
Description

This is macro ARP_CACHE_ENTRIES_ENCJ60.

5.8.4.5.4 ARP_CACHE_ENTRIES_ENCJ600 Macro

C

```
#define ARP_CACHE_ENTRIES_ENCJ600 5
```

Description

This is macro ARP_CACHE_ENTRIES_ENCJ600.

5.8.4.5.5 ARP_CACHE_ENTRIES_MRF24W Macro

C

```
#define ARP_CACHE_ENTRIES_MRF24W 5
```

Description

This is macro ARP_CACHE_ENTRIES_MRF24W.

5.8.4.5.6 ARP_CACHE_ENTRIES_PIC32INT Macro

C

```
#define ARP_CACHE_ENTRIES_PIC32INT 5
```

Description

specific interaces numbers

5.8.4.5.7 ARP_CACHE_PENDING_ENTRY_TMO Macro

C

```
#define ARP_CACHE_PENDING_ENTRY_TMO (1 * 60)
```

Description

timeout for a pending to be solved entry in the cache, in seconds the entry will be removed if the tmo elapsed and the entry has not been solved a solved entry moves to the solved entries timeout

5.8.4.5.8 ARP_CACHE_PENDING_RETRY_TMO Macro

C

```
#define ARP_CACHE_PENDING_RETRY_TMO (2)
```

Description

timeout for resending an ARP request for a pending entry In order to prevent the ARP flooding the standard recommends it to be greater than 1 sec. Of course, it should be less than [ARP_CACHE_PENDING_ENTRY_TMO](#)

5.8.4.5.9 ARP_CACHE_PERMANENT_QUOTA Macro

C

```
#define ARP_CACHE_PERMANENT_QUOTA 50
```

Description

max percentage of permanent entries in the cache note that since permanent entries cannot be removed they tend to degrade the efficiency of the cache look up

5.8.4.5.10 ARP_CACHE_PURGE_QUANTA Macro

C

```
#define ARP_CACHE_PURGE_QUANTA 3
```

Description

how many entries to delete, once the threshold is reached

5.8.4.5.11 ARP_CACHE_PURGE_THRESHOLD Macro

C

```
#define ARP_CACHE_PURGE_THRESHOLD 75
```

Description

default purge threshold, percentage once the number of resolved entries in the cache gets beyond the threshold some resolved entries will be purged

5.8.4.5.12 ARP_CACHE_SOLVED_ENTRY_TMO Macro

C

```
#define ARP_CACHE_SOLVED_ENTRY_TMO (20 * 60)
```

Description

timeout for a solved entry in the cache, in seconds the entry will be removed if the tmo elapsed and the entry has not been referenced again

5.8.4.5.13 ARP_TASK_PROCESS_RATE Macro

C

```
#define ARP_TASK_PROCESS_RATE (2)
```

Description

ARP task processing rate, in seconds the ARP module will process a timer event with this rate for maintaining its own queues, processing timeouts, etc. Choose it so that the other ARP_CACHE_XXX_TMO are multiple of this

5.8.4.6 Building the Library

This section list the files that are available in the \src of the ARP driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

- arp.c

5.8.4.7 Library Interface

Data Types and Constants

	Name	Description
	TCPIP_ARP_ENTRY_QUERY	ARP Entry Query
	TCPIP_ARP_ENTRY_TYPE	Type of ARP entry
	TCPIP_ARP_EVENT_HANDLER	Notification handler that can be called when a specific entry is resolved.
	TCPIP_ARP_EVENT_TYPE	Events reported by ARP
	TCPIP_ARP_HANDLE	ARP Handle
	TCPIP_ARP_OPERATION_TYPE	Type of ARP operation
	TCPIP_ARP_RESULT	ARP Results (success and failure codes)
	ARP_MODULE_CONFIG	This is type ARP_MODULE_CONFIG.
	arp_app_callbacks	TCPIP_STACK_USE_ZEROCONF_LINK_LOCAL API specific Definitions

Cache Manipulation Functions

	Name	Description
	TCPIP_ARP_CacheEntriesNoGet	Used to retrieve the number of entereies for a specific interface
	TCPIP_ARP_CacheThresholdSet	Sets the cache threshold for the specified interface in %
	TCPIP_ARP_EntryQuery	Querries an ARP cache entry using the index of the cache line.
	TCPIP_ARP_EntryRemoveAll	Removes all the mapping belonging to an interface.

General Functions

	Name	Description
	TCPIP_ARP_CallbacksDeregister	De-Registering callbacks with ARP module that are registered previously.
	TCPIP_ARP_CallbacksRegister	Registering callback with ARP module to get notified about certian events.
	TCPIP_ARP_Deinitialize	Deinitializes the ARP module.
	TCPIP_ARP_EntryGet	gets the current mapping for an IP address
	TCPIP_ARP_EntryRemove	removes the mapping of an address, even a permanent one
	TCPIP_ARP_EntryRemoveNet	Removes all the entries belonging to a network interface.
	TCPIP_ARP_HandlerDeRegister	deregister the event handler
	TCPIP_ARP_HandlerRegister	Register an ARP resolve handler
	TCPIP_ARP_Initialize	Initializes the ARP module.
	TCPIP_ARP_IsResolved	Determines if an ARP request has been resolved yet.
	TCPIP_ARP_Probe	Transmits an ARP probe to resolve an IP address.

	TCPIP_ARP_Resolve	Transmits an ARP request to resolve an IP address.
	TCPIP_ARP_Task	Performs ARP tasks from within TCPIP stack tasks.
	TCPIP_ARP_TaskIsPending	Returns true if an ARP task is pending, false otherwise.
	TCPIP_ARP_EntrySet	Adds an ARP cache entry for the specified interface.
	TCPIP_ARP_Process	Processes an incoming ARP packet.

Description

This section describes the Application Programming Interface (API) functions of the ARP TCP/IP Stack Library.

Refer to each section for a detailed description.

5.8.4.7.1 General Functions**5.8.4.7.1.1 TCPIP_ARP_CallbacksDeregister Function****C**

```
bool TCPIP_ARP_CallbacksDeregister(
    int8_t id
);
```

Description

This function allows end user-application to de-register with callbacks, which were registered previously. This is called by user-application, when its no longer interested in notifications from ARP-Module. This allows the other application to get registered with ARP-module.

Preconditions

None

Parameters

Parameters	Description
reg_id	Registration-id returned in TCPIP_ARP_CallbacksRegister call

Returns

true - On success false - Failure to indicate invalid reg_id

5.8.4.7.1.2 TCPIP_ARP_CallbacksRegister Function**C**

```
int8_t TCPIP_ARP_CallbacksRegister(
    struct arp_app_callbacks * app
);
```

Description

This function allows end user application to register with callbacks, which will be called by ARP module to give notification to user-application about events occurred at ARP layer. For ex: when a ARP-packet is received, which is conflicting with our own pair of addresses (MAC-Address and IP-address). This is an extension for zeroconf protocol implementation (ZeroconfLL.c)

Preconditions

None

Parameters

Parameters	Description
app	ARP-Application callbacks structure supplied by user-application

Returns

id > 0 - Returns non-negative value that represents the id of registration The same id needs to be used in de-registration -1 - When registered applications exceed MAX_REG_APPS and there is no free slot for registration

5.8.4.7.1.3 TCPIP_ARP_Deinitialize Function**C**

```
void TCPIP_ARP_Deinitialize(  
    const TCPIP_STACK_MODULE_CTRL* const stackData  
);
```

Description

Deinitializes the ARP module.

Preconditions

None.

Parameters

Parameters	Description
stackCtrl	stack initialization parameters, used by TCPIP_ARP_Initialize to initialize the ARP module.

Returns

None.

Remarks

None.

5.8.4.7.1.4 TCPIP_ARP_EntryGet Function**C**

```
TCPIP_ARP_RESULT TCPIP_ARP_EntryGet(  
    TCPIP_NET_HANDLE hNet,  
    IPV4_ADDR* ipAdd,  
    TCPIP_MAC_ADDR* pHwAdd,  
    bool probe  
);
```

Description

If probe == false The function behaves identical to [TCPIP_ARP_IsResolved\(\)](#): If the corresponding MAC address exists in the cache it is copied to the user supplied pHwAdd

If probe == true The function behaves identical to [TCPIP_ARP_Resolve\(\)](#):

- If the corresponding MAC address does not exist in the cache

this function transmits an ARP request. Upon the address resolution it calls the registered handler (if available) with the supplied notification parameter (if != 0)

- If the hardware address exists, the result is written to pHwAdd

Preconditions

ARP module should have been initialized

Parameters

Parameters	Description
hNet	Interface to use
ipAdd	The ip address to get entries from
pHwAdd	pointer to store the hardware address
probe	boolean to specify if ARP probing is initiated or not

Returns

ARP_RES_ENTRY_SOLVED - if the required entry is already solved
ARP_RES_ENTRY_QUEUED - if the required entry was already queued
ARP_RES_ENTRY_NEW - if the operation succeeded and a new entry was added (and queued for resolving)
ARP_RES_CACHE_FULL - if new entry could not be inserted, the cache was full
ARP_RES_BAD_ADDRESS - bad address specified
ARP_RES_NO_INTERFACE - no such interface

Remarks

similar to [TCPIP_ARP_Resolve\(\)](#) + [TCPIP_ARP_IsResolved\(\)](#) It avoids a double hash search when the mapping exists.

Example

None

5.8.4.7.1.5 TCPIP_ARP_EntryRemove Function**C**

```
TCPIP_ARP_RESULT TCPIP_ARP_EntryRemove(  
    TCPIP_NET_HANDLE hNet,  
    IPV4_ADDR* ipAdd  
);
```

Description

None

Preconditions

ARP module should have been initialized

Parameters

Parameters	Description
hNet	Interface to use
ipAdd	ip Address to remove entries for

Returns

[TCPIP_ARP_RESULT](#) On Success - On Failure - ARP_RES_NO_ENTRY (if no such mapping exists)

Remarks

None

Example

None

5.8.4.7.1.6 TCPIP_ARP_EntryRemoveNet Function

C

```
TCPIP_ARP_RESULT TCPIP_ARP_EntryRemoveNet(  
    TCPIP_NET_HANDLE hNet,  
    IPV4_ADDR* ipAdd,  
    IPV4_ADDR* mask,  
    TCPIP_ARP_ENTRY_TYPE type  
);
```

Description

if(entry->type == type and entry->ipAdd & mask == ipAdd & mask) then remove entry

Preconditions

ARP module should have been initialized

Parameters

Parameters	Description
hNet	Interface handle to use
ipAdd	ip address
mask	ip address of mask
type	type of entries to remove:
valid types	ARP_ENTRY_TYPE_PERMANENT ARP_ENTRY_TYPE_COMPLETE ARP_ENTRY_TYPE_INCOMPLETE ARP_ENTRY_TYPE_ANY

Returns

ARP_RES_OK

Remarks

None

Example

None

5.8.4.7.1.7 TCPIP_ARP_HandlerDeRegister Function

C

```
bool TCPIP_ARP_HandlerDeRegister(  
    TCPIP_ARP_HANDLE hArp  
);
```

Description

None

Preconditions

ARP module should have been initialized

Parameters

Parameters	Description
hArp	ARP Handle

Returns

bool On Success - true On Failure - false (If no such handler registered)

Remarks

None

Example

None

5.8.4.7.1.8 TCPIP_ARP_HandlerRegister Function

C

```
TCPIP_ARP_HANDLE TCPIP_ARP_HandlerRegister(  
    TCPIP_NET_HANDLE hNet,  
    TCPIP_ARP_EVENT_HANDLER handler,  
    const void* hParam  
);
```

Description

NONE

Preconditions

ARP module should have been initialized

Parameters

Parameters	Description
hNet	Specifies interface to register on. Use hNet == 0 to register on all interfaces available.
handler	Handler to be called for event.
hParam	The hParam is passed by the client and will be used by the ARP when the notification is made. It is used for per-thread content or if more modules, for example, share the same handler and need a way to differentiate the callback.

Returns

TCPIP_ARP_HANDLE On Success - Returns a valid handle On Failure - null handle

Remarks

NONE

Example

None

5.8.4.7.1.9 TCPIP_ARP_Initialize Function

C

```
bool TCPIP_ARP_Initialize(  
    const TCPIP_STACK_MODULE_CTRL* const stackData,  
    const ARP_MODULE_CONFIG* arpData  
);
```

Description

Initializes the ARP module. Calls can be done with the request of not tearing down the ARP cache This helps for ifup/ifdown sequences. Of course, if this is the case the memory allocated for the ARP cache has to be from a persistent heap.

Preconditions

None

Parameters

Parameters	Description
stackCtrl	stack initialization parameters
arpData	ARP specific initialization parameters

Returns

true if initialization succeeded, false otherwise

Remarks

The request to maintain old ARP cache info (deleteOld field from the [ARP_MODULE_CONFIG](#) initialization data) is not implemented for stack nit/deinit sequences. To maintain the data after the stack is completely de-initialized would need a persistent heap that's not yet implemented. The selection cannot be changed by ifup since this operation does not carry ARP configuration parameters (arpData == 0).

5.8.4.7.1.10 TCPIP_ARP_IsResolved Function**C**

```
bool TCPIP_ARP_IsResolved(  
    TCPIP_NET_HANDLE hNet,  
    IPV4_ADDR* IPAddr,  
    TCPIP_MAC_ADDR* MACAddr  
);
```

Description

This function checks if an ARP request has been resolved yet, and if so, stores the resolved MAC address in the pointer provided.

Preconditions

ARP module should have been initialized

Parameters

Parameters	Description
hNet	interface to use
IPAddr	The IP address to be resolved. This must match the IP address provided to the TCPIP_ARP_Resolve() function call.
MACAddr	A buffer to store the corresponding MAC address retrieved from the ARP query.

Return Values

Return Values	Description
true	The IP address has been resolved and MACAddr MAC address field indicates the response.
false	The IP address is not yet resolved. Try calling TCPIP_ARP_IsResolved() again at a later time. If you don't get a response after a application specific timeout period, you may want to call TCPIP_ARP_Resolve() again to transmit another ARP query (in case if the original query or response was lost on the network). If you never receive an ARP response, this may indicate that the IP address isn't in use.

5.8.4.7.1.11 TCPIP_ARP_Probe Function**C**

```
TCPIP_ARP_RESULT TCPIP_ARP_Probe(  
    TCPIP_NET_HANDLE hNet,  
    IPV4_ADDR* IPAddr,
```

```
    IPV4_ADDR* srcAddr,  
    TCPIP_ARP_OPERATION_TYPE opType  
);
```

Description

This function transmits an ARP probe to determine the hardware address of a given IP address. The packet will use the type of operation and the source address specified as parameters.

Preconditions

ARP module should have been initialized

Parameters

Parameters	Description
hNet	interface to use
IPAddr	The IP address to be resolved. The address must be specified in network byte order (big endian).
srcAddr	The source address to be used in the ARP packet
opType	Operation code to be set in the outgoing ARP packet

Returns

ARP_RES_ENTRY_SOLVED - if the required entry is already solved
ARP_RES_ENTRY_QUEUED - if the required entry was already queued
ARP_RES_ENTRY_NEW - if the operation succeeded and a new entry was added (and queued for resolving)
ARP_RES_CACHE_FULL - if new entry could not be inserted, the cache was full
ARP_RES_BAD_ADDRESS - bad address specified
ARP_RES_NO_INTERFACE - no such interface

Remarks

This function is a more advanced version of [TCPIP_ARP_Resolve](#). It allows the caller to specify the operation type and the source address of the outgoing ARP packet.

No check is done for IPAddr to be valid.

To retrieve the ARP query result, call the [TCPIP_ARP_IsResolved\(\)](#) function.

5.8.4.7.1.12 TCPIP_ARP_Resolve Function

C

```
TCPIP_ARP_RESULT TCPIP_ARP_Resolve(  
    TCPIP_NET_HANDLE hNet,  
    IPV4_ADDR* IPAddr  
);
```

Description

This function transmits an ARP request to determine the hardware address of a given IP address. Upon the address resolution it calls the registered handler (if available) with the supplied notification parameter (if != 0)

Preconditions

ARP module should have been initialized

Parameters

Parameters	Description
hNet	interface to use
IPAddr	The IP address to be resolved. The address must be specified in network byte order (big endian).

Returns

An element from the [TCPIP_ARP_RESULT](#) enumeration. ARP_RES_ENTRY_SOLVED - if the required entry is already solved
ARP_RES_ENTRY_QUEUED - if the required entry was already queued
ARP_RES_ENTRY_NEW - if the operation succeeded and a new entry was added (and queued for resolving)
ARP_RES_CACHE_FULL - if new entry could not be inserted, the cache was full
ARP_RES_BAD_ADDRESS - bad address specified
ARP_RES_NO_INTERFACE - no such interface

Remarks

To retrieve the ARP query result, call the [TCPIP_ARP_IsResolved\(\)](#) function.

5.8.4.7.1.13 TCPIP_ARP_Task Function**C**

```
void TCPIP_ARP_Task();
```

Description

Performs ARP tasks from within TCPIP stack tasks.

Preconditions

None.

Returns

None.

Remarks

None.

5.8.4.7.1.14 TCPIP_ARP_TaskIsPending Function**C**

```
bool TCPIP_ARP_TaskIsPending();
```

Description

Returns true if an ARP task is pending, false otherwise.

Preconditions

None.

Returns

true - ARP task is pending
false - ARP task is not pending

5.8.4.7.1.15 TCPIP_ARP_EntrySet Function**C**

```
TCPIP_ARP_RESULT TCPIP_ARP_EntrySet(  
    TCPIP_NET_HANDLE hNet,  
    IPV4_ADDR* ipAdd,  
    TCPIP_MAC_ADDR* hwAdd,  
    bool perm  
);
```

Description

Can be added as permanent. Not subject to timeouts. If cache is full, an entry will be deleted to make room.

Preconditions

ARP module should have been initialized

Parameters

Parameters	Description
hNet	Interface to use
ipAdd	The ip address
hwAdd	
perm	

Returns

On Success - ARP_RES_OK/ARP_RES_ENTRY_EXIST ON Failure - An Error (for example, cache is full with permanent entries that cannot be purged or the permanent quota exceeded)

Remarks

None

Example

None

5.8.4.7.1.16 TCPIP_ARP_Process Function**C**

```
TCPIP_ARP_RESULT TCPIP_ARP_Process(  
    TCPIP_NET_IF* pIf,  
    TCPIP_MAC_PACKET* pPkt  
);
```

Description

Retrieves an ARP packet from the MAC buffer and determines if it is a response to our request (in which case the ARP is resolved) or if it is a request requiring our response (in which case we transmit one.)

Preconditions

ARP packet is ready in the MAC buffer.

Return Values

Return Values	Description
ARP_RES_OK	processing OK.
ARP_RES_error	some error occurred

5.8.4.7.2 Cache Manipulation Functions**5.8.4.7.2.1 TCPIP_ARP_CacheEntriesNoGet Function****C**

```
size_t TCPIP_ARP_CacheEntriesNoGet(  
    TCPIP_NET_HANDLE hNet,  
    TCPIP_ARP_ENTRY_TYPE type  
);
```

Description

None

Preconditions

ARP module should have been initialized

Parameters

Parameters	Description
hNet	Interface to use
type	Type of ARP entry

Returns

The number of entries of the specified type per interface

Remarks

None

Example

None

5.8.4.7.2.2 TCPIP_ARP_CacheThresholdSet Function**C**

```
TCPIP_ARP_RESULT TCPIP_ARP_CacheThresholdSet(  
    TCPIP_NET_HANDLE hNet,  
    int purgeThres,  
    int purgeEntries  
);
```

Description

once the number of entries in the cache is > than the threshold a number of purgeEntries (usually one) will be discarded

Preconditions

ARP module should have been initialized

Parameters

Parameters	Description
hNet	Interface handle to use
purgeThres	Threshold to start cache purging
purgeEntries	Number of entries to purge

Returns

ARP_RES_OK

Remarks

None

Example

None

5.8.4.7.2.3 TCPIP_ARP_EntryQuery Function**C**

```
TCPIP_ARP_RESULT TCPIP_ARP_EntryQuery(  
    TCPIP_NET_HANDLE hNet,  
    size_t index,
```

```
    TCPIP_ARP_ENTRY_QUERY* pArpQuery  
);
```

Description

None

Preconditions

ARP module should have been initialized The index has to be a valid one i.e. < then [TCPIP_ARP_CacheEntriesNoGet\(\)](#) populates the supplied query routine if not NULL

Parameters

Parameters	Description
hNet	Interface handle to use
index	Index to cache
pArpQuery	entry type, ip address, hardware address

Returns

On Success - ARP_RES_OK On Failure - ARP_RES_BAD_INDEX (if index is out of range) use it for displaying the cache contents

Remarks

None

Example

None

5.8.4.7.2.4 TCPIP_ARP_EntryRemoveAll Function

C

```
TCPIP_ARP_RESULT TCPIP_ARP_EntryRemoveAll(  
    TCPIP_NET_HANDLE hNet  
);
```

Description

None

Preconditions

ARP module should have been initialized

Parameters

Parameters	Description
hNet	network interface handle

Returns

ARP_RES_OK

Remarks

None

Example

None

5.8.4.7.3 Data Types and Constants

5.8.4.7.3.1 TCPIP_ARP_ENTRY_QUERY Structure

C

```
typedef struct {
    TCPIP_ARP_ENTRY_TYPE entryType;
    IPV4_ADDR entryIpAdd;
    TCPIP_MAC_ADDR entryHwAdd;
} TCPIP_ARP_ENTRY_QUERY;
```

Description

Structure: TCPIP_ARP_ENTRY_QUERY

None

Members

Members	Description
TCPIP_ARP_ENTRY_TYPE entryType;	what entry type
IPV4_ADDR entryIpAdd;	the entry IP address
TCPIP_MAC_ADDR entryHwAdd;	the entry hardware address

5.8.4.7.3.2 TCPIP_ARP_ENTRY_TYPE Enumeration

C

```
typedef enum {
    ARP_ENTRY_TYPE_INVALID,
    ARP_ENTRY_TYPE_PERMANENT,
    ARP_ENTRY_TYPE_COMPLETE,
    ARP_ENTRY_TYPE_INCOMPLETE,
    ARP_ENTRY_TYPE_ANY,
    ARP_ENTRY_TYPE_TOTAL
} TCPIP_ARP_ENTRY_TYPE;
```

Description

Enumeration: TCPIP_ARP_ENTRY_TYPE

None

Members

Members	Description
ARP_ENTRY_TYPE_INVALID	empty entry
ARP_ENTRY_TYPE_PERMANENT	entry valid and permanent
ARP_ENTRY_TYPE_COMPLETE	entry valid
ARP_ENTRY_TYPE_INCOMPLETE	entry not resolved yet
ARP_ENTRY_TYPE_ANY	any busy entry (PERMANENT COMPLETE INCOMPLETE)
ARP_ENTRY_TYPE_TOTAL	total entries - the number of entries the cache can store

Remarks

None

5.8.4.7.3.3 TCPIP_ARP_EVENT_HANDLER Type

C

```
typedef void (* TCPIP_ARP_EVENT_HANDLER)(TCPIP_NET_HANDLE hNet, const IPV4_ADDR* ipAdd, const
TCPIP_MAC_ADDR* MACAddr, TCPIP_ARP_EVENT_TYPE evType, const void* param);
```

Description

Type: TCPIP_ARP_EVENT_HANDLER

None

Remarks

The param member significance is module dependent. It can be an IP address, pointer to some other structure, etc. The handler is called when an event of some sort occurs for a particular IP address entry. If pNetIf == 0 then the notification is called for events on any interface

5.8.4.7.3.4 TCPIP_ARP_EVENT_TYPE Enumeration

C

```
typedef enum {
    ARP_EVENT_SOLVED = 0x01,
    ARP_EVENT_UPDATED = 0x02,
    ARP_EVENT_PERM_UPDATE = 0x04,
    ARP_EVENT_TMO = -1
} TCPIP_ARP_EVENT_TYPE;
```

Description

Enumeration: TCPIP_ARP_EVENT_TYPE

None

Members

Members	Description
ARP_EVENT_SOLVED = 0x01	a queued cache entry was solved;
ARP_EVENT_UPDATED = 0x02	an existent cache entry was updated
ARP_EVENT_PERM_UPDATE = 0x04	an update for an permanent entry was received however the permanent entry was not updated
ARP_EVENT_TMO = -1	an entry could not be solved and a tmo occurred

Remarks

Possibly multiple events can be set, where it makes sense.

5.8.4.7.3.5 TCPIP_ARP_HANDLE Type

C

```
typedef const void* TCPIP_ARP_HANDLE;
```

Description

Type: TCPIP_ARP_HANDLE

A handle that a client can use.

Remarks

This handle can be used by the client after the event handler has been registered.

5.8.4.7.3.6 TCPIP_ARP_OPERATION_TYPE Enumeration

C

```
typedef enum {
    ARP_OPERATION_REQ = 1,
```

```

    ARP_OPERATION_RESP = 2,
    ARP_OPERATION_MASK = 0x000f,
    ARP_OPERATION_CONFIGURE = 0x1000
} TCPIP_ARP_OPERATION_TYPE;

```

Description

Enumeration: TCPIP_ARP_OPERATION_TYPE

Operation to be performed by an ARP probe

Members

Members	Description
ARP_OPERATION_REQ = 1	ARP request
ARP_OPERATION_RESP = 2	ARP response
ARP_OPERATION_MASK = 0x000f	extract ARP operation
ARP_OPERATION_CONFIGURE = 0x1000	stack configuration ARP packet

Remarks

Used for low level functionality, [TCPIP_ARP_Probe](#)

5.8.4.7.3.7 TCPIP_ARP_RESULT Enumeration**C**

```

typedef enum {
    ARP_RES_OK = 0,
    ARP_RES_ENTRY_NEW,
    ARP_RES_ENTRY_SOLVED,
    ARP_RES_ENTRY_QUEUED,
    ARP_RES_ENTRY_EXIST,
    ARP_RES_PERM_QUOTA_EXCEED,
    ARP_RES_NO_ENTRY = -1,
    ARP_RES_CACHE_FULL = -2,
    ARP_RES_TX_FAILED = -3,
    ARP_RES_BAD_INDEX = -4,
    ARP_RES_BAD_ADDRESS = -5,
    ARP_RES_NO_INTERFACE = -6,
    ARP_RES_BAD_TYPE = -7,
    ARP_RES_CONFIGURE_ERR = -8
} TCPIP_ARP_RESULT;

```

Description

Enumeration: TCPIP_ARP_RESULT

Various Definitions for Success and Failure Codes

Members

Members	Description
ARP_RES_OK = 0	operation succeeded
ARP_RES_ENTRY_NEW	operation succeeded and a new entry was added
ARP_RES_ENTRY_SOLVED	the required entry is already solved
ARP_RES_ENTRY_QUEUED	the required entry was already queued
ARP_RES_ENTRY_EXIST	the required entry was already cached
ARP_RES_PERM_QUOTA_EXCEED	info: the quota of permanent entries was exceeded
ARP_RES_NO_ENTRY = -1	no such entry exists
ARP_RES_CACHE_FULL = -2	the cache is full and no entry could be removed to make room
ARP_RES_TX_FAILED = -3	failed to transmit an ARP message

ARP_RES_BAD_INDEX = -4	bad query index
ARP_RES_BAD_ADDRESS = -5	bad IP address specified
ARP_RES_NO_INTERFACE = -6	no such interface exists
ARP_RES_BAD_TYPE = -7	no such type is valid/exists
ARP_RES_CONFIGURE_ERR = -8	interface is configuring now, no ARP probes

Remarks

None

5.8.4.7.3.8 ARP_MODULE_CONFIG Structure**C**

```
typedef struct {
    size_t cacheEntries;
    bool deleteOld;
    int entrySolvedTmo;
    int entryPendingTmo;
    int entryRetryTmo;
    int permQuota;
    int purgeThres;
    int purgeQuanta;
} ARP_MODULE_CONFIG;
```

Description

This is type ARP_MODULE_CONFIG.

Members

Members	Description
size_t cacheEntries;	cache entries for this interface
bool deleteOld;	delete old cache if still in place, else don't re-initialize it
int entrySolvedTmo;	solved entry removed after this tmo if not referenced - seconds
int entryPendingTmo;	timeout for a pending to be solved entry in the cache, in seconds
int entryRetryTmo;	timeout for resending an ARP request for a pending entry - seconds 1 sec < tmo < entryPendingTmo
int permQuota;	max percentage of permanent entries allowed in the cache -
int purgeThres;	purge threshold -
int purgeQuanta;	no of entries to delete once the threshold is reached

5.8.4.7.3.9 arp_app_callbacks Structure**C**

```
struct arp_app_callbacks {
    bool used;
    void (* TCPIP_ARP_PacketNotify)(TCPIP_NET_IF* pNetIf, uint32_t SenderIPAddr, uint32_t TargetIPAddr, TCPIP_MAC_ADDR* SenderMACAddr, TCPIP_MAC_ADDR* TargetMACAddr, uint8_t op_req);
};
```

Description

TCPIP_STACK_USE_ZEROCONF_LINK_LOCAL API specific Definitions

5.8.4.8 Files

Files

Name	Description
arp.h	This is file arp.h.
arp_config.h	ARP configuration file
arp_manager.h	Stack internal definitions for ARP module

Description

5.8.4.8.1 arp.h

This is file arp.h.

Enumerations

	Name	Description
	TCPIP_ARP_ENTRY_TYPE	Type of ARP entry
	TCPIP_ARP_EVENT_TYPE	Events reported by ARP
	TCPIP_ARP_OPERATION_TYPE	Type of ARP operation
	TCPIP_ARP_RESULT	ARP Results (success and failure codes)

Functions

	Name	Description
	TCPIP_ARP_CacheEntriesNoGet	Used to retrieve the number of entereies for a specific interface
	TCPIP_ARP_CacheThresholdSet	Sets the cache threshold for the specified interface in %
	TCPIP_ARP_EntryGet	gets the current mapping for an IP address
	TCPIP_ARP_EntryQuery	Queries an ARP cache entry using the index of the cache line.
	TCPIP_ARP_EntryRemove	removes the mapping of an address, even a permanent one
	TCPIP_ARP_EntryRemoveAll	Removes all the mapping belonging to an interface.
	TCPIP_ARP_EntryRemoveNet	Removes all the entries belonging to a network interface.
	TCPIP_ARP_EntrySet	Adds an ARP cache entry for the specified interface.
	TCPIP_ARP_HandlerDeRegister	deregister the event handler
	TCPIP_ARP_HandlerRegister	Register an ARP resolve handler
	TCPIP_ARP_IsResolved	Determines if an ARP request has been resolved yet.
	TCPIP_ARP_Probe	Transmits an ARP probe to resolve an IP address.
	TCPIP_ARP_Resolve	Transmits an ARP request to resolve an IP address.

Structures

	Name	Description
	ARP_MODULE_CONFIG	This is type ARP_MODULE_CONFIG.
	TCPIP_ARP_ENTRY_QUERY	ARP Entry Query

Types

	Name	Description
	TCPIP_ARP_EVENT_HANDLER	Notification handler that can be called when a specific entry is resolved.

	TCPIP_ARP_HANDLE	ARP Handle

5.8.4.8.2 arp_config.h

Address Resolution Protocol (ARP) Configuration file

This file contains the ARP module configuration options

Macros

	Name	Description
	ARP_CACHE_ENTRIES_97J60	This is macro ARP_CACHE_ENTRIES_97J60.
	ARP_CACHE_ENTRIES_DEFAULT	number of entries in the cache default number of entries per interface
	ARP_CACHE_ENTRIES_ENCJ60	This is macro ARP_CACHE_ENTRIES_ENCJ60.
	ARP_CACHE_ENTRIES_ENCJ600	This is macro ARP_CACHE_ENTRIES_ENCJ600.
	ARP_CACHE_ENTRIES_MRF24W	This is macro ARP_CACHE_ENTRIES_MRF24W.
	ARP_CACHE_ENTRIES_PIC32INT	specific interaces numbers
	ARP_CACHE_PENDING_ENTRY_TMO	timeout for a pending to be solved entry in the cache, in seconds the entry will be removed if the tmo elapsed and the entry has not been solved a solved entry moves to the solved entries timeout
	ARP_CACHE_PENDING_RETRY_TMO	timeout for resending an ARP request for a pending entry In order to prevent the ARP flooding the standard recommends it to be greater than 1 sec. Of course, it should be less than ARP_CACHE_PENDING_ENTRY_TMO
	ARP_CACHE_PERMANENT_QUOTA	max percentage of permanent entries in the cache note that since permanent entries cannot be removed they tend to degrade the efficiency of the cache look up
	ARP_CACHE_PURGE_QUANTA	how many entries to delete, once the threshold is reached
	ARP_CACHE_PURGE_THRESHOLD	default purge threshold, percentage once the number of resolved entries in the cache gets beyond the threshold some resolved entries will be purged
	ARP_CACHE_SOLVED_ENTRY_TMO	timeout for a solved entry in the cache, in seconds the entry will be removed if the tmo elapsed and the entry has not been referenced again
	ARP_TASK_PROCESS_RATE	ARP task processing rate, in seconds the ARP module will process a timer event with this rate for maintaining its own queues, processing timeouts, etc. Choose it so that the other ARP_CACHE_xxx_TMO are multiple of this

5.8.4.8.3 arp_manager.h

ARP module manager header

This file contains the stack internal API for the ARP module

Functions

	Name	Description
	TCPIP_ARP_CallbacksDeregister	De-Registering callbacks with ARP module that are registered previously.
	TCPIP_ARP_CallbacksRegister	Registering callback with ARP module to get notified about certian events.
	TCPIP_ARP_Deinitialize	Deinitializes the ARP module.
	TCPIP_ARP_Initialize	Initializes the ARP module.
	TCPIP_ARP_Process	Processes an incoming ARP packet.
	TCPIP_ARP_Task	Performs ARP tasks from within TCPIP stack tasks.

	TCPIP_ARP_TaskIsPending	Returns true if an ARP task is pending, false otherwise.

Structures

	Name	Description
	arp_app_callbacks	TCPIP_STACK_USE_ZEROCONF_LINK_LOCAL API specific Definitions

5.8.5 Berkeley TCP/IP Stack Library

5.8.5.1 Introduction

Berkeley TCP/IP Stack Library

for

Microchip Microcontrollers

This library provides the API of the Berkeley TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

The Berkeley Socket Distribution (BSD) APIs provide a BSD wrapper to the native Microchip TCP/IP Stack APIs. Using this interface, programmers familiar with BSD sockets can quickly develop applications using Microchip's TCP/IP Stack.

The illustration below shows a typical interaction for a TCP server or client using the Berkeley [socket](#) APIs.

5.8.5.2 Release Notes

MPLAB Harmony Version: v0.70b **Berkeley TCP/IP Stack Library Version :** 1.0 **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.8.5.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO

YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.8.5.4 Using the Library

This topic describes the basic architecture of the Berkeley TCP/IP Stack Library and provides information and examples on how to use it.

Interface Header File: [berkeley_api.h](#)

The interface to the Berkeley TCP/IP Stack library is defined in the "[berkeley_api.h](#)" header file. This file is included by the "tcpip.h" file. Any C language source (.c) file that uses the berkeley TCP/IP Stack library should include "tcpip.h".

Library File:

The Berkeley TCP/IP Stack library archive (.a) file is installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the TCP/IP Stack interacts with the framework.

5.8.5.4.1 Abstraction Model

This library provides the API of the Berkeley TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

Berkeley Software Abstraction Block Diagram

The illustration below shows a typical interaction for a TCP server or client using the Berkeley [socket](#) APIs.

5.8.5.4.2 Library Overview

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the Berkeley module.

Library Interface Section	Description
Functions	Routines for Configuring DHCP
Data Types and Constants	This section provides various definitions describing This API

5.8.5.5 Configuring the Library

Macros

	Name	Description
	MAX_BSD_CLIENT_CONNECTIONS	Berkeley API client Sockets simultaneous supported connections.
	MAX_BSD_SERVER_CONNECTIONS	Berkeley API server Sockets simultaneous supported connections.

Description

The configuration of the Berkeley TCP/IP Stack is based on the file tcpip_config.h

This header file contains the configuration selection for the Berkeley TCP/IP Stack. Based on the selections made, the Berkeley TCP/IP Stack will support or not support selected features. These configuration settings will apply to all instances of the Berkeley TCP/IP Stack.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.8.5.5.1 MAX_BSD_CLIENT_CONNECTIONS Macro

C

```
#define MAX_BSD_CLIENT_CONNECTIONS (2)
```

Description

Berkeley API client Sockets simultaneous supported connections.

5.8.5.5.2 MAX_BSD_SERVER_CONNECTIONS Macro

C

```
#define MAX_BSD_SERVER_CONNECTIONS (2)
```

Description

Berkeley API server Sockets simultaneous supported connections.

5.8.5.6 Building the Library

This section list the files that are available in the \src of the Berkeley driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

5.8.5.7 Library Interface

Data Types and Constants

	Name	Description
	AF_INET	Internet Address Family - UDP, TCP, etc.
	INADDR_ANY	IP address for server binding.
	INVALID_TCP_PORT	Invalid TCP port
	IP_ADDR_ANY	IP Address for server binding
	IPPROTO_IP	Indicates IP pseudo-protocol.
	IPPROTO_TCP	Indicates TCP for the internet address family.
	IPPROTO_UDP	Indicates UDP for the internet address family.
	SOCK_DGRAM	Connectionless datagram socket . Use UDP for the internet address family.
	SOCK_STREAM	Connection based byte streams. Use TCP for the internet address family.
	SOCKET_CNXN_IN_PROGRESS	Socket connection state.
	SOCKET_DISCONNECTED	Socket disconnected
	SOCKET_ERROR	Socket error
	BERKELEY_MODULE_CONFIG	Berkeley API module configuration structure
	SOCKADDR	generic address structure for all address families
	SOCKADDR_IN	In the Internet address family
	SOCKET	Socket descriptor
	in_addr	in_addr structure

	sockaddr	generic address structure for all address families
	sockaddr_in	In the Internet address family

Functions

	Name	Description
	accept	This function accepts connection requests queued for a listening socket .
	bind	This function assigns a name to the socket descriptor.
	closesocket	The closesocket function closes an existing socket .
	connect	This function connects to the peer communications end point.
	gethostname	Returns the standard host name for the system.
	listen	The listen function sets the specified socket in a listen mode
	recv	The recv() function is used to receive incoming data that has been queued for a socket .
	recvfrom	The recvfrom() function is used to receive incoming data that has been queued for a socket .
	send	The send function is used to send outgoing data on an already connected socket .
	sendto	This function used to send the data for both connection oriented and connection-less sockets.
	socket	This function creates a new Berkeley socket.

Description

This section describes the Application Programming Interface (API) functions of the Berkeley TCP/IP Stack.

Refer to each section for a detailed description.

5.8.5.7.1 Functions

5.8.5.7.1.1 accept Function

C

```
SOCKET accept(
    SOCKET s,
    struct sockaddr* addr,
    int* addrlen
);
```

Description

The accept function is used to accept connection requests queued for a listening [socket](#). If a connection request is pending, accept removes the request from the queue, and a new [socket](#) is created for the connection. The original listening [socket](#) remains open and continues to queue new connection requests. The [socket](#) must be a [SOCK_STREAM](#) type [socket](#).

Preconditions

[listen](#) function should be called.

Parameters

Parameters	Description
s	Socket descriptor returned from a previous call to socket . must be bound to a local name and in listening mode.
addr	Optional pointer to a buffer that receives the address of the connecting entity.
addrlen	Optional pointer to an integer that contains the length of the address addr

Returns

If the `accept` function succeeds, it returns a non-negative integer that is a descriptor for the accepted [socket](#). Otherwise, the value [SOCKET_ERROR](#) is returned. (and `errno` set accordingly).

Remarks

None.

5.8.5.7.1.2 bind Function**C**

```
int bind(  
    SOCKET s,  
    const struct sockaddr* name,  
    int namelen  
);
```

Description

The `bind` function assigns a name to an unnamed [socket](#). The name represents the local address of the communication endpoint. For sockets of type [SOCK_STREAM](#), the name of the remote endpoint is assigned when a [connect](#) or [accept](#) function is executed.

Preconditions

[socket](#) function should be called.

Parameters

Parameters	Description
s	Socket descriptor returned from a previous call to socket .
name	pointer to the sockaddr structure containing the local address of the socket .
namelen	length of the sockaddr structure.

Returns

If `bind` is successful, a value of 0 is returned. A return value of [SOCKET_ERROR](#) indicates an error. (and `errno` set accordingly).

Remarks

None.

5.8.5.7.1.3 closesocket Function**C**

```
int closesocket(  
    SOCKET s  
);
```

Description

The `closesocket` function closes an existing [socket](#). This function releases the [socket](#) descriptor s. Any data buffered at the [socket](#) is discarded. If the [socket](#) s is no longer needed, `closesocket()` must be called in order to release all resources associated with s.

Preconditions

None.

Parameters

Parameters	Description
s	Socket descriptor returned from a previous call to socket

Returns

If `closesocket` is successful, a value of 0 is returned. A return value of [SOCKET_ERROR](#) (-1) indicates an error. (and `errno` set accordingly).

Remarks

None.

5.8.5.7.1.4 connect Function**C**

```
int connect(  
    SOCKET s,  
    struct sockaddr* name,  
    int namelen  
);
```

Description

The `connect` function assigns the address of the peer communications endpoint. For stream sockets, connection is established between the endpoints. For datagram sockets, an address filter is established between the endpoints until changed with another `connect()` function.

Preconditions

[socket](#) function should be called.

Parameters

Parameters	Description
s	Socket descriptor returned from a previous call to socket .
name	pointer to the sockaddr structure containing the peer address and port number.
namelen	length of the sockaddr structure.

Returns

If the `connect()` function succeeds, it returns 0. Otherwise, the value [SOCKET_ERROR](#) is returned to indicate an error condition (and `errno` set accordingly). For stream based [socket](#), if the connection is not established yet, `connect` returns [SOCKET_ERROR](#) and `errno` = `EINPROGRESS`.

Remarks

None.

5.8.5.7.1.5 gethostname Function**C**

```
int gethostname(  
    char* name,  
    int namelen  
);
```

Description

This function returns the standard host name of the system which is calling this function. The returned name is null-terminated.

Preconditions

None.

Parameters

Parameters	Description
name	Pointer to a buffer that receives the local host name.
namelen	size of the name array.

Returns

Success will return a value of 0. If name is too short to hold the host name or any other error occurs, [SOCKET_ERROR](#) (-1) will be returned (and errno set accordingly). On error, *name will be unmodified and no null terminator will be generated.

Remarks

The function returns the host name as set on the default network interface.

5.8.5.7.1.6 listen Function**C**

```
int listen(  
    SOCKET s,  
    int backlog  
);
```

Description

This function sets the specified [socket](#) in a listen mode. Calling the listen function indicates that the application is ready to [accept](#) connection requests arriving at a [socket](#) of type [SOCK_STREAM](#). The connection request is queued (if possible) until accepted with an [accept](#) function. The backlog parameter defines the maximum number of pending connections that may be queued.

Preconditions

[bind\(\)](#) must have been called on the s [socket](#) first.

Parameters

Parameters	Description
s	Socket identifier returned from a prior socket() call.
backlog	Maximum number of connection requests that can be queued. Note that each backlog requires a TCP socket to be allocated.

Returns

Returns 0 on success, else return [SOCKET_ERROR](#). (and errno set accordingly).

Remarks

None

5.8.5.7.1.7 recv Function**C**

```
int recv(  
    SOCKET s,  
    char* buf,  
    int len,  
    int flags  
);
```

Description

The `recv()` function is used to receive incoming data that has been queued for a `socket`. This function can be used with both datagram and stream `socket`. If the available data is too large to fit in the supplied application buffer `buf`, excess bytes are discarded in case of `SOCK_DGRAM` type sockets. For `SOCK_STREAM` types, the data is buffered internally so the application can retrieve all data by multiple calls of `recvfrom`.

Preconditions

`connect` function should be called for TCP and UDP sockets. Server side, `accept` function should be called.

Parameters

Parameters	Description
<code>s</code>	Socket descriptor returned from a previous call to <code>socket</code> .
<code>buf</code>	application data receive buffer.
<code>len</code>	buffer length in bytes.
<code>flags</code>	no significance in this implementation

Returns

If `recv` is successful, the number of bytes copied to application buffer `buf` is returned. A return value of `SOCKET_ERROR` (-1) indicates an error condition (and `errno` set accordingly). A value of zero indicates `socket` has been shutdown by the peer.

Remarks

None.

5.8.5.7.1.8 `recvfrom` Function

C

```
int recvfrom(  
    SOCKET s,  
    char* buf,  
    int len,  
    int flags,  
    struct sockaddr* from,  
    int* fromlen  
);
```

Description

The `recvfrom()` function is used to receive incoming data that has been queued for a `socket`. This function can be used with both datagram and stream type sockets. If the available data is too large to fit in the supplied application buffer `buf`, excess bytes are discarded in case of `SOCK_DGRAM` type sockets. For `SOCK_STREAM` types, the data is buffered internally so the application can retrieve all data by multiple calls of `recvfrom`.

Preconditions

`socket` function should be called.

Parameters

Parameters	Description
<code>s</code>	Socket descriptor returned from a previous call to <code>socket</code> .
<code>buf</code>	application data receive buffer.
<code>len</code>	buffer length in bytes.
<code>flags</code>	message flags. Currently this is not supported.
<code>from</code>	pointer to the <code>sockaddr</code> structure that will be filled in with the destination address.
<code>fromlen</code>	size of buffer pointed by <code>from</code> .

Returns

If `recvfrom` is successful, the number of bytes copied to application buffer `buf` is returned. A return value of `SOCKET_ERROR` (-1) indicates an error condition (and `errno` set accordingly). A value of zero indicates `socket` has been shutdown by the peer.

Remarks

None.

5.8.5.7.1.9 send Function**C**

```
int send(  
    SOCKET s,  
    const char* buf,  
    int len,  
    int flags  
);
```

Description

The `send` function is used to send outgoing data on an already connected `socket`. This function is used to send a reliable, ordered stream of data bytes on a `socket` of type `SOCK_STREAM` but can also be used to send datagrams on a `socket` of type `SOCK_DGRAM`.

Preconditions

`connect` function should be called for TCP and UDP sockets. Server side, `accept` function should be called.

Parameters

Parameters	Description
<code>s</code>	Socket descriptor returned from a previous call to <code>socket</code> .
<code>buf</code>	application data buffer containing data to transmit.
<code>len</code>	length of data in bytes.
<code>flags</code>	message flags. Currently this field is not supported.

Returns

On success, `send` returns number of bytes sent. Zero indicates no data send. In case of error it returns `SOCKET_ERROR` (and `errno` set accordingly).

Remarks

None.

5.8.5.7.1.10 sendto Function**C**

```
int sendto(  
    SOCKET s,  
    const char* buf,  
    int len,  
    int flags,  
    const struct sockaddr* to,  
    int tolen  
);
```

Description

The `sendto` function is used to `send` outgoing data on a `socket`. The destination address is given by `to` and `tolen`. Both Datagram and stream sockets are supported.

Preconditions

[socket](#) function should be called.

Parameters

Parameters	Description
s	Socket descriptor returned from a previous call to socket .
buf	application data buffer containing data to transmit.
len	length of data in bytes.
flags	message flags. Currently this field is not supported.
to	Optional pointer to the the sockaddr structure containing the destination address. If NULL, the currently bound remote port and IP address are used as the destination.
tolen	length of the sockaddr structure.

Returns

On success, sendto returns number of bytes sent. In case of error returns [SOCKET_ERROR](#) (and errno set accordingly).

Remarks

None.

5.8.5.7.1.11 socket Function**C**

```
SOCKET socket(  
    int af,  
    int type,  
    int protocol  
);
```

Description

This function creates a new BSD socket for the microchip TCPIP stack. The return socket descriptor is used for the subsequent BSD operations.

Preconditions

BerkeleySocketInit function should be called.

Parameters

Parameters	Description
af	address family - AF_INET .
type	socket type SOCK_DGRAM or SOCK_STREAM .
protocol	IP protocol IPPROTO_UDP or IPPROTO_TCP .

Returns

New socket descriptor. [SOCKET_ERROR](#) in case of error. (and errno set accordingly).

Remarks

None.

5.8.5.7.2 Data Types and Constants

5.8.5.7.2.1 AF_INET Macro

C

```
#define AF_INET 2           // Internet Address Family - UDP, TCP, etc.
```

Description

Internet Address Family - UDP, TCP, etc.

5.8.5.7.2.2 INADDR_ANY Macro

C

```
#define INADDR_ANY 0x00000000u // IP address for server binding.
```

Description

IP address for server binding.

5.8.5.7.2.3 INVALID_TCP_PORT Macro

C

```
#define INVALID_TCP_PORT (0L) //Invalid TCP port
```

Description

Invalid TCP port

5.8.5.7.2.4 IP_ADDR_ANY Macro

C

```
#define IP_ADDR_ANY 0u // IP Address for server binding
```

Description

IP Address for server binding

5.8.5.7.2.5 IPPROTO_IP Macro

C

```
#define IPPROTO_IP 0 // Indicates IP pseudo-protocol.
```

Description

Indicates IP pseudo-protocol.

5.8.5.7.2.6 IPPROTO_TCP Macro

C

```
#define IPPROTO_TCP 6 // Indicates TCP for the internet address family.
```

Description

Indicates TCP for the internet address family.

5.8.5.7.2.7 IPPROTO_UDP Macro

C

```
#define IPPROTO_UDP 17 // Indicates UDP for the internet address family.
```

Description

Indicates UDP for the internet address family.

5.8.5.7.2.8 SOCK_DGRAM Macro**C**

```
#define SOCK_DGRAM 110 //Connectionless datagram socket. Use UDP for the internet address family.
```

Description

Connectionless datagram [socket](#). Use UDP for the internet address family.

5.8.5.7.2.9 SOCK_STREAM Macro**C**

```
#define SOCK_STREAM 100 //Connection based byte streams. Use TCP for the internet address family.
```

Description

Connection based byte streams. Use TCP for the internet address family.

5.8.5.7.2.10 SOCKET_CNXN_IN_PROGRESS Macro**C**

```
#define SOCKET_CNXN_IN_PROGRESS (-2) //Socket connection state.
```

Description

Socket connection state.

5.8.5.7.2.11 SOCKET_DISCONNECTED Macro**C**

```
#define SOCKET_DISCONNECTED (-3) //Socket disconnected
```

Description

Socket disconnected

5.8.5.7.2.12 SOCKET_ERROR Macro**C**

```
#define SOCKET_ERROR (-1) //Socket error
```

Description

Socket error

5.8.5.7.2.13 BERKELEY_MODULE_CONFIG Structure**C**

```
typedef struct {  
} BERKELEY_MODULE_CONFIG;
```

Description

Berkeley API module configuration structure

5.8.5.7.2.14 SOCKADDR Type

C

```
typedef struct sockaddr SOCKADDR;
```

Description

generic address structure for all address families

5.8.5.7.2.15 SOCKADDR_IN Type

C

```
typedef struct sockaddr_in SOCKADDR_IN;
```

Description

In the Internet address family

5.8.5.7.2.16 SOCKET Type

C

```
typedef int16_t SOCKET;
```

Description

Socket descriptor

5.8.5.7.2.17 in_addr Structure

C

```
struct in_addr {  
    union {  
        struct {  
            uint8_t s_b1, s_b2, s_b3, s_b4;  
        } S_un_b;  
        struct {  
            uint16_t s_w1, s_w2;  
        } S_un_w;  
        uint32_t S_addr;  
    } S_un;  
};
```

Description

in_addr structure

Members

Members	Description
union { struct { uint8_t s_b1, s_b2, s_b3, s_b4; } S_un_b; struct { uint16_t s_w1, s_w2; } S_un_w; uint32_t S_addr; } S_un;	union of IP address
struct { uint8_t s_b1, s_b2, s_b3, s_b4; } S_un_b;	IP address in Byte
struct { uint16_t s_w1, s_w2; } S_un_w;	IP address in Word
uint32_t S_addr;	IP address

5.8.5.7.2.18 sockaddr Structure**C**

```

struct sockaddr {
    unsigned short sa_family;
    char sa_data[14];
};

```

Description

generic address structure for all address families

Members

Members	Description
unsigned short sa_family;	address family
char sa_data[14];	up to 14 bytes of direct address

5.8.5.7.2.19 sockaddr_in Structure**C**

```

struct sockaddr_in {
    short sin_family;
    uint16_t sin_port;
    struct in_addr sin_addr;
    char sin_zero[8];
};

```

Description

In the Internet address family

Members

Members	Description
short sin_family;	Address family; must be AF_INET .
uint16_t sin_port;	Internet Protocol (IP) port.

struct in_addr sin_addr;	IP address in network byte order.
char sin_zero[8];	Padding to make structure the same size as SOCKADDR .

5.8.5.8 Files

Files

Name	Description
berekely_api_config.h	Berekely Sockets API Client and Server
berkeley_api.h	

Description

5.8.5.8.1 berekely_api_config.h

Berekely Sockets API Configuration file

This file contains the BerekelyAPI module configuration options

Macros

	Name	Description
	MAX_BSD_CLIENT_CONNECTIONS	Berkeley API client Sockets simultaneous supported connections.
	MAX_BSD_SERVER_CONNECTIONS	Berkeley API server Sockets simultaneous supported connections.

5.8.5.8.2 berkeley_api.h

Berekely Socket Distribution API Header File

Functions

	Name	Description
	accept	This function accepts connection requests queued for a listening socket .
	bind	This function assigns a name to the socket descriptor.
	closesocket	The closesocket function closes an existing socket .
	connect	This function connects to the peer communications end point.
	gethostname	Returns the standard host name for the system.
	listen	The listen function sets the specified socket in a listen mode
	recv	The recv() function is used to receive incoming data that has been queued for a socket .
	recvfrom	The recvfrom() function is used to receive incoming data that has been queued for a socket .
	send	The send function is used to send outgoing data on an already connected socket .
	sendto	This function used to send the data for both connection oriented and connection-less sockets.
	socket	This function creates a new Berkeley socket.

Macros

	Name	Description
	AF_INET	Internet Address Family - UDP, TCP, etc.

	INADDR_ANY	IP address for server binding.
	INVALID_TCP_PORT	Invalid TCP port
	IP_ADDR_ANY	IP Address for server binding
	IPPROTO_IP	Indicates IP pseudo-protocol.
	IPPROTO_TCP	Indicates TCP for the internet address family.
	IPPROTO_UDP	Indicates UDP for the internet address family.
	SOCK_DGRAM	Connectionless datagram socket . Use UDP for the internet address family.
	SOCK_STREAM	Connection based byte streams. Use TCP for the internet address family.
	SOCKET_CNXN_IN_PROGRESS	Socket connection state.
	SOCKET_DISCONNECTED	Socket disconnected
	SOCKET_ERROR	Socket error

Structures

	Name	Description
	in_addr	in_addr structure
	sockaddr	generic address structure for all address families
	sockaddr_in	In the Internet address family
	BERKELEY_MODULE_CONFIG	Berkeley API module configuration structure

Types

	Name	Description
	SOCKADDR	generic address structure for all address families
	SOCKADDR_IN	In the Internet address family
	SOCKET	Socket descriptor

5.8.6 DHCP TCP/IP Stack Library

5.8.6.1 Introduction

Dynamic Host Configuration Protocol (DHCP) TCP/IP Stack Library

for

Microchip Microcontrollers

This library provides the API of the DHCP TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

The DHCP client module will allow your application to dynamically obtain an IP address from a DHCP server on the same network. Doing this will reset the IP address, subnet mask, gateway address, and some other configuration parameters in your AppConfig structure.

5.8.6.2 Release Notes

MPLAB Harmony Version: v0.70b **DHCP TCP/IP Stack Library Version :** 1.0 **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.8.6.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.8.6.4 Using the Library

This topic describes the basic architecture of the DHCP TCP/IP Stack Library and provides information and examples on how to use it.

Interface Header File: [dhcp.h](#)

The interface to the DHCP TCP/IP Stack library is defined in the "[dhcp.h](#)" header file. This file is included by the "tcpip.h" file. Any C language source (.c) file that uses the DHCP TCP/IP Stack library should include "tcpip.h".

Library File:

The DHCP TCP/IP Stack library archive (.a) file installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the TCP/IP Stack interacts with the framework.

5.8.6.4.1 Abstraction Model

This library provides the API of the DHCP TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

DHCP Software Abstraction Block Diagram

This module provides software abstraction of the DHCP module existent in any TCP/IP Stack implementation. It removes the overhead of address resolution from all other modules in the stack.

5.8.6.4.2 Library Overview

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the DHCP module.

Library Interface Section	Description
Configuration Functions	Routines for Configuring DHCP
Status Functions	Routines for Obtaining DHCP Status Information
Data Types and Constants	This section provides various definitions describing This API

5.8.6.4.3 How the Library Works

To use DHCP, include the files dhcp.c, dhcps.c, and [dhcp.h](#) in your project, and add or uncomment the definition "#define TCPIP_STACK_USE_DHCP_CLIENT" to tcpip_config.h. The TCP/IP stack also includes a simple DHCP server that can supply an IP address to one DHCP client. To enable this functionality, add the macro "#define TCPIP_STACK_USE_DHCP_SERVER" to tcpip_config.h.

5.8.6.5 Configuring the Library

Macros

	Name	Description
	DHCP_CLIENT_ENABLED	enable/disable the DHCP client at stack start up
	DHCP_CLIENT_PORT	UDP client local port for DHCP Client transactions
	DHCP_SERVER_PORT	UDP remote port for DHCP Server
	DHCP_TASK_TICK_RATE	5 ms default rate
	DHCP_TIMEOUT	Defines how long to wait before a DHCP request times out, seconds

Description

The configuration of the DHCP TCP/IP Stack is based on the file `sys_config.h`

This header file contains the configuration selection for the DHCP TCP/IP Stack. Based on the selections made, the DHCP TCP/IP Stack will support or not support selected features. These configuration settings will apply to all instances of the DHCP TCP/IP Stack.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.8.6.5.1 DHCP_CLIENT_ENABLED Macro**C**

```
#define DHCP_CLIENT_ENABLED 1
```

Description

enable/disable the DHCP client at stack start up

Remarks

the interface initialization setting in `TCPIP_NETWORK_CONFIG` takes precedence!

5.8.6.5.2 DHCP_CLIENT_PORT Macro**C**

```
#define DHCP_CLIENT_PORT (68u)
```

Description

UDP client local port for DHCP Client transactions

5.8.6.5.3 DHCP_SERVER_PORT Macro**C**

```
#define DHCP_SERVER_PORT (67u)
```

Description

UDP remote port for DHCP Server

5.8.6.5.4 DHCP_TASK_TICK_RATE Macro**C**

```
#define DHCP_TASK_TICK_RATE (5)    // 5 ms default rate
```

Description

5 ms default rate

5.8.6.5.5 DHCP_TIMEOUT Macro**C**

```
#define DHCP_TIMEOUT (2u1)
```

Description

Defines how long to wait before a DHCP request times out, seconds

5.8.6.6 Building the Library

This section list the files that are available in the \src of the DHCP driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

5.8.6.7 Library Interface

Data Types and Constants

	Name	Description
	DHCP_MODULE_CONFIG	DHCP Module Configuration Typedef
	TCPIP_DHCP_EVENT_HANDLER	DHCP Event Handler
	TCPIP_DHCP_EVENT_TYPE	DHCP Event Type
	TCPIP_DHCP_HANDLE	DHCP Handle

Configuration Functions

	Name	Description
	TCPIP_DHCP_Disable	Disables the DHCP Client for the specified interface.
	TCPIP_DHCP_Enable	Enables the DHCP client for the specified interface.
	TCPIP_DHCP_HandlerDeRegister	DHCP De-Register Handler
	TCPIP_DHCP_HandlerRegister	DHCP Register Handler
	TCPIP_DHCP_Renew	Renews the DHCP lease for the specified interface.
	TCPIP_DHCP_Request	Requests the supplied IPv4 address from a DHCP server.
	TCPIP_DHCP_RequestTimeoutSet	DHCP Set Request Timeout

Status Functions

	Name	Description
	TCPIP_DHCP_IsBound	Determins if the DHCP client has an IP address lease on the specified interface.
	TCPIP_DHCP_IsEnabled	Determins if the DHCP client is enabled on the specified interface.
	TCPIP_DHCP_IsServerDetected	Determins if the DHCP client on the specified interface has seen a DHCP server.

Description

This section describes the Application Programming Interface (API) functions of the DHCP TCP/IP Stack.

Refer to each section for a detailed description.

5.8.6.7.1 Configuration Functions

5.8.6.7.1.1 TCPIP_DHCP_Disable Function

C

```
bool TCPIP_DHCP_Disable(
    TCPIP_NET_HANDLE hNet
);
```

Description

Disables the DHCP client for the specified interface.

Preconditions

None

Parameters

Parameters	Description
pNetIf	Interface to disable the DHCP client on.

Returns

true if success false otherwise

Remarks

When the interface continues using its old configuration, it is possible that the lease may expire and the DHCP server provide the IP to another client. The application should not request the keeping of the old lease unless there is no danger of conflict.

5.8.6.7.1.2 TCPIP_DHCP_Enable Function**C**

```
bool TCPIP_DHCP_Enable(  
    TCPIP_NET_HANDLE hNet  
);
```

Description

Enables the DHCP client for the specified interface, if it is disabled. If it is already enabled, nothing is done.

Preconditions

None

Parameters

Parameters	Description
hNet	Interface to enable the DHCP client on.

Returns

true if success false otherwise

5.8.6.7.1.3 TCPIP_DHCP_HandlerDeRegister Function**C**

```
bool TCPIP_DHCP_HandlerDeRegister(  
    TCPIP_DHCP_HANDLE hDhcp  
);
```

Description

deregister the event handler returns true or false if no such handler registered

5.8.6.7.1.4 TCPIP_DHCP_HandlerRegister Function**C**

```
TCPIP_DHCP_HANDLE TCPIP_DHCP_HandlerRegister(  
    TCPIP_NET_HANDLE hNet,  
    TCPIP_DHCP_EVENT_HANDLER handler,
```

```
    const void* hParam  
);
```

Description

Register an DHCP event handler. Use hNet == 0 to register on all interfaces available. Returns a valid handle if the call succeeds, or a null handle if the call failed. Function has to be called after the DHCP is initialized. The hParam is passed by the client and will be used by the DHCP when the notification is made. It is used for per-thread content or if more modules, for example, share the same handler and need a way to differentiate the callback.

5.8.6.7.1.5 TCPIP_DHCP_Renew Function**C**

```
bool TCPIP_DHCP_Renew(  
    TCPIP_NET_HANDLE hNet  
);
```

Description

Tries to contact the server and renew the DHCP lease for the specified interface. The interface should have the DHCP enabled and in bound state for this call to succeed.

Preconditions

DHCP enabled, a valid lease

Parameters

Parameters	Description
hNet	Interface to renew the DHCP lease on.

Returns

true if success false otherwise

5.8.6.7.1.6 TCPIP_DHCP_Request Function**C**

```
bool TCPIP_DHCP_Request(  
    TCPIP_NET_HANDLE hNet,  
    IPV4_ADDR reqAddress  
);
```

Description

If the DHCP client is not enabled on that interface, this call will first try to enable it. If this succeeds or the DHCP client was already enabled, the following steps are taken: The DHCP client probes the DHCP server and requests the supplied IPv4 address as a valid lease for the specified interface. If the server acknowledges the request, then this is the new IPv4 address of the interface. If the DHCP server rejects the request, then the whole DHCP process is resumed starting with the DHCP Discovery phase.

Preconditions

DHCP enabled, a valid lease

Parameters

Parameters	Description
hNet	Interface to renew the DHCP lease on.

Returns

true if success false otherwise

Remarks

The requested IPv4 address should be a previous lease that was granted to the host. This call should be used when the host is restarting.

5.8.6.7.1.7 TCPIP_DHCP_RequestTimeoutSet Function

C

```
bool TCPIP_DHCP_RequestTimeoutSet(
    TCPIP_NET_HANDLE hNet,
    int tmo
);
```

Description

Adjust the DHCP timeout. How long to wait before a DHCP request times out, seconds.

5.8.6.7.2 Status Functions

5.8.6.7.2.1 TCPIP_DHCP_IsBound Function

C

```
bool TCPIP_DHCP_IsBound(
    TCPIP_NET_HANDLE hNet
);
```

Description

Determines if the DHCP client has an IP address lease on the specified interface.

Preconditions

None

Parameters

Parameters	Description
hNet	Interface to query

Returns

true - DHCP client has obtained an IP address lease (and likely other parameters) and these values are currently being used.
false - No IP address is currently leased

5.8.6.7.2.2 TCPIP_DHCP_IsEnabled Function

C

```
bool TCPIP_DHCP_IsEnabled(
    TCPIP_NET_HANDLE hNet
);
```

Description

Determines if the DHCP client is enabled on the specified interface.

Preconditions

None

Parameters

Parameters	Description
hNet	Interface to query.

Returns

None

5.8.6.7.2.3 TCPIP_DHCP_IsServerDetected Function**C**

```
bool TCPIP_DHCP_IsServerDetected(  
    TCPIP_NET_HANDLE hNet  
);
```

Description

Determines if the DHCP client on the specified interface has seen a DHCP server.

Preconditions

None

Parameters

Parameters	Description
hNet	Interface to query.

Returns

true - At least one DHCP server is attached to the specified network interface. false - No DHCP servers are currently detected on the specified network interface.

5.8.6.7.3 Data Types and Constants**5.8.6.7.3.1 DHCP_MODULE_CONFIG Structure****C**

```
typedef struct {  
    bool dhcpEnable;  
    int dhcpTmo;  
    int dhcpCliPort;  
    int dhcpSrvPort;  
} DHCP_MODULE_CONFIG;
```

Description

DHCP Module Configuration

Used in [dhcp_config.h](#)

Members

Members	Description
int dhcpTmo;	timeout to wait for a DHCP request, seconds
int dhcpCliPort;	client port for DHCP client transactions
int dhcpSrvPort;	remote server port for DHCP server messages

5.8.6.7.3.2 TCPIP_DHCP_EVENT_HANDLER Type

C

```
typedef void (* TCPIP_DHCP_EVENT_HANDLER)(TCPIP_NET_HANDLE hNet, TCPIP_DHCP_EVENT_TYPE evType,
const void* param);
```

Description

Type: TCPIP_DHCP_EVENT_HANDLER

Prototype of a DHCP event handler clients can register a handler with the DHCP service. Once an DHCP event occurs the DHCP service will called the registered handler. The handler has to be short and fast. It is meant for setting an event flag, not for lengthy processing!

5.8.6.7.3.3 TCPIP_DHCP_EVENT_TYPE Enumeration

C

```
typedef enum {
    DHCP_EVENT_DISCOVER = 1,
    DHCP_EVENT_BOUND,
    DHCP_EVENT_LEASE_EXPIRED,
    DHCP_EVENT_CONN_LOST,
    DHCP_EVENT_SERVICE_DISABLED
} TCPIP_DHCP_EVENT_TYPE;
```

Description

Enumeration: TCPIP_DHCP_EVENT_TYPE

None

Members

Members	Description
DHCP_EVENT_DISCOVER = 1	DHCP cycle started
DHCP_EVENT_BOUND	DHCP lease obtained
DHCP_EVENT_LEASE_EXPIRED	lease expired
DHCP_EVENT_CONN_LOST	connection to the DHCP server lost, reverted to the defaultIP address
DHCP_EVENT_SERVICE_DISABLED	DHCP service disabled, reverted to the defaultIP address

5.8.6.7.3.4 TCPIP_DHCP_HANDLE Type

C

```
typedef const void* TCPIP_DHCP_HANDLE;
```

Description

Type: TCPIP_DHCP_HANDLE

A handle that a client can use after the event handler has been registered.

5.8.6.8 Files

Files

Name	Description
dhcp.h	Dynamic Host Configuration Protocol (DHCP) Client API

dhcp_config.h	DHCP configuration file

Description**5.8.6.8.1 dhcp.h**

Provides automatic IP address, subnet mask, gateway address, DNS server address, and other configuration parameters on DHCP enabled networks.

- Reference: RFC 2131, 2132

Enumerations

	Name	Description
	TCPIP_DHCP_EVENT_TYPE	DHCP Event Type

Functions

	Name	Description
	TCPIP_DHCP_Disable	Disables the DHCP Client for the specified interface.
	TCPIP_DHCP_Enable	Enables the DHCP client for the specified interface.
	TCPIP_DHCP_HandlerDeRegister	DHCP De-Register Handler
	TCPIP_DHCP_HandlerRegister	DHCP Register Handler
	TCPIP_DHCP_IsBound	Determines if the DHCP client has an IP address lease on the specified interface.
	TCPIP_DHCP_IsEnabled	Determines if the DHCP client is enabled on the specified interface.
	TCPIP_DHCP_IsServerDetected	Determines if the DHCP client on the specified interface has seen a DHCP server.
	TCPIP_DHCP_Renew	Renews the DHCP lease for the specified interface.
	TCPIP_DHCP_Request	Requests the supplied IPv4 address from a DHCP server.
	TCPIP_DHCP_RequestTimeoutSet	DHCP Set Request Timeout

	<u>DHCP_TASK_TICK_RATE</u>	5 ms default rate
	<u>DHCP_TIMEOUT</u>	Defines how long to wait before a DHCP request times out, seconds

5.8.7 DHCP Server TCP/IP Stack Library

5.8.7.1 Introduction

DHCP Server TCP/IP Stack Library
for
Microchip Microcontrollers

This library provides the API of the DHCP server TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

The DHCP Server module is used to assign the IP address to the DHCP client from the configured IP address database. When the server receives a request from a client, the DHCP server determines the network to which the DHCP client is connected, and then allocates an IP address that is appropriate for the client, and sends configuration information appropriate for that client. DHCP servers typically grant IP addresses to clients only for a limited interval. DHCP clients are responsible for renewing their IP address before that interval has expired, and must stop using the address once the interval has expired, if they have not been able to renew it.

5.8.7.2 Release Notes

MPLAB Harmony Version: v0.70b **DHCP Server TCP/IP Library Version :** 1.0 **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.8.7.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.8.7.4 Using the Library

This topic describes the basic architecture of the DHCP Server TCP/IP Stack Library and provides information and examples on how to use it.

Interface Header File: [dhcps.h](#)

The interface to the DHCP Server TCP/IP Stack library is defined in the "[dhcps.h](#)" header file. This file is included by the "tcpip.h" file. Any C language source (.c) file that uses the DHCP Server TCP/IP Stack library should include "tcpip.h".

Library File:

The DHCP Server TCP/IP Stack library archive (.a) file is installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the TCP/IP Stack interacts with the framework.

5.8.7.4.1 Abstraction Model

This library provides the API of the DHCP Server TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

DHCP Server Software Abstraction Block Diagram

This module provides software abstraction of the DHCP Server module existent in any TCP/IP Stack implementation. It removes the overhead of address resolution from all other modules in the stack.

Typical DCHP Usage

5.8.7.4.2 Library Overview

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the DHCP Server module.

Library Interface Section	Description
Configuration Functions	Routines for Configuring DHCP server
Status Functions	Routines for Obtaining DHCP Status Information
Data Types and Constants	This section provides various definitions describing This API

5.8.7.4.3 How the Library Works

To use DHCP Server, include the files `dhcps.c`, `dhcp.c`, and [dhcp.h](#) in your project, and add or uncomment the definition `"#define TCPIP_STACK_USE_DHCP_SERVER"` to `tcip_config.h`.

5.8.7.5 Configuring the Library

Macros

	Name	Description
	DHCP_SERVER_GATEWAY_ADDRESS	as we are in same network, Gateway address is same as server IP address.
	DHCP_SERVER_IP_ADDRESS	First three octet should match to the TP address range for Server address and the begining address should be reserved for server address
	DHCP_SERVER_NETMASK_ADDRESS	Net mask value
	DHCP_SERVER_PRIMARY_DNS_ADDRESS	DNS Primary address
	DHCP_SERVER_SECONDARY_DNS_ADDRESS	DNS Secondary address
	DHCP_IP_ADDRESS_RANGE_START	Address range is starting from 100, because the from 1 to 100 is reserved. Start address(192.168.100.1) should be used as server address
	DHCP_LEASE_DURATION	timeout for a solved entry in the cache, in seconds the entry will be removed if the tmo elapsed and the entry has not been referenced again
	DHCP_LEASE_ENTRIES_DEFAULT	number of entries in the cache default number of entries per interface
	DHCP_LEASE_REMOVED_BEFORE_ACK	The entry should be removed from the entry if there is no REQUEST after OFFER
	DHCP_LEASE_SOLVED_ENTRY_TMO	timeout for a solved entry in the cache, in seconds the entry will be removed if the tmo elapsed and the entry has not been referenced again
	DHCP_TASK_PROCESS_RATE	DHCP task processing rate, in seconds the DHCP module will process a timer event with this rate for maintaining its own queues, processing timeouts, etc.

Description

The configuration of the DHCP Server TCP/IP Stack is based on the file [dhcps_config.h](#)

This header file contains the configuration selection for the DHCP Server TCP/IP Stack. Based on the selections made, the DHCP Server TCP/IP Stack will support or not support selected features. These configuration settings will apply to all instances of the DHCP Server TCP/IP Stack.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.8.7.5.1 DHCP_SERVER_GATEWAY_ADDRESS Macro

C

```
#define DHCP_SERVER_GATEWAY_ADDRESS "192.168.100.1" // as we are in same network, Gateway  
address is same as server IP address.
```

Description

as we are in same network, Gateway address is same as server IP address.

5.8.7.5.2 DHCP_SERVER_IP_ADDRESS Macro

C

```
#define DHCP_SERVER_IP_ADDRESS "192.168.100.1" // First three octet should match to the TP  
address range for Server address
```

Description

First three octet should match to the TP address range for Server address and the beginning address should be reserved for server address

5.8.7.5.3 DHCP_SERVER_NETMASK_ADDRESS Macro

C

```
#define DHCP_SERVER_NETMASK_ADDRESS "255.255.255.0" // Net mask value
```

Description

Net mask value

5.8.7.5.4 DHCP_SERVER_PRIMARY_DNS_ADDRESS Macro

C

```
#define DHCP_SERVER_PRIMARY_DNS_ADDRESS "192.168.100.1" // DNS Primary address
```

Description

DNS Primary address

5.8.7.5.5 DHCP_SERVER_SECONDARY_DNS_ADDRESS Macro

C

```
#define DHCP_SERVER_SECONDARY_DNS_ADDRESS "192.168.100.1" // DNS Secondary address
```

Description

DNS Secondary address

5.8.7.5.6 DHCP_IP_ADDRESS_RANGE_START Macro

C

```
#define DHCP_IP_ADDRESS_RANGE_START "192.168.100.100" // Address range is starting from 100,  
because the from 1 to 100 is reserved. Start address(192.168.100.1)
```

Description

Address range is starting from 100, because the from 1 to 100 is reserved. Start address(192.168.100.1) should be used as server address

5.8.7.5.7 DHCP_LEASE_DURATION Macro

C

```
#define DHCP_LEASE_DURATION DHCP_LEASE_SOLVED_ENTRY_TMO
```

Description

timeout for a solved entry in the cache, in seconds the entry will be removed if the tmo elapsed and the entry has not been referenced again

5.8.7.5.8 DHCP_LEASE_ENTRIES_DEFAULT Macro

C

```
#define DHCP_LEASE_ENTRIES_DEFAULT 15
```

Description

number of entries in the cache default number of entries per interface

5.8.7.5.9 DHCP_LEASE_REMOVED_BEFORE_ACK Macro

C

```
#define DHCP_LEASE_REMOVED_BEFORE_ACK (5)
```

Description

The entry should be removed from the entry if there is no REQUEST after OFFER

5.8.7.5.10 DHCP_LEASE_SOLVED_ENTRY_TMO Macro

C

```
#define DHCP_LEASE_SOLVED_ENTRY_TMO (20 * 60)
```

Description

timeout for a solved entry in the cache, in seconds the entry will be removed if the tmo elapsed and the entry has not been referenced again

5.8.7.5.11 DHCP_TASK_PROCESS_RATE Macro

C

```
#define DHCP_TASK_PROCESS_RATE (1)
```

Description

DHCPS task processing rate, in seconds the DHCPS module will process a timer event with this rate for maintaining its own queues, processing timeouts, etc.

5.8.7.6 Building the Library

This section list the files that are available in the \src of the DHCP server. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

5.8.7.7 Library Interface

Data Types and Constants

	Name	Description
	DHCP_SERVER_POOL_ENTRY_TYPE	DHCP server pool types are used to get the leased IP address details.
	DHCP_LEASE_ENTRY	listing of the leases
	DHCP_LEASE_HANDLE	Lease details which is used by the CLI command prompt.
	DHCP_MODULE_CONFIG	DHCP server configuration details

Configuration Functions

	Name	Description
	TCPIP_DHCP_Disable	Disables the DHCP Server for the specified interface.
	TCPIP_DHCP_Enable	Enables the DHCP Server for the specified interface.
	TCPIP_DHCP_GetPoolEntries	Get all the entries or only used entries of a certain type belonging to a network interface.
	TCPIP_DHCP_LeaseEntryGet	returns a lease entry and allows iteration through the whole list of leases if leaseHandle it starts from the begining returns a non-zero DHCP_LEASE_HANDLE to be used in the subsequent calls or 0 if end of list or wrong interface, or DHCP server not running on that interface
	TCPIP_DHCP_RemovePoolEntries	Removes all the entries or only used entries of a certain type belonging to a network interface.

Status Functions

	Name	Description
	TCPIP_DHCP_IsEnabled	Determines if the DHCP Server is enabled on the specified interface.

Description

This section describes the Application Programming Interface (API) functions of the DHCP Server TCP/IP Stack.

Refer to each section for a detailed description.

5.8.7.7.1 Configuration Functions

5.8.7.7.1.1 TCPIP_DHCP_Disable Function

C

```
bool TCPIP_DHCP_Disable(
    TCPIP_NET_HANDLE hNet
```

```
);
```

Description

Disables the DHCP Server for the specified interface.

Preconditions

None

Parameters

Parameters	Description
pNetIf	Interface to disable the DHCP Server on.

Returns

true if success false otherwise

Remarks

When the interface continues using its old configuration, it is possible that the lease may take sometime to expire. And The communication will be there till it is not expired. Lease time is configured in [dhcps_config.h](#).

5.8.7.7.1.2 TCPIP_DHCPS_Enable Function

C

```
bool TCPIP_DHCPS_Enable(  
    TCPIP_NET_HANDLE hNet  
);
```

Description

Enables the DHCP Server for the specified interface, if it is disabled. If it is already enabled, nothing is done.

Preconditions

None

Parameters

Parameters	Description
hNet	Interface to enable the DHCP Server on.

Returns

true if success false otherwise

5.8.7.7.1.3 TCPIP_DHCPS_GetPoolEntries Function

C

```
int TCPIP_DHCPS_GetPoolEntries(  
    TCPIP_NET_HANDLE netH,  
    DHCP_SERVER_POOL_ENTRY_TYPE type  
);
```

Description

This API is used to get the DHCP server entries from the pool as per [DHCP_SERVER_POOL_ENTRY_TYPE](#).

Preconditions

DHCP server module should have been initialized

Parameters

Parameters	Description
hNet	Interface handle to use
type	type of entries to remove:
valid types	DHCP_SERVER_POOL_ENTRY_ALL, DHCP_SERVER_POOL_ENTRY_IN_USE

Returns

true or false

Remarks

None

Example

None

5.8.7.7.1.4 TCPIP_DHCPs_LeaseEntryGet Function

C

```
DHCPS_LEASE_HANDLE TCPIP_DHCPs_LeaseEntryGet(  
    TCPIP_NET_HANDLE netH,  
    DHCPS_LEASE_ENTRY* pLeaseEntry,  
    DHCPS_LEASE_HANDLE leaseHandle  
);
```

Description

returns a lease entry and allows iteration through the whole list of leases if leaseHandle it starts from the beginning returns a non-zero [DHCPS_LEASE_HANDLE](#) to be used in the subsequent calls or 0 if end of list or wrong interface, or DHCP server not running on that interface

5.8.7.7.1.5 TCPIP_DHCPs_RemovePoolEntries Function

C

```
bool TCPIP_DHCPs_RemovePoolEntries(  
    TCPIP_NET_HANDLE netH,  
    DHCP_SERVER_POOL_ENTRY_TYPE type  
);
```

Description

This API is used to remove the DHCP server entries from the pool as per [DHCP_SERVER_POOL_ENTRY_TYPE](#).

Preconditions

DHCP server module should have been initialized

Parameters

Parameters	Description
hNet	Interface handle to use
type	type of entries to remove:
valid types	DHCP_SERVER_POOL_ENTRY_ALL, DHCP_SERVER_POOL_ENTRY_IN_USE

Returns

true or false

Remarks

None

Example

None

5.8.7.7.2 Status Functions

5.8.7.7.2.1 TCPIP_DHCPs_IsEnabled Function

C

```
bool TCPIP_DHCPs_IsEnabled(  
    TCPIP_NET_HANDLE hNet  
);
```

Description

Determines if the DHCP Server is enabled on the specified interface.

Preconditions

None

Parameters

Parameters	Description
hNet	Interface to query.

Returns

None

5.8.7.7.3 Data Types and Constants

5.8.7.7.3.1 DHCP_SERVER_POOL_ENTRY_TYPE Enumeration

C

```
typedef enum {  
    DHCP_SERVER_POOL_ENTRY_ALL,  
    DHCP_SERVER_POOL_ENTRY_IN_USE  
} DHCP_SERVER_POOL_ENTRY_TYPE;
```

Description

DHCP server pool types are used to get the leased IP address details.

Members

Members	Description
DHCP_SERVER_POOL_ENTRY_ALL	Get or Remove all the Leased address . There might be a address which may not be used.
DHCP_SERVER_POOL_ENTRY_IN_USE	Get or remove only Leased IP address.

5.8.7.7.3.2 DHCPs_LEASE_ENTRY Structure

C

```
typedef struct {
```

```
TCPIP_MAC_ADDR hwAddr;  
IPV4_ADDR ipAddress;  
uint32_t leaseTime;  
} DHCP_LEASE_ENTRY;
```

Description

listing of the leases

Members

Members	Description
TCPIP_MAC_ADDR hwAddr;	Client MAC address
IPV4_ADDR ipAddress;	Leased IP address
uint32_t leaseTime;	Lease period

5.8.7.7.3.3 DHCP_LEASE_HANDLE Type

C

```
typedef const void* DHCP_LEASE_HANDLE;
```

Description

Lease details which is used by the CLI command prompt.

5.8.7.7.3.4 DHCP_MODULE_CONFIG Structure

C

```
typedef struct {  
    bool enabled;  
    bool deleteOldLease;  
    size_t leaseEntries;  
    int entrySolvedTmo;  
    char * startIpAddressRange;  
} DHCP_MODULE_CONFIG;
```

Description

DHCP server configuration details

Members

Members	Description
bool enabled;	enable DHCP server
bool deleteOldLease;	delete old cache if still in place, specific DHCP params
size_t leaseEntries;	max number of lease entries
int entrySolvedTmo;	solved entry removed after this tmo if not referenced - seconds
char * startIpAddressRange;	start value of the IP address for DHCP clients.

5.8.7.8 Files

Files

Name	Description
dhcps.h	Dynamic Host Configuration Protocol(DHCP) Server APIs.
dhcps_config.h	DHCPS configuration file

Description**5.8.7.8.1 dhcps.h**

The DHCP server permanently assigns a free IP address to a requesting client from the range defined in the [dhcps_config.h](#) file.

- Reference: RFC 2131, 2132

Enumerations

	Name	Description
	DHCP_SERVER_POOL_ENTRY_TYPE	DHCP server pool types are used to get the leased IP address details.

Functions

	Name	Description
	TCPIP_DHCP_DISABLE	Disables the DHCP Server for the specified interface.
	TCPIP_DHCP_ENABLE	Enables the DHCP Server for the specified interface.
	TCPIP_DHCP_GET_POOL_ENTRIES	Get all the entries or only used entries of a certain type belonging to a network interface.
	TCPIP_DHCP_IS_ENABLED	Determines if the DHCP Server is enabled on the specified interface.
	TCPIP_DHCP_LEASE_ENTRY_GET	returns a lease entry and allows iteration through the whole list of leases if leaseHandle it starts from the beginning returns a non-zero DHCP_LEASE_HANDLE to be used in the subsequent calls or 0 if end of list or wrong interface, or DHCP server not running on that interface
	TCPIP_DHCP_REMOVE_POOL_ENTRIES	Removes all the entries or only used entries of a certain type belonging to a network interface.

Structures

	Name	Description
	DHCP_LEASE_ENTRY	listing of the leases
	DHCP_MODULE_CONFIG	DHCP server configuration details

Types

	Name	Description
	DHCP_LEASE_HANDLE	Lease details which is used by the CLI command prompt.

File Name

dhcps.h

Company

Microchip Technology Incorporated

5.8.7.8.2 dhcps_config.h

Dynamic Host Configuration Protocol (DHCP) Configuration file

This file contains the DHCP module configuration options

Macros

	Name	Description
	<u>DHCP_SERVER_GATEWAY_ADDRESS</u>	as we are in same network, Gateway address is same as server IP address.
	<u>DHCP_SERVER_IP_ADDRESS</u>	First three octet should match to the TP address range for Server address and the begining address should be reserved for server address
	<u>DHCP_SERVER_NETMASK_ADDRESS</u>	Net mask value
	<u>DHCP_SERVER_PRIMARY_DNS_ADDRESS</u>	DNS Primary address
	<u>DHCP_SERVER_SECONDARY_DNS_ADDRESS</u>	DNS Secondary address
	<u>DHCPS_IP_ADDRESS_RANGE_START</u>	Address range is starting from 100, because the from 1 to 100 is reserved. Start address(192.168.100.1) should be used as server address
	<u>DHCPS_LEASE_DURATION</u>	timeout for a solved entry in the cache, in seconds the entry will be removed if the tmo elapsed and the entry has not been referenced again
	<u>DHCPS_LEASE_ENTRIES_DEFAULT</u>	number of entries in the cache default number of entries per interface
	<u>DHCPS_LEASE_REMOVED_BEFORE_ACK</u>	The entry should be removed from the entry if there is no REQUEST after OFFER
	<u>DHCPS_LEASE_SOLVED_ENTRY_TMO</u>	timeout for a solved entry in the cache, in seconds the entry will be removed if the tmo elapsed and the entry has not been referenced again
	<u>DHCPS_TASK_PROCESS_RATE</u>	DHCPS task processing rate, in seconds the DHCPS module will process a timer event with this rate for maintaining its own queues, processing timeouts, etc.

5.8.8 DNS TCP/IP Stack Library

5.8.8.1 Introduction

Domain Name System (DNS) TCP/IP Stack Library

for

Microchip Microcontrollers

This library provides the API of the DNS TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

The Domain Name Service associates host names (such as www.microchip.com) with IP addresses (such as 10.0.54.2). The DNS Client module provides DNS resolution capabilities to the stack.

TCP applications do not need to use the DNS module. Any necessary DNS operations can be handled by the TCPOpen function. Applications built using UDP may need to use DNS when the IP address of the remote server is unknown.

5.8.8.2 Release Notes

MPLAB Harmony Version: v0.70b **DNS TCP/IP Stack Library Version :** 1.0 **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.8.8.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.8.8.4 Using the Library

This topic describes the basic architecture of the DNS TCP/IP Stack Library and provides information and examples on how to use it.

Interface Header File: [dns.h](#)

The interface to the DNS TCP/IP Stack library is defined in the "[dns.h](#)" header file. This file is included by the "tcpip.h" file. Any C language source (.c) file that uses the DNS TCP/IP Stack library should include "tcpip.h".

Library File:

The DNS TCP/IP Stack library archive (.a) file is installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the TCP/IP Stack interacts with the framework.

5.8.8.4.1 Abstraction Model

This library provides the API of the DNS TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

DNS is part of the Application Layer:

DNS resolution operations follow a simple state machine, as indicated in the diagram below.

5.8.8.4.2 Library Overview

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the DNS module.

Library Interface Section	Description
General Functions	This section provides general interface routines to DNS
Data Types and Constants	This section provides various definitions describing this API

5.8.8.5 Configuring the Library

Macros

	Name	Description
	DNS_CLIENT_ARP_TMO	When the DNS Client performs an ARP request for the DNS Server this is the elapsed time after which a ARP resolution is considered to have timed out In seconds
	DNS_CLIENT_OPEN_TMO	The DNS Client performs an UDP socket open request to communicate with the DNS Server This is the elapsed time after which an open request is considered to have timed out In seconds
	DNS_CLIENT_PORT	Default port for DNS resolutions
	DNS_CLIENT_SERVER_TMO	When the DNS Client connected to the DNS Server this is the elapsed time after which an the communication is considered to have timed failed if there was no reply from the server In seconds

	DNS_CLIENT_TASK_PROCESS_RATE	DNS Client task processing rate, in milli-seconds the DNS Client module will process a timer event with this rate for processing its own state machine, etc.
	DNS_CLIENT_VERSION_NO	DNS Client version Depending on the version of the DNS implementation the DNS task process will be performed differently

Description

The configuration of the DNS TCP/IP Stack is based on the file `tcip_config.h`

This header file contains the configuration selection for the DNS TCP/IP Stack. Based on the selections made, the DNS TCP/IP Stack will support or not support selected features. These configuration settings will apply to all instances of the DNS TCP/IP Stack.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.8.8.5.1 DNS_CLIENT_ARP_TMO Macro

C

```
#define DNS_CLIENT_ARP_TMO (1)
```

Description

When the DNS Client performs an ARP request for the DNS Server this is the elapsed time after which a ARP resolution is considered to have timed out In seconds

5.8.8.5.2 DNS_CLIENT_OPEN_TMO Macro

C

```
#define DNS_CLIENT_OPEN_TMO (1)
```

Description

The DNS Client performs an UDP [socket](#) open request to communicate with the DNS Server This is the elapsed time after which an open request is considered to have timed out In seconds

5.8.8.5.3 DNS_CLIENT_PORT Macro

C

```
#define DNS_CLIENT_PORT 53
```

Description

Default port for DNS resolutions

5.8.8.5.4 DNS_CLIENT_SERVER_TMO Macro

C

```
#define DNS_CLIENT_SERVER_TMO (1)
```

Description

When the DNS Client connected to the DNS Server this is the elapsed time after which an the communication is considered to have timed failed if there was no reply from the server In seconds

5.8.8.5.5 DNS_CLIENT_TASK_PROCESS_RATE Macro

C

```
#define DNS_CLIENT_TASK_PROCESS_RATE (500)
```

Description

DNS Client task processing rate, in milli-seconds the DNS Client module will process a timer event with this rate for processing its own state machine, etc.

5.8.8.5.6 DNS_CLIENT_VERSION_NO Macro

C

```
#define DNS_CLIENT_VERSION_NO 1
```

Description

DNS Client version Depending on the version of the DNS implementation the DNS task process will be performed differently

5.8.8.6 Building the Library

This section list the files that are available in the \src of the DNS driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

5.8.8.7 Library Interface

Data Types and Constants

	Name	Description
	DNS_CLIENT_MODULE_CONFIG	Provides a placeholder for DNS client configuration.
	DNS_RESOLVE_TYPE	This enumeration provides the RecordType argument for TCPIP_DNS_Resolve .
	DNS_RESULT	This enumeration provides result codes for various DNS operations.
	DNS_SERVER_MODULE_CONFIG	Provides a placeholder for DNS server configuration.

General Functions

	Name	Description
	TCPIP_DNS_IsResolved	Determines if the DNS resolution is complete and provides the IP.
	TCPIP_DNS_Resolve	Begins resolution of an address.
	TCPIP_DNS_UsageBegin	Claims access to the DNS module.
	TCPIP_DNS_UsageEnd	Releases control of the DNS module.

Description

This section describes the Application Programming Interface (API) functions of the DNS TCP/IP Stack.

Refer to each section for a detailed description.

5.8.8.7.1 General Functions

5.8.8.7.1.1 TCPIP_DNS_IsResolved Function

C

```
DNS_RESULT TCPIP_DNS_IsResolved(  
    const char* HostName,  
    void* HostIP  
);
```

Description

Call this function to determine if the DNS resolution of an address has been completed. If so, the resolved address will be provided in HostIP.

Preconditions

[TCPIP_DNS_Resolve](#) has been called.

Parameters

Parameters	Description
Hostname	A pointer to the null terminated string specifying the host for which to resolve an IP.
HostIP	A pointer to an IPV4_ADDR structure in which to store the resolved IP address once resolution is complete.

Return Values

Return Values	Description
DNS_RES_OK	The DNS client has obtained an IP HostIP will contain the resolved address.
DNS_RES_PENDING	The resolution process is still in progress.
DNS_RES_SERVER_TMO	DNS server timed out
DNS_RES_NO_ENTRY	no such entry to be resolved exists

Remarks

None.

5.8.8.7.1.2 TCPIP_DNS_Resolve Function

C

```
DNS_RESULT TCPIP_DNS_Resolve(  
    const char* HostName,  
    DNS_RESOLVE_TYPE Type  
);
```

Description

This function attempts to resolve a host name to an IP address. When called, it starts the DNS state machine. Call [TCPIP_DNS_IsResolved](#) repeatedly to determine if the resolution is complete.

Only one DNS resolution may be executed at a time. The Hostname must not be modified in memory until the resolution is complete.

Preconditions

[TCPIP_DNS_UsageBegin](#) returned DNS_RES_OK on a previous call.

Parameters

Parameters	Description
Hostname	A pointer to the null terminated string specifying the host for which to resolve an IP.
RecordType	DNS_TYPE_A or DNS_TYPE_MX depending on what type of record resolution is desired.

Returns

DNS_RES_OK

Remarks

This function requires access to one UDP [socket](#). If none are available, [UDP_MAX_SOCKETS](#) may need to be increased.

5.8.8.7.1.3 TCPIP_DNS_UsageBegin Function**C**

```
DNS_RESULT TCPIP_DNS_UsageBegin(  
    TCPIP_NET_HANDLE neth  
);
```

Description

This function acts as a semaphore to obtain usage of the DNS module. Call this function and ensure that it returns DNS_RES_OK before calling any other DNS APIs. Call [TCPIP_DNS_UsageEnd](#) when this application no longer needs the DNS module so that other applications may make use of it.

Preconditions

Stack is initialized.

Parameters

Parameters	Description
neth	interface to use If 0, a default interface will be selected

Return Values

Return Values	Description
DNS_RES_OK	the calling application has successfully taken ownership of the DNS module
DNS_RES_BUSY	The DNS module is currently in use. Yield to the stack and attempt this call again later.

Remarks

Ensure that [TCPIP_DNS_UsageEnd](#) is always called once your application has obtained control of the DNS module. If this is not done, the stack will hang for all future applications requiring DNS access.

5.8.8.7.1.4 TCPIP_DNS_UsageEnd Function**C**

```
DNS_RESULT TCPIP_DNS_UsageEnd(  
    TCPIP_NET_HANDLE neth  
);
```

Description

This function acts as a semaphore to release control of the DNS module. Call this function when this application no longer needs the DNS module so that other applications may make use of it.

Preconditions

[TCPIP_DNS_UsageBegin](#) returned DNS_RES_OK on a previous call.

Parameters

Parameters	Description
neth	interface to release Not used.

Return Values

Return Values	Description
DNS_RES_OK	The DNS module successfully released.

Remarks

Ensure that TCPIP_DNS_UsageEnd is always called once your application has obtained control of the DNS module. If this is not done, the stack will hang for all future applications requiring DNS access.

5.8.8.7.2 Data Types and Constants

5.8.8.7.2.1 DNS_CLIENT_MODULE_CONFIG Structure

C

```
typedef struct {  
} DNS_CLIENT_MODULE_CONFIG;
```

Description

DNS_CLIENT_MODULE_CONFIG Structure Typedef
Provides a placeholder for DNS client configuration.

Remarks

None.

5.8.8.7.2.2 DNS_RESOLVE_TYPE Enumeration

C

```
typedef enum {  
    DNS_TYPE_A = 1,  
    DNS_TYPE_MX = 15,  
    DNS_TYPE_AAAA = 28u  
} DNS_RESOLVE_TYPE;
```

Description

DNS_RESOLVE_TYPE Enumeration
This enumeration provides the RecordType argument for [TCPIP_DNS_Resolve](#).

Members

Members	Description
DNS_TYPE_A = 1	Constant for record type in TCPIP_DNS_Resolve . Indicates an A (standard address) record.
DNS_TYPE_MX = 15	Constant for record type in TCPIP_DNS_Resolve . Indicates an MX (mail exchanger) record.

DNS_TYPE_AAAA = 28u	Constant for record type in TCPIP_DNS_Resolve . Indicates a quad-A (IPv6 address) address record.

Remarks

None.

5.8.8.7.2.3 DNS_RESULT Enumeration

C

```
typedef enum {
    DNS_RES_OK = 0,
    DNS_RES_PENDING,
    DNS_RES_NO_ENTRY = -1,
    DNS_RES_CACHE_FULL = -2,
    DNS_RES_OPEN_TMO = -3,
    DNS_RES_SERVER_TMO = -4,
    DNS_RES_NO_SERVICE = -5,
    DNS_RES_NO_INTERFACE = -10,
    DNS_RES_BUSY = -11,
    DNS_RES_ARP_TMO = -12
} DNS_RESULT;
```

Description

DNS_RESULT Enumeration

This enumeration provides result codes for various DNS operations.

Members

Members	Description
DNS_RES_OK = 0	operation succeeded
DNS_RES_PENDING	operation is ongoing
DNS_RES_NO_ENTRY = -1	no such entry exists
DNS_RES_CACHE_FULL = -2	the cache is full and no entry could be
DNS_RES_OPEN_TMO = -3	DNS client couldn't get a socket
DNS_RES_SERVER_TMO = -4	DNS server response tmo
DNS_RES_NO_SERVICE = -5	DNS service not implemented
DNS_RES_NO_INTERFACE = -10	an active/requested interface could not be found
DNS_RES_BUSY = -11	module is in use by other task; retry later
DNS_RES_ARP_TMO = -12	ARP tmo

Remarks

None.

5.8.8.7.2.4 DNS_SERVER_MODULE_CONFIG Structure

C

```
typedef struct {
} DNS_SERVER_MODULE_CONFIG;
```

Description

DNS_SERVER_MODULE_CONFIG Structure Typedef

Provides a placeholder for DNS server configuration.

Remarks

None.

5.8.8.8 Files

Files

Name	Description
dns.h	DNS definitions and interface file
dns_config.h	DNS configuration file

Description

5.8.8.8.1 dns.h

Domain Name System (DNS) client Header file

This source file contains the DNS client module API

Enumerations

	Name	Description
	DNS_RESOLVE_TYPE	This enumeration provides the RecordType argument for TCPIP_DNS_Resolve .
	DNS_RESULT	This enumeration provides result codes for various DNS operations.

Functions

	Name	Description
	TCPIP_DNS_IsResolved	Determines if the DNS resolution is complete and provides the IP.
	TCPIP_DNS_Resolve	Begins resolution of an address.
	TCPIP_DNS_UsageBegin	Claims access to the DNS module.
	TCPIP_DNS_UsageEnd	Releases control of the DNS module.

	<u>DNS_CLIENT_VERSION_NO</u>	DNS Client version Depending on the version of the DNS implementation the DNS task process will be performed differently

5.8.9 Dynamic DNS TCP/IP Stack Library

5.8.9.1 Introduction

Dynamic Domain Name System (DDNS) TCP/IP Stack Library

for

Microchip Microcontrollers

This library provides the API of the DDNS TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

The Dynamic DNS Client module provides a method for updating a dynamic IP address to a public DDNS service. These services can be used to provide DNS hostname mapping to devices that behind routers, firewalls, and/or on networks that dynamically assign IP addresses.

Note that this only solves one of the two problems for communicating to devices on local subnets from the Internet. While Dynamic DNS can help to locate the device, the router or firewall it sits behind must still properly forward the incoming connection request. This generally requires port forwarding to be configured for the router behind which the device is located.

The Dynamic DNS client supports the popular interface used by DynDNS.org, No-IP.com, and DNS-O-Matic.com.

IMPORTANT: The dynamic DNS services stipulate that updates should be made no more frequently than 10 minutes, and only when the IP address has changed. Updates made more often than that are considered abusive, and may eventually cause your account to be disabled. Production devices that get rebooted frequently may need to store the last known IP in non-volatile memory. You also should not enable this module while testing the rest of your application.

5.8.9.2 Release Notes

MPLAB Harmony Version: v0.70b **DDNS TCP/IP Stack Library Version :** 1.0 **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.8.9.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.8.9.4 Using the Library

This topic describes the basic architecture of the DDNS TCP/IP Stack Library and provides information and examples on how to use it.

Interface Header File: `dyn_dns.h`

The interface to the DDNS TCP/IP Stack library is defined in the "dyn_dns.h" header file. This file is included by the "tcpip.h" file. Any C language source (.c) file that uses the DDNS TCP/IP Stack library should include "tcpip.h".

Library File:

The DDNS TCP/IP Stack library archive (.a) file is installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the TCP/IP Stack interacts with the framework.

5.8.9.4.1 Abstraction Model

This library provides the API of the DDNS TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description**DDNS Software Abstraction Block Diagram**

Note: This diagram was not available at time of release and will be added in a future version of MPLAB Harmony.

5.8.9.4.2 Library Overview

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the DDNS module.

Library Interface Section	Description
Functions	Routines for Configuring DDNS
Data Types and Constants	This section provides various definitions describing this API

5.8.9.5 Configuring the Library

Macros

	Name	Description
	DDNS_CHECKIP_SERVER	Default CheckIP server for determining current IP address
	DDNS_DEFAULT_PORT	Default port for CheckIP server

Description

The configuration of the DDNS TCP/IP Stack Library is based on the file `tcpip_config.h`

This header file contains the configuration selection for the DDNS TCP/IP Stack Library. Based on the selections made, the DDNS TCP/IP Stack Library will support or not support selected features. These configuration settings will apply to all instances of the DDNS TCP/IP Stack Library.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.8.9.5.1 DDNS_CHECKIP_SERVER Macro

C

```
#define DDNS_CHECKIP_SERVER (const uint8_t*)"checkip.dyndns.com"
```

Description

Default CheckIP server for determining current IP address

5.8.9.5.2 DDNS_DEFAULT_PORT Macro

C

```
#define DDNS_DEFAULT_PORT (80u)
```

Description

Default port for CheckIP server

5.8.9.6 Building the Library

This section list the files that are available in the `\src` of the DDNS driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

5.8.9.7 Library Interface

Data Types and Constants

	Name	Description
	DDNS_MODULE_CONFIG	This is type DDNS_MODULE_CONFIG.
	DDNS_POINTERS	Configuration parameters for the Dynamic DNS Client
	DDNS_SERVICES	Dynamic DNS Services. Must support the DynDNS API (Auxlang) and correspond to ddnsServiceHosts and ddnsServicePorts in DynDNS.c.
	DDNS_STATUS	Status message for DynDNS client. GOOD and NOCHG are ok, but ABUSE through 911 are fatal. UNCHANGED through INVALID are locally defined.

Functions

	Name	Description
	TCPIP_DDNS_LastIPGet	Returns the status of the most recent update.
	TCPIP_DDNS_LastStatusGet	Returns the last known external IP address of the device.
	TCPIP_DDNS_ServiceSet	Selects a pre-configured Dynamic DNS service
	TCPIP_DDNS_UpdateForce	Forces an immediate DDNS update

Description

This section describes the Application Programming Interface (API) functions of the DDNS TCP/IP Stack.

Refer to each section for a detailed description.

5.8.9.7.1 Functions

5.8.9.7.1.1 TCPIP_DDNS_LastIPGet Function

C

```
IPV4_ADDR TCPIP_DDNS_LastIPGet();
```

Description

This function returns the status of the most recent update. See the [DDNS_STATUS](#) enumeration for possible codes.

Preconditions

None

Returns

[DDNS_STATUS](#) indicating the status code for the most recent update.

5.8.9.7.1.2 TCPIP_DDNS_LastStatusGet Function

C

```
DDNS_STATUS TCPIP_DDNS_LastStatusGet();
```

Description

This function returns the last known external IP address of the device.

Preconditions

None

Returns

The last known external IP address of the device.

5.8.9.7.1.3 TCPIP_DDNS_ServiceSet Function**C**

```
void TCPIP_DDNS_ServiceSet(  
    DDNS_SERVICES svc  
);
```

Description

This function selects a Dynamic DNS service based on parameters configured in `ddnsServiceHosts` and `ddnsServicePorts`. These arrays must match the [DDNS_SERVICES](#) enumeration.

Preconditions

None

Parameters

Parameters	Description
svc	one of the DDNS_SERVICES elements to indicate the selected service

Returns

None

5.8.9.7.1.4 TCPIP_DDNS_UpdateForce Function**C**

```
void TCPIP_DDNS_UpdateForce();
```

Description

This function forces the DDNS Client to execute a full update immediately. Any error message is cleared, and the update will be executed whether the IP address has changed or not. Call this function every time the DDNSClient parameters have been modified.

Preconditions

TCPIP_DDNS_Initialize must have been called.

Returns

None

5.8.9.7.2 Data Types and Constants**5.8.9.7.2.1 DDNS_MODULE_CONFIG Structure****C**

```
typedef struct {  
} DDNS_MODULE_CONFIG;
```

Description

This is type DDNS_MODULE_CONFIG.

5.8.9.7.2.2 DDNS_POINTERS Structure

C

```
typedef struct {
    union {
        uint8_t * szRAM;
        const uint8_t * szROM;
    } CheckIPServer;
    uint16_t CheckIPPort;
    union {
        uint8_t * szRAM;
        const uint8_t * szROM;
    } UpdateServer;
    uint16_t UpdatePort;
    union {
        uint8_t * szRAM;
        const uint8_t * szROM;
    } Username;
    union {
        uint8_t * szRAM;
        const uint8_t * szROM;
    } Password;
    union {
        uint8_t * szRAM;
        const uint8_t * szROM;
    } Host;
    struct {
        unsigned char CheckIPServer : 1;
        unsigned char UpdateServer : 1;
        unsigned char Username : 1;
        unsigned char Password : 1;
        unsigned char Host : 1;
    } ROMPointers;
} DDNS_POINTERS;
```

Description

This structure of pointers configures the Dynamic DNS Client. Initially, all pointers will be null and the client will be disabled. Set `DDNSClient.[field name].szRAM` to use a string stored in RAM, or `DDNSClient.[field name].szROM` to use a string stored in const. (Where [field name] is one of the parameters below.)

If a const string is specified, `DDNSClient.ROMPointers.[field name]` must also be set to 1 to indicate that this field should be retrieved from const instead of RAM.

Parameters

Parameters	Description
CheckIPServer	The server used to determine the external IP address
CheckIPPort	Port on the above server to connect to
UpdateServer	The server where updates should be posted
UpdatePort	Port on the above server to connect to
Username	The user name for the dynamic DNS server
Password	The password to supply when making updates
Host	The host name you wish to update
ROMPointers	Indicates which parameters to read from const instead of RAM.

5.8.9.7.2.3 DDNS_SERVICES Enumeration

C

```
typedef enum {  
    DYNDNS_ORG = 0u,  
    NO_IP_COM,  
    DNSOMATIC_COM  
} DDNS_SERVICES;
```

Description

Dynamic DNS Services. Must support the DynDNS API (Auxlang) and correspond to ddnsServiceHosts and ddnsServicePorts in DynDNS.c.

Members

Members	Description
DYNDNS_ORG = 0u	www.dyndns.org
NO_IP_COM	www.no-ip.com
DNSOMATIC_COM	www.dnsomatic.com

5.8.9.7.2.4 DDNS_STATUS Enumeration

C

```
typedef enum {  
    DDNS_STATUS_GOOD = 0u,  
    DDNS_STATUS_NOCHG,  
    DDNS_STATUS_ABUSE,  
    DDNS_STATUS_BADSYS,  
    DDNS_STATUS_BADAGENT,  
    DDNS_STATUS_BDAUTH,  
    DDNS_STATUS_NOT_DONATOR,  
    DDNS_STATUS_NOT_FQDN,  
    DDNS_STATUS_NOHOST,  
    DDNS_STATUS_NOT_YOURS,  
    DDNS_STATUS_NUMHOST,  
    DDNS_STATUS_DNSERR,  
    DDNS_STATUS_911,  
    DDNS_STATUS_UPDATE_ERROR,  
    DDNS_STATUS_UNCHANGED,  
    DDNS_STATUS_CHECKIP_ERROR,  
    DDNS_STATUS_DNS_ERROR,  
    DDNS_STATUS_SKT_ERROR,  
    DDNS_STATUS_INVALID,  
    DDNS_STATUS_UNKNOWN  
} DDNS_STATUS;
```

Description

Status message for DynDNS client. GOOD and NOCHG are ok, but ABUSE through 911 are fatal. UNCHANGED through INVALID are locally defined.

Members

Members	Description
DDNS_STATUS_GOOD = 0u	Update successful, hostname is now updated
DDNS_STATUS_NOCHG	Update changed no setting and is considered abusive. Additional 'nochg' updates will cause hostname to be blocked.
DDNS_STATUS_ABUSE	The hostname specified is blocked for update abuse.
DDNS_STATUS_BADSYS	System parameter not valid. Should be dyndns, statdns or custom.

DDNS_STATUS_BADAGENT	The user agent was blocked or not sent.
DDNS_STATUS_BDAUTH	The username and password pair do not match a real user.
DDNS_STATUS_NOT_DONATOR	An option available only to credited users (such as offline URL) was specified, but the user is not a credited user. If multiple hosts were specified, only a single !donator will be returned.
DDNS_STATUS_NOT_FQDN	The hostname specified is not a fully-qualified domain name (not in the form hostname.dyndns.org or domain.com).
DDNS_STATUS_NOHOST	The hostname specified does not exist in this user account (or is not in the service specified in the system parameter).
DDNS_STATUS_NOT_YOURS	The hostname specified does not belong to this user account.
DDNS_STATUS_NUMHOST	Too many hosts specified in an update.
DDNS_STATUS_DNSERR	Unspecified DNS error encountered by the DDNS service.
DDNS_STATUS_911	There is a problem or scheduled maintenance with the DDNS service.
DDNS_STATUS_UPDATE_ERROR	Error communicating with Update service.
DDNS_STATUS_UNCHANGED	The IP Check indicated that no update was necessary.
DDNS_STATUS_CHECKIP_ERROR	Error communicating with CheckIP service.
DDNS_STATUS_DNS_ERROR	DNS error resolving the CheckIP service.
DDNS_STATUS_SKT_ERROR	TCP socket opening error
DDNS_STATUS_INVALID	DDNS Client data is not valid.
DDNS_STATUS_UNKNOWN	DDNS client has not yet been executed with this configuration.

	DDNS_DEFAULT_PORT	Default port for CheckIP server

5.8.10 FTP TCP/IP Stack Library**5.8.10.1 Introduction****File Transfer Protocol (FTP) TCP/IP Stack Library**

for

Microchip Microcontrollers

This library provides the API of the FTP TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

An embedded FTP (File Transfer Protocol) server is an excellent addition to any network-enabled device. FTP server capability facilitates the uploading of files to, and downloading of files from, an embedded device. Almost all computers have, at the very least, a command line FTP client that will allow a user to [connect](#) to an embedded FTP server.

5.8.10.2 Release Notes

MPLAB Harmony Version: v0.70b **FTP TCP/IP Stack Library Version :** 1.0 **Release Date:** 18Nov2013

New This Release:

The FTP server provided here with these following functionalities. You can easily add new functionality as required.

The FTP server presented here incorporates the following features:

- Server Works with both Passive and Active mode

- FTP Server APIs are compatible with PIC24
- FTP connection is authenticated by using username as "admin" and password "microchip". Anonymous login is provided
- GET, MGET, PUT, and MPUT commands are provided

Known Issues:

None to report at this time.

5.8.10.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.8.10.4 Using the Library

This topic describes the basic architecture of the FTP TCP/IP Stack Library and provides information and examples on how to use it.

Interface Header File: [ftp.h](#)

The interface to the FTP TCP/IP Stack library is defined in the "[ftp.h](#)" header file. This file is included by the "tcpip.h" file. Any C language source (.c) file that uses the FTP TCP/IP Stack library should include "tcpip.h".

Library File:

The FTP TCP/IP Stack library archive (.a) file is installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the TCP/IP Stack interacts with the framework.

5.8.10.4.1 Abstraction Model

This library provides the API of the FTP TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description**FTP Server Dependencies**

Since FTP server requires the use of TCP/IP stack and a file system which can be a MPFS or MDD , it also inherits the program memory and RAM requirements of those as well.

5.8.10.4.2 Library Overview

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the FTP module.

Library Interface Section	Description
Data Types and Constants	This section provides various definitions describing This API

5.8.10.5 Configuring the Library

Macros

	Name	Description
	TCPIP_FTP_DATA_SKT_RX_BUFF_SIZE	Define the size of the RX buffer for the FTP Data socket Use 0 for default
	TCPIP_FTP_DATA_SKT_TX_BUFF_SIZE	Define the size of the TX buffer for the FTP Data socket Use 0 for default
	TCPIP_FTP_MAX_CONNECTIONS	Maximum number of FTP connections allowed per interface
	TCPIP_FTP_PASSWD_LEN	Specifies the max length of FTP login password
	TCPIP_FTP_PUT_ENABLED	Comment this line out to disable MPFS
	TCPIP_FTP_USER_NAME_LEN	Specifies the max length for user name

Description

The configuration of the FTP TCP/IP Stack is based on the file `tcPIP_config.h`

This header file contains the configuration selection for the FTP TCP/IP Stack. Based on the selections made, the FTP TCP/IP Stack will support or not support selected features. These configuration settings will apply to all instances of the FTP TCP/IP Stack.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.8.10.5.1 TCPIP_FTP_DATA_SKT_RX_BUFF_SIZE Macro

C

```
#define TCPIP_FTP_DATA_SKT_RX_BUFF_SIZE 0
```

Description

Define the size of the RX buffer for the FTP Data [socket](#) Use 0 for default

5.8.10.5.2 TCPIP_FTP_DATA_SKT_TX_BUFF_SIZE Macro**C**

```
#define TCPIP_FTP_DATA_SKT_TX_BUFF_SIZE 0
```

Description

Define the size of the TX buffer for the FTP Data [socket](#) Use 0 for default

5.8.10.5.3 TCPIP_FTP_MAX_CONNECTIONS Macro**C**

```
#define TCPIP_FTP_MAX_CONNECTIONS (1)
```

Description

Maximum number of FTP connections allowed per interface

5.8.10.5.4 TCPIP_FTP_PASSWD_LEN Macro**C**

```
#define TCPIP_FTP_PASSWD_LEN (10)
```

Description

Specifies the max length of FTP login password

5.8.10.5.5 TCPIP_FTP_PUT_ENABLED Macro**C**

```
#define TCPIP_FTP_PUT_ENABLED
```

Description

Comment this line out to disable MPFS

5.8.10.5.6 TCPIP_FTP_USER_NAME_LEN Macro**C**

```
#define TCPIP_FTP_USER_NAME_LEN (10)
```

Description

Specifies the max length for user name

5.8.10.6 Building the Library

This section list the files that are available in the \src of the FTP driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

5.8.10.7 Library Interface

Data Types and Constants

	Name	Description
	FTP_MODULE_CONFIG	FTP module dynamic configuration data

Description

This section describes the Application Programming Interface (API) functions of the FTP TCP/IP Stack.

Refer to each section for a detailed description.

5.8.10.7.1 Data Types and Constants

5.8.10.7.1.1 FTP_MODULE_CONFIG Structure

C

```
typedef struct {
    uint16_t dataSktTxBuffSize;
    uint16_t dataSktRxBuffSize;
    uint8_t  userName[10+1];
    uint8_t  password[10+1];
} FTP_MODULE_CONFIG;
```

Description

FTP module dynamic configuration data

Members

Members	Description
uint16_t dataSktTxBuffSize;	size of Data socket TX buffer for the associatted socket ; leave 0 for default
uint16_t dataSktRxBuffSize;	size of Data Socket RX buffer for the associatted socket ; leave 0 for default
uint8_t userName[10+1];	FTP login User name TCPIP_FTP_USER_NAME_LEN
uint8_t password[10+1];	FTP login password TCPIP_FTP_PASSWD_LEN

5.8.10.8 Files

5.8.10.8.2 ftp_config.h

File Transfer Protocol (FTP) Configuration file

This file contains the FTP module configuration options

Macros

	Name	Description
	TCPIP_FTP_DATA_SKT_RX_BUFF_SIZE	Define the size of the RX buffer for the FTP Data socket Use 0 for default
	TCPIP_FTP_DATA_SKT_TX_BUFF_SIZE	Define the size of the TX buffer for the FTP Data socket Use 0 for default
	TCPIP_FTP_MAX_CONNECTIONS	Maximum number of FTP connections allowed per interface
	TCPIP_FTP_PASSWD_LEN	Specifies the max length of FTP login password
	TCPIP_FTP_PUT_ENABLED	Comment this line out to disable MPFS
	TCPIP_FTP_USER_NAME_LEN	Specifies the max length for user name

5.8.11 HTTP Server TCP/IP Stack Library**5.8.11.1 Introduction**

Hypertext Transfer Protocol (HTTP) TCP/IP Stack Library
for
Microchip Microcontrollers

This library provides the API of the HTTP TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

The HTTP web server module and its associated MPFS2 file system module allow the board to act as a web server. This facilitates an easy method to view status information and control applications using any standard web browser.

5.8.11.2 Release Notes

MPLAB Harmony Version: v0.70b **HTTP TCP/IP Stack Library Version :** 1.0 **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.8.11.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.8.11.4 Using the Library

This topic describes the basic architecture of the HTTP TCP/IP Stack Library and provides information and examples on how to use it.

Interface Header File: [http.h](#)

The interface to the HTTP TCP/IP Stack library is defined in the "[http.h](#)" header file. This file is included by the "tcpip.h" file. Any C language source (.c) file that uses the HTTP TCP/IP Stack library should include "tcpip.h".

Library File:

The HTTP TCPIP Stack library archive (.a) file is installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the TCP/IP Stack interacts with the framework.

5.8.11.4.1 Abstraction Model

This library provides the API of the HTTP TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description**HTTP Software Abstraction Block Diagram**

Three main components are necessary to understand how the HTTP web server works: the web pages, the MPFS2 Utility, and the source files CustomHTTPApp.c and HTTPPrint.h. An overview of the entire process is shown below.

Web Pages

This includes all the HTML and associated images, CSS stylesheets, and JavaScript files necessary to display the website. A sample application including all these components is located in the WebPages2 folder.

MPFS2 Utility

This program, supplied by Microchip, packages the web pages into a format that can be efficiently stored in either external non-volatile storage, or internal flash program memory. This program also indexes dynamic variables found in the web pages and updates HTTPPrint.h with these indices.

If external storage is being used, the MPFS2 Utility outputs a BIN file and can upload that file directly to the board. If the data

5.8.11.4.2 Library Overview

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the HTTP module.

Library Interface Section	Description
Functions	Routines for Configuring DHCP
Data Types and Constants	This section provides various definitions describing this API

5.8.11.5 Configuring the Library

Macros

	Name	Description
	HTTP_CACHE_LEN	Max lifetime (sec) of static responses as string
	HTTP_CONFIG_FLAGS	Define the HTTP module configuration flags Use 0 for default
	HTTP_DEFAULT_FILE	Indicate what file to serve when no specific one is requested
	HTTP_DEFAULT_LEN	For buffer overrun protection. Set to longest length of above two strings.
	HTTP_FILE_UPLOAD	Configure MPFS over HTTP updating Comment this line to disable updating via HTTP
	HTTP_MAX_CONNECTIONS	Maximum numbers of simultaneous supported HTTP connections.
	HTTP_MAX_DATA_LEN	Define the maximum data length for reading cookie and GET/POST arguments (bytes)
	HTTP_MAX_HEADER_LEN	Set to length of longest string above
	HTTP_MIN_CALLBACK_FREE	Define the minimum number of bytes free in the TX FIFO before executing callbacks
	HTTP_PORT	Define the listening port for the HTTP server

	HTTP_SKT_RX_BUFF_SIZE	Define the size of the RX buffer for the http socket Use 0 for default
	HTTP_SKT_TX_BUFF_SIZE	Define the size of the TX buffer for the http socket Use 0 for default
	HTTP_SSL_ONLY_CHAR	Files beginning with this character will only be served over HTTPS Set to 0x00 to require for all files Set to 0xff to require for no files
	HTTP_TIMEOUT	Max time (sec) to await more data before timing out and disconnecting the socket
	HTTP_USE_AUTHENTICATION	Enable basic authentication support
	HTTP_USE_COOKIES	Enable cookie support
	HTTP_USE_POST	Define which HTTP modules to use If not using a specific module, comment it to save resources Enable POST support
	HTTPS_DEFAULT_FILE	Indicate what file to serve when no specific one is requested
	HTTPS_PORT	Listening port for HTTPS server (when SSL enabled)
	TCPIP_STACK_USE_BASE64_DECODE	TCPIP_STACK_USE_BASE64_DECODE HTTP_USE_AUTHENTICATION

Description

The configuration of the HTTP TCP/IP Stack is based on the file `tcPIP_config.h`

This header file contains the configuration selection for the HTTP TCP/IP Stack. Based on the selections made, the HTTP TCP/IP Stack will support or not support selected features. These configuration settings will apply to all instances of the HTTP TCP/IP Stack.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.8.11.5.1 HTTP_CACHE_LEN Macro**C**

```
#define HTTP_CACHE_LEN ("600")
```

Description

Max lifetime (sec) of static responses as string

5.8.11.5.2 HTTP_CONFIG_FLAGS Macro**C**

```
#define HTTP_CONFIG_FLAGS 0
```

Description

Define the HTTP module configuration flags Use 0 for default

5.8.11.5.3 HTTP_DEFAULT_FILE Macro**C**

```
#define HTTP_DEFAULT_FILE "index.htm"
```

Description

Indicate what file to serve when no specific one is requested

5.8.11.5.4 HTTP_DEFAULT_LEN Macro

C

```
#define HTTP_DEFAULT_LEN (10u)
```

Description

For buffer overrun protection. Set to longest length of above two strings.

5.8.11.5.5 HTTP_FILE_UPLOAD Macro

C

```
#define HTTP_FILE_UPLOAD "mpfsupload"
```

Description

Configure MPFS over HTTP updating Comment this line to disable updating via HTTP

5.8.11.5.6 HTTP_MAX_CONNECTIONS Macro

C

```
#define HTTP_MAX_CONNECTIONS (4)
```

Description

Maximum numbers of simultaneous supported HTTP connections.

5.8.11.5.7 HTTP_MAX_DATA_LEN Macro

C

```
#define HTTP_MAX_DATA_LEN (100u)
```

Description

Define the maximum data length for reading cookie and GET/POST arguments (bytes)

5.8.11.5.8 HTTP_MAX_HEADER_LEN Macro

C

```
#define HTTP_MAX_HEADER_LEN (15u)
```

Description

Set to length of longest string above

5.8.11.5.9 HTTP_MIN_CALLBACK_FREE Macro

C

```
#define HTTP_MIN_CALLBACK_FREE (16u)
```

Description

Define the minimum number of bytes free in the TX FIFO before executing callbacks

5.8.11.5.10 HTTP_PORT Macro

C

```
#define HTTP_PORT (80u)
```

Description

Define the listening port for the HTTP server

5.8.11.5.11 HTTP_SKT_RX_BUFF_SIZE Macro

C

```
#define HTTP_SKT_RX_BUFF_SIZE 0
```

Description

Define the size of the RX buffer for the http [socket](#) Use 0 for default

5.8.11.5.12 HTTP_SKT_TX_BUFF_SIZE Macro

C

```
#define HTTP_SKT_TX_BUFF_SIZE 0
```

Description

Define the size of the TX buffer for the http [socket](#) Use 0 for default

5.8.11.5.13 HTTP_SSL_ONLY_CHAR Macro

C

```
#define HTTP_SSL_ONLY_CHAR (0xFF)
```

Description

Files beginning with this character will only be served over HTTPS Set to 0x00 to require for all files Set to 0xff to require for no files

5.8.11.5.14 HTTP_TIMEOUT Macro

C

```
#define HTTP_TIMEOUT (45u)
```

Description

Max time (sec) to await more data before timing out and disconnecting the [socket](#)

5.8.11.5.15 HTTP_USE_AUTHENTICATION Macro

C

```
#define HTTP_USE_AUTHENTICATION
```

Description

Enable basic authentication support

5.8.11.5.16 HTTP_USE_COOKIES Macro

C

```
#define HTTP_USE_COOKIES
```

Description

Enable cookie support

5.8.11.5.17 HTTP_USE_POST Macro

C

```
#define HTTP_USE_POST
```

Description

Define which HTTP modules to use If not using a specific module, comment it to save resources Enable POST support

5.8.11.5.18 HTTPS_DEFAULT_FILE Macro

C

```
#define HTTPS_DEFAULT_FILE "index.htm"
```

Description

Indicate what file to serve when no specific one is requested

5.8.11.5.19 HTTPS_PORT Macro

C

```
#define HTTPS_PORT (443u)
```

Description

Listening port for HTTPS server (when SSL enabled)

5.8.11.5.20 TCPIP_STACK_USE_BASE64_DECODE Macro

C

```
#define TCPIP_STACK_USE_BASE64_DECODE
```

Description

TCPIP_STACK_USE_BASE64_DECODE [HTTP_USE_AUTHENTICATION](#)

5.8.11.6 Library Interface

Data Types and Constants

	Name	Description
	HTTP_CONN_HANDLE	HTTP connection identifier, handle of a HTTP connection
	HTTP_FILE_TYPE	File type definitions
	HTTP_IO_RESULT	Result states for execution callbacks

	HTTP_MODULE_CONFIG	HTTP module dynamic configuration data
	HTTP_MODULE_FLAGS	HTTP module configuration flags
	HTTP_READ_STATUS	Result states for HTTPPostReadName and HTTPPostReadValue
	HTTP_STATUS	Supported Commands and Server Response Codes
	HTTPReadPostPair	Reads a name and value pair from a URL encoded string in the TCP buffer.

Functions

	Name	Description
	TCPIP_HTTP_ActiveConnectionCountGet	Gets the number of active connections.
	TCPIP_HTTP_ArgGet	Locates a form field value in a given data array.
	TCPIP_HTTP_CurrentConnectionByteCountDec	Decrements byte count.
	TCPIP_HTTP_CurrentConnectionByteCountGet	Returns how many bytes have been read so far
	TCPIP_HTTP_CurrentConnectionByteCountSet	Sets how many bytes have been read so far
	TCPIP_HTTP_CurrentConnectionCallbackPosGet	Returns the callback position indicator.
	TCPIP_HTTP_CurrentConnectionCallbackPosSet	Sets the callback position indicator.
	TCPIP_HTTP_CurrentConnectionDataBufferGet	Returns pointer to connection general purpose data buffer.
	TCPIP_HTTP_CurrentConnectionFileGet	Get handle to current connection's file.
	TCPIP_HTTP_CurrentConnectionHasArgsSet	Sets whether there are get or cookie arguments
	TCPIP_HTTP_CurrentConnectionIsAuthorizedGet	Get the authorized state for the current connection.
	TCPIP_HTTP_CurrentConnectionIsAuthorizedSet	Sets the authorized state for the current connection.
	TCPIP_HTTP_CurrentConnectionPostSmGet	Get the POST state machine state.
	TCPIP_HTTP_CurrentConnectionPostSmSet	Set the POST state machine state.
	TCPIP_HTTP_CurrentConnectionSocketGet	Get the socket for the current connection.
	TCPIP_HTTP_CurrentConnectionStatusSet	Sets HTTP status.
	TCPIP_HTTP_CurrentConnectionUserDataGet	Gets the user data parameter for the current connection.
	TCPIP_HTTP_CurrentConnectionUserDataSet	Sets the user data parameter for the current connection.
	TCPIP_HTTP_FileInclude	Writes a file byte-for-byte to the currently loaded TCP socket .
	TCPIP_HTTP_PostNameRead	Reads a name from a URL encoded string in the TCP buffer.
	TCPIP_HTTP_PostValueRead	Reads a value from a URL encoded string in the TCP buffer.
	TCPIP_HTTP_URLDecode	Parses a string from URL encoding to plain-text.
	HTTPCheckAuth	Performs validation on a specific user name and password.
	HTTPExecuteGet	Processes GET form field variables and cookies.
	HTTPExecutePost	Processes POST form variables and data.
	HTTPNeedsAuth	Determines if a given file name requires authentication
	HTTPPrint_varname	Inserts dynamic content into a web page

Description

This section describes the Application Programming Interface (API) functions of the HTTP TCP/IP Stack.

Refer to each section for a detailed description.

5.8.11.6.1 Functions

5.8.11.6.1.1 TCPIP_HTTP_ActiveConnectionCountGet Function

C

```
int TCPIP_HTTP_ActiveConnectionCountGet();
```

Description

Returns the number of active connections at the current time.

Preconditions

None

Remarks

The value returned by this function is informational only. The number of active connections changes dynamically.

Example

```
int nConns;

nConns = TCPIP_HTTP_ActiveConnectionCountGet();
```

5.8.11.6.1.2 TCPIP_HTTP_ArgGet Function**C**

```
const uint8_t* TCPIP_HTTP_ArgGet(
    const uint8_t* cData,
    const uint8_t* cArg
);
```

Description

Searches through a data array to find the value associated with a given argument. It can be used to find form field values in data received over GET or POST.

The end of data is assumed to be reached when a null name parameter is encountered. This requires the string to have an even number of null-terminated strings, followed by an additional null terminator.

Preconditions

The data array has a valid series of null terminated name/value pairs.

Parameters

Parameters	Description
data	the buffer to search
arg	the name of the argument to find

Returns

A pointer to the argument value, or NULL if not found.

Remarks

None.

Example

```
void HTTPPrint_cookieName(HTTP_CONN_HANDLE connHandle)
{
    const uint8_t *ptr;
    TCP_SOCKET sktHTTP;

    ptr = TCPIP_HTTP_ArgGet(TCPIP_HTTP_CurrentConnectionDataBufferGet(connHandle), (const
uint8_t*)"name");
    sktHTTP = TCPIP_HTTP_CurrentConnectionSocketGet(connHandle);
    if(ptr)
        TCPIP_TCP_StringPut(sktHTTP, ptr);
    else
        TCPIP_TCP_StringPut(sktHTTP, (const uint8_t*)"not set");
}
```

5.8.11.6.1.3 TCPIP_HTTP_CurrentConnectionByteCountDec Function

C

```
void TCPIP_HTTP_CurrentConnectionByteCountDec(  
    HTTP_CONN_HANDLE connHandle,  
    uint32_t byteCount  
);
```

Description

Decrements byte count.

Preconditions

None.

Parameters

Parameters	Description
connHandle	HTTP connection handle
byteCount	byte count reduction

Remarks

None.

Example

5.8.11.6.1.4 TCPIP_HTTP_CurrentConnectionByteCountGet Function

C

```
uint32_t TCPIP_HTTP_CurrentConnectionByteCountGet(  
    HTTP_CONN_HANDLE connHandle  
);
```

Description

Returns how many bytes have been read so far

Preconditions

None.

Parameters

Parameters	Description
connHandle	HTTP connection handle

Remarks

None.

Example

```
switch(TCPIP_HTTP_CurrentConnectionPostSmGet(connHandle))  
{  
    case SM_CFG_SNMP_READ_NAME:  
        // If all parameters have been read, end  
        if(TCPIP_HTTP_CurrentConnectionByteCountGet(connHandle) == 0u)  
        {  
            return HTTP_IO_DONE;  
        }  
    .  
    .  
    .  
}
```

```
}
```

5.8.11.6.1.5 TCPIP_HTTP_CurrentConnectionByteCountSet Function

C

```
void TCPIP_HTTP_CurrentConnectionByteCountSet(  
    HTTP_CONN_HANDLE connHandle,  
    uint32_t byteCount  
);
```

Description

Sets how many bytes have been read so far

Parameters

Parameters	Description
connHandle	HTTP connection handle
byteCount	byte count to be set

Remarks

None.

Example

5.8.11.6.1.6 TCPIP_HTTP_CurrentConnectionCallbackPosGet Function

C

```
uint32_t TCPIP_HTTP_CurrentConnectionCallbackPosGet(  
    HTTP_CONN_HANDLE connHandle  
);
```

Description

Returns the callback position indicator for connection defined by connHandle.

Preconditions

None.

Parameters

Parameters	Description
connHandle	HTTP connection handle

Remarks

None.

Example

```
uint32_t callbackPos;  
callbackPos = TCPIP_HTTP_CurrentConnectionCallbackPosGet(connHandle);  
if(callbackPos == 0x00u)  
    callbackPos = (uint32_t)DDNSClient.Host.szRAM;  
callbackPos =  
(uint32_t)TCPIP_TCP_StringPut(TCPIP_HTTP_CurrentConnectionSocketGet(connHandle),  
(uint8_t*)callbackPos);  
if(*(uint8_t*)callbackPos == '0')  
    callbackPos = 0x00;  
TCPIP_HTTP_CurrentConnectionCallbackPosSet(connHandle, callbackPos);
```

5.8.11.6.1.7 TCPIP_HTTP_CurrentConnectionCallbackPosSet Function

C

```
void TCPIP_HTTP_CurrentConnectionCallbackPosSet(  
    HTTP_CONN_HANDLE connHandle,  
    uint32_t  
);
```

Description

Sets the callback position indicator for connection defined by connHandle.

Preconditions

None.

Parameters

Parameters	Description
connHandle	HTTP connection handle

Remarks

None.

Example

```
void HTTPPrint_builddate(HTTP_CONN_HANDLE connHandle)  
{  
    TCP_SOCKET sktHTTP;  
    sktHTTP = TCPIP_HTTP_CurrentConnectionSocketGet(connHandle);  
  
    TCPIP_HTTP_CurrentConnectionCallbackPosSet(connHandle, 0x01);  
    if(TCPIP_TCP_PutIsReady(sktHTTP) < strlen((const char*)__DATE__ " " __TIME__))  
    { // Don't have room to output build date and time  
        return;  
    }  
    TCPIP_HTTP_CurrentConnectionCallbackPosSet(connHandle, 0x00);  
    TCPIP_TCP_StringPut(sktHTTP, (const void*)__DATE__ " " __TIME__);  
}
```

5.8.11.6.1.8 TCPIP_HTTP_CurrentConnectionDataBufferGet Function

C

```
uint8_t* TCPIP_HTTP_CurrentConnectionDataBufferGet(  
    HTTP_CONN_HANDLE connHandle  
);
```

Description

Returns pointer to connection general purpose data buffer.

Preconditions

None.

Parameters

Parameters	Description
connHandle	HTTP connection handle

Remarks

None.

Example

```

void HTTPPrint_cookiesname(HTTP_CONN_HANDLE connHandle)
{
    const uint8_t *ptr;
    TCP_SOCKET sktHTTP;

    ptr = TCPIP_HTTP_ArgGet(TCPIP_HTTP_CurrentConnectionDataBufferGet(connHandle), (const
uint8_t*)"name");
    sktHTTP = TCPIP_HTTP_CurrentConnectionSocketGet(connHandle);
    if(ptr)
        TCPIP_TCP_StringPut(sktHTTP, ptr);
    else
        TCPIP_TCP_StringPut(sktHTTP, (const uint8_t*)"not set");
}

```

5.8.11.6.1.9 TCPIP_HTTP_CurrentConnectionFileGet Function**C**

```

FILE_HANDLE TCPIP_HTTP_CurrentConnectionFileGet(
    HTTP_CONN_HANDLE connHandle
);

```

Description

Get handle to current connection's file.

Preconditions

None.

Parameters

Parameters	Description
connHandle	HTTP connection handle

Remarks

None.

Example

```

uint8_t filename[20];

// Load the file name
// Make sure uint8_t filename[] above is large enough for your longest name
MPFSGetFilename(TCPIP_HTTP_CurrentConnectionFileGet(connHandle), filename, 20);

```

5.8.11.6.1.10 TCPIP_HTTP_CurrentConnectionHasArgsSet Function**C**

```

void TCPIP_HTTP_CurrentConnectionHasArgsSet(
    HTTP_CONN_HANDLE connHandle,
    bool args
);

```

Description

Sets whether there are get or cookie arguments

Preconditions

None.

Parameters

Parameters	Description
connHandle	HTTP connection handle
args	boolean if there arguments or not

Remarks

None.

