI_LANE_MODE</u>	Defines the list of SQI Lane Modes (single/dual/quad)
	<u>SQI_MODE_BYTES</u>	Defines the list of SQI Mode Bytes
	<u>SQI_MODULE_ID</u>	Identifies the SQI modules supported
	<u>SQI_XFER_CMD</u>	Defines the list of SQI Transfer Commands
	<u>SQI_XFER_MODE</u>	Defines the list of SQI Transfer Modes

Clock Configuration Management Functions

	Name	Description
	<u>PLIB_SQI_ClockDividerGet</u>	Returns the SQI clock divider value.
	<u>PLIB_SQI_ClockDividerSet</u>	Sets the SQI clock (that drives the SQI protocol) divider value. Divides the base clock to generate the SQI clock.
	<u>PLIB_SQI_ClockEnable</u>	Enables the SQI transfer clock.
	<u>PLIB_SQI_ClockIsStable</u>	Returns SQI transfer clock state.

DMA Buffer Address Management Functions

	Name	Description
	<u>PLIB_SQI_DMABDBaseAddressGet</u>	Returns the address of the base buffer descriptor.
	<u>PLIB_SQI_DMABDBaseAddressSet</u>	Sets the address of the base buffer descriptor.
	<u>PLIB_SQI_DMABDCurrentAddressGet</u>	Returns the address of the current buffer descriptor in process.

DMA Buffer Descriptor Management Functions

	Name	Description
	<u>PLIB_SQI_DMABDControlWordGet</u>	Returns Current Buffer Descriptor Control Word Information.
	<u>PLIB_SQI_DMABDReceiveBufferCountGet</u>	Returns the receive buffer space in bytes.
	<u>PLIB_SQI_DMABDReceiveBufferLengthGet</u>	Returns the receive length in bytes.

	PLIB_SQI_DMABDReceiveStateGet	Returns the current state of the buffer descriptor in progress.
	PLIB_SQI_DMABDTransmitBufferCountGet	Returns the transmit buffer space in bytes.
	PLIB_SQI_DMABDTransmitBufferLengthGet	Returns the transmit length in bytes.
	PLIB_SQI_DMABDTransmitStateGet	Returns the current state of the buffer descriptor in progress.

DMA Control and Status Management Functions

	Name	Description
	PLIB_SQI_DMABDFetchStart	Start the DMA buffer descriptor fetch process.
	PLIB_SQI_DMABDIsBusy	Returns true if DMA Buffer Descriptor is busy.
	PLIB_SQI_DMABDPollCounterSet	Sets the poll counter value.
	PLIB_SQI_DMABDPollDisable	Disables the buffer descriptor polling.
	PLIB_SQI_DMABDPollEnable	Enables the buffer descriptor polling.
	PLIB_SQI_DMABDPollsEnabled	Returns true if DAM buffer descriptor poll is eanbled and false if it's disabled.
	PLIB_SQI_DMABDStateGet	Returns the current state of the buffer descriptor in progress.
	PLIB_SQI_DMADisable	Disables the built-in DMA logic.
	PLIB_SQI_DMAEnable	Enables the built-in DMA logic.
	PLIB_SQI_DMAHasStarted	Returns true if DMA process has started if not returns false.
	PLIB_SQI_DMAIsEnabled	Returns true if DAM is eanbled and false if it's disabled.

Feature Existence Functions

	Name	Description
	PLIB_SQI_ExistsBDBaseAddress	Identifies whether the BDBaseAddress feature exists on the SQI module
	PLIB_SQI_ExistsBDControlWord	Identifies whether the BDControlWord feature exists on the SQI module
	PLIB_SQI_ExistsBDCurrentAddress	Identifies whether the BDCurrentAddress feature exists on the SQI module
	PLIB_SQI_ExistsBDPollCount	Identifies whether the BDPollCount feature exists on the SQI module
	PLIB_SQI_ExistsBDPollingEnable	Identifies whether the BDPollingEnable feature exists on the SQI module
	PLIB_SQI_ExistsBDProcessState	Identifies whether the BDProcessState feature exists on the SQI module
	PLIB_SQI_ExistsBDRxBufCount	Identifies whether the BDRxBufCount feature exists on the SQI module
	PLIB_SQI_ExistsBDRxLength	Identifies whether the BDRxLength feature exists on the SQI module
	PLIB_SQI_ExistsBDRxState	Identifies whether the BDRxState feature exists on the SQI module
	PLIB_SQI_ExistsBDTxBufCount	Identifies whether the BDTxBufCount feature exists on the SQI module
	PLIB_SQI_ExistsBDTxLength	Identifies whether the BDTxLength feature exists on the SQI module
	PLIB_SQI_ExistsBDTxState	Identifies whether the BDTxState feature exists on the SQI module
	PLIB_SQI_ExistsBurstControl	Identifies whether the BurstControl feature exists on the SQI module
	PLIB_SQI_ExistsChipSelect	Identifies whether the ChipSelect feature exists on the SQI module
	PLIB_SQI_ExistsClockControl	Identifies whether the ClockControl feature exists on the SQI module
	PLIB_SQI_ExistsClockDivider	Identifies whether the ClockDivider feature exists on the SQI module
	PLIB_SQI_ExistsClockReady	Identifies whether the ClockReady feature exists on the SQI module
	PLIB_SQI_ExistsConBufThreshold	Identifies whether the ConBufThreshold feature exists on the SQI module
	PLIB_SQI_ExistsConfigWord	Identifies whether the ConfigWord feature exists on the SQI module

	PLIB_SQI_ExistsControlWord	Identifies whether the ControlWord feature exists on the SQI module
	PLIB_SQI_ExistsCSDeassert	Identifies whether the CSDeassert feature exists on the SQI module
	PLIB_SQI_ExistsCSOutputEnable	Identifies whether the CSOutputEnable feature exists on the SQI module
	PLIB_SQI_ExistsDataFormat	Identifies whether the DataFormat feature exists on the SQI module
	PLIB_SQI_ExistsDataModeControl	Identifies whether the DataModeControl feature exists on the SQI module
	PLIB_SQI_ExistsDataOutputEnable	Identifies whether the DataOutputEnable feature exists on the SQI module
	PLIB_SQI_ExistsDataPinStatus	Identifies whether the DataPinStatus feature exists on the SQI module
	PLIB_SQI_ExistsDmaEnable	Identifies whether the DMAEnable feature exists on the SQI module
	PLIB_SQI_ExistsDMAEngineBusy	Identifies whether the DMAEngineBusy feature exists on the SQI module
	PLIB_SQI_ExistsDMAProcessInProgress	Identifies whether the DMAProcessInProgress feature exists on the SQI module
	PLIB_SQI_ExistsEnableControl	Identifies whether the EnableControl feature exists on the SQI module
	PLIB_SQI_ExistsHoldPinControl	Identifies whether the HoldPinControl feature exists on the SQI module
	PLIB_SQI_ExistsInterruptControl	Identifies whether the InterruptControl feature exists on the SQI module
	PLIB_SQI_ExistsInterruptSignalControl	Identifies whether the InterruptSignalControl feature exists on the SQI module
	PLIB_SQI_ExistsInterruptStatus	Identifies whether the InterruptStatus feature exists on the SQI module
	PLIB_SQI_ExistsLaneMode	Identifies whether the LaneMode feature exists on the SQI module
	PLIB_SQI_ExistsReceiveLatch	Identifies whether the ReceiveLatch feature exists on the SQI module
	PLIB_SQI_ExistsRxBufferCount	Identifies whether the RxBufferCount feature exists on the SQI module
	PLIB_SQI_ExistsRxBufIntThreshold	Identifies whether the RxBufIntThreshold feature exists on the SQI module
	PLIB_SQI_ExistsRxBufThreshold	Identifies whether the RxBufThreshold feature exists on the SQI module
	PLIB_SQI_ExistsRxData	Identifies whether the RxData feature exists on the SQI module
	PLIB_SQI_ExistsRxUnderRun	Identifies whether the RxUnderRun feature exists on the SQI module
	PLIB_SQI_ExistsSoftReset	Identifies whether the SoftReset feature exists on the SQI module
	PLIB_SQI_ExistsStartDMA	Identifies whether the StartDMA feature exists on the SQI module
	PLIB_SQI_ExistsTransferCommand	Identifies whether the TransferCommand feature exists on the SQI module
	PLIB_SQI_ExistsTransferCount	Identifies whether the TransferCount feature exists on the SQI module
	PLIB_SQI_ExistsTransferModeControl	Identifies whether the TransferModeControl feature exists on the SQI module
	PLIB_SQI_ExistsTxBufferFree	Identifies whether the TxBufferFree feature exists on the SQI module
	PLIB_SQI_ExistsTxBufIntThreshold	Identifies whether the TxBufIntThreshold feature exists on the SQI module
	PLIB_SQI_ExistsTxBufThreshold	Identifies whether the TxBufThreshold feature exists on the SQI module

	PLIB_SQI_ExistsTxData	Identifies whether the TxData feature exists on the SQI module
	PLIB_SQI_ExistsTxOverFlow	Identifies whether the TxOverFlow feature exists on the SQI module
	PLIB_SQI_ExistsWPPinControl	Identifies whether the WPPinControl feature exists on the SQI module
	PLIB_SQI_ExistsXIPChipSelect	Identifies whether the XIPChipSelect feature exists on the SQI module
	PLIB_SQI_ExistsXIPControlWord1	Identifies whether the XIPControlWord1 feature exists on the SQI module
	PLIB_SQI_ExistsXIPControlWord2	Identifies whether the XIPControlWord2 feature exists on the SQI module
	PLIB_SQI_ExistsXIPLaneMode	Identifies whether the XIPLaneMode feature exists on the SQI module
	PLIB_SQI_ExistsXIPModeBytes	Identifies whether the XIPModeBytes feature exists on the SQI module
	PLIB_SQI_ExistsXIPModeCode	Identifies whether the XIPModeCode feature exists on the SQI module
	PLIB_SQI_ExistsXIPNumberOfAddressBytes	Identifies whether the XIPNumberOfAddressBytes feature exists on the SQI module
	PLIB_SQI_ExistsXIPNumberOfDummyBytes	Identifies whether the XIPNumberOfDummyBytes feature exists on the SQI module
	PLIB_SQI_ExistsXIPReadOpCode	Identifies whether the XIPReadOpCode feature exists on the SQI module

Interrupt Control and Status Management Functions

	Name	Description
	PLIB_SQI_DataLineStatus	Returns the logical status of the SQI data lines.
	PLIB_SQI_InterruptDisable	Disables the interrupt source.
	PLIB_SQI_InterruptEnable	Enables the interrupt source passed.
	PLIB_SQI_InterruptFlagGet	Return SQI Interrupt flag status.
	PLIB_SQI_InterruptIsEnabled	Returns the interrupt state (eanbled/disabled).
	PLIB_SQI_InterruptSignalDisable	Disables the interrupt signal source.
	PLIB_SQI_InterruptSignalEnable	Enables the interrupt signal source passed.
	PLIB_SQI_InterruptSignalIsEnabled	Returns the interrupt signal state (eanbled/disabled).

Mode Configuration Management Functions

	Name	Description
	PLIB_SQI_BurstEnable	This bit sets the burst enable (BURSTEN) function for higher throughput. This function is artifact of the system bus architecture.
	PLIB_SQI_ClockDisable	Disables the SQI transfer clock.
	PLIB_SQI_ControlBufferThresholdGet	Returns the transmit buffer space in bytes.
	PLIB_SQI_ControlBufferThresholdSet	Sets the control buffer threshold value.
	PLIB_SQI_ControlWordGet	Get the SQI control word.
	PLIB_SQI_ControlWordSet	Sets SQI Control Word.
	PLIB_SQI_CSOutputEnableSelect	Selects the output enables on SQI chip select pins.
	PLIB_SQI_DataFormatGet	Returns the data format to Least Significant Bit First or LITTLE-ENDIAN.
	PLIB_SQI_DataFormatSet	Sets the data format to Least Significant Bit First or LITTLE-ENDIAN.
	PLIB_SQI_DataModeGet	Returns the SQI data mode of operation (SPI Mode0/Mode3).
	PLIB_SQI_DataModeSet	Sets the SQI data mode of operation (SPI Mode0/Mode3/Serial Flash).

	PLIB_SQI_DataOutputEnableSelect	Selects the output enables on SQI data outputs.
	PLIB_SQI_Disable	Disables the SQI module.
	PLIB_SQI_Enable	Enables the SQI module.
	PLIB_SQI_HoldClear	This bit clears the hold function to be disabled on SQID3 in single and dual lane modes.
	PLIB_SQI_HoldGet	This bit gets the status of HOLD function on SQID3 pin.
	PLIB_SQI_HoldSet	This bit sets the hold function to be enabled on SQID3 in single or dual lane modes.
	PLIB_SQI_LaneModeGet	Returns the lane mode (single/dual/quad).
	PLIB_SQI_LaneModeSet	Sets the data lane mode (single/dual/quad).
	PLIB_SQI_NumberOfReceiveBufferReads	Returns the number of receive buffer reads.
	PLIB_SQI_ReceiveData	Reads the data from the receive buffer.
	PLIB_SQI_ReceiveLatchDisable	Disables the receive latch so receive data is discarded when in transmit mode.
	PLIB_SQI_ReceiveLatchEnable	Enable the receive latch so receive data is latched during transmit mode.
	PLIB_SQI_ReceiveLatchGet	Returns the receive latch status in transmit mode.
	PLIB_SQI_SoftReset	This bit issues a soft reset to the SQI module.
	PLIB_SQI_TransferModeGet	Returns the SQI transfer mode (PIO/DMA/XIP) of operation.
	PLIB_SQI_TransferModeSet	Sets the SQI transfer mode (PIO/DMA/XIP) of operation.
	PLIB_SQI_TransmitData	Writes data into the SQI transmit buffer.
	PLIB_SQI_WriteProtectClear	This bit clears the Write-Protect function to be disabled on SQID2 in single or dual lane modes.
	PLIB_SQI_WriteProtectGet	This bit gets the Write-Protect state of Write_Protect Feature on SQID2.
	PLIB_SQI_WriteProtectSet	This bit sets the Write-Protect function to be enabled on SQID2 in single or dual Lane modes only.

PIO Mode Transfer Management Functions

	Name	Description
	PLIB_SQI_ByteCountGet	Returns the current transmit/receive count.
	PLIB_SQI_ByteCountSet	Sets the transmit/receive count.
	PLIB_SQI_ChipSelectDeassertDisable	Clears the chip select de-assert.
	PLIB_SQI_ChipSelectDeassertEnable	Sets the chip select de-assert.
	PLIB_SQI_ChipSelectGet	Returns the chip select that is currently active.
	PLIB_SQI_ChipSelectSet	Activates the chip select.
	PLIB_SQI_ConfigWordGet	Get the SQI configuration word.
	PLIB_SQI_ConfigWordSet	Sets SQI Configuration Word.
	PLIB_SQI_ReceiveBufferIsUnderrun	Returns the status of receive buffer.
	PLIB_SQI_RxBufferThresholdGet	Returns the receive command threshold.
	PLIB_SQI_RxBufferThresholdIntGet	Sets the receive buffer threshold interrupt.
	PLIB_SQI_RxBufferThresholdIntSet	Sets the receive buffer threshold for interrupt.
	PLIB_SQI_RxBufferThresholdSet	Sets the receive command threshold.
	PLIB_SQI_TransferDirectionGet	Returns the transfer command.
	PLIB_SQI_TransferDirectionSet	Sets the transfer command.
	PLIB_SQI_TransmitBufferFreeSpaceGet	Returns the number of transmit buffer words available.
	PLIB_SQI_TransmitBufferHasOverflowed	Returns the current status of the transmit buffer.
	PLIB_SQI_TxBufferThresholdGet	Returns the transmit command threshold value.

	PLIB_SQI_TxBufferThresholdIntGet	Returns the value to trigger the transmit buffer threshold interrupt.
	PLIB_SQI_TxBufferThresholdIntSet	Sets the value to trigger the transmit buffer threshold interrupt.
	PLIB_SQI_TxBufferThresholdSet	Sets the transmit command threshold.

XIP Configuration Management Functions

	Name	Description
	PLIB_SQI_XIPAddressBytesGet	Returns the number of address bytes.
	PLIB_SQI_XIPAddressBytesSet	Sets the number of address bytes.
	PLIB_SQI_XIPChipSelectGet	Returns the current active chip select.
	PLIB_SQI_XIPChipSelectSet	Activates the chip select in XIP mode.
	PLIB_SQI_XIPControlWord1Get	Get the XIP mode control word 1.
	PLIB_SQI_XIPControlWord1Set	Sets the XIP mode control word 1.
	PLIB_SQI_XIPControlWord2Get	Get the XIP mode control word 2.
	PLIB_SQI_XIPControlWord2Set	Sets the XIP mode control word 2.
	PLIB_SQI_XIPDummyBytesGet	Sets the number of dummy bytes.
	PLIB_SQI_XIPDummyBytesSet	Sets the number of dummy bytes.
	PLIB_SQI_XIPLaneModeGet	Returns the lane (single/dual/quad) mode in XIP mode.
	PLIB_SQI_XIPLaneModeSet	Selects the lane (Single/Dual/Quad) mode for different transaction in XIP mode.
	PLIB_SQI_XIPModeBytesGet	Returns the number of bytes used for mode code command.
	PLIB_SQI_XIPModeBytesSet	Allocates the bytes for mode code command.
	PLIB_SQI_XIPModeCodeGet	Returns the mode code op-code.
	PLIB_SQI_XIPModeCodeSet	Sets the mode code command.
	PLIB_SQI_XIPReadOpcodeGet	Returns the read opcode in XIP mode.
	PLIB_SQI_XIPReadOpcodeSet	Sets the read opcode in XIP mode.

Description

This section describes the Application Programming Interface (API) functions of the SQI Peripheral Library. Refer to each section for a detailed description.

5.6.23.5.1 Mode Configuration Management Functions

5.6.23.5.1.1 PLIB_SQI_BurstEnable Function

C

```
void PLIB_SQI_BurstEnable(
    SQI_MODULE_ID index
);
```

Description

This routine enables burst mode for higher throughput. Burst mode should always be enabled.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
PLIB_SQI_BurstEnable(MY_SQI_INSTANCE);
```

5.6.23.5.1.2 PLIB_SQI_ClockDisable Function**C**

```
void PLIB_SQI_ClockDisable(  
    SQI_MODULE_ID index  
);
```

Description

This routine disables the SQI transfer clock (divided clock).

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

SQICLK is disabled.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
PLIB_SQI_ClockDisable(MY_SQI_INSTANCE);
```

5.6.23.5.1.3 PLIB_SQI_ControlBufferThresholdGet Function**C**

```
uint8_t PLIB_SQI_ControlBufferThresholdGet(  
    SQI_MODULE_ID index  
);
```

Description

This routine returns the threshold value for the control buffer in bytes.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

Control buffer threshold space.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
uint8_t conBufThres = PLIB_SQI_ControlBufferThresholdGet(MY_SQI_INSTANCE);
```

5.6.23.5.1.4 PLIB_SQI_ControlBufferThresholdSet Function**C**

```
void PLIB_SQI_ControlBufferThresholdSet(  
    SQI_MODULE_ID index,  
    uint8_t threshold  
);
```

Description

This routine sets the control buffer threshold value in bytes, that is used to signal control buffer threshold interrupts.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
threshold	Control buffer threshold

Returns

None.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer and MY_CONBUF_THRESHOLD is the threshold value.  
PLIB_SQI_ControlBufferThresholdSet(MY_SQI_INSTANCE, MY_CONBUF_THRESHOLD);
```

5.6.23.5.1.5 PLIB_SQI_ControlWordGet Function**C**

```
uint32_t PLIB_SQI_ControlWordGet(  
    SQI_MODULE_ID index  
);
```

Description

This routine returns the SQI control word.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
uint32_t sqiCon = PLIB_SQI_ControlWordGet (MY_SQI_INSTANCE);
```

5.6.23.5.1.6 PLIB_SQI_ControlWordSet Function**C**

```
void PLIB_SQI_ControlWordSet(  
    SQI_MODULE_ID index,  
    bool csDeassert,  
    SQI_CS_NUM csNum,  
    SQI_LANE_MODE laneMode,  
    SQI_XFER_CMD command,  
    uint16_t xferCount  
);
```

Description

This routine sets SQI Control Word. This API is cumulation of multiple APIs, in case driver plans to write the complete control word. In PIO Mode Control word is before each transfer

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
csDeassert	Chip select deassert after transfer
csNum	Active chip select number (0/1)
laneMode	SQI lane mode (QUAL/DUAL/SINGLE)
command	Transfer command (TRANSMIT/RECIEVE/IDLE)
xferCount	Number of bytes to be transmitted/received

Returns

None.

Remarks

Chip select is not actually asserted, only enabled to be asserted.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
PLIB_SQI_ControlWordSet(MY_SQI_INSTANCE,  
    1,  
    SQI_CS_1,
```

```
SQI_LANE_QUAD,  
SQI_CMD_TRANSMIT,  
5  
);
```

5.6.23.5.1.7 PLIB_SQI_CSOutputEnableSelect Function

C

```
void PLIB_SQI_CSOutputEnableSelect(  
    SQI_MODULE_ID index,  
    SQI_CS_OEN csPins  
);
```

Description

This routine enables the selected SQI chip selects as outputs.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
csPins	Chip select pins for which outputs are enabled

Returns

None.

Remarks

Chip select is not actually asserted, only enabled to be asserted.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
PLIB_SQI_CSOutputEnableSelect(MY_SQI_INSTANCE, SQI_CS_OEN_0);
```

5.6.23.5.1.8 PLIB_SQI_DataFormatGet Function

C

```
SQI_DATA_FORMAT PLIB_SQI_DataFormatGet(  
    SQI_MODULE_ID index  
);
```

Description

This routine returns the SQI data format (LSBF/MSBF).

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

True if Data Format is LSBF, else false.

Remarks

Typical data format in most of the Systems is LITTLE ENDIAN.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
SQI_DATA_FORMAT dataFormat = PLIB_SQI_DataFormatGet(MY_SQI_INSTANCE);
```

5.6.23.5.1.9 PLIB_SQI_DataFormatSet Function**C**

```
void PLIB_SQI_DataFormatSet(  
    SQI_MODULE_ID index,  
    SQI_DATA_FORMAT dataformat  
);
```

Description

This routine sets the SQI data format to LSBF (LITTLE-ENDIAN).

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

Typical data format in most of the Systems is LITTLE ENDIAN.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
PLIB_SQI_DataFormatSet(MY_SQI_INSTANCE, SQI_DATA_FORMAT_LSBF);
```

5.6.23.5.1.10 PLIB_SQI_DataModeGet Function**C**

```
SQI_DATA_MODE PLIB_SQI_DataModeGet(  
    SQI_MODULE_ID index  
);
```

Description

This routine returns the SQI data mode (SPI Mode 0/Mode 3) of operation.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

Data mode (SPI Mode 0/Mode 3).

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
SQI_DATA_MODE dataMode = PLIB_SQI_DataModeGet(MY_SQI_INSTANCE);
```

5.6.23.5.1.11 PLIB_SQI_DataModeSet Function**C**

```
void PLIB_SQI_DataModeSet(  
    SQI_MODULE_ID index,  
    SQI_DATA_MODE mode  
);
```

Description

This routine sets the data mode to be SPI Mode 0, SPI Mode 3 or Serial Flash.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
mode	Data mode (Mode 0/ Mode 3)

Returns

None.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer and SQI_DATA_MODE_3 is an enum element.  
PLIB_SQI_DataModeSet(MY_SQI_INSTANCE, SQI_DATA_MODE_SF);
```

5.6.23.5.1.12 PLIB_SQI_DataOutputEnableSelect Function**C**

```
void PLIB_SQI_DataOutputEnableSelect(  
    SQI_MODULE_ID index,  
    SQI_DATA_OEN dataPins  
);
```

Description

This routine enables the selected SQI data lines as outputs.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
dataPins	Data pins for which outputs are enabled

Returns

None.

Remarks

Chip select is not actually asserted, only enabled to be asserted.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
PLIB_SQI_DataOutputEnableSelect(MY_SQI_INSTANCE, SQI_DATA_OEN_DUAL);
```

5.6.23.5.1.13 PLIB_SQI_Disable Function**C**

```
void PLIB_SQI_Disable(  
    SQI_MODULE_ID index  
);
```

Description

This routine disables the SQI module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
PLIB_SQI_Disable(MY_SQI_INSTANCE);
```

5.6.23.5.1.14 PLIB_SQI_Enable Function**C**

```
void PLIB_SQI_Enable(  
    SQI_MODULE_ID index  
);
```

Description

This routine enables the SQI module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

The SQICLK, SQICSx, SQID0, SQID1, SQID2 and SQID3 pins must be assigned to available RPN pins before use.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
PLIB_SQI_Enable(MY_SQI_INSTANCE);
```

5.6.23.5.1.15 PLIB_SQI_HoldClear Function**C**

```
void PLIB_SQI_HoldClear(  
    SQI_MODULE_ID index  
);
```

Description

This routine sets SQID3 to be controlled by SQI for normal data operation.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
PLIB_SQI_HoldClear(MY_SQI_INSTANCE);
```

5.6.23.5.1.16 PLIB_SQI_HoldGet Function**C**

```
void PLIB_SQI_HoldGet(  
    SQI_MODULE_ID index  
);
```

Description

This routine gets the status of HOLD function on SQID3 pin.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
bool holdStatus = PLIB_SQI_HoldGet(MY_SQI_INSTANCE);
```

5.6.23.5.1.17 PLIB_SQI_HoldSet Function**C**

```
void PLIB_SQI_HoldSet(  
    SQI_MODULE_ID index  
);
```

Description

This routine sets the SQID3 pin to HIGH/LOW to be used for hold function in single and dual lane modes for supported flash memories.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This function should be used only when SQI is in single/dual lane modes.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
PLIB_SQI_HoldSet(MY_SQI_INSTANCE);
```

5.6.23.5.1.18 PLIB_SQI_LaneModeGet Function**C**

```
SQI_LANE_MODE PLIB_SQI_LaneModeGet(  
    SQI_MODULE_ID index  
);
```

Description

This routine returns the number of lanes (single/dual/quad) used for transfers.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

Lane Mode.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
SQI_LANE_MODE laneMode = PLIB_SQI_LaneModeGet(MY_SQI_INSTANCE);
```

5.6.23.5.1.19 PLIB_SQI_LaneModeSet Function**C**

```
void PLIB_SQI_LaneModeSet(  
    SQI_MODULE_ID index,  
    SQI_LANE_MODE mode  
);
```

Description

This routine sets the number of lanes (single/dual/quad) used for transfers.

Preconditions

Make sure the output enable is selected on the data lines ([PLIB_SQI_DataOutputEnableSelect](#)). The device needs to be programmed to the same mode that the SQI controller is set to (might require special commands).

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
mode	Lane mode (single/dual/quad)

Returns

None.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
PLIB_SQI_LaneModeSet(MY_SQI_INSTANCE, SQI_LANE_QUAD);
```

5.6.23.5.1.20 PLIB_SQI_NumberOfReceiveBufferReads Function

C

```
uint8_t PLIB_SQI_NumberOfReceiveBufferReads(  
    SQI_MODULE_ID index  
);
```

Description

This routine returns the number of receive buffer reads for debug purpose.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

Number of Receive Buffer Reads.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
uint8_t rxBufReads = PLIB_SQI_ReceiveBufferReadsGet(MY_SQI_INSTANCE);
```

5.6.23.5.1.21 PLIB_SQI_ReceiveData Function

C

```
uint32_t PLIB_SQI_ReceiveData(  
    SQI_MODULE_ID index  
);
```

Description

This routine reads the data from the SQI receive buffer.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
uint32_t receivedData= PLIB_SQI_ReceiveData(MY_SQI_INSTANCE);
```

5.6.23.5.1.22 PLIB_SQI_ReceiveLatchDisable Function

C

```
void PLIB_SQI_ReceiveLatchDisable(  
    SQI_MODULE_ID index  
);
```

Description

This routine disables the receive latch, which disables the receive data to be latched in transmit mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
PLIB_SQI_ReceiveLatchDisable(MY_SQI_INSTANCE);
```

5.6.23.5.1.23 PLIB_SQI_ReceiveLatchEnable Function

C

```
void PLIB_SQI_ReceiveLatchEnable(  
    SQI_MODULE_ID index  
);
```

Description

This routine enables the receive latch, which latches receive data in transmit mode. Otherwise receive data in transmit mode is discarded.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

As most of the SQI communication is half-duplex, enable this function only when it's absolutely required.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.
```

```
PLIB_SQI_ReceiveLatchEnable(MY_SQI_INSTANCE);
```

5.6.23.5.1.24 PLIB_SQI_ReceiveLatchGet Function

C

```
bool PLIB_SQI_ReceiveLatchGet(  
    SQI_MODULE_ID index  
);
```

Description

This routine returns the receive latch status in transmit mode. Returns true, if latch is set (enabling latching of receive buffer data), false if latch is not set (disabling the latching of the receive buffer data).

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

True if Receive latch is set, false if not.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
bool rxLatch = PLIB_SQI_ReceiveLatchGet(MY_SQI_INSTANCE);
```

5.6.23.5.1.25 PLIB_SQI_SoftReset Function

C

```
void PLIB_SQI_SoftReset(  
    SQI_MODULE_ID index  
);
```

Description

This routine issues a software reset to the SQI module clearing all the read/write register, internal state machines and data buffers.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
PLIB_SQI_SoftReset(MY_SQI_INSTANCE);
```

5.6.23.5.1.26 PLIB_SQI_TransferModeGet Function**C**

```
SQI_XFER_MODE PLIB_SQI_TransferModeGet(  
    SQI_MODULE_ID index  
);
```

Description

This routine returns the SQI transfer mode (PIO/DMA/XIP) of operation.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured.

Returns

Transfer mode (PIO/DMA/XIP).

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
SQI_XFER_MODE xferMode = PLIB_SQI_TransferModeGet(MY_SQI_INSTANCE);
```

5.6.23.5.1.27 PLIB_SQI_TransferModeSet Function**C**

```
void PLIB_SQI_TransferModeSet(  
    SQI_MODULE_ID index,  
    SQI_XFER_MODE mode  
);
```

Description

This routine sets the SQI transfer mode (PIO/DMA/XIP) of operation.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
mode	Transfer mode (PIO/DMA/XIP)

Returns

None.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer and SQI_XFER_MODE_DMA is an enum element.  
PLIB_SQI_TransferModeSet(MY_SQI_INSTANCE, SQI_XFER_MODE_DMA);
```

5.6.23.5.1.28 PLIB_SQI_TransmitData Function**C**

```
void PLIB_SQI_TransmitData(  
    SQI_MODULE_ID index,  
    uint32_t data  
);
```

Description

This routine writes the data into the SQI transmit buffer, which will be eventually sent out on SQI bus.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
data	Data to be transmitted

Returns

None.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer and MY_TRANSMIT_DATA is the data to be sent.  
PLIB_SQI_TransmitData(MY_SQI_INSTANCE, MY_TRANSMIT_DATA);
```

5.6.23.5.1.29 PLIB_SQI_WriteProtectClear Function**C**

```
void PLIB_SQI_WriteProtectClear(  
    SQI_MODULE_ID index  
);
```

Description

This routine disables the SQID2 pin to be used for write-protect function.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
PLIB_SQI_WriteProtectClear(MY_SQI_INSTANCE);
```

5.6.23.5.1.30 PLIB_SQI_WriteProtectGet Function**C**

```
bool PLIB_SQI_WriteProtectGet(  
    SQI_MODULE_ID index  
);
```

Description

This routine gets the Write-Protect feature status on SQID2 pin.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
bool wpStatus = PLIB_SQI_WriteProtectGet(MY_SQI_INSTANCE);
```

5.6.23.5.1.31 PLIB_SQI_WriteProtectSet Function**C**

```
void PLIB_SQI_WriteProtectSet(  
    SQI_MODULE_ID index  
);
```

Description

This routine enables the SQID2 pin to be used for write-protect in single and dual lane modes for supported flash memories.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This function should be used only when SQI is in single/dual lane modes.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
PLIB_SQI_WriteProtectSet (MY_SQI_INSTANCE);
```

5.6.23.5.2 Clock Configuration Management Functions

5.6.23.5.2.1 PLIB_SQI_ClockDividerGet Function

C

```
SQI_CLK_DIV PLIB_SQI_ClockDividerGet(  
    SQI_MODULE_ID index  
);
```

Description

This routine returns the SQI clock divider value. The returned value in conjunction with the SQI base clock can be used to get the clock rate of SQI clock.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

Clock Divider Value.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
SQI_CLK_DIV clkDiv = PLIB_SQI_ClockDividerGet(MY_SQI_INSTANCE);
```

5.6.23.5.2.2 PLIB_SQI_ClockDividerSet Function

C

```
void PLIB_SQI_ClockDividerSet(  
    SQI_MODULE_ID index,  
    SQI_CLK_DIV clkDivider  
);
```

Description

This routine sets the SQI clock divider value.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
clkDivider	Clock divider value

Returns

None.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
PLIB_SQI_ClockDividerSet(MY_SQI_INSTANCE, CLK_DIV_1);
```

5.6.23.5.2.3 PLIB_SQI_ClockEnable Function**C**

```
void PLIB_SQI_ClockEnable(  
    SQI_MODULE_ID index  
);
```

Description

This routine enables the SQI transfer clock (divided clock).

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

SQICLK is enabled.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
PLIB_SQI_ClockEnable(MY_SQI_INSTANCE);
```

5.6.23.5.2.4 PLIB_SQI_ClockIsStable Function**C**

```
bool PLIB_SQI_ClockIsStable(  
    SQI_MODULE_ID index  
);
```

Description

This routine returns the SQI transfer clock state.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

True if clock is stable and false if it's not.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
bool clockState = PLIB_SQI_ClockIsStable(MY_SQI_INSTANCE);
```

5.6.23.5.3 XIP Configuration Management Functions

5.6.23.5.3.1 PLIB_SQI_XIPAddressBytesGet Function

C

```
SQI_ADDR_BYTES PLIB_SQI_XIPAddressBytesGet(  
    SQI_MODULE_ID index  
);
```

Description

This routine returns the number of address bytes to be sent to the flash.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

Number of Address Bytes.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
uint8_t addressBytes = PLIB_SQI_XIPAddressBytesGet(MY_SQI_INSTANCE);
```

5.6.23.5.3.2 PLIB_SQI_XIPAddressBytesSet Function

C

```
void PLIB_SQI_XIPAddressBytesSet(  
    SQI_MODULE_ID index,  
    SQI_ADDR_BYTES bytes
```

```
);
```

Description

This routine sets the number of address bytes to be sent to the flash. Typical flash address bytes are 3 (24-bit address).

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
bytes	Number of address bytes

Returns

None.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
PLIB_SQI_XIPAddressBytesSet(MY_SQI_INSTANCE, ADDR_BYTES_3);
```

5.6.23.5.3.3 PLIB_SQI_XIPChipSelectGet Function**C**

```
SQI_CS_NUM PLIB_SQI_XIPChipSelectGet(  
    SQI_MODULE_ID index  
);
```

Description

This routine returns the active chip select in XIP mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
SQI_CS_NUM xipCSActive = (PLIB_SQI_XIPChipSelectGet(MY_SQI_INSTANCE);
```

5.6.23.5.3.4 PLIB_SQI_XIPChipSelectSet Function**C**

```
void PLIB_SQI_XIPChipSelectSet(  

```

```
    SQI_MODULE_ID index,  
    SQI_CS_NUM csNum  
);
```

Description

This routine sets the chip select that is active in XIP mode.

Preconditions

Make sure the chip select output enable is selected on the CS lines ([PLIB_SQI_CSOutputEnableSelect](#)).

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
csNum	Chip select number

Returns

None.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
PLIB_SQI_XIPChipSelectSet(MY_SQI_INSTANCE, SQI_CS_0);
```

5.6.23.5.3.5 PLIB_SQI_XIPControlWord1Get Function**C**

```
uint32_t PLIB_SQI_XIPControlWord1Get(  
    SQI_MODULE_ID index  
);
```

Description

This routine returns the XIP mode control word 1.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
uint32_t xipCon1 = PLIB_SQI_XIPControlWord1Set (MY_SQI_INSTANCE);
```

5.6.23.5.3.6 PLIB_SQI_XIPControlWord1Set Function

C

```
void PLIB_SQI_XIPControlWord1Set(  
    SQI_MODULE_ID index,  
    SQI_DUMMY_BYTES dummyBytes,  
    SQI_ADDR_BYTES addressBytes,  
    uint8_t readOpcode,  
    SQI_LANE_MODE dataLaneMode,  
    SQI_LANE_MODE dummyLaneMode,  
    SQI_LANE_MODE modeCodeLaneMode,  
    SQI_LANE_MODE addressLaneMode,  
    SQI_LANE_MODE cmdLaneMode  
);
```

Description

This routine sets XIP mode control word 1. This routine combines work of multiple PLIB APIs and can be used by the driver where complete XIP control word 1 is being modified.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
dummyBytes	Number of dummy bytes (0-7)
addressBytes	Number of address bytes (0-4)
readOpcode	Quad flash read opcode (ex: 0x0B)
dataLaneMode	Number of SQI data lanes used for sending data bytes
dummyLaneMode	Number of SQI data lanes used for sending dummy bytes
modeCodeLaneMode	Number of SQI data lanes used for sending mode code
addressLaneMode	Number of SQI data lanes used for sending address
cmdLaneMode	Number of SQI data lanes used for sending command

Returns

None.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
PLIB_SQI_XIPControlWord1Set (MY_SQI_INSTANCE,  
                             DUMMY_BYTES_2,  
                             ADDR_BYTES_3,  
                             0x0B,  
                             SQI_LANE_QUAD,  
                             SQI_LANE_QUAD,  
                             SQI_LANE_QUAD,  
                             SQI_LANE_QUAD,  
                             SQI_LANE_QUAD,  
                             );
```

5.6.23.5.3.7 PLIB_SQI_XIPControlWord2Get Function

C

```
uint32_t PLIB_SQI_XIPControlWord2Get(  
    SQI_MODULE_ID index  
);
```

Description

This routine returns the XIP mode control word 2.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
uint32_t xipCon2 = PLIB_SQI_XIPControlWord2Set (MY_SQI_INSTANCE);
```

5.6.23.5.3.8 PLIB_SQI_XIPControlWord2Set Function

C

```
void PLIB_SQI_XIPControlWord2Set(  
    SQI_MODULE_ID index,  
    SQI_CS_NUM devSelect,  
    SQI_MODE_BYTES modeBytes,  
    uint8_t modeCode  
);
```

Description

This routine sets XIP mode control word 2. This routine combines work of multiple PLIB APIs and can be used by the driver where complete XIP control word 2 is being modified.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
modeCode	Mode code used for supported flash devices
modeBytes	Number of mode code bytes
devSelect	Chip select for XIP mode

Returns

None.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
PLIB_SQI_XIPControlWord2Set (MY_SQI_INSTANCE,  
                             SQI_CS_0,  
                             MODE_BYTES_0,  
                             0x0  
                             );
```

5.6.23.5.3.9 PLIB_SQI_XIPDummyBytesGet Function**C**

```
SQI_DUMMY_BYTES PLIB_SQI_XIPDummyBytesGet(  
    SQI_MODULE_ID index  
);
```

Description

This routine returns the number of dummy bytes to be sent to the flash after the address bytes, i.e., before doing a fast read.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
uint8_t dummyBytes = PLIB_SQI_XIPDummyBytesGet(MY_SQI_INSTANCE);
```

5.6.23.5.3.10 PLIB_SQI_XIPDummyBytesSet Function**C**

```
void PLIB_SQI_XIPDummyBytesSet(  
    SQI_MODULE_ID index,  
    SQI_DUMMY_BYTES bytes  
);
```

Description

This routine sets the number of dummy bytes to be sent to the flash after the address bytes, i.e., before doing a fast read.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
bytes	Number of dummy bytes

Returns

None.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
PLIB_SQI_XIPDummyBytesSet(MY_SQI_INSTANCE, DUMMY_BYTE_1);
```

5.6.23.5.3.11 PLIB_SQI_XIPLaneModeGet Function**C**

```
SQI_LANE_MODE PLIB_SQI_XIPLaneModeGet(  
    SQI_MODULE_ID index  
);
```

Description

This routine returns the the number of SQI lanes ((single/dual/quad)) used in XIP mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

Lane Mode (Single/Dual/Quad) that SQI Command uses.

Remarks

This routine can't be called when in XIP mode.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
SQI_LANE_MODE laneMode = PLIB_SQI_XIPCommandTypeGet(MY_SQI_INSTANCE);
```

5.6.23.5.3.12 PLIB_SQI_XIPLaneModeSet Function**C**

```
void PLIB_SQI_XIPLaneModeSet(  
    SQI_MODULE_ID index,  
    SQI_LANE_MODE dataLanes,  
    SQI_LANE_MODE dummyLanes,  
    SQI_LANE_MODE modeLanes,  
    SQI_LANE_MODE addrLanes,  
    SQI_LANE_MODE cmdLanes  
);
```

Description

This routine selects the lane (Single/Dual/Quad) mode for different transaction in XIP mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
dataLanes	Data lane mode (single/dual/quad)
dummyLanes	Dummy lane mode (single/dual/quad)
modeLanes	Mode lane mode (single/dual/quad)
addrLanes	Address lane mode (single/dual/quad)
cmdLanes	Command lane mode (single/dual/quad)

Returns

None.

Remarks

This routine can't be called when in XIP mode.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
PLIB_SQI_XIPLaneModeSet(MY_SQI_INSTANCE,  
                          SQI_QUAD_SINGLE,  
                          SQI_QUAD_SINGLE,  
                          SQI_QUAD_SINGLE,  
                          SQI_QUAD_SINGLE,  
                          SQI_QUAD_SINGLE  
                          );
```

5.6.23.5.3.13 PLIB_SQI_XIPModeBytesGet Function**C**

```
SQI_MODE_BYTES PLIB_SQI_XIPModeBytesGet(  
    SQI_MODULE_ID index  
);
```

Description

This routine returns the number of bytes for the mode code command in XIP mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

Number of Bytes used for Mode Code Command.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
SQI_MODE_BYTES modeCodeBytes = PLIB_SQI_XIPModeBytesGet(MY_SQI_INSTANCE);
```

5.6.23.5.3.14 PLIB_SQI_XIPModeBytesSet Function**C**

```
void PLIB_SQI_XIPModeBytesSet(  
    SQI_MODULE_ID index,  
    SQI_MODE_BYTES bytes  
);
```

Description

This routine sets the number of bytes for the mode code command in XIP mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
bytes	Number of bytes of Mode code

Returns

None.

Remarks

Refer to serial device datasheet for the details on this command.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
PLIB_SQI_XIPModeBytesSet(MY_SQI_INSTANCE, MODE_BYTES_0);
```

5.6.23.5.3.15 PLIB_SQI_XIPModeCodeGet Function**C**

```
uint8_t PLIB_SQI_XIPModeCodeGet(  
    SQI_MODULE_ID index  
);
```

Description

This routine returns the mode code command (opcode) in XIP mode for the devices that support it.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

Mode Code Opcode.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
uint8_t modeCode = PLIB_SQI_XIPModeCodeGet(MY_SQI_INSTANCE);
```

5.6.23.5.3.16 PLIB_SQI_XIPModeCodeSet Function**C**

```
void PLIB_SQI_XIPModeCodeSet(  
    SQI_MODULE_ID index,  
    uint8_t code  
);
```

Description

This routine sets the mode code command in XIP mode for the supported flash devices.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
code	Mode code (byte)

Returns

None.

Remarks

Some of the devices seems to support this command, refer to specific serial device data sheet for op-code and sequence details.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
PLIB_SQI_XIPModeCodeSet(MY_SQI_INSTANCE, MY_MODE_CODE);
```

5.6.23.5.3.17 PLIB_SQI_XIPReadOpcodeGet Function**C**

```
uint8_t PLIB_SQI_XIPReadOpcodeGet(  
    SQI_MODULE_ID index  
);
```

Description

This routine returns the read opcode used in XIP mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

Read Opcode.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
uint8_t readOpcode = PLIB_SQI_XIPReadOpcodeGet(MY_SQI_INSTANCE);
```

5.6.23.5.3.18 PLIB_SQI_XIPReadOpcodeSet Function**C**

```
void PLIB_SQI_XIPReadOpcodeSet(  
    SQI_MODULE_ID index,  
    uint8_t opCode  
);
```

Description

This routine sets the flash read opcode in XIP mode. Value of read opcode depends on the flash device attached.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
opCode	Flash read opcode

Returns

None.

Remarks

Refer to the flash device datasheet for supported read opcodes.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer and MY_READ_OPCODE is the opcode dependant on  
// attached serial device.  
PLIB_SQI_XIPReadOpcodeSet(MY_SQI_INSTANCE, MY_READ_OPCODE);
```

5.6.23.5.4 PIO Mode Transfer Management Functions**5.6.23.5.4.1 PLIB_SQI_ByteCountGet Function****C**

```
uint16_t PLIB_SQI_ByteCountGet(  
    SQI_MODULE_ID index  
);
```

Description

This routine returns the transmit/receive count, which is set by software and is actively controlled and maintained by hardware.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
count	Transmit/Receive count

Returns

Transfer Count.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
uint16_t xferCount = PLIB_SQI_ByteCountGet(MY_SQI_INSTANCE);
```

5.6.23.5.4.2 PLIB_SQI_ByteCountSet Function**C**

```
void PLIB_SQI_ByteCountSet(  
    SQI_MODULE_ID index,  
    uint16_t xferCount  
);
```

Description

This routine sets the number of bytes to transmit or receive, which is set by software and is actively controlled and maintained by hardware.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
count	Transmit/Receive count

Returns

None.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer and MY_XFER_COUNT is the transfer count.  
PLIB_SQI_ByteCountSet(MY_SQI_INSTANCE, MY_XFER_COUNT);
```

5.6.23.5.4.3 PLIB_SQI_ChipSelectDeassertDisable Function**C**

```
void PLIB_SQI_ChipSelectDeassertDisable(  
    SQI_MODULE_ID index
```

```
);
```

Description

This routine disables the chip select de-assert. Chip select stays asserted after transmission or reception of specified number of bytes.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
PLIB_SQI_ChipSelectDeassertDisable(MY_SQI_INSTANCE);
```

5.6.23.5.4.4 PLIB_SQI_ChipSelectDeassertEnable Function**C**

```
void PLIB_SQI_ChipSelectDeassertEnable(  
    SQI_MODULE_ID index  
);
```

Description

This routine enables chip select de-assert. Chip select is de-asserted after transmission or reception of the specified number of bytes.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
PLIB_SQI_ChipSelectDeassertEnable(MY_SQI_INSTANCE);
```

5.6.23.5.4.5 PLIB_SQI_ChipSelectGet Function

C

```
SQI_CS_NUM PLIB_SQI_ChipSelectGet(  
    SQI_MODULE_ID index  
);
```

Description

This routine returns the chip select that is currently active.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

Chip Select (2-bit) - Current chip select active (0/1).

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
SQI_CS_NUM csNum = PLIB_SQI_ChipSelectGet(MY_SQI_INSTANCE);
```

5.6.23.5.4.6 PLIB_SQI_ChipSelectSet Function

C

```
void PLIB_SQI_ChipSelectSet(  
    SQI_MODULE_ID index,  
    SQI_CS_NUM csNum  
);
```

Description

This routine sets the chip select to be activated on the next transaction.

Preconditions

Make sure the chip select output enable is selected on the CS lines ([PLIB_SQI_CSOutputEnableSelect](#)).

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
csNum	Chip select number

Returns

None.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the
```

```
// application developer and SQI_CS_NUM_0 is the enum element.  
PLIB_SQI_ChipSelectSet(MY_SQI_INSTANCE, SQI_CS_NUM_0);
```

5.6.23.5.4.7 PLIB_SQI_ConfigWordGet Function

C

```
uint32_t PLIB_SQI_ConfigWordGet(  
    SQI_MODULE_ID index  
);
```

Description

This routine returns the SQI configuration word.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
uint32_t sqiCfg = PLIB_SQI_ConfigWordGet (MY_SQI_INSTANCE);
```

5.6.23.5.4.8 PLIB_SQI_ConfigWordSet Function

C

```
void PLIB_SQI_ConfigWordSet(  
    SQI_MODULE_ID index,  
    bool sqiEnable,  
    SQI_CS_OEN csPins,  
    SQI_DATA_OEN dataPins,  
    bool reset,  
    bool burstEn,  
    bool hold,  
    bool writeProtect,  
    bool rxLatch,  
    SQI_DATA_FORMAT lsbF,  
    SQI_DATA_MODE dataMode,  
    SQI_XFER_MODE xferMode  
);
```

Description

This routine sets SQI Configuration Word. This API is cumulation of multiple APIs, in case driver plans to write the complete configuration word.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
sqiEnable	Enables/Disables the SQI module
csPins	Chip Select Output Enable
dataPins	Data Output Enable
reset	Resets control, transmit, receive buffers and state machines
burstEn	Burst Enable (always set to '1')
hold	SQID2 to act as HOLD# signal in single and dual lane modes
writeProtect	SQID3 to act as WP# signal in single and dual lane modes
rxLatch	Activates receive latch in transmit mode
lsbf	Sets data endian mode to least significant bit first (LSBF)
dataMode	Sets data mode to mode 0/mode 1/serial flash mode
xferMode	Sets transfer mode to XIP/DMA/PIO mode

Returns

None.

Remarks

Chip select is not actually asserted, only enabled to be asserted.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the
// application developer.
PLIB_SQI_ConfigWordSet(MY_SQI_INSTANCE,
    1,
    SQI_CS_OEN_0,
    SQI_DATA_OEN_QUAD,
    0,
    1,
    0,
    0,
    0,
    0,
    SQI_DATA_FORMAT_LSBF,
    SQI_DATA_MODE_3,
    SQI_XFER_MODE_PIO
);
```

5.6.23.5.4.9 PLIB_SQI_ReceiveBufferIsUnderrun Function**C**

```
bool PLIB_SQI_ReceiveBufferIsUnderrun(
    SQI_MODULE_ID index
);
```

Description

This routine returns the status of the receive buffer.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

True if Receive Buffer is Underrun, False if not.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
bool rxun = PLIB_SQI_ReceiveBufferIsUnderrun(MY_SQI_INSTANCE);
```

5.6.23.5.4.10 PLIB_SQI_RxBufferThresholdGet Function**C**

```
uint8_t PLIB_SQI_RxBufferThresholdGet(  
    SQI_MODULE_ID index  
);
```

Description

This routine returns the receive command threshold that is used to monitor receives based on the receive buffer space availability.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

Receive Buffer Threshold value.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
uint8_t rxBufThres = PLIB_SQI_RxCommandThresholdGet(MY_SQI_INSTANCE);
```

5.6.23.5.4.11 PLIB_SQI_RxBufferThresholdIntGet Function**C**

```
uint8_t PLIB_SQI_RxBufferThresholdIntGet(  
    SQI_MODULE_ID index  
);
```

Description

This routine returns the receive buffer threshold used to set an interrupt.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
threshold	Receive interrupt (buffer) threshold

Returns

Receive Buffer Threshold value (used to trigger an interrupt).

Remarks

This is a 5-bit field and bits 7,6,5 are ignored in the char.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the
// application developer.
uint8_t rxBufIntThres = PLIB_SQI_RxBufferThresholdIntGet(MY_SQI_INSTANCE);
```

5.6.23.5.4.12 PLIB_SQI_RxBufferThresholdIntSet Function**C**

```
void PLIB_SQI_RxBufferThresholdIntSet(
    SQI_MODULE_ID index,
    uint8_t threshold
);
```

Description

This routine sets the receive buffer threshold used to trigger an interrupt. Sets an interrupt condition when receive buffer count is larger than or equal to the receive interrupt threshold bytes.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
threshold	Receive buffer threshold for interrupt

Returns

None.

Remarks

This is a 5-bit field and bits 7,6,5 are ignored in the char.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the
// application developer and MY_RX_INT_THRESHOLD is the threshold value.
PLIB_SQI_RxBufferThresholdIntSet(MY_SQI_INSTANCE, MY_RX_INT_THRESHOLD);
```

5.6.23.5.4.13 PLIB_SQI_RxBufferThresholdSet Function**C**

```
void PLIB_SQI_RxBufferThresholdSet(
    SQI_MODULE_ID index,
    uint8_t threshold
);
```

Description

This routine sets the receive command threshold that is used to monitor receives based on the receive buffer space availability.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
threshold	Receive command (buffer) threshold

Returns

None.

Remarks

Valid threshold values are 0-31.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer and MY_RECEIVE_THRESHOLD is the receive threshold value.  
PLIB_SQI_RxCommandThresholdSet(MY_SQI_INSTANCE, MY_RECEIVE_THRESHOLD);
```

5.6.23.5.4.14 PLIB_SQI_TransferDirectionGet Function**C**

```
SQI_XFER_CMD PLIB_SQI_TransferDirectionGet(  
    SQI_MODULE_ID index  
);
```

Description

This routine returns the transfer command that is active currently.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

Transfer Command (Idle/Receive/Transmit).

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
SQI_XFER_CMD xferDirection = PLIB_SQI_TransferDirectionGet(MY_SQI_INSTANCE);
```

5.6.23.5.4.15 PLIB_SQI_TransferDirectionSet Function**C**

```
void PLIB_SQI_TransferDirectionSet(  
    SQI_MODULE_ID index,
```

```
    SQI_XFER_CMD  command
);
```

Description

This routine sets the transfer command to Idle/Transmit/Receive.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
command	Transfer command

Returns

None.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer and SQI_CMD_TRANSMIT is an enum element.  
PLIB_SQI_TransferDirectionSet(MY_SQI_INSTANCE, SQI_CMD_TRANSMIT);
```

5.6.23.5.4.16 PLIB_SQI_TransmitBufferFreeSpaceGet Function

C

```
uint8_t PLIB_SQI_TransmitBufferFreeSpaceGet(  
    SQI_MODULE_ID index  
);
```

Description

This routine returns the number of transmit buffer bytes available.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

Amount of transmit buffer space free in bytes.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
uint8_t txBufFreeSpace = PLIB_SQI_TransmitBufferFreeSpaceGet(MY_SQI_INSTANCE);
```

5.6.23.5.4.17 PLIB_SQI_TransmitBufferHasOverflowed Function

C

```
bool PLIB_SQI_TransmitBufferHasOverflowed(  
    SQI_MODULE_ID index  
);
```

Description

This routine returns the current state of the transmit buffer.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

True if Transmit Buffer has Overflowed, false if not.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
bool tx0v = PLIB_SQI_TransmitBufferHasOverflowed(MY_SQI_INSTANCE);
```

5.6.23.5.4.18 PLIB_SQI_TxBufferThresholdGet Function

C

```
uint8_t PLIB_SQI_TxBufferThresholdGet(  
    SQI_MODULE_ID index  
);
```

Description

This routine returns the transmit command threshold value that is used to monitor transmits based on the transmit buffer space availability.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

Transmit buffer threshold value.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.
```

```
uint8_t txThreshold = PLIB_SQI_TxBufferThresholdGet(MY_SQI_INSTANCE);
```

5.6.23.5.4.19 PLIB_SQI_TxBufferThresholdIntGet Function

C

```
uint8_t PLIB_SQI_TxBufferThresholdIntGet(  
    SQI_MODULE_ID index  
);
```

Description

This routine returns the transmit buffer threshold used to set an interrupt. When enabled, interrupt is triggered when transmit buffer has more space than the transmit interrupt threshold bytes.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

Transmit buffer threshold for interrupt.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
uint8_t txBufIntThres = PLIB_SQI_TxBufferThresholdIntGet(MY_SQI_INSTANCE);
```

5.6.23.5.4.20 PLIB_SQI_TxBufferThresholdIntSet Function

C

```
void PLIB_SQI_TxBufferThresholdIntSet(  
    SQI_MODULE_ID index,  
    uint8_t threshold  
);
```

Description

This routine sets the transmit buffer threshold used for an interrupt. When enabled, interrupt is triggered when transmit buffer has more space than the transmit interrupt threshold bytes.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
threshold	Transmit interrupt (buffer) threshold

Returns

None.

Remarks

This is a 5-bit field and bits 7,6,5 are ignored in the char.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the
// application developer and MY_TX_INT_THRESHOLD is the threshold value.
PLIB_SQI_TxBufferThresholdIntSet(MY_SQI_INSTANCE, MY_TX_INT_THRESHOLD);
```

5.6.23.5.4.21 PLIB_SQI_TxBufferThresholdSet Function

C

```
void PLIB_SQI_TxBufferThresholdSet(
    SQI_MODULE_ID index,
    uint8_t threshold
);
```

Description

This routine sets the transmit command threshold, which is used to control transmits based on the transmit buffer space availability.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
threshold	Transmit command (buffer) threshold

Returns

None.

Remarks

Valid threshold values are 0-31.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the
// application developer and MY_TRANSMIT_THRESHOLD is the threshold value.
PLIB_SQI_TxBufferThresholdSet(MY_SQI_INSTANCE, MY_TRANSMIT_THRESHOLD);
```

5.6.23.5.5 Interrupt Control and Status Management Functions

5.6.23.5.5.1 PLIB_SQI_DataLineStatus Function

C

```
bool PLIB_SQI_DataLineStatus(
    SQI_MODULE_ID index,
    bool dataPin
);
```

Description

This routine returns the logical status of the data lines(0/1).

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
dataPin	Data pin for which status will be returned (0/1/2/3)

Returns

SQIDx Status (High/Low).

Remarks

Parsing values other than 0/1/2/3 returns SQID0 pin status.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the
// application developer.
bool sqiDataLineStatus = PLIB_SQI_DataLineStatus(MY_SQI_INSTANCE, 3);
```

5.6.23.5.5.2 PLIB_SQI_InterruptDisable Function**C**

```
void PLIB_SQI_InterruptDisable(
    SQI_MODULE_ID index,
    SQI_INTERRUPTS interruptFlag
);
```

Description

This routine disables the interrupt source passed into the function.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
interruptFlag	Interrupt to be disabled

Returns

None.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the
// application developer and TXFULL is an enum element.
PLIB_SQI_InterruptDisable(MY_SQI_INSTANCE, SQI_TXFULL);
```

5.6.23.5.5.3 PLIB_SQI_InterruptEnable Function**C**

```
void PLIB_SQI_InterruptEnable(
    SQI_MODULE_ID index,
    SQI_INTERRUPTS interruptFlag
);
```

Description

This routine enables the interrupt source passed into the function.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
interruptFlag	Interrupt to be enabled

Returns

None.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the
// application developer.
PLIB_SQI_InterruptEnable(MY_SQI_INSTANCE, SQI_TXFULL);
```

5.6.23.5.5.4 PLIB_SQI_InterruptFlagGet Function**C**

```
bool PLIB_SQI_InterruptFlagGet(
    SQI_MODULE_ID index,
    SQI_INTERRUPTS interruptFlag
);
```

Description

This routine returns the SQI interrupt source flag status (set/cleared).

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
interruptFlag	Interrupt flag of interest

Returns

Interrupt status.

Remarks

None.

Example

```
if ( PLIB_SQI_InterruptFlagGet(MY_SQI_INSTANCE, SQI_INT_ANY) )
    if ( PLIB_SQI_InterruptFlagGet(MY_SQI_INSTANCE, SQI_TXFULL) )
    {
        ...
    }
    if ( PLIB_SQI_InterruptFlagGet(MY_SQI_INSTANCE, SQI_RXFULL) )
    {
```

```
        ...
    }
    .
    .
    .
}
```

5.6.23.5.5.5 PLIB_SQI_InterruptIsEnabled Function

C

```
bool PLIB_SQI_InterruptIsEnabled(
    SQI_MODULE_ID index,
    SQI_INTERRUPTS interruptFlag
);
```

Description

This routine returns the interrupt state.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
interruptFlag	Interrupt under check

Returns

True if Interrupt is Enabled, else false.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the
// application developer.
if (PLIB_SQI_InterruptIsEnabled(MY_SQI_INSTANCE, SQI_TXFULL))
{
    ..
}
```

5.6.23.5.5.6 PLIB_SQI_InterruptSignalDisable Function

C

```
void PLIB_SQI_InterruptSignalDisable(
    SQI_MODULE_ID index,
    SQI_INTERRUPTS interruptFlag
);
```

Description

This routine disables the interrupt signals source passed into the function, thus prohibiting it from reaching to the external interrupt controller.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
interruptFlag	Interrupt to be disabled

Returns

None.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
PLIB_SQI_InterruptSignalDisable(MY_SQI_INSTANCE, SQI_TXFULL);
```

5.6.23.5.5.7 PLIB_SQI_InterruptSignalEnable Function**C**

```
void PLIB_SQI_InterruptSignalEnable(  
    SQI_MODULE_ID index,  
    SQI_INTERRUPTS interruptFlag  
);
```

Description

This routine enables the interrupt signal source passed into the function, thus letting it go out to the external interrupt controller.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
interruptFlag	Interrupt to be enabled

Returns

None.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
PLIB_SQI_InterruptSignalEnable(MY_SQI_INSTANCE, SQI_TXFULL);
```

5.6.23.5.5.8 PLIB_SQI_InterruptSignalIsEnabled Function**C**

```
bool PLIB_SQI_InterruptSignalIsEnabled(  
    SQI_MODULE_ID index,  
    SQI_INTERRUPTS interruptFlag  
);
```

Description

This routine returns the interrupt signal state.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
interruptFlag	Interrupt signal under check

Returns

Boolean flag - Interrupt state true - Interrupt signal is enabled false - Interrupt signal is disabled

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
if (PLIB_SQI_InterruptSignalIsEnabled(MY_SQI_INSTANCE, SQI_TXFULL))  
{  
    ..  
}
```

5.6.23.5.6 DMA Buffer Address Management Functions

5.6.23.5.6.1 PLIB_SQI_DMABDBaseAddressGet Function

C

```
void* PLIB_SQI_DMABDBaseAddressGet(  
    SQI_MODULE_ID index  
);
```

Description

This routine returns the address of the base DMA buffer descriptor.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

Base Buffer Descriptor Address.

Remarks

Check to make sure if DMA Buffer Descriptor fetch is in progress.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
void *baseBDAddress;
```

```
If (!PLIB_SQI_DMAIsActive(MY_SQI_INSTANCE))
{
    baseBDAddress = PLIB_SQI_DMABDBaseAddressGet(MY_SQI_INSTANCE);
}
```

5.6.23.5.6.2 PLIB_SQI_DMABDBaseAddressSet Function

C

```
void PLIB_SQI_DMABDBaseAddressSet(
    SQI_MODULE_ID index,
    void * baseBDAddress
);
```

Description

This routine writes the address of the base (first/only) buffer descriptor into the buffer descriptor base address register.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
baseBDAddress	Base buffer descriptor address

Returns

None.

Remarks

Check to make sure if DMA Buffer Descriptor fetch is in progress.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the
// application developer.
if (!PLIB_SQI_DMAIsActive(MY_SQI_INSTANCE))
    PLIB_SQI_DMABDBaseAddressSet(MY_SQI_INSTANCE, (void *) (&MY_BD_STRUCT));
```

5.6.23.5.6.3 PLIB_SQI_DMABDCurrentAddressGet Function

C

```
void* PLIB_SQI_DMABDCurrentAddressGet(
    SQI_MODULE_ID index
);
```

Description

This routine returns the address of the DMA buffer descriptor that is currently in progress.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

Current Buffer Descriptor Address.

Remarks

Check to make sure if DMA Buffer Descriptor fetch is in progress.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
uint32_t currentBDAddress;  
  
If (PLIB_SQI_DMAIsActive(MY_SQI_INSTANCE))  
{  
    void* currentBDAddress = PLIB_SQI_DMABDCurrentAddressGet(MY_SQI_INSTANCE);  
}
```

5.6.23.5.7 DMA Buffer Descriptor Management Functions

5.6.23.5.7.1 PLIB_SQI_DMABDControlWordGet Function

C

```
uint16_t PLIB_SQI_DMABDControlWordGet(  
    SQI_MODULE_ID index  
);
```

Description

This routine returns current buffer descriptor control word information excluding buffer length. This information is returned in transmit and receive status functions.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

Control Word - DMA Buffer Descriptor Control Word

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
uint16_t dmabdconword;  
  
dmabdconword = PLIB_SQI_DMABDControlWordGet(MY_SQI_INSTANCE);  
  
switch (dmabdconword)  
{  
    case BD_ENABLED: ...;  
    case BD_DISABLED: ...;  
    .  
    .  
    .  
}
```

5.6.23.5.7.2 PLIB_SQI_DMABDReceiveBufferCountGet Function

C

```
uint8_t PLIB_SQI_DMABDReceiveBufferCountGet(  
    SQI_MODULE_ID index  
);
```

Description

This routine returns the current receive buffer space in bytes.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

Receive buffer space in bytes.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
uint8_t bdRxBufCount = PLIB_SQI_DMABDReceiveBufferCountGet(MY_SQI_INSTANCE);
```

5.6.23.5.7.3 PLIB_SQI_DMABDReceiveBufferLengthGet Function

C

```
uint8_t PLIB_SQI_DMABDReceiveBufferLengthGet(  
    SQI_MODULE_ID index  
);
```

Description

This routine returns the current receive length in bytes.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

Receive buffer space in bytes.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
uint8_t bdRxBufLength = PLIB_SQI_DMABDReceiveBufferLengthGet(MY_SQI_INSTANCE);
```

5.6.23.5.7.4 PLIB_SQI_DMABDReceiveStateGet Function

C

```
SQI_BD_STATE PLIB_SQI_DMABDReceiveStateGet(  
    SQI_MODULE_ID index  
);
```

Description

This routine returns the current state of the buffer descriptor in progress.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

Status - DMA Buffer Descriptor State

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
uint8_t bdrxState = PLIB_SQI_DMABDReceiveStateGet(MY_SQI_INSTANCE);  
  
switch (bdrxState)  
{  
    case BD_IDLE: ...;  
    case BD_STATE_FETCH_REQ_PENDING: ...;  
    .  
    .  
    .  
}
```

5.6.23.5.7.5 PLIB_SQI_DMABDTransmitBufferCountGet Function

C

```
uint8_t PLIB_SQI_DMABDTransmitBufferCountGet(  
    SQI_MODULE_ID index  
);
```

Description

This routine returns the current transmit buffer space in bytes.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

Transmit buffer space in bytes.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
uint8_t bdTxBufCount = PLIB_SQI_DMABDTransmitBufferCountGet(MY_SQI_INSTANCE);
```

5.6.23.5.7.6 PLIB_SQI_DMABDTransmitBufferLengthGet Function**C**

```
uint8_t PLIB_SQI_DMABDTransmitBufferLengthGet(  
    SQI_MODULE_ID index  
);
```

Description

This routine returns the current transmit length in bytes.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

Transmit buffer space in bytes.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
uint8_t bdTxBufLength = PLIB_SQI_DMABDTransmitBufferLengthGet(MY_SQI_INSTANCE);
```

5.6.23.5.7.7 PLIB_SQI_DMABDTransmitStateGet Function**C**

```
SQI_BD_STATE PLIB_SQI_DMABDTransmitStateGet(  
    SQI_MODULE_ID index  
);
```

Description

This routine returns the current state of the buffer descriptor in progress.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

Status - DMA Buffer Descriptor State

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the
// application developer.
uint8_t bdTxState = PLIB_SQI_DMABDTransmitStateGet(MY_SQI_INSTANCE);

switch (bdTxState)
{
    case BD_IDLE: ...;
    case BD_FETCH_REQ_PENDING: ...;
    .
    .
    .
}
```

5.6.23.5.8 DMA Control and Status Management Functions

5.6.23.5.8.1 PLIB_SQI_DMABDFetchStart Function

C

```
void PLIB_SQI_DMABDFetchStart(
    SQI_MODULE_ID index
);
```

Description

This routine starts the DMA buffer descriptor fetch process.

Preconditions

Make sure the buffer descaptors are setup and the buffer descriptor base address register is pointing to the first/only buffer descriptor. Also ensure any previous BD processing is fixed.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the
// application developer.
PLIB_SQI_DMABDFetchStart(MY_SQI_INSTANCE);
```

5.6.23.5.8.2 PLIB_SQI_DMABDIsBusy Function

C

```
bool PLIB_SQI_DMABDIsBusy(
    SQI_MODULE_ID index
);
```

Description

This routine returns true if DMA buffer descriptor process is busy, if not returns false.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

True if DMA Buffer Descriptor is Busy.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
bool bdBusy = PLIB_SQI_DMABDIsBusy(MY_SQI_INSTANCE)
```

5.6.23.5.8.3 PLIB_SQI_DMABDPollCounterSet Function**C**

```
void PLIB_SQI_DMABDPollCounterSet(  
    SQI_MODULE_ID index,  
    uint16_t pollCount  
);
```

Description

This routine sets the poll counter value that indicates the number of cycles the DMA would wait before fetching the next descriptor word, if the current descriptor fetched was disabled.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
pollControl	Polling value

Returns

None.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
if (PLIB_SQI_DMABDPollIsEnabled(MY_SQI_INSTANCE)  
{  
    PLIB_SQI_DMABDPollCounterSet(MY_SQI_INSTANCE, MY_POLL_VALUE);  
}
```

5.6.23.5.8.4 PLIB_SQI_DMABDPollDisable Function

C

```
void PLIB_SQI_DMABDPollDisable(  
    SQI_MODULE_ID index  
);
```

Description

This routine disables the buffer descriptor polling.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
PLIB_SQI_DMABDPollDisable(MY_SQI_INSTANCE);
```

5.6.23.5.8.5 PLIB_SQI_DMABDPollEnable Function

C

```
void PLIB_SQI_DMABDPollEnable(  
    SQI_MODULE_ID index  
);
```

Description

This routine enables the buffer descriptor polling and works in tandem with poll control register.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

Enable this control bit only when you are planning to have dead descriptors in the linked list.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
PLIB_SQI_DMABDPollEnable(MY_SQI_INSTANCE);
```

5.6.23.5.8.6 PLIB_SQI_DMABDPollIsEnabled Function

C

```
bool PLIB_SQI_DMABDPollIsEnabled(  
    SQI_MODULE_ID index  
);
```

Description

This routine returns true/false if DMA buffer descriptor poll is enabled/disabled.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

True if DMA Poll Control is Enabled, else it's false.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
If (PLIB_SQI_DMABDPollIsEnabled(MY_SQI_INSTANCE))  
{  
    PLIB_SQI_PollControlSet(MY_SQI_INSTANCE, MY_POLL_CONTROL_VALUE);  
}
```

5.6.23.5.8.7 PLIB_SQI_DMABDStateGet Function

C

```
SQI_BD_STATE PLIB_SQI_DMABDStateGet(  
    SQI_MODULE_ID index  
);
```

Description

This routine returns the current state of the buffer descriptor in progress.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

Status - DMA Buffer Descriptor State

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the
// application developer.
uint8_t bdState = PLIB_SQI_DMABDStateGet(MY_SQI_INSTANCE);

switch (bdState)
{
    case BD_IDLE: ...;
    case BD_FETCH_REQ_PENDING: ...;
    .
    .
    .
}
```

5.6.23.5.8.8 PLIB_SQI_DMADisable Function

C

```
void PLIB_SQI_DMADisable(
    SQI_MODULE_ID index
);
```

Description

This routine disables the built-in DMA logic for data transfer.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the
// application developer.
PLIB_SQI_DMADisable(MY_SQI_INSTANCE);
```

5.6.23.5.8.9 PLIB_SQI_DMAEnable Function

C

```
void PLIB_SQI_DMAEnable(
    SQI_MODULE_ID index
);
```

Description

This routine enables the built-in DMA logic for data transfer.

Preconditions

DMA buffer descriptors need to be setup before enabling the DMA.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
PLIB_SQI_DMAEnable(MY_SQI_INSTANCE);
```

5.6.23.5.8.10 PLIB_SQI_DMAHasStarted Function**C**

```
bool PLIB_SQI_DMAHasStarted(  
    SQI_MODULE_ID index  
);
```

Description

This routine returns true if DMA process started and false if DMA process has not started.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

True if DMA process has started, false if not.

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the  
// application developer.  
bool dmaStarted = PLIB_SQI_DMAHasStarted (MY_SQI_INSTANCE)
```

5.6.23.5.8.11 PLIB_SQI_DMAIsEnabled Function**C**

```
bool PLIB_SQI_DMAIsEnabled(  
    SQI_MODULE_ID index  
);
```

Description

This routine returns true/false if DMA is enabled/disabled.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

Boolean Flag - DMA Enable Status true - DMA is enabled false - DMA is disabled

Remarks

None.

Example

```
// Where MY_SQI_INSTANCE, is the SQI instance selected for use by the
// application developer.
If (PLIB_SQI_DMAIEnabled(MY_SQI_INSTANCE))
{
    ...
}
```

5.6.23.5.9 Data Types and Constants**5.6.23.5.9.1 SQI_ADDR_BYTES Enumeration****C**

```
typedef enum {
    ADDR_BYTES_4,
    ADDR_BYTES_3,
    ADDR_BYTES_2,
    ADDR_BYTES_1,
    ADDR_BYTES_0
} SQI_ADDR_BYTES;
```

Description

SQI Number of Address Bytes

This macro defines the list of SQI Address Bytes

Members

Members	Description
ADDR_BYTES_4	SQI is set to Transmit 4 Address Bytes
ADDR_BYTES_3	SQI is set to Transmit 3 Address Bytes
ADDR_BYTES_2	SQI is set to Transmit 2 Address Bytes
ADDR_BYTES_1	SQI is set to Transmit 1 Address Bytes
ADDR_BYTES_0	SQI is set to Transmit No Address Bytes

5.6.23.5.9.2 SQI_BD_CTRL_WORD Enumeration**C**

```
typedef enum {
    BD_ENABLE,
    BD_DISABLE,
    CS_1_ACTIVE,
    CS_0_ACTIVE,
    FLASH_SC_ENABLE,
    FLASH_SC_DISABLE,
    SET_LSBF,
```

```

SET_MSBF,
DMA_LANE_QUAD,
DMA_LANE_DUAL,
DMA_LANE_SINGLE,
DMA_IN_TRANSMIT,
DMA_IN_RECEIVE,
LAST_BD,
NOT_LAST_BD,
LAST_PKT,
NOT_LAST_PKT,
PKT_INT_ENABLE,
PKT_INT_DISABLE,
BD_DONE_INT_ENABLE,
BD_DONE_INT_DISABLE,
BD_BUF_LENGTH
} SQI_BD_CTRL_WORD;

```

Description

SQI Buffer Descriptor Control Words

This macro defines the list of SQI Buffer Descriptor Control Word

Members

Members	Description
BD_ENABLE	Current Buffer Descriptor is Enabled
BD_DISABLE	Current Buffer Descriptor is Disabled
CS_1_ACTIVE	Chip Select 1 is Active
CS_0_ACTIVE	Chip Select 0 is Active
FLASH_SC_ENABLE	Automatic Status Check Enabled
FLASH_SC_DISABLE	Automatic Status Check Disabled
SET_LSBF	Least Significant Bit First
SET_MSBF	Most Significant Bit First
DMA_LANE_QUAD	DMA writes/reads in Quad Lane Mode
DMA_LANE_DUAL	DMA writes/reads in Dual Lane Mode
DMA_LANE_SINGLE	DMA writes/reads in Single Lane Mode
DMA_IN_TRANSMIT	DMA is Transmitting
DMA_IN_RECEIVE	DMA is Receiving
LAST_BD	Indicates Last Buffer Descriptor in the List
NOT_LAST_BD	Indicates Non Last Buffer Descriptor in the List
LAST_PKT	Indicates Last Packet of the Data Chunk
NOT_LAST_PKT	Indicates Non Last Packet of the Data Chunk
PKT_INT_ENABLE	Indicates Packet Interrupt is Enabled
PKT_INT_DISABLE	Indicates Packet Interrupt is Disabled
BD_DONE_INT_ENABLE	Indicates Buffer Descriptor Done Interrupt is Enabled
BD_DONE_INT_DISABLE	Indicates Buffer Descriptor Done Interrupt is Disabled
BD_BUF_LENGTH	Indicates Buffer Length

5.6.23.5.9.3 SQI_BD_STATE Enumeration

C

```

typedef enum {
    BD_STATE_DISABLED,
    BD_STATE_DONE,
    BD_STATE_PROCESSING_DATA,

```

```

    BD_STATE_BEING_FETCHED,
    BD_STATE_FETCH_REQ_PENDING,
    BD_STATE_IDLE
} SQI_BD_STATE;

```

Description

SQI Buffer Descriptor (BD) State

This macro defines the list of SQI Buffer Descriptor states

Members

Members	Description
BD_STATE_DISABLED	Fetches Buffer Descriptor is Disabled
BD_STATE_DONE	Fetches Buffer Descriptor Processed
BD_STATE_PROCESSING_DATA	Fetches Buffer Descriptor is in Data transfer phase
BD_STATE_BEING_FETCHED	In the process of Fetching the Buffer Descriptor
BD_STATE_FETCH_REQ_PENDING	Buffer Descriptor Fetch Request Pending
BD_STATE_IDLE	Buffer Descriptor process is idle

5.6.23.5.9.4 SQI_CLK_DIV Enumeration**C**

```

typedef enum {
    CLK_DIV_256,
    CLK_DIV_128,
    CLK_DIV_64,
    CLK_DIV_32,
    CLK_DIV_16,
    CLK_DIV_8,
    CLK_DIV_4,
    CLK_DIV_2,
    CLK_DIV_1
} SQI_CLK_DIV;

```

Description

SQI Clock Divider

This macro defines the list of SQI Clock Divider Values

Members

Members	Description
CLK_DIV_256	SQI Clock is divided by 256
CLK_DIV_128	SQI Clock is divided by 128
CLK_DIV_64	SQI Clock is divided by 64
CLK_DIV_32	SQI Clock is divided by 32
CLK_DIV_16	SQI Clock is divided by 16
CLK_DIV_8	SQI Clock is divided by 8
CLK_DIV_4	SQI Clock is divided by 4
CLK_DIV_2	SQI Clock is divided by 2
CLK_DIV_1	SQI Clock is not divided

5.6.23.5.9.5 SQI_CS_NUM Enumeration

C

```
typedef enum {
    SQI_CS_1,
    SQI_CS_0
} SQI_CS_NUM;
```

Description

SQI Device Select or Chip Select

This macro defines the list of SQI Chip Selects

Members

Members	Description
SQI_CS_1	SQI Chip Select 1
SQI_CS_0	SQI Chip Select 0

5.6.23.5.9.6 SQI_CS_OEN Enumeration

C

```
typedef enum {
    SQI_CS_OEN_BOTH,
    SQI_CS_OEN_1,
    SQI_CS_OEN_0,
    SQI_CS_OEN_NONE
} SQI_CS_OEN;
```

Description

SQI Chip Select Output Enable

This macro defines the list of SQI Chip Select Output Enables

Members

Members	Description
SQI_CS_OEN_BOTH	SQI chip select 0 and 1 are enabled
SQI_CS_OEN_1	SQI chip select 1 is enabled but chip select 0 is disabled
SQI_CS_OEN_0	SQI chip select 0 is enabled but chip select 1 is disabled
SQI_CS_OEN_NONE	SQI chip select 0 and 1 are disabled

5.6.23.5.9.7 SQI_DATA_FORMAT Enumeration

C

```
typedef enum {
    SQI_DATA_FORMAT_LSBF,
    SQI_DATA_FORMAT_MSBF
} SQI_DATA_FORMAT;
```

Description

SQI Data Mode

This macro defines the Data Formats (LSBF/MSBF)

Members

Members	Description
SQI_DATA_FORMAT_LSBF	SQI Data is Least Significant Bit First Formatted
SQI_DATA_FORMAT_MSBF	SQI Data is Most Significant Bit First Formatted

5.6.23.5.9.8 SQI_DATA_MODE Enumeration**C**

```
typedef enum {  
    SQI_DATA_MODE_SF,  
    SQI_DATA_MODE_3,  
    SQI_DATA_MODE_0  
} SQI_DATA_MODE;
```

Description

SQI Data Mode

This macro defines the list of SQI Data Modes

Members

Members	Description
SQI_DATA_MODE_SF	SQI is in Serial Flash Mode
SQI_DATA_MODE_3	SQI is in SPI mode 3
SQI_DATA_MODE_0	SQI is in SPI mode 0

5.6.23.5.9.9 SQI_DATA_OEN Enumeration**C**

```
typedef enum {  
    SQI_DATA_OEN_QUAD,  
    SQI_DATA_OEN_DUAL,  
    SQI_DATA_OEN_SINGLE  
} SQI_DATA_OEN;
```

Description

SQI Data Output Enable

This macro defines the list of SQI Data Output Enables

Members

Members	Description
SQI_DATA_OEN_QUAD	SQI data outputs 3 to 0 are enabled (quad lane mode)
SQI_DATA_OEN_DUAL	SQI data outputs 1 and 0 are enabled (dual lane mode)
SQI_DATA_OEN_SINGLE	SQI data output 0 is enabled (single lane mode)

5.6.23.5.9.10 SQI_DATA_TYPE Type**C**

```
typedef uint32_t SQI_DATA_TYPE;
```

Description

SQI Data Type definition

This data type defines the SQI Data size

Remarks

None

5.6.23.5.9.11 SQI_DUMMY_BYTES Enumeration

C

```
typedef enum {
    DUMMY_BYTES_7,
    DUMMY_BYTES_6,
    DUMMY_BYTES_5,
    DUMMY_BYTES_4,
    DUMMY_BYTES_3,
    DUMMY_BYTES_2,
    DUMMY_BYTE_1,
    DUMMY_BYTES_0
} SQI_DUMMY_BYTES;
```

Description

SQI Number of Dummy Bytes

This macro defines the list of SQI Dummy Bytes after Address Bytes

Members

Members	Description
DUMMY_BYTES_7	SQI is set to Transmit 7 Dummy Bytes
DUMMY_BYTES_6	SQI is set to Transmit 6 Dummy Bytes
DUMMY_BYTES_5	SQI is set to Transmit 5 Dummy Bytes
DUMMY_BYTES_4	SQI is set to Transmit 4 Dummy Bytes
DUMMY_BYTES_3	SQI is set to Transmit 3 Dummy Bytes
DUMMY_BYTES_2	SQI is set to Transmit 2 Dummy Bytes
DUMMY_BYTE_1	SQI is set to Transmit 1 Dummy Bytes
DUMMY_BYTES_0	SQI is set to Transmit No Dummy Bytes

5.6.23.5.9.12 SQI_INTERRUPTS Enumeration

C

```
typedef enum {
    SQI_PKTCOMP,
    SQI_BDDONE,
    SQI_CONTHR,
    SQI_CONEMPTY,
    SQI_CONFULL,
    SQI_RXTHR,
    SQI_RXEMPTY,
    SQI_RXFULL,
    SQI_TXTHR,
    SQI_TXEMPTY,
    SQI_TXFULL,
    SQI_ALL_INT
} SQI_INTERRUPTS;
```

Description

SQI Interrupt List

This macro defines the list of SQI Interrupts

Members

Members	Description
SQI_PKTCOMP	SQI Packet Complete Interrupt (used in DMA mode)
SQI_BDDONE	SQI Buffer Descriptor Done Interrupt (used in DMA mode)
SQI_CONTHR	SQI Control Buffer Threshold Interrupt
SQI_CONEMPTY	SQI Control Buffer Empty Interrupt
SQI_CONFULL	SQI Control Buffer Full Interrupt
SQI_RXTHR	SQI Receive Buffer Threshold Interrupt
SQI_RXEMPTY	SQI Receive Buffer Empty Interrupt
SQI_RXFULL	SQI Receive Buffer Full Interrupt
SQI_TXTHR	SQI Transmit Buffer Threshold Interrupt
SQI_TXEMPTY	SQI Transmit Buffer Empty Interrupt
SQI_TXFULL	SQI Transmit Buffer Full Interrupt
SQI_ALL_INT	All or any of the above interrupts

5.6.23.5.9.13 SQI_LANE_MODE Enumeration**C**

```
typedef enum {
    SQI_LANE_QUAD,
    SQI_LANE_DUAL,
    SQI_LANE_SINGLE
} SQI_LANE_MODE;
```

Description

SQI Lane Mode

This macro defines the list of SQI Lane Modes

Members

Members	Description
SQI_LANE_QUAD	SQI is set into Quad Lane Mode
SQI_LANE_DUAL	SQI is set into Dual Lane Mode
SQI_LANE_SINGLE	SQI is set into Single Lane Mode

5.6.23.5.9.14 SQI_MODE_BYTES Enumeration**C**

```
typedef enum {
    MODE_BYTES_3,
    MODE_BYTES_2,
    MODE_BYTES_1,
    MODE_BYTES_0
} SQI_MODE_BYTES;
```

Description

SQI Number of Mode Bytes

This macro defines the list of SQI Mode Bytes allocated for Mode Code

Members

Members	Description
MODE_BYTES_3	SQI is set to Transmit 3 Mode Bytes
MODE_BYTES_2	SQI is set to Transmit 2 Mode Bytes
MODE_BYTES_1	SQI is set to Transmit 1 Mode Bytes
MODE_BYTES_0	SQI is set to Transmit No Mode Bytes

5.6.23.5.9.15 SQI_MODULE_ID Enumeration**C**

```
typedef enum {  
    SQI_ID_1,  
    SQI_NUMBER_OF_MODULES  
} SQI_MODULE_ID;
```

Description

SQI Module ID

This enumeration identifies the SQI modules which are available on the microcontroller. This is the super set of all the possible instances that might be available on the Microchip microcontrollers.

Members

Members	Description
SQI_ID_1	SQI Module 1 ID
SQI_NUMBER_OF_MODULES	Number of available SQI modules

Remarks

The caller should not rely on the specific numbers assigned to any of these values as they may change from one processor to the next.

Not all modules will be available on all microcontrollers. Refer to the data sheet for the specific controller in use to determine which modules are supported. The numbers used in the enumeration values will match the numbers given in the data sheet.

5.6.23.5.9.16 SQI_XFER_CMD Enumeration**C**

```
typedef enum {  
    SQI_CMD_RECEIVE,  
    SQI_CMD_TRANSMIT,  
    SQI_CMD_IDLE  
} SQI_XFER_CMD;
```

Description

SQI Transfer Command

This macro defines the list of SQI Transfer Commands

Members

Members	Description
SQI_CMD_RECEIVE	SQI issues a Receive Command
SQI_CMD_TRANSMIT	SQI issues a Transmit Command
SQI_CMD_IDLE	SQI is Idle

5.6.23.5.9.17 SQI_XFER_MODE Enumeration

C

```
typedef enum {  
    SQI_XFER_MODE_XIP,  
    SQI_XFER_MODE_DMA,  
    SQI_XFER_MODE_PIO  
} SQI_XFER_MODE;
```

Description

SQI Transfer Mode

This macro defines the list of SQI Transfer Modes

Members

Members	Description
SQI_XFER_MODE_XIP	SQI is in XIP mode
SQI_XFER_MODE_DMA	SQI is in DMA mode
SQI_XFER_MODE_PIO	SQI is in PIO mode

5.6.23.5.10 Feature Existence Functions

5.6.23.5.10.1 PLIB_SQI_ExistsBDBaseAddress Function

C

```
bool PLIB_SQI_ExistsBDBaseAddress(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the BDBaseAddress feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_DMABDBaseAddressSet](#)
- [PLIB_SQI_DMABDBaseAddressGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The BDBaseAddress feature is supported on the device
- false - The BDBaseAddress feature is not supported on the device

Remarks

None.

5.6.23.5.10.2 PLIB_SQI_ExistsBDControlWord Function

C

```
bool PLIB_SQI_ExistsBDControlWord(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the BDControlWord feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_DMABDControlWordGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The BDControlWord feature is supported on the device
- false - The BDControlWord feature is not supported on the device

Remarks

None.

5.6.23.5.10.3 PLIB_SQI_ExistsBDCurrentAddress Function

C

```
bool PLIB_SQI_ExistsBDCurrentAddress(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the BDCurrentAddress feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_DMABDCurrentAddressGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The BDCurrentAddress feature is supported on the device
- false - The BDCurrentAddress feature is not supported on the device

Remarks

None.

5.6.23.5.10.4 PLIB_SQI_ExistsBDPollCount Function

C

```
bool PLIB_SQI_ExistsBDPollCount(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the BDPollCount feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_DMABDPollCounterSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The BDPollCount feature is supported on the device
- false - The BDPollCount feature is not supported on the device

Remarks

None.

5.6.23.5.10.5 PLIB_SQI_ExistsBDPollingEnable Function

C

```
bool PLIB_SQI_ExistsBDPollingEnable(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the BDPollingEnable feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_DMABDPollEnable](#)
- [PLIB_SQI_DMABDPollDisable](#)
- [PLIB_SQI_DMABDPollIsEnabled](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The BDPollingEnable feature is supported on the device
- false - The BDPollingEnable feature is not supported on the device

Remarks

None.

5.6.23.5.10.6 PLIB_SQI_ExistsBDProcessState Function**C**

```
bool PLIB_SQI_ExistsBDProcessState(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the BDProcessState feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_DMABDStateGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The BDProcessState feature is supported on the device
- false - The BDProcessState feature is not supported on the device

Remarks

None.

5.6.23.5.10.7 PLIB_SQI_ExistsBDRxBufCount Function**C**

```
bool PLIB_SQI_ExistsBDRxBufCount(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the BDRxBufCount feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_DMABDReceiveBufferCountGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The BDRxBufCount feature is supported on the device
- false - The BDRxBufCount feature is not supported on the device

Remarks

None.

5.6.23.5.10.8 PLIB_SQI_ExistsBDRxLength Function**C**

```
bool PLIB_SQI_ExistsBDRxLength(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the BDRxLength feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_DMABDReceiveBufferLengthGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The BDRxLength feature is supported on the device
- false - The BDRxLength feature is not supported on the device

Remarks

None.

5.6.23.5.10.9 PLIB_SQI_ExistsBDRxState Function**C**

```
bool PLIB_SQI_ExistsBDRxState(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the BDRxState feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_DMABDReceiveStateGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The BDRxState feature is supported on the device
- false - The BDRxState feature is not supported on the device

Remarks

None.

5.6.23.5.10.10 PLIB_SQI_ExistsBDTxBufCount Function**C**

```
bool PLIB_SQI_ExistsBDTxBufCount(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the BDTxBufCount feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_DMABDTransmitBufferCountGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The BDTxBufCount feature is supported on the device
- false - The BDTxBufCount feature is not supported on the device

Remarks

None.

5.6.23.5.10.11 PLIB_SQI_ExistsBDTxLength Function**C**

```
bool PLIB_SQI_ExistsBDTxLength(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the BDTxLength feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_DMABDTransmitBufferLengthGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The BDTxLength feature is supported on the device
- false - The BDTxLength feature is not supported on the device

Remarks

None.

5.6.23.5.10.12 PLIB_SQI_ExistsBDTxState Function**C**

```
bool PLIB_SQI_ExistsBDTxState(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the BDTxState feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_DMABDTransmitStateGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The BDTxState feature is supported on the device
- false - The BDTxState feature is not supported on the device

Remarks

None.

5.6.23.5.10.13 PLIB_SQI_ExistsBurstControl Function**C**

```
bool PLIB_SQI_ExistsBurstControl(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the BurstControl feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_BurstEnable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The BurstControl feature is supported on the device
- false - The BurstControl feature is not supported on the device

Remarks

None.

5.6.23.5.10.14 PLIB_SQI_ExistsChipSelect Function**C**

```
bool PLIB_SQI_ExistsChipSelect(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the ChipSelect feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_ChipSelectSet](#)
- [PLIB_SQI_ChipSelectGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChipSelect feature is supported on the device
- false - The ChipSelect feature is not supported on the device

Remarks

None.

5.6.23.5.10.15 PLIB_SQI_ExistsClockControl Function**C**

```
bool PLIB_SQI_ExistsClockControl(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the ClockControl feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_ClockEnable](#)
- [PLIB_SQI_ClockDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ClockControl feature is supported on the device
- false - The ClockControl feature is not supported on the device

Remarks

None.

5.6.23.5.10.16 PLIB_SQI_ExistsClockDivider Function**C**

```
bool PLIB_SQI_ExistsClockDivider(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the ClockDivider feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_ClockDividerSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ClockDivider feature is supported on the device
- false - The ClockDivider feature is not supported on the device

Remarks

None.

5.6.23.5.10.17 PLIB_SQI_ExistsClockReady Function**C**

```
bool PLIB_SQI_ExistsClockReady(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the ClockReady feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_ClockIsStable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ClockReady feature is supported on the device
- false - The ClockReady feature is not supported on the device

Remarks

None.

5.6.23.5.10.18 PLIB_SQI_ExistsConBufThreshold Function**C**

```
bool PLIB_SQI_ExistsConBufThreshold(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the ConBufThreshold feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_ControlBufferThresholdSet](#)
- [PLIB_SQI_ControlBufferThresholdGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ConBufThreshold feature is supported on the device
- false - The ConBufThreshold feature is not supported on the device

Remarks

None.

5.6.23.5.10.19 PLIB_SQI_ExistsConfigWord Function**C**

```
bool PLIB_SQI_ExistsConfigWord(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the ConfigWord feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_ConfigWordSet](#)
- [PLIB_SQI_ConfigWordGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ConfigWord feature is supported on the device
- false - The ConfigWord feature is not supported on the device

Remarks

None.

5.6.23.5.10.20 PLIB_SQI_ExistsControlWord Function**C**

```
bool PLIB_SQI_ExistsControlWord(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the ControlWord feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_ControlWordSet](#)
- [PLIB_SQI_ControlWordGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ControlWord feature is supported on the device
- false - The ControlWord feature is not supported on the device

Remarks

None.

5.6.23.5.10.21 PLIB_SQI_ExistsCSDeassert Function**C**

```
bool PLIB_SQI_ExistsCSDeassert(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the CSDeassert feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_ChipSelectDeassertEnable](#)
- [PLIB_SQI_ChipSelectDeassertDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The CSDeassert feature is supported on the device
- false - The CSDeassert feature is not supported on the device

Remarks

None.

5.6.23.5.10.22 PLIB_SQI_ExistsCSOutputEnable Function**C**

```
bool PLIB_SQI_ExistsCSOutputEnable(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the CSOutputEnable feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_CSOutputEnableSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The CSOutputEnable feature is supported on the device
- false - The CSOutputEnable feature is not supported on the device

Remarks

None.

5.6.23.5.10.23 PLIB_SQI_ExistsDataFormat Function**C**

```
bool PLIB_SQI_ExistsDataFormat(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the DataFormat feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_DataFormatSet](#)

- [PLIB_SQI_DataFormatGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The DataFormat feature is supported on the device
- false - The DataFormat feature is not supported on the device

Remarks

None.

5.6.23.5.10.24 PLIB_SQI_ExistsDataModeControl Function**C**

```
bool PLIB_SQI_ExistsDataModeControl(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the DataModeControl feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_DataModeSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The DataModeControl feature is supported on the device
- false - The DataModeControl feature is not supported on the device

Remarks

None.

5.6.23.5.10.25 PLIB_SQI_ExistsDataOutputEnable Function**C**

```
bool PLIB_SQI_ExistsDataOutputEnable(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the DataOutputEnable feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_DataOutputEnableSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The DataOutputEnable feature is supported on the device
- false - The DataOutputEnable feature is not supported on the device

Remarks

None.

5.6.23.5.10.26 PLIB_SQI_ExistsDataPinStatus Function**C**

```
bool PLIB_SQI_ExistsDataPinStatus(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the DataPinStatus feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_DataLineStatus](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The DataPinStatus feature is supported on the device
- false - The DataPinStatus feature is not supported on the device

Remarks

None.

5.6.23.5.10.27 PLIB_SQI_ExistsDmaEnable Function**C**

```
bool PLIB_SQI_ExistsDmaEnable(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the DMAEnable feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_DMAEnable](#)

- [PLIB_SQI_DMADisable](#)
- [PLIB_SQI_DMAIsEnabled](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The DMAEnable feature is supported on the device
- false - The DMAEnable feature is not supported on the device

Remarks

None.

5.6.23.5.10.28 PLIB_SQI_ExistsDMAEngineBusy Function**C**

```
bool PLIB_SQI_ExistsDMAEngineBusy(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the DMAEngineBusy feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_DMABDIsBusy](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The DMAEngineBusy feature is supported on the device
- false - The DMAEngineBusy feature is not supported on the device

Remarks

None.

5.6.23.5.10.29 PLIB_SQI_ExistsDMAProcessInProgress Function**C**

```
bool PLIB_SQI_ExistsDMAProcessInProgress(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the DMAProcessInProgress feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_DMAHasStarted](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The DMAProcessInProgress feature is supported on the device
- false - The DMAProcessInProgress feature is not supported on the device

Remarks

None.

5.6.23.5.10.30 PLIB_SQI_ExistsEnableControl Function**C**

```
bool PLIB_SQI_ExistsEnableControl(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the EnableControl feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_Enable](#)
- [PLIB_SQI_Disable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The EnableControl feature is supported on the device
- false - The EnableControl feature is not supported on the device

Remarks

None.

5.6.23.5.10.31 PLIB_SQI_ExistsHoldPinControl Function**C**

```
bool PLIB_SQI_ExistsHoldPinControl(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the HoldPinControl feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_HoldSet](#)
- [PLIB_SQI_HoldClear](#)
- [PLIB_SQI_HoldGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The HoldPinControl feature is supported on the device
- false - The HoldPinControl feature is not supported on the device

Remarks

None.

5.6.23.5.10.32 PLIB_SQI_ExistsInterruptControl Function**C**

```
bool PLIB_SQI_ExistsInterruptControl(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the InterruptControl feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_InterruptEnable](#)
- [PLIB_SQI_InterruptDisable](#)
- [PLIB_SQI_InterruptIsEnabled](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The InterruptControl feature is supported on the device
- false - The InterruptControl feature is not supported on the device

Remarks

None.

5.6.23.5.10.33 PLIB_SQI_ExistsInterruptSignalControl Function**C**

```
bool PLIB_SQI_ExistsInterruptSignalControl(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the InterruptSignalControl feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_InterruptSignalEnable](#)
- [PLIB_SQI_InterruptSignalDisable](#)
- [PLIB_SQI_InterruptSignalIsEnabled](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The InterruptSignalControl feature is supported on the device
- false - The InterruptSignalControl feature is not supported on the device

Remarks

None.

5.6.23.5.10.34 PLIB_SQI_ExistsInterruptStatus Function**C**

```
bool PLIB_SQI_ExistsInterruptStatus(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the InterruptStatus feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_InterruptFlagGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The InterruptStatus feature is supported on the device
- false - The InterruptStatus feature is not supported on the device

Remarks

None.

5.6.23.5.10.35 PLIB_SQI_ExistsLaneMode Function

C

```
bool PLIB_SQI_ExistsLaneMode(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the LaneMode feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_LaneModeSet](#)
- [PLIB_SQI_LaneModeGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The LaneMode feature is supported on the device
- false - The LaneMode feature is not supported on the device

Remarks

None.

5.6.23.5.10.36 PLIB_SQI_ExistsReceiveLatch Function

C

```
bool PLIB_SQI_ExistsReceiveLatch(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the ReceiveLatch feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_ReceiveLatchEnable](#)
- [PLIB_SQI_ReceiveLatchDisable](#)
- [PLIB_SQI_ReceiveLatchGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ReceiveLatch feature is supported on the device
- false - The ReceiveLatch feature is not supported on the device

Remarks

None.

5.6.23.5.10.37 PLIB_SQI_ExistsRxBufferCount Function**C**

```
bool PLIB_SQI_ExistsRxBufferCount(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the RxBufferCount feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_NumberOfReceiveBufferReads](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The RxBufferCount feature is supported on the device
- false - The RxBufferCount feature is not supported on the device

Remarks

None.

5.6.23.5.10.38 PLIB_SQI_ExistsRxBufIntThreshold Function**C**

```
bool PLIB_SQI_ExistsRxBufIntThreshold(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the RxBufIntThreshold feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_RxBufferThresholdIntSet](#)
- [PLIB_SQI_RxBufferThresholdIntGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The RxBufIntThreshold feature is supported on the device

- false - The RxBufIntThreshold feature is not supported on the device

Remarks

None.

5.6.23.5.10.39 PLIB_SQI_ExistsRxBufThreshold Function**C**

```
bool PLIB_SQI_ExistsRxBufThreshold(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the RxBufThreshold feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_RxBufferThresholdSet](#)
- [PLIB_SQI_RxBufferThresholdGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The RxBufThreshold feature is supported on the device
- false - The RxBufThreshold feature is not supported on the device

Remarks

None.

5.6.23.5.10.40 PLIB_SQI_ExistsRxData Function**C**

```
bool PLIB_SQI_ExistsRxData(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the RxData feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_ReceiveData](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The RxData feature is supported on the device

- false - The RxData feature is not supported on the device

Remarks

None.

5.6.23.5.10.41 PLIB_SQI_ExistsRxUnderRun Function**C**

```
bool PLIB_SQI_ExistsRxUnderRun(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the RxUnderRun feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_ReceiveBufferIsUnderrun](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The RxUnderRun feature is supported on the device
- false - The RxUnderRun feature is not supported on the device

Remarks

None.

5.6.23.5.10.42 PLIB_SQI_ExistsSoftReset Function**C**

```
bool PLIB_SQI_ExistsSoftReset(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the SoftReset feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_SoftReset](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The SoftReset feature is supported on the device
- false - The SoftReset feature is not supported on the device

Remarks

None.

5.6.23.5.10.43 PLIB_SQI_ExistsStartDMA Function**C**

```
bool PLIB_SQI_ExistsStartDMA(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the StartDMA feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_DMABDFetchStart](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The StartDMA feature is supported on the device
- false - The StartDMA feature is not supported on the device

Remarks

None.

5.6.23.5.10.44 PLIB_SQI_ExistsTransferCommand Function**C**

```
bool PLIB_SQI_ExistsTransferCommand(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the TransferCommand feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_TransferDirectionSet](#)
- [PLIB_SQI_TransferDirectionGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The TransferCommand feature is supported on the device

- false - The TransferCommand feature is not supported on the device

Remarks

None.

5.6.23.5.10.45 PLIB_SQI_ExistsTransferCount Function**C**

```
bool PLIB_SQI_ExistsTransferCount(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the TransferCount feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_ByteCountSet](#)
- [PLIB_SQI_ByteCountGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The TransferCount feature is supported on the device
- false - The TransferCount feature is not supported on the device

Remarks

None.

5.6.23.5.10.46 PLIB_SQI_ExistsTransferModeControl Function**C**

```
bool PLIB_SQI_ExistsTransferModeControl(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the TransferModeControl feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_TransferModeSet](#)
- [PLIB_SQI_TransferModeGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The TransferModeControl feature is supported on the device
- false - The TransferModeControl feature is not supported on the device

Remarks

None.

5.6.23.5.10.47 PLIB_SQI_ExistsTxBufferFree Function**C**

```
bool PLIB_SQI_ExistsTxBufferFree(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the TxBufferFree feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_TransmitBufferFreeSpaceGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The TxBufferFree feature is supported on the device
- false - The TxBufferFree feature is not supported on the device

Remarks

None.

5.6.23.5.10.48 PLIB_SQI_ExistsTxBufIntThreshold Function**C**

```
bool PLIB_SQI_ExistsTxBufIntThreshold(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the TxBufIntThreshold feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_TxBufferThresholdIntSet](#)
- [PLIB_SQI_TxBufferThresholdIntGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The TxBufIntThreshold feature is supported on the device
- false - The TxBufIntThreshold feature is not supported on the device

Remarks

None.

5.6.23.5.10.49 PLIB_SQI_ExistsTxBufThreshold Function**C**

```
bool PLIB_SQI_ExistsTxBufThreshold(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the TxBufThreshold feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_TxBufferThresholdSet](#)
- [PLIB_SQI_TxBufferThresholdGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The TxBufThreshold feature is supported on the device
- false - The TxBufThreshold feature is not supported on the device

Remarks

None.

5.6.23.5.10.50 PLIB_SQI_ExistsTxData Function**C**

```
bool PLIB_SQI_ExistsTxData(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the TxData feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_TransmitData](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The TxData feature is supported on the device
- false - The TxData feature is not supported on the device

Remarks

None.

5.6.23.5.10.51 PLIB_SQI_ExistsTxOverFlow Function**C**

```
bool PLIB_SQI_ExistsTxOverFlow(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the TxOverFlow feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_TransmitBufferHasOverflowed](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The TxOverFlow feature is supported on the device
- false - The TxOverFlow feature is not supported on the device

Remarks

None.

5.6.23.5.10.52 PLIB_SQI_ExistsWPPinControl Function**C**

```
bool PLIB_SQI_ExistsWPPinControl(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the WPPinControl feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_WriteProtectSet](#)

- [PLIB_SQI_WriteProtectClear](#)
- [PLIB_SQI_WriteProtectGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The WPPinControl feature is supported on the device
- false - The WPPinControl feature is not supported on the device

Remarks

None.

5.6.23.5.10.53 PLIB_SQI_ExistsXIPChipSelect Function**C**

```
bool PLIB_SQI_ExistsXIPChipSelect(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the XIPChipSelect feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_XIPChipSelectSet](#)
- [PLIB_SQI_XIPChipSelectGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The XIPChipSelect feature is supported on the device
- false - The XIPChipSelect feature is not supported on the device

Remarks

None.

5.6.23.5.10.54 PLIB_SQI_ExistsXIPControlWord1 Function**C**

```
bool PLIB_SQI_ExistsXIPControlWord1(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the XIPControlWord1 feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_XIPControlWord1Set](#)
- [PLIB_SQI_XIPControlWord1Get](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The XIPControlWord1 feature is supported on the device
- false - The XIPControlWord1 feature is not supported on the device

Remarks

None.

5.6.23.5.10.55 PLIB_SQI_ExistsXIPControlWord2 Function**C**

```
bool PLIB_SQI_ExistsXIPControlWord2(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the XIPControlWord2 feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_XIPControlWord2Set](#)
- [PLIB_SQI_XIPControlWord2Get](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The XIPControlWord2 feature is supported on the device
- false - The XIPControlWord2 feature is not supported on the device

Remarks

None.

5.6.23.5.10.56 PLIB_SQI_ExistsXIPLaneMode Function

C

```
bool PLIB_SQI_ExistsXIPLaneMode(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the XIPLaneMode feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_XIPLaneModeSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The XIPLaneMode feature is supported on the device
- false - The XIPLaneMode feature is not supported on the device

Remarks

None.

5.6.23.5.10.57 PLIB_SQI_ExistsXIPModeBytes Function

C

```
bool PLIB_SQI_ExistsXIPModeBytes(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the XIPModeBytes feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_XIPModeBytesSet](#)
- [PLIB_SQI_XIPModeBytesGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The XIPModeBytes feature is supported on the device
- false - The XIPModeBytes feature is not supported on the device

Remarks

None.

5.6.23.5.10.58 PLIB_SQI_ExistsXIPModeCode Function

C

```
bool PLIB_SQI_ExistsXIPModeCode(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the XIPModeCode feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_XIPModeCodeSet](#)
- [PLIB_SQI_XIPModeCodeGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The XIPModeCode feature is supported on the device
- false - The XIPModeCode feature is not supported on the device

Remarks

None.

5.6.23.5.10.59 PLIB_SQI_ExistsXIPNumberOfAddressBytes Function

C

```
bool PLIB_SQI_ExistsXIPNumberOfAddressBytes(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the XIPNumberOfAddressBytes feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_XIPAddressBytesSet](#)
- [PLIB_SQI_XIPAddressBytesGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The XIPNumberOfAddressBytes feature is supported on the device
- false - The XIPNumberOfAddressBytes feature is not supported on the device

Remarks

None.

