Create a N-element Kaiser Window, and store the output to OutWindow. Operations are performed at higher resolution floating point, and rounded for the most accuracy possible. Output values are in Q15 fractional format. The Kaiser Window follows the equation:

Window(n) = 0.402 - 0.498 * COS(2*Pi*n/N) + 0.098 * cos(4*Pi*n/N) + 0.001 * cos(6*Pi*n/N) where n is the window sample number N is the total number of samples

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int16_t)
N	number of samples (int)

Returns

None.

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library. The functional window is an intermediate result that needs to be multiplied by an input vector prior to FFT processing. Because of significant processing time the window need only be computed once and the multiply of the (window * input) vector done during recurring loop processing.

Example**5.4.1.5.4.29 DSP_TransformWinInit_Kaiser32 Function****C**

```
void DSP_TransformWinInit_Kaiser32(
    int32_t * OutWindow,
    int N
);
```

Description

Function DSP_TransformWinInit_Kaiser32:

```
void DSP_TransformWinInit_Kaiser32(int32_t *OutWindow, int N);
```

Create a N-element Kaiser Window, and store the output to OutWindow. Operations are performed at higher resolution floating point, and rounded for the most accuracy possible. Output values are in Q31 fractional format. The Kaiser Window follows the equation:

Window(n) = 0.402 - 0.498 * COS(2*Pi*n/N) + 0.098 * cos(4*Pi*n/N) + 0.001 * cos(6*Pi*n/N) where n is the window sample number N is the total number of samples

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int32_t)
N	number of samples (int)

Returns

None.

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library. The functional window is an intermediate result that needs to be multiplied by an input vector prior to FFT processing. Because of significant processing time the window need only be computed once and the multiply of the (window * input) vector done during recurring loop processing.

Example**5.4.1.5.5 Vector Math Functions****5.4.1.5.5.1 DSP_VectorAbs16 Function****C**

```
void DSP_VectorAbs16(
    int16_t * outdata,
    int16_t * indata,
    int N
);
```

Description

Function DSP_VectorAbs16:

```
void DSP_VectorAbs16(int16_t *outdata, int16_t *indata, int N);
```

Computes the absolute value of each element of indata and stores it to outdata. The number of samples to process is given by the parameter N. Data is in a Q15 fractional format. outdata[i] filled with the absolute value of elements of indata

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to eight and a multiple of eight.

Parameters

Parameters	Description
outdata	pointer to output array of 16-bit elements (int16_t)
indata	pointer to input array of 16-bit elements (int16_t)
N	number of samples (int)

Returns

None.

Remarks

This must be assembled with .set microMIPS.

Example

```
int16_t *pOutdata;
int16_t outVal[8];
int16_t inBufTest[16] = {-5, 2, -3, 4, -1, 0, -2, -8, -21, 21, 10, 100, 200, 127, -127, -2};
int Num = 8;

pOutdata = &outVal;

DSP_VectorAbs16(pOutdata, inBufTest, Num);

// outVal[i] = {5, 2, 3, 4, 1, 0, 2, 8}
```

5.4.1.5.5.2 DSP_VectorAbs32 Function**C**

```
void DSP_VectorAbs32(
    int32_t * outdata,
    int32_t * indata,
```

```
    int N
);
```

Description

Function DSP_VectorAbs32:

```
void DSP_VectorAbs32(int32_t *outdata, int32_t *indata, int N);
```

Computes the absolute value of each element of indata and stores it to outdata. The number of samples to process is given by the parameter N. Data is in a Q31 fractional format. outdata[i] filled with N elements of abs(indata[i])

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to eight and a multiple of eight.

Parameters

Parameters	Description
outdata	pointer to output array of 16-bit elements (int32_t)
indata	pointer to input array of 16-bit elements (int32_t)
N	number of samples (int)

Returns

None.

Remarks

This must be assembled with .set microMIPS.

Example

```
int16_t *pOutdata;
int32_t outVal[8];
int32_t inBufTest[16] = {-5, 2, -3, 4, -1, 0, -2, -8, -21, 21, 10, 100, 200, 127, -127, -2};
int Num = 8;

pOutdata = &outVal;

DSP_VectorAbs32(pOutdata, inBufTest, Num);

// outVal[i] = {5, 2, 3, 4, 1, 0, 2, 8}
```

5.4.1.5.5.3 DSP_VectorAdd16 Function

C

```
void DSP_VectorAdd16(
    int16_t * outdata,
    int16_t * indata1,
    int16_t * indata2,
    int N
);
```

Description

Function DSP_VectorAdd16:

```
void DSP_VectorAdd16(int16_t *outdata, int16_t *indata1, int16_t *indata2, int N);
```

Computes the sum value of each element of indata1 + indata2 and stores it to outdata. The number of samples to process is given by the parameter N. Data is in the Q15 fractional format. outdata[i] filled with N elements of indata1[i] + indata2[i]

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to eight and a multiple of

eight.

Parameters

Parameters	Description
outdata	pointer to output array of 16-bit elements (int16_t)
indata1	pointer to input array of 16-bit elements (int16_t)
indata2	pointer to input array of 16-bit elements (int16_t)
N	number of samples (int)

Returns

None.

Remarks

This must be assembled with .set microMIPS.

Example

```
int16_t *pOutdata;
int16_t outVal[8];
int16_t inBufTest[16] = {-5,2,-3,4,-1,0,-2,-8,-21,21,10,100, 200, 127,-127,-2};
int16_t inBuf2[16]=    { 1,2, 3,4, 5,6, 7, 8, 9, 10,-1,-100,-127,127,-7, 0};
int Num = 8;

pOutdata = &outVal;

DSP_VectorAdd16(pOutdata, inBufTest, inBuf2, Num);

// outVal[i] = inBufTest[i] + inBuf2[i] = {-4,4,0,8,4,6,5,0}
```

5.4.1.5.5.4 DSP_VectorAdd32 Function

C

```
void DSP_VectorAdd32(
    int32_t * outdata,
    int32_t * indata1,
    int32_t * indata2,
    int N
);
```

Description

Function DSP_VectorAdd32:

```
void DSP_VectorAdd32(int32_t *outdata, int32_t *indata1, int32_t *indata2, int N);
```

Computes the sum value of each element of indata1 + indata2 and stores it to outdata. The number of samples to process is given by the parameter N. Data is in a Q31 fractional format. outdata[i] filled with N elements of indata1[i] + indata2[i]

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to four and a multiple of four.

Parameters

Parameters	Description
outdata	pointer to output array of 16-bit elements (int32_t)
indata1	pointer to input array of 16-bit elements (int32_t)
indata2	pointer to input array of 16-bit elements (int32_t)
N	number of samples

Returns

None.

Remarks

This must be assembled with .set microMIPS.

Example

```
int16_t *pOutdata;
int32_t outVal[8];
int32_t inBufTest[16] = {-5,2,-3,4,-1,0,-2,-8,-21,21,10,100, 200, 127,-127,-2};
int32_t inBuf2[16]=    { 1,2, 3,4, 5,6, 7, 8, 9, 10,-1,-100,-127,127,-7, 0};
int Num = 8;

pOutdata = &outVal;

DSP_VectorAdd32(pOutdata, inBufTest, inBuf2, Num);

// outVal[i] = inBufTest[i] + inBuf2[i] = {-4,4,0,8,4,6,5,0}
```

5.4.1.5.5.5 DSP_VectorAddc16 Function**C**

```
void DSP_VectorAddc16(
    int16_t * outdata,
    int16_t * indata,
    int16_t c,
    int N
);
```

Description

Function DSP_VectorAddc16:

```
void DSP_VectorAddc16(int16_t *outdata, int16_t *indata, int16_t c, int N);
```

Computes the sum value of each element of (indata + c) and stores it to outdata. The number of samples to process is given by the parameter N. Data is in a Q15 fractional format. outdata[i] filled with N elements of indata[i] + c

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to eight and a multiple of eight.

Parameters

Parameters	Description
outdata	pointer to output array of 16-bit elements (int16_t)
indata	pointer to input array of 16-bit elements (int16_t)
c	constant value added to all indata1 elements (int16_t)
N	number of samples (int)

Returns

None.

Remarks

This must be assembled with .set microMIPS.

Example

```
int16_t *pOutdata;
int16_t outVal[8];
```

```

int16_t inBufTest[16] = {-5, 2, -3, 4, -1, 0, -2, -8, -21, 21, 10, 100, 200, 127, -127, -2};
int16_t constValue = 3;
int Num = 8;

pOutdata = &outVal;

DSP_VectorAddc16(pOutdata, inBufTest, constValue, Num);

// outVal[i] = inBufTest[i] + constValue = {-2, 5, 0, 7, 2, 3, 1, -5}

```

5.4.1.5.5.6 DSP_VectorAddc32 Function

C

```

void DSP_VectorAddc32(
    int32_t * outdata,
    int32_t * indata,
    int32_t c,
    int N
);

```

Description

Function DSP_VectorAddc32:

```
void DSP_VectorAddc32(int32_t *outdata, int32_t *indata, int32_t c, int N);
```

Computes the sum value of each element of (indata + c) and stores it to outdata. The number of samples to process is given by the parameter N. Data is in a Q31 fractional format. outdata[i] filled with N elements of indata1[i] + c

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to four and a multiple of four.

Parameters

Parameters	Description
outdata	pointer to output array of 16-bit elements (int32_t)
indata	pointer to input array of 16-bit elements (int32_t)
c	constant value added to all indata1 elements (int32_t)
N	number of samples (int)

Returns

None.

Remarks

This must be assembled with .set microMIPS.

Example

```

int16_t *pOutdata;
int32_t outVal[8];
int32_t inBufTest[16] = {-5, 2, -3, 4, -1, 0, -2, -8, -21, 21, 10, 100, 200, 127, -127, -2};
int32_t constValue = 3;
int Num = 8;

pOutdata = &outVal;

DSP_VectorAddc32(pOutdata, inBufTest, constValue, Num);

// outVal[i] = inBufTest[i] + constValue = {-2, 5, 0, 7, 2, 3, 1, -5}

```

5.4.1.5.5.7 DSP_VectorAutocorr16 Function

C

```
void DSP_VectorAutocorr16(
    int16_t * outCorr,
    int16_t * inVector,
    int N,
    int K
);
```

Description

Function DSP_VectorAutocorr16:

```
void DSP_VectorAutocorr16(int16_t *outCorr, int16_t *inVector, int N, int K);
```

Calculates the autocorrelation, with a lag of 1 to K, on the first N elements of inVector and returns the 16-bit scalar result in outCorr. The autocorrelation is calculated from other statistical equations including mean and variance. While in some cases these equations exist inside the DSP library, the functions are executed in a serial fashion within this code to provide enhanced performance. The unbiased function has the form -

mean (M) = $\text{sum}[0..N-1](x(n) / N)$ variance (V) = $\text{sum}[0..N-1]((x(n) - M)^2) / (N-1)$ autocovariance (ACV)[k] = $\text{sum}[0..(N-k)]((x(n) - M) * (x(n+k) - M) / (N-k))$ autocorrelation (AC)[k] = CV[k] / V where N is the number of vector elements, n is the index of those elements x(n) is a single element in the input vector M is the mean of the N elements of the vector k is the lag or series index

The output of the function will return K elements, and the outCorr array should be sized to [accept](#) those 16-bit results. The outputs correspond to k=1, k=2, ..., k=K delay states. The function returns a 16-bit value in rounded, saturated Q15 format.

Input values of the vector and output scalar value is Q15 fractional format. This format has data that ranges from -1 to 1, and has internal saturation limits of those same values. Some care has been taken to reduce the impact of saturation by adding processing steps to effectively complete the processing in blocks. However, in some extreme cases of data variance it is still possible to reach the saturation limits.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. outCorr must be an array with at least K values. N must be greater than or equal to four and a multiple of four.

Parameters

Parameters	Description
outCorr	pointer to output array (int16_t)
inVector	pointer to source array of elements (int16_t)
N	number of samples (int)
K	lag value, number of output elements (int)

Returns

None.

Remarks

This function is optimized with microMIPS and M14KCe ASE DSP instructions. This function is dependent on the LIBQ library, and the [_LIBQ_Q16Div](#) specifically.

Example

```
int autocvN = 16; // N value, number of samples in array
int autocvLag = 4; // Lag value, output shifts to observe
int16_t outAC[16]={0};
int16_t CVIn16[16] = {0x1999, 0xD99A, 0x1000, 0x6000, 0x1999, 0x1999, 0x2666,
    0x3333, 0x1000, 0x6000, 0x1999, 0x1999, 0x2666, 0x3333, 0x1999, 0x0CCC};
```

```
// = { .2, -.3, .125, .75, .2, .2, .3, .4, .125, .75, .2, .2, .3, .4, .2, .1};
DSP_VectorAutocorr16(outAC, CVIn16, autocvN, autocvLag);
// outAC = {0xF406, D46C, 0x098F, 0x191A}
//      = -0.093567, -0.34045, 0.07468, 0.19611
```

5.4.1.5.5.8 DSP_VectorBexp16 Function

C

```
int DSP_VectorBexp16(
    int16_t * DataIn,
    int N
);
```

Description

Function DSP_VectorBexp16:

```
int DSP_VectorBexp16(int16_t *DataIn, int N);
```

Calculates the maximum binary exponent on the first N elements of the input vector DataIn, and stores the integer result. The returned value represents the potential binary scaling of the vector, and may be used with other functions that auto scale their output without saturation. Inputs are given in Q15 fractional data format.

Preconditions

N must be a multiple of 2 and greater or equal to 2.

Parameters

Parameters	Description
DataIn	pointer to input array of 16-bit elements (int16_t)
N	number of samples (int)

Returns

Binary exponent [log2 multiplier] (int)

Remarks

None.

Example

```
int valN = 4;
int16_t dummy16[valN]={0x3004, 0x00CC, 0xFC04, 0xFFFF};
//                      0.375, 0.0062, -0.0311, -0.00049
int answer;

answer = DSP_VectorBexp16(dummy16, valN);

// answer = 1, maximum binary gain is 2.
```

5.4.1.5.5.9 DSP_VectorBexp32 Function

C

```
int DSP_VectorBexp32(
    int32_t * DataIn,
    int N
);
```

Description

Function DSP_VectorBexp32:

```
int DSP_VectorBexp32(int32_t *DataIn, int N);
```

Calculates the maximum binary exponent on the first N elements of the input vector DataIn, and stores the integer result. The returned value represents the potential binary scaling of the vector, and may be used with other functions that auto scale their output without saturation. Inputs are given in Q31 fractional data format.

Preconditions

None.

Parameters

Parameters	Description
DataIn	pointer to input array of 16-bit elements (int32_t)
N	number of samples (int)

Returns

Binary exponent [log2 multiplier] (int)

Remarks

None.

Example

```
int valN=4;
int32_t datInput32[4]={0xFF000000, 0x07000000,0x000CCCCC, 0x08000000};
//                                -0.007183, 0.054688, 0.0003906, 0.0625
int answer32;

answer32 = DSP_VectorBexp32(datInput32, valN);

// answer = 3, maximum binary gain is 8.
```

5.4.1.5.5.10 DSP_VectorChkEqu32 Function

C

```
int DSP_VectorChkEqu32(
    int32_t * indata1,
    int32_t * indata2,
    int N
);
```

Description

Function DSP_VectorChkEqu32:

```
int DSP_VectorChkEqu32(int32_t *indata1, int32_t *indata2, int N);
```

Compares the first N values of indata1 to the same elements of indata2. The comparison requires that all numbers be in Q31 fractional data format. Returns the integer value '1' if all numbers are equal, and '0' if they are not equal. N must be greater than or equal to four and a multiple of four, or it will be truncated to the nearest multiple of four.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to four and a multiple of four.

Parameters

Parameters	Description
indata1	pointer to input array 1 of elements (int32_t)
indata2	pointer to input array 2 of elements (int32_t)

N	number of samples (int)

Returns

(int) - '1' if vectors are equal, '0' if vectors are not equal

Remarks

None.

Example

```
int outCheck;
int Num = 4;
int32_t inBufTestA[8]={0x7FFFFFFF, 0x80000000, 0x73333333, 0x66666666,
                      0x19999999, 0x40000000, 0x7FFFFFFF, 0xB3333334};
//          1,      -1,      0.9,      0.8,      0.2,      0.5,      1,      -0.6
int32_t inBufTestB[8]={0x7FFFFFFF, 0x80000000, 0x73333333, 0x66666666,
                      0x80000000, 0x40000000, 0x7FFFFFFF, 0x20000000};
//          1,      -1,      0.9,      0.8,      -1,      0.5,      1,      0.25

outCheck = DSP_VectorChkEqu32(inBufTestA, inBufTestB, Num);

// outCheck = 1 // true for first 4 numbers of series
```

5.4.1.5.5.11 DSP_VectorCopy Function

C

```
void DSP_VectorCopy(
    int32_t * outdata,
    int32_t * indata,
    int N
);
```

Description

Function DSP_VectorCopy:

void DSP_VectorCopy(int32_t *outdata, int32_t *indata, int N);

Fills the first N values of an input vector outdata with the the elements from indata. N must be a multiple of four and greater than or equal to four or it will be truncated to the nearest multiple of four. The vector result and the scalar value to fill are both Q31 fractional format.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to four and a multiple of four.

Parameters

Parameters	Description
outdata	pointer to destination array of values (int32_t)
indata	pointer to source array of elements (int32_t)
N	number of samples (int)

Returns

None.

Remarks

None.

Example

```

int Num = 4;
int32_t inBufTestA[8]={0x7FFFFFFF, 0x80000000, 0x73333333, 0x66666666,
                       0x19999999, 0x40000000, 0x7FFFFFFF, 0xB3333334};
//           1,      -1,      0.9,      0.8,      0.2,      0.5,      1,      -0.6
int32_t inBufTestB[8]={0x00000000, 0x7FFFFFFF, 0x40000000, 0x0CCCCCCC,
                       0x40000000, 0x60000000, 0x80000000, 0x20000000};
//           0,      1,      0.5,      0.1,      0.75,      0.5,      -1,      0.25

DSP_VectorCopy(inBufTestA, inBufTestB, Num);

// inBufTestA = {0x00000000, 0x7FFFFFFF, 0x40000000, 0x0CCCCCCC,
//               0x19999999, 0x40000000, 0x7FFFFFFF, 0xB3333334} // first 4 values copied

```

5.4.1.5.5.12 DSP_VectorCopyReverse32 Function**C**

```

void DSP_VectorCopyReverse32(
    int32_t * outdata,
    int32_t * indata,
    int N
);

```

Description

Function DSP_VectorCopyReverse32:

```
void DSP_VectorCopyReverse32(int32_t *outdata, int32_t *indata, int N);
```

Fills the first N values of an input vector Outdata with the the reverse elements from INDATA. N must be a multiple of 4 and greater than 4 or will be truncated to the nearest multiple of 4. The vectors are both Q31 fractional format.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to four and a multiple of four.

Parameters

Parameters	Description
outdata	pointer to destination array of values (int32_t)
indata	pointer to source array of elements (int32_t)
N	number of samples (int)

Returns

None.

Remarks

None.

Example

```

int Num = 4;
int32_t inBufTestA[8]={0x7FFFFFFF, 0x80000000, 0x73333333, 0x66666666,
                       0x19999999, 0x40000000, 0x7FFFFFFF, 0xB3333334};
//           1,      -1,      0.9,      0.8,      0.2,      0.5,      1,      -0.6
int32_t inBufTestB[8]={0x00000000, 0x7FFFFFFF, 0x40000000, 0x0CCCCCCC,
                       0x40000000, 0x60000000, 0x80000000, 0x20000000};
//           0,      1,      0.5,      0.1,      0.75,      0.5,      -1,      0.25

DSP_VectorCopyReverse32(inBufTestA, inBufTestB, Num);

// inBufTestA = {0x0CCCCCCC, 0x40000000, 0x7FFFFFFF, 0x00000000,

```

```
//      0x19999999, 0x40000000, 0x7FFFFFFF, 0xB3333334}
// first 4 values copied reverse order
```

5.4.1.5.5.13 DSP_VectorDivC Function

C

```
void DSP_VectorDivC(
    _Q16 * outVector,
    _Q16 * inVector,
    _Q16 divisor,
    int N
);
```

Description

Function DSP_VectorDivC:

```
void DSP_VectorDivC(_Q16 *outVector, _Q16 *inVector, _Q16 divisor, int N);
```

Divides each element of the first N elements of inVector by a constant, divisor. The output is stored to outVector. Both vectors and the scalar are [_Q16](#) format, which is 32-bit data with 15 bits for the integer and 16 bits for the fractional portion. If values exceed maximum or minimum they will saturate to the maximum or minimum respectively.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. This function uses the Div function from the LIBQ library. That library must be compiled as part of the project.

Parameters

Parameters	Description
outdata	pointer to desination array of elements (_Q16)
indata	pointer to source array of elements (_Q16)
divisor	scalar divisor for the input vector (_Q16)
N	number of samples (int)

Returns

None.

Remarks

This function uses the Microchip PIC32MZ LIBQ library to function. The user must include that library and header file into the design in order to operate this function. For more information on the Div function see the LIBQ documentation for [LIBQ_Q16Div](#).

Example

```
int divNum = 4;
_Q16 divScalar = 0x00020000; // 2.0
_Q16 inDivVec[8] = {0x08000000, 0xfffc0000, 0x00024000, 0x00100000, 0x00038000,
    0x00400000, 0xfffe0000, 0x00058000};
//      2048, -4, 2.25, 16, 3.5, 64, -2, 5.5
_Q16 outDivVec[8] = {0};

DSP_VectorDivC(outDivVec, inDivVec, divScalar, divNum);

// outDivVec = 0x04000000, 0xFFFFE0000, 0x00012000, 0x00080000, 0, 0, 0, 0
//              1024.0,      -2.0,      1.125,      16.0, 0, 0, 0, 0
```

5.4.1.5.5.14 DSP_VectorDotp16 Function

C

```
int16_t DSP_VectorDotp16(
    int16_t * indata1,
```

```

    int16_t * indata2,
    int N,
    int scale
);

```

Description

Function DSP_VectorDotp16:

```
int16_t DSP_VectorDotp16(int16_t *indata1, int16_t *indata2, int N, int scale);
```

Calculates the dot product of two input vectors, and scales the output. Function will saturate if it exceeds maximum or minimum values. Scaling is done by binary shifting, after accumulation in a 32 bit register. All calculations are done in Q15 fractional format. return = $1/(2^{\text{scale}}) * \text{sum}(\text{indata1}[i] * \text{indata2}[i])$

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to eight and a multiple of eight.

Parameters

Parameters	Description
indata1	pointer to input array of 16-bit elements (int16_t)
indata2	pointer to input array of 16-bit elements (int16_t)
scale	number of bits to shift return right (int)
N	number of samples (int)

Returns

int16_t - scaled output of calculation, Q15 format

Remarks

This must be assembled with .set microMIPS.

Example

```

int16_t inBufMultA[8]={0x7FFF, 0x8000, 0x7333, 0x6666, 0x1999, 0x4000, 0x7FFF, 0xB334};
//      1,      -1,      0.9,      0.8,      0.2,      0.5,      1,      -0.6
int16_t inBufMultB[8]={0x0CCD, 0x0CCD, 0x4000, 0xC000, 0xE667, 0x4000, 0x0000, 0x0CCD};
//      0.1,      0.1,      0.5,      -0.5,      -0.2,      0.5,      0,      0.1
int Num = 8;
int scaleVal = 2;
int16_t outScalar;

int Num = 8;

outScalar = DSP_VectorDotp16(inBufMultA, inBufMultB, Num, scaleVal);

// outScalar = 1/(2^scaleVal)*(inBufMultA[] dot inBufMultB[]) =
// (1/4) * (0.1 + -0.1 + 0.45 + -0.4 + -0.04 + 0.25 + 0 + -0.06) = 0.25 * 0.20 = 0.05
// = (int16_t)0x0666

```

5.4.1.5.5.15 DSP_VectorDotp32 Function

C

```

int32_t DSP_VectorDotp32(
    int32_t * indata1,
    int32_t * indata2,
    int N,
    int scale
);

```

Description

Function DSP_VectorDotp32:

```
int32_t DSP_VectorDotp32(int32_t *indata1, int32_t *indata2, int N, int scale);
```

Calculates the dot product of two input vectors, and scales the output. Function will saturate if it exceeds maximum or minimum values. Scaling is done by binary shifting, after calculation of the result. All calculations are done in Q31 fractional format. return = $1/(2^{\text{scale}}) * \text{sum}(\text{indata1}[i] * \text{indata2}[i])$

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to four and a multiple of four.

Parameters

Parameters	Description
indata1	pointer to input array of 16-bit elements (int32_t)
indata2	pointer to input array of 16-bit elements (int32_t)
scale	number of bits to shift return right (int)
N	number of samples (int)

Returns

int16_t - scaled output of calculation, Q31 format

Remarks

This must be assembled with .set microMIPS.

Example

```
int32_t inBufMultA[8]={0x7FFFFFFF, 0x80000000, 0x73333333, 0x66666666,
                      0x19999999, 0x40000000, 0x7FFFFFFF, 0xB3333334};
//          1,      -1,      0.9,      0.8,      0.2,      0.5,      1,      -0.6
int32_t inBufMultB[8]={0x0CCCCCD, 0x0CCCCCD, 0x40000000, 0xC0000000,
                      0xE6666667, 0x40000000, 0x00000000, 0x0CCCCCD};
//          0.1,      0.1,      0.5,     -0.5,     -0.2,      0.5,      0,      0.1
int Num = 8;
int scaleVal = 2;
int32_t outScalar;

int Num = 8;

outScalar = DSP_VectorDotp32(inBufMultA, inBufMultB, Num, scaleVal);

// outScalar = 1/(2^scaleVal)*(inBufMultA[] dot inBufMultB[]) =
// (1/4) * (0.1 + -0.1 + 0.45 + -0.4 + -0.04 + 0.25 + 0 + -0.06) = 0.25 * 0.20 = 0.05
// = (int32_t)0x06666666
```

5.4.1.5.5.16 DSP_VectorExp Function**C**

```
void DSP_VectorExp(
    _Q16 * outVector,
    _Q16 * inVector,
    int N
);
```

Description

Function DSP_VectorExp:

```
void DSP_VectorExp(_Q16 *outVector, _Q16 *inVector, int N);
```

Computes the Exp value, e to the power of X , on the first N elements of `inVector`. The output is stored to `outVector`. Both vectors are `_Q16` format, which is 32-bit data with 15 bits for the integer and 16 bits for the fractional portion. If values exceed maximum or minimum they will saturate to the maximum or zero respectively.

Preconditions

The pointers `outdata` and `indata` must be aligned on 4-byte boundaries. This function uses the Exp and Div functions from the LIBQ library. That library must be compiled as part of the project.

Parameters

Parameters	Description
<code>outdata</code>	pointer to desination array of elements (<code>_Q16</code>)
<code>indata</code>	pointer to source array of elements (<code>_Q16</code>)
<code>N</code>	number of samples (int)

Returns

None.

Remarks

Inclusion of the LIBQ header file and library is mandatory to use this function.

Example

```
int expNum = 4;
_Q16 inExpVec[8] = {0x00010000, 0xffff0000, 0x00020000, 0x00030000, 0x00038000,
                    0x00040000, 0xfffe0000, 0x00058000};
//          1.0,  -1.0,  2.0,  3.0,   3.5,  4.0,  -2.0,  5.5
_Q16 outExpVec[8] = {0};

DSP_VectorExp(outExpVec, inExpVec, expNum);

// outExpVec = 0x0002B7E1, 0x00005E2D, 0x00076399, 0x001415E6, 0, 0, 0, 0
//          2.71828,  0.26787,   7.3891,  20.0855, 0, 0, 0, 0
```

5.4.1.5.5.17 DSP_VectorFill Function

C

```
void DSP_VectorFill(
    int32_t * indata,
    int32_t data,
    int N
);
```

Description

Function `DSP_VectorFill`:

```
void DSP_VectorFill(int32_t *indata, int32_t data, int N);
```

Fills the first N values of an input vector `indata` with the value `data`. N must be a multiple of four and greater than or equal to four or it will be truncated to the nearest multiple of four. The vector result and the scalar value to fill are both Q31 fractional format.

Preconditions

The pointers `outdata` and `indata` must be aligned on 4-byte boundaries. N must be greater than or equal to four and a multiple of four.

Parameters

Parameters	Description
<code>indata</code>	pointer to source array of elements (int32_t)

data	scalar value to fill the array (int32_t)
N	number of samples (int)

Returns

None.

Remarks

None.

Example

```
int32_t fillValue = 0x3FFFFFFF;
int Num = 4;
int32_t inBufTestA[8]={0x7FFFFFFF, 0x80000000, 0x73333333, 0x66666666,
                      0x19999999, 0x40000000, 0x7FFFFFFF, 0xB3333334};
//          1,      -1,      0.9,      0.8,      0.2,      0.5,      1,      -0.6

DSP_VectorFill(inBufTestA, fillValue, Num);

// inBufTestA = {0x3FFFFFFF, 0x3FFFFFFF, 0x3FFFFFFF, 0x3FFFFFFF,
//               0x19999999, 0x40000000, 0x7FFFFFFF, 0xB3333334} // first 4 values filled
```

5.4.1.5.5.18 DSP_VectorLn Function**C**

```
void DSP_VectorLn(
    _Q4_11 * outVector,
    _Q16 * inVector,
    int N
);
```

Description

Function DSP_VectorLn:

```
void DSP_VectorLn(_Q4_11 *outVector, _Q16 *inVector, int N);
```

Computes the Ln(x) value, on the first N elements of inVector. The output is stored to outVector. Input vector is Q16 format, which is 32-bit data with 15 bits for the integer and 16 bits for the fractional portion. The output vector is reduced resolution Q4.11 format, which is a 16-bit integer format with 11 bits representing the fractional resolution. If values exceed maximum or minimum they will saturate to the maximum or zero respectively.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. This function uses the Ln function from the LIBQ library. That library must be compiled as part of the project.

Parameters

Parameters	Description
outdata	pointer to desination array of elements (<u>Q16</u>)
indata	pointer to source array of elements (<u>Q4_11</u>)
N	number of samples (int)

Returns

None.

Remarks

This function uses the Microchip PIC32MZ LIBQ library to function. The user must include that library and header file into the design in order to operate this function. For more information on the Ln function see the LIBQ documentation for

[_LIBQ_Q4_11_In_Q16](#). A negative number input will return a saturated negative value (0x8000).

Example

```
int lnNum = 4;
_Q16 inLnVal[8] = {0x40000000, 0xffff0000, 0x00020000, 0x00100000, 0x00038000,
                  0x00400000, 0xfffe0000, 0x00058000};
//      16384.0,  -1.0,  2.0,  16.0,   3.5,   64.0,  -2.0,  5.5
_Q4_11 outLnVal[8] = {0};

DSP_VectorLn(outLnVal, inLnVal, lnNum);

// outLnVal =      0x4DA2,      0x8000,   0x058C,   0x162E,  0,  0,  0,  0
//              9.704,  sat negative,  0.6934,   2.772,  0,  0,  0,  0
```

5.4.1.5.5.19 DSP_VectorLog10 Function

C

```
void DSP_VectorLog10(
    _Q3_12 * outVector,
    _Q16 * inVector,
    int N
);
```

Description

Function DSP_VectorLog10:

```
void DSP_VectorLog10(_Q3_12 *outVector, _Q16 *inVector, int N);
```

Computes the Log10(x) value, on the first N elements of inVector. The output is stored to outVector. Input vector is [_Q16](#) format, which is 32-bit data with 15 bits for the integer and 16 bits for the fractional portion. The output vector is reduced resolution Q3.12 format, which is a 16-bit integer format with 12 bits representing the fractional resolution. If values exceed maximum or minimum they will saturate to the maximum or zero respectively.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. This function uses the Log10 function from the LIBQ library. That library must be compiled as part of the project.

Parameters

Parameters	Description
outdata	pointer to desination array of elements (_Q16)
indata	pointer to source array of elements (_Q3_12)
N	number of samples (int)

Returns

None.

Remarks

This function uses the Microchip PIC32MZ LIBQ library to function. The user must include that library and header file into the design in order to operate this function. For more information on the Log10 function see the LIBQ documentation for [_LIBQ_Q3_12_log10_Q16](#). A negative number input will return a saturated negative value (0x8000).

Example

```
int logNum = 4;
_Q16 inLogVal[8] = {0x40000000, 0xffff0000, 0x00020000, 0x00100000, 0x00038000,
                  0x00400000, 0xfffe0000, 0x00058000};
//      16384.0,  -1.0,  2.0,  16.0,   3.5,   64.0,  -2.0,  5.5
_Q3_12 outLogVal[8] = {0};
```

```
DSP_VectorLog10(outLogVal, inLogVal, logNum);

// outLogVal =      0x436E,      0x8000,      0x04D1,      0x1344, 0, 0, 0, 0
//              4.2144,  sat negative,  0.3010,      1.2041, 0, 0, 0, 0
```

5.4.1.5.5.20 DSP_VectorLog2 Function

C

```
void DSP_VectorLog2(
    _Q5_10 * outVector,
    _Q16 * inVector,
    int N
);
```

Description

Function DSP_VectorLog2:

```
void DSP_VectorLog2(_Q5_10 *outVector, _Q16 *inVector, int N);
```

Computes the Log2 value, where $\log_2(x) = \ln(x) * \log_2(e)$, on the first N elements of inVector. The output is stored to outVector. Input vector is Q16 format, which is 32-bit data with 15 bits for the integer and 16 bits for the fractional portion. The output vector is reduced resolution Q5.10 format, which is a 16-bit integer format with 10 bits representing the fractional resolution. If values exceed maximum or minimum they will saturate to the maximum or zero respectively.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. This function uses the Log2 function from the LIBQ library. That library must be compiled as part of the project.

Parameters

Parameters	Description
outdata	pointer to desination array of elements (<u>Q16</u>)
indata	pointer to source array of elements (<u>Q5_10</u>)
N	number of samples (int)

Returns

None.

Remarks

This function uses the Microchip PIC32MZ LIBQ library to function. The user must include that library and header file into the design in order to operate this function. For more information on the Log2 function see the LIBQ documentation for LIBQ_Q5_10_log2_Q16. A negative number input will return a saturated negative value (0x8000).

Example

```
int log2Num = 4;
_Q16 inLog2Val[8] = {0x40000000, 0xffff0000, 0x00020000, 0x00030000, 0x00038000,
                    0x00040000, 0xfffe0000, 0x00058000};
//      16384.0,  -1.0,   2.0,   3.0,   3.5,   4.0,  -2.0,   5.5
_Q5_10 outLog2Val[8] = {0};

DSP_VectorLog2(outLog2Val, inLog2Val, log2Num);

// outLog2Val =      0x3800,      0x8000,      0x0400,      0x0657, 0, 0, 0, 0
//              14.0,  sat negative,      1.0,      1.585, 0, 0, 0, 0
```

5.4.1.5.5.21 DSP_VectorMax32 Function

C

```
int32_t DSP_VectorMax32(
```

```

    int32_t * indata,
    int N
);

```

Description

Function DSP_VectorMax32:

```
int32_t DSP_VectorMax32(int32_t *indata, int N);
```

Returns the highest value of the first N elements of the vector indata. The comparison requires that all numbers be in Q31 fractional data format. N must be greater than or equal to four and a multiple of four, or it will be truncated to the nearest multiple of four.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to four and multiple of four.

Parameters

Parameters	Description
indata	pointer to input array of elements (int32_t)
N	number of samples (int)

Returns

(int32_t) - maximum value within the vector, Q31 format

Remarks

None.

Example

```

int32_t outCheck;
int Num = 4;
int32_t inBufTestA[8]={0x7FFFFFFF, 0x80000000, 0x73333333, 0x66666666,
                      0x19999999, 0x40000000, 0x7FFFFFFF, 0xB3333334};
//          1,      -1,      0.9,      0.8,      0.2,      0.5,      1,      -0.6

outCheck = DSP_VectorMax32(inBufTestA, Num);

// outCheck = 0x7FFFFFFF // first 4 values

```

5.4.1.5.5.22 DSP_VectorMaxIndex32 Function

C

```

int DSP_VectorMaxIndex32(
    int32_t * indata,
    int N
);

```

Description

Function DSP_VectorMaxIndex32:

```
int DSP_VectorMaxIndex32(int32_t *indata, int N);
```

Returns the index of the highest value of the first N elements of the vector indata. The comparison requires that all numbers be in Q31 fractional data format. N must be greater than or equal to four and a multiple of four, or it will be truncated to the nearest multiple of four.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to four and a multiple of

four.

Parameters

Parameters	Description
indata	pointer to source array of elements (int32_t)
N	number of samples (int)

Returns

int - index of the position of the maximum array element

Remarks

Index values range from 0 .. (n-1).

Example

```
int    indexValue;
int    Num = 8;
int32_t inBufTestA[8]={0x3FFFFFFF, 0x80000000, 0x73333333, 0x66666666,
                       0x19999999, 0x40000000, 0x7FFFFFFF, 0xB3333334};
//           0.5,      -1,      0.9,      0.8,      0.2,      0.5,      1,      -0.6

indexValue = DSP_VectorMaxIndex32(inBufTestA, Num);

// returnValue = 6 (position corresponding to 0x7FFFFFFF)
```

5.4.1.5.5.23 DSP_VectorMean32 Function

C

```
int32_t DSP_VectorMean32(
    int32_t * indata1,
    int N
);
```

Description

Function DSP_VectorMean32:

```
int32_t DSP_VectorMean32(int32_t *indata, int N);
```

Calculates the mean average of the first N elements of the vector indata. The values of indata1 are in Q31 fractional format. The value N must be greater than or equal to four and a multiple of four, or it will be truncated to the nearest multiple of four.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to four and a multiple of four.

Parameters

Parameters	Description
indata	pointer to source array of elements (int32_t)
N	number of samples (int)

Returns

int32_t - mean average value of the vector

Remarks

None.

Example

```
int32_t    returnValue;
```

```

int      Num = 4;
int32_t inBufTestA[8]={0x7FFFFFFF, 0x80000000, 0x73333333, 0x66666666,
                       0x19999999, 0x40000000, 0x7FFFFFFF, 0xB3333334};
//           1,      -1,      0.9,      0.8,      0.2,      0.5,      1,      -0.6

returnValue = DSP_VectorMean32(inBufTestA, Num);

// returnValue = 0x36666666 = (1-1+0.9+0.8)/4 = 0.425

```

5.4.1.5.5.24 DSP_VectorMin32 Function

C

```

int32_t DSP_VectorMin32(
    int32_t * input,
    int N
);

```

Description

Function DSP_VectorMin32:

```
int32_t DSP_VectorMin32(int32_t *indata, int N);
```

Returns the lowest value of the first N elements of the vector indata. The comparison requires that all numbers be in Q31 fractional data format. N must be greater than or equal to four and a multiple of four, or it will be truncated to the nearest multiple of four.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to four and multiple of four.

Parameters

Parameters	Description
indata	pointer to input array of elements (int32_t)
N	number of samples (int)

Returns

(int32_t) - minimum value within the vector, Q31 format

Remarks

None.

Example

```

int32_t outCheck;
int      Num = 4;
int32_t inBufTestA[8]={0x7FFFFFFF, 0x80000000, 0x73333333, 0x66666666,
                       0x19999999, 0x40000000, 0x7FFFFFFF, 0xB3333334};
//           1,      -1,      0.9,      0.8,      0.2,      0.5,      1,      -0.6

outCheck = DSP_VectorMin32(inBufTestA, Num);

// outCheck = 0x80000000 // first 4 values

```

5.4.1.5.5.25 DSP_VectorMinIndex32 Function

C

```

int DSP_VectorMinIndex32(
    int32_t * indata,
    int N
);

```

Description

Function DSP_VectorMinIndex32:

```
int DSP_VectorMinIndex32(int32_t *indata, int N);
```

Returns the relative position index of the lowest value of the first N elements of the vector indata. The comparison requires that all numbers be in Q31 fractional data format. N must be greater than or equal to four and a multiple of four, or it will be truncated to the nearest multiple of four.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to four and a multiple of four.

Parameters

Parameters	Description
indata	pointer to source array of elements (int32_t)
N	number of samples (int)

Returns

int32_t - mean average value of the vector

Remarks

Index values range from 0 .. (n-1).

Example

```
int    indexValue;
int    Num = 8;
int32_t inBufTestA[8]={0x3FFFFFFF, 0x80000000, 0x73333333, 0x66666666,
                      0x19999999, 0x40000000, 0x7FFFFFFF, 0xB3333334};
//           0.5,      -1,      0.9,      0.8,      0.2,      0.5,      1,      -0.6

indexValue = DSP_VectorMinIndex32(inBufTestA, Num);

// return value = 1 (position corresponding to 0x80000000)
```

5.4.1.5.5.26 DSP_VectorMul16 Function**C**

```
void DSP_VectorMul16(
    int16_t * outdata,
    int16_t * indata1,
    int16_t * indata2,
    int N
);
```

Description

Function DSP_VectorMul16:

```
void DSP_VectorMul16(int16_t *outdata, int16_t *indata1, int16_t *indata2, int N);
```

Multiplies the value of each element of indata1 * indata2 and stores it to outdata. The number of samples to process is given by the parameter N. Data is in the Q15 fractional format. outdata[i] filled with N elements of indata1[i] * indata2[i]

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to eight and a multiple of eight.

Parameters

Parameters	Description
outdata	pointer to output array of 16-bit elements (int16_t)
indata1	pointer to input array of 16-bit elements (int16_t)
indata2	pointer to input array of 16-bit elements (int16_t)
N	number of samples (int)

Returns

None.

Remarks

This must be assembled with .set microMIPS.

Example

```
int16_t *pOutdata;
int16_t outVal[8];
int16_t inBufMultA[8]={0x7FFF, 0x8000, 0x7333, 0x6666, 0x1999, 0x4000, 0x7FFF, 0xB334};
//      1,      -1,      0.9,      0.8,      0.2,      0.5,      1,      -0.6
int16_t inBufMultB[8]={0x0CCD, 0x0CCD, 0x4000, 0xC000, 0xE667, 0x4000, 0x0000, 0x0CCD};
//      0.1,      0.1,      0.5,      -0.5,      -0.2,      0.5,      0,      0.1
int Num = 8;

pOutdata = &outVal;

DSP_VectorMul16(pOutdata, inBufMultA, inBufMultB, Num);

// outVal[i] = inBufTest[i] * inBuf2[i] =
//      {0x0CCD, 0xF333, 0x399A, 0xCCCD, 0xFAE2, 0x2000, 0x0000, 0xF852}
//      0.1,      -0.1,      0.45,      -0.4,      -0.04,      0.25,      0,      -0.06
```

5.4.1.5.5.27 DSP_VectorMul32 Function**C**

```
void DSP_VectorMul32(
    int32_t * outdata,
    int32_t * indata1,
    int32_t * indata2,
    int N
);
```

Description

Function DSP_VectorMul32:

```
void DSP_VectorMul32(int32_t *outdata, int32_t *indata1, int32_t *indata2, int N);
```

Multiplies the value of each element of indata1 * indata2 and stores it to outdata. The number of samples to process is given by the parameter N. Data is in the Q31 fractional format. outdata[i] filled with N elements of indata1[i] * indata2[i]

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to four and a multiple of four.

Parameters

Parameters	Description
outdata	pointer to output array of 16-bit elements (int32_t)
indata1	pointer to input array of 16-bit elements (int32_t)

indata2	pointer to input array of 16-bit elements (int32_t)
N	number of samples (int)

Returns

None.

Remarks

This must be assembled with .set microMIPS.

Example

```
int16_t *pOutdata;
int32_t outVal[8];
int32_t inBufMultA[8]={0x7FFFFFFF, 0x80000000, 0x73333333, 0x66666666,
                      0x19999999, 0x40000000, 0x7FFFFFFF, 0xB3333334};
//          1,      -1,      0.9,      0.8,      0.2,      0.5,      1,      -0.6
int32_t inBufMultB[8]={0x0CCCCCD, 0x0CCCCCD, 0x40000000, 0xC0000000,
                      0xE6666667, 0x40000000, 0x00000000, 0x0CCCCCD};
//          0.1,      0.1,      0.5,      -0.5,      -0.2,      0.5,      0,      0.1
int Num = 8;

pOutdata = &outVal;

DSP_VectorMul32(pOutdata, inBufMultA, inBufMultB, Num);

// outVal[i] = inBufTest[i] * inBuf2[i] =
// {0x0CCCCCD, 0xF3333333, 0x3999999A, 0xCCCCCD, 0xFAE147AE,
//   0x20000000, 0x00000000, 0xF851EB86}
// 0.1,      -0.1,      0.45,      -0.4,      -0.04,      0.25,      0,      -0.06
```

5.4.1.5.5.28 DSP_VectorMulc16 Function**C**

```
void DSP_VectorMulc16(
    int16_t * outdata,
    int16_t * indata,
    int16_t c,
    int N
);
```

Description

Function DSP_VectorMulc16:

```
void DSP_VectorMulc16(int16_t *outdata, int16_t *indata, int16_t c, int N);
```

Multiplies the value of each element of indata1 * c and stores it to outdata. The number of samples to process is given by the parameter N. Data is in a Q15 fractional format. outdata[i] filled with N elements of indata[i] * c

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to eight and a multiple of eight.

Parameters

Parameters	Description
outdata	pointer to output array of 16-bit elements (int16_t)
indata	pointer to input array of 16-bit elements (int16_t)
c	scalar multiplicand (int16_t)
N	number of samples (int)

Returns

None.

Remarks

This must be assembled with .set microMIPS.

Example

```
int16_t *pOutdata;
int16_t outVal[8];
int16_t inBufMultA[8]={0x7FFF, 0x8000, 0x7333, 0x6666, 0x1999, 0x4000, 0x0000, 0xB334};
//      1,      -1,      0.9,      0.8,      0.2,      0.5,      0,      -0.6
int16_t constValue = 0x4000;
int Num = 8;

pOutdata = &outVal;

DSP_VectorMulc16(pOutdata, inBufMultA, constValue, Num);

// outVal[i] = inBufTest[i] * constValue =
//      {0x4000, 0xC000, 0x399A, 0x3333, 0x1999, 0x2000, 0x0000, 0xD99A}
//      0.5,      -0.5,      0.45,      0.4,      0.1,      0.25,      0,      -0.3
```

5.4.1.5.5.29 DSP_VectorMulc32 Function**C**

```
void DSP_VectorMulc32(
    int32_t * outdata,
    int32_t * indata,
    int32_t c,
    int N
);
```

Description

Function DSP_VectorMulc32:

```
void DSP_VectorMulc32(int32_t *outdata, int32_t *indata, int32_t c, int N);
```

Multiples the value of each element of indata * c and stores it to outdata. The number of samples to process is given by the parameter N. Data is in a Q31 fractional format. outdata[i] filled with N elements of indata[i] * c

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to four and a multiple of four.

Parameters

Parameters	Description
outdata	pointer to output array of 16-bit elements (int32_t)
indata	pointer to input array of 16-bit elements (int32_t)
c	scalar multiplicand (int32_t)
N	number of samples (int)

Returns

None.

Remarks

This must be assembled with .set microMIPS.

Example

```

int16_t *pOutdata;
int32_t outVal[8];
int32_t inBufMultA[8]={0x7FFFFFFF, 0x80000000, 0x73333333, 0x66666666,
                      0x19999999, 0x40000000, 0x00000000, 0xB3333334};
//      1,      -1,      0.9,      0.8,      0.2,      0.5,      1,      -0.6
int32_t constValue = 0x4000;
int Num = 8;

pOutdata = &outVal;

DSP_VectorMulc32(pOutdata, inBufMultA, constValue, Num);

// outVal[i] = inBufTest[i] * constValue =
//      {0x40000000, 0xC0000000, 0x3999999A, 0x33333333, 0x19999999,
//      0x20000000, 0x00000000, 0xD999999A}
//      0.5,      -0.5,      0.45,      0.4,      0.1,      0.25,      0,      -0.3

```

5.4.1.5.5.30 DSP_VectorNegate Function**C**

```

void DSP_VectorNegate(
    int32_t * outdata,
    int32_t * indata,
    int N
);

```

Description

Function DSP_VectorNegate:

```
void DSP_VectorNegate(int32_t *outdata, int32_t *indata, int N);
```

Sign inversion of the first N values of an indata are assigned to outdata. N must be a multiple of four and greater than or equal to four or it will be truncated to the nearest multiple of four. The vector result and the scalar value to fill are both Q31 fractional format.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to four and a multiple of four.

Parameters

Parameters	Description
outdata	pointer to desination array of elements (int32_t)
indata	pointer to source array of elements (int32_t)
N	number of samples (int)

Returns

None.

Remarks

None.

Example

```

int Num = 4;
int32_t inBufTestA[8]={0x7FFFFFFF, 0x80000000, 0x73333333, 0x66666666,
                      0x19999999, 0x40000000, 0x7FFFFFFF, 0xB3333334};
//      1,      -1,      0.9,      0.8,      0.2,      0.5,      1,      -0.6
int32_t outBufTest[8]={0x0CCCCCD, 0x0CCCCCD, 0x40000000, 0xC0000000,

```

```

//          0xE6666667, 0x40000000, 0x00000000, 0x0CCCCCD};
//          0.1,    0.1,    0.5,   -0.5,   -0.2,    0.5,    0,    0.1;

DSP_VectorNegate(outBufTest, inBufTestA, Num);

// inBufTestA = {0x80000000, 0x7FFFFFFF, 0x8CCCCCD, 0x9999999A,
//               0x19999999, 0x40000000, 0x7FFFFFFF, 0xB3333334} // first 4 values neg
//               -1,    1,   -0.9,   -0.8,   -0.2,    0.5,    0,    0.1

```

5.4.1.5.5.31 DSP_VectorRecip Function

C

```

void DSP_VectorRecip(
    _Q16 * outVector,
    _Q16 * inVector,
    int N
);

```

Description

Function DSP_VectorRecip:

```
void DSP_VectorRecip(_Q16 *outVector, _Q16 *inVector, int N);
```

Computes the reciprocal (1/x) on the first N elements of inVector. The output is stored to outVector. Both vectors are Q16 format, which is 32-bit data with 15 bits for the integer and 16 bits for the fractional portion. If values exceed maximum or minimum they will saturate to the maximum or minimum respectively.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. This function uses the Div function from the LIBQ library. That library must be compiled as part of the project.

Parameters

Parameters	Description
outdata	pointer to desination array of elements (<u>Q16</u>)
indata	pointer to source array of elements (<u>Q16</u>)
N	number of samples (int)

Returns

None.

Remarks

This function uses the Microchip PIC32MZ LIBQ library to function. The user must include that library and header file into the design in order to operate this function. For more information on the Div function see the LIBQ documentation for LIBQ_Q16Div. A value of zero in the array will not cause an error, but will return 0.

Example

```

int recNum = 4;
_Q16 inRecVec[8] = {0x08000000, 0xfffc0000, 0x00020000, 0x00100000, 0x00038000,
                   0x00400000, 0xfffe0000, 0x00058000};
//          2048.0, -4.0, 2.0, 16.0, 3.5, 64.0, -2.0, 5.5
_Q16 outRecVec[8] = {0};

DSP_VectorRecip(outRecVec, inRecVec, recNum);

// outRecVec = 0x00000020, 0xFFFFC000, 0x00008000, 0x00001000, 0, 0, 0, 0
//          0.000488,   -0.25,         0.5,       0.0625, 0, 0, 0, 0

```

5.4.1.5.5.32 DSP_VectorRMS16 Function

C

```
int16_t DSP_VectorRMS16(
    int16_t * inVector,
    int N
);
```

Description

Function DSP_VectorRMS16:

```
int16_t DSP_VectorRMS16(int16_t *inVector, int N);
```

Computes the root mean square value of the first N values of inVector. Both input and output are Q15 fractional values. The function will saturate if maximum or minimum values are exceeded.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to four and multiple of four.

Parameters

Parameters	Description
indata	pointer to input array of 16-bit elements (int16_t)
N	number of samples (int)

Returns

int16_t - RMS function output, Q15 format

Remarks

This function is optimized with microMIPS and M14KCe ASE DSP instructions. This function is dependent on the LIBQ library, and uses the [_LIBQ_Q16Sqrt](#) external function call.

Example

```
int16_t vecRMSIn[32]={0x1999, 0xD99A, 0x4000, 0x2666,0x1999,0x1999,0x2666, 0x3333};
// 0.2, -0.3, 0.5, 0.3, 0.2, 0.2, 0.3, 0.4
int16_t RMSOut=0;
int Nrms = 8;

RMSOut = DSP_VectorRMS16(vecRMSIn, Nrms);

// RMSOut = 0x287C (= 0.31628)
```

5.4.1.5.5.33 DSP_VectorShift Function

C

```
void DSP_VectorShift(
    int32_t * outdata,
    int32_t * indata,
    int N,
    int shift
);
```

Description

Function DSP_VectorShift:

```
void DSP_VectorShift(int32_t *outdata, int32_t *indata, int N, int shift);
```

Shifts N data elements of indata to outdata, with an index change of shift. The amount of data shifted includes zero padding for

the first (shift) elements if shift is positive. The vector size of indata and outdata need not be the same, however, N must not exceed either array size.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must not exceed the amount of elements in the source array. shift must not exceed the number of elements in the destination array.

Parameters

Parameters	Description
outdata	pointer to desination array of elements (int32_t)
indata	pointer to source array of elements (int32_t)
N	number of samples (int)
shift	number of indexes to shift (int)

Returns

None.

Remarks

Destination array values shift to left (relative to the input vector) when shift is positive (back filled with zeros) and shift to the right when shift is negative. The total amount of values copied to the destination array is the length of N less the shift amount.

Example

```
int shiftValue = 3;
int Num = 8;
int32_t inBufTestA[8]={0x7FFFFFFF, 0x80000000, 0x73333333, 0x66666666,
                      0x19999999, 0x40000000, 0x7FFFFFFF, 0xB3333334};
//           1,      -1,      0.9,      0.8,      0.2,      0.5,      1,      -0.6
int32_t inBufTestB[8]={0x80000000, 0x7FFFFFFF, 0x40000000, 0x0CCCCCCC,
                      0x40000000, 0x60000000, 0x80000000, 0x20000000};
//           -1,      1,      0.5,      0.1,      0.75,      0.5,      -1,      0.25

DSP_VectorShift(inBufTestA, inBufTestB, Num, shiftVal);

// inBufTestA = {0x00000000, 0x00000000, 0x00000000, 0x80000000,
//               0x7FFFFFFF, 0x40000000, 0x0CCCCCCC, 0x40000000} // shifted 3 positive
```

5.4.1.5.5.34 DSP_VectorSqrt Function

C

```
void DSP_VectorSqrt(
    _Q16 * outVector,
    _Q16 * inVector,
    int N
);
```

Description

Function DSP_VectorSqrt:

```
void DSP_VectorSqrt(_Q16 *outVector, _Q16 *inVector, int N);
```

Computes the Sqrt(x) on the first N elements of inVector. The output is stored to outVector. Both vectors are Q16 format, which is 32-bit data with 15 bits for the integer and 16 bits for the fractional portion. If values exceed maximum or minimum they will saturate to the maximum or zero respectively.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. This function uses the Sqrt function from the LIBQ library. That library must be compiled as part of the project.

Parameters

Parameters	Description
outdata	pointer to desination array of elements (_Q16)
indata	pointer to source array of elements (_Q16)
N	number of samples (int)

Returns

None.

Remarks

This function uses the Microchip PIC32MZ LIBQ library to function. The user must include that library and header file into the design in order to operate this function. For more information on the Sqrt function see the LIBQ documentation for [_LIBQ_Q16Sqrt](#). A negative number input will return a saturated value (0x00FFFFxx).

Example

```
int sqrtNum = 4;
_Q16 inSqrtVec[8] = {0x40000000, 0xffff0000, 0x00020000, 0x00100000, 0x00038000,
                    0x00400000, 0xfffe0000, 0x00058000};
//      16384.0,  -1.0,  2.0,  16.0,   3.5,   64.0,  -2.0,  5.5
_Q16 outSqrtVec[8] = {0};

DSP_VectorSqrt(outSqrtVec, inSqrtVec,  sqrtNum);

// outSqrtVec =  0x00800000, 0x00FFFF80, 0x00016A0A, 0x00040000, 0, 0, 0, 0
//              128.0,  sat negative,  1.41422,    4.0,    0, 0, 0, 0
```

5.4.1.5.5.35 DSP_VectorStdDev16 Function**C**

```
int16_t DSP_VectorStdDev16(
    int16_t * inVector,
    int N
);
```

Description

Function DSP_VectorStdDev16:

```
int16_t DSP_VectorStdDev16(int16_t *inVector, int N);
```

Calculates the standard deviation on the first N elements of inVector and returns the 16-bit scalar result. The standard deviation is the square root of the variance, which is a measure of the delta from mean values. The mean value of the vector is computed in the process. The function has the form -

$$\text{StdDev} = \text{SQRT}(\text{sum}[0..N]((x(i) - M(N))^2) / (N-1))$$
 where N is the number of vector elements x(i) is a single element in the vector M(N) is the mean of the N elements of the vector

Input values of the vector and output scalar value is Q15 fractional format. This format has data that ranges from -1 to 1, and has internal saturation limits of those same values. Some care has been taken to reduce the impact of saturation by adding processing steps to effectively complete the processing in blocks. However, in some extreme cases of data variance it is still possible to reach the saturation limits.

Preconditions

The pointers inVector must be aligned on 4-byte boundaries. N must be greater than or equal to four and a multiple of four. Dependent on use of the LIBQ library.

Parameters

Parameters	Description
inVector	pointer to source array of elements (int16_t)
N	number of samples (int)

Returns

int16_t - Standard Deviation of N selected elements

Remarks

The input vector elements number, N, must be at least 4 and a multiple of 4. This function is optimized with microMIPS and M14KCe ASE DSP instructions. This function is dependent on the LIBQ library, and the [_LIBQ_Q16Sqrt](#) specifically.

Example

```
int16_t vecStdDevIn[32]={0x4000, 0xD99A, 0x1000, 0x6000,0x1999,0x1999,0x2666, 0x3333};
// .2, -.3, .125, .75, .2, .2, .3, .4
int16_t StdDevOut, Var16Out;
int Nstdev = 4;

StdDevOut = DSP_VectorStdDev16(vecStdDevIn, Nstdev);
// StdDevOut = 0x3A9E (= 0.45797)
```

5.4.1.5.36 DSP_VectorSub16 Function**C**

```
void DSP_VectorSub16(
    int16_t * outdata,
    int16_t * indata1,
    int16_t * indata2,
    int N
);
```

Description

Function DSP_VectorSub16:

```
void DSP_VectorSub16(int16_t *outdata, int16_t *indata1, int16_t *indata2, int N);
```

Computes the difference value of each element of indata1 - indata2 and stores it to outdata. The number of samples to process is given by the parameter N. Data is in a Q15 fractional format. outdata[i] filled with N elements of indata1[i] - indata2[i]

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to eight and a multiple of eight.

Parameters

Parameters	Description
outdata	pointer to output array of 16-bit elements (int16_t)
indata1	pointer to input array of 16-bit elements (int16_t)
indata2	pointer to input array of 16-bit elements (int16_t)
N	number of samples (int)

Returns

None.

Remarks

This must be assembled with .set microMIPS.