Example

```
else if(!memcmp(filename, "cookies.htm", 11))
{ // If it's the LED updater file
    TCPIP_HTTP_CurrentConnectionHasArgsSet(connHandle, true);
}
```

5.8.11.6.1.11 TCPIP_HTTP_CurrentConnectionIsAuthorizedGet Function**C**

```
uint8_t TCPIP_HTTP_CurrentConnectionIsAuthorizedGet(
    HTTP_CONN_HANDLE connHandle
);
```

Description

Get the authorization status for the current connection.

Preconditions

None

Parameters

Parameters	Description
connHandle	HTTP connection handle

Remarks

None.

Example

```
uint8_t isAuth;

isAuth = TCPIP_HTTP_CurrentConnectionIsAuthorizedGet(connHandle);
```

5.8.11.6.1.12 TCPIP_HTTP_CurrentConnectionIsAuthorizedSet Function**C**

```
void TCPIP_HTTP_CurrentConnectionIsAuthorizedSet(
    HTTP_CONN_HANDLE connHandle,
    uint8_t auth
);
```

Description

Sets the authorization status for the current connection.

Preconditions

None

Parameters

Parameters	Description
connHandle	HTTP connection handle
auth	new authorization state

Remarks

None.

Example

```
uint8_t auth = 0x80;

TCPIP_HTTP_CurrentConnectionIsAuthorizedSet(connHandle, auth);
```

5.8.11.6.1.13 TCPIP_HTTP_CurrentConnectionPostSmGet Function**C**

```
int TCPIP_HTTP_CurrentConnectionPostSmGet(
    HTTP_CONN_HANDLE connHandle
);
```

Description

Get the POST state machine state for connection defined by connHandle

Preconditions

None

Parameters

Parameters	Description
connHandle	HTTP connection handle

Remarks

None

Example

```
switch(TCPIP_HTTP_CurrentConnectionPostSmGet(connHandle))
{
    // Find the name
    case SM_POST_LCD_READ_NAME:
        .
        .
        .
    // Found the value, so store the LCD and return
    case SM_POST_LCD_READ_VALUE:
        .
        .
        .
}
```

5.8.11.6.1.14 TCPIP_HTTP_CurrentConnectionPostSmSet Function**C**

```
void TCPIP_HTTP_CurrentConnectionPostSmSet(
    HTTP_CONN_HANDLE connHandle,
    int state
);
```

Description

Set the POST state machine state for connection defined by connHandle

Preconditions

None.

Parameters

Parameters	Description
connHandle	HTTP connection handle
state	Integer state for POST state machine

Remarks

None

Example

```
uint8_t* httpDataBuff;
switch(TCPIP_HTTP_CurrentConnectionPostSmGet(connHandle))
{
    // Find the name
    case SM_POST_LCD_READ_NAME:

        // Read a name
        if(TCPIP_HTTP_PostNameRead(connHandle, httpDataBuff, HTTP_MAX_DATA_LEN) ==
HTTP_READ_INCOMPLETE)
            return HTTP_IO_NEED_DATA;

        TCPIP_HTTP_CurrentConnectionPostSmSet(connHandle, SM_POST_LCD_READ_VALUE);
        // No break...continue reading value

        // Found the value, so store the LCD and return
    case SM_POST_LCD_READ_VALUE:
        .
        .
        .
}
```

5.8.11.6.1.15 TCPIP_HTTP_CurrentConnectionSocketGet Function**C**

```
TCP_SOCKET TCPIP_HTTP_CurrentConnectionSocketGet(
    HTTP_CONN_HANDLE connHandle
);
```

Description

Get the [socket](#) for the current connection.

Preconditions

None

Parameters

Parameters	Description
connHandle	HTTP connection handle

Remarks

None.

Example

```
uint32_t byteCount;
TCP_SOCKET sktHTTP;

byteCount = TCPIP_HTTP_CurrentConnectionByteCountGet(connHandle);
sktHTTP = TCPIP_HTTP_CurrentConnectionSocketGet(connHandle);
if(byteCount > TCPIP_TCP_GetIsReady(sktHTTP) + TCPIP_TCP_FifoRxFreeGet(sktHTTP))
{
    // Configuration Failure
    TCPIP_HTTP_CurrentConnectionStatusSet(connHandle, HTTP_REDIRECT);
    return HTTP_IO_DONE;
}
```

5.8.11.6.1.16 TCPIP_HTTP_CurrentConnectionStatusSet Function**C**

```
void TCPIP_HTTP_CurrentConnectionStatusSet(
    HTTP_CONN_HANDLE connHandle,
    HTTP_STATUS stat
);
```

Description

Sets HTTP status to value in enumeration [HTTP_STATUS](#).

Preconditions

None.

Parameters

Parameters	Description
connHandle	HTTP connection handle

Remarks

None.

Example

```
byteCount = TCPIP_HTTP_CurrentConnectionByteCountGet(connHandle);
sktHTTP = TCPIP_HTTP_CurrentConnectionSocketGet(connHandle);
if(byteCount > TCPIP_TCP_GetIsReady(sktHTTP) + TCPIP_TCP_FifoRxFreeGet(sktHTTP))
{
    // Configuration Failure
    // 302 Redirect will be returned
    TCPIP_HTTP_CurrentConnectionStatusSet(connHandle, HTTP_REDIRECT);
}
```

5.8.11.6.1.17 TCPIP_HTTP_CurrentConnectionUserDataGet Function**C**

```
const void* TCPIP_HTTP_CurrentConnectionUserDataGet(
    HTTP_CONN_HANDLE connHandle
);
```

Description

Returns the value of the user parameter for the current connection.

Preconditions

None

Parameters

Parameters	Description
connHandle	HTTP connection handle

Remarks

None.

Example

```
uint32_t myConnData;  
  
myConnData = (uint32_t)TCPIP_HTTP_CurrentConnectionUserDataGet(connHandle);
```

5.8.11.6.1.18 TCPIP_HTTP_CurrentConnectionUserDataSet Function**C**

```
void TCPIP_HTTP_CurrentConnectionUserDataSet(  
    HTTP_CONN_HANDLE connHandle,  
    const void* uData  
);
```

Description

Sets the user data value for the current connection.

Preconditions

None

Parameters

Parameters	Description
connHandle	HTTP connection handle
uData	user supplied data

Remarks

None.

Example

```
uint32_t myConnData;  
  
TCPIP_HTTP_CurrentConnectionUserDataSet(connHandle, (const void*)myConnData);
```

5.8.11.6.1.19 TCPIP_HTTP_FileInclude Function**C**

```
void TCPIP_HTTP_FileInclude(  
    HTTP_CONN_HANDLE connHandle,  
    const uint8_t* cFile  
);
```

Description

Allows an entire file to be included as a dynamic variable, providing a basic templating system for HTML web pages. This reduces unneeded duplication of visual elements such as headers, menus, etc.

When pHttpCon->callbackPos is 0, the file is opened and as many bytes as possible are written. The current position is then saved to pHttpCon->callbackPos and the file is closed. On subsequent calls, reading begins at the saved location and continues. Once the end of the input file is reached, pHttpCon->callbackPos is set back to 0 to indicate completion.

Preconditions

None

Parameters

Parameters	Description
cFile	the name of the file to be sent

Returns

None

Remarks

Users should not call this function directly, but should instead add dynamic variables in the form of ~inc:filename.ext~ in their HTML code to include (for example) the file "filename.ext" at that specified location. The MPFS2 Generator utility will handle the rest.

Example**5.8.11.6.1.20 TCPIP_HTTP_PostNameRead Function****C**

```
HTTP_READ_STATUS TCPIP_HTTP_PostNameRead(  
    HTTP_CONN_HANDLE connHandle,  
    uint8_t* cData,  
    uint16_t wLen  
);
```

Description

Reads a name from a URL encoded string in the TCP buffer. This function is meant to be called from an [HTTPExecutePost](#) callback to facilitate easier parsing of incoming data. This function also prevents buffer overflows by forcing the programmer to indicate how many bytes are expected. At least 2 extra bytes are needed in cData over the maximum length of data expected to be read.

This function will read until the next '=' character, which indicates the end of a name parameter. It assumes that the front of the buffer is the beginning of the name parameter to be read.

This function properly updates pHttpCon->byteCount by decrementing it by the number of bytes read. It also removes the delimiting '=' from the buffer.

Preconditions

Front of TCP buffer is the beginning of a name parameter, and the rest of the TCP buffer contains a URL-encoded string with a name parameter terminated by a '=' character.

Parameters

Parameters	Description
connHandle	HTTP connection handle
cData	where to store the name once it is read
wLen	how many bytes can be written to cData

Return Values

Return Values	Description
HTTP_READ_OK	name was successfully read
HTTP_READ_TRUNCATED	entire name could not fit in the buffer, so the value was truncated and data has been lost

HTTP_READ_INCOMPLETE	entire name was not yet in the buffer, so call this function again later to retrieve

Remarks

None

Example**5.8.11.6.1.21 TCPIP_HTTP_PostValueRead Function****C**

```

HTTP_READ_STATUS TCPIP_HTTP_PostValueRead(
    HTTP_CONN_HANDLE connHandle,
    uint8_t* cData,
    uint16_t wLen
);

```

Description

Reads a value from a URL encoded string in the TCP buffer. This function is meant to be called from an [HTTPExecutePost](#) callback to facilitate easier parsing of incoming data. This function also prevents buffer overflows by forcing the programmer to indicate how many bytes are expected. At least 2 extra bytes are needed in cData above the maximum length of data expected to be read.

This function will read until the next '&' character, which indicates the end of a value parameter. It assumes that the front of the buffer is the beginning of the value parameter to be read. If pHttpCon->byteCount indicates that all expected bytes are in the buffer, it assumes that all remaining data is the value and acts accordingly.

This function properly updates pHttpCon->byteCount by decrementing it by the number of bytes read. The terminating '&' character is also removed from the buffer.

Preconditions

Front of TCP buffer is the beginning of a name parameter, and the rest of the TCP buffer contains a URL-encoded string with a name parameter terminated by a '=' character.

Parameters

Parameters	Description
connHandle	HTTP connection handle
cData	where to store the value once it is read
wLen	how many bytes can be written to cData

Return Values

Return Values	Description
HTTP_READ_OK	value was successfully read
HTTP_READ_TRUNCATED	entire value could not fit in the buffer, so the value was truncated and data has been lost
HTTP_READ_INCOMPLETE	entire value was not yet in the buffer, so call this function again later to retrieve

Remarks

None

Example

5.8.11.6.1.22 TCPIP_HTTP_URLDecode Function

C

```
uint8_t* TCPIP_HTTP_URLDecode(  
    uint8_t* cData  
);
```

Description

Parses a string from URL encoding to plain-text. The following conversions are made: '=' to '0', '&' to '0', '+' to ' ', and "%xx" to a single hex byte.

After completion, the data has been decoded and a null terminator signifies the end of a name or value. A second null terminator (or a null name parameter) indicates the end of all the data.

Preconditions

The data parameter is null terminated and has at least one extra byte free.

Parameters

Parameters	Description
cData	The string which is to be decoded in place.

Returns

A pointer to the last null terminator in data, which is also the first free byte for new data.

Remarks

This function is called by the stack to parse GET arguments and cookie data. User applications can use this function to decode POST data, but first need to verify that the string is null-terminated.

Example

code>

5.8.11.6.1.23 HTTPCheckAuth Function

C

```
uint8_t HTTPCheckAuth(  
    HTTP_CONN_HANDLE connHandle,  
    uint8_t* cUser,  
    uint8_t* cPass  
);
```

Description

This function is implemented by the application developer in CustomHTTPApp.c. Its function is to determine if the user name and password supplied by the client are acceptable for this resource.

The value of curHTTP.isAuthorized will be set to the previous return value of HTTPRequiresAuthorization. This callback function can check this value to determine if only specific user names or passwords will be accepted for this resource.

Return values 0x80 - 0xff indicate that the credentials were accepted, while values from 0x00 to 0x79 indicate that authorization failed. While most applications will only use a single value to grant access, flexibility is provided to store multiple values in order to indicate which user (or user's group) logged in.

The return value of this function is saved as curHTTP.isAuthorized, and will be available to future callbacks, including any of the [HTTPExecuteGet](#), [HTTPExecutePost](#), or [HTTPPrint_varname](#) callbacks.

Preconditions

None

Parameters

Parameters	Description
connHandle	HTTP connection handle
cUser	the user name supplied by the client
cPass	the password supplied by the client

Return Values

Return Values	Description
<= 0x79	the credentials were rejected
>= 0x80	access is granted for this connection

Remarks

This function is only called when an Authorization header is encountered.

This function may NOT write to the TCP buffer.

5.8.11.6.1.24 HTTPExecuteGet Function**C**

```
HTTP_IO_RESULT HTTPExecuteGet(  
    HTTP_CONN_HANDLE connHandle  
);
```

Description

This function is implemented by the application developer in CustomHTTPApp.c. Its purpose is to parse the data received from URL parameters (GET method forms) and cookies and perform any application-specific tasks in response to these inputs. Any required authentication has already been validated.

When this function is called, curHTTP.data contains sequential name/value pairs of strings representing the data received. In this format, [TCPIP_HTTP_ArgGet](#) can be used to search for specific variables in the input. If data buffer space associated with this connection is required, curHTTP.data may be overwritten here once the application is done with the values. Any data placed there will be available to future callbacks for this connection, including [HTTPExecutePost](#) and any [HTTPPrint_varname](#) dynamic substitutions.

This function may also issue redirections by setting curHTTP.data to the destination file name or URL, and curHTTP.httpStatus to HTTP_REDIRECT.

Finally, this function may set cookies. Set curHTTP.data to a series of name/value string pairs (in the same format in which parameters arrive) and then set curHTTP.hasArgs equal to the number of cookie name/value pairs. The cookies will be transmitted to the browser, and any future requests will have those values available in curHTTP.data.

Preconditions

None

Parameters

Parameters	Description
connHandle	HTTP connection handle

Return Values

Return Values	Description
HTTP_IO_DONE	application is done processing
HTTP_IO_NEED_DATA	this value may not be returned because more data will not become available
HTTP_IO_WAITING	the application is waiting for an asynchronous process to complete, and this function should be called again later

Remarks

This function is only called if variables are received via URL parameters or Cookie arguments. This function may NOT write to the TCP buffer.

This function may service multiple HTTP requests simultaneously. Exercise caution when using global or static variables inside this routine. Use `curHTTP.callbackPos` or `curHTTP.data` for storage associated with individual requests.

5.8.11.6.1.25 HTTPExecutePost Function

C

```
HTTP_IO_RESULT HTTPExecutePost(  
    HTTP_CONN_HANDLE connHandle  
);
```

Description

This function is implemented by the application developer in `CustomHTTPApp.c`. Its purpose is to parse the data received from POST forms and perform any application-specific tasks in response to these inputs. Any required authentication has already been validated before this function is called.

When this function is called, POST data will be waiting in the TCP buffer. `curHTTP.byteCount` will indicate the number of bytes remaining to be received before the browser request is complete.

Since data is still in the TCP buffer, the application must call [TCPIP_TCP_Get](#) or [TCPIP_TCP_ArrayGet](#) in order to retrieve bytes. When this is done, `curHTTP.byteCount` MUST be updated to reflect how many bytes now remain. The functions [TCPIP_TCP_Find](#), `TCPIFindString`, and [TCPIP_TCP_ArrayFind](#) may be helpful to locate data in the TCP buffer.

In general, data submitted from web forms via POST is URL encoded. The [TCPIP_HTTP_URLDecode](#) function can be used to decode this information back to a standard string if required. If data buffer space associated with this connection is required, `curHTTP.data` may be overwritten here once the application is done with the values. Any data placed there will be available to future callbacks for this connection, including `HTTPExecutePost` and any [HTTPPrint_varname](#) dynamic substitutions.

Whenever a POST form is processed it is recommended to issue a redirect back to the browser, either to a status page or to the same form page that was posted. This prevents accidental duplicate submissions (by clicking refresh or back/forward) and avoids browser warnings about "resubmitting form data". Redirects may be issued to the browser by setting `curHTTP.data` to the destination file or URL, and `curHTTP.httpStatus` to `HTTP_REDIRECT`.

Finally, this function may set cookies. Set `curHTTP.data` to a series of name/value string pairs (in the same format in which parameters arrive) and then set `curHTTP.hasArgs` equal to the number of cookie name/value pairs. The cookies will be transmitted to the browser, and any future requests will have those values available in `curHTTP.data`.

Preconditions

None

Parameters

Parameters	Description
<code>connHandle</code>	HTTP connection handle

Return Values

Return Values	Description
HTTP_IO_DONE	application is done processing
HTTP_IO_NEED_DATA	more data is needed to continue, and this function should be called again later
HTTP_IO_WAITING	the application is waiting for an asynchronous process to complete, and this function should be called again later

Remarks

This function is only called when the request method is POST, and is only used when [HTTP_USE_POST](#) is defined. This method may NOT write to the TCP buffer.

This function may service multiple HTTP requests simultaneously. Exercise caution when using global or static variables inside this routine. Use curHTTP.callbackPos or curHTTP.data for storage associated with individual requests.

5.8.11.6.1.26 HTTPNeedsAuth Function**C**

```
uint8_t HTTPNeedsAuth(  
    HTTP_CONN_HANDLE connHandle,  
    uint8_t* cFile  
);
```

Description

This function is implemented by the application developer in CustomHTTPApp.c. Its function is to determine if a file being requested requires authentication to view. The user name and password, if supplied, will arrive later with the request headers, and will be processed at that time.

Return values 0x80 - 0xff indicate that authentication is not required, while values from 0x00 to 0x79 indicate that a user name and password are required before proceeding. While most applications will only use a single value to grant access and another to require authorization, the range allows multiple "realms" or sets of pages to be protected, with different credential requirements for each.

The return value of this function is saved as curHTTP.isAuthorized, and will be available to future callbacks, including [HTTPCheckAuth](#) and any of the [HTTPExecuteGet](#), [HTTPExecutePost](#), or [HTTPPrint_varname](#) callbacks.

Preconditions

None

Parameters

Parameters	Description
connHandle	HTTP connection handle
cFile	the name of the file being requested

Return Values

Return Values	Description
<= 0x79	valid authentication is required
>= 0x80	access is granted for this connection

Remarks

This function may NOT write to the TCP buffer.

5.8.11.6.1.27 HTTPPrint_varname Function

C

```
void HTTPPrint_varname(  
    HTTP_CONN_HANDLE connHandle,  
    uint16_t wParam1,  
    uint16_t wParam2,  
    ...  
);
```

Description

Functions in this style are implemented by the application developer in CustomHTTPApp.c. These functions generate dynamic content to be inserted into web pages and other files returned by the HTTP server.

Functions of this type are called when a dynamic variable is located in a web page. (ie, ~varname~) The name between the tilde '~' characters is appended to the base function name. In this example, the callback would be named HTTPPrint_varname.

The function prototype is located in your project's http_print.h, which is automatically generated by the MPFS2 Utility. The prototype will have uint16_t parameters included for each parameter passed in the dynamic variable. For example, the variable "~myArray(2,6)~" will generate the prototype "void HTTPPrint_varname(uint16_t, uint16_t);".

When called, this function should write its output directly to the TCP [socket](#) using any combination of [TCPIP_TCP_PutIsReady](#), [TCPIP_TCP_Put](#), [TCPIP_TCP_ArrayPut](#), [TCPIP_TCP_StringPut](#), [TCPIP_TCP_ArrayPut](#), and [TCPIP_TCP_StringPut](#).

Before calling, the HTTP server guarantees that at least [HTTP_MIN_CALLBACK_FREE](#) bytes (defaults to 16 bytes) are free in the output buffer. If the function is writing less than this amount, it should simply write the data to the [socket](#) and return.

In situations where a function needs to write more this amount, it must manage its output state using curHTTP.callbackPos. This value will be set to zero before the function is called. If the function is managing its output state, it must set this to a non-zero value before returning. Typically this is used to track how many bytes have been written, or how many remain to be written. If curHTTP.callbackPos is non-zero, the function will be called again when more buffer space is available. Once the callback completes, set this value back to zero to resume normal servicing of the request.

Preconditions

None

Parameters

Parameters	Description
connHandle	HTTP connection handle
wParam1	first parameter passed in the dynamic variable (if any)
wParam2	second parameter passed in the dynamic variable (if any)
...	additional parameters as necessary

Returns

None

Remarks

This function may service multiple HTTP requests simultaneously, especially when managing its output state. Exercise caution when using global or static variables inside this routine. Use curHTTP.callbackPos or curHTTP.data for storage associated with individual requests.

5.8.11.6.2 Data Types and Constants

5.8.11.6.2.1 HTTP_CONN_HANDLE Type

C

```
typedef const void* HTTP_CONN_HANDLE;
```

Description

HTTP connection identifier, handle of a HTTP connection

5.8.11.6.2.2 HTTP_FILE_TYPE Enumeration

C

```
typedef enum {  
    HTTP_TXT = 0u,  
    HTTP_HTM,  
    HTTP_HTML,  
    HTTP_CGI,  
    HTTP_XML,  
    HTTP_CSS,  
    HTTP_GIF,  
    HTTP_PNG,  
    HTTP_JPG,  
    HTTP_JAVA,  
    HTTP_WAV,  
    HTTP_UNKNOWN  
} HTTP_FILE_TYPE;
```

Description

File type definitions

Members

Members	Description
HTTP_TXT = 0u	File is a text document
HTTP_HTM	File is HTML (extension .htm)
HTTP_HTML	File is HTML (extension .html)
HTTP_CGI	File is HTML (extension .cgi)
HTTP_XML	File is XML (extension .xml)
HTTP_CSS	File is stylesheet (extension .css)
HTTP_GIF	File is GIF image (extension .gif)
HTTP_PNG	File is PNG image (extension .png)
HTTP_JPG	File is JPG image (extension .jpg)
HTTP_JAVA	File is java (extension .java)
HTTP_WAV	File is audio (extension .wav)
HTTP_UNKNOWN	File type is unknown

5.8.11.6.2.3 HTTP_IO_RESULT Enumeration

C

```
typedef enum {  
    HTTP_IO_DONE = 0u,  
    HTTP_IO_NEED_DATA,  
    HTTP_IO_WAITING  
} HTTP_IO_RESULT;
```

Description

Result states for execution callbacks

Members

Members	Description
HTTP_IO_DONE = 0u	Finished with procedure
HTTP_IO_NEED_DATA	More data needed to continue, call again later
HTTP_IO_WAITING	Waiting for asynchronous process to complete, call again later

5.8.11.6.2.4 HTTP_MODULE_CONFIG Structure**C**

```
typedef struct {
    uint16_t nConnections;
    uint16_t dataLen;
    uint16_t sktTxBuffSize;
    uint16_t sktRxBuffSize;
    uint16_t configFlags;
} HTTP_MODULE_CONFIG;
```

Description

HTTP module dynamic configuration data

Members

Members	Description
uint16_t nConnections;	number of http connections
uint16_t dataLen;	size of the data buffer for reading cookie and GET/POST arguments (bytes)
uint16_t sktTxBuffSize;	size of TX buffer for the associatted socket ; leave 0 for default
uint16_t sktRxBuffSize;	size of RX buffer for the associatted socket ; leave 0 for default
uint16_t configFlags;	a HTTP_MODULE_FLAGS value.

5.8.11.6.2.5 HTTP_MODULE_FLAGS Enumeration**C**

```
typedef enum {
    HTTP_MODULE_FLAG_ADJUST_SKT_FIFOS = 0x01,
    HTTP_MODULE_FLAG_NO_DELAY = 0x02
} HTTP_MODULE_FLAGS;
```

Description

HTTP module configuration flags

Members

Members	Description
HTTP_MODULE_FLAG_ADJUST_SKT_FIFOS = 0x01	adjust corresponding socket FIFO at run time improves throughput when the socket buffers are small
HTTP_MODULE_FLAG_NO_DELAY = 0x02	create the http sockets with NO-DELAY option it will flush data as soon as possible

5.8.11.6.2.6 HTTP_READ_STATUS Enumeration**C**

```
typedef enum {
```

```

    HTTP_READ_OK = 0u,
    HTTP_READ_TRUNCATED,
    HTTP_READ_INCOMPLETE
} HTTP_READ_STATUS;

```

Description

Result states for HTTPPostReadName and HTTPPostReadValue

Members

Members	Description
HTTP_READ_OK = 0u	Read was successful
HTTP_READ_TRUNCATED	Buffer overflow prevented by truncating value
HTTP_READ_INCOMPLETE	Entire object is not yet in the buffer. Try again later.

5.8.11.6.2.7 HTTP_STATUS Enumeration**C**

```

typedef enum {
    HTTP_GET = 0u,
    HTTP_POST,
    HTTP_BAD_REQUEST,
    HTTP_UNAUTHORIZED,
    HTTP_NOT_FOUND,
    HTTP_OVERFLOW,
    HTTP_INTERNAL_SERVER_ERROR,
    HTTP_NOT_IMPLEMENTED,
    HTTP_REDIRECT,
    HTTP_SSL_REQUIRED,
    HTTP_MPFS_FORM,
    HTTP_MPFS_UP,
    HTTP_MPFS_OK,
    HTTP_MPFS_ERROR
} HTTP_STATUS;

```

Description

Supported Commands and Server Response Codes

Members

Members	Description
HTTP_GET = 0u	GET command is being processed
HTTP_POST	POST command is being processed
HTTP_BAD_REQUEST	400 Bad Request will be returned
HTTP_UNAUTHORIZED	401 Unauthorized will be returned
HTTP_NOT_FOUND	404 Not Found will be returned
HTTP_OVERFLOW	414 Request-URI Too Long will be returned
HTTP_INTERNAL_SERVER_ERROR	500 Internal Server Error will be returned
HTTP_NOT_IMPLEMENTED	501 Not Implemented (not a GET or POST command)
HTTP_REDIRECT	302 Redirect will be returned
HTTP_SSL_REQUIRED	403 Forbidden is returned, indicating SSL is required
HTTP_MPFS_FORM	Show the MPFS Upload form
HTTP_MPFS_UP	An MPFS Upload is being processed
HTTP_MPFS_OK	An MPFS Upload was successful
HTTP_MPFS_ERROR	An MPFS Upload was not a valid image

5.8.11.6.2.8 HTTPReadPostPair Macro

C

```
#define HTTPReadPostPair(connHandle, cData, wLen) TCPIP_HTTP_PostValueRead(connHandle, cData, wLen)
```

Description

Reads a name and value pair from a URL encoded string in the TCP buffer. This function is meant to be called from an [HTTPExecutePost](#) callback to facilitate easier parsing of incoming data. This function also prevents buffer overflows by forcing the programmer to indicate how many bytes are expected. At least 2 extra bytes are needed in cData over the maximum length of data expected to be read.

This function will read until the next '&' character, which indicates the end of a value parameter. It assumes that the front of the buffer is the beginning of the name parameter to be read.

This function properly updates curHTTP.byteCount by decrementing it by the number of bytes read. It also removes the delimiting '&' from the buffer.

Once complete, two strings will exist in the cData buffer. The first is the parameter name that was read, while the second is the associated value.

Preconditions

Front of TCP buffer is the beginning of a name parameter, and the rest of the TCP buffer contains a URL-encoded string with a name parameter terminated by a '=' character and a value parameter terminated by a '&'.

Parameters

Parameters	Description
connHandle	HTTP connection handle
cData	where to store the name and value strings once they are read
wLen	how many bytes can be written to cData

Return Values

Return Values	Description
HTTP_READ_OK	name and value were successfully read
HTTP_READ_TRUNCATED	entire name and value could not fit in the buffer, so input was truncated and data has been lost
HTTP_READ_INCOMPLETE	entire name and value was not yet in the buffer, so call this function again later to retrieve

Remarks

This function is aliased to [TCPIP_HTTP_PostValueRead](#), since they effectively perform the same task. The name is provided only for completeness.

5.8.11.7 Files

Files

Name	Description
http.h	
http_config.h	HTTP configuration file

Description

5.8.11.7.1 http.h

HTTP Headers for Microchip TCP/IP Stack

Enumerations

	Name	Description
	HTTP_FILE_TYPE	File type definitions
	HTTP_IO_RESULT	Result states for execution callbacks
	HTTP_MODULE_FLAGS	HTTP module configuration flags
	HTTP_READ_STATUS	Result states for HTTPPostReadName and HTTPPostReadValue
	HTTP_STATUS	Supported Commands and Server Response Codes

Functions

	Name	Description
	HTTPCheckAuth	Performs validation on a specific user name and password.
	HTTPExecuteGet	Processes GET form field variables and cookies.
	HTTPExecutePost	Processes POST form variables and data.
	HTTPNeedsAuth	Determines if a given file name requires authentication
	HTTPPrint_varname	Inserts dynamic content into a web page
	TCPIP_HTTP_ActiveConnectionCountGet	Gets the number of active connections.
	TCPIP_HTTP_ArgGet	Locates a form field value in a given data array.
	TCPIP_HTTP_CurrentConnectionByteCountDec	Decrements byte count.
	TCPIP_HTTP_CurrentConnectionByteCountGet	Returns how many bytes have been read so far
	TCPIP_HTTP_CurrentConnectionByteCountSet	Sets how many bytes have been read so far
	TCPIP_HTTP_CurrentConnectionCallbackPosGet	Returns the callback position indicator.
	TCPIP_HTTP_CurrentConnectionCallbackPosSet	Sets the callback position indicator.
	TCPIP_HTTP_CurrentConnectionDataBufferGet	Returns pointer to connection general purpose data buffer.
	TCPIP_HTTP_CurrentConnectionFileGet	Get handle to current connection's file.
	TCPIP_HTTP_CurrentConnectionHasArgsSet	Sets whether there are get or cookie arguments
	TCPIP_HTTP_CurrentConnectionIsAuthorizedGet	Get the authorized state for the current connection.
	TCPIP_HTTP_CurrentConnectionIsAuthorizedSet	Sets the authorized state for the current connection.
	TCPIP_HTTP_CurrentConnectionPostSmGet	Get the POST state machine state.
	TCPIP_HTTP_CurrentConnectionPostSmSet	Set the POST state machine state.
	TCPIP_HTTP_CurrentConnectionSocketGet	Get the socket for the current connection.
	TCPIP_HTTP_CurrentConnectionStatusSet	Sets HTTP status.
	TCPIP_HTTP_CurrentConnectionUserDataGet	Gets the user data parameter for the current connection.
	TCPIP_HTTP_CurrentConnectionUserDataSet	Sets the user data parameter for the current connection.
	TCPIP_HTTP_FileInclude	Writes a file byte-for-byte to the currently loaded TCP socket .
	TCPIP_HTTP_PostNameRead	Reads a name from a URL encoded string in the TCP buffer.
	TCPIP_HTTP_PostValueRead	Reads a value from a URL encoded string in the TCP buffer.
	TCPIP_HTTP_URLDecode	Parses a string from URL encoding to plain-text.

Macros

	Name	Description
	HTTPReadPostPair	Reads a name and value pair from a URL encoded string in the TCP buffer.

Structures

	Name	Description
	HTTP_MODULE_CONFIG	HTTP module dynamic configuration data

Types

	Name	Description
	HTTP_CONN_HANDLE	HTTP connection identifier, handle of a HTTP connection

5.8.11.7.2 http_config.h

HyperText Transfer Protocol (HTTP) Configuration file

This file contains the HTTP module configuration options

Macros

	Name	Description
	HTTP_CACHE_LEN	Max lifetime (sec) of static responses as string
	HTTP_CONFIG_FLAGS	Define the HTTP module configuration flags Use 0 for default
	HTTP_DEFAULT_FILE	Indicate what file to serve when no specific one is requested
	HTTP_DEFAULT_LEN	For buffer overrun protection. Set to longest length of above two strings.
	HTTP_FILE_UPLOAD	Configure MPFS over HTTP updating Comment this line to disable updating via HTTP
	HTTP_MAX_CONNECTIONS	Maximum numbers of simultaneous supported HTTP connections.
	HTTP_MAX_DATA_LEN	Define the maximum data length for reading cookie and GET/POST arguments (bytes)
	HTTP_MAX_HEADER_LEN	Set to length of longest string above
	HTTP_MIN_CALLBACK_FREE	Define the minimum number of bytes free in the TX FIFO before executing callbacks
	HTTP_PORT	Define the listening port for the HTTP server
	HTTP_SKT_RX_BUFF_SIZE	Define the size of the RX buffer for the http socket Use 0 for default
	HTTP_SKT_TX_BUFF_SIZE	Define the size of the TX buffer for the http socket Use 0 for default
	HTTP_SSL_ONLY_CHAR	Files beginning with this character will only be served over HTTPS Set to 0x00 to require for all files Set to 0xff to require for no files
	HTTP_TIMEOUT	Max time (sec) to await more data before timing out and disconnecting the socket
	HTTP_USE_AUTHENTICATION	Enable basic authentication support
	HTTP_USE_COOKIES	Enable cookie support
	HTTP_USE_POST	Define which HTTP modules to use If not using a specific module, comment it to save resources Enable POST support
	HTTPS_DEFAULT_FILE	Indicate what file to serve when no specific one is requested
	HTTPS_PORT	Listening port for HTTPS server (when SSL enabled)
	TCPIP_STACK_USE_BASE64_DECODE	TCPIP_STACK_USE_BASE64_DECODE HTTP_USE_AUTHENTICATION

5.8.12 ICMP TCP/IP Stack Library

5.8.12.1 Introduction

Internet Control Message Protocol (ICMP) TCP/IP Stack Library

for

Microchip Microcontrollers

This library provides the API of the ICMP TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

The Internet Control Message Protocol is used to **send** error and status messages and requests. The ICMP module implements the Echo Reply message type (commonly referred to as a ping) which can be used to determine if a specified host is reachable across an IP network from a device running the TCP/IP stack. An ICMP server is also supported to respond to pings from other devices.

5.8.12.2 Release Notes

MPLAB Harmony Version: v0.70b **ICMP TCP/IP Stack Library Version :** 1.0 **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.8.12.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.8.12.4 Using the Library

This topic describes the basic architecture of the ICMP TCP/IP Stack Library and provides information and examples on how to use it.

Interface Header File: [icmp.h](#)

The interface to the ICMP TCP/IP Stack library is defined in the "[icmp.h](#)" header file. This file is included by the "tcpip.h" file. Any C language source (.c) file that uses the ICMP TCP/IP Stack library should include "tcpip.h".

Library File:

The ICMP TCP/IP Stack library archive (.a) file is installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the TCP/IP Stack interacts with the framework.

5.8.12.4.1 Abstraction Model

This library provides the API of the ICMP TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

5.8.12.4.2 Library Overview

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the ICMP module.

Library Interface Section	Description
Functions	This section provides general interface routines
Data Types and Constants	This section provides various definitions describing this API

5.8.12.5 Configuring the Library

Macros

	Name	Description
	ICMP_TIMEOUT	ICMP Timeout Value

Description

The configuration of the ICMP TCP/IP Stack is based on the file `tcip_config.h`.

This header file contains the configuration selection for the ICMP TCP/IP Stack. Based on the selections made, the ICMP TCP/IP Stack will support or not support selected features. These configuration settings will apply to all instances of the ICMP TCP/IP Stack.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.8.12.5.1 ICMP_TIMEOUT Macro**C**

```
#define ICMP_TIMEOUT (4ul*SYS_TICK_TicksPerSecondGet())
```

Description

ICMP Timeout Value

5.8.12.6 Building the Library

This section list the files that are available in the `\src` of the ICMP driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

5.8.12.7 Library Interface**Data Types and Constants**

	Name	Description
	ICMP_ECHO_RESULT	result of an <code>ICMPSendEchoRequest</code> call
	ICMP_HANDLE	a handle that a client can use after the event handler has been registered
	ICMP_MODULE_CONFIG	Provides a placeholder for ICMP module configuration.

Functions

	Name	Description
	TCPIP_ICMP_CallbackDeregister	De-registers the ICMP callback function.
	TCPIP_ICMP_CallbackRegister	Registers a callback to allow the application layer to process incoming ICMPv4 packets
	TCPIP_ICMP_EchoRequestSend	Sends an ICMP echo request to a remote node.

Description

This section describes the Application Programming Interface (API) functions of the ICMP TCP/IP Stack.

Refer to each section for a detailed description.

5.8.12.7.1 Functions

5.8.12.7.1.1 TCPIP_ICMP_CallbackDeregister Function

C

```
bool TCPIP_ICMP_CallbackDeregister(  
    ICMP_HANDLE hIcmp  
);
```

Description

This function a stack client to remove its former registered notification handler. After this operation the client will no longer be notified about the receiving of replies to the ICMP requests.

Preconditions

TCPIP Stack initialized, up and running. A previous successful call to [TCPIP_ICMP_CallbackRegister\(\)](#) has been done.

Parameters

Parameters	Description
hIcmp	an ICMP handle obtained by TCPIP_ICMP_CallbackRegister()

Returns

true - if the notification handler has been successfully removed false - if such notification handler couldn't be found

Remarks

None

Example

```
void MyICMPCallbackFunction(TCPIP_NET_HANDLE hNetIf, IPV4_ADDR * remoteIP, void * data);  
ICMP_HANDLE hIcmp = TCPIP_ICMP_CallbackRegister(&MyICMPCallbackFunction);  
if(hIcmp != 0)  
{  
    // successfully registered my handler  
    // send requests and process the incoming results  
    // ...  
    // later on, once ew're done, remove the notification handler  
    TCPIP_ICMP_CallbackDeregister(hIcmp);  
}
```

5.8.12.7.1.2 TCPIP_ICMP_CallbackRegister Function

C

```
ICMP_HANDLE TCPIP_ICMP_CallbackRegister(  
    void (*callback)(TCPIP_NET_HANDLE hNetIf, IPV4_ADDR * remoteIP, void * data)  
);
```

Description

Allows a stack client to be notified of the receiving of a response from an ICMP query. Once an Echo request reply is received, the notification handler callback will be called, letting the client know of the result of the query. The callback will contain as parameters:

- the network interface handle on which the query reply was received
- the remote host IP address
- a 32 bit value containing the sequence number in the low 16 bit part and the identifier value in the high 16 bit part.

Preconditions

TCPIP Stack initialized, up and running.

Parameters

Parameters	Description
callback	notification function to be registered This function will be called when an echo request reply is received.

Returns

- A non-null handle if the registration succeeded
- 0 if the registration operation failed (out of memory, for example).

Remarks

None

Example

```
// Callback function prototype
void MyICMPCallbackFunction(TCPIP_NET_HANDLE hNetIf, IPV4_ADDR * remoteIP, void * data);

// *****
// Register callback function
ICMP_HANDLE hIcmp = TCPIP_ICMP_CallbackRegister(&MyICMPCallbackFunction);
if(hIcmp == 0)
{
    // process error; couldn't register a handler
}

// success; I can send an Echo request and receive notification

// *****
IPV4_ADDR remoteIP = 0xc0a00101;
uint16_t mySequenceNumber = 1;
uint16_t myId = 0x1234;
// send an ICMP query request
TCPIP_ICMP_EchoRequestSend(&remoteIP, mySequenceNumber, myId;

// *****
// process the ICMP reply in the callback function
void MyICMPCallbackFunction(TCPIP_NET_HANDLE hNetIf, IPV4_ADDR * remoteIP, void * data)
{
    // process request from interface hNetIf and remoteIP address
    uint16_t* pReply = (uint16_t*)data;
    uint16_t myRecvId = *pReply;
    uint16_t myRecvSequenceNumber = *(pReply + 1);

    // check that the sequence number, ID and IP address match, etc.
}
```

5.8.12.7.1.3 TCPIP_ICMP_EchoRequestSend Function**C**

```
ICMP_ECHO_RESULT TCPIP_ICMP_EchoRequestSend(
    IPV4_ADDR * targetAddr,
    uint16_t sequenceNumber,
    uint16_t identifier
);
```

Description

This function allows a stack client to [send](#) an ICMP query message to a remote host. The supplied sequence number and identifier will be used in the query message. The user will be notified by the result of the query using a notification handle registered by using the [TCPIP_ICMP_CallbackRegister](#) function.

Preconditions

TCPIP Stack initialized, up and running.

Parameters

Parameters	Description
targetAddr	remote host IP address.

Returns

true - if the query request was successfully sent false otherwise (interface not ready for transmission)

Remarks

None

Example

```
IPV4_ADDR remoteAddress = 0xc0a00101;
uint16_t mySequenceNumber = 1;
uint16_t myId = 0x1234;

if(TCPIP_ICMP_EchoRequestSend(&remoteAddress, mySequenceNumber, myId) )
{
    // successfully sent the ICMP request
    //
}
else
{
    // process the error
}
```

5.8.12.7.2 Data Types and Constants

5.8.12.7.2.1 ICMP_ECHO_RESULT Enumeration

C

```
typedef enum {
    ICMP_ECHO_OK = 0,
    ICMP_ECHO_ALLOC_ERROR = -1,
    ICMP_ECHO_ROUTE_ERROR = -2,
    ICMP_ECHO_TRANSMIT_ERROR = -3
} ICMP_ECHO_RESULT;
```

Description

result of an ICMPSendEchoRequest call

Members

Members	Description
ICMP_ECHO_OK = 0	operation successful error codes, < 0
ICMP_ECHO_ALLOC_ERROR = -1	could not allocate memory
ICMP_ECHO_ROUTE_ERROR = -2	could not find a route to destination
ICMP_ECHO_TRANSMIT_ERROR = -3	could not transmit (dead interface, etc.)

5.8.12.7.2.2 ICMP_HANDLE Type

C

```
typedef const void* ICMP_HANDLE;
```

Description

a handle that a client can use after the event handler has been registered

5.8.12.7.2.3 ICMP_MODULE_CONFIG Structure**C**

```
typedef struct {  
} ICMP_MODULE_CONFIG;
```

Description

ICMP Module Configuration Structure Typedef

Provides a placeholder for ICMP module configuration.

Remarks

None.

5.8.12.8 Files**Files**

5.8.13 ICMPv6 TCP/IP Stack Library

5.8.13.1 Introduction

ICMPv6 TCP/IP Library

for

Microchip Microcontrollers

This library provides the API of the ICMPv6 TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

This document specifies a set of APIs of Internet Control Message Protocol (ICMP) messages for use with version 6 of the Internet Protocol (IPv6).

The Internet Protocol, version 6 (IPv6) is a new version of IP, uses the Internet Control Message Protocol (ICMP) as defined for IPv4

[RFC-792], with a number of changes. It is called ICMPv6, and has an IPv6 Next Header value of 58.

ICMPv6 messages are used by IPv6 nodes to report *error messages* and *information messages*. ICMPv6 is also used for Ipv6 node diagnostic (i.e., IPv6 ping).

The ICMPv6 protocol also provides a framework for the following:

Neighbor Discovery

Neighbor Discovery is a series of five ICMPv6 messages that manage node-to-node communication on a link. Neighbor Discovery replaces Address Resolution Protocol (ARP), ICMP(IPv4) Router Discovery, and the ICMP(IPv4) Redirect message.

Multicast Listener Discovery (MLD)

Multicast Listener Discovery is a series of three ICMP messages that manage subnet multicast membership. Multicast Listener Discovery replaces version 2 of the Internet Group Management Protocol (IGMP) for IPv4.

Path MTU Discovery

The maximum transmission unit (MTU) for a path is the minimum link MTU of all links on a path between a source and a destination. IPv6 packets that are smaller than the path MTU do not require fragmentation by the host and are successfully forwarded by all routers on the path. To discover the path MTU, the sending host uses the receipt of **ICMPv6 Packet Too Big**

messages.

ICMPv6 Common Messages	Functions
Echo Request	Sent to check IPv6 connectivity to a particular host.
Echo Reply	Sent in response to an ICMPv6 Echo Request.
Destination Unreachable	Sent by a router or the destination host to inform the sending host that the packet or payload cannot be delivered.
Packet too big	Sent by a router to inform a sending host that a packet is too large to forward.
Time exceeded	Sent by a router to inform a sending host that the Hop Limit of an IPv6 packet has expired.
Parameter Problem	Sent by a router to inform a sending host that an error was encountered in processing the IPv6 header or an IPv6 extension header.

5.8.13.2 Release Notes

MPLAB Harmony Version: v0.70b **ICMPv6 TCP/IP Stack Library Version :** 1.0 **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.8.13.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.8.13.4 Using the Library

This topic describes the basic architecture of the ICMPv6 TCP/IP Library and provides information and examples on how to use it.

Interface Header File: [icmpv6.h](#)

The interface to the ICMPv6 TCP/IP library is defined in the "[icmpv6.h](#)" header file. Any C language source (.c) file that uses the ICMPv6 TCP/IP library should include "IPv6.h", [icmpv6.h](#) and [ndp.h](#)".

Library File:

The IP TCP/IP Stack library archive (.a) file installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the TCP/IP Stack interacts with the framework.

5.8.13.4.1 Abstraction Model

This library provides the API of the ICMPv6 TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

ICMPv6 Software Abstraction Block Diagram

This module provides software abstraction of the IPv6 module existent in any TCP/IP Stack implementation. It removes the overhead of address resolution from all other modules in the stack.

IPv6 Block Diagram

ICMPv6 message communication

5.8.13.4.2 Library Overview

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the IPv6 and ICMPv6 module.

Library Interface Section	Description
Functions	This section provides general interface routines
Data Types and Constants	This section provides various definitions describing this API

5.8.13.5 Configuring the Library

Macros

	Name	Description
	ICMPV6_TIMEOUT	ICMPv6 Timeout Value

Description

The configuration of the ICMPv6 TCP/IP Stack is based on the file [icmpv6_config.h](#)

This header file contains the configuration selection for the ICMPv6 TCP/IP Stack. Based on the selections made, the ICMPv6 TCP/IP Stack IP will support or not support selected features. These configuration settings will apply to all instances of the ICMPv6 TCP/IP Stack.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build.

5.8.13.5.1 ICMPV6_TIMEOUT Macro

C

```
#define ICMPV6_TIMEOUT (4ul*SYS_TICK_ResolutionGet())
```

Description

ICMPv6 Timeout Value

5.8.13.6 Building the Library

This section list the files that are available in the \src of the IPv6 and ICMPv6 driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

- ipv6.c
- icmpv6.c
- ndp.c

TCPIP_STACK_USE_IPV6 is enabled from tcpip_config.h .

5.8.13.7 Library Interface

Data Types and Constants

	Name	Description
	ICMPV6_ERR_PTB_CODE	Definition for ICMPv6 Packet Too Big error code
	ICMPV6_INFO_EREQ_CODE	Definition for ICMPv6 Packet Echo Request info code
	ICMPV6_INFO_ERPL_CODE	Definition for ICMPv6 Packet Echo Reply info code

	TCPIP_ICMPV6_PutHeaderEchoReply	This is macro TCPIP_ICMPV6_PutHeaderEchoReply.
	ICMPV6_ERR_DU_CODE	Definitions for ICMPv6 Destination Unreachable error code
	ICMPV6_ERR_PP_CODE	Definitions for ICMPv6 Parameter Problem error code
	ICMPV6_ERR_TE_CODE	Definitions for ICMPv6 Time Exceeded error code
	ICMPV6_HANDLE	a handle that a client can use after the event handler has been registered
	ICMPV6_HEADER_ECHO	Header for an ICMPv6 Echo Request/Reply packet
	ICMPV6_HEADER_ERROR	Header for an ICMPv6 Error packet
	ICMPV6_PACKET_TYPES	ICMPv6 packet types

Functions

	Name	Description
	TCPIP_ICMPV6_CallbackDeregister	Deregisters an upper-layer function from ICMPv6 callback.
	TCPIP_ICMPV6_CallbackRegister	Registers an upper-layer function for ICMPv6 callback.
	TCPIP_ICMPV6_Close	This is function TCPIP_ICMPV6_Close.
	TCPIP_ICMPV6_Flush	Flushes an ICMPv6 Packet
	TCPIP_ICMPV6_HeaderEchoRequestPut	Allocates a packet, IPv6 Header, and Upper-layer header for an ICMPv6 echo request.

Description

This section describes the Application Programming Interface (API) functions of the ICMPv6 TCP/IP Stack Library.

Refer to each section for a detailed description.

5.8.13.7.1 Functions

5.8.13.7.1.1 TCPIP_ICMPV6_CallbackDeregister Function

C

```
bool TCPIP_ICMPV6_CallbackDeregister(
    ICMPV6_HANDLE hIcmpv6
);
```

Description

deregisters an upper-layer function from the ICMPv6 register list.

Preconditions

None

Parameters

Parameters	Description
hIcmpv6	ICMPv6 handler

Returns

true or false

Remarks

None

5.8.13.7.1.2 TCPIP_ICMPV6_CallbackRegister Function

```
C
ICMPV6_HANDLE TCPIP_ICMPV6_CallbackRegister(
    void (*callback)(TCPIP_NET_HANDLE hNetIf, uint8_t type, IPV6_ADDR * localIP, IPV6_ADDR *
remoteIP, void * header)
);
```

Description

Registers an upper-layer function to handle ICMPv6 messages that may require action at the application layer (Echo Replies, Error messages)

Preconditions

None

Parameters

Parameters	Description
type	ICMPv6 header type
localIP	IPv6 destination address of the incoming message
remoteIP	IPv6 address of the node that originated the incoming message
header	Pointer to the ICMPv6 header

Returns

A **ICMPV6_HANDLE**

Remarks

None

5.8.13.7.1.3 TCPIP_ICMPV6_Close Function

```
C
void TCPIP_ICMPV6_Close(
    IPV6_PACKET * pkt
);
```

Description

This is function TCPIP_ICMPV6_Close.

5.8.13.7.1.4 TCPIP_ICMPV6_Flush Function

```
C
bool TCPIP_ICMPV6_Flush(
    IPV6_PACKET * pkt
);
```

Description

Flushes an ICMPv6 Packet

Preconditions

None

Parameters

Parameters	Description
pkt	The packet to flush

Returns

true if the packet was flushed, false if the packet was queued

Remarks

None

5.8.13.7.1.5 TCPIP_ICMPV6_HeaderEchoRequestPut Function**C**

```
IPV6_PACKET * TCPIP_ICMPV6_HeaderEchoRequestPut(  
    TCPIP_NET_HANDLE hNetIf,  
    IPV6_ADDR * localIP,  
    IPV6_ADDR * remoteIP,  
    uint8_t type,  
    uint16_t identifier,  
    uint16_t sequenceNumber  
);
```

Description

Allocates a packet, IPv6 Header, and Upper-layer header for an ICMPv6 echo request.

Preconditions

None

Parameters

Parameters	Description
pNetIf	The interface for the outgoing packet.
localIP	The local address that should be used for this packet.
remoteIP	The packet's destination address
type	Echo Request or Echo Reply
identifier	The Echo Request id.
sequenceNumber	The Echo request sequence number

Returns

IPV6_PACKET * - The constructed error packet or NULL

Remarks

None

5.8.13.7.2 Data Types and Constants**5.8.13.7.2.1 ICMPV6_ERR_PTB_CODE Macro****C**

```
#define ICMPV6_ERR_PTB_CODE 0u
```

Description

Definition for ICMPv6 Packet Too Big error code

5.8.13.7.2.2 ICMPV6_INFO_EREQ_CODE Macro

C

```
#define ICMPV6_INFO_EREQ_CODE 0u
```

Description

Definition for ICMPv6 Packet Echo Request info code

5.8.13.7.2.3 ICMPV6_INFO_ERPL_CODE Macro

C

```
#define ICMPV6_INFO_ERPL_CODE 0u
```

Description

Definition for ICMPv6 Packet Echo Reply info code

5.8.13.7.2.4 TCPIP_ICMPV6_PutHeaderEchoReply Macro

C

```
#define TCPIP_ICMPV6_PutHeaderEchoReply TCPIP_ICMPV6_HeaderEchoRequestPut
```

Description

This is macro TCPIP_ICMPV6_PutHeaderEchoReply.

5.8.13.7.2.5 ICMPV6_ERR_DU_CODE Enumeration

C

```
typedef enum {
    ICMPV6_ERR_DU_NO_ROUTE = 0u,
    ICMPV6_ERR_DU_PROHIBITED = 1u,
    ICMPV6_ERR_DU_OUTSIDE_SCOPE = 2u,
    ICMPV6_ERR_DU_ADDR_UNREACHABLE = 3u,
    ICMPV6_ERR_DU_PORT_UNREACHABLE = 4u,
    ICMPV6_ERR_DU_SRC_FAILED_INGRESS_POLICY = 5u,
    ICMPV6_ERR_DU_REJECT_ROUTE = 6u
} ICMPV6_ERR_DU_CODE;
```

Description

Definitions for ICMPv6 Destination Unreachable error code

Members

Members	Description
ICMPV6_ERR_DU_NO_ROUTE = 0u	No route to destination
ICMPV6_ERR_DU_PROHIBITED = 1u	Communication with destination administratively prohibited
ICMPV6_ERR_DU_OUTSIDE_SCOPE = 2u	Beyond scope of source address
ICMPV6_ERR_DU_ADDR_UNREACHABLE = 3u	Address unreachable
ICMPV6_ERR_DU_PORT_UNREACHABLE = 4u	Port unreachable

ICMPV6_ERR_DU_SRC_FAILED_INGRESS_POLICY = 5u	Source address failed ingress/egress policy
ICMPV6_ERR_DU_REJECT_ROUTE = 6u	Reject route to destination

5.8.13.7.2.6 ICMPV6_ERR_PP_CODE Enumeration

C

```
typedef enum {
    ICMPV6_ERR_PP_ERRONEOUS_HEADER = 0u,
    ICMPV6_ERR_PP_UNRECOGNIZED_NEXT_HEADER = 1u,
    ICMPV6_ERR_PP_UNRECOGNIZED_IPV6_OPTION = 2u
} ICMPV6_ERR_PP_CODE;
```

Description

Definitions for ICMPv6 Parameter Problem error code

Members

Members	Description
ICMPV6_ERR_PP_ERRONEOUS_HEADER = 0u	Erroneous header field encountered
ICMPV6_ERR_PP_UNRECOGNIZED_NEXT_HEADER = 1u	Unrecognized Next Header type encountered
ICMPV6_ERR_PP_UNRECOGNIZED_IPV6_OPTION = 2u	Unrecognized IPv6 option encountered

5.8.13.7.2.7 ICMPV6_ERR_TE_CODE Enumeration

C

```
typedef enum {
    ICMPV6_ERR_TE_HOP_LIMIT_EXCEEDED = 0u,
    ICMPV6_ERR_TE_FRAG_ASSEMBLY_TIME_EXCEEDED = 1u
} ICMPV6_ERR_TE_CODE;
```

Description

Definitions for ICMPv6 Time Exceeded error code

Members

Members	Description
ICMPV6_ERR_TE_HOP_LIMIT_EXCEEDED = 0u	Hop limit exceeded in transit
ICMPV6_ERR_TE_FRAG_ASSEMBLY_TIME_EXCEEDED = 1u	Fragment reassembly time exceeded

5.8.13.7.2.8 ICMPV6_HANDLE Type

C

```
typedef const void* ICMPV6_HANDLE;
```

Description

a handle that a client can use after the event handler has been registered

5.8.13.7.2.9 ICMPV6_HEADER_ECHO Structure

C

```
typedef struct {
    uint8_t vType;
    uint8_t vCode;
    uint16_t wChecksum;
    uint16_t identifier;
    uint16_t sequenceNumber;
} ICMPV6_HEADER_ECHO;
```

Description

Header for an ICMPv6 Echo Request/Reply packet

Members

Members	Description
uint8_t vType;	icmpV6 request or reply type
uint8_t vCode;	Error code
uint16_t wChecksum;	Packet TX and RX checksum
uint16_t identifier;	incoming and outgoing packet identifier
uint16_t sequenceNumber;	request and reply sequence number

5.8.13.7.2.10 ICMPV6_HEADER_ERROR Structure

C

```
typedef struct {
    uint8_t vType;
    uint8_t vCode;
    uint16_t wChecksum;
    uint32_t additionalData;
} ICMPV6_HEADER_ERROR;
```

Description

Header for an ICMPv6 Error packet

Members

Members	Description
uint8_t vType;	icmpV6 request or reply type
uint8_t vCode;	error code
uint16_t wChecksum;	Packet TX and RX checksum
uint32_t additionalData;	Unused for Dest. Unreachable and Time Exceeded. MTU for MTU. Pointer for Parameter Problem.

5.8.13.7.2.11 ICMPV6_PACKET_TYPES Enumeration

C

```
typedef enum {
    ICMPV6_ERROR_DEST_UNREACHABLE = 1u,
    ICMPV6_ERROR_PACKET_TOO_BIG = 2u,
    ICMPV6_ERROR_TIME_EXCEEDED = 3u,
    ICMPV6_ERROR_PARAMETER_PROBLEM = 4u,
    ICMPV6_INFO_ECHO_REQUEST = 128u,
    ICMPV6_INFO_ECHO_REPLY = 129u,
    ICMPV6_INFO_ROUTER_SOLICITATION = 133u,
    ICMPV6_INFO_ROUTER_ADVERTISEMENT = 134u,
```

```

ICMPV6_INFO_NEIGHBOR_SOLICITATION = 135u,
ICMPV6_INFO_NEIGHBOR_ADVERTISEMENT = 136u,
ICMPV6_INFO_REDIRECT = 137u
} ICMPV6_PACKET_TYPES;

```

Description

ICMPv6 packet types

Members

Members	Description
ICMPV6_ERROR_DEST_UNREACHABLE = 1u	Destination Unreachable error packet
ICMPV6_ERROR_PACKET_TOO_BIG = 2u	Packet Too Big error packet
ICMPV6_ERROR_TIME_EXCEEDED = 3u	Time Exceeded error packet
ICMPV6_ERROR_PARAMETER_PROBLEM = 4u	Parameter Problem error packet
ICMPV6_INFO_ECHO_REQUEST = 128u	Echo Request packet
ICMPV6_INFO_ECHO_REPLY = 129u	Echo Reply packet
ICMPV6_INFO_ROUTER_SOLICITATION = 133u	Router solicitation NDP packet
ICMPV6_INFO_ROUTER_ADVERTISEMENT = 134u	Router advertisement NDP packet
ICMPV6_INFO_NEIGHBOR_SOLICITATION = 135u	Neighbor Solicitation NDP packet
ICMPV6_INFO_NEIGHBOR_ADVERTISEMENT = 136u	Neighbor Advertisement NDP packet
ICMPV6_INFO_REDIRECT = 137u	Redirect NDP packet

5.8.13.8 Files

Files

Name	Description
icmpv6.h	IPv6 Internet Communication Message Protocol
icmpv6_config.h	ICMPv6 configuration file

Description

5.8.13.8.1 icmpv6.h

Internet Control Message Protocol (ICMP) in IPv6 functions the same as ICMP in IPv4. ICMPv6 is used to report error messages and information messages for IPv6 nodes. ICMP packets in IPv6 are used in the IPv6 neighbor discovery process, path MTU discovery, and the Multicast Listener Discovery (MLD) protocol for IPv6.

Enumerations

5.8.14 IPv4 TCP/IP Stack Library

5.8.14.1 Introduction

Internet Protocol (IP) TCP/IP Stack Library

for

Microchip Microcontrollers

This library provides the API of the IP TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

IP is the workhorse protocol of the TCP/IP protocol suite. All TCP, UDP, ICMP, and IGMP data gets transmitted as IP datagrams (Figure 1.4). IP provides an unreliable, connectionless datagram delivery service.

IP provides a best effort service. When something goes wrong, such as a router temporarily running out of buffers, IP has a simple error handling algorithm: throw away the datagram and try to **send** an ICMP message back to the source. Any required reliability must be provided by the upper layers (e.g., TCP).

The term connectionless means that IP does not maintain any state information about successive datagrams. Each datagram is handled independently from all other datagrams. This also means that IP datagrams can get delivered out of order. If a source sends two consecutive datagrams (first A, then B) to the same destination, each is routed independently and can take different routes, with B arriving before A.

5.8.14.2 Release Notes

MPLAB Harmony Version: v0.70b **IPv4 TCP/IP Stack Library Version :** 1.0 **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.8.14.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.8.14.4 Using the Library

This topic describes the basic architecture of the IP TCPIP Stack Library and provides information and examples on how to use it.

Interface Header File: ip.h

The interface to the IPv4 TCP/IP Stack library is defined in the "ip.h" header file. This file is included by the "tcpip.h" file. Any C language source (.c) file that uses the IPv4 TCP/IP Stack library should include "tcpip.h".

Library File:

The IPv4 TCP/IP Stack library archive (.a) file installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the TCP/IP Stack interacts with the framework.

5.8.14.4.1 Abstraction Model

This library provides the API of the IPv4 TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

IPv4 Software Abstraction Block Diagram

This module provides software abstraction of the IPv4 module existent in any TCP/IP Stack implementation. It removes the overhead of address resolution from all other modules in the stack.

Note: This diagram was not available at time of release and will be added in a future version of MPLAB Harmony.

5.8.14.4.2 Library Overview

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the IP module.

Library Interface Section	Description
Functions	Routines for configuring IPv4
Data Types and Constants	This section provides various definitions describing this API

5.8.14.5 Configuring the Library

Macros

	Name	Description
	IP_DEFAULT_ALLOCATION_BLOCK_SIZE	Used to configure payload size
	IPV4_QUEUED_PACKET_LIMIT	This option defines the maximum number of queued IPv4 TX packets. If an additional packet is queued, the oldest packet in the queue will be removed.

	IPV4_QUEUED_PACKET_TIMEOUT	This option defines the number of seconds an IPv4 TX packet will remain in the queue before being timed out
	IPV4_TASK_PROCESS_RATE	default 1 second

Description

The configuration of the IPv4 TCP/IP Stack is based on the file sys_config.h

This header file contains the configuration selection for the IPv4 TCP/IP Stack. Based on the selections made, the IPv4 TCP/IP Stack will support or not support selected features. These configuration settings will apply to all instances of the IPv4 TCP/IP Stack.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.8.14.5.1 IP_DEFAULT_ALLOCATION_BLOCK_SIZE Macro**C**

```
#define IP_DEFAULT_ALLOCATION_BLOCK_SIZE (64u)
```

Description

Used to configure payload size

5.8.14.5.2 IPV4_QUEUED_PACKET_LIMIT Macro**C**

```
#define IPV4_QUEUED_PACKET_LIMIT 4u
```

Description

This option defines the maximum number of queued IPv4 TX packets. If an additional packet is queued, the oldest packet in the queue will be removed.

5.8.14.5.3 IPV4_QUEUED_PACKET_TIMEOUT Macro**C**

```
#define IPV4_QUEUED_PACKET_TIMEOUT 10u
```

Description

This option defines the number of seconds an IPv4 TX packet will remain in the queue before being timed out

5.8.14.5.4 IPV4_TASK_PROCESS_RATE Macro**C**

```
#define IPV4_TASK_PROCESS_RATE (1000) // default 1 second
```

Description

default 1 second

5.8.14.6 Building the Library

This section list the files that are available in the \src of the IP driver. It lists which files need to be included in the build based on

either a hardware feature present on the board or configuration option selected by the system.

- ip.c

5.8.14.7 Library Interface

Data Types and Constants

	Name	Description
	IPV4_HEADER	None
	IPV4_HEADER_TYPE	None
	IPV4_MODULE_CONFIG	
	IPV4_PACKET	Packet structure/state tracking for IPv4 packets

Functions

	Name	Description
	TCPIP_IPV4_PacketFormatTx	Formats an IPv4 packet and makes it ready for transmission.
	TCPIP_IPV4_PacketGetDestAddress	Returns the IPv4 destination address associated with a TCPIP_MAC_PACKET
	TCPIP_IPV4_PacketGetSourceAddress	Returns the IPv4 source address associated with a TCPIP_MAC_PACKET
	TCPIP_IPV4_PacketTransmit	Transmits an IPv4 packet over the network.
	TCPIP_IPV4_SelectSourceInterface	Selects a source address and an interface based on the IPv4 destination address

Description

This section describes the Application Programming Interface (API) functions of the IPv4 TCP/IP Stack Library.

Refer to each section for a detailed description.

5.8.14.7.1 Functions

5.8.14.7.1.1 TCPIP_IPV4_PacketFormatTx Function

C

```
void TCPIP_IPV4_PacketFormatTx(
    IPV4_PACKET* pPkt,
    uint8_t protocol,
    uint16_t ipLen
);
```

Description

The necessary fields are set into the IPv4 packet.

Preconditions

Properly allocated pPkt. The source and destination addresses should be updated in the packet.

Parameters

Parameters	Description
pPkt	the packet to be formatted
protocol	the protocol associated with the packet

ipLoadLen	the IPv4 packet payload length

Returns

None

Remarks

The segments should be properly updated with the right number of bytes (segLen). The ipLoadLen is added only to the 1st segment of the packet! Other segments (for packets having multiple packets) are not touched.

5.8.14.7.1.2 TCPIP_IPV4_PacketGetDestAddress Function

C

```
__inline__ const IPV4_ADDR* TCPIP_IPV4_PacketGetDestAddress(  
    TCPIP_MAC_PACKET* pPkt  
);
```

Description

The function will return a pointer to where the IPv4 destination address is located in the [TCPIP_MAC_PACKET](#). The [TCPIP_MAC_PACKET](#) is supposed to be a valid IPv4 packet that has properly destination address set.

Preconditions

pPkt - valid IPv4 packet, pNetLayer filed properly set

Parameters

Parameters	Description
pPkt	packet to query

Returns

a valid pointer to an IPV4_ADDR if it succeeds 0 - if call failed

Remarks

This function is mainly meant for RX packets.

5.8.14.7.1.3 TCPIP_IPV4_PacketGetSourceAddress Function

C

```
__inline__ const IPV4_ADDR* TCPIP_IPV4_PacketGetSourceAddress(  
    TCPIP_MAC_PACKET* pPkt  
);
```

Description

The function will return a pointer to where the IPv4 source address is located in the [TCPIP_MAC_PACKET](#). The [TCPIP_MAC_PACKET](#) is supposed to be a valid IPv4 packet that has properly source address set.

Preconditions

pPkt - valid IPv4 packet, pNetLayer filed properly set

Parameters

Parameters	Description
pPkt	packet to query

Returns

a valid pointer to an IPV4_ADDR if it succeeds 0 - if call failed

Remarks

This function is mainly meant for RX packets.

5.8.14.7.1.4 TCPIP_IPV4_PacketTransmit Function**C**

```
bool TCPIP_IPV4_PacketTransmit(  
    IPV4_PACKET* pPkt  
);
```

Description

The IPv4 packet is sent to the MAC for transmission.

Preconditions

pPkt should have been properly formatted with [TCPIP_IPV4_PacketFormatTx\(\)](#). The packet interface should be updated.

Parameters

Parameters	Description
pPkt	the packet to be transmitted

Returns

true - if the packet was handed to the MAC or is queued for transmission
false - the packet cannot be transmitted (wrong interface, etc.)

Remarks

Only single packets can be transmitted. Chained packets are not supported for now.

5.8.14.7.1.5 TCPIP_IPV4_SelectSourceInterface Function**C**

```
TCPIP_NET_HANDLE TCPIP_IPV4_SelectSourceInterface(  
    TCPIP_NET_HANDLE netH,  
    IPV4_ADDR* pDestAddress,  
    IPV4_ADDR* pSrcAddress,  
    bool srcSet  
);
```

Description

Updates the pSrcAddress and returns the needed interface, if successful if srcSet == 1 and netH != 0 the function won't change anything if srcSet == 1 and netH == 0 then the call will never fail it will use whatever value in pSrcAddress (even 0) and will try to come up with an appropriate interface. if srcSet == 0 and netH == 0 it will use the destination address if srcSet == 0 and netH != 0 it will use the address of that interface

Preconditions

netH has to be valid (if non 0)

Parameters

Parameters	Description
netH	network interface handle
pDestAddress	pointer to destination address
pSrcAddress	pointer to source address
srcSet	boolean; true if address pointed by pSrcAddress is valid

Returns

a valid interface - if it succeeds and a valid source interface selected 0 - interface selection failed

Remarks

None

5.8.14.7.2 Data Types and Constants

5.8.14.7.2.1 IPV4_HEADER Structure

C

```
typedef struct {  
    uint8_t VersionIHL;  
    uint8_t TypeOfService;  
    uint16_t TotalLength;  
    uint16_t Identification;  
    uint16_t FragmentInfo;  
    uint8_t TimeToLive;  
    uint8_t Protocol;  
    uint16_t HeaderChecksum;  
    IPV4_ADDR SourceAddress;  
    IPV4_ADDR DestAddress;  
} IPV4_HEADER;
```

Description

IPv4 packet header definition

None

Remarks

None

5.8.14.7.2.2 IPV4_HEADER_TYPE Enumeration

C

```
typedef enum {  
    IP_PROT_ICMP = (1u),  
    IP_PROT_TCP = (6u),  
    IP_PROT_UDP = (17u)  
} IPV4_HEADER_TYPE;
```

Description

IPv4 supported protocols

None

Remarks

None

5.8.14.7.2.3 IPV4_MODULE_CONFIG Structure

C

```
typedef struct {  
} IPV4_MODULE_CONFIG;
```

5.8.14.7.2.4 IPV4_PACKET Structure

C

```
typedef struct {
    TCPIP_MAC_PACKET macPkt;
    IPV4_ADDR srcAddress;
    IPV4_ADDR destAddress;
    TCPIP_NET_HANDLE netIfH;
    IPV4_ADDR arpTarget;
} IPV4_PACKET;
```

Description

Packet structure/state tracking for IPv4 packets

Members

Members	Description
TCPIP_MAC_PACKET macPkt;	standard MAC packet header safe cast to TCPIP_MAC_PACKET
IPV4_ADDR srcAddress;	packet source
IPV4_ADDR destAddress;	packet destination
TCPIP_NET_HANDLE netIfH;	packet interface
IPV4_ADDR arpTarget;	ARP resolution target

5.8.14.8 Files

Files

Name	Description
ip_config.h	IP configuration file
ipv4.h	

Description

5.8.14.8.1 ip_config.h

Internet Protocol (IP) Configuration file

This file contains the IP module configuration options

Macros

	Name	Description
	IP_DEFAULT_ALLOCATION_BLOCK_SIZE	Used to configure payload size
	IPV4_QUEUED_PACKET_LIMIT	This option defines the maximum number of queued IPv4 TX packets. If an additional packet is queued, the oldest packet in the queue will be removed.
	IPV4_QUEUED_PACKET_TIMEOUT	This option defines the number of seconds an IPv4 TX packet will remain in the queue before being timed out
	IPV4_TASK_PROCESS_RATE	default 1 second
	IPV6_DEFAULT_BASE_REACHABLE_TIME	30 seconds
	IPV6_DEFAULT_CUR_HOP_LIMIT	(IPv4 Time-to-Live parameter)
	IPV6_DEFAULT_LINK_MTU	Default Maximum Transmission Unit

	IPV6_DEFAULT_RETRANSMIT_TIME	1 second
	IPV6_INIT_TASK_PROCESS_RATE	default 32 ms
	IPV6_MINIMUM_LINK_MTU	Sets the lower bounds of the the Maximum Transmission Unit
	IPV6_NEIGHBOR_CACHE_ENTRY_STALE_TIMEOUT	10 minutes
	IPV6_QUEUE_MCAST_PACKET_LIMIT	This option defines the maximum number of multicast queued IPv6. If an additional packet is queued, the oldest packet in the queue will be removed.
	IPV6_QUEUE_NEIGHBOR_PACKET_LIMIT	This option defines the maximum number of queued packets per remote. If an additional packet needs to be queued, the oldest packet in the queue will be removed.
	IPV6_QUEUED_MCAST_PACKET_TIMEOUT	This option defines the number of seconds an IPv6 multicast packet will remain in the queue before being timed out
	IPV6_TASK_PROCESS_RATE	default 1 second
	IPV6_ULA_NTP_ACCESS_TMO	NTP access timeout for the IPv6 ULA address generation, ms
	IPV6_ULA_NTP_VALID_WINDOW	the NTP time stamp validity window, ms if a stamp was obtained outside this interval from the moment of the request a new request will be issued

5.8.14.8.2 ipv4.h

IPv4 Defs for Microchip TCP/IP Stack

Enumerations

	Name	Description
	IPV4_HEADER_TYPE	None

Functions

	Name	Description
	TCPIP_IPV4_PacketFormatTx	Formats an IPV4 packet and makes it ready for transmission.
	TCPIP_IPV4_PacketGetDestAddress	Returns the IPv4 destination address associated with a TCPIP_MAC_PACKET
	TCPIP_IPV4_PacketGetSourceAddress	Returns the IPv4 source address associated with a TCPIP_MAC_PACKET
	TCPIP_IPV4_PacketTransmit	Transmits an IPV4 packet over the network.
	TCPIP_IPV4_SelectSourceInterface	Selects a source address and an interface based on the IPv4 destination address

Structures

	Name	Description
	IPV4_HEADER	None
	IPV4_MODULE_CONFIG	
	IPV4_PACKET	Packet structure/state tracking for IPv4 packets

5.8.15 IPv6 TCP/IP Stack Library

5.8.15.1 Introduction

Internet Protocol (IP) TCP/IP Stack Library

for

Microchip Microcontrollers

This library provides the API of the IPv6 TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

IPv6 is the workhorse protocol of the TCP/IP protocol suite. All TCP, UDP, ICMP, and IGMP data gets transmitted as IP datagrams (Figure 1.4). IP provides an unreliable, connectionless datagram delivery service.

IPv6 provides a best effort service. When something goes wrong, such as a router temporarily running out of buffers, IPv6 has a simple error handling algorithm: throw away the datagram and try to **send** an ICMP message back to the source. Any required reliability must be provided by the upper layers (e.g., TCP).

The term connectionless means that IPv6 does not maintain any state information about successive datagrams. Each datagram is handled independently from all other datagrams. This also means that IPv6 datagrams can get delivered out of order. If a source sends two consecutive datagrams (first A, then B) to the same destination, each is routed independently and can take different routes, with B arriving before A.

5.8.15.2 Release Notes

MPLAB Harmony Version: v0.70b **IPv6 TCP/IP Stack Library Version :** 1.0 **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.8.15.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO

YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.8.15.4 Using the Library

This topic describes the basic architecture of the IPv6 TCP/IP Stack Library and provides information and examples on how to use it.

Interface Header File: ip.h

The interface to the IPv6 TCP/IP Stack library is defined in the "ip.h" header file. This file is included by the "tcpip.h" file. Any C language source (.c) file that uses the IPv6 TCP/IP Stack library should include "tcpip.h".

Library File:

The IPv6 TCP/IP Stack library archive (.a) file installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the TCP/IP Stack interacts with the framework.

5.8.15.4.1 Abstraction Model

This library provides the API of the IP TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

IP Software Abstraction Block Diagram

This module provides software abstraction of the IP module existent in any TCP/IP Stack implementation. It removes the overhead of address resolution from all other modules in the stack.

Note: This diagram was not available at time of release and will be added in a future version of MPLAB Harmony.

5.8.15.4.2 Library Overview

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the IP module.

Library Interface Section	Description
Functions	Routines for Configuring IPv6
Data Types and Constants	This section provides various definitions describing this API

5.8.15.5 Configuring the Library

Macros

	Name	Description
	<u>IPV6_INIT_TASK_PROCESS_RATE</u>	default 32 ms
	<u>IPV6_MINIMUM_LINK_MTU</u>	Sets the lower bounds of the the Maximum Transmission Unit
	<u>IPV6_NEIGHBOR_CACHE_ENTRY_STALE_TIMEOUT</u>	10 minutes
	<u>IPV6_QUEUE_MCAST_PACKET_LIMIT</u>	This option defines the maximum number of multicast queued IPv6. If an additional packet is queued, the oldest packet in the queue will be removed.
	<u>IPV6_QUEUE_NEIGHBOR_PACKET_LIMIT</u>	This option defines the maximum number of queued packets per remote. If an additional packet needs to be queued, the oldest packet in the queue will be removed.
	<u>IPV6_QUEUED_MCAST_PACKET_TIMEOUT</u>	This option defines the number of seconds an IPv6 multicast packet will remain in the queue before being timed out
	<u>IPV6_TASK_PROCESS_RATE</u>	default 1 second
	<u>IPV6_ULA_NTP_ACCESS_TMO</u>	NTP access timeout for the IPv6 ULA address generation, ms
	<u>IPV6_ULA_NTP_VALID_WINDOW</u>	the NTP time stamp validity window, ms if a stamp was obtained outside this interval from the moment of the request a new request will be issued
	<u>IPV6_DEFAULT_BASE_REACHABLE_TIME</u>	30 seconds
	<u>IPV6_DEFAULT_CUR_HOP_LIMIT</u>	(IPv4 Time-to-Live parameter)
	<u>IPV6_DEFAULT_LINK_MTU</u>	Default Maximum Transmission Unit
	<u>IPV6_DEFAULT_RETRANSMIT_TIME</u>	1 second

Description

The configuration of the IPv6 TCP/IP Stack is based on the file `sys_config.h`.

This header file contains the configuration selection for the IPv6 TCP/IP Stack. Based on the selections made, the IPv6 TCP/IP Stack will support or not support selected features. These configuration settings will apply to all instances of the IPv6 TCP/IP Stack.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.8.15.5.1 IPV6_INIT_TASK_PROCESS_RATE Macro

C

```
#define IPV6_INIT_TASK_PROCESS_RATE (32)           // default 32 ms
```

Description

default 32 ms

5.8.15.5.2 IPV6_MINIMUM_LINK_MTU Macro

C

```
#define IPV6_MINIMUM_LINK_MTU 1280u
```

Description

Sets the lower bounds of the the Maximum Transmission Unit

5.8.15.5.3 IPV6_NEIGHBOR_CACHE_ENTRY_STALE_TIMEOUT Macro

C

```
#define IPV6_NEIGHBOR_CACHE_ENTRY_STALE_TIMEOUT 600ul           // 10 minutes
```

Description

10 minutes

5.8.15.5.4 IPV6_QUEUE_MCAST_PACKET_LIMIT Macro

C

```
#define IPV6_QUEUE_MCAST_PACKET_LIMIT 4
```

Description

This option defines the maximum number of multicast queued IPv6. If an additional packet is queued, the oldest packet in the queue will be removed.

5.8.15.5.5 IPV6_QUEUE_NEIGHBOR_PACKET_LIMIT Macro

C

```
#define IPV6_QUEUE_NEIGHBOR_PACKET_LIMIT 1
```

Description

This option defines the maximum number of queued packets per remote. If an additional packet needs to be queued, the oldest packet in the queue will be removed.

5.8.15.5.6 IPV6_QUEUED_MCAST_PACKET_TIMEOUT Macro

C

```
#define IPV6_QUEUED_MCAST_PACKET_TIMEOUT 10u
```

Description

This option defines the number of seconds an IPv6 multicast packet will remain in the queue before being timed out

5.8.15.5.7 IPV6_TASK_PROCESS_RATE Macro

C

```
#define IPV6_TASK_PROCESS_RATE (1000)           // default 1 second
```

Description

default 1 second

5.8.15.5.8 IPV6_ULA_NTP_ACCESS_TMO Macro

C

```
#define IPV6_ULA_NTP_ACCESS_TMO (12000)
```

Description

NTP access timeout for the IPv6 ULA address generation, ms

5.8.15.5.9 IPV6_ULA_NTP_VALID_WINDOW Macro

C

```
#define IPV6_ULA_NTP_VALID_WINDOW (1000)
```

Description

the NTP time stamp validity window, ms if a stamp was obtained outside this interval from the moment of the request a new request will be issued

5.8.15.5.10 IPV6_DEFAULT_BASE_REACHABLE_TIME Macro

C

```
#define IPV6_DEFAULT_BASE_REACHABLE_TIME 30u
```

Description

30 seconds

5.8.15.5.11 IPV6_DEFAULT_CUR_HOP_LIMIT Macro

C

```
#define IPV6_DEFAULT_CUR_HOP_LIMIT 64u
```

Description

(IPv4 Time-to-Live parameter)

5.8.15.5.12 IPV6_DEFAULT_LINK_MTU Macro

C

```
#define IPV6_DEFAULT_LINK_MTU 1500u
```

Description

Default Maximum Transmission Unit

5.8.15.5.13 IPV6_DEFAULT_RETRANSMIT_TIME Macro

C

```
#define IPV6_DEFAULT_RETRANSMIT_TIME 1000u
```

Description

1 second

5.8.15.6 Building the Library

This section list the files that are available in the \src of the IP driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

- ip.c

5.8.15.7 Library Interface

Data Types and Constants

	Name	Description
	<u>IP_VERSION_4</u>	Using IPv4
	<u>IP_VERSION_6</u>	Using IPv6
	<u>IPV6_DATA_DYNAMIC_BUFFER</u>	Data to transmit is allocated in dynamically allocated RAM
	<u>IPV6_DATA_NETWORK_FIFO</u>	Data to transmit is stored in the Network Controller's FIFOs
	<u>IPV6_DATA_NONE</u>	The data segment is unused
	<u>IPV6_DATA_PIC_RAM</u>	Data to transmit is stored in PIC RAM
	<u>IPV6_HEADER_OFFSET_DEST_ADDR</u>	Header offset for destination address
	<u>IPV6_HEADER_OFFSET_NEXT_HEADER</u>	Header offset for next header
	<u>IPV6_HEADER_OFFSET_PAYLOAD_LENGTH</u>	Header offset for payload length
	<u>IPV6_HEADER_OFFSET_SOURCE_ADDR</u>	Header offset for source address
	<u>IPV6_NO_UPPER_LAYER_CHECKSUM</u>	Value flag for no upper layer checksum
	<u>IPV6_TLV_HBHO_PAYLOAD_JUMBOGRAM</u>	IPv6 Type-length-value type code for the Hop-by-hop "Jumbogram Payload" option
	<u>IPV6_TLV_HBHO_ROUTER_ALERT</u>	IPv6 Type-length-value type code for the Hop-by-hop "Router Alert" option
	<u>IPV6_TLV_PAD_1</u>	IPv6 Type-length-value type code for the Pad 1 option
	<u>IPV6_TLV_PAD_N</u>	IPv6 Type-length-value type code for the Pad N option
	<u>IPV6_TLV_UNREC_OPT_DISCARD_PP</u>	IPv6 action code for the unrecognized option reaction to discard the packet and send an ICMP parameter problem message
	<u>IPV6_TLV_UNREC_OPT_DISCARD_PP_NOT_MC</u>	IPv6 action code for the unrecognized option reaction to discard the packet and send an ICMP parameter problem message is the destination addr isn't a multicast address
	<u>IPV6_TLV_UNREC_OPT_DISCARD_SILENT</u>	IPv6 action code for the unrecognized option reaction to discard the packet silently
	<u>IPV6_TLV_UNREC_OPT_SKIP_OPTION</u>	IPv6 action code for the unrecognized option reaction to skip the option
	<u>TCPIP_IPV6_PutArray</u>	Writes data to a packet
	<u>IPV6_ACTION</u>	Provides a list of possible IPv6 actions.
	<u>IPV6_ADDRESS_POLICY</u>	
	<u>IPV6_ADDRESS_PREFERENCE</u>	Provides selection of public versus temporary addresses.
	<u>IPV6_ADDRESS_TYPE</u>	Data structure for IPv6 addresses.
	<u>IPV6_DATA_SEGMENT_HEADER</u>	
	<u>IPV6_EVENT_HANDLER</u>	Clients can register a handler with the IPv6 service.
	<u>IPV6_EVENT_TYPE</u>	None

	IPV6_FRAGMENT_HEADER	
	IPV6_HANDLE	Pointer to IPv6 object
	IPV6_HEADER	None
	IPV6_MODULE_CONFIG	Provides a placeholder for IPv6 configuration.
	IPV6_NEXT_HEADER_TYPE	Defines a list of next header types
	IPV6_PACKET	Packet structure/state tracking for IPv6 packets
	IPV6_PACKET_ACK_FNC	None
	IPV6_RX_FRAGMENT_BUFFER	
	IPV6_SEGMENT_TYPE	Provides an enumeration of IPv6 segment types.
	IPV6_TLV_OPTION_TYPE	Data structure for IPv6 TLV options.
	IPV6_ULA_FLAGS	Provides a list of possible flags for the Unique Local Address (ULA) generation.
	IPV6_ULA_RESULT	Provides a list of possible results for the Unique Local Address (ULA) generation.

Functions

	Name	Description
	TCPIP_IPV6_AddressUnicastRemove	Removed a configured unicast address from an interface.
	TCPIP_IPV6_ArrayGet	Reads the next byte of data from the specified MAC.
	TCPIP_IPV6_ArrayPutHelper	Helper function to write data to a packet.
	TCPIP_IPV6_DASSourceAddressSelect	Determines the appropriate source address for a given destination address.
	TCPIP_IPV6_DestAddressGet	Gets the destination address for an IPv6 packet.
	TCPIP_IPV6_DestAddressSet	Sets the destination address for an IPv6 packet.
	TCPIP_IPV6_Flush	Flushes an IP TX packet.
	TCPIP_IPV6_Get	Reads the next byte of data from the specified MAC.
	TCPIP_IPV6_HandlerDeregister	Deregisters an IPv6 event handler callback function.
	TCPIP_IPV6_HandlerRegister	Registers an IPv6 event handler callback function.
	TCPIP_IPV6_InterfaceIsReady	Determines if an interface is ready for IPv6 transactions.
	TCPIP_IPV6_MulticastListenerAdd	Adds a multicast listener to an interface.
	TCPIP_IPV6_MulticastListenerRemove	Removes a multicast listener from a given interface.
	TCPIP_IPV6_PacketFree	Frees a TCP/IP Packet structure from dynamic memory.
	TCPIP_IPV6_PayloadSet	Allocates a segment on the end of a packet segment chain and uses it to address pre-buffered data.
	TCPIP_IPV6_Put	Writes a character of data to a packet.
	TCPIP_IPV6_SourceAddressGet	Gets the source address for an IPv6 packet.
	TCPIP_IPV6_SourceAddressSet	Sets the source address for an IPv6 packet.
	TCPIP_IPV6_TxIsPutReady	Determines whether a TX packet can be written to.
	TCPIP_IPV6_TxPacketAllocate	Dynamically allocates a packet for transmitting IP protocol data.
	TCPIP_IPV6_UnicastAddressAdd	Adds a unicast address to a specified interface
	TCPIP_IPV6_UniqueLocalUnicastAddressAdd	Adds a Unique Local Unicast Address (ULA) to a specified interface

Description

This section describes the Application Programming Interface (API) functions of the IPv6 TCP/IP Stack Library.

Refer to each section for a detailed description.

5.8.15.7.1 Functions

5.8.15.7.1.1 TCPIP_IPV6_AddressUnicastRemove Function

C

```
void TCPIP_IPV6_AddressUnicastRemove(  
    TCPIP_NET_HANDLE netH,  
    IPV6_ADDR * address  
);
```

Description

Removed a configured unicast address from an interface.

Preconditions

None

Parameters

Parameters	Description
netH	The interface.
address	The address

Returns

None

Remarks

None

5.8.15.7.1.2 TCPIP_IPV6_ArrayGet Function

C

```
uint8_t TCPIP_IPV6_ArrayGet(  
    TCPIP_MAC_PACKET* pRxPkt,  
    uint8_t * val,  
    uint16_t len  
);
```

Description

Reads a character of data from a packet.

Preconditions

None

Parameters

Parameters	Description
pRxPkt	The MAC RX packet to read data from
val	The buffer to store the data
len	The amount of data to read

Returns

uint8_t - The number of bytes read.

Remarks

None

5.8.15.7.1.3 TCPIP_IPV6_ArrayPutHelper Function**C**

```
unsigned short TCPIP_IPV6_ArrayPutHelper(  
    IPV6_PACKET * pkt,  
    const void * dataSource,  
    uint8_t dataType,  
    unsigned short len  
);
```

Description

Helper function to write data to a packet.

Preconditions

None

Parameters

Parameters	Description
ptrPacket	The packet.
dataSource	The address of the data on its medium.
dataType	Descriptor of the data type (dynamic memory on PIC, in a network FIFO, in static PIC RAM)
len	Length of the data.

Returns

unsigned short - The number of bytes of data written.

Remarks

None

5.8.15.7.1.4 TCPIP_IPV6_DASSourceAddressSelect Function**C**

```
IPV6_ADDR_STRUCT * TCPIP_IPV6_DASSourceAddressSelect(  
    TCPIP_NET_HANDLE hNetIf,  
    IPV6_ADDR * dest,  
    IPV6_ADDR * requestedSource  
);
```

Description

Determines the appropriate source address for a given destination address.

Preconditions

None

Parameters

Parameters	Description
hNetIf	The given interface.
dest	The destination address.
requestedSource	A specified source.

Returns

IPV6_ADDR_STRUCT * - The selected source address.

Remarks

None

5.8.15.7.1.5 TCPIP_IPV6_DestAddressGet Function**C**

```
IPV6_ADDR * TCPIP_IPV6_DestAddressGet(  
    IPV6_PACKET * p  
);
```

Description

Gets the destination address for an IPv6 packet.

Preconditions

None.

Parameters

Parameters	Description
p	pointer to IPv6 packet

Returns

Destination address.

Remarks

None.

5.8.15.7.1.6 TCPIP_IPV6_DestAddressSet Function**C**

```
void TCPIP_IPV6_DestAddressSet(  
    IPV6_PACKET * p,  
    const IPV6_ADDR * addr  
);
```

Description

Sets the destination address for an IPv6 packet.

Preconditions

None.

Parameters

Parameters	Description
p	pointer to IPv6 packet
addrValue	destination address

Returns

None.

Remarks

None

5.8.15.7.1.7 TCPIP_IPV6_Flush Function

C

```
int TCPIP_IPV6_Flush(  
    IPV6_PACKET * pkt  
);
```

Description

Flushes an IP TX packet. Determines the link-layer address if necessary. Calculates the upper-layer checksum if necessary.

Preconditions

None

Parameters

Parameters	Description
ptrPacket	The packet to flush.

Returns

1 - if the packet has been transmitted 0 - if the packet has been queued. < 0 - if the packet has been discarded for some error

Remarks

None

5.8.15.7.1.8 TCPIP_IPV6_Get Function

C

```
uint8_t TCPIP_IPV6_Get(  
    TCPIP_MAC_PACKET* pRxPkt,  
    uint8_t* pData  
);
```

Description

Reads a character of data from a packet.

Preconditions

None

Parameters

Parameters	Description
pRxPkt	The MAC RX packet to read data from

Returns

The data read.

Remarks

None

5.8.15.7.1.9 TCPIP_IPV6_HandlerDeregister Function

C

```
bool TCPIP_IPV6_HandlerDeregister(  
    IPV6_HANDLE hIpv6  
);
```

Description

Deregisters an IPv6 event handler callback function.

Preconditions

None

Parameters

Parameters	Description
hIpv6	Handle to registered callback

Returns

true - if deregister successful false - otherwise.

Remarks

None

5.8.15.7.1.10 TCPIP_IPV6_HandlerRegister Function**C**

```
IPv6_HANDLE TCPIP_IPV6_HandlerRegister(  
    TCPIP_NET_HANDLE hNet,  
    IPV6_EVENT_HANDLER handler,  
    const void* hParam  
);
```

Description

Registers an IPv6 event handler callback function.

Preconditions

None

Parameters

Parameters	Description
netH	The interface
handler	event handler
hParam	

Returns

Handle to registered callback.

Remarks

None

5.8.15.7.1.11 TCPIP_IPV6_InterfaceIsReady Function**C**

```
bool TCPIP_IPV6_InterfaceIsReady(  
    TCPIP_NET_HANDLE netH  
);
```

Description

Determines if an interface is ready for IPv6 transactions.

Preconditions

None

Parameters

Parameters	Description
pNetIf	The interface to check

Returns

true if the interface has IPv6 functionality available, false otherwise

Remarks

None

5.8.15.7.1.12 TCPIP_IPV6_MulticastListenerAdd Function**C**

```
IPv6_ADDR_STRUCT * TCPIP_IPV6_MulticastListenerAdd(  
    TCPIP_NET_HANDLE hNet,  
    IPV6_ADDR * address  
);
```

Description

Adds a multicast listener to an interface.

Preconditions

None

Parameters

Parameters	Description
pNetIf	The interface to add the address to.
address	The new listener

Returns

IPv6_ADDR_STRUCT * - Pointer to the new listener, or NULL

Remarks

None

5.8.15.7.1.13 TCPIP_IPV6_MulticastListenerRemove Function**C**

```
void TCPIP_IPV6_MulticastListenerRemove(  
    TCPIP_NET_HANDLE neth,  
    IPV6_ADDR * address  
);
```

Description

Removes a multicast listener from a given interface.

Preconditions

None

Parameters

Parameters	Description
neth	The interface
address	The address

Returns

None

Remarks

None

5.8.15.7.1.14 TCPIP_IPV6_PacketFree Function**C**

```
void TCPIP_IPV6_PacketFree(  
    IPV6_PACKET * pkt  
)  
;
```

Description

Frees a TCP/IP Packet structure from dynamic memory.

Preconditions

None

Parameters

Parameters	Description
ptrPacket	The packet to free.

Returns

None

Remarks

None

5.8.15.7.1.15 TCPIP_IPV6_PayloadSet Function**C**

```
unsigned short TCPIP_IPV6_PayloadSet(  
    IPV6_PACKET * pkt,  
    uint8_t* payload,  
    unsigned short len  
)  
;
```

Description

This function will allocate a data segment header and append it to the end of a chain of segments in a TX packet. It will set the data ptr in the packet segment to a pre-existing buffer of data.

Preconditions

None

Parameters

Parameters	Description
ptrPacket	The packet.

payload	Address of the data payload.
len	Length of the data payload

Returns

unsigned short - The amount of data added to the packet length.

Remarks

This function is useful for adding payloads to outgoing packets without copying them if the data is in another preexisting buffer (i.e. TCP).

5.8.15.7.1.16 TCPIP_IPV6_Put Function**C**

```
bool TCPIP_IPV6_Put(  
    IPV6_PACKET * pkt,  
    unsigned char v  
);
```

Description

Writes a character of data to a packet.

Preconditions

None

Parameters

Parameters	Description
pkt	The packet.
v	The character.

Returns

true if the character was written, false otherwise

Remarks

None

5.8.15.7.1.17 TCPIP_IPV6_SourceAddressGet Function**C**

```
IPV6_ADDR * TCPIP_IPV6_SourceAddressGet(  
    IPV6_PACKET * p  
);
```

Description

Gets the source address for an IPv6 packet.

Parameters

Parameters	Description
p	pointer to IPv6 packet

Returns

Source address.

Remarks

None.

5.8.15.7.1.18 TCPIP_IPV6_SourceAddressSet Function**C**

```
void TCPIP_IPV6_SourceAddressSet(  
    IPV6_PACKET * p,  
    const IPV6_ADDR * addr  
);
```

Description

Sets the source address for an IPv6 packet.

Preconditions

None.

Parameters

Parameters	Description
p	pointer to IPv6 packet
addrValue	source address

Returns

None.

Remarks

None

5.8.15.7.1.19 TCPIP_IPV6_TxIsPutReady Function**C**

```
unsigned short TCPIP_IPV6_TxIsPutReady(  
    IPV6_PACKET * pkt,  
    unsigned short count  
);
```

Description

Determines whether a TX packet can be written to. This function will allocate additional space to the packet to accomodate the user.

Preconditions

None

Parameters

Parameters	Description
ptrPacket	The packet to check.
count	The amount of writable space to check for,

Returns

unsigned short - The amount of space available.

Remarks

None

5.8.15.7.1.20 TCPIP_IPV6_TxPacketAllocate Function

C

```
IPV6_PACKET * TCPIP_IPV6_TxPacketAllocate(  
    TCPIP_NET_HANDLE netH,  
    IPV6_PACKET_ACK_FNC ackFnc,  
    void* ackParam  
);
```

Description

Dynamically allocates a packet for transmitting IP protocol data.

Preconditions

None

Parameters

Parameters	Description
netH	Interface of the outgoing packet.
ackFnc	function to be called when IP is done with the TX packet (finished transmitting)
ackParam	parameter to be used for this callback This has meaning only for the caller of the TCPIP_IPV6_TxPacketAllocate

Returns

[IPV6_PACKET](#) * - Pointer to the allocated packet.

Remarks

None

5.8.15.7.1.21 TCPIP_IPV6_UnicastAddressAdd Function

C

```
IPV6_ADDR_STRUCT * TCPIP_IPV6_UnicastAddressAdd(  
    TCPIP_NET_HANDLE netH,  
    IPV6_ADDR * address,  
    uint8_t skipProcessing  
);
```

Description

Adds a unicast address to a specified interface. Starts duplicate address detection if necessary.

Preconditions

None

Parameters

Parameters	Description
netH	The interface to add the address to.
address	The address to add.
skipProcessing	true to skip Duplicate address detection, false otherwise

Returns

IPV6_ADDR_STRUCT * - Pointer to the structure of the newly allocated address

Remarks

None

5.8.15.7.1.22 TCPIP_IPV6_UniqueLocalUnicastAddressAdd Function

C

```
IPV6_ULA_RESULT TCPIP_IPV6_UniqueLocalUnicastAddressAdd(
    TCPIP_NET_HANDLE netH,
    uint16_t subnetID,
    IPV6_ULA_FLAGS genFlags,
    IP_MULTI_ADDRESS* ntpAddress
);
```

Description

This function starts the process of adding an ULA address to the specified interface. The segments of the generated address are as follows: FC00::7 - ULA prefix L - 1 bit set to 1, locally assigned Global ID - 40 bit random generated identifier subnet ID - 16 bit subnet identifier Interface ID - 64 bit interface identifier generated as a EUI64 from the specified interface MAC.

The randomness of the "Global ID" prefix of the generated IPv6 address is obtained by using an NTP server. The supplied NTP server will be contacted to obtain an NTP timestamp. This timestamp together with the EUI64 identifier obtained from the interface MAC are passed through a 160 bits hash algorithm (SHA1) and the least seighbificant 40 bits are used as the GlobalID of the interface.

Preconditions

None

Parameters

Parameters	Description
netH	the interface to add the address to.
subnetID	the subnet ID to be used.

5.8.15.7.2 Data Types and Constants

5.8.15.7.2.1 IP_VERSION_4 Macro

C

```
#define IP_VERSION_4 (0u) // Using IPv4
```

Description

Using IPv4

5.8.15.7.2.2 IP_VERSION_6 Macro

C

```
#define IP_VERSION_6 (1u) // Using IPv6
```

Description

Using IPv6

5.8.15.7.2.3 IPV6_DATA_DYNAMIC_BUFFER Macro

C

```
#define IPV6_DATA_DYNAMIC_BUFFER (0x1u) // Data to transmit is allocated in dynamically allocated RAM
```

Description

Data to transmit is allocated in dynamically allocated RAM

5.8.15.7.2.4 IPV6_DATA_NETWORK_FIFO Macro**C**

```
#define IPV6_DATA_NETWORK_FIFO (0x2u)           // Data to transmit is stored in the Network  
Controller's FIFOs
```

Description

Data to transmit is stored in the Network Controller's FIFOs

5.8.15.7.2.5 IPV6_DATA_NONE Macro**C**

```
#define IPV6_DATA_NONE (0x0u)                   // The data segment is unused
```

Description

The data segment is unused

5.8.15.7.2.6 IPV6_DATA_PIC_RAM Macro**C**

```
#define IPV6_DATA_PIC_RAM (0x3u)                // Data to transmit is stored in PIC RAM
```

Description

Data to transmit is stored in PIC RAM

5.8.15.7.2.7 IPV6_HEADER_OFFSET_DEST_ADDR Macro**C**

```
#define IPV6_HEADER_OFFSET_DEST_ADDR (0x08u + sizeof (IPV6_ADDR)) // Header offset for  
destination address
```

Description

Header offset for destination address

5.8.15.7.2.8 IPV6_HEADER_OFFSET_NEXT_HEADER Macro**C**

```
#define IPV6_HEADER_OFFSET_NEXT_HEADER (0x06u) // Header offset for next header
```

Description

Header offset for next header

5.8.15.7.2.9 IPV6_HEADER_OFFSET_PAYLOAD_LENGTH Macro**C**

```
#define IPV6_HEADER_OFFSET_PAYLOAD_LENGTH (0x04u) // Header offset for payload length
```

Description

Header offset for payload length

5.8.15.7.2.10 IPV6_HEADER_OFFSET_SOURCE_ADDR Macro

C

```
#define IPV6_HEADER_OFFSET_SOURCE_ADDR (0x08u) // Header offset for source address
```

Description

Header offset for source address

5.8.15.7.2.11 IPV6_NO_UPPER_LAYER_CHECKSUM Macro

C

```
#define IPV6_NO_UPPER_LAYER_CHECKSUM (0xFFFFu) // Value flag for no upper layer checksum
```

Description

Value flag for no upper layer checksum

5.8.15.7.2.12 IPV6_TLV_HBHO_PAYLOAD_JUMBOGRAM Macro

C

```
#define IPV6_TLV_HBHO_PAYLOAD_JUMBOGRAM 0xC2u
```

Description

IPv6 Type-length-value type code for the Hop-by-hop "Jumbogram Payload" option

5.8.15.7.2.13 IPV6_TLV_HBHO_ROUTER_ALERT Macro

C

```
#define IPV6_TLV_HBHO_ROUTER_ALERT 0x05u
```

Description

IPv6 Type-length-value type code for the Hop-by-hop "Router Alert" option

5.8.15.7.2.14 IPV6_TLV_PAD_1 Macro

C

```
#define IPV6_TLV_PAD_1 0u
```

Description

IPv6 Type-length-value type code for the Pad 1 option

5.8.15.7.2.15 IPV6_TLV_PAD_N Macro

C

```
#define IPV6_TLV_PAD_N 1u
```

Description

IPv6 Type-length-value type code for the Pad N option

5.8.15.7.2.16 IPV6_TLV_UNREC_OPT_DISCARD_PP Macro

C

```
#define IPV6_TLV_UNREC_OPT_DISCARD_PP 0b10
```

Description

IPv6 action code for the unrecognized option reaction to discard the packet and [send](#) an ICMP parameter problem message

5.8.15.7.2.17 IPV6_TLV_UNREC_OPT_DISCARD_PP_NOT_MC Macro

C

```
#define IPV6_TLV_UNREC_OPT_DISCARD_PP_NOT_MC 0b11
```

Description

IPv6 action code for the unrecognized option reaction to discard the packet and [send](#) an ICMP parameter problem message is the destination addr isn't a multicast address

5.8.15.7.2.18 IPV6_TLV_UNREC_OPT_DISCARD_SILENT Macro

C

```
#define IPV6_TLV_UNREC_OPT_DISCARD_SILENT 0b01
```

Description

IPv6 action code for the unrecognized option reaction to discard the packet silently

5.8.15.7.2.19 IPV6_TLV_UNREC_OPT_SKIP_OPTION Macro

C

```
#define IPV6_TLV_UNREC_OPT_SKIP_OPTION 0b00
```

Description

IPv6 action code for the unrecognized option reaction to skip the option

5.8.15.7.2.20 TCPIP_IPV6_PutArray Macro

C

```
#define TCPIP_IPV6_PutArray(pkt,data,len) TCPIP_IPV6_ArrayPutHelper(pkt, data, IPV6_DATA_PIC_RAM, len)
```

Description

Writes data to an outgoing packet.

Preconditions

The [TCPIP_IPV6_TxIsPutReady](#) function must have returned a value greater than or equal to 'len.'

Parameters

Parameters	Description
ptrPacket	The packet.
dataSource	Pointer to the data to copy to the packet.
len	Length of the data.

Returns

unsigned short - The number of bytes of data written.

Remarks

None

5.8.15.7.2.21 IPV6_ACTION Enumeration

C

```
typedef enum {  
    IPV6_ACTION_NONE = 0,  
    IPV6_ACTION_DISCARD_SILENT,  
    IPV6_ACTION_DISCARD_PP_0,  
    IPV6_ACTION_DISCARD_PP_2,  
    IPV6_ACTION_DISCARD_PP_2_NOT_MC,  
    IPV6_ACTION_BEGIN_EX_HEADER_PROCESSING  
} IPV6_ACTION;
```

Description

IPV6_ACTION Enumeration

Provides a list of possible IPv6 actions.

Remarks

None

5.8.15.7.2.22 IPV6_ADDRESS_POLICY Structure

C

```
typedef struct {  
    IPV6_ADDR address;  
    unsigned char prefixLength;  
    unsigned char precedence;  
    unsigned char label;  
} IPV6_ADDRESS_POLICY;
```

Description

IPV6_ADDRESS_POLICY Structure Typedef

Remarks

None

5.8.15.7.2.23 IPV6_ADDRESS_PREFERENCE Enumeration

C

```
typedef enum {  
    IPV6_PREFER_PUBLIC_ADDRESSES = 0,  
    IPV6_PREFER_TEMPORARY_ADDRESSES  
} IPV6_ADDRESS_PREFERENCE;
```

Description

IPV6_ADDRESS_PREFERENCE Enumeration

Provides selection of public versus temporary addresses.

Remarks

None

5.8.15.7.2.24 IPV6_ADDRESS_TYPE Union

C

```
typedef union {
```

```

    unsigned char byte;
    struct {
        unsigned scope : 4;
        unsigned type : 2;
    } bits;
} IPV6_ADDRESS_TYPE;

```

Description

IPV6_ADDRESS_TYPE Union Typedef

Data structure for IPv6 addresses.

Remarks

None

5.8.15.7.2.25 IPV6_DATA_SEGMENT_HEADER Type**C**

```

typedef struct _IPV6_DATA_SEGMENT_HEADER IPV6_DATA_SEGMENT_HEADER;

```

Description

IPV6_DATA_SEGMENT_HEADER Structure Typedef

Remarks

None

5.8.15.7.2.26 IPV6_EVENT_HANDLER Type**C**

```

typedef void (* IPV6_EVENT_HANDLER)(TCPIP_NET_HANDLE hNet, IPV6_EVENT_TYPE evType, const void*
evParam, const void* usrParam);

```

Description

Prototype of an IPv6 event handler

Once an IPv6 event occurs the IPv6 service will call the registered handler. The handler has to be short and fast. It is meant for setting an event flag, not for lengthy processing!

evParam is a parameter that's associated to an IPv6 event

- For an address event (IPV6_EVENT_ADDRESS_ADDED, IPV6_EVENT_ADDRESS_REMOVED) it should be typecasted to (const IPV6_ADDR_STRUCT*)
- For an IPV6_EVENT_ULA_ADDRESS_GENERATED ULA event it should be typecasted to (const IPV6_ADDR*)
- For an IPV6_EVENT_ULA_ADDRESS_FAILED ULA event the evParam is an [IPV6_ULA_RESULT](#) error code

The evParam is invalid outside of the IPV6_EVENT_HANDLER context call and should not be stored by the caller. Info that's needed has to be copied into caller's own context.

usrParam is a user supplied parameter

Remarks

For address related events the passed (const IPV6_ADDR_STRUCT*) parameter is invalid after the notification call.

5.8.15.7.2.27 IPV6_EVENT_TYPE Enumeration**C**

```

typedef enum {

```

```

    IPV6_EVENT_ADDRESS_ADDED = 1,
    IPV6_EVENT_ADDRESS_REMOVED,
    IPV6_EVENT_ULA_ADDRESS_GENERATED,
    IPV6_EVENT_ULA_ADDRESS_FAILED
} IPV6_EVENT_TYPE;

```

Description

IPV6_EVENT_TYPE Enumeration

None

Remarks

None

5.8.15.7.2.28 IPV6_FRAGMENT_HEADER Structure**C**

```

```

Description

IPV6_TLV_OPTION_TYPE Union Typedef

Data structure for IPv6 TLV options.

Remarks

None

5.8.15.7.2.38 IPV6_ULA_FLAGS Enumeration

C

```
typedef enum {
    IPV6_ULA_FLAG_NTPV4 = 0x01,
    IPV6_ULA_FLAG_GENERATE_ONLY = 0x02,
    IPV6_ULA_FLAG_SKIP_DAD = 0x04
} IPV6_ULA_FLAGS;
```

Description

IPV6_ULA_FLAGS Enumeration

Provides a list of possible ULA action flags.

Members

Members	Description
IPV6_ULA_FLAG_NTPV4 = 0x01	use an IPv4 NTP server access in Unique Local Address generation default is an IPv6 server
IPV6_ULA_FLAG_GENERATE_ONLY = 0x02	generate an address only, don't add it to the interface addresses
IPV6_ULA_FLAG_SKIP_DAD = 0x04	when adding the address to the interface, skip the Duplicate Address Detection

Remarks

None

5.8.15.7.2.39 IPV6_ULA_RESULT Enumeration

C

```
typedef enum {
    IPV6_ULA_RES_OK,
    IPV6_ULA_RES_BUSY = -1,
    IPV6_ULA_RES_IF_ERR = -2,
    IPV6_ULA_RES_NTP_ACCESS_ERR = -3,
    IPV6_ULA_RES_NTP_TSTAMP_ERR = -4
} IPV6_ULA_RESULT;
```

Description

IPV6_ULA_RESULT Enumeration

Provides a list of possible ULA results.

Members

Members	Description
IPV6_ULA_RES_OK	the address generation was started successfully
IPV6_ULA_RES_BUSY = -1	address generation module is busy
IPV6_ULA_RES_IF_ERR = -2	interface non existent
IPV6_ULA_RES_NTP_ACCESS_ERR = -3	NTP module could not be accessed
IPV6_ULA_RES_NTP_TSTAMP_ERR = -4	wrong NTP time stamp received

IPv6 Defs for Microchip TCP/IP Stack

Enumerations

	Name	Description
	IPV6_ACTION	Provides a list of possible IPv6 actions.
	IPV6_ADDRESS_PREFERENCE	Provides selection of public versus temporary addresses.
	IPV6_EVENT_TYPE	None
	IPV6_NEXT_HEADER_TYPE	Defines a list of next header types
	IPV6_SEGMENT_TYPE	Provides an enumeration of IPv6 segment types.
	IPV6_ULA_FLAGS	Provides a list of possible flags for the Unique Local Address (ULA) generation.
	IPV6_ULA_RESULT	Provides a list of possible results for the Unique Local Address (ULA) generation.

Functions

	Name	Description
	TCPIP_IPV6_AddressUnicastRemove	Removed a configured unicast address from an interface.
	TCPIP_IPV6_ArrayGet	Reads the next byte of data from the specified MAC.
	TCPIP_IPV6_ArrayPutHelper	Helper function to write data to a packet.
	TCPIP_IPV6_DASSourceAddressSelect	Determines the appropriate source address for a given destination address.
	TCPIP_IPV6_DestAddressGet	Gets the destination address for an IPv6 packet.
	TCPIP_IPV6_DestAddressSet	Sets the destination address for an IPv6 packet.
	TCPIP_IPV6_Flush	Flushes an IP TX packet.
	TCPIP_IPV6_Get	Reads the next byte of data from the specified MAC.
	TCPIP_IPV6_HandlerDeregister	Deregisters an IPv6 event handler callback function.
	TCPIP_IPV6_HandlerRegister	Registers an IPv6 event handler callback function.
	TCPIP_IPV6_InterfacesReady	Determines if an interface is ready for IPv6 transactions.
	TCPIP_IPV6_MulticastListenerAdd	Adds a multicast listener to an interface.
	TCPIP_IPV6_MulticastListenerRemove	Removes a multicast listener from a given interface.
	TCPIP_IPV6_PacketFree	Frees a TCP/IP Packet structure from dynamic memory.
	TCPIP_IPV6_PayloadSet	Allocates a segment on the end of a packet segment chain and uses it to address pre-buffered data.
	TCPIP_IPV6_Put	Writes a character of data to a packet.
	TCPIP_IPV6_SourceAddressGet	Gets the source address for an IPv6 packet.
	TCPIP_IPV6_SourceAddressSet	Sets the source address for an IPv6 packet.
	TCPIP_IPV6_TxIsPutReady	Determines whether a TX packet can be written to.
	TCPIP_IPV6_TxPacketAllocate	Dynamically allocates a packet for transmitting IP protocol data.
	TCPIP_IPV6_UnicastAddressAdd	Adds a unicast address to a specified interface
	TCPIP_IPV6_UniqueLocalUnicastAddressAdd	Adds a Unique Local Unicast Address (ULA) to a specified interface

Macros

	Name	Description
	IP_VERSION_4	Using IPv4
	IP_VERSION_6	Using IPv6
	IPV6_DATA_DYNAMIC_BUFFER	Data to transmit is allocated in dynamically allocated RAM
	IPV6_DATA_NETWORK_FIFO	Data to transmit is stored in the Network Controller's FIFOs
	IPV6_DATA_NONE	The data segment is unused
	IPV6_DATA_PIC_RAM	Data to transmit is stored in PIC RAM
	IPV6_HEADER_OFFSET_DEST_ADDR	Header offset for destination address
	IPV6_HEADER_OFFSET_NEXT_HEADER	Header offset for next header
	IPV6_HEADER_OFFSET_PAYLOAD_LENGTH	Header offset for payload length
	IPV6_HEADER_OFFSET_SOURCE_ADDR	Header offset for source address
	IPV6_NO_UPPER_LAYER_CHECKSUM	Value flag for no upper layer checksum
	IPV6_TLV_HBHO_PAYLOAD_JUMBOGRAM	IPv6 Type-length-value type code for the Hop-by-hop "Jumbogram Payload" option
	IPV6_TLV_HBHO_ROUTER_ALERT	IPv6 Type-length-value type code for the Hop-by-hop "Router Alert" option
	IPV6_TLV_PAD_1	IPv6 Type-length-value type code for the Pad 1 option
	IPV6_TLV_PAD_N	IPv6 Type-length-value type code for the Pad N option

	IPV6_TLV_UNREC_OPT_DISCARD_PP	IPv6 action code for the unrecognized option reaction to discard the packet and send an ICMP parameter problem message
	IPV6_TLV_UNREC_OPT_DISCARD_PP_NOT_MC	IPv6 action code for the unrecognized option reaction to discard the packet and send an ICMP parameter problem message is the destination addr isn't a multicast address
	IPV6_TLV_UNREC_OPT_DISCARD_SILENT	IPv6 action code for the unrecognized option reaction to discard the packet silently
	IPV6_TLV_UNREC_OPT_SKIP_OPTION	IPv6 action code for the unrecognized option reaction to skip the option
	TCPIP_IPV6_PutArray	Writes data to a packet

Structures

	Name	Description
	IPV6_ADDRESS_POLICY	
	IPV6_FRAGMENT_HEADER	
	IPV6_HEADER	None
	IPV6_MODULE_CONFIG	Provides a placeholder for IPv6 configuration.

Types

	Name	Description
	IPV6_DATA_SEGMENT_HEADER	
	IPV6_EVENT_HANDLER	Clients can register a handler with the IPv6 service.
	IPV6_HANDLE	Pointer to IPv6 object
	IPV6_PACKET	Packet structure/state tracking for IPv6 packets
	IPV6_PACKET_ACK_FNC	None
	IPV6_RX_FRAGMENT_BUFFER	

Unions

	Name	Description
	IPV6_ADDRESS_TYPE	Data structure for IPv6 addresses.
	IPV6_TLV_OPTION_TYPE	Data structure for IPv6 TLV options.

5.8.15.8.2 ip_config.h

5.8.16 MAC TCP/IP Stack Library

5.8.16.1 Introduction

Media Access Control (MAC) TCP/IP Stack Library

for

Microchip Microcontrollers

This library provides the API of the MAC TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

In the seven-layer OSI model of computer networking, media access control (MAC) data communication protocol is a sublayer of the data link layer, which itself is layer 2. The MAC sublayer provides addressing and channel access control mechanisms that make it possible for several terminals or network nodes to communicate within a multiple access network that incorporates a shared medium, e.g. Ethernet. The hardware that implements the MAC is referred to as a medium access controller.

The MAC sublayer acts as an interface between the logical link control (LLC) sublayer and the network's physical layer. The MAC layer emulates a full-duplex logical communication channel in a multi-point network. This channel may provide unicast, multicast or broadcast communication service.

5.8.16.2 Release Notes

MPLAB Harmony Version: v0.70b **MAC TCP/IP Stack Library Version :** 1.0 **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.8.16.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.8.16.4 Using the Library

This topic describes the basic architecture of the MAC TCP/IP Stack Library and provides information and examples on how to use it.

Interface Header File: [tcpip_mac.h](#)

The interface to the MAC TCP/IP Stack library is defined in the "[tcpip_mac.h](#)" header file. This file is included by the "tcpip.h" file. Any C language source (.c) file that uses the MAC TCP/IP Stack library should include "tcpip.h".

Library File:

The MAC TCP/IP Stack library archive (.a) file installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the TCP/IP Stack interacts with the framework.

5.8.16.4.1 Abstraction Model

This library provides the API of the MAC TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

MAC Software Abstraction Block Diagram

Note: This diagram was not available at time of release and will be added in a future version of MPLAB Harmony.

5.8.16.4.2 Library Overview

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the MAC module.

Library Interface Section	Description
Functions	Routines for configuring the MAC TCP/IP Stack
Data Types and Constants	This section provides various definitions describing this API

5.8.16.5 Configuring the Library

Macros

	Name	Description
	EMAC_RX_BUFF_SIZE	size of a RX buffer. should be multiple of 16 this is the size of all receive buffers processed by the ETHC The size should be enough to accomodate any network received packet If the packets are larger, they will have to take multiple RX buffers and the packet manipulation is less efficient <code>#define EMAC_RX_BUFF_SIZE 512</code>
	EMAC_RX_DESCRIPTOR	number of the RX descriptors and RX buffers to be created
	EMAC_RX_FRAGMENTS	MAC maximum number of supported fragments Based on the values of EMAC_RX_MAX_FRAME and EMAC_RX_BUFF_SIZE an incoming frame may span multiple RX buffers (fragments). Note that excessive fragmentation leads to performance degradation. The default and recommended value should be 1. <code>#define EMAC_RX_FRAGMENTS 1</code> Alternatively you can use the calculation of the number of fragments based on the selected RX sizes:
	EMAC_RX_MAX_FRAME	Maximum MAC supported RX frame size. Any incoming ETH frame that's longer than this size will be discarded. The default value is 1536 (allows for VLAN tagged frames, although the VLAN tagged frames are discarded) Normally you shouldn't need to touch this value unless you know exactly the maximum size of the frames you want to process or you need to control packets fragmentation (together with the EMAC_RX_BUFF_SIZE).
	EMAC_TX_DESCRIPTOR	number of the TX descriptors to be created
	ETH_CFG_10	use/advertise 10 Mbps capability

	ETH_CFG_100	use/advertise 100 Mbps capability
	ETH_CFG_AUTO	use auto negotiation
	ETH_CFG_AUTO_MDIX	use/advertise auto MDIX capability
	ETH_CFG_FDUPLEX	use/advertise full duplex capability
	ETH_CFG_HDUPLEX	use/advertise half duplex capability
	ETH_CFG_LINK	set to 1 if you need to config the link to specific following parameters otherwise the default connection will be attempted depending on the selected PHY
	ETH_CFG_LINK_INIT_DELAY	some PHYs need an initialization delay for insuring that the PHY is ready to transmit data. milliseconds
	ETH_CFG_SWAP_MDIX	use swapped MDIX. else normal MDIX

Description

The configuration of the MAC TCP/IP Stack is based on the file `tcpip_config.h`

This header file contains the configuration selection for the MAC TCP/IP Stack. Based on the selections made, the MAC TCP/IP Stack will support or not support selected features. These configuration settings will apply to all instances of the MAC TCP/IP Stack.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.8.16.5.1 EMAC_RX_BUFF_SIZE Macro

C

```
#define EMAC_RX_BUFF_SIZE 1536
```

Description

size of a RX buffer. should be multiple of 16 this is the size of all receive buffers processed by the ETHC The size should be enough to accomodate any network received packet If the packets are larger, they will have to take multiple RX buffers and the packet manipulation is less efficient #define EMAC_RX_BUFF_SIZE 512

5.8.16.5.2 EMAC_RX_DESCRIPTORs Macro

C

```
#define EMAC_RX_DESCRIPTORs 6
```

Description

number of the RX descriptors and RX buffers to be created

5.8.16.5.3 EMAC_RX_FRAGMENTS Macro

C

```
#define EMAC_RX_FRAGMENTS ((EMAC_RX_MAX_FRAME + (EMAC_RX_BUFF_SIZE - 1)) / (EMAC_RX_BUFF_SIZE))
```

Description

MAC maximum number of supported fragments Based on the values of [EMAC_RX_MAX_FRAME](#) and [EMAC_RX_BUFF_SIZE](#) an incoming frame may span multiple RX buffers (fragments). Note that excessive fragmentation leads to performance degradation. The default and recommended value should be 1. #define EMAC_RX_FRAGMENTS 1 Alternatively you can use the calculation of the number of fragments based on the selected RX sizes:

5.8.16.5.4 EMAC_RX_MAX_FRAME Macro

C

```
#define EMAC_RX_MAX_FRAME 1536
```

Description

Maximum MAC supported RX frame size. Any incoming ETH frame that's longer than this size will be discarded. The default value is 1536 (allows for VLAN tagged frames, although the VLAN tagged frames are discarded) Normally you shouldn't need to touch this value unless you know exactly the maximum size of the frames you want to process or you need to control packets fragmentation (together with the [EMAC_RX_BUFF_SIZE](#)).

Remarks

Always multiple of 16!

5.8.16.5.5 EMAC_TX_DESCRIPTOR Macro

C

```
#define EMAC_TX_DESCRIPTOR 8
```

Description

number of the TX descriptors to be created

5.8.16.5.6 ETH_CFG_10 Macro

C

```
#define ETH_CFG_10 1
```

Description

use/advertise 10 Mbps capability

5.8.16.5.7 ETH_CFG_100 Macro

C

```
#define ETH_CFG_100 1
```

Description

use/advertise 100 Mbps capability

5.8.16.5.8 ETH_CFG_AUTO Macro

C

```
#define ETH_CFG_AUTO 1
```

Description

use auto negotiation

5.8.16.5.9 ETH_CFG_AUTO_MDIX Macro

C

```
#define ETH_CFG_AUTO_MDIX 1
```

Description

use/advertise auto MDIX capability

5.8.16.5.10 ETH_CFG_FDUPLEX Macro

C

```
#define ETH_CFG_FDUPLEX 1
```

Description

use/advertise full duplex capability

5.8.16.5.11 ETH_CFG_HDUPLEX Macro

C

```
#define ETH_CFG_HDUPLEX 1
```

Description

use/advertise half duplex capability

5.8.16.5.12 ETH_CFG_LINK Macro

C

```
#define ETH_CFG_LINK 0
```

Description

set to 1 if you need to config the link to specific following parameters otherwise the default connection will be attempted depending on the selected PHY

5.8.16.5.13 ETH_CFG_LINK_INIT_DELAY Macro

C

```
#define ETH_CFG_LINK_INIT_DELAY 500
```

Description

some PHYs need an initialization delay for insuring that the PHY is ready to transmit data. milliseconds

5.8.16.5.14 ETH_CFG_SWAP_MDIX Macro

C

```
#define ETH_CFG_SWAP_MDIX 1
```

Description

use swapped MDIX. else normal MDIX

5.8.16.6 Building the Library

This section list the files that are available in the \src of the MAC driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

5.8.16.7 Library Interface

Data Types and Constants

	Name	Description

5.8.16.7.1 Functions

5.8.16.7.1.1 TCPIP_MAC_Close Function

C

```
TCPIP_MAC_RES TCPIP_MAC_Close(
    TCPIP_MAC_HANDLE hMac
);
```

Description

closes a MAC client

5.8.16.7.1.2 TCPIP_MAC_Deinitialize Function

C

```
TCPIP_MAC_RES TCPIP_MAC_Deinitialize(
    const TCPIP_MAC_MODULE_CTRL * const
);
```

Description

MAC de-initialization function Returns a result to indicate that everything has been cleaned up.

5.8.16.7.1.3 TCPIP_MAC_EventAcknowledge Function

C

```
bool TCPIP_MAC_EventAcknowledge(
    TCPIP_MAC_HANDLE hMac,
    TCPIP_MAC_EVENT macEvents
);
```

Description

acknowledges reported event(s) returns false if no event to be acknowledged true otherwise

5.8.16.7.1.4 TCPIP_MAC_EventMaskSet Function

C

```
bool TCPIP_MAC_EventMaskSet(
    TCPIP_MAC_HANDLE hMac,
    TCPIP_MAC_EVENT macEvents,
    bool enable
);
```

```
);
```

Description

enables/disables the events to be reported multiple events could be or-ed returns false if some error occurred

5.8.16.7.1.5 TCPIP_MAC_EventPendingGet Function**C**

```
TCPIP_MAC_EVENT TCPIP_MAC_EventPendingGet(  
    TCPIP_MAC_HANDLE hMac  
);
```

Description

returns current pending events

5.8.16.7.1.6 TCPIP_MAC_Initialize Function**C**

```
TCPIP_MAC_RES TCPIP_MAC_Initialize(  
    TCPIP_MAC_MODULE_CTRL* const stackData,  
    const void* const moduleData  
);
```

Description

TCPIP_MAC_Initialize

5.8.16.7.1.7 TCPIP_MAC_LinkCheck Function**C**

```
bool TCPIP_MAC_LinkCheck(  
    TCPIP_MAC_HANDLE hMac  
);
```

Description

Link Interface functions

5.8.16.7.1.8 TCPIP_MAC_Open Function**C**

```
TCPIP_MAC_HANDLE TCPIP_MAC_Open(  
    unsigned int macId  
);
```

Description

function to open a MAC and get a client handle

5.8.16.7.1.9 TCPIP_MAC_PacketRx Function**C**

```
TCPIP_MAC_PACKET* TCPIP_MAC_PacketRx(  
    TCPIP_MAC_HANDLE hMac,  
    TCPIP_MAC_RES* pRes,  
    const TCPIP_MAC_PACKET_RX_STAT** ppPktStat  
);
```

Description

TCPIP_MAC_PacketRx

This is the MAC receive function.

Once a pending packet is available in the MAC driver internal RX queues this function will dequeue the packet and hand it over to the MAC driver's client - i.e. the stack - for further processing.

The flags for a RX packet have to be updated by the MAC driver:

- TCPIP_MAC_PKT_FLAG_RX has to be set If the MAC supports it, it should set:
 - TCPIP_MAC_PKT_FLAG_UNICAST has to be set if that packet is a unicast packet
 - TCPIP_MAC_PKT_FLAG_BCAST has to be set if that packet is a broadcast packet
 - TCPIP_MAC_PKT_FLAG_MCAST has to be set if that packet is a multicast packet
 - TCPIP_MAC_PKT_FLAG_QUEUED has to be set
 - TCPIP_MAC_PKT_FLAG_SPLIT has to be set if the packet has multiple data segments
- Additional information about the packet is available by providing the pRes and ppPktStat fields.

Parameters

Parameters	Description
hMac	handle identifying the MAC driver client
pRes	optional pointer to an address that will receive an additional result associated with the operation. Can be 0 if not needed.
ppPktStat	optional pointer to an address that will receive the received packet status. Note that this pointer cannot be used once the packet acknowledgement function was called. Can be 0 if not needed.

Returns

a valid pointer to an available RX packet 0 if no packet pending/available

Remarks

The MAC driver should dequeue and return to the caller just one single packet, and not multiple chained packets!

Once the higher level layers in the stack are done with processing the RX packet, they have to call the corresponding packet acknowledgement function that tells the owner of that packet that it can resume control of that packet.

Once the stack modules are done processing the RX packets and the acknowledge function is called it is up to the driver design to reuse the RX packets, or simply return them to the pool they were allocated from (assuming that some sort of allocation is implemented). This document makes no requirement about how the MAC RX packets are obtained, using dynamic or static allocation techniques. This is up to the design of the MAC.

The MAC driver can use the [TCPIP_MAC_Process\(\)](#) for obtaining new RX packets if needed.

Not all the MACs have hardware support for the received packet status. If the MAC driver cannot supply the [TCPIP_MAC_PACKET_RX_STAT](#) info, it should set the ppPktStat to 0.

5.8.16.7.1.10 TCPIP_MAC_PacketTx Function**C**

```
TCPIP_MAC_RES TCPIP_MAC_PacketTx(
    TCPIP_MAC_HANDLE hMac,
    TCPIP_MAC_PACKET * ptrPacket
);
```

Description**TCPIP_MAC_PacketTx**

This is the MAC transmit function. The MAC driver has to support internal queueing! A packet is to be rejected only if it's not properly formatted. Otherwise it has to be scheduled for transmission in an internal queue!

Once the packet is scheduled for transmission the MAC driver has to set the `TCPIP_MAC_PKT_FLAG_QUEUED` flag so that the stack is aware that this packet is under processing and cannot be modified!

Once the packet is transmitted, the `TCPIP_MAC_PKT_FLAG_QUEUED` has to be cleared, the proper packet acknowledgement result (`ackRes`) has to be set and the packet acknowledgement function (`ackFunc`) has to be called. It is implementation dependant if all these steps are implemented as part of the `ackFunc` itself or as discrete steps.

Parameters

Parameters	Description
<code>hMac</code>	handle identifying the MAC driver client
<code>ptrPacket</code>	pointer to a TCPIP_MAC_PACKET that's completely formatted and ready to be transmitted over the network

Remarks

See notes for the `segLoadOffset` member.

On 32 bit machines the 1st segment payload of a packet is allocated so that it is always 32 bit aligned and its size is 32 bits multiple. The `segLoadOffset` adds to the payload address and insures that the network layer data is 32 bit aligned.

- PIC32 MAC driver specific : the driver checks that the `segLoadOffset` ≥ 2 .

The packet is not required to contain the Frame Check Sequence (FCS/CRC32) field. The MAC driver/controller will insert that field itself, if it's required.

The MAC driver is required to support the transmission of multiple chained packets.

5.8.16.7.1.11 TCPIP_MAC_Process Function**C**

```
TCPIP_MAC_RES TCPIP_MAC_Process(
    TCPIP_MAC_HANDLE hMac
);
```

Description**TCPIP_MAC_Process**

This is a function that allows for internal processing by the MAC driver. It is meant for processing that cannot be done from within ISR.

Some of the processing that this is intended for:

- the MAC driver can process its pending TX queues (although it should do that preferably from within the TX ISR)
- RX buffers replenishing. If the number of packets in the RX queue falls below a specified limit, the MAC driver can use this function to allocate some extra RX packets. Similarly, if there are too many allocated RX packets, the MAC driver can free some of them.

Normally this function will be called in response to an TX and/or RX event signalled by the driver. This is specified by the MAC driver at initialization time using [TCPIP_MAC_MODULE_CTRL](#).

An alternative approach is that the MAC driver uses a system service to create a timer signal that will call the `TCPIP_MAC_Process` on a periodic basis.

Parameters

Parameters	Description
hMac	handle identifying the MAC driver client

Returns

TCPIP_MAC_RES_OK if all processing went on OK a [TCPIP_MAC_RES](#) error code if processing failed for some reason

Remarks

None.

5.8.16.7.1.12 TCPIP_MAC_Reinitialize Function

C

```
TCPIP_MAC_RES TCPIP_MAC_Reinitialize(
    const TCPIP_MAC_MODULE_CTRL* const stackData,
    const void* const moduleData
);
```

Description

MAC re-initialization function Allows re-initialization of the MAC with different power modes, etc. probably the same signature as [TCPIP_MAC_Initialize](#) Optional function

5.8.16.7.1.13 TCPIP_MAC_RxFilterHashTableEntrySet Function

C

```
TCPIP_MAC_RES TCPIP_MAC_RxFilterHashTableEntrySet(
    TCPIP_MAC_HANDLE hMac,
    TCPIP_MAC_ADDR* DestMACAddr
);
```

Description

set the hash table filter

5.8.16.7.2 Data Types and Constants**5.8.16.7.2.1 TCPIP_MAC_ACTION Enumeration**

C

```
typedef enum {
    TCPIP_MAC_ACTION_INIT,
    TCPIP_MAC_ACTION_REINIT,
    TCPIP_MAC_ACTION_DEINIT,
    TCPIP_MAC_ACTION_IF_UP,
    TCPIP_MAC_ACTION_IF_DOWN
} TCPIP_MAC_ACTION;
```

Description

- Interface functions

network interface action for initialization/de-initialization

Members

Members	Description
TCPIP_MAC_ACTION_INIT	stack is initialized
TCPIP_MAC_ACTION_REINIT	stack is re-initialized
TCPIP_MAC_ACTION_DEINIT	stack is de-initialized
TCPIP_MAC_ACTION_IF_UP	interface is brought up
TCPIP_MAC_ACTION_IF_DOWN	interface is brought down

5.8.16.7.2.2 TCPIP_MAC_ADDR Structure**C**

```
typedef struct {
    uint8_t v[6];
} TCPIP_MAC_ADDR;
```

Description

Structure to contain a MAC address

5.8.16.7.2.3 TCPIP_MAC_DATA_SEGMENT Type**C**

```
typedef struct _tag_MAC_DATA_SEGMENT TCPIP_MAC_DATA_SEGMENT;
```

Description

TCPIP MAC Data Segment

Structure of a segment buffer transferred with the MAC. A MAC TX or RX packet can consist of multiple data segments. On TX the MAC has to be able to transmit packets that span multiple data segments. On RX of a network frame the MAC may have to use multiple segments to construct a packet. (For performance reasons, a contiguous MAC packet, with just one segment, if possible, is preferred).

Remarks

See notes for the segLoadOffset member.

On 32 bit machines the segment payload is allocated so that it is always 32 bit aligned and its size is 32 bits multiple. The segLoadOffset adds to the payload address and insures that the network layer data is 32 bit aligned.

5.8.16.7.2.4 TCPIP_MAC_ETHERNET_HEADER Structure**C**

```
typedef struct {
    TCPIP_MAC_ADDR DestMACAddr;
    TCPIP_MAC_ADDR SourceMACAddr;
    uint16_t Type;
} TCPIP_MAC_ETHERNET_HEADER;
```

Description

A generic structure representing the Ethernet header starting all Ethernet frames

5.8.16.7.2.5 TCPIP_MAC_EVENT Enumeration**C**

```
typedef enum {
```

```
TCPIP_MAC_EV_NONE = 0x0000,
TCPIP_MAC_EV_RX_PKTEND = 0x0001,
TCPIP_MAC_EV_RX_OVFLOW = 0x0002,
TCPIP_MAC_EV_RX_BUFNA = 0x0004,
TCPIP_MAC_EV_RX_ACT = 0x0008,
TCPIP_MAC_EV_RX_DONE = 0x0010,
TCPIP_MAC_EV_RX_FWMARK = 0x0020,
TCPIP_MAC_EV_RX_EWMARK = 0x0040,
TCPIP_MAC_EV_RX_BUSERR = 0x0080,
TCPIP_MAC_EV_TX_DONE = 0x0100,
TCPIP_MAC_EV_TX_ABORT = 0x0200,
TCPIP_MAC_EV_TX_BUSERR = 0x0400,
TCPIP_MAC_EV_CONN_ESTABLISHED = 0x0800,
TCPIP_MAC_EV_CONN_LOST = 0x1000,
TCPIP_MAC_EV_RX_ALL =
(TCPIP_MAC_EV_RX_PKTEND|TCPIP_MAC_EV_RX_OVFLOW|TCPIP_MAC_EV_RX_BUFNA|TCPIP_MAC_EV_RX_ACT|
TCPIP_MAC_EV_RX_DONE|TCPIP_MAC_EV_RX_FWMARK|TCPIP_MAC_EV_RX_EWMARK|TCPIP_MAC_EV_RX_BUSERR),
TCPIP_MAC_EV_TX_ALL = (TCPIP_MAC_EV_TX_DONE|TCPIP_MAC_EV_TX_ABORT|TCPIP_MAC_EV_TX_BUSERR),
TCPIP_MAC_EV_RTX_ERRORS =
(TCPIP_MAC_EV_RX_OVFLOW|TCPIP_MAC_EV_RX_BUFNA|TCPIP_MAC_EV_RX_BUSERR|TCPIP_MAC_EV_TX_ABORT|TCPIP_MAC_EV_TX_BUSERR),
TCPIP_MAC_EV_CONN_ALL = (TCPIP_MAC_EV_CONN_ESTABLISHED|TCPIP_MAC_EV_CONN_LOST)
} TCPIP_MAC_EVENT;
```

Description

TCPIP MAC Events Codes

This enumeration defines all the possible events that can be reported by the MAC to the stack.

Depending on the type of the hardware Ethernet/WiFi interface, etc., not all events are possible.