5.6.23.5.10.60 PLIB_SQI_ExistsXIPNumberOfDummyBytes Function**C**

```
bool PLIB_SQI_ExistsXIPNumberOfDummyBytes(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the XIPNumberOfDummyBytes feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_XIPDummyBytesSet](#)
- [PLIB_SQI_XIPDummyBytesGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The XIPNumberOfDummyBytes feature is supported on the device
- false - The XIPNumberOfDummyBytes feature is not supported on the device

Remarks

None.

5.6.23.5.10.61 PLIB_SQI_ExistsXIPReadOpCode Function**C**

```
bool PLIB_SQI_ExistsXIPReadOpCode(  
    SQI_MODULE_ID index  
);
```

Description

This function identifies whether the XIPReadOpCode feature is available on the SQI module. When this function returns true, these functions are supported on the device:

- [PLIB_SQI_XIPReadOpcodeSet](#)
- [PLIB_SQI_XIPReadOpcodeGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The XIPReadOpCode feature is supported on the device
- false - The XIPReadOpCode feature is not supported on the device

Remarks

None.

5.6.23.6 Files

Files

Name	Description
plib_sqi.h	SQI PLIB Interface Header for common definitions

Description

5.6.23.6.1 plib_sqi.h

SQI Peripheral Library Interface Header

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the SQI PLIB.

Functions

	Name	Description
≡	PLIB_SQI_BurstEnable	This bit sets the burst enable (BURSTEN) function for higher throughput. This function is artifact of the system bus architecture.
≡	PLIB_SQI_ByteCountGet	Returns the current transmit/receive count.
≡	PLIB_SQI_ByteCountSet	Sets the transmit/receive count.
≡	PLIB_SQI_ChipSelectDeassertDisable	Clears the chip select de-assert.
≡	PLIB_SQI_ChipSelectDeassertEnable	Sets the chip select de-assert.
≡	PLIB_SQI_ChipSelectGet	Returns the chip select that is currently active.
≡	PLIB_SQI_ChipSelectSet	Activates the chip select.
≡	PLIB_SQI_ClockDisable	Disables the SQI transfer clock.
≡	PLIB_SQI_ClockDividerGet	Returns the SQI clock divider value.
≡	PLIB_SQI_ClockDividerSet	Sets the SQI clock (that drives the SQI protocol) divider value. Divides the base clock to generate the SQI clock.
≡	PLIB_SQI_ClockEnable	Enables the SQI transfer clock.
≡	PLIB_SQI_ClockIsStable	Returns SQI transfer clock state.
≡	PLIB_SQI_ConfigWordGet	Get the SQI configuration word.
≡	PLIB_SQI_ConfigWordSet	Sets SQI Configuration Word.
≡	PLIB_SQI_ControlBufferThresholdGet	Returns the transmit buffer space in bytes.
≡	PLIB_SQI_ControlBufferThresholdSet	Sets the control buffer threshold value.
≡	PLIB_SQI_ControlWordGet	Get the SQI control word.
≡	PLIB_SQI_ControlWordSet	Sets SQI Control Word.
≡	PLIB_SQI_CSOutputEnableSelect	Selects the output enables on SQI chip select pins.

	PLIB_SQI_DataFormatGet	Returns the data format to Least Significant Bit First or LITTLE-ENDIAN.
	PLIB_SQI_DataFormatSet	Sets the data format to Least Significant Bit First or LITTLE-ENDIAN.
	PLIB_SQI_DataLineStatus	Returns the logical status of the SQI data lines.
	PLIB_SQI_DataModeGet	Returns the SQI data mode of operation (SPI Mode0/Mode3).
	PLIB_SQI_DataModeSet	Sets the SQI data mode of operation (SPI Mode0/Mode3/Serial Flash).
	PLIB_SQI_DataOutputEnableSelect	Selects the output enables on SQI data outputs.
	PLIB_SQI_Disable	Disables the SQI module.
	PLIB_SQI_DMABDBaseAddressGet	Returns the address of the base buffer descriptor.
	PLIB_SQI_DMABDBaseAddressSet	Sets the address of the base buffer descriptor.
	PLIB_SQI_DMABDControlWordGet	Returns Current Buffer Descriptor Control Word Information.
	PLIB_SQI_DMABDCurrentAddressGet	Returns the address of the current buffer descriptor in process.
	PLIB_SQI_DMABDFetchStart	Start the DMA buffer descriptor fetch process.
	PLIB_SQI_DMABDIsBusy	Returns true if DMA Buffer Descriptor is busy.
	PLIB_SQI_DMABDPollCounterSet	Sets the poll counter value.
	PLIB_SQI_DMABDPollDisable	Disables the buffer descriptor polling.
	PLIB_SQI_DMABDPollEnable	Enables the buffer descriptor polling.
	PLIB_SQI_DMABDPollIsEnabled	Returns true if DAM buffer descriptor poll is eanbled and false if it's disabled.
	PLIB_SQI_DMABDReceiveBufferCountGet	Returns the receive buffer space in bytes.
	PLIB_SQI_DMABDReceiveBufferLengthGet	Returns the receive length in bytes.
	PLIB_SQI_DMABDReceiveStateGet	Returns the current state of the buffer descriptor in progress.
	PLIB_SQI_DMABDStateGet	Returns the current state of the buffer descriptor in progress.
	PLIB_SQI_DMABDTransmitBufferCountGet	Returns the transmit buffer space in bytes.
	PLIB_SQI_DMABDTransmitBufferLengthGet	Returns the transmit length in bytes.
	PLIB_SQI_DMABDTransmitStateGet	Returns the current state of the buffer descriptor in progress.
	PLIB_SQI_DMADisable	Disables the built-in DMA logic.
	PLIB_SQI_DMAEnable	Enables the built-in DMA logic.
	PLIB_SQI_DMAHasStarted	Returns true if DMA process has started if not returns false.
	PLIB_SQI_DMAIsEnabled	Returns true if DAM is eanbled and false if it's disabled.
	PLIB_SQI_Enable	Enables the SQI module.
	PLIB_SQI_ExistsBDBaseAddress	Identifies whether the BDBaseAddress feature exists on the SQI module
	PLIB_SQI_ExistsBDControlWord	Identifies whether the BDControlWord feature exists on the SQI module
	PLIB_SQI_ExistsBDCurrentAddress	Identifies whether the BDCurrentAddress feature exists on the SQI module
	PLIB_SQI_ExistsBDPollCount	Identifies whether the BDPollCount feature exists on the SQI module
	PLIB_SQI_ExistsBDPollingEnable	Identifies whether the BDPollingEnable feature exists on the SQI module
	PLIB_SQI_ExistsBDProcessState	Identifies whether the BDProcessState feature exists on the SQI module
	PLIB_SQI_ExistsBDRxBufCount	Identifies whether the BDRxBufCount feature exists on the SQI module
	PLIB_SQI_ExistsBDRxLength	Identifies whether the BDRxLength feature exists on the SQI module
	PLIB_SQI_ExistsBDRxState	Identifies whether the BDRxState feature exists on the SQI module

	<u>PLIB_SQI_ExistsBDTxBufCount</u>	Identifies whether the BDTxBufCount feature exists on the SQI module
	<u>PLIB_SQI_ExistsBDTxLength</u>	Identifies whether the BDTxLength feature exists on the SQI module
	<u>PLIB_SQI_ExistsBDTxState</u>	Identifies whether the BDTxState feature exists on the SQI module
	<u>PLIB_SQI_ExistsBurstControl</u>	Identifies whether the BurstControl feature exists on the SQI module
	<u>PLIB_SQI_ExistsChipSelect</u>	Identifies whether the ChipSelect feature exists on the SQI module
	<u>PLIB_SQI_ExistsClockControl</u>	Identifies whether the ClockControl feature exists on the SQI module
	<u>PLIB_SQI_ExistsClockDivider</u>	Identifies whether the ClockDivider feature exists on the SQI module
	<u>PLIB_SQI_ExistsClockReady</u>	Identifies whether the ClockReady feature exists on the SQI module
	<u>PLIB_SQI_ExistsConBufThreshold</u>	Identifies whether the ConBufThreshold feature exists on the SQI module
	<u>PLIB_SQI_ExistsConfigWord</u>	Identifies whether the ConfigWord feature exists on the SQI module
	<u>PLIB_SQI_ExistsControlWord</u>	Identifies whether the ControlWord feature exists on the SQI module
	<u>PLIB_SQI_ExistsCSDeassert</u>	Identifies whether the CSDeassert feature exists on the SQI module
	<u>PLIB_SQI_ExistsCSOutputEnable</u>	Identifies whether the CSOutputEnable feature exists on the SQI module
	<u>PLIB_SQI_ExistsDataFormat</u>	Identifies whether the DataFormat feature exists on the SQI module
	<u>PLIB_SQI_ExistsDataModeControl</u>	Identifies whether the DataModeControl feature exists on the SQI module
	<u>PLIB_SQI_ExistsDataOutputEnable</u>	Identifies whether the DataOutputEnable feature exists on the SQI module
	<u>PLIB_SQI_ExistsDataPinStatus</u>	Identifies whether the DataPinStatus feature exists on the SQI module
	<u>PLIB_SQI_ExistsDmaEnable</u>	Identifies whether the DMAEnable feature exists on the SQI module
	<u>PLIB_SQI_ExistsDMAEngineBusy</u>	Identifies whether the DMAEngineBusy feature exists on the SQI module
	<u>PLIB_SQI_ExistsDMAProcessInProgress</u>	Identifies whether the DMAProcessInProgress feature exists on the SQI module
	<u>PLIB_SQI_ExistsEnableControl</u>	Identifies whether the EnableControl feature exists on the SQI module
	<u>PLIB_SQI_ExistsHoldPinControl</u>	Identifies whether the HoldPinControl feature exists on the SQI module
	<u>PLIB_SQI_ExistsInterruptControl</u>	Identifies whether the InterruptControl feature exists on the SQI module
	<u>PLIB_SQI_ExistsInterruptSignalControl</u>	Identifies whether the InterruptSignalControl feature exists on the SQI module
	<u>PLIB_SQI_ExistsInterruptStatus</u>	Identifies whether the InterruptStatus feature exists on the SQI module
	<u>PLIB_SQI_ExistsLaneMode</u>	Identifies whether the LaneMode feature exists on the SQI module
	<u>PLIB_SQI_ExistsReceiveLatch</u>	Identifies whether the ReceiveLatch feature exists on the SQI module
	<u>PLIB_SQI_ExistsRxBufferCount</u>	Identifies whether the RxBufferCount feature exists on the SQI module
	<u>PLIB_SQI_ExistsRxBufIntThreshold</u>	Identifies whether the RxBufIntThreshold feature exists on the SQI module
	<u>PLIB_SQI_ExistsRxBufThreshold</u>	Identifies whether the RxBufThreshold feature exists on the SQI module
	<u>PLIB_SQI_ExistsRxData</u>	Identifies whether the RxData feature exists on the SQI module
	<u>PLIB_SQI_ExistsRxUnderRun</u>	Identifies whether the RxUnderRun feature exists on the SQI module

	PLIB_SQI_ExistsSoftReset	Identifies whether the SoftReset feature exists on the SQI module
	PLIB_SQI_ExistsStartDMA	Identifies whether the StartDMA feature exists on the SQI module
	PLIB_SQI_ExistsTransferCommand	Identifies whether the TransferCommand feature exists on the SQI module
	PLIB_SQI_ExistsTransferCount	Identifies whether the TransferCount feature exists on the SQI module
	PLIB_SQI_ExistsTransferModeControl	Identifies whether the TransferModeControl feature exists on the SQI module
	PLIB_SQI_ExistsTxBufferFree	Identifies whether the TxBufferFree feature exists on the SQI module
	PLIB_SQI_ExistsTxBufIntThreshold	Identifies whether the TxBufIntThreshold feature exists on the SQI module
	PLIB_SQI_ExistsTxBufThreshold	Identifies whether the TxBufThreshold feature exists on the SQI module
	PLIB_SQI_ExistsTxData	Identifies whether the TxData feature exists on the SQI module
	PLIB_SQI_ExistsTxOverFlow	Identifies whether the TxOverFlow feature exists on the SQI module
	PLIB_SQI_ExistsWPPinControl	Identifies whether the WPPinControl feature exists on the SQI module
	PLIB_SQI_ExistsXIPChipSelect	Identifies whether the XIPChipSelect feature exists on the SQI module
	PLIB_SQI_ExistsXIPControlWord1	Identifies whether the XIPControlWord1 feature exists on the SQI module
	PLIB_SQI_ExistsXIPControlWord2	Identifies whether the XIPControlWord2 feature exists on the SQI module
	PLIB_SQI_ExistsXIPLaneMode	Identifies whether the XIPLaneMode feature exists on the SQI module
	PLIB_SQI_ExistsXIPModeBytes	Identifies whether the XIPModeBytes feature exists on the SQI module
	PLIB_SQI_ExistsXIPModeCode	Identifies whether the XIPModeCode feature exists on the SQI module
	PLIB_SQI_ExistsXIPNumberOfAddressBytes	Identifies whether the XIPNumberOfAddressBytes feature exists on the SQI module
	PLIB_SQI_ExistsXIPNumberOfDummyBytes	Identifies whether the XIPNumberOfDummyBytes feature exists on the SQI module
	PLIB_SQI_ExistsXIPReadOpCode	Identifies whether the XIPReadOpCode feature exists on the SQI module
	PLIB_SQI_HoldClear	This bit clears the hold function to be disabled on SQID3 in single and dual lane modes.
	PLIB_SQI_HoldGet	This bit gets the status of HOLD function on SQID3 pin.
	PLIB_SQI_HoldSet	This bit sets the hold function to be enabled on SQID3 in single or dual lane modes.
	PLIB_SQI_InterruptDisable	Disables the interrupt source.
	PLIB_SQI_InterruptEnable	Enables the interrupt source passed.
	PLIB_SQI_InterruptFlagGet	Return SQI Interrupt flag status.
	PLIB_SQI_InterruptIsEnabled	Returns the interrupt state (enabled/disabled).
	PLIB_SQI_InterruptSignalDisable	Disables the interrupt signal source.
	PLIB_SQI_InterruptSignalEnable	Enables the interrupt signal source passed.
	PLIB_SQI_InterruptSignalIsEnabled	Returns the interrupt signal state (enabled/disabled).
	PLIB_SQI_LaneModeGet	Returns the lane mode (single/dual/quad).
	PLIB_SQI_LaneModeSet	Sets the data lane mode (single/dual/quad).

	<u>PLIB_SQI_NumberOfReceiveBufferReads</u>	Returns the number of receive buffer reads.
	<u>PLIB_SQI_ReceiveBufferIsUnderrun</u>	Returns the status of receive buffer.
	<u>PLIB_SQI_ReceiveData</u>	Reads the data from the receive buffer.
	<u>PLIB_SQI_ReceiveLatchDisable</u>	Disables the receive latch so receive data is discarded when in transmit mode.
	<u>PLIB_SQI_ReceiveLatchEnable</u>	Enable the receive latch so receive data is latched during transmit mode.
	<u>PLIB_SQI_ReceiveLatchGet</u>	Returns the receive latch status in transmit mode.
	<u>PLIB_SQI_RxBufferThresholdGet</u>	Returns the receive command threshold.
	<u>PLIB_SQI_RxBufferThresholdIntGet</u>	Sets the receive buffer threshold interrupt.
	<u>PLIB_SQI_RxBufferThresholdIntSet</u>	Sets the receive buffer threshold for interrupt.
	<u>PLIB_SQI_RxBufferThresholdSet</u>	Sets the receive command threshold.
	<u>PLIB_SQI_SoftReset</u>	This bit issues a soft reset to the SQI module.
	<u>PLIB_SQI_TransferDirectionGet</u>	Returns the transfer command.
	<u>PLIB_SQI_TransferDirectionSet</u>	Sets the transfer command.
	<u>PLIB_SQI_TransferModeGet</u>	Returns the SQI transfer mode (PIO/DMA/XIP) of operation.
	<u>PLIB_SQI_TransferModeSet</u>	Sets the SQI transfer mode (PIO/DMA/XIP) of operation.
	<u>PLIB_SQI_TransmitBufferFreeSpaceGet</u>	Returns the number of transmit buffer words available.
	<u>PLIB_SQI_TransmitBufferHasOverflowed</u>	Returns the current status of the transmit buffer.
	<u>PLIB_SQI_TransmitData</u>	Writes data into the SQI transmit buffer.
	<u>PLIB_SQI_TxBufferThresholdGet</u>	Returns the transmit command threshold value.
	<u>PLIB_SQI_TxBufferThresholdIntGet</u>	Returns the value to trigger the transmit buffer threshold interrupt.
	<u>PLIB_SQI_TxBufferThresholdIntSet</u>	Sets the value to trigger the transmit buffer threshold interrupt.
	<u>PLIB_SQI_TxBufferThresholdSet</u>	Sets the transmit command threshold.
	<u>PLIB_SQI_WriteProtectClear</u>	This bit clears the Write-Protect function to be disabled on SQID2 in single or dual lane modes.
	<u>PLIB_SQI_WriteProtectGet</u>	This bit gets the Write-Protect state of Write_Protect Feature on SQID2.
	<u>PLIB_SQI_WriteProtectSet</u>	This bit sets the Write-Protect function to be enabled on SQID2 in single or dual Lane modes only.
	<u>PLIB_SQI_XIPAddressBytesGet</u>	Returns the number of address bytes.
	<u>PLIB_SQI_XIPAddressBytesSet</u>	Sets the number of address bytes.
	<u>PLIB_SQI_XIPChipSelectGet</u>	Returns the current active chip select.
	<u>PLIB_SQI_XIPChipSelectSet</u>	Activates the chip select in XIP mode.
	<u>PLIB_SQI_XIPControlWord1Get</u>	Get the XIP mode control word 1.
	<u>PLIB_SQI_XIPControlWord1Set</u>	Sets the XIP mode control word 1.
	<u>PLIB_SQI_XIPControlWord2Get</u>	Get the XIP mode control word 2.
	<u>PLIB_SQI_XIPControlWord2Set</u>	Sets the XIP mode control word 2.
	<u>PLIB_SQI_XIPDummyBytesGet</u>	Sets the number of dummy bytes.
	<u>PLIB_SQI_XIPDummyBytesSet</u>	Sets the number of dummy bytes.
	<u>PLIB_SQI_XIPLaneModeGet</u>	Returns the lane (single/dual/quad) mode in XIP mode.
	<u>PLIB_SQI_XIPLaneModeSet</u>	Selects the lane (Single/Dual/Quad) mode for different transaction in XIP mode.
	<u>PLIB_SQI_XIPModeBytesGet</u>	Returns the number of bytes used for mode code command.
	<u>PLIB_SQI_XIPModeBytesSet</u>	Allocates the bytes for mode code command.
	<u>PLIB_SQI_XIPModeCodeGet</u>	Returns the mode code op-code.
	<u>PLIB_SQI_XIPModeCodeSet</u>	Sets the mode code command.

	PLIB_SQI_XIPReadOpcodeGet	Returns the read opcode in XIP mode.
	PLIB_SQI_XIPReadOpcodeSet	Sets the read opcode in XIP mode.

5.6.24 Timer Peripheral Library

5.6.24.1 Introduction

Timer Peripheral Library
for
Microchip Microcontrollers

This library provides a low-level abstraction of the Timer module on the Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, thereby hiding differences from one microcontroller variant to another.

Description

Overview of Timers

The timer function is one of the basic features of a microcontroller. Timers are useful for generating accurate time-based periodic interrupts for software application or real-time operating systems. Other uses include counting external pulses or accurate timing measurement of external events using the timer's gate functions or producing precise time delays. Some timers can also be used to control timing of other peripherals.

5.6.24.2 Release Notes

MPLAB Harmony Version: v0.70b Timer Peripheral Library Version : 0.70b Release Date: 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.6.24.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED AS IS MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.6.24.4 Using the Library

This topic describes the basic architecture of the Timer Peripheral Library and provides information and examples on how to use it.

Interface Header File: [plib_tmr.h](#)

The interface to the Timer Peripheral Library is defined in the "[plib_tmr.h](#)" header file. Any C language source (.c) file that uses the Timer Peripheral Library must include "[plib_tmr.h](#)".

Library File:

The Timer Peripheral Library is part of the processor-specific peripheral library archive (.a) file installed with the compiler. Libraries in this archive are automatically available to the linker (in the default search path) for any project built using the Microchip compiler.

5.6.24.4.1 Hardware Abstraction Model

This library provides the low-level abstraction of the Timer module on the Microchip family of microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in the software and introduces the library interface.

Note: The interface provided is a superset of all the functionality of the available timers on the device. Refer to the specific device data sheet or related family reference manual to determine the set of functions that are supported for each Timer module on your device.

Description

Microchip timers can be classified as:

- Overflow-based
- Period match-based

These timers are essentially counters of a specific size (8-, 16-, or 32-bits wide) that increment based on the clock cycle and the

timer prescaler. An application can monitor these counters to determine how much time has elapsed.

The prescaler determines the timer granularity (resolution). It is a mechanism for generating the clock for the timer by the CPU clock. Every CPU has a clock source and the frequency of this source decides the rate at which instructions are executed by the processor. Most of the timers have the option of providing input clock prescalers, while some have the optional postscalers. The prescaler is used to divide the clock frequency of the Timer module and produce a clock for the timer.

Each timer can be configured with a different source (internal or external) meaning, the source of the timer's input clock is selectable. Both internal and external sources are available, depending on the part in use, with some timers providing a clock synchronization mechanisms with reference to external source.

On some timers the clock edge, either the rising or the falling edge, on which the increment occurs, is selectable.

Overflow-based Timers

Overflow-based timers provide timer outputs or generate interrupts after a rollover from the maximum possible timer count.

Overflow Timer Abstraction Diagram

An overflow interrupt is triggered whenever the timer register overflows (i.e., reaches its maximum value based on its size as depicted by the following diagram).

Period Match-based Timers

Period match-based timers provide the timer outputs or generate interrupts upon a match between the counter's count value against the preprogrammed period.

Period Match timer Abstraction Diagram

Gated Time Accumulation/Gated Control Mode

The Gated Time Accumulation/Gate control mode allows the internal timer to increment based upon the duration of the high time applied to the timer input pin. In the Gated Time Accumulation mode, the timer clock source is derived from the internal system clock. When the input clock pin state is high, the timer will count up until a period match has occurred, or the input pin state is changed to a low state. A pin state transition from high-to-low will trigger an interrupt.

A period/compare match interrupt is issued by a timer whenever the value of the timer becomes equal to a certain predefined value as depicted by the following diagram,

5.6.24.4.2 Library Overview

The library interface routines are divided into various subsections, each of the sub-sections addresses one of the blocks or the overall operation of the Timer module.

Library Interface Section	Description

5.6.24.4.3 How the Library Works

Timer modules can operate in the following modes:

- Synchronous Clock Counter
- Synchronous External Clock Counter
- Asynchronous External Clock Counter
- Gated Timer

Note: Not all modes are available on all devices. Please refer to the specific device data sheet to determine availability.

5.6.24.4.3.1 Synchronous Internal Clock Counter

This section provides information and examples for setting up Synchronous Internal Clock Counter operation.

Note: Not all modes are available on all devices. Please refer to the specific device data sheet to determine the supported modes for your device.

Description

Synchronous Clock Counter operation provides the following capabilities:

- Elapsed time measurements
- Time delays
- Periodic timer interrupts

Setup

Use the following steps for synchronous internal clock counter setup:

1. Some timer modules support multiple resolutions, which can be selected using [PLIB_TMR_Mode8BitEnable](#), [PLIB_TMR_Mode16BitEnable](#), or [PLIB_TMR_Mode32BitEnable](#).
2. Set the start value of the timer using [PLIB_TMR_Counter8BitSet](#) and [PLIB_TMR_Counter16BitSet](#) and [PLIB_TMR_Counter32BitSet](#).
3. The period register value can be set using [PLIB_TMR_Period8BitSet](#), [PLIB_TMR_Period16BitSet](#) or [PLIB_TMR_Period32BitSet](#). Use the appropriate function based on the resolution of the timer.
4. Clear the timer register using [PLIB_TMR_Counter8BitClear](#), [PLIB_TMR_Counter16BitClear](#), or [PLIB_TMR_Counter32BitClear](#).
5. In this mode, the input clock source for the timer is the internal clock, and is selected using [PLIB_TMR_ClockSourceSelect](#), depending on which clock is used as the internal clock in the timer module of the device.
6. The prescaler for the clock can be selected using [PLIB_TMR_PrescaleSelect](#). Pass in the desired prescaler into the function from the enumeration [TMR_PRESCALE](#).
7. Timer count is incremented on the rising timer clock edge. On some microcontrollers, this is can be changed using [PLIB_TMR_ClockSourceEdgeSelect](#). with the appropriate parameter for the falling edge (i.e., increment on high-to-low).
8. On some microcontrollers, the timer output can go through a postscaler. The postscaler can be configured using [PLIB_TMR_PostscaleSelect](#).
9. Start the timer once the setup is complete using [PLIB_TMR_Start](#). The timer operation can be stopped using [PLIB_TMR_Stop](#).

Example: Synchronous Counter (Internal Clock) Setup

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the application
// developer.

// Stop the timer
PLIB_TMR_Stop(MY_TIMER_INSTANCE);
```

```
// Set the prescaler, and set the clock source as internal
PLIB_TMR_PrescaleSelect(MY_TIMER_INSTANCE, TMR_PRESCALE_TMRX_VALUE_1);
PLIB_TMR_ClockSourceSelect(MY_TIMER_INSTANCE, TMR_CLOCK_SOURCE_PERIPHERAL_CLOCK);

// Clear the timer
PLIB_TMR_Counter16BitClear(MY_TIMER_INSTANCE);

// Load the period register
PLIB_TMR_Period16BitSet(MY_TIMER_INSTANCE, 0xFFFF);

// Start the timer
PLIB_TMR_Start(MY_TIMER_INSTANCE);
```

Timer interrupt is generated if enabled, when the timer count matches the period value if available, or when the counter overflows.

Example: Changing Counter Value During Timer Operation

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the application
// developer.
uint16_t timer_value;

// Clear the timer
timer_value = PLIB_TMR_Counter16BitGet(MY_TIMER_INSTANCE);

if(timer_value > 0x0fff0)
{
    PLIB_TMR_Counter16BitSet(MY_TIMER_INSTANCE, 0x000a);
}
```

Note: Not all modes are available on all devices. Please refer to the specific device data sheet to determine the supported modes for your device.

5.6.24.4.3.2 Synchronous External Clock Counter

This section provides information and examples for Synchronous External Clock Counter operation.

Note: Not all modes are available on all devices. Please refer to the specific device data sheet to determine the supported modes for your device.

Description

Synchronous external clock counter operation provides the following capabilities:

- Counting periodic or non-periodic pulses
- Use external clock as time base for timers

Setup

Use the following steps for synchronous external clock counter setup:

1. Some timer modules support multiple resolutions, which can be selected using [PLIB_TMR_Mode8BitEnable](#), [PLIB_TMR_Mode16BitEnable](#), or [PLIB_TMR_Mode32BitEnable](#).
2. The period register value can be set using [PLIB_TMR_Period8BitSet](#), [PLIB_TMR_Period16BitSet](#), or [PLIB_TMR_Period32BitSet](#). Use the appropriate function based on the resolution of the timer.
3. Set the start value of the timer using [PLIB_TMR_Counter8BitSet](#), [PLIB_TMR_Counter16BitSet](#), or [PLIB_TMR_Counter32BitSet](#).
4. Some timer modules, can select an external clock as its input source. Use [PLIB_TMR_ClockSourceSelect](#) to select the external clock source.
5. The clock source is synchronized with the internal clock for synchronous operation. Use [PLIB_TMR_ClockSourceExternalSyncEnable](#) to synchronize the external clock source.

6. The prescaler for the clock can be selected using [PLIB_TMR_PrescaleSelect](#). Pass in the desired prescaler into the function from the enumeration [TMR_PRESCALE](#).
7. Timer count is incremented on the rising timer clock edge. On some microcontrollers, this is can be changed using [PLIB_TMR_ClockSourceEdgeSelect](#), with the appropriate parameter for the falling edge (i.e., increment on high-to-low).
8. On some microcontrollers, the timer output can go through a postscaler. The postscaler can be configured using [PLIB_TMR_PostscaleSelect](#).
9. Clear the timer register using [PLIB_TMR_Counter8BitClear](#), [PLIB_TMR_Counter16BitClear](#), or [PLIB_TMR_Counter32BitClear](#).
10. Start the timer once the setup is complete using [PLIB_TMR_Start](#). The timer operation can be stopped using [PLIB_TMR_Stop](#).

Example: Synchronous Counter (External Clock) Setup

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the application
// developer.

// Stop the timer
PLIB_TMR_Stop(MY_TIMER_INSTANCE);

// Set the prescaler, and set the clock source as external and enable synchronization
PLIB_TMR_PrescaleSelect(MY_TIMER_INSTANCE, TMR_PRESCALE_VALUE_256);
PLIB_TMR_ClockSourceSelect(MY_TIMER_INSTANCE, TMR_CLOCK_SOURCE_EXTERNAL_INPUT_PIN);
PLIB_TMR_ClockSourceExternalSyncEnable(MY_TIMER_INSTANCE);

// Clear the timer
PLIB_TMR_Counter16BitClear(MY_TIMER_INSTANCE);

// Load the period register
PLIB_TMR_Period16BitSet(MY_TIMER_INSTANCE, 0xFFFF);

// Start the timer
PLIB_TMR_Start(MY_TIMER_INSTANCE);
```

A timer interrupt is generated if enabled, when the timer count matches the period value if available, or when the counter overflows.

Example: Changing Counter Value During Timer Operation

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the application
// developer.
uint16_t timer_value;

// read the current timer value
timer_value = PLIB_TMR_Counter16BitGet(MY_TIMER_INSTANCE);

if(timer_value > 0x0fff0)
{
    PLIB_TMR_Counter16BitSet(MY_TIMER_INSTANCE, 0x000a);
}
```

Note: Not all modes are available on all devices. Please refer to the specific device data sheet to determine the supported modes for your device.

5.6.24.4.3.3 Asynchronous Counter

This section provides information and examples for setting up Asynchronous Counter operation.

Note: Not all modes are available on all devices. Please refer to the specific device data sheet to determine the supported modes for your device.

Description

Asynchronous Counter operation provides the following capabilities:

- The timer can operate in Sleep mode and can generate an interrupt on a period match
- The processor can wake up from Sleep on the timer interrupt
- The timer can be clocked from the Secondary Oscillator for real-time clock applications

Setup

Use the following steps for Asynchronous Counter setup:

1. Some timer modules support multiple resolutions, which can be selected using [PLIB_TMR_Mode8BitEnable](#), [PLIB_TMR_Mode16BitEnable](#), or [PLIB_TMR_Mode32BitEnable](#).
2. The period register value can be set using [PLIB_TMR_Period8BitSet](#), [PLIB_TMR_Period16BitSet](#), or [PLIB_TMR_Period32BitSet](#). Use the appropriate function based on the resolution of the timer.
3. Set the start value of the timer using [PLIB_TMR_Counter8BitSet](#), [PLIB_TMR_Counter16BitSet](#), and [PLIB_TMR_Counter32BitSet](#).
4. Some timer modules can select an external clock as its input source. Use [PLIB_TMR_ClockSourceSelect](#) to select the external clock source.
5. For Asynchronous mode operation, the clock source is not synchronized with the internal clock. Use [PLIB_TMR_ClockSourceExternalSyncDisable](#) to disable the synchronization of the external clock source.
6. The prescaler for the clock can be selected using [PLIB_TMR_PrescaleSelect](#). Pass in the desired prescaler into the function from the enumeration [TMR_PRESCALE](#).
7. Timer count is incremented on the rising timer clock edge. On some microcontrollers, this can be changed using [PLIB_TMR_ClockSourceEdgeSelect](#), with the appropriate parameter for the falling edge (i.e., increment on high-to-low).
8. On some microcontrollers, the timer output can go through a postscaler. The postscaler can be configured using [PLIB_TMR_PostscaleSelect](#).
9. Clear the timer register using [PLIB_TMR_Counter8BitClear](#), [PLIB_TMR_Counter16BitClear](#), or [PLIB_TMR_Counter32BitClear](#).
10. Start the timer once the setup is complete using [PLIB_TMR_Start](#). The timer operation can be stopped using [PLIB_TMR_Stop](#).

Example: Asynchronous Counter Setup

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the application
// developer.

// Stop the timer
PLIB_TMR_Stop(MY_TIMER_INSTANCE);

// Set the prescaler, and set the clock source as external and disable synchronization
PLIB_TMR_PrescaleSelect(MY_TIMER_INSTANCE, TMR_PRESCALE_VALUE_64);
PLIB_TMR_ClockSourceSelect(MY_TIMER_INSTANCE, TMR_CLOCK_SOURCE_EXTERNAL_INPUT_PIN);
PLIB_TMR_ClockSourceExternalSyncDisable(MY_TIMER_INSTANCE);

// Clear the timer
PLIB_TMR_Counter16BitClear(MY_TIMER_INSTANCE);

// Load the period register
PLIB_TMR_Period16BitSet(MY_TIMER_INSTANCE, 0x7F);

// Start the timer
PLIB_TMR_Start(MY_TIMER_INSTANCE);
```

A timer interrupt is generated if enabled, when the timer count matches the period value if available, or when the counter overflows.

Note: Not all modes are available on all devices. Please refer to the specific device data sheet to determine the supported modes for your device.

5.6.24.4.3.4 Gated Timer

This section provides information and examples for setting up Gated Timer operation.

Note: Not all modes are available on all devices. Please refer to the specific device data sheet to determine the supported modes for your device.

Description

Gated Timer operation can be used to allow measurement of an external signal.

Setup

Use the following steps for Gated Timer setup:

1. Some timer modules support multiple resolutions, which can be selected using [PLIB_TMR_Mode8BitEnable](#), [PLIB_TMR_Mode16BitEnable](#), or [PLIB_TMR_Mode32BitEnable](#).
2. The period register value can be set using [PLIB_TMR_Period8BitSet](#), [PLIB_TMR_Period16BitSet](#), or [PLIB_TMR_Period32BitSet](#). Use the appropriate function based on the resolution of the timer.
3. Set the start value of the timer using [PLIB_TMR_Counter8BitSet](#), [PLIB_TMR_Counter16BitSet](#), and [PLIB_TMR_Counter32BitSet](#).
4. In this mode, the input clock source for the timer is the internal clock, and is selected using [PLIB_TMR_ClockSourceSelect](#), depending on which clock is used as the internal clock in the timer module of the device.
5. The prescaler for the clock can be selected using [PLIB_TMR_PrescaleSelect](#). Pass in the desired pre scaler into the function from the enumeration [TMR_PRESCALE](#).
6. Timer count is incremented on the rising timer clock edge. On some microcontrollers, this is can be changed using [PLIB_TMR_ClockSourceEdgeSelect](#), with the appropriate parameter for the falling edge (i.e., increment on high-to-low).
7. On some microcontrollers, the timer output can go through a postscaler. The postscaler can be configured using [PLIB_TMR_PostscaleSelect](#).
8. Clear the timer register using [PLIB_TMR_Counter8BitClear](#), [PLIB_TMR_Counter16BitClear](#), or [PLIB_TMR_Counter32BitClear](#).
9. Gated operation can be enabled using the function [PLIB_TMR_GateEnable](#).
10. On some devices, additional gate functionality can be controlled:
 - Gate Polarity: To allow the timer to count when the gate signal is high, use [PLIB_TMR_GatePolaritySelect](#) with the parameter [TMR_GATE_POLARITY_ACTIVE_HIGH](#). To allow the timer to count when the gate signal is low, use [PLIB_TMR_GatePolaritySelect](#) with the parameter [TMR_GATE_POLARITY_ACTIVE_LOW](#).
 - Gate Toggle mode: To allow the timer to measure the full cycle length of gate signal as opposed to the duration of a single pulse level, use [PLIB_TMR_GateToggleModeEnable](#). To disable this mode, use [PLIB_TMR_GateToggleModeDisable](#).
 - Gate Single Pulse mode: To allow the timer to capture a single pulse gate event, use [PLIB_TMR_GateSinglePulseModeEnable](#) and [PLIB_TMR_GateSinglePulseModeDisable](#). The single pulse acquisition can be started using [PLIB_TMR_GateSinglePulseAcquisitionStart](#), and its status can be read using [PLIB_TMR_GateSinglePulseAcquisitionHasCompleted](#).
 - Additionally, the current state of the gate can be obtained using [PLIB_TMR_GateCurrentStateGet](#)
 - The gate source can be selected using [PLIB_TMR_GateSourceSelect](#), using one of the possible values from [TMR_GATE_SOURCE](#)
11. Start the timer once the setup is complete using [PLIB_TMR_Start](#). The timer operation can be stopped using [PLIB_TMR_Stop](#).

Example 1: Gated Timer Setup

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the application
// developer.

// Stop the timer
```

```

PLIB_TMR_Stop(MY_TIMER_INSTANCE);

// Set the prescaler, and set the clock source as external and disable synchronization
PLIB_TMR_PrescaleSelect(MY_TIMER_INSTANCE, TMR_PRESCALE_VALUE_64);
PLIB_TMR_ClockSourceSelect(MY_TIMER_INSTANCE, TMR_CLOCK_SOURCE_EXTERNAL_INPUT_PIN);
PLIB_TMR_ClockSourceExternalSyncDisable(MY_TIMER_INSTANCE);

// Clear the timer
PLIB_TMR_Counter16BitClear(MY_TIMER_INSTANCE);

// Load the period register
PLIB_TMR_Period16BitSet(MY_TIMER_INSTANCE, 0x7F00);

// Enable the gate timer
PLIB_TMR_GateEnable(MY_TIMER_INSTANCE);

// Start the timer
PLIB_TMR_Start(MY_TIMER_INSTANCE);

```

Example 2: Gated Timer Setup

```

// Stop the timer
uint8_t pulse_width;
PLIB_TMR_Stop(MY_TIMER_INSTANCE);

// Set the prescaler, and set the clock source as external and disable synchronization
PLIB_TMR_PrescaleSelect(MY_TIMER_INSTANCE, TMR_PRESCALE_VALUE_64);
PLIB_TMR_ClockSourceExternalInputClockEnable(MY_TIMER_INSTANCE);
PLIB_TMR_ClockSourceExternalSyncDisable(MY_TIMER_INSTANCE);

// Clear the timer
PLIB_TMR_Counter16BitClear(MY_TIMER_INSTANCE);
// Load the period register
PLIB_TMR_Period16BitSet(MY_TIMER_INSTANCE, 0x7F00);

// Enable the gate timer
PLIB_TMR_GateEnable(MY_TIMER_INSTANCE);
// Gate source selection
PLIB_TMR_GateSourceSelect(MY_TIMER_INSTANCE, TMR_GATE_SOURCE_T1_GATE);
// Start the timer
PLIB_TMR_Start(MY_TIMER_INSTANCE);
// Single pulse acquisition start
PLIB_TMR_GateSinglePulseAcquisitionStart(MY_TIMER_INSTANCE);
// Counting enabled on the rising edge
PLIB_TMR_GatePolaritySelect(MY_TIMER_INSTANCE, TMR_GATE_POLARITY_ACTIVE_HIGH);
// Gate pulse mode enabled
PLIB_TMR_GateSinglePulseModeEnable(MY_TIMER_INSTANCE);

```

A timer interrupt is generated if enabled, on the falling edge of the gate signal. Refer to the specific device data sheet to determine whether this feature is available for your device.

Note: Not all modes are available on all devices. Please refer to the specific device data sheet to determine the supported modes for your device.

5.6.24.4.3.5 Other Features

This section provides information on additional features.

Description

Each of the following modes can additionally support some or all of the features listed. Please refer to the specific device data sheet or family reference manual for details.

Operation During Sleep Mode

When the Timer module is configured to operate in Asynchronous mode (with an external clock source), it will continue to increment each timer clock (or prescale multiple of clocks) during Sleep mode.

On some devices, Timer operation during Sleep mode can be disabled using [PLIB_TMR_OperateInSleepDisable](#), and can be enabled using [PLIB_TMR_OperateInSleepEnable](#).

Operation During Idle Mode

A Timer module can continue to operate in Idle mode by calling [PLIB_TMR_StopInIdleDisable](#), or can stop operation in Idle mode by calling [PLIB_TMR_StopInIdleEnable](#).

Event Trigger Reset

If the PWM modules are configured to use a Timer module, a special event trigger can be generated in Compare mode. The trigger can reset the timer modules. If supported by the device, the special event trigger reset can be enabled using [PLIB_TMR_TriggerEventResetEnable](#), or disabled using [PLIB_TMR_TriggerEventResetDisable](#).

To be able to use this feature, the Timer module must be configured in one of the synchronous modes.

Timer Mode Control

- [PLIB_TMR_Mode8BitEnable](#) - For PIC18 timers, This interface disables 16-bit mode and enables 8-bit mode
- [PLIB_TMR_Mode16BitEnable](#):
 - For PIC18 timers, This interface disables 8-bit mode and enables 16-bit mode
 - For PIC24/PIC32 timers, this interface enables 16-bit mode and disables 32-bit mode
- [PLIB_TMR_Mode32BitEnable](#) - For PIC24/PIC32 timers, this interface enables 32-bit mode and disables 16-bit mode

Timer Usage Mode

Some timers operate in either Period Match mode or Overflow mode. The mode state can be retrieved from the Timer Peripheral Library using [IsPeriodMatchBased](#). This function returns 'true' Period Match mode and 'false' for Overflow mode.

Timer Prescaler Information

Prescaler divisor information associated with the respective prescaler value selected through [TMR_PRESCALE](#) can be retrieved through [PLIB_TMR_PrescaleDivisorGet](#).

The true prescaler value can be obtained by using [PLIB_TMR_PrescaleGet](#).

Timer Postscaler Information

Postscaler divisor information associated with the respective postscaler value is selected through the enumeration [TMR_POSTSCALE](#), and can be retrieved through [PLIB_TMR_PostscaleDivisorGet](#).

The true postscaler value can be obtained by using [PLIB_TMR_PostscaleGet](#).

Timer Source Edge Information

The TMR source edge information can be retrieved using [PLIB_TMR_ClockSourceEdgeGet](#).

5.6.24.4.4 Configuring the Library

The library is configured for the supported Timer modules when the processor is chosen in the MPLAB IDE.

5.6.24.5 Library Interface

Data Types and Constants

	Name	Description
	<u>TMR_ASSIGNMENT</u>	Data type defining the Timer assignment to modules.
	<u>TMR_CLOCK_SOURCE</u>	Data type defining the different clock sources.
	<u>TMR_CLOCK_SOURCE_EDGE</u>	Data type defining the different source edges.
	<u>TMR_GATE_POLARITY</u>	Data type defining the different gate polarities.
	<u>TMR_GATE_SOURCE</u>	Data type defining the different gate source selections.
	<u>TMR_MODULE_ID</u>	Identifies the supported Timer modules.
	<u>TMR_POSTSCALE</u>	Defines the list of possible postscaler values.
	<u>TMR_PRESCALE</u>	Defines the list of possible prescaler values.

Clock Source Control Functions

	Name	Description
	<u>PLIB_TMR_ClockSourceEdgeGet</u>	Gets the source edge information.
	<u>PLIB_TMR_ClockSourceEdgeSelect</u>	Selects the input clock source edge.
	<u>PLIB_TMR_ClockSourceExternalSyncDisable</u>	Disables the clock synchronization of the external input.
	<u>PLIB_TMR_ClockSourceExternalSyncEnable</u>	Enables the clock synchronization of the external input.
	<u>PLIB_TMR_ClockSourceSelect</u>	Selects the clock source.

Counter Control Functions

	Name	Description
	<u>PLIB_TMR_Counter16BitClear</u>	Clears the 16-bit timer value.
	<u>PLIB_TMR_Counter16BitGet</u>	Gets the 16-bit timer value.
	<u>PLIB_TMR_Counter16BitSet</u>	Sets the 16-bit timer value.
	<u>PLIB_TMR_Counter32BitClear</u>	Clears the 32-bit timer value.
	<u>PLIB_TMR_Counter32BitGet</u>	Gets the 32-bit timer value.
	<u>PLIB_TMR_Counter32BitSet</u>	Sets the 32-bit timer value.
	<u>PLIB_TMR_Counter8BitClear</u>	Clears the 8-bit timer value.
	<u>PLIB_TMR_Counter8BitGet</u>	Gets the 8-bit timer value.
	<u>PLIB_TMR_Counter8BitSet</u>	Sets the 8-bit timer value.
	<u>PLIB_TMR_CounterAsyncWriteDisable</u>	Disables the writes to the counter register until the pending write operation completes.
	<u>PLIB_TMR_CounterAsyncWriteEnable</u>	Enables back-to-back writes with legacy asynchronous timer functionality.
	<u>PLIB_TMR_CounterAsyncWriteInProgress</u>	Returns the status of the counter write in Asynchronous mode.

Feature Existence Functions

	Name	Description
	<u>PLIB_TMR_ExistsClockSource</u>	Identifies whether the ClockSource feature exists on the Timer module.
	<u>PLIB_TMR_ExistsClockSourceEdge</u>	Identifies whether the ClockSourceEdge feature exists on the Timer module.
	<u>PLIB_TMR_ExistsClockSourceSync</u>	Identifies whether the ClockSourceSync feature exists on the Timer module.

	PLIB_TMR_ExistsCounter16Bit	Identifies whether the Counter16Bit feature exists on the Timer module.
	PLIB_TMR_ExistsCounter32Bit	Identifies whether the Counter32Bit feature exists on the Timer module.
	PLIB_TMR_ExistsCounter8Bit	Identifies whether the Counter8bit feature exists on the Timer module.
	PLIB_TMR_ExistsCounterAsyncWriteControl	Identifies whether the CounterAsyncWriteControl feature exists on the Timer module.
	PLIB_TMR_ExistsCounterAsyncWriteInProgress	Identifies whether the CounterAsyncWriteInProgress feature exists on the Timer module.
	PLIB_TMR_ExistsCountMode	Identifies whether the CountMode feature exists on the Timer module.
	PLIB_TMR_ExistsEnableControl	Identifies whether the EnableControl feature exists on the Timer module.
	PLIB_TMR_ExistsGateCurrentState	Identifies whether the GateCurrentState feature exists on the Timer module.
	PLIB_TMR_ExistsGatedTimeAccumulation	Identifies whether the GatedTimeAccumulation feature exists on the Timer module.
	PLIB_TMR_ExistsGatePolarity	Identifies whether the GatePolarity feature exists on the Timer module.
	PLIB_TMR_ExistsGateSinglePulseAcquisition	Identifies whether the GateSinglePulseAcquisition feature exists on the Timer module.
	PLIB_TMR_ExistsGateSinglePulseMode	Identifies whether the GateSinglePulseMode feature exists on the Timer module.
	PLIB_TMR_ExistsGateSource	Identifies whether the GateSource feature exists on the Timer module.
	PLIB_TMR_ExistsGateToggleMode	Identifies whether the GateToggleMode feature exists on the Timer module.
	PLIB_TMR_ExistsMode16Bit	Identifies whether the Mode16Bit feature exists on the Timer module.
	PLIB_TMR_ExistsMode32Bit	Identifies whether the Mode32Bit feature exists on the Timer module.
	PLIB_TMR_ExistsMode8Bit	Identifies whether the Mode8Bit feature exists on the Timer module.
	PLIB_TMR_ExistsOperationInSleep	Identifies whether the OperationInSleep feature exists on the Timer module.
	PLIB_TMR_ExistsPeriod16Bit	Identifies whether the Period16Bit feature exists on the Timer module.
	PLIB_TMR_ExistsPeriod32Bit	Identifies whether the Period32Bit feature exists on the Timer module.
	PLIB_TMR_ExistsPeriod8Bit	Identifies whether the Period8Bit feature exists on the Timer module.
	PLIB_TMR_ExistsPostscale	Identifies whether the Postscale feature exists on the Timer module.
	PLIB_TMR_ExistsPrescale	Identifies whether the Prescale feature exists on the Timer module.
	PLIB_TMR_ExistsPrescalerAssignment	Identifies whether the PrescalerControl feature exists on the Timer module.
	PLIB_TMR_ExistsStopInIdleControl	Identifies whether the StopInIdle feature exists on the Timer module.
	PLIB_TMR_ExistsSystemClockStatus	Identifies whether the SystemClockStatus feature exists on the Timer module.

	PLIB_TMR_ExistsTimerAssignment	Identifies whether the TimerAssignment feature exists on the Timer module.
	PLIB_TMR_ExistsTimerOperationMode	Identifies whether the TimerOperationMode feature exists on the Timer module.
	PLIB_TMR_ExistsTimerOscillator	Identifies whether the TimerOscillator feature exists on the Timer module.
	PLIB_TMR_ExistsTriggerEventReset	Identifies whether the TriggerEventReset feature exists on the Timer module.

Gate Control Functions

	Name	Description
	PLIB_TMR_GateCurrentStateGet	Returns the current level of the timer gate.
	PLIB_TMR_GateDisable	Enables counting regardless of the corresponding timer gate function.
	PLIB_TMR_GateEnable	Enables counting controlled by the corresponding gate function.
	PLIB_TMR_GatePolaritySelect	Selects the timer gate polarity.
	PLIB_TMR_GateSinglePulseAcquisitionHasCompleted	Returns the gate single pulse acquisition status.
	PLIB_TMR_GateSinglePulseAcquisitionStart	Starts the gate single pulse acquisition.
	PLIB_TMR_GateSinglePulseModeDisable	Disables Single Pulse mode.
	PLIB_TMR_GateSinglePulseModeEnable	Enables Single pulse mode and the controlling corresponding timer gate.
	PLIB_TMR_GateSourceSelect	Selects the timer gate source.
	PLIB_TMR_GateToggleModeDisable	Disables the Gate Toggle mode.
	PLIB_TMR_GateToggleModeEnable	Enables the Gate Toggle mode.

General Setup Functions

	Name	Description
	PLIB_TMR_AssignmentSelect	Assigns the specified Timer(s) to the selected modules.
	PLIB_TMR_ContinuousCountModeEnable	Enables Continuous Count mode
	PLIB_TMR_Mode16BitEnable	Enables the Timer module for 16-bit operation and disables all other modes.
	PLIB_TMR_Mode32BitEnable	Enables 32-bit operation on the Timer module combination.
	PLIB_TMR_Mode8BitEnable	Enables the Timer module in 8-bit operation mode and disables 16-bit mode.
	PLIB_TMR_Start	Starts/enables the indexed timer.
	PLIB_TMR_Stop	Stops/disables the indexed timer.
	PLIB_TMR_TimerOscillatorDisable	Disables the oscillator associated with the Timer module.
	PLIB_TMR_TimerOscillatorEnable	Enables the oscillator associated with the Timer module.
	PLIB_TMR_TriggerEventResetDisable	Disables the special event trigger reset.
	PLIB_TMR_TriggerEventResetEnable	Enables the special event trigger reset.
	PLIB_TMR_SingleShotModeEnable	Enables Single-shot mode.

Miscellaneous Functions

	Name	Description
	PLIB_TMR_IsPeriodMatchBased	Gets the operating mode state of the Timer module based on Period Match or Overflow mode.
	PLIB_TMR_SystemClockFromTimerIsActive	Gets the system clock status.

Period Control Functions

	Name	Description
≡	PLIB_TMR_Period16BitGet	Gets the 16-bit period value.
≡	PLIB_TMR_Period16BitSet	Sets the 16-bit period value.
≡	PLIB_TMR_Period32BitGet	Gets the 32-bit period value.
≡	PLIB_TMR_Period32BitSet	Sets the 32-bit period value.
≡	PLIB_TMR_Period8BitGet	Gets the 8-bit period value.
≡	PLIB_TMR_Period8BitSet	Sets the 8-bit period value.

Post-processing Functions

	Name	Description
≡	PLIB_TMR_PostscaleDivisorGet	Gets the postscaler divisor information.
≡	PLIB_TMR_PostscaleGet	Gets the postscaler divisor information.
≡	PLIB_TMR_PostscaleSelect	Selects the output clock postscaler.

Power Control Functions

	Name	Description
≡	PLIB_TMR_OperateInSleepDisable	Disables Timer module operation when the device is in Sleep mode.
≡	PLIB_TMR_OperateInSleepEnable	Enables Timer module operation when the device is in Sleep mode.
≡	PLIB_TMR_StopInIdleDisable	Continue module operation when the device enters Idle mode.
≡	PLIB_TMR_StopInIdleEnable	Discontinues module operation when the device enters Idle mode.

Preprocessing Functions

	Name	Description
≡	PLIB_TMR_PrescaleDivisorGet	Gets the prescaler divisor information.
≡	PLIB_TMR_PrescaleGet	Gets the prescaler information.
≡	PLIB_TMR_PrescalerDisable	Disables the prescaler assignment to the indexed Timer module.
≡	PLIB_TMR_PrescalerEnable	Enables the prescaler assignment to the indexed Timer module.
≡	PLIB_TMR_PrescaleSelect	Selects the clock prescaler.

Description

This section lists and describes the functions, data types, and constants available in the Timer Peripheral Library.

5.6.24.5.1 General Setup Functions**5.6.24.5.1.1 PLIB_TMR_AssignmentSelect Function****C**

```
void PLIB_TMR_AssignmentSelect(
    TMR_MODULE_ID index,
    TMR_ASSIGNMENT tmrNums
);
```

Description

This function assigns the specified Timer(s) as the clock source for the selected modules.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
tmrNums	One of the possible values of TMR_ASSIGNMENT

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsTimerAssignment](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the  
// application developer.  
PLIB_TMR_AssignmentSelect(MY_TMR_INSTANCE, TMR_ASSIGNMENT_T1_TO_CCP_ALL);
```

5.6.24.5.1.2 PLIB_TMR_ContinuousCountModeEnable Function**C**

```
void PLIB_TMR_ContinuousCountModeEnable(  
    TMR_MODULE_ID index  
);
```

Description

This function enables Continuous Count mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsCountMode](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the  
// application developer.  
PLIB_TMR_ContinuousCountModeEnable(MY_TMR_INSTANCE);
```

5.6.24.5.1.3 PLIB_TMR_Mode16BitEnable Function**C**

```
void PLIB_TMR_Mode16BitEnable(  
    TMR_MODULE_ID index  
);
```

Description

This function enables the Timer module for 16-bit operation and disables all other modes.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

Calling this function disables the operation of the Timer module 8-bit mode.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsMode16Bit](#) in your application to determine whether this feature is available.

For PIC18 Timers, this function disables 8-bit mode and enables 16-bit mode. For PIC24/PIC32 TMRs, this function enables 16-bit mode and disables 32-bit mode.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the
// application developer.
PLIB_TMR_Mode16BitEnable(MY_TMR_INSTANCE);
```

5.6.24.5.1.4 PLIB_TMR_Mode32BitEnable Function**C**

```
void PLIB_TMR_Mode32BitEnable(
    TMR_MODULE_ID index
);
```

Description

This function enables the Timer module and the index +1 Timer module to act as one 32-bit timer module and disables all other modes.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsMode32Bit](#) in your application to determine whether this feature is available.

For PIC24/PIC32 Timers, this function enables 32-bit mode and disables 16-bit mode.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the
// application developer.
PLIB_TMR_Mode32BitEnable(MY_TMR_INSTANCE);
```

5.6.24.5.1.5 PLIB_TMR_Mode8BitEnable Function

C

```
void PLIB_TMR_Mode8BitEnable(  
    TMR_MODULE_ID index  
);
```

Description

This function enables the Timer module in 8-bit operation mode and disables 16-bit mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

Calling this function disables the operation of Timer module in 16-bit mode.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsMode8Bit](#) in your application to determine whether this feature is available.

For PIC18 Timers, this function disables 16-bit mode and enables 8-bit mode.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the  
// application developer.  
PLIB_TMR_Mode8BitEnable(MY_TMR_INSTANCE);
```

5.6.24.5.1.6 PLIB_TMR_Start Function

C

```
void PLIB_TMR_Start(  
    TMR_MODULE_ID index  
);
```

Description

This function starts/enables the indexed timer.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use

[PLIB_TMR_ExistsEnableControl](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the
// application developer.
PLIB_TMR_Start(MY_TMR_INSTANCE);
```

5.6.24.5.1.7 PLIB_TMR_Stop Function

C

```
void PLIB_TMR_Stop(
    TMR_MODULE_ID index
);
```

Description

This function stops/disables the indexed timer.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsEnableControl](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the
// application developer.
PLIB_TMR_Stop(MY_TMR_INSTANCE);
```

5.6.24.5.1.8 PLIB_TMR_TimerOscillatorDisable Function

C

```
void PLIB_TMR_TimerOscillatorDisable(
    TMR_MODULE_ID index
);
```

Description

This function disables the oscillator associated with the Timer module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsTimerOscillator](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the
// application developer.
PLIB_TMR_TimerOscillatorDisable(MY_TMR_INSTANCE);
```

5.6.24.5.1.9 PLIB_TMR_TimerOscillatorEnable Function**C**

```
void PLIB_TMR_TimerOscillatorEnable(
    TMR_MODULE_ID index
);
```

Description

This function enables the oscillator associated with the Timer module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsTimerOscillator](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the
// application developer.
PLIB_TMR_TimerOscillatorEnable(MY_TMR_INSTANCE);
```

5.6.24.5.1.10 PLIB_TMR_TriggerEventResetDisable Function**C**

```
void PLIB_TMR_TriggerEventResetDisable(
    TMR_MODULE_ID index
);
```

Description

This function disables the special event trigger reset.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsTriggerEventReset](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the  
// application developer.  
PLIB_TMR_TriggerEventResetDisable(MY_TMR_INSTANCE);
```

5.6.24.5.1.11 PLIB_TMR_TriggerEventResetEnable Function**C**

```
void PLIB_TMR_TriggerEventResetEnable(  
    TMR_MODULE_ID index  
)
```

Description

This function enables the special event trigger reset.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsTriggerEventReset](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the  
// application developer.  
PLIB_TMR_TriggerEventResetEnable(MY_TMR_INSTANCE);
```

5.6.24.5.1.12 PLIB_TMR_SingleShotModeEnable Function**C**

```
void PLIB_TMR_SingleShotModeEnable(  
    TMR_MODULE_ID index  
)
```

Description

This function enables Single-shot mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsCountMode](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the  
// application developer.  
PLIB_TMR_SingleShotModeEnable(MY_TMR_INSTANCE);
```

5.6.24.5.2 Power Control Functions

5.6.24.5.2.1 PLIB_TMR_OperateInSleepDisable Function

C

```
void PLIB_TMR_OperateInSleepDisable(  
    TMR_MODULE_ID index  
);
```

Description

This function disables Timer module operation when the device is in Sleep mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsOperationInSleep](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the  
// application developer.  
PLIB_TMR_OperateInSleepDisable(MY_TMR_INSTANCE);
```

5.6.24.5.2.2 PLIB_TMR_OperateInSleepEnable Function

C

```
void PLIB_TMR_OperateInSleepEnable(  
    TMR_MODULE_ID index  
);
```

Description

This function enables Timer module operation when the device is in Sleep mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsOperationInSleep](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the
// application developer.
PLIB_TMR_OperateInSleepEnable(MY_TMR_INSTANCE);
```

5.6.24.5.2.3 PLIB_TMR_StopInIdleDisable Function**C**

```
void PLIB_TMR_StopInIdleDisable(
    TMR_MODULE_ID index
);
```

Description

This function continues module operation when the device enters Idle mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsStopInIdleControl](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the
// application developer.
PLIB_TMR_StopInIdleDisable(MY_TMR_INSTANCE);
```

5.6.24.5.2.4 PLIB_TMR_StopInIdleEnable Function**C**

```
void PLIB_TMR_StopInIdleEnable(
```

```
TMR_MODULE_ID index  
);
```

Description

This function discontinues module operation when the device enters Idle mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsStopInIdleControl](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the // application developer.  
PLIB_TMR_StopInIdleEnable(MY_TMR_INSTANCE);
```

5.6.24.5.3 Clock Source Control Functions

5.6.24.5.3.1 PLIB_TMR_ClockSourceEdgeGet Function

C

```
TMR_CLOCK_SOURCE_EDGE PLIB_TMR_ClockSourceEdgeGet(  
    TMR_MODULE_ID index  
);
```

Description

This function gets the input clock source edge information.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

One of the possible values of [TMR_CLOCK_SOURCE_EDGE](#).

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsClockSourceEdge](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the  
// application developer.
```

```
TMR_CLOCK_SOURCE_EDGE source;  
source = PLIB_TMR_ClockSourceEdgeGet(MY_TMR_INSTANCE);
```

5.6.24.5.3.2 PLIB_TMR_ClockSourceEdgeSelect Function

C

```
void PLIB_TMR_ClockSourceEdgeSelect(  
    TMR_MODULE_ID index,  
    TMR_CLOCK_SOURCE_EDGE source  
);
```

Description

This function selects the input clock source edge, which could either be high-to-low (falling edge) or low-to-high (rising edge).

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
source	One of the possible values of TMR_CLOCK_SOURCE_EDGE

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsClockSourceEdge](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the  
// application developer.  
PLIB_TMR_ClockSourceEdgeSelect(MY_TMR_INSTANCE,  
    TMR_CLOCK_SOURCE_EDGE_INCREMENT_ON_LOW_TO_HIGH);
```

5.6.24.5.3.3 PLIB_TMR_ClockSourceExternalSyncDisable Function

C

```
void PLIB_TMR_ClockSourceExternalSyncDisable(  
    TMR_MODULE_ID index  
);
```

Description

This function disables the clock synchronization of the external input.

Preconditions

The timer module must be configured to use the external clock using the function [PLIB_TMR_ClockSourceSelect](#) with the clock source as `TMR_CLOCK_SOURCE_EXTERNAL_INPUT_PIN`. If the function [PLIB_TMR_ClockSourceSelect](#) configures the clock with some other enumeration, this function will have no effect.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsClockSourceSync](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the  
// application developer.  
PLIB_TMR_ClockSourceExternalSyncDisable(MY_TMR_INSTANCE);
```

5.6.24.5.3.4 PLIB_TMR_ClockSourceExternalSyncEnable Function**C**

```
void PLIB_TMR_ClockSourceExternalSyncEnable(  
    TMR_MODULE_ID index  
);
```

Description

This function enables the clock synchronization of the external input.

Preconditions

The timer module must be configured to use the external clock using the function [PLIB_TMR_ClockSourceSelect](#) with the clock source as TMR_CLOCK_SOURCE_EXTERNAL_INPUT_PIN. If the function [PLIB_TMR_ClockSourceSelect](#) configures the clock with some other enumeration, this function will have no effect.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsClockSourceSync](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the  
// application developer.  
PLIB_TMR_ClockSourceExternalSyncEnable(MY_TMR_INSTANCE);
```

5.6.24.5.3.5 PLIB_TMR_ClockSourceSelect Function**C**

```
void PLIB_TMR_ClockSourceSelect(  
    TMR_MODULE_ID index,  
    TMR_CLOCK_SOURCE source  
);
```

Description

This function selects the clock source.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
source	One of the possible values of TMR_CLOCK_SOURCE

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsGateSource](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the
// application developer.
PLIB_TMR_ClockSourceSelect(MY_TMR_INSTANCE, TMR_CLOCK_SOURCE_PERIPHERAL_CLOCK);
```

5.6.24.5.4 Gate Control Functions

5.6.24.5.4.1 PLIB_TMR_GateCurrentStateGet Function

C

```
bool PLIB_TMR_GateCurrentStateGet(
    TMR_MODULE_ID index
);
```

Description

This function returns the current level of the timer gate. The gate value is set for the entire duration of the clock count whether it is a single pulse or a full clock cycle.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

- true - Acquisition has started
- false - Acquisition has completed or has not been started

Remarks

This feature is not affected by [PLIB_TMR_GateEnable](#) or [PLIB_TMR_GateDisable](#).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsGateCurrentState](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the
// application developer.
bool gatestate = PLIB_TMR_GateCurrentStateGet(MY_TMR_INSTANCE);
```

5.6.24.5.4.2 PLIB_TMR_GateDisable Function

C

```
void PLIB_TMR_GateDisable(  
    TMR_MODULE_ID index  
);
```

Description

This function enables counting regardless of the gate function.

Preconditions

The timer must be enabled for this function to take effect.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsGatedTimeAccumulation](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the  
// application developer.  
PLIB_TMR_GateDisable(MY_TMR_INSTANCE);
```

5.6.24.5.4.3 PLIB_TMR_GateEnable Function

C

```
void PLIB_TMR_GateEnable(  
    TMR_MODULE_ID index  
);
```

Description

This function enables counting controlled by the gate function.

Preconditions

The timer must be enabled, for this function to take effect.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsGatedTimeAccumulation](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the
```

```
// application developer.  
PLIB_TMR_GateEnable(MY_TMR_INSTANCE);
```

5.6.24.5.4.4 PLIB_TMR_GatePolaritySelect Function

C

```
void PLIB_TMR_GatePolaritySelect(  
    TMR_MODULE_ID index,  
    TMR_GATE_POLARITY polarity  
);
```

Description

This function selects the timer gate polarity.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
polarity	One of the possible values of TMR_GATE_POLARITY

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsGatePolarity](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the  
// application developer.  
PLIB_TMR_GatePolaritySelect(MY_TMR_INSTANCE, TMR_GATE_POLARITY_ACTIVE_HIGH);
```

5.6.24.5.4.5 PLIB_TMR_GateSinglePulseAcquisitionHasCompleted Function

C

```
bool PLIB_TMR_GateSinglePulseAcquisitionHasCompleted(  
    TMR_MODULE_ID index  
);
```

Description

This function returns the gate single pulse acquisition status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

- true - Acquisition is waiting for an edge
- false - Acquisition has completed or has not been started

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsGateSinglePulseAcquisition](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the  
// application developer.  
bool isComplete;  
isComplete = PLIB_TMR_GateSinglePulseAcquisitionHasCompleted(MY_TMR_INSTANCE);
```

5.6.24.5.4.6 PLIB_TMR_GateSinglePulseAcquisitionStart Function**C**

```
void PLIB_TMR_GateSinglePulseAcquisitionStart(  
    TMR_MODULE_ID index  
);
```

Description

This function starts the gate single pulse acquisition feature.

Preconditions

[PLIB_TMR_GateSinglePulseModeEnable](#) should be called before this function.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsGateSinglePulseAcquisition](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the  
// application developer.  
PLIB_TMR_GateSinglePulseAcquisitionStart(MY_TMR_INSTANCE);
```

5.6.24.5.4.7 PLIB_TMR_GateSinglePulseModeDisable Function**C**

```
void PLIB_TMR_GateSinglePulseModeDisable(  
    TMR_MODULE_ID index  
);
```

Description

This function disables Single Pulse mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsGateSinglePulseMode](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the  
// application developer.  
PLIB_TMR_GateSinglePulseModeDisable(MY_TMR_INSTANCE);
```

5.6.24.5.4.8 PLIB_TMR_GateSinglePulseModeEnable Function**C**

```
void PLIB_TMR_GateSinglePulseModeEnable(  
    TMR_MODULE_ID index  
);
```

Description

This function enables Single pulse mode and the controlling corresponding timer gate.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsGateSinglePulseMode](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the  
// application developer.  
PLIB_TMR_GateSinglePulseModeEnable(MY_TMR_INSTANCE);
```

5.6.24.5.4.9 PLIB_TMR_GateSourceSelect Function**C**

```
void PLIB_TMR_GateSourceSelect(  
    TMR_MODULE_ID index,  
    TMR_GATE_SOURCE source  
);
```

Description

This function selects the timer gate source.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
source	One of the possible values of TMR_GATE_SOURCE

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsGateSource](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the  
// application developer.  
PLIB_TMR_GateSourceSelect(MY_TMR_INSTANCE, TMR_GATE_SOURCE_CMP1_SYNC_OUTPUT);
```

5.6.24.5.4.10 PLIB_TMR_GateToggleModeDisable Function**C**

```
void PLIB_TMR_GateToggleModeDisable(  
    TMR_MODULE_ID index  
);
```

Description

This function disables Gate Toggle mode and the toggle flip flop is cleared.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsGateToggleMode](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the  
// application developer.  
PLIB_TMR_GateToggleModeDisable(MY_TMR_INSTANCE);
```

5.6.24.5.4.11 PLIB_TMR_GateToggleModeEnable Function**C**

```
void PLIB_TMR_GateToggleModeEnable(  
    TMR_MODULE_ID index  
);
```

Description

This function enables Gate Toggle mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsGateToggleMode](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the
// application developer.
PLIB_TMR_GateToggleModeEnable(MY_TMR_INSTANCE);
```

5.6.24.5.5 Preprocessing Functions

5.6.24.5.5.1 PLIB_TMR_PrescaleDivisorGet Function

C

```
uint16_t PLIB_TMR_PrescaleDivisorGet(
    TMR_MODULE_ID index,
    TMR_PRESCALE prescale
);
```

Description

This function gets the prescaler divisor information.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
prescale	One of the possible values of TMR_PRESCALE

Returns

prescale divisor value

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsPrescale](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the
// application developer.
uint16_t div = PLIB_TMR_PrescaleDivisorGet (MY_TMR_INSTANCE, TMR_PRESCALE_VALUE_1);
```

5.6.24.5.5.2 PLIB_TMR_PrescaleGet Function

C

```
TMR_PRESCALE PLIB_TMR_PrescaleGet(  
    TMR_MODULE_ID index  
);
```

Description

This function gets the prescaler information.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

One of the possible values of [TMR_PRESCALE](#)

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsPrescale](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the  
// application developer.  
TMR_PRESCALE prescale;  
prescale = PLIB_TMR_PrescaleGet (MY_TMR_INSTANCE);
```

5.6.24.5.5.3 PLIB_TMR_PrescalerDisable Function

C

```
void PLIB_TMR_PrescalerDisable(  
    TMR_MODULE_ID index  
);
```

Description

This function disables the prescaler assignment to the indexed Timer module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsPrescalerAssignment](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the
// application developer.
PLIB_TMR_PrescalerDisable(MY_TMR_INSTANCE);
```

5.6.24.5.5.4 PLIB_TMR_PrescalerEnable Function**C**

```
void PLIB_TMR_PrescalerEnable(
    TMR_MODULE_ID index
);
```

Description

This function enables the prescaler assignment to the indexed Timer module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsPrescalerAssignment](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the
// application developer.
PLIB_TMR_PrescalerEnable(MY_TMR_INSTANCE);
```

5.6.24.5.5.5 PLIB_TMR_PrescaleSelect Function**C**

```
void PLIB_TMR_PrescaleSelect(
    TMR_MODULE_ID index,
    TMR_PRESCALE prescale
);
```

Description

This function selects the clock prescaler.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
prescale	One of the possible values of TMR_PRESCALE

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsPrescale](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the  
// application developer.  
PLIB_TMR_PrescaleSelect(MY_TMR_INSTANCE, TMR_PRESCALE_VALUE_8);
```

5.6.24.5.6 Period Control Functions

5.6.24.5.6.1 PLIB_TMR_Period16BitGet Function

C

```
uint16_t PLIB_TMR_Period16BitGet(  
    TMR_MODULE_ID index  
);
```

Description

This function gets the 16-bit period value.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

period - 16-bit period value

Remarks

The timer period register may be written at any time before the timer is started or after the timer is stopped. The timer period register can also be written when servicing the interrupt for the timer. When the timer is in operation, it is not recommended to write to the period register.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsPeriod16Bit](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the  
// application developer.  
uint16_t period = PLIB_TMR_Period16BitGet(MY_TMR_INSTANCE);
```

5.6.24.5.6.2 PLIB_TMR_Period16BitSet Function

C

```
void PLIB_TMR_Period16BitSet(  
    TMR_MODULE_ID index,  
    uint16_t period  
);
```

Description

This function sets the 16-bit period value.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
period	16-bit period register value

Returns

None.

Remarks

The timer period register may be written at any time before the timer is started or after the timer is stopped. The timer period register can also be written when servicing the interrupt for the timer. When the timer is in operation, it is not recommended to write to the period register.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsPeriod16Bit](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the
// application developer.
// where, MY_PERIOD_VALUE is the 16-bit value which needs to be stored in the
// period register.
PLIB_TMR_Period16BitSet(MY_TMR_INSTANCE, MY_PERIOD_VALUE);
```

5.6.24.5.6.3 PLIB_TMR_Period32BitGet Function**C**

```
uint32_t PLIB_TMR_Period32BitGet(
    TMR_MODULE_ID index
);
```

Description

This function gets the 32-bit period value.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

period - 32-bit period value

Remarks

The timer period register may be written at any time before the timer is started or after the timer is stopped. The timer period register can also be written when servicing the interrupt for the timer. When the timer is in operation, it is not recommended to write to the period register.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsPeriod32Bit](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the  
// application developer.  
uint32_t period = PLIB_TMR_Period32BitGet(MY_TMR_INSTANCE);
```

5.6.24.5.6.4 PLIB_TMR_Period32BitSet Function**C**

```
void PLIB_TMR_Period32BitSet(  
    TMR_MODULE_ID index,  
    uint32_t period  
);
```

Description

This function sets the 32-bit period value.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
period	32-bit period register value

Returns

None.

Remarks

The timer period register may be written at any time before the timer is started or after the timer is stopped. The timer period register can also be written when servicing the interrupt for the timer. When the timer is in operation, it is not recommended to write to the period register.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsPeriod32Bit](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the  
// application developer.  
// where, MY_PERIOD_VALUE is the 32-bit value which needs to be stored in the  
// period register.  
PLIB_TMR_Period32BitSet(MY_TMR_INSTANCE, MY_PERIOD_VALUE);
```

5.6.24.5.6.5 PLIB_TMR_Period8BitGet Function**C**

```
uint8_t PLIB_TMR_Period8BitGet(  
    TMR_MODULE_ID index  
);
```

Description

This function gets the 8-bit period value.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

period - 8-bit period value

Remarks

The timer period register may be written at any time before the timer is started or after the timer is stopped. The timer period register can also be written when servicing the interrupt for the timer. When the timer is in operation, it is not recommended to write to the period register.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsPeriod8Bit](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the
// application developer.
uint8_t period = PLIB_TMR_Period8BitGet(MY_TMR_INSTANCE);
```

5.6.24.5.6.6 PLIB_TMR_Period8BitSet Function**C**

```
void PLIB_TMR_Period8BitSet(
    TMR_MODULE_ID index,
    uint8_t period
);
```

Description

This function sets the 8-bit period value.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
period	8-bit period value

Returns

None.

Remarks

The timer period register may be written at any time before the timer is started or after the timer is stopped. The timer period register can also be written when servicing the interrupt for the timer. When the timer is in operation, it is not recommended to write to the period register.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsPeriod8Bit](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the
// application developer.
// where, MY_PERIOD_VALUE is the 8-bit value which needs to be stored in the
// period register.
```

```
PLIB_TMR_Period8BitSet(MY_TMR_INSTANCE, MY_PERIOD_VALUE);
```

5.6.24.5.7 Counter Control Functions

5.6.24.5.7.1 PLIB_TMR_Counter16BitClear Function

C

```
void PLIB_TMR_Counter16BitClear(  
    TMR_MODULE_ID index  
);
```

Description

This function clears the 16-bit timer value.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

When the timer register is written, the timer increment does not occur for that cycle. Writes to the timer register in the asynchronous counter mode should be avoided.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsCounter16Bit](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the  
// application developer.  
PLIB_TMR_Counter16BitClear(MY_TMR_INSTANCE);
```

5.6.24.5.7.2 PLIB_TMR_Counter16BitGet Function

C

```
uint16_t PLIB_TMR_Counter16BitGet(  
    TMR_MODULE_ID index  
);
```

Description

This function gets the 16-bit timer value.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

16-bit timer value.

Remarks

PLIB_TMR_Counter16BitGet does not prevent the timer from incrementing during the same instruction cycle.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsCounter16Bit](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the  
// application developer.  
uint16_t timerValue = PLIB_TMR_Counter16BitGet(MY_TMR_INSTANCE);
```

5.6.24.5.7.3 PLIB_TMR_Counter16BitSet Function**C**

```
void PLIB_TMR_Counter16BitSet(  
    TMR_MODULE_ID index,  
    uint16_t value  
);
```

Description

This function sets the 16-bit timer value.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
value	16-bit value to be set

Returns

None.

Remarks

When the timer register is written to, the timer increment does not occur for that cycle. Writes to the timer register in the asynchronous counter mode should be avoided.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsCounter16Bit](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the  
// application developer.  
PLIB_TMR_Counter16BitSet(MY_TMR_INSTANCE, 0x100);
```

5.6.24.5.7.4 PLIB_TMR_Counter32BitClear Function**C**

```
void PLIB_TMR_Counter32BitClear(  
    TMR_MODULE_ID index  
);
```

Description

This function clears the 32-bit timer value.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

When the timer register is written, the timer increment does not occur for that cycle. Writes to the timer register in the asynchronous counter mode should be avoided.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsCounter32Bit](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the
// application developer.
PLIB_TMR_Counter32BitClear(MY_TMR_INSTANCE);
```

5.6.24.5.7.5 PLIB_TMR_Counter32BitGet Function**C**

```
uint32_t PLIB_TMR_Counter32BitGet(
    TMR_MODULE_ID index
);
```

Description

This function gets the 32-bit timer value.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

32 bit timer value.

Remarks

PLIB_TMR_Counter32BitGet does not prevent the timer from incrementing during the same instruction cycle.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsCounter32Bit](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the
// application developer.
uint32_t timerValue = PLIB_TMR_Counter32BitGet(MY_TMR_INSTANCE);
```

5.6.24.5.7.6 PLIB_TMR_Counter32BitSet Function

C

```
void PLIB_TMR_Counter32BitSet(  
    TMR_MODULE_ID index,  
    uint32_t value  
);
```

Description

This function sets the 32-bit timer value.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
value	32-bit value to be set

Returns

None.

Remarks

When the timer register is written, the timer increment does not occur for that cycle. Writes to the timer register in the asynchronous counter mode should be avoided.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsCounter32Bit](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the  
// application developer.  
PLIB_TMR_Counter32BitSet(MY_TMR_INSTANCE, 0x1000000);
```

5.6.24.5.7.7 PLIB_TMR_Counter8BitClear Function

C

```
void PLIB_TMR_Counter8BitClear(  
    TMR_MODULE_ID index  
);
```

Description

This function clears the 8-bit timer value.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

When the timer register is written, the timer increment does not occur for that cycle. Writes to the timer register in the asynchronous counter mode should be avoided.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsCounter8Bit](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the
// application developer.
PLIB_TMR_Counter8BitClear(MY_TMR_INSTANCE);
```

5.6.24.5.7.8 PLIB_TMR_Counter8BitGet Function**C**

```
uint8_t PLIB_TMR_Counter8BitGet(
    TMR_MODULE_ID index
);
```

Description

This function gets the 8-bit timer value.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

8-bit timer value.

Remarks

PLIB_TMR_Counter8BitGet does not prevent the timer from incrementing during the same instruction cycle.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsCounter8Bit](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the
// application developer.
uint8_t timerValue = PLIB_TMR_Counter8BitGet(MY_TMR_INSTANCE);
```

5.6.24.5.7.9 PLIB_TMR_Counter8BitSet Function**C**

```
void PLIB_TMR_Counter8BitSet(
    TMR_MODULE_ID index,
    uint8_t value
);
```

Description

This function sets the 8-bit timer value.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
value	8-bit value to be set

Returns

None.

Remarks

When the timer register is written, the timer increment does not occur for that cycle. Writes to the timer register in the asynchronous counter mode should be avoided.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsCounter8Bit](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the
// application developer.
PLIB_TMR_Counter8BitSet(MY_TMR_INSTANCE, 0x10);
```

5.6.24.5.7.10 PLIB_TMR_CounterAsyncWriteDisable Function**C**

```
void PLIB_TMR_CounterAsyncWriteDisable(
    TMR_MODULE_ID index
);
```

Description

This function disables the writes to the counter register until the pending write operation completes.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsCounterAsyncWriteControl](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the
// application developer.
PLIB_TMR_CounterAsyncWriteDisable(MY_TMR_INSTANCE);
```

5.6.24.5.7.11 PLIB_TMR_CounterAsyncWriteEnable Function**C**

```
void PLIB_TMR_CounterAsyncWriteEnable(
    TMR_MODULE_ID index
);
```

Description

This function enables back-to-back writes with legacy asynchronous timer functionality .

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsCounterAsyncWriteControl](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the  
// application developer.  
PLIB_TMR_CounterAsyncWriteEnable(MY_TMR_INSTANCE);
```

5.6.24.5.7.12 PLIB_TMR_CounterAsyncWriteInProgress Function**C**

```
bool PLIB_TMR_CounterAsyncWriteInProgress(  
    TMR_MODULE_ID index  
);
```

Description

This function returns the status of the counter write in Asynchronous mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

- true - Write is in progress
- false - Write is complete

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsCounterAsyncWriteInProgress](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the  
// application developer.  
bool inProgress = PLIB_TMR_CounterAsyncWriteInProgress(MY_TMR_INSTANCE);
```

5.6.24.5.8 Post-processing Functions

5.6.24.5.8.1 PLIB_TMR_PostscaleDivisorGet Function

C

```
uint16_t PLIB_TMR_PostscaleDivisorGet(  
    TMR_MODULE_ID index,  
    TMR_POSTSCALE postscale  
);
```

Description

This function gets the postscaler divisor information.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
postscale	One of the possible values of TMR_POSTSCALE

Returns

Postscaler divisor value.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsPostscale](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the  
// application developer.  
uint16_t div = PLIB_TMR_PostscaleDivisorGet (MY_TMR_INSTANCE, TMR_POSTSCALE_1_TO_16);
```

5.6.24.5.8.2 PLIB_TMR_PostscaleGet Function

C

```
TMR_POSTSCALE PLIB_TMR_PostscaleGet(  
    TMR_MODULE_ID index  
);
```

Description

This function gets the postscaler divisor information.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

One of the possible values of [TMR_POSTSCALE](#).

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsPostscale](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the  
// application developer.  
TMR_POSTSCALE postscale;  
postscale = PLIB_TMR_PostscaleGet (MY_TMR_INSTANCE);
```

5.6.24.5.8.3 PLIB_TMR_PostscaleSelect Function**C**

```
void PLIB_TMR_PostscaleSelect(  
    TMR_MODULE_ID index,  
    TMR_POSTSCALE postscale  
);
```

Description

This function selects the output clock postscaler.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
postscale	One of the possible values of TMR_POSTSCALE

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsPostscale](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the  
// application developer.  
PLIB_TMR_PostscaleSelect(MY_TMR_INSTANCE, TMR_POSTSCALE_1_TO_1);
```

5.6.24.5.9 Miscellaneous Functions**5.6.24.5.9.1 PLIB_TMR_IsPeriodMatchBased Function****C**

```
bool PLIB_TMR_IsPeriodMatchBased(  
    TMR_MODULE_ID index  
);
```

Description

This function gets the operating mode state of the Timer module based on Period Match or Overflow mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

- true - Operation in Period Match mode
- false - Operation in Overflow mode

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsTimerOperationMode](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the
// application developer.
bool status = PLIB_TMR_IsPeriodMatchBased(MY_TMR_INSTANCE);
```

5.6.24.5.9.2 PLIB_TMR_SystemClockFromTimerIsActive Function**C**

```
bool PLIB_TMR_SystemClockFromTimerIsActive(
    TMR_MODULE_ID index
);
```

Description

This function gets the system clock derivation status. When the function returns true, the system and peripheral clocks are sourced from the timer.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

- true - System/Device Clock is derived from the timer
- false - System/Device Clock is from another source

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_TMR_ExistsSystemClockStatus](#) in your application to determine whether this feature is available.

Example

```
// Where MY_TMR_INSTANCE, is the timer instance selected for use by the
// application developer.
uint8_t status = PLIB_TMR_SystemClockFromTimerIsActive(MY_TMR_INSTANCE);
```

5.6.24.5.10 Data Types and Constants

5.6.24.5.10.1 TMR_ASSIGNMENT Enumeration

C

```
typedef enum {
    TMR_ASSIGNMENT_T1_TO_CCP_ALL,
    TMR_ASSIGNMENT_T3_TO_CCP2_T1_TO_CCP1,
    TMR_ASSIGNMENT_T3_TO_CCP_ALL
} TMR_ASSIGNMENT;
```

Description

TMR assignment to modules definition

This data type defines the Timer assignment to modules.

Members

Members	Description
TMR_ASSIGNMENT_T1_TO_CCP_ALL	Timer1 is the capture/compare clock source for the CCP modules
TMR_ASSIGNMENT_T3_TO_CCP2_T1_TO_CCP1	Timer3 is the capture/compare clock source for CCP2 & Timer1 is the capture/compare clock source for CCP1
TMR_ASSIGNMENT_T3_TO_CCP_ALL	Timer3 is the capture/compare clock source for the CCP modules

Remarks

None.

5.6.24.5.10.2 TMR_CLOCK_SOURCE Enumeration

C

```
typedef enum {
    TMR_CLOCK_SOURCE_PERIPHERAL_CLOCK,
    TMR_CLOCK_SOURCE_EXTERNAL_INPUT_PIN
} TMR_CLOCK_SOURCE;
```

Description

Clock sources selection enumeration

This data type defines the different clock sources.

Members

Members	Description
TMR_CLOCK_SOURCE_PERIPHERAL_CLOCK	Clock source is the internal clock = FOSC/n (where n, is processor specific)
TMR_CLOCK_SOURCE_EXTERNAL_INPUT_PIN	Clock source is the external input pin

Remarks

None.

5.6.24.5.10.3 TMR_CLOCK_SOURCE_EDGE Enumeration

C

```
typedef enum {
    TMR_CLOCK_SOURCE_EDGE_INCREMENT_ON_LOW_TO_HIGH,
    TMR_CLOCK_SOURCE_EDGE_INCREMENT_ON_HIGH_TO_LOW
} TMR_CLOCK_SOURCE_EDGE;
```

Description

Source edge selection enumeration

This data type defines the different source edges.

Members

Members	Description
TMR_CLOCK_SOURCE_EDGE_INCREMENT_ON_LOW_TO_HIGH	Source edge - increment on low to high edge
TMR_CLOCK_SOURCE_EDGE_INCREMENT_ON_HIGH_TO_LOW	Source edge - increment on high to low edge

Remarks

None.

5.6.24.5.10.4 TMR_GATE_POLARITY Enumeration

C

```
typedef enum {
    TMR_GATE_POLARITY_ACTIVE_HIGH,
    TMR_GATE_POLARITY_ACTIVE_LOW
} TMR_GATE_POLARITY;
```

Description

Gate polarity selection enumeration

This data type defines the different gate polarities.

Members

Members	Description
TMR_GATE_POLARITY_ACTIVE_HIGH	Gate Polarity - Active High
TMR_GATE_POLARITY_ACTIVE_LOW	Gate Polarity - Active Low

Remarks

None.

5.6.24.5.10.5 TMR_GATE_SOURCE Enumeration

C

```
typedef enum {
    TMR_GATE_SOURCE_T1_GATE,
    TMR_GATE_SOURCE_T0_OVERFLOW,
    TMR_GATE_SOURCE_CMP1_SYNC_OUTPUT,
    TMR_GATE_SOURCE_CMP2_SYNC_OUTPUT
} TMR_GATE_SOURCE;
```

Description

Gate Source selection enumeration

This data type defines the different gate source selections.

Members

Members	Description
TMR_GATE_SOURCE_T1_GATE	Timer1 Gate pin
TMR_GATE_SOURCE_T0_OVERFLOW	Timer0 overflow output
TMR_GATE_SOURCE_CMP1_SYNC_OUTPUT	Comparator 1 optionally synchronized output
TMR_GATE_SOURCE_CMP2_SYNC_OUTPUT	Comparator 2 optionally synchronized output

Remarks

None.

5.6.24.5.10.6 TMR_MODULE_ID Enumeration

C

```
typedef enum {
    TMR_ID_0,
    TMR_ID_1,
    TMR_ID_2,
    TMR_ID_3,
    TMR_ID_4,
    TMR_ID_5,
    TMR_ID_6,
    TMR_ID_7,
    TMR_ID_8,
    TMR_ID_9,
    TMR_NUMBER_OF_MODULES
} TMR_MODULE_ID;
```

Description

TMR Module ID

This enumeration identifies the available Timer modules.

Members

Members	Description
TMR_ID_0	Timer 0
TMR_ID_1	Timer 1
TMR_ID_2	Timer 2
TMR_ID_3	Timer 3
TMR_ID_4	Timer 4
TMR_ID_5	Timer 5
TMR_ID_6	Timer 6
TMR_ID_7	Timer 7
TMR_ID_8	Timer 8
TMR_ID_9	Timer 9
TMR_NUMBER_OF_MODULES	Max number of timers

Remarks

The caller should not rely on the specific numbers assigned to any of these values as they may change from one processor to the next.

Not all modules will be available on all microcontrollers. Refer to the data sheet for the specific controller in use to determine which modules are supported. The numbers used in the enumeration values will match the numbers given in the data sheet.

5.6.24.5.10.7 TMR_POSTSCALE Enumeration

C

```
typedef enum {
    TMR_POSTSCALE_1_TO_1,
    TMR_POSTSCALE_1_TO_2,
    TMR_POSTSCALE_1_TO_3,
    TMR_POSTSCALE_1_TO_4,
```

```

TMR_POSTSCALE_1_TO_5,
TMR_POSTSCALE_1_TO_6,
TMR_POSTSCALE_1_TO_7,
TMR_POSTSCALE_1_TO_8,
TMR_POSTSCALE_1_TO_9,
TMR_POSTSCALE_1_TO_10,
TMR_POSTSCALE_1_TO_11,
TMR_POSTSCALE_1_TO_12,
TMR_POSTSCALE_1_TO_13,
TMR_POSTSCALE_1_TO_14,
TMR_POSTSCALE_1_TO_15,
TMR_POSTSCALE_1_TO_16
} TMR_POSTSCALE;

```

Description

Postscaler Values

This macro defines the list of possible postscaler values.

Members

Members	Description
TMR_POSTSCALE_1_TO_1	Timer Postscale Value 1:1
TMR_POSTSCALE_1_TO_2	Timer Postscale Value 1:2
TMR_POSTSCALE_1_TO_3	Timer Postscale Value 1:3
TMR_POSTSCALE_1_TO_4	Timer Postscale Value 1:4
TMR_POSTSCALE_1_TO_5	Timer Postscale Value 1:5
TMR_POSTSCALE_1_TO_6	Timer Postscale Value 1:6
TMR_POSTSCALE_1_TO_7	Timer Postscale Value 1:7
TMR_POSTSCALE_1_TO_8	Timer Postscale Value 1:8
TMR_POSTSCALE_1_TO_9	Timer Postscale Value 1:9
TMR_POSTSCALE_1_TO_10	Timer Postscale Value 1:10
TMR_POSTSCALE_1_TO_11	Timer Postscale Value 1:11
TMR_POSTSCALE_1_TO_12	Timer Postscale Value 1:12
TMR_POSTSCALE_1_TO_13	Timer Postscale Value 1:13
TMR_POSTSCALE_1_TO_14	Timer Postscale Value 1:14
TMR_POSTSCALE_1_TO_15	Timer Postscale Value 1:15
TMR_POSTSCALE_1_TO_16	Timer0 Prescaler Value 1:16

5.6.24.5.10.8 TMR_PRESCALE Enumeration

C

```

typedef enum {
    TMR_PRESCALE_1_TO_1,
    TMR_PRESCALE_1_TO_8,
    TMR_PRESCALE_1_TO_64,
    TMR_PRESCALE_1_TO_256,
    TMR_PRESCALE_VALUE_1,
    TMR_PRESCALE_VALUE_2,
    TMR_PRESCALE_VALUE_4,
    TMR_PRESCALE_VALUE_8,
    TMR_PRESCALE_VALUE_16,
    TMR_PRESCALE_VALUE_32,
    TMR_PRESCALE_VALUE_64,
    TMR_PRESCALE_VALUE_256
} TMR_PRESCALE;

```

Description

Prescaler Values

This macro defines the list of possible prescaler values.

Members

Members	Description
TMR_PRESCALE_1_TO_1	Timer Prescaler Value 1:1
TMR_PRESCALE_1_TO_8	Timer Prescaler Value 1:8
TMR_PRESCALE_1_TO_64	Timer Prescaler Value 1:64
TMR_PRESCALE_1_TO_256	Timer Prescaler Value 1:256
TMR_PRESCALE_VALUE_1	Timer Prescaler Value 1:1
TMR_PRESCALE_VALUE_2	Timer Prescaler Value 1:2
TMR_PRESCALE_VALUE_4	Timer Prescaler Value 1:4
TMR_PRESCALE_VALUE_8	Timer Prescaler Value 1:8
TMR_PRESCALE_VALUE_16	Timer Prescaler Value 1:16
TMR_PRESCALE_VALUE_32	Timer Prescaler Value 1:32
TMR_PRESCALE_VALUE_64	Timer Prescaler Value 1:64
TMR_PRESCALE_VALUE_256	Timer Prescaler Value 1:256

5.6.24.5.11 Feature Existence Functions

5.6.24.5.11.1 PLIB_TMR_ExistsClockSource Function

C

```
bool PLIB_TMR_ExistsClockSource(  
    TMR_MODULE_ID index  
);
```

Description

This function identifies whether the ClockSource feature is available on the Timer module. When this function returns true, this function is supported on the device:

- [PLIB_TMR_ClockSourceSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ClockSource feature is supported on the device
- false - The ClockSource feature is not supported on the device

Remarks

None.

5.6.24.5.11.2 PLIB_TMR_ExistsClockSourceEdge Function

C

```
bool PLIB_TMR_ExistsClockSourceEdge(  
    TMR_MODULE_ID index  
);
```

Description

This function identifies whether the ClockSourceEdge feature is available on the Timer module. When this function returns true, these functions are supported on the device:

- [PLIB_TMR_ClockSourceEdgeSelect](#)
- [PLIB_TMR_ClockSourceEdgeGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ClockSourceEdge feature is supported on the device
- false - The ClockSourceEdge feature is not supported on the device

Remarks

None.

5.6.24.5.11.3 PLIB_TMR_ExistsClockSourceSync Function

C

```
bool PLIB_TMR_ExistsClockSourceSync(  
    TMR_MODULE_ID index  
);
```

Description

This function identifies whether the ClockSourceSync feature is available on the Timer module. When this function returns true, these functions are supported on the device:

- [PLIB_TMR_ClockSourceExternalSyncEnable](#)
- [PLIB_TMR_ClockSourceExternalSyncDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ClockSourceSync feature is supported on the device
- false - The ClockSourceSync feature is not supported on the device

Remarks

None.

5.6.24.5.11.4 PLIB_TMR_ExistsCounter16Bit Function**C**

```
bool PLIB_TMR_ExistsCounter16Bit(  
    TMR_MODULE_ID index  
);
```

Description

This function identifies whether the Counter16Bit feature is available on the Timer module. When this function returns true, these functions are supported on the device:

- [PLIB_TMR_Counter16BitSet](#)
- [PLIB_TMR_Counter16BitGet](#)
- [PLIB_TMR_Counter16BitClear](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The Counter16Bit feature is supported on the device
- false - The Counter16Bit feature is not supported on the device

Remarks

None.

5.6.24.5.11.5 PLIB_TMR_ExistsCounter32Bit Function**C**

```
bool PLIB_TMR_ExistsCounter32Bit(  
    TMR_MODULE_ID index  
);
```

Description

This function identifies whether the Counter32Bit feature is available on the Timer module. When this function returns true, these functions are supported on the device:

- [PLIB_TMR_Counter32BitSet](#)
- [PLIB_TMR_Counter32BitGet](#)
- [PLIB_TMR_Counter32BitClear](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The Counter32Bit feature is supported on the device
- false - The Counter32Bit feature is not supported on the device

Remarks

None.

5.6.24.5.11.6 PLIB_TMR_ExistsCounter8Bit Function**C**

```
bool PLIB_TMR_ExistsCounter8Bit(  
    TMR_MODULE_ID index  
);
```

Description

This function identifies whether the Counter8bit feature is available on the Timer module. When this function returns true, these functions are supported on the device:

- [PLIB_TMR_Counter8BitSet](#)
- [PLIB_TMR_Counter8BitGet](#)
- [PLIB_TMR_Counter8BitClear](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The Counter8bit feature is supported on the device
- false - The Counter8bit feature is not supported on the device

Remarks

None.

5.6.24.5.11.7 PLIB_TMR_ExistsCounterAsyncWriteControl Function**C**

```
bool PLIB_TMR_ExistsCounterAsyncWriteControl(  
    TMR_MODULE_ID index  
);
```

Description

This function identifies whether the CounterAsyncWriteControl feature is available on the Timer module. When this function returns true, these functions are supported on the device:

- [PLIB_TMR_CounterAsyncWriteEnable](#)

- [PLIB_TMR_CounterAsyncWriteDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The CounterAsyncWriteControl feature is supported on the device
- false - The CounterAsyncWriteControl feature is not supported on the device

Remarks

None.

5.6.24.5.11.8 PLIB_TMR_ExistsCounterAsyncWriteInProgress Function

C

```
bool PLIB_TMR_ExistsCounterAsyncWriteInProgress(  
    TMR_MODULE_ID index  
);
```

Description

This function identifies whether the CounterAsyncWriteInProgress feature is available on the Timer module. When this function returns true, this function is supported on the device:

- [PLIB_TMR_CounterAsyncWriteInProgress](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The CounterAsyncWriteInProgress feature is supported on the device
- false - The CounterAsyncWriteInProgress feature is not supported on the device

Remarks

None.

5.6.24.5.11.9 PLIB_TMR_ExistsCountMode Function

C

```
bool PLIB_TMR_ExistsCountMode(  
    TMR_MODULE_ID index  
);
```

Description

This function identifies whether the CountMode feature is available on the Timer module. When this function returns true, these functions are supported on the device:

- [PLIB_TMR_ContinuousCountModeEnable](#)

- [PLIB_TMR_SingleShotModeEnable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The CountMode feature is supported on the device
- false - The CountMode feature is not supported on the device

Remarks

None.

5.6.24.5.11.10 PLIB_TMR_ExistsEnableControl Function**C**

```
bool PLIB_TMR_ExistsEnableControl(  
    TMR_MODULE_ID index  
);
```

Description

This function identifies whether the EnableControl feature is available on the Timer module. When this function returns true, these functions are supported on the device:

- [PLIB_TMR_Start](#)
- [PLIB_TMR_Stop](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The EnableControl feature is supported on the device
- false - The EnableControl feature is not supported on the device

Remarks

None.

5.6.24.5.11.11 PLIB_TMR_ExistsGateCurrentState Function**C**

```
bool PLIB_TMR_ExistsGateCurrentState(  
    TMR_MODULE_ID index  
);
```

Description

This function identifies whether the GateCurrentState feature is available on the Timer module. When this function returns true, this function is supported on the device:

- [PLIB_TMR_GateCurrentStateGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The GateCurrentState feature is supported on the device
- false - The GateCurrentState feature is not supported on the device

Remarks

None.

5.6.24.5.11.12 PLIB_TMR_ExistsGatedTimeAccumulation Function**C**

```
bool PLIB_TMR_ExistsGatedTimeAccumulation(  
    TMR_MODULE_ID index  
);
```

Description

This function identifies whether the GatedTimeAccumulation feature is available on the Timer module. When this function returns true, these functions are supported on the device:

- [PLIB_TMR_GateEnable](#)
- [PLIB_TMR_GateDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The GatedTimeAccumulation feature is supported on the device
- false - The GatedTimeAccumulation feature is not supported on the device

Remarks

None.

5.6.24.5.11.13 PLIB_TMR_ExistsGatePolarity Function**C**

```
bool PLIB_TMR_ExistsGatePolarity(  
    TMR_MODULE_ID index  
);
```

Description

This function identifies whether the GatePolarity feature is available on the Timer module. When this function returns true, this function is supported on the device:

- [PLIB_TMR_GatePolaritySelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The GatePolarity feature is supported on the device
- false - The GatePolarity feature is not supported on the device

Remarks

None.

5.6.24.5.11.14 PLIB_TMR_ExistsGateSinglePulseAcquisition Function**C**

```
bool PLIB_TMR_ExistsGateSinglePulseAcquisition(  
    TMR_MODULE_ID index  
);
```

Description

This function identifies whether the GateSinglePulseAcquisition feature is available on the Timer module. When this function returns true, these functions are supported on the device:

- [PLIB_TMR_GateSinglePulseAcquisitionStart](#)
- [PLIB_TMR_GateSinglePulseAcquisitionHasCompleted](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The GateSinglePulseAcquisition feature is supported on the device
- false - The GateSinglePulseAcquisition feature is not supported on the device

Remarks

None.

5.6.24.5.11.15 PLIB_TMR_ExistsGateSinglePulseMode Function**C**

```
bool PLIB_TMR_ExistsGateSinglePulseMode(  
    TMR_MODULE_ID index  
);
```

Description

This function identifies whether the GateSinglePulseMode feature is available on the Timer module. When this function returns true, these functions are supported on the device:

- [PLIB_TMR_GateSinglePulseModeEnable](#)
- [PLIB_TMR_GateSinglePulseModeDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The GateSinglePulseMode feature is supported on the device
- false - The GateSinglePulseMode feature is not supported on the device

Remarks

None.

5.6.24.5.11.16 PLIB_TMR_ExistsGateSource Function**C**

```
bool PLIB_TMR_ExistsGateSource(  
    TMR_MODULE_ID index  
);
```

Description

This function identifies whether the GateSource feature is available on the Timer module. When this function returns true, this function is supported on the device:

- [PLIB_TMR_GateSourceSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The GateSource feature is supported on the device
- false - The GateSource feature is not supported on the device

Remarks

None.

5.6.24.5.11.17 PLIB_TMR_ExistsGateToggleMode Function**C**

```
bool PLIB_TMR_ExistsGateToggleMode(  
    TMR_MODULE_ID index  
);
```

Description

This function identifies whether the GateToggleMode feature is available on the Timer module. When this function returns true, these functions are supported on the device:

- [PLIB_TMR_GateToggleModeEnable](#)
- [PLIB_TMR_GateToggleModeDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The GateToggleMode feature is supported on the device
- false - The GateToggleMode feature is not supported on the device

Remarks

None.

5.6.24.5.11.18 PLIB_TMR_ExistsMode16Bit Function

C

```
bool PLIB_TMR_ExistsMode16Bit(  
    TMR_MODULE_ID index  
);
```

Description

This function identifies whether the Mode16Bit feature is available on the Timer module. When this function returns true, this function is supported on the device:

- [PLIB_TMR_Mode16BitEnable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The Mode16Bit feature is supported on the device
- false - The Mode16Bit feature is not supported on the device

Remarks

None.

5.6.24.5.11.19 PLIB_TMR_ExistsMode32Bit Function

C

```
bool PLIB_TMR_ExistsMode32Bit(  
    TMR_MODULE_ID index  
);
```

Description

This function identifies whether the Mode32Bit feature is available on the Timer module. When this function returns true, this function is supported on the device:

- [PLIB_TMR_Mode32BitEnable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The Mode32Bit feature is supported on the device
- false - The Mode32Bit feature is not supported on the device

Remarks

None.

5.6.24.5.11.20 PLIB_TMR_ExistsMode8Bit Function**C**

```
bool PLIB_TMR_ExistsMode8Bit(  
    TMR_MODULE_ID index  
);
```

Description

This function identifies whether the Mode8Bit feature is available on the Timer module. When this function returns true, this function is supported on the device:

- [PLIB_TMR_Mode8BitEnable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The Mode8Bit feature is supported on the device
- false - The Mode8Bit feature is not supported on the device

Remarks

None.

5.6.24.5.11.21 PLIB_TMR_ExistsOperationInSleep Function**C**

```
bool PLIB_TMR_ExistsOperationInSleep(  
    TMR_MODULE_ID index  
);
```

Description

This function identifies whether the OperationInSleep feature is available on the Timer module. When this function returns true, these functions are supported on the device:

- [PLIB_TMR_OperateInSleepEnable](#)

- [PLIB_TMR_OperateInSleepDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The OperationInSleep feature is supported on the device
- false - The OperationInSleep feature is not supported on the device

Remarks

None.

5.6.24.5.11.22 PLIB_TMR_ExistsPeriod16Bit Function**C**

```
bool PLIB_TMR_ExistsPeriod16Bit(  
    TMR_MODULE_ID index  
);
```

Description

This function identifies whether the Period16Bit feature is available on the Timer module. When this function returns true, these functions are supported on the device:

- [PLIB_TMR_Period16BitSet](#)
- [PLIB_TMR_Period16BitGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The Period16Bit feature is supported on the device
- false - The Period16Bit feature is not supported on the device

Remarks

None.

5.6.24.5.11.23 PLIB_TMR_ExistsPeriod32Bit Function**C**

```
bool PLIB_TMR_ExistsPeriod32Bit(  
    TMR_MODULE_ID index  
);
```

Description

This function identifies whether the Period32Bit feature is available on the Timer module. When this function returns true, these functions are supported on the device:

- [PLIB_TMR_Period32BitSet](#)
- [PLIB_TMR_Period32BitGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The Period32Bit feature is supported on the device
- false - The Period32Bit feature is not supported on the device

Remarks

None.

5.6.24.5.11.24 PLIB_TMR_ExistsPeriod8Bit Function**C**

```
bool PLIB_TMR_ExistsPeriod8Bit(  
    TMR_MODULE_ID index  
);
```

Description

This function identifies whether the Period8Bit feature is available on the Timer module. When this function returns true, these functions are supported on the device:

- [PLIB_TMR_Period8BitSet](#)
- [PLIB_TMR_Period8BitGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The Period8Bit feature is supported on the device
- false - The Period8Bit feature is not supported on the device

Remarks

None.

5.6.24.5.11.25 PLIB_TMR_ExistsPostscale Function**C**

```
bool PLIB_TMR_ExistsPostscale(  
    TMR_MODULE_ID index  
);
```

Description

This function identifies whether the Postscale feature is available on the Timer module. When this function returns true, these functions are supported on the device:

- [PLIB_TMR_PostscaleSelect](#)
- [PLIB_TMR_PostscaleGet](#)
- [PLIB_TMR_PostscaleDivisorGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The Postscale feature is supported on the device
- false - The Postscale feature is not supported on the device

Remarks

None.

5.6.24.5.11.26 PLIB_TMR_ExistsPrescale Function**C**

```
bool PLIB_TMR_ExistsPrescale(  
    TMR_MODULE_ID index  
);
```

Description

This function identifies whether the Prescale feature is available on the Timer module. When this function returns true, these functions are supported on the device:

- [PLIB_TMR_PrescaleSelect](#)
- [PLIB_TMR_PrescaleGet](#)
- [PLIB_TMR_PrescaleDivisorGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The Prescale feature is supported on the device
- false - The Prescale feature is not supported on the device

Remarks

None.

5.6.24.5.11.27 PLIB_TMR_ExistsPrescalerAssignment Function

C

```
bool PLIB_TMR_ExistsPrescalerAssignment(  
    TMR_MODULE_ID index  
);
```

Description

This function identifies whether the PrescalerControl feature is available on the Timer module. When this function returns true, these functions are supported on the device:

- [PLIB_TMR_PrescalerEnable](#)
- [PLIB_TMR_PrescalerDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The PrescalerControl feature is supported on the device
- false - The PrescalerControl feature is not supported on the device

Remarks

None.

5.6.24.5.11.28 PLIB_TMR_ExistsStopInIdleControl Function

C

```
bool PLIB_TMR_ExistsStopInIdleControl(  
    TMR_MODULE_ID index  
);
```

Description

This function identifies whether the StopInIdle feature is available on the Timer module. When this function returns true, these functions are supported on the device:

- [PLIB_TMR_StopInIdleEnable](#)
- [PLIB_TMR_StopInIdleDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The StopInIdle feature is supported on the device
- false - The StopInIdle feature is not supported on the device

Remarks

None.

5.6.24.5.11.29 PLIB_TMR_ExistsSystemClockStatus Function**C**

```
bool PLIB_TMR_ExistsSystemClockStatus(  
    TMR_MODULE_ID index  
);
```

Description

This function identifies whether the SystemClockStatus feature is available on the Timer module. When this function returns true, this function is supported on the device:

- [PLIB_TMR_SystemClockFromTimerIsActive](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The SystemClockStatus feature is supported on the device
- false - The SystemClockStatus feature is not supported on the device

Remarks

None.

5.6.24.5.11.30 PLIB_TMR_ExistsTimerAssignment Function**C**

```
bool PLIB_TMR_ExistsTimerAssignment(  
    TMR_MODULE_ID index  
);
```

Description

This function identifies whether the TimerAssignment feature is available on the Timer module. When this function returns true, this function is supported on the device:

- [PLIB_TMR_AssignmentSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The TimerAssignment feature is supported on the device
- false - The TimerAssignment feature is not supported on the device

Remarks

None.

5.6.24.5.11.31 PLIB_TMR_ExistsTimerOperationMode Function**C**

```
bool PLIB_TMR_ExistsTimerOperationMode(  
    TMR_MODULE_ID index  
);
```

Description

This function identifies whether the TimerOperationMode feature is available on the Timer module. When this function returns true, this function is supported on the device:

- [PLIB_TMR_IsPeriodMatchBased](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The TimerOperationMode feature is supported on the device
- false - The TimerOperationMode feature is not supported on the device

Remarks

None.

5.6.24.5.11.32 PLIB_TMR_ExistsTimerOscillator Function**C**

```
bool PLIB_TMR_ExistsTimerOscillator(  
    TMR_MODULE_ID index  
);
```

Description

This function identifies whether the TimerOscillator feature is available on the Timer module. When this function returns true, these functions are supported on the device:

- [PLIB_TMR_TimerOscillatorEnable](#)
- [PLIB_TMR_TimerOscillatorDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The TimerOscillator feature is supported on the device

- false - The TimerOscillator feature is not supported on the device

Remarks

None.

5.6.24.5.11.33 PLIB_TMR_ExistsTriggerEventReset Function

C

```
bool PLIB_TMR_ExistsTriggerEventReset(  
    TMR_MODULE_ID index  
);
```

Description

This function identifies whether the TriggerEventReset feature is available on the Timer module. When this function returns true, these functions are supported on the device:

- [PLIB_TMR_TriggerEventResetEnable](#)
- [PLIB_TMR_TriggerEventResetDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The TriggerEventReset feature is supported on the device
- false - The TriggerEventReset feature is not supported on the device

Remarks

None.

Description

5.6.24.6.1 plib_tmr.h

Timer Peripheral Library Interface Header

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the Timer Peripheral Library.

Functions

	Name	Description
	PLIB_TMR_AssignmentSelect	Assigns the specified Timer(s) to the selected modules.
	PLIB_TMR_ClockSourceEdgeGet	Gets the source edge information.
	PLIB_TMR_ClockSourceEdgeSelect	Selects the input clock source edge.
	PLIB_TMR_ClockSourceExternalSyncDisable	Disables the clock synchronization of the external input.
	PLIB_TMR_ClockSourceExternalSyncEnable	Enables the clock synchronization of the external input.
	PLIB_TMR_ClockSourceSelect	Selects the clock source.
	PLIB_TMR_ContinuousCountModeEnable	Enables Continuous Count mode
	PLIB_TMR_Counter16BitClear	Clears the 16-bit timer value.
	PLIB_TMR_Counter16BitGet	Gets the 16-bit timer value.
	PLIB_TMR_Counter16BitSet	Sets the 16-bit timer value.
	PLIB_TMR_Counter32BitClear	Clears the 32-bit timer value.
	PLIB_TMR_Counter32BitGet	Gets the 32-bit timer value.
	PLIB_TMR_Counter32BitSet	Sets the 32-bit timer value.
	PLIB_TMR_Counter8BitClear	Clears the 8-bit timer value.
	PLIB_TMR_Counter8BitGet	Gets the 8-bit timer value.
	PLIB_TMR_Counter8BitSet	Sets the 8-bit timer value.
	PLIB_TMR_CounterAsyncWriteDisable	Disables the writes to the counter register until the pending write operation completes.
	PLIB_TMR_CounterAsyncWriteEnable	Enables back-to-back writes with legacy asynchronous timer functionality.
	PLIB_TMR_CounterAsyncWriteInProgress	Returns the status of the counter write in Asynchronous mode.
	PLIB_TMR_ExistsClockSource	Identifies whether the ClockSource feature exists on the Timer module.
	PLIB_TMR_ExistsClockSourceEdge	Identifies whether the ClockSourceEdge feature exists on the Timer module.
	PLIB_TMR_ExistsClockSourceSync	Identifies whether the ClockSourceSync feature exists on the Timer module.
	PLIB_TMR_ExistsCounter16Bit	Identifies whether the Counter16Bit feature exists on the Timer module.
	PLIB_TMR_ExistsCounter32Bit	Identifies whether the Counter32Bit feature exists on the Timer module.
	PLIB_TMR_ExistsCounter8Bit	Identifies whether the Counter8bit feature exists on the Timer module.
	PLIB_TMR_ExistsCounterAsyncWriteControl	Identifies whether the CounterAsyncWriteControl feature exists on the Timer module.
	PLIB_TMR_ExistsCounterAsyncWriteInProgress	Identifies whether the CounterAsyncWriteInProgress feature exists on the Timer module.
	PLIB_TMR_ExistsCountMode	Identifies whether the CountMode feature exists on the Timer module.
	PLIB_TMR_ExistsEnableControl	Identifies whether the EnableControl feature exists on the Timer module.
	PLIB_TMR_ExistsGateCurrentState	Identifies whether the GateCurrentState feature exists on the Timer module.
	PLIB_TMR_ExistsGatedTimeAccumulation	Identifies whether the GatedTimeAccumulation feature exists on the Timer module.

	<u>PLIB_TMR_ExistsGatePolarity</u>	Identifies whether the GatePolarity feature exists on the Timer module.
	<u>PLIB_TMR_ExistsGateSinglePulseAcquisition</u>	Identifies whether the GateSinglePulseAcquisition feature exists on the Timer module.
	<u>PLIB_TMR_ExistsGateSinglePulseMode</u>	Identifies whether the GateSinglePulseMode feature exists on the Timer module.
	<u>PLIB_TMR_ExistsGateSource</u>	Identifies whether the GateSource feature exists on the Timer module.
	<u>PLIB_TMR_ExistsGateToggleMode</u>	Identifies whether the GateToggleMode feature exists on the Timer module.
	<u>PLIB_TMR_ExistsMode16Bit</u>	Identifies whether the Mode16Bit feature exists on the Timer module.
	<u>PLIB_TMR_ExistsMode32Bit</u>	Identifies whether the Mode32Bit feature exists on the Timer module.
	<u>PLIB_TMR_ExistsMode8Bit</u>	Identifies whether the Mode8Bit feature exists on the Timer module.
	<u>PLIB_TMR_ExistsOperationInSleep</u>	Identifies whether the OperationInSleep feature exists on the Timer module.
	<u>PLIB_TMR_ExistsPeriod16Bit</u>	Identifies whether the Period16Bit feature exists on the Timer module.
	<u>PLIB_TMR_ExistsPeriod32Bit</u>	Identifies whether the Period32Bit feature exists on the Timer module.
	<u>PLIB_TMR_ExistsPeriod8Bit</u>	Identifies whether the Period8Bit feature exists on the Timer module.
	<u>PLIB_TMR_ExistsPostscale</u>	Identifies whether the Postscale feature exists on the Timer module.
	<u>PLIB_TMR_ExistsPrescale</u>	Identifies whether the Prescale feature exists on the Timer module.
	<u>PLIB_TMR_ExistsPrescalerAssignment</u>	Identifies whether the PrescalerControl feature exists on the Timer module.
	<u>PLIB_TMR_ExistsStopInIdleControl</u>	Identifies whether the StopInIdle feature exists on the Timer module.
	<u>PLIB_TMR_ExistsSystemClockStatus</u>	Identifies whether the SystemClockStatus feature exists on the Timer module.
	<u>PLIB_TMR_ExistsTimerAssignment</u>	Identifies whether the TimerAssignment feature exists on the Timer module.
	<u>PLIB_TMR_ExistsTimerOperationMode</u>	Identifies whether the TimerOperationMode feature exists on the Timer module.
	<u>PLIB_TMR_ExistsTimerOscillator</u>	Identifies whether the TimerOscillator feature exists on the Timer module.
	<u>PLIB_TMR_ExistsTriggerEventReset</u>	Identifies whether the TriggerEventReset feature exists on the Timer module.
	<u>PLIB_TMR_GateCurrentStateGet</u>	Returns the current level of the timer gate.
	<u>PLIB_TMR_GateDisable</u>	Enables counting regardless of the corresponding timer gate function.
	<u>PLIB_TMR_GateEnable</u>	Enables counting controlled by the corresponding gate function.
	<u>PLIB_TMR_GatePolaritySelect</u>	Selects the timer gate polarity.
	<u>PLIB_TMR_GateSinglePulseAcquisitionHasCompleted</u>	Returns the gate single pulse acquisition status.
	<u>PLIB_TMR_GateSinglePulseAcquisitionStart</u>	Starts the gate single pulse acquisition.
	<u>PLIB_TMR_GateSinglePulseModeDisable</u>	Disables Single Pulse mode.

	PLIB_TMR_GateSinglePulseModeEnable	Enables Single pulse mode and the controlling corresponding timer gate.
	PLIB_TMR_GateSourceSelect	Selects the timer gate source.
	PLIB_TMR_GateToggleModeDisable	Disables the Gate Toggle mode.
	PLIB_TMR_GateToggleModeEnable	Enables the Gate Toggle mode.
	PLIB_TMR_IsPeriodMatchBased	Gets the operating mode state of the Timer module based on Period Match or Overflow mode.
	PLIB_TMR_Mode16BitEnable	Enables the Timer module for 16-bit operation and disables all other modes.
	PLIB_TMR_Mode32BitEnable	Enables 32-bit operation on the Timer module combination.
	PLIB_TMR_Mode8BitEnable	Enables the Timer module in 8-bit operation mode and disables 16-bit mode.
	PLIB_TMR_OperateInSleepDisable	Disables Timer module operation when the device is in Sleep mode.
	PLIB_TMR_OperateInSleepEnable	Enables Timer module operation when the device is in Sleep mode.
	PLIB_TMR_Period16BitGet	Gets the 16-bit period value.
	PLIB_TMR_Period16BitSet	Sets the 16-bit period value.
	PLIB_TMR_Period32BitGet	Gets the 32-bit period value.
	PLIB_TMR_Period32BitSet	Sets the 32-bit period value.
	PLIB_TMR_Period8BitGet	Gets the 8-bit period value.
	PLIB_TMR_Period8BitSet	Sets the 8-bit period value.
	PLIB_TMR_PostscaleDivisorGet	Gets the postscale divisor information.
	PLIB_TMR_PostscaleGet	Gets the postscale divisor information.
	PLIB_TMR_PostscaleSelect	Selects the output clock postscale.
	PLIB_TMR_PrescaleDivisorGet	Gets the prescaler divisor information.
	PLIB_TMR_PrescaleGet	Gets the prescaler information.
	PLIB_TMR_PrescalerDisable	Disables the prescaler assignment to the indexed Timer module.
	PLIB_TMR_PrescalerEnable	Enables the prescaler assignment to the indexed Timer module.
	PLIB_TMR_PrescaleSelect	Selects the clock prescaler.
	PLIB_TMR_SingleShotModeEnable	Enables Single-shot mode.
	PLIB_TMR_Start	Starts/enables the indexed timer.
	PLIB_TMR_Stop	Stops/disables the indexed timer.
	PLIB_TMR_StopInIdleDisable	Continue module operation when the device enters Idle mode.
	PLIB_TMR_StopInIdleEnable	Discontinues module operation when the device enters Idle mode.
	PLIB_TMR_SystemClockFromTimerIsActive	Gets the system clock status.
	PLIB_TMR_TimerOscillatorDisable	Disables the oscillator associated with the Timer module.
	PLIB_TMR_TimerOscillatorEnable	Enables the oscillator associated with the Timer module.
	PLIB_TMR_TriggerEventResetDisable	Disables the special event trigger reset.
	PLIB_TMR_TriggerEventResetEnable	Enables the special event trigger reset.

5.6.25 USART Peripheral Library

5.6.25.1 Introduction

USART Peripheral Library

for

Microchip Microcontrollers

This library provides a low-level abstraction of the USART Peripheral Library on the Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, thus hiding differences from one microcontroller variant to another.

Description**Overview**

The Universal Synchronous/Asynchronous Receiver/Transmitter (USART) module is the key component of the serial communications sub-system of a computer. The USART takes the data and transmits the individual bits in a sequential fashion. While receiving, the USART reassembles the bits into complete bytes. The data can be **8-bit** or **9-bit**.

There are two primary forms of serial transmission: Asynchronous and Synchronous.

Asynchronous

Asynchronous transmission allows data to be transmitted without the sender having to send a clock signal to the receiver. Instead, the sender and receiver must agree on timing parameters (i.e., baud rate) in advance and special bits are added to each word, which are used to synchronize the sending and receiving units.

When a word is given to the USART for asynchronous transmissions, a bit called the "Start" bit is added to the beginning of each word that is to be transmitted. The Start bit is used to alert the receiver that a word of data is about to be sent. After the Start bit, the individual bits of the word of data are sent, with the Least Significant bit (LSb) being sent first. When the entire data word has been sent, the transmitter may add a Parity bit that the transmitter generates. The Parity bit may be used by the receiver to perform simple error checking. Then, at least one Stop bit is sent by the transmitter.

The Start bit is always a space and the Stop bits are always marks. Each transmitted bit persists for a period of $1/(\text{Baud Rate})$. An on-chip dedicated Baud Rate Generator (BRG) is used to derive standard baud rate frequencies.

When the receiver has received all of the bits in the data word, it may check for the Parity bits (both sender and receiver must agree on whether a Parity bit is to be used), and then the receiver looks for a Stop bit. If the Stop bit does not appear when it is supposed to, the USART module considers the entire word to be unintelligible and will report a framing error to the host processor when the data word is read.

Note: Please refer to the the specific device data sheet or the related family reference manual section for details.

Synchronous

Synchronous serial transmission requires that the sender and receiver share a clock with one another, or that the sender provide a strobe or other timing signal so that the receiver knows when to "read" the next bit of the data. This mode is not available on all microcontrollers.

It is typically used in systems with a single master and one or more slaves. The master device contains the necessary circuitry for baud rate generation and supplies the clock for all devices in the system.

There are two signal lines a bidirectional data line and a clock line. Since the data line is bidirectional, synchronous operation is only half-duplex.

Start and Stop bits are not used in synchronous transmissions.

5.6.25.2 Release Notes

MPLAB Harmony Version: v0.70b **USART Peripheral Library Version :** 0.70b **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.6.25.3 SW License Agreement

© 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS." MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.6.25.4 Using the Library

This topic describes the basic architecture of the USART Peripheral Library and provides information and examples on how to use it.

Interface Header File: peripheral.h

The interface to the USART Peripheral library is defined in the "plib_usart.h" header file. Any C language source (.c) file that uses the USART Peripheral library should include "peripheral.h".

Library File:

The USART Peripheral library archive (.a) file is installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the library interacts with the framework.

5.6.25.4.1 Hardware Abstraction Model

This section describes the hardware abstraction model.

Description

⁽¹⁾ - Not available in all microcontrollers

Hardware Abstraction Model

The USART Peripheral Library provides interface routines to interact with the blocks shown in the diagram.

The **Baud Rate Controller** controls the timing in Asynchronous mode, the desired baud rate can be programmed in the baud rate controller or, the baud rate controller can be configured to determine the baud rate of the transmitting device automatically.

The **Transmitter** and **Receiver** are capable of handling 8-bit or 9-bit data, which can be programmed in the control logic. The 9th bit is used to transfer the address or the parity. Enable 9-bit mode if the hardware is to be used for address or parity detection.

The **Status and Control logic**, provide the ability to control different ways the transmitter, receiver, and the baud rate controller can function. It also can provides status about the transmitter, receiver, or the baud rate controller.

The **Hardware Flow Control** uses CTS and the RTS lines to perform handshaking. Flow control is the ability to stop, and then restart the flow without any loss of bytes. Flow control is needed for modems and other hardware to allow a jump in instantaneous flow rates.

Note: This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

The USART module provides two types of infrared USART support: one is the **IrDA** clock output to support the external IrDA encoder and decoder, and the other is the full implementation of the IrDA encoder and decoder.

Note: This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

5.6.25.4.2 Library Usage Model

This section describes the library usage model.

Description

Each of the blocks in the diagram correspond to the library interface section.

Library Interface Section	Description

5.6.25.4.3 How the Library Works

This section provides information on using the peripheral library with the USART module. The usage model for different scenarios is also described.

5.6.25.4.3.1 State Machine

This section describes the transmission and reception state machine.

Description

The following state machine is for the transmission and reception during normal operation. This state machine provides a general idea of the usage model of the USART Peripheral Library. Refer to the usage model for more detailed steps for the scenario that is being used.

Transmit and Receive State machine

**Notes:**

1. The wait states shown in red in the diagram can either be achieved using polled functions or using interrupts.
2. Refer to the specific USART mode in use for the setup and initialization steps.
3. Refer to the following table for the functions that can be used at each state.

State	Associated Function
Setup and initialization	Refer to the specific USART mode for detailed setup instructions.
Wait for data to send	Once the USART module has been appropriately set up and initialized, the state machine waits for the application to issue one of the send data functions.
Wait for data to be received	When the application is using Polled mode, the application can use the function PLIB_USART_ReceiverDataIsAvailable . When the application is using Interrupt mode, the application should wait for a receive interrupt.
Enable transmitter	Use the function PLIB_USART_TransmitterEnable to enable the transmitter

Wait for transmitter to have empty space	When the application is using polled mode, the application can use the function PLIB_USART_TransmitterBufferIsFull . When the application is using Interrupt mode, the application should wait for a transmit interrupt.
Send data	Use the function PLIB_USART_TransmitterByteSend to send data. If an address needs to be transmitted or if a byte needs to be transmitted with a Parity bit use the function PLIB_USART_Transmitter9BitsSend .
Disable transmitter	Use the function PLIB_USART_TransmitterDisable to disable the transmitter.
Get status	To get the status of the hardware module, use the set of functions, PLIB_USART_ReceiverFramingErrorHasOccurred , PLIB_USART_ReceiverParityErrorHasOccurred , and PLIB_USART_ReceiverOverrunHasOccurred .
Read data	Use the function PLIB_USART_ReceiverByteReceive to read data.
Clear overrun error	Clear the overrun error using the function PLIB_USART_ReceiverOverrunErrorClear .

5.6.25.4.3.2 Asynchronous USART Mode

This section provides processes for setting up asynchronous transmission and reception.

Description

Asynchronous Transmission

Setup

1. Set the desired baud rate using either [PLIB_USART_BaudRateHighSet](#) or [PLIB_USART_BaudRateSet](#).
2. Set the appropriate I/O direction and corresponding RX and TX I/O pins.
3. *If available on the device*, enable the asynchronous serial port using [PLIB_USART_SyncModeSelect](#).
4. Set the number of data bits (8 or 9) and other line control modes using [PLIB_USART_LineControlModeSelect](#).
5. *Optional (if available on the device)*: If desired, enable the transmit interrupt.
 - Ensure that the interrupts are enabled for the system and the peripherals
 - Select the interrupt priority
 - Set up the transmit FIFO interrupt mode using [PLIB_USART_TransmitterInterruptModeSelect](#). Refer to [USART_TRANSMIT_INTR_MODE](#) for a list of possible values.
6. Enable the USART module using the function [PLIB_USART_Enable](#)

Example: Asynchronous Transmission Setup

```
// Set the desired baud rate
uint32_t baudRate = 9600;

// where, MY_USART_INSTANCE - is a specific instance of the hardware peripheral.
// where, MY_CLOCK_FREQUENCY - is hardware clock frequency which is currently
//being used by the system.
PLIB_USART_BaudRateSet(MY_USART_INSTANCE, baudRate, MY_CLOCK_FREQUENCY);

// Enable the asynchronous serial port.
// enable asynchronous mode if the part supports it
PLIB_USART_SyncModeSelect(MY_USART_INSTANCE, USART_ASYNC_MODE);

/* Select 8 data bits, No parity and one stop bit */
PLIB_USART_LineControlModeSelect(MY_USART_INSTANCE, USART_8N1);
```

```
// enable USART
PLIB_USART_Enable(MY_USART_INSTANCE);

// Set the appropriate IO direction for USART pins
// TODO - Call the appropriate function.
```

Enable Transmission

1. Enable the transmission using [PLIB_USART_TransmitterEnable](#).
2. Ensure that the transmit buffer is not full, before attempting to write into the transmit buffer. Either poll using [PLIB_USART_TransmitterBufferIsFull](#) or wait for the transmit interrupt.
3. Start the transmission using [PLIB_USART_TransmitterByteSend](#) (if transmitting 8-bit data) or [PLIB_USART_Transmitter9BitsSend](#) (if transmitting an address or if transmitting a byte with parity).
4. After the transmission is complete, disable the transmitter.

Example: Asynchronous Transmission

```
// Enable the transmission
PLIB_USART_TransmitterEnable(MY_USART_INSTANCE);

// TODO - Either wait for Transmit buffer to be not full or wait for
//an transmit interrupt.

// Transmit the byte when Transmit buffer is empty.
// where, my_byte is the 8 bit data to be transmitted
PLIB_USART_TransmitterByteSend(MY_USART_INSTANCE, my_byte);
```

Asynchronous Transmission of Break Characters

A break characters consists of a **Start Bit** followed by twelve bits of "0" and a **Stop Bit**.

Setup and Transmission

1. Configure the desired mode, using the previous steps described.
2. Enable the transmitter using [PLIB_USART_TransmitterEnable](#).
3. Transmit the break character using [PLIB_USART_TransmitterBreakSend](#) function.
4. Check if the break transmission is complete using [PLIB_USART_TransmitterBreakSendIsComplete](#).
5. Transmission of the next bytes can start.

Example: USART Break and Sync Transmission

```
// Set the desired baud rate
uint32_t baudRate = 9600;

// where, MY_USART_INSTANCE - is a specific instance of the hardware peripheral
// where, MY_CLOCK_FREQUENCY - is hardware clock frequency which is currently
//being used by the system.
PLIB_USART_BaudRateSet(MY_USART_INSTANCE, baudRate, MY_CLOCK_FREQUENCY);

// Enable the asynchronous serial port.
// enable asynchronous mode if the part supports it
PLIB_USART_SyncModeSelect(MY_USART_INSTANCE, USART_ASYNC_MODE);

/* Select 8 data bits, No parity and one stop bit */
PLIB_USART_LineControlModeSelect(MY_USART_INSTANCE, USART_8N1);

// enable USART
PLIB_USART_Enable(MY_USART_INSTANCE);

// Set the appropriate IO direction for USART pins
// TODO - Call the appropriate function.
```

```
// Enable the transmission
PLIB_USART_TransmitterEnable(MY_USART_INSTANCE);

// Start the transmission
// Transmit the break character
PLIB_USART_TransmitterBreakSend(MY_USART_INSTANCE);

// Transmit the byte
while(PLIB_USART_TransmitterBreakSendIsComplete(MY_USART_INSTANCE));

PLIB_USART_TransmitterByteSend(MY_USART_INSTANCE, 0x55);
```

Refer to the following steps for setting up asynchronous receptions and how to receive data.