Example

```

int16_t *pOutdata;
int16_t outVal[8];
int16_t inBufTest[16] = {-5,2,-3,4,-1,0,-2,-8,-21,21,10,100, 200, 127,-127,-2};
int16_t inBuf2[16]=     { 1,2, 3,4, 5,6, 7, 8, 9, 10,-1,-100,-127,127,-7, 0};
int Num = 8;

pOutdata = &outVal;

DSP_VectorSub16(pOutdata, inBufTest, inBuf2, Num);

// outVal[i] = inBufTest[i] - inBuf2[i] = {-6,0,-6,0,-6,-6,-9,-16}

```

5.4.1.5.5.37 DSP_VectorSub32 Function**C**

```

void DSP_VectorSub32(
    int32_t * outdata,
    int32_t * indata1,
    int32_t * indata2,
    int N
);

```

Description

Function DSP_VectorSub32:

```
void DSP_VectorSub32(int32_t *outdata, int32_t *indata1, int32_t *indata2, int N);
```

Computes the difference value of each element of indata1 - indata2 and stores it to outdata. The number of samples to process is given by the parameter N. Data is in a Q31 fractional format. outdata[i] filled with N elements of indata1[i] - indata2[i]

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to four and a multiple of four.

Parameters

Parameters	Description
outdata	pointer to output array of 16-bit elements (int32_t)
indata1	pointer to input array of 16-bit elements (int32_t)
indata2	pointer to input array of 16-bit elements (int32_t)
N	number of samples (int)

Returns

None.

Remarks

This must be assembled with .set microMIPS.

Example

```

int16_t *pOutdata;
int32_t outVal[8];
int32_t inBufTest[16] = {-5,2,-3,4,-1,0,-2,-8,-21,21,10,100, 200, 127,-127,-2};
int32_t inBuf2[16]=     { 1,2, 3,4, 5,6, 7, 8, 9, 10,-1,-100,-127,127,-7, 0};
int Num = 8;

pOutdata = &outVal;

DSP_VectorSub32(pOutdata, inBufTest, inBuf2, Num);

```

```
// outVal[i] = inBufTest[i] - inBuf2[i] = {-6,0,-6,0,-6,-6,-9,-16}
```

5.4.1.5.5.38 DSP_VectorSumSquares16 Function

C

```
int16_t DSP_VectorSumSquares16(
    int16_t * indata,
    int N,
    int scale
);
```

Description

Function DSP_VectorSumSquares16:

```
int16_t DSP_VectorSumSquares16(int16_t *indata, int N, int scale);
```

Calculates the sum of the squares of each element of an input vector, and scales the output. Function will saturate if it exceeds maximum or minimum values. Scaling is done by binary shifting, after accumulation in a 32 bit register. All calculations are done in Q15 fractional format. return = $1/(2^{\text{scale}}) * \text{sum}(\text{indata}[i]^2)$

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to eight and a multiple of eight.

Parameters

Parameters	Description
indata	pointer to input array of 16-bit elements (int16_t)
scale	number of bits to shift return right (int)
N	number of samples (int)

Returns

int16_t - scaled output of calculation, Q15 format

Remarks

This must be assembled with .set microMIPS.

Example

```
int16_t inBufMultA[8]={0x7FFF, 0x8000, 0x7333, 0x6666, 0x1999, 0x4000, 0x7FFF, 0xB334};
//                      1,      -1,      0.9,      0.8,      0.2,      0.5,      1,      -0.6
int Num = 8;
int scaleVal = 3;
int16_t outScalar;

outScalar = DSP_VectorSumSquares16(inBufMultA, Num, scaleVal);

// outScalar = 1/(2^scaleVal)* sum(inBufMultA[i]^2) =
// (1/8) * (1 + 1 + 0.81 + 0.64 + 0.04 + 0.25 + 1 + 0.36) = 0.125 * 5.1 = 0.6375
// = (int16_t)0x5199
```

5.4.1.5.5.39 DSP_VectorSumSquares32 Function

C

```
int32_t DSP_VectorSumSquares32(
    int32_t * indata,
    int N,
    int scale
);
```

Description

Function DSP_VectorSumSquares32:

```
int32_t DSP_VectorSumSquares32(int32_t *indata, int N, int scale);
```

Calculates the sum of the squares of each element of an input vector, and scales the output. The function will saturate if it exceeds maximum or minimum values. Scaling is done by binary shifting, after calculation of the results. All calculations are done in Q31 fractional format. $\text{return} = 1/(2^{\text{scale}}) * \text{sum}(\text{indata}[i]^2)$

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to four and multiple of four.

Parameters

Parameters	Description
indata	pointer to input array of 16-bit elements (int32_t)
scale	number of bits to shift return right (int)
N	number of samples (int)

Returns

int32_t - scaled output of calculation, Q15 format

Remarks

This must be assembled with .set microMIPS.

Example

```
int32_t inBufMultA[8]={0x7FFFFFFF, 0x80000000, 0x73333333, 0x66666666,
                      0x19999999, 0x40000000, 0x00000000, 0xB3333334};
//          1,      -1,      0.9,      0.8,      0.2,      0.5,      1,      -0.6
int Num = 8;
int scaleVal = 3;
int32_t outScalar;

outScalar = DSP_VectorSumSquares32(inBufMultA, Num, scaleVal);

// outScalar = 1/(2^scaleVal)* sum(inBufMultA[i]^2) =
// (1/8) * (1 + 1 + 0.81 + 0.64 + 0.04 + 0.25 + 1 + 0.36) = 0.125 * 5.1 = 0.6375
// = (int32_t)0x51999999
```

5.4.1.5.5.40 DSP_VectorVari16 Function**C**

```
int16_t DSP_VectorVari16(
    int16_t * inVector,
    int N
);
```

Description

Function DSP_VectorVari16:

```
int16_t DSP_VectorVari16(int16_t *inVector, int N);
```

Calculates the variance on the first N elements of inVector and returns the 16-bit scalar result. The variance is a measure of the delta from mean values, and the mean value of the vector is computed in the process. The function has the form -

$\text{var} = \text{sum}[0..N]((x(i) - M(N))^2) / (N-1)$ where N is the number of vector elements x(i) is a single element in the vector M(N) is the mean of the N elements of the vector

Input values of the vector and output scalar value is Q15 fractional format. This format has data that ranges from -1 to 1, and has internal saturation limits of those same values. Some care has been taken to reduce the impact of saturation by adding processing steps to effectively complete the processing in blocks. However, in some extreme cases of data variance it is still possible to reach the saturation limits.

Preconditions

The pointers inVector must be aligned on 4-byte boundaries. N must be greater than or equal to four and a multiple of four.

Parameters

Parameters	Description
inVector	pointer to source array of elements (int16_t)
N	number of samples (int)

Returns

int16_t - Variance of N selected elements

Remarks

The input vector elements number, N, must be at least 4 and a multiple of 4. This function is optimized with microMIPS and M14KCe ASE DSP instructions.

Example

```
int16_t vecStDevIn[32]={0x4000, 0xD99A, 0x1000, 0x6000,0x1999,0x1999,0x2666, 0x3333};
// .2, -.3, .125, .75, .2, .2, .3, .4
int16_t Var16Out;
int Nvar = 4;

Var16Out= DSP_VectorVari16(vecStDevIn, Nvar); // 16-bit variance function
// Var16Out = 0x1AD8 (= 0.20974)
```

5.4.1.5.5.41 DSP_VectorVariance Function

C

```
int32_t DSP_VectorVariance(
    int32_t * inVector,
    int N
);
```

Description

Function DSP_VectorVariance:

```
int32_t DSP_VectorVariance(int32_t *inVector, int N);
```

Calculates the variance on the first N elements of inVector and returns the 32-bit scalar result. The variance is a measure of the delta from mean values, and the mean value of the vector is computed in the process. The function has the form -

$$\text{var} = \text{sum}[0..N]((x(i) - M(N))^2) / (N-1)$$
 where N is the number of vector elements x(i) is a single element in the vector M(N) is the mean of the N elements of the vector

Input values of the vector and output scalar value is Q31 fractional format. This format has data that ranges from -1 to 1, and has internal saturation limits of those same values. Some care has been taken to reduce the impact of saturation by adding processing steps to effectively complete the processing in blocks. However, in some extreme cases of data variance it is still possible to reach the saturation limits.

Preconditions

The pointers inVector must be aligned on 4-byte boundaries. N must be greater than or equal to four and a multiple of four.

Parameters

Parameters	Description
inVector	pointer to source array of elements (int32_t)
N	number of samples (int)

Returns

int32_t - Variance of N selected elements

Remarks

The input vector elements number, N, must be at least 4 and a multiple of 4. This function is optimized with microMIPS and M14KCe ASE DSP instructions.

Example

```
int varN = 8;

int32_t inVarVec[8] = {0xE6666667, 0x40000000, 0x40000000, 0x0CCCCCCC,
                      0x00000000, 0x59999999, 0x20000000, 0xC0000000};
//      -0.2, 0.5, 0.5, 0.1, 0, 0.7, 0.25, -0.5
int32_t outVar = 0;

outVar = DSP_VectorVariance(inVarVec, varN);

// outVar == 0x1490D2A6, = 0.1606696
```

5.4.1.5.5.42 DSP_VectorZeroPad Function**C**

```
void DSP_VectorZeroPad(
    int32_t * indata,
    int N
);
```

Description

Function DSP_VectorZeroPad:

```
void DSP_VectorZeroPad(int32_t *indata, int N);
```

Fills the first N values of an input vector indata with the value zero. N must be a multiple of four and greater than or equal to four or it will be truncated to the nearest multiple of four. The vector result is in Q31 fractional format.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to four and a multiple of four.

Parameters

Parameters	Description
indata	pointer to source array of elements (int32_t)
N	number of samples (int)

Returns

None.

Remarks

None.

Example

```

int Num = 4;
int32_t inBufTestA[8]={0x3FFFFFFF, 0x80000000, 0x73333333, 0x66666666,
                      0x19999999, 0x40000000, 0x7FFFFFFF, 0xB3333334};
//          0.5,      -1,      0.9,      0.8,      0.2,      0.5,      1,      -0.6

DSP_VectorZeroPad(inBufTestA, Num);

// inBufTestA = {0x00000000, 0x00000000, 0x00000000, 0x00000000,
//               0x19999999, 0x40000000, 0x7FFFFFFF, 0xB3333334};
//               0,        0,        0,        0,        0.2,      0.5,      1,      -0.6

```

dsp.h	DSP functions for the PIC32MZ device family

Description

5.4.1.6.1 dsp.h

Digital Signal Processing (DSP) Library

The DSP Library provides functions supplied by MIPS and Microchip that are optimized for performance on the microAptiv(TM) core of the PIC32MZ family of microcontrollers. The library provides advanced mathematical operations for complex numbers, vector and matrix mathematics, digital filtering and transforms.

All functions are implemented in efficient assembly with C-callable prototypes. In some cases both 16-bit and 32-bit functions are supplied to enable the user with a choice of resolution and performance.

For most functions, input and output data is represented by 16-bit fractional numbers in Q15 format, which is the most commonly used data format for signal processing. Some functions use other data formats internally for increased precision of intermediate results.

The Q15 data type used by the DSP functions is specified as `int16_t` in the C header file that is supplied with the library. Note that within C code, care must be taken to avoid confusing fixed-point values with integers. To the C compiler, objects declared with `int16_t` type are integers, not fixed-point, and all arithmetic operations performed on those objects in C will be done as integers. Fixed-point values have been declared as `int16_t` only because the standard C language does not include intrinsic support for fixed-point data types.

Some functions also have versions operating on 32-bit fractional data in Q31 format. These functions operate similarly to their 16-bit counterparts. However, it should be noted that the 32-bit functions do not benefit much from the SIMD capabilities offered by DSP ASE. Thus, the performance of the 32-bit functions is generally reduced compared to the performance of the corresponding 16-bit functions.

Signed fixed point types are defined as follows:

`Qn.m` where:

- `n` is the number of data bits to the left of the radix point
- `m` is the number of data bits to the right of the radix point
- a signed bit is implied

Unique variable types for fractional representation are also defined:

Exact Name # Bits Required Type Q0.15 (Q15) 16 `int16_t` Q0.31 (Q31) 32 `int32_t`

Table of DSP Library functions:

Complex Math:

```
void DSP\_ComplexAdd32(int32c *indata1, int32c *indata2, int32c *Output);  
void DSP\_ComplexConj16(int16c *indata, int16c *Output);  
void DSP\_ComplexConj32(int32c *indata, int32c *Output);
```

```
void DSP_ComplexDotProd32(int32c *indata1, int32c *indata2, int32c *Output);
```

```
void DSP_ComplexMult32(int32c *indata1, int32c *indata2, int32c *Output);
```

```
void DSP_ComplexScalarMult32(int32c *indata, int32_t Scalar, int32c *Output);
```

```
void DSP_ComplexSub32(int32c *indata1, int32c *indata2, int32c *Output);
```

Filter Functions:

```
void DSP_FilterFIR32(int32_t *outdata, int32_t *indata, int32_t *coeffs2x, int32_t *delayline, int N, int K, int scale);
```

```
void DSP_FilterFIRDecim32(int32_t *outdata, int32_t *indata, int32_t *coeffs, int32_t *delayline, int N, int K, int scale, int rate);
```

```
int16_t DSP_FilterIIR16(int16_t in, int16_t *coeffs, int16_t *delayline, int B, int scale);
```

```
void DSP_FilterIIRSetup16(int16_t *coeffs, biquad16 *bq, int B);
```

```
void DSP_FilterFIRInterp32(int32_t *outdata, int32_t *indata, int32_t *coeffs, int32_t *delayline, int N, int K, int scale, int rate);
```

```
int16_t DSP_FilterLMS16(int16_t in, int16_t ref, int16_t *coeffs, int16_t *delayline, int16_t *error, int K, int16_t mu);
```

```
int16_t DSP_FilterIIRBQ16_fast(int16_t Xin, PARM_EQUAL_FILTER_16 *pFilter);
```

```
int16_t DSP_FilterIIRBQ16(int16_t Xin, PARM_EQUAL_FILTER *pFilter);
```

```
int32_t DSP_FilterIIRBQ32(int32_t Xin, PARM_EQUAL_FILTER_32 *pFilter);
```

```
int16_t DSP_FilterIIRBQ16_cascade8(int16_t Xin, PARM_EQUAL_FILTER *pFilter_Array);
```

```
int16_t DSP_FilterIIRBQ16_cascade8_fast(int16_t Xin, PARM_EQUAL_FILTER_16 *pFilter_Array);
```

```
int16_t DSP_FilterIIRBQ16_parallel8(int16_t Xin, PARM_EQUAL_FILTER *pFilter);
```

```
int16_t DSP_FilterIIRBQ16_parallel8_fast(int16_t Xin, PARM_EQUAL_FILTER_16 *pFilter);
```

Matrix Functions:

```
void DSP_MatrixAdd32(matrix32 *resMat, matrix32 *srcMat1, matrix32 *srcMat2);
```

```
void DSP_MatrixEqual32(matrix32 *resMat, matrix32 *srcMat);
```

```
void DSP_MatrixInit32(int32_t *data_buffer, int32_t N, int32_t num);
```

```
void DSP_MatrixMul32(matrix32 *resMat, matrix32 *srcMat1, matrix32 *srcMat2);
```

```
void DSP_MatrixScale32(int32_t *data_buffer, int32_t N, int32_t num);
```

```
void DSP_MatrixSub32(matrix32 *resMat, matrix32 *srcMat1, matrix32 *srcMat2);
```

```
void DSP_MatrixTranspose32(matrix32 *desMat, matrix32 *srcMat);
```

Transforms:

```
void DSP_TransformFFT16(int16c *dout, int16c *din, int16c *twiddles, int16c *scratch, int log2N);
```

```
void DSP_TransformIFFT16(int16c *dout, int16c *din, int16c *twiddles, int16c *scratch, int log2N);
```

```
void DSP_TransformFFT16_setup(int16c *twiddles, int log2N);
```

```
void DSP_TransformFFT32(int32c *dout, int32c *din, int32c *twiddles, int32c *scratch, int log2N);
```

```
void DSP_TransformFFT32_setup(int32c *twiddles, int log2N);
```

```
void DSP_TransformWindow_Bart16(int16_t *OutVector, int16_t *InVector, int N);
```

```
void DSP_TransformWindow_Bart32(int32_t *OutVector, int32_t *InVector, int N);
```

```
void DSP_TransformWindow_Black16(int16_t *OutVector, int16_t *InVector, int N);
```

```
void DSP\_TransformWindow\_Black32(int32_t *OutVector, int32_t *InVector, int N);
void DSP\_TransformWindow\_Cosine16(int16_t *OutVector, int16_t *InVector, int N);
void DSP\_TransformWindow\_Cosine32(int32_t *OutVector, int32_t *InVector, int N);
void DSP\_TransformWindow\_Hamm16(int16_t *OutVector, int16_t *InVector, int N);
void DSP\_TransformWindow\_Hamm32(int32_t *OutVector, int32_t *InVector, int N);
void DSP\_TransformWindow\_Hann16(int16_t *OutVector, int16_t *InVector, int N);
void DSP\_TransformWindow\_Hann32(int32_t *OutVector, int32_t *InVector, int N);
void DSP\_TransformWindow\_Kaiser16(int16_t *OutVector, int16_t *InVector, int N);
void DSP\_TransformWindow\_Kaiser32(int32_t *OutVector, int32_t *InVector, int N);
void DSP\_TransformWinInit\_Bart16(int16_t *OutWindow, int N);
void DSP\_TransformWinInit\_Bart32(int32_t *OutWindow, int N);
void DSP\_TransformWinInit\_Black16(int16_t *OutWindow, int N);
void DSP\_TransformWinInit\_Black32(int32_t *OutWindow, int N);
void DSP\_TransformWinInit\_Cosine16(int16_t *OutWindow, int N);
void DSP\_TransformWinInit\_Cosine32(int32_t *OutWindow, int N);
void DSP\_TransformWinInit\_Hamm16(int16_t *OutWindow, int N);
void DSP\_TransformWinInit\_Hamm32(int32_t *OutWindow, int N);
void DSP\_TransformWinInit\_Hann16(int16_t *OutWindow, int N);
void DSP\_TransformWinInit\_Hann32(int32_t *OutWindow, int N);
void DSP\_TransformWinInit\_Kaiser16(int16_t *OutWindow, int N);
void DSP\_TransformWinInit\_Kaiser32(int32_t *OutWindow, int N);
```

Vector Math:

```
void DSP\_VectorAbs16(int16_t *outdata, int16_t *indata, int N);
void DSP\_VectorAbs32(int32_t *outdata, int32_t *indata, int N);
void DSP\_VectorAdd16(int16_t *outdata, int16_t *indata1, int16_t *indata2, int N);
void DSP\_VectorAdd32(int32_t *outdata, int32_t *indata1, int32_t *indata2, int N);
void DSP\_VectorAddc16(int16_t *outdata, int16_t *indata, int16_t c, int N);
void DSP\_VectorAddc32(int32_t *outdata, int32_t *indata, int32_t c, int N);
void DSP\_VectorAutocorr16(int16_t *outCorr, int16_t *inVector, int N, int K);
int DSP\_VectorBexp16(int16_t *DataIn, int N);
int DSP\_VectorBexp32(int32_t *DataIn, int N);
int DSP\_VectorChkEqu32(int32_t *indata1, int32_t *indata2, int N);
void DSP\_VectorCopy(int32_t *outdata, int32_t *indata, int N);
void DSP\_VectorCopyReverse32(int32_t *outdata, int32_t *indata, int N);
void DSP\_VectorDivC(\_Q16 *outVector, \_Q16 *inVector, \_Q16 divisor, int N);
```

```

int16_t DSP\_VectorDotp16(int16_t *indata1, int16_t *indata2, int N, int scale);
int32_t DSP\_VectorDotp32(int32_t *indata1, int32_t *indata2, int N, int scale);
void DSP\_VectorExp(\_Q16 *outVector, \_Q16 *inVector, int N);
void DSP\_VectorFill(int32_t *indata, int32_t data, int N);
void DSP\_VectorLog10(\_Q3\_12 *outVector, \_Q16 *inVector, int N);
void DSP\_VectorLog2(\_Q5\_10 *outVector, \_Q16 *inVector, int N);
void DSP\_VectorLn(\_Q4\_11 *outVector, \_Q16 *inVector, int N);
int32_t DSP\_VectorMax32(int32_t *indata, int N);
int DSP\_VectorMaxIndex32(int32_t *indata, int N);
int32_t DSP\_VectorMean32(int32_t *indata, int N);
int32_t DSP\_VectorMin32(int32_t *input, int N);
int DSP\_VectorMinIndex32(int32_t *indata, int N);
void DSP\_VectorMul16(int16_t *outdata, int16_t *indata1, int16_t *indata2, int N);
void DSP\_VectorMul32(int32_t *outdata, int32_t *indata1, int32_t *indata2, int N);
void DSP\_VectorMulc16(int16_t *outdata, int16_t *indata, int16_t c, int N);
void DSP\_VectorMulc32(int32_t *outdata, int32_t *indata, int32_t c, int N);
void DSP\_VectorNegate(int32_t *outdata, int32_t *indata, int N);
void DSP\_VectorRecip(\_Q16 *outVector, \_Q16 *inVector, int N);
int16_t DSP\_VectorRMS16(int16_t *inVector, int N);
void DSP\_VectorShift(int32_t *outdata, int32_t *indata, int N, int shift);
int16_t DSP\_VectorStdDev16(int16_t *inVector, int N);
void DSP\_VectorSqrt(\_Q16 *outVector, \_Q16 *inVector, int N);
void DSP\_VectorSub16(int16_t *outdata, int16_t *indata1, int16_t *indata2, int N);
void DSP\_VectorSub32(int32_t *outdata, int32_t *indata1, int32_t *indata2, int N);
int16_t DSP\_VectorSumSquares16(int16_t *indata, int N, int scale);
int32_t DSP\_VectorSumSquares32(int32_t *indata, int N, int scale);
int16_t DSP\_VectorVari16(int16_t *inVector, int N);
int32_t DSP\_VectorVariance(int32_t *inVector, int N);
void DSP\_VectorZeroPad(int32_t *indata, int N);

```

Functions

	Name	Description
≡	DSP_ComplexAdd32	Calculates the sum of two complex numbers.
≡	DSP_ComplexConj16	Calculates the complex conjugate of a complex number.
≡	DSP_ComplexConj32	Calculates the complex conjugate of a complex number.
≡	DSP_ComplexDotProd32	Calculates the dot product of two complex numbers.
≡	DSP_ComplexMult32	Multiplies two complex numbers.

	DSP_ComplexScalarMult32	Multiplies a complex number and a scalar number.
	DSP_ComplexSub32	Calculates the difference of two complex numbers.
	DSP_FilterFIR32	Performs a Finite Impulse Response filter on a vector.
	DSP_FilterFIRDecim32	Performs a decimating FIR filter on the input array.
	DSP_FilterFIRInterp32	Performs an interpolating FIR filter on the input array.
	DSP_FilterIIR16	Performs a single-sample cascaded biquad Infinite Impulse Response (IIR) filter.
	DSP_FilterIIRBQ16	Performs a single-pass IIR Biquad Filter.
	DSP_FilterIIRBQ16_cascade8	Performs a single IIR Biquad Filter as a cascade of 8 series filters.
	DSP_FilterIIRBQ16_cascade8_fast	Performs a single IIR Biquad Filter as a cascade of 8 series filters.
	DSP_FilterIIRBQ16_fast	Performs a single-pass IIR Biquad Filter.
	DSP_FilterIIRBQ16_parallel8	Performs a 8 parallel single-pass IIR Biquad Filters, and sums the result.
	DSP_FilterIIRBQ16_parallel8_fast	Performs a 8 parallel single-pass IIR Biquad Filters, and sums the result.
	DSP_FilterIIRBQ32	Performs a high resolution single-pass IIR Biquad Filter.
	DSP_FilterIIRSetup16	Converts biquad structure to coeffs array to set up IIR filter.
	DSP_FilterLMS16	Performs a single sample Least Mean Squares FIR Filter.
	DSP_MatrixAdd32	Addition of two matrices $C = (A + B)$.
	DSP_MatrixEqual32	Equality of two matrices $C = (A)$.
	DSP_MatrixInit32	Initializes the first N elements of a Matrix to the value num.
	DSP_MatrixMul32	Multiplication of two matrices $C = A \times B$.
	DSP_MatrixScale32	Scales each element of an input buffer (matrix) by a fixed number.
	DSP_MatrixSub32	Subtraction of two matrices $C = (A - B)$.
	DSP_MatrixTranspose32	Transpose of a Matrix $C = A^T$.
	DSP_TransformFFT16	Creates an Fast Fourier Transform (FFT) from a time domain input.
	DSP_TransformFFT16_setup	Creates FFT coefficients for use in the FFT16 function.
	DSP_TransformFFT32	Creates an Fast Fourier Transform (FFT) from a time domain input.
	DSP_TransformFFT32_setup	Creates FFT coefficients for use in the FFT32 function.
	DSP_TransformIFFT16	Creates an Inverse Fast Fourier Transform (FFT) from a frequency domain input.
	DSP_TransformWindow_Bart16	Perform a Bartlett window on a vector.
	DSP_TransformWindow_Bart32	Perform a Bartlett window on a vector.
	DSP_TransformWindow_Black16	Perform a Blackman window on a vector.
	DSP_TransformWindow_Black32	Perform a Blackman window on a vector.
	DSP_TransformWindow_Cosine16	Perform a Cosine (Sine) window on a vector.
	DSP_TransformWindow_Cosine32	Perform a Cosine (Sine) window on a vector.
	DSP_TransformWindow_Hamm16	Perform a Hamming window on a vector.
	DSP_TransformWindow_Hamm32	Perform a Hamming window on a vector.
	DSP_TransformWindow_Hann16	Perform a Hanning window on a vector.
	DSP_TransformWindow_Hann32	Perform a Hanning window on a vector.
	DSP_TransformWindow_Kaiser16	Perform a Kaiser window on a vector.
	DSP_TransformWindow_Kaiser32	Perform a Kaiser window on a vector.
	DSP_TransformWinInit_Bart16	Create a Bartlett window.
	DSP_TransformWinInit_Bart32	Create a Bartlett window.
	DSP_TransformWinInit_Black16	Create a Blackman window.
	DSP_TransformWinInit_Black32	Create a Blackman window.
	DSP_TransformWinInit_Cosine16	Create a Cosine (Sine) window.

	DSP_TransformWinInit_Cosine32	Create a Cosine (Sine) window.
	DSP_TransformWinInit_Hamm16	Create a Hamming window.
	DSP_TransformWinInit_Hamm32	Create a Hamming window.
	DSP_TransformWinInit_Hann16	Create a Hanning window.
	DSP_TransformWinInit_Hann32	Create a Hanning window.
	DSP_TransformWinInit_Kaiser16	Create a Kaiser window.
	DSP_TransformWinInit_Kaiser32	Create a Kaiser window.
	DSP_VectorAbs16	Calculate the absolute value of a vector.
	DSP_VectorAbs32	Calculate the absolute value of a vector.
	DSP_VectorAdd16	Calculate the sum of two vectors.
	DSP_VectorAdd32	Calculate the sum of two vectors.
	DSP_VectorAddc16	Calculate the sum of two vectors.
	DSP_VectorAddc32	Calculate the sum of two vectors.
	DSP_VectorAutocorr16	Computes the Autocorrelation of a Vector.
	DSP_VectorBexp16	Computes the maximum binary exponent of a vector.
	DSP_VectorBexp32	Computes the maximum binary exponent of a vector.
	DSP_VectorChkEqu32	Compares two input vectors, returns an integer '1' if equal, and '0' if not equal.
	DSP_VectorCopy	Copies the elements of one vector to another.
	DSP_VectorCopyReverse32	Reverses the order of elements in one vector and copies them into another.
	DSP_VectorDivC	Divides the first N elements of inVector by a constant divisor, and stores the result in outVector.
	DSP_VectorDotp16	Computes the dot product of two vectors, and scales the output by a binary factor.
	DSP_VectorDotp32	Computes the dot product of two vectors, and scales the output by a binary factor
	DSP_VectorExp	Computes the EXP (e^x) of the first N elements of inVector, and stores the result in outVector.
	DSP_VectorFill	Fills an input vector with scalar data.
	DSP_VectorLn	Computes the Natural Log, $\ln(x)$, of the first N elements of inVector, and stores the result in outVector.
	DSP_VectorLog10	Computes the $\log_{10}(x)$, of the first N elements of inVector, and stores the result in outVector.
	DSP_VectorLog2	Computes the $\log_2(x)$ of the first N elements of inVector, and stores the result in outVector.
	DSP_VectorMax32	Returns the maximum value of a vector.
	DSP_VectorMaxIndex32	Returns the index of the maximum value of a vector.
	DSP_VectorMean32	Calculates the mean average of an input vector.
	DSP_VectorMin32	Returns the minimum value of a vector.
	DSP_VectorMinIndex32	Returns the index of the minimum value of a vector.
	DSP_VectorMul16	Multiplication of a series of numbers in one vector to another vector.
	DSP_VectorMul32	Multiplication of a series of numbers in one vector to another vector.
	DSP_VectorMulc16	Multiplication of a series of numbers in one vector to a scalar value.
	DSP_VectorMulc32	Multiplication of a series of numbers in one vector to a scalar value.
	DSP_VectorNegate	Inverses the sign (negates) the elements of a vector.
	DSP_VectorRecip	Computes the reciprocal ($1/x$) of the first N elements of inVector, and stores the result in outVector.
	DSP_VectorRMS16	Computes the root mean square (RMS) value of a vector.

	DSP_VectorShift	Shifts the data index of an input data vector.
	DSP_VectorSqrt	Computes the square root of the first N elements of inVector, and stores the result in outVector.
	DSP_VectorStdDev16	Computes the Standard Deviation of a Vector.
	DSP_VectorSub16	Calculate the difference of two vectors.
	DSP_VectorSub32	Calculate the difference of two vectors.
	DSP_VectorSumSquares16	Computes the sum of squares of a vector, and scales the output by a binary factor.
	DSP_VectorSumSquares32	Computes the sum of squares of a vector, and scales the output by a binary factor.
	DSP_VectorVari16	Computes the variance of N elements of a Vector.
	DSP_VectorVariance	Computes the variance of N elements of inVector.
	DSP_VectorZeroPad	Fills an input vector with zeros.
	mul16	multiply and shift integer
	mul16r	multiply and shift Q15
	mul32	multiply and shift Q31
	SAT16	saturate both positive and negative Q15
	SAT16N	saturate negative Q15
	SAT16P	saturate positive Q15

Macros

	Name	Description
	MAX16	maximum Q15
	MAX32	maximum Q31
	MIN16	minimum Q15
	MIN32	minimum Q31

Structures

	Name	Description
	_PARM_EQUAL_FILTER	IIR BQ filter structure Q15 data, Q31 storage
	_PARM_EQUAL_FILTER_16	IIR BQ filter structure Q15
	_PARM_EQUAL_FILTER_32	IIR BQ filter structure Q31
	biquad16	Q15 biquad
	int16c	Q15 complex number (a + bi)
	int32c	Q31 complex number (a + bi)
	matrix32	Q31 matrix
	PARM_EQUAL_FILTER	IIR BQ filter structure Q15 data, Q31 storage
	PARM_EQUAL_FILTER_16	IIR BQ filter structure Q15
	PARM_EQUAL_FILTER_32	IIR BQ filter structure Q31
	PARM_FILTER_GAIN	filter gain structure

5.4.2 LibQ Fixed-Point Math Library

5.4.2.1 Introduction

LibQ Fixed-Point Math Library

for

Microchip Microcontrollers

The LibQ Fixed-Point Math Library is available for the PIC32MZ family of microcontrollers. This library was created from optimized assembly routines written specifically for the microAptive™ core.

Description

The LibQ Fixed-Point Math Library simplifies writing fixed point algorithms, supporting Q15, Q31 and other 16-bit and 32-bit data formats. Using the simple, C callable functions contained in the library, fast fixed point mathematical operations can be easily executed. Fixed-point mathematical calculations may replace some functions implemented in the floating point library (math.h), depending on performance and resolution requirements.

Functions included in the LibQ library include capabilities for trigonometric, power and logarithms, and data conversion. In many cases the functions are identical other than the precision of their operands and the corresponding value that they return.

These functions are implemented in efficient assembly, and generally tuned to optimize performance over code size. In some cases the library breaks out functions that enable one to be optimized for accuracy, while another version is optimized for speed. These functions such as `_LIBQ_Q2_29_acos_Q31` and `_LIBQ_Q2_29_acos_Q31_Fast` are otherwise identical and can be used interchangeably. Each of these functions are typically used in computationally intensive real-time applications where execution time is a critical parameter.

5.4.2.2 Release Notes

MPLAB Harmony Version: v0.70b **LibQ Fixed-Point Library Version :** 1.0 **Release Date:** 18Nov2013

New This Release:

Fixed Point "libq" Math Library

- 31 functions
 - Trigonometric
 - Power, log and exponent functions
 - Divide & square root
 - Number conversions
 - Random number generator
- 16-bit and 32-bit fixed-point integer math
- Optimized in high-performance assembly
- Precision balanced with speed, some fast functions available

Known Issues:

- Optimized for PIC32MZ microAptiv core only
- `_fast` functions have reduced precision

5.4.2.3 SW License Agreement

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.4.2.4 Using the Library

This topic describes the basic architecture of the LibQ Fixed-Point Math Library and provides information and examples on how to use it.

Interface Header File: [libq.h](#)

The interface to the LibQ Fixed-Point Math Library is defined in the "[libq.h](#)" header file. Any C language source (.c) file that uses the LibQ Fixed-Point Library should include "[libq.h](#)".

Library File:

The LibQ Fixed-Point Math Library archive (.a) file installed with MPLAB Harmony.

5.4.2.4.1 Library Overview

The LibQ Fixed-Point Math Library contains functions for manipulating Q15, Q31 and other intermediate integer representations of real numbers. Library Interface details the operation of the data formats and explains each function in detail.

Signed fixed-point types are defined as follows:

`Qn_m` where:

- *n* is the number of data bits to the left of the radix point
- *m* is the number of data bits to the right of the radix point
- a signed bit is implied

For convenience, short names are also defined:

Exact Name	Number of Bits Required	Short Name
<u>Q0_15</u>	16	<u>Q15</u>
<u>Q15_16</u>	32	<u>Q16</u>
<u>Q0_31</u>	32	<u>Q31</u>

Q_n_m numerical values are used by the library processing data as integers. In this format the n represents the number of integer bits, and the m represents the number of fractional bits. All values assume a sign bit in the most significant bit. The range of the numerical value therefore is:

$$-2^{(n-1)} \text{ to } [2^{(n-1)} - 2^{(-m)}]; \text{ with a resolution of } 2^{(-m)}.$$

A Q16 format number (Q15_16) would range from -32768.0 (0x8000 0000) to 32767.99998474 with a precision of 0.000015259 (or 2^{-16}).

For example, a numerical representation of the number 3.14159 in Q2_13 notation would be:

$$3.14159 * 2^{13} = 25735.9 \Rightarrow 0x6488$$

And converting from the Q7_8 format with the value 0x1D89 would be:

$$0x1D89 / 2^8 = 7561 / 256 \Rightarrow 29.5316, \text{ accurate to } 0.00391$$

Functions in the library are prefixed with the type of the return value. For example, LIBQ_Q16Sqrt returns a Q16 value equal to the square root of its argument. Argument types do not always match the return type. Refer to the function prototype for a specification of its arguments.

In cases where the return value is not a fixed-point type, the argument type is appended to the function name. For example, LIBQ_ToFloatQ31 accepts a type Q31 argument.

In some cases, both the return type and the argument type are specified within the function name. For example:

Function Name	Return Type	Argument Type
<u>LIBQ_Q15_sin_Q2_13</u>	<u>Q15</u>	<u>Q2_13</u>
<u>LIBQ_Q31_sin_Q2_29</u>	<u>Q31</u>	<u>Q2_29</u>

5.4.2.4.2 Table of Library Functions

Math Function	Function Definition
Divide	<u>Q16</u> <u>LIBQ_Q16Div</u> (<u>Q16</u> dividend, <u>Q16</u> divisor);
Square Root	<u>Q16</u> <u>LIBQ_Q16Sqrt</u> (<u>Q16</u> x);
Exponential	<u>Q16</u> <u>LIBQ_Q16Exp</u> (<u>Q16</u> x);
Log	<u>Q4_11</u> <u>LIBQ_Q4_11_ln_Q16</u> (<u>Q16</u> x); <u>Q3_12</u> <u>LIBQ_Q3_12_log10_Q16</u> (<u>Q16</u> x); <u>Q5_10</u> <u>LIBQ_Q5_10_log2_Q16</u> (<u>Q16</u> x);
Power	<u>Q16</u> <u>LIBQ_Q16Power</u> (<u>Q16</u> x, <u>Q16</u> y);
Sine	<u>Q15</u> <u>LIBQ_Q15_sin_Q2_13</u> (<u>Q2_13</u> x); <u>Q31</u> <u>LIBQ_Q31_sin_Q2_29</u> (<u>Q2_29</u> x);

Cosine	<code>__Q15_LIBQ_Q15_cos_Q2_13 (__Q2_13 x);</code> <code>__Q31_LIBQ_Q31_cos_Q2_29 (__Q2_29 x);</code>

5.4.2.5 Library Interface

Data Types and Constants

	Name	Description
	<code>__Q15_MAX</code>	Maximum value of <code>__Q15</code> (~1.0)
	<code>__Q15_MIN</code>	Minimum value of <code>__Q15</code> (-1.0)
	<code>__Q16_MAX</code>	Maximum value of <code>__Q16</code> (~32768.0)
	<code>__Q16_MIN</code>	Minimum value of <code>__Q16</code> (-32768.0)
	<code>__Q2_13_MAX</code>	Maximum value of <code>__Q2_13</code> (~4.0)
	<code>__Q2_13_MIN</code>	Minimum value of <code>__Q2_13</code> (-4.0)
	<code>__Q2_29_MAX</code>	Maximum value of <code>__Q2_29</code> (~4.0)
	<code>__Q2_29_MIN</code>	Minimum value of <code>__Q2_29</code> (-4.0)
	<code>__Q3_12_MAX</code>	Maximum value of <code>__Q3_12</code> (~8.0)
	<code>__Q3_12_MIN</code>	Minimum value of <code>__Q3_12</code> (-8.0)
	<code>__Q31_MAX</code>	Maximum value of <code>__Q31</code> (~1.0)
	<code>__Q31_MIN</code>	Minimum value of <code>__Q31</code> (-1.0)
	<code>__Q4_11_MAX</code>	Maximum value of <code>__Q4_11</code> (~16.0)
	<code>__Q4_11_MIN</code>	Minimum value of <code>__Q4_11</code> (-16.0)
	<code>__Q5_10_MAX</code>	Maximum value of <code>__Q5_10</code> (~32.0)
	<code>__Q5_10_MIN</code>	Minimum value of <code>__Q5_10</code> (-32.0)

	_Q7_8_MAX	Maximum value of _Q7_8 (~128.0)
	_Q7_8_MIN	Minimum value of _Q7_8 (-128.0)
	_Q0_15	1 sign bit, 15 bits right of radix
	_Q0_31	1 sign bit, 31 bits right of radix
	_Q15	Short name for _Q0_15
	_Q15_16	1 sign bit, 15 bits left of radix, 16 bits right of radix
	_Q16	Short name for _Q15_16
	_Q2_13	1 sign bit, 2 bits left of radix, 13 bits right of radix
	_Q2_29	1 sign bit, 2 bits left of radix, 29 bits right of radix
	_Q3_12	1 sign bit, 3 bits left of radix, 12 bits right of radix
	_Q31	Short name for _Q_0_31
	_Q4_11	1 sign bit, 4 bits left of radix, 11 bits right of radix
	_Q5_10	1 sign bit, 5 bits left of radix, 10 bits right of radix
	_Q7_8	1 sign bit, 7 bits left of radix, 8 bits right of radix

Arccos Functions

	Name	Description
	_LIBQ_Q2_13_acos_Q15	Calculates the value of $\text{acos}(x)$.
	_LIBQ_Q2_29_acos_Q31	Calculates the value of $\text{acos}(x)$.
	_LIBQ_Q2_29_acos_Q31_Fast	Calculates the value of $\text{acos}(x)$. This function executes faster than _LIBQ_Q2_29_acos_Q31 but is less precise.

Arcsin Functions

	Name	Description
	_LIBQ_Q2_13_asin_Q15	Calculates the asin value of $\text{asin}(x)$.
	_LIBQ_Q2_29_asin_Q31	Calculates the value of $\text{asin}(x)$.
	_LIBQ_Q2_29_asin_Q31_Fast	Calculates the value of $\text{asin}(x)$. This function executes faster than the _LIBQ_Q2_29_asin_Q31 function, but is less precise.

Arctan Functions

	Name	Description
	_LIBQ_Q2_13_atan_Q7_8	Calculates the value of $\text{atan}(x)$.
	_LIBQ_Q2_29_atan_Q16	Calculates the value of $\text{atan}(x)$.

Arctan2 Functions

	Name	Description
	_LIBQ_Q2_13_atan2_Q7_8	Calculates the value of $\text{atan2}(y, x)$.
	_LIBQ_Q2_29_atan2_Q16	Calculates the value of $\text{atan2}(y, x)$.

Cosine Functions

	Name	Description
	_LIBQ_Q15_cos_Q2_13	Calculates the value of $\text{cosine}(x)$.
	_LIBQ_Q31_cos_Q2_29	Calculates the value of $\text{cosine}(x)$.

Divide Functions

	Name	Description
	_LIBQ_Q16Div	_Q16 fixed point divide.

Exponential Functions

	Name	Description
	<u>_LIBQ_Q16Exp</u>	Calculates the exponential function e^x .

Float Functions

	Name	Description
	<u>_LIBQ_Q15FromFloat</u>	Converts a float to a <u>_Q15</u> value.
	<u>_LIBQ_Q31FromFloat</u>	Converts a float to a <u>_Q31</u> value.
	<u>_LIBQ_ToFloatQ15</u>	Converts a <u>_Q15</u> value to a float.
	<u>_LIBQ_ToFloatQ31</u>	Converts a <u>_Q31</u> value to a float.

Log Functions

	Name	Description
	<u>_LIBQ_Q3_12_log10_Q16</u>	Calculates the value of $\text{Log}_{10}(x)$.
	<u>_LIBQ_Q4_11_ln_Q16</u>	Calculates the natural logarithm $\ln(x)$.
	<u>_LIBQ_Q5_10_log2_Q16</u>	Calculates the value of $\log_2(x)$.

Power Functions

	Name	Description
	<u>_LIBQ_Q16Power</u>	Calculates the value of x raised to the y power (x^y).

Random Number Functions

	Name	Description
	<u>_LIBQ_Q15Rand</u>	Generate a <u>_Q15</u> random number.
	<u>_LIBQ_Q31Rand</u>	Generate a <u>_Q31</u> random number.

Sine Functions

	Name	Description
	<u>_LIBQ_Q15_sin_Q2_13</u>	Calculates the value of $\sin(x)$.
	<u>_LIBQ_Q31_sin_Q2_29</u>	Calculates the value of $\sin(x)$.

Square Root Functions

	Name	Description
	<u>_LIBQ_Q16Sqrt</u>	Square root of a positive <u>_Q16</u> fixed point value.

String Functions

	Name	Description
	<u>_LIBQ_Q15FromString</u>	Ascii to <u>_Q15</u> conversion.
	<u>_LIBQ_ToStringQ15</u>	<u>_Q15</u> to ascii conversion.

Target Functions

	Name	Description
	<u>_LIBQ_Q16_tan_Q2_29</u>	Calculates the value of $\tan(x)$.
	<u>_LIBQ_Q7_8_tan_Q2_13</u>	Calculates the value of $\tan(x)$.

Description

This section describes the Application Programming Interface (API) functions, macros, and types of the LibQ Fixed Point Math Library.

Refer to each section for a detailed description.

5.4.2.5.1 Divide Functions

5.4.2.5.1.1 _LIBQ_Q16Div Function

C

```
_Q16 _LIBQ_Q16Div(
    _Q16 dividend,
    _Q16 divisor
);
```

Description

Function _LIBQ_Q16Div:

_Q16 _LIBQ_Q16Div (_Q16 dividend, _Q16 divisor);

Quotient (_Q16) = Dividend (_Q16) / Divisor (_Q16).

Preconditions

Divisor must not equal 0.

Parameters

Parameters	Description
dividend	The divide operation dividend (<u>_Q16</u>)
divisor	The divide operation divisor (<u>_Q16</u>)

Returns

_Q16 quotient of the divide operation

Remarks

The _LIBQ_Q16Div operation saturates its result.

Execution Time (cycles): 143 typical (80 to 244) Program Memory 204 bytes

Error <= 0.000015258789 (accurate to least significant _Q16 bit within the non-saturated range)

Example

```
_Q16 quotient, dividend, divisor;

dividend = (_Q16)0x00010000; // 1
divisor  = (_Q16)0x00008000; // 0.5

quotient = _LIBQ_Q16Div (dividend, divisor);

// quotient now equals 2; ie. (_Q16)0x00020000;
```

5.4.2.5.2 Square Root Functions

5.4.2.5.2.1 _LIBQ_Q16Sqrt Function

C

```
_Q16 _LIBQ_Q16Sqrt(
    _Q16 x
);
```

Description

Function `_LIBQ_Q16Sqrt`:

`_Q16 _LIBQ_Q16Sqrt(_Q16 x);`

Calculate the square root of a positive `_Q16` fixed point value, and return the `_Q16` result.

Preconditions

The input value must be positive.

Parameters

Parameters	Description
x	The <code>_Q16</code> fixed point value input from which to find the square root.

Returns

`_LIBQ_Q16Sqrt` returns the `_Q16` fixed point value which is the square root of the input parameter.

Remarks

Execution Time (cycles): 240 typical (104 to 258) Program Memory 152 bytes

Error <= 0.000015258789 (accurate to least significant `_Q16` bit)

Example

```
_Q16 squareRoot;

squareRoot = _LIBQ_Q16Sqrt((_Q16)0x01000000); // The square root of 256.0 is 16.0 (0x00100000)
squareRoot = _LIBQ_Q16Sqrt((_Q16)0x00004000); // The square root of 0.25 is 0.5 (0x00008000)
squareRoot = _LIBQ_Q16Sqrt((_Q16)0x5851f42d); // The square root of 22609.953125 is
150.366074 (0x00965db7)
```

5.4.2.5.3 Log Functions

5.4.2.5.3.1 _LIBQ_Q3_12_log10_Q16 Function

C

```
_Q3_12 _LIBQ_Q3_12_log10_Q16(
    _Q16 x
);
```

Description

Function `_LIBQ_Q3_12_log10_Q16`:

`_Q3_12 _LIBQ_Q3_12_log10_Q16 (_Q16 x);`

Calculates the $\log_{10}(x)$, where $\log_{10}(x) = \ln(x) * \log_{10}(e)$. x is of type `_Q16` and must be positive. The resulting value is of type `_Q3_12`.

Preconditions

The input x must be positive.

Parameters

Parameters	Description
x	The input value from which to calculate $\log_{10}(x)$.

Returns

`_LIBQ_Q3_12_log10_Q16` returns the `_Q3_12` fixed point result from the calculation $\log_{10}(x)$.

Remarks

Execution Time (cycles): 301 typical (14 to 346) Program Memory 176 bytes

Error ≤ 0.000244140625 (accurate to least significant `_Q3_12` bit)

Example

```
_Q3_12 resultLog10;

resultLog10 = _LIBQ_Q3_12_log10_Q16 ((_Q16)0x12ed7d91); // _LIBQ_Q3_12_log10_Q16(4845.490494)
= 3.685303 (0x3af7)
```

5.4.2.5.3.2 _LIBQ_Q4_11_In_Q16 Function**C**

```
_Q4_11 _LIBQ_Q4_11_ln_Q16(
    _Q16 x
);
```

Description

Function `_LIBQ_Q4_11_ln_Q16`:

`_Q4_11 _LIBQ_Q4_11_ln_Q16 (_Q16 x)`;

Calculates the natural logarithm $\ln(x)$. x is of type `_Q16` and must be positive. The resulting value is of type `_Q4_11`.

Preconditions

The input x must be positive.

Parameters

Parameters	Description
x	The input value from which to calculate $\ln(x)$.

Returns

`_LIBQ_Q4_11_ln_Q16` returns the `_Q4_11` fixed point result from the calculation $\ln(x)$.

Remarks

Execution Time (cycles): 301 typical (14 to 346) Program Memory 176 bytes

Error ≤ 0.00048828 (accurate to least significant `_Q4_11` bit)

Example

```
_Q4_11 resultLN;

resultLN = _LIBQ_Q4_11_ln_Q16 ((_Q16)0x00004000); // _LIBQ_Q4_11_ln_Q16(0.250000) = -1.386230
(0xf4e9)
```

5.4.2.5.3.3 _LIBQ_Q5_10_log2_Q16 Function**C**

```
_Q5_10 _LIBQ_Q5_10_log2_Q16(
    _Q16 x
);
```

Description

Function `_LIBQ_Q5_10_log2_Q16`:

```
_Q5_10 _LIBQ_Q5_10_log2_Q16 (_Q16 x);
```

Calculates the $\log_2(x)$, where $\log_2(x) = \ln(x) * \log_2(e)$. x is of type Q16 and must be positive. The resulting value is of type Q5_10.

Preconditions

The input x must be positive.

Parameters

Parameters	Description
x	The input value from which to calculate $\log_2(x)$.

Returns

_LIBQ_Q5_10_log2_Q16 returns the Q5_10 fixed point result from the calculation $\log_2(x)$.

Remarks

Execution Time (cycles): 227 typical (14 to 268) Program Memory 164 bytes

Error ≤ 0.0009765625 (accurate to least significant Q5_10 bit)

Example

```
_Q5_10 resultLog2;

resultLog2 = _LIBQ_Q5_10_log2_Q16 ((_Q16)0x40000000); // _LIBQ_Q5_10_log2_Q16(16384.000000) =
14.000000 (0x3800)
```

5.4.2.5.4 Power Functions

5.4.2.5.4.1 _LIBQ_Q16Power Function

C

```
_Q16 _LIBQ_Q16Power(
    _Q16 x,
    _Q16 y
);
```

Description

Function _LIBQ_Q16Power:

```
_Q16 _LIBQ_Q16Power (_Q16 x, _Q16 y);
```

Calculates the x raised to the y power. Both x and y are of type Q16. x must be positive. The calculation will saturate if the resulting value is outside the range of the Q16 representation.

Preconditions

x must be positive.

Parameters

Parameters	Description
x	The <u>Q16</u> input value x from which to calculate x raised to the y.
y	The <u>Q16</u> input value y from which to calculate x raised to the y.

Returns

_LIBQ_Q16Power returns the Q16 fixed point result from the calculation x raised to the y.

Remarks

Execution Time (cycles): 882 typical (586 to 1042) Program Memory 1038 bytes

Error <= 0.000015258789 (accurate to least significant Q16 bit within the non-saturated range)

Example

```
_Q16 resultPower;

resultPower = _LIBQ_Q16Power ((_Q16)0x00020000, (_Q16)0xffff0000); //
_LIBQ_Q16Power(2.000000, -1.000000) = 0.500000 (0x00008000)
```

5.4.2.5.5 Exponential Functions

5.4.2.5.5.1 _LIBQ_Q16Exp Function

C

```
_Q16 _LIBQ_Q16Exp(
    _Q16 x
);
```

Description

Function _LIBQ_Q16Exp:

Q16 _LIBQ_Q16Exp(Q16 x);

Calculates the exponential function e^x . The calculation will saturate if the resulting value is outside the range of the Q16 representation. For $x > 10.3972015380859375$, the resulting value will be saturated to 0x7ffffff. For $x < -10.3972015380859375$ the resulting value will be saturated to 0.

Preconditions

None.

Parameters

Parameters	Description
x	The exponent value

Returns

_LIBQ_Q16Exp returns the Q16 fixed point result from the calculation e^x .

Remarks

The function _LIBQ_Q16Div is called by this routine and thus must be linked into the executable image.

Execution Time (cycles): 170 typical (18 to 292) Program Memory 446 bytes

Error <= 0.000015258789 (accurate to least significant Q16 bit within the non-saturated range)

Example

```
_Q16 expResult;

expResult = _LIBQ_Q16Exp((_Q16)0x00010000); // _LIBQ_Q16Exp(1.000000) = 2.718277 (0x0002b7e1)
```

5.4.2.5.6 Sine Functions

5.4.2.5.6.1 _LIBQ_Q15_sin_Q2_13 Function

C

```
_Q15 _LIBQ_Q15_sin_Q2_13(
    _Q2_13 x
);
```

Description

Function _LIBQ_Q15_sin_Q2_13:

Q15 _LIBQ_Q15_sin_Q2_13 (Q2_13 x);

Calculates the sine(x), where x is of type Q2_13 radians and the resulting value is of type Q15.

Preconditions

None.

Parameters

Parameters	Description
x	The <u>Q2_13</u> input value from which to calculate sine(x).

Returns

_LIBQ_Q15_sin_Q2_13 returns the Q15 fixed point result from the calculation sine(x).

Remarks

Execution Time (cycles): 100 typical (100 to 102) Program Memory 220 bytes

Error <= 0.00003052 (accurate to least significant Q15 bit)

Example

```
_Q15 resultSin;

resultSin = _LIBQ_Q15_sin_Q2_13 ((_Q2_13)0x4093); // _LIBQ_Q15_sin_Q2_13(2.017944) = 0.901672
(0x736a)
```

5.4.2.5.6.2 _LIBQ_Q31_sin_Q2_29 Function

C

```
_Q31 _LIBQ_Q31_sin_Q2_29(
    _Q2_29 x
);
```

Description

Function _LIBQ_Q31_sin_Q2_29:

Q31 _LIBQ_Q31_sin_Q2_29 (Q2_29 x);

Calculates the sine(x), where x is of type Q2_29 radians and the resulting value is of type Q31.

Preconditions

None.

Parameters

Parameters	Description
x	The <u>Q2_29</u> input value from which to calculate sine(x).

Returns

`_LIBQ_Q31_sin_Q2_29` returns the `_Q31` fixed point result from the calculation `sine(x)`.

Remarks

Execution Time (cycles): 246 typical (244 to 266) Program Memory 598 bytes

Error <= 0.00000000047 (accurate to least significant `_Q31` bit)

Example

```
_Q31 resultSin;

resultSin = _LIBQ_Q31_sin_Q2_29 ((_Q2_29)0x5a637cfe); // _LIBQ_Q31_sin_Q2_29( 2.824644562) =
0.311668121 (0x27e4bdb1)
```

5.4.2.5.7 Cosine Functions

5.4.2.5.7.1 _LIBQ_Q15_cos_Q2_13 Function

C

```
_Q15 _LIBQ_Q15_cos_Q2_13(
    _Q2_13 x
);
```

Description

Function `_LIBQ_Q15_cos_Q2_13`:

`_Q15 _LIBQ_Q15_cos_Q2_13 (_Q2_13 x);`

Calculates the `cosine(x)`, where `x` is of type `_Q2_13` radians and the resulting value is of type `_Q15`.

Preconditions

None

Parameters

Parameters	Description
<code>x</code>	The <code>_Q2_13</code> input value from which to calculate <code>cosine(x)</code> .

Returns

`_LIBQ_Q15_cos_Q2_13` returns the `_Q15` fixed point result from the calculation `cosine(x)`.

Remarks

Execution Time (cycles): 102 cycles Program Memory 224 bytes

Error <= 0.00003052 (accurate to least significant `_Q15` bit)

Example

```
_Q15 resultCos;

resultCos = _LIBQ_Q15_cos_Q2_13 ((_Q2_13)0x2171); // _LIBQ_Q15_cos_Q2_13(1.045044) = 0.501862
(0x403d)
```

5.4.2.5.7.2 _LIBQ_Q31_cos_Q2_29 Function

C

```
_Q31 _LIBQ_Q31_cos_Q2_29(
    _Q2_29 x
```

```
);
```

Description

Function `_LIBQ_Q31_cos_Q2_29`:

```
_Q31 _LIBQ_Q31_cos_Q2_29 (_Q2_29 x);
```

Calculates the cosine(x), where x is of type `_Q2_29` radians and the resulting value is of type `_Q31`.

Preconditions

None.

Parameters

Parameters	Description
x	The <code>_Q2_29</code> input value from which to calculate cosine(x).

Returns

`_LIBQ_Q31_cos_Q2_29` returns the `_Q31` fixed point result from the calculation sine(x).

Remarks

Execution Time (cycles): 265 typical (22 to 288) Program Memory 746 bytes

Error <= 0.00000000047 (accurate to least significant `_Q31` bit)

Example

```
_Q31 resultCos;

resultCos = _LIBQ_Q31_cos_Q2_29 ((_Q2_29)0x07e2e1c2); // _LIBQ_Q31_cos_Q2_29( 0.246445540) =
0.969785686 (0x7c21eff7)
```

5.4.2.5.8 Target Functions

5.4.2.5.8.1 _LIBQ_Q16_tan_Q2_29 Function

C

```
_Q16 _LIBQ_Q16_tan_Q2_29(
_Q2_29 x
);
```

Description

Function `_LIBQ_Q16_tan_Q2_29`:

```
_Q16 _LIBQ_Q16_tan_Q2_29 (_Q2_29 x);
```

Calculates the tan(x), where x is of type `_Q2_29` radians and the resulting value is of type `_Q16`.

Preconditions

None

Parameters

Parameters	Description
x	The <code>_Q2_29</code> input value from which to calculate tan(x).

Returns

`_LIBQ_Q16_tan_Q2_29` returns the `_Q16` fixed point result from the calculation tan(x). The resulting value is saturated.

Remarks

The functions `_LIBQ_Q31_sin_Q2_29`, `_LIBQ_Q31_cos_Q2_29`, and `_LIBQ_Q16Div` are called by this routine and thus must be linked into the executable image.

Execution Time (cycles): 703 typical (22 to 796) Program Memory 88 bytes

Error <= 0.000015259 (accurate to least significant `_Q16` bit for the input range -1.568 .. 1.568) Error rises from 0.0 to 0.065 for the input range -1.568 .. -1.570765808 and 1.568 .. 1.570765808)

Example

```
_Q16 resultTan;

resultTan = _LIBQ_Q16_tan_Q2_29 ((_Q2_29)0x16720c36); // _LIBQ_Q16_tan_Q2_29( 0.701421838) =
0.844726562 (0x0000d840)
```

5.4.2.5.8.2 _LIBQ_Q7_8_tan_Q2_13 Function**C**

```
_Q7_8 _LIBQ_Q7_8_tan_Q2_13(
    _Q2_13 x
);
```

Description

Function `_LIBQ_Q7_8_tan_Q2_13`:

`_Q7_8 _LIBQ_Q7_8_tan_Q2_13 (_Q2_13 x);`

Calculates the tan(x), where x is of type `_Q2_13` radians and the resulting value is of type `_Q7_8`.

Preconditions

None

Parameters

Parameters	Description
x	The <code>_Q2_13</code> input value from which to calculate tan(x).

Returns

`_LIBQ_Q7_8_tan_Q2_13` returns the `_Q7_8` fixed point result from the calculation tan(x).

Remarks

Execution Time (cycles): 288 typical (18 to 346) Program Memory 980 bytes

Error <= 0.00390625 (accurate to least significant `_Q7_8` bit)

Example

```
_Q7_8 resultTan;

resultTan = _LIBQ_Q7_8_tan_Q2_13 ((_Q2_13)0x2e20); // _LIBQ_Q7_8_tan_Q2_13(1.441406) =
7.683594 (0x07af)
```

5.4.2.5.9 Arcsin Functions**5.4.2.5.9.1 _LIBQ_Q2_13_asin_Q15 Function****C**

```
_Q2_13 _LIBQ_Q2_13_asin_Q15(
```

```
    _Q15 x
);
```

Description

Function `_LIBQ_Q2_13_asin_Q15`:

`_Q2_13` `_LIBQ_Q2_13_asin_Q15` (`_Q15` x);

Calculates `asin(x)`, where x is of type `_Q15` and the resulting value is of type `_Q2_13`. The output value will be radians in the range $\pi \geq \text{result} \geq -\pi$.

Preconditions

None.