Members

5.8.16.7.2.6 TCPIP_MAC_EventF Type

C

```
typedef void (* TCPIP_MAC_EventF)(TCPIP_MAC_EVENT event, const void* eventParam);
```

Description

event notification Function: typedef void (*TCPIP_MAC_EventF)([TCPIP_MAC_EVENT](#) event, const void* eventParam);

This function describes the MAC event notification handler. This is a handler specified by the user of the MAC (the TCP/IP stack). The stack can use the handler to be notified of MAC events. Whenever a notification occurs the passed events have to be eventually processed:

- Stack should process the TCPIP_EV_RX_PKTEND/TCPIP_EV_RX_DONE, TCPIP_EV_TX_DONE events
- Process the specific (error) condition
- Acknowledge the events by calling [TCPIP_MAC_EventAcknowledge\(\)](#) so that they can be re-enabled.

Preconditions

None

Parameters

Parameters	Description
event	event that's reported (multiple events can be OR-ed)
eventParam	user parameter that's used in the notification handler

Returns

None

Remarks

The notification handler will be called from the ISR which detects the corresponding event. The event notification handler has to be kept as short as possible and non-blocking. Mainly useful for RTOS integration where this handler will wake-up a thread that waits for a MAC event to occur.

The event notification system also enables the user of the TCPIP stack to call into the stack for processing only when there are relevant events rather than being forced to periodically call from within a loop at unknown moments.

Without a notification handler the stack user can still call [TCPIP_MAC_EventPendingGet\(\)](#) to see if processing by the stack needed.

This is a default way of adding MAC interrupt processing to the TCP/IP stack.

5.8.16.7.2.7 TCPIP_MAC_HANDLE Type

C

```
typedef const void* TCPIP_MAC_HANDLE;
```

Description

handle to a MAC

5.8.16.7.2.8 TCPIP_MAC_HEAP_CallocF Type

C

```
typedef void* (* TCPIP_MAC_HEAP_CallocF)(TCPIP_MAC_HEAP_HANDLE heapH, size_t nElems, size_t elemSize);
```

Description

calloc function

5.8.16.7.2.9 TCPIP_MAC_HEAP_FreeF Type

C

```
typedef int (* TCPIP_MAC_HEAP_FreeF)(TCPIP_MAC_HEAP_HANDLE heapH, const void* pBuffer);
```

Description

free function

5.8.16.7.2.10 TCPIP_MAC_HEAP_HANDLE Type

C

```
typedef const void* TCPIP_MAC_HEAP_HANDLE;
```

Description

handle to a heap

5.8.16.7.2.11 TCPIP_MAC_HEAP_MallocF Type

C

```
typedef void* (* TCPIP_MAC_HEAP_MallocF)(TCPIP_MAC_HEAP_HANDLE heapH, size_t nBytes);
```

Description

malloc function

5.8.16.7.2.12 TCPIP_MAC_MODULE_CTRL Structure

C

```
typedef struct {
    int nIfs;
    TCPIP_MAC_HEAP_MallocF mallocF;
    TCPIP_MAC_HEAP_CallocF callocF;
    TCPIP_MAC_HEAP_FreeF freeF;
    TCPIP_MAC_HEAP_HANDLE memH;
    TCPIP_MAC_PKT_AllocF pktAllocF;
    TCPIP_MAC_PKT_FreeF pktFreeF;
    TCPIP_MAC_PKT_AckF pktAckF;
    TCPIP_MAC_EventF eventF;
    const void* eventParam;
    unsigned int moduleId;
    int netIx;
    TCPIP_MAC_ACTION macAction;
    TCPIP_MAC_POWER_MODE powerMode;
    TCPIP_MAC_ADDR ifPhyAddress;
    TCPIP_MAC_PROCESS_FLAGS processFlags;
} TCPIP_MAC_MODULE_CTRL;
```

Description

data that's passed as reference to MAC driver module init/deinit.

Members

Members	Description
int nIfs;	permanent data; this data is maintained by the stack for one full session i.e. accross Initialize() -> DeInitialize() calls number of the interfaces supported in this seession
TCPIP_MAC_HEAP_MallocF mallocF;	transient data; contains info for a specific module call allocation functions/parameters
TCPIP_MAC_HEAP_HANDLE memH;	handle to be used in the stack allocation service calls
TCPIP_MAC_PKT_AllocF pktAllocF;	packet allocation functions
TCPIP_MAC_EventF eventF;	function to be used by the MAC for event reporting
const void* eventParam;	parameter to be used when the event function is called
unsigned int moduleId;	module identifier; allows multiple channels/ports, etc. MAC support
int netIx;	index of the current interface

TCPIP_MAC_ACTION macAction;	current action for the MAC/stack
TCPIP_MAC_POWER_MODE powerMode;	the power mode for this interface to go to valid only if stackAction == init/re-init; ignored for de-init
TCPIP_MAC_ADDR ifPhyAddress;	physical address of the interface

5.8.16.7.2.13 TCPIP_MAC_PACKET Type

C

```
typedef struct _tag_TCPIP_MAC_PACKET TCPIP_MAC_PACKET;
```

Description

forward declaration

5.8.16.7.2.14 TCPIP_MAC_PACKET_ACK_FUNC Type

C

```
typedef void (* TCPIP_MAC_PACKET_ACK_FUNC)(TCPIP_MAC_PACKET* pkt, const void* param);
```

Description

This is type TCPIP_MAC_PACKET_ACK_FUNC.

5.8.16.7.2.15 TCPIP_MAC_PACKET_FLAGS Enumeration

C

```
typedef enum {
    TCPIP_MAC_PKT_FLAG_STATIC = 0x0001,
    TCPIP_MAC_PKT_FLAG_TX = 0x0002,
    TCPIP_MAC_PKT_FLAG_SPLIT = 0x0004,
    TCPIP_MAC_PKT_FLAG_QUEUED = 0x0008,
    TCPIP_MAC_PKT_FLAG_UNICAST = 0x0010,
    TCPIP_MAC_PKT_FLAG_BCAST = 0x0020,
    TCPIP_MAC_PKT_FLAG_MCAST = 0x0040,
    TCPIP_MAC_PKT_FLAG_CAST_MASK = 0x0070,
    TCPIP_MAC_PKT_FLAG_CAST_DISABLED = 0x0000,
    TCPIP_MAC_PKT_FLAG_USER = 0x0100
} TCPIP_MAC_PACKET_FLAGS;
```

Description

16 bits only packet flags!

Members

Members	Description
TCPIP_MAC_PKT_FLAG_STATIC = 0x0001	packet/segment can not be dynamically deallocated set when the packet is allocated
TCPIP_MAC_PKT_FLAG_TX = 0x0002	if set, it's an TX packet/segment else is an RX packet
TCPIP_MAC_PKT_FLAG_SPLIT = 0x0004	packet data spans multiple segments - ZC functionality if not set the packet has only one data segment set by the MAC driver when a RX packet spans multiple data segments
TCPIP_MAC_PKT_FLAG_QUEUED = 0x0008	packet data is queued somewhere, cannot be freed flag is set by the packet source when the packet is passed for further processing to a destination cleared by the packet destination when the packet processing was completed.
TCPIP_MAC_PKT_FLAG_UNICAST = 0x0010	MAC updated: it's an unicast packet

TCPIP_MAC_PKT_FLAG_BCAST = 0x0020	MAC updated: it's an broadcast packet
TCPIP_MAC_PKT_FLAG_MCAST = 0x0040	MAC updated: it's an multicast packet
TCPIP_MAC_PKT_FLAG_CAST_MASK = 0x0070	packet cast mask bits
TCPIP_MAC_PKT_FLAG_CAST_DISABLED = 0x0000	if all zeroes MAC packet MCAST/BCAST fields are not updated by the MAC RX process
TCPIP_MAC_PKT_FLAG_USER = 0x0100	available user flags start here

5.8.16.7.2.16 TCPIP_MAC_PACKET_RX_STAT Structure

C

```
typedef struct {
    unsigned chksumOk : 1;
    unsigned pktChecksum : 16;
    unsigned runtPkt : 1;
    unsigned notMeUcast : 1;
    unsigned htMatch : 1;
    unsigned magicMatch : 1;
    unsigned pmMatch : 1;
    unsigned uMatch : 1;
    unsigned bMatch : 1;
    unsigned mMatch : 1;
    unsigned rxBytes : 16;
    unsigned crcError : 1;
    unsigned lenError : 1;
    unsigned lenRange : 1;
    unsigned rxOk : 1;
    unsigned mcast : 1;
    unsigned bcast : 1;
    unsigned rxCtrl : 1;
    unsigned rxVLAN : 1;
} TCPIP_MAC_PACKET_RX_STAT;
```

Description

Received Packet Status

This structure contains the status of a received packet.

Members

Members	Description
unsigned chksumOk : 1;	correct checksum filled in
unsigned pktChecksum : 16;	Packet payload checksum
unsigned runtPkt : 1;	Runt packet received
unsigned notMeUcast : 1;	Unicast, not me packet,
unsigned htMatch : 1;	Hash table match
unsigned magicMatch : 1;	Magic packet match
unsigned pmMatch : 1;	Pattern match match
unsigned uMatch : 1;	Unicast match
unsigned bMatch : 1;	Broadcast match
unsigned mMatch : 1;	Multicast match
unsigned rxBytes : 16;	Received bytes
unsigned crcError : 1;	CRC error in packet
unsigned lenError : 1;	Receive length check error

unsigned lenRange : 1;	Receive length out of range
unsigned rxOk : 1;	Receive OK
unsigned mcast : 1;	Multicast packet
unsigned bcast : 1;	Broadcast packet
unsigned rxCtrl : 1;	Control frame received
unsigned rxVLAN : 1;	Received VLAN tagged frame

Remarks

Not all the MACs have hardware support for the received packet status.

5.8.16.7.2.17 TCPIP_MAC_PKT_ACK_RES Enumeration**C**

```
typedef enum {
    TCPIP_MAC_PKT_ACK_NONE = 0,
    TCPIP_MAC_PKT_ACK_TX_OK = 1,
    TCPIP_MAC_PKT_ACK_RX_OK = 2,
    TCPIP_MAC_PKT_ACK_LINK_DOWN = -1,
    TCPIP_MAC_PKT_ACK_NET_DOWN = -2,
    TCPIP_MAC_PKT_ACK_BUFFER_ERR = -3,
    TCPIP_MAC_PKT_ACK_ARP_TMO = -4,
    TCPIP_MAC_PKT_ACK_ARP_NET_ERR = -5,
    TCPIP_MAC_PKT_ACK_CHKSUM_ERR = -10,
    TCPIP_MAC_PKT_ACK_SOURCE_ERR = -11,
    TCPIP_MAC_PKT_ACK_TYPE_ERR = -12,
    TCPIP_MAC_PKT_ACK_STRUCT_ERR = -13,
    TCPIP_MAC_PKT_ACK_PROTO_DEST_ERR = -14,
    TCPIP_MAC_PKT_ACK_FRAGMENT_ERR = -15,
    TCPIP_MAC_PKT_ACK_PROTO_DEST_CLOSE = -16,
    TCPIP_MAC_PKT_ACK_ALLOC_ERR = -17
} TCPIP_MAC_PKT_ACK_RES;
```

Description

list of return codes for a packet acknowledge function 16 bits only acknowledge results!

Members

Members	Description
TCPIP_MAC_PKT_ACK_NONE = 0	packet result unknown, unspecified TX success code - positive
TCPIP_MAC_PKT_ACK_TX_OK = 1	packet was transmitted successfully RX success code - positive
TCPIP_MAC_PKT_ACK_RX_OK = 2	packet was received/processed successfully TX error codes - negative
TCPIP_MAC_PKT_ACK_LINK_DOWN = -1	packet was dropped because the link was down
TCPIP_MAC_PKT_ACK_NET_DOWN = -2	packet was dropped because the network is down
TCPIP_MAC_PKT_ACK_BUFFER_ERR = -3	packet was dropped because the buffer type is not supported
TCPIP_MAC_PKT_ACK_ARP_TMO = -4	packet was dropped because of an ARP timeout
TCPIP_MAC_PKT_ACK_ARP_NET_ERR = -5	packet associated interface is down or non existent RX error codes - negative
TCPIP_MAC_PKT_ACK_CHKSUM_ERR = -10	packet was dropped because the checksum was incorrect
TCPIP_MAC_PKT_ACK_SOURCE_ERR = -11	packet was dropped because of wrong interface source address
TCPIP_MAC_PKT_ACK_TYPE_ERR = -12	packet was dropped because the type was unknown
TCPIP_MAC_PKT_ACK_STRUCT_ERR = -13	internal packet structure error

TCPIP_MAC_PKT_ACK_PROTO_DEST_ERR = -14	the packet protocol couldn't find a destination for it
TCPIP_MAC_PKT_ACK_FRAGMENT_ERR = -15	the packet too fragmented
TCPIP_MAC_PKT_ACK_PROTO_DEST_CLOSE = -16	the packet destination is closing
TCPIP_MAC_PKT_ACK_ALLOC_ERR = -17	memory allocation error

5.8.16.7.2.18 TCPIP_MAC_PKT_AckF Type

C

```
typedef void (* TCPIP_MAC_PKT_AckF)(TCPIP_MAC_PACKET* pPkt, TCPIP_MAC_PKT_ACK_RES ackRes);
```

Description

acknowledges a packet clears the TCPIP_MAC_PKT_FLAG_QUEUED flag a packet should always have an acknowledgment function packet's ackRes is updated only if the parameter ackRes != TCPIP_MAC_PKT_ACK_NONE.

5.8.16.7.2.19 TCPIP_MAC_PKT_AllocF Type

C

```
typedef TCPIP_MAC_PACKET* (* TCPIP_MAC_PKT_AllocF)(uint16_t pktLen, uint16_t segLoadLen, TCPIP_MAC_PACKET_FLAGS flags);
```

Description

allocates a [TCPIP_MAC_PACKET](#) packet ([TCPIP_MAC_ETHERNET_HEADER](#) always added); pktLen - the size of the packet (it will be 32 bits rounded up) segLoadLen - the payload size for the segment associated to this packet; Payload is always 32 bit aligned if 0 no segment is created/attached to the packet

5.8.16.7.2.20 TCPIP_MAC_PKT_FreeF Type

C

```
typedef void (* TCPIP_MAC_PKT_FreeF)(TCPIP_MAC_PACKET* pPkt);
```

Description

frees a previously allocated packet that neither the packet nor segments marked with TCPIP_MAC_PKT_FLAG_STATIC/TCPIP_MAC_SEG_FLAG_STATIC are not freed Also note that this function does not free explicetely the external segment payload. A payload that was created contiguously when the segment was created will be automatically freed by this function.

5.8.16.7.2.21 TCPIP_MAC_POWER_MODE Enumeration

C

```
typedef enum {
    TCPIP_MAC_POWER_NONE,
    TCPIP_MAC_POWER_FULL,
    TCPIP_MAC_POWER_LOW,
    TCPIP_MAC_POWER_DOWN
} TCPIP_MAC_POWER_MODE;
```

Description

supported MAC power mode state

Members

Members	Description
TCPIP_MAC_POWER_NONE	unknown power mode;
TCPIP_MAC_POWER_FULL	up and running; valid for init/re-init
TCPIP_MAC_POWER_LOW	low power mode; valid for init/re-init
TCPIP_MAC_POWER_DOWN	interface is down;

5.8.16.7.2.22 TCPIP_MAC_PROCESS_FLAGS Enumeration**C**

```
typedef enum {
    TCPIP_MAC_PROCESS_FLAG_NONE = 0x0000,
    TCPIP_MAC_PROCESS_FLAG_RX = 0x0001,
    TCPIP_MAC_PROCESS_FLAG_TX = 0x0002,
    TCPIP_MAC_PROCESS_FLAG_ANY = 0x0100
} TCPIP_MAC_PROCESS_FLAGS;
```

Description

specific MAC process flags multiple flags can be orred

Members

Members	Description
TCPIP_MAC_PROCESS_FLAG_NONE = 0x0000	the stack never has to call the TCPIP_MAC_Process function
TCPIP_MAC_PROCESS_FLAG_RX = 0x0001	the stack has to call the TCPIP_MAC_Process after an RX signal
TCPIP_MAC_PROCESS_FLAG_TX = 0x0002	the stack has to call the TCPIP_MAC_Process after an TX signal
TCPIP_MAC_PROCESS_FLAG_ANY = 0x0100	the stack has to call the TCPIP_MAC_Process after any type of signal

5.8.16.7.2.23 TCPIP_MAC_RES Enumeration**C**

```
typedef enum {
    TCPIP_MAC_RES_OK = 0,
    TCPIP_MAC_RES_PENDING = 1,
    TCPIP_MAC_RES_TYPE_ERR = -1,
    TCPIP_MAC_RES_IS_BUSY = -2,
    TCPIP_MAC_RES_INIT_FAIL = -3,
    TCPIP_MAC_RES_PHY_INIT_FAIL = -4,
    TCPIP_MAC_RES_EVENT_INIT_FAIL = -5,
    TCPIP_MAC_RES_OP_ERR = -6,
    TCPIP_MAC_RES_ALLOC_ERR = -7,
    TCPIP_MAC_RES_INSTANCE_ERR = -8,
    TCPIP_MAC_RES_FRAGMENT_ERR = -9,
    TCPIP_MAC_RES_PACKET_ERR = -10,
    TCPIP_MAC_RES_QUEUE_TX_FULL = -11
} TCPIP_MAC_RES;
```

Description

list of return codes from MAC functions

Members

Members	Description
TCPIP_MAC_RES_OK = 0	operation successful benign operation results - positive codes
TCPIP_MAC_RES_PENDING = 1	operation is pending upon some hardware resource call again to completion error codes - negative
TCPIP_MAC_RES_TYPE_ERR = -1	unsupported type
TCPIP_MAC_RES_IS_BUSY = -2	device is in use
TCPIP_MAC_RES_INIT_FAIL = -3	generic initialization failure
TCPIP_MAC_RES_PHY_INIT_FAIL = -4	PHY initialization failure
TCPIP_MAC_RES_EVENT_INIT_FAIL = -5	Event system initialization failure
TCPIP_MAC_RES_OP_ERR = -6	unsupported operation
TCPIP_MAC_RES_ALLOC_ERR = -7	memory allocation error
TCPIP_MAC_RES_INSTANCE_ERR = -8	already instantiated, initialized error
TCPIP_MAC_RES_FRAGMENT_ERR = -9	too fragmented, RX buffer too small
TCPIP_MAC_RES_PACKET_ERR = -10	unsupported/corrupted packet error
TCPIP_MAC_RES_QUEUE_TX_FULL = -11	TX queue exceeded the limit

5.8.16.7.2.24 TCPIP_MAC_SEGMENT_FLAGS Enumeration**C**

```
typedef enum {
    TCPIP_MAC_SEG_FLAG_STATIC = 0x0001,
    TCPIP_MAC_SEG_FLAG_TX = 0x0002,
    TCPIP_MAC_SEG_FLAG_USER = 0x0100
} TCPIP_MAC_SEGMENT_FLAGS;
```

Description

16 bits only segment flags!

Members

Members	Description
TCPIP_MAC_SEG_FLAG_STATIC = 0x0001	segment can not be dynamically deallocated set when the segment is allocated
TCPIP_MAC_SEG_FLAG_TX = 0x0002	if set, it's an TX segment else is an RX packet available user segment flags start here

5.8.16.7.2.25 TCPIP_MODULE_MAC_97J60_CONFIG Structure**C**

```
typedef struct {
} TCPIP_MODULE_MAC_97J60_CONFIG;
```

Description

This is type TCPIP_MODULE_MAC_97J60_CONFIG.

5.8.16.7.2.26 TCPIP_MODULE_MAC_ENCJ60_CONFIG Structure**C**

```
typedef struct {
} TCPIP_MODULE_MAC_ENCJ60_CONFIG;
```

Description

MAC initialization data Each supported MAC has its own specific init/configuration data

5.8.16.7.2.27 TCPIP_MODULE_MAC_ENCJ600_CONFIG Structure**C**

```
typedef struct {  
} TCPIP_MODULE_MAC_ENCJ600_CONFIG;
```

Description

This is type TCPIP_MODULE_MAC_ENCJ600_CONFIG.

5.8.16.7.2.28 TCPIP_MODULE_MAC_MRF24W_CONFIG Structure**C**

```
typedef struct {  
} TCPIP_MODULE_MAC_MRF24W_CONFIG;
```

Description

This is type TCPIP_MODULE_MAC_MRF24W_CONFIG.

5.8.16.7.2.29 TCPIP_MODULE_MAC_PIC32INT_CONFIG Structure**C**

```
typedef struct {  
    int nTxDescriptors;  
    int rxBuffSize;  
    int nRxDescriptors;  
} TCPIP_MODULE_MAC_PIC32INT_CONFIG;
```

Description

This is type TCPIP_MODULE_MAC_PIC32INT_CONFIG.

Members

Members	Description
int nTxDescriptors;	number of TX descriptors
int rxBuffSize;	size of the corresponding RX buffer
int nRxDescriptors;	number of RX descriptors

5.8.16.8 Files**Files**

Name	Description
tcpip_mac.h	
tcpip_mac_config.h	configuration file

Description

5.8.16.8.1 tcpip_mac.h

MAC Module Defs for Microchip Stack

Enumerations

	Name	Description

5.8.16.8.2 tcpip_mac_config.h

MAC Configuration file

This file contains the MAC module configuration options

Macros

	Name	Description
	<u>EMAC_RX_BUFF_SIZE</u>	size of a RX buffer. should be multiple of 16 this is the size of all receive buffers processed by the ETHC The size should be enough to accomodate any network received packet If the packets are larger, they will have to take multiple RX buffers and the packet manipulation is less efficient #define EMAC_RX_BUFF_SIZE 512
	<u>EMAC_RX_DESCRIPTOR</u>	number of the RX descriptors and RX buffers to be created
	<u>EMAC_RX_FRAGMENTS</u>	MAC maximum number of supported fragments Based on the values of <u>EMAC_RX_MAX_FRAME</u> and <u>EMAC_RX_BUFF_SIZE</u> an incoming frame may span multiple RX buffers (fragments). Note that excessive fragmentation leads to performance degradation. The default and recommended value should be 1. #define EMAC_RX_FRAGMENTS 1 Alternatively you can use the calculation of the number of fragments based on the selected RX sizes:
	<u>EMAC_RX_MAX_FRAME</u>	Maximum MAC supported RX frame size. Any incoming ETH frame that's longer than this size will be discarded. The default value is 1536 (allows for VLAN tagged frames, although the VLAN tagged frames are discarded) Normally you shouldn't need to touch this value unless you know exactly the maximum size of the frames you want to process or you need to control packets fragmentation (together with the <u>EMAC_RX_BUFF_SIZE</u>).
	<u>EMAC_TX_DESCRIPTOR</u>	number of the TX descriptors to be created
	<u>ETH_CFG_10</u>	use/advertise 10 Mbps capability
	<u>ETH_CFG_100</u>	use/advertise 100 Mbps capability
	<u>ETH_CFG_AUTO</u>	use auto negotiation
	<u>ETH_CFG_AUTO_MDIX</u>	use/advertise auto MDIX capability
	<u>ETH_CFG_FDUPLEX</u>	use/advertise full duplex capability
	<u>ETH_CFG_HDUPLEX</u>	use/advertise half duplex capability
	<u>ETH_CFG_LINK</u>	set to 1 if you need to config the link to specific following parameters otherwise the default connection will be attempted depending on the selected PHY
	<u>ETH_CFG_LINK_INIT_DELAY</u>	some PHYs need an initialization delay for insuring that the PHY is ready to transmit data. milliseconds
	<u>ETH_CFG_SWAP_MDIX</u>	use swapped MDIX. else normal MDIX

5.8.17 Manager TCP/IP Stack Library

5.8.17.1 Introduction

Manager TCP/IP Stack Library for Microchip Microcontrollers

This library provides the API of the Manager TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

Handles internal RX packet pre-processing prior to dispatching to upper application layers.

5.8.17.2 Release Notes

MPLAB Harmony Version: v0.70b **Manager TCP/IP Stack Library Version :** 1.0 **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.8.17.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.8.17.4 Using the Library

This topic describes the basic architecture of the Manager TCP/IP Stack Library and provides information and examples on how to use it.

Interface Header File: [tcpip_manager.h](#)

The interface to the Manager TCPIP Stack library is defined in the "[tcpip_manager.h](#)" header file. This file is included by the "tcpip.h" file. Any C language source (.c) file that uses the Manager TCP/IP Stack library should include "tcpip.h".

Library File:

The Manager TCPIP Stack library archive (.a) file installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the TCP/IP Stack interacts with the framework.

5.8.17.4.1 Abstraction Model

This library provides the API of the Manager TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

Manager Software Abstraction Block Diagram

Handles internal RX packet pre-processing prior to dispatching to upper application layers.

5.8.17.4.2 Library Overview

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the MAC module.

Library Interface Section	Description
Task and Initialize Functions	Routines to Initialize and De-Initialize this Module
Network Up/Down/Linked Functions	Routines to Set and Get the Network's Up/Down Status
Network Status and Control Functions	Routines to Set and Get the Various Network Controls
Network Address Status and Control Functions	Routines to Set and Get the Network's Address Status
Network Structure Storage Functions	Network Information Routines.

5.8.17.5 Configuring the Library

The configuration of the Manager TCP/IP Stack is based on the file `sys_config.h`

This header file contains the configuration selection for the Manager TCP/IP Stack. Based on the selections made, the Manager TCP/IP Stack will support or not support selected features. These configuration settings will apply to all instances of the Manager TCP/IP Stack.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.8.17.6 Building the Library

This section list the files that are available in the `\src` of the Manager driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

5.8.17.7 Library Interface

Data Types and Constants

	Name	Description
	TCPIP_LOCAL_MASK_TYPE	types of masks used in the detection of a local/nonlocal network
	TCPIP_NET_HANDLE	a network interface handle

Network Address Status and Control Functions

	Name	Description
	TCPIP_STACK_ModuleGetConfig	This function returns the current configuration data of the stack module specified by the corresponding module ID.
	TCPIP_STACK_NetAddress	
	TCPIP_STACK_NetAddressBcast	
	TCPIP_STACK_NetAddressDnsPrimary	
	TCPIP_STACK_NetAddressDnsPrimarySet	
	TCPIP_STACK_NetAddressDnsSecond	
	TCPIP_STACK_NetAddressDnsSecondSet	
	TCPIP_STACK_NetAddressGateway	
	TCPIP_STACK_NetAddressGatewaySet	
	TCPIP_STACK_NetAddressMac	
	TCPIP_STACK_NetAddressMacSet	
	TCPIP_STACK_NetAddressSet	
	TCPIP_STACK_NetIPv6AddressGet	This function allows the listing of the IPv6 addresses associated with an interface.

Network Status and Control Functions

	Name	Description
	TCPIP_STACK_IndexToNet	

	TCPIP_STACK_NetBIOSName	
	TCPIP_STACK_NetBiosNameSet	
	TCPIP_STACK_NetDefaultGet	
	TCPIP_STACK_NetDefaultSet	
	TCPIP_STACK_NetHandleGet	
	TCPIP_STACK_NetIndexGet	
	TCPIP_STACK_NetMask	
	TCPIP_STACK_NetNameGet	
	TCPIP_STACK_NumberOfNetworksGet	

Network Structure Storage Functions

	Name	Description
	TCPIP_STACK_NetConfigGet	This function dumps the current configuration data of the network interface specified by the corresponding network handle into the supplied buffer.

5.8.17.7.1 Task and Initialize Functions

5.8.17.7.1.1 TCPIP_STACK_Deinitialize Function

C

```
void TCPIP_STACK_Deinitialize();
```

Description

This function performs the de-initialization of the TCPIP stack

Preconditions

None

Returns

None

Side Effects

None

Remarks

None

5.8.17.7.1.2 TCPIP_STACK_Initialize Function

C

```
bool TCPIP_STACK_Initialize(
    const TCPIP_NETWORK_CONFIG* pNetConf,
    int nNets,
    const TCPIP_STACK_MODULE_CONFIG* pModConfig,
    int nModules
);
```

Description

The function initializes the stack. If an error occurs, the SYS_ERROR() is called and the function de-initialize itself and will return false.

Preconditions

None

Parameters

Parameters	Description
pNetConf	pointer to an array of TCPIP_NETWORK_CONFIG to support
nNets	number of network configurations in the array
pModConfig	pointer to an array of TCPIP_STACK_MODULE_CONFIG
nModules	number of modules to initialize

Returns

true if Stack and its componets are initialized false otherwise

Side Effects

None

Remarks

This function must be called before any of the stack or its component routines are used.

New TCPIP_NETWORK_CONFIG types should be added/removed at run time for implementations that support dynamic network interface creation.

5.8.17.7.1.3 TCPIP_STACK_SetLocalMasks Function

C

```
bool TCPIP_STACK_SetLocalMasks(  
    TCPIP_NET_HANDLE netH,  
    uint32_t andMask,  
    uint32_t orMask  
);
```

Description

This function sets the masks used in the stack decision of a destination address being a local or nonlocal address. These masks will be used when the corresponding mask type is set to TCPIP_LOCAL_MASK_SET.

Preconditions

None

Parameters

Parameters	Description
netH	handle of the interface to use
andMask	AND mask to use for local network detection, big endian (BE) format
orType	OR mask to use for local network detection , BE format

Returns

if interface exists then this function will set the masks and return true. otherwise it will return false

Remarks

None

Example

```
TCPIP_NET_HANDLE netH = TCPIP_STACK_NetHandleGet("PIC32INT"); TCPIP_STACK_SetLocalMasks(netH, 0x0101a0c0,  
0x0);
```

5.8.17.7.1.4 TCPIP_STACK_SetLocalMasksType Function

C

```
bool TCPIP_STACK_SetLocalMasksType(  
    TCPIP_NET_HANDLE netH,  
    TCPIP_LOCAL_MASK_TYPE andType,  
    TCPIP_LOCAL_MASK_TYPE orType  
);
```

Description

This function sets the types of masks used in the stack decision of a destination address being a local or nonlocal address. For example, when a TCP connection is made, the advertised MSS usually has different values for local versus nonlocal networks.

In order to decide if a destination IP address (destAdd) is local to a network interface (having the netAdd address) the following calculation is performed: if $((\text{destAdd} \& \text{andMask}) | \text{orMask}) == ((\text{netAdd} \& \text{andMask}) | \text{orMask})$ then the destination address is considered to be a local address. else the destination address is nonlocal.

This function sets the types of masks used for the AND and OR operations, as follows:

- TCPIP_LOCAL_MASK_ZERO: use the all 0's mask (0x00000000)
- TCPIP_LOCAL_MASK_ONE: use the all 1's mask (0xffffffff)
- TCPIP_LOCAL_MASK_NET: use the current network mask
- TCPIP_LOCAL_MASK_SET: use a mask that's set by the application There are operations to set a specific AND and OR masks

Using different valuse for the AND and OR masks an application can select various destination networks to be considered as local/nonlocal:

- only the own network
- any network
- no network
- specific (range of) networks
- etc.

Preconditions

None

Parameters

Parameters	Description
netH	handle of the interface to use
andType	AND type of mask to use for local network detection
orType	OR type of mask to use for local network detection

Returns

if interface exists then this function will set the mask types and return true. otherwise it will return false

Remarks

The default value for both AND and OR masks is set to TCPIP_LOCAL_MASK_ZERO so that any destination network is considered to be local!

Example

```
TCPIP_NET_HANDLE netH = TCPIP_STACK_NetHandleGet("PIC32INT"); TCPIP_STACK_SetLocalMasksType(netH,  
TCPIP_LOCAL_MASK_NET, TCPIP_LOCAL_MASK_ZERO);
```

5.8.17.7.1.5 TCPIP_STACK_Task Function

C

```
void TCPIP_STACK_Task();
```

Preconditions

TCPIP_STACK_Initialize() is already called.

Returns

Stack Finite-state Machine (FSM) is executed.

Side Effects

None

Remarks

This FSM checks for new incoming packets, and routes it to appropriate stack components. It also performs timed operations.

This function must be called periodically to ensure timely responses.

5.8.17.7.2 Network Status and Control Functions

5.8.17.7.2.1 TCPIP_STACK_IndexToNet Function

C

```
TCPIP_NET_HANDLE TCPIP_STACK_IndexToNet(
    int netIx
);
```

Preconditions

TCPIP stack should have been initialized by TCPIP_STACK_Initialize()

Parameters

Parameters	Description
netH	Interface handle.

Returns

Resolves an index to an network handle.

Side Effects

None

Remarks

None

5.8.17.7.2.2 TCPIP_STACK_NetBIOSName Function

C

```
const char* TCPIP_STACK_NetBIOSName(
    TCPIP_NET_HANDLE netH
);
```

Preconditions

None

Parameters

Parameters	Description
netH	Interface handle to get name of.

Returns

if interface is enabled then it returns the NetBIOS name of that interface else return 0

Remarks

None

Example

```
TCPIP_NET_HANDLE netH = TCPIP_STACK_NetHandleGet("PIC32INT"); const char* biosName =  
TCPIP_STACK_NetBIOSName(netH);
```

5.8.17.7.2.3 TCPIP_STACK_NetBiosNameSet Function**C**

```
bool TCPIP_STACK_NetBiosNameSet(  
    TCPIP_NET_HANDLE netH,  
    const char* biosName  
);
```

Preconditions

None

Parameters

Parameters	Description
netH	Interface handle to set name of.

Returns

if interface exists then it sets the NetBIOS name of that interface and returns true else return false

Remarks

See Important Note above!

Example

```
TCPIP_NET_HANDLE netH = TCPIP_STACK_NetHandleGet("PIC32INT"); TCPIP_STACK_NetBiosNameSet(netH,  
myBiosName);
```

5.8.17.7.2.4 TCPIP_STACK_NetDefaultGet Function**C**

```
TCPIP_NET_HANDLE TCPIP_STACK_NetDefaultGet();
```

Preconditions

TCPIP stack should have been initialized by [TCPIP_STACK_Initialize\(\)](#)

Returns

The default net interface for multi-homed hosts

Side Effects

None

Remarks

Function to dynamically change the default interface will be added.

5.8.17.7.2.5 TCPIP_STACK_NetDefaultSet Function**C**

```
bool TCPIP_STACK_NetDefaultSet(  
    TCPIP_NET_HANDLE netH  
);
```

Preconditions

None

Parameters

Parameters	Description
netH	Interface handle.

Returns

true if success false if failed (the old interface does not change)

Side Effects

None

Remarks

sets the default interface

5.8.17.7.2.6 TCPIP_STACK_NetHandleGet Function**C**

```
TCPIP_NET_HANDLE TCPIP_STACK_NetHandleGet(  
    const char* interface  
);
```

Preconditions

TCPIP stack should have been initialized by [TCPIP_STACK_Initialize\(\)](#)

Parameters

Parameters	Description
interface	The names specified in tcpip_config.h::TCPIP_NETWORK_CONFIG.

Returns

Resolves an interface name to a handle.

Side Effects

None

Remarks

None

Example

```
TCPIP\_NET\_HANDLE hNet = TCPIP_STACK_NetHandleGet("PIC32INT");
```

5.8.17.7.2.7 TCPIP_STACK_NetIndexGet Function

C

```
int TCPIP_STACK_NetIndexGet(  
    TCPIP_NET_HANDLE hNet  
);
```

Preconditions

None

Parameters

Parameters	Description
hNet	Interface handle.

Returns

Index of this entry in the stack network handles

Side Effects

None

Remarks

None

5.8.17.7.2.8 TCPIP_STACK_NetMask Function

C

```
uint32_t TCPIP_STACK_NetMask(  
    TCPIP_NET_HANDLE netH  
);
```

Preconditions

None

Parameters

Parameters	Description
netH	Interface handle to get mask of.

Returns

if interface is enabled then it returns the IP address mask of that interface else return 0

Remarks

None

Example

```
TCPIP_NET_HANDLE netH = TCPIP_STACK_NetHandleGet("PIC32INT"); uint32_t subMask = TCPIP_STACK_NetMask(netH);
```

5.8.17.7.2.9 TCPIP_STACK_NetNameGet Function

C

```
const char* TCPIP_STACK_NetNameGet(  
    TCPIP_NET_HANDLE netH  
);
```

Preconditions

TCPIP stack should have been initialized by [TCPIP_STACK_Initialize\(\)](#)

Parameters

Parameters	Description
netH	Interface handle to get the name of.

Returns

it returns the name associated to that interface handle returns 0 if no such name

Side Effects

None

Remarks

None

Example

```
TCPIP\_NET\_HANDLE netH = TCPIP\_STACK\_IndexToNet(0); const char* netName = TCPIP\_STACK\_NetNameGet(netH);
```

5.8.17.7.2.10 TCPIP_STACK_NumberOfNetworksGet Function

C

```
int TCPIP\_STACK\_NumberOfNetworksGet();
```

Preconditions

TCPIP stack should have been initialized by [TCPIP_STACK_Initialize\(\)](#)

Returns

Number of network interfaces

Side Effects

None

Remarks

None

5.8.17.7.3 Network Up/Down/Linked Functions

5.8.17.7.3.1 TCPIP_STACK_NetDown Function

C

```
bool TCPIP\_STACK\_NetDown(  
    TCPIP\_NET\_HANDLE netH  
);
```

Description

This function performs the de-initialization of a net interface

Preconditions

None

Parameters

Parameters	Description
neth	Interface handle.

Returns

true if success false if no such network

Side Effects

None

Remarks

None

5.8.17.7.3.2 TCPIP_STACK_NetIsLinked Function**C**

```
bool TCPIP_STACK_NetIsLinked(  
    TCPIP_NET_HANDLE hNet  
);
```

Preconditions

None

Parameters

Parameters	Description
hNet	Interface handle.

Returns

true if interface exists and the corresponding MAC is linked false otherwise

Side Effects

None

Remarks

None

5.8.17.7.3.3 TCPIP_STACK_NetIsUp Function**C**

```
bool TCPIP_STACK_NetIsUp(  
    TCPIP_NET_HANDLE hNet  
);
```

Preconditions

None

Parameters

Parameters	Description
hNet	Interface handle.

Returns

true if interface exists and is enabled false otherwise

Side Effects

None

Remarks

None

5.8.17.7.3.4 TCPIP_STACK_NetUp Function

C

```
bool TCPIP_STACK_NetUp(
    TCPIP_NET_HANDLE neth,
    const TCPIP_NETWORK_CONFIG* pUsrConfig
);
```

Description

This function brings the desired interface up.

Preconditions

None

Parameters

Parameters	Description
neth	Interface handle.
pUsrConfig	pointer to a TCPIP_NETWORK_CONFIG for the interface initialization

Returns

true if success false if no such network or an error occurred

Side Effects

None

Remarks

None

5.8.17.7.4 Network Address Status and Control Functions

5.8.17.7.4.1 TCPIP_STACK_ModuleGetConfig Function

C

```
size_t TCPIP_STACK_ModuleGetConfig(
    TCPIP_STACK_MODULE modId,
    void* configBuff,
    size_t buffSize,
    size_t* pNeededSize
);
```

Description

This function returns the current configuration data of the stack module specified by the corresponding module ID.

Preconditions

None

Parameters

Parameters	Description
modId	the ID that identifies the requested module
configBuff	pointer to a buffer that will receive the configuration data. If this pointer is 0, just the pNeededSize will be updated.
buffSize	size of the provided buffer
pNeededSize	pointer to an address to store the number of bytes needed to store this module configuration data. Can be NULL if not needed.

Returns

number of bytes copied to the user buffer: -1 if the module ID is invalid, 0 if the configBuff is NULL or buffSize is less than required, >0 if the call succeeded and the configuration was copied.

Remarks

None

Example

```
uint8_t      configBuffer[200];      size_t      configSize;      size_t      copiedSize;      copiedSize      =
TCPIP_STACK_ModuleGetConfig(TCPIP_MODULE_MAC_MRF24W, configBuffer, sizeof(configBuffer), &configSize);
```

5.8.17.7.4.2 TCPIP_STACK_NetAddress Function**C**

```
uint32_t TCPIP_STACK_NetAddress(
    TCPIP_NET_HANDLE netH
);
```

Preconditions

TCPIP stack should have been initialized by [TCPIP_STACK_Initialize\(\)](#)

Parameters

Parameters	Description
netH	Interface handle to get address of.

Returns

if interface is enabled then it returns the IP address of that interface else return 0

Side Effects

None

Remarks

None

Example

```
TCPIP\_NET\_HANDLE netH = TCPIP\_STACK\_NetHandleGet("PIC32INT"); uint32_t ipAdd = TCPIP_STACK_NetAddress(netH);
```

5.8.17.7.4.3 TCPIP_STACK_NetAddressBcast Function**C**

```
uint32_t TCPIP_STACK_NetAddressBcast(
    TCPIP_NET_HANDLE netH
);
```

Preconditions

TCPIP stack should have been initialized by [TCPIP_STACK_Initialize\(\)](#)

Parameters

Parameters	Description
netH	Interface handle to get address of.

Returns

if interface is enabled then it returns the broadcast IP address mask of that interface else return 0

Side Effects

None

Remarks

None

5.8.17.7.4.4 TCPIP_STACK_NetAddressDnsPrimary Function**C**

```
uint32_t TCPIP_STACK_NetAddressDnsPrimary(  
    TCPIP_NET_HANDLE netH  
);
```

Preconditions

TCPIP stack should have been initialized by [TCPIP_STACK_Initialize\(\)](#)

Parameters

Parameters	Description
netH	Interface handle to get the DNS address of.

Returns

the primary DNS address if succes false if not such interface or interface is down

Side Effects

None

Remarks

None

Example

```
TCPIP\_NET\_HANDLE netH = TCPIP\_STACK\_NetHandleGet("PIC32INT"); myIPAddress =  
TCPIP\_STACK\_NetAddressDnsPrimary(netH);
```

5.8.17.7.4.5 TCPIP_STACK_NetAddressDnsPrimarySet Function**C**

```
bool TCPIP_STACK_NetAddressDnsPrimarySet(  
    TCPIP_NET_HANDLE netH,  
    IPV4_ADDR* ipAddress  
);
```

Preconditions

TCPIP stack should have been initialized by [TCPIP_STACK_Initialize\(\)](#)

Parameters

Parameters	Description
netH	Interface handle to set the DNS address of.
ipAddress	IP address to set

Returns

true if succes false if not such interface

Side Effects

None

Remarks

See Important Note above!

Example

```
TCPIP\_NET\_HANDLE netH = TCPIP\_STACK\_NetHandleGet("PIC32INT"); TCPIP\_STACK\_NetAddressDnsPrimarySet(netH,  
&myIPAddress);
```

5.8.17.7.4.6 TCPIP_STACK_NetAddressDnsSecond Function**C**

```
uint32_t TCPIP\_STACK\_NetAddressDnsSecond(  
    TCPIP\_NET\_HANDLE netH  
);
```

Preconditions

TCPIP stack should have been initialized by [TCPIP_STACK_Initialize\(\)](#)

Parameters

Parameters	Description
netH	Interface handle to get the DNS address of.

Returns

the secondary DNS address if succes false if not such interface or interface is down

Side Effects

None

Remarks

None

Example

```
TCPIP\_NET\_HANDLE netH = TCPIP\_STACK\_NetHandleGet("PIC32INT"); myIPAddress =  
TCPIP\_STACK\_NetAddressDnsSecond(netH);
```

5.8.17.7.4.7 TCPIP_STACK_NetAddressDnsSecondSet Function**C**

```
bool TCPIP\_STACK\_NetAddressDnsSecondSet(  
    TCPIP\_NET\_HANDLE netH,  
    IPV4\_ADDR\* ipAddress  
);
```

Preconditions

TCPIP stack should have been initialized by [TCPIP_STACK_Initialize\(\)](#)

Parameters

Parameters	Description
netH	Interface handle to set the secondary DNS address of.
ipAddress	IP address to set

Returns

true if succes false if not such interface

Side Effects

None

Remarks

See Important Note above!

Example

```
TCPIP\_NET\_HANDLE netH = TCPIP\_STACK\_NetHandleGet("PIC32INT"); TCPIP\_STACK\_NetAddressDnsSecondSet(netH,  
&myIPAddress);
```

5.8.17.7.4.8 TCPIP_STACK_NetAddressGateway Function**C**

```
uint32_t TCPIP\_STACK\_NetAddressGateway(  
    TCPIP\_NET\_HANDLE netH  
);
```

Preconditions

TCPIP stack should have been initialized by [TCPIP_STACK_Initialize\(\)](#)

Parameters

Parameters	Description
netH	Interface handle to get address of.

Returns

if interface is enabled then it returns the gateway address of that interface else return 0

Side Effects

None

Remarks

None

Example

```
TCPIP\_NET\_HANDLE netH = TCPIP\_STACK\_NetHandleGet("PIC32INT"); uint32_t ipAdd =  
TCPIP\_STACK\_NetAddressGateway(netH);
```

5.8.17.7.4.9 TCPIP_STACK_NetAddressGatewaySet Function**C**

```
bool TCPIP\_STACK\_NetAddressGatewaySet(
```

```
    TCPIP_NET_HANDLE netH,  
    IPV4_ADDR* ipAddress  
);
```

Preconditions

TCPIP stack should have been initialized by [TCPIP_STACK_Initialize\(\)](#)

Parameters

Parameters	Description
netH	Interface handle to set the gateway address of.
ipAddress	IP address to set

Returns

true if succes false if not such interface

Side Effects

None

Remarks

See Important Note above!

Example

```
TCPIP\_NET\_HANDLE netH = TCPIP\_STACK\_NetHandleGet("PIC32INT"); TCPIP\_STACK\_NetAddressGatewaySet(netH,  
&myIPAddress);
```

5.8.17.7.4.10 TCPIP_STACK_NetAddressMac Function

C

```
const uint8_t* TCPIP\_STACK\_NetAddressMac(  
    TCPIP_NET_HANDLE netH  
);
```

Preconditions

None

Parameters

Parameters	Description
netH	Interface handle to get the address of.

Returns

if interface is enabled then it returns a constant pointer to the MAC address of that interface else return 0

Remarks

None

Example

```
TCPIP\_NET\_HANDLE netH = TCPIP\_STACK\_NetHandleGet("PIC32INT"); const TCPIP\_MAC\_ADDR\* pAdd =  
TCPIP\_STACK\_NetAddressMac(netH);
```

5.8.17.7.4.11 TCPIP_STACK_NetAddressMacSet Function

C

```
bool TCPIP\_STACK\_NetAddressMacSet(  
    TCPIP_NET_HANDLE netH,
```

```
    const TCPIP_MAC_ADDR* pAddr  
);
```

Preconditions

None

Parameters

Parameters	Description
netH	Interface handle to set the address of.

Returns

if interface is enabled then it returns a constant pointer to the MAC address of that interface else return 0

Remarks

See Important Note above!

Example

```
TCPIP\_NET\_HANDLE netH = TCPIP\_STACK\_NetHandleGet("PIC32INT"); TCPIP\_STACK\_NetAddressMacSet(netH,  
&myMacAddress);
```

5.8.17.7.4.12 TCPIP_STACK_NetAddressSet Function**C**

```
bool TCPIP_STACK_NetAddressSet(  
    TCPIP_NET_HANDLE netH,  
    IPV4_ADDR* ipAddress,  
    IPV4_ADDR* mask,  
    bool setDefault  
);
```

Preconditions

TCPIP stack should have been initialized by [TCPIP_STACK_Initialize\(\)](#)

Parameters

Parameters	Description
netH	Interface handle to set address of.
ipAddress	IP address to set (could be NULL to set only the mask)
mask	corresponding network mask to set (could be NULL to set only the IP address)
setDefault	if true, the interface default address/mask is also set

Returns

true if succes false if not such interface

Side Effects

None

Remarks

See Important Note above!

This function sets the associated network IP address and/or mask. If you're changing the network then it's preferred that you set both these values simultaneously to avoid having the stack running with a mismatch between its IP address and mask.

Example

```
TCPIP\_NET\_HANDLE netH = TCPIP\_STACK\_NetHandleGet("PIC32INT"); TCPIP\_STACK\_NetAddressSet(netH,  
&myIPAddress);
```

5.8.17.7.4.13 TCPIP_STACK_NetIPv6AddressGet Function

C

```
IPV6_ADDR_HANDLE TCPIP_STACK_NetIPv6AddressGet(
    TCPIP_NET_HANDLE netH,
    IPV6_ADDR_TYPE addType,
    IPV6_ADDR_STRUCT* pAddStruct,
    IPV6_ADDR_HANDLE addHandle
);
```

Description

This function allows the listing of the IPv6 addresses associated with an interface.

Preconditions

None

Parameters

Parameters	Description
netH	handle of the interface to retrieve the addresses for
addType	type of address to request: IPV6_ADDR_TYPE_UNICAST and IPV6_ADDR_TYPE_MULTICAST supported for now
pAddStruct	structure provided by the user that will be filled with corresponding IPV6_ADDR_STRUCT data
addHandle	an address handle that allows iteration across multiple IPv6 addresses.
On the first call	has to be 0; it will begin the listing of the IPv6 addresses
On subsequent calls	has to be a handle previously returned by a call to this function

Returns

- a non NULL IPV6_ADDR_HANDLE if an valid IPv6 address was found and the pAddStruct structure was filled with data
- 0 if no other IPv6 exists or if the supplied IPV6_ADDR_HANDLE is invalid

Remarks

None

Example

```
IPV6_ADDR_STRUCT    currAddr;    IPV6_ADDR_HANDLE    currHandle;    TCPIP_NET_HANDLE    hNet    =
TCPIP_STACK_NetHandleGet("PIC32INT"); char ipv6AddBuff[44];

currHandle = 0; do { currHandle = TCPIP_STACK_NetIPv6AddressGet(netH, IPV6_ADDR_TYPE_UNICAST, &currAddr,
currHandle); if(currHandle) { // have a valid address; display it TCPIP_HELPER_IPv6AddressToString(&currAddr.address,
ipv6AddBuff, sizeof(ipv6AddBuff)); } }while(currHandle != 0);
```

5.8.17.7.5 Network Structure Storage Functions

5.8.17.7.5.1 TCPIP_STACK_NetConfigGet Function

C

```
size_t TCPIP_STACK_NetConfigGet(
    TCPIP_NET_HANDLE netH,
    void* configStoreBuff,
    size_t configStoreSize,
    size_t* pNeededSize
);
```

Description

This function dumps the current configuration data of the network interface specified by the corresponding network handle into the supplied buffer.

Preconditions

None

Parameters

Parameters	Description
netH	the handle that identifies the requested interface
configStoreBuff	pointer to a buffer that will receive the current configuration data. All the data that's needed to restore a TCPIP_NETWORK_CONFIG structure is stored in this buffer. Can be NULL if only the storage size is needed.
configStoreSize	size of the supplied buffer
pNeededSize	pointer to store the size needed for storage; Can be NULL if not needed

Returns

-1 if the interface is invalid or the stack is not initialized 0 if no data is copied (no supplied buffer or buffer too small) >0 for success, indicating the amount of data copied.

Remarks

The function is a helper for retrieving the network configuration data. Its companion function, [TCPIP_STACK_NetConfigSet](#), restores the TCPIP_NETWORK_CONFIG from the dump buffer.

Currently the data is saved in plain binary format into the supplied buffer. However the application must not make use of this assumption as it may change in the future releases (some compression scheme may be implemented).

Example

```
uint8_t currConfig[100]; size_t neededSize, result; TCPIP\_NET\_HANDLE hNet = TCPIP\_STACK\_NetHandleGet("PIC32INT");
result = TCPIP_STACK_NetConfigGet(hNet, currConfig, sizeof(currConfig), &neededSize); if(result > 0) { // store the currConfig
to some external storage }
```

5.8.17.7.5.2 TCPIP_STACK_NetConfigSet Function**C**

```
TCPIP_NETWORK_CONFIG* TCPIP\_STACK\_NetConfigSet(
    void* configStoreBuff,
    void* netConfigBuff,
    size_t buffSize,
    size_t* pNeededSize
);
```

Description

This function restores data from a previously dump buffer and updates the supplied interface configuration. All the data is recovered and constructed into the netConfigBuff (supposing this buffer is large enough). If this operation succeeded, the netConfigBuff can be safely cast to a (TCPIP_NETWORK_CONFIG*).

The structure of the netConfigBuff is as follows:

- a TCPIP_NETWORK_CONFIG sturcture is created at the very beginning of the buffer
- all the needed fields that are part of the TCPIP_NETWORK_CONFIG will be placed in the buffer itself.

Preconditions

None

Parameters

Parameters	Description
configStoreBuff	pointer to a buffer that received configuration data from a TCPIP_STACK_NetConfigGet call.
netConfigBuff	pointer to a buffer that will receive the TCPIP_NETWORK_CONFIG data
buffSize	size of the supplied netConfigBuff buffer
pNeededSize	pointer to store the size needed for storage; Can be NULL if not needed

Returns

a valid TCPIP_NETWORK_CONFIG pointer (netConfigBuff) if the netConfigBuff is successfully updated 0 - if the netConfigBuff is not supplied or not big enough

If supplied, the pNeededSize will be updated with the actual size that's needed for the netConfigBuff

Remarks

The function is a helper for being able to restore the configuration data. Its companion function, [TCPIP_STACK_NetConfigGet](#), saves the TCPIP_NETWORK_CONFIG to a dump buffer.

Example

```
uint8_t currConfig[100]; uint8_t restoreBuff[100]; size_t neededSize, result; TCPIP\_NET\_HANDLE hNet =
TCPIP\_STACK\_NetHandleGet("PIC32INT"); result = TCPIP\_STACK\_NetConfigGet(hNet, currConfig, sizeof(currConfig),
&neededSize); if(result > 0) { // store the currConfig buffer to some external storage (neededSize bytes needed)

// later on restore the configuration TCPIP_NETWORK_CONFIG* netConfig; // extract the network configuration from the
previously saved buffer netConfig = TCPIP_STACK_NetConfigSet(currConfig, restoreBuff, sizeof(restoreBuff), neededSize);
if(netConfig) { // use this netConfig to initialize a network interface TCPIP\_STACK\_NetUp(hNet, netConfig); }
```

5.8.17.7.5.3 TCPIP_STACK_NetMACId Function**C**

```
TCPIP_STACK_MODULE TCPIP\_STACK\_NetMACId(
    TCPIP\_NET\_HANDLE netH
);
```

Description

This function returns the module ID of the MAC that's attached to the specified network interface.

Preconditions

None

Parameters

Parameters	Description
netH	handle of the interface to use

Returns

a TCPIP_STACK_MODULE ID that belongs to the MAC of that network interface.

Remarks

None

Example

```
TCPIP\_NET\_HANDLE netH = TCPIP\_STACK\_NetHandleGet("PIC32INT"); TCPIP\_STACK\_MODULE modId =
TCPIP\_STACK\_NetMACId(netH); if(modId == TCPIP\_MODULE\_MAC\_PIC32INT) { // an internal PIC32 MAC attached to this
```

interface }

5.8.17.7.6 Data Types and Constants

5.8.17.7.6.1 TCPIP_LOCAL_MASK_TYPE Enumeration

C

```
typedef enum {
    TCPIP_LOCAL_MASK_ZERO,
    TCPIP_LOCAL_MASK_ONE,
    TCPIP_LOCAL_MASK_NET,
    TCPIP_LOCAL_MASK_SET
} TCPIP_LOCAL_MASK_TYPE;
```

Description

types of masks used in the detection of a local/nonlocal network

Members

Members	Description
TCPIP_LOCAL_MASK_ZERO	use an all zero network mask
TCPIP_LOCAL_MASK_ONE	use an all ones network mask
TCPIP_LOCAL_MASK_NET	use the current network mask
TCPIP_LOCAL_MASK_SET	use the set value for the network mask there are operations available that set the local/nonlocal detection network mask

5.8.18 NBNS TCP/IP Stack Library

5.8.18.1 Introduction

NetBIOS (NBNS) TCP/IP Stack Library

for

Microchip Microcontrollers

This library provides the API of the NBNS TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

The NetBIOS Name Service protocol associates host names with IP addresses, similarly to DNS, but on the same IP subnet. Practically, this allows the assignment of human-name hostnames to access boards on the same subnet. For example, in the "TCP/IP Demo App" demonstration project, the demo board is programmed with the human name 'mchpboard' so it can be accessed directly instead of with its IP address.

5.8.18.2 Release Notes

MPLAB Harmony Version: v0.70b **NBNS TCP/IP Stack Library Version :** 1.0 **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.8.18.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.8.18.4 Using the Library

This topic describes the basic architecture of the NBNS TCP/IP Stack Library and provides information and examples on how to use it.

Interface Header File: [nbns.h](#)

The interface to the NBNS TCPIP Stack library is defined in the "[nbns.h](#)" header file. This file is included by the "tcpip.h" file. Any C language source (.c) file that uses the NBNS TCP/IP Stack library should include "tcpip.h".

Library File:

The NBNS TCPIP Stack library archive (.a) file installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the TCP/IP Stack interacts with the framework.

5.8.18.4.1 Abstraction Model

This library provides the API of the NBNS TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description**NBNS Software Abstraction Block Diagram**

Note: This image was not available at time of release and will be added in a future release of MPLAB Harmony.

5.8.18.4.2 Library Overview

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the NBNS module.

Library Interface Section	Description
Data Types and Constants	This section provides various definitions describing This API

5.8.18.5 Configuring the Library

Macros

	Name	Description
	NBNS_PORT	NetBIOS Name Service port

Description

The configuration of the NBNS TCP/IP Stack is based on the file tcpip_config.h

This header file contains the configuration selection for the NBNS TCP/IP Stack. Based on the selections made, the NBNS TCP/IP Stack will support or not support selected features. These configuration settings will apply to all instances of the NBNS TCP/IP Stack.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.8.18.5.1 NBNS_PORT Macro

C

```
#define NBNS_PORT (137u)
```

Description

NetBIOS Name Service port

5.8.18.6 Building the Library

This section list the files that are available in the \src of the NBNS driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

5.8.19 NDP TCP/IP Stack Library

5.8.19.1 Introduction

NDP TCP/IP Stack Library

for

Microchip Microcontrollers

This library provides the API of the NDP (Neighbor Discovery Protocol) TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

This document provides NDP(Neighbor Discovery Protocol) for IP version 6.IPv6 nodes on same link use neighbor discovery to discover each other's presence. RFC - 4861.

It is responsible for

1. Address Auto configuration of nodes
2. Discovery of other nodes in the link(It can be a Router Discovery or Neighbor Discovery)
3. Determining the link layer address of other nodes
4. Duplicate address detection (DAD)
5. Finding available routers and Domain Name System (DNS) servers
6. Address Prefix discovery
7. Parameter Discovery (Such as Link MTU or Hop limit)

Comparing with IPv4

- NDP is a substitute of ARP (Address Resolution protocol). This new mechanism uses a mix of ICMPv6 and multicast addresses to discover the IPv6 node on same link.
- NDP includes Neighbor Unreachability Detection (NUD) , thus improving the robustness of packet delivery.
- Unlike IPv4 broadcast addresses, IPv6 address resolution multicasts are spread over 4 billion (2^{32}) multicast addresses, greatly reducing address resolution-related interrupts on nodes other than the target. Moreover, non-IPv6 machines should not be interrupted at all.
- Neighbor Discovery defines five different ICMPv6 packet types.

Five different ICMPv6 Packet types -

1. **Router Solicitation** - Hosts inquire with Router Solicitation message to locate routers on the attached link.
2. **Router Advertisement** - Router advertise their presence periodically to all the nodes or in response to the Router Solicitation

message.

3. **Neighbor Solicitation** - Neighbor solicitations are used by nodes to determine the Link Layer address of a neighbor, or to verify that a neighbor is still reachable via a cached Link Layer address.
4. **Neighbor Advertisement** - Neighbor advertisements are used by nodes to respond to a Neighbor Solicitation message
5. **Redirect** - Routers may inform hosts of a better first hop router for a destination.

5.8.19.2 Release Notes

MPLAB Harmony Version: v0.70b **NDP TCP/IP Stack Library Version :** 1.0 **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.8.19.3 SW License Agreement

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.8.19.4 Using the Library

This topic describes the basic architecture of the NDP TCP/IP Stack Library and provides information and examples on how to use it.

Interface Header File: [ndp.h](#)

The interface to the NDP TCP/IP Stack Library is defined in the "[ndp.h](#)" header file. Any C language source (.c) file that uses the NDP TCP/IP library should include "IPv6.h", [icmpv6.h](#) and [ndp.h](#)".

Library File:

The NDP TCP/IP Stack library archive (.a) file installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the TCP/IP Stack Library interacts with the framework.

5.8.19.4.1 Abstraction Model

This library provides the API of the NDP TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

NDP with IPv6 Software Abstraction Block Diagram

This module provides software abstraction of the IPv6 module existent in any TCP/IP Stack implementation. It removes the overhead of address resolution from all other modules in the stack.

IPv6 Block Diagram

Link Layer Neighbor Discovery

1) Using the address FEC0::1:0:0:1 :A, node A wants to deliver packets to destination node B using the IPv6 address FEC0::1 :0:0:1 :B on the same local link. However, node A does not know node B's link-layer address. Node A sends an ICMPv6 Type

135 message (neighbor solicitation) on the local link using its site-local address FEC0::1:0:0:1:A as the IPv6 source address, the solicited-node multicast address FF02::1 :FF01:B corresponding to the target address FEC0::1 :0:0:1 :B as the destination IPv6 address, and the source link-layer address 00:04:a3:13:12:b4 of the sender, node A, as data of the ICMPv6 message. The source link-layer address of this frame is the link-layer address 00:04:a3:13:12:b4 of node A. The destination link-layer address 33:33:FF:01 :00:0B of this frame uses multicast mapping of the destination IPv6 address FF02::1 :FF01:B.

2) Node B, which is listening to the local link for multicast addresses, intercepts the neighbor solicitation message because the destination IPv6 address FF02::1:FF01:B represents the solicited-node multicast address corresponding to its IPv6 address FEC0::1:0:0:1:B.

3) Node B replies by sending a neighbor advertisement message using its site-local address FEC0::1 :0:0:1 :B as the IPv6 source address and the site-local address FEC0::1 :0:0:1 :A as the destination IPv6 address. It also includes its link-layer address 00:04:a3:13:12:b5 in the ICMPv6 message. After receiving neighbor solicitation and neighbor advertisement messages, node A and node B know each other's link-layer addresses.

Learned link-layer addresses are kept in a neighbor discovery table (neighbor cache). Therefore, the nodes can communicate on the local link. The neighbor solicitation message is also used by nodes to verify the reachability of neighbor nodes in the neighbor discovery table (neighbor cache). However, the unicast addresses of the neighbor nodes are used as destination IPv6 addresses in ICMPv6 messages instead of solicited-node multicast addresses in this situation. It is possible for a node that changes its link-layer address to inform all other neighbor nodes on the local link by sending a neighbor advertisement message using the all-nodes multicast address FF02::1 . The neighbor discovery table of the nodes on the local link is updated with the new linklayer address.

5.8.19.4.2 Library Overview

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the IPv6 , ICMPv6 and NDP module.

Library Interface Section	Description
Reachability Functions	Reachability routine functionality

5.8.19.5 Configuring the Library

5.8.20 Reboot TCP/IP Stack Library

5.8.20.1 Introduction

Reboot TCP/IP Stack Library

for

Microchip Microcontrollers

This library provides the API of the Reboot TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

The Reboot module will allow a user to remotely reboot the PIC microcontroller that is running the TCP/IP stack. This feature is primarily used for bootloader applications, which must reset the microcontroller to enter the bootloader code section. This module will execute a task that listens on a specified UDP port for a packet, and then reboots if it receives one.

5.8.20.2 Release Notes

Harmony Version: v0.70b **Reboot TCP/IP Stack Library Version :** 1.0 **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.8.20.3 SW License Agreement

5.8.21 SMTP TCP/IP Stack Library

5.8.21.1 Introduction

Simple Mail Transfer Protocol (SMTP) TCP/IP Stack Library for Microchip Microcontrollers

This library provides the API of the SMTP TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

The SMTP client module in the TCP/IP Stack lets applications **send** e-mails to any recipient worldwide. These message could include status information or important alerts. Using the e-mail to SMS gateways provided by most cell phone carriers, these messages can also be delivered directly to cell phone handsets.

Using the SMTP client requires access to a local mail server (such as mail.yourdomain.com) for reliable operation. Your MPLAB Harmony or network administrator can provide the correct address, but end-user applications will need an interface to provide this data.

5.8.21.2 Release Notes

MPLAB Harmony Version: v0.70b **SMTP TCP/IP Stack Library Version :** 1.0 **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.8.21.3 SW License Agreement

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.8.21.4 Using the Library

This topic describes the basic architecture of the SMTP TCP/IP Stack Library and provides information and examples on how to use it.

Interface Header File: [smtp.h](#)

The interface to the SMTP TCP/IP Stack library is defined in the "[smtp.h](#)" header file. This file is included by the "tcpip.h" file. Any C language source (.c) file that uses the SMTP TCP/IP Stack library should include "tcpip.h".

Library File:

The SMTP TCPIP Stack library archive (.a) file installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the TCP/IP Stack interacts with the framework.

5.8.21.4.1 Abstraction Model

This library provides the API of the SMTP TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

SMTP Software Abstraction Block Diagram

Note: This image was not available at time of release and will be added in a future release of MPLAB Harmony.

5.8.21.4.2 Library Overview

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the SMTP module.

Library Interface Section	Description
Functions	Routines to configure this module
Data Types and Constants	This section provides various definitions describing this API

5.8.21.4.3 SMTP Client Examples

Module

SMTP Client

Description

The following two examples demonstrate the use of the SMTP client in different scenarios. The first, and simpler example, sends a short message whose contents are all located in RAM at once.

The second example is more involved and demonstrates generating a message on the fly in the case where the entire message cannot fit into RAM at once. In this case, the message

5.8.21.4.3.1 SMTP Client Short Message Example

The SMTP client API is simplified when messages can be buffered entirely in RAM. The SMTPDemo (see page 99) example provided in MainDemo.c sends a brief e-mail message indicating the current status of the board's buttons. This document will walk through that example.

Make sure `STACK_USE_SMTP_CLIENT` is uncommented in `TCPIPConfig.h` before continuing.

The following diagram provides an overview of the process:

First, call `SMTPBeginUsage` (see page 304) to verify that the SMTP client is available and to begin a new message. If `FALSE` is returned, the SMTP client is busy and the application must return to the main loop to allow `StackTask` to execute again.

Next, set the local relay server to use as `SMTPClient.Server`. If the local relay server requires a user name and password, set `SMTPClient.Username` and `SMTPClient.Password` to the appropriate credentials.

If server parameters are not set, the stack will attempt to deliver the message directly to its destination host. This will likely fail due to spam prevention measures put in place by most ISPs and network administrators.

Continue on to set the header strings as necessary for the message. This includes the subject line, from address, and any recipients you need to add. Finally, set `SMTPClient.Body` to the message to be sent.

At this point, verify that `SMTPClient.ROMPointers` is correctly configured for any strings that are stored in program memory. Once the message is ready to send, call `SMTPSendMail` (see page 310) to instruct the SMTP client to begin transmission.

The application must now call `SMTPIsBusy` (see page 306) until it returns `FALSE`. Each time `TRUE` is returned, return to the main loop and wait for `StackTask` to execute again. This allows the SMTP server to continue its work in a cooperative multitasking manner. Once `FALSE` is returned, call `SMTPEndUsage` (see page 305) to release the SMTP client. Check the return value of this function to determine if the message was successfully sent.

The example in `MainDemo.c` needs minor modifications to use your e-mail address. The `Server` and `To` fields must be set in `SMTPDemo` (see page 99) in order for the message to be properly delivered. Once this is done, holding down `BUTTON2` and `BUTTON3` simultaneously (the left-most two buttons) will begin sending the message. `LED1` will light as the message is being

processed, and will extinguish when the SMTP state machine completes. If the transmission was successful LED2 will light, otherwise it will remain dark.

5.8.21.4.3.2 SMTP Client Long Message Example

The SMTP client API is capable of sending messages that do not fit entirely in RAM. To do so, the application must manage its output state and only write as many bytes as are available in the buffer at a time. The second SMTPDemo (see page 99) example provided in MainDemo.c sends a message that is a dump of all contents of the PIC's RAM. This example is currently commented out. Comment out the previous Short Message Example and uncomment the Long Message Example. This document will walk through sending a longer message.

Make sure `STACK_USE_SMTP_CLIENT` is uncommented in `TCIPConfig.h` before continuing.

Sending longer messages is divided into three stages. The first stage configures the SMTP client to **send** the message. The second stage sends the message in small chunks as buffer space is available. The final stage finishes the transmission and determines whether or not the message was successful.

The following diagram illustrates the first stage:

The first stage is largely similar to the first few steps in sending a short message. First, call `SMTPBeginUsage` (see page 304) to verify that the SMTP client is available and to begin a new message. If `FALSE` is returned, the SMTP client is busy and the application must return to the main loop to allow `StackTask` to execute again.

Next, set the local relay server to use as `SMTPClient.Server`. If the local relay server requires a user name and password, set `SMTPClient.Username` and `SMTPClient.Password` to the appropriate credentials.

If server parameters are not set, the stack will attempt to deliver the message directly to its destination host. This will likely fail due to spam prevention measures put in place by most ISPs and network administrators.

Continue on to set the header strings as necessary for the message. This includes the subject line, from address, and any recipients you need to add.

The next portion of the process differs. Ensure that `SMTPClient.Body` remains set to its default (`NULL`). At this point, call `SMTPSendMail` (see page 310) to open a connection to the remote server and transmit the headers. The application is now ready to proceed to the second stage and **send** the message body.

The following diagram provides an overview of stage two and three:

Upon entering stage two, the application should call `SMTPIsBusy` (see page 306) to verify that the connection to the remote server is active and has not been lost. If the call succeeds, call `SMTPIsPutReady` (see page 306) to determine how many bytes are available in the TX buffer. If no bytes are available, return to the main loop so that `StackTask` can transmit the data to the remote node and free up the buffer.

If space is available, any combination of the `SMTPPut` (see page 307), `SMTPPutArray` (see page 307), `SMTPPutROMArray` (see page 308), `SMTPPutString` (see page 309), and `SMTPPutROMString` (see page 309) functions may be called to transmit the message. These functions return the number of bytes successfully written. Use this value, along with the value originally returned from `SMTPIsPutReady` (see page 306) to track how much free space remains in the TX buffer. Once the buffer is depleted, call `SMTPFlush` (see page 305) to force the data written to be sent.

The SMTP client module can [accept](#) (see page 170) as much data as the TCP TX FIFO can hold. This is determined by the [socket](#) initializer for `TCP_PURPOSE_DEFAULT` type sockets in `TCPIPConfig.h`, which defaults to 200 bytes.

If the TX buffer is exhausted before the message is complete, return to the main loop so that `StackTask` may transmit the data to the remote node and free up the buffer. Upon return, go to the beginning of the second stage to transmit the next portion of the message.

Once the message is complete, the application will move to the third stage. Call `SMTPPutDone` (see page 308) to inform the SMTP client that no more data remains. Then call `SMTPIsBusy` (see page 306) repeatedly. Each time TRUE is returned, return to the main loop and wait for `StackTask` to execute again. Once FALSE is returned, the message transmission has completed and the application must call `SMTPEndUsage` (see page 305) to release the SMTP client. Check the return value of this function to determine if the message was successfully sent.

The example in `MainDemo.c` needs minor modifications to use your e-mail address. Set the Server and To fields in `SMTPDemo` (see page 99), and ensure that these fields are being properly assigned to `SMTPClient` (see page 305) struct. The demo works exactly the same way as the previous one, with `BUTTON2` and `BUTTON3` held down simultaneously (the left-most two buttons) kicking off the state machine. LED1 will light as the message is being processed, and will extinguish when the SMTP state machine completes. If the transmission was successful LED2 will light, otherwise it will remain dark.

5.8.21.5 Configuring the Library

Macros

	Name	Description
	MAX_SMTP_CONNECTIONS	Maximum number of SMTP connections allowed
	SMTP_PORT	Default port to use when unspecified
	SMTP_SERVER_REPLY_TIMEOUT	How long to wait before assuming the connection has been dropped (default 8 seconds)

Description

The configuration of the SMTP TCP/IP Stack Library is based on the file `tcip_config.h`

This header file contains the configuration selection for the SMTP TCP/IP Stack Library. Based on the selections made, the SMTP TCP/IP Stack Library will support or not support selected features. These configuration settings will apply to all instances of the SMTP TCP/IP Stack Library.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.8.21.5.1 MAX_SMTP_CONNECTIONS Macro

C

```
#define MAX_SMTP_CONNECTIONS (1)
```

Description

Maximum number of SMTP connections allowed

5.8.21.5.2 SMTP_PORT Macro

C

```
#define SMTP_PORT 25
```

Description

Default port to use when unspecified

5.8.21.5.3 SMTP_SERVER_REPLY_TIMEOUT Macro

C

```
#define SMTP_SERVER_REPLY_TIMEOUT (8uL)
```

Description

How long to wait before assuming the connection has been dropped (default 8 seconds)

5.8.21.6 Building the Library

This section list the files that are available in the `\src` of the SMTP driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

5.8.21.7 Library Interface

Functions

	Name	Description
	TCPIP_SMTP_ArrayPut	Writes a series of bytes to the SMTP client.
	TCPIP_SMTP_Flush	Flushes the SMTP socket and forces all data to be sent.
	TCPIP_SMTP_IsBusy	Determines if the SMTP client is busy.
	TCPIP_SMTP_IsPutReady	Determines how much data can be written to the SMTP client.
	TCPIP_SMTP_MailSend	Initializes the message sending process.
	TCPIP_SMTP_Put	Writes a single byte to the SMTP client.
	TCPIP_SMTP_PutIsDone	Indicates that the on-the-fly message is complete.
	TCPIP_SMTP_StringPut	Writes a string to the SMTP client.
	TCPIP_SMTP_UsageBegin	Requests control of the SMTP client module.
	TCPIP_SMTP_UsageEnd	Releases control of the SMTP client module.

Data Types and Functions

	Name	Description
	SMTP_CONNECT_ERROR	Connection to SMTP server failed
	SMTP_RESOLVE_ERROR	DNS lookup for SMTP server failed
	SMTP_SUCCESS	Message was successfully sent
	SMTP_CLIENT_MODULE_CONFIG	This is type SMTP_CLIENT_MODULE_CONFIG.
	SMTP_POINTERS	Configures the SMTP client to send a message

Description

This section describes the Application Programming Interface (API) functions of the SMTP TCP/IP Stack.

Refer to each section for a detailed description.

5.8.21.7.1 Functions

5.8.21.7.1.1 TCPIP_SMTP_ArrayPut Function

C

```
uint16_t TCPIP_SMTP_ArrayPut(
    uint8_t* Data,
    uint16_t Len
);
```

Description

Writes a series of bytes to the SMTP client.

Preconditions

[TCPIP_SMTP_UsageBegin](#) returned true on a previous call.

Parameters

Parameters	Description
Data	The data to be written
Len	How many bytes should be written

Returns

The number of bytes written. If less than Len, then the TX FIFO became full before all bytes could be written.

Remarks

This function should only be called externally when the SMTP client is generating an on-the-fly message. (That is, [TCPIP_SMTP_MailSend](#) was called with SMTPClient.Body set to NULL.)

5.8.21.7.1.2 TCPIP_SMTP_Flush Function**C**

```
void TCPIP_SMTP_Flush();
```

Description

Flushes the SMTP [socket](#) and forces all data to be sent.

Preconditions

[TCPIP_SMTP_UsageBegin](#) returned true on a previous call.

Returns

None

Remarks

This function should only be called externally when the SMTP client is generating an on-the-fly message. (That is, [TCPIP_SMTP_MailSend](#) was called with SMTPClient.Body set to NULL.)

5.8.21.7.1.3 TCPIP_SMTP_IsBusy Function**C**

```
bool TCPIP_SMTP_IsBusy();
```

Description

Call this function to determine if the SMTP client is busy performing background tasks. This function should be called after any call to [TCPIP_SMTP_MailSend](#), [TCPIP_SMTP_PutIsDone](#) to determine if the stack has finished performing its internal tasks. It should also be called prior to any call to [TCPIP_SMTP_IsPutReady](#) to verify that the SMTP client has not prematurely disconnected. When this function returns false, the next call should be to [TCPIP_SMTP_UsageEnd](#) to release the module and obtain the status code for the operation.

Preconditions

[TCPIP_SMTP_UsageBegin](#) returned true on a previous call.

Return Values

Return Values	Description
true	The SMTP Client is busy with internal tasks or sending an on-the-fly message.
false	The SMTP Client is terminated and is ready to be released.

5.8.21.7.1.4 TCPIP_SMTP_IsPutReady Function**C**

```
uint16_t TCPIP_SMTP_IsPutReady();
```

Description

Use this function to determine how much data can be written to the SMTP client when generating an on-the-fly message.

Preconditions

[TCPIP_SMTP_UsageBegin](#) returned true on a previous call, and an on-the-fly message is being generated. This requires that [TCPIP_SMTP_MailSend](#) was called with SMTPClient.Body set to NULL.

Returns

The number of free bytes the SMTP TX FIFO.

Remarks

This function should only be called externally when the SMTP client is generating an on-the-fly message. (That is, [TCPIP_SMTP_MailSend](#) was called with SMTPClient.Body set to NULL.)

5.8.21.7.1.5 TCPIP_SMTP_MailSend Function**C**

```
void TCPIP_SMTP_MailSend(  
    SMTP_POINTERS* smtpClientMessage  
);
```

Description

This function starts the state machine that performs the actual transmission of the message. Call this function after all the fields in SMTPClient have been set.

Preconditions

[TCPIP_SMTP_UsageBegin](#) returned true on a previous call.

Parameters

Parameters	Description
smtpClientMessage	message to send

Returns

None

5.8.21.7.1.6 TCPIP_SMTP_Put Function**C**

```
bool TCPIP_SMTP_Put(  
    char c  
);
```

Description

Writes a single byte to the SMTP client.

Preconditions

[TCPIP_SMTP_UsageBegin](#) returned true on a previous call.

Parameters

Parameters	Description
c	The byte to be written

Return Values

Return Values	Description
true	The byte was successfully written

false	The byte was not written, most likely because the buffer was full

Remarks

This function should only be called externally when the SMTP client is generating an on-the-fly message. (That is, [TCPIP_SMTP_MailSend](#) was called with SMTPClient.Body set to NULL.)

5.8.21.7.1.7 TCPIP_SMTP_PutIsDone Function

C

```
void TCPIP_SMTP_PutIsDone();
```

Description

Indicates that the on-the-fly message is complete.

Preconditions

[TCPIP_SMTP_UsageBegin](#) returned true on a previous call, and the SMTP client is generated an on-the-fly message. (That is, [TCPIP_SMTP_MailSend](#) was called with SMTPClient.Body set to NULL.)

Returns

None

5.8.21.7.1.8 TCPIP_SMTP_StringPut Function

C

```
uint16_t TCPIP_SMTP_StringPut(
    char* Data
);
```

Description

Writes a string to the SMTP client.

Preconditions

[TCPIP_SMTP_UsageBegin](#) returned true on a previous call.

Parameters

Parameters	Description
Data	The data to be written

Returns

The number of bytes written. If less than the length of Data, then the TX FIFO became full before all bytes could be written.

Remarks

This function should only be called externally when the SMTP client is generating an on-the-fly message. (That is, [TCPIP_SMTP_MailSend](#) was called with SMTPClient.Body set to NULL.)

5.8.21.7.1.9 TCPIP_SMTP_UsageBegin Function

C

```
bool TCPIP_SMTP_UsageBegin();
```

Description

Call this function before calling any other SMTP Client APIs. This function obtains a lock on the SMTP Client, which can only be used by one stack application at a time. Once the application is finished with the SMTP client, it must call

[TCPIP_SMTP_UsageEnd](#) to release control of the module to any other waiting applications.

This function initializes all the SMTP state machines and variables back to their default state.

Preconditions

None

Return Values

Return Values	Description
true	The application has successfully obtained control of the module
false	The SMTP module is in use by another application. Call TCPIP_SMTP_UsageBegin again later, after returning to the main program loop

5.8.21.7.1.10 TCPIP_SMTP_UsageEnd Function

C

```
uint16_t TCPIP_SMTP_UsageEnd();
```

Description

Call this function to release control of the SMTP client module once an application is finished using it. This function releases the lock obtained by [TCPIP_SMTP_UsageBegin](#), and frees the SMTP client to be used by another application.

Preconditions

[TCPIP_SMTP_UsageBegin](#) returned true on a previous call.

Return Values

Return Values	Description
SMTP_SUCCESS	A message was successfully sent
SMTP_RESOLVE_ERROR	The SMTP server could not be resolved
SMTP_CONNECT_ERROR	The connection to the SMTP server failed or was prematurely terminated
1-199 and 300-399	The last SMTP server response code

5.8.21.7.2 Data Types and Functions

5.8.21.7.2.1 SMTP_CONNECT_ERROR Macro

C

```
#define SMTP_CONNECT_ERROR (0x8001u)    // Connection to SMTP server failed
```

Description

Connection to SMTP server failed

5.8.21.7.2.2 SMTP_RESOLVE_ERROR Macro

C

```
#define SMTP_RESOLVE_ERROR (0x8000u)    // DNS lookup for SMTP server failed
```

Description

DNS lookup for SMTP server failed

5.8.21.7.2.3 SMTP_SUCCESS Macro

C

```
#define SMTP_SUCCESS (0x0000u)    // Message was successfully sent
```

Description

Message was successfully sent

5.8.21.7.2.4 SMTP_CLIENT_MODULE_CONFIG Structure

C

```
typedef struct {
} SMTP_CLIENT_MODULE_CONFIG;
```

Description

This is type SMTP_CLIENT_MODULE_CONFIG.

5.8.21.7.2.5 SMTP_POINTERS Structure

C

```
typedef struct {
    char* Server;
    char* Username;
    char* Password;
    char* To;
    char* CC;
    char* BCC;
    char* From;
    char* Subject;
    char* OtherHeaders;
    char* Body;
    bool UseSSL;
    uint16_t ServerPort;
} SMTP_POINTERS;
```

Description

This structure of pointers configures the SMTP Client to [send](#) an e-mail message.

Parameters

Parameters	Description
Server	the SMTP server to relay the message through
Username	the user name to use when logging into the SMTP server, if any is required
Password	the password to supply when logging in, if any is required
To	the destination address for this message. May be a comma-separated list of addresss, and/or formatted.
CC	The CC addresses for this message, if any. May be a comma-separated list of addresss, and/or formatted.
BCC	The BCC addresses for this message, if any. May be a comma-separated list of addresss, and/or formatted.
From	The From address for this message. May be formatted.
Subject	The Subject header for this message.
OtherHeaders	Any additional headers for this message. Each additional header, including the last one, must be terminated with a CRLF pair.

Body	When sending a message from memory, the location of the body of this message in memory. Leave as NULL to build a message on-the-fly.
UseSSL	When TCPIP_STACK_USE_SSL_CLIENT is enabled, this flag causes the SMTP client to make an SSL connection to the server.
ServerPort	(uint16_t value) Indicates the port on which to connect to the remote SMTP server.

Remarks

When formatting an e-mail address, the SMTP standard format for associating a printable name may be used. This format places the printable name in quotation marks, with the address following in pointed brackets, such as "John Smith" <john.smith@domain.com>

5.8.21.8 Files

Files

Name	Description
smtp.h	Module for Microchip TCP/IP Stack
smtp_config.h	SMTP configuration file

Description

5.8.21.8.1 smtp.h

Simple Mail Transfer Protocol (SMTP) Client

Functions

	Name	Description
≡	TCPIP_SMTP_ArrayPut	Writes a series of bytes to the SMTP client.
≡	TCPIP_SMTP_Flush	Flushes the SMTP socket and forces all data to be sent.

5.8.22 SNMP TCP/IP Stack Library

5.8.22.1 Introduction

Simple Network Management Protocol (SNMP) TCP/IP Stack Library

for

Microchip Microcontrollers

This library provides the API of the SNMP TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

Note: This information was not available at time of release and will be added in a future release of MPLAB Harmony.

5.8.22.2 Release Notes

MPLAB Harmony Version: v0.70b **SNMP TCP/IP Stack Library Version :** 1.0 **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.8.22.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its

licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.8.22.4 Using the Library

This topic describes the basic architecture of the SNMP TCP/IP Stack Library and provides information and examples on how to use it.

Interface Header File: [snmp.h](#)

The interface to the SNMP TCP/IP Stack library is defined in the "[snmp.h](#)" header file. This file is included by the "tcpip.h" file. Any C language source (.c) file that uses the SNMP TCP/IP Stack library should include "tcpip.h".

Library File:

The SNMP TCPIP Stack library archive (.a) file installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the TCP/IP Stack interacts with the framework.

5.8.22.4.1 Abstraction Model

This library provides the API of the SNMP TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

SNMP Software Abstraction Block Diagram

Note: This image was not available at time of release and will be added in a future release of MPLAB Harmony.

5.8.22.4.2 Library Overview

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the SNMP module.

Library Interface Section	Description
SNMP Module Functions	Routines to configure this module
SNMPv3 Module Functions	Routines to configure this module
SNMP Application Functions	Routines to configure an application
SNMPv3 Application Functions	Routines to configure an application
SNMP Data Types and Constants	This section provides various definitions describing this API

SNMPv3 Data Types and Constants

This section provides various definitions describing this API

5.8.22.5 Configuring the Library

Macros

	Name	Description
	<u>AUTH_LOCALIZED_PASSWORD_KEY_LEN</u>	SNMPv3 Authentication Localized password key length size
	<u>END_OF_SNMP_READ_COMMUNITIES</u>	??
	<u>END_OF_SNMP_WRITE_COMMUNITIES</u>	??
	<u>MY_DEFAULT_SNMP_IF</u>	For multi-homed hosts, the default SNMP interface
	<u>NOTIFY_COMMUNITY_LEN</u>	Length of Community name array
	<u>OID_MAX_LEN</u>	Change this to match your OID string length.
	<u>PRIV_LOCALIZED_PASSWORD_KEY_LEN</u>	SNMPv3 Privacy Password key length size
	<u>SNMP_BIB_FILE_NAME</u>	Name of the bib file for snmp
	<u>SNMP_COMMUNITY_MAX_LEN</u>	This is the maximum length for community string. Application must ensure that this length is observed. SNMP module adds one byte extra after <code>SNMP_COMMUNITY_MAX_LEN</code> for adding '0' NULL character.
	<u>SNMP_MAX_COMMUNITY_SUPPORT</u>	Specifying more strings than <code>SNMP_MAX_COMMUNITY_SUPPORT</code> will result in the later strings being ignored (but still wasting program memory). Specifying fewer strings is legal, as long as at least one is present.
	<u>SNMP_MAX_MSG_SIZE</u>	SNMP MIN and MAX message 484 bytes in size. As per RFC 3411 <code>snmpEngineMaxMessageSize</code> and RFC 1157 (section 4- protocol specification) and implementation supports more than 484 whenever feasible.
	<u>SNMP_MAX_NON_REC_ID_OID</u>	Update the Non record id OID value which is part of <code>CustomSnmpDemo.c</code> file

	SNMP_READ_COMMUNITIES	Default SNMPv2C community names. These can be overridden at run time if alternate strings are present in external EEPROM or Flash (actual strings could be stored by the TCPIP storage service. These strings are case sensitive. An empty string means disabled (not matchable). For application security, these default community names should not be used, but should all be disabled to force the end user to select unique community names. These defaults are provided only to make it easier to start development. Specifying more strings than SNMP_MAX_COMMUNITY_SUPPORT will result in the later strings being ignored (but still wasting program memory). Specifying... more
	SNMP_TRAP_COMMUNITY_MAX_LEN_MEM_USE	This macro will be used to avoid SNMP OID memory buffer corruption
	SNMP_WRITE_COMMUNITIES	Default SNMPv2C community names. See SNMP_READ_COMMUNITIES for more information.
	SNMPV3_AUTH_LOCALIZED_PASSWORD_KEY_LEN_MEM_USE	SNMPv3 authentication localized Key length for memory validation
	SNMPV3_PRIV_LOCALIZED_PASSWORD_KEY_LEN_MEM_USE	SNMPv3 privacy key length size for memory validation
	SNMPV3_TRAP_MSG_PROCESS_MODEL_DB	This is macro SNMPV3_TRAP_MSG_PROCESS_MODEL_DB.
	SNMPV3_TRAP_SECURITY_LEVEL_DB	This is macro SNMPV3_TRAP_SECURITY_LEVEL_DB.
	SNMPV3_TRAP_SECURITY_MODEL_TYPE_DB	This is macro SNMPV3_TRAP_SECURITY_MODEL_TYPE_DB.
	SNMPV3_TRAP_USER_SECURITY_NAME_DB	This is macro SNMPV3_TRAP_USER_SECURITY_NAME_DB.
	SNMPV3_USER_AUTH_PASSWD_DB	This is macro SNMPV3_USER_AUTH_PASSWD_DB.
	SNMPV3_USER_AUTH_TYPE_DB	This is macro SNMPV3_USER_AUTH_TYPE_DB.
	SNMPV3_USER_PRIV_PASSWD_DB	This is macro SNMPV3_USER_PRIV_PASSWD_DB.
	SNMPV3_USER_PRIV_TYPE_DB	This is macro SNMPV3_USER_PRIV_TYPE_DB.
	SNMPV3_USER_SECURITY_NAME_DB	This is macro SNMPV3_USER_SECURITY_NAME_DB.
	SNMPV3_USER_SECURITY_NAME_LEN_MEM_USE	User security name length for memory validation
	SNMPV3_USM_MAX_USER	Client configuration options
	TRAP_COMMUNITY_MAX_LEN	Maximum length of community name table
	TRAP_TABLE_SIZE	This table maintains list of interested receivers who should receive notifications when some interesting event occurs.

	USER_SECURITY_NAME_LEN	SNMPv3 User Security Name length

Structures

	Name	Description
	SNMP_NET_CONFIG	SNMP Network Configuration structure typedef

Description

The configuration of the SNMP TCP/IP Stack Library is based on the file tcpip_config.h

This header file contains the configuration selection for the SNMP TCP/IP Stack Library. Based on the selections made, the SNMP TCP/IP Stack Library will support or not support selected features. These configuration settings will apply to all instances of the SNMP TCP/IP Stack Library.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.8.22.5.1 AUTH_LOCALIZED_PASSWORD_KEY_LEN Macro**C**

```
#define AUTH_LOCALIZED_PASSWORD_KEY_LEN (20)
```

Description

SNMPv3 Authentication Localized password key length size

5.8.22.5.2 END_OF_SNMP_READ_COMMUNITIES Macro**C**

```
#define END_OF_SNMP_READ_COMMUNITIES
```

Description

??

5.8.22.5.3 END_OF_SNMP_WRITE_COMMUNITIES Macro**C**

```
#define END_OF_SNMP_WRITE_COMMUNITIES
```

Description

??

5.8.22.5.4 MY_DEFAULT_SNMP_IF Macro**C**

```
#define MY_DEFAULT_SNMP_IF "PIC32INT"
```

Description

For multi-homed hosts, the default SNMP interface

5.8.22.5.5 NOTIFY_COMMUNITY_LEN Macro

C

```
#define NOTIFY_COMMUNITY_LEN (SNMP_COMMUNITY_MAX_LEN)
```

Description

Length of Community name array

5.8.22.5.6 OID_MAX_LEN Macro

C

```
#define OID_MAX_LEN (18)
```

Description

Change this to match your OID string length.

5.8.22.5.7 PRIV_LOCALIZED_PASSWORD_KEY_LEN Macro

C

```
#define PRIV_LOCALIZED_PASSWORD_KEY_LEN (20)
```

Description

SNMPv3 Privacy Password key length size

5.8.22.5.8 SNMP_BIB_FILE_NAME Macro

C

```
#define SNMP_BIB_FILE_NAME "snmp.bib"
```

Description

Name of the bib file for snmp

5.8.22.5.9 SNMP_COMMUNITY_MAX_LEN Macro

C

```
#define SNMP_COMMUNITY_MAX_LEN (8u)
```

Description

This is the maximum length for community string. Application must ensure that this length is observed. SNMP module adds one byte extra after SNMP_COMMUNITY_MAX_LEN for adding '0' NULL character.

5.8.22.5.10 SNMP_MAX_COMMUNITY_SUPPORT Macro

C

```
#define SNMP_MAX_COMMUNITY_SUPPORT (3u)
```

Description

Specifying more strings than SNMP_MAX_COMMUNITY_SUPPORT will result in the later strings being ignored (but still wasting program memory). Specifying fewer strings is legal, as long as at least one is present.

5.8.22.5.11 SNMP_MAX_MSG_SIZE Macro

C

```
#define SNMP_MAX_MSG_SIZE 484
```

Description

SNMP MIN and MAX message 484 bytes in size. As per RFC 3411 snmpEngineMaxMessageSize and RFC 1157 (section 4- protocol specification) and implementation supports more than 484 whenever feasible.

5.8.22.5.12 SNMP_MAX_NON_REC_ID_OID Macro

C

```
#define SNMP_MAX_NON_REC_ID_OID 3
```

Description

Update the Non record id OID value which is part of CustomSnmpDemo.c file

5.8.22.5.13 SNMP_READ_COMMUNITIES Macro

C

```
#define SNMP_READ_COMMUNITIES {"public", "read", ""}
```

Description

Default SNMPv2C community names. These can be overridden at run time if alternate strings are present in external EEPROM or Flash (actual strings could be stored by the TCPIP storage service. These strings are case sensitive. An empty string means disabled (not matchable). For application security, these default community names should not be used, but should all be disabled to force the end user to select unique community names. These defaults are provided only to make it easier to start development. Specifying more strings than [SNMP_MAX_COMMUNITY_SUPPORT](#) will result in the later strings being ignored (but still wasting program memory). Specifying fewer strings is legal, as long as at least one is present. A string larger than [SNMP_COMMUNITY_MAX_LEN](#) bytes will be ignored.

5.8.22.5.14 SNMP_TRAP_COMMUNITY_MAX_LEN_MEM_USE Macro

C

```
#define SNMP_TRAP_COMMUNITY_MAX_LEN_MEM_USE (8)
```

Description

This macro will be used to avoid SNMP OID memory buffer corruption

5.8.22.5.15 SNMP_WRITE_COMMUNITIES Macro

C

```
#define SNMP_WRITE_COMMUNITIES {"private", "write", "public"}
```

Description

Default SNMPv2C community names. See [SNMP_READ_COMMUNITIES](#) for more information.

5.8.22.5.16 SNMPV3_AUTH_LOCALIZED_PASSWORD_KEY_LEN_MEM_USE Macro

C

```
#define SNMPV3_AUTH_LOCALIZED_PASSWORD_KEY_LEN_MEM_USE (AUTH_LOCALIZED_PASSWORD_KEY_LEN+1)
```

Description

SNMPv3 authentication localized Key length for memory validation

5.8.22.5.17 SNMPV3_PRIV_LOCALIZED_PASSWORD_KEY_LEN_MEM_USE Macro

C

```
#define SNMPV3_PRIV_LOCALIZED_PASSWORD_KEY_LEN_MEM_USE (PRIV_LOCALIZED_PASSWORD_KEY_LEN+1)
```

Description

SNMPv3 privacy key length size for memory validation

5.8.22.5.18 SNMPV3_TRAP_MSG_PROCESS_MODEL_DB Macro

C

```
#define SNMPV3_TRAP_MSG_PROCESS_MODEL_DB  
{SNMPV3_MSG_PROCESSING_MODEL, SNMPV3_MSG_PROCESSING_MODEL, SNMPV3_MSG_PROCESSING_MODEL}
```

Description

This is macro SNMPV3_TRAP_MSG_PROCESS_MODEL_DB.

5.8.22.5.19 SNMPV3_TRAP_SECURITY_LEVEL_DB Macro

C

```
#define SNMPV3_TRAP_SECURITY_LEVEL_DB {AUTH_PRIV, AUTH_NO_PRIV, NO_AUTH_NO_PRIV}
```

Description

This is macro SNMPV3_TRAP_SECURITY_LEVEL_DB.

5.8.22.5.20 SNMPV3_TRAP_SECURITY_MODEL_TYPE_DB Macro

C

```
#define SNMPV3_TRAP_SECURITY_MODEL_TYPE_DB  
{SNMPV3_USM_SECURITY_MODEL, SNMPV3_USM_SECURITY_MODEL, SNMPV3_USM_SECURITY_MODEL}
```

Description

This is macro SNMPV3_TRAP_SECURITY_MODEL_TYPE_DB.

5.8.22.5.21 SNMPV3_TRAP_USER_SECURITY_NAME_DB Macro

C

```
#define SNMPV3_TRAP_USER_SECURITY_NAME_DB {"microchip", "SnpAdmin", "root"}
```

Description

This is macro SNMPV3_TRAP_USER_SECURITY_NAME_DB.

5.8.22.5.22 SNMPV3_USER_AUTH_PASSWD_DB Macro

C

```
#define SNMPV3_USER_AUTH_PASSWD_DB {"auth12345", "ChandlerUS", ""}
```

Description

This is macro SNMPV3_USER_AUTH_PASSWD_DB.

5.8.22.5.23 SNMPV3_USER_AUTH_TYPE_DB Macro

C

```
#define SNMPV3_USER_AUTH_TYPE_DB {SNMPV3_HMAC_MD5, SNMPV3_HMAC_SHA1, SNMPV3_NO_HMAC_AUTH}
```

Description

This is macro SNMPV3_USER_AUTH_TYPE_DB.

5.8.22.5.24 SNMPV3_USER_PRIV_PASSWD_DB Macro

C

```
#define SNMPV3_USER_PRIV_PASSWD_DB {"priv12345", "", ""}
```

Description

This is macro SNMPV3_USER_PRIV_PASSWD_DB.

5.8.22.5.25 SNMPV3_USER_PRIV_TYPE_DB Macro

C

```
#define SNMPV3_USER_PRIV_TYPE_DB {SNMPV3_AES_PRIV, SNMPV3_NO_PRIV, SNMPV3_NO_PRIV}
```

Description

This is macro SNMPV3_USER_PRIV_TYPE_DB.

5.8.22.5.26 SNMPV3_USER_SECURITY_NAME_DB Macro

C

```
#define SNMPV3_USER_SECURITY_NAME_DB {"microchip", "SnmpAdmin", "root"}
```

Description

This is macro SNMPV3_USER_SECURITY_NAME_DB.

5.8.22.5.27 SNMPV3_USER_SECURITY_NAME_LEN_MEM_USE Macro

C

```
#define SNMPV3_USER_SECURITY_NAME_LEN_MEM_USE (USER_SECURITY_NAME_LEN+1)
```

Description

User security name length for memory validation

5.8.22.5.28 SNMPV3_USM_MAX_USER Macro

C

```
#define SNMPV3_USM_MAX_USER 3
```

Description

Client configuration options

5.8.22.5.29 TRAP_COMMUNITY_MAX_LEN Macro

C

```
#define TRAP_COMMUNITY_MAX_LEN (SNMP_TRAP_COMMUNITY_MAX_LEN_MEM_USE+1)
```

Description

Maximum length of community name table

5.8.22.5.30 TRAP_TABLE_SIZE Macro

C

```
#define TRAP_TABLE_SIZE (2)
```

Description

This table maintains list of interested receivers who should receive notifications when some interesting event occurs.

5.8.22.5.31 USER_SECURITY_NAME_LEN Macro

C

```
#define USER_SECURITY_NAME_LEN (16)
```

Description

SNMPv3 User Security Name length

5.8.22.5.32 SNMP_NET_CONFIG Structure

C

```
typedef struct {  
    uint8_t readCommunity[SNMP_MAX_COMMUNITY_SUPPORT][SNMP_COMMUNITY_MAX_LEN+1];  
    uint8_t writeCommunity[SNMP_MAX_COMMUNITY_SUPPORT][SNMP_COMMUNITY_MAX_LEN+1];  
    uint32_t SnmpEngineBootRcrd;  
} SNMP_NET_CONFIG;
```

Description

SNMP Network Configuration structure typedef

Members

Members	Description
uint8_t readCommunity[SNMP_MAX_COMMUNITY_SUPPORT][SNMP_COMMUNITY_MAX_LEN+1];	SNMPv2C Read community names SNMP_COMMUNITY_MAX_LEN (8) + 1 null termination byte
uint8_t writeCommunity[SNMP_MAX_COMMUNITY_SUPPORT][SNMP_COMMUNITY_MAX_LEN+1];	SNMPv2C Write community names SNMP_COMMUNITY_MAX_LEN (8) + 1 null termination byte
uint32_t SntpEngineBootRcrd;	SNMP Engine Boot Record location

5.8.22.6 Building the Library

This section list the files that are available in the \src of the SNMP driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

5.8.22.7 Library Interface

SNMP Application Functions

	Name	Description
≡	SNMPGetExactIndex	To search for exact index node in case of a Sequence variable.
≡	SNMPGetNextIndex	To search for next index node in case of a Sequence variable.
≡	SNMPGetVar	Used to Get/collect OID variable information.
≡	SNMPIsValidSetLen	Validates the set variable data length to data type.
≡	SNMPSendTrap	Prepare, validate remote node which will receive trap and send trap pdu.
≡	SNMPSetVar	This routine Set the mib variable with the requested value.
≡	SNMPValidateCommunity	Validates community name for access control.

SNMP Data Types and Constants

	Name	Description
≡	SNMP_END_OF_VAR	This is macro SNMP_END_OF_VAR .

	SNMP_H	FileName: SNMP.h Copyright © 2012 released Microchip Technology Inc. All rights reserved. Microchip licenses to you the right to use, modify, copy and distribute Software only when embedded on a Microchip microcontroller or digital signal controller that is integrated into your product or third party product (pursuant to the sublicense terms in the accompanying license agreement). You should refer to the license agreement accompanying this Software for additional information regarding your rights and obligations. SOFTWARE AND DOCUMENTATION ARE PROVIDED "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESS OR IMPLIED, INCLUDING WITHOUT LIMITATION, ANY WARRANTY OF MERCHANTABILITY, TITLE, NON-INFRINGEMENT AND... more
	SNMP_INDEX_INVALID	This is macro SNMP_INDEX_INVALID.
	SNMP_START_OF_VAR	
	SNMP_V1	
	SNMP_V2C	This is macro SNMP_V2C.
	SNMP_V3	This is macro SNMP_V3.
	GENERIC_TRAP_NOTIFICATION_TYPE	This is type GENERIC_TRAP_NOTIFICATION_TYPE.
	IPV6_SNMP_TRAP_INFO	This is type IPV6_SNMP_TRAP_INFO.
	SNMP_BUFFER_DATA	SNMPv1/v2c
	SNMP_COMMUNITY_TYPE	This is type SNMP_COMMUNITY_TYPE.
	SNMP_ID	This is the SNMP OID variable id. This id is assigned via MIB file. Only dynamic and AgentID variables can contain ID. MIB2BIB utility enforces this rule when BIB was generated. typedef int SNMP_ID;
	SNMP_INDEX	This is type SNMP_INDEX.
	SNMP_MODULE_CONFIG	This is type SNMP_MODULE_CONFIG.
	SNMP_NON_MIB_RECD_INFO	This is type SNMP_NON_MIB_RECD_INFO.
	SNMP_NOTIFY_INFO	// the only if that runs SNMP
	SNMP_PROCESSING_MEM_INFO_PTRS	This is type SNMP_PROCESSING_MEM_INFO_PTRS.
	SNMP_STACK_DCPT_STUB	
	SNMP_TRAP_INFO	This is type SNMP_TRAP_INFO.
	SNMP_TRAP_IP_ADDRESS_TYPE	This is type SNMP_TRAP_IP_ADDRESS_TYPE.
	SNMP_VAL	This is type SNMP_VAL.
	TCPIP_SNMP_DCPT	TCPIP_STACK_USE_IPV6
	TCPIP_SNMP_SM	This is type TCPIP_SNMP_SM.
	VENDOR_SPECIFIC_TRAP_NOTIFICATION_TYPE	This is type VENDOR_SPECIFIC_TRAP_NOTIFICATION_TYPE.
	tIPV6_SNMP_TRAP_INFO	This is type IPV6_SNMP_TRAP_INFO.
	tSNMP_TRAP_INFO	This is type SNMP_TRAP_INFO.

SNMP Module Functions

	Name	Description
	TCPIP_SNMP_ClientGetNet	
	TCPIP_SNMP_DataCopyToProcessBuffer	Copies uint8_t data to dynamically allocated memory buffer.
	TCPIP_SNMP_EventNotifyGet	To Get the IPv6 DHCP event notification.
	TCPIP_SNMP_Notify	Creates and Sends TRAP pdu.

	TCPIP_SNMP_NotifyIsReady	Resolves given remoteHost IP address into MAC address.
	TCPIP_SNMP_NotifyPrepare	Collects trap notification info and send ARP to remote host.
	TCPIP_SNMP_PacketProcStubPtrsGet	Get SNMP packet processing memory pointer.
	TCPIP_SNMP_ProcessBufferDataGet	Reads uint8_t data from dynamically allocated memory buffer.
	TCPIP_SNMP_ReadCommunityGet	Get the readCommunity String with Snmp index.
	TCPIP_SNMP_TrapTimeGet	Get SNMP Trap UDP client open socket timeout.
	TCPIP_SNMP_WriteCommunityGet	Get the writeCommunity String with Snmp index.

SNMPv3 Application Functions

	Name	Description
	SNMPv3ComputeHMACIpadOpadForAuthLocalizedKey	Compute HMAC inner and outer pad for authorization localized key.
	SNMPv3USMAuthPrivPswdLocalization	Convert Auth and Priv password to the localized Key using SNMPEngineID.
	TCPIP_SNMPv3_CmprTrapSecNameAndSecLvIWithUSMDb	Routine to find the index of the user name in the user data base table.

SNMPv3 Data Types and Constants

	Name	Description
	SNMPV3_PROCESSING_MEM_INFO_PTRS	SNMPv3 Processing Memory Pointers
	SNMPV3_STACK_DCPT_STUB	SNMPv3 Descriptor Structure Typedef

SNMPv3 Module Functions

	Name	Description
	TCPIP_SNMPv3_Notify	Creates and Sends SNMPv3 TRAP pdu.
	TCPIP_SNMPV3_PacketProcStubPtrsGet	Get SNMPv3 packet processing memory pointer.

Description

This section describes the Application Programming Interface (API) functions of the SNMP TCP/IP Stack.

Refer to each section for a detailed description.

5.8.22.7.1 SNMP Module Functions

5.8.22.7.1.1 TCPIP_SNMP_ClientGetNet Function

C

```
TCPIP_NET_HANDLE TCPIP_SNMP_ClientGetNet();
```

5.8.22.7.1.2 TCPIP_SNMP_DataCopyToProcessBuffer Function

C

```
bool TCPIP_SNMP_DataCopyToProcessBuffer(
    uint8_t val,
    SNMP_BUFFER_DATA * putbuf
);
```

Description

The SNMPv1 and v2c stack implementation uses dynamically allocated memory buffer for processing of request and response packets. This routine copies the uint8_t data to the allocated buffer and updates the offset length counter.

Preconditions

The SNMPv1 and v2c stack has successfully allocated dynamic memory buffer from the Heap

Parameters

Parameters	Description
val	uint8_t value to be written to the buffer
putbuf	pointer to the dynamically allocated buffer to which the 'val' to be written

Return Values

Return Values	Description
true	if successfully write to the buffer
false	failure in writing to the buffer

Remarks

This routine is used by the SNMP stack. If required to be used by the application code, valid pointers should be passed to this routine.

5.8.22.7.1.3 TCPIP_SNMP_EventNotifyGet Function**C**

```
IPV6_EVENT_TYPE TCPIP_SNMP_EventNotifyGet(  
    TCPIP_NET_HANDLE hNet  
);
```

Description

This routine is used to get the DHCP with IPv6 notification if the IPv6 unicast address is updated.

Preconditions

TCPIP_SNMP_Initialize() is called.

Parameters

Parameters	Description
hNet	Interface

Remarks

None.

5.8.22.7.1.4 TCPIP_SNMP_Notify Function**C**

```
bool TCPIP_SNMP_Notify(  
    SNMP_ID var,  
    SNMP_VAL val,  
    SNMP_INDEX index  
);
```

Description

This function creates SNMP V2 Trap PDU and sends it to previously specified remoteHost.

SNMP V1 trap pdu: | PDU-type | enterprise | agent-addr | generic-trap | specific-trap | | time-stamp | varbind-list |

The v1 enterprise is mapped directly to SNMPv2TrapOID.0

SNMP V2 trap pdu: version (0 or 1) | community | SNMP-PDU | pdu-type | request-id | error-status | err-index | varbinds

The first two variables (in varbind-list) of snmpv2 are: sysUpTime.0 and SNMPv2TrapOID.0

Generic Trap OID is used as the varbind for authentication failure.

Preconditions

[TCPIP_SNMP_NotifyIsReady\(\)](#) is already called and returned true.

Parameters

Parameters	Description
var	SNMP var ID that is to be used in notification
val	Value of var. Only value of uint8_t, uint16_t or uint32_t can be sent.
index	Index of var. If this var is a single, index would be 0, or else if this var is a sequence, index could be any value from 0 to 127

Return Values

Return Values	Description
true	if SNMP notification was successful sent. This does not guarantee that remoteHost received it.
false	Notification sent failed.
This would fail under following conditions	1) Given SNMP_BIB_FILE does not exist in file system 2) Given var does not exist. 3) Previously given agentID does not exist
4) Data type of given var is unknown	possible if file system itself was corrupted.

Remarks

This would fail if there were not UDP [socket](#) to open.

5.8.22.7.1.5 TCPIP_SNMP_NotifyIsReady Function

C

```
bool TCPIP_SNMP_NotifyIsReady(  
    IP_MULTI_ADDRESS* remoteHost,  
    SNMP_TRAP_IP_ADDRESS_TYPE eTrapMultiAddressType  
);
```

Description

This function resolves given remoteHost IP address into MAC address using ARP module. If remoteHost is not available, this function would never return true. Application must implement timeout logic to handle "remoteHost not available" situation.

Preconditions

[TCPIP_SNMP_NotifyPrepare\(\)](#) is already called.

Parameters

Parameters	Description
remoteHost	Pointer to remote Host IP address

Return Values

Return Values	Description
true	If remoteHost IP address is resolved and TCPIP_SNMP_Notify may be called.
false	If remoteHost IP address is not resolved.

Remarks

This would fail if there were not UDP [socket](#) to open.

5.8.22.7.1.6 TCPIP_SNMP_NotifyPrepare Function

C

```
void TCPIP_SNMP_NotifyPrepare(  
    IP_MULTI_ADDRESS* remoteHost,  
    char* community,  
    uint8_t communityLen,  
    SNMP_ID agentIDVar,  
    uint8_t notificationCode,  
    uint32_t timestamp  
);
```

Description

This function prepares SNMP module to [send](#) SNMP trap notification to remote host. It sends ARP request to remote host to learn remote host MAC address.

Preconditions

TCPIP_SNMP_Initialize() is already called.

Parameters

Parameters	Description
remoteHost	pointer to remote Host IP address
community	Community string to use to notify
communityLen	Community string length
agentIDVar	System ID to use identify this agent
notificaitonCode	Notification Code to use
timestamp	Notification timestamp in 100th of second.

Returns

None

Remarks

This is first of series of functions to complete SNMP notification.

5.8.22.7.1.7 TCPIP_SNMP_PacketProcStubPtrsGet Function

C

```
void TCPIP_SNMP_PacketProcStubPtrsGet(  
    SNMP_PROCESSING_MEM_INFO_PTRS * dynMemInfoPtr  
);
```

Description

This function is used to get dynamic memory allocation pointer details which is used for SNMP packet processing.

Preconditions

TCPIP_SNMP_Initialize() is already called.

Parameters

Parameters	Description
dynMemInfoPtr	Dynamic memory pointer for packet processing

Remarks

None.

5.8.22.7.1.8 TCPIP_SNMP_ProcessBufferDataGet Function

C

```
uint8_t TCPIP_SNMP_ProcessBufferDataGet(  
    SNMP_BUFFER_DATA getbuf,  
    uint16_t pos  
);
```

Description

The SNMPstack implementation uses dynamically allocated memory buffer for processing of request and response packets. This routine reads the uint8_t data from the allocated buffer at the positions (offset) provided.

Preconditions

The SNMPv1 and v2c stack has successfully allocated dynamic memory buffer from the Heap

Parameters

Parameters	Description
getbuf	Structure from where to read the data byte.
pos	position in the buffer from which the data to be read

Return Values

Return Values	Description
uint8_t	1 byte value read

Remarks

The read position offset is required to be provided every time the routine is called. This API do not increment the buffer read offset automatically, everytime it is called.

5.8.22.7.1.9 TCPIP_SNMP_ReadCommunityGet Function

C

```
uint8_t* TCPIP_SNMP_ReadCommunityGet(  
    int index  
);
```

Description

Get the readCommunity String with Snmp index.

Preconditions

_SNMP_ProcessVariables() is called.

Parameters

Parameters	Description
index	SNMP_MAX_COMMUNITY_SUPPORT .

Return Values

Return Values	Description
uint8_t *	unsigned char community string

Remarks

None.

5.8.22.7.1.10 TCPIP_SNMP_TrapTimeGet Function

C

```
SYS_TICK TCPIP_SNMP_TrapTimeGet();
```

Description

This function returns a SYS_TICK time(snmpTrapTimer) which is used to timeout a SNMP TRAP notification for a HOST. snmpTrapTimer is initialized when there is UDP client [socket](#) open either for a HOST IPv4 or IPv6 address.

Preconditions

TCPIP_SNMP_Initialize() is already called.

Remarks

None.

5.8.22.7.1.11 TCPIP_SNMP_WriteCommunityGet Function

C

```
uint8_t* TCPIP_SNMP_WriteCommunityGet(  
    int index  
);
```

Description

Get the writeCommunity String with Snmp index.

Preconditions

_SNMP_ProcessVariables() is called.

Parameters

Parameters	Description
index	SNMP_MAX_COMMUNITY_SUPPORT .

Return Values

Return Values	Description
uint8_t *	unsigned char community string

Remarks

None.

5.8.22.7.2 SNMPv3 Module Functions

5.8.22.7.2.1 TCPIP_SNMPv3_Notify Function

C

```
bool TCPIP_SNMPv3_Notify(  
    SNMP_ID var,  
    SNMP_VAL val,  
    SNMP_INDEX index,  
    uint8_t targetIndex  
);
```

Description

This function creates SNMPv3 trap PDU and sends it to previously specified remoteHost.

Preconditions

TRAP event is triggered.

Parameters

Parameters	Description
var	SNMP var ID that is to be used in notification
val	Value of var. Only value of uint8_t, uint16_t or uint32_t can be sent.
index	Index of var. If this var is a single, index would be 0, or else if this var is a sequence, index could be any value from 0 to 127 targetIndex -index of the 'Snmpv3TrapConfigData' table's security user name for which the TRAP PDU message header to constructed.

Return Values

Return Values	Description
true	if SNMP notification was successful sent. This does not guarantee that remoteHost recieved it.
false	Notification sent failed.
This would fail under following contions	1) Given SNMP_BIB_FILE does not exist in file system 2) Given var does not exist. 3) Previously given agentID does not exist
4) Data type of given var is unknown	only possible if file system itself was corrupted. SNMPV3_MSG_PRIV_FAIL -encryption of the trap msg failed
SNMPV3_MSG_AUTH_FAIL	HAMC of the trap msg failed

Remarks

None

5.8.22.7.2.2 TCPIP_SNMPV3_PacketProcStubPtrsGet Function**C**

```
void TCPIP_SNMPV3_PacketProcStubPtrsGet(  
    SNMPV3_PROCESSING_MEM_INFO_PTRS * dynMemInfoPtr  
);
```

Description

This function is used to get dynamic memory allocation pointer details which is used for SNMPv3 packet processing.

Preconditions

TCPIP_SNMP_Initialize() is already called.

Parameters

Parameters	Description
dynMemInfoPtr	Dynamic memory pointer for packet processing

Remarks

The source code for this routine is found in snmp.c, not snmpv3.c.

5.8.22.7.3 SNMP Application Functions

5.8.22.7.3.1 SNMPGetExactIndex Function

C

```
bool SNMPGetExactIndex(  
    SNMP_ID var,  
    SNMP_INDEX * index  
);
```

Description

This is a callback function called by SNMP module. SNMP user must implement this function in user application and provide appropriate data when called. This function will only be called for OID variable of type sequence.

Preconditions

None

Parameters

Parameters	Description
var	Variable id as per mib.h (input)
index	Index of variable (input)

Return Values

Return Values	Description
true	If the exact index value exists for given variable at given index.
false	Otherwise.

Remarks

Only sequence index needs to be handled in this function.

5.8.22.7.3.2 SNMPGetNextIndex Function

C

```
bool SNMPGetNextIndex(  
    SNMP_ID var,  
    SNMP_INDEX* index  
);
```

Description

This is a callback function called by SNMP module. SNMP user must implement this function in user application and provide appropriate data when called. This function will only be called for OID variable of type sequence.

Preconditions

None

Parameters

Parameters	Description
var	Variable id whose value is to be returned
index	Next Index of variable that should be transferred

Return Values

Return Values	Description
true	If a next index value exists for given variable at given index and index parameter contains next valid index.

false	Otherwise.

Remarks

Only sequence index needs to be handled in this function.

5.8.22.7.3.3 SNMPGetVar Function

C

```
bool SNMPGetVar(  
    SNMP_ID var,  
    SNMP_INDEX index,  
    uint8_t* ref,  
    SNMP_VAL* val  
);
```

Description

This is a callback function called by SNMP module. SNMP user must implement this function in user application and provide appropriate data when called.

Preconditions

None

Parameters

Parameters	Description
var	Variable id whose value is to be returned
index	Index of variable that should be transferred
ref	Variable reference used to transfer multi-byte data It is always SNMP_START_OF_VAR when very first byte is requested. Otherwise, use this as a reference to keep track of multi-byte transfers.
val	Pointer to up to 4 byte buffer. If var data type is uint8_t, transfer data in val->byte If var data type is uint16_t, transfer data in val->word If var data type is uint32_t, transfer data in val->dword If var data type is IP_ADDRESS, transfer data in val->v[] or val->dword If var data type is COUNTER32, TIME_TICKS or GAUGE32, transfer data in val->dword If var data type is ASCII_STRING or OCTET_STRING transfer data in val->byte using multi-byte transfer mechanism.

Return Values

Return Values	Description
true	If a value exists for given variable at given index.
false	Otherwise.

Remarks

None.

5.8.22.7.3.4 SNMPIsValidSetLen Function

C

```
bool SNMPIsValidSetLen(  
    SNMP_ID var,  
    uint8_t len,  
    uint8_t index  
);
```

Description

This routine is used to validate the dynamic variable data length to the variable data type. It is used when SET request is processed. This is a callback function called by module. User application must implement this function.

Preconditions

TCPIP_SNMP_ProcessSetVar() is called.

Parameters

Parameters	Description
var	Variable id whose value is to be set
len	Length value that is to be validated.

Return Values

Return Values	Description
true	if given var can be set to given len
false	if otherwise.

Remarks

This function will be called for only dynamic variables that are defined as ASCII_STRING and OCTET_STRING (i.e. data length greater than 4 bytes)

5.8.22.7.3.5 SNMPSendTrap Function

C

```
void SNMPSendTrap();
```

Description

This function is used to [send](#) trap notification to previously configured ip address if trap notification is enabled. There are different trap notification code. The current implementation sends trap for authentication failure (4).

Preconditions

If application defined event occurs to [send](#) the trap.

Returns

None.

Remarks

This is a callback function called by the application on certain predefined events. This routine only implemented to [send](#) a authentication failure Notification-type macro with PUSH_BUTTON oid stored in MPFS. If the ARP is not resolved i.e. if [TCPIP_SNMP_NotifyIsReady\(\)](#) returns false, this routine times out in 5 seconds. This routine should be modified according to event occurred and should update corresponding OID and notification type to the trap pdu.

5.8.22.7.3.6 SNMPSetVar Function

C

```
bool SNMPSetVar(  
    SNMP_ID var,  
    SNMP_INDEX index,  
    uint8_t ref,  
    SNMP_VAL val  
);
```

Description

This is a callback function called by module for the snmp SET request. User application must modify this function for the new variables address.

Preconditions

TCPIP_SNMP_ProcessVariables() is called.

Parameters

Parameters	Description
var	Variable id whose value is to be set
ref	Variable reference used to transfer multi-byte data 0 if first byte is set otherwise nonzero value to indicate corresponding byte being set.
val	Up to 4 byte data value. If var data type is uint8_t, variable value is in val->byte If var data type is uint16_t, variable value is in val->word If var data type is uint32_t, variable value is in val->dword. If var data type is IP_ADDRESS, COUNTER32, or GAUGE32, value is in val->dword If var data type is OCTET_STRING, ASCII_STRING value is in val->byte; multi-byte transfer will be performed to transfer remaining bytes of data.

Return Values

Return Values	Description
true	if it is OK to set more byte(s).
false	if otherwise.

Remarks

This function may get called more than once depending on number of bytes in a specific set request for given variable. only dynamic read-write variables needs to be handled.

5.8.22.7.3.7 SNMPValidateCommunity Function**C**

```
uint8_t SNMPValidateCommunity(  
    uint8_t* community  
);
```

Description

This function validates the community name for the mib access to NMS. The snmp community name received in the request pdu is validated for read and write community names. The agent gives an access to the mib variables only if the community matches with the predefined values. This routine also sets a global flag to [send](#) trap if authentication failure occurs.

Preconditions

TCPIP_SNMP_Initialize is already called.

Parameters

Parameters	Description
community	Pointer to community string as sent by NMS.

Returns

This routine returns the community validation result as READ_COMMUNITY or WRITE_COMMUNITY or INVALID_COMMUNITY

Remarks

This is a callback function called by module. User application must implement this function and verify that community matches

with predefined value. This validation occurs for each NMS request.

5.8.22.7.4 SNMPv3 Application Functions

5.8.22.7.4.1 SNMPv3ComputeHMACIpadOpadForAuthLoclzedKey Function

C

```
void SNMPv3ComputeHMACIpadOpadForAuthLoclzedKey(  
    uint8_t userDBIndex  
);
```

Description

This routine computes HMAC inner and outer pad strings for authorization localized key. RFC - 2104.

Preconditions

TCPIP_SNMPv3_Initialize() and ProcessVariabels() are called.

Parameters

Parameters	Description
userDBIndex	password storage poniter

Remarks

None

5.8.22.7.4.2 SNMPv3USMAuthPrivPswdLocalization Function

C

```
void SNMPv3USMAuthPrivPswdLocalization(  
    uint8_t userDBIndex  
);
```

Description

This routine converts MD5 or SHA1 and AES privacy password key to localized key using snmpEngineID(RFC- 3414 - section 6).

Preconditions

TCPIP_SNMPv3_Initialize() and ProcessVariabels() are called.

Parameters

Parameters	Description
userDBIndex	authentication protocol type

Remarks

None

5.8.22.7.4.3 TCPIP_SNMPv3_CmprTrapSecNameAndSecLvIWithUSMDb Function

C

```
bool TCPIP_SNMPv3_CmprTrapSecNameAndSecLvIWithUSMDb(  
    uint8_t tragetIndex,  
    uint8_t userTrapSecLen,  
    uint8_t * userTrapSecurityName,  
    STD_BASED_SNMPV3_SECURITY_LEVEL securityLevel  
);
```

Description

There are two different data base tables defined with SNMPv3 stack, like 'UserInfoDataBase' and 'Snmpv3TrapConfigData'. This routine is used to validate the trap user security level setting with SET request.

Preconditions

SET operation would be allowed if the USM security conditions and user security name in the request is matched to one of the user security name stored in the usm user database.

Parameters

Parameters	Description
userTrapSecLen	user sec name length in the SET request
userTrapSecurityName	pointer to user sec name in the SET request
securityLevel	trap security level to be SET on the agent

Return Values

Return Values	Description
true	if the trap target user sec level setting is successful
FLASE	If the SET failed due to non matching of the security parameters

Remarks

None.

5.8.22.7.5 SNMP Data Types and Constants

5.8.22.7.5.1 SNMP_END_OF_VAR Macro

C

```
#define SNMP_END_OF_VAR (0xff)
```

Description

This is macro SNMP_END_OF_VAR.

5.8.22.7.5.2 SNMP_H Macro

C

```
#define SNMP_H
```

Description

5.8.22.7.5.3 SNMP_INDEX_INVALID Macro

C

```
#define SNMP_INDEX_INVALID (0xff)
```

Description

This is macro SNMP_INDEX_INVALID.

5.8.22.7.5.4 SNMP_START_OF_VAR Macro

C

```
#define SNMP_START_OF_VAR (0)
```

5.8.22.7.5.5 SNMP_V1 Macro

C

```
#define SNMP_V1 (0)
```

5.8.22.7.5.6 SNMP_V2C Macro

C

```
#define SNMP_V2C (1)
```

Description

This is macro SNMP_V2C.

5.8.22.7.5.7 SNMP_V3 Macro

C

```
#define SNMP_V3 (3)
```

Description

This is macro SNMP_V3.

5.8.22.7.5.8 GENERIC_TRAP_NOTIFICATION_TYPE Enumeration

C

```
typedef enum {  
    COLD_START = 0x0,  
    WARM_START = 0x1,  
    LINK_DOWN = 0x2,  
    LINK_UP = 0x3,  
    AUTH_FAILURE = 0x4,  
    EGP_NEBOR_LOSS = 0x5,  
    ENTERPRISE_SPECIFIC = 0x6  
} GENERIC_TRAP_NOTIFICATION_TYPE;
```

Description

This is type GENERIC_TRAP_NOTIFICATION_TYPE.

5.8.22.7.5.9 IPV6_SNMP_TRAP_INFO Structure

C

```
typedef struct tIPV6_SNMP_TRAP_INFO {  
    uint8_t Size;  
    struct {  
        uint8_t communityLen;  
        char community[TRAP_COMMUNITY_MAX_LEN];  
        IPV6_ADDR IPv6Address;  
        struct {  
            unsigned int bEnabled : 1;  
        } Flags;  
    } table[TRAP_TABLE_SIZE];  
} IPV6_SNMP_TRAP_INFO;
```

Description

This is type IPV6_SNMP_TRAP_INFO.

Members

Members	Description
uint8_t communityLen;	Community name length
char community[TRAP_COMMUNITY_MAX_LEN];	Community name array
IPV6_ADDR IPv6Address;	IPv6 address to which trap to be sent
unsigned int bEnabled : 1;	Trap enabled flag

5.8.22.7.5.10 SNMP_BUFFER_DATA Structure

C

```
typedef struct {  
    uint8_t * head;  
    uint16_t length;  
} SNMP_BUFFER_DATA;
```

Description

SNMPv1/v2c

5.8.22.7.5.11 SNMP_COMMUNITY_TYPE Enumeration

C

```
typedef enum {  
    READ_COMMUNITY = 1,  
    WRITE_COMMUNITY = 2,  
    INVALID_COMMUNITY = 3  
} SNMP_COMMUNITY_TYPE;
```

Description

This is type SNMP_COMMUNITY_TYPE.

Members

Members	Description
READ_COMMUNITY = 1	Read only community
WRITE_COMMUNITY = 2	Read write community
INVALID_COMMUNITY = 3	Community invalid

5.8.22.7.5.12 SNMP_ID Type

C

```
typedef uint32_t SNMP_ID;
```

Description

This is the SNMP OID variable id. This id is assigned via MIB file. Only dynamic and AgentID variables can contain ID. MIB2BIB utility enforces this rule when BIB was generated. typedef int SNMP_ID;

5.8.22.7.5.13 SNMP_INDEX Type

C

```
typedef uint8_t SNMP_INDEX;
```

Description

This is type SNMP_INDEX.

5.8.22.7.5.14 SNMP_MODULE_CONFIG Structure

C

```
typedef struct {  
} SNMP_MODULE_CONFIG;
```

Description

This is type SNMP_MODULE_CONFIG.

5.8.22.7.5.15 SNMP_NON_MIB_RECD_INFO Structure

C

```
typedef struct {  
    uint8_t oidstr[16];  
    uint8_t version;  
} SNMP_NON_MIB_RECD_INFO;
```

Description

This is type SNMP_NON_MIB_RECD_INFO.

5.8.22.7.5.16 SNMP_NOTIFY_INFO Structure

C

```
typedef struct {  
    char community[NOTIFY_COMMUNITY_LEN];  
    uint8_t communityLen;  
    SNMP_ID agentIDVar;  
    uint8_t notificationCode;  
    UDP_SOCKET socket;  
    TCPIP_UINT32_VAL timestamp;  
    SNMP_ID trapIDVar;  
    TCPIP_NET_HANDLE snmpTrapInf;  
} SNMP_NOTIFY_INFO;
```

Description

// the only if that runs SNMP

Members

Members	Description
char community[NOTIFY_COMMUNITY_LEN];	Community name array
uint8_t communityLen;	Community name length
SNMP_ID agentIDVar;	Agent id for trap identification
uint8_t notificationCode;	Trap notification code
UDP_SOCKET socket;	Udp socket number
TCPIP_UINT32_VAL timestamp;	Time stamp for trap
SNMP_ID trapIDVar;	SNMPV2 specific trap
TCPIP_NET_HANDLE snmpTrapInf;	interface we use for the SNMP TRAP

5.8.22.7.5.17 SNMP_PROCESSING_MEM_INFO_PTRS Structure**C**

```
typedef struct {
    SNMP_STACK_DCPT_STUB* snmpStkDynMemStubPtr;
    const void* snmpHeapMemHandler;
    TCPIP_SNMP_DCPT* snmpDcptPtr;
} SNMP_PROCESSING_MEM_INFO_PTRS;
```

Description

This is type SNMP_PROCESSING_MEM_INFO_PTRS.

5.8.22.7.5.18 SNMP_STACK_DCPT_STUB Structure**C**

```
typedef struct {
    uint8_t gOIDCorrespondingSnmplibID;
    uint8_t gSetTrapSendFlag;
    bool getZeroInstance;
    uint8_t appendZeroToOID;
    uint8_t gSendTrapFlag;
    uint8_t gGenericTrapNotification;
    uint8_t gSpecificTrapNotification;
    SNMP_NOTIFY_INFO SNMPNotifyInfo;
    SNMP_BUFFER_DATA outPduBufData;
    SNMP_BUFFER_DATA trapPduOutBufData;
    SNMP_NET_CONFIG snmpNetConfig;
} SNMP_STACK_DCPT_STUB;
```

Members

Members	Description
SNMP_NOTIFY_INFO SNMPNotifyInfo;	notify info for trap

5.8.22.7.5.19 SNMP_TRAP_INFO Structure**C**

```
typedef struct tSNMP_TRAP_INFO {
    uint8_t Size;
    struct {
        uint8_t communityLen;
        char community[TRAP_COMMUNITY_MAX_LEN];
        IPV4_ADDR IPAddress;
        struct {
```

```

    unsigned int bEnabled : 1;
    } Flags;
    } table[TRAP_TABLE_SIZE];
} SNMP_TRAP_INFO;

```

Description

This is type SNMP_TRAP_INFO.

Members

Members	Description
uint8_t communityLen;	Community name length
char community[TRAP_COMMUNITY_MAX_LEN];	Community name array
IPV4_ADDR IPAddress;	IP address to which trap to be sent
unsigned int bEnabled : 1;	Trap enabled flag

5.8.22.7.5.20 SNMP_TRAP_IP_ADDRESS_TYPE Enumeration

C

```

typedef enum {
    IPV4_SNMP_TRAP = 1,
    IPV6_SNMP_TRAP
} SNMP_TRAP_IP_ADDRESS_TYPE;

```

Description

This is type SNMP_TRAP_IP_ADDRESS_TYPE.

5.8.22.7.5.21 SNMP_VAL Union

C

```

typedef union {
    uint32_t dword;
    uint16_t word;
    uint8_t byte;
    uint8_t v[sizeof(uint32_t)];
} SNMP_VAL;

```

Description

This is type SNMP_VAL.

Members

Members	Description
uint32_t dword;	double word value
uint16_t word;	word value
uint8_t byte;	byte value
uint8_t v[sizeof(uint32_t)];	byte array

5.8.22.7.5.22 TCPIP_SNMP_DCPT Structure

C

```

typedef struct {
    TCPIP_SNMP_SM sm;
    UDP_SOCKET skt;
    bool readFromSnmpBuf;
    IPV6_HANDLE snmpIPV6Handler;
}

```

```
    IPV6_EVENT_TYPE ipv6EventType;  
} TCPIP_SNMP_DCPT;
```

Description

TCPIP_STACK_USE_IPV6

Members

Members	Description
TCPIP_SNMP_SM sm;	current status
UDP_SOCKET skt;	associated socket

5.8.22.7.5.23 TCPIP_SNMP_SM Enumeration

C

```
typedef enum {  
    SNMP_HOME = 0,  
    SNMP_LISTEN,  
    SNMP_PROCESS,  
    SNMP_PACKET_DISCARD  
} TCPIP_SNMP_SM;
```

Description

This is type TCPIP_SNMP_SM.

5.8.22.7.5.24 VENDOR_SPECIFIC_TRAP_NOTIFICATION_TYPE Enumeration

C

```
typedef enum {  
    VENDOR_TRAP_DEFAULT = 0x0,  
    BUTTON_PUSH_EVENT = 0x1,  
    POT_READING_MORE_512 = 0x2  
} VENDOR_SPECIFIC_TRAP_NOTIFICATION_TYPE;
```

Description

This is type VENDOR_SPECIFIC_TRAP_NOTIFICATION_TYPE.

5.8.22.7.6 SNMPv3 Data Types and Constants

SNMP Defs for Microchip TCP/IP Stack

Enumerations

	Name	Description
	GENERIC_TRAP_NOTIFICATION_TYPE	This is type GENERIC_TRAP_NOTIFICATION_TYPE.
	SNMP_COMMUNITY_TYPE	This is type SNMP_COMMUNITY_TYPE.
	SNMP_TRAP_IP_ADDRESS_TYPE	This is type SNMP_TRAP_IP_ADDRESS_TYPE.
	TCPIP_SNMP_SM	This is type TCPIP_SNMP_SM.
	VENDOR_SPECIFIC_TRAP_NOTIFICATION_TYPE	This is type VENDOR_SPECIFIC_TRAP_NOTIFICATION_TYPE.

Functions

	Name	Description
	SNMPGetExactIndex	To search for exact index node in case of a Sequence variable.
	SNMPGetNextIndex	To search for next index node in case of a Sequence variable.
	SNMPGetVar	Used to Get/collect OID variable information.
	SNMPIsValidSetLen	Validates the set variable data length to data type.
	SNMPSendTrap	Prepare, validate remote node which will receive trap and send trap pdu.
	SNMPSetVar	This routine Set the mib variable with the requested value.
	SNMPValidateCommunity	Validates community name for access control.
	TCPIP_SNMP_ClientGetNet	
	TCPIP_SNMP_DataCopyToProcessBuffer	Copies uint8_t data to dynamically allocated memory buffer.
	TCPIP_SNMP_EventNotifyGet	To Get the IPv6 DHCP event notification.
	TCPIP_SNMP_Notify	Creates and Sends TRAP pdu.
	TCPIP_SNMP_NotifyIsReady	Resolves given remoteHost IP address into MAC address.
	TCPIP_SNMP_NotifyPrepare	Collects trap notification info and send ARP to remote host.
	TCPIP_SNMP_PacketProcStubPtrsGet	Get SNMP packet processing memory pointer.
	TCPIP_SNMP_ProcessBufferDataGet	Reads uint8_t data from dynamically allocated memory buffer.
	TCPIP_SNMP_ReadCommunityGet	Get the readCommunity String with Snmp index.
	TCPIP_SNMP_TrapTimeGet	Get SNMP Trap UDP client open socket timeout.
	TCPIP_SNMP_WriteCommunityGet	Get the writeCommunity String with Snmp index.

Macros

	Name	Description
	SNMP_END_OF_VAR	This is macro SNMP_END_OF_VAR.