Asynchronous Reception

Setup

1. Set the desired baud rate using [PLIB_USART_BaudRateHighSet](#) or [PLIB_USART_BaudRateSet](#).
2. Set the appropriate I/O direction and corresponding RX and TX I/O pins.
3. *If available on the device*, enable the asynchronous serial port using [PLIB_USART_SyncModeSelect](#).
4. Set the number of data bits (8 or 9) and other line control modes using [PLIB_USART_LineControlModeSelect](#).
5. *Optional (if available on the device)*: If desired, enable the receive interrupt.
 - Ensure that the interrupts are enabled for the system and the peripherals
 - Select the interrupt priority
 - Set up the receive FIFO interrupt mode using [PLIB_USART_ReceiverInterruptModeSelect](#). Refer to [USART_RECEIVE_INTR_MODE](#) for a list of possible values.
6. *Optional*: If inverted receive polarity is desired, use [PLIB_USART_ReceiverIdleStateLowEnable](#).
7. *If available on the device*, enable the reception using [PLIB_USART_ReceiverEnable](#).
8. Enable the USART module using [PLIB_USART_Enable](#).

Example: Asynchronous Reception Setup

```
// Set the desired baud rate
uint32_t baudRate = 9600;

// where, MY_USART_INSTANCE - is a specific instance of the hardware peripheral.
// where, MY_CLOCK_FREQUENCY - is hardware clock frequency which is currently being
// used by the system.
PLIB_USART_BaudRateHighSet(MY_USART_INSTANCE, baudRate, MY_CLOCK_FREQUENCY);

// Enable the synchronous slave serial port.
// enable asynchronous mode if the part supports it
PLIB_USART_SyncModeSelect(MY_USART_INSTANCE, USART_ASYNC_MODE);
// enable USART
PLIB_USART_Enable(MY_USART_INSTANCE);

// Set the appropriate IO direction for USART pins
// TODO - Call the appropriate function.

// Start the reception
// Enable the continuous reception
PLIB_USART_ReceiverEnable(MY_USART_INSTANCE);
```

Reception

1. Either wait for an interrupt, which will be generated when the reception is completed, or poll using [PLIB_USART_ReceiverDataIsAvailable](#).

2. Read the status of the device using [PLIB_USART_ReceiverOverrunHasOccurred](#), [PLIB_USART_ReceiverParityErrorHasOccurred](#), and [PLIB_USART_ReceiverFramingErrorOccurred](#).
3. Read the data using [PLIB_USART_ReceiverByteReceive](#).
4. If an overrun error occurred, clear the error using [PLIB_USART_ReceiverOverrunErrorClear](#).

Example: Asynchronous Reception

```
// TODO - Either wait for Receive buffer to have data or wait for
// a receive interrupt.
// read the data
my_byte = PLIB_USART_ReceiverByteReceive(MY_USART_INSTANCE);
// where, my_byte is the 8 bit data received

// If overrun error clear the error.
if(PLIB_USART_ReceiverOverrunHasOccurred(MY_USART_INSTANCE))
{
    PLIB_USART_ReceiverOverrunErrorClear(MY_USART_INSTANCE);
}
```

Asynchronous Reception with Address Detection Mode

A typical multi-processor communication protocol will differentiate between data bytes and address/control bytes. A common method is to use a 9th data bit to identify whether a data byte is address or data information. If the 9th bit is set, the data is processed as address or control information. If the 9th bit is cleared, the received data word is processed as data associated with the previous address/control byte.

The protocol operates as follows:

- The master device transmits a data word with 9th bit set. The data word contains the address of a slave device.
- All slave devices in the communication chain receive the address word and check the slave address.
- The slave device that was addressed will receive and process subsequent data bytes sent by the master device. All other slave devices will discard subsequent data bytes until a new address word(9th bit set) is received.

This mode will typically be used in RS-485 systems.

Setup

1. Set the desired baud rate using [PLIB_USART_BaudRateHighSet](#) or [PLIB_USART_BaudRateSet](#).
2. Set the appropriate I/O direction and corresponding RX and TX I/O pins.
3. *If available on the device*, enable the asynchronous serial port using [PLIB_USART_SyncModeSelect](#).
4. Set the number of data bits (8 or 9) and other line control modes using [PLIB_USART_LineControlModeSelect](#).
5. *Optional (if available on the device)*: If desired, enable the receive interrupt.
 - Ensure that the interrupts are enabled for the system and the peripherals. Also select the interrupt priority.
 - Set up the receive FIFO interrupt mode by using the function [PLIB_USART_ReceiverInterruptModeSelect](#). Refer to [USART_RECEIVE_INTR_MODE](#) for a list of possible values.
 - For Address Detect mode, configure [PLIB_USART_ReceiverInterruptModeSelect](#) with the receive FIFO interrupt mode as [USART_RECEIVE_FIFO_ONE_CHAR](#).
6. *Optional*: If inverted receive polarity is desired, use [PLIB_USART_ReceiverIdleStateLowEnable](#).
7. *If available on the device*, enable the reception using [PLIB_USART_ReceiverEnable](#).
8. Enable address detection using [PLIB_USART_ReceiverAddressDetectEnable](#).
9. Enable the USART module using [PLIB_USART_Enable](#).

Note: This feature is not available on all devices. On devices where automatic address detection is available, configure automatic address detection using [PLIB_USART_AutomaticAddressDetectModeSetup](#). Skip steps 2-6 in the following Reception section during the reception phase.

Example: Asynchronous Reception Setup (with address detect enable)

```

// Set the desired baud rate
uint32_t baudRate = 9600;

// where, MY_USART_INSTANCE - is a specific instance of the hardware peripheral.
// where, MY_CLOCK_FREQUENCY - is hardware clock frequency which is currently
// being used by the system.
PLIB_USART_BaudRateHighSet(MY_USART_INSTANCE, baudRate, MY_CLOCK_FREQUENCY);

// Enable the synchronous slave serial port.
// enable sync mode
PLIB_USART_SyncModeSelect(MY_USART_INSTANCE, USART_ASYNC_MODE);
// enable USART
PLIB_USART_Enable(MY_USART_INSTANCE);

// Set the appropriate IO direction for USART pins
// TODO - Call the appropriate function.

// Set the reception to 9 bits to enable address byte.
PLIB_USART_LineControlModeSelect(MY_USART_INSTANCE, USART_9N1);

// Enable address detection.
PLIB_USART_ReceiverAddressDetectEnable(MY_USART_INSTANCE);

// Start the reception
// Enable the continuous reception
PLIB_USART_ReceiverEnable(MY_USART_INSTANCE);

```

Reception

1. Either wait for an interrupt, which will be generated when the reception is completed or poll using [PLIB_USART_ReceiverDataIsAvailable](#).
2. Read the address using [PLIB_USART_ReceiverByteReceive](#).
3. The application determines if this is the device address. If the device is addressed, disable address detect using [PLIB_USART_ReceiverAddressDetectDisable](#) to allow subsequent data bytes to be received; otherwise, discard the received word.
4. Read the status of the device using [PLIB_USART_ReceiverOverrunHasOccurred](#), [PLIB_USART_ReceiverParityErrorHasOccurred](#), and [PLIB_USART_ReceiverFramingErrorHasOccurred](#).
5. If an overrun error occurred, clear the error using [PLIB_USART_ReceiverOverrunErrorClear](#).
6. If the device has been addressed, disable the address detection using [PLIB_USART_ReceiverAddressDetectDisable](#), which will allow all received data into the receive buffer and generate interrupts if desired.
7. *Optional (if available on the device):* If a long packet is expected, the receive interrupt mode could be changed to buffer more than one data word between interrupts. Use [PLIB_USART_ReceiverInterruptModeSelect](#) with `USART_RECEIVE_FIFO_HALF_FULL` or `USART_RECEIVE_FIFO_3B4FULL`.
8. When the last data byte has been received, enable the address detect using [PLIB_USART_ReceiverAddressDetectEnable](#), so that only address bytes will be received.
9. *Optional (if available on the device):* Ensure that the receive interrupt is configured to be triggered after each received word using [PLIB_USART_ReceiverInterruptModeSelect](#) with `USART_RECEIVE_FIFO_ONE_CHAR`.

Example: Asynchronous Reception (with Address Detect)

```

// Either wait for Receive buffer to have data or wait for a receive interrupt.
int8_t my_address;

// Receive the address
if(PLIB_USART_ReceiverDataIsAvailable(MY_USART_INSTANCE))
{
    my_address = PLIB_USART_ReceiverByteReceive(MY_USART_INSTANCE);
    // where, my_address is the address received
}

```

```

// If overrun error clear the error.
if(PLIB_USART_ReceiverOverrunHasOccurred(MY_USART_INSTANCE))
{
    PLIB_USART_ReceiverOverrunErrorClear(MY_USART_INSTANCE);
}

if(my_address == MY_DEVICE_ADDRESS)
{
    // The device has been addressed.
    PLIB_USART_ReceiverAddressDetectDisable(MY_USART_INSTANCE);
}

// TODO - Receive the data bytes for the packet. Either wait for RX buffer
//to have data or wait for a receive interrupt.

// When all the bytes for the packet are received.

// Enable address detection mode
PLIB_USART_ReceiverAddressDetectEnable(MY_USART_INSTANCE);

```

5.6.25.4.3.3 Synchronous Master Mode

This section provides processes for setting up synchronous master transmission and reception.

Note: This feature is not available on all devices. Please refer to the specific device data sheet or related family reference manual to determine which features are supported for your device.

Description

Synchronous Master Transmission

Setup

1. Set the desired baud rate using [PLIB_USART_BaudRateSet](#) or [PLIB_USART_BaudRateHighSet](#).
2. Enable the synchronous master serial port using [PLIB_USART_SyncModeSelect](#), [PLIB_USART_SyncClockSourceSelect](#), and [PLIB_USART_Enable](#).
3. Set the appropriate I/O direction and corresponding RX and TX I/O pins.
4. Disable receive using [PLIB_USART_ReceiverDisable](#).
5. *Optional:* If desired set the number of data bits to 9 (to [send](#) address byte or to enable parity check) using [PLIB_USART_Transmitter9BitModeEnable](#).
6. *Optional:* If desired, enable the transmit interrupt, ensuring that the interrupts are enabled for the system and the peripherals.

Example: Synchronous Master Transmission Setup

```

// Set the desired baud rate
uint32_t baudRate = 9600;

// where, MY_USART_INSTANCE - is a specific instance of the hardware peripheral.
// where, MY_CLOCK_FREQUENCY - is hardware clock frequency which is currently being used by
// the system.
PLIB_USART_BaudRateHighSet(MY_USART_INSTANCE, baudRate, MY_CLOCK_FREQUENCY);

// Enable the synchronous master serial port.
// enable sync mode
PLIB_USART_SyncModeSelect(MY_USART_INSTANCE, USART_ASYNC_MODE);
// enable master clock
PLIB_USART_SyncClockSourceSelect(MY_USART_INSTANCE, USART_SYNC_CLOCK_SOURCE_MASTER);
// enable USART
PLIB_USART_Enable(MY_USART_INSTANCE);

// Set the appropriate IO direction for USART pins
// TODO Call the appropriate function.

```

Transmission

1. Enable transmission using [PLIB_USART_TransmitterEnable](#).
2. Ensure that the transmit buffer is not full before attempting to write onto the transmit buffer. Either poll using [PLIB_USART_TransmitterBufferIsFull](#) or wait for the transmit interrupt.

Note: If using interrupts, make sure that interrupts are also enabled for the system and the peripherals.

3. Start the transmission using [PLIB_USART_TransmitterByteSend](#) (if transmitting 8 - bit data) or [PLIB_USART_Transmitter9BitsSend](#) (if transmitting address or if transmitting a byte with parity).
4. After the transmission is complete, disable the transmitter.

Example: Synchronous Master Transmission

```
// Enable the transmission
PLIB_USART_TransmitterEnable(MY_USART_INSTANCE);

// TODO Either wait for Transmit buffer to be not full or wait for an transmit interrupt.

// Transmit the byte when Transmit buffer is empty.
// where, my_byte is the 8 bit data to be transmitted
PLIB_USART_TransmitterByteSend(MY_USART_INSTANCE, my_byte);
```

Synchronous Master Reception

Setup

1. Set the desired baud rate using [PLIB_USART_BaudRateSet](#) or [PLIB_USART_BaudRateHighSet](#).
2. Enable the synchronous master serial port using [PLIB_USART_SyncModeSelect](#), [PLIB_USART_SyncClockSourceSelect](#), and [PLIB_USART_Enable](#).
3. Set the appropriate IO direction and corresponding to RX and TX I/O pins.
4. *Optional:* If desired, enable the receive interrupt, ensuring that the interrupts are enabled for the system and the peripherals.
5. Start the reception using [PLIB_USART_ReceiverDisable](#).

Example: Synchronous Master Reception Setup

```
uint32_t baudRate = 9600;
// where, MY_USART_INSTANCE - is a specific instance of the hardware peripheral.
// where, MY_CLOCK_FREQUENCY - is hardware clock frequency which is currently being used by
the system.
PLIB_USART_BaudRateHighSet(MY_USART_INSTANCE, baudRate, MY_CLOCK_FREQUENCY);

PLIB_USART_HandshakeModeSelect(MY_USART_INSTANCE,
                               USART_HANDSHAKE_MODE_SIMPLEX);
// Enable the synchronous master serial port.
// enable sync mode
PLIB_USART_SyncModeSelect(MY_USART_INSTANCE, USART_SYNC_MODE);
// enable master clock
PLIB_USART_SyncClockSourceSelect(MY_USART_INSTANCE, USART_SYNC_CLOCK_SOURCE_MASTER);
// enable USART
PLIB_USART_Enable(MY_USART_INSTANCE);

// Set the appropriate IO direction for USART pins
// TODO - Call the appropriate function.

// Enable receive mode
PLIB_USART_ReceiverEnable(MY_USART_INSTANCE);
```

Reception

1. Either wait for an interrupt, which will be generated when the reception is completed, or poll using [PLIB_USART_ReceiverDataIsAvailable](#).

Note: If using interrupts, ensure that interrupts are also enabled for the system and the peripherals.

2. Read the status of the device using [PLIB_USART_ReceiverOverrunHasOccurred](#), [PLIB_USART_ReceiverParityErrorHasOccurred](#) and [PLIB_USART_ReceiverFramingErrorHasOccurred](#).
3. Read the data using [PLIB_USART_ReceiverByteReceive](#).
4. If an overrun error occurred, clear the error using the function [PLIB_USART_ReceiverOverrunErrorClear](#).

Example: Synchronous Master Reception

```
// Read the byte
// where, my_byte is the 8 bit data to be transmitted
my_byte = PLIB_USART_ReceiverByteReceive(MY_USART_INSTANCE);

if(PLIB_USART_ReceiverOverrunHasOccurred(MY_USART_INSTANCE))
{
    PLIB_USART_ReceiverOverrunErrorClear(MY_USART_INSTANCE);
}
```

5.6.25.4.3.4 Synchronous Slave Mode

This section provides processes for setting up synchronous slave transmission and reception.

Note: This feature is not available on all devices. Please refer to the specific device data sheet or related family reference manual to determine which features are supported for your device.

Description

Synchronous Slave Transmission

Setup

1. Set the desired baud rate using either [PLIB_USART_BaudRateHighSet](#) or [PLIB_USART_BaudRateSet](#).
2. Enable the synchronous slave serial port using [PLIB_USART_SyncModeSelect](#), [PLIB_USART_ClockSourceSlaveSelect](#), and [PLIB_USART_Enable](#).
3. Set the appropriate I/O direction and corresponding RX and TX I/O pins.
4. Disable receive mode using [PLIB_USART_ReceiverDisable](#).
5. *Optional:* If desired, enable the transmit interrupt, ensuring that the interrupts are enabled for the system and the peripherals.

Example: Synchronous Slave Transmission Setup

```
// Set the desired baud rate
uint32_t baudRate = 9600;

// where, MY_USART_INSTANCE - is a specific instance of the hardware
// peripheral MY_CLOCK_FREQUENCY - is hardware clock frequency which is
// currently being used by the system.
PLIB_USART_BaudRateHighSet(MY_USART_INSTANCE, baudRate, MY_CLOCK_FREQUENCY);

// Enable the synchronous slave serial port.
// enable sync mode
PLIB_USART_SyncModeSelect(MY_USART_INSTANCE, USART_SYNC_MODE);
// enable slave clock
PLIB_USART_SyncClockSourceSelect(MY_USART_INSTANCE, USART_SYNC_CLOCK_SOURCE_SLAVE);
// enable USART
PLIB_USART_Enable(MY_USART_INSTANCE);

// Set the appropriate IO direction for USART pins
// TODO - Call the appropriate function.

// Disable receive mode
PLIB_USART_ReceiverDisable(MY_USART_INSTANCE);

// TODO - If using interrupts Enable the transmit interrupt
// TODO - Call the appropriate function for the transmit enable interrupt,
```

// TODO - Also, make sure that the interrupts are enabled for system and the peripherals.

Transmission

1. Enable transmission using [PLIB_USART_TransmitterEnable](#).
2. Ensure that the transmit buffer is not full before attempting to write into the transmit buffer. Either poll using [PLIB_USART_TransmitterBufferIsFull](#) or wait for the transmit interrupt.

Note: If using interrupts, ensure that interrupts are also enabled for the system and the peripherals.

3. Start the transmission using [PLIB_USART_TransmitterByteSend](#) (if transmitting 8-bit data) or [PLIB_USART_Transmitter9BitsSend](#) (if transmitting address if transmitting a byte with parity)
4. After the transmission is complete, disable the transmitter.

Example: Synchronous Slave Transmission

```
// Enable the transmission
PLIB_USART_TransmitterEnable(MY_USART_INSTANCE);

// TODO - Either wait for Transmit buffer to be not full or wait
//for an transmit interrupt.

// Transmit the byte when Transmit buffer is empty.
PLIB_USART_TransmitterByteSend(MY_USART_INSTANCE, my_word);
// where, my_word is the 9 bit data to be transmitted
```

Synchronous Slave Reception

Setup

1. Set the desired baud rate using [PLIB_USART_BaudRateHighSet](#) or [PLIB_USART_BaudRateSet](#).
2. Enable the synchronous master serial port using [PLIB_USART_SyncModeSelect](#), [PLIB_USART_SyncClockSourceSelect](#), and [PLIB_USART_Enable](#).
3. Set the appropriate I/O direction and corresponding RX and TX I/O pins.
4. *Optional:* If desired, enable the receive interrupt, ensuring that the interrupts are enabled for the system and the peripherals.
5. Start the reception using [PLIB_USART_ReceiverEnable](#).

Example: Synchronous Slave Reception Setup

```
// Set the desired baud rate
uint32_t baudRate = 9600;

// where, MY_USART_INSTANCE - is a specific instance of the hardware peripheral.
// where, MY_CLOCK_FREQUENCY - is hardware clock frequency which is currently
//being used by the system.
PLIB_USART_BaudRateHighSet(MY_USART_INSTANCE, baudRate, MY_CLOCK_FREQUENCY);

// Enable the synchronous slave serial port.
// enable sync mode
PLIB_USART_SyncModeSelect(MY_USART_INSTANCE, USART_SYNC_MODE);
// enable master clock
PLIB_USART_SyncClockSourceSelect(MY_USART_INSTANCE, USART_SYNC_CLOCK_SOURCE_SLAVE);
// enable USART
PLIB_USART_Enable(MY_USART_INSTANCE);

// Set the appropriate IO direction for USART pins
// TODO - Call the appropriate function.

// Start the reception
// Enable the continuous reception
PLIB_USART_ReceiverDisable(MY_USART_INSTANCE);
```

Reception

1. Either wait for an interrupt, which will be generated when the reception is completed, or poll using [PLIB_USART_ReceiverDataIsAvailable](#).

Note: If using interrupts make sure that interrupts are also enabled for the system and the peripherals.

2. Read the status of the device using [PLIB_USART_ReceiverOverrunHasOccurred](#), [PLIB_USART_ReceiverParityErrorHasOccurred](#), and [PLIB_USART_ReceiverFramingErrorHasOccurred](#).
3. Read the data using [PLIB_USART_ReceiverByteReceive](#).
4. If an overrun error occurred, clear the error using [PLIB_USART_ReceiverOverrunErrorClear](#).

Example: Synchronous Slave Reception

```
// Transmit the data
my_byte = PLIB_USART_ReceiverByteReceive(MY_USART_INSTANCE);
// where, my_byte is the 8 bit data received

// If overrun error clear the error.
if(PLIB_USART_ReceiverOverrunHasOccurred(MY_USART_INSTANCE))
{
    PLIB_USART_ReceiverOverrunErrorClear(MY_USART_INSTANCE);
}
```

5.6.25.4.3.5 Other Features

This section describes additional features of the USART Peripheral Library.

Note: The features described in this section are not available on all devices. Please refer to the specific device data sheet or the related family reference manual to determine which features are supported by your device.

Description

IrDA Support

Support for IrDA is available in some microcontrollers.

1. Enable IrDA support using [PLIB_USART_IrDAEnable](#). IrDA support can be disabled using [PLIB_USART_IrDADisable](#).
2. *Optional:* If using the external IrDA encoder and decoder, use the function [PLIB_USART_OperationModeSelect](#) with [USART_ENABLE_TX_RX_BCLK_USED](#) to output the 16x baud clock.
3. *Optional:* IrDA Transmit Polarity can be inverted using [PLIB_USART_TransmitterIdleIsLowEnable](#).
4. *Optional:* IrDA Receive Polarity can be inverted using [PLIB_USART_ReceiverIdleStateLowEnable](#).
5. Enable the USART using [PLIB_USART_Enable](#).

Loopback Support

This is the mode in which the transmission is internally connected to reception.

1. Set the desired baud rate using [PLIB_USART_BaudRateSet](#) or [PLIB_USART_BaudRateHighSet](#).
2. Set up the line control parameters (data bits, stop bits, parity, flow control) using [PLIB_USART_LineControlModeSelect](#). Refer to [USART_LINECONTROL_MODE](#) for a list of possible values.
3. Set the appropriate I/O direction and corresponding RX and TX I/O pins.
4. *Optional:* If desired, enable the transmit interrupt, also make sure that the interrupts are enabled for the system and the peripherals.
5. *Optional:* Also select the interrupt priority.
6. *Optional:* Also, set up the transmit FIFO interrupt mode using [PLIB_USART_TransmitterInterruptModeSelect](#). Refer to [USART_TRANSMIT_INTR_MODE](#) for a list of possible values.
7. Enable the USART module using [PLIB_USART_Enable](#) and enable the transmission using [PLIB_USART_TransmitterEnable](#).

8. Enable loopback using [PLIB_USART_LoopbackEnable](#). Loopback can be disabled at any time using [PLIB_USART_LoopbackDisable](#).
9. Continue with transmission and/or reception using the same steps as for asynchronous transmission/reception.

Auto Baud Support

1. Enable the auto baud detection using the function [PLIB_USART_BaudRateAutoDetectEnable](#), which requires a reception of the Sync character (0x55).
2. *Optional:* Poll [PLIB_USART_BaudRateAutoDetectIsComplete](#) to check if the baud rate is detected.
3. *Optional:* Call [PLIB_USART_BaudRateGet](#) to get the baud rate that was detected.
4. Clear the receive interrupt.
5. On some microcontrollers, reading the data using [PLIB_USART_ReceiverByteReceive](#) may be required.

Flow Control Support

The USART can use Simplex or Flow Control modes:

- Use [PLIB_USART_HandshakeModeSelect](#) to enable flow control (USART_HANDSHAKE_MODE_FLOW_CONTROL) or use simplex mode (USART_HANDSHAKE_MODE_SIMPLEX) selected from [USART_HANDSHAKE_MODE](#).
- To configure the USART line control features, use [PLIB_USART_LineControlModeSelect](#) selected from [USART_LINECONTROL_MODE](#).
- Additionally, the USART pins may need to be configured using [PLIB_USART_OperationModeSelect](#) and the appropriate values from [USART_OPERATION_MODE](#).

Operation During Sleep Mode

When the device enters Sleep mode, all clock sources supplied to the USART modules are shut down. If the device enters Sleep mode in the middle of a USART transmission or reception operation, the operation is aborted and the USART pins are driven to default state.

A Start bit, when detected, can wake up the device.

- The application needs to enable the wake-up on start bit using [PLIB_USART_WakeOnStartEnable](#) just before entering Sleep mode, to wake-up the device
- For the device to wake-up from sleep, reception of the Sync character or Wake-up Signal character is required
- *Optional:* If using interrupts, a receive interrupt is generated

Operation During Idle Mode

When the device enters Idle mode, the system clock sources remain functional and the CPU stops code execution.

- USART operation during Idle mode can be stopped using [PLIB_USART_StopInIdleEnable](#). When the device enters Idle mode, the USART module operation is similar to that as in Sleep mode (Refer to Operation in Sleep Mode).
- By default, the USART module continues to operate in Idle mode and provide full functionality

USART Operation With DMA

The DMA module can be used to transfer data between the USART and the CPU, without CPU assistance.

1. Set the desired baud rate using the function [PLIB_USART_BaudRateSet](#) or [PLIB_USART_BaudRateHighSet](#).
2. Set up the line control parameters (data bits, stop bits, parity, flow control) using the function [PLIB_USART_LineControlModeSelect](#). Refer to [USART_LINECONTROL_MODE](#) for a list of possible values.
3. Set the appropriate I/O direction and corresponding RX and TX I/O pins.
4. Enable the USART module using [PLIB_USART_Enable](#) and enable the transmission using [PLIB_USART_TransmitterEnable](#).
5. Enable the Transmit, Receive, and Error interrupts, ensuring that the interrupts are enabled for the system and the peripherals.

6. Select the interrupt priority.
7. Set up the Transmit FIFO Interrupt mode and Receive FIFO Interrupt mode using the `PLIB_USART_TransmitterFIFOLevelSelect` and `PLIB_USART_ReceiverFIFOLevelSelect` functions. To generate interrupts for every character received, use `USART_RECEIVE_FIFO_ONE_CHAR` from [USART_RECEIVE_INTR_MODE](#).
8. Configure the DMA to be used with the USART receiver and transmitter.

5.6.25.4.4 Configuring the Library

The library is configured for the supported USART modules when the processor is chosen in the MPLAB IDE.

5.6.25.5 Library Interface

Data Types and Constants

	Name	Description
	USART_BAUD_RATE_MODE	Lists the USART baud rate modes.
	USART_HANDSHAKE_MODE	Lists the USART handshake modes.
	USART_LINECONTROL_MODE	Data type defining the different configurations by which the USART data flow can be configured.
	USART_MODULE_ID	Enumeration: <code>USART_MODULE_ID</code> This enumeration defines the number of modules that are available on the microcontroller. This is the superset of all of the possible instances that might be available on Microchip microcontrollers. Refer to the data sheet to get the correct number of modules defined for desired microcontroller.
	USART_OPERATION_MODE	Data type defining the different configurations by which the USART can be enabled.
	USART_RECEIVE_INTR_MODE	Data type defining the different Receive FIFO levels by which the USART receive interrupt modes can be configured.
	USART_RECEIVE_MODES	Lists the USART receive modes.
	USART_SYNC_CLOCK_SOURCE	Lists the USART clock sources.
	USART_SYNC_MODES	Selection between asynchronous communication and synchronous communication.
	USART_TRANSMIT_INTR_MODE	Data type defining the different transmit FIFO levels by which the USART transmit interrupt modes can be configured.

Baud Rate Generator Functions

	Name	Description
	PLIB_USART_BaudRateAutoDetectEnable	Enables baud rate measurement on the next character, which requires reception of the Sync character.
	PLIB_USART_BaudRateAutoDetectIsComplete	Gets the state of the automatic baud detection.
	PLIB_USART_BaudRateAutoDetectOverflowHasOccurred	Identifies if the automatic baud timer has overflowed.
	PLIB_USART_BaudRateGet	Gets the baud rate current in use.
	PLIB_USART_BaudRateHighDisable	Disables the high baud rate selection.
	PLIB_USART_BaudRateHighEnable	Enables high baud rate selection.
	PLIB_USART_BaudRateHighSet	Sets the baud rate to the desired value.
	PLIB_USART_BaudRateModeSelect	Enables the 16-bit Baud Rate Generator (BRG).
	PLIB_USART_BaudRateSet	Sets the baud rate to the desired value.

Feature Existence Functions

	Name	Description
	<u>PLIB_USART_ExistsAlternateIO</u>	Identifies whether the AlternateIOEnableControl feature exists on the USART module.
	<u>PLIB_USART_ExistsBaudRate</u>	Identifies whether the BaudRate feature exists on the USART module.
	<u>PLIB_USART_ExistsBaudRateAutoDetect</u>	Identifies whether the BaudRateAutoDetect feature exists on the USART module.
	<u>PLIB_USART_ExistsBaudRateAutoDetectOverflow</u>	Identifies whether the BaudRateAutoDetectOverflow feature exists on the USART module.
	<u>PLIB_USART_ExistsBaudRateBitMode</u>	Identifies whether the BaudRateMode feature exists on the USART module.
	<u>PLIB_USART_ExistsBaudRateHigh</u>	Identifies whether the BaudRateHigh feature exists on the USART module.
	<u>PLIB_USART_ExistsEnable</u>	Identifies whether the EnableControl feature exists on the USART module.
	<u>PLIB_USART_ExistsHandshakeMode</u>	Identifies whether the HandShakeMode feature exists on the USART module.
	<u>PLIB_USART_ExistsIrDA</u>	Identifies whether the IrDAControl feature exists on the USART module.
	<u>PLIB_USART_ExistsLineControlMode</u>	Identifies whether the LineControlMode feature exists on the USART module.
	<u>PLIB_USART_ExistsLoopback</u>	Identifies whether the Loopback feature exists on the USART module.
	<u>PLIB_USART_ExistsOperationMode</u>	Identifies whether the OperationMode feature exists on the USART module.
	<u>PLIB_USART_ExistsReceiver</u>	Identifies whether the Receiver feature exists on the USART module.
	<u>PLIB_USART_ExistsReceiverAddressAutoDetect</u>	Identifies whether the ReceiverAddressAutoDetect feature exists on the USART module.
	<u>PLIB_USART_ExistsReceiverAddressDetect</u>	Identifies whether the ReceiverAddressDetect feature exists on the USART module.
	<u>PLIB_USART_ExistsReceiverDataAvailableStatus</u>	Identifies whether the ReceiverDataAvailable feature exists on the USART module.
	<u>PLIB_USART_ExistsReceiverEnable</u>	Identifies whether the ReceiverEnableControl feature exists on the USART module.
	<u>PLIB_USART_ExistsReceiverFramingErrorStatus</u>	Identifies whether the ReceiverFramingError feature exists on the USART module.
	<u>PLIB_USART_ExistsReceiverIdleStateLowEnable</u>	Identifies whether the ReceiverPolarityInvert feature exists on the USART module.
	<u>PLIB_USART_ExistsReceiverIdleStatus</u>	Identifies whether the ReceiverIdle feature exists on the USART module.
	<u>PLIB_USART_ExistsReceiverInterruptMode</u>	Identifies whether the ReceiverInterruptMode feature exists on the USART module.
	<u>PLIB_USART_ExistsReceiverMode</u>	Identifies whether the ReceiverMode feature exists on the USART module.
	<u>PLIB_USART_ExistsReceiverOverrunStatus</u>	Identifies whether the ReceiverOverrunError feature exists on the USART module.
	<u>PLIB_USART_ExistsReceiverParityErrorStatus</u>	Identifies whether the ReceiverParityError feature exists on the USART module.

	PLIB_USART_ExistsStopInIdle	Identifies whether the StopInIdle feature exists on the USART module.
	PLIB_USART_ExistsSyncClockPolarity	Identifies whether the SyncClockPolarity feature exists on the USART module.
	PLIB_USART_ExistsSyncClockSource	Identifies whether the SyncClockSource feature exists on the USART module.
	PLIB_USART_ExistsSyncMode	Identifies whether the SyncMode feature exists on the USART module.
	PLIB_USART_ExistsTransmitter	Identifies whether the Transmitter feature exists on the USART module.
	PLIB_USART_ExistsTransmitter9BitsSend	Identifies whether the Transmitter9Bits feature exists on the USART module.
	PLIB_USART_ExistsTransmitterBreak	Identifies whether the TransmitterBreak feature exists on the USART module.
	PLIB_USART_ExistsTransmitterBufferFullStatus	Identifies whether the TransmitterBufferFull feature exists on the USART module.
	PLIB_USART_ExistsTransmitterEmptyStatus	Identifies whether the TransmitterEmpty feature exists on the USART module.
	PLIB_USART_ExistsTransmitterEnable	Identifies whether the TransmitterEnableControl feature exists on the USART module.
	PLIB_USART_ExistsTransmitterIdleIsLow	Identifies whether the TransmitterIdleIsLow feature exists on the USART module.
	PLIB_USART_ExistsTransmitterIdleStatus	Identifies whether the TransmitterIdle feature exists on the USART module.
	PLIB_USART_ExistsTransmitterInterruptMode	Identifies whether the TransmitterInterruptMode feature exists on the USART module.
	PLIB_USART_ExistsWakeOnStart	Identifies whether the WakeOnStart feature exists on the USART module.

General Functions

	Name	Description
	PLIB_USART_AlternateIODisable	Disables the use of alternate I/O pins for the receiver and transmitter.
	PLIB_USART_AlternateIOEnable	Enables the use of alternate I/O pins for the receiver and transmitter.
	PLIB_USART_Disable	Disables the specific USART module.
	PLIB_USART_Enable	Enables the specific USART module.
	PLIB_USART_HandshakeModeSelect	Sets the data flow configuration.
	PLIB_USART_IrDADisable	Disables the IrDA encoder and decoder.
	PLIB_USART_IrDAEnable	Enables the IrDA encoder and decoder.
	PLIB_USART_LineControlModeSelect	Sets the data flow configuration.
	PLIB_USART_LoopbackDisable	Disables Loopback mode.
	PLIB_USART_LoopbackEnable	Enables Loopback mode.
	PLIB_USART_OperationModeSelect	Configures the operation mode of the USART module.
	PLIB_USART_StopInIdleDisable	Disables the Stop in Idle mode (the USART module continues operation when the device is in Idle mode).
	PLIB_USART_StopInIdleEnable	Discontinues operation when the device enters Idle mode.
	PLIB_USART_SyncClockPolarityIdleHighDisable	Sets the idle state of the clock to low.
	PLIB_USART_SyncClockPolarityIdleHighEnable	Sets the idle state of the clock to high.
	PLIB_USART_SyncClockSourceSelect	Sets the clock source.

	PLIB_USART_SyncModeSelect	Selects the USART mode to be asynchronous.
	PLIB_USART_WakeOnStartDisable	Disables the wake-up on start bit detection feature during Sleep mode.
	PLIB_USART_WakeOnStartEnable	Enables the wake-up on start bit detection feature during Sleep mode.
	PLIB_USART_WakeOnStartIsEnabled	Gets the state of the sync break event completion.

Receiver Functions

	Name	Description
	PLIB_USART_ReceiverAddressAutoDetectDisable	Disables the automatic Address Detect mode.
	PLIB_USART_ReceiverAddressAutoDetectEnable	Setup the automatic Address Detect mode.
	PLIB_USART_ReceiverAddressDetectDisable	Enables the Address Detect mode.
	PLIB_USART_ReceiverAddressDetectEnable	Enables the Address Detect mode.
	PLIB_USART_ReceiverAddressIsReceived	Checks and return if the data received is an address.
	PLIB_USART_ReceiverByteReceive	Data to be received in the Byte mode.
	PLIB_USART_ReceiverDataIsAvailable	Identifies if the receive data is available for the specified USART module.
	PLIB_USART_ReceiverDisable	Disables the USART receiver.
	PLIB_USART_ReceiverEnable	Enables the USART receiver.
	PLIB_USART_ReceiverFramingErrorHasOccurred	Gets the framing error status.
	PLIB_USART_ReceiverIdleStateLowDisable	Disables receive polarity inversion.
	PLIB_USART_ReceiverIdleStateLowEnable	Enables receive polarity inversion.
	PLIB_USART_ReceiverInterruptModeSelect	Sets the USART receiver FIFO level.
	PLIB_USART_ReceiverIsIdle	Identifies if the receiver is idle.
	PLIB_USART_ReceiverModeSelect	Disables Single Receive mode.
	PLIB_USART_ReceiverOverrunErrorClear	Clears a USART Overrun error.
	PLIB_USART_ReceiverOverrunHasOccurred	Identifies if there was a receiver overrun error.
	PLIB_USART_ReceiverParityErrorHasOccurred	Gets the parity error status.

Transmitter Functions

	Name	Description
	PLIB_USART_Transmitter9BitsSend	Data to be transmitted in the byte mode with the 9th bit.
	PLIB_USART_TransmitterBreakSend	Transmits the break character.
	PLIB_USART_TransmitterBreakSendIsComplete	Returns the status of the break transmission
	PLIB_USART_TransmitterBufferIsFull	Gets the transmit buffer full status.
	PLIB_USART_TransmitterByteSend	Data to be transmitted in the Byte mode.
	PLIB_USART_TransmitterDisable	Disables the specific USART module transmitter.
	PLIB_USART_TransmitterEnable	Enables the specific USART module transmitter.
	PLIB_USART_TransmitterIdleIsLowDisable	Disables the Transmit Idle Low state.
	PLIB_USART_TransmitterIdleIsLowEnable	Enables the Transmit Idle Low state.
	PLIB_USART_TransmitterInterruptModeSelect	Set the USART transmitter interrupt mode.
	PLIB_USART_TransmitterIsEmpty	Gets the transmit shift register empty status.
	PLIB_USART_TransmitterIsIdle	Gets the transmit buffer full status.

Description

This section describes the functions, data types, and constants available in the USART Peripheral Library.

5.6.25.5.1 General Functions

5.6.25.5.1.1 PLIB_USART_AlternateIODisable Function

C

```
void PLIB_USART_AlternateIODisable(  
    USART_MODULE_ID index  
);
```

Description

This function disables the USART module to use the alternate I/O pins for the receiver and transmitter.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsAlternateIO](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1  
  
PLIB_USART_AlternateIODisable(MY_USART_INSTANCE);
```

5.6.25.5.1.2 PLIB_USART_AlternateIOEnable Function

C

```
void PLIB_USART_AlternateIOEnable(  
    USART_MODULE_ID index  
);
```

Description

This function enables the USART module to use the alternate I/O pins for the receiver and transmitter.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use

[PLIB_USART_ExistsAlternateIO](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

PLIB_USART_AlternateIOEnable(MY_USART_INSTANCE);
```

5.6.25.5.1.3 PLIB_USART_Disable Function**C**

```
void PLIB_USART_Disable(
    USART_MODULE_ID index
);
```

Description

This function disables the specific USART module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

The default state after any reset for a USART module is the disable state. If the USART is disabled, all of the related pins are in control of the general purpose I/O logic.

Disabling the USART module resets the buffers to empty states. Any data characters in the buffers are lost and the baud rate is reset. All error and status bits are also reset.

Disabling the USART while the USART is active, will abort all pending transmissions and receptions. Re-enabling the USART will restart the module in the same configuration.

When disabled, the USART power consumption is minimal.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsEnable](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

PLIB_USART_Disable(MY_USART_INSTANCE);
```

5.6.25.5.1.4 PLIB_USART_Enable Function**C**

```
void PLIB_USART_Enable(
    USART_MODULE_ID index
);
```

Description

This function enables the specific USART module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

By calling this function, the USART pins are controlled by the USART module.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsEnable](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

PLIB_USART_Enable(MY_USART_INSTANCE);
```

5.6.25.5.1.5 PLIB_USART_HandshakeModeSelect Function**C**

```
void PLIB_USART_HandshakeModeSelect(
    USART_MODULE_ID index,
    USART_HANDSHAKE_MODE handshakeConfig
);
```

Description

This function sets the USART data flow configuration based on the mask provided and the specified baud rate.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
mode	For possible data flow configurations, refer to USART_HANDSHAKE_MODE

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsHandshakeMode](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

PLIB_USART_HandshakeModeSelect(MY_USART_INSTANCE,
    USART_HANDSHAKE_MODE_SIMPLEX);
```

5.6.25.5.1.6 PLIB_USART_IrDADisable Function

C

```
void PLIB_USART_IrDADisable(  
    USART_MODULE_ID index  
);
```

Description

This function disables the IrDA encoder and decoder.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

By default, the IrDA Encoder and Decoder are disabled.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsIrDA](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1  
  
PLIB_USART_IrDADisable(MY_USART_INSTANCE);
```

5.6.25.5.1.7 PLIB_USART_IrDAEnable Function

C

```
void PLIB_USART_IrDAEnable(  
    USART_MODULE_ID index  
);
```

Description

This function enables the IrDA encoder and decoder.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsIrDA](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

PLIB_USART_IrDAEnable(MY_USART_INSTANCE);
```

5.6.25.5.1.8 PLIB_USART_LineControlModeSelect Function**C**

```
void PLIB_USART_LineControlModeSelect(
    USART_MODULE_ID index,
    USART_LINECONTROL_MODE dataFlowConfig
);
```

Description

This function sets the USART data flow configuration based on the mask provided and the specified baud rate.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
mode	For possible data flow configurations, refer to USART_LINECONTROL_MODE

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsLineControlMode](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

PLIB_USART_LineControlModeSelect(MY_USART_INSTANCE,
    USART_8N1);
```

5.6.25.5.1.9 PLIB_USART_LoopbackDisable Function**C**

```
void PLIB_USART_LoopbackDisable(
    USART_MODULE_ID index
);
```

Description

This function disables Loopback mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

By default, Loopback mode is disabled.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsLoopback](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

PLIB_USART_LoopbackDisable(MY_USART_INSTANCE);
```

5.6.25.5.1.10 PLIB_USART_LoopbackEnable Function**C**

```
void PLIB_USART_LoopbackEnable(
    USART_MODULE_ID index
);
```

Description

This function enables Loopback mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

By default, Loopback mode is disabled.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsLoopback](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

PLIB_USART_LoopbackEnable(MY_USART_INSTANCE);
```

5.6.25.5.1.11 PLIB_USART_OperationModeSelect Function**C**

```
void PLIB_USART_OperationModeSelect(
    USART_MODULE_ID index,
    USART_OPERATION_MODE operationmode
);
```

Description

This function configures the operation mode of the USART (i.e., controls the pins used by the USART module). Refer to [USART_OPERATION_MODE](#) for the possible settings.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
operationmode	One of the possible values from USART_OPERATION_MODE

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsOperationMode](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

PLIB_USART_OperationModeSelect(MY_USART_INSTANCE, USART_ENABLE_TX_RX_BCLK_USED);
```

5.6.25.5.1.12 PLIB_USART_StopInIdleDisable Function**C**

```
void PLIB_USART_StopInIdleDisable(
    USART_MODULE_ID index
);
```

Description

This function disables the Stop in Idle mode. The USART module continues operation when the device is in Idle mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

By default, the USART module will continue operation in idle mode.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsStopInIdle](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

PLIB_USART_StopInIdleDisable(MY_USART_INSTANCE);
```

5.6.25.5.1.13 PLIB_USART_StopInIdleEnable Function**C**

```
void PLIB_USART_StopInIdleEnable(
```

```
    USART_MODULE_ID index
);
```

Description

This function enables the USART module to discontinue operation when the device enters Idle mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsStopInIdle](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

PLIB_USART_StopInIdleEnable(MY_USART_INSTANCE);
```

5.6.25.5.1.14 PLIB_USART_SyncClockPolarityIdleHighDisable Function**C**

```
void PLIB_USART_SyncClockPolarityIdleHighDisable(
    USART_MODULE_ID index
);
```

Description

This function sets the clock idle in the synchronous mode to low.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

Calling this function disables the clock polarity idle as high.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsSyncClockPolarity](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

PLIB_USART_SyncClockPolarityIdleHighDisable(MY_USART_INSTANCE);
```

5.6.25.5.1.15 PLIB_USART_SyncClockPolarityIdleHighEnable Function

C

```
void PLIB_USART_SyncClockPolarityIdleHighEnable(  
    USART_MODULE_ID index  
);
```

Description

This function sets the clock idle in the Synchronous mode to high.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

Calling this function disables the clock polarity idle as low.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsSyncClockPolarity](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1  
  
PLIB_USART_SyncClockPolarityIdleHighEnable(MY_USART_INSTANCE);
```

5.6.25.5.1.16 PLIB_USART_SyncClockSourceSelect Function

C

```
void PLIB_USART_SyncClockSourceSelect(  
    USART_MODULE_ID index,  
    USART_SYNC_CLOCK_SOURCE source  
);
```

Description

This function sets the clock source to either master or slave, which is only valid in Synchronous mode. The clock is generated from the baud rate generator.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

Calling this function disables the use of the slave as the clock source.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsSyncClockSource](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

PLIB_USART_SyncClockSourceSelect(MY_USART_INSTANCE, USART_SYNC_CLOCK_SOURCE_MASTER);
```

5.6.25.5.1.17 PLIB_USART_SyncModeSelect Function**C**

```
void PLIB_USART_SyncModeSelect(
    USART_MODULE_ID index,
    USART_SYNC_MODES mode
);
```

Description

This function enables the Asynchronous mode of the USART module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

Calling this function disables the Synchronous mode of the USART module. By default, the module is in Asynchronous mode after a reset.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsSyncMode](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

PLIB_USART_SyncModeSelect(MY_USART_INSTANCE, USART_ASYNC_MODE);
```

5.6.25.5.1.18 PLIB_USART_WakeOnStartDisable Function**C**

```
void PLIB_USART_WakeOnStartDisable(
    USART_MODULE_ID index
);
```

Description

This function disables the wake-up on start bit detection feature during Sleep mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsWakeOnStart](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

PLIB_USART_WakeOnStartDisable(MY_USART_INSTANCE);
```

5.6.25.5.1.19 PLIB_USART_WakeOnStartEnable Function**C**

```
void PLIB_USART_WakeOnStartEnable(
    USART_MODULE_ID index
);
```

Description

This function enables the wake-up on start feature during Sleep mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsWakeOnStart](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

PLIB_USART_WakeOnStartEnable(MY_USART_INSTANCE);
```

5.6.25.5.1.20 PLIB_USART_WakeOnStartIsEnabled Function**C**

```
bool PLIB_USART_WakeOnStartIsEnabled(
    USART_MODULE_ID index
);
```

Description

This function returns the status of the sync break event, when called after enabling using [PLIB_USART_WakeOnStartEnable](#).

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsWakeOnStart](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

//Call the interface just prior to entering the sleep mode.
PLIB_USART_WakeOnStartEnable(MY_USART_INSTANCE);

// Check the status if the Sync break event is over.
if(PLIB_USART_WakeOnStartIsEnabled(MY_USART_INSTANCE))
{
    // Do Something
}
```

5.6.25.5.2 Baud Rate Generator Functions

5.6.25.5.2.1 PLIB_USART_BaudRateAutoDetectEnable Function

C

```
void PLIB_USART_BaudRateAutoDetectEnable(
    USART_MODULE_ID index
);
```

Description

This function enables the baud rate measurement on the next character, which requires reception of the Sync character.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsBaudRateAutoDetect](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1
```

```
PLIB_USART_BaudRateAutoDetectEnable(MY_USART_INSTANCE);  
  
// Wait till the baud rate is detected.  
while(!PLIB_USART_BaudRateAutoDetectIsComplete(MY_USART_INSTANCE));
```

5.6.25.5.2.2 PLIB_USART_BaudRateAutoDetectIsComplete Function

C

```
bool PLIB_USART_BaudRateAutoDetectIsComplete(  
    USART_MODULE_ID index  
);
```

Description

This function gets the state of the automatic baud detection and returns a '0' if the baud rate auto detection is complete.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

- true - Baud rate detection is not complete
- false - Baud rate detection is complete

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsBaudRateAutoDetect](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1  
  
PLIB_USART_BaudRateAutoDetectEnable(MY_USART_INSTANCE);  
  
// Wait till the baud rate is detected.  
while(!PLIB_USART_BaudRateAutoDetectIsComplete(MY_USART_INSTANCE));
```

5.6.25.5.2.3 PLIB_USART_BaudRateAutoDetectOverflowHasOccurred Function

C

```
bool PLIB_USART_BaudRateAutoDetectOverflowHasOccurred(  
    USART_MODULE_ID index  
);
```

Description

This function identifies whether or not the automatic baud timer has overflowed.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

- true - An auto-baud overflow has occurred
- false - An auto-baud overflow has not occurred

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsBaudRateAutoDetectOverflow](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

status = PLIB_USART_BaudRateAutoDetectOverflowHasOccurred(MY_USART_INSTANCE);
```

5.6.25.5.2.4 PLIB_USART_BaudRateGet Function**C**

```
uint32_t PLIB_USART_BaudRateGet(
    USART_MODULE_ID index,
    int32_t clockFrequency
);
```

Description

This function gets the baud rate that is currently in use. The clock frequency needs to be passed to the function.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
clockFrequency	Clock Frequency

Returns

BaudRate - Baud Rate Value

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsBaudRate](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

uint32_t baudRate ;
PLIB_USART_BaudRateSet(MY_USART_INSTANCE, MY_CLOCK_FREQUENCY, 9600);
baudRate = PLIB_USART_BaudRateGet(MY_USART_INSTANCE, MY_CLOCK_FREQUENCY);
```

5.6.25.5.2.5 PLIB_USART_BaudRateHighDisable Function**C**

```
void PLIB_USART_BaudRateHighDisable(
    USART_MODULE_ID index
);
```

Description

This function disables the high baud rate selection.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsBaudRateHigh](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

PLIB_USART_BaudRateHighDisable(MY_USART_INSTANCE);
```

5.6.25.5.2.6 PLIB_USART_BaudRateHighEnable Function**C**

```
void PLIB_USART_BaudRateHighEnable(
    USART_MODULE_ID index
);
```

Description

This function enables high baud rate selection.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsBaudRateHigh](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

PLIB_USART_BaudRateHighEnable(MY_USART_INSTANCE);
```

5.6.25.5.2.7 PLIB_USART_BaudRateHighSet Function**C**

```
void PLIB_USART_BaudRateHighSet(
    USART_MODULE_ID index,
    uint32_t clockFrequency,
    uint32_t baudRate
);
```

```
);
```

Description

This function sets the baud rate to the desired value.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
baudRate	Baud Rate Value, it is the baud rate value
clockFrequency	Clock Frequency

Returns

None.

Remarks

Setting a new baud rate value causes the baud rate timer to reset. This ensures that the baud rate timer does not have to overflow before outputting the new baud rate.

If the system clock is changed during an active receive operation, a receiver error or data loss may result. To avoid this issue verify that no receptions are in progress before changing the system clock.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsBaudRateHigh](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

uint32_t baudRateValue ;
PLIB_USART_BaudRateHighSet(MY_USART_INSTANCE, MY_CLOCK_FREQUENCY, 9600);
baudRateValue = PLIB_USART_BaudRateGet(MY_USART_INSTANCE, MY_CLOCK_FREQUENCY);
```

5.6.25.5.2.8 PLIB_USART_BaudRateModeSelect Function**C**

```
void PLIB_USART_BaudRateModeSelect(
    USART_MODULE_ID index,
    USART_BAUD_RATE_MODE mode
);
```

Description

This function enables the 16-bit Baud Rate Generator.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
mode	Baud rate mode

Returns

None.

Remarks

Calling this function disables the 8-bit Baud Rate Generator. The 16-bit mode is used to achieve a slow baud rate for fast oscillator frequencies.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsBaudRateBitMode](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

PLIB_USART_BaudRateModeSelect(MY_USART_INSTANCE, USART_BAUD_RATE_16_BIT_MODE);
```

5.6.25.5.2.9 PLIB_USART_BaudRateSet Function**C**

```
void PLIB_USART_BaudRateSet(
    USART_MODULE_ID index,
    uint32_t clockFrequency,
    uint32_t baudRate
);
```

Description

This function sets the baud rate to the desired value.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
baudRate	Baud Rate Value
clockFrequency	Clock Frequency

Returns

None.

Remarks

Setting a new baud rate value causes the baud rate timer to reset. This ensures that the baud rate timer does not have to overflow before outputting the new baud rate.

If the system clock is changed during an active receive operation, a receiver error or data loss may result. To avoid this issue verify that no receptions are in progress before changing the system clock.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsBaudRate](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

uint32_t baudRateValue ;
PLIB_USART_BaudRateSet(MY_USART_INSTANCE, MY_CLOCK_FREQUENCY, 9600);
baudRateValue = PLIB_USART_BaudRateGet(MY_USART_INSTANCE, MY_CLOCK_FREQUENCY);
```

5.6.25.5.3 Transmitter Functions

5.6.25.5.3.1 PLIB_USART_Transmitter9BitsSend Function

C

```
void PLIB_USART_Transmitter9BitsSend(  
    USART_MODULE_ID index,  
    int8_t data,  
    bool Bit9th  
);
```

Description

The data is transmitted in the byte mode for the specified USART module, with 9th bit.

Preconditions

The USART module should be configured to use the 9 data bits.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
data	Data to be transmitted.
9thBit	9th bit of the data to be transmitted.

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsTransmitter9BitsSend](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1  
  
uint8_t data = 'a';  
  
if(!PLIB_USART_TransmitterBufferIsFull(MY_USART_INSTANCE))  
{  
    PLIB_USART_Transmitter9BitsSend(MY_USART_INSTANCE, data, false);  
}
```

5.6.25.5.3.2 PLIB_USART_TransmitterBreakSend Function

C

```
void PLIB_USART_TransmitterBreakSend(  
    USART_MODULE_ID index  
);
```

Description

This function transmits the break character.

Preconditions

The application should wait for the transmitter to be idle, before calling this function.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

After the break has been transmitted, the application can start transmitting next bytes.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsTransmitterBreak](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

// Wait for the Transmit buffer to be empty.
while(PLIB_USART_TransmitterBufferIsFull(MY_USART_INSTANCE));

// Transmit the break character.
PLIB_USART_TransmitterBreakSend(MY_USART_INSTANCE);

// wait for the break transmission to complete
while(!PLIB_USART_TransmitterBreakSendIsComplete(MY_USART_INSTANCE));
```

5.6.25.5.3.3 PLIB_USART_TransmitterBreakSendIsComplete Function**C**

```
bool PLIB_USART_TransmitterBreakSendIsComplete(
    USART_MODULE_ID index
);
```

Description

The function returns the status of the break transmission.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

- true - Transmit Break on the next transmission
- false - Break Transmission completed or not started

Remarks

After the break has been transmitted, the application can start transmitting next bytes.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsTransmitterBreak](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

// Wait for the Transmit buffer to be empty.
while(PLIB_USART_TransmitterBufferIsFull(MY_USART_INSTANCE));

// Transmit the break character.
PLIB_USART_TransmitterBreakSend(MY_USART_INSTANCE);

// wait for the break transmission to complete
```

```
while(!PLIB_USART_TransmitterBreakSendIsComplete(MY_USART_INSTANCE));
```

5.6.25.5.3.4 PLIB_USART_TransmitterBufferIsFull Function

C

```
bool PLIB_USART_TransmitterBufferIsFull(  
    USART_MODULE_ID index  
);
```

Description

Gets the transmit status of the specified USART module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

- true - The transmit buffer is full
- false - The transmit buffer is not full, at least one more character can be written.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsTransmitterBufferFullStatus](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1  
  
// Wait for the Transmit buffer to be empty.  
while(PLIB_USART_TransmitterBufferIsFull(MY_USART_INSTANCE));  
  
// Transmit the break character.  
PLIB_USART_TransmitterBreakSend(MY_USART_INSTANCE);
```

5.6.25.5.3.5 PLIB_USART_TransmitterByteSend Function

C

```
void PLIB_USART_TransmitterByteSend(  
    USART_MODULE_ID index,  
    int8_t data  
);
```

Description

The data is transmitted in the Byte mode for the specified USART module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
data	Data to be transmitted.

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsTransmitter](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

uint8_t data = 'a';
if(!PLIB_USART_TransmitterBufferIsFull(MY_USART_INSTANCE))
{
    PLIB_USART_TransmitterByteSend(MY_USART_INSTANCE, data);
}
```

5.6.25.5.3.6 PLIB_USART_TransmitterDisable Function**C**

```
void PLIB_USART_TransmitterDisable(
    USART_MODULE_ID index
);
```

Description

This function disables the specific USART module transmitter.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

Disabling the transmitter during a transmission will cause the transmission to be aborted.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsTransmitterEnable](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

PLIB_USART_TransmitterDisable(MY_USART_INSTANCE);
```

5.6.25.5.3.7 PLIB_USART_TransmitterEnable Function**C**

```
void PLIB_USART_TransmitterEnable(
    USART_MODULE_ID index
);
```

Description

This function enables the specific USART module transmitter.

Preconditions

The USART module should be enabled using the function [PLIB_USART_Enable](#) before this function is called.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

The transmitter should not be enabled until the USART is enabled. The transmissions will not be enabled otherwise.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsTransmitterEnable](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

PLIB_USART_TransmitterEnable(MY_USART_INSTANCE);
```

5.6.25.5.3.8 PLIB_USART_TransmitterIdleIsLowDisable Function**C**

```
void PLIB_USART_TransmitterIdleIsLowDisable(
    USART_MODULE_ID index
);
```

Description

This function disables the Transmit Idle Low state. In USART Synchronous mode, this function configures that the TX polarity the idle state is high.

When IrDA is enabled, this function sets the IrDA encoded Transmit Idle state to a '0'.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsTransmitterIdleIsLow](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

PLIB_USART_TransmitterIdleIsLowDisable(MY_USART_INSTANCE);
```

5.6.25.5.3.9 PLIB_USART_TransmitterIdleIsLowEnable Function

C

```
void PLIB_USART_TransmitterIdleIsLowEnable(  
    USART_MODULE_ID index  
);
```

Description

This function enables the Transmit Idle Low state. In the USART Synchronous mode, this function configures that the TX polarity, the idle state is low.

When IrDA(c) is enabled, this function sets that IrDA encoded Transmit Idle state to a '1'.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsTransmitterIdleIsLow](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1  
  
PLIB_USART_TransmitterIdleIsLowEnable(MY_USART_INSTANCE);
```

5.6.25.5.3.10 PLIB_USART_TransmitterInterruptModeSelect Function

C

```
void PLIB_USART_TransmitterInterruptModeSelect(  
    USART_MODULE_ID index,  
    USART_TRANSMIT_INTR_MODE fifolevel  
);
```

Description

This function sets the condition in which the USART module should generate an interrupt.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
interruptMode	Interrupt mode; for possible configurations, refer to USART_TRANSMIT_INTR_MODE

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsTransmitterInterruptMode](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

PLIB_USART_TransmitterInterruptModeSelect(MY_USART_INSTANCE,
    USART_TRANSMIT_FIFO_EMPTY );
```

5.6.25.5.3.11 PLIB_USART_TransmitterIsEmpty Function**C**

```
bool PLIB_USART_TransmitterIsEmpty(
    USART_MODULE_ID index
);
```

Description

This function gets the transmit shift register empty status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

- true - The transmit shift register is empty
- false - The transmit shift register is not empty

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsTransmitterEmptyStatus](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

// Wait for the Transmit buffer to be empty.
while( !PLIB_USART_TransmitterIsEmpty(MY_USART_INSTANCE));

// Transmit the break character.
PLIB_USART_TransmitterBreakSend(MY_USART_INSTANCE);
```

5.6.25.5.3.12 PLIB_USART_TransmitterIsIdle Function**C**

```
bool PLIB_USART_TransmitterIsIdle(
    USART_MODULE_ID index
);
```

Description

This function gets the transmit buffer full status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

- true - The transmitter is idle
- false - The transmitter is not idle

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsTransmitterIdleStatus](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

status = PLIB_USART_TransmitterIsIdle(MY_USART_INSTANCE);
```

5.6.25.5.4 Receiver Functions

5.6.25.5.4.1 PLIB_USART_ReceiverAddressAutoDetectDisable Function

C

```
void PLIB_USART_ReceiverAddressAutoDetectDisable(
    USART_MODULE_ID index
);
```

Description

This function disables the automatic Address Detect mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsReceiverAddressAutoDetect](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

PLIB_USART_ReceiverAddressAutoDetectDisable(MY_USART_INSTANCE);
```

5.6.25.5.4.2 PLIB_USART_ReceiverAddressAutoDetectEnable Function

C

```
void PLIB_USART_ReceiverAddressAutoDetectEnable(
    USART_MODULE_ID index,
    int8_t Mask
);
```

```
);
```

Description

This function configures the automatic Address Detect mode. Uses the mask as the address character for automatic address detection.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
Mask	Address character to be used, when enabled

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsReceiverAddressAutoDetect](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

PLIB_USART_ReceiverAddressAutoDetectEnable(MY_USART_INSTANCE,
                                             MY_DEVICE_ADDRESS);
```

5.6.25.5.4.3 PLIB_USART_ReceiverAddressDetectDisable Function**C**

```
void PLIB_USART_ReceiverAddressDetectDisable(
    USART_MODULE_ID index
);
```

Description

This function disables the Address Detect mode. If it is enabled, and the device is addressed, disable the Address Detect mode to continue receiving bytes.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

All bytes are received, and the 9th bit can be used as the parity bit. By default, the address detect is disabled.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsReceiverAddressDetect](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1
```

```
PLIB_USART_ReceiverAddressDetectDisable(MY_USART_INSTANCE);
```

5.6.25.5.4.4 PLIB_USART_ReceiverAddressDetectEnable Function

C

```
void PLIB_USART_ReceiverAddressDetectEnable(  
    USART_MODULE_ID index  
);
```

Description

This function enables the Address Detect mode. If it is enabled, and the device is addressed, disable the Address Detect mode to continue receiving bytes.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

If 9 data bits are not selected, this bit has no effect.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsReceiverAddressDetect](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1  
  
PLIB_USART_ReceiverAddressDetectEnable(MY_USART_INSTANCE);
```

5.6.25.5.4.5 PLIB_USART_ReceiverAddressIsReceived Function

C

```
bool PLIB_USART_ReceiverAddressIsReceived(  
    USART_MODULE_ID index  
);
```

Description

Checks and return if the data received is an address. The address has the 9th bit set. If data received, has 9th bit set, function returns true, else returns false.

Preconditions

The USART module should be configured to use the 9 data bits.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

- true - if the data received has the 9th bit set
- false - if the address received has the 9th bit cleared

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsReceiverAddressDetect](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

int8_t address;

if(PLIB_USART_ReceiverAddressIsReceived(MY_USART_INSTANCE))
{
    address = PLIB_USART_ReceiverByteReceive(MY_USART_INSTANCE);
}
```

5.6.25.5.4.6 PLIB_USART_ReceiverByteReceive Function**C**

```
int8_t PLIB_USART_ReceiverByteReceive(
    USART_MODULE_ID index
);
```

Description

The data to be received in Byte mode from the specified USART module. Call the functions [PLIB_USART_ReceiverFramingErrorHasOccurred](#), [PLIB_USART_ReceiverParityErrorHasOccurred](#) and [PLIB_USART_ReceiverOverrunHasOccurred](#) to get any error that occurred.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

data - Data to be received.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsReceiver](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

bool isError;
uint8_t mydata;

if(PLIB_USART_ReceiverDataIsAvailable(MY_USART_INSTANCE))
{
    mydata = PLIB_USART_ReceiverByteReceive(MY_USART_INSTANCE);
}

isError = PLIB_USART_ReceiverFramingErrorHasOccurred(MY_USART_INSTANCE) |
          PLIB_USART_ReceiverParityErrorHasOccurred(MY_USART_INSTANCE) |
          PLIB_USART_ReceiverOverrunHasOccurred(MY_USART_INSTANCE);

if(PLIB_USART_ReceiverOverrunHasOccurred(MY_USART_INSTANCE))
{
    PLIB_USART_ReceiverOverrunErrorClear(MY_USART_INSTANCE);
}
```

```
}
```

5.6.25.5.4.7 PLIB_USART_ReceiverDataIsAvailable Function

C

```
bool PLIB_USART_ReceiverDataIsAvailable(  
    USART_MODULE_ID index  
);
```

Description

This function identifies if the receive data is available for the specified USART module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

- true - The data is available
- false - The data is not available

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsReceiverDataAvailableStatus](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1  
  
int8_t mydata;  
  
if(PLIB_USART_ReceiverDataIsAvailable(MY_USART_INSTANCE))  
{  
    mydata = PLIB_USART_ReceiverByteReceive(MY_USART_INSTANCE);  
}
```

5.6.25.5.4.8 PLIB_USART_ReceiverDisable Function

C

```
void PLIB_USART_ReceiverDisable(  
    USART_MODULE_ID index  
);
```

Description

This function disables the USART receiver.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsReceiverEnable](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

PLIB_USART_ReceiverDisable(MY_USART_INSTANCE);
```

5.6.25.5.4.9 PLIB_USART_ReceiverEnable Function**C**

```
void PLIB_USART_ReceiverEnable(
    USART_MODULE_ID index
);
```

Description

This function enables the USART receiver.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsReceiverEnable](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

PLIB_USART_ReceiverEnable(MY_USART_INSTANCE);
```

5.6.25.5.4.10 PLIB_USART_ReceiverFramingErrorHasOccurred Function**C**

```
bool PLIB_USART_ReceiverFramingErrorHasOccurred(
    USART_MODULE_ID index
);
```

Description

This function gets the framing error status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

- true - The framing error was detected on the current character
- false - The framing error was not detected on the current character

Remarks

Reading the error clears the error.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsReceiverFramingErrorStatus](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

status = PLIB_USART_ReceiverFramingErrorHasOccurred(MY_USART_INSTANCE);
```

5.6.25.5.4.11 PLIB_USART_ReceiverIdleStateLowDisable Function**C**

```
void PLIB_USART_ReceiverIdleStateLowDisable(
    USART_MODULE_ID index
);
```

Description

This function disables receive polarity inversion. In the USART Synchronous mode, this function configures that the data is not inverted.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsReceiverIdleStateLowEnable](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

PLIB_USART_ReceiverIdleStateLowDisable(MY_USART_INSTANCE);
```

5.6.25.5.4.12 PLIB_USART_ReceiverIdleStateLowEnable Function**C**

```
void PLIB_USART_ReceiverIdleStateLowEnable(
    USART_MODULE_ID index
);
```

Description

This function enables receive polarity inversion. In the USART Synchronous mode, this function configures that the data is inverted.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsReceiverIdleStateLowEnable](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

PLIB_USART_ReceiverIdleStateLowEnable(MY_USART_INSTANCE);
```

5.6.25.5.4.13 PLIB_USART_ReceiverInterruptModeSelect Function**C**

```
void PLIB_USART_ReceiverInterruptModeSelect(
    USART_MODULE_ID index,
    USART_RECEIVE_INTR_MODE interruptMode
);
```

Description

This function sets the USART receiver FIFO level.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
fifolevel	For possible configurations, refer to USART_RECEIVE_INTR_MODE

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsReceiverInterruptMode](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

PLIB_USART_ReceiverInterruptModeSelect(MY_USART_INSTANCE,
    USART_RECEIVE_FIFO_ONE_CHAR );
```

5.6.25.5.4.14 PLIB_USART_ReceiverIsIdle Function**C**

```
bool PLIB_USART_ReceiverIsIdle(
```

```
    USART_MODULE_ID index
);
```

Description

This function identifies if the receiver is idle.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

- true - The receive buffer is idle
- false - The receive buffer is not idle

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsReceiverIdleStatus](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

int8_t mydata;

if(PLIB_USART_ReceiverIsIdle(MY_USART_INSTANCE))
{
    mydata = PLIB_USART_ReceiverByteReceive(MY_USART_INSTANCE);
}
```

5.6.25.5.4.15 PLIB_USART_ReceiverModeSelect Function**C**

```
void PLIB_USART_ReceiverModeSelect(
    USART_MODULE_ID index,
    USART_RECEIVE_MODES mode
);
```

Description

This function disables Single Receive mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This function has no effect during Asynchronous mode, or in the Synchronous Slave mode. By default, the single receive is disabled after a reset.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use

[PLIB_USART_ExistsReceiverMode](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

PLIB_USART_ReceiverModeSelect(MY_USART_INSTANCE, USART_RECEIVE_MODE_SINGLE);
```

5.6.25.5.4.16 PLIB_USART_ReceiverOverrunErrorClear Function**C**

```
void PLIB_USART_ReceiverOverrunErrorClear(
    USART_MODULE_ID index
);
```

Description

Clears an overrun error. Clearing the error, resets the receive buffer.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

WARNING: Calling this API will clear all the previously received data.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsReceiverOverrunStatus](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

if(PLIB_USART_ReceiverOverrunHasOccurred(MY_USART_INSTANCE))
{
    PLIB_USART_ReceiverOverrunErrorClear(MY_USART_INSTANCE);
}
```

5.6.25.5.4.17 PLIB_USART_ReceiverOverrunHasOccurred Function**C**

```
bool PLIB_USART_ReceiverOverrunHasOccurred(
    USART_MODULE_ID index
);
```

Description

This function identifies if there was a receiver overrun error.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

- true - The receive buffer has overflowed
- false - The receive buffer has not overflowed

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsReceiverOverrunStatus](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

if(PLIB_USART_ReceiverOverrunHasOccurred(MY_USART_INSTANCE))
{
    PLIB_USART_ReceiverOverrunErrorClear(MY_USART_INSTANCE);
}
```

5.6.25.5.4.18 PLIB_USART_ReceiverParityErrorHasOccurred Function**C**

```
bool PLIB_USART_ReceiverParityErrorHasOccurred(
    USART_MODULE_ID index
);
```

Description

This function gets the parity error status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

- true - The parity error was detected on the current character
- false - The parity error was not detected on the current character

Remarks

Reading the error clears the error.

A Parity error is irrelevant in case of 9-bit mode.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USART_ExistsReceiverParityErrorStatus](#) in your application to determine whether this feature is available.

Example

```
#define MY_USART_INSTANCE USART_ID_1

status = PLIB_USART_ReceiverParityErrorHasOccurred(MY_USART_INSTANCE);
```

5.6.25.5.5 Data Types and Constants

5.6.25.5.5.1 USART_BAUD_RATE_MODE Enumeration

C

```
typedef enum {  
    USART_BAUD_RATE_8_BIT_MODE,  
    USART_BAUD_RATE_16_BIT_MODE  
} USART_BAUD_RATE_MODE;
```

Description

/* USART Baud rate mode

This enumeration lists the USART baud rate modes.

Members

Members	Description
USART_BAUD_RATE_8_BIT_MODE	Baud rate register is 8 bit
USART_BAUD_RATE_16_BIT_MODE	Baud rate register is 16 bit

Remarks

None.

5.6.25.5.5.2 USART_HANDSHAKE_MODE Enumeration

C

```
typedef enum {  
    USART_HANDSHAKE_MODE_FLOW_CONTROL,  
    USART_HANDSHAKE_MODE_SIMPLEX  
} USART_HANDSHAKE_MODE;
```

Description

/* USART Handshake modes

This enumeration lists the USART handshake modes.

Members

Members	Description
USART_HANDSHAKE_MODE_FLOW_CONTROL	Enables flow control
USART_HANDSHAKE_MODE_SIMPLEX	Enables simplex mode communication, no flow control

Remarks

None.

5.6.25.5.5.3 USART_LINECONTROL_MODE Enumeration

C

```
typedef enum {  
    USART_8N1,  
    USART_8E1,  
    USART_8O1,  
    USART_8N2,  
    USART_8E2,  
    USART_8O2,  
    USART_9N1,  
    USART_9N2  
} USART_LINECONTROL_MODE;
```

Description

Data Flow configuration

This data type defines the different configurations by which the USART can be configured for the data flow.

Members

Members	Description
USART_8N1	8 Data Bits, No Parity,one Stop Bit
USART_8E1	8 Data Bits, Even Parity, 1 stop bit
USART_8O1	8 Data Bits, odd Parity, 1 stop bit
USART_8N2	8 Data Bits, No Parity,two Stop Bits
USART_8E2	8 Data Bits, Even Parity, 2 stop bits
USART_8O2	8 Data Bits, odd Parity, 2 stop bits
USART_9N1	9 Data Bits, No Parity, 1 stop bit
USART_9N2	9 Data Bits, No Parity, 2 stop bits

Remarks

None.

5.6.25.5.5.4 USART_MODULE_ID Enumeration**C**

```
typedef enum {
    USART_ID_1,
    USART_ID_2,
    USART_ID_3,
    USART_ID_4,
    USART_ID_5,
    USART_ID_6,
    USART_NUMBER_OF_MODULES
} USART_MODULE_ID;
```

Description

Enumeration: USART_MODULE_ID

This enumeration defines the number of modules that are available on the microcontroller. This is the superset of all of the possible instances that might be available on Microchip microcontrollers.

Refer to the data sheet to get the correct number of modules defined for desired microcontroller.

Members

Members	Description
USART_ID_1	USART 1
USART_ID_2	USART 2
USART_ID_3	USART 3
USART_ID_4	USART 4
USART_ID_5	USART 5
USART_ID_6	USART 6
USART_NUMBER_OF_MODULES	Total number of USART modules available

5.6.25.5.5.5 USART_OPERATION_MODE Enumeration

C

```
typedef enum {
    USART_ENABLE_TX_RX_BCLK_USED,
    USART_ENABLE_TX_RX_CTS_RTS_USED,
    USART_ENABLE_TX_RX_RTS_USED,
    USART_ENABLE_TX_RX_USED
} USART_OPERATION_MODE;
```

Description

Enable configuration

This data type defines the different configurations by which the USART can be enabled.

Members

Members	Description
USART_ENABLE_TX_RX_BCLK_USED	TX, RX and BCLK pins are used by USART module
USART_ENABLE_TX_RX_CTS_RTS_USED	TX, RX, CTS and RTS pins are used by USART module
USART_ENABLE_TX_RX_RTS_USED	TX, RX and RTS pins are used by USART module
USART_ENABLE_TX_RX_USED	TX and RX pins are used by USART module

Remarks

The actual definition of this enumeration is device-specific.

5.6.25.5.5.6 USART_RECEIVE_INTR_MODE Enumeration

C

```
typedef enum {
    USART_RECEIVE_FIFO_HALF_FULL,
    USART_RECEIVE_FIFO_3B4FULL,
    USART_RECEIVE_FIFO_ONE_CHAR
} USART_RECEIVE_INTR_MODE;
```

Description

Receive Interrupt mode configuration

This data type defining the different Receive FIFO levels by which the USART receive interrupt modes can be configured.

Members

Members	Description
USART_RECEIVE_FIFO_HALF_FULL	Interrupt when receive buffer is half full
USART_RECEIVE_FIFO_3B4FULL	Interrupt when receive buffer is 3/4 full
USART_RECEIVE_FIFO_ONE_CHAR	Interrupt when a character is received

Remarks

None.

5.6.25.5.5.7 USART_RECEIVE_MODES Enumeration

C

```
typedef enum {
    USART_RECEIVE_MODE_CONTINUOUS,
    USART_RECEIVE_MODE_SINGLE,
```

```
    USART_RECEIVE_MODES_NONE
} USART_RECEIVE_MODES;
```

Description

/* USART Receive modes

This enumeration lists the USART receive modes.

Members

Members	Description
USART_RECEIVE_MODE_CONTINUOUS	Continuous Receive mode
USART_RECEIVE_MODE_SINGLE	Single Receive mode
USART_RECEIVE_MODES_NONE	No Receive mode

Remarks

This enumeration may not exist for all devices.

5.6.25.5.5.8 USART_SYNC_CLOCK_SOURCE Enumeration**C**

```
typedef enum {
    USART_SYNC_CLOCK_SOURCE_MASTER,
    USART_SYNC_CLOCK_SOURCE_SLAVE
} USART_SYNC_CLOCK_SOURCE;
```

Description

/* USART Clock sources

This enumeration lists the USART clock sources.

Members

Members	Description
USART_SYNC_CLOCK_SOURCE_MASTER	USART clock source is from master
USART_SYNC_CLOCK_SOURCE_SLAVE	USART clock source is from slave

Remarks

None.

5.6.25.5.5.9 USART_SYNC_MODES Enumeration**C**

```
typedef enum {
    USART_ASYNC_MODE,
    USART_SYNC_MODE
} USART_SYNC_MODES;
```

Description

/* USART Synchronisation Modes

Lists enumerations selecting asynchronous communication or synchronous communication.

Members

Members	Description
USART_ASYNC_MODE	Normal UART. Asynchronous
USART_SYNC_MODE	Synchronous

Remarks

This enumeration is not used for devices which does not have the synchronous communication option (i.e., always asynchronous).

5.6.25.5.10 USART_TRANSMIT_INTR_MODE Enumeration**C**

```
typedef enum {
    USART_TRANSMIT_FIFO_EMPTY,
    USART_TRANSMIT_FIFO_FULL,
    USART_TRANSMIT_FIFO_IDLE,
    USART_TRANSMIT_FIFO_NOT_FULL
} USART_TRANSMIT_INTR_MODE;
```

Description

/* Transmit Interrupt mode configuration

This data type defining the different transmit FIFO levels by which the USART transmit interrupt modes can be configured.

Members

Members	Description
USART_TRANSMIT_FIFO_EMPTY	Interrupt when the transmit buffer becomes empty
USART_TRANSMIT_FIFO_FULL	Interrupt when the last transmission is over and all transmit operations are completed
USART_TRANSMIT_FIFO_IDLE	Interrupt when all characters are transmitted
USART_TRANSMIT_FIFO_NOT_FULL	Interrupt when atleast one location is empty in the transmit buffer

Remarks

None.

5.6.25.5.6 Feature Existence Functions**5.6.25.5.6.1 PLIB_USART_ExistsAlternateIO Function****C**

```
bool PLIB_USART_ExistsAlternateIO(
    USART_MODULE_ID index
);
```

Description

This function identifies whether the AlternateIOEnableControl feature is available on the USART module. When this function returns true, these functions are supported on the device:

- [PLIB_USART_AlternateIOEnable](#)
- [PLIB_USART_AlternateIODisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The AlternateIOEnableControl feature is supported on the device
- false - The AlternateIOEnableControl feature is not supported on the device

Remarks

None.

5.6.25.5.6.2 PLIB_USART_ExistsBaudRate Function**C**

```
bool PLIB_USART_ExistsBaudRate(  
    USART_MODULE_ID index  
);
```

Description

This function identifies whether the BaudRate feature is available on the USART module. When this function returns true, these functions are supported on the device:

- [PLIB_USART_BaudRateSet](#)
- [PLIB_USART_BaudRateGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The BaudRate feature is supported on the device
- false - The BaudRate feature is not supported on the device

Remarks

None.

5.6.25.5.6.3 PLIB_USART_ExistsBaudRateAutoDetect Function**C**

```
bool PLIB_USART_ExistsBaudRateAutoDetect(  
    USART_MODULE_ID index  
);
```

Description

This function identifies whether the BaudRateAutoDetect feature is available on the USART module. When this function returns true, these functions are supported on the device:

- [PLIB_USART_BaudRateAutoDetectEnable](#)
- [PLIB_USART_BaudRateAutoDetectIsComplete](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The BaudRateAutoDetect feature is supported on the device
- false - The BaudRateAutoDetect feature is not supported on the device

Remarks

None.

5.6.25.5.6.4 PLIB_USART_ExistsBaudRateAutoDetectOverflow Function**C**

```
bool PLIB_USART_ExistsBaudRateAutoDetectOverflow(  
    USART_MODULE_ID index  
);
```

Description

This function identifies whether the BaudRateAutoDetectOverflow feature is available on the USART module. When this function returns true, this function is supported on the device:

- [PLIB_USART_BaudRateAutoDetectOverflowHasOccurred](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The BaudRateAutoDetectOverflow feature is supported on the device
- false - The BaudRateAutoDetectOverflow feature is not supported on the device

Remarks

None.

5.6.25.5.6.5 PLIB_USART_ExistsBaudRateBitMode Function**C**

```
bool PLIB_USART_ExistsBaudRateBitMode(  
    USART_MODULE_ID index  
);
```

Description

This function identifies whether the BaudRateMode feature is available on the USART module. When this function returns true, this function is supported on the device:

- [PLIB_USART_BaudRateModeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The BaudRateMode feature is supported on the device
- false - The BaudRateMode feature is not supported on the device

Remarks

None.

5.6.25.5.6.6 PLIB_USART_ExistsBaudRateHigh Function**C**

```
bool PLIB_USART_ExistsBaudRateHigh(  
    USART_MODULE_ID index  
);
```

Description

This function identifies whether the BaudRateHigh feature is available on the USART module. When this function returns true, these functions are supported on the device:

- [PLIB_USART_BaudRateHighSet](#)
- [PLIB_USART_BaudRateHighDisable](#)
- [PLIB_USART_BaudRateHighEnable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The BaudRateHigh feature is supported on the device
- false - The BaudRateHigh feature is not supported on the device

Remarks

None.

5.6.25.5.6.7 PLIB_USART_ExistsEnable Function**C**

```
bool PLIB_USART_ExistsEnable(  
    USART_MODULE_ID index  
);
```

Description

This function identifies whether the EnableControl feature is available on the USART module. When this function returns true, these functions are supported on the device:

- [PLIB_USART_Disable](#)

- [PLIB_USART_Enable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The EnableControl feature is supported on the device
- false - The EnableControl feature is not supported on the device

Remarks

None.

5.6.25.5.6.8 PLIB_USART_ExistsHandshakeMode Function

C

```
bool PLIB_USART_ExistsHandshakeMode(  
    USART_MODULE_ID index  
);
```

Description

This function identifies whether the HandShakeMode feature is available on the USART module. When this function returns true, this function is supported on the device:

- [PLIB_USART_HandshakeModeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The HandShakeMode feature is supported on the device
- false - The HandShakeMode feature is not supported on the device

Remarks

None.

5.6.25.5.6.9 PLIB_USART_ExistsIrDA Function

C

```
bool PLIB_USART_ExistsIrDA(  
    USART_MODULE_ID index  
);
```

Description

This function identifies whether the IrDAControl feature is available on the USART module. When this function returns true, these functions are supported on the device:

- [PLIB_USART_IrDADisable](#)

- [PLIB_USART_IrDAEnable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The IrDAControl feature is supported on the device
- false - The IrDAControl feature is not supported on the device

Remarks

None.

5.6.25.5.6.10 PLIB_USART_ExistsLineControlMode Function

C

```
bool PLIB_USART_ExistsLineControlMode(  
    USART_MODULE_ID index  
);
```

Description

This function identifies whether the LineControlMode feature is available on the USART module. When this function returns true, this function is supported on the device:

- [PLIB_USART_LineControlModeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The LineControlMode feature is supported on the device
- false - The LineControlMode feature is not supported on the device

Remarks

None.

5.6.25.5.6.11 PLIB_USART_ExistsLoopback Function

C

```
bool PLIB_USART_ExistsLoopback(  
    USART_MODULE_ID index  
);
```

Description

This function identifies whether the Loopback feature is available on the USART module. When this function returns true, these functions are supported on the device:

- [PLIB_USART_LoopbackEnable](#)

- [PLIB_USART_LoopbackDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The Loopback feature is supported on the device
- false - The Loopback feature is not supported on the device

Remarks

None.

5.6.25.5.6.12 PLIB_USART_ExistsOperationMode Function**C**

```
bool PLIB_USART_ExistsOperationMode(  
    USART_MODULE_ID index  
);
```

Description

This function identifies whether the OperationMode feature is available on the USART module. When this function returns true, this function is supported on the device:

- [PLIB_USART_OperationModeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The OperationMode feature is supported on the device
- false - The OperationMode feature is not supported on the device

Remarks

None.

5.6.25.5.6.13 PLIB_USART_ExistsReceiver Function**C**

```
bool PLIB_USART_ExistsReceiver(  
    USART_MODULE_ID index  
);
```

Description

This function identifies whether the Receiver feature is available on the USART module. When this function returns true, this function is supported on the device:

- [PLIB_USART_ReceiverByteReceive](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The Receiver feature is supported on the device
- false - The Receiver feature is not supported on the device

Remarks

None.

5.6.25.5.6.14 PLIB_USART_ExistsReceiverAddressAutoDetect Function**C**

```
bool PLIB_USART_ExistsReceiverAddressAutoDetect(  
    USART_MODULE_ID index  
);
```

Description

This function identifies whether the ReceiverAddressAutoDetect feature is available on the USART module. When this function returns true, these functions are supported on the device:

- [PLIB_USART_ReceiverAddressAutoDetectEnable](#)
- [PLIB_USART_ReceiverAddressAutoDetectDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ReceiverAddressAutoDetect feature is supported on the device
- false - The ReceiverAddressAutoDetect feature is not supported on the device

Remarks

None.

5.6.25.5.6.15 PLIB_USART_ExistsReceiverAddressDetect Function**C**

```
bool PLIB_USART_ExistsReceiverAddressDetect(  
    USART_MODULE_ID index  
);
```

Description

This function identifies whether the ReceiverAddressDetect feature is available on the USART module. When this function returns true, these functions are supported on the device:

- [PLIB_USART_ReceiverAddressDetectEnable](#)
- [PLIB_USART_ReceiverAddressDetectDisable](#)
- [PLIB_USART_ReceiverAddressIsReceived](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ReceiverAddressDetect feature is supported on the device
- false - The ReceiverAddressDetect feature is not supported on the device

Remarks

None.

5.6.25.5.6.16 PLIB_USART_ExistsReceiverDataAvailableStatus Function**C**

```
bool PLIB_USART_ExistsReceiverDataAvailableStatus(  
    USART_MODULE_ID index  
);
```

Description

This function identifies whether the ReceiverDataAvailable feature is available on the USART module. When this function returns true, this function is supported on the device:

- [PLIB_USART_ReceiverDataIsAvailable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ReceiverDataAvailable feature is supported on the device
- false - The ReceiverDataAvailable feature is not supported on the device

Remarks

None.

5.6.25.5.6.17 PLIB_USART_ExistsReceiverEnable Function**C**

```
bool PLIB_USART_ExistsReceiverEnable(  
    USART_MODULE_ID index  
);
```

Description

This function identifies whether the ReceiverEnableControl feature is available on the USART module. When this function returns true, these functions are supported on the device:

- [PLIB_USART_ReceiverEnable](#)
- [PLIB_USART_ReceiverDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ReceiverEnableControl feature is supported on the device
- false - The ReceiverEnableControl feature is not supported on the device

Remarks

None.

5.6.25.5.6.18 PLIB_USART_ExistsReceiverFramingErrorStatus Function**C**

```
bool PLIB_USART_ExistsReceiverFramingErrorStatus(  
    USART_MODULE_ID index  
);
```

Description

This function identifies whether the ReceiverFramingError feature is available on the USART module. When this function returns true, this function is supported on the device:

- [PLIB_USART_ReceiverFramingErrorHasOccurred](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ReceiverFramingError feature is supported on the device
- false - The ReceiverFramingError feature is not supported on the device

Remarks

None.

5.6.25.5.6.19 PLIB_USART_ExistsReceiverIdleStateLowEnable Function**C**

```
bool PLIB_USART_ExistsReceiverIdleStateLowEnable(  
    USART_MODULE_ID index
```

```
);
```

Description

This function identifies whether the ReceiverPolarityInvert feature is available on the USART module. When this function returns true, these functions are supported on the device:

- [PLIB_USART_ReceiverIdleStateLowEnable](#)
- [PLIB_USART_ReceiverIdleStateLowDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ReceiverPolarityInvert feature is supported on the device
- false - The ReceiverPolarityInvert feature is not supported on the device

Remarks

None.

5.6.25.5.6.20 PLIB_USART_ExistsReceiverIdleStatus Function**C**

```
bool PLIB_USART_ExistsReceiverIdleStatus(  
    USART_MODULE_ID index  
);
```

Description

This function identifies whether the ReceiverIdle feature is available on the USART module. When this function returns true, this function is supported on the device:

- [PLIB_USART_ReceiverIdle](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ReceiverIdle feature is supported on the device
- false - The ReceiverIdle feature is not supported on the device

Remarks

None.

5.6.25.5.6.21 PLIB_USART_ExistsReceiverInterruptMode Function**C**

```
bool PLIB_USART_ExistsReceiverInterruptMode(  

```

```
    USART_MODULE_ID index
);
```

Description

This function identifies whether the ReceiverInterruptMode feature is available on the USART module. When this function returns true, this function is supported on the device:

- [PLIB_USART_ReceiverInterruptModeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ReceiverInterruptMode feature is supported on the device
- false - The ReceiverInterruptMode feature is not supported on the device

Remarks

None.

5.6.25.5.6.22 PLIB_USART_ExistsReceiverMode Function

C

```
bool PLIB_USART_ExistsReceiverMode(
    USART_MODULE_ID index
);
```

Description

This function identifies whether the ReceiverMode feature is available on the USART module. When this function returns true, this function is supported on the device:

- [PLIB_USART_ReceiverModeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ReceiverMode feature is supported on the device
- false - The ReceiverMode feature is not supported on the device

Remarks

None.

5.6.25.5.6.23 PLIB_USART_ExistsReceiverOverrunStatus Function

C

```
bool PLIB_USART_ExistsReceiverOverrunStatus(
    USART_MODULE_ID index
);
```

```
);
```

Description

This function identifies whether the ReceiverOverrunError feature is available on the USART module. When this function returns true, these functions are supported on the device:

- [PLIB_USART_ReceiverOverrunErrorClear](#)
- [PLIB_USART_ReceiverOverrunHasOccurred](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ReceiverOverrunError feature is supported on the device
- false - The ReceiverOverrunError feature is not supported on the device

Remarks

None.

5.6.25.5.6.24 PLIB_USART_ExistsReceiverParityErrorStatus Function

C

```
bool PLIB_USART_ExistsReceiverParityErrorStatus(  
    USART_MODULE_ID index  
);
```

Description

This function identifies whether the ReceiverParityError feature is available on the USART module. When this function returns true, this function is supported on the device:

- [PLIB_USART_ReceiverParityErrorHasOccurred](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ReceiverParityError feature is supported on the device
- false - The ReceiverParityError feature is not supported on the device

Remarks

None.

5.6.25.5.6.25 PLIB_USART_ExistsStopInIdle Function

C

```
bool PLIB_USART_ExistsStopInIdle(  

```

```
    USART_MODULE_ID index
);
```

Description

This function identifies whether the StopInIdle feature is available on the USART module. When this function returns true, these functions are supported on the device:

- [PLIB_USART_StopInIdleEnable](#)
- [PLIB_USART_StopInIdleDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The StopInIdle feature is supported on the device
- false - The StopInIdle feature is not supported on the device

Remarks

None.

5.6.25.5.6.26 PLIB_USART_ExistsSyncClockPolarity Function

C

```
bool PLIB_USART_ExistsSyncClockPolarity(
    USART_MODULE_ID index
);
```

Description

This function identifies whether the SyncClockPolarity feature is available on the USART module. When this function returns true, these functions are supported on the device:

- [PLIB_USART_SyncClockPolarityIdleHighDisable](#)
- [PLIB_USART_SyncClockPolarityIdleHighEnable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The SyncClockPolarity feature is supported on the device
- false - The SyncClockPolarity feature is not supported on the device

Remarks

None.

5.6.25.5.6.27 PLIB_USART_ExistsSyncClockSource Function

C

```
bool PLIB_USART_ExistsSyncClockSource(  
    USART_MODULE_ID index  
);
```

Description

This function identifies whether the SyncClockSource feature is available on the USART module. When this function returns true, this function is supported on the device:

- [PLIB_USART_SyncClockSourceSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The SyncClockSource feature is supported on the device
- false - The SyncClockSource feature is not supported on the device

Remarks

None.

5.6.25.5.6.28 PLIB_USART_ExistsSyncMode Function

C

```
bool PLIB_USART_ExistsSyncMode(  
    USART_MODULE_ID index  
);
```

Description

This function identifies whether the SyncMode feature is available on the USART module. When this function returns true, this function is supported on the device:

- [PLIB_USART_SyncModeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The SyncMode feature is supported on the device
- false - The SyncMode feature is not supported on the device

Remarks

None.

5.6.25.5.6.29 PLIB_USART_ExistsTransmitter Function

C

```
bool PLIB_USART_ExistsTransmitter(  
    USART_MODULE_ID index  
);
```

Description

This function identifies whether the Transmitter feature is available on the USART module. When this function returns true, this function is supported on the device:

- [PLIB_USART_TransmitterByteSend](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The Transmitter feature is supported on the device
- false - The Transmitter feature is not supported on the device

Remarks

None.

5.6.25.5.6.30 PLIB_USART_ExistsTransmitter9BitsSend Function

C

```
bool PLIB_USART_ExistsTransmitter9BitsSend(  
    USART_MODULE_ID index  
);
```

Description

This function identifies whether the Transmitter9Bits feature is available on the USART module. When this function returns true, this function is supported on the device:

- [PLIB_USART_Transmitter9BitsSend](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The Transmitter9Bits feature is supported on the device
- false - The Transmitter9Bits feature is not supported on the device

Remarks

None.

5.6.25.5.6.31 PLIB_USART_ExistsTransmitterBreak Function

C

```
bool PLIB_USART_ExistsTransmitterBreak(  
    USART_MODULE_ID index  
);
```

Description

This function identifies whether the TransmitterBreak feature is available on the USART module. When this function returns true, these functions are supported on the device:

- [PLIB_USART_TransmitterBreakSend](#)
- [PLIB_USART_TransmitterBreakSendIsComplete](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The TransmitterBreak feature is supported on the device
- false - The TransmitterBreak feature is not supported on the device

Remarks

None.

5.6.25.5.6.32 PLIB_USART_ExistsTransmitterBufferFullStatus Function

C

```
bool PLIB_USART_ExistsTransmitterBufferFullStatus(  
    USART_MODULE_ID index  
);
```

Description

This function identifies whether the TransmitterBufferFull feature is available on the USART module. When this function returns true, these functions are supported on the device:

- [PLIB_USART_TransmitterBufferIsFull](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The TransmitterBufferFull feature is supported on the device
- false - The TransmitterBufferFull feature is not supported on the device

Remarks

None.

5.6.25.5.6.33 PLIB_USART_ExistsTransmitterEmptyStatus Function

C

```
bool PLIB_USART_ExistsTransmitterEmptyStatus(  
    USART_MODULE_ID index  
);
```

Description

This function identifies whether the TransmitterEmpty feature is available on the USART module. When this function returns true, these functions are supported on the device:

- [PLIB_USART_TransmitterIsEmpty](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The TransmitterEmpty feature is supported on the device
- false - The TransmitterEmpty feature is not supported on the device

Remarks

None.

5.6.25.5.6.34 PLIB_USART_ExistsTransmitterEnable Function

C

```
bool PLIB_USART_ExistsTransmitterEnable(  
    USART_MODULE_ID index  
);
```

Description

This function identifies whether the TransmitterEnableControl feature is available on the USART module. When this function returns true, these functions are supported on the device:

- [PLIB_USART_TransmitterEnable](#)
- [PLIB_USART_TransmitterDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The TransmitterEnableControl feature is supported on the device
- false - The TransmitterEnableControl feature is not supported on the device

Remarks

None.

5.6.25.5.6.35 PLIB_USART_ExistsTransmitterIdleIsLow Function

C

```
bool PLIB_USART_ExistsTransmitterIdleIsLow(  
    USART_MODULE_ID index  
);
```

Description

This function identifies whether the TransmitterIdleIsLow feature is available on the USART module. When this function returns true, these functions are supported on the device:

- [PLIB_USART_TransmitterIdleIsLowDisable](#)
- [PLIB_USART_TransmitterIdleIsLowEnable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The TransmitterIdleIsLow feature is supported on the device
- false - The TransmitterIdleIsLow feature is not supported on the device

Remarks

None.

5.6.25.5.6.36 PLIB_USART_ExistsTransmitterIdleStatus Function

C

```
bool PLIB_USART_ExistsTransmitterIdleStatus(  
    USART_MODULE_ID index  
);
```

Description

This function identifies whether the TransmitterIdle feature is available on the USART module. When this function returns true, this function is supported on the device:

- [PLIB_USART_TransmitterIdle](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The TransmitterIdle feature is supported on the device
- false - The TransmitterIdle feature is not supported on the device

Remarks

None.

5.6.25.5.6.37 PLIB_USART_ExistsTransmitterInterruptMode Function

C

```
bool PLIB_USART_ExistsTransmitterInterruptMode(  
    USART_MODULE_ID index  
);
```

Description

This function identifies whether the TransmitterInterruptMode feature is available on the USART module. When this function returns true, this function is supported on the device:

- [PLIB_USART_TransmitterInterruptModeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The TransmitterInterruptMode feature is supported on the device
- false - The TransmitterInterruptMode feature is not supported on the device

Remarks

None.

5.6.25.5.6.38 PLIB_USART_ExistsWakeOnStart Function

C

```
bool PLIB_USART_ExistsWakeOnStart(  
    USART_MODULE_ID index  
);
```

Description

This function identifies whether the WakeOnStart feature is available on the USART module. When this function returns true, these functions are supported on the device:

- [PLIB_USART_WakeOnStartEnable](#)
- [PLIB_USART_WakeOnStartDisable](#)
- [PLIB_USART_WakeOnStartIsEnabled](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The WakeOnStart feature is supported on the device
- false - The WakeOnStart feature is not supported on the device

Remarks

None.

USART Peripheral Library Interface Header

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the USART Peripheral Library for all families of Microchip microcontrollers. The functions in this file are common to the USART module.

Functions

	Name	Description
≡	PLIB_USART_AlternateIODisable	Disables the use of alternate I/O pins for the receiver and transmitter.
≡	PLIB_USART_AlternateIOEnable	Enables the use of alternate I/O pins for the receiver and transmitter.
≡	PLIB_USART_BaudRateAutoDetectEnable	Enables baud rate measurement on the next character, which requires reception of the Sync character.
≡	PLIB_USART_BaudRateAutoDetectIsComplete	Gets the state of the automatic baud detection.
≡	PLIB_USART_BaudRateAutoDetectOverflowHasOccurred	Identifies if the automatic baud timer has overflowed.
≡	PLIB_USART_BaudRateGet	Gets the baud rate current in use.
≡	PLIB_USART_BaudRateHighDisable	Disables the high baud rate selection.
≡	PLIB_USART_BaudRateHighEnable	Enables high baud rate selection.
≡	PLIB_USART_BaudRateHighSet	Sets the baud rate to the desired value.
≡	PLIB_USART_BaudRateModeSelect	Enables the 16-bit Baud Rate Generator (BRG).
≡	PLIB_USART_BaudRateSet	Sets the baud rate to the desired value.
≡	PLIB_USART_Disable	Disables the specific USART module
≡	PLIB_USART_Enable	Enables the specific USART module.
≡	PLIB_USART_ExistsAlternateIO	Identifies whether the AlternateIOEnableControl feature exists on the USART module.
≡	PLIB_USART_ExistsBaudRate	Identifies whether the BaudRate feature exists on the USART module.
≡	PLIB_USART_ExistsBaudRateAutoDetect	Identifies whether the BaudRateAutoDetect feature exists on the USART module.
≡	PLIB_USART_ExistsBaudRateAutoDetectOverflow	Identifies whether the BaudRateAutoDetectOverflow feature exists on the USART module.

	<u>PLIB_USART_ExistsBaudRateBitMode</u>	Identifies whether the BaudRateMode feature exists on the USART module.
	<u>PLIB_USART_ExistsBaudRateHigh</u>	Identifies whether the BaudRateHigh feature exists on the USART module.
	<u>PLIB_USART_ExistsEnable</u>	Identifies whether the EnableControl feature exists on the USART module.
	<u>PLIB_USART_ExistsHandshakeMode</u>	Identifies whether the HandShakeMode feature exists on the USART module.
	<u>PLIB_USART_ExistsIrDA</u>	Identifies whether the IrDAControl feature exists on the USART module.
	<u>PLIB_USART_ExistsLineControlMode</u>	Identifies whether the LineControlMode feature exists on the USART module.
	<u>PLIB_USART_ExistsLoopback</u>	Identifies whether the Loopback feature exists on the USART module.
	<u>PLIB_USART_ExistsOperationMode</u>	Identifies whether the OperationMode feature exists on the USART module.
	<u>PLIB_USART_ExistsReceiver</u>	Identifies whether the Receiver feature exists on the USART module.
	<u>PLIB_USART_ExistsReceiverAddressAutoDetect</u>	Identifies whether the ReceiverAddressAutoDetect feature exists on the USART module.
	<u>PLIB_USART_ExistsReceiverAddressDetect</u>	Identifies whether the ReceiverAddressDetect feature exists on the USART module.
	<u>PLIB_USART_ExistsReceiverDataAvailableStatus</u>	Identifies whether the ReceiverDataAvailable feature exists on the USART module.
	<u>PLIB_USART_ExistsReceiverEnable</u>	Identifies whether the ReceiverEnableControl feature exists on the USART module.
	<u>PLIB_USART_ExistsReceiverFramingErrorStatus</u>	Identifies whether the ReceiverFramingError feature exists on the USART module.
	<u>PLIB_USART_ExistsReceiverIdleStateLowEnable</u>	Identifies whether the ReceiverPolarityInvert feature exists on the USART module.
	<u>PLIB_USART_ExistsReceiverIdleStatus</u>	Identifies whether the ReceiverIdle feature exists on the USART module.
	<u>PLIB_USART_ExistsReceiverInterruptMode</u>	Identifies whether the ReceiverInterruptMode feature exists on the USART module.
	<u>PLIB_USART_ExistsReceiverMode</u>	Identifies whether the ReceiverMode feature exists on the USART module.
	<u>PLIB_USART_ExistsReceiverOverrunStatus</u>	Identifies whether the ReceiverOverrunError feature exists on the USART module.
	<u>PLIB_USART_ExistsReceiverParityErrorStatus</u>	Identifies whether the ReceiverParityError feature exists on the USART module.
	<u>PLIB_USART_ExistsStopInIdle</u>	Identifies whether the StopInIdle feature exists on the USART module.
	<u>PLIB_USART_ExistsSyncClockPolarity</u>	Identifies whether the SyncClockPolarity feature exists on the USART module.
	<u>PLIB_USART_ExistsSyncClockSource</u>	Identifies whether the SyncClockSource feature exists on the USART module.
	<u>PLIB_USART_ExistsSyncMode</u>	Identifies whether the SyncMode feature exists on the USART module.
	<u>PLIB_USART_ExistsTransmitter</u>	Identifies whether the Transmitter feature exists on the USART module.
	<u>PLIB_USART_ExistsTransmitter9BitsSend</u>	Identifies whether the Transmitter9Bits feature exists on the USART module.

	<u>PLIB_USART_ExistsTransmitterBreak</u>	Identifies whether the TransmitterBreak feature exists on the USART module.
	<u>PLIB_USART_ExistsTransmitterBufferFullStatus</u>	Identifies whether the TransmitterBufferFull feature exists on the USART module.
	<u>PLIB_USART_ExistsTransmitterEmptyStatus</u>	Identifies whether the TransmitterEmpty feature exists on the USART module.
	<u>PLIB_USART_ExistsTransmitterEnable</u>	Identifies whether the TransmitterEnableControl feature exists on the USART module.
	<u>PLIB_USART_ExistsTransmitterIdleLow</u>	Identifies whether the TransmitterIdleLow feature exists on the USART module.
	<u>PLIB_USART_ExistsTransmitterIdleStatus</u>	Identifies whether the TransmitterIdle feature exists on the USART module.
	<u>PLIB_USART_ExistsTransmitterInterruptMode</u>	Identifies whether the TransmitterInterruptMode feature exists on the USART module.
	<u>PLIB_USART_ExistsWakeOnStart</u>	Identifies whether the WakeOnStart feature exists on the USART module.
	<u>PLIB_USART_HandshakeModeSelect</u>	Sets the data flow configuration.
	<u>PLIB_USART_IrDADisable</u>	Disables the IrDA encoder and decoder.
	<u>PLIB_USART_IrDAEnable</u>	Enables the IrDA encoder and decoder.
	<u>PLIB_USART_LineControlModeSelect</u>	Sets the data flow configuration.
	<u>PLIB_USART_LoopbackDisable</u>	Disables Loopback mode.
	<u>PLIB_USART_LoopbackEnable</u>	Enables Loopback mode.
	<u>PLIB_USART_OperationModeSelect</u>	Configures the operation mode of the USART module.
	<u>PLIB_USART_ReceiverAddressAutoDetectDisable</u>	Disables the automatic Address Detect mode.
	<u>PLIB_USART_ReceiverAddressAutoDetectEnable</u>	Setup the automatic Address Detect mode.
	<u>PLIB_USART_ReceiverAddressDetectDisable</u>	Enables the Address Detect mode.
	<u>PLIB_USART_ReceiverAddressDetectEnable</u>	Enables the Address Detect mode.
	<u>PLIB_USART_ReceiverAddressIsReceived</u>	Checks and return if the data received is an address.
	<u>PLIB_USART_ReceiverByteReceive</u>	Data to be received in the Byte mode.
	<u>PLIB_USART_ReceiverDataIsAvailable</u>	Identifies if the receive data is available for the specified USART module.
	<u>PLIB_USART_ReceiverDisable</u>	Disables the USART receiver.
	<u>PLIB_USART_ReceiverEnable</u>	Enables the USART receiver.
	<u>PLIB_USART_ReceiverFramingErrorHasOccurred</u>	Gets the framing error status.
	<u>PLIB_USART_ReceiverIdleStateLowDisable</u>	Disables receive polarity inversion.
	<u>PLIB_USART_ReceiverIdleStateLowEnable</u>	Enables receive polarity inversion.
	<u>PLIB_USART_ReceiverInterruptModeSelect</u>	Sets the USART receiver FIFO level.
	<u>PLIB_USART_ReceiverIsIdle</u>	Identifies if the receiver is idle.
	<u>PLIB_USART_ReceiverModeSelect</u>	Disables Single Receive mode.
	<u>PLIB_USART_ReceiverOverrunErrorClear</u>	Clears a USART Overrun error.
	<u>PLIB_USART_ReceiverOverrunHasOccurred</u>	Identifies if there was a receiver overrun error.
	<u>PLIB_USART_ReceiverParityErrorHasOccurred</u>	Gets the parity error status.
	<u>PLIB_USART_StopInIdleDisable</u>	Disables the Stop in Idle mode (the USART module continues operation when the device is in Idle mode).
	<u>PLIB_USART_StopInIdleEnable</u>	Discontinues operation when the device enters Idle mode.
	<u>PLIB_USART_SyncClockPolarityIdleHighDisable</u>	Sets the idle state of the clock to low.
	<u>PLIB_USART_SyncClockPolarityIdleHighEnable</u>	Sets the idle state of the clock to high.

	PLIB_USART_SyncClockSourceSelect	Sets the clock source.
	PLIB_USART_SyncModeSelect	Selects the USART mode to be asynchronous.
	PLIB_USART_Transmitter9BitsSend	Data to be transmitted in the byte mode with the 9th bit.
	PLIB_USART_TransmitterBreakSend	Transmits the break character.
	PLIB_USART_TransmitterBreakSendIsComplete	Returns the status of the break transmission
	PLIB_USART_TransmitterBufferIsFull	Gets the transmit buffer full status.
	PLIB_USART_TransmitterByteSend	Data to be transmitted in the Byte mode.
	PLIB_USART_TransmitterDisable	Disables the specific USART module transmitter.
	PLIB_USART_TransmitterEnable	Enables the specific USART module transmitter.
	PLIB_USART_TransmitterIdleIsLowDisable	Disables the Transmit Idle Low state.
	PLIB_USART_TransmitterIdleIsLowEnable	Enables the Transmit Idle Low state.
	PLIB_USART_TransmitterInterruptModeSelect	Set the USART transmitter interrupt mode.
	PLIB_USART_TransmitterIsEmpty	Gets the transmit shift register empty status.
	PLIB_USART_TransmitterIsIdle	Gets the transmit buffer full status.
	PLIB_USART_WakeOnStartDisable	Disables the wake-up on start bit detection feature during Sleep mode.
	PLIB_USART_WakeOnStartEnable	Enables the wake-up on start bit detection feature during Sleep mode.
	PLIB_USART_WakeOnStartIsEnabled	Gets the state of the sync break event completion.

5.6.26 USB Peripheral Library

5.6.26.1 Introduction

This library provides a low-level abstraction of the USB module on Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, thus hiding differences from one microcontroller variant to another.

Description

USB Peripheral Library for Microchip Microcontrollers

USB Overview

USB is an asynchronous serial interface with a tiered star configuration. USB is implemented as a master/slave configuration. On a given bus, there can be multiple (up to 127) slaves (devices), but there is only one master (host). There are three possible module implementations: host, device and OTG dual role. The user should have an understanding of the USB documents available on the USB implementers web site (www.usb.org).

Device

The USB device accepts data from the host and responds to requests for data. It performs some peripheral functions, such as a mouse or data storage device.

- Functionality may be class or vendor-specific
- Draws 100 mA or less before configuration
- Can draw up to 500 mA after successful negotiation with the host
- Can support low-speed, full-speed or hi-speed protocol. Hi-speed support requires implementation of full-speed. (*Low, Full, and Hi-Speed supported by this module.*)
- Supports control transfers. Supports data transfers required for implementation
- Optionally supports Session Request Protocol (SRP)
- Can be bus-powered or self-powered

Host

The host is the master in a USB system and is responsible for identifying all devices connected to it (enumeration), initiating all transfers, allocating bus bandwidth and supplying power to any bus-powered USB devices connected directly to it. There are two types of hosts.

USB Standard Host:

- A large variety of devices are supported
- This host supports all USB transfer types
- USB hubs are supported to allow connection of multiple devices simultaneously
- Device drivers can be updated to support new devices
- A type 'A' receptacle is used for each port
- Each port must be able to deliver a minimum of 100 mA for a configured or unconfigured

- device, and optionally, up to 500 mA for a configured device
- Full-Speed and Low-Speed must be supported. Hi-Speed can be supported.
- This is a typical personal computer implementation

Embedded Host

- Only supports a specific list of devices, referred to as a Targeted Peripheral List (TPL)
- This type of host is only required to support transfer types required by devices in the TPL
- USB hub support is optional (*Provided in this module*)
- Device drivers are not required to be pocketable
- A type 'A' receptacle is used for each port
- Only speeds required by devices in the TPL must be supported. (*Low, Full, and Hi-Speed supported by this module.*)
- Each port must be able to deliver a minimum of 100 mA for a configured or unconfigured device, and optionally, up to 500 mA for a configured device
- This is a typical implementation for a microcontroller

USB On-the-Go (OTG)

The OTG dual role device supports both USB host and device functionality. OTG dual role devices use a micro-AB receptacle. This allows a micro-A or a micro-B plug to be attached. Both the micro-A and micro-B plugs have an additional pin, the ID pin, to signify the [connect](#) type. The plug type, micro-A or micro-B, determines the default role of the OTG device, host or USB device. An OTG device will perform the role of a host when a micro-A plug is detected. When a micro-B plug is detected, the role of a USB device is performed.

When an OTG device is directly connected to another OTG device using an OTG cable, micro-A to micro-B, Host Negotiation Protocol (HNP) can be used to swap the roles of the host and USB device between the two without disconnecting and reconnecting cabling. To differentiate between the two OTG devices, the term, "A-device", is used to refer to the device connected to the micro-A plug and "B-device" is used to refer to the OTG device connected to the micro-B plug.

OTG dual role operating as a host (A-device):

- Only supports a specific list of devices, referred to as a Targeted Peripheral List (TPL). Generic class support is not allowed.
- Only required to support transaction types required by devices in the TPL
- USB hub support is optional. (*Multi-point support provided by this module.*)
- Device drivers are not required to be pocketable
- Only a single micro-AB receptacle is used
- Only full speed must be supported. Hi-Speed and/or Low-Speed can be supported. (*Low, Full, and Hi-Speed supported by this module.*)
- The USB port must be able to deliver a minimum of 8 mA for a configured or unconfigured device, and optionally, up to 500 mA for a configured device
- Supports Host Negotiation Protocol (HNP) and Session Request Protocol (SRP). The host can switch roles to become a device. The initial role as a host or device is determined by the plug type, micro-A or micro-B, inserted into the micro-AB receptacle
- The A-device supplies VBUS power, when the bus is powered, even if the roles are swapped using HNP

OTG dual role operating as a USB device (B-device):

- Class or vendor-specific functionality
- Draws 8 mA or less before configuration
- Is typically self-powered due to low-current requirements, but can draw up to 500 mA after successful negotiation with the host

- Only a single micro-AB receptacle is used
- Must support Full-Speed. Support of low speed and/or Hi-Speed is optional
- Supports control transactions. Supports data transactions required for implementation.
- Supports Session Request Protocol (SRP) and/or Host Negotiation Protocol (HNP). (*This module supports both SRP and HNP.*)
- The A-device supplies VBUS power, when the bus is powered, even if the roles are swapped using HNP

Additional Features of the Hi-Speed USB Module

- Operates either as a function controller of a Hi-Speed/Full-Speed USB device or as the host/device in a point-to-point or multi-point communications with other USB function
- Supports OTG communications with on or more Hi-Speed, Full-Speed, or Low-Speed devices
- Provides soft [connect/disconnect](#).
- In addition to Endpoint Zero, supports seven transmit and seven receive endpoints
- Dynamic FIFO sizing for Endpoints 1-7. (Endpoint Zero FIFO fixed at 64 bytes.) FIFOs use module-internal SRAM.
- Module-internal eight channel DMA with access to all FIFOs
- All host transaction scheduling supported in hardware
- Supports Link Power Management

5.6.26.2 Release Notes

MPLAB Harmony Version: v0.70b **USB PLIB Library Version :** 0.70b **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.6.26.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.6.26.4 Using the Library

This topic describes the basic architecture of the USB Peripheral Library and provides information and examples on how to use it.

Interface Header File: peripheral.h

The interface to the USB Peripheral Library is defined in the "**plib_usb.h**" header file, which is included by the "peripheral.h" peripheral library header file. Any C language source (.c) file that uses the USB Peripheral Library must include "peripheral.h".

Library File:

The USB Peripheral Library is part of the processor-specific peripheral library archive (.a) file installed with the compiler. Libraries in this archive are automatically available to the linker (in the default search path) for any project built using the Microchip compiler.

5.6.26.4.1 Hardware Abstraction Models

This section describes the hardware abstraction model for the USB Peripheral Library.

Description

Hardware Abstraction Model

Figure 1. shows the USB Module for the PIC32 family of devices.

- Note**
- 1: PB clock is only available on this pin for select EC modes.
 - 2: Pins can be used as digital inputs when USB is not enabled.
 - 3: This bit field is contained in the OSCCON register.
 - 4: This bit field is contained in the OSCSTRM register.
 - 5: USB PLL U_{FIN} requirements: $4\text{ MHz} \leq U_{FIN} \leq 5\text{ MHz}$.
 - 6: This bit field is contained in the DEVCFG2 register.
 - 7: A 48 MHz clock is required for proper USB operation.
 - 8: Pins can be used as GPIO when the USB OTG module is disabled.
 - 9: Pin is pulled high internally when USB OTG module is enabled.

Figure 1: PIC32 USB Module

The USB OTG module contains analog and digital components to provide a USB 2.0 full-speed and low-speed embedded host, full-speed device, or On-The-Go (OTG) implementation with a minimum of external components. This module in Host mode is intended for use as an embedded host and therefore does not implement a Universal Host Controller Interface (UHCI) or a Open Host Controller Interface (OHCI).

The USB OTG module consists of the clock generator, the USB voltage comparators, the transceiver, the Serial Interface Engine (SIE), a dedicated USB Bus Master, pull-up and pull-down resistors and the register interface.

The clock generator provides the 48 MHz clock, which is required for USB full-speed and low-speed communication. The voltage comparators monitor the voltage on the VBUS pin to determine the state of the bus. The transceiver provides the analog translation between the USB bus and the digital logic. The SIE is a state machine that transfers data to and from the endpoint buffers, and generates the hardware protocol for data transfers. The USB Bus Master transfers data between the data buffers in RAM and the SIE. The integrated pull-up and pull-down resistors eliminate the need for external signaling components. The register interface allows the CPU to configure and communicate with the module.

Figure 2 shows the USB module found in PIC24/dsPIC33 devices.

Figure 2: PIC24/dsPIC33 USB Module

The two implementations are nearly identical, but the PIC24/dsPIC33 USB module also supports using an external USB transceiver.

Figure 3 provides an example of a USB module on an 8-bit device.

**Figure 3: PIC18 USB Module**

5.6.26.4.2 Library Overview

This library provides the low level abstraction of the USB Peripheral on Microchip family of microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in the software and introduces the library interface.

Description

Figure 4 describes the abstraction model employed by the USB Peripheral Library.

Figure 4: USB Peripheral Library Abstraction Model

The peripheral functions are grouped together under different function groups. These application must then use a combination of function from the different function groups to achieve the desired USB peripheral operation.

Library Interface Section	Description
USB Setup Functions	This section provides functions to perform general USB peripheral setup such as functions to set USB Speed, control on-chip pull ups, etc.
Buffer Descriptor Table Functions	This section provides functions that allow the application to setup, configure and access/modify the Buffer Descriptors in the Buffer Descriptor Table.
USB Activity Functions	This section provides function that allow the application to monitor bus conditions on the USB.
USB Bus Signaling Functions	This section provides functions that allow the application to generate Reset and Resume Signaling.
Last Transaction Status Functions	This section provides functions that allow the application to query conditions of the USB peripheral.
Endpoints Functions	This section provides functions that allow the application to manage endpoints.
Interrupts Functions	This section provides functions that allow the application to enable, disable and query the status interrupts in the USB peripheral.
Host Functions	This section provides functions that are required to operate the USB module while in Host mode.

On-The-Go (OTG) Functions	This section provides functions that are required to operate the USB module while in OTG mode.
External Transceiver Support Functions	This section provides function that are required to operate to enable/disable the external transceiver interface.
VBus Support Functions	This section provides functions that allow VBUS level monitoring and VBUS boost PWM module control.
Test Support Functions	This section provides functions that enable/disable test signals needed for eye pattern measurement.

5.6.26.4.3 USB Buffers and the Buffer Descriptor Table (BDT)

This section describes USB buffers and the Buffer Descriptor Table.

Description

All USB endpoints are implemented using buffers and control bits in RAM. Both software and the USB module have access to these buffers and control bits. To arbitrate this access a semaphore flag system is used.

Each endpoint can be configured for transmit only, receive only or transmit *and* receive. Transmit and receive functions have separate buffers. For each buffer there is a Buffer Descriptor (BD) in the Buffer Descriptor Table (BDT). On most devices the BDT has room for two transmit and two receive buffers for each endpoint, supporting ping-pong buffering. Buffer descriptors must be aligned on 512 byte boundaries to enable the USB module to correctly read each entry.