Parameters

Parameters	Description
x	The <code>_Q15</code> input value from which to calculate <code>asin(x)</code> .

Returns

`_LIBQ_Q2_13_asin_Q15` returns the `_Q2_13` fixed point result from the calculation `asin(x)`.

Remarks

The functions `_LIBQ_Q16Sqrt` and `_LIBQ_Q16Div` are called by this routine and thus must be linked into the executable image.

Execution Time (cycles): 578 typical (22 to 656) Program Memory 336 bytes

Error ≤ 0.00012207 (accurate to least significant `_Q2_13` bit)

A higher resolution version of this function exists with equivalent performance, see `_LIBQ_Q2_29_asin_Q31_Fast`

Example

```
_Q2_13 resultAsin;

resultAsin = _LIBQ_Q2_13_asin_Q15 ((_Q15)0x3231); // _LIBQ_Q2_13_asin_Q15(0.392120) =
0.402954 (0x0ce5)
```

5.4.2.5.9.2 `_LIBQ_Q2_29_asin_Q31` Function

C

```
_Q2_29 _LIBQ_Q2_29_asin_Q31(
    _Q31 x
);
```

Description

Function `_LIBQ_Q2_29_asin_Q31`:

`_Q2_29` `_LIBQ_Q2_29_asin_Q31` (`_Q31` x);

Calculates the `asin(x)`, where x is of type `_Q31` and the resulting value is of type `_Q2_29`. The output value will be in radians the range $\pi \geq \text{result} \geq -\pi$.

Preconditions

None.

Parameters

Parameters	Description
x	The <code>_Q31</code> input value from which to calculate <code>asin(x)</code> .

Returns

`_LIBQ_Q2_29_asin_Q31` returns the `_Q2_29` fixed point result from the calculation `asin(x)`.

Remarks

The functions `_LIBQ_Q2_29_asin_Q31_Fast` and `_LIBQ_Q31_sin_Q2_29` are called by this routine and thus must be linked into the executable image.

Execution Time (cycles): 2525 typical (286 to 4330) Program Memory 138 bytes

Error ≤ 0.0000000019 (accurate to least significant `_Q2_29` bit for the range -0.9993..0.9993) Error ≤ 0.0000000346 (accurate to 5th least significant `_Q2_29` bit for the range -1.0 .. -0.9993 and 0.9993 .. 1.0)

A faster version of this function exists with modestly reduced accuracy, see `_LIBQ_Q2_29_asin_Q31_Fast`

Example

```
_Q2_29 resultAsin;

resultAsin = _LIBQ_Q2_29_asin_Q31 ((_Q31)0x7fe50658); // _LIBQ_Q2_29_asin_Q31( 0.9991767816)
= 1.5302172359 (0x30f78a23)
```

5.4.2.5.9.3 _LIBQ_Q2_29_asin_Q31_Fast Function**C**

```
_Q2_29 _LIBQ_Q2_29_asin_Q31_Fast(
    _Q31 x
);
```

Description

Function `_LIBQ_Q2_29_asin_Q31_Fast`:

`_Q2_29` `_LIBQ_Q2_29_asin_Q31_Fast` (`_Q31` x);

Calculates the `asin(x)`, where x is of type `_Q31` and the resulting value is of type `_Q2_29`. The output value will be in radians the range $\pi \geq \text{result} \geq -\pi$.

Preconditions

None.

Parameters

Parameters	Description
x	The <code>_Q31</code> input value from which to calculate <code>asin(x)</code> .

Returns

`_LIBQ_Q2_29_asin_Q31_Fast` returns the `_Q2_29` fixed point result from the calculation `asin(x)`.

Remarks

Execution Time (cycles): 507 typical (22 to 1300) Program Memory 638 bytes

Error ≤ 0.000000911 (accurate to 9 least significant `_Q2_29` bits)

A higher resolution version of this function exists with reduced performance, see `_LIBQ_Q2_29_asin_Q31`

Example

```
_Q2_29 resultAsin;

resultAsin = _LIBQ_Q2_29_asin_Q31_Fast ((_Q31)0x7fe50658); // _LIBQ_Q2_29_asin_Q31_Fast(
0.9991767816) = 1.5302172359 (0x30f78a23)
```

5.4.2.5.10 Arccos Functions

5.4.2.5.10.1 _LIBQ_Q2_13_acos_Q15 Function

C

```
_Q2_13 _LIBQ_Q2_13_acos_Q15(
    _Q15 x
);
```

Description

Function _LIBQ_Q2_13_acos_Q15:

[_Q2_13](#) _LIBQ_Q2_13_acos_Q15 ([_Q15](#) x);

Calculates the acos(x), where x is of type [_Q15](#) and the resulting value is of type [_Q2_13](#). The output value will be radians in the range $\pi \geq \text{result} \geq -\pi$.

Preconditions

None.

Parameters

Parameters	Description
x	The _Q15 input value from which to calculate acos(x).

Returns

_LIBQ_Q2_13_acos_Q15 returns the [_Q2_13](#) fixed point result from the calculation acos(x).

Remarks

The function [_LIBQ_Q2_13_asin_Q15](#) is called by this routine and thus must be linked into the executable image.

Execution Time (cycles): 588 typical (32 to 666) Program Memory 24 bytes

Error ≤ 0.00012207 (accurate to least significant [_Q2_13](#) bit)

A higher precision function with equivalent performance exists, see [_LIBQ_Q2_29_acos_Q31_Fast](#)

Example

```
_Q2_13 resultAcos;

resultAcos = _LIBQ_Q2_13_acos_Q15((_Q15)0x2993); // \_LIBQ\_Q2\_13\_acos\_Q15\(0.324799\) = 1.239990
(0x27ae)
```

5.4.2.5.10.2 _LIBQ_Q2_29_acos_Q31 Function

C

```
_Q2_29 _LIBQ_Q2_29_acos_Q31(
    _Q31 x
);
```

Description

Function _LIBQ_Q2_29_acos_Q31:

[_Q2_29](#) _LIBQ_Q2_29_acos_Q31 ([_Q31](#) x);

Calculates the acos(x), where x is of type [_Q31](#) and the resulting value is of type [_Q2_29](#). The output value will be radians in the range $\pi \geq \text{result} \geq -\pi$.

Preconditions

None.

Parameters

Parameters	Description
x	The _Q31 input value from which to calculate acos(x).

Returns

[_LIBQ_Q2_29_acos_Q31](#) returns the [_Q2_29](#) fixed point result from the calculation acos(x).

Remarks

The functions [_LIBQ_Q2_29_asin_Q31_Fast](#) and [_LIBQ_Q31_cos_Q2_29](#) are called by this routine and thus must be linked into the executable image.

Execution Time (cycles): 3370 typical (70 to 4824) Program Memory 142 bytes

Error <= 0.0000000019 (accurate to least significant [_Q2_29](#) bit for the range -0.9993..0.9993) Error <= 0.0000000355 (accurate to 5th least significant [_Q2_29](#) bit for the range -1.0 .. -0.9993 and 0.9993 .. 1.0)

A similar function with higher performance and reduced precision exists, see [_LIBQ_Q2_29_acos_Q31_Fast](#)

Example

```
_Q2_29 resultAcos;

resultAcos = _LIBQ_Q2_29_acos_Q31 ((_Q31)0xee63708c); // \_LIBQ\_Q2\_29\_acos\_Q31\(-0.1375903431\)
= 1.7088244837 \(0x36aeb0af\)
```

5.4.2.5.10.3 [_LIBQ_Q2_29_acos_Q31_Fast](#) Function**C**

```
_Q2_29 \_LIBQ\_Q2\_29\_acos\_Q31\_Fast(
    _Q31 x
);
```

Description

Function [_LIBQ_Q2_29_acos_Q31_Fast](#):

[_Q2_29](#) [_LIBQ_Q2_29_acos_Q31_Fast](#) ([_Q31](#) x);

Calculates the acos(x), where x is of type [_Q31](#) and the resulting value is of type [_Q2_29](#). The output value will be radians in the range $\pi \geq \text{result} \geq -\pi$.

Preconditions

None.

Parameters

Parameters	Description
x	The _Q31 input value from which to calculate acos(x).

Returns

[_LIBQ_Q2_29_acos_Q31_Fast](#) returns the [_Q2_29](#) fixed point result from the calculation acos(x).

Remarks

The function [_LIBQ_Q2_29_asin_Q31_Fast](#) is called by this routine and thus must be linked into the executable image.

Execution Time (cycles): 517 typical (32 to 1310) Program Memory 28 bytes

Error <= 0.000000911 (accurate to 9 least significant Q2_29 bits)

A higher precision function with reduced performance exists, see LIBQ_Q2_29_acos_Q31

Example

```
_Q2_29 resultAcos;

resultAcos = _LIBQ_Q2_29_acos_Q31_Fast ((_Q31)0xee63708c); //
_LIBQ_Q2_29_acos_Q31_Fast(-0.1375903431) = 1.7088244837 (0x36aeb0af)
```

5.4.2.5.11 Arctan Functions

5.4.2.5.11.1 _LIBQ_Q2_13_atan_Q7_8 Function

C

```
_Q2_13 _LIBQ_Q2_13_atan_Q7_8(
    _Q7_8 x
);
```

Description

Function LIBQ_Q2_13_atan_Q7_8:

Q2_13 LIBQ_Q2_13_atan_Q7_8 (Q7_8 x);

Calculates the atan(x), where x is of type Q7_8 and the resulting value is of type Q2_13. The output value will be radians in the range $\pi \geq \text{result} \geq -\pi$.

Preconditions

None.

Parameters

Parameters	Description
x	The <u>Q7_8</u> input value from which to calculate atan(x).

Returns

LIBQ_Q2_13_atan_Q7_8 returns the Q2_13 fixed point result from the calculation atan(x).

Remarks

The function LIBQ_Q2_13_atan2_Q7_8 is called by this routine and thus must be linked into the executable image.

Execution Time (cycles): 240 typical (202 to 256) Program Memory 16 bytes

Error <= 0.00012207 (accurate to least significant Q2_13 bit)

Example

```
_Q2_13 resultAtan;

resultAtan = _LIBQ_Q2_13_atan_Q7_8 ((_Q7_8)0x0097); // _LIBQ_Q2_13_atan_Q7_8(0.589844) =
0.532959 (0x110e)
```

5.4.2.5.11.2 _LIBQ_Q2_29_atan_Q16 Function

C

```
_Q2_29 _LIBQ_Q2_29_atan_Q16(
    _Q16 x
);
```

Description

Function `_LIBQ_Q2_29_atan_Q16`:

`_Q2_29 _LIBQ_Q2_29_atan_Q16 (_Q16 x);`

Calculates the $\text{atan}(x)$, where x is of type `_Q16` and the resulting value is of type `_Q2_29`. The output value will be radians in the range $\pi \geq \text{result} \geq -\pi$.

Preconditions

None.

Parameters

Parameters	Description
x	The <code>_Q16</code> input value from which to calculate $\text{atan}(x)$.

Returns

`_LIBQ_Q2_29_atan_Q16` returns the `_Q2_29` fixed point result from the calculation $\text{atan}(x)$.

Remarks

The function `_LIBQ_Q2_29_atan2_Q16` is called by this routine and thus must be linked into the executable image.

Execution Time (cycles): 354 typical (178 to 360) Program Memory 16 bytes

Error ≤ 0.000000003 (accurate within one least significant `_Q2_29` bit)

Example

```
_Q2_29 resultAtan;
```

```
resultAtan = _LIBQ_Q2_29_atan_Q16 ((_Q16)0x00098b31); // _LIBQ_Q2_29_atan_Q16(9.543716) = 1.466396 (0x2eecb7ee)
```

5.4.2.5.12 Arctan2 Functions

5.4.2.5.12.1 _LIBQ_Q2_13_atan2_Q7_8 Function

C

```
_Q2_13 _LIBQ_Q2_13_atan2_Q7_8(
    _Q7_8 y,
    _Q7_8 x
);
```

Description

Function `_LIBQ_Q2_13_atan2_Q7_8`:

`_Q2_13 _LIBQ_Q2_13_atan2_Q7_8 (_Q7_8 y, _Q7_8 x);`

Calculates the $\text{atan2}(y, x)$, where y and x are of type `_Q7_8` and the resulting value is of type `_Q2_13`. The output value will be radians in the range $\pi \geq \text{result} \geq -\pi$.

Preconditions

None.

Parameters

Parameters	Description
y	The <code>_Q7_8</code> input value from which to calculate $\text{atan2}(y, x)$.

x	The <u>Q7_8</u> input value from which to calculate atan2(y, x).

Returns

LIBQ_Q2_13_atan2_Q7_8 returns the Q2_13 fixed point result from the calculation atan2(y, x).

Remarks

The function LIBQ_Q16Div is called by this routine and thus must be linked into the executable image.

Execution Time (cycles): 220 typical (22 to 250) Program Memory 288 bytes

Error <= 0.00012207 (accurate to least significant Q2_13 bit)

Example

```
Q2_13 resultAtan2;

resultAtan2 = LIBQ_Q2_13_atan2_Q7_8 ((_Q7_8)0x589d, (_Q7_8)0xf878); //
LIBQ_Q2_13_atan2_Q7_8(88.613281, -7.531250) = 1.655518 (0x34fa)
```

5.4.2.5.12.2 LIBQ_Q2_29_atan2_Q16 Function**C**

```
Q2_29 LIBQ_Q2_29_atan2_Q16(
    Q16 y,
    Q16 x
);
```

Description

Function LIBQ_Q2_29_atan2_Q16:

Q2_29 LIBQ_Q2_29_atan2_Q16 (Q16 y, Q16 x);

Calculates the atan(y, x), where y and x are of type Q16 and the resulting value is of type Q2_29. The output value will be radians in the range $\pi \geq \text{result} \geq -\pi$.

Preconditions

None.

Parameters

Parameters	Description
y	The <u>Q16</u> input value from which to calculate atan2(y, x).
x	The <u>Q16</u> input value from which to calculate atan2(y, x).

Returns

LIBQ_Q2_29_atan2_Q16 returns the Q2_29 fixed point result from the calculation atan2(y, x).

Remarks

The C function `__divdi3` is called by this routine and thus must be linked into the executable image.

Execution Time (cycles): 348 typical (20 to 376) Program Memory 464 bytes

Error <= 0.000000003 (accurate within one least significant Q2_29 bit)

Example

```
Q2_29 resultAtan2;

resultAtan2 = LIBQ_Q2_29_atan2_Q16 ((_Q16)0xf6276270, x(_Q16)0x34b4b4c0); //
LIBQ_Q2_29_atan2_Q16(-2520.615479, 13492.706055) = -0.184684 (0xfa1710c7)
```

5.4.2.5.13 Random Number Functions

5.4.2.5.13.1 _LIBQ_Q15Rand Function

C

```
_Q15 _LIBQ_Q15Rand(
    int64_t * pSeed
);
```

Description

Function _LIBQ_Q15Rand:

```
_Q15 _LIBQ_Q15Rand (int64_t *pSeed);
```

Generates a _Q15 pseudo-random value based on the seed supplied as a parameter. The first time this function is called, the seed value must be supplied by the user; this initial seed value can either be constant or random, depending on whether the user wants to generate a repeatable or a non-repeatable pseudo-random sequence.

The function updates the *pSeed value each time it is called. The updated *pSeed value must be passed back to the function with each subsequent call.

Warning: The pseudo-random sequence generated by this function may be insufficient for cryptographic use.

Preconditions

None.

Parameters

Parameters	Description
pSeed	A pointer to the seed value used by the function to generate a pseudo-random sequence.

Returns

_LIBQ_Q15Rand returns a random _Q15 value. _LIBQ_Q15Rand also updates the int64_t *pSeed value.

Remarks

Execution Time (cycles): 32 Program Memory 92 bytes

Example

```
// Initialize seed to a constant or random value
static int64_t randomSeed = 0xA71078BE72D4C1F1;

_Q15 randomValue;

randomValue = _LIBQ_Q15Rand(&randomSeed);
...
randomValue = _LIBQ_Q15Rand(&randomSeed);
```

5.4.2.5.13.2 _LIBQ_Q31Rand Function

C

```
_Q31 _LIBQ_Q31Rand(
    int64_t * pSeed
);
```

Description

Function _LIBQ_Q31Rand:

```
_Q31 _LIBQ_Q31Rand (int64_t *pSeed);
```

Generates a _Q31 pseudo-random value based on the seed supplied as a parameter. The first time this function is called, the seed value must be supplied by the user; this initial seed value can either be constant or random, depending on whether the user wants to generate a repeatable or a non-repeatable pseudo-random sequence.

The function updates the *pSeed value each time it is called. The updated *pSeed value must be passed back to the function with each subsequent call.

Warning: The pseudo-random sequence generated by this function may be insufficient for cryptographic use.

Preconditions

None.

Parameters

Parameters	Description
pSeed	A pointer to the seed value used by the function to generate a pseudo-random sequence.

Returns

_LIBQ_Q31Rand returns a pseudo-random _Q31 value. _LIBQ_Q31Rand also updates the int64_t *pSeed value.

Remarks

Execution Time (cycles): 32 Program Memory 88 bytes

Example

```
// Initialize seed to a constant or random value
static int64_t randomSeed = 0x7F18BA710E72D4C1;

_Q31 randomValue;

randomValue = _LIBQ_Q31Rand(&randomSeed);
...
randomValue = _LIBQ_Q31Rand(&randomSeed);
```

5.4.2.5.14 Float Functions

5.4.2.5.14.1 _LIBQ_Q15FromFloat Function

C

```
_Q15 _LIBQ_Q15FromFloat(
    float x
);
```

Description

Function _LIBQ_Q15FromFloat:

```
_Q15 _LIBQ_Q15FromFloat(float x);
```

Converts a floating point value to a _Q15 fixed point representation. The _Q15 fixed point value is returned by the function. The conversion will saturate if the value is outside the range of the _Q15 representation.

Preconditions

None.

Parameters

Parameters	Description
x	The float point value to convert to <u>Q15</u> fixed point

Returns

`_LIBQ_Q15FromFloat` returns the Q15 fixed point value corresponding to the floating point (float) input value.

Remarks

The C library functions `__gesf2`, `__lesf2`, `__addsf3`, `__mulsf3`, and `__fixsfsi` are called by this routine and thus must be linked into the executable image.

Execution Time (cycles): 213 typical (158 to 224) Program Memory 96 bytes

Example

```
_Q15 q15;

q15 = _LIBQ_Q15FromFloat((float)0.5); // q15 now equals (_Q15)0x4000
q15 = _LIBQ_Q15FromFloat((float)-1.0); // q15 now equals (_Q15)0x8000
q15 = _LIBQ_Q15FromFloat((float)-0.233828); // q15 now equals (_Q15)0xe212
```

5.4.2.5.14.2 _LIBQ_Q31FromFloat Function**C**

```
_Q31 _LIBQ_Q31FromFloat(
    float x
);
```

Description

Function `_LIBQ_Q31FromFloat`:

Q31 `_LIBQ_Q31FromFloat(float x);`

Converts a floating point value to a Q31 fixed point representation. The Q31 fixed point value is returned by the function. The conversion will saturate if the value is outside the range of the Q31 representation.

Preconditions

None.

Parameters

Parameters	Description
x	The floating point value to convert to <u>Q31</u> fixed point.

Returns

`_LIBQ_Q31FromFloat` returns the Q31 fixed point value corresponding to the floating point (float) input value.

Remarks

The C library functions `__gesf2`, `__lesf2`, `__addsf3`, `__mulsf3`, and `__fixsfsi` are called by this routine and thus must be linked into the executable image.

Execution Time (cycles): 210 typical (158 to 214) Program Memory 100 bytes

Example

```
_Q31 q31;

q31 = _LIBQ_Q31FromFloat((float)0.000008); // q31 now equals (_Q31)0x00004000
```

```
q31 = _LIBQ_Q31FromFloat((float)-1.0); // q31 now equals (_Q31)0x80000000
q31 = _LIBQ_Q31FromFloat((float)0.690001); // q31 now equals (_Q31)0x5851f400
```

5.4.2.5.14.3 _LIBQ_ToFloatQ15 Function

C

```
float _LIBQ_ToFloatQ15(
    _Q15 x
);
```

Description

Function _LIBQ_ToFloatQ15:

```
float _LIBQ_ToFloatQ15(_Q15 x);
```

Converts a Q15 fixed point value to a floating point representation. The floating point value is returned by the function.

Preconditions

None.

Parameters

Parameters	Description
x	The <u>Q15</u> fixed point value to convert to float

Returns

_LIBQ_ToFloatQ15 returns the floating point (float) value corresponding to the Q15 input value.

Remarks

The C library functions __floatsisf and __divsf3 are called by this routine and thus must be linked in to the executable image.

Execution Time (cycles): 158 typical (54 to 176) Program Memory 28 bytes

Example

```
float f;

f = _LIBQ_ToFloatQ15((_Q15)0x4000); // f now equals 0.5
f = _LIBQ_ToFloatQ15((_Q15)0x8000); // f now equals -1.0
f = _LIBQ_ToFloatQ15((_Q15)0xb7ff); // f now equals -0.562531
```

5.4.2.5.14.4 _LIBQ_ToFloatQ31 Function

C

```
float _LIBQ_ToFloatQ31(
    _Q31 x
);
```

Description

Function _LIBQ_ToFloatQ31:

```
float _LIBQ_ToFloatQ31(_Q31 x);
```

Converts a Q31 fixed point value to a floating point representation. The floating point value is returned by the function.

Preconditions

None.

Parameters

Parameters	Description
x	The <u>Q31</u> fixed point value to convert to float

Returns

LIBQ_ToFloatQ31 returns the floating point (float) value corresponding to the Q31 input value.

Remarks

The C library functions `__floatsisf` and `__divsf3` are called by this routine and thus must be linked in to the executable image.

Execution Time (cycles): 163 typical (54 to 176) Program Memory 28 bytes

Example

```
float f;

f = _LIBQ_ToFloatQ31((_Q31)0x00004000); // f now equals 0.000008
f = _LIBQ_ToFloatQ31((_Q31)0x80000000); // f now equals -1.0
f = _LIBQ_ToFloatQ31((_Q31)0x5851f42d); // f now equals 0.690001
```

5.4.2.5.15 String Functions

5.4.2.5.15.1 LIBQ_Q15FromString Function

C

```
_Q15 _LIBQ_Q15FromString(
    char * s
);
```

Description

Function LIBQ_Q15FromString:

Q15 LIBQ_Q15FromString(char *s);

Convert an ascii string into a Q15 fixed point value. The ascii string must be in an -N.NNNNNN format. Leading spaces are ignored. The conversion stops at either the first non-conforming character in the string or the Null string terminator. There must be no spaces within the string value itself.

Preconditions

None.

Parameters

Parameters	Description
s	A pointer to the ascii input string representing the <u>Q15</u> fixed point value.

Returns

LIBQ_Q15FromString returns the Q15 fixed point value represented by the input string.

Remarks

Execution Time (cycles): 296 typical (28 to 346) Program Memory 172 bytes

Example

```
_Q15 x;
```

```
x = _LIBQ_Q15FromString("0.125");    // x will equal 0.125 using
                                     // an internal value of 0x1000

x = _LIBQ_Q15FromString("-1.0");      // x will equal -1.0 using
                                     // an internal value of 0x8000

x = _LIBQ_Q15FromString("0.999969"); // x will equal 0.999969 using
                                     // an internal value of 0x7FFF
```

5.4.2.5.15.2 **_LIBQ_ToStringQ15 Function**

```
C
void _LIBQ_ToStringQ15(
    _Q15 x,
    char * s
);
```

Description

Function `_LIBQ_ToStringQ15`:

```
void _LIBQ_ToStringQ15(_Q15 x, char *s);
```

Convert a _Q15 fixed point value to an ascii string representation in a -N.NNNNNN format.

Preconditions

The character string "s" must be at least 10 characters long, including the Null string terminator.

Parameters

Parameters	Description
x	The fixed point value to be converted into an ascii string (<u>_Q15</u>)
s	A pointer to the output string of at least 10 characters

Returns

An ascii string that represents the _Q15 fixed point value in -N.NNNNNN format. The output string will be terminated by a Null (0x00) character.

Remarks

Execution Time (cycles): 118 typical (28 to 132) Program Memory 200 bytes

Example

```
char s[10];

_LIBQ_ToStringQ15((_Q15)0x1000, s);    // s will equal "0.125000"
_LIBQ_ToStringQ15((_Q15)0x8000, s);    // s will equal "-1.000000"
_LIBQ_ToStringQ15((_Q15)0x7FFF, s);    // s will equal "0.999969"
```

5.4.2.5.16 **Data Types and Constants**

5.4.2.5.16.1 **_Q15_MAX Macro**

```
C
#define _Q15_MAX ((_Q15)0x7FFF)      // Maximum value of _Q15 (~1.0)
```

Description

Maximum value of _Q15 (~1.0)

5.4.2.5.16.2 _Q15_MIN Macro

C

```
#define _Q15_MIN ((_Q15)0x8000) // Minimum value of _Q15 (-1.0)
```

Description

Minimum value of **_Q15** (-1.0)

5.4.2.5.16.3 _Q16_MAX Macro

C

```
#define _Q16_MAX ((_Q16)0x7FFFFFFF) // Maximum value of _Q16 (~32768.0)
```

Description

Maximum value of **_Q16** (~32768.0)

5.4.2.5.16.4 _Q16_MIN Macro

C

```
#define _Q16_MIN ((_Q16)0x80000000) // Minimum value of _Q16 (-32768.0)
```

Description

Minimum value of **_Q16** (-32768.0)

5.4.2.5.16.5 _Q2_13_MAX Macro

C

```
#define _Q2_13_MAX ((_Q2_13)0x7FFF) // Maximum value of _Q2_13 (~4.0)
```

Description

Maximum value of **_Q2_13** (~4.0)

5.4.2.5.16.6 _Q2_13_MIN Macro

C

```
#define _Q2_13_MIN ((_Q2_13)0x8000) // Minimum value of _Q2_13 (-4.0)
```

Description

Minimum value of **_Q2_13** (-4.0)

5.4.2.5.16.7 _Q2_29_MAX Macro

C

```
#define _Q2_29_MAX ((_Q2_29)0x7FFFFFFF) // Maximum value of _Q2_29 (~4.0)
```

Description

Maximum value of **_Q2_29** (~4.0)

5.4.2.5.16.8 _Q2_29_MIN Macro

C

```
#define _Q2_29_MIN ((_Q2_29)0x80000000) // Minimum value of _Q2_29 (-4.0)
```

Description

Minimum value of Q2_29 (-4.0)

5.4.2.5.16.9 _Q3_12_MAX Macro

C

```
#define _Q3_12_MAX (( _Q3_12)0x7FFF) // Maximum value of _Q3_12 (~8.0)
```

Description

Maximum value of Q3_12 (~8.0)

5.4.2.5.16.10 _Q3_12_MIN Macro

C

```
#define _Q3_12_MIN (( _Q3_12)0x8000) // Minimum value of _Q3_12 (-8.0)
```

Description

Minimum value of Q3_12 (-8.0)

5.4.2.5.16.11 _Q31_MAX Macro

C

```
#define _Q31_MAX (( _Q31)0x7FFFFFFF) // Maximum value of _Q31 (~1.0)
```

Description

Maximum value of Q31 (~1.0)

5.4.2.5.16.12 _Q31_MIN Macro

C

```
#define _Q31_MIN (( _Q31)0x80000000) // Minimum value of _Q31 (-1.0)
```

Description

Minimum value of Q31 (-1.0)

5.4.2.5.16.13 _Q4_11_MAX Macro

C

```
#define _Q4_11_MAX (( _Q4_11)0x7FFF) // Maximum value of _Q4_11 (~16.0)
```

Description

Maximum value of Q4_11 (~16.0)

5.4.2.5.16.14 _Q4_11_MIN Macro

C

```
#define _Q4_11_MIN (( _Q4_11)0x8000) // Minimum value of _Q4_11 (-16.0)
```

Description

Minimum value of Q4_11 (-16.0)

5.4.2.5.16.15 _Q5_10_MAX Macro

C

```
#define _Q5_10_MAX (( _Q5_10)0x7FFF) // Maximum value of _Q5_10 (~32.0)
```

Description

Maximum value of **_Q5_10** (~32.0)

5.4.2.5.16.16 _Q5_10_MIN Macro

C

```
#define _Q5_10_MIN (( _Q5_10)0x8000) // Minimum value of _Q5_10 (-32.0)
```

Description

Minimum value of **_Q5_10** (-32.0)

5.4.2.5.16.17 _Q7_8_MAX Macro

C

```
#define _Q7_8_MAX (( _Q7_8)0x7FFF) // Maximum value of _Q7_8 (~128.0)
```

Description

Maximum value of **_Q7_8** (~128.0)

5.4.2.5.16.18 _Q7_8_MIN Macro

C

```
#define _Q7_8_MIN (( _Q7_8)0x8000) // Minimum value of _Q7_8 (-128.0)
```

Description

Minimum value of **_Q7_8** (-128.0)

5.4.2.5.16.19 _Q0_15 Type

C

```
typedef int16_t _Q0_15;
```

Description

1 sign bit, 15 bits right of radix

5.4.2.5.16.20 _Q0_31 Type

C

```
typedef int32_t _Q0_31;
```

Description

1 sign bit, 31 bits right of radix

5.4.2.5.16.21 _Q15 Type

C

```
typedef _Q0_15 _Q15;
```

Description

Short name for [_Q0_15](#)

5.4.2.5.16.22 _Q15_16 Type

C

```
typedef int32_t _Q15_16;
```

Description

1 sign bit, 15 bits left of radix, 16 bits right of radix

5.4.2.5.16.23 _Q16 Type

C

```
typedef _Q15_16 _Q16;

Description

Short name for [_Q15_16](#)

5.4.2.5.16.24 _Q2_13 Type

C

```
typedef int16_t _Q2_13;
```

Description

1 sign bit, 2 bits left of radix, 13 bits right of radix

5.4.2.5.16.25 _Q2_29 Type

C

```
typedef int32_t _Q2_29;
```

Description

1 sign bit, 2 bits left of radix, 29 bits right of radix

5.4.2.5.16.26 _Q3_12 Type

C

```
typedef int16_t _Q3_12;
```

Description

1 sign bit, 3 bits left of radix, 12 bits right of radix

5.4.2.5.16.27 _Q31 Type

C

```
typedef _Q0_31 _Q31;
```

Description

Short name for [_Q_0_31](#)

5.4.2.5.16.28 _Q4_11 Type

C

```
typedef int16_t _Q4_11;
```

Description

1 sign bit, 4 bits left of radix, 11 bits right of radix

5.4.2.5.16.29 _Q5_10 Type

C

```
typedef int16_t _Q5_10;
```

Description

1 sign bit, 5 bits left of radix, 10 bits right of radix

5.4.2.5.16.30 _Q7_8 Type

C

```
typedef int16_t _Q7_8;
```

Description

1 sign bit, 7 bits left of radix, 8 bits right of radix

5.4.2.6 Files

Files

Name	Description
libq.h	Optimized fixed point math functions for the PIC32MZ microAptiv™ core platform.

Description

5.4.2.6.1 libq.h

Fixed Point Library

libq.h provides a library of fixed point math functions for the PIC32MZ platform. All functions are optimized for speed. This header file specifies characteristics of each function, including execution time, memory size, and resolution.

Signed fixed point types are defined as follows:

Qn_m where:

- n is the number of data bits to the left of the radix point
- m is the number of data bits to the right of the radix point
- a signed bit is implied

For convenience, short names are also defined:

Exact Name (# Bits) Required Short Name [_Q0_15](#) (16) [_Q15](#); [_Q15_16](#) (32) [_Q16](#); [_Q0_31](#) (32) [_Q31](#)

Functions in the library are prefixed with the type of the return value. For example, `_LIBQ_Q16Sqrt` returns a Q16 value equal to the square root of its argument.

Argument types do not always match the return type. Refer to the function prototype for a specification of its arguments.

In cases where the return value is not a fixed point type, the argument type is appended to the function name. For example, `_LIBQ_ToFloatQ31` accepts a type `_Q31` argument.

In some cases, both the return type and the argument type are specified within the function name. For example,

Function Name (Return Type) [Argument Type]: `_LIBQ_Q15_sin_Q2_13 (_Q15) [_Q2_13]`; `_LIBQ_Q31_sin_Q2_29 (_Q31) [_Q2_29]`

Table of LIBQ functions:

Divide: `_Q16 _LIBQ_Q16Div (_Q16 dividend, _Q16 divisor)`;

Square root: `_Q16 _LIBQ_Q16Sqrt (_Q16 x)`;

Exponential: `_Q16 _LIBQ_Q16Exp (_Q16 x)`;

Log: `_Q4_11 _LIBQ_Q4_11_ln_Q16 (_Q16 x)`; `_Q3_12 _LIBQ_Q3_12_log10_Q16 (_Q16 x)`; `_Q5_10 _LIBQ_Q5_10_log2_Q16 (_Q16 x)`;

Power: `_Q16 _LIBQ_Q16Power (_Q16 x, _Q16 y)`;

Sine: `_Q15 _LIBQ_Q15_sin_Q2_13 (_Q2_13 x)`; `_Q31 _LIBQ_Q31_sin_Q2_29 (_Q2_29 x)`;

Cosine: `_Q15 _LIBQ_Q15_cos_Q2_13 (_Q2_13 x)`; `_Q31 _LIBQ_Q31_cos_Q2_29 (_Q2_29 x)`;

Tangent: `_Q7_8 _LIBQ_Q7_8_tan_Q2_13 (_Q2_13 x)`; `_Q16z _LIBQ_Q16_tan_Q2_29 (_Q2_29 x)`;

Arcsin: `_Q2_13 _LIBQ_Q2_13_asin_Q15 (_Q15 x)`; `_Q2_29 _LIBQ_Q2_29_asin_Q31 (_Q31 x)`; `_Q2_29 _LIBQ_Q2_29_asin_Q31_Fast (_Q31 x)`;

Arccos: `_Q2_13 _LIBQ_Q2_13_acos_Q15 (_Q15 x)`; `_Q2_29 _LIBQ_Q2_29_acos_Q31 (_Q31 x)`; `_Q2_29 _LIBQ_Q2_29_acos_Q31_Fast (_Q31 x)`;

Arctan: `_Q2_13 _LIBQ_Q2_13_atan_Q7_8 (_Q7_8 x)`; `_Q2_29 _LIBQ_Q2_29_atan_Q16 (_Q16 x)`;

Arctan2: `_Q2_13 _LIBQ_Q2_13_atan2_Q7_8 (_Q7_8 y, _Q7_8 x)`; `_Q2_29 _LIBQ_Q2_29_atan2_Q16 (_Q16 y, _Q16 x)`;

Random number: `_Q15 _LIBQ_Q15Rand (int64_t *pSeed)`; `_Q31 _LIBQ_Q31Rand (int64_t *pSeed)`;

Float: `float _LIBQ_ToFloatQ31 (_Q31 x)`; `float _LIBQ_ToFloatQ15 (_Q15 x)`; `_Q31 _LIBQ_Q31FromFloat (float x)`; `_Q15 _LIBQ_Q15FromFloat (float x)`;

String: `void _LIBQ_ToStringQ15 (_Q15 x, char *s)`; `_Q15 _LIBQ_Q15FromString (char *s)`;

Functions

	Name	Description
≡	<code>_LIBQ_Q15_cos_Q2_13</code>	Calculates the value of cosine(x).
≡	<code>_LIBQ_Q15_sin_Q2_13</code>	Calculates the value of sine(x).
≡	<code>_LIBQ_Q15FromFloat</code>	Converts a float to a <code>_Q15</code> value.
≡	<code>_LIBQ_Q15FromString</code>	Ascii to <code>_Q15</code> conversion.
≡	<code>_LIBQ_Q15Rand</code>	Generate a <code>_Q15</code> random number.
≡	<code>_LIBQ_Q16_tan_Q2_29</code>	Calculates the value of tan(x).
≡	<code>_LIBQ_Q16Div</code>	<code>_Q16</code> fixed point divide.
≡	<code>_LIBQ_Q16Exp</code>	Calculates the exponential function e^x .

	_LIBQ_Q16Power	Calculates the value of x raised to the y power (x^y).
	_LIBQ_Q16Sqrt	Square root of a positive _Q16 fixed point value.
	_LIBQ_Q2_13_acos_Q15	Calculates the value of $\text{acos}(x)$.
	_LIBQ_Q2_13_asin_Q15	Calculates the asin value of $\text{asin}(x)$.
	_LIBQ_Q2_13_atan_Q7_8	Calculates the value of $\text{atan}(x)$.
	_LIBQ_Q2_13_atan2_Q7_8	Calculates the value of $\text{atan2}(y, x)$.
	_LIBQ_Q2_29_acos_Q31	Calculates the value of $\text{acos}(x)$.
	_LIBQ_Q2_29_acos_Q31_Fast	Calculates the value of $\text{acos}(x)$. This function executes faster than _LIBQ_Q2_29_acos_Q31 but is less precise.
	_LIBQ_Q2_29_asin_Q31	Calculates the value of $\text{asin}(x)$.
	_LIBQ_Q2_29_asin_Q31_Fast	Calculates the value of $\text{asin}(x)$. This function executes faster than the _LIBQ_Q2_29_asin_Q31 function, but is less precise.
	_LIBQ_Q2_29_atan_Q16	Calculates the value of $\text{atan}(x)$.
	_LIBQ_Q2_29_atan2_Q16	Calculates the value of $\text{atan2}(y, x)$.
	_LIBQ_Q3_12_log10_Q16	Calculates the value of $\text{Log}_{10}(x)$.
	_LIBQ_Q31_cos_Q2_29	Calculates the value of $\text{cosine}(x)$.
	_LIBQ_Q31_sin_Q2_29	Calculates the value of $\text{sine}(x)$.
	_LIBQ_Q31FromFloat	Converts a float to a _Q31 value.
	_LIBQ_Q31Rand	Generate a _Q31 random number.
	_LIBQ_Q4_11_ln_Q16	Calculates the natural logarithm $\ln(x)$.
	_LIBQ_Q5_10_log2_Q16	Calculates the value of $\log_2(x)$.
	_LIBQ_Q7_8_tan_Q2_13	Calculates the value of $\tan(x)$.
	_LIBQ_ToFloatQ15	Converts a _Q15 value to a float.
	_LIBQ_ToFloatQ31	Converts a _Q31 value to a float.
	_LIBQ_ToStringQ15	_Q15 to ascii conversion.

Macros

	Name	Description
	_Q15_MAX	Maximum value of _Q15 (~1.0)
	_Q15_MIN	Minimum value of _Q15 (-1.0)
	_Q16_MAX	Maximum value of _Q16 (~32768.0)
	_Q16_MIN	Minimum value of _Q16 (-32768.0)
	_Q2_13_MAX	Maximum value of _Q2_13 (~4.0)
	_Q2_13_MIN	Minimum value of _Q2_13 (-4.0)
	_Q2_29_MAX	Maximum value of _Q2_29 (~4.0)
	_Q2_29_MIN	Minimum value of _Q2_29 (-4.0)
	_Q3_12_MAX	Maximum value of _Q3_12 (~8.0)
	_Q3_12_MIN	Minimum value of _Q3_12 (-8.0)
	_Q31_MAX	Maximum value of _Q31 (~1.0)
	_Q31_MIN	Minimum value of _Q31 (-1.0)
	_Q4_11_MAX	Maximum value of _Q4_11 (~16.0)
	_Q4_11_MIN	Minimum value of _Q4_11 (-16.0)
	_Q5_10_MAX	Maximum value of _Q5_10 (~32.0)
	_Q5_10_MIN	Minimum value of _Q5_10 (-32.0)
	_Q7_8_MAX	Maximum value of _Q7_8 (~128.0)
	_Q7_8_MIN	Minimum value of _Q7_8 (-128.0)

Types

	Name	Description
	<u>_Q0_15</u>	1 sign bit, 15 bits right of radix
	<u>_Q0_31</u>	1 sign bit, 31 bits right of radix
	<u>_Q15</u>	Short name for <u>_Q0_15</u>
	<u>_Q15_16</u>	1 sign bit, 15 bits left of radix, 16 bits right of radix
	<u>_Q16</u>	Short name for <u>_Q15_16</u>
	<u>_Q2_13</u>	1 sign bit, 2 bits left of radix, 13 bits right of radix
	<u>_Q2_29</u>	1 sign bit, 2 bits left of radix, 29 bits right of radix
	<u>_Q3_12</u>	1 sign bit, 3 bits left of radix, 12 bits right of radix
	<u>_Q31</u>	Short name for <u>_Q_0_31</u>
	<u>_Q4_11</u>	1 sign bit, 4 bits left of radix, 11 bits right of radix
	<u>_Q5_10</u>	1 sign bit, 5 bits left of radix, 10 bits right of radix
	<u>_Q7_8</u>	1 sign bit, 7 bits left of radix, 8 bits right of radix

5.5 Operating System Abstraction Layer (OSAL) Library Help

5.5.1 Introduction

OSAL Library

for

Microchip Microcontrollers

The Operating System Abstraction Layer (OSAL) provides a consistent interface to an application and parts of MPLAB Harmony that allow them to take advantage of Operating System constructs when running in an OS environment OR when operating without one. It is designed to allow operation of MPLAB Harmony on any Microchip microcontroller and takes care of the underlying differences between the available OS Kernels or when no kernel is present.

Description

The OSAL provides the interface to commonly available RTOSes such that drivers and middleware (and optionally, applications) may be written using a single interface to a minimal set of OS-specific features needed to provide thread safety. The OSAL interface can be implemented appropriately to support almost any desired RTOS. For applications where no RTOS is available, or desired, a bare version of the OSAL supports either polled or interrupt-driven environments running directly on the hardware. This allows applications and the MPLAB Harmony stack to be executed in all three common embedded environments: polled (shared multi-tasking), interrupt-driven, or RTOS-based.

Scope

The OSAL is not designed to replace a commercial kernel and therefore the user is encouraged to use any of the specific features of their chosen RTOS in order to achieve best performance. As such the OSAL can also be considered to be an Operating System Compatibility Layer offering MPLAB Harmony and users the required common functions to ensure that MPLAB Harmony will correctly compile and operate in both RTOS and non-RTOS environments.

The common interface presented by the OSAL is designed to offer a set of services typically found on micro-kernel and mini-scheduler systems. Because of this it has no aspirations to provide an equivalent set of capabilities as those found on large multi-tasking systems such as uCLinux. The common services are designed to allow MPLAB Harmony to implement thread-safe Drivers and Middleware. The design intention is that drivers will use the minimal set of OSAL features necessary to ensure that they can safely operate in a multi-threaded environment yet can also compile correctly when no underlying RTOS is present. The

range of features used by a driver is typically limited to these OSAL features:

- Semaphore Functions
- Mutexe Functions
- Critical Section Functions

5.5.2 Release Notes

MPLAB Harmony Version: v0.70b **OSAL Library Version :** 0.1 **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Three OSAL implementations:

- **OSAL_USE_NONE** - Default implementation of the OSAL that includes no RTOS functionality and features only sufficient code to ensure that elements of MPLAB Harmony that make OSAL calls will compile correctly. 'Safe' parameters and #defines have been used so that MPLAB Harmony drivers will compile correctly.
- **OSAL_USE_BASIC** - Minimal OSAL implementation not designed to operate in multi-threaded environments but offers some usable features so that interrupt driven applications can still compile and operate correctly. Minimal implementations include Events, Semaphores and Mutexes.
- **OSAL_USE_RTOS** - An RTOS is being used and the relevant RTOS header file will be included in the sys_config.h file.

Currently a reference implementation of the FreeRTOS(tm) and Micrium uC/OSIII operating systems have been implemented. Other operating systems implementations are under development.

Known Issues:

Nothing to report in this release.

5.5.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.5.4 Using the Library

This topic describes the basic architecture of the OSAL Library and provides information and examples on how to use it.

Description

Interface Header File: [osal.h](#)

The interface to the OSAL Library is defined in the "[osal.h](#)" header file. Any C language source (.c) file that uses the OSAL System Service library should include "[osal.h](#)".

Library File: [osal.c](#) OR osal_xxxx.c

The OSAL Library consists of a base implementation and individual ports of the OSAL to target operating systems. These target operating systems consist of a basic implementation (used when the macro OSAL_USE_BASIC is defined) and ports of third party RTOSs (used when the macro OSAL_USE_RTOS is defined).

If no RTOS support is required then the file "[osal.c](#)" can be *optionally* included into the project; however, it is *not required*. This file provides implementations for the OSAL_USE_BASIC and configurations of the library.

When an RTOS is being used (the OSAL_USE_RTOS configuration) then an external implementation file which provides the required interface wrappers should be added to the project. For instance for the FreeRTOS operating system the file "osal_freertos.c" should be added, whilst for the Micrium uC/OS-III operating system the file "osal_micrium.c" should be added.

The base implementation and some generic ports are provided with the Library however it is the responsibility of third party vendors to supply the correctly implemented interface file.

Please refer to the [MPLAB Harmony Overview](#) for how the OSAL Library interacts with the framework.

5.5.4.1 Abstraction Model

The OSAL Library provides a predefined set of functions and types that match those services that an RTOS will typically provide. It is designed to be a lightweight model and deliberately excludes the much broader depth and breadth of services that a fully fledged RTOS provides. As such the interface defines only those core functions necessary for the MPLAB Harmony Drivers and middleware to operate in a multi-threaded environment AND some additional functionality to support RTOS independent development of middleware and user applications in the future.

Description

The common interface can easily be ported to many host RTOSs by third parties and the set of functions provides a basic level of RTOS compatibility. Where a specific RTOS does not implement a given architectural feature (e.g., events), the OSAL port for that RTOS should endeavor to imitate that feature using the constructs that are available. Although it is recognized that this may have a detrimental effect on the performance of that system it does allow MPLAB Harmony developers the broadest scope for using RTOS features in their designs.

Include Hierarchy of osal.h

5.5.4.2 Library Overview

This section provides an overview of the OSAL Library.

Description

Refer to the section System Services Overview for how the system services operates in a system.

The OSAL Library provides a defined interface such that driver and middleware developers will be able to create MPLAB Harmony code that can safely operate in a multi-threaded environment when a supported RTOS is present yet will still compile and function correctly when MPLAB Harmony is being used in a non-RTOS environment with an interrupt or non-interrupt driven application model.

The defined interface will help application developers during the early stages of their design when various platforms and architectures are still under consideration. The developer is encouraged to use the specific features of a chosen RTOS once it has been selected since this is likely to provide a more effective and rich programming environment.

The OSAL Library is deliberately designed to be a thin layer over an underlying RTOS which presents a predefined interface to the common features used by the majority of RTOSes, which includes:

Library Interface Section	Description
Semaphore Functions	Binary and counting semaphores for inter thread communications.
Queue Functions	Arbitrary queue mechanism with pass by copy.
Mutex Functions	Thread and resource locking mechanism.
Critical Section Functions	Application and scheduler locking mechanism.
Thread Functions	Basic thread creation and control.
Interrupt Handling Functions	ISR primitives to allow RTOS calls from within an ISR context.
Error Handling Functions	Simple error handling.

Memory Allocation Functions	Memory allocation primitives or wrappers.
OSAL Control Functions	OS initialization and start-up.

One of the primary design guidelines is that a host operating system may not be present and so any operations that the OSAL presents are designed to compile out to safe default values if no RTOS is present. This can mean the following:

- Implementing a dummy function that mimics typical RTOS behavior
- Implementing a #define or inline function that returns a 'safe' generic return value, such as 'TRUE' or 'Call succeeded'
- Returning a OSAL_RESULT_NOT_IMPLEMENTED value to indicate an unsupported operation
- Throwing an ASSERT failure to indicate a terminal error that prevents operation under specific circumstances

5.5.4.3 How the Library Works

This section provides information on how the OSAL Library works.

5.5.4.3.1 Core Functionality

The OSAL Library implements a lightweight abstraction layer on top of a host operating system. The OSAL functionality is designed to allow a programmer access to typical RTOS based functions than can reasonably be expected to exist on a small kernel or micro-scheduler typically found on the target Microchip Microcontrollers.

The OSAL is designed to be compiled under three specific mutually exclusive operating modes:

Compilation Mode	Description
<code>OSAL_USE_NONE</code>	No RTOS or OSAL support is provided. The OSAL interface functions will compile to 'nothing' or are defined to have no value.
<code>OSAL_USE_BASIC</code>	Basic level of support. There is no underlying RTOS however certain facilities are replicated such as Semaphores and Mutexes.
<code>OSAL_USE_RTOS</code>	A full implementation of the OSAL interface is available and there is an underlying RTOS as part of the program.

In the absence of any one of these values being defined or passed into the compiler as a command line parameter then the OSAL will default to the `OSAL_USE_NONE` mode of operation.

The following conceptual diagram shows the common interface and how the individual implementations are derived depending upon the configured mode of compilation.

The OSAL interface makes extensive use of object handles when passing RTOS parameters around the various functions. This has been done since depending on the operating mode and underlying RTOS (if any) there may be substantial differences between the C types of the variables. For instance, in the basic implementation mode a semaphore is implemented as a single 8-bit quantity to ensure atomic access on all architectures. On a third party RTOS the same semaphore may be implemented as a 16-bit index into an array of pointers whilst on another RTOS it could be represented as a `size_t` pointer (a pointer to the basic word type for that architecture). Because of these differences, the most convenient mechanism to maintain a regular interface is by the use of handles to implementation defined variables.

The majority of the OSAL objects also provide a `OSAL_XXX_Delete` function. This is provided for completeness however care should be taken in its use. Many RTOS implementations do not provide the ability to delete an object and excessive use of the delete can lead to memory fragmentation and unpredictable system behavior. It is recommended that it is not used at this time, or if used, the return value should be checked for a possible failure to delete the object.

In the following sections the basic behavior of the supported functions are documented. For the purposes of documentation the assumed operation mode will be that a full RTOS is present and so the behavior is that which will be observed in that scenario.

5.5.4.3.2 Other Functionality

5.5.4.3.3 Thread Operation

The OSAL implements a simple threading model that assumes the use of a priority based pre-emptive scheduler.

Description

Each thread is implemented as a single C function which can be reused across multiple threads if desired. For this reason care should be taken if static variables are allocated within the thread function.

The priority of a thread is defined using higher values to indicate higher priority. Thread priorities range from 1 up to the application defined value `OSAL_CONFIG_MAX_PRIORITIES` minus 1. No importance is placed upon any specific value of priority other than that a thread with a higher priority will execute before a lower priority one if they are both in the ready state. Certain RTOS implementations may require threads to each have a unique priority; however, since MPLAB Harmony has no knowledge of the various ways in which libraries may be connected together it is not possible to define any fixed priorities. The application programmer is therefore responsible for ensuring the relative priority of threads.

It is assumed that each thread is created with its own stack and that the RTOS is responsible for the correct allocation of memory resources. The requested memory size is specified in bytes and its value is normally arrived at by inspection of the program, the underlying hardware architecture (16-/32-bits) and the total available memory.

No significance is placed upon the textual name given to a task and it is normally only used for diagnostic purposes.

The following diagram shows the sequence of states that a typical RTOS will move a given task through during its lifetime.

The *pdata* parameter passed during thread creation allows the application programmer to generate more sophisticated behavior based upon passing a configuration parameter to a thread. The thread can be created multiple times and perform per instance operations related to the passed parameter.

The *phandle* parameter allows the created threads handle to be passed back to the calling code allowing later manipulation of the thread by other parts of the program.

Example Code:

```

/* Create the application thread for this test harness. This example thread
 * replicates the functionality of the ADC data logger thread
 * The priority of the application task should be selected as a middle value
 * since the check tasks are manipulated above and below this priority level */
OSAL_THREAD_Create(APP_Tasks, "APP", 500, OTH_APP_THREAD_PRIORITY, NULL, NULL);

```

The OSAL supports the creation of daemon threads which are designed to allow multi-threaded drivers with their own task routine to operate with an underlying RTOS. The [OSAL_THREAD_CreateDaemon](#) function takes a single parameter, which is the name of the Daemon thread. The user is responsible for implementing the Daemon thread as appropriate for their system. This thread should then call the individual driver state machines ensuring that they continue to operate. For example, consider the following scenario:

1. The application uses a driver that has no tasks routine although it does use driver tasks called as a result of an interrupt.
2. The application also uses a driver with a state machine that needs calling every 500 us.
3. The application also uses two more drivers that can conveniently be called one after the other (perhaps it is the same driver but with two instantiations) and only needs processing every 100 ms.

For item 1, no Deamon thread is required. For item 2, a Daemon thread is required that calls the driver task routine and then sleeps for 500 us. For the remaining driver, a single Daemon thread can be created that calls the driver twice (with different object handles) and then sleeps for 100 ms.

5.5.4.3.4 Events

The event mechanism is based upon a single boolean value that can be set or reset by a thread. Multiple threads may pend (or block) waiting on the value to be set or flagged.

The OSAL implementation of events is extremely basic and no combinatorial operations are available. Furthermore, whilst multiple threads may block on the event, only the highest priority thread will be released by the event being flagged.

It is strongly suggested that developers consider the use of queues or semaphores for inter process communication or

sequencing since they provide a more deterministic response time than multiple event flags.

5.5.4.3.5 Semaphores

The semaphore implements a method for thread synchronization. This synchronization can be either between one thread and another or between an interrupt service routine (ISR) and a thread. A semaphore once signalled will unblock the highest priority thread currently pending on it.

Description

A semaphore can be used to lock a shared resource, although it is more normal to use a mutex for such an activity. Once obtained a semaphore should be posted back to enable it to be re-taken at a later time or in another thread.

```
/* mainline code prior to OS start */
/* declare a variable of type semaphore handle */
OSAL_SEM_DECLARE(semSync);
/* create the semaphore */
OSAL_SEM_Create(&semSync, OSAL_SEM_TYPE_BINARY, 0, 0);

/* thread one */
...
/* take the semaphore without waiting */
OSAL_SEM_Pend(semSync, 0);
... perform some actions
/* return the semaphore */
OSAL_SEM_Post(semSync);
...

/* thread two must not execute until thread one has finished its operations*/
...
/* block on the semaphore */
OSAL_SEM_Pend(semSync, OSAL_WAIT_FOREVER);
... perform some more actions
/* return the semaphore */
OSAL_SEM_Post(semSync);
```

A semaphore can be signalled multiple times and so provides a method for an ISR to release a thread waiting on it. Even though the blocked thread never returns the semaphore, because the asynchronous ISR repeatedly posts it the next time the thread wants to pend on the semaphore it will be available. By moving the majority of interrupt service processing from the ISR to a high priority thread the system response time is improved and the eventual processing can take advantage of OSAL features such as mutexes and queues which would normally be harder to implement inside the ISR. This technique is known as deferred interrupt processing.

```
/* an example interrupt handler called from an ISR that performs task synchronization using a semaphore */
void _ISRTasksRX(void) /* N.B. pseudo-code ISR */
{
    ...

    _DRV_USART_InterruptSourceStatusClear(_DRV_USART_GET_INT_SRC_RX(_DRV_USART_OBJ(dObj,
rxInterruptSource)));

    /* Release the receive semaphore unblocking any tasks */
    OSAL_SEM_PostISR(_DRV_USART_OBJ(dObj, rxSemID));
} /* DRV_USART_TasksRX */
```

5.5.4.3.6 Mutex Operation

A mutex or mutual exclusion is used to protect a shared resource from access by multiple threads at the same time. A shared resource may be a common data structure in RAM or it may be a hardware peripheral. In either case a mutex can be used to

ensure the integrity of the entire resource by only allowing one thread to access it at a time.

Description

The program must be written in such a way that before the shared resources is accessed the mutex has to be obtained. Once obtained the accesses should occur, and once complete the mutex should then be released. While no restrictions are enforced the sequence of operations between the lock and unlock should ideally take as few lines of code as possible to ensure good system performance.

The mutex may be implemented as a form of binary semaphore but an underlying RTOS will often add other features. It is normal to add the restriction that a mutex may only be unlocked from the thread that originally obtained the lock in the first place. The RTOS may also provide features to mitigate priority inversion problems (where a high priority thread blocks on a lower priority one holding a mutex) by providing priority inheritance allowing lower priority threads to be temporarily raised to complete and release a locked mutex.

```
/* perform operations on a shared data structure */
struct myDataStructure {
    uint16_t x;
    uint8_t y;
} myDataStructure;

...
OSAL_MUTEX_DECLARE(mutexDS);
OSAL_MUTEX_Create(&mutexDS);

...
/* wait 2 seconds to obtain the mutex */
if (OSAL_MUTEX_Lock(mutexDS, 2000) == OSAL_RESULT_TRUE)
{
    /* operate on the data structure */
    myDataStructure.x = 32;
    OSAL_MUTEX_Unlock(mutexDS);
}
```

5.5.4.3.7 Queue Operation

This section describes the implementation of queues using the OSAL Library.

Description

The OSAL implements queues as a fixed structure of elements, with each element the same size. The size and number of each element is defined when the queue is created but cannot be reconfigured later. Elements are added to the queue when using the Add function call and removed on a first-in-first-out basis when using the Remove function. If the queue is full at the time of attempting to add data, the call will block for the specified time before failing. Data placed on the queue is done using a copy operation so that the source may be over written if required. For large data items it may be better to pass pointers to the data via the queue however care must be taken on ownership once the pointer has been copied between threads.

It is possible to place an item at the front of a queue using the AddHead function. Since the implementation of this is heavily dependent upon the underlying RTOS the call may return with OSAL_RETURN_NOT_IMPLEMENTED if this operation is not possible.

```
/* Create a queue */
OSAL_QUEUE_Declare(myQueue);

...
/* create a queue that accepts 1 byte chars and is 4 items long */
OSAL_QUEUE_Create(&myQueue, 1, 4);

...
/* Add data */
char c = 'A';
OSAL_QUEUE_Add(myQueue, &c, 0);
c = 'B';
OSAL_QUEUE_Add(myQueue, &c, 0);
```

```

c = 'C';
OSAL_QUEUE_Add(myQueue, &c, 0);

/* remove data */
char d;
OSAL_QUEUE_Remove(myQueue, &d, OSAL_WAIT_FOREVER);

```

5.5.4.3.8 Critical Section Operation

This section describes how critical sections are used.

Description

Critical sections are used to form sequences of code that must operate in an atomic manner. The interface allows for the possibility of two types of critical section.

- When the critical section is entered all interrupts on the microcontroller are disabled. This prevents the protected sequence of code from being interrupted and ensures the complete atomicity of the operation. This is denoted by the OSAL_CRIT_TYPE_HIGH value.
- When the critical section is entered the RTOS scheduler is disabled. In this second case other threads are prevented from running however interrupts can still occur which allows any asynchronous events to still be received and for the temporal accuracy of the RTOS scheduler to be maintained. This is denoted by the OSAL_CRIT_TYPE_LOW value.

Since the behavior in the two cases is different the type of critical section must be identified in both the call to enter and leave.

```

/* enter and leave a critical section disabling interrupts */
OSAL_CRIT_Enter(OSAL_CRIT_TYPE_HIGH);
/* perform an atomic sequence of code */
...
/* leave the critical section */
OSAL_CRIT_Leave(OSAL_CRIT_TYPE_HIGH);

```

The underlying RTOS may not support the second scenario, in which case the OSAL implementation will default to disabling all interrupts.

5.5.4.3.9 Interrupt Operation

This section describes interrupt handling by the OSAL Library.

Description

Interrupt handling in the OSAL is implemented using a separate set of interrupt-only functions. Within MPLAB Harmony, interrupts are deemed to be handled at an application level, meaning the initial interrupt handler or vector is dealt with while

writing the application rather than defaulting to MPLAB Harmony provided handlers. However, within MPLAB Harmony there may be functions that are called within the context of an ISR and also during mainline program flow depending on whether MPLAB Harmony has been built with interrupt or polled drivers. Because of this, to allow the most flexible and adaptable OSAL implementation, the following call sequence should be performed.

1. At the application interrupt handler level, immediately after the interrupt has been entered and before any further calls are made, call `OSAL_ISR_Enter()`.
2. Once inside the ISR OR inside any descendent functions called as a result of entering the ISR ensure that only `OSAL_XXX_xxxxISR` variants of functions are called.
3. At the exit point(s) of the ISR call `OSAL_ISR_Exit()`.

By following this sequence of operations, the OSAL can be made to adapt to the requirements of different underlying RTOS architectures.

In the main ISR handler:

```
void __ISR ( _TIMER_1_VECTOR ) _InterruptHandler_TMR_1_stub ( void )
{
    OSAL_ISR_Enter();

    /* Call the timer driver's "Tasks" routine */
    DRV_TMR_Tasks ( appDrvObject.tmrObject );

    OSAL_ISR_Exit();
}
```

In the called function:

```
void _DRV_TMR_MAKE_NAME( Tasks )
(
    _DRV_TMR_DYN_ARG( SYS_MODULE_OBJ object )
)
{
    ...