5.8.22.8.2 snmp_config.h

Simple Network Management Protocol (SNMP) Configuration file

This file contains the SNMP module configuration options

Macros

	Name	Description
	END_OF_SNMP_READ_COMMUNITIES	??
	END_OF_SNMP_WRITE_COMMUNITIES	??
	MY_DEFAULT_SNMP_IF	For multi-homed hosts, the default SNMP interface
	NOTIFY_COMMUNITY_LEN	Length of Community name array
	OID_MAX_LEN	Change this to match your OID string length.
	SNMP_BIB_FILE_NAME	Name of the bib file for snmp
	SNMP_COMMUNITY_MAX_LEN	This is the maximum length for community string. Application must ensure that this length is observed. SNMP module adds one byte extra after SNMP_COMMUNITY_MAX_LEN for adding '0' NULL character.
	SNMP_MAX_COMMUNITY_SUPPORT	Specifying more strings than SNMP_MAX_COMMUNITY_SUPPORT will result in the later strings being ignored (but still wasting program memory). Specifying fewer strings is legal, as long as at least one is present.
	SNMP_MAX_MSG_SIZE	SNMP MIN and MAX message 484 bytes in size. As per RFC 3411 snmpEngineMaxMessageSize and RFC 1157 (section 4- protocol specification) and implementation supports more than 484 whenever feasible.
	SNMP_MAX_NON_REC_ID_OID	Update the Non record id OID value which is part of CustomSnmpDemo.c file
	SNMP_READ_COMMUNITIES	Default SNMPv2C community names. These can be overridden at run time if alternate strings are present in external EEPROM or Flash (actual strings could be stored by the TCPIP storage service. These strings are case sensitive. An empty string means disabled (not matchable). For application security, these default community names should not be used, but should all be disabled to force the end user to select unique community names. These defaults are provided only to make it easier to start development. Specifying more strings than SNMP_MAX_COMMUNITY_SUPPORT will result in the later strings being ignored (but still wasting program memory). Specifying... more
	SNMP_TRAP_COMMUNITY_MAX_LEN_MEM_USE	This macro will be used to avoid SNMP OID memory buffer corruption
	SNMP_WRITE_COMMUNITIES	Default SNMPv2C community names. See SNMP_READ_COMMUNITIES for more information.
	TRAP_COMMUNITY_MAX_LEN	Maximum length of community name table
	TRAP_TABLE_SIZE	This table maintains list of interested receivers who should receive notifications when some interesting event occurs.

Structures

	Name	Description
	SNMP_NET_CONFIG	SNMP Network Configuration structure typedef

5.8.22.8.3 snmpv3.h

This is file snmpv3.h.

Functions

	Name	Description
	SNMPv3ComputeHMACIpadOpadForAuthLoclzedKey	Compute HMAC inner and outer pad for authorization localized key.
	SNMPv3USMAuthPrivPswdLocalization	Convert Auth and Priv password to the localized Key using SNMPEngineID.
	TCPIP_SNMPv3_CmprTrapSecNameAndSecLvIWithUSMDb	Routine to find the index of the user name in the user data base table.
	TCPIP_SNMPv3_Notify	Creates and Sends SNMPv3 TRAP pdu.
	TCPIP_SNMPV3_PacketProcStubPtrsGet	Get SNMPv3 packet processing memory pointer.

Structures

	Name	Description
	SNMPV3_PROCESSING_MEM_INFO_PTRS	SNMPv3 Processing Memory Pointers
	SNMPV3_STACK_DCPT_STUB	SNMPv3 Descriptor Structure Typedef

5.8.22.8.4 snmpv3_config.h

Simple Network Management Protocol (SNMPv3) Configuration file

This file contains the SNMPv3 module configuration options

Macros

	Name	Description
	AUTH_LOCALIZED_PASSWORD_KEY_LEN	SNMPv3 Authentication Localized passwed key lenegth size
	PRIV_LOCALIZED_PASSWORD_KEY_LEN	SNMPv3 Privacy Pasword key length size
	SNMPV3_AUTH_LOCALIZED_PASSWORD_KEY_LEN_MEM_USE	SNMPv3 authentication localized Key length for memory validation
	SNMPV3_PRIV_LOCALIZED_PASSWORD_KEY_LEN_MEM_USE	SNMPv3 privacy key length size for memory validation
	SNMPV3_TRAP_MSG_PROCESS_MODEL_DB	This is macro SNMPV3_TRAP_MSG_PROCESS_MODEL_DB.
	SNMPV3_TRAP_SECURITY_LEVEL_DB	This is macro SNMPV3_TRAP_SECURITY_LEVEL_DB.
	SNMPV3_TRAP_SECURITY_MODEL_TYPE_DB	This is macro SNMPV3_TRAP_SECURITY_MODEL_TYPE_DB.
	SNMPV3_TRAP_USER_SECURITY_NAME_DB	This is macro SNMPV3_TRAP_USER_SECURITY_NAME_DB.
	SNMPV3_USER_AUTH_PASSWD_DB	This is macro SNMPV3_USER_AUTH_PASSWD_DB.
	SNMPV3_USER_AUTH_TYPE_DB	This is macro SNMPV3_USER_AUTH_TYPE_DB.
	SNMPV3_USER_PRIV_PASSWD_DB	This is macro SNMPV3_USER_PRIV_PASSWD_DB.
	SNMPV3_USER_PRIV_TYPE_DB	This is macro SNMPV3_USER_PRIV_TYPE_DB.

	SNMPV3_USER_SECURITY_NAME_DB	This is macro SNMPV3_USER_SECURITY_NAME_DB.
	SNMPV3_USER_SECURITY_NAME_LEN_MEM_USE	User security name length for memory validation
	SNMPV3_USM_MAX_USER	Client configuration options
	USER_SECURITY_NAME_LEN	SNMPv3 User Security Name length

5.8.23 SNTP TCP/IP Stack Library

5.8.23.1 Introduction

Simple Network Time Protocol (SNTP) TCP/IP Stack Library

for

Microchip Microcontrollers

This library provides the API of the SNTP TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

The SNTP module implements the Simple Network Time Protocol. The module (by default) updates its internal time every 10 minutes using a pool of public global time servers. It then calculates reference times on any call to `SNTPGetUTCSeconds` (see page 458) using the internal Tick timer module.

The SNTP module is good for providing absolute time stamps. However, it should not be relied upon for measuring time differences (especially small differences). The pool of public time servers is implemented using round-robin DNS, so each update will come from a different server. Differing network delays and the fact that these servers are not verified implies that this time could be non-linear. While it is deemed reliable, it is not guaranteed to be accurate.

The Tick module provides much better accuracy (since it is driven by a hardware clock) and resolution, and should be used for measuring timeouts and other internal requirements.

Developers can change the value of [NTP_SERVER](#) (see page 462) if they wish to always point to a preferred time server, or to specify a region when accessing time servers. The default is to use the global pool.

5.8.23.2 Release Notes

MPLAB Harmony Version: v0.70b **SNTP TCP/IP Stack Library Version :** 1.0 **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.8.23.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.8.23.4 Using the Library

This topic describes the basic architecture of the SNTP TCP/IP Stack Library and provides information and examples on how to use it.

Interface Header File: [sntp.h](#)

The interface to the SNTP TCP/IP Stack library is defined in the "[sntp.h](#)" header file. This file is included by the "tcpip.h" file. Any C language source (.c) file that uses the SNTP TCP/IP Stack library should include "tcpip.h".

Library File:

The SNTP TCP/IP Stack library archive (.a) file installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the TCP/IP Stack interacts with the framework.

5.8.23.4.1 Abstraction Model

This library provides the API of the SNTP TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

SNTP Software Abstraction Block Diagram

Note: This image was not available at time of release and will be added in a future release of MPLAB Harmony.

5.8.23.4.2 Library Overview

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the SNTP module.

Library Interface Section	Description
Functions	Routines for configuring SNTP
Data Types and Constants	This section provides various definitions describing this API

5.8.23.5 Configuring the Library

Macros

	Name	Description
	NTP_DEFAULT_CONNECTION_TYPE	The default connection type to use: IPv4/IPv6
	NTP_DEFAULT_IF	for multi-homed hosts, the default SNTP interface
	NTP_EPOCH	Reference Epoch to use. (default: 01-Jan-1970 00:00:00)
	NTP_FAST_QUERY_INTERVAL	Defines how long to wait to retry an update after a failure, seconds. Updates may take up to 6 seconds to fail, so this 14 second delay is actually only an 8-second retry.
	NTP_MAX_RETRIES	Number of retries to connect to the server
	NTP_MAX_STRATUM	The maximum acceptable NTP stratum number Should be less than 16 (unsynchronized server)
	NTP_QUERY_INTERVAL	Defines how frequently to resynchronize the date/time, seconds (default: 10 minutes)
	NTP_REPLY_TIMEOUT	Defines how long to wait before assuming the query has failed, seconds
	NTP_SERVER	These are normally available network time servers. The actual IP returned from the pool will vary every minute so as to spread the load around stratum 1 timeservers. For best accuracy and network overhead you should locate the pool server closest to your geography, but it will still work if you use the global pool.ntp.org address or choose the wrong one or ship your embedded device to another geography.
	NTP_SERVER_PORT	Port for contacting NTP servers
	NTP_TIME_STAMP_TMO	elapsed time that qualifies a time stamp as stale normally it should be correlated with NTP_QUERY_INTERVAL
	NTP_VERSION	The default NTP version to use (3 or 4)

Description

The configuration of the SNTP TCP/IP Stack Library is based on the file tcpip_config.h

This header file contains the configuration selection for the SNTP TCP/IP Stack Library. Based on the selections made, the SNTP TCP/IP Stack Library will support or not support selected features. These configuration settings will apply to all instances of the SNTP TCP/IP Stack Library.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.8.23.5.1 NTP_DEFAULT_CONNECTION_TYPE Macro

C

```
#define NTP_DEFAULT_CONNECTION_TYPE (IP_ADDRESS_TYPE_IPV4)
```

Description

The default connection type to use: IPv4/IPv6

5.8.23.5.2 NTP_DEFAULT_IF Macro

C

```
#define NTP_DEFAULT_IF "PIC32INT"
```

Description

for multi-homed hosts, the default SNTP interface

5.8.23.5.3 NTP_EPOCH Macro

C

```
#define NTP_EPOCH (86400ul * (365ul * 70ul + 17ul))
```

Description

Reference Epoch to use. (default: 01-Jan-1970 00:00:00)

5.8.23.5.4 NTP_FAST_QUERY_INTERVAL Macro

C

```
#define NTP_FAST_QUERY_INTERVAL (14ul)
```

Description

Defines how long to wait to retry an update after a failure, seconds. Updates may take up to 6 seconds to fail, so this 14 second delay is actually only an 8-second retry.

5.8.23.5.5 NTP_MAX_RETRIES Macro

C

```
#define NTP_MAX_RETRIES (3)
```

Description

Number of retries to [connect](#) to the server

5.8.23.5.6 NTP_MAX_STRATUM Macro

C

```
#define NTP_MAX_STRATUM (15)
```

Description

The maximum acceptable NTP stratum number Should be less than 16 (unsynchronized server)

5.8.23.5.7 NTP_QUERY_INTERVAL Macro

C

```
#define NTP_QUERY_INTERVAL (10ul*60ul)
```

Description

Defines how frequently to resynchronize the date/time, seconds (default: 10 minutes)

5.8.23.5.8 NTP_REPLY_TIMEOUT Macro

C

```
#define NTP_REPLY_TIMEOUT (6ul)
```

Description

Defines how long to wait before assuming the query has failed, seconds

5.8.23.5.9 NTP_SERVER Macro

C

```
#define NTP_SERVER "pool.ntp.org"
```

Description

These are normally available network time servers. The actual IP returned from the pool will vary every minute so as to spread the load around stratum 1 timeservers. For best accuracy and network overhead you should locate the pool server closest to your geography, but it will still work if you use the global pool.ntp.org address or choose the wrong one or ship your embedded device to another geography.

5.8.23.5.10 NTP_SERVER_PORT Macro

C

```
#define NTP_SERVER_PORT (123ul)
```

Description

Port for contacting NTP servers

5.8.23.5.11 NTP_TIME_STAMP_TMO Macro

C

```
#define NTP_TIME_STAMP_TMO (11 * 60)
```

Description

elapsed time that qualifies a time stamp as stale normally it should be correlated with [NTP_QUERY_INTERVAL](#)

5.8.23.5.12 NTP_VERSION Macro

C

```
#define NTP_VERSION (4)
```

Description

The default NTP version to use (3 or 4)

5.8.23.6 Building the Library

This section list the files that are available in the \src of the SNTP driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

5.8.23.7 Library Interface

Data Types and Constants

	Name	Description
	SNTP_MODULE_CONFIG	Placeholder for SNTP Module Configuration
	SNTP_RESULT	Provides a list of possible results for the SNTP module.

Functions

	Name	Description
	TCPIP_SNTP_ConnectionInitiate	Forces a connection to the NTP server
	TCPIP_SNTP_ConnectionParamSet	Sets the current SNTP connection parameters
	TCPIP_SNTP_LastErrorGet	Gets the last error code set in the NTP server
	TCPIP_SNTP_TimeStampGet	Gets the last valid timestamp obtained from an NTP server
	TCPIP_SNTP_UTCSecondsGet	Obtains the current time from the SNTP module.

Description

This section describes the Application Programming Interface (API) functions of the SNTP TCP/IP Stack.

Refer to each section for a detailed description.

5.8.23.7.1 Functions

5.8.23.7.1.1 TCPIP_SNTP_ConnectionInitiate Function

C

```
SNTP_RESULT TCPIP_SNTP_ConnectionInitiate();
```

Description

This function will start a connection to the NTP server

Preconditions

TCP/IP Stack should have been initialized

Returns

SNTP_RES_OK - if the call succeeded SNTP_RES_BUSY error code if the connection could not have been started

Remarks

None

5.8.23.7.1.2 TCPIP_SNTP_ConnectionParamSet Function

C

```
SNTP_RESULT TCPIP_SNTP_ConnectionParamSet(
    TCPIP_NET_HANDLE netH,
    IP_ADDRESS_TYPE ntpConnType
);
```

Description

This function sets the parameters for the next SNTP connections.

Preconditions

TCP/IP Stack should have been initialized

Parameters

Parameters	Description
neth	new interface to use as default SNTP interface if 0, the current interface is not changed
ntpConnType	type of conenction to make: IPv4 or IPv6 if IP_ADDRESS_TYPE_ANY, the current setting is not changed

Returns

SNTP_RES_OK - if the call succeeded [SNTP_RESULT](#) error code otherwise

Remarks

None

5.8.23.7.1.3 TCPIP_SNTP_LastErrorGet Function**C**

```
SNTP_RESULT TCPIP_SNTP_LastErrorGet();
```

Description

This function returns the last NTP error code and clears the current error code

Preconditions

TCP/IP Stack should have been initialized

Returns

the last error code encountered by the NTP module

Remarks

None

5.8.23.7.1.4 TCPIP_SNTP_TimeStampGet Function**C**

```
SNTP_RESULT TCPIP_SNTP_TimeStampGet(  
    uint64_t* pTStamp,  
    SYS_TICK* pLastUpdate  
);
```

Description

This function gets the last valid timestamp obtained from an NTP server

Preconditions

TCP/IP Stack should have been initialized

Parameters

Parameters	Description
pTStamp	pointer to a 64 bit buffer to store the last NTP timestamp could be NULL if the timestamp not needed
pLastUpdate	pointer to store the last time stamp update tick could be NULL if the update time not needed

Returns

SNTP_RES_OK - if the call succeeded SNTP_RES_TSTAMP_STALE error code if there's no recent time stamp

Remarks

None

5.8.23.7.1.5 TCPIP_Sntp_UTCSecondsGet Function

C

```
uint32_t TCPIP_Sntp_UTCSecondsGet();
```

Description

This function obtains the current time as reported by the SNTP module. Use this value for absolute time stamping. The value returned is (by default) the number of seconds since 01-Jan-1970 00:00:00.

Preconditions

TCP/IP Stack should have been initialized

Returns

The number of seconds since the Epoch. (Default 01-Jan-1970 00:00:00)

Remarks

Do not use this function for time difference measurements. The Tick module is more appropriate for those requirements.

5.8.23.7.2 Data Types and Constants

5.8.23.7.2.1 SNTP_MODULE_CONFIG Structure

C

```
typedef struct {  
} SNTP_MODULE_CONFIG;
```

Description

Placeholder for SNTP Module Configuration

5.8.23.7.2.2 SNTP_RESULT Enumeration

C

```
typedef enum {  
    SNTP_RES_OK,  
    SNTP_RES_PROGRESS,  
    SNTP_RES_BUSY = -1,  
    SNTP_RES_TSTAMP_STALE = -2,  
    SNTP_RES_SKT_ERR = -3,  
    SNTP_RES_NTP_SERVER_TMO = -4,  
    SNTP_RES_NTP_VERSION_ERR = -5,  
    SNTP_RES_NTP_TSTAMP_ERR = -6,  
    SNTP_RES_NTP_SYNC_ERR = -7,  
    SNTP_RES_NTP_KOD_ERR = -8,  
    SNTP_RES_NTP_DNS_ERR = -9  
} SNTP_RESULT;
```

Description

SNTP_RESULT Enumeration

Provides a list of possible SNTP results.

Members

Members	Description
SNTP_RES_OK	the operation was successful
SNTP_RES_PROGRESS	an NTP operation is in progress
SNTP_RES_BUSY = -1	module is busy
SNTP_RES_TSTAMP_STALE = -2	timestamp is stale, there's no recent timestamp
SNTP_RES_SKT_ERR = -3	NTP socket could not be opened
SNTP_RES_NTP_SERVER_TMO = -4	NTP server could not be accessed
SNTP_RES_NTP_VERSION_ERR = -5	wrong NTP version received
SNTP_RES_NTP_TSTAMP_ERR = -6	wrong NTP time stamp received
SNTP_RES_NTP_SYNC_ERR = -7	NTP time synchronization error
SNTP_RES_NTP_KOD_ERR = -8	an NTP KissOfDeath code has been received
SNTP_RES_NTP_DNS_ERR = -9	an NTP DNS error

Remarks

None

5.8.23.8 Files

Files

Name	Description
sntp.h	
sntp_config.h	SNTP configuration file

Description

5.8.23.8.1 sntp.h

SNTP Client Module Header

Enumerations

	Name	Description

5.8.24 SSL TCP/IP Stack Library**5.8.24.1 Introduction**

Secure Sockets Layer (SSL) TCP/IP Stack Library

for

Microchip Microcontrollers

This library provides the API of the SSL TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

The SSL module adds encryption support to the TCP layer by implementing the SSLv3 protocol. This protocol is the standard for secure communications across the Internet, and prevents snooping or tampering of data as it travels across an untrusted network. This implementation of SSL supports the RSA asymmetric encryption protocol and the ARCFOUR symmetric encryption protocol.

To comply with US Export Control restrictions, the encryption portion of the SSL module must be purchased separately from Microchip. The library of Data Encryption Routines (SW300052) is available for a nominal fee from microchipDirect.

Newer versions of the TCP/IP Stack include modifications to the SSL module to enable an expanded range of RSA key lengths. This will allow the TCP/IP Stack to support a wider range of SSL client/servers. Because of these changes, you may need to manually modify your copy of RSA.c or obtain an updated copy from microchipDirect. The following table enumerates which cryptographic add-on is required for which stack version.

5.8.24.2 Release Notes

MPLAB Harmony Version: v0.70b **SSL TCP/IP Stack Library Version :** 1.0 **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.8.24.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.8.24.4 Using the Library

This topic describes the basic architecture of the SSL TCP/IP Stack Library and provides information and examples on how to use it.

Interface Header File: [ssl.h](#)

The interface to the SSL TCP/IP Stack library is defined in the "[ssl.h](#)" header file. This file is included by the "tcpip.h" file. Any C language source (.c) file that uses the SSL TCP/IP Stack library should include "tcpip.h".

Library File:

The SSL TCP/IP Stack library archive (.a) file installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the TCP/IP Stack interacts with the framework.

5.8.24.4.1 Abstraction Model

This library provides the API of the SSL TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

SSL Software Abstraction Block Diagram

Note: This image was not available at time of release and will be added in a future release of MPLAB Harmony.

5.8.24.4.2 Library Overview

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the SSL module.

Library Interface Section	Description
Functions	Routines for configuring SSL
Data Types and Constants	This section provides various definitions describing this API

5.8.24.4.3 How the Library Works

5.8.24.4.3.1 SSL Client Support

An SSL client can be initiated by first opening a TCP connection, then calling TCPStartSSLSession to initiate the SSL handshake process. The handshake uses the public key from the certificate provided by the server. Key lengths up to 1024 bits are supported on all processors; key lengths up to 2048 bits are supported on PIC32 microcontrollers. The [SSL_RSA_CLIENT_SIZE](#) macro in SSLClientSize.h sets the maximum certificate key length that your client should process.

```
#define SSL_RSA_CLIENT_SIZE (1024u1) // Size of Encryption Buffer (must be larger than key size)
```

Once the handshake has started, call TCPSSLIsHandshaking (see page 468) until it returns FALSE. This will indicate that the handshake has completed and all traffic is now secured using 128-bit ARCFOUR encryption. If the handshake fails for any reason, the TCP connection will automatically be terminated as required by the SSL protocol specification.

For faster performance, the SSL module caches security parameters for the most recently made connections. This allows quick reconnections to the same node without the computational expense of another RSA handshake. By default, the two most recent connections are cached, but this can be modified in TCPIPConfig.h.

SSL client support is already enabled for SMTP. When STACK_USE_SSL_CLIENT is defined, the SMTP module automatically adds a field to SMTPClient (see page 304) called UseSSL. That field controls whether or not the SMTP client module will attempt to make an SSL connection before transmitting any data.

Note that TCP sockets using SSL may require an increase in TX/RX buffer size to support SSL. You can adjust the size of your sockets using the TCP/IP Configuration Utility included with the stack.

5.8.24.4.3.2 SSL Server Support

To initiate an SSL server, first open a TCP [socket](#) for listening using TCPOpen (see page 542). Then call TCPAddSSLListener (see page 468) to [listen](#) (see page 175) for incoming SSL connections on an alternate port. This allows a single [socket](#) to share application-level resources and [listen](#) (see page 175) for connections on two different ports. Connections occurring on the originally opened port will proceed unsecured, while connections on the SSL port will first complete an SSL handshake to secure the data.

If your application will not [accept](#) (see page 169) unsecured traffic, simply open a non-secured [socket](#) on a free port number, then verify that each incoming connection is secured (not on that port) by calling TCPIsSSL (see page 469).

SSL server support is automatically enabled for HTTP2 when STACK_USE_SSL_SERVER is defined. By default, the HTTP2 module will then [listen](#) (see page 175) for unsecured traffic on port 80 and secured connections on port 443.

This SSL server implementation supports key lengths up to 1024 bits on most PIC microcontrollers, and 2048 bits on PIC32 microcontrollers. The [SSL_RSA_KEY_SIZE](#) (see page 471) macro in TCPIPConfig.h sets the server certificate key length.

```
// Bits in SSL RSA key. This parameter is used for SSL sever  
// connections only.  
#define SSL_RSA_KEY_SIZE (512u1)
```

Note that TCP sockets using SSL may require an increase in TX/RX buffer size to support SSL. You can adjust the size of your sockets using the TCP/IP Configuration Utility included with the stack.

5.8.24.4.3.3 SSL Limitations

SSL was designed for desktop PCs with faster processors and significantly more resources than are available on an embedded platform. A few compromises must be made in order to use SSL in a less resource-intensive manner.

The SSL client module does not perform any validation or verification of certificates. Doing so would require many root certificates to be stored locally for verification, which is not feasible for memory-limited parts. This does not compromise security once the connection has been established, but does not provide complete security against man-in-the-middle attacks. (This sort of attack is uncommon and would be difficult to execute.)

Neither the SSL client nor the server can completely verify MACs before processing data. SSL records include a signature to verify that messages were not modified in transit. This Message Authentication (see page 89) Code, or MAC, is inserted after at least every 16kB of traffic. (It usually is inserted much more frequently than that.) Without 16kB of RAM to buffer packets for each [socket](#), incoming data must be handed to the application layer before the MAC can be completely verified. Invalid MACs will still cause the connection to terminate immediately, but by the time this is detected some bad data may have already reached the application. Since the ARCFOUR cipher in use is a stream cipher, it would be difficult to exploit this in any meaningful way. An attacker would not be able to control what data is actually modified or inserted, as doing so without knowledge of the key would yield garbage. However, it is important to understand that incoming data is not completely verified before being passed to the application.

5.8.24.4.4 Generating Server Certificates

The SSL certificates used by the TCP/IP Stack's SSL module are stored in the CustomSSLCert.c source file. The following series of steps describe how to create the structures in CustomSSLCert.c using an SSL certificate.

1. Download and install the OpenSSL library. There are several third-party sites that offer SSL installers (e.g. <http://www.slproweb.com/products/Win32OpenSSL.html>). Note that some distributions may not include all commands specified by the OpenSSL documentation.

2. Open a console and change directory to the **OpenSSL/bin** folder.
3. If you don't have a key and certificate, you can generate them first. The following example console commands will generate a 512-bit key:
 1. Generate the key: **openssl genrsa -out 512bits.key 512**
 2. Generate the Certificate Signing Request (CSR). You will need to add additional information when prompted: **openssl req -new -key 512bits.key -out 512bits.csr**
 3. Generate the X.509 certificate if self-signing (or **send** the CSR to a Certificate Authority for signing): **openssl x509 -req -days 365 -in 512bits.csr -signkey 512bits.key -out 512bits.crt** (note that if the -days option is not specified, the default expiration time is 30 days)
 4. For additional documentation, refer to <http://www.openssl.org/docs/apps/openssl.html>.

4. Parse your key file using the command: **openssl.exe asn1parse -in "[directory containing your key]\512bits.key"**

5. You should see a screen like this:

6. If you are not using an ENCX24J600 family device, then the last 5 integers displayed here are the SSL_P, SSL_Q, SSL_dP, SSL_dQ, and SSL_qInv parameters, respectively. However, they are displayed here in big-endian format, and the Microchip cryptographic library implementation requires parameters in little-endian format, so you will have to enter the parameters into the C arrays in opposite order. For example, the INTEGER at offset 145:

```
145:d=1 h1=2 ;= 33 prim: INTEGER
```

```
:D777566780029FCD610200B66D89507D
```

```
915E3E5BDB6FAB0233B5DFA2E4081DF7
```

will be swapped in the CustomSSLCert.c file:

```
ROM BYTE SSL_P[] = {
```

```
0xF7 , 0x1D, 0x08, 0xE4, 0xA2, 0xDF, 0xB5, 0x33,
```

```
0x02, 0xAB, 0x6F, 0xDB, 0x5B, 0x3E, 0x5E, 0x91,
```

```
0x7D, 0x50, 0x89, 0x6D, 0xB6, 0x00, 0x02, 0x61,
```

```
0xCD, 0x9F, 0x02, 0x80, 0x67, 0x56, 0x77, 0xD7
```

```
};
```

7. If you are using an ENCX24J600 family device, then the second and fourth integers displayed here are the SSL_N and SSL_D parameters, respectively. There is no need to do an endian format change for these parameters. For the example, the expected SSL_N and SSL_D values are shown in the figure below:

8. Parse your X.509 certificate using the command: **openssl.exe asn1parse -in "[directory containing your cert]\512bits.crt" -out cert.bin**

9. Open the cert.bin output file in a hex editor. For example, here is the default certificate information generated from 512bits.crt given in the stack:

10. This information must be copied verbatim into the SSL_CERT [] array. Note that this is binary data (not a large integer) so it does not get endian-swapped like the private key parameters.

```
ROM BYTE SSL_CERT[524] = {
```

```
0x30, 0x82, 0x02, 0x08, 0x30, 0x82, 0x01, 0xb2, 0x02, 0x09, 0x00, 0xa5, 0x6a, 0xea, 0x1a,

```

11. Update the SSL_CERT_LEN variable to contain the correct value.

5.8.24.5 Configuring the Library

Macros

	Name	Description
	<u>SSL_MAX_BUFFERS</u>	Max # of SSL buffers (2 per <u>socket</u>)

	SSL_MAX_CONNECTIONS	Maximum number of simultaneous connections via SSL
	SSL_MAX_HASHES	Max # of SSL hashes (2 per socket , plus 1 to avoid deadlock)
	SSL_MAX_SESSIONS	Max number of cached SSL sessions
	SSL_MIN_SESSION_LIFETIME	Minimum lifetime for SSL Sessions Sessions cannot be reallocated until this much time (seconds) has elapsed
	SSL_MULTIPLE_INTERFACES	SSL on all interfaces in a multi-homed host set to 0 to work only on one interface
	SSL_RSA_CLIENT_SIZE	Size of encryption buffer, must be at least as big as the key size
	SSL_RSA_KEY_SIZE	Bits in SSL RSA key. This parameter is used for SSL sever connections only. The only valid value is 512 bits (768 and 1024 bits do not work at this time). Note, however, that SSL client operations do currently work up to 1024 bit RSA key length.
	SSL_RSA_LIFETIME_EXTENSION	Lifetime extension for RSA operations Sessions lifetime is extended by this amount (seconds) when an RSA calculation is made
	SSL_VERSION	Moved from MicrochipIncludeTCPIP StackSSL.h
	SSL_VERSION_HI	SSL version number (high byte)
	SSL_VERSION_LO	SSL version number (low byte)

Description

The configuration of the SSL TCP/IP Stack Library is based on the file `tcPIP_config.h`

This header file contains the configuration selection for the SSL TCP/IP Stack Library. Based on the selections made, the SSL TCP/IP Stack Library will support or not support selected features. These configuration settings will apply to all instances of the TCP/IP Stack SSL Library.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.8.24.5.1 SSL_MAX_BUFFERS Macro**C**

```
#define SSL_MAX_BUFFERS (4)
```

Description

Max # of SSL buffers (2 per [socket](#))

5.8.24.5.2 SSL_MAX_CONNECTIONS Macro**C**

```
#define SSL_MAX_CONNECTIONS (2)
```

Description

Maximum number of simultaneous connections via SSL

5.8.24.5.3 SSL_MAX_HASHES Macro**C**

```
#define SSL_MAX_HASHES (5)
```

Description

Max # of SSL hashes (2 per [socket](#), plus 1 to avoid deadlock)

5.8.24.5.4 SSL_MAX_SESSIONS Macro

C

```
#define SSL_MAX_SESSIONS (2)
```

Description

Max number of cached SSL sessions

5.8.24.5.5 SSL_MIN_SESSION_LIFETIME Macro

C

```
#define SSL_MIN_SESSION_LIFETIME (1ul)
```

Description

Minimum lifetime for SSL Sessions Sessions cannot be reallocated until this much time (seconds) has elapsed

5.8.24.5.6 SSL_MULTIPLE_INTERFACES Macro

C

```
#define SSL_MULTIPLE_INTERFACES 1
```

Description

SSL on all interfaces in a multi-homed host set to 0 to work only on one interface

5.8.24.5.7 SSL_RSA_CLIENT_SIZE Macro

C

```
#define SSL_RSA_CLIENT_SIZE (1024ul)
```

Description

Size of encryption buffer, must be at least as big as the key size

5.8.24.5.8 SSL_RSA_KEY_SIZE Macro

C

```
#define SSL_RSA_KEY_SIZE (1024ul)
```

Description

Bits in SSL RSA key. This parameter is used for SSL sever connections only. The only valid value is 512 bits (768 and 1024 bits do not work at this time). Note, however, that SSL client operations do currently work up to 1024 bit RSA key length.

5.8.24.5.9 SSL_RSA_LIFETIME_EXTENSION Macro

C

```
#define SSL_RSA_LIFETIME_EXTENSION (8ul)
```

Description

Lifetime extension for RSA operations Sessions lifetime is extended by this amount (seconds) when an RSA calculation is made

5.8.24.5.10 SSL_VERSION Macro

C

```
#define SSL_VERSION (0x0300u) // Moved from Microchip\Include\TCPIP Stack\SSL.h
```

Description

Moved from Microchip\Include\TCPIP Stack\SSL.h

5.8.24.5.11 SSL_VERSION_HI Macro

C

```
#define SSL_VERSION_HI (0x03u)
```

Description

SSL version number (high byte)

5.8.24.5.12 SSL_VERSION_LO Macro

C

```
#define SSL_VERSION_LO (0x00u)
```

Description

SSL version number (low byte)

5.8.24.6 Building the Library

This section list the files that are available in the \src of the SSL driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

5.8.24.7 Library Interface

Data Types and Constants

	Name	Description
	SSL_MODULE_CONFIG	SSL layer configuration/initialization

Functions

	Name	Description
	TCPIP_TCP_SocketIsSecuredBySSL	Determines if a TCP connection is secured with SSL.
	TCPIP_TCPSSL_ClientBegin	Begins an SSL client session.
	TCPIP_TCPSSL_ClientStart	Begins an SSL client session.
	TCPIP_TCPSSL_HandshakeClear	Clears the SSL handshake flag.
	TCPIP_TCPSSL_ListenerAdd	Listens for SSL connection on a specific port.
	TCPIP_TCPSSL_ServerStart	Begins an SSL server session.
	TCPIP_TCPSSL_StillHandshaking	Determines if an SSL session is still handshaking.

Description

This section describes the Application Programming Interface (API) functions of the SSL TCP/IP Stack.

Refer to each section for a detailed description.

5.8.24.7.1 Functions

5.8.24.7.1.1 TCPIP_TCP_SocketIsSecuredBySSL Function

C

```
bool TCPIP_TCP_SocketIsSecuredBySSL(  
    TCP_SOCKET hTCP  
);
```

Description

Call this function to determine whether or not a TCP connection is secured with SSL.

Preconditions

TCP is initialized and hTCP is connected.

Parameters

Parameters	Description
hTCP	TCP connection to check

Return Values

Return Values	Description
true	Connection is secured via SSL
false	Connection is not secured

5.8.24.7.1.2 TCPIP_TCPSSL_ClientBegin Function

C

```
bool TCPIP_TCPSSL_ClientBegin(  
    TCP_SOCKET hTCP,  
    uint8_t* host,  
    void * buffer,  
    uint8_t suppDataType  
);
```

Description

This function escalates the current connection to an SSL secured connection by initiating an SSL client handshake.

Preconditions

TCP is initialized and hTCP is already connected.

Parameters

Parameters	Description
hTCP	TCP connection to secure
host	Expected host name on certificate (currently ignored)
buffer	Buffer for supplementary data return
suppDataType	Type of supplementary data to copy

Return Values

Return Values	Description
true	an SSL connection was initiated
false	Insufficient SSL resources (stubs) were available

Remarks

The host parameter is currently ignored and is not validated.

5.8.24.7.1.3 TCPIP_TCPSSL_ClientStart Function**C**

```
bool TCPIP_TCPSSL_ClientStart(  
    TCP_SOCKET hTCP,  
    uint8_t* host  
);
```

Description

This function escalates the current connection to an SSL secured connection by initiating an SSL client handshake.

Preconditions

TCP is initialized and hTCP is already connected.

Parameters

Parameters	Description
hTCP	TCP connection to secure
host	Expected host name on certificate (currently ignored)

Return Values

Return Values	Description
true	an SSL connection was initiated
false	Insufficient SSL resources (stubs) were available

Remarks

The host parameter is currently ignored and is not validated.

5.8.24.7.1.4 TCPIP_TCPSSL_HandshakeClear Function**C**

```
void TCPIP_TCPSSL_HandshakeClear(  
    TCP_SOCKET hTCP  
);
```

Description

This function clears the flag indicating that an SSL handshake is complete.

Preconditions

TCP is initialized and hTCP is connected.

Parameters

Parameters	Description
hTCP	TCP connection to set

Returns

None

Remarks

This function should never be called by an application. It is used only by the SSL module itself.

5.8.24.7.1.5 TCPIP_TCPSSL_ListenerAdd Function**C**

```
bool TCPIP_TCPSSL_ListenerAdd(  
    TCP_SOCKET hTCP,  
    uint16_t port  
);
```

Description

This function adds an additional listening port to a TCP connection. Connections made on this alternate port will be secured via SSL.

Preconditions

TCP is initialized and hTCP is listening.

Parameters

Parameters	Description
hTCP	TCP connection to secure
port	SSL port to listen on

Return Values

Return Values	Description
true	SSL port was added.
false	The socket was not a listening socket .

5.8.24.7.1.6 TCPIP_TCPSSL_ServerStart Function**C**

```
bool TCPIP_TCPSSL_ServerStart(  
    TCP_SOCKET hTCP  
);
```

Description

This function sets up an SSL server session when a new connection is established on an SSL port.

Preconditions

TCP is initialized and hTCP is already connected.

Parameters

Parameters	Description
hTCP	TCP connection to secure

Return Values

Return Values	Description
true	an SSL connection was initiated
false	Insufficient SSL resources (stubs) were available

5.8.24.7.1.7 TCPIP_TCPSSL_StillHandshaking Function

C

```
bool TCPIP_TCPSSL_StillHandshaking(  
    TCP_SOCKET hTCP  
);
```

Description

Call this function after calling [TCPIP_TCPSSL_ClientStart](#) until false is returned. Then your application may continue with its normal data transfer (which is now secured).

Preconditions

TCP is initialized and hTCP is connected.

Parameters

Parameters	Description
hTCP	TCP connection to check

Return Values

Return Values	Description
true	SSL handshake is still progressing
false	SSL handshake has completed

5.8.24.7.2 Data Types and Constants

5.8.24.7.2.1 SSL_MODULE_CONFIG Structure

C

```
typedef struct {  
} SSL_MODULE_CONFIG;
```

Description

SSL layer configuration/initialization

5.8.24.8 Files

Files

Name	Description
ssl.h	
ssl_config.h	SSL configuration file

Description

5.8.24.8.1 ssl.h

SSLv3 Module Headers

Functions

	Name	Description
	TCPIP_TCP_SocketIsSecuredBySSL	Determines if a TCP connection is secured with SSL.
	TCPIP_TCPSSL_ClientBegin	Begins an SSL client session.
	TCPIP_TCPSSL_ClientStart	Begins an SSL client session.
	TCPIP_TCPSSL_HandshakeClear	Clears the SSL handshake flag.
	TCPIP_TCPSSL_ListenerAdd	Listens for SSL connection on a specific port.
	TCPIP_TCPSSL_ServerStart	Begins an SSL server session.
	TCPIP_TCPSSL_StillHandshaking	Determines if an SSL session is still handshaking.

Structures

	Name	Description
	SSL_MODULE_CONFIG	SSL layer configuration/initialization

5.8.24.8.2 ssl_config.h

Secure Sockets Layer (SSL) Configuration file

This file contains the SSL module configuration options

Macros

	Name	Description
	SSL_MAX_BUFFERS	Max # of SSL buffers (2 per socket)
	SSL_MAX_CONNECTIONS	Maximum number of simultaneous connections via SSL
	SSL_MAX_HASHES	Max # of SSL hashes (2 per socket , plus 1 to avoid deadlock)
	SSL_MAX_SESSIONS	Max number of cached SSL sessions
	SSL_MIN_SESSION_LIFETIME	Minimum lifetime for SSL Sessions Sessions cannot be reallocated until this much time (seconds) has elapsed
	SSL_MULTIPLE_INTERFACES	SSL on all interfaces in a multi-homed host set to 0 to work only on one interface
	SSL_RSA_CLIENT_SIZE	Size of encryption buffer, must be at least as big as the key size
	SSL_RSA_KEY_SIZE	Bits in SSL RSA key. This parameter is used for SSL sever connections only. The only valid value is 512 bits (768 and 1024 bits do not work at this time). Note, however, that SSL client operations do currently work up to 1024 bit RSA key length.
	SSL_RSA_LIFETIME_EXTENSION	Lifetime extension for RSA operations Sessions lifetime is extended by this amount (seconds) when an RSA calculation is made
	SSL_VERSION	Moved from MicrochipIncludeTCPIP StackSSL.h
	SSL_VERSION_HI	SSL version number (high byte)
	SSL_VERSION_LO	SSL version number (low byte)

5.8.25 TCP TCP/IP Stack Library

5.8.25.1 Introduction

Transmission Control Protocol (TCP) TCP/IP Stack Library for Microchip Microcontrollers

This library provides the API of the TCP TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

TCP is a standard transport layer protocol described in RFC 793. It provides reliable stream-based connections over unreliable networks, and forms the foundation for HTTP, SMTP, and many other protocol standards.

5.8.25.2 Release Notes

MPLAB Harmony Version: v0.70b **TCP TCP/IP Stack Library Version :** 1.0 **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.8.25.4 Using the Library

This topic describes the basic architecture of the TCP TCP/IP Stack Library and provides information and examples on how to use it.

Interface Header File: [tcp.h](#)

The interface to the TCP TCP/IP Stack library is defined in the "[tcp.h](#)" header file. This file is included by the "tcPIP.h" file. Any C language source (.c) file that uses the TCP TCP/IP Stack library should include "tcPIP.h".

Library File:

The TCP TCP/IP Stack library archive (.a) file installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the TCP/IP Stack interacts with the framework.

5.8.25.4.1 Abstraction Model

This library provides the API of the TCP TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

TCP Software Abstraction Block Diagram

This module provides software abstraction of the TCP module existent in any TCP/IP Stack implementation. It removes the overhead of address resolution from all other modules in the stack.

5.8.25.4.2 Library Overview

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the TCP module.

Library Interface Section	Description
Socket Management Functions	Routines for Managing TCP Sockets
Transmit Data Transfer Functions	Routines for Managing Outgoing Data Transmissions

Receive Data Transfer Functions	Routines for Managing Incoming Data Transmissions
Data Types and Constants	This section provides various definitions describing This API

5.8.25.4.3 How the Library Works

Connections made over TCP guarantee data transfer at the expense of throughput. Connections are made through a three-way handshake process, ensuring a one-to-one connection. Remote nodes advertise how much data they are ready to receive, and all data transmitted must be acknowledged. If a remote node fails to acknowledge the receipt of data, it is automatically retransmitted. This ensures that network errors such as lost, corrupted, or out-of-order packets are automatically corrected.

To accomplish this, TCP must operate in a buffer. Once the transmit buffer is full, no more data can be sent until the remote node has acknowledged receipt. For the Microchip TCP/IP Stack, the application must return to the main stack loop in order for this to happen. Likewise, the remote node cannot transmit more data until the local device has acknowledged receipt and that space is available in the buffer. When a local application needs to read more data, it must return to the main stack loop and wait for a new packet to arrive.

5.8.25.4.3.1 Core Functionality

The TCP flow diagram below provides an overview for the use of the TCP module:

Sockets are opened using `TCPOpen`. This function can either open a listening [socket](#) to wait for client connections, or can make a client connection to the remote node. The remote node can be specified by a host name string to be resolved in DNS, an IP address, or a `NODE_INFO` struct containing previously resolved IP and MAC address information.

Once connected, applications can read and write data. On each entry, the application must verify that the [socket](#) is still connected. For most applications a call to [TCPIP_TCP_IsConnected](#) will be sufficient, but [TCPIP_TCP_WasReset](#) may also be used for listening sockets that may turn over quickly.

To write data, call [TCPIP_TCP_PutIsReady](#) to check how much space is available. Then, call any of the [TCPIP_TCP_Put](#) family of functions to write data as space is available. Once complete, call [TCPIP_TCP_Flush](#) to transmit data immediately. Alternately, return to the main stack loop. Data will be transmitted when either a) half of the transmit buffer becomes full or b) a delay time has passed.

To read data, call [TCPIP_TCP_GetIsReady](#) to determine how many bytes are ready to be retrieved. Then use the [TCPIP_TCP_Get](#) family of functions to read data from the [socket](#), and/or the [TCPIP_TCP_Find](#) family of functions to locate data in the buffer. When no more data remains, return to the main stack loop to wait for more data to arrive.

If the application needs to close the connection, call [TCPIP_TCP_Disconnect](#), then return to the main stack loop and wait for the

remote node to acknowledge the disconnection. Client sockets will return to the idle state, while listening sockets will wait for a new connection. For more information, refer to the GenericTCPClient or GenericTCPServer examples, or read the associated RFC.

5.8.25.5 Configuring the Library

Macros

	Name	Description
	<u>LOCAL_TCP_PORT_END_NUMBER</u>	Last port number for randomized local port number selection
	<u>LOCAL_TCP_PORT_START_NUMBER</u>	First port number for randomized local port number selection Use the dynamic port range defined by IANA consists of the 49152-65535 range and is meant for the selection of ephemeral ports (RFC 6056). Adjust to your needs but stay within the IANA range
	<u>TCP_AUTO_TRANSMIT_TIMEOUT_VAL</u>	Timeout before automatically transmitting unflushed data, ms; Default 40 ms
	<u>TCP_CLOSE_WAIT_TIMEOUT</u>	Timeout for the CLOSE_WAIT state, ms
	<u>TCP_DELAYED_ACK_TIMEOUT</u>	Timeout for delayed-acknowledgement algorithm, ms
	<u>TCP_FIN_WAIT_2_TIMEOUT</u>	Timeout for FIN WAIT 2 state, ms
	<u>TCP_KEEP_ALIVE_TIMEOUT</u>	Timeout for keep-alive messages when no traffic is sent, ms
	<u>TCP_MAX_RETRIES</u>	Maximum number of retransmission attempts
	<u>TCP_MAX_SEG_SIZE_RX_LOCAL</u>	TCP Maximum Segment Size for RX (MSS). This value is advertised during TCP connection establishment and the remote node should obey it. The value has to be set in such a way to avoid IP layer fragmentation from causing packet loss. However, raising its value can enhance performance at the (small) risk of introducing incompatibility with certain special remote nodes (ex: ones connected via a slow dial up modem). On Ethernet networks the standard value is 1460. On dial-up links, etc. the default values should be 536. Adjust these values according to your network. The stack will use the local... <u>more</u>
	<u>TCP_MAX_SEG_SIZE_RX_NON_LOCAL</u>	Max segment size, non local
	<u>TCP_MAX_SEG_SIZE_TX</u>	TCP Maximum Segment Size for TX. The TX maximum segment size is actually governed by the remote node's MSS option advertised during connection establishment. However, if the remote node specifies an unhandlably large MSS (ex: > Ethernet MTU), this define sets a hard limit so that we don't cause any TX buffer overflows. If the remote node does not advertise a MSS option, all TX segments are fixed at 536 bytes maximum.
	<u>TCP_MAX_SOCKETS</u>	The maximum number of sockets to create in the stack. When defining TCP_MAX_SOCKETS take into account the number of interfaces the stack is supporting
	<u>TCP_MAX_SYN_RETRIES</u>	Smaller than all other retries to reduce SYN flood DoS duration
	<u>TCP_MAX_UNACKED_KEEP_ALIVES</u>	Maximum number of keep-alive messages that can be sent without receiving a response before automatically closing the connection
	<u>TCP_SOCKET_DEFAULT_RX_SIZE</u>	default <u>socket</u> Rx buffer size
	<u>TCP_SOCKET_DEFAULT_TX_SIZE</u>	default <u>socket</u> Tx buffer size
	<u>TCP_START_TIMEOUT_VAL</u>	TCP Timeout and retransmit numbers All timeouts in milliseconds Timeout to retransmit unacked data, ms
	<u>TCP_TASK_TICK_RATE</u>	5 ms default rate
	<u>TCP_WINDOW_UPDATE_TIMEOUT_VAL</u>	Timeout before automatically transmitting a window update due to a <u>TCPIP_TCP_Get()</u> or <u>TCPIP_TCP_ArrayGet()</u> function call, ms

Description

The configuration of the TCP/IP TCP is based on the file `sys_config.h`

This header file contains the configuration selection for the TCP/IP TCP. Based on the selections made, the TCP/IP TCP will support or not support selected features. These configuration settings will apply to all instances of the TCP/IP TCP.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.8.25.5.1 LOCAL_TCP_PORT_END_NUMBER Macro

C

```
#define LOCAL_TCP_PORT_END_NUMBER (65535)
```

Description

Last port number for randomized local port number selection

5.8.25.5.2 LOCAL_TCP_PORT_START_NUMBER Macro

C

```
#define LOCAL_TCP_PORT_START_NUMBER (49152)
```

Description

First port number for randomized local port number selection Use the dynamic port range defined by IANA consists of the 49152-65535 range and is meant for the selection of ephemeral ports (RFC 6056). Adjust to your needs but stay within the IANA range

5.8.25.5.3 TCP_AUTO_TRANSMIT_TIMEOUT_VAL Macro

C

```
#define TCP_AUTO_TRANSMIT_TIMEOUT_VAL (40u1)
```

Description

Timeout before automatically transmitting unflushed data, ms; Default 40 ms

5.8.25.5.4 TCP_CLOSE_WAIT_TIMEOUT Macro

C

```
#define TCP_CLOSE_WAIT_TIMEOUT (200u1)
```

Description

Timeout for the CLOSE_WAIT state, ms

5.8.25.5.5 TCP_DELAYED_ACK_TIMEOUT Macro

C

```
#define TCP_DELAYED_ACK_TIMEOUT (100u1)
```

Description

Timeout for delayed-acknowledgement algorithm, ms

5.8.25.5.6 TCP_FIN_WAIT_2_TIMEOUT Macro

C

```
#define TCP_FIN_WAIT_2_TIMEOUT (5000u1)
```

Description

Timeout for FIN WAIT 2 state, ms

5.8.25.5.7 TCP_KEEP_ALIVE_TIMEOUT Macro

C

```
#define TCP_KEEP_ALIVE_TIMEOUT (10000u1)
```

Description

Timeout for keep-alive messages when no traffic is sent, ms

5.8.25.5.8 TCP_MAX_RETRIES Macro

C

```
#define TCP_MAX_RETRIES (5u)
```

Description

Maximum number of retransmission attempts

5.8.25.5.9 TCP_MAX_SEG_SIZE_RX_LOCAL Macro

C

```
#define TCP_MAX_SEG_SIZE_RX_LOCAL (1460)
```

Description

TCP Maximum Segment Size for RX (MSS). This value is advertised during TCP connection establishment and the remote node should obey it. The value has to be set in such a way to avoid IP layer fragmentation from causing packet loss. However, raising its value can enhance performance at the (small) risk of introducing incompatibility with certain special remote nodes (ex: ones connected via a slow dial up modem). On Ethernet networks the standard value is 1460. On dial-up links, etc. the default values should be 536. Adjust these values according to your network. The stack will use the local value for local destination networks and the default value for nonlocal networks.

5.8.25.5.10 TCP_MAX_SEG_SIZE_RX_NON_LOCAL Macro

C

```
#define TCP_MAX_SEG_SIZE_RX_NON_LOCAL (536) // Max segment size, non local
```

Description

Max segment size, non local

5.8.25.5.11 TCP_MAX_SEG_SIZE_TX Macro

C

```
#define TCP_MAX_SEG_SIZE_TX (1460u)
```

Description

TCP Maximum Segment Size for TX. The TX maximum segment size is actually governed by the remote node's MSS option advertised during connection establishment. However, if the remote node specifies an unhandlably large MSS (ex: > Ethernet MTU), this define sets a hard limit so that we don't cause any TX buffer overflows. If the remote node does not advertise a MSS option, all TX segments are fixed at 536 bytes maximum.

5.8.25.5.12 TCP_MAX_SOCKETS Macro

C

```
#define TCP_MAX_SOCKETS (10)
```

Description

The maximum number of sockets to create in the stack. When defining TCP_MAX_SOCKETS take into account the number of interfaces the stack is supporting

5.8.25.5.13 TCP_MAX_SYN_RETRIES Macro

C

```
#define TCP_MAX_SYN_RETRIES (2u)
```

Description

Smaller than all other retries to reduce SYN flood DoS duration

5.8.25.5.14 TCP_MAX_UNACKED_KEEP_ALIVES Macro

C

```
#define TCP_MAX_UNACKED_KEEP_ALIVES (6u)
```

Description

Maximum number of keep-alive messages that can be sent without receiving a response before automatically closing the connection

5.8.25.5.15 TCP_SOCKET_DEFAULT_RX_SIZE Macro

C

```
#define TCP_SOCKET_DEFAULT_RX_SIZE 512
```

Description

default [socket](#) Rx buffer size

5.8.25.5.16 TCP_SOCKET_DEFAULT_TX_SIZE Macro

C

```
#define TCP_SOCKET_DEFAULT_TX_SIZE 512
```

Description

default [socket](#) Tx buffer size

5.8.25.5.17 TCP_START_TIMEOUT_VAL Macro

C

```
#define TCP_START_TIMEOUT_VAL (1000uL)
```

Description

TCP Timeout and retransmit numbers All timeouts in milliseconds Timeout to retransmit unacked data, ms

5.8.25.5.18 TCP_TASK_TICK_RATE Macro

C

```
#define TCP_TASK_TICK_RATE (5)           // 5 ms default rate
```

Description

5 ms default rate

5.8.25.5.19 TCP_WINDOW_UPDATE_TIMEOUT_VAL Macro

C

```
#define TCP_WINDOW_UPDATE_TIMEOUT_VAL (200uL)
```

Description

Timeout before automatically transmitting a window update due to a [TCPIP_TCP_Get\(\)](#) or [TCPIP_TCP_ArrayGet\(\)](#) function call, ms

5.8.25.6 Building the Library

This section list the files that are available in the \src of the TCP driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

- tcp.c

5.8.25.7 Library Interface

Data Types and Constants

	Name	Description
	TCPIP_TCP_FifoRxFullGet	TCP Get Rx First In, First Out Full
	TCPIP_TCP_FifoTxFreeGet	TCP Get TX First In, First Out Free
	TCP_ADJUST_FLAGS	TCP Adjust Falgs

	TCP_MODULE_CONFIG	TCP layer configuration/initialization
	TCP_OPTION_LINGER_DATA	Linger options
	TCP_PORT	TCP Port
	TCP_SOCKET	TCP Socket
	TCP_SOCKET_INFO	TCP Socket Information
	TCP_SOCKET_OPTION	TCP Socket Option
	INVALID_SOCKET	The socket is invalid or could not be opened

Receive Data Transfer Functions

	Name	Description
	TCPIP_TCP_ArrayFind	Searches for a string in the TCP RX buffer.
	TCPIP_TCP_ArrayGet	Reads an array of data bytes from a TCP socket 's receive FIFO. The data is removed from the FIFO in the process.
	TCPIP_TCP_ArrayPeek	Reads a specified number of data bytes from the TCP RX FIFO without removing them from the buffer.
	TCPIP_TCP_Discard	Discards any pending data in the TCP RX FIFO.
	TCPIP_TCP_FifoSizeAdjust	Adjusts the relative sizes of the RX and TX buffers.
	TCPIP_TCP_Find	Searches for a byte in the TCP RX buffer.
	TCPIP_TCP_Get	Retrieves a single byte to a TCP socket .
	TCPIP_TCP_GetIsReady	Determines how many bytes can be read from the TCP RX buffer.
	TCPIP_TCP_Peek	Peaks at one byte in the TCP RX FIFO without removing it from the buffer.
	TCPIP_TCP_FifoRxFreeGet	Determines how many bytes are free in the RX FIFO.

Socket Management Functions

	Name	Description
	TCPIP_TCP_Bind	Bind a socket to a local address. This function is meant for unconnected server and client sockets. It is similar to TCPIP_TCP_SocketNetSet() that assigns a specific source interface for a socket . If localPort is 0 the stack will assign a unique local port.
	TCPIP_TCP_ClientOpen	Opens a TCP socket as a client.
	TCPIP_TCP_Close	Disconnects an open socket and destroys the socket handle, releasing the associated resources.
	TCPIP_TCP_Connect	Connects a client socket .
	TCPIP_TCP_Disconnect	Disconnects an open socket .
	TCPIP_TCP_IsConnected	Determines if a socket has an established connection.
	TCPIP_TCP_OptionsGet	Allows getting the options for a socket like: current Rx/Tx buffer size, etc.
	TCPIP_TCP_OptionsSet	Allows setting options to a socket like adjust Rx/Tx buffer size, etc.
	TCPIP_TCP_RemoteBind	Bind a socket to a remote address. This function is meant for unconnected server and client sockets.
	TCPIP_TCP_ServerOpen	Opens a TCP socket as a server.
	TCPIP_TCP_SocketInfoGet	Obtains information about a currently open socket .
	TCPIP_TCP_SocketNetGet	Gets the MAC interface of an TCP socket .
	TCPIP_TCP_WasReset	Self-clearing semaphore indicating socket reset.
	TCPIP_TCP_Abort	Aborts a connection.
	TCPIP_TCP_SocketNetSet	Sets the interface for an TCP socket .

Transmit Data Transfer Functions

	Name	Description
≡	TCPIP_TCP_ArrayPut	Writes an array from RAM to a TCP socket .
≡	TCPIP_TCP_FifoTxFullGet	Determines how many bytes are pending in the TCP TX FIFO.
≡	TCPIP_TCP_Flush	Immediately transmits all pending TX data.
≡	TCPIP_TCP_Put	Writes a single byte to a TCP socket .
≡	TCPIP_TCP_PutIsReady	Determines how much free space is available in the TCP TX buffer.
≡	TCPIP_TCP_StringPut	Writes a null-terminated string from RAM to a TCP socket . The null-terminator is not copied to the socket .

Description

This section describes the Application Programming Interface (API) functions of the TCP TCP/IP Stack Library.

Refer to each section for a detailed description.

5.8.25.7.1 Socket Management Functions**5.8.25.7.1.1 TCPIP_TCP_Bind Function****C**

```
bool TCPIP_TCP_Bind(
    TCP_SOCKET hTCP,
    IP_ADDRESS_TYPE addType,
    TCP_PORT localPort,
    IP_MULTI_ADDRESS* localAddress
);
```

Description

Sockets don't need specific binding, it is done automatically by the stack. However, specific binding can be requested using these functions. Works for both client and server sockets.

Preconditions

TCP [socket](#) should have been opened with [TCPIP_TCP_ServerOpen\(\)](#)/[TCPIP_TCP_ClientOpen\(\)](#). hTCP - valid [socket](#)

Parameters

Parameters	Description
hTCP	Socket to bind
addType	The type of address being used. Example: IP_ADDRESS_TYPE_IPV4.
localPort	Local port to use. If 0, the stack will assign a unique local port.
localAddress	The local address to bind to. Could be NULL if the local address does not need to be changed.

Returns

True of success, false otherwise.

Remarks

The call should fail if the [socket](#) is already connected (both server and client sockets). However, this is not currently implemented. It is the user's responsibility to call this function only for sockets that are not connected. Changing the [socket](#) parameters while the [socket](#) is connected will result in connection loss/unpredictable behavior.

5.8.25.7.1.2 TCPIP_TCP_ClientOpen Function

C

```
TCP_SOCKET TCPIP_TCP_ClientOpen(
    IP_ADDRESS_TYPE addType,
    TCP_PORT remotePort,
    IP_MULTI_ADDRESS* remoteAddress
);
```

Description

Provides a unified method for opening TCP client sockets.

Sockets are dynamically allocated at stack initialization, and can be claimed with this function and freed using [TCPIP_TCP_Abort](#) or [TCPIP_TCP_Close](#).

Preconditions

TCP is initialized.

Parameters

Parameters	Description
IP_ADDRESS_TYPE addType	The type of address being used. Example: IP_ADDRESS_TYPE_IPV4.
TCP_PORT remotePort	TCP port to connect to. The local port for client sockets will be automatically picked by the TCP module.
IP_MULTI_ADDRESS* remoteAddress	The remote address to be used. If 0 then the address is unspecified

Returns

[INVALID_SOCKET](#) - No sockets of the specified type were available to be opened. Otherwise - A [TCP_SOCKET](#) handle. Save this handle and use it when calling all other TCP APIs.

Remarks

IP_ADDRESS_TYPE_ANY is not supported (not a valid type for client open)!

If the remoteAddress != 0 (and the address pointed by remoteAddress != 0) then the [socket](#) will immediately initiate a connection to the remote host

If the remoteAddress is unspecified, then no connection is initiated. Client [socket](#) parameters can be set using [TCPIP_TCP_Bind\(\)](#), [TCPIP_TCP_RemoteBind\(\)](#), etc. calls and then connection initiated by calling [TCPIP_TCP_Connect\(\)](#).

5.8.25.7.1.3 TCPIP_TCP_Close Function

C

```
void TCPIP_TCP_Close(
    TCP_SOCKET hTCP
);
```

Description

- If the graceful option is set for the [socket](#) (default):
 - a [TCPIP_TCP_Disconnect](#) will be tried. If the linger option is set (default) the [TCPIP_TCP_Disconnect](#) will try to [send](#) any queued TX data before issuing FIN. If the FIN [send](#) operation fails or the [socket](#) is not connected the abort is generated.
- If the graceful option is not set, or the previous step could not [send](#) the FIN: A TCPAbort() is called, sending a RST to the remote node. Communication is closed, the [socket](#) is no longer valid and the associated resources are freed.

Preconditions

TCP [socket](#) should have been opened with [TCPIP_TCP_ServerOpen\(\)](#)/[TCPIP_TCP_ClientOpen\(\)](#). hTCP - valid [socket](#)

Parameters

Parameters	Description
hTCP	Handle to the socket to disconnect and close.

Returns

None

5.8.25.7.1.4 TCPIP_TCP_Connect Function**C**

```
bool TCPIP_TCP_Connect(  
    TCP_SOCKET hTCP  
);
```

Description

This function will try to initiate a connection on a client [socket](#) that's not connected yet. The client [socket](#) should have been created with a call to [TCPIP_TCP_ClientOpen](#) having the remoteAddress set to 0;

Preconditions

TCP [socket](#) should have been opened with [TCPIP_TCP_ClientOpen\(\)](#) with an unspecified address. hTCP - valid [socket](#)

Parameters

Parameters	Description
hTCP	Handle to the client socket to connect .

Returns

true is the call succeeded false otherwise

Remarks

the call will fail if the client [socket](#) has no remote host specified. Use [TCPIP_TCP_RemoteBind\(\)](#) to specify a remote host address for the client [socket](#).

5.8.25.7.1.5 TCPIP_TCP_Disconnect Function**C**

```
bool TCPIP_TCP_Disconnect(  
    TCP_SOCKET hTCP  
);
```

Description

This function closes the TX side of a connection by sending a FIN (if currently connected) to the remote node of the connection.

If the [socket](#) has the linger option set (default), the queued TX data transmission will be attempted before sending the FIN. If the linger option is off, the queued TX data will be discarded.

Please note that this call may fail in which case it can be re-issued.

Preconditions

TCP [socket](#) should have been opened with [TCPIP_TCP_ServerOpen\(\)](#)/[TCPIP_TCP_ClientOpen\(\)](#). hTCP - valid [socket](#)

Parameters

Parameters	Description
hTCP	Handle of the socket to disconnect.

Returns

true if the call succeeded false otherwise; that means that the notification could not be sent to the remote host. the call can be re-issued at a later time if desired

Remarks

If the [socket](#) is using SSL, a CLOSE_NOTIFY record will be transmitted first to allow the SSL session to be resumed at a later time.

5.8.25.7.1.6 TCPIP_TCP_IsConnected Function**C**

```
bool TCPIP_TCP_IsConnected(  
    TCP_SOCKET hTCP  
);
```

Description

This function determines if a [socket](#) has an established connection to a remote node. Call this function after calling [TCPIP_TCP_ServerOpen\(\)](#)/[TCPIP_TCP_ClientOpen\(\)](#) to determine when the connection is set up and ready for use. This function was historically used to check for disconnections, but [TCPIP_TCP_WasReset](#) is now a more appropriate solution.

Preconditions

TCP [socket](#) should have been opened with [TCPIP_TCP_ServerOpen\(\)](#)/[TCPIP_TCP_ClientOpen\(\)](#). hTCP - valid [socket](#)

Parameters

Parameters	Description
hTCP	The socket to check.

Return Values

Return Values	Description
true	The socket has an established connection to a remote node.
false	The socket is not currently connected.

Remarks

A [socket](#) is said to be connected only if it is in the TCP_ESTABLISHED state. Sockets in the process of opening or closing will return false.

5.8.25.7.1.7 TCPIP_TCP_OptionsGet Function**C**

```
bool TCPIP_TCP_OptionsGet(  
    TCP_SOCKET hTCP,  
    TCP_SOCKET_OPTION option,  
    void* optParam  
);
```

Description

Various options can be get at the [socket](#) level. This function provides compatibility with BSD implementations.

Preconditions

TCP [socket](#) should have been opened with [TCPIP_TCP_ServerOpen\(\)](#)/[TCPIP_TCP_ClientOpen\(\)](#). hTCP - valid [socket](#)

Parameters

Parameters	Description
hTCP	socket to get options for
option	specific option to get
optParam	pointer to an area that will receive the option value; this is option dependent the size of the area has to be large enough to accomodate the specific option TCP_OPTION_LINGER -- pointer to a TCP_OPTION_LINGER_DATA structure TCP_OPTION_KEEPPALIVE -- not supported yet TCP_OPTION_RX_BUFF -- size of the new RX buffer TCP_OPTION_TX_BUFF -- size of the new TX buffer TCP_OPTION_RX_TMO -- not supported yet TCP_OPTION_TX_TMO -- not supported yet TCP_OPTION_NODELAY -- pointer to boolean to return current NO DELAY status TCP_OPTION_EXCLUSIVE_ADDRESS -- not supported yet

Returns

true if success false otherwise

5.8.25.7.1.8 TCPIP_TCP_OptionsSet Function**C**

```
bool TCPIP_TCP_OptionsSet(
    TCP_SOCKET hTCP,
    TCP_SOCKET_OPTION option,
    void* optParam
);
```

Description

Various options can be set at the [socket](#) level. This function provides compatibility with BSD implementations.

Preconditions

TCP [socket](#) should have been opened with [TCPIP_TCP_ServerOpen\(\)](#)/[TCPIP_TCP_ClientOpen\(\)](#). hTCP - valid [socket](#)

Parameters

Parameters	Description
hTCP	socket to set options for
option	specific option to be set
optParam	the option value; this is option dependent TCP_OPTION_LINGER -- pointer to a TCP_OPTION_LINGER_DATA structure TCP_OPTION_KEEPPALIVE -- not supported yet TCP_OPTION_RX_BUFF -- size of the new RX buffer TCP_OPTION_TX_BUFF -- size of the new TX buffer TCP_OPTION_RX_TMO -- not supported yet TCP_OPTION_TX_TMO -- not supported yet TCP_OPTION_NODELAY -- boolean to enable/disable the NO DELAY functionality TCP_OPTION_EXCLUSIVE_ADDRESS -- not supported yet

Returns

true if success false otherwise

5.8.25.7.1.9 TCPIP_TCP_RemoteBind Function**C**

```
bool TCPIP_TCP_RemoteBind(
    TCP_SOCKET hTCP,
```

```
    IP_ADDRESS_TYPE addType,  
    TCP_PORT remotePort,  
    IP_MULTI_ADDRESS* remoteAddress  
);
```

Description

Sockets don't need specific remote binding, they should [accept](#) connections on any incoming interface. Thus the binding is done automatically by the stack. However, specific remote binding can be requested using these functions. For a server [socket](#) it can be used to restrict accepting connections from a specific remote host. For a client [socket](#) it will just change the default binding done when the [socket](#) was opened.

Preconditions

TCP [socket](#) should have been opened with [TCPIP_TCP_ServerOpen\(\)](#)/[TCPIP_TCP_ClientOpen\(\)](#). hTCP - valid [socket](#)

Parameters

Parameters	Description
hTCP	Socket to bind
addType	The type of address being used. Example: IP_ADDRESS_TYPE_IPV4.
remotePort	remote port to use Could be 0 if the remote port does not need to be changed
remoteAddress	The remote address to bind to. Could be NULL if the remote address does not need to be changed

Returns

True of success false otherwise

Remarks

The [socket](#) remote port is changed only if a non-zero remotePort value is passed. The [socket](#) remote host address is changed only if a non-zero remoteAddress value is passed.

The call should fail if the [socket](#) is already connected (both server and client sockets). However this is not currently implemented. It is the user's responsibility to call this function only for sockets that are not connected. Changing the [socket](#) parameters while the [socket](#) is connected will result in connection loss/unpredictable behavior.

5.8.25.7.1.10 TCPIP_TCP_ServerOpen Function

C

```
TCP_SOCKET TCPIP_TCP_ServerOpen(  
    IP_ADDRESS_TYPE addType,  
    TCP_PORT localPort,  
    IP_MULTI_ADDRESS* localAddress  
);
```

Description

Provides a unified method for opening TCP server sockets.

Sockets are statically/dynamically allocated on boot, and can be claimed with this function and freed using [TCPIP_TCP_Close](#).

Preconditions

TCP is initialized.

Parameters

Parameters	Description
IP_ADDRESS_TYPE addType	The type of address being used. Example: IP_ADDRESS_TYPE_IPV4.
TCP_PORT localPort	TCP port to listen on for connections.

IP_MULTI_ADDRESS* localAddress	Local address to use.

Returns

[INVALID_SOCKET](#) - No sockets of the specified type were available to be opened. Otherwise - A [TCP_SOCKET](#) handle. Save this handle and use it when calling all other TCP APIs.

5.8.25.7.1.11 TCPIP_TCP_SocketInfoGet Function**C**

```
bool TCPIP_TCP_SocketInfoGet(  
    TCP_SOCKET hTCP,  
    TCP_SOCKET_INFO* pInfo  
);
```

Description

Fills the provided [TCP_SOCKET_INFO](#) structure associated with this [socket](#). This contains the NODE_INFO structure with IP and MAC address (or gateway MAC) and the remote port.

Preconditions

TCP is initialized and the [socket](#) is connected.

Parameters

Parameters	Description
hTCP	The socket to check.

Returns

true if the call succeeded false if no such [socket](#) or the [socket](#) is not opened

5.8.25.7.1.12 TCPIP_TCP_SocketNetGet Function**C**

```
TCPIP_NET_HANDLE TCPIP_TCP_SocketNetGet(  
    TCP_SOCKET hTCP  
);
```

Description

This function returns the interface handle of an TCP [socket](#)

Preconditions

TCP [socket](#) should have been opened with `_TCP_Open()`. hTCP - valid [socket](#)

Parameters

Parameters	Description
hTCP	The TCP socket

Returns

the handle of the local interface this [socket](#) is bound to.

5.8.25.7.1.13 TCPIP_TCP_WasReset Function**C**

```
bool TCPIP_TCP_WasReset(  
    TCP_SOCKET hTCP
```

```
);
```

Description

This function is a self-clearing semaphore indicating whether or not a [socket](#) has been disconnected since the previous call. This function works for all possible disconnections: a call to [TCPIP_TCP_Disconnect](#), a FIN from the remote node, or an acknowledgement timeout caused by the loss of a network link. It also returns true after the first call to [TCPIP_TCP_Initialize](#). Applications should use this function to reset their state machines.

Preconditions

TCP is initialized.

Parameters

Parameters	Description
hTCP	The socket to check.

Return Values

Return Values	Description
true	The socket has been disconnected since the previous call.
false	The socket has not been disconnected since the previous call.

5.8.25.7.1.14 TCPIP_TCP_Abort Function

C

```
void TCPIP_TCP_Abort(  
    TCP_SOCKET hTCP,  
    bool killSocket  
);
```

Description

This function aborts a connection to a remote node by sending a RST (if currently connected). Any pending TX/RX data is discarded.

A client [socket](#) will always be closed and the associated resources released. The [socket](#) cannot be used again after this call.

A server [socket](#) will abort the current connection:

- if killSocket == false the [socket](#) will remain listening
- if killSocket == true the [socket](#) will be closed and all associated resources released. The [socket](#) cannot be used again after this call.

Preconditions

TCP [socket](#) should have been opened with [TCPIP_TCP_ServerOpen\(\)](#)/[TCPIP_TCP_ClientOpen\(\)](#). hTCP - valid [socket](#)

Parameters

Parameters	Description
hTCP	Handle to the socket to disconnect.
killSocket	if true, it kills a server socket

Returns

None

5.8.25.7.1.15 TCPIP_TCP_SocketNetSet Function

C

```
bool TCPIP_TCP_SocketNetSet(  
    TCP_SOCKET hTCP,  
    TCPIP_NET_HANDLE hNet  
);
```

Description

This function sets the network interface for an TCP [socket](#)

Preconditions

TCP [socket](#) should have been opened with `_TCP_Open()`. hTCP - valid [socket](#)

Parameters

Parameters	Description
hTCP	The TCP socket
hNet	interface handle.

Returns

true if success false otherwise.

Remarks

None

5.8.25.7.2 Transmit Data Transfer Functions

5.8.25.7.2.1 TCPIP_TCP_ArrayPut Function

C

```
uint16_t TCPIP_TCP_ArrayPut(  
    TCP_SOCKET hTCP,  
    const uint8_t* Data,  
    uint16_t Len  
);
```

Description

Writes an array from RAM to a TCP [socket](#).

Preconditions

TCP is initialized.

Parameters

Parameters	Description
hTCP	The socket to which data is to be written.
data	Pointer to the array to be written.
len	Number of bytes to be written.

Returns

The number of bytes written to the [socket](#). If less than len, the buffer became full or the [socket](#) is not connected.

5.8.25.7.2.2 TCPIP_TCP_FifoTxFullGet Function

C

```
uint16_t TCPIP_TCP_FifoTxFullGet(  
    TCP_SOCKET hTCP  
);
```

Description

Determines how many bytes are pending in the TCP TX FIFO.

Preconditions

TCP is initialized.

Parameters

Parameters	Description
hTCP	The socket to check.

Returns

Number of bytes pending to be flushed in the TCP TX FIFO.

5.8.25.7.2.3 TCPIP_TCP_Flush Function

C

```
bool TCPIP_TCP_Flush(  
    TCP_SOCKET hTCP  
);
```

Description

This function immediately transmits all pending TX data with a PSH flag. If this function is not called, data will automatically be sent when either a) the TX buffer is half full or b) the [TCP_AUTO_TRANSMIT_TIMEOUT_VAL](#) (default: 40ms) has elapsed.

Preconditions

TCP is initialized and the [socket](#) is connected.

Parameters

Parameters	Description
hTCP	The socket whose data is to be transmitted.

Returns

None

Remarks

SSL application data is automatically flushed, so this function has no effect for SSL sockets.

5.8.25.7.2.4 TCPIP_TCP_Put Function

C

```
uint16_t TCPIP_TCP_Put(  
    TCP_SOCKET hTCP,  
    uint8_t byte  
);
```

Description

Writes a single byte to a TCP [socket](#).

Preconditions

TCP [socket](#) should have been opened with [TCPIP_TCP_ServerOpen\(\)](#)/[TCPIP_TCP_ClientOpen\(\)](#). hTCP - valid [socket](#)

Parameters

Parameters	Description
hTCP	The socket to which data is to be written.
byte	The byte to write.

Return Values

Return Values	Description
0	The byte was written to the transmit buffer.
1	The transmit buffer was full, or the socket is not connected.

Remarks

Note that the following function is inefficient. A buffered approach ([TCPIP_TCP_ArrayPut](#)) should be preferred

5.8.25.7.2.5 TCPIP_TCP_PutIsReady Function**C**

```
uint16_t TCPIP_TCP_PutIsReady(  
    TCP_SOCKET hTCP  
);
```

Description

Call this function to determine how many bytes can be written to the TCP TX buffer. If this function returns zero, the application must return to the main stack loop before continuing in order to transmit more data.

Preconditions

TCP is initialized.

Parameters

Parameters	Description
hTCP	The socket to check.

Returns

The number of bytes available to be written in the TCP TX buffer.

5.8.25.7.2.6 TCPIP_TCP_StringPut Function**C**

```
const uint8_t* TCPIP_TCP_StringPut(  
    TCP_SOCKET hTCP,  
    const uint8_t* Data  
);
```

Description

Writes a null-terminated string from RAM to a TCP [socket](#). The null-terminator is not copied to the [socket](#).

Preconditions

TCP is initialized.

Parameters

Parameters	Description
hTCP	The socket to which data is to be written.
data	Pointer to the string to be written.

Returns

Pointer to the byte following the last byte written to the [socket](#). If this pointer does not dereference to a NUL byte, the buffer became full or the [socket](#) is not connected.

Remarks

The return value of this function differs from that of [TCPIP_TCP_ArrayPut](#). To write long strings in a single state, initialize the *data pointer to the first byte, then call this function repeatedly (breaking to the main stack loop after each call) until the return value dereferences to a NUL byte. Save the return value as the new starting *data pointer otherwise.

5.8.25.7.3 Receive Data Transfer Functions

5.8.25.7.3.1 TCPIP_TCP_ArrayFind Function

C

```
uint16_t TCPIP_TCP_ArrayFind(  
    TCP_SOCKET hTCP,  
    const uint8_t* cFindArray,  
    uint16_t wLen,  
    uint16_t wStart,  
    uint16_t wSearchLen,  
    bool bTextCompare  
);
```

Description

This function finds the first occurrence of an array of bytes in the TCP RX buffer. It can be used by an application to abstract searches out of their own application code. For increased efficiency, the function is capable of limiting the scope of search to a specific range of bytes. It can also perform a case-insensitive search if required.

For example, if the buffer contains "I love PIC MCUs!" and the search array is "love" with a length of 4, a value of 2 will be returned.

Preconditions

TCP is initialized.

Parameters

Parameters	Description
hTCP	The socket to search within.
cFindArray	The array of bytes to find in the buffer.
wLen	Length of cFindArray.
wStart	Zero-indexed starting position within the buffer.
wSearchLen	Length from wStart to search in the buffer.
bTextCompare	true for case-insensitive text search, false for binary search

Return Values

Return Values	Description
0xFFFF	Search array not found

Otherwise	Zero-indexed position of the first occurrence

Remarks

Since this function usually must transfer data from external storage to internal RAM for comparison, its performance degrades significantly when the buffer is full and the array is not found. For better performance, try to search for characters that are expected to exist or limit the scope of the search as much as possible. The HTTP module, for example, uses this function to parse headers. However, it searches for newlines, then the separating colon, then reads the header name to RAM for final comparison. This has proven to be significantly faster than searching for full header name strings outright.

5.8.25.7.3.2 TCPIP_TCP_ArrayGet Function**C**

```
uint16_t TCPIP_TCP_ArrayGet(
    TCP_SOCKET hTCP,
    uint8_t* buffer,
    uint16_t count
);
```

Description

Reads an array of data bytes from a TCP [socket](#)'s receive FIFO. The data is removed from the FIFO in the process.

Preconditions

TCP is initialized.

Parameters

Parameters	Description
hTCP	The socket from which data is to be read.
buffer	Pointer to the array to store data that was read.
len	Number of bytes to be read.

Returns

The number of bytes read from the [socket](#). If less than len, the RX FIFO buffer became empty or the [socket](#) is not connected.

5.8.25.7.3.3 TCPIP_TCP_ArrayPeek Function**C**

```
uint16_t TCPIP_TCP_ArrayPeek(
    TCP_SOCKET hTCP,
    uint8_t * vBuffer,
    uint16_t wLen,
    uint16_t wStart
);
```

Description

Reads a specified number of data bytes from the TCP RX FIFO without removing them from the buffer. No TCP control actions are taken as a result of this function (ex: no window update is sent to the remote node).

Preconditions

TCP is initialized.

Parameters

Parameters	Description
hTCP	The socket to peak from (read without removing from stream).

vBuffer	Destination to write the peeked data bytes.
wLen	Length of bytes to peak from the RX FIFO and copy to vBuffer.
wStart	Zero-indexed starting position within the FIFO to start peeking from.

Remarks

None

5.8.25.7.3.4 TCPIP_TCP_Discard Function**C**

```
uint16_t TCPIP_TCP_Discard(
    TCP_SOCKET hTCP
);
```

Description

Discards any pending data in the TCP RX FIFO.

Preconditions

TCP is initialized.

Parameters

Parameters	Description
hTCP	The socket whose RX FIFO is to be cleared.

Returns

Number of bytes that have been discarded from the RX buffer.

5.8.25.7.3.5 TCPIP_TCP_FifoSizeAdjust Function**C**

```
bool TCPIP_TCP_FifoSizeAdjust(
    TCP_SOCKET hTCP,
    uint16_t wMinRXSize,
    uint16_t wMinTXSize,
    TCP_ADJUST_FLAGS vFlags
);
```

Description

This function can be used to simultaneously adjust the sizes of the RX and TX FIFOs.

Adjusting the size of the TX/RX FIFO on the fly can allow for optimal transmission speed for one-sided application protocols. For example, HTTP typically begins by receiving large amounts of data from the client, then switches to serving large amounts of data back. Adjusting the FIFO at these points can increase performance in systems that have limited resources. Once the FIFOs are adjusted, a window update is sent.

The [TCP_ADJUST_FLAGS](#) control the distribution of the remaining available space between the TX and RX FIFOs. If neither or both of TCP_ADJUST_GIVE_REST_TO_TX and TCP_ADJUST_GIVE_REST_TO_RX are set, the function distributes the remaining space (if any) equally. If the new requested FIFOs space is greater than the old existing FIFOs space the TCP_ADJUST_GIVE_REST_TO_TX and TCP_ADJUST_GIVE_REST_TO_RX are ignored.

TCP_ADJUST_PRESERVE_RX and TCP_ADJUST_PRESERVE_TX request the preserving of the existing data. Existing data can be preserved as long as the old data in the buffer does not exceed the capacity of the new buffer.

Preconditions

TCP is initialized.

Parameters

Parameters	Description
hTCP	The socket to be adjusted
wMinRXSize	Minimum number of bytes for the RX FIFO
wMinTXSize	Minimum number of bytes for the TX FIFO
vFlags	If TCP_ADJUST_TX_ONLY or TCP_ADJUST_RX_ONLY are not set, then the TX and RX buffers are evaluated together and any

5.8.25.7.3.6 TCPIP_TCP_Find Function**C**

```
uint16_t TCPIP_TCP_Find(  
    TCP_SOCKET hTCP,  
    uint8_t cFind,  
    uint16_t wStart,  
    uint16_t wSearchLen,  
    bool bTextCompare  
);
```

Description

This function finds the first occurrence of a byte in the TCP RX buffer. It can be used by an application to abstract searches out of their own application code. For increased efficiency, the function is capable of limiting the scope of search to a specific range of bytes. It can also perform a case-insensitive search if required.

For example, if the buffer contains "I love PIC MCUs!" and the cFind byte is ' ', a value of 1 will be returned.

Preconditions

TCP is initialized.

Parameters

Parameters	Description
hTCP	The socket to search within.
cFind	The byte to find in the buffer.
wStart	Zero-indexed starting position within the buffer.
wSearchLen	Length from wStart to search in the buffer.
bTextCompare	true for case-insensitive text search, false for binary search

Return Values

Return Values	Description
0xFFFF	Search array not found
Otherwise	Zero-indexed position of the first occurrence

Remarks

Since this function usually must transfer data from external storage to internal RAM for comparison, its performance degrades significantly when the buffer is full and the array is not found. For better performance, try to search for characters that are expected to exist or limit the scope of the search as much as possible. The HTTP module, for example, uses this function to parse headers. However, it searches for newlines, then the separating colon, then reads the header name to RAM for final comparison. This has proven to be significantly faster than searching for full header name strings outright.

5.8.25.7.3.7 TCPIP_TCP_Get Function

C

```
uint16_t TCPIP_TCP_Get(  
    TCP_SOCKET hTCP,  
    uint8_t* byte  
);
```

Description

Retrieves a single byte to a TCP [socket](#).

Preconditions

TCP [socket](#) should have been opened with [TCPIP_TCP_ServerOpen\(\)](#)/[TCPIP_TCP_ClientOpen\(\)](#). hTCP - valid [socket](#)

Parameters

Parameters	Description
hTCP	The socket from which to read.
byte	Pointer to location in which the read byte should be stored.

Return Values

Return Values	Description
1	A byte was read from the buffer.
0	The buffer was empty, or the socket is not connected.

Remarks

Note that the following function is inefficient. A buffered approach ([TCPIP_TCP_ArrayGet](#)) should be preferred

5.8.25.7.3.8 TCPIP_TCP_GetIsReady Function

C

```
uint16_t TCPIP_TCP_GetIsReady(  
    TCP_SOCKET hTCP  
);
```

Description

Call this function to determine how many bytes can be read from the TCP RX buffer. If this function returns zero, the application must return to the main stack loop before continuing in order to wait for more data to arrive.

Preconditions

TCP is initialized.

Parameters

Parameters	Description
hTCP	The socket to check.

Returns

The number of bytes available to be read from the TCP RX buffer.

5.8.25.7.3.9 TCPIP_TCP_Peek Function

C

```
uint8_t TCPIP_TCP_Peek(  
    TCP_SOCKET hTCP,
```

```
    uint16_t wStart  
);
```

Description

Peeks at one byte in the TCP RX FIFO without removing it from the buffer.

Preconditions

TCP is initialized.

Parameters

Parameters	Description
hTCP	The socket to peak from (read without removing from stream).
wStart	Zero-indexed starting position within the FIFO to peek from.

Remarks

Use the [TCPIP_TCP_ArrayPeek\(\)](#) function to read more than one byte. It will perform better than calling [TCPIP_TCP_Peek\(\)](#) in a loop.

5.8.25.7.3.10 TCPIP_TCP_FifoRxFreeGet Function

C

```
uint16_t TCPIP_TCP_FifoRxFreeGet(  
    TCP_SOCKET hTCP  
);
```

Description

Determines how many bytes are free in the RX FIFO.

Preconditions

TCP is initialized.

Parameters

Parameters	Description
hTCP	The socket to check.

Returns

The number of bytes free in the TCP RX FIFO. If zero, no additional data can be received until the application removes some data using one of the [TCPIP_TCP_Get](#) family functions.

5.8.25.7.4 Data Types and Constants

5.8.25.7.4.1 TCPIP_TCP_FifoRxFullGet Macro

C

```
#define TCPIP_TCP_FifoRxFullGet(a) TCPIP_TCP_GetIsReady(a)
```

Description

Macro: [TCPIP_TCP_FifoRxFullGet](#)

Alias to [TCPIP_TCP_GetIsReady](#) provided for API completeness

5.8.25.7.4.2 TCPIP_TCP_FifoTxFreeGet Macro

C

```
#define TCPIP_TCP_FifoTxFreeGet(a) TCPIP_TCP_PutIsReady(a)
```

Description

Macro: TCPIP_TCP_FifoTxFreeGet([TCP_SOCKET](#) hTCP)

Alias to [TCPIP_TCP_PutIsReady](#) provided for API completeness

Parameters

Parameters	Description
hTCP	The socket to check.

Returns

The number of bytes available to be written in the TCP TX buffer.

5.8.25.7.4.3 TCP_ADJUST_FLAGS Enumeration

C

```
typedef enum {
    TCP_ADJUST_GIVE_REST_TO_RX = 0x01,
    TCP_ADJUST_GIVE_REST_TO_TX = 0x02,
    TCP_ADJUST_PRESERVE_RX = 0x04,
    TCP_ADJUST_PRESERVE_TX = 0x08,
    TCP_ADJUST_TX_ONLY = 0x10,
    TCP_ADJUST_RX_ONLY = 0x20
} TCP_ADJUST_FLAGS;
```

Description

Enumeration: TCP_ADJUST_FLAGS

Adjust [socket](#) buffer sizes.

Members

Members	Description
TCP_ADJUST_GIVE_REST_TO_RX = 0x01	Resize flag: extra bytes go to RX
TCP_ADJUST_GIVE_REST_TO_TX = 0x02	Resize flag: extra bytes go to TX
TCP_ADJUST_PRESERVE_RX = 0x04	Resize flag: attempt to preserve RX buffer
TCP_ADJUST_PRESERVE_TX = 0x08	Resize flag: attempt to preserve TX buffer
TCP_ADJUST_TX_ONLY = 0x10	Resize flag: adjust the TX buffer only
TCP_ADJUST_RX_ONLY = 0x20	Resize flag: adjust the RX buffer only

5.8.25.7.4.4 TCP_MODULE_CONFIG Structure

C

```
typedef struct {
    int nSockets;
    uint16_t sktTxBuffSize;
    uint16_t sktRxBuffSize;
} TCP_MODULE_CONFIG;
```

Description

Structure: TCP_MODULE_CONFIG

TCP layer configuration/initialization

Members

Members	Description
int nSockets;	number of sockets to be created
uint16_t sktTxBuffSize;	size of the socket tx buffer
uint16_t sktRxBuffSize;	size of the socket rx buffer

5.8.25.7.4.5 TCP_OPTION_LINGER_DATA Structure

C

```
typedef struct {  
    bool lingerEnable;  
    bool gracefulEnable;  
    uint16_t lingerTmo;  
} TCP_OPTION_LINGER_DATA;
```

Description

Structure: TCP_OPTION_LINGER_DATA

Linger options

Members

Members	Description
bool lingerEnable;	enable/disable linger; enabled by default for any socket
bool gracefulEnable;	enable/disable graceful close; enabled by default for any socket
uint16_t lingerTmo;	linger timeout in seconds (when enabled) this option is not supported yet

5.8.25.7.4.6 TCP_PORT Type

C

```
typedef uint16_t TCP_PORT;
```

Description

Type: TCP_PORT

TCP Port Number identifier

5.8.25.7.4.7 TCP_SOCKET Type

C

```
typedef int16_t TCP_SOCKET;
```

Description

Type: TCP_SOCKET

A TCP_SOCKET is stored as a single uint8_t

5.8.25.7.4.8 TCP_SOCKET_INFO Structure

C

```
typedef struct {
    IP_ADDRESS_TYPE  addressType;
    IP_MULTI_ADDRESS remoteIPAddress;
    IP_MULTI_ADDRESS localIPAddress;
    TCP_PORT  remotePort;
    TCP_PORT  localPort;
} TCP_SOCKET_INFO;
```

Description

Structure: TCP_SOCKET_INFO

Information about a [socket](#)

Members

Members	Description
TCP_PORT remotePort;	Port number associated with remote node
TCP_PORT localPort;	local port number

5.8.25.7.4.9 TCP_SOCKET_OPTION Enumeration

C

```
typedef enum {
    TCP_OPTION_LINGER,
    TCP_OPTION_KEEPPALIVE,
    TCP_OPTION_RX_BUFF,
    TCP_OPTION_TX_BUFF,
    TCP_OPTION_RX_TMO,
    TCP_OPTION_TX_TMO,
    TCP_OPTION_NODELAY,
    TCP_OPTION_EXCLUSIVE_ADDRESS
} TCP_SOCKET_OPTION;
```

Description

Enumeration: TCP_SOCKET_OPTION

Socket options

Members

Members	Description
TCP_OPTION_LINGER	The LINGER option controls the action taken when unsent data is queued on a socket and the socket is closed. The linger option can be turned on/off and the timeout can be specified.
TCP_OPTION_KEEPPALIVE	enable the use of keep-alive packets on TCP connections The option can be turned on/off and the timeout can be specified
TCP_OPTION_RX_BUFF	request different RX buffer size. Has to call TCPIP_TCP_OptionsGet to see the exact space allocated
TCP_OPTION_TX_BUFF	request different TX buffer size. Has to call TCPIP_TCP_OptionsGet to see the exact space allocated
TCP_OPTION_RX_TMO	specifies the RX timeout. If no data arrives in the specified timeout the socket is closed
TCP_OPTION_TX_TMO	specifies the TX timeout. If no data can be sent in the specified timeout the socket is closed
TCP_OPTION_NODELAY	enables the NO DELAY/Nagle algorithm functionality;

TCP_OPTION_EXCLUSIVE_ADDRESS	enables a socket to be bound for exclusive access.

5.8.25.7.4.10 INVALID_SOCKET Macro

C

```
#define INVALID_SOCKET (-1)    // The socket is invalid or could not be opened
```

Description

The [socket](#) is invalid or could not be opened

5.8.25.8 Files

Files

Name	Description
tcp.h	Transmission Control Protocol (TCP) Communications Layer API
tcp_config.h	TCP configuration file

Description

5.8.25.8.1 tcp.h

- Provides reliable, handshaked transport of application stream oriented data with flow control
- Reference: RFC 793

Enumerations

	Name	Description
	TCP_ADJUST_FLAGS	TCP Adjust Falgs
	TCP_SOCKET_OPTION	TCP Socket Option

Functions

	Name	Description
	TCPIP_TCP_Abort	Aborts a connection.
	TCPIP_TCP_ArrayFind	Searches for a string in the TCP RX buffer.
	TCPIP_TCP_ArrayGet	Reads an array of data bytes from a TCP socket 's receive FIFO. The data is removed from the FIFO in the process.
	TCPIP_TCP_ArrayPeek	Reads a specified number of data bytes from the TCP RX FIFO without removing them from the buffer.
	TCPIP_TCP_ArrayPut	Writes an array from RAM to a TCP socket .
	TCPIP_TCP_Bind	Bind a socket to a local address This function is meant for unconnected server and client sockets. It is similar to TCPIP_TCP_SocketNetSet() that assigns a specific source interface for a socket . If localPort is 0 the stack will assign a unique local port
	TCPIP_TCP_ClientOpen	Opens a TCP socket as a client.
	TCPIP_TCP_Close	Disconnects an open socket and destroys the socket handle, releasing the associated resources.
	TCPIP_TCP_Connect	Connects a client socket .
	TCPIP_TCP_Discard	Discards any pending data in the TCP RX FIFO.

	TCPIP_TCP_Disconnect	Disconnects an open socket .
	TCPIP_TCP_FifoRxFreeGet	Determines how many bytes are free in the RX FIFO.
	TCPIP_TCP_FifoSizeAdjust	Adjusts the relative sizes of the RX and TX buffers.
	TCPIP_TCP_FifoTxFullGet	Determines how many bytes are pending in the TCP TX FIFO.
	TCPIP_TCP_Find	Searches for a byte in the TCP RX buffer.
	TCPIP_TCP_Flush	Immediately transmits all pending TX data.
	TCPIP_TCP_Get	Retrieves a single byte to a TCP socket .
	TCPIP_TCP_GetIsReady	Determines how many bytes can be read from the TCP RX buffer.
	TCPIP_TCP_IsConnected	Determines if a socket has an established connection.
	TCPIP_TCP_OptionsGet	Allows getting the options for a socket like: current Rx/Tx buffer size, etc
	TCPIP_TCP_OptionsSet	Allows setting options to a socket like adjust Rx/Tx buffer size, etc
	TCPIP_TCP_Peek	Peaks at one byte in the TCP RX FIFO without removing it from the buffer.
	TCPIP_TCP_Put	Writes a single byte to a TCP socket .
	TCPIP_TCP_PutIsReady	Determines how much free space is available in the TCP TX buffer.
	TCPIP_TCP_RemoteBind	Bind a socket to a remote address This function is meant for unconnected server and client sockets.
	TCPIP_TCP_ServerOpen	Opens a TCP socket as a server.
	TCPIP_TCP_SocketInfoGet	Obtains information about a currently open socket .
	TCPIP_TCP_SocketNetGet	Gets the MAC interface of an TCP socket
	TCPIP_TCP_SocketNetSet	Sets the interface for an TCP socket
	TCPIP_TCP_StringPut	Writes a null-terminated string from RAM to a TCP socket . The null-terminator is not copied to the socket .
	TCPIP_TCP_WasReset	Self-clearing semaphore indicating socket reset.

Macros

	Name	Description
	INVALID_SOCKET	The socket is invalid or could not be opened
	TCPIP_TCP_FifoRxFullGet	TCP Get Rx First In, First Out Full
	TCPIP_TCP_FifoTxFreeGet	TCP Get TX First In, First Out Free

Structures

	Name	Description
	TCP_MODULE_CONFIG	TCP layer configuration/initialization
	TCP_OPTION_LINGER_DATA	Linger options
	TCP_SOCKET_INFO	TCP Socket Information

Types

	Name	Description
	TCP_PORT	TCP Port
	TCP_SOCKET	TCP Socket

Company

Microchip Technology Incorporated

5.8.25.8.2 tcp_config.h

Transmission Control Protocol (TCP) Configuration file

This file contains the TCP module configuration options

Macros

	Name	Description
	<u>LOCAL_TCP_PORT_END_NUMBER</u>	Last port number for randomized local port number selection
	<u>LOCAL_TCP_PORT_START_NUMBER</u>	First port number for randomized local port number selection Use the dynamic port range defined by IANA consists of the 49152-65535 range and is meant for the selection of ephemeral ports (RFC 6056). Adjust to your needs but stay within the IANA range
	<u>TCP_AUTO_TRANSMIT_TIMEOUT_VAL</u>	Timeout before automatically transmitting unflushed data, ms; Default 40 ms
	<u>TCP_CLOSE_WAIT_TIMEOUT</u>	Timeout for the CLOSE_WAIT state, ms
	<u>TCP_DELAYED_ACK_TIMEOUT</u>	Timeout for delayed-acknowledgement algorithm, ms
	<u>TCP_FIN_WAIT_2_TIMEOUT</u>	Timeout for FIN WAIT 2 state, ms
	<u>TCP_KEEP_ALIVE_TIMEOUT</u>	Timeout for keep-alive messages when no traffic is sent, ms
	<u>TCP_MAX_RETRIES</u>	Maximum number of retransmission attempts
	<u>TCP_MAX_SEG_SIZE_RX_LOCAL</u>	TCP Maximum Segment Size for RX (MSS). This value is advertised during TCP connection establishment and the remote node should obey it. The value has to be set in such a way to avoid IP layer fragmentation from causing packet loss. However, raising its value can enhance performance at the (small) risk of introducing incompatibility with certain special remote nodes (ex: ones connected via a slow dial up modem). On Ethernet networks the standard value is 1460. On dial-up links, etc. the default values should be 536. Adjust these values according to your network. The stack will use the local... <u>more</u>
	<u>TCP_MAX_SEG_SIZE_RX_NON_LOCAL</u>	Max segment size, non local
	<u>TCP_MAX_SEG_SIZE_TX</u>	TCP Maximum Segment Size for TX. The TX maximum segment size is actually governed by the remote node's MSS option advertised during connection establishment. However, if the remote node specifies an unhandlably large MSS (ex: > Ethernet MTU), this define sets a hard limit so that we don't cause any TX buffer overflows. If the remote node does not advertise a MSS option, all TX segments are fixed at 536 bytes maximum.
	<u>TCP_MAX_SOCKETS</u>	The maximum number of sockets to create in the stack. When defining TCP_MAX_SOCKETS take into account the number of interfaces the stack is supporting
	<u>TCP_MAX_SYN_RETRIES</u>	Smaller than all other retries to reduce SYN flood DoS duration
	<u>TCP_MAX_UNACKED_KEEP_ALIVES</u>	Maximum number of keep-alive messages that can be sent without receiving a response before automatically closing the connection
	<u>TCP_SOCKET_DEFAULT_RX_SIZE</u>	default <u>socket</u> Rx buffer size
	<u>TCP_SOCKET_DEFAULT_TX_SIZE</u>	default <u>socket</u> Tx buffer size
	<u>TCP_START_TIMEOUT_VAL</u>	TCP Timeout and retransmit numbers All timeouts in milliseconds Timeout to retransmit unacked data, ms
	<u>TCP_TASK_TICK_RATE</u>	5 ms default rate
	<u>TCP_WINDOW_UPDATE_TIMEOUT_VAL</u>	Timeout before automatically transmitting a window update due to a <u>TCPIP_TCP_Get()</u> or <u>TCPIP_TCP_ArrayGet()</u> function call, ms

5.8.26 Telnet TCP/IP Stack Library

5.8.26.1 Introduction

Telnet TCP/IP Stack Library

for

Microchip Microcontrollers

This library provides the API of the Telnet TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

Telnet provides bidirectional, interactive communication between two nodes on the Internet or on a Local Area Network. The sTelnet code included with Microchip's TCP/IP stack is a demonstration of the structure of a Telnet application. This demo begins by listening for a Telnet connection. When a client attempts to make one, the demo will prompt the client for a username and password, and if the correct one is provided, will output and periodically refresh several values obtained from the demo board.

There are several changes that you may need to make to Telnet.c and/or Telnet.h to suit your application. All of the Telnet Public members can be re-defined in the application-specific section of TCPIPConfig.h. You may also wish to change some of the Telnet Internal Member strings, located in Telnet.c, to more accurately reflect your application. You will also need to modify the TelnetTask (see page 574) function to include the functionality you'd like. You may insert or change states in TelnetTask (see page 574) as needed.

5.8.26.2 Release Notes

MPLAB Harmony Version: v0.70b **Telnet TCP/IP Stack Library Version :** 1.0 **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.8.26.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY,

FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.8.26.4 Using the Library

This topic describes the basic architecture of the Telnet TCP/IP Stack Library and provides information and examples on how to use it.

Interface Header File: [telnet.h](#)

The interface to the Telnet TCP/IP Stack library is defined in the "[telnet.h](#)" header file. This file is included by the "tcpip.h" file. Any C language source (.c) file that uses the Telnet TCP/IP Stack library should include "tcpip.h".

Library File:

The Telnet TCP/IP Stack library archive (.a) file installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the TCP/IP Stack interacts with the framework.

5.8.26.4.1 Abstraction Model

This library provides the API of the Telnet TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

Telnet Software Abstraction Block Diagram

Note: This image was not available at time of release and will be added in a future release of MPLAB Harmony.

5.8.26.4.2 Library Overview

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the Telnet module.

Library Interface Section	Description
Data Types and Constants	This section provides various definitions describing this API

5.8.26.5 Configuring the Library

Macros

	Name	Description
	MAX_TELNET_CONNECTIONS	Maximum number of Telnet connections
	TELNET_PASSWORD	Default Telnet password

	TELNET_PORT	Unsecured Telnet port
	TELNET_USERNAME	Default Telnet user name
	TELNETS_PORT	SSL Secured Telnet port (ignored if TCPIP_STACK_USE_SSL_SERVER is undefined)

Description

The configuration of the Telnet TCP/IP Stack Library is based on the file `tcip_config.h`

This header file contains the configuration selection for the Telnet TCP/IP Stack Library. Based on the selections made, the Telnet TCP/IP Stack Library will support or not support selected features. These configuration settings will apply to all instances of the Telnet TCP/IP Stack Library.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.8.26.5.1 MAX_TELNET_CONNECTIONS Macro**C**

```
#define MAX_TELNET_CONNECTIONS (2u)
```

Description

Maximum number of Telnet connections

5.8.26.5.2 TELNET_PASSWORD Macro**C**

```
#define TELNET_PASSWORD "microchip"
```

Description

Default Telnet password

5.8.26.5.3 TELNET_PORT Macro**C**

```
#define TELNET_PORT 23
```

Description

Unsecured Telnet port

5.8.26.5.4 TELNET_USERNAME Macro**C**

```
#define TELNET_USERNAME "admin"
```

Description

Default Telnet user name

5.8.26.5.5 TELNETS_PORT Macro

C

```
#define TELNETS_PORT 992
```

Description

SSL Secured Telnet port (ignored if TCPIP_STACK_USE_SSL_SERVER is undefined)

5.8.26.6 Building the Library

This section list the files that are available in the \src of the Telnet driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

5.8.26.7 Library Interface

Data Types and Constants

	Name	Description
	TELNET_MODULE_CONFIG	Telnet Configuration structure placeholder

Description

There are no user accessible functions in this interface. There is only a place holder for Telnet module configuration.

5.8.26.7.1 Data Types and Constants

5.8.26.7.1.1 TELNET_MODULE_CONFIG Structure

C

```
typedef struct {  
} TELNET_MODULE_CONFIG;
```

Description

Telnet Configuration structure placeholder

5.8.26.8 Files

Files

Name	Description
telnet.h	
telnet_config.h	Configuration file

Description

5.8.26.8.1 telnet.h

Telnet Server Module for Microchip TCP/IP Stack

-Listens on TCP Port 23

Structures

	Name	Description
	TELNET_MODULE_CONFIG	Telnet Configuration structure placeholder

5.8.26.8.2 telnet_config.h

Telnet Configuration file

This file contains the Telnet module configuration options

Macros

	Name	Description
	MAX_TELNET_CONNECTIONS	Maximum number of Telnet connections
	TELNET_PASSWORD	Default Telnet password
	TELNET_PORT	Unsecured Telnet port
	TELNET_USERNAME	Default Telnet user name
	TELNETS_PORT	SSL Secured Telnet port (ignored if TCPIP_STACK_USE_SSL_SERVER is undefined)

5.8.27 TFTP TCP/IP Stack Library

5.8.27.1 Introduction

Trivial File Transfer Protocol (TFTP) TCP/IP Stack Library

for

Microchip Microcontrollers

This library provides the API of the TFTP TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

The Trivial File Transfer Protocol provides unreliable upload and download services to applications connected to the UDP-based TFTP server.

5.8.27.2 Release Notes

MPLAB Harmony Version: v0.70b TFTP TCP/IP Stack Library Version : 1.0 Release Date: 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.8.27.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.8.27.4 Using the Library

This topic describes the basic architecture of the TFTP TCP/IP Stack Library and provides information and examples on how to use it.

Interface Header File: [tftp.h](#)

The interface to the TFTP TCP/IP Stack library is defined in the "[tftp.h](#)" header file. This file is included by the "tcpip.h" file. Any C language source (.c) file that uses the [tftp.h](#) TCP/IP Stack library should include "tcpip.h".

Library File:

The TFTP TCP/IP Stack library archive (.a) file installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the TCP/IP Stack interacts with the framework.

5.8.27.4.1 Abstraction Model

This library provides the API of the TFTP TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description**TFTP Software Abstraction Block Diagram**

TFTP Process Flow Notes

- If a decision block returns `TFTP_ERROR`, `TFTPGetError()` should be called and the result should be handled.
- If a decision block returns `TFTP_TIMEOUT`, restart the TFTP operations.
- If a decision block returns `TFTP_NOT_READY`, or if `TFTPisFileOpenReady()` returns `FALSE`, alternate calling `StackTask()` and that decision block function.

5.8.27.4.2 Library Overview

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the TFTP module.

Library Interface Section	Description
General Functions	This section provides general interface routines to TFTP
Data Types and Constants	This section provides various definitions describing this API

5.8.27.5 Configuring the Library

Macros

	Name	Description
	TFTP_ARP_TIMEOUT_VAL	Number of seconds to wait before declaring TIMEOUT error on Put, seconds
	TFTP_BLOCK_SIZE	The size of a TFTP block - 512 bytes
	TFTP_BLOCK_SIZE_MSB	The MSB of the TFTP_BLOCK_SIZE
	TFTP_CLIENT_PORT	The TFTP Client port - a unique port on this device
	TFTP_GET_TIMEOUT_VAL	Number of seconds to wait before declaring TIMEOUT error on Get, seconds.
	TFTP_MAX_RETRIES	Number of attempts before declaring TIMEOUT error.
	TFTP_SERVER_PORT	The TFTP Server Port

Description

The configuration of the TFTP TCP/IP Stack Library is based on the file `tcip_config.h`

This header file contains the configuration selection for the TFTP TCP/IP Stack Library. Based on the selections made, the TFTP TCP/IP Stack Library will support or not support selected features. These configuration settings will apply to all instances of the TFTP TCP/IP Stack Library.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.8.27.5.1 TFTP_ARP_TIMEOUT_VAL Macro

C

```
#define TFTP_ARP_TIMEOUT_VAL (3uL)
```

Description

Number of seconds to wait before declaring TIMEOUT error on Put, seconds

5.8.27.5.2 TFTP_BLOCK_SIZE Macro

C

```
#define TFTP_BLOCK_SIZE (0x200L)
```

Description

The size of a TFTP block - 512 bytes

5.8.27.5.3 TFTP_BLOCK_SIZE_MSB Macro

C

```
#define TFTP_BLOCK_SIZE_MSB (0x02u)
```

Description

The MSB of the [TFTP_BLOCK_SIZE](#)

5.8.27.5.4 TFTP_CLIENT_PORT Macro

C

```
#define TFTP_CLIENT_PORT 65352L
```

Description

The TFTP Client port - a unique port on this device

5.8.27.5.5 TFTP_GET_TIMEOUT_VAL Macro

C

```
#define TFTP_GET_TIMEOUT_VAL (3uL)
```

Description

Number of seconds to wait before declaring TIMEOUT error on Get, seconds.

5.8.27.5.6 TFTP_MAX_RETRIES Macro

C

```
#define TFTP_MAX_RETRIES (3u)
```

Description

Number of attempts before declaring TIMEOUT error.

5.8.27.5.7 TFTP_SERVER_PORT Macro

C

```
#define TFTP_SERVER_PORT (69L)
```

Description

The TFTP Server Port

5.8.27.6 Building the Library

This section list the files that are available in the \src of the TFTP driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

5.8.27.7 Library Interface

Data Types and Constants

	Name	Description
	<u>TFTP_UPLOAD_COMPLETE</u>	Status codes for <u>TCPIP_TFTP_UploadStatusGet()</u> function. Zero means upload success, >0 means working and <0 means fatal error.
	<u>TFTP_UPLOAD_CONNECT</u>	This is macro TFTP_UPLOAD_CONNECT.
	<u>TFTP_UPLOAD_CONNECT_TIMEOUT</u>	This is macro TFTP_UPLOAD_CONNECT_TIMEOUT.

	TFTP_UPLOAD_GET_DNS	This is macro TFTP_UPLOAD_GET_DNS.
	TFTP_UPLOAD_HOST_RESOLVE_TIMEOUT	This is macro TFTP_UPLOAD_HOST_RESOLVE_TIMEOUT.
	TFTP_UPLOAD_RESOLVE_HOST	This is macro TFTP_UPLOAD_RESOLVE_HOST.
	TFTP_UPLOAD_SEND_DATA	This is macro TFTP_UPLOAD_SEND_DATA.
	TFTP_UPLOAD_SEND_FILENAME	This is macro TFTP_UPLOAD_SEND_FILENAME.
	TFTP_UPLOAD_SERVER_ERROR	This is macro TFTP_UPLOAD_SERVER_ERROR.
	TFTP_UPLOAD_WAIT_FOR_CLOSURE	This is macro TFTP_UPLOAD_WAIT_FOR_CLOSURE.
	TFTPClose	Macro: void TFTPClose(void) Closes TFTP client socket .
	TFTPGetError	Macro: uint16_t TFTPGetError(void) Returns previously saved error code.
	TFTPisFileOpenReady	Macro: bool TFTPisFileOpenReady(void) Checks to see if it is okay to send TFTP file open request to remote server.
	TFTP_ACCESS_ERROR	Standard error codes as defined by TFTP spec. Use to decode value returned by TFTPGetError() .
	TFTP_CHUNK_DESCRIPTOR	This is type TFTP_CHUNK_DESCRIPTOR.
	TFTP_FILE_MODE	File open mode as used by TFTPFileOpen().
	TFTP_RESULT	Enum. of results returned by most of the TFTP functions.

Functions

	Name	Description
	TCPIP_TFTP_DataByteGet	This is function TCPIP_TFTP_DataByteGet.
	TCPIP_TFTP_DataBytePut	This is function TCPIP_TFTP_DataBytePut.
	TCPIP_TFTP_DataIsGetReady	This is function TCPIP_TFTP_DataIsGetReady.
	TCPIP_TFTP_FileClose	This is function TCPIP_TFTP_FileClose.
	TCPIP_TFTP_FileIsClosed	This is function TCPIP_TFTP_FileIsClosed.
	TCPIP_TFTP_FileIsOpen	This is function TCPIP_TFTP_FileIsOpen.
	TCPIP_TFTP_FragRAMFileUploadToHost	This is function TCPIP_TFTP_FragRAMFileUploadToHost.
	TCPIP_TFTP_IsOpen	This is function TCPIP_TFTP_IsOpen.
	TCPIP_TFTP_IsReadyForPut	This is function TCPIP_TFTP_IsReadyForPut.
	TCPIP_TFTP_Open	This is function TCPIP_TFTP_Open.
	TCPIP_TFTP_RAMFileUploadToHost	This is function TCPIP_TFTP_RAMFileUploadToHost.
	TCPIP_TFTP_UploadStatusGet	This is function TCPIP_TFTP_UploadStatusGet.
	TFTPOpenFile	This is function TFTPOpenFile.

Description

This section describes the Application Programming Interface (API) functions of the TFTP TCP/IP Stack.

Refer to each section for a detailed description.

5.8.27.7.1 Functions

5.8.27.7.1.1 TCPIP_TFTP_DataByteGet Function

C

```
uint8_t TCPIP_TFTP_DataByteGet();
```

Description

This is function TCPIP_TFTP_DataByteGet.

5.8.27.7.1.2 TCPIP_TFTP_DataBytePut Function**C**

```
void TCPIP_TFTP_DataBytePut(  
    uint8_t c  
);
```

Description

This is function TCPIP_TFTP_DataBytePut.

5.8.27.7.1.3 TCPIP_TFTP_DataIsGetReady Function**C**

```
TFTP_RESULT TCPIP_TFTP_DataIsGetReady();
```

Description

This is function TCPIP_TFTP_DataIsGetReady.

5.8.27.7.1.4 TCPIP_TFTP_FileClose Function**C**

```
void TCPIP_TFTP_FileClose();
```

Description

This is function TCPIP_TFTP_FileClose.

5.8.27.7.1.5 TCPIP_TFTP_FileIsClosed Function**C**

```
TFTP_RESULT TCPIP_TFTP_FileIsClosed();
```

Description

This is function TCPIP_TFTP_FileIsClosed.

5.8.27.7.1.6 TCPIP_TFTP_FileIsOpen Function**C**

```
TFTP_RESULT TCPIP_TFTP_FileIsOpen();
```

Description

This is function TCPIP_TFTP_FileIsOpen.

5.8.27.7.1.7 TCPIP_TFTP_FragRAMFileUploadToHost Function**C**

```
void TCPIP_TFTP_FragRAMFileUploadToHost(  
    const uint8_t * vRemoteHost,  
    const uint8_t * vFilename,  
    TFTP_CHUNK_DESCRIPTOR * vFirstChunkDescriptor  
);
```

Description

This is function TCPIP_TFTP_FragRAMFileUploadToHost.

5.8.27.7.1.8 TCPIP_TFTP_IsOpen Function**C**

```
TFTP_RESULT TCPIP_TFTP_IsOpen();
```

Description

This is function TCPIP_TFTP_IsOpen.

5.8.27.7.1.9 TCPIP_TFTP_IsReadyForPut Function**C**

```
TFTP_RESULT TCPIP_TFTP_IsReadyForPut();
```

Description

This is function TCPIP_TFTP_IsReadyForPut.

5.8.27.7.1.10 TCPIP_TFTP_Open Function**C**

```
void TCPIP_TFTP_Open(  
    IPV4_ADDR * host  
);
```

Description

This is function TCPIP_TFTP_Open.

5.8.27.7.1.11 TCPIP_TFTP_RAMFileUploadToHost Function**C**

```
void TCPIP_TFTP_RAMFileUploadToHost(  
    const uint8_t * vRemoteHost,  
    const uint8_t * vFilename,  
    uint8_t * vData,  
    uint16_t wDataLength  
);
```

Description

This is function TCPIP_TFTP_RAMFileUploadToHost.

5.8.27.7.1.12 TCPIP_TFTP_UploadStatusGet Function**C**

```
int8_t TCPIP_TFTP_UploadStatusGet();
```

Description

This is function TCPIP_TFTP_UploadStatusGet.

5.8.27.7.1.13 TFTPOpenFile Function

C

```
void TFTPOpenFile(  
    const uint8_t * fileName,  
    TFTP_FILE_MODE mode  
);
```

Description

This is function TFTPOpenFile.

5.8.27.7.2 Data Types and Constants

5.8.27.7.2.1 TFTP_UPLOAD_COMPLETE Macro

C

```
#define TFTP_UPLOAD_COMPLETE 0
```

Description

Status codes for [TCPIP_TFTP_UploadStatusGet\(\)](#) function. Zero means upload success, >0 means working and <0 means fatal error.

5.8.27.7.2.2 TFTP_UPLOAD_CONNECT Macro

C

```
#define TFTP_UPLOAD_CONNECT 3
```

Description

This is macro TFTP_UPLOAD_CONNECT.

5.8.27.7.2.3 TFTP_UPLOAD_CONNECT_TIMEOUT Macro

C

```
#define TFTP_UPLOAD_CONNECT_TIMEOUT -2
```

Description

This is macro TFTP_UPLOAD_CONNECT_TIMEOUT.

5.8.27.7.2.4 TFTP_UPLOAD_GET_DNS Macro

C

```
#define TFTP_UPLOAD_GET_DNS 1
```

Description

This is macro TFTP_UPLOAD_GET_DNS.

5.8.27.7.2.5 TFTP_UPLOAD_HOST_RESOLVE_TIMEOUT Macro

C

```
#define TFTP_UPLOAD_HOST_RESOLVE_TIMEOUT -1
```

Description

This is macro TFTP_UPLOAD_HOST_RESOLVE_TIMEOUT.

5.8.27.7.2.6 TFTP_UPLOAD_RESOLVE_HOST Macro

C

```
#define TFTP_UPLOAD_RESOLVE_HOST 2
```

Description

This is macro TFTP_UPLOAD_RESOLVE_HOST.

5.8.27.7.2.7 TFTP_UPLOAD_SEND_DATA Macro

C

```
#define TFTP_UPLOAD_SEND_DATA 5
```

Description

This is macro TFTP_UPLOAD_SEND_DATA.

5.8.27.7.2.8 TFTP_UPLOAD_SEND_FILENAME Macro

C

```
#define TFTP_UPLOAD_SEND_FILENAME 4
```

Description

This is macro TFTP_UPLOAD_SEND_FILENAME.

5.8.27.7.2.9 TFTP_UPLOAD_SERVER_ERROR Macro

C

```
#define TFTP_UPLOAD_SERVER_ERROR -3
```

Description

This is macro TFTP_UPLOAD_SERVER_ERROR.

5.8.27.7.2.10 TFTP_UPLOAD_WAIT_FOR_CLOSURE Macro

C

```
#define TFTP_UPLOAD_WAIT_FOR_CLOSURE 6
```

Description

This is macro TFTP_UPLOAD_WAIT_FOR_CLOSURE.

5.8.27.7.2.11 TFTPclose Macro

C

```
#define TFTPclose(void) TCPIP_UDP_Close(_tftpSocket)
```

Description

Macro: void TFTPclose(void)

Closes TFTP client [socket](#).

Preconditions

[TCPIP_TFTP_Open](#) is already called and [TCPIP_TFTP_IsOpen\(\)](#) returned TFTP_OK.

Returns

None

Side Effects

None

Remarks

Once closed, application must do [TCPIP_TFTP_Open](#) to perform any new TFTP operations.

If TFTP server does not change during application life-time, one may not need to call TFTP_CLOSE and keep TFTP [socket](#) open.

5.8.27.7.2.12 TFTPGetError Macro

C

```
#define TFTPGetError (_tftpError)
```

Description

Macro: uint16_t TFTPGetError(void)

Returns previously saved error code.

Preconditions

One of the TFTP function returned with TFTP_ERROR result.

Returns

Error code as returned by remote server. Application may use [TFTP_ACCESS_ERROR](#) enum. to decode standard error code.

Side Effects

None

Remarks

None

5.8.27.7.2.13 TFTP_IsFileOpenReady Macro

C

```
#define TFTP_IsFileOpenReady UDPIsPutReady(_tftpSocket)
```

Description

Macro: bool TFTP_IsFileOpenReady(void)

Checks to see if it is okay to [send](#) TFTP file open request to remote server.

Preconditions

[TCPIP_TFTP_Open](#) is already called and [TCPIP_TFTP_IsOpen\(\)](#) returned TFTP_OK.

Returns

true, if it is ok to call [TFTPOpenFile\(\)](#) false, if otherwise.

Side Effects

None

Remarks

None

5.8.27.7.2.14 TFTP_ACCESS_ERROR Type

C

```
typedef enum _TFTP_ACCESS_ERROR TFTP_ACCESS_ERROR;
```

Description

Standard error codes as defined by TFTP spec. Use to decode value retuned by [TFTPGetError\(\)](#).

5.8.27.7.2.15 TFTP_CHUNK_DESCRIPTOR Structure

C

```
typedef struct {
    uint8_t * vDataPointer;
    uint16_t wDataLength;
} TFTP_CHUNK_DESCRIPTOR;
```

Description

This is type TFTP_CHUNK_DESCRIPTOR.

5.8.27.7.2.16 TFTP_FILE_MODE Type

C

```
typedef enum _TFTP_FILE_MODE TFTP_FILE_MODE;
```

Description

File open mode as used by TFTPFileOpen().

5.8.27.7.2.17 TFTP_RESULT Type

C

```
typedef enum _TFTP_RESULT TFTP_RESULT;
```

Description

Enum. of results returned by most of the TFTP functions.

5.8.27.8 Files

Files

Name	Description
tftpc.h	
tftpc_config.h	(TFTP) Configuration file

Description

5.8.27.8.1 tftpc.h

TFTP Client module for Microchip TCP/IP Stack

Functions

	Name	Description
	TCPIP_TFTP_DataByteGet	This is function TCPIP_TFTP_DataByteGet.
	TCPIP_TFTP_DataBytePut	This is function TCPIP_TFTP_DataBytePut.
	TCPIP_TFTP_DatalsGetReady	This is function TCPIP_TFTP_DatalsGetReady.
	TCPIP_TFTP_FileClose	This is function TCPIP_TFTP_FileClose.
	TCPIP_TFTP_FileIsClosed	This is function TCPIP_TFTP_FileIsClosed.
	TCPIP_TFTP_FileIsOpen	This is function TCPIP_TFTP_FileIsOpen.
	TCPIP_TFTP_FragRAMFileUploadToHost	This is function TCPIP_TFTP_FragRAMFileUploadToHost.
	TCPIP_TFTP_IsOpen	This is function TCPIP_TFTP_IsOpen.
	TCPIP_TFTP_IsReadyForPut	This is function TCPIP_TFTP_IsReadyForPut.
	TCPIP_TFTP_Open	This is function TCPIP_TFTP_Open.
	TCPIP_TFTP_RAMFileUploadToHost	This is function TCPIP_TFTP_RAMFileUploadToHost.
	TCPIP_TFTP_UploadStatusGet	This is function TCPIP_TFTP_UploadStatusGet.
	TFTPOpenFile	This is function TFTPOpenFile.

Macros

	Name	Description
	TFTP_MAX_RETRIES	Number of attempts before declaring TIMEOUT error.
	TFTP_UPLOAD_COMPLETE	Status codes for TCPIP_TFTP_UploadStatusGet() function. Zero means upload success, >0 means working and <0 means fatal error.
	TFTP_UPLOAD_CONNECT	This is macro TFTP_UPLOAD_CONNECT.
	TFTP_UPLOAD_CONNECT_TIMEOUT	This is macro TFTP_UPLOAD_CONNECT_TIMEOUT.
	TFTP_UPLOAD_GET_DNS	This is macro TFTP_UPLOAD_GET_DNS.
	TFTP_UPLOAD_HOST_RESOLVE_TIMEOUT	This is macro TFTP_UPLOAD_HOST_RESOLVE_TIMEOUT.
	TFTP_UPLOAD_RESOLVE_HOST	This is macro TFTP_UPLOAD_RESOLVE_HOST.
	TFTP_UPLOAD_SEND_DATA	This is macro TFTP_UPLOAD_SEND_DATA.
	TFTP_UPLOAD_SEND_FILENAME	This is macro TFTP_UPLOAD_SEND_FILENAME.
	TFTP_UPLOAD_SERVER_ERROR	This is macro TFTP_UPLOAD_SERVER_ERROR.
	TFTP_UPLOAD_WAIT_FOR_CLOSURE	This is macro TFTP_UPLOAD_WAIT_FOR_CLOSURE.
	TFTPClose	Macro: void TFTPClose(void) Closes TFTP client socket .
	TFTPGetError	Macro: uint16_t TFTPGetError(void) Returns previously saved error code.
	TFTPisFileOpenReady	Macro: bool TFTPisFileOpenReady(void) Checks to see if it is okay to send TFTP file open request to remote server.

Structures

	Name	Description
	TFTP_CHUNK_DESCRIPTOR	This is type TFTP_CHUNK_DESCRIPTOR.

Types

	Name	Description
	TFTP_ACCESS_ERROR	Standard error codes as defined by TFTP spec. Use to decode value returned by TFTPGetError() .
	TFTP_FILE_MODE	File open mode as used by TFTPFileOpen() .
	TFTP_RESULT	Enum. of results returned by most of the TFTP functions.

5.8.27.8.2 tftpc_config.h

Trivial File Transfer Protocol (TFTP) Configuration file

This file contains the TFTP module configuration options

Macros

	Name	Description
	TFTP_ARP_TIMEOUT_VAL	Number of seconds to wait before declaring TIMEOUT error on Put, seconds
	TFTP_BLOCK_SIZE	The size of a TFTP block - 512 bytes
	TFTP_BLOCK_SIZE_MSB	The MSB of the TFTP_BLOCK_SIZE
	TFTP_CLIENT_PORT	The TFTP Client port - a unique port on this device
	TFTP_GET_TIMEOUT_VAL	Number of seconds to wait before declaring TIMEOUT error on Get, seconds.
	TFTP_SERVER_PORT	The TFTP Server Port

5.8.28 UDP TCP/IP Stack Library**5.8.28.1 Introduction****UDP TCP/IP Stack Library**

for

Microchip Microcontrollers

This library provides the API of the UDP TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

UDP is a standard transport layer protocol described in RFC 768. It provides fast but unreliable data-gram based transfers over networks, and forms the foundation SNTP, SNMP, DNS, and many other protocol standards.

5.8.28.2 Release Notes

MPLAB Harmony Version: v0.70b **UDP TCP/IP Stack Library Version :** 1.0 **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.8.28.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.8.28.4 Using the Library

This topic describes the basic architecture of the UDP TCP/IP Stack Library and provides information and examples on how to use it.

Interface Header File: [udp.h](#)

The interface to the UDP TCP/IP Stack library is defined in the "[udp.h](#)" header file. This file is included by the "tcpip.h" file. Any C language source (.c) file that uses the UDP TCP/IP Stack library should include "tcpip.h".

Library File:

The UDP TCPIP Stack library archive (.a) file installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the TCP/IP Stack interacts with the framework.

5.8.28.4.1 Abstraction Model

This library provides the API of the UDP TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description**UDP Software Abstraction Block Diagram**

This module provides software abstraction of the UDP module existent in any TCP/IP Stack implementation. It removes the overhead of address resolution from all other modules in the stack.

Typical UDP Implementation

5.8.28.4.2 Library Overview

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the UDP module.

Library Interface Section	Description
Socket Management Functions	Routines for Managing UDP Sockets
Transmit Data Transfer Functions	Routines for Managing Outgoing Data Transmissions
Receive Data Transfer Functions	Routines for Managing Incoming Data Transmissions
Data Types and Constants	This section provides various definitions describing This API

5.8.28.4.3 How the Library Works

Connections over UDP should be thought of as data-gram based transfers. Each packet is a separate entity, the application should expect some packets to arrive out-of-order or even fail to reach the destination node. This is in contrast to TCP, in which the connection is thought of as a stream and network errors are automatically corrected. These tradeoffs in reliability are made for an increase in throughput. In general, UDP transfers operate 2 to 3 times faster than those made over TCP.

Since UDP is packet-oriented, each packet must be dealt with in its entirety by your application before returning to the main stack loop. When a packet is received, your application will be called to handle it. This packet will no longer be available the next time your application is called, so you must either perform all necessary processing or copy the data elsewhere before returning. When transmitting a packet, your application must build and transmit the complete packet in one cycle.

5.8.28.4.3.1 Core Functionality

The UDP flow diagram below provides an overview for the use of the UDP module:

Note: This image was not available at time of release and will be added in a future release of MPLAB Harmony.

Sockets are opened using `UDPOpen`. This function can either open a listening [socket](#) to wait for incoming segments, or can make a client connection to a remote node. When making a client connection, you will need to perform any required DNS and/or ARP resolution using those modules directly before invoking `UDPOpen`.

Once the [socket](#) is opened, you can immediately begin transmitting data. To transmit a segment, call [UDP_IsPutReady](#) to determine how many bytes can be written and to designate a currently active [socket](#). Then, use any of the [TCPIP_UDP_Put](#) family of functions to write data to the [socket](#). Once all data has been written, call [TCPIP_UDP_Flush](#) to build and transmit the packet. This sequence must be accomplished all in one step. If your application returns to the main stack loop after calling [TCPIP_UDP_Put](#) but before calling [TCPIP_UDP_Flush](#), the data may be lost or the module may behave unpredictably.

5.8.28.5 Configuring the Library

Macros

	Name	Description
	UDP_LOCAL_PORT_END_NUMBER	Last port number for randomized local port number selection
	UDP_LOCAL_PORT_START_NUMBER	The dynamic port range defined by IANA consists of the 49152-65535 range and is meant for the selection of ephemeral ports (RFC 6056). Adjust to your needs but stay within the IANA range First port number for randomized local port number selection
	UDP_MAX_SOCKETS	global number of UDP sockets created dynamically
	UDP_SOCKET_DEFAULT_TX_QUEUE_LIMIT	the maximum number of packets that can be queued by an UDP socket at a certain time. For sockets that need to transfer a lot of data (iperf, for example), especially on slow connections this limit prevents running out of memory because the MAC transfer cannot keep up with the UDP packet allocation rate imposed by the application. Adjust depending on the UDP_SOCKET_DEFAULT_TX_SIZE , the connection speed and the amount of memory available to the stack.
	UDP_SOCKET_DEFAULT_TX_SIZE	default socket Tx buffer size
	UDP_SOCKET_POOL_BUFFER_SIZE	size of the buffers in the UDP pool any UDP socket that is enabled to use the pool and has the TX size <= than this size can use a buffer from the pool
	UDP_SOCKET_POOL_BUFFERS	use 0 to disable the feature
	UDP_USE_RX_CHECKSUM	check incoming packets to have proper checksum
	UDP_USE_TX_CHECKSUM	This slows UDP TX performance by nearly 50%, except when using the ENCX24J600, which has a super fast DMA and incurs virtually no speed penalty.

Description

The configuration of the UDP TCP/IP Stack Library is based on the file `sys_config.h`

This header file contains the configuration selection for the UP TCP/IP Stack Library. Based on the selections made, the UDP TCP/IP Stack Library will support or not support selected features. These configuration settings will apply to all instances of the UDP TCP/IP Stack Library.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.8.28.5.1 UDP_LOCAL_PORT_END_NUMBER Macro

C

```
#define UDP_LOCAL_PORT_END_NUMBER (65535)
```

Description

Last port number for randomized local port number selection

5.8.28.5.2 UDP_LOCAL_PORT_START_NUMBER Macro

C

```
#define UDP_LOCAL_PORT_START_NUMBER (49152)
```

Description

The dynamic port range defined by IANA consists of the 49152-65535 range and is meant for the selection of ephemeral ports (RFC 6056). Adjust to your needs but stay within the IANA range First port number for randomized local port number selection

5.8.28.5.3 UDP_MAX_SOCKETS Macro

C

```
#define UDP_MAX_SOCKETS (10)
```

Description

global number of UDP sockets created dynamically

5.8.28.5.4 UDP_SOCKET_DEFAULT_TX_QUEUE_LIMIT Macro

C

```
#define UDP_SOCKET_DEFAULT_TX_QUEUE_LIMIT 3
```

Description

the maximum number of packets that can be queued by an UDP [socket](#) at a certain time. For sockets that need to transfer a lot of data (iperf, for example), especially on slow connections this limit prevents running out of memory because the MAC transfer cannot keep up with the UDP packet allocation rate imposed by the application. Adjust depending on the [UDP_SOCKET_DEFAULT_TX_SIZE](#), the connection speed and the amount of memory available to the stack.

5.8.28.5.5 UDP_SOCKET_DEFAULT_TX_SIZE Macro

C

```
#define UDP_SOCKET_DEFAULT_TX_SIZE 512
```

Description

default [socket](#) Tx buffer size

5.8.28.5.6 UDP_SOCKET_POOL_BUFFER_SIZE Macro

C

```
#define UDP_SOCKET_POOL_BUFFER_SIZE 512 // size of the buffers in the UDP pool
```

Description

size of the buffers in the UDP pool any UDP [socket](#) that is enabled to use the pool and has the TX size <= than this size can use a buffer from the pool

5.8.28.5.7 UDP_SOCKET_POOL_BUFFERS Macro

C

```
#define UDP_SOCKET_POOL_BUFFERS 4           // use 0 to disable the feature
```

Description

use 0 to disable the feature

5.8.28.5.8 UDP_USE_RX_CHECKSUM Macro

C

```
#define UDP_USE_RX_CHECKSUM
```

Description

check incoming packets to have proper checksum

5.8.28.5.9 UDP_USE_TX_CHECKSUM Macro

C

```
#define UDP_USE_TX_CHECKSUM
```

Description

This slows UDP TX performance by nearly 50%, except when using the ENC24J600, which has a super fast DMA and incurs virtually no speed penalty.

5.8.28.6 Building the Library

This section list the files that are available in the \src of the UDP driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

- udp.c

5.8.28.7 Library Interface

Data Types and Constants

	Name	Description
	INVALID_UDP_SOCKET	Indicates a UDP socket that is not valid
	TCPIP_UDP_IsOpened	backward compatibility call
	UDP_MODULE_CONFIG	UDP layer configuration/initialization
	UDP_PORT	Stores a UDP Port Number
	UDP_SOCKET	Provides a handle to a UDP Socket
	UDP_SOCKET_BCAST_TYPE	This is type UDP_SOCKET_BCAST_TYPE .
	UDP_SOCKET_INFO	Information about a socket
	UDP_SOCKET_OPTION	UDP socket options

Receive Data Transfer Functions

	Name	Description
≡	TCPIP_UDP_Discard	Discards any remaining RX data from a UDP socket .
≡	TCPIP_UDP_Get	Reads a byte from the UDP socket .
≡	TCPIP_UDP_GetIsReady	Determines how many bytes can be read from the UDP socket .
≡	TCPIP_UDP_RxOffsetSet	Moves the pointer within the RX buffer.

Socket Management Functions

	Name	Description
≡	TCPIP_UDP_BcastIPv4AddressSet	Sets the broadcast IP address of a socket . Allows an UDP socket to send broadcasts.
≡	TCPIP_UDP_Bind	Bind a socket to a local address and port. This function is meant for client sockets. It assigns a specific source address and port for a socket .
≡	TCPIP_UDP_ClientOpen	Opens a UDP socket as a client.
≡	TCPIP_UDP_Close	Closes a UDP socket and frees the handle.
≡	TCPIP_UDP_DestinationIPAddressSet	Sets the destination IP address of a socket .
≡	TCPIP_UDP_IsConnected	Determines if a socket has an established connection.
≡	TCPIP_UDP_OptionsGet	Allows getting the options for a socket like: current Rx/Tx buffer size, etc
≡	TCPIP_UDP_OptionsSet	Allows setting options to a socket like adjust Rx/Tx buffer size, etc
≡	TCPIP_UDP_RemoteBind	Bind a socket to a remote address. This function is meant for server sockets.
≡	TCPIP_UDP_ServerOpen	Opens a UDP socket as a server.
≡	TCPIP_UDP_SocketInfoGet	Points handle at socket info for socket hUDP
≡	TCPIP_UDP_SocketNetGet	Gets the network interface of an UDP socket .
≡	TCPIP_UDP_SocketNetSet	Sets the network interface for an UDP socket .
≡	TCPIP_UDP_SourceIPAddressSet	Sets the source IP address of a socket .
≡	TCPIP_UDP_TxOffsetSet	Moves the pointer within the TX buffer.

Transmit Data Transfer Functions

	Name	Description
≡	TCPIP_UDP_ArrayGet	Reads an array of bytes from the UDP socket .
≡	TCPIP_UDP_Flush	Transmits all pending data in a UDP socket .
≡	TCPIP_UDP_Put	Writes a byte to the UDP socket .
≡	TCPIP_UDP_StringPut	Writes null-terminated string to the UDP socket .
≡	TCPIP_UDP_TxCountGet	Returns the amount of bytes written into the UDP socket .
≡	TCPIP_UDP_TxPutIsReady	Determines how many bytes can be written to the UDP socket .
≡	TCPIP_UDP_ArrayPut	Writes an array of bytes to the UDP socket .
≡	UDP_IsPutReady	Determines how many bytes can be written to the UDP socket .

Description

This section describes the Application Programming Interface (API) functions of the UDP TCP/IP Stack Library.

Refer to each section for a detailed description.

5.8.28.7.1 Socket Management Functions

5.8.28.7.1.1 TCPIP_UDP_BcastIPv4AddressSet Function

C

```
bool TCPIP_UDP_BcastIPv4AddressSet(  
    UDP_SOCKET s,  
    UDP_SOCKET_BCAST_TYPE bcastType,  
    TCPIP_NET_HANDLE hNet  
);
```

Description

It sets the broadcast address for the [socket](#)

Preconditions

UDP initialized UDP [socket](#) should have been opened with [TCPIP_UDP_ServerOpen\(\)](#)/[TCPIP_UDP_ClientOpen\(\)](#). s - valid [socket](#)

Parameters

Parameters	Description
s	the UDP socket
bcastType	Type of broadcast
hNet	handle of an interface to use for the network directed broadcast Not used for network limited broadcast

Returns

True if success False otherwise

Remarks

This function allows changing of the destination IPv4 address dynamically.

However, the call will fail if the [socket](#) was previously set to broadcast using the [TCPIP_UDP_OptionsSet](#) call. [TCPIP_UDP_OptionsSet](#) takes precedence.