The starting address of the Buffer Descriptor Table is set by the [PLIB_USB_BDTBaseAddressSet](#).

```
#define USB_MAX_EP_NUMBER 15

#define USB_PING_PONG_MODE_SELECTION  USB_PING_PONG__FULL_PING_PONG

#if (USB_PING_PONG_MODE_SELECTION == USB_PING_PONG__NO_PING_PONG)
    #define BDT_NUM_ENTRIES ((USB_MAX_EP_NUMBER + 1) * 2)
#elif (USB_PING_PONG_MODE_SELECTION == USB_PING_PONG__EP0_OUT_ONLY)
    #define BDT_NUM_ENTRIES (((USB_MAX_EP_NUMBER + 1) * 2)+1)
#elif (USB_PING_PONG_MODE_SELECTION == USB_PING_PONG__FULL_PING_PONG)
    #define BDT_NUM_ENTRIES ((USB_MAX_EP_NUMBER + 1) * 4)
#elif (USB_PING_PONG_MODE_SELECTION == USB_PING_PONG__ALL_BUT_EP0)
    #define BDT_NUM_ENTRIES (((USB_MAX_EP_NUMBER + 1) * 4)-2)
#else
    #error "No ping pong mode defined."
#endif

#if defined(__18CXX)
    #pragma udata gBDT=USB_BDT_ADDRESS
#elif defined(__PIC32MX__)
    volatile union USB_BDT_ENTRY_TAG gBDT[BDT_NUM_ENTRIES] __attribute__((aligned (512)));
#else
    volatile union USB_BDT_ENTRY_TAG gBDT[BDT_NUM_ENTRIES];
#endif//defined(__18CXX)
```

(For PIC18 devices, this isn't necessary since the BDT always starts at 0x0400 in memory.)

Each Buffer Descriptor entry in the BDT has a **bufferAddress** pointer to the Buffer Descriptor's buffer in memory (RAM or FLASH).

Figure 5 shows the structure for most PIC24 and all PIC32 devices. These devices support ping-pong buffering for all endpoints.

Figure 5: Buffer Descriptor Table and Endpoint Buffers

With 16 endpoints (Endpoints 0 - 15) there are 64 possible entries in the Buffer Descriptor Table:

```
//                                     (Even,Odd) or (Ping,Pong)
//                                     (Rx, Tx) |
//                                     (EP0 to EPn) |
volatile USB_BDT_ENTRY myBDT[(USB_MAX_EP_NUMBER + 1)][2][2] __attribute__((aligned(512)))
);
```

On PIC18F and PIC24F devices, ping-pong buffering can be disabled for all of some of the endpoints. Figure 6 shows the buffering options available for PIC24F devices and Figure 7 shows the buffering options available for PIC18F devices.

Figure 6: Buffer Descriptor Table Mapping for Various PIC24F Ping-Pong Configurations

Note: Memory area not shown to scale.

Figure 7: Buffer Descriptor Table Mapping for Various PIC18F Ping-Pong Configurations

Peripheral library functions are provided to support reading each BD while hiding the details of BDT addressing that can change when ping-pong buffering is disabled for one or more endpoints. The format of Buffer Descriptors vary from family to family and it is not important to know the differences, since peripheral library functions hide these details. To understand the information stored in each Buffer Descriptor Table entry it is informative to look at the C language description for one family of devices. (All device families support the same information but with different ways of packing the data into memory.)

For most PIC24/dsPIC33 devices and all PIC32 devices each BD is 8 bytes long and is described by this C code:

```
typedef union _USB_BDT_ENTRY __attribute__((packed))
{
    uint64_t      dValue;           //Double Long Integer Value
    uint32_t      lValue[2];        //Long Integer Values
    uint16_t      sValue[4];        //Short Integer Values
    struct __attribute__((packed))
    {
        USB_BD_STATUS  bufferStatus; //((RW) Buffer Status
        uint16_t        byteCount:10; //((RW) Byte Count
        uint8_t          : 6;         //(( ) Reserved
    }
}
```

```

        uint32_t      bufferAddress;  //(RW) Buffer Address in Data Ram or Flash
    };
} USB_BDT_ENTRY;

```

For transmit buffers **byteCount** is set to the length of the buffer using [PLIB_USB_BufferByteCountSet](#). For receive buffers [PLIB_USB_BufferByteCountSet](#) is used to set the maximum allowable receive data length. [PLIB_USB_BufferByteCountGet](#) is used to determine how many bytes were actually transmitted or received. The memory address of each buffer is found in **bufferAddress**. The functions [PLIB_USB_BufferAddressSet](#) and [PLIB_USB_BufferAddressGet](#) support this field in the Buffer Descriptor.

Buffer status is stored in the 16 least significant bits of each BDT entry:

```

typedef union _USB_BD_STATUS __attribute__((packed))
{
    uint16_t      sValue;  //Short Integer Value
    struct __attribute__((packed))
    {
        uint8_t      :2;  //( ) Reserved
        uint8_t      stallEnable      :1;  //( W) Buffer Stall Enable
        uint8_t      dataToggleSyncEnable :1;  //( W) Data Toggle Synch Enable
        uint8_t      :1;  //( ) Reserved
        uint8_t      :1;  //( ) Reserved
        uint8_t      dataToggle      :1;  //(RW) Data Toggle Synch Value
        uint8_t      USBOwnsBuffer    :1;  //(RW) USB Ownership of buffer and BDT entry
    };
    struct __attribute__((packed))
    {
        uint8_t      :2;  //( ) Reserved
        uint8_t      packetID          :4;  //(R ) Packet Identifier (PID)
    };
} USB_BD_STATUS;

```

The fields **stallEnable** and **dataToggleSyncEnable** in the Buffer Descriptor status structure are writable but not readable. The function [PLIB_USB_BufferStallEnable](#) sets the **stallEnable** bit. (Hardware will clear the bit after receiving a SETUP token from the host.) The functions [PLIB_USB_BufferDataToggleSyncEnable](#) and [PLIB_USB_BufferDataToggleSyncDisable](#) manipulate **dataToggleSyncEnable**.

On a read from the status structure **stallEnable** and **dataToggleSyncEnable** and the next two (reserved) bits are replaced by the Packet Identifier (PID), called **packetID** in the structure. The function [PLIB_USB_BufferPIDGet](#) reads **packetID**.

The rest of the status structure is writable and readable: **dataToggle** and **USBOwnsBuffer**.

The **dataToggle** (DATA0 or DATA1) of a receive buffer is determined by using [PLIB_USB_BufferDataToggleGet](#). For transmit buffers the **dataToggle** value is set using [PLIB_USB_BufferDataToggleSelect](#).

The field **USBOwnsBuffer** is used by both software and the USB module as a semaphore. The function [PLIB_USB_BufferReleaseToUSB](#) releases the buffer to the USB module and the function [PLIB_USB_BufferReleasedToSW](#) returns a boolean **true** when the buffer is released back to software by the USB module. As long as [PLIB_USB_BufferReleasedToSW](#) returns **false**, software should not change the Buffer Descriptor Table entry or its associated buffer.

5.6.26.4.4 USB Setup Example

This section provides example code for setting up the USB module.

Description

Following is an example of how to set up the USB module:

```

#define USB_MAX_EP_NUMBER 15

#define USB_PING_PONG_MODE_SELECTION  USB_PING_PONG__FULL_PING_PONG

```

```

#if (USB_PING_PONG_MODE_SELECTION == USB_PING_PONG_NO_PING_PONG)
#define BDT_NUM_ENTRIES ((USB_MAX_EP_NUMBER + 1) * 2)
#elif (USB_PING_PONG_MODE_SELECTION == USB_PING_PONG_EP0_OUT_ONLY)
#define BDT_NUM_ENTRIES (((USB_MAX_EP_NUMBER + 1) * 2)+1)
#elif (USB_PING_PONG_MODE_SELECTION == USB_PING_PONG_FULL_PING_PONG)
#define BDT_NUM_ENTRIES ((USB_MAX_EP_NUMBER + 1) * 4)
#elif (USB_PING_PONG_MODE_SELECTION == USB_PING_PONG_ALL_BUT_EP0)
#define BDT_NUM_ENTRIES (((USB_MAX_EP_NUMBER + 1) * 4)-2)
#else
#error "No ping pong mode defined."
#endif

#if defined(__18CXX)
#pragma udata gBDT=USB_BDT_ADDRESS
#elif defined(__PIC32MX__)
volatile union USB_BDT_ENTRY_TAG gBDT[BDT_NUM_ENTRIES] __attribute__ (( aligned (512) ));
#else
volatile union USB_BDT_ENTRY_TAG gBDT[BDT_NUM_ENTRIES];
#endif//defined(__18CXX))

unsigned int bufferTransactionCount[BDT_NUM_ENTRIES];

// Turn off USB module
PLIB_USB_Disable( usbID );

// Setup the Hardware
if ( usbModuleSetup.StopInIdle )
{
    PLIB_USB_StopInIdleEnable( usbID );
}
else
{
    PLIB_USB_StopInIdleDisable( usbID );
}

if ( usbModuleSetup.SuspendInSleep )
{
    PLIB_USB_AutoSuspendEnable( usbID );
}
else
{
    PLIB_USB_AutoSuspendDisable( usbID );
}

PLIB_USB_OperatingModeSelect( usbID, usbModuleSetup.OpMode );
PLIB_USB_PingPongModeSelect( usbID, usbModuleSetup.ppMode );

// Reset all ping pong buffers to "Even"
PLIB_USB_PingPongFreeze( usbID );
PLIB_USB_PingPongUnfreeze( usbID );

// Interrupt flag cleared on the safer side

    // Release buffers to USB module

```

```
PLIB_USB_BufferReleaseToUSB(usbID, (void*)gBDT, ppMode, 0, USB_BUFFER_RX, USB_BUFFER_EVEN);
PLIB_USB_Enable( gDrvUSBObj[hDriver].usbID ); // Turn on USB module
```

5.6.26.5 Configuring the Library

The library is configured for the supported processor when the processor is chosen in the MPLAB IDE.

5.6.26.6 Library Interface

Data Types and Constants

	Name	Description
	USB_BUFFER_DATA01	Provides enumeration data toggle for a buffer.
	USB_BUFFER_DIRECTION	Provides enumeration transmit/receive direction for a buffer.
	USB_BUFFER_PING_PONG	Enumerates the ping-pong buffer (Even vs. Odd).
	USB_BUFFER_SCHEDULE_DATA01	Provides enumeration data toggle for a buffer.
	USB_EP_TXRX	Provides enumeration transmit/receive setup for an endpoint.
	USB_OPMODES	Provides enumeration of operating modes supported by USB.
	USB_OTG_INTERRUPTS	Provides enumeration of interrupts related to the USB On-The-Go (OTG) module.
	USB_OTG_PULL_UP_PULL_DOWN	USB OTG pull-Up and pull-Down resistors for D+ and D- .
	USB_PID	Legal PID values.
	USB_PING_PONG_MODE	Supports the four modes of ping-pong buffering for PIC18 and PIC24F devices.
	USB_PING_PONG_STATE	Decodes which buffer (Even vs. Odd) was used for the last transaction.
	USB_TOKEN_SPEED	Provides enumeration of available token speeds.
	USB_MAX_EP_NUMBER	Maximum number of endpoints supported (not including EP0).

Buffer Descriptor Table Functions

	Name	Description
	PLIB_USB_BDTBaseAddressGet	Returns the base address of the Buffer Descriptor Table.
	PLIB_USB_BDTBaseAddressSet	Sets the base address for the Buffer Descriptor Table for PIC24 and PIC32 devices.
	PLIB_USB_BufferAddressGet	Gets the memory address of an endpoint buffer.
	PLIB_USB_BufferAddressSet	Sets the endpoint buffer address.
	PLIB_USB_BufferAllCancelReleaseToUSB	Cancels all endpoint buffer releases to the USB module and hands over the buffer to the CPU.
	PLIB_USB_BufferByteCountGet	Returns the endpoint buffer byte count.
	PLIB_USB_BufferByteCountSet	Sets the buffer byte count.
	PLIB_USB_BufferCancelReleaseToUSB	Cancels release of the endpoint buffer by software, allowing software to again access the buffer.
	PLIB_USB_BufferClearAll	Clears (zeros out) entries in the Buffer Descriptor Table.
	PLIB_USB_BufferClearAllDTSEnable	Clears the endpoint descriptor entry and enables data toggle synchronization.
	PLIB_USB_BufferDataToggleGet	Returns data synchronization (DATA0 or DATA1) for the endpoint buffer.
	PLIB_USB_BufferDataToggleSelect	Sets the endpoint buffer to DATA0 or DATA1.

	<u>PLIB_USB_BufferDataToggleSyncDisable</u>	Disables DATA0/DATA1 synchronization between the device and host.
	<u>PLIB_USB_BufferDataToggleSyncEnable</u>	Enables DATA0/DATA1 synchronization between the device and host.
	<u>PLIB_USB_BufferEP0RxStatusInitialize</u>	Initializes the Endpoint 0 RX endpoint buffer descriptors.
	<u>PLIB_USB_BufferIndexGet</u>	Gets the Buffer Descriptor Table index for a buffer.
	<u>PLIB_USB_BufferPIDBitsClear</u>	Clears the Buffer Status bits in the Buffer Descriptor Table.
	<u>PLIB_USB_BufferPIDGet</u>	Returns the token packet ID (PID) from the endpoint buffer status.
	<u>PLIB_USB_BufferReleasedToSW</u>	Returns the boolean flag value of 'true' when the buffer has been released by the USB module.
	<u>PLIB_USB_BufferReleaseToUSB</u>	Releases the endpoint buffer by software, allowing the USB module access to the buffer.
	<u>PLIB_USB_BufferSchedule</u>	Hands over a buffer to the USB module along with the buffer address and byte count.
	<u>PLIB_USB_BufferStallDisable</u>	Disables STALL handshaking for the associated endpoint buffer.
	<u>PLIB_USB_BufferStallEnable</u>	Enables STALL handshaking for the associated endpoint buffer.
	<u>PLIB_USB_BufferStallGet</u>	Returns the buffer stall status for an endpoint/direction/ping-pong.

Endpoints Functions

	Name	Description
	<u>PLIB_USB_EP0HostSetup</u>	Sends token to the specified address.
	<u>PLIB_USB_EP0LSDirectConnectDisable</u>	Disables direct connection to a low-speed device for Endpoint 0.
	<u>PLIB_USB_EP0LSDirectConnectEnable</u>	Enables direct connection to a low-speed device for Endpoint 0.
	<u>PLIB_USB_EP0NakRetryDisable</u>	Disables retrying of NAKed transactions.
	<u>PLIB_USB_EP0NakRetryEnable</u>	Enables retrying NAK'd transactions for Endpoint 0.
	<u>PLIB_USB_EPnAttributesClear</u>	Clears the set attributes of the specified endpoint.
	<u>PLIB_USB_EPnAttributesSet</u>	Configures attributes of the endpoint such as direction, handshake capability and direction.
	<u>PLIB_USB_EPnControlTransferDisable</u>	Disables endpoint control transfers.
	<u>PLIB_USB_EPnControlTransferEnable</u>	Enables endpoint control transfers.
	<u>PLIB_USB_EPnDirectionDisable</u>	Disables the specified endpoint direction.
	<u>PLIB_USB_EPnHandshakeDisable</u>	Disables endpoint handshaking.
	<u>PLIB_USB_EPnHandshakeEnable</u>	Enables endpoint handshaking.
	<u>PLIB_USB_EPnIsStalled</u>	Tests whether the endpoint epValue is stalled.
	<u>PLIB_USB_EPnRxDisable</u>	Disables an endpoint's ability to process IN tokens.
	<u>PLIB_USB_EPnRxEnable</u>	Enables an endpoint to process IN tokens.
	<u>PLIB_USB_EPnRxSelect</u>	Selects receive capabilities of an endpoint.
	<u>PLIB_USB_EPnStallClear</u>	Clears an endpoint's stalled flag.
	<u>PLIB_USB_EPnTxDisable</u>	Disables an endpoint's ability to process OUT tokens.
	<u>PLIB_USB_EPnTxEnable</u>	Enables an endpoint to process OUT tokens.
	<u>PLIB_USB_EPnTxRxSelect</u>	Selects transmit and/or receive capabilities of an endpoint.
	<u>PLIB_USB_EPnTxSelect</u>	Selects transmit capabilities of an endpoint.

Error Interrupts Functions

	Name	Description
	<u>PLIB_USB_ErrorInterruptDisable</u>	Disables an error interrupt for the USB module.
	<u>PLIB_USB_ErrorInterruptEnable</u>	Enables an error interrupt for the USB module.
	<u>PLIB_USB_ErrorInterruptFlagAllGet</u>	Returns a logically ORed bit map of active error interrupt flags.
	<u>PLIB_USB_ErrorInterruptFlagClear</u>	Clears an error interrupt flag for the USB module.

	PLIB_USB_ErrorInterruptFlagGet	Tests an error interrupt flag for the USB module.
	PLIB_USB_ErrorInterruptFlagSet	Sets an error interrupt flag for the USB module.
	PLIB_USB_ErrorInterruptIsEnabled	Returns true if interrupts are enabled.

External Transceiver Support Functions

	Name	Description
	PLIB_USB_I2CInterfaceForExtModuleDisable	Specifies external module(s) are controlled via dedicated pins.
	PLIB_USB_I2CInterfaceForExtModuleEnable	Specifies external module(s) are controlled via the I2C interface.
	PLIB_USB_TransceiverDisable	Disables the on-chip transceiver
	PLIB_USB_TransceiverEnable	Enables the on-chip transceiver.

Feature Existence Functions

	Name	Description
	PLIB_USB_ExistsActivityPending	Identifies whether the ActivityPending feature exists on the USB module.
	PLIB_USB_ExistsALL_Interrupt	Identifies whether the ALL_Interrupt feature exists on the USB module.
	PLIB_USB_ExistsAutomaticSuspend	Identifies whether the AutomaticSuspend feature exists on the USB module.
	PLIB_USB_ExistsBDTBaseAddress	Identifies whether the BDTBaseAddress feature exists on the USB module.
	PLIB_USB_ExistsBDTFunctions	Identifies whether the BDTFunctions feature exists on the USB module.
	PLIB_USB_ExistsBufferFreeze	Identifies whether the BufferFreeze feature exists on the USB module.
	PLIB_USB_ExistsDeviceAddress	Identifies whether the DeviceAddress feature exists on the USB module.
	PLIB_USB_ExistsEP0LowSpeedConnect	Identifies whether the EP0LowSpeedConnect feature exists on the USB module.
	PLIB_USB_ExistsEP0NAKRetry	Identifies whether the EP0NAKRetry feature exists on the USB module.
	PLIB_USB_ExistsEPnRxEnable	Identifies whether the EPnRxEnableEnhanced feature exists on the USB module.
	PLIB_USB_ExistsEPnTxRx	Identifies whether the EPnTxRx feature exists on the USB module.
	PLIB_USB_ExistsERR_Interrupt	Identifies whether the ERR_Interrupt feature exists on the USB module.
	PLIB_USB_ExistsERR_InterruptStatus	Identifies whether the ERR_InterruptStatus feature exists on the USB module.
	PLIB_USB_ExistsEyePattern	Identifies whether the EyePattern feature exists on the USB module.
	PLIB_USB_ExistsFrameNumber	Identifies whether the FrameNumber feature exists on the USB module.
	PLIB_USB_ExistsGEN_Interrupt	Identifies whether the GEN_Interrupt feature exists on the USB module.
	PLIB_USB_ExistsGEN_InterruptStatus	Identifies whether the GEN_InterruptStatus feature exists on the USB module.
	PLIB_USB_ExistsHostBusyWithToken	Identifies whether the HostBusyWithToken feature exists on the USB module.
	PLIB_USB_ExistsHostGeneratesReset	Identifies whether the HostGeneratesReset feature exists on the USB module.
	PLIB_USB_ExistsLastDirection	Identifies whether the LastDirection feature exists on the USB module.
	PLIB_USB_ExistsLastEndpoint	Identifies whether the LastEndpoint feature exists on the USB module.
	PLIB_USB_ExistsLastPingPong	Identifies whether the LastPingPong feature exists on the USB module.
	PLIB_USB_ExistsLastTransactionDetails	Identifies whether the LastTransactionDetails feature exists on the USB module.
	PLIB_USB_ExistsLiveJState	Identifies whether the LiveJState feature exists on the USB module.
	PLIB_USB_ExistsLiveSingleEndedZero	Identifies whether the LiveSingleEndedZero feature exists on the USB module.

	PLIB_USB_ExistsModuleBusy	Identifies whether the ModuleBusy feature exists on the USB module.
	PLIB_USB_ExistsModulePower	Identifies whether the ModulePower feature exists on the USB module.
	PLIB_USB_ExistsNextTokenSpeed	Identifies whether the NextTokenSpeed feature exists on the USB module.
	PLIB_USB_ExistsOnChipPullup	Identifies whether the OnChipPullup feature exists on the USB module.
	PLIB_USB_ExistsOnChipTransceiver	Identifies whether the OnChipTransceiver feature exists on the USB module.
	PLIB_USB_ExistsOpModeSelect	Identifies whether the OpModeSelect feature exists on the USB module.
	PLIB_USB_ExistsOTG_ASessionValid	Identifies whether the OTG_ASessionValid feature exists on the USB module.
	PLIB_USB_ExistsOTG_BSessionEnd	Identifies whether the OTG_BSessionEnd feature exists on the USB module.
	PLIB_USB_ExistsOTG_IDPinState	Identifies whether the OTG_IDPinState feature exists on the USB module.
	PLIB_USB_ExistsOTG_Interrupt	Identifies whether the OTG_Interrupt feature exists on the USB module.
	PLIB_USB_ExistsOTG_InterruptStatus	Identifies whether the OTG_InterruptStatus feature exists on the USB module.
	PLIB_USB_ExistsOTG_LineState	Identifies whether the OTG_LineState feature exists on the USB module.
	PLIB_USB_ExistsOTG_PullUpPullDown	Identifies whether the OTG_PullUpPullDown feature exists on the USB module.
	PLIB_USB_ExistsOTG_SessionValid	Identifies whether the OTG_SessionValid feature exists on the USB module.
	PLIB_USB_ExistsOTG_VbusCharge	Identifies whether the OTG_VbusCharge feature exists on the USB module.
	PLIB_USB_ExistsOTG_VbusDischarge	Identifies whether the OTG_VbusDischarge feature exists on the USB module.
	PLIB_USB_ExistsOTG_VbusPowerOnOff	Identifies whether the OTG_VbusPowerOnOff feature exists on the USB module.
	PLIB_USB_ExistsPacketTransfer	Identifies whether the PacketTransfer feature exists on the USB module.
	PLIB_USB_ExistsPingPongMode	Identifies whether the PingPongMode feature exists on the USB module.
	PLIB_USB_ExistsResumeSignaling	Identifies whether the ResumeSignaling feature exists on the USB module.
	PLIB_USB_ExistsSleepEntryGuard	Identifies whether the SleepEntryGuard feature exists on the USB module.
	PLIB_USB_ExistsSOFThreshold	Identifies whether the SOFThreshold feature exists on the USB module.
	PLIB_USB_ExistsSpeedControl	Identifies whether the SpeedControl feature exists on the USB module.
	PLIB_USB_ExistsStartOfFrames	Identifies whether the StartOfFrames feature exists on the USB module.
	PLIB_USB_ExistsStopInIdle	Identifies whether the StopInIdle feature exists on the USB module.
	PLIB_USB_ExistsSuspend	Identifies whether the Suspend feature exists on the USB module.
	PLIB_USB_ExistsTokenEP	Identifies whether the TokenEP feature exists on the USB module.
	PLIB_USB_ExistsTokenPID	Identifies whether the TokenPID feature exists on the USB module.
	PLIB_USB_ExistsUOEMonitor	Identifies whether the UOEMonitor feature exists on the USB module.

Host Functions

	Name	Description
	PLIB_USB_IsBusyWithToken	Indicates whether there is a token being executed by the USB module as Host.
	PLIB_USB_SOFDisable	Disables the automatic generation of the SOF token.
	PLIB_USB_SOFEnable	Enables the automatic generation of the SOF token every 1 ms.
	PLIB_USB_SOFThresholdGet	Returns the Start-of-Frame (SOF) Count bits.

	PLIB_USB_SOFThresholdSet	Sets the Start-of-Frame (SOF) threshold value.
	PLIB_USB-TokenEPGet	Returns the specified Endpoint address.
	PLIB_USB-TokenEPSet	Sets the Endpoint address for a host transaction.
	PLIB_USB-TokenPIDGet	Returns the token transaction type.
	PLIB_USB-TokenPIDSet	Sets the token transaction type to pidValue.
	PLIB_USB-TokenSpeedSelect	Selects low speed or full speed for subsequent token executions.

Interrupts Functions

	Name	Description
	PLIB_USB_InterruptDisable	Disables a general interrupt for the USB module.
	PLIB_USB_InterruptEnable	Enables a general interrupt for the USB module.
	PLIB_USB_InterruptEnableGet	Returns the enable/disable status of general USB module interrupts
	PLIB_USB_InterruptFlagAllGet	Returns a logically ORed bit map of active general USB interrupt flags.
	PLIB_USB_InterruptFlagClear	Clears a general interrupt flag for the USB module.
	PLIB_USB_InterruptFlagGet	Tests a general interrupt flag for the USB module.
	PLIB_USB_InterruptFlagSet	Sets a general interrupt flag for the USB module.
	PLIB_USB_InterruptIsEnabled	Returns true if interrupts are enabled.

Last Transaction Status Functions

	Name	Description
	PLIB_USB_LastTransactionDetailsGet	Returns the details of the last completed transaction.
	PLIB_USB_LastTransactionDirectionGet	Indicates the direction of the last transaction.
	PLIB_USB_LastTransactionEndPtGet	Returns the endpoint number of the last USB transfer.
	PLIB_USB_LastTransactionPingPongStateGet	Indicates whether the last transaction was to an EVEN buffer or an ODD buffer.

On-The-Go (OTG) Functions

	Name	Description
	PLIB_USB_OTG_BSessionHasEnded	Returns the status of the B-Session End Indicator bit.
	PLIB_USB_OTG_IDPinStateIsTypeA	Returns the ID Pin state.
	PLIB_USB_OTG_LineStateIsStable	Returns the status of the Line Stable Indicator bit.
	PLIB_USB_OTG_PullUpPullDownSetup	Enables or disables pull-up and pull-down resistors.
	PLIB_USB_OTG_SessionValid	Returns the status of the Session Valid Indicator bit.
	PLIB_USB_OTG_VBusChargeDisable	Disables VBUS line charge.
	PLIB_USB_OTG_VBusChargeEnable	Enables the VBUS line to be charged through a pull-up resistor.
	PLIB_USB_OTG_VBusChargeTo3V	Sets the VBUS line to charge to 3.3V.
	PLIB_USB_OTG_VBusChargeTo5V	Sets the VBUS line to charge to 5V.
	PLIB_USB_OTG_VBusDischargeDisable	Disables VBUS line discharge.
	PLIB_USB_OTG_VBusDischargeEnable	Enables VBUS line to be discharged through a resistor.
	PLIB_USB_OTG_VBusPowerOff	Turns off power on the VBUS Line.
	PLIB_USB_OTG_VBusPowerOn	Turns on power for the VBUS line.
	PLIB_USB_OTG_VBusValid	Returns the status of the A-VBUS valid indicator.

OTG Interrupts Functions

	Name	Description
	PLIB_USB_OTG_InterruptDisable	Disables a USB On-The-Go (OTG) Interrupt for the USB module.
	PLIB_USB_OTG_InterruptEnable	Enables a USB On-The-Go (OTG) Interrupt for the USB module.

	PLIB_USB_OTG_InterruptFlagClear	Clears a USB On-The-Go (OTG) Interrupt flag for the USB module.
	PLIB_USB_OTG_InterruptFlagGet	Tests a USB On-The-Go (OTG) Interrupt flag for the USB module.
	PLIB_USB_OTG_InterruptFlagSet	Sets a USB On-The-Go (OTG) Interrupt flag for the USB module.
	PLIB_USB_OTG_InterruptIsEnabled	Returns whether or not interrupts are enabled.

Other Functions

	Name	Description
	PLIB_USB_ModuleIsBusy	Indicates if the USB module is not ready to be enabled.
	PLIB_USB_PingPongFreeze	Resets all Ping-Pong buffer pointers to even buffers.
	PLIB_USB_PingPongReset	Resets the USB peripheral internal Ping-Pong indicator to point to even buffers.
	PLIB_USB_PingPongUnfreeze	Enables Ping-Pong buffering.
	PLIB_USB_TokenSend	Sends token to the specified address.

Test Support Functions

	Name	Description
	PLIB_USB_EyePatternDisable	Disables the USB eye pattern test.
	PLIB_USB_EyePatternEnable	Enables USB eye pattern test.

USB Activity Functions

	Name	Description
	PLIB_USB_ActivityPending	Returns whether or not USB activity is pending.
	PLIB_USB_FrameNumberGet	Returns the USB frame number.
	PLIB_USB_JStateIsActive	Live differential receiver J State flag.
	PLIB_USB_PacketTransferDisable	Disables the Serial Interface Engine (SIE).
	PLIB_USB_PacketTransferEnable	Re-enables the Serial Interface Engine (SIE), allowing token and packet processing.
	PLIB_USB_PacketTransferIsDisabled	Indicates that a setup token has been received from the Host and that token/packet processing is disabled.
	PLIB_USB_SE0InProgress	Returns whether a single-ended zero event is in progress.

USB Bus Signaling Functions

	Name	Description
	PLIB_USB_ResetSignalDisable	Disables reset signalling on the USB bus.
	PLIB_USB_ResetSignalEnable	Enables reset signalling on the USB bus.
	PLIB_USB_ResumeSignalingDisable	Disables resume signaling.
	PLIB_USB_ResumeSignalingEnable	Enables resume signaling.

USB Setup Functions

	Name	Description
	PLIB_USB_AllInterruptEnable	Configures the USB peripheral general interrupts, error interrupts and OTG interrupts.
	PLIB_USB_AutoSuspendDisable	Disables USB OTG Auto-suspend mode.
	PLIB_USB_AutoSuspendEnable	Enables USB Auto-suspend mode.
	PLIB_USB_DeviceAddressGet	Returns the address of the USB module in Device mode.
	PLIB_USB_DeviceAddressSet	Sets the USB Device's address.
	PLIB_USB_Disable	Disables (powers down) the USB module.
	PLIB_USB_Enable	Enables (powers up) the USB module.
	PLIB_USB_FullSpeedDisable	Forces the USB module to operate at low speed.

	PLIB_USB_FullSpeedEnable	Enables the USB to operate at full speed.
	PLIB_USB_OnChipPullUpDisable	Disables on-chip pull-ups.
	PLIB_USB_OnChipPullUpEnable	Enables on-chip pull-ups.
	PLIB_USB_OperatingModeSelect	Selects the operating mode of the USB module.
	PLIB_USB_PingPongModeGet	Returns the Ping-Pong Configuration setting.
	PLIB_USB_PingPongModeSelect	Selects the Ping-Pong Configuration setting.
	PLIB_USB_SleepGuardDisable	This function disables Sleep Guard. Entry into Sleep mode is immediate.
	PLIB_USB_SleepGuardEnable	Entry into Sleep mode is blocked if bus activity is detected or if an interrupt is pending.
	PLIB_USB_StopInIdleDisable	Allows the USB module to continue operation when the device enters Idle mode.
	PLIB_USB_StopInIdleEnable	Enables USB module operation to stop when the device enters Idle mode.
	PLIB_USB_SuspendDisable	Disables USB OTG Suspend mode.
	PLIB_USB_SuspendEnable	Enables USB Suspend mode.
	PLIB_USB_UOEMonitorDisable	Disables the OE signal output.
	PLIB_USB_UOEMonitorEnable	Enables the OE signal output.

VBus Support Functions

	Name	Description
	PLIB_USB_ExternalComparatorMode2Pin	Sets the 2-pin input configuration for VBUS comparators.
	PLIB_USB_ExternalComparatorMode3Pin	Sets the 3-pin input configuration for VBUS Comparators.
	PLIB_USB_PWMCounterDisable	Disables the PWM counter used to generate the VBUS for the USB module.
	PLIB_USB_PWMCounterEnable	Enables the PWM counter used to generate the VBUS for the USB module.
	PLIB_USB_PWMDisable	Disables the PWM Generator.
	PLIB_USB_PWMEnable	Enables the PWM Generator.
	PLIB_USB_PWMPolarityActiveLow	Sets the PWM output to active-high and resets low.
	PLIB_USB_PWMPolarityActiveHigh	Sets the PWM output to active-low and resets high.
	PLIB_USB_VBoostDisable	Disables the On-Chip 5V Boost Regulator Circuit Disabled bit.
	PLIB_USB_VBoostEnable	Enables the On-Chip 5V Boost Regulator Circuit Enabled bit.
	PLIB_USB_VBUSComparatorDisable	Disables the on-chip VBUS Comparator.
	PLIB_USB_VBUSComparatorEnable	Enables the on-chip VBUS Comparator.
	PLIB_USB_VBUSPullUpDisable	Disables the pull-up on the VBUS pin.
	PLIB_USB_VBUSPullUpEnable	Enables the pull-up on the VBUS pin.

Description

This library provides the low level abstraction of the USB Peripheral on Microchip family of microcontrollers with a convenient C language interface.

5.6.26.6.1 USB Setup Functions

5.6.26.6.1.1 PLIB_USB_AllInterruptEnable Function

C

```
void PLIB_USB_AllInterruptEnable(
    USB_MODULE_ID index,
    USB_INTERRUPTS usbInterruptsFlag,
    USB_ERROR_INTERRUPTS usbErrorInterruptsFlag,
```

```
    USB_OTG_INTERRUPTS otgInterruptFlag  
);
```

Description

This function configures the USB peripheral general interrupts, error interrupts and OTG interrupts.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
usbInterruptsFlag	General interrupts to be configured
usbErrorInterruptsFlag	USB Error interrupts to be configured
otgInterruptFlag	OTG interrupts to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsALL_Interrupt](#) in your application to determine whether this feature is available.

Example

```
// This code snippet disables all OTG interrupts, disables  
// the SOF interrupt and enables all error interrupts.  
USB_OTG_INTERRUPTS otgInterruptEnables = ~USB_OTG_INT_ALL ;  
USB_INTERRUPTS generalInterruptEnables = USB_INT_ALL & ~USB_INT_SOF ;  
USB_ERROR_INTERRUPTS errorInterruptEnables = USB_ERR_INT_ALL ;  
  
PLIB_USB_AllInterruptEnable(USB_MODULE_ID index, USB_INTERRUPTS usbInterruptsFlag,  
    USB_ERROR_INTERRUPTS usbErrorInterruptsFlag,  
    USB_OTG_INTERRUPTS otgInterruptFlag);
```

5.6.26.6.1.2 PLIB_USB_AutoSuspendDisable Function**C**

```
void PLIB_USB_AutoSuspendDisable(  
    USB_MODULE_ID index  
);
```

Description

This function disables USB OTG Auto-suspend mode. The USB OTG module will operate normally and does not automatically suspend upon entry to Sleep mode. Software must use [PLIB_USB_SuspendEnable](#) to suspend the module, including the USB 48 MHz clock

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

Not available on PIC18 devices.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsAutomaticSuspend](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_AutoSuspendDisable(MY_USB_INSTANCE);
```

5.6.26.6.1.3 PLIB_USB_AutoSuspendEnable Function**C**

```
void PLIB_USB_AutoSuspendEnable(  
    USB_MODULE_ID index  
);
```

Description

This function enables USB Auto-suspend mode. The USB module automatically suspends upon entry to Sleep mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

Not available on PIC18 devices.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsAutomaticSuspend](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_AutoSuspendEnable(MY_USB_INSTANCE);
```

5.6.26.6.1.4 PLIB_USB_DeviceAddressGet Function**C**

```
uint8_t PLIB_USB_DeviceAddressGet(  
    USB_MODULE_ID index  
);
```

Description

This function returns the address of the USB module in Device mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

Device Address

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_USB_ExistsDeviceAddress` in your application to determine whether this feature is available.

Example

```
myUSBAddress = PLIB_USB_DeviceAddressGet(MY_USB_INSTANCE);
```

5.6.26.6.1.5 PLIB_USB_DeviceAddressSet Function**C**

```
void PLIB_USB_DeviceAddressSet(  
    USB_MODULE_ID index,  
    uint8_t address  
);
```

Description

This function sets the USB Device's address as part of enumeration.

Preconditions

USB module must be in Host mode.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
address	USB address

Returns

None.

Remarks

Not applicable for PIC18 devices, since USB Host functionality is not available on PIC18 devices.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_USB_ExistsDeviceAddress` in your application to determine whether this feature is available.

Example

```
uint8_t myUSBAddress = . . . ;  
PLIB_USB_DeviceAddressSet(MY_USB_INSTANCE, myUSBAddress);
```

5.6.26.6.1.6 PLIB_USB_Disable Function**C**

```
void PLIB_USB_Disable(  
    USB_MODULE_ID index  
);
```

Description

This function disables (powers down) the USB module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

For PIC24/dsPIC33 and PIC32 devices, the USB module must be in Device mode before the USB module is powered down.

For PIC32 devices, all reads or writes to module registers after powering down the module will be invalid until [PLIB_USB_ModuleIsBusy](#) (MY_USB_INSTANCE) == false.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsModulePower](#) in your application to determine whether this feature is available.

Example

```
#if ( defined(__PIC24E__) || defined(__dsPIC33E__) || defined(__PIC32MX__) )
    // Disable Host, Device, or OTG before powering down
    PLIB_USB_OperatingModeSelect( MY_USB_INSTANCE, USB_OPMODE_NONE );
#endif
    // Turn off USB
    PLIB_USB_Disable(MY_USB_INSTANCE);
#ifdef __PIC32MX__
    // For PIC32, wait until module is no longer busy before trying to
    // access any USB module registers.
    while ( PLIB_USB_ModuleIsBusy (MY_USB_INSTANCE) )
    {
        //wait
    }
#endif
    // Can now read or modify USB module status
```

5.6.26.6.1.7 PLIB_USB_Enable Function**C**

```
void PLIB_USB_Enable(
    USB_MODULE_ID index
);
```

Description

This function enables (powers up) the USB module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

Not valid on PIC18 devices until a valid clock source is provided to the USB module.

See also [PLIB_USB_ModuleIsBusy](#).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_USB_ExistsModulePower` your application to determine whether this feature is available.

Example

```
// Complete Needed setup for the module  
PLIB_USB_Enable(MY_USB_INSTANCE);
```

5.6.26.6.1.8 PLIB_USB_FullSpeedDisable Function**C**

```
void PLIB_USB_FullSpeedDisable(  
    USB_MODULE_ID index  
);
```

Description

This function forces the USB module to operate at low speed.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

For PIC18 devices, use only before the USB module is enabled to select low speed. In addition, an input clock of 6 MHz instead of 48 MHz is required.

For all others devices: Host mode only.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsSpeedControl](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_FullSpeedDisable(MY_USB_INSTANCE);
```

5.6.26.6.1.9 PLIB_USB_FullSpeedEnable Function**C**

```
void PLIB_USB_FullSpeedEnable(  
    USB_MODULE_ID index  
);
```

Description

This function enables the USB to operate at full speed.

Preconditions

Use only before the USB module is enabled by calling [PLIB_USB_Enable](#).

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

For PIC18 devices, use only before the USB module is enabled to select low speed. In addition, an input clock of 6 MHz instead of 48 MHz is required.

For all others devices: Host mode only.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsSpeedControl](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_FullSpeedEnable(MY_USB_INSTANCE);
```

5.6.26.6.1.10 PLIB_USB_OnChipPullUpDisable Function**C**

```
void PLIB_USB_OnChipPullUpDisable(  
    USB_MODULE_ID index  
);
```

Description

This function disables on-chip pull-ups.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

PIC18 devices only.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsOnChipPullup](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_OnChipPullUpDisable(MY_USB_INSTANCE);
```

5.6.26.6.1.11 PLIB_USB_OnChipPullUpEnable Function**C**

```
void PLIB_USB_OnChipPullUpEnable(  
    USB_MODULE_ID index  
);
```

Description

This function enables on-chip pull-ups. Pull-up on D+ in Full-Speed mode. Pull-up on D- in Low-Speed mode.

Preconditions

Use only before the USB module is enabled by calling [PLIB_USB_Enable](#).

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

PIC18 devices only.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsOnChipPullup](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_OnChipPullUpEnable(MY_USB_INSTANCE);
```

5.6.26.6.1.12 PLIB_USB_OperatingModeSelect Function**C**

```
void PLIB_USB_OperatingModeSelect(  
    USB_MODULE_ID index,  
    USB_OPMODES opMode  
);
```

Description

This function selects the operating mode of the USB module, either Host, Device, or OTG.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
opMode	Selected operating mode: USB_OPMODE_DEVICE, USB_OPMODE_HOST, or USB_OPMODE_OTG

Returns

None.

Remarks

Not needed on PIC18 devices, since only UPB_OPMODE_DEVICE is supported and there are no other operating modes. Use USB_OPMODE_NONE to disable all possible functions.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsOpModeSelect](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_OperatingModeSelect( MY_USB_INSTANCE, USB_OPMODE_DEVICE );
```

5.6.26.6.1.13 PLIB_USB_PingPongModeGet Function**C**

```
USB_PING_PONG_MODE PLIB_USB_PingPongModeGet(  
    USB_MODULE_ID index  
);
```

Description

This function returns the Ping-Pong Configuration setting.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

Ping-Pong Mode - One of USB_PING_PONG__ALL_BUT_EP0, USB_PING_PONG__FULL_PING_PONG, USB_PING_PONG__EP0_OUT_ONLY, USB_PING_PONG__NO_PING_PONG

Remarks

For PIC18F and PIC24F devices only.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsPingPongMode](#) in your application to determine whether this feature is available.

Example

```
ppConfig = PLIB_USB_PingPongModeGet(MY_USB_INSTANCE);
```

5.6.26.6.1.14 PLIB_USB_PingPongModeSelect Function**C**

```
void PLIB_USB_PingPongModeSelect(  
    USB_MODULE_ID index,  
    USB_PING_PONG_MODE ppConfig  
);
```

Description

This function selects the Ping-Pong Configuration setting.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
ppConfig	Ping-Pong configuration selection. One of USB_PING_PONG__ALL_BUT_EP0, USB_PING_PONG__FULL_PING_PONG, USB_PING_PONG__EP0_OUT_ONLY, USB_PING_PONG__NO_PING_PONG

Returns

None.

Remarks

For PIC18F and PIC24F devices only. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsPingPongMode](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_PingPongModeSelect(MY_USB_INSTANCE, USB_PING_PONG__ALL_BUT_EP0);
```

5.6.26.6.1.15 PLIB_USB_SleepGuardDisable Function

C

```
void PLIB_USB_SleepGuardDisable(  
    USB_MODULE_ID index  
);
```

Description

This function disables Sleep Guard. Entry into Sleep mode is immediate.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

Not available on PIC18, dsPIC or PIC24 devices. Not available on all PIC32 devices. Refer to the specific device data sheet for details.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsSleepEntryGuard](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_SleepGuardDisable(MY_USB_INSTANCE);
```

5.6.26.6.1.16 PLIB_USB_SleepGuardEnable Function

C

```
void PLIB_USB_SleepGuardEnable(  
    USB_MODULE_ID index  
);
```

Description

This function block entry into Sleep mode if bus activity is detected or if an interrupt is pending.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

Not available on PIC18, dsPIC, or PIC24 devices. Not available on all PIC32 devices. Refer to the specific device data sheet for details. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsSleepEntryGuard](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_SleepGuardEnable(MY_USB_INSTANCE);
```

5.6.26.6.1.17 PLIB_USB_StopInIdleDisable Function**C**

```
void PLIB_USB_StopInIdleDisable(  
    USB_MODULE_ID index  
);
```

Description

This function allows the USB module to continue operation when the device enters Idle mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

Not available on PIC18 devices. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsStopInIdle](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_StopInIdleDisable(MY_USB_INSTANCE);
```

5.6.26.6.1.18 PLIB_USB_StopInIdleEnable Function**C**

```
void PLIB_USB_StopInIdleEnable(  
    USB_MODULE_ID index  
);
```

Description

This function enables USB module operation to stop when the device enters Idle mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

Not available on PIC18 devices. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsStopInIdle](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_StopInIdleEnable(MY_USB_INSTANCE);
```

5.6.26.6.1.19 PLIB_USB_SuspendDisable Function**C**

```
void PLIB_USB_SuspendDisable(  
    USB_MODULE_ID index  
);
```

Description

This function disables USB OTG Suspend mode. The USB OTG module will operate normally.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

Not available on PIC18 devices.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsSuspend](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_SuspendDisable(MY_USB_INSTANCE);
```

5.6.26.6.1.20 PLIB_USB_SuspendEnable Function**C**

```
void PLIB_USB_SuspendEnable(  
    USB_MODULE_ID index  
);
```

Description

This function enables USB Suspend mode. The 48 MHz USB clock will be gated off. The transceiver is placed in a low-power state.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

Not available on PIC18 devices.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsSuspend](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_SuspendEnable(MY_USB_INSTANCE);
```

5.6.26.6.1.21 PLIB_USB_UOEMonitorDisable Function**C**

```
void PLIB_USB_UOEMonitorDisable(  
    USB_MODULE_ID index  
);
```

Description

This function disables the OE signal output.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsUOEMonitor](#) in your application to determine whether this feature is available.

Example

```
//Disable the OE output.  
PLIB_USB_UOEMonitorDisable(MY_USB_INSTANCE);
```

5.6.26.6.1.22 PLIB_USB_UOEMonitorEnable Function**C**

```
void PLIB_USB_UOEMonitorEnable(  
    USB_MODULE_ID index  
);
```

Description

This function enables the OE signal output.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsUOEMonitor](#) in your application to determine whether this feature is available.

Example

```
//Enable the OE output.  
PLIB_USB_UOEMonitorEnable(MY_USB_INSTANCE);
```

5.6.26.6.2 Buffer Descriptor Table Functions

5.6.26.6.2.1 PLIB_USB_BDTBaseAddressGet Function

C

```
void* PLIB_USB_BDTBaseAddressGet(  
    USB_MODULE_ID index  
);
```

Description

This function returns the base address of the Buffer Descriptor Table.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

Always set to 0x400 for PIC18 devices. Must be set for dsPIC33E/PIC24E, PIC24F, and PIC32 devices using [PLIB_USB_BDTBaseAddressSet](#).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsBDTBaseAddress](#) in your application to determine whether this feature is available.

Example

```
void * pMyBDT;  
pMyBDT = PLIB_USB_BDTBaseAddressGet(MY_USB_INSTANCE);
```

5.6.26.6.2.2 PLIB_USB_BDTBaseAddressSet Function

C

```
void PLIB_USB_BDTBaseAddressSet(  
    USB_MODULE_ID index,  
    void* address  
);
```

Description

This function sets the base address for the Buffer Descriptor Table. This function is only available on PIC24 and PIC32 devices.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
address	Physical memory address in RAM of Buffer Descriptor Table

Returns

None.

Remarks

Available on dsPIC33E/PIC24E, PIC24F, and PIC32. For PIC18 devices the address is fixed at 0x400. The address of the Buffer Descriptor Table must be 512 byte-aligned. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsBDTBaseAddress](#) in your application to determine whether this feature is available.

Example

```
#if defined(__PIC32MX__)
// For PIC32
PLIB_USB_BDTBaseAddressSet(MY_USB_INSTANCE, (void *)((uint32_t)KVA_TO_PA(&myBDT)) );
#else
// Everybody else
PLIB_USB_BDTBaseAddressSet(MY_USB_INSTANCE, (void *)&myBDT );
#endif
```

5.6.26.6.2.3 PLIB_USB_BufferAddressGet Function**C**

```
void* PLIB_USB_BufferAddressGet(
    USB_MODULE_ID index,
    void* pBDT,
    USB_PING_PONG_MODE ppMode,
    uint8_t epValue,
    USB_BUFFER_DIRECTION bufferDirection,
    USB_BUFFER_PING_PONG bufferPingPong
);
```

Description

This function gets the memory address of an endpoint buffer.

Preconditions

None.

Parameters

Parameters	Description
index	Dummy argument, identifier for the device instance of interest
pBDT	Pointer to start of Buffer Descriptor Table
ppMode	Ping-Pong buffering mode
epValue	Endpoint Value, 0 <= epValue <= Module Maximum Endpoint
bufferDirection	USB_BUFFER_RX or USB_BUFFER_TX
bufferPingPong	USB_BUFFER_EVEN or USB_BUFFER_ODD

Returns

Buffer address in memory.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsBDTFunctions](#) in your application to determine whether this feature is available.

Example**5.6.26.6.2.4 PLIB_USB_BufferAddressSet Function****C**

```
void PLIB_USB_BufferAddressSet(
    USB_MODULE_ID index,
    void* pBDT,
    USB_PING_PONG_MODE ppMode,
    uint8_t epValue,
    USB_BUFFER_DIRECTION bufferDirection,
    USB_BUFFER_PING_PONG bufferPingPong,
    void* bufferAddress
);
```

Description

This function sets the endpoint buffer address.

Preconditions

None.

Parameters

Parameters	Description
index	Dummy argument, identifier for the device instance of interest
pBDT	Pointer to start of Buffer Descriptor Table
ppMode	Ping-Pong buffering mode
epValue	Endpoint value, 0 <= epValue <= Module Maximum Endpoint
bufferDirection	USB_BUFFER_RX or USB_BUFFER_TX
bufferPingPong	USB_BUFFER_EVEN or USB_BUFFER_ODD
bufferAddress	address in memory of endpoint transmit or receive buffer

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsBDTFunctions](#) in your application to determine whether this feature is available.

Example**5.6.26.6.2.5 PLIB_USB_BufferAllCancelReleaseToUSB Function****C**

```
void PLIB_USB_BufferAllCancelReleaseToUSB(
    USB_MODULE_ID index,
    void * pBDT,
    USB_PING_PONG_MODE ppMode,
    int nEndpoints
);
```

Description

This function cancels all endpoint buffer releases to the USB module and hands over the buffer to the CPU.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
pBDT	Pointer to the Buffer Descriptor Table
ppMode	Buffer Descriptor Table Ping-Pong mode
nEndpoints	Number of endpoints in the Buffer-Descriptor table

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsBDTFunctions](#) in your application to determine whether this feature is available.

Example

```
//Cancel all buffer releases to USB.
//BDT has 3 Endpoints.

PLIB_USB_BufferAllCancelReleaseToUSB(MY_USB_INSTANCE, pBDT,
                                       USB_PING_PONG_NO_PING_PONG, 3);
```

5.6.26.6.2.6 PLIB_USB_BufferByteCountGet Function**C**

```
uint16_t PLIB_USB_BufferByteCountGet(
    USB_MODULE_ID index,
    void* pBDT,
    USB_PING_PONG_MODE ppMode,
    uint8_t epValue,
    USB_BUFFER_DIRECTION bufferDirection,
    USB_BUFFER_PING_PONG bufferPingPong
);
```

Description

This function returns the endpoint buffer byte count, the actual number of bytes transmitted or received.

Preconditions

None.

Parameters

Parameters	Description
index	Dummy argument, identifier for the device instance of interest
pBDT	Pointer to start of Buffer Descriptor Table
ppMode	Ping-Pong buffering mode
epValue	Endpoint value, 0 <= epValue <= Module Maximum Endpoint
bufferDirection	USB_BUFFER_RX or USB_BUFFER_TX
bufferPingPong	USB_BUFFER_EVEN or USB_BUFFER_ODD

Returns

Endpoint buffer byte count.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsBDTFunctions](#) in your application to determine whether this feature is available.

Example**5.6.26.6.2.7 PLIB_USB_BufferByteCountSet Function**

C

```
void PLIB_USB_BufferByteCountSet(
    USB_MODULE_ID index,
    void* pBDT,
    USB_PING_PONG_MODE ppMode,
    uint8_t epValue,
    USB_BUFFER_DIRECTION bufferDirection,
    USB_BUFFER_PING_PONG bufferPingPong,
    uint16_t bufferByteCount
);
```

Description

This function sets the number of bytes to be transmitted or the maximum number of bytes to be received.

Preconditions

None.

Parameters

Parameters	Description
index	Dummy argument, identifier for the device instance of interest
pBDT	Pointer to start of Buffer Descriptor Table
ppMode	Ping-Pong buffering mode
epValue	Endpoint value, 0 <= epValue <= Module Maximum Endpoint
bufferDirection	USB_BUFFER_RX or USB_BUFFER_TX
bufferPingPong	USB_BUFFER_EVEN or USB_BUFFER_ODD
bufferByteCount	number of bytes to be transmitted or the maximum number of bytes to be received

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsBDTFunctions](#) in your application to determine whether this feature is available.

Example**5.6.26.6.2.8 PLIB_USB_BufferCancelReleaseToUSB Function**

C

```
void PLIB_USB_BufferCancelReleaseToUSB(
    USB_MODULE_ID index,
    void* pBDT,
    USB_PING_PONG_MODE ppMode,
```

```
uint8_t epValue,
USB_BUFFER_DIRECTION bufferDirection,
USB_BUFFER_PING_PONG bufferPingPong
);
```

Description

This function cancels the release of the endpoint buffer by software, allowing software to again access the buffer.

Preconditions

None.

Parameters

Parameters	Description
index	Dummy argument, identifier for the device instance of interest
pBDT	Pointer to start of Buffer Descriptor Table
ppMode	Ping-Pong buffering mode
epValue	Endpoint value, 0 <= epValue <= Module Maximum Endpoint
bufferDirection	USB_BUFFER_RX or USB_BUFFER_TX
bufferPingPong	USB_BUFFER_EVEN or USB_BUFFER_ODD

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsBDTFunctions](#) in your application to determine whether this feature is available.

Example**5.6.26.6.2.9 PLIB_USB_BufferClearAll Function****C**

```
void PLIB_USB_BufferClearAll(
    USB_MODULE_ID index,
    void * pBDT,
    USB_PING_PONG_MODE ppMode,
    uint8_t epValue,
    USB_BUFFER_DIRECTION bufferDirection,
    USB_BUFFER_PING_PONG bufferPingPong
);
```

Description

This function clears (zeros out) the entries in the Buffer Descriptor Table.

Preconditions

None.

Parameters

Parameters	Description
index	Dummy argument, identifier for the device instance of interest
pBDT	Pointer to start of Buffer Descriptor Table
ppMode	Ping-Pong buffering mode
epValue	Endpoint value, 0 <= epValue <= Module Maximum Endpoint
bufferDirection	USB_BUFFER_RX or USB_BUFFER_TX

bufferPingPong	USB_BUFFER_EVEN or USB_BUFFER_ODD

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsBDTFunctions](#) in your application to determine whether this feature is available.

Example

5.6.26.6.2.10 PLIB_USB_BufferClearAllDTSEnable Function

C

```
void PLIB_USB_BufferClearAllDTSEnable(  
    USB_MODULE_ID index,  
    void * pBDT,  
    USB_PING_PONG_MODE ppMode,  
    uint8_t epValue,  
    USB_BUFFER_DIRECTION bufferDirection  
);
```

Description

This function clears the endpoint descriptor entry and enables data toggle synchronization.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
pBDT	pointer to Buffer Descriptor Table
pingpong	Ping-Pong mode.
epvalue	Endpoint to be be affected
bufferDirection	Endpoint direction

Returns

None.

Remarks

None.

Example

```
//Clear endpoint 6 buffer descriptor transmit entry and  
//enable data toggle synchronization.  
  
PLIB_USB_BufferClearAllDTSEnable ( MY_USB_INSTANCE, pBDT,  
    USB_PING_PONG_NO_PING_PONG, 6, USB_BUFFER_TX);
```

5.6.26.6.2.11 PLIB_USB_BufferDataToggleGet Function

C

```
USB_BUFFER_DATA01 PLIB_USB_BufferDataToggleGet(  
    USB_MODULE_ID index,  
    void* pBDT,
```

```

    USB_PING_PONG_MODE ppMode,
    uint8_t epValue,
    USB_BUFFER_DIRECTION bufferDirection,
    USB_BUFFER_PING_PONG bufferPingPong
);

```

Description

This function returns data synchronization (DATA0 or DATA1) for the endpoint buffer.

Preconditions

None.

Parameters

Parameters	Description
index	Dummy argument, identifier for the device instance of interest
pBDT	Pointer to start of Buffer Descriptor Table
ppMode	Ping-Pong buffering mode
epValue	Endpoint value, 0 <= epValue <= Module Maximum Endpoint
bufferDirection	USB_BUFFER_RX or USB_BUFFER_TX
bufferPingPong	USB_BUFFER_EVEN or USB_BUFFER_ODD

Returns

Data Toggle value, USB_BUFFER_DATA0 or USB_BUFFER_DATA1, for the buffer

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsBDTFunctions](#) in your application to determine whether this feature is available.

Example**5.6.26.6.2.12 PLIB_USB_BufferDataToggleSelect Function****C**

```

void PLIB_USB_BufferDataToggleSelect(
    USB_MODULE_ID index,
    void* pBDT,
    USB_PING_PONG_MODE ppMode,
    uint8_t epValue,
    USB_BUFFER_DIRECTION bufferDirection,
    USB_BUFFER_PING_PONG bufferPingPong,
    USB_BUFFER_DATA01 bufferData01
);

```

Description

This function sets the endpoint buffer to DATA0 or DATA1.

Preconditions

None.

Parameters

Parameters	Description
index	Dummy argument, identifier for the device instance of interest
pBDT	Pointer to start of Buffer Descriptor Table
ppMode	Ping-Pong buffering mode
epValue	Endpoint value, 0 <= epValue <= Module Maximum Endpoint

bufferDirection	USB_BUFFER_RX or USB_BUFFER_TX
bufferPingPong	USB_BUFFER_EVEN or USB_BUFFER_ODD
bufferData01	USB_BUFFER_DATA0 or USB_BUFFER_DATA1

Returns

None.

Remarks

See [PLIB_USB_BufferDataToggleGet](#) to determine the received data toggle setting. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsBDTFunctions](#) in your application to determine whether this feature is available.

Example**5.6.26.6.2.13 PLIB_USB_BufferDataToggleSyncDisable Function**

C

```
void PLIB_USB_BufferDataToggleSyncDisable(
    USB_MODULE_ID index,
    void* pBDT,
    USB_PING_PONG_MODE ppMode,
    uint8_t epValue,
    USB_BUFFER_DIRECTION bufferDirection,
    USB_BUFFER_PING_PONG bufferPingPong
);
```

Description

This function disables DATA0/DATA1 synchronization between the device and host.

Preconditions

None.

Parameters

Parameters	Description
index	Dummy argument, identifier for the device instance of interest
pBDT	Pointer to start of Buffer Descriptor Table
ppMode	Ping-Pong buffering mode
epValue	Endpoint value, 0 <= epValue <= Module Maximum Endpoint
bufferDirection	USB_BUFFER_RX or USB_BUFFER_TX
bufferPingPong	USB_BUFFER_EVEN or USB_BUFFER_ODD

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsBDTFunctions](#) in your application to determine whether this feature is available.

Example**5.6.26.6.2.14 PLIB_USB_BufferDataToggleSyncEnable Function**

C

```
void PLIB_USB_BufferDataToggleSyncEnable(
```

```
USB_MODULE_ID index,  
void* pBDT,  
USB_PING_PONG_MODE ppMode,  
uint8_t epValue,  
USB_BUFFER_DIRECTION bufferDirection,  
USB_BUFFER_PING_PONG bufferPingPong  
);
```

Description

This function enables DATA0/DATA1 synchronization between the device and host.

Preconditions

None.

Parameters

Parameters	Description
index	Dummy argument, identifier for the device instance of interest
pBDT	Pointer to start of Buffer Descriptor Table
ppMode	Ping-Pong buffering mode
epValue	Endpoint value, 0 <= epValue <= Module Maximum Endpoint
bufferDirection	USB_BUFFER_RX or USB_BUFFER_TX
bufferPingPong	USB_BUFFER_EVEN or USB_BUFFER_ODD

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsBDTFunctions](#) in your application to determine whether this feature is available.

Example**5.6.26.6.2.15 PLIB_USB_BufferEP0RxStatusInitialize Function****C**

```
void PLIB_USB_BufferEP0RxStatusInitialize(  
    USB_MODULE_ID index,  
    void* pBDT,  
    USB_PING_PONG_MODE ppMode,  
    USB_BUFFER_PING_PONG pingpong,  
    uint16_t bufferByteCount  
);
```

Description

This function initializes the Endpoint 0 RX endpoint buffer descriptors. This function will clear the Endpoint 0 RX Buffer Descriptor status field, load the endpoint size and release the buffer to the USB module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
pBDT	Pointer to Buffer Descriptor Table
pingpong	Ping-Pong mode

bufferByteCount	size of the EP0 RX buffer in bytes

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsBDTFunctions](#) in your application to determine whether this feature is available.

Example

```
//Initialize EP0 RX even buffer descriptor and release back to
//USB. Buffer size is 64
```

```
PLIB_USB_BufferEP0RxStatusInitialize ( MY_USB_INSTANCE, pBDT,
    USB_PING_PONG_NO_PING_PONG, USB_BUFFER_EVEN, 64);
```

5.6.26.6.2.16 PLIB_USB_BufferIndexGet Function**C**

```
uint8_t PLIB_USB_BufferIndexGet(
    USB_MODULE_ID index,
    USB_PING_PONG_MODE ppMode,
    uint8_t epValue,
    USB_BUFFER_DIRECTION bufferDirection,
    USB_BUFFER_PING_PONG bufferPingPong
);
```

Description

This function gets the Buffer Descriptor Table index for a buffer.

Preconditions

None.

Parameters

Parameters	Description
index	Dummy argument, identifier for the device instance of interest
ppMode	Ping-Pong buffering mode
epValue	Endpoint value, 0 <= epValue <= Module Maximum Endpoint
bufferDirection	USB_BUFFER_RX or USB_BUFFER_TX
bufferPingPong	USB_BUFFER_EVEN or USB_BUFFER_ODD

Returns

Buffer index into the Buffer Descriptor Table.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsBDTFunctions](#) in your application to determine whether this feature is available.

Example**5.6.26.6.2.17 PLIB_USB_BufferPIDBitsClear Function****C**

```
void PLIB_USB_BufferPIDBitsClear(
    USB_MODULE_ID index,
```

```

void* pBDT,
USB_PING_PONG_MODE ppMode,
uint8_t epValue,
USB_BUFFER_DIRECTION bufferDirection,
USB_BUFFER_PING_PONG bufferPingPong
);

```

Description

This function clears the Buffer Status bits in the Buffer Descriptor Table.

Preconditions

The associated buffer must have been released by the USB module (i.e., [PLIB_USB_BufferReleasedToSW](#) returns 'true').

Parameters

Parameters	Description
index	Dummy argument, identifier for the device instance of interest
pBDT	Pointer to start of Buffer Descriptor Table
ppMode	Ping-Pong buffering mode
epValue	Endpoint value, 0 <= epValue <= Module Maximum Endpoint
bufferDirection	USB_BUFFER_RX or USB_BUFFER_TX
bufferPingPong	USB_BUFFER_EVEN or USB_BUFFER_ODD

Returns

None.

Remarks

Call [PLIB_USB_BufferPIDBitsClear](#) before setting buffer control bits. This is equivalent to: [PLIB_USB_BufferCancelReleaseToUSB\(...\)](#) [PLIB_USB_BufferDataToggleSelect\(...,USB_BUFFER_DATA0\)](#) [PLIB_USB_BufferDataToggleSyncDisable\(...\)](#) [PLIB_USB_BufferStallDisable\(...\)](#) This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsBDTFunctions](#) in your application to determine whether this feature is available.

Example**5.6.26.6.2.18 PLIB_USB_BufferPIDGet Function****C**

```

uint8_t PLIB_USB_BufferPIDGet(
    USB_MODULE_ID index,
    void* pBDT,
    USB_PING_PONG_MODE ppMode,
    uint8_t epValue,
    USB_BUFFER_DIRECTION bufferDirection,
    USB_BUFFER_PING_PONG bufferPingPong
);

```

Description

This function returns the token packet ID (PID) from the endpoint buffer status.

Preconditions

None.

Parameters

Parameters	Description
index	Dummy argument, identifier for the device instance of interest

pBDT	Pointer to start of Buffer Descriptor Table
ppMode	Ping-Pong buffering mode
epValue	Endpoint value, 0 <= epValue <= Module Maximum Endpoint
bufferDirection	USB_BUFFER_RX or USB_BUFFER_TX
bufferPingPong	USB_BUFFER_EVEN or USB_BUFFER_ODD

Returns

Endpoint buffer packet ID (PID).

Remarks

There is no equivalent "Set" routine, since this field is read-only in the buffer status register within the Buffer Descriptor Table. It is set when the buffer has been transmitted or received by the USB module and the usbOwnsBuffer field has been cleared by the USB module, releasing the buffer for software access. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsBDTFunctions](#) in your application to determine whether this feature is available.

Example**5.6.26.6.2.19 PLIB_USB_BufferReleasedToSW Function****C**

```
bool PLIB_USB_BufferReleasedToSW(
    USB_MODULE_ID index,
    void* pBDT,
    USB_PING_PONG_MODE ppMode,
    uint8_t epValue,
    USB_BUFFER_DIRECTION bufferDirection,
    USB_BUFFER_PING_PONG bufferPingPong
);
```

Description

This function returns the boolean flag value of 'true' when the buffer has been released by the USB module.

Preconditions

None.

Parameters

Parameters	Description
index	Dummy argument, identifier for the device instance of interest
pBDT	Pointer to start of Buffer Descriptor Table
ppMode	Ping-Pong buffering mode
epValue	Endpoint value, 0 <= epValue <= Module Maximum Endpoint
bufferDirection	USB_BUFFER_RX or USB_BUFFER_TX
bufferPingPong	USB_BUFFER_EVEN or USB_BUFFER_ODD

Returns

- true - The buffer has been released by hardware
- false - The buffer is still controlled by hardware

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsBDTFunctions](#) in your application to determine whether this feature is available.

Example**5.6.26.6.2.20 PLIB_USB_BufferReleaseToUSB Function****C**

```

void PLIB_USB_BufferReleaseToUSB(
    USB_MODULE_ID index,
    void* pBDT,
    USB_PING_PONG_MODE ppMode,
    uint8_t epValue,
    USB_BUFFER_DIRECTION bufferDirection,
    USB_BUFFER_PING_PONG bufferPingPong
);

```

Description

This function releases the endpoint buffer by software, allowing the USB module access to buffer.

Preconditions

None.

Parameters

Parameters	Description
index	Dummy argument, identifier for the device instance of interest
pBDT	Pointer to start of Buffer Descriptor Table
ppMode	Ping-Pong buffering mode
epValue	Endpoint value, 0 <= epValue <= Module Maximum Endpoint
bufferDirection	USB_BUFFER_RX or USB_BUFFER_TX
bufferPingPong	USB_BUFFER_EVEN or USB_BUFFER_ODD

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsBDTFunctions](#) in your application to determine whether this feature is available.

Example**5.6.26.6.2.21 PLIB_USB_BufferSchedule Function****C**

```

void PLIB_USB_BufferSchedule(
    USB_MODULE_ID index,
    void* pBDT,
    USB_PING_PONG_MODE ppMode,
    uint8_t epValue,
    USB_BUFFER_DIRECTION bufferDirection,
    USB_BUFFER_PING_PONG bufferPingPong,
    void * bufferAddress,
    int16_t bufferByteCount,
    USB_BUFFER_SCHEDULE_DATA01 bufferData01
);

```

Description

This function sets the endpoint descriptor buffer address, sets the [send](#)/receive byte count, and then hands over the buffer to the USB module.

Preconditions

None.

Parameters

Parameters	Description
index	Dummy argument, identifier for the device instance of interest
pBDT	Pointer to start of Buffer Descriptor Table
ppMode	Ping-Pong buffering mode
epValue	Endpoint value, 0 <= epValue <= Module Maximum Endpoint
bufferDirection	USB_BUFFER_RX or USB_BUFFER_TX
bufferPingPong	USB_BUFFER_EVEN or USB_BUFFER_ODD
bufferAddress	Address of the application buffer
bufferByteCount	Send or expected receive byte count
bufferData01	USB_BUFFER_SET_DATA0, USB_BUFFER_SET_DATA1, or USB_BUFFER_DONTCHANGE (The last choice leaves the existing DATA0/1 value of the buffer alone.)

Returns

None.

Remarks

This function does the work of three other functions: [PLIB_USB_BufferAddressSet](#), [PLIB_USB_BufferByteCountSet](#), [PLIB_USB_BufferReleaseToUSB](#)

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsBDTFunctions](#) in your application to determine whether this feature is available.

5.6.26.6.2.22 PLIB_USB_BufferStallDisable Function**C**

```
void PLIB_USB_BufferStallDisable(
    USB_MODULE_ID index,
    void* pBDT,
    USB_PING_PONG_MODE ppMode,
    uint8_t epValue,
    USB_BUFFER_DIRECTION bufferDirection,
    USB_BUFFER_PING_PONG bufferPingPong
);
```

Description

This function disables STALL handshaking for the associated endpoint buffer.

Preconditions

The associated buffer must have been released by the USB module (i.e., [PLIB_USB_BufferReleasedToSW](#) returns 'true').

Parameters

Parameters	Description
index	Dummy argument, identifier for the device instance of interest
pBDT	Pointer to start of Buffer Descriptor Table
ppMode	Ping-Pong buffering mode
epValue	Endpoint value, 0 <= epValue <= Module Maximum Endpoint
bufferDirection	USB_BUFFER_RX or USB_BUFFER_TX

bufferPingPong	USB_BUFFER_EVEN or USB_BUFFER_ODD

Returns

None.

Remarks

Release of a STALL handshake for the buffer is done by hardware when the host sends a SETUP token to the associated endpoint or resets the USB module. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsBDTFunctions](#) in your application to determine whether this feature is available. .

Example**5.6.26.6.2.23 PLIB_USB_BufferStallEnable Function****C**

```
void PLIB_USB_BufferStallEnable(
    USB_MODULE_ID index,
    void* pBDT,
    USB_PING_PONG_MODE ppMode,
    uint8_t epValue,
    USB_BUFFER_DIRECTION bufferDirection,
    USB_BUFFER_PING_PONG bufferPingPong
);
```

Description

This function enables STALL handshaking for the associated endpoint buffer.

Preconditions

The associated buffer must have been released by the USB module (i.e. [PLIB_USB_BufferReleasedToSW](#) returns 'true').

Parameters

Parameters	Description
index	Dummy argument, identifier for the device instance of interest
pBDT	Pointer to start of Buffer Descriptor Table
ppMode	Ping-Pong buffering mode
epValue	Endpoint value, 0 <= epValue <= Module Maximum Endpoint
bufferDirection	USB_BUFFER_RX or USB_BUFFER_TX
bufferPingPong	USB_BUFFER_EVEN or USB_BUFFER_ODD

Returns

None.

Remarks

Release of a STALL handshake for the buffer is done by hardware when the host sends a SETUP token to the associated endpoint or resets the USB module. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsBDTFunctions](#) in your application to determine whether this feature is available.

Example

5.6.26.6.2.24 PLIB_USB_BufferStallGet Function

C

```
bool PLIB_USB_BufferStallGet(
    USB_MODULE_ID index,
    void* pBDT,
    USB_PING_PONG_MODE ppMode,
    uint8_t epValue,
    USB_BUFFER_DIRECTION bufferDirection,
    USB_BUFFER_PING_PONG bufferPingPong
);
```

Description

This function returns the buffer stall status for an endpoint/direction/ping-pong.

Preconditions

the associated buffer must have been released by the USB module (i.e., [PLIB_USB_BufferReleasedToSW](#) returns 'true').

Parameters

Parameters	Description
index	Dummy argument, identifier for the device instance of interest
pBDT	Pointer to start of Buffer Descriptor Table
ppMode	Ping-Pong buffering mode
epValue	Endpoint value, 0 <= epValue <= Module Maximum Endpoint
bufferDirection	USB_BUFFER_RX or USB_BUFFER_TX
bufferPingPong	USB_BUFFER_EVEN or USB_BUFFER_ODD

Returns

- true - Buffer stall is enabled
- false - Buffer stall is not enabled

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsBDTFunctions](#) in your application to determine whether this feature is available.

Example

5.6.26.6.3 Endpoints Functions

5.6.26.6.3.1 PLIB_USB_EP0HostSetup Function

C

```
void PLIB_USB_EP0HostSetup(
    USB_MODULE_ID index
);
```

Description

This function configures endpoint 0 for typical host operation. Control transfers are enable. Transmit and Receive is enabled. Handshaking is enabled. Low Speed connection is disabled. NAK retry is disabled.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsGEN_Interrupt](#) in your application to determine whether this feature is available.

Example

```
// Configure endpoint 0 for host operation  
PLBIB_USB_EP0HostSetup(USB_MODULE_ID index);
```

5.6.26.6.3.2 PLIB_USB_EP0LSDirectConnectDisable Function**C**

```
void PLIB_USB_EP0LSDirectConnectDisable(  
    USB_MODULE_ID index  
);
```

Description

This function disables direct connection to a low-speed device for Endpoint 0.

Preconditions

The USB module must be in Host mode.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

Host mode and U1EP0 only. Not applicable for PIC18 devices, since USB Host functionality is not available on PIC18 devices. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsEP0LowSpeedConnect](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_EP0LSDirectConnectDisable(MY_USB_INSTANCE);
```

5.6.26.6.3.3 PLIB_USB_EP0LSDirectConnectEnable Function**C**

```
void PLIB_USB_EP0LSDirectConnectEnable(  
    USB_MODULE_ID index  
);
```

Description

This function enables direct connection to a low-speed device for Endpoint 0.

Preconditions

USB module must be in Host mode.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

Host Mode and U1EP0 only. Not applicable for PIC18 devices, since USB Host functionality is not available on PIC18 devices. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsEP0LowSpeedConnect](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_EP0LSDirectConnectEnable(MY_USB_INSTANCE);
```

5.6.26.6.3.4 PLIB_USB_EP0NakRetryDisable Function**C**

```
void PLIB_USB_EP0NakRetryDisable(  
    USB_MODULE_ID index  
);
```

Description

This function disables retrying of NAKed transactions.

Preconditions

The USB module must be in Host or OTG modes.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

Host/OTG only. Not applicable for PIC18 devices, since USB Host and OTG functionality is not available on PIC18 devices. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsEP0NAKRetry](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_EP0NakRetryDisable(MY_USB_INSTANCE);
```

5.6.26.6.3.5 PLIB_USB_EP0NakRetryEnable Function**C**

```
void PLIB_USB_EP0NakRetryEnable(  
    USB_MODULE_ID index  
);
```

Description

This function enables retrying NAK'd transactions for Endpoint 0.

Preconditions

The USB module must be in Host or OTG modes.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

Host/OTG only. Not applicable for PIC18 devices, since USB Host or OTG functionality is not available on PIC18 devices. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsEP0NAKRetry](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_EP0NakRetryEnable(MY_USB_INSTANCE);
```

5.6.26.6.3.6 PLIB_USB_EPnAttributesClear Function**C**

```
void PLIB_USB_EPnAttributesClear(  
    USB_MODULE_ID index,  
    uint8_t epValue  
);
```

Description

Clears the set attributes of the specified endpoint. The endpoint transmit receive, handshake and setup packet handling capability is disabled.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
epValue	Endpoint value, 0 <= epValue <= Module Maximum Endpoint

Returns

None.

Remarks

None.

Example

```
// This clears up the endpoint 0 attributes and thus disables  
// the endpoints  
PLIB_USB_EPnAttributesClear(MY_USB_INSTANCE, 0);
```

5.6.26.6.3.7 PLIB_USB_EPnAttributesSet Function

C

```
void PLIB_USB_EPnAttributesSet(  
    USB_MODULE_ID index,  
    uint8_t epValue,  
    int direction,  
    bool isControl,  
    bool handshake  
);
```

Description

Configures attributes of the endpoint such as direction, handshake capability and direction. If the isControl flag is true, then the direction and handshake parameters are ignored and the endpoint is configured for control transfers.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
epValue	Endpoint value, 0 <= epValue <= Module Maximum Endpoint
direction	Endpoint direction, if 1 then RX and if 0 then TX.
isControl	If true endpoint is configured for control transfers.
handshake	If true, then handshake is enabled on the endpoint else it is disabled.

Returns

None.

Remarks

None.

Example

```
// This enables endpoint 0 for control transfers.  
PLIB_USB_EPnAttributesSet(MY_USB_INSTANCE, 0, 0, true, true);  
// This enables endpoint 2 for non control transfer, direction  
// is RX and handshake enable.  
PLIB_USB_EPnAttributesSet(MY_USB_INSTANCE, 2, 1, false, true);
```

5.6.26.6.3.8 PLIB_USB_EPnControlTransferDisable Function

C

```
void PLIB_USB_EPnControlTransferDisable(  
    USB_MODULE_ID index,  
    uint8_t epValue  
);
```

Description

This function disables endpoint control transfers when endpoint transmit and endpoint receive are both enabled.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
epValue	Endpoint value, 0 <= epValue <= Module Maximum Endpoint

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsEPnRxEnable](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_EPnControlTransferDisable(MY_USB_INSTANCE, someEP);
```

5.6.26.6.3.9 PLIB_USB_EPnControlTransferEnable Function**C**

```
void PLIB_USB_EPnControlTransferEnable(  
    USB_MODULE_ID index,  
    uint8_t epValue  
);
```

Description

This function enables endpoint control transfers when endpoint transmit and endpoint receive are both enabled.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
epValue	Endpoint value, 0 <= epValue <= Module Maximum Endpoint

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsEPnRxEnable](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_EPnControlTransferEnable(MY_USB_INSTANCE, someEP);
```

5.6.26.6.3.10 PLIB_USB_EPnDirectionDisable Function**C**

```
void PLIB_USB_EPnDirectionDisable(  
    USB_MODULE_ID index,  
    uint8_t epValue,  
    int direction  
);
```

Description

Disables the specified endpoint direction.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
epValue	Endpoint value, 0 <= epValue <= Module Maximum Endpoint
direction	If 1, then TX direction is disabled. If 0 RX direction is disabled.

Returns

None.

Remarks

None.

Example

```
// This function disables the TX direction of endpoint 1  
PLIB_USB_EPnDirectionDisable(MY_USB_INSTANCE, 1, 1);
```

5.6.26.6.3.11 PLIB_USB_EPnHandshakeDisable Function**C**

```
void PLIB_USB_EPnHandshakeDisable(  
    USB_MODULE_ID index,  
    uint8_t epValue  
);
```

Description

This function disables endpoint handshaking. Typically used for Isochronous endpoints.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
epValue	Endpoint value, 0 <= epValue <= Module Maximum Endpoint

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsEPnRxEnable](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_EPnHandshakeDisable(MY_USB_INSTANCE, someEP);
```

5.6.26.6.3.12 PLIB_USB_EPnHandshakeEnable Function**C**

```
void PLIB_USB_EPnHandshakeEnable(  
    USB_MODULE_ID index,  
    uint8_t epValue  
);
```

```
);
```

Description

This function enables endpoint handshaking.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
epValue	Endpoint value, 0 <= epValue <= Module Maximum Endpoint

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsEPnRxEnable](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_EPnHandshakeEnable(MY_USB_INSTANCE, someEP);
```

5.6.26.6.3.13 PLIB_USB_EPnIsStalled Function

C

```
bool PLIB_USB_EPnIsStalled(  
    USB_MODULE_ID index,  
    uint8_t epValue  
);
```

Description

This function tests whether the endpoint epValue is stalled.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
epValue	Endpoint value, 0 <= epValue <= Module Maximum Endpoint

Returns

- true - The endpoint is stalled
- false - The endpoint is not stalled

Remarks

Not valid before an endpoint is enabled. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsEPnRxEnable](#) in your application to determine whether this feature is available.

Example

```
if( PLIB_USB_EPnIsStalled(MY_USB_INSTANCE, someEP) )  
{  
    // Handle the stall
```

```
}
```

5.6.26.6.3.14 PLIB_USB_EPnRxDisable Function

C

```
void PLIB_USB_EPnRxDisable(  
    USB_MODULE_ID index,  
    uint8_t endpoint  
);
```

Description

This function disables an endpoint's ability to process IN tokens.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
endpoint	Endpoint to be affected

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsEPnRxEnable](#) in your application to determine whether this feature is available.

Example

```
//De-provision endpoint 3 to process IN Token  
PLIB_USB_EPnRxDisable(MY_USB_INSTANCE, 3);
```

5.6.26.6.3.15 PLIB_USB_EPnRxEnable Function

C

```
void PLIB_USB_EPnRxEnable(  
    USB_MODULE_ID index,  
    uint8_t endpoint  
);
```

Description

This function enables an endpoint to process IN tokens.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
endpoint	Endpoint to be affected

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsEPnRxEnable](#) in your application to determine whether this feature is available.

Example

```
//Provision endpoint 3 to process IN Token
PLIB_USB_EPnRxEnable(MY_USB_INSTANCE, 3);
```

5.6.26.6.3.16 PLIB_USB_EPnRxSelect Function

C

```
void PLIB_USB_EPnRxSelect(
    USB_MODULE_ID index,
    uint8_t epValue,
    USB_EP_TXRX epTxRx
);
```

Description

This function selects receive capabilities of an endpoint.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
epValue	Endpoint value, 0 <= epValue <= Module Maximum Endpoint
epTxRx	Transmit/Receive setting for endpoint: USB_EP_RX, USB_EP_NOTXRX

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsEPnRxEnable](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_EPnRxSelect(MY_USB_INSTANCE, someEP, USB_EP_RX);
```

5.6.26.6.3.17 PLIB_USB_EPnStallClear Function

C

```
void PLIB_USB_EPnStallClear(
    USB_MODULE_ID index,
    uint8_t epValue
);
```

Description

This function clears an endpoint's stalled flag.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
epValue	Endpoint value, 0 <= epValue <= Module Maximum Endpoint

Returns

None.

Remarks

Not valid before an endpoint is enabled. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsEPnRxEnable](#) in your application to determine whether this feature is available.

Example

```
if( PLIB_USB_EPnIsStalled(MY_USB_INSTANCE, someEP) )
{
    // Handle the stall
    PLIB_USB_EPnStallClear(MY_USB_INSTANCE, someEP);
}
```

5.6.26.6.3.18 PLIB_USB_EPnTxDisable Function**C**

```
void PLIB_USB_EPnTxDisable(
    USB_MODULE_ID index,
    uint8_t endpoint
);
```

Description

This function disables an endpoint's ability to process OUT tokens.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
endpoint	Endpoint to be affected

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsEPnRxEnable](#) in your application to determine whether this feature is available.

Example

```
//De-provision endpoint 3 to process OUT Token
PLIB_USB_EPnTxDisable(MY_USB_INSTANCE, 3);
```

5.6.26.6.3.19 PLIB_USB_EPnTxEnable Function**C**

```
void PLIB_USB_EPnTxEnable(
```

```
    USB_MODULE_ID index,  
    uint8_t endpoint  
);
```

Description

This function enables an endpoint to process OUT tokens.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
endpoint	Endpoint to be affected

Returns

None.

Remarks

None.

Example

```
//Provision endpoint 3 to process OUT Token  
PLIB_USB_EPnTxEnable(MY_USB_INSTANCE, 3);
```

5.6.26.6.3.20 PLIB_USB_EPnTxRxSelect Function**C**

```
void PLIB_USB_EPnTxRxSelect(  
    USB_MODULE_ID index,  
    uint8_t epValue,  
    USB_EP_TXRX epTxRx  
);
```

Description

This function selects transmit and/or receive capabilities of an endpoint.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
epValue	Endpoint value, 0 <= epValue <= Module Maximum Endpoint
epTxRx	Transmit/Receive setting for endpoint: USB_EP_TX, USB_EP_RX, USB_EP_TX_RX, USB_EP_NOTXRX

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsEPnRxEnable](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_EPnTxRxSelect(MY_USB_INSTANCE, someEP, USB_EP_TXRX);
```

5.6.26.6.3.21 PLIB_USB_EPnTxSelect Function**C**

```
void PLIB_USB_EPnTxSelect(  
    USB_MODULE_ID index,  
    uint8_t epValue,  
    USB_EP_TXRX epTxRx  
);
```

Description

This function selects transmit capabilities of an endpoint.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
epValue	Endpoint value, 0 <= epValue <= Module Maximum Endpoint
epTxRx	Transmit/Receive setting for endpoint: USB_EP_TX, USB_EP_NOTXRX

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsEPnRxEnable](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_EPnTxSelect(MY_USB_INSTANCE, someEP, USB_EP_TX);
```

5.6.26.6.4 Interrupts Functions**5.6.26.6.4.1 PLIB_USB_InterruptDisable Function****C**

```
void PLIB_USB_InterruptDisable(  
    USB_MODULE_ID index,  
    USB_INTERRUPTS interruptFlag  
);
```

Description

This function disables a general interrupt source for the USB module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

interruptFlag	Interrupt

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsGEN_Interrupt](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_InterruptDisable( MY_USB_INSTANCE, USB_INT_ERROR );
```

5.6.26.6.4.2 PLIB_USB_InterruptEnable Function**C**

```
void PLIB_USB_InterruptEnable(  
    USB_MODULE_ID index,  
    USB_INTERRUPTS interruptFlag  
);
```

Description

This function enables general interrupt sources of the USB module to trigger a USB interrupt.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
interruptFlag	Interrupt

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsGEN_Interrupt](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_InterruptEnable( MY_USB_INSTANCE, USB_INT_ERROR );
```

5.6.26.6.4.3 PLIB_USB_InterruptEnableGet Function**C**

```
USB_INTERRUPTS PLIB_USB_InterruptEnableGet(  
    USB_MODULE_ID index  
);
```

Description

Returns the enable/disable status of general USB module interrupts

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

A bit map containing status of enabled interrupts.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsGEN_Interrupt](#) in your application to determine whether this feature is available.

Example

```
USB_INTERRUPTS enabledInterrupts;
enabledInterrupts = PLIB_USB_InterruptEnableGet( MY_USB_INSTANCE);
if(enabledInterrupts|USB_INT_ATTACH)
{
    // This means Attach interrupt is enabled.
}
```

5.6.26.6.4.4 PLIB_USB_InterruptFlagAllGet Function**C**

```
USB_INTERRUPTS PLIB_USB_InterruptFlagAllGet(
    USB_MODULE_ID index
);
```

Description

This function returns a logically ORed bit map of active general USB interrupt flags.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

Returns a logically ORed bit map of active general USB interrupt flags.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsGEN_InterruptStatus](#) in your application to determine whether this feature is available.

Example

```
USB_INTERRUPTS interruptEnables;

interruptEnables = PLIB_USB_InterruptFlagAllGet(MY_USB_INSTANCE);
if(interruptEnables | USB_INT_DEVICE_RESET)
{
    // Device received reset signalling
}
```

5.6.26.6.4.5 PLIB_USB_InterruptFlagClear Function**C**

```
void PLIB_USB_InterruptFlagClear(
```

```
    USB_MODULE_ID index,  
    USB_INTERRUPTS interruptFlag  
);
```

Description

This function clears a general interrupt source flag for the USB module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
interruptFlag	Interrupt

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsGEN_InterruptStatus](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_InterruptFlagClear( MY_USB_INSTANCE, USB_INT_ERROR );
```

5.6.26.6.4.6 PLIB_USB_InterruptFlagGet Function**C**

```
bool PLIB_USB_InterruptFlagGet(  
    USB_MODULE_ID index,  
    USB_INTERRUPTS interruptFlag  
);
```

Description

This function tests a general interrupt source flag for the USB module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
interruptFlag	Interrupt

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsGEN_InterruptStatus](#) in your application to determine whether this feature is available.

Example

```
if ( PLIB_USB_InterruptFlagGet(MY_USB_INSTANCE, USB_INT_ANY) )  
    if ( PLIB_USB_InterruptFlagGet(MY_USB_INSTANCE, USB_INT_ERROR) )  
    {  
        PLIB_USB_InterruptFlagClear(MY_USB_INSTANCE, USB_INT_ERROR);  
    }
```

```
        // Error clean up
    }
    if ( PLIB_USB_InterruptFlagGet(MY_USB_INSTANCE, USB_INT_HOST_DETACH) )
    {
        PLIB_USB_InterruptFlagClear(MY_USB_INSTANCE, USB_INT_HOST_DETACH);
        // Device detached clean up
    }
    .
    .
    .
}
```

5.6.26.6.4.7 PLIB_USB_InterruptFlagSet Function

C

```
void PLIB_USB_InterruptFlagSet(
    USB_MODULE_ID index,
    USB_INTERRUPTS interruptFlag
);
```

Description

This function sets a general interrupt source flag for the USB module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
interruptFlag	Interrupt

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsGEN_InterruptStatus](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_InterruptFlagSet( MY_USB_INSTANCE, USB_INT_ERROR );
```

5.6.26.6.4.8 PLIB_USB_InterruptIsEnabled Function

C

```
bool PLIB_USB_InterruptIsEnabled(
    USB_MODULE_ID index,
    USB_INTERRUPTS interruptFlag
);
```

Description

This function returns true if interrupts are enabled.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
interruptFlag	Interrupt

Returns

- true - Interrupts are enabled
- false - Interrupts are not enabled

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsGEN_Interrupt](#) in your application to determine whether this feature is available.

Example

```
if ( PLIB_USB_InterruptIsEnabled( MY_USB_INSTANCE, USB_INT_ERROR ) )
{
}
```

5.6.26.6.5 Error Interrupts Functions

5.6.26.6.5.1 PLIB_USB_ErrorInterruptDisable Function

C

```
void PLIB_USB_ErrorInterruptDisable(
    USB_MODULE_ID index,
    USB_ERROR_INTERRUPTS interruptFlag
);
```

Description

This function disables an error interrupt source for the USB module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
interruptFlag	Interrupt

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsERR_Interrupt](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_ErrorInterruptDisable( MY_USB_INSTANCE, USB_ERR_INT_BAD_CRC16 );
```

5.6.26.6.5.2 PLIB_USB_ErrorInterruptEnable Function

C

```
void PLIB_USB_ErrorInterruptEnable(  
    USB_MODULE_ID index,  
    USB_ERROR_INTERRUPTS interruptFlag  
);
```

Description

This function enables error interrupt sources of the USB module to trigger a USB interrupt.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
interruptFlag	Interrupt

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsERR_Interrupt](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_ErrorInterruptEnable( MY_USB_INSTANCE, USB_ERR_INT_BAD_CRC16 );
```

5.6.26.6.5.3 PLIB_USB_ErrorInterruptFlagAllGet Function

C

```
USB_ERROR_INTERRUPTS PLIB_USB_ErrorInterruptFlagAllGet(  
    USB_MODULE_ID index  
);
```

Description

This function returns a logically ORed bit map of active error interrupt flags.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

Returns a logically ORed bit map of active error interrupt flags.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsERR_InterruptStatus](#) in your application to determine whether this feature is available.

Example

```
USB_ERROR_INTERRUPTS errorInterruptEnables;

errorInterruptEnables = PLIB_USB_ErrorInterruptFlagAllGet(MY_USB_INSTANCE);
if(errorInterruptEnables | USB_ERR_INT_DEVICE_EOF_ERROR)
{
    // End of frame error occurred.
}
```

5.6.26.6.5.4 PLIB_USB_ErrorInterruptFlagClear Function**C**

```
void PLIB_USB_ErrorInterruptFlagClear(
    USB_MODULE_ID index,
    USB_ERROR_INTERRUPTS interruptFlag
);
```

Description

This function clears an error interrupt source flag for the USB module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
interruptFlag	Interrupt

Returns

None.

Remarks

None.

Example

```
PLIB_USB_ErrorInterruptFlagClear( MY_USB_INSTANCE, USB_ERR_INT_BAD_CRC16 );
```

5.6.26.6.5.5 PLIB_USB_ErrorInterruptFlagGet Function**C**

```
bool PLIB_USB_ErrorInterruptFlagGet(
    USB_MODULE_ID index,
    USB_ERROR_INTERRUPTS interruptFlag
);
```

Description

This function tests an error interrupt source flag for the USB module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
interruptFlag	Interrupt

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsERR_InterruptStatus](#) in your application to determine whether this feature is available.

Example

```
if ( PLIB_USB_ErrorInterruptFlagGet(MY_USB_INSTANCE,USB_ERR_INT_ANY) )
{
    if ( PLIB_USB_ErrorInterruptFlagGet(MY_USB_INSTANCE,USB_ERR_INT_PID_CHECK_FAILURE) )
    {
        PLIB_USB_ErrorInterruptFlagClear(MY_USB_INSTANCE,USB_ERR_INT_PID_CHECK_FAILURE);
        // PID Error Check failure cleanup
    }
    if ( PLIB_USB_ErrorInterruptFlagGet(MY_USB_INSTANCE,USB_ERR_INT_DEVICE_EOF_ERROR) )
    {
        PLIB_USB_ErrorInterruptFlagClear(MY_USB_INSTANCE,USB_ERR_INT_DEVICE_EOF_ERROR);
        // EOF error cleanup
    }
    .
    .
    .
}
```

5.6.26.6.5.6 PLIB_USB_ErrorInterruptFlagSet Function

C

```
void PLIB_USB_ErrorInterruptFlagSet(
    USB_MODULE_ID index,
    USB_ERROR_INTERRUPTS interruptFlag
);
```

Description

This function sets an error interrupt source flag for the USB module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
interruptFlag	Interrupt

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsERR_InterruptStatus](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_ErrorInterruptFlagSet( MY_USB_INSTANCE, USB_ERR_INT_BAD_CRC16 );
```

5.6.26.6.5.7 PLIB_USB_ErrorInterruptIsEnabled Function

C

```
bool PLIB_USB_ErrorInterruptIsEnabled(
```

```
    USB_MODULE_ID index,  
    USB_INTERRUPTS interruptFlag  
);
```

Description

This function determines whether interrupts are enabled.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
interruptFlag	Interrupt

Returns

- true - Interrupts are enabled
- false - Interrupts are not enabled

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsERR_InterruptStatus](#) in your application to determine whether this feature is available.

Example

```
if ( PLIB_USB_ErrorInterruptIsEnabled( MY_USB_INSTANCE, USB_ERR_INT_BAD_CRC16 ) )  
{  
  
}
```

5.6.26.6.6 Last Transaction Status Functions

5.6.26.6.6.1 PLIB_USB_LastTransactionDetailsGet Function

C

```
void PLIB_USB_LastTransactionDetailsGet(  
    USB_MODULE_ID index,  
    USB_BUFFER_DIRECTION * direction,  
    USB_PING_PONG_STATE * pingpong,  
    uint8_t * endpoint  
);
```

Description

This function returns the details of the last completed transaction.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
direction	Return value contains direction of the last transfer
pingpong	Return value contains Ping-Pong indication of the the last transfer
endpoint	Return value contains the endpoint which processed the last transfer

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsLastTransactionDetails](#) in your application to determine whether this feature is available.

Example

```
USB_BUFFER_DIRECTION direction;
USB_PING_PONG_STATE pingpong;
uint8_t endpoint;

interruptEnables = PLIB_USB_InterruptFlagAllGet(MY_USB_INSTANCE);
if(interruptEnables | USB_INT_TOKEN_DONE)
{
    // Find out details of the token
    PLIB_USB_LastTransactionDetailsGet(MY_USB_INSTANCE, &direction,
                                      &pingpong, &endpoint);
}
```

5.6.26.6.2 PLIB_USB_LastTransactionDirectionGet Function**C**

```
USB_BUFFER_DIRECTION PLIB_USB_LastTransactionDirectionGet(
    USB_MODULE_ID index
);
```

Description

This function indicates the direction of the last transaction, either transmit or receive.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

USB_LastDirection: USB_RECEIVE_TRANSFER or USB_TRANSMIT_TRANSFER

Remarks

None.

Example

See [PLIB_USB_LastTransactionEndPtGet](#).

5.6.26.6.3 PLIB_USB_LastTransactionEndPtGet Function**C**

```
uint8_t PLIB_USB_LastTransactionEndPtGet(
    USB_MODULE_ID index
);
```

Description

This function returns the endpoint number of the last USB transfer, which is actually the index into the Buffer Descriptor Table of the last USB transfer.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

endPoint - Endpoint of last completed USB transfer

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsLastDirection](#) in your application to determine whether this feature is available.

Example

```
while ( !PLIB_USB_INT_FlagGet(MY_USB_INSTANCE, USB_INT_GEN, TOKEN_DONE) )
{
    // Do nothing, wait until completion of next transaction
}

// Retrieve information relating to the last completed transaction
endpoint = PLIB_USB_LastTransactionEndPtGet(MY_USB_INSTANCE);
direction = PLIB_USB_LastTransactionDirectionGet(MY_USB_INSTANCE);
pingPongState = PLIB_USB_LastTransactionPingPongStateGet(MY_USB_INSTANCE);

// Clearing the Token Processing Done flag advances the status FIFO to
// oldest transaction in the FIFO. Wait for completion of next transaction
// before using PLIB_USB_Last*Get functions again to read status.
PLIB_USB_INT_FlagClear(MY_USB_INSTANCE, USB_INT_GEN, TOKEN_DONE);
```

5.6.26.6.6.4 PLIB_USB_LastTransactionPingPongStateGet Function**C**

```
USB_PING_PONG_STATE PLIB_USB_LastTransactionPingPongStateGet(
    USB_MODULE_ID index
);
```

Description

This function indicates whether the last transaction was to an Even buffer or an Odd buffer.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

[USB_PING_PONG_STATE](#).

Remarks

Not valid if PIC18 or PIC24F endpoint does not have ping-pong buffering enabled. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsLastPingPong](#) in your application to determine whether this feature is available.

Example

See [PLIB_USB_LastTransactionEndPtGet](#).

5.6.26.6.7 Host Functions

5.6.26.6.7.1 PLIB_USB_IsBusyWithToken Function

C

```
bool PLIB_USB_IsBusyWithToken(  
    USB_MODULE_ID index  
);
```

Description

This function indicates whether there is a token being executed by the USB module as Host. Software should check that the previous token is finished before issuing a new token.

Preconditions

USB module must be in Host mode.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

Not applicable for PIC18 devices since PIC18 devices do not support Host mode. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsHostBusyWithToken](#) in your application to determine whether this feature is available.

Example

```
while( PLIB_USB_IsBusyWithToken(MY_USB_INSTANCE) )  
{  
    // do nothing  
}  
// Issue new token
```

5.6.26.6.7.2 PLIB_USB_SOFDisable Function

C

```
void PLIB_USB_SOFDisable(  
    USB_MODULE_ID index  
);
```

Description

This function disables the automatic generation of the SOF token.

Preconditions

USB module must be in Host mode.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

Not applicable for PIC18 devices since PIC18 devices do not support Host mode. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsStartOfFrames](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_SOFDisable(MY_USB_INSTANCE);
```

5.6.26.6.7.3 PLIB_USB_SOFEnable Function**C**

```
void PLIB_USB_SOFEnable(  
    USB_MODULE_ID index  
);
```

Description

This function enables the automatic generation of the SOF token every 1 ms.

Preconditions

USB module must be in Host mode.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

Not applicable for PIC18 devices since PIC18 devices do not support Host mode. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsStartOfFrames](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_SOFEnable(MY_USB_INSTANCE);
```

5.6.26.6.7.4 PLIB_USB_SOFThresholdGet Function**C**

```
uint8_t PLIB_USB_SOFThresholdGet(  
    USB_MODULE_ID index  
);
```

Description

This function returns the Start-of-Frame (SOF) Count bits. (Value represents 10 + (packet size of n bytes);).

Preconditions

The USB module must be in Host mode.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

SOF threshold value.

Remarks

Host mode only.

```
SOF Threshold Value = packet byte count + 10
                    = 0b0100_1010 = 0x4A = 74 for 64-byte packet
                    = 0b0010_1010 = 0x2A = 42 for 32-byte packet
                    = 0b0001_1010 = 0x1A = 26 for 16-byte packet
                    = 0x0001_0010 = 0x12 = 18 for 8-byte packet
```

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsSOFThreshold](#) in your application to determine whether this feature is available.

Example

```
thresholdSOF = PLIB_USB_SOFThresholdGet(MY_USB_INSTANCE);
```

5.6.26.6.7.5 PLIB_USB_SOFThresholdSet Function**C**

```
void PLIB_USB_SOFThresholdSet(
    USB_MODULE_ID index,
    uint8_t threshold
);
```

Description

This function sets the Start-of-Frame (SOF) threshold value.

Preconditions

The USB module must be in Host mode.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
threshold	SOF threshold

Returns

None.

Remarks

Host mode only.

```
SOF Threshold Value = packet byte count + 10
                    = 0b0100_1010 = 0x4A = 74 for 64-byte packet
                    = 0b0010_1010 = 0x2A = 42 for 32-byte packet
                    = 0b0001_1010 = 0x1A = 26 for 16-byte packet
                    = 0x0001_0010 = 0x12 = 18 for 8-byte packet
```

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsSOFThreshold](#) in your application to determine whether this feature is available.

Example

```
// Set SOF threshold for 64-byte packets
PLIB_USB_SOFThresholdSet(MY_USB_INSTANCE, 64+10);
```

5.6.26.6.7.6 PLIB_USB-TokenEPGet Function**C**

```
uint8_t PLIB_USB-TokenEPGet(
    USB_MODULE_ID index
);
```

Description

This function returns the address of the specified Endpoint.

Preconditions

The USB module must be in Host mode.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

Endpoint value - $0 \leq \text{epValue} \leq \text{Module Maximum Endpoint}$.

Remarks

Host mode only.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsTokenEP](#) in your application to determine whether this feature is available.

Example

```
someEP = PLIB_USB-TokenEPGet(MY_USB_INSTANCE);
```

5.6.26.6.7.7 PLIB_USB-TokenEPSet Function**C**

```
void PLIB_USB-TokenEPSet(
    USB_MODULE_ID index,
    uint8_t epValue
);
```

Description

This function sets the Endpoint address for a host transaction.

Preconditions

The USB module must be in Host mode.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
epValue	Endpoint value, $0 \leq \text{epValue} \leq \text{Module Maximum Endpoint}$

Returns

None.

Remarks

Host mode only. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsTokenEP](#) in your application to determine whether this feature is available.

Example

```
uint8_t someEP = 0x03;
PLIB_USB-TokenEPSet(MY_USB_INSTANCE, someEP);
```

5.6.26.6.7.8 PLIB_USB-TokenPIDGet Function

C

```
USB_PID PLIB_USB-TokenPIDGet(
    USB_MODULE_ID index
);
```

Description

This function returns the token transaction type.

Preconditions

The USB module must be in Host mode.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

Packet ID of token, USB_PID_SETUP, USB_PID_IN, or USB_PID_OUT

Remarks

Host mode only. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsTokenPID](#) in your application to determine whether this feature is available.

Example

```
somePID = PLIB_USB-TokenPIDGet(MY_USB_INSTANCE);
```

5.6.26.6.7.9 PLIB_USB-TokenPIDSet Function

C

```
void PLIB_USB-TokenPIDSet(
    USB_MODULE_ID index,
    USB_PID pidValue
);
```

Description

This function sets the token transaction type to pidValue.

Preconditions

The USB module must be in Host mode.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

pidValue	USB_PID_SETUP, USB_PID_IN, or USB_PID_OUT

Returns

None.

Remarks

Host mode only. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsTokenPID](#) in your application to determine whether this feature is available.

Example

```
somePID = USB_PID_SETUP;
PLIB_USB-TokenPIDSet (MY_USB_INSTANCE, somePID );
```

5.6.26.6.7.10 PLIB_USB-TokenSpeedSelect Function

C

```
void PLIB_USB-TokenSpeedSelect(
    USB_MODULE_ID index,
    USB_TOKEN_SPEED tokenSpeed
);
```

Description

This function selects low speed or full speed for subsequent token executions.

Preconditions

The USB module must be in Host mode.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
tokenSpeed	Speed for next token execution: USB_LOWSPEED_TOKENS or USB_FULLSPEED_TOKENS

Returns

None.

Remarks

Not applicable for PIC18 devices since PIC18 devices do not support Host mode. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsNextTokenSpeed](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB-TokenSpeedSet (MY_USB_INSTANCE, USB_LOWSPEED_TOKENS);
```

5.6.26.6.8 USB Bus Signaling Functions

5.6.26.6.8.1 PLIB_USB_ResetSignalDisable Function

C

```
void PLIB_USB_ResetSignalDisable(
    USB_MODULE_ID index
);
```

Description

This function disables reset signalling on the USB bus.

Preconditions

The USB module must be in Host mode.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

Not applicable for PIC18, since USB Host functionality is Not available on PIC18 devices. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsHostGeneratesReset](#) in your application to determine whether this feature is available.

Example

See [PLIB_USB_ResetSignalEnable](#).

5.6.26.6.8.2 PLIB_USB_ResetSignalEnable Function**C**

```
void PLIB_USB_ResetSignalEnable(  
    USB_MODULE_ID index  
);
```

Description

This function enables reset signalling on the USB bus.

Preconditions

The USB module must be in Host mode.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

Not applicable for PIC18, since USB Host functionality is Not available on PIC18 devices. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsHostGeneratesReset](#) in your application to determine whether this feature is available.

Example

```
// Snippet to perform a software reset:  
PLIB_USB_ResetSignalEnable(MY_USB_INSTANCE);  
// ... delay 50ms  
PLIB_USB_ResetSignalDisable(MY_USB_INSTANCE);
```

5.6.26.6.8.3 PLIB_USB_ResumeSignalingDisable Function

C

```
void PLIB_USB_ResumeSignalingDisable(  
    USB_MODULE_ID index  
);
```

Description

This function disables resume signaling.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsResumeSignaling](#) in your application to determine whether this feature is available.

Example

See [PLIB_USB_ResumeSignalingEnable](#).

5.6.26.6.8.4 PLIB_USB_ResumeSignalingEnable Function

C

```
void PLIB_USB_ResumeSignalingEnable(  
    USB_MODULE_ID index  
);
```

Description

This function enables resume signalling. Resume allows the peripheral to perform a remote wake-up by executing resume signaling.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

Software must enable resume signaling for 10 ms if the device is in Device mode, or for 25 ms if the device is in Host mode, and then disable resume signaling to enable remote wake-up. In Host mode, the USB module will append a low-speed EOP to the end resume signaling when it is disabled. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsResumeSignaling](#) in your application to determine whether this

feature is available.

Example

```
// Perform resume signaling:
PLIB_USB_ResumeSignalingEnable(MY_USB_INSTANCE);
// Delay 10ms
PLIB_USB_ResumeSignalingDisable(MY_USB_INSTANCE);
```

5.6.26.6.9 On-The-Go (OTG) Functions

5.6.26.6.9.1 PLIB_USB_OTG_BSessionHasEnded Function

C

```
bool PLIB_USB_OTG_BSessionHasEnded(
    USB_MODULE_ID index
);
```

Description

This function returns the status of the B-Session End Indicator bit.

Preconditions

The USB module must be in OTG mode.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

- true - The VBUS Voltage is below VB_SESS_END on the B-device
- false - The VBUS voltage is above VB_SESS_END on the B-device

Remarks

Not available on PIC18 devices. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsOTG_BSessionEnd](#) in your application to determine whether this feature is available.

Example

```
if ( !PLIB_USB_OTG_BSessionHasEnded(MY_USB_INSTANCE) )
{
    // B session valid
}
else
{
    // B session not valid
}
```

5.6.26.6.9.2 PLIB_USB_OTG_IDPinStateIsTypeA Function

C

```
bool PLIB_USB_OTG_IDPinStateIsTypeA(
    USB_MODULE_ID index
);
```

Description

This function returns ID Pin state.

Preconditions

The USB module must be in OTG mode.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

- true - Type A Cable attached,
- false - No cable is attached or a Type B cable is attached

Remarks

Not available on PIC18 devices. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsOTG_IDPinState](#) in your application to determine whether this feature is available.

Example

```
if ( PLIB_USB_OTG_IDPinStateIsTypeA(MY_USB_INSTANCE) )
{
    // Type A cable attached
}
else
{
    // No cable or Type B cable attached
};
```

5.6.26.6.9.3 PLIB_USB_OTG_LineStateIsStable Function**C**

```
bool PLIB_USB_OTG_LineStateIsStable(
    USB_MODULE_ID index
);
```

Description

This function returns the status of the Line Stable Indicator bit.

Preconditions

The USB module must be in OTG mode.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

- true - The USB line state has been stable for the previous 1 ms
- false - The USB line state has not been stable for the previous 1 ms

Remarks

Not available on PIC18 devices. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsOTG_LineState](#) in your application to determine whether this feature is available.

Example

```
if( PLIB_USB_OTG_LineStateIsStable(MY_USB_INSTANCE) ) {
    // Line has been stable
}
```

```
    // ... rest of code ...  
}
```

5.6.26.6.9.4 PLIB_USB_OTG_PullUpPullDownSetup Function

C

```
void PLIB_USB_OTG_PullUpPullDownSetup(  
    USB_MODULE_ID index,  
    USB_OTG_PULL_UP_PULL_DOWN resistor,  
    bool enableResistor  
);
```

Description

This function enables or disables pull-up and pull-down resistors.

Preconditions

USB On-The-Go (OTG) must be enabled.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
resistor	USB_OTG_DPLUS_PULLUP, USB_OTG_DMINUS_PULLUP, USB_OTG_DPLUS_PULLDN, or USB_OTG_DMINUS_PULLDN
enableResistor	true to enable resistor, false to disable it

Returns

None.

Remarks

Not available on PIC18 devices. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsOTG_PullUpPullDown](#) in your application to determine whether this feature is available.

Example

```
// Enable pull-up resistor for D+  
PLIB_USB_OTG_PullUpPullDownSetup(MY_USB_INSTANCE, USB_OTG_DPLUS_PULLUP, true);
```

5.6.26.6.9.5 PLIB_USB_OTG_SessionValid Function

C

```
bool PLIB_USB_OTG_SessionValid(  
    USB_MODULE_ID index  
);
```

Description

This function returns the status of the Session Valid Indicator bit.

Preconditions

The USB module must be in OTG mode.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

- true - The VBUS voltage is above Session Valid on the A or B device

- false - The VBUS voltage is below Session Valid on the A or B device

Remarks

Not available on PIC18 devices. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsOTG_SessionValid](#) in your application to determine whether this feature is available.

Example

```
if ( PLIB_USB_OTG_SessionValid(MY_USB_INSTANCE) )
{
    // Session valid
}
else
{
    // Session not valid
}
```

5.6.26.6.9.6 PLIB_USB_OTG_VBusChargeDisable Function**C**

```
void PLIB_USB_OTG_VBusChargeDisable(
    USB_MODULE_ID index
);
```

Description

This function disables VBUS line charge.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

Not available on PIC18 or PIC32 devices. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsOTG_VbusCharge](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_OTG_VBusChargeDisable(MY_USB_INSTANCE);
```

5.6.26.6.9.7 PLIB_USB_OTG_VBusChargeEnable Function**C**

```
void PLIB_USB_OTG_VBusChargeEnable(
    USB_MODULE_ID index
);
```

Description

This function enables the VBUS line to be charged through a pull-up resistor.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

Not available on PIC18 or PIC32 devices. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsOTG_VbusDischarge](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_OTG_VBusChargeEnable(MY_USB_INSTANCE);
```

5.6.26.6.9.8 PLIB_USB_OTG_VBusChargeTo3V Function**C**

```
void PLIB_USB_OTG_VBusChargeTo3V(  
    USB_MODULE_ID index  
);
```

Description

This function sets the VBUS line to charge to 3.3V.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

Not available on PIC18 or PIC32 devices.

Example

```
PLIB_USB_OTG_VBusChargeTo3V(MY_USB_INSTANCE);
```

5.6.26.6.9.9 PLIB_USB_OTG_VBusChargeTo5V Function**C**

```
void PLIB_USB_OTG_VBusChargeTo5V(  
    USB_MODULE_ID index  
);
```

Description

This function sets the VBUS line to charge to 5V.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

Not available on PIC18 or PIC32 devices.

Example

```
PLIB_USB_OTG_VBusChargeTo5V (MY_USB_INSTANCE);
```

5.6.26.6.9.10 PLIB_USB_OTG_VBusDischargeDisable Function**C**

```
void PLIB_USB_OTG_VBusDischargeDisable(  
    USB_MODULE_ID index  
);
```

Description

This function disables VBUS line discharge.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

Not available on PIC18 or PIC32 devices. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsOTG_VbusDischarge](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_OTG_VBusDischargeDisable(MY_USB_INSTANCE);
```

5.6.26.6.9.11 PLIB_USB_OTG_VBusDischargeEnable Function**C**

```
void PLIB_USB_OTG_VBusDischargeEnable(  
    USB_MODULE_ID index  
);
```

Description

This function enables the VBUS line to be discharged through a resistor.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

Not available on PIC18 or PIC32 devices. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsOTG_VbusCharge](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_OTG_VBusDischargeEnable(MY_USB_INSTANCE);
```

5.6.26.6.9.12 PLIB_USB_OTG_VBusPowerOff Function**C**

```
void PLIB_USB_OTG_VBusPowerOff(  
    USB_MODULE_ID index  
);
```

Description

This function turns off power on the VBUS Line.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

Not available on PIC18 devices. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsOTG_VbusPowerOnOff](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_OTG_VBusPowerOff(MY_USB_INSTANCE);
```

5.6.26.6.9.13 PLIB_USB_OTG_VBusPowerOn Function**C**

```
void PLIB_USB_OTG_VBusPowerOn(  
    USB_MODULE_ID index  
);
```

Description

This function turns on power for the VBUS line.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

Not available on PIC18 devices. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsOTG_VbusPowerOnOff](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_OTG_VBusPowerOn(MY_USB_INSTANCE);
```

5.6.26.6.9.14 PLIB_USB_OTG_VBusValid Function**C**

```
bool PLIB_USB_OTG_VBusValid(  
    USB_MODULE_ID index  
);
```

Description

This function returns the status of the A-VBUS valid indicator.

Preconditions

The USB module must be in OTG mode.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

- true - The VBUS voltage is above VA_VBUS_VLD on the A-device,
- false - The VBUS voltage is below VA_VBUS_VLD on the A-device

Remarks

Not available on PIC18 devices. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsOTG_ASessionValid](#) in your application to determine whether this feature is available.

Example

```
if ( PLIB_USB_OTG_VBusValid(MY_USB_INSTANCE) )  
{  
    // Vbus voltage above session valid for A device  
}  
else  
{  
    // Vbus voltage below session valid for A device  
}
```

5.6.26.6.10 OTG Interrupts Functions

5.6.26.6.10.1 PLIB_USB_OTG_InterruptDisable Function

C

```
void PLIB_USB_OTG_InterruptDisable(  
    USB_MODULE_ID index,  
    USB_OTG_INTERRUPTS interruptFlag  
);
```

Description

This function disables a USB On-The-Go (OTG) interrupt source for the USB module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
interruptFlag	Interrupt

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsOTG_Interrupt](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_OTG_InterruptDisable( MY_USB_INSTANCE, USB_OTG_INT_ID_STATE_CHANGE );
```

5.6.26.6.10.2 PLIB_USB_OTG_InterruptEnable Function

C

```
void PLIB_USB_OTG_InterruptEnable(  
    USB_MODULE_ID index,  
    USB_OTG_INTERRUPTS interruptFlag  
);
```

Description

This function enables USB On-The-Go (OTG) interrupt sources of the USB module to trigger a USB interrupt.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
interruptFlag	Interrupt

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsOTG_Interrupt](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_OTG_InterruptEnable( MY_USB_INSTANCE, USB_OTG_INT_ID_STATE_CHANGE );
```

5.6.26.6.10.3 PLIB_USB_OTG_InterruptFlagClear Function**C**

```
void PLIB_USB_OTG_InterruptFlagClear(  
    USB_MODULE_ID index,  
    USB_OTG_INTERRUPTS interruptFlag  
);
```

Description

This function clears a USB On-The-Go (OTG) interrupt source flag for the USB module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
interruptFlag	Interrupt

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsOTG_InterruptStatus](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_OTG_InterruptFlagClear( MY_USB_INSTANCE, USB_OTG_INT_ID_STATE_CHANGE );
```

5.6.26.6.10.4 PLIB_USB_OTG_InterruptFlagGet Function**C**

```
bool PLIB_USB_OTG_InterruptFlagGet(  
    USB_MODULE_ID index,  
    USB_OTG_INTERRUPTS interruptFlag  
);
```

Description

This function tests a USB On-The-Go (OTG) interrupt source flag for the USB module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
interruptFlag	Interrupt

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsOTG_InterruptStatus](#) in your application to determine whether this feature is available.