    /* Clear Timer Interrupt/Status Flag */
    _DRV_TMR_InterruptSourceClear( _DRV_TMR_GET_INT_SRC( _DRV_TMR_OBJ(dObj, interruptSource) )
);

    /* release a semaphore, note use of ISR variant */
    OSAL_SEM_PostISR(&semTMR);
} /* DRV_TMR_Tasks */
```

It is not appropriate (or logical) to block inside an ISR so all variants of the OSAL functions with ISR at the end do not take a block time parameter. The use of ISR specific versions of OSAL functions is dependent on the RTOS; however, if the xxxISR variants are used by default inside any ISRs, the actual implementation of the interface on a given RTOS can be allowed to handle the complexities on that specific platform.

5.5.4.3.10 Error Operation

This section describes error handling within an OSAL function.

Description

If an error occurs within an OSAL function or inside the underlying RTOS, the `OSAL_ErrorCallback` function will be called. This callback function is declared as a `_weak_` function and the programmer can override it to provide application specific error handling. Currently, only a few error codes are listed and it is normally difficult to provide any kind of constructive recovery from an internal error. The default course of action is to either block and indicate the condition using some visual means or to perform a processor reset.

```
/* user implementation of the error callback */
void OSAL_ErrorCallback(OSAL_ERROR_CALLBACK_TYPE type)
{
    while (1)
    {
        // a non recoverable error occurred so loop here
        BlinkLED();
    }
}
```

5.5.4.3.11 Memory Operation

The OSAL Library provides an interface to a memory allocation mechanism. The memory required for dynamic instantiation of variables is normally provided by allocating it from the heap. However the standard C library implementation of malloc and free are not considered thread safe and so OSAL specific functions must be used if MPLAB Harmony or the application requires dynamic memory during operation.

When operating without an underlying RTOS the OSAL memory allocators default to using standard malloc and free functions. However, when operating with an RTOS the calls will defer to the specific scheme used by the RTOS. This may involve multiple memory pools or it may simply involve adding a critical section around calls to malloc and free. It is left to the implementation to define the most appropriate scheme.

```
/* allocate a large buffer */
uint8_t* buffer;

buffer = OSAL_Malloc(8000);
if (buffer != NULL)
{
    ... manipulate the buffer
    /* free the buffer */
    OSAL_Free(buffer);
    buffer = NULL;
}
```

5.5.4.3.12 OSAL Operation

This section describes OSAL control features.

Description

When the OSAL is using an underlying RTOS it may be necessary to allow the RTOS to perform one-time initialization before any calls to it are made. For instance, the RTOS might implement multiple memory pools for managing threads, queues and semaphores and it must be given the chance to create these pools before any of the objects are created. For this reason the application program should call [OSAL_Initialize\(\)](#) early on and certainly before any MPLAB Harmony Drivers or middleware is initialized (since these may also create OSAL objects at creation time).

Once the OSAL is initialized and any other remaining parts of the system are configured correctly, the OSAL can be entered with [OSAL_Start\(\)](#). There is no expectation that control will be returned from this function and any return is likely to indicate a fault condition.

5.5.5 Configuring the Library

The configuration of the OSAL Library is based on the file sys_config.h

This header file contains the configuration selection for the OSAL Library. Based on the selections made, the OSAL will support or not support selected features.

This header can be placed anywhere, the path of this header needs to be present in the include search path for a successful build. Refer to the [Applications Overview](#) section for more details.

Description

To configure the OSAL the compilation mode needs to be selected. Three options are currently supported and these define the implementation details for the OSAL. In all cases the same interface is present; however, the functionality at the varying levels will be different or not supported. Only one of these #define statements should be specified, and this can be either done in a common location (such as sysconfig.h) or on the build tool command line.

Compilation Mode	Description
<code>OSAL_USE_NONE</code>	No RTOS or OSAL support is provided. The OSAL interface functions will compile to 'nothing' or are defined to have no value.
<code>OSAL_USE_BASIC</code>	Basic level of support. There is no underlying RTOS; however, certain facilities are replicated such as Semaphores and Mutexes.
<code>OSAL_USE_RTOS</code>	A full implementation of the OSAL interface is available and there is an underlying RTOS as part of the program.

5.5.5.1 Initialization Overrides

This section provides information for overriding OSAL initialization.

Description

The OSAL requires minimal configuration. In the case of the `OSAL_USE_NONE` and `OSAL_USE_BASIC` all of the configuration required is provided by the standard "`osal.h`" include file. When a particular RTOS is being used then additional OSAL configuration parameters should be placed in "`sys_config.h`".

The primary requirement is to include the relevant interface implementation for the selected RTOS being used. This file will contain the mappings from OSAL interface types to types relevant for the chosen RTOS.

```
/* included the name of the port specific interface file */
#include "osal_<port name>.h"
```

Configuration parameter to define the maximum number of unique priority levels that a thread may take.

Configuration Parameter	Purpose
<code>OSAL_MAX_PRIORITIES</code>	Maximum number of thread priority levels allowed in the application. The assignable priorities for a thread are assumed to run from 1 to <code>OSAL_MAX_PRIORITIES</code> - 1 . Some underlying RTOSs may permit multiple threads at the same priority level (implementing a round-robin scheduling) so the total number of threads may actually be higher than the defined value. This is an application design decision.

If the application is to support multi-threaded drivers with Daemon threads then the stack size and priority of the these should be defined using the following macros:

Configuration Parameter	Purpose
<code>OSAL_DAEMON_STACK_SIZE</code>	Number of bytes to allocate to a daemon thread. These threads are likely to be small and require small stacks although the exact size depends on the architecture. Any OSAL port should implement safe defaults. Typical values are 800 bytes for a PIC32 or 300 for a PIC24.

OSAL_DAEMON_PRIORITY	Default priority of a daemon thread. Since these threads are typically calling MPLAB Harmony drivers and middleware their priority should be higher than the majority of the application in order to keep them from suffering driver starvation. The most appropriate value is left to the programmer to decide.

5.5.5.2 Others

[Drag and Drop other configuration options](#)

5.5.5.3 Examples - Sample Functionality

Example sys_config.h fragment:

```
// *****
// *****
// Section: Application Configuration
// *****
// *****
/* These definitions select the configuration options for the application
*/
/* configure the priorities and stack sizes for the daemon tasks */
#define OSAL_DAEMON_STACK_SIZE      800
#define OSAL_DAEMON_PRIORITY        4

/* configure the maximum number of priorities in this application */
#define OSAL_CONFIG_MAX_PRIORITIES  31

/* declare the daemon tasks used by the OSAL to implement driver tasks */
extern void osalDaemon1(void* pv);
extern void osalDaemon2(void* pv);

/* Include the port specific OS implementation files. The file is required to
 * create an implementation layer for the selected OS. This include will be
 * changed depending on the required OS being used */
#include "osal_freertos.h"
```

5.5.6 Building the Library

This section list the files that are available in the \src of the OSAL Library. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

Files

Name	Description
osal.c	Bare metal implementation of OSAL functions

Description

As additional implementations of the OSAL Library are added to MPLAB Harmony, their interface files may be added to the \src directory. Since many RTOS vendors offer their products as a commercial and licensed offering it is likely that considerably more source files will be required than just the "osal_xxxx.c" file. These RTOS source files will be placed inside directories specific to the manufacturer and instructions on how to add them to a MPLAB Harmony project will be provided by the supplier.

Summary

if you are building using the default OSAL Library and have selected the [OSAL_USE_NONE](#) or `OSAL_USE_BASIC` compilation options then only "[osal.c](#)" needs to be added to the project. However, if a specific RTOS is being targeted and `OSAL_USE_RTOS` is selected, the port specific implementation file will need to be added to the project along with the files for that vendor.

5.5.6.1 osal.c

Basic OSAL compatibility layer.

This file contains functional implementations of the bare metal OSAL. Where it is logical and possible to implement non threading versions of the common function calls they have been implemented here directly or in the [osal.h](#) file as macros. If it is not possible, or logical, to implement a feature WITHOUT an RTOS present, the the matching definition in [osal.h](#) will be set to a NULL (or empty) implementation.

File Name

osal.c

5.5.7 Library Interface

Data Types and Constants

	Name	Description
	OSAL_MUTEX_HANDLE_TYPE	Handle to a mutex, this is the default implementation and may be overridden in an actual implementation file
	OSAL_QUEUE_HANDLE_TYPE	Handle to a queue, this is the default implementation and may be overridden in an actual implementation file
	OSAL_SEM_HANDLE_TYPE	Handle to a semaphore, this is the default implementation and may be overridden in an actual implementation file
	OSAL_THREAD_HANDLE_TYPE	Handle to a thread, this is the default implementation and may be overridden in an actual implementation file
	OSAL_USE_NONE	This is macro <code>OSAL_USE_NONE</code> .
	OSAL_WAIT_FOREVER	Default value indicating block forever
	OSAL_RESULT	Enumerated type representing the general return value from OSAL functions.
	OSAL_SEM_TYPE	Enumerated type representing the possible types of semaphore.

Critical Section Functions

	Name	Description
	OSAL_CRIT_Enter	Enters a critical section with the specified severity level.
	OSAL_CRIT_Leave	Leaves a critical section with the specified severity level.
	OSAL_CRIT_TYPE	Enumerated type representing the possible types of critical section.

Error Handling Functions

	Name	Description
	OSAL_ERROR_CALLBACK_TYPE	Enumerated type representing the possible types of callback message.
	OSAL_ErrorCallback	Lightweight error handling callback function for the RTOS.

Interrupt Handling Functions

	Name	Description
≡	OSAL_ISR_Enter	Informs the OSAL and RTOS that an ISR is being entered.
≡	OSAL_ISR_Exit	Informs the OSAL and RTOS that an ISR is being exited.

Memory Allocation Functions

	Name	Description
≡	OSAL_Free	Deallocates a block of memory and return to the default pool.
≡	OSAL_Malloc	Allocates memory using the OSAL default allocator.

Mutex Functions

	Name	Description
≡	OSAL_MUTEX_Create	Creates a mutex.
≡	OSAL_MUTEX_Delete	Deletes a mutex.
≡	OSAL_MUTEX_Lock	Locks a mutex.
≡	OSAL_MUTEX_Unlock	Unlocks a mutex.
≡	OSAL_MUTEX_DECLARE	Declares an OSAL mutex.

OSAL Control Functions

	Name	Description
≡	OSAL_Initialize	Performs OSAL initialization.
≡	OSAL_Name	Obtains the name of the underlying RTOS.
≡	OSAL_Start	Starts the underlying RTOS

Queue Functions

	Name	Description
≡	OSAL_QUEUE_DECLARE	Declares an OSAL queue.
≡	OSAL_QUEUE_Add	Add the specified item to the queue with a time-out if the queue is full.
≡	OSAL_QUEUE_AddHead	Adds the specified item to the front of the queue with a timeout if the queue is full.
≡	OSAL_QUEUE_AddHeadISR	Adds the specified item to the front of the queue from within an ISR.
≡	OSAL_QUEUE_AddISR	Adds the specified item to the queue from with an ISR.
≡	OSAL_QUEUE_Create	Creates a queue with the specified width and depth.
≡	OSAL_QUEUE_Delete	Deletes an OSAL_QUEUE.
≡	OSAL_QUEUE_Peek	Copys the item at the head of the queue but leave it on the queue. If the queue is empty, it will block up to waitMS.
≡	OSAL_QUEUE_PeekISR	Copys the item at the head of the queue but leaves it on the queue.
≡	OSAL_QUEUE_Remove	Removes the item at the head of the queue. If the queue is empty it will block up to waitMS.
≡	OSAL_QUEUE_RemoveISR	Removes the item at the head of the queue.

Semaphore Functions

	Name	Description
≡	OSAL_SEM_Create	Creates an OSAL Semaphore.
≡	OSAL_SEM_Delete	Deletes an OSAL Semaphore.
≡	OSAL_SEM_GetCount	Returns the current value of a counting semaphore.
≡	OSAL_SEM_Pend	Waits on a semaphore. Returns true if the semaphore was obtained within the time limit.

	OSAL_SEM_Post	Posts a semaphore or increments a counting semaphore.
	OSAL_SEM_PostISR	Posts a semaphore or increments a counting semaphore from within an Interrupt Service Routine (ISR).
	OSAL_SEM_DECLARE	Declares an OSAL semaphore.

Thread Functions

	Name	Description
	OSAL_THREAD_FUNCTION	Functions that will operate as a separate thread under the OSAL should match this type.
	OSAL_THREAD_Create	Creates an OSAL thread with the specified parameters.
	OSAL_THREAD_CreateDaemon	Creates a Daemon thread for use with multi-threaded Harmony drivers.
	OSAL_THREAD_PriorityGet	Gets the priority of a thread.
	OSAL_THREAD_PrioritySet	Sets the priority of a thread.
	OSAL_THREAD_Resume	Resumes a specified thread.
	OSAL_THREAD_ResumeAll	Resumes all suspended threads.
	OSAL_THREAD_Sleep	Puts the currently executing thread to sleep.
	OSAL_THREAD_Suspend	Suspends a specified thread.
	OSAL_THREAD_SuspendAll	Suspends all threads apart from the calling thread.

Description

This section describes the APIs of the OSAL Library. Refer to each section for a description.

5.5.7.1 Thread Functions

5.5.7.1.1 OSAL_THREAD_FUNCTION Type

C

```
typedef void (* OSAL_THREAD_FUNCTION)(void* pData);
```

Description

OSAL thread function template

OSAL thread functions must match this type or use it explicitly. Thread functions are expected to return nothing. The pData parameter is information passed at creation time and is implementation specific.

Remarks

None.

5.5.7.1.2 OSAL_THREAD_Create Function

C

```
OSAL_RESULT OSAL_THREAD_Create(
    OSAL_THREAD_FUNCTION task,
    const char* name,
    uint16_t stack_size,
    uint8_t priority,
    void* pData,
    OSAL_THREAD_HANDLE_TYPE* pHandle
);
```

Description

This function creates an OSAL thread. The thread function is implemented as a simple task that will normally not return (i.e., a while(1) loop). The name is not used by the OSAL, but may be used by the RTOS for diagnostic and reporting purposes. The thread is created with a fixed stack size that is allocated from one of the available memory pools or more normally from the heap. The priority of the thread is an 8-bit quantity with higher values denoting threads of a higher priority. Optionally, a parameter may be passed to the thread function that can be used to implement per instance behavior. For example, one LED flashing task could be created several times with the LED number passed as a parameter at creation time. A handle to the created thread is returned in pHandle. Threads may be created prior to the RTOS starting, however, no execution will occur until it is started. A created thread is immediately placed into the READY state and is able to run provided that it is the highest priority thread when all threads are evaluated by the kernel, either during normal operation, or at RTOS start-up time.

Preconditions

Thread function must exist in program memory.

Parameters

Parameters	Description
task	Name of the function that implements the thread code
name	Textual name of the thread. Not used by the OSAL but may be used by the RTOS for diagnostic and tracing purposes.
stack_size	Size of the stack associated with a thread in bytes. The RTOS will allocate this many bytes from any underlying memory pool or the heap.
priority	Priority of the thread from 1-255. Higher values indicate threads with higher priorities. It is left down to the underlying RTOS whether threads of the same priority are permitted or if threads should be given a unique priority.
pData	Pointer to data passed to the thread. Optionally, NULL may be passed.
pHandle	Pointer to a variable that can contain the created threads handle

Returns

OSAL_RESULT_TRUE - Thread successfully created

OSAL_RESULT_FALSE - Thread not created or insufficient memory available

Remarks

None.

Example

```
// create a thread passing a data structure as a parameter during creation
OSAL_THREAD_Create(threadCheck, "CHECK", 500, OTH_APP_THREAD_PRIORITY + 2, (void*) &appData,
NULL);
```

5.5.7.1.3 OSAL_THREAD_CreateDaemon Function**C**

```
OSAL_RESULT OSAL_THREAD_CreateDaemon(
    OSAL_THREAD_FUNCTION task
);
```

Description

This function will create a daemon or system thread designed to assist Harmony driver modules with their operation. Some Harmony drivers will incorporate state machines or other loop structures that must be periodically called for the driver to continue operating. For instance, a USART driver may have a state machine that manages the prioritization and transmission of data from multiple clients. This could work in addition to any processing that occurs when operating under interrupts so it will have a separate DRV_xxxx_Tasks routine (or similar) that must be periodically called. Since the prioritization and frequency of these

calls is only known to the programmer when designing the end application, the OSAL provides a lightweight thread mechanism that is primarily intended to be used internally by MPLAB Harmony. The Daemon threads have a fixed size stack (defined in `system_config.h`) and operate at a fixed priority.

Preconditions

Daemon function must exist in program memory.

Parameters

Parameters	Description
task	The name of the function that implements the Daemon

Returns

OSAL_RESULT_TRUE - Thread successfully created

OSAL_RESULT_FALSE - Thread not created or insufficient memory available

Remarks

None.

Example

```
// inside driver initialization routine
...
OSAL_THREAD_CreateDaemon(DRV_USART_Tasks);
```

5.5.7.1.4 OSAL_THREAD_PriorityGet Function

C

```
uint8_t OSAL_THREAD_PriorityGet(
    OSAL_THREAD_HANDLE_TYPE handle
);
```

Description

This function gets the priority of a thread. The priority of the thread with the specified handle is returned. A handle value of NULL returns the priority of the thread making the call.

Preconditions

Thread must have been created.

Parameters

Parameters	Description
handle	The thread handle. NULL indicates use the current thread.

Returns

0-255 - The current priority of the thread. Higher values indicate higher priority.

Remarks

None.

Example

```
// raise the priority of this thread to ensure it completes a complex
// operation
uint8_t currPriority;

currPriority = OSAL_THREAD_PriorityGet(NULL);
OSAL_THREAD_PrioritySet(NULL, currPriority + 1);
```

```
... perform a time critical operation

// restore the priority
OSAL_THREAD_PrioritySet(NULL, currPriority);
```

5.5.7.1.5 OSAL_THREAD_PrioritySet Function

C

```
OSAL_RESULT OSAL_THREAD_PrioritySet(
    OSAL_THREAD_HANDLE_TYPE handle,
    uint8_t priority
);
```

Description

This function sets the priority of a thread. The priority of the thread with the specified handle is changed to the new value. If as a result of the change, it now has the highest priority and if not blocked, will start executing.

Preconditions

Thread must have been created.

Parameters

Parameters	Description
handle	The thread handle. NULL indicates change the priority of the thread in which the call was made.
priority	Priority to be assigned to the thread

Returns

OSAL_RESULT_TRUE - Priority changed

OSAL_RESULT_FALSE - Priority not changed

Remarks

None.

Example

```
// raise the priority of this thread to ensure it completes a complex
// operation
uint8_t currPriority;

currPriority = OSAL_THREAD_GetPriority(NULL);
OSAL_THREAD_PrioritySet(NULL, currPriority + 1);

... perform a time critical operation

// restore the priority
OSAL_THREAD_PrioritySet(NULL, currPriority);
```

5.5.7.1.6 OSAL_THREAD_Resume Function

C

```
OSAL_RESULT OSAL_THREAD_Resume(
    OSAL_THREAD_HANDLE_TYPE handle
);
```

Description

This function resumes a specific thread.

Preconditions

Thread must have been created.

Parameters

Parameters	Description
handle	The thread handle

Returns

OSAL_RESULT_TRUE - Thread resumed

OSAL_RESULT_FALSE - Thread could not be resumed

Remarks

None.

Example

```
// suspend a thread until a later time
OSAL_THREAD_Suspend(thread1Handle);

...

// resume the suspended thread
OSAL_THREAD_RESUME(thread1Handle);
```

5.5.7.1.7 OSAL_THREAD_ResumeAll Function

C

```
OSAL_RESULT OSAL_THREAD_ResumeAll();
```

Description

This function resumes all suspended threads. Execution will continue with the highest priority thread that is ready to execute.

Preconditions

Thread must have been created.

Returns

OSAL_RESULT_TRUE - Successful call

Remarks

None.

Example

```
// resume all threads
OSAL_THREAD_ResumeAll();
```

5.5.7.1.8 OSAL_THREAD_Sleep Function

C

```
OSAL_RESULT OSAL_THREAD_Sleep(
    uint16_t waitMS
);
```

Description

This function puts the currently executing thread to sleep. Execution of the current thread is placed into a blocked state for the specified amount of time. The exact amount of time that the thread will sleep will depend upon the granularity of the underlying

pre-emptive tick.

Preconditions

Thread must have been created.

Parameters

Parameters	Description
waitMS	Number of milliseconds the thread will be blocked

Returns

OSAL_RESULT_TRUE - Call succeeded

Remarks

None.

Example

```
while (1)
{
    // sleep for 500ms
    OSAL_THREAD_Sleep(500);
    // toggle an LED
    DRV_IO_Toggle(drvHandle, LED_ID);
}
```

5.5.7.1.9 OSAL_THREAD_Suspend Function

C

```
OSAL_RESULT OSAL_THREAD_Suspend(
    OSAL_THREAD_HANDLE_TYPE handle
);
```

Description

This function suspends a specific thread. If NULL is passed, the RTOS will attempt to suspend the thread in which the call was made. The thread will then only resume when unsuspended by another part of the program with an appropriate resume call.

Preconditions

Thread must have been created.

Parameters

Parameters	Description
handle	The thread handle. NULL may be passed indicating suspend the calling thread.

Returns

OSAL_RESULT_TRUE - Thread suspended

OSAL_RESULT_FALSE - Thread could not be suspended

Remarks

None.

Example

```
// suspend this thread
OSAL_THREAD_Suspend(NULL);
```

5.5.7.1.10 OSAL_THREAD_SuspendAll Function

C

```
OSAL_RESULT OSAL_THREAD_SuspendAll();
```

Description

This function suspends all threads. Interrupts are still enabled. The calling thread will continue executing at the next instruction.

Preconditions

Thread must have been created.

Returns

OSAL_RESULT_TRUE - Threads suspended

OSAL_RESULT_FALSE - Threads could not be suspended

Remarks

None.

Example

```
// suspend all threads
OSAL_THREAD_SuspendAll();

// perform critical code sequence
// NB a critical section may be a better choice here
...
```

5.5.7.2 Semaphore Functions

5.5.7.2.1 OSAL_SEM_Create Function

C

```
OSAL_RESULT OSAL_SEM_Create(
    OSAL_SEM_HANDLE_TYPE* semID,
    OSAL_SEM_TYPE type,
    uint8_t maxCount,
    uint8_t initialCount
);
```

Description

This function creates an OSAL binary or counting semaphore. If OSAL_SEM_TYPE_BINARY is specified, the maxcount and initialCount values are ignored; otherwise, these must contain valid values.

Preconditions

Semaphore must have been declared.

Parameters

Parameters	Description
semID	Pointer to the Semaphore ID
type	OSAL_SEM_TYPE_BINARY, create a binary semaphore OSAL_SEM_TYPE_COUNTING, create a counting semaphore with the specified count values
maxCount	Maximum value for a counting semaphore (ignored for a BINARY semaphore)

initialCount	Starting count value for the semaphore (ignored for a BINARY semaphore)

Returns

OSAL_RESULT_TRUE - Semaphore created

OSAL_RESULT_FALSE - Semaphore creation failed

semID - Updated with valid semaphore handle if call was successful

Remarks

None.

Example

```
OSAL_SEM_Create(&mySemID, OSAL_SEM_TYPE_COUNTING, 10, 5);
```

5.5.7.2.2 OSAL_SEM_Delete Function

C

```
OSAL_RESULT OSAL_SEM_Delete(  
    OSAL_SEM_HANDLE_TYPE* semID  
);
```

Description

This function deletes an OSAL semaphore, freeing up any allocated storage associated with it.

Preconditions

Semaphore must have been created.

Parameters

Parameters	Description
semID	Pointer to the semID

Returns

OSAL_RESULT_TRUE - Semaphore deleted

OSAL_RESULT_FALSE - Semaphore deletion failed

Remarks

None.

Example

```
OSAL_SEM_Delete(&mySemID);
```

5.5.7.2.3 OSAL_SEM_GetCount Function

C

```
uint8_t OSAL_SEM_GetCount(  
    OSAL_SEM_HANDLE_TYPE semID  
);
```

Description

This function returns the current value of a counting semaphore. The value returned is assumed to be a single value ranging from 0-255.

Preconditions

Semaphore must have been created.

Parameters

Parameters	Description
semID	The semID

Returns

0 - Semaphore is unavailable

1-255 - Current value of the counting semaphore

Remarks

None.

Example

```
uint8_t semCount;

semCount = OSAL_SEM_GetCount(semUART);

if (semCount > 0)
{
    // obtain the semaphore
    if (OSAL_SEM_Pend(semUART) == OSAL_RESULT_TRUE)
    {
        // perform processing on the comm channel
        ...
    }
}
else
{
    // no comm channels available
    ...
}
```

5.5.7.2.4 OSAL_SEM_Pend Function

C

```
OSAL_RESULT OSAL_SEM_Pend(
    OSAL_SEM_HANDLE_TYPE semID,
    uint16_t waitMS
);
```

Description

This function is a blocking function call that waits (i.e., pends) on a semaphore. The function will return true if the semaphore has been obtained, or false if it was not available or the time limit was exceeded.

Preconditions

Semaphore must have been created.

Parameters

Parameters	Description
semID	The semID
waitMS	Time limit to wait in milliseconds. 0, do not wait OSAL_WAIT_FOREVER , return only when semaphore is obtained Other values, timeout delay

Returns

- OSAL_RESULT_TRUE - Semaphore obtained
- OSAL_RESULT_FALSE - Semaphore not obtained or timeout occurred

Remarks

None.

Example

```
if (OSAL_SEM_Pend(semUARTRX, 50) == OSAL_RESULT_TRUE)
{
    // character available
    c = DRV_USART_ReadByte(drvID);
    ...
}
else
{
    // character not available, resend prompt
    ...
}
```

5.5.7.2.5 OSAL_SEM_Post Function

C

```
OSAL_RESULT OSAL_SEM_Post(
    OSAL_SEM_HANDLE_TYPE semID
);
```

Description

This function posts a binary semaphore or increments a counting semaphore. The highest priority task currently blocked on the semaphore will be released and made ready to run.

Preconditions

Semaphore must have been created.

Parameters

Parameters	Description
semID	The semID

Returns

- OSAL_RESULT_TRUE - Semaphore posted
- OSAL_RESULT_FALSE - Semaphore not posted

Remarks

None.

Example

```
OSAL_SEM_Post(semSignal);
```

5.5.7.2.6 OSAL_SEM_PostISR Function

C

```
OSAL_RESULT OSAL_SEM_PostISR(
    OSAL_SEM_HANDLE_TYPE semID
);
```

Description

This function posts a binary semaphore or increments a counting semaphore. The highest priority task currently blocked on the semaphore will be released and made ready to run. This form of the post function should be used inside an ISR.

Preconditions

Semaphore must have been created.

Parameters

Parameters	Description
semID	The semID

Returns

OSAL_RESULT_TRUE - Semaphore posted

OSAL_RESULT_FALSE - Semaphore not posted

Remarks

This version of the [OSAL_SEM_Post](#) function should be used if the program is, or may be, operating inside an ISR. The OSAL will take the necessary steps to ensure correct operation possibly disabling interrupts or entering a critical section. The exact requirements will depend upon the particular RTOS being used.

Example

```
void __ISR(UART_2_VECTOR) _UART2RXHandler()  
{  
    char c;  
  
    // indicate to the OSAL that this is an interrupt function  
    OSAL_ISR_Enter();  
  
    // read the character  
    c = U2RXREG;  
    // clear the interrupt flag  
    IFS1bits.U2IF = 0;  
    // post a semaphore indicating a character has been received  
    OSAL_SEM_PostISR(semSignal);  
  
    // indicate to the OSAL the ISR is ending  
    OSAL_ISR_Exit();  
}
```

5.5.7.2.7 OSAL_SEM_DECLARE Macro

C

```
#define OSAL_SEM_DECLARE(semID) OSAL_SEM_HANDLE_TYPE semID
```

Description

OSAL_SEM_Declare(semID)

This function declares a data item of type [OSAL_SEM_HANDLE_TYPE](#).

Remarks

None.

5.5.7.3 Mutex Functions

5.5.7.3.1 OSAL_MUTEX_Create Function

C

```
OSAL_RESULT OSAL_MUTEX_Create(  
    OSAL_MUTEX_HANDLE_TYPE* mutexID  
);
```

Description

This function creates a mutex, allocating storage if required and placing the mutex handle into the passed parameter.

Preconditions

Mutex must have been declared.

Parameters

Parameters	Description
mutexID	Pointer to the mutex handle

Returns

OSAL_RESULT_TRUE - Mutex successfully created

OSAL_RESULT_FALSE - Mutex failed to be created

Remarks

None.

Example

```
OSAL_MUTEX_HANDLE_TYPE mutexData;  
OSAL_MUTEX_Create(&mutexData);  
...  
if (OSAL_MUTEX_Lock(mutexData, 1000) == OSAL_RESULT_TRUE)  
{  
    // manipulate the shared data  
    ...  
}
```

5.5.7.3.2 OSAL_MUTEX_Delete Function

C

```
OSAL_RESULT OSAL_MUTEX_Delete(  
    OSAL_MUTEX_HANDLE_TYPE* mutexID  
);
```

Description

This function deletes a mutex and frees associated storage if required.

Preconditions

None.

Parameters

Parameters	Description
mutexID	Pointer to the mutex handle

Returns

OSAL_RESULT_TRUE - Mutex successfully deleted

OSAL_RESULT_FALSE - Mutex failed to be deleted

Remarks

None.

Example

```
OSAL_MUTEX_Delete(&mutexData);
```

5.5.7.3.3 OSAL_MUTEX_Lock Function

C

```
OSAL_RESULT OSAL_MUTEX_Lock(  
    OSAL_MUTEX_HANDLE_TYPE mutexID,  
    uint16_t waitMS  
);
```

Description

This function locks a mutex, waiting for the specified timeout. If it cannot be obtained or the timeout period elapses 'false' is returned.

Preconditions

Mutex must have been created.

Parameters

Parameters	Description
mutexID	The mutex handle
waitMS	Timeout value in milliseconds 0, do not wait return immediately OSAL_WAIT_FOREVER , wait until mutex is obtained before returning Other values, Timeout delay

Returns

OSAL_RESULT_TRUE - Mutex successfully obtained

OSAL_RESULT_FALSE - Mutex failed to be obtained or timeout occurred

Remarks

None.

Example

```
OSAL_MUTEX_HANDLE_TYPE mutexData;  
  
OSAL_MUTEX_Create(&mutexData);  
  
...  
if (OSAL_MUTEX_Lock(mutexData, 1000) == OSAL_RESULT_TRUE)  
{  
    // manipulate the shared data  
    ...  
  
    // unlock the mutex  
    OSAL_MUTEX_Unlock(mutexData);  
}
```

5.5.7.3.4 OSAL_MUTEX_Unlock Function

C

```
OSAL_RESULT OSAL_MUTEX_Unlock(  
    OSAL_MUTEX_HANDLE_TYPE mutexID  
);
```

Description

This function unlocks a previously obtained mutex.

Preconditions

Mutex must have been created.

Parameters

Parameters	Description
mutexID	The mutex handle

Returns

OSAL_RESULT_TRUE - Mutex released

OSAL_RESULT_FALSE - Mutex failed to be released or error occurred

Remarks

None.

Example

```
OSAL_MUTEX_HANDLE_TYPE mutexData;  
OSAL_MUTEX_Create(&mutexData);  
...  
if (OSAL_MUTEX_Lock(mutexData, 1000) == OSAL_RESULT_TRUE)  
{  
    // manipulate the shared data  
    ...  
    // unlock the mutex  
    OSAL_MUTEX_Unlock(mutexData);  
}
```

5.5.7.3.5 OSAL_MUTEX_DECLARE Macro

C

```
#define OSAL_MUTEX_DECLARE(mutexID) OSAL_MUTEX_HANDLE_TYPE mutexID
```

Description

OSAL_MUTEX_Declare(mutexID)

This function declares a data item of type [OSAL_MUTEX_HANDLE_TYPE](#)

Remarks

None

5.5.7.4 Queue Functions

5.5.7.4.1 OSAL_QUEUE_DECLARE Macro

C

```
#define OSAL_QUEUE_DECLARE(queueID) OSAL_QUEUE_HANDLE_TYPE queueID
```

Description

OSAL_QUEUE_Declare(queueID)

This function declares a data item of type [OSAL_QUEUE_HANDLE_TYPE](#).

Remarks

None

5.5.7.4.2 OSAL_QUEUE_Add Function

C

```
OSAL_RESULT OSAL_QUEUE_Add(  
    OSAL_QUEUE_HANDLE_TYPE queueID,  
    uint8_t* pdata,  
    uint16_t waitMS  
);
```

Description

This function adds the specified item to the queue by copying it. If the queue has space, the function will return immediately. If there is no space on the queue, the function will wait up to the specified time before returning. The item is added to the tail of the queue.

Preconditions

Queue must have been created.

Parameters

Parameters	Description
queueID	The OSAL_QUEUE handle
pdata	Pointer to the data to be copied to the queue. The data item must be the same size as that specified when creating the queue.
waitMS	Time to wait while trying to write to a full queue before timing out

Returns

OSAL_RESULT_TRUE - Item successfully added to the queue

OSAL_RESULT_FALSE - Item could not be written to the queue or a timeout occurred

Remarks

None.

Example

```
// create a queue containing 16 byte items, queue is 5 items long.  
OSAL_QUEUE_Create(&msgQueue, 16, 5);  
  
...  
// define a message (Note 0 at end is allowed for)  
const char msg[16] = "Hello World....";  
  
// write data to the queue. Wait until space is available  
// Note in this case that the 0 at the end of msg is also copied
```

```
OSAL_QUEUE_Add(msgQueue, (uint8_t*) msg, OSAL_WAIT_FOREVER);
```

5.5.7.4.3 OSAL_QUEUE_AddHead Function

C

```
OSAL_RESULT OSAL_QUEUE_AddHead(  
    OSAL_QUEUE_HANDLE_TYPE queueID,  
    uint8_t* pdata,  
    uint16_t waitMS  
);
```

Description

This function adds the specified item to the front of the queue by copying it. If the queue has space the function will return immediately. If there is no space on the queue then wait up to the specified time before returning. The item is added to the front of the queue.

Preconditions

Queue must have been created.

Parameters

Parameters	Description
queueID	The OSAL_QUEUE handle
pdata	Pointer to the data to be copied to the queue. The data item must be the same size as that specified when creating the queue.
waitMS	Time to wait while trying to write to a full queue before timing out

Returns

OSAL_RESULT_TRUE - Item successfully added to the queue
OSAL_RESULT_FALSE - Item could not be written to the queue or a timeout occurred
OSAL_RESULT_NOT_IMPLEMENTED - Function not implemented in the current RTOS

Remarks

None.

Example

```
// create a queue containing byte items, queue is 5 items long.  
OSAL_QUEUE_Create(&msgQueue, sizeof(uint8_t), 5);  
  
...  
// Send an important message  
uint8_t sigMsg = 42;  
  
// write data to the front of the queue.  
OSAL_QUEUE_AddHead(msgQueue, &sigMsg, OSAL_WAIT_FOREVER);
```

5.5.7.4.4 OSAL_QUEUE_AddHeadISR Function

C

```
OSAL_RESULT OSAL_QUEUE_AddHeadISR(  
    OSAL_QUEUE_HANDLE_TYPE queueID,  
    uint8_t* pdata  
);
```

Description

This function adds the specified item to the queue by copying it. The item is added to the front of the queue. This version of Add

should be used within an ISR.

Preconditions

Queue must have been created.

Parameters

Parameters	Description
queueID	The OSAL_QUEUE handle
pdata	Pointer to the data to be copied to the queue. The data item must be the same size as that specified when creating the queue.

Returns

OSAL_RESULT_TRUE - Item successfully added to the queue

OSAL_RESULT_FALSE - Item could not be written to the queue

OSAL_RESULT_NOT_IMPLEMENTED - Function not implemented in the current RTOS

Remarks

None.

Example

```
void __ISR(EXTERNAL_VECTOR) _ExternalIRQHandler()
{
    const uint8_t msg = EMERGENCY_STOP;

    OSAL_ISR_Enter();

    // clear the interrupt flag
    IFS1bit.EIF = 0;

    // send an emergency message to any listening task
    OSAL_QUEUE_AddHeadISR(myRXQueue, msg);

    OSAL_ISR_Exit();
}
```

5.5.7.4.5 OSAL_QUEUE_AddISR Function

C

```
OSAL_RESULT OSAL_QUEUE_AddISR(
    OSAL_QUEUE_HANDLE_TYPE queueID,
    uint8_t* pdata
);
```

Description

This function adds the specified item to the queue by copying it. The item is added to the tail of the queue. This version of Add should be used within an ISR.

Preconditions

Queue must have been created.

Parameters

Parameters	Description
queueID	The OSAL_QUEUE handle
pdata	Pointer to the data to be copied to the queue. The data item must be the same size as that specified when creating the queue.

Returns

OSAL_RESULT_TRUE - Item successfully to the queue

OSAL_RESULT_FALSE - Item could not be added to the queue

Remarks

None.

Example

```
void __ISR(UART_2_VECTOR) _UART2RXHandler()  
{  
    char c;  
  
    OSAL_ISR_Enter();  
  
    // read the character  
    c = U2RXREG;  
    // clear the interrupt flag  
    IFS1bits.U2IF = 0;  
  
    // post the received character onto a queue for later processing  
    OSAL_QUEUE_AddISR(myRXQueue, c);  
  
    OSAL_ISR_Exit();  
}
```

5.5.7.4.6 OSAL_QUEUE_Create Function

C

```
OSAL_RESULT OSAL_QUEUE_Create(  
    OSAL_QUEUE_HANDLE_TYPE* queueID,  
    uint16_t width,  
    uint16_t depth  
);
```

Description

This function allocates storage and creates an OSAL queue entity. Each entry in the queue will be 'width' bytes in size and the queue can contain at most 'depth' items.

Preconditions

Queue must have been declared.

Parameters

Parameters	Description
queueID	Pointer to the OSAL queue
width	Width in bytes of each item in the queue
depth	Maximum number of entries that can be stored in the queue

Returns

OSAL_RESULT_TRUE - Queue created

OSAL_RESULT_FALSE - Queue failed to be created

Remarks

The function creates an OSAL_QUEUE with the specified parameters. OSAL_QUEUES are assumed to work on copy with passed data being copied into the queue or other temporary storage so that the passed data storage is released.

Example

```
// declare a queue variable
OSAL_QUEUE_Declare(serialQueue);

// create a queue that contains 16bit integers and is 10 items long
OSAL_QUEUE_Create(&serialQueue, sizeof(uint16_t), 10);
```

5.5.7.4.7 OSAL_QUEUE_Delete Function

C

```
OSAL_RESULT OSAL_QUEUE_Delete(
    OSAL_QUEUE_HANDLE_TYPE* queueID
);
```

Description

This function deletes an OSAL_QUEUE pointed to be the passed argument. Associated storage is released upon completion.

Preconditions

Queue must have been created.

Parameters

Parameters	Description
queueID	Pointer to the OSAL_QUEUE object handle

Returns

OSAL_RESULT_TRUE - Queue deleted

OSAL_RESULT_FALSE - Queue failed to be deleted

Remarks

None.

Example

```
// declare a queue variable
OSAL_QUEUE_Declare(serialQueue);

// create a queue that contains 16bit integers and is 10 items long
OSAL_QUEUE_Create(&serialQueue, sizeof(uint16_t), 10);

// application is terminating, delete queue object
OSAL_QUEUE_Delete(&serialQueue);
```

5.5.7.4.8 OSAL_QUEUE_Peek Function

C

```
OSAL_RESULT OSAL_QUEUE_Peek(
    OSAL_QUEUE_HANDLE_TYPE queueID,
    uint8_t* pdata,
    uint16_t waitMS
);
```

Description

This function examines the queue and copy the item at the head leaving the item on the queue for the next access. If there is nothing on the queue, block until waitMS milliseconds have elapsed before returning, or until something is placed on the queue.

Preconditions

Queue must have been created.

Parameters

Parameters	Description
queueID	The OSAL_QUEUE handle
pdata	Pointer to the location to receive data copied from the queue. The data item must be the same size as that specified when creating the queue.
waitMS	Maximum time to wait before returning if the queue is empty 0, return immediately OSAL_WAIT_FOREVER , wait until data is in the queue Others, maximum blocking time in milliseconds

Returns

OSAL_RESULT_TRUE - Item successfully copied from the queue

OSAL_RESULT_FALSE - Nothing copied from the queue or timeout occurred

OSAL_RESULT_NOT_IMPLEMENTED - Operation not available on the current RTOS

Remarks

None.

Example

```
// copy filenames from a queue and process the data in the file
// however if another filename is on the queue then abort and
// restart the operation
OSAL_QUEUE_Remove(rxQueue, fileName, OSAL_WAITFOREVER);

while (abort == false)
{
    // read data from the file and process it
    ...

    // check for a new filename to process
    if (OSAL_QUEUE_Peek(rxQueue, fileName, 0) == OSAL_RESULT_TRUE)
    {
        abort = true;
    }
}
```

5.5.7.4.9 OSAL_QUEUE_PeekISR Function**C**

```
OSAL_RESULT OSAL_QUEUE_PeekISR(
    OSAL_QUEUE_HANDLE_TYPE queueID,
    uint8_t* pdata
);
```

Description

This function examines the queue and copies the item at the head, leaving the item on the queue for the next access. This version should be called from inside an ISR.

Preconditions

Queue must have been created.

Parameters

Parameters	Description
queueID	The OSAL_QUEUE handle
pdata	Pointer to the location to receive data copied from the queue. The data item must be the same size as that specified when creating the queue.

Returns

OSAL_RESULT_TRUE - Item successfully copied from the queue

OSAL_RESULT_FALSE - Nothing copied from the queue

OSAL_RESULT_NOT_IMPLEMENTED - Operation not available on the current RTOS

Remarks

None.

Example

```
uint16_t data;  
OSAL_QUEUE_PeekISR(myQueue, &data);
```

5.5.7.4.10 OSAL_QUEUE_Remove Function

C

```
OSAL_RESULT OSAL_QUEUE_Remove(  
    OSAL_QUEUE_HANDLE_TYPE queueID,  
    uint8_t* pdata,  
    uint16_t waitMS  
);
```

Description

This function removes the item at the head of the queue. The item is copied to the location pointed to by pdata. The user should ensure that there is sufficient space to receive the copied data. If no data is available, the function will block for waitMS before returning.

Preconditions

Queue must have been created.

Parameters

Parameters	Description
queueID	The OSAL_QUEUE handle
pdata	Pointer to the location to receive data copied from the queue. The data item must be the same size as that specified when creating the queue.
waitMS	Maximum time to wait before returning if the queue is empty 0, return immediately OSAL_WAIT_FOREVER , wait until data is in the queue Others, maximum blocking time in milliseconds

Returns

OSAL_RESULT_TRUE - Item successfully removed from the queue

OSAL_RESULT_FALSE - Nothing removed from the queue or timeout occurred

Remarks

None.

Example

```
char rxChar;
// wait up to one second to process the next character
if (OSAL_QUEUE_Remove(rxQueue, &rxChar, 1000) == OSAL_RESULT_TRUE)
{
    // process the data
    ...
}
else
{
    // nothing received in the last one second so perform other processing
    ...
}
```

5.5.7.4.11 OSAL_QUEUE_RemoveISR Function**C**

```
OSAL_RESULT OSAL_QUEUE_RemoveISR(
    OSAL_QUEUE_HANDLE_TYPE queueID,
    uint8_t* pdata
);
```

Description

This function removes the item at the head of the queue. Item is copied to the location pointed to by pdata. The user should ensure that there is sufficient space to receive the copied data. This version of the queue remove function should be used inside an ISR.

Preconditions

Queue must have been created.

Parameters

Parameters	Description
queueID	The OSAL_QUEUE handle
pdata	Pointer to the location to receive data copied from the queue. The data item must be the same size as that specified when creating the queue.

Returns

OSAL_RESULT_TRUE - Item successfully removed from the queue

OSAL_RESULT_FALSE - Nothing removed from the queue

Remarks

None.

Example

```
char rxChar;
void __ISR(TIMER_1_VECTOR) _ET1IRQHandler()
{
    const uint8_t msg;

    OSAL_ISR_Enter();

    // clear the interrupt flag
    IFS0bits.T1IF = 0;

    // check for data to be sent from a queue
    if (OSAL_QUEUE_RemoveISR(myTXQueue, msg) == OSAL_RESULT_TRUE)
    {

```

```
        DRV_USART_WriteByte(uart_drv, msg);
    }
    OSAL_ISR_Exit();
}
```

5.5.7.5 Critical Section Functions

5.5.7.5.1 OSAL_CRIT_Enter Function

C

```
void OSAL_CRIT_Enter(
    OSAL_CRIT_TYPE severity
);
```

Description

Critical Section group

This function enters a critical section of code. It is assumed that the sequence of operations bounded by the enter and leave critical section operations is treated as one atomic sequence that will not be disturbed.

Preconditions

None.

Parameters

Parameters	Description
severity	OSAL_CRIT_TYPE_LOW, The RTOS should disable all other running tasks effectively locking the scheduling mechanism. OSAL_CRIT_TYPE_HIGH, The RTOS should disable all possible interrupts sources including the scheduler ensuring that the sequence of code operates without interruption.

Returns

None.

Remarks

The sequence of operations bounded by the OSAL_CRIT_Enter and [OSAL_CRIT_Leave](#) form a critical section. The severity level defines whether the RTOS should perform task locking or completely disable all interrupts.

Example

```
// prevent other tasks pre-empting this sequence of code
OSAL_CRIT_Enter(OSAL_CRIT_TYPE_LOW);
// modify the peripheral
DRV_USART_Reinitialize( objUSART, &initData);
OSAL_CRIT_Leave(OSAL_CRIT_TYPE_LOW);
```

5.5.7.5.2 OSAL_CRIT_Leave Function

C

```
void OSAL_CRIT_Leave(
    OSAL_CRIT_TYPE severity
);
```

Description

This function leaves a critical section of code. It is assumed that the sequence of operations bounded by the enter and leave critical section operations is treated as one atomic sequence that will not be disturbed. The severity should match the severity level used in the corresponding [OSAL_CRIT_Enter](#) call to ensure that the RTOS carries out the correct action.

Preconditions

None.

Parameters

Parameters	Description
severity	OSAL_CRIT_TYPE_LOW, The RTOS should disable all other running tasks effectively locking the scheduling mechanism. OSAL_CRIT_TYPE_HIGH, The RTOS should disable all possible interrupts sources including the scheduler ensuring that the sequence of code operates without interruption.

Returns

None.

Remarks

The sequence of operations bounded by the [OSAL_CRIT_Enter](#) and [OSAL_CRIT_Leave](#) form a critical section. The severity level defines whether the RTOS should perform task locking or completely disable all interrupts.

Example

```
// prevent other tasks pre-empting this sequence of code
OSAL_CRIT_Enter(OSAL_CRIT_TYPE_LOW);
// modify the peripheral
DRV_USART_Reinitialize( objUSART,  &initData);
OSAL_CRIT_Leave(OSAL_CRIT_TYPE_LOW);
```

5.5.7.5.3 OSAL_CRIT_TYPE Enumeration

C

```
enum OSAL_CRIT_TYPE {
    OSAL_CRIT_TYPE_LOW,
    OSAL_CRIT_TYPE_HIGH
};
```

Description

OSAL Critical Type

This enum represents possible critical section types.

OSAL_CRIT_TYPE_LOW - Low priority critical section, can be formed by locking the scheduler (if supported by RTOS)

OSAL_CRIT_TYPE_HIGH - High priority critical section, will be formed by disabling all interrupts.

Remarks

Critical section types

5.5.7.6 Interrupt Handling Functions

5.5.7.6.1 OSAL_ISR_Enter Function

C

```
void OSAL_ISR_Enter();
```

Description

This function allows the OSAL and RTOS to implement any set up required should an OSAL function be called during the interrupt handler. Depending on the underlying RTOS, it may be necessary to set a global flag indicating that an interrupt is currently being executed for the correct context code to be executed during calls to the kernel. OSAL_ISR_Enter allows the RTOS to implement the required functions.

Preconditions

None, (in an interrupt handler).

Returns

None.

Remarks

None.

Example

```
void __ISR(UART_2_VECTOR) _UART2RXHandler()
{
    char c;

    OSAL_ISR_Enter();

    // perform interrupt processing and clear the flag
    ...

    OSAL_ISR_Exit();
}
```

5.5.7.6.2 OSAL_ISR_Exit Function

C

```
void OSAL_ISR_Exit();
```

Description

This function allows the OSAL and RTOS to implement any restoration required after an ISR has completed. Depending on the underlying RTOS, it may be necessary to set a global flag indicating that an interrupt is currently being executed for the correct context code to be executed during calls to the kernel. OSAL_ISR_Exit allows the RTOS to implement the required functions.

Preconditions

None, (in an interrupt handler).

Returns

None.

Remarks

None.

Example

```
void __ISR(UART_2_VECTOR) _UART2RXHandler()
{
```

```
char c;

OSAL_ISR_Enter();

// perform interrupt processing and clear the flag
...

OSAL_ISR_Exit();
}
```

5.5.7.7 Error Handling Functions

5.5.7.7.1 OSAL_ERROR_CALLBACK_TYPE Enumeration

C

```
enum OSAL_ERROR_CALLBACK_TYPE {
    OSAL_ERROR_CALLBACK_DEFAULT = 0,
    OSAL_ERROR_CALLBACK_OUT_OF_MEMORY,
    OSAL_ERROR_CALLBACK_STACK_OVERFLOW,
    OSAL_ERROR_CALLBACK_ERROR
};
```

Description

OSAL Error Callback Type

This enum represents possible OSAL error callback types.

OSAL_ERROR_CALLBACK_DEFAULT - Default error
OSAL_ERROR_CALLBACK_OUT_OF_MEMORY - Out of memory allocating resource such as creating a task or queue
OSAL_ERROR_CALLBACK_STACK_OVERFLOW - Stack overflow detected in a task
OSAL_ERROR_CALLBACK_ERROR - Generic error message

Remarks

Error types are heavily RTOS specific so only basic types are indicated

5.5.7.7.2 OSAL_ErrorCallback Function

C

```
void OSAL_ErrorCallback(
    OSAL_ERROR_CALLBACK_TYPE type
);
```

Description

The callback function will be executed whenever an error occurs within an underlying RTOS. The OSAL implements this function as a weak type allowing it to be overridden by the user. The type and severity of errors that can be encountered by an RTOS will vary according to the specific implementation so this only provides lightweight error handling. There is no expectation that the function should return and if this does happen there is no guarantee that the RTOS will continue to function properly. A user application could override this function and provide simple signalling of the error such as logging a message or flashing a light.

Preconditions

None.

Parameters

Parameters	Description
type	Type of error OSAL_ERROR_CALLBACK_DEFAULT, Default error OSAL_ERROR_CALLBACK_OUT_OF_MEMORY, Memory allocation error OSAL_ERROR_CALLBACK_STACK_OVERFLOW, Stack overflow in a thread OSAL_ERROR_CALLBACK_ERROR, Generic error

Returns

None

Remarks

None.

Example

```
// application override of the callback
void OSAL_ErrorCallback(OSAL_ERROR_CALLBACK_TYPE type)
{
    // turn on the fault light
    LATAbits.LATA0 = 1;
    // do not return
    while (1)
    {
    }
}
```

5.5.7.8 Memory Allocation Functions

5.5.7.8.1 OSAL_Free Function

C

```
void OSAL_Free(
    void* pData
);
```

Description

This function deallocates memory and returns it to the default pool. In an RTOS-based application, the memory may have been allocated from multiple pools or simply from the heap. In non-RTOS applications, this function calls the C standard function free.

Preconditions

None.

Parameters

Parameters	Description
pData	Pointer to the memory block to be set free

Returns

None.

Remarks

None.

Example

```
// create a working array
uint8_t* pData;

pData = OSAL_Malloc(32);
if (pData != NULL)
{
    ...