5.8.28.7.1.2 TCPIP_UDP_Bind Function

C

```
bool TCPIP_UDP_Bind(  
    UDP_SOCKET hUDP,  
    IP_ADDRESS_TYPE addType,  
    UDP_PORT localPort,  
    IP_MULTI_ADDRESS* localAddress  
);
```

Description

Sockets don't need specific binding, it is done automatically by the stack However, specific binding can be requested using these functions. Works for both client and server sockets.

Preconditions

UDP [socket](#) should have been opened with [TCPIP_UDP_ServerOpen\(\)](#)/[TCPIP_UDP_ClientOpen\(\)](#). hUDP - valid [socket](#)

Parameters

Parameters	Description
hUDP	The socket to bind .
addType	The type of address being used. Example: IP_ADDRESS_TYPE_IPV4.
localPort	The local port to bind to.

localAddress	Local address to use.

Returns

True if success False otherwise

Remarks

If localAddress == 0 the local address of the [socket](#) won't be changed.

If localPort is 0 the stack will assign a unique local port

5.8.28.7.1.3 TCPIP_UDP_ClientOpen Function

C

```
UDP_SOCKET TCPIP_UDP_ClientOpen(  
    IP_ADDRESS_TYPE addType,  
    UDP_PORT remotePort,  
    IP_MULTI_ADDRESS* remoteAddress  
);
```

Description

Provides a unified method for opening UDP client sockets.

Preconditions

UDP is initialized.

Parameters

Parameters	Description
IP_ADDRESS_TYPE addType	The type of address being used. Example: IP_ADDRESS_TYPE_IPV4.
UDP_PORT remotePort	The remote UDP port to which a connection should be made. The local port for client sockets will be automatically picked by the UDP module.
IP_MULTI_ADDRESS* remoteAddress	The remote address to connect to.

Returns

[INVALID_SOCKET](#) - No sockets of the specified type were available to be opened.

Otherwise - A [UDP_SOCKET](#) handle. Save this handle and use it when calling all other UDP APIs.

Remarks

IP_ADDRESS_TYPE_ANY is not supported!

5.8.28.7.1.4 TCPIP_UDP_Close Function

C

```
void TCPIP_UDP_Close(  
    UDP_SOCKET hUDP  
);
```

Description

Closes a UDP [socket](#) and frees the handle. Call this function to release a [socket](#) and return it to the pool for use by future communications.

Preconditions

UDP [socket](#) should have been opened with [TCPIP_UDP_ServerOpen\(\)](#)/[TCPIP_UDP_ClientOpen\(\)](#). hUDP - valid [socket](#)

Parameters

Parameters	Description
hUDP	The socket handle to be released.

Returns

None

5.8.28.7.1.5 TCPIP_UDP_DestinationIPAddressSet Function**C**

```
bool TCPIP_UDP_DestinationIPAddressSet(  
    UDP_SOCKET s,  
    IP_ADDRESS_TYPE addType,  
    IP_MULTI_ADDRESS* remoteAddress  
);
```

Description

- It sets the IP destination address This allows changing the destination IPv4 address dynamically.

Preconditions

UDP initialized UDP [socket](#) should have been opened with [TCPIP_UDP_ServerOpen\(\)](#)/[TCPIP_UDP_ClientOpen\(\)](#). s - valid [socket](#) remoteAddress - valid address pointer

Parameters

Parameters	Description
s	the UDP socket
addType	Type of address: IPv4/IPv6
remoteAddress	pointer to an address to use

Returns

true if success false otherwise

Remarks

The call will fail if the [socket](#) was previously set to broadcast using the [TCPIP_UDP_OptionsSet](#) call. [TCPIP_UDP_OptionsSet](#) takes precedence.

The call will fail if remoteAddress is 0. The destination IP address will not be changed.

5.8.28.7.1.6 TCPIP_UDP_IsConnected Function**C**

```
bool TCPIP_UDP_IsConnected(  
    UDP_SOCKET hUDP  
);
```

Description

This function determines if a [socket](#) has an established connection to a remote node . Call this function after calling [TCPIP_UDP_ServerOpen\(\)](#)/[TCPIP_UDP_ClientOpen\(\)](#) to determine when the connection is set up and ready for use.

Preconditions

UDP [socket](#) should have been opened with [TCPIP_UDP_ServerOpen\(\)](#)/[TCPIP_UDP_ClientOpen\(\)](#). hUDP - valid [socket](#)

Parameters

Parameters	Description
hUDP	The socket to check.

Return Values

Return Values	Description
true	The socket has been opened and ARP has been resolved.
false	The socket is not currently connected.

Remarks

None

5.8.28.7.1.7 TCPIP_UDP_OptionsGet Function**C**

```
bool TCPIP_UDP_OptionsGet(  
    UDP_SOCKET hUDP,  
    UDP_SOCKET_OPTION option,  
    void* optParam  
);
```

Description

Various options can be get at the [socket](#) level. This function provides compatibility with BSD implementations.

Preconditions

UDP [socket](#) should have been opened with [TCPIP_UDP_ServerOpen\(\)](#)/[TCPIP_UDP_ClientOpen\(\)](#). hUDP - valid [socket](#)

Parameters

Parameters	Description
hUDP	socket to get options for
option	specific option to get
optParam	pointer to an area that will receive the option value; this is option dependent the size of the area has to be large enough to accomodate the specific option UDP_OPTION_STRICT_PORT -- pointer to boolean UDP_OPTION_STRICT_NET -- pointer to boolean UDP_OPTION_BROADCAST -- UDP_SOCKET_BCAST_TYPE pointer to boolean UDP_OPTION_BUFFER_POOL -- pointer to boolean UDP_OPTION_TX_BUFF -- pointer to a 16 bit value to receive bytes of the TX buffer UDP_OPTION_TX_QUEUE_LIMIT -- pointer to an 8 bit value to receive the TX queue limit

Returns

true if success false otherwise

5.8.28.7.1.8 TCPIP_UDP_OptionsSet Function**C**

```
bool TCPIP_UDP_OptionsSet(  
    UDP_SOCKET hUDP,  
    UDP_SOCKET_OPTION option,  
    void* optParam  
);
```

Description

Various options can be set at the [socket](#) level. This function provides compatibility with BSD implementations.

Preconditions

UDP [socket](#) should have been opened with [TCPIP_UDP_ServerOpen\(\)](#)/[TCPIP_UDP_ClientOpen\(\)](#). hUDP - valid [socket](#)

Parameters

Parameters	Description
hUDP	socket to set options for
option	specific option to be set
optParam	the option value; this is option dependent UDP_OPTION_STRICT_PORT -- boolean enable/disable UDP_OPTION_STRICT_NET -- boolean enable/disable UDP_OPTION_BROADCAST -- UDP_SOCKET_BCAST_TYPE UDP_OPTION_BUFFER_POOL -- boolean enable/disable

Returns

true if success false otherwise

Remarks

changing the UDP_OPTION_BUFFER_POOL will discard the data in the current [socket](#) buffer UDP_OPTION_TX_BUFF -- 16 bit value in bytes of the TX buffer

the UDP_OPTION_TX_BUFF will discard the data in the current [socket](#) buffer UDP_OPTION_TX_QUEUE_LIMIT -- 8 bit value of the TX queue limit

5.8.28.7.1.9 TCPIP_UDP_RemoteBind Function**C**

```
bool TCPIP_UDP_RemoteBind(
    UDP_SOCKET hUDP,
    IP_ADDRESS_TYPE addType,
    UDP_PORT remotePort,
    IP_MULTI_ADDRESS* remoteAddress
);
```

Description

Sockets don't need specific remote binding, they should [accept](#) connections on any incoming interface. Thus the binding is done automatically by the stack. However, specific binding can be requested using these functions. For a server [socket](#) it can be used to restrict accepting connections from a specific remote host. For a client [socket](#) it will just change the default binding done when the [socket](#) was opened. TBD: the call should fail if the [socket](#) is already bound to an interface (a server [socket](#) is connected or a client [socket](#) already sent the data on an interface). Implementation pending

Preconditions

UDP [socket](#) should have been opened with [TCPIP_UDP_ServerOpen\(\)](#)/[TCPIP_UDP_ClientOpen\(\)](#). hUDP - valid [socket](#)

Parameters

Parameters	Description
hUDP	The socket to bind .
addType	The type of address being used. Example: IP_ADDRESS_TYPE_IPV4.
remotePort	The remote port to bind to.
remoteAddress	Remote address to use.

Returns

True if success False otherwise

Remarks

If remoteAddress == 0 the remote address of the [socket](#) won't be changed. The remote port is always changed, even if remotePort == 0.

5.8.28.7.1.10 TCPIP_UDP_ServerOpen Function**C**

```
UDP_SOCKET TCPIP_UDP_ServerOpen(  
    IP_ADDRESS_TYPE addType,  
    UDP_PORT localPort,  
    IP_MULTI_ADDRESS* localAddress  
);
```

Description

Provides a unified method for opening UDP server sockets.

Preconditions

UDP is initialized.

Parameters

Parameters	Description
IP_ADDRESS_TYPE addType	The type of address being used. Example: IP_ADDRESS_TYPE_IPV4.
UDP_PORT localPort	UDP port on which to listen for connections
IP_MULTI_ADDRESS* localAddress	Local address to use. Can be NULL if any incoming interface will do.

Returns

[INVALID_SOCKET](#) - No sockets of the specified type were available to be opened.

Otherwise - A [UDP_SOCKET](#) handle. Save this handle and use it when calling all other UDP APIs.

5.8.28.7.1.11 TCPIP_UDP_SocketInfoGet Function**C**

```
bool TCPIP_UDP_SocketInfoGet(  
    UDP_SOCKET hUDP,  
    UDP_SOCKET_INFO* pInfo  
);
```

Preconditions

UDP [socket](#) should have been opened with [TCPIP_UDP_ServerOpen\(\)](#)/[TCPIP_UDP_ClientOpen\(\)](#). hUDP - valid [socket](#)

Parameters

Parameters	Description
UDP_SOCKET hUDP	Socket to obtain info for.
UDP_SOCKET_INFO* pInfo	pointer to reference info location.

5.8.28.7.1.12 TCPIP_UDP_SocketNetGet Function**C**

```
TCPIP_NET_HANDLE TCPIP_UDP_SocketNetGet(  
    UDP_SOCKET hUDP  
);
```

Description

This function returns the interface handle of an UDP [socket](#)

Preconditions

UDP [socket](#) should have been opened with [TCPIP_UDP_ServerOpen\(\)](#)/[TCPIP_UDP_ClientOpen\(\)](#). hUDP - valid [socket](#)

Parameters

Parameters	Description
hUDP	The UDP socket

Returns

IHandle of the interface that [socket](#) currently uses.

5.8.28.7.1.13 TCPIP_UDP_SocketNetSet Function**C**

```
bool TCPIP_UDP_SocketNetSet(  
    UDP_SOCKET hUDP,  
    TCPIP_NET_HANDLE hNet  
);
```

Description

This function sets the network interface for an UDP [socket](#)

Preconditions

UDP [socket](#) should have been opened with [TCPIP_UDP_ServerOpen\(\)](#)/[TCPIP_UDP_ClientOpen\(\)](#). hUDP - valid [socket](#)

Parameters

Parameters	Description
hUDP	The UDP socket
hNet	interface handle

Returns

true if success false otherwise.

Remarks

An invalid hNet can be passed (0) so that the current [socket](#) network interface selection will be cleared

5.8.28.7.1.14 TCPIP_UDP_SourceIPAddressSet Function**C**

```
bool TCPIP_UDP_SourceIPAddressSet(  
    UDP_SOCKET s,  
    IP_ADDRESS_TYPE addType,  
    IP_MULTI_ADDRESS* localAddress  
);
```

Description

- It sets the IP source address This allows changing the source IPv4 address dynamically.

Preconditions

UDP initialized UDP [socket](#) should have been opened with [TCPIP_UDP_ServerOpen\(\)](#)/[TCPIP_UDP_ClientOpen\(\)](#). s - valid [socket](#) localAddress - valid address pointer

Parameters

Parameters	Description
s	the UDP socket
addType	Type of address: IPv4/IPv6
localAddress	pointer to an address to use

Returns

true if success false otherwise

Remarks

The call will fail if localAddress is 0. The source IP address will not be changed.

5.8.28.7.1.15 TCPIP_UDP_TxOffsetSet Function**C**

```
bool TCPIP_UDP_TxOffsetSet(  
    UDP_SOCKET hUDP,  
    uint16_t wOffset,  
    bool relative  
);
```

Description

This function allows the write location within the TX buffer to be specified. Future calls to [TCPIP_UDP_Put](#), [TCPIP_UDP_ArrayPut](#), [TCPIP_UDP_StringPut](#), etc will write data from the indicated location.

Preconditions

UDP [socket](#) should have been opened with [TCPIP_UDP_ServerOpen\(\)](#)/[TCPIP_UDP_ClientOpen\(\)](#). hUDP - valid [socket](#)

Parameters

Parameters	Description
hUDP	UDP socket handle
wOffset	Offset in the UDP packet data payload to move the write pointer.
relative	if true, the wOffset is added to the current write pointer. else the wOffset is from the beginning of the UDP buffer

Returns

true if the offset is a valid one false otherwise

5.8.28.7.2 Transmit Data Transfer Functions**5.8.28.7.2.1 TCPIP_UDP_ArrayGet Function****C**

```
uint16_t TCPIP_UDP_ArrayGet(  
    UDP_SOCKET hUDP,  
    uint8_t * cData,  
    uint16_t wDataLen  
);
```

Description

This function reads an array of bytes from the UDP [socket](#), while decrementing the remaining bytes available. [TCPIP_UDP_GetIsReady](#) could be used before calling this function to get the number of the available bytes in the [socket](#).

Preconditions

UDP [socket](#) should have been opened with [TCPIP_UDP_ServerOpen\(\)](#)/[TCPIP_UDP_ClientOpen\(\)](#). hUDP - valid [socket](#)

Parameters

Parameters	Description
hUDP	UDP socket handle
cData	The buffer to receive the bytes being read. If NULL, the bytes are simply discarded without being written anywhere (effectively skips over the bytes in the RX buffer, although if you need to skip a lot of data, seeking using the TCPIP_UDP_RxOffsetSet() will be more efficient).
wDataLen	Number of bytes to be read from the socket .

Returns

The number of bytes successfully read from the UDP buffer. If this value is less than wDataLen, then the buffer was emptied and no more data is available.

5.8.28.7.2.2 TCPIP_UDP_Flush Function**C**

```
uint16_t TCPIP_UDP_Flush(  
    UDP_SOCKET hUDP  
);
```

Description

This function builds a UDP packet with the pending TX data and marks it for transmission over the network interface. There is no UDP state machine to [send](#) the [socket](#) data automatically. The UDP [socket](#) client must call this function to actually [send](#) the data over the network.

Preconditions

UDP [socket](#) should have been opened with [TCPIP_UDP_ServerOpen\(\)](#)/[TCPIP_UDP_ClientOpen\(\)](#). hUDP - valid [socket](#)

Parameters

Parameters	Description
hUDP	UDP socket handle

Returns

The number of bytes that currently were in the [socket](#) TX buffer and have been flushed.

Remarks

Note that unlike [TCPIP_TCP_Flush](#), TCPIP_UDP_Flush must be called before returning to the main stack loop. There is no auto transmit for UDP segments.

5.8.28.7.2.3 TCPIP_UDP_Put Function**C**

```
uint16_t TCPIP_UDP_Put(  
    UDP_SOCKET hUDP,  
    uint8_t v  
);
```

Description

This function writes a single byte to the UDP [socket](#), while incrementing the buffer length. [TCPIP_UDP_TxPutIsReady](#) could be used before calling this function to verify that there is room in the [socket](#) buffer.

Preconditions

UDP [socket](#) should have been opened with [TCPIP_UDP_ServerOpen\(\)](#)/[TCPIP_UDP_ClientOpen\(\)](#). hUDP - valid [socket](#)

Parameters

Parameters	Description
hUDP	UDP socket handle
v	The byte to be loaded into the transmit buffer.

Return Values

Return Values	Description
1	The byte was successfully written to the socket .
0	The transmit buffer is already full and so the write failed.

Remarks

The following function is very inefficient. A buffered approach ([TCPIP_UDP_ArrayPut](#)) should be preferred

5.8.28.7.2.4 TCPIP_UDP_StringPut Function**C**

```
const uint8_t* TCPIP_UDP_StringPut(  
    UDP_SOCKET hUDP,  
    const uint8_t * strData  
);
```

Description

This function writes a null-terminated string to the UDP [socket](#) while incrementing the buffer length. [TCPIP_UDP_TxPutIsReady](#) could be used before calling this function to verify that there is room in the [socket](#) buffer.

Preconditions

UDP [socket](#) should have been opened with [TCPIP_UDP_ServerOpen\(\)](#)/[TCPIP_UDP_ClientOpen\(\)](#). hUDP - valid [socket](#)

Parameters

Parameters	Description
hUDP	UDP socket handle
cData	Pointer to the string to be written to the socket .

Returns

A pointer to the byte following the last byte written. Note that this is different than the [TCPIP_UDP_ArrayPut](#) functions. If this pointer does not dereference to a NULL byte, then the buffer became full and the input data was truncated.

5.8.28.7.2.5 TCPIP_UDP_TxCountGet Function**C**

```
uint16_t TCPIP_UDP_TxCountGet(  
    UDP_SOCKET hUDP  
);
```

Description

This function returns the amount of bytes written into the UDP [socket](#).

Preconditions

UDP [socket](#) should have been opened with [TCPIP_UDP_ServerOpen\(\)](#)/[TCPIP_UDP_ClientOpen\(\)](#). hUDP - valid [socket](#)

Parameters

Parameters	Description
hUDP	UDP socket handle

5.8.28.7.2.6 TCPIP_UDP_TxPutIsReady Function**C**

```
uint16_t TCPIP_UDP_TxPutIsReady(  
    UDP_SOCKET hUDP,  
    unsigned short count  
);
```

Description

This function determines how many bytes can be written to the specified UDP [socket](#).

Preconditions

UDP [socket](#) should have been opened with [TCPIP_UDP_ServerOpen\(\)](#)/[TCPIP_UDP_ClientOpen\(\)](#). hUDP - valid [socket](#)

Parameters

Parameters	Description
hUDP	UDP socket handle
count	Number of bytes requested

Returns

The number of bytes that can be written to this [socket](#).

Remarks

The function won't increase the size of the UDP TX buffer. If this is needed use [TCPIP_UDP_OptionsSet\(\)](#). The count variable is not used.

5.8.28.7.2.7 TCPIP_UDP_ArrayPut Function**C**

```
uint16_t TCPIP_UDP_ArrayPut(  
    UDP_SOCKET hUDP,  
    const uint8_t * cData,  
    uint16_t wDataLen  
);
```

Description

This function writes an array of bytes to the UDP [socket](#), while incrementing the buffer length. [TCPIP_UDP_TxPutIsReady](#) could be used before calling this function to verify that there is room in the [socket](#) buffer.

Preconditions

UDP [socket](#) should have been opened with [TCPIP_UDP_ServerOpen\(\)](#)/[TCPIP_UDP_ClientOpen\(\)](#). hUDP - valid [socket](#)

Parameters

Parameters	Description
cData	The array to write to the socket .
wDataLen	Number of bytes from cData to be written.

Returns

The number of bytes successfully placed in the UDP transmit buffer. If this value is less than wDataLen, then the buffer became

full and the input was truncated.

5.8.28.7.2.8 UDPIsPutReady Function

C

```
uint16_t UDPIsPutReady(  
    UDP_SOCKET hUDP  
);
```

Description

This function determines how many bytes can be written to the specified UDP [socket](#).

Preconditions

UDP [socket](#) should have been opened with [TCPIP_UDP_ServerOpen\(\)](#)/[TCPIP_UDP_ClientOpen\(\)](#). hUDP - valid [socket](#)

Parameters

Parameters	Description
hUDP	UDP socket handle

Returns

The number of bytes that can be written to this [socket](#).

Remarks

The function is similar to the [TCPIP_UDP_TxPutIsReady](#) and maintained for backward compatibility.

5.8.28.7.3 Receive Data Transfer Functions

5.8.28.7.3.1 TCPIP_UDP_Discard Function

C

```
void TCPIP_UDP_Discard(  
    UDP_SOCKET hUDP  
);
```

Description

This function discards any remaining received data in the UDP [socket](#).

Preconditions

UDP [socket](#) should have been opened with [TCPIP_UDP_ServerOpen\(\)](#)/[TCPIP_UDP_ClientOpen\(\)](#). hUDP - valid [socket](#)

Parameters

Parameters	Description
hUDP	socket handle

Returns

None

Remarks

It is safe to call this function more than is necessary. If no data is available, this function does nothing.

5.8.28.7.3.2 TCPIP_UDP_Get Function

C

```
uint16_t TCPIP_UDP_Get(  
    UDP_SOCKET hUDP,  
    uint8_t * v  
);
```

Description

This function reads a single byte from the UDP [socket](#), while decrementing the remaining buffer length. [TCPIP_UDP_GetIsReady](#) could be used before calling this function to get the number of bytes available in the [socket](#).

Preconditions

UDP [socket](#) should have been opened with [TCPIP_UDP_ServerOpen\(\)](#)/[TCPIP_UDP_ClientOpen\(\)](#). hUDP - valid [socket](#)

Parameters

Parameters	Description
hUDP	socket handle
v	The buffer to receive the data being read.

Return Values

Return Values	Description
1	A byte was successfully read
0	No data remained in the read buffer or invalid socket

Remarks

The following function is very inefficient. A buffered approach ([TCPIP_UDP_ArrayGet](#)) should be preferred

5.8.28.7.3.3 TCPIP_UDP_GetIsReady Function

C

```
uint16_t TCPIP_UDP_GetIsReady(  
    UDP_SOCKET hUDP  
);
```

Description

This function determines if bytes can be read from the specified UDP [socket](#).

Preconditions

UDP [socket](#) should have been opened with [TCPIP_UDP_ServerOpen\(\)](#)/[TCPIP_UDP_ClientOpen\(\)](#). hUDP - valid [socket](#)

Parameters

Parameters	Description
hUDP	UDP socket handle

Returns

The number of bytes that can be read from this [socket](#).

5.8.28.7.3.4 TCPIP_UDP_RxOffsetSet Function

C

```
void TCPIP_UDP_RxOffsetSet(  
    UDP_SOCKET hUDP,
```

```
    uint16_t rOffset  
);
```

Description

This function allows the read location within the RX buffer to be specified. Future calls to [TCPIP_UDP_Get](#) and [TCPIP_UDP_ArrayGet](#) will read data from the indicated location forward.

Preconditions

UDP [socket](#) should have been opened with [TCPIP_UDP_ServerOpen\(\)](#)/[TCPIP_UDP_ClientOpen\(\)](#). hUDP - valid [socket](#)

Parameters

Parameters	Description
hUDP	UDP socket handle
wOffset	Offset from beginning of UDP packet data payload to place the read pointer.

Returns

None

5.8.28.7.4 Data Types and Constants

5.8.28.7.4.1 INVALID_UDP_SOCKET Macro

```
C  
#define INVALID_UDP_SOCKET (-1)           // Indicates a UDP socket that is not valid
```

Description

Indicates a UDP [socket](#) that is not valid

5.8.28.7.4.2 TCPIP_UDP_IsOpened Macro

```
C  
#define TCPIP_UDP_IsOpened(s) TCPIP_UDP_IsConnected(s)
```

Description

backward compatibility call

5.8.28.7.4.3 UDP_MODULE_CONFIG Structure

```
C  
typedef struct {  
    uint16_t nSockets;  
    uint16_t sktTxBuffSize;  
    uint16_t poolBuffers;  
    uint16_t poolBufferSize;  
} UDP_MODULE_CONFIG;
```

Description

UDP layer configuration/initialization

Members

Members	Description
uint16_t nSockets;	number of sockets to be created

uint16_t sktTxBuffSize;	size of the socket tx buffer
uint16_t poolBuffers;	number of buffers in the pool; 0 if none
uint16_t poolBufferSize;	size of the buffers in the pool; all equal

5.8.28.7.4.4 UDP_PORT Type

C

```
typedef uint16_t UDP_PORT;
```

Description

Stores a UDP Port Number

5.8.28.7.4.5 UDP_SOCKET Type

C

```
typedef int16_t UDP_SOCKET;
```

Description

Provides a handle to a UDP Socket

5.8.28.7.4.6 UDP_SOCKET_BCAST_TYPE Enumeration

C

```
typedef enum {
    UDP_BCAST_NONE,
    UDP_BCAST_NETWORK_LIMITED,
    UDP_BCAST_NETWORK_DIRECTED
} UDP_SOCKET_BCAST_TYPE;
```

Description

This is type UDP_SOCKET_BCAST_TYPE.

Members

Members	Description
UDP_BCAST_NONE	no broadcast
UDP_BCAST_NETWORK_LIMITED	network limited broadcast
UDP_BCAST_NETWORK_DIRECTED	network directed broadcast

5.8.28.7.4.7 UDP_SOCKET_INFO Structure

C

```
typedef struct {
    IP_ADDRESS_TYPE addressType;
    IP_MULTI_ADDRESS remoteIPAddress;
    IP_MULTI_ADDRESS localIPAddress;
    UDP_PORT remotePort;
    UDP_PORT localPort;
} UDP_SOCKET_INFO;
```

Description

Information about a [socket](#)

Members

Members	Description
UDP_PORT remotePort;	Port number associated with remote node
UDP_PORT localPort;	local port number

5.8.28.7.4.8 UDP_SOCKET_OPTION Enumeration**C**

```
typedef enum {
    UDP_OPTION_STRICT_PORT,
    UDP_OPTION_STRICT_NET,
    UDP_OPTION_BROADCAST,
    UDP_OPTION_BUFFER_POOL,
    UDP_OPTION_TX_BUFF,
    UDP_OPTION_TX_QUEUE_LIMIT
} UDP_SOCKET_OPTION;
```

Description

UDP [socket](#) options

Members

Members	Description
UDP_OPTION_STRICT_PORT	When connection is done the socket stores the remote host local port. If option is enabled the remote host local port is always checked to match the initial one. If disabled the remote host local port is not checked. Disabled by default on a socket server. Enabled by default on a client socket .
UDP_OPTION_STRICT_NET	When connection is done the socket stores the network interface the connection occurred on. If option is enabled the socket accepts data only from the interface that matches the initial connection. If disabled the socket receives data from any remote host irrespective of the interface on which the packet arrived. Disabled by default on a socket server. Enabled by default on a client socket .
UDP_OPTION_BROADCAST	Enables the Broadcast transmission by the socket
UDP_OPTION_BUFFER_POOL	Enables the socket to use the private UDP buffers pool. The size of the TX buffer has to be less than the size of the buffers in the pool
UDP_OPTION_TX_BUFF	request different TX buffer size. Has to call TCPIP_UDP_OptionsGet to see the exact space allocated
UDP_OPTION_TX_QUEUE_LIMIT	Sets the maximum number of packets that can be queued/allocated by an UDP socket at a certain time. For sockets that need to transmit a lot of data (iperf client, for example), especially on slow connections this limit prevents running out of memory because the MAC transfer cannot keep up with the UDP packet allocation rate imposed by the application. Adjust depending on the size of the UDP TX buffer, the connection speed and the amount of memory available to the stack.

5.8.28.8 Files**Files**

Name	Description
udp.h	
udp_config.h	UDP onfiguration file

Description

5.8.28.8.1 udp.h

UDP Module Defs for Microchip TCP/IP Stack

Enumerations

	Name	Description
	UDP_SOCKET_BCAST_TYPE	This is type UDP_SOCKET_BCAST_TYPE.
	UDP_SOCKET_OPTION	UDP socket options

Functions

	Name	Description
	TCPIP_UDP_ArrayGet	Reads an array of bytes from the UDP socket .
	TCPIP_UDP_ArrayPut	Writes an array of bytes to the UDP socket .
	TCPIP_UDP_BcastIPv4AddressSet	Sets the broadcast IP address of a socket . Allows an UDP socket to send broadcasts.
	TCPIP_UDP_Bind	Bind a socket to a local address and port. This function is meant for client sockets. It assigns a specific source address and port for a socket .
	TCPIP_UDP_ClientOpen	Opens a UDP socket as a client.
	TCPIP_UDP_Close	Closes a UDP socket and frees the handle.
	TCPIP_UDP_DestinationIPAddressSet	Sets the destination IP address of a socket .
	TCPIP_UDP_Discard	Discards any remaining RX data from a UDP socket .
	TCPIP_UDP_Flush	Transmits all pending data in a UDP socket .
	TCPIP_UDP_Get	Reads a byte from the UDP socket .
	TCPIP_UDP_GetIsReady	Determines how many bytes can be read from the UDP socket .
	TCPIP_UDP_IsConnected	Determines if a socket has an established connection.
	TCPIP_UDP_OptionsGet	Allows getting the options for a socket like: current Rx/Tx buffer size, etc
	TCPIP_UDP_OptionsSet	Allows setting options to a socket like adjust Rx/Tx buffer size, etc
	TCPIP_UDP_Put	Writes a byte to the UDP socket .
	TCPIP_UDP_RemoteBind	Bind a socket to a remote address. This function is meant for server sockets.
	TCPIP_UDP_RxOffsetSet	Moves the pointer within the RX buffer.
	TCPIP_UDP_ServerOpen	Opens a UDP socket as a server.
	TCPIP_UDP_SocketInfoGet	Points handle at socket info for socket hUDP
	TCPIP_UDP_SocketNetGet	Gets the network interface of an UDP socket .
	TCPIP_UDP_SocketNetSet	Sets the network interface for an UDP socket .
	TCPIP_UDP_SourceIPAddressSet	Sets the source IP address of a socket .
	TCPIP_UDP_StringPut	Writes null-terminated string to the UDP socket .
	TCPIP_UDP_TxCountGet	Returns the amount of bytes written into the UDP socket .
	TCPIP_UDP_TxOffsetSet	Moves the pointer within the TX buffer.
	TCPIP_UDP_TxPutIsReady	Determines how many bytes can be written to the UDP socket .
	UDPIsPutReady	Determines how many bytes can be written to the UDP socket .

Macros

	Name	Description
	INVALID_UDP_SOCKET	Indicates a UDP socket that is not valid
	TCPIP_UDP_IsOpened	backward compatibility call

Structures

	Name	Description
	UDP_MODULE_CONFIG	UDP layer configuration/initialization
	UDP_SOCKET_INFO	Information about a socket

Types

	Name	Description
	UDP_PORT	Stores a UDP Port Number
	UDP_SOCKET	Provides a handle to a UDP Socket

5.8.28.8.2 udp_config.h

User Datagram Protocol (UDP) Configuration file

This file contains the UDP module configuration options

Macros

	Name	Description
	UDP_LOCAL_PORT_END_NUMBER	Last port number for randomized local port number selection
	UDP_LOCAL_PORT_START_NUMBER	The dynamic port range defined by IANA consists of the 49152-65535 range and is meant for the selection of ephemeral ports (RFC 6056). Adjust to your needs but stay within the IANA range First port number for randomized local port number selection
	UDP_MAX_SOCKETS	global number of UDP sockets created dynamically
	UDP_SOCKET_DEFAULT_TX_QUEUE_LIMIT	the maximum number of packets that can be queued by an UDP socket at a certain time. For sockets that need to transfer a lot of data (iperf, for example), especially on slow connections this limit prevents running out of memory because the MAC transfer cannot keep up with the UDP packet allocation rate imposed by the application. Adjust depending on the UDP_SOCKET_DEFAULT_TX_SIZE , the connection speed and the amount of memory available to the stack.
	UDP_SOCKET_DEFAULT_TX_SIZE	default socket Tx buffer size
	UDP_SOCKET_POOL_BUFFER_SIZE	size of the buffers in the UDP pool any UDP socket that is enabled to use the pool and has the TX size <= than this size can use a buffer from the pool
	UDP_SOCKET_POOL_BUFFERS	use 0 to disable the feature
	UDP_USE_RX_CHECKSUM	check incoming packets to have proper checksum
	UDP_USE_TX_CHECKSUM	This slows UDP TX performance by nearly 50%, except when using the ENCX24J600, which has a super fast DMA and incurs virtually no speed penalty.

5.8.29 Zeroconf TCP/IP Stack Library

5.8.29.1 Introduction

Zero Configuration (Zeroconf) TCP/IP Stack Library for Microchip Microcontrollers

This library provides the API of the Zero Conf TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

Zero configuration (Zeroconf), provides a mechanism to ease the configuration of a device on a network. It also provides for a more human-like naming convention, instead of relying on IP addresses alone. Zeroconf also goes by the names Bonjour (Apple) and Avahi (Linux), and is an IETF standard.

5.8.29.2 Release Notes

MPLAB Harmony Version: v0.70b **Zero Conf TCP/IP Stack Library Version :** 1.0 **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.8.29.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.8.29.4 Using the Library

This topic describes the basic architecture of the Zeroconf TCP/IP Stack Library and provides information and examples on how to use it.

Interface Header Files: `zero_conf_helper.h`, `zero_conf_link_local.h`, and `zero_conf_multicast_dns.h`

The interface to the Zeroconf TCP/IP Stack library is defined in the "`zero_conf_helper.h`", "`zero_conf_link_local.h`", and "`zero_conf_multicast_dns.h`" header files. This file is included by the "`tcpip.h`" file. Any C language source (.c) file that uses the Zeroconf TCP/IP Stack library should include "`tcpip.h`".

Library File:

The Zeroconf TCP/IP Stack library archive (.a) file installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the TCP/IP Stack interacts with the framework.

5.8.29.4.1 Abstraction Model

This library provides the API of the Zeroconf TCP/IP Module that is available on the Microchip family of microcontrollers with a convenient C language interface. It is a module that belongs to the TCP/IP stack.

Description

Zero Conf Software Abstraction Block

Note: This image was not available at time of release and will be added in a future release of MPLAB Harmony.

5.8.29.4.2 Library Overview

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the Zeroconf module.

Library Interface Section	Description
Multicast DNS Functions	This section provides multicast DNS interface routines to Zeroconf
Link Local Functions	This section provides Link Local interface routines to Zeroconf
Data Types and Constants	This section provides various definitions describing this API

5.8.29.4.3 Core Functionality

5.8.29.4.3.1 Enabling

Zeroconf can be enabled by setting the following two defines in `TCPIPConfig.h`:

- `STACK_USE_ZEROCONF_LINK_LOCAL`
- `STACK_USE_ZEROCONF_MDNS_SD`

Currently, the use of Zeroconf is limited to the W-iFi demo applications (and the MRF24WB0M module). Future versions of the stack should enable Zeroconf support across all Ethernet solutions.

5.8.29.4.3.2 Link Local (Zeroconf)

The first component of Zeroconf is the ability to self-assign an IP address to each member of a network. Normally, a DHCP server would handle such situations. However, in cases where no DHCP server exists, Zeroconf enabled devices negotiate unique IP addresses amongst themselves.

5.8.29.4.3.3 mDNS

The second component of Zeroconf is the ability to self-assign human-readable hostnames for themselves. Multicast DNS provides a local network the ability to have the features of a DNS server. Users can use easily remembered hostnames to access the devices on the network. In the event that devices elect to use the same hostname, as in the IP address resolution, each of the devices will auto-negotiate new names for themselves (usually by appending a number to the end of the name).

5.8.29.4.3.4 Service Discovery

The last component of Zeroconf is service discovery. All Zeroconf devices can broadcast what services they provide. For instance, a printer can broadcast that it has printing services available. A thermostat can broadcast that it has an HVAC control service. Other interested parties on the network who are looking for certain services can then see a list of devices that have the capability of providing the service, and [connect](#) directly to it. This further eliminates the need to know whether something exists on a network (and what its IP or hostname is). As an end-user, all you would need to do is query the network if a certain service exists, and easily [connect](#) to it.

5.8.29.4.3.5 Demonstration

The demo, when enabled, shows all three items above working together. Each development kit in the network assumes the hostname of MCHPBOARD-x.local, where x is an incrementing number from 1 (only in the case where multiple kits are programmed for the network). Each board will broadcast its service, which is the DemoWebServer.

5.8.29.4.3.6 Zeroconf Enabled Environments

All Apple products have Zeroconf enabled by default. On Windows, you'll need to download the Safari web browser, and during the install, enable support for Bonjour. Note that in the Safari browser, you can browse and see a list of all Bonjour enabled devices, and click through to them automatically.

5.8.29.5 Configuring the Library

The configuration of the Zeroconf TCP/IP Stack Library is based on the file `tcpip_config.h`.

This header file contains the configuration selection for the Zeroconf TCP/IP Stack Library. Based on the selections made, the Zeroconf TCP/IP Stack Library will support or not support selected features. These configuration settings will apply to all instances of the Zeroconf TCP/IP Stack Library.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

5.8.29.6 Building the Library

This section lists the files that are available in the `\src` of the Zeroconf driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

5.8.29.7 Library Interface

Data Types and Constants

	Name	Description
	MDNSD_ERR_CODE	void DisplayHostName(uint8_t *HostName);
	ZCLL_MODULE_CONFIG	Placeholder for Zero Configuration Link Layer module configuration.

Link Local Functions

	Name	Description
	TCPIP_ZCLL_Disable	disables the ZCLL on an interface
	TCPIP_ZCLL_Enable	enables ZCLL on an interface
	TCPIP_ZCLL_IsEnabled	returns true if ZCLL is currently enabled on that interface

Multicast DNS Functions

	Name	Description
	TCPIP_MDNS_ServiceDeregister	DNS-Service Discovery API for end-user to De-register a service-advertisement, which was previously registered with TCPIP_MDNS_ServiceRegister API.
	TCPIP_MDNS_ServiceRegister	DNS-Service Discovery API for end-users to register a service-advertisement. The service is associated with all interfaces.
	TCPIP_MDNS_ServiceUpdate	DNS-Service Discovery API for end-user to update the service -advertisement, which was previously registered with TCPIP_MDNS_ServiceRegister

Description

This section describes the Application Programming Interface (API) functions of the Zeroconf TCP/IP Stack.

Refer to each section for a detailed description.

5.8.29.7.1 Multicast DNS Functions

5.8.29.7.1.1 TCPIP_MDNS_ServiceDeregister Function

C

```
MDNSD_ERR_CODE TCPIP_MDNS_ServiceDeregister(
    TCPIP_NET_HANDLE netH
);
```

Description

This API is used by end-user application to de-register DNS-Service Discovery on a local network. When this gets invoked by end-user DNS-SD stack sends out Good-Bye packets to update all peer machines that service will no longer be present. All peer machines remove the corresponding entry from Browser list.

This is the last API that needs to be invoked by end-user application to free-up the DNS-SD stack for some other app.

Preconditions

[TCPIP_MDNS_ServiceRegister](#) must be invoked before this call.

Parameters

Parameters	Description
netH	handle of the network to be de-registered

Returns

MDNSD_ERR_CODE - Returns Error-code to indicate registration is success or not. 1) MDNSD_SUCCESS - returns on success of call 2) MDNSD_ERR_INVALID - When the input parameters are invalid or if the API is invoked in invalid state

5.8.29.7.1.2 TCPIP_MDNS_ServiceRegister Function**C**

```
MDNSD_ERR_CODE TCPIP_MDNS_ServiceRegister(
    TCPIP_NET_HANDLE netH,
    const char * srv_name,
    const char * srv_type,
    uint16_t port,
    const uint8_t * txt_record,
    uint8_t auto_rename,
    void (*call_back)(char *name, MDNSD_ERR_CODE err, void *context),
    void * context
);
```

Description

DNS-Service Discovery APIs

This API is used by end-user application to announce its service on local network. All peer machines that are compliant with Multicast-DNS & DNS-Service Discovery protocol can detect the announcement and lists out an entry in Service-Browser list. End-User selects an entry to [connect](#) to this service. So ultimately this is an aid to end-user to discover any service of interest on a local network.

This is the first API that needs to be invoked by end-user application. Presently Multicast-DNS & Service-discovery stack supports only single service-advertisement. Once the application wants to terminate the service it has to invoke [TCPIP_MDNS_ServiceDeregister\(\)](#) API to free-up the DNS-SD stack for some other application.

Preconditions

None

Parameters

Parameters	Description
netH	handle of the network to be registered
srv_name	Service Name, which is being advertised
srv_type	For a HTTP-Service its "_http._tcp.local"
_http	is application protocol preceeded with under-score
_tcp	is lower-layer protocol on which service runs
local	is to represent service is on local-network For a iTunes Music Sharing "_daap._tcp.local" For a Printing Service "_ipp._tcp.local" Refer to http://www.dns-sd.org/ServiceTypes.html for more service types
port	Port number on which service is running
txt_len	For additional information about service like default page (eg "index.htm") for HTTP-service. Length of such additional information
txt_record	String of additional information (eg "index.htm") for HTTP-service.
auto_rename	A flag to indicate DNS-SD stack, whether to rename the service automatically or not. If this is set to '0' Callback parameter will be used to indicate the conflict error and user has to select different name and re-register with this API. If this is set to '1' service-name will be automatically renamed with numerical suffix.

callback	Callback function, which is user-application defined.
This callback gets invoked on completion of service	advertisement. If an service name-conflict error is detected and auto_rename is set to '0' callback gets invoked with MDNSD_ERR_CONFLICT as error-code.
context	Opaque context (pointer to opaque data), which needs to be used in callback function.

Returns

MDNSD_ERR_CODE - Returns Error-code to indicate registration is success or not. 1) MDNSD_SUCCESS - returns on success of call 2) MDNSD_ERR_BUSY - When already some other service is being advertised using this DNS-SD stack 3) MDNSD_ERR_INVALID - Invalid Parameter

5.8.29.7.1.3 TCPIP_MDNS_ServiceUpdate Function**C**

```
MDNSD_ERR_CODE TCPIP_MDNS_ServiceUpdate(
    TCPIP_NET_HANDLE netH,
    uint16_t port,
    const uint8_t * txt_record
);
```

Description

This API is used by end-user application to update its service which was previously registered. With this API end-user app update the port number on which the service is running. It can update the additional information of service. For example: the default page can be updated to new page and corresponding page name can be input to this API to update all peer machines. The modified service will be announced with new contents on local network.

This is an optional API and should be invoked only if it is necessary.

Preconditions

TCPIP_MDNS_ServiceRegister must be invoked before this call.

Parameters

Parameters	Description
netH	handle of the network to perform the service update
port	Port number on which service is running
txt_record	String of additional information (eg "index.htm") for HTTP-service.

Returns

MDNSD_ERR_CODE - Returns Error-code to indicate registration is success or not. 1) MDNSD_SUCCESS - returns on success of call 2) MDNSD_ERR_INVALID - When the input parameters are invalid or if the API is invoked in invalid state

5.8.29.7.2 Link Local Functions**5.8.29.7.2.1 TCPIP_ZCLL_Disable Function****C**

```
bool TCPIP_ZCLL_Disable(
    TCPIP_NET_HANDLE hNet
);
```

Description

disables the ZCLL on an interface

5.8.29.7.2.2 TCPIP_ZCLL_Enable Function

C

```
bool TCPIP_ZCLL_Enable(  
    TCPIP_NET_HANDLE hNet  
);
```

Description

enables ZCLL on an interface

5.8.29.7.2.3 TCPIP_ZCLL_IsEnabled Function

C

```
bool TCPIP_ZCLL_IsEnabled(  
    TCPIP_NET_HANDLE hNet  
);
```

Description

returns true if ZCLL is currently enabled on that interface

5.8.29.7.3 Data Types and Constants

5.8.29.7.3.1 MDNSD_ERR_CODE Enumeration

C

```
typedef enum {  
    MDNSD_SUCCESS = 0,  
    MDNSD_ERR_BUSY = 1,  
    MDNSD_ERR_CONFLICT = 2,  
    MDNSD_ERR_INVAL = 3  
} MDNSD_ERR_CODE;
```

Description

void DisplayHostName(uint8_t *HostName);

Members

Members	Description
MDNSD_ERR_BUSY = 1	Already Being used for another Service
MDNSD_ERR_CONFLICT = 2	Name Conflict
MDNSD_ERR_INVAL = 3	Invalid Parameter

5.8.29.7.3.2 ZCLL_MODULE_CONFIG Structure

C

```
typedef struct {  
} ZCLL_MODULE_CONFIG;
```

Description

Placeholder for Zero Configuration Link Layer module configuration.

5.8.29.8 Files

Files

Name	Description
zero_conf_link_local.h	
zero_conf_multicast_dns.h	This is file zero_conf_multicast_dns.h.

Description

5.8.29.8.1 zero_conf_link_local.h

Zero Confiruation (Zeroconf) IPV4 Link Local Addressing Module for Microchip TCP/IP Stack

Functions

	Name	Description
	TCPIP_ZCLL_Disable	disables the ZCLL on an interface
	TCPIP_ZCLL_Enable	enables ZCLL on an interface
	TCPIP_ZCLL_IsEnabled	returns true if ZCLL is currently enabled on that interface

Structures

	Name	Description
	ZCLL_MODULE_CONFIG	Placeholder for Zero Configuration Link Layer module configuration.

5.8.29.8.2 zero_conf_multicast_dns.h

This is file zero_conf_multicast_dns.h.

Enumerations

	Name	Description
	MDNSD_ERR_CODE	void DisplayHostName(uint8_t *HostName);

Functions

	Name	Description
	TCPIP_MDNS_ServiceDeregister	DNS-Service Discovery API for end-user to De-register a service-advertisement, which was previously registered with TCPIP_MDNS_ServiceRegister API.
	TCPIP_MDNS_ServiceRegister	DNS-Service Discovery API for end-users to register a service-advertisement. The service is associated with all interfaces.
	TCPIP_MDNS_ServiceUpdate	DNS-Service Discovery API for end-user to update the service -advertisement, which was previously registered with TCPIP_MDNS_ServiceRegister

5.9 USB Library Help

5.9.1 USB Device Library - Getting Started

5.9.1.1 Introduction

Provides an introduction to the MPLAB Harmony USB Device Library

Description

The MPLAB Harmony USB Device Library (referred to as the USB Device Library) provides embedded application developers with a framework to design and develop a wide variety of USB Devices. A choice of Full Speed only or Full Speed and Hi-Speed USB operations are available, depending on the selected PIC32 microcontroller. The USB Device Library facilitates development of standard USB devices through function drivers that implement standard USB Device class specification. Custom USB devices can also be implemented via a Generic Function driver. The USB Device Library is modular, thus allowing application developers to readily design composite USB devices. The USB Device Library is a part of the MPLAB Harmony installation and is accompanied by demonstration applications that highlight library usage. These demonstrations can also be modified or updated to build custom applications. The USB Device Library also features the following:

- Support for different USB device classes (CDC, Audio, HID, MSC and Generic)
- Supports multiple instance of the same class in a composite device
- Supports multiple configurations at different speeds
- Supports full speed and high speed operation
- Supports multiple USB peripherals (allows multiple device stacks)
- Modular and Layered architecture
- Supports deferred control transfer responses.
- Completely non-blocking
- Supports both polled and interrupt operation.
- Works readily in an RTOS environment.

This document serves as getting started guide and provides information on the following:

- USB Device Stack Architecture
- USB Device Library - Application Interaction
- Creating your own USB device

Note: This document assumes that the reader is familiar with the USB 2.0 specification (available at www.usbif.org). While the document, for the sake completeness, does cover certain aspects of the USB 2.0 protocol, it is recommended that the reader

refer to the specification for a complete description of USB operation.

5.9.1.2 Release Notes

MPLAB Harmony Version: v0.70b **Release Date:** 18Nov2013

New This Release:

Nothing to report in this release.

Known Issues:

- USB Device Stack:
 - Limited USB chapter 9 testing performed on HID and MSD function drivers.
 - The stack has not been tested for USB Interoperability.
 - The USB Device Stack has not been tested with a Real Time Operating System.
 - Attach/Detach behavior has been tested in a limited capacity.
 - The device stack only supports interrupt mode operation. Polled mode operation will be added in a future release.
 - While running the device stack on PIC32MZ microcontroller, the stack requires 3 seconds to initialize. This is due to a hardware issue with PIC32MZ USB module.
 - Device stack operation has been tested with Windows XP and Windows 7 OS based PC USB Host.
 - The USB_DEVICE_ResumeStart() and USB_DEVICE_ResumeStop() functions are not implemented.
- USB Host Stack:
 - The host Stack has not been tested with a Real Time Operating System.
 - Attach/Detach behavior has been tested in a limited capacity.
 - The host stack only supports interrupt mode operation. Polled mode operation will be added in a future release.
 - While running the host stack on PIC32MZ microcontroller, the stack requires 3 seconds to initialize. This is due to a hardware issue with PIC32MZ USB module. The 3 second delay is implemented using a while loop. This will be replaced with System Timer services in the next release.
 - MSD Host has been tested with a limited number of commercially available USB Flash Drives.
 - MSD Host and the USB Host Layer have not been tested for read/write throughput. This will be done in a future release.
 - Host stack has not been tested with low speed devices.
 - The PIC32MZ host layer performs direct access of Timer 2 peripheral SFR, for its timing requirements. This will be replaced with Harmony System Timer services in the next release of the host stack.
 - USB_HOST_DeviceSuspend() and the USB_HOST_DeviceResume() functions are not implemented.

5.9.1.2.1 Previous Versions

5.9.1.2.1.1 v0.51b

Release notes for version 0.51b of the MPLAB Harmony USB Stack.

Description

New features in this release:

- Added Device Stack support for Mass Storage device class.
- Added Device Stack support for Audio Device class.
- Added demonstration applications for Audio and Mass Storage Device classes.
- Added support for PIC32MZ devices and High Speed operation.
- HID Basic Demonstration application tested for USB 2.0 chapter-9 conformance.
- MSD Basic Demonstration application tested for USB2.0 chapter-9 conformance.
- First Release of Host Layer and CDC Host Driver along with a demonstration application.

Limitations and Known Issues:

The following are the known issues in this release. These issues will be fixed in the subsequent releases of the MPLAB Harmony USB Stack.

- The USB device stack is tested with Windows environment only. Performance and working of the device stack is not tested with other OS environments.
- The stack is not thoroughly tested for inter operability with other USB devices when connected to hub along with other devices.
- All demos are tested in dynamic interrupt mode only.
- Limited testing is done with hub.
- Limited testing is done with RTOS.
- APIs may change in subsequent releases and are not final.
- PIC32MZ USB Driver supports only on instance of the USB peripheral.
- The Mass Storage Device Class demonstration application works with Windows XP OS only.
- The Audio Speaker demo may not restart audio playback if the playback is paused from the PC.
- The CDC Host layer has been in tested in a limited capacity.
- PIC32MZ and Hi-Speed USB support is tested with CDC and HID device classes only.
- HID Keyboard demonstration application does not receive output report from PC USB host.

5.9.1.2.1.2 v0.51.02b

Release notes for the current version of the MPLAB Harmony USB Stack

Description**New features in this release:**

- Updated documentation to include a Getting Started with USB Device Library.
- Updated the documentation for CDC and HID Function Drivers. Improved code size and RAM requirement of the demos.
- The following issues from the v0.51b are fixed in this release
 - HID Keyboard demonstration application does not receive output report from PC USB host.
 - The Audio Speaker demo may not restart audio playback if the playback is paused from the PC.
 - The Mass Storage Device Class demonstration application works with Windows XP OS only. The demo now works with Windows 7.

Limitations and Known Issues:

The following are the known issues in this release. These issues will be fixed in the subsequent releases of the MPLAB Harmony USB Stack.

- The USB device stack is tested with Windows environment only. Performance and working of the device stack is not tested with other OS environments.

- The stack is not thoroughly tested for inter operability with other USB devices when connected to hub along with other devices.
- All demos are tested in dynamic interrupt mode only.
- Limited testing is done with hub. Limited testing is done with RTOS.
- Audio Speaker demo may not work with all USB Hosts. This has been observed with faster PC Hosts.
- APIs are not final and may change in subsequent releases.
- PIC32MZ USB Driver supports only one instance of the USB peripheral.
- The CDC Host layer has been tested in a limited capacity.
- PIC32MZ and Hi-Speed USB support is tested with CDC and HID device classes only.
- Polling operation is not implemented
- Static USB Controller Driver is not available.

5.9.1.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.9.1.4 USB Device Library Architecture

Describes the USB Device Library Architecture.

Description

The USB Device Library features a modular and layered architecture. This is shown in figure 1.

Figure 1: USB Device Library Architecture

As seen in figure 1, the USB Device Library consists of the 3 major components

1. The **USB Controller Driver (USBCD)** manages the state of the USB peripheral and provides the Device Layer with structured data access methods to the USB. It also provides the device layer with USB events. The USBCD is a MPLAB Harmony driver and uses the Harmony framework components (the USB peripheral Library, the Interrupt System Service) for its operation. It supports only one client per instance of the USB Peripheral. This client would typically be the Device Layer. In case of multiple USB peripherals, the USBCD can manage multiple USB peripherals, each being accessed by one client. The driver is accessed exclusively by the Device Layer in the USB Device Layer Architecture. It is initialized by the Device Layer (when the Device Layer is initialized) and in case of polling operation, it's Tasks routine is called by the Device Layer. The USBCD provides functions to

- enable, disable and stall endpoints
- schedule USB transfers.
- attach or detach the device
- control resume signalling

2. The **Device Layer** responds to the enumeration requests issued by the USB host. It has exclusive access to an instance of the USBCD and Endpoint 0 which is the control endpoint. When the host issues a class specific control transfer request, the Device Layer will analyze the setup packet of the control transfer and will route the control transfer to the appropriate function driver. The Device Layer must be initialized with the following data:

- Master Descriptor Table: This is a table of all the configuration descriptors and string descriptors.
- Function Driver Registration Table : This table contains information about the function drivers in the application
- USBCD initialization information: This specifies the USB peripheral interrupt, the USB Peripheral instance and sleep mode operation options.

The Device Layer initializes all function drivers that are registered with it when it receives a Set Configuration (for a supported configuration) from the host. It de-initializes the function drivers when a USB reset event occurs. It initializes the USBCD, opens it and registers a event handler to receive USB events. The Device Layer can also be opened by the application (the application

becomes a client to the Device Layer). The application can then receive bus and device events and respond to control transfer requests. The Device Layer provides events to the application such as device configured or device reset. The application must then respond appropriately to these events.

3. The **Function Drivers** implements various USB device classes as per the class specification. The USB Device Library architecture can support multiple instances of a function driver. An example would be a USB CDC device that emulates 2 serial ports. Function drivers provide an abstracted and an easy to use interface to the application. The application must register an event handler with the function driver to receive function driver events and must respond to some of these events with control transfer read/write functions. Function driver access the bus through the Device Layer.

5.9.1.5 USB Device Library - Application Interaction

Describes how the application must interact with the USB Device Stack

Description

Figure 2 highlights the steps that the application must follow in order to use the USB Device Library.

Figure 2: Application Interaction with Device Layer

The application must first initialize the Device Layer. As a part of the Device Layer initialization process, the Device Layer initialization structure must be defined which in turn requires the following data structures to be designed

- The master descriptor table
- The function driver registration table

Figure 3 shows a pictorial representation of the data that forms the Device Layer initialization structure. Additional information on Device Layer initialization is available in the Device Layer Help File.

Figure 3. Device Layer Initialization

After successful initialization of the device layer, the application can open the device layer and register a device layer event handler. The device layer event handler receives device level events such as device configured, device de-configured, device reset and device suspended. The device configured event and de-configured event are important. The application can use the device deconfigured event to re-initialize its internal state machine. When the application receives a device configured event, it must register event handlers for each function driver that is relevant to the configuration that was set. The function driver event handler registration must be done in the device configured event context because the device layer acknowledges the set configuration request from the host when it exits the device configured event handler context. The application at this point should be ready to respond to function driver events which require application intervention.

Note: Not registering the function driver event handler in the device layer device configured event could cause the device to not

respond to the host requests and hence be non-compliant.

Once configured, the device is now ready to serve its intended function on the USB. The application interacts with the device layer and function drivers through API function and event handlers. The application must be aware of function driver events which require application response. For example, the `USB_DEVICE_CDC_EVENT_SET_LINE_CODING` event from the CDC Function Driver requires the application to respond with a `USB_DEVICE_CDC_ControlRead()` function. This function provides the buffer to **accept** the line coding parameters that the host will provide in the data stage of the Set Line Coding control transfer. Figure 4 shows the application interaction with device layer and function driver after the device has been configured.

Figure 4: Application - Device Layer Interaction after device configuration

In figure 4, the application should have registered the device layer event handler before attaching the device on the bus. It should have registered the function driver event handler before exiting the device configured - device layer event. The application will then receive function driver instance specific events via the function driver event handlers.

Deferring Control Transfer Responses:

Some function driver events require the application to respond to the data stage and/or the status stage of the function driver (class) specific control transfer associated with the event. The application responds to the data stage by specifying a buffer that either contains the data that needs to be sent to host (control read) or will contain the data that host sends to the device (control write). In case of a control write, the application may wish to inspect the data which was received from the host and then acknowledge or stall the status stage of the control transfer. In such cases, it is possible that the application may not be ready within the function driver event handler context, with data that needs to be sent in the control read transfer or the success/ failure decision in response to the control write transfer. Performing extended processing or waiting for external hardware within the function driver event handler context is not recommended as USB 2.0 specification places restrictions on the control transfer response time.

In cases where the application is not ready to respond to control transfer requests within the function driver event handler context, the USB Device Library provides the option of deferring the response to the event. The application can respond to the control transfer request out of function driver event handler context. The function driver generates a control transfer handle, which the application must use while responding to the function driver event outside the event handler context. The application must still observe the USB 2.0 specification control transfer timing requirements while responding to the control transfer. Deferring the response in such a manner provides the application with flexibility to analyze the control transfer without affecting the dynamic response of the device.

5.9.1.6 Creating Your Own USB Device

Describes how to create a USB device with MPLAB Harmony USB Device Library

Description

The first step in creating a USB device is identifying if the desired device function fits into any of the standard USB device class functions. Using standard USB classes may be advantageous as major operating systems feature ready Host driver support for standard USB devices. The application may however not wish to tolerate the overhead associated with standard USB device class protocols, in which case, a custom USB device can be implemented. A custom USB device can be implemented by using the Generic Device function driver in the USB Device Library, but these devices will require development of host drivers for their operation. Having identified the device class to be used, the following approaches are available for developing a USB device by using the USB Device Library.

1. Use the available library demonstration applications. The USB Device Library release package contains a set of demo applications which are representative of common USB devices. These can be modified easily to include application specific initialization and application logic. The application logic must be non-blocking and could be implemented as a state machine.

- The application specific initialization can be called in the `SYS_Initialize()` function (in the `sys_init.c` file). The `SYS_Initialize` is called when the device comes out of power on reset.

- The application logic can be called in the `SYS_Tasks()` function (in the `sys_tasks.c` file). The application logic can interact with the function driver and the device layer by using relevant API calls.

- The application logic can track device events by processing the events in the application USB device event handler function (`APP_USBDeviceEventHandler()` function in `app.c`).

2. Build a USB Device Library application from scratch. In a case where the available demo applications do not meet the end application requirements, a USB device can be created by building a USB Device Library application from scratch. Figure 5 shows a flowchart for the steps that need to be followed to do this.

Figure 5: Steps to create a USB Device Library Application

Step 1:

Create a MPLAB Project and add the required USB Device Library file to the project. The following files are needed to build the a USB Device Library project

- system_config.h - This file should contain the compile time configuration macros for the Function Driver, Device Layer and Controller Driver. Refer to the "Configuring the Library" section in the documentation
- usb_device.c - This is the device layer implementation
- drv_usb.c and drv_usb_device.c - These files implement the USB device mode Controller Driver.
- sys_int_pic32.c and plib_int_pic32.c - These files implement the system interrupt service that is required by the USB CD.
- function driver implementation files - This depends on the USB device function being implemented. The "Using the Library" section in the function driver specific help file provides more details on the files to be included while using the function driver.
- Application specific files - These file will implement the application logic

Step 2:

Setup the fuse configuration bits to enable PLL. The code snippets below can be used to do this for PIC32MX and PIC32MZ processors

```

/*****
 * The following code snippet shows the USB PLL related
 * fuse configuration bits for PIC32MX processors. A 8MHz
 * external crystal/oscillator is assumed.
 *****/
#pragma config UPLLEN    = ON        /* Enable USB PLL */
#pragma config UPLLIDIV = DIV_2     /* USB PLL input divider */
/*****
 * The following code snippet shows the USB PLL related
 * fuse configuration bits for PIC32MZ processors. A 24MHz
 * external crystal/oscillator is assumed.
 *****/
#pragma config UPLLFSEL = FREQ_24MHZ // USB PLL Input Frequency Selection
#pragma config UPLLEN   = ON

```

Step 3:

Design the USB Device, Configuration and Class specific descriptors that are required for successful enumeration of the USB device. These should comply with the USB 2.0 specification. Class Specific descriptors should comply with the class specifications. The device and configuration descriptors should be added to the Master Descriptor Table. A Function Driver Registration Table should be created and registered with the Device Layer. The function driver registration table associates instance of a function driver with a Device Layer instance. Refer to "Setting up Master Descriptor Table" and "Function Driver Registration" in the Device Layer help file for more information.

Step 4:

The application should create a Device Layer Event Handler which will handle all the events generated by the Device Layer. The following code snippet shows a list of all possible events that are generated by the Device Layer. The code snippet can be used in the application and updated to meet the application requirements. Refer to "Device Events" in the Device Layer documentation for more details on the Device Layer Event Handling.

```

void APP_USBDeviceEventHandler(USB_DEVICE_EVENT event, USB_DEVICE_EVENT_DATA * eventData)
{
    switch(event)
    {
        case USB_DEVICE_EVENT_RESET:
            break;
        case USB_DEVICE_EVENT_DECONFIGURED:
            break;
        case USB_DEVICE_EVENT_CONFIGURED:
            break;
        case USB_DEVICE_EVENT_SUSPENDED:
            break;
        case USB_DEVICE_EVENT_RESUMED:
            break;
    }
}

```

```

        case USB_DEVICE_EVENT_ATTACHED:
            break;
        case USB_DEVICE_EVENT_DETACHED:
            break;
        case USB_DEVICE_EVENT_ERROR:
            break;
        default:
            break;
    }
}

```

Step 5:

The application should create a Function Driver Event Handler which will handle all the events generated by the Function Driver. Refer to "Event Handling" section in the applicable function driver documentation for more details on the Function Driver Event Handling.

Step 6:

If the application intends to operate the USB Device Library in polling mode, the a interrupt service routine is not required. If the application intends to operate in interrupt mode, a USB Interrupt Handler should be defined as shown here:

```

/* Use this for PIC32MX */
void __ISR ( _USB_1_VECTOR ) _InterruptHandler_USB_stub ( void )
{
    DRV_USB_Tasks_ISR((SYS_MODULE_OBJ)0);
}

/* Use this for PIC32MZ */
void __ISR ( _USB_VECTOR,ipl4 ) _InterruptHandler_USB_stub ( void )
{
    DRV_USB_Tasks_ISR((SYS_MODULE_OBJ)0);
}

```

Step 7:

The application should create a while(1) loop that continuously updates the USB Device Layer State machine and the application state machine. This requires the application state machine to be non-blocking.

```

/* This while(1) loop will continuously update Device Layer State machine
 * and the application state machine */
while(1)
{
    USB_DEVICE_Tasks(deviceLayerObject);
    APP_Tasks();
}

```

Step 8:

If interrupt based operation is needed, the interrupts need to be enabled first. The application should then initialize and open the device layer. When the device layer is opened successfully, a device layer event handler can be registered. The device can then be attached on the bus. Refer to the "Initializing the Library" section in the USB Device Layer documentation for more details on initializing the USB Device Layer

```

/* Initialize the interrupt system */
SYS_INT_Initialize();

/* Initialize the global interrupts */
SYS_INT_Enable();

SYS_INT_VectorPrioritySet(INT_VECTOR_USB, INT_PRIORITY_LEVEL3);
SYS_INT_VectorSubprioritySet(INT_VECTOR_USB, INT_SUBPRIORITY_LEVEL3);

/* Initialize the USB device layer */
deviceLayerObject = USB_DEVICE_Initialize (USB_DEVICE_INDEX_0 ,

```

```

        ( SYS_MODULE_INIT* ) & usbDevInitData);

/* check if the object returned by the device layer is valid */
SYS_ASSERT((SYS_MODULE_OBJ_INVALID != deviceLayerObject), "Invalid USB DEVICE object");

/* Open an instance of the device layer */
appData.deviceHandle = USB_DEVICE_Open( USB_DEVICE_INDEX_0,
                                         DRV_IO_INTENT_READWRITE );

/* Register a callback with device layer to get
 * event notification (for end point 0) */

USB_DEVICE_EventCallBackSet(appData.deviceHandle, APP_USBDeviceEventHandler);

/* Attach the device */

USB_DEVICE_Attach(appData.deviceHandle);

```

5.9.1.7 USB Device Stack Migration Guide

5.9.1.7.1 Introduction

This topic provides information for migrating from USB Device from MLA to MPLAB Harmony.

5.9.1.7.2 Source Files to Include

This topic provides information on the source files to be included when migrating from USB device projects from MLA to MPLAB Harmony.

Description

The following table lists the source files that must be included for MLA based and MPLAB Harmony based USB device projects. In MLA there is no separate controller driver implementation. Both enumeration functionality and controller driver is implemented in `usb_device.c` file. In MPLAB Harmony USB Device Stack, the controller driver is implemented in `drv_usb.c` and `drv_usb_device.c` files and enumeration functionality is implemented in `usb_device.c` file.

MLA	MPLAB Harmony	Description
<code>usb_device.c</code>	<code>usb_device.c</code>	In MLA, this file contains enumeration functionality and controller driver implementations. In MPLAB Harmony, this file implements enumeration functionality only.
<code>usb_function_xxx.c</code> (Where xxx stands for function driver name like hid, msd, etc.)	<code>usb_device_xxx.c</code> (Where xxx stands for function driver name like hid, msd, etc.)	Contains all function driver implementations.
<code>usb_descriptors.c</code>	<code>system_config.c</code>	Contains USB stack configurations
N/A	<code>drv_usb.c</code> and <code>drv_usb_device.c</code>	USB peripheral driver implementation.

5.9.1.7.3 Initializing the USB Device Stack

This topic provides initialization information when migrating a USB device project from MLA to MPLAB Harmony.

Description

In MLA, initializing the USB device stack consists of calling USB functions in the sequence shown in the following flow chart.

`USBDeviceInit()` function will initialize the USB Device stack. `USBDeviceAttach()` function will attach the device to bus. `USBDeviceTasks()` function will run the stack task routine.

In MPLAB Harmony USB Device Stack, initializing the USB device stack consists of calling USB functions in the sequence shown in the following chart.

The `USB_DEVICE_Initialize()` function will initialize the USB device stack. On successful initialization, this function returns a valid system object. `USB_DEVICE_Open()` returns a client handle to the application. The application must use this client handle for any further communication with the USB device stack. `USB_DEVICE_Attach()` function attaches the device to USB bus. `USB_DEVICE_Tasks()` will run the task routine of the stack.

5.9.1.7.4 Configuring the Stack

This topic provides stack configuration information when migrating from a USB device project from MLA to MPLAB Harmony.

Description

To configure the stack in MLA, USB descriptors have to be defined in the `usb_descriptors.c` file. The configuration is done in `usb_config.h`. Whereas in MPLAB Harmony, USB descriptors are defined in `system_config.c`. The MPLAB Harmony USB Device Stack configuration is done in `system_config.h`. Apart from descriptors, user also will have to define a function registration table and a master descriptor table in `system_config.c`. Refer to USB device help file of MPLAB Harmony for more information on the function registration table and the master descriptor table.

5.9.1.7.5 Event Handling

This topic provides event handling information when migrating a USB device project from MLA to MPLAB Harmony.

Description

In MLA, user will have to handle events inside `USER_USB_CALLBACK_EVENT_HANDLER` function. Whereas in case of MPLAB Harmony, user application client will have to register an event handler with the USB device stack using `USB_DEVICE_EventCallBackSet()` function. All USB bus events are then forwarded to this user registered event handler function. In case of multi client environment, it is possible for each client to register its own event handler with the USB stack. This allows each application clients to individually manage the events separately. Following code snippet shows an example of registering the event handler in case of MPAB Harmony stack using `USB_DEVICE_EventCallBackSet()` function. In the following code snippet, `APP_UsbDeviceEventCallBack()` function is the application event handler.

```
/* Initialize the USB device layer */
usbDevObject = USB_DEVICE_Initialize (USB_DEVICE_INDEX_0 ,
                                     { SYS_MODULE_INIT* } & usbDevInitData);

/* open an instance of the device layer */
usbDevHandle = USB_DEVICE_Open( USB_DEVICE_INDEX_0, DRV_IO_INTENT_READWRITE );

/* Register a callback with device layer to get event notification (for and point 0) */
USB_DEVICE_EventCallBackSet(usbDevHandle, &APP_UsbDeviceEventCallBack);

USB_DEVICE_HID_EventHandlerSet(0, APP_usbHID_CallBack, (uintptr_t)NULL );

USB_DEVICE_Attach(usbDevHandle);
```

The following code snippet shows the implementation of `APP_UsbDeviceEventCallBack` function.

```
void APP_UsbDeviceEventCallBack(USB_DEVICE_EVENT event, USB_DEVICE_EVENT_DATA * eventData)
{
    if((event == USB_DEVICE_EVENT_DECONFIGURED) || (event == USB_DEVICE_EVENT_RESET))
    {
        appData.deviceConfigured = false;
    }
    else if(event == USB_DEVICE_EVENT_CONFIGURED)
    {
        // Set the flag indicating device is configured.
        appData.deviceConfigured = true;

        // Save the other details for later use.
        appData.configurationValue = eventData->eventConfigured.configurationValue;
        appData.usbSpeed = eventData->eventConfigured.speed ;
    }
}
```

5.9.1.7.6 Initializing and Communicating with the Endpoint

This topic provides endpoint initialization and communication information when migrating a USB device project from MLA to MPLAB Harmony.

Description

In MLA, user application will have to explicitly initialize the required endpoints and can directly read and write to the endpoints. The following code snippet shows how MLA initializes the endpoints in event handler when the device is configured.

```

*****
BOOL USER_USB_CALLBACK_EVENT_HANDLER(int event, void *pdata, WORD size)
{
    switch(event)
    {
        case EVENT_CONFIGURED:
            //enable the HID endpoint
            USBEnableEndpoint(HID_EP,
                USB_IN_ENABLED|USB_OUT_ENABLED|USB_HANDSHAKE_ENABLED|USB_DISALLOW_SETUP);
            //Prepare the OUT endpoint for the next packet
            USBOutHandle = HIDRxPacket(HID_EP, (BYTE*)&ReceivedDataBuffer, 64);
            break;

        case EVENT_TRANSFER:
            //Add application specific callback task or callback function here if desired.
            break;

        case EVENT_SOF:
            USBCB_SOF_Handler();
            break;

        case EVENT_SUSPEND:
            USBCBSuspend();
    }
}

```

Endpoint configured in MLA

In case of MPLAB Harmony the user application has no direct access to endpoints. USB device layer initializes the endpoint and any communication to endpoint must happen through function driver APIs. The USB device layer initializes the endpoint based on the information provided by the user in the configurations descriptor. The USB device layer does this by parsing the descriptors table at run time. So the user does not have to explicitly enable or disable the endpoint.

5.9.1.7.7 Handling Endpoint 0 (EP0) Packets

This topic provides information for handling Endpoint 0 packets when migrating a USB device project from MLA to MPLAB Harmony.

Description

Standard device requests are handled by device stack in both MLA and MPLAB Harmony. The difference lies in handling class specific requests. In MLA, the class specific requests are forwarded to the application as EP0 events and application forwards them to appropriate function driver. The following code snippet shows how application forwards them to appropriate function driver in the event handler.

```

*****
BOOL USER_USB_CALLBACK_EVENT_HANDLER(int event, void *pdata, WORD size)
{
    switch(event)
    {
        case EVENT_EP0_REQUEST:
            USBCheckHIDRequest();
            break;

        case EVENT_TRANSFER:
            //Add application specific callback task or callback function here if desi
            break;

        case EVENT_CONFIGURED:
            //enable the HID endpoint
            USBEnableEndpoint(HID_EP,
                USB_IN_ENABLED|USB_OUT_ENABLED|USB_HANDSHAKE_ENABLED|USB_DISALLOW_SETUP)
    }
}

```

EP0 request is forwarded to HID

In the case of MPLAB Harmony USB Device Stack, EP0 events are generated from appropriate function driver as meaningful events. For example the HID function driver in MPLAB harmony parses the EP0 packet to generate events like USB_DEVICE_HID_EVENT_GET_IDLE, USB_DEVICE_HID_EVENT_SET_REPORT and USB_DEVICE_HID_EVENT_SET_IDLE etc.

The following code snippet shows how the event handler callback is registered with the HID function driver using `USB_DEVICE_HID_EventHandlerSet()` function.

```
/* Register a callback with device layer to get event notification (for end poi
USB_DEVICE_EventCallbackSet(usbDevHandle, &APP_UsbDeviceEventCallback);

USB_DEVICE_HID_EventHandlerSet(USB_DEVICE_HID_INDEX_0, APP_usbHID_Callback,
                               (uintptr_t)NULL );
```

The following code snippet shows the implementation of the HID event handler function in the application. Note how the HID function driver converts EP0 requests to meaningful format for the application.

```
USB_DEVICE_HID_EVENT_RESPONSE APP_usbHID_Callback ( USB_DEVICE_HID_INDEX iHID,
                                                    USB_DEVICE_HID_EVENT event,
                                                    USB_DEVICE_HID_CONTROL_TRANSFER_HANDLE controlTransferHandle,
                                                    void * eventData,
                                                    uintptr_t userData )
{
    USB_DEVICE_HID_EVENT_DATA_REPORT_SENT * reportSent;
    USB_DEVICE_HID_EVENT_DATA_REPORT_RECEIVED * reportReceived;

    /* Check type of event */
    switch (event)
    {
        case USB_DEVICE_HID_EVENT_SET_IDLE:
            /* For now we just accept this request as is. We acknowledge
             * this request using the USB_DEVICE_HID_ControlStatus()
             * function with a USB_DEVICE_CONTROL_STATUS_OK flag */
            USB_DEVICE_HID_ControlStatus(iHID, controlTransferHandle,
                                         USB_DEVICE_CONTROL_STATUS_OK);
            break;

        case USB_DEVICE_HID_EVENT_REPORT_SENT:
            /* The eventData parameter will be USB_DEVICE_HID_EVENT_REPORT_SENT
             * pointer type containing details about the report that was
             * sent. */
            reportSent = (USB_DEVICE_HID_EVENT_DATA_REPORT_SENT *) eventData;
            if(reportSent->transferHandle == appData.txTransferHandle )
            {
                // Transfer progressed.
```

5.9.2 USB Audio Device Library

5.9.2.1 Introduction

Introduces the MPLAB Harmony USB Device Audio Library.

Description

This library provides a high-level abstraction of the Universal Serial Bus (USB) Audio Device Class function driver that is part of the MPLAB Harmony USB stack with a convenient C language interface. This library supports revision 1.0 of the USB Audio specification release by the USB Implementers forum.

The Audio Device Class Definition applies to all devices or functions embedded in composite devices that are used to manipulate audio, voice, and sound-related functionality. This includes both audio data (analog and digital) and the functionality that is used to directly control the audio environment, such as Volume and Tone Control. Audio device can also MIDI Data stream through USB.

USB Audio is used with many applications related to voice telephony, audio playback, and recording eg:- Speaker, Microphone,

Mixer etc.

The MPLAB Harmony USB Device Audio library offers services to the application to interact and respond to the host requests. The MPLAB Harmony USB Device Audio library is also referred to as Audio function driver in this document.

5.9.2.2 Release Notes

MPLAB Harmony Version: v0.70b **USB Audio Device Library Version :** 0.01 Alpha **Release Date:** 18Nov2013

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

New This Release:

Nothing to report in this release.

Known Issues:

Nothing to report in this release.

5.9.2.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.9.2.4 Library Architecture

Provides an Architectural Overview of the Audio Function Driver.

Description

The USB Audio function driver offers various services to a USB Audio device to communicate with the host by abstracting USB specification details. It must be used along with the USB Device layer and USB controller to communicate with the USB host. Figure 1 shows a block diagram representation of the MPLAB Harmony USB Architecture and where the USB Audio Function Driver is placed.

Figure 1: USB Device Audio Function Driver

The USB controller driver takes the responsibility of managing the USB peripheral on the device. The USB device layer handles the device enumeration etc. The Audio function driver receives The USB Device layer forwards all Audio specific control transfers to the Audio Function Driver. The Audio Function Driver interprets the control transfers and requests application's intervention through event handlers and well defined set of API. The application must respond to the Audio events either in or out of the event handler. The application must interact directly with the Audio Function Driver to [send](#)/receive data and Audio Control data.

5.9.2.5 Using the Library

5.9.2.5.1 Files to Include

Describes which files to include in project while using the Audio Function Driver.

Description

Table 2 shows the files that must be included in the project in order to use the Audio Function Driver. These files are located in the framework folder of the MPLAB Harmony installation. It is assumed that the Device Layer files (and the files needed by the Device Layer) are already included in the project.

Filename	Description
\framework\usb\src\dynamic\usb_device_audio.c	This file contains all of functions, macros, definitions, variables, datatypes, etc. that are required for usage with the USB device Audio function driver.
\framework\usb\usb_device_audio.h	Must be included in every source file that needs to invoke Audio function driver API.
system_config.h	User created file which contains the Audio function driver configuration.

Table 2: Files to be included in USB Audio Device Project.

5.9.2.5.2 Initializing the Library

Describes how Audio function driver is initialized.

Description

The Audio function driver instance for a USB device configuration is initialized by the Device Layer when the configuration is set by the host. This process does not require application intervention. Each instance of the Audio function driver should be registered with the Device layer through the Device Layer Function Driver Registration Table. The Audio function driver does not require a initialization data structure. The funcDriverInit member of the function driver registration table entry for the Audio function driver instance should be set to NULL. The audioFuncDriver object is a global object provided by the Audio function driver and points to the Audio function driver - Device Layer interface functions which are required by the Device Layer. The code snippet below shows an example of how multiple instances of Audio Function driver can registered with the Device Layer.

```
/* This code snippet shows an example of how an Audio function
 * driver instances can be registered with the Device Layer
 * via the Device Layer Function Driver Registration Table.
 * In this case Device Configuration 1 consists of one Audio
 * function driver instance. */

const USB_DEVICE_FUNC_REGISTRATION_TABLE funcRegistrationTable[1] =
{
    {
        .speed = USB_SPEED_FULL|USB_SPEED_HIGH,    // Supported speed
        .configurationValue = 1,                   // To be initialized for Configuration 1
        .interfaceNumber = 0,                       // Starting interface number.
        .numberOfInterfaces = 2,                    // Number of interfaces in this instance
        .funcDriverIndex = 0,                       // Function Driver instance index is 0
        .funcDriverInit = NULL,                     // Function Driver does not need
        initialization data structure
        .driver = &audioFuncDriver                  // Pointer to Function Driver - Device
        Layer interface functions
    },
};
```

The sequence for initializing the USB Audio Function driver is depicted in the Figure 2.

Figure 2. USB Audio function driver Initialization

1. Call set of APIs to initialize USB Device Layer. Refer USB Device Layer documentation for details about these APIs.
2. The Device Layer provides a callback to the application for any USB Device events like attached, powered, configured etc. The application should receive a callback with an event `USB_DEVICE_EVENT_CONFIGURED` to proceed.
3. Once the Device Layer is configured the application needs to register callback functions with USB Audio function driver to receive Audio Control transfers and also other audio function driver events. Now the application can use audio function driver APIs to communicate with USB Host.

5.9.2.5.3 Event Handling

Describes Audio function driver event handler registration and event handling.

Description

Registering Audio Function Driver callback functions:

While creating USB Audio Device based application, an event handler must be registered with the Device Layer (the Device Layer Event Handler) and every Audio function driver instance (Audio Function Driver Event Handler). The application needs to register two callback functions with Audio function driver

1. For receiving Audio Control Requests from Host like Volume Control, Mute Control etc.
2. For handling other events from Audio function driver. eg:- Data Write Complete or Data Read Complete

The callback functions should be registered before the USB device layer acknowledges the SET CONFIGURATION request from the USB Host. In order to ensure this, the callback functions should be set in the `USB_DEVICE_EVENT_CONFIGURED` event that is generated by the device layer. The code example below shows an example of how this can be done.

```
/* This a sample Application Device Layer Event Handler
 * Note how the Audio Function Driver callback functions
 * APP_AudioEntitySettingsCallback() and APP_AudioEventCallback()
 * are registered in the USB_DEVICE_EVENT_CONFIGURED event. */
```

```
void APP_USBDeviceEventCallback ( USB_DEVICE_EVENT event,
                                USB_DEVICE_EVENT_DATA * eventData )
```

```

{
    switch ( event )
    {
        case USB_DEVICE_EVENT_RESET:
        case USB_DEVICE_EVENT_DECONFIGURED:

            // USB device is reset or device is deconfigured.
            // This means that USB device layer is about to deinitalize
            // all function drivers.

            break;

        case USB_DEVICE_EVENT_CONFIGURED:

            /* check the configuration */
            if ( eventData->eventConfigured.configurationValue == 1)
            {

                /* Register the callback function for handling Audio Control requests.*/
                USB_DEVICE_AUDIO_RegisterCallbacks (USB_DEVICE_CDC_INDEX_0 ,
                                                    APP_AudioEntitySettingsCallback ,
                                                    USB_DEVICE_AUDIO_CALLBACK_ENTITY_SETTINGS );

                /* Register the callback function for handling Audio function driver Events*/
                USB_DEVICE_AUDIO_RegisterCallbacks (USB_DEVICE_CDC_INDEX_0 ,
                                                    APP_AudioEventCallback ,
                                                    USB_DEVICE_AUDIO_CALLBACK_EVENTS );

                /* mark that set configuration is complete */
                appData.isConfigured = true;

            }
            break;

        case USB_DEVICE_EVENT_SUSPENDED:

            break;

        case USB_DEVICE_EVENT_RESUMED:
        case USB_DEVICE_EVENT_ATTACHED:
        case USB_DEVICE_EVENT_DETACHED:
        case USB_DEVICE_EVENT_ERROR:
        default:
            break;
    }
}

```

Handling Audio Control Requests:

The audio function driver notifies the application by calling the provided callback function, whenever an Audio Control request is received from USB Host. Below example shows how to handle Audio Control request.

// This code example shows handling Audio Control requests. The below handles a Mute request (both SET GET) received from USB Host.

```

//The below are ID of each terminal/Unit in the USB audio function.
//Device makes these IDs known to Host through USB descriptors
// if that terminal/unit is present in this USB audio device application.
#define APP_ID_INPUT_TERMINAL 0x01
#define APP_ID_OUTPUT_TERMINAL 0x02
#define APP_ID_MIXER_UNIT 0x03
#define APP_ID_SELECTOR_UNIT 0x04
#define APP_ID_FEATURE_UNIT 0x05

```

```

#define APP_ID_PROCESSING_UNIT 0x06
#define APP_ID_EXTENSION_UNIT 0x07

int APP_AudioEntitySettingsCallback
(
    USB_DEVICE_AUDIO_INDEX iAudio ,

```

Handling Audio function driver events :

The audio function driver events are discussed at [USB_DEVICE_AUDIO_EVENT Enumeration](#).

5.9.2.5.4 Transferring Data

Describes how to [send](#)/receive data to/from USB Host using this USB Audio function driver.

Description

The USB Audio function driver offers API to [send](#), receive data.

Receiving Data :

USB_DEVICE_AUDIO_Read Function can be used to schedule a data read from the USB Host. Whenever there is data available from Host, the USB audio function driver calls back USB audio event handler with an event USB_DEVICE_AUDIO_EVENT_READ_COMPLETE. User can take necessary actions once the data is received like playback the audio samples through a CODEC and/or schedule next read request for audio samples.

Sending Data :

USB_DEVICE_AUDIO_Write Function can be used to schedule a data [send](#) to the Host. The data will be [send](#) to Host, whenever it is ready to receive. Once the data [send](#) is complete the audio function driver callback USB audio event handler with an event USB_DEVICE_AUDIO_EVENT_WRITE_COMPLETE. User can take necessary action once the data write is complete like schedule next data write, etc.

5.9.2.6 Configuring the Library

Describes how to configure the Audio Function Driver.

Description

The application designer must specify the following configuration parameters while using the Audio Function Driver. The configuration macros that implement these parameters must be located in the `system_config.h` file in the application project and a compiler include path (to point to the folder that contains this file) should be specified.

Configuration Macro Name	Description	Comments
USB_DEVICE_AUDIO_INSTANCES_NUMBER	Number of Audio Function Driver Instances in the application	This macro defines the number of instances of the Audio Function Driver. For example, if the application needs to implement two instances of the Audio Function Driver on one USB Device, the macro should <code>USB_DEVICE_AUDIO_INSTANCES_NUMBER</code> be set to 2. Note that implementing a USB Device that features multiple Audio interfaces requires appropriate USB configuration descriptors.
USB_DEVICE_AUDIO_QUEUE_SIZE	Audio Function Driver Buffer Queue size	This macro defines the Audio function driver internal buffer queue. The choice of this parameter defines the readiness of the function driver to respond successfully to read and write requests. The queue is shared by <code>USB_DEVICE_AUDIO_INSTANCES_NUMBER</code> number of Audio instances. A buffer in the queue is allocated to a read, write or a serial state notification request. In a simple application, that does not require buffer queuing and serial state notification, the <code>USB_DEVICE_AUDIO_QUEUE_SIZE</code> macro can be set to 2. In a case where higher throughput is required, this parameter should be set to a higher value. Note that increasing the queue size requires more RAM.

5.9.2.7 Library Interface

Data Types and Constants

	Name	Description
	<code>USB_DEVICE_AUDIO_EVENT_RESPONSE_NONE</code>	USB Device Audio Function Driver Event Handler Response Type None.
	<code>USB_DEVICE_AUDIO_TRANSFER_HANDLE_INVALID</code>	USB Device Audio Function Driver Invalid Transfer Handle Definition.
	<code>USB_DEVICE_AUDIO_CONTROL_TRANSFER_HANDLE</code>	USB Device Audio Function Driver Control Transfer Handle
	<code>USB_DEVICE_AUDIO_EP_INSTANCE</code>	This is type <code>USB_DEVICE_AUDIO_EP_INSTANCE</code> .
	<code>USB_DEVICE_AUDIO_EVENT</code>	USB Device Audio Function Driver Control Transfer Status

	USB_DEVICE_AUDIO_EVENT_DATA_READ_COMPLETE	USB Device Audio Function Driver Read and Write Complete Event Data.
	USB_DEVICE_AUDIO_EVENT_DATA_WRITE_COMPLETE	USB Device Audio Function Driver Read and Write Complete Event Data.
	USB_DEVICE_AUDIO_EVENT_HANDLER	USB Device Audio Event Handler Function Pointer Type.
	USB_DEVICE_AUDIO_EVENT_RESPONSE	USB Device Audio Function Driver Event Callback Response Type
	USB_DEVICE_AUDIO_INDEX	USB Device Audio Function Driver Index
	USB_DEVICE_AUDIO_INSTANCE	This is type USB_DEVICE_AUDIO_INSTANCE .
	USB_DEVICE_AUDIO_INSTANCE_STATE	This is type USB_DEVICE_AUDIO_INSTANCE_STATE .
	USB_DEVICE_AUDIO_INTERFACE_COLLECTION	This is type USB_DEVICE_AUDIO_INTERFACE_COLLECTION .
	USB_DEVICE_AUDIO_INTERFACE_INFO	This is type USB_DEVICE_AUDIO_INTERFACE_INFO .
	USB_DEVICE_AUDIO_INTERFACE_TYPE	This is type USB_DEVICE_AUDIO_INTERFACE_TYPE .
	USB_DEVICE_AUDIO_IRP_OBJECT	USB Device Audio Function Driver IRP object.
	USB_DEVICE_AUDIO_RESULT	USB Device Audio Function Driver USB Device Audio Result enumeration.
	USB_DEVICE_AUDIO_STREAMING_INTERFACE	This is type USB_DEVICE_AUDIO_STREAMING_INTERFACE .
	USB_DEVICE_AUDIO_STREAMING_INTERFACE_ALTERNATE_SETTING	This is type USB_DEVICE_AUDIO_STREAMING_INTERFACE_ALTERNATE_SETTING .
	USB_DEVICE_AUDIO_TRANSFER_HANDLE	USB Device Audio Function Driver Transfer Handle Definition.

Functions

	Name	Description
	USB_DEVICE_AUDIO_ControlReceive	This function allows the application to respond to the Audio function driver specific control transfer requests. It allows the application to receive data from the host in the data stage of the control transfer.
	USB_DEVICE_AUDIO_ControlSend	This function allows the application to respond to the Audio function driver specific control transfer requests. It allows the application to send data to the host in the data stage of the control transfer.
	USB_DEVICE_AUDIO_ControlStatus	This function allows the application to complete the status stage of the the Audio Function Driver specific control transfer request.
	USB_DEVICE_AUDIO_EventHandlerSet	This function registers an event handler for the specified Audio function driver instance.

	USB_DEVICE_AUDIO_Read	This function requests a data read from the USB Device Audio Function Driver Layer.
	USB_DEVICE_AUDIO_Write	This function requests a data write to the USB Device Audio Function Driver Layer.

Description

This section describes the Application Programming Interface (API) functions of the USB Device Audio Library

Refer to each section for a detailed description.

5.9.2.7.1 Functions

5.9.2.7.1.1 USB_DEVICE_AUDIO_ControlReceive Function

C

```
USB_DEVICE_AUDIO_RESULT USB_DEVICE_AUDIO_ControlReceive(
    USB_DEVICE_AUDIO_INDEX instanceIndex,
    USB_DEVICE_AUDIO_CONTROL_TRANSFER_HANDLE controlTransferHandle,
    void * data,
    size_t size
);
```

Description

This function allows the application to respond to the Audio function driver specific control transfer requests. It allows the application to receive data from the host in the data stage of the control transfer.

For example, when the Host wants to set current Volume settings to Device, the Host first sends a SETUP packet to the Device indicating that it intends to set Volume. After receiving the SETUP packet the Device should be prepared to receive current Volume from Host. Application should make use of USB_DEVICE_AUDIO_ControlReceive() function to receive data from the Host in such cases. The function can be called in the Audio Function Driver event handler or can be called outside the event handler. Calling this function outside the event handler defers the response to the event. This allows the application to prepare the data buffer out of the event handler context, especially if the data buffer to receive the data is not readily available. Note however, that there are timing considerations when responding to the control transfer. Exceeding the response time will cause the host to cancel the control transfer and may cause USB host to reject the device. The application must use the control transfer handle that was generated along with the event as the controlTransferHandle.

Preconditions

This function should only be called in response to a Audio function driver event that requires a control transfer response.

Parameters

Parameters	Description
instance	USB Device Audio Function Driver instance.
controlTransferHandle	Control Transfer handle for the control transfer.
data	Data buffer to receive the data stage of the control transfer.
size	size (in bytes) of the data to sent.

Returns

USB_DEVICE_AUDIO_RESULT_ERROR_CONTROL_TRANSFER_FAILED - The request was not successful because the USB host cancelled the control transfer.

USB_DEVICE_AUDIO_RESULT_OK - The request was successful.

Example

```

// -----
// In this example, the application receives current Mute info
// with in the event handler. The application uses the
// USB_DEVICE_AUDIO_ControlReceive() function to do this.
// -----
uint8_t DACMute = 1; // Holds the status of Mute Control
USB_DEVICE_AUDIO_EVENT_RESPONSE USBDeviceAudioEventHandler
(
    USB_DEVICE_AUDIO_INDEX instanceIndex,
    USB_DEVICE_AUDIO_EVENT event,
    USB_DEVICE_AUDIO_CONTROL_TRANSFER_HANDLE controlTransferHandle,
    USB_DEVICE_AUDIO_EVENT_DATA * pData,
    uintptr_t userData
)
{
    switch(event)
    {
        case USB_DEVICE_AUDIO_EVENT_ENTITY_SETTINGS_RECEIVED:
            //In this example we have received a Set Mute request from the Host.

            // Typcast the recived data into interface request.
            controlRequest = (USB_AUDIO_CONTROL_INTERFACE_REQUEST*) pData;

            //check entity ID (Note: Entity IDs are specified in the USB device descriptor.
            switch(controlRequest->entityID)
            {
                case APP_ID_FEATURE_UNIT :
                    featureRequest = (USB_AUDIO_FEATURE_CONTROL_REQUEST*)pData;
                    switch(featureRequest->controlSelector)
                    {
                        case USB_AUDIO_FCS_MUTE_CONTROL:
                            {
                                if(featureRequest->bRequest == USB_AUDIO_CSRC_SET_CUR)
                                {
                                    //A control write transfer recived from Host. Now recieve data
                                    USB_DEVICE_AUDIO_ControlReceive(iAudio, controlHandle,(uint8_t *)
from Host.
                                    &DACMute, 1 );
                                }
                                break;
                            }
                        break;
                    }
                break;
            }
            break;

        case USB_DEVICE_AUDIO_EVENT_CONTROL_TRANSFER_RECEIVED:
            USB_DEVICE_ControlStatus(appData.usbDevHandle,controlTransferHandle,
            USB_DEVICE_CONTROL_STATUS_OK );
            if (appData.currentInterfaceAlternateSetting == 1)
                AK4953ADACMute(pCodecHandle, DACMute);
            break;
    }
    Remarks:    None.
}

```

5.9.2.7.1.2 USB_DEVICE_AUDIO_ControlSend Function**C**

```

USB_DEVICE_AUDIO_RESULT USB_DEVICE_AUDIO_ControlSend(
    USB_DEVICE_AUDIO_INDEX instanceIndex,
    USB_DEVICE_AUDIO_CONTROL_TRANSFER_HANDLE controlTransferHandle,
    void * data,
    size_t size
);

```

Description

This function allows the application to respond to the Audio function driver specific control transfer requests. It allows the application to **send** data to the host in the data stage of the control transfer. For example, if the Host requests current Volume settings to Device, then the Device needs to **send** a control transfer data to the Host. The function can be called in the Audio Function Driver event handler or can be called outside the event handler. Calling this function outside the event handler defers the response to the event. This allows the application to prepare the response data out of the event handler context, especially if the data is not readily available. Note however, that there are timing considerations when responding to the control transfer. Exceeding the response time will cause the host to cancel the control transfer and may cause USB host to reject the device. The application must use the control transfer handle that was generated along with the event as the controlTransferHandle.

Preconditions

This function should only be called in response to a Audio function driver event that requires a control transfer response.

Parameters

Parameters	Description
instance	USB Device Audio Function Driver instance.
controlTransferHandle	Control Transfer handle for the control transfer.
data	Data that represents the data stage of the control transfer.
size	size (in bytes) of the data to sent.

Returns

USB_DEVICE_AUDIO_RESULT_ERROR_CONTROL_TRANSFER_FAILED - The request was not successful because the USB host cancelled the control transfer.

USB_DEVICE_AUDIO_RESULT_OK - The request was successful.

Example

```
// -----
// In this example, the application responds to an Audio Control request
// with in the event handler. The application uses the
// USB_DEVICE_AUDIO_ControlSend() function to do this.
// -----
uint8_t DACMute = 1; // Holds the status of Mute Control
USB_DEVICE_AUDIO_EVENT_RESPONSE USBDeviceAudioEventHandler
(
    USB_DEVICE_AUDIO_INDEX instanceIndex,
    USB_DEVICE_AUDIO_EVENT event,
    USB_DEVICE_AUDIO_CONTROL_TRANSFER_HANDLE controlTransferHandle,
    USB_DEVICE_AUDIO_EVENT_DATA * pData,
    uintptr_t userData
)
{
    switch(event)
    {
        case USB_DEVICE_AUDIO_EVENT_ENTITY_SETTINGS_RECEIVED:
            //In this example we have received a Get Mute request from the Host.

            // Typcast the recived data into interface request.
            controlRequest = (USB_AUDIO_CONTROL_INTERFACE_REQUEST*) pData;

            //check entity ID (Note: Entity IDs are specified in the USB device descriptor.
            switch(controlRequest->entityID)
            {
                case APP_ID_FEATURE_UNIT :
                    featureRequest = (USB_AUDIO_FEATURE_CONTROL_REQUEST*)pData;
                    switch(featureRequest->controlSelector)
                    {
                        case USB_AUDIO_FCS_MUTE_CONTROL:
```

```

        {
            if(featureRequest->bRequest == USB_AUDIO_CSRC_GET_CUR)
            {
                // In this case, the application should send the current mute
                // status to the host. The application must send the
                // USB_DEVICE_AUDIO_ControlSend() function to send the data.
                USB_DEVICE_AUDIO_ControlSend(iAudio, controlHandle, (uint8_t
*)&DACMute, 1 );
            }
        }
        break;
    }
    break;
}
break;
}
Remarks:    None.

```

5.9.2.7.1.3 USB_DEVICE_AUDIO_ControlStatus Function

C

```

USB_DEVICE_AUDIO_RESULT USB_DEVICE_AUDIO_ControlStatus(
    USB_DEVICE_AUDIO_INDEX instanceIndex,
    USB_DEVICE_AUDIO_CONTROL_TRANSFER_HANDLE controlTransferHandle,
    USB_DEVICE_AUDIO_CONTROL_STATUS status
);

```

Description

This function allows the application to complete the status stage of the the Audio Function Driver specific control transfer request. The application can either **accept** the data stage or stall it. Calling this function with status set to USB_DEVICE_AUDIO_CONTROL_STATUS_OK will acknowledge the status stage of the control transfer. The control transfer can be stalled by setting the status parameter to USB_DEVICE_AUDIO_CONTROL_STATUS_STALL. The function can be called in the Audio Function Driver event handler or can be called outside the event handler. Calling this function outside the event handler defers the response to the event. This allows the application to analyze the event response outside the event handler. Note however, that there are timing considerations when responding to the control transfer. Exceeding the response time will cause the host to cancel the control transfer and may cause USB host to reject the device. The application must use the control transfer handle that was generated along with the event as the controlTransferHandle. The application must be aware of events and associated control transfers that do or do not require data stages. Incorrect usage of the USB_DEVICE_AUDIO_ControlStatus() function could cause the device function to be non-compliant.

Preconditions

This function should only be called in response to a Audio function driver event that requires a control transfer response.

Parameters

Parameters	Description
instance	USB Device Audio Function Driver instance.
controlTransferHandle	Control Transfer handle for the control transfer.
status	Set to USB_DEVICE_AUDIO_CONTROL_STATUS_OK to acknowledge the control transfer. Set to USB_DEVICE_AUDIO_CONTROL_STATUS_STALL to stall the transfer.

Returns

USB_DEVICE_AUDIO_RESULT_ERROR_CONTROL_TRANSFER_FAILED - The request was not successful because the USB host cancelled the control transfer.

USB_DEVICE_AUDIO_RESULT_OK - The request was successful.

Example

Remarks: None.

5.9.2.7.1.4 USB_DEVICE_AUDIO_EventHandlerSet Function**C**

```
USB_DEVICE_AUDIO_RESULT USB_DEVICE_AUDIO_EventHandlerSet(
    USB_DEVICE_AUDIO_INDEX iAudio,
    USB_DEVICE_AUDIO_EVENT_HANDLER eventHandler,
    uintptr_t context
);
```

Description

This function registers a event handler for the specified Audio function driver instance. This function should be called by the client when it receives a SET CONFIGURATION event from the device layer. A event handler must be registered for function driver to respond to function driver specific commands. If the event handler is not registered, the device layer will stall function driver specific commands and the USB device may not function.

Preconditions

This function should be called when the function driver has been initialized as a result of a set configuration.

Parameters

Parameters	Description
instance	Instance of the Audio Function Driver.
eventHandler	A pointer to event handler function.
context	Application specific context that is returned in the event handler.

Returns

USB_DEVICE_AUDIO_RESULT_OK - The operation was successful
 USB_DEVICE_AUDIO_RESULT_ERROR_INSTANCE_INVALID - The specified instance does not exist.
 USB_DEVICE_AUDIO_RESULT_ERROR_INVALID_HANDLER - The eventHandler parameter is NULL

Remarks

None.

Example

```
// This code snippet shows an example registering an event handler. Here
// the application specifies the context parameter as a pointer to an
// application object (appObject) that should be associated with this
// instance of the Audio function driver.
```

```
USB_DEVICE_AUDIO_RESULT result;

USB_DEVICE_AUDIO_EVENT_RESPONSE APP_USBDeviceAUDIOEventHandler
(
    USB_DEVICE_AUDIO_INDEX instanceIndex ,
    USB_DEVICE_AUDIO_EVENT event ,
    USB_DEVICE_AUDIO_CONTROL_TRANSFER_HANDLE controlTransferHandle
    void* pData, uintptr_t context
)
{
    // Event Handling comes here

    switch(event)
    {
        ...
    }
}
```

```

    return(USB_DEVICE_AUDIO_EVENT_RESPONSE_NONE);

}

result = USB_DEVICE_AUDIO_EventHandlerSet ( 0 ,&APP_EventHandler, (uintptr_t) &appObject);
if(USB_DEVICE_AUDIO_RESULT_OK != result)
{
    SYS_ASSERT ( false , "invalid event handler function" );
}

```

5.9.2.7.1.5 USB_DEVICE_AUDIO_Read Function

C

```

USB_DEVICE_AUDIO_RESULT USB_DEVICE_AUDIO_Read(
    USB_DEVICE_AUDIO_INDEX iAudio,
    USB_DEVICE_AUDIO_TRANSFER_HANDLE* transferHandle,
    uint8_t interfaceNum,
    void * data,
    size_t size
);

```

Description

This function requests a data read from the USB Device Audio Function Driver Layer. The function places a requests with driver, the request will get serviced as data is made available by the USB Host. A handle to the request is returned in the transferHandle parameter. The termination of the request is indicated by the USB_DEVICE_AUDIO_EVENT_READ_COMPLETE event. The amount of data read and the transfer handle associated with the request is returned along with the event. The transfer handle expires when event handler for the USB_DEVICE_AUDIO_EVENT_READ_COMPLETE exits. If the read request could not be accepted, the function returns an error code and transferHandle will contain the value [USB_DEVICE_AUDIO_TRANSFER_HANDLE_INVALID](#).

Preconditions

The function driver should have been configured.

Parameters

Parameters	Description
instance	USB Device Audio Function Driver instance.
transferHandle	Pointer to a USB_DEVICE_AUDIO_TRANSFER_HANDLE type of variable. This variable will contain the transfer handle in case the read request was successful.
interfaceNum	The USB Audio streaming interface number on which read request is to be placed.
data	pointer to the data buffer where read data will be stored.
size	Size of the data buffer. Refer to the description section for more details on how the size affects the transfer.

Returns

USB_DEVICE_AUDIO_RESULT_OK - The read request was successful. transferHandle contains a valid transfer handle.

USB_DEVICE_AUDIO_RESULT_ERROR_TRANSFER_QUEUE_FULL - internal request queue is full. The write request could not be added.

USB_DEVICE_AUDIO_RESULT_ERROR_TRANSFER_SIZE_INVALID - The specified transfer size was not a multiple of endpoint size or is 0.

USB_DEVICE_AUDIO_RESULT_ERROR_INSTANCE_NOT_CONFIGURED - The specified instance is not configured yet.

USB_DEVICE_AUDIO_RESULT_ERROR_INSTANCE_INVALID - The specified instance was not provisioned in the application

and is invalid.

Remarks

None

Example

```
// Shows an example of how to read. This assumes that
// driver was opened successfully.
USB_DEVICE_AUDIO_INDEX iAudio;
USB_DEVICE_AUDIO_TRANSFER_HANDLE transferHandle;
uint8_t interfaceNumber;
uint8_t rxBuffer[192];
USB_DEVICE_AUDIO_RESULT readRequestResult;
iAudio = 0; //specify the Audio Function driver instance number.
interfaceNumber = 1; //Specify the Audio Streaming interface number.
readRequestResult = USB_DEVICE_AUDIO_Read
(
    iAudio,
    &transferHandle,
    interfaceNumber,
    &rxBuffer,
    192
);

if(USB_DEVICE_AUDIO_RESULT_OK != readRequestResult)
{
    //Do Error handling here
}

// The completion of the read request will be indicated by the
// USB_DEVICE_AUDIO_EVENT_READ_COMPLETE event.
```

5.9.2.7.1.6 USB_DEVICE_AUDIO_Write Function

C

```
USB_DEVICE_AUDIO_RESULT USB_DEVICE_AUDIO_Write(
    USB_DEVICE_AUDIO_INDEX iAudio,
    USB_DEVICE_AUDIO_TRANSFER_HANDLE* transferHandle,
    uint8_t interfaceNum,
    void * data,
    size_t size
);
```

Description

This function requests a data write to the USB Device Audio Function Driver Layer. The function places a requests with driver, the request will get serviced as data is requested by the USB Host. A handle to the request is returned in the transferHandle parameter. The termination of the request is indicated by the USB_DEVICE_AUDIO_EVENT_WRITE_COMPLETE event. The amount of data written and the transfer handle associated with the request is returned along with the event in writeCompleteData member of the pData parameter in the event handler.

The transfer handle expires when event handler for the USB_DEVICE_AUDIO_EVENT_WRITE_COMPLETE exits. If the read request could not be accepted, the function returns an error code and transferHandle will contain the value [USB_DEVICE_AUDIO_TRANSFER_HANDLE_INVALID](#).

Preconditions

The function driver should have been configured.

Parameters

Parameters	Description
instance	USB Device Audio Function Driver instance.

transferHandle	Pointer to a USB_DEVICE_AUDIO_TRANSFER_HANDLE type of variable. This variable will contain the transfer handle in case the write request was successful.
interfaceNum	The USB Audio streaming interface number on which the write request is to placed.
data	pointer to the data buffer contains the data to be written.
size	Size of the data buffer. Refer to the description section for more details on how the size affects the transfer.

Returns

USB_DEVICE_AUDIO_RESULT_OK - The read request was successful. transferHandle contains a valid transfer handle.

USB_DEVICE_AUDIO_RESULT_ERROR_TRANSFER_QUEUE_FULL - internal request queue is full. The write request could not be added.

USB_DEVICE_AUDIO_RESULT_ERROR_TRANSFER_SIZE_INVALID - The specified transfer size was not a multiple of endpoint size or is 0.

USB_DEVICE_AUDIO_RESULT_ERROR_INSTANCE_NOT_CONFIGURED - The specified instance is not configured yet.

USB_DEVICE_AUDIO_RESULT_ERROR_INSTANCE_INVALID - The specified instance was not provisioned in the application and is invalid.

Remarks

None

Example

```
// Shows an example of how to write. This assumes that
// driver was opened successfully.
USB_DEVICE_AUDIO_INDEX iAudio;
USB_DEVICE_AUDIO_TRANSFER_HANDLE transferHandle;
uint8_t interfaceNumber;
uint8_t txBuffer[192];
USB_DEVICE_AUDIO_RESULT writeRequestResult;
iAudio = 0; //specify the Audio Function driver instance number.
interfaceNumber = 1; //Specify the Audio Streaming interface number.

writeRequestResult = USB_DEVICE_AUDIO_Write
(
    iAudio,
    &transferHandle,
    interfaceNumber,
    &txBuffer,
    192
);

if(USB_DEVICE_AUDIO_RESULT_OK != writeRequestResult)
{
    //Do Error handling here
}

// The completion of the write request will be indicated by the
// USB_DEVICE_AUDIO_EVENT_Write_COMPLETE event.
```

5.9.2.7.2 Data Types and Constants**5.9.2.7.2.1 USB_DEVICE_AUDIO_EVENT_RESPONSE_NONE Macro**

C

```
#define USB_DEVICE_AUDIO_EVENT_RESPONSE_NONE
```

Description

USB Device Audio Function Driver Event Handler Response None

This is the definition of the Audio Function Driver Event Handler Response Type none.

Remarks

Intentionally defined to be empty.

5.9.2.7.2.2 USB_DEVICE_AUDIO_TRANSFER_HANDLE_INVALID Macro

```
C
#define USB_DEVICE_AUDIO_TRANSFER_HANDLE_INVALID ((USB_DEVICE_AUDIO_TRANSFER_HANDLE)(-1))
```

Description

USB Device Audio Function Driver Invalid Transfer Handle Definition

This definition defines a USB Device Audio Function Driver Invalid Transfer Handle. A Invalid Transfer Handle is returned by the USB_DEVICE_Audio_Write() and USB_DEVICE_Audio_Read() functions when the request was not successful.

Remarks

None.

5.9.2.7.2.3 USB_DEVICE_AUDIO_CONTROL_TRANSFER_HANDLE Type

```
C
typedef USB_DEVICE_CONTROL_TRANSFER_HANDLE USB_DEVICE_AUDIO_CONTROL_TRANSFER_HANDLE;
```

Description

USB Device Audio Function Driver Control Transfer Handle

This is returned by the Audio function driver event handler and should be used by the application while responding to Audio function driver control transfer requests.

Remarks

None.

5.9.2.7.2.4 USB_DEVICE_AUDIO_EP_INSTANCE Structure

```
C
typedef struct {
    uint8_t epAddr;
    uint16_t epMaxPacketSize;
    USB_DEVICE_AUDIO_IRP_OBJECT irpObject[USB_DEVICE_AUDIO_QUEUE_SIZE];
} USB_DEVICE_AUDIO_EP_INSTANCE;
```

Description

This is type USB_DEVICE_AUDIO_EP_INSTANCE.

Members

Members	Description
uint8_t epAddr;	End point address
uint16_t epMaxPacketSize;	End point maximum payload
USB_DEVICE_AUDIO_IRP_OBJECT irpObject[USB_DEVICE_AUDIO_QUEUE_SIZE];	IRP object Q per end point

5.9.2.7.2.5 USB_DEVICE_AUDIO_EVENT Enumeration

C

```
typedef enum {
    USB_DEVICE_AUDIO_EVENT_WRITE_COMPLETE,
    USB_DEVICE_AUDIO_EVENT_READ_COMPLETE,
    USB_DEVICE_AUDIO_EVENT_INTERAFCE_ALTERNATE_SETTING,
    USB_DEVICE_AUDIO_EVENT_CONTROL_TRANSFER_RECEIVED,
    USB_DEVICE_AUDIO_EVENT_CONTROL_TRANSFER_SENT,
    USB_DEVICE_AUDIO_EVENT_ENTITY_SETTINGS_RECEIVED
} USB_DEVICE_AUDIO_EVENT;
```

Description

USB Device Audio Function Driver Control Transfer Status

This flag is used along with the [USB_DEVICE_AUDIO_ControlStatus\(\)](#) function to indicate success or failure of an Audio class specific control transfer request.

Members

Members	Description
USB_DEVICE_AUDIO_EVENT_WRITE_COMPLETE	This event occurs when a write operation scheduled by calling the USB_DEVICE_AUDIO_Write() function has completed. The pData member in the event handler will point to USB_DEVICE_AUDIO_EVENT_WRITE_COMPLETE_DATA type.
USB_DEVICE_AUDIO_EVENT_READ_COMPLETE	This event occurs when a read operation scheduled by calling the USB_DEVICE_AUDIO_Read() function has completed. The pData member in the event handler will point to USB_DEVICE_AUDIO_EVENT_READ_COMPLETE_DATA type.
USB_DEVICE_AUDIO_EVENT_INTERAFCE_ALTERNATE_SETTING	USB spec allows Devices to have multiple alternate settings for the same interface. This event occurs when Host trying set an alternate setting for an interface present in this audio function. The callback function USB_DEVICE_AUDIO_EVENT_CALLBACK also sends Interface Number and Alternate setting number when this event occurs. An application need to take necessary action based on the interface alternate setting.
USB_DEVICE_AUDIO_EVENT_CONTROL_TRANSFER_RECEIVED	This event occurs when the data stage of a control write transfer has completed. This would occur after the application would respond with a USB_DEVICE_ControlReceive() function to a control write request from Host. This event notifies the application that the data is recived from Host and is available at the location passed by the USB_DEVICE_ControlReceive() function. The application should respond to Host with Zero Length Packet by calling USB_DEVICE_ControlStatus() function.

USB_DEVICE_AUDIO_EVENT_CONTROL_TRANSFER_SENT	This event occurs when the data stage of a control read transfer has completed. This event would occur after the application uses the USB_DEVICE_ControlSend() function to respond to an entity request recived from Host.

Remarks

None.

5.9.2.7.2.6 USB_DEVICE_AUDIO_EVENT_DATA_READ_COMPLETE Structure

C

```
typedef struct {
    USB_DEVICE_AUDIO_TRANSFER_HANDLE handle;
    uint16_t length;
} USB_DEVICE_AUDIO_EVENT_DATA_WRITE_COMPLETE, USB_DEVICE_AUDIO_EVENT_DATA_READ_COMPLETE;
```

Description

USB Device Audio Function Driver Read and Write Complete Event Data.

This data type defines the data structure returned by the driver along with USB_DEVICE_AUDIO_EVENT_READ_COMPLETE and USB_DEVICE_AUDIO_EVENT_WRITE_COMPLETE events.

Members

Members	Description

5.9.2.7.2.7 USB_DEVICE_AUDIO_EVENT_DATA_WRITE_COMPLETE Structure

C

```
typedef struct {
    USB_DEVICE_AUDIO_TRANSFER_HANDLE handle;
    uint16_t length;
} USB_DEVICE_AUDIO_EVENT_DATA_WRITE_COMPLETE, USB_DEVICE_AUDIO_EVENT_DATA_READ_COMPLETE;
```

Description

USB Device Audio Function Driver Read and Write Complete Event Data.

This data type defines the data structure returned by the driver along with USB_DEVICE_AUDIO_EVENT_READ_COMPLETE and USB_DEVICE_AUDIO_EVENT_WRITE_COMPLETE events.

Members

Members	Description

5.9.2.7.2.8 USB_DEVICE_AUDIO_EVENT_HANDLER Type

C

```
typedef USB_DEVICE_AUDIO_EVENT_RESPONSE (*
USB_DEVICE_AUDIO_EVENT_HANDLER)(USB_DEVICE_AUDIO_INDEX iAudio , USB_DEVICE_AUDIO_EVENT event ,
USB_DEVICE_AUDIO_CONTROL_TRANSFER_HANDLE controlTransferHandle, void * pData, uintptr_t
context);
```

Description

USB Device Audio Event Handler Function Pointer Type.

This data type defines the required function signature USB Device Audio Function Driver event handling callback function. The application must register a pointer to an Audio Function Driver events handling function who's function signature (parameter and return value types) match the types specified by this function pointer in order to receive event call backs from the Audio Function

Driver. The function driver will invoke this function with event relevant parameters. The description of the event handler function parameters is given here.

instanceIndex - Instance index of the Audio Function Driver that generated the event.

event - Type of event generated.

controlTransferHandle - Control Transfer Handle for Audio function driver events that require application response. The application should use this handle when the USB Audio Device Control Transfer functions to respond to the events.

pData - This parameter should be type casted to a event specific pointer type based on the event that has occurred. Refer to the [USB_DEVICE_AUDIO_EVENT](#) enumeration description for more details.

context - Value identifying the context of the application that registered the event handling function.

Remarks

None.

5.9.2.7.2.9 USB_DEVICE_AUDIO_EVENT_RESPONSE Type

C

```
typedef void USB_DEVICE_AUDIO_EVENT_RESPONSE;
```

Description

USB Device Audio Function Driver Event Handler Response Type

This is the return type of the Audio Function Driver event handler.

Remarks

None.

5.9.2.7.2.10 USB_DEVICE_AUDIO_INDEX Type

C

```
typedef uintptr_t USB_DEVICE_AUDIO_INDEX;
```

Description

USB Device Audio Function Driver Index

This uniquely identifies a Audio Function Driver instance.

Remarks

None.

5.9.2.7.2.11 USB_DEVICE_AUDIO_INSTANCE Structure

C

```
typedef struct {
    USB_DEVICE_HANDLE devLayerHandle;
    USB_DEVICE_AUDIO_INDEX audioIndex;
    USB_DEVICE_AUDIO_INTERFACE_COLLECTION infCollection;
    USB_DEVICE_AUDIO_INSTANCE_STATE state;
    USB_DEVICE_AUDIO_EVENT_HANDLER appEventCallback;
    uintptr_t userData;
} USB_DEVICE_AUDIO_INSTANCE;
```

Description

This is type USB_DEVICE_AUDIO_INSTANCE.

Members

Members	Description
USB_DEVICE_HANDLE devLayerHandle;	device layer instance associated with this function driver instance
USB_DEVICE_AUDIO_INDEX audiolIndex;	instance index
USB_DEVICE_AUDIO_INSTANCE_STATE state;	Current state of the function driver instance
USB_DEVICE_AUDIO_EVENT_HANDLER appEventCallBack;	Application callback
uintptr_t userData;	Application user data

5.9.2.7.2.12 USB_DEVICE_AUDIO_INSTANCE_STATE Enumeration**C**

```
typedef enum {
    USB_DEVICE_AUDIO_INSTANCE_NOT_INITIALIZED = 0,
    USB_DEVICE_AUDIO_INSTANCE_INITIALIZED,
    USB_DEVICE_AUDIO_INSTANCE_OPENED,
    USB_DEVICE_AUDIO_INSTANCE_CLOSED
} USB_DEVICE_AUDIO_INSTANCE_STATE;
```

Description

This is type USB_DEVICE_AUDIO_INSTANCE_STATE.

5.9.2.7.2.13 USB_DEVICE_AUDIO_INTERFACE_COLLECTION Structure**C**

```
typedef struct {
    uint8_t bControlInterfaceNum;
    uint8_t numStreamingInf;
    uint16_t bcdADC;
    USB_DEVICE_AUDIO_EP_INSTANCE intEp[1];
    bool isIntEpExists;
    USB_DEVICE_AUDIO_STREAMING_INTERFACE streamInf[USB_DEVICE_AUDIO_MAX_STREAMING_INTERFACES];
} USB_DEVICE_AUDIO_INTERFACE_COLLECTION;
```

Description

This is type USB_DEVICE_AUDIO_INTERFACE_COLLECTION.

Members

Members	Description
uint8_t bControlInterfaceNum;	control interface number
uint8_t numStreamingInf;	number of streaming interfaces
uint16_t bcdADC;	Audio spec in BCD 0x100 or 0x200
USB_DEVICE_AUDIO_EP_INSTANCE intEp[1];	optional interrupt ep info
bool isIntEpExists;	presence or absence of the interrupt EP

5.9.2.7.2.14 USB_DEVICE_AUDIO_INTERFACE_INFO Structure**C**

```
typedef struct {
    uint8_t interfaceNumber;
    uint8_t interfaceAlternateSetting;
} USB_DEVICE_AUDIO_INTERFACE_INFO;
```

Description

This is type USB_DEVICE_AUDIO_INTERFACE_INFO.

5.9.2.7.2.15 USB_DEVICE_AUDIO_INTERFACE_TYPE Enumeration

C

```
typedef enum {
    USB_DEVICE_AUDIO_INTERFACE_STREAM_UNDEFINED = 0,
    USB_DEVICE_AUDIO_INTERFACE_STREAM_AUDIO,
    USB_DEVICE_AUDIO_INTERFACE_STREAM_MIDI,
    USB_DEVICE_AUDIO_INTERFACE_FEEDBACK
} USB_DEVICE_AUDIO_INTERFACE_TYPE;
```

Description

This is type USB_DEVICE_AUDIO_INTERFACE_TYPE.

5.9.2.7.2.16 USB_DEVICE_AUDIO_IRP_OBJECT Structure

C

```
typedef struct {
    USB_DEVICE_IRP irp;
    USB_DEVICE_AUDIO_INDEX iAudio;
} USB_DEVICE_AUDIO_IRP_OBJECT;
```

Description

USB Device Audio Function Driver IRP object.
IRP object used by the Audio to service application requests.

Remarks

None.

5.9.2.7.2.17 USB_DEVICE_AUDIO_RESULT Enumeration

C

```
typedef enum {
    USB_DEVICE_AUDIO_RESULT_OK,
    USB_DEVICE_AUDIO_RESULT_ERROR_TRANSFER_SIZE_INVALID,
    USB_DEVICE_AUDIO_RESULT_ERROR_TRANSFER_QUEUE_FULL,
    USB_DEVICE_AUDIO_RESULT_ERROR_INSTANCE_INVALID,
    USB_DEVICE_AUDIO_RESULT_ERROR_INSTANCE_NOT_CONFIGURED,
    USB_DEVICE_AUDIO_RESULT_ERROR_INVALID_HANDLER,
    USB_DEVICE_AUDIO_RESULT_ERROR_CONTROL_TRANSFER_FAILED,
    USB_DEVICE_AUDIO_RESULT_ERROR_INVALID_INTERFACE_ID,
    USB_DEVICE_AUDIO_RESULT_ERROR_INVALID_BUFFER
} USB_DEVICE_AUDIO_RESULT;
```

Description

USB Device Audio Function Driver USB Device Audio Result enumeration.
This enumeration lists the possible USB Device Audio Function Driver operation results. These values are returned by the [USB_DEVICE_AUDIO_Write\(\)](#) and [USB_DEVICE_AUDIO_Read\(\)](#) functions.

Members

Members	Description
USB_DEVICE_AUDIO_RESULT_OK	The operation was successful

USB_DEVICE_AUDIO_RESULT_ERROR_TRANSFER_SIZE_INVALID	The transfer size is invalid. Refer to the description of the read or write function for more details
USB_DEVICE_AUDIO_RESULT_ERROR_TRANSFER_QUEUE_FULL	The transfer queue is full and no new transfers can be scheduled
USB_DEVICE_AUDIO_RESULT_ERROR_INSTANCE_INVALID	The specified instance is not provisioned in the system
USB_DEVICE_AUDIO_RESULT_ERROR_INSTANCE_NOT_CONFIGURED	The specified instance is not configured yet
USB_DEVICE_AUDIO_RESULT_ERROR_INVALID_HANDLER	The event handler provided is NULL
USB_DEVICE_AUDIO_RESULT_ERROR_CONTROL_TRANSFER_FAILED	The control transfer was aborted
USB_DEVICE_AUDIO_RESULT_ERROR_INVALID_INTERFACE_ID	Interface number passed to the read or write function is invalid.

Remarks

None.

5.9.2.7.2.18 USB_DEVICE_AUDIO_STREAMING_INTERFACE Structure

C

```
typedef struct {
    uint8_t interfaceNum;
    USB_DEVICE_AUDIO_INTERFACE_TYPE infType;
    uint8_t activeSetting;
    USB_DEVICE_AUDIO_STREAMING_INTERFACE_ALTERNATE_SETTING
    alterntSetting[USB_DEVICE_AUDIO_MAX_ALTERNATE_SETTING];
} USB_DEVICE_AUDIO_STREAMING_INTERFACE;
```

Description

This is type USB_DEVICE_AUDIO_STREAMING_INTERFACE.

Members

Members	Description
uint8_t interfaceNum;	interface number
uint8_t activeSetting;	currently active alternate setting

5.9.2.7.2.19 USB_DEVICE_AUDIO_STREAMING_INTERFACE_ALTERNATE_SETTING Structure

C

```
typedef struct {
    uint8_t numEndPoints;
    USB_DEVICE_AUDIO_EP_INSTANCE isoDataEp;
    USB_DEVICE_AUDIO_EP_INSTANCE isoSyncEp;
} USB_DEVICE_AUDIO_STREAMING_INTERFACE_ALTERNATE_SETTING;
```

Description

This is type USB_DEVICE_AUDIO_STREAMING_INTERFACE_ALTERNATE_SETTING.

Members

Members	Description
uint8_t numEndPoints;	number of end-points in this interface
USB_DEVICE_AUDIO_EP_INSTANCE isoDataEp;	end points associated with this interface

5.9.2.7.2.20 USB_DEVICE_AUDIO_TRANSFER_HANDLE Type

C

```
typedef uintptr_t USB_DEVICE_AUDIO_TRANSFER_HANDLE;
```

Description

USB Device Audio Function Driver Transfer Handle Definition

This definition defines a USB Device Audio Function Driver Transfer Handle. A Transfer Handle is owned by the application but its value is modified by the [USB_DEVICE_AUDIO_Write\(\)](#) and [USB_DEVICE_AUDIO_Read\(\)](#) functions. The transfer handle is valid for the life time of the transfer and expires when the transfer related event had occurred.

Remarks

None.

5.9.2.8 Files

Files

Name	Description
usb_device_audio.h	USB Device AUDIO function Driver Interface

Description

5.9.2.8.1 usb_device_audio.h

USB DEVICE AUDIO Function Driver Interface

This file describes the USB Device AUDIO Function Driver interface.

Enumerations

	Name	Description
	USB_DEVICE_AUDIO_EVENT	USB Device Audio Function Driver Control Transfer Status
	USB_DEVICE_AUDIO_INSTANCE_STATE	This is type USB_DEVICE_AUDIO_INSTANCE_STATE.
	USB_DEVICE_AUDIO_INTERFACE_TYPE	This is type USB_DEVICE_AUDIO_INTERFACE_TYPE.
	USB_DEVICE_AUDIO_RESULT	USB Device Audio Function Driver USB Device Audio Result enumeration.

Functions

	Name	Description
	USB_DEVICE_AUDIO_ControlReceive	This function allows the application to respond to the Audio function driver specific control transfer requests. It allows the application to receive data from the host in the data stage of the control transfer.
	USB_DEVICE_AUDIO_ControlSend	This function allows the application to respond to the Audio function driver specific control transfer requests. It allows the application to send data to the host in the data stage of the control transfer.
	USB_DEVICE_AUDIO_ControlStatus	This function allows the application to complete the status stage of the the Audio Function Driver specific control transfer request.
	USB_DEVICE_AUDIO_EventHandlerSet	This function registers an event handler for the specified Audio function driver instance.

	USB_DEVICE_AUDIO_Read	This function requests a data read from the USB Device Audio Function Driver Layer.
	USB_DEVICE_AUDIO_Write	This function requests a data write to the USB Device Audio Function Driver Layer.

Macros

	Name	Description
	USB_DEVICE_AUDIO_EVENT_RESPONSE_NONE	USB Device Audio Function Driver Event Handler Response Type None.
	USB_DEVICE_AUDIO_TRANSFER_HANDLE_INVALID	USB Device Audio Function Driver Invalid Transfer Handle Definition.

Structures

	Name	Description
	USB_DEVICE_AUDIO_EP_INSTANCE	This is type USB_DEVICE_AUDIO_EP_INSTANCE .
	USB_DEVICE_AUDIO_EVENT_DATA_READ_COMPLETE	USB Device Audio Function Driver Read and Write Complete Event Data.
	USB_DEVICE_AUDIO_EVENT_DATA_WRITE_COMPLETE	USB Device Audio Function Driver Read and Write Complete Event Data.
	USB_DEVICE_AUDIO_INSTANCE	This is type USB_DEVICE_AUDIO_INSTANCE .
	USB_DEVICE_AUDIO_INTERFACE_COLLECTION	This is type USB_DEVICE_AUDIO_INTERFACE_COLLECTION .
	USB_DEVICE_AUDIO_INTERFACE_INFO	This is type USB_DEVICE_AUDIO_INTERFACE_INFO .
	USB_DEVICE_AUDIO_IRP_OBJECT	USB Device Audio Function Driver IRP object.
	USB_DEVICE_AUDIO_STREAMING_INTERFACE	This is type USB_DEVICE_AUDIO_STREAMING_INTERFACE .
	USB_DEVICE_AUDIO_STREAMING_INTERFACE_ALTERNATE_SETTING	This is type USB_DEVICE_AUDIO_STREAMING_INTERFACE_ALTERNATE_SETTING .

Types

	Name	Description
	USB_DEVICE_AUDIO_CONTROL_TRANSFER_HANDLE	USB Device Audio Function Driver Control Transfer Handle
	USB_DEVICE_AUDIO_EVENT_HANDLER	USB Device Audio Event Handler Function Pointer Type.
	USB_DEVICE_AUDIO_EVENT_RESPONSE	USB Device Audio Function Driver Event Callback Response Type
	USB_DEVICE_AUDIO_INDEX	USB Device Audio Function Driver Index
	USB_DEVICE_AUDIO_TRANSFER_HANDLE	USB Device Audio Function Driver Transfer Handle Definition.

5.9.3 USB Device Layer Library

5.9.3.1 Introduction

Introduces the MPLAB Harmony USB Device Layer

Description

The USB device layer library is part of the USB device stack that is available for the Microchip family of microcontrollers. This library has a dependency on the USB device driver to interact with the USB peripheral and therefore cannot operate independently. Within the USB device stack, the USB device layer is basically responsible for enumeration and performing control transfers. The USB device library implementation adheres to *USB Device Framework* of chapter-9 of USB specification 2.0.

In the USB device stack, the device layer features the following:

- Supports both USB Full-Speed and Hi-Speed operation
- Based on a modular and event driven architecture
- Supports the PIC32MX and PIC32MZ families of microcontrollers
- Supports composite USB devices
- Contains function drivers to implement the following type of device classes:
 - CDC-ACM
 - MSD
 - Generic
 - Audio
 - HID
- Supports non-blocking operation and is RTOS friendly
- Designed to integrate readily with other Harmony Middleware
- Supports both interrupt and polling operation

5.9.3.2 Release Notes

MPLAB Harmony Version: v0.70b **USB Device Layer Library Version :** 0.01 Alpha **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

- Limited USB chapter 9 testing performed on HID and MSD function drivers.
- The stack has not been tested for USB Interoperability.
- The USB Device Stack has not been tested with a Real Time Operating System.
- Attach/Detach behavior has been tested in a limited capacity.
- The device stack only supports interrupt mode operation. Polled mode operation will be added in a future release.
- While running the device stack on PIC32MZ microcontroller, the stack requires 3 seconds to initialize. This is due to a hardware issue with PIC32MZ USB module.
- Device stack operation has been tested with Windows XP and Windows 7 OS based PC USB Host.

5.9.3.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.9.3.4 Using the Library

5.9.3.4.1 Abstraction Model

Describes the Abstraction Model of the USB Device Layer.

Description

The block diagram shows USB device layer interaction with USB controller driver, function drivers, user application and the system.

USB Device Layer Software Abstraction Block Diagram

System Interaction

The system is responsible for initializing and de-initializing the device layer. It is also responsible for calling the USB device layer task routine.

Function driver interaction

The USB device layer interacts with a function driver for following reasons.

- Device layer initializes the function driver when device is configured by the host. This can happen when host issues a set configuration request to the device. The device layer initializes only those function drivers that are valid for the selected configuration.
- Device layer de-initializes the function driver when host issues a bus reset or when device is detached from the host or when host unconfigures the device by setting configuration value to 0.
- The function driver task routines are run by the device layer. This means that function driver tasks runs at the same priority as device layer task.
- The device layer forwards class/interface specific setup requests from host to function drivers for processing. The function drivers can use device layer APIs to read data stage from endpoint 0 or write data stage to endpoint 0.

All of the above interactions are initiated by the device layer and hence it is required for a function driver to register a set of standard APIs with the device layer for initializing/de-initializing the function driver, for handling control transfers and for running the task routines. Registering of these callback functions with the device layer is compile time option and is done using function driver registration table. Function driver registration is explained in the subsequent sections of this help file.

User application (client) interaction

User application clients can register a callback function with the device layer to get USB device events. Apart from device events, the clients can interact with USB device layer to know other status like USB speed and remote wakeup status.

5.9.3.4.2 Library Overview

Provides an overview of the USB Device Layer Library

Description

The USB device layer mainly interacts with system, its clients and function drivers as shown in [USB Device Layer Software Abstraction Block Diagram](#). Hence the interfaces provided by the USB device layer can be broadly be classified as shown in the below table. Please refer to section "Library Interface" for more information on APIs, data types and constants.

Library Interface Section	Description
System Interaction Functions	Provides system module interfaces, device initialization, de-initialization, re-initialization and task functions
Client Core Functions	Provides function to register callbacks, mechanism to pass events to clients and functions to know the status.
Driver Interaction Functions	Provides function driver level interfaces for handling event callbacks and performing control transfers

5.9.3.5 How the Library Works

5.9.3.5.1 Files to Include

Describes which files to include in project while using the USB Device Layer

Description

Table 1 shows the files that must be included in the project in order to use the USB Device Layer. These files are located in the framework folder of the MPLAB Harmony installation. It is assumed that the USB Driver files are already included in the project.

Filename	Description
\\framework\\usb\\src\\dynamic\\usb_device.c	Contains the USB Device Layer Implementation.
\\framework\\usb\\ usb_device.h	Must included in every source file that needs to invoke USB Device Layer API.
system_config.h	User created file which contains the USB Device Layer Configuration MACors.

Table 1: Files to be included in USB Device Project

5.9.3.5.2 Initializing the Library

Describes how the USB Device Layer must be initialized

Description

Following are the components that a user must initialize and register with the USB device stack for the proper operation of the stack.

- Descriptors
- Master descriptor table
- Function registration table

The subsequent sections of this help file explains how these components must be initialized using code examples.

The flow chart shows the steps that has to be followed by the system and clients to initialize the USB device layer. The system initializes the USB device layer. After system initializes the device layer, clients can open handle to device layer, setup callback into the device layer and start capturing the events from the device layer.

Flowchart showing the sequence for initializing the USB device layer

The following code example shows the system side initialization sequence.

Example:

```

SYS_MODULE_OBJ usbDeviceObj;
DRV_HANDLE usbDevHandle;

// System module initialization
deviceLayerInit.moduleInit.value = SYS_MODULE_POWER_RUN_FULL;
// Identifies peripheral (PLIB-level) ID
deviceLayerInit.usbID = USB_ID_1;
// Boolean flag: true -> Stop USB module in Idle Mode
deviceLayerInit.stopInIdle = false;
// Boolean flag: true -> Suspend USB in Sleep Mode
deviceLayerInit.suspendInSleep = false;
// Interrupt Source for USB module
deviceLayerInit.interruptSource = INT_SOURCE_USB_1;
// Number of function drivers registered to this instance of the
USB device layer
deviceLayerInit.registeredFuncCount = 1;
// Function driver table registered to this instance of the USB device layer
deviceLayerInit.registeredFunctions = funcRegistrationTable;
// Pointer to USB Descriptor structure
deviceLayerInit.usbMasterDescriptor = &usbMasterDescriptor;
// USB operation speed.
deviceLayerInit.deviceSpeed = USB_SPEED_HIGH;

// USB device initialization
usbDeviceObj = USB_DEVICE_Initialize(USB_DEVICE_INDEX_0, &deviceLayerInit);
  
```

```

if (SYS_MODULE_OBJ_INVALID == usbDriverObj)
{
    // Handle error
}

while(1)
{
    // Call device layer task
    USB_DEVICE_Tasks( usbDeviceObj );
}

```

The following code example shows how a client can open an handle to device layer and use the same.

Example:

```

void clientInitialize( void )
{
    DRV_HANDLE usbDevHandle;

    // Open the device layer.
    usbDevHandle = USB_DEVICE_Open( USB_DEVICE_INDEX_0 );

    if(DRV_HANDLE_INVALID == usbDevHandle)
    {
        // Handle error
    }

    // Register a callback with device layer to get event notification (for end point 0)
    USB_DEVICE_EventCallbackSet(usbDevHandle, usbDeviceEventCallback); // Where
usbDeviceEventCallback is a callback function                                // that must be
provided by the client
}

void usbDeviceEventCallback( USB_DEVICE_EVENTS events, USB_DEVICE_EVENT_DATA * eventData )
{
    // Handle all device layer events here.
    switch( event )
    {
        case USB_DEVICE_EVENT_RESET:
        case USB_DEVICE_EVENT_DECONFIGURED:
            /* Bus reset is detected or device is unconfigured */
            /* TODO: Add user code here. */

            break;

        case USB_DEVICE_EVENT_CONFIGURED:
            if( eventData->eventConfigured.configurationValue == 1 )
            {
                /* The device is in configured state */
                /* TODO: Add user code here. */
            }
            break;

        case USB_DEVICE_EVENT_SUSPENDED:
            /* Device is suspended */
            /* TODO: Add user code here. */

            break;

        case USB_DEVICE_EVENT_RESUMED:
        case USB_DEVICE_EVENT_ATTACHED:
        case USB_DEVICE_EVENT_DETACHED:
        case USB_DEVICE_EVENT_ERROR:
        default:
            break;
    }
}

```

```
    }
}
```

5.9.3.5.2.1 Descriptors

A USB device reports its attributes to host using descriptors that are defined in chapter 9 of USB Specification, Revision 2.0. The user must initialize device descriptor, configurations descriptor, string descriptors and device qualifier descriptor using static tables. If the device supports dual speeds then there can be two sets of these descriptors, one for full speed and another for high speed. These descriptors are then registered to the USB device stack using master descriptor table.