Example

```
if ( PLIB_USB_OTG_InterruptFlagGet(MY_USB_INSTANCE,USB_OTG_INT_ANY) )
{
    if ( PLIB_USB_OTG_InterruptFlagGet(MY_USB_INSTANCE,USB_OTG_INT_BDEVICE_SESSION_END) )
    {
        PLIB_USB_OTG_InterruptFlagClear(MY_USB_INSTANCE,USB_OTG_INT_ADEVICE_VBUS_VALID );
        // Device A Vbus Valid Change
    }
    if ( PLIB_USB_OTG_InterruptFlagGet(MY_USB_INSTANCE,USB_OTG_INT_BDEVICE_SESSION_END) )
    {
        PLIB_USB_OTG_InterruptFlagClear(MY_USB_INSTANCE,USB_OTG_INT_BDEVICE_SESSION_END);
        // Device B Vbus Valid Change
    }
    .
    .
    .
}
```

5.6.26.6.10.5 PLIB_USB_OTG_InterruptFlagSet Function

C

```
void PLIB_USB_OTG_InterruptFlagSet(
    USB_MODULE_ID index,
    USB_OTG_INTERRUPTS interruptFlag
);
```

Description

This function sets a USB On-The-Go (OTG) interrupt source flag for the USB module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
interruptFlag	Interrupt

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsOTG_InterruptStatus](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_OTG_InterruptFlagSet( MY_USB_INSTANCE, USB_OTG_INT_ID_STATE_CHANGE );
```

5.6.26.6.10.6 PLIB_USB_OTG_InterruptIsEnabled Function

C

```
bool PLIB_USB_OTG_InterruptIsEnabled(
```

```
    USB_MODULE_ID index,  
    USB_INTERRUPTS interruptFlag  
);
```

Description

This function returns whether or not interrupts are enabled.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
interruptFlag	Interrupt

Returns

- true - Interrupts are enabled
- false - Interrupts are not enabled

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsOTG_Interrupt](#) in your application to determine whether this feature is available.

Example

```
if ( PLIB_USB_OTG_InterruptIsEnabled( MY_USB_INSTANCE, USB_OTG_INT_ID_STATE_CHANGE ) )  
{  
  
}
```

5.6.26.6.11 USB Activity Functions

5.6.26.6.11.1 PLIB_USB_ActivityPending Function

C

```
bool PLIB_USB_ActivityPending(  
    USB_MODULE_ID index  
);
```

Description

This function returns whether or not USB bus activity has been detected, an interrupt is pending, or an interrupt is yet to be generated.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

- true - The USB module should not be suspended
- false - No interrupts are pending or module may be suspended or powered down

Remarks

Not available on PIC18 devices. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsActivityPending](#) in your application to determine whether this feature is available.

Example

```
while ( PLIB_USB_ActivityPending(MY_USB_INSTANCE) )
{
    // Wait
}
// Suspend USB module.
```

5.6.26.6.11.2 PLIB_USB_FrameNumberGet Function**C**

```
uint16_t PLIB_USB_FrameNumberGet(
    USB_MODULE_ID index
);
```

Description

This function returns the USB frame number in the lower 11 bits.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

Current frame number in lower 11 bits.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsFrameNumber](#) in your application to determine whether this feature is available.

Example

```
frameNumber = PLIB_USB_FrameNumberGet(MY_USB_INSTANCE);
```

5.6.26.6.11.3 PLIB_USB_JStateIsActive Function**C**

```
bool PLIB_USB_JStateIsActive(
    USB_MODULE_ID index
);
```

Description

This function indicates the live JState (differential '0' in low speed, differential '1' in full speed) on the bus.

Preconditions

The USB module must be in Host mode.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

Not applicable for PIC18 devices since PIC18 devices do not support Host mode. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsLiveJState](#) in your application to determine whether this feature is available.

Example

```
// Enable Host Mode
PLIB_USB_OperatingModeSelect(MY_USB_INSTANCE, USB_OPMODE_HOST);

// Enable D+ and D- pull-down resistors
PLIB_USB_OTG_PullUpPullDownSetup(MY_USB_INSTANCE, USB_OTG_DPLUS_PULLDN, true);
PLIB_USB_OTG_PullUpPullDownSetup(MY_USB_INSTANCE, USB_OTG_DMINUS_PULLDN, true);

// Disable D+ and D- pull-up resistors
PLIB_USB_OTG_PullUpPullDownSetup(MY_USB_INSTANCE, USB_OTG_DPLUS_PULLUP, false);
PLIB_USB_OTG_PullUpPullDownSetup(MY_USB_INSTANCE, USB_OTG_DMINUS_PULLUP, false);

// Enable SOF Packet generation
PLIB_USB_SOFEnable(MY_USB_INSTANCE);

// Enable the device attach interrupt
PLIB_USB_INT_Enable(MY_USB_INSTANCE, USB_INT_OTG, ACTIVITY_DETECT);

// Wait for the Attach interrupt.
while( !PLIB_USB_INT_FlagGet(MY_USB_INSTANCE, USB_INT_OTG, ACTIVITY_DETECT) )
{
    //Do nothing
}

// Check JState
if( PLIB_USB_JStateIsActive(MY_USB_INSTANCE) )
{
    // Full Speed
    PLIB_USB_FullSpeedEnable(MY_USB_INSTANCE);
}
else
{
    // Low Speed
    PLIB_USB_FullSpeedDisable(MY_USB_INSTANCE);
}
```

5.6.26.6.11.4 PLIB_USB_PacketTransferDisable Function

C

```
void PLIB_USB_PacketTransferDisable(
    USB_MODULE_ID index
);
```

Description

This function disables the Serial Interface Engine (SIE).

Preconditions

USB module must be in device mode.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

```
if( PLIB_USB_PacketTransferIsDisabled(MY_USB_INSTANCE) )
{
    // SETUP token received, do the needful operations
    .
    .
    .
    // SETUP handling completed, enable Setup token and packet processing:
    PLIB_USB_PacketTransferDisable(MY_USB_INSTANCE);
}
```

Remarks

Not valid when the USB module is in Host mode. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsPacketTransfer](#) in your application to determine whether this feature is available.

5.6.26.6.11.5 PLIB_USB_PacketTransferEnable Function**C**

```
void PLIB_USB_PacketTransferEnable(
    USB_MODULE_ID index
);
```

Description

This function re-enables the Serial Interface Engine (SIE), allowing token and packet processing.

Preconditions

USB module must be in device mode.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

```
if( PLIB_USB_PacketTransferIsDisabled(MY_USB_INSTANCE) )
{
    // SETUP token received, do the needful operations
    .
    .
    .
    // SETUP handling completed, enable Setup token and packet processing:
    PLIB_USB_PacketTransferEnable(MY_USB_INSTANCE);
}
```

Remarks

Not valid when the USB module is in Host mode. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsPacketTransfer](#) in your application to determine whether this feature is available.

5.6.26.6.11.6 PLIB_USB_PacketTransferIsDisabled Function**C**

```
bool PLIB_USB_PacketTransferIsDisabled(
```

```
    USB_MODULE_ID index
);
```

Description

This function indicates that a setup token has been received from the Host and that the Serial Interface Engine (SIE) has been turned off, disabling token and packet processing.

Preconditions

USB module must be in device mode.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

Not valid when USB is Host. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsPacketTransfer](#) in your application to determine whether this feature is available.

Example

```
if( PLIB_USB_PacketTransferIsDisabled(MY_USB_INSTANCE) )
{
    // SETUP token received, do the needful operations
    .
    .
    .
    // SETUP handling completed, enable Setup token and packet processing:
    PLIB_USB_PacketTransferEnable(MY_USB_INSTANCE);
}
```

5.6.26.6.11.7 PLIB_USB_SE0InProgress Function**C**

```
bool PLIB_USB_SE0InProgress(
    USB_MODULE_ID index
);
```

Description

This function returns whether a single-ended zero event is in progress.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

- true - A single ended zero event (SE0) is occurring
- false - A single-ended zero event (SE0) is not occurring

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsLiveSingleEndedZero](#) in your application to determine whether this feature is available.

Example

```
if( PLIB_USB_SE0InProgress(MY_USB_INSTANCE) )
{
    // handle the SE0 event
}
```

5.6.26.6.12 External Transceiver Support Functions

5.6.26.6.12.1 PLIB_USB_I2CInterfaceForExtModuleDisable Function

C

```
void PLIB_USB_I2CInterfaceForExtModuleDisable(
    USB_MODULE_ID index
);
```

Description

Specifies that external module(s) are controlled via dedicated pins.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine whether this feature is available on your device.

Example

```
PLIB_USB_I2CInterfaceForExtModuleDisable(MY_USB_INSTANCE);
```

5.6.26.6.12.2 PLIB_USB_I2CInterfaceForExtModuleEnable Function

C

```
void PLIB_USB_I2CInterfaceForExtModuleEnable(
    USB_MODULE_ID index
);
```

Description

This function specifies that external module(s) are controlled via the I2C interface.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine whether this feature is available on your device.

Example

```
PLIB_USB_I2CInterfaceForExtModuleEnable(MY_USB_INSTANCE);
```

5.6.26.6.12.3 PLIB_USB_TransceiverDisable Function**C**

```
void PLIB_USB_TransceiverDisable(  
    USB_MODULE_ID index  
);
```

Description

This function disables the on-chip transceiver and enables the interface to the off-chip transceiver.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

PIC18 devices only. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsOnChipTransceiver](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_TransceiverDisable(MY_USB_INSTANCE);
```

5.6.26.6.12.4 PLIB_USB_TransceiverEnable Function**C**

```
void PLIB_USB_TransceiverEnable(  
    USB_MODULE_ID index  
);
```

Description

This function enables the on-chip transceiver. The interface to the off-chip transceiver is disabled.

Preconditions

Use only before the USB module is enabled by calling [PLIB_USB_Enable](#).

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

PIC18 devices only. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsOnChipTransceiver](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_TransceiverEnable(MY_USB_INSTANCE);
```

5.6.26.6.13 VBus Support Functions

5.6.26.6.13.1 PLIB_USB_ExternalComparatorMode2Pin Function

C

```
void PLIB_USB_ExternalComparatorMode2Pin(  
    USB_MODULE_ID index  
);
```

Description

This function sets the 2-pin input configuration for VBUS Comparators.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine whether this feature is available on your device.

Example

```
PLIB_USB_ExternalComparatorMode2Pin(MY_USB_INSTANCE);
```

5.6.26.6.13.2 PLIB_USB_ExternalComparatorMode3Pin Function

C

```
void PLIB_USB_ExternalComparatorMode3Pin(  
    USB_MODULE_ID index  
);
```

Description

This function sets the 3-pin input configuration for VBUS comparators.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine whether this feature is available on your device.

Example

```
PLIB_USB_ExternalComparatorMode3Pin(MY_USB_INSTANCE);
```

5.6.26.6.13.3 PLIB_USB_PWMCounterDisable Function**C**

```
void PLIB_USB_PWMCounterDisable(  
    USB_MODULE_ID index  
);
```

Description

This function disables the PWM counter used to generate the VBUS for the USB module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine whether this feature is available on your device.

Example

```
PLIB_USB_PWMDisable(MY_USB_INSTANCE);  
PLIB_USB_PWMCounterDisable(MY_USB_INSTANCE);
```

5.6.26.6.13.4 PLIB_USB_PWMCounterEnable Function**C**

```
void PLIB_USB_PWMCounterEnable(  
    USB_MODULE_ID index  
);
```

Description

This function enables the PWM counter used to generate the VBUS for the USB module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine whether this feature is available on your device.

Example

```
PLIB_USB_PWMEnable(MY_USB_INSTANCE);  
PLIB_USB_PWMCounterEnable(MY_USB_INSTANCE);
```

5.6.26.6.13.5 PLIB_USB_PWMDisable Function**C**

```
void PLIB_USB_PWMDisable(  
    USB_MODULE_ID index  
);
```

Description

This function disables the PWM Generator. PWM output held in a reset state defined by [PLIB_USB_PWMPolarityActiveHigh](#) or [PLIB_USB_PWMPolarityActiveLow](#).

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine whether this feature is available on your device.

Example

```
PLIB_USB_PWMDisable (MY_USB_INSTANCE);
```

5.6.26.6.13.6 PLIB_USB_PWMEnable Function**C**

```
void PLIB_USB_PWMEnable(  
    USB_MODULE_ID index  
);
```

Description

This function enables the PWM Generator.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine whether this feature is available on your device.

Example

```
PLIB_USB_PWMEnable(MY_USB_INSTANCE);
```

5.6.26.6.13.7 PLIB_USB_PWMPolarityActiveLow Function**C**

```
void PLIB_USB_PWMPolarityActiveLow(  
    USB_MODULE_ID index  
);
```

Description

This function sets the PWM output to active-high and resets low.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine whether this feature is available on your device.

5.6.26.6.13.8 PLIB_USB_PWMPolarityActiveHigh Function**C**

```
void PLIB_USB_PWMPolarityActiveHigh(  
    USB_MODULE_ID index  
);
```

Description

This function sets the PWM output to active-low and resets high.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine whether this feature is available on your device.

Example

```
PLIB_USB_PWMPolarity (MY_USB_INSTANCE);
```

5.6.26.6.13.9 PLIB_USB_VBoostDisable Function**C**

```
void PLIB_USB_VBoostDisable(  
    USB_MODULE_ID index  
);
```

Description

This function disables the On-Chip 5V Boost Regulator Circuit Disabled bit.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine whether this feature is available on your device.

Example

```
PLIB_USB_VBoostDisable(MY_USB_INSTANCE);
```

5.6.26.6.13.10 PLIB_USB_VBoostEnable Function**C**

```
void PLIB_USB_VBoostEnable(  
    USB_MODULE_ID index  
);
```

Description

This function enables the On-Chip 5V Boost Regulator Circuit Enabled bit.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine whether this feature is available on your device.

Example

```
PLIB_USB_VBoostEnable(MY_USB_INSTANCE);
```

5.6.26.6.13.11 PLIB_USB_VBUSComparatorDisable Function**C**

```
void PLIB_USB_VBUSComparatorDisable(  
    USB_MODULE_ID index  
);
```

Description

This function disables the on-chip VBUS Comparator.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine whether this feature is available on your device.

Example

```
PLIB_USB_VBUSComparatorDisable(MY_USB_INSTANCE);
```

5.6.26.6.13.12 PLIB_USB_VBUSComparatorEnable Function**C**

```
void PLIB_USB_VBUSComparatorEnable(  
    USB_MODULE_ID index  
);
```

Description

This function enables the on-chip VBUS Comparator.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine whether this feature is available on your device.

Example

```
PLIB_USB_VBUSComparatorEnable(MY_USB_INSTANCE);
```

5.6.26.6.13.13 PLIB_USB_VBUSPullUpDisable Function**C**

```
void PLIB_USB_VBUSPullUpDisable(  
    USB_MODULE_ID index  
);
```

Description

This function disables the pull-up on the VBUS pin.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine whether this feature is available on your device.

Example

```
PLIB_USB_VBUSPullUpDisable(MY_USB_INSTANCE);
```

5.6.26.6.13.14 PLIB_USB_VBUSPullUpEnable Function**C**

```
void PLIB_USB_VBUSPullUpEnable(  
    USB_MODULE_ID index  
);
```

Description

This function enables the pull-up on the VBUS pin.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine whether this feature is available on your device.

Example

```
PLIB_USB_VBUSPullUpEnable(MY_USB_INSTANCE);
```

5.6.26.6.14 Test Support Functions

5.6.26.6.14.1 PLIB_USB_EyePatternDisable Function

C

```
void PLIB_USB_EyePatternDisable(  
    USB_MODULE_ID index  
);
```

Description

This function disables the USB eye pattern test.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsEyePattern](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_EyePatternDisable(MY_USB_INSTANCE);
```

5.6.26.6.14.2 PLIB_USB_EyePatternEnable Function

C

```
void PLIB_USB_EyePatternEnable(  
    USB_MODULE_ID index  
);
```

Description

This function enables the USB eye pattern test.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsEyePattern](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_EyePatternEnable(MY_USB_INSTANCE);
```

5.6.26.6.15 Other Functions

5.6.26.6.15.1 PLIB_USB_ModuleIsBusy Function

C

```
bool PLIB_USB_ModuleIsBusy(  
    USB_MODULE_ID index  
);
```

Description

This function indicates if the USB module is not ready to be enabled.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

- true - USB module is active or disabled, but not ready to be enabled
- false - USB module is not active and is ready to be enabled

Remarks

This feature is not available on PIC18, PIC24, and dsPIC33 devices.

If `PLIB_USB_ModuleIsBusy(MY_USB_INSTANCE) == true` and the USB module is disabled, and all status returned for the module, all enables/disables for the module will produce undefined results.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_USB_ExistsModuleBusy` in your application to determine whether this feature is available.

Example

```
#ifndef (__PIC32MX__)  
while ( PLIB_USB_ModuleIsBusy(MY_USB_INSTANCE) )  
{  
    // wait
```

```
}  
#endif  
    PLIB_USB_Disable(MY_USB_INSTANCE);
```

5.6.26.6.15.2 PLIB_USB_PingPongFreeze Function

C

```
void PLIB_USB_PingPongFreeze(  
    USB_MODULE_ID index  
);
```

Description

This function resets all Ping-Pong buffer pointers to even buffers.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

Buffers remain "frozen" at "Even" until they are unfrozen using [PLIB_USB_PingPongUnfreeze](#).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsBufferFreeze](#) in your application to determine whether this feature is available.

Example

```
// Reset all ping-pong buffers to "Even"  
PLIB_USB_PingPongFreeze(MY_USB_INSTANCE);  
PLIB_USB_PingPongUnfreeze(MY_USB_INSTANCE);
```

5.6.26.6.15.3 PLIB_USB_PingPongReset Function

C

```
void PLIB_USB_PingPongReset(  
    USB_MODULE_ID index  
);
```

Description

This function resets the USB peripheral internal Ping-Pong indicator to point to Even buffers.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use

[PLIB_USB_ExistsBufferFreeze](#) in your application to determine whether this feature is available.

Example

```
PLIB_USB_PingPongReset(MY_USB_INSTANCE);
```

5.6.26.6.15.4 PLIB_USB_PingPongUnfreeze Function

C

```
void PLIB_USB_PingPongUnfreeze(  
    USB_MODULE_ID index  
);
```

Description

This function enables Ping-Pong buffering.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest

Returns

None.

Remarks

See [PLIB_USB_PingPongFreeze](#). This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsBufferFreeze](#) in your application to determine whether this feature is available.

Example

```
// Reset all Ping-Pong buffers to "Even"  
PLIB_USB_PingPongFreeze(MY_USB_INSTANCE);  
PLIB_USB_PingPongUnfreeze(MY_USB_INSTANCE);
```

5.6.26.6.15.5 PLIB_USB_TokenSend Function

C

```
void PLIB_USB_TokenSend(  
    USB_MODULE_ID index,  
    USB_PID pidValue,  
    uint8_t endpoint,  
    uint8_t deviceAddress,  
    bool isLowSpeed  
);
```

Description

This function sends the specified token to the specified endpoint and address. The token is placed on the bus at the next available time. The token can be executed at low speed.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance of interest
pidValue	PID of the token to be placed on the bus.

endpoint	Device endpoint to which the token should be sent.
isLowSpeed	Is true if the token should be executed at low speed.

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_USB_ExistsGEN_Interrupt](#) in your application to determine whether this feature is available.

Example

```
// Send an OUT token to endpoint 1 device address 2 at full speed  
PLIB_USB_SendToken(MY_USB_INSTANCE, USB_PID_OUT, 1, 2, false);
```

5.6.26.6.16 Data Types and Constants

5.6.26.6.16.1 USB_BUFFER_DATA01 Enumeration

C

```
typedef enum {  
    USB_BUFFER_DATA0,  
    USB_BUFFER_DATA1  
} USB_BUFFER_DATA01;
```

Description

USB Endpoint Buffer Data Toggle Enumeration

This data type provides enumeration data toggle for a buffer.

Members

Members	Description
USB_BUFFER_DATA0	DATA0/1 = 0
USB_BUFFER_DATA1	DATA0/1 = 1

Remarks

None.

5.6.26.6.16.2 USB_BUFFER_DIRECTION Enumeration

C

```
typedef enum {  
    USB_BUFFER_RX,  
    USB_BUFFER_TX  
} USB_BUFFER_DIRECTION;
```

Description

USB Endpoint Buffer Direction Enumeration

This data type provides enumeration transmit/receive direction for a buffer.

Members

Members	Description
USB_BUFFER_RX	Receive
USB_BUFFER_TX	Transmit

Remarks

None.

5.6.26.6.16.3 USB_BUFFER_PING_PONG Enumeration

C

```
typedef enum {  
    USB_BUFFER_EVEN,  
    USB_BUFFER_ODD  
} USB_BUFFER_PING_PONG;
```

Description

Enumeration of USB Buffer Ping-Pong

This data type enumerates the ping-pong buffer (Even vs. Odd).

Members

Members	Description
USB_BUFFER_EVEN	Even Buffer
USB_BUFFER_ODD	Odd Buffer

Remarks

None.

5.6.26.6.16.4 USB_BUFFER_SCHEDULE_DATA01 Enumeration

C

```
typedef enum {  
    USB_BUFFER_DONTCHANGE,  
    USB_BUFFER_SET_DATA0,  
    USB_BUFFER_SET_DATA1  
} USB_BUFFER_SCHEDULE_DATA01;
```

Description

USB Endpoint Buffer Data Toggle Enumeration for Buffer Scheduling

This data type provides enumeration data toggle for a buffer.

Members

Members	Description
USB_BUFFER_DONTCHANGE	Don't Change DATA0/1
USB_BUFFER_SET_DATA0	DATA0/1 = 0
USB_BUFFER_SET_DATA1	DATA0/1 = 1

Remarks

None.

5.6.26.6.16.5 USB_EP_TXRX Enumeration

C

```
typedef enum {  
    USB_EP_NOTXRX,  
    USB_EP_RX,  
    USB_EP_TX,  
}
```

```

    USB_EP_TX_RX
} USB_EP_TXRX;

```

Description

Enumeration of USB Endpoint Transmit/Receive Setup

This data type provides enumeration transmit/receive setup for an endpoint.

Members

Members	Description
USB_EP_NOTXRX	Nothing enabled for endpoint
USB_EP_RX	Receive enabled for endpoint
USB_EP_TX	Transmit enabled for endpoint
USB_EP_TX_RX	Transmit and Receive enabled for endpoint

Remarks

None.

5.6.26.6.16.6 USB_OPMODES Enumeration**C**

```

typedef enum {
    USB_OPMODE_NONE,
    USB_OPMODE_DEVICE,
    USB_OPMODE_HOST,
    USB_OPMODE_OTG
} USB_OPMODES;

```

Description

USB Operating Modes Enumeration

This data type provides enumeration of the operating modes supported by the USB module.

Members

Members	Description
USB_OPMODE_NONE	None
USB_OPMODE_DEVICE	Device
USB_OPMODE_HOST	Host
USB_OPMODE_OTG	OTG

Remarks

PIC18 devices only support USB_OPMODE_DEVICE.

5.6.26.6.16.7 USB_OTG_INTERRUPTS Enumeration**C**

```

typedef enum {
    USB_OTG_INT_ADEVICE_VBUS_VALID,
    USB_OTG_INT_OTG_RESERVED,
    USB_OTG_INT_BDEVICE_SESSION_END,
    USB_OTG_INT_SESSION_VALID,
    USB_OTG_INT_ACTIVITY_DETECT,
    USB_OTG_INT_STABLE_LINE_STATE,
    USB_OTG_INT_ONE_MS_TIMEOUT,
    USB_OTG_INT_ID_STATE_CHANGE,
    USB_OTG_INT_ANY,
}

```

```

    USB_OTG_INT_ALL
} USB_OTG_INTERRUPTS;

```

Description

USB OTG Interrupts Enumeration

This data type provides enumeration of interrupts related to the USB OTG module.

Members

Members	Description
USB_OTG_INT_ADEVICE_VBUS_VALID	State of (Vbus > Va_vbus_vld) on the A device has changed
USB_OTG_INT_OTG_RESERVED	Reserved. Don't use.
USB_OTG_INT_BDEVICE_SESSION_END	State of (Vbus < Vb_sess_end) on the B device has changed
USB_OTG_INT_SESSION_VALID	State of (Vbus > Va_sess_vld) on the A or B devices has changed
USB_OTG_INT_ACTIVITY_DETECT	Activity detected on the D+, D-, ID, or Vbus lines
USB_OTG_INT_STABLE_LINE_STATE	USB line state has been stable for 1 ms, but different from last time
USB_OTG_INT_ONE_MS_TIMEOUT	One millescond timer has expired
USB_OTG_INT_ID_STATE_CHANGE	Change in state of ID pin detected.
USB_OTG_INT_ANY	All or Any of the above
USB_OTG_INT_ALL	All or Any of the above

Remarks

Not applicable on PIC18 devices or if the USB OTG module is not enabled.

5.6.26.6.16.8 USB_OTG_PULL_UP_PULL_DOWN Enumeration**C**

```

typedef enum {
    USB_OTG_DPLUS_PULLUP,
    USB_OTG_DMINUS_PULLUP,
    USB_OTG_DPLUS_PULLDN,
    USB_OTG_DMINUS_PULLDN
} USB_OTG_PULL_UP_PULL_DOWN;

```

Description

Enumeration of Pull-Up and Pull-Down Resistors for OTG

This data type enumerates the OTG Pull-Up and Pull-Down resistors for D+ and D- .

Members

Members	Description
USB_OTG_DPLUS_PULLUP	D+ Pull-Up
USB_OTG_DMINUS_PULLUP	D- Pull-Up
USB_OTG_DPLUS_PULLDN	D+ Pull-Down
USB_OTG_DMINUS_PULLDN	D- Pull-Down

Remarks

Not applicable for PIC18 devices.

5.6.26.6.16.9 USB_PID Enumeration**C**

```

typedef enum {

```

```

    USB_PID_SETUP,
    USB_PID_IN,
    USB_PID_OUT
} USB_PID;

```

Description

Enumeration of Legal Packet IDs (PIDs)

This data type enumerates the valid (i.e., legal) PID values. While the PID field is four bits long, only these values are legal and should be used. The use of any other values may cause unpredictable results.

Members

Members	Description
USB_PID_SETUP	Setup token
USB_PID_IN	IN token
USB_PID_OUT	OUT token

5.6.26.6.16.10 USB_PING_PONG_MODE Enumeration**C**

```

typedef enum {
    USB_PING_PONG_ALL_BUT_EP0,
    USB_PING_PONG_FULL_PING_PONG,
    USB_PING_PONG_EP0_OUT_ONLY,
    USB_PING_PONG_NO_PING_PONG
} USB_PING_PONG_MODE;

```

Description

Enumeration of USB Ping-Pong Modes for PIC18 and PIC24F

This data type supports the four modes of ping-pong buffering for PIC18 and PIC24F devices.

Members

Members	Description
USB_PING_PONG_ALL_BUT_EP0	Ping-Pong buffering on all endpoints except Endpoint Zero
USB_PING_PONG_FULL_PING_PONG	Ping-Pong buffering on all endpoints
USB_PING_PONG_EP0_OUT_ONLY	Ping-Pong buffering on just Endpoint Zero transmit
USB_PING_PONG_NO_PING_PONG	No ping-pong buffering

Remarks

For PIC18 and PIC24F devices only.

5.6.26.6.16.11 USB_PING_PONG_STATE Enumeration**C**

```

typedef enum {
    USB_PING_PONG_EVEN,
    USB_PING_PONG_ODD
} USB_PING_PONG_STATE;

```

Description

Enumeration of USB Ping-Pong Indicator

This data type decodes which buffer (Even vs. Odd) was used for the last transaction.

Members

Members	Description
USB_PING_PONG_EVEN	Last transaction on Even Buffer
USB_PING_PONG_ODD	Last transaction on Odd Buffer

Remarks

None.

5.6.26.6.16.12 USB_TOKEN_SPEED Enumeration**C**

```
typedef enum {  
    USB_LOWSPEED_TOKENS,  
    USB_FULLSPEED_TOKENS  
} USB_TOKEN_SPEED;
```

Description

USB Token Speeds Enumeration

This data type provides enumeration of available token speeds.

Members

Members	Description
USB_LOWSPEED_TOKENS	Low Speed Tokens
USB_FULLSPEED_TOKENS	Full Speed Tokens

Remarks

For Host mode only.

5.6.26.6.16.13 USB_MAX_EP_NUMBER Macro**C**

```
#define USB_MAX_EP_NUMBER 15
```

Description

Maximum number of endpoints

This constant defines the maximum number of endpoints supported (not including EP0). It is used in dimensioning the Buffer Descriptor Table (BDT) array.

5.6.26.6.17 Feature Existence Functions**5.6.26.6.17.1 PLIB_USB_ExistsActivityPending Function****C**

```
bool PLIB_USB_ExistsActivityPending(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the ActivityPending feature is available on the USB module. When this function returns true, this function is supported on the device:

- [PLIB_USB_ActivityPending](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ActivityPending feature is supported on the device
- false - The ActivityPending feature is not supported on the device

Remarks

None.

5.6.26.6.17.2 PLIB_USB_ExistsALL_Interrupt Function

C

```
bool PLIB_USB_ExistsALL_Interrupt(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the ALL_Interrupt feature is available on the USB module. When this function returns true, these functions are supported on the device:

- [PLIB_USB_AllInterruptEnable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ALL_Interrupt feature is supported on the device
- false - The ALL_Interrupt feature is not supported on the device

Remarks

None.

5.6.26.6.17.3 PLIB_USB_ExistsAutomaticSuspend Function

C

```
bool PLIB_USB_ExistsAutomaticSuspend(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the AutomaticSuspend feature is available on the USB module. When this function returns true, these functions are supported on the device:

- [PLIB_USB_AutoSuspendDisable](#)

- [PLIB_USB_AutoSuspendEnable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The AutomaticSuspend feature is supported on the device
- false - The AutomaticSuspend feature is not supported on the device

Remarks

None.

5.6.26.6.17.4 PLIB_USB_ExistsBDTBaseAddress Function

C

```
bool PLIB_USB_ExistsBDTBaseAddress(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the BDTBaseAddress feature is available on the USB module. When this function returns true, these functions are supported on the device:

- [PLIB_USB_BDTBaseAddressGet](#)
- [PLIB_USB_BDTBaseAddressSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The BDTBaseAddress feature is supported on the device
- false - The BDTBaseAddress feature is not supported on the device

Remarks

None.

5.6.26.6.17.5 PLIB_USB_ExistsBDTFunctions Function

C

```
bool PLIB_USB_ExistsBDTFunctions(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the BDTFunctions feature is available on the USB module. When this function returns true, these functions are supported on the device:

- [PLIB_USB_BufferAddressGet](#)
- [PLIB_USB_BufferAddressSet](#)
- [PLIB_USB_BufferByteCountGet](#)
- [PLIB_USB_BufferByteCountSet](#)
- [PLIB_USB_BufferCancelReleaseToUSB](#)
- [PLIB_USB_BufferAllCancelReleaseToUSB](#)
- [PLIB_USB_BufferClearAll](#)
- [PLIB_USB_BufferDataToggleGet](#)
- [PLIB_USB_BufferDataToggleSelect](#)
- [PLIB_USB_BufferDataToggleSyncEnable](#)
- [PLIB_USB_BufferDataToggleSyncDisable](#)
- [PLIB_USB_BufferIndexGet](#)
- [PLIB_USB_BufferPIDBitsClear](#)
- [PLIB_USB_BufferPIDGet](#)
- [PLIB_USB_BufferReleasedToSW](#)
- [PLIB_USB_BufferReleaseToUSB](#)
- [PLIB_USB_BufferSchedule](#)
- [PLIB_USB_BufferStallDisable](#)
- [PLIB_USB_BufferStallEnable](#)
- [PLIB_USB_BufferStallGet](#)
- [PLIB_USB_BufferEP0RxStatusInitialize](#)
- [PLIB_USB_BufferClearAllDTSEnable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The BDTFunctions feature is supported on the device
- false - The BDTFunctions feature is not supported on the device

Remarks

None.

5.6.26.6.17.6 PLIB_USB_ExistsBufferFreeze Function**C**

```
bool PLIB_USB_ExistsBufferFreeze(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the BufferFreeze feature is available on the USB module. When this function returns true, these

functions are supported on the device:

- [PLIB_USB_PingPongFreeze](#)
- [PLIB_USB_PingPongUnfreeze](#)
- [PLIB_USB_PingPongReset](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The BufferFreeze feature is supported on the device
- false - The BufferFreeze feature is not supported on the device

Remarks

None.

5.6.26.6.17.7 PLIB_USB_ExistsDeviceAddress Function

C

```
bool PLIB_USB_ExistsDeviceAddress(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the DeviceAddress feature is available on the USB module. When this function returns true, these functions are supported on the device:

- [PLIB_USB_DeviceAddressSet](#)
- [PLIB_USB_DeviceAddressGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The DeviceAddress feature is supported on the device
- false - The DeviceAddress feature is not supported on the device

Remarks

None.

5.6.26.6.17.8 PLIB_USB_ExistsEP0LowSpeedConnect Function

C

```
bool PLIB_USB_ExistsEP0LowSpeedConnect(  
    USB_MODULE_ID index
```

```
);
```

Description

This function identifies whether the EP0LowSpeedConnect feature is available on the USB module. When this function returns true, these functions are supported on the device:

- [PLIB_USB_EP0LSDirectConnectEnable](#)
- [PLIB_USB_EP0LSDirectConnectDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The EP0LowSpeedConnect feature is supported on the device
- false - The EP0LowSpeedConnect feature is not supported on the device

Remarks

None.

5.6.26.6.17.9 PLIB_USB_ExistsEP0NAKRetry Function

C

```
bool PLIB_USB_ExistsEP0NAKRetry(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the EP0NAKRetry feature is available on the USB module. When this function returns true, these functions are supported on the device:

- [PLIB_USB_EP0NakRetryEnable](#)
- [PLIB_USB_EP0NakRetryDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The EP0NAKRetry feature is supported on the device
- false - The EP0NAKRetry feature is not supported on the device

Remarks

None.

5.6.26.6.17.10 PLIB_USB_ExistsEPnRxEnable Function

C

```
bool PLIB_USB_ExistsEPnRxEnable(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the EPnRxEnableEnhanced feature is available on the USB module. When this function returns true, these functions are supported on the device:

- [PLIB_USB_EPnRxEnable](#)
- [PLIB_USB_EPnRxDisable](#)
- [PLIB_USB_EPnTxEnable](#)
- [PLIB_USB_EPnTxDisable](#)
- [PLIB_USB_EPnHandshakeEnable](#)
- [PLIB_USB_EPnHandshakeDisable](#)
- [PLIB_USB_EPnControlTransferEnable](#)
- [PLIB_USB_EPnControlTransferDisable](#)
- [PLIB_USB_EPnIsStalled](#)
- [PLIB_USB_EPnStallClear](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The EPnRxEnableEnhanced feature is supported on the device
- false - The EPnRxEnableEnhanced feature is not supported on the device

Remarks

None.

5.6.26.6.17.11 PLIB_USB_ExistsEPnTxRx Function

C

```
bool PLIB_USB_ExistsEPnTxRx(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the EPnTxRx feature is available on the USB module. When this function returns true, these functions are supported on the device:

- [PLIB_USB_EPnTxSelect](#)
- [PLIB_USB_EPnRxSelect](#)
- [PLIB_USB_EPnTxRxSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The EPnTxRx feature is supported on the device
- false - The EPnTxRx feature is not supported on the device

Remarks

None.

5.6.26.6.17.12 PLIB_USB_ExistsERR_Interrupt Function**C**

```
bool PLIB_USB_ExistsERR_Interrupt(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the ERR_Interrupt feature is available on the USB module. When this function returns true, these functions are supported on the device:

- [PLIB_USB_ErrorInterruptEnable](#)
- [PLIB_USB_ErrorInterruptDisable](#)
- [PLIB_USB_ErrorInterruptIsEnabled](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ERR_Interrupt feature is supported on the device
- false - The ERR_Interrupt feature is not supported on the device

Remarks

None.

5.6.26.6.17.13 PLIB_USB_ExistsERR_InterruptStatus Function**C**

```
bool PLIB_USB_ExistsERR_InterruptStatus(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the ERR_InterruptStatus feature is available on the USB module. When this function returns true,

these functions are supported on the device:

- [PLIB_USB_ErrorInterruptFlagSet](#)
- [PLIB_USB_ErrorInterruptFlagClear](#)
- [PLIB_USB_ErrorInterruptFlagGet](#)
- [PLIB_USB_ErrorInterruptFlagAllGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ERR_InterruptStatus feature is supported on the device
- false - The ERR_InterruptStatus feature is not supported on the device

Remarks

None.

5.6.26.6.17.14 PLIB_USB_ExistsEyePattern Function

C

```
bool PLIB_USB_ExistsEyePattern(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the EyePattern feature is available on the USB module. When this function returns true, these functions are supported on the device:

- [PLIB_USB_EyePatternDisable](#)
- [PLIB_USB_EyePatternEnable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The EyePattern feature is supported on the device
- false - The EyePattern feature is not supported on the device

Remarks

None.

5.6.26.6.17.15 PLIB_USB_ExistsFrameNumber Function

C

```
bool PLIB_USB_ExistsFrameNumber(  

```

```
    USB_MODULE_ID index
);
```

Description

This function identifies whether the FrameNumber feature is available on the USB module. When this function returns true, this function is supported on the device:

- [PLIB_USB_FrameNumberGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The FrameNumber feature is supported on the device
- false - The FrameNumber feature is not supported on the device

Remarks

None.

5.6.26.6.17.16 PLIB_USB_ExistsGEN_Interrupt Function

C

```
bool PLIB_USB_ExistsGEN_Interrupt(
    USB_MODULE_ID index
);
```

Description

This function identifies whether the GEN_Interrupt feature is available on the USB module. When this function returns true, these functions are supported on the device:

- [PLIB_USB_InterruptEnable](#)
- [PLIB_USB_InterruptDisable](#)
- [PLIB_USB_InterruptIsEnabled](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The GEN_Interrupt feature is supported on the device
- false - The GEN_Interrupt feature is not supported on the device

Remarks

None.

5.6.26.6.17.17 PLIB_USB_ExistsGEN_InterruptStatus Function

C

```
bool PLIB_USB_ExistsGEN_InterruptStatus(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the GEN_InterruptStatus feature is available on the USB module. When this function returns true, these functions are supported on the device:

- [PLIB_USB_InterruptFlagSet](#)
- [PLIB_USB_InterruptFlagClear](#)
- [PLIB_USB_InterruptFlagGet](#)
- [PLIB_USB_InterruptFlagAllGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The GEN_InterruptStatus feature is supported on the device
- false - The GEN_InterruptStatus feature is not supported on the device

Remarks

None.

5.6.26.6.17.18 PLIB_USB_ExistsHostBusyWithToken Function

C

```
bool PLIB_USB_ExistsHostBusyWithToken(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the HostBusyWithToken feature is available on the USB module. When this function returns true, this function is supported on the device:

- [PLIB_USB_IsBusyWithToken](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The HostBusyWithToken feature is supported on the device
- false - The HostBusyWithToken feature is not supported on the device

Remarks

None.

5.6.26.6.17.19 PLIB_USB_ExistsHostGeneratesReset Function**C**

```
bool PLIB_USB_ExistsHostGeneratesReset(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the HostGeneratesReset feature is available on the USB module. When this function returns true, these functions are supported on the device:

- [PLIB_USB_ResetSignalEnable](#)
- [PLIB_USB_ResetSignalDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The HostGeneratesReset feature is supported on the device
- false - The HostGeneratesReset feature is not supported on the device

Remarks

None.

5.6.26.6.17.20 PLIB_USB_ExistsLastDirection Function**C**

```
bool PLIB_USB_ExistsLastDirection(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the LastDirection feature is available on the USB module. When this function returns true, this function is supported on the device:

- [PLIB_USB_LastTransactionDirectionGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The LastDirection feature is supported on the device

- false - The LastDirection feature is not supported on the device

Remarks

None.

5.6.26.6.17.21 PLIB_USB_ExistsLastEndpoint Function**C**

```
bool PLIB_USB_ExistsLastEndpoint(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the LastEndpoint feature is available on the USB module. When this function returns true, this function is supported on the device:

- [PLIB_USB_LastTransactionEndPtGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The LastEndpoint feature is supported on the device
- false - The LastEndpoint feature is not supported on the device

Remarks

None.

5.6.26.6.17.22 PLIB_USB_ExistsLastPingPong Function**C**

```
bool PLIB_USB_ExistsLastPingPong(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the LastPingPong feature is available on the USB module. When this function returns true, this function is supported on the device:

- [PLIB_USB_LastTransactionPingPongStateGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The LastPingPong feature is supported on the device
- false - The LastPingPong feature is not supported on the device

Remarks

None.

5.6.26.6.17.23 PLIB_USB_ExistsLastTransactionDetails Function**C**

```
bool PLIB_USB_ExistsLastTransactionDetails(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the LastTransactionDetails feature is available on the USB module. When this function returns true, this function is supported on the device:

- [PLIB_USB_LastTransactionDetailsGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The LastTransactionDetails feature is supported on the device
- false - The LastTransactionDetails feature is not supported on the device

Remarks

None.

5.6.26.6.17.24 PLIB_USB_ExistsLiveJState Function**C**

```
bool PLIB_USB_ExistsLiveJState(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the LiveJState feature is available on the USB module. When this function returns true, this function is supported on the device:

- [PLIB_USB_JStateIsActive](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The LiveJState feature is supported on the device
- false - The LiveJState feature is not supported on the device

Remarks

None.

5.6.26.6.17.25 PLIB_USB_ExistsLiveSingleEndedZero Function**C**

```
bool PLIB_USB_ExistsLiveSingleEndedZero(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the LiveSingleEndedZero feature is available on the USB module. When this function returns true, this function is supported on the device:

- [PLIB_USB_SE0InProgress](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The LiveSingleEndedZero feature is supported on the device
- false - The LiveSingleEndedZero feature is not supported on the device

Remarks

None.

5.6.26.6.17.26 PLIB_USB_ExistsModuleBusy Function**C**

```
bool PLIB_USB_ExistsModuleBusy(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the ModuleBusy feature is available on the USB module. When this function returns true, these functions are supported on the device:

- [PLIB_USB_ModuleIsBusy](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ModuleBusy feature is supported on the device
- false - The ModuleBusy feature is not supported on the device

Remarks

None.

5.6.26.6.17.27 PLIB_USB_ExistsModulePower Function**C**

```
bool PLIB_USB_ExistsModulePower(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the ModulePower feature is available on the USB module. When this function returns true, these functions are supported on the device:

- [PLIB_USB_Enable](#)
- [PLIB_USB_Disable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ModulePower feature is supported on the device
- false - The ModulePower feature is not supported on the device

Remarks

None.

5.6.26.6.17.28 PLIB_USB_ExistsNextTokenSpeed Function**C**

```
bool PLIB_USB_ExistsNextTokenSpeed(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the NextTokenSpeed feature is available on the USB module. When this function returns true, this function is supported on the device:

- [PLIB_USB_TokenSpeedSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The NextTokenSpeed feature is supported on the device

- false - The NextTokenSpeed feature is not supported on the device

Remarks

None.

5.6.26.6.17.29 PLIB_USB_ExistsOnChipPullup Function**C**

```
bool PLIB_USB_ExistsOnChipPullup(  
    USB_MODULE_ID index  
)  
;
```

Description

This function identifies whether the OnChipPullup feature is available on the USB module. When this function returns true, these functions are supported on the device:

- [PLIB_USB_OnChipPullUpDisable](#)
- [PLIB_USB_OnChipPullUpEnable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The OnChipPullup feature is supported on the device
- false - The OnChipPullup feature is not supported on the device

Remarks

None.

5.6.26.6.17.30 PLIB_USB_ExistsOnChipTransceiver Function**C**

```
bool PLIB_USB_ExistsOnChipTransceiver(  
    USB_MODULE_ID index  
)  
;
```

Description

This function identifies whether the OnChipTransceiver feature is available on the USB module. When this function returns true, these functions are supported on the device:

- [PLIB_USB_TransceiverEnable](#)
- [PLIB_USB_TransceiverDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The OnChipTransceiver feature is supported on the device
- false - The OnChipTransceiver feature is not supported on the device

Remarks

None.

5.6.26.6.17.31 PLIB_USB_ExistsOpModeSelect Function**C**

```
bool PLIB_USB_ExistsOpModeSelect(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the OpModeSelect feature is available on the USB module. When this function returns true, this function is supported on the device:

- [PLIB_USB_OperatingModeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The OpModeSelect feature is supported on the device
- false - The OpModeSelect feature is not supported on the device

Remarks

None.

5.6.26.6.17.32 PLIB_USB_ExistsOTG_ASessionValid Function**C**

```
bool PLIB_USB_ExistsOTG_ASessionValid(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the OTG_ASessionValid feature is available on the USB module. When this function returns true, this function is supported on the device:

- [PLIB_USB_OTG_VBusValid](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The OTG_ASessionValid feature is supported on the device
- false - The OTG_ASessionValid feature is not supported on the device

Remarks

None.

5.6.26.6.17.33 PLIB_USB_ExistsOTG_BSessionEnd Function**C**

```
bool PLIB_USB_ExistsOTG_BSessionEnd(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the OTG_BSessionEnd feature is available on the USB module. When this function returns true, this function is supported on the device:

- [PLIB_USB_OTG_BSessionHasEnded](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The OTG_BSessionEnd feature is supported on the device
- false - The OTG_BSessionEnd feature is not supported on the device

Remarks

None.

5.6.26.6.17.34 PLIB_USB_ExistsOTG_IDPinState Function**C**

```
bool PLIB_USB_ExistsOTG_IDPinState(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the OTG_IDPinState feature is available on the USB module. When this function returns true, this function is supported on the device:

- [PLIB_USB_OTG_IDPinStateIsTypeA](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The OTG_IDPinState feature is supported on the device
- false - The OTG_IDPinState feature is not supported on the device

Remarks

None.

5.6.26.6.17.35 PLIB_USB_ExistsOTG_Interrupt Function**C**

```
bool PLIB_USB_ExistsOTG_Interrupt(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the OTG_Interrupt feature is available on the USB module. When this function returns true, these functions are supported on the device:

- [PLIB_USB_OTG_InterruptEnable](#)
- [PLIB_USB_OTG_InterruptDisable](#)
- [PLIB_USB_OTG_InterruptIsEnabled](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The OTG_Interrupt feature is supported on the device
- false - The OTG_Interrupt feature is not supported on the device

Remarks

None.

5.6.26.6.17.36 PLIB_USB_ExistsOTG_InterruptStatus Function**C**

```
bool PLIB_USB_ExistsOTG_InterruptStatus(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the OTG_InterruptStatus feature is available on the USB module. When this function returns true, these functions are supported on the device:

- [PLIB_USB_OTG_InterruptFlagSet](#)
- [PLIB_USB_OTG_InterruptFlagClear](#)
- [PLIB_USB_OTG_InterruptFlagGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The OTG_InterruptStatus feature is supported on the device
- false - The OTG_InterruptStatus feature is not supported on the device

Remarks

None.

5.6.26.6.17.37 PLIB_USB_ExistsOTG_LineState Function**C**

```
bool PLIB_USB_ExistsOTG_LineState(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the OTG_LineState feature is available on the USB module. When this function returns true, this function is supported on the device:

- [PLIB_USB_OTG_LineStateIsStable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The OTG_LineState feature is supported on the device
- false - The OTG_LineState feature is not supported on the device

Remarks

None.

5.6.26.6.17.38 PLIB_USB_ExistsOTG_PullUpPullDown Function**C**

```
bool PLIB_USB_ExistsOTG_PullUpPullDown(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the OTG_PullUpPullDown feature is available on the USB module. When this function returns true, this function is supported on the device:

- [PLIB_USB_OTG_PullUpPullDownSetup](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The OTG_PullUpPullDown feature is supported on the device
- false - The OTG_PullUpPullDown feature is not supported on the device

Remarks

None.

5.6.26.6.17.39 PLIB_USB_ExistsOTG_SessionValid Function**C**

```
bool PLIB_USB_ExistsOTG_SessionValid(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the OTG_SessionValid feature is available on the USB module. When this function returns true, this function is supported on the device:

- [PLIB_USB_OTG_SessionValid](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The OTG_SessionValid feature is supported on the device
- false - The OTG_SessionValid feature is not supported on the device

Remarks

None.

5.6.26.6.17.40 PLIB_USB_ExistsOTG_VbusCharge Function**C**

```
bool PLIB_USB_ExistsOTG_VbusCharge(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the OTG_VbusCharge feature is available on the USB module. When this function returns true, these functions are supported on the device:

- [PLIB_USB_OTG_VBusChargeEnable](#)

- [PLIB_USB_OTG_VBusChargeDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The OTG_VbusCharge feature is supported on the device
- false - The OTG_VbusCharge feature is not supported on the device

Remarks

None.

5.6.26.6.17.41 PLIB_USB_ExistsOTG_VbusDischarge Function**C**

```
bool PLIB_USB_ExistsOTG_VbusDischarge(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the OTG_VbusDischarge feature is available on the USB module. When this function returns true, these functions are supported on the device:

- [PLIB_USB_OTG_VBusDischargeEnable](#)
- [PLIB_USB_OTG_VBusDischargeDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The OTG_VbusDischarge feature is supported on the device
- false - The OTG_VbusDischarge feature is not supported on the device

Remarks

None.

5.6.26.6.17.42 PLIB_USB_ExistsOTG_VbusPowerOnOff Function**C**

```
bool PLIB_USB_ExistsOTG_VbusPowerOnOff(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the OTG_VbusPowerOnOff feature is available on the USB module. When this function returns true, these functions are supported on the device:

- [PLIB_USB_OTG_VBusPowerOff](#)
- [PLIB_USB_OTG_VBusPowerOn](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The OTG_VbusPowerOnOff feature is supported on the device
- false - The OTG_VbusPowerOnOff feature is not supported on the device

Remarks

None.

5.6.26.6.17.43 PLIB_USB_ExistsPacketTransfer Function**C**

```
bool PLIB_USB_ExistsPacketTransfer(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the PacketTransfer feature is available on the USB module. When this function returns true, these functions are supported on the device:

- [PLIB_USB_PacketTransferIsDisabled](#)
- [PLIB_USB_PacketTransferEnable](#)
- [PLIB_USB_PacketTransferDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The PacketTransfer feature is supported on the device
- false - The PacketTransfer feature is not supported on the device

Remarks

None.

5.6.26.6.17.44 PLIB_USB_ExistsPingPongMode Function**C**

```
bool PLIB_USB_ExistsPingPongMode(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the PingPongMode feature is available on the USB module. When this function returns true, these functions are supported on the device:

- [PLIB_USB_PingPongModeSelect](#)
- [PLIB_USB_PingPongModeGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The PingPongMode feature is supported on the device
- false - The PingPongMode feature is not supported on the device

Remarks

None.

5.6.26.6.17.45 PLIB_USB_ExistsResumeSignaling Function**C**

```
bool PLIB_USB_ExistsResumeSignaling(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the ResumeSignaling feature is available on the USB module. When this function returns true, these functions are supported on the device:

- [PLIB_USB_ResumeSignalingEnable](#)
- [PLIB_USB_ResumeSignalingDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ResumeSignaling feature is supported on the device
- false - The ResumeSignaling feature is not supported on the device

Remarks

None.

5.6.26.6.17.46 PLIB_USB_ExistsSleepEntryGuard Function

C

```
bool PLIB_USB_ExistsSleepEntryGuard(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the SleepEntryGuard feature is available on the USB module. When this function returns true, these functions are supported on the device:

- [PLIB_USB_SleepGuardEnable](#)
- [PLIB_USB_SleepGuardDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The SleepEntryGuard feature is supported on the device
- false - The SleepEntryGuard feature is not supported on the device

Remarks

None.

5.6.26.6.17.47 PLIB_USB_ExistsSOFThreshold Function

C

```
bool PLIB_USB_ExistsSOFThreshold(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the SOFThreshold feature is available on the USB module. When this function returns true, these functions are supported on the device:

- [PLIB_USB_SOFThresholdGet](#)
- [PLIB_USB_SOFThresholdSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The SOFThreshold feature is supported on the device
- false - The SOFThreshold feature is not supported on the device

Remarks

None.

5.6.26.6.17.48 PLIB_USB_ExistsSpeedControl Function**C**

```
bool PLIB_USB_ExistsSpeedControl(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the SpeedControl feature is available on the USB module. When this function returns true, these functions are supported on the device:

- [PLIB_USB_FullSpeedEnable](#)
- [PLIB_USB_FullSpeedDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The SpeedControl feature is supported on the device
- false - The SpeedControl feature is not supported on the device

Remarks

None.

5.6.26.6.17.49 PLIB_USB_ExistsStartOfFrames Function**C**

```
bool PLIB_USB_ExistsStartOfFrames(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the StartOfFrames feature is available on the USB module. When this function returns true, these functions are supported on the device:

- [PLIB_USB_SOFEnable](#)
- [PLIB_USB_SOFDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The StartOfFrames feature is supported on the device
- false - The StartOfFrames feature is not supported on the device

Remarks

None.

5.6.26.6.17.50 PLIB_USB_ExistsStopInIdle Function**C**

```
bool PLIB_USB_ExistsStopInIdle(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the StopInIdle feature is available on the USB module. When this function returns true, these functions are supported on the device:

- [PLIB_USB_StopInIdleEnable](#)
- [PLIB_USB_StopInIdleDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The StopInIdle feature is supported on the device
- false - The StopInIdle feature is not supported on the device

Remarks

None.

5.6.26.6.17.51 PLIB_USB_ExistsSuspend Function**C**

```
bool PLIB_USB_ExistsSuspend(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the Suspend feature is available on the USB module. When this function returns true, these functions are supported on the device:

- [PLIB_USB_SuspendEnable](#)
- [PLIB_USB_SuspendDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The Suspend feature is supported on the device
- false - The Suspend feature is not supported on the device

Remarks

None.

5.6.26.6.17.52 PLIB_USB_ExistsTokenEP Function**C**

```
bool PLIB_USB_ExistsTokenEP(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the TokenEP feature is available on the USB module. When this function returns true, these functions are supported on the device:

- [PLIB_USB-TokenEPGet](#)
- [PLIB_USB-TokenEPSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The TokenEP feature is supported on the device
- false - The TokenEP feature is not supported on the device

Remarks

None.

5.6.26.6.17.53 PLIB_USB_ExistsTokenPID Function**C**

```
bool PLIB_USB_ExistsTokenPID(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the TokenPID feature is available on the USB module. When this function returns true, these functions are supported on the device:

- [PLIB_USB-TokenPIDGet](#)
- [PLIB_USB-TokenPIDSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The TokenPID feature is supported on the device
- false - The TokenPID feature is not supported on the device

Remarks

None.

5.6.26.6.17.54 PLIB_USB_ExistsUOEMonitor Function

C

```
bool PLIB_USB_ExistsUOEMonitor(  
    USB_MODULE_ID index  
);
```

Description

This function identifies whether the UOEMonitor feature is available on the USB module. When this function returns true, these functions are supported on the device:

- [PLIB_USB_UOEMonitorEnable](#)
- [PLIB_USB_UOEMonitorDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The UOEMonitor feature is supported on the device
- false - The UOEMonitor feature is not supported on the device

Remarks

None.

5.6.26.7 Files

Files

Name	Description
plib_usb.h	USB PLIB Interface Header for common definitions

Description

5.6.26.7.1 plib_usb.h

USB Peripheral Library Interface Header

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the USB Peripheral Library.

Enumerations

	Name	Description
	<u>USB_BUFFER_DATA01</u>	Provides enumeration data toggle for a buffer.
	<u>USB_BUFFER_DIRECTION</u>	Provides enumeration transmit/receive direction for a buffer.
	<u>USB_BUFFER_PING_PONG</u>	Enumerates the ping-pong buffer (Even vs. Odd).
	<u>USB_BUFFER_SCHEDULE_DATA01</u>	Provides enumeration data toggle for a buffer.
	<u>USB_EP_TXRX</u>	Provides enumeration transmit/receive setup for an endpoint.
	<u>USB_OPMODES</u>	Provides enumeration of operating modes supported by USB.
	<u>USB_OTG_INTERRUPTS</u>	Provides enumeration of interrupts related to the USB On-The-Go (OTG) module.
	<u>USB_OTG_PULL_UP_PULL_DOWN</u>	USB OTG pull-Up and pull-Down resistors for D+ and D- .
	<u>USB_PID</u>	Legal PID values.
	<u>USB_PING_PONG_MODE</u>	Supports the four modes of ping-pong buffering for PIC18 and PIC24F devices.
	<u>USB_PING_PONG_STATE</u>	Decodes which buffer (Even vs. Odd) was used for the last transaction.
	<u>USB_TOKEN_SPEED</u>	Provides enumeration of available token speeds.

Functions

	Name	Description
	<u>PLIB_USB_ActivityPending</u>	Returns whether or not USB activity is pending.
	<u>PLIB_USB_AllInterruptEnable</u>	Configures the USB peripheral general interrupts, error interrupts and OTG interrupts.
	<u>PLIB_USB_AutoSuspendDisable</u>	Disables USB OTG Auto-suspend mode.
	<u>PLIB_USB_AutoSuspendEnable</u>	Enables USB Auto-suspend mode.
	<u>PLIB_USB_BDTBaseAddressGet</u>	Returns the base address of the Buffer Descriptor Table.
	<u>PLIB_USB_BDTBaseAddressSet</u>	Sets the base address for the Buffer Descriptor Table for PIC24 and PIC32 devices.
	<u>PLIB_USB_BufferAddressGet</u>	Gets the memory address of an endpoint buffer.
	<u>PLIB_USB_BufferAddressSet</u>	Sets the endpoint buffer address.
	<u>PLIB_USB_BufferAllCancelReleaseToUSB</u>	Cancels all endpoint buffer releases to the USB module and hands over the buffer to the CPU.
	<u>PLIB_USB_BufferByteCountGet</u>	Returns the endpoint buffer byte count.
	<u>PLIB_USB_BufferByteCountSet</u>	Sets the buffer byte count.
	<u>PLIB_USB_BufferCancelReleaseToUSB</u>	Cancels release of the endpoint buffer by software, allowing software to again access the buffer.
	<u>PLIB_USB_BufferClearAll</u>	Clears (zeros out) entries in the Buffer Descriptor Table.
	<u>PLIB_USB_BufferClearAllDTSEnable</u>	Clears the endpoint descriptor entry and enables data toggle synchronization.
	<u>PLIB_USB_BufferDataToggleGet</u>	Returns data synchronization (DATA0 or DATA1) for the endpoint buffer.
	<u>PLIB_USB_BufferDataToggleSelect</u>	Sets the endpoint buffer to DATA0 or DATA1.

	PLIB_USB_BufferDataToggleSyncDisable	Disables DATA0/DATA1 synchronization between the device and host.
	PLIB_USB_BufferDataToggleSyncEnable	Enables DATA0/DATA1 synchronization between the device and host.
	PLIB_USB_BufferEP0RxStatusInitialize	Initializes the Endpoint 0 RX endpoint buffer descriptors.
	PLIB_USB_BufferIndexGet	Gets the Buffer Descriptor Table index for a buffer.
	PLIB_USB_BufferPIDBitsClear	Clears the Buffer Status bits in the Buffer Descriptor Table.
	PLIB_USB_BufferPIDGet	Returns the token packet ID (PID) from the endpoint buffer status.
	PLIB_USB_BufferReleasedToSW	Returns the boolean flag value of 'true' when the buffer has been released by the USB module.
	PLIB_USB_BufferReleaseToUSB	Releases the endpoint buffer by software, allowing the USB module access to the buffer.
	PLIB_USB_BufferSchedule	Hands over a buffer to the USB module along with the buffer address and byte count.
	PLIB_USB_BufferStallDisable	Disables STALL handshaking for the associated endpoint buffer.
	PLIB_USB_BufferStallEnable	Enables STALL handshaking for the associated endpoint buffer.
	PLIB_USB_BufferStallGet	Returns the buffer stall status for an endpoint/direction/ping-pong.
	PLIB_USB_DeviceAddressGet	Returns the address of the USB module in Device mode.
	PLIB_USB_DeviceAddressSet	Sets the USB Device's address.
	PLIB_USB_Disable	Disables (powers down) the USB module.
	PLIB_USB_Enable	Enables (powers up) the USB module.
	PLIB_USB_EP0HostSetup	Sends token to the specified address.
	PLIB_USB_EP0LSDirectConnectDisable	Disables direct connection to a low-speed device for Endpoint 0.
	PLIB_USB_EP0LSDirectConnectEnable	Enables direct connection to a low-speed device for Endpoint 0.
	PLIB_USB_EP0NakRetryDisable	Disables retrying of NAKed transactions.
	PLIB_USB_EP0NakRetryEnable	Enables retrying NAK'd transactions for Endpoint 0.
	PLIB_USB_EPnAttributesClear	Clears the set attributes of the specified endpoint.
	PLIB_USB_EPnAttributesSet	Configures attributes of the endpoint such as direction, handshake capability and direction.
	PLIB_USB_EPnControlTransferDisable	Disables endpoint control transfers.
	PLIB_USB_EPnControlTransferEnable	Enables endpoint control transfers.
	PLIB_USB_EPnDirectionDisable	Disables the specified endpoint direction.
	PLIB_USB_EPnHandshakeDisable	Disables endpoint handshaking.
	PLIB_USB_EPnHandshakeEnable	Enables endpoint handshaking.
	PLIB_USB_EPnIsStalled	Tests whether the endpoint epValue is stalled.
	PLIB_USB_EPnRxDisable	Disables an endpoint's ability to process IN tokens.
	PLIB_USB_EPnRxEnable	Enables an endpoint to process IN tokens.
	PLIB_USB_EPnRxSelect	Selects receive capabilities of an endpoint.
	PLIB_USB_EPnStallClear	Clears an endpoint's stalled flag.
	PLIB_USB_EPnTxDisable	Disables an endpoint's ability to process OUT tokens.
	PLIB_USB_EPnTxEnable	Enables an endpoint to process OUT tokens.
	PLIB_USB_EPnTxRxSelect	Selects transmit and/or receive capabilities of an endpoint.
	PLIB_USB_EPnTxSelect	Selects transmit capabilities of an endpoint.
	PLIB_USB_ErrorInterruptDisable	Disables an error interrupt for the USB module.
	PLIB_USB_ErrorInterruptEnable	Enables an error interrupt for the USB module.
	PLIB_USB_ErrorInterruptFlagAllGet	Returns a logically ORed bit map of active error interrupt flags.
	PLIB_USB_ErrorInterruptFlagClear	Clears an error interrupt flag for the USB module.

	PLIB_USB_ErrorInterruptFlagGet	Tests an error interrupt flag for the USB module.
	PLIB_USB_ErrorInterruptFlagSet	Sets an error interrupt flag for the USB module.
	PLIB_USB_ErrorInterruptIsEnabled	Returns true if interrupts are enabled.
	PLIB_USB_ExistsActivityPending	Identifies whether the ActivityPending feature exists on the USB module.
	PLIB_USB_ExistsALL_Interrupt	Identifies whether the ALL_Interrupt feature exists on the USB module.
	PLIB_USB_ExistsAutomaticSuspend	Identifies whether the AutomaticSuspend feature exists on the USB module.
	PLIB_USB_ExistsBDTBaseAddress	Identifies whether the BDTBaseAddress feature exists on the USB module.
	PLIB_USB_ExistsBDTFunctions	Identifies whether the BDTFunctions feature exists on the USB module.
	PLIB_USB_ExistsBufferFreeze	Identifies whether the BufferFreeze feature exists on the USB module.
	PLIB_USB_ExistsDeviceAddress	Identifies whether the DeviceAddress feature exists on the USB module.
	PLIB_USB_ExistsEP0LowSpeedConnect	Identifies whether the EP0LowSpeedConnect feature exists on the USB module.
	PLIB_USB_ExistsEP0NAKRetry	Identifies whether the EP0NAKRetry feature exists on the USB module.
	PLIB_USB_ExistsEPnRxEnable	Identifies whether the EPnRxEnableEnhanced feature exists on the USB module.
	PLIB_USB_ExistsEPnTxRx	Identifies whether the EPnTxRx feature exists on the USB module.
	PLIB_USB_ExistsERR_Interrupt	Identifies whether the ERR_Interrupt feature exists on the USB module.
	PLIB_USB_ExistsERR_InterruptStatus	Identifies whether the ERR_InterruptStatus feature exists on the USB module.
	PLIB_USB_ExistsEyePattern	Identifies whether the EyePattern feature exists on the USB module.
	PLIB_USB_ExistsFrameNumber	Identifies whether the FrameNumber feature exists on the USB module.
	PLIB_USB_ExistsGEN_Interrupt	Identifies whether the GEN_Interrupt feature exists on the USB module.
	PLIB_USB_ExistsGEN_InterruptStatus	Identifies whether the GEN_InterruptStatus feature exists on the USB module.
	PLIB_USB_ExistsHostBusyWithToken	Identifies whether the HostBusyWithToken feature exists on the USB module.
	PLIB_USB_ExistsHostGeneratesReset	Identifies whether the HostGeneratesReset feature exists on the USB module.
	PLIB_USB_ExistsLastDirection	Identifies whether the LastDirection feature exists on the USB module.
	PLIB_USB_ExistsLastEndpoint	Identifies whether the LastEndpoint feature exists on the USB module.
	PLIB_USB_ExistsLastPingPong	Identifies whether the LastPingPong feature exists on the USB module.
	PLIB_USB_ExistsLastTransactionDetails	Identifies whether the LastTransactionDetails feature exists on the USB module.
	PLIB_USB_ExistsLiveJState	Identifies whether the LiveJState feature exists on the USB module.
	PLIB_USB_ExistsLiveSingleEndedZero	Identifies whether the LiveSingleEndedZero feature exists on the USB module.

	<u>PLIB_USB_ExistsModuleBusy</u>	Identifies whether the ModuleBusy feature exists on the USB module.
	<u>PLIB_USB_ExistsModulePower</u>	Identifies whether the ModulePower feature exists on the USB module.
	<u>PLIB_USB_ExistsNextTokenSpeed</u>	Identifies whether the NextTokenSpeed feature exists on the USB module.
	<u>PLIB_USB_ExistsOnChipPullup</u>	Identifies whether the OnChipPullup feature exists on the USB module.
	<u>PLIB_USB_ExistsOnChipTransceiver</u>	Identifies whether the OnChipTransceiver feature exists on the USB module.
	<u>PLIB_USB_ExistsOpModeSelect</u>	Identifies whether the OpModeSelect feature exists on the USB module.
	<u>PLIB_USB_ExistsOTG_ASessionValid</u>	Identifies whether the OTG_ASessionValid feature exists on the USB module.
	<u>PLIB_USB_ExistsOTG_BSessionEnd</u>	Identifies whether the OTG_BSessionEnd feature exists on the USB module.
	<u>PLIB_USB_ExistsOTG_IDPinState</u>	Identifies whether the OTG_IDPinState feature exists on the USB module.
	<u>PLIB_USB_ExistsOTG_Interrupt</u>	Identifies whether the OTG_Interrupt feature exists on the USB module.
	<u>PLIB_USB_ExistsOTG_InterruptStatus</u>	Identifies whether the OTG_InterruptStatus feature exists on the USB module.
	<u>PLIB_USB_ExistsOTG_LineState</u>	Identifies whether the OTG_LineState feature exists on the USB module.
	<u>PLIB_USB_ExistsOTG_PullUpPullDown</u>	Identifies whether the OTG_PullUpPullDown feature exists on the USB module.
	<u>PLIB_USB_ExistsOTG_SessionValid</u>	Identifies whether the OTG_SessionValid feature exists on the USB module.
	<u>PLIB_USB_ExistsOTG_VbusCharge</u>	Identifies whether the OTG_VbusCharge feature exists on the USB module.
	<u>PLIB_USB_ExistsOTG_VbusDischarge</u>	Identifies whether the OTG_VbusDischarge feature exists on the USB module.
	<u>PLIB_USB_ExistsOTG_VbusPowerOnOff</u>	Identifies whether the OTG_VbusPowerOnOff feature exists on the USB module.
	<u>PLIB_USB_ExistsPacketTransfer</u>	Identifies whether the PacketTransfer feature exists on the USB module.
	<u>PLIB_USB_ExistsPingPongMode</u>	Identifies whether the PingPongMode feature exists on the USB module.
	<u>PLIB_USB_ExistsResumeSignaling</u>	Identifies whether the ResumeSignaling feature exists on the USB module.
	<u>PLIB_USB_ExistsSleepEntryGuard</u>	Identifies whether the SleepEntryGuard feature exists on the USB module.
	<u>PLIB_USB_ExistsSOFThreshold</u>	Identifies whether the SOFThreshold feature exists on the USB module.
	<u>PLIB_USB_ExistsSpeedControl</u>	Identifies whether the SpeedControl feature exists on the USB module.
	<u>PLIB_USB_ExistsStartOfFrames</u>	Identifies whether the StartOfFrames feature exists on the USB module.
	<u>PLIB_USB_ExistsStopInIdle</u>	Identifies whether the StopInIdle feature exists on the USB module.
	<u>PLIB_USB_ExistsSuspend</u>	Identifies whether the Suspend feature exists on the USB module.
	<u>PLIB_USB_ExistsTokenEP</u>	Identifies whether the TokenEP feature exists on the USB module.

	PLIB_USB_ExistsTokenPID	Identifies whether the TokenPID feature exists on the USB module.
	PLIB_USB_ExistsUOEMonitor	Identifies whether the UOEMonitor feature exists on the USB module.
	PLIB_USB_ExternalComparatorMode2Pin	Sets the 2-pin input configuration for VBUS comparators.
	PLIB_USB_ExternalComparatorMode3Pin	Sets the 3-pin input configuration for VBUS Comparators.
	PLIB_USB_EyePatternDisable	Disables the USB eye pattern test.
	PLIB_USB_EyePatternEnable	Enables USB eye pattern test.
	PLIB_USB_FrameNumberGet	Returns the USB frame number.
	PLIB_USB_FullSpeedDisable	Forces the USB module to operate at low speed.
	PLIB_USB_FullSpeedEnable	Enables the USB to operate at full speed.
	PLIB_USB_I2CInterfaceForExtModuleDisable	Specifies external module(s) are controlled via dedicated pins.
	PLIB_USB_I2CInterfaceForExtModuleEnable	Specifies external module(s) are controlled via the I2C interface.
	PLIB_USB_InterruptDisable	Disables a general interrupt for the USB module.
	PLIB_USB_InterruptEnable	Enables a general interrupt for the USB module.
	PLIB_USB_InterruptEnableGet	Returns the enable/disable status of general USB module interrupts
	PLIB_USB_InterruptFlagAllGet	Returns a logically ORed bit map of active general USB interrupt flags.
	PLIB_USB_InterruptFlagClear	Clears a general interrupt flag for the USB module.
	PLIB_USB_InterruptFlagGet	Tests a general interrupt flag for the USB module.
	PLIB_USB_InterruptFlagSet	Sets a general interrupt flag for the USB module.
	PLIB_USB_InterruptIsEnabled	Returns true if interrupts are enabled.
	PLIB_USB_IsBusyWithToken	Indicates whether there is a token being executed by the USB module as Host.
	PLIB_USB_JStatIsActive	Live differential receiver J State flag.
	PLIB_USB_LastTransactionDetailsGet	Returns the details of the last completed transaction.
	PLIB_USB_LastTransactionDirectionGet	Indicates the direction of the last transaction.
	PLIB_USB_LastTransactionEndPtGet	Returns the endpoint number of the last USB transfer.
	PLIB_USB_LastTransactionPingPongStateGet	Indicates whether the last transaction was to an EVEN buffer or an ODD buffer.
	PLIB_USB_ModuleIsBusy	Indicates if the USB module is not ready to be enabled.
	PLIB_USB_OnChipPullUpDisable	Disables on-chip pull-ups.
	PLIB_USB_OnChipPullUpEnable	Enables on-chip pull-ups.
	PLIB_USB_OperatingModeSelect	Selects the operating mode of the USB module.
	PLIB_USB_OTG_BSessionHasEnded	Returns the status of the B-Session End Indicator bit.
	PLIB_USB_OTG_IDPinStateIsTypeA	Returns the ID Pin state.
	PLIB_USB_OTG_InterruptDisable	Disables a USB On-The-Go (OTG) Interrupt for the USB module.
	PLIB_USB_OTG_InterruptEnable	Enables a USB On-The-Go (OTG) Interrupt for the USB module.
	PLIB_USB_OTG_InterruptFlagClear	Clears a USB On-The-Go (OTG) Interrupt flag for the USB module.
	PLIB_USB_OTG_InterruptFlagGet	Tests a USB On-The-Go (OTG) Interrupt flag for the USB module.
	PLIB_USB_OTG_InterruptFlagSet	Sets a USB On-The-Go (OTG) Interrupt flag for the USB module.
	PLIB_USB_OTG_InterruptIsEnabled	Returns whether or not interrupts are enabled.
	PLIB_USB_OTG_LineStateIsStable	Returns the status of the Line Stable Indicator bit.
	PLIB_USB_OTG_PullUpPullDownSetup	Enables or disables pull-up and pull-down resistors.
	PLIB_USB_OTG_SessionValid	Returns the status of the Session Valid Indicator bit.
	PLIB_USB_OTG_VBusChargeDisable	Disables VBUS line charge.
	PLIB_USB_OTG_VBusChargeEnable	Enables the VBUS line to be charged through a pull-up resistor.

	PLIB_USB_OTG_VBusChargeTo3V	Sets the VBUS line to charge to 3.3V.
	PLIB_USB_OTG_VBusChargeTo5V	Sets the VBUS line to charge to 5V.
	PLIB_USB_OTG_VBusDischargeDisable	Disables VBUS line discharge.
	PLIB_USB_OTG_VBusDischargeEnable	Enables VBUS line to be discharged through a resistor.
	PLIB_USB_OTG_VBusPowerOff	Turns off power on the VBUS Line.
	PLIB_USB_OTG_VBusPowerOn	Turns on power for the VBUS line.
	PLIB_USB_OTG_VBusValid	Returns the status of the A-VBUS valid indicator.
	PLIB_USB_PacketTransferDisable	Disables the Serial Interface Engine (SIE).
	PLIB_USB_PacketTransferEnable	Re-enables the Serial Interface Engine (SIE), allowing token and packet processing.
	PLIB_USB_PacketTransferIsDisabled	Indicates that a setup token has been received from the Host and that token/packet processing is disabled.
	PLIB_USB_PingPongFreeze	Resets all Ping-Pong buffer pointers to even buffers.
	PLIB_USB_PingPongModeGet	Returns the Ping-Pong Configuration setting.
	PLIB_USB_PingPongModeSelect	Selects the Ping-Pong Configuration setting.
	PLIB_USB_PingPongReset	Resets the USB peripheral internal Ping-Pong indicator to point to even buffers.
	PLIB_USB_PingPongUnfreeze	Enables Ping-Pong buffering.
	PLIB_USB_PWMCounterDisable	Disables the PWM counter used to generate the VBUS for the USB module.
	PLIB_USB_PWMCounterEnable	Enables the PWM counter used to generate the VBUS for the USB module.
	PLIB_USB_PWMDisable	Disables the PWM Generator.
	PLIB_USB_PWMEEnable	Enables the PWM Generator.
	PLIB_USB_PWMPolarityActiveLow	Sets the PWM output to active-high and resets low.
	PLIB_USB_PWMPolarityActiveHigh	Sets the PWM output to active-low and resets high.
	PLIB_USB_ResetSignalDisable	Disables reset signalling on the USB bus.
	PLIB_USB_ResetSignalEnable	Enables reset signalling on the USB bus.
	PLIB_USB_ResumeSignalingDisable	Disables resume signaling.
	PLIB_USB_ResumeSignalingEnable	Enables resume signaling.
	PLIB_USB_SE0InProgress	Returns whether a single-ended zero event is in progress.
	PLIB_USB_SleepGuardDisable	This function disables Sleep Guard. Entry into Sleep mode is immediate.
	PLIB_USB_SleepGuardEnable	Entry into Sleep mode is blocked if bus activity is detected or if an interrupt is pending.
	PLIB_USB_SOFDisable	Disables the automatic generation of the SOF token.
	PLIB_USB_SOFEnable	Enables the automatic generation of the SOF token every 1 ms.
	PLIB_USB_SOFThresholdGet	Returns the Start-of-Frame (SOF) Count bits.
	PLIB_USB_SOFThresholdSet	Sets the Start-of-Frame (SOF) threshold value.
	PLIB_USB_StopInIdleDisable	Allows the USB module to continue operation when the device enters Idle mode.
	PLIB_USB_StopInIdleEnable	Enables USB module operation to stop when the device enters Idle mode.
	PLIB_USB_SuspendDisable	Disables USB OTG Suspend mode.
	PLIB_USB_SuspendEnable	Enables USB Suspend mode.
	PLIB_USB-TokenEPGet	Returns the specified Endpoint address.
	PLIB_USB-TokenEPSet	Sets the Endpoint address for a host transaction.

	PLIB_USB-TokenPIDGet	Returns the token transaction type.
	PLIB_USB-TokenPIDSet	Sets the token transaction type to pidValue.
	PLIB_USB-TokenSend	Sends token to the specified address.
	PLIB_USB-TokenSpeedSelect	Selects low speed or full speed for subsequent token executions.
	PLIB_USB-TransceiverDisable	Disables the on-chip transceiver
	PLIB_USB-TransceiverEnable	Enables the on-chip transceiver.
	PLIB_USB-UOEMonitorDisable	Disables the OE signal output.
	PLIB_USB-UOEMonitorEnable	Enables the OE signal output.
	PLIB_USB-VBoostDisable	Disables the On-Chip 5V Boost Regulator Circuit Disabled bit.
	PLIB_USB-VBoostEnable	Enables the On-Chip 5V Boost Regulator Circuit Enabled bit.
	PLIB_USB-VBUSComparatorDisable	Disables the on-chip VBUS Comparator.
	PLIB_USB-VBUSComparatorEnable	Enables the on-chip VBUS Comparator.
	PLIB_USB-VBUSPullUpDisable	Disables the pull-up on the VBUS pin.
	PLIB_USB-VBUSPullUpEnable	Enables the pull-up on the VBUS pin.

Macros

	Name	Description
	USB_MAX_EP_NUMBER	Maximum number of endpoints supported (not including EP0).

5.6.27 Watchdog Timer Peripheral Library

5.6.27.1 Introduction

Watchdog Timer (WDT) Peripheral Library

for

Microchip Microcontrollers

This library provides a low-level abstraction of the WDT Peripheral Library that is available on the Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, there by abstracting differences from one microcontroller variant to another.

Description

The primary function of the Watchdog Timer (WDT) is to reset the microcontroller, in the event of a software malfunction, by resetting the device if it has not been cleared by software. To ensure that application doesn't hang, the application is supposed to reset the timer periodically. It can also be used to wake the device from Sleep or Idle mode. The WDT is a free-running timer, which uses the Low-Power RC (LPRC) Oscillator and requires no external components. Therefore, the WDT will continue to operate even if the system's primary clock source is stopped.

5.6.27.2 Release Notes

MPLAB Harmony Version: v0.70b **Watchdog Timer Peripheral Library Version :** 0.70b **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.6.27.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.6.27.4 How the Library Works

This section describes how the WDT Peripheral Library works.

Description

Initializing the WDT module involves these processes.

- Selecting the postscaler
- Enabling the WDT using [PLIB_WDT_Enable](#)
- Selecting the window size if the application wants the WDT in Windowed mode using [PLIB_WDT_WindowEnable](#)

Note: Selecting the postscaler and window size should be done through the Configuration bits

The application should periodically clear the timer once it is enabled; otherwise, a time-out will lead to a device Reset. Use [PLIB_WDT_TimerClear](#) to clear the WDT. A timer clear before a time-out may also lead to a reset in Windowed mode. The user application can clear the window only in the allowed window. Refer to the specific device data sheet to determine the allowed window period for your device.

Example

```

/*****
 * This code fragment assumes the WDT is not enabled through
 * device configuration bits. The Postscaler value must be set
 * through the device configuration and window size should be
 * set if applicable
 *****/

/* Initializing the watchdog involves */
PLIB_WDT_Enable(WDT_ID_0);

//Application loop
while(1)
{
    PLIB_WDT_TimerClear(WDT_ID_0);

    //user code
}
  
```

Note: Refer to the specific device data sheet for information on the allowed window periods for your device and other Configuration bit settings.

5.6.27.4.1 Using the Library

This topic describes the basic architecture of the WDT Peripheral Library and provides information and examples on how to use it.

Interface Header File: [plib_wdt.h](#)

The interface to the WDT Peripheral Library is defined in the "[plib_wdt.h](#)" header file. Any C language source (.c) file that uses the WDT Peripheral Library should include "peripheral.h".

Library File:

The WDT Peripheral Library archive (.a) file is installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the library interacts with the framework.

5.6.27.4.1.1 Hardware Abstraction Model

This library provides the low-level abstraction of the *Watchdog timer* module on the Microchip family of microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in the software and introduces the library interface.

Note: The interface provided is a superset of all of the functionality of the available Watchdog Timer modules on the device. Refer to the specific device data sheet or related family reference manual section to determine the set of functions that are supported for each Watchdog Timer module on your device.

Description**Watchdog Timer Software Abstraction Block Diagram**

The WDT uses the internal Low-Power RC (LPRC) Oscillator as the clock source. The clock is divided by the configured prescaler value. There may be one more postscaler divisors. The divided clock is then used to increment a counter. The WDT module uses the watchdog register as a timer. If there is no reset signal from the software and if the counter overflows, this results in a reset in normal mode. In the case of Sleep or Idle mode, the overflow will result in a device wake-up.

For Windowed mode, resetting the counter when the count is not in the specified window will also lead to a reset. If the device is in Sleep or Idle mode, the reset signal will be used to wake-up the device.

5.6.27.4.1.2 Library Overview

Library Interface Section	Description
General Configuration Functions	This includes module enable, module disable, watchdog timer window enable, watchdog timer window disable and the timer reset routines.
General Status Functions	Status routines for the WDT.

5.6.27.5 Configuring the Library

The library is configured for the supported processor when the processor is chosen in the MPLAB IDE.

5.6.27.6 Library Interface

Data Types and Constants

	Name	Description
	WDT_MODULE_ID	Identifies the supported WDT modules.

Feature Existence Functions

	Name	Description
	PLIB_WDT_ExistsEnableControl	Identifies whether the EnableControl feature exists on the WDT module.
	PLIB_WDT_ExistsPostscalarValue	Identifies whether the PostscalarValue feature exists on the WDT module.
	PLIB_WDT_ExistsTimerClear	Identifies whether the TimerClear feature exists on the WDT module.
	PLIB_WDT_ExistsWindowEnable	Identifies whether the WindowEnable feature exists on the WDT module.

General Configuration Functions

	Name	Description
	PLIB_WDT_Disable	Disables the WDT module.
	PLIB_WDT_Enable	Enables the WDT module.
	PLIB_WDT_WindowDisable	Disables the WDT Windowed mode.
	PLIB_WDT_WindowEnable	Enables the WDT Window mode.
	PLIB_WDT_TimerClear	Resets the WDT module.

General Status Functions

	Name	Description
	PLIB_WDT_IsEnabled	Returns the watchdog timer on/off(enable/disable) status.
	PLIB_WDT_PostscalarValueGet	Returns the WDT postscalar value.

Description

This section describes the functions, data types, and constants available in the WDT Peripheral Library.

5.6.27.6.1 General Configuration Functions

5.6.27.6.1.1 PLIB_WDT_Disable Function

C

```
void PLIB_WDT_Disable(
    WDT_MODULE_ID index
);
```

Description

This function disables the WDT module if it is enabled in software.

Preconditions

The WDT module must be enabled through software.

Parameters

Parameters	Description
index	Identifies the desired WDT module

Returns

None.

Remarks

This function will not disable the WDT module if it is enabled through its Configuration bits.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_WDT_ExistsEnableControl](#) in your application to determine whether this feature is available.

Example

```
PLIB_WDT_Disable ( WDT_ID_0 );
```

5.6.27.6.1.2 PLIB_WDT_Enable Function**C**

```
void PLIB_WDT_Enable(  
    WDT_MODULE_ID index  
);
```

Description

This function enables the WDT module. If it is already enabled through the Configuration bits, it will keep it enabled.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired WDT module

Returns

None.

Remarks

Calling this function is not necessary if it is enabled through its Configuration bits.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_WDT_ExistsEnableControl](#) in your application to determine whether this feature is available.

Example

```
PLIB_WDT_Enable ( WDT_ID_0 );
```

5.6.27.6.1.3 PLIB_WDT_WindowDisable Function**C**

```
void PLIB_WDT_WindowDisable(  
    WDT_MODULE_ID index  
);
```

Description

This function disables the WDT Windowed mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired WDT module

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_WDT_ExistsWindowEnable](#) in your application to determine whether this feature is available.

Example

```
PLIB_WDT_WindowDisable ( WDT_ID_0 );
```

5.6.27.6.1.4 PLIB_WDT_WindowEnable Function**C**

```
void PLIB_WDT_WindowEnable(  
    WDT_MODULE_ID index  
);
```

Description

This function enables the WDT Windowed mode.

Preconditions

The window size must be set through the Configuration bits.

Parameters

Parameters	Description
index	Identifies the desired WDT module

Returns

None.

Remarks

The window size must be set through the Configuration bits.

The example code doesn't include the settings that should be done through the Configuration bits.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_WDT_ExistsWindowEnable](#) in your application to determine whether this feature is available.

Example

```
PLIB_WDT_WindowEnable ( WDT_ID_0 );  
PLIB_WDT_Enable ( WDT_ID_0 );
```

5.6.27.6.1.5 PLIB_WDT_TimerClear Function**C**

```
void PLIB_WDT_TimerClear(  
    WDT_MODULE_ID index  
);
```

Description

This function resets the WDT module. The WDT module should be cleared periodically before the count crosses and forces the

device to reset.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired WDT module

Returns

None.

Remarks

Resetting the device before the count reaches the window will cause a reset in Windowed mode.

The example code doesn't include the settings that should be done through the Configuration bits.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_WDT_ExistsTimerClear](#) in your application to determine whether this feature is available.

Example

```
PLIB_WDT_Enable ( WDT_ID_0 );  
  
//Application loop  
while(1)  
{  
    PLIB_WDT_TimerClear ( WDT_ID_0 );  
    //user code  
}
```

5.6.27.6.2 General Status Functions

5.6.27.6.2.1 PLIB_WDT_IsEnabled Function

C

```
bool PLIB_WDT_IsEnabled(  
    WDT_MODULE_ID index  
);
```

Description

Returns the 'true', if the watchdog timer is already ON. Otherwise returns 'false'.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired WDT module

Returns

true - If the watchdog timer is on false - If the watchdog timer is off

Remarks

This function returns 'true' if the device is enabled either through the Configuration bits or in the software.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use

[PLIB_WDT_ExistsEnableControl](#) in your application to determine whether this feature is available.

Example

```
if ( PLIB_WDT_IsEnabled ( WDT_ID_0 ) )
{
    //Do some action
}
```

5.6.27.6.2.2 PLIB_WDT_PostscalarValueGet Function

C

```
char PLIB_WDT_PostscalarValueGet(
    WDT_MODULE_ID index
);
```

Description

This function returns the WDT postscalar value. The value will correspond to a division factor.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired WDT module

Returns

The postscalar value.

Remarks

The value returned will be right-aligned.

Refer the datasheet of the specific device to get the division factor corresponding to the value.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_WDT_ExistsPostscalarValue](#) in your application to determine whether this feature is available.

Example

```
uint8_t value;

PLIB_WDT_Enable ( WDT_ID_0 );
value = PLIB_WDT_PostscalarValueGet ( WDT_ID_0 );
```

5.6.27.6.3 Data Types and Constants

5.6.27.6.3.1 WDT_MODULE_ID Enumeration

C

```
typedef enum {
    WDT_ID,
    WDT_NUMBER_OF_MODULES
} WDT_MODULE_ID;
```

Description

WDT Module ID

This enumeration identifies the available WDT modules.

Members

Members	Description
WDT_ID	WDT Module 1 ID
WDT_NUMBER_OF_MODULES	Number of available WDT modules.

Remarks

The caller should not rely on the specific numbers assigned to any of these values as they may change from one processor to the next.

5.6.27.6.4 Feature Existence Functions

5.6.27.6.4.1 PLIB_WDT_ExistsEnableControl Function

C

```
bool PLIB_WDT_ExistsEnableControl(  
    WDT_MODULE_ID index  
);
```

Description

This function identifies whether the EnableControl feature is available on the WDT module. When this function returns true, these functions are supported on the device:

- [PLIB_WDT_Enable](#)
- [PLIB_WDT_Disable](#)
- [PLIB_WDT_IsEnabled](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

Existence of the EnableControl feature:

- true - When EnableControl feature is supported on the device
- false - When EnableControl feature is not supported on the device

Remarks

None.

5.6.27.6.4.2 PLIB_WDT_ExistsPostscalarValue Function

C

```
bool PLIB_WDT_ExistsPostscalarValue(  
    WDT_MODULE_ID index  
);
```

Description

This function identifies whether the PostscalarValue feature is available on the WDT module. When this function returns true, this

function is supported on the device:

- [PLIB_WDT_PostscalarValueGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The PostscalarValue feature is supported on the device
- false - The PostscalarValue feature is not supported on the device

Remarks

None.

5.6.27.6.4.3 PLIB_WDT_ExistsTimerClear Function

C

```
bool PLIB_WDT_ExistsTimerClear(  
    WDT_MODULE_ID index  
);
```

Description

This function identifies whether the TimerClear feature is available on the WDT module. When this function returns true, this function is supported on the device:

- [PLIB_WDT_TimerClear](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The TimerClear feature is supported on the device
- false - The TimerClear feature is not supported on the device

Remarks

None.

5.6.27.6.4.4 PLIB_WDT_ExistsWindowEnable Function

C

```
bool PLIB_WDT_ExistsWindowEnable(  
    WDT_MODULE_ID index  
);
```

Description

This function identifies whether the WindowEnable feature is available on the WDT module. When this function returns true, these functions are supported on the device:

- [PLIB_WDT_WindowEnable](#)
- [PLIB_WDT_WindowDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The WindowEnable feature is supported on the device
- false - The WindowEnable feature is not supported on the device

Remarks

None.

5.6.27.7 Files

Files

Name	Description
plib_wdt.h	Watchdog Timer (WDT) Peripheral Library interface header for Watchdog Timer common definitions.

Description

5.6.27.7.1 plib_wdt.h

WDT Peripheral Library Interface Header

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the Watchdog Timer Peripheral Library for all families of Microchip microcontrollers. The definitions in this file are common to the Watchdog Timer peripheral.

Functions

	Name	Description
≡	PLIB_WDT_Disable	Disables the WDT module.
≡	PLIB_WDT_Enable	Enables the WDT module.
≡	PLIB_WDT_ExistsEnableControl	Identifies whether the EnableControl feature exists on the WDT module.
≡	PLIB_WDT_ExistsPostscalarValue	Identifies whether the PostscalarValue feature exists on the WDT module.
≡	PLIB_WDT_ExistsTimerClear	Identifies whether the TimerClear feature exists on the WDT module.
≡	PLIB_WDT_ExistsWindowEnable	Identifies whether the WindowEnable feature exists on the WDT module.
≡	PLIB_WDT_IsEnabled	Returns the watchdog timer on/off(enable/disable) status.
≡	PLIB_WDT_PostscalarValueGet	Returns the WDT postscalar value.
≡	PLIB_WDT_TimerClear	Resets the WDT module.
≡	PLIB_WDT_WindowDisable	Disables the WDT Windowed mode.
≡	PLIB_WDT_WindowEnable	Enables the WDT Window mode.

File Name

plib_wdt.h

Microchip Technology Inc.

5.7 System Service Library Help

5.7.1 System Service Overview

System services provide common functionality that would otherwise need to be duplicated or would force other drivers and libraries to interact in complex and difficult to manage ways. System services have two primary types of implementations:

- System Service Libraries
- Low-Level Support

Most system service libraries follow the same basic model as a device driver (directly using a peripheral library to access hardware) or a middleware library (using a device driver to access hardware) as the rest of the system.

Some low-level support libraries provide common (cross-micro/cross-board) interfaces, but require system-specific implementation as part of a Board Support Package (BSP) or application configuration (for example, the low-level "raw" interrupt support necessary for interrupt-driven configurations).

5.7.1.1 Library Interface

Data Types and Constants

	Name	Description
	<u>_SYS_TASKS_PRIORITIES</u>	Defines system tasks priorities.
	<u>MAIN_RETURN_CODES</u>	Predefined list of return codes for "main".
	<u>SYS_MODULE_DATA</u>	Contains module-interface info used to define a table of system modules
	<u>SYS_MODULE_DEINITIALIZE_ROUTINE</u>	Pointer to a routine that de-initializes a system module (driver, library, or system-maintained application)
	<u>SYS_MODULE_INDEX</u>	Identifies which instance of a system module should be initialized or opened.
	<u>SYS_MODULE_INIT</u>	Initializes a module (including device drivers) in a current power status as requested by the system or power manager.
	<u>SYS_MODULE_INITIALIZE_ROUTINE</u>	Pointer to a routine that initializes a system module (driver, library, or system-maintained application).
	<u>SYS_MODULE_INTERFACE</u>	Structure contains pointers to module-interface routines for a single system module.
	<u>SYS_MODULE_OBJ</u>	Handle to an instance of a system module.
	<u>SYS_MODULE_REINITIALIZE_ROUTINE</u>	Pointer to a routine that reinitializes a system module (driver, library, or system-maintained application)
	<u>SYS_MODULE_STATUS_ROUTINE</u>	Pointer to a routine that gets the current status of a system module (driver, library, or system-maintained application).
	<u>SYS_MODULE_TASKS_DATA</u>	Structure contains pointers to module's tasks routine.

	<u>SYS_MODULE_TASKS_ROUTINE</u>	Pointer to a routine that performs the tasks necessary to maintain a state machine in a module system module (driver, library, or system-maintained application).
	<u>SYS_STATUS</u>	Identifies the current status/state of a system module (including device drivers).
	<u>SYS_TASKS_PRIORITY</u>	Defines system tasks priorities.
	<u>MAIN_RETURN</u>	Defines the correct return type for the "main" routine.
	<u>MAIN_RETURN_CODE</u>	Provides the correct value for the return code from "main".
	<u>SYS_MODULE_OBJ_INVALID</u>	Object handle value returned if unable to initialize the requested instance of a system module.
	<u>SYS_MODULE_OBJ_STATIC</u>	Object handle value returned by static modules.
	<u>SYS_MODULE_POWER_IDLE_RUN</u>	Module power-state idle-run state code.
	<u>SYS_MODULE_POWER_IDLE_STOP</u>	Module power-state idle-stop state code.
	<u>SYS_MODULE_POWER_OFF</u>	Module power-state power off state code.
	<u>SYS_MODULE_POWER_RUN_FULL</u>	Module power-state run-full state code.
	<u>SYS_MODULE_POWER_SLEEP</u>	Module power-state sleep state code.

System Functions

	Name	Description
	<u>SYS_Tasks</u>	Function that performs all polled system tasks.

Description

5.7.1.1.1 System Functions

5.7.1.1.1.1 SYS_Tasks Function

C

```
void SYS_Tasks();
```

Description

System Tasks Function

This function performs all polled system tasks by calling the state machine "tasks" functions for all polled modules in the system, including drivers, services, middleware and applications.

Preconditions

The [SYS_Initialize](#) function must have been called and completed.

Returns

None.

Remarks

If the module is interrupt driven, the system will call this routine from an interrupt context.

Example

```
SYS_Initialize ( NULL );

while ( true )
{
    SYS_Tasks ( );
}
```

```
}
```

5.7.1.1.2 Data Types and Constants

5.7.1.1.2.1 MAIN_RETURN_CODES Enumeration

C

```
typedef enum {
    MAIN_RETURN_FAILURE = -1,
    MAIN_RETURN_SUCCESS = 0
} MAIN_RETURN_CODES;
```

Description

Main Routine Codes

This enumeration provides a predefined list of return codes for "main".

Remarks

These codes can be passed into the [MAIN_RETURN_CODE](#) macro to convert them to the appropriate type (or discard them if not needed) for the Microchip microcontroller in use.

Example

```
MAIN_RETURN main ( void )
{
    // Initialize the system
    SYS_Initialize(...);

    // Main Loop
    while(true)
    {
        SYS_Tasks();
    }

    return MAIN_RETURN_CODE(MAIN_RETURN_SUCCESS);
}
```

5.7.1.1.2.2 SYS_MODULE_DATA Structure

C

```
typedef struct {
    SYS_MODULE_INTERFACE interface;
    SYS_MODULE_OBJ object;
    SYS_TASKS_PRIORITY priority;
    unsigned int count;
} SYS_MODULE_DATA;
```

Description

System Module Data

This structure contains module-interface info used to define a table of system modules.

Members

Members	Description
SYS_MODULE_INTERFACE interface;	Module interface (function pointers, index, etc)
SYS_MODULE_OBJ object;	Object handle obtained from initialization call
SYS_TASKS_PRIORITY priority;	Requested module priority (identifies "Tasks" interval)
unsigned int count;	Number of intervals (of the module priority) before calling this module's "Tasks" routine.

Remarks

Used internally by the system services. Not to be accessed by user code.

5.7.1.1.2.3 SYS_MODULE_DEINITIALIZE_ROUTINE Type**C**

```
typedef void (* SYS_MODULE_DEINITIALIZE_ROUTINE)(SYS_MODULE_OBJ object);
```

Description

System Module De-initialization Routine Pointer

This data type is a pointer to a routine that deinitializes a system module (driver, library, or system-maintained application).

Preconditions

The low-level board initialization must have (and will be) completed and the module's initialization routine will have been called before the system will call the deinitialization routine for any modules.

Parameters

Parameters	Description
object	Handle to the module instance

Returns

None.

Remarks

If the module instance has to be used again, the module's "initialize" function must first be called.

Example

TBD

5.7.1.1.2.4 SYS_MODULE_INDEX Type**C**

```
typedef unsigned short int SYS_MODULE_INDEX;
```

Description

System Module Index

This data type identifies to which instance of a system module a call to that module's "Initialize" and "Open" routines refers.

Remarks

Each individual module will usually define macro names for the index values it supports (ex. [DRV_TMR_INDEX_1](#), [DRV_TMR_INDEX_2](#), ...).

5.7.1.1.2.5 SYS_MODULE_INIT Union**C**

```
typedef union {  
    uint8_t value;  
    struct {  
        uint8_t powerState : 4;  
        uint8_t reserved : 4;  
    } sys;  
} SYS_MODULE_INIT;
```

Description

System Module Init

This structure provides the necessary data to initialize or reinitialize a module (including device drivers) into a requested power state. The structure can be extended in a module specific way as to carry module specific initialization data.

Members

Members	Description
uint8_t powerState : 4;	Requested power state
uint8_t reserved : 4;	Module-definable field, module-specific usage

Remarks

This structure is used in the device driver routines DRV__Initialize and DRV__Reinitialize that are defined by each device driver.

The "powerState" member has several pre-defined values (shown below). All other available values (within the 4-bit field) are available for module-specific meaning.

Pre-defined powerState Values:

0. [SYS_MODULE_POWER_OFF](#) - Module power-state power off state code
1. [SYS_MODULE_POWER_SLEEP](#) - Module power-state sleep state code
2. [SYS_MODULE_POWER_IDLE_STOP](#) - Module power-state idle-stop state code
3. [SYS_MODULE_POWER_IDLE_RUN](#) - Module power-state idle-run state code
- 4-14. - Module-specific meaning
15. [SYS_MODULE_POWER_RUN_FULL](#) - Module power-state run-full state code

5.7.1.1.2.6 SYS_MODULE_INITIALIZE_ROUTINE Type

C

```
typedef SYS_MODULE_OBJ (* SYS_MODULE_INITIALIZE_ROUTINE)(const SYS_MODULE_INDEX index, const  
SYS_MODULE_INIT * const init);
```

Description

System Module Initialization Routine Pointer

This data type is a pointer to a routine that initializes a system module (driver, library, or system-maintained application).

Preconditions

The low-level board initialization must have (and will be) completed before the system will call the initialization routine for any modules.

Parameters

Parameters	Description
index	Identifier for the module instance to be initialized

init	Pointer to the data structure containing any data necessary to initialize the module. This pointer may be null if no data is required and default initialization is to be used.

Returns

A handle to the instance of the system module that was initialized. This handle is a necessary parameter to all of the other system-module level routines for that module.

Remarks

This function will only be called once during system initialization.

5.7.1.1.2.7 SYS_MODULE_INTERFACE Structure

C

```
typedef struct {
    SYS_MODULE_INITIALIZE_ROUTINE pModuleInitialize;
    SYS_MODULE_REINITIALIZE_ROUTINE pModuleReinitialize;
    SYS_MODULE_DEINITIALIZE_ROUTINE pModuleDeinitialize;
    SYS_MODULE_STATUS_ROUTINE pModuleStatus;
    SYS_MODULE_TASKS_DATA * pTasksData;
    SYS_MODULE_INIT * pModuleInitData;
    SYS_MODULE_INDEX index;
    unsigned int tasksNum;
} SYS_MODULE_INTERFACE;
```

Description

System Module Interface

This structure contains pointers to module-interface routines for a single system module. The system will initialize these modules (using their respective initialization routines) and (potentially) monitor and maintain their states using the reinitialize, deinitialize, and status routines.

Members

Members	Description
SYS_MODULE_INITIALIZE_ROUTINE pModuleInitialize;	Pointer to the module's initialization routine
SYS_MODULE_REINITIALIZE_ROUTINE pModuleReinitialize;	Pointer to the module's re-initializtion routine
SYS_MODULE_DEINITIALIZE_ROUTINE pModuleDeinitialize;	Pointer to the module's de-initialization routine
SYS_MODULE_STATUS_ROUTINE pModuleStatus;	Pointer to the module's status routine
SYS_MODULE_TASKS_DATA * pTasksData;	Pointer to the module's "Tasks" routine
SYS_MODULE_INIT * pModuleInitData;	Pointer to the module's init data table
SYS_MODULE_INDEX index;	Index to the module instance
unsigned int tasksNum;	Number of tasks supported by this module

Remarks

A pointer to this structure is passed to the SYS_ModuleRegister routine.

Example

TBD

5.7.1.1.2.8 SYS_MODULE_OBJ Type

C

```
typedef uintptr_t SYS_MODULE_OBJ;
```

Description

System Module Object

This data type is a handle to a specific instance of a system module (such as a device driver).

Remarks

Code outside of a specific module should consider this as an opaque type (much like a void *). Do not make any assumptions about base type as it may change in the future or about the value stored in a variable of this type.

5.7.1.1.2.9 SYS_MODULE_REINITIALIZE_ROUTINE Type

C

```
typedef void (* SYS_MODULE_REINITIALIZE_ROUTINE)(SYS_MODULE_OBJ object, const SYS_MODULE_INIT  
* const init);
```

Description

System Module Re-initialization Routine Pointer

This data type is a pointer to a routine that re-initializes a system module (driver, library, or system-maintained application).

Preconditions

The low-level board initialization must have (and will be) completed and the module's initialization routine will have been called before the system will call the reinitialization routine for any modules.

Parameters

Parameters	Description
object	Handle to the module instance
init	Pointer to the data structure containing any data necessary to initialize the module. This pointer may be null if no data is required and default initialization is to be used.

Returns

None.

Remarks

This operation uses the same initialization data structure as the Initialize operation.

This operation can be used to change the power state of a module.

This operation can also be used to refresh the hardware state as defined by the initialization data, thus it must guarantee that all hardware state has been refreshed.

This function can be called multiple times to reinitialize the module.

Example

TBD

5.7.1.1.2.10 SYS_MODULE_STATUS_ROUTINE Type

C

```
typedef SYS_STATUS (* SYS_MODULE_STATUS_ROUTINE)(SYS_MODULE_OBJ object);
```

Description

System Module Status Routine Pointer

This data type is a pointer to a routine that gets the current status of a system module (driver, library, or system-maintained application).

Preconditions

The low-level board initialization must have (and will be) completed and the module's initialization routine will have been called before the system will call the status routine for any modules.

Parameters

Parameters	Description
object	Handle to the module instance

Returns

One of the possible status codes from [SYS_STATUS](#)

Remarks

A module's status operation can be used to determine when any of the other module level operations has completed as well as to obtain general status of the module. The value returned by the status routine will be checked after calling any of the module operations to find out when they have completed.

If the status operation returns SYS_STATUS_BUSY, the previous operation has not yet completed. Once the status operation returns SYS_STATUS_READY, any previous operations have completed.

The value of SYS_STATUS_ERROR is negative (-1). A module may define module-specific error values of less or equal SYS_STATUS_ERROR_EXTENDED (-10).

The status function must NEVER block.

If the status operation returns an error value, the error may be cleared by calling the reinitialize operation. If that fails, the deinitialize operation will need to be called, followed by the initialize operation to return to normal operations.

Example

TBD

5.7.1.1.2.11 SYS_MODULE_TASKS_DATA Structure

C

```
typedef struct {  
    SYS_MODULE_TASKS_ROUTINE pTasksFunction;  
    bool intModule;  
} SYS_MODULE_TASKS_DATA;
```

Description

System Module Tasks data

This structure contains pointers to module's tasks routine. A module can have an array of such structures depending on number of tasks routines it supports. The system will either directly/indirectly call the tasks routine depending on the value of intModule.

Members

Members	Description
SYS_MODULE_TASKS_ROUTINE pTasksFunction;	Pointer to the module's "Tasks" routine
bool intModule;	Tasks type (polled/interrupt)

Remarks

A pointer to this structure is passed to the SYS_ModuleRegister routine.

Example

TBD

5.7.1.1.2.12 SYS_MODULE_TASKS_ROUTINE Type**C**

```
typedef void (* SYS_MODULE_TASKS_ROUTINE)(SYS_MODULE_OBJ object);
```

Description

System Module Tasks Routine Pointer

This data type is a pointer to a routine that performs the tasks necessary to maintain a state machine in a module system module (driver, library, or system-maintained application).

Preconditions

The low-level board initialization must have (and will be) completed and the module's initialization routine will have been called before the system will call the deinitialization routine for any modules.

Parameters

Parameters	Description
object	Handle to the module instance

Returns

None.

Remarks

If the module is interrupt driven, the system will call this routine from an interrupt context.

Example

TBD

5.7.1.1.2.13 SYS_STATUS Enumeration**C**

```
typedef enum {  
    SYS_STATUS_ERROR_EXTENDED = -10,  
    SYS_STATUS_ERROR = -1,  
    SYS_STATUS_UNINITIALIZED = 0,  
    SYS_STATUS_BUSY = 1,  
    SYS_STATUS_READY = 2,  
    SYS_STATUS_READY_EXTENDED = 10  
} SYS_STATUS;
```

Description

System Module Status

This enumeration identifies the current status/state of a system module (including device drivers).

Members

Members	Description
SYS_STATUS_ERROR_EXTENDED = -10	Indicates that a non-system defined error has occurred. The caller must call the extended status routine for the module in question to identify the error.
SYS_STATUS_ERROR = -1	An un-specified error has occurred.
SYS_STATUS_UNINITIALIZED = 0	The module has not yet been initialized
SYS_STATUS_BUSY = 1	An operation is currently in progress
SYS_STATUS_READY = 2	Any previous operations have succeeded and the module is ready for additional operations
SYS_STATUS_READY_EXTENDED = 10	Indicates that the module is in a non-system defined ready/run state. The caller must call the extended status routine for the module in question to identify the state.

Remarks

This enumeration is the return type for the system-level status routine defined by each device driver or system module (for example, DRV_I2C_Status).

5.7.1.1.2.14 SYS_TASKS_PRIORITY Enumeration**C**

```
typedef enum SYS_TASKS_PRIORITIES {
    SYS_TASKS_PRIORITY_INVALID = 0,
    SYS_TASKS_PRIORITY_HIGH,
    SYS_TASKS_PRIORITY_MEDIUM,
    SYS_TASKS_PRIORITY_LOW
} SYS_TASKS_PRIORITY;
```

Description

System Tasks Priority

This enumeration defines the available system tasks priorities.

Members

Members	Description
SYS_TASKS_PRIORITY_INVALID = 0	Invalid priority (can be used as a sentinel value)
SYS_TASKS_PRIORITY_HIGH	High priority tasks are called every time through the loop
SYS_TASKS_PRIORITY_MEDIUM	Called at the medium priority interval.
SYS_TASKS_PRIORITY_LOW	Called at the low priority interval.

Remarks

To use medium priority tasks, a medium priority interval must be defined by defining SYS_TASKS_CONFIG_MEDIUM_INTERVAL to the desired interval (in milliseconds).

To use low priority tasks, a low priority interval must be defined by defining SYS_TASKS_CONFIG_LOW_INTERVAL to the desired interval (in milliseconds).

5.7.1.1.2.15 MAIN_RETURN Macro**C**

```
#define MAIN_RETURN void
```

Description

Main Routine Return Type

This macro defines the correct return type for the "main" routine for the selected Microchip microcontroller family.

Remarks

This type changes depending upon which family of Microchip microcontrollers is chosen. Most Microchip microcontrollers do not return any value from "main".

Example

```
MAIN_RETURN main ( void )
{
    // Initialize the system
    SYS_Initialize(...);

    // Main Loop
    while(true)
    {
        SYS_Tasks();
    }

    return MAIN_RETURN_CODE(MAIN_RETURN_SUCCESS);
}
```

5.7.1.1.2.16 MAIN_RETURN_CODE Macro

C

```
#define MAIN_RETURN_CODE(c)
```

Description

Main Routine Code Macro

This macro provides the correct value for the return code from "main".

Remarks

Most Microchip microcontrollers do not provide a return value from "main". Therefore, this macro discards the code it is given unless it is needed.

Example

```
MAIN_RETURN main ( void )
{
    // Initialize the system
    SYS_Initialize(...);

    // Main Loop
    while(true)
    {
        SYS_Tasks();
    }

    return MAIN_RETURN_CODE(MAIN_RETURN_SUCCESS);
}
```

5.7.1.1.2.17 SYS_MODULE_OBJ_INVALID Macro

C

```
#define SYS_MODULE_OBJ_INVALID ((SYS_MODULE_OBJ) -1 )
```

Description

System Module Object Invalid

This is the object handle value returned if unable to initialize the requested instance of a system module.

Remarks

Do not rely on the actual value of this constant. It may change in future implementations.

5.7.1.1.2.18 SYS_MODULE_OBJ_STATIC Macro**C**

```
#define SYS_MODULE_OBJ_STATIC ((SYS_MODULE_OBJ) 0 )
```

Description

System Module Object Static

This is the object handle value returned by static system modules.

Remarks

Do not rely on the actual value of this constant. It may change in future implementations.

5.7.1.1.2.19 SYS_MODULE_POWER_IDLE_RUN Macro**C**

```
#define SYS_MODULE_POWER_IDLE_RUN 3
```

Description

System Module Power Idle-Run State

This value identifies the current power status/state of a system module (including device drivers). It is used to indicate that the module should prepare to enter an idle-run state.

Remarks

An idle-run state indicates that the core CPU clock may be stopped, but the module's peripheral clock may continue running and peripheral operations may continue as long as no code needs to be executed. If code needs to execute, the module must cause an interrupt.

This value is passed in the powerState field of the [SYS_MODULE_INIT](#) structure that takes part in all modules initialization and reinitialization.

The power state codes between [SYS_MODULE_POWER_IDLE_RUN](#) (with a value of 3) and [SYS_MODULE_POWER_RUN_FULL](#) (with a value of 15) are available for module-specific definition and usage.

5.7.1.1.2.20 SYS_MODULE_POWER_IDLE_STOP Macro**C**

```
#define SYS_MODULE_POWER_IDLE_STOP 2
```

Description

System Module Power Idle-Stop State

This value identifies the current power status/state of a system module (including device drivers). It is used to indicate that the module should prepare to enter an idle-stop state.

Remarks

An idle-stop state indicates that the core CPU clock may be stopped, but the module's peripheral clock may continue running. However, the peripheral should prepare to stop operations when the idle state is entered.

This value is passed in the powerState field of the [SYS_MODULE_INIT](#) structure that takes part in all modules initialization and reinitialization.

The power state codes between [SYS_MODULE_POWER_IDLE_RUN](#) (with a value of 3) and [SYS_MODULE_POWER_RUN_FULL](#) (with a value of 15) are available for module-specific definition and usage.

5.7.1.1.2.21 SYS_MODULE_POWER_OFF Macro

C

```
#define SYS_MODULE_POWER_OFF 0
```

Description

System Module Power Off State

This value identifies the current power status/state of a system module (including device drivers). It is used to indicate that the module should prepare to enter a full power-off state.

Remarks

A power off state indicates that power may be completely removed (0 Volts).

This value is passed in the powerState field of the [SYS_MODULE_INIT](#) structure that takes part in all modules initialization and reinitialization.

The power state codes between [SYS_MODULE_POWER_IDLE_RUN](#) (with a value of 3) and [SYS_MODULE_POWER_RUN_FULL](#) (with a value of 15) are available for module-specific definition and usage.

5.7.1.1.2.22 SYS_MODULE_POWER_RUN_FULL Macro

C

```
#define SYS_MODULE_POWER_RUN_FULL 15
```

Description

System Module Power Run-Full State

This value identifies the current power status/state of a system module (including device drivers). It is used to indicate that the module should prepare to enter an run-full state.

Remarks

An run-full state indicates that the core CPU and peripheral clocks are operational at their normal configured speed and the module should be ready for normal operation.

This value is passed in the powerState field of the [SYS_MODULE_INIT](#) structure that takes part in all modules initialization and reinitialization.

The power state codes between [SYS_MODULE_POWER_IDLE_RUN](#) (with a value of 3) and [SYS_MODULE_POWER_RUN_FULL](#) (with a value of 15) are available for module-specific definition and usage.

5.7.1.1.2.23 SYS_MODULE_POWER_SLEEP Macro

C

```
#define SYS_MODULE_POWER_SLEEP 1
```

Description

System Module Power Sleep State

This value identifies the current power status/state of a system module (including device drivers). It is used to indicate that the module should prepare to enter a sleep state.

Remarks

A Sleep state indicates that the core CPU and peripheral clocks may be stopped and no code will execute and any module hardware will be stopped.

This value is passed in the powerState field of the `SYS_MODULE_INIT` structure that takes part in all modules initialization and reinitialization.

The power state codes between `SYS_MODULE_POWER_IDLE_RUN` (with a value of 3) and `SYS_MODULE_POWER_RUN_FULL` (with a value of 15) are available for module-specific definition and usage.

5.7.1.2 Files

Files

Name	Description
<code>sys_common.h</code>	Common definitions and declarations required for the system.
<code>sys_module.h</code>	Defines definitions and declarations related to system modules.
<code>system.h</code>	Aggregates all of the system services library interface headers.

Description

5.7.1.2.1 sys_common.h

System Services Common Library Header

This file defines the common definitions and declarations required for the system.

Remarks

This file is included by "`system.h`".

Enumerations

	Name	Description
	<code>_SYS_TASKS_PRIORITIES</code>	Defines system tasks priorities.
	<code>MAIN_RETURN_CODES</code>	Predefined list of return codes for "main".
	<code>SYS_TASKS_PRIORITY</code>	Defines system tasks priorities.

Macros

	Name	Description
	<code>MAIN_RETURN</code>	Defines the correct return type for the "main" routine.
	<code>MAIN_RETURN_CODE</code>	Provides the correct value for the return code from "main".

File Name

`sys_common.h`

Company

Microchip Technology Inc.

5.7.1.2.2 sys_module.h

System Module Header

This file defines definitions and interfaces related to system modules.

Remarks

This file is included via "[system.h](#)" and does not normally need to be included directly.

Enumerations

	Name	Description
	SYS_STATUS	Identifies the current status/state of a system module (including device drivers).

Functions

	Name	Description
	SYS_Initialize	Function that initializes all modules in the system.
	SYS_Tasks	Function that performs all polled system tasks.

Macros

	Name	Description
	SYS_MODULE_OBJ_INVALID	Object handle value returned if unable to initialize the requested instance of a system module.
	SYS_MODULE_OBJ_STATIC	Object handle value returned by static modules.
	SYS_MODULE_POWER_IDLE_RUN	Module power-state idle-run state code.
	SYS_MODULE_POWER_IDLE_STOP	Module power-state idle-stop state code.
	SYS_MODULE_POWER_OFF	Module power-state power off state code.
	SYS_MODULE_POWER_RUN_FULL	Module power-state run-full state code.
	SYS_MODULE_POWER_SLEEP	Module power-state sleep state code.

Structures

	Name	Description
	SYS_MODULE_DATA	Contains module-interface info used to define a table of system modules
	SYS_MODULE_INTERFACE	Structure contains pointers to module-interface routines for a single system module.
	SYS_MODULE_TASKS_DATA	Structure contains pointers to module's tasks routine.

Types

	Name	Description
	SYS_MODULE_DEINITIALIZE_ROUTINE	Pointer to a routine that de-initializes a system module (driver, library, or system-maintained application)
	SYS_MODULE_INDEX	Identifies which instance of a system module should be initialized or opened.
	SYS_MODULE_INITIALIZE_ROUTINE	Pointer to a routine that initializes a system module (driver, library, or system-maintained application).
	SYS_MODULE_OBJ	Handle to an instance of a system module.
	SYS_MODULE_REINITIALIZE_ROUTINE	Pointer to a routine that reinitializes a system module (driver, library, or system-maintained application)
	SYS_MODULE_STATUS_ROUTINE	Pointer to a routine that gets the current status of a system module (driver, library, or system-maintained application).

	<u>SYS_MODULE_TASKS_ROUTINE</u>	Pointer to a routine that performs the tasks necessary to maintain a state machine in a module system module (driver, library, or system-maintained application).

Unions

	Name	Description
	<u>SYS_MODULE_INIT</u>	Initializes a module (including device drivers) in a current power status as requested by the system or power manager.

File Name

sys_module.h

Company

Microchip Technology Inc.

5.7.1.2.3 system.h

System Services Library Interface Header

This file aggregates all of the system services library interface headers so that client code only needs to include this one single header to obtain prototypes and definitions for the interface to all system service libraries. System services provide common functionality that would otherwise need to be duplicated by multiple other modules or would force other drivers and libraries to interact in complex and hard to manage ways. System services eliminate conflicts by controlling access shared resources.

Remarks

The directory in which this file resides should be added to the compiler's search path for header files. Many Harmony libraries assume that "system.h" is available in the "include" path.

File Name

system.h

Microchip Technology Inc.

5.7.2 Clock System Service Library

5.7.2.1 Introduction

Clock System Service Library
for
Microchip Microcontrollers

This library provides an interface to manage the Oscillator module on Microchip family of micro controllers during different modes of operation.

Overview of Oscillator

The Oscillator is the heart of the microcontroller which provides the clock on which the core and the peripherals run. For all of the oscillators present on a Microchip microcontroller, two kinds of configurations exist:

- Through Configuration bits
- At Execution time

The first is through 'Configuration bits' which is a one-time configuration and it is done during the programming of the device. These one-time configurations are programmed in the code memory. The other is 'Execution time' configuration, which deals with features that are allowed to change during the code execution. This library provides functions which deals only with the 'Execution time' configurable features of the Oscillator module.

Oscillator is a device which supports the CPU and other peripherals by providing clock. So there is more of initialization and a little or no run time operations. The run time operations would be getting the System clock or any other 'output clocks'. If the application want to change any of the initialization, at run time, that can be done.

The Oscillator module as a whole is a group of oscillators. These are provided for the application to choose right oscillator for his application. It is important to wisely choose the oscillator and the frequency at which the CPU and the other peripheral should run at in a very power critical environments.

5.7.2.2 Release Notes

MPLAB Harmony Version: v0.70b **Oscillator System Service Library Version :** 0.01a **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.7.2.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED AS IS MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY,

FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.7.2.4 Using the Library

This topic describes the basic architecture of the Oscillator System Service and provides information and examples on how to use it.

Interface Header File: sys_osc.h

The interface to the Oscillator System Service is defined in the "sys_osc.h" header file, which is included by the "sys.h" header file.

Any C language source (.c) file that uses the Oscillator system service must include "sys.h".

5.7.2.4.1 Abstraction Model

To understand the oscillator module and how each of its feature is mapped in this library, it is important to understand all these terminologies.

Oscillators:

A clock source is hardware which generates oscillations. This may be internal or external.

Divisor and Multiplier/PLL:

These are hardware modules which can scale the clock. The rate at which the scaling is done may be fixed or configurable.

Clocks:

Clock outputs means output lines from the oscillator module which may route to different modules of the device or to the CPU(the system clock).

The diagram above gives a simplified explanation and the relationship between the above mentioned terms. In most of the cases, there are multiple clock source options available for each of the clock outputs. But not all the clock sources are available for all the output clocks. Scaling is an optional feature in most of the cases.

5.7.2.4.2 Library Overview

The diagram below shows the flow of an application call to Oscillator System service. Refer to the section [System Services Overview](#) for how the system services operates in a system.

Configuration
- Configuration bit divisors - Configuration bit multipliers - Primary oscillator clock input - Secondary oscillator clock input
Initialization
- General - Action on Wait instruction - Enable Secondary - Clock Sources - System Clock - USB Clock - Graphics Clock - Reference clock - PLL and Clock divisors - Doze Mode
Oscillator Tuning
- Internal FRC oscillator Tuning
Status routines
- Get clock - Clock Fail Status

The library interface routines are divided into various subsections, each of the subsection addresses one of the blocks or the overall operation of the Oscillator System Service module.

Library Interface Section	Description
System Initialization Functions	This section provides an initialization routine to configure the module at the startup of the system and Re-initialization if the application want to change any of the initialization settings
System Status Functions	Provides function to read different clock outputs from the oscillator module.
Optional System Functions	FRC oscillator tuning and clock fail detection APIs

5.7.2.4.3 How the Library Works

5.7.2.4.3.1 Initialization

Oscillator is a module with a little or no run time operations. So the application must do most of the configurations at the time of System initialization even though it is allowed to change the clock frequency at run time.

Not all the devices will need all the initialization parameters of the structure. Refer the datasheet of the specific device to know the features available in each device.

Call the initialization API by passing the initialization data required.