    // deallocate the memory
    OSAL_Free(pData);
    // and prevent it accidentally being used again
    pData = NULL;
}
```

5.5.7.8.2 OSAL_Malloc Function

C

```
void* OSAL_Malloc(
    size_t size
);
```

Description

This function allocates a block of memory from the default allocator from the underlying RTOS. If no RTOS is present, it defaults to malloc. Many operating systems incorporate their own memory allocation scheme, using pools, blocks or by wrapping the standard C library functions in a critical section. Since an Harmony application may not know what target OS is being used (if any), this function ensures that the correct thread safe memory allocator will be used.

Preconditions

None.

Parameters

Parameters	Description
size	Size of the requested memory block in bytes

Returns

Pointer to the block of allocated memory. NULL is returned if memory could not be allocated.

Remarks

None.

Example

```
// create a working array
uint8_t* pData;

pData = OSAL_Malloc(32);
if (pData != NULL)
{
    ...
}
```

5.5.7.9 OSAL Control Functions

5.5.7.9.1 OSAL_Initialize Function

C

```
OSAL_RESULT OSAL_Initialize();
```

Description

This function performs OSAL initialization. This function should be called near the start of main in an application that will use an underlying RTOS. This permits the RTOS to perform any one time initialization before the application attempts to create drivers or other items that may use the RTOS. Typical actions performed by OSAL_Initialize would be to allocate and prepare any memory pools for later use.

Preconditions

None.

Returns

OSAL_RESULT_TRUE - Initialization completed successfully.

Remarks

None.

Example

```
int main()
{
    OSAL_Initialize();

    App_Init();
    OSAL_Start();
}
```

5.5.7.9.2 OSAL_Name Function

C

```
const char* OSAL_Name();
```

Description

This function returns a const char* to the textual name of the RTOS. The name is a NULL terminated string.

Preconditions

None.

Returns

const char* - Name of the underlying RTOS or NULL

Remarks

None.

Example

```
// get the RTOS name
const char* sName;

sName = OSAL_Name();
sprintf(buff, "RTOS: %s", sName);
```

5.5.7.9.3 OSAL_Start Function

C

```
OSAL_RESULT OSAL_Start();
```

Description

This function starts the underlying RTOS application. The application will not normally return from this function call since the RTOS and interrupts will be responsible for all program operation. A return from this function is usually fatal and indicates that the program has failed in some way.

Preconditions

None.

Returns

OSAL_RESULT_FALSE - The OS terminated for some reason

Remarks

None.

Example

```
int main()
{
    OSAL_Initialize();

    App_Init();
    OSAL_Start();
}
```

5.5.7.10 Data Types and Constants

5.5.7.10.1 OSAL_MUTEX_HANDLE_TYPE Macro

C

```
#define OSAL_MUTEX_HANDLE_TYPE uint8_t
```

Description

Handle to a mutex, this is the default implementation and may be overridden in an actual implementation file

5.5.7.10.2 OSAL_QUEUE_HANDLE_TYPE Macro

C

```
#define OSAL_QUEUE_HANDLE_TYPE uint8_t
```

Description

Handle to a queue, this is the default implementation and may be overridden in an actual implementation file

5.5.7.10.3 OSAL_SEM_HANDLE_TYPE Macro

C

```
#define OSAL_SEM_HANDLE_TYPE uint8_t
```

Description

Handle to a semaphore, this is the default implementation and may be overridden in an actual implementation file

5.5.7.10.4 OSAL_THREAD_HANDLE_TYPE Macro**C**

```
#define OSAL_THREAD_HANDLE_TYPE uintptr_t
```

Description

Handle to a thread, this is the default implementation and may be overridden in an actual implementation file

5.5.7.10.5 OSAL_USE_NONE Macro**C**

```
#define OSAL_USE_NONE
```

Description

This is macro OSAL_USE_NONE.

5.5.7.10.6 OSAL_WAIT_FOREVER Macro**C**

```
#define OSAL_WAIT_FOREVER (uint16_t) 0xFFFF
```

Description

Default value indicating block forever

5.5.7.10.7 OSAL_RESULT Enumeration**C**

```
enum OSAL_RESULT {  
    OSAL_RESULT_NOT_IMPLEMENTED = -1,  
    OSAL_RESULT_FALSE = 0,  
    OSAL_RESULT_TRUE = 1  
};
```

Description

OSAL Result type

This enum represents possible return types from OSAL functions.

Remarks

These enum values are the possible return values from OSAL functions where a standard success/fail type response is required. The majority of OSAL functions will return this type with a few exceptions.

5.5.7.10.8 OSAL_SEM_TYPE Enumeration**C**

```
enum OSAL_SEM_TYPE {  
    OSAL_SEM_TYPE_BINARY,
```

```
    OSAL_SEM_TYPE_COUNTING
};
```

Description

OSAL Semaphore Type

This enum represents possible semaphore types.

OSAL_SEM_TYPE_BINARY - Simple binary type that can be taken once

OSAL_SEM_TYPE_COUNTING - Complex type that can be taken set number of times defined at creation time

Remarks

Binary and counting semaphore type.

5.5.8 Files

Files

Name	Description
osal.h	Common interface definitions for the Operating System Abstraction Layer (OSAL).

Description

5.5.8.1 osal.h

Descriptive File Name: Operating System Abstraction Layer

This file defines the common interface to the Operating System Abstraction Layer. It defines the common types used by the OSAL and defines the function prototypes. Depending upon the OSAL mode, a support level specific implementation file is included by this file to give the required level of compatibility. The available support levels include, [OSAL_USE_NONE](#), [OSAL_USE_BASIC](#), and [OSAL_USE_RTOS](#).

Enumerations

	Name	Description
	OSAL_CRIT_TYPE	Enumerated type representing the possible types of critical section.
	OSAL_ERROR_CALLBACK_TYPE	Enumerated type representing the possible types of callback message.
	OSAL_RESULT	Enumerated type representing the general return value from OSAL functions.
	OSAL_SEM_TYPE	Enumerated type representing the possible types of semaphore.

Functions

	Name	Description
	OSAL_CRIT_Enter	Enters a critical section with the specified severity level.
	OSAL_CRIT_Leave	Leaves a critical section with the specified severity level.
	OSAL_ErrorCallback	Lightweight error handling callback function for the RTOS.
	OSAL_Free	Deallocates a block of memory and return to the default pool.
	OSAL_Initialize	Performs OSAL initialization.
	OSAL_ISR_Enter	Informs the OSAL and RTOS that an ISR is being entered.
	OSAL_ISR_Exit	Informs the OSAL and RTOS that an ISR is being exited.

	OSAL_Malloc	Allocates memory using the OSAL default allocator.
	OSAL_MUTEX_Create	Creates a mutex.
	OSAL_MUTEX_Delete	Deletes a mutex.
	OSAL_MUTEX_Lock	Locks a mutex.
	OSAL_MUTEX_Unlock	Unlocks a mutex.
	OSAL_Name	Obtains the name of the underlying RTOS.
	OSAL_QUEUE_Add	Adds the specified item to the queue with a time-out if the queue is full.
	OSAL_QUEUE_AddHead	Adds the specified item to the front of the queue with a timeout if the queue is full.
	OSAL_QUEUE_AddHeadISR	Adds the specified item to the front of the queue from within an ISR.
	OSAL_QUEUE_AddISR	Adds the specified item to the queue from with an ISR.
	OSAL_QUEUE_Create	Creates a queue with the specified width and depth.
	OSAL_QUEUE_Delete	Deletes an OSAL_QUEUE.
	OSAL_QUEUE_Peek	Copys the item at the head of the queue but leave it on the queue. If the queue is empty, it will block up to waitMS.
	OSAL_QUEUE_PeekISR	Copys the item at the head of the queue but leaves it on the queue.
	OSAL_QUEUE_Remove	Removes the item at the head of the queue. If the queue is empty it will block up to waitMS.
	OSAL_QUEUE_RemoveISR	Removes the item at the head of the queue.
	OSAL_SEM_Create	Creates an OSAL Semaphore.
	OSAL_SEM_Delete	Deletes an OSAL Semaphore.
	OSAL_SEM_GetCount	Returns the current value of a counting semaphore.
	OSAL_SEM_Pend	Waits on a semaphore. Returns true if the semaphore was obtained within the time limit.
	OSAL_SEM_Post	Posts a semaphore or increments a counting semaphore.
	OSAL_SEM_PostISR	Posts a semaphore or increments a counting semaphore from within an Interrupt Service Routine (ISR).
	OSAL_Start	Starts the underlying RTOS
	OSAL_THREAD_Create	Creates an OSAL thread with the specified parameters.
	OSAL_THREAD_CreateDaemon	Creates a Daemon thread for use with multi-threaded Harmony drivers.
	OSAL_THREAD_PriorityGet	Gets the priority of a thread.
	OSAL_THREAD_PrioritySet	Sets the priority of a thread.
	OSAL_THREAD_Resume	Resumes a specified thread.
	OSAL_THREAD_ResumeAll	Resumes all suspended threads.
	OSAL_THREAD_Sleep	Puts the currently executing thread to sleep.
	OSAL_THREAD_Suspend	Suspends a specified thread.
	OSAL_THREAD_SuspendAll	Suspends all threads apart from the calling thread.

Macros

	Name	Description
	OSAL_MUTEX_DECLARE	Declares an OSAL mutex.
	OSAL_MUTEX_HANDLE_TYPE	Handle to a mutex, this is the default implementation and may be overridden in an actual implementation file
	OSAL_QUEUE_DECLARE	Declares an OSAL queue.
	OSAL_QUEUE_HANDLE_TYPE	Handle to a queue, this is the default implementation and may be overridden in an actual implementation file
	OSAL_SEM_DECLARE	Declares an OSAL semaphore.

	<u>OSAL_SEM_HANDLE_TYPE</u>	Handle to a semaphore, this is the default implementation and may be overridden in an actual implementation file
	<u>OSAL_THREAD_HANDLE_TYPE</u>	Handle to a thread, this is the default implementation and may be overridden in an actual implementation file
	<u>OSAL_USE_NONE</u>	This is macro OSAL_USE_NONE.
	<u>OSAL_WAIT_FOREVER</u>	Default value indicating block forever

Types

	Name	Description
	<u>OSAL_THREAD_FUNCTION</u>	Functions that will operate as a separate thread under the OSAL should match this type.

Microchip Technology Inc.

5.6 Peripheral Library Help

This section provides descriptions of the MPLAB Harmony peripheral libraries.

Description

This section contains the list of peripheral libraries.

5.6.1 ADC Peripheral Library

This topic describes the Analog-to-Digital Converter peripheral library interface.

Description

This section contains the list of topics.

5.6.1.1 Introduction

This library provides a low-level abstraction of the Analog-to-Digital Converter (ADC) module, which is available on the Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, thus hiding differences from one microcontroller variant to another.

ADC Overview

An ADC is an analog peripheral that converts a continuous quantity to a discrete digital number. An ADC is a signal conversion process that periodically samples and converts a continuously varying signal - analog level into digital values. An ADC might be used to make an isolated measurement. ADCs are also used to quantize time-varying signals by turning them into a sequence of digital samples. This results in the signal being quantized in both time and value. The resolution of a converter indicates the number of discrete values it can produce over the range of analog values. This library currently supports 8-bit, 10-bit, and 12-bit resolution.

5.6.1.2 Release Notes

MPLAB Harmony Version: v0.70b **ADC Peripheral Library Version:** 0.70b **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.6.1.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED AS IS MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.6.1.4 Using the Library

Using the Library

This topic describes the basic architecture of the ADC Peripheral Library and provides information and examples on how to use it.

Interface Header File: [plib_adc.h](#)

The interface to the ADC library is defined in the "[plib_adc.h](#)" header file, which is included by the "peripheral.h" peripheral library header file. Any C language source (.c) file that uses the ADC library must include "peripheral.h".

Library File:

The ADC peripheral library is part of the processor-specific peripheral library installed with the compiler. This library is automatically available (in the default search path) for any project built using a Microchip compiler.

5.6.1.4.1 Hardware Abstraction Model

This library provides a low-level abstraction of the ADC module on Microchip microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Description

Hardware Abstraction Model

The ADC module accepts an analog signal at any one instance and converts it to a corresponding 8-bit, 10-bit, or 12-bit digital value. It can accommodate a number of analog inputs and separate reference inputs; the actual number available on a particular device depends on the package size.

Hardware Abstraction Block Diagram

A combination of input multiplexers can select the signal to be converted from multiple analog input pins. The entire multiplexer path includes provision for differential analog input, although the number of negative input pins is limited, and the signal difference must remain positive (i.e., unipolar).

Sampling Logic:

An internal Sample and Hold (S&H) circuit acquires a sample of an input signal, and then holds that value constant during the conversion process. The purpose of the S&H circuitry is to take a snapshot of the sensor signal and hold the value. The sampled voltage is held and converted to a digital value, which strictly speaking, represents the ratio of that input voltage to a reference voltage. Configuration choices can allow connection of an external reference or use of the device power and ground (AVDD and AVSS).

Conversion Logic:

The heart of the ADC is the conversion logic that converts the analog signal value into its equivalent discrete representation. Conversions can be started individually by program control, continuously free-running, or triggered by selected hardware events. A single channel may be repeatedly converted, alternate conversions may be performed on two channels, or any or all of the channels may be sequentially scanned and converted according to a user-defined bit map.

Result Handling:

The resulting conversion output is a 8-bit, 10-bit, or 12-bit digital number that can be signed or unsigned, left- or right-justified in a 16-bit word.

ADC Timing Details:

Sample time is the time that the ADC module's S&H circuit is connected to the analog input pin. The sample time may be started and ended automatically by the ADC's hardware or under direct program control. There is a minimum sample time to ensure that the S&H circuit will provide sufficient accuracy for the analog-to-digital conversion.

Conversion time is the time required for the ADC to convert the voltage held by the S&H circuit. The conversion trigger ends the sampling time and begins an analog-to-digital conversion or a repeating sequence. The conversion trigger sources can be taken from a variety of hardware sources or can be controlled directly in software.

Once the conversion is complete, the S&H circuit can be reconnected to the input pin and a CPU interrupt may be generated. The sum of the sample time and the analog-to-digital conversion time provides the total ADC sequence time. The following figure shows the basic conversion sequence and the relationship between intervals.

ADC Sample/Convert Sequence

The conversion trigger sources can be taken from a variety of hardware sources, or can be controlled directly by software. One of the conversion trigger options is an auto-conversion, which uses a counter and the ADC clock to set the time between auto-conversions. The Auto-Sample mode and auto-conversion trigger can be used together to provide continuous automatic conversions without software intervention.

A sample/convert sequence that uses multiple S&H channels can be simultaneously sampled or sequentially sampled. Simultaneously sampling multiple signals ensures that the snapshot of the analog inputs occurs at precisely the same time for all inputs. Sequential sampling takes a snapshot of each analog input just before conversion starts on that input. The sampling of multiple inputs is not correlated.

Channel Multiplexers:

On some devices, S&H circuits have analog multiplexers on both their non-inverting and inverting inputs to select which analog input(s) are sampled. The ADC of some devices incorporate two independent sets of input multiplexers (MUX A and MUX B), which allow users to choose the analog channels that are to be sampled. Functionally, MUX A and MUX B are very similar to each other. Both multiplexers allow any of the analog input channels to be selected for individual sampling and allow selection of a negative reference source for differential signals. In addition, MUX A can be configured for sequential analog channel scanning. By default the ADC only samples and converts the inputs selected by MUX A. There is also a possibility to alternate between two sets of inputs selected by MUX A and MUX B during successive samples.

MUX Abstraction Model

When using MUX A to select analog inputs, the ADC module has the ability to scan multiple analog channels sequentially.

Input Selection:

The ADC module provides a flexible mechanism to select analog inputs for conversion:

- Fixed input selection
- Alternate input selection
- Channel scanning

Fixed input selection:

This is achieved through one or more of the S&H channels available in the device. The S&H channels are connected to the analog input pins through the analog multiplexer.

Alternate Sampling:

In an Alternate Input Selection mode, the ADC completes one sweep using the MUX A selection, and then another sweep using the MUX B selection, and then another sweep using the MUX A selection, and so on.

Alternate Input Selection in 2-Channel Sequential Sampling Configuration

Channel Scanning:

On some devices, the ADC module supports the Channel Scan mode using S&H Channel 0 (CH0). The number of inputs scanned is software selectable. Any subset of the analog inputs from AN0 to AN31 (depending on the number of analog inputs present on a specific device) can be selected for conversion. The selected inputs are converted in ascending order. For example, if the input selection includes AN4, AN1, and AN3, the conversion sequence is AN1, AN3, and AN4.

Scan Four Analog Inputs Using CH0

Multi-Channel Sample Conversion:

Multi-channel analog-to-digital converters typically convert each input channel sequentially using an input multiplexer. Simultaneously sampling multiple signals ensures that the snapshot of the analog inputs occurs at precisely the same time for all inputs. Certain applications require simultaneous sampling, especially when phase information exists between different channels. Sequential sampling takes a snapshot of each analog input just before conversion starts on that input. Certain ADC modules supports simultaneous sampling using two S&H or four S&H channels to sample the inputs at the same instance, and then perform the conversion for each channel sequentially.

Simultaneous and Sequential Sampling

Specifying Conversion Results Buffering for Devices with Direct Memory Access (DMA):

The ADC module contains a single-word, read-only, dual-port register, which stores the ADC conversion result. If more than one conversion result needs to be buffered before triggering an interrupt, DMA data transfers can be used. If DMA is supported and enabled, multiple conversion results can be automatically transferred from ADC internal buffer to a user-defined buffer in the DMA RAM area. Therefore, the application can process several conversion results with minimal software overhead.

5.6.1.4.2 Library Usage Model

Usage Model

The set of interface routines for the ADC Peripheral Library are:

Library Interface Section	Description

5.6.1.4.3 How the Library Works

How the Library Works

The following processes are involved while using an ADC module:

- [Initialization](#)
- [Controlling the sampling process](#)
- [Controlling the conversion process](#)
- [Accessing the results buffer](#)

5.6.1.4.3.1 General

The ADC conversion process can be thought of in terms of a finite state machine. The sample state represents the time that the input channel is connected to the S&H circuit and the signal is passed to the converter input. The convert state is transitory; the module enters this state as soon as it exits the sample state and transitions to a different state when that is done. The inactive state is the default state prior to module initialization and following a software-controlled conversion; it can be avoided in operation by using Auto-Sample mode.

Description

ADC Conversion Sequence or State Machine

5.6.1.4.3.2 Initialization

This topic provides information on the different processes needed to perform an analog-to-digital conversion.

Description

The following processes should be followed for performing an analog-to-digital conversion:

Initialize the ADC Module:

Number	Description	Functions associated
1	Selecting the voltage reference source Idle mode control	PLIB_ADC_VoltageReferenceSelect PLIB_ADC_StopInIdleEnable/ PLIB_ADC_StopInIdleDisable
2	Selecting the ADC conversion clock	PLIB_ADC_ConversionClockSet
3	Input channel selection Configuring MUX A and MUX B inputs, Alternating MUX A and MUX B input selections, Scanning through several inputs	Scan Mask Selection PLIB_ADC_InputScanMaskAdd PLIB_ADC_InputScanMaskRemove Positive Inputs PLIB_ADC_InputSelectPositive PLIB_ADC_MuxChannel0InputPositiveSelect PLIB_ADC_MuxChannel123InputPositiveSelect Negative Inputs PLIB_ADC_InputSelectNegative PLIB_ADC_MuxChannel0InputNegativeSelect PLIB_ADC_MuxChannel123InputNegativeSelect Scan Mode Selection PLIB_ADC_MuxAInputScanEnable PLIB_ADC_MuxAInputScanDisable
4	Enabling the ADC module	PLIB_ADC_Enable
5	Determine how many S&H channels will be used	PLIB_ADC_ChannelGroupSelect
6	Determine how sampling will occur	Sampling Control PLIB_ADC_SamplingModeEnable PLIB_ADC_SamplingModeDisable PLIB_ADC_SampleAcquisitionTimeSet
7	Selecting Manual or Auto-Sampling	PLIB_ADC_SampleAutoStartEnable PLIB_ADC_SampleAutoStartDisable PLIB_ADC_SamplingStart
8	Select conversion trigger and sampling time	PLIB_ADC_ConversionStart PLIB_ADC_ConversionClockSourceSelect PLIB_ADC_ConversionTriggerSourceSelect PLIB_ADC_ConversionStopSequenceEnable/ PLIB_ADC_ConversionStopSequenceDisable
9	Select how conversion results are stored in buffer	PLIB_ADC_ResultBufferModeSelect
10	Select the result format Result sign	PLIB_ADC_ResultFormatSelect PLIB_ADC_ResultSignGet
11	Select the number of readings per interrupt	PLIB_ADC_SamplesPerInterruptSelect
12	Select number of samples in DMA buffer for each ADC module and select how the DMA will access the ADC buffers	PLIB_ADC_DMAEnable/PLIB_ADC_DMADisable PLIB_ADC_DMABufferModeSelect PLIB_ADC_DMAAddressIncrementSelect PLIB_ADC_DMAInputBufferSelect

13	Select the 10-bit or 12-bit mode	PLIB_ADC_ResultSizeSelect
14	Channel pair configuration	PLIB_ADC_PairTriggerSourceSelect PLIB_ADC_PairConversionStart PLIB_ADC_PairInterruptRequestEnable PLIB_ADC_PairInterruptRequestDisable
15	Miscellaneous ADC functions:	
	Asynchronous sampling selection	PLIB_ADC_AsynchronousDedicatedSamplingEnable PLIB_ADC_AsynchronousDedicatedSamplingDisable
	Early interrupt control	PLIB_ADC_PairInterruptAfterFirstConversion PLIB_ADC_PairInterruptAfterSecondConversion
	Conversion order selection	PLIB_ADC_ConversionOrderSelect
	Global software trigger control	PLIB_ADC_GlobalSoftwareTriggerSet
	User ISR jump address	PLIB_ADC_IsrJumpTableBaseAddressSet

Reference Channels Initialization:

Internal reference channels like band gap voltage [ADC_REFERENCE_INPUT_VBG_DIV_BY_1], half of the band gap [ADC_REFERENCE_INPUT_VBG_DIV_BY_2] or one-sixth voltage band gap [ADC_REFERENCE_INPUT_VBG_DIV_BY_6] can be enabled or disabled through the APIs [PLIB_ADC_InternalReferenceChannelEnable](#) and [PLIB_ADC_InternalReferenceChannelDisable](#) respectively with appropriate parameters. The same APIs can be used to control the internal core voltage [ADC_REFERENCE_INPUT_VDDCORE] channels.

ADC Pairs Initialization:

Some ADC modules convert analog inputs in pairs. The analog input pair is a combination of an even and odd numbered analog input, such as AN0 and AN1, AN2, AN3, and so on. The technique of using pairs is particularly useful in power conversion applications that require voltage and current measurement for each PWM control loop.

- An interrupt request can be enabled/disabled using the API [PLIB_ADC_PairInterruptRequestEnable/PLIB_ADC_PairInterruptRequestDisable](#)
- A software trigger can be activated using the API [PLIB_ADC_PairConversionStart](#)
- Each ADC input pair can select an individual software trigger as a trigger source via the API [PLIB_ADC_PairTriggerSourceSelect](#)
- Each ADC input pair can select the global software trigger as a trigger source via the API [PLIB_ADC_GlobalSoftwareTriggerSet](#)

Each analog input uses a dedicated result register to store the converted result. For example, AN0 conversion results are always stored in the ADCBUF0 register and AN1 conversion results are always stored in the ADCBUF1 register.

Conversion Result Handling Using DMA:

DMA can be enabled or disabled using [PLIB_ADC_DMAEnable](#) and [PLIB_ADC_DMADisable](#), respectively. The DMA Buffer Build mode feature controlled through [PLIB_ADC_DMABufferModeSelect](#) determines how the conversion results are filled in the DMA RAM buffer area being used for the ADC. With the parameter ADC_DMA_BUFFER_MODE_ORDER_OF_CONV, DMA buffers are written in the order of conversion; otherwise, with ADC_DMA_BUFFER_MODE_SCATTER_GATHER, DMA buffers are written in Scatter/Gather mode. In the Scatter/Gather mode, the DMA channel must be configured for Peripheral Indirect Addressing. The DMA buffer is divided into consecutive memory blocks corresponding to all available analog inputs (out of AN0-AN31). Each conversion result for a particular analog input is automatically transferred by the ADC module to the corresponding block within the user-defined DMA buffer area. Successive samples for the same analog input are stored in sequence within the block assigned to that input.

The number of samples that need to be stored in the DMA buffer for each analog input is controlled by

[PLIB_ADC_DMAInputBufferSelect](#). The rate at which this internal pointer is incremented when data is written to the DMA buffer is controlled by [PLIB_ADC_DMAAddressIncrementSelect](#).

1. Configure the ADC interrupt (if required):
 - Clear the interrupt status flag
 - Select the ADC interrupt priority
 - Enable the ADC interrupt
2. Configure the DMA Channel.
3. Turn on the ADC module using API [PLIB_ADC_Enable](#).

Example Initialization:

```
// Include all channels in scan
PLIB_ADC_InputScanMaskAdd(MY_ADC_INSTANCE, ADC_INPUT_SCAN_ALL);

// Internal Counter triggers conversion
PLIB_ADC_ConversionTriggerSourceSelect(MY_ADC_INSTANCE, ADC_CONVERSION_TRIGGER_INTERNAL_COUNT);

// Sample Time = 31TAD and TAD = 2TCY
PLIB_ADC_SampleAcquisitionTimeSet(MY_ADC_INSTANCE, 30);
PLIB_ADC_ConversionClockSet(MY_ADC_INSTANCE, 80000000, 320000000);

// Set the interrupt every 16 samples
PLIB_ADC_SamplesPerInterruptSelect(MY_ADC_INSTANCE, ADC_SAMPLES_PER_INTERRUPT_16);

// Enable scanning of channels
PLIB_ADC_ScanMuxAInputEnable(MY_ADC_INSTANCE);

// Enable the ADC
PLIB_ADC_Enable(MY_ADC_INSTANCE);
```

Note: Not all functionality is available on all devices. Refer to the "Analog-to-Digital Converter (ADC)" chapter in the specific device data sheet for availability.

5.6.1.4.3.3 Controlling the Sampling Process

This topic describes the modes and related sampling functionality for the sampling process.

Description

The sampling process can be set up using the following two modes:

- **Manual Sampling:** Calling [PLIB_ADC_SamplingStart](#) causes the ADC to begin sampling. One of several options as discussed in "[Controlling the Conversion Process](#)" can be used to end sampling and complete conversions. Sampling does not resume until [PLIB_ADC_SamplingStart](#) is called again.
- **Automatic Sampling:** Setting the ADC in the Auto-Sampling mode using [PLIB_ADC_SampleAutoStartEnable](#) automatically begins sampling a channel whenever a conversion is not active on that channel. One of several options can be used to end sampling and complete conversions, as discussed in "[Controlling the Conversion Process](#)". If the simultaneous sampling is selected using [PLIB_ADC_SamplingModeEnable](#) with parameter `ADC_SAMPLING_MODE_SIMULTANEOUS`, sampling on a channel resumes after the conversion of all channels completes.

Other sampling related functionality:

- **Monitoring Sample Status:** [PLIB_ADC_SamplingIsActive](#) obtains the status as sampling or holding for the ADC module.
- **Aborting a Sample:** While in Manual Sampling mode, calling [PLIB_ADC_SamplingStop](#) will terminate sampling. If the conversion trigger source is selected as `ADC_CONVERSION_TRIGGER_SAMP_CLEAR` using [PLIB_ADC_ConversionTriggerSourceSelect](#), this causes a conversion to start automatically. While in Auto-Sampling mode, calling [PLIB_ADC_SampleAutoStartEnable](#) does not terminate an outgoing sample/convert sequence; however, sampling will not resume after a subsequent conversion.
- **Sampling Modes:** Different sampling modes can be changed using [PLIB_ADC_SamplingModeEnable](#) with the appropriate

parameter such as `ADC_SAMPLING_MODE_ALTERNATE_INPUT` for alternate input mode, `ADC_SAMPLING_MODE_SIMULTANEOUS` for simultaneous sampling mode, or `ADC_SAMPLING_MODE_SEQUENTIAL` for the sequential sampling mode. There is a possibility to combine the sampling modes say the Alternate input mode with either the simultaneous or the sequential sampling modes.

Note: Not all functionality is available on all devices. Refer to the "**Analog-to-Digital Converter (ADC)**" chapter in the specific device data sheet for availability.

5.6.1.4.3.4 Controlling the Conversion Process

The conversion trigger source will terminate sampling and start a selected sequence of conversions. It is also possible to obtain the value of the conversion clock, which is obtained by calling [PLIB_ADC_ConversionClockGet](#). '[PLIB_ADC_ConversionTriggerSourceSelect](#)' selects the source of the conversion trigger.

Description

Conversion can be started in one of the following three ways:

1. Manual Conversion Sequence:

- **Manual Sample Start, Manual Conversion Start:** When `ADC_CONVERSION_TRIGGER_SAMP_CLEAR` is selected using [PLIB_ADC_ConversionTriggerSourceSelect](#), the conversion trigger is under software control. Calls to [PLIB_ADC_SamplingStop](#) will stop the sampling and start the conversion sequence. The user must call [PLIB_ADC_SamplingStart](#) and [PLIB_ADC_SamplingStop](#) in a timed manner, to ensure adequate sampling time.

Converting One Channel, Manual Sample Start, Manual Conversion Start

- **Automatic Sample Start, Manual Conversion Start:** Automatic sampling is initiated using [PLIB_ADC_SampleAutoStartEnable](#), calling [PLIB_ADC_SamplingStop](#) will terminate sampling and start conversion. After the conversion, the sampling starts again automatically. The user must call [PLIB_ADC_SamplingStop](#) in a timed manner, to ensure adequate sampling time. Wait for required acquisition/auto sample time (minimum of 1 TAD), and then call [PLIB_ADC_SamplingStop](#) to start the conversion process.

Converting One Channel, Automatic Sample Start, Manual Conversion Start

2. Clocked Conversion Sequence:

- Manual Sample Start and TAD based Conversion Start:** When `ADC_CONVERSION_TRIGGER_INTERNAL_COUNT` is selected using `PLIB_ADC_ConversionTriggerSourceSelect`, the conversion trigger is under analog-to-digital clock control. `PLIB_ADC_SampleAcquisitionTimeSet` selects the TAD clock cycles between the start of sampling and the start of conversion. [Minimum 1 clock cycle has to be selected to ensure the sampling requirements are met]. `PLIB_ADC_SamplingStart` starts the sampling for the configured acquisition time, and then `PLIB_ADC_SamplingStop` starts the conversion process.

Converting One Channel, Manual Sample Start, TAD-Based Conversion Start

- Auto Sample Start and TAD based Conversion Start or Free Running Sample Conversion:** With the selection of `ADC_CONVERSION_TRIGGER_INTERNAL_COUNT` using `PLIB_ADC_ConversionTriggerSourceSelect` and Automatic sampling initiation using `PLIB_ADC_SampleAutoStartEnable` allows the ADC module to schedule sample/conversion sequences with no intervention by the user or other device resources.

Converting One Channel, Auto-Sample Start, TAD-Based Conversion Start

3. **Event Trigger Conversion Start:** It might be necessary to synchronize the end of sampling and the start of conversion with some other time event. The ADC module may use one of following as conversion trigger sequences:

- **External Pin Trigger:** When `ADC_CONVERSION_TRIGGER_INT0_TRANSITION` is selected using [PLIB_ADC_ConversionTriggerSourceSelect](#)
- **General Purpose Timer Compare Match:** When `ADC_CONVERSION_TRIGGER_TMR3_COMPARE_MATCH` or `ADC_CONVERSION_TRIGGER_TMR5_COMPARE_MATCH` is selected using [PLIB_ADC_ConversionTriggerSourceSelect](#)

Both of the event trigger conversion modes previously described can be used in combination with auto-sampling ([PLIB_ADC_SampleAutoStartEnable](#)) to cause the ADC to synchronize the sample conversion events to the trigger pulse source.

Users should note that some devices have additional conversion trigger sources as part of the enumeration [ADC_CONVERSION_TRIGGER_SOURCE](#).

Other operations during Conversion process:

- **Monitoring Conversion process:** The status of the conversion can be obtained using [PLIB_ADC_ConversionHasCompleted](#)
- **Generating ADC Interrupt:** [PLIB_ADC_SamplesPerInterruptSelect](#) controls the generation of the ADC interrupt. To enable the interrupt it is also essential to enable the ADC interrupt.
- **Aborting the Conversion:** Calling [PLIB_ADC_Disable](#) will abort the current conversion. The result buffer is not updated with the partially completed ADC conversion sequence.
- ADC pair conversion status can be obtained from [PLIB_ADC_PairConversionIsPending](#)

Timing Details:

- **TAD** - The ADC module has a maximum rate at which conversions may be completed. An analog module clock, TAD, controls the conversion timing.
- **TSAMP** - The time required to sample and hold the sampled analog signal, configured through [PLIB_ADC_SampleAcquisitionTimeSet](#)
- **TCONV** - The time required to convert the sampled analog signal, configured through [PLIB_ADC_ConversionClockSet](#). The conversion clock can be verified using [PLIB_ADC_ConversionClockGet](#).

Note: Not all functionality is available on all devices. Refer to the "Analog-to-Digital Converter (ADC)" chapter in the specific device data sheet for availability.

5.6.1.4.3.5 Accessing the Result Buffers

The result buffers can be formatted to the desired format using the function [PLIB_ADC_ResultFormatSelect](#).

Description

As the analog-to-digital conversions are completed, the ADC module writes the results of the conversions into the ADC result buffer. This buffer is a RAM array of 16 words, accessed through the Special Function Register (SFR) space.

User software may attempt to read each ADC conversion result as it is generated; however, this might consume too much CPU time. Generally, to minimize software overhead, the ADC module will fill the buffer with results, and then generate an interrupt when the buffer is filled. There are two different modes for accessing the result buffers.

Note: Refer to the "**Analog-to-Digital Converter (ADC)**" chapter in the specific device data sheet to determine the correct mode for accessing the result buffer for your device.

- **Single Buffer mode:** Conversion results are automatically stored in a dedicated buffer. The module sets its interrupt flag after the conversion is complete, it also marks the conversion status as complete. After the interrupt, the conversion sequence can restart. For 8-bit results, the converted values are available through [PLIB_ADC_ResultGet](#).
- **Multi Buffer mode:** Conversion results are automatically stored in a dedicated position in the result buffer comprising an array of 16 words, allowing for multiple successive readings to be taken before software service is needed. Successive conversions are placed into sequential buffer positions. Alternatively, the buffer can be split into two arrays of 8 words for simultaneous conversion and read operations. The ADC module sets its interrupt flag after a selectable number of conversions, from 1 to 16, when the all buffer positions can be read. After the interrupt, the sequence restarts at the beginning of the buffer. When the interrupt flag is set, scan selections and the output buffer pointer return to their starting positions. The ADC result buffer is a set of 16 words, accessed through [PLIB_ADC_ResultGetByIndex](#), where buffer index can be any value ranging from 0 to 15.
 - [PLIB_ADC_SamplesPerInterruptSelect](#) selects how many analog-to-digital conversions will take place before the CPU is interrupted
 - The buffer fill mode can be selected using [PLIB_ADC_ResultBufferModeSelect](#) with the parameter of the type [ADC_BUFFER_MODE](#)
 - When the conversion result buffer is split ([ADC_BUFFER_MODE_TWO_8WORD_BUFFERS](#) used as the parameter for [PLIB_ADC_ResultBufferModeSelect](#)), [PLIB_ADC_ResultBufferIsFull](#) indicates which half of the buffer is being currently written by the ADC module
- **DMA Buffer mode:** The ADC result buffer is a single word register that stores the ADC conversion result. DMA data transfer can be used to buffer more than one conversion result, before triggering an interrupt. If no DMA is to be used, each result should be read by the user application using [PLIB_ADC_ResultGet](#) before it is overwritten by the next conversion. ADC DMA is enabled through [PLIB_ADC_DMAEnable](#).
 - The DMA buffer build mode selected using [PLIB_ADC_DMABufferModeSelect](#) with the parameter of type [ADC_DMA_BUFFER_MODE](#), which determines how the conversion results are filled in the DMA buffer area. If [ADC_DMA_BUFFER_MODE_SCATTER_GATHER](#) is selected, the ADC module needs to provide a scatter/gather address to the DMA channel based on the index of the analog input and size of the DMA buffer. If [ADC_DMA_BUFFER_MODE_ORDER_OF_CONV](#) is selected, the ADC module provides the address of the non-DMA stand-alone buffer.
 - [PLIB_ADC_DMAInputBufferSelect](#) selects the number of samples that need to be stored in the DMA buffer for each analog input
- **Miscellaneous:**
 - Output result sign (positive or negative) is available through [PLIB_ADC_ResultSignGet](#)
 - ADC pair sample availability can be checked using [PLIB_ADC_PairSamplesAvailable](#)

Note: Not all functionality is available on all devices. Refer to the "**Analog-to-Digital Converter (ADC)**" chapter in the specific device data sheet for availability.

5.6.1.4.3.6 Power-Saving Modes

This topic provides information on the power-saving modes available for use with the ADC module.

Description

Operation in Sleep mode: Operation in Sleep mode requires that the internal RC clock is selected using [PLIB_ADC_ConversionClockSourceSelect](#) with the parameter `ADC_CLOCK_SOURCE_INTERNAL_RC`. If the ADC interrupt is enabled, the device will wake up from Sleep mode on the ADC interrupt. On some microcontrollers, operation in Sleep mode requires that `ADC_CONVERSION_CLOCK_FRC` is selected using [PLIB_ADC_ConversionClockSourceSelect](#). If the ADC interrupt is enabled, the device will wake up from Sleep mode on the ADC interrupt.

Operation in Idle mode: [PLIB_ADC_StopInIdleEnable](#) and [PLIB_ADC_StopInIdleDisable](#) determine if the ADC module stops or continues operation in Idle mode. If [PLIB_ADC_StopInIdleDisable](#) is used, the module will continue operation in Idle mode. If the ADC interrupt is enabled, the device will wake up from Idle mode on the ADC interrupt. If [PLIB_ADC_StopInIdleEnable](#) is used, the module will stop in Idle mode. If the device enters Idle mode in the middle of conversion, the conversion is aborted.

Operation in other Power-Saving modes: If the ADC module is expected to operate in a power-saving mode, configure the acquisition time and the conversion clock using the functions in accordance with the power-saving mode clock that will be used. After the power-saving mode is entered, an analog-to-digital acquisition can be started. Once the acquisition is started, the device can continue to be clocked by the same power-saving source until the conversion has completed. If desired, the device may be placed in the power-saving Idle mode during conversion.

Note: Not all functionality is available on all devices. Refer to the "Analog-to-Digital Converter (ADC)" chapter in the specific device data sheet for availability.

5.6.1.4.3.7 Conversion Sequence Examples

This topic provides examples on how the sampling and conversion will occur in various configurations.

Description

Converting Single Channel, Manual Sample Start, Manual Conversion Start

*// Where MY_ADC_INSTANCE, is the instance of ADC that the application is using. It is one of the possible values
// from ADC_MODULE_ID*

```
int16_t ADCValue;
```

// Enabling the sampling manually

5.6.1.5 Configuring the Library

The library is configured for the supported ADC modules with the multi-buffer interface when the processor is chosen in the MPLAB IDE.

5.6.1.6 Library Interface

Channel Pairs Control

	Name	Description
≡	PLIB_ADC_PairConversionIsPending	Informs whether conversion is pending or complete.
≡	PLIB_ADC_PairConversionStart	Start conversion of the requested ADC pair.
≡	PLIB_ADC_PairInterruptAfterFirstConversion	ADC pair conversion interrupt is generated after the first conversion.
≡	PLIB_ADC_PairInterruptAfterSecondConversion	ADC pair conversion interrupt is generated after the second conversion.
≡	PLIB_ADC_PairInterruptRequestDisable	Disable IRQ generation for the ADC pair.
≡	PLIB_ADC_PairInterruptRequestEnable	Enable IRQ generation for the ADC pair.
≡	PLIB_ADC_PairSampleIsAvailable	Provides status of the ADC pair sample availability in the buffer.
≡	PLIB_ADC_PairSampleStatusClear	Clears the ADC pair ready status flag.
≡	PLIB_ADC_PairTriggerSourceSelect	Selects trigger source for the requested ADC pair.

Conversion Control Logic

	Name	Description
≡	PLIB_ADC_ConversionStart	Starts ADC module manual conversion process.
≡	PLIB_ADC_ConversionHasCompleted	Provides the conversion completion status of the ADC.
≡	PLIB_ADC_ConversionTriggerSourceSelect	Selects the conversion trigger source.
≡	PLIB_ADC_ConversionStopSequenceEnable	Stop conversion sequence (when the first ADC module interrupt is generated).
≡	PLIB_ADC_ConversionStopSequenceDisable	Normal conversion sequence.
≡	PLIB_ADC_ConversionClockSet	Sets the ADC module conversion clock.
≡	PLIB_ADC_ConversionClockGet	Obtains the conversion clock.
≡	PLIB_ADC_ConversionClockSourceSelect	Selects the ADC module conversion clock source.
≡	PLIB_ADC_ConversionTriggerGroupSelect	Selects the conversion trigger source group.
≡	PLIB_ADC_ConversionOrderSelect	Selects the conversion order.

Data Types & Constants

	Name	Description
≡	ADC_MODULE_ID	Identifies the supported ADC modules supported.
≡	ADC_VOLTAGE_REFERENCE	Data type defining the different ADC Voltage Reference by which the ADC can be configured.
≡	ADC_INPUTS_NEGATIVE	Data type defining the different ADC Negative Input Enumeration.
≡	ADC_SAMPLES_PER_INTERRUPT	Data type defining the Samples Per Interrupt Enumeration.
≡	ADC_CHANNEL_GROUP	Data type defines the ADC Channel Group.
≡	ADC_CLOCK_SOURCE	Data type defines the ADC Clock Source Select.
≡	ADC_CONVERSION_TRIGGER_SOURCE	Data type defines the ADC Conversion Trigger Source.
≡	ADC_RESULT_SIZE	Data type defines the ADC Result Size.
≡	ADC_BUFFER_MODE	Data type defines the ADC Buffer Mode.
≡	ADC_RESULT_BUF_STATUS	Data type defines the ADC Result Buffer Status
≡	ADC_MUX	Data type defining the different ADC MUX Enumeration.
≡	ADC_SAMPLING_MODE	Data type defines the ADC Sampling Mode Select.
≡	ADC_INPUTS_SCAN	Data type defines the ADC Scan inputs.

	ADC_REFERENCE_INPUT	Data type defines the ADC Reference Input Enumeration.
	ADC_RESULT_FORMAT	Data type defines the ADC Result Format.
	ADC_DMA_BUFFER_MODE	Data type defines the ADC Buffer Mode.
	ADC_PAIR	Data type defines the ADC Pair.
	ADC_CHANNEL123_INPUTS_NEG	Data type defines the ADC Channel 123 Negative Input Select.
	ADC_CHANNEL123_INPUTS_POS	Data type defines the ADC Channel 123 Positive Input Select.
	ADC_INPUTS_POSITIVE	Data type defines the ADC inputs.
	ADC_CONVERSION_ORDER	Data type defines the ADC Conversion Order.
	ADC_DMA_ADDRESS_INCREMENT	Data type defines the ADC DMA Increment Rate.
	ADC_DMA_INPUT_BUFFER	Data type defines the ADC DMA Buffer Per Input.
	ADC_ACQUISITION_TIME	Data type defining the different ADC acquisition times by which the ADC can be configured.
	ADC_CONVERSION_CLOCK	Data type defines the different ADC Conversion clock
	ADC_SAMPLE	Data type defining the size of the adc sample register.

DMA Transactions

	Name	Description
	PLIB_ADC_DMAAddressIncrementSelect	Selects the increment rate for the DMA address.
	PLIB_ADC_DMABufferModeSelect	DMA Buffer Build mode.
	PLIB_ADC_DMADisable	Disables the ADC Direct Memory Access (DMA).
	PLIB_ADC_DMAEnable	Enables the ADC Direct Memory Access (DMA).
	PLIB_ADC_DMAInputBufferSelect	Selects the number of DMA buffer locations per analog input.

Feature Existence

	Name	Description
	PLIB_ADC_ExistsAsynchronousDedicatedSampling	Identifies whether the AsynchronousDedicatedSampling feature exists on the ADC module
	PLIB_ADC_ExistsCalibrationControl	Identifies whether the CalibrationControl feature exists on the ADC module
	PLIB_ADC_ExistsChannelGroup	Identifies whether the ChannelGroup feature exists on the ADC module
	PLIB_ADC_ExistsConversionClock	Identifies whether the ConversionClock feature exists on the ADC module
	PLIB_ADC_ExistsConversionClockSource	Identifies whether the ConversionClockSource feature exists on the ADC module
	PLIB_ADC_ExistsConversionControl	Identifies whether the ConversionControl feature exists on the ADC module
	PLIB_ADC_ExistsConversionOrder	Identifies whether the ConversionOrder feature exists on the ADC module
	PLIB_ADC_ExistsConversionStatus	Identifies whether the ConversionStatus feature exists on the ADC module
	PLIB_ADC_ExistsConversionStopSequenceControl	Identifies whether the ConversionStopSequenceControl feature exists on the ADC module
	PLIB_ADC_ExistsConversionTriggerGroup	Identifies whether the ConversionTriggerGroup feature exists on the ADC module
	PLIB_ADC_ExistsConversionTriggerSource	Identifies whether the ConversionTriggerSource feature exists on the ADC module
	PLIB_ADC_ExistsDMAAddressIncrement	Identifies whether the DMAAddressIncrement feature exists on the ADC module

	<u>PLIB_ADC_ExistsDMABufferMode</u>	Identifies whether the DMABufferMode feature exists on the ADC module
	<u>PLIB_ADC_ExistsDMABuffersPerAnalogInput</u>	Identifies whether the DMABuffersPerInput feature exists on the ADC module
	<u>PLIB_ADC_ExistsDMAControl</u>	Identifies whether the DMAControl feature exists on the ADC module
	<u>PLIB_ADC_ExistsEnableControl</u>	Identifies whether the EnableControl feature exists on the ADC module.
	<u>PLIB_ADC_ExistsGlobalSoftwareTrigger</u>	Identifies whether the GlobalSoftwareTrigger feature exists on the ADC module
	<u>PLIB_ADC_ExistsInputSelect</u>	Identifies whether the InputSelect feature exists on the ADC module
	<u>PLIB_ADC_ExistsInternalReferenceChannelControl</u>	Identifies whether the InternalReferenceChannelControl feature exists on the ADC module
	<u>PLIB_ADC_ExistsISRJumpTableBaseAddress</u>	Identifies whether the ISRJumpTableBaseAddress feature exists on the ADC module
	<u>PLIB_ADC_ExistsMuxChannel0NegativeInput</u>	Identifies whether the MuxChannel0NegativeInput feature exists on the ADC module
	<u>PLIB_ADC_ExistsMuxChannel0PositiveInput</u>	Identifies whether the MuxChannel0PositiveInput feature exists on the ADC module
	<u>PLIB_ADC_ExistsMuxChannel123NegativeInput</u>	Identifies whether the MuxChannel123NegativeInput feature exists on the ADC module
	<u>PLIB_ADC_ExistsMuxChannel123PositiveInput</u>	Identifies whether the MuxChannel123PositiveInput feature exists on the ADC module
	<u>PLIB_ADC_ExistsMuxInputScanControl</u>	Identifies whether the MuxInputScanControl feature exists on the ADC module
	<u>PLIB_ADC_ExistsMuxInputScanSelect</u>	Identifies whether the MuxInputScanSelect feature exists on the ADC module
	<u>PLIB_ADC_ExistsPairConversionControl</u>	Identifies whether the PairConversionControl feature exists on the ADC module
	<u>PLIB_ADC_ExistsPairInterruptOnConversion</u>	Identifies whether the PairInterruptOnConversion feature exists on the ADC module
	<u>PLIB_ADC_ExistsPairInterruptRequest</u>	Identifies whether the PairInterruptRequest feature exists on the ADC module
	<u>PLIB_ADC_ExistsPairSampleStatus</u>	Identifies whether the PairSampleStatus feature exists on the ADC module
	<u>PLIB_ADC_ExistsPairTriggerSource</u>	Identifies whether the PairTriggerSource feature exists on the ADC module
	<u>PLIB_ADC_ExistsResultBufferFillStatus</u>	Identifies whether the ResultBufferFillStatus feature exists on the ADC module
	<u>PLIB_ADC_ExistsResultBufferMode</u>	Identifies whether the ResultBufferMode feature exists on the ADC module
	<u>PLIB_ADC_ExistsResultFormat</u>	Identifies whether the ResultFormat feature exists on the ADC module
	<u>PLIB_ADC_ExistsResultGet</u>	Identifies whether the ResultGet feature exists on the ADC module
	<u>PLIB_ADC_ExistsResultGetByIndex</u>	Identifies whether the ResultGetByIndex feature exists on the ADC module
	<u>PLIB_ADC_ExistsResultSign</u>	Identifies whether the ResultSign feature exists on the ADC module
	<u>PLIB_ADC_ExistsResultSize</u>	Identifies whether the ResultSize feature exists on the ADC module

	PLIB_ADC_ExistsSampleResolution	Identifies whether the SampleResolution feature exists on the ADC module
	PLIB_ADC_ExistsSamplesPerInterruptSelect	Identifies whether the SamplesPerInterruptSelect feature exists on the ADC module
	PLIB_ADC_ExistsSamplingAcquisitionTime	Identifies whether the SamplingAcquisitionTime feature exists on the ADC module
	PLIB_ADC_ExistsSamplingAutoStart	Identifies whether the SamplingAutoStart feature exists on the ADC module
	PLIB_ADC_ExistsSamplingControl	Identifies whether the SamplingControl feature exists on the ADC module
	PLIB_ADC_ExistsSamplingModeControl	Identifies whether the SamplingModeControl feature exists on the ADC module
	PLIB_ADC_ExistsSamplingStatus	Identifies whether the SamplingStatus feature exists on the ADC module
	PLIB_ADC_ExistsStopInIdleControl	Identifies whether the StopInIdle feature exists on the ADC module
	PLIB_ADC_ExistsVoltageReference	Identifies whether the VoltageReference feature exists on the ADC module

General Configuration

	Name	Description
	PLIB_ADC_Enable	ADC module is enabled (turned ON).
	PLIB_ADC_Disable	ADC module is disabled (turned OFF).
	PLIB_ADC_StopInIdleDisable	Continue ADC module operation when the device is in Idle mode.
	PLIB_ADC_StopInIdleEnable	Discontinue ADC module operation when device enters Idle mode.
	PLIB_ADC_VoltageReferenceSelect	Voltage reference configuration.
	PLIB_ADC_CalibrationEnable	Calibration is performed on the next ADC conversion.
	PLIB_ADC_CalibrationDisable	Normal ADC module operation (no calibration is performed).
	PLIB_ADC_InputSelectPositive	Positive analog input channel selection.
	PLIB_ADC_InputSelectNegative	Analog negative channel selection.
	PLIB_ADC_InputScanMaskAdd	Select ADC analog channel for input scan.
	PLIB_ADC_InputScanMaskRemove	Omits ADC analog channel for input scan.
	PLIB_ADC_InternalReferenceChannelEnable	Internal reference input is enabled.
	PLIB_ADC_InternalReferenceChannelDisable	Internal reference input is disabled.
	PLIB_ADC_ChannelGroupSelect	Selects channels to be utilized.

Miscellaneous

	Name	Description
	PLIB_ADC_AsynchronousDedicatedSamplingDisable	Disables asynchronous dedicated S&H sampling.
	PLIB_ADC_AsynchronousDedicatedSamplingEnable	Enables asynchronous dedicated S&H sampling.
	PLIB_ADC_GlobalSoftwareTriggerSet	Global software trigger enable/set control.
	PLIB_ADC_IsrJumpTableBaseAddressGet	Gets the base address of the user's ADC Interrupt Service Routine (ISR) jump table.
	PLIB_ADC_IsrJumpTableBaseAddressSet	Sets the base address of the user's ADC Interrupt Service Routine (ISR) jump table.

Mux Selection and Channel Scan

	Name	Description
	PLIB_ADC_MuxAInputScanDisable	Do not scan input selections for CH0+ of MUX A.

	PLIB_ADC_MuxAInputScanEnable	Scan input selections for CH0+ of MUX A.
	PLIB_ADC_MuxChannel0InputNegativeSelect	Channel 0 negative input select for multiplexer setting.
	PLIB_ADC_MuxChannel0InputPositiveSelect	Channel 0 positive input select for multiplexer setting.
	PLIB_ADC_MuxChannel123InputNegativeSelect	Channel 1, 2, and 3 negative input select.
	PLIB_ADC_MuxChannel123InputPositiveSelect	Channel 1, 2, and 3 positive input select.

Output Configuration

	Name	Description
	PLIB_ADC_ResultBufferModeSelect	Selects the result buffer mode.
	PLIB_ADC_ResultBufferStatusGet	Provides the buffer fill status.
	PLIB_ADC_ResultFormatSelect	Selects the result format.
	PLIB_ADC_ResultGet	Obtains the ADC sample/result value.
	PLIB_ADC_ResultGetByIndex	Provides the ADC conversion result based on the buffer index.
	PLIB_ADC_ResultSignGet	Obtains the ADC result sign.
	PLIB_ADC_ResultSizeSelect	Selects the ADC module mode/result size.

Sample and Hold Control Logic

	Name	Description
	PLIB_ADC_SampleAcquisitionTimeSet	Sets the ADC acquisition/auto-sample time in TADs.
	PLIB_ADC_SampleAutoStartDisable	Sampling auto-start is disabled.
	PLIB_ADC_SampleAutoStartEnable	Sampling auto-start is enabled.
	PLIB_ADC_SampleMaxGet	Provides the maximum sample value.
	PLIB_ADC_SampleMinGet	Provides the minimum sample value.
	PLIB_ADC_SamplesPerInterruptSelect	Interrupts at the completion of conversion for each nth sample.
	PLIB_ADC_SamplingIsActive	Provides the ADC sampling status.
	PLIB_ADC_SamplingModeSelect	Enable the selected sampling mode.
	PLIB_ADC_SamplingStart	Sampling is enabled.
	PLIB_ADC_SamplingStop	Holding is enabled.

Description

This section lists the interface routines, data types, constants and macros required for ADC library.

5.6.1.6.1 General Configuration

5.6.1.6.1.1 PLIB_ADC_Enable Function

C

```
void PLIB_ADC_Enable(
    ADC_MODULE_ID index
);
```

Description

This function enables (turns ON) the selected ADC module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsEnableControl](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the  
// application developer.  
PLIB_ADC_Enable(MY_ADC_INSTANCE);
```

5.6.1.6.1.2 PLIB_ADC_Disable Function**C**

```
void PLIB_ADC_Disable(  
    ADC_MODULE_ID index  
)
```

Description

This function disables (turns OFF) the selected ADC module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsEnableControl](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the  
// application developer.  
PLIB_ADC_Disable(MY_ADC_INSTANCE);
```

5.6.1.6.1.3 PLIB_ADC_StopInIdleDisable Function**C**

```
void PLIB_ADC_StopInIdleDisable(  
    ADC_MODULE_ID index  
)
```

Description

This function enables the ADC module to continue operation when the device is in Idle mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsStopInIdleControl](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_StopInIdleDisable(MY_ADC_INSTANCE);
```

5.6.1.6.1.4 PLIB_ADC_StopInIdleEnable Function**C**

```
void PLIB_ADC_StopInIdleEnable(
    ADC_MODULE_ID index
);
```

Description

This function discontinues ADC module operation when the device enters Idle mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsStopInIdleControl](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_StopInIdleEnable(MY_ADC_INSTANCE);
```

5.6.1.6.1.5 PLIB_ADC_VoltageReferenceSelect Function**C**

```
void PLIB_ADC_VoltageReferenceSelect(
    ADC_MODULE_ID index,
    ADC_VOLTAGE_REFERENCE configValue
);
```

Description

This function configures the ADC module voltage reference.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
configValue	One of the possible values from ADC_VOLTAGE_REFERENCE

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsVoltageReference](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_VoltageReferenceSelect(MY_ADC_INSTANCE, ADC_REFERENCE_VREFPLUS_TO_AVSS);
```

5.6.1.6.1.6 PLIB_ADC_CalibrationEnable Function**C**

```
void PLIB_ADC_CalibrationEnable(
    ADC_MODULE_ID index
);
```

Description

This function enables calibration to be performed on the next ADC conversion.

When the Calibration bit is enabled, inputs are disconnected and tied to AVss. This sets the inputs of the ADC to zero. Then, the user can perform a conversion. Use of the Calibration mode is not affected if the ADC line has been configured as analog or digital, nor by channel input selection. Any analog input switches are disconnected from the ADC module in this mode. The conversion result is stored by the user software and is used to compensate subsequent conversions. This can be done by adding the two's complement of the result obtained during calibration to all normal ADC conversions.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsCalibrationControl](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the  
// application developer.  
PLIB_ADC_CalibrationEnable(MY_ADC_INSTANCE);
```

5.6.1.6.1.7 PLIB_ADC_CalibrationDisable Function**C**

```
void PLIB_ADC_CalibrationDisable(  
    ADC_MODULE_ID index  
);
```

Description

This function enables normal ADC module operation without any calibration.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsCalibrationControl](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the  
// application developer.  
PLIB_ADC_CalibrationDisable(MY_ADC_INSTANCE);
```

5.6.1.6.1.8 PLIB_ADC_InputSelectPositive Function**C**

```
void PLIB_ADC_InputSelectPositive(  
    ADC_MODULE_ID index,  
    ADC_INPUTS_POSITIVE inputs  
);
```

Description

This function selects the positive analog input channel for the ADC module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

Valid for ADC modules without MUX A, MUX B, etc.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsInputSelect](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the  
// application developer.  
PLIB_ADC_InputSelectPositive(MY_ADC_INSTANCE, ADC_INPUT_POSITIVE_AN2);
```

5.6.1.6.1.9 PLIB_ADC_InputSelectNegative Function**C**

```
void PLIB_ADC_InputSelectNegative(  
    ADC_MODULE_ID index,  
    ADC_INPUTS_NEGATIVE negInput  
);
```

Description

This function selects a negative channel for the ADC module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
negInput	One of the possible values from ADC_INPUTS_NEGATIVE

Returns

None.

Remarks

Valid for ADC modules without MUX A, MUX B, etc.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsInputSelect](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the  
// application developer.  
PLIB_ADC_InputSelectNegative(MY_ADC_INSTANCE, ADC_INPUT_NEGATIVE_VREF_MINUS);
```

5.6.1.6.1.10 PLIB_ADC_InputScanMaskAdd Function**C**

```
void PLIB_ADC_InputScanMaskAdd(  
    ADC_MODULE_ID index,  
    ADC_INPUTS_SCAN scanInputs  
);
```

Description

This function selects the ADC analog channel for input scanning.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
scanInputs	One of the possible values from ADC_INPUTS_SCAN . Inputs are added for scanning.

Returns

None.

Remarks

Multiple channels can be added simultaneously by ORing.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsMuxInputScanSelect](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
// Single channel addition
PLIB_ADC_InputScanMaskAdd(MY_ADC_INSTANCE, ADC_INPUT_SCAN_AN2);
// Multiple channels addition
PLIB_ADC_InputScanMaskAdd(ADC_ID_1, ADC_INPUT_SCAN_AN2 | ADC_INPUT_SCAN_AN2);
```

5.6.1.6.1.11 PLIB_ADC_InputScanMaskRemove Function**C**

```
void PLIB_ADC_InputScanMaskRemove(
    ADC_MODULE_ID index,
    ADC_INPUTS_SCAN scanInputs
);
```

Description

This function allows the ADC analog channel to be omitted from input scanning.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
scanInputs	One of the possible values from ADC_INPUTS_SCAN . Inputs are removed from scanning.

Returns

None.

Remarks

Multiple channels can be removed simultaneously by ORing.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsMuxInputScanSelect](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the  
// application developer.  
// Single channel addition  
PLIB_ADC_InputScanMaskRemove(MY_ADC_INSTANCE, ADC_INPUT_SCAN_AN2);  
// Multiple channels addition  
PLIB_ADC_InputScanMaskRemove(ADC_ID_1, ADC_INPUT_SCAN_AN2 | ADC_INPUT_SCAN_AN3);
```

5.6.1.6.1.12 PLIB_ADC_InternalReferenceChannelEnable Function**C**

```
void PLIB_ADC_InternalReferenceChannelEnable(  
    ADC_MODULE_ID index,  
    ADC_REFERENCE_INPUT input  
);
```

Description

This function enables the internal reference input.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

Internal reference can be the band gap or core/regulator output voltage channels.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsInternalReferenceChannelControl](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the  
// application developer.  
PLIB_ADC_InternalReferenceChannelEnable(MY_ADC_INSTANCE,  
                                         ADC_REFERENCE_INPUT_VBG_DIV_BY_1);
```

5.6.1.6.1.13 PLIB_ADC_InternalReferenceChannelDisable Function**C**

```
void PLIB_ADC_InternalReferenceChannelDisable(  
    ADC_MODULE_ID index,  
    ADC_REFERENCE_INPUT input  
);
```

Description

This function disables the internal reference input.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

Internal reference can be the band gap or core/regulator output voltage channels.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsInternalReferenceChannelControl](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_InternalReferenceChannelDisable(MY_ADC_INSTANCE,
                                         ADC_REFERENCE_INPUT_VBG_DIV_BY_1);
```

5.6.1.6.1.14 PLIB_ADC_ChannelGroupSelect Function**C**

```
void PLIB_ADC_ChannelGroupSelect(
    ADC_MODULE_ID index,
    ADC_CHANNEL_GROUP chlGroup
);
```

Description

This function selects the channels to be utilized by the ADC module.

Preconditions

Automatic sampling must be disabled.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
chlGroup	One of the possible values from ADC_CHANNEL_GROUP

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsChannelGroup](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_ChannelGroupSelect(MY_ADC_INSTANCE, ADC_CHANNEL_GROUP_CH0_CH1);
```

5.6.1.6.2 Sample and Hold Control Logic

5.6.1.6.2.1 PLIB_ADC_SampleAcquisitionTimeSet Function

C

```
void PLIB_ADC_SampleAcquisitionTimeSet(  
    ADC_MODULE_ID index,  
    ADC_ACQUISITION_TIME acqTime  
);
```

Description

This function sets the ADC acquisition/auto-sample time in TADs.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
acqTime	Unsigned value of type ADC_ACQUISITION_TIME

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsSamplingAcquisitionTime](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the  
// application developer.  
PLIB_ADC_SampleAcquisitionTimeSet(MY_ADC_INSTANCE, 2);
```

5.6.1.6.2.2 PLIB_ADC_SampleAutoStartDisable Function

C

```
void PLIB_ADC_SampleAutoStartDisable(  
    ADC_MODULE_ID index  
);
```

Description

This function disables auto-sampling and enables manual sampling.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsSamplingAutoStart](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the  
// application developer.  
PLIB_ADC_SampleAutoStartDisable(MY_ADC_INSTANCE);
```

5.6.1.6.2.3 PLIB_ADC_SampleAutoStartEnable Function**C**

```
void PLIB_ADC_SampleAutoStartEnable(  
    ADC_MODULE_ID index  
);
```

Description

This function enables auto-sampling. Sampling begins immediately after the last conversion is completed.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsSamplingAutoStart](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the  
// application developer.  
PLIB_ADC_SampleAutoStartEnable(MY_ADC_INSTANCE);
```

5.6.1.6.2.4 PLIB_ADC_SampleMaxGet Function**C**

```
ADC_SAMPLE PLIB_ADC_SampleMaxGet(  
    ADC_MODULE_ID index  
);
```

Description

This function provides the maximum sample value based on the supported ADC resolution.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

[ADC_SAMPLE](#) - ADC Sample

Remarks

Possible maximum value that can be obtained from the converted value.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsSampleResolution](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
ADC_SAMPLE maxSample = PLIB_ADC_SampleMaxGet(MY_ADC_INSTANCE);
```

5.6.1.6.2.5 PLIB_ADC_SampleMinGet Function**C**

```
ADC_SAMPLE PLIB_ADC_SampleMinGet(
    ADC_MODULE_ID index
);
```

Description

This function provides the minimum sample value based on the supported ADC resolution.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

[ADC_SAMPLE](#) - ADC sample

Remarks

Possible minimum value that can be obtained from the converted value.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsSampleResolution](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
ADC_SAMPLE maxSample = PLIB_ADC_SampleMinGet(MY_ADC_INSTANCE);
```

5.6.1.6.2.6 PLIB_ADC_SamplesPerInterruptSelect Function**C**

```
void PLIB_ADC_SamplesPerInterruptSelect(
    ADC_MODULE_ID index,
    ADC_SAMPLES_PER_INTERRUPT value
);
```

Description

This function interrupts at the completion of conversion for each nth sample/convert sequence.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
value	Possible values from ADC_SAMPLES_PER_INTERRUPT

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsSamplesPerInterruptSelect](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_SamplesPerInterruptSelect(MY_ADC_INSTANCE, ADC_16SAMPLES_PER_INTERRUPT);
```

5.6.1.6.2.7 PLIB_ADC_SamplingIsActive Function**C**

```
bool PLIB_ADC_SamplingIsActive(
    ADC_MODULE_ID index
);
```

Description

This function returns the ADC sampling status on whether the ADC is sampling or holding.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

bool - true = ADC S&H circuit is sampling

- false = ADC S&H circuit is holding

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsSamplingStatus](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
bool my_status = PLIB_ADC_SamplingIsActive(MY_ADC_INSTANCE);
```

5.6.1.6.2.8 PLIB_ADC_SamplingModeSelect Function**C**

```
void PLIB_ADC_SamplingModeSelect(
    ADC_MODULE_ID index,
    ADC_SAMPLING_MODE mode
);
```

Description

This function selects the sampling mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
mode	One of the possible values from ADC_SAMPLING_MODE

Returns

None.

Remarks

Sampling mode could be alternate input or Simultaneous or Sequential mode. Alternate input can be combined with Simultaneous or Sequential modes.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsSamplingModeControl](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_SamplingModeSelect(MY_ADC_INSTANCE, ADC_SAMPLING_MODE_ALTERNATE_INPUT);
```

5.6.1.6.2.9 PLIB_ADC_SamplingStart Function**C**

```
void PLIB_ADC_SamplingStart(
    ADC_MODULE_ID index
);
```

Description

This function starts the ADC Sample and Hold (S&H) circuit to sample the input channel.

Preconditions

Automatic sampling must be disabled.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsSamplingControl](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_SamplingStart(MY_ADC_INSTANCE);
```

5.6.1.6.2.10 PLIB_ADC_SamplingStop Function

C

```
void PLIB_ADC_SamplingStop(  
    ADC_MODULE_ID index  
);
```

Description

This function stops the ADC S&H circuit from sampling and holds the sampled data.