The following code example shows how the descriptors are initialized in `system_config.c` file using static tables. Refer to Master Descriptor Table to know how to register these descriptors into USB device stack.

```
/* Example USB descriptors for a MSD device */

/* Device Descriptor Table */
const USB_DEVICE_DESCRIPTOR deviceDescriptor =
{
    0x12, // Size of this descriptor in bytes
    USB_DESCRIPTOR_DEVICE, // DEVICE descriptor type
    0x0110, // USB Spec Release Number in BCD format
    0x00, // Class Code
    0x00, // Subclass code
    0x00, // Protocol code
    USB_DEVICE_EP0_BUFFER_SIZE, // Max packet size for EP0, see usbcfg.h
    0x04D8, // Vendor ID
    0x0009, // Product ID: mass storage device demo
    0x0001, // Device release number in BCD format
    0x01, // Manufacturer string index
    0x02, // Product string index
    0x03, // Device serial number string index
    0x01 // Number of possible configurations
};

/* Configurations Descriptor Table */
const uint8_t configDescriptor[] =
{
    /* Configuration Descriptor */
    9, // Size of this descriptor in bytes
    USB_DESCRIPTOR_CONFIGURATION, // CONFIGURATION descriptor type
    0x20, 0x00, // Total length of data for this cfg
    1, // Number of interfaces in this cfg
    1, // Index value of this configuration
    0, // Configuration string index
    USB_ATTRIBUTE_DEFAULT | USB_ATTRIBUTE_SELF_POWERED, // Attributes, see usbdefs_std_dsc.h
    50, // Max power consumption (2X mA)

    /* Interface Descriptor */
    9, // Size of this descriptor in bytes
    USB_DESCRIPTOR_INTERFACE, // INTERFACE descriptor type
    0, // Interface Number
    0, // Alternate Setting Number
    2, // Number of endpoints in this intf
    USB_DEVICE_MSD_INTF, // Class code
    USB_DEVICE_MSD_INTF_SUBCLASS, // Subclass code
    USB_DEVICE_MSD_PROTOCOL, // Protocol code
    0, // Interface string index

    /* Endpoint Descriptor */
    7,
    USB_DESCRIPTOR_ENDPOINT,
    0x01 | USB_EP_DIRECTION_IN,
    USB_TRANSFER_TYPE_BULK,
    MSD_IN_EP_SIZE,
}
```

```

    0x00,
    0x00,

    7,
    USB_DESCRIPTOR_ENDPOINT,
    0x01 | USB_EP_DIRECTION_OUT,
    USB_TRANSFER_TYPE_BULK,
    MSD_OUT_EP_SIZE,
    0x00,
    0x00
};

/* String descriptors Table */

/* Language code string descriptor */
const struct
{
    uint8_t bLength;
    uint8_t bDscType;
    uint16_t string[1];
} sd000 =
{
    sizeof(sd000),
    USB_DESCRIPTOR_STRING,
    { 0x0409 }
};

/* Manufacturer string descriptor */
const struct
{
    const uint8_t bLength;
    uint8_t bDscType;
    uint16_t string[25];
} sd001 =
{
    sizeof(sd001),
    USB_DESCRIPTOR_STRING,
    {
        'M', 'i', 'c', 'r', 'o', 'c', 'h', 'i', 'p', ' ',
        'T', 'e', 'c', 'h', 'n', 'o', 'l', 'o', 'g', 'y', ' ', 'I', 'n', 'c', '.'
    }
};

/* Product string descriptor */
const struct
{
    const uint8_t bLength;
    uint8_t bDscType;
    uint16_t string[22];
} sd002 =
{
    sizeof(sd002),
    USB_DESCRIPTOR_STRING,
    {
        'S', 'i', 'm', 'p', 'l', 'e', ' ', 'M', 'S', 'D', ' ',
        'D', 'e', 'v', 'i', 'c', 'e', ' ', 'D', 'e', 'm', 'o'
    }
};

/* Serial number string descriptor. Note: This should be unique for each unit
built on the assembly line. Plugging in two units simultaneously with the
same serial number into a single machine can cause problems. Additionally, not
all hosts support all character values in the serial number string. The MSD
Bulk Only Transport (BOT) specs v1.0 restrict the serial number to consist only
of ASCII characters "0" through "9" and capital letters "A" through "F". */

```

```

const struct
{
    uint8_t bLength;
    uint8_t bDscType;
    uint16_t string[12];
} sd003 =
{
    sizeof(sd003), USB_DESCRIPTOR_STRING,
    {'1','2','3','4','5','6','7','8','9','9','9','9'}
};

```

5.9.3.5.2.2 Master Descriptor Table

Master Descriptor Table is a static table that holds collection of pointers that points to USB descriptors. User will have to initialize the master descriptor table and must register it with the USB device stack. During the device enumeration the stack uses these information from the Master Descriptor Table to respond to the setup requests from the host. Following code example shows how to set up the Master Descriptor Table. The Master Descriptor Table must then be registered with the USB device stack while initializing the USB device layer. Refer to Initializing the Data Structure to know how it can be registered with the USB device stack.

```

/* Array of string descriptors */
/* Refer to Descriptors section to see how the
   string descriptors sd000 to sd003 are defined */

const uint8_t *const USB_SD_Ptr[4]=
{
    (const uint8_t *const)&sd000,
    (const uint8_t *const)&sd001,
    (const uint8_t *const)&sd002,
    (const uint8_t *const)&sd003
};

/* Array of full speed config descriptors */
/* Refer to Descriptors section to see how the
   configurations descriptor configDescriptor[] is defined */

const uint8_t *const fullSpeedConfigDescSet[1] =
{
    (const uint8_t *const)&configDescriptor[0]
};

/* Initialize the master descriptor table */

const USB_MASTER_DESCRIPTOR usbMasterDescriptor =
{
    /* Low/Full speed device descriptor */
    /* Refer to Descriptors section to see how deviceDescriptor
       is initialized */
    (uint8_t *)&deviceDescriptor ,

    /* Total number of low/full speed configurations available */
    sizeof( fullSpeedConfigDescSet )/sizeof( uint8_t* ) ,

    /* Pointer to array of low/full speed configurations descriptors */
    ( USB_DEVICE_CONFIG_DESCS_PTR )&fullSpeedConfigDescSet[0] ,

    /* High speed device descriptor. Not supported in this example
       and is set to NULL.*/
    NULL,

    /* Total number of high speed configurations available.

```

```

    Zero for this example */
0,

/* Pointer to array of high speed configurations descriptors.
   Not supported in this example*/
NULL,

/* Total number of string descriptors available */
sizeof( USB_SD_Ptr )/sizeof( uint8_t* ),

/* Pointer to array of string descriptors */
(USB_DEVICE_STRING_DESCS_PTR)USB_SD_Ptr,

/* Pointer to full speed dev qualifier. Not supported in this
   example */
NULL,

/* Pointer to high speed dev qualifier. Not supported in this
   example*/
NULL,
};

```

5.9.3.5.2.3 Functions Registration Table

This section explains how function drivers can be registered with the USB device layer using Function Registration Table. Function Registration Table is a static table and must be configured at compile time. It contains mapping of function driver instance to USB speed and configuration. This table helps the USB device layer to initialize the appropriate function driver for a configuration value and device speed selected by the host.

Following code example shows how to build a function registration table.

```

/* This is a code example that registers MSD function
   driver to the USB device stack*/

#define MSD_INDEX 0

const USB_DEVICE_FUNC_REGISTRATION_TABLE funcRegistrationTable[1] =
{
    {
        /* Speed: Indicating both full/high speeds here
           will make the device stack to load MSD function driver
           for both the speeds */
        USB_SPEED_FULL | USB_SPEED_HIGH,

        /* Configuration value */
        1,

        /* InterfaceNumber */
        0,

        /* Total number of interfaces in this driver */
        1,

        /* Instance Index of the MSD function driver that will be loaded
           for this configuration value and speed */
        MSD_INDEX,

        /* MSD initialization data structure. See MSD documentation for this structure */
        (void*)&msdInit,

        /* Pointer to the structure that contains collection of MSD driver function pointers.
           The USB device stack calls out these MSD functions appropriately */
        (USB_DEVICE_FUNCTION_DRIVER*) &msdFunctionDriver
    }
}

```

```
};
```

5.9.3.5.2.4 Initializing the Data Structure

This section explains about the USB device initialization data structure. Before initializing this data structure user must keep the descriptors table, master descriptor table and function registration table ready and initialized. This structure maps these static tables to an instance of USB device layer and provides a mechanism to register these static tables with the USB device layer. Pointer to this initialization structure is then passed to USB device layer using [USB_DEVICE_Initialize\(\)](#) function. Following code example shows how to initialize this structure and register the same with the USB device stack.

```
/* USB Device initialization data structure */

const USB_DEVICE_INIT usbDevInitData =
{
    /* System module initialization */
    {SYS_MODULE_POWER_RUN_FULL},

    /* Identifies peripheral (PLIB-level) ID */
    USB_ID_1,

    /* Stop in idle */
    false,

    /* Stop in sleep */
    false,

    /* Interrupt source */
    INT_SOURCE_USB_1,

    /* Number of functions registered to this instance of the
    USB device layer. See Function Registration Table section of this help file.
    We are registering on */
    (sizeof(funcRegistrationTable)/sizeof(USB_DEVICE_FUNC_REGISTRATION_TABLE)),

    /* Function driver table registered to this instance of the USB device layer*/
    (USB_DEVICE_FUNC_REGISTRATION_TABLE*)funcRegistrationTable,

    /* Pointer to Master Descriptor structure.
    See Master Descriptor Table section of this help file. */
    (USB_MASTER_DESCRIPTOR*)&usbMasterDescriptor
};
/* This is an example that shows how the device initialization structure
is registered with USB_DEVICE_Initialize() */

typedef struct
{
    /* device layer object returned by device layer init function */
    SYS_MODULE_OBJ      usbDevObject;

    /* Controller driver object returned by controller driver init function */
    SYS_MODULE_OBJ      usbCDObject;
} APP_DRV_OBJECTS;

typedef struct
{
    /* device layer handle returned by device layer open function */
    DRV_HANDLE          usbDevHandle;
} APP_DATA;

/* Application objects */
APP_DRV_OBJECTS appDrvObject;
```

```

/* Application data */
APP_DATA appData =
{
    /* device layer handle */
    DRV_HANDLE_INVALID
};

void SYS_Initialize ( void )
{
    /* Set up cache and wait states for
    * maximum performance. */
    SYSTEMConfigPerformance(80000000);

    /* Initialize the BSP */
    BSP_Initialize( );

    /* Initialize the USB device layer.
    Note the registration of initialization data structure with the USB
    device layer */
    appDrvObject.usbDevObject = USB_DEVICE_Initialize (USB_DEVICE_INDEX_0 ,
        ( SYS_MODULE_INIT* ) & usbDevInitData);

    /* check if the object returned by the device layer is valid */
    SYS_ASSERT((SYS_MODULE_OBJ_INVALID != appDrvObject.usbDevObject),
        "Invalid USB DEVICE object");

    /* open an instance of the device layer */
    appData.usbDevHandle = USB_DEVICE_Open( USB_DEVICE_INDEX_0, 0 );

    /* Register a callback with device layer to get event notification
    (for end point 0) */
    USB_DEVICE_EventCallBackSet(appData.usbDevHandle,
        APP_UsbDeviceEventCallBack);

    /* Enable USB device layer */
    USB_DEVICE_Attach(appData.usbDevHandle);

    /* Initialize the Application */
    APP_Initialize ( );

    /* Initialize the interrupt system */
    SYS_INT_Initialize();

    /* set priority for USB interrupt source */
    SYS_INT_VectorPrioritySet(INT_VECTOR_USB, INT_PRIORITY_LEVEL3);

    /* set sub-priority for USB interrupt source */
    SYS_INT_VectorSubprioritySet(INT_VECTOR_USB, INT_SUBPRIORITY_LEVEL3);

    /* Initialize the global interrupts */
    SYS_INT_Enable();
}

```

5.9.3.5.3 Device Events

Describes the USB Device Layer Events

Description

The device layer generates following events. The application clients can capture these events by registering a callback function into the device layer using [USB_DEVICE_EventCallBackSet\(\)](#) function.

Events	Description
USB_DEVICE_EVENT_RESET	USB bus reset occurred. This event is an indication to the application client that device layer has de-initialized the function drivers. For application client, this event means that USB device has moved to default state and any further communication with the function drivers must be stopped.
USB_DEVICE_EVENT_SUSPENDED	This event is an indication to the application client that device is suspended and it can put the device to power-down mode if required.
USB_DEVICE_EVENT_RESUMED	Event that indicates that device has resumed from suspended state.
USB_DEVICE_EVENT_ERROR	This event is an indication to the application client that an error occurred on the USB bus.
USB_DEVICE_EVENT_SOF	This event is generated for every new start of frame. Application client can use this SOF event for general time based house keeping activities.
USB_DEVICE_EVENT_DETACHED	This event is an indication to the application client that the device is detached from the host and device layer is about to de-initialize the function drivers. For application client, this event means that it has to stop any further interactions with the function driver.
USB_DEVICE_EVENT_DECONFIGURED	This event is generated when the USB host unconfigures the device by configuring the device to configuration value 0.
USB_DEVICE_EVENT_CONFIGURED	This event is generated when the device is configured by the host. The device layer loads all the function drivers applicable to that configuration and application client can interact with function drivers.
USB_DEVICE_EVENT_ATTACHED	Device is attached to the USB, but is not powered.

The following code example shows how the application clients can register callback function with the to capture these events

Example:

```

void SYS_Initialize( void )
{
    /* Add user initialization code here */

    /* Register a callback with device layer to get event notification (for end point 0) */
    USB_DEVICE_EventCallBackSet(appData.usbDevHandle, APP_UsbDeviceEventCallBack);

    /* Enable the device */
    USB_DEVICE_Attach(appData.usbDevHandle);
}

void APP_UsbDeviceEventCallBack( USB_DEVICE_EVENT event, USB_DEVICE_EVENT_DATA * pEventData )
{
    switch( event )
    {
        case USB_DEVICE_EVENT_RESET:
        case USB_DEVICE_EVENT_DECONFIGURED:
            /* USB device is reset or device is deconfigured. */
            /* Add user code here */

            break;

        case USB_DEVICE_EVENT_CONFIGURED:
            /* Device is configured */
            /* Check the configuration value */

            if(pEventData->eventConfigured.configurationValue == 1)

```

```

    {
        /* Host selected configuration value 1 */
    }
    break;

case USB_DEVICE_EVENT_SUSPENDED:
    /* Add user's code here to handle USB bus suspend event */

    break;

case USB_DEVICE_EVENT_RESUMED:
case USB_DEVICE_EVENT_ERROR:
case USB_DEVICE_EVENT_SOF:
case USB_DEVICE_EVENT_DETACHED:
case USB_DEVICE_EVENT_ATTACHED:
default:
    break;
}
}

```

5.9.3.5.4 Developing Vendor-specific Function Drivers

This topic describes the development of vendor-specific function drivers.

Description

This section is important for the users who wish to develop their own function drivers. This section covers the interface between the function driver and USB device layer. The framework explains how the USB device layer manages function driver through a set of callbacks.

Framework showing the interaction between Function Driver and Device Layer

The USB device layer manages the function driver using a set of standard callout functions. A function driver must implement these callout functions as described in the following paragraphs. The pointer to these callout functions must be packed in [USB_DEVICE_FUNCTION_DRIVER](#) structure and pointer to this structure must be registered with the USB device layer using function registration table.

InitializeByDescriptor()

Device layer initializes a function driver by calling this function when host issues a set configuration request. This function is called multiple times by the device layer for every descriptor that is found under the interface owned by the function driver. The function driver must implement appropriate logic to configure itself for each descriptor. This function is called from within the interrupt context. Therefore the function driver design must ensure that the execution time of this function is short.

The example code for `initializeByDescriptor()` is shown below.

```

/*****

```

Function:

```

void USB_DEVICE_MYCLASS_InitializeByDescriptorType ( SYS_MODULE_INDEX iFunctionDriver,
                                                    SYS_MODULE_INDEX iDriver,
                                                    SYS_MODULE_INDEX iUsbDevice,
                                                    void* funcDriverInit ,
                                                    uint8_t* pConfigDesc )

```

Summary:

USB Device MYCLASS function driver initialization. The device layer calls this function to initialize the function driver based on the descriptor found (from the configurations descriptor).

Precondition:

None.

Parameters:

iFunctionDriver : Function driver instance index.
usbDeviceHandle : USB device handle for communicating with the USB device layer.
funcDriverInit : Pointer to function driver init data structure. User can have his own function driver init data structure and can register the same in the function registration table.
intfNumber : The interface number the descriptor identified by descriptorType belongs to.
altSetting : The alternate setting of the descriptor that is identified by descriptorType belongs to.
pDescriptor : Pointer to the descriptor. This can point to interface descriptor or endpoint descriptor or any class specific descriptor based on the descriptorType.

Returns:

None.

Remarks:

None

```

*/

```

```

void USB_DEVICE_MYCLASS_InitializeByDescriptorType(SYS_MODULE_INDEX iFunctionDriver,
DRV_HANDLE usbDeviceHandle,
                                                    void* funcDriverInit, uint8_t intfNumber, uint8_t
altSetting,
                                                    uint8_t descriptorType, uint8_t * pDescriptor)
{
    USB_ENDPOINT endpoint;
    USB_ENDPOINT_DESCRIPTOR endpointDescriptor

    switch(descriptorType )
    {
        case USB_DESCRIPTOR_ENDPOINT:
            // Get the endpoint
            endpointDescriptor = (USB_ENDPOINT_DESCRIPTOR *)pDescriptor;

            // Enable endpoint.
            USB_DEVICE_EndpointEnable(usbDeviceHandle, endpointDescriptor->endpoint,
                                     endpointDescriptor->transferType,
                                     endpointDescriptor->wMaxPacketSize);

            break;

        case USB_DESCRIPTOR_INTERFACE:
            // Do interface specific initialization here.

```

```

        break;

    default:
        // Handle class specific descriptor.
        break;
}

```

DeInitialize()

Device layer de-initializes a function driver by calling this callout function when host issues a USB bus reset or when host deconfigures the device by selecting configuration value as 0. In the DeInitialize() function, user must implement functionalities to close endpoints and cancel the IRPs owned by that particular function driver. This callout function is called from within the interrupt context. Therefore the design must ensure that the execution time of this callout function is short.

The example code for DeInitialize() is shown below.

```

/*****
Function:
    void USB_DEVICE_MYCLASS_DeInitialize( SYS_MODULE_INDEX iFunctionDriver )

Summary:
    Deinitializes an instance of the MYCLASS.

Description:

Parameters:
    iFunctionDriver          - function driver index

Returns:
    None.

*/

static void USB_DEVICE_MYCLASS_DeInitialize( SYS_MODULE_INDEX iFunctionDriver )
{
    /* Cancel all IRPs on the endpoint/s used by
       MYCLASS function driver */
    USB_DEVICE_IRPCancelAll( usbDeviceHandle, endpoint );

    /* Disable endpoints used by this function driver */
    USB_DEVICE_EndpointDisable( usbDeviceHandle, endpoint );
}

```

ControlTransferNotification()

Only standard setup packets whose recipient is device/endpoint is supported by the device layer. All other types of setup packet targeted to interface/class is forwarded to appropriate function driver using "controlTransferNotification()" callout function. Setup packets with "other" as recipient is discarded by the device layer and a STALL is generated on the control endpoint. In this callout function, the function driver has to parse the setup packet. If the request is supported, function driver can initiate data stage by using [USB_DEVICE_ControlSend](#)/[USB_DEVICE_ControlReceive](#) functions. If the request is not supported, function driver can stall the control endpoints by using [USB_DEVICE_ControlStatus](#) function. This callout function is called from within the interrupt context. Therefore the design must ensure that the execution time of this callout function is short. This is not a mandatory callout function and can be set to NULL if a function driver does not support class specific setup request.

```

/*****
Function:
    void USB_DEVICE_MYCLASS_ControlTransferHandler(
        USB_DEVICE_CONTROL_TRANSFER_HANDLE controlHandle,
        SYS_MODULE_INDEX iFunctionDriver,
        USB_DEVICE_CONTROL_TRANSFER_EVENT controlEvent,

```

```
void * pEventData )
```

Summary:

Handles all MYCLASS related control transfers.

Description:

Parameters:

*controlHandle - Control Handle
iFunctionDriver - Function driver index
controlEvent - Control transfer event
pEventData - Pointer to event related data*

Returns:

None.

```
*/
```

```
void USB_DEVICE_MYCLASS_ControlTransferHandler(
    USB_DEVICE_CONTROL_TRANSFER_HANDLE controlHandle,
    SYS_MODULE_INDEX iFunctionDriver,
    USB_DEVICE_CONTROL_TRANSFER_EVENT controlEvent,
    USB_DEVICE_CONTROL_TRANSFER_EVENT_DATA * pEventData )
{
    USB_DEVICE_HID_INSTANCE *hidThisInstance;
    SETUP_PKT * setupPkt = pEventData->setupRequest;
    USB_DEVICE_HID_EVENT_DATA eventData;

    hidThisInstance = &gUsbDeviceHidInstance[iHID] ;

    if( controlEvent == USB_DEVICE_CONTROL_SETUP_REQUEST )
    {
        /* Setup request is received */

        if( setupPkt->bmRequestType & SETUP_RECIPIENT_INTERFACE)
        {
            /* Handle interface specific requests here */
            /* Use USB_DEVICE_ControlSend, USB_DEVICE_ControlReceive or
               USB_DEVICE_ControlStatus functions appropriately to respond to
               setup packet */

        }
        else if( ( setupPkt->bmRequestType & SETUP_TYPE_CLASS ) &&
                 ( hidThisInstance->appCallBack != NULL ) )
        {
            /* Handle class specific requests here */
            /* Use USB_DEVICE_ControlSend, USB_DEVICE_ControlReceive or
               USB_DEVICE_ControlStatus functions appropriately to respond to
               setup packet */

        }
    }
    else if ( controlEvent == USB_DEVICE_CONTROL_DATA_RECEIVED )
    {
        /* Data stage is received. Handle the data */
        /* Use USB_DEVICE_ControlStatus functions appropriately to respond to
           data stage */

    }
    else if ( controlEvent == USB_DEVICE_CONTROL_DATA_SENT )
    {
        /* Data stage is sent */
        /* This is just a success event. If required inform the same to
           application clients here. */

    }
}
```

Tasks()

All function driver tasks are called from within the device layer tasks. Device layer can call function driver task routine using this function driver provided callout function. Within this callout function, a function driver can implement its task specific routines. This is not a mandatory callback function. Set this callout function to NULL if it is not supported by the function driver.

```

/*****
Function:
    void USB_DEVICE_MYCLASS_Tasks ( SYS_MODULE_INDEX iFunctionDriver )

Summary:
    This function handles the main MSD state machine.

Description:

Precondition:
    None.

Parameters:
    iFunctionDriver    : Function driver index.

Returns:
    None.

Remarks:
    None
*/
void USB_DEVICE_MYCLASS_Tasks ( SYS_MODULE_INDEX iFunctionDriver )
{
    /* Perform all function driver tasks here */
}

```

Registering the callout functions

To register the above callout functions with the device layer, create a static table of type [USB_DEVICE_FUNCTION_DRIVER](#) structure with pointers to callout functions. The structure must then be registered to USB device layer using function registration table. Here is the code snippet that shows the same.

```

/* Make a table of USB_DEVICE_FUNCTION_DRIVER with pointers to callout functions */
const USB_DEVICE_FUNCTION_DRIVER myclassDriver = {
    /* MYCLASS init function */
    .initializeByDescriptor = USB_DEVICE_MYCLASS_InitializeByDescriptorType ,

    /* MYCLASS de-init function */
    .deInitialize = USB_DEVICE_MYCLASS_Deinitialization ,

    /* MYCLASS set-up packet handler */
    .controlTransferNotification = USB_DEVICE_MYCLASS_ControlTransferHandler ,

    /* MYCLASS tasks function */
    .tasks = USB_DEVICE_MYCLASS_Tasks
};

/* Using the function registration table register MYCLASS driver with USB device stack */
const USB_DEVICE_FUNC_REGISTRATION_TABLE funcRegistrationTable[1] =
{
    {
        /* Speed
        USB_SPEED_FULL | USB_SPEED_HIGH,

        /* Configuration value
        1,

        /* interface number of MYCLASS

```

```

    0,

    // number of interfaces in MYCLASS
    1,

    // instance index of MYCLASS
    0,

    // MYCLASS data init structure. This structure is class specific data structure
    // that will be passed as funcDriverInit parameter to
    // USB_DEVICE_MYCLASS_InitializeByDescriptorType()
    &myclassInit,

    // My class driver structure having pointers to all the callouts
    &myclassDriver
};
}

```

5.9.3.5.5 Library Configuration

Describes how to configure the USB Device Library

Macros

	Name	Description
	USB_DEVICE_MAX_CLIENTS	Sets the maximum possible number of clients an instance of the USB device can open using USB_DEVICE_Open .
	USB_DEVICE_MAX_FUNCTION_DRIVER	Sets the maximum number of function drivers at a time that are supported by an instance of the USB device layer.
	USB_DEVICE_MAX_INSTANCES	Sets the maximum possible number of instances of the USB device that can be instantiated by using USB_DEVICE_Initialize() routine.

Description

The application designer must specify the following configuration parameters while using the USB Device Library. The configuration macros that implement these parameters must be located in the system_config.h file in the application project and a compiler include path (to point to the folder that contains this file) should be specified.

Configuration Macro Name	Description	Comments
USB_DEVICE_MAX_INSTANCES	Sets the maximum possible number of instances of the USB device that can be instantiated by using USB_DEVICE_Initialize() routine.	In case of microcontrollers with more than one USB peripheral, the value of this constant can be increased to support more than one instances of USB device layer. The static implementation supports only one instance. Setting the value of this constant to > 1 has no effect on static implementations. Only in dynamic implementations of the USB device layer this value can be set > 1. The USB device layer has to support at least one instance. Therefore, ensure that the value of this constant is set to > 0. Increasing the instance count consumes RAM and can lead to performance degradation.
USB_DEVICE_MAX_CLIENTS	Sets the maximum possible number of clients an instance of the USB device can open using USB_DEVICE_Open .	If multiple clients need USB device layer services, user can set the value of this constant to > 1. The value of this macro must not be set to zero. Each instance of the USB device layer must support at least one client. Therefore, set the value to at least 1. The static single client implementation of the USB device layer supports only one client. Therefore, increasing the value of this constant > 1 has no effect in static single client implementation. Increasing the client count consumes RAM and can lead to performance degradation.

5.9.3.5.5.1 USB_DEVICE_MAX_CLIENTS Macro

C

```
#define USB_DEVICE_MAX_CLIENTS 1
```

Description

If multiple clients need USB device layer services, user can set the value of this constant to > 1.

Remarks

The value of this macro must not be set to zero. Each instance of the USB device layer must support at least one client. Therefore, set the value to at least 1.

The static single client implementaion of the USB device layer supports only one client. Therefore, increasing the value of this constant > 1 has no effect in static single client implementation.

Increase the client count consumes RAM and can lead to performance degradation.

5.9.3.5.5.2 USB_DEVICE_MAX_FUNCTION_DRIVER Macro

C

```
#define USB_DEVICE_MAX_FUNCTION_DRIVER 3
```

Description

This constant sets the maximum number of function drivers that are loaded by a USB device instance for a configuration set by the USB host.

Remarks

None.

5.9.3.5.5.3 USB_DEVICE_MAX_INSTANCES Macro

C

```
#define USB_DEVICE_MAX_INSTANCES 1
```

Description

In case of microcontrollers with more than one USB peripheral, the value of this constant can be increased to support more than one instances of USB device layer.

Remarks

The static implementation supports only one instance. Setting the value of this constant to > 1 has no effect on static implementations. Only in dynamic implementations of the USB device layer this value can be set > 1.

The USB device layer has to support at least one instance. Therefore, ensure that the value of this constant is set to > 0.

Increasing the instance count consumes RAM and can lead to performance degradation.

5.9.3.6 Library Interface

Data Types and Constants

	Name	Description
	USB_DEVICE_INDEX_0	USB device layer index definitions.
	USB_DEVICE_INDEX_1	This is macro USB_DEVICE_INDEX_1.

	USB_DEVICE_INDEX_2	This is macro USB_DEVICE_INDEX_2.
	USB_DEVICE_INDEX_3	This is macro USB_DEVICE_INDEX_3.
	USB_DEVICE_INDEX_4	This is macro USB_DEVICE_INDEX_4.
	USB_DEVICE_INDEX_5	This is macro USB_DEVICE_INDEX_5.
	USB_DEVICE_INDEX_COUNT	Number of valid USB Device Layer indices
	USB_DEVICE_CALLBACK	Pointer to a USB Device Layer callback function data type for bus events.
	USB_DEVICE_CONFIG_DESCS_PTR	Pointer to an array that contains pointer to configuration descriptors.
	USB_DEVICE_CONTROL_STATUS	This enumerated data-type identifies the status stage of control transfer.
	USB_DEVICE_CONTROL_TRANSFER_CALLBACK	
	USB_DEVICE_CONTROL_TRANSFER_EVENT	This datatype defines the different control transfer events.
	USB_DEVICE_CONTROL_TRANSFER_EVENT_DATA	USB device control transfer event data.
	USB_DEVICE_CONTROL_TRANSFER_HANDLE	Data type of USB device control transfer handle.
	USB_DEVICE_CONTROL_TRANSFER_RESULT	Enumerated data type identifying results of a control transfer.
	USB_DEVICE_EVENT	Enumerated data-type identifying the bus events that has occurred in the USB device layer.
	USB_DEVICE_EVENT_DATA	Data associated with USB bus events.
	USB_DEVICE_EVENT_DATA_CONFIGURED	Data-type that holds the data related to USB device configured event.
	USB_DEVICE_FUNC_REGISTRATION_TABLE	A function driver has to be registered with the USB device layer using this structure.
	USB_DEVICE_FUNCTION_DRIVER	A function driver has to expose standard APIs to device layer using following structure.
	USB_DEVICE_HANDLE	Data type for USB device handle.
	USB_DEVICE_INIT	This structure has to be initialized by the system/application and must be passed as parameter to USB_DEVICE_Initialize() .
	USB_DEVICE_POWER_STATE	Enumerated data type that identifies if the device is self powered or bus powered .
	USB_DEVICE_REMOTE_WAKEUP_STATUS	Enumerated data type that identifies if the remote wakeup status of the device.
	USB_DEVICE_STATE	Standard USB device states as described in Chapter-9 of USB 2.0 Specification.
	USB_DEVICE_STRING_DESCS_PTR	Pointer to an array that contains pointer to string descriptors.
	USB_MASTER_DESCRIPTOR	Global USB descriptor structure containing pointers to standard USB descriptor structures.
	USB_DEVICE_ENDPOINT_TABLE_SIZE	This is macro USB_DEVICE_ENDPOINT_TABLE_SIZE.
	USB_DEVICE_HANDLE_INVALID	Macro that defines the value of invalid device handle.

Client Core Functions

	Name	Description
	USB_DEVICE_Open	Opens the specified USB device layer instance and returns a handle to it.
	USB_DEVICE_ControlReceive	Receives data stage of the control transfer from host to device.
	USB_DEVICE_ControlSend	Sends data stage of the control transfer from device to host.
	USB_DEVICE_Attach	This function will attach the device to the USB.

	USB_DEVICE_Detach	This function will detach the device from the USB.
	USB_DEVICE_Status	Provides the current status of the USB device layer
	USB_DEVICE_ClientStatus	Gets the current client-specific status of the USB device layer.
	USB_DEVICE_ResumeStart	This function will start the resume signalling.
	USB_DEVICE_ResumeStop	This function will stop the resume signalling.
	USB_DEVICE_GetDeviceSpeed	Informs the client of the current operation speed of the USB bus.
	USB_DEVICE_GetDeviceState	Returns the current state of the USB device.
	USB_DEVICE_GetConfigurationValue	Informs the client of the current USB device configuration set by the USB host.
	USB_DEVICE_RemoteWakeupIsEnabled	Gets the "Remote wakeup" status of the device.
	USB_DEVICE_PowerStateSet	Sets power state of the device.

Driver Interaction Functions

	Name	Description
	USB_DEVICE_ControlStatus	Initiates status stage of the control transfer.
	USB_DEVICE_EndpointEnable	This function enables a endpoint for the specified direction and endpoint size.
	USB_DEVICE_EndpointIsEnabled	This function returns the enable/ disable status of the specified endpoint and direction.
	USB_DEVICE_EndpointIsStalled	This function returns the stall status of the specified endpoint and direction.
	USB_DEVICE_EndpointStall	This function stalls an endpoint in the specified direction.
	USB_DEVICE_EndpointStallClear	This function clears the stall on an endpoint in the specified direction.
	USB_DEVICE_IRPCancelAll	This function cancels all IRPs that are queued and in progress at the specified endpoint.
	USB_DEVICE_IRPSubmit	This function submits a I/O Request Packet (IRP) for processing to the USB Driver.

System Interaction Functions

	Name	Description
	USB_DEVICE_Deinitialize	Deinitializes the specified instance of the USB device layer.
	USB_DEVICE_Close	Closes an opened handle to an instance of the USB device layer.
	USB_DEVICE_Initialize	Creates and initializes an instance of the USB device layer.
	USB_DEVICE_ControlEventCallBackSet	Client can register its call-back function into the device layer to get control transfer events.
	USB_DEVICE_Reinitialize	Reinitializes the USB device layer
	USB_DEVICE_EndpointDisable	This function disables an endpoint.
	USB_DEVICE_EventCallBackSet	Client can register its call-back function into the device layer.
	USB_DEVICE_Tasks	USB Device layer calls all other function driver tasks in this function. It also generates and forwards events to its clients.

Description

This section describes the Application Programming Interface (API) functions of the USB device layer library

Refer to each section for a detailed description.

5.9.3.6.1 System Interaction Functions

5.9.3.6.1.1 USB_DEVICE_Deinitialize Function

C

```
void USB_DEVICE_Deinitialize(  
    SYS_MODULE_OBJ usbDeviceObj  
);
```

Description

This function deinitializes the specified instance of the USB device layer, disabling its operation (and any hardware) and invalidates all of the internal data.

Preconditions

Function [USB_DEVICE_Initialize](#) must have been called before calling this routine and a valid [SYS_MODULE_OBJ](#) must have been returned.

Parameters

Parameters	Description
object	USB device layer object handle, returned by USB_DEVICE_Initialize

Returns

None.

Remarks

Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again.

Example

5.9.3.6.1.2 USB_DEVICE_Close Function

C

```
void USB_DEVICE_Close(  
    USB_DEVICE_HANDLE usbDeviceHandle  
);
```

Description

This function closes an opened handle to an instance of the USB device layer, invalidating the handle.

Preconditions

The [USB_DEVICE_Initialize](#) function must have been called for the specified device layer instance. [USB_DEVICE_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from USB_DEVICE_Open

Returns

None

Remarks

After calling this routine, the handle passed in "usbDevHandle" must not be used with any of the remaining driver routines. A new handle must be obtained by calling [USB_DEVICE_Open\(\)](#) before the client may use the device layer again.

Example

```

USB_DEVICE_HANDLE usbDeviceHandle;

// Before opening a handle, USB device must have been initialized
// by calling USB_DEVICE_Initialize().
usbDeviceHandle = USB_DEVICE_Open( USB_DEVICE_INDEX_0 );

if(USB_DEVICE_HANDLE_INVALID == usbDeviceHandle)
{
    //Failed to open handle.
}

.....
.....
// User's code
.....
.....
// Close handle
USB_DEVICE_Close( usbDevHandle );

```

5.9.3.6.1.3 USB_DEVICE_Initialize Function**C**

```

SYS_MODULE_OBJ USB_DEVICE_Initialize(
    const SYS_MODULE_INDEX instanceIndex,
    const SYS_MODULE_INIT * const init
);

```

Description

This function initializes an instance of USB device layer, making it ready for clients to open and use it. The number of instances is limited by the value of macro [USB_DEVICE_MAX_INSTANCES](#).

Preconditions

None.

Parameters

Parameters	Description
instanceIndex	In case of microcontrollers with multiple USB peripherals, user can create multiple instances of USB device layer. Parameter instanceIndex identifies this instance.
init	Pointer to a data structure containing any data necessary to initialize the USB device layer

Returns

If successful, returns a valid handle to a device layer object. Otherwise, it returns [SYS_MODULE_OBJ_INVALID](#).

Remarks

This routine must be called before any other USB Device Layer routine is called and after the initialization of USB Device Driver. This routine should only be called once during system initialization.

Example

```

USB_DEVICE_INIT deviceLayerInit;
SYS_MODULE_OBJ usbDeviceObj;

// System module initialization
deviceLayerInit.moduleInit.value = SYS_MODULE_POWER_RUN_FULL;
// Identifies peripheral (PLIB-level) ID
deviceLayerInit.usbID = USB_ID_1;
// Boolean flag: true -> Stop USB module in Idle Mode
deviceLayerInit.stopInIdle = false;

```

```

// Boolean flag: true -> Suspend USB in Sleep Mode
deviceLayerInit.suspendInSleep = false;
// Interrupt Source for USB module
deviceLayerInit.interruptSource = INT_SOURCE_USB_1;
// Number of function drivers registered to this instance of the
USB device layer
deviceLayerInit.registeredFuncCount = 1;
// Function driver table registered to this instance of the USB device layer
deviceLayerInit.registeredFunctions = funcRegistrationTable;
// Pointer to USB Descriptor structure
deviceLayerInit.usbMasterDescriptor = &usbMasterDescriptor;

// USB device initialization
usbDeviceObj = USB_DEVICE_Initialize(USB_DEVICE_INDEX_0, &deviceLayerInit);

if (SYS_MODULE_OBJ_INVALID == usbDeviceObj)
{
    // Handle error
}

```

5.9.3.6.1.4 USB_DEVICE_ControlEventCallbackSet Function

C

```

USB_ERROR USB_DEVICE_ControlEventCallbackSet(
    USB_DEVICE_HANDLE usbDeviceHandle,
    const USB_DEVICE_CONTROL_TRANSFER_CALLBACK callBackFunc
);

```

Description

The USB Device Layer notifies the control transfer events to the client by calling callBackFunc.

Preconditions

The device layer must have been initialized by calling [USB_DEVICE_Initialize](#) and a valid handle to the instance must have been obtained by calling [USB_DEVICE_Open](#).

Parameters

Parameters	Description
usbDeviceHandle	Pointer to the device layer handle that is returned from USB_DEVICE_Open
callBackFunc	Pointer to the control transfer event handler. The device layer notifies the client about control transfer event by calling this function.

Returns

Returns USB_ERROR_NONE if successful.

Remarks

None.

Example

5.9.3.6.1.5 USB_DEVICE_Reinitialize Function

C

```

void USB_DEVICE_Reinitialize(
    SYS_MODULE_OBJ usbDeviceObj,
    const SYS_MODULE_INIT * const init
);

```

Description

This function reinitializes the USB device layer.

Preconditions

USB device driver and USB device layer must have been initialized.

Parameters

Parameters	Description
usbDeviceObj	Driver object handle, returned by USB_DEVICE_Initialize
init	Pointer to a data structure containing any data necessary to reinitialize the USB device layer.

Returns

None

Remarks

This function can be called multiple times to reinitialize the USB device layer.

This operation reinitializes all the module variables of the USB device layer associated with the instance specified by the parameter "usbDeviceObj".

Example

```

USB_DEVICE_INIT deviceLayerInit;

// System module initialization
deviceLayerInit.moduleInit.value = SYS_MODULE_POWER_RUN_FULL;
// Identifies peripheral (PLIB-level) ID
deviceLayerInit.usbID = USB_ID_1;
// Boolean flag: true -> Stop USB module in Idle Mode
deviceLayerInit.stopInIdle = false;
// Boolean flag: true -> Suspend USB in Sleep Mode
deviceLayerInit.suspendInSleep = false;
// Interrupt Source for USB module
deviceLayerInit.interruptSource = INT_SOURCE_USB_1;
// Number of function drivers registered to this instance of the
USB device layer
deviceLayerInit.registeredFuncCount = 1;
// Function driver table registered to this instance of the USB device layer
deviceLayerInit.registeredFunctions = funcRegistrationTable;
// Pointer to USB Descriptor structure
deviceLayerInit.usbMasterDescriptor = &usbMasterDescriptor;

// USB device initialization
usbDeviceObj = USB_DEVICE_Initialize(USB_DEVICE_INDEX_0, &deviceLayerInit);

if (SYS_MODULE_OBJ_INVALID == usbDeviceObj)
{
}

// Do something here.

// Re-initialize if required.
// System module initialization
deviceLayerInit.moduleInit.value = SYS_MODULE_POWER_RUN_FULL;
// Identifies peripheral (PLIB-level) ID
deviceLayerInit.usbID = USB_ID_1;
// Boolean flag: true -> Stop USB module in Idle Mode
deviceLayerInit.stopInIdle = false;
// Boolean flag: true -> Suspend USB in Sleep Mode
deviceLayerInit.suspendInSleep = false;
// Interrupt Source for USB module
deviceLayerInit.interruptSource = INT_SOURCE_USB_1;
// Number of function drivers registered to this instance of the

```

```

USB device layer
deviceLayerInit.registeredFuncCount = 1;
// Function driver table registered to this instance of the USB device layer
deviceLayerInit.registeredFunctions = funcRegistrationTable;
// Pointer to USB Descriptor structure
deviceLayerInit.usbMasterDescriptor = &usbMasterDescriptor;

USB_DEVICE_ReInitialize(USB_DEVICE_INDEX_0, &deviceLayerInit);

```

5.9.3.6.1.6 USB_DEVICE_EndpointDisable Function

C

```

USB_ERROR USB_DEVICE_EndpointDisable(
    USB_DEVICE_HANDLE usbDeviceHandle,
    USB_ENDPOINT endpointAndDirection
);

```

Description

This function disables an endpoint. If the endpoint type is control type then both directions are disabled. For non-control endpoints, the function disables one direction at a time.

Preconditions

Client handle should be valid.

Parameters

Parameters	Description
usbDeviceHandle	USB device handle returned by USB_DEVICE_Open() .
endpointAndDirection	Specifies the endpoint and direction.

Returns

USB_ERROR_NONE - The endpoint was successfully enabled. USB_ERROR_DEVICE_ENDPOINT_INVALID - If the endpoint that is being accessed is out of the valid endpoint defined for this driver instance.

Remarks

This function must not be called by the application clients. Application has no access to modify the endpoint features.

Example

```

// This code snippet shows an example of how to disable
// a control endpoint. Note that the direction parameter is ignored.
// For a control endpoint, both the directions are disabled.

handle = USB_DEVICE_Open(USB_DEVICE_INDEX_0);
USB_ENDPOINT ep;

ep.endpoint = 0;
ep.direction = USB_DATA_DIRECTION_DEVICE_TO_HOST;

USB_DEVICE_EndpointDisable(handle, ep );

// This code snippet shows an example of how to disable a BULK IN
// endpoint

USB_ENDPOINT ep;

ep.endpoint = 1;
ep.direction = USB_DATA_DIRECTION_DEVICE_TO_HOST;

USB_DEVICE_EndpointDisable(handle, ep );

```

5.9.3.6.1.7 USB_DEVICE_EventCallbackSet Function

C

```
USB_ERROR USB_DEVICE_EventCallbackSet(  
    USB_DEVICE_HANDLE usbDeviceHandle,  
    const USB_DEVICE_CALLBACK callBackFunc  
);
```

Description

The USB Device Layer notifies the event to the client by calling callBackFunc.

Preconditions

The device layer must have been initialized by calling [USB_DEVICE_Initialize](#) and a valid handle to the instance must have been obtained by calling [USB_DEVICE_Open](#).

Parameters

Parameters	Description
usbDeviceHandle	Pointer to the device layer handle that is returned from USB_DEVICE_Open
callBackFunc	Pointer to the call back function. The device layer calls notifies the client about bus event by calling this function.

Returns

Returns USB_ERROR_NONE if successful.

Remarks

None.

Example

5.9.3.6.1.8 USB_DEVICE_Tasks Function

C

```
void USB_DEVICE_Tasks(  
    SYS_MODULE_OBJ object  
);
```

Description

This function must be periodically called by the user application. The USB Device layer calls all other function driver tasks in this function. It also generates and forwards events to its clients.

Preconditions

Device layer must have been initialized by calling [USB_DEVICE_Initialize](#).

Parameters

Parameters	Description
devLayerObj	Pointer to the Device Layer Object that is returned from USB_DEVICE_Initialize

Returns

none.

Remarks

This function must be called only after the device layer is initialized by calling function [USB_DEVICE_Initialize](#).

Example

5.9.3.6.2 Client Core Functions

5.9.3.6.2.1 USB_DEVICE_Open Function

C

```
USB_DEVICE_HANDLE USB_DEVICE_Open(  
    const SYS_MODULE_INDEX instanceIndex,  
    const DRV_IO_INTENT intent  
);
```

Description

This function opens the USB device layer instance specified by instance index and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the USB device layer. The number of handles a client can open is limited by the value set to [USB_DEVICE_MAX_CLIENTS](#).

Preconditions

This function must be called after USB device driver initialization and after the initialization of USB Device Layer.

Parameters

Parameters	Description
instanceIndex	USB device layer instance index
intent	Zero or more of the values from the enumeration DRV_IO_INTENT ORed together to indicate the intended use of the driver

Returns

If successful, returns a valid handle to a device layer object. Otherwise, it returns [SYS_MODULE_OBJ_INVALID](#).

Remarks

This routine must be called after USB device driver initialization and after the initialization of USB Device Layer. This routine should be called only once during system initialization.

Example

```
USB_DEVICE_HANDLE usbDeviceHandle;  
  
// Before opening a handle, USB device must have been initialized  
// by calling USB_DEVICE_Initialize().  
usbDeviceHandle = USB_DEVICE_Open( USB_DEVICE_INDEX_0, DRV_IO_INTENT_BLOCKING );  
  
if(USB_DEVICE_HANDLE_INVALID == usbDeviceHandle)  
{  
    //Failed to open handle.  
}
```

5.9.3.6.2.2 USB_DEVICE_ControlReceive Function

C

```
USB_DEVICE_CONTROL_TRANSFER_RESULT USB_DEVICE_ControlReceive(  
    USB_DEVICE_HANDLE usbDeviceHandle,  
    USB_DEVICE_CONTROL_TRANSFER_HANDLE controlXferHandle,  
    void * data,  
    size_t length  
);
```

Preconditions

Client handle should be valid.

Parameters

Parameters	Description
usbDeviceHandle	USB device handle returned by USB_DEVICE_Open() .
controlXferHandle	Control transfer handle that is returned by bus event callback function.
data	Pointer to buffer that holds data.
length	Size in bytes.

Returns

USB_DEVICE_CONTROL_TRANSFER_RESULT_FAILED - If control transfer is failed due to host aborting the previous control transfer.

USB_DEVICE_CONTROL_TRANSFER_RESULT_SUCCESS - Control endpoint is successfully armed with data buffer.

Example**5.9.3.6.2.3 USB_DEVICE_ControlSend Function****C**

```
USB_DEVICE_CONTROL_TRANSFER_RESULT USB_DEVICE_ControlSend(  
    USB_DEVICE_HANDLE usbDeviceHandle,  
    USB_DEVICE_CONTROL_TRANSFER_HANDLE controlXferHandle,  
    void * data,  
    size_t length  
);
```

Preconditions

Client handle should be valid.

Parameters

Parameters	Description
usbDeviceHandle	USB device handle returned by USB_DEVICE_Open() .
controlXferHandle	Control transfer handle that is returned by the in bus event callback function.
data	Pointer to buffer that holds data.
length	Size in bytes.

Returns

USB_DEVICE_CONTROL_TRANSFER_RESULT_FAILED - If control transfer is failed due to host aborting the previous control transfer.

USB_DEVICE_CONTROL_TRANSFER_RESULT_SUCCESS - Control endpoint is successfully armed with data buffer.

Example**5.9.3.6.2.4 USB_DEVICE_Attach Function****C**

```
void USB_DEVICE_Attach(  
    USB_DEVICE_HANDLE usbDeviceHandle  
);
```

Description

This function will attach the device to the USB. It does this by enabling the pull up resistors on the D+ or D- lines. This function should be called when the USB device layer is ready to receive communication from the host (typically after all initialization is complete).

Preconditions

Client handle should be valid.

Parameters

Parameters	Description
usbDeviceHandle	Client's USB device layer handle (returned from USB_DEVICE_Open)

Returns

None.

Remarks

None.

Example

```

USB_DEVICE_INIT deviceLayerInit;
SYS_MODULE_OBJ usbDeviceObj;
USB_DEVICE_HANDLE usbDeviceHandle;

// System module initialization
deviceLayerInit.moduleInit.value = SYS_MODULE_POWER_RUN_FULL;
// Identifies peripheral (PLIB-level) ID
deviceLayerInit.usbID = USB_ID_1;
// Boolean flag: true -> Stop USB module in Idle Mode
deviceLayerInit.stopInIdle = false;
// Boolean flag: true -> Suspend USB in Sleep Mode
deviceLayerInit.suspendInSleep = false;
// Interrupt Source for USB module
deviceLayerInit.interruptSource = INT_SOURCE_USB_1;
// Number of function drivers registered to this instance of the
USB device layer
deviceLayerInit.registeredFuncCount = 1;
// Function driver table registered to this instance of the USB device layer
deviceLayerInit.registeredFunctions = funcRegistrationTable;
// Pointer to USB Descriptor structure
deviceLayerInit.usbMasterDescriptor = &usbMasterDescriptor;

// USB device initialization
usbDeviceObj = USB_DEVICE_Initialize(USB_DEVICE_INDEX_0, &deviceLayerInit);

if (SYS_MODULE_OBJ_INVALID == usbDeviceObj)
{
    // Handle error
}

// Get an handle to the USB device layer.
usbDeviceHandle = USB_DEVICE_Open( USB_DEVICE_INDEX_0,
                                   DRV_IO_INTENT_BLOCKING );

if(USB_DEVICE_HANDLE_INVALID == usbDeviceHandle)
{
    // Failed to open handle.
    // Handle error.
}

// Now, connect device to USB
USB_DEVICE_Attach(usbDeviceHandle);

```

5.9.3.6.2.5 USB_DEVICE_Detach Function**C**

```
void USB_DEVICE_Detach(
```

```
    USB_DEVICE_HANDLE usbDeviceHandle  
);
```

Description

This function will detach the device from the USB. It does this by disabling the pull up resistors on the D+ or D- lines. This function should be called when the application wants to disconnect the device from the bus (typically to implement a soft detach or switch to host mode operation).

Preconditions

Client handle should be valid.

Parameters

Parameters	Description
usbDeviceHandle	Client's driver handle (returned from USB_DEVICE_Open)

Returns

None.

Remarks

None.

Example

```
USB_DEVICE_HANDLE usbDeviceHandle;  
  
// Detach the device from the USB  
USB_DEVICE_Detach( usbDeviceHandle );
```

5.9.3.6.2.6 USB_DEVICE_Status Function

C

```
SYS_STATUS USB_DEVICE_Status(  
    SYS_MODULE_OBJ object  
);
```

Description

This function provides the current status of the USB device layer.

Preconditions

The [USB_DEVICE_Initialize](#) function must have been called before calling this function.

Parameters

Parameters	Description
object	Driver object handle, returned from USB_DEVICE_Initialize

Returns

SYS_STATUS_READY - Indicates that the device is busy with a previous system level operation and cannot start another

Remarks

Any value greater than SYS_STATUS_READY is also a normal running state in which the device is ready to [accept](#) new operations.

SYS_STATUS_BUSY - Indicates that the device is busy with a previous system level operation and cannot start another

SYS_STATUS_UNINITIALIZED - Indicates that the device has never been initialized

SYS_STATUS_ERROR - Indicates that the device is in an error state

Any value less than `SYS_STATUS_ERROR` is also an error state.

None.

Example

```
SYS_MODULE_OBJ    object;    // Returned from DRV_USB_Initialize
SYS_STATUS        status;

status = USB_DEVICE_Status(object);

if (SYS_STATUS_ERROR >= status)
{
    // Handle error
}
```

5.9.3.6.2.7 USB_DEVICE_ClientStatus Function

C

```
DRV_CLIENT_STATUS USB_DEVICE_ClientStatus(
    USB_DEVICE_HANDLE usbDevHandle
);
```

Description

This function gets the client-specific status of the USB device layer associated with the specified handle.

Preconditions

The [USB_DEVICE_Initialize](#) function must have been called. [USB_DEVICE_Open](#) must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open instance handle, returned from USB_DEVICE_Open

Returns

A value of enum type [DRV_CLIENT_STATUS](#) describing the current status of the USB device layer.

Remarks

None.

Example

5.9.3.6.2.8 USB_DEVICE_ResumeStart Function

C

```
void USB_DEVICE_ResumeStart(
    USB_DEVICE_HANDLE usbDeviceHandle
);
```

Preconditions

Client handle should be valid.

Parameters

Parameters	Description
usbDeviceHandle	Client's driver handle (returned from USB_DEVICE_Open)

Returns

None.

Remarks

None.

Example**5.9.3.6.2.9 USB_DEVICE_ResumeStop Function****C**

```
void USB_DEVICE_ResumeStop(  
    USB_DEVICE_HANDLE usbDeviceHandle  
)  
;
```

Preconditions

Client handle should be valid.

Parameters

Parameters	Description
usbDeviceHandle	Client's driver handle (returned from USB_DEVICE_Open)

Returns

None.

Remarks

None.

Example**5.9.3.6.2.10 USB_DEVICE_GetDeviceSpeed Function****C**

```
USB_SPEED USB_DEVICE_GetDeviceSpeed(  
    USB_DEVICE_HANDLE usbDeviceHandle  
)  
;
```

Description

The USB device stack supports both high speed and full speed operations. This function returns the current operation speed of the USB bus.

Preconditions

The USB device layer must have been initialized and a valid handle to USB device layer must have been opened.

Parameters

Parameters	Description
usbDeviceHandle	Pointer to device layer handle that is returned from USB_DEVICE_Open

Returns

USB_SPEED_LOW - USB module is at low speed

USB_SPEED_FULL - USB module is at full speed

USB_SPEED_HIGH - USB module is at high speed

Remarks

This function must be called only after the device layer is initialized and opened by calling [USB_DEVICE_Initialize](#) and [USB_DEVICE_Open](#).

Example

5.9.3.6.2.11 USB_DEVICE_GetDeviceState Function

C

```
USB_DEVICE_STATE USB_DEVICE_GetDeviceState(  
    USB_DEVICE_HANDLE usbDeviceHandle  
);
```

Description

This function returns the current state of the USB device, as described in Chapter 9 of USB 2.0 Specification.

Preconditions

The USB device layer must have been initialized and opened before calling this function.

Parameters

Parameters	Description
usbDeviceHandle	Pointer to the device layer handle that is returned from USB_DEVICE_Open

Returns

USB_DEVICE_STATE_DETACHED - Device is not in any of the known states

USB_DEVICE_STATE_ATTACHED - Device is attached to the USB, but is not powered

USB_DEVICE_STATE_POWERED - Device is attached to the USB and powered, but has not been reset

USB_DEVICE_STATE_DEFAULT - Device is attached to the USB and powered and has been reset, but has not been assigned a unique address

USB_DEVICE_STATE_ADDRESS - Device is attached to the USB, powered, has been reset, and a unique device address has been assigned

USB_DEVICE_STATE_CONFIGURED - Device is attached to the USB, powered, has been reset, has a unique address, is configured, and is not suspended

USB_DEVICE_STATE_SUSPENDED - Device is, at minimum, attached to the USB and is powered and has not seen bus activity for 3 ms. The device is still in addressed state.

Remarks

This function must be called only after the device layer is initialized and opened by calling [USB_DEVICE_Initialize](#) and [USB_DEVICE_Open](#).

Example

```
USB_DEVICE_STATE usbDevState;  
  
// Get USB Device State.  
usbDevState = USB_DEVICE_GetDeviceState( usbDeviceHandle );  
  
switch(usbDevState)  
{  
    case USB_DEVICE_STATE_ATTACHED:  
        // Add code here  
        break;  
  
    case USB_DEVICE_STATE_POWERED:  
        // Add code here  
        break;  
  
    default:
```

```
        break;  
    }
```

5.9.3.6.2.12 USB_DEVICE_GetConfigurationValue Function

C

```
uint8_t USB_DEVICE_GetConfigurationValue(  
    USB_DEVICE_HANDLE usbDeviceHandle  
);
```

Description

This function returns the current active USB device configuration.

Preconditions

The USB Device Layer must have been initialized and opened before calling this function.

Parameters

Parameters	Description
usbDeviceHandle	Pointer to the Device Layer Handle that is returned from USB_DEVICE_Open

Returns

Present active configuration.

Remarks

This function must be called only after the device layer is initialized and opened by calling [USB_DEVICE_Initialize](#) and [USB_DEVICE_Open](#).

Example

5.9.3.6.2.13 USB_DEVICE_RemoteWakeupIsEnabled Function

C

```
USB_DEVICE_REMOTE_WAKEUP_STATUS USB_DEVICE_RemoteWakeupIsEnabled(  
    USB_DEVICE_HANDLE usbDeviceHandle  
);
```

Preconditions

Client handle should be valid.

Parameters

Parameters	Description
usbDeviceHandle	USB device handle returned by USB_DEVICE_Open() .

Returns

USB_DEVICE_REMOTE_WAKEUP_ENABLED - Remote wakeup is enabled. USB_DEVICE_REMOTE_WAKEUP_DISABLED - Remote wakeup is disabled.

Example

5.9.3.6.2.14 USB_DEVICE_PowerStateSet Function

C

```
void USB_DEVICE_PowerStateSet(  
    USB_DEVICE_HANDLE usbDeviceHandle,  
    USB_DEVICE_POWER_STATE powerState  
);
```

Description

Application clients can use this function to set the power state of the device. A USB device can be bus powered or self powered.

Preconditions

Client handle should be valid.

Parameters

Parameters	Description
usbDeviceHandle	USB device handle returned by USB_DEVICE_Open() .
powerState	USB_DEVICE_POWER_STATE_BUS_POWERED/ USB_DEVICE_POWER_STATE_SELF_POWERED

Returns

None.

Example

5.9.3.6.3 Driver Interaction Functions

5.9.3.6.3.1 USB_DEVICE_ControlStatus Function

C

```
USB_DEVICE_CONTROL_TRANSFER_RESULT USB_DEVICE_ControlStatus(  
    USB_DEVICE_HANDLE usbDeviceHandle,  
    USB_DEVICE_CONTROL_TRANSFER_HANDLE controlTransferHandle,  
    USB_DEVICE_CONTROL_STATUS status  
);
```

Preconditions

Client handle should be valid.

Parameters

Parameters	Description
usbDeviceHandle	USB device handle returned by USB_DEVICE_Open() .
controlTransferHandle	Control transfer handle that is returned by bus event callback function.
status	USB_DEVICE_CONTROL_STATUS_SEND_ZLP/ USB_DEVICE_CONTROL_STATUS_STALL

Returns

USB_DEVICE_CONTROL_TRANSFER_RESULT_FAILED - If control transfer is failed due to host aborting the previous control transfer.

USB_DEVICE_CONTROL_TRANSFER_RESULT_SUCCESS - Control endpoint is successfully armed with data buffer.

Example

5.9.3.6.3.2 USB_DEVICE_EndpointEnable Function

C

```
USB_ERROR USB_DEVICE_EndpointEnable(  
    USB_DEVICE_HANDLE usbDeviceHandle,  
    USB_ENDPOINT endpointAndDirection,  
    USB_TRANSFER_TYPE transferType,  
    uint16_t endpointSize  
);
```

```
);
```

Description

This function enables a endpoint for the specified direction and endpoint size. The function will enable the endpoint for communication in one direction at a time. It must be called twice if the endpoint is required to communicate in both the directions, except for control endpoints. If the endpoint type is a control endpoint, the endpoint is always bi-directional and the function needs to be called only once. The size of the endpoint must match the wMaxPacketSize reported in the endpoint descriptor for this endpoint. The function does not check if the endpoint is already in use. It is the client's responsibility to make sure that a endpoint is not accidentally re-used.

Preconditions

Client handle should be valid.

Parameters

Parameters	Description
usbDeviceHandle	USB device handle returned by USB_DEVICE_Open() .
endpointAndDirection	Specifies the endpoint and direction.
transferType	Should be USB_TRANSFER_TYPE_CONTROL for control endpoint, USB_TRANSFER_TYPE_BULK for bulk endpoint, USB_TRANSFER_TYPE_INTERRUPT for interrupt endpoint and USB_TRANSFER_TYPE_ISOCHRONOUS for isochronous endpoint.
endpointSize	Maximum size (in bytes) of the endpoint as reported in the endpoint descriptor.

Returns

USB_ERROR_NONE - The endpoint was successfully enabled. USB_ERROR_DEVICE_ENDPOINT_INVALID - If the endpoint that is being accessed is out of the valid endpoint defined for this driver instance.

Remarks

None.

Example

```
// This code snippet shows an example of how to enable endpoint
// 0 for control transfers. Note that for a control endpoint, the
// direction parameter is ignored. A control endpoint is always
// bi-directional. Endpoint size is 64 bytes.

USB_ENDPOINT ep;

handle = USB_DEVICE_Open(USB_DEVICE_INDEX_0);
ep.endpoint = 0;
ep.direction = USB_DATA_DIRECTION_DEVICE_TO_HOST;

USB_DEVICE_EndpointEnable(handle, ep, USB_TRANSFER_TYPE_CONTROL, 64);

// This code snippet shows an example of how to set up a endpoint
// for BULK IN transfer. For an IN transfer, data moves from device
// to host. In this example, endpoint 1 is enabled. The maximum
// packet size is 64.

USB_ENDPOINT ep;

ep.endpoint = 1;
ep.direction = USB_DATA_DIRECTION_DEVICE_TO_HOST;

USB_DEVICE_EndpointEnable(handle, ep, USB_TRANSFER_TYPE_BULK, 64);

// If endpoint 1 must also be set up for BULK OUT, then the enable
// function must be called again, as shown here.
```

```
ep.endpoint = 1;
ep.direction = USB_DATA_DIRECTION_HOST_TO_DEVICE;

USB_DEVICE_EndpointEnable(handle, ep, USB_TRANSFER_TYPE_BULK, 64);
```

5.9.3.6.3.3 USB_DEVICE_EndpointIsEnabled Function

C

```
bool USB_DEVICE_EndpointIsEnabled(
    USB_DEVICE_HANDLE usbDeviceHandle,
    USB_ENDPOINT endpointAndDirection
);
```

Description

This function returns the enable/ disable status of the specified endpoint and direction.

Preconditions

Client handle should be valid.

Parameters

Parameters	Description
usbDeviceHandle	USB device handle returned by USB_DEVICE_Open() .
endpointAndDirection	Specifies the endpoint and direction.

Returns

Returns true if the endpoint is enabled, false otherwise.

Remarks

This function must not be called by the application clients. Application has no access to read the endpoint features.

Example

```
// This code snippet shows an example of how the
// USB_DEVICE_EndpointIsEnabled() function can be used to obtain the
// status of the endpoint 1 and IN direction.

USB_ENDPOINT ep;

ep.endpoint = 1;
ep.direction = USB_DATA_DIRECTION_DEVICE_TO_HOST;

if(DRV_USB_ENDPOINT_STATE_DISABLED ==
    USB_DEVICE_EndpointIsEnabled(handle, ep))
{
    // Endpoint is disabled. Enable endpoint.

    USB_DEVICE_EndpointEnable(handle, ep, USB_ENDPOINT_TYPE_BULK, 64);
}
```

5.9.3.6.3.4 USB_DEVICE_EndpointIsStalled Function

C

```
bool USB_DEVICE_EndpointIsStalled(
    USB_DEVICE_HANDLE usbDeviceHandle,
    USB_ENDPOINT endpoint
);
```

Description

This function returns the stall status of the specified endpoint and direction.

Preconditions

Client handle should be valid.

Parameters

Parameters	Description
usbDeviceHandle	USB device handle returned by USB_DEVICE_Open() .
endpointAndDirection	Specifies the endpoint and direction.

Returns

Returns true if endpoint is stalled, false otherwise.

Remarks

This function must not be called by the application clients. Application has no access to read the endpoint features.

Example

```
// This code snippet shows an example of how the  
// USB_DEVICE_EndpointIsStalled() function can be used to obtain the  
// stall status of the endpoint 1 and IN direction.
```

```
USB_ENDPOINT ep;  
  
ep.endpoint = 1;  
ep.direction = USB_DATA_DIRECTION_DEVICE_TO_HOST;  
  
if(true == USB_DEVICE_EndpointIsStalled (handle, ep))  
{  
    // Endpoint stall is enabled. Clear the stall.  
    USB_DEVICE_EndpointStallClear(handle, ep);  
}
```

5.9.3.6.3.5 USB_DEVICE_EndpointStall Function**C**

```
USB_ERROR USB_DEVICE_EndpointStall(  
    USB_DEVICE_HANDLE usbDeviceHandle,  
    USB_ENDPOINT endpointAndDirection  
);
```

Description

This function stalls an endpoint in the specified direction.

Preconditions

Client handle should be valid.

Parameters

Parameters	Description
usbDeviceHandle	USB device handle returned by USB_DEVICE_Open() .
endpointAndDirection	Specifies the endpoint and direction.

Returns

USB_ERROR_NONE - The endpoint was successfully enabled. USB_ERROR_DEVICE_ENDPOINT_INVALID - If the endpoint that is being accessed is out of the valid endpoint defined for this driver instance.

Remarks

This function must not be called by the application clients. Application has no access to modify the endpoint features.

Example

```
// This code snippet shows an example of how to stall an endpoint. In  
// this case , endpoint 1 IN direction is stalled.
```

```
USB_ENDPOINT ep;  
  
ep.endpoint = 1;  
ep.direction = USB_DATA_DIRECTION_DEVICE_TO_HOST;  
  
USB_DEVICE_EndpointStall(handle, ep);
```

5.9.3.6.3.6 USB_DEVICE_EndpointStallClear Function**C**

```
USB_ERROR USB_DEVICE_EndpointStallClear(  
    USB_DEVICE_HANDLE usbDeviceHandle,  
    USB_ENDPOINT endpointAndDirection  
);
```

Description

This function clears the stall on an endpoint in the specified direction.

Preconditions

Client handle should be valid.

Parameters

Parameters	Description
usbDeviceHandle	USB device handle returned by USB_DEVICE_Open() .
endpointAndDirection	Specifies the endpoint and direction.

Returns

USB_ERROR_NONE - The endpoint was successfully enabled. USB_ERROR_DEVICE_ENDPOINT_INVALID - If the endpoint that is being accessed is out of the valid endpoint defined for this driver instance.

Remarks

This function must not be called by the application clients. Application has no access to modify the endpoint features.

Example

```
// This code snippet shows an example of how to clear a stall. In this  
// example. the stall on endpoint 1 IN direction is cleared.
```

```
USB_ENDPOINT ep;  
  
ep.endpoint = 1;  
ep.direction = USB_DATA_DIRECTION_DEVICE_TO_HOST;  
  
USB_DEVICE_EndpointStallClear(handle, ep);
```

5.9.3.6.3.7 USB_DEVICE_IRPCancelAll Function**C**

```
USB_ERROR USB_DEVICE_IRPCancelAll(  
    USB_DEVICE_HANDLE usbDeviceHandle,  
    USB_ENDPOINT endpointAndDirection  
);
```

Description

This function cancels all IRPs that are queued and in progress at the specified endpoint. The driver checks if IRPs are to be cancelled at two instances; when it has called the IRP callback and is ready to process the next IRP in the queue and when it is ready to process the next transaction in the the current IRP. It is recommended that this function be called in the IRP callback of the IRP that just completed as this ensures that an IRP in progress is not cancelled. Cancelling an IRP that is progress may cause disturbance to the USB host firmware. Cancelling the IRP from any other location, other than a IRP callback could cause an IRP that is in progress to get cancelled.

Preconditions

Client handle should be valid.

Parameters

Parameters	Description
usbDeviceHandle	USB device handle returned by USB_DEVICE_Open() .
endpointAndDirection	Specifies the endpoint and direction.

Returns

USB_ERROR_NONE - The endpoint was successfully enabled. USB_ERROR_DEVICE_ENDPOINT_INVALID - If the endpoint that is being accessed is out of the valid endpoint defined for this driver instance.

Remarks

This function must not be called by the application clients. Application has no access modify the IRPs.

Example

// This code snippet shows an exampl of how to cancel all IRPs.

```
void MyIRPCallback(USB_DEVICE_IRP * irp)
{
    // Check if this is setup command

    if(irp->status == USB_DEVICE_IRP_STATUS_SETUP)
    {
        if(IsSetupCommandSupported(irp->data) == false)
        {
            // This means that this setup command is not
            // supported. Stall the endpoint.

            USB_DEVICE_IRPCancelAll(handle, ep);
            USB_DEVICE_EndpointStall(handle, ep);
        }
    }
}
```

5.9.3.6.3.8 USB_DEVICE_IRPSubmit Function**C**

```
USB_ERROR USB_DEVICE_IRPSubmit(
    USB_DEVICE_HANDLE usbDeviceHandle,
    USB_ENDPOINT endpointAndDirection,
    USB_DEVICE_IRP * irp
);
```

Description

This function submits a I/O Request Packet (IRP) for processing to the USB Driver. The IRP allows a client to [send](#) and receive data from the USB Host. The data will sent or received through the specified endpoint. The direction of the data transfer is indicated by the direction flag in the endpointAndDirection structure. Submitting an IRP arms the endpoint to either [send](#) data to

or receive data from the host. If an IRP is under progress on the endpoint, then the subsequent IRP submit operation will result in the IRPs getting queued. The contents of the IRP should not be changed till the IRP has been processed.

Particular attention should be paid to the size parameter of IRP. The following should be noted:

- The size parameter while sending data to the host can be less than, greater than, equal to or be an exact multiple of maximum packet size for the endpoint. The maximum packet size for the endpoint determines the number of transactions required to process the IRP.
- If the size parameter while sending data to the host is less than maximum packet size, the transfer will complete in one transaction.
- If the size parameter while sending data to the host is greater than maximum packet size, the IRP will be processed in multiple transactions.
- If the size parameter while sending data to the host is equal to or an exact multiple of the maximum packet size, the client can optionally ask the driver to **send** a Zero Length packet by specifying the USB_DEVICE_IRP_FLAG_SEND_ZLP flag as the flag parameter.
- The size parameter while receiving data from the host must be an exact multiple of the maximum packet size of the endpoint. If this is not the case, the driver will return a USB_DEVICE_IRP_SUBMIT_RESULT_INVALID_SIZE result. If while processing the IRP, the driver receives less than maximum packet size or a ZLP from the host, the driver considers the IRP as processed. The size parameter at this point contains the actual amount of data received from the host.

Preconditions

Client handle should be valid.

Parameters

Parameters	Description
usbDeviceHandle	USB device handle returned by USB_DEVICE_Open() .
endpointAndDirection	Specifies the endpoint and direction.
irp	Pointer to the USB_DEVICE_IRP structure.

Returns

USB_ERROR_NONE - if the IRP was submitted successful. USB_ERROR_IRP_SIZE_INVALID - if the size parameter of the IRP is not correct. USB_ERROR_IRP_QUEUE_FULL - if the driver IRP queue is full.

Remarks

This function must not be called by the application clients. Application must not submit IRP directly.

Example

*// The following code snippet shows an example of how to schedule a
// IRP to send data from device to host. Assume that max packet size
// is 64 and endpoint is 1.*

```

USB_ENDPOINT ep;
USB_DEVICE_IRP irp;

ep.direction = USB_DATA_DIRECTION_DEVICE_TO_HOST;
ep.endpoint = 1;

irp.data = myDataBufferToSend;
irp.size = 130;
irp.flags = USB_DEVICE_IRP_FLAG_NONE;
irp.callback = MyIRPCompletionCallback;
irp.referenceData = (uintptr_t)&myDeviceLayerObj;

if (USB_DEVICE_IRPSubmit(handle, ep, irp)
    != USB_ERROR_NONE)
{

```

```

    // This means there was an error.
}
else
{
    // The status of the IRP can be checked.
    while(irp.status != USB_DEVICE_IRP_STATUS_COMPLETED)
    {
        // Wait or run a task routine.
    }
}

// The following code snippet shows how the client can request
// the driver to send a ZLP when the size is an exact multiple of
// end point size.

irp.data = myDataBufferToSend;
irp.size = 128;
irp.flags = USB_DEVICE_IRP_FLAG_SEND_ZLP;
irp.callback = MyIRPCompletionCallback;
irp.referenceData = (uintptr_t)&myDeviceLayerObj;

// Note that while receiving data from the host, the size should
// be an exact multiple maximum packet size of the endpoint. In the
// example below, the USB_DEVICE_IRPSubmit() function will
// return a USB_DEVICE_IRP_SUBMIT_RESULT_INVALID_SIZE value.

ep.direction = USB_DATA_DIRECTION_HOST_TO_DEVICE;
ep.endpoint = 1;

irp.data = myDataBufferToSend;
irp.size = 60; // THIS SIZE IS NOT CORRECT
irp.flags = USB_DEVICE_IRP_FLAG_NONE;
irp.callback = MyIRPCompletionCallback;
irp.referenceData = (uintptr_t)&myDeviceLayerObj;

```

5.9.3.6.4 Data Types and Constants

5.9.3.6.4.1 USB_DEVICE_INDEX_0 Macro

C

```
#define USB_DEVICE_INDEX_0 0
```

Description

USB Device Layer Index Numbers

These constants provide USB device layer index definitions.

Remarks

These constants should be used in place of hard-coded numeric literals.

These values should be passed into the [USB_DEVICE_Initialize](#) and [USB_DEVICE_Open](#) routines to identify the device layer instance in use.

5.9.3.6.4.2 USB_DEVICE_INDEX_1 Macro

C

```
#define USB_DEVICE_INDEX_1 1
```

Description

This is macro USB_DEVICE_INDEX_1.

5.9.3.6.4.3 USB_DEVICE_INDEX_2 Macro

C

```
#define USB_DEVICE_INDEX_2 2
```

Description

This is macro USB_DEVICE_INDEX_2.

5.9.3.6.4.4 USB_DEVICE_INDEX_3 Macro

C

```
#define USB_DEVICE_INDEX_3 3
```

Description

This is macro USB_DEVICE_INDEX_3.

5.9.3.6.4.5 USB_DEVICE_INDEX_4 Macro

C

```
#define USB_DEVICE_INDEX_4 4
```

Description

This is macro USB_DEVICE_INDEX_4.

5.9.3.6.4.6 USB_DEVICE_INDEX_5 Macro

C

```
#define USB_DEVICE_INDEX_5 5
```

Description

This is macro USB_DEVICE_INDEX_5.

5.9.3.6.4.7 USB_DEVICE_INDEX_COUNT Macro

C

```
#define USB_DEVICE_INDEX_COUNT _USB_DEVICE_EXISTS
```

Description

USB Device Layer Module Index Count

This constant identifies number of valid USB device layer indices.

Remarks

This constant should be used in place of hard-coded numeric literals.

This value is derived from part-specific header files defined as part of the peripheral libraries.

5.9.3.6.4.8 USB_DEVICE_CALLBACK Type

C

```
typedef void (* USB_DEVICE_CALLBACK)(USB_DEVICE_EVENT event, USB_DEVICE_EVENT_DATA *  
eventData);
```

Description

USB Device Layer Callback Function Pointer

This is the data type of the callback function that will be called by the USB device layer when there is a bus event from USB device layer.

Remarks

A USB Device Layer callback function must have the following function signature:

```
void MyCallBack ( USB\_DEVICE\_EVENT event, USB\_DEVICE\_EVENT\_DATA * eventData );
```

Where, "event" indicates an event on the USB device layer, and "MyCallBack" can be any name desired as the function is called through the pointer.

5.9.3.6.4.9 USB_DEVICE_CONFIG_DESCS_PTR Type

C

```
typedef uint8_t** USB\_DEVICE\_CONFIG\_DESCS\_PTR;
```

Description

Configuration descriptors pointer

5.9.3.6.4.10 USB_DEVICE_CONTROL_STATUS Enumeration

C

```
typedef enum {
    USB\_DEVICE\_CONTROL\_STATUS\_OK,
    USB\_DEVICE\_CONTROL\_STATUS\_ERROR
} USB\_DEVICE\_CONTROL\_STATUS;
```

Description

Control transfer status stage

Members

Members	Description
USB_DEVICE_CONTROL_STATUS_OK	Control transfer is supported. Send ZLP in the status stage.
USB_DEVICE_CONTROL_STATUS_ERROR	Control transfer is not supported. Stall control endpoint.

Remarks

Also see, [USB_DEVICE_ControlStatus](#)

5.9.3.6.4.11 USB_DEVICE_CONTROL_TRANSFER_CALLBACK Type

C

```
typedef void (* USB\_DEVICE\_CONTROL\_TRANSFER\_CALLBACK)(USB\_DEVICE\_CONTROL\_TRANSFER\_HANDLE
handle, USB\_DEVICE\_CONTROL\_TRANSFER\_EVENT event, USB\_DEVICE\_CONTROL\_TRANSFER\_EVENT\_DATA *
eventData);
```

Description

USB Device Layer control transfer callback Function Pointer

This is the data type of the callback function that will be called by the USB device layer when there is a control transfer event from USB device layer.

Remarks

A USB Device Layer callback function must have the following function signature:

```
void MyCallBack ( USB\_DEVICE\_EVENT event, USB_DEVICE );
```

Where, "event" indicates an event on the USB device layer, and "MyCallBack" can be any name desired as the function is called through the pointer.

5.9.3.6.4.12 USB_DEVICE_CONTROL_TRANSFER_EVENT Enumeration**C**

```
typedef enum {
    USB_DEVICE_CONTROL_TRANSFER_ABORTED,
    USB_DEVICE_CONTROL_DATA_RECEIVED,
    USB_DEVICE_CONTROL_SETUP_REQUEST,
    USB_DEVICE_CONTROL_DATA_SENT = 3
} USB_DEVICE_CONTROL_TRANSFER_EVENT;
```

Description

USB Device control transfer events

Members

Members	Description
USB_DEVICE_CONTROL_TRANSFER_ABORTED	Previous control transfer was aborted.
USB_DEVICE_CONTROL_DATA_RECEIVED	Control transfer data stage was completed
USB_DEVICE_CONTROL_SETUP_REQUEST	A setup packet was received and control transfer is in setup stage
USB_DEVICE_CONTROL_DATA_SENT = 3	Control transfer data stage transmit is complete

Remarks

None.

5.9.3.6.4.13 USB_DEVICE_CONTROL_TRANSFER_EVENT_DATA Union**C**

```
typedef union {
    USB_SETUP_PACKET * setupRequest;
} USB_DEVICE_CONTROL_TRANSFER_EVENT_DATA;
```

Description

USB Device control transfer event data.

Members

Members	Description
USB_SETUP_PACKET * setupRequest;	Data associated with USB_DEVICE_CONTROL_SETUP_REQUEST

Remarks

None.

5.9.3.6.4.14 USB_DEVICE_CONTROL_TRANSFER_HANDLE Type**C**

```
typedef uintptr_t USB_DEVICE_CONTROL_TRANSFER_HANDLE;
```

Description

Data type of control transfer handle.

This is the data type of the handle that must be used by the application client for all control transfers.

Remarks

Also see, [USB_DEVICE_ControlSend](#) [USB_DEVICE_ControlReceive](#) [USB_DEVICE_ControlStatus](#)

5.9.3.6.4.15 USB_DEVICE_CONTROL_TRANSFER_RESULT Enumeration**C**

```
typedef enum {  
    USB_DEVICE_CONTROL_TRANSFER_RESULT_FAILED,  
    USB_DEVICE_CONTROL_TRANSFER_RESULT_SUCCESS  
} USB_DEVICE_CONTROL_TRANSFER_RESULT;
```

Description

These enumerated values are the possible return values for control transfer operation.

Members

Members	Description
USB_DEVICE_CONTROL_TRANSFER_RESULT_FAILED	Control transfer failed. This could be because the control transfer handle is no more valid since the control transfer was aborted by host by sending a new setup packet
USB_DEVICE_CONTROL_TRANSFER_RESULT_SUCCESS	Control transfer was successful

Remarks

Also see, [USB_DEVICE_ControlSend](#) [USB_DEVICE_ControlReceive](#) [USB_DEVICE_ControlStatus](#)

5.9.3.6.4.16 USB_DEVICE_EVENT Enumeration**C**

```
typedef enum {  
    USB_DEVICE_EVENT_RESET,  
    USB_DEVICE_EVENT_SUSPENDED,  
    USB_DEVICE_EVENT_RESUMED,  
    USB_DEVICE_EVENT_ERROR,  
    USB_DEVICE_EVENT_SOF,  
    USB_DEVICE_EVENT_DETACHED,  
    USB_DEVICE_EVENT_DECONFIGURED,  
    USB_DEVICE_EVENT_CONFIGURED,  
    USB_DEVICE_EVENT_ATTACHED  
} USB_DEVICE_EVENT;
```

Description

Datatype that identifies the event that is active in the USB device layer.

Members

Members	Description
USB_DEVICE_EVENT_RESET	USB bus reset occurred. This event is an indication to the application client that device layer is about to de-initialize the function drivers. For application client, this event means that it has to close any open handles to function drivers
USB_DEVICE_EVENT_SUSPENDED	This event is an indication to the application client that device is suspended and it can put the device to power-down mode if required.
USB_DEVICE_EVENT_RESUMED	This event indicates that device has resumed from suspended state.

USB_DEVICE_EVENT_ERROR	This event is an indication to the application client that an error occurred on the USB bus

5.9.3.6.4.17 USB_DEVICE_EVENT_DATA Union

C

```
typedef union {
    USB_DEVICE_EVENT_DATA_CONFIGURED eventConfigured;
} USB_DEVICE_EVENT_DATA;
```

Members

Members	Description
USB_DEVICE_EVENT_DATA_CONFIGURED eventConfigured;	Data related to configured event

Remarks

Also see [USB_DEVICE_CALLBACK](#)

5.9.3.6.4.18 USB_DEVICE_EVENT_DATA_CONFIGURED Structure

C

```
typedef struct {
    uint8_t configurationValue;
    USB_SPEED speed;
} USB_DEVICE_EVENT_DATA_CONFIGURED;
```

Members

Members	Description
uint8_t configurationValue;	Configuration value selected by the host
USB_SPEED speed;	USB speed at which the device is connected to host

Remarks

Also see [USB_DEVICE_EVENT_DATA](#) [USB_DEVICE_CALLBACK](#)

5.9.3.6.4.19 USB_DEVICE_FUNC_REGISTRATION_TABLE Structure

C

```
typedef struct {
    USB_SPEED speed;
    uint8_t configurationValue;
    uint8_t interfaceNumber;
    uint8_t numberOfInterfaces;
    SYS_MODULE_INDEX funcDriverIndex;
    void* funcDriverInit;
    USB_DEVICE_FUNCTION_DRIVER* driver;
} USB_DEVICE_FUNC_REGISTRATION_TABLE;
```

Description

Global USB Device function registration structure

Members

Members	Description
USB_SPEED speed;	Type of speed (high, full or low speed)
uint8_t configurationValue;	Configuration Value to which the function driver has to be tied

uint8_t interfaceNumber;	Interface number to which this function driver has to be tied
uint8_t numberOfInterfaces;	Number of interfaces used by the function
SYS_MODULE_INDEX funcDriverIndex;	Function driver instance index
void* funcDriverInit;	Pointer to a structure that contains function driver initialization data
USB_DEVICE_FUNCTION_DRIVER* driver;	Pointer to a standard structure that exposes function driver APIs to USB device layer

5.9.3.6.4.20 USB_DEVICE_FUNCTION_DRIVER Structure

C

```
typedef struct {
    void (* initializeByDescriptor)(SYS_MODULE_INDEX funcDriverIndex, USB_DEVICE_HANDLE
usbDeviceHandle, void* funcDriverInit, uint8_t interfaceNumber, uint8_t alternateSetting,
uint8_t descriptorType, uint8_t * pDescriptor);
    void (* deInitialize)(SYS_MODULE_INDEX funcDriverIndex);
    void (* controlTransferNotification)(USB_DEVICE_CONTROL_TRANSFER_HANDLE controlHandle,
SYS_MODULE_INDEX index, USB_DEVICE_CONTROL_TRANSFER_EVENT controlEvent,
USB_DEVICE_CONTROL_TRANSFER_EVENT_DATA * controlEventData);
    void (* tasks)(SYS_MODULE_INDEX funcDriverIndex);
} USB_DEVICE_FUNCTION_DRIVER;
```

Description

USB function driver structure

All function drivers (including vendor specific ones) must provide callback functions to USB device layer in the format specified by this structure. The USB device layer calls these callback functions at the time of appropriate event.

Members

Members	Description
void (* initializeByDescriptor)(SYS_MODULE_INDEX funcDriverIndex, USB_DEVICE_HANDLE usbDeviceHandle, void* funcDriverInit, uint8_t interfaceNumber, uint8_t alternateSetting, uint8_t descriptorType, uint8_t * pDescriptor);	Initialize gets called by the Device layer when it receives set configuration event. The device layer will initialize a function driver for every descriptor. Based on the descriptor type the function driver has to initialize itself.
void (* deInitialize)(SYS_MODULE_INDEX funcDriverIndex);	deInit gets called when the device layer detects a device detach, change in configuration or on USB bus reset.
void (* controlTransferNotification)(USB_DEVICE_CONTROL_TRANSFER_HANDLE controlHandle, SYS_MODULE_INDEX index, USB_DEVICE_CONTROL_TRANSFER_EVENT controlEvent, USB_DEVICE_CONTROL_TRANSFER_EVENT_DATA * controlEventData);	This function will be called by the device layer when there is an interface specific setup packet request
void (* tasks)(SYS_MODULE_INDEX funcDriverIndex);	Function driver Tasks

Remarks

Even the vendor specific function drivers must provide callback functions in this format.

5.9.3.6.4.21 USB_DEVICE_HANDLE Type

C

```
typedef uintptr_t USB_DEVICE_HANDLE;
```

Description

Data type for USB device handle.

The data type of the handle that is returned from [USB_DEVICE_Open](#) function.

Remarks

None.

5.9.3.6.4.22 USB_DEVICE_INIT Structure

C

```
typedef struct {
    SYS_MODULE_INIT moduleInit;
    unsigned int usbID;
    bool stopInIdle;
    bool suspendInSleep;
    INT_SOURCE interruptSource;
    void * endpointTable;
    uint16_t registeredFuncCount;
    USB_DEVICE_FUNC_REGISTRATION_TABLE * registeredFunctions;
    USB_MASTER_DESCRIPTOR * usbMasterDescriptor;
    USB_SPEED deviceSpeed;
} USB_DEVICE_INIT;
```

Description

USB Device Initialization Structure

Members

Members	Description
SYS_MODULE_INIT moduleInit;	System module initialization
unsigned int usbID;	Identifies peripheral (PLIB-level) ID
bool stopInIdle;	Boolean flag: true -> Stop USB module in Idle Mode
bool suspendInSleep;	Boolean flag: true -> Suspend USB in Sleep Mode
INT_SOURCE interruptSource;	Interrupt Source for USB module
void * endpointTable;	Endpoint Table Buffer
uint16_t registeredFuncCount;	Number of function drivers registered to this instance of the USB device layer
USB_DEVICE_FUNC_REGISTRATION_TABLE * registeredFunctions;	Function driver table registered to this instance of the USB device layer
USB_MASTER_DESCRIPTOR * usbMasterDescriptor;	Pointer to USB Descriptor structure
USB_SPEED deviceSpeed;	Speed at which this device speed should operate

Remarks

Also see, [USB_DEVICE_Initialization](#)

5.9.3.6.4.23 USB_DEVICE_POWER_STATE Enumeration

C

```
typedef enum {
    USB_DEVICE_POWER_STATE_BUS_POWERED,
    USB_DEVICE_POWER_STATE_SELF_POWERED
} USB_DEVICE_POWER_STATE;
```

Description

Power state

Members

Members	Description
USB_DEVICE_POWER_STATE_BUS_POWERED	Device is bus powered
USB_DEVICE_POWER_STATE_SELF_POWERED	Device is self powered

Remarks

Also see, [USB_DEVICE_PowerStateSet](#)

5.9.3.6.4.24 USB_DEVICE_REMOTE_WAKEUP_STATUS Enumeration**C**

```
typedef enum {  
    USB_DEVICE_REMOTE_WAKEUP_DISABLED,  
    USB_DEVICE_REMOTE_WAKEUP_ENABLED  
} USB_DEVICE_REMOTE_WAKEUP_STATUS;
```

Description

Remote wakeup status

Members

Members	Description
USB_DEVICE_REMOTE_WAKEUP_DISABLED	Remote wakeup is disabled
USB_DEVICE_REMOTE_WAKEUP_ENABLED	Remote wakeup is enabled

Remarks

Also see, [USB_DEVICE_RemoteWakeupsEnabled](#)

5.9.3.6.4.25 USB_DEVICE_STATE Enumeration**C**

```
typedef enum {  
    USB_DEVICE_STATE_DETACHED,  
    USB_DEVICE_STATE_ATTACHED,  
    USB_DEVICE_STATE_POWERED,  
    USB_DEVICE_STATE_DEFAULT,  
    USB_DEVICE_STATE_ADDRESSED,  
    USB_DEVICE_STATE_CONFIGURED,  
    USB_DEVICE_STATE_SUSPENDED  
} USB_DEVICE_STATE;
```

Description

USB device states as described in chapter-9 of USB 2.0 specification

This data type identifies the USB Device States.

Members

Members	Description
USB_DEVICE_STATE_DETACHED	Device is not in any of the known USB states
USB_DEVICE_STATE_ATTACHED	Device is in attached state
USB_DEVICE_STATE_POWERED	Device is in powered state
USB_DEVICE_STATE_DEFAULT	Device is in default state
USB_DEVICE_STATE_ADDRESSED	Device is in addressed state
USB_DEVICE_STATE_CONFIGURED	Device is in configured state

USB_DEVICE_STATE_SUSPENDED	Device is in suspended state

Remarks

The USB specification doesn't define the state of a device when it is detached from the USB. The USB_DEVICE_STATE_DETACHED is not the standard state, but is required to indicate the user, that the device is not in any of the known states.

5.9.3.6.4.26 USB_DEVICE_STRING_DESCS_PTR Type**C**

```
typedef uint8_t** USB_DEVICE_STRING_DESCS_PTR;
```

Description

String descriptors pointer

5.9.3.6.4.27 USB_MASTER_DESCRIPTOR Structure**C**

```
typedef struct {
    uint8_t* ptrDeviceDescriptor;
    uint8_t configDescriptorCount;
    USB_DEVICE_CONFIG_DESCS_PTR ptrConfigDescriptor;
    uint8_t* ptrHighSpeedDeviceDescriptor;
    uint8_t highSpeedConfigDescriptorCount;
    USB_DEVICE_CONFIG_DESCS_PTR ptrHighSpeedConfigDescriptor;
    uint8_t stringDescCount;
    USB_DEVICE_STRING_DESCS_PTR ptrStringDesc;
    uint8_t* ptrFullSpeedDeviceQualifier;
    uint8_t* ptrHighSpeedDeviceQualifier;
} USB_MASTER_DESCRIPTOR;
```

Description

Global USB Descriptor Structure.

Members

Members	Description
uint8_t* ptrDeviceDescriptor;	Pointer to standard device descriptor (for low/full speed)
uint8_t configDescriptorCount;	Total number configurations available (for low/full speed)
USB_DEVICE_CONFIG_DESCS_PTR ptrConfigDescriptor;	Pointer to array of configurations descriptor pointers (for low/full speed)
uint8_t* ptrHighSpeedDeviceDescriptor;	Pointer to array of high speed standard Device descriptor. Assign this to NULL if not supported.
uint8_t highSpeedConfigDescriptorCount;	Total number of high speed configurations available. Set this to zero if not supported
USB_DEVICE_CONFIG_DESCS_PTR ptrHighSpeedConfigDescriptor;	Pointer to array of high speed configurations descriptor pointers. Set this to NULL if not supported
uint8_t stringDescCount;	Total number of string descriptors available (common to all speeds)
USB_DEVICE_STRING_DESCS_PTR ptrStringDesc;	Pointer to array of string Descriptor pointers (common to all speeds)
uint8_t* ptrFullSpeedDeviceQualifier;	Pointer to full speed device_qualifier descriptor. Device responds with this descriptor when it is operating at high speed
uint8_t* ptrHighSpeedDeviceQualifier;	Pointer to high speed device_qualifier descriptor. Device responds with this descriptor when it is operating at full speed

5.9.3.6.4.28 USB_DEVICE_ENDPOINT_TABLE_SIZE Macro

C

```
#define USB_DEVICE_ENDPOINT_TABLE_SIZE (DRV_USB_ENDPOINTS_NUMBER *  
DRV_USB_ENDPOINT_TABLE_ENTRY_SIZE)
```

Description

This is macro USB_DEVICE_ENDPOINT_TABLE_SIZE.

5.9.3.6.4.29 USB_DEVICE_HANDLE_INVALID Macro

C

```
#define USB_DEVICE_HANDLE_INVALID ((USB_DEVICE_HANDLE)(-1))
```

Description

USB Device Layer invalid handle

5.9.3.7 Files

Files

Name	Description
usb_device.h	USB Device Layer Interface Header
usb_device_config_template.h	USB device configuration template header file.

Description

5.9.3.7.1 usb_device.h

USB Device Layer Interface Definition

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the USB device layer.

Enumerations

	Name	Description
	USB_DEVICE_CONTROL_STATUS	This enumerated data-type identifies the status stage of control transfer.
	USB_DEVICE_CONTROL_TRANSFER_EVENT	This datatype defines the different control transfer events.
	USB_DEVICE_CONTROL_TRANSFER_RESULT	Enumerated data type identifying results of a control transfer.
	USB_DEVICE_EVENT	Enumerated data-type identifying the bus events that has occurred in the USB device layer.
	USB_DEVICE_POWER_STATE	Enumerated data type that identifies if the device is self powered or bus powered .
	USB_DEVICE_REMOTE_WAKEUP_STATUS	Enumerated data type that identifies if the remote wakeup status of the device.
	USB_DEVICE_STATE	Standard USB device states as described in Chapter-9 of USB 2.0 Specification.

Functions

	Name	Description
	<u>USB_DEVICE_Attach</u>	This function will attach the device to the USB.
	<u>USB_DEVICE_ClientStatus</u>	Gets the current client-specific status of the USB device layer.
	<u>USB_DEVICE_Close</u>	Closes an opened handle to an instance of the USB device layer.
	<u>USB_DEVICE_ControlEventCallBackSet</u>	Client can register its call-back function into the device layer to get control transfer events.
	<u>USB_DEVICE_ControlReceive</u>	Receives data stage of the control transfer from host to device.
	<u>USB_DEVICE_ControlSend</u>	Sends data stage of the control transfer from device to host.
	<u>USB_DEVICE_ControlStatus</u>	Initiates status stage of the control transfer.
	<u>USB_DEVICE_Deinitialize</u>	Deinitializes the specified instance of the USB device layer.
	<u>USB_DEVICE_Detach</u>	This function will detach the device from the USB.
	<u>USB_DEVICE_EndpointDisable</u>	This function disables an endpoint.
	<u>USB_DEVICE_EndpointEnable</u>	This function enables a endpoint for the specified direction and endpoint size.
	<u>USB_DEVICE_EndpointIsEnabled</u>	This function returns the enable/ disable status of the specified endpoint and direction.
	<u>USB_DEVICE_EndpointIsStalled</u>	This function returns the stall status of the specified endpoint and direction.
	<u>USB_DEVICE_EndpointStall</u>	This function stalls an endpoint in the specified direction.
	<u>USB_DEVICE_EndpointStallClear</u>	This function clears the stall on an endpoint in the specified direction.
	<u>USB_DEVICE_EventCallBackSet</u>	Client can register its call-back function into the device layer.
	<u>USB_DEVICE_GetConfigurationValue</u>	Informs the client of the current USB device configuration set by the USB host.
	<u>USB_DEVICE_GetDeviceSpeed</u>	Informs the client of the current operation speed of the USB bus.
	<u>USB_DEVICE_GetDeviceState</u>	Returns the current state of the USB device.
	<u>USB_DEVICE_Initialize</u>	Creates and initializes an instance of the USB device layer.
	<u>USB_DEVICE_IRPCancelAll</u>	This function cancels all IRPs that are queued and in progress at the specified endpoint.
	<u>USB_DEVICE_IRPSubmit</u>	This function submits a I/O Request Packet (IRP) for processing to the USB Driver.
	<u>USB_DEVICE_Open</u>	Opens the specified USB device layer instance and returns a handle to it.
	<u>USB_DEVICE_PowerStateSet</u>	Sets power state of the device.
	<u>USB_DEVICE_Reinitialize</u>	Reinitializes the USB device layer
	<u>USB_DEVICE_RemoteWakeupIsEnabled</u>	Gets the "Remote wakeup" status of the device.
	<u>USB_DEVICE_ResumeStart</u>	This function will start the resume signalling.
	<u>USB_DEVICE_ResumeStop</u>	This function will stop the resume signalling.
	<u>USB_DEVICE_Status</u>	Provides the current status of the USB device layer
	<u>USB_DEVICE_Tasks</u>	USB Device layer calls all other function driver tasks in this function. It also generates and forwards events to its clients.

Macros

	Name	Description
	<u>USB_DEVICE_ENDPOINT_TABLE_SIZE</u>	This is macro USB_DEVICE_ENDPOINT_TABLE_SIZE.
	<u>USB_DEVICE_HANDLE_INVALID</u>	Macro that defines the value of invalid device handle.
	<u>USB_DEVICE_INDEX_0</u>	USB device layer index definitions.

	USB_DEVICE_INDEX_1	This is macro USB_DEVICE_INDEX_1.
	USB_DEVICE_INDEX_2	This is macro USB_DEVICE_INDEX_2.
	USB_DEVICE_INDEX_3	This is macro USB_DEVICE_INDEX_3.
	USB_DEVICE_INDEX_4	This is macro USB_DEVICE_INDEX_4.
	USB_DEVICE_INDEX_5	This is macro USB_DEVICE_INDEX_5.
	USB_DEVICE_INDEX_COUNT	Number of valid USB Device Layer indices

Structures

	Name	Description
	USB_DEVICE_EVENT_DATA_CONFIGURED	Data-type that holds the data related to USB device configured event.
	USB_DEVICE_FUNC_REGISTRATION_TABLE	A function driver has to be registered with the USB device layer using this structure.
	USB_DEVICE_FUNCTION_DRIVER	A function driver has to expose standard APIs to device layer using following structure.
	USB_DEVICE_INIT	This structure has to be initialized by the system/application and must be passed as parameter to USB_DEVICE_Initialize() .
	USB_MASTER_DESCRIPTOR	Global USB descriptor structure containing pointers to standard USB descriptor structures.

Types

	Name	Description
	USB_DEVICE_CALLBACK	Pointer to a USB Device Layer callback function data type for bus events.
	USB_DEVICE_CONFIG_DESCS_PTR	Pointer to an array that contains pointer to configuration descriptors.
	USB_DEVICE_CONTROL_TRANSFER_CALLBACK	
	USB_DEVICE_CONTROL_TRANSFER_HANDLE	Data type of USB device control transfer handle.
	USB_DEVICE_HANDLE	Data type for USB device handle.
	USB_DEVICE_STRING_DESCS_PTR	Pointer to an array that contains pointer to string descriptors.

Unions

	Name	Description
	USB_DEVICE_CONTROL_TRANSFER_EVENT_DATA	USB device control transfer event data.
	USB_DEVICE_EVENT_DATA	Data associated with USB bus events.

USB Device Layer Compile Time Options

This file contains USB device layer compile time options (macros) that are to be configured by the user. This file is a template file and must be used as an example only. This file must not be directly included in the project.

Macros

	Name	Description
	<u>USB_DEVICE_MAX_CLIENTS</u>	Sets the maximum possible number of clients an instance of the USB device can open using <u>USB_DEVICE_Open</u> .
	<u>USB_DEVICE_MAX_FUNCTION_DRIVER</u>	Sets the maximum number of function drivers at a time that are supported by an instance of the USB device layer.
	<u>USB_DEVICE_MAX_INSTANCES</u>	Sets the maximum possible number of instances of the USB device that can be instantiated by using <u>USB_DEVICE_Initialize()</u> routine.

5.9.4 USB Device CDC Library

5.9.4.1 Introduction

Introduces the MPLAB Harmony USB Device CDC Library

Description

The MPLAB Harmony USB Device CDC library provides a high-level abstraction of the Universal Serial Bus (USB) Communications Device Class (CDC). This function driver is a part of the MPLAB Harmony USB Device stack. The library offers a convenient C language interface and supports revision 1.2 of the USB CDC specification release.

The USB Communications Device Class (or USB CDC) is a composite Universal Serial Bus device class. The communications device class is primarily used for

- Telecommunication Devices (analog modems, ISDN terminal adapters, digital telephones, and analog phones)
- Networking Devices (ADSL modems, cable modems and Ethernet cross-over cables).

USB CDC specification, and associated subclass specifications, do not attempt to redefine existing standards for connection and control of communications services. The Communications Class defines mechanisms for a device and host to identify which existing protocols to use. Where possible, existing data formats are used and the transport of these formats are merely enabled by the USB through the definition of the appropriate descriptors, interfaces, and requests.

The MPLAB Harmony USB Device CDC library (also referred to as CDC function driver in this document) offers services to the application to interact and respond to the host requests.

5.9.4.2 Release Notes

MPLAB Harmony Version: v0.70b **USB Device CDC Library Version :** 0.01 Alpha **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.9.4.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.9.4.4 Library Architecture

5.9.4.4.1 Abstraction Model

Provides an Architectural Overview of the CDC Function Driver.

Description

The CDC Function Driver offers services to a USB CDC device to communicate with the host by abstracting the USB specification details. It must be used along with the USB Device layer and USB controller to communicate with the USB host. Figure 1 shows a block diagram representation of the MPLAB Harmony USB Architecture and where the USB CDC Function Driver is placed.

Figure 1: USB CDC Function Driver

The USB controller driver takes the responsibility of managing the USB peripheral on the device. The USB device layer handles the device enumeration etc. The USB Device layer forwards all CDC specific control transfers to the CDC Function Driver. The CDC Function Driver ACM sub-layer interprets the control transfers and requests application's intervention through event handlers and well defined set of API. The application must register a event handler with the CDC function driver in the Device Layer Set Configuration Event. While the application must respond to the CDC ACM events, it can do this either in the event handler or out of it. The application interacts directly with the CDC Function Driver to [send](#)/receive data and to [send](#) serial state notifications.

As per the CDC specification, a USB CDC device is a collection of following interfaces.

- Communication Interface (Device Management) on endpoint 0
- Communication Interface (Notification) on an interrupt endpoint. This is optional
- Data Interface (either a bulk or isochronous endpoint). This is optional.

Figure 2: CDC Function Driver Architecture

Figure 2 shows the architecture of the CDC Function Driver. The device management on end point zero is handled by the device library(class specific requests are routed to the CDC function driver by USB Device Layer). So an instance of CDC function driver actually consists of a data interface and a notification interface. The library is implemented in two .c files. The `usb_device_cdc.c` file implements the CDC data and serial state notification. The `usb_device_cdc_acm.c` file implements the control transfer interpretation and and event generation.

5.9.4.4.2 Abstract Control Model (ACM)

Describes the various ACM commands supported by this CDC Function Driver Implementation

Description

One of the basic supported models for communication by CDC is POTS (Plain Old Telephone Service). The POTS model is for devices that communicate via ordinary phone lines and generic COM port devices. The USB CDC specification refers to this basic model as PSTN (Public Switched Telephone Network).

Depending on the amount of data processing the device is responsible for POTS/PSTN is divided into several models. The processing of data can include modulation, demodulation, error correction and data compression.

Of the supported PSTN models, this CDC function driver implements Abstract Control Model (ACM). In the ACM the device handles modulation, demodulation and handles V.25ter (AT) commands. This model (ACM) also supports requests and notifications to get and set R-232 status, control and asynchronous port part parameters. Virtual COM port devices use Abstract Control Model.

The following sections describe the management requests and notifications supported by the CDC ACM function driver.

Management Requests:

The host requests/sends some information in the form of management requests on the bi-directional end-point 0. Table 1 shows the CDC specification ACM sub class management requests and how these request are handled by the CDC Function Driver.

Request Code	Required/Optional	Comments
SEND_ENCAPSULATED_COMMAND	Required	Implemented by CDC Function Driver ACM layer. This request is stalled.
GET_ENCAPSULATED_RESPONSE	Required	Implemented by CDC Function Driver ACM layer. This request is stalled.
SET_COMM_FEATURE	Optional	Not Implemented
GET_COMM_FEATURE	Optional	Not Implemented
CLEAR_COMM_FEATURE	Optional	Not Implemented
SET_LINE_CODING	Optional	Implemented by CDC Function Driver ACM layer. Requires application response
GET_LINE_CODING	Optional	Implemented by CDC Function Driver ACM layer. Requires application response
SET_CONTROL_LINE_STATE	Optional	Implemented by CDC Function Driver ACM layer. Requires application response
SEND_BREAK	Optional	Implemented by CDC Function Driver ACM layer. Requires application response

Table 1: CDC ACM management requests and CDC Function Driver support status.

5.9.4.5 Using the Library

5.9.4.5.1 Files to Include

Describes which files to include in project while using the CDC Function Driver

Description

Table 2 shows the files that must be included in the project in order to use the CDC Function Driver. These files are located in the framework folder of the MPLAB Harmony installation. It is assumed that the Device Layer files (and the files needed by the Device Layer) are already included in the project.

Filename	Description
\\framework\\usb\\src\\dynamic\\usb_device_cdc.c	Contains the CDC data and serial notification transfer functions implementation.
\\framework\\usb\\src\\dynamic\\usb_device_cdc_acm.c	Implements the control transfer interpretation and and event generation of CDC-ACM events.
\\framework\\usb\\ usb_device_cdc.h	Must included in every source file that needs to invoke CDC function driver API.
system_config.h	User created file which contains the CDC function driver configuration.

Table 2: Files to be included in USB CDC Device Project.

5.9.4.5.2 Library Configuration

Describes how to configure the CDC Function Driver

Description

The application designer must specify the following configuration parameters while using the CDC Function Driver. The configuration macros that implement these parameters must be located in the system_config.h file in the application project and a compiler include path (to point to the folder that contains this file) should be specified.

Configuration Macro Name	Description	Comments
USB_DEVICE_CDC_INSTANCES_NUMBER	Number of CDC Function Driver Instances in the application	This macro defines the number of instances of the CDC Function Driver. For example, if the application needs to implement two instances of the CDC Function Driver (to create two COM ports) on one USB Device, the macro should be set to 2. Note that implementing a USB Device that features multiple CDC interfaces requires appropriate USB configuration descriptors.
USB_DEVICE_CDC_QUEUE_SIZE	CDC Function Driver Buffer Combined Queue size	This macro defines the number of entries in all queues in all instances of the CDC function driver. This value can be obtained by adding up the read and write queue sizes of each CDC Function driver instance. In a simple single instance USB CDC device application, that does not require buffer queuing and serial state notification, the USB_DEVICE_CDC_QUEUE_SIZE macro can be set to 2. Consider a case with two CDC function driver instances, CDC 1 has a read queue size of 2 and write queue size of 3, CDC 2 has a read queue size of 4 and write queue size of 1, this macro should be set to 10 (2 + 3 + 4 + 1).

5.9.4.5.3 Library Initialization

Describes how the CDC Function Driver is initialized.

Description

The CDC function driver instance for a USB device configuration is initialized by the Device Layer when the configuration is set by the host. This process does not require application intervention. Each instance of the CDC function driver should be registered with the Device layer through the Device Layer Function Driver Registration Table. The CDC function driver does not require a initialization data structure. The funcDriverInit member of the function driver registration table entry for the CDC function driver instance should be set to NULL. The cdcFuncDriver object is a global object provided by the CDC function driver and points to the CDC function driver - Device Layer interface functions which are required by the Device Layer. The code snippet below shows an example of how multiple instances of CDC Function driver can be registered with the Device Layer.

```

/* This code snippet shows an example of how two CDC function
 * driver instances can be registered with the Device Layer
 * via the Device Layer Function Driver Registration Table.
 * In this case Device Configuration 1 consists of two CDC
 * function driver instances. */

/* Define the CDC initialization data structure for CDC instance 0.
 * Set read queue size to 2 and write queue size to 3 */

const USB_DEVICE_CDC_INIT cdcInit0 = {.queueSizeRead = 2, .queueSizeWrite = 3};

```

```

/* Define the CDC initialization data structure for CDC instance 1.
 * Set read queue size to 4 and write queue size to 1 */

const USB_DEVICE_CDC_INIT cdcInit1 = {.queueSizeRead = 4, .queueSizeWrite = 1};

const USB_DEVICE_FUNC_REGISTRATION_TABLE funcRegistrationTable[2] =
{
    /* This is the first instance of the CDC Function Driver */
    {
        .speed = USB_SPEED_FULL|USB_SPEED_HIGH, // Supported speed
        .configurationValue = 1, // To be initialized for Configuration 1
        .interfaceNumber = 0, // Starting interface number.
        .numberOfInterfaces = 2, // Number of interfaces in this instance
        .funcDriverIndex = 0, // Function Driver instance index is 0
        .funcDriverInit = &cdcInit0, // Function Driver initialization data structure
        .driver = &cdcFuncDriver // Pointer to Function Driver - Device Layer interface
    },
    /* This is the second instance of the CDC Function Driver */
    {
        .speed = USB_SPEED_FULL|USB_SPEED_HIGH, // Supported speed
        .configurationValue = 1, // To be initialized for Configuration 1
        .interfaceNumber = 2, // Starting interface number.
        .numberOfInterfaces = 2, // Number of interfaces in this instance
        .funcDriverIndex = 1, // Function Driver instance index is 1
        .funcDriverInit = &cdcInit1, // Function Driver initialization data structure
        .driver = &cdcFuncDriver // Pointer to Function Driver - Device Layer interface
    },
};

```

5.9.4.5.4 Event Handling

Describes CDC function driver event handler registration and event handling.

Description

Registering a CDC Function Driver Event Handler:

While creating a USB CDC Device based application, an event handler must be registered with the Device Layer (the Device Layer Event Handler) and every CDC function driver instance (CDC Function Driver Event Handler). The CDC function driver event handler receives CDC and CDC ACM events. This event handler should be registered before the USB device layer acknowledges the SET CONFIGURATION request from the USB Host. In order to ensure this, the event handler should be set in the USB_DEVICE_EVENT_CONFIGURED event that is generated by the device layer. While registering the CDC function driver event handler, the CDC function driver allows the application to also pass a application context object. This object gets associated with the instance of the CDC function driver and is returned by the CDC function driver when a CDC function driver event occurs. The code example below shows an example of how this can be done.

```

/* This a sample Application Device Layer Event Handler
 * Note how the CDC Function Driver event handler APP_USBDeviceCDCEventHandler()
 * is registered in the USB_DEVICE_EVENT_CONFIGURED event. The appData
 * object that is passed in the USB_DEVICE_CDC_EventHandlerSet()
 * function will be returned as the userData parameter in the
 * when the APP_USBDeviceCDCEventHandler() function is invoked */

void APP_USBDeviceEventCallBack ( USB_DEVICE_EVENT event,
                                USB_DEVICE_EVENT_DATA * eventData )
{
    switch ( event )
    {
        case USB_DEVICE_EVENT_RESET:
        case USB_DEVICE_EVENT_DECONFIGURED:

```

```

    // USB device is reset or device is deconfigured.
    // This means that USB device layer is about to deinitalize
    // all function drivers.

    break;

case USB_DEVICE_EVENT_CONFIGURED:

    /* check the configuration */
    if ( eventData->eventConfigured.configurationValue == 1)
    {

        /* Register the CDC Device application event handler here.
        * Note how the appData object pointer is passed as the
        * user data */

        USB_DEVICE_CDC_EventHandlerSet(USB_DEVICE_CDC_INDEX_0,
            APP_USBDeviceCDCEventHandler, (uintptr_t)&appData);

        /* mark that set configuration is complete */
        appData.isConfigured = true;

    }
    break;

case USB_DEVICE_EVENT_SUSPENDED:

    break;

case USB_DEVICE_EVENT_RESUMED:
case USB_DEVICE_EVENT_ATTACHED:
case USB_DEVICE_EVENT_DETACHED:
case USB_DEVICE_EVENT_ERROR:
default:
    break;
}
}

```

CDC Function Driver Events:

The CDC Function Driver generates events that the application must respond. Some of these events are management requests communicated through control transfers. The application must therefore complete the control transfer. Based on the generated event, the application may be required to:

- Respond with a [USB_DEVICE_CDC_ControlSend\(\)](#) function which completes the data stage of a Control Read Transfer.
- Respond with a [USB_DEVICE_CDC_ControlReceive\(\)](#) function which provisions the data stage of a Control Write Transfer.
- Respond with a [USB_DEVICE_CDC_ControlStatus\(\)](#) function which completes the handshake stage of the Control Transfer. The application can either STALL or Acknowledge the handshake stage via the [USB_DEVICE_CDC_ControlStatus\(\)](#) function.
- Analyze the pData member of the event handler and check for event specific data. This data member should be type cast to an event specific data type. The table below shows the event and the data type to use while type casting. Note that the pData member is not required for all events

CDC Function Driver Event	Related pData type
USB_DEVICE_CDC_EVENT_SET_LINE_CODING	Not Applicable
USB_DEVICE_CDC_EVENT_GET_LINE_CODING	Not Applicable
USB_DEVICE_CDC_EVENT_SET_CONTROL_LINE_STATE	USB_DEVICE_CDC_EVENT_DATA_SET_CONTROL_LINE_STATE *

USB_DEVICE_CDC_EVENT_SEND_BREAK	USB_DEVICE_CDC_EVENT_DATA_SEND_BREAK *
USB_DEVICE_CDC_EVENT_WRITE_COMPLETE	USB_DEVICE_CDC_EVENT_DATA_WRITE_COMPLETE *
USB_DEVICE_CDC_EVENT_READ_COMPLETE	USB_DEVICE_CDC_EVENT_DATA_READ_COMPLETE *
USB_DEVICE_CDC_EVENT_SERIAL_STATE_NOTIFICATION_COMPLETE	USB_DEVICE_CDC_EVENT_DATA_SERIAL_STATE_NOTIFICATION_COMPLETE *
USB_DEVICE_CDC_EVENT_CONTROL_TRANSFER_DATA_SENT	Not Applicable
USB_DEVICE_CDC_EVENT_CONTROL_TRANSFER_DATA_RECEIVED	Not Applicable

The possible CDC Function Driver events are described here along with the required application response, event specific data and likely follow up function driver event:

1. USB_DEVICE_CDC_EVENT_SET_LINE_CODING

Application Response: This event occurs when the host issues a SET LINE CODING command. The application must provide a [USB_DEVICE_CDC_EVENT_DATA_SET_LINE_CODING](#) data structure to the device layer to receive the line coding data that the host will provide. The application must provide the buffer by calling the [USB_DEVICE_CDC_ControlReceive\(\)](#) function either in the event handler or in the application (outside of the event handler function). The application must use the controlTransferHandle parameter provided in the event while calling [USB_DEVICE_CDC_ControlReceive\(\)](#) function. The application can use the USB_DEVICE_CDC_EVENT_CONTROL_TRANSFER_DATA_SENT event to track completion of the command.

Event Specific Data (pData): The pData parameter will be NULL.

Likely Follow-up event: This event will likely be followed by the USB_DEVICE_CDC_EVENT_CONTROL_TRANSFER_DATA_RECEIVED event. This indicates that the data was received successfully. The application must either acknowledge or stall the handshake stage of the control transfer by calling [USB_DEVICE_ControlStatus\(\)](#) function with USB_DEVICE_CONTROL_STATUS_OK or USB_DEVICE_CONTROL_STATUS_ERROR flag respectively.

2. USB_DEVICE_CDC_EVENT_GET_LINE_CODING

Application Response: This event occurs when the host issues a GET LINE CODING command. The application must provide a [USB_DEVICE_CDC_EVENT_DATA_GET_LINE_CODING](#) data structure to the device layer that contains the line coding data that to be provided to the host. The application must provide the buffer by calling the [USB_DEVICE_CDC_ControlSend\(\)](#) function either in the event handler or in the application (outside of the event handler function). The application must use the controlTransferHandle parameter provided in the event while calling [USB_DEVICE_CDC_ControlSend\(\)](#) function. The size of the buffer is indicated by the length parameter. The application can use the USB_DEVICE_CDC_EVENT_CONTROL_TRANSFER_DATA_SENT event to track completion of the command.

Event Specific Data (pData): The pData parameter will be NULL.

Likely Follow-up event: This event will likely be followed by the USB_DEVICE_CDC_EVENT_CONTROL_TRANSFER_DATA_SENT event. This indicates that the data was sent to the host successfully. The application must acknowledge the handshake stage of the control transfer by calling [USB_DEVICE_CDC_ControlStatus\(\)](#) function with USB_DEVICE_CONTROL_STATUS_OK flag.

3. USB_DEVICE_CDC_EVENT_SET_CONTROL_LINE_STATE

Application Response: This event occurs when the host issues a SET CONTROL LINE STATE command. . The application can then use the [USB_DEVICE_CDC_ControlStatus\(\)](#) function to indicate acceptance or rejection of the command. The [USB_DEVICE_CDC_ControlStatus\(\)](#) function can be called from the event handler or in the application (out of the event handler context). The application should use the controlTransferHandle while calling the [USB_DEVICE_ControlStatus\(\)](#) function.

Event Specific Data (pData): The application must interpret the pData parameter as a pointer to a [USB_DEVICE_CDC_EVENT_DATA_SET_CONTROL_LINE_STATE](#) data type that contains the control line state data.

Likely Follow-up event: None.

4. USB_DEVICE_CDC_EVENT_SEND_BREAK

Application Response: This event occurs when the host issues a SEND BREAK command. The application can then use the [USB_DEVICE_CDC_ControlStatus\(\)](#) function to indicate acceptance or rejection of the command. The [USB_DEVICE_CDC_ControlStatus\(\)](#) function can be called from the event handler or in the application (out of the event handler context). The application should use the controlTransferHandle while calling the [USB_DEVICE_CDC_ControlStatus\(\)](#) function.

Event Specific Data (pData): The application must interpret the pData parameter as a pointer to a [USB_DEVICE_CDC_EVENT_DATA_SEND_BREAK](#) data type that contains the break duration data.

Likely Follow-up event: None.

5. USB_DEVICE_CDC_EVENT_WRITE_COMPLETE

Application Response: This event occurs when a write operation scheduled by calling the [USB_DEVICE_CDC_Write\(\)](#) function has completed. This event does not require the application to respond with any function calls..

Event Specific Data (pData): The pData member in the event handler will point to [USB_DEVICE_CDC_EVENT_DATA_WRITE_COMPLETE](#) type.

Likely Follow-up event: None.

6. USB_DEVICE_CDC_EVENT_READ_COMPLETE

Application Response: This event occurs when a read operation scheduled by calling the [USB_DEVICE_CDC_Read\(\)](#) function has completed. This event does not require the application to respond with any function calls..

Event Specific Data (pData): The pData member in the event handler will point to [USB_DEVICE_CDC_EVENT_DATA_READ_COMPLETE](#) type.

Likely Follow-up event: None.

7. USB_DEVICE_CDC_EVENT_SERIAL_STATE_NOTIFICATION_COMPLETE

Application Response: This event occurs when a serial state notification [send](#) scheduled by calling the [USB_DEVICE_CDC_SerialStateNotificationSend\(\)](#) function has completed. This event does not require the application to respond with any function calls..

Event Specific Data (pData): The pData member in the event handler will point to [USB_DEVICE_CDC_EVENT_DATA_SERIAL_STATE_NOTIFICATION_COMPLETE](#) type.

Likely Follow-up event: None.

8. USB_DEVICE_CDC_EVENT_CONTROL_TRANSFER_DATA_SENT

Application Response: This event occurs when the data stage of a control read transfer has completed in response to the [USB_DEVICE_CDC_ControlSend\(\)](#) function (in the USB_DEVICE_CDC_EVENT_GET_LINE_CODING event). The application must acknowledge the handshake stage of the control transfer by calling [USB_DEVICE_CDC_ControlStatus\(\)](#) function with USB_DEVICE_CONTROL_STATUS_OK flag.

Event Specific Data (pData): The pData parameter will be NULL.

Likely Follow-up event: None.

9. USB_DEVICE_CDC_EVENT_CONTROL_TRANSFER_DATA_RECEIVED

Application Response: This event occurs when the data stage of a control write transfer has completed in response to the `USB_DEVICE_CDC_ControlReceive()` function (in the `USB_DEVICE_CDC_EVENT_SET_LINE_CODING` event). The application must either acknowledge or stall the handshake stage of the control transfer by calling `USB_DEVICE_CDC_ControlStatus()` function with `USB_DEVICE_CONTROL_STATUS_OK` or `USB_DEVICE_CONTROL_STATUS_ERROR` flag respectively.

Event Specific Data (pData): The pData parameter will be NULL.

Likely Follow-up event: None.

CDC Function Driver Event Handling:

The following code snippet shows an example event handling scheme. The application always returns from the event handler with a `USB_DEVICE_CDC_EVENT_RESPONSE_NONE` value.

```
// This code example shows all CDC Function Driver possible events
// and a possible scheme for handling these events. In this case
// event responses are not deferred.

USB_DEVICE_CDC_EVENT_DATA_SET_LINE_CODING_DATA setLineCodingData;
USB_DEVICE_CDC_EVENT_DATA_GET_LINE_CODING_DATA getLineCodingData;
USB_DEVICE_CDC_EVENT_DATA_SET_CONTROL_LINE_STATE_DATA controlLineStateData;
USB_DEVICE_CDC_EVENT_DATA_SEND_BREAK_DATA breakData;

USB_DEVICE_CDC_EVENT_RESPONSE USBDeviceCDCEventHandler
(
    USB_DEVICE_CDC_INDEX instanceIndex,
    USB_DEVICE_CDC_EVENT event,
    uintptr_t controlTransferHandle,
    void * data,
    uintptr_t userData
)
{
    switch(event)
    {
        case USB_DEVICE_CDC_EVENT_SET_LINE_CODING:
            // In this case, the application should read the line coding
            // data that is sent by the host.

            USB_DEVICE_CDC_ControlReceive(usbDeviceHandle, controlTransferHandle
                                           &setLineCodingData,
                                           sizeof(USB_DEVICE_CDC_EVENT_DATA_SET_LINE_CODING));

            break;

        case USB_DEVICE_CDC_EVENT_GET_LINE_CODING:
            // In this case, the application should send the line coding
            // data to the host.

            USB_DEVICE_CDC_ControlSend(usbDeviceHandle, controlTransferHandle
                                       &getLineCodingData,
                                       sizeof(USB_DEVICE_CDC_EVENT_DATA_GET_LINE_CODING));

            break;

        case USB_DEVICE_CDC_EVENT_SET_CONTROL_LINE_STATE:
            // In this case, pData will point to a
            // USB_DEVICE_CDC_EVENT_DATA_SET_CONTROL_LINE_STATE type data object that
            // will contain the control line state data sent by the host.
```

```

        controllLineStateData.dtr =
            ((USB_DEVICE_CDC_EVENT_DATA_SET_CONTROL_LINE_STATE *)pData)->dtr;
        controllLineStateData.carrier =
            ((USB_DEVICE_CDC_EVENT_DATA_SET_CONTROL_LINE_STATE *)pData)->carrier;

        USB_DEVICE_CDC_ControlStatus(usbDeviceHandle, controlTransferHandle,
                                     USB_DEVICE_CONTROL_STATUS_OK);

        break;

    case USB_DEVICE_CDC_EVENT_SEND_BREAK:

        // In this case, pData will point to a
        // USB_DEVICE_CDC_EVENT_SEND_BREAK_DATA type data object that

        USB_DEVICE_CDC_ControlStatus(usbDeviceHandle, controlTransferHandle,
                                     USB_DEVICE_CONTROL_STATUS_OK);

        break;

    case USB_DEVICE_CDC_EVENT_CONTROL_TRANSFER_DATA_SENT:
    case USB_DEVICE_CDC_EVENT_CONTROL_TRANSFER_DATA_RECEIVED:

        // This means that the data stage is complete. The data in
        // setLineCodingData is valid or data in getLineCodingData was
        // sent to the host. The application can now decide whether it
        // supports this data. It is not mandatory to do this in the
        // event handler.

        USB_DEVICE_ControlStatus(usbDeviceHandle, controlTransferHandle,
                                 USB_DEVICE_CONTROL_STATUS_OK);

    case USB_DEVICE_CDC_EVENT_WRITE_COMPLETE:

        // This means USB_DEVICE_CDC_Write() operation completed.
        // The pData member will point to a
        // USB_DEVICE_CDC_EVENT_DATA_WRITE_COMPLETE type of data.

        break;

    case USB_DEVICE_CDC_EVENT_READ_COMPLETE:

        // This means USB_DEVICE_CDC_Read() operation completed.
        // The pData member will point to a
        // USB_DEVICE_CDC_EVENT_DATA_READ_COMPLETE type of data.

        break;

    case USB_DEVICE_CDC_EVENT_SERIAL_STATE_NOTIFICATION_COMPLETE:

        // This means USB_DEVICE_CDC_SerialStateNotification() operation
        // completed. The pData member will point to a
        // USB_DEVICE_CDC_EVENT_DATA_SERIAL_STATE_NOTIFICATION_COMPLETE type of data.

        break;

    default:
        break;
}

return(USB_DEVICE_CDC_EVENT_RESPONSE_NONE);
}

```

Refer to the [USB_DEVICE_CDC_EVENT](#) enumeration for more details on each event.

5.9.4.5.5 Sending Data

Describes how to [send](#) data to the CDC Host.

Description

The application may need to [send](#) data or serial state notification to the USB CDC Host. This is done by using the [USB_DEVICE_CDC_Write\(\)](#) and [USB_DEVICE_CDC_SerialStateNotificationSend\(\)](#) functions respectively.

1. Sending data to the USB Host:

The application can [send](#) data to the host by using the [USB_DEVICE_CDC_Write\(\)](#) function. This function returns a transfer handler that allows the application to track the read request. The request is completed when the host as requested for the data. The completion of the write transfer is indicated by USB_DEVICE_CDC_EVENT_WRITE_COMPLETE event. A write request could fail if the function driver instance transfer queue is full.

The [USB_DEVICE_CDC_Write\(\)](#) function also allows the application to [send](#) data to the host without ending the transfer. This is done by specifying the USB_DEVICE_CDC_TRANSFER_FLAGS_DATA_PENDING flag. The application can use this option when the data to be sent is not readily available or when the application is memory constrained. The combination of the transfer flag and the transfer size affects how the function driver sends the data to the host.

- a. If size is a multiple of maxPacketSize (the IN endpoint size) and flag is set as USB_DEVICE_CDC_TRANSFER_FLAGS_DATA_COMPLETE, the write function will append a Zero Length Packet (ZLP) to complete the transfer.
- b. If size is a multiple of maxPacketSize and flag is set as USB_DEVICE_CDC_TRANSFER_FLAGS_MORE_DATA_PENDING, the write function will not append a ZLP and hence will not complete the transfer.
- c. If size is greater than but not a multiple of maxPacketSize and flags is set as USB_DEVICE_CDC_TRANSFER_FLAGS_DATA_COMPLETE, the write function schedules (length/maxPacketSize) packets and one packet for the residual data.
- d. If size is greater than but not a multiple of maxPacketSize and flags is set as USB_DEVICE_CDC_TRANSFER_FLAGS_MORE_DATA_PENDING, the write function schedules (size/maxPacketSize) packets only.
- e. If size is less than maxPacketSize and flag is set as USB_DEVICE_CDC_TRANSFER_FLAGS_DATA_COMPLETE, the write function schedules one packet.
- f. If size is less than maxPacketSize and flag is set as USB_DEVICE_CDC_TRANSFER_FLAGS_MORE_DATA_PENDING, the write function returns an error code and sets the transferHandle parameter to [USB_DEVICE_CDC_TRANSFER_HANDLE_INVALID](#).

The following code snippet explains this in more detail:

```
// Below is a set of examples showing various conditions trying to
// send data with the USB_DEVICE_CDC_Write() command.
//
// This assumes that driver was opened successfully.
// Assume maxPacketSize is 64.

USB_DEVICE_CDC_TRANSFER_HANDLE transferHandle;
USB_DEVICE_CDC_RESULT writeRequestHandle;
USB_DEVICE_CDC_INDEX instance;

//-----
// In this example we want to send 34 bytes only.

writeRequestResult = USB_DEVICE_CDC_Write(instance,
                                         &transferHandle, data, 34,
```

```

        USB_DEVICE_CDC_TRANSFER_FLAGS_DATA_COMPLETE);

if(USB_DEVICE_CDC_RESULT_OK != writeRequestResult)
{
    //Do Error handling here
}

//-----
// In this example we want to send 64 bytes only.
// This will cause a ZLP to be sent.

writeRequestResult = USB_DEVICE_CDC_Write(instance,
        &transferHandle, data, 64,
        USB_DEVICE_CDC_TRANSFER_FLAGS_DATA_COMPLETE);

if(USB_DEVICE_CDC_RESULT_OK != writeRequestResult)
{
    //Do Error handling here
}

//-----
// This example will return an error because size is less
// than maxPacketSize and the flag indicates that more
// data is pending.

writeRequestResult = USB_DEVICE_CDC_Write(instanceHandle,
        &transferHandle, data, 32,
        USB_DEVICE_CDC_TRANSFER_FLAGS_MORE_DATA_PENDING);

//-----
// In this example we want to place a request for a 70 byte transfer.
// The 70 bytes will be sent out in a 64 byte transaction and a 6 byte
// transaction completing the transfer.

writeRequestResult = USB_DEVICE_CDC_Write(instanceHandle,
        &transferHandle, data, 70,
        USB_DEVICE_CDC_TRANSFER_FLAGS_DATA_COMPLETE);

if(USB_DEVICE_CDC_RESULT_OK != writeRequestResult)
{
    //Do Error handling here
}

//-----
// In this example we want to place a request for a 70 bytes to be sent
// but that we don't end the transfer as more data is coming. 64 bytes
// of the 70 will be sent out and the USB_DEVICE_CDC_EVENT_WRITE_COMPLETE
// with 64 bytes. This indicates that the extra 6 bytes weren't
// sent because it would cause the end of the transfer. Thus the
// user needs add these 6 bytes back to the buffer for the next group
// of data that needs to be sent out.

writeRequestResult = USB_DEVICE_CDC_Write(instanceHandle,
        &transferHandle, data, 70,
        USB_DEVICE_CDC_TRANSFER_FLAGS_MORE_DATA_PENDING);

if(USB_DEVICE_CDC_RESULT_OK != writeRequestResult)
{
    //Do Error handling here
}

// The completion of the write request will be indicated by the
// USB_DEVICE_CDC_EVENT_WRITE_COMPLETE event.

```

2. Sending a serial state notification:

The application can **send** a Serial State Notification by using the `USB_DEVICE_CDC_SerialStateSend()` function. his function

returns a transfer handler that allows the application to track the read request. The request is completed when the host as requested for the data. The completion of the transfer is USB_DEVICE_CDC_EVENT_SERIAL_STATE_NOTIFICATION_COMPLETE event. A request could fail if the function driver transfer queue is full. The following code snippet shows an example of how this can be done.

```
USB_DEVICE_CDC_INDEX instanceIndex;
USB_DEVICE_CDC_TRANSFER_HANDLE transferHandle;
USB_DEVICE_CDC_SERIAL_STATE_NOTIFICATION_DATA notificationData;

// This application function could possibly update the notificationData
// data structure.

APP_UpdateNotificationData(&notificationData);

// Now send the updated notification data to the host.

result = USB_DEVICE_CDC_SerialStateDataSend(instanceIndex, &transferHandle,
                                              &notificationData);

if(USB_DEVICE_CDC_RESULT_OK != result)
{
    // Error handling here
}
```

5.9.4.5.6 Receiving Data

Describes how the CDC device can read data from the Host.

Description

The application can receive data from the host by using the [USB_DEVICE_CDC_Read\(\)](#) function. This function returns a transfer handler that allows the application to track the read request. The request is completed when the host sends the required amount or less than required amount of data. The application must make sure that it allocates a buffer size that is at least the size or a multiple of the receive endpoint size. The return value of the function indicates the success of the request. A read request could fail if the function driver transfer queue is full. The completion of the read transfer is USB_DEVICE_CDC_EVENT_READ_COMPLETE event. The request completes based on the amount of the data that was requested and size of the transaction initiated by the host.

- If the size parameter is not a multiple of maxPacketSize or is 0, the function returns [USB_DEVICE_CDC_TRANSFER_HANDLE_INVALID](#) in transferHandle and returns USB_DEVICE_CDC_RESULT_ERROR_TRANSFER_SIZE_INVALID as a return value.
- If the size parameter is a multiple of maxPacketSize and the host [send](#) less than maxPacketSize data in any transaction, the transfer completes and the function driver will issue a USB_DEVICE_CDC_EVENT_READ_COMPLETE event along with the USB_DEVICE_CDC_EVENT_READ_COMPLETE_DATA data structure.
- If the size parameter is a multiple of maxPacketSize and the host sends maxPacketSize amount of data, and total data received does not exceed size, then the function driver will wait for the next packet.

The following code snippet shows an example if the [USB_DEVICE_CDC_Read\(\)](#) function:

```
// Shows an example of how to read. This assumes that
// driver was opened successfully.

USB_DEVICE_CDC_TRANSFER_HANDLE transferHandle;
USB_DEVICE_CDC_RESULT readRequestResult;
USB_DEVICE_CDC_HANDLE instanceHandle;

readRequestResult = USB_DEVICE_CDC_Read(instanceHandle,
                                         &transferHandle, data, 128);

if(USB_DEVICE_CDC_RESULT_OK != readRequestResult)
```

```

{
    //Do Error handling here
}

// The completion of the read request will be indicated by the
// USB_DEVICE_CDC_EVENT_READ_COMPLETE event.

```

	USB_DEVICE_CDC_TRANSFER_HANDLE_INVALID	USB Device CDC Function Driver Invalid Transfer Handle Definition.

Functions

	Name	Description
	USB_DEVICE_CDC_ControlReceive	This function allows the application to respond to the CDC function driver specific control transfer requests. It allows the application to receive data from the host in the data stage of the control transfer.
	USB_DEVICE_CDC_ControlSend	This function allows the application to respond to the CDC function driver specific control transfer requests. It allows the application to send data to the host in the data stage of the control transfer.
	USB_DEVICE_CDC_ControlStatus	This function allows the application to complete the status stage of the the CDC Function Driver specific control transfer request.
	USB_DEVICE_CDC_EventHandlerSet	This function registers a event handler for the specified CDC function driver instance.
	USB_DEVICE_CDC_Read	This function requests a data read from the USB Device CDC Function Driver Layer.
	USB_DEVICE_CDC_SerialStateNotificationSend	This function schedules a request to send serial state notification to the host.
	USB_DEVICE_CDC_Write	This function requests a data write to the USB Device CDC Function Driver Layer.

Description

5.9.4.6.1 Functions

5.9.4.6.1.1 USB_DEVICE_CDC_ControlReceive Function

C

```

USB_DEVICE_CDC_RESULT USB_DEVICE_CDC_ControlReceive(
    USB_DEVICE_CDC_INDEX instanceIndex,
    USB_DEVICE_CDC_CONTROL_TRANSFER_HANDLE controlTransferHandle,
    void * data,
    size_t size
);

```

Description

This function allows the application to respond to the CDC function driver specific control transfer requests. It allows the application to receive data from the host in the data stage of the control transfer. For example, the [USB_DEVICE_CDC_EVENT_DATA_SET_LINE_CODING](#) event requires a control transfer response. The function can be called in the CDC Function Driver event handler or can be called outside the event handler. Calling this function outside the event handler defers the response to the event. This allows the application to prepare the data buffer out of the event handler context, especially if the data buffer to receive the data is not readily available. Note however, that there are timing

considerations when responding to the control transfer. Exceeding the response time will cause the host to cancel the control transfer and may cause USB host to reject the device. The application must use the control transfer handle that was generated along with the event as the controlTransferHandle.