```

generalInit.auxOscMode = CLK_AUX_HS;
generalInit.auxPllEnable = true;
generalInit.refOscEnable = true;
generalInit.trimValue = 0;
generalInit.secondaryOscKeepEnabled = true;
generalInit.onWaitOperation = CLK_ON_WAIT_IDLE;

generalInit.sysClockSource = SYS_CLK_SYSCLOCK_PRIMARY_PLL;
generalInit.usbClockSource = SYS_CLK_USBCLK_PRIMARY_PLL;
generalInit.auxClockSource = CLK_AUX_CLOCK_PRIMARY_PLL;
generalInit.refOscBaseClock = CLK_REF_PB_CLOCK;
generalInit.pll_multiplier = SYS_CLK_PLL_SYSCLOCK_BY_20;
generalInit.frcClockDivisor = CLK_FRC_DIVISOR_4;
generalInit.peripheralBusClkDiv = CLK_PB_CLOCK_DIV_8;
generalInit.auxPllMultiplier = CLK_PLL_MUL_18;
generalInit.refOscDivisor = 1024;

```

```
generalInit.dozeRatio = CLK_DOZE_RATIO_4;
generalInit.dozeRecoverOnInterrupt = true;
```

```
SYS_CLK_Initialize (&generalInit);
```

Oscillator needs some time to settle. So it is recommended to do the oscillator initialization before initializing other modules. Check for the oscillator status once all the initializations are complete and before application task routine takes control.

5.7.2.4.3.2 Changing the Clock

It is allowed to change any of the clock frequency at run time. There is a single API provided to set the clock source and configure it to the clock frequency requested. User is supposed to look at the data sheet and find out one of the possible values of the output clock. The API, internally, adjusts the multipliers/divisors necessary.

Setting the System Clock:

```
SYS_CLK_ClockFrequencySet(CLK_SYSTEM, SYS_CLK_SOURCE_FRC, 8000000);
```

Setting the USB Clock:

```
SYS_CLK_ClockFrequencySet(CLK_USB, SYS_CLK_SOURCE_FRCPLL, 48000000);
```

5.7.2.4.3.3 Using Status Functions

Once the initialization is done, oscillator needs some time to settle down and get into its normal operation. The application can add a delay, do other initialization or wait in the status check routine. To minimize the waiting time it is highly recommended to do the initialization before all other initializations.

```
// Populate the oscillator initialization structure
// Call the initialization routines

// Do other initializations

// Check whether all the oscillators are ready
while((!SYS_OSC_IsReady(OSC_OUTPUT_SYSCLOCK)) &&
      (!SYS_OSC_IsReady(OSC_OUTPUT_PBCLOCK)) &&
      (!SYS_OSC_IsReady(OSC_OUTPUT_USBCLOCK)) &&
      (!SYS_OSC_IsReady(OSC_OUTPUT_GFXCLOCK)));

while(1)
{
    // Application
}
```

The application can read the frequency at which the system is running at any time after the initialization is complete.

```
uint32_t sysClockOutputHz, usbClockOutputHz, pbClockOutputHz, gfxClockOutputHz;
```

```
// Get the system clock
sysClockOutputHz = SYS_OSC_ClockFrequencyGet(OSC_OUTPUT_SYSCLOCK);
// Get the peripheral clock
pbClockOutputHz = SYS_OSC_ClockFrequencyGet(OSC_OUTPUT_PBCLOCK);
// Get the USB clock
usbClockOutputHz = SYS_OSC_ClockFrequencyGet(OSC_OUTPUT_USBCLOCK);
// Get the graphics clock
gfxClockOutputHz = SYS_OSC_ClockFrequencyGet(OSC_OUTPUT_GFXCLOCK);
```

5.7.2.4.3.4 Oscillator Tuning

Tuning the Oscillator:

Oscillator Tuning will help compensate for temperature effects on the FRC frequency over a wide range of temperatures. The tuning step size is an approximation, the application is supposed to try different values to achieve the best result. In some of the

devices there are different tuning modes available.

Direct Number method:

```
//Software must unlock before the start of the tuning.
SYS_OSC_FRCTUNING_DATA tuningInput;
OSC_FRC_TUNING_VALUE tuningValue = OSC_TUNE_TO_CENTRAL_FREQ_PLUS_0_86;

tuningInput.tuningMode = OSC_TUNING_USING_NUMBER;
tuningInput.tuningData = &tuningValue;
SYS_OSC_FRCTuningSet(&tuningInput);
```

Sequential Dithering:

To get the Sequential Dithering working, the application is suppose to set the value in 7 sequencers and also in the tuning register. Then configure the PWM module, set the period and pulse width. The Oscillator module generates frequencies corresponding the value specified in these registers in every 8th PWM cycle.

```
//Software must unlock before the start of the tuning.
SYS_OSC_FRCTUNING_DATA tuningInput;
OSC_FRC_TUNING_VALUE tuningValue[8];

//Initialize with tuning values
tuningValue[0] = OSC_TUNE_TO_CENTRAL_MINUS_2_25_PERC;
tuningValue[1] = OSC_TUNE_TO_CENTRAL_MINUS_1_5_PERC;
tuningValue[2] = OSC_TUNE_TO_CENTRAL_MINUS_0_375_PERC;
tuningValue[3] = OSC_TUNE_TO_CENTRAL_PLUS_0_43_PERC;
tuningValue[4] = OSC_TUNE_TO_CENTRAL_PLUS_1_29_PERC;
tuningValue[5] = OSC_TUNE_TO_CENTRAL_PLUS_2_54_PERC;
tuningValue[6] = OSC_TUNE_TO_CENTRAL_MINUS_3_PERC;
tuningValue[7] = OSC_TUNE_TO_CENTRAL_MINUS_3_PERC;

tuningInput.tuningMode = OSC_TUNING_SEQ_DITHER;
tuningInput.tuningData = tuningValue;
SYS_OSC_FRCTuningSet(&tuningInput);
```

Pseudo-Random Number:

Select the tuning mode. Then configure the PWM module, set the period and pulse width. The Oscillator system generates a 4-bit number based on Pseudo-Random number generation algorithm. It then uses this value to tune the FRC oscillator. The module will generate different frequencies corresponding to the generated Pseudo-Random numbers every 8th PWM cycle.

```
//Software must unlock before the start of the tuning.
SYS_OSC_FRCTUNING_DATA tuningInput;
OSC_FRC_TUNING_VALUE tuningValue = 0x7FFF;

tuningInput.tuningMode = OSC_TUNING_PSEUDO_RANDOM;
tuningInput.tuningData = &tuningValue;
SYS_OSC_FRCTuningSet(&tuningInput);
```

5.7.2.5 Configuring the Library

The configuration of the Oscillator System Service Library is based on the file `sys_config.h`

This header file contains the configuration selection for the Oscillator System Service Library. Based on the selections made, the Oscillator System Service Library will support or not support selected features. These configuration settings will apply to all instances of the Oscillator System Service Library.

This header can be placed anywhere, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.7.2.6 Library Interface

Data Types and Constants

	Name	Description
	SYS_CLK_FRCTUNING_DATA	Defines the data required for tuning the FRC Oscillator.
	SYS_CLK_INIT	Defines the data required to initialize the Oscillator for the Clock System Service.
	SYS_CLK_OUTPUT	Lists the available clock outputs.
	SYS_CLK_SOURCE	Lists the available clock outputs.
	CLK_PERIPH_BUS_MZ	Lists the available peripheral clocks.
	CLK_SOURCE_PERIPHERAL	Lists the available clock sources for the peripheral clock.

Optional System Functions

	Name	Description
	SYS_CLK_FRCTuningSet	Starts the FRC tuning.

System Initialization Functions

	Name	Description
	SYS_CLK_ClockFailureCallbackRegister	Allows registration of a call back function that will be triggered on a clock failure.
	SYS_CLK_Initialize	Initializes hardware and internal data structure of the System Clock.

System Status Functions

	Name	Description
	SYS_CLK_ClockFrequencyGet	Gets the selected clock frequency in Hz.
	SYS_CLK_ClockFrequencySet	Configures the clock multiplier and divisor values.
	SYS_CLK_ClockIsReady	Checks whether the selected clock output is stable and ready to use.
	SYS_CLK_FRCTune	This function is used for direct value based FRC oscillator tuning.
	SYS_CLK_MZPeriphBusFreqGet	Gets the selected peripheral clock frequency in Hz (PIC32MZ only).

Description

5.7.2.6.1 System Initialization Functions

5.7.2.6.1.1 SYS_CLK_ClockFailureCallbackRegister Function

C

```
void SYS_CLK_ClockFailureCallbackRegister(
    void * callback
);
```

Description

This function allows registration of a callback function that will be triggered on a clock failure. In addition, this function monitors the Fail-Safe Clock Monitor (FSCM).

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired System Clock

Returns

None.

Remarks

This function is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
SYS_CLK_ClockFailureCallbackRegister(&ErrorHandle);

void ErrorHandle (void)
{
    //Handle the error.
}
```

5.7.2.6.1.2 SYS_CLK_Initialize Function**C**

```
void SYS_CLK_Initialize(
    const SYS_CLK_INIT const * clkInit
);
```

Description

This function initializes the hardware and internal data structure of the System Clock.

Preconditions

None.

Parameters

Parameters	Description
clkInit	Pointer to a data structure containing any data necessary to initialize the System Clock. This pointer can be NULL if no data is required as static overrides have been provided.

Returns

None.

Example

```
SYS_CLK_INIT generalInit;

// Populate the oscillator initialization structure
generalInit.systemClockSource = SYS_CLK_SOURCE_FRC_SYSPLL;
generalInit.systemClockFrequency = 30000000;
generalInit.usbClockEnable = true;
generalInit.usbClockSource = SYS_CLK_SOURCE_PRIMARY_USBPLL;
generalInit.usbClockFrequency = 48000000;
generalInit.peripheralClockEnable = true;
generalInit.peripheralClockSource = SYS_CLK_SOURCE_SYSClk_OUT;
generalInit.peripheralClockFrequency = 15000000;

generalInit.referenceClockEnable = true;
generalInit.referenceClockSource = SYS_CLK_SOURCE_FRC;
generalInit.referenceClockFrequency = 8000000;

SYS_CLK_Initialize (&generalInit);
```

Remarks: This could be called at the time of system initialization to initialize the oscillator or after initialization to change any of the initialization settings.

5.7.2.6.2 System Status Functions

5.7.2.6.2.1 SYS_CLK_ClockFrequencyGet Function

C

```
unsigned long SYS_CLK_ClockFrequencyGet(  
    SYS_CLK_OUTPUT clockOutput  
);
```

Description

This function gets the selected clock frequency in Hz.

Preconditions

The selected clock output must be configured and enabled.

Returns

Clock frequency in Hz.

Example

```
unsigned long sysClockOutputHz;  
  
sysClockOutputHz = SYS_CLK_ClockFrequencyGet(CLK_SYSTEM);
```

5.7.2.6.2.2 SYS_CLK_ClockFrequencySet Function

C

```
unsigned long SYS_CLK_ClockFrequencySet(  
    SYS_CLK_OUTPUT outputClock,  
    SYS_CLK_SOURCE clockSource,  
    unsigned long clockFrequency  
);
```

Description

This function configures the clock multiplier and divisor values. This function covers all of the configuration for an oscillator clock output. All of the arguments in the API may not be applicable in all cases. The API discards the arguments that are not relevant.

Preconditions

The [SYS_CLK_Initialize](#) function should be called before calling this API.

Parameters

Parameters	Description
outputClock	Clock for which the source is to be selected
clockSource	Select the clock source
clockFrequency	Select the clock clock frequency

Returns

None.

Example

```
SYS_CLK_ClockFrequencySet(CLK_SYSTEM, SYS_CLK_SOURCE_FRC, 8000000);  
Remarks: This API returns a zero if it cannot achieve the value requested. The user
```

must recheck the hardware and enter the possible value.

5.7.2.6.2.3 SYS_CLK_ClockIsReady Function

C

```
bool SYS_CLK_ClockIsReady(  
    SYS_CLK_OUTPUT clockOutput  
);
```

Description

This function checks whether the selected clock output is stable. This should be checked at system start-up, after the initialization is complete and also each time when there is a change in the clock setup configuration. This function checks the PLL lock status to determine whether the PLL is enabled.

Preconditions

None.

Returns

- true - The selected clock output is stable
- false - The selected clock output is not stable

Remarks

This function should be called at system start-up.

This API is non-blocking in nature, so the application must call this API in a loop to wait until the initial settling time of the oscillator expires and the oscillator becomes ready.

Example

```
//Wait until the selected clock output is getting stabilized.  
while(!SYS_CLK_ClockIsReady(CLK_SYSTEM));
```

5.7.2.6.2.4 SYS_CLK_FRCTune Function

C

```
void SYS_CLK_FRCTune(  
    OSC_FRC_DIV tuningData  
);
```

Description

This function triggers the FRC tuning based on the selected mode. FRC tuning functionality has been provided to help customers compensate for temperature effects on the FRC frequency over a wide range of temperatures.

Preconditions

The device selected must support the oscillator tuning feature.

Parameters

Parameters	Description
tuningData	One of the possible value of OSC_FRC_TUNE enum

Returns

None.

Remarks

The tuning step size is an approximation, and is neither characterized, nor tested.

This API may can be only used with devices that support direct value based FRC tuning. Refer to the specific device data sheet

to determine whether this feature exists for your device.

Example

```
SYS_CLK_FRCTune( OSC_FRC_TUNE_MINUS_1_875_PERCENT);
```

5.7.2.6.2.5 SYS_CLK_MZPeriphBusFreqGet Function

C

```
unsigned long SYS_CLK_MZPeriphBusFreqGet(  
    CLK_PERIPH_BUS_MZ periphBus  
);
```

Description

This function gets the selected clock frequency in Hz (PIC32MZ only).

Preconditions

The selected clock output must be configured and enabled.

Returns

Clock frequency in Hz.

Example

```
unsigned long sysClockOutputHz;  
  
sysClockOutputHz = SYS_CLK_ClockFrequencyGet(CLK_PERIPH_BUS_2);
```

5.7.2.6.3 Optional System Functions

5.7.2.6.3.1 SYS_CLK_FRCTuningSet Function

C

```
void SYS_CLK_FRCTuningSet(  
    SYS_CLK_FRCTUNING_DATA * tuningData  
);
```

Description

This function triggers the FRC tuning based on the selected mode.

Preconditions

The device selected must support the oscillator tuning feature.

Parameters

Parameters	Description
tuningData	An instance of the structure SYS_CLK_FRCTUNING_DATA Data used for tuning
tuningMode	FRC oscillator tuning mode

Returns

None.

Remarks

This function is not applicable for devices that do not have an FRC oscillator and devices that do have an FRC oscillator, but not FRC tuning. Refer to the specific device data sheet to determine whether this feature exists for your device.

Example

```
SYS_CLK_FRCTUNING_DATA tuningInput;
```

```
CLK_FRC_TUNING_VALUE tuningValue;

tuningData.tuningMode = CLK_TUNING_USING_NUMBER;
tuningInput.tuningData = &tuningValue;

SYS_CLK_FRCTuningSet(&tuningInput);
```

5.7.2.6.4 Data Types and Constants

5.7.2.6.4.1 SYS_CLK_FRCTUNING_DATA Structure

C

```
typedef struct {
    OSC_TUNING_MODE tuningMode;
    uint8_t * tuningData;
} SYS_CLK_FRCTUNING_DATA;
```

Description

Clock module FRC tuning modes

This structure defines the necessary data required to tune the FRC Oscillator.

Members

Members	Description
OSC_TUNING_MODE tuningMode;	Oscillator tuning mode
uint8_t * tuningData;	The data required may vary depending on the mode. This could be pointed to a variable or an array of data

Remarks

None.

5.7.2.6.4.2 SYS_CLK_INIT Structure

C

```
typedef struct {
    SYS_CLK_SOURCE systemClockSource;
    unsigned long systemClockFrequency;
    bool usbClockEnable;
    SYS_CLK_SOURCE usbClockSource;
    unsigned long usbClockFrequency;
    bool peripheralClockEnable;
    SYS_CLK_SOURCE peripheralClockSource;
    unsigned long peripheralClockFrequency;
    bool referenceClockEnable;
    SYS_CLK_SOURCE referenceClockSource;
    unsigned long referenceClockFrequency;
    bool secondaryOscKeepEnabled;
    OSC_OPERATION_ON_WAIT onWaitInstruction;
    bool referenceStopInIdle;
    bool referenceSuspendInSleep;
} SYS_CLK_INIT;
```

Description

Clock System Service Reference Oscillator initialization data

This structure defines the data required to initialize the Oscillator for the Clock System Service.

Members

Members	Description
SYS_CLK_SOURCE systemClockSource;	Initializations for System clock
unsigned long systemClockFrequency;	Set the System clock frequency
bool usbClockEnable;	Initializations for USB clock Enable the USB clock. If the device doesn't need USB clock, set this variable to 'false'. In that case, user need not set next two variables.
SYS_CLK_SOURCE usbClockSource;	Select the USB clock source
unsigned long usbClockFrequency;	Set the USB clock frequency
bool peripheralClockEnable;	Initializations for Peripheral clock Enable the Peripheral clock. If the device doesn't need Peripheral clock, set this variable to 'false'. In that case, user need not set next two variables.
SYS_CLK_SOURCE peripheralClockSource;	Select the Peripheral clock source
unsigned long peripheralClockFrequency;	Set the Peripheral clock frequency
bool referenceClockEnable;	Initializations for Reference clock out Set this variable to 'true' to enable the reference clock out. The system service will discard this either if this variable is set to 'false' or if the device doesn't has 'reference clock out' feature.
SYS_CLK_SOURCE referenceClockSource;	Base clock for the reference clock out. This will be divided and tuned to get the actual Reference clock output
unsigned long referenceClockFrequency;	Use this to fine tune the divided reference oscillator clock out.
bool secondaryOscKeepEnabled;	Even though the secondary oscillator is not used, keeping the oscillator running, allows a fast switch to the lower system clock for low-power operation
OSC_OPERATION_ON_WAIT onWaitInstruction;	System action on a 'Wait' instruction
bool referenceStopInIdle;	Stop reference clock out in Idle mode
bool referenceSuspendInSleep;	Stop reference clock out in sleep mode

Remarks

Calling this API may not be essential in some cases. Some of the elements in this structure are part of the library configuration file. Setting them here will override the configuration file setting.

5.7.2.6.4.3 SYS_CLK_OUTPUT Enumeration**C**

```
typedef enum {
    CLK_SYSTEM,
    CLK_PERIPHERAL,
    CLK_USB,
    CLK_REFERENCE,
    CLK_GRAPHIX,
    CLK_ADCPWM
} SYS_CLK_OUTPUT;
```

Description

Clocks enumeration

This enumeration lists all of the available clock outputs. This is used by the [SYS_CLK_ClockFrequencyGet](#) and [SYS_CLK_ClockIsReady](#) functions.

Members

Members	Description
CLK_SYSTEM	Selects System clock output. This is used by the CPU and some of the peripherals

CLK_PERIPHERAL	Selects peripheral clock output. This is used by most of the peripherals
CLK_USB	Selects USB clock output. This is used by the USB module
CLK_REFERENCE	Selects referece clock output. This to check any of the clock or it could be used as a clock source for other devices
CLK_GRAPHIX	Selects Graphics clock output. This is used by the display module
CLK_ADCPWM	Selects ADC/PWM clock

Remarks

'Clock output' means output from the clock source.

5.7.2.6.4.4 SYS_CLK_SOURCE Enumeration**C**

```
typedef enum {
    SYS_CLK_TOTAL_SOURCES,
    SYS_CLK_SOURCE_EXTERNAL,
    SYS_CLK_SOURCE_USBPPLL_OUT,
    SYS_CLK_SOURCE_SYSPPLL_OUT,
    SYS_CLK_SOURCE_PBCLK_OUT,
    SYS_CLK_SOURCE_SYSCLK_OUT,
    SYS_CLK_SOURCE_AUXILIARY,
    SYS_CLK_SOURCE_FRC_BY_DIV,
    SYS_CLK_SOURCE_FRC_BY_16,
    SYS_CLK_SOURCE_LPRC,
    SYS_CLK_SOURCE_SECONDARY,
    SYS_CLK_SOURCE_PRIMARY_USBPPLL,
    SYS_CLK_SOURCE_PRIMARY_SYSPPLL,
    SYS_CLK_SOURCE_PRIMARY,
    SYS_CLK_SOURCE_FRC_SYSPPLL,
    SYS_CLK_SOURCE_FRC
} SYS_CLK_SOURCE;
```

Description

Clock clocks enumeration

This enumeration lists all the available clock outputs. This is used by the [SYS_CLK_ClockFrequencyGet](#) and [SYS_CLK_ClockIsReady](#) functions.

Members

Members	Description
SYS_CLK_TOTAL_SOURCES	This gives the total number of sources present
SYS_CLK_SOURCE_EXTERNAL	Source of clock is external(from the pin) This is used only for the Reference clock.
SYS_CLK_SOURCE_USBPPLL_OUT	Source of clock is output of USB PLL This is used only for the Reference clock.
SYS_CLK_SOURCE_SYSPPLL_OUT	Source of clock is the output of System PLL. This is used only for the Reference clock.
SYS_CLK_SOURCE_PBCLK_OUT	Source of clock is peripheral clock. This is used only for the Reference clock.
SYS_CLK_SOURCE_SYSCLK_OUT	Source of clock is System clock. This is used for Peripheral clock and the Reference clock.
SYS_CLK_SOURCE_AUXILIARY	Source of clock is Auxiliary clock.
SYS_CLK_SOURCE_FRC_BY_DIV	Source of clock is internal fast RC divided by the divisor configured in software. This is used only for the System clock.
SYS_CLK_SOURCE_FRC_BY_16	Source of clock is internal fast RC divided by 16. This is used only for the System clock.
SYS_CLK_SOURCE_LPRC	Source of clock is internal low power RC. This is used for System clock and the Reference clock.

SYS_CLK_SOURCE_SECONDARY	Source of clock is secondary oscillator. This is used for System clock and the Reference clock.
SYS_CLK_SOURCE_PRIMARY_USBPLL	Source of clock is primary oscillator multiplied by the USB PLL value and divided by the divisor configured by software. This is used only for the USB clock
SYS_CLK_SOURCE_PRIMARY_SYSPLL	Source of clock is primary oscillator multiplied by the System PLL value and divided by the divisor configured by software. This is used for System clock and the Reference clock.
SYS_CLK_SOURCE_PRIMARY	Source of clock is primary oscillator. This is used for System clock, Reference clock and the USB clock
SYS_CLK_SOURCE_FRC_SYSPLL	Source of clock is internal fast RC multiplied by system PLL. This is used for System clock and the Reference clock.
SYS_CLK_SOURCE_FRC	Source of clock is internal fast RC This is used for System clock, Reference clock and the USB clock

Remarks

'Clock output' means output from the clock source. Not all clock sources are available for all devices. Refer to the specific device data sheet to determine the available clock sources.

5.7.2.6.4.5 CLK_PERIPH_BUS_MZ Enumeration**C**

```
typedef enum {
    CLK_PERIPH_BUS_1,
    CLK_PERIPH_BUS_2,
    CLK_PERIPH_BUS_3,
    CLK_PERIPH_BUS_4,
    CLK_PERIPH_BUS_5,
    CLK_PERIPH_BUS_6,
    CLK_PERIPH_BUS_7,
    CLK_PERIPH_BUS_8
} CLK_PERIPH_BUS_MZ;
```

Description

Peripherals Clocks enumeration (PIC32MZ only)

This enumeration lists all of the available peripheral clocks. This is used by the [SYS_CLK_ClockFrequencyGet](#) function to return the peripheral clock frequency to the caller.

Members

Members	Description
CLK_PERIPH_BUS_6	not used

Remarks

None.

5.7.2.6.4.6 CLK_SOURCE_PERIPHERAL Enumeration**C**

```
typedef enum {
    SYS_CLK_SOURCE_SYSTEMCLK
} CLK_SOURCE_PERIPHERAL;
```

Description

Peripheral clock sources enumeration

This enumeration lists all the available peripheral clock sources. This is used by the [SYS_CLK_ClockFrequencySet](#) function.

Members

Members	Description
SYS_CLK_SOURCE_SYSTEMCLK	Source of clock is system clock

Remarks

None.

5.7.2.7 Files

Files

Name	Description
sys_clk.h	API for the Clock System Service.

Description

5.7.2.7.1 sys_clk.h

Clock System Service Interface Definition

This file contains the interface definition for the Clock System Service. It provides a way to interact with the Clock subsystem to manage the timing requests supported by the system.

Enumerations

	Name	Description
	CLK_PERIPH_BUS_MZ	Lists the available peripheral clocks.
	CLK_SOURCE_PERIPHERAL	Lists the available clock sources for the peripheral clock.
	SYS_CLK_OUTPUT	Lists the available clock outputs.
	SYS_CLK_SOURCE	Lists the available clock outputs.

Functions

	Name	Description
	SYS_CLK_ClockFailureCallbackRegister	Allows registration of a call back function that will be triggered on a clock failure.
	SYS_CLK_ClockFrequencyGet	Gets the selected clock frequency in Hz.
	SYS_CLK_ClockFrequencySet	Configures the clock multiplier and divisor values.
	SYS_CLK_ClockIsReady	Checks whether the selected clock output is stable and ready to use.
	SYS_CLK_FRCTune	This function is used for direct value based FRC oscillator tuning.
	SYS_CLK_FRCTuningSet	Starts the FRC tuning.
	SYS_CLK_Initialize	Initializes hardware and internal data structure of the System Clock.
	SYS_CLK_MZPeriphBusFreqGet	Gets the selected peripheral clock frequency in Hz (PIC32MZ only).

Structures

	Name	Description
	SYS_CLK_FRCTUNING_DATA	Defines the data required for tuning the FRC Oscillator.
	SYS_CLK_INIT	Defines the data required to initialize the Oscillator for the Clock System Service.

File Name

sys_clk.h

5.7.3 Device Control System Service Library

5.7.3.1 Introduction

Device Control System Service Library

for

Microchip Microcontrollers

This library provides a low-level abstraction of the Device Control System Service Library that is available on the Microchip family of PIC32 microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, thereby hiding differences from one microcontroller variant to another.

Description

The Device Control System Service provides the developer a simple API to configure their device for maximum performance. It does this by minimizing the number of clock cycles required to fetch instructions and data from Program Flash Memory (PFM), and SRAM. For PIC32MX devices, it also sets the peripheral clock bus to the fastest speed available for the current system clock frequency.

5.7.3.2 Release Notes

MPLAB Harmony Version: v0.70b **Device Control System Service Library Version :** 0.1 **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.7.3.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.7.3.4 Using the Library

This topic describes the basic architecture of the Device Control System Service Library and provides information and examples on how to use it.

Interface Header File: [sys_devcon.h](#)

The interface to the Device Control System Service library is defined in the "[sys_devcon.h](#)" header file. This file is included by the "[system.h](#)" file. Any C language source (.c) file that uses the Device Control System Service library should include "[system.h](#)".

Library File:

The Device Control System Service library archive (.a) file installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the System Service interacts with the framework.

5.7.3.4.1 Abstraction Model

This topic provides a description of the software abstraction for the Device Control System Service.

Description

Device Control Software Abstraction Block Diagram

The Device Control System Service configures the device for maximum performance given the current system clock speed. The system clock is retrieved using the System Clock service when the Device Control service is initialized. For this reason, the System Clock Service must be initialized prior to the Device Control Service.

The Device Control Service increases performance by:

- Minimizing the number of wait states inserted in an instruction fetch from Program Flash Memory (PFM).
- Minimizing the number of wait states inserted in a CPU access to Data RAM Memory (DRM) (PIC32MX only).
- Enabling the prefetch logic in the Prefetch Cache module.
- Setting the peripheral bus clock to the maximum speed (PIC32MX only).

5.7.3.4.2 Library Overview

Refer to the section [System Services Overview](#) for how the system services operates in a system.

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the Device Control module.

Library Interface Section	Description
System Interaction Functions	Provides system module APIs. Device initialization, de-initialization, re-initialization and status functions.
Core Functionality	Configures Device based on current system clock

5.7.3.4.3 How the Library Works

5.7.3.4.3.1 System Interaction

Initialization and Reinitialization

Initialization of the Device Control System Service initializes an internal data structure that stores the current system clock frequency. Any time the system clock is changed, the Device Control system service should be reinitialized.

The system clock is read using the Clock System Service. Therefore, the Clock System Service must be initialized prior to initializing the Device Control System Service.

The Device Control Status and Tasks routines are provided as stubs for future enhancement. They are not currently required for this system service.

5.7.3.4.3.2 Core Functionality

The Device Control System Service currently provides a single API to configure the device for maximum performance. It uses the current clock frequency stored in an internal data structure to tune the wait states, enable the prefetch buffer and set the peripheral clock (PIC32MX only) for maximum performance. The API takes no arguments and returns void.

```
SYS_DEVCON_PerformanceConfig()
```

5.7.3.5 Configuring the Library

Macros

	Name	Description
	SYS_DEVCON_PIC32MX_MAX_PB_FREQ	This is macro SYS_DEVCON_PIC32MX_MAX_PB_FREQ.
	SYS_DEVCON_PRIMARY_CLOCK	This is macro SYS_DEVCON_PRIMARY_CLOCK.
	SYS_DEVCON_SYSTEM_CLOCK	This is macro SYS_DEVCON_SYSTEM_CLOCK.

Description

The configuration of the Device Control system service is based on the file sys_config.h

This header file contains the configuration selection for the Device Control system service. Based on the selections made, the Device Control system service will support or not support selected features. These configuration settings will apply to all instances of the Device Control system service.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.7.3.5.1 Others

Three configuration options exist for the Device Control System Service.

[SYS_DEVCON_PRIMARY_CLOCK](#): Primary oscillator frequency. Not currently used.

[SYS_DEVCON_SYSTEM_CLOCK](#): System clock frequency. Retrieved using the System Clock Service. Not currently used.

[SYS_DEVCON_PIC32MX_MAX_PB_FREQ](#): Maximum peripheral bus clock frequency. Required for PIC32MX devices only.

5.7.3.5.2 Examples - Sample Functionality

```
/* Primary Oscillator clock frequency
```

Summary:

Sets up the Primary Oscillator clock frequency.

Description:

This macro sets up the Primary Oscillator clock frequency.

Remarks:

None.

```
*/
```

```
#define SYS\_DEVCON\_PRIMARY\_CLOCK 24000000L
```

```
// *****
```

```
/* System Clock frequency
```

Summary:

Sets up the System clock frequency.

Description:

This macro sets up the System clock frequency.

Remarks:

None.

```
*/
```

```
#define SYS\_DEVCON\_SYSTEM\_CLOCK 200000000L
```

```
// *****
```

```
/* PIC32MX Max Peripheral Bus Frequency
```

Summary:

Defines the maximum peripheral bus clock frequency for PIC32MX.

Description:

This macro defines the maximum peripheral bus clock frequency for PIC32MX.

Remarks:

None.

```
*/
```

```
#define SYS\_DEVCON\_PIC32MX\_MAX\_PB\_FREQ 80000000L
```

5.7.3.5.3 SYS_DEVCON_PIC32MX_MAX_PB_FREQ Macro

C

```
#define SYS_DEVCON_PIC32MX_MAX_PB_FREQ 80000000L
```

Description

This is macro SYS_DEVCON_PIC32MX_MAX_PB_FREQ.

5.7.3.5.4 SYS_DEVCON_PRIMARY_CLOCK Macro

C

```
#define SYS_DEVCON_PRIMARY_CLOCK 24000000L
```

Description

This is macro SYS_DEVCON_PRIMARY_CLOCK.

5.7.3.5.5 SYS_DEVCON_SYSTEM_CLOCK Macro

C

```
#define SYS_DEVCON_SYSTEM_CLOCK 200000000L
```

Description

This is macro SYS_DEVCON_SYSTEM_CLOCK.

5.7.3.6 Building the Library

This section list the files that are available in the \src of the Device Control System Service. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

sys_devcon.c

5.7.3.7 Library Interface

Data Types and Constants

	Name	Description
	SYS_DEVCON_HANDLE	Identifies a particular registered event instance.
	SYS_DEVCON_INIT	Identifies the system timer initialize structure.
	SYS_DEVCON_INDEX_0	Device Control System Service index definitions.

System Interaction Functions

	Name	Description
	SYS_DEVCON_Deinitialize	Deinitializes the specific module instance of the DEVCON module
	SYS_DEVCON_Initialize	Initializes data for the instance of the Device Control module and opens the specific module instance.
	SYS_DEVCON_PerformanceConfig	Configures the PFM wait states and prefetch (cache) module for maximum performance.

	SYS_DEVCON_Reinitialize	Reinitializes and refreshes the hardware for the instance of the Device Control module.
	SYS_DEVCON_Status	Returns status of the specific instance of the Device Control module.
	SYS_DEVCON_Tasks	Maintains the system Device Control state machine.
	SYS_Initialize	Function that initializes all modules in the system.

Description

5.7.3.7.1 System Interaction Functions

5.7.3.7.1.1 SYS_DEVCON_Deinitialize Function

C

```
void SYS_DEVCON_Deinitialize(
    SYS_MODULE_OBJ object
);
```

Description

This function deinitializes the specific module instance disabling its operation (and any hardware for driver modules). Resets all of the internal data structures and fields for the specified instance to the default settings.

Preconditions

The [SYS_DEVCON_Initialize](#) function should have been called before calling this function.

Parameters

Parameters	Description
object	SYS DEVCON object handle, returned from SYS_DEVCON_Initialize

Returns

None.

Example

```
SYS_MODULE_OBJ    object;    // Returned from SYS_DEVCON_Initialize
SYS_STATUS        status;

SYS_DEVCON_Deinitialize (object);
```

```
status = SYS_DEVCON_Status (object);
if (SYS_MODULE_DEINITIALIZED == status)
{
    // Check again later if you need to know
    // when the SYS DEVCON is deinitialized.
}
```

Remarks: Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again.

5.7.3.7.1.2 SYS_DEVCON_Initialize Function

C

```
SYS_MODULE_OBJ SYS_DEVCON_Initialize(
    const SYS_MODULE_INDEX index,
    const SYS_MODULE_INIT * const init
);
```

Description

This function initializes the instance of the Device Control module, using the specified initialization data. It also initializes any internal data structures.

Preconditions

None.

Parameters

Parameters	Description
index	Index for the instance to be initialized
init	Pointer to a data structure containing any data necessary to initialize the Device Control module. This pointer may be null if no data is required because static overrides have been provided.

Returns

If successful, returns a valid handle to an object. Otherwise, it returns [SYS_MODULE_OBJ_INVALID](#). The returned object must be passed as argument to [SYS_DEVCON_Reinitialize](#), [SYS_DEVCON_Deinitialize](#), [SYS_DEVCON_Tasks](#) and [SYS_DEVCON_Status](#) routines.

Example

```

SYS_MODULE_OBJ  objectHandle;
SYS_DEVCON_INIT  initConfig;

// Populate the devcon initialization structure
initConfig.moduleInit.value      = SYS_MODULE_POWER_RUN_FULL;
initConfig.sysOscFreq           = CONFIG_OSC_FREQ;

objectHandle = SYS_DEVCON_Initialize (SYS_DEVCON_INDEX_0, (SYS_MODULE_INIT*)&initConfig);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}

```

Remarks: This routine should only be called once during system initialization unless [SYS_DEVCON_Deinitialize](#) is first called to deinitialize the device instance before reinitializing it. If the system was already initialized it safely returns without causing any disturbance.

5.7.3.7.1.3 SYS_DEVCON_PerformanceConfig Function**C**

```
void SYS_DEVCON_PerformanceConfig();
```

Description

This function configures the PFM wait states and prefetch (cache) module for maximum performance.

Preconditions

The [SYS_DEVCON_Initialize](#) function should have been called before calling this function.

Returns

None.

Example

```

SYS_DEVCON_PerformanceConfig();
Remarks:    None.

```

5.7.3.7.1.4 SYS_DEVCON_Reinitialize Function

C

```
void SYS_DEVCON_Reinitialize(
    SYS_MODULE_OBJ object,
    const SYS_MODULE_INIT * const init
);
```

Description

This function reinitializes the instance of the Device Control module using the supplied data. It modifies the internal data structure.

Preconditions

The [SYS_DEVCON_Initialize](#) function should have been called before calling this function.

Parameters

Parameters	Description
object	Identifies the SYS DEVCON Object returned by the Initialize interface
init	Pointer to the data structure containing any data necessary to initialize the hardware

Returns

None

Example

```
SYS_MODULE_OBJ  objectHandle;
SYS_DEVCON_INIT  initConfig;
SYS_STATUS      devconStatus;

// Populate the timer initialization structure
initConfig.moduleInit.value    = SYS_MODULE_POWER_RUN_FULL;
initConfig.sysOscFreq         = CONFIG_OSC_FREQ;

SYS_DEVCON_Reinitialize (objectHandle, (SYS_MODULE_INIT*)&initConfig);

devconStatus = SYS_DEVCON_Status (object);
if (SYS_STATUS_ERROR >= devconStatus)
{
    // Handle error
}
```

Remarks: This operation uses the same initialization data structure as the SYS_DEVCON_Initialize operation. This operation can be used to change the power state of a DEVCON module. This function can be called multiple times to reinitialize the module. This operation uses the same initialization data structure as the Initialize operation. This operation can also be used to refresh the hardware registers as defined by the initialization data.

5.7.3.7.1.5 SYS_DEVCON_Status Function

C

```
SYS_STATUS SYS_DEVCON_Status(
    SYS_MODULE_OBJ object
);
```

Description

This function returns the status of the specific module instance disabling its operation (and any hardware for driver modules).

Preconditions

The [SYS_DEVCON_Initialize](#) function should have been called before calling this function.

Parameters

Parameters	Description
object	SYS DEVCON object handle, returned from SYS_DEVCON_Initialize

Returns

SYS_STATUS_READY - Indicates that any previous operations have succeeded and the module is ready for additional operations.

Remarks

Any value greater than SYS_STATUS_READY is also a normal running state in which the driver is ready to **accept** new operations

SYS_STATUS_BUSY - Indicates that the driver is busy with a previous system level operation and cannot start another

SYS_STATUS_ERROR - Indicates that the driver is in an error state

Any value less than SYS_STATUS_ERROR is also an error state.

SYS_MODULE_DEINITIALIZED - Indicates that the driver has been de-initialized

This value is less than SYS_STATUS_ERROR.

Example

```
SYS_MODULE_OBJ    object;    // Returned from SYS_DEVCON_Initialize
SYS_STATUS        tmrStatus;
```

```
devconStatus = SYS_DEVCON_Status (object);
else if (SYS_STATUS_ERROR >= devconStatus)
{
    // Handle error
}
```

Remarks: Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again.

5.7.3.7.1.6 SYS_DEVCON_Tasks Function**C**

```
void SYS_DEVCON_Tasks(
    SYS_MODULE_OBJ object
);
```

Description

This function is used to maintain the system Device Control internal state machine.

Preconditions

The [SYS_DEVCON_Initialize](#) function must have been called for the specified DEVCON driver instance.

Parameters

Parameters	Description
object	SYS DEVCON object handle, returned from SYS_DEVCON_Initialize

Returns

None

Remarks

This function is normally not called directly by an application. It is called by the system's Tasks routine ([SYS_Tasks](#)) or by the appropriate raw ISR.

Example

```
SYS_MODULE_OBJ      object;      // Returned from SYS_DEVCON_Initialize

while (true)
{
    SYS_DEVCON_Tasks (object);

    // Do other tasks
}
```

5.7.3.7.1.7 SYS_Initialize Function

C

```
void SYS_Initialize(
    void * data
);
```

Description

System Initialization Function

This function initializes all modules in the system, including any drivers, services, middleware, and applications.

Preconditions

None.

Parameters

Parameters	Description
data	Pointer to the data structure containing any data necessary to initialize the module. This pointer may be null if no data is required and default initialization is to be used.

Returns

None.

Remarks

This function will only be called once, after system reset.

Example

```
SYS_Initialize ( NULL );

while ( true )
{
    SYS_Tasks ( );
}
```

5.7.3.7.2 Data Types and Constants

5.7.3.7.2.1 SYS_DEVCON_HANDLE Type

C

```
typedef int8_t SYS_DEVCON_HANDLE;
```

Description

SYS DEVCON Handle

This event handle identifies a registered instance of an event. Every time the application that tries to access the paramateres with respect to a particular event, shall used this event handle to refer to that event.

Remarks

None.

5.7.3.7.2.2 SYS_DEVCON_INIT Structure

C

```
typedef struct {
    SYS_MODULE_INIT moduleInit;
    uint32_t sysOscFreq;
} SYS_DEVCON_INIT;
```

Description

SYS DEVCON Initialize structure

This structure identifies the system timer initialize structure.

Members

Members	Description
SYS_MODULE_INIT moduleInit;	System module initialization
uint32_t sysOscFreq;	System Oscillator Frequency in Hertz

Remarks

None.

5.7.3.7.2.3 SYS_DEVCON_INDEX_0 Macro

C

```
#define SYS_DEVCON_INDEX_0 0
```

Description

SYS Device Control Module Index Numbers

These constants provide Device Control System Service index definitions.

Remarks

These constants should be used in place of hard-coded numeric literals.

5.7.3.8 Files

Files

Name	Description
sys_devcon.h	Device Control System Service interface definition.
sys_devcon_config.h	Device Control System Service configuration templates.

Description

5.7.3.8.1 sys_devcon.h

Device Control System Service Interface Definition

This file contains the interface definition for the Device Control System Service. It provides a way to interact with the Device Control subsystem to manage the device control requests supported by the system.

Functions

	Name	Description
	SYS_DEVCON_Deinitialize	Deinitializes the specific module instance of the DEVCON module
	SYS_DEVCON_Initialize	Initializes data for the instance of the Device Control module and opens the specific module instance.
	SYS_DEVCON_PerformanceConfig	Configures the PFM wait states and prefetch (cache) module for maximum performance.
	SYS_DEVCON_Reinitialize	Reinitializes and refreshes the hardware for the instance of the Device Control module.
	SYS_DEVCON_Status	Returns status of the specific instance of the Device Control module.
	SYS_DEVCON_Tasks	Maintains the system Device Control state machine.

Macros

5.7.4 File System Service Library

5.7.4.1 Introduction

Introduction to the MPLAB Harmony File System (FS).

Description

The MPLAB Harmony File System (FS) provides file system services to MPLAB Harmony based applications. Figure 1 shows the architecture of the File System Service.

Figure 1: File System Architecture

The File System Service provides an application programming interface (API) through which a utility or user program requests services of a file system. Some file system APIs may also include interfaces for maintenance operations, such as creating or initializing a file system and verifying the file system for integrity.

The File System service is really a framework designed to support multiple file systems (native file system) and multiple media in the same application. Examples of native file systems are FAT12, FAT32, MPFS, and JFS, among others. Each of these native file systems have a common set of APIs that can be used to access the files of that particular native file system.

The File System Service abstracts the native file system calls and provides a common interface to the user/application layer. For example, while the application layer requests for a file read or write from a disk, due to the presence of this abstraction, the application need not be bothered about the native file system implemented on that disk. Instead, the application can call the

read/write API of the File System, which in turn translates to the read/write command of the native file system used on the required disk.

This simplifies the implementation of the higher application layer and also provides a mechanism to add more native file system to the File System framework in the future.

Note: Throughout this document, "File System Service" and "sys_fs" are used interchangeably.

5.7.4.2 Release Notes

MPLAB Harmony Version: v0.70b **File System Service Library Version :** 0.1 **Release Date:** 18Nov2013

New in This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

- Supports multiple file systems. Presently, FAT FS and MPFS are the two native file systems that are supported.
- Supports multiple media.
- Supports both static media (SD card, non-volatile memory, etc.) and dynamic media (mass storage device).
- Supports long file names for files.
- Supports media with multiple partitions.

Known Issues:

- Does not work in MIPS16 mode.
- For some SD cards, reading or writing data of more than 1 sector (512Bytes) causes random junk characters to be inserted in the data. Hence, it is advised to read or write 512Bytes or lesser at a time.
- SD cards (size 2 GB or less) do not work with the present version of File system. Only SDHC cards work.
- Hardware switch-based write protection feature is not implemented for SD cards.
- Since the FS demonstration codes do not have an integrated real-time clock module, the time is set internally to a fixed value of 9th August 2013, 3:06pm (in the file diskio.c).
- Not all functions (such as directory related functions) from native FAT FS are supported in the present version of the MPLAB Harmony FS. For the list of implemented functions, please refer to the Library Interface section.
- SD cards do not support dynamic card insertion. To use an SD card, the card has to be inserted before running the code execution.
- Testing on multi-partitioned media was not carried out extensively.

5.7.4.3 SW License Agreement

5.7.4.4 Getting Started

This topic provides an introduction to the MPLAB Harmony File System.

Description

The MPLAB Harmony File System (FS) provides embedded application developers with a file system framework for retrieving and storing data from various media.

The MPLAB Harmony file system is designed to support multiple file systems (native file systems) and multiple media at the same time. Examples of native file systems are FAT12, FAT32, MPFS, and JFS, among others. Each of these native file systems has a common set of APIs that can be used to access the files of that particular native file system. The FS is a part of the MPLAB Harmony installation and is accompanied by demonstration applications that highlight usage. These demonstrations can also be modified or updated to build custom applications.

FS features include the following:

- Support for multiple file system (FAT, MPFS)
- Supports multiple physical media (NVM, SD card)
- More physical media can be interfaced with the FS, once the driver is available for the media
- Modular and Layered architecture

5.7.4.4.1 Architecture

This topic describes the architecture of the MPLAB Harmony File System.

Description

The FS framework features a modular and layered architecture, as shown in Figure 1.

Figure 1: FS Framework Architecture

As seen in Figure 1, the FS Framework consists of the following major blocks:

- The **Driver** for the physical media has to be included as a part of the FS Framework. This layer provides a low-level interface to access the physical media. This layer also enables multiple instances of media. Examples of drivers are:
 - NVM driver – To access files using NVM (Flash memory)
 - SPI driver – To access files from SD card, which interfaces using the SPI peripheral
- The **Media driver** provides a mechanism to access the media as “sectors”. Sectors are the smallest storage element accessed by a file system and are contiguous memory locations. Typically, each sector has 512 bytes. Depending on the requirement, in some cases, the driver and media driver could be combined as one layer.
- The **Media manager** implements a disk and sector based media access mechanism. It also performs disk allocated/deallocated on media attach/detach. Due to the implementation of this layer, the FS Framework can support multiple disks.
- The **Native file system** implements support for the media file system format. Examples of native file systems are: FAT12, FAT32, and MPFS, among other. At present, only the FAT and MPFS file systems are supported by the FS framework; however, more native file systems can be included.
- The **Virtual file system (or SYS_FS)** layer provides a file system independent file system operation interface. This layer translates virtual file systems calls to native file system calls. Due to this layer, applications can now support multiple file systems. Interfaces provided by this layer, but not limited to, include:
 - SYS_FS_mount
 - SYS_FS_open
 - SYS_FS_read
 - SYS_FS_write
 - SYS_FS_close

5.7.4.4.2 Application Interaction

This topic describes how an application must interact with the File System.

Description

The interaction of various layers is shown in Figure 1.

Figure 1: Application Interaction with FS Framework

In the process of using the FS Framework, the application must first **mount** the media drive for the FS Framework to access the media. Unless the mounting process returns successfully, the application should continue trying to mount the drive. If the drive is not attached, the mounting process will fail. In such a situation, the application should not proceed further unless the mounting is success.

Figure 2: Application Mounts a Drive

Once the drive is mounted, the application code can then **open the file** from the drive with different attributes (such as read-only or write). If the file open returns a valid handle, the application can proceed further. Otherwise, the application will enter an error state. The reason for an invalid handle could be that the application was trying to read a file from the drive that does not exist. Another reason for an invalid handle is when the application tries to write to a drive that is write-protected.

Once the file is opened, the valid file handle is further used to **read/write** data to the file. Once the required operation is performed on the file, the file can then be **closed** by the application by passing the file handle. Figure 3 illustrates the process.

**Figure 3: Further File System Operations**

5.7.4.4.3 Using the File System

This topic describes how to use the File System.

Description

Use the Available Library Demonstration Applications

The FS framework release package contains a set of demonstration applications that are representative of common scenario (single/multi-media and single/multi-native file systems). These demonstrations can be easily modified to include application-specific initialization and application logic. The application logic must be non-blocking and could be implemented as a state machine.

- The application specific initialization can be called in the [SYS_Initialize\(\)](#) function (in the sys_init.c file). The [SYS_Initialize](#) is called when the device comes out of Power-on Reset (POR).
- The application logic can be called in the [SYS_Tasks\(\)](#) function (in the sys_tasks.c file). The application logic can interact with the FS layer by using relevant API calls, as provided in the [APP_Tasks\(\)](#) (in the app.c file)

Building a FS Application from Scratch

In a case where the available demonstration applications do not meet the end application requirements, an application to use the FS framework can be created by from scratch. Figure 1 shows a flowchart for the steps that need to be performed.

Figure 1: Steps to create a FS Application

Step 1:

Create a MPLAB Project and add the required FS framework files to the project. The following files are needed to build the a FS project

- system_config.h - This file should contain the compile time configuration macros for the Driver, Media Layer, and FS layer. The file also contains the clock speed setting, which is set for the microcontroller.
- system_init.c – This file should contain the initial settings for each driver. It should also call the functions required to initialize different drivers to be used by the FS.
- ff.c, diskio.c, mpfs.c, sys_fs.c, sys_fs_media_manager.c – These files are part of the FS, which must be included in the project
- sys_int_pic32.c and plib_int_pic32.c - These files implement the system interrupt service that is required by the FS
- sys_ports.c – If the FS is using a SD card as media, this file needs to be included (for Chip Select)
- Driver – The driver for media to be used by FS should also be included
- Application specific files - These file will implement the application logic

Step 2:

Since the MPLAB Harmony drivers included with the File System operate in interrupt mode, a driver Handler should be defined as follows:

```

/* Use this for PIC32MX */
void __ISR ( _SPI1_VECTOR, ipl4 ) _InterruptHandler_SPI_stub ( void )
{
    DRV_SPI_Tasks((SYS_MODULE_OBJ)appDrvObjects.drvSPIObject);
}

/* Use this for PIC32MZ */
void __ISR ( _SPI2_RX_VECTOR, ipl4 ) _InterruptHandler_SPI_RX_stub ( void )
{
    DRV_SPI_Tasks((SYS_MODULE_OBJ)appDrvObjects.drvSPIObject);
}

void __ISR ( _SPI2_TX_VECTOR, ipl4 ) _InterruptHandler_SPI_TX_stub ( void )
{
    DRV_SPI_Tasks((SYS_MODULE_OBJ)appDrvObjects.drvSPIObject);
}
  
```

Step 3:

The application should create a while(1) loop that continuously updates the driver layer State Machine and the application state machine. This requires the application state machine to be non-blocking.

/ This while(1) loop will continuously update the driver layer state machine and the application state machine */*

```
while(1)
{
    /* Task routine for sys_fs */
    SYS_FS_Tasks();

    /* Call the SDCARD Task */
    DRV_SDCARD_Tasks(appDrvObjects.drvSDCARDObject);

    /* Call the application's tasks routine */
    APP_Tasks ( );
}
```

Step 4:

If interrupt-based operation is needed, the interrupts need to be enabled first. The application should then initialize the driver layer. Refer to the driver specific documents regarding usage.

/ Initialize the interrupt system */*

```
SYS_INT_Initialize();
```

/ Initialize the global interrupts */*

```
SYS_INT_Enable();
```

/ set priority for SPI interrupt source */*

```
SYS_INT_VectorPrioritySet(INT_VECTOR_SPI1, INT_PRIORITY_LEVEL3);
```

/ set sub-priority for SPI interrupt source */*

```
SYS_INT_VectorSubprioritySet(INT_VECTOR_SPI1, INT_SUBPRIORITY_LEVEL3);
```

/ Initialize the global interrupts */*

```
SYS_INT_Enable();
```

/ Initialize the SPI driver */*

```
appDrvObjects.drvSPIObject = DRV_SPI_Initialize(DRV_SPI_INDEX_0,
    (SYS_MODULE_INIT *)&drvSPIInit);
```

/ Initialize the SDCARD driver*/*

```
appDrvObjects.drvSDCARDObject = DRV_SDCARD_Initialize(DRV_SDCARD_INDEX_0,
    (SYS_MODULE_INIT *)&drvSDCARDInit);
```

Step 5:

The application code can be implemented as a non-blocking state machine inside the APP_TASKS() function, as shown below for an application to read a file and write the content into another newly created file.

The input file "TEST.JPG" is not provided with the release package. It could be any arbitrary JPEG file chosen by the user, and then suitably renamed to "TEST.JPG". The reason for choosing a JPEG file for test purposes is that the duplicate file "TEST1.JPG" created by the FS demonstration could be easily verified for correctness by inserting the SD card in the computer and opening the "TEST1.JPG" file.

```
void APP_Tasks ( void )
{
    /* The application task state machine */

    switch(appData.state)
    {
```

```

case APP_MOUNT_DISK:
    if(SYS_FS_Mount("/dev/mmcblk1", "/mnt/myDrive", FAT, 0, NULL) != 0)
    {
        /* The disk could not be mounted. Try
         * mounting again untill success. */

        appData.state = APP_MOUNT_DISK;
    }
    else
    {
        /* Mount was successful. Open a file.
         * Let the switch case fall through. */
        appData.state = APP_OPEN_FILE;
    }
    break;

case APP_OPEN_FILE:

    appData.fileHandle = SYS_FS_FileOpen("/mnt/myDrive/TEST.JPG",
        (FA_READ));
    if(appData.fileHandle == SYS_FS_HANDLE_INVALID)
    {
        /* Could not open the file. Error out*/
        appData.state = APP_ERROR;
    }
    else
    {
        appData.fileHandle1 = SYS_FS_FileOpen("/mnt/myDrive/TEST1.JPG",
            (FA_WRITE|FA_CREATE_ALWAYS));
        if(appData.fileHandle == SYS_FS_HANDLE_INVALID)
        {
            /* Could not open the file. Error out*/
            appData.state = APP_ERROR;
        }
        else
        {
            /* Check the file to be read */
            appData.state = APP_CHECK_FILE;
        }
    }
    break;

case APP_CHECK_FILE:
    /* check the size of file */
    fileSize = SYS_FS_FileSize(appData.fileHandle);
    /* since, we will read 512 bytes at a time, find the number of times, the read has
    to be performed */
    sectorCounter = integralSector = (fileSize/512);
    /* find the remaining bytes */
    balanceSector = (fileSize%512);

    appData.state = APP_READ_WRITE_TO_FILE;

    break;

case APP_READ_WRITE_TO_FILE:

    if(SYS_FS_FileRead((void *)appData.data, 512, appData.fileHandle) == -1)
    {
        /* There was an error while reading the file.
         * Close the file and error out. */

        SYS_FS_FileClose(appData.fileHandle);
        appData.state = APP_ERROR;
    }

```

```

-1)    else if(SYS_FS_FileWrite((const void *)appData.data, 512, appData.fileHandle1) ==
      {
        /* Write was not successful. Close the file
         * and error out.*/
        SYS_FS_FileClose(appData.fileHandle1);
        appData.state = APP_ERROR;
      }
      else
      {
        sectorCounter--;
        /* if entire integral sectors are written, then write the balance sector*/
        if(sectorCounter == 0)
        {
          if(SYS_FS_FileRead((void *)appData.data, balanceSector,
appData.fileHandle) == -1)
          {
            /* There was an error while reading the file.
             * Close the file and error out. */

            SYS_FS_FileClose(appData.fileHandle);
            appData.state = APP_ERROR;
          }
          else if(SYS_FS_FileWrite((const void *)appData.data, balanceSector,
appData.fileHandle1) == -1)
          {
            /* Write was not successful. Close the file
             * and error out.*/
            SYS_FS_FileClose(appData.fileHandle1);
            appData.state = APP_ERROR;
          }
          else
          {
            appData.state = APP_CLOSE_FILE;
          }
        }
      }
      break;

case APP_CLOSE_FILE:
  /* Close both files */
  SYS_FS_FileClose(appData.fileHandle);
  SYS_FS_FileClose(appData.fileHandle1);
  /* The test was successful. Lets idle. */
  appData.state = APP_IDLE;
  break;

case APP_IDLE:
  /* The application comes here when the demo
   * has completed successfully. Switch on
   * green LED. */
  BSP_SwitchONLED(LED_2);
  break;

case APP_ERROR:
  /* The application comes here when the demo
   * has failed. Switch on the red LED.*/
  BSP_SwitchONLED(LED_1);
  break;

default:
  break;
}

} //End of APP_Tasks

```

5.7.4.5 Migration Guide

This section provides information for migrating an existing File System (FS) application that uses legacy MLA code to MPLAB Harmony.

Description

The topics covered include:

- [Initialization](#)
- [System Configuration](#)
- [Mounting a Volume](#)
- [Opening a File](#)
- [Reading a File](#)
- [Writing a File](#)
- [Closing a File](#)
- [File EOF](#)
- [File Tell](#)
- [File Seek](#)
- [SYS_FS_Tasks](#)

In each topic, differences between the legacy MLA code and MPLAB Harmony are described and examples are provided to assist with the migration.

5.7.4.5.1 Comparison of API Names

This topic tabulates the API names for MLA vs. the name for MPLAB Harmony.

Description

API Name in MLA	API Name in MPLAB Harmony
N/A	SYS_FS_Mount
N/A	SYS_FS_Unmount
N/A	SYS_FS_FileError
FSInit	SYS_FS_Initialize
N/A	SYS_FS_Tasks
Fsfclose	SYS_FS_FileClose
Fsfeof	SYS_FS_FileEOF
FSfread	SYS_FS_FileRead
FSftell	SYS_FS_FileTell
FSfwrite	SYS_FS_FileWrite
N/A	SYS_FS_FileSize
wFSfopen	SYS_FS_FileOpen
N/A	SYS_FS_FileStat
FSfseek	SYS_FS_FileSeek

5.7.4.5.2 Initialization

This topic describes the differences in initialization.

Description

MLA Initialization (Legacy code):

In legacy MLA code, the initialization involves modification of the header file "HardwareProfile.h". The header file has definitions for the SPI modules used (SPI1 or SPI2), configuration for SPI module, clock frequency, pin mapping for SD card, and pin remapping for SPI (SDI, SDO and SCLK pins). The following two images illustrate these modifications.

```

HardwareProfile.h
566 // Description: The definition for the SPI baud rate generator register (PIC32)
567 #define SPIBRG          SPI1BRG
568
569 // Tris pins for SCK/SDI/SDO lines
570
571 // Tris pins for SCK/SDI/SDO lines
572 #if defined(__32MX460F512L__)
573 // Description: The TRIS bit for the SCK pin
574 #define SPICLOCK          TRISDbits.TRISD10
575 // Description: The TRIS bit for the SDI pin
576 #define SPIIN             TRISCbits.TRISC4
577 // Description: The TRIS bit for the SDO pin
578 #define SPIOUT            TRISDbits.TRISD0
579 #else // example: PIC32MX360F512L
580 // Description: The TRIS bit for the SCK pin
581 #define SPICLOCK          TRISFbits.TRISF6
582 // Description: The TRIS bit for the SDI pin
583 #define SPIIN             TRISFbits.TRISF7
584 // Description: The TRIS bit for the SDO pin
585 #define SPIOUT            TRISFbits.TRISF8
586 #endif
587
588 //SPI library functions
589 #define putcSPI            putcSPI1
590 #define getcSPI            getcSPI1
591 #define OpenSPI(config1, config2) OpenSPI1(config1, config2)
592
593 #elif defined MDD_USE_SPI_2
594 // Description: SD-SPI Chip Select Output bit
595 #define SD_CS             LATBbits.LATB9

```

Device specific SPI pin remapping based on "#define"

SPI module number specific functions based on "#define"

Inside the main() function, the initialization of interrupts and the clock occurs in a series of function calls. Then, the media detect function is called for the media used. Later, the FS init function is called, which internally performs the disk mount, and if the mount process and FS initialization is successful, the functions returns as "1".

```

Demonstration3.c
177
178 int main(void)
179 {
180     FSFILE * pointer;
181     #if defined(SUPPORT_LFN)
182     char count = 80;
183     #endif
184     char * pointer2;
185     SearchRec rec;
186     unsigned char attributes;
187     unsigned char size = 0, i;
188
189     // Turn on the interrupts
190     INTEnableSystemMultiVectoredInt();
191     SYSTEMConfigPerformance(GetSystemClock());
192     mOSCSetPBDIV(OSC_PB_DIV_2);
193     //Initialize the RTCC
194     RtccInit();
195     while(RtccGetClkStat() != RTCC_CLK_ON); // wait for the SOSC to be actually running and RTCC to have its clock source
196     // could wait here at most 32ms
197     RtccOpen(0x10073000, 0x07011602, 0);
198
199     while (!MDD_MediaDetect());
200
201     // Initialize the library
202     while (!FSInit());
203
204     #ifdef ALLOW_WRITES
205     // Create a file
206     pointer = wFSfopen ((const unsigned short int *) &str1[0], "w");

```

main() function

Clock and interrupt initialization

Media detection and FS initialization

MPLAB Harmony Initialization:

In the case of MPLAB Harmony, the initialization is done by the sys_initialize() function, which is called from the main() function.

Inside the sys_initialize() function, the BSP, interrupt, clock, port remapping, driver initialization, FS initialization and application-specific initialization is done. All initialization is done by calling specific system function calls, as shown in the following image. For more information, refer to the demonstration code provided as a part of the MPLAB Harmony release

package.

The SPI module selection and configuration of the SPI module is done through the SPI driver initialization structure. Similarly, the selection of pins related to SD card functionality and the selection of the SPI clock frequency is done through the SD card driver initialization structure. The initialization structures are passed as input parameters during driver initialization function calls. There are no #define used, as was done in the case of legacy MLA code.

Since MPLAB Harmony supports multiple file systems, there is a structure which needs to be defined and then passed as an input parameter to the `SYS_FS_Init()` function.

5.7.4.5.3 System Configuration

This topic describes differences in system configuration.

Description

system_config.h file in MPLAB Harmony:

The file "system_config.h" contains the various system configurations required to run an application. Examples of system configurations related to, but not limited to drivers are:

- SPI driver configuration: such as `DRV_SPI_INSTANCES_NUMBER`, `DRV_SPI_CLIENTS_NUMBER`,

[DRV_SPI_INTERRUPT_MODE](#), [DRV_SPI_BUFFER_SIZE](#), etc.

- SD Card driver configuration: such as [DRV_SDCARD_INSTANCES_NUMBER](#), [DRV_SDCARD_CLIENTS_NUMBER](#), [DRV_SDCARD_QUEUE_POOL_SIZE](#), etc.

These configurations are required to configure the drivers used for the FS. Since the driver concept was not present in the legacy MLA code, this is a new addition to MPLAB Harmony. To get detailed information about each of the configuration parameter, please refer to the driver help.

Media manager configuration:

- [SYS_FS_MEDIA_NUMBER](#) - Number of media that will be used in the application. For example, if the application uses SD card and Mass storage device the [SYS_FS_MEDIA_NUMBER](#) should be defined as 2.
- [SYS_FS_VOLUME_NUMBER](#) - Number of volumes that will be used in the application. MPLAB Harmony supports multi-partitioned media. If the application uses a SD card that has three partitions and a Mass storage device, which has one partition, the [SYS_FS_VOLUME_NUMBER](#) should be defined as 4.
- Clock related configurations are present in the file, which are used to set the clock for the device

File system related configuration:

- [SYS_FS_MAX_FILE_SYSTEM_TYPE](#) - Number of native file system that will be used in the application. MPLAB Harmony supports multiple native file systems. If the application uses two file systems, FAT FS and MPFS2, [SYS_FS_MAX_FILE_SYSTEM_TYPE](#) should be defined as 2.
- [SYS_FS_MAX_FILES](#) - Maximum number of files that will be opened by the application at a time
- Other application-specific configuration settings

[SYS_Tasks\(\)](#) in MPLAB Harmony:

In the case of MPLAB Harmony, certain tasks need to be executed periodically. These tasks are executed from a common function called [SYS_Tasks\(\)](#), which is in turn called from the main loop (while(1)) loop. While the concept of running certain functions from the main loop is not new, the legacy MLA demonstration code did not have any functions that had to run from the main loop. However, in case of MPLAB Harmony, it is mandatory that certain tasks should be running periodically from the main loop.

In the case of the FS application, tasks that have to run from [SYS_Tasks\(\)](#) function are:

- [SYS_FS_Tasks\(\)](#) - This task maintains the working of the [SYS_FS](#) layer and other file system related layers. It is extremely essential that this function runs periodically from the [SYS_Tasks\(\)](#) function.
- Driver task - Consider a case where the FS application uses a SD card -- there is no hardware module that controls the SD card. In such a case, the task routine for the SD card must run from [SYS_Tasks\(\)](#). This is required so that the internal driver mechanism for the SD card continues working.
- Any other application related task

```

88      Remarks:
89      When not using the dynamic system "Tasks" service, this routine must be
90      implemented by the application's system configuration (in the application's
91      configuration-specific "sys_tasks.c" file).
92      */
93
94      void SYS_Tasks ( void )
95      {
96          /* Task routine for sys_fs */
97          SYS_FS_Tasks();
98
99          /* Call the SDCARD Task */
100         DRV_SDCARD_Tasks(appDrvObjects.drvcSDCARDObject);
101
102         /* Call the application's tasks routine */
103         APP_Tasks ( );
104     }
105

```

5.7.4.5.4 Mounting a Volume

This topic describes differences when mounting a volume.

Description

Mounting a Volume in MLA vs. MPLAB Harmony:

In case of MLA, the complete mounting of a volume was achieved by calling the two functions, MDD_MediaDetect() and FSInit(), until the function returns success. The features of mounting a volume in MLA were:

- There are two functions that completely achieve the mounting process
- Both functions were of input type as "void" (no input argument)
- Both functions were called in blocking mode

```

193      //Initialize the RTCC
194      RtccInit();
195      while(RtccGetClkStat() != RTCC_CLK_ON); // wait for the SOSC to be actually runni
196                                          // could wait here at most 32ms
197      RtccOpen(0x10073000, 0x07011602, 0);
198
199      while (!MDD_MediaDetect());
200
201      // Initialize the library
202      while (!FSInit());
203
204      #ifdef ALLOW_WRITES
205      // Create a file
206      pointer = wFSfopen ((const unsigned short int * )sstr1[0], "w");
207      if (pointer == NULL)
208          while(1);
209

```

In the case of MPLAB Harmony, the mounting of a volume is achieved by calling the [SYS_FS_Mount\(\)](#) function, until the function returns success. The features of mounting a volume in MPLAB Harmony are:

- [SYS_FS_Mount\(\)](#) function includes both media detection and mounting the volume. Please note that, MPLAB Harmony FS still needs the function [SYS_FS_Initialize\(\)](#) to be called during system initialization. Though the name [SYS_FS_Initialize\(\)](#) seems similar to the MLA function FSInit(), the task achieved by calling these functions are very different.
- [SYS_FS_Initialize\(\)](#) (MPLAB Harmony function) - Just does the initialization of SYS_FS layer. It does not do any mounting of volumes.
- FSInit() (MLA function) - Did the initialization of FS and also did mount the disk.
- [SYS_FS_Mount\(\)](#) function accepts input parameter such as devName, mntName, fileType etc. To know each of the parameter in detail, please refer to the documentation of the [SYS_FS_Mount\(\)](#) function.

- `SYS_FS_Mount()` has to be running in a non-blocking mode. The following image shows an application where `SYS_FS_Mount()` is called from the state machine implementation. This is required as the implementation of the state machine allows the `SYS_Tasks()` function to be run periodically. This is quite different from the earlier implementations of MLA.

```

193 //Initialize the RTCC
194 RtccInit();
195 while(RtccGetClkStat()!=RTCC_CLK_ON); // wait for the SOSC to be actually runni
196 // could wait here at most 32ms
197 RtccOpen(0x10073000, 0x07011602, 0);
198
199 while (!MDD_MediaDetect());
200
201 // Initialize the library
202 while (!FSInit());
203
204 #ifndef ALLOW_WRITES
205 // Create a file
206 pointer = wFSfopen ((const unsigned short int * )&str1[0], "w");
207 if (pointer == NULL)
208     while(1);
209
210

```

5.7.4.5.5 Opening a File

This topic describes differences when opening a file.

Description

Opening a file in MLA vs. MPLAB Harmony:

Opening a file remains similar for both MLA and MPLAB Harmony. However, a critical difference in MPLAB Harmony is that, while opening the file, the complete path of the file must be specified. In addition, the path must be preceded by the string "/mnt/". The complete path is required because the MPLAB Harmony FS implements a multi-partition media support. Therefore, the file path should include the name of volume (assigned media partition), and from where the file is to be opened. For more details, please refer to the documentation of the `SYS_FS_FileOpen()` function. The following two figures illustrate opening a file in MLA vs. MPLAB Harmony.

In case of MLA, the error in opening a file was indicated by the file open function returning a NULL, while, in MPLAB harmony, the file open returns `SYS_FS_HANDLE_INVALID`.

```

244 #endif
245
246 // Open file 1 in read mode
247 pointer = wFSfopen ((const unsigned short int * )&str1[0], "r");
248 if (pointer == NULL)
249     while(1);
250
251 if (wFSrename ((const unsigned short int * )&str3[0], pointer))
252     while(1);
253
254 // Read one four-byte object
255 if (FSfread (receiveBuffer, 4, 1, pointer) != 1)
256     while(1);

```

Figure 1: Opening a File in MLA

```

173
174 case APP_OPEN_FILE:
175
176     appData.fileHandle = SYS_FS_FileOpen("/mnt/myDrive/FILE_TOO_LONG_NAME_EXAMPLE_123.JPG",
177                                         (SYS_FS_FILE_OPEN_READ));
178     if(appData.fileHandle == SYS_FS_HANDLE_INVALID)
179     {
180         /* Could not open the file. Error out*/
181         appData.state = APP_ERROR;
182     }
183     else
184     {
185         appData.fileHandle = SYS_FS_FileOpen("/mnt/myDrive/FILE_TOO_LONG_NAME_EXAMPLE_123.JPG",
186                                         (SYS_FS_FILE_OPEN_READ));

```

Figure 2: Opening a File in MPLAB Harmony

5.7.4.5.6 Reading a File

This topic describes the differences between legacy MLA code for FS and MPLAB Harmony FS, while reading a file.

Description

Reading a file in MLA vs. MPLAB Harmony:

Reading a file remains similar for both MLA and MPLAB Harmony, as depicted in the screen shots below. The smaller differences are that, the name of the function to read the file is different, the order of parameters passed are different and MPLAB Harmony only takes 3 parameters. The MPLAB Harmony function only enables byte based access.

Though, both MLA and MPLAB harmony file read functions returns the number of bytes read, the MPLAB Harmony functions also returns “-1” if there were any errors while reading the file.

The screenshot shows a code editor window titled "Demonstration3.c". The code is as follows:

```
253
254 // Read one four-byte object
255 if (FSfread (receiveBuffer, 4, 1, pointer) != 1)
256     while(1);
257
258 // Check if this is the end of the file- it shouldn't be
259 if (FSfeof (pointer))
```

Figure: Reading a File in MLA

The screenshot shows a code editor window with tabs for "app.c" and "main.c". The code is as follows:

```
201
202 if(SYS_FS_FileRead((void *)appData.data, 512, appData.fileHandle) == -1)
203 {
204     /* There was an error while reading the file.
205      * Close the file and error out. */
206
207     SYS_FS_FileClose(appData.fileHandle);
208     appData.state = APP_ERROR;
209 }
```

Figure: Reading a File in MPLAB Harmony

5.7.4.5.7 Writing a File

This topic describes the differences between legacy MLA code for FS and MPLAB Harmony FS, while writing to a file.

Description

Writing to a file in MLA vs. MPLAB Harmony:

Writing to a file remains similar for both MLA and MPLAB Harmony, as depicted in the screen shots below. The smaller differences are that, the name of the function to write to the file is different, the order of parameters passed are different and MPLAB Harmony only takes 3 parameters. The MPLAB Harmony function only enables byte based access.

Though, both MLA and MPLAB harmony file read functions returns the number of bytes written, the MPLAB Harmony functions also returns “-1” if there were any errors while writing to the file.

```

208     while(1);
209
210     // Write 21 1-byte objects from sendBuffer into the file
211     if (FSfwrite (sendBuffer, 1, 21, pointer) != 21)
212         while(1);
213

```

Figure: Writing to a File in MLA

```

212     /* If read was success, try writing to the new file */
213     if(SYS_FS_FileWrite((const void *)appData.data, 512, appData.fileHandle1) == -1)
214     {
215         /* Write was not successful. Close the file
216          * and attempt once more */

```

Figure: Writing to a File in MPLAB Harmony

5.7.4.5.8 Closing a File

This topic describes the differences between legacy MLA code for FS and MPLAB Harmony FS, while closing a file.

Description

Closing a file in MLA vs. MPLAB Harmony:

Closing a file remains similar for both MLA and MPLAB Harmony, as depicted in the screen shots below. The smaller difference is that, the name of the function is different.

```

227
228     // Close the file
229     if (FSfclose (pointer))
230         while(1);
231

```

Figure: Closing a File in MLA

```

229     /* Close both files */
230     SYS_FS_FileClose (appData.fileHandle);
231     SYS_FS_FileClose (appData.fileHandle1);
232     /* The test was successful. Lets idle. */
233     appData.state = APP_IDLE;

```

Figure: Closing a File in MPLAB Harmony

5.7.4.5.9 File EOF

This topic describes the differences between legacy MLA code for FS and MPLAB Harmony FS, while checking for end of file.

Description

Checking for EOF in MLA vs. MPLAB Harmony:

The EOF function remains similar for both MLA and MPLAB Harmony, as depicted in the screen shots below. The smaller

difference is that, the name of the function is different.

```

Demonstration3.c FSIO.h
257
258 // Check if this is the end of the file- it shouldn't be
259 if (FSfeof (pointer))
260 while(1);

```

Figure: EOF in MLA

```

Start Page app.c main.c
219 }
220 else if(SYS_FS_FileEOF(appData.fileHandle) == 1) /* Test for end of file */
221 {
222 /* Continue the read and write process, untill the end of file is reached */
223 appData.state = APP_CLOSE_FILE;

```

Figure: EOF in MPLAB Harmony

5.7.4.5.10 File Tell

This topic describes the differences between legacy MLA code for FS and MPLAB Harmony FS, while checking for file pointer (tell).

Description

Checking for file pointer (tell) in MLA vs. MPLAB Harmony:

The function to check for file pointer (tell) remains similar for both MLA and MPLAB Harmony, as depicted in the screen shots below. The smaller difference is that, the name of the function is different.

```

Demonstration3.c FSIO.h
213
214 // FSftell returns the file's current position
215 if (FSftell (pointer) != 21)
216 while(1);
217

```

Figure: Tell Function in MLA

```

Start Page app.c sys_fs.h
155
156 tell = SYS_FS_FileTell(fileHandle);
157
158 case APP_OPEN_FILE_2:

```

Figure: Tell Function in MPLAB Harmony

5.7.4.5.11 File Seek

This topic describes the differences between legacy MLA code for FS and MPLAB Harmony FS, while performing a file seek.

Description

File seek in MLA vs. MPLAB Harmony:

The function to perform file seek remains similar for both MLA and MPLAB Harmony, as depicted in the screen shots below. The

smaller difference is that, the name of the function is different.

```
217
218 // FSfseek sets the position one byte before the end
219 // It can also set the position of a file forward from the
220 // beginning or forward from the current position
221 if (FSfseek(pointer, 1, SEEK_END))
222     while(1);
223
```

Figure: File Seek in MLA

```
209 case APP_DO_FILE_SEEK:
210     if(SYS_FS_FileSeek(appData.fileHandle_2, -10, SYS_FS_SEEK_END) != -10)
211     {
212         /* File seek went wrong somewhere */
213         appData.state = APP_ERROR;
```

Figure: File Seek in MPLAB Harmony

5.7.4.5.12 SYS_FS_Tasks

This topic describes the differences between legacy MLA code for FS and MPLAB Harmony FS with respect to [SYS_FS_Tasks\(\)](#) function.

Description

[SYS_FS_Tasks\(\)](#) in MLA vs. MPLAB Harmony:

The MPLAB Harmony needs the [SYS_FS_Tasks\(\)](#) function to be running periodically from the [SYS_Tasks\(\)](#) function. The MLA code did not had any such function which had to be running periodically.

```
93
94 void SYS_Tasks ( void )
95 {
96     /* Task routine for sys_fs */
97     SYS_FS_Tasks();
98
99     /* Call the application's tasks routine */
100     APP_Tasks();
101
102 }
```

Figure: Running [SYS_FS_Tasks\(\)](#) Function from [SYS_Tasks\(\)](#)

5.7.4.6 Library Interface

Data Types and Constants

	Name	Description
	SYS_FS_ERROR	Lists the various error cases
	SYS_FS_FILE_OPEN_ATTRIBUTES	Lists the various attributes (modes) in which a file can be opened
	SYS_FS_FILE_SEEK_CONTROL	Lists the various modes of file seek

	<u>SYS_FS_FILE_SYSTEM_TYPE</u>	Enumerated data type identifying native file systems supported.
	<u>SYS_FS_FSTAT</u>	The structure to obtain the status of a file.
	<u>SYS_FS_FUNCTIONS</u>	SYS FS Function signature structure for native file systems
	<u>SYS_FS_HANDLE</u>	This type defines the file handle.
	<u>SYS_FS_REGISTRATION_TABLE</u>	The sys_fs layer has to be initialized by passing this structure with suitably initialized members.
	<u>SYS_FS_RESULT</u>	Lists the various results of a file operation
	<u>FAT_FS_MAX_LFN</u>	Lists the maximum length of file name during LFN selection
	<u>FAT_FS_MAX_SS</u>	Lists the definitions for FAT file system sector size.
	<u>FAT_FS_USE_LFN</u>	Lists the definitions for FAT file system LFN selection
	<u>SYS_FS_HANDLE_INVALID</u>	This definitions defines the SYS FS file invalid handle.

File Operation Functions

	Name	Description
	<u>SYS_FS_FileClose</u>	Close a file.
	<u>SYS_FS_FileEOF</u>	check handle status
	<u>SYS_FS_FileOpen</u>	Open a file
	<u>SYS_FS_FileRead</u>	Read specified bytes from a file
	<u>SYS_FS_FileSeek</u>	Move the file pointer.
	<u>SYS_FS_FileSize</u>	Returns the size of the file
	<u>SYS_FS_FileStat</u>	Get file status
	<u>SYS_FS_FileTell</u>	Obtains the file pointer position
	<u>SYS_FS_FileWrite</u>	Write on the file
	<u>SYS_FS_FileNameGet</u>	Reads the file name.

General Operation Functions

	Name	Description
	<u>SYS_FS_FileError</u>	check the type of error
	<u>SYS_FS_Initialize</u>	Initializes the File system Abstraction Layer (sys_fs layer).
	<u>SYS_FS_Mount</u>	Mount filesystems
	<u>SYS_FS_Tasks</u>	Tasks for the sys_fs layer
	<u>SYS_FS_Unmount</u>	unmount filesystems

Description

This section describes the Application Programming Interface (API) functions of the File System.

5.7.4.6.1 File Operation Functions

5.7.4.6.1.1 SYS_FS_FileClose Function

C

```
SYS_FS_RESULT SYS_FS_FileClose(
    SYS_FS_HANDLE handle
);
```

Description

The SYS_FS_FileClose() function closes an opened file

Preconditions

A valid file handle must be obtained before closing a file.

Parameters

Parameters	Description
handle	A valid handle, which was obtained while opening the file.

Returns

If Success - SYS_FS_RES_SUCCESS

If Failure - SYS_FS_RES_FAILURE

The reason for failure could be retrieved with SYS_FS_Error

Remarks

None

Example

```
SYS_FS_HANDLE fileHandle;  
fileHandle = SYS_FS_FileOpen("/mnt/myDrive/FILE.JPG",  
    (SYS_FS_FILE_OPEN_READ));  
  
if(fileHandle != SYS_FS_HANDLE_INVALID)  
{  
    // File open is successful  
}  
...  
...  
  
SYS_FS_FileClose(fileHandle);
```

5.7.4.6.1.2 SYS_FS_FileEOF Function**C**

```
bool SYS_FS_FileEOF(  
    SYS_FS_HANDLE handle  
);
```

Description

Checks whether or not the file position indicator is at the end of the file.

Preconditions

A valid file handle must be obtained before knowing a file eof.

Parameters

Parameters	Description
handle	file handle obtained during file Open.

Returns

If Success -

When file pointer has not reached the end of file - false

When file pointer has reached the end of file - true

If Failure - false

The reason for failure could be retrieved with SYS_FS_Error

Remarks

None

Example

```
SYS_FS_HANDLE fileHandle;
bool eof;

fileHandle = SYS_FS_FileOpen("/mnt/myDrive/FILE.JPG",
                             (SYS_FS_FILE_OPEN_READ));

if(fileHandle != SYS_FS_HANDLE_INVALID)
{
    // File open is successful
}
...
...

eof = SYS_FS_FileEOF(fileHandle);

if(eof == false)
{
    // could be not EOF or a failure
    // Check the error state using SYS_FS_FileError
}
```

5.7.4.6.1.3 SYS_FS_FileOpen Function

C

```
SYS_FS_HANDLE SYS_FS_FileOpen(
    const char* fname,
    SYS_FS_FILE_OPEN_ATTRIBUTES attributes
);
```

Description

The SYS_FS_FileOpen opens a requested file in a specific mode (attribute).

Preconditions

Prior to opening a file, the name of the volume on which the file resides should be known. Also, that volume should be already mounted. While opening the file, the name of the volume is to be passed along with the file name.

Parameters

Parameters	Description
path	Path to the file along with the volume name. The string of volume and file name has to be preceeded by "/mnt/". Also, the volume name and file name has to be separated by a slash "/".
attributes	Access mode of the file, of the type SYS_FS_FILE_OPEN_ATTRIBUTES

Returns

- If Success - Valid handle will be returned
- If Failure - Returned handle will be [SYS_FS_HANDLE_INVALID](#)
- The reason for failure could be retrieved with SYS_FS_Error

Remarks

None

Example

```
SYS_FS_HANDLE fileHandle;
```

```

fileHandle = SYS_FS_FileOpen("/mnt/myDrive/FILE.JPG",
                             (SYS_FS_FILE_OPEN_READ));

if(fileHandle != SYS_FS_HANDLE_INVALID)
{
    // File open is successful
}

```

5.7.4.6.1.4 SYS_FS_FileRead Function

C

```

size_t SYS_FS_FileRead(
    void * buf,
    size_t nbyte,
    SYS_FS_HANDLE handle
);

```

Description

The SYS_FS_FileRead() function shall attempt to read nbyte bytes from the file associated with the file handle into the buffer pointed to by buf.

Preconditions

A valid file handle must be obtained before reading a file.

Parameters

Parameters	Description
handle	File handle obtained during file open.
buf	Pointer to buffer into which data is read.
nbyte	Number of bytes to be read

Returns

If Success - The number of bytes successfully read (0 or positive number)

If Failure - (-1)

The reason for failure could be retrieved with SYS_FS_Error

Remarks

None

Example

```

...
char buf[20];
size_t nbytes;
size_t bytes_read;
SYS_FS_HANDLE fd;
...
nbytes = sizeof(buf);
bytes_read = SYS_FS_FileRead(buf, nbytes, fd);
...

```

5.7.4.6.1.5 SYS_FS_FileSeek Function

C

```

int32_t SYS_FS_FileSeek(
    SYS_FS_HANDLE fildes,
    int32_t offset,
    SYS_FS_FILE_SEEK_CONTROL whence

```

```
);
```

Description

The SYS_FS_FileSeek() function shall set the file pointer for a open file associated with the file handle, as follows:

If whence is SYS_FS_SEEK_SET, the file offset shall be set to offset bytes from the begining.

If whence is SYS_FS_SEEK_CUR, the file offset shall be set to its current location plus offset.

If whence is SYS_FS_SEEK_END, the file offset shall be set to the size of the file plus offset. If SYS_FS_SEEK_END is selected, then offset has to be a negative number, inorder for the file pointer to be valid.

Trying to move the file pointer using SYS_FS_FileSeek, beyond the range of file will only cause the pointer to be moved to the last location of the file.

Preconditions

A valid file handle must be obtained before seeking a file.

Parameters

Parameters	Description
handle	A valid file handle obtained during file open.
offset	The number of bytes which act as file offset. This value could be a positive or negative value.
whence	File seek control input of type SYS_FS_FILE_SEEK_CONTROL .

Returns

If Success - The number of bytes by which file pointer is moved (0 or positive number)

If Failure - (-1) If the choosen offset value was (-1), then the success or failure can be ascertained with SYS_FS_Error.

The reason for failure could be retrieved with SYS_FS_Error

Remarks

None

Example

```
SYS_FS_HANDLE fileHandle;
int status;

fileHandle = SYS_FS_FileOpen("/mnt/myDrive/FILE.JPG",
    (SYS_FS_FILE_OPEN_READ));

if(fileHandle != SYS_FS_HANDLE_INVALID)
{
    // File open is successful
}
...
...

status = SYS_FS_FileSeek(fileHandle, 5, SYS_FS_SEEK_CUR);

if((status != -1) && (status == 5))
{
    // Success
}
```

5.7.4.6.1.6 SYS_FS_FileSize Function

C

```
int32_t SYS_FS_FileSize(
```

```
    SYS_FS_HANDLE handle  
);
```

Description

Returns the size of the file as pointed by the handle.

Preconditions

A valid file handle must be obtained before knowing a file size.

Parameters

Parameters	Description
handle	File handle obtained during file Open.

Returns

If Success - file size

If Failure - (-1)

The reason for failure could be retrieved with SYS_FS_Error

Remarks

None

Example

```
SYS_FS_HANDLE fileHandle;  
long fileSize;  
  
fileHandle = SYS_FS_FileOpen("/mnt/myDrive/FILE.JPG",  
    (SYS_FS_FILE_OPEN_READ));  
  
if(fileHandle != SYS_FS_HANDLE_INVALID)  
{  
    // File open is successful  
}  
...  
...  
  
fileSize = SYS_FS_FileSize(fileHandle);  
  
if(fileSize != -1)  
{  
    // Success  
}
```

5.7.4.6.1.7 SYS_FS_FileStat Function**C**

```
SYS_FS_RESULT SYS_FS_FileStat(  
    const char* fname,  
    SYS_FS_FSTAT * buf  
);
```

Description

The SYS_FS_FileStat() function shall obtain information about a file associated with the file name, and shall write it to the structure pointed to by buf.

The buf argument is a pointer to a [SYS_FS_FSTAT](#) structure, into which information is placed concerning the file.

This function can read the status of file irrespective of a file is opened or not.

Preconditions

Prior to opening a file, the name of the volume on which the file resides should be known. Also, that volume should be already mounted. While opening the file, the name of the volume is to be passed along with the file name.

Parameters

Parameters	Description
path	Path to the file along with the volume name. The string of volume and file name has to be preceded by "/mnt/". Also, the volume name and file name has to be separated by a slash "/".
buf	pointer to SYS_FS_FSTAT structure.

Returns

If Success - `SYS_FS_RES_SUCCESS`

If Failure - `SYS_FS_RES_FAILURE`

The reason for failure could be retrieved with `SYS_FS_Error`

Remarks

None

Example

```
SYS_FS_fStat fileStat;

if(SYS_FS_FileStat("/mnt/myDrive/FILE.TXT", &fileStat) == SYS_FS_RES_SUCCESS)
{
    // Successfully read the status of file "FILE.TXT"
}
```

5.7.4.6.1.8 SYS_FS_FileTell Function**C**

```
int32_t SYS_FS_FileTell(
    SYS_FS_HANDLE handle
);
```

Description

Obtains the current value of the file position indicator for the file, pointed to by handle.

Preconditions

A valid file handle must be obtained before performing a file tell.

Parameters

Parameters	Description
handle	File handle obtained during file Open.

Returns

If Success - current file position

If Failure - (-1)

The reason for failure could be retrieved with `SYS_FS_Error`

Remarks

None

Example

```
SYS_FS_HANDLE fileHandle;
int32_t tell;

fileHandle = SYS_FS_FileOpen("/mnt/myDrive/FILE.JPG",
                             (SYS_FS_FILE_OPEN_READ));

if(fileHandle != SYS_FS_HANDLE_INVALID)
{
    // File open is successful
}
...
...

tell = SYS_FS_FileTell(fileHandle);

if(tell != -1)
{
    // Success
}
```

5.7.4.6.1.9 SYS_FS_FileWrite Function

C

```
size_t SYS_FS_FileWrite(
    const void * buf,
    size_t nbyte,
    SYS_FS_HANDLE handle
);
```

Description

The SYS_FS_FileWrite() function shall attempt to write nbyte bytes from the buffer pointed to by buf to the file associated with the file handle.

Preconditions

A valid file handle must be obtained before writing a file.

Parameters

Parameters	Description
handle	File handle obtained during file open.
buf	Pointer to buffer from which data is to be written
nbyte	Number of bytes to be written

Returns

- If Success - The number of bytes successfully written (0 or positive number)
 - If Failure - (-1)
- The reason for failure could be retrieved with SYS_FS_Error

Remarks

None

Example

```
...
```

```
const char *buf = "Hello World";
size_t nbytes;
size_t bytes_written;
SYS_FS_HANDLE fd;
...

bytes_written = SYS_FS_FileWrite((const void *)buf, nbytes, fd);
...
```

5.7.4.6.1.10 SYS_FS_FileNameGet Function

C

```
bool SYS_FS_FileNameGet(
    SYS_FS_HANDLE handle,
    uint8_t* cName,
    uint16_t wLen
);
```

Description

Reads the file name of a file that is already open.

Preconditions

The file handle referenced by handle is already open.

Parameters

Parameters	Description
handle	file handle obtained during file Open.
cName	where to store the name of the file.
wLen	the maximum length of data to store in cName.

Returns

If Success -

The file name was successfully located - true

If Failure The file handle provided is not currently open - false

The reason for failure could be retrieved with SYS_FS_Error

Remarks

None

Example

```
SYS_FS_HANDLE fileHandle;
bool stat;
uint8_t fileName[255];

fileHandle = SYS_FS_FileOpen("/mnt/myDrive/FILE.JPG",
    (SYS_FS_FILE_OPEN_READ));

if(fileHandle != SYS_FS_HANDLE_INVALID)
{
    // File open is successful
}
...
...

stat = SYS_FS_FileNameGet(fileHandle, fileName, 8 );

if(stat == false)
{
```

```
    // file not located based on handle passed  
    // Check the error state using SYS_FS_FileError  
}
```

5.7.4.6.2 General Operation Functions

5.7.4.6.2.1 SYS_FS_FileError Function

C

```
SYS_FS_ERROR SYS_FS_FileError();
```

Description

When a file system operation fails, the application can know the exact reason of failure by calling the SYS_FS_FileError.

Preconditions

This function has to be called immediately after a failure is observed while doing a file operation. Any subsequent failure will overwrite the cause of previous failure.

Returns

Error code of type [SYS_FS_ERROR](#)

Remarks

None

Example

```
SYS_FS_HANDLE fileHandle;  
SYS_FS_ERROR err;  
  
fileHandle = SYS_FS_FileOpen("/mnt/myDrive/FILE.JPG",  
    (SYS_FS_FILE_OPEN_READ));  
  
if(fileHandle == SYS_FS_HANDLE_INVALID)  
{  
    // If failure, now know the specific reason for failure  
    err = SYS_FS_FileError();  
}
```

5.7.4.6.2.2 SYS_FS_Initialize Function

C

```
SYS_FS_RESULT SYS_FS_Initialize(  
    const void* initData  
);
```

Description

Initializes the abstraction layer (sys_fs layer) and sets up the necessary parameters.

Preconditions

This is the first function to be called during usage of sys_fs. Calling other functions from sys_fs without initializing the sys_fs will cause un-predictable behavior.

Parameters

Parameters	Description
initData	The pointer to array of the type SYS_FS_REGISTRATION_TABLE , but type casted to (const void *). The number of elements of array is decided by the definition SYS_FS_MAX_FILE_SYSTEM_TYPE. If the application uses 1 file system (say only FAT FS), then SYS_FS_MAX_FILE_SYSTEM_TYPE is defined to be 1. Otherwise, if the application uses 2 file systems (say FAT FS and MPFS2), then SYS_FS_MAX_FILE_SYSTEM_TYPE is defined to be 2. The SYS_FS_MAX_FILE_SYSTEM_TYPE has to be defined in system_config.h file.

Returns

If Success - SYS_FS_RES_SUCCESS

If Failure - SYS_FS_RES_FAILURE

The reason for failure could be retrieved with SYS_FS_Error

Example

```
// This code snippet shows an example of how the
// SYS FS is initialized

// Only 1 file system is used

#define SYS_FS_MAX_FILE_SYSTEM_TYPE          1

// Functions pointer table for FAT FS

const SYS_FS_FUNCTIONS FatFsFunctions =
{
    .mount    = f_mount,
    .unmount  = f_unmount,
    .open     = f_open,
    .read     = f_read,
    .write    = f_write,
    .close    = f_close,
    .seek     = f_lseek,
    .tell     = f_tell,

    .size     = f_size,
    .fstat    = f_stat,
};

const SYS_FS_REGISTRATION_TABLE sysFSInit [ SYS_FS_MAX_FILE_SYSTEM_TYPE ] =
{
    {
        .nativeFileSystemType = FAT,
        .nativeFileSystemFunctions = &FatFsFunctions
    }
};

SYS_FS_Initialize( (const void *) sysFSInit );
```

5.7.4.6.2.3 SYS_FS_Mount Function**C**

```
SYS_FS_RESULT SYS_FS_Mount(
    const char * devName,
    const char * mountName,
    SYS_FS_FILE_SYSTEM_TYPE filesystemtype,
    unsigned long mountflags,
    const void * data
);
```

Description

The mount command attaches the filesystem specified to a volume.

When a media (say, SD card or USB thumb drive) is attached to the system, the [SYS_FS_Tasks\(\)](#) function needs to run atleast 8 times (for each partition), from the [SYS_Tasks\(\)](#), before the volume names are assigned to each partitions. Hence it is mandatory that the [SYS_FS_Tasks\(\)](#) is run periodically. Also, it is mandatory that the [SYS_FS_Mount\(\)](#) function call from the application code, is not blocking. The application code has to allow the [SYS_FS_Tasks\(\)](#) to run periodically while calling the [SYS_FS_Mount](#) function. If the [SYS_FS_Mount\(\)](#) is called in a blocking mode, then the [SYS_Tasks\(\)](#) never gets a chance to run and hence, the media will not be analyzed and finally, the [SYS_FS_Mount](#) will never succeed. This will result in a dead-lock.

There is no mechanism available for the application to know if the specified volume (devName) is really attached or not. The only available possibility is to keep trying to mount the volume (with the devname), untill success is achieved. It is prudent that the application code implements a time out mechanism while trying to mount a volume (by calling [SYS_FS_Mount](#)). The trial for mount should continue atleast 10 times before assuming that the mount will never succeeded. This has to be done for every new volume to be mounted.

The name standard of volume (devName) used in Harmony file system is as below: -

For NVM - "nvm" "media number" "volume number"

For SD card - "mmcblk" "media number" "volume number"

For MSD - "sd" "media number" "volume number"

Where, "media number" - a, b, c... depending upon number of media of certain type connected.

Where, "volume number" - 1, 2, 3... depending upon number of partitions in that media.

The convention for assigning names to volumes is given by an example: -

If an SD card (with 4 partitions) is attached to the system, and assuming all 4 partitions are recognized, then there will be 4 devNames -- mmcblk1, mmcblk2, mmcblk3 and mmcblk4.

Subsequently, a NVM media is attached which has only 1 partition, then the devname will be -- nvma1.

Later, another SD card is attached to the system which has 1 partition, then the devname will be -- mmcblk1.

Finally, there will be 6 volume names (or devNames), which is available for the application to be mounted and used for file system.

Preconditions

The "devName" name for the volume has to be known. The file sytem type with which each of the volumes are formatted has to be known. Trying to mount a volume with a file system which is different from what the volume is actually formatted, will cause mounting failure.

Parameters

Parameters	Description
devName	The device name (name of volume) which needs to be mounted. The devName has to be preceeded by the string "/dev/".
mountName	Mount name for the device to be mounted. This is a name provided by the user. In future, while accessing the mounted volume (say, during SYS_FS_FileOpen operation), the mountName is used to refer the path for file. The mount name has to be preceeded by the string "/mnt/".
filesystemtype	native file system of SYS_FS_FILE_SYSTEM_TYPE type.
mountflags	mounting control flags. This parameter is reserved for future enhancements. Hence, always pass zero.

data	The data argument is interpreted by the different file systems. This parameter is reserved for future enhancements. Hence, always pass NULL.

Returns

If Success - SYS_FS_RES_SUCCESS

If Failure - SYS_FS_RES_FAILURE

The reason for failure could be retrieved with SYS_FS_Error

Example

```

switch(appState)
{
    case TRY_MOUNT:
        if(SYS_FS_Mount("/dev/mmcblk1", "/mnt/myDrive", FAT, 0, NULL) !=
SYS_FS_RES_SUCCESS)
        {
            // Failure, hence try mounting again
        }
        else
        {
            // Mount was successful. Do further file operations
            appState = DO_FURTHER_STUFFS;
        }
        break;

```

5.7.4.6.2.4 SYS_FS_Tasks Function**C**

```
void SYS_FS_Tasks();
```

Description

This routine is used to run the various tasks and functionalities of sys_fs layer.

Preconditions

The [SYS_FS_Initialize](#) routine must have been called before running the tasks.

Returns

None

Remarks

This routine is not called directly by an application. It is called by the system's Tasks routine ([SYS_Tasks](#)).

Example

```

void SYS_Tasks ( void )
{
    SYS_FS_Tasks ();

    // Do other tasks
}

```

5.7.4.6.2.5 SYS_FS_Unmount Function**C**

```

SYS_FS_RESULT SYS_FS_Unmount(
    const char * mountName
);

```

Description

remove the attachment of the volume from the fil system

Preconditions

The volume name has to be know in order to pass as input to Unmount. The specified volume name to be unmounted should have been already mounted.

Parameters

Parameters	Description
mountName	Mount name for the volume to be mounted. The mount name has to be preceeded by the string "/mnt/".

Returns

If Success - SYS_FS_RES_SUCCESS

If Failure - SYS_FS_RES_FAILURE

The reason for failure could be retrieved with SYS_FS_Error

Example

```

if(SYS_FS_Unmount("/mnt/myDrive") != SYS_FS_RES_SUCCESS)
{
    // Failure, hence try unmouting again
}
else
{
    // Unmount was successful.
}

```

5.7.4.6.3 Data Types and Constants

5.7.4.6.3.1 SYS_FS_ERROR Enumeration

C

```

typedef enum {
    SYS_FS_ERROR_OK = 0,
    SYS_FS_ERROR_DISK_ERR,
    SYS_FS_ERROR_INT_ERR,
    SYS_FS_ERROR_NOT_READY,
    SYS_FS_ERROR_NO_FILE,
    SYS_FS_ERROR_NO_PATH,
    SYS_FS_ERROR_INVALID_NAME,
    SYS_FS_ERROR_DENIED,
    SYS_FS_ERROR_EXIST,
    SYS_FS_ERROR_INVALID_OBJECT,
    SYS_FS_ERROR_WRITE_PROTECTED,
    SYS_FS_ERROR_INVALID_DRIVE,
    SYS_FS_ERROR_NOT_ENABLED,
    SYS_FS_ERROR_NO_FILESYSTEM,
    SYS_FS_ERROR_FORMAT_ABORTED,
    SYS_FS_ERROR_TIMEOUT,
    SYS_FS_ERROR_LOCKED,
    SYS_FS_ERROR_NOT_ENOUGH_CORE,
    SYS_FS_ERROR_TOO_MANY_OPEN_FILES,
    SYS_FS_ERROR_INVALID_PARAMETER,
    SYS_FS_ERROR_NOT_ENOUGH_FREE_VOLUME,
    SYS_FS_ERROR_FS_NOT_SUPPORTED,
    SYS_FS_ERROR_FS_NOT_MATCH_WITH_VOLUME,
    SYS_FS_ERROR_NOT_SUPPORTED_IN_NATIVE_FS
}

```

```
} SYS_FS_ERROR;
```

Description

File Error error enumeration

This enumeration lists the various error cases. When the application calls for a file system function which has a return type of [SYS_FS_RESULT](#) and if the return value is `SYS_FS_RES_FAILURE`, the application can know the specific reason for failure by calling the [SYS_FS_FileError](#) function. The return value of [SYS_FS_FileError](#) function will be one of the enumeration of the type `SYS_FS_ERROR`.

Members

Members	Description
<code>SYS_FS_ERROR_OK = 0</code>	Success
<code>SYS_FS_ERROR_DISK_ERR</code>	(1) A hard error occurred in the low level disk I/O layer
<code>SYS_FS_ERROR_INT_ERR</code>	(2) Assertion failed
<code>SYS_FS_ERROR_NOT_READY</code>	(3) The physical drive cannot work
<code>SYS_FS_ERROR_NO_FILE</code>	(4) Could not find the file
<code>SYS_FS_ERROR_NO_PATH</code>	(5) Could not find the path
<code>SYS_FS_ERROR_INVALID_NAME</code>	(6) The path name format is invalid
<code>SYS_FS_ERROR_DENIED</code>	(7) Access denied due to prohibited access or directory full
<code>SYS_FS_ERROR_EXIST</code>	(8) Access denied due to prohibited access
<code>SYS_FS_ERROR_INVALID_OBJECT</code>	(9) The file/directory object is invalid
<code>SYS_FS_ERROR_WRITE_PROTECTED</code>	(10) The physical drive is write protected
<code>SYS_FS_ERROR_INVALID_DRIVE</code>	(11) The logical drive number is invalid
<code>SYS_FS_ERROR_NOT_ENABLED</code>	(12) The volume has no work area
<code>SYS_FS_ERROR_NO_FILESYSTEM</code>	(13) There is no valid volume
<code>SYS_FS_ERROR_FORMAT_ABORTED</code>	(14) The Format() aborted due to any parameter error
<code>SYS_FS_ERROR_TIMEOUT</code>	(15) Could not get a grant to access the volume within defined period
<code>SYS_FS_ERROR_LOCKED</code>	(16) The operation is rejected according to the file sharing policy
<code>SYS_FS_ERROR_NOT_ENOUGH_CORE</code>	(17) LFN working buffer could not be allocated
<code>SYS_FS_ERROR_TOO_MANY_OPEN_FILES</code>	(18) Number of open files
<code>SYS_FS_ERROR_INVALID_PARAMETER</code>	(19) Given parameter is invalid
<code>SYS_FS_ERROR_NOT_ENOUGH_FREE_VOLUME</code>	(20) Too many mounts requested. Not enough free volume available
<code>SYS_FS_ERROR_FS_NOT_SUPPORTED</code>	(21) Requested native file system is not supported
<code>SYS_FS_ERROR_FS_NOT_MATCH_WITH_VOLUME</code>	(22) Requested native file system does not match the format of volume
<code>SYS_FS_ERROR_NOT_SUPPORTED_IN_NATIVE_FS</code>	(23) Function not supported in native file system layer

5.7.4.6.3.2 SYS_FS_FILE_OPEN_ATTRIBUTES Enumeration

C

```
typedef enum {
    SYS_FS_FILE_OPEN_READ = 0,
    SYS_FS_FILE_OPEN_WRITE,
    SYS_FS_FILE_OPEN_APPEND,
    SYS_FS_FILE_OPEN_READ_PLUS,
    SYS_FS_FILE_OPEN_WRITE_PLUS,
    SYS_FS_FILE_OPEN_APPEND_PLUS
} SYS_FS_FILE_OPEN_ATTRIBUTES;
```

Description

File open attributes

Lists the various attributes (modes) in which a file can be opened

Members

Members	Description
SYS_FS_FILE_OPEN_READ = 0	reading the file = possible, if file exists. reading the file = file open returns error, if file does not exist. writing to the file = not possible. Write operation returns error
SYS_FS_FILE_OPEN_WRITE	reading the file = not possible. Read operation returns error writing to the file = possible. If file exists, write happens from the beginning of the file, overwriting the existing content of the file. writing to the file = If file does not exist, a new file will be created and data will be written into the newly created file.
SYS_FS_FILE_OPEN_APPEND	reading the file = not possible. Read operation returns error writing to the file = possible. If file exists, write happens from the end of the file, preserving the existing content of the file. writing to the file = If file does not exist, a new file will be created and data will be written into the newly created file.
SYS_FS_FILE_OPEN_READ_PLUS	reading the file = possible, if file exists. reading the file = file open returns error, if file does not exist. writing to the file = possible, if file exists, starting from the beginning of the file (overwriting). writing to the file = file open returns error, if file does not exist.
SYS_FS_FILE_OPEN_WRITE_PLUS	reading the file = possible, if file exists. reading the file = If file does not exist, a new file will be created. writing to the file = possible. If file exists, write happens from the beginning of the file, overwriting the existing content of the file. writing to the file = If file does not exist, a new file will be created and data will be written into the newly created file.
SYS_FS_FILE_OPEN_APPEND_PLUS	reading the file = possible, if file exists. reading the file = If file does not exist, a new file will be created. writing to the file = possible. If file exists, write happens from the end of the file, preserving the existing content of the file. writing to the file = If file does not exist, a new file will be created and data will be written into the newly created file.

5.7.4.6.3.3 SYS_FS_FILE_SEEK_CONTROL Enumeration

C

```
typedef enum {
    SYS_FS_SEEK_SET,
    SYS_FS_SEEK_CUR,
    SYS_FS_SEEK_END
} SYS_FS_FILE_SEEK_CONTROL;
```

Description

File Seek control

This enumeration lists the various modes of file seek. When the application calls the [SYS_FS_FileSeek](#) function, it specifies the kind of seek that needs to be performed. The enumeration lists the various modes of file seek.

Members

Members	Description
SYS_FS_SEEK_SET	The file offset shall be set to input number of bytes from the start
SYS_FS_SEEK_CUR	The file offset shall be set to its current location plus input number of bytes

SYS_FS_SEEK_END	The file offset shall be set to the size of the file plus input number of bytes

Remarks

None.

5.7.4.6.3.4 SYS_FS_FILE_SYSTEM_TYPE Enumeration

C

```
typedef enum {
    FAT,
    MPFS2
} SYS_FS_FILE_SYSTEM_TYPE;
```

Description

File System type

These enumerated values are the possible native file system that can be supported by the SYS FS layer.

Members

Members	Description
FAT	FAT FS native File system
MPFS2	MPFS2 native File system

Remarks

None.

5.7.4.6.3.5 SYS_FS_FSTAT Structure

C

```
typedef struct {
    uint32_t fsize;
    uint16_t fdate;
    uint16_t ftime;
    uint8_t fattrib;
    char fname[13];
    char* lfname;
    uint32_t lfsize;
} SYS_FS_FSTAT;
```

Description

SYS FS File status structure

This structure holds the various status of a file. The structure is passed when SYS_FS_Stat function is called and after a successful execution of the function, the members of this structure carries the file status.

Members

Members	Description
uint32_t fsize;	File size
uint16_t fdate;	Last modified date
uint16_t ftime;	Last modified time
uint8_t fattrib;	Attribute
char fname[13];	Short file name (8.3 format)
char* lfname;	Pointer to the LFN buffer
uint32_t lfsize;	Size of LFN buffer in TCHAR

Remarks

None.

5.7.4.6.3.6 SYS_FS_FUNCTIONS Structure**C**

```
typedef struct {
    int (* mount)(uint8_t vol);
    int (* unmount)(uint8_t vol);
    int (* open)(uintptr_t handle, const char* path, uint8_t mode);
    int (* read)(uintptr_t fp, void* buff, uint32_t btr, uint32_t *br);
    int (* write)(uintptr_t fp, const void* buff, uint32_t btw, uint32_t* bw);
    int (* close)(uintptr_t fp);
    int (* seek)(uintptr_t handle, uint32_t offset);
    uint32_t (* tell)(uintptr_t handle);
    bool (* eof)(uintptr_t handle);
    uint32_t (* size)(uintptr_t handle);
    int (* fstat)(const char* path, uintptr_t fno);
} SYS_FS_FUNCTIONS;
```

Description

SYS FS Function signature structure for native file systems

The SYS FS layer supports functions from each native file system layer. This structure specifies the signature for each function from native file system (parameter that needs to be passed to each function and return type for each function). If a new native file system is to be integrated with the SYS FS layer, the functions should follow the signature.

The structure of function pointer for 2 native file system -- FAT FS and MPFS2 is already provided in the respective source files for the native file system. Hence the following structure is not immediately useful for the user. But the explanation for the structure is still provided for advanced users who would wish to integrate a new native file system to the Harmony File system framework.

Members

Members	Description
int (* mount)(uint8_t vol);	Function pointer of native file system for mounting a volume
int (* unmount)(uint8_t vol);	Function pointer of native file system for unmounting a volume
int (* open)(uintptr_t handle, const char* path, uint8_t mode);	Function pointer of native file system for opening a file
int (* read)(uintptr_t fp, void* buff, uint32_t btr, uint32_t *br);	Function pointer of native file system for reading a file
int (* write)(uintptr_t fp, const void* buff, uint32_t btw, uint32_t* bw);	Function pointer of native file system for writing to a file
int (* close)(uintptr_t fp);	Function pointer of native file system for closing a file
int (* seek)(uintptr_t handle, uint32_t offset);	Function pointer of native file system for moving the file pointer by a desired offset
uint32_t (* tell)(uintptr_t handle);	Function pointer of native file system for finding the position of the file pointer
bool (* eof)(uintptr_t handle);	Function pointer of native file system to check if the end of file is reached
uint32_t (* size)(uintptr_t handle);	Function pointer of native file system to know the size of file
int (* fstat)(const char* path, uintptr_t fno);	Function pointer of native file system to know the status of file

Remarks

None.

5.7.4.6.3.7 SYS_FS_HANDLE Type

C

```
typedef uintptr_t SYS_FS_HANDLE;
```

Description

SYS FS File Handle

While the application code opens a file, a file handle is returned by the open function (on successful open). This type defines the type of file handle.

Remarks

None.

5.7.4.6.3.8 SYS_FS_REGISTRATION_TABLE Structure

C

```
typedef struct {  
    SYS_FS_FILE_SYSTEM_TYPE nativeFileSystemType;  
    const SYS_FS_FUNCTIONS * nativeFileSystemFunctions;  
} SYS_FS_REGISTRATION_TABLE;
```

Description

SYS_FS_REGISTRATION_TABLE structure

When the SYS FS layer is initialised, it has to know the type of native file system it has to support and the list of functions for native file system. The members of this structure can be initialized with suitable values and then passed on to [SYS_FS_Initialize](#) initialization function. Please refer to the example code provided for [SYS_FS_Initialize](#).

Members

Members	Description
SYS_FS_FILE_SYSTEM_TYPE nativeFileSystemType;	Native file system of type SYS_FS_FILE_SYSTEM_TYPE
const SYS_FS_FUNCTIONS * nativeFileSystemFunctions;	Pointer to the structure of type SYS_FS_FUNCTIONS which has the list of

Remarks

None.

5.7.4.6.3.9 SYS_FS_RESULT Enumeration

C

```
typedef enum {  
    SYS_FS_RES_SUCCESS = 0,  
    SYS_FS_RES_FAILURE = -1  
} SYS_FS_RESULT;
```

Description

File operation result enum

This enumeration lists the various results of a file operation. When a file operation function is called from the application, and if the return type of the function is SYS_FS_RESULT, then, the enumeration below specifies the value of function return.

Members

Members	Description
SYS_FS_RES_SUCCESS = 0	Operation successful
SYS_FS_RES_FAILURE = -1	operation failed

5.7.4.6.3.10 FAT_FS_MAX_LFN Macro**C**

```
#define FAT_FS_MAX_LFN 255
```

Description

FAT File System LFN (long file name) max length

Set the value to 255

5.7.4.6.3.11 FAT_FS_MAX_SS Macro**C**

```
#define FAT_FS_MAX_SS 512
```

Description

FAT File System Sector size

Maximum sector size to be handled. Always set the value of sector size to 512

5.7.4.6.3.12 FAT_FS_USE_LFN Macro**C**

```
#define FAT_FS_USE_LFN 1
```

Description

FAT File System LFN (long file name) selection

The FAT_FS_USE_LFN option switches the LFN support. Set the value to 1

5.7.4.6.3.13 SYS_FS_HANDLE_INVALID Macro**C**

```
#define SYS_FS_HANDLE_INVALID ((SYS_FS_HANDLE)(-1))
```

Description

SYS FS File Invalid Handle

While the application code opens a file, if the file open is unsuccessful, an invalid file handle is returned. This definition defines the type of invalid file handle.

Remarks

None.

5.7.4.7 Files

Files

Name	Description
sys_fs.h	This file contains function and type declarations required to interact with the Harmony File System System Framework.

Description

5.7.4.7.1 sys_fs.h

File System System-Library Interface Declarations and types.

This file contains function and type declarations required to interact with the Harmony File System System Framework.

Enumerations

	Name	Description
	SYS_FS_ERROR	Lists the various error cases
	SYS_FS_FILE_OPEN_ATTRIBUTES	Lists the various attributes (modes) in which a file can be opened
	SYS_FS_FILE_SEEK_CONTROL	Lists the various modes of file seek
	SYS_FS_FILE_SYSTEM_TYPE	Enumerated data type identifying native file systems supported.
	SYS_FS_RESULT	Lists the various results of a file operation

Functions

	Name	Description
	SYS_FS_FileClose	Close a file.
	SYS_FS_FileEOF	check handle status
	SYS_FS_FileError	check the type of error
	SYS_FS_FileNameGet	Reads the file name.
	SYS_FS_FileOpen	Open a file
	SYS_FS_FileRead	Read specified bytes from a file
	SYS_FS_FileSeek	Move the file pointer.
	SYS_FS_FileSize	Returns the size of the file
	SYS_FS_FileStat	Get file status
	SYS_FS_FileTell	Obtains the file pointer position
	SYS_FS_FileWrite	Write on the file
	SYS_FS_Initialize	Initializes the File system Abstraction Layer (sys_fs layer).
	SYS_FS_Mount	Mount filesystems
	SYS_FS_Tasks	Tasks for the sys_fs layer
	SYS_FS_Unmount	unmount filesystems

Macros

	Name	Description
	FAT_FS_MAX_LFN	Lists the maximum length of file name during LFN selection
	FAT_FS_MAX_SS	Lists the definitions for FAT file system sector size.
	FAT_FS_USE_LFN	Lists the definitions for FAT file system LFN selection

	SYS_FS_HANDLE_INVALID	This definitions defines the SYS FS file invalid handle.

Structures

	Name	Description
	SYS_FS_FSTAT	The structure to obtain the status of a file.
	SYS_FS_FUNCTIONS	SYS FS Function signature structure for native file systems
	SYS_FS_REGISTRATION_TABLE	The sys_fs layer has to be initialized by passing this structure with suitably initialized members.

Types

	Name	Description
	SYS_FS_HANDLE	This type defines the file handle.

5.7.5 Interrupt System Service Library

5.7.5.1 Introduction

This library implements the Interrupt System Service. It is part of the system services that provides support for processing interrupts. The Interrupt System provides support for initializing the processor's interrupt controller, registering Interrupt Service Routines (ISRs) and managing interrupts. These features enable making efficient and dynamic applications, drivers, and middleware that respond to external events as they occur in real time.

5.7.5.2 Release Notes

MPLAB Harmony Version: v0.70b Interrupt System Service Library Version : 1.0 Release Date: 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.7.5.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.7.5.4 Using the Library

This topic describes the basic architecture of the Interrupt System Service Library and provides information and examples on how to use it.

Interface Header File: [sys_int.h](#)

The interface to the Interrupt System Service library is defined in the "[sys_int.h](#)" header file, which is included by the "sys.h" system service header file. Any C language source (.c) file that uses the Interrupt System Service library should include "sys.h".

Library File:

The Interrupt System Service library (.a) file installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the library interacts with the framework.

5.7.5.4.1 Abstraction Model

This library provides an abstraction of the interrupt subsystem that is used by device drivers, middleware libraries and applications to receive and control interrupts in real time.

Interrupt System Service

The interrupt system services provide support for initializing the processor's interrupt controller, managing Interrupt Service Routines (ISRs) and managing interrupts.

Initialization

Each software module (device driver, library, or application) that needs to receive an interrupt must enable that interrupt itself. This is normally done in the module's initialization routine which is called by the "[SYS_Initialize](#)" service.

A module that intends to use an interrupt must first register the "Tasks" function that is to be called when the desired source causes an interrupt. Then, it must enable that source, once it is ready to start receiving interrupts.

If the interrupt system service is configured for static usage, then the routine that dynamically registers the "Tasks" function will be nulled out by a macro (generating no run-time code) and, instead, the "Tasks" routine must be called statically from the function that implements the raw ISR vector. How this is done is different for each processor family, as explained below.

Interrupt Service Routine (ISR)

Each software module (device driver, library, or application) that needs to receive an interrupt must implement a "Tasks" routine to handle that interrupt. In order for the module to operate in an interrupt-driven mode, the "Tasks" routine must be called from within the appropriate "raw" Interrupt Service Routine (ISR).

How the raw ISR is implemented is highly dependent upon the specific processor being used. Libraries are available that implement raw ISRs for each processor family in a way that allows dynamic registration and de-registration of "Tasks" routines. These libraries maintain tables that associate the "Tasks" routine registered by the SYS INIT service with each interrupt source in the system.

Alternately, in a statically-linked system implementation, the ISR may be implemented by the system designer or integrator (in the configuration-specific "sys_int.c" file). Such "static" ISR implementations must identify the source of the interrupt then directly call the appropriate module's "Tasks" routine. This requires knowledge of the modules that have been included in the system and cannot be implemented in advance as a library.

Note: It is also possible, in a highly optimized system (or to support highly resource-restricted parts), to implement the logic of the module's "Tasks" routine directly in the raw ISR. However, this method is not recommended unless absolutely necessary to meet system timing requirements.

Board Support Packages (BSPs)

If the processor is affixed directly to the board, the BSP may also implement any required "raw" ISRs, eliminating the need for the system designer or integrator to implement the ISR(s) himself. Refer to the documentation for the BSP in use for details on what initialization and ISR support it provides. This support is not implemented by the Interrupt System Services library.