Preconditions

Automatic sampling must be disabled.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsSamplingControl](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the  
// application developer.  
PLIB_ADC_SamplingStop(MY_ADC_INSTANCE);
```

5.6.1.6.3 Conversion Control Logic

5.6.1.6.3.1 PLIB_ADC_ConversionStart Function

C

```
void PLIB_ADC_ConversionStart(  
    ADC_MODULE_ID index  
);
```

Description

This function starts the ADC module manual conversion process.

Preconditions

Automatic sampling must be disabled.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use

[PLIB_ADC_ExistsConversionControl](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_ConversionStart(MY_ADC_INSTANCE);
```

5.6.1.6.3.2 PLIB_ADC_ConversionHasCompleted Function

C

```
bool PLIB_ADC_ConversionHasCompleted(
    ADC_MODULE_ID index
);
```

Description

This function provides the completion status of analog-to-digital conversion.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

bool - true = ADC conversion is done/completed

- false = ADC conversion is in progress or has not started

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsConversionStatus](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
bool my_status = PLIB_ADC_ConversionHasCompleted(MY_ADC_INSTANCE);
```

5.6.1.6.3.3 PLIB_ADC_ConversionTriggerSourceSelect Function

C

```
void PLIB_ADC_ConversionTriggerSourceSelect(
    ADC_MODULE_ID index,
    ADC_CONVERSION_TRIGGER_SOURCE source
);
```

Description

This function selects the ADC module conversion trigger source.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
source	One of the possible values from ADC_CONVERSION_TRIGGER_SOURCE

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsConversionTriggerSource](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the  
// application developer.  
PLIB_ADC_ConversionTriggerSourceSelect(MY_ADC_INSTANCE, ADC_CONVERSION_TRIGGER_INTERNAL_COUNT);
```

5.6.1.6.3.4 PLIB_ADC_ConversionStopSequenceEnable Function**C**

```
void PLIB_ADC_ConversionStopSequenceEnable(  
    ADC_MODULE_ID index  
);
```

Description

This function stops conversions when the first ADC module interrupt is generated. Hardware clears the Automatic Sampling bit when the ADC interrupt is generated.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsConversionStopSequenceControl](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the  
// application developer.  
PLIB_ADC_ConversionStopSequenceEnable(MY_ADC_INSTANCE);
```

5.6.1.6.3.5 PLIB_ADC_ConversionStopSequenceDisable Function**C**

```
void PLIB_ADC_ConversionStopSequenceDisable(  
    ADC_MODULE_ID index  
);
```

Description

This function enables normal operation, wherein the buffer contents will be overwritten by the next conversion sequence.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsConversionStopSequenceControl](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the  
// application developer.  
PLIB_ADC_ConversionStopSequencedisable(MY_ADC_INSTANCE);
```

5.6.1.6.3.6 PLIB_ADC_ConversionClockSet Function**C**

```
void PLIB_ADC_ConversionClockSet(  
    ADC_MODULE_ID index,  
    uint32_t baseFrequency,  
    ADC_CONVERSION_CLOCK value  
);
```

Description

This function sets the ADC module conversion clock prescaler.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
value	Unsigned value of type ADC_CONVERSION_CLOCK

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsConversionClock](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the  
// application developer.  
PLIB_ADC_ConversionClockSet(MY_ADC_INSTANCE, 80000000, 320000000);
```

5.6.1.6.3.7 PLIB_ADC_ConversionClockGet Function**C**

```
ADC_CONVERSION_CLOCK PLIB_ADC_ConversionClockGet(  
    ADC_MODULE_ID index,  
    uint32_t baseFrequency  
);
```

Description

This function obtains the conversion clock that is being used by the ADC module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
baseFrequencyHz	Input clock frequency to the ADC module in Hz

Returns

uint32_t - Conversion clock value

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsConversionClock](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
// baseFrequency is the peripheral input frequency
ADC_CONVERSION_CLOCK conversionClock; // To store the conversion clock value
conversionClock = PLIB_ADC_ConversionClockGet(MY_ADC_INSTANCE, 8000000);
```

5.6.1.6.3.8 PLIB_ADC_ConversionClockSourceSelect Function**C**

```
void PLIB_ADC_ConversionClockSourceSelect(
    ADC_MODULE_ID index,
    ADC_CLOCK_SOURCE source
);
```

Description

This function selects the ADC module conversion clock source.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
source	One of the possible values from ADC_CLOCK_SOURCE

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsConversionClockSource](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_ConversionClockSourceSelect(MY_ADC_INSTANCE, ADC_CLOCK_SOURCE_SYSTEM_CLOCK);
```

5.6.1.6.3.9 PLIB_ADC_ConversionTriggerGroupSelect Function

C

```
void PLIB_ADC_ConversionTriggerGroupSelect(  
    ADC_MODULE_ID index,  
    ADC_CONVERSION_TRIGGER_GROUP group  
);
```

Description

This function selects the ADC module conversion trigger source group.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
group	One of the possible values from ADC_CONVERSION_TRIGGER_GROUP

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsConversionTriggerGroup](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the  
// application developer.  
PLIB_ADC_ConversionTriggerGroupSelect(MY_ADC_INSTANCE, ADC_CONVERSION_TRIGGER_GROUP_SEL);
```

5.6.1.6.3.10 PLIB_ADC_ConversionOrderSelect Function

C

```
void PLIB_ADC_ConversionOrderSelect(  
    ADC_MODULE_ID index,  
    ADC_CONVERSION_ORDER order  
);
```

Description

This function selects the conversion order of the analog input.

Preconditions

The ADC module must be disabled.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
order	One of the possible values from ADC_CONVERSION_ORDER

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use

[PLIB_ADC_ExistsConversionOrder](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_ConversionOrderSelect(MY_ADC_INSTANCE, ADC_CONVERSION_ORDER_ODD_FIRST);
```

5.6.1.6.4 DMA Transactions

5.6.1.6.4.1 PLIB_ADC_DMAAddressIncrementSelect Function

C

```
void PLIB_ADC_DMAAddressIncrementSelect(
    ADC_MODULE_ID index,
    ADC_DMA_ADDRESS_INCREMENT incRate
);
```

Description

This function selects the increment rate of the DMA address after completion of incRate number of sample/conversion operations. This gives information on how often the DMA RAM buffer pointer is incremented.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
incRate	One of the possible values from ADC_DMA_ADDRESS_INCREMENT

Returns

None.

Remarks

These represent the same set of bits as does the samples per interrupt selection.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsDMAAddressIncrement](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_DMAAddressIncrementSelect(MY_ADC_INSTANCE, ADC_DMA_ADDRESS_INCREMENT_EVERY_SAMPLE);
```

5.6.1.6.4.2 PLIB_ADC_DMABufferModeSelect Function

C

```
void PLIB_ADC_DMABufferModeSelect(
    ADC_MODULE_ID index,
    ADC_DMA_BUFFER_MODE bufferMode
);
```

Description

This function selects the DMA Buffer Build mode regardless of the DMA buffers being written in the order of conversion or in scatter/gather mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
bufferMode	One of the possible values from ADC_DMA_BUFFER_MODE

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsDMABufferMode](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_DMABufferModeSelect(MY_ADC_INSTANCE, ADC_DMA_BUFFER_MODE_ORDER_OF_CONV);
```

5.6.1.6.4.3 PLIB_ADC_DMADisable Function**C**

```
void PLIB_ADC_DMADisable(
    ADC_MODULE_ID index
);
```

Description

This function disables the ADC Direct Memory Access (DMA).

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

Conversion results are stored in multiple buffers and the DMA will not be used.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsDMAControl](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_DMADisable(MY_ADC_INSTANCE);
```

5.6.1.6.4.4 PLIB_ADC_DMAEnable Function**C**

```
void PLIB_ADC_DMAEnable(
```

```
    ADC_MODULE_ID index  
);
```

Description

This function enables the ADC Direct Memory Access (DMA).

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

Conversion results are stored in a single register and are transferred to RAM using DMA.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsDMAControl](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the  
// application developer.  
PLIB_ADC_DMAEnable(MY_ADC_INSTANCE);
```

5.6.1.6.4.5 PLIB_ADC_DMAInputBufferSelect Function

C

```
void PLIB_ADC_DMAInputBufferSelect(  
    ADC_MODULE_ID index,  
    ADC_DMA_INPUT_BUFFER buffer  
);
```

Description

This function selects the number of DMA buffer locations per analog input and specifies the number of samples that need to be stored in the DMA buffer for each analog input.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
buffer	One of the possible values from ADC_DMA_INPUT_BUFFER

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsDMABuffersPerAnalogInput](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
```

```
// application developer.  
PLIB_ADC_DMAInputBufferSelect(MY_ADC_INSTANCE, ADC_DMA_INPUT_BUFFER_1WORD);
```

5.6.1.6.5 Channel Pairs Control

5.6.1.6.5.1 PLIB_ADC_PairConversionIsPending Function

C

```
bool PLIB_ADC_PairConversionIsPending(  
    ADC_MODULE_ID index,  
    ADC_PAIR pairNum  
);
```

Description

This function provides information on whether the conversion is pending or complete for the ADC pair.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
pairNum	One of the possible values from ADC_PAIR

Returns

bool - true = Conversion of a pair of channels is pending. Set when selected trigger is asserted

- false = Conversion is complete

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsPairConversionControl](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the  
// application developer.  
bool my_status = PLIB_ADC_PairConversionIsPending(MY_ADC_INSTANCE,  
                                                    ADC_PAIR_AN0_AN1);
```

5.6.1.6.5.2 PLIB_ADC_PairConversionStart Function

C

```
void PLIB_ADC_PairConversionStart(  
    ADC_MODULE_ID index,  
    ADC_PAIR pairNum  
);
```

Description

This function starts conversion of the requested ADC pair.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

pairNum	One of the possible values from ADC_PAIR

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsPairConversionControl](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the  
// application developer.  
PLIB_ADC_PairConversionStart(MY_ADC_INSTANCE, ADC_PAIR_AN0_AN1);
```

5.6.1.6.5.3 PLIB_ADC_PairInterruptAfterFirstConversion Function**C**

```
void PLIB_ADC_PairInterruptAfterFirstConversion(  
    ADC_MODULE_ID index  
);
```

Description

This function generates an interrupt after the first conversion is completed.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsPairInterruptOnConversion](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the  
// application developer.  
PLIB_ADC_PairInterruptAfterFirstConversion(MY_ADC_INSTANCE);
```

5.6.1.6.5.4 PLIB_ADC_PairInterruptAfterSecondConversion Function**C**

```
void PLIB_ADC_PairInterruptAfterSecondConversion(  
    ADC_MODULE_ID index  
);
```

Description

This function generates an interrupt after the second conversion is completed.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsPairInterruptOnConversion](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the  
// application developer.  
PLIB_ADC_PairInterruptAfterSecondConversion(MY_ADC_INSTANCE);
```

5.6.1.6.5.5 PLIB_ADC_PairInterruptRequestDisable Function**C**

```
void PLIB_ADC_PairInterruptRequestDisable(  
    ADC_MODULE_ID index,  
    ADC_PAIR pairNum  
);
```

Description

This function disables IRQ generation for the requested ADC pair.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
pairNum	One of the possible values from ADC_PAIR

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsPairInterruptRequest](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the  
// application developer.  
PLIB_ADC_PairInterruptRequestDisable(MY_ADC_INSTANCE, ADC_PAIR_AN0_AN1);
```

5.6.1.6.5.6 PLIB_ADC_PairInterruptRequestEnable Function**C**

```
void PLIB_ADC_PairInterruptRequestEnable(  
    ADC_MODULE_ID index,  
    ADC_PAIR pairNum  
);
```

Description

This function enables IRQ generation, when requested conversion of channels associated with the pair is completed.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
pairNum	one of the possible values from ADC_PAIR

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsPairInterruptRequest](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_PairInterruptRequestEnable(MY_ADC_INSTANCE, ADC_PAIR_AN0_AN1);
```

5.6.1.6.5.7 PLIB_ADC_PairSampleIsAvailable Function**C**

```
bool PLIB_ADC_PairSampleIsAvailable(
    ADC_MODULE_ID index,
    ADC_PAIR pairNum
);
```

Description

This function provides information on whether the samples for the ADC pair selected are available in the buffer.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
pairNum	One of the possible values from ADC_PAIR

Returns

bool - true = Data is ready in buffer

- false = Data is not ready

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsPairSampleStatus](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
bool my_status;
```

```
my_status = PLIB_ADC_PairSampleIsAvailable(MY_ADC_INSTANCE, ADC_PAIR_AN0_AN1);
```

5.6.1.6.5.8 PLIB_ADC_PairSampleStatusClear Function

C

```
void PLIB_ADC_PairSampleStatusClear(  
    ADC_MODULE_ID index,  
    ADC_PAIR pairNum  
);
```

Description

This function clears a pair conversion ready status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
pairNum	One of the possible values from ADC_PAIR

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsPairSampleStatus](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the  
// application developer.  
PLIB_ADC_PairSampleStatusClear(MY_ADC_INSTANCE, ADC_PAIR_AN0_AN1);
```

5.6.1.6.5.9 PLIB_ADC_PairTriggerSourceSelect Function

C

```
void PLIB_ADC_PairTriggerSourceSelect(  
    ADC_MODULE_ID index,  
    ADC_PAIR pairNum,  
    ADC_CONVERSION_TRIGGER_SOURCE trigSrc  
);
```

Description

This function selects the trigger source for the requested ADC pair.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
pairNum	One of the possible values from ADC_PAIR

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsPairTriggerSource](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_PairTriggerSourceSelect(MY_ADC_INSTANCE, ADC_PAIR_AN0_AN1,
                                ADC_CONVERSION_TRIGGER_TMR3_COMPARE_MATCH);
```

5.6.1.6.6 Output Configuration

5.6.1.6.6.1 PLIB_ADC_ResultBufferModeSelect Function

C

```
void PLIB_ADC_ResultBufferModeSelect(
    ADC_MODULE_ID index,
    ADC_BUFFER_MODE mode
);
```

Description

This function selects the result buffer mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
mode	One of the possible values from ADC_BUFFER_MODE

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsResultBufferMode](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_ResultBufferModeSelect(MY_ADC_INSTANCE,
                                ADC_BUFFER_MODE_TWO_8WORD_BUFFERS);
```

5.6.1.6.6.2 PLIB_ADC_ResultBufferStatusGet Function

C

```
ADC_RESULT_BUF_STATUS PLIB_ADC_ResultBufferStatusGet(
    ADC_MODULE_ID index
);
```

Description

This function obtains the buffer fill status.

Preconditions

ADC multi-buffer support is available and configured.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

bool - true = ADC is currently filling buffer 08-0F, user should access data in 00-07

- false = ADC is currently filling buffer 00-07, user should access data in 08-0F

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsResultBufferFillStatus](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
ADC_RESULT_BUF_STATUS my_status;

my_status = PLIB_ADC_ResultBufferStatusGet(MY_ADC_INSTANCE);
```

5.6.1.6.6.3 PLIB_ADC_ResultFormatSelect Function**C**

```
void PLIB_ADC_ResultFormatSelect(
    ADC_MODULE_ID index,
    ADC_RESULT_FORMAT resultFormat
);
```

Description

This function selects the result format.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
resultFormat	One of the possible values from ADC_RESULT_FORMAT

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsResultFormat](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_ResultFormatSelect(MY_ADC_INSTANCE, ADC_RESULT_FORMAT_INTEGER_16BIT);
```

5.6.1.6.6.4 PLIB_ADC_ResultGet Function

C

```
ADC_SAMPLE PLIB_ADC_ResultGet(  
    ADC_MODULE_ID index  
);
```

Description

This function obtains the ADC sample/result value.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

ADC_SAMPLE - Right-/Left-justified ADC result

Remarks

Only applicable for 10-bit or 12-bit ADC outputs.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsResultGet](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the  
// application developer.  
ADC_SAMPLE my_res;  
my_res = PLIB_ADC_ResultGet(MY_ADC_INSTANCE);
```

5.6.1.6.6.5 PLIB_ADC_ResultGetByIndex Function

C

```
ADC_SAMPLE PLIB_ADC_ResultGetByIndex(  
    ADC_MODULE_ID index,  
    uint8_t bufferIndex  
);
```

Description

This function provides the ADC module conversion result based on the buffer index.

Preconditions

ADC multi-buffer support available and configured.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
bufferIndex	Value ranging from 0 to 15

Returns

int16_t - ADC Conversion result at the respective bufferIndex

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsResultGetByIndex](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the  
// application developer.  
ADC_SAMPLE my_res = PLIB_ADC_ResultGetByIndex(MY_ADC_INSTANCE, 15);
```

5.6.1.6.6 PLIB_ADC_ResultSignGet Function**C**

```
bool PLIB_ADC_ResultSignGet(  
    ADC_MODULE_ID index  
)
```

Description

This function obtains the ADC result sign status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

- bool - true = ADC result is negative
- false = ADC result is positive

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsResultSign](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the  
// application developer.  
bool my_sign = PLIB_ADC_ResultSignGet(MY_ADC_INSTANCE);
```

5.6.1.6.6.7 PLIB_ADC_ResultSizeSelect Function**C**

```
void PLIB_ADC_ResultSizeSelect(  
    ADC_MODULE_ID index,  
    ADC_RESULT_SIZE resSize  
)
```

Description

This function selects the ADC module mode/result size.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
resSize	One of the possible values from ADC_RESULT_SIZE

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsResultSize](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the  
// application developer.  
PLIB_ADC_ResultSizeSelect(MY_ADC_INSTANCE, ADC_RESULT_SIZE_10_BITS);
```

5.6.1.6.7 Miscellaneous

5.6.1.6.7.1 PLIB_ADC_AsynchronousDedicatedSamplingDisable Function

C

```
void PLIB_ADC_AsynchronousDedicatedSamplingDisable(  
    ADC_MODULE_ID index  
)
```

Description

This function disables constant sampling, and starts sampling when the trigger event is detected and completes the sampling process in two ADC clock cycles.

Preconditions

The ADC module must be disabled.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsAsynchronousDedicatedSampling](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the  
// application developer.  
PLIB_ADC_AsynchronousDedicatedSamplingDisable(MY_ADC_INSTANCE);
```

5.6.1.6.7.2 PLIB_ADC_AsynchronousDedicatedSamplingEnable Function

C

```
void PLIB_ADC_AsynchronousDedicatedSamplingEnable(  
    ADC_MODULE_ID index  
)
```

```
    ADC_MODULE_ID index
);
```

Description

This function enables constant sampling of the dedicated S&H, and then terminates sampling as soon as the trigger pulse is detected.

Preconditions

The ADC module must be disabled.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsAsynchronousDedicatedSampling](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_AsynchronousDedicatedSamplingEnable(MY_ADC_INSTANCE);
```

5.6.1.6.7.3 PLIB_ADC_GlobalSoftwareTriggerSet Function

C

```
void PLIB_ADC_GlobalSoftwareTriggerSet(
    ADC_MODULE_ID index
);
```

Description

This function enables/sets the global software trigger. It will trigger conversions based on the trigger sources selected.

Preconditions

Global software trigger has to be cleared before setting back.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature/bit is automatically cleared by hardware.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsGlobalSoftwareTrigger](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_GlobalSoftwareTriggerSet(MY_ADC_INSTANCE);
```

5.6.1.6.7.4 PLIB_ADC_IsrJumpTableBaseAddressGet Function

C

```
int PLIB_ADC_IsrJumpTableBaseAddressGet(  
    ADC_MODULE_ID index  
)  
;
```

Description

This function gets the base address of the user's ADC Interrupt Service Routine (ISR) jump table.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

baseAddr - Upper 15 bits of the user's ADC ISR jump table address (bit 0 is a don't care)

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsISRJumpTableBaseAddress](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the  
// application developer.  
unsigned int add;  
add = PLIB_ADC_IsrJumpTableBaseAddressGet(MY_ADC_INSTANCE);
```

5.6.1.6.7.5 PLIB_ADC_IsrJumpTableBaseAddressSet Function

C

```
void PLIB_ADC_IsrJumpTableBaseAddressSet(  
    ADC_MODULE_ID index,  
    int baseAddr  
)  
;
```

Description

This function sets the base address of the user's ADC Interrupt Service Routine (ISR) jump table.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
baseAddr	Upper 15 bits of the user's ADC ISR jump table address (bit 0 is a don't care)

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsISRJumpTableBaseAddress](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_IsrJumpTableBaseAddressSet(MY_ADC_INSTANCE, 0x1000);
```

5.6.1.6.8 Data Types & Constants**5.6.1.6.8.1 ADC_MODULE_ID Enumeration****C**

```
typedef enum {
    ADC_ID_1,
    ADC_ID_2,
    ADC_ID_3,
    ADC_ID_4,
    ADC_ID_5,
    ADC_NUMBER_OF_MODULES
} ADC_MODULE_ID;
```

Description

ADC Module ID

This enumeration identifies the available ADC modules.

Members

Members	Description
ADC_ID_1	ADC Module 1 ID
ADC_ID_2	ADC Module 2 ID
ADC_ID_3	ADC Module 3 ID
ADC_ID_4	ADC Module 4 ID
ADC_ID_5	ADC Module 5 ID
ADC_NUMBER_OF_MODULES	Number of available ADC modules.

Remarks

The caller should not rely on the specific numbers assigned to any of these values as they may change from one processor to the next.

Not all modules are available on all devices. Refer to the specific data sheet to determine which modules are supported. The numbers used in the enumeration values will match the numbers provided in the data sheet.

5.6.1.6.8.2 ADC_VOLTAGE_REFERENCE Enumeration**C**

```
typedef enum {
    ADC_VREF_POS_TO_VDD,
    ADC_VREF_POS_TO_VREF_PLUS,
    ADC_VREF_NEG_TO_VSS,
    ADC_VREF_NEG_TO_VREF_MINUS,
    ADC_REFERENCE_VDD_TO_AVSS,
    ADC_REFERENCE_VREFPLUS_TO_AVSS,
    ADC_REFERENCE_AVDD_TO_VREF_NEG,
    ADC_REFERENCE_VREFPLUS_TO_VREFNEG
} ADC_VOLTAGE_REFERENCE;
```

Description

ADC Voltage Reference Enumeration

This data type defines the different ADC Voltage Reference by which the ADC can be configured.

Members

Members	Description
ADC_VREF_POS_TO_VDD	Positive voltage reference supplied internally by VDD
ADC_VREF_POS_TO_VREF_PLUS	Positive voltage reference supplied externally through VREF+ pin
ADC_VREF_NEG_TO_VSS	Negative voltage reference supplied internally through VSS
ADC_VREF_NEG_TO_VREF_MINUS	Negative voltage reference supplied externally through VREF- pin
ADC_REFERENCE_VDD_TO_AVSS	Positive voltage reference supplied internally by VDD and Negative voltage reference supplied internally through VSS
ADC_REFERENCE_VREFPLUS_TO_AVSS	Positive voltage reference supplied externally through VREF+ pin and Negative voltage reference supplied internally through VSS
ADC_REFERENCE_AVDD_TO_VREF_NEG	Positive voltage reference supplied internally by VDD and Negative voltage reference supplied externally through VREF- pin
ADC_REFERENCE_VREFPLUS_TO_VREFNEG	Positive voltage reference supplied externally through VREF+ pin and Negative voltage reference supplied externally through VREF- pin

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

5.6.1.6.8.3 ADC_INPUTS_NEGATIVE Enumeration**C**

```
typedef enum {
    ADC_INPUT_NEGATIVE_VREF_MINUS,
    ADC_INPUT_NEGATIVE_AN1,
    ADC_INPUT_NEGATIVE_AN2,
    ADC_INPUT_NEGATIVE_AN3,
    ADC_INPUT_NEGATIVE_AN4,
    ADC_INPUT_NEGATIVE_AN5,
    ADC_INPUT_NEGATIVE_AN6
} ADC_INPUTS_NEGATIVE;
```

Description

ADC Negative Input Enumeration

This data type defines the different ADC Negative Input Enumeration.

Members

Members	Description
ADC_INPUT_NEGATIVE_VREF_MINUS	Negative input is Vref
ADC_INPUT_NEGATIVE_AN1	Negative input is AN1
ADC_INPUT_NEGATIVE_AN2	Negative input is AN2
ADC_INPUT_NEGATIVE_AN3	Negative input is AN3
ADC_INPUT_NEGATIVE_AN4	Negative input is AN4
ADC_INPUT_NEGATIVE_AN5	Negative input is AN5
ADC_INPUT_NEGATIVE_AN6	Negative input is AN6

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

5.6.1.6.8.4 ADC_SAMPLES_PER_INTERRUPT Enumeration

C

```
typedef enum {
    ADC_1SAMPLE_PER_INTERRUPT,
    ADC_2SAMPLES_PER_INTERRUPT,
    ADC_3SAMPLES_PER_INTERRUPT,
    ADC_4SAMPLES_PER_INTERRUPT,
    ADC_5SAMPLES_PER_INTERRUPT,
    ADC_6SAMPLES_PER_INTERRUPT,
    ADC_7SAMPLES_PER_INTERRUPT,
    ADC_8SAMPLES_PER_INTERRUPT,
    ADC_9SAMPLES_PER_INTERRUPT,
    ADC_10SAMPLES_PER_INTERRUPT,
    ADC_11SAMPLES_PER_INTERRUPT,
    ADC_12SAMPLES_PER_INTERRUPT,
    ADC_13SAMPLES_PER_INTERRUPT,
    ADC_14SAMPLES_PER_INTERRUPT,
    ADC_15SAMPLES_PER_INTERRUPT,
    ADC_16SAMPLES_PER_INTERRUPT,
    ADC_17SAMPLES_PER_INTERRUPT,
    ADC_18SAMPLES_PER_INTERRUPT,
    ADC_19SAMPLES_PER_INTERRUPT,
    ADC_20SAMPLES_PER_INTERRUPT,
    ADC_21SAMPLES_PER_INTERRUPT,
    ADC_22SAMPLES_PER_INTERRUPT,
    ADC_23SAMPLES_PER_INTERRUPT,
    ADC_24SAMPLES_PER_INTERRUPT,
    ADC_25SAMPLES_PER_INTERRUPT,
    ADC_26SAMPLES_PER_INTERRUPT,
    ADC_27SAMPLES_PER_INTERRUPT,
    ADC_28SAMPLES_PER_INTERRUPT,
    ADC_29SAMPLES_PER_INTERRUPT,
    ADC_30SAMPLES_PER_INTERRUPT,
    ADC_31SAMPLES_PER_INTERRUPT,
    ADC_32SAMPLES_PER_INTERRUPT
} ADC_SAMPLES_PER_INTERRUPT;
```

Description

ADC samples per Interrupt Enumeration

This data type defines the Samples Per Interrupt Enumeration.

Members

Members	Description
ADC_1SAMPLE_PER_INTERRUPT	Interrupts at the completion of conversion for each sample/convert sequence
ADC_2SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 2nd sample/convert sequence
ADC_3SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 3rd sample/convert sequence
ADC_4SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 4th sample/convert sequence
ADC_5SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 5th sample/convert sequence
ADC_6SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 6th sample/convert sequence
ADC_7SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 7th sample/convert sequence
ADC_8SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 8th sample/convert sequence
ADC_9SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 9th sample/convert sequence
ADC_10SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 10th sample/convert sequence
ADC_11SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 11th sample/convert sequence
ADC_12SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 12th sample/convert sequence

ADC_13SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 13th sample/convert sequence
ADC_14SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 14th sample/convert sequence
ADC_15SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 15th sample/convert sequence
ADC_16SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 16th sample/convert sequence
ADC_17SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 17th sample/convert sequence
ADC_18SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 18th sample/convert sequence
ADC_19SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 19th sample/convert sequence
ADC_20SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 20th sample/convert sequence
ADC_21SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 21st sample/convert sequence
ADC_22SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 22nd sample/convert sequence
ADC_23SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 23rd sample/convert sequence
ADC_24SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 24th sample/convert sequence
ADC_25SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 25th sample/convert sequence
ADC_26SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 26th sample/convert sequence
ADC_27SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 27th sample/convert sequence
ADC_28SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 28th sample/convert sequence
ADC_29SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 29th sample/convert sequence
ADC_30SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 30th sample/convert sequence
ADC_31SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 31st sample/convert sequence
ADC_32SAMPLES_PER_INTERRUPT	Interrupts at the completion of conversion for each 32nd sample/convert sequence

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

5.6.1.6.8.5 ADC_CHANNEL_GROUP Enumeration**C**

```
typedef enum {
    ADC_CHANNEL_GROUP_CH0_CH1_CH2_CH3,
    ADC_CHANNEL_GROUP_CH0_CH1,
    ADC_CHANNEL_GROUP_CH0
} ADC_CHANNEL_GROUP;
```

Description

ADC Channel Group

This data type defines the ADC Channel Group.

Members

Members	Description
ADC_CHANNEL_GROUP_CH0_CH1_CH2_CH3	Converts Channels CH0, CH1, CH2 and CH3
ADC_CHANNEL_GROUP_CH0_CH1	Converts Channels CH0, CH1
ADC_CHANNEL_GROUP_CH0	Converts Channel CH0

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

5.6.1.6.8.6 ADC_CLOCK_SOURCE Enumeration

C

```
typedef enum {
    ADC_CLOCK_SOURCE_SYSTEM_CLOCK,
    ADC_CLOCK_SOURCE_INTERNAL_RC,
    ADC_CLOCK_SOURCE_AUXILIARY_PLL,
    ADC_CLOCK_SOURCE_PRIMARY_PLL
} ADC_CLOCK_SOURCE;
```

Description

ADC Clock Source Select

This data type defines the ADC Clock Source Select.

Members

Members	Description
ADC_CLOCK_SOURCE_SYSTEM_CLOCK	A/D system clock
ADC_CLOCK_SOURCE_INTERNAL_RC	A/D internal RC clock
ADC_CLOCK_SOURCE_AUXILIARY_PLL	ADC is clocked by the auxiliary PLL (ACLK)
ADC_CLOCK_SOURCE_PRIMARY_PLL	ADC is clock by the primary PLL (FVCO)

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

5.6.1.6.8.7 ADC_CONVERSION_TRIGGER_SOURCE Enumeration

C

```
typedef enum {
    ADC_CONVERSION_TRIGGER_SAMP_CLEAR,
    ADC_CONVERSION_TRIGGER_INT0_TRANSITION,
    ADC_CONVERSION_TRIGGER_TMR3_COMPARE_MATCH,
    ADC_CONVERSION_TRIGGER_TMR5_COMPARE_MATCH,
    ADC_CONVERSION_TRIGGER_CTMU_EVENT,
    ADC_CONVERSION_TRIGGER_CTMU_EVENT_ALTERNATIVE,
    ADC_CONVERSION_TRIGGER_INTERNAL_COUNT,
    ADC_CONVERSION_TRIGGER_NO_CONVERSION,
    ADC_CONVERSION_TRIGGER_INDIVIDUAL_SFW_TRIG,
    ADC_CONVERSION_TRIGGER_GLOBAL_SFW_TRIG,
    ADC_CONVERSION_TRIGGER_PWM_PRIMARY_SPECIAL_EVENT,
    ADC_CONVERSION_TRIGGER_PWM_GEN1_PRIMARY,
    ADC_CONVERSION_TRIGGER_PWM_GEN2_PRIMARY,
    ADC_CONVERSION_TRIGGER_PWM_GEN3_PRIMARY,
    ADC_CONVERSION_TRIGGER_PWM_GEN4_PRIMARY,
    ADC_CONVERSION_TRIGGER_PWM_GEN5_PRIMARY,
    ADC_CONVERSION_TRIGGER_PWM_GEN6_PRIMARY,
    ADC_CONVERSION_TRIGGER_PWM_GEN7_PRIMARY,
    ADC_CONVERSION_TRIGGER_PWM_GEN8_PRIMARY,
    ADC_CONVERSION_TRIGGER_TMR1_PERIOD_MATCH,
    ADC_CONVERSION_TRIGGER_PWM_SECONDARY_SPECIAL_EVENT,
    ADC_CONVERSION_TRIGGER_PWM_GEN1_SECONDARY,
    ADC_CONVERSION_TRIGGER_PWM_GEN2_SECONDARY,
    ADC_CONVERSION_TRIGGER_PWM_GEN3_SECONDARY,
    ADC_CONVERSION_TRIGGER_PWM_GEN4_SECONDARY,
    ADC_CONVERSION_TRIGGER_PWM_GEN5_SECONDARY,
    ADC_CONVERSION_TRIGGER_PWM_GEN6_SECONDARY,
    ADC_CONVERSION_TRIGGER_PWM_GEN7_SECONDARY,
    ADC_CONVERSION_TRIGGER_PWM_GEN8_SECONDARY,
    ADC_CONVERSION_TRIGGER_PWM_GEN9_SECONDARY,
}
```

```

ADC_CONVERSION_TRIGGER_PWM_GEN1_CURRENT_LMT_ADC,
ADC_CONVERSION_TRIGGER_PWM_GEN2_CURRENT_LMT_ADC,
ADC_CONVERSION_TRIGGER_PWM_GEN3_CURRENT_LMT_ADC,
ADC_CONVERSION_TRIGGER_PWM_GEN4_CURRENT_LMT_ADC,
ADC_CONVERSION_TRIGGER_PWM_GEN5_CURRENT_LMT_ADC,
ADC_CONVERSION_TRIGGER_PWM_GEN6_CURRENT_LMT_ADC,
ADC_CONVERSION_TRIGGER_PWM_GEN7_CURRENT_LMT_ADC,
ADC_CONVERSION_TRIGGER_PWM_GEN8_CURRENT_LMT_ADC,
ADC_CONVERSION_TRIGGER_TMR2_PERIOD_MATCH
} ADC_CONVERSION_TRIGGER_SOURCE;

```

Description

ADC Conversion Trigger Source

This data type defines the ADC Conversion Trigger Source.

Members

Members	Description
ADC_CONVERSION_TRIGGER_SAMP_CLEAR	Clearing SAMP bit (full program control)
ADC_CONVERSION_TRIGGER_INT0_TRANSITION	Active transition on INT0 pin (basic sync convert)
ADC_CONVERSION_TRIGGER_TMR3_COMPARE_MATCH	Timer3 compare match
ADC_CONVERSION_TRIGGER_TMR5_COMPARE_MATCH	Timer5 compare match
ADC_CONVERSION_TRIGGER_CTMU_EVENT	CTMU event
ADC_CONVERSION_TRIGGER_CTMU_EVENT_ALTERNATIVE	CTMU event Alternative
ADC_CONVERSION_TRIGGER_INTERNAL_COUNT	Internal counter (auto-convert)
ADC_CONVERSION_TRIGGER_NO_CONVERSION	No conversion enabled
ADC_CONVERSION_TRIGGER_INDIVIDUAL_SFW_TRIG	Individual software trigger selected
ADC_CONVERSION_TRIGGER_GLOBAL_SFW_TRIG	Global software trigger selected
ADC_CONVERSION_TRIGGER_PWM_PRIMARY_SPECIAL_EVENT	PWM Special/Primary Special Event Trigger selected
ADC_CONVERSION_TRIGGER_PWM_GEN1_PRIMARY	PWM Generator 1 primary trigger selected
ADC_CONVERSION_TRIGGER_PWM_GEN2_PRIMARY	PWM Generator 2 primary trigger selected
ADC_CONVERSION_TRIGGER_PWM_GEN3_PRIMARY	PWM Generator 3 primary trigger selected
ADC_CONVERSION_TRIGGER_PWM_GEN4_PRIMARY	PWM Generator 4 primary trigger selected
ADC_CONVERSION_TRIGGER_PWM_GEN5_PRIMARY	PWM Generator 5 primary trigger selected
ADC_CONVERSION_TRIGGER_PWM_GEN6_PRIMARY	PWM Generator 6 primary trigger selected
ADC_CONVERSION_TRIGGER_PWM_GEN7_PRIMARY	PWM Generator 7 primary trigger selected
ADC_CONVERSION_TRIGGER_PWM_GEN8_PRIMARY	PWM Generator 8 primary trigger selected
ADC_CONVERSION_TRIGGER_TMR1_PERIOD_MATCH	Timer1 period match
ADC_CONVERSION_TRIGGER_PWM_SECONDARY_SPECIAL_EVENT	PWM secondary special event trigger selected
ADC_CONVERSION_TRIGGER_PWM_GEN1_SECONDARY	PWM Generator 1 secondary trigger selected
ADC_CONVERSION_TRIGGER_PWM_GEN2_SECONDARY	PWM Generator 2 secondary trigger selected
ADC_CONVERSION_TRIGGER_PWM_GEN3_SECONDARY	PWM Generator 3 secondary trigger selected
ADC_CONVERSION_TRIGGER_PWM_GEN4_SECONDARY	PWM Generator 4 secondary trigger selected
ADC_CONVERSION_TRIGGER_PWM_GEN5_SECONDARY	PWM Generator 5 secondary trigger selected
ADC_CONVERSION_TRIGGER_PWM_GEN6_SECONDARY	PWM Generator 6 secondary trigger selected
ADC_CONVERSION_TRIGGER_PWM_GEN7_SECONDARY	PWM Generator 7 secondary trigger selected
ADC_CONVERSION_TRIGGER_PWM_GEN8_SECONDARY	PWM Generator 8 secondary trigger selected
ADC_CONVERSION_TRIGGER_PWM_GEN9_SECONDARY	PWM Generator 9 secondary trigger selected
ADC_CONVERSION_TRIGGER_PWM_GEN1_CURRENT_LMT_ADC	PWM Generator 1 current-limit ADC trigger

ADC_CONVERSION_TRIGGER_PWM_GEN2_CURRENT_LMT_ADC	PWM Generator 2 current-limit ADC trigger
ADC_CONVERSION_TRIGGER_PWM_GEN3_CURRENT_LMT_ADC	PWM Generator 3 current-limit ADC trigger
ADC_CONVERSION_TRIGGER_PWM_GEN4_CURRENT_LMT_ADC	PWM Generator 4 current-limit ADC trigger
ADC_CONVERSION_TRIGGER_PWM_GEN5_CURRENT_LMT_ADC	PWM Generator 5 current-limit ADC trigger
ADC_CONVERSION_TRIGGER_PWM_GEN6_CURRENT_LMT_ADC	PWM Generator 6 current-limit ADC trigger
ADC_CONVERSION_TRIGGER_PWM_GEN7_CURRENT_LMT_ADC	PWM Generator 7 current-limit ADC trigger
ADC_CONVERSION_TRIGGER_PWM_GEN8_CURRENT_LMT_ADC	PWM Generator 8 current-limit ADC trigger
ADC_CONVERSION_TRIGGER_TMR2_PERIOD_MATCH	Timer2 period match

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

5.6.1.6.8.8 ADC_RESULT_SIZE Enumeration

C

```
typedef enum {
    ADC_RESULT_SIZE_8_BITS,
    ADC_RESULT_SIZE_10_BITS,
    ADC_RESULT_SIZE_12_BITS
} ADC_RESULT_SIZE;
```

Description

ADC Result Size

This data type defines the ADC Result Size.

Members

Members	Description
ADC_RESULT_SIZE_8_BITS	Converter Mode/Result Size is 8-bits
ADC_RESULT_SIZE_10_BITS	Converter Mode/Result Size is 10-bits
ADC_RESULT_SIZE_12_BITS	Converter Mode/Result Size is 12-bits

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

5.6.1.6.8.9 ADC_BUFFER_MODE Enumeration

C

```
typedef enum {
    ADC_BUFFER_MODE_ONE_16WORD_BUFFER,
    ADC_BUFFER_MODE_TWO_8WORD_BUFFERS
} ADC_BUFFER_MODE;
```

Description

ADC Buffer Mode

This data type defines the ADC Buffer Mode.

Members

Members	Description
ADC_BUFFER_MODE_ONE_16WORD_BUFFER	Buffer configured as one 16-word buffer (ADC1BUF0 to ADC1BUFF)
ADC_BUFFER_MODE_TWO_8WORD_BUFFERS	Buffer configured as two 8-word buffers (ADC1BUF0 to ADC1BUF7 and ADC1BUF8 to ADC1BUFF)

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

5.6.1.6.8.10 ADC_RESULT_BUF_STATUS Enumeration**C**

```
typedef enum {  
    ADC_FILLING_BUF_0TO7,  
    ADC_FILLING_BUF_8TOF  
} ADC_RESULT_BUF_STATUS;
```

Description

ADC Result Buffer Status

This data type defines the elements that specify which group of eight buffers the ADC is currently filling.

Members

Members	Description
ADC_FILLING_BUF_0TO7	Buffers 0x0 to 0x7 are getting filled
ADC_FILLING_BUF_8TOF	Buffers 0x8 to 0xF are getting filled

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

5.6.1.6.8.11 ADC_MUX Enumeration**C**

```
typedef enum {  
    ADC_MUX_A,  
    ADC_MUX_B  
} ADC_MUX;
```

Description

ADC MUX Enumeration

This data type defines the different ADC MUX Enumeration.

Members

Members	Description
ADC_MUX_A	ADC Mux A Selection
ADC_MUX_B	ADC Mux B Selection

Remarks

None

5.6.1.6.8.12 ADC_SAMPLING_MODE Enumeration**C**

```
typedef enum {  
    ADC_SAMPLING_MODE_SIMULTANEOUS,  
    ADC_SAMPLING_MODE_SEQUENTIAL  
} ADC_SAMPLING_MODE;
```

Description

ADC Sampling Mode Select

This data type defines the ADC Sampling Mode Select.

Members

Members	Description
ADC_SAMPLING_MODE_SIMULTANEOUS	Simultaneous Sampling Mode
ADC_SAMPLING_MODE_SEQUENTIAL	Sequential Sampling Mode

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

5.6.1.6.8.13 ADC_INPUTS_SCAN Enumeration**C**

```
typedef enum {
    ADC_INPUT_SCAN_AN0,
    ADC_INPUT_SCAN_AN1,
    ADC_INPUT_SCAN_AN2,
    ADC_INPUT_SCAN_AN3,
    ADC_INPUT_SCAN_AN4,
    ADC_INPUT_SCAN_AN5,
    ADC_INPUT_SCAN_AN6,
    ADC_INPUT_SCAN_AN7,
    ADC_INPUT_SCAN_AN8,
    ADC_INPUT_SCAN_AN9,
    ADC_INPUT_SCAN_AN10,
    ADC_INPUT_SCAN_AN11,
    ADC_INPUT_SCAN_AN12,
    ADC_INPUT_SCAN_AN13,
    ADC_INPUT_SCAN_AN14,
    ADC_INPUT_SCAN_AN15,
    ADC_INPUT_SCAN_AN16,
    ADC_INPUT_SCAN_AN17,
    ADC_INPUT_SCAN_AN18,
    ADC_INPUT_SCAN_AN19,
    ADC_INPUT_SCAN_AN20,
    ADC_INPUT_SCAN_AN21,
    ADC_INPUT_SCAN_AN22,
    ADC_INPUT_SCAN_AN23,
    ADC_INPUT_SCAN_AN24,
    ADC_INPUT_SCAN_AN25,
    ADC_INPUT_SCAN_AN26,
    ADC_INPUT_SCAN_AN27,
    ADC_INPUT_SCAN_AN28,
    ADC_INPUT_SCAN_AN29,
    ADC_INPUT_SCAN_AN30,
    ADC_INPUT_SCAN_AN31,
    ADC_INPUT_SCAN_IVREF,
    ADC_INPUT_SCAN_CTMU,
    ADC_INPUT_SCAN_VSS,
    ADC_INPUT_SCAN_VBG_DIV_BY_6,
    ADC_INPUT_SCAN_VBG_DIV_BY_2,
    ADC_INPUT_SCAN_VBG_DIV_BY_1,
    ADC_INPUT_SCAN_VDDCORE,
    ADC_INPUT_SCAN_ALL
} ADC_INPUTS_SCAN;
```

Description

ADC Scan Inputs Enumeration

This data type defines the ADC Scan inputs.

Members

Members	Description
ADC_INPUT_SCAN_AN0	Scan input is AN0
ADC_INPUT_SCAN_AN1	Scan input is AN1
ADC_INPUT_SCAN_AN2	Scan input is AN2
ADC_INPUT_SCAN_AN3	Scan input is AN3
ADC_INPUT_SCAN_AN4	Scan input is AN4
ADC_INPUT_SCAN_AN5	Scan input is AN5
ADC_INPUT_SCAN_AN6	Scan input is AN6
ADC_INPUT_SCAN_AN7	Scan input is AN7
ADC_INPUT_SCAN_AN8	Scan input is AN8
ADC_INPUT_SCAN_AN9	Scan input is AN9
ADC_INPUT_SCAN_AN10	Scan input is AN10
ADC_INPUT_SCAN_AN11	Scan input is AN11
ADC_INPUT_SCAN_AN12	Scan input is AN12
ADC_INPUT_SCAN_AN13	Scan input is AN13
ADC_INPUT_SCAN_AN14	Scan input is AN14
ADC_INPUT_SCAN_AN15	Scan input is AN15
ADC_INPUT_SCAN_AN16	Scan input is AN16
ADC_INPUT_SCAN_AN17	Scan input is AN17
ADC_INPUT_SCAN_AN18	Scan input is AN18
ADC_INPUT_SCAN_AN19	Scan input is AN19
ADC_INPUT_SCAN_AN20	Scan input is AN20
ADC_INPUT_SCAN_AN21	Scan input is AN21
ADC_INPUT_SCAN_AN22	Scan input is AN22
ADC_INPUT_SCAN_AN23	Scan input is AN23
ADC_INPUT_SCAN_AN24	Scan input is AN24
ADC_INPUT_SCAN_AN25	Scan input is AN25
ADC_INPUT_SCAN_AN26	Scan input is AN26
ADC_INPUT_SCAN_AN27	Scan input is AN27
ADC_INPUT_SCAN_AN28	Scan input is AN28
ADC_INPUT_SCAN_AN29	Scan input is AN29
ADC_INPUT_SCAN_AN30	Scan input is AN30
ADC_INPUT_SCAN_AN31	Scan input is AN31
ADC_INPUT_SCAN_IVREF	Scan input is IVref
ADC_INPUT_SCAN_CTMU	Scan input is CTMU input
ADC_INPUT_SCAN_VSS	Scan input is Vss
ADC_INPUT_SCAN_VBG_DIV_BY_6	Scan input is VBG/6
ADC_INPUT_SCAN_VBG_DIV_BY_2	Scan input is VBG/2
ADC_INPUT_SCAN_VBG_DIV_BY_1	Scan input is VBG
ADC_INPUT_SCAN_VDDCORE	Scan input is VDDCORE

ADC_INPUT_SCAN_ALL	All Inputs

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

5.6.1.6.8.14 ADC_REFERENCE_INPUT Enumeration**C**

```
typedef enum {
    ADC_REFERENCE_INPUT_VBG_DIV_BY_1,
    ADC_REFERENCE_INPUT_VBG_DIV_BY_2,
    ADC_REFERENCE_INPUT_VBG_DIV_BY_6,
    ADC_REFERENCE_INPUT_VDDCORE
} ADC_REFERENCE_INPUT;
```

Description

ADC Reference Input Enumeration

This data type defines the ADC Reference Input Enumeration.

Members

Members	Description
ADC_REFERENCE_INPUT_VBG_DIV_BY_1	Internal Band Gap Reference Channel VBG
ADC_REFERENCE_INPUT_VBG_DIV_BY_2	Internal Band Gap Reference Channel VBG/2
ADC_REFERENCE_INPUT_VBG_DIV_BY_6	Internal Band Gap Reference Channel VBG/6
ADC_REFERENCE_INPUT_VDDCORE	Internal Reference Channel VDDCORE

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

5.6.1.6.8.15 ADC_RESULT_FORMAT Enumeration**C**

```
typedef enum {
    ADC_RESULT_FORMAT_LEFT_JUSTIFIED,
    ADC_RESULT_FORMAT_RIGHT_JUSTIFIED,
    ADC_RESULT_FORMAT_INTEGER_16BIT,
    ADC_RESULT_FORMAT_SIGNED_INTEGER_16BIT,
    ADC_RESULT_FORMAT_FRACTIONAL_16BIT,
    ADC_RESULT_FORMAT_SIGNED_FRACTIONAL_16BIT,
    ADC_RESULT_FORMAT_INTEGER_32BIT,
    ADC_RESULT_FORMAT_SIGNED_INTEGER_32BIT,
    ADC_RESULT_FORMAT_FRACTIONAL_32BIT,
    ADC_RESULT_FORMAT_SIGNED_FRACTIONAL_32BIT
} ADC_RESULT_FORMAT;
```

Description

ADC Result Format

This data type defines the ADC Result Format.

Members

Members	Description
ADC_RESULT_FORMAT_LEFT_JUSTIFIED	Result Left justified
ADC_RESULT_FORMAT_RIGHT_JUSTIFIED	Result Right justified

ADC_RESULT_FORMAT_INTEGER_16BIT	Integer 16-bit
ADC_RESULT_FORMAT_SIGNED_INTEGER_16BIT	Signed Integer 16-bit
ADC_RESULT_FORMAT_FRACTIONAL_16BIT	Fractional 16-bit
ADC_RESULT_FORMAT_SIGNED_FRACTIONAL_16BIT	Signed Fractional 16-bit
ADC_RESULT_FORMAT_INTEGER_32BIT	Integer 32-bit
ADC_RESULT_FORMAT_SIGNED_INTEGER_32BIT	Signed Integer 32-bit
ADC_RESULT_FORMAT_FRACTIONAL_32BIT	Fractional 32-bit
ADC_RESULT_FORMAT_SIGNED_FRACTIONAL_32BIT	Signed Fractional 32-bit

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

5.6.1.6.8.16 ADC_DMA_BUFFER_MODE Enumeration**C**

```
typedef enum {
    ADC_DMA_BUFFER_MODE_SCATTER_GATHER,
    ADC_DMA_BUFFER_MODE_ORDER_OF_CONV
} ADC_DMA_BUFFER_MODE;
```

Description

ADC DMA Buffer Mode

This data type defines the ADC Buffer Mode.

Members

Members	Description
ADC_DMA_BUFFER_MODE_SCATTER_GATHER	DMA buffers are written in Scatter/Gather mode
ADC_DMA_BUFFER_MODE_ORDER_OF_CONV	DMA buffers are written in the order of conversion

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

5.6.1.6.8.17 ADC_PAIR Enumeration**C**

```
typedef enum {
    ADC_PAIR_AN0_AN1,
    ADC_PAIR_AN2_AN3,
    ADC_PAIR_AN4_AN5,
    ADC_PAIR_AN6_AN7,
    ADC_PAIR_AN8_AN9,
    ADC_PAIR_AN10_AN11,
    ADC_PAIR_AN12_AN13,
    ADC_PAIR_AN14_AN15,
    ADC_PAIR_AN16_AN17,
    ADC_PAIR_AN18_AN19,
    ADC_PAIR_AN20_AN21,
    ADC_PAIR_AN22_AN23,
    ADC_PAIR_AN24_AN25
} ADC_PAIR;
```

Description

ADC Pair

This data type defines the ADC Pair.

Members

Members	Description
ADC_PAIR_AN0_AN1	Pair 0 - AN0, AN1
ADC_PAIR_AN2_AN3	Pair 1 - AN2, AN3
ADC_PAIR_AN4_AN5	Pair 2 - AN4, AN5
ADC_PAIR_AN6_AN7	Pair 3 - AN6, AN7
ADC_PAIR_AN8_AN9	Pair 4 - AN8, AN9
ADC_PAIR_AN10_AN11	Pair 5 - AN10, AN11
ADC_PAIR_AN12_AN13	Pair 6 - AN12, AN13
ADC_PAIR_AN14_AN15	Pair 7 - AN14, AN15
ADC_PAIR_AN16_AN17	Pair 8 - AN16, AN17
ADC_PAIR_AN18_AN19	Pair 9 - AN18, AN19
ADC_PAIR_AN20_AN21	Pair 10 - AN20, AN21
ADC_PAIR_AN22_AN23	Pair 11 - AN22, AN23
ADC_PAIR_AN24_AN25	Pair 12 - AN24, AN25

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

5.6.1.6.8.18 ADC_CHANNEL123_INPUTS_NEG Enumeration**C**

```
typedef enum {
    ADC_CHANNEL123_INPUT_NEG_CH123_VREF_MINUS,
    ADC_CHANNEL123_INPUT_NEG_CH1_AN6_CH2_AN7_CH3_NC,
    ADC_CHANNEL123_INPUT_NEG_CH1_AN6_CH2_AN7_CH3_AN8,
    ADC_CHANNEL123_INPUT_NEG_CH1_AN9_CH2_AN10_CH3_AN11,
    ADC_CHANNEL123_INPUT_NEG_CH1_AN9_CH2_CH3_NC
} ADC_CHANNEL123_INPUTS_NEG;
```

Description

ADC Channel 123 Negative Input Select

This data type defines the ADC Channel 123 Negative Input Select.

Members

Members	Description
ADC_CHANNEL123_INPUT_NEG_CH123_VREF_MINUS	CH1, CH2, CH3 negative input is VREF
ADC_CHANNEL123_INPUT_NEG_CH1_AN6_CH2_AN7_CH3_NC	CH1 negative input is AN6, CH2 negative input is AN7, CH3 negative input is not connected
ADC_CHANNEL123_INPUT_NEG_CH1_AN6_CH2_AN7_CH3_AN8	CH1 negative input is AN6, CH2 negative input is AN7, CH3 negative input is AN8
ADC_CHANNEL123_INPUT_NEG_CH1_AN9_CH2_AN10_CH3_AN11	CH1 negative input is AN9, CH2 negative input is AN10, CH3 negative input is AN11
ADC_CHANNEL123_INPUT_NEG_CH1_AN9_CH2_CH3_NC	CH1 negative input is AN9, CH2 and CH3 negative inputs are not connected

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

5.6.1.6.8.19 ADC_CHANNEL123_INPUTS_POS Enumeration

C

```
typedef enum {
    ADC_CHANNEL123_INPUT_POS_CH1_AN3_CH2_CH3_NC,
    ADC_CHANNEL123_INPUT_POS_CH1_AN0_CH2_AN1_CH3_AN2,
    ADC_CHANNEL123_INPUT_POS_CH1_AN3_CH2_AN4_CH3_AN5
} ADC_CHANNEL123_INPUTS_POS;
```

Description

ADC Channel 123 Positive Input Select

This data type defines the ADC Channel 123 Positive Input Select.

Members

Members	Description
ADC_CHANNEL123_INPUT_POS_CH1_AN3_CH2_CH3_NC	CH1 positive input is AN3, CH2 and CH3 positive inputs are not connected
ADC_CHANNEL123_INPUT_POS_CH1_AN0_CH2_AN1_CH3_AN2	CH1 positive input is AN0, CH2 positive input is AN1, CH3 positive input is AN2
ADC_CHANNEL123_INPUT_POS_CH1_AN3_CH2_AN4_CH3_AN5	CH1 positive input is AN3, CH2 positive input is AN4, CH3 positive input is AN5

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

5.6.1.6.8.20 ADC_INPUTS_POSITIVE Enumeration

C

```
typedef enum {
    ADC_INPUT_POSITIVE_AN0,
    ADC_INPUT_POSITIVE_AN1,
    ADC_INPUT_POSITIVE_AN2,
    ADC_INPUT_POSITIVE_AN3,
    ADC_INPUT_POSITIVE_AN4,
    ADC_INPUT_POSITIVE_AN5,
    ADC_INPUT_POSITIVE_AN6,
    ADC_INPUT_POSITIVE_AN7,
    ADC_INPUT_POSITIVE_AN8,
    ADC_INPUT_POSITIVE_AN9,
    ADC_INPUT_POSITIVE_AN10,
    ADC_INPUT_POSITIVE_AN11,
    ADC_INPUT_POSITIVE_AN12,

```

Description

ADC Inputs Enumeration

This data type defines the ADC inputs.

Members

Members	Description
ADC_INPUT_POSITIVE_AN0	Positive input is AN0
ADC_INPUT_POSITIVE_AN1	Positive input is AN1
ADC_INPUT_POSITIVE_AN2	Positive input is AN2
ADC_INPUT_POSITIVE_AN3	Positive input is AN3
ADC_INPUT_POSITIVE_AN4	Positive input is AN4
ADC_INPUT_POSITIVE_AN5	Positive input is AN5
ADC_INPUT_POSITIVE_AN6	Positive input is AN6
ADC_INPUT_POSITIVE_AN7	Positive input is AN7
ADC_INPUT_POSITIVE_AN8	Positive input is AN8
ADC_INPUT_POSITIVE_AN9	Positive input is AN9
ADC_INPUT_POSITIVE_AN10	Positive input is AN10
ADC_INPUT_POSITIVE_AN11	Positive input is AN11
ADC_INPUT_POSITIVE_AN12	Positive input is AN12
ADC_INPUT_POSITIVE_AN13	Positive input is AN13
ADC_INPUT_POSITIVE_AN14	Positive input is AN14
ADC_INPUT_POSITIVE_AN15	Positive input is AN15
ADC_INPUT_POSITIVE_AN16	Positive input is AN16
ADC_INPUT_POSITIVE_AN17	Positive input is AN17
ADC_INPUT_POSITIVE_AN18	Positive input is AN18
ADC_INPUT_POSITIVE_AN19	Positive input is AN19
ADC_INPUT_POSITIVE_AN20	Positive input is AN20
ADC_INPUT_POSITIVE_AN21	Positive input is AN21
ADC_INPUT_POSITIVE_AN22	Positive input is AN22
ADC_INPUT_POSITIVE_AN23	Positive input is AN23
ADC_INPUT_POSITIVE_AN24	Positive input is AN24
ADC_INPUT_POSITIVE_AN25	Positive input is AN25
ADC_INPUT_POSITIVE_AN26	Positive input is AN26

ADC_INPUT_POSITIVE_AN27	Positive input is AN27
ADC_INPUT_POSITIVE_AN28	Positive input is AN28
ADC_INPUT_POSITIVE_AN29	Positive input is AN29
ADC_INPUT_POSITIVE_AN30	Positive input is AN30
ADC_INPUT_POSITIVE_AN31	Positive input is AN31
ADC_INPUT_POSITIVE_ABS_VOLTAGE_REF	ADC Channel 0.6V Absolute Voltage Reference
ADC_INPUT_POSITIVE_MUX_DISCONNECT	ADC Channel MUX Disconnect
ADC_INPUT_POSITIVE_TEMP_INDICATOR	ADC Channel Temperature Diode/Indicator
ADC_INPUT_POSITIVE_DAC_OUTPUT	ADC Channel DAC Output
ADC_INPUT_POSITIVE_FVR_BUFFER1_OUTPUT	ADC Channel Fixed Voltage Reference Buffer1 Output
ADC_INPUT_POSITIVE_VBG_DIV_BY_6	Positive input is VBG/6
ADC_INPUT_POSITIVE_VBG_DIV_BY_2	Positive input is VBG/2
ADC_INPUT_POSITIVE_VBG_DIV_BY_1	Positive input is VBG
ADC_INPUT_POSITIVE_VDDCORE	Positive input is VDDCORE
ADC_INPUT_POSITIVE_MAX	Maximum Inputs
ADC_INPUT_POSITIVE_CTMU	Positive input is from CTMU
ADC_INPUT_POSITIVE_IVREF	Positive input is IVref
ADC_INPUT_POSITIVE_OPEN	Positive input is Open

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

5.6.1.6.8.21 ADC_CONVERSION_ORDER Enumeration**C**