Preconditions

This function should only be called in response to a CDC function driver event that requires a control transfer response.

Parameters

Parameters	Description
instance	USB Device CDC Function Driver instance.
controlTransferHandle	Control Transfer handle for the control transfer.
data	Data buffer to receive the data stage of the control transfer.
size	size (in bytes) of the data to sent.

Returns

USB_DEVICE_CDC_RESULT_ERROR_CONTROL_TRANSFER_FAILED - The request was not successful because the USB host cancelled the control transfer.

USB_DEVICE_CDC_RESULT_OK - The request was successful.

Remarks

None.

Example

```
// -----
// In this example, the application responds to the SET LINE CODING
// with in the event handler. The application uses the
// USB_DEVICE_CDC_ControlReceive() function to do this.
// -----

USB_DEVICE_CDC_EVENT_DATA_SET_LINE_CODING setLineCodingData;
USB_DEVICE_CDC_CONTROL_TRANSFER_HANDLE controlTransferHandle;

USB_DEVICE_CDC_EVENT_RESPONSE USBDeviceCDCEventHandler
(
    USB_DEVICE_CDC_INDEX instanceIndex,
    USB_DEVICE_CDC_EVENT event,
    USB_DEVICE_CDC_CONTROL_TRANSFER_HANDLE controlTransferHandle,
    void * pData,
    uintptr_t userData
)
{
    switch(event)
    {
        case USB_DEVICE_CDC_EVENT_SET_LINE_CODING:

            // In this case, the application should receive the line coding
            // data from the host. The application must use the
            // USB_DEVICE_CDC_ControlReceive() function to receive the data.

            USB_DEVICE_CDC_ControlReceive(instanceIndex, controlTransferHandle
                                           &setLineCodingData,
                                           sizeof(USB_DEVICE_CDC_EVENT_DATA_SET_LINE_CODING));

            break;
    }
}

// -----
// In this example, the application defers the response to the
// event. This is done by calling the USB_DEVICE_CDC_ControlReceive()
```

```

// function after the event handler exits.
// -----

    USB_DEVICE_CDC_ControlReceive(instanceIndex, thisControlTransferHandle
                                &setLineCodingData,
                                sizeof(USB_DEVICE_CDC_EVENT_DATA_SET_LINE_CODING));
}

```

5.9.4.6.1.2 USB_DEVICE_CDC_ControlSend Function

C

```

USB_DEVICE_CDC_RESULT USB_DEVICE_CDC_ControlSend(
    USB_DEVICE_CDC_INDEX instanceIndex,
    USB_DEVICE_CDC_CONTROL_TRANSFER_HANDLE controlTransferHandle,
    void * data,
    size_t size
);

```

Description

This function allows the application to respond to the CDC function driver specific control transfer requests. It allows the application to **send** data to the host in the data stage of the control transfer. For example, the USB_DEVICE_CDC_EVENT_GET_LINE_CODING event requires a control transfer response. The function can be called in the CDC Function Driver event handler or can be called outside the event handler. Calling this function outside the event handler defers the response to the event. This allows the application to prepare the response data out of the event handler context, especially if the data is not readily available. Note however, that there are timing considerations when responding to the control transfer. Exceeding the response time will cause the host to cancel the control transfer and may cause USB host to reject the

device. The application must use the control transfer handle that was generated along with the event as the controlTransferHandle.

Preconditions

This function should only be called in response to a CDC function driver event that requires a control transfer response.

Parameters

Parameters	Description
instance	USB Device CDC Function Driver instance.
controlTransferHandle	Control Transfer handle for the control transfer.
data	Data that represents the data stage of the control transfer.
size	size (in bytes) of the data to sent.

Returns

USB_DEVICE_CDC_RESULT_ERROR_CONTROL_TRANSFER_FAILED - The request was not successful because the USB host cancelled the control transfer.

USB_DEVICE_CDC_RESULT_OK - The request was successful.

Remarks

None.

Example

```
// -----
// In this example, the application responds to the GET LINE CODING
// with in the event handler. The application uses the
// USB_DEVICE_CDC_ControlSend() function to do this.
// -----

USB_DEVICE_CDC_EVENT_DATA_GET_LINE_CODING getLineCodingData;
USB_DEVICE_CDC_CONTROL_TRANSFER_HANDLE controlTransferHandle;

USB_DEVICE_CDC_EVENT_RESPONSE USBDeviceCDCEventHandler
(
    USB_DEVICE_CDC_INDEX instanceIndex,
    USB_DEVICE_CDC_EVENT event,
    USB_DEVICE_CDC_CONTROL_TRANSFER_HANDLE controlTransferHandle,
    void * pData,
    uintptr_t userData
)
{
    switch(event)
    {
        case USB_DEVICE_CDC_EVENT_GET_LINE_CODING:

            // In this case, the application should send the line coding
            // data to the host. The application must use the
            // USB_DEVICE_CDC_ControlSend() function to send the data.

            USB_DEVICE_CDC_ControlSend(instanceIndex, controlTransferHandle
                                         &getLineCodingData,
                                         sizeof(USB_DEVICE_CDC_EVENT_DATA_GET_LINE_CODING));

            break;
    }
}

// -----
// In this example, the application defers the response to the
// event. This is done by calling the USB_DEVICE_CDC_ControlSend()
// function after the event handler exits.
// -----
```

```

USB_DEVICE_CDC_EVENT_DATA_GET_LINE_CODING getLineCodingData;
USB_DEVICE_CDC_CONTROL_TRANSFER_HANDLE thisControlTransferHandle;
bool sendLineCodingToHost;

USB_DEVICE_CDC_EVENT_RESPONSE USBDeviceCDCEventHandler
(
    USB_DEVICE_CDC_INDEX instanceIndex,
    USB_DEVICE_CDC_EVENT event,
    USB_DEVICE_CDC_CONTROL_TRANSFER_HANDLE controlTransferHandle,
    void * pData,
    uintptr_t userData
)
{
    switch(event)
    {
        case USB_DEVICE_CDC_EVENT_GET_LINE_CODING:

            // In this case, the application should send the line coding
            // data to the host. The application does not call
            // USB_DEVICE_CDC_ControlSend() function
            // in the event handler, because it does not have the line
            // coding data ready.

            thisControlTransferHandle = controlTransferHandle;
            sendLineCodingToHost = true;

            break;
    }
}

// This is outside the event handler.

if(sendLineCodingToHost)
{
    // The application fetches the line coding from the
    // an EEPROM.

    GetLineCodingFromEEPROM(&getLineCoding);

    USB_DEVICE_CDC_ControlSend(instanceIndex, thisControlTransferHandle
                                &getLineCodingData,
                                sizeof(USB_DEVICE_CDC_EVENT_DATA_GET_LINE_CODING));
}

```

5.9.4.6.1.3 USB_DEVICE_CDC_ControlStatus Function

C

```

USB_DEVICE_CDC_RESULT USB_DEVICE_CDC_ControlStatus(
    USB_DEVICE_CDC_INDEX instanceIndex,
    USB_DEVICE_CDC_CONTROL_TRANSFER_HANDLE controlTransferHandle,
    USB_DEVICE_CDC_CONTROL_STATUS status
);

```

Description

This function allows the application to complete the status stage of the the CDC Function Driver specific control transfer request. The application can either **accept** the data stage or stall it. Calling this function with status set to USB_DEVICE_CDC_CONTROL_STATUS_OK will acknowledge the status stage of the control transfer. The control transfer can be stalled by setting the status parameter to USB_DEVICE_CDC_CONTROL_STATUS_ERROR. The function can be called in the CDC Function Driver event handler or can be called outside the event handler. Calling this function outside the event handler defers the response to the event. This allows the application to analyze the event response outside the event handler. Note however, that there are timing considerations when responding to the control transfer. Exceeding the response time will cause the host to cancel the control transfer and may cause USB host to reject the device. The application must use the control transfer

handle that was generated along with the event as the controlTransferHandle. The application must be aware of events and associated control transfers that do or do not require data stages. Incorrect usage of the USB_DEVICE_CDC_ControlStatus() function could cause the device function to be non-compliant.

Preconditions

This function should only be called in response to a CDC function driver event that requires a control transfer response.

Parameters

Parameters	Description
instance	USB Device CDC Function Driver instance.
controlTransferHandle	Control Transfer handle for the control transfer.
status	Set to USB_DEVICE_CDC_CONTROL_STATUS_OK to acknowledge the control transfer. Set to USB_DEVICE_CDC_CONTROL_STATUS_ERROR to stall the transfer.

Returns

USB_DEVICE_CDC_RESULT_ERROR_CONTROL_TRANSFER_FAILED - The request was not successful because the USB host cancelled the control transfer.

USB_DEVICE_CDC_RESULT_OK - The request was successful.

Remarks

None.

Example

```
// -----
// In this code example, the application responds to the the
// SEND_BREAK event in the event handler.
// -----

USB_DEVICE_CDC_EVENT_DATA_SEND_BREAK * sendBreakData;

USB_DEVICE_CDC_EVENT_RESPONSE USBDeviceCDCEventHandler
(
    USB_DEVICE_CDC_INDEX instanceIndex,
    USB_DEVICE_CDC_EVENT event,
    USB_DEVICE_CDC_CONTROL_TRANSFER_HANDLE controlTransferHandle,
    void * pData,
    uintptr_t userData
)
{
    switch(event)
    {
        case USB_DEVICE_CDC_EVENT_SEND_BREAK:

            // The application can check if the break duration is supported.

            sendBreakData = (USB_DEVICE_CDC_EVENT_DATA_SEND_BREAK *)pData;

            if(IsBreakDurationSupported(sendBreakData->duration))
            {
                USB_DEVICE_CDC_ControlStatus(instanceIndex,
                    controlTransferHandle, USB_DEVICE_CDC_CONTROL_STATUS_OK);
            }
            else
            {
                // If the break duration is not supported the application
                // can stall it.

                USB_DEVICE_CDC_ControlStatus(instanceIndex,
                    controlTransferHandle, USB_DEVICE_CDC_CONTROL_STATUS_ERROR);
            }
        }
    }
}
```

```

        }
        break;
    }
}

// -----
// In this example, the application defers the response to the
// SEND_BREAK event. The application responds to the event
// after the event handler exits.
// -----

USB_DEVICE_CDC_CONTROL_TRANSFER_HANDLE thisControlTransferHandle;
USB_DEVICE_CDC_EVENT_DATA_SEND_BREAK * sendBreakData;
uint16_t breakDuration;
bool sendBreakEvent;

USB_DEVICE_CDC_EVENT_RESPONSE USBDeviceCDCEventHandler
(
    USB_DEVICE_CDC_INDEX instanceIndex,
    USB_DEVICE_CDC_EVENT event,
    USB_DEVICE_CDC_CONTROL_TRANSFER_HANDLE controlTransferHandle,
    void * pData,
    uintptr_t userData
)
{
    switch(event)
    {
        case USB_DEVICE_CDC_EVENT_SEND_BREAK:

            // Get the break duration.

            sendBreakData = (USB_DEVICE_CDC_EVENT_DATA_SEND_BREAK *)pData;
            breakDuration = sendBreakData->duration;
            sendBreakEvent = true;
            break;

    }
}

    // The application checks if the duration is supported
    // Note that this occurs after the event handler has exited.

    if(IsBreakDurationSupported(breakDuration))
    {
        USB_DEVICE_CDC_ControlStatus(instanceIndex,
            controlTransferHandle, USB_DEVICE_CDC_CONTROL_STATUS_OK);
    }
    else
    {
        // If the break duration is not supported the application
        // can stall it.

        USB_DEVICE_CDC_ControlStatus(instanceIndex,
            controlTransferHandle, USB_DEVICE_CDC_CONTROL_STATUS_ERROR);
    }
}
}

```

5.9.4.6.1.4 USB_DEVICE_CDC_EventHandlerSet Function

C

```

USB_DEVICE_CDC_RESULT USB_DEVICE_CDC_EventHandlerSet(
    USB_DEVICE_CDC_INDEX instanceIndex,
    USB_DEVICE_CDC_EVENT_HANDLER eventHandler,

```

```
    uintptr_t context
);
```

Description

This function registers a event handler for the specified CDC function driver instance. This function should be called by the client when it receives a SET CONFIGURATION event from the device layer. A event handler must be registered for function driver to respond to function driver specific commands. If the event handler is not registered, the device layer will stall function driver specific commands and the USB device may not function.

Preconditions

This function should be called when the function driver has been initialized as a result of a set configuration.

Parameters

Parameters	Description
instance	Instance of the CDC Function Driver.
eventHandler	A pointer to event handler function.
context	Application specific context that is returned in the event handler.

Returns

USB_DEVICE_CDC_RESULT_OK - The operation was successful
 USB_DEVICE_CDC_RESULT_ERROR_INSTANCE_INVALID - The specified instance does not exist.
 USB_DEVICE_CDC_RESULT_ERROR_PARAMETER_INVALID - The eventHandler parameter is NULL

Remarks

None.

Example

```
// This code snippet shows an example registering an event handler. Here
// the application specifies the context parameter as a pointer to an
// application object (appObject) that should be associated with this
// instance of the CDC function driver.

USB_DEVICE_CDC_RESULT result;

USB_DEVICE_CDC_EVENT_RESPONSE APP_USBDeviceCDCEventHandler
(
    USB_DEVICE_CDC_INDEX instanceIndex ,
    USB_DEVICE_CDC_EVENT event ,
    USB_DEVICE_CDC_CONTROL_TRANSFER_HANDLE controlTransferHandle
    void* pData, uintptr_t context
)
{
    // Event Handling comes here

    switch(event)
    {
        ...
    }

    return(USB_DEVICE_CDC_EVENT_RESPONSE_NONE);
}

result = USB_DEVICE_CDC_EventHandlerSet ( 0 ,&APP_EventHandler, (uintptr_t) &appObject);
if(USB_DEVICE_CDC_RESULT_OK != result)
{
    SYS_ASSERT ( false , "invalid event handler function" );
}
```

5.9.4.6.1.5 USB_DEVICE_CDC_Read Function

C

```
USB_DEVICE_CDC_RESULT USB_DEVICE_CDC_Read(  
    USB_DEVICE_CDC_INDEX instanceIndex,  
    USB_DEVICE_CDC_TRANSFER_HANDLE * transferHandle,  
    void * data,  
    size_t size  
);
```

Description

This function requests a data read from the USB Device CDC Function Driver Layer. The function places a requests with driver, the request will get serviced as data is made available by the USB Host. A handle to the request is returned in the transferHandle parameter. The termination of the request is indicated by the USB_DEVICE_CDC_EVENT_READ_COMPLETE event. The amount of data read and the transfer handle associated with the request is returned along with the event in the pData parameter of the event handler. The transfer handle expires when event handler for the USB_DEVICE_CDC_EVENT_READ_COMPLETE exits. If the read request could not be accepted, the function returns an error code and transferHandle will contain the value [USB_DEVICE_CDC_TRANSFER_HANDLE_INVALID](#).

If the size parameter is not a multiple of maxPacketSize or is 0, the function returns [USB_DEVICE_CDC_TRANSFER_HANDLE_INVALID](#) in transferHandle and returns an error code as a return value. If the size parameter is a multiple of maxPacketSize and the host send less than maxPacketSize data in any transaction, the transfer completes and the function driver will issue a USB_DEVICE_CDC_EVENT_READ_COMPLETE event along with the USB_DEVICE_CDC_EVENT_READ_COMPLETE_DATA data structure. If the size parameter is a multiple of maxPacketSize and the host sends maxPacketSize amount of data, and total data received does not exceed size, then the function driver will wait for the next packet.

Preconditions

The function driver should have been configured.

Parameters

Parameters	Description
instance	USB Device CDC Function Driver instance.
transferHandle	Pointer to a USB_DEVICE_CDC_TRANSFER_HANDLE type of variable. This variable will contain the transfer handle in case the read request was successful.
data	pointer to the data buffer where read data will be stored.
size	Size of the data buffer. Refer to the description section for more details on how the size affects the transfer.

Returns

USB_DEVICE_CDC_RESULT_OK - The read request was successful. transferHandle contains a valid transfer handle.

USB_DEVICE_CDC_RESULT_ERROR_TRANSFER_QUEUE_FULL - internal request queue is full. The write request could not be added.

USB_DEVICE_CDC_RESULT_ERROR_TRANSFER_SIZE_INVALID - The specified transfer size was not a mulitple of endpoint size or is 0.

USB_DEVICE_CDC_RESULT_ERROR_INSTANCE_NOT_CONFIGURED - The specified instance is not configured yet.

USB_DEVICE_CDC_RESULT_ERROR_INSTANCE_INVALID - The specified instance was not provisioned in the application and is invalid.

Remarks

None.

Example

```
// Shows an example of how to read. This assumes that
// driver was opened successfully.

USB_DEVICE_CDC_TRANSFER_HANDLE transferHandle;
USB_DEVICE_CDC_RESULT readRequestResult;
USB_DEVICE_CDC_HANDLE instanceHandle;

readRequestResult = USB_DEVICE_CDC_Read(instanceHandle,
                                         &transferHandle, data, 128);

if(USB_DEVICE_CDC_RESULT_OK != readRequestResult)
{
    //Do Error handling here
}

// The completion of the read request will be indicated by the
// USB_DEVICE_CDC_EVENT_READ_COMPLETE event.
```

5.9.4.6.1.6 USB_DEVICE_CDC_SerialStateNotificationSend Function**C**

```
USB_DEVICE_CDC_RESULT USB_DEVICE_CDC_SerialStateNotificationSend(
    USB_DEVICE_CDC_INDEX instanceIndex,
    USB_DEVICE_CDC_TRANSFER_HANDLE * transferHandle,
    USB_DEVICE_CDC_SERIAL_STATE_NOTIFICATION_DATA * notificationData
);
```

Description

This function places a request to **send** serial state notification data to the host. The function will place the request with the driver, the request will get serviced when the data is requested by the USB host. A handle to the request is returned in the `transferHandle` parameter. The termination of the request is indicated by the `USB_DEVICE_CDC_EVENT_SERIAL_STATE_NOTIFICATION_COMPLETE` event. The amount of data transmitted and the transfer handle associated with the request is returned along with the event in the `serialStateNotificationCompleteData` member of `pData` parameter of the event handler. The transfer handle expires when the event handler for the `USB_DEVICE_CDC_EVENT_SERIAL_STATE_NOTIFICATION_COMPLETE` event exits. If the **send** request could not be accepted, the function returns an error code and `transferHandle` will contain the value `USB_DEVICE_CDC_TRANSFER_HANDLE_INVALID`.

Preconditions

The function driver should have been configured

Parameters

Parameters	Description
<code>instance</code>	USB Device CDC Function Driver instance.
<code>transferHandle</code>	Pointer to a output only variable that will contain transfer handle.
<code>notificationData</code>	<code>USB_DEVICE_CDC_SERIAL_STATE_NOTIFICATION_DATA</code> type of notification data to be sent to the host.

Returns

`USB_DEVICE_CDC_RESULT_OK` - The request was successful. `transferHandle` contains a valid transfer handle.

`USB_DEVICE_CDC_RESULT_ERROR_TRANSFER_QUEUE_FULL` - Internal request queue is full. The request could not be added.

`USB_DEVICE_CDC_RESULT_ERROR_INSTANCE_NOT_CONFIGURED` - The specified instance is not configured yet.

`USB_DEVICE_CDC_RESULT_ERROR_INSTANCE_INVALID` - The specified instance was not provisioned in the application

and is invalid.

Remarks

None.

Example

```
USB_DEVICE_CDC_SERIAL_STATE_NOTIFICATION_DATA notificationData;

// This application function could possibly update the notificationData
// data structure.

APP_UpdateNotificationData(&notificationData);

// Now send the updated notification data to the host.

result = USB_DEVICE_CDC_SerialStateNotificationSend
(instanceIndex, &transferHandle, &notificationData);

if(USB_DEVICE_CDC_RESULT_OK != result)
{
    // Error handling here. The transferHandle will contain
    // USB_DEVICE_CDC_TRANSFER_HANDLE_INVALID in this case.
}
```

5.9.4.6.1.7 USB_DEVICE_CDC_Write Function

C

```
USB_DEVICE_CDC_RESULT USB_DEVICE_CDC_Write(
    USB_DEVICE_CDC_INDEX instanceIndex,
    USB_DEVICE_CDC_TRANSFER_HANDLE * transferHandle,
    const void * data,
    size_t size,
    USB_DEVICE_CDC_TRANSFER_FLAGS flags
);
```

Description

This function requests a data write to the USB Device CDC Function Driver Layer. The function places a requests with driver, the request will get serviced as data is requested by the USB Host. A handle to the request is returned in the transferHandle parameter. The termination of the request is indicated by the USB_DEVICE_CDC_EVENT_WRITE_COMPLETE event. The amount of data written and the transfer handle associated with the request is returned along with the event in writeCompleteData member of the pData parameter in the event handler. The transfer handle expires when event handler for the USB_DEVICE_CDC_EVENT_WRITE_COMPLETE exits. If the read request could not be accepted, the function returns an error code and transferHandle will contain the value [USB_DEVICE_CDC_TRANSFER_HANDLE_INVALID](#).

The behavior of the write request depends on the flags and size parameter. If the application intends to [send](#) more data in a request, then it should use the USB_DEVICE_CDC_TRANSFER_FLAGS_MORE_DATA_PENDING flag. If there is no more data to be sent in the request, the application must use the USB_DEVICE_CDC_EVENT_WRITE_COMPLETE flag. This is explained in more detail here:

- If size is a multiple of maxPacketSize and flag is set as

USB_DEVICE_CDC_TRANSFER_FLAGS_DATA_COMPLETE, the write function will append a Zero Length Packet (ZLP) to complete the transfer.

- If size is a multiple of maxPacketSize and flag is set as

USB_DEVICE_CDC_TRANSFER_FLAGS_MORE_DATA_PENDING, the write function will not append a ZLP and hence will

not complete the transfer.

- If size is greater than but not a multiple of maxPacketSize and

flags is set as USB_DEVICE_CDC_TRANSFER_FLAGS_DATA_COMPLETE, the write function schedules (length/maxPacketSize) packets and one packet for the residual data.

- If size is greater than but not a multiple of maxPacketSize and flags is

set as USB_DEVICE_CDC_TRANSFER_FLAGS_MORE_DATA_PENDING, the write function schedules (size/maxPacketSize) packets only.

- If size is less than maxPacketSize and flag is set as

USB_DEVICE_CDC_TRANSFER_FLAGS_DATA_COMPLETE, the write function schedules one packet.

- If size is less than maxPacketSize and flag is set as

USB_DEVICE_CDC_TRANSFER_FLAGS_MORE_DATA_PENDING, the write function returns an error code and sets the transferHandle parameter to [USB_DEVICE_CDC_TRANSFER_HANDLE_INVALID](#).

Completion of the write transfer is indicated by the USB_DEVICE_CDC_EVENT_WRITE_COMPLETE event. The amount of data written along with the transfer handle is returned along with the event.

Preconditions

The function driver should have been configured.

Parameters

Parameters	Description
instance	USB Device CDC Function Driver instance.
transferHandle	Pointer to a USB_DEVICE_CDC_TRANSFER_HANDLE type of variable. This variable will contain the transfer handle in case the write request was successful.
data	pointer to the data buffer that contains the data to written.
size	Size of the data buffer. Refer to the description section for more details on how the size affects the transfer.
flags	Flags that indicate whether the transfer should continue or end. Refer to the description for more details.

Returns

USB_DEVICE_CDC_RESULT_OK - The write request was successful. transferHandle contains a valid transfer handle.

USB_DEVICE_CDC_RESULT_ERROR_TRANSFER_QUEUE_FULL - internal request queue is full. The write request could not be added.

USB_DEVICE_CDC_RESULT_ERROR_TRANSFER_SIZE_INVALID - The specified transfer size and flag parameter are invalid.

USB_DEVICE_CDC_RESULT_ERROR_INSTANCE_NOT_CONFIGURED - The specified instance is not configured yet.

USB_DEVICE_CDC_RESULT_ERROR_INSTANCE_INVALID - The specified instance was not provisioned in the application and is invalid.

Remarks

None.

Example

```

// Below is a set of examples showing various conditions trying to
// send data with the Write() command.
//
// This assumes that driver was opened successfully.
// Assume maxPacketSize is 64.

USB_DEVICE_CDC_TRANSFER_HANDLE transferHandle;
USB_DEVICE_CDC_RESULT writeRequestHandle;
USB_DEVICE_CDC_INDEX instance;

//-----
// In this example we want to send 34 bytes only.

writeRequestResult = USB_DEVICE_CDC_Write(instance,
                                          &transferHandle, data, 34,
                                          USB_DEVICE_CDC_TRANSFER_FLAGS_DATA_COMPLETE);

if(USB_DEVICE_CDC_RESULT_OK != writeRequestResult)
{
    //Do Error handling here
}

//-----
// In this example we want to send 64 bytes only.
// This will cause a ZLP to be sent.

writeRequestResult = USB_DEVICE_CDC_Write(instance,
                                          &transferHandle, data, 64,
                                          USB_DEVICE_CDC_TRANSFER_FLAGS_DATA_COMPLETE);

if(USB_DEVICE_CDC_RESULT_OK != writeRequestResult)
{
    //Do Error handling here
}

//-----
// This example will return an error because size is less
// than maxPacketSize and the flag indicates that more
// data is pending.

writeRequestResult = USB_DEVICE_CDC_Write(instanceHandle,
                                          &transferHandle, data, 32,
                                          USB_DEVICE_CDC_TRANSFER_FLAGS_MORE_DATA_PENDING);

//-----
// In this example we want to place a request for a 70 byte transfer.
// The 70 bytes will be sent out in a 64 byte transaction and a 6 byte
// transaction completing the transfer.

writeRequestResult = USB_DEVICE_CDC_Write(instanceHandle,
                                          &transferHandle, data, 70,
                                          USB_DEVICE_CDC_TRANSFER_FLAGS_DATA_COMPLETE);

if(USB_DEVICE_CDC_RESULT_OK != writeRequestResult)
{
    //Do Error handling here
}

//-----
// In this example we want to place a request for a 70 bytes to be sent but
// that we don't end the transfer as more data is coming. 64 bytes of the
// 70 will be sent out and the USB_DEVICE_CDC_EVENT_WRITE_COMPLETE with 64
// bytes. This indicates that the extra 6 bytes weren't sent because it
// would cause the end of the transfer. Thus the user needs add these 6

```

```

// bytes back to the buffer for the next group of data that needs to be sent
// out.

writeRequestResult = USB_DEVICE_CDC_Write(instanceHandle,
                                          &transferHandle, data, 70,
                                          USB_DEVICE_CDC_TRANSFER_FLAGS_MORE_DATA_PENDING);

if(USB_DEVICE_CDC_RESULT_OK != writeRequestResult)
{
    //Do Error handling here
}

// The completion of the write request will be indicated by the
// USB_DEVICE_CDC_EVENT_WRITE_COMPLETE event.

```

5.9.4.6.2 Data Types and Constants

5.9.4.6.2.1 USB_DEVICE_CDC_CONTROL_TRANSFER_HANDLE Type

C

```
typedef USB_DEVICE_CONTROL_TRANSFER_HANDLE USB_DEVICE_CDC_CONTROL_TRANSFER_HANDLE;
```

Description

USB Device CDC Function Driver Control Transfer Handle

This is returned by the CDC function driver event handler and should be used by the application while responding to CDC function driver control transfer requests.

Remarks

None.

5.9.4.6.2.2 USB_DEVICE_CDC_EVENT Enumeration

C

```

typedef enum {
    USB_DEVICE_CDC_EVENT_SET_LINE_CODING,
    USB_DEVICE_CDC_EVENT_GET_LINE_CODING,
    USB_DEVICE_CDC_EVENT_SET_CONTROL_LINE_STATE,
    USB_DEVICE_CDC_EVENT_SEND_BREAK,
    USB_DEVICE_CDC_EVENT_WRITE_COMPLETE,
    USB_DEVICE_CDC_EVENT_READ_COMPLETE,
    USB_DEVICE_CDC_EVENT_SERIAL_STATE_NOTIFICATION_COMPLETE,
    USB_DEVICE_CDC_EVENT_CONTROL_TRANSFER_DATA_SENT,
    USB_DEVICE_CDC_EVENT_CONTROL_TRANSFER_DATA_RECEIVED
} USB_DEVICE_CDC_EVENT;

```

Description

USB Device CDC Function Driver Control Transfer Status

This flag is used along with the [USB_DEVICE_CDC_ControlStatus\(\)](#) function to indicate success or failure of a CDC class specific control transfer request.

Members

Members	Description
USB_DEVICE_CDC_EVENT_SET_LINE_CODING	This event occurs when the host issues a SET LINE CODING command. The application must provide a USB_DEVICE_CDC_EVENT_DATA_SET_LINE_CODING data structure to the device layer to receive the line coding data that the host will provide. The application must provide the buffer by calling the USB_DEVICE_CDC_ControlReceive() function either in the event handler or in the application (outside the event handler function). The application must use the controlTransferHandle parameter provided in the event while calling USB_DEVICE_CDC_ControlReceive() function. The pData parameter will be NULL. The application can use the USB_DEVICE_CDC_EVENT_CONTROL_TRANSFER_DATA_RECEIVED event to track completion of the command.
USB_DEVICE_CDC_EVENT_GET_LINE_CODING	This event occurs when the host issues a GET LINE CODING command. The application must provide a USB_DEVICE_CDC_EVENT_DATA_GET_LINE_CODING data structure to the device layer that contains the line coding data to be provided to the host. The application must provide the buffer by calling the USB_DEVICE_CDC_ControlSend() function either in the event handler or in the application (outside the event handler function). The application must use the controlTransferHandle parameter provided in the event while calling USB_DEVICE_CDC_ControlSend() function. The size of the buffer is indicated by the length parameter. The application can use the USB_DEVICE_CDC_EVENT_CONTROL_TRANSFER_DATA_SENT event to track completion of the command.
USB_DEVICE_CDC_EVENT_SET_CONTROL_LINE_STATE	This event occurs when the host issues a SET CONTROL LINE STATE command. The application must interpret the pData parameter as USB_DEVICE_CDC_EVENT_DATA_SET_CONTROL_LINE_STATE pointer type. This data structure contains the control line state data. The application can then use the USB_DEVICE_CDC_ControlStatus() function to indicate acceptance or rejection of the command. The USB_DEVICE_CDC_ControlStatus() function can be called from the event handler or in the application (out of the event handler context). The application should use the controlTransferHandle while calling the USB_DEVICE_CDC_ControlStatus() function.

USB_DEVICE_CDC_EVENT_SEND_BREAK	This event occurs when the host issues a SEND BREAK command. The application must interpret the pData parameter as a <code>USB_DEVICE_CDC_EVENT_SEND_BREAK_DATA</code> pointer type. This data structure contains the break duration data. The application can then use the <code>USB_DEVICE_CDC_ControlStatus()</code> function to indicate acceptance or rejection of the command. The <code>USB_DEVICE_CDC_ControlStatus()</code> function can be called from the event handler or in the application (out of the event handler context). The application should use the <code>controlTransferHandle</code> while calling the <code>USB_DEVICE_CDC_ControlStatus()</code> function.
USB_DEVICE_CDC_EVENT_WRITE_COMPLETE	This event occurs when a write operation scheduled by calling the <code>USB_DEVICE_CDC_Write()</code> function has completed. The pData parameter should be interpreted as a <code>USB_DEVICE_CDC_EVENT_DATA_WRITE_COMPLETE</code> pointer type. This will contain the transfer handle associated with the completed write transfer and the amount of data written.
USB_DEVICE_CDC_EVENT_READ_COMPLETE	This event occurs when a read operation scheduled by calling the <code>USB_DEVICE_CDC_Read()</code> function has completed. The pData parameter should be interpreted as a <code>USB_DEVICE_CDC_EVENT_DATA_READ_COMPLETE</code> pointer type. This will contain the transfer handle associated with the completed read transfer and the amount of data read.
USB_DEVICE_CDC_EVENT_SERIAL_STATE_NOTIFICATION_COMPLETE	This event occurs when a serial state notification scheduled using the <code>USB_DEVICE_CDC_SerialDataSend()</code> function, was sent to the host. The pData parameter should be interpreted as a <code>USB_DEVICE_CDC_EVENT_DATA_SERIAL_STATE_NOTIFICATION_COMPLETE</code> pointer type and will contain the transfer handle associated with the completed <code>send</code> transfer and the amount of data sent.
USB_DEVICE_CDC_EVENT_CONTROL_TRANSFER_DATA_SENT	This event occurs when the data stage of a control read transfer has completed. This event would occur after the application uses the <code>USB_DEVICE_CDC_ControlSend()</code> function to respond to the <code>USB_DEVICE_CDC_EVENT_GET_LINE_CODING</code> event.

USB_DEVICE_CDC_EVENT_CONTROL_TRANSFER_DATA_RECEIVED	This event occurs when the data stage of a control write transfer has completed. This would occur after the application would respond with a USB_DEVICE_CDC_ControlReceive() function to the USB_DEVICE_CDC_EVENT_SET_LINE_CODING_EVENT and the data has been received.

Remarks

None.

5.9.4.6.2.3 USB_DEVICE_CDC_EVENT_DATA_GET_LINE_CODING Type

C

```
typedef USB_CDC_LINE_CODING USB_DEVICE_CDC_EVENT_DATA_GET_LINE_CODING;
```

Description

USB Device CDC Event Get Line Coding Data Type.

This type defines the data type of the data that the user needs to respond with as a result of a USB_DEVICE_CDC_EVENT_GET_LINE_CODING event. This data is sent to the host via the USB_DEVICE_ControlWrite() function.

The valid values for the members of this structure are defined in table 17 of the PSTN120.pdf document. This document is part of the CDC specification download available on the USB.org website: http://www.usb.org/developers/devclass_docs/CDC1.2_WMC1.1_012011.zip

Remarks

None.

5.9.4.6.2.4 USB_DEVICE_CDC_EVENT_DATA_READ_COMPLETE Structure

C

```
typedef struct {
    USB_DEVICE_CDC_TRANSFER_HANDLE handle;
    size_t length;
} USB_DEVICE_CDC_EVENT_DATA_WRITE_COMPLETE, USB_DEVICE_CDC_EVENT_DATA_READ_COMPLETE,
USB_DEVICE_CDC_EVENT_DATA_SERIAL_STATE_NOTIFICATION_COMPLETE;
```

Description

USB Device CDC Function Driver Read and Write Complete Event Data.

This data type defines the data structure returned by the driver along with USB_DEVICE_CDC_EVENT_READ_COMPLETE and USB_DEVICE_CDC_EVENT_WRITE_COMPLETE events.

Members

Members	Description

5.9.4.6.2.5 USB_DEVICE_CDC_EVENT_DATA_SEND_BREAK Structure

C

```
typedef struct {
    uint16_t duration;
} USB_DEVICE_CDC_EVENT_DATA_SEND_BREAK;
```

Description

USB Device CDC Event Set Break Data Type.

This defines the data type of the data generated to the CDC event handler on a USB_DEVICE_CDC_EVENT_SEND_BREAK event.

The SEND_BREAK command is described in section 6.3.13 of the PSTN120.pdf document. This document is part of the CDC specification [download available on the USB.org website:](http://www.usb.org/developers/devclass_docs/CDC1.2_WMC1.1_012011.zip)

Remarks

None.

5.9.4.6.2.6 USB_DEVICE_CDC_EVENT_DATA_SERIAL_STATE_NOTIFICATION_COMPLETE Structure

C

```
typedef struct {
    USB_DEVICE_CDC_TRANSFER_HANDLE handle;
    size_t length;
} USB_DEVICE_CDC_EVENT_DATA_WRITE_COMPLETE, USB_DEVICE_CDC_EVENT_DATA_READ_COMPLETE,
USB_DEVICE_CDC_EVENT_DATA_SERIAL_STATE_NOTIFICATION_COMPLETE;
```

Description

USB Device CDC Function Driver Read and Write Complete Event Data.

This data type defines the data structure returned by the driver along with USB_DEVICE_CDC_EVENT_READ_COMPLETE and USB_DEVICE_CDC_EVENT_WRITE_COMPLETE events.

Members

Members	Description

5.9.4.6.2.7 USB_DEVICE_CDC_EVENT_DATA_SET_CONTROL_LINE_STATE Type

C

```
typedef USB_CDC_CONTROL_LINE_STATE USB_DEVICE_CDC_EVENT_DATA_SET_CONTROL_LINE_STATE;
```

Description

USB Device CDC Event Set Control Line State Data Type.

This defines the data type of the data that should be provided to the function driver via the [USB_DEVICE_CDC_ControlReceive\(\)](#) function when the function driver generates USB_DEVICE_CDC_EVENT_SET_CONTROL_LINE_STATE event.

Remarks

None.

5.9.4.6.2.8 USB_DEVICE_CDC_EVENT_DATA_SET_LINE_CODING Type

C

```
typedef USB_CDC_LINE_CODING USB_DEVICE_CDC_EVENT_DATA_SET_LINE_CODING;
```

Description

USB Device CDC Event Set Line Coding Data Type.

This defines the data type of the data generated to the CDC event handler on a USB_DEVICE_CDC_EVENT_SET_LINE_CODING event.

The valid values for the members of this structure are defined in table 17 of the PSTN120.pdf document. This document is part of the CDC specification download available on the USB.org website: http://www.usb.org/developers/devclass_docs/CDC1.2_WMC1.1_012011.zip

Remarks

None.

5.9.4.6.2.9 USB_DEVICE_CDC_EVENT_DATA_WRITE_COMPLETE Structure

C

```
typedef struct {
    USB_DEVICE_CDC_TRANSFER_HANDLE handle;
    size_t length;
} USB_DEVICE_CDC_EVENT_DATA_WRITE_COMPLETE, USB_DEVICE_CDC_EVENT_DATA_READ_COMPLETE,
USB_DEVICE_CDC_EVENT_DATA_SERIAL_STATE_NOTIFICATION_COMPLETE;
```

Description

USB Device CDC Function Driver Read and Write Complete Event Data.

This data type defines the data structure returned by the driver along with USB_DEVICE_CDC_EVENT_READ_COMPLETE and USB_DEVICE_CDC_EVENT_WRITE_COMPLETE events.

Members

Members	Description

5.9.4.6.2.10 USB_DEVICE_CDC_EVENT_HANDLER Type

C

```
typedef USB_DEVICE_CDC_EVENT_RESPONSE (* USB_DEVICE_CDC_EVENT_HANDLER)(USB_DEVICE_CDC_INDEX
instanceIndex, USB_DEVICE_CDC_EVENT event, USB_DEVICE_CDC_CONTROL_TRANSFER_HANDLE
controlTransferHandle, void * pData, uintptr_t context);
```

Description

USB Device CDC Event Handler Function Pointer Type.

This data type defines the required function signature of the USB Device CDC Function Driver event handling callback function. The application must register a pointer to a CDC Function Driver events handling function whose function signature (parameter and return value types) match the types specified by this function pointer in order to receive event call backs from the CDC Function Driver. The function driver will invoke this function with event relevant parameters. The description of the event handler function parameters is given here.

instanceIndex - Instance index of the CDC Function Driver that generated the event.

event - Type of event generated.

controlTransferHandle - Control Transfer Handle for CDC function driver events that require application response. The application should use this handle when calling the USB CDC Device Control Transfer functions to respond to the events.

pData - This parameter should be type casted to a event specific pointer type based on the event that has occurred. Refer to the [USB_DEVICE_CDC_EVENT](#) enumeration description for more details.

context - Value identifying the context of the application that was registered along with the event handling function.

Remarks

None.

5.9.4.6.2.11 USB_DEVICE_CDC_EVENT_RESPONSE Type

C

```
typedef void USB_DEVICE_CDC_EVENT_RESPONSE;
```

Description

USB Device CDC Function Driver Event Handler Response Type

This is the return type of the CDC Function Driver event handler.

Remarks

None.

5.9.4.6.2.12 USB_DEVICE_CDC_INDEX Type

C

```
typedef uintptr_t USB_DEVICE_CDC_INDEX;
```

Description

USB Device CDC Function Driver Index

This uniquely identifies a CDC Function Driver instance.

Remarks

None.

5.9.4.6.2.13 USB_DEVICE_CDC_INIT Structure

C

```
typedef struct {
    size_t queueSizeRead;
    size_t queueSizeWrite;
    size_t queueSizeSerialStateNotification;
} USB_DEVICE_CDC_INIT;
```

Description

USB Device CDC Function Driver Initialization Data Structure

This data structure must be defined for every instance of the CDC function driver. It is passed to the CDC function driver, by the Device Layer, at the time of initialization. The funcDriverInit member of the Device Layer Function Driver registration table entry must point to this data structure for an instance of the CDC function driver.

Members

Members	Description

5.9.4.6.2.14 USB_DEVICE_CDC_RESULT Enumeration

C

```
typedef enum {
    USB_DEVICE_CDC_RESULT_OK,
    USB_DEVICE_CDC_RESULT_ERROR_TRANSFER_SIZE_INVALID,
    USB_DEVICE_CDC_RESULT_ERROR_TRANSFER_QUEUE_FULL,
    USB_DEVICE_CDC_RESULT_ERROR_INSTANCE_INVALID,
    USB_DEVICE_CDC_RESULT_ERROR_INSTANCE_NOT_CONFIGURED,
    USB_DEVICE_CDC_RESULT_ERROR_PARAMETER_INVALID,
    USB_DEVICE_CDC_RESULT_ERROR_CONTROL_TRANSFER_FAILED
}
```

```
} USB_DEVICE_CDC_RESULT;
```

Description

USB Device CDC Function Driver USB Device CDC Result enumeration.

This enumeration lists the possible USB Device CDC Function Driver operation results. These values are returned by USB Device CDC Library functions.

Members

Members	Description
USB_DEVICE_CDC_RESULT_OK	The operation was successful

5.9.4.6.2.15 USB_DEVICE_CDC_SERIAL_STATE_NOTIFICATION_DATA Type**C**

```
typedef USB_CDC_SERIAL_STATE USB_DEVICE_CDC_SERIAL_STATE_NOTIFICATION_DATA;
```

Description

USB Device CDC Serial State Notification Data Type.

This defines the data type for the CDC Serial State. This data is sent to the host over the CDC notification interface.

Remarks

None.

5.9.4.6.2.16 USB_DEVICE_CDC_TRANSFER_FLAGS Enumeration**C**

```
typedef enum {  
    USB_DEVICE_CDC_TRANSFER_FLAGS_DATA_COMPLETE,  
    USB_DEVICE_CDC_TRANSFER_FLAGS_MORE_DATA_PENDING  
} USB_DEVICE_CDC_TRANSFER_FLAGS;
```

Description

USB Device CDC Transfer Flags

These flags are used to indicate status of the pending data while sending data to the host by using the [USB_DEVICE_CDC_Write\(\)](#) function.

Members

Members	Description
USB_DEVICE_CDC_TRANSFER_FLAGS_DATA_COMPLETE	This flag indicates there is no further data to be sent in this transfer and that the transfer should end. If the size of the transfer is a multiple of the maximum packet size for related endpoint configuration, the function driver will send a zero length packet to indicate end of the transfer to the host.

USB_DEVICE_CDC_TRANSFER_FLAGS_MORE_DATA_PENDING	This flag indicates there is more data to be sent in this transfer. If the size of the transfer is a multiple of the maximum packet size for the related endpoint configuration, the function driver will not send a zero length packet. If the size of the transfer is greater than (but not a multiple of) the maximum packet size, the function driver will only send maximum packet size amount of data. If the size of the transfer is greater than endpoint size but not an exact multiple of endpoint size, only the closest endpoint size multiple bytes of data will be sent. This flag should not be specified if the size of the transfer is less than maximum packet size.

Remarks

The relevance of the specified flag depends on the size of the buffer. Refer to the individual flag descriptions for more details.

5.9.4.6.2.17 USB_DEVICE_CDC_TRANSFER_HANDLE Type**C**

```
typedef uintptr_t USB_DEVICE_CDC_TRANSFER_HANDLE;
```

Description

USB Device CDC Function Driver Transfer Handle Definition

This definition defines a USB Device CDC Function Driver Transfer Handle. A Transfer Handle is owned by the application but its value is modified by the [USB_DEVICE_CDC_Write\(\)](#), [USB_DEVICE_CDC_Read\(\)](#) and the [USB_DEVICE_CDC_SerialStateDataSend](#) functions. The transfer handle is valid for the life time of the transfer and expires when the transfer related event had occurred.

Remarks

None.

5.9.4.6.2.18 USB_DEVICE_CDC_EVENT_RESPONSE_NONE Macro**C**

```
#define USB_DEVICE_CDC_EVENT_RESPONSE_NONE
```

Description

USB Device CDC Function Driver Event Handler Response None

This is the definition of the CDC Function Driver Event Handler Response Type none.

Remarks

Intentionally defined to be empty.

5.9.4.6.2.19 USB_DEVICE_CDC_TRANSFER_HANDLE_INVALID Macro**C**

```
#define USB_DEVICE_CDC_TRANSFER_HANDLE_INVALID ((USB_DEVICE_CDC_TRANSFER_HANDLE)(-1))
```

Description

USB Device CDC Function Driver Invalid Transfer Handle Definition

This definition defines a USB Device CDC Function Driver Invalid Transfer Handle. A Invalid Transfer Handle is returned by the [USB_DEVICE_CDC_Write\(\)](#), [USB_DEVICE_CDC_Read\(\)](#) and the [USB_DEVICE_CDC_SerialStateNotificationSend\(\)](#) functions

when the request was not successful.

Remarks

None.

5.9.4.7 Files

Files

Name	Description
usb_device_cdc.h	USB Device CDC Function Driver Interface

Description

5.9.4.7.1 usb_device_cdc.h

USB Device CDC Function Driver Interface

This file describes the USB Device CDC Function Driver interface.

Enumerations

	Name	Description
	USB_DEVICE_CDC_EVENT	USB Device CDC Function Driver Control Transfer Status
	USB_DEVICE_CDC_RESULT	USB Device CDC Function Driver USB Device CDC Result enumeration.
	USB_DEVICE_CDC_TRANSFER_FLAGS	USB Device CDC Function Driver Transfer Flags

Functions

	Name	Description
	USB_DEVICE_CDC_ControlReceive	This function allows the application to respond to the CDC function driver specific control transfer requests. It allows the application to receive data from the host in the data stage of the control transfer.
	USB_DEVICE_CDC_ControlSend	This function allows the application to respond to the CDC function driver specific control transfer requests. It allows the application to send data to the host in the data stage of the control transfer.
	USB_DEVICE_CDC_ControlStatus	This function allows the application to complete the status stage of the the CDC Function Driver specific control transfer request.
	USB_DEVICE_CDC_EventHandlerSet	This function registers a event handler for the specified CDC function driver instance.
	USB_DEVICE_CDC_Read	This function requests a data read from the USB Device CDC Function Driver Layer.
	USB_DEVICE_CDC_SerialStateNotificationSend	This function schedules a request to send serial state notification to the host.
	USB_DEVICE_CDC_Write	This function requests a data write to the USB Device CDC Function Driver Layer.

Macros

	Name	Description
	USB_DEVICE_CDC_EVENT_RESPONSE_NONE	USB Device CDC Function Driver Event Handler Response Type None.
	USB_DEVICE_CDC_TRANSFER_HANDLE_INVALID	USB Device CDC Function Driver Invalid Transfer Handle Definition.

Structures

	Name	Description
	USB_DEVICE_CDC_EVENT_DATA_READ_COMPLETE	USB Device CDC Function Driver Read and Write Complete Event Data.
	USB_DEVICE_CDC_EVENT_DATA_SEND_BREAK	USB Device CDC Event Set Break Data Type.
	USB_DEVICE_CDC_EVENT_DATA_SERIAL_STATE_NOTIFICATION_COMPLETE	USB Device CDC Function Driver Read and Write Complete Event Data.
	USB_DEVICE_CDC_EVENT_DATA_WRITE_COMPLETE	USB Device CDC Function Driver Read and Write Complete Event Data.
	USB_DEVICE_CDC_INIT	USB Device CDC Function Driver Initialization Data Structure

Types

	Name	Description
	USB_DEVICE_CDC_CONTROL_TRANSFER_HANDLE	USB Device CDC Function Driver Control Transfer Handle
	USB_DEVICE_CDC_EVENT_DATA_GET_LINE_CODING	USB Device CDC Event Get Line Coding Data Type.
	USB_DEVICE_CDC_EVENT_DATA_SET_CONTROL_LINE_STATE	USB Device CDC Event Set Line Coding Data Type.
	USB_DEVICE_CDC_EVENT_DATA_SET_LINE_CODING	USB Device CDC Event Set Line Coding Data Type.
	USB_DEVICE_CDC_EVENT_HANDLER	USB Device CDC Event Handler Function Pointer Type.
	USB_DEVICE_CDC_EVENT_RESPONSE	USB Device CDC Function Driver Event Callback Response Type
	USB_DEVICE_CDC_INDEX	USB Device CDC Function Driver Index
	USB_DEVICE_CDC_SERIAL_STATE_NOTIFICATION_DATA	USB Device Serial State Notification Data Type.
	USB_DEVICE_CDC_TRANSFER_HANDLE	USB Device CDC Function Driver Transfer Handle Definition.

5.9.5 USB Generic Device Library

5.9.5.1 Introduction

Introduces the MPLAB Harmony USB Generic Device Library.

Description

The USB Generic Device library provides a framework to develop custom or vendor class USB device applications. The library supports all USB transfer types (control, bulk, interrupt, isochronous) along with endpoint management functions. The USB device generic library implementation supports USB specification 2.0. Following figure illustrates how Generic Device Library fits into the MPLAB Harmony USB Device Stack architecture.

Figure: MPLAB Harmony USB Device library architecture

This USB Generic Device Library offers services to the application to interact and respond to the host requests. USB Generic Device library is also referred to as Generic function driver in this document.

5.9.5.2 Release Notes

MPLAB Harmony Version: v0.70b **USB Generic Device Library Version :** 0.01 Alpha **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.9.5.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.9.5.4 Library Architecture

5.9.5.4.1 Library Overview

Provides an overview of the Generic Device function driver.

Description

The Generic Device function driver overview diagram is shown below.

Figure: USB DEVICE GENERIC Library Overview diagram

A Generic function driver instance is a collection of Generic USB interfaces.

The device management on end point zero is handled by the device library(vendor class specific requests are routed to the Generic function driver by device library).

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the USB DEVICE Generic module.

Library Interface Section	Description
Client Setup	Details Opening an instance of the USB Generic function driver, registering callback with the USB Generic function driver and closing an instance of the USB Generic function driver.
Client Data Handling	Details read/write to/from the host
Client Subclass Specific	Details the supported sub class specific management requests and notification.

5.9.5.4.2 Abstraction Model

Provides an architectural overview of the USB Generic Device function driver.

Description

The USB Generic Device function driver offers various services to a vendor specific class USB device to communicate with the host by abstracting USB specification details. The USB Generic Device function driver with USB DEVICE layer and USB controller driver forms the basic library entity using which the device can communicate with the USB host. The basic software architecture into which Generic function driver fits into is depicted in the following diagram.

Figure: USB DEVICE Generic Software Abstraction Block Diagram

Vendor specific functions have to register a set of standard APIs with the generic library. This library calls these APIs as call back function at run time. For example, vendor specific tasks function routine is called when USB device generic function driver receives vendor specific transfer from a USB host. All generic function driver tasks are called from the task routine of USB device layer. so here maximum performance of the device can be achieved with this library.

The USB controller driver takes the responsibility of managing the USB peripheral on the device. The USB device layer handles the device enumeration etc. For more details about the USB controller driver and USB device layer library kindly refer to the corresponding documents.

5.9.5.5 Using the Library

5.9.5.5.1 Files to Include

Describes which files to include in the project to use the Generic Device Function Driver.

Description

The following table shows the files that must be included in the project in order to use the Generic Function Driver. These files are located in the framework folder of the MPLAB Harmony installation. It is assumed that the Device Layer files (and the files needed by the Device Layer) are already included in the project. A path to the framework folder in the Harmony installation should be added to the project include search path.

Filename	Description
framework\usb\src\usb_device_generic.c	Contains the implementation of the Generic device function driver.
framework\usb\usb_device_generic.h	Must be included in every file that needs to invoke the Generic device function driver API
system_config.h	User created file which contains the Generic device function driver configuration.

5.9.5.5.2 Library Configuration

Describes how to configure the Generic Function Driver.

Description

The configuration of the USB Generic Device Function Driver is contained in system_config.h These configuration settings will apply to all instances of the USB Generic Device Function Driver. This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

This section explains the data structures that need to be setup by the application to use the Generic function driver. For setting data relevant for other modules (device layer and controller driver) kindly refer to the respective module documentation.

Constants:

USB_DEVICE_GEN_DRIVER_MAX_INSTANCES: The maximum number of Generic function driver instances to be supported. The valid values are greater than or equal to 1. this constant is not defined the default value taken by the Generic function driver is 1.

Data structures:

The application should form structure USB_DEVICE_GEN_DRIVER_INIT_INSTANCE. The structure takes pointers to the following functions.

- A vendor defined initialize function that is called by the device layer when it initializes the generic function driver. This will happen when the device layer process a SET CONFIGURATION command from the host.
- A vendor defined de-initialize function that is called by the device layer when it de-initializes the generic function driver. This will happen when the device layer process a reset event or is required to change the configuration by the host.
- A vendor defined Setup packet handler. This function is called by the device layer when it needs to pass class specific control

transfer to the generic function driver.

- A vendor specified tasks functions. This is called periodically by the device layer. This function can maintain a vendor device state machine.

The application needs to define an array of USB_DEVICE_GEN_DRIVER_MAX_INSTANCES (defined by the application in system_config.h) such structures. For example, if the application needs two instances of the Generic Device, then the size of this array should be two.

Example: Creating the USB_DEVICE_GEN_DRIVER_INIT_INSTANCE structure.

```
USB_DEVICE_GEN_DRIVER_INIT_INSTANCE genUsbInitInstance[] =
{
    {
        .vendorSpecificInitialize = APP_Initialize,
        .vendorSpecificDeInitialize = APP_DeInitialize,
        .vendorSpecificSetupPacketHandler = APP_SetupPacketHandler,
        .tasks = APP_Tasks
    }
};
```

5.9.5.5.3 Client Setup

Note: To invoke any of the client setup routines listed in this section the device should be in configured state. Any attempts invoking the client setup routines before the configured state will result in graceful exit.

Before using any of the USB Generic function driver services it needs to be setup once in the application.

Setting up the USB Generic function driver involves

1. Opening an instance of the USB Generic function driver.
2. Registering callback with the USB Generic function driver.
3. Closing an instance of the USB Generic function driver.

Opening an Instance of the USB GENERIC function driver:

Before attempting to use any of the USB Generic function driver services an instance of it needs to be opened by the application. An instance of USB Generic function driver is defined as a group of minimum interfaces that constitute a Generic USB device.

To open an instance of USB Generic function driver application should call the function USB_DEVICE_GEN_DRIVER_Open.

Example: Opening a USB Generic instance

```
// Client Handle
DRV_HANDLE genHandle;

// open Generic USB device function driver instance 0
genHandle = USB_DEVICE_GEN_DRIVER_Open ( 0 );

// Check the validity of the handle returned
if(DRV_HANDLE_INVALID == genHandle)
{
    \ Handle the error
}
```

Registering callback with the USB GENERIC function driver:

USB Generic function driver will inform the status of various events (both management and data) to the application using a callback function registered with the USB Generic function driver.

This callback function should be registered with the function driver before expecting any event notifications.

There are three sources of generating events

- Data transmission request (USB_DEVICE_GEN_DRIVER_CALLBACK_TX_)
- Data reception request (USB_DEVICE_GEN_DRIVER_CALLBACK_RX)
- Management Requests (USB_DEVICE_GEN_DRIVER_CALLBACK_MANAGEMENT)

Each of these requests will result in the generation of events of type USB_DEVICE_GEN_DRIVER_CALLBACK_TYPE

For a detailed list of events go through the above enum data type.

To register a callback with the Generic function driver application should first define a function of the signature USB_DEVICE_GEN_DRIVER_CALLBACK_EVENT.

Once defined it can be registered with the Generic function driver using the function USB_DEVICE_GEN_DRIVER_RegisterCallBack.

Example: Registering an application callback with the Generic function driver

```
// Application callback to handle relevant events.
void app_gen_CallBack ( SYS_MODULE_INDEX funcDriverIndex,
                        USB_DEVICE_GEN_DRIVER_CALLBACK_TYPE callback,
                        USB_DEVICE_GEN_DRIVER_CALLBACK_EVENT event)
{
    switch (callback)
    {
        case USB_DEVICE_GEN_DRIVER_CALLBACK_TX:
            break;
        case USB_DEVICE_GEN_DRIVER_CALLBACK_RX:
            break;
        case USB_DEVICE_GEN_DRIVER_CALLBACK_MANAGEMENT:
            break;
        default:
            break;
    }
}

int main ()
{
    DRV_HANDLE genHandle;
    USB_ERROR_STATUS err;

    // open the Generic USB device driver instance 0 ( or what ever is applicable)
    genHandle = USB_DEVICE_GEN_DRIVER_Open ( 0 );

    err = USB_DEVICE_GEN_DRIVER_RegisterCallBack (genHandle,app_gen_CallBack );

    if(err)
    {
        //handle error
    }

    // app code

    // Occurrence of any event of type USB_DEVICE_GEN_DRIVER_CALLBACK_EVENT results in
    // calling of the registered application callback

    return 0;
}
```

Closing an Instance of the USB Generic function driver:

If at all the application wants to close an opened Generic function driver instance it can do so by calling the function `USB_DEVICE_GEN_DRIVER_Close`. The application should pass the client handle it received with opened the Generic function driver instance as the parameter. If the close is successful 0 is returned by the Generic to indicate success.

Example: Closing a Generic USB instance

```
// Return status
USB_ERROR_STATUS status;

// Close Generic USB device driver instance 0
status = USB_DEVICE_GEN_DRIVER_Close(0);

if(USB_ERROR_INVALID_HANDLE ==status)
{
    // Generic USB device function driver instance 0 is either not opened/initialized yet
}

else if(status == USB_ERROR_OK)
{
    // Generic USB device function driver instance 0 is successfully closed.
    // app code
}
```

Before closing the Generic function driver instance the application should be aware of the following

1. Once an instance of the Generic function driver is closed the application cannot write to or read from the data end points(if driven by Generic function driver).
2. The application will not get any event notifications .

INITIAL SETUP:

Before invoking any of the services offered by the Generic function driver following steps should have been completed

1. Certain key data structures need to be setup(initialized) by the application.
2. Certain system functions belonging to the MPLAB Harmony USB Device library should have been called.
3. The device should be in configured state.

The setup of the key data structures is explained in the Configuring the Library section. The following section focuses on the key system functions that need to be called by the application before using Generic function driver.

The following diagram explains the sequence of system functions (belonging to the MPLAB Harmony USB Device library only) invocations.

Figure: System Initialization

Example: System initialization

```

// Populate USB Controller driver init data
usbInitData.usbID = USB_ID_1;
usbInitData.usbModuleSetup.OpMode           = USB_OPMODE_DEVICE;
usbInitData.usbModuleSetup.ppMode           = USB_PING_PONG_MODE_SELECTION;
usbInitData.usbModuleSetup.StopInIdle       = false;
usbInitData.usbModuleSetup.SuspendInSleep   = false;

// Initialize the USB Control driver
driverObjectHandle = DRV_USB_Initialize(DRV_USB_INDEX_0, (SYS_MODULE_INIT*)&usbInitData);
if (SYS_MODULE_OBJ_INVALID == driverObjectHandle)
{
    // Handle error
}

// NOTE: USB controller driver is opened by both device layer and function driver and not by
// the application.

// Populate USB Device layer init data
deviceLayerInit.moduleInit.value           = SYS_MODULE_POWER_RUN_FULL;
deviceLayerInit.usbDriverIndex             = DRV_USB_INDEX_0;
deviceLayerInit.usbMasterDescriptor        = (USB_MASTER_DESCRIPTOR*)&usbMasterDescriptor;
deviceLayerInit.registeredFuncCount        = 1;
deviceLayerInit.registeredFunctions        =
(USB_DEVICE_FUNC_REGISTRATION_TABLE*)funcRegistrationTable;
  
```

```

// Initialize the USB device layer
usbDeviceObj = USB_DEVICE_Initialize( USB_DEVICE_INDEX_0, (SYS_MODULE_INIT*)&deviceLayerInit );

// Open the device layer.
usbDevHandle = USB_DEVICE_Open( USB_DEVICE_INDEX_0 );

// Register a callback with device layer to get event notification (for end point 0)
USB_DEVICE_EventCallBackSet(usbDevHandle, usbDeviceEventCallBack);

```

The following example provides a complete Generic function driver setup. This example do not use separate functions to do activities like system initialization, Generic function driver setup etc for the sake of clarity. It is recommended to use separate functions to have a structured view of the project.

```

// Application callback to handle relevant events.
void app_gen_CallBack ( SYS_MODULE_INDEX funcDriverIndex,
                        USB_DEVICE_GEN_DRIVER_CALLBACK_TYPE callback,
                        USB_DEVICE_GEN_DRIVER_CALLBACK_EVENT event)
{
    switch (callback)
    {
        case USB_DEVICE_GEN_DRIVER_CALLBACK_TX:
            break;
        case USB_DEVICE_GEN_DRIVER_CALLBACK_RX:
            break;
        case USB_DEVICE_GEN_DRIVER_CALLBACK_MANAGEMENT:
            break;
        default:
            break;
    }
}

// Device event callback of the application.
// This will be registered with the device layer
// during the system initialization.
void usbDeviceEventCallBack(USB_DEVICE_EVENTS events)
{
    if(events.setConfiguration)
    {
        // Device is configured.
        // Initialize function drivers.
        isConfigured = true;

        ////////////////////////////////////////////////// Generic function driver Setup- Begin////////////////////////////////////

        DRV_HANDLE genHandle;
        USB_ERROR_STATUS err;

        // open the Generic USB device driver instance 0 ( or what ever is applicable)
        genHandle = USB_DEVICE_GEN_DRIVER_Open ( 0 );

        err = USB_DEVICE_GEN_DRIVER_RegisterCallBack (genHandle,app_gen_CallBack );

        if(err)
        {
            //handle error
        }

        ////////////////////////////////////////////////// Generic function driver Setup- End////////////////////////////////////
    }
}

int main ()
{

```

```

// Device layer Init structure
USB_DEVICE_INIT deviceLayerInit;

// objects for Controller driver and device layer (returned by init routines)
SYS_MODULE_OBJ driverObjectHandle, usbDeviceObj;

// Client handle
DRV_HANDLE genHandle;

// Client handle for device layer
DRV_HANDLE usbDevHandle;

// USB controller driver init data
DRV_USB_INIT usbInitData;

////////// system initialization- Begin//////////

// Populate USB Controller driver init data
usbInitData.usbID = USB_ID_1;
usbInitData.usbModuleSetup.OpMode           = USB_OPMODE_DEVICE;
usbInitData.usbModuleSetup.ppMode           = USB_PING_PONG_MODE_SELECTION;
usbInitData.usbModuleSetup.StopInIdle       = false;
usbInitData.usbModuleSetup.SuspendInSleep   = false;

// Initialize the USB Control driver
driverObjectHandle = DRV_USB_Initialize(DRV_USB_INDEX_0, (SYS_MODULE_INIT*)&usbInitData);
if (SYS_MODULE_OBJ_INVALID == driverObjectHandle)
{
    // Handle error
}

// NOTE: USB controller driver is opened by both device layer and
// function driver and not by the application.

// Populate USB Device layer init data
deviceLayerInit.moduleInit.value = SYS_MODULE_POWER_RUN_FULL;
deviceLayerInit.usbDriverIndex   = DRV_USB_INDEX_0;
deviceLayerInit.usbMasterDescriptor = (USB_MASTER_DESCRIPTOR*)&usbMasterDescriptor;
deviceLayerInit.registeredFuncCount = 1;
deviceLayerInit.registeredFunctions =
(USB_DEVICE_FUNC_REGISTRATION_TABLE*)funcRegistrationTable;

// Initialize the USB device layer
usbDeviceObj = USB_DEVICE_Initialize( USB_DEVICE_INDEX_0, (SYS_MODULE_INIT*)&deviceLayerInit
);

// Open the device layer.
usbDevHandle = USB_DEVICE_Open( USB_DEVICE_INDEX_0 );

// Register a callback with device layer to get event notification (for end point 0)
USB_DEVICE_EventCallBackSet(usbDevHandle, usbDeviceEventCallBack);

////////// system initialization- End//////////

// the application body
while(1)
{
    // Device layer task
    USB_DEVICE_Tasks(usbDeviceObj);

    // Check if the enumeration is complete
    if(isConfigured)
    {
        // Start calling application tasks
    }
}

```

```
return 0;
}
```

5.9.5.5.4 Client Data Handling

The USB Generic function driver provides APIs to handle data to/from the host. The following section provides the usage of these APIs.

The data transfer in the Generic function driver happens over the end points with all the type of transfer modes (BULK, ISOCRONOUS, INTERRUPT) at both direction of IN and OUT.

The following sections focus on the data transmission over the end points .

The read and write naming conventions used for the data handling APIs are from the device point of view. So USB_DEVICE_GEN_DRIVER_ReadEp function is a request to the MPLAB Harmony USB Device library to get data available from the host. Similarly USB_DEVICE_GEN_DRIVER_WriteEp function is a request to make data available to the host.

Generic USB Buffer Objects:

In order place a read/write request with the Generic function driver the application should first create a buffer object of the type USB_DEVICE_GEN_DRIVER_DATA_BUFFER_OBJECT. It is recommended to create separate buffer objects for read and write operations. A USB_DEVICE_GEN_DRIVER_DATA_BUFFER_OBJECT contains a pointer to the data buffer, length of the buffer and transfer count. The transfer count is updated by the Generic function driver (after the read/write request is submitted) to indicate the actual amount of data transferred to/from the host.

Example: Generic USB DATA Buffer Object Creation

```
// buffer for read operation of size 64 bytes
uint8_t inBuffer[64];
// define and initialize the buffer object
USB_DEVICE_GEN_DRIVER_DATA_BUFFER_OBJECT inBufferObject = {(uint8_t*)&inBuffer, 64, 0};
```

Read From the Host:

As explained above the application should make use of the API USB_DEVICE_GEN_DRIVER_ReadEp to get data from the host. Before placing a read request with the Generic function driver the application should get the pipeHandle using USB_DEVICE_GEN_DRIVER_GetPipeHandle . If the received is valid , applicatio has to check if it can place the next read request. This status can be obtained using the API USB_DEVICE_GEN_DRIVER_TxRx_StatusGet. If this API returns USB_DEVICE_GEN_DRIVER_INSTANCE_RX_READY then the application can place a request for a read operation. If the received status is anything else then the application should poll until the receive status is ready. The following example shows the usage of read request.

Example: Data Read Request

```
#define APP_USB_DEVICE_GEN_DRIVER_FUNC_INDEX 0
// create buffer
uint8_t outBuffer[64];

uint8_t datalen = 64;

uint8_t epNum = 1;

dirn = USB_DEVICE_GEN_DRIVER_EP_IN_INDEX; //OUT:(0x00) or IN: 0x01

DRV_HANDLE genHandle,pipeHandle;

USB_ERROR_STATUS genErr;

//create the buffer object with datalength 64
USB_DEVICE_GEN_DRIVER_DATA_BUFFER_OBJECT readBufferObject = {&outBuffer, 64, 0};
```

```

// open the Generic USB device driver instance 0 ( or what ever is applicable)
genHandle = USB_DEVICE_GEN_DRIVER_Open ( APP_USB_DEVICE_GEN_DRIVER_FUNC_INDEX );

if(USB_DEVICE_GEN_DRIVER_RegisterCallBack (genHandle,app_gen_CallBack ))
{
    //handle error
}

//Get the pipe handle for the endpoint
pipeHandle = USB_DEVICE_GEN_DRIVER_GetPipeHandle(genHandle, epNum, dirn))
if ( DRV_HANDLE_INVALID == pipeHandle)
{
    //The request was not successful
}

//Got the pipe handle for the endpoint
//Pass the pipe handle to USB_DEVICE_GEN_DRIVER_ReadEp

genErr = USB_DEVICE_GEN_DRIVER_ReadEp( pipeHandle,&readBufferObject);

if(USB_ERROR_OK != genErr)
{
    //Read request is not accepted.
}

```

If the application has registered a callback function with the Generic function driver then any events related to the read request will be informed to the application via this callback. In the callback the application can check whether all of the data requested is received. The following example shows this.

Example: Data Read Request with application callback

```

#define APP_USB_DEVICE_GEN_DRIVER_FUNC_INDEX 0

// Application callback to handle relevant events.
void app_gen_CallBack ( SYS_MODULE_INDEX funcDriverIndex,
                        USB_DEVICE_GEN_DRIVER_CALLBACK_TYPE callback,
                        USB_DEVICE_GEN_DRIVER_CALLBACK_EVENT event)
{
    switch (callback)
    {
        case USB_DEVICE_GEN_DRIVER_CALLBACK_TX:
            break;
        case USB_DEVICE_GEN_DRIVER_CALLBACK_RX:
            if (readBufferObject.transferCount == readBufferObject.dataLen)
            {
                //entire data is read from the host.
            }
            else
            {
                //some of the data is not read.
                //get some logic in place to handle this
            }
            break;
        case USB_DEVICE_GEN_DRIVER_CALLBACK_MANAGEMENT:
            break;
        default:
            break;
    }
}

```

```

int main ()
{
    // create buffer
    uint8_t outBuffer[64];

    uint8_t datalen = 64;

    uint8_t epNum = 1;

    dirn = USB_DEVICE_GEN_DRIVER_EP_OUT_INDEX; //OUT:(0x00) or IN: 0x01

    DRV_HANDLE genHandle;

    USB_ERROR_STATUS genErr;

    DRVHANDLE pipeHandle;

    //create the buffer object with datalength 64
    USB_DEVICE_GEN_DRIVER_DATA_BUFFER_OBJECT readBufferObject = {&outBuffer, 64, 0};

    // open the Generic USB device driver instance 0 ( or what ever is applicable)
    genHandle = USB_DEVICE_GEN_DRIVER_Open ( 0 );

    if(USB_DEVICE_GEN_DRIVER_RegisterCallBack (genHandle,app_gen_CallBack ))
    {
        //handle error
    }
    //Get the pipe handle for the endpoint
    pipeHandle = USB_DEVICE_GEN_DRIVER_GetPipeHandle(genHandle, epNum, dirn)
    if ( DRV_HANDLE_INVALID == pipeHandle)
    {
        //The request was not successful
    }
    //we got the pipe handle for the endpoint

    //Pass the pipe handle to USB_DEVICE_GEN_DRIVER_ReadEp
    genErr = USB_DEVICE_GEN_DRIVER_ReadEp( pipeHandle,&readBufferObject);
    if(USB_ERROR_OK == genErr)
    {
        //read request is accepted
        //if app callback is registered, rest needs to be handled
        //in the appcallback, which is called by the Generic USB device function
        //driver when it is intimated by the device layer about
        //the transfer.
    }
    else
    {
        // something wrong in the read request
        // handle the error case
        switch ( genErr )
        {
            case USB_ERROR_INVALID_HANDLE:
                break;
            case USB_ERROR_INVALID_BUFFER:
                break;
            case USB_ERROR_BUSY:
                break;
        }
    }

    return 0;
}

```

The read request code flow can be better understood with the following diagram.

Write to the Host:

The application should make use of the API `USB_DEVICE_GEN_DRIVER_WriteEp` to get transfer data to the host. Before placing a write request with the Generic function driver the application should get the pipeHandle using `USB_DEVICE_GEN_DRIVER_GetPipeHandle`. If the received is valid, application has to check if it can place the next write request. This status can be obtained using the API `USB_DEVICE_GEN_DRIVER_TxRx_StatusGet`. If this API returns `USB_DEVICE_GEN_DRIVER_INSTANCE_TX_READY` then the application can place a request for a write operation. If the received status is anything else then the application should poll until the transmit status is ready. The following example shows the usage of read request.

Example: Data Read Request

```
#define APP_USB_DEVICE_GEN_DRIVER_FUNC_INDEX 0
// create buffer. Assuming data end-point max packet size is 64 bytes.
uint8_t inBuffer[64];

uint8_t datalen = 64;

uint8_t epNum = 1;

uint8_t dirn = USB_DEVICE_GEN_DRIVER_EP_IN_INDEX; // OUT : 0x00 or IN : 0x01

DRV_HANDLE pipeHandle, genHandle;

//create the buffer object with data length 64
USB_DEVICE_GEN_DRIVER_DATA_BUFFER_OBJECT writeBufferObject = {&inBuffer, 64, 0};

//open the Generic USB device driver instance 0 ( or what ever is applicable)
genHandle = USB_DEVICE_GEN_DRIVER_DRIVER_Open (APP_USB_DEVICE_GEN_DRIVER_FUNC_INDEX);

if(USB_DEVICE_GEN_DRIVER_DRIVER_RegisterCallbacks (genHandle, app_gen_Callback ))
{
    //handle error
}

//Get the pipe handle for the endpoint
pipeHandle = USB_DEVICE_GEN_DRIVER_GetPipeHandle(genHandle, epNum, dirn)

if ( DRV_HANDLE_INVALID == pipeHandle)
{
    //The request was not successful.
}
//we got the pipe handle for the endpoint
//Pass the pipe handle to USB_DEVICE_GEN_DRIVER_WriteEp

genErr = USB_DEVICE_GEN_DRIVER_WriteEp( pipeHandle, &writeBufferObject);
if(USB_ERROR_OK != genErr)
{
    //write request is not accepted
}

}
```

If the application has registered a callback function with the Generic function driver then any events related to the write request will be informed to the application via this callback. In the callback the application can check whether all of the data requested is transmitted. The following example shows this.

Example: Data Read Request with application callback

```
#define APP_USB_DEVICE_GEN_DRIVER_FUNC_INDEX 0

// Application callback to handle relevant events.
void app_gen_Callback ( SYS_MODULE_INDEX funcDriverIndex,
                        USB_DEVICE_GEN_DRIVER_CALLBACK_TYPE callback,
                        USB_DEVICE_GEN_DRIVER_CALLBACK_EVENT event)
```

```

{
    switch (callback)
    {
        case USB_DEVICE_GEN_DRIVER_CALLBACK_TX:
            if (writeBufferObject.transferCount == writeBufferObject.dataLen)
            {
                //entire data is written to host.
            }
            else
            {
                //some of the data is not sent to the host.
                //think and get some logic in place to handle this
            }
            break;
        case USB_DEVICE_GEN_DRIVER_CALLBACK_RX:
            break;
        case USB_DEVICE_GEN_DRIVER_CALLBACK_MANAGEMENT:
            break;
        default:
            break;
    }
}

int main ()
{
    // create buffer. Assuming data end-point max packet size is 64 bytes.
    uint8_t inBuffer[64] ;

    uint8_t datalen = 64;

    uint8_t epNum = 1;

    uint8_t dirn = USB_DEVICE_GEN_DRIVER_EP_OUT_INDEX;// OUT :0x00 or IN : 0x01

    DRV_HANDLE pipeHandle,genHandle;

    //create the buffer object with datalength 64
    USB_DEVICE_GEN_DRIVER_DATA_BUFFER_OBJECT writeBufferObject = {&inBuffer, 64, 0};

    //open the Generic USB device driver instance 0 ( or what ever is applicable)
    genHandle = USB_DEVICE_GEN_DRIVER_DRIVER_Open ( 0 );

    if(USB_DEVICE_GEN_DRIVER_DRIVER_RegisterCallbacks (genHandle,app_gen_CallBack ))
    {
        //handle error
    }

    //Get the pipe handle for the endpoint
    pipeHandle = USB_DEVICE_GEN_DRIVER_GetPipeHandle(genHandle, epNum, dirn))

    if ( DRV_HANDLE_INVALID == pipeHandle)
    {
        //The request was not successful.
    }
    //we got the pipe handle for the endpoint
    //Pass the pipe handle to USB_DEVICE_GEN_DRIVER_WriteEp

    genErr = USB_DEVICE_GEN_DRIVER_WriteEp( pipeHandle,&writeBufferObject);
    if(USB_ERROR_OK != genErr)
    {
        //write request is not accepted
    }
}

```

```
    }  
    return 0;  
}
```

The write request code flow can be better understood with the following diagram.

5.9.5.5.5 Client Subclass Specific

This section details the vendor specific sub-class specific requests and notifications handled by the Generic function driver.

5.9.5.6 Library Interface

Data Types and Constants

	Name	Description
	<u>USB_DEVICE_GENERIC_EVENT</u>	This is type <code>USB_DEVICE_GENERIC_EVENT</code> .
	<u>USB_DEVICE_GENERIC_EVENT_DATA</u>	Union that holds event data for different generic driver events.
	<u>USB_DEVICE_GENERIC_EVENT_DATA_CONTROL_TRANSFER_SETUP_REQUEST</u>	The data-type that holds the event data associated with <code>USB_DEVICE_GENERIC_EVENT_DATA_CONTROL_TRANSFER_SETUP_REQUEST</code> event.
	<u>USB_DEVICE_GENERIC_EVENT_DATA_ENDPOINT_READ_COMPLETE</u>	The data-type that holds the event data associated with <code>USB_DEVICE_GENERIC_EVENT_ENDPOINT_READ_COMPLETE</code> event.
	<u>USB_DEVICE_GENERIC_EVENT_DATA_ENDPOINT_WRITE_COMPLETE</u>	The data-type that holds the event data associated with <code>USB_DEVICE_GENERIC_EVENT_ENDPOINT_WRITE_COMPLETE</code> event.
	<u>USB_DEVICE_GENERIC_EVENT_HANDLER</u>	The data-type that defines the signature of the event callback function.
	<u>USB_DEVICE_GENERIC_EVENT_RESPONSE</u>	The return type of the application callback function.
	<u>USB_DEVICE_GENERIC_INDEX</u>	Data-type for USB device generic driver index.
	<u>USB_DEVICE_GENERIC_RESULT</u>	The enumerated data-type that identifies the possible result of an operation.

	USB_DEVICE_GENERIC_TRANSFER_FLAG	Enumerated data-type that identifies the USB device generic function driver's transfer flag.
	USB_DEVICE_GENERIC_TRANSFER_HANDLE	Data-type of the generic driver transfer handle.

Functions

	Name	Description
	USB_DEVICE_GENERIC_EndpointIsEnabled	This function returns true if the requested endpoint is enabled.
	USB_DEVICE_GENERIC_EndpointRead	Reads data received from host on the requested endpoint.
	USB_DEVICE_GENERIC_EndpointStall	This function stalls the requested endpoint.
	USB_DEVICE_GENERIC_EndpointStallClear	Clears STALL on the endpoint.
	USB_DEVICE_GENERIC_EndpointStallStatusGet	USB Generic function driver library function that returns true if STALL is enabled on the endpoint.
	USB_DEVICE_GENERIC_EndpointWrite	This function allows the application client to transfer data from device to host on the requested endpoint.
	USB_DEVICE_GENERIC_EventHandlerSet	This function allows the application client to register event handler callback with the generic function driver library.

Description

This section describes the Application Programming Interface (API) functions of the USB Generic Device Library.

Refer to each section for a detailed description.

5.9.5.6.1 Functions

5.9.5.6.1.1 USB_DEVICE_GENERIC_EndpointIsEnabled Function

C

```
bool USB_DEVICE_GENERIC_EndpointIsEnabled(
    USB_DEVICE_GENERIC_INDEX iGEN,
    USB_ENDPOINT endpoint
);
```

Preconditions

USB device layer be initialized.

Parameters

Parameters	Description
iGEN	USB generic driver function driver instance ID.
endpoint	endpoint address.

Returns

true if endpoint is enabled.

Remarks

None.

Example

5.9.5.6.1.2 USB_DEVICE_GENERIC_EndpointRead Function

C

```
USB_DEVICE_GENERIC_RESULT USB_DEVICE_GENERIC_EndpointRead(  
    USB_DEVICE_GENERIC_INDEX iGEN,  
    USB_DEVICE_GENERIC_TRANSFER_HANDLE * transferHandle,  
    USB_ENDPOINT endpoint,  
    uint8_t * buffer,  
    size_t bufferSize  
);
```

Preconditions

USB device layer be initialized.

Parameters

Parameters	Description
iGEN	USB generic function driver instance ID.
transferHandle	Pointer to transfer handle.
endpoint	endpoint address
buffer	Buffer pointer
bufferSize	Buffer size

Returns

See [USB_DEVICE_GENERIC_RESULT](#).

Remarks

None.

Example

5.9.5.6.1.3 USB_DEVICE_GENERIC_EndpointStall Function

C

```
USB_DEVICE_GENERIC_RESULT USB_DEVICE_GENERIC_EndpointStall(  
    USB_DEVICE_GENERIC_INDEX iGEN,  
    USB_ENDPOINT endpoint  
);
```

Preconditions

USB device layer must be initialized.

Parameters

Parameters	Description
iGEN	USB device generic function driver instance ID.
endpoint	Endpoint address.

Returns

See [USB_DEVICE_GENERIC_RESULT](#)

Remarks

None.

Example**5.9.5.6.1.4 USB_DEVICE_GENERIC_EndpointStallClear Function****C**

```
USB_DEVICE_GENERIC_RESULT USB_DEVICE_GENERIC_EndpointStallClear(  
    USB_DEVICE_GENERIC_INDEX iGEN,  
    USB_ENDPOINT endpoint  
);
```

Preconditions

USB device layer be initialized.

Parameters

Parameters	Description
iGEN	Generic driver instance index.
endpoint	Endpoint address for which the stall has to be cleared.

Returns

See [USB_DEVICE_GENERIC_RESULT](#).

Remarks

None.

Example**5.9.5.6.1.5 USB_DEVICE_GENERIC_EndpointStallStatusGet Function****C**

```
bool USB_DEVICE_GENERIC_EndpointStallStatusGet(  
    USB_DEVICE_GENERIC_INDEX iGEN,  
    USB_ENDPOINT endpoint  
);
```

Preconditions

USB device layer be initialized.

Parameters

Parameters	Description
iGEN	USB generic function driver instance ID.
endpoint	endpoint address.

Returns

true if endpoint is stalled.

Remarks

None.

Example

5.9.5.6.1.6 USB_DEVICE_GENERIC_EndpointWrite Function

C

```
USB_DEVICE_GENERIC_RESULT USB_DEVICE_GENERIC_EndpointWrite(  
    USB_DEVICE_GENERIC_INDEX iGEN,  
    USB_DEVICE_GENERIC_TRANSFER_HANDLE * transferHandle,  
    USB_ENDPOINT endpoint,  
    uint8_t * buffer,  
    size_t bufferSize,  
    USB_DEVICE_GENERIC_TRANSFER_FLAG flags  
);
```

Preconditions

USB device layer be initialized.

Parameters

Parameters	Description
iGEN	USB generic function driver instance ID.
transferHandle	Pointer to transfer handle.
endpoint	endpoint address
buffer	Buffer pointer
bufferSize	Buffer size
flags	Flag that specifies this function whether to end the transfer with a short packet or not.

Returns

See [USB_DEVICE_GENERIC_RESULT](#).

Remarks

None.

Example

5.9.5.6.1.7 USB_DEVICE_GENERIC_EventHandlerSet Function

C

```
USB_DEVICE_GENERIC_RESULT USB_DEVICE_GENERIC_EventHandlerSet(  
    USB_DEVICE_GENERIC_INDEX iGEN,  
    USB_DEVICE_GENERIC_EVENT_HANDLER eventHandler,  
    uintptr_t userData  
);
```

Preconditions

USB device layer be initialized.

Parameters

Parameters	Description
instanceIndex	USB Generic function driver instance ID.
eventHandler	Pointer to application event handler callback function.

Returns

See [USB_DEVICE_GENERIC_RESULT](#).

Remarks

None.

Example

5.9.5.6.2 Data Types and Constants

5.9.5.6.2.1 USB_DEVICE_GENERIC_EVENT Enumeration

C

```
typedef enum {
    USB_DEVICE_GENERIC_EVENT_CONTROL_TRANSFER_SETUP_REQUEST,
    USB_DEVICE_GENERIC_EVENT_CONTROL_TRANSFER_DATA_RECEIVED,
    USB_DEVICE_GENERIC_EVENT_CONTROL_TRANSFER_DATA_SENT,
    USB_DEVICE_GENERIC_EVENT_CONTROL_TRANSFER_ABORTED,
    USB_DEVICE_GENERIC_EVENT_ENDPOINT_WRITE_COMPLETE,
    USB_DEVICE_GENERIC_EVENT_ENDPOINT_READ_COMPLETE
} USB_DEVICE_GENERIC_EVENT;
```

Description

This is type USB_DEVICE_GENERIC_EVENT.

Members

Members	Description
USB_DEVICE_GENERIC_EVENT_CONTROL_TRANSFER_SETUP_REQUEST	Control transfer data stage is received from host to device
USB_DEVICE_GENERIC_EVENT_CONTROL_TRANSFER_DATA_RECEIVED	Control transfer data stage is received from host to device
USB_DEVICE_GENERIC_EVENT_CONTROL_TRANSFER_DATA_SENT	Control transfer data stage is transmitted from device to host

5.9.5.6.2.2 USB_DEVICE_GENERIC_EVENT_DATA Union

C

```
typedef union {
    USB_DEVICE_GENERIC_EVENT_DATA_ENDPOINT_WRITE_COMPLETE endpointWriteComplete;
    USB_DEVICE_GENERIC_EVENT_DATA_ENDPOINT_READ_COMPLETE endpointReadComplete;
    USB_DEVICE_GENERIC_EVENT_DATA_CONTROL_TRANSFER_SETUP_REQUEST * ptrSetupRequest;
} USB_DEVICE_GENERIC_EVENT_DATA;
```

Description

Event Data.

Members

Members	Description
USB_DEVICE_GENERIC_EVENT_DATA_ENDPOINT_WRITE_COMPLETE endpointWriteComplete;	Data associated with USB_DEVICE_GENERIC_EVENT_ENDPOINT_WRITE_COMPLETE event
USB_DEVICE_GENERIC_EVENT_DATA_ENDPOINT_READ_COMPLETE endpointReadComplete;	Data associated with USB_DEVICE_GENERIC_EVENT_ENDPOINT_READ_COMPLETE event

USB_DEVICE_GENERIC_EVENT_DATA_CONTROL_TRANSFER_SETUP_REQUEST * ptrSetupRequest;	Data associated with USB_DEVICE_GENERIC_EVENT_D ATACONTROL

Remarks

None.

5.9.5.6.2.3**USB_DEVICE_GENERIC_EVENT_DATA_CONTROL_TRANSFER_SETUP_REQUEST
Structure****C**

```
typedef struct {
    uint8_t bmRequestType;
    uint8_t bRequest;
    uint16_t wValue;
    uint16_t wIndex;
    uint16_t wLength;
} USB_DEVICE_GENERIC_EVENT_DATA_CONTROL_TRANSFER_SETUP_REQUEST;
```

Description

Data associated with USB_DEVICE_GENERIC_EVENT_DATA_CONTROL_TRANSFER_SETUP_REQUEST event.

Members

Members	Description
uint8_t bmRequestType;	Format of setup packet from table 9-2 of USB 2.0 spec

Remarks

None.

**5.9.5.6.2.4 USB_DEVICE_GENERIC_EVENT_DATA_ENDPOINT_READ_COMPLETE
Structure****C**

```
typedef struct {
    unsigned int dataSize;
    uint8_t * data;
    USB_DEVICE_IRP_STATUS status;
    USB_DEVICE_GENERIC_TRANSFER_HANDLE transferHandle;
} USB_DEVICE_GENERIC_EVENT_DATA_ENDPOINT_READ_COMPLETE;
```

Description

Data associated with USB_DEVICE_GENERIC_EVENT_ENDPOINT_READ_COMPLETE event.

Members

Members	Description
unsigned int dataSize;	data size received
uint8_t * data;	Pointer to data buffer
USB_DEVICE_IRP_STATUS status;	Status
USB_DEVICE_GENERIC_TRANSFER_HANDLE transferHandle;	Transfer handle

Remarks

None.

5.9.5.6.2.5 USB_DEVICE_GENERIC_EVENT_DATA_ENDPOINT_WRITE_COMPLETE Structure

C

```
typedef struct {
    unsigned int dataSize;
    uint8_t * data;
    USB_DEVICE_IRP_STATUS status;
    USB_DEVICE_GENERIC_TRANSFER_HANDLE transferHandle;
} USB_DEVICE_GENERIC_EVENT_DATA_ENDPOINT_WRITE_COMPLETE;
```

Description

Data associated with USB_DEVICE_GENERIC_EVENT_ENDPOINT_WRITE_COMPLETE event.

Members

Members	Description
unsigned int dataSize;	data size transmitted
uint8_t * data;	Pointer to data buffer
USB_DEVICE_IRP_STATUS status;	Status
USB_DEVICE_GENERIC_TRANSFER_HANDLE transferHandle;	Transfer handle

Remarks

None.

5.9.5.6.2.6 USB_DEVICE_GENERIC_EVENT_HANDLER Type

C

```
typedef USB_DEVICE_GENERIC_EVENT_RESPONSE (*
USB_DEVICE_GENERIC_EVENT_HANDLER)(USB_DEVICE_GENERIC_INDEX instanceIndex,
USB_DEVICE_CONTROL_TRANSFER_HANDLE controlTransferHandle, USB_DEVICE_GENERIC_EVENT event,
USB_DEVICE_GENERIC_EVENT_DATA * eventData, uintptr_t userData);
```

Description

USB device generic function driver event handle.

The application provided event callback function must be of this data-type.

Remarks

None.

5.9.5.6.2.7 USB_DEVICE_GENERIC_EVENT_RESPONSE Type

C

```
typedef void USB_DEVICE_GENERIC_EVENT_RESPONSE;
```

Description

Return type of the application callback function.

Remarks

Also see, [USB_DEVICE_GENERIC_EVENT_HANDLER](#)

5.9.5.6.2.8 USB_DEVICE_GENERIC_INDEX Type

C

```
typedef SYS_MODULE_INDEX USB_DEVICE_GENERIC_INDEX;
```

Description

Data-type for USB device generic driver index.

Remarks

None.

5.9.5.6.2.9 USB_DEVICE_GENERIC_RESULT Enumeration

C

```
typedef enum {  
    USB_DEVICE_GENERIC_RESULT_QUEUE_FULL,  
    USB_DEVICE_GENERIC_RESULT_OK,  
    USB_DEVICE_GENERIC_RESULT_ENDPOINT_NOT_CONFIGURED,  
    USB_DEVICE_GENERIC_RESULT_PARAMETER_INVALID  
} USB_DEVICE_GENERIC_RESULT;
```

Description

Possible results of Generic Driver operations.

Members

Members	Description
USB_DEVICE_GENERIC_RESULT_QUEUE_FULL	Queue is full
USB_DEVICE_GENERIC_RESULT_OK	No Error
USB_DEVICE_GENERIC_RESULT_ENDPOINT_NOT_CONFIGURED	Endpoint not configured
USB_DEVICE_GENERIC_RESULT_PARAMETER_INVALID	One or more parameter/s of the function is invalid

Remarks

None.

5.9.5.6.2.10 USB_DEVICE_GENERIC_TRANSFER_FLAG Enumeration

C

```
typedef enum {  
    USB_DEVICE_GENERIC_TRANSFER_FLAG_NONE,  
    USB_DEVICE_GENERIC_TRANSFER_FLAG_DATA_COMPLETE  
} USB_DEVICE_GENERIC_TRANSFER_FLAG;
```

Description

USB device generic function driver transfer flags.

Members

Members	Description
USB_DEVICE_GENERIC_TRANSFER_FLAG_NONE	Transfer flag that specifies no special request
USB_DEVICE_GENERIC_TRANSFER_FLAG_DATA_COMPLETE	Transfer flag that specifies the generic driver to complete the transfer

Remarks

Also see, [USB_DEVICE_GENERIC_EndpointWrite](#)

5.9.5.6.2.11 USB_DEVICE_GENERIC_TRANSFER_HANDLE Type

C

```
typedef uintptr_t USB_DEVICE_GENERIC_TRANSFER_HANDLE;
```

Description

Generic driver transfer handle.

Remarks

Also see, [USB_DEVICE_GENERIC_EndpointRead](#) [USB_DEVICE_GENERIC_EndpointWrite](#)

5.9.5.7 Files

Files

Name	Description
usb_device_generic.h	Generic USB device function driver header

Description

5.9.5.7.1 usb_device_generic.h

Generic USB device function driver header file

Generic USB device function driver header file

Enumerations

	Name	Description
	USB_DEVICE_GENERIC_EVENT	This is type USB_DEVICE_GENERIC_EVENT.
	USB_DEVICE_GENERIC_RESULT	The enumerated data-type that identifies the possible result of an operation.
	USB_DEVICE_GENERIC_TRANSFER_FLAG	Enumerated data-type that identifies the USB device generic function driver's transfer flag.

Functions

	Name	Description
	USB_DEVICE_GENERIC_EndpointIsEnabled	This function returns true if the requested endpoint is enabled.
	USB_DEVICE_GENERIC_EndpointRead	Reads data received from host on the requested endpoint.
	USB_DEVICE_GENERIC_EndpointStall	This function stalls the requested endpoint.
	USB_DEVICE_GENERIC_EndpointStallClear	Clears STALL on the endpoint.
	USB_DEVICE_GENERIC_EndpointStallStatusGet	USB Generic function driver library function that returns true if STALL is enabled on the endpoint.
	USB_DEVICE_GENERIC_EndpointWrite	This function allows the application client to transfer data from device to host on the requested endpoint.
	USB_DEVICE_GENERIC_EventHandlerSet	This function allows the application client to register event handler callback with the generic function driver library.

Structures

	Name	Description
	<u>USB_DEVICE_GENERIC_EVENT_DATA_CONTROL_TRANSFER_SETUP_REQUEST</u>	The data-type that holds the event data associated with USB_DEVICE_GENERIC_EVENT_DATA_CONTROL_TRANSFER_SETUP_REQUEST event.
	<u>USB_DEVICE_GENERIC_EVENT_DATA_ENDPOINT_READ_COMPLETE</u>	The data-type that holds the event data associated with USB_DEVICE_GENERIC_EVENT_ENDPOINT_READ_COMPLETE event.
	<u>USB_DEVICE_GENERIC_EVENT_DATA_ENDPOINT_WRITE_COMPLETE</u>	The data-type that holds the event data associated with USB_DEVICE_GENERIC_EVENT_ENDPOINT_WRITE_COMPLETE event.

Types

	Name	Description
	<u>USB_DEVICE_GENERIC_EVENT_HANDLER</u>	The data-type that defines the signature of the event callback function.
	<u>USB_DEVICE_GENERIC_EVENT_RESPONSE</u>	The return type of the application callback function.
	<u>USB_DEVICE_GENERIC_INDEX</u>	Data-type for USB device generic driver index.
	<u>USB_DEVICE_GENERIC_TRANSFER_HANDLE</u>	Data-type of the generic driver transfer handle.

Unions

	Name	Description
	<u>USB_DEVICE_GENERIC_EVENT_DATA</u>	Union that holds event data for different generic driver events.

5.9.6 USB HID Device Library

5.9.6.1 Introduction

Introduces the MPLAB Harmony USB Device HID Library

Description

This library provides a high-level abstraction of the Human Interface Devices (HID) class under the Universal Serial Bus (USB) communication with a convenient C language interface. This library supports revision 1.11 of the USB HID specification release by the USB Implementers forum. This library is part of the MPLAB Harmony USB Device stack.

USB Human Interface Devices class (or USB HID) supports class of devices that are used by humans to control the operation of computer systems. The HID class of devices include a wide variety of human interface, data indicator, data feedback devices with various types of outputs directed to the end user. Some common examples of HID class devices include:

- Keyboards
- Pointing devices such as standard mouse, joysticks, trackballs
- Front-panel controls like knobs, switches, buttons, sliders
- Controls found on telephony, gaming or simulation devices like steering wheels, rudder pedals, dial pads
- Data devices such as bar-code scanners, thermometers, analyzers

The USB Device HID library (also referred to as HID function driver in this document) offers services to the application to interact and respond to the host requests. Additional information about the HID class can be obtained from the HID specification available www.usbif.org.

5.9.6.2 Release Notes

MPLAB Harmony Version: v0.70b **USB HID Device Library Version :** 0.01 Alpha **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.9.6.3 SW License Agreement

5.9.6.4 Library Architecture

5.9.6.4.1 Architecture Overview

Provides an Architectural Overview of the HID Function Driver

Description

The HID Function Driver offers services to a USB HID device to communicate with the host by abstracting the HID specification details. It must be used along with the USB Device layer and USB controller to communicate with the USB host. Figure 1 shows a block diagram representation of the MPLAB Harmony USB Architecture and where the USB HID Function Driver is placed.

Figure 1: USB HID Function Driver

The HID function driver together with USB Device layer and USB controller driver forms the basic library entity through which a HID device can communicate with the USB host. The USB controller driver takes the responsibility of managing the USB peripheral on the device. The USB device layer handles the device enumeration etc. The USB Device layer forwards all HID specific control transfers to the HID Function Driver. The HID Function Driver interprets the control transfers and requests application's intervention through event handlers and well defined set of API. The application must register a event handler with the HID function driver in the Device Layer Set Configuration Event. While the application must respond to the HID function driver events, it can do this either in the event handler or out of it. The application interacts with HID Function Driver routines to [send](#) and receive HID reports over the USB.

Figure 2 : Architecture of the HID function driver.

Figure 2 shows the architecture of the HID function Driver. The function driver maintains the state of each instance. It receives HID class specific control transfers from the Device Layer. Class specific control transfers that require application response are forwarded to the application as function driver events. Depending on the type of device, the HID function driver can use the control endpoint and/or interrupt endpoints for data transfers. The HID device exchanges data with host through data objects called reports. The report data format is described by the HID report descriptor which is provided to the host when requested. Refer to the HID specification available www.usb.org for more details on the USB HID device class and how reports descriptors can be created. The HID function driver allows report descriptors to be specified for every instance. This allow the application to implement a composite HID device.

5.9.6.5 Using the Library

5.9.6.5.1 Files to Include

Describes which files to include in project while using the HID Function Driver

Description

Table 1 shows the files that must be included in the project in order to use the HID Function Driver. These files are located in the

framework folder of the MPLAB Harmony installation. It is assumed that the Device Layer files (and the files needed by the Device Layer) are already included in the project.

Filename	Description
\framework\usb\src\dynamic\usb_device_hid.c	Contains the HID Control Interface and Data Interface management routines
\framework\usb\usb_device_hid.h	Must included in every source file that needs to invoke HID function driver API.
system_config.h	User created file which contains the HID function driver configuration.

Table 1: Files to be included in USB CDC Device Project.

5.9.6.5.2 Library Configuration

Describes how to configure the HID Function Driver

Description

The following configuration parameters must be defined while using the HID Function Driver. The configuration macros that implement these parameters must be located in the system_config.h file in the application project and a compiler include path (to point to the folder that contains this file) should be specified.

Configuration Macro Name	Description	Comments
USB_DEVICE_HID_MAX_INSTANCES	Number of HID Function Driver Instances in the application	This macro defines the number of instances of the HID Function Driver. For example, if the application needs to implement two instances of the HID Function Driver (for example to create a mouse + keyboard device) on one USB Device, the macro USB_DEVICE_HID_INSTANCES_NUMBER should be set to 2. Note that implementing a USB Device that features multiple HID interfaces requires appropriate USB configuration descriptors.
USB_DEVICE_HID_QUEUE_SIZE	HID Function Driver Buffer Queue Combined size	This macro defines the number of entries in all queues in all instances of the HID function driver. This value can be obtained by adding up the read and write queue sizes of each HID Function driver instance. In a simple single instance USB HID device application, that does not require buffer queuing, the USB_DEVICE_HID_QUEUE_DEPTH_COMBINED macro can be set to 2. Consider a case with two HIDfunction driver instances, CDC 1 has a read queue size of 2 and write queue size of 3, HID 2 has a read queue size of 4 and write queue size of 1, this macro should be set to 10 (2 +3 + 4 + 1).

5.9.6.5.3 Library Initialization

Describes how the HID Function Driver is initialized.

Description

The HID function driver instance for a USB device configuration is initialized by the Device Layer when the configuration is set by the host. This process does not require application intervention. Each instance of the HID function driver should be registered with the Device layer through the Device Layer Function Driver Registration Table. The HID function driver requires a initialization data structure that contains details about the report descriptor associated with the specific instance of the HID function driver. The hidFuncDriver object is a global object provided by the HID function driver and points to the HID function driver - Device Layer interface functions which are required by the Device Layer. The code snippet below shows an example of how a HID function driver instance (implementing a USB HID Mouse) can be registered with the Device Layer.

```

/* This code snippet shows an example of registering a HID function driver
 * with the Device Layer. While registering the function driver, an initialization
 * data structure must be specified. In this example, hidInit is the HID function
 * driver initialization data structure. */

/* This hid_rpt01 report descriptor describes a 3 button 2
 * axis mouse pointing device */
const uint8_t hid_rpt01[] =
{
    0x06, 0x00, 0xFF,    // Usage Page = 0xFF00 (Vendor Defined Page 1)
    0x09, 0x01,          // Usage (Vendor Usage 1)
    0xA1, 0x01,          // Collection (Application)
    0x19, 0x01,          // Usage Minimum
    0x29, 0x40,          // Usage Maximum //64 input usages total (0x01 to 0x40)
    0x15, 0x01,          // Logical Minimum (data bytes in the report may have minimum value =
0x00)
    0x25, 0x40,          // Logical Maximum (data bytes in the report may have maximum value =
0x00FF = unsigned 255)
    0x75, 0x08,          // Report Size: 8-bit field size
    0x95, 0x40,          // Report Count: Make sixty-four 8-bit fields (the next time the
parser hits an "Input", "Output", or "Feature" item)
    0x81, 0x00,          // Input (Data, Array, Abs): Instantiates input packet fields based
on the above report size, count, logical min/max, and usage.
    0x19, 0x01,          // Usage Minimum
    0x29, 0x40,          // Usage Maximum //64 output usages total (0x01 to 0x40)
    0x91, 0x00,          // Output (Data, Array, Abs): Instantiates output packet fields.
Uses same report size and count as "Input" fields, since
nothing // new or different was specified to the
parser since the "Input" item.
    0xC0                // End Collection
};

/* HID Function Driver Initialization data structure. This
 * contains the size of the report descriptor and a pointer
 * to the report descriptor. If there are multiple HID instances
 * each with different report descriptors, then multiple such data
 * structures may be needed */

USB_DEVICE_HID_INITIALIZATION hidInit =
{
    sizeof(hid_rpt01),
    (uint8_t *)&hid_rpt01
};

/* The HID function driver instance is now registered with
 * device layer through the function driver registration
 * table. */

const USB_DEVICE_FUNC_REGISTRATION_TABLE funcRegistrationTable[1] =
{
    {
        .speed = USB_SPEED_FULL|USB_SPEED_HIGH, // Supported speed
        .configurationValue = 1,                // To be initialized for Configuration 1
        .interfaceNumber = 0,                   // Starting interface number
        .numberOfInterfaces = 1,                 // Number of Interfaces
        .funcDriverIndex = 0,                   // Function Driver instance index is 0
        .funcDriverInit = &hidInit,             // Function Driver Initialization
        .driver = &hidFuncDriver                // Pointer to the function driver - Device
Layer Interface functions
    }
};

```

5.9.6.5.4 Event Handling

Describes HID function driver event handler registration and event handling.

Description

Registering a HID Function Driver Event Handler:

While creating USB HID Device based application, an event handler must be registered with the Device Layer (the Device Layer Event Handler) and every HID function driver instance (HID Function Driver Event Handler). The HID function driver event handler receives HID events. This event handler should be registered before the USB device layer acknowledges the SET CONFIGURATION request from the USB Host. In order to ensure this, the event handler should be set in the USB_DEVICE_EVENT_CONFIGURED event that is generated by the device layer. While registering the HID function driver event handler, the HID function driver allows the application to also pass a data object in the event handler register function. This data object gets associated with the instance of the HID function driver and is returned by the HID function driver when a HID function driver event occurs. The code example below shows an example of how this can be done.

```
/* This a sample Application Device Layer Event Handler
 * Note how the HID Function Driver event handler APP_USBDeviceHIDEventHandler()
 * is registered in the USB_DEVICE_EVENT_CONFIGURED event. The appData
 * object that is passed in the USB_DEVICE_HID_EventHandlerSet()
 * function will be returned as the userData parameter in the
 * when the APP_USBDeviceHIDEventHandler() function is invoked */
```

```
void APP_USBDeviceEventCallBack ( USB_DEVICE_EVENT event,
                                USB_DEVICE_EVENT_DATA * eventData )
{
    switch ( event )
    {
        case USB_DEVICE_EVENT_RESET:
        case USB_DEVICE_EVENT_DECONFIGURED:

            // USB device is reset or device is deconfigured.
            // This means that USB device layer is about to deinitalize
            // all function drivers.

            break;

        case USB_DEVICE_EVENT_CONFIGURED:

            /* check the configuration */
            if ( eventData->eventConfigured.configurationValue == 1)
            {

                /* Register the HID Device application event handler here.
                 * Note how the appData object pointer is passed as the
                 * user data */

                USB_DEVICE_HID_EventHandlerSet(USB_DEVICE_HID_INDEX_0,
                                                APP_USBDeviceHIDEventHandler, (uintptr_t)&appData);

                /* mark that set configuration is complete */
                appData.isConfigured = true;

            }
            break;

        case USB_DEVICE_EVENT_SUSPENDED:

            break;

        case USB_DEVICE_EVENT_RESUMED:
        case USB_DEVICE_EVENT_ATTACHED:
        case USB_DEVICE_EVENT_DETACHED:
        case USB_DEVICE_EVENT_ERROR:
        default:
            break;
    }
}
```

```
}

```

HID Function Driver Events:

The HID Function Driver generates events that the application must respond to. Some of these events are control requests communicated through control transfers. The application must therefore complete the control transfer. Based on the generated event, the application may be required to:

- Respond with a [USB_DEVICE_ControlSend\(\)](#) function which completes the data stage of a Control Read Transfer.
- Respond with a [USB_DEVICE_ControlReceive\(\)](#) function which provisions the data stage of a Control Write Transfer.
- Respond with a [USB_DEVICE_ControlStatus\(\)](#) function which completes the handshake stage of the Control Transfer. The application can either STALL or Acknowledge the handshake stage via the [USB_DEVICE_ControlStatus\(\)](#) function.
- Analyze the pData member of the event handler and check for event specific data.

The possible HID Function Driver events are described here along with the required application response, event specific data and likely follow up function driver event:

1. USB_DEVICE_HID_EVENT_CONTROL_GET_REPORT

Application Response: This event is generated when the HID host is requesting for a report over the control interface. The application must provide the report by calling the [USB_DEVICE_ControlSend\(\)](#) function either in the event handler or in the application (outside of the event handler function). The application must use the controlTransferHandle parameter provided in the event while calling [USB_DEVICE_ControlSend\(\)](#) function. The application can use the USB_DEVICE_HID_EVENT_CONTROL_TRANSFER_DATA_SENT event to track completion of the command.

Event Specific Data (eventData): The getReport member of the eventData data structure will contain the details about the requested report.

Likely Follow-up event: This event will likely be followed by the USB_DEVICE_HID_EVENT_CONTROL_TRANSFER_DATA_SENT event. This indicates that the data was sent to the host successfully. The application must acknowledge the handshake stage of the control transfer by calling [USB_DEVICE_ControlStatus\(\)](#) function with the USB_DEVICE_CONTROL_STATUS_SEND_ZLP flag.

2. USB_DEVICE_HID_EVENT_CONTROL_SET_REPORT

Application Response: This event is generated when the HID host wants to [send](#) a report over the control interface. The application must provide a buffer to receive the report by calling the [USB_DEVICE_ControlReceive\(\)](#) function either in the event handler or in the application (outside of the event handler function). The application must use the controlTransferHandle parameter provided in the event while calling [USB_DEVICE_ControlReceive\(\)](#) function. The application can use the USB_DEVICE_HID_EVENT_CONTROL_TRANSFER_DATA_RECEIVED event to track completion of the command.

Event Specific Data (eventData): The setReport member of the eventData data structure will contain the details about the report that the host intends to [send](#).

Likely Follow-up event: This event will likely be followed by the USB_DEVICE_HID_EVENT_CONTROL_TRANSFER_DATA_RECEIVED event. This indicates that the data was received successfully. The application must either acknowledge or stall the handshake stage of the control transfer by calling [USB_DEVICE_ControlStatus\(\)](#) function with USB_DEVICE_CONTROL_STATUS_SEND_ZLP or USB_DEVICE_CONTROL_STATUS_STALL flag respectively.

3. USB_DEVICE_HID_EVENT_CONTROL_GET_IDLE

Application Response: This event is generated when the HID host wants to read the current idle rate for the specified report. The application must provide the idle rate through the [USB_DEVICE_ControlSend\(\)](#) function either in the event handler or in the application (outside of the event handler function). The application must use the controlTransferHandle parameter provided in the event while calling [USB_DEVICE_ControlSend\(\)](#) function. The application can use the USB_DEVICE_HID_EVENT_CONTROL_TRANSFER_DATA_SENT event to track completion of the command.

Event Specific Data (eventData): The getIdle member of the eventData data structure will contain the details about the report for which the idle rate is requested.

Likely Follow-up event: This event will likely be followed by the USB_DEVICE_HID_EVENT_CONTROL_TRANSFER_DATA_SENT event. This indicates that the data was sent to the host successfully. The application must acknowledge the handshake stage of the control transfer by calling [USB_DEVICE_ControlStatus\(\)](#) function with the USB_DEVICE_CONTROL_STATUS_SEND_ZLP flag.

4. USB_DEVICE_HID_EVENT_CONTROL_SET_IDLE

Application Response: This event is generated when the HID host sends a Set Idle request to the device . The application must inspect the eventData and determine if the idle rate is to be supported. The application must either acknowledge (if the idle rate is supported) or stall the handshake stage of the control transfer (if the idle rate is not supported) by calling [USB_DEVICE_ControlStatus\(\)](#) function with USB_DEVICE_CONTROL_STATUS_SEND_ZLP or USB_DEVICE_CONTROL_STATUS_STALL flag respectively.

Event Specific Data (eventData): The setIdle member of the eventData data structure will contain the details about the report for which the idle rate should be set and the idle duration.

Likely Follow-up event: None.

5. USB_DEVICE_HID_EVENT_CONTROL_SET_PROTOCOL

Application Response: This event is generated when the HID host sends a Set Protocol request to the device . The application must inspect the eventData and determine if the protocol is to be supported. The application must either acknowledge (if the protocol is supported) or stall the handshake stage of the control transfer (if the protocol is not supported) by calling [USB_DEVICE_ControlStatus\(\)](#) function with USB_DEVICE_CONTROL_STATUS_SEND_ZLP or USB_DEVICE_CONTROL_STATUS_STALL flag respectively.

Event Specific Data (eventData): The setProtocol member of the eventData data structure will contain the details about the protocol to switch to.

Likely Follow-up event: None.

6. USB_DEVICE_HID_EVENT_CONTROL_GET_PROTOCOL

Application Response: This event is generated when the HID host issues a Get Protocol Request. The application must provide the current protocol through the [USB_DEVICE_ControlSend\(\)](#) function either in the event handler or in the application (outside of the event handler function). The application must use the controlTransferHandle parameter provided in the event while calling [USB_DEVICE_ControlSend\(\)](#) function. The application can use the USB_DEVICE_HID_EVENT_CONTROL_TRANSFER_DATA_SENT event to track completion of the command.

Event Specific Data (eventData): None.

Likely Follow-up event: This event will likely be followed by the USB_DEVICE_HID_EVENT_CONTROL_TRANSFER_DATA_SENT event. This indicates that the data was sent to the host successfully. The application must acknowledge the handshake stage of the control transfer by calling [USB_DEVICE_ControlStatus\(\)](#) function with the USB_DEVICE_CONTROL_STATUS_SEND_ZLP flag.

7. USB_DEVICE_HID_EVENT_CONTROL_SET_DESCRIPTOR

Application Response: This event is generated when the HID host issues a Set Descriptor request. The application must provide a buffer to receive the descriptor through the [USB_DEVICE_ControlReceive\(\)](#) function either in the event handler or in the application (outside of the event handler function). The application must use the controlTransferHandle parameter provided in the event while calling [USB_DEVICE_ControlReceive\(\)](#) function. The application can use the USB_DEVICE_HID_EVENT_CONTROL_TRANSFER_DATA_RECEIVED event to track completion of the command.

Event Specific Data: None

Likely Follow-up event: This event will likely be followed by the `USB_DEVICE_HID_EVENT_CONTROL_TRANSFER_DATA_RECEIVED` event. This indicates that the data was received successfully. The application must either acknowledge or stall the handshake stage of the control transfer by calling `USB_DEVICE_ControlStatus()` function with `USB_DEVICE_CONTROL_STATUS_SEND_ZLP` or `USB_DEVICE_CONTROL_STATUS_STALL` flag respectively.

8. `USB_DEVICE_HID_EVENT_REPORT_SENT`

Application Response: This event occurs when a report `send` operation scheduled by calling the `USB_DEVICE_HID_ReportSend()` function has completed. This event does not require the application to respond with any function calls..

Event Specific Data (pData): The `reportSent` member of the `eventData` data structure will contains details about the report `send` operation.

Likely Follow-up event: None.

9. `USB_DEVICE_HID_EVENT_REPORT_RECEIVED`

Application Response: This event occurs when a report receive operation scheduled by calling the `USB_DEVICE_HID_ReportReceive()` function has completed. This event does not require the application to respond with any function calls..

Event Specific Data (pData): The `reportReceived` member of the `eventData` data structure will contains details about the report receive operation.

Likely Follow-up event: None

10. `USB_DEVICE_HID_EVENT_CONTROL_TRANSFER_DATA_SENT`

Application Response: This event occurs when the data stage of a control read transfer has completed in response to the `USB_DEVICE_ControlSend()` function. The application must acknowledge the handshake stage of the control transfer by calling `USB_DEVICE_ControlStatus()` function with `USB_DEVICE_CONTROL_STATUS_SEND_ZLP` flag.

Event Specific Data (pData): None.

Likely Follow-up event: None.

11. `USB_DEVICE_HID_EVENT_CONTROL_TRANSFER_DATA_RECEIVED`

Application Response: This event occurs when the data stage of a control write transfer has completed in response to the `USB_DEVICE_ControlReceive()` function. The application must either acknowledge or stall the handshake stage of the control transfer by calling `USB_DEVICE_ControlStatus()` function with `USB_DEVICE_CONTROL_STATUS_SEND_ZLP` or `USB_DEVICE_CONTROL_STATUS_STALL` flag respectively.

Event Specific Data (pData): None

Likely Follow-up event: None.

12. `USB_DEVICE_HID_EVENT_CONTROL_TRANSFER_ABORTED`

Application Response: This event occurs when the a control transfer request is aborted by the host. The application can use this event to update its HID class specific control transfer state machine.

Event Specific Data (pData): None

Likely Follow-up event: None.

5.9.6.5.5 Sending a Report

Describes how to `send` a report.

Description

The USB HID device sends data to the HID host as reports. The HID device application should use the `USB_DEVICE_HID_ReportSend()` function to **send** the report. This function returns a transfer handler that allows the application to track the read request. The request is completed when the host as requested for the data. A report **send** request could fail if the function driver instance transfer queue is full. The completion of the write transfer is indicated by `USB_DEVICE_HID_EVENT_REPORT_SENT` event. The transfer handle and the amount of data sent is returned in the `reportSent` member of the `eventData` data structure along with the event.

The following code snippet shows an example of how USB HID Mouse application sends a report to the host.

```
/* In this code example, the application uses the
 * USB_HID_MOUSE_ReportCreate to create the mouse report
 * and then uses the USB_DEVICE_HID_ReportSend() function
 * to send the report */

USB_HID_MOUSE_ReportCreate(appData.xCoordinate, appData.yCoordinate,
    appData.mouseButton, &appData.mouseReport);

/* Send the mouse report. */
USB_DEVICE_HID_ReportSend(appData.hidInstance,
    &appData.reportTransferHandle, (uint8_t*)&appData.mouseReport,
    sizeof(USB_HID_MOUSE_REPORT));
```

5.9.6.5.6 Receiving a Report

Describes how to receive a report

Description

The application can receive a report from the host by using the `USB_DEVICE_HID_ReportReceive()` function. This function returns a transfer handler that allows the application to track the read request. The request is completed when the host sends the report. The application must make sure that it allocates a buffer size that is at least the size of the report. The return value of the function indicates the success of the request. A read request could fail if the function driver transfer queue is full. The completion of the read transfer is `USB_DEVICE_HID_EVENT_REPORT_RECEIVED` event. The `reportReceived` member of the `eventData` data structure contains details about the received report. The following code snippet shows an example of how a USB HID Keyboard can schedule a receive report operation to get the keyboard LED status.

```
/* The following code snippet shows how the
 * USB HID Keyboard application schedules a
 * receive report operation to receive the
 * keyboard output report from the host. This
 * report contains the keyboard LED status. The
 * size of the report is 1 byte */

result = USB_DEVICE_HID_ReportReceive(appData.hidInstance,
    &appData.receiveTransferHandle,
    (uint8_t *)&appData.keyboardOutputReport,1);

if(USB_DEVICE_HID_RESULT_OK != result)
{
    /* Do error handling here */
}
```

5.9.6.6 Library Interface

Data Types and Constants

	Name	Description
	<u>USB_DEVICE_HID_CONTROL_STATUS</u>	USB Device HID Function Driver Control Transfer Status
	<u>USB_DEVICE_HID_CONTROL_TRANSFER_HANDLE</u>	USB Device HID Function Driver Control Transfer Handle
	<u>USB_DEVICE_HID_EVENT</u>	USB Device HID Function Driver Events
	<u>USB_DEVICE_HID_EVENT_DATA_GET_IDLE</u>	USB Device HID Get Idle Event Data Type.
	<u>USB_DEVICE_HID_EVENT_DATA_GET_PROTOCOL</u>	USB Device HID Get Protocol Event Data Type.
	<u>USB_DEVICE_HID_EVENT_DATA_GET_REPORT</u>	USB Device HID Get Report Event Data Type.
	<u>USB_DEVICE_HID_EVENT_DATA_REPORT_RECEIVED</u>	USB Device HID Report Received Event Data Type.
	<u>USB_DEVICE_HID_EVENT_DATA_REPORT_SENT</u>	USB Device HID Report Sent Event Data Type.
	<u>USB_DEVICE_HID_EVENT_DATA_SET_DESCRIPTOR</u>	USB Device HID Set Descriptor Event Data Type.
	<u>USB_DEVICE_HID_EVENT_DATA_SET_IDLE</u>	USB Device HID Set Idle Event Data Type.
	<u>USB_DEVICE_HID_EVENT_DATA_SET_PROTOCOL</u>	USB Device HID Set Protocol Event Data Type.
	<u>USB_DEVICE_HID_EVENT_DATA_SET_REPORT</u>	USB Device HID Set Report Event Data Type.
	<u>USB_DEVICE_HID_EVENT_HANDLER</u>	USB Device HID Event Handler Function Pointer Type.
	<u>USB_DEVICE_HID_EVENT_RESPONSE</u>	USB Device HID Function Driver Event Callback Response Type
	<u>USB_DEVICE_HID_INDEX</u>	USB device HID Function Driver Index.
	<u>USB_DEVICE_HID_INIT</u>	USB Device HID Function Driver Initialization Data Structure
	<u>USB_DEVICE_HID_RESULT</u>	USB Device HID Function Driver USB Device HID Result enumeration.
	<u>USB_DEVICE_HID_TRANSFER_HANDLE</u>	USB Device HID Function Driver Transfer Handle Definition.
	<u>USB_DEVICE_HID_EVENT_RESPONSE_NONE</u>	USB Device HID Function Driver Event Handler Response Type None.
	<u>USB_DEVICE_HID_INSTANCES_NUMBER</u>	Specifies the number of HID instances.
	<u>USB_DEVICE_HID_QUEUE_DEPTH_COMINED</u>	DOM-IGONORE-BEGIN
	<u>USB_DEVICE_HID_TRANSFER_HANDLE_INVALID</u>	USB Device HID Function Driver Invalid Transfer Handle Definition.

Functions

	Name	Description
	<u>USB_DEVICE_HID_ControlReceive</u>	This function allows the application to respond to the HID function driver specific control transfer requests. It allows the application to receive data from the host in the data stage of the control transfer.
	<u>USB_DEVICE_HID_ControlSend</u>	This function allows the application to respond to the HID function driver specific control transfer requests. It allows the application to send data to the host in the data stage of the control transfer.
	<u>USB_DEVICE_HID_ControlStatus</u>	This function allows the application to complete the status stage of the the HID Function Driver specific control transfer request.
	<u>USB_DEVICE_HID_EventHandlerSet</u>	This function registers a event handler for the specified HID function driver instance.

	USB_DEVICE_HID_ReportReceive	This function submits the buffer to HID function driver library to receive a report from host to device.
	USB_DEVICE_HID_ReportSend	This function submits the buffer to HID function driver library to send a report from device to host.

Description

This section describes the Application Programming Interface (API) functions of the USB Device HID library.

Refer to each section for a detailed description.

5.9.6.6.1 Functions**5.9.6.6.1.1 USB_DEVICE_HID_ControlReceive Function****C**

```

USB_DEVICE_HID_RESULT USB_DEVICE_HID_ControlReceive(
    USB_DEVICE_HID_INDEX instanceIndex,
    USB_DEVICE_HID_CONTROL_TRANSFER_HANDLE controlTransferHandle,
    void * data,
    size_t size
);

```

Description

This function allows the application to respond to the HID function driver specific control transfer requests. It allows the application to receive data from the host in the data stage of the control transfer. For example, the [USB_DEVICE_HID_EVENT_DATA_SET_REPORT](#) event requires a control transfer response. The function can be called in the HID Function Driver event handler or can be called outside the event handler. Calling this function outside the event handler defers the response to the event. This allows the application to prepare the data buffer out of the event handler context, especially if the data buffer to receive the data is not readily available. Note however, that there are timing considerations when responding to the control transfer. Exceeding the response time will cause the host to cancel the control transfer and may cause USB host to reject the device. The application must use the control transfer handle that was generated along with the event as the controlTransferHandle.

Preconditions

This function should only be called in response to a HID function driver event that requires a control transfer response.

Parameters

Parameters	Description
instance	USB Device HID Function Driver instance.
controlTransferHandle	Control Transfer handle for the control transfer.
data	Data buffer to receive the data stage of the control transfer.
size	size (in bytes) of the data to sent.

Returns

USB_DEVICE_HID_RESULT_ERROR_CONTROL_TRANSFER_FAILED - The request was not successful because the USB host cancelled the control transfer.

USB_DEVICE_HID_RESULT_OK - The request was successful.

Remarks

None.

Example

```
// -----
// In this example, the application responds to the SET REPORT command with
// in the event handler. The application uses the
// USB_DEVICE_HID_ControlReceive() function to do this.
// -----

USB_DEVICE_HID_EVENT_DATA_SET_REPORT * setReportEventData;
USB_DEVICE_HID_CONTROL_TRANSFER_HANDLE controlTransferHandle;
uint8_t someReport[128];

USB_DEVICE_HID_EVENT_RESPONSE USBDeviceHIDEventHandler
(
    USB_DEVICE_HID_INDEX instanceIndex,
    USB_DEVICE_HID_EVENT event,
    USB_DEVICE_HID_CONTROL_TRANSFER_HANDLE controlTransferHandle,
    void * pData,
    uintptr_t userData
)
{
    switch(event)
    {
        case USB_DEVICE_HID_EVENT_SET_REPORT:

            // In this case, the application should receive the report
            // data from the host. The application must use the
            // USB_DEVICE_HID_ControlReceive() function to receive the data.

            setReportEventData = (USB_DEVICE_HID_EVENT_DATA_SET_REPORT *) pData;
            USB_DEVICE_HID_ControlReceive(instanceIndex, controlTransferHandle,
                                         someReport, setReportEventData->reportSize);

            break;
    }
}

// -----
// In this example, the application defers the response to the
// event. This is done by calling the USB_DEVICE_HID_ControlReceive()
// function out side the event handler.
// -----

USB_DEVICE_HID_EVENT_DATA_SET_REPORT setReportEventData;
USB_DEVICE_HID_CONTROL_TRANSFER_HANDLE thisControlTransferHandle;
bool receiveReportFromHost;
uint8_t * someReport;

USB_DEVICE_HID_EVENT_RESPONSE USBDeviceHIDEventHandler
(
    USB_DEVICE_HID_INDEX instanceIndex,
    USB_DEVICE_HID_EVENT event,
    USB_DEVICE_HID_CONTROL_TRANSFER_HANDLE controlTransferHandle,
    void * pData,
    uintptr_t userData
)
{
    switch(event)
    {
        case USB_DEVICE_HID_EVENT_SET_LINE_CODING:

            // In this case, the application should send the line coding
            // data to the host. The application must responds to the
            // event outside the event handler because the data buffer is
            // not available.

            setReportEventData = (USB_DEVICE_HID_EVENT_DATA_GET_REPORT *)pData;
```

```

        thisControlTransferHandle = controlTransferHandle;
        receiveReportFromHost = true;

        break;
    }
}

// This is outside the event handler.
if(receiveReportFromHost)
{
    // The application allocates a buffer using an arbitrary function
    setReport = AllocateMemoryBuffer();

    USB_DEVICE_HID_ControlReceive(instanceIndex, thisControlTransferHandle
        setReport, setReportEventData->reportSize);
}

```

5.9.6.6.1.2 USB_DEVICE_HID_ControlSend Function

C

```

USB_DEVICE_HID_RESULT USB_DEVICE_HID_ControlSend(
    USB_DEVICE_HID_INDEX instanceIndex,
    USB_DEVICE_HID_CONTROL_TRANSFER_HANDLE controlTransferHandle,
    void * data,
    size_t size
);

```

Description

This function allows the application to respond to the HID function driver specific control transfer requests. It allows the application to [send](#) data to the host in the data stage of the control transfer. For example, the [USB_DEVICE_HID_EVENT_DATA_REPORT_SENT](#) event requires a control transfer response. The function can be called in the HID Function Driver event handler or can be called outside the event handler. Calling this function outside the event handler defers the response to the event. This allows the application to prepare the response data out of the event handler context, especially if the data is not readily available. Note however, that there are timing considerations when responding to the control transfer. Exceeding the response time will cause the host to cancel the control transfer and may cause USB host to reject the device. The application must use the control transfer handle that was generated along with the event as the controlTransferHandle.

Preconditions

This function should only be called in response to a HID function driver event that requires a control transfer response.

Parameters

Parameters	Description
instance	USB Device HID Function Driver instance.
controlTransferHandle	Control Transfer handle for the control transfer.
data	Data that represents the data stage of the control transfer.
size	size (in bytes) of the data to sent.

Returns

USB_DEVICE_HID_RESULT_ERROR_CONTROL_TRANSFER_FAILED - The request was not successful because the USB host cancelled the control transfer.

USB_DEVICE_HID_RESULT_OK - The request was successful.

Remarks

None.

Example

```

// -----
// In this example, the application responds to the GET REPORT
// with in the event handler. The application uses the
// USB_DEVICE_HID_ControlSend() function to do this.
// -----

USB_DEVICE_HID_EVENT_DATA_GET_REPORT * getReportEventData;
USB_DEVICE_HID_CONTROL_TRANSFER_HANDLE controlTransferHandle;
uint8_t someReport[128];

USB_DEVICE_HID_EVENT_RESPONSE USBDeviceHIDEventHandler
(
    USB_DEVICE_HID_INDEX instanceIndex,
    USB_DEVICE_HID_EVENT event,
    USB_DEVICE_HID_CONTROL_TRANSFER_HANDLE controlTransferHandle,
    void * pData,
    uintptr_t userData
)
{
    switch(event)
    {
        case USB_DEVICE_HID_EVENT_GET_REPORT:

            // In this case, the application should send the report
            // to the host. The application must use the
            // USB_DEVICE_HID_ControlSend() function to send the data.

            getReportEventData = (USB_DEVICE_HID_EVENT_DATA_GET_REPORT *)pData;

            USB_DEVICE_HID_ControlSend(instanceIndex, controlTransferHandle
                                         someReport,
                                         getReportEventData->reportSize);

            break;
    }
}

// -----
// In this example, the application defers the response to the
// event. This is done by calling the USB_DEVICE_HID_ControlSend()
// function out side the event handler.
// -----

USB_DEVICE_HID_EVENT_DATA_GET_REPORT * getReportEventData;
USB_DEVICE_HID_CONTROL_TRANSFER_HANDLE controlTransferHandle;
uint8_t someReport[128];
bool sendReportToHost;

USB_DEVICE_HID_EVENT_RESPONSE USBDeviceHIDEventHandler
(
    USB_DEVICE_HID_INDEX instanceIndex,
    USB_DEVICE_HID_EVENT event,
    USB_DEVICE_HID_CONTROL_TRANSFER_HANDLE controlTransferHandle,
    void * pData,
    uintptr_t userData
)
{
    switch(event)
    {
        case USB_DEVICE_HID_EVENT_GET_REPORT:

            // In this case, the application should send the report
            // data to the host. The application does not call this function
            // in the event handler, because it does not have the report
            // data ready.

```

```

        getReportEventData = (USB_DEVICE_HID_EVENT_DATA_GET_REPORT *)pData;
        thisControlTransferHandle = controlTransferHandle;
        sendReportToHost = true;

        break;
    }
}

// This is outside the event handler.

if(sendReportToHost)
{
    // The application fetches the report coding from the
    // an EEPROM.

    GetReportFromEEPROM(someReport);

    USB_DEVICE_HID_ControlSend(instanceIndex, controlTransferHandle
                               someReport,
                               getReportEventData->reportSize);
}

```

5.9.6.6.1.3 USB_DEVICE_HID_ControlStatus Function

C

```

USB_DEVICE_HID_RESULT USB_DEVICE_HID_ControlStatus(
    USB_DEVICE_HID_INDEX instanceIndex,
    USB_DEVICE_HID_CONTROL_TRANSFER_HANDLE controlTransferHandle,
    USB_DEVICE_HID_CONTROL_STATUS status
);

```

Description

This function allows the application to complete the status stage of the the HID Function Driver specific control transfer request. The application can either **accept** the data stage or stall it. Calling this function with status set to USB_DEVICE_HID_CONTROL_STATUS_OK will acknowledge the status stage of the control transfer. The control transfer can be stalled by setting the status parameter to USB_DEVICE_HID_CONTROL_STATUS_ERROR. The function can be called in the HID Function Driver event handler or can be called outside the event handler. Calling this function outside the event handler defers the response to the event. This allows the application to analyze the event response outside the event handler. Note however, that there are timing considerations when responding to the control transfer. Exceeding the response time will cause the host to cancel the control transfer and may cause USB host to reject the device. The application must use the control transfer handle that was generated along with the event as the controlTransferHandle. The application must be aware of events and associated control transfers that do or do not require data stages. Incorrect usage of the USB_DEVICE_HID_ControlStatus() function could cause the device function to be non-compliant.

Preconditions

This function should only be called in response to a HID function driver event that requires a control transfer response.

Parameters

Parameters	Description
instance	USB Device HID Function Driver instance.
controlTransferHandle	Control Transfer handle for the control transfer.
status	Set to USB_DEVICE_HID_CONTROL_STATUS_OK to acknowledge the control transfer. Set to USB_DEVICE_HID_CONTROL_STATUS_ERROR to stall the transfer.

Returns

USB_DEVICE_HID_RESULT_ERROR_CONTROL_TRANSFER_FAILED - The request was not successful because the USB

host cancelled the control transfer.

USB_DEVICE_HID_RESULT_OK - The request was successful.

Remarks

None.

Example

```
// -----
// In this code example, the application responds to the the
// SET_IDLE event in the event handler.
// -----

USB_DEVICE_HID_EVENT_DATA_SET_IDLE * setIdleEventData;

USB_DEVICE_HID_EVENT_RESPONSE USBDeviceHIDEventHandler
(
    USB_DEVICE_HID_INDEX instanceIndex,
    USB_DEVICE_HID_EVENT event,
    USB_DEVICE_HID_CONTROL_TRANSFER_HANDLE controlTransferHandle,
    void * pData,
    uintptr_t userData
)
{
    switch(event)
    {
        case USB_DEVICE_HID_EVENT_SET_IDLE:

            // The application can check if the break duration is supported.
            setIdleEventData = (USB_DEVICE_HID_EVENT_DATA_SET_IDLE *)pData;
            if(IsDurationSupported(setIdleEventData->duration))
            {
                USB_DEVICE_HID_ControlStatus(instanceIndex,
                    controlTransferHandle, USB_DEVICE_HID_CONTROL_STATUS_OK);
            }
            else
            {
                // If the duration is not supported the application
                // can stall it.

                USB_DEVICE_HID_ControlStatus(instanceIndex,
                    controlTransferHandle, USB_DEVICE_HID_CONTROL_STATUS_ERROR);
            }
            break;

            ...

    }

    return(USB_DEVICE_HID_EVENT_RESPONSE_NONE);
}

// -----
// In this example, the application defers the response to the
// SET_IDLE event. The application responds to the event in
// outside the event handler.
// -----

USB_DEVICE_HID_CONTROL_TRANSFER_HANDLE thisControlTransferHandle;
USB_DEVICE_HID_EVENT_DATA_SET_IDLE * setIdleEventData;
uint8_t duration;
bool setIdleEvent;

USB_DEVICE_HID_EVENT_RESPONSE USBDeviceHIDEventHandler
(
    USB_DEVICE_HID_INDEX instanceIndex,
```

```

    USB_DEVICE_HID_EVENT event,
    USB_DEVICE_HID_CONTROL_TRANSFER_HANDLE controlTransferHandle,
    void * pData,
    uintptr_t userData
)
{
    switch(event)
    {
        case USB_DEVICE_HID_EVENT_SEND_BREAK:

            // Get the idle duration.

            setIdleEventData = (USB_DEVICE_HID_EVENT_DATA_SET_IDLE *)pData;
            duration = setIdleEventData->duration;
            setIdleEvent = true;
            break;

            ...

    }

    return(USB_DEVICE_HID_EVENT_RESPONSE_NONE);
}

// This is outside the event handler.
if(setIdleEvent)
{
    // The application checks if the duration is supported
    if(IsDurationSupported(setIdleEventData->duration))
    {
        USB_DEVICE_HID_ControlStatus(instanceIndex,
            controlTransferHandle, USB_DEVICE_HID_CONTROL_STATUS_OK);
    }
    else
    {
        // If the duration is not supported the application
        // can stall it.

        USB_DEVICE_HID_ControlStatus(instanceIndex,
            controlTransferHandle, USB_DEVICE_HID_CONTROL_STATUS_ERROR);
    }
}
}

```

5.9.6.6.1.4 USB_DEVICE_HID_EventHandlerSet Function

C

```

USB_DEVICE_HID_RESULT USB_DEVICE_HID_EventHandlerSet(
    USB_DEVICE_HID_INDEX instanceIndex,
    USB_DEVICE_HID_EVENT_HANDLER eventHandler,
    uintptr_t context
);

```

Description

This function registers a event handler for the specified HID function driver instance. This function should be called by the client when it receives a SET CONFIGURATION event from the device layer. A event handler must be registered for function driver to respond to function driver specific commands. If the event handler is not registered, the device layer will stall function driver specific commands and the USB device may not function.

Preconditions

This function should be called when the function driver has been initialized as a result of a set configuration.

Parameters

Parameters	Description
instance	Instance of the HID Function Driver.
eventHandler	A pointer to event handler function.
context	Application specific context that is returned in the event handler.

Returns

USB_DEVICE_HID_RESULT_OK - The operation was successful
 USB_DEVICE_HID_RESULT_ERROR_INSTANCE_INVALID - The specified instance does not exist.
 USB_DEVICE_HID_RESULT_ERROR_PARAMETER_INVALID - The eventHandler parameter is NULL

Remarks

None.