5.7.5.4.2 Library Overview

The diagram below describes the major components of the usage model.

Library Usage Model

Each of the blocks in the diagram above correspond to the library interface section.

Library Interface Section	Description
Interrupt System Setup Functions	Provides processor specific initialization of the interrupt system.
Global Interrupt Management Functions	Provide interface routines to enable/disable all interrupts on the system.

5.7.5.4.3 How the Library Works

The Interrupt System Service Library can be used by a device driver, middleware layer, or application to provide access to, and control over, interrupts to the processor.

Note: Not all modes are available on all devices. Please refer to the specific device data sheet to determine the modes supported for your device.

5.7.5.4.3.1 Interrupt System Setup

The Interrupt System Service library must be initialized by calling the `SYS_INT_Initialize` routine. If the MPLAB Harmony dynamic initialization service is used, the "`SYS_INT_Initialize`" routine will be called automatically when the "`SYS_Initialize`" function is called. In a statically initialized system, the system designer or integrator must implement the "`SYS_Initialize`" function and that function must call "`SYS_INT_Initialize`" before initializing any modules that might require use of the interrupt system service. Once the library has been initialized, call the function `SYS_INT_Enable` to enable interrupts to the processor. However, before enabling the generation of interrupts to the processor, each individual module (driver, library, or application) must have a "Tasks" routine in place (either registered with `SYS_INT_DynamicRegister` or statically linked to the raw ISR) to handle the interrupt before it enables its own interrupt.

Example: Initializing the System Interrupt Library

```

SYS_INT_Initialize();
// Initialize all interrupt-aware software modules
SYS_INT_Enable();
  
```

5.7.5.4.3.2 Critical Sections

Critical Sections

Critical sections of code are small sections of code that must execute atomically, with no possibility of being interrupted. To support this, the following technique can be used.

Global Interrupt Management provides routines to create a global critical section of code.

Global Critical Section

If no interrupts of any kind can be allowed within a critical section of code, the following routines can be used to ensure this.

- [SYS_INT_Disable](#): To start a critical section, all interrupts are disabled with the call of this function
- [SYS_INT_Enable](#) : To end a critical section, interrupts are enabled from the interrupt controller to the core.
- [SYS_INT_IsEnabled](#): Status to indicate if interrupts are currently enabled or not.

Example: Global Critical Section

```
bool flag;
flag = SYS_INT_Disable();

// Do something critical

if (flag)
{
    SYS_INT_Enable();
}
```

Source Interrupt Management provides interface routines to create local critical sections

Local Critical Sections

Normally, it is not necessary to globally disable all possible interrupts. For example, in a driver for a specific device, it is not normally important if an unrelated interrupt occurs in the middle of a critical section of code. However, if the interrupt for the source that the driver manages must not occur within a critical section of code, it can be protected using the following technique.

Example: Local Critical Section

```
bool flag;
// interrupt source enable status before disable is called
flag = SYS_INT_SourceDisable(MY_DRIVER_INTERRUPT_SOURCE);

// Do something critical

if (flag)
{
    SYS_INT_SourceEnable(MY_DRIVER_INTERRUPT_SOURCE);
}
```

Note: These methods of protecting critical sections is usually implemented as part of an Operating System Abstraction Layer (OSAL), so it is not normally necessary to use these examples explicitly. Normally, the OSAL will provide single functions or macros that implement this functionality. So, if available, an OSAL method is preferred over implementing the critical section code as shown in the above examples.

5.7.5.4.3.3 Source Interrupt Management

The driver, middleware, or application's interrupt-handling "Tasks" routine must do two things at a minimum, in the following order.

1. Remove the cause of the interrupt
2. Clear the interrupt source by calling the function [SYS_INT_SourceStatusClear](#)

Exactly what actions are necessary to remove the cause of an interrupt is completely dependent on the source of the interrupt. This is normally the main purpose of the driver itself and is beyond the scope of this section. Refer to the documentation for the peripheral being managed.

WARNING! The cause of the interrupt must be removed before clearing the interrupt source or the interrupt may re-occur immediately after the source is cleared potentially causing an infinite loop. An infinite loop may also occur if the source is not cleared before the interrupt-handler returns.

Example: Handling Interrupts

```
void DRV_MYDEV_Tasks( SYS_MODULE_OBJ object )
{
```

```
// Remove the cause of the interrupt  
//...  
  
// Clear Interrupt source  
SYS_INT_SourceStatusClear(myIntSourceID);  
}
```

Note: The value of "myIntSourceID" is usually either a static or dynamic configuration option. Refer to the documentation for the specific device driver to identify how to define the interrupt source ID.

Testing Interrupt

Some times it is necessary to cause an interrupt in software, possibly for testing purposes. To support this, the function [SYS_INT_SourceStatusSet](#) is provided.

Example: Causing an Interrupt in Software

```
SYS\_INT\_SourceStatusSet(MY_DRIVER_INTERRUPT_SOURCE);
```

Note: This feature is not available for all interrupt sources on all Microchip microcontrollers. Refer to the data sheet for the microcontroller being used to determine if it is possible for software to set a specific interrupt source.

5.7.5.5 Configuring the Library

Three things must be correctly configured in order to use the System Interrupt library.

1. Select the Appropriate Processor
2. Initialize the Interrupt System Service
3. Configure the Raw ISR Support

Select the Appropriate Processor

The following data types are dependent on the processor selection and are actually defined in the interrupt peripheral library for the specific microcontroller being used.

- [INT_SOURCE](#)
- [INT_PRIORITY](#)
- [INT_SUBPRIORITY](#)

These are configured by selecting the appropriate processor in MPLAB, which adds the "mprocessor" option to the compiler command line to identify the correct processor and processor-specific implementation of the peripheral library to use. Since the System Interrupt library is part of the Microchip Firmware Framework, it will get built with the correct definition of these data types.

Initialize the Interrupt System Service

There are two ways to initialize the interrupt system service, depending on whether you're using a static configuration or a dynamic configuration.

For a dynamic configuration the constant `SYS_INT_DYNAMIC` needs to be defined. This makes [SYS_INT_DynamicRegister](#) and [SYS_INT_DynamicDeregister](#) available. The required driver tasks routines need to be registered using [SYS_INT_DynamicRegister](#) function.

For a static configuration, the system designer or integrator must implement the [SYS_INT_Initialize](#) routine. This routine's purpose is to perform any actions necessary to initialize the interrupt subsystem and interrupt controller on the specific processor and system, usually interacting directly with the Interrupt controller modules Peripheral Library (PLIB) to accomplish these tasks.

Configure the Raw ISR Support

In some systems, there may only be a single actual ("raw") ISR to handle all interrupts. In this sort of system, most of the System Interrupt library may be implemented in software, with only the highest level interrupt being supported by hardware. In other systems, all interrupts may be supported by separate ISRs and vector selection and prioritization will be supported by hardware.

ISRs may be dynamically linked to specific interrupt sources or they may be statically linked at build time. If a dynamic interrupt library is used (by defining the constant `SYS_INT_DYNAMIC`), the calls to [SYS_INT_DynamicRegister](#) will register a pointer to the given "Tasks" routine for each registered interrupt source in an internal table. The dynamic library will then determine the source of the interrupt and call the given "Tasks" routine.

If a static configuration is desired, the "raw" ISR support must be implemented so that it directly calls (using static, build-time linkage) the appropriate module's "Tasks" routine. This requires the system implementer or integrator to implement the raw ISR, but it reduces the amount of overhead necessary to handle interrupts, reducing both interrupt latency and code size.

5.7.5.5.1 Static Configuration

When statically configuring raw ISR support, the system implementer or integrator must directly implement the raw ISRs in an appropriate manner for the selected processor. The Raw ISR, must then call the appropriate "Tasks" routine to properly handle and clear the interrupt source.

Description

A static configuration of the raw ISR support for MPLAB Harmony requires processor-family-specific knowledge. Or, more accurately, it requires compiler-specific knowledge. The examples below will show a sampling of how to implement a raw ISR for different part families. Refer to the compiler manual for the selected processor family for details of how to implement an interrupt service routine.

Raw ISR Responsibilities:

1. Identify the Interrupt Source
2. Call the Appropriate Module's "Tasks" Routine

The first thing a raw ISR must do is identify the source of the interrupt. For some processor families, each interrupt source has its own interrupt "vector". This means that the only time a specific ISR is called is when a specific source has caused an interrupt. Thus, the raw ISR can assume that every time it is called it's source has caused an interrupt. Other processor families combine two or more interrupt sources into a single interrupt "vector". In such a case, the raw ISR must verify which source caused the interrupt and it must verify if that source is enabled. In either case, once the raw ISR has identified the interrupt source, it must call the appropriate module's "Tasks" routine to service and clear the interrupt.

Example: PIC32 Timer-1 Raw ISR

```
void __ISR ( _TIMER_1_VECTOR ) _InterruptHandler_TMR_1_stub( void )
{
    /* Call the timer driver's "Tasks" routine */
    DRV_TMR_Tasks ( gTMRObject );
}
```

Example: PIC24 Timer-1 Raw ISR

```
void __attribute__ ( ( interrupt, no_auto_psv ) ) _ISR _T1Interrupt( void )
{
    /* Call the timer driver's "Tasks" routine */
    DRV_TMR_Tasks ( gTMRObject );
}
```

Example: PIC18 Timer-1 Raw ISR

```
#pragma interrupt_level 0
void interrupt low_priority InterruptHandler_low_priority_stub ( void )
{
    if ( SYS_INT_SourceIsEnabled( gTMRObject ) && PLIB_INT_SourceFlagGet( gTMRObject ) )
    {
        /* Call the timer driver's "Tasks" routine */
        DRV_TMR_Tasks ( gTMRObject );
    }
    // Check other sources...
}
```

In all of the above examples, "gTMRObject" holds the return value from the ["DRV_TMR_Initialize"](#) routine.

The [SYS_INT_DynamicRegister](#) and [SYS_INT_DynamicDeregister](#) routines are macro switched to compile away to nothing if a static configuration is chosen

5.7.5.5.2 Dynamic Configuration

When dynamically configuring raw ISR support, the system implementer or integrator must register each interrupt-driven driver or module's "Tasks" routine with the dynamic system interrupt service for the appropriate interrupt source. The dynamic SYS INT service will then ensure that the appropriate "Tasks" routine is called when an interrupt occurs.

Description

When using the dynamic system interrupt (SYS INT) service, it is not necessary to implement "raw ISRs" for interrupt-driven modules. The processor-family-specific, dynamic SYS INT implementation provided with MPLAB Harmony implements the "raw ISR(s)" so the system developer or integrator doesn't have to. Instead, the system developer must register the module's "Tasks" routine(s) using the "SYS_ModuleRegister" routine after registering the module in the module registration routine (described in the SYS INIT documentation). The example below shows how a module must register its ISR "Tasks" routine.

Example: Dynamic Registration of an Interrupt-Driven Module

```
// Register the TMR driver's "Tasks" routine with the SYS INT service
SYS_INT_DynamicRegister(object, DRV_TMR_Tasks, PLIB_INT_SOURCE_TIMER_1);
```

The module init routine must register the module's "Tasks" routine(s) with the SYS INT service instead of the SYS TASKS service. to do this, it calls the ["SYS_INT_DynamicRegister"](#) routine, passing in the object(the same object handle returned by the module's initialization routine), along with a pointer to the module's "Tasks" routine and the interrupt source with which it will be associated.

5.7.5.6 Library Interface

Data Types and Constants

	Name	Description
	SYS_INT_TASKS_POINTER	Pointer to an interrupt-handling "Tasks" routine.

Global Interrupt Management Functions

	Name	Description
	SYS_INT_Disable	Disables interrupts to the processor.
	SYS_INT_Enable	Enables global interrupts to the processor.
	SYS_INT_IsEnabled	Identifies if interrupts are currently enabled or disabled at the top level.

Interrupt Source Management Functions

	Name	Description
≡	SYS_INT_SourceDisable	Disables the specified source from generating interrupts to the processor.
≡	SYS_INT_SourceEnable	Enables the specified source to generate interrupts to the processor.
≡	SYS_INT_SourceIsEnabled	Identifies if the specified source is enabled or disabled.
≡	SYS_INT_SourceStatusClear	Clears the interrupt request for the specified interrupt source.
≡	SYS_INT_SourceStatusGet	Determines the status of the specified interrupt source.
≡	SYS_INT_SourceStatusSet	Sets the specified interrupt source.
≡	SYS_INT_VectorPrioritySet	Sets the given interrupt vector to the specified priority.
≡	SYS_INT_VectorSubprioritySet	Sets the specified interrupt vector to the given sub priority.

Interrupt System Setup Functions

	Name	Description
≡	SYS_INT_Initialize	Configures and initializes the interrupt subsystem.
≡	SYS_INT_DynamicDeregister	Deregisters the current ISR from the given interrupt source.
≡	SYS_INT_DynamicRegister	Registers an Interrupt "Tsks" Routine for the specified interrupt source or trap).

Description**5.7.5.6.1 Interrupt System Setup Functions****5.7.5.6.1.1 SYS_INT_Initialize Function****C**

```
void SYS_INT_Initialize();
```

Description

This function configures and initializes the interrupt subsystem appropriately for the current system design.

Preconditions

None.

Returns

None.

Remarks

None.

The System Interrupt library must be initialized by calling the SYS_INT_Initialize routine. This is normally done in the "[SYS_Initialize](#)" routine before any interrupt support is used. If the dynamic interrupt system service is not used, the "[SYS_Initialize](#)" routine must be implemented by the system designer or integrator as required by the system design and is not implemented by the System Interrupt library. The global interrupts are enabled as a part the call to "SYS_INT_Initialize". However, before enabling the generation of interrupts to the processor, each individual module (driver, library, or application) must have a "Tasks" routine to in place (statically linked to the raw ISR) to handle the interrupt before it enables it's own interrupt.

Example: Initializing the System Interrupt Library

```
SYS_INT_Initialize();
```

Example

```
// Initialize the interrupt system. This needs to be done in the initialization  
// code.  
SYS_INT_Initialize();
```

5.7.5.6.1.2 SYS_INT_DynamicDeregister Function**C**

```
void SYS_INT_DynamicDeregister(  
    INT_SOURCE source  
);
```

Description

This function deregisters the current Interrupt Service Routine (ISR), if any, from the specified interrupt source.

Preconditions

[SYS_INT_Initialize](#) must have been called.

Parameters

Parameters	Description
source	Identifier for the desired interrupt source

Returns

None.

Remarks

It is safe to call this routine, even if no ISR has been registered for the given interrupt source.

Calling this routine is optional. If the system is designed such that the given ISR is expected to always be available once the system has been initialized, this routine does not need to be called.

Example

```
SYS_INT_DynamicDeregister(SYS_INT_TIMER_1);
```

5.7.5.6.1.3 SYS_INT_DynamicRegister Function**C**

```
void SYS_INT_DynamicRegister(  
    INT_SOURCE source,  
    SYS_INT_TASKS_POINTER tasks,  
    SYS_MODULE_OBJ object  
);
```

Description

This function registers an Interrupt "Tasks" Routine for the specified interrupt source or trap).

Preconditions

[SYS_INT_Initialize](#) must have been called.

Parameters

Parameters	Description
source	Identifier for the desired interrupt source
tasks	Pointer to the tasks routine
object	Handle to the module instance

Returns

None.

Remarks

This routine only generates executable code when a driver is configured to register dynamically its "Tasks" routine with the system interrupt service. However, it should be called even if the ISR-to-source association is defined statically at compile time to maintain source code compatibility. A device driver normally registers its own ISR from its initialization routine.

In the example code, the macros MY_DRIVER_INTERRUPT_SOURCE would be defined in the appropriate configuration header, which would be included by the driver source file where the "DRV_MYDEV_Tasks" routine and the MyParam data would be defined.

It is safe to call this routine without first calling [SYS_INT_DynamicDeregister](#), even if a previous ISR has been registered. The effect will be that the new ISR supplants the old one.

The System Interrupt library must be initialized by calling the [SYS_INT_Initialize](#) routine. This is normally done in the "[SYS_Initialize](#)" routine before any interrupt support is used.

If the dynamic interrupt system service is not used, the "[SYS_Initialize](#)" routine must be implemented by the system designer or integrator as required by the system design and is not implemented by the System Interrupt library.

Once the library has been initialized, call the function [SYS_INT_Enable](#) to enable interrupts to the processor. However, before enabling the generation of interrupts to the processor, each individual module (driver, library, or application) must have a "Tasks" routine in place (either registered with SYS_INT_DynamicRegister or statically linked to the raw ISR) to handle the interrupt before it enables its own interrupt.

Example: Initializing the System Interrupt Library

```
// Initialize the interrupt system.  
SYS_INT_Initialize();  
// Initialize all interrupt-aware software modules  
SYS_INT_Enable();
```

Example

```
SYS_INT_Initialize();  
SYS_INT_DynamicRegister(MY_DRIVER_INTERRUPT_SOURCE, DRV_MYDEV_Tasks, MyObject);
```

5.7.5.6.2 Global Interrupt Management Functions

5.7.5.6.2.1 SYS_INT_Disable Function

C

```
bool SYS_INT_Disable();
```

Description

This function disables interrupts to the processor at the top level. This function can be called to prevent any source from being able to generate an interrupt. It returns the global interrupt status before disabling the interrupts.

Preconditions

[SYS_INT_Initialize](#) must have been called.

Returns

true - Global Interrupts are enabled (before the call to disable) false - Global Interrupts are disabled (before the call to disable)

Remarks

None.

Example

```
// Interrupt enable status
bool flag;
// Disable the global interrupts
flag = SYS_INT_Disable();
// Do something critical
// Check if interrupts were disabled/enabled
if (flag)
{
    // enable the global interrupts if they were enabled before the
    // call to SYS_INT_Disable()
    SYS_INT_Enable();
}
```

5.7.5.6.2.2 SYS_INT_Enable Function**C**

```
void SYS_INT_Enable();
```

Description

This function enables interrupts to the processor at the top level, allowing any currently enabled source to generate an interrupt. This function must be called before any source will be able to generate an interrupt.

Preconditions

None.

Returns

None.

Remarks

SYS_INT_Enable is called from the [SYS_INT_Initialize\(\)](#) function.

Example

```
// Check if global interrupts are enabled
if(!SYS_INT_IsEnabled())
{
    // Enable the global interrupts.
    SYS_INT_Enable();
}
```

5.7.5.6.2.3 SYS_INT_IsEnabled Function**C**

```
bool SYS_INT_IsEnabled();
```

Description

This function identifies if interrupts are enabled or disabled at the top level.

Preconditions

[SYS_INT_Initialize](#) must have been called.

Returns

- true - If the interrupts are currently enabled
- false - If the interrupts are currently disabled

Remarks

None.

Example

```
// Check if global interrupts are enabled
if ( SYS_INT_IsEnabled() )
{
    // Interrupt enable status
    bool flag;
    // Disable the global interrupts.
    flag = SYS_INT_Disable();
}
```

5.7.5.6.3 Interrupt Source Management Functions

5.7.5.6.3.1 SYS_INT_SourceDisable Function

C

```
bool SYS_INT_SourceDisable(
    INT_SOURCE source
);
```

Description

This routine disables the given source from generating interrupts the processor when events occur. It returns the interrupt source enable/disable status before disabling the interrupt source.

Preconditions

[SYS_INT_Initialize](#) must have been called.

Parameters

Parameters	Description
source	Identifier for the desired interrupt source.

Returns

- true - The Interrupt source is enabled (before the call to SYS_INT_SourceDisable)
- false - The Interrupt source is disabled (before the call to SYS_INT_SourceDisable)

Remarks

None.

Example

```
// interrupt source enable/disable status.
bool flag
// Initialize the interrupt system. This needs to be done in the initialization
// code.
SYS_INT_Initialize();
// Disable the interrupt source
flag = SYS_INT_SourceDisable(INT_SOURCE_PARALLEL_PORT);
// before enabling the source check the enable/disable status
if(flag)
{
    SYS_INT_SourceEnable(INT_SOURCE_PARALLEL_PORT);
}
```

5.7.5.6.3.2 SYS_INT_SourceEnable Function

C

```
void SYS_INT_SourceEnable(  
    INT_SOURCE source  
);
```

Description

This routine enables the specified source to generate interrupts to the processor when events occur.

Preconditions

[SYS_INT_Initialize](#) must have been called and an ISR must have been registered for the source.

Parameters

Parameters	Description
source	Identifier for the desired interrupt source

Returns

None.

Remarks

An Interrupt Service Routine (ISR) for the given interrupt source must be ready to receive the call before the source is enabled.

Example

```
// Initialize the interrupt system. This needs to be done in the initialization  
// code.  
SYS_INT_Initialize();  
// Enable the interrupt source  
SYS_INT_SourceEnable(INT_SOURCE_PARALLEL_PORT);
```

5.7.5.6.3.3 SYS_INT_SourceIsEnabled Function

C

```
bool SYS_INT_SourceIsEnabled(  
    INT_SOURCE source  
);
```

Description

This function identifies if the specified source is currently enabled or is currently disabled.

Preconditions

[SYS_INT_Initialize](#) must have been called.

Parameters

Parameters	Description
source	Identifier for the desired interrupt source.

Returns

- true - If the given source is currently enabled.
- false - If the given source is currently disabled.

Remarks

None.

Example

```
// Initialize the interrupt system. This needs to be done in the initialization
// code.
SYS_INT_Initialize();
// Check if the required interrupt source is enabled
if ( SYS_INT_SourceIsEnabled(INT_SOURCE_PARALLEL_PORT))
{
    // App code
}
```

5.7.5.6.3.4 SYS_INT_SourceStatusClear Function**C**

```
void SYS_INT_SourceStatusClear(
    INT_SOURCE source
);
```

Description

This function clears the interrupt request for the specified interrupt source.

Preconditions

[SYS_INT_Initialize](#) must have been called.

Parameters

Parameters	Description
source	Identifier for the desired interrupt source

Returns

None.

Remarks

None.

Example

```
// Initialize the interrupt system. This needs to be done in the initialization
// code.
SYS_INT_Initialize();
// Check if the interrupt source flag is set
if ( SYS_INT_SourceStatusGet(INT_SOURCE_PARALLEL_PORT) )
{
    // Clear the interrupt flag
    SYS_INT_SourceStatusClear(INT_SOURCE_PARALLEL_PORT);
}
```

5.7.5.6.3.5 SYS_INT_SourceStatusGet Function**C**

```
bool SYS_INT_SourceStatusGet(
    INT_SOURCE source
);
```

Description

This function determines the current status of the interrupt source.

Preconditions

[SYS_INT_Initialize](#) must have been called.

Parameters

Parameters	Description
source	Identifier for the desired interrupt source

Returns

- true - If the given interrupt source is currently set
- false - If the given interrupt source is not currently set

Remarks

Works even if the interrupt source or interrupts in general have not been enabled, so it can be used for polling implementations.

Example

```
// Initialize the interrupt system.This needs to done in the initialization
// code.
SYS_INT_Initialize();
// Check if the required interrupt source is set
if ( SYS_INT_SourceStatusGet(INT_SOURCE_PARALLEL_PORT) )
{
    // Handle interrupt
}
```

5.7.5.6.3.6 SYS_INT_SourceStatusSet Function**C**

```
void SYS_INT_SourceStatusSet(
    INT_SOURCE source
);
```

Description

This function sets the specified interrupt source, causing the processor to be interrupted if interrupts are enabled, the source has been enabled, and the priority is higher than the current priority.

Preconditions

[SYS_INT_Initialize](#) must have been called and an ISR must have been registered for the source (if interrupts and the source are enabled).

Parameters

Parameters	Description
source	Identifier for the desired interrupt source

Returns

None.

Remarks

Not supported for all interrupt sources. Check the specific data sheet for software clear only interrupt sources.

The driver, middleware, or application's interrupt-handling "Tasks" routine must do two things at a minimum, in the following order.

1. Remove the cause of the interrupt
2. Clear the interrupt source by calling the function [SYS_INT_SourceStatusClear](#)

Exactly what actions are necessary to remove the cause of an interrupt is completely dependent on the source of the interrupt. This is normally the main purpose of the driver itself and is beyond the scope of this section. Refer to the documentation for the peripheral being managed.

WARNING! The cause of the interrupt must be removed before clearing the interrupt source or the interrupt may re-occur immediately after the source is cleared potentially causing an infinite loop. An infinite loop may also occur if the source is not cleared before the interrupt-handler returns.

Example: Handling Interrupts

```
void DRV_MYDEV_Tasks( SYS_MODULE_OBJ object )
{
    // Remove the cause of the interrupt
    //...

    // Clear Interrupt source
    SYS_INT_SourceStatusClear(myIntSourceID);
}
```

Note: the value of "myIntSourceID" is usually either a static or dynamic configuration option. Refer to the documentation for the specific device driver to identify how to define the interrupt source ID.

Testing Interrupt

Some times it is necessary to cause an interrupt in software, possibly for testing purposes. To support this, the function SYS_INT_SourceStatusSet is provided.

Example: Causing an Interrupt in Software

```
SYS_INT_SourceStatusSet(MY_DRIVER_INTERRUPT_SOURCE);
```

Note: This feature is not available for all interrupt sources on all Microchip microcontrollers. Refer to the data sheet for the microcontroller being used to determine if it is possible for software to set a specific interrupt source.

Example

```
// Initialize the interrupt system. This needs to done in the initialization
// code.
SYS_INT_Initialize();
// Check if interrupt source flag is set
if ( !SYS_INT_SourceStatusGet(INT_SOURCE_PARALLEL_PORT) )
{
    // Set the interrupt source flag
    SYS_INT_SourceStatusSet(INT_SOURCE_PARALLEL_PORT);
}
```

5.7.5.6.3.7 SYS_INT_VectorPrioritySet Function

C

```
void SYS_INT_VectorPrioritySet(
    INT_VECTOR vector,
    INT_PRIORITY_LEVEL priority
);
```

Description

This routine sets the given interrupt vector to the specified priority.

Preconditions

[SYS_INT_Initialize](#) must have been called.

Parameters

Parameters	Description
vector	Identifier for the desired interrupt vector
priority	Priority (if supported)

Returns

None.

Remarks

This feature is not supported on all devices. Refer to the specific device data sheet or family reference manual to determine whether this feature is supported.

In the example code, the macros MY_DRIVER_INTERRUPT_VECTOR, MY_DRIVER_ISR_PRIORITY would be defined appropriately during configuration.

Example

```
#define MY_DRIVER_INTERRUPT_VECTOR INT_VECTOR_T1
#define MY_DRIVER_ISR_PRIORITY     INT_PRIORITY_LEVEL2
// Initialize the interrupt system.This needs to done in the initialization
// code.
SYS_INT_Initialize();
// Assign priority to the interrupt vector
SYS_INT_VectorPrioritySet(MY_DRIVER_INTERRUPT_VECTOR, MY_DRIVER_ISR_PRIORITY);
```

5.7.5.6.3.8 SYS_INT_VectorSubprioritySet Function**C**

```
void SYS_INT_VectorSubprioritySet(
    INT_VECTOR vector,
    INT_SUBPRIORITY_LEVEL subpriority
);
```

Description

This function sets the specified interrupt vector to the specified sub-priority.

Preconditions

[SYS_INT_Initialize](#) must have been called.

Parameters

Parameters	Description
vector	Identifier for the desired interrupt vector
subpriority	Subpriority (if supported)

Returns

None.

Remarks

This feature is not supported on all devices. Refer to the specific device data sheet or family reference manual to determine whether this feature is supported.

In the example code, the macros MY_DRIVER_INTERRUPT_VECTOR, MY_DRIVER_ISR_SUB_PRIORITY would be defined appropriately during configuration.

Example

```
#define MY_DRIVER_INTERRUPT_VECTOR INT_VECTOR_T1
#define MY_DRIVER_ISR_PRIORITY     INT_PRIORITY_LEVEL2
#define MY_DRIVER_ISR_SUB_PRIORITY INT_SUBPRIORITY_LEVEL1
// Initialize the interrupt system.This needs to done in the initialization
// code.
SYS_INT_Initialize();
// Assign priority to the interrupt vector
SYS_INT_VectorPrioritySet(MY_DRIVER_INTERRUPT_VECTOR, MY_DRIVER_ISR_PRIORITY);
```

```
// Assign sub-priority to the interrupt vector
SYS_INT_VectorSubprioritySet(MY_DRIVER_INTERRUPT_VECTOR, MY_DRIVER_ISR_SUB_PRIORITY);
```

5.7.5.6.4 Data Types and Constants

5.7.5.6.4.1 SYS_INT_TASKS_POINTER Type

C

```
typedef void (* SYS_INT_TASKS_POINTER)(SYS_MODULE_OBJ object);
```

Description

Interrupt Tasks Routine Pointer

This data type defines a pointer to an interrupt-handling "Tasks" routine. The form of a tasks routine is as follows:

```
void My_Tasks ( SYS_MODULE_OBJ object );
```

Where "MyTasks" is the name of the tasks routine and object is a Handle to the module instance.

Remarks

"Tasks" is normally defined by a device driver, middleware, or system layer.

The term Interrupt Service Routine (ISR) is used for the "raw" ISR code that is either located directly at the interrupt vector address or whose address is loaded from the interrupt vector. The term "Tasks" routine is used to identify the driver-specific routine that is called by the actual ISR to perform the tasks necessary to handle and clear the interrupt.

5.7.5.7 Files

Files

Name	Description
sys_int.h	Interrupt System Service.

Description

5.7.5.7.1 sys_int.h

Interrupt System Service Library Interface Definition

This file contains the interface definition for the Interrupt System Service. It provides a way to interact with the interrupt subsystem to manage the occurrence of interrupts for sources supported by the system.

Functions

	Name	Description
≡	SYS_INT_Disable	Disables interrupts to the processor.
≡	SYS_INT_DynamicDeregister	Deregisters the current ISR from the given interrupt source.
≡	SYS_INT_DynamicRegister	Registers an Interrupt "Tsks" Routine for the specified interrupt source or trap).
≡	SYS_INT_Enable	Enables global interrupts to the processor.
≡	SYS_INT_Initialize	Configures and initializes the interrupt subsystem.
≡	SYS_INT_IsEnabled	Identifies if interrupts are currently enabled or disabled at the top level.
≡	SYS_INT_SourceDisable	Disables the specified source from generating interrupts to the processor.

	SYS_INT_SourceEnable	Enables the specified source to generate interrupts to the processor.
	SYS_INT_SourcesEnabled	Identifies if the specified source is enabled or disabled.
	SYS_INT_SourceStatusClear	Clears the interrupt request for the specified interrupt source.
	SYS_INT_SourceStatusGet	Determines the status of the specified interrupt source.
	SYS_INT_SourceStatusSet	Sets the specified interrupt source.
	SYS_INT_VectorPrioritySet	Sets the given interrupt vector to the specified priority.
	SYS_INT_VectorSubprioritySet	Sets the specified interrupt vector to the given sub priority.

Types

	Name	Description
	SYS_INT_TASKS_POINTER	Pointer to an interrupt-handling "Tasks" routine.

5.7.6 Messaging System Service Library

5.7.6.1 Introduction

Messaging System Service Library

for

Microchip Microcontrollers

This library provides intra-process and inter-process communication by the sending and receiving of simple messages. The format of these messages is under developer control, providing flexibility to tune message format for each application. The number and size of message queues is under developer control, with a message priority scheme implemented by multiple queues. Each priority queue has an configurable size. The number of message types and the number of receiving mailboxes is also configurable.

Description

This library provides intra-process and inter-process communication by the sending and receiving of simple messages. The format of these messages is under developer control, providing flexibility to tune message format for each application. The number and size of message queues is under developer control, with a message priority scheme implemented by multiple queues. Each priority queue has an configurable size. The number of message types and the number of receiving mailboxes is also configurable.

Consider an application that combines graphics on a display screen, with a touch overlay on top of the screen, and several buttons. System messages can be used by touch software to alert the graphics part of the application to update the screen as well as alert other parts of the application to perhaps change the audio volume whenever a slider value has changed. This is easily supported by the Messaging System Services Library.

5.7.6.2 Release Notes

MPLAB Harmony Version: v0.70b **Messaging System Service Library Version :** 0.01a **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.7.6.3 SW License Agreement

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.7.6.4 Using the Library

Interface Header File: [sys_msg.h](#)

The interface to the Messaging System Service library is defined in the "[sys_msg.h](#)" header file".

This library uses calloc to allocate memory for:

- Message queues for each priority as part of [SYS_MSG_Initialize](#)
- Mailbox definition objects
- Message type objects

If calls to calloc fails to allocate the needed memory then object handles are returned with a value of [SYS_OBJ_HANDLE_INVALID](#).

Here is a simple example that can be run on any PIC32 starter kit:

```
#include <sys/appio.h>
#include <GenericTypeDefs.h>

#include "system/common/sys_module.h"
#include "system/msg/sys_msg.h"
#include "system/msg/src/sys_msg_local.h"
```

```

// Strawman callback functions for three mailboxes
void myCallBack0( SYS_MSG_OBJECT *pMessage )
{
    DBPRINTF("CallBack0:: Message Type: %d, nSource: %d\r\n"
            "        param 0: %d, param1: %d, param2: %d \r\n",
            pMessage->nMessageTypeID,
            pMessage->nSource, pMessage->param0,
            pMessage->param1, pMessage->param2
            );
}

void myCallBack1( SYS_MSG_OBJECT *pMessage )
{
    DBPRINTF("CallBack1:: Message Type: %d, nSource: %d\r\n"
            "        param 0: %d, param1: %d, param2: %d \r\n",
            pMessage->nMessageTypeID,
            pMessage->nSource, pMessage->param0,
            pMessage->param1, pMessage->param2
            );
}

void myCallBack2( SYS_MSG_OBJECT *pMessage )
{
    DBPRINTF("CallBack2:: Message Type: %d, nSource: %d\r\n"
            "        param 0: %d, param1: %d, param2: %d \r\n",
            pMessage->nMessageTypeID,
            pMessage->nSource, pMessage->param0,
            pMessage->param1, pMessage->param2
            );
}

int main(void)
{
    SYS_MSG_MESSAGING_OBJECT oSysMsg;
    SYS_OBJ_HANDLE hSysMsg, hMsgType[5], hMailbox[3];
    SYS_MSG_INSTANCE iSysMsg = SYS_MSG_0;
    SYS_MSG_OBJECT myMessage[5];

    { // SYS_MSG_Initialize
        uint8_t nQSizes[] = SYS_MSG_BUFFER_SIZES;

        // Initialize the messaging system. This needs to be done in the initialization code.
        hSysMsg = SYS_MSG_Initialize(iSysMsg, SYS_MSG_MAX_PRIORITY+1, nQSizes);

        SYS_ASSERT( SYS_OBJ_HANDLE_INVALID != hSysMsg, "Bad hSysMsg!" );
    }

    // Create the message types to be used
    // ID:      :Priority

}

return 0;
}

```

5.7.6.4.1 Abstraction Model

This library provides an abstraction of the messaging subsystem that is used by device drivers, middleware libraries and applications to receive and control interrupts in real time.

[<add figure> and supporting text](#)

5.7.6.4.2 Library Overview

The following diagram describes the major components of the usage model.

<add figure>

Library Usage Model

Each of the blocks in the diagram correspond to the library interface section.

Library Interface Section	Description
Initialization, Tasks, and Versioning Functions	Provides
Mailbox Functions	Provides
Message Type Functions	Provides
Message Send/Receive Functions	Provides
Utility Functions	Provides
Configuration Functions	Provides

5.7.6.4.3 How the Library Works

The Messaging System Service Library can be used by a device driver, middleware layer, or application to provide access to, and control over, interrupts to the processor.

Note: Not all modes are available on all devices. Please refer to the specific device data sheet to determine the modes supported for your device.

5.7.6.5 Configuring the Library

The file `framework/system/msg/config/sys_msg_config.h` provides configuration parameters that the implementer can use to adapt the System Messaging Service library to a particular application.

By default, the system message format provides 64 bits of information in a message:

```
typedef union
{
    struct
    {
        uint16_t    param0; // Message parameter zero
        uint16_t    param1; // Message parameter one
        uint16_t    param2; // Message parameter two
        uint16_t    nMessageTypeID; // Message type identifier
    };
    struct
    {
        uint16_t    nSource; // Message source identifier
        uintptr_t   * pData; // Pointer to additional message data
    };
} SYS_MSG_OBJECT;
```

The only required field in the message format definition is `nMessageTypeID`. But it doesn't need to be 16 bits long.

The maximum number of mailboxes is defined by:

```
#define SYS_MSG_MAX_MAILBOXES (32)
```

The minimum number of mailboxes is one.

The maximum number of message types is defined by:

```
#define SYS_MSG_MAX_TYPES (32)
```

The minimum number of message types is one.

Message priorities run from zero to [SYS_MSG_MAX_PRIORITY](#), which is defined by:

```
#define SYS_MSG_MAX_PRIORITY    (4)
```

For each message priority from 0,1, to [SYS_MSG_MAX_PRIORITY](#) a queue is created. The size of each queue is defined by:

```
//           Message Priority:  0   1   2   3   4
#define SYS_MSG_BUFFER_SIZES { 64, 32, 16,  8,  4 }
```

In this example there are five priorities, 0,1,..4, and the sizes of each message queue is provided in the definition of [SYS_MSG_BUFFER_SIZES](#).

Then this information is used when initializing the System Messaging Service in the application startup code:

```
SYS_OBJ_HANDLE hSysMsg;
{ //SYS_MSG_Initialize
    uint16_t nQSizes[] = SYS_MSG_BUFFER_SIZES;
    hSysMsg = SYS_MSG_Initialize(SYS_MSG_MAX_PRIORITY+1,nQSizes);
    SYS_ASSERT( SYS_OBJ_HANDLE_INVALID != hSysMsg, "Bad hSysMsg!" );
}
```

5.7.6.6 Building the Library

This section list the files that are available in the \src of the System Message Service Library driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

5.7.6.7 Library Interface

Data Types and Constants

	Name	Description
	SYS_MSG_INIT	Contains all the data necessary to initialize an instance of the System Messaging Service.
	SYS_MSG_INSTANCE	System Messaging instances numbering is from 0,1, to SYS_MSG_MAX_INSTANCE .
	SYS_MSG_OBJECT	This is type SYS_MSG_OBJECT .
	SYS_MSG_QUEUE_STATUS	Messaging queue status enumeration.
	SYS_MSG_RECEIVE_CALLBACK	Pointer to the System Message Received Callback Function
	SYS_MSG_RESULTS	Enumeration of message send results.
	SYS_MSGQ_ELEMENT	Defines queue element for message queue belonging to each priority.
	_SYS_MSG_H	This is macro _SYS_MSG_H .
	_SYS_MSG_OBJECT	Defines the contents of a system message.
	SYS_MSG_MAILBOXES_ADDONE	don't need to round up the number of bitmaps
	SYS_MSG_NUM_MAILBOX_BITMAPS	This is macro SYS_MSG_NUM_MAILBOX_BITMAPS .

Configuration Functions

	Name	Description
	SYS_MSG_BUFFER_SIZES	define SYS_MSG_BUFFER_SIZES { 4, 4, 4, 4, 1
	SYS_MSG_MAX_MAILBOXES	Specifies the maximum number of mailboxes possible.
	SYS_MSG_MAX_MSGS_DELIVERED	Specifies the maximum number of messages delivered per each call to SYS_MSG_Tasks .
	SYS_MSG_MAX_PRIORITY	Specifies the maximum message priority.
	SYS_MSG_MAX_TYPES	Specifies the maximum number of message types possible.

Initialization, Tasks, and Versioning Functions

	Name	Description
≡	<u>SYS_MSG_Deinitialize</u>	Deinitializes System Messaging Instance.
≡	<u>SYS_MSG_Initialize</u>	Configures and initializes the messaging subsystem.
≡	<u>SYS_MSG_Tasks</u>	System Messaging Service Tasks routine.
≡	<u>SYS_MSG_VersionGet</u>	Gets the System Messaging Service version in numerical format.
≡	<u>SYS_MSG_VersionStrGet</u>	Gets System Messaging Service version in string format.

Mailbox Functions

	Name	Description
≡	<u>SYS_MSB_MailboxClose</u>	Closes (destroys) a mailbox previously opened with <u>SYS_MSB_MailboxOpen</u> .
≡	<u>SYS_MSB_MailboxOpen</u>	Opens a system messaging mailbox.
≡	<u>SYS_MSB_MailboxReinit</u>	Reinitialize previously opened mailbox.
≡	<u>SYS_MSG_MailboxMessagesGet</u>	Get queued messages for a mailbox.
≡	<u>SYS_MSG_MailboxMsgAdd</u>	Adds a message type to the list of messages received by a mailbox.
≡	<u>SYS_MSG_MailboxMsgRemove</u>	Removes a message type from the list of messages received by a mailbox.

Message Send/Receive Functions

	Name	Description
≡	<u>SYS_MSG_GotMessages</u>	Returns true if system messaging has undelivered messages, false otherwise.
≡	<u>SYS_MSG_MessageDeliver</u>	Deliver message to mailboxes.
≡	<u>SYS_MSG_MessageReceive</u>	Receive next message in message queues.
≡	<u>SYS_MSG_MessageSend</u>	Sends a message, as defined by a message structure.

Message Type Functions

	Name	Description
≡	<u>SYS_MSG_TypeCreate</u>	Creates a new message type.
≡	<u>SYS_MSG_TypeRemove</u>	Removes an existing message type.

Utility Functions

	Name	Description
≡	<u>SYS_MSG_ID2hMsgType</u>	Translates message type identifier into handle of corresponding message type object.
≡	<u>SYS_MSG_QueueStatus</u>	Returns message queue status for a given message priority.

Description**5.7.6.7.1 Initialization, Tasks, and Versioning Functions****5.7.6.7.1.1 SYS_MSG_Deinitialize Function****C**

```
void SYS_MSG_Deinitialize(
    SYS_OBJ_HANDLE handleSysMsg
);
```

Description

Deinitializes System Messaging Instance and frees up allocated memory for it.

Preconditions

None.

Parameters

Parameters	Description
hSysMsg	handle to System Messaging Object for instance to be removed.

Returns

None.

Remarks

None.

Example

```
SYS_OBJ_HANDLE hSysMsg;
uint16_t nQSizes[] = SYS_MSG_BUFFER_SIZES;

// Initialize the messaging system. This needs to be done in the initialization code.
// Choose System Messaging instance that supports 8 byte messages
hSysMsg = SYS_MSG_Initialize(SYS_MSG_8Bytes, SYS_MSG_MAX_PRIORITY+1, nQSizes);

if (SYS_OBJ_HANDLE_INVALID == hSysMsg)
{
    // Handle error
}
.
.
.
// Remove this instance.
SYS_MSG_Deinitialize( hSysMsg );
```

5.7.6.7.1.2 SYS_MSG_Initialize Function**C**

```
SYS_OBJ_HANDLE SYS_MSG_Initialize(
    const SYS_MSG_INSTANCE iSysMsg,
    SYS_OBJ_HANDLE pInitializeSysMsg
);
```

Description

This routine configures and initializes the messaging subsystem appropriately for the current system design.

Preconditions

None.

Parameters

Parameters	Description
iSysMsg	Index of System Messaging Service to be initialized.
pInitSysMsg	Pointer to System Messaging initialization data structure. If NULL default config values are used.

Returns

Handle to the System Messaging object created. Returns `SYS_OBJ_HANDLE_INVALID` if allocation of data structure fails.

Returns [SYS_OBJ_HANDLE_INVALID](#) if pointer to initialization data structure is NULL.

Remarks

None.

Example

```
SYS_OBJ_HANDLE hSysMsg;  
SYS_MSG_INIT sInitSysMsg = { 0, (SYS_MSG_MAX_PRIORITY+1), { SYS_MSG_BUFFER_SIZES } };  
//uint16_t nQSizes[] = SYS_MSG_BUFFER_SIZES;  
  
// Initialize the messaging system. This needs to be done in the initialization code.  
// Choose System Messaging instance that supports 8 byte messages  
hSysMsg = SYS_MSG_Initialize(SYS_MSG_8Bytes,&sInitSysMsg);  
  
if (SYS_OBJ_HANDLE_INVALID == hSysMsg)  
{  
    // Handle error  
}
```

5.7.6.7.1.3 SYS_MSG_Tasks Function**C**

```
void SYS_MSG_Tasks(  
    SYS_OBJ_HANDLE handleSysMsg  
);
```

Description

System Messaging Service Tasks routine.

Preconditions

hSysMsg must have been returned from a call to [SYS_MSG_Initialize](#).

Parameters

Parameters	Description
hSysMsg	handle to System Messaging Object.

Returns

None.

Remarks

None.

Example

```
while ( SYS_MSG_GotMessages(iSysMsg) )  
{  
    SYS_MSG_Tasks(hSysMsg);  
}
```

5.7.6.7.1.4 SYS_MSG_VersionGet Function**C**

```
unsigned int SYS_MSG_VersionGet();
```

Description

This routine gets the System Messaging Service version. The version is encoded as major * 10000 + minor * 100 + patch. The stringized version can be obtained using [SYS_MSG_VersionStrGet](#)()

Preconditions

None.

Parameters

Parameters	Description
drvIndex	Identifier for the object instance to get the version for.

Returns

Current System Messaging Service version in numerical format.

Remarks

None.

Example

```
unsigned int version;

version = SYS_MSG_VersionGet();

if(version < 110200)
{
    // Do Something
}
```

5.7.6.7.1.5 SYS_MSG_VersionStrGet Function**C**

```
char * SYS_MSG_VersionStrGet();
```

Description

This routine gets the System Messaging Service version. The version is returned as major.minor.path[type], where type is optional. The numerical version can be obtained using [SYS_MSG_VersionGet\(\)](#)

Preconditions

None.

Parameters

Parameters	Description
drvIndex	Identifier for the object instance to get the version for.

Returns

Current System Messaging Service version in the string format.

Remarks

None.

Example

```
char *version;

version = SYS_MSG_VersionStrGet();

printf("%s", version);
```

5.7.6.7.2 Mailbox Functions

5.7.6.7.2.1 SYS_MSB_MailboxClose Function

C

```
void SYS_MSB_MailboxClose(  
    SYS_OBJ_HANDLE hMailbox  
);
```

Description

Closes (destroys) a mailbox previously opened with [SYS_MSB_MailboxOpen](#).

Preconditions

hMailbox provided by call to [SYS_MSB_MailboxOpen](#).

Parameters

Parameters	Description
hMailbox	Handle to mailbox that is to be closed (destroyed).

Returns

None.

None.

Example

```
SYS_OBJ_HANDLE hMyMailbox;  
  
hMyMailbox = SYS_MSB_MailboxOpen( iSysMsg, &myCallBackFunction );  
SYS_MSB_MailboxClose(hMyMailbox);
```

5.7.6.7.2.2 SYS_MSB_MailboxOpen Function

C

```
SYS_OBJ_HANDLE SYS_MSB_MailboxOpen(  
    const SYS_MSG_INSTANCE iSysMsg,  
    SYS_MSG_RECEIVE_CALLBACK msgCallBackFunction  
);
```

Description

Opens a system messaging mailbox, providing a message callback function that is called whenever a message is received.

Preconditions

iSysMsg must have been used in a call to [SYS_MSG_Initialize](#). Message callback function will not be called until SYS_MSG_MailboxSignUp has been used to sign up the mailbox for messages of interest.

Parameters

Parameters	Description
iSysMsg	Index of System Messaging Service instance.
msgCallBackFunction	pointer to message callback function

Returns

Handle to new system messaging mailbox.

Remarks

A null callback function disables messaging callbacks.

Example

```

SYS_OBJ_HANDLE hMyMailbox;

hMyMailbox = SYS_MSB_MailboxOpen( iSysMsg, &myCallBackFunction );
if (SYS_OBJ_HANDLE_INVALID == SYS_MSG_TypeRemove)
{
    // Handle error
}

```

5.7.6.7.2.3 SYS_MSB_MailboxReinit Function**C**

```

void SYS_MSB_MailboxReinit(
    SYS_OBJ_HANDLE hMailbox,
    SYS_MSG_RECEIVE_CALLBACK msgCallBackFunction
);

```

Description

Reinitialize previously opened mailbox by providing new call back function and clearing all message type assignments.

Preconditions

hMailbox provided by call to [SYS_MSB_MailboxOpen](#).

Parameters

Parameters	Description
hMailbox	Object handle to mailbox
msgCallBackFunction	pointer to new message callback function

Remarks

A null callback function disables messaging callbacks.

Example

```

SYS_OBJ_HANDLE hMyMailbox;

hMyMailbox = SYS_MSB_MailboxOpen( iSysMsg, &myCallBackFunction );
SYS_MSB_MailboxReinit(hMyMailbox,&anotherCallBackFunction );

```

5.7.6.7.2.4 SYS_MSG_MailboxMessagesGet Function**C**

```

SYS_MSG_OBJECT * SYS_MSG_MailboxMessagesGet(
    SYS_OBJ_HANDLE hMailbox
);

```

Description

Get queued messages for a mailbox. Messages returned by this function will not be received via the mailbox's callback function.

Preconditions

hMailbox provided by call to [SYS_MSB_MailboxOpen](#).

Parameters

Parameters	Description
hMailbox	Object handle to mailbox

Returns

Pointer to next message in the queue(s) that is of interest to the mailbox. Function returns NULL if no messages are found in the

queue.

Remarks

None.

Example

```
SYS_MSG_OBJECT *pNextMessage;
while ( NULL != (pNextMessage = SYS_MSG_MailboxMessagesGet(hMyMailbox)) )
{
    // Process message at *pNextMessage.
}
```

5.7.6.7.2.5 SYS_MSG_MailboxMsgAdd Function

C

```
void SYS_MSG_MailboxMsgAdd(
    SYS_OBJ_HANDLE hMailbox,
    SYS_OBJ_HANDLE hMsgType
);
```

Description

Adds a message type to the list of messages received by a mailbox.

Preconditions

hMailbox provided by call to [SYS_MSB_MailboxOpen](#).

Parameters

Parameters	Description
hMailbox	Object handle to mailbox
hMsgType	Handle to message type of interest for this mailbox.

Returns

None.

Remarks

When the message type handle is unknown but the message ID is known use [SYS_MSG_ID2hMsgType](#) to provide the message type handle. See code example.

Example

```
const SYS_MSG_INSTANCE iSysMsg;
SYS_OBJ_HANDLE hMsgType[5], hMailbox[3];

// Create three mailboxes
hMailbox[0] = SYS_MSB_MailboxOpen( iSysMsg, &myCallBack0 );
hMailbox[1] = SYS_MSB_MailboxOpen( iSysMsg, &myCallBack1 );
hMailbox[2] = SYS_MSB_MailboxOpen( iSysMsg, &myCallBack2 );

// Create five message types
//                                     Message ID: :Priority
hMsgType[0] = SYS_MSG_TypeCreate(iSysMsg,1<<0,0);
hMsgType[1] = SYS_MSG_TypeCreate(iSysMsg,1<<1,1);
hMsgType[2] = SYS_MSG_TypeCreate(iSysMsg,1<<2,2);
hMsgType[3] = SYS_MSG_TypeCreate(iSysMsg,1<<3,3);
hMsgType[4] = SYS_MSG_TypeCreate(iSysMsg,1<<4,4);

// Add messages to each mailbox
SYS_MSG_MailboxMsgAdd(hMailbox[0],hMsgType[0]);
SYS_MSG_MailboxMsgAdd(hMailbox[1],hMsgType[1]);
SYS_MSG_MailboxMsgAdd(hMailbox[2],hMsgType[2]);
```

```

SYS_MSG_MailboxMsgAdd(hMailbox[0], SYS_MSG_ID2hMsgType(iSysMsg, 1<<1));
SYS_MSG_MailboxMsgAdd(hMailbox[0], SYS_MSG_ID2hMsgType(iSysMsg, 1<<2));
SYS_MSG_MailboxMsgAdd(hMailbox[0], SYS_MSG_ID2hMsgType(iSysMsg, 1<<3));
SYS_MSG_MailboxMsgAdd(hMailbox[0], SYS_MSG_ID2hMsgType(iSysMsg, 1<<4));

```

5.7.6.7.2.6 SYS_MSG_MailboxMsgRemove Function

C

```

void SYS_MSG_MailboxMsgRemove(
    SYS_OBJ_HANDLE hMailbox,
    SYS_OBJ_HANDLE hMsgType
);

```

Description

Removes a message type from the list of messages received by a mailbox.

Preconditions

hMailbox provided by call to [SYS_MSB_MailboxOpen](#).

Parameters

Parameters	Description
hMailbox	Object handle to mailbox
hMsgType	Handle to message type to be ignored by this mailbox.

Returns

None.

Remarks

When the message type handle is unknown but the message ID is known use [SYS_MSG_ID2hMsgType](#) to provide the message type handle. See code example.

Example

```

const SYS_MSG_INSTANCE iSysMsg;
SYS_OBJ_HANDLE hMsgType[5], hMailbox[3];

// Create three mailboxes
hMailbox[0] = SYS_MSB_MailboxOpen( iSysMsg, &myCallBack0 );
hMailbox[1] = SYS_MSB_MailboxOpen( iSysMsg, &myCallBack1 );
hMailbox[2] = SYS_MSB_MailboxOpen( iSysMsg, &myCallBack2 );

// Create five message types
//                                     Message ID:  :Priority
hMsgType[0] = SYS_MSG_TypeCreate(iSysMsg, 1<<0, 0);
hMsgType[1] = SYS_MSG_TypeCreate(iSysMsg, 1<<1, 1);
hMsgType[2] = SYS_MSG_TypeCreate(iSysMsg, 1<<2, 2);
hMsgType[3] = SYS_MSG_TypeCreate(iSysMsg, 1<<3, 3);
hMsgType[4] = SYS_MSG_TypeCreate(iSysMsg, 1<<4, 4);

// Add messages to each mailbox
SYS_MSG_MailboxMsgAdd(hMailbox[0], hMsgType[0]);
SYS_MSG_MailboxMsgAdd(hMailbox[1], hMsgType[1]);
SYS_MSG_MailboxMsgAdd(hMailbox[2], hMsgType[2]);

SYS_MSG_MailboxMsgAdd(hMailbox[0], SYS_MSG_ID2hMsgType(iSysMsg, 1<<1));
SYS_MSG_MailboxMsgAdd(hMailbox[0], SYS_MSG_ID2hMsgType(iSysMsg, 1<<2));
SYS_MSG_MailboxMsgAdd(hMailbox[0], SYS_MSG_ID2hMsgType(iSysMsg, 1<<3));
SYS_MSG_MailboxMsgAdd(hMailbox[0], SYS_MSG_ID2hMsgType(iSysMsg, 1<<4));

```

5.7.6.7.3 Message Type Functions

5.7.6.7.3.1 SYS_MSG_TypeCreate Function

C

```
SYS_OBJ_HANDLE SYS_MSG_TypeCreate(  
    const SYS_MSG_INSTANCE iSysMsg,  
    uint8_t nMessageTypeID,  
    uint8_t nMessagePriority  
);
```

Description

Creates a new message type, defining an integer message type and priority.

Preconditions

iSysMsg must have been used in a call to [SYS_MSG_Initialize](#).

Parameters

Parameters	Description
iSysMsg	Index of System Messaging Service instance.
nMessageTypeID	Integer message type identifier
nMessagePriority	Message priority, between 0 and SYS_MSG_MAX_PRIORITIES

Returns

Handle to new message type definition.

Remarks

None.

Example

```
SYS_OBJ_HANDLE hMsgType;  
hMsgType = SYS_MSG_TypeCreate( iSysMsg, 1, 3 );  
if (SYS_OBJ_HANDLE_INVALID == hMsgType)  
{  
    // Handle error  
}
```

5.7.6.7.3.2 SYS_MSG_TypeRemove Function

C

```
void SYS_MSG_TypeRemove(  
    SYS_OBJ_HANDLE hMsgType  
);
```

Description

Removes an existing message type.

Preconditions

None.

Parameters

Parameters	Description
hMsgType	Handle to message type that is to be removed

Returns

None.

Remarks

When the message type handle is unknown but the message ID is known use [SYS_MSG_ID2hMsgType](#) to provide the message type handle. See code example.

Example

```
SYS_OBJ_HANDLE hMsgType;
hMsgType = SYS_MSG_TypeCreate( iSysMsg, 1, 3 );
SYS_MSG_TypeRemove( hMsgType );
```

Alternately:

```
SYS_OBJ_HANDLE hMsgType;
hMsgType = SYS_MSG_TypeCreate( iSysMsg, 1, 3 );
SYS_MSG_TypeRemove( SYS_MSG_ID2hMsgType(iSysMsg,1) );
```

5.7.6.7.4 Message Send/Receive Functions**5.7.6.7.4.1 SYS_MSG_GotMessages Function****C**

```
bool SYS_MSG_GotMessages(
    const SYS_MSG_INSTANCE iSysMsg
);
```

Description

Returns true if system messaging has undelivered messages, false otherwise.

Preconditions

iSysMsg must have been used in a call to [SYS_MSG_Initialize](#).

Parameters

Parameters	Description
iSysMsg	Index of System Messaging Service instance.

Returns

True if there are undelivered system messages, false otherwise.

Remarks

None.

Example

```
DBPRINTF("rnGot Messages: %drn",SYS_MSG_GotMessages(iSysMsg));
while ( (pNextMessage = SYS_MSG_MessageReceive(iSysMsg)) != NULL )
{
    SYS_MSG_MessageDeliver(iSysMsg,pNextMessage);
    DBPRINTF("rn");
}
DBPRINTF("Got Messages: %drn",SYS_MSG_GotMessages(ihSysMsg));
```

5.7.6.7.4.2 SYS_MSG_MessageDeliver Function**C**

```
void SYS_MSG_MessageDeliver(
    const SYS_MSG_INSTANCE iSysMsg,
    SYS_MSGQ_ELEMENT * pQElement
);
```

Description

Deliver message to mailboxes, remove message from queue when done.

Preconditions

iSysMsg must have been used in a call to [SYS_MSG_Initialize](#).

Parameters

Parameters	Description
iSysMsg	Index of System Messaging Service instance.
pQElement	pointer to queue element to be delivered.

Returns

None.

Remarks

None.

Example

```
SYS_MSGQ_ELEMENT *pQElement;  
SYS_MSG_OBJECT nextMessage;  
while ( (pQElement = SYS_MSG_MessageReceive(iSysMsg)) != NULL )  
{  
    // In case you desire to examine message before delivering it.  
    nextMessage = pQElement->sMessage;  
  
    // Deliver message to all interested mailboxes  
    SYS_MSG_MessageDeliver(iSysMsg,pQElement);  
}
```

5.7.6.7.4.3 SYS_MSG_MessageReceive Function**C**

```
SYS_MSGQ_ELEMENT * SYS_MSG_MessageReceive(  
    const SYS_MSG_INSTANCE iSysMsg  
);
```

Description

Receive next message in message queues, returning NULL if queues are empty.

Preconditions

iSysMsg must have been used in a call to [SYS_MSG_Initialize](#).

Parameters

Parameters	Description
iSysMsg	Index of System Messaging Service instance.

Returns

Pointer to next message, as found in a message queue element, NULL if there are no messages.

Remarks

None.

Example

```
SYS_MSGQ_ELEMENT *pQElement;  
SYS_MSG_OBJECT nextMessage;  
while ( (pQElement = SYS_MSG_MessageReceive(iSysMsg)) != NULL )
```

```
{
    // In case you desire to examine message before delivering it.
    nextMessage = pQElement->sMessage;

    // Deliver message to all interested mailboxes
    SYS_MSG_MessageDeliver(iSysMsg, pQElement);
}
```

5.7.6.7.4.4 **SYS_MSG_MessageSend Function**

C

```
SYS_MSG_RESULTS SYS_MSG_MessageSend(
    const SYS_MSG_INSTANCE iSysMsg,
    SYS_MSG_OBJECT * pMessage
);
```

Description

Sends a message, as defined by a message structure.

Preconditions

iSysMsg must have been used in a call to [SYS_MSG_Initialize](#).

Parameters

Parameters	Description
iSysMsg	Index of System Messaging Service instance.
pMessage	Pointer to message definition.

Returns

Message result from [SYS_MSG_RESULTS](#) enumeration.

Remarks

None.

Example

```
SYS_MSG_OBJECT myMessage;
SYS_MSG_RESULTS myMessageStatus;
SYS_OBJ_HANDLE hMyMsgType;

hMyMsgType = SYS_MSG_TypeCreate( iSysMsg, 1, 3 );
if (SYS_OBJ_HANDLE_INVALID == hMyMsgType)
{
    // Handle error
}

myMessage.hMsgType = hMyMsgType;
myMessage.nSource = myMsgSource;
myMessage.param1 = parameterOneValue;
myMessage.param1 = parameterTwoValue;

myMessageStatus = SYS_MSG_MessageSend(iSysMsg, &myMessage);
SYS_ASSERT( myMessageStatus > 0, "Bad message status!" );
```

5.7.6.7.5 **Utility Functions**

5.7.6.7.5.1 **SYS_MSG_ID2hMsgType Function**

C

```
SYS_OBJ_HANDLE SYS_MSG_ID2hMsgType(
```

```
    const SYS_MSG_INSTANCE iSysMsg,  
    uint8_t nMessageTypeID  
);
```

Description

Translates message type identifier into handle of corresponding message type object.

Preconditions

iSysMsg must have been used in a call to [SYS_MSG_Initialize](#).

Parameters

Parameters	Description
iSysMsg	Index of System Messaging Service instance.
nMessageTypeID	Integer message type identifier.

Returns

Handle to message type definition object corresponding to the message type identifier. Returns NULL if the message type is not defined.

Remarks

This function is useful in situations where the message type identifier is known but the message type handle is not. This allows applications to statically define message type IDs and use them in code instead of having to wait until message handles are known and then dynamically sharing message handles via global variables.

Example

```
#define MY_MESSAGE_TYPE_ID 1;  
  
// Create message type  
SYS_OBJ_HANDLE hMsgType;  
uint8_t nPriority = 3;  
hMsgType = SYS_MSG_TypeCreate( iSysMsg, MY_MESSAGE_TYPE_ID, nPriority );  
if (SYS_OBJ_HANDLE_INVALID == hMsgType)  
{  
    // Handle error  
}  
.  
.  
.  
// Remove message type without knowing message type handle  
SYS_MSG_TypeRemove( iSysMsg, SYS_MSG_ID2hMsgType( iSysMsg, MY_MESSAGE_TYPE_ID ) );
```

5.7.6.7.5.2 SYS_MSG_QueueStatus Function

C

```
SYS_MSG_QUEUE_STATUS SYS_MSG_QueueStatus(  
    const SYS_MSG_INSTANCE iSysMsg,  
    uint8_t nMessagePriority  
);
```

Description

Returns message queue status for a given message priority.

Preconditions

iSysMsg must have been used in a call to [SYS_MSG_Initialize](#).

Parameters

Parameters	Description
iSysMsg	Index of System Messaging Service instance.
nMessagePriority	message priority of interest, from zero to SYS_MSG_MAX_PRIORITIES.

Returns

Number of messages in queue if not full or SYS_MSG_QUEUE_FULL if full. If message priority is not legal, returns SYS_MSG_QUEUE_BAD.

Remarks

None.

Example

5.7.6.7.6 Configuration Functions

5.7.6.7.6.1 SYS_MSG_BUFFER_SIZES Macro

```
C
#define SYS_MSG_BUFFER_SIZES { 16 }
```

Description

define SYS_MSG_BUFFER_SIZES { 4, 4, 4, 4, 1

5.7.6.7.6.2 SYS_MSG_MAX_MAILBOXES Macro

```
C
#define SYS_MSG_MAX_MAILBOXES (2)
```

Description

System Messaging Max Number of Mailboxes
Specifies the maximum number of mailboxes possible.

Remarks

Minimum number is 1 mailbox.

5.7.6.7.6.3 SYS_MSG_MAX_MSGS_DELIVERED Macro

```
C
#define SYS_MSG_MAX_MSGS_DELIVERED (1)
```

Description

System Messaging Maximum Number of Messages Delivered per call to [SYS_MSG_Tasks](#)
Specifies the maximum number of messages delivered per each call to [SYS_MSG_Tasks](#). If zero then all message queues are emptied before the tasks routine finishes execution.

Remarks

0 implies all queues are empty after [SYS_MSG_Tasks](#) is done.

5.7.6.7.6.4 SYS_MSG_MAX_PRIORITY Macro

C

```
#define SYS_MSG_MAX_PRIORITY (0)
```

Description

System Messaging Maximum Priority

Specifies the maximum message priority.

Remarks

Message priorities run from 0 to SYS_MSG_MAX_PRIORITIES. The number of message queues is SYS_MSG_MAX_PRIORITIES+1.

5.7.6.7.6.5 SYS_MSG_MAX_TYPES Macro

C

```
#define SYS_MSG_MAX_TYPES (2)
```

Description

System Messaging Max Number of Message Types

Specifies the maximum number of message types possible.

Remarks

Minimum number is 1.

5.7.6.7.7 Data Types and Constants

5.7.6.7.7.1 SYS_MSG_INIT Structure

C

```
typedef struct {
    uint8_t nMaxMsgsDelivered;
    uint8_t nMessagePriorities;
    uint16_t * nQSizes;
} SYS_MSG_INIT;
```

Description

System Messaging Service Initialization Data

Contains all the data necessary to initialize an instance of the System Messaging Service.

Members

Members	Description
uint8_t nMaxMsgsDelivered;	Maximum number of messages delivered per call to SYS_MSG_Tasks
uint8_t nMessagePriorities;	Number of message priorities desired
uint16_t * nQSizes;	Array of qukeue sizes for priorities 0,1,... SYS_MSG_MAX_PRIORITY

Remarks

A pointer to a structure of this format containing the desired initialization data must be passed into the [SYS_MSG_Initialize](#) routine. If nMaxMsgsDelivered == 0 then ALL messages in priority queues are delivered each time [SYS_MSG_Tasks](#) is called.

5.7.6.7.7.2 SYS_MSG_INSTANCE Enumeration

C

```
typedef enum {
    SYS_MSG_0,
    SYS_MSG_1,
    SYS_MSG_2,
    SYS_MSG_3,
    SYS_MSG_4,
    SYS_MSG_NUM_INSTANCES
} SYS_MSG_INSTANCE;
```

Description

Enumeration of the Allowable of System Messaging Instances

System Messaging instances numbering is from 0,1, to SYS_MSG_MAX_INSTANCE.

Remarks

None.

5.7.6.7.7.3 SYS_MSG_OBJECT Structure

C

```
typedef struct {
    union {
        struct {
            uint8_t nMessageTypeID;
            uint8_t nSource;
            uint16_t param0;
            uint16_t param1;
            uint16_t param2;
        }
        struct {
            uint16_t dummy;
            uint16_t nSizeData;
            uintptr_t * pData;
        }
    }
} SYS_MSG_OBJECT;
```

Description

This is type SYS_MSG_OBJECT.

Members

Members	Description
uint8_t nMessageTypeID;	Message type identifier
uint8_t nSource;	Message source identifier
uint16_t param0;	Message parameter zero
uint16_t param1;	Message parameter one
uint16_t param2;	Message parameter two
uint16_t nSizeData;	Size of data that pData identifies
uintptr_t * pData;	Pointer to additional message data

5.7.6.7.7.4 SYS_MSG_QUEUE_STATUS Enumeration

C

```
typedef enum {
    SYS_MSG_QUEUE_BAD,
    SYS_MSG_QUEUE_FULL,
    SYS_MSG_QUEUE_EMPTY
} SYS_MSG_QUEUE_STATUS;
```

Description

System Messaging Queue Status Enumeration

Messaging queue status enumeration. Positive values indicate number of messages in the queue.

Members

Members	Description
SYS_MSG_QUEUE_BAD	QUEUE Status: full
SYS_MSG_QUEUE_FULL	QUEUE Status: full
SYS_MSG_QUEUE_EMPTY	QUEUE Status: empty

Remarks

None.

5.7.6.7.7.5 SYS_MSG_RECEIVE_CALLBACK Type

C

```
typedef void (* SYS_MSG_RECEIVE_CALLBACK)(SYS_MSG_OBJECT *pMessage);
```

Description

Pointer to the System Message Received Callback Function

Pointer to the function provided for each system messaging mailbox that is called when a system message is received for each mailbox.

5.7.6.7.7.6 SYS_MSG_RESULTS Enumeration

C

```
typedef enum {
    SYS_MSG_NOT_SENT_QFULL,
    SYS_MSG_BAD_PRIORITY,
    SYS_MSG_BAD_MSGTYPE,
    SYS_MSG_NOT_SENT,
    SYS_MSG_SENT
} SYS_MSG_RESULTS;
```

Description

System Messaging Results Enumeration

Enumeration of message [send](#) results.

Members

Members	Description
SYS_MSG_NOT_SENT_QFULL	Message could not be sent, no room available in priority queues
SYS_MSG_BAD_PRIORITY	Message could not be sent, Message Message priority bad
SYS_MSG_BAD_MSGTYPE	Message could not be sent, Message type bad

SYS_MSG_NOT_SENT	Message could not be sent, no other information available
SYS_MSG_SENT	Message sent

Remarks

SYS_MSG_SENT aligns with SYS_MSGQ_Success. SYS_MSG_NOT_SENT aligns with SYS_MSGQ_Failure

5.7.6.7.7.7 SYS_MSGQ_ELEMENT Structure

C

```
typedef struct {
    SYS_MSG_OBJECT sMessage;
    uint16_t mailboxInterestBitMap[SYS_MSG_NUM_MAILBOX_BITMAPS];
} SYS_MSGQ_ELEMENT;
```

Description

System Messaging Queues Element

Defines queue element for message queue belonging to each priority.

Members

Members	Description
SYS_MSG_OBJECT sMessage;	System Message Bit map for mailboxes interested in this message type, modified as each mailbox is notified.

Remarks

None

5.7.6.7.7.8 _SYS_MSG_H Macro

C

```
#define _SYS_MSG_H
```

Description

This is macro _SYS_MSG_H.

5.7.6.7.7.9 _SYS_MSG_OBJECT Macro

C

```
#define _SYS_MSG_OBJECT
```

Description

System Message Format

Defines the contents of a system message. This information is copied into an element of the system message queue identified by the message priority.

Remarks

None

5.7.6.7.7.10 SYS_MSG_MAILBOXES_ADDONE Macro

C

```
#define SYS_MSG_MAILBOXES_ADDONE 0
```

Description

don't need to round up the number of bitmaps

5.7.6.7.7.11 SYS_MSG_NUM_MAILBOX_BITMAPS Macro

C

```
#define SYS_MSG_NUM_MAILBOX_BITMAPS (SYS_MSG_MAX_MAILBOXES/16 + SYS_MSG_MAILBOXES_ADDONE)
```

Description

This is macro SYS_MSG_NUM_MAILBOX_BITMAPS.

5.7.6.8 Files**Files**

Name	Description
sys_msg.h	System Service for the messaging module.
sys_msg_config.h	System Messaging Configuration definitions file

Description**5.7.6.8.1 sys_msg.h**

Messaging System-Library Interface Definition

This file contains the interface definition for the messaging system service. It provides a way to interact with the messaging subsystem.

Enumerations

	Name	Description
	SYS_MSG_INSTANCE	System Messaging instances numbering is from 0,1, to SYS_MSG_MAX_INSTANCE.
	SYS_MSG_QUEUE_STATUS	Messaging queue status enumeration.
	SYS_MSG_RESULTS	Enumeration of message send results.

Functions

	Name	Description
	SYS_MSB_MailboxClose	Closes (destroys) a mailbox previously opened with SYS_MSB_MailboxOpen .
	SYS_MSB_MailboxOpen	Opens a system messaging mailbox.
	SYS_MSB_MailboxReinit	Reinitialize previously opened mailbox.
	SYS_MSG_Deinitialize	Deinitializes System Messaging Instance.
	SYS_MSG_GotMessages	Returns true if system messaging has undelivered messages, false otherwise.
	SYS_MSG_ID2hMsgType	Translates message type identifier into handle of corresponding message type object.
	SYS_MSG_Initialize	Configures and initializes the messaging subsystem.
	SYS_MSG_MailboxMessagesGet	Get queued messages for a mailbox.
	SYS_MSG_MailboxMsgAdd	Adds a message type to the list of messages received by a mailbox.
	SYS_MSG_MailboxMsgRemove	Removes a message type from the list of messages received by a mailbox.

	SYS_MSG_MessageDeliver	Deliver message to mailboxes.
	SYS_MSG_MessageReceive	Receive next message in message queues.
	SYS_MSG_MessageSend	Sends a message, as defined by a message structure.
	SYS_MSG_QueueStatus	Returns message queue status for a given message priority.
	SYS_MSG_Tasks	System Messaging Service Tasks routine.
	SYS_MSG_TypeCreate	Creates a new message type.
	SYS_MSG_TypeRemove	Removes an existing message type.
	SYS_MSG_VersionGet	Gets the System Messaging Service version in numerical format.
	SYS_MSG_VersionStrGet	Gets System Messaging Service version in string format.

Macros

	Name	Description
	_SYS_MSG_H	This is macro _SYS_MSG_H.
	_SYS_MSG_OBJECT	Defines the contents of a system message.
	SYS_MSG_MAILBOXES_ADDONE	don't need to round up the number of bitmaps
	SYS_MSG_NUM_MAILBOX_BITMAPS	This is macro SYS_MSG_NUM_MAILBOX_BITMAPS.
	SYS_OBJ_HANDLE_INVALID	This is macro SYS_OBJ_HANDLE_INVALID.
	SYS_OBJ_HANDLE_STATIC	This is macro SYS_OBJ_HANDLE_STATIC.

Structures

	Name	Description
	SYS_MSG_INIT	Contains all the data necessary to initialize an instance of the System Messaging Service.
	SYS_MSG_OBJECT	This is type SYS_MSG_OBJECT.
	SYS_MSGQ_ELEMENT	Defines queue element for message queue belonging to each priority.

Types

	Name	Description
	SYS_MSG_RECEIVE_CALLBACK	Pointer to the System Message Received Callback Function
	SYS_OBJ_HANDLE	SYS_MODULE_OBJ is badly named. It should be SYS_MODULE_OBJ_HANDLE or something shorter. For brevity, it is renamed to SYS_OBJ_HANDLE.

File Name

5.7.7 Ports System Service Library

5.7.7.1 Introduction

Ports System Service Library

for

Microchip Microcontrollers

This library provides an interface to manage and control general purpose input or output ports (GPIO) controlled by the PORTx modules on the Microchip families of microcontrollers.

Overview

One challenge designers of general purpose microcontroller devices face is to provide a large set of available peripheral features on parts with a limited number of I/O pins. To help meet this challenge and to provide flexibility for board designers, many parts provide an ability to route I/O signals for selected peripherals to different I/O pins. Still, in some cases, general purpose I/O pins must be used to implement the desired functionality under direct software control. The purpose of the ports system service is to provide direct control of general purpose I/O pins and to support the selection of the desired peripheral functionality for supported I/O pins and ports.

General purpose I/O pins can be controlled individually, but they are also grouped together in sets and can be controlled together as a unit. These groups of GPIO pins are called "ports" on Microchip microcontrollers and this library provides the ability to read and write data patterns to or from them in sets or as individual pins. In addition peripheral IO routing and pin/port control, this library provides the ability to select and configure several other features of the I/O pins and ports available on Microchip microcontrollers as described below.

Other Features

- Individual output pin/port open-drain enable/disable
- Individual input pin/port pull-up enable/disable
- Monitor select inputs and generate interrupt on mismatch condition [Change Notification]
- Operate during CPU Sleep and Idle modes
- Port line Analog/Digital Selection

- Port slew rate control

Note: Trademarks and Intellectual Property are property of their respective owners. Customers are responsible for obtaining appropriate licensing or rights before using this software.

5.7.7.2 Release Notes

MPLAB Harmony Version: v0.70b **Ports System Service Library Library Version :** 0.01 **Release Date:** %ReleaseNotes%

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.7.7.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED AS IS MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.7.7.4 Using the Library

This topic describes the basic architecture of the Ports System Service Library and provides information and examples on how to use it.

Interface Header File: [sys_ports.h](#)

The interface to the Ports System Service Library is defined in the "[sys_ports.h](#)" header file, which is included by the "sys.h" header file.

Any C language source (.c) file that uses the Ports System Service must include "sys.h".

5.7.7.4.1 Abstraction Model

This model explains how the system interfaces with the Ports System Service and the application as depicted in the below diagram.

General Purpose I/O:

All port pins have three registers directly associated with their operation as digital I/O. The Data Direction register determines whether the pin is an input or an output. If the data direction bit is a '1', then the pin is an input. All port pins are defined as inputs after a Reset. Reads from the Output Latch register, read the latch. Writes to the latch, write the latch. Reads from the port, read the port pins, while writes to the port pins, write the latch.

The *pull-ups* act as a current source or sink source connected to the pin, and eliminates the need for external resistors when push-button or keypad devices are connected. These *pull-ups* prevent floating state of the pins by providing voltage to it. These features are available on some pins and some parts. Please check the data sheet of the specific device for further information.

The *open-drain* feature allows the generation of outputs higher than VDD (e.g., 5V) on any desired digital only pins by using external pull-up resistors. The maximum open-drain voltage allowed is the same as the maximum VIH specification.

The *input change notification* function of the I/O ports allows the microcontrollers to generate interrupt requests to the processor in response to a change of state on selected input pins. This feature is capable of detecting input change of states even in Sleep mode, when the clocks are disabled.

The *Alternate Pin Function selections* are used to steer specific peripheral input and output functions between different pins.

The *output slew rate* of each port is programmable to select either the standard transition rate or a reduced transition rate of x times the standard to minimize EMI. The reduced transition time is the default slew rate for all ports.

Peripheral Pin Select:

AVAILABLE PINS:

The number of available pins is dependent on the particular device and its pin count. Pins that support the peripheral pin select feature include the designation “RPn” in their full pin designation, where “RP” designates a remappable peripheral and “n” is the remappable port number.

AVAILABLE PERIPHERALS:

The peripherals managed by the peripheral pin select are all digital-only peripherals. These include general serial communications (UART and SPI), general purpose timer clock inputs, timer-related peripherals (input capture and output compare) and interrupt-on-change inputs.

In comparison, some digital-only peripheral modules are never included in the peripheral pin select feature. This is because the peripheral's function requires special I/O circuitry on a specific port and cannot be easily connected to multiple pins. These modules include I2C among others. A similar requirement excludes all modules with analog inputs, such as the A/D converter. A key difference between remappable and non-remappable peripherals is that remappable peripherals are not associated with a default I/O pin. The peripheral must always be assigned to a specific I/O pin before it can be used. In contrast, non-remappable peripherals are always available on a default pin, assuming that the peripheral is active and not conflicting with another peripheral.

When a remappable peripheral is active on a given I/O pin, it takes priority over all other digital I/O and digital communication peripherals associated with the pin. Priority is given regardless of the type of peripheral that is mapped. Remappable peripherals never take priority over any analog functions associated with the pin.

INPUT MAPPING:

The inputs of the peripheral pin select options are mapped on the basis of the peripheral. That is, a control register associated with a peripheral dictates the pin it will be mapped to.

Remappable Input Example for USART 1 Receive

Note: For input only, peripheral pin select functionality does not have priority over I/O port settings. Therefore, when configuring Remappable Pin for input, the corresponding bit in the I/O port register must also be configured for input (set to '1').

OUTPUT MAPPING:

In contrast to inputs, the outputs of the peripheral pin select options are mapped on the basis of the pin. In this case, a control register associated with a particular pin dictates the peripheral output to be mapped.

Multiplexing of Remappable Output for RPn**Mapping Limitations:**

The control schema of the peripheral select pins is not limited to a small range of fixed peripheral configurations. There are no mutual or hardware-enforced lockouts between any of the peripheral mapping SFRs. Literally any combination of peripheral mappings across any or all of the RPn pins is possible. This includes both many-to-one and one-to-many mappings of peripheral inputs and outputs to pins. While such mappings may be technically possible from a configuration point of view, they may not be supportable from an electrical point of view.

5.7.7.4.2 Library Overview

The Ports System Service Library is a MPLAB Harmony system service. Please refer to the system services documentation for a detailed description of MPLAB system services.

The library interface routines are divided into various subsections, each subsection addresses one of the blocks or the overall operation of the PORTx module.

Library Interface Section	Description
Pin Control Functions	Port bit/pin read/write/toggle/clear/set interfaces.
Ports Control Functions	Port access read/write/toggle/clear/set interfaces.
Change Notification Functions	Interface routines for Port line change notification.
Peripheral Pin Select Functions	Interface routines for mapping the digital input/output to a specific PPS Remappable input/output pin.

5.7.7.4.3 How the Library Works

5.7.7.4.3.1 Pin Control

Pins Functions Usage

Pin Read:

Port pin can be read at bit/pin level using "[SYS_PORTS_PinRead](#)" with appropriate parameters.

Pin Write:

Port pin can be written at bit/pin level using "[SYS_PORTS_PinWrite](#)" with appropriate parameters.

Pin Clear:

Port pin can be cleared at bit/pin level using "[SYS_PORTS_PinClear](#)" with appropriate parameters.

Pin Set:

Port pin can be set at bit/pin level using "[SYS_PORTS_PinSet](#)" with appropriate parameters.

Pin Direction Control:

Port pin direction can be set at bit/pin level using "[SYS_PORTS_PinDirectionSelect](#)" with appropriate parameters.

The Direction information can be obtained through the interface "[SYS_PORTS_DirectionGet](#)".

Pin Toggle:

Port pin can be toggled at bit/pin level using "[SYS_PORTS_PinToggle](#)" with appropriate parameters.

Pin Open Drain:

Port pin can be enabled open drain functionality at bit/pin level using "[SYS_PORTS_PinOpenDrainEnable](#)" with appropriate parameters. Similarly, the Port pin can be disabled open drain functionality at bit/pin level using "[SYS_PORTS_PinOpenDrainDisable](#)" with appropriate parameters.

Pin Pull up:

Port pin can be enabled pull up functionality at bit/pin level using "[SYS_PORTS_PinPullUpEnable](#)" with appropriate parameters. Similarly, the Port pin can be disabled pull up functionality at bit/pin level using "[SYS_PORTS_PinPullUpDisable](#)" with appropriate parameters.

Example:

```
// PORT Direction setting for output
SYS_PORTS_PinDirectionSelect(MY_PORTS_INSTANCE, SYS_PORTS_DIRECTION_OUTPUT, MY_CHANNEL,
MY_PINNUM);
// PORT Direction setting for input
SYS_PORTS_PinDirectionSelect(MY_PORTS_INSTANCE, SYS_PORTS_DIRECTION_INPUT, MY_CHANNEL,
MY_PINNUM);
// Writing a value into a PORT
SYS_PORTS_PinWrite(MY_PORTS_INSTANCE, MY_CHANNEL, MY_PINNUM, MY_VALUE);
// Reading back the previously written value
bool readData = SYS_PORTS_PinRead(MY_PORTS_INSTANCE, MY_CHANNEL, MY_PINNUM);
// Clearing the PORT
SYS_PORTS_PinClear(MY_PORTS_INSTANCE, MY_CHANNEL, MY_PINNUM);
// Setting the port
SYS_PORTS_PinSet(MY_PORTS_INSTANCE, MY_CHANNEL, MY_PINNUM);
// Toggling a PORT
SYS_PORTS_PinToggle(MY_PORTS_INSTANCE, MY_CHANNEL, MY_PINNUM);
```

Note: Not all the features are available on all devices. Please refer to the specific device data sheet to determine availability.

5.7.7.4.3.2 Ports Control

Port Functions Usage**Port Read:**

Ports can be read at byte/word level using the interface "[SYS_PORTS_Read](#)" with appropriate parameters.

Port Write:

Ports can be written to at byte/word level using the interface "[SYS_PORTS_Write](#)" appropriate parameters.

Port Clear:

Ports can be cleared at byte/word level using the interface "[SYS_PORTS_Clear](#)" with appropriate parameters.

Port Set:

Ports can be set at byte/word level using the interface "[SYS_PORTS_Set](#)" with appropriate parameters.

Port Direction Control:

Ports direction can be set at byte/word level using the interface "[SYS_PORTS_DirectionSelect](#)" with appropriate parameters.

The Direction information can be obtained through the interface "[SYS_PORTS_DirectionGet](#)".

Port Toggle:

Ports can be toggled at byte/word level using the interface "[SYS_PORTS_Toggle](#)" with appropriate parameters.

Port Open Drain:

Ports can be enabled open drain functionality at byte/word level using the interface "[SYS_PORTS_OpenDrainEnable](#)" with appropriate parameters. Similarly, the Ports can be disabled open drain functionality at byte/word level using the interface "[SYS_PORTS_OpenDrainDisable](#)" with appropriate parameters.

Port Pull up:

Ports can be enabled pull up functionality at byte/word level using the interface "[SYS_PORTS_PullUpEnable](#)" with appropriate parameters. Similarly, the Ports can be disabled pull up functionality at byte/word level using the interface "[SYS_PORTS_PullUpDisable](#)" with appropriate parameters.

Example:

```
// PORT Direction setting for output
SYS_PORTS_DirectionSelect(MY_PORTS_INSTANCE, SYS_PORTS_DIRECTION_OUTPUT, MY_CHANNEL,
(PORTS_DATA_MASK)0xFFFF);
// PORT Direction setting for input
SYS_PORTS_DirectionSelect(MY_PORTS_INSTANCE, SYS_PORTS_DIRECTION_INPUT, MY_CHANNEL,
(PORTS_DATA_MASK)0xFFFF);
// Writing a value into a PORT
SYS_PORTS_Write(MY_PORTS_INSTANCE, MY_CHANNEL, (PORTS_DATA_TYPE)0x1234)
// Reading back the previously written value
PORTS_DATA_TYPE readData = SYS_PORTS_Read(MY_PORTS_INSTANCE, MY_CHANNEL);
// Clearing the PORT
SYS_PORTS_Clear(MY_PORTS_INSTANCE, MY_CHANNEL, (PORTS_DATA_MASK)0x00FF);
// Setting the port
SYS_PORTS_Set(MY_PORTS_INSTANCE, MY_CHANNEL, 0x1234, (PORTS_DATA_MASK)0x00FF);
// Toggling a PORT
SYS_PORTS_Toggle(MY_PORTS_INSTANCE, MY_CHANNEL, (PORTS_DATA_MASK)0x00FF);
```

Note: Not all the features are available on all devices. Please refer to the specific device data sheet to determine availability.

5.7.7.4.3.3 Change Notification

Change Notification Feature Usage

The change notification feature can be enabled using "[SYS_PORTS_ChangeNotificationEnable](#)". This routine does the following operations.

Change notification can be disabled after the successful usage using the interface "[SYS_PORTS_ChangeNotificationDisable](#)".

Certain microcontrollers support the global control over the change notification feature using the following interfaces "[SYS_PORTS_ChangeNotificationGlobalEnable](#)" and "[SYS_PORTS_ChangeNotificationGlobalDisable](#)".

The status of the change notification pin can be obtained through interface "[SYS_PORTS_ChangeNotificationStatus](#)".

If there are any requirements to control the pull downs the following interfaces could be used,

"[SYS_PORTS_ChangeNotificationPullDownEnable](#)" and "[SYS_PORTS_ChangeNotificationPullDownDisable](#)".

If there are any requirements to control the pull ups the following interfaces could be used,

"[SYS_PORTS_ChangeNotificationPullUpEnable](#)" and "[SYS_PORTS_ChangeNotificationPullUpDisable](#)".

Change Notification Operation in Sleep and Idle Modes

The change notification module continues to operate during Sleep or Idle mode. Its operation can be enabled /disabled using the interfaces "[SYS_PORTS_ChangeNotificationInIdleModeEnable](#)" / "[SYS_PORTS_ChangeNotificationInIdleModeDisable](#)".

If one of the enabled change notify pins changes states, the respective status bit will be set which can be monitored using the interface "[SYS_PORTS_ChangeNotificationStatus](#)".

Example:

```
// Enabling the global change notification
SYS_PORTS_ChangeNotificationGlobalEnable(MY_PORTS_INSTANCE);
// Enabling weak pull-ups for the change notification PIN 10
SYS_PORTS_ChangeNotificationPullUpEnable(MY_PORTS_INSTANCE, PORTS_CHANGE_NOTICE_PIN_10);
// Enabling change notification on PIN 10
SYS_PORTS_ChangeNotificationEnable(MY_PORTS_INSTANCE, PORTS_CHANGE_NOTICE_PIN_10,
SYS_PORTS_PULLUP_ENABLE);
```

```
// Enabling the change notification in idle mode.
SYS_PORTS_ChangeNotificationInIdleModeEnable(MY_PORTS_INSTANCE);
//Obtaining the status of the change notification pin.
bool status;
status = SYS_PORTS_ChangeNotificationStatus(MY_PORTS_INSTANCE, PORTS_CHANGE_NOTICE_PIN_10);
```

Note: Not all the features are available on all devices. Please refer to the specific device data sheet to determine availability.

5.7.7.4.3.4 Peripheral Pin Select

Ports Remapping or Peripheral Pin Select Usage

Input/Output Function Remapping:

"SYS_PORTS_RemapInputOutput" with appropriate parameters can be used to remap a particular port pin as input/output for a peripheral.

Input/Output Lock:

"SYS_PORTS_IOLockEnable" and "SYS_PORTS_IOLockDisable" with appropriate parameters can be used to lock/unlock a pin.

Example:

```
// Remapping input function 'Input Capture 1' to the Remappable input pin 'RPI1'
SYS_PORTS_RemapInputOutput(MY_PORTS_INSTANCE, PORTS_REMAP_FUNCTION_IC1,
PORTS_REMAP_PIN_RPI1);
// Remapping output function 'UART1 Transmit' to the Remappable output pin 'RP3'
SYS_PORTS_RemapInputOutput(MY_PORTS_INSTANCE, PORTS_REMAP_FUNCTION_U1TX,
PORTS_REMAP_PIN_RP3);
```

Note: Not all the features are available on all devices. Please refer to the specific device data sheet to determine availability.

5.7.7.4.3.5 Miscellaneous

Other Usage

Slew Rate:

Slew rate of a particular port can be controlled through the interface "SYS_PORTS_SlewRateSetReduced" and "SYS_PORTS_SlewRateSetStandard".

Open Drain:

Peripheral based open drain can be controlled through the interfaces "SYS_PORTS_PeripheralOpenDrainEnable" and "SYS_PORTS_PeripheralOpenDrainDisable".

Note: Not all the features are available on all devices. Please refer to the specific device data sheet to determine availability.

5.7.7.4.3.6 Special Considerations

Note on Ports Usage:

1. Setting a port pin as an analog input also requires that the corresponding direction be set. If the direction is set to output, the digital output level (VOH or VOL) will be outputted.
2. When reading the port register, all pins configured as analog input channels will read as cleared.
3. Pins configured as digital inputs will not output an analog input. Analog levels on any pin that is defined as a digital input may cause the input buffer to consume current that exceeds the device specifications.
4. Pull-ups and pull-downs on change notification pins should always be disabled when the port pin is configured as a digital output.

Considerations for the Peripheral Pin Select:

The ability to control Peripheral Pin Select options introduces several considerations into application design that could be overlooked. This is particularly true for several common peripherals that are available only as remappable peripherals.

The main consideration is that the Peripheral Pin Selects are not available on default pins in the device's default (Reset) state, all Peripheral Pin Select inputs are tied to Vss and all Peripheral Pin Select outputs are disconnected. This situation requires the user to initialize the device with the proper peripheral configuration before any other application code is executed. For application safety, however, it is best to lock the configuration after writing to the control registers.

A final consideration is that Peripheral Pin Select functions neither override analog inputs, nor reconfigure pins with analog functions for digital I/O. If a pin is configured as an analog input on device Reset, it must be explicitly reconfigured as digital I/O when used with a Peripheral Pin Select.

Note: Not all the features are available on all devices. Please refer to the specific device data sheet to determine availability.

5.7.7.5 Configuring the Library

The configuration of the Ports System Service is based on the file `sys_config.h`

This header file contains the configuration selection for the PORTS System Service. Based on the selections made, the Ports System Service will support or not support selected features. These configuration settings will apply to all instances of the Ports System Service.

This header can be placed anywhere, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.7.7.6 Building the Library

5.7.7.7 Library Interface

Data Types and Constants

	Name	Description
	SYS_PORTS_PIN_DIRECTION	Defines the direction of the port pins.
	SYS_PORTS_PULLUP_PULLDOWN_STATUS	Provides the pull-up and pull-down status.

Change Notification Functions

	Name	Description
	SYS_PORTS_ChangeNotificationDisable	Disables the change notification for the selected port.
	SYS_PORTS_ChangeNotificationEnable	Enables the change notification for the selected port.
	SYS_PORTS_ChangeNotificationGlobalDisable	Globally disables the change notification for the selected port.
	SYS_PORTS_ChangeNotificationGlobalEnable	Globally enables the change notification for the selected port.
	SYS_PORTS_ChangeNotificationInIdleModeDisable	Disables the change notification for the selected port in Sleep or Idle mode.
	SYS_PORTS_ChangeNotificationInIdleModeEnable	Enables the change notification for the selected port in Sleep or Idle mode.
	SYS_PORTS_ChangeNotificationPullDownDisable	Disables pull-down on input change.
	SYS_PORTS_ChangeNotificationPullDownEnable	Enables pull-down on input change.
	SYS_PORTS_ChangeNotificationPullUpDisable	Disables pull-up on input change.

	SYS_PORTS_ChangeNotificationPullUpEnable	Enables a weak pull-up on the change notification pin.
	SYS_PORTS_ChangeNotificationStatus	Gets the status of the corresponding notification pin.

Peripheral Pin Select Functions

	Name	Description
	SYS_PORTS_IOLockDisable	Disables the I/O lock.
	SYS_PORTS_IOLockEnable	Enables the I/O lock.
	SYS_PORTS_IOLockIsActive	Returns the status of I/O lock.
	SYS_PORTS_RemapInput	Input/Output (I/O) function remapping.
	SYS_PORTS_RemapOutput	Input/Output (I/O) function remapping.

Pin Control Functions

	Name	Description
	SYS_PORTS_PinModeSelect	Enables the selected pin as analog or digital.
	SYS_PORTS_PinOpenDrainDisable	Disables the open-drain functionality for the selected pin.
	SYS_PORTS_PinOpenDrainEnable	Enables the open-drain functionality for the selected pin.
	SYS_PORTS_PinPullUpDisable	Disables the pull-up functionality for the selected pin
	SYS_PORTS_PinPullUpEnable	Enables the pull-up functionality for the selected pin.
	SYS_PORTS_PinRead	Reads the selected digital pin.
	SYS_PORTS_PinSet	Sets the selected digital pin/latch.
	SYS_PORTS_PinToggle	Toggles the selected digital pin.
	SYS_PORTS_PinWrite	Writes the selected digital pin.
	SYS_PORTS_PinClear	Clears the selected digital pin.
	SYS_PORTS_PinDirectionSelect	Enables the direction for the selected pin.

Ports Control Functions

	Name	Description
	SYS_PORTS_Clear	Clears the selected digital port.
	SYS_PORTS_DirectionGet	Reads the direction for the selected port.
	SYS_PORTS_DirectionSelect	Enables the direction for the selected port.
	SYS_PORTS_OpenDrainDisable	Disables the open-drain functionality for the selected port.
	SYS_PORTS_OpenDrainEnable	Enables the open-drain functionality for the selected port.
	SYS_PORTS_PullUpDisable	Disables the pull-up for the selected port.
	SYS_PORTS_PullUpEnable	Enables the pull-up for the selected port.
	SYS_PORTS_Read	Reads the data from the I/O port.
	SYS_PORTS_Set	Writes the selected digital port/latch based on the mask.
	SYS_PORTS_Toggle	Toggles the selected digital port pins.
	SYS_PORTS_Write	Writes the data to the I/O port.

Description

5.7.7.7.1 Pin Control Functions

5.7.7.7.1.1 SYS_PORTS_PinModeSelect Function

C

```
void SYS_PORTS_PinModeSelect(  
    PORTS_MODULE_ID index,  
    PORTS_ANALOG_PIN pin,  
    PORTS_PIN_MODE mode  
);
```

Description

This function enables the selected pin as analog or digital.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
pin	Possible values of PORTS_ANALOG_PIN
mode	Possible values of PORTS_PIN_MODE

Returns

None.

Remarks

Not all features are available on all devices. Refer to the specific device data sheet for availability.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the // application developer. // MY_PIN -  
PORTS_ANALOG_PIN_AN0 // MY_PIN_MODE - PORTS_PIN_MODE_ANALOG  
SYS_PORTS_PinModSYS_PORTS_PinModeSelecteSelect( MY_PORTS_INSTANCE, MY_PIN, MY_PIN_MODE );
```

5.7.7.7.1.2 SYS_PORTS_PinOpenDrainDisable Function

C

```
void SYS_PORTS_PinOpenDrainDisable(  
    PORTS_MODULE_ID index,  
    PORTS_CHANNEL channel,  
    PORTS_BIT_POS bitPos  
);
```

Description

This function disables the open-drain functionality for the selected pin.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Identifier for the PORT channel: A, B, C, etc.
bitPos	Possible values of PORTS_BIT_POS

Returns

None.

Remarks

Not all features are available on all devices. Refer to the specific device data sheet for availability.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the // application developer. // MY_PINNUM -  
PORTS_PIN_10 SYS_PORTS_PinOpenDrainDisable(MY_PORTS_INSTANCE, MY_PINNUM);
```

5.7.7.7.1.3 SYS_PORTS_PinOpenDrainEnable Function

C

```
void SYS_PORTS_PinOpenDrainEnable(  
    PORTS_MODULE_ID index,  
    PORTS_CHANNEL channel,  
    PORTS_BIT_POS bitPos  
);
```

Description

This function enables the open-drain functionality for the selected pin.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Identifier for the PORT channel: A, B, C, etc.
bitPos	Possible values of PORTS_BIT_POS

Returns

None.

Remarks

Not all features are available on all devices. Refer to the specific device data sheet for availability.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the // application developer. // MY_PINNUM -  
PORTS_PIN_10 SYS_PORTS_PinOpenDrainEnable( MY_PORTS_INSTANCE, MY_CHANNEL, MY_PINNUM );
```

5.7.7.7.1.4 SYS_PORTS_PinPullUpDisable Function

C

```
void SYS_PORTS_PinPullUpDisable(  
    PORTS_MODULE_ID index,  
    PORTS_CHANNEL channel,  
    PORTS_BIT_POS bitPos  
);
```

Description

This function disables the pull-up functionality for the selected pin.

Preconditions

None

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Identifier for the PORT channel: A, B, C, etc.
bitPos	Possible values of PORTS_BIT_POS

Returns

None.

Remarks

Not all features are available on all devices. Refer to the specific device data sheet for availability. On some devices, pull-up disable leads to pull-down enable.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the // application developer. // MY_PINNUM -  
PORTS_PIN_10 SYS_PORTS_PinPullUpDisable( MY_PORTS_INSTANCE, MY_CHANNEL, MY_PINNUM );
```

5.7.7.7.1.5 SYS_PORTS_PinPullUpEnable Function**C**

```
void SYS_PORTS_PinPullUpEnable(  
    PORTS_MODULE_ID index,  
    PORTS_CHANNEL channel,  
    PORTS_BIT_POS bitPos  
);
```

Description

This function enables the pull-up functionality for the selected pin.

Preconditions

None

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Identifier for the PORT channel: A, B, C, etc.
bitPos	Possible values of PORTS_BIT_POS

Returns

None.

Remarks

Not all features are available on all devices. Refer to the specific device data sheet for availability.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the // application developer. // MY_PINNUM -  
PORTS_PIN_10 SYS_PORTS_PinPullUpEnable( MY_PORTS_INSTANCE, MY_CHANNEL, MY_PINNUM );
```

5.7.7.7.1.6 SYS_PORTS_PinRead Function

C

```
bool SYS_PORTS_PinRead(  
    PORTS_MODULE_ID index,  
    PORTS_CHANNEL channel,  
    PORTS_BIT_POS bitPos  
);
```

Description

This function reads the selected digital pin.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Identifier for the PORT channel: A, B, C, etc.
bitPos	Possible values of PORTS_BIT_POS

Returns

The status of the port pin.

Remarks

Not all features are available on all devices. Refer to the specific device data sheet for availability.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the // application developer. // MY_PINNUM -  
PORTS_PIN_10 bool bitStatus = SYS_PORTS_PinRead(MY_PORTS_INSTANCE, MY_CHANNEL, MY_PINNUM);
```

5.7.7.7.1.7 SYS_PORTS_PinSet Function

C

```
void SYS_PORTS_PinSet(  
    PORTS_MODULE_ID index,  
    PORTS_CHANNEL channel,  
    PORTS_BIT_POS bitPos  
);
```

Description

This function sets the selected digital pin/latch.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Identifier for the PORT channel: A, B, C, etc.
bitPos	Possible values of PORTS_BIT_POS

Returns

None.

Remarks

Not all features are available on all devices. Refer to the specific device data sheet for availability.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the
// application developer.
// MY_PINNUM - PORTS_PIN_10
SYS_PORTS_PinSet(MY_PORTS_INSTANCE, MY_CHANNEL, MY_PINNUM);
```

5.7.7.7.1.8 SYS_PORTS_PinToggle Function**C**

```
void SYS_PORTS_PinToggle(
    PORTS_MODULE_ID index,
    PORTS_CHANNEL channel,
    PORTS_BIT_POS bitPos
);
```

Description

This function toggles the selected digital pin.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Identifier for the PORT channel: A, B, C, etc.
bitPos	Possible values of PORTS_BIT_POS

Returns

None.

Remarks

Not all features are available on all devices. Refer to the specific device data sheet for availability.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the // application developer. // MY_PINNUM -
PORTS_PIN_10 SYS_PORTS_PinToggle( MY_PORTS_INSTANCE, MY_CHANNEL, MY_PINNUM );
```

5.7.7.7.1.9 SYS_PORTS_PinWrite Function**C**

```
void SYS_PORTS_PinWrite(
    PORTS_MODULE_ID index,
    PORTS_CHANNEL channel,
    PORTS_BIT_POS bitPos,
    bool value
);
```

Description

This function writes the selected digital pin.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Identifier for the PORT channel: A, B, C, etc.
bitPos	Possible values of PORTS_BIT_POS

5.7.7.7.1.10 SYS_PORTS_PinClear Function**C**

```
void SYS_PORTS_PinClear(
    PORTS_MODULE_ID index,
    PORTS_CHANNEL channel,
    PORTS_BIT_POS bitPos
);
```

Description

This function clears the selected digital pin.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Identifier for the PORT channel: A, B, C, etc.
bitPos	Possible values of PORTS_BIT_POS

Returns

None.

Remarks

Not all features are available on all devices. Refer to the specific device data sheet for availability.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the // application developer. // MY_PINNUM -
PORTS_IO_PIN_10 SYS_PORTS_PinClear( MY_PORTS_INSTANCE, MY_CHANNEL, MY_PINNUM );
```

5.7.7.7.1.11 SYS_PORTS_PinDirectionSelect Function**C**

```
void SYS_PORTS_PinDirectionSelect(
    PORTS_MODULE_ID index,
    SYS_PORTS_PIN_DIRECTION pinDir,
    PORTS_CHANNEL channel,
    PORTS_BIT_POS bitPos
);
```

Description

This functino enables the direction for the selected pin.

Preconditions

None

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
pinDir	Pin direction
channel	Identifier for the PORT channel: A, B, C, etc.
bitPos	Possible values of PORTS_BIT_POS

Returns

None.

Remarks

Not all features are available on all devices. Refer to the specific device data sheet for availability.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the // application developer. // MY_PINNUM -  
PORTS_PIN_10 SYS\_PORTS\_PIN\_DIRECTION pinDir; pinDir = SYS_PORTS_DIRECTION_INPUT;  
SYS_PORTS_PinDirectionSelect(MY_PORTS_INSTANCE, pinDir, MY_CHANNEL, MY_PINNUM);
```

5.7.7.7.2 Ports Control Functions

5.7.7.7.2.1 SYS_PORTS_Clear Function

C

```
void SYS_PORTS_Clear(  
    PORTS_MODULE_ID index,  
    PORTS_CHANNEL channel,  
    PORTS_DATA_MASK clearMask  
);
```

Description

This function clears the selected digital port.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Identifier for the PORT channel: A, B, C, etc.
clearMask	Identifies the bits to be cleared

Returns

None.

Remarks

Not all features are available on all devices. Refer to the specific device data sheet for availability.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the // application developer. PORTS_DATA_MASK
clearMask = (PORTS_DATA_MASK)0x00FF; SYS_PORTS_Clear( MY_PORTS_INSTANCE, MY_CHANNEL, clearMask );
```

5.7.7.7.2.2 SYS_PORTS_DirectionGet Function**C**

```
PORTS_DATA_MASK SYS_PORTS_DirectionGet(
    PORTS_MODULE_ID index,
    PORTS_CHANNEL channel
);
```

Description

This function reads the direction for the selected port.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Identifier for the PORT channel: A, B, C, etc.

Returns

Direction of the port.

Remarks

None.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the // application developer. PORTS_DATA_MASK
value; value = SYS_PORTS_DirectionGet( MY_PORTS_INSTANCE, MY_CHANNEL );
```

5.7.7.7.2.3 SYS_PORTS_DirectionSelect Function**C**

```
void SYS_PORTS_DirectionSelect(
    PORTS_MODULE_ID index,
    SYS_PORTS_PIN_DIRECTION pinDir,
    PORTS_CHANNEL channel,
    PORTS_DATA_MASK mask
);
```

Description

This function enables the direction for the selected port.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
pinDir	Pin direction

channel	Identifier for the PORT channel: A, B, C, etc.
mask	Mask for the direction of width PORTS_DATA_MASK

Returns

None

Remarks

None.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the // application developer.
SYS_PORTS_PIN_DIRECTION pinDir; pinDir = SYS_PORTS_DIRECTION_INPUT; PORTS\_DATA\_MASK myMask =
(PORTS\_DATA\_MASK)0x00FF; SYS_PORTS_DirectionSelect(MY_PORTS_INSTANCE, pinDir, MY_CHANNEL, myMask );
```

5.7.7.7.2.4 SYS_PORTS_OpenDrainDisable Function**C**

```
void SYS_PORTS_OpenDrainDisable(
    PORTS_MODULE_ID index,
    PORTS_CHANNEL channel,
    PORTS_DATA_MASK mask
);
```

Description

This function disables the open-drain functionality for the selected port.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Identifier for the PORT channel: A, B, C, etc.
mask	Mask of type PORTS_DATA_MASK

Returns

None

Remarks

Not all features are available on all devices. Refer to the specific device data sheet for availability.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the // application developer.
SYS_PORTS_PeripheralOpenDrainDisable( MY_PORTS_INSTANCE, MY_CHANNEL, (PORTS\_DATA\_MASK)0x00FF );
```

5.7.7.7.2.5 SYS_PORTS_OpenDrainEnable Function**C**

```
void SYS_PORTS_OpenDrainEnable(
    PORTS_MODULE_ID index,
    PORTS_CHANNEL channel,
    PORTS_DATA_MASK mask
);
```

Description

This function enables the open-drain functionality for the selected port.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Identifier for the PORT channel: A, B, C, etc.
mask	Mask of type PORTS_DATA_MASK

Returns

None

Remarks

Not all features are available on all devices. Refer to the specific device data sheet for availability.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the // application developer.  
SYS_PORTS_OpenDrainEnable( MY_PORTS_INSTANCE, MY_CHANNEL, (PORTS\_DATA\_MASK)0x00FF );
```

5.7.7.7.2.6 SYS_PORTS_PullUpDisable Function**C**

```
void SYS_PORTS_PullUpDisable(  
    PORTS_MODULE_ID index,  
    PORTS_CHANNEL channel,  
    PORTS_DATA_MASK mask  
);
```

Description

This function disables the pull-up for the selected port.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Identifier for the PORT channel: A, B, C, etc.
mask	Mask of type PORTS_DATA_MASK

Returns

None.

Remarks

Not all features are available on all devices. Refer to the specific device data sheet for availability. On some devices, pull-up disable leads to pull-down enable.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the // application developer.
```

```
SYS_PORTS_PullUpDisable( MY_PORTS_INSTANCE, MY_CHANNEL, (PORTS_DATA_MASK)0x00FF );
```

5.7.7.7.2.7 SYS_PORTS_PullUpEnable Function

C

```
void SYS_PORTS_PullUpEnable(  
    PORTS_MODULE_ID index,  
    PORTS_CHANNEL channel,  
    PORTS_DATA_MASK mask  
);
```

Description

This function enables the pull-up for the selected port.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Identifier for the PORT channel: A, B, C, etc.
mask	Mask of type PORTS_DATA_MASK

Returns

None.

Remarks

Not all features are available on all devices. Refer to the specific device data sheet for availability.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the // application developer.  
SYS_PORTS_PullUpEnable( MY_PORTS_INSTANCE, MY_CHANNEL, (PORTS_DATA_MASK)0x00FF );
```

5.7.7.7.2.8 SYS_PORTS_Read Function

C

```
PORTS_DATA_TYPE SYS_PORTS_Read(  
    PORTS_MODULE_ID index,  
    PORTS_CHANNEL channel  
);
```

Description

This function reads the data from the I/O port.

Preconditions

The direction of the port to be set as input.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Identifier for the PORT channel: A, B, C, etc.

Returns

Return the data read from the port.

Remarks

None.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the // application developer. PORTS\_DATA\_TYPE  
readData; readData = SYS_PORTS_Read( MY_PORTS_INSTANCE, MY_CHANNEL );
```

5.7.7.7.2.9 SYS_PORTS_Set Function**C**

```
void SYS_PORTS_Set(  
    PORTS_MODULE_ID index,  
    PORTS_CHANNEL channel,  
    PORTS_DATA_TYPE value,  
    PORTS_DATA_MASK mask  
);
```

Description

This function writes to the selected digital port/latch relative to the mask.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Identifier for the PORT channel: A, B, C, etc.
value	Value to be written into a port of width PORTS_DATA_TYPE
mask	Identifies the bits to be written

Returns

None.

Remarks

Not all features are available on all devices. Refer to the specific device data sheet for availability.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the  
// application developer.  
// MY_VALUE - 0x1234  
PORTS_DATA_MASK myMask = (PORTS_DATA_MASK)0x00FF;  
SYS_PORTS_Set(MY_PORTS_INSTANCE, MY_CHANNEL, MY_VALUE, myMask);
```

5.7.7.7.2.10 SYS_PORTS_Toggle Function**C**

```
void SYS_PORTS_Toggle(  
    PORTS_MODULE_ID index,  
    PORTS_CHANNEL channel,  
    PORTS_DATA_MASK toggleMask  
);
```

Description

This function toggles the selected digital port pins.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Identifier for the PORT channel: A, B, C, etc.
toggleMask	Identifies the bits to be toggled

Returns

None

Remarks

None.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the // application developer. PORTS_DATA_MASK
toggleMask = (PORTS_DATA_MASK)0x00FF; SYS_PORTS_Toggle( MY_PORTS_INSTANCE, MY_CHANNEL, toggleMask );
```

5.7.7.7.2.11 SYS_PORTS_Write Function**C**

```
void SYS_PORTS_Write(
    PORTS_MODULE_ID index,
    PORTS_CHANNEL channel,
    PORTS_DATA_TYPE value
);
```

Description

This function writes the data to the I/O port.

Preconditions

The direction of the port to be set as output.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	Identifier for the PORT channel: A, B, C, etc.
value	Value to be written into a port of width PORTS_DATA_TYPE

Returns

None.

Remarks

None.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the // application developer. PORTS_DATA_TYPE
writeData; SYS_PORTS_Write( MY_PORTS_INSTANCE, MY_CHANNEL, MY_VALUE );
```

5.7.7.7.3 Change Notification Functions

5.7.7.7.3.1 SYS_PORTS_ChangeNotificationDisable Function

C

```
void SYS_PORTS_ChangeNotificationDisable(  
    PORTS_MODULE_ID index,  
    PORTS_CHANGE_NOTICE_PIN pinNum  
);
```

Description

This function disables the change notification for the selected port.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
pinNum	Possible values of PORTS_CHANGE_NOTICE_PIN

Returns

None.

Remarks

Not all features are available on all devices. Refer to the specific device data sheet for availability.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the // application developer.  
PORTS\_CHANGE\_NOTICE\_PIN pinNum; SYS_PORTS_ChangeNotificationDisable( index, pinNum );
```

5.7.7.7.3.2 SYS_PORTS_ChangeNotificationEnable Function

C

```
void SYS_PORTS_ChangeNotificationEnable(  
    PORTS_MODULE_ID index,  
    PORTS_CHANGE_NOTICE_PIN pinNum,  
    SYS_PORTS_PULLUP_PULLDOWN_STATUS value  
);
```

Description

This function enables the change notification for the selected port.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
value	Pull-up enable or disable value
pinNum	Possible values of PORTS_CHANGE_NOTICE_PIN

Returns

None

Remarks

Not all features are available on all devices. Refer to the specific device data sheet for availability.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the // application developer.  
SYS_PORTS_PULLUP_PULLDOWN_STATUS value; PORTS_CHANGE_NOTICE_PIN pinNum;  
SYS_PORTS_ChangeNotificationEnable( index, pinNum, value );
```

5.7.7.7.3.3 SYS_PORTS_ChangeNotificationGlobalDisable Function**C**

```
void SYS_PORTS_ChangeNotificationGlobalDisable(  
    PORTS_MODULE_ID index  
);
```

Description

This function globally disables the change notification for the selected port.

Preconditions

None.

Returns

None.

Remarks

Not all features are available on all devices. Refer to the specific device data sheet for availability.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the // application developer.  
SYS_PORTS_ChangeNotificationGlobalDisable( MY_PORTS_INSTANCE);
```

5.7.7.7.3.4 SYS_PORTS_ChangeNotificationGlobalEnable Function**C**

```
void SYS_PORTS_ChangeNotificationGlobalEnable(  
    PORTS_MODULE_ID index  
);
```

Description

This function globally enables the change notification for the selected port.

Preconditions

None.

Returns

None.

Remarks

Not all features are available on all devices. Refer to the specific device data sheet for availability.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the // application developer.  
SYS_PORTS_ChangeNotificationGlobalEnable( MY_PORTS_INSTANCE );
```

5.7.7.7.3.5 SYS_PORTS_ChangeNotificationInIdleModeDisable Function

C

```
void SYS_PORTS_ChangeNotificationInIdleModeDisable(  
    PORTS_MODULE_ID index  
);
```

Description

This function disables the change notification for the selected port in Sleep or Idle mode.

Preconditions

None.

Returns

None.

Remarks

Not all features are available on all devices. Refer to the specific device data sheet for availability.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the // application developer.  
SYS_PORTS_ChangeNotificationInIdleModeDisable( MY_PORTS_INSTANCE );
```

5.7.7.7.3.6 SYS_PORTS_ChangeNotificationInIdleModeEnable Function

C

```
void SYS_PORTS_ChangeNotificationInIdleModeEnable(  
    PORTS_MODULE_ID index  
);
```

Description

This function enables the change notification for the selected port in Sleep or Idle mode.

Preconditions

None.

Returns

None.

Remarks

Not all features are available on all devices. Refer to the specific device data sheet for availability.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the // application developer.  
SYS_PORTS_ChangeNotificationInIdleModeEnable( MY_PORTS_INSTANCE );
```

5.7.7.7.3.7 SYS_PORTS_ChangeNotificationPullDownDisable Function

C

```
void SYS_PORTS_ChangeNotificationPullDownDisable(  
    PORTS_MODULE_ID index,  
    PORTS_CHANGE_NOTICE_PIN pinNum  
);
```

Description

This function disables pull-down on input change.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
pinNum	Possible values of PORTS_CHANGE_NOTICE_PIN

Returns

None.

Remarks

Not all features are available on all devices. Refer to the specific device data sheet for availability.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the // application developer. // MY_PINNUM -  
PORTS_CHANGE_NOTICE_PIN_10      SYS_PORTS_ChangeNotificationPullDownDisable(      MY_PORTS_INSTANCE,  
MY_PINNUM );
```

5.7.7.7.3.8 SYS_PORTS_ChangeNotificationPullDownEnable Function**C**

```
void SYS_PORTS_ChangeNotificationPullDownEnable(  
    PORTS_MODULE_ID index,  
    PORTS_CHANGE_NOTICE_PIN pinNum  
);
```

Description

This function enables pull-down on input change.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
pinNum	Possible values of PORTS_CHANGE_NOTICE_PIN

Returns

None.

Remarks

Not all features are available on all devices. Refer to the specific device data sheet for availability.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the // application developer. // MY_PINNUM -  
PORTS_CHANGE_NOTICE_PIN_10      SYS_PORTS_ChangeNotificationPullDownEnable(      MY_PORTS_INSTANCE,  
MY_PINNUM );
```

5.7.7.7.3.9 SYS_PORTS_ChangeNotificationPullUpDisable Function

C

```
void SYS_PORTS_ChangeNotificationPullUpDisable(  
    PORTS_MODULE_ID index,  
    PORTS_CHANGE_NOTICE_PIN pinNum  
);
```

Description

This function disables pull-up on input change.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
pinNum	Possible values of PORTS_CHANGE_NOTICE_PIN

Returns

None.

Remarks

Not all features are available on all devices. Refer to the specific device data sheet for availability.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the // application developer. // MY_PINNUM -  
PORTS_CHANGE_NOTICE_PIN_10 SYS_PORTS_ChangeNotificationPullUpDisable( MY_PORTS_INSTANCE, MY_PINNUM );
```

5.7.7.7.3.10 SYS_PORTS_ChangeNotificationPullUpEnable Function

C

```
void SYS_PORTS_ChangeNotificationPullUpEnable(  
    PORTS_MODULE_ID index,  
    PORTS_CHANGE_NOTICE_PIN pinNum  
);
```

Description

This function enables a weak pull-up on the change notification pin.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
pinNum	Possible values of PORTS_CHANGE_NOTICE_PIN

Returns

None.

Remarks

Not all features are available on all devices. Refer to the specific device data sheet for availability.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the // application developer. // MY_PINNUM -  
PORTS_CHANGE_NOTICE_PIN_10 SYS_PORTS_ChangeNotificationPullUpEnable( MY_PORTS_INSTANCE, MY_PINNUM );
```

5.7.7.7.3.11 SYS_PORTS_ChangeNotificationStatus Function**C**

```
bool SYS_PORTS_ChangeNotificationStatus(  
    PORTS_MODULE_ID index,  
    PORTS_CHANGE_NOTICE_PIN pinNum  
);
```

Description

This function gets the status of the corresponding notification pin..

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
pinNum	Possible values of PORTS_CHANGE_NOTICE_PIN

Returns

- true - Change notice has occurred
- false - Change notice has not occurred

Remarks

Not all features are available on all devices. Refer to the specific device data sheet for availability.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the // application developer. //pinNUM is the change  
notification pin bool status; status = SYS_PORTS_ChangeNotificationStatus( MY_PORTS_INSTANCE, MY_PINNUM );
```

5.7.7.7.4 Peripheral Pin Select Functions**5.7.7.7.4.1 SYS_PORTS_IOLockDisable Function****C**

```
void SYS_PORTS_IOLockDisable(  
    PORTS_MODULE_ID index  
);
```

Description

This function disables the I/O lock.