```
typedef enum {
    ADC_CONVERSION_ORDER_ODD_FIRST,
    ADC_CONVERSION_ORDER_EVEN_FIRST
} ADC_CONVERSION_ORDER;
```

Description

ADC Conversion Order

This data type defines the ADC Conversion Order.

Members

Members	Description
ADC_CONVERSION_ORDER_ODD_FIRST	Odd numbered analog input is converted first, followed by conversion of even numbered input
ADC_CONVERSION_ORDER_EVEN_FIRST	Even numbered analog input is converted first, followed by conversion of odd numbered input

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

5.6.1.6.8.22 ADC_DMA_ADDRESS_INCREMENT Enumeration**C**

```
typedef enum {
    ADC_DMA_ADDRESS_INCREMENT_EVERY_SAMPLE,
    ADC_DMA_ADDRESS_INCREMENT_EVERY_2ND_SAMPLE,
```

```

ADC_DMA_ADDRESS_INCREMENT EVERY 3RD SAMPLE,
ADC_DMA_ADDRESS_INCREMENT EVERY 4TH SAMPLE,
ADC_DMA_ADDRESS_INCREMENT EVERY 5TH SAMPLE,
ADC_DMA_ADDRESS_INCREMENT EVERY 6TH SAMPLE,
ADC_DMA_ADDRESS_INCREMENT EVERY 7TH SAMPLE,
ADC_DMA_ADDRESS_INCREMENT EVERY 8TH SAMPLE,
ADC_DMA_ADDRESS_INCREMENT EVERY 9TH SAMPLE,
ADC_DMA_ADDRESS_INCREMENT EVERY 10TH SAMPLE,
ADC_DMA_ADDRESS_INCREMENT EVERY 11TH SAMPLE,
ADC_DMA_ADDRESS_INCREMENT EVERY 12TH SAMPLE,
ADC_DMA_ADDRESS_INCREMENT EVERY 13TH SAMPLE,
ADC_DMA_ADDRESS_INCREMENT EVERY 14TH SAMPLE,
ADC_DMA_ADDRESS_INCREMENT EVERY 15TH SAMPLE,
ADC_DMA_ADDRESS_INCREMENT EVERY 16TH SAMPLE,
ADC_DMA_ADDRESS_INCREMENT EVERY 17TH SAMPLE,
ADC_DMA_ADDRESS_INCREMENT EVERY 18TH SAMPLE,
ADC_DMA_ADDRESS_INCREMENT EVERY 19TH SAMPLE,
ADC_DMA_ADDRESS_INCREMENT EVERY 20TH SAMPLE,
ADC_DMA_ADDRESS_INCREMENT EVERY 21ST SAMPLE,
ADC_DMA_ADDRESS_INCREMENT EVERY 22ND SAMPLE,
ADC_DMA_ADDRESS_INCREMENT EVERY 23RD SAMPLE,
ADC_DMA_ADDRESS_INCREMENT EVERY 24TH SAMPLE,
ADC_DMA_ADDRESS_INCREMENT EVERY 25TH SAMPLE,
ADC_DMA_ADDRESS_INCREMENT EVERY 26TH SAMPLE,
ADC_DMA_ADDRESS_INCREMENT EVERY 27TH SAMPLE,
ADC_DMA_ADDRESS_INCREMENT EVERY 28TH SAMPLE,
ADC_DMA_ADDRESS_INCREMENT EVERY 29TH SAMPLE,
ADC_DMA_ADDRESS_INCREMENT EVERY 30TH SAMPLE,
ADC_DMA_ADDRESS_INCREMENT EVERY 31ST SAMPLE,
ADC_DMA_ADDRESS_INCREMENT EVERY 32ND SAMPLE
} ADC_DMA_ADDRESS_INCREMENT;

```

Description

ADC DMA Increment Rate

This data type defines the ADC DMA Increment Rate.

Members

Members	Description
ADC_DMA_ADDRESS_INCREMENT EVERY SAMPLE	Increments the DMA address after completion of every sample/conversion operation
ADC_DMA_ADDRESS_INCREMENT EVERY 2ND SAMPLE	Increments the DMA address after completion of every 2nd sample/conversion operation
ADC_DMA_ADDRESS_INCREMENT EVERY 3RD SAMPLE	Increments the DMA address after completion of every 3rd sample/conversion operation
ADC_DMA_ADDRESS_INCREMENT EVERY 4TH SAMPLE	Increments the DMA address after completion of every 4th sample/conversion operation
ADC_DMA_ADDRESS_INCREMENT EVERY 5TH SAMPLE	Increments the DMA address after completion of every 5th sample/conversion operation
ADC_DMA_ADDRESS_INCREMENT EVERY 6TH SAMPLE	Increments the DMA address after completion of every 6th sample/conversion operation
ADC_DMA_ADDRESS_INCREMENT EVERY 7TH SAMPLE	Increments the DMA address after completion of every 7th sample/conversion operation
ADC_DMA_ADDRESS_INCREMENT EVERY 8TH SAMPLE	Increments the DMA address after completion of every 8th sample/conversion operation
ADC_DMA_ADDRESS_INCREMENT EVERY 9TH SAMPLE	Increments the DMA address after completion of every 9th sample/conversion operation
ADC_DMA_ADDRESS_INCREMENT EVERY 10TH SAMPLE	Increments the DMA address after completion of every 10th sample/conversion operation

ADC_DMA_ADDRESS_INCREMENT EVERY_11TH_SAMPLE	Increments the DMA address after completion of every 11th sample/conversion operation
ADC_DMA_ADDRESS_INCREMENT EVERY_12TH_SAMPLE	Increments the DMA address after completion of every 12th sample/conversion operation
ADC_DMA_ADDRESS_INCREMENT EVERY_13TH_SAMPLE	Increments the DMA address after completion of every 13th sample/conversion operation
ADC_DMA_ADDRESS_INCREMENT EVERY_14TH_SAMPLE	Increments the DMA address after completion of every 14th sample/conversion operation
ADC_DMA_ADDRESS_INCREMENT EVERY_15TH_SAMPLE	Increments the DMA address after completion of every 15th sample/conversion operation
ADC_DMA_ADDRESS_INCREMENT EVERY_16TH_SAMPLE	Increments the DMA address after completion of every 16th sample/conversion operation
ADC_DMA_ADDRESS_INCREMENT EVERY_17TH_SAMPLE	Increments the DMA address after completion of every 17th sample/conversion operation
ADC_DMA_ADDRESS_INCREMENT EVERY_18TH_SAMPLE	Increments the DMA address after completion of every 18th sample/conversion operation
ADC_DMA_ADDRESS_INCREMENT EVERY_19TH_SAMPLE	Increments the DMA address after completion of every 19th sample/conversion operation
ADC_DMA_ADDRESS_INCREMENT EVERY_20TH_SAMPLE	Increments the DMA address after completion of every 20th sample/conversion operation
ADC_DMA_ADDRESS_INCREMENT EVERY_21ST_SAMPLE	Increments the DMA address after completion of every 21st sample/conversion operation
ADC_DMA_ADDRESS_INCREMENT EVERY_22ND_SAMPLE	Increments the DMA address after completion of every 22nd sample/conversion operation
ADC_DMA_ADDRESS_INCREMENT EVERY_23RD_SAMPLE	Increments the DMA address after completion of every 23rd sample/conversion operation
ADC_DMA_ADDRESS_INCREMENT EVERY_24TH_SAMPLE	Increments the DMA address after completion of every 24th sample/conversion operation
ADC_DMA_ADDRESS_INCREMENT EVERY_25TH_SAMPLE	Increments the DMA address after completion of every 25th sample/conversion operation
ADC_DMA_ADDRESS_INCREMENT EVERY_26TH_SAMPLE	Increments the DMA address after completion of every 26th sample/conversion operation
ADC_DMA_ADDRESS_INCREMENT EVERY_27TH_SAMPLE	Increments the DMA address after completion of every 27th sample/conversion operation
ADC_DMA_ADDRESS_INCREMENT EVERY_28TH_SAMPLE	Increments the DMA address after completion of every 28th sample/conversion operation
ADC_DMA_ADDRESS_INCREMENT EVERY_29TH_SAMPLE	Increments the DMA address after completion of every 29th sample/conversion operation
ADC_DMA_ADDRESS_INCREMENT EVERY_30TH_SAMPLE	Increments the DMA address after completion of every 30th sample/conversion operation
ADC_DMA_ADDRESS_INCREMENT EVERY_31ST_SAMPLE	Increments the DMA address after completion of every 31st sample/conversion operation
ADC_DMA_ADDRESS_INCREMENT EVERY_32ND_SAMPLE	Increments the DMA address after completion of every 32nd sample/conversion operation

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

5.6.1.6.8.23 ADC_DMA_INPUT_BUFFER Enumeration**C**

```
typedef enum {
```

```

ADC_DMA_INPUT_BUFFER_1WORD,
ADC_DMA_INPUT_BUFFER_2WORDS,
ADC_DMA_INPUT_BUFFER_4WORDS,
ADC_DMA_INPUT_BUFFER_8WORDS,
ADC_DMA_INPUT_BUFFER_16WORDS,
ADC_DMA_INPUT_BUFFER_32WORDS,
ADC_DMA_INPUT_BUFFER_64WORDS,
ADC_DMA_INPUT_BUFFER_128WORDS
} ADC_DMA_INPUT_BUFFER;

```

Description

ADC DMA Buffer Per Input

This data type defines the ADC DMA Buffer Per Input.

Members

Members	Description
ADC_DMA_INPUT_BUFFER_1WORD	Allocates 1 word of buffer to each analog input
ADC_DMA_INPUT_BUFFER_2WORDS	Allocates 2 words of buffer to each analog input
ADC_DMA_INPUT_BUFFER_4WORDS	Allocates 4 words of buffer to each analog input
ADC_DMA_INPUT_BUFFER_8WORDS	Allocates 8 words of buffer to each analog input
ADC_DMA_INPUT_BUFFER_16WORDS	Allocates 16 words of buffer to each analog input
ADC_DMA_INPUT_BUFFER_32WORDS	Allocates 32 words of buffer to each analog input
ADC_DMA_INPUT_BUFFER_64WORDS	Allocates 64 words of buffer to each analog input
ADC_DMA_INPUT_BUFFER_128WORDS	Allocates 128 words of buffer to each analog input

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all devices.

5.6.1.6.8.24 ADC_ACQUISITION_TIME Type**C**

```
typedef unsigned int ADC_ACQUISITION_TIME;
```

Description

ADC Acquisition Time Selection Data Type

This data type defines the different ADC acquisition times by which the ADC can be configured.

Remarks

None

5.6.1.6.8.25 ADC_CONVERSION_CLOCK Type**C**

```
typedef unsigned int ADC_CONVERSION_CLOCK;
```

Description

ADC Conversion Clock Selection Data Type

This data type defines the different ADC Conversion clock

Remarks

None

5.6.1.6.8.26 ADC_SAMPLE Type

C

```
typedef unsigned int ADC_SAMPLE;
```

Description

ADC Sample size

This data type defines the size of the adc sample register.

Remarks

None

5.6.1.6.9 Feature Existence

5.6.1.6.9.1 PLIB_ADC_ExistsAsynchronousDedicatedSampling Function

C

```
bool PLIB_ADC_ExistsAsynchronousDedicatedSampling(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the AsynchronousDedicatedSampling feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_AsynchronousDedicatedSamplingEnable](#)
- [PLIB_ADC_AsynchronousDedicatedSamplingDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The AsynchronousDedicatedSampling feature is supported on the device
- false = The AsynchronousDedicatedSampling feature is not supported on the device

Remarks

None.

5.6.1.6.9.2 PLIB_ADC_ExistsCalibrationControl Function

C

```
bool PLIB_ADC_ExistsCalibrationControl(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the CalibrationControl feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_CalibrationEnable](#)
- [PLIB_ADC_CalibrationDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The CalibrationControl feature is supported on the device
- false = The CalibrationControl feature is not supported on the device

Remarks

None.

5.6.1.6.9.3 PLIB_ADC_ExistsChannelGroup Function

C

```
bool PLIB_ADC_ExistsChannelGroup(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the ChannelGroup feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_ChannelGroupSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The ChannelGroup feature is supported on the device
- false = The ChannelGroup feature is not supported on the device

Remarks

None.

5.6.1.6.9.4 PLIB_ADC_ExistsConversionClock Function

C

```
bool PLIB_ADC_ExistsConversionClock(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the ConversionClock feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_ConversionClockSet](#)
- [PLIB_ADC_ConversionClockGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The ConversionClock feature is supported on the device
- false = The ConversionClock feature is not supported on the device

Remarks

None.

5.6.1.6.9.5 PLIB_ADC_ExistsConversionClockSource Function

C

```
bool PLIB_ADC_ExistsConversionClockSource(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the ConversionClockSource feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_ConversionClockSourceSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The ConversionClockSource feature is supported on the device
- false = The ConversionClockSource feature is not supported on the device

Remarks

None.

5.6.1.6.9.6 PLIB_ADC_ExistsConversionControl Function

C

```
bool PLIB_ADC_ExistsConversionControl(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the ConversionControl feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_ConversionStart](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = When ConversionControl feature is supported on the device
- false = When ConversionControl feature is not supported on the device

Remarks

None.

5.6.1.6.9.7 PLIB_ADC_ExistsConversionOrder Function**C**

```
bool PLIB_ADC_ExistsConversionOrder(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the ConversionOrder feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_ConversionOrderSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The ConversionOrder feature is supported on the device
- false = The ConversionOrder feature is not supported on the device

Remarks

None.

5.6.1.6.9.8 PLIB_ADC_ExistsConversionStatus Function**C**

```
bool PLIB_ADC_ExistsConversionStatus(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the ConversionStatus feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_ConversionHasCompleted](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The ConversionStatus feature is supported on the device
- false = The ConversionStatus feature is not supported on the device

Remarks

None.

5.6.1.6.9.9 PLIB_ADC_ExistsConversionStopSequenceControl Function**C**

```
bool PLIB_ADC_ExistsConversionStopSequenceControl(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the ConversionStopSequenceControl feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_ConversionStopSequenceEnable](#)
- [PLIB_ADC_ConversionStopSequenceDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The ConversionStopSequenceControl feature is supported on the device
- false = The ConversionStopSequenceControl feature is not supported on the device

Remarks

None.

5.6.1.6.9.10 PLIB_ADC_ExistsConversionTriggerGroup Function**C**

```
bool PLIB_ADC_ExistsConversionTriggerGroup(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the ConversionTriggerGroup feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_ConversionTriggerGroupSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The ConversionTriggerGroup feature is supported on the device
- false = The ConversionTriggerGroup feature is not supported on the device

Remarks

None.

5.6.1.6.9.11 PLIB_ADC_ExistsConversionTriggerSource Function**C**

```
bool PLIB_ADC_ExistsConversionTriggerSource(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the ConversionTriggerSource feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_ConversionTriggerSourceSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The ConversionTriggerSource feature is supported on the device
- false = The ConversionTriggerSource feature is not supported on the device

Remarks

None.

5.6.1.6.9.12 PLIB_ADC_ExistsDMAAddressIncrement Function**C**

```
bool PLIB_ADC_ExistsDMAAddressIncrement(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the DMAAddressIncrement feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_DMAAddressIncrementSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The DMAAddressIncrement feature is supported on the device
- false = The DMAAddressIncrement feature is not supported on the device

Remarks

None.

5.6.1.6.9.13 PLIB_ADC_ExistsDMABufferMode Function**C**

```
bool PLIB_ADC_ExistsDMABufferMode(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the DMABufferMode feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_DMABufferModeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The DMABufferMode feature is supported on the device
- false = The DMABufferMode feature is not supported on the device

Remarks

None.

5.6.1.6.9.14 PLIB_ADC_ExistsDMABuffersPerAnalogInput Function**C**

```
bool PLIB_ADC_ExistsDMABuffersPerAnalogInput(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the DMABuffersPerInput feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_DMAInputBufferSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The DMABuffersPerInput feature is supported on the device
- false = The DMABuffersPerInput feature is not supported on the device

Remarks

None.

5.6.1.6.9.15 PLIB_ADC_ExistsDMAControl Function**C**

```
bool PLIB_ADC_ExistsDMAControl(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the DMAControl feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_DMAEnable](#)
- [PLIB_ADC_DMADisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The DMAControl feature is supported on the device
- false = The DMAControl feature is not supported on the device

Remarks

None.

5.6.1.6.9.16 PLIB_ADC_ExistsEnableControl Function**C**

```
bool PLIB_ADC_ExistsEnableControl(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the EnableControl feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_Enable](#)
- [PLIB_ADC_Disable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The EnableControl feature is supported on the device
- false = The EnableControl feature is not supported on the device

Remarks

None.

5.6.1.6.9.17 PLIB_ADC_ExistsGlobalSoftwareTrigger Function**C**

```
bool PLIB_ADC_ExistsGlobalSoftwareTrigger(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the GlobalSoftwareTrigger feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_GlobalSoftwareTriggerSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The GlobalSoftwareTrigger feature is supported on the device
- false = The GlobalSoftwareTrigger feature is not supported on the device

Remarks

None.

5.6.1.6.9.18 PLIB_ADC_ExistsInputSelect Function**C**

```
bool PLIB_ADC_ExistsInputSelect(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the InputSelect feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_InputSelectPositive](#)
- [PLIB_ADC_InputSelectNegative](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The InputSelect feature is supported on the device
- false = The InputSelect feature is not supported on the device

Remarks

None.

5.6.1.6.9.19 PLIB_ADC_ExistsInternalReferenceChannelControl Function**C**

```
bool PLIB_ADC_ExistsInternalReferenceChannelControl(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the InternalReferenceChannelControl feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_InternalReferenceChannelEnable](#)
- [PLIB_ADC_InternalReferenceChannelDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The InternalReferenceChannelControl feature is supported on the device
- false = The InternalReferenceChannelControl feature is not supported on the device

Remarks

None.

5.6.1.6.9.20 PLIB_ADC_ExistsISRJumpTableBaseAddress Function**C**

```
bool PLIB_ADC_ExistsISRJumpTableBaseAddress(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the `ISRJumpTableBaseAddress` feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_IsrJumpTableBaseAddressSet](#)
- [PLIB_ADC_IsrJumpTableBaseAddressGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The `ISRJumpTableBaseAddress` feature is supported on the device
- false = The `ISRJumpTableBaseAddress` feature is not supported on the device

Remarks

None.

5.6.1.6.9.21 PLIB_ADC_ExistsMuxChannel0NegativeInput Function**C**

```
bool PLIB_ADC_ExistsMuxChannel0NegativeInput(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the `MuxChannel0NegativeInput` feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_MuxChannel0InputNegativeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The `MuxChannel0NegativeInput` feature is supported on the device
- false = The `MuxChannel0NegativeInput` feature is not supported on the device

Remarks

None.

5.6.1.6.9.22 PLIB_ADC_ExistsMuxChannel0PositiveInput Function**C**

```
bool PLIB_ADC_ExistsMuxChannel0PositiveInput(  
    ADC_MODULE_ID index
```

```
);
```

Description

This function identifies whether the MuxChannel0PositiveInput feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_MuxChannel0InputPositiveSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The MuxChannel0PositiveInput feature is supported on the device
- false = The MuxChannel0PositiveInput feature is not supported on the device

Remarks

None.

5.6.1.6.9.23 PLIB_ADC_ExistsMuxChannel123NegativeInput Function

C

```
bool PLIB_ADC_ExistsMuxChannel123NegativeInput(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the MuxChannel123NegativeInput feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_MuxChannel123InputNegativeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The MuxChannel123NegativeInput feature is supported on the device
- false = The MuxChannel123NegativeInput feature is not supported on the device

Remarks

None.

5.6.1.6.9.24 PLIB_ADC_ExistsMuxChannel123PositiveInput Function

C

```
bool PLIB_ADC_ExistsMuxChannel123PositiveInput(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the MuxChannel123PositiveInput feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_MuxChannel123InputPositiveSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The MuxChannel123PositiveInput feature is supported on the device
- false = The MuxChannel123PositiveInput feature is not supported on the device

Remarks

None.

5.6.1.6.9.25 PLIB_ADC_ExistsMuxInputScanControl Function**C**

```
bool PLIB_ADC_ExistsMuxInputScanControl(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the MuxInputScanControl feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_MuxAInputScanEnable](#)
- [PLIB_ADC_MuxAInputScanDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The MuxInputScanControl feature is supported on the device
- false = The MuxInputScanControl feature is not supported on the device

Remarks

None.

5.6.1.6.9.26 PLIB_ADC_ExistsMuxInputScanSelect Function**C**

```
bool PLIB_ADC_ExistsMuxInputScanSelect(  
    ADC_MODULE_ID index
```

```
);
```

Description

This function identifies whether the MuxInputScanSelect feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_InputScanMaskAdd](#)
- [PLIB_ADC_InputScanMaskRemove](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The MuxInputScanSelect feature is supported on the device
- false = The MuxInputScanSelect feature is not supported on the device

Remarks

None.

5.6.1.6.9.27 PLIB_ADC_ExistsPairConversionControl Function

C

```
bool PLIB_ADC_ExistsPairConversionControl(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the PairConversionControl feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_PairConversionStart](#)
- [PLIB_ADC_PairConversionIsPending](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The PairConversionControl feature is supported on the device
- false = The PairConversionControl feature is not supported on the device

Remarks

None.

5.6.1.6.9.28 PLIB_ADC_ExistsPairInterruptOnConversion Function

C

```
bool PLIB_ADC_ExistsPairInterruptOnConversion(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the PairInterruptOnConversion feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_PairInterruptAfterFirstConversion](#)
- [PLIB_ADC_PairInterruptAfterSecondConversion](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The PairInterruptOnConversion feature is supported on the device
- false = The PairInterruptOnConversion feature is not supported on the device

Remarks

None.

5.6.1.6.9.29 PLIB_ADC_ExistsPairInterruptRequest Function

C

```
bool PLIB_ADC_ExistsPairInterruptRequest(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the PairInterruptRequest feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_PairInterruptRequestEnable](#)
- [PLIB_ADC_PairInterruptRequestDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The PairInterruptRequest feature is supported on the device
- false = The PairInterruptRequest feature is not supported on the device

Remarks

None.

5.6.1.6.9.30 PLIB_ADC_ExistsPairSampleStatus Function**C**

```
bool PLIB_ADC_ExistsPairSampleStatus(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the PairSampleStatus feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_PairSampleStatusClear](#)
- [PLIB_ADC_PairSamplesAvailable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The PairSampleStatus feature is supported on the device
- false = The PairSampleStatus feature is not supported on the device

Remarks

None.

5.6.1.6.9.31 PLIB_ADC_ExistsPairTriggerSource Function**C**

```
bool PLIB_ADC_ExistsPairTriggerSource(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the PairTriggerSource feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_PairTriggerSourceSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The PairTriggerSource feature is supported on the device

- false = The PairTriggerSource feature is not supported on the device

Remarks

None.

5.6.1.6.9.32 PLIB_ADC_ExistsResultBufferFillStatus Function**C**

```
bool PLIB_ADC_ExistsResultBufferFillStatus(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the ResultBufferFillStatus feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_ResultBufferStatusGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The ResultBufferFillStatus feature is supported on the device
- false = The ResultBufferFillStatus feature is not supported on the device

Remarks

None.

5.6.1.6.9.33 PLIB_ADC_ExistsResultBufferMode Function**C**

```
bool PLIB_ADC_ExistsResultBufferMode(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the ResultBufferMode feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_ResultBufferModeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The ResultBufferMode feature is supported on the device
- false = The ResultBufferMode feature is not supported on the device

Remarks

None.

5.6.1.6.9.34 PLIB_ADC_ExistsResultFormat Function**C**

```
bool PLIB_ADC_ExistsResultFormat(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the ResultFormat feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_ResultFormatSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The ResultFormat feature is supported on the device
- false = The ResultFormat feature is not supported on the device

Remarks

None.

5.6.1.6.9.35 PLIB_ADC_ExistsResultGet Function**C**

```
bool PLIB_ADC_ExistsResultGet(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the ResultGet feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_ResultGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The ResultGet feature is supported on the device
- false = The ResultGet feature is not supported on the device

Remarks

None.

5.6.1.6.9.36 PLIB_ADC_ExistsResultGetByIndex Function**C**

```
bool PLIB_ADC_ExistsResultGetByIndex(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the ResultGetByIndex feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_ResultGetByIndex](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The ResultGetByIndex feature is supported on the device
- false = The ResultGetByIndex feature is not supported on the device

Remarks

None.

5.6.1.6.9.37 PLIB_ADC_ExistsResultSign Function**C**

```
bool PLIB_ADC_ExistsResultSign(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the ResultSign feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_ResultSignGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The ResultSign feature is supported on the device
- false = The ResultSign feature is not supported on the device

Remarks

None.

5.6.1.6.9.38 PLIB_ADC_ExistsResultSize Function**C**

```
bool PLIB_ADC_ExistsResultSize(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the ResultSize feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_ResultSizeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The ResultSize feature is supported on the device
- false = The ResultSize feature is not supported on the device

Remarks

None.

5.6.1.6.9.39 PLIB_ADC_ExistsSampleResolution Function**C**

```
bool PLIB_ADC_ExistsSampleResolution(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the SampleResolution feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_SampleMaxGet](#)
- [PLIB_ADC_SampleMinGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The SampleResolution feature is supported on the device

- false = The SampleResolution feature is not supported on the device

Remarks

None.

5.6.1.6.9.40 PLIB_ADC_ExistsSamplesPerInterruptSelect Function**C**

```
bool PLIB_ADC_ExistsSamplesPerInterruptSelect(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the SamplesPerInterruptSelect feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_SamplesPerInterruptSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The SamplesPerInterruptSelect feature is supported on the device
- false = The SamplesPerInterruptSelect feature is not supported on the device

Remarks

None.

5.6.1.6.9.41 PLIB_ADC_ExistsSamplingAcquisitionTime Function**C**

```
bool PLIB_ADC_ExistsSamplingAcquisitionTime(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the SamplingAcquisitionTime feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_SampleAcquisitionTimeSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The SamplingAcquisitionTime feature is supported on the device
- false = The SamplingAcquisitionTime feature is not supported on the device

Remarks

None.

5.6.1.6.9.42 PLIB_ADC_ExistsSamplingAutoStart Function**C**

```
bool PLIB_ADC_ExistsSamplingAutoStart(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the SamplingAutoStart feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_SampleAutoStartEnable](#)
- [PLIB_ADC_SampleAutoStartDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The SamplingAutoStart feature is supported on the device
- false = The SamplingAutoStart feature is not supported on the device

Remarks

None.

5.6.1.6.9.43 PLIB_ADC_ExistsSamplingControl Function**C**

```
bool PLIB_ADC_ExistsSamplingControl(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the SamplingControl feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_SamplingStart](#)
- [PLIB_ADC_SamplingStop](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The SamplingControl feature is supported on the device
- false = The SamplingControl feature is not supported on the device

Remarks

None.

5.6.1.6.9.44 PLIB_ADC_ExistsSamplingModeControl Function**C**

```
bool PLIB_ADC_ExistsSamplingModeControl(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the SamplingModeControl feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_SamplingModeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The SamplingModeControl feature is supported on the device
- false = The SamplingModeControl feature is not supported on the device

Remarks

None.

5.6.1.6.9.45 PLIB_ADC_ExistsSamplingStatus Function**C**

```
bool PLIB_ADC_ExistsSamplingStatus(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the SamplingStatus feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_SamplingIsActive](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The SamplingStatus feature is supported on the device
- false = The SamplingStatus feature is not supported on the device

Remarks

None.

5.6.1.6.9.46 PLIB_ADC_ExistsStopInIdleControl Function**C**

```
bool PLIB_ADC_ExistsStopInIdleControl(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the StopInIdle feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_StopInIdleEnable](#)
- [PLIB_ADC_StopInIdleDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The StopInIdle feature is supported on the device
- false = The StopInIdle feature is not supported on the device

Remarks

None.

5.6.1.6.9.47 PLIB_ADC_ExistsVoltageReference Function**C**

```
bool PLIB_ADC_ExistsVoltageReference(  
    ADC_MODULE_ID index  
);
```

Description

This function identifies whether the VoltageReference feature is available on the ADC module. When this function returns true, these functions are supported on the device:

- [PLIB_ADC_VoltageReferenceSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The VoltageReference feature is supported on the device
- false = The VoltageReference feature is not supported on the device

Remarks

None.

5.6.1.6.10 Mux Selection and Channel Scan

5.6.1.6.10.1 PLIB_ADC_MuxAInputScanDisable Function

C

```
void PLIB_ADC_MuxAInputScanDisable(  
    ADC_MODULE_ID index  
);
```

Description

This function disables scan input for CH0+ of MUX A.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsMuxInputScanControl](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the  
// application developer.  
PLIB_ADC_MuxAInputScanDisable(MY_ADC_INSTANCE);
```

5.6.1.6.10.2 PLIB_ADC_MuxAInputScanEnable Function

C

```
void PLIB_ADC_MuxAInputScanEnable(  
    ADC_MODULE_ID index  
);
```

Description

This function enables scan input for CH0+ of MUX A.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsMuxInputScanControl](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_MuxAInputScanEnable(MY_ADC_INSTANCE);
```

5.6.1.6.10.3 PLIB_ADC_MuxChannel0InputNegativeSelect Function**C**

```
void PLIB_ADC_MuxChannel0InputNegativeSelect(
    ADC_MODULE_ID index,
    ADC_MUX muxType,
    ADC_INPUTS_NEGATIVE input
);
```

Description

This function selects the negative input for channel 0 of MUX A or MUX B.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
muxType	One of the possible values from ADC_MUX

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsMuxChannel0NegativeInput](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the
// application developer.
PLIB_ADC_MuxChannel0InputNegativeSelect(MY_ADC_INSTANCE, ADC_MUX_A,
ADC_INPUT_NEGATIVE_VREF_MINUS);
```

5.6.1.6.10.4 PLIB_ADC_MuxChannel0InputPositiveSelect Function

C

```
void PLIB_ADC_MuxChannel0InputPositiveSelect(  
    ADC_MODULE_ID index,  
    ADC_MUX muxType,  
    ADC_INPUTS_POSITIVE input  
);
```

Description

This function selects the positive input for channel 0 of MUX A or MUX B.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
muxType	One of the possible values from ADC_MUX

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsMuxChannel0PositiveInput](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the  
// application developer.  
PLIB_ADC_MuxChannel0InputPositiveSelect(MY_ADC_INSTANCE, ADC_MUX_A, ADC_INPUT_POSITIVE_AN2);
```

5.6.1.6.10.5 PLIB_ADC_MuxChannel123InputNegativeSelect Function

C

```
void PLIB_ADC_MuxChannel123InputNegativeSelect(  
    ADC_MODULE_ID index,  
    ADC_MUX muxType,  
    ADC_CHANNEL123_INPUTS_NEG input  
);
```

Description

This function selects the negative input for channels 1, 2, and 3 of MUX A or MUX B.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
muxType	One of the possible values from ADC_MUX

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsMuxChannel123NegativeInput](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the  
// application developer.  
PLIB_ADC_MuxChannel123InputNegativeSelect(MY_ADC_INSTANCE, ADC_MUX_A,  
ADC_CHANNEL123_INPUT_NEG_CH123_VREF_MINUS);
```

5.6.1.6.10.6 PLIB_ADC_MuxChannel123InputPositiveSelect Function**C**

```
void PLIB_ADC_MuxChannel123InputPositiveSelect(  
    ADC_MODULE_ID index,  
    ADC_MUX muxType,  
    ADC_CHANNEL123_INPUTS_POS input  
);
```

Description

This function selects the positive input for channels 1, 2, and 3 of MUX A or MUX B.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
muxType	One of the possible values from ADC_MUX

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_ADC_ExistsMuxChannel123PositiveInput](#) in your application to determine whether this feature is available.

Example

```
// Where MY_ADC_INSTANCE, is the ADC instance selected for use by the  
// application developer.  
PLIB_ADC_MuxChannel123InputPositiveSelect(MY_ADC_INSTANCE, ADC_MUX_A,  
ADC_CHANNEL123_INPUT_POS_CH1_AN0_CH2_AN1_CH3_AN2);
```

5.6.1.7 Files**Files**

Name	Description
plib_adc.h	ADC PLIB interface header for definitions common to the ADC peripheral.

Description

5.6.1.7.1 plib_adc.h

ADC Peripheral Library Interface Header

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the ADC PLIB for all families of Microchip microcontrollers. The definitions in this file are common to the ADC peripheral.

Functions

	Name	Description
≡	<u>PLIB_ADC_AsynchronousDedicatedSamplingDisable</u>	Disables asynchronous dedicated S&H sampling.
≡	<u>PLIB_ADC_AsynchronousDedicatedSamplingEnable</u>	Enables asynchronous dedicated S&H sampling.
≡	<u>PLIB_ADC_CalibrationDisable</u>	Normal ADC module operation (no calibration is performed).
≡	<u>PLIB_ADC_CalibrationEnable</u>	Calibration is performed on the next ADC conversion.
≡	<u>PLIB_ADC_ChannelGroupSelect</u>	Selects channels to be utilized.
≡	<u>PLIB_ADC_ConversionClockGet</u>	Obtains the conversion clock.
≡	<u>PLIB_ADC_ConversionClockSet</u>	Sets the ADC module conversion clock.
≡	<u>PLIB_ADC_ConversionClockSourceSelect</u>	Selects the ADC module conversion clock source.
≡	<u>PLIB_ADC_ConversionHasCompleted</u>	Provides the conversion completion status of the ADC.
≡	<u>PLIB_ADC_ConversionOrderSelect</u>	Selects the conversion order.
≡	<u>PLIB_ADC_ConversionStart</u>	Starts ADC module manual conversion process.
≡	<u>PLIB_ADC_ConversionStopSequenceDisable</u>	Normal conversion sequence.
≡	<u>PLIB_ADC_ConversionStopSequenceEnable</u>	Stop conversion sequence (when the first ADC module interrupt is generated).
≡	<u>PLIB_ADC_ConversionTriggerGroupSelect</u>	Selects the conversion trigger source group.
≡	<u>PLIB_ADC_ConversionTriggerSourceSelect</u>	Selects the conversion trigger source.
≡	<u>PLIB_ADC_Disable</u>	ADC module is disabled (turned OFF).
≡	<u>PLIB_ADC_DMAAddressIncrementSelect</u>	Selects the increment rate for the DMA address.
≡	<u>PLIB_ADC_DMABufferModeSelect</u>	DMA Buffer Build mode.
≡	<u>PLIB_ADC_DMADisable</u>	Disables the ADC Direct Memory Access (DMA).
≡	<u>PLIB_ADC_DMAEnable</u>	Enables the ADC Direct Memory Access (DMA).
≡	<u>PLIB_ADC_DMAInputBufferSelect</u>	Selects the number of DMA buffer locations per analog input.
≡	<u>PLIB_ADC_Enable</u>	ADC module is enabled (turned ON).
≡	<u>PLIB_ADC_ExistsAsynchronousDedicatedSampling</u>	Identifies whether the AsynchronousDedicatedSampling feature exists on the ADC module
≡	<u>PLIB_ADC_ExistsCalibrationControl</u>	Identifies whether the CalibrationControl feature exists on the ADC module
≡	<u>PLIB_ADC_ExistsChannelGroup</u>	Identifies whether the ChannelGroup feature exists on the ADC module
≡	<u>PLIB_ADC_ExistsConversionClock</u>	Identifies whether the ConversionClock feature exists on the ADC module
≡	<u>PLIB_ADC_ExistsConversionClockSource</u>	Identifies whether the ConversionClockSource feature exists on the ADC module
≡	<u>PLIB_ADC_ExistsConversionControl</u>	Identifies whether the ConversionControl feature exists on the ADC module
≡	<u>PLIB_ADC_ExistsConversionOrder</u>	Identifies whether the ConversionOrder feature exists on the ADC module
≡	<u>PLIB_ADC_ExistsConversionStatus</u>	Identifies whether the ConversionStatus feature exists on the ADC module

	PLIB_ADC_ExistsConversionStopSequenceControl	Identifies whether the ConversionStopSequenceControl feature exists on the ADC module
	PLIB_ADC_ExistsConversionTriggerGroup	Identifies whether the ConversionTriggerGroup feature exists on the ADC module
	PLIB_ADC_ExistsConversionTriggerSource	Identifies whether the ConversionTriggerSource feature exists on the ADC module
	PLIB_ADC_ExistsDMAAddressIncrement	Identifies whether the DMAAddressIncrement feature exists on the ADC module
	PLIB_ADC_ExistsDMABufferMode	Identifies whether the DMABufferMode feature exists on the ADC module
	PLIB_ADC_ExistsDMABuffersPerAnalogInput	Identifies whether the DMABuffersPerInput feature exists on the ADC module
	PLIB_ADC_ExistsDMAControl	Identifies whether the DMAControl feature exists on the ADC module
	PLIB_ADC_ExistsEnableControl	Identifies whether the EnableControl feature exists on the ADC module.
	PLIB_ADC_ExistsGlobalSoftwareTrigger	Identifies whether the GlobalSoftwareTrigger feature exists on the ADC module
	PLIB_ADC_ExistsInputSelect	Identifies whether the InputSelect feature exists on the ADC module
	PLIB_ADC_ExistsInternalReferenceChannelControl	Identifies whether the InternalReferenceChannelControl feature exists on the ADC module
	PLIB_ADC_ExistsISRJumpTableBaseAddress	Identifies whether the ISRJumpTableBaseAddress feature exists on the ADC module
	PLIB_ADC_ExistsMuxChannel0NegativeInput	Identifies whether the MuxChannel0NegativeInput feature exists on the ADC module
	PLIB_ADC_ExistsMuxChannel0PositiveInput	Identifies whether the MuxChannel0PositiveInput feature exists on the ADC module
	PLIB_ADC_ExistsMuxChannel123NegativeInput	Identifies whether the MuxChannel123NegativeInput feature exists on the ADC module
	PLIB_ADC_ExistsMuxChannel123PositiveInput	Identifies whether the MuxChannel123PositiveInput feature exists on the ADC module
	PLIB_ADC_ExistsMuxInputScanControl	Identifies whether the MuxInputScanControl feature exists on the ADC module
	PLIB_ADC_ExistsMuxInputScanSelect	Identifies whether the MuxInputScanSelect feature exists on the ADC module
	PLIB_ADC_ExistsPairConversionControl	Identifies whether the PairConversionControl feature exists on the ADC module
	PLIB_ADC_ExistsPairInterruptOnConversion	Identifies whether the PairInterruptOnConversion feature exists on the ADC module
	PLIB_ADC_ExistsPairInterruptRequest	Identifies whether the PairInterruptRequest feature exists on the ADC module
	PLIB_ADC_ExistsPairSampleStatus	Identifies whether the PairSampleStatus feature exists on the ADC module
	PLIB_ADC_ExistsPairTriggerSource	Identifies whether the PairTriggerSource feature exists on the ADC module
	PLIB_ADC_ExistsResultBufferFillStatus	Identifies whether the ResultBufferFillStatus feature exists on the ADC module
	PLIB_ADC_ExistsResultBufferMode	Identifies whether the ResultBufferMode feature exists on the ADC module
	PLIB_ADC_ExistsResultFormat	Identifies whether the ResultFormat feature exists on the ADC module

	PLIB_ADC_ExistsResultGet	Identifies whether the ResultGet feature exists on the ADC module
	PLIB_ADC_ExistsResultGetByIndex	Identifies whether the ResultGetByIndex feature exists on the ADC module
	PLIB_ADC_ExistsResultSign	Identifies whether the ResultSign feature exists on the ADC module
	PLIB_ADC_ExistsResultSize	Identifies whether the ResultSize feature exists on the ADC module
	PLIB_ADC_ExistsSampleResolution	Identifies whether the SampleResolution feature exists on the ADC module
	PLIB_ADC_ExistsSamplesPerInterruptSelect	Identifies whether the SamplesPerInterruptSelect feature exists on the ADC module
	PLIB_ADC_ExistsSamplingAcquisitionTime	Identifies whether the SamplingAcquisitionTime feature exists on the ADC module
	PLIB_ADC_ExistsSamplingAutoStart	Identifies whether the SamplingAutoStart feature exists on the ADC module
	PLIB_ADC_ExistsSamplingControl	Identifies whether the SamplingControl feature exists on the ADC module
	PLIB_ADC_ExistsSamplingModeControl	Identifies whether the SamplingModeControl feature exists on the ADC module
	PLIB_ADC_ExistsSamplingStatus	Identifies whether the SamplingStatus feature exists on the ADC module
	PLIB_ADC_ExistsStopInIdleControl	Identifies whether the StopInIdle feature exists on the ADC module
	PLIB_ADC_ExistsVoltageReference	Identifies whether the VoltageReference feature exists on the ADC module
	PLIB_ADC_GlobalSoftwareTriggerSet	Global software trigger enable/set control.
	PLIB_ADC_InputScanMaskAdd	Select ADC analog channel for input scan.
	PLIB_ADC_InputScanMaskRemove	Omits ADC analog channel for input scan.
	PLIB_ADC_InputSelectNegative	Analog negative channel selection.
	PLIB_ADC_InputSelectPositive	Positive analog input channel selection.
	PLIB_ADC_InternalReferenceChannelDisable	Internal reference input is disabled.
	PLIB_ADC_InternalReferenceChannelEnable	Internal reference input is enabled.
	PLIB_ADC_IsrJumpTableBaseAddressGet	Gets the base address of the user's ADC Interrupt Service Routine (ISR) jump table.
	PLIB_ADC_IsrJumpTableBaseAddressSet	Sets the base address of the user's ADC Interrupt Service Routine (ISR) jump table.
	PLIB_ADC_MuxAInputScanDisable	Do not scan input selections for CH0+ of MUX A.
	PLIB_ADC_MuxAInputScanEnable	Scan input selections for CH0+ of MUX A.
	PLIB_ADC_MuxChannel0InputNegativeSelect	Channel 0 negative input select for multiplexer setting.
	PLIB_ADC_MuxChannel0InputPositiveSelect	Channel 0 positive input select for multiplexer setting.
	PLIB_ADC_MuxChannel123InputNegativeSelect	Channel 1, 2, and 3 negative input select.
	PLIB_ADC_MuxChannel123InputPositiveSelect	Channel 1, 2, and 3 positive input select.
	PLIB_ADC_PairConversionIsPending	Informs whether conversion is pending or complete.
	PLIB_ADC_PairConversionStart	Start conversion of the requested ADC pair.
	PLIB_ADC_PairInterruptAfterFirstConversion	ADC pair conversion interrupt is generated after the first conversion.
	PLIB_ADC_PairInterruptAfterSecondConversion	ADC pair conversion interrupt is generated after the second conversion.

	PLIB_ADC_PairInterruptRequestDisable	Disable IRQ generation for the ADC pair.
	PLIB_ADC_PairInterruptRequestEnable	Enable IRQ generation for the ADC pair.
	PLIB_ADC_PairSamplesAvailable	Provides status of the ADC pair sample availability in the buffer.
	PLIB_ADC_PairSampleStatusClear	Clears the ADC pair ready status flag.
	PLIB_ADC_PairTriggerSourceSelect	Selects trigger source for the requested ADC pair.
	PLIB_ADC_ResultBufferModeSelect	Selects the result buffer mode.
	PLIB_ADC_ResultBufferStatusGet	Provides the buffer fill status.
	PLIB_ADC_ResultFormatSelect	Selects the result format.
	PLIB_ADC_ResultGet	Obtains the ADC sample/result value.
	PLIB_ADC_ResultGetByIndex	Provides the ADC conversion result based on the buffer index.
	PLIB_ADC_ResultSignGet	Obtains the ADC result sign.
	PLIB_ADC_ResultSizeSelect	Selects the ADC module mode/result size.
	PLIB_ADC_SampleAcquisitionTimeSet	Sets the ADC acquisition/auto-sample time in TADs.
	PLIB_ADC_SampleAutoStartDisable	Sampling auto-start is disabled.
	PLIB_ADC_SampleAutoStartEnable	Sampling auto-start is enabled.
	PLIB_ADC_SampleMaxGet	Provides the maximum sample value.
	PLIB_ADC_SampleMinGet	Provides the minimum sample value.
	PLIB_ADC_SamplesPerInterruptSelect	Interrupts at the completion of conversion for each nth sample.
	PLIB_ADC_SamplingIsActive	Provides the ADC sampling status.
	PLIB_ADC_SamplingModeSelect	Enable the selected sampling mode.
	PLIB_ADC_SamplingStart	Sampling is enabled.
	PLIB_ADC_SamplingStop	Holding is enabled.
	PLIB_ADC_StopInIdleDisable	Continue ADC module operation when the device is in Idle mode.
	PLIB_ADC_StopInIdleEnable	Discontinue ADC module operation when device enters Idle mode.
	PLIB_ADC_VoltageReferenceSelect	Voltage reference configuration.

Types

	Name	Description
	ADC_ACQUISITION_TIME	Data type defining the different ADC acquisition times by which the ADC can be configured.
	ADC_CONVERSION_CLOCK	Data type defines the different ADC Conversion clock
	ADC_SAMPLE	Data type defining the size of the adc sample register.

5.6.2 ADCP Peripheral Library

This topic describes the Pipelined Analog-to-Digital Converter peripheral library interface.

Description

This section contains the list of topics.

5.6.2.1 Introduction

Pipelined Analog-to-Digital Converter Peripheral Library for Microchip Microcontrollers

This library provides a low-level abstraction of the Pipelined Analog-to-Digital Converter (ADCP) Peripheral Library that is available on the Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, thereby hiding differences from one microcontroller variant to another.

Description

The Pipelined Analog-to-Digital Converter (ADCP) peripheral is used to convert an analog input into a digital number that represents that input voltage. When the input is periodically converted, the result is a sequence of digital values that have converted a continuous-time and continuous-amplitude analog signal to a discrete-time and discrete-amplitude digital signal. This particular ADC architecture is pipelined allowing it to simultaneously convert up to 6 samples, each at a different stage of conversion resulting in a low overall latency of multiple sampled inputs.

The structure of the ADCP is shown in the diagram below.

1. Analog input pins [connect](#) to the sample and hold (S&H) circuits. These circuits capture the analog signal so that it can be passed to the pipeline converter.
2. The S&H circuits are controlled by predefined trigger sources. These trigger sources switch the sample and hold circuit to hold and queue the conversion of the sample.
3. Channel scan is available which allows a single trigger to start a sample/conversion sequence of multiple analog inputs using a predefined scan list.
4. A conversion clock is required for the pipeline converter. This clock determines the conversion speed and latency and effects power consumption.
5. A voltage reference is required for the pipeline converter. This voltage reference determines allowable input range of the analog signal.
6. Result registers store the conversion results and can be read by the software application. Software is notified of ready results by either polling or through the use of interrupts.
7. Optional Oversampling Digital Filters can be used to provide increased measurement accuracy at the sacrifice of sample rate. Software is notified of ready oversampling results by either polling or through the use of interrupts.
8. Optional digital comparators can be used to test conversion results independent of software and generate interrupts based on predefined conditions.

5.6.2.2 Release Notes

MPLAB Harmony Version: v0.70b ADCP Peripheral Library Version : 0.70b Release Date: 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.6.2.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.6.2.4 Using the Library

This topic describes the basic architecture of the Pipelined Analog-to-Digital Converter (ADCP) Peripheral Library and provides information and examples on how to use it.

Interface Header File: `plib_adc.h`

The interface to the ADCP Peripheral library is defined in the "[plib_adcp.h](#)" header file. This file is included by the "peripheral.h" file. Any C language source (.c) file that uses the Pipelined Analog to Digital Converter (ADCP) Peripheral library should include "peripheral.h".

Library File:

The ADCP Peripheral library archive (.a) file installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the Peripheral interacts with the framework.

5.6.2.4.1 Hardware Abstraction Model

The interface provided is a super set of all the functionality of the available Pipelined Analog-to-Digital Converter (ADCP) on the device. Refer to the specific device data sheet or related family reference manual section to determine the set of functions that are supported for each ADCP module on the device.

This library provides the low-level abstraction of the ADCP module on the Microchip family of microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in the software and introduces the library interface.

Description

Pipelined Analog-to-Digital Converter (ADCP) Software Abstraction Block Diagram

5.6.2.4.2 Library Overview

The library interface routines are divided into various sub-sections, each of sub-section addresses one of the blocks or the overall operation of the ADCP module.

Library Interface Section	Description
Interface Routines - Configuration	These library functions are used to configure the ADC, enable and disable it, initiate a calibration and manage low power states.
Interface Routines - Status	These library functions return status information related to the ADC.
Interface Routines - Input Selection	These library functions select and configure the ANx inputs to the ADC.
Interface Routines - Channel Scan	These library functions are used to configure the channel scan feature.
Interface Routines - Triggering	These library functions are used to configure and initiate conversion triggers.
Interface Routines - Analog Input Conversion Results	These library function are used to retrieve individual conversion results for ANx pins.
Interface Routines - Digital Comparator	These library functions are used to configure and query the digital comparators.
Interface Routines - Oversampling Digital Filter	These library functions are used to configure the Oversampling Digital Filter and fetch results from it.

5.6.2.4.3 How the Library Works

Core Functionality

Name	Description
Example - Simultaneous Sampling Three Class 1 Inputs	Simultaneous sampling is used when the application requires capture of more than one signal at the same instance of time. Simultaneous sampling requires the use of multiple Class 1 inputs where each is assigned the same trigger source. The following example illustrates simultaneous sampling of AN0, AN1 and AN2 using the global software trigger as the trigger source. The dedicated sample and holds (S&Hs) are configured for single-ended input and a unipolar (unsigned) output. No interrupts are used so the results are polled for ready status.
Example - Channel Scanning	Channel scanning is used in applications where precise timing of the sample to an external source is not needed. Channel scanning allows a large number of analog inputs to be sampled and converted in sequence each time a single trigger occurs. The following example illustrates how to configure channel scanning of multiple Class 2 and Class 3 inputs using the shared S&H. This example uses inputs AN5, AN11 - AN14. AN5 and AN11 are Class 2 inputs. AN13 and AN 14 are Class 3 inputs. The global software trigger is used to initiate the scan. A 4 TAD sample time... more

Other Functionality

Name	Description
Example - Digital Oversampling Filter	The Digital Oversampling filter can be used to increase resolution of the conversion result at the expense of throughput. The example below shows how two extra bits of resolution can be obtained using 16X oversampling (sixteen samples are used to create one higher resolution result). AN0 is used for the input. The sampling time for the retriggers is set to 3.5 TAD. Example:
Example - Digital Comparator	The Digital Comparator is used to automatically evaluate results as they are output by the converter. The following example illustrates an automated test of AN5 for values $\geq 80\%$ of full scale or $< 20\%$ of full scale. A count is incremented each time an event occurs. Example:

Description

Note: Not all modes are available on all devices. Please refer to the specific device data sheet to determine the supported modes.

5.6.2.4.3.1 Core Functionality**5.6.2.4.3.1.1 Example - Simultaneous Sampling Three Class 1 Inputs**

Simultaneous sampling is used when the application requires capture of more than one signal at the same instance of time. Simultaneous sampling requires the use of multiple Class 1 inputs where each is assigned the same trigger source. The following example illustrates simultaneous sampling of AN0, AN1 and AN2 using the global software trigger as the trigger source. The dedicated sample and holds (S&Hs) are configured for single-ended input and a unipolar (unsigned) output. No interrupts are used so the results are polled for ready status.

Example:

```
int32_t results[3] ; // storage for results

// This structure is used to simplify testing for a ready channel
AN_READY anReady ;

// Configure the ADC
// AVdd/AVss reference, ADC clock is system clock (SYSCLK) divided by 8
// No need to specify sample time for class 2/3 inputs or oversampling
// sample time as Class 2/3 inputs and oversampling is not used.
PLIB_ADCP_Configure ( ADCP_ID_1 ,
                      ADCP_VREF_AVDD_AVSS , // AVdd and AVss as reference
                      FALSE ,                // No VREF boost
                      FALSE ,                // Do not use fractional format
                      FALSE ,                // Do not stop in idle
                      ADCP_CLK_SRC_SYSCLK , // SYSCLK is the clock source
                      4 ,                    // TAD = 1/SYSCLK * 2 * 4
                                              // or ADC Clock = SYSCLK / (2 * 4)
                      0 ,                    // Oversampling is not used.
                      0 ,                    // No early interrupt.
                      0 );                  // No class 2 or 3 channels are used

// Set up the triggers
// Configure AN0 for triggering from software.
PLIB_ADCP_Class12TriggerConfigure ( ADCP_ID_1 ,
                                    ADCP_CLASS12_AN0 ,
                                    ADCP_TRG_SRC_SOFTWARE ) ;

// Configure AN1 for triggering from software.
PLIB_ADCP_Class12TriggerConfigure ( ADCP_ID_1 ,
                                    ADCP_CLASS12_AN1 ,
                                    ADCP_TRG_SRC_SOFTWARE ) ;

// Configure AN2 for triggering from software.
PLIB_ADCP_Class12TriggerConfigure ( ADCP_ID_1 ,
                                    ADCP_CLASS12_AN2 ,
                                    ADCP_TRG_SRC_SOFTWARE ) ;

// Set S&H modes
PLIB_ADCP_SHModeSelect ( ADCP_ID_1 , ADCP_SH0 , ADCP_SH_MODE_SINGLE_ENDED_UNIPOLAR ) ;
PLIB_ADCP_SHModeSelect ( ADCP_ID_1 , ADCP_SH1 , ADCP_SH_MODE_SINGLE_ENDED_UNIPOLAR ) ;
PLIB_ADCP_SHModeSelect ( ADCP_ID_1 , ADCP_SH2 , ADCP_SH_MODE_SINGLE_ENDED_UNIPOLAR ) ;
// Enable the ADC Module
PLIB_ADCP_Enable ( ADCP_ID_1 ) ;

// Wait for a ready status
while ( !PLIB_ADCP_ModuleIsReady ( ADCP_ID_1 ) ) ;

while ( 1 )
```

```

{
    // Initiate a trigger
    PLIB_ADCP_GlobalSoftwareTrigger ( ADCP_ID_1 ) ;

    // Wait for a data results to be ready
    // if lowest priority channel is done then all are done.
    do
    {
        anReady = PLIB_ADCP_ResultReady ( ADCP_ID_1 ) ;
    }
    while (anReady.AN2 == 0) ;

    // fetch AN0
    if (anReady.AN0 == 1)
        results[0] = PLIB_ADCP_ResultGet ( ADCP_ID_1 , ADCP_AN0 ) ;

    // fetch AN1
    if (anReady.AN1 == 1)
        results[1] = PLIB_ADCP_ResultGet ( ADCP_ID_1 , ADCP_AN1 ) ;

    // fetch AN2
    if (anReady.AN2 == 1)
        results[2] = PLIB_ADCP_ResultGet ( ADCP_ID_1 , ADCP_AN2 ) ;
}

```

5.6.2.4.3.1.2 Example - Channel Scanning

Channel scanning is used in applications where precise timing of the sample to an external source is not needed. Channel scanning allows a large number of analog inputs to be sampled and converted in sequence each time a single trigger occurs. The following example illustrates how to configure channel scanning of multiple Class 2 and Class 3 inputs using the shared S&H. This example uses inputs AN5, AN11 - AN14. AN5 and AN11 are Class 2 inputs. AN13 and AN 14 are Class 3 inputs. The global software trigger is used to initiate the scan. A 4 TAD sample time is specified for the shared S&H. The shared S&H is configured for single-ended operation and a unipolar output. No interrupts are used so the results are polled for ready status.

Example:

```

int32_t results[5] ; // storage for results

// This structure is used to simplify testing of the ready status
AN_READY anReady ;

// This structure is used to simplify specifying channels for scan
// AN5, AN11, AN12, AN13 and AN14 are selected for scanning.
AN_SELECT anSelect ;
anSelect.highWord = 0 ;
anSelect.lowWord = 0 ;
anSelect.AN5 = 1 ;
anSelect.AN11 = 1 ;
anSelect.AN12 = 1 ;
anSelect.AN13 = 1 ;
anSelect.AN14 = 1 ;

// Configure the ADC
// AVdd/AVss reference, ADC clock is system clock (SYSCLK) divided by 8
// The sample for the shared S&H must be adequate for all inputs.
// In this example it is set to 4 TAD.
// No need to specify sample time for oversampling as it is not used.
PLIB_ADCP_Configure ( ADCP_ID_1 ,
    ADCP_VREF_AVDD_AVSS , // AVdd and AVss as reference
    FALSE ,               // No VREF boost
    FALSE ,               // Do not use fractional format
    FALSE ,               // Do not stop in idle
    ADCP_CLK_SRC_SYSCLK , // SYSCLK is the clock source
    4 ,                   // TAD = 1/SYSCLK * 2 * 4
                        // or ADC Clock = SYSCLK / (2 * 4)

```

```

        0 ,           // Oversampling is not used.
        0 ,           // No early interrupt.
        3 ) ;         // 3 + 1 = 4 TAD for Class 2 and 3
                        // Sample Time.
// Specify the inputs to include in the Channel Scan using the selections made when
// initializing anSelect. Use the software trigger to initiate the scan.
PLIB_ADCP_ChannelScanConfigure ( ADCP_ID_1 ,
                                anSelect.lowWord , anSelect.highWord ,
                                ADCP_SCAN_TRG_SRC_SOFTWARE ) ;

// Set S&H 5 (shared S&H) to use the single ended, unipolar mode
PLIB_ADCP_SHModeSelect ( ADCP_ID_1 , ADCP_SH5 , ADCP_SH_MODE_SINGLE_ENDED_UNIPOLAR ) ;

// Enable the ADC Module
PLIB_ADCP_Enable ( ADCP_ID_1 ) ;

// Wait for a ready status
while ( !PLIB_ADCP_ModuleIsReady ( ADCP_ID_1 ) ) ;

while (1)
{
    // Initiate a trigger
    PLIB_ADCP_GlobalSoftwareTrigger ( ADCP_ID_1 ) ;

    // Wait for a data results to be ready
    // if lowest priority channel is done then all are done.
    do
    {
        anReady = PLIB_ADCP_ResultReady ( ADCP_ID_1 ) ;
    }
    while (anReady.AN14 == 0) ;

    // fetch AN5
    if (anReady.AN5 == 1)
        results[0] = PLIB_ADCP_ResultGet ( ADCP_ID_1 , ADCP_AN5 ) ;

    // fetch AN11
    if (anReady.AN11 == 1)
        results[1] = PLIB_ADCP_ResultGet ( ADCP_ID_1 , ADCP_AN11 ) ;

    // fetch AN12
    if (anReady.AN12 == 1)
        results[2] = PLIB_ADCP_ResultGet ( ADCP_ID_1 , ADCP_AN12 ) ;

    // fetch AN13
    if (anReady.AN13 == 1)
        results[3] = PLIB_ADCP_ResultGet ( ADCP_ID_1 , ADCP_AN13 ) ;

    // fetch AN14
    if (anReady.AN14 == 1)
        results[4] = PLIB_ADCP_ResultGet ( ADCP_ID_1 , ADCP_AN14 ) ;
}

```

5.6.2.4.3.2 Other Functionality

5.6.2.4.3.2.1 Example - Digital Oversampling Filter

The Digital Oversampling filter can be used to increase resolution of the conversion result at the expense of throughput. The example below shows how two extra bits of resolution can be obtained using 16X oversampling (sixteen samples are used to create one higher resolution result). AN0 is used for the input. The sampling time for the retriggers is set to 3.5 TAD.