Example

*// This code snippet shows an example registering an event handler. Here
 // the application specifies the context parameter as a pointer to an
 // application object (appObject) that should be associated with this
 // instance of the HID function driver.*

```
USB_DEVICE_HID_RESULT result;

USB_DEVICE_HID_EVENT_RESPONSE APP_USBDeviceHIDEventHandler
(
    USB_DEVICE_HID_INDEX instanceIndex,
    USB_DEVICE_HID_EVENT event,
    USB_DEVICE_HID_CONTROL_TRANSFER_HANDLE controlTransferHandle,
    void * pData,
    uintptr_t context
)
{
    // Event Handling comes here

    switch(event)
    {
        ...
    }

    return(USB_DEVICE_HID_EVENT_RESPONSE_NONE);
}

result = USB_DEVICE_HID_EventHandlerSet ( 0 ,&APP_EventHandler, (uintptr_t) &appObject);
if(USB_DEVICE_HID_RESULT_OK != result)
{
    SYS_ASSERT ( false , "Error while registering event handler" );
}
```

5.9.6.6.1.5 USB_DEVICE_HID_ReportReceive Function**C**

```
USB_DEVICE_HID_RESULT USB_DEVICE_HID_ReportReceive(
    USB_DEVICE_HID_INDEX iHID,
    USB_DEVICE_HID_TRANSFER_HANDLE * handle,
    void * buffer,
    size_t size
);
```

Description

This function submits the buffer to HID function driver library to receive a report from host to device. On completion of the

transfer the library generates `USB_DEVICE_HID_EVENT_REPORT_RECEIVED` event to the application. A handle to the request is passed in the `transferHandle` parameter. The transfer handle expires when event handler for the `USB_DEVICE_HID_EVENT_REPORT_RECEIVED` exits. If the receive request could not be accepted, the function returns an error code and `transferHandle` will contain the value `USB_DEVICE_HID_TRANSFER_HANDLE_INVALID`.

Preconditions

USB device layer must be initialized.

Parameters

Parameters	Description
<code>iHID</code>	HID instance index.
<code>transferHandle</code>	HID transfer handle.
<code>buffer</code>	Pointer to buffer where the received report has to be received stored.
<code>size</code>	Buffer size.

Returns

`USB_DEVICE_HID_RESULT_OK` - The receive request was successful. `transferHandle` contains a valid transfer handle.

`USB_DEVICE_HID_RESULT_ERROR_TRANSFER_QUEUE_FULL` - internal request queue is full. The receive request could not be added.

`USB_DEVICE_HID_RESULT_ERROR_INSTANCE_NOT_CONFIGURED` - The specified instance is not configured yet.

`USB_DEVICE_HID_RESULT_ERROR_INSTANCE_INVALID` - The specified instance was not provisioned in the application and is invalid.

Remarks

None.

Example

```

USB_DEVICE_HID_TRANSFER_HANDLE hidTransferHandle;
USB_DEVICE_HID_RESULT result;

// Register APP_HIDEEventHandler function
USB_DEVICE_HID_EventHandlerSet( USB_DEVICE_HID_INDEX_0 ,
                                APP_HIDEEventHandler );

// Prepare report and request HID to send the report.
result = USB_DEVICE_HID_ReportReceive( USB_DEVICE_HID_INDEX_0,
                                        &hidTransferHandle ,
                                        &appReport[0], sizeof(appReport));

if( result != USB_DEVICE_HID_RESULT_OK)
{
    //Handle error.
}

//Implementation of APP_HIDEEventHandler
USB_DEVICE_HID_EVENT_RESPONSE APP_HIDEEventHandler
{
    USB_DEVICE_HID_INDEX instanceIndex,
    USB_DEVICE_HID_EVENT event,
    USB_DEVICE_HID_CONTROL_TRANSFER_HANDLE controlTransferHandle,
    void * pData,
    uintptr_t context
}
{
    USB_DEVICE_HID_EVENT_DATA_REPORT_RECEIVED reportReceivedEventData;
```

```

    // Handle HID events here.
    switch (event)
    {
        case USB_DEVICE_HID_EVENT_REPORT_RECEIVED:
            if( (reportReceivedEventData->reportSize == sizeof(appReport)
                && reportReceivedEventData->report == &appReport[0])
                {
                // Previous transfer was complete.
            }
            break;
        ....
    }
}

```

5.9.6.6.1.6 USB_DEVICE_HID_ReportSend Function

C

```

USB_DEVICE_HID_RESULT USB_DEVICE_HID_ReportSend(
    USB_DEVICE_HID_INDEX iHID,
    USB_DEVICE_HID_TRANSFER_HANDLE * handle,
    void * buffer,
    size_t size
);

```

Description

This function places a request to [send](#) a HID report with the USB Device HID Function Driver Layer. The function places a requests with driver, the request will get serviced when report is requested by the USB Host. A handle to the request is returned in the transferHandle parameter. The termination of the request is indicated by the USB_DEVICE_HID_EVENT_REPORT_SENT event. The amount of data sent, a pointer to the report and the transfer handle associated with the request is returned along with the event in the pData parameter of the event handler. The transfer handle expires when event handler for the USB_DEVICE_HID_EVENT_REPORT_SENT exits. If the [send](#) request could not be accepted, the function returns an error code and transferHandle will contain the value [USB_DEVICE_HID_TRANSFER_HANDLE_INVALID](#).

Preconditions

USB device layer must be initialized.

Parameters

Parameters	Description
instance	USB Device HID Function Driver instance.
transferHandle	Pointer to a USB_DEVICE_HID_TRANSFER_HANDLE type of variable. This variable will contain the transfer handle in case the send request was successful.
data	pointer to the data buffer containing the report to be sent.
size	Size (in bytes) of the report to be sent.

Returns

USB_DEVICE_HID_RESULT_OK - The [send](#) request was successful. transferHandle contains a valid transfer handle.

USB_DEVICE_HID_RESULT_ERROR_TRANSFER_QUEUE_FULL - Internal request queue is full. The [send](#) request could not be added.

USB_DEVICE_HID_RESULT_ERROR_INSTANCE_NOT_CONFIGURED - The specified instance is not configured yet.

USB_DEVICE_HID_RESULT_ERROR_INSTANCE_INVALID - The specified instance was not provisioned in the application and is invalid.

Remarks

None.

Example

```

USB_DEVICE_HID_TRANSFER_HANDLE hidTransferHandle;
USB_DEVICE_HID_RESULT result;

// Register APP_HIDEventHandler function
USB_DEVICE_HID_EventHandlerSet( USB_DEVICE_HID_INDEX_0 ,
                                APP_HIDEventHandler );

// Prepare report and request HID to send the report.
result = USB_DEVICE_HID_ReportSend( USB_DEVICE_HID_INDEX_0,
                                    &hidTransferHandle ,
                                    &appReport[0], sizeof(appReport));

if( result != USB_DEVICE_HID_RESULT_OK)
{
    //Handle error.
}

//Implementation of APP_HIDEventHandler
USB_DEVICE_HID_EVENT_RESPONSE APP_HIDEventHandler
{
    USB_DEVICE_HID_INDEX instanceIndex,
    USB_DEVICE_HID_EVENT event,
    USB_DEVICE_HID_CONTROL_TRANSFER_HANDLE controlTransferHandle,
    void * pData,
    uintptr_t context
}
{
    USB_DEVICE_HID_EVENT_DATA_REPORT_SENT * reportSentEventData;

    // Handle HID events here.
    switch (event)
    {
        case USB_DEVICE_HID_EVENT_REPORT_SENT:

            reportSentEventData = (USB_DEVICE_HID_EVENT_REPORT_SENT *)pData;
            if(reportSentEventData->reportSize == sizeof(appReport))
            {
                // The report was sent completely.
            }
            break;

            ....

    }
    return(USB_DEVICE_HID_EVENT_RESPONSE_NONE);
}

```

5.9.6.6.2 Data Types and Constants**5.9.6.6.2.1 USB_DEVICE_HID_CONTROL_STATUS Enumeration****C**

```

typedef enum {
    USB_DEVICE_HID_CONTROL_STATUS_OK,
    USB_DEVICE_HID_CONTROL_STATUS_ERROR
} USB_DEVICE_HID_CONTROL_STATUS;

```

Description

USB Device HID Function Driver Control Transfer Status

This flag is used along with the [USB_DEVICE_HID_ControlStatus\(\)](#) function to indicate success or failure of a HID class specific control transfer request.

Members

Members	Description
USB_DEVICE_HID_CONTROL_STATUS_OK	The application must use this flag when the data received through the USB_DEVICE_HID_ControlReceive() function was accepted. Using this flag causes the status stage of the associated control transfer to be completed.
USB_DEVICE_HID_CONTROL_STATUS_ERROR	The application must use this flag when the control request was not supported or the data received using the USB_DEVICE_HID_ControlReceive() function was not accepted. Using this flag causes the status stage of the associated control transfer to be stalled.

Remarks

None.

5.9.6.6.2.2 USB_DEVICE_HID_CONTROL_TRANSFER_HANDLE Type

C

```
typedef USB_DEVICE_CONTROL_TRANSFER_HANDLE USB_DEVICE_HID_CONTROL_TRANSFER_HANDLE;
```

Description

USB Device HID Function Driver Control Transfer Handle

This is returned by the HID function driver event handler and should be used by the application while responding to HID function driver control transfer requests.

Remarks

None.

5.9.6.6.2.3 USB_DEVICE_HID_EVENT Enumeration

C

```
typedef enum {
    USB_DEVICE_HID_EVENT_CONTROL_TRANSFER_DATA_RECEIVED,
    USB_DEVICE_HID_EVENT_CONTROL_TRANSFER_DATA_SENT,
    USB_DEVICE_HID_EVENT_CONTROL_TRANSFER_ABORTED,
    USB_DEVICE_HID_EVENT_GET_REPORT,
    USB_DEVICE_HID_EVENT_GET_IDLE,
    USB_DEVICE_HID_EVENT_GET_PROTOCOL,
    USB_DEVICE_HID_EVENT_SET_REPORT,
    USB_DEVICE_HID_EVENT_SET_IDLE,
    USB_DEVICE_HID_EVENT_SET_PROTOCOL,
    USB_DEVICE_HID_EVENT_SET_DESCRIPTOR,
    USB_DEVICE_HID_EVENT_REPORT_SENT,
    USB_DEVICE_HID_EVENT_REPORT_RECEIVED
} USB_DEVICE_HID_EVENT;
```

Description

USB Device HID Function Driver Events

These events are specific to the USB Device HID Function Driver instance. Each event description contains details about the parameters passed with event. The contents of pData depends on the generated event.

Events that are associated with the HID Function Driver Specific Control Transfers require application response and will be

generated along with a HID Control Transfer Handle. This allows the application to respond to the HID function driver control transfer requests. The application should respond to these events by using the [USB_DEVICE_HID_ControlReceive\(\)](#), [USB_DEVICE_HID_ControlSend\(\)](#) and [USB_DEVICE_HID_ControlStatus\(\)](#) functions.

Calling the [USB_DEVICE_HID_ControlStatus\(\)](#) function with a USB_DEVICE_HID_CONTROL_STATUS_ERROR will stall the control transfer request. The application would do this if the control transfer request is not supported. Calling the [USB_DEVICE_HID_ControlStatus\(\)](#) function with a USB_DEVICE_HID_CONTROL_STATUS_OK will complete the status stage of the control transfer request. The application would do this if the control transfer request is supported

The following code snippet shows an example of a possible event handling scheme.

```
// This code example shows all HID Function Driver events and a possible
// scheme for handling these events. In this example event responses are not
// deferred.
```

```
USB_DEVICE_HID_EVENT_RESPONSE USB_AppHIDEventHandler
(
    USB_DEVICE_HID_INDEX instanceIndex,
    USB_DEVICE_HID_EVENT event,
    USB_DEVICE_HID_CONTROL_TRANSFER_HANDLE controlTransferHandle,
    void * pData,
    uintptr_t userData
)
{
    USB_DEVICE_HID_EVENT_DATA_GET_REPORT          * getReportEventData;
    USB_DEVICE_HID_EVENT_DATA_GET_PROTOCOL        currentProtocol;
    USB_DEVICE_HID_EVENT_DATA_SET_PROTOCOL        * setProtocolEventData;

        // reset any HID control transfer related tasks when it receives
        // this event.

        break;

    case USB_DEVICE_HID_EVENT_REPORT_RECEIVED:

        // This means a HID report receive request has completed.
        // The pData member should be interpreted as a
        // USB_DEVICE_HID_EVENT_DATA_REPORT_RECEIVED pointer type.

        break;

    case USB_DEVICE_HID_EVENT_REPORT_SENT:

        // This means a HID report send request has completed.
        // The pData member should be interpreted as a
        // USB_DEVICE_HID_EVENT_DATA_REPORT_SENT pointer type.

        break;
}

return(USB_DEVICE_HID_EVENT_RESPONSE_NONE);
}

```

Members

Members	Description
USB_DEVICE_HID_EVENT_CONTROL_TRANSFER_DATA_RECEIVED	This event occurs when the data stage of a control write transfer has completed. This event would occur after the application uses the USB_DEVICE_HID_ControlReceive() function to respond to a HID Function Driver Control Transfer Event that requires data to be received from the host. The pData parameter will be NULL.

USB_DEVICE_HID_EVENT_CONTROL_TRANSFER_DATA_SENT	This event occurs when the data stage of a control read transfer has completed. This event would occur after the application uses the USB_DEVICE_HID_ControlSend() function to respond to a HID Function Driver Control Transfer Event that requires data to be sent to the host. The pData parameter will be NULL.
USB_DEVICE_HID_EVENT_CONTROL_TRANSFER_ABORTED	This event occurs when an ongoing control transfer was aborted. The application must stop any remaining activities on control transfers.
USB_DEVICE_HID_EVENT_GET_REPORT	This event occurs when the host issues a GET REPORT command. The application must interpret the pData parameter as USB_DEVICE_HID_EVENT_DATA_GET_REPORT pointer type. If the report request is supported, the application must send the report to the host by using the USB_DEVICE_HID_ControlSend() function either in the event handler or after the event handler routine has returned. The application can track the completion of the request by using the USB_DEVICE_HID_EVENT_CONTROL_TRANSFER_DATA_SENT event. If the report request is not supported, the application must stall the request by calling the USB_DEVICE_HID_ControlStatus() function with a USB_DEVICE_HID_CONTROL_STATUS_ERROR flag.
USB_DEVICE_HID_EVENT_GET_IDLE	This event occurs when the host issues a GET IDLE command. The pData parameter will be a USB_DEVICE_HID_EVENT_DATA_GET_IDLE pointer type. If the request is supported, the application must send the idle rate to the host by calling the USB_DEVICE_HID_ControlSend() function. This function can be called either in the event handler or after the event handler routine has returned. The application can track the completion of the request by using the USB_DEVICE_HID_EVENT_CONTROL_TRANSFER_DATA_SENT event. If the request is not supported, the application must stall the request by calling the USB_DEVICE_HID_ControlStatus() function with a USB_DEVICE_HID_CONTROL_STATUS_ERROR flag.

USB_DEVICE_HID_EVENT_GET_PROTOCOL	This event occurs when the host issues a GET PROTOCOL command. The pData parameter will be NULL. If the request is supported, the application must send a USB_DEVICE_HID_EVENT_DATA_GET_PROTOCOL data type object, containing the current protocol, to the host by calling the USB_DEVICE_HID_ControlSend() function. This function can be called either in the event handler or after the event handler routine has returned. The application can track the completion of the request by using the USB_DEVICE_HID_EVENT_CONTROL_TRANSFER_DATA_SENT event. If the request is not supported, the application must stall the request by calling the USB_DEVICE_HID_ControlStatus() function with a USB_DEVICE_HID_CONTROL_STATUS_ERROR flag.
USB_DEVICE_HID_EVENT_SET_REPORT	This event occurs when the host issues a SET REPORT command. The application must interpret the pData parameter as a USB_DEVICE_HID_EVENT_DATA_SET_REPORT pointer type. If the report request is supported, the application must provide a buffer, to receive the report, to the host by calling the USB_DEVICE_HID_ControlReceive() function either in the event handler or after the event handler routine has returned. The application can track the completion of the request by using the USB_DEVICE_HID_EVENT_CONTROL_TRANSFER_DATA_RECEIVED event. If the report request is not supported, the application must stall the request by calling the USB_DEVICE_HID_ControlStatus() function with a USB_DEVICE_HID_CONTROL_STATUS_ERROR flag.
USB_DEVICE_HID_EVENT_SET_IDLE	This event occurs when the host issues a SET IDLE command. The pData parameter will be USB_DEVICE_HID_EVENT_DATA_SET_IDLE pointer type. The application can analyze the idle duration and acknowledge or reject the setting by calling the USB_DEVICE_HID_ControlStatus() function. This function can be called in the event handler or after the event handler exits. If application can reject the request by calling the USB_DEVICE_HID_ControlStatus() function with a USB_DEVICE_HID_CONTROL_STATUS_ERROR flag. It can accept the request by calling this function with USB_DEVICE_HID_CONTROL_STATUS_OK flag.

USB_DEVICE_HID_EVENT_SET_PROTOCOL	This event occurs when the host issues a SET PROTOCOL command. The pData parameter will be NULL. If the request is supported, the application must provide a USB_DEVICE_HID_EVENT_DATA_SET_PROTOCOL data type object to receive the current protocol from the host by calling the USB_DEVICE_HID_ControlReceive() function. This function can be called either in the event handler or after the event handler routine has returned. The application can track the completion of the request by using the USB_DEVICE_HID_EVENT_CONTROL_TRANSFER_DATA_RECEIVED event. If the request is not supported, the application must stall the request by calling the USB_DEVICE_HID_ControlStatus() function with a USB_DEVICE_HID_CONTROL_STATUS_ERROR flag.
USB_DEVICE_HID_EVENT_SET_DESCRIPTOR	This event occurs when the host issues a SET DESCRIPTOR command. The pData parameter will be a USB_DEVICE_HID_EVENT_DATA_SET_DESCRIPTOR type pointer. If the request is supported, the application must provide a buffer to receive the descriptor from the host by calling the USB_DEVICE_HID_ControlReceive() function. This function can be called either in the event handler or after the event handler routine has returned. The application can track the completion of the request by using the USB_DEVICE_HID_EVENT_CONTROL_TRANSFER_DATA_RECEIVED event. If the request is not supported, the application must stall the request by calling the USB_DEVICE_HID_ControlStatus() function with a USB_DEVICE_HID_CONTROL_STATUS_ERROR flag.
USB_DEVICE_HID_EVENT_REPORT_SENT	This event indicates that USB_DEVICE_HID_ReportSend() function completed a report transfer on interrupt endpoint from host to device. The pData parameter will be a USB_DEVICE_HID_EVENT_DATA_REPORT_SENT type.
USB_DEVICE_HID_EVENT_REPORT_RECEIVED	This event indicates that USB_DEVICE_HID_ReportReceive() function completed a report transfer on interrupt endpoint from device to host. The pData parameter will be a USB_DEVICE_HID_EVENT_DATA_REPORT_RECEIVED type

Remarks

Some of the events allow the application to defer responses. This allows the application some time to obtain the response data rather than having to respond to the event immediately. Note that a USB host will typically wait for event response for a finite

time duration before timing out and cancelling the event and associated transactions. Even when deferring response, the application must respond promptly if such timeouts have to be avoided.

5.9.6.6.2.4 USB_DEVICE_HID_EVENT_DATA_GET_IDLE Structure

C

```
typedef struct {  
    uint8_t reportID;  
} USB_DEVICE_HID_EVENT_DATA_GET_IDLE;
```

Description

USB Device HID Get Idle Event Data Type.

This defines the data type of the data generated to the HID event handler on a USB_DEVICE_HID_EVENT_SET_REPORT event.

Members

Members	Description
uint8_t reportID;	Report ID of the report of which idle rate is requested.

Remarks

None.

5.9.6.6.2.10 USB_DEVICE_HID_EVENT_DATA_SET_IDLE Structure**C**

```
typedef struct {  
    uint8_t duration;  
    uint8_t reportID;  
} USB_DEVICE_HID_EVENT_DATA_SET_IDLE;
```

Description

USB Device HID Set Idle Event Data Type.

This defines the data type of the data generated to the HID event handler on a USB_DEVICE_HID_EVENT_SET_IDLE event.

Members

Members	Description
uint8_t duration;	Idle duration
uint8_t reportID;	Report ID

Remarks

None.

5.9.6.6.2.11 USB_DEVICE_HID_EVENT_DATA_SET_PROTOCOL Structure**C**

```
typedef struct {  
    USB_HID_PROTOCOL_CODE protocol;  
} USB_DEVICE_HID_EVENT_DATA_SET_PROTOCOL;
```

Description

USB Device HID Set Protocol Event Data Type.

This defines the data type of the data generated to the HID event handler on a USB_DEVICE_HID_EVENT_SET_PROTOCOL event.

Remarks

None.

5.9.6.6.2.12 USB_DEVICE_HID_EVENT_DATA_SET_REPORT Structure**C**

```
typedef struct {  
    uint8_t reportType;  
    uint8_t reportID;  
    uint16_t reportLength;  
} USB_DEVICE_HID_EVENT_DATA_SET_REPORT;
```

Description

USB Device HID Set Report Event Data Type.

This defines the data type of the data generated to the HID event handler on a USB_DEVICE_HID_EVENT_SET_REPORT event.

Members

Members	Description
uint8_t reportType;	Report type
uint8_t reportID;	Report ID
uint16_t reportLength;	Report Length

Remarks

None.

5.9.6.6.2.13 USB_DEVICE_HID_EVENT_HANDLER Type**C**

```
typedef USB_DEVICE_HID_EVENT_RESPONSE (* USB_DEVICE_HID_EVENT_HANDLER)(USB_DEVICE_HID_INDEX  
instanceIndex, USB_DEVICE_HID_EVENT event, USB_DEVICE_HID_CONTROL_TRANSFER_HANDLE  
controlTransferHandle, void * pData, uintptr_t context);
```

Description

USB Device HID Event Handler Function Pointer Type.

This data type defines the required function signature of the USB Device HID Function Driver event handling callback function. The application must register a pointer to a HID Function Driver events handling function whose function signature (parameter and return value types) match the types specified by this function pointer in order to receive event call backs from the HID Function Driver. The function driver will invoke this function with event relevant parameters. The description of the event handler function parameters is given here.

instanceIndex - Instance index of the HID Function Driver that generated the event.

event - Type of event generated.

controlTransferHandle - Control Transfer Handle for HID function driver events that require application response. The application should use this handle when calling the USB HID Device Control Transfer functions to respond to the events.

pData - This parameter should be type casted to a event specific pointer type based on the event that has occurred. Refer to the [USB_DEVICE_HID_EVENT](#) enumeration description for more details.

context - Value identifying the context of the application that registered the event handling function.

Remarks

None.

5.9.6.6.2.14 USB_DEVICE_HID_EVENT_RESPONSE Type**C**

```
typedef void USB_DEVICE_HID_EVENT_RESPONSE;
```

Description

USB Device HID Function Driver Event Handler Response Type

This is the return type of the HID Function Driver event handler.

Remarks

None.

5.9.6.6.2.15 USB_DEVICE_HID_INDEX Type**C**

```
typedef uintptr_t USB_DEVICE_HID_INDEX;
```

Description

USB Device HID Driver Index Numbers

This uniquely identifies a HID Function Driver instance.

Remarks

None.

5.9.6.6.2.16 USB_DEVICE_HID_INIT Structure**C**

```
typedef struct {  
    size_t hidReportDescriptorSize;  
    void * hidReportDescriptor;  
    size_t queueSizeReportSend;  
    size_t queueSizeReportReceive;  
} USB_DEVICE_HID_INIT;
```

Description

USB Device HID Function Driver Initialization Data Structure

This data structure must be defined for every instance of the HID function driver. It is passed to the HID function driver, by the Device Layer, at the time of initialization. The funcDriverInit member of the Device Layer Function Driver registration table entry must point to this data structure for an instance of the HID function driver.

Members

Members	Description
size_t hidReportDescriptorSize;	Size of the HID report descriptor
void * hidReportDescriptor;	Pointer to HID report descriptor

size_t queueSizeReportSend;	Report send queue size
size_t queueSizeReportReceive;	Report receive queue size

Remarks

None.

5.9.6.6.2.17 USB_DEVICE_HID_RESULT Enumeration**C**

```
typedef enum {  
    USB_DEVICE_HID_RESULT_OK,  
    USB_DEVICE_HID_RESULT_ERROR_TRANSFER_QUEUE_FULL,  
    USB_DEVICE_HID_RESULT_ERROR_INSTANCE_NOT_CONFIGURED,  
    USB_DEVICE_HID_RESULT_ERROR_INSTANCE_INVALID  
} USB_DEVICE_HID_RESULT;
```

Description

USB Device HID Function Driver USB Device HID Result enumeration.

This enumeration lists the possible USB Device HID Function Driver operation results. These values USB Device HID Library functions.

Members

Members	Description
USB_DEVICE_HID_RESULT_OK	The operation was successful

5.9.6.6.2.18 USB_DEVICE_HID_TRANSFER_HANDLE Type**C**

```
typedef uintptr_t USB_DEVICE_HID_TRANSFER_HANDLE;
```

Description

USB Device HID Function Driver Transfer Handle Definition

This definition defines a USB Device HID Function Driver Transfer Handle. A Transfer Handle is owned by the application but its value is modified by the [USB_DEVICE_HID_ReportSend\(\)](#) and [USB_DEVICE_HID_ReportReceive\(\)](#) functions. The transfer handle is valid for the life time of the transfer and expires when the transfer related event has occurred.

Remarks

None.

5.9.6.6.2.19 USB_DEVICE_HID_EVENT_RESPONSE_NONE Macro**C**

```
#define USB_DEVICE_HID_EVENT_RESPONSE_NONE
```

Description

USB Device HID Function Driver Event Handler Response None

This is the definition of the HID Function Driver Event Handler Response Type none.

Remarks

Intentionally defined to be empty.

5.9.6.6.2.20 USB_DEVICE_HID_INSTANCES_NUMBER Macro

C

```
#define USB_DEVICE_HID_INSTANCES_NUMBER
```

Description

USB Device HID Maximum Number of Instances

This macro defines the number of instances of the HID Function Driver. For example, if the application needs to implement two instances of the HID Function Driver (to create composite device) on one USB Device, the macro should be set to 2. Note that implementing a USB Device that features multiple HID interfaces requires appropriate USB configuration descriptors.

Remarks

None.

5.9.6.6.2.21 USB_DEVICE_HID_QUEUE_DEPTH_COMINED Macro

C

```
#define USB_DEVICE_HID_QUEUE_DEPTH_COMINED
```

Description

DOM-IGONORE-BEGIN

5.9.6.6.2.22 USB_DEVICE_HID_TRANSFER_HANDLE_INVALID Macro

C

```
#define USB_DEVICE_HID_TRANSFER_HANDLE_INVALID ((USB_DEVICE_HID_TRANSFER_HANDLE)(-1))
```

Description

USB Device HID Function Driver Invalid Transfer Handle Definition

This definition defines a USB Device HID Function Driver Invalid Transfer Handle. A Invalid Transfer Handle is returned by the [USB_DEVICE_HID_ReportReceive\(\)](#) and [USB_DEVICE_HID_ReportSend\(\)](#) functions when the request was not successful.

Remarks

None.

5.9.7 USB MSD Device Library**5.9.7.1 Introduction****USB Mass Storage Device (MSD) Class Library for Microchip Microcontrollers**

This library provides a high-level abstraction of USB Mass Storage Device (MSD) function driver with a convenient C language interface. This library supports USB Mass Storage Class Bulk-Only Transport, Revision 1.0 from USB Implementers Forum.

Description

The mass storage device class function driver library enables the developers to add mass storage functionality to a device. This library along with USB device stack and a required media driver can be used to build devices like USB thumb drive and card readers.

5.9.7.2 Release Notes

MPLAB Harmony Version: v0.70b **USB MSD Device Library Version :** 0.01 Alpha **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.9.7.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.9.7.4 Using the Library

5.9.7.4.1 Abstraction Model

The basic software architecture into which USB mass storage device class function driver fits into is depicted in the following diagram.

The system makes no direct calls to MSD function driver. It is the USB device layer that initializes and deinitializes the MSD function driver. The MSD function driver is initialized when host configures the device. It is deinitialized when device exits the configured state. The device exits the configured state when device is detached from the host or if host issues a bus reset to the device or if host changes the device configuration to a new value. The MSD function driver task is called from within the USB device layer task. This means that MSD function driver task runs at the same priority level as USB device layer task. So, the user has to register the MSD function driver with USB device layer to allow the USB device layer to make calls to MSD function driver callback functions at runtime. This registration can be done using compile time configuration.

The system does the media driver initialization and is responsible for calling the media driver tasks. The MSD function driver interacts with media driver at runtime to perform sector read, write and erase by calling the media driver callback functions. This requires for the user to register the media driver with the MSD function driver using compile time configuration.

The subsequent sections of this help document describes how to register the MSD function driver and media driver with USB device layer and MSD function driver respectively.

5.9.7.4.2 How the Library Works

5.9.7.4.2.1 System Interaction

The above figure shows the system interaction required for MSD function driver. The system has to initialize the media driver and the USB device layer. There are no direct calls the system has to make to initialize the MSD function driver. The USB device layer initializes and deinitializes the MSD function driver appropriately at runtime. The system is also responsible for calling the media driver tasks if applicable.

5.9.7.4.2.2 Object Initialization

Each instance of MSD function driver must be initialized by an object of data type `USB_DEVICE_MSD_INIT` at compile time. If there are more than one instance of MSD function driver, then user must create multiple objects of this data type. The Init Object is then linked to an instance of MSD function driver by adding its pointer to the function driver registration table (Refer to section "Registering MSD function driver").

The MSD Init Object contains following data about an instance of MSD.

1. Interface number.
2. Bulk-IN endpoint address
3. Bulk-OUT endpoint address
4. Size of the endpoint
5. Number of logical units (LUN) supported by the particular instance of MSD.
6. One or more media driver instance number depending on the number of logical units supported. This is the media driver with which the particular logical unit will interact.
7. One or more inquiry response structure depending on the number of logical units supported.
8. Pointers to one or more sets of media driver callback functions depending on the number of logical units supported.

The device layer passes the Init Object to MSD function driver when it initializes the function driver.

The following code example shows how to initialize the MSD using Init Object.

```

const USB_DEVICE_MSD_INIT msdInit =
{
    0, /* Interface number */

```

```

1,  /* Bulk IN endpoint */
1,  /* Bulk OUT endpoint */
64, /* Size of the bulk endpoint */

1, /* Number of logical unit (LUN) */

{
    /* Begin first LUN info */
    {
        /* Media driver instance number */
        USB_DEVICE_MDD_INTFLASH_INDEX,

        /* Inquiry response for the first logical unit */
        {
            0x00, /* peripheral device is connected, direct access block device */
            0x80, /* removable media */
            0x04, /* version = 00=> does not conform to any standard, 4=> SPC-2 */
            0x02, /* response is in format specified by SPC-2 */
            0x20, /* n-4 = 36-4=32= 0x20 */
            0x00, /* sccs etc. */
            0x00, /* bque=1 and cmdque=0, indicates simple queuing 00 is obsolete
                    but as in case of other device, we are just using 00. */
            0x00, /* 00 obsolete, 0x80 for basic task queuing */
            {
                'M','i','c','r','o','c','h','p'
            },
            /* this is the T10 assigned Vendor ID */
            {
                'M','a','s','s',' ','S','t','o','r','a','g','e',' ',' ',' ',' ',' '
            },
            {
                '0','0','0','1'
            }
        },

        /* MDD function callback pointers for first loical uint */
        {
            &USB_DEVICE_MDD_INTFLASH_Status,
            &USB_DEVICE_MDD_INTFLASH_Open,
            &USB_DEVICE_MDD_INTFLASH_ReadCapacity,
            &USB_DEVICE_MDD_INTFLASH_ReadSectorSize ,
            &USB_DEVICE_MDD_INTFLASH_MediaDetect,
            &USB_DEVICE_MDD_INTFLASH_SectorRead,
            &USB_DEVICE_MDD_INTFLASH_WriteProtectState,
            &USB_DEVICE_MDD_INTFLASH_SectorWrite
        }
    }
} /* End of first LUN info */

{ /* Start of second LUN info */

} /* End of second LUN info */

};

```

5.9.7.4.2.3 MSD Function Driver Registration

The MSD function driver is registered with the USB device layer using the function registration table structure. The following code example shows how the MSD function driver can be registered with the USB device layer using function registration table. The structure variable *msdFunctionDriver* contains pointers to MSD function driver callbacks.

Example:

```

/* The device layer invokes the MSD function driver if the speed is full speed
and the host selects configuration value as 1 */
funcRegistrationTable[1] =
{
    {
        /* Speed
        USB_SPEED_FULL,

        /* Configuration value */
        1,

        /* Interface number */
        0,

        /* Number of interfaces */
        1,

        /* MSD instance index */
        USBMSD_FUNC_INDEX,

        /* MSD driver init object */
        (void*)&msdInit,

        /* MSD driver */
        &msdFunctionDriver
    }
};

```

5.9.7.4.2.4 Media Driver Registration

The MSD function driver makes call to media driver functions at runtime to perform sector erase, read and write operations. Therefore, the user must register the pointers to media driver callback functions with the MSD function driver . This has to be done at compile time while initializing the Init Object. Refer to the code example shown in the "Init Object" section for more information.

5.9.7.5 Library Interface

This section describes the configuration options provided by the MSD function driver to the system and the available data types. Refer to each section for a detailed description.

5.9.7.5.1 System Configuration Functions

Macros

	Name	Description
	<u>USB_DEVICE_MSD_MAX_INSTANCES</u>	This constant sets maximum possible number of instances of USB device MSD function driver that can be instantiated by using USB_DEVICE_MSD_Initialize() routine.
	<u>USB_DEVICE_MSD_MAX_LUN</u>	This constant sets maximum possible number of Logical Unit an instance of MSD can support.
	<u>USB_DEVICE_MSD_MAX_SECTOR_SIZE</u>	This constant defines the max possible media sector size supported by the MSD.

Description

5.9.7.5.1.1 USB_DEVICE_MSD_MAX_INSTANCES Macro

C

```
#define USB_DEVICE_MSD_MAX_INSTANCES 1
```

Remarks

The static implementation supports only one instance. Setting the value of this constant to > 1 has no effect on static implementations. Only in dynamic implementation of USB device MSD function driver this value can be set > 1.

USB device MSD function driver has to support atleast one instance. Hence, make sure the value of this constant is set to > 0.

Increasing the instance count consumes RAM and can lead to performance degradation.

5.9.7.5.1.2 USB_DEVICE_MSD_MAX_LUN Macro

C

```
#define USB_DEVICE_MSD_MAX_LUN 1
```

Description

This constant sets maximum possible number of Logical Unit (LUN) an instance of MSD can support.

Remarks

The value of this macro must not be set to zero. Each instance of USB MSDfunction driver can support atleast one LUN. Hence set the value to atleast 1.

5.9.7.5.1.3 USB_DEVICE_MSD_MAX_SECTOR_SIZE Macro

C

```
#define USB_DEVICE_MSD_MAX_SECTOR_SIZE 512
```

Description

If there are two logical units (LUNs), one that supports sector size 512 bytes and then the other one that supports 1024 bytes, then set the value of this macro to 1024.

Remarks

none.

5.9.7.5.2 Data Types and Constants

Macros

	Name	Description
	USB_DEVICE_MSD_INTF	MSD Interface Class Code
	USB_DEVICE_MSD_INTF_SUBCLASS	Only scsi transparent is supported.
	USB_DEVICE_MSD_PROTOCOL	MSD Interface Class Protocol Codes

Structures

	Name	Description
	USB_DEVICE_MSD_MEDIA_FUNCTIONS	This structure contains all the media driver callback function pointers. The MSD driver makes call to these function pointers at run time to know the status of the media and to read and write the media.
	USB_DEVICE_MSD_INIT	This structure contains required parameters for MSD initialization.

	USB_DEVICE_MSD_INQUIRY_RESPONSE	Inquiry response structure.
	USB_DEVICE_MSD_MEDIA_INIT_DATA	This structure holds media related data of a particular logical unit.

Description**5.9.7.5.2.1 USB_DEVICE_MSD_INTF Macro****C**

```
#define USB_DEVICE_MSD_INTF 0x08
```

Description

MSD Interface Class Code

5.9.7.5.2.2 USB_DEVICE_MSD_INTF_SUBCLASS Macro**C**

```
#define USB_DEVICE_MSD_INTF_SUBCLASS 0x06 // Only scsi transparent is supported.
```

Description

Only scsi transparent is supported.

5.9.7.5.2.3 USB_DEVICE_MSD_PROTOCOL Macro**C**

```
#define USB_DEVICE_MSD_PROTOCOL 0x50
```

Description

MSD Interface Class Protocol Codes

5.9.7.5.2.4 USB_DEVICE_MSD_MEDIA_FUNCTIONS Structure**C**

```
struct USB_DEVICE_MSD_MEDIA_FUNCTIONS {
    SYS_STATUS (* mediaInitState)(SYS_MODULE_OBJ objIndex);
    DRV_HANDLE (* open)(const SYS_MODULE_INDEX index, const DRV_IO_INTENT intent);
    void (* close)(DRV_HANDLE hClient);
    uint32_t (* readCapacity)(DRV_HANDLE drvHandle);
    uint32_t (* readSectorSize)(DRV_HANDLE drvHandle);
    bool (* mediaDetect)(DRV_HANDLE drvHandle);
    bool (* sectorRead)(DRV_HANDLE drvHandle, uint32_t sector_addr, uint8_t * buffer, void *
refHandle, MEDIA_OP_CMPLT_CB callBack);
    uint8_t (* writeProtectState)(DRV_HANDLE drvHandle);
    bool (* sectorWrite)(DRV_HANDLE drvHandle, uint32_t sector_addr, uint8_t* buffer, void *
refHandle, MEDIA_OP_CMPLT_CB callBack);
};
```

Description

The user must provide the callback function address of the media at compile time. MSD driver calls these function during run time to perform media operation or to know the media status.

Members

Members	Description
<code>SYS_STATUS (* mediaInitState)(SYS_MODULE_OBJ objIndex);</code>	Media init state.
<code>DRV_HANDLE (* open)(const SYS_MODULE_INDEX index, const DRV_IO_INTENT intent);</code>	Function pointer to the MediaInitialize() function of the physical media being used.
<code>void (* close)(DRV_HANDLE hClient);</code>	Function pointer for closing the physical media.
<code>uint32_t (* readCapacity)(DRV_HANDLE drvHandle);</code>	Function pointer to the ReadCapacity() function of the physical media being used.
<code>uint32_t (* readSectorSize)(DRV_HANDLE drvHandle);</code>	Function pointer to the ReadSectorSize() function of the physical media being used.
<code>bool (* mediaDetect)(DRV_HANDLE drvHandle);</code>	Function pointer to the MediaDetect() function of the physical media being used.
<code>bool (* sectorRead)(DRV_HANDLE drvHandle, uint32_t sector_addr, uint8_t * buffer, void * refHandle, MEDIA_OP_CMPLT_CB callBack);</code>	Function pointer to the SectorRead() function of the physical media being used.
<code>uint8_t (* writeProtectState)(DRV_HANDLE drvHandle);</code>	Function pointer to the WriteProtectState() function of the physical media being used.
<code>bool (* sectorWrite)(DRV_HANDLE drvHandle, uint32_t sector_addr, uint8_t * buffer, void * refHandle, MEDIA_OP_CMPLT_CB callBack);</code>	Function pointer to the SectorWrite() function of the physical media being used.

Remarks

None.

5.9.7.5.2.5 USB_DEVICE_MSD_INIT Structure**C**

```
struct USB_DEVICE_MSD_INIT {
    uint8_t numberOfLogicalUnits;
    USB_DEVICE_MSD_MEDIA_INIT_DATA mediaInit[USB_DEVICE_MSD_MAX_LUN];
};
```

Description

USB MSD init structure.

This structure contains interface number, bulk-IN and bulk-OUT endpoint addresses, endpointSize, number of logical units supported and pointer to array of structure that contains media initialization.

Members

Members	Description
<code>uint8_t numberOfLogicalUnits;</code>	Number of logical units supported.
<code>USB_DEVICE_MSD_MEDIA_INIT_DATA mediaInit[USB_DEVICE_MSD_MAX_LUN];</code>	Media related data

Remarks

This structure must be configured by the user at compile time.

5.9.7.5.2.6 USB_DEVICE_MSD_INQUIRY_RESPONSE Structure

C

```

struct USB_DEVICE_MSD_INQUIRY_RESPONSE {
    uint8_t peripheral;
    uint8_t removable;
    uint8_t version;
    uint8_t responseDataFormat;
    uint8_t additionalLength;
    uint8_t sccstp;
    uint8_t bqueetc;
    uint8_t cmdQue;
    uint8_t vendorID[8];
    uint8_t productID[16];
    uint8_t productRev[4];
};

```

Description

USB Device MSD inquiry response structure as defined in SCSI Primary Commands - 4.

Members

Members	Description
uint8_t peripheral;	Peripheral_Qualifier:3; Peripheral_DevType:5;
uint8_t removable;	Removable medium bit7 = 0 means non removable, rest reserved
uint8_t version;	Version
uint8_t responseDataFormat;	b7,b6 Obsolete, b5 Access control co-ordinator, b4 hierarchical addressing support b3:0 response data format 2 indicates response is in format defined by spec
uint8_t additionalLength;	length in bytes of remaining in standard inquiry data
uint8_t sccstp;	b7 SCCS, b6 ACC, b5-b4 TGPS, b3 3PC, b2-b1 Reserved, b0 Protected
uint8_t bqueetc;	b7 bque, b6- EncServ, b5-VS, b4-MultiP, b3-MChngr, b2-b1 Obsolete, b0-Addr16
uint8_t cmdQue;	b7-b6 Obsolete, b5-WBUS, b4-Sync, b3-Linked, b2 Obsolete, b1 Cmdque, b0-VS
uint8_t vendorID[8];	Vendor ID
uint8_t productID[16];	Product ID
uint8_t productRev[4];	Product Revision

Remarks

None.

5.9.7.5.2.7 USB_DEVICE_MSD_MEDIA_INIT_DATA Structure

C

```

struct USB_DEVICE_MSD_MEDIA_INIT_DATA {
    SYS_MODULE_INDEX instanceIndex;
    USB_DEVICE_MSD_INQUIRY_RESPONSE inquiryResponse;
    USB_DEVICE_MSD_MEDIA_FUNCTIONS mediaCallBackPtrs;
};

```

Description

It holds pointer to inquiry response, instance index and pointer to a structure that contains all media callback functions.

Members

Members	Description
SYS_MODULE_INDEX instanceIndex;	Instance index of the media

USB_DEVICE_MSD_INQUIRY_RESPONSE inquiryResponse;	Pointer to inquiry response
USB_DEVICE_MSD_MEDIA_FUNCTIONS mediaCallBackPtrs;	Callback function pointers of the media

Remarks

An object of this structure must be configured by the user at compile time.

5.9.7.6 Files

Files

Name	Description
usb_device_msd.h	USB device MSD function driver interface header
usb_device_msd_config_template.h	usb device MSD configuration template header file

Description

5.9.7.6.1 usb_device_msd.h

USB MSD function driver interface header

USB device MSD function driver interface header

Macros

	Name	Description
	USB_DEVICE_MSD_INTF	MSD Interface Class Code
	USB_DEVICE_MSD_INTF_SUBCLASS	Only scsi transparent is supported.
	USB_DEVICE_MSD_PROTOCOL	MSD Interface Class Protocol Codes

Structures

	Name	Description
	USB_DEVICE_MSD_INIT	This structure contains required parameters for MSD initialization.
	USB_DEVICE_MSD_INQUIRY_RESPONSE	Inquiry response structure.
	USB_DEVICE_MSD_MEDIA_FUNCTIONS	This structure contains all the media driver callback function pointers. The MSD driver makes call to these function pointers at run time to know the status of the media and to read and write the media.
	USB_DEVICE_MSD_MEDIA_INIT_DATA	This structure holds media related data of a particular logical unit.

File Name

usb_device_msd.h

Company

Microchip Technology Inc.

5.9.7.6.2 usb_device_msd_config_template.h

USB device MSD function driver compile time options

This file contains USB device MSD function driver compile time options(macros) that has to be configured by the user. This file is

a template file and must be used as an example only. This file must not be directly included in the project.

Macros

	Name	Description
	<u>USB_DEVICE_MSD_MAX_INSTANCES</u>	This constant sets maximum possible number of instances of USB device MSD function driver that can be instantiated by using USB_DEVICE_MSD_Initialize() routine.
	<u>USB_DEVICE_MSD_MAX_LUN</u>	This constant sets maximum possible number of Logical Unit an instance of MSD can support.
	<u>USB_DEVICE_MSD_MAX_SECTOR_SIZE</u>	This constant defines the max possible media sector size supported by the MSD.

File Name

usb_device_msd_config_template.h

Company

Microchip Technology Incorporated

5.9.8 USB Host Layer Library

5.9.8.1 Introduction

Introduces the MPLAB Harmony USB Host Library

Description

The USB Host layer library is part of USB Host stack that is available for the Microchip family of microcontrollers. This library uses the USB Host Controller Driver to interact with the USB peripheral and therefore cannot operate independently of it. Within the USB Host stack, the USB Host layer is responsible for enumeration the attached device, matching available class drivers and maintaining the class drivers.

The USB Host layer library implementation adheres to USB Device Framework of chapter-9 of USB specification 2.0. In the USB Host stack, the host layer features the following:

- Supports USB Low-Speed, Full-Speed, and Hi-Speed USB Devices
- Based on a modular and event driven architecture.
- Supports the PIC32MX and PIC32MZ families of microcontrollers
- Designed to support multiple device and multiple configurations
- Contains class driver to supports the following type of devices
 - CDC
 - MSD
- Supports non-blocking operation and is RTOS friendly
- Designed to integrate readily with other Harmony Middleware
- Supports both interrupt and polling operation

5.9.8.2 Release Notes

MPLAB Harmony Version: v0.70b **USB Host Layer Library Version :** 0.01 Alpha **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

- The host Stack has not been tested with a Real Time Operating System.
- Attach/Detach behavior has been tested in a limited capacity.
- The host stack only supports interrupt mode operation. Polled mode operation will be added in a future release.
- While running the host stack on PIC32MZ microcontroller, the stack requires 3 seconds to initialize. This is due to a hardware issue with PIC32MZ USB module.
- MSD Host has been tested with a limited number of commercially available USB Flash Drives.
- MSD Host and the USB Host Layer have not been tested for read/write throughput. This will be done in a future release.
- Host stack has not been tested with low speed devices.

5.9.8.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.9.8.4 Library Interface

Data Types and Constants

	Name	Description
	<u>USB_HOST_HANDLE</u>	Handle identifying a client when calling Host layer client functions.
	<u>USB_HOST_INIT</u>	Defines the data required to initialize a USB Host Layer instance.
	<u>USB_HOST_HANDLE_INVALID</u>	Definition of an invalid USB Host Client Handle

	USB_DEVICE_INFORMATION	Defines the USB Device Information data structure.
	USB_HOST_EVENT_CALLBACK	USB Host Event Handler Function Pointer Type.
	USB_HOST_EVENT_DATA_VBUS_REQUEST_POWER	Defines the data returned along with the USB_HOST_EVENT_VBUS_REQUEST_POWER event.
	USB_HOST_EVENT_RESPONSE	USB Host Event Handler Response Type
	USB_HOST_EVENTS	Identifies the possible events that the host layer can generate.
	USB_HOST_TPL_FLAGS	USB Host Layer Target Peripheral List Entry flags
	TPL_MATCH_VID_PID	This macro when used in the TPL table will direct the Host Layer to match the corresponding class driver by device vendor ID (VID) and product ID (PID).
	USB_HOST_0	USB Host module index definitions
	USB_HOST_1	This is macro USB_HOST_1.
	USB_HOST_ENDPOINT_TABLE_SIZE	USB Host Endpoint Table size needed while running the host on PIC32MX devices.
	USB_HOST_EVENT_RESPONSE_NONE	USB Host Layer Event Handler Response Type None.

Functions

	Name	Description
	USB_HOST_Close	Closes an opened-instance of the USB Host Layer.
	USB_HOST_Open	Opens the specified Host Layer instance and returns a handle to it
	USB_HOST_Deinitialize	Deinitializes the specified instance of the USB Host Layer.
	USB_HOST_DeviceInformationGet	Returns select information about the attached device.
	USB_HOST_DeviceIsResumed	Checks if the attached USB device has been resumed.
	USB_HOST_DeviceIsSuspended	Checks if the attached USB device has been suspended.
	USB_HOST_DeviceResume	Resumes the USB.
	USB_HOST_DeviceSuspend	Suspends the USB.
	USB_HOST_EventCallBackSet	Allows a client to identify an event handling function for the host layer to call back when host layer events are generated.
	USB_HOST_Initialize	Initializes the USB Host layer instance for the specified instance index.
	USB_HOST_OperationDisable	Disabled host operation.
	USB_HOST_OperationEnable	Enables host operation.
	USB_HOST_OperationIsEnabled	Allows the application to check if the host operation is enabled.
	USB_HOST_Status	Gets the current status of the USB Host Layer.
	USB_HOST_Tasks	Maintains the USB Host's state machine. It manages the USB Module driver and responds to USB Module driver events.

Description

This section describes the Application Programming Interface (API) functions of the USB Host Layer

5.9.8.4.1 Functions

5.9.8.4.1.1 USB_HOST_Close Function

C

```
void USB_HOST_Close(
    USB_HOST_HANDLE hostHandle
);
```

Description

This routine closes an opened-instance of the USB Host Layer, invalidating the handle.

Preconditions

The [USB_HOST_Initialize](#) routine must have been called for the specified USB Host Layer instance.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the Host Layers's open routine

Returns

None

Remarks

After calling this routine, the handle passed in "handle" must not be used with any of the remaining driver routines. A new handle must be obtained by calling [USB_HOST_Open](#) before the caller may use the driver again. This function is thread safe in a RTOS application.

Usually there is no need for the driver client to verify that the Close operation has completed.

Example

```
USB_HOST_HANDLE handle; // Returned from USB_HOST_Open

USB_HOST_Close(handle);
```

5.9.8.4.1.2 USB_HOST_Open Function

C

```
USB_HOST_HANDLE USB_HOST_Open(
    SYS_MODULE_INDEX index,
    const DRV_IO_INTENT ioIntent
);
```

Description

This routine opens the specified Host Layer instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the host layer. The host layer can be opened exclusively by a client by specifying the ioIntent as DRV_IO_INTENT_EXCLUSIVE. Any other flag settings will not have an effect on clients interaction with the host layer.

Preconditions

Function [USB_HOST_Initialize](#) must have been called before calling this function.

Parameters

Parameters	Description
index	Identifier for the object instance to be opened
intent	can be DRV_IO_INTENT_EXCLUSIVE which allows a client to open the host layer exclusively. Any other flags are ignored.

Returns

If successful, the routine returns a valid open-instance handle (a number identifying both the caller and the module instance).

If an error occurs, the return value is [USB_HOST_HANDLE_INVALID](#). Error can occur

- if the number of client objects allocated via USB_HOST_CLIENTS_NUMBER is insufficient.

- if the client is trying to open the host layer but host layer has been opened exclusively by another client.
- if the host layer instance being opened is not initialized or is invalid.

Remarks

The handle returned is valid until the [USB_HOST_Close](#) routine is called. This routine will NEVER block waiting for hardware. This function is thread safe in a RTOS application. It should not be called in an ISR.

Example

```
USB_HOST_HANDLE handle;

handle = USB_HOST_Open(USB_HOST_0, DRV_IO_INTENT_EXCLUSIVE);
if (USB_HOST_HANDLE_INVALID == handle)
{
    // Unable to open the driver
    // May be the driver is not initialized or the initialization
    // is not complete.
}
```

5.9.8.4.1.3 USB_HOST_Deinitialize Function

C

```
void USB_HOST_Deinitialize(
    SYS_MODULE_OBJ driverObject
);
```

Description

Deinitializes the specified instance of the USB Host Layer. This function will also deinitialize the USB Module driver and hence stop all USB Host related operation on the bus. All internal data structures will be reset.

Preconditions

Function [USB_HOST_Initialize](#) should have been called before calling this function.

Parameters

Parameters	Description
object	USB Host layer object handle, returned from the USB_HOST_Initialize routine

Returns

None.

Remarks

Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again. This routine will NEVER block waiting for hardware.

Example

```
SYS_MODULE_OBJ    object;    // Returned from USB_HOST_Initialize
SYS_STATUS        status;

USB_HOST_Deinitialize(object);

status = USB_HOST_Status(object);
if (SYS_MODULE_DEINITIALIZED != status)
{
    // Check again later if you need to know
    // when the driver is deinitialized.
}
```

```
}
```

5.9.8.4.1.4 USB_HOST_DeviceInformationGet Function

C

```
USB_ERROR USB_HOST_DeviceInformationGet(  
    USB_HOST_HANDLE hostHandle,  
    uint8_t deviceAddress,  
    USB_DEVICE_INFORMATION * deviceInfo  
);
```

Description

This function returns select information about the attached device. The application may use this information to update its display or for other application purposes. The device information is returned in the deviceInformation data structure.

Preconditions

The [USB_HOST_Initialize](#) routine must have been called for the specified USB Host Layer instance.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the Host Layers's open routine
address	Address of the device.
deviceInformation	pointer to a data structure where the device information will be stored

Returns

USB_ERROR_NONE - Function was successful. USB_ERROR_PARAMETER_INVALID - Device address or host handle is invalid or deviceInformation pointer is NULL.

Remarks

None.

Example

```
USB_HOST_HANDLE handle; // Returned from USB_HOST_Open  
USB_ERROR result;  
USB_DEVICE_INFORMATION deviceInfo;  
  
// Get informationa about attached device with address 2  
result = USB_HOST_DeviceInformationGet(handle, 2, &deviceInfo);  
if(USB_ERROR_NONE == result)  
{  
    // Display the string descriptor of the attached device.  
    APP_PrintToDisplay(deviceInformation.stringDescriptor);  
}
```

5.9.8.4.1.5 USB_HOST_DeviceIsResumed Function

C

```
bool USB_HOST_DeviceIsResumed(  
    USB_HOST_HANDLE hostHandle,  
    uint8_t deviceAddress  
);
```

Description

This function checks if the attached USB device has been resumed. This function can be called after calling the [USB_HOST_DeviceResume\(\)](#) function to check if resume request has been completed.

Preconditions

The [USB_HOST_Initialize](#) routine must have been called for the specified USB Host Layer instance.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the Host Layers's open routine
address	Address of the device.

Returns

true - Device is resumed. false - Device is not resumed or device address or handle is invalid.

Remarks

In cases where the device is connected directly to the USB Module, the bus resume request will be serviced immediately. In cases where the device is connected to the USB module via a hub, the application must call the [USB_HOST_DeviceIsResumed\(\)](#) function to check if the device has been resumed.

Example

```
USB_HOST_HANDLE handle; // Returned from USB_HOST_Open
USB_ERROR result;

// Resume the device with address 2
result = USB_HOST_DeviceResume(handle, 2);
if(USB_ERROR_NONE == result)
{
    // Wait till device is resumed.
    while(!USB_HOST_DeviceIsResumed(handle, 2));
}
```

5.9.8.4.1.6 USB_HOST_DeviceIsSuspended Function

C

```
bool USB_HOST_DeviceIsSuspended(
    USB_HOST_HANDLE hostHandle,
    uint8_t deviceAddress
);
```

Description

This function checks if the attached USB device has been suspended. This function can be called after calling the [USB_HOST_DeviceSuspend\(\)](#) function to check if suspend request has been completed.

Preconditions

The [USB_HOST_Initialize](#) routine must have been called for the specified USB Host Layer instance.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the Host Layers's open routine
address	Address of the device.

Returns

true - Device is suspended. false - Device is not suspended or device address or handle is invalid.

Remarks

In cases where the device is connected directly to the USB Module, the bus suspend request will be serviced immediately. In cases where the device is connected to the USB module via a hub, the application must call the [USB_HOST_DeviceIsSuspended\(\)](#) function to check if the device has been suspended.

Example

```
USB_HOST_HANDLE handle; // Returned from USB_HOST_Open
USB_ERROR result;

// Suspend the device with address 2
result = USB_HOST_Device(handle, 2);
if(USB_ERROR_NONE == result)
{
    // Wait till device is suspended.
    while(!USB_HOST_DeviceIsSuspended(handle, 2));
}
```

5.9.8.4.1.7 USB_HOST_DeviceResume Function**C**

```
USB_ERROR USB_HOST_DeviceResume(
    USB_HOST_HANDLE hostHandle,
    uint8_t deviceAddress
);
```

Description

The function resumes the USB. If address is an address of a device that is connected directly to the USB module, this function will directly resume the bus. If the address is an address of a device that is connected to the module via a hub, the USB Host layer will resume the hub port to which this device is connected. The function only places a request to resume the device. The application must use the `USB_HOST_DeviceIsResumed()` function to check if the device resume is complete.

Preconditions

The [USB_HOST_Initialize](#) routine must have been called for the specified USB Host Layer instance.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the Host Layers's open routine
address	Address of the device.

Returns

USB_ERROR_NONE - The request was accepted successfully. USB_ERROR_PARAMETER_INVALID - The device address or handle is invalid.

Remarks

In cases where the device is connected directly to the USB Module, the bus resume request will be serviced immediately. In cases where the device is connected to the USB module via a hub, the application must call the [USB_HOST_DeviceIsResumed\(\)](#) function to check if the device has been resumed.

Example

```
USB_HOST_HANDLE handle; // Returned from USB_HOST_Open
USB_ERROR result;

// Resume the device with address 2
result = USB_HOST_Device(handle, 2);
if(USB_ERROR_NONE == result)
{
    // Wait till device is resumed.
    while(!USB_HOST_DeviceIsResumed(handle, 2));
}
```

5.9.8.4.1.8 USB_HOST_DeviceSuspend Function

C

```
USB_ERROR USB_HOST_DeviceSuspend(  
    USB_HOST_HANDLE hostHandle,  
    uint8_t deviceAddress  
);
```

Description

The function suspends the USB. If address is an address of a device that is connected directly to the USB module, this function will directly suspend the bus. If the address is an address of a device that is connected to the module via a hub, the USB Host layer will suspend the hub port to which this device is connected. The function only places a request to suspend the device. The application must use the [USB_HOST_DeviceIsSuspended\(\)](#) function to check if the device suspend is complete.

Preconditions

The [USB_HOST_Initialize](#) routine must have been called for the specified USB Host Layer instance.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the Host Layers's open routine
address	Address of the device.

Returns

USB_ERROR_NONE - The request was accepted successfully. USB_ERROR_PARAMETER_INVALID - The device address or handle is invalid.

Remarks

In cases where the device is connected directly to the USB Module, the bus suspend request will be serviced immediately. In cases where the device is connected to the USB module via a hub, the application must call the [USB_HOST_DeviceIsSuspended\(\)](#) function to check if the device has been suspended.

Example

```
USB_HOST_HANDLE handle; // Returned from USB_HOST_Open  
USB_ERROR result;  
  
// Suspend the device with address 2  
result = USB_HOST_Device(handle, 2);  
if(USB_ERROR_NONE == result)  
{  
    // Wait till device is suspended.  
    while(!USB_HOST_DeviceIsSuspended(handle, 2));  
}
```

5.9.8.4.1.9 USB_HOST_EventCallbackSet Function

C

```
USB_ERROR USB_HOST_EventCallbackSet(  
    USB_HOST_HANDLE hostHandle,  
    USB_HOST_EVENT_CALLBACK callback,  
    uintptr_t context  
);
```

Description

This function allows a client to identify an event handling function for the host layer to call back when host layer events are generated.

The event handler should be set before the client the host layer operation is enabled. The event handler once set, persists until the client closes the driver or sets another event handler.

Preconditions

The [USB_HOST_Initialize](#) routine must have been called for the specified Host Layer instance.

[USB_HOST_Open](#) must have been called to obtain a valid opened Host Layer handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the host layer's open routine
callback	Pointer to the event handler function.
context	The value of parameter will be passed back to the client unchanged, when the eventHandler function is called. It can be used to identify any client specific data object that identifies the instance of the client module (for example, it may be a pointer to the client module's state structure).

Returns

USB_ERROR_NONE - Callback function was registered successfully. USB_ERROR_PARAMETER_INVALID - Callback function was NULL or hostHandle is invalid.

Remarks

None.

Example

```
// myAppObj is an application specific state data object.
MY_APP_OBJ myAppObj;

USB_HOST_HANDLE usbHostHandle;

// usbHostHandle is the handle returned
// by the USB_HOST_Open function.

// Client registers an event handler with host layer.

USB_HOST_EventCallbackSet( usbHostHandle, APP_USBHostEventHandler,
                           (uintptr_t)&myAppObj );

USB_HOST_EVENT_RESPONSE APP_USBHostEventHandler(uintptr_t context,
        USB_HOST_EVENTS event, void * eventData)
{
    switch(event)
    {
        case USB_HOST_EVENT_UNSUPPORTED_DEVICE:
            break;
        ...
    }
    return(USB_HOST_EVENT_RESPONSE_NONE);
}
```

5.9.8.4.1.10 USB_HOST_Initialize Function

C

```
SYS_MODULE_OBJ USB_HOST_Initialize(
    const SYS_MODULE_INDEX index,
    const SYS_MODULE_INIT * init
);
```

Description

This routine initializes the USB Host Layer instance for the specified instance index, making it ready for clients to open and use it. The initialization data is specified by the `init` parameter. The initialization may fail if the number of host layer objects allocated are insufficient or if the specified host layer instance is already initialized. This function also initializes the USB Module driver for host mode operation. The `init` data structure thus contains information required for driver initialization. Note that initializing the Host Layer does not enable its operations. This must be done using [USB_HOST_OperationEnable\(\)](#) function.

Preconditions

None.

Parameters

Parameters	Description
<code>index</code>	Identifier for the instance to be initialized
<code>init</code>	Pointer to a USB_HOST_INIT data structure containing data necessary to initialize the driver.

Returns

If successful, returns a valid handle to a driver instance object. Otherwise, returns [SYS_MODULE_OBJ_INVALID](#).

Remarks

This routine must be called before any other USB Host routine is called.

This routine should only be called once during system initialization unless [USB_HOST_Deinitialize](#) is called to de-initialize the Host Layer instance. This routine will NEVER block for hardware access.

Example

```
// Initializes the host layer for use with PIC32MX devices.
// We assume that the TPL table is already created and has two
// entries.

USB_HOST_TARGET_PERIPHERAL_LIST * tplTable;

USB_HOST_INIT    usbHostInit;
SYS_MODULE_OBJ   objectHandle;

// Allocate an endpoint table
uint8_t __attribute__((aligned(512))) endpointTable[USB_HOST_ENDPOINT_TABLE_SIZE];

usbHostInit.moduleInit = SYS_MODULE_POWER_RUN_FULL;

// The usbID member of the USB_HOST_INIT data structure
// should be USB_ID_x for PIC32MX devices and should be
// USBHS_ID_x PIC32MZ devices. Typical values are USB_ID_1
// for PIC32MX and USBHS_ID_0 for PIC32MZ devices.

usbHostInit.usbID      = USB_ID_1; //for PIC32MX devices
usbHostInit.stopInIdle = false;
usbHostInit.suspendInSleep = false;
usbHostInit.endpointTable = endpointTable;
usbHostInit.interruptSource = INT_SOURCE_USB_1;
usbHostInit.nTPLEntries  = 2;
usbHostInit.usbSpeed     = USB_SPEED_FULL;
usbHostInit.tplTable     = tplTable;

objectHandle = USB_HOST_Initialize(USB_HOST_0, (SYS_MODULE_INIT*)usbHostInit);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}
```

5.9.8.4.1.11 USB_HOST_OperationDisable Function

C

```
void USB_HOST_OperationDisable(  
    USB_HOST_HANDLE hostHandle  
)  
;
```

Description

The function disables host operation. Disabling the host operation will cause the host to ignore attached device. All bus communication will be halted and USB bus will be suspended.

Preconditions

The [USB_HOST_Initialize](#) routine must have been called for the specified USB Host Layer instance.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the Host Layers's open routine

Returns

None

Remarks

This function may not be used in a typical USB Host application. One possible use could be in a case where a fatal system error has occurred. Once disabled, the Host operation must be enabled again using the [USB_HOST_OperationEnable\(\)](#) function.

Example

```
USB_HOST_HANDLE handle; // Returned from USB_HOST_Open  
  
// Enabled host operation  
USB_HOST_OperationDisable(handle);
```

5.9.8.4.1.12 USB_HOST_OperationEnable Function

C

```
void USB_HOST_OperationEnable(  
    USB_HOST_HANDLE hostHandle  
)  
;
```

Description

The function enables host operation. When enabled, the host layer can detect and enumerate attached devices. The application must call the [USB_HOST_OperationIsEnabled\(\)](#) function to check if the operation has completed.

Preconditions

The [USB_HOST_Initialize](#) routine must have been called for the specified USB Host Layer instance.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the Host Layers's open routine

Returns

None

Remarks

It is recommended that only on host layer client call this function. Multiple host layer clients calling this may cause indeterministic behavior.

Example

```
USB_HOST_HANDLE handle; // Returned from USB_HOST_Open

// Enabled host operation
USB_HOST_OperationEnable(handle);

// Wait till host operation is enabled.
while(!USB_HOST_OperationIsEnabled(handle));
```

5.9.8.4.1.13 USB_HOST_OperationIsEnabled Function**C**

```
bool USB_HOST_OperationIsEnabled(
    USB_HOST_HANDLE hostHandle
);
```

Description

The function allows the application to check if the host operation is enabled. This function should be called after the [USB_HOST_OperationEnable\(\)](#) function is called to check if the operation has been enabled.

Preconditions

The [USB_HOST_Initialize](#) routine must have been called for the specified USB Host Layer instance.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the Host Layers's open routine

Returns

None.

Remarks

None.

Example

```
USB_HOST_HANDLE handle; // Returned from USB_HOST_Open

// Enabled host operation
USB_HOST_OperationEnable(handle);

// Wait till host operation is enabled.
while(!USB_HOST_OperationIsEnabled(handle));
```

5.9.8.4.1.14 USB_HOST_Status Function**C**

```
SYS_STATUS USB_HOST_Status(
    SYS_MODULE_OBJ driverObject
);
```

Description

This routine provides the current status of the USB Host Layer.

Preconditions

Function [USB_HOST_Initialize](#) should have been called before calling this function.

Parameters

Parameters	Description
object	USB Host Layer object handle, returned from the USB_HOST_Initialize routine

Returns

SYS_STATUS_READY - Indicates that the USB Host layer is ready for operations.

SYS_STATUS_DEINITIALIZED - Indicates that the driver has been de-initialized

Remarks

None.

Example

```
SYS_MODULE_OBJ    object;    // Returned from USB_HOST_Initialize
SYS_STATUS        status;

status = USB_HOST_Status(object);
if (SYS_STATUS_READY == status)
{
    // This means the driver can be opened using the
    // USB_HOST_Open() function.
}
```

5.9.8.4.1.15 USB_HOST_Tasks Function**C**

```
void USB_HOST_Tasks(
    SYS_MODULE_OBJ driverObject
);
```

Description

This routine maintains the USB Host layer's state machine. It manages and the USB Module driver and responds to USB module driver events. This function should be called from the [SYS_Tasks\(\)](#) function.

Preconditions

The [USB_HOST_Initialize](#) routine must have been called for the specified USB Host Layer instance.

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from USB_HOST_Initialize)

Returns

None.

Remarks

This routine is normally not called directly by an application.

Example

```
SYS_MODULE_OBJ    object;    // Returned from USB_HOST_Initialize

while (true)
{
    USB_HOST_Tasks (object);

    // Do other tasks
}
```

5.9.8.4.2 Data Types and Constants

5.9.8.4.2.1 USB_HOST_HANDLE Type

C

```
typedef uintptr_t USB_HOST_HANDLE;
```

Description

USB Host Client Handle

A USB Host Client Handle is returned by a call to the [USB_HOST_Open\(\)](#) function. The handle maintains the relationship between USB Host Layer and its client. All USB Host Client functions required the client handle to be specified when the functions are called. A client handle is valid till the the client calls the [USB_HOST_Close\(\)](#) function at which point it becomes invalid.

Remarks

None.

5.9.8.4.2.2 USB_HOST_INIT Structure

C

```
typedef struct {
    SYS_MODULE_INIT moduleInit;
    uint8_t usbID;
    bool stopInIdle;
    bool suspendInSleep;
    void * endpointTable;
    INT_SOURCE interruptSource;
    unsigned int nTPLEntries;
    USB_SPEED usbSpeed;
    USB_HOST_TARGET_PERIPHERAL_LIST * tplList;
} USB_HOST_INIT;
```

Description

USB Host Initialization Data Structure

This data type defines the data required to initialize an USB Host Layer Instance. A pointer to a structure of this type is required by the [USB_HOST_Initialize\(\)](#) function.

Members

Members	Description
SYS_MODULE_INIT moduleInit;	System Module Initialization data
uint8_t usbID;	Identifies the Peripheral Library ID of the USB Peripheral to be used by this instance of the host layer
bool stopInIdle;	Identifies the Idle mode behavior. If true the USB module will stop when the microcontroller enter IDLE mode
bool suspendInSleep;	If true, the USB module will automatically suspend when the the microcontroller enter sleep mode
void * endpointTable;	Pointer to an endpoint table whose size should be USB_HOST_ENDPOINT_TABLE_SIZE number of bytes.
INT_SOURCE interruptSource;	Interrupt Peripheral Library ID of the interrupt source of USB module which this Host layer will control
unsigned int nTPLEntries;	Number of entries in the TPL table

USB_SPEED usbSpeed;	Speed at which the module should operate
USB_HOST_TARGET_PERIPHERAL_LIST * tplList;	Pointer to the TPL table

Remarks

Intentionally defined to be empty.

5.9.8.4.2.3 USB_HOST_HANDLE_INVALID Macro

C

```
#define USB_HOST_HANDLE_INVALID
```

Description

USB Host Invalid Client Handle

This is the definition of an invalid USB Host Client Handle. An invalid client handle is returned by the [USB_HOST_Open\(\)](#) function when it was not able to open the USB Host Layer successfully.

Remarks

None.

5.9.8.4.2.4 USB_DEVICE_INFORMATION Structure

C

```
typedef struct {
    uint16_t vid;
    uint16_t pid;
    uint16_t stringDescriptor[USB_HOST_DEVICE_INFORMATION_STRING_LENGTH];
} USB_DEVICE_INFORMATION;
```

Description

USB Device Information Structure

This data type defines the USB Device information data structure. This data structure is passed to [USB_HOST_DeviceInformationGet\(\)](#) function to obtain specific information about the device. The application can use this information to update its display or for other purposes. When processed by the [USB_HOST_DeviceInformationGet\(\)](#) function, the stringDescriptor member of this data structure will contain a NULL terminated string descriptor string in UTF-16 format. The vid and pid members of the data structure will be populated with VID and PID of the attached device respectively.

Members

Members	Description
uint16_t vid;	VID of the attached device
uint16_t pid;	PID of the attached device
uint16_t stringDescriptor[USB_HOST_DEVICE_INFORMATION_STRING_LENGTH];	String descriptor string in UTF-16 format. The string when returned by USB_HOST_DeviceInformationGet() function will be NULL terminated.

Remarks

None.

5.9.8.4.2.5 USB_HOST_EVENT_CALLBACK Type

C

```
typedef USB_HOST_EVENT_RESPONSE (* USB_HOST_EVENT_CALLBACK)(USB_HOST_EVENTS event, void *  
eventData, uintptr_t context);
```

Description

USB Host Event Handler Function Pointer Type.

This data type defines the required function signature of the USB Host Layer event handling callback function. The application must register a pointer to a USB Host Event handling function whose function signature (parameter and return value types) match the types specified by this function pointer in order to receive event call backs from the USB Host Layer. The function driver will invoke this function with event relevant parameters. The description of the event handler function parameters is given here.

event - Type of event generated.

eventData - This parameter should be type casted to a event specific pointer type based on the event that has occurred. Refer to the [USB_HOST_EVENTS](#) enumeration description for more details.

context - Value identifying the context of the application that registered the event handling function.

Remarks

None.

5.9.8.4.2.6 USB_HOST_EVENT_DATA_VBUS_REQUEST_POWER Structure

C

```
typedef struct {  
    uint8_t port;  
    uint8_t current;  
} USB_HOST_EVENT_DATA_VBUS_REQUEST_POWER;
```

Description

USB Host VBUS Power Request Event Data Structure

This data type defines the data returned along with the USB_HOST_EVENT_VBUS_REQUEST_POWER event.

Members

Members	Description
uint8_t port;	Port where the device is connected
uint8_t current;	Current (in 2mA units) that the device is requesting

Remarks

None.

5.9.8.4.2.7 USB_HOST_EVENT_RESPONSE Type

C

```
typedef void USB_HOST_EVENT_RESPONSE;
```

Description

USB Host Event Handler Response Type

This is the return type of the USB Host Layer Event Handler

Remarks

None.

5.9.8.4.2.8 USB_HOST_EVENTS Enumeration

C

```
typedef enum {
    USB_HOST_EVENT_VBUS_REQUEST_POWER,
    USB_HOST_EVENT_UNSUPPORTED_DEVICE,
    USB_HOST_EVENT_CANNOT_ENUMERATE
} USB_HOST_EVENTS;
```

Description

USB Host Events

This enumeration identifies the possible events that the host layer can generate. A Host Layer client should register an event handler using the [USB_HOST_EventCallBackSet\(\)](#) function to receive host layer events. An event may have data associated with it. The event description before provides details of such cases.

Members

Members	Description

5.9.8.4.2.9 USB_HOST_TPL_FLAGS Enumeration

C

```
typedef enum {
    TPL_FLAG_VID_PID = 0x1,
    TPL_FLAG_CLASS_SUBCLASS_PROTOCOL = 0x2
} USB_HOST_TPL_FLAGS;
```

Description

USB Host Layer TPL Table Entry Flags

This type defines the possible flags that can be used when adding an entry into the TPL table. Using the TPL_FLAG_VID_PID will direct the host layer to match the class driver to the attached device based on the device Vendor ID and the Product ID. Using the TPL_FLAG_CLASS_SUBCLASS_PROTOCOL will direct the host layer to match the class driver to the attached device based on the device class, subclass and protocol fields.

Members

Members	Description
TPL_FLAG_VID_PID = 0x1	Match by VID and PID
TPL_FLAG_CLASS_SUBCLASS_PROTOCOL = 0x2	Match by Class, Subclass and Protocol

Remarks

None.

5.9.8.4.2.10 TPL_MATCH_VID_PID Macro

C

```
#define TPL_MATCH_VID_PID(vid,pid)
```

Description

USB Host Class Driver Match by VID and PID

This macro when used in the TPL table will direct the Host Layer to match the corresponding class driver by device vendor ID and product ID. The application must set the device member of the TPL table entry to this macro in order to match the attached device to the class driver by device Vendor ID and Product ID.

Remarks

None.

5.9.8.4.2.11 USB_HOST_0 Macro

C

```
#define USB_HOST_0 0
```

Description

Driver USB Host Module Index

These constants provide USB Host index definitions.

Remarks

These constants should be used in place of hard-coded numeric literals. These values should be passed into the [USB_HOST_Initialize\(\)](#) and [USB_HOST_Open\(\)](#) routines to identify the host layer instance in use.

5.9.8.4.2.12 USB_HOST_1 Macro

C

```
#define USB_HOST_1 1
```

Description

This is macro USB_HOST_1.

5.9.8.4.2.13 USB_HOST_ENDPOINT_TABLE_SIZE Macro

C

```
#define USB_HOST_ENDPOINT_TABLE_SIZE
```

Description

USB Host Endpoint Table Size

This macro defines the USB Endpoint Table size while running the host layer on PIC32MX devices. The application should allocate a `uint8_t` type array of this size. The array should be aligned at a 512 byte boundary.

Remarks

None.

5.9.8.4.2.14 USB_HOST_EVENT_RESPONSE_NONE Macro

C

```
#define USB_HOST_EVENT_RESPONSE_NONE
```

Description

USB Host Layer Event Handler Response None

This is the definition of the USB Host Layer Event Handler Response Type None.

Remarks

Intentionally defined to be empty.

5.9.8.5 Files

Files

Name	Description
usb_host.h	USB HOST Layer Interface Header

Description

5.9.8.5.1 usb_host.h

USB Host Layer Interface Definition

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the USB HOST layer.

Enumerations

	Name	Description
	USB_HOST_EVENTS	Identifies the possible events that the host layer can generate.
	USB_HOST_TPL_FLAGS	USB Host Layer Target Peripheral List Entry flags

Functions

	Name	Description
	USB_HOST_Close	Closes an opened-instance of the USB Host Layer.
	USB_HOST_Deinitialize	Deinitializes the specified instance of the USB Host Layer.
	USB_HOST_DeviceInformationGet	Returns select information about the attached device.
	USB_HOST_DeviceIsResumed	Checks if the attached USB device has been resumed.
	USB_HOST_DeviceIsSuspended	Checks if the attached USB device has been suspended.
	USB_HOST_DeviceResume	Resumes the USB.
	USB_HOST_DeviceSuspend	Suspends the USB.
	USB_HOST_EventCallBackSet	Allows a client to identify an event handling function for the host layer to call back when host layer events are generated.
	USB_HOST_Initialize	Initializes the USB Host layer instance for the specified instance index.
	USB_HOST_Open	Opens the specified Host Layer instance and returns a handle to it
	USB_HOST_OperationDisable	Disabled host operation.
	USB_HOST_OperationEnable	Enables host operation.
	USB_HOST_OperationIsEnabled	Allows the application to check if the host operation is enabled.
	USB_HOST_Status	Gets the current status of the USB Host Layer.
	USB_HOST_Tasks	Maintains the USB Host's state machine. It manages the USB Module driver and responds to USB Module driver events.

Macros

	Name	Description
	<u>TPL_MATCH_VID_PID</u>	This macro when used in the TPL table will direct the Host Layer to match the corresponding class driver by device vendor ID (VID) and product ID (PID).
	<u>USB_HOST_0</u>	USB Host module index definitions
	<u>USB_HOST_1</u>	This is macro USB_HOST_1.
	<u>USB_HOST_ENDPOINT_TABLE_SIZE</u>	USB Host Endpoint Table size needed while running the host on PIC32MX devices.
	<u>USB_HOST_EVENT_RESPONSE_NONE</u>	USB Host Layer Event Handler Response Type None.
	<u>USB_HOST_HANDLE_INVALID</u>	Definition of an invalid USB Host Client Handle

Structures

	Name	Description
	<u>USB_DEVICE_INFORMATION</u>	Defines the USB Device Information data structure.
	<u>USB_HOST_EVENT_DATA_VBUS_REQUEST_POWER</u>	Defines the data returned along with the USB_HOST_EVENT_VBUS_REQUEST_POWER event.
	<u>USB_HOST_INIT</u>	Defines the data required to initialize a USB Host Layer instance.

Types

	Name	Description
	<u>USB_HOST_EVENT_CALLBACK</u>	USB Host Event Handler Function Pointer Type.
	<u>USB_HOST_EVENT_RESPONSE</u>	USB Host Event Handler Response Type
	<u>USB_HOST_HANDLE</u>	Handle identifying a client when calling Host layer client functions.

5.9.9 USB CDC Host Library

5.9.9.1 Introduction

Introduces the MPLAB Harmony USB Host CDC Class Driver Library

Description

The USB Host CDC Class Driver library is a part of the USB Host stack that is available for Microchip family of microcontrollers. This library uses the USB Host Layer to interact with the attached USB CDC device and therefore cannot operate independently of it. Within the USB Host stack, the CDC Class Driver library is responsible for providing the host application with access to the functionality of the attached CDC Device.

The USB Host CDC Class Driver library implementation adheres to revision 1.2 of the USB CDC Specification release. The USB Host CDC Class Driver provides the following features:

- Support CDC-ACM devices.
- Abstracts CDC function interface details from the application and provides a clear interface to device functions.
- Provides functions to [send](#) commands such as Set Line Coding , Get Line Coding to the attached CDC Device.
- Provides functions to read and write data and request serial line notification from the device.
- Generates bus related events to user application and class drivers.
- Provides events to indicate completion and status of class driver functions.

5.9.9.2 Release Notes

MPLAB Harmony Version: v0.70b **USB CDC Host Library Version :** 0.01 Alpha **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.9.9.3 SW License Agreement

5.9.9.4 Library Interface

5.9.9.4.1 Functions

Functions

	Name	Description
	USB_HOST_CDC_BreakSend	This function sends a request to the attached to update it's break duration.
	USB_HOST_CDC_ControlLineStateSet	This function sets the state of the control line connecting the host to the device.
	USB_HOST_CDC_EventHandlerSet	This class registers a event handler for the specified CDC class driver instance.
	USB_HOST_CDC_LineCodingGet	This function requests line coding from the attached CDC device.
	USB_HOST_CDC_LineCodingSet	This function sets the line coding of the attached CDC device.
	USB_HOST_CDC_Read	This function reads data from the attached CDC device.
	USB_HOST_CDC_SerialStateNotificationGet	This function requests serial state noitification data from the attached CDC device.
	USB_HOST_CDC_Write	This function writes data to the attached CDC device.

Description

5.9.9.4.1.1 USB_HOST_CDC_BreakSend Function

C

```

USB_HOST_CDC_RESULT USB_HOST_CDC_BreakSend(
    USB_HOST_CDC_INDEX index,
    USB_HOST_CDC_TRANSFER_HANDLE * transferHandle,
    uint16_t breakDuration
);

```

Description

This function sends a request to the attached to update it's break duration. The function schedules a SEND BREAK control transfer. If successful, the transferHandle parameter will contain a valid transfer handle, else it will contain [USB_HOST_CDC_TRANSFER_HANDLE_INVALID](#). When completed, the CDC class driver will generate a USB_HOST_CDC_EVENT_SEND_BREAK_COMPLETE event. The CDC Class driver does not support queuing of control transfers. If a control transfer is in progress, this function will return with an error.

Preconditions

None.

Parameters

Parameters	Description
index	CDC Class Driver Instance Index where the request should be scheduled.
transferHandle	Pointer to USB_HOST_CDC_TRANSFER_HANDLE type of a variable. This will contain a valid transfer handle if the request was successful.
breakDuration	Break duration.

Returns

USB_HOST_CDC_RESULT_OK - The operation was successful. transferHandle will contain a valid transfer handle.
 USB_HOST_CDC_RESULT_ERROR_INSTANCE_INVALID - The specified instance does not exist.
 USB_HOST_CDC_RESULT_ERROR_TRANSFER_QUEUE_FULL - Another control transfer is in progress and this transfer cannot be scheduled.
 USB_HOST_CDC_RESULT_ERROR_INSTANCE_NOT_READY - The specified instance does not have

a CDC device associated with it. This can happen if the attached device was disconnected or the set request was called with an CDC class driver instance that was not attached with a CDC device.

Remarks

None.

Example

*// The following code snippet shows an example of scheduling a CDC Class
// Driver Control Line State Set Request.*

```
USB_HOST_CDC_TRANSFER_HANDLE transferHandle;
USB_HOST_CDC_RESULT result;
uint16_t breakDuration;

result = USB_HOST_CDC_BreakSend(USB_HOST_CDC_0,
                                &transferHandle, breakDuration);

if(USB_HOST_CDC_RESULT_OK != result)
{
    // Error handling here
}

// The completion of the set request can be tracked by using the
// USB_HOST_CDC_EVENT_SEND_BREAK_COMPLETE event.
```

5.9.9.4.1.2 USB_HOST_CDC_ControlLineStateSet Function

C

```
USB_HOST_CDC_RESULT USB_HOST_CDC_ControlLineStateSet(
    USB_HOST_CDC_INDEX index,
    USB_HOST_CDC_TRANSFER_HANDLE * transferHandle,
    USB_CDC_CONTROL_LINE_STATE * controlLineState
);
```

Description

This function sets the state of the control line connecting the host to the device. The function schedules a SET CONTROL LINE STATE control transfer. If successful, the transferHandle parameter will contain a valid transfer handle, else it will contain [USB_HOST_CDC_TRANSFER_HANDLE_INVALID](#). When completed, the CDC class driver will generate a USB_HOST_CDC_EVENT_SET_CONTROL_LINE_STATE_COMPLETE event. The CDC Class driver does not support queuing of control transfers. If a control transfer is in progress, this function will return with an error.

Preconditions

None.

Parameters

Parameters	Description
index	CDC Class Driver Instance Index where the request should be scheduled.
transferHandle	Pointer to USB_HOST_CDC_TRANSFER_HANDLE type of a variable. This will contain a valid transfer handle if the request was successful.
controlLineState	pointer to the buffer containing control line state data to be sent to the device

Returns

USB_HOST_CDC_RESULT_OK - The operation was successful. transferHandle will contain a valid transfer handle.
 USB_HOST_CDC_RESULT_ERROR_INSTANCE_INVALID - The specified instance does not exist.
 USB_HOST_CDC_RESULT_ERROR_TRANSFER_QUEUE_FULL - Another control transfer is in progress and this transfer cannot be scheduled.
 USB_HOST_CDC_RESULT_ERROR_INSTANCE_NOT_READY - The specified instance does not have a CDC device associated with it. This can happen if the attached device was disconnected or the set request was called with an

CDC class driver instance that was not attached with a CDC device.
USB_HOST_CDC_RESULT_ERROR_PARAMETER_INVALID - The controlLineState buffer pointer is NULL.

Remarks

None.

Example

```
// The following code snippet shows an example of scheduling a CDC Class  
// Driver Control Line State Set Request.
```

```
USB_HOST_CDC_TRANSFER_HANDLE transferHandle;  
USB_HOST_CDC_RESULT result;  
USB_CDC_HOST_CONTROL_LINE_STATE * buffer;  
  
result = USB_HOST_CDC_ControlLineStateSet(USB_HOST_CDC_0,  
                                           &transferHandle, buffer);  
  
if(USB_HOST_CDC_RESULT_OK != result)  
{  
    // Error handling here  
}
```

```
// The completion of the set request can be tracked by using the  
// USB_HOST_CDC_EVENT_SET_CONTROL_LINE_STATE_COMPLETE event.
```

5.9.9.4.1.3 USB_HOST_CDC_EventHandlerSet Function**C**

```
USB_HOST_CDC_RESULT USB_HOST_CDC_EventHandlerSet(  
    USB_HOST_CDC_INDEX index,  
    USB_HOST_CDC_EVENT_HANDLER eventHandler,  
    uintptr_t context  
);
```

Description

This function registers an application event handler for the specified CDC class driver instance events. The event handler should be registered before the host layer operation is enabled.

Preconditions

None.

Parameters

Parameters	Description
instance	Instance of the CDC Class Driver.
eventHandler	A pointer to event handler function.
context	Application specific context that is returned in the event handler.

Returns

USB_HOST_CDC_RESULT_OK - The operation was successful
USB_HOST_CDC_RESULT_ERROR_INSTANCE_INVALID - The specified instance does not exist.
USB_HOST_CDC_RESULT_ERROR_PARAMETER_INVALID - The eventHandler parameter is NULL

Remarks

None.

Example

```
// This code snippet shows an example of registering an event handler. Here  
// the application specifies the context parameter as a pointer to an
```

```

// application object (appObject) that should be associated with this
// instance of the CDC class driver.

USB_HOST_CDC_RESULT result;

USB_HOST_CDC_EVENT_RESPONSE APP_USBHostCDCEventHandler
(
    USB_HOST_CDC_INDEX instanceIndex ,
    USB_HOST_CDC_EVENT event ,
    void * event, uintptr_t context
)
{
    // Event Handling comes here

    switch(event)
    {
        ...
    }

    return(USB_HOST_CDC_EVENT_RESPONSE_NONE);
}

result = USB_HOST_CDC_EventHandlerSet ( 0 ,&APP_EventHandler, (uintptr_t) &appObject);

if(USB_HOST_CDC_RESULT_OK != result)
{
    SYS_ASSERT ( false , "invalid event handler class" );
}

```

5.9.9.4.1.4 USB_HOST_CDC_LineCodingGet Function

C

```

USB_HOST_CDC_RESULT USB_HOST_CDC_LineCodingGet(
    USB_HOST_CDC_INDEX index,
    USB_HOST_CDC_TRANSFER_HANDLE * transferHandle,
    USB_CDC_LINE_CODING * lineCoding
);

```

Description

This function requests line coding from the attached CDC device. The function schedules a GET LINE CODING control transfer. If successful, the transferHandle parameter will contain a valid transfer handle, else it will contain [USB_HOST_CDC_TRANSFER_HANDLE_INVALID](#). When completed, the CDC class driver will generate a USB_HOST_CDC_EVENT_GET_LINE_CODING_COMPLETE event. When completed, the lineCoding parameter will contain the line coding. The CDC Class driver does not support queuing of control transfers. If a control transfer is in progress, this function will return with an error.

Preconditions

None.

Parameters

Parameters	Description
index	CDC Class Driver Instance Index where the request should be scheduled.
transferHandle	Pointer to USB_HOST_CDC_TRANSFER_HANDLE type of a variable. This will contain a valid transfer handle if the request was successful.
lineCoding	pointer to the buffer where the line coding data will be stored.

Returns

USB_HOST_CDC_RESULT_OK - The operation was successful. transferHandle will contain a valid transfer handle.
 USB_HOST_CDC_RESULT_ERROR_INSTANCE_INVALID - The specified instance does not exist.

USB_HOST_CDC_RESULT_ERROR_TRANSFER_QUEUE_FULL - Another control transfer is in progress and this transfer cannot be scheduled. USB_HOST_CDC_RESULT_ERROR_INSTANCE_NOT_READY - The specified instance does not have a CDC device associated with it. This can happen if the attached device was disconnected or the get request was called with an CDC class driver instance that was not attached with a CDC device. USB_HOST_CDC_RESULT_ERROR_PARAMETER_INVALID - The lineCoding buffer pointer is NULL.

Remarks

None.

Example

*// The following code snippet shows an example of scheduling a CDC Class
// Driver Get Line Coding Request.*

```
USB_HOST_CDC_TRANSFER_HANDLE transferHandle;
USB_HOST_CDC_RESULT result;
USB_CDC_LINE_CODING * buffer;

result = USB_HOST_CDC_LineCodingGet(USB_HOST_CDC_0,
                                   &transferHandle, buffer);

if(USB_HOST_CDC_RESULT_OK != result)
{
    // Error handling here
}

// The completion of the get request can be tracked by using the
// USB_HOST_CDC_EVENT_GET_LINE_CODING_COMPLETE event.
```

5.9.9.4.1.5 USB_HOST_CDC_LineCodingSet Function

C

```
USB_HOST_CDC_RESULT USB_HOST_CDC_LineCodingSet(
    USB_HOST_CDC_INDEX index,
    USB_HOST_CDC_TRANSFER_HANDLE * transferHandle,
    USB_CDC_LINE_CODING * lineCoding
);
```

Description

This function sets the line coding of the attached CDC device. The function schedules a SET LINE CODING control transfer. If successful, the transferHandle parameter will contain a valid transfer handle, else it will contain [USB_HOST_CDC_TRANSFER_HANDLE_INVALID](#). When completed, the CDC class driver will generate a USB_HOST_CDC_EVENT_SET_LINE_CODING_COMPLETE event. The lineCoding parameter contain the line coding to be sent to the attached device. The CDC Class driver does not support queuing of control transfers. If a control transfer is in progress, this function will return with an error.

Preconditions

None.

Parameters

Parameters	Description
index	CDC Class Driver Instance Index where the request should be scheduled.
transferHandle	Pointer to USB_HOST_CDC_TRANSFER_HANDLE type of a variable. This will contain a valid transfer handle if the request was successful.
lineCoding	pointer to the buffer containing line coding data to be sent to the device

Returns

USB_HOST_CDC_RESULT_OK - The operation was successful. transferHandle will contain a valid transfer handle.

USB_HOST_CDC_RESULT_ERROR_INSTANCE_INVALID - The specified instance does not exist.
 USB_HOST_CDC_RESULT_ERROR_TRANSFER_QUEUE_FULL - Another control transfer is in progress and this transfer cannot be scheduled.
 USB_HOST_CDC_RESULT_ERROR_INSTANCE_NOT_READY - The specified instance does not have a CDC device associated with it. This can happen if the attached device was disconnected or the set request was called with an CDC class driver instance that was not attached with a CDC device.
 USB_HOST_CDC_RESULT_ERROR_PARAMETER_INVALID - The lineCoding buffer pointer is NULL.

Remarks

None.

Example

*// The following code snippet shows an example of scheduling a CDC Class
 // Driver Set Line Coding Request.*

```
USB_HOST_CDC_TRANSFER_HANDLE transferHandle;
USB_HOST_CDC_RESULT result;
USB_CDC_LINE_CODING * buffer;

result = USB_HOST_CDC_LineCodingSet(USB_HOST_CDC_0,
                                     &transferHandle, buffer);

if(USB_HOST_CDC_RESULT_OK != result)
{
    // Error handling here
}

// The completion of the set request can be tracked by using the
// USB_HOST_CDC_EVENT_SET_LINE_CODING_COMPLETE event.
```

5.9.9.4.1.6 USB_HOST_CDC_Read Function**C**

```
USB_HOST_CDC_RESULT USB_HOST_CDC_Read(
    USB_HOST_CDC_INDEX index,
    USB_HOST_CDC_TRANSFER_HANDLE * transferHandle,
    void * destination,
    size_t length
);
```

Description

This function reads data from the attached CDC device. The function will schedule a read transfer. If successful, the transferHandle parameter will contain a valid transfer handle, else it will contain [USB_HOST_CDC_TRANSFER_HANDLE_INVALID](#). When completed, the CDC class driver will generate a USB_HOST_CDC_EVENT_READ_COMPLETE event. Multiple read requests can be queued. In such a case, the transfer handle for each request will be unique.

Preconditions

None.

Parameters

Parameters	Description
index	CDC Class Driver Instance Index where the request should be scheduled.
transferHandle	Pointer to USB_HOST_CDC_TRANSFER_HANDLE type of a variable. This will contain a valid transfer handle if the request was successful.
dest	pointer to the buffer where the read data will be stored.
length	Amount of data to read (in bytes).

Returns

USB_HOST_CDC_RESULT_OK - The operation was successful. transferHandle will contain a valid transfer handle.
 USB_HOST_CDC_RESULT_ERROR_INSTANCE_INVALID - The specified instance does not exist.
 USB_HOST_CDC_RESULT_ERROR_TRANSFER_QUEUE_FULL - The transfer queue is full and the requested transfer cannot be scheduled.
 USB_HOST_CDC_RESULT_ERROR_INSTANCE_NOT_READY - The specified instance does not have a CDC device associated with it. This can happen if the attached device was disconnected or the read function was called with an CDC class driver instance that was not attached to a CDC device.
 USB_HOST_CDC_RESULT_ERROR_PARAMETER_INVALID - The destination buffer pointer is NULL or the length parameter is zero.

Remarks

None.

Example

*// The following code snippet shows an example of scheduling a CDC Class
 // Driver read. In this example, the class driver reads 64 bytes from the
 // attached device.*

```
USB_HOST_CDC_TRANSFER_HANDLE transferHandle;
USB_HOST_CDC_RESULT result;
uint8_t buffer[64];

result = USB_HOST_CDC_Read(USB_HOST_CDC_0, &transferHandle, buffer, 64);

if(USB_HOST_CDC_RESULT_OK != result)
{
    // Error handling here
}

// The completion of the read request can be tracked by using the
// USB_HOST_CDC_EVENT_READ_COMPLETE.
```

5.9.9.4.1.7 USB_HOST_CDC_SerialStateNotificationGet Function**C**

```
USB_HOST_CDC_RESULT USB_HOST_CDC_SerialStateNotificationGet(
    USB_HOST_CDC_INDEX index,
    USB_HOST_CDC_TRANSFER_HANDLE * transferHandle,
    USB_HOST_CDC_SERIAL_STATE_NOTIFICATION_DATA * dest
);
```

Description

This function requests serial state notification data from the attached CDC device. The function will schedule a read transfer over the CDC notification interface. If successful, the transferHandle parameter will contain a valid transfer handle, else it will contain [USB_HOST_CDC_TRANSFER_HANDLE_INVALID](#). When completed, the CDC class driver will generate a USB_HOST_CDC_EVENT_SERIAL_STATE_NOTIFICATION_RECEIVED event. Multiple get requests can be queued. In such a case, the transfer handle for each request will be unique.

Preconditions

None.

Parameters

Parameters	Description
index	CDC Class Driver Instance Index where the request should be scheduled.
transferHandle	Pointer to USB_HOST_CDC_TRANSFER_HANDLE type of a variable. This will contain a valid transfer handle if the request was successful.

dest	pointer to the buffer where the serial state notification data should be stored.

Returns

USB_HOST_CDC_RESULT_OK - The operation was successful. transferHandle will contain a valid transfer handle.
 USB_HOST_CDC_RESULT_ERROR_INSTANCE_INVALID - The specified instance does not exist.
 USB_HOST_CDC_RESULT_ERROR_TRANSFER_QUEUE_FULL - The transfer queue is full and the requested transfer cannot be scheduled.
 USB_HOST_CDC_RESULT_ERROR_INSTANCE_NOT_READY - The specified instance does not have a CDC device associated with it. This can happen if the attached device was disconnected or the get request was called with an CDC class driver instance that was not attached with a CDC device.
 USB_HOST_CDC_RESULT_ERROR_PARAMETER_INVALID - The source buffer pointer is NULL.

Remarks

None.

Example

*// The following code snippet shows an example of scheduling a CDC Class
 // Driver Serial State Notification Get function.*

```
USB_HOST_CDC_TRANSFER_HANDLE transferHandle;
USB_HOST_CDC_RESULT result;
USB_HOST_CDC_SERIAL_STATE_NOTIFICATION_DATA * buffer;

result = USB_HOST_CDC_SerialStateNotificationGet(USB_HOST_CDC_0,
                                                &transferHandle, buffer);

if(USB_HOST_CDC_RESULT_OK != result)
{
    // Error handling here
}

// The completion of the get request can be tracked by using the
// USB_HOST_CDC_EVENT_SERIAL_STATE_NOTIFICATION_RECEIVED.
```

5.9.9.4.1.8 USB_HOST_CDC_Write Function**C**

```
USB_HOST_CDC_RESULT USB_HOST_CDC_Write(
    USB_HOST_CDC_INDEX index,
    USB_HOST_CDC_TRANSFER_HANDLE * transferHandle,
    void * source,
    size_t length
);
```

Description

This function writes data to the attached CDC device. The function will schedule a write transfer. If successful, the transferHandle parameter will contain a valid transfer handle, else it will contain **USB_HOST_CDC_TRANSFER_HANDLE_INVALID**. When completed, the CDC class driver will generate a USB_HOST_CDC_EVENT_WRITE_COMPLETE event. Multiple write requests can be queued. In such a case, the transfer handle for each request will be unique.

Preconditions

None.

Parameters

Parameters	Description
index	CDC Class Driver Instance Index where the request should be scheduled.

transferHandle	Pointer to USB_HOST_CDC_TRANSFER_HANDLE type of a variable. This will contain a valid transfer handle if the request was successful.
source	pointer to the buffer containing data to be written to the device.
length	Amount of data to written (in bytes).

Returns

USB_HOST_CDC_RESULT_OK - The operation was successful. transferHandle will contain a valid transfer handle.
 USB_HOST_CDC_RESULT_ERROR_INSTANCE_INVALID - The specified instance does not exist.
 USB_HOST_CDC_RESULT_ERROR_TRANSFER_QUEUE_FULL - The transfer queue is full and the requested transfer cannot be scheduled.
 USB_HOST_CDC_RESULT_ERROR_INSTANCE_NOT_READY - The specified instance does not have a CDC device associated with it. This can happen if the attached device was disconnected or the write function was called with an CDC class driver instance that was not attached to a CDC device.
 USB_HOST_CDC_RESULT_ERROR_PARAMETER_INVALID - The source buffer pointer is NULL or the length parameter is zero.

Remarks

None.

Example

// The following code snippet shows an example of scheduling a CDC Class Driver Write. In this example, the class driver writes 64 bytes to the attached device.

```

USB_HOST_CDC_TRANSFER_HANDLE transferHandle;
USB_HOST_CDC_RESULT result;
uint8_t buffer[64];

result = USB_HOST_CDC_Write(USB_HOST_CDC_0, &transferHandle, buffer, 64);

if(USB_HOST_CDC_RESULT_OK != result)
{
    // Error handling here
}

// The completion of the write request can be tracked by using the
// USB_HOST_CDC_EVENT_WRITE_COMPLETE.
```

5.9.9.4.2 Data Types and Constants**Enumerations**

	Name	Description
	USB_HOST_CDC_EVENT	Identifies the possible events that the CDC Class Driver can generate.
	USB_HOST_CDC_RESULT	USB Host CDC Class Driver CDC Result enumeration.
	USB_HOST_CDC_TRANSFER_STATUS	USB Host CDC Class Driver Transfer Status enumeration.

Macros

	Name	Description
	USB_HOST_CDC_EVENT_RESPONSE_NONE	USB Host CDC Class Driver Event Handler Response Type None.
	USB_HOST_CDC_TRANSFER_HANDLE_INVALID	USB Host CDC Class Driver Invalid Transfer Handle Definition.

Structures

	Name	Description
	USB_HOST_CDC_EVENT_DATA_GET_LINE_CODING_COMPLETE	USB Host CDC Class Driver Event Data.
	USB_HOST_CDC_EVENT_DATA_READ_COMPLETE	USB Host CDC Class Driver Event Data.
	USB_HOST_CDC_EVENT_DATA_SEND_BREAK_COMPLETE	USB Host CDC Class Driver Event Data.
	USB_HOST_CDC_EVENT_DATA_SERIAL_STATE_NOTIFICATION_RECEIVED	USB Host CDC Class Driver Event Data.
	USB_HOST_CDC_EVENT_DATA_SET_CONTROL_LINE_STATE_COMPLETE	USB Host CDC Class Driver Event Data.
	USB_HOST_CDC_EVENT_DATA_SET_LINE_CODING_COMPLETE	USB Host CDC Class Driver Event Data.
	USB_HOST_CDC_EVENT_DATA_WRITE_COMPLETE	USB Host CDC Class Driver Event Data.

Types

	Name	Description
	USB_HOST_CDC_TRANSFER_HANDLE	USB Host CDC Class Driver Transfer Handle
	USB_HOST_CDC_EVENT_HANDLER	USB Host CDC Class Driver Event Handler Function Pointer Type.
	USB_HOST_CDC_EVENT_RESPONSE	USB Host CDC Class Driver Event Callback Response Type
	USB_HOST_CDC_INDEX	USB Host CDC Class Driver Index
	USB_HOST_CDC_SERIAL_STATE_NOTIFICATION_DATA	USB Host Serial State Notification Data Type.
	USB_HOST_CDC_CONTROL_LINE_STATE	USB Host Control Line State Data Type.

Description

5.9.9.4.2.1 USB_HOST_CDC_EVENT Enumeration

C

```
typedef enum {
    USB_HOST_CDC_EVENT_READ_COMPLETE,
    USB_HOST_CDC_EVENT_WRITE_COMPLETE,
    USB_HOST_CDC_EVENT_SERIAL_STATE_NOTIFICATION_RECEIVED,
    USB_HOST_CDC_EVENT_GET_LINE_CODING_COMPLETE,
    USB_HOST_CDC_EVENT_SET_LINE_CODING_COMPLETE,
    USB_HOST_CDC_EVENT_SET_CONTROL_LINE_STATE_COMPLETE,
    USB_HOST_CDC_EVENT_SEND_BREAK_COMPLETE,
    USB_HOST_CDC_EVENT_ATTACH,
    USB_HOST_CDC_EVENT_DETACH
} USB_HOST_CDC_EVENT;
```

Description

CDC Class Driver Events

This enumeration identifies the possible events that the CDC Class Driver can generate. The application should register an event handler using the [USB_HOST_CDC_EventHandlerSet\(\)](#) function to receive CDC Class Driver events.

An event may have data associated with it. Events that are generated due to a transfer of data between the host and device are accompanied by data structures that provide the status of the transfer termination. For example, the

USB_HOST_CDC_EVENT_SET_LINE_CODING_COMPLETE event is accompanied by a pointer to a [USB_HOST_CDC_EVENT_DATA_SET_LINE_CODING_COMPLETE](#) data structure. The transferStatus member of this data structure indicates the success or failure of the transfer. A transfer may fail due to device not responding on the bus, if the device stalls any stages of the transfer or due to NAK timeouts. The event description provides details on the nature of the event and the data that is associated with the event.

The following code snippet shows an example event handling scheme for

```
// This code snippet shows an example event handling scheme for
// CDC Class Driver events.
```

```
USB_HOST_CDC_EVENT_RESPONSE APP_USBHostCDCEventHandler
(
    USB_HOST_CDC_INDEX index,
    USB_HOST_CDC_EVENT event,
    void * eventData,
    uintptr_t context
)
{
    uint8_t deviceAddress;

```

Members

Members	Description
USB_HOST_CDC_EVENT_READ_COMPLETE	This event occurs when a CDC Class Driver Read operation has completed i.e when the data has been received from the connected CDC device. This event is generated after the application calls the USB_HOST_CDC_Read() function. The eventData parameter in the event call back function will be of a pointer to a USB_HOST_CDC_EVENT_DATA_READ_COMPLETE structure. This contains details about the transfer handle associated with this read request, the amount of data read and the termination status of the read request.
USB_HOST_CDC_EVENT_WRITE_COMPLETE	This event occurs when a CDC Class Driver Write operation has completed i.e when the data has been written to the connected CDC device. This event is generated after the application calls the USB_HOST_CDC_Write() function. The eventData parameter in the event call back function will be of a pointer to a USB_HOST_CDC_EVENT_DATA_WRITE_COMPLETE structure. This contains details about the transfer handle associated with this write request, the amount of data written and the termination status of the write request.

USB_HOST_CDC_EVENT_SERIAL_STATE_NOTIFICATION_RECEIVED	This event occurs when a CDC Class Driver Serial State Notification Get operation has completed. This event is generated after the application calls the USB_HOST_CDC_SerialStateNotificationGet() and the device sends a serial state notification to the host. The eventData parameter in the event call back function will be of a pointer to a USB_HOST_CDC_EVENT_DATA_SERIAL_STATE_NOTIFICATION_RECEIVED structure. This contains details about the transfer handle associated with this request, the amount of data received and the termination status of the get request.
USB_HOST_CDC_EVENT_GET_LINE_CODING_COMPLETE	This event occurs when a CDC Class Driver Get Line Coding request has completed. This event is generated after the application calls the USB_HOST_CDC_LineCodingGet() function and the device sends the line coding to the host. The eventData parameter in the event call back function will be of a pointer to a USB_HOST_CDC_EVENT_DATA_GET_LINE_CODING_COMPLETE structure. This contains details about the transfer handle associated with this request, the amount of data received and the termination status of the get request.
USB_HOST_CDC_EVENT_SET_LINE_CODING_COMPLETE	This event occurs when a CDC Class Driver Set Line Coding request has completed. This event is generated after the application calls the USB_HOST_CDC_LineCodingSet() function and the device either acknowledged or stalled the request. The eventData parameter in the event call back function will be of a pointer to a USB_HOST_CDC_EVENT_DATA_SET_LINE_CODING_COMPLETE structure. This contains details about the transfer handle associated with this request, the amount of data sent and the termination status of the set request.
USB_HOST_CDC_EVENT_SET_CONTROL_LINE_STATE_COMPLETE	This event occurs when a CDC Class Driver Set Control Line State request has completed. This event is generated after the application calls the USB_HOST_CDC_ControlLineStateSet() function and the device has either acknowledged or stalled the request. The eventData parameter in the event call back function will be of a pointer to a USB_HOST_CDC_EVENT_DATA_SET_CONTROL_LINE_STATE_COMPLETE structure. This contains details about the transfer handle associated with this request, the amount of data sent and the termination status of the set request.

USB_HOST_CDC_EVENT_SEND_BREAK_COMPLETE	This event occurs when a CDC Class Driver Send Break request has completed. This event is generated after the application calls the USB_HOST_CDC_BreakSend() function and the device has either acknowledged or stalled the request. The eventData parameter in the event call back function will be of a pointer to a USB_HOST_CDC_EVENT_DATA_SET_CONTROL_LINE_STATE_COMPLETE structure. This contains details about the transfer handle associated with this request, the amount of data sent and the termination status of the set request.
USB_HOST_CDC_EVENT_ATTACH	This event occurs when the host layer has successfully attached the CDC Class Driver instance to the attached USB CDC device. The event also indicates that the class driver is fully initialized and is ready to accept command and data transfer requests from the application. The eventData parameter should be interpreted as a <code>uint8_t</code> pointer to the device address.
USB_HOST_CDC_EVENT_DETACH	This event occurs when host layer has detached the CDC class driver instance from a USB CDC device. This can happen if the device itself was detached, or if the device configuration was changed. There is no event data associated with this event.

Remarks

None.

5.9.9.4.2.2 USB_HOST_CDC_RESULT Enumeration

C

```
typedef enum {
    USB_HOST_CDC_RESULT_OK,
    USB_HOST_CDC_RESULT_ERROR_TRANSFER_QUEUE_FULL,
    USB_HOST_CDC_RESULT_ERROR_INSTANCE_INVALID,
    USB_HOST_CDC_RESULT_ERROR_INSTANCE_NOT_READY,
    USB_HOST_CDC_RESULT_ERROR_PARAMETER_INVALID
} USB_HOST_CDC_RESULT;
```

Description

USB Host CDC Class Driver Result enumeration.

This enumeration lists the possible USB Host CDC Class Driver operation results. These values are returned by CDC Class Driver functions.

Members

Members	Description
USB_HOST_CDC_RESULT_OK	The operation was successful

5.9.9.4.2.3 USB_HOST_CDC_TRANSFER_HANDLE Type

C

```
typedef uintptr_t USB_HOST_CDC_TRANSFER_HANDLE;
```

Description

USB Host CDC Class Driver Transfer Handle

This is returned by the CDC Class driver command and data transfer routines and should be used by the application to track the transfer especially in cases where transfers are queued.

Remarks

None.

5.9.9.4.2.4 USB_HOST_CDC_EVENT_DATA_GET_LINE_CODING_COMPLETE Structure

C

```
typedef struct {
    USB_HOST_CDC_TRANSFER_HANDLE transferHandle;

size_t length;	Amount of data transferred

Remarks

None.

5.9.9.4.2.11 USB_HOST_CDC_EVENT_HANDLER Type

C

```
typedef USB_HOST_CDC_EVENT_RESPONSE (* USB_HOST_CDC_EVENT_HANDLER)(USB_HOST_CDC_INDEX index,
    USB_HOST_CDC_EVENT event, void * eventData, uintptr_t context);
```

Description

USB Host CDC Class Driver Event Handler Function Pointer Type.

This data type defines the required function signature of the USB Host CDC Class Driver event handling callback function. The application must register a pointer to a CDC Class Driver events handling function whose function signature (parameter and return value types) match the types specified by this function pointer in order to receive event call backs from the CDC Class

Driver. The class driver will invoke this function with event relevant parameters. The description of the event handler function parameters is given here.

instanceIndex - Instance index of the CDC Class Driver that generated the event.

event - Type of event generated.

eventData - This parameter should be type casted to a event specific pointer type based on the event that has occurred. Refer to the [USB_HOST_CDC_EVENT](#) enumeration description for more details.

context - Value identifying the context of the application that was registered along with the event handling function.

Remarks

None.

5.9.9.4.2.12 USB_HOST_CDC_EVENT_RESPONSE Type**C**

```
typedef void USB_HOST_CDC_EVENT_RESPONSE;
```

Description

USB Host CDC Class Driver Event Handler Response Type

This is the return type of the CDC Class Driver event handler.

Remarks

None.

5.9.9.4.2.13 USB_HOST_CDC_INDEX Type**C**

```
typedef uintptr_t USB_HOST_CDC_INDEX;
```

Description

USB Host CDC Class Driver Index

This uniquely identifies a CDC Class Driver instance.

Remarks

None.

5.9.9.4.2.14 USB_HOST_CDC_SERIAL_STATE_NOTIFICATION_DATA Type**C**

```
typedef USB_CDC_SERIAL_STATE USB_HOST_CDC_SERIAL_STATE_NOTIFICATION_DATA;
```

Description

USB Host CDC Serial State Notification Data Type.

This defines the data type for the CDC Serial State. This data is requested from the device over the CDC notification interface.

Remarks

None.

5.9.9.4.2.15 USB_HOST_CDC_TRANSFER_STATUS Enumeration

C

```
typedef enum {
    USB_HOST_CDC_TRANSFER_STATUS_OK,
    USB_HOST_CDC_TRANSFER_STATUS_ERROR
} USB_HOST_CDC_TRANSFER_STATUS;
```

Description

USB Host CDC Class Driver Transfer Status.

This enumeration lists the possible termination status of CDC class driver transfers. This information is a part of the event data that is returned along with transfer related events.

Members

Members	Description
USB_HOST_CDC_TRANSFER_STATUS_OK	The transfer completed successfully. In case of read transfers, either the requested amount of data was received or the device sent less data
USB_HOST_CDC_TRANSFER_STATUS_ERROR	The transfer terminated due to an error. The error could be due to device malfunction on the bus, a NAK timeout occurred or the device stalled the request

Remarks

None.

5.9.9.4.2.16 USB_HOST_CDC_EVENT_RESPONSE_NONE Macro

C

```
#define USB_HOST_CDC_EVENT_RESPONSE_NONE
```

Description

USB Host CDC Class Driver Event Handler Response None

This is the definition of the CDC Class Driver Event Handler Response Type none.

Remarks

Intentionally defined to be empty.

5.9.9.4.2.17 USB_HOST_CDC_TRANSFER_HANDLE_INVALID Macro

C

```
#define USB_HOST_CDC_TRANSFER_HANDLE_INVALID ((USB_HOST_CDC_TRANSFER_HANDLE) (-1))
```

Description

USB Host CDC Class Driver Invalid Transfer Handle Definition

This definition defines a USB Host CDC Class Driver Invalid Transfer Handle. A Invalid Transfer Handle is returned by the CDC Class Driver data and command transfer routines when the request was not successful.

Remarks

None.

5.9.9.4.2.18 USB_HOST_CDC_CONTROL_LINE_STATE Type

C

```
typedef USB_CDC_CONTROL_LINE_STATE USB_HOST_CDC_CONTROL_LINE_STATE;
```

Description

USB Host CDC Control Line State Data Type.

This defines the data type for the CDC Control Line State. This data is requested from the device over the CDC control interface.

Remarks

None.

5.9.9.5 Files

Files

Name	Description
usb_host_cdc.h	USB Host CDC Class Driver Interface Header

Description

5.9.9.5.1 usb_host_cdc.h

USB Host CDC Class Driver Interface Definition

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the USB Host CDC Class Driver.

Enumerations

	Name	Description
	USB_HOST_CDC_EVENT	Identifies the possible events that the CDC Class Driver can generate.
	USB_HOST_CDC_RESULT	USB Host CDC Class Driver CDC Result enumeration.
	USB_HOST_CDC_TRANSFER_STATUS	USB Host CDC Class Driver Transfer Status enumeration.

Functions

	Name	Description
	USB_HOST_CDC_BreakSend	This function sends a request to the attached to update it's break duration.
	USB_HOST_CDC_ControlLineStateSet	This function sets the state of the control line connecting the host to the device.
	USB_HOST_CDC_EventHandlerSet	This class registers a event handler for the specified CDC class driver instance.
	USB_HOST_CDC_LineCodingGet	This function requests line coding from the attached CDC device.
	USB_HOST_CDC_LineCodingSet	This function sets the line coding of the attached CDC device.
	USB_HOST_CDC_Read	This function reads data from the attached CDC device.
	USB_HOST_CDC_SerialStateNotificationGet	This function requests serial state noitification data from the attached CDC device.
	USB_HOST_CDC_Write	This function writes data to the attached CDC device.

Macros

	Name	Description
	<u>USB_HOST_CDC_EVENT_RESPONSE_NONE</u>	USB Host CDC Class Driver Event Handler Response Type None.
	<u>USB_HOST_CDC_TRANSFER_HANDLE_INVALID</u>	USB Host CDC Class Driver Invalid Transfer Handle Definition.

Structures

	Name	Description
	<u>USB_HOST_CDC_EVENT_DATA_GET_LINE_CODING_COMPLETE</u>	USB Host CDC Class Driver Event Data.
	<u>USB_HOST_CDC_EVENT_DATA_READ_COMPLETE</u>	USB Host CDC Class Driver Event Data.
	<u>USB_HOST_CDC_EVENT_DATA_SEND_BREAK_COMPLETE</u>	USB Host CDC Class Driver Event Data.
	<u>USB_HOST_CDC_EVENT_DATA_SERIAL_STATE_NOTIFICATION_RECEIVED</u>	USB Host CDC Class Driver Event Data.
	<u>USB_HOST_CDC_EVENT_DATA_SET_CONTROL_LINE_STATE_COMPLETE</u>	USB Host CDC Class Driver Event Data.
	<u>USB_HOST_CDC_EVENT_DATA_SET_LINE_CODING_COMPLETE</u>	USB Host CDC Class Driver Event Data.
	<u>USB_HOST_CDC_EVENT_DATA_WRITE_COMPLETE</u>	USB Host CDC Class Driver Event Data.

Types

	Name	Description
	<u>USB_HOST_CDC_CONTROL_LINE_STATE</u>	USB Host Control Line State Data Type.
	<u>USB_HOST_CDC_EVENT_HANDLER</u>	USB Host CDC Class Driver Event Handler Function Pointer Type.
	<u>USB_HOST_CDC_EVENT_RESPONSE</u>	USB Host CDC Class Driver Event Callback Response Type
	<u>USB_HOST_CDC_INDEX</u>	USB Host CDC Class Driver Index
	<u>USB_HOST_CDC_SERIAL_STATE_NOTIFICATION_DATA</u>	USB Host Serial State Notification Data Type.
	<u>USB_HOST_CDC_TRANSFER_HANDLE</u>	USB Host CDC Class Driver Transfer Handle

File Name

6 Third-Party Library Help

6.1 Third-Party Library Overview

6.1.1 Introduction

This topic provides an overview of the Third-Party Libraries in MPLAB Harmony.

Description

Note: This information was not available at time of release and will be added in a future release of MPLAB Harmony.

6.1.2 Release Notes

MPLAB Harmony Version: v0.70b **Release Date:** 18Nov2013

New This Release:

Nothing to report in this release.

Known Issues:

Nothing to report in this release.

6.1.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

7 Board Support Packages Help

7.1 Board Support Packages Overview

7.1.1 Introduction

This topic provides information for the Board Support Package (BSP) in MPLAB Harmony.

Description

A Board Support Package (BSP) provides code and configuration items necessary to support board-specific hardware. A BSP may be provided for Microchip development or demo boards or may be defined by customers for their own boards (which is recommended to make it easy to support multiple boards in the future, even if only a single board exists when a project is first created).

A BSP may contain a board-specific configuration header ("[bsp_config.h](#)" and possibly others), a board-specific system initialization file ("[bsp_sys_init.c](#)"), a file containing board-specific ISR implementations ("[bsp_sys_int.c](#)"), a board-specific system "tasks" routine (implemented in a "[bsp_sys_tasks.c](#)" file), and even board-specific driver implementations (each with its own directory).

Everything that is contained within a BSP can be either used by or replaced by application-specific items if desired. For example, the application may configure the system initialization routine ("[SYS_Initialize](#)") to directly call a board-specific initialization routine (called "[BSP_Initialize](#)") or it can use the BSP-specific initialization routine as an example from which to start developing application-specific board initialization code. Normally, Microchip demo applications will use the BSP code directly to avoid duplication of board-specific code.

7.1.2 Configuration

This topic describes the BSP configuration header options.

Description

A BSP configuration header defines configuration options that are "fixed" by the board. That is, any option that cannot be changed unless the hardware on the board is changed may be defined in a BSP's "[bsp_config.h](#)" file (or in a file included by it). This will normally include board parameters such as the oscillator frequency for a fixed-frequency oscillator or convenient names by which board-specific features may be identified (such as which pins [connect](#) to switches or LEDs). It may also include options for libraries and drivers that can be used by an application running on that board that are "fixed" by the hardware on the board. However, it may not define all options necessary for a library, only the board-specific options. Application-specific headers may include BSP-specific headers to define the board-hardware-specific options or it may define them itself, thus overriding a BSP's options.

7.1.3 Board Drivers

This topic describes the board drivers of the BSP.

Description

Some peripheral hardware may not be directly built into the microcontroller. For example, devices such as external CODECs, EEPROMs, etc, may be built onto a board and will not be available as peripherals in the microcontroller. Devices such as these still need device drivers and these drivers still need to follow the MPLAB harmony driver architecture. However, they will not normally be provided as part of the standard MPLAB Harmony driver set for Microchip microcontrollers. Instead, all files related to drivers for devices mounted on Microchip demo and development boards will be contained within the "bsp/drivers" directory. They will otherwise, follow the same rules as all other MPLAB Harmony device drivers.

7.1.4 System Initialization

This topic describes BSP system initialization.

Description

Normally, an application will define or configure the "[SYS_Initialize](#)" routine in any way that is necessary to initialize the system as desired. However, board-specific initialization may be necessary. When it is, a BSP must implement a board-specific initialization routine called "[BSP_Initialize](#)" that performs any necessary low-level board initialization necessary to support normal system operation. The "[BSP_Initialize](#)" routine may have an associated "initialization" structure, a pointer to which may be passed in as a parameter, to define any application-specific parameters necessary to initialize any low-level board hardware. Low-level board hardware may be things like power subsystems, bus enable signals, or other items necessary for basic board operations. It should not include the initialization of board-specific drivers as that is done separately. However, a BSP may define initialization data used to initialize board-specific drivers if that data is "fixed" by the board.

7.1.5 ISR Implementation

This topic describes BSP ISR implementation.

Description

Like the [SYS_Initialize](#) routine, an ISR may be implemented by an application in any way necessary to support the desired system behavior. Unlike the initialization support, a BSP-specific ISR implementation should never be called by the application-specific ISR implementation. It must either be used exactly as defined by the BSP or the application's system interrupt support must define its own ISR implementation. If the application defines its own implementation, the BSP ISR can be used as an example.

7.2 Explorer 16 PIC32MX795F512L BSP Library

7.2.1 Introduction

Explorer 16 PIC32MX795F512L BSP Library

for

Microchip Microcontrollers

This library provides a low-level abstraction of the Explorer 16 PIC32MX795F512L BSP Library that is available on the Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, thereby hiding differences from one microcontroller variant to another.

Description

Note: This information was not available at time of release and will be added in a future release of MPLAB Harmony.

7.2.2 Release Notes

MPLAB Harmony Version: v0.70b **Explorer 16 PIC32MX795F512L BSP Library Version :** 0.51.03b **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

7.2.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS

BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

7.2.4 Using the Library

This topic describes the basic architecture of the Explorer 16 PIC32MX795F512L BSP Library and provides information and examples on how to use it.

Interface Header File: [bsp_config.h](#)

The interface to the Explorer 16 PIC32MX795F512L BSP library is defined in the "[bsp_config.h](#)" header file. Any C language source (.c) file that uses the Explorer 16 PIC32MX795F512L BSP library should include "[bsp_config.h](#)".

7.2.4.1 Library Overview

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the Explorer 16 PIC32MX795F512L BSP Library module.

Library Interface Section	Description
Initialization Functions	This section provides initialization functions.
LED Control Functions	This section provides functions for LED Control.
Other Functions	This section provides additional functions for this API.
Data Types and Constants	This section provides various definitions describing this API.

7.3 PIC32 USB Starter Kit II BSP Library

7.3.1 Introduction

PIC32 USB Starter Kit II BSP Library

for

Microchip Microcontrollers

This library provides a low-level abstraction of the PIC32 USB Starter Kit II Library that is available on the Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, there by hiding differences from one microcontroller variant to another.

Description

Note: This information was not available at time of release and will be added in a future release of MPLAB Harmony.

7.3.2 Release Notes

MPLAB Harmony Version: v0.70b **PIC32 USB Starter Kit II BSP Library Version :** 0.51.03b **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

7.3.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

7.3.4 Using the Library

This topic describes the basic architecture of the PIC32 USB Starter Kit II BSP Library and provides information and examples on how to use it.

Interface Header File: [bsp_config.h](#)

The interface to the PIC32 USB Starter Kit II BSP Library is defined in the "[bsp_config.h](#)" header file. Any C language source (.c) file that uses the PIC32 USB Starter Kit II BSP Library should include "[bsp_config.h](#)".

7.3.4.1 Library Overview

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the PIC32 USB Starter Kit II Library module.

Library Interface Section	Description
Initialization Functions	This section provides initialization functions.
LED Control Functions	This section provides functions for LED Control.
Other Functions	This section provides additional functions for this API.
Data Types and Constants	This section provides various definitions describing this API.

7.4 PIC32MX USB Audio BSP Library

7.4.1 Introduction

PIC32MX USB Audio BSP Library
for
Microchip Microcontrollers

This library provides a low-level abstraction of the PIC32MX USB Audio BSP Library that is available on the Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, there by hiding differences from one microcontroller variant to another.

Description

Note: This information was not available at time of release and will be provided in a future release of MPLAB Harmony.

7.4.2 Release Notes

MPLAB Harmony Version: v0.70b **PIC32MX USB Audio BSP Library Version :** 0.51.03b **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

7.4.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR

CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

7.4.4 Using the Library

This topic describes the basic architecture of the PIC32MX USB Audio BSP Library and provides information and examples on how to use it.

Interface Header File: [bsp_config.h](#)

The interface to the PIC32MX USB Audio BSP Library is defined in the "[bsp_config.h](#)" header file. Any C language source (.c) file that uses the PIC32MX USB Audio BSP Library should include "[bsp_config.h](#)".

7.4.4.1 Library Overview

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the PIC32MX USB Audio BSP Library module.

Library Interface Section	Description
Initialization Functions	This section provides initialization functions.
LED Control Functions	This section provides functions for LED Control.
Other Functions	This section provides additional functions for this API.
Data Types and Constants	This section provides various definitions describing this API.

7.5 PIC32MZ Embedded Connectivity (EC) Starter Kit BSP Library

7.5.1 Introduction

**PIC32MZ Embedded Connectivity (EC) Starter Kit BSP Library
for
Microchip Microcontrollers**

This library provides a low-level abstraction of the PIC32MZ Embedded Connectivity (EC) Starter Kit BSP Library that is available on the Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, thereby hiding differences from one microcontroller variant to another.

Description

Note: This information was not available at time of release and will be added in a future release of MPLAB Harmony.

7.5.2 Release Notes

MPLAB Harmony Version: v0.70b **PIC32MZ Embedded Connectivity (EC) Starter Kit BSP Library Version :** 0.51.03b
Release Date: 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

7.5.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY,

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

7.5.4 Using the Library

This topic describes the basic architecture of the PIC32MZ Embedded Connectivity (EC) Starter Kit BSP Library and provides information and examples on how to use it.

Interface Header File: [bsp_config.h](#)

The interface to the PIC32MZ Embedded Connectivity (EC) Starter Kit BSP Library is defined in the "[bsp_config.h](#)" header file. Any C language source (.c) file that uses the PIC32MZ Embedded Connectivity (EC) Starter Kit BSP Library should include "[bsp_config.h](#)".

7.5.4.1 Library Overview

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the PIC32MZ Embedded Connectivity (EC) Starter Kit BSP Library module.

Library Interface Section	Description
Initialization Functions	This section provides initialization functions.
LED Control Functions	This section provides functions for LED Control.
Other Functions	This section provides additional functions for this API.
Data Types and Constants	This section provides various definitions describing this API.

7.6 Library Interface

7.6.1 Initialization Functions

Functions

	Name	Description
	BSP_Initialize	Performs the necessary actions to initialize a board

Description

7.6.1.1 BSP_Initialize Function

C

```
void BSP_Initialize();
```

Description

This routine performs the neccessary actions to initialize a board

Preconditions

None

Returns

None

7.6.2 LED Control Functions

Functions

	Name	Description
	BSP_SwitchOFFLED	Turns OFF specified LED on the board.
	BSP_SwitchONLED	Turns ON specified LED on the board.
	BSP_ToggleLED	Toggles specified LED on the board.
	BSP_SwitchToggleLED	Toggles the onboard LED.

Description

7.6.2.1 BSP_SwitchOFFLED Function

C

```
void BSP_SwitchOFFLED(  
    BSP_LED led  
);
```

Description

This function turns OFF specified LED on the board.

Preconditions

BSP should be initialized by calling void [BSP_Initialize](#)(void) function.

Parameters

Parameters	Description
led	LED ID as specified by BSP_LED enum.

Returns

None

7.6.2.2 BSP_SwitchONLED Function

C

```
void BSP_SwitchONLED(  
    BSP_LED led  
);
```

Description

This function turns ON specified LED on the board.

Preconditions

BSP should be initialized by calling void [BSP_Initialize](#)(void) function.

Parameters

Parameters	Description
led	LED ID as specified by BSP_LED enum.

Returns

None

7.6.2.3 BSP_ToggleLED Function

C

```
void BSP_ToggleLED(  
    BSP_LED led  
);
```

Description

This function Toggles specified LED on the board.

Preconditions

BSP should be initialized by calling void [BSP_Initialize](#)(void) function.

Parameters

Parameters	Description
led	LED ID as specified by BSP_LED enum.

Returns

None

7.6.2.4 BSP_SwitchToggleLED Function

C

```
void BSP_SwitchToggleLED(  
    BSP_LED led  
);
```

Description

This routine toggles the onboard LED.

7.6.3 Other Functions

Functions

	Name	Description
	SYSTEMConfigPerformance	Configures the system cache and flash wait states for maximum performance.
	BSP_ReadCoreTimer	Returns the current core timer value.
	BSP_ReadSwitch	Reads the switch state.

Description

7.6.3.1 SYSTEMConfigPerformance Function

C

```
unsigned int SYSTEMConfigPerformance(  
    unsigned int sys_clock  
);
```

Description

This function configures the system cache and flash wait states for maximum performance.

Preconditions

None

Parameters

Parameters	Description
sys_clock	Value of system clock

7.6.3.2 BSP_ReadCoreTimer Function

C

```
uint32_t BSP_ReadCoreTimer();
```

Description

Returns the current core timer value.

Preconditions

None

7.6.3.3 BSP_ReadSwitch Function

C

```
BSP_SWITCH_STATE BSP_ReadSwitch(  
    BSP_SWITCH bspSwitch  
);
```

Description

Reads the switch state.

Preconditions

None

Parameters

Parameters	Description
bspSwitch	Switch ID as specified by BSP_SWITCH enum.

Return Values

Return Values	Description
BSP_SWITCH_STATE_PRESSED	Switch is pressed.
BSP_SWITCH_STATE_RELEASED	Switch is not pressed.

7.6.4 Data Types and Constants

Enumerations

	Name	Description
	BSP_LED	Holds LED numbers.
	BSP_SWITCH	Holds Switch numbers.
	BSP_SWITCH_STATE	Holds Switch status.

Macros

	Name	Description
	<u>BSP_ANALOG_PIN</u>	Defines the constant which identifies analog pin
	<u>BSP_DIGITAL_PIN</u>	Defines the constant which identifies digital pin
	<u>BSP_INPUT</u>	Defines the constant which identifies input
	<u>BSP_OUTPUT</u>	Defines the constant which identifies output

Description

7.6.4.1 BSP_ANALOG_PIN Macro

C

```
#define BSP_ANALOG_PIN PORTS_PIN_MODE_ANALOG
```

Description

analog Pin Constant

This constant identifies analog pin

7.6.4.2 BSP_DIGITAL_PIN Macro

C

```
#define BSP_DIGITAL_PIN PORTS_PIN_MODE_DIGITAL
```

Description

Digital Pin Constant

This constant identifies digital pin

7.6.4.3 BSP_INPUT Macro

C

```
#define BSP_INPUT 1
```

Description

Input Constant

This constant identifies input

7.6.4.4 BSP_OUTPUT Macro

C

```
#define BSP_OUTPUT 0
```

Description

Output Constant

This constant identifies output

7.6.4.5 BSP_LED Enumeration

C

```
typedef enum {
    LED_3 = PORTS_BIT_POS_0,
    LED_4 = PORTS_BIT_POS_1,
    LED_5 = PORTS_BIT_POS_2,
    LED_6 = PORTS_BIT_POS_3,
    LED_7 = PORTS_BIT_POS_4,
    LED_8 = PORTS_BIT_POS_5,
    LED_9 = PORTS_BIT_POS_6,
    LED_10 = PORTS_BIT_POS_7
} BSP_LED;
```

Description

LED Number.

This enumeration defines the LED numbers.

Members

Members	Description
LED_3 = PORTS_BIT_POS_0	LED 3
LED_4 = PORTS_BIT_POS_1	LED 4
LED_5 = PORTS_BIT_POS_2	LED 5
LED_6 = PORTS_BIT_POS_3	LED 6
LED_7 = PORTS_BIT_POS_4	LED 7
LED_8 = PORTS_BIT_POS_5	LED 8
LED_9 = PORTS_BIT_POS_6	LED 9
LED_10 = PORTS_BIT_POS_7	LED 10

Remarks

None.

7.6.4.6 BSP_SWITCH Enumeration

C

```
typedef enum {
    SWITCH_3 = PORTS_BIT_POS_6,
    SWITCH_4 = PORTS_BIT_POS_13,
    SWITCH_5 = PORTS_BIT_POS_7,
    SWITCH_6 = PORTS_BIT_POS_7
} BSP_SWITCH;
```

Description

BSP Switch.

This enumeration defines the Switch numbers.

Members

Members	Description
SWITCH_3 = PORTS_BIT_POS_6	SWITCH 3
SWITCH_4 = PORTS_BIT_POS_13	SWITCH 4
SWITCH_5 = PORTS_BIT_POS_7	SWITCH 5
SWITCH_6 = PORTS_BIT_POS_7	SWITCH 6

Remarks

None.

7.6.4.7 BSP_SWITCH_STATE Enumeration

C

```
typedef enum {  
    BSP_SWITCH_STATE_PRESSED = 0,  
    BSP_SWITCH_STATE_RELEASED = 1  
} BSP_SWITCH_STATE;
```

Description

BSP Switch state.

This enumeration defines the switch state.

Members

Members	Description
BSP_SWITCH_STATE_PRESSED = 0	Switch pressed
BSP_SWITCH_STATE_RELEASED = 1	Switch not pressed

Remarks

None.

7.7 Files

Files

Name	Description
bsp_config.h	Board support configuration file.

Description

7.7.1 bsp_config.h

Board support configuration file.

This contains all the configuration that is required to be done for the application running on PIC32 USB starter kit

Enumerations

	Name	Description
	BSP_LED	Holds LED numbers.
	BSP_SWITCH	Holds Switch numbers.
	BSP_SWITCH_STATE	Holds Switch status.

Functions

	Name	Description
	BSP_Initialize	Performs the necessary actions to initialize a board
	BSP_ReadCoreTimer	Returns the current core timer value.
	BSP_ReadSwitch	Reads the switch state.
	BSP_SwitchOFFLED	Turns OFF specified LED on the board.
	BSP_SwitchONLED	Turns ON specified LED on the board.
	BSP_SwitchToggleLED	Toggles the onboard LED.
	BSP_ToggleLED	Toggles specified LED on the board.
	SYSTEMConfigPerformance	Configures the system cache and flash wait states for maximum performance.

Macros

	Name	Description
	BSP_ANALOG_PIN	Defines the constant which identifies analog pin
	BSP_DIGITAL_PIN	Defines the constant which identifies digital pin
	BSP_INPUT	Defines the constant which identifies input
	BSP_OUTPUT	Defines the constant which identifies output

8 Symbol Reference

8.1 Macros

Macros

	Name	Description
	DRV_ETHMAC_INDEX_0	Ethernet driver index definitions.
	DRV_ETHMAC_INDEX_COUNT	Number of valid Ethernet driver indices.

8.1.1 DRV_ETHMAC_INDEX_0 Macro

C

```
#define DRV_ETHMAC_INDEX_0 0
```

Description

Ethernet Driver Module Index Numbers

These constants provide Ethernet driver index definitions.

Remarks

These constants should be used in place of hard-coded numeric literals.

These values should be passed into the DRV_ETHMAC_Initialize and DRV_ETHMAC_Open routines to identify the driver instance in use.

8.1.2 DRV_ETHMAC_INDEX_COUNT Macro

C

```
#define DRV_ETHMAC_INDEX_COUNT ETH_NUMBER_OF_MODULES
```

Description

Ethernet Driver Module Index Count

This constant identifies number of valid Ethernet driver indices.

Remarks

This constant should be used in place of hard-coded numeric literals.

This value is derived from part-specific header files defined as part of the peripheral libraries.