Preconditions

index - Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is available for devices with PPS functionality. If the associated Configuration bit is set and if the I/O lock is enabled, this feature can never be used to disable the I/O lock. The only way to clear the bit and re-enable peripheral remapping is to perform a device Reset.

This function is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the  
// application developer.  
SYS_PORTS_IOLockDisable(MY_PORTS_INSTANCE);
```

5.7.7.7.4.2 SYS_PORTS_IOLockEnable Function**C**

```
void SYS_PORTS_IOLockEnable(  
    PORTS_MODULE_ID index  
);
```

Description

This function enables the I/O lock.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is available for devices with Peripheral Pin Select (PPS) functionality. If the associated Configuration bit is set, this function can only be set once.

This function is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the  
// application developer.  
SYS_PORTS_IOLockEnable(MY_PORTS_INSTANCE);
```

5.7.7.7.4.3 SYS_PORTS_IOLockIsActive Function**C**

```
bool SYS_PORTS_IOLockIsActive(  
    PORTS_MODULE_ID index  
);
```

Description

This function returns the status of I/O lock.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

- true - I/O lock is active
- false - I/O lock is not active

Remarks

This feature is available for devices with PPS functionality.

This function is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the  
// application developer.  
bool lockStatus;  
lockStatus = SYS_PORTS_IOLockIsActive(MY_PORTS_INSTANCE);
```

5.7.7.7.4.4 SYS_PORTS_RemapInput Function**C**

```
void SYS_PORTS_RemapInput(  
    PORTS_MODULE_ID index,  
    PORTS_REMAP_INPUT_FUNCTION function,  
    PORTS_REMAP_INPUT_PIN remapPin  
);
```

Description

This function controls the I/O function remapping.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use SYS_PORTS_ExistsRemapInputOutput in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the  
// application developer.  
// Remapping input function 'Input Capture 1' to the Remappable pin 'RPD2'  
SYS_PORTS_RemapInput(MY_PORTS_INSTANCE, INPUT_FUNC_IC1, INPUT_PIN_RPD2 );
```

5.7.7.7.4.5 SYS_PORTS_RemapOutput Function**C**

```
void SYS_PORTS_RemapOutput(  
    PORTS_MODULE_ID index,
```

```
    PORTS_REMAP_OUTPUT_FUNCTION function,  
    PORTS_REMAP_OUTPUT_PIN remapPin  
);
```

Description

This function controls the I/O function remapping.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use SYS_PORTS_ExistsRemapInputOutput in your application to determine whether this feature is available.

Example

```
// Where MY_PORTS_INSTANCE, is the ports instance selected for use by the  
// application developer.  
// Remapping output function 'UART3 Transmit' to the Remappable pin 'RPA14'  
SYS_PORTS_RemapInputOutput(MY_PORTS_INSTANCE, OUTPUT_FUNC_U3TX, OUTPUT_PIN_RPA14);
```

5.7.7.7.5 Data Types and Constants

5.7.7.7.5.1 SYS_PORTS_PIN_DIRECTION Enumeration

C

```
typedef enum {  
    SYS_PORTS_DIRECTION_OUTPUT,  
    SYS_PORTS_DIRECTION_INPUT  
} SYS_PORTS_PIN_DIRECTION;
```

Description

SYS_PORTS_PIN_DIRECTION

These constants provide the port pin direction definitions.

Members

Members	Description
SYS_PORTS_DIRECTION_OUTPUT	Direction as output
SYS_PORTS_DIRECTION_INPUT	Direction as input

Remarks

None.

5.7.7.7.5.2 SYS_PORTS_PULLUP_PULLDOWN_STATUS Enumeration

C

```
typedef enum {  
    SYS_PORTS_PULLUP_DISABLE,
```

```
SYS_PORTS_PULLUP_ENABLE
} SYS_PORTS_PULLUP_PULLDOWN_STATUS;
```

Description

SYS PORTS PULLUP status

These constants provide the pull-up or pull-down status definitions.

Members

Members	Description
SYS_PORTS_PULLUP_DISABLE	PULLUP Disable
SYS_PORTS_PULLUP_ENABLE	PULLUP Enable

Remarks

None.

5.7.7.8 Files

Files

Name	Description
help_sys_ports.h	This is file help_sys_ports.h.
sys_ports.h	Ports System Service interface definitions

Description

5.7.7.8.1 help_sys_ports.h

This is file help_sys_ports.h.

Enumerations

	Name	Description
	PORTS_ANALOG_PIN	Data type defining the different Analog input pins
	PORTS_CHANGE_NOTICE_PIN	Data type defining the different Change Notification Pins enumeration
	PORTS_CHANNEL	Identifies the PORT Channels Supported.
	PORTS_MODULE_ID	Identifies the PORT Modules Supported.
	PORTS_PERIPHERAL_OD	Data type defining the different Peripherals available for Open drain Configuration
	PORTS_PIN	Data type defining the different PORTS IO Pins enumeration
	PORTS_REMAP_FUNCTION	Data type defining the different remap function enumeration
	PORTS_REMAP_PIN	Data type defining the different remappable input/output enumeration

5.7.7.8.2 sys_ports.h

Ports System Service Interface Definition

This file contains the interface definition for the Ports system service. It provides a way to interact with the Ports subsystem to manage the timing requests supported by the system

Enumerations

	Name	Description
	SYS_PORTS_PIN_DIRECTION	Defines the direction of the port pins.
	SYS_PORTS_PULLUP_PULLDOWN_STATUS	Provides the pull-up and pull-down status.

Functions

	Name	Description
	SYS_PORTS_ChangeNotificationDisable	Disables the change notification for the selected port.
	SYS_PORTS_ChangeNotificationEnable	Enables the change notification for the selected port.
	SYS_PORTS_ChangeNotificationGlobalDisable	Globally disables the change notification for the selected port.
	SYS_PORTS_ChangeNotificationGlobalEnable	Globally enables the change notification for the selected port.
	SYS_PORTS_ChangeNotificationInIdleModeDisable	Disables the change notification for the selected port in Sleep or Idle mode.
	SYS_PORTS_ChangeNotificationInIdleModeEnable	Enables the change notification for the selected port in Sleep or Idle mode.
	SYS_PORTS_ChangeNotificationPullDownDisable	Disables pull-down on input change.
	SYS_PORTS_ChangeNotificationPullDownEnable	Enables pull-down on input change.
	SYS_PORTS_ChangeNotificationPullUpDisable	Disables pull-up on input change.
	SYS_PORTS_ChangeNotificationPullUpEnable	Enables a weak pull-up on the change notification pin.
	SYS_PORTS_ChangeNotificationStatus	Gets the status of the corresponding notification pin.
	SYS_PORTS_Clear	Clears the selected digital port.
	SYS_PORTS_DirectionGet	Reads the direction for the selected port.
	SYS_PORTS_DirectionSelect	Enables the direction for the selected port.
	SYS_PORTS_IOLockDisable	Disables the I/O lock.
	SYS_PORTS_IOLockEnable	Enables the I/O lock.
	SYS_PORTS_IOLockIsActive	Returns the status of I/O lock.
	SYS_PORTS_OpenDrainDisable	Disables the open-drain functionality for the selected port.
	SYS_PORTS_OpenDrainEnable	Enables the open-drain functionality for the selected port.
	SYS_PORTS_PinClear	Clears the selected digital pin.
	SYS_PORTS_PinDirectionSelect	Enables the direction for the selected pin.
	SYS_PORTS_PinModeSelect	Enables the selected pin as analog or digital.
	SYS_PORTS_PinOpenDrainDisable	Disables the open-drain functionality for the selected pin.
	SYS_PORTS_PinOpenDrainEnable	Enables the open-drain functionality for the selected pin.
	SYS_PORTS_PinPullUpDisable	Disables the pull-up functionality for the selected pin
	SYS_PORTS_PinPullUpEnable	Enables the pull-up functionality for the selected pin.
	SYS_PORTS_PinRead	Reads the selected digital pin.
	SYS_PORTS_PinSet	Sets the selected digital pin/latch.
	SYS_PORTS_PinToggle	Toggles the selected digital pin.
	SYS_PORTS_PinWrite	Writes the selected digital pin.
	SYS_PORTS_PullUpDisable	Disables the pull-up for the selected port.
	SYS_PORTS_PullUpEnable	Enables the pull-up for the selected port.
	SYS_PORTS_Read	Reads the data from the I/O port.
	SYS_PORTS_RemapInput	Input/Output (I/O) function remapping.
	SYS_PORTS_RemapOutput	Input/Output (I/O) function remapping.
	SYS_PORTS_Set	Writes the selected digital port/latch based on the mask.
	SYS_PORTS_Toggle	Toggles the selected digital port pins.

	SYS_PORTS_Write	Writes the data to the I/O port.

5.7.8 Timer System Service Library

5.7.8.1 Introduction

Timer System Service Library
for
Microchip Microcontrollers

This library provides interfaces to manage alarms and/or delays.

Overview

The Timer System Service Library is capable of providing periodic or one shot alarms, delays to the user. It works as a client for the Timer driver and opens one of the instances of the driver to perform the activities. The periodicity or the delay is an integer multiple of the Timer driver alarm period.

5.7.8.2 Release Notes

MPLAB Harmony Version: v0.70b **Timer System Service Version :** 0.01 Alpha **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.7.8.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED AS IS MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.7.8.4 Using the Library

This topic describes the basic architecture of the Timer System Service Library and provides information and examples on how to use it.

Interface Header File: [sys_tmr.h](#)

The interface to the Timer System Service library is defined in the "[sys_tmr.h](#)" header file, which is included by the "sys.h" system service header file. Any C language source (.c) file that uses the Timer System Service library should include "sys.h".

Library File:

The Timer System Service Library archive (.a) file installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the System Service interacts with the framework.

Useful Terminologies:

Term	Description
Tick	Heart beats provided by the system timer. Defines the rate at which the callback gets called in a periodicity. One tick corresponds to one alarm period.
Alarm	Minimum resolution to which the Timer driver is configured, a tick or a callback is a multiple of this time.
One Shot callback	Callback gets called only once after the time is elapsed.
Periodic callback	Callback gets called at a periodic rate as defined by the user.
Delay	Non-blocking delays

Pre-requisites: Following modules are necessary for the Timer System Service layer to function,

- Timer Peripheral library
- Timer Device driver
- Interrupt Peripheral library [If Interrupt mode is opted]

- Interrupt System Service [If Interrupt mode is opted]

5.7.8.4.1 Abstraction Model

The Timer System Service module uses the Timer driver abstraction layer to provide the following functionalities,

- Periodic Callback
- One Shot/Single Callback
- Delays [interrupt mode alone]

Note: Periodic/One shot modes of the Timer System Service will work in both polling and interrupt driven environments.

Simple Timer System Service abstraction model.

The following flow diagram depicts Periodic Callback usage model.

The following flow diagram depicts One Shot Callback usage model.

The following flow diagram depicts Delay usage model.

5.7.8.4.2 Library Overview

The library interface routines are divided into various subsections, each of the subsections addresses one of the blocks or the overall operation of the Timer System Service Library.

Library Interface Section	Description
System Level Interaction Functions	Provides system module APIs. Device initialization, deinitialization, reinitialization and status functions.
Timed Callback Functions	Provides interfaces to handle timed periodic or one shot callbacks
Timed Delay Functions	Provides interfaces to handle timed delays
Miscellaneous Functions	Provides interfaces for timer tick counts, etc.

5.7.8.4.3 How the Library Works

The library provides interfaces to support:

- System Interaction
- Periodic Callback
- One shot/Single Callback
- Delays [In Interrupt mode Alone]
- Tick count Information

The following model gives information on interaction between various modules.

Note: The arrows in the above diagram indicates the dependencies or support.

Module interaction occurs in the following order:

1. The initialization, reinitialization, deinitialization are handled by the SYS INIT module.
2. The Timer System Service Initialization function initializes the library's internal data structures.
3. After the initialization, Timer System Service Tasks function would be called by the SYS Tasks module to open the Timer Driver and do other configuration activities. Once the Timer driver is ready to be used the Timer System Service Tasks API makes the system ready to be used by setting the status of the Timer System Service module to `SYS_MODULE_RUNNING`.
4. The application can now enable either periodic callback or one-shot callback or enable delays.

Notes:

1. It is possible to have multiple clients access the system timer service.
2. Multiple client system calls for the configuration of multiple periodic callbacks or one shot and single periodic callback event etc.
3. It is not possible to use one client in polling and the other in the interrupt driven mode.
4. User or the application has to make sure to initialize the interrupt system module and set priorities accordingly.

5.7.8.4.3.1 System Interaction**Initialization and Reinitialization:**

The SYS module performs the initialization and the reinitialization of the Timer System Service. During initialization the following informations are populated into the internal data structures from the init structure '[SYS_TMR_INIT](#)' passed as a parameter:

Initialization Member	Description
moduleInit	System module initialization of the power state
drvIndex	Timer driver module/instance index, the same index used to initialize the timer driver
alarmPeriod	Alarm period in ms to configure the timer driver. This period will be used as the base time for further calculations of periodic or single callbacks etc.

The [SYS_TMR_Initialize](#) API returns a dummy handle of the type [SYS_MODULE_OBJ](#). There on, the object handle returned by the Initialize interface would be used by the other system interfaces like [SYS_TMR_Reinitialize](#), [SYS_TMR_Deinitialize](#), [SYS_TMR_Status](#) and [SYS_TMR_Tasks](#).

Note: Already initialized SYS TMR module if tried to initialize again, will safely return without modifying the behavior of the system.

Example for Timer System Service initialization:

```

SYS_MODULE_OBJ  objectHandle;
SYS_TMR_INIT    initConfig;

// Populate the SYS TMR initialization structure
initConfig.moduleInit.value      = SYS_MODULE_POWER_RUN_FULL;
initConfig.drvIndex              = DRV_TMR_INDEX_0;
initConfig.alarmPeriod           = 100;

objectHandle = SYS_TMR_Initialize( SYS_TMR_INDEX_0, ( SYS_MODULE_INIT * )&initConfig );
if( SYS_MODULE_OBJ_INVALID == objectHandle )
{
    // Handle error
}

```

Sample initialization sequence in polling environment:

```

void SYS_Initialize( SYS_INIT_DATA *data )
{
    /* Application Initialization */
    App_Init();

    /* Initialize the Timer driver */
    drvTmrObject = DRV_TMR_Initialize( DRV_TMR_INDEX_0, (SYS_MODULE_INIT *)&tmrInitData );

    /* Initialize the SYS TMR Module */
    sysTmrObject = SYS_TMR_Initialize( DRV_TMR_INDEX_0, (SYS_MODULE_INIT *)&sysTmrInitData );
}

```

Sample initialization sequence in an interrupt driven environment:

```

void SYS_Initialize( SYS_INIT_DATA *data )
{
    /* Application Initialization */
    App_Init();

    /* Initialize the Timer driver */
    drvTmrObject = DRV_TMR_Initialize( DRV_TMR_INDEX_0, ( SYS_MODULE_INIT * )&tmrInitData );

    /* Initialize the SYS TMR Module */
    sysTmrObject = SYS_TMR_Initialize( DRV_TMR_INDEX_0, ( SYS_MODULE_INIT * )&sysTmrInitData );

    /* Set the Timer Interrupt priority, sub-priority if supported by the device */
    SYS_INT_PrioritySet( INT_SOURCE_TIMER_1, INT_PRIORITY_LEVEL1 );
    SYS_INT_SubprioritySet( INT_SOURCE_TIMER_1, INT_SUBPRIORITY_LEVEL1 );

    /* Initialize the interrupt sub system module */
    SYS_INT_Initialize();
}

```

Deinitialization:

The deinitialize operation ([SYS_TMR_Deinitialize](#)) places the module in inactive state. Once the initialize operation has been called, the deinitialize operation must be called before the initialize is called again. If the operation requires time to allow the hardware to complete, this will be reported by the [SYS_TMR_Status](#) operation.

Status:

Status of the system timer module can be checked using [SYS_TMR_Status](#) interface. After the initialization, reinitialization or the deinitialization activities the System timer Service status can be retrieved and checked for further actions.

Tasks Routine:

The system will call [SYS_TMR_Tasks](#) from System Task Service no matter whether we are in a polled or an interrupt driven environment. This interface gets the system timer module into running mode. This interface needs to be called after the timer driver is successfully initialized.

Sample call order in case of a polling environment:

```

void SYS_Tasks( void )
{
    /* Call Driver TMR Tasks API */
    DRV_TMR_Tasks( drvTmrObject );

    /* Call SYS TMR Tasks API */
    SYS_TMR_Tasks( sysTmrObject );

    /* Call the Application Tasks */
    App_Tasks();
}

```

Sample call order in case of an interrupt driven environment:

```

void SYS_Tasks( void )
{
    /* Call SYS TMR Tasks */
    SYS_TMR_Tasks( sysTmrObject );

    /* Call the Application Tasks */
    App_Tasks();
}

void InterruptServiceRoutine( void )
{
    /* Call the timer driver's "Tasks" routine */
    DRV_TMR_Tasks( drvTmrObject );
}

```

5.7.8.4.3.2 Periodic Callback

This section deals with the periodic callback registration and its usage.

The following diagram depicts the interaction across various modules for the periodic callback feature,

Steps involved in registering & using the feature:

1. Set the Timer System Service in the running mode (SYS_MODULE_RUNNING). See description to set to running mode. Use the SYS_TMR_STATUS function to verify that the service is in this mode.
2. Register the periodic callback feature using the [SYS_TMR_CallbackPeriodic](#) with the period and the pointer to the callback routine. The period parameter should be integral multiple of the Timer driver alarm period. The interface 'SYS_TMR_CallbackPeriodic' returns a valid handle after successful registration.

Note: The handle can be later used by the user to stop the periodic callback temporarily by the user using the interface 'SYS_TMR_CallbackStop'. Based on the periodicity set by the user the respective callback would be triggered repetitively after it elapses.

Example use case of this feature is described below,

```

void SYS_Initialize ( SYS_INIT_DATA *data )
{
    /* Initialize the Timer driver */
    drvTmrObject = DRV_TMR_Initialize ( SYS_INDEX, (SYS_MODULE_INIT *)&tmrInitData );

    /* Initialize the SYS TMR Module */
    sysTmrObject = SYS_TMR_Initialize ( SYS_INDEX, (SYS_MODULE_INIT *)&sysTmrInitData );

    /* Application Initialization */
    App_Initialize ();
}

void SYS_Tasks(void)

```

```

{
    /* Call Driver TMR Tasks API */
    DRV_TMR_Tasks ( drvTmrObject );

    /* Call SYS TMR Tasks API */
    SYS_TMR_Tasks ( sysTmrObject );

    /* Call the App Tasks */
    App_Tasks ();
}

void App_Tasks ( void )
{
    switch (testState)
    {
        /* Wait in Init state till the SYS TMR Module is in running mode */
        case TEST_STATE_Init:
            if (SYS_MODULE_RUNNING == SYS_TMR_Status(sysTmrObject))
            {
                /* SYS TMR is in running mode */
                testState = TEST_STATE_Config_Periodic;
            }
            else
            {
                testState = TEST_STATE_Init;
            }
            break;

        case TEST_STATE_Config_Periodic:
            /* Activate periodic callback */
            handle = SYS_TMR_CallbackPeriodic (120, &Test_Callback);
            testState = TEST_STATE_Count_Read;
            break;

        case TEST_STATE_Count_Read:
            testCount1 = SYS_TMR_TickCountGet ();
            break;
    }
}

// Callback which will be called repetitively after the configured
// time elapses
void Test_Callback ( void )
{
    PORTA = ~PORTA;
}

```

Note: The configuration '[SYS_TMR_INTERRUPT_MODE](#)' has no impact on this feature.

Single Periodic Event Feature: The configuration macro/switch '[SYS_TMR_SINGLE_PERIODIC_EVENT](#)', if set true will enables single periodic event feature. After the user creates one periodic callback event, no other periodic callback events are allowed. In the sense, multiple periodic events cannot be registered.

Multiple Periodic Event Feature: The configuration macro/switch '[SYS_TMR_SINGLE_PERIODIC_EVENT](#)', if set false will enable multiple periodic event feature.

5.7.8.4.3.3 One Shot Callback

This section deals with the one-shot/single callback registration and its usage.

The following diagram depicts the interaction across various modules for the one-shot callback feature,

Steps involved in registering and using the feature:

1. Initial requirement is to have the Timer System Service module in the mode 'SYS_MODULE_RUNNING'. The user can call the function [SYS_TMR_Status](#) to get the current status information of the module.
2. One-shot/Single callback feature can be registered by calling the function '[SYS_TMR_CallbackSingle](#)' with the parameters periodicity of the callback & a pointer to the user's callback routine. The period parameter has to be integral multiple of the TMR driver alarm period.

Based on the periodicity set by the user the respective callback would be triggered once after it elapses.

Note: The handle can be later used by the user to stop the one shot callback temporarily by the user using the interface '[SYS_TMR_CallbackStop](#)'.

Example use case of this feature is described below,

```

void SYS_Initialize ( SYS_INIT_DATA *data )
{
    /* Initialize the Timer driver */
    drvTmrObject = DRV_TMR_Initialize ( SYS_INDEX, (SYS_MODULE_INIT *)&tmrInitData );

    /* Initialize the SYS TMR Module */
    sysTmrObject = SYS_TMR_Initialize ( SYS_INDEX, (SYS_MODULE_INIT *)&sysTmrInitData );

    /* Application Initialization */
    App_Initialize ();
}

void SYS_Tasks(void)
{
    /* Call Driver TMR Tasks API */
    DRV_TMR_Tasks ( drvTmrObject );

    /* Call SYS TMR Tasks API */
    SYS_TMR_Tasks ( sysTmrObject );

    /* Call the App Tasks */
    App_Tasks ();
}
  
```

```

void App_Tasks ( void )
{
    switch (testState)
    {
        /* Wait in Init state till the SYS TMR Module is in running mode */
        case TEST_STATE_Init:
            if (SYS_MODULE_RUNNING == SYS_TMR_Status(sysTmrObject))
            {
                /* SYS TMR is in running mode */
                testState = TEST_STATE_Config_Single;
            }
            else
            {
                testState = TEST_STATE_Init;
            }
            break;

        case TEST_STATE_Config_Single:
            /* Activate one shot/single callback */
            handle = SYS_TMR_CallbackSingle (120, &Test_Callback);
            testState = TEST_STATE_Count_Read;
            break;

        case TEST_STATE_Count_Read:
            testCount1 = SYS_TMR_TickCountGet ();
            break;
    }
}

// Callback which will be called repetitively after the configured
// time elapses
void Test_Callback ( void )
{
    PORTA = ~PORTA;
}

```

Note: The configuration '**SYS_TMR_INTERRUPT_MODE**' has no impact on this feature.

5.7.8.4.3.4 Delays

This section deals with the delay registration and its usage. The mechanism depicted supports only non-blocking delays.

The following diagram depicts the interaction across various modules for the delay feature,

Steps involved in registering and using the feature:

1. Initial requirement is to have the Timer System Service module in the mode 'SYS_MODULE_RUNNING'. The user can call the function [SYS_TMR_Status](#) to get the current status information of the module.
2. Delay feature can be registered by calling the function '[SYS_TMR_DelayMS](#)' with the delay parameter. The delay parameter has to be integral multiple of the Timer driver alarm period.

Note: The API '[SYS_TMR_DelayMS](#)' returns a valid handle after successful registration. This handle can be later used by the user to check the status of the delay using the API '[SYS_TMR_DelayStatusGet](#)'.

The following code fragment gives a typical use case for this feature,

```

case DELAY_START_STATE:
    handle = SYS_TMR_DelayMS (500);
    state = DELAY_CHECKSTATE;
break;

case DELAY_CHECKSTATE:
    if (SYS_TMR_DELAY_EXPIRED == SYS_TMR_DelayStatusGet(handle))
    {
        state = DELAY_START_STATE;
    }
    else
    {
        state = DELAY_CHECKSTATE;
    }
break;
  
```

Note: For the usage of the Delay feature, the configuration switch '[SYS_TMR_INTERRUPT_MODE](#)' needs to be set to 'true'.

5.7.8.4.3.5 Miscellaneous

Tick Counts Information: The API '[SYS_TMR_TickCountGet](#)' provides the current tick information.

Alarm Period: The previously configured alarm period can be obtained using the interface '[SYS_TMR_AlarmPeriodGet](#)'. Period chosen for the periodic/one shot callback should be a multiple of the driver's alarm period. Say if the alarm period is 10ms, then the period should be a multiple of 10.

5.7.8.4.3.6 Examples

Sample application tasks:

Periodic callback with only one period with 120 ms period:

```
switch (state)
{
    case STATE_Init:
        if (SYS_MODULE_RUNNING == SYS_TMR_Status(sysTmrObject))
        {
            state = STATE_Config_Periodic;
        }
        else
        {
            state = STATE_Init;
        }
        break;

    case STATE_Config_Periodic:
        handle = SYS_TMR_CallbackPeriodic (120, &Test_Callback);
        state = STATE_Count_Read;
        break;

    case STATE_Count_Read:
        testCount = SYS_TMR_TickCountGet ();
        state = STATE_Count_Read;
        break;
}
```

Periodic callback with multiple periods 120 ms and 250 ms:

```
switch (state)
{
    case STATE_Init:
        if (SYS_MODULE_RUNNING == SYS_TMR_Status(sysTmrObject))
        {
            state = STATE_Config_Periodic;
        }
        else
        {
            state = STATE_Init;
        }
        break;

    case STATE_Config_Periodic:
        handle1 = SYS_TMR_CallbackPeriodic (120, &Test_Callback1);
        handle2 = SYS_TMR_CallbackPeriodic (250, &Test_Callback2);
        state = STATE_Count_Read;
        break;

    case STATE_Count_Read:
        testCount = SYS_TMR_TickCountGet ();
        state = STATE_Count_Read;
        break;
}

void Test_Callback1 ( void )
{
    /* Assume RA0 is connected to one LED */
    PORTAbits.RA0 = ~PORTAbits.RA0;
}

void Test_Callback2 ( void )
{
    /* Assume RA1 is connected to another LED */
```

```
    PORTAbits.RA1 = ~PORTAbits.RA1;
}
```

One-Shot Callback:

```
switch (state)
{
    case STATE_Init:
        if (SYS_MODULE_RUNNING == SYS_TMR_Status(sysTmrObject))
        {
            state = STATE_Config_Single;
        }
        else
        {
            state = STATE_Init;
        }
        break;

    case STATE_Config_Single:
        SYS_TMR_CallbackSingle (500, &Test_Callback);
        state = STATE_Count_Read;
        break;

    case STATE_Count_Read:
        testCount = SYS_TMR_TickCountGet ();
        state = STATE_Count_Read;
        break;
}
```

Delay:

```
switch (state)
{
    case STATE_Init:
        if (SYS_MODULE_RUNNING == SYS_TMR_Status(sysTmrObject))
        {
            state = STATE_DelayStart;
        }
        else
        {
            state = STATE_Init;
        }
        break;

    case STATE_DelayStart:
        dlHandle = SYS_TMR_DelayMS (500);
        state = STATE_DelayCheck;
        break;

    case STATE_DelayCheck:
        if (SYS_TMR_DELAY_EXPIRED == SYS_TMR_DelayStatusGet(dlHandle))
        {
            state = STATE_DelayStart;
        }
        else
        {
            state = STATE_DelayCheck;
        }
        break;
}
```

5.7.8.5 Configuring the Library

Macros

	Name	Description
	SYS_TMR_ERROR_TOLERANCE	Sets the error tolerance in milliseconds.
	SYS_TMR_INTERRUPT_MODE	Activates the Interrupt mode.
	SYS_TMR_SINGLE_PERIODIC_EVENT	Sets the type of the periodic event.
	SYS_TMR_MAX_PERIODIC_EVENTS	Sets the maximum periodic multi-event callbacks supported.

Description

The configuration of the Timer System Service is based on the file `sys_config.h`.

This header file contains the configuration selection for the Timer System Service build. Based on the selections made, the Timer System Service will support or not support selected features. These configuration settings will apply to all instances of the Timer System Service.

This header can be placed anywhere, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.7.8.5.1 SYS_TMR_ERROR_TOLERANCE Macro

C

```
#define SYS_TMR_ERROR_TOLERANCE 0
```

Description

Error Tolerance configuration

This macro sets the error tolerance in milliseconds with reference to the configured alarm period of the timer driver.

Remarks

None.

5.7.8.5.2 SYS_TMR_INTERRUPT_MODE Macro

C

```
#define SYS_TMR_INTERRUPT_MODE false
```

Description

Interrupt Mode configuration

This macro sets up the interrupt mode, which can [accept](#) the following values:

- true - Interrupt mode
- false - No Interrupt mode

Remarks

The delay feature works only if the Interrupt mode is set to 'true' and the respective Timer has been configured for Interrupt mode. This feature has been designed to provide a non-blocking delay.

5.7.8.5.3 SYS_TMR_SINGLE_PERIODIC_EVENT Macro

C

```
#define SYS_TMR_SINGLE_PERIODIC_EVENT true
```

Description

Periodic event type configuration

This macro sets the type of the periodic event, which can [accept](#) the following values:

- true - Single periodic event
- false - Multiple periodic events

Remarks

If multiple periodic events are enabled, the switch [SYS_TMR_MAX_PERIODIC_EVENTS](#) has to be configured to support the maximum permitted events.

5.7.8.5.4 SYS_TMR_MAX_PERIODIC_EVENTS Macro

C

```
#define SYS_TMR_MAX_PERIODIC_EVENTS 5
```

Description

Maximum periodic events configuration

This macro sets the maximum periodic multi-event callbacks.

Remarks

This requires multiple periodic events enabled through the switch [SYS_TMR_SINGLE_PERIODIC_EVENT](#).

5.7.8.6 Building the Library

5.7.8.7 Library Interface

Data Types and Constants

	Name	Description
	SYS_TMR_CALLBACK	Defines a pointer to a callback function.
	SYS_TMR_DELAY_STATUS	Defines the callback service type.
	SYS_TMR_HANDLE	Identifies a particular registered event instance.
	SYS_TMR_INIT	Identifies the system timer initialize structure.
	SYS_TMR_HANDLE_INVALID	Identifies the invalid handle of the system timer.
	SYS_TMR_INDEX_0	Timer System Service index definitions.
	SYS_TMR_RUNNING	Identifies the current status/state of the system timer.

Miscellaneous Functions

	Name	Description
≡	SYS_TMR_AlarmPeriodGet	Returns the previously configured alarm period.
≡	SYS_TMR_TickCountGet	Provides the current counter value.

System Level Interaction Functions

	Name	Description
≡	SYS_TMR_Deinitialize	Deinitializes the specific module instance of the TMR module
≡	SYS_TMR_Initialize	Initializes hardware and data for the instance of the Timer module and opens the specific module instance.
≡	SYS_TMR_Reinitialize	Reinitializes and refreshes the hardware for the instance of the Timer module.
≡	SYS_TMR_Status	Returns status of the specific instance of the Timer module.
≡	SYS_TMR_Tasks	Maintains the system timer's state machine and implements its ISR.

Timed Callback Functions

	Name	Description
≡	SYS_TMR_CallbackPeriodic	The Periodic callback is registered and started using this function.
≡	SYS_TMR_CallbackSingle	The one-shot/single callback is registered and started using this function.
≡	SYS_TMR_CallbackStop	Stops the periodic callback service.

Timed Delay Functions

	Name	Description
≡	SYS_TMR_DelayMS	Registers an event for the specified delay.
≡	SYS_TMR_DelayStatusGet	Intimates if the previously configured delay has elapsed.

Description

This section describes the APIs of the Timer System Service Library.

Refer to each section for a detailed description.

5.7.8.7.1 System Level Interaction Functions**5.7.8.7.1.1 SYS_TMR_Deinitialize Function****C**

```
void SYS_TMR_Deinitialize(
    SYS_MODULE_OBJ object
);
```

Description

This function deinitializes the specific module instance disabling its operation (and any hardware for driver modules). Resets all of the internal data structures and fields for the specified instance to the default settings.

Preconditions

The [SYS_TMR_Initialize](#) function should have been called before calling this function.

Parameters

Parameters	Description
object	SYS TMR object handle, returned from SYS_TMR_Initialize

Returns

None.

Example

```
SYS_MODULE_OBJ    object;    // Returned from SYS_TMR_Initialize
SYS_STATUS        status;
```

```
SYS_TMR_Deinitialize (object);
```

```
status = SYS_TMR_Status (object);
if (SYS_MODULE_DEINITIALIZED == status)
{
    // Check again later if you need to know
    // when the SYS TMR is deinitialized.
}
```

Remarks: Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again.

5.7.8.7.1.2 SYS_TMR_Initialize Function**C**

```
SYS_MODULE_OBJ SYS_TMR_Initialize(
    const SYS_MODULE_INDEX index,
    const SYS_MODULE_INIT * const init
);
```

Description

This function initializes hardware for the instance of the Timer module, using the specified hardware initialization data. It also initializes any internal data structures.

Preconditions

None.

Parameters

Parameters	Description
index	Index for the instance to be initialized
init	Pointer to a data structure containing any data necessary to initialize the sys timer. This pointer may be null if no data is required because static overrides have been provided.

Returns

If successful, returns a valid handle to an object. Otherwise, it returns [SYS_MODULE_OBJ_INVALID](#). The returned object must be passed as argument to [SYS_TMR_Reinitialize](#), [SYS_TMR_Deinitialize](#), [SYS_TMR_Tasks](#) and [SYS_TMR_Status](#) routines.

Example

```
SYS_MODULE_OBJ    objectHandle;
SYS_TMR_INIT      initConfig;

// Populate the timer initialization structure
initConfig.moduleInit.value      = SYS_MODULE_POWER_RUN_FULL;
initConfig.drvIndex             = DRV_TMR_INDEX_0;
initConfig.alarmPeriod           = 100;

objectHandle = SYS_TMR_Initialize (SYS_TMR_INDEX_0, (SYS_MODULE_INIT*)&initConfig);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}
```

Remarks: This routine should only be called once during system initialization unless SYS_TMR_Deinitialize is first called to deinitialize the device instance before reinitializing it. If the system was already initialized it safely returns without causing any disturbance.

5.7.8.7.1.3 SYS_TMR_Reinitialize Function

C

```
void SYS_TMR_Reinitialize(
    SYS_MODULE_OBJ object,
    const SYS_MODULE_INIT * const init
);
```

Description

This function reinitializes and refreshes the hardware for the instance of the Timer module using the supplied data. It modifies the internal data structure.

Preconditions

The [SYS_TMR_Initialize](#) function should have been called before calling this function.

Parameters

Parameters	Description
object	Identifies the SYS TMR Object returned by the Initialize interface
init	Pointer to the data structure containing any data necessary to initialize the hardware

Returns

None

Example

```
SYS_MODULE_OBJ  objectHandle;
SYS_TMR_INIT    initConfig;
SYS_STATUS      tmrStatus;

// Populate the timer initialization structure
initConfig.moduleInit.value      = SYS_MODULE_POWER_RUN_FULL;
initConfig.drvIndex              = DRV_TMR_INDEX_0;
initConfig.alarmPeriod           = 100;

SYS_TMR_Reinitialize (objectHandle, (SYS_MODULE_INIT*)&initConfig);

tmrStatus = SYS_TMR_Status (object);
if (SYS_STATUS_BUSY == tmrStatus)
{
    // Check again later to ensure the driver is ready
}
else if (SYS_STATUS_ERROR >= tmrStatus)
{
    // Handle error
}
```

Remarks: This operation uses the same initialization data structure as the SYS_TMR_Initialize operation. This operation can be used to change the power state of a TMR module. This function can be called multiple times to reinitialize the module. This operation uses the same initialization data structure as the Initialize operation. This operation can also be used to refresh the hardware registers as defined by the initialization data.

5.7.8.7.1.4 SYS_TMR_Status Function

C

```
SYS_STATUS SYS_TMR_Status(  
    SYS_MODULE_OBJ object  
);
```

Description

This function returns the status of the specific module instance disabling its operation (and any hardware for driver modules).

Preconditions

The [SYS_TMR_Initialize](#) function should have been called before calling this function.

Parameters

Parameters	Description
object	SYS TMR object handle, returned from SYS_TMR_Initialize

Returns

SYS_STATUS_READY - Indicates that the driver is busy with a previous system level operation and cannot start another

Remarks

Any value greater than SYS_STATUS_READY is also a normal running state in which the driver is ready to [accept](#) new operations

SYS_STATUS_BUSY - Indicates that the driver is busy with a previous system level operation and cannot start another

SYS_STATUS_ERROR - Indicates that the driver is in an error state

Any value less than SYS_STATUS_ERROR is also an error state.

SYS_MODULE_DEINITIALIZED - Indicates that the driver has been de-initialized

This value is less than SYS_STATUS_ERROR.

Example

```
SYS_MODULE_OBJ    object;    // Returned from SYS_TMR_Initialize  
SYS_STATUS        tmrStatus;  
  
tmrStatus = SYS_TMR_Status (object);  
else if (SYS_STATUS_ERROR >= tmrStatus)  
{  
    // Handle error  
}
```

Remarks: Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again.

5.7.8.7.1.5 SYS_TMR_Tasks Function

C

```
void SYS_TMR_Tasks(  
    SYS_MODULE_OBJ object  
);
```

Description

This function is used to maintain the system timer's internal state machine and implement its ISR for interrupt-driven implementations.

Preconditions

The [SYS_TMR_Initialize](#) function must have been called for the specified TMR driver instance.

Parameters

Parameters	Description
object	SYS TMR object handle, returned from SYS_TMR_Initialize

Returns

None

Remarks

This function is normally not called directly by an application. It is called by the system's Tasks routine ([SYS_Tasks](#)) or by the appropriate raw ISR.

Example

```
SYS_MODULE_OBJ    object;    // Returned from SYS_TMR_Initialize

while (true)
{
    SYS_TMR_Tasks (object);

    // Do other tasks
}
```

5.7.8.7.2 Timed Callback Functions

5.7.8.7.2.1 SYS_TMR_CallbackPeriodic Function

C

```
SYS_TMR_HANDLE SYS_TMR_CallbackPeriodic(
    unsigned int period,
    SYS_TMR_CALLBACK callback
);
```

Description

This function registers the periodic callback service corresponding to the configuration parameters passed by the user.

Preconditions

The [SYS_TMR_Initialize](#) function should have been called before calling this function.

Parameters

Parameters	Description
period	Periodic delay in milliseconds
callback	Pointer to a callback routine that will be called periodically

Returns

A valid event handler of type [SYS_TMR_HANDLE](#) is returned.

Example

```
SYS_TMR_HANDLE handle;
unsigned int period = 20;

void Test_Callback1 (void);

handle = SYS_TMR_CallbackPeriodic (period, &Test_Callback1);
```

Remarks: The Period chosen should be a multiple of the driver's alarm period. For example, if the alarm period is 10 ms, the period should be a multiple of 10.

5.7.8.7.2.2 SYS_TMR_CallbackSingle Function

C

```
SYS_TMR_HANDLE SYS_TMR_CallbackSingle(  
    unsigned int period,  
    SYS_TMR_CALLBACK callback  
);
```

Description

This function registers a one-shot/single callback service corresponding to the configuration parameters passed by the user.

Preconditions

The [SYS_TMR_Initialize](#) function should have been called before calling this function.

Parameters

Parameters	Description
period	Periodic delay in milliseconds
callback	Pointer to a callback routine which will be called periodically

Returns

A valid event handler of type [SYS_TMR_HANDLE](#) is returned.

Example

```
SYS_TMR_HANDLE handle;  
unsigned int period = 20;  
void Test_Callback1 (void);
```

```
handle = SYS_TMR_CallbackSingle (period, &Test_Callback1);  
Remarks: None.
```

5.7.8.7.2.3 SYS_TMR_CallbackStop Function

C

```
void SYS_TMR_CallbackStop(  
    SYS_TMR_HANDLE handle  
);
```

Description

This function stops the previously registered periodic callbacks service.

Preconditions

The [SYS_TMR_CallbackPeriodic](#) function should have been called before calling this function.

Parameters

Parameters	Description
handle	A valid callback service handle, returned from the system API SYS_TMR_CallbackPeriodic

Returns

None.

Example

```
SYS_TMR_HANDLE handle;  
uint16_t period = 20;
```

```
void Test_Callback1 (void);  
handle = SYS_TMR_CallbackPeriodic (period, &Test_Callback1);  
...  
...  
SYS_TMR_CallbackStop (handle);  
Remarks:    None.
```

5.7.8.7.3 Timed Delay Functions

5.7.8.7.3.1 SYS_TMR_DelayMS Function

C

```
SYS_TMR_HANDLE SYS_TMR_DelayMS(  
    unsigned int delay  
);
```

Description

This function registers an event for the specified delay.

Preconditions

The [SYS_TMR_Initialize](#) function should have been called before calling this function.

Parameters

Parameters	Description
delay	Indicates the delay required in milliseconds

Returns

A valid event handler of type [SYS_TMR_HANDLE](#) is returned.

Example

```
SYS_TMR_DelayStart (50);  
Remarks:    Works only in Interrupt mode.
```

5.7.8.7.3.2 SYS_TMR_DelayStatusGet Function

C

```
SYS_TMR_DELAY_STATUS SYS_TMR_DelayStatusGet(  
    SYS_TMR_HANDLE handle  
);
```

Description

This function intimates if the previously configured delay has elapsed.

Preconditions

The [SYS_TMR_DelayStart](#) function should have been called before calling this function.

Parameters

Parameters	Description
handle	A valid callback service handle, returned from the system API SYS_TMR_DelayMS

Returns

One of the possible values of [SYS_TMR_DELAY_STATUS](#).

Example

```
if (SYS_TMR_DELAY_EXPIRED == SYS_TMR_DelayStatusGet ())  
    // Do Something  
Remarks:    None.
```

5.7.8.7.4 Miscellaneous Functions

5.7.8.7.4.1 SYS_TMR_AlarmPeriodGet Function

C

```
uint32_t SYS_TMR_AlarmPeriodGet();
```

Description

This function obtains the previously configured alarm period.

Preconditions

The [SYS_TMR_Initialize](#) function should have been called before calling this function.

Returns

uint32_t - Alarm period in milliseconds

Example

```
uint32_t period;  
period = SYS_TMR_AlarmPeriodGet();  
Remarks:    None.
```

5.7.8.7.4.2 SYS_TMR_TickCountGet Function

C

```
uint32_t SYS_TMR_TickCountGet();
```

Description

This function provides the current counter value.

Preconditions

The [SYS_TMR_CallbackPeriodic](#) function should have been called before calling this function.

Returns

uint32_t - Current system timer tick count value

Example

```
uint32_t count;  
count = SYS_TMR_TickCountGet ();  
Remarks:    None.
```

5.7.8.7.5 Data Types and Constants

5.7.8.7.5.1 SYS_TMR_CALLBACK Type

C

```
typedef void (* SYS_TMR_CALLBACK)(void);
```

Description

SYS TMR Callback Function

This data type defines a pointer callback function.

Remarks

None.

5.7.8.7.5.2 SYS_TMR_DELAY_STATUS Enumeration

C

```
typedef enum {
    SYS_TMR_DELAY_IDLE,
    SYS_TMR_DELAY_EXPIRED,
    SYS_TMR_DELAY_NOT_EXPIRED,
    SYS_TMR_DELAY_ERROR
} SYS_TMR_DELAY_STATUS;
```

Description

Callback service type enumeration

This data type defines the callback service type.

Members

Members	Description
SYS_TMR_DELAY_IDLE	Delay Idle
SYS_TMR_DELAY_EXPIRED	Delay Expired
SYS_TMR_DELAY_NOT_EXPIRED	Delay not yet expired
SYS_TMR_DELAY_ERROR	delay error

Remarks

None.

5.7.8.7.5.3 SYS_TMR_HANDLE Type

C

```
typedef int8_t SYS_TMR_HANDLE;
```

Description

SYS TMR Handle

This event handle identifies a registered instance of an event. Every time the application that tries to access the paramateres with respect to a particular event, shall used this event handle to refer to that event.

Remarks

None.

5.7.8.7.5.4 SYS_TMR_INIT Structure

C

```
typedef struct {
    SYS_MODULE_INIT moduleInit;
    SYS_MODULE_INDEX drvIndex;
    uint32_t alarmPeriod;
} SYS_TMR_INIT;
```

Description

SYS TMR Initialize structure

This structure identifies the system timer initialize structure.

Members

Members	Description
SYS_MODULE_INIT moduleInit;	System module initialization
SYS_MODULE_INDEX drvIndex;	Driver Module index
uint32_t alarmPeriod;	Alarm period in ms

Remarks

None.

5.7.8.7.5.5 SYS_TMR_HANDLE_INVALID Macro**C**

```
#define SYS_TMR_HANDLE_INVALID ((int8_t)-1)
```

Description

SYS Timer invalid handle macro definition

This enumeration identifies the invalid handle of the system timer.

Remarks

None.

5.7.8.7.5.6 SYS_TMR_INDEX_0 Macro**C**

```
#define SYS_TMR_INDEX_0 0
```

Description

SYS Timer Module Index Numbers

These constants provide Timer System Service index definitions.

Remarks

These constants should be used in place of hard-coded numeric literals.

5.7.8.7.5.7 SYS_TMR_RUNNING Macro**C**

```
#define SYS_TMR_RUNNING (SYS_STATUS_READY + 1)
```

Description

SYS Timer Module specific Status

This enumeration identifies the current status/state of the system timer.

Remarks

This enumeration is the return type for the system-level status routine defined by each device driver or system module (for example: [SYS_TMR_Status](#)).

5.7.8.8 Files

Files

Name	Description
sys_tmr.h	Timer System Service interface definition.
sys_tmr_config.h	Contains configuration definitions that are common to timer system services and aggregates the configuration files for the system services.

Description

5.7.8.8.1 sys_tmr.h

Timer System Service Interface Definition

This file contains the interface definition for the Timer System Service. It provides a way to interact with the Timer subsystem to manage the timing requests supported by the system.

Enumerations

	Name	Description
	SYS_TMR_DELAY_STATUS	Defines the callback service type.

Functions

	Name	Description
	SYS_TMR_AlarmPeriodGet	Returns the previously configured alarm period.
	SYS_TMR_CallbackPeriodic	The Periodic callback is registered and started using this function.
	SYS_TMR_CallbackSingle	The one-shot/single callback is registered and started using this function.
	SYS_TMR_CallbackStop	Stops the periodic callback service.
	SYS_TMR_Deinitialize	Deinitializes the specific module instance of the TMR module
	SYS_TMR_DelayMS	Registers an event for the specified delay.
	SYS_TMR_DelayStatusGet	Intimates if the previously configured delay has elapsed.
	SYS_TMR_Initialize	Initializes hardware and data for the instance of the Timer module and opens the specific module instance.
	SYS_TMR_Reinitialize	Reinitializes and refreshes the hardware for the instance of the Timer module.
	SYS_TMR_Status	Returns status of the specific instance of the Timer module.
	SYS_TMR_Tasks	Maintains the system timer's state machine and implements its ISR.
	SYS_TMR_TickCountGet	Provides the current counter value.

Macros

	Name	Description
	SYS_TMR_HANDLE_INVALID	Identifies the invalid handle of the system timer.
	SYS_TMR_INDEX_0	Timer System Service index definitions.
	SYS_TMR_RUNNING	Identifies the current status/state of the system timer.

Structures

	Name	Description
	SYS_TMR_INIT	Identifies the system timer initialize structure.

Types

	Name	Description
	<u>SYS_TMR_CALLBACK</u>	Defines a pointer to a callback function.
	<u>SYS_TMR_HANDLE</u>	Identifies a particular registered event instance.

File Name

sys_tmr.h

Company

Microchip Technology Inc.

5.7.8.8.2 sys_tmr_config.h

Timer System Service Configuration Definitions for the Template Version

This file contains configuration definitions that are common to timer drivers and aggregates the configuration files for the system services.

Macros

	Name	Description
	<u>SYS_TMR_ERROR_TOLERANCE</u>	Sets the error tolerance in milliseconds.
	<u>SYS_TMR_INTERRUPT_MODE</u>	Activates the Interrupt mode.
	<u>SYS_TMR_MAX_PERIODIC_EVENTS</u>	Sets the maximum periodic multi-event callbacks supported.
	<u>SYS_TMR_SINGLE_PERIODIC_EVENT</u>	Sets the type of the periodic event.

File Name

sys_tmr_config.h

Company

Microchip Technology Inc.

5.7.9 Watchdog Timer (WDT) System Service Library

5.7.9.1 Introduction

Watchdog Timer (WDT) System Service Library**for****Microchip Microcontrollers**

The primary function of the Watchdog Timer (WDT) is to reset the microcontroller, in the event of a software malfunction, by resetting the device if it has not been cleared by software. To ensure that application doesn't hang, the application is required to reset the timer periodically. It can also be used to wake the device from Sleep or Idle mode. The WDT is a free-running timer which uses the low-power RC oscillator and requires no external components. Therefore, the WDT will continue to operate even if the system's primary clock source is stopped.

This library provides a low-level abstraction of the Watchdog Timer System Service Library that is available on the Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, there by abstracting differences from one microcontroller variant to another.

5.7.9.2 Release Notes

MPLAB Harmony Version: v0.70b **Watchdog Timer (WDT) System Service Library Version :** 0.1 **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.7.9.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.7.9.4 Using the Library

This topic describes the basic architecture of the Watchdog Timer System Service Library and provides information and examples on how to use it.

Interface Header File: [sys_wdt.h](#)

The interface to the Watchdog Timer System Service library is defined in the "[sys_wdt.h](#)" header file. This file is included by the "sys.h" file. Any C language source (.c) file that uses the Watchdog Timer System Service library should include "sys.h".

Library File:

The Watchdog Timer System Service library archive (.a) file installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the System Service interacts with the framework.

5.7.9.4.1 Abstraction Model

Watchdog Timer Software Abstraction Block Diagram

Watchdog timer uses internal Low Power RC(LPRC) oscillator as the source of clock. The clock is divided by the configured prescaler value. There may be one more postscaler divisors and these should be set through the 'configuration bits'. The divided clock is then used to increment a counter. If the software does not clear the counter in time the counter overflows and that will result in reset in normal mode. In case of Sleep or Idle mode the overflow will result in device wakeup.

In case of windowed mode, resetting the counter when the count is not in the window specified will also lead to a reset.

5.7.9.4.2 Library Overview

Refer to the [System Services Overview](#) section for how the system services operates in a system.

The library interface routines are divided into various sub-sections, each sub-section addresses one of the blocks of the overall operation of the Watchdog Timer module.

Library Interface Section	Description
Enable and Disable Functions	APIs to enable and disable the Watchdog Timer
Clearing the Timer Functions	API to clear the Watchdog Timer

5.7.9.4.3 How the Library Works

Initialization of Watchdog Timer:

In case of devices which has 'Window mode', use the argument to control the window mode. The argument will be discarded in case of devices which doesn't has 'Window mode'.

```
SYS_WDT_Enable(true);  
  
//Some code  
SYS_WDT_Enable(false);  
  
//Some code  
SYS_WDT_Disable();
```

Note: For all the above code to work, the watchdog timer should not be controlled through configuration bits.

Service the Watchdog Timer:

To ensure the normal operation of the system, the software must clear the Watchdog timer periodically.

```
SYS_WDT_TimerClear();
```

Note: Not all modes are available on all devices. Please refer to the specific device data sheet to determine the supported modes.

5.7.9.5 Configuring the Library

Macros

	Name	Description
	WDT_PLIB_ID	Configures the module's ID used by the peripheral library.

Description

The configuration of the Watchdog Timer System Service is based on the file `sys_config.h`

This header file contains the configuration selection for the Watchdog Timer System Service. Based on the selections made, the Watchdog Timer System Service will support or not support selected features. These configuration settings will apply to all instances of the Watchdog Timer System Service.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.7.9.5.1 WDT_PLIB_ID Macro

C

```
#define WDT_PLIB_ID WDT_ID_1
```

Description

Watchdog timer module ID used by the Peripheral Library

This macro configures the module's ID used by the peripheral library.

Remarks

None.

5.7.9.6 Building the Library

This section list the files that are available in the `\src` of the Watchdog Timer System Service driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

5.7.9.7 Library Interface

Clearing the Timer Functions

	Name	Description
	SYS_WDT_TimerClear	Reset the WDT.

Enable and Disable Functions

	Name	Description
	SYS_WDT_Disable	Disables the WDT if it is enabled in software.
	SYS_WDT_Enable	Enables the WDT. The argument 'windowModeEnable' will be used only for those devices that support 'window mode'. Otherwise, it will be discarded.

Description

This section describes the Application Programming Interface (API) functions of the Watchdog Timer System Service.

Refer to each section for a detailed description.

5.7.9.7.1 Enable and Disable Functions

5.7.9.7.1.1 SYS_WDT_Disable Function

C

```
void SYS_WDT_Disable();
```

Description

This function disables the WDT if it is enabled in software. If the WDT is enabled through 'configuration bits' it cannot be disabled using this function.

Preconditions

The WDT should be disabled through 'configuration bits'.

Returns

None.

Remarks

The example code doesn't include the settings that should be done through configuration bits.

Example

```
SYS_WDT_Disable();
```

5.7.9.7.1.2 SYS_WDT_Enable Function

C

```
void SYS_WDT_Enable(  
    bool windowModeEnable  
);
```

Description

This function enables the WDT. The argument 'windowModeEnable' will be used only for those devices that support 'window mode'. Otherwise, the argument will be discarded. This function could be called multiple times to enable/disable the 'window mode'.

Preconditions

None.

Parameters

Parameters	Description

5.7.9.7.2 Clearing the Timer Functions

5.7.9.7.2.1 SYS_WDT_TimerClear Function

C

```
void SYS_WDT_TimerClear();
```

Description

This function clears the WDT counter. The WDT should be cleared periodically before the count overflows and forces the device to Reset.

Preconditions

None.

Returns

None.

Remarks

Clearing the WDT before the count reaches the window, will cause a reset in Windowed mode.

The example code doesn't include the settings that should be done through Configuration bits.

This feature is not available on all devices. Please refer to the specific device data sheet to determine whether this feature is supported.

Example

```
//Application loop
while(1)
{
    SYS_WDT_TimerClear();
    //user code
}
```

5.7.9.8 Files

Files

Name	Description
sys_wdt.h	Watchdog Timer (WDT) System Service interface definition.
sys_wdt_config.h	Watchdog Timer (WDT) System Service interface definition.

Description

5.7.9.8.1 sys_wdt.h

Watchdog Timer System Service Interface Definition

This file contains the interface definition for the WDT System Service. It provides a way to interact with the WDT subsystem to manage the timing requests supported by the system.

Functions

	Name	Description
	SYS_WDT_Disable	Disables the WDT if it is enabled in software.
	SYS_WDT_Enable	Enables the WDT. The argument 'windowModeEnable' will be used only for those devices that support 'window mode'. Otherwise, it will be discarded.
	SYS_WDT_TimerClear	Reset the WDT.

5.8 TCP/IP Stack Library Help

5.8.1 TCP/IP Library Overview

5.8.1.1 Introduction

This topic provides an overview of the TCP/IP Stack in MPLAB Harmony.

Description

The MPLAB Harmony TCP/IP Stack provides a foundation for embedded network applications by handling most of the interaction required between the physical network port and your application. It includes modules for several commonly used application layers, including HTTP for serving web pages, SMTP for sending e-mails, SNMP for providing status and control, Telnet, TFTP, Serial-to-Ethernet and much more. In addition, the stack includes light-weight and high-performance implementations of the TCP and UDP transport layers, as well as other supporting modules such as IP, ICMP, DHCP, ARP, and DNS.

This help file serves two purposes. The first is to be a guide for first-time users of the TCP/IP Stack. The Getting Started section begins a series of pages to help you become familiar with the stack and configure it for use on a Microchip development board.

The second purpose is to serve as a programmer's reference guide to the features and APIs available in the TCP/IP Stack.

5.8.1.2 Release Notes

MPLAB Harmony Version: v0.70b **TCP/IP Stack Library Version :** 1.0 **Release Date:** 18Nov2013

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Description

Resource Usage and Network Metrics for the PIC32MX

Memory and Flash usage

Module	RAM No Optimization	Flash No Optimization	RAM Optimize for Size	Flash Optimize for Size	RAM Optimized for Speed	Flash Optimized for Speed
Core (arp, tcp manager, tcp helpers, hash functions, etc.)	356	51,380	352	24,772	352	34,812
Berkeley API	116	7,464	116	4,116	116	7,080

Commands for TCP Configuration	120	18,348	120	13,104	124	14,556
DHCP Client	40	11,328	40	6,036	44	7,676
DHCP Server	76	15,188	76	7,464	76	10,456
DNS Client	66	6,868	62	3,496	68	4,368
DNS Server	86	2,276	86	1,052	88	1,192
FTP Server	40	11,368	40	5,384	40	6,548
HTTP Server	24	19,964	24	10,404	24	13,128
ICMPv4 Server	20	2,472	20	1,112	20	1,264
ICMPv6 Server	20	11,852	20	6,332	20	7,336
IPerf	252	22,344	252	12,136	252	14,240
IPv4	40	4,572	40	2,348	40	2,640
IPv6	224	45,488	224	25,060	224	40,480
Microchip Embedded Ethernet Device Discoverer	36	3,280	36	1,764	36	2,164
NetBIOS Name Resolution	12	2,884	12	1,372	12	2,024
Reboot Server	12	1,048	12	576	12	764
SMTP Client	98	8,252	102	4,324	104	6,052
SNMP Server	72	30,616	68	16,244	72	28,900
SNMPv3 Server	864	32,600	864	15,580	864	27,052
SNTP Client	72	2,796	72	1,572	72	1,780
SSL	72	33,416	72	18,096	72	49,252
TCP Protocol	28	42,268	28	21,604	32	28,556
Telnet Server	28	3,708	28	1,908	28	2,236
UDP Protocol	36	17,052	36	9,308	40	11,884
Zero Config for Local Link	25	22,296	25	10,892	25	13,116

Network Performance measured with iPerf

The following commands were used to generate the performance numbers:

- UDP/IP Client:
 - **PIC32 Board:** iperf -c <PC IP Address> -u -b 100M -i 5 -t 20
 - **PC:** iperf -s -u -i 5
- UDP/IP Server:
 - **PIC32 Board:** iperf -s -u -i 5
 - **PC:** iperf -c mchpboard_e -u -b 100M -i 5 -t 20
- TCP/IP Client
 - **PIC32 Board:** iperf -c <PC IP Address> -t 10 -i 5 -l 1024 -x 100M -M 1460
 - **PC:** iperf -s -i 5 -m -w 10K -N
- TCP/IP Server
 - **PIC32 Board:** iperf -s -i 5 -x 100M

- **PC:** iperf -c mchpboard_e -t 10 -i 5 -l 1024

UDP/IP Client	UDP/IP Server	TCP/IP Client	TCP/IP Server
89.3 MBits/sec	95.7 MBits/sec	50.1 MBits/sec	60.3 MBits/sec

Resource Usage and Network Metrics for the PIC32MZ

Memory and Flash usage

Module	RAM No Optimization	Flash No Optimization	RAM Optimized for Size	Flash Optimized for Size	RAM Optimized for Speed	Flash Optimized for Speed
Core (arp, tcp manager, tcp helpers, hash functions, etc.)	356	51,112	352	24,868	352	34,632
Berkeley API	116	7,348	116	4,116	116	7,056
Commands for TCP Configuration	120	18,232	120	13,084	124	14,472

5.8.1.3 SW License Agreement

MICROCHIP IS WILLING TO LICENSE THE ACCOMPANYING SOFTWARE AND DOCUMENTATION TO YOU ONLY ON THE CONDITION THAT YOU ACCEPT ALL OF THE FOLLOWING TERMS. TO ACCEPT THE TERMS OF THIS LICENSE, CLICK "I ACCEPT" AND PROCEED WITH THE DOWNLOAD OR INSTALL. IF YOU DO NOT ACCEPT THESE LICENSE TERMS, CLICK "I DO NOT ACCEPT," AND DO NOT DOWNLOAD OR INSTALL THIS SOFTWARE.

NON-EXCLUSIVE SOFTWARE LICENSE AGREEMENT

This Nonexclusive Software License Agreement ("Agreement") is a contract between you, your heirs, successors and assigns ("Licensee") and Microchip Technology Incorporated, a Delaware corporation, with a principal place of business at 2355 W. Chandler Blvd., Chandler, AZ 85224-6199, and its subsidiary, Microchip Technology (Barbados) II Incorporated (collectively, "Microchip") for the accompanying Microchip software including, but not limited to, Graphics Library Software, IrDA Stack Software, MCHPFSUSB Stack Software, Memory Disk Drive File System Software, mTouch(TM) Capacitive Library Software, Smart Card Library Software, TCP/IP Stack Software, MiWi(TM) DE Software, Security Package Software, and/or any PC programs and any updates thereto (collectively, the "Software"), and accompanying documentation, including images and any other graphic resources provided by Microchip ("Documentation").

1. Definitions. As used in this Agreement, the following capitalized terms will have the meanings defined below: a. "Microchip Products" means Microchip microcontrollers and Microchip digital signal controllers.

b. "Licensee Products" means Licensee products that use or incorporate Microchip Products.

c. "Object Code" means the Software computer programming code that is in binary form (including related documentation, if any), and error corrections, improvements, modifications, and updates.

d. "Source Code" means the Software computer programming code that may be printed out or displayed in human readable form (including related programmer comments and documentation, if any), and error corrections, improvements, modifications, and updates.

e. "Third Party" means Licensee's agents, representatives, consultants, clients, customers, or contract manufacturers. f. "Third Party Products" means Third Party products that use or incorporate Microchip Products.

2. Software License Grant. Microchip grants strictly to Licensee a non-exclusive, non-transferable, worldwide license to: a. use the Software in connection with Licensee Products and/or Third Party Products;
- b. if Source Code is provided, modify the Software; provided that Licensee clearly notifies Third Parties regarding the source of such modifications;
- c. distribute the Software to Third Parties for use in Third Party Products, so long as such Third Party agrees to be bound by this Agreement (in writing or by "click to [accept](#) (see page 174)") and this Agreement accompanies such distribution;
- d. sublicense to a Third Party to use the Software, so long as such Third Party agrees to be bound by this Agreement (in writing or by "click to [accept](#) (see page 174)");
- e. with respect to the TCP/IP Stack Software, Licensee may port the ENC28J60.c, ENC28J60.h, ENC24J600.c, and ENC24J600.h driver source files to a non-Microchip Product used in conjunction with a Microchip ethernet controller;
- f. with respect to the MiWi (TM) DE Software, Licensee may only exercise its rights when the Software is embedded on a Microchip Product and used with a Microchip radio frequency transceiver or UBEC UZ2400 radio frequency transceiver which are integrated into Licensee Products or Third Party Products.

For purposes of clarity, Licensee may NOT embed the Software on a non-Microchip Product, except as described in this Section.

3. Documentation License Grant. Microchip grants strictly to Licensee a non-exclusive, non-transferable, worldwide license to use the Documentation in support of Licensee's authorized use of the Software

4. Third Party Requirements. Licensee acknowledges that it is Licensee's responsibility to comply with any third party license terms or requirements applicable to the use of such third party software, specifications, systems, or tools. This includes, by way of example but not as a limitation, any standards setting organizations requirements and, particularly with respect to the Security Package Software, local encryption laws and requirements. Microchip is not responsible and will not be held responsible in any manner for Licensee's failure to comply with such applicable terms or requirements.

5. Open Source Components. Notwithstanding the license grant in Section 1 above, Licensee further acknowledges that certain components of the Software may be covered by so-called "open source" software licenses ("Open Source Components"). Open Source Components means any software licenses approved as open source licenses by the Open Source Initiative or any substantially similar licenses, including without limitation any license that, as a condition of distribution of the software licensed under such license, requires that the distributor make the software available in source code format. To the extent required by the licenses covering Open Source Components, the terms of such license will apply in lieu of the terms of this Agreement. To the extent the terms of the licenses applicable to Open Source Components prohibit any of the restrictions in this Agreement with respect to such Open Source Components, such restrictions will not apply to such Open Source Component.

6. Licensee Obligations. Licensee will not: (a) engage in unauthorized use, modification, disclosure or distribution of Software or Documentation, or its derivatives; (b) use all or any portion of the Software, Documentation, or its derivatives except in conjunction with Microchip Products, Licensee Products or Third Party Products; or (c) reverse engineer (by disassembly, decompilation or otherwise) Software or any portion thereof. Licensee may not remove or alter any Microchip copyright or other proprietary rights notice posted in any portion of the Software or Documentation. Licensee will defend, indemnify and hold Microchip and its subsidiaries harmless from and against any and all claims, costs, damages, expenses (including reasonable attorney's fees), liabilities, and losses, including without limitation: (x) any claims directly or indirectly arising from or related to the use, modification, disclosure or distribution of the Software, Documentation, or any intellectual property rights related thereto; (y) the use, sale and distribution of Licensee Products or Third Party Products; and (z) breach of this Agreement.

7. Confidentiality. Licensee agrees that the Software (including but not limited to the Source Code, Object Code and library files) and its derivatives, Documentation and underlying inventions, algorithms, know-how and ideas relating to the Software and the Documentation are proprietary information belonging to Microchip and its licensors ("Proprietary Information"). Except as expressly and unambiguously allowed herein, Licensee will hold in confidence and not use or disclose any Proprietary Information and will similarly [bind](#) its employees and Third Party(ies) in writing. Proprietary Information will not include information that: (i) is in or enters the public domain without breach of this Agreement and through no fault of the receiving party; (ii) the receiving party was legally in possession of prior to receiving it; (iii) the receiving party can demonstrate was developed by

the receiving party independently and without use of or reference to the disclosing party's Proprietary Information; or (iv) the receiving party receives from a third party without restriction on disclosure. If Licensee is required to disclose Proprietary Information by law, court order, or government agency, Licensee will give Microchip prompt notice of such requirement in order to allow Microchip to object or limit such disclosure. Licensee agrees that the provisions of this Agreement regarding unauthorized use and nondisclosure of the Software, Documentation and related Proprietary Rights are necessary to protect the legitimate business interests of Microchip and its licensors and that monetary damage alone cannot adequately compensate Microchip or its licensors if such provisions are violated. Licensee, therefore, agrees that if Microchip alleges that Licensee or Third Party has breached or violated such provision then Microchip will have the right to injunctive relief, without the requirement for the posting of a bond, in addition to all other remedies at law or in equity.

8. Ownership of Proprietary Rights. Microchip and its licensors retain all right, title and interest in and to the Software and Documentation including, but not limited to all patent, copyright, trade secret and other intellectual property rights in the Software, Documentation, and underlying technology and all copies and derivative works thereof (by whomever produced). Licensee and Third Party use of such modifications and derivatives is limited to the license rights described in this Agreement.

9. Termination of Agreement. Without prejudice to any other rights, this Agreement terminates immediately, without notice by Microchip, upon a failure by Licensee or Third Party to comply with any provision of this Agreement. Upon termination, Licensee and Third Party will immediately stop using the Software, Documentation, and derivatives thereof, and immediately destroy all such copies.

10. Warranty Disclaimers. THE SOFTWARE AND DOCUMENTATION ARE PROVIDED "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESS OR IMPLIED, INCLUDING WITHOUT LIMITATION, ANY WARRANTY OF MERCHANTABILITY, TITLE, NON-INFRINGEMENT AND FITNESS FOR A PARTICULAR PURPOSE. MICROCHIP AND ITS LICENSORS ASSUME NO RESPONSIBILITY FOR THE ACCURACY, RELIABILITY OR APPLICATION OF THE SOFTWARE OR DOCUMENTATION. MICROCHIP AND ITS LICENSORS DO NOT WARRANT THAT THE SOFTWARE WILL MEET REQUIREMENTS OF LICENSEE OR THIRD PARTY, BE UNINTERRUPTED OR ERROR-FREE. MICROCHIP AND ITS LICENSORS HAVE NO OBLIGATION TO CORRECT ANY DEFECTS IN THE SOFTWARE.

11. Limited Liability. IN NO EVENT WILL MICROCHIP OR ITS LICENSORS BE LIABLE OR OBLIGATED UNDER ANY LEGAL OR EQUITABLE THEORY FOR ANY DIRECT OR INDIRECT DAMAGES OR EXPENSES INCLUDING BUT NOT LIMITED TO INCIDENTAL, SPECIAL, INDIRECT, PUNITIVE OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY, SERVICES, OR ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), OR OTHER SIMILAR COSTS. The aggregate and cumulative liability of Microchip and its licensors for damages hereunder will in no event exceed \$1000 or the amount Licensee paid Microchip for the Software and Documentation, whichever is greater. Licensee acknowledges that the foregoing limitations are reasonable and an essential part of this Agreement.

12. General. THIS AGREEMENT WILL BE GOVERNED BY AND CONSTRUED UNDER THE LAWS OF THE STATE OF ARIZONA AND THE UNITED STATES WITHOUT REGARD TO CONFLICTS OF LAWS PROVISIONS. Licensee agrees that any disputes arising out of or related to this Agreement, Software or Documentation will be brought exclusively in either the U.S. District Court for the District of Arizona, Phoenix Division, or the Superior Court of Arizona located in Maricopa County, Arizona. This Agreement will constitute the entire agreement between the parties with respect to the subject matter hereof. It will not be modified except by a written agreement signed by an authorized representative of Microchip. If any provision of this Agreement will be held by a court of competent jurisdiction to be illegal, invalid or unenforceable, that provision will be limited or eliminated to the minimum extent necessary so that this Agreement will otherwise remain in full force and effect and enforceable. No waiver of any breach of any provision of this Agreement will constitute a waiver of any prior, concurrent or subsequent breach of the same or any other provisions hereof, and no waiver will be effective unless made in writing and signed by an authorized representative of the waiving party. Licensee agrees to comply with all import and export laws and restrictions and regulations of the Department of Commerce or other United States or foreign agency or authority. The indemnities, obligations of confidentiality, and limitations on liability described herein, and any right of action for breach of this Agreement prior to termination, will survive any termination of this Agreement. Any prohibited assignment will be null and void. Use, duplication or disclosure by the United States Government is subject to restrictions set forth in subparagraphs (a) through (d) of the Commercial Computer-Restricted Rights clause of FAR 52.227-19 when applicable, or in subparagraph (c)(1)(ii) of the Rights in

Technical Data and Computer Software clause at DFARS 252.227-7013, and in similar clauses in the NASA FAR Supplement. Contractor/manufacturer is Microchip Technology Inc., 2355 W. Chandler Blvd., Chandler, AZ 85224-6199.

If Licensee has any questions about this Agreement, please write to Microchip Technology Inc., 2355 W. Chandler Blvd., Chandler, AZ 85224-6199 USA. ATTN: Marketing.

5.8.1.4 Getting Help

This topic provides information for requesting support assistance with the TCP/IP Stack.

Description

The TCP/IP Stack is supported through Microchip's standard support channels. If you encounter difficulties, you may submit ticket requests at <http://support.microchip.com>.

The Microchip forums are also an excellent source of information, with a very lively community dedicated specifically to Ethernet and TCP/IP discussions at <http://forum.microchip.com>.

Microchip also offers embedded network classes through Regional Training Centers. For more information, visit <http://www.microchip.com/rtc>.

5.8.1.5 Utilities

This section discusses the computer software applications included with the TCP/IP Stack.

These tools are implemented using the C# or Java programming languages, or both. The C# tools (*.exe) will require the Microsoft® .NET Framework v2.0 to be installed on the local PC. The Java tools (*.jar) require Java Runtime Environment (JRE) 1.6 or later to be installed on the target computer.

5.8.1.5.1 MPFS2 Utility

This topic provides a description of the MPFS2 Utility.

Description

The MPFS2 Utility packages web pages into a format for efficient storage in an embedded system. It is a graphical application for PCs that can generate MPFS2 images for storage in external storage or internal Flash program memory.

When used to build MPFS2 images, the MPFS2 Utility also indexes the dynamic variables found. It uses this information to generate HTTPPrint.h, which ensures that the proper callback functions are invoked as necessary. It also stores this index information along with the file in the MPFS2 image, which alleviates the task of searching from the embedded device.

Finally, when developing an application that uses external storage, the MPFS2 Utility can upload images to the external storage device using the upload functionality built into the HTTP2 web server or FTP server.

The source code for this application is included in the Microchip Applications Libraries installer.

5.8.1.5.1.1 Building MPFS2 Images

This topic provides information for building MPFS2 images.

Description

The MPFS2 Utility has four steps, which are denoted on the left hand side of the dialog. To build an MPFS image, select **Start With: Webpage Directory** in step 1 and choose the directory in which the web pages are stored.

Step 2 selects the output format. If storing the web pages in external EEPROM or serial Flash, choose the **BIN Image** output format. If internal program memory will be used, select **C18/C32 Image** for use with 8-bit and 32-bit parts, or **ASM30 Array** for 16-bit targets. To store the web pages on a device formatted with the FAT file system without compressing them into an MPFS image, select **MDD**.

Step 3 asks for the MPLAB IDE project directory. The MPFS tool will write the image file to the project directory, and will also update the HTTPPrint.h file there if needed. Select the correct directory so that the right files are modified.

Step 4 controls the upload settings. When external EEPROM or serial flash is used for storage, the option to upload the newly created image to the board is available. Check the box next to **Upload Image To** to enable this feature. The target host name (or IP address), upload protocol, and upload path may need to be changed to the one chosen when the board was first configured. You may also need to modify the user name and password used to access the secured functionality in your application, like web page upload. Use the **Settings** button to edit these values.

If internal program memory is being used, the image will be compiled in with the project and so direct uploads are not available. Make sure to include the output source file indicated in step 3 as part of the project.

Once all the correct settings have been chosen, click the **Generate** button to create the image. If uploads are enabled, this will also attempt to upload the file to the device.

5.8.1.5.1.2 Uploading Pre-built MPFS2 Images

This topic provides information on uploading pre-built MPFS2 images.

Description

There are two ways to upload a pre-built image to external storage. The first is described in the Getting Started (see page 79) section, and involves uploading from the browser directly. The second is to use the MPFS2 Utility to upload the image. You can select HTTP or FTP uploading to match the protocol that your application uses.

To use the MPFS2 Utility to upload an image, begin by selecting Start With: Pre-Build MPFS Image in step 1 at the top.

Choose the image file to upload.

Steps 2 and 3 are not required for pre-built images. Proceed directly to step 4 and verify that the upload settings are correct. The target host name (or IP address), upload protocol, and upload path may need to be changed to the one chosen when the board was first configured. You may also need to modify the user name and password used to access the secured functionality in your application, like web page upload. Use the Settings button to edit these values.

Once all the settings are correct, click the Upload button. The image will be uploaded to the board.

5.8.1.5.1.3 Advanced MPFS2 Settings

This topic provides information on advanced MPFS2 settings.

Description

The Advanced Settings dialog found in step 2 provides greater control over how files are processed.

The **Dynamic Files** list indicates which file types to parse for dynamic variables. By default, all files with the extensions htm, html, cgi, or xml are parsed. If an application has dynamic variables in other file types, these types must be added to the list. This field must be a comma-separated list of extensions and file names.

The **Do Not Compress** field indicates which file types should never be compressed. Compressing files with GZIP saves both storage space and transmission time. However, this is only suitable for static content such as CSS or JavaScript. Any files with dynamic variables will automatically be excluded. In addition, any file that the PIC may need to process internally should be excluded. Files included via ~inc:filename~ should not be compressed, nor should any BIB file used for the SNMP module (if present). Additional file types can be added to this list if a custom application will be accessing the MPFS.

The GZIP compressor will attempt to shrink all files. In some cases, especially with images, little or no compression is achieved. When this occurs the file is stored as-is in the MPFS image.

5.8.1.5.1.4 MPFS2 Command Line Options

This topic provides a description of the MPFS2 command line options.

Description

To facilitate batch files and automation, the MPFS2 Utility also supports execution from the command line. The syntax is as follows:

```
MPFS2.jar [options] <SourceDir> <ProjectDir> <OutputFile>
```

The SourceDir, ProjectDir, and OutputFile options are required and should be enclosed in quotation marks. The OutputFile option will be relative to ProjectDir, and cannot be a full path name. The various option switches are described in the following table.

Switch	Short	Description
/BIN	/b	Output a BIN image (Default)
/C18_C32	/c	Output a C18 or XC32 image
/ASM16	/s	Output an ASM16 image
/mpfs2	/2	Use the MPFS2 format (Default)
/html "..."	/h "..."	File types to be parsed for dynamic variables (Default: "*.htm, *.html, *.cgi, *.xml")
/xgzip "..."	/z "..."	File types to be excluded from GZIP compression (Default: "*.bib, *.inc")

The command-line interface does not support image uploads. For batch or production uploads, use a tool such as wget to upload the generated BIN image.

5.8.1.5.2 TCP/IP Discoverer

This topic provides a description of the TCP/IP Discoverer.

Description

The TCP/IP Discoverer PC project (formerly known as the Embedded Ethernet Device Discoverer) will aid in embedded product device discovery (with the Announce (see page 160) protocol) and will demonstrate how to write PC applications to communicate to embedded devices.

When the "Discover Devices" button is clicked, this application will transmit a broadcast UDP packet containing the message, "Discovery: Who is out there?" on the local network to port 30303. If any embedded devices with the Announce (see page 160) protocol enabled are connected to the network, they will respond with a UDP packet containing their host name (NBNS (see page 295)) and MAC address.

The Java source code for this application is also included. This source code should provide a rough idea of how to write a PC-based application to communicate with your embedded devices.

5.8.2 TCP/IP Stack Porting Guide

5.8.2.1 Introduction

Porting to the MPLAB Harmony TCP/IP Stack

This help file provides information for porting from a previous version of the TCP/IP Stack to the TCP/IP Stack within MPLAB Harmony.

5.8.2.2 Release Notes

MPLAB Harmony Version: v0.70b **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.8.2.3 SW License Agreement

© 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS." MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.8.2.4 Upgrading from the V5 TCP/IP Stack to the MPLAB Harmony TCP/IP Stack

The MPLAB Harmony TCP/IP Stack is a completely new distribution, which is included as part of the MPLAB Harmony installation. No files need to be maintained from an existing V5 TCP/IP Stack installation.

5.8.2.4.1 MPLAB Harmony TCP/IP Stack Key Features

This topic provides a description of the key features of the MPLAB Harmony TCP/IP Stack.

Description

Note: The PIC18 device family is not supported by the MPLAB Harmony TCP/IP Stack.

The following are the key features of the MPLAB Harmony TCP/IP Stack:

- Multiple interfaces
- IPV6 support
- Fully dynamic:
 - Stack initialization/deinitialization
 - Up/down interface
 - Resource management
 - Module configuration
- Improved modularity and stack layout
- Run-time configuration through the TCP/IP console
- Interrupt driven operation
- RTOS friendly, with easy RTOS integration

5.8.2.4.2 MPLAB Harmony TCP/IP Stack Structure

This topic describes the structure of the MPLAB Harmony TCP/IP Stack.

Description

The MPLAB Harmony TCP/IP Stack consists of the following structure:

- Lowercase file names
- Underscores are used (e.g., `tcpip_manager.h`)
- Private headers are no longer exposed and have been moved to the source folder
- System services have been removed from the stack, such as:
 - Interrupts
 - Drivers
 - Timer services
 - File system
 - Board Support Package (BSP)

By default, the TCP/IP Stack is placed into the following location during installation of MPLAB Harmony on a Windows[®] system:

C:\Microchip\harmony\<version>\framework\tcpip

The following figure shows the list of files in the tcpip folder.

5.8.2.4.3 MPLAB Harmony TCP/IP Stack Design

This topic discusses the design of the MPLAB Harmony TCP/IP Stack.

Description

The MPLAB Harmony TCP/IP Stack is designed as a part of a system running other applications, middleware, etc. Therefore, it makes use of the system services that are available to other modules in the system or to the application, such as:

- File system
- System interrupts
- System driver services
- System timers
- System device drivers
- System command processor
- System console
- System debug services

Refer to the `./framework/tcpip/src/system` folder for the header files that expose the system wide available API.

5.8.2.4.4 MPLAB Harmony TCP/IP Stack API Changes

This topic discusses the reasons behind the API changes to the MPLAB Harmony TCP/IP Stack.

Description

For most modules, the API should be backward compatible to the V5 TCP/IP Stack.

The changes in the stack API have been minimized so that the porting process is straightforward. However, new functionality has been added because of new features, such as IPV6 support, multiple network interfaces, and the dynamic configuration of the stack. Other than these new features, the changes to the API were only made when an existing V5 TCP/IP Stack function did not support the required parameters/flexibility, or they were confusing.

The API changes are at the TCP, UDP, ARP, HTTP, SMTP, and stack access and initialization level.

5.8.2.4.4.1 TCP Changes

This topic discusses the changes made to the [tcp.h](#) file.

Description

TCP Changes

The TCP/IP Stack include header file, [tcp.h](#), has been updated as follows.

- *DNS Resolution* - DNS resolution is no longer performed automatically when opening a TCP [socket](#). The TCP layer takes only an IP address as an input parameter. If you need a DNS resolution, you have to perform it before opening a [socket](#) (see [dns.h](#)).
- *IPv6 Support* - Support for IPV6 has been added

Opening TCP Sockets

To open TCP sockets, the required functions are now:

[TCP_SOCKET](#) [TCPIP_TCP_ServerOpen](#)(IP_ADDRESS_TYPE addType, [TCP_PORT](#) localPort, IP_MULTI_ADDRESS* localAddress)

and

[TCP_SOCKET](#) [TCPIP_TCP_ClientOpen](#)(IP_ADDRESS_TYPE addType, [TCP_PORT](#) remotePort, IP_MULTI_ADDRESS* remoteAddress)

These two new functions replace the V5 TCP/IP Stack TCPOpen function. The application code must replace the calls to TCPOpen with [TCP_SOCKET](#) [TCPIP_TCP_ServerOpen](#) or [TCP_SOCKET](#) [TCPIP_TCP_ClientOpen](#), as appropriate.

The new calls add the possibility to use IPV6 addresses and make clear the choice of parameters for server or client sockets. The parameters are:

- typedef union

```
{
IPV4_ADDR v4Add;
IPV6_ADDR v6Add;
}IP_MULTI_ADDRESS;
```
- typedef enum

```
{
IP_ADDRESS_TYPE_ANY = 0, // either IPv4 or IPv6; unspecified;
IP_ADDRESS_TYPE_IPV4 = 1, // IPv4 address type
IP_ADDRESS_TYPE_IPV6 // IPv6 address type
}IP_ADDRESS_TYPE;
```

Note: Currently, IP_ADDRESS_TYPE_ANY is only supported for server sockets.

Disconnecting a Socket

The functions to disconnect a [socket](#) have changed to include added functionality:

- [TCPIP_TCP_Disconnect](#)([TCP_SOCKET](#) hTCP)

This function closes the TX side of a connection by sending a FIN (if currently connected) to the remote node of the connection. It no longer sends a RST signal to the remote node so that a sequence of two sequential calls to the function is no longer needed.

If the [socket](#) has the Linger option set (default), the queued TX data transmission will be attempted before sending the FIN. If the Linger option is off, the queued TX data will be discarded.

No more data can be sent by this [socket](#), but more data can be received (the [socket](#) will be eventually closed when a FIN is received from the remote node or by a time-out dictated by the [TCP_FIN_WAIT_2_TIMEOUT](#) value in [tcp_config.h](#)).

Please note that this call may fail in which case it can be reissued.

Setting the [socket](#) options is done using the function [TCPIP_TCP_OptionsSet\(\)](#).

- [TCPIP_TCP_Abort](#)([TCP_SOCKET](#) hTCP, bool killSocket)

This function aborts a connection to a remote node by sending a RST (if currently connected). Any pending TX/RX data is discarded.

A client [socket](#) will always be closed and the associated resources released. The [socket](#) cannot be used again after this call.

A server [socket](#) will abort the current connection if:

- killSocket == false (the [socket](#) will remain listening)
- killSocket == true (the [socket](#) will be closed and all associated resources released. The [socket](#) cannot be used again after this call.)
- [TCPIP_TCP_Close](#)([TCP_SOCKET](#) hTCP)

This function disconnects an open [socket](#) and destroys the [socket](#) handle, releasing the associated resources.

If the graceful option is set for the [socket](#) (default) a [TCPIP_TCP_Disconnect](#) will be tried (FIN will be sent):

- If the linger option is set (default) the [TCPIP_TCP_Disconnect](#) will attempt to [send](#) any queued TX data before issuing the FIN
- If the FIN [send](#) operation fails or the [socket](#) is not connected, an abort is generated

If the graceful option is not set, or the previous step could not [send](#) the FIN:

- A [TCPIP_TCP_Abort\(\)](#) is called, sending a RST to the remote node and communication is closed. The [socket](#) is no longer valid and the associated resources are freed.

Setting the [socket](#) options is done using the call [TCPIP_TCP_OptionsSet\(\)](#);

Adjusting Socket Size

The function to adjust the size of a [socket](#)'s RX and TX buffers has changed to include added functionality:

- [TCPIP_TCP_FifoSizeAdjust](#)([TCP_SOCKET](#) hTCP, uint16_t wMinRXSize, uint16_t wMinTXSize, [TCP_ADJUST_FLAGS](#) vFlags)

The TX and RX FIFOs (buffers) associated with a [socket](#) are now completely separate and independent.

Two new flags, [TCP_ADJUST_TX_ONLY](#) and [TCP_ADJUST_RX_ONLY](#), have been added, which allow changing the size of TX and RX buffers independently. This is the preferred option.

However, when either flag is not set, for the purpose of this function, the TX and RX FIFOs are considered to be contiguous so that the total FIFO space is divided between the TX and RX FIFOs. This provides backward compatibility with previous versions of this function.

Note: The TX or RX associated buffer sizes can be independently changed too using the [socket](#) options. See the [TCPIP_TCP_OptionsSet](#) help for more information.

5.8.2.4.4.2 UDP Changes

This topic discusses the changes made to the [udp.h](#) file.

Description

UDP Changes

The TCP/IP Stack include header file, [udp.h](#), has been updated as follows.

- *DNS Resolution* - DNS resolution is no longer performed automatically when opening a UDP [socket](#). The UDP layer takes only an IP address as an input parameter. If you need a DNS resolution, you have to perform it before opening a [socket](#) (see [dns.h](#)).
- *IPv6 Support* - Support for IPV6 has been added

Opening UDP Sockets

To open UDP sockets, the required functions are now:

```
UDP\_SOCKET TCPIP\_UDP\_ServerOpen(IP_ADDRESS_TYPE addType, UDP\_PORT localPort, IP_MULTI_ADDRESS* localAddress);
```

and

```
UDP\_SOCKET TCPIP\_UDP\_ClientOpen(IP_ADDRESS_TYPE addType, UDP\_PORT remotePort, IP_MULTI_ADDRESS* remoteAddress);
```

These two new functions replace the V5 TCP/IP Stack UDPOpen function.

The application code must replace any calls to UDPOpen with [UDP_SOCKET TCPIP_UDP_ServerOpen\(\)](#) or [UDP_SOCKET TCPIP_UDP_ClientOpen\(\)](#), as appropriate.

Note: Currently, IP_ADDRESS_TYPE_ANY is only supported for server sockets.

5.8.2.4.4.3 ARP Changes

This topic discusses the changes made to the [arp.h](#) file.

Description

ARP Changes

The header file, [arp.h](#), has been updated as follows.

The ARP module has been redesigned to support multiple network interfaces and to implement internal storage (caches) per interface for eliminating the need for frequent access to the network.

Some of the most important changes include:

- Manipulation/control of the cache entries ([TCPIP_ARP_EntryGet](#), [TCPIP_ARP_EntrySet](#), [TCPIP_ARP_EntryRemove](#)) with permanent entries support
- Dynamic notification mechanism ([TCPIP_ARP_HandlerRegister](#), [TCPIP_ARP_HandlerDeRegister](#)) for signaling of the ARP events
- Resolution calls ([TCPIP_ARP_Resolve](#), [TCPIP_ARP_Probe](#), [TCPIP_ARP_IsResolved](#)).

Normally, the application does not need access to the ARP module. The address resolution is performed internally by the stack.

The ARP module cache manipulation access is meant for TCP/IP Stack control and configuration depending on the actual network topology.

5.8.2.4.4.4 HTTP Changes

This topic discusses the changes made to the [http.h](#) file.

Note: This file was named http2.h in the V6 Beta TCP/IP Stack.

Description

HTTP Changes

The TCP/IP Stack include header file, [http.h](#), has been updated as follows.

All of the functions that the HTTP exposes as its API now take a first parameter, a HTTP connection handle, named [HTTP_CONN_HANDLE](#). This allows a cleaner and better behavior in both multi-threaded environments and in the situation where we it may be desired to run multiple instances of the HTTP process itself, allowing for serving multiple independent connections.

For example, the HTTP functions now appear as:

- [TCPIP_HTTP_FileInclude](#)([HTTP_CONN_HANDLE](#) connHandle, const uint8_t* cFile) ;
- [HTTPExecuteGet](#)([HTTP_CONN_HANDLE](#) connHandle);
- [HTTPExecutePost](#)([HTTP_CONN_HANDLE](#) connHandle);
- [TCPIP_HTTP_CurrentConnectionFileGet](#)([HTTP_CONN_HANDLE](#) connHandle);
- [TCPIP_HTTP_CurrentConnectionCallbackPosGet](#)([HTTP_CONN_HANDLE](#) connHandle);

Support has been added for the HTTP module client to store/retrieve its own connection related data. For example:

- [TCPIP_HTTP_CurrentConnectionUserDataSet](#)([HTTP_CONN_HANDLE](#) connHandle, const void* uData);
- [TCPIP_HTTP_CurrentConnectionUserDataGet](#)([HTTP_CONN_HANDLE](#) connHandle);

HTTP Print

Also, the functions exposed in [http_print.h](#) take the connection handle parameter. For example:

- [HTTPPrint](#)([HTTP_CONN_HANDLE](#) connHandle, uint32_t callbackID);
- [HTTPPrint_hellomsg](#)([HTTP_CONN_HANDLE](#) connHandle);

These changes affect all of the function calls in the file, [custom_http_app.c](#), such as:

- [HTTPExecuteGet](#)([HTTP_CONN_HANDLE](#) connHandle);
- [HTTPExecutePost](#)([HTTP_CONN_HANDLE](#) connHandle);

To port an existing application, the extra parameter will have to be added. The connection handle is passed to the application as part of the HTTP callback. The modifications should be minimal and possible using an editor without any other impact.

Please note that the MPFS2 generator tool ([mpfs2.jar](#)) has been updated to support the new HTTP API.

See the list of the complete API changes in [http.h](#) and [http_print.h](#).

5.8.2.4.4.5 MPLAB Harmony TCP/IP Stack Storage Changes

This topic describes the storage changes in the MPLAB Harmony TCP/IP Stack.

Description

MPLAB Harmony TCP/IP Stack Storage Changes

The V5 TCP/IP Stack include header file, [tcpip_storage.h](#), *does not* exist in the MPLAB Harmony TCP/IP Stack.

The TCP/IP Stack storage has become obsolete and is no longer maintained. This is mainly due to the way the dynamic initialization of the stack is done in the V5 TCP/IP Stack:

- Each module has its own initialization data
- There are many parameters that could be relevant for an application and that may require storage besides the IP address, IP Mask, or SSID, etc.
- The data is passed dynamically at the stack initialization. There is no more “build time” set of parameters against which to

check at stack configuration (although support for a default configuration set at build time is present). The actual data contents are the application responsibility.

- A system database service will be added that will use the File System. The database service will maintain configurations for all the modules in the system, including the TCP/IP. The system database service API will be available to the applications as well for storing/retrieving proprietary information.
- The parameter, `TCPIP_STACK_USE_STORAGE`, in the file, `tcPIP_config.h`, should not be enabled. Future plans call for this service to be removed from the distribution.

5.8.2.4.4.6 MPLAB Harmony TCP/IP Stack Configuration Changes

This topic describes the configuration changes in the MPLAB Harmony TCP/IP Stack.

Description

The stack configuration has a completely *new* structure. Each project has its own configuration folder that stores multiple configurations based on CPU platforms and hardware boards.

Note: V5 TCP/IP Stack configuration files *cannot* be reused in the MPLAB Harmony TCP/IP Stack.

The following is a list of the most important features:

- `system_config` folder for projects – all profiles are stored in this location
- Multiple profiles per project, which are separated by CPU platform. The TCP/IP profile is usually common.
- `tcPIP_config.h` – selects modules that are part of the build
- Each module has its own profile: [arp_config.h](#), [tcp_config.h](#), [ssl_config.h](#), etc.
- BSP profiles per development board containing:
 - `hardware_config.h` – the BSP specific hardware settings
 - `media_storage_config.h` – storage media and partitioning settings
 - `sys_fs_config.h` – file system configuration and settings
 - `mpfs_config.h` – MPFS file system settings
 - `network_config.h` – configuration for every network interface: NetBIOS names, default IP addresses, etc.
 - `system_config.h` – system configuration (i.e, system tick, system console selection, system debug services, etc.)

5.8.2.4.4.6.1 MPLAB Harmony TCP/IP Stack Configuration

This topic provides information on the configuration of the MPLAB Harmony TCP/IP Stack.

Description

MPLAB Harmony TCP/IP Stack Configuration

The presented structure is simply a model and a different layout can be chosen. The only requirement is to use the proper path in your project so that the necessary configuration files are found at build time.

For example, depending on your exact hardware platform or development board, a path similar to the following can be added to your project path:

```
..\harmony\<version>\apps\tcpip\tcpip_web_server_demo_app\firmware\src\system_config\pic32_eth_sk_int_dyn\tcpip_profile
```

5.8.2.4.4.6.2 MPLAB Harmony TCP/IP Stack Heap Configuration

This topic provides information on the heap configuration of the MPLAB Harmony TCP/IP Stack.

Description

MPLAB Harmony TCP/IP Stack Heap Configuration

The MPLAB Harmony TCP/IP Stack uses dynamic memory for both initialization and run time buffers. Therefore, there are two requirements for a project containing the stack to work properly.

The first requirement is that the TCP/IP stack should be configured with enough heap space. The amount of heap used by the stack is specified by the `TCPIP_STACK_DRAM_SIZE` parameter in the `tcip_config.h` file.

The value of the required TCP/IP heap for a project is application dependent. Some of the most important factors that impact the heap size are:

- Number of TCP sockets
 - By default, each TCP [socket](#) requires 512 bytes for a RX buffer and 512 bytes for a TX buffer. These parameters can be adjusted by modifying the values specified in [tcp_config.h](#) or dynamically through the [TCPIP_TCP_OptionsSet\(\)](#) function.
- Number of UDP sockets:
 - For each UDP [socket](#) that needs to initiate a transmission, the IP layer will have to allocate the required space (suggested by the functions, `UDPv4IsTxPutReady` or `UDPv4IsTxPutReady`)
 - Once the UDP buffering will be added, each [socket](#) will have its own RX and TX buffers. These parameters can be adjusted by modifying the values specified in the file, [udp_config.h](#), or dynamically through the [TCPIP_UDP_OptionsSet\(\)](#) function
- The type of Ethernet MAC that is used:
 - The PIC32MX6XX/7XX devices with a built-in 100 Mbps Ethernet controller use system memory for buffering incoming RX traffic. For sustained 100 Mbps operation, adequate RX buffer space must be provided. This parameter can be adjusted by modifying the values specified in the file, [network_config.h](#), using the array, `TCPIP_HOSTS_CONFIGURATION[]`.
- If SSL is enabled, it will require additional buffering for encryption/decryption at run-time. The SSL module buffering requirement is dependent on the RSA key length specified in [ssl_config.h](#).

The second requirement is that the project that includes the MPLAB Harmony TCP/IP Stack must be built with sufficient heap size to accommodate the stack (at a minimum, the project needs the `TCPIP_STACK_DRAM_SIZE` bytes of heap). This parameter is adjusted on the Linker tab in the project properties.

In general, for a TCP/IP project running on a PIC32MX device with an embedded Ethernet controller, at least 8 KB of heap space is needed by the stack. However, the following is implied:

- 100 Mbps traffic is not sustained
- No SSL
- Relatively few sockets

A typical value for comfortably handling 100 Mbps Ethernet traffic would be 40 KB of TCP/IP heap space.

The amount of the required heap is less for an external Ethernet MAC.

Keep in mind the following when assigning heap space:

- If there is not enough heap space the stack initialization may fail
- If there is not enough heap space some run time buffer allocation may fail and some packets transmission will have to be deferred until a later time, thus impacting the stack performance
- It is always a good idea to have a reserve, at least an extra 2 KB of heap space above the total amount of space that is used
- A very useful tool in understanding the heap allocation and how the space is distributed among the stack modules is the TCP/IP command processor

By enabling the parameter, `TCPIP_STACK_DRAM_DEBUG_ENABLE`, in the `tcip_config.h` file, the stack will output debug messages when it runs out of memory. Then, using the `heapinfo` command at the TCP/IP command processor prompt will

return a snapshot of the current TCP/IP heap status and can help in early detection of problems.

Optionally, enabling the parameter, `TCPIP_STACK_DRAM_TRACE_ENABLE` in the `tcip_config.h` file, will instruct the TCP/IP heap allocation module to store trace information that will be displayed with the `heapinfo` command.

5.8.2.4.4.7 New MPLAB Harmony TCP/IP Stack API Functions

This topic describes some of the important new API functions in the MPLAB Harmony TCP/IP Stack.

Description

There are many new functions available that have been introduced to take advantage of new features, such as IPV6 and support of multiple interfaces. However, there is no concern for the porting process regarding the new API calls as the previous stack implementation did not support this kind of service.

A new API function should be added to the application only when the access to the new feature is needed.

Existent applications should port easily without using the new API.

For reference, the following are a few of the most important new API functions that could prove useful in the porting of your application:

- Initialization of the stack network interfaces:
 - [`TCPIP\_STACK\_NetUp\(\)`](#)
 - [`TCPIP\_STACK\_NetDown\(\)`](#)
- Default interface selection:
 - [`TCPIP\_STACK\_NetDefaultGet\(\)`](#)
 - [`TCPIP\_STACK\_NetDefaultSet\(\)`](#)
- TCP/UDP multiple interface support:
 - [`TCPIP\_TCP\_Bind\(\)`](#)
 - [`TCPIP\_TCP\_RemoteBind\(\)`](#)
 - [`TCPIP\_TCP\_SocketNetGet\(\)`](#)
 - [`TCPIP\_TCP\_SocketNetSet\(\)`](#)
 - [`TCPIP\_UDPBind\(\)`](#)
 - [`TCPIP\_UDP\_RemoteBind\(\)`](#)
 - [`TCPIP\_UDP\_SocketNetGet\(\)`](#)
 - [`TCPIP\_UDP\_SocketNetSet\(\)`](#)

Refer to the file, [`tcip\_manager.h`](#), for a complete list of all new network interface APIs.

5.8.2.4.4.7.1 Main Program Changes

This topic describes the main program changes in the MPLAB Harmony TCP/IP Stack.

Description

Main Program Changes

There are few changes that the main program loop has to take care of. A full working example is given with the file, `main_demo.c`, which is provided with the stack distribution.

The main program should call the following functions:

- [`SYS\_Initialize\(\)`](#) – This function is what initializes the system and runs the Board Support Package (BSP) specific code

- [SYS_Tasks\(\)](#) – This is the function that takes care of the system tasks and must be called periodically
- [TCPIP_STACK_Task\(\)](#) – This is the TCP/IP stack tasks function that runs all of the state machines that are part of the TCP/IP stack. This function must be called periodically. Please note the name change.

To gain access to a network interface the `TCPIP_STACK_NetHandle("iname")` function should be used. Examples are provided in the previous section.

5.8.2.4.4.8 MPLAB Harmony TCP/IP Stack Initialization Changes

This topic describes the initialization updates to the MPLAB Harmony TCP/IP Stack.

Description

The TCP/IP Stack include header file, [tcpip_manager.h](#), has been updated as follows.

To initialize the stack the call is now:

```
TCPIP\_STACK\_Initialize(const          TCPIP_NETWORK_CONFIG*          pNetConf,          int          nNets,
TCPIP_STACK_MODULE_CONFIG* pModConfig, int nModules);
```

Where:

- `pNetConf` – is a pointer to an array of configurations for all the initialized network interfaces
- `nNets` – is the number of the network interfaces that the stack is to support
- `pModConfig` – is a pointer to a table storing configuration data for the TCP/IP stack modules
- `nModules` – is the number of entries in this table, (i.e., the number of initialized modules)

The default TCP/IP stack configuration is provided with the stack distribution and consists of:

- `network_config.h`: `TCPIP_HOSTS_CONFIGURATION[]` – an array of `TCPIP_NETWORK_CONFIG` entries describing the default configuration of each network interface
- `tcpip_modules_config.h`: `TCPIP_STACK_MODULE_CONFIG_TBL[]` – an array of `TCPIP_STACK_MODULE_CONFIG` entries storing the default configuration data for each module of the TCP/IP stack. This is just an aggregate of all the default configurations per module found in the module configuration header files, such as [tcp_config.h](#), [udp_config.h](#), [arp_config.h](#), and so on.

These tables are defined by default in the configuration files. See MPLAB Harmony TCP/IP Stack Configuration Changes for details.

You can change the parameters of these structures as appropriate.

An example of the TCP/IP initialization is part of the distributed file, `main_demo.c`. This file is located in the following Windows[®] path:

```
.\harmony<version>\apps\tcpip\tcpip_web_server_demo_app\firmware\src
```

Note: The stack initialization may fail. The application code must check the result of this call to detect if the stack failed to initialize properly.

5.8.2.4.4.9 MPLAB Harmony TCP/IP Stack Access Changes

This topic describes the stack access updates that were made to the MPLAB Harmony TCP/IP Stack.

Description

The TCP/IP Stack include header file, [tcpip_manager.h](#), has been updated as follows.

Direct access to the internally maintained stack structures has been removed. To access the information for a specific network interface a handle must be obtained using the interface name. For example:

```
TCPIP\_NET\_HANDLE hNet = TCPIP\_STACK\_NetHandleGet("PIC32INT");
```

or

```
TCPIP_NET_HANDLE hNet = TCPIP_STACK_NetHandleGet("MRF24W");
```

Once a handle to the interface has been obtained, different parameters of that network interface can be queried and set. For example:

- `TCPIP_STACK_NetAddress(TCPIP_NET_HANDLE netH)` – returns the network interface address
- `TCPIP_STACK_NetAddressGateway(TCPIP_NET_HANDLE netH)` – returns the interface gateway address

Refer to the `tcpip_manager.h` file for a complete list of functions.

Note: The `TCPIP_NET_HANDLE` is an opaque data type.

The well known names of the network interfaces are currently in the file, `tcpip.h`.

The exact header file that exposes the network interfaces names may change in the future; however, the names of the supported network interfaces will be retained.

Use the file, `network_config.h`, as an example.

Refer to the file, `main_demo.c`, for an example of how to use the interface handle functions.

5.8.2.5 MPLAB Harmony TCP/IP Stack Utilities

This topic describes the MPLAB Harmony TCP/IP Stack utilities.

Description

The MPLAB Harmony TCP/IP Stack includes the following utilities:

- MPFS2 - The MPFS2 Java utility that assists the application in generating the MPFS image of the files needed by the Web server has been updated. This utility supports both the V5 and MPLAB Harmony versions of the TCP/IP stack with improved functionality. The V5 TCP/IP Stack utility can still be used; however, some minor adjustments may need to be done manually.
- TCP/IP Discoverer - The TCP/IP Discoverer Java utility has been updated to support not only the MPLAB Harmony TCP/IP Stack, but also IPV6. This utility is up and running and is backward compatible with the V5 TCP/IP Stack.
- TCP/IP Configuration - The TCP/IP Configuration utility is currently not supported. The need of individually configuring TCP and UDP sockets is no longer needed, as all sockets behave similarly and they are allocated dynamically as needed.

5.8.2.6 MPLAB Harmony TCP/IP Stack SSL/RSA Usage

This topic provides information regarding the usage of SSL and RSA.

Description

The SSL design has been updated to support multiple interfaces. The same is true for the RSA engine. However, the SSL module does not currently use the Microchip Crypto Library. Until the proper Crypto Library support is added to SSL, the stack is distributed with the RSA and RC4 code embedded into the stack.

In the future, the Crypto Library will be completely removed from the TCP/IP stack, and the stack will be just a client to the Crypto Library.

5.8.2.7 Porting Applications from the V6 Beta TCP/IP Stack to the MPLAB Harmony TCP/IP Stack

Porting an application from the V6 Beta TCP/IP Stack into the TCP/IP Stack within MPLAB Harmony consists of updating

existing TCP/IP Stack function names in your application to the new MPLAB Harmony function names.

5.8.2.7.1 MPLAB Harmony TCP/IP Stack Function Name Compliance

This topic provides header file function mapping tables that show the V6 Beta TCP/IP Stack function name and the compliant name within the MPLAB Harmony TCP/IP Stack.

Description

The replacement names chosen to make existing TCP/IP Stack functions compliant with MPLAB Harmony are shown in individual tables per header file name.

The files listed in the tables are located in the following two MPLAB Harmony installation folders:

```
. \harmony\<version>\framework\tcpip
. \harmony\<version>\framework\tcpip\src
```

Each table shows the original and new names used. Note that other than name changes, no other modifications were made to the middleware functions.

Header File: **arp.h**

V6 Beta TCP/IP Stack Name	MPLAB Harmony Compliant Name
ARP_ENTRY_QUERY	TCPIP_ARP_ENTRY_QUERY
ARP_ENTRY_TYPE	TCPIP_ARP_ENTRY_TYPE
ARP_EVENT_HANDLER	TCPIP_ARP_EVENT_HANDLER
ARP_EVENT_TYPE	TCPIP_ARP_EVENT_TYPE
ARP_HANDLE	TCPIP_ARP_HANDLE
ARP_OPERATION_TYPE	TCPIP_ARP_OPERATION_TYPE
ARP_RESULT	TCPIP_ARP_RESULT
ARPCacheGetEntriesNo	TCPIP_ARP_CacheEntriesNoGet
ARPCacheSetThreshold	TCPIP_ARP_CacheThresholdSet
ARPEntryGet	TCPIP_ARP_EntryGet
ARPEntryQuery	TCPIP_ARP_EntryQuery
ARPEntryRemove	TCPIP_ARP_EntryRemove
ARPEntryRemoveAll	TCPIP_ARP_EntryRemoveAll
ARPEntryRemoveNet	TCPIP_ARP_EntryRemoveNet
ARPEntrySet	TCPIP_ARP_EntrySet
ARPDeRegisterHandler	TCPIP_ARP_HandlerDeRegister
ARPIsResolved	TCPIP_ARP_IsResolved
ARPProbe	TCPIP_ARP_Probe
ARPRegisterHandler	TCPIP_ARP_HandlerRegister
ARPResolve	TCPIP_ARP_Resolve
ARPRegisterCallbacks	TCPIP_ARP_CallbacksRegister

Header File: [dhcp.h](#)

5.8.2.7.2 Development Information (Advance Information)

This *advance information* is specifically provided to assist MPLAB Harmony driver development for porting the existing Ethernet Controller Library and MAC/PHY drivers to the new platform.

5.8.2.7.2.1 Porting the MPLAB Harmony Drivers and Peripheral Library

Note: This information is considered to be *Advance Information*.

This topic provides function mapping tables that show the V6 Beta TCP/IP Stack function name and the compliant name within the MPLAB Harmony TCP/IP Stack for the purpose of porting to the MPLAB Harmony Ethernet Drivers and Ethernet Peripheral Library.

Description

Note: This information is considered to be *Advance Information*.

Porting the MPLAB Harmony Ethernet Drivers and the MPLAB Harmony Ethernet Peripheral Library involves replacing the Ethernet Controller Library with calls to MPLAB Harmony equivalents. This information is listed in Table 1. Please note that function arguments were modified in some instances.

To understand how a function of the Ethernet Controller Library is different from its equivalent MPLAB Harmony function, the header of the MPLAB Harmony function should be examined. The MPLAB Harmony function header always lists the Ethernet Controller Library function(s) that the new MPLAB Harmony function replaces, including the arguments of the old function.

Table 1: TCP/IP Stack Function Mapping

5.8.3 Announce TCP/IP Stack Library

5.8.3.1 Introduction

Announce TCP/IP Stack Library

for

Microchip Microcontrollers

This library provides the API of the Announce TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

This module will facilitate device discovery on DHCP enabled networks by broadcasting a UDP message on port 30303 whenever the local IP address changes.

5.8.3.2 Release Notes

MPLAB Harmony Version: v0.70b **Announce TCP/IP Stack Library Version :** 1.0 **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.8.3.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.8.3.4 Using the Library

This topic describes the basic architecture of the Announce TCPIP Stack Library and provides information and examples on how to use it.

Interface Header File: [tcpip_announce_config.h](#)

The interface to the Announce TCPIP Stack library is defined in the "[tcpip_announce_config.h](#)" header file. This file is included by the "tcpip.h" file. Any C language source (.c) file that uses the Announce TCPIP Stack library should include "tcpip.h".

Library File:

The Announce TCPIP Stack library archive (.a) file installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the TCPIP Stack interacts with the framework.

5.8.3.4.1 Abstraction Model

This library provides the API of the Announce TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description**Announce Software Abstraction Block Diagram**

Note: This diagram was not available at time of release and will included in a future release of MPLAB Harmony.

5.8.3.4.2 Library Overview

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the Announce module.

Library Interface Section	Description
Functions	Routines for Configuring DHCP
Data Types and Constants	This section provides various definitions describing This API

5.8.3.5 Configuring the Library**Macros**

	Name	Description
	ANNOUNCE_MAX_PAYLOAD	Maximum size of a payload sent once
	ANNOUNCE_PORT	The announce port

Description

The configuration of the Announce TCP/IP Stack Library is based on the file tcpip_config.h

This header file contains the configuration selection for the Announce TCP/IP Stack Library. Based on the selections made, the Announce TCP/IP Stack Library will support or not support selected features. These configuration settings will apply to all instances of the AnnounceTCP/IP Stack Library.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.8.3.5.1 ANNOUNCE_MAX_PAYLOAD Macro**C**

```
#define ANNOUNCE_MAX_PAYLOAD (512)
```

Description

Maximum size of a payload sent once

5.8.3.5.2 ANNOUNCE_PORT Macro**C**

```
#define ANNOUNCE_PORT 30303
```

Description

The announce port

5.8.3.6 Building the Library

This section list the files that are available in the \src of the Announce driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

5.8.3.7 Library Interface

Data Types and Constants

	Name	Description
	TCPIP_ANNOUNCE_MODULE_CONFIG	Announce layer configuration/initialization

Functions

	Name	Description
	TCPIP_ANNOUNCE_DeInit	This is function TCPIP_ANNOUNCE_DeInit.
	TCPIP_ANNOUNCE_Init	manager
	TCPIP_ANNOUNCE_Send	This is function TCPIP_ANNOUNCE_Send.
	TCPIP_ANNOUNCE_Task	This is function TCPIP_ANNOUNCE_Task.
	TCPIP_ANNOUNCE_TaskPending	This is function TCPIP_ANNOUNCE_TaskPending.

Description

This section describes the Application Programming Interface (API) functions of the Announce TCP/IP Stack.

Refer to each section for a detailed description.

5.8.3.7.1 Functions

5.8.3.7.1.1 TCPIP_ANNOUNCE_DeInit Function

C

```
void TCPIP_ANNOUNCE_DeInit(  
    const TCPIP_STACK_MODULE_CTRL* const stackData  
);
```

Description

This is function TCPIP_ANNOUNCE_DeInit.

5.8.3.7.1.2 TCPIP_ANNOUNCE_Init Function

C

```
bool TCPIP_ANNOUNCE_Init(  
    const TCPIP_STACK_MODULE_CTRL* const stackData,  
    const TCPIP_ANNOUNCE_MODULE_CONFIG* announceData  
);
```

Description

manager

5.8.3.7.1.3 TCPIP_ANNOUNCE_Send Function

C

```
void TCPIP_ANNOUNCE_Send();
```

Description

This is function TCPIP_ANNOUNCE_Send.

5.8.3.7.1.4 TCPIP_ANNOUNCE_Task Function

C

```
bool TCPIP_ANNOUNCE_Task(TCPIP_NET_IF *pNetIf);
```

Description

This is function TCPIP_ANNOUNCE_Task.

5.8.3.7.1.5 TCPIP_ANNOUNCE_TaskPending Function

C

```
bool TCPIP_ANNOUNCE_TaskPending();
```

Description

This is function TCPIP_ANNOUNCE_TaskPending.

5.8.3.7.2 Data Types and Constants

5.8.3.7.2.1 TCPIP_ANNOUNCE_MODULE_CONFIG Structure

C

```
typedef struct {
} TCPIP_ANNOUNCE_MODULE_CONFIG;
```

Description

Announce layer configuration/initialization

5.8.3.8 Files

Files

Name	Description
tcpip_announce_config.h	Announce configuration file
tcpip_announce_manager.h	

Description

5.8.3.8.1 tcpip_announce_config.h

Announce Configuration file

This file contains the Announce module configuration options

Macros

	Name	Description
	ANNOUNCE_MAX_PAYLOAD	Maximum size of a payload sent once
	ANNOUNCE_PORT	The announce port

5.8.3.8.2 tcpip_announce_manager.h

TCPIP Announce Manager Header

Functions

	Name	Description
	TCPIP_ANNOUNCE_DeInit	This is function TCPIP_ANNOUNCE_DeInit.
	TCPIP_ANNOUNCE_Init	manager
	TCPIP_ANNOUNCE_Send	This is function TCPIP_ANNOUNCE_Send.
	TCPIP_ANNOUNCE_Task	This is function TCPIP_ANNOUNCE_Task.
	TCPIP_ANNOUNCE_TaskPending	This is function TCPIP_ANNOUNCE_TaskPending.

5.8.4 ARP TCP/IP Stack Library

5.8.4.1 Introduction

Address Resolution Protocol (ARP) TCP/IP Stack Library

for

Microchip Microcontrollers

This library provides the API of the ARP TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

The Address Resolution Protocol, or ARP, is a foundation layer of TCP/IP. It translates IP addresses to physical MAC addresses, or locates a gateway through which a machine may be located.

TCP and UDP applications will not need to access ARP directly. The TCPOpen and UDPOpen functions will handle both ARP and DNS operations transparently.

Responses to incoming ARP requests are processed automatically. Resolution of ARP requests follows a simple state machine, as indicated in the following diagram.

5.8.4.2 Release Notes

MPLAB Harmony Version: v0.70b **ARP TCP/IP Stack Library Version :** 1.0 **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.8.4.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.8.4.4 Using the Library

This topic describes the basic architecture of the ARP TCP/IP Stack Library and provides information and examples on how to use it.

Interface Header File: [arp.h](#)

The interface to the arp TCP/IP Stack library is defined in the "[arp.h](#)" header file. This file is included by the "tcpip.h" file. Any C

language source (.c) file that uses the ARP TCP/IP Stack library should include "tcpip.h".

Library File:

The ARP TCP/IP Stack library archive (.a) file installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the TCP/IP Stack interacts with the framework.

5.8.4.4.1 Abstraction Model

This library provides the API of the ARP TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

ARP Software Abstraction Block Diagram

This module provides software abstraction of the ARP module existent in any TCP/IP Stack implementation. It removes the overhead of address resolution from all other modules in the stack.

5.8.4.4.2 Library Overview

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the ARP module.

Library Interface Section	Description
General Functions	Functions used by the ARP library interface.
Cache Manipulation Functions	This section provides an interface to the internal data storage (cache) that the ARP module implements.
Data Types and Constants	Derived types and enumerations used by the ARP library interface.

5.8.4.4.3 How the Library Works

The ARP module provides address resolution capabilities for the TCP/IP stack.

The ARP module is an independent module that maintains its state across calls and updates its state machine. A data storage (cache) is maintained and updated internally for each interface existent in the system. The number of entries in each cache is configurable at initialization time.

The ARP state machine can remove entries from the cache and can provide signals when a specific entry has been resolved or has timed out. The purging of the cache is done internally base on a time-out parameter that is dynamically configurable.

The module provides a notification mechanism which simplifies the design of the ARP clients. The most important client of the ARP module is the IPv4 layer.

5.8.4.5 Configuring the Library

Macros

	Name	Description
	<u>ARP_CACHE_ENTRIES_97J60</u>	This is macro ARP_CACHE_ENTRIES_97J60.
	<u>ARP_CACHE_ENTRIES_DEFAULT</u>	number of entries in the cache default number of entries per interface
	<u>ARP_CACHE_ENTRIES_ENCJ60</u>	This is macro ARP_CACHE_ENTRIES_ENCJ60.
	<u>ARP_CACHE_ENTRIES_ENCJ600</u>	This is macro ARP_CACHE_ENTRIES_ENCJ600.
	<u>ARP_CACHE_ENTRIES_MRF24W</u>	This is macro ARP_CACHE_ENTRIES_MRF24W.
	<u>ARP_CACHE_ENTRIES_PIC32INT</u>	specific interfaces numbers
	<u>ARP_CACHE_PENDING_ENTRY_TMO</u>	timeout for a pending to be solved entry in the cache, in seconds the entry will be removed if the tmo elapsed and the entry has not been solved a solved entry moves to the solved entries timeout
	<u>ARP_CACHE_PENDING_RETRY_TMO</u>	timeout for resending an ARP request for a pending entry In order to prevent the ARP flooding the standard recommends it to be greater than 1 sec. Of course, it should be less than <u>ARP_CACHE_PENDING_ENTRY_TMO</u>
	<u>ARP_CACHE_PERMANENT_QUOTA</u>	max percentage of permanent entries in the cache note that since permanent entries cannot be removed they tend to degrade the efficiency of the cache look up
	<u>ARP_CACHE_PURGE_QUANTA</u>	how many entries to delete, once the threshold is reached
	<u>ARP_CACHE_PURGE_THRESHOLD</u>	default purge threshold, percentage once the number of resolved entries in the cache gets beyond the threshold some resolved entries will be purged
	<u>ARP_CACHE_SOLVED_ENTRY_TMO</u>	timeout for a solved entry in the cache, in seconds the entry will be removed if the tmo elapsed and the entry has not been referenced again
	<u>ARP_TASK_PROCESS_RATE</u>	ARP task processing rate, in seconds the ARP module will process a timer event with this rate for maintaining its own queues, processing timeouts, etc. Choose it so that the other ARP_CACHE_xxx_TMO are multiple of this

Description

The configuration of the TCP/IP Stack ARP is based on the file sys_config.h

This header file contains the configuration selection for the TCP/IP Stack ARP. Based on the selections made, the TCP/IP Stack ARP will support or not support selected features. These configuration settings will apply to the single instance of the TCP/IP Stack ARP.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.8.4.5.1 ARP_CACHE_ENTRIES_97J60 Macro

C

```
#define ARP_CACHE_ENTRIES_97J60 5
```

Description

This is macro ARP_CACHE_ENTRIES_97J60.

5.8.4.5.2 ARP_CACHE_ENTRIES_DEFAULT Macro

C

```
#define ARP_CACHE_ENTRIES_DEFAULT 5
```

Description

number of entries in the cache default number of entries per interface

5.8.4.5.3 ARP_CACHE_ENTRIES_ENCJ60 Macro

C

```
#define ARP_CACHE_ENTRIES_ENCJ60 5
```