Example:

```
int32_t result; // storage for result
```

```

// Configure the ADC
// AVdd/AVss reference, ADC clock is system clock (SYSCLK) divided by 8
// No need to specify sample time for Class 2/3 inputs as they are not used.
// Oversampling sample time is set to 3.5 TAD.
PLIB_ADCP_Configure(ADCP_ID_1,
                    ADCP_VREF_AVDD_AVSS, // AVdd and AVss as reference
                    FALSE,                // No VREF boost
                    FALSE,                // Do not use fractional format
                    FALSE,                // Do not stop in idle
                    ADCP_CLK_SRC_SYSCLK,  // SYSCLK is the clock source
                    4,                    // TAD = 1/SYSCLK * 2 * 4
                    2,                    // or ADC Clock = SYSCLK / (2 * 4)
                    0,                    // 2 + 1.5 = 3.5 TAD between
                    0,                    // oversampling triggers
                    0);                  // No early interrupt.
// No Class 2 and 3 are used.

// Set up the triggers
// Configure AN0 for triggering from software.
PLIB_ADCP_Class12TriggerConfigure(ADCP_ID_1, ADCP_CLASS12_AN0, ADCP_TRG_SRC_SOFTWARE);

// Set S&H modes
// Set S&H 0 to use the single ended, unipolar mode
PLIB_ADCP_SHModeSelect(ADCP_ID_1, ADCP_SH0, ADCP_SH_MODE_SINGLE_ENDED_UNIPOLAR);

// Configure the Oversampling Filter
PLIB_ADCP_OsampDigFilterConfig(ADCP_ID_1,          // ADCP module ID
                               ADCP_ODFLTR1,        // Filter ID
                               ADCP_AN0,            // Oversample AN0
                               ADCP_ODFLTR_16X,     // 16 x oversampling
                               FALSE);              // No Global Int Enable

// Enable ODFLTR0
PLIB_ADCP_OsampDigFilterEnable(ADCP_ID_1, ADCP_ODFLTR1);

// Enable the ADC Module
PLIB_ADCP_Enable(ADCP_ID_1);

// Wait for a ready status
while (!PLIB_ADCP_ModuleIsReady(ADCP_ID_1));

while (1) {
    // Initiate a trigger
    PLIB_ADCP_GlobalSoftwareTrigger(ADCP_ID_1);

    // Wait for data to be ready
    while (PLIB_ADCP_OsampDigFilterDataRdy(ADCP_ID_1, ADCP_ODFLTR1) == FALSE);

    // get the result
    result = PLIB_ADCP_OsampDigFilterDataGet(ADCP_ID_1, ADCP_ODFLTR1);
}

```

5.6.2.4.3.2.2 Example - Digital Comparator

The Digital Comparator is used to automatically evaluate results as they are output by the converter. The following example illustrates an automated

test of AN5 for values $\geq 80\%$ of full scale or $< 20\%$ of full scale. A count is incremented each time an event occurs.

Example:

```

int32_t result; // storage for result
int32_t count = 0;

```

```

/* This structure is used to simplify testing for a ready channel */
AN_READY anReady;

// Configure the ADC
// AVdd/AVss reference, ADC clock is system clock (SYSCLK) divided by 8
// The sample for the shared S&H must be adequate for all inputs.
// In this example it is set to 4 TAD.
// No need to specify sample time for oversampling as it is not used.
PLIB_ADCP_Configure(ADCP_ID_1,
                    ADCP_VREF_AVDD_AVSS, // AVdd and AVss as reference
                    FALSE, // No VREF boost
                    FALSE, // Do not use fractional format
                    FALSE, // Do not stop in idle
                    ADCP_CLK_SRC_SYSCLK, // SYSCLK is the clock source
                    4, // TAD = 1/SYSCLK * 2 * 4 or
                    // ADC Clock = SYSCLK / (2 * 4)
                    0, // no oversampling
                    0, // No early interrupt.
                    3); // 3 + 1 = 4 TAD for Class 2 and 3 Sample Time.

// Set up the triggers
// Configure AN5 for triggering from software.
PLIB_ADCP_Class12TriggerConfigure(ADCP_ID_1, ADCP_CLASS12_AN5, ADCP_TRG_SRC_SOFTWARE);

// Set S&H modes
// Set S&H 5 to use the single ended, unipolar mode
PLIB_ADCP_SHModeSelect(ADCP_ID_1, ADCP_SH5, ADCP_SH_MODE_SINGLE_ENDED_UNIPOLAR);

// Configure the Digital Comparator
// Creates an event when the reading of AN5 is less than 20% or
// greater than or equal to 80% of the full scale 12-bit output.
PLIB_ADCP_DigCmpConfig(ADCP_ID_1, // ADCP module ID
                       ADCP_DCMP1, // Comparator ID
                       FALSE, // No Global Int Enable
                       FALSE, // no test for between low and high
                       TRUE, // test for greater than or equal to high
                       FALSE, // no test for less than high
                       FALSE, // no test for greater than or equal to low
                       TRUE, // test for less than low
                       1 << 5, // enable AN5 for comparison
                       0xFFF - (0xFFF / 5), // high limit is 80% of full scale
                       0xFFF / 5); // low limit is 20% of full scale

// Enable DigCmp1
PLIB_ADCP_DigCmpEnable(ADCP_ID_1, ADCP_DCMP1);

// Enable the ADC Module
PLIB_ADCP_Enable(ADCP_ID_1);

// Wait for a ready status
while (!PLIB_ADCP_ModuleIsReady(ADCP_ID_1));

while (1) {
    // Initiate a trigger
    PLIB_ADCP_GlobalSoftwareTrigger(ADCP_ID_1);

    // wait for conversion to complete
    do {
        anReady = PLIB_ADCP_ResultReady(ADCP_ID_1);
    } while (anReady.AN5 == 0);

    // Check result and increment count if an out of range event
    // occurred on digital comparator 1 for AN5
    if (PLIB_ADCP_DigCmpAidGet(ADCP_ID_1, ADCP_DCMP1) == 5) {
        count++;
    }
}

```

```

    }
}

```

5.6.2.4.4 Configuring the Library

The library is configured for the supported processor when the processor is chosen in the MPLAB IDE.

5.6.2.5 Library Interface

Data Types

	Name	Description
	ADCP_MODULE_ID	Identifies the number of ADC Modules Supported.
	ADCP_VREF_SOURCE	Data type defines the ADCP VREF Source Select
	ADCP_CLOCK_SOURCE	Data type defines the ADCP Clock Source Select
	ADCP_CLASS12_INPUT_ID	Type for identifying the Class 1 and Class 2 ADC Inputs
	ADCP_SH_ID	Identifies the S&Hs supported regardless of type.
	ADCP_DSH_ID	Identifies the Dedicated S&Hs supported
	ADCP_SH_MODE	Data type defines the available modes for the S&H
	ADCP_INPUT_ID	Type for identifying the available ADC Inputs
	ADCP_DCMP_ID	Identifies the Digital Comparators supported.
	ADCP_ODFLTR_ID	Identifies the Oversampling Digital Filter supported.
	ADCP_ODFLTR_OSR	Identifies the Oversampling Digital Filter oversampling ratios supported.
	ADCP_SCAN_TRG_SRC	Data type defines the ADCP Channel Scan Trigger Source Selections
	ADCP_TRG_SRC	Data type defines the ADCP Trigger Source Selections
	AN_SELECT	This union of structures is provided to simply selection of analog inputs for inclusion in a particular function.
	AN_READY	This union (identical to the AN_SELECT union) is used as the return value by the <code>PLIB_ADCP_Result_Ready()</code> function.

Interface Routines - Channel Scan

	Name	Description
	PLIB_ADCP_ChannelScanConfigure	Selects input to include in Channel Scan Mode
	PLIB_ADCP_ExistsChannelScan	Identifies whether the ChannelScan feature exists on the ADCP module

Interface Routines - Configuration

	Name	Description
	PLIB_ADCP_Configure	Configures the Pipelined ADC converter including the ADC calibration registers.
	PLIB_ADCP_Enable	Enables the Pipelined ADC module
	PLIB_ADCP_Disable	Pipelined ADC module is disabled (turned OFF).
	PLIB_ADCP_CalibrationStart	Initiates Pipelined ADC Calibration.
	PLIB_ADCP_LowPowerStateEnter	Places the Pipelined ADC module in a low power state.
	PLIB_ADCP_LowPowerStateExit	Takes the Pipelined ADC module out of low power state and puts it into an operational mode.
	PLIB_ADCP_LowPowerStateGet	Returns the state of the low power setting.
	PLIB_ADCP_ExistsCalibration	Identifies whether the Calibration feature exists on the ADCP module
	PLIB_ADCP_ExistsEnableControl	Identifies whether the EnableControl feature exists on the ADCP module

	PLIB_ADCP_ExistsLowPowerControl	Identifies whether the LowPowerControl feature exists on the ADCP module
	PLIB_ADCP_ExistsConfiguration	Identifies whether the Configuration feature exists on the ADCP module

Interface Routines - Digital Comparator

	Name	Description
	PLIB_ADCP_DigCmpEnable	Enables the Digital Comparator in the Pipelined ADC module
	PLIB_ADCP_DigCmpDisable	Disables the Digital Comparator in the Pipelined ADC module
	PLIB_ADCP_DigCmpAldGet	Returns the Analog Input ID of for the Comparator Event
	PLIB_ADCP_DigCmpConfig	Configures the Digital Comparator on the Pipelined ADC converter.
	PLIB_ADCP_ExistsDigCmp	Identifies whether the DigitalComparator feature exists on the ADCP module

Interface Routines - Individual Analog Input Conversion Results

	Name	Description
	PLIB_ADCP_ResultReady	Returns the ADC conversion result ready bits for the module.
	PLIB_ADCP_ResultGet	Returns a Pipelined ADC conversion result.
	PLIB_ADCP_ResultReadyGrpIntConfigure	Selects input to include in global interrupt.
	PLIB_ADCP_ExistsConversionResults	Identifies whether the ConversionResults feature exists on the ADCP module

Interface Routines - Input Selection

	Name	Description
	PLIB_ADCP_AlternateInputSelect	Selects the alternate physical input for the specified dedicated (Class 1) S&H.
	PLIB_ADCP_DefaultInputSelect	Selects the default physical input for the specified dedicated (Class 1) S&H.
	PLIB_ADCP_ExistsInputSelect	Identifies whether the InputSelect feature exists on the ADCP module
	PLIB_ADCP_ExistsModeSelect	Identifies whether the ModeSelect feature exists on the ADCP module
	PLIB_ADCP_SHModeSelect	Selects the mode for the specified S&H.

Interface Routines - Oversampling Digital Filter

	Name	Description
	PLIB_ADCP_OsampDigFilterEnable	Enables the Oversampling Digital Filter in the Pipelined ADC module
	PLIB_ADCP_OsampDigFilterDisable	Disables the Oversampling Digital Filter in the Pipelined ADC module
	PLIB_ADCP_OsampDigFilterDataRdy	Used to determine if the Oversampling Digital Filter has data ready.
	PLIB_ADCP_OsampDigFilterDataGet	Used to fetch the data result from the Oversampling Digital Filter.
	PLIB_ADCP_ExistsOsampDigFilter	Identifies whether the OsampDigitalFilter feature exists on the ADCP module
	PLIB_ADCP_OsampDigFilterConfig	Configures the Oversampling Digital Filter on the Pipelined ADC converter.

Interface Routines - Status

	Name	Description
	PLIB_ADCP_ModuleIsReady	Returns the overall ready status of the module.
	PLIB_ADCP_ExistsReadyStatus	Identifies whether the ReadyStatus feature exists on the ADCP module

Interface Routines - Triggering

	Name	Description
	PLIB_ADCP_GlobalSoftwareTrigger	Initiate a Global Software Trigger on the specified module.
	PLIB_ADCP_IndividualTrigger	Triggers an individual channel independent of the configured trigger source
	PLIB_ADCP_Class12TriggerConfigure	Configures a Class 1 or Class 2 Trigger Source.
	PLIB_ADCP_ExistsTriggering	Identifies whether the Triggering feature exists on the ADCP module

Description

This section describes the Application Programming Interface (API) functions of the Pipelined Analog-to-Digital Converter (ADCP) Peripheral.

Refer to each section for a detailed description.

5.6.2.5.1 Interface Routines - Configuration**5.6.2.5.1.1 PLIB_ADCP_Configure Function**

C

```
void PLIB_ADCP_Configure(
    ADCP_MODULE_ID index,
    ADCP_VREF_SOURCE voltageRefSelect,
    bool boostVref,
    bool fractionalOutputOn,
    bool stopInIdle,
    ADCP_CLOCK_SOURCE adcClockSource,
    int8_t adcClockDivider,
    int8_t oversampleDigFilterSamTime,
    int8_t earlyIntEnable,
    int8_t class2and3SampleTime
);
```

Description

Configures all ADC parameters common to all inputs. This configuration must occur prior to enabling the ADC and therefore must be called when the ADC is disabled.

Preconditions

The module is disabled when calling this function.

Parameters

Parameters	Description
index	Identifier for the ADCP instance
voltageRefSelect	VREF Source Selection
boostVref	Enables the VREF boost if TRUE.
Use when VREFH	$VREFL < .64 (AVDD - AVSS)$
fractionalOutputOn	sets output to a fractional format if TRUE
stopInIdle	sets ADC to stop when device is in idle mode if TRUE
adcClockSource	Clock source selection
adcClockDivider	Clock source divider. Values range from 0 to 254.
oversampleDigFilterSamTime	Sets the delay (sample time) between automatically generated oversampling filter triggers. Values range from 0 to 31 for 1.5 TAD to 32.5 TAD respectively.
earlyIntEnable	Sets the number of clocks prior to the actual arrival of data that the ADRDY bit is set. Range is 0 to 7. Used to generate an early interrupt.
class2and3SampleTime	Set the sample time for Class 2 and Class 3 inputs. Range is 0 to 255 for a sample time of 1 to 256 respectively.

Returns

none

Remarks

This function must be called when the ADC is disabled.

Example

```
// Where MY_ADCP_INSTANCE, is the ADCP instance selected for use by the
// application developer.
```

```
// Configure the ADC
PLIB_ADCP_Configure( MY_ADCP_INSTANCE,
    ADCP_VREF_VREFP_VREFN, // VREF+ and VREF- as reference
    FALSE, // No VREF boost
    TRUE, // Use fractionl format
    TRUE, // Do stop in idle
    ADCP_CLK_SRC_SYSCLK, // SYSCLK is the clock source
    3, // TAD = 1/SYSCLK * 2 * 3
    // or ADC Clock = SYSCLK / (2 * 3)
    2, // 2 + 1.5 = 3.5 TAD between
    // oversampling triggers
    0, // No early interrupt.
    3 ); // 3 + 1 = 4 TAD for Class 2 and 3
    // Sample Time.
```

```
// Enable the ADC
PLIB_ADCP_Enable(MY_ADCP_INSTANCE);
```

5.6.2.5.1.2 PLIB_ADCP_Enable Function**C**

```
void PLIB_ADCP_Enable(
    ADCP_MODULE_ID index
);
```

Description

This function enables (turns ON) the selected Pipelined ADC module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the ADCP instance to be configured

Returns

None.

Remarks

None

Example

```
// Where MY_ADCP_INSTANCE, is the ADCP instance selected for use by the
// application developer.
PLIB_ADCP_Enable(MY_ADCP_INSTANCE);
```

5.6.2.5.1.3 PLIB_ADCP_Disable Function**C**

```
void PLIB_ADCP_Disable(
    ADCP_MODULE_ID index
```

```
);
```

Description

This function disables (turns OFF) the selected Pipelined ADC module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the ADCP instance to be configured

Returns

None.

Remarks

Not all functionality is available on all devices. Please refer to the specific device data sheet for the list of available features.

Example

```
// Where MY_ADCP_INSTANCE, is the ADCP instance selected for use by the  
// application developer.  
PLIB_ADCP_Disable(MY_ADCP_INSTANCE);
```

5.6.2.5.1.4 PLIB_ADCP_CalibrationStart Function**C**

```
void PLIB_ADCP_CalibrationStart(  
    ADCP_MODULE_ID index  
);
```

Description

This function initiates calibration of the module. During calibration the module cannot perform conversion.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the ADCP instance to be configured

Returns

None.

Remarks

Calibration is complete when [PLIB_ADCP_ModuleIsReady\(\)](#) returns a TRUE result.

Example

```
// Where MY_ADCP_INSTANCE, is the ADCP instance selected for use by the  
// application developer.  
PLIB_ADCP_CalibrationStart(MY_ADCP_INSTANCE);  
while (!PLIB_ADCP_ModuleIsReady(MY_ADCP_INSTANCE));
```

5.6.2.5.1.5 PLIB_ADCP_LowPowerStateEnter Function**C**

```
void PLIB_ADCP_LowPowerStateEnter(  

```

```
    ADCP_MODULE_ID index
);
```

Description

Places the Pipelined ADC module in a low power state. The feature is used in lieu of disabling the ADC when power reduction is needed. The Pipelined ADC can come out of low power state and be operational much faster since recalibration is not required.

Preconditions

The Pipelined ADC must be enabled.

Parameters

Parameters	Description
index	Identifier for the ADCP instance

Returns

None.

Remarks

None.

Example

```
PLIB_ADCP_LowPowerStateEnter(MY_ADCP_INSTANCE);
```

5.6.2.5.1.6 PLIB_ADCP_LowPowerStateExit Function**C**

```
void PLIB_ADCP_LowPowerStateExit(
    ADCP_MODULE_ID index
);
```

Description

Takes the Pipelined ADC module out of low power state and puts it into an operational mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the ADCP instance

Returns

None.

Remarks

The first five conversions following the exit from ADC Low-power mode may be subject to lower accuracy than specified in the device data sheet.

Example

```
PLIB_ADCP_LowPowerStateExit(MY_ADCP_INSTANCE);
```

5.6.2.5.1.7 PLIB_ADCP_LowPowerStateGet Function**C**

```
bool PLIB_ADCP_LowPowerStateGet(
    ADCP_MODULE_ID index
);
```

Description

Returns the state of the low power setting.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the ADCP instance

Returns

A Boolean indicating the state of the low power setting.

Remarks

None.

Example

```
bool lowPowerSate = PLIB_ADCP_LowPowerStateGet(MY_ADCP_INSTANCE);
```

5.6.2.5.1.8 PLIB_ADCP_ExistsCalibration Function**C**

```
bool PLIB_ADCP_ExistsCalibration(  
    ADCP_MODULE_ID index  
);
```

Description

This function identifies whether the Calibration feature is available on the ADCP module. When this function returns true, these functions are supported on the device:

- [PLIB_ADCP_CalibrationStart](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

Existence of the Calibration feature:

- true - When Calibration feature is supported on the device
- false - When Calibration feature is not supported on the device

Remarks

None.

5.6.2.5.1.9 PLIB_ADCP_ExistsEnableControl Function**C**

```
bool PLIB_ADCP_ExistsEnableControl(  
    ADCP_MODULE_ID index  
);
```

Description

This function identifies whether the EnableControl feature is available on the ADCP module. When this function returns true, these functions are supported on the device:

- [PLIB_ADCP_Enable](#)
- [PLIB_ADCP_Disable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

Existence of the EnableControl feature:

- true - When EnableControl feature is supported on the device
- false - When EnableControl feature is not supported on the device

Remarks

None.

5.6.2.5.1.10 PLIB_ADCP_ExistsLowPowerControl Function

C

```
bool PLIB_ADCP_ExistsLowPowerControl(  
    ADCP_MODULE_ID index  
);
```

Description

This function identifies whether the LowPowerControl feature is available on the ADCP module. When this function returns true, these functions are supported on the device:

- [PLIB_ADCP_LowPowerStateEnter](#)
- [PLIB_ADCP_LowPowerStateExit](#)
- [PLIB_ADCP_LowPowerStateGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

Existence of the LowPowerControl feature:

- true - When LowPowerControl feature is supported on the device
- false - When LowPowerControl feature is not supported on the device

Remarks

None.

5.6.2.5.1.11 PLIB_ADCP_ExistsConfiguration Function

C

```
bool PLIB_ADCP_ExistsConfiguration(  
    ADCP_MODULE_ID index  
);
```

Description

This function identifies whether the Configuration feature is available on the ADCP module. When this function returns true, these functions are supported on the device:

- [PLIB_ADCP_Configure](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

Existence of the Configuration feature:

- true - When Configuration feature is supported on the device
- false - When Configuration feature is not supported on the device

Remarks

None.

5.6.2.5.2 Interface Routines - Status

5.6.2.5.2.1 PLIB_ADCP_ModuleIsReady Function

C

```
bool PLIB_ADCP_ModuleIsReady(  
    ADCP_MODULE_ID index  
);
```

Description

Returns the ready status of the Pipelined ADC. The ADC must be ready before operation.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the ADCP instance

Returns

boolean indicating ready status.

Remarks

None.

Example

```
// Where MY_ADCP_INSTANCE, is the ADCP instance selected for use by the
// application developer.

// Enable the module
PLIB_ADCP_Enable(MY_ADCP_INSTANCE);

// wait for calibration to complete
while (!PLIB_ADCP_ModuleIsReady(MY_ADCP_INSTANCE));

// begin sampling
...
```

5.6.2.5.2 PLIB_ADCP_ExistsReadyStatus Function**C**

```
bool PLIB_ADCP_ExistsReadyStatus(
    ADCP_MODULE_ID index
);
```

Description

This function identifies whether the ReadyStatus feature is available on the ADCP module. When this function returns true, these functions are supported on the device:

- [PLIB_ADCP_ModuleIsReady](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

Existence of the ReadyStatus feature:

- true - When ReadyStatus feature is supported on the device
- false - When ReadyStatus feature is not supported on the device

Remarks

None.

5.6.2.5.3 Interface Routines - Input Selection**5.6.2.5.3.1 PLIB_ADCP_AlternateInputSelect Function****C**

```
void PLIB_ADCP_AlternateInputSelect(
    ADCP_MODULE_ID index,
    ADCP_DSH_ID id
);
```

Description

Selects the alternate physical input for the specified S&H.

Preconditions

The function only applies to dedicated S&Hs (Class 1 Inputs).

Parameters

Parameters	Description
index	Identifier for the ADCP instance
id	An ADCP_DSH_ID type indicating which dedicated Class 1 S&H to configure for its alternate input source.

Returns

none.

Remarks

None.

Example

```
// Where MY_ADCP_INSTANCE, is the ADCP instance selected for use by the  
// application developer.
```

```
// Set S&H 1 to use the alternate input.  
PLIB_ADCP_AlternateInputSelect(MY_ADCP_INSTANCE, ADCP_DSH1)
```

5.6.2.5.3.2 PLIB_ADCP_DefaultInputSelect Function**C**

```
void PLIB_ADCP_DefaultInputSelect(  
    ADCP_MODULE_ID index,  
    ADCP_DSH_ID id  
);
```

Description

Selects the default physical input for the specified S&H.

Preconditions

The function only applies to dedicated S&Hs (Class 1 Inputs).

Parameters

Parameters	Description
index	Identifier for the ADCP instance
id	An ADCP_DSH_ID type indicating which dedicated Class 1 S&H to configure for its alternate input source.

Returns

none.

Remarks

None.

Example

```
// Where MY_ADCP_INSTANCE, is the ADCP instance selected for use by the  
// application developer.
```

```
// Set S&H 1 to use the default input.  
PLIB_ADCP_DefaultInputSelect(MY_ADCP_INSTANCE, ADCP_DSH1)
```

5.6.2.5.3.3 PLIB_ADCP_ExistsInputSelect Function

C

```
bool PLIB_ADCP_ExistsInputSelect(  
    ADCP_MODULE_ID index  
);
```

Description

This function identifies whether the InputSelect feature is available on the ADCP module. When this function returns true, these functions are supported on the device:

- PLIB_ADCP_DedicatedSHInputSelect

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

Existence of the InputSelect feature:

- true - When InputSelect feature is supported on the device
- false - When InputSelect feature is not supported on the device

Remarks

None.

5.6.2.5.3.4 PLIB_ADCP_ExistsModeSelect Function

C

```
bool PLIB_ADCP_ExistsModeSelect(  
    ADCP_MODULE_ID index  
);
```

Description

This function identifies whether the ModeSelect feature is available on the ADCP module. When this function returns true, these functions are supported on the device:

- [PLIB_ADCP_SHModeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

Existence of the ModeSelect feature:

- true - When ModeSelect feature is supported on the device
- false - When ModeSelect feature is not supported on the device

Remarks

None.

5.6.2.5.3.5 PLIB_ADCP_SHModeSelect Function**C**

```
void PLIB_ADCP_SHModeSelect(
    ADCP_MODULE_ID index,
    ADCP_DSH_ID id,
    ADCP_SH_MODE mode
);
```

Description

Selects the mode (single ended or differential) and encoding (unipolar or two's compliment) for the specified S&H.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the ADCP instance
id	An ADCP_DSH_ID type indicating which dedicated S&H to configure to use its alternate source.
mode	An ADCP_SH_MODE type indicating the mode selection.

Returns

none.

Remarks

None.

Example

```
// Where MY_ADCP_INSTANCE, is the ADCP instance selected for use by the
// application developer.

// Set S&H 1 to use the single ended, two's complement mode
// selection.
PLIB_ADCP_SHModeSelect(MY_ADCP_INSTANCE,
    ADCP_SH1,
    ADCP_SH_MODE_SINGLE_ENDED_TWOS_COMP)
```

5.6.2.5.4 Interface Routines - Channel Scan**5.6.2.5.4.1 PLIB_ADCP_ChannelScanConfigure Function****C**

```
void PLIB_ADCP_ChannelScanConfigure(
    ADCP_MODULE_ID index,
    uint32_t lowEnable,
    uint32_t highEnable,
    ADCP_SCAN_TRG_SRC triggerSource
);
```

Description

Selects inputs, as determined by the low and high enable scan list for inclusion in the channel scan sequence. If the input is a

Class 1 or Class 2 type, it will also select the trigger source for that input to be the scan trigger, which is required if included in channel scanning.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the ADCP instance
lowEnable	bit mask for selecting low order scan channels
highEnable	bit mask for selecting high order scan channels
triggerSource	Trigger source used to initiate channel scan.

Returns

none.

Remarks

The type def [AN_SELECT](#) can be used to create a variable to simplify selection of the inputs to include in the channel scan. This typedef creates bit field structures for each ANx input that are joined with unions for the low and high 32-bit words. See the code example for Channel scan in the ADCP PLIB help documentation for details on its use.

Example

```
// Where MY_ADCP_INSTANCE, is the ADCP instance selected for use by the
// application developer.

// Configure Channel Scanning
// Channels 10 through 13
// Trigger on Timer 1 match.
PLIB_ADCP_ChannelScanConfigure(MY_ADCP_INSTANCE,
                                0XF000, // AN12 - AN15
                                0X0F00, // AN24 - AN27
                                ADCP_SCAN_TRG_SRC_TMR1_MATCH)
```

5.6.2.5.4.2 PLIB_ADCP_ExistsChannelScan Function

C

```
bool PLIB_ADCP_ExistsChannelScan(
    ADCP_MODULE_ID index
);
```

Description

This function identifies whether the ChannelScan feature is available on the ADCP module. When this function returns true, these functions are supported on the device:

- [PLIB_ADCP_ChannelScanConfigure](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

Existence of the ChannelScan feature:

- true - When ChannelScan feature is supported on the device
- false - When ChannelScan feature is not supported on the device

Remarks

None.

5.6.2.5.5 Interface Routines - Triggering

5.6.2.5.5.1 PLIB_ADCP_GlobalSoftwareTrigger Function

C

```
void PLIB_ADCP_GlobalSoftwareTrigger(  
    ADCP_MODULE_ID index  
);
```

Description

All inputs or scan list that is configured to trigger on the global software trigger are triggered.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the ADCP instance

Returns

None.

Remarks

None.

Example

```
PLIB_ADCP_GlobalSoftwareTrigger(MY_ADCP_INSTANCE);
```

5.6.2.5.5.2 PLIB_ADCP_IndividualTrigger Function

C

```
void PLIB_ADCP_IndividualTrigger(  
    ADCP_MODULE_ID index,  
    ADCP_INPUT_ID inputId  
);
```

Description

Forces a trigger of an individual Class 1 or Class 2 channel independent of its configured trigger source.

Preconditions

The function only applies to Class 1 and Class 2 inputs.

Parameters

Parameters	Description
index	Identifier for the ADCP instance
inputId	An ADCP_INPUT_ID type indicating which input to trigger.

Returns

none.

Remarks

None.

Example

```
// Where MY_ADCP_INSTANCE, is the ADCP instance selected for use by the
// application developer.

// Force a trigger of AN5
PLIB_ADCP_IndividualTrigger(MY_ADCP_INSTANCE, ADCP_CLASS12_AN5)
```

5.6.2.5.5.3 PLIB_ADCP_Class12TriggerConfigure Function**C**

```
void PLIB_ADCP_Class12TriggerConfigure(
    ADCP_MODULE_ID index,
    ADCP_CLASS12_INPUT_ID inputId,
    ADCP_TRG_SRC triggerSource
);
```

Description

Configures the trigger source for Class 1 or Class 2 inputs. A call to this function is not required when the input is being used as part of a channel scan as the channel scan configure function also configures all trigger sources.

Preconditions

The function only applies to Class 1 and Class 2 inputs.

Parameters

Parameters	Description
index	Identifier for the ADCP instance
inputId	Class 1 or Class 2 input to configure the trigger for.
triggerSource	Trigger source to use for this input.

Returns

none.

Remarks

None.

Example

```
// Where MY_ADCP_INSTANCE, is the ADCP instance selected for use by the
// application developer.

// Configure AN0 for triggering from INT0.
PLIB_ADCP_Class12TriggerConfigure(MY_ADCP_INSTANCE,
    ADCP_CLASS12_AN0,
    ADCP_TRG_SRC_INT0);
```

5.6.2.5.5.4 PLIB_ADCP_ExistsTriggering Function**C**

```
bool PLIB_ADCP_ExistsTriggering(
    ADCP_MODULE_ID index
);
```

Description

This function identifies whether the Triggering feature is available on the ADCP module. When this function returns true, these functions are supported on the device:

- [PLIB_ADCP_Class12TriggerConfigure](#)
- [PLIB_ADCP_GlobalSoftwareTrigger](#)
- [PLIB_ADCP_IndividualTrigger](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

Existence of the Triggering feature:

- true - When Triggering feature is supported on the device
- false - When Triggering feature is not supported on the device

Remarks

None.

5.6.2.5.6 Interface Routines - Individual Analog Input Conversion Results

5.6.2.5.6.1 PLIB_ADCP_ResultReady Function

C

```
AN_READY PLIB_ADCP_ResultReady(  
    ADCP_MODULE_ID index  
);
```

Description

Returns a result indicating which analog inputs have conversion results ready.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the ADCP instance

Returns

A [AN_READY](#) type indicating conversion result status.

Remarks

This function returns individual conversion results. It does not return results from the module.

Example

```
// Where MY_ADCP_INSTANCE, is the ADCP instance selected for use by the  
// application developer.
```

```
AN_READY      MyRdyStatus;

// check for data and process it
if ((MyRdyStatus = PLIB_ADCP_ResultReady(MY_ADCP_INSTANCE)) != 0) {
    // fetch the results and process
}
```

5.6.2.5.6.2 PLIB_ADCP_ResultGet Function

C

```
int32_t PLIB_ADCP_ResultGet(
    ADCP_MODULE_ID index,
    ADCP_INPUT_ID inputId
);
```

Description

Returns the specified Pipelined ADC analog input conversion result.

Preconditions

A valid conversion is ready to be fetched.

Parameters

Parameters	Description
index	Identifier for the ADCP instance
inputId	Identifier for the input

Returns

The conversion result expressed as a 32 bit integer.

Remarks

None.

Example

```
int32_t      result;
...
// fetch result for AN31
result = PLIB_ADCP_ResultGet( MY_ADCP_INSTANCE, ADCP_AN31 );
```

5.6.2.5.6.3 PLIB_ADCP_ResultReadyGrpIntConfigure Function

C

```
void PLIB_ADCP_ResultReadyGrpIntConfigure(
    ADCP_MODULE_ID index,
    uint32_t lowEnable,
    uint32_t highEnable
);
```

Description

Selects inputs, as determined by the input mask channel scan list for inclusion in the global or global interrupt.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the ADCP instance
lowEnable	bit mask for selecting low order scan channels

highEnable	bit mask for selecting high order scan channels

Returns

none.

Remarks

The type def [AN_SELECT](#) can be used to create a variable to simplify selection of the inputs to include in the global interrupt. This typedef creates bit field structures for each ANx input that are joined with unions for the low and high 32-bit words. See the code example for Channel scan in the ADCP PLIB help documentation for details on its use.

Example

```
// Where MY_ADCP_INSTANCE, is the ADCP instance selected for use by the  
// application developer.  
  
// Configure Global Interrupts  
// Analog inputs 10 through 13 are included in the global interrupt.  
PLIB_ADCP_ResultReadyGrpIntConfigure(MY_ADCP_INSTANCE,  
                                     0x0F00, // inputs AN8 - AN11  
                                     0x000F ); // inputs AN16 - AN19
```

5.6.2.5.6.4 PLIB_ADCP_ExistsConversionResults Function**C**

```
bool PLIB_ADCP_ExistsConversionResults(  
    ADCP_MODULE_ID index  
);
```

Description

This function identifies whether the ConversionResults feature is available on the ADCP module. When this function returns true, these functions are supported on the device:

- [PLIB_ADCP_ResultReady](#)
- [PLIB_ADCP_ResultGet](#)
- [PLIB_ADCP_ResultReadyGrpIntConfigure](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

Existence of the ConversionResults feature:

- true - When ConversionResults feature is supported on the device
- false - When ConversionResults feature is not supported on the device

Remarks

None.

5.6.2.5.7 Interface Routines - Digital Comparator

5.6.2.5.7.1 PLIB_ADCP_DigCmpEnable Function

C

```
void PLIB_ADCP_DigCmpEnable(  
    ADCP_MODULE_ID index,  
    ADCP_DCMP_ID id  
);
```

Description

This function enables (turns ON) the selected Digital Comparator in the specified Pipelined ADC module.

Preconditions

The digital comparator should be configured using the [PLIB_ADCP_Configure\(\)](#) function prior to enabling.

Parameters

Parameters	Description
index	Identifier for the ADCP instance
id	Identifier for the digital comparator in the ADCP module.

Returns

None.

Remarks

None

Example

```
// Where MY_ADCP_INSTANCE, is the ADCP instance selected for use by the  
// application developer.  
  
// Enable Digital Comparator 1  
PLIB_ADCP_DigCmpEnable(MY_ADCP_INSTANCE, ADCP_DCMP1);
```

5.6.2.5.7.2 PLIB_ADCP_DigCmpDisable Function

C

```
void PLIB_ADCP_DigCmpDisable(  
    ADCP_MODULE_ID index,  
    ADCP_DCMP_ID id  
);
```

Description

This function Disables (turns OFF) the selected Digital Comparator in the specified Pipelined ADC module.

Preconditions

none.

Parameters

Parameters	Description
index	Identifier for the ADCP instance
id	Identifier for the digital comparator in the ADCP module.

Returns

None.

Remarks

None

Example

```
// Where MY_ADCP_INSTANCE, is the ADCP instance selected for use by the
// application developer.

// Disable Digital Comparator 1
PLIB_ADCP_DigCmpDisable(MY_ADCP_INSTANCE, ADCP_DCMP1);
```

5.6.2.5.7.3 PLIB_ADCP_DigCmpAidGet Function**C**

```
int16_t PLIB_ADCP_DigCmpAidGet(
    ADCP_MODULE_ID index,
    ADCP_DCMP_ID id
);
```

Description

This function tests the DigCmp Event Flag and if true, returns the ANx Identifier for the input which caused the event or -1 if there was no pending DigCmp event. The ID value returned corresponds to numeric portion of the analog input ID, ANx.

Preconditions

none.

Parameters

Parameters	Description
index	Identifier for the ADCP instance
id	Identifier for the digital comparator in the ADCP module.

Returns

Value x of type int16_t where x is the index to the analog input ANx which caused the event or -1 if no event has occurred.

Remarks

None

Example

```
// Where MY_ADCP_INSTANCE, is the ADCP instance selected for use by the
// application developer.
int16_t DigCmpResult;

// Get Digital Comparator 1 result.
DigCmpResult = PLIB_ADCP_DigCmpAidGet(MY_ADCP_INSTANCE, ADCP_DCMP1);
if (DigCmpResult != -1) {
    // process event
}
```

5.6.2.5.7.4 PLIB_ADCP_DigCmpConfig Function**C**

```
void PLIB_ADCP_DigCmpConfig(
    ADCP_MODULE_ID index,
    ADCP_DCMP_ID id,
    bool globalIntEnable,
    bool inBetweenOrEqual,
    bool greaterEqualHi,
    bool lessThanHi,
    bool greaterEqualLo,
```

```

    bool lessThanLo,
    uint32_t inputEnable,
    int32_t hiLimit,
    int32_t loLimit
);

```

Description

Configures all parameters for the Digital Comparator module of the pipelined ADC.

Preconditions

The module is disabled when calling this function.

Parameters

Parameters	Description
index	Identifier for the ADCP instance
id	Identifier for the digital comparator in this device
globalIntEnable	When set, comparator events are included in the Global Interrupt
inBetweenOrEqual	Event is generated when result is greater than or equal to loLimit and less than hiLimit
greaterEqualHi	Event is generated when result is greater than or equal to hiLimit
lessThanHi	Event is generated when result is less than hiLimit
greaterEqualLo	Event is generated when result is greater than or equal to loLimit
lessThanLo	Event is generated when result is less than loLimit
inputEnable	Bit field which determines which analog inputs are tested by this comparator module. Bit 0 applies to AN0 and bit 31 to AN31.
hiLimit	High limit in the same format as the conversion result.
loLimit	Low limit in the same format as the conversion result.

Returns

none

Remarks

This function must be called when the ADC is disabled. The format of hiLimit and loLimit must match the output format of the channel(s) specified in inputEnable.

Example

```

// Where MY_ADCP_INSTANCE, is the ADCP instance selected for use by the
// application developer.

// Configure the Digital Comparator
// Creates an event when the reading of AN0 is between 20% to 80% of the
// full scale 12-bit output.
PLIB_ADCP_DigCmpConfig( MY_ADCP_INSTANCE,    // ADCP module ID
                        ADCP_DCMP1,          // Comparator ID
                        FALSE,                // Global Int Enable
                        TRUE,                 // test for between low and high
                        FALSE,                // no test for greater then equal to high
                        FALSE,                // no test for less than high
                        FALSE,                // no test for greater then equal to low
                        FALSE,                // no test for less than low
                        1 << 3,               // enable AN3
                        0x0CCD,               // high limit, 80% of full scale
                        0x0333);              // low limit, 20% of full scale

// Enable Digital Comparator 1
PLIB_ADCP_DigCmpEnable(MY_ADCP_INSTANCE, ADCP_DCMP1);

```

5.6.2.5.7.5 PLIB_ADCP_ExistsDigCmp Function

C

```
bool PLIB_ADCP_ExistsDigCmp(  
    ADCP_MODULE_ID index  
);
```

Description

This function identifies whether the DigitalComparator feature is available on the ADCP module. When this function returns true, these functions are supported on the device:

- [PLIB_ADCP_DigCmpConfig](#)
- [PLIB_ADCP_DigCmpEnable](#)
- [PLIB_ADCP_DigCmpDisable](#)
- [PLIB_ADCP_DigCmpAldGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

Existence of the DigitalComparator feature:

- true - When DigitalComparator feature is supported on the device
- false - When DigitalComparator feature is not supported on the device

Remarks

None.

5.6.2.5.8 Interface Routines - Oversampling Digital Filter

5.6.2.5.8.1 PLIB_ADCP_OsampDigFilterEnable Function

C

```
void PLIB_ADCP_OsampDigFilterEnable(  
    ADCP_MODULE_ID index,  
    ADCP_ODFLTR_ID id  
);
```

Description

This function enables (turns ON) the selected Oversampling Digital Filter in the specified Pipelined ADC module.

Preconditions

The Oversampling Digital Filter should be configured using the [PLIB_ADCP_Configure\(\)](#) function prior to enabling.

Parameters

Parameters	Description
index	Identifier for the ADCP instance
id	Identifier for the digital Filter in the ADCP module.

Returns

None.

Remarks

None

Example

```
// Where MY_ADCP_INSTANCE, is the ADCP instance selected for use by the  
// application developer.  
  
// Enable OsampDigFilter1  
PLIB_ADCP_OsampDigFilterEnable(MY_ADCP_INSTANCE, ADCP_ODFLTR1);
```

5.6.2.5.8.2 PLIB_ADCP_OsampDigFilterDisable Function**C**

```
void PLIB_ADCP_OsampDigFilterDisable(  
    ADCP_MODULE_ID index,  
    ADCP_ODFLTR_ID id  
);
```

Description

This function Disables (turns OFF) the selected Oversampling Digital Filter in the specified Pipelined ADC module.

Preconditions

none.

Parameters

Parameters	Description
index	Identifier for the ADCP instance
id	Identifier for the digital Filter in the ADCP module.

Returns

None.

Remarks

None

Example

```
// Where MY_ADCP_INSTANCE, is the ADCP instance selected for use by the  
// application developer.  
  
// Disable OsampDigFilter1  
PLIB_ADCP_OsampDigFilterDisable(MY_ADCP_INSTANCE, ADCP_ODFLTR1);
```

5.6.2.5.8.3 PLIB_ADCP_OsampDigFilterDataRdy Function**C**

```
bool PLIB_ADCP_OsampDigFilterDataRdy(  
    ADCP_MODULE_ID index,  
    ADCP_ODFLTR_ID id  
);
```

Description

Used to determine if the ADCP digital filter has data ready. A TRUE is returned when data is available which can be fetched using [PLIB_ADCP_OsampDigFilterDataGet\(\)](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the ADCP instance
id	Identifier for the digital Filter in this device

Returns

A boolean TRUE if data is ready or FALSE if not. .

Remarks

None.

Example

```
if (PLIB_ADCP_OsampDigFilterDataRdy(MY_ADCP_INSTANCE, ADCP_ODFLTR_ID_0)) {  
    // fetch and process data  
}
```

5.6.2.5.8.4 PLIB_ADCP_OsampDigFilterDataGet Function**C**

```
int16_t PLIB_ADCP_OsampDigFilterDataGet(  
    ADCP_MODULE_ID index,  
    ADCP_ODFLTR_ID id  
);
```

Description

This function is used to fetch data from the Oversampling Digital Filter. The format of the data is determined by the oversampling setting configuration defined in the call of [PLIB_ADCP_OsampDigFilterConfig\(\)](#).

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the ADCP instance
dfiltrID	Identifier for the digital Filter in this device

Returns

A 16 bit result in the format specified by the filter's oversampling setting

Remarks

None.

Example

```
int16_t myODFLTRResult;  
  
if (PLIB_ADCP_OsampDigFilterDataRdy(MY_ADCP_INSTANCE, ADCP_ODFLTR1)) {  
    // fetch data  
    myODFLTRResult = PLIB_ADCP_OsampDigFilterDataGet(MY_ADCP_INSTANCE, ADCP_ODFLTR1);  
    // process result  
    ...  
}
```

5.6.2.5.8.5 PLIB_ADCP_ExistsOsampDigFilter Function

C

```
bool PLIB_ADCP_ExistsOsampDigFilter(  
    ADCP_MODULE_ID index  
);
```

Description

This function identifies whether the OsampDigitalFilter feature is available on the ADCP module. When this function returns true, these functions are supported on the device:

- [PLIB_ADCP_OsampDigFilterConfig](#)
- [PLIB_ADCP_OsampDigFilterEnable](#)
- [PLIB_ADCP_OsampDigFilterDisable](#)
- [PLIB_ADCP_OsampDigFilterDataRdy](#)
- [PLIB_ADCP_OsampDigFilterDataGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

Existence of the OsampDigitalFilter feature:

- true - When OsampDigitalFilter feature is supported on the device
- false - When OsampDigitalFilter feature is not supported on the device

Remarks

None.

5.6.2.5.8.6 PLIB_ADCP_OsampDigFilterConfig Function

C

```
void PLIB_ADCP_OsampDigFilterConfig(  
    ADCP_MODULE_ID index,  
    ADCP_ODFLTR_ID id,  
    ADCP_INPUT_ID inputId,  
    ADCP_ODFLTR_SAMPLE_RATIO oversampleRatio,  
    bool globalIntEnable  
);
```

Description

Configures all parameters for the Oversampling Digital Filter module of the pipelined ADC.

Preconditions

The Oversampling Digital Filter module is disabled when calling this function.

Parameters

Parameters	Description
index	Identifier for the ADCP instance

id	Identifier for the digital Filter in this device
inputId	Identifier for the analog input to be oversampled
oversampleRatio	Enumerator specifying the oversampling ratio
globalIntEnable	When set, Filter events are included in the Global Interrupt

Returns

none

Remarks

This function must be called when the ADC is disabled.

Example

```
// Where MY_ADCP_INSTANCE, is the ADCP instance selected for use by the
// application developer.

// Configure the Oversampling Digital Filter
// AN4 is oversampled at a 16X rate. No global interrupt is enabled.
PLIB_ADCP_OsampDigFilterConfig( MY_ADCP_INSTANCE,    // ADCP module ID
                                ADCP_ODFLTR1,        // Filter ID
                                ADCP_AN4,            // Oversample AN4
                                ADCP_ODFLTR_16X,     // 16 x oversampling
                                FALSE );              // No Global Int Enable

// Enable OsampDigFilter1
PLIB_ADCP_OsampDigFilterEnable(MY_ADCP_INSTANCE, ADCP_ODFLTR1);
```

5.6.2.5.9 Data Types

5.6.2.5.9.1 ADCP_MODULE_ID Enumeration

C

```
typedef enum {
    ADCP_ID_1,
    ADC_NUMBER_OF_MODULES
} ADCP_MODULE_ID;
```

Description

ADC Module ID

This enumeration identifies the available ADC modules.

Members

Members	Description
ADCP_ID_1	ADC Module 1 ID
ADC_NUMBER_OF_MODULES	Number of available ADC modules.

Remarks

The caller should not rely on the specific numbers assigned to any of these values as they may change from one processor to the next.

Not all modules will be available on all microcontrollers. Refer to the data sheet for the specific controller in use to determine which modules are supported. The numbers used in the enumeration values will match the numbers given in the data sheet.

5.6.2.5.9.2 ADCP_VREF_SOURCE Enumeration

C

```
typedef enum {
    ADCP_VREF_AVDD_AVSS,
    ADCP_VREF_VREFP_AVSS,
    ADCP_VREF_AVDD_VREFN,
    ADCP_VREF_VREFP_VREFN,
} ADCP_VREF_SOURCE;
```

Description

ADCP VREF Source Select

This data type defines the ADCP Reference Voltage (VREF) Source Select

Members

Members	Description
ADCP_VREF_AVDD_AVSS	Reference voltage set to AVDD and AVSS
ADCP_VREF_VREFP_AVSS	Reference voltage set to VREF positive and AVSS
ADCP_VREF_AVDD_VREFN	Reference voltage set to AVDD and VREF negative
ADCP_VREF_VREFP_VREFN	Reference voltage set to VREF positive and VREF negative

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all parts

5.6.2.5.9.3 ADCP_CLOCK_SOURCE Enumeration

C

```
typedef enum {
    ADCP_CLK_SRC_NONE,
    ADCP_CLK_SRC_SYSCLK,
    ADCP_CLK_SRC_RFCLK3,
    ADCP_CLK_SRC_FRC,
} ADCP_CLOCK_SOURCE;
```

Description

ADCP Clock Source Select

This enumeration data type defines the ADCP Clock Source Select

Members

Members	Description
ADCP_CLK_SRC_NONE	TAD clock disabled
ADCP_CLK_SRC_SYSCLK	TAD clock set to SYSCLK (TCY)
ADCP_CLK_SRC_RFCLK3	TAD clock set to REFCLK3
ADCP_CLK_SRC_FRC	TAD clock set to FRC

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all parts

5.6.2.5.9.4 ADCP_CLASS12_INPUT_ID Enumeration

C

```
typedef enum {
```

```
ADCP_CLASS12_AN0,  
ADCP_CLASS12_AN1,  
ADCP_CLASS12_AN2,  
ADCP_CLASS12_AN3,  
ADCP_CLASS12_AN4,  
ADCP_CLASS12_AN5,  
ADCP_CLASS12_AN6,  
ADCP_CLASS12_AN7,  
ADCP_CLASS12_AN8,  
ADCP_CLASS12_AN9,  
ADCP_CLASS12_AN10,  
ADCP_CLASS12_AN11  
} ADCP_CLASS12_INPUT_ID;
```

Description

ADC Class 1 and Class 2 Input ID

Used to identify the Class 1 and Class 2 ADC analog inputs

Members

Members	Description
ADCP_CLASS12_AN0	Analog Input AN0
ADCP_CLASS12_AN1	Analog Input AN1
ADCP_CLASS12_AN2	Analog Input AN2
ADCP_CLASS12_AN3	Analog Input AN3
ADCP_CLASS12_AN4	Analog Input AN4
ADCP_CLASS12_AN5	Analog Input AN5
ADCP_CLASS12_AN6	Analog Input AN6
ADCP_CLASS12_AN7	Analog Input AN7
ADCP_CLASS12_AN8	Analog Input AN8
ADCP_CLASS12_AN9	Analog Input AN9
ADCP_CLASS12_AN10	Analog Input AN10
ADCP_CLASS12_AN11	Analog Input AN11

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all parts

5.6.2.5.9.5 ADCP_SH_ID Enumeration

C

```
typedef enum {  
    ADCP_SH0,  
    ADCP_SH1,  
    ADCP_SH2,  
    ADCP_SH3,  
    ADCP_SH4,  
    ADCP_SH5,  
    ADCP_NUMBER_OF_SH  
} ADCP_SH_ID;
```

Description

ADCP S&H Select

This enumeration identifies all supported S&Hs.

Members

Members	Description
ADCP_SH0	S&H 0
ADCP_SH1	S&H 1
ADCP_SH2	S&H 2
ADCP_SH3	S&H 3
ADCP_SH4	S&H 4
ADCP_SH5	S&H 5
ADCP_NUMBER_OF_SH	Number of S&Hs

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all parts

5.6.2.5.9.6 ADCP_DSH_ID Enumeration**C**

```
typedef enum {
    ADCP_DSH0,
    ADCP_DSH1,
    ADCP_DSH2,
    ADCP_DSH3,
    ADCP_DSH4,
    ADCP_NUMBER_OF_DSH
} ADCP_DSH_ID;
```

Description

ADCP Dedicated S&H Select

This enumeration identifies the supported Dedicated S&Hs.

Members

Members	Description
ADCP_DSH0	Dedicated S&H 0
ADCP_DSH1	Dedicated S&H 1
ADCP_DSH2	Dedicated S&H 2
ADCP_DSH3	Dedicated S&H 3
ADCP_DSH4	Dedicated S&H 4
ADCP_NUMBER_OF_DSH	Number of Dedicated S&Hs

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all parts

5.6.2.5.9.7 ADCP_SH_MODE Enumeration**C**

```
typedef enum {
    ADCP_SH_MODE_SINGLE_ENDED_UNIPOLAR,
    ADCP_SH_MODE_SINGLE_ENDED_TWOS_COMP,
    ADCP_SH_MODE_DIFFERENTIAL_UNIPOLAR,
    ADCP_SH_MODE_DIFFERENTIAL_TWOS_COMP
} ADCP_SH_MODE;
```

Description

ADCP S&H Mode

Data type defines the available modes for the S&H

Members

Members	Description
ADCP_SH_MODE_SINGLE_ENDED_UNIPOLAR	Sinlge Ended input, Unipolar encoded
ADCP_SH_MODE_SINGLE_ENDED_TWOS_COMP	Sinlge Ended input, two's compliment encoded
ADCP_SH_MODE_DIFFERENTIAL_UNIPOLAR	Differential input, Unipolar encoded
ADCP_SH_MODE_DIFFERENTIAL_TWOS_COMP	Differential input, two's compliment encoded

Remarks

None

Description

ADC Input ID

Type for identifying the available ADC Inputs, regardless of Class.

Members

Members	Description
ADCP_AN0	Analog Input AN0
ADCP_AN1	Analog Input AN1
ADCP_AN2	Analog Input AN2
ADCP_AN3	Analog Input AN3
ADCP_AN4	Analog Input AN4
ADCP_AN5	Analog Input AN5
ADCP_AN6	Analog Input AN6
ADCP_AN7	Analog Input AN7
ADCP_AN8	Analog Input AN8
ADCP_AN9	Analog Input AN9
ADCP_AN10	Analog Input AN10
ADCP_AN11	Analog Input AN11
ADCP_AN12	Analog Input AN12
ADCP_AN13	Analog Input AN13
ADCP_AN14	Analog Input AN14
ADCP_AN15	Analog Input AN15
ADCP_AN16	Analog Input AN16
ADCP_AN17	Analog Input AN17
ADCP_AN18	Analog Input AN18
ADCP_AN19	Analog Input AN19
ADCP_AN20	Analog Input AN20

ADCP_AN21	Analog Input AN21
ADCP_AN22	Analog Input AN22
ADCP_AN23	Analog Input AN23
ADCP_AN24	Analog Input AN24
ADCP_AN25	Analog Input AN25
ADCP_AN26	Analog Input AN26
ADCP_AN27	Analog Input AN27

ADCP_AN56	Analog Input AN56
ADCP_AN57	Analog Input AN57
ADCP_AN58	Analog Input AN58
ADCP_AN59	Analog Input AN59
ADCP_AN60	Analog Input AN60
ADCP_AN61	Analog Input AN61
ADCP_AN62	Analog Input AN62
ADCP_AN63	Analog Input AN63
ADCP_IVREF	Analog Input for Internal Voltage Reference
ADCP_IVTEMP	Analog Input for Internal Temperature Sensor

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all parts

5.6.2.5.9.9 ADCP_DCMP_ID Enumeration

C

```
typedef enum {
    ADCP_DCMP1,
    ADCP_DCMP2,
    ADCP_DCMP3,
    ADCP_DCMP4,
    ADCP_DCMP5,
    ADCP_DCMP6,
    ADCP_NUMBER_OF_DCMP
} ADCP_DCMP_ID;
```

Description

ADCP Digital Comparator

This enumeration identifies all supported digital comparators for this ADCP module.

Members

Members	Description
ADCP_DCMP1	DCMP1
ADCP_DCMP2	DCMP2
ADCP_DCMP3	DCMP3
ADCP_DCMP4	DCMP4
ADCP_DCMP5	DCMP5
ADCP_DCMP6	DCMP6
ADCP_NUMBER_OF_DCMP	Number of Digital Comparators

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all parts

5.6.2.5.9.10 ADCP_ODFLTR_ID Enumeration

C

```
typedef enum {
    ADCP_ODFLTR1,
    ADCP_ODFLTR2,
    ADCP_ODFLTR3,
    ADCP_ODFLTR4,
    ADCP_ODFLTR5,
    ADCP_ODFLTR6,
    ADCP_NUMBER_OF_ODFLTR
} ADCP_ODFLTR_ID;
```

Description

ADCP Oversampling Digital Filter

This enumeration identifies all supported digital Filters for this ADCP module.

Members

Members	Description
ADCP_ODFLTR1	ODFLTR1

ADCP_ODFLTR2	ODFLTR2
ADCP_ODFLTR3	ODFLTR3
ADCP_ODFLTR4	ODFLTR4
ADCP_ODFLTR5	ODFLTR5
ADCP_ODFLTR6	ODFLTR6
ADCP_NUMBER_OF_ODFLTR	Number of Oversampling Digital Filters

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all parts

5.6.2.5.9.11 ADCP_ODFLTR_OSR Enumeration**C**

```
typedef enum {
    ADCP_ODFLTR_4X,
    ADCP_ODFLTR_16X,
    ADCP_ODFLTR_64X,
    ADCP_ODFLTR_256X,
    ADCP_ODFLTR_2X,
    ADCP_ODFLTR_8X,
    ADCP_ODFLTR_32X,
    ADCP_ODFLTR_128X
} ADCP_ODFLTR_OSR;
```

Description

ADCP Oversampling Ratio

ADCP Oversampling Digital Filter oversampling Ratio

This enumeration identifies all supported digital Filter oversampling ratios for this ADCP module. Oversampling ratios determine the number of samples used to generate a single output and the resulting resolution and format.

Members

Members	Description
ADCP_ODFLTR_4X	4x oversampling, shift sum 1 bit to right, output data is 13 bits
ADCP_ODFLTR_16X	16x oversampling, shift sum 2 bits to right, output data is 14 bits
ADCP_ODFLTR_64X	64x oversampling, shift sum 3 bits to right, output data is 15 bits
ADCP_ODFLTR_256X	256x oversampling, shift sum 4 bits to right, output data is 16 bits
ADCP_ODFLTR_2X	2x oversampling, shift sum 0 bits to right, output data is in 12.1 format
ADCP_ODFLTR_8X	8x oversampling, shift sum 1 bit to right, output data is in 13.1 format
ADCP_ODFLTR_32X	32x oversampling, shift sum 2 bits to right, output data is in 14.1 format
ADCP_ODFLTR_128X	128x oversampling, shift sum 3 bit to right, output data is in 15.1 format

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all parts

5.6.2.5.9.12 ADCP_SCAN_TRG_SRC Enumeration**C**

```
typedef enum {
    ADCP_SCAN_TRG_SRC_NONE,
    ADCP_SCAN_TRG_SRC_SOFTWARE,
    ADCP_SCAN_TRG_SRC_INT0,
    ADCP_SCAN_TRG_SRC_TMR1_MATCH,
```

```

ADCP_SCAN_TRG_SRC_TMR3_MATCH,
ADCP_SCAN_TRG_SRC_TMR5_MATCH,
ADCP_SCAN_TRG_SRC_OCMP1,
ADCP_SCAN_TRG_SRC_OCMP3,
ADCP_SCAN_TRG_SRC_OCMP5,
ADCP_SCAN_TRG_SRC_COMP1_COUT,
ADCP_SCAN_TRG_SRC_COMP2_COUT
} ADCP_SCAN_TRG_SRC;

```

Description

ADCP Channel Scan Trigger Source Select

This data type defines the ADCP Channel Scan Trigger Source Selections

Members

Members	Description
ADCP_SCAN_TRG_SRC_NONE	No scan trigger source is selected
ADCP_SCAN_TRG_SRC_SOFTWARE	Global Software trigger selected as scan trigger source
ADCP_SCAN_TRG_SRC_INT0	Interrupt 0 (INT0) selected as scan trigger source
ADCP_SCAN_TRG_SRC_TMR1_MATCH	Timer 1 Match (TMR1) selected as scan trigger source
ADCP_SCAN_TRG_SRC_TMR3_MATCH	Timer 3 Match (TMR3) selected as scan trigger source
ADCP_SCAN_TRG_SRC_TMR5_MATCH	Timer 5 Match (TMR5) selected as scan trigger source
ADCP_SCAN_TRG_SRC_OCMP1	Output Compare 1 (OCMP1) selected as scan trigger source
ADCP_SCAN_TRG_SRC_OCMP3	Output Compare 3 (OCMP3) selected as scan trigger source
ADCP_SCAN_TRG_SRC_OCMP5	Output Compare 5 (OCMP5) selected as scan trigger source
ADCP_SCAN_TRG_SRC_COMP1_COUT	Analog Comparator 1 (COUT) selected as scan trigger source
ADCP_SCAN_TRG_SRC_COMP2_COUT	Analog Comparator 2 (COUT) selected as scan trigger source

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all parts

5.6.2.5.9.13 ADCP_TRG_SRC Enumeration**C**

```

typedef enum {
    ADCP_TRG_SRC_NONE,
    ADCP_TRG_SRC_SOFTWARE,
    ADCP_TRG_SRC_SCAN_TRG,
    ADCP_TRG_SRC_INT0,
    ADCP_TRG_SRC_TMR1_MATCH,
    ADCP_TRG_SRC_TMR3_MATCH,
    ADCP_TRG_SRC_TMR5_MATCH,
    ADCP_TRG_SRC_OCMP1,
    ADCP_TRG_SRC_OCMP3,
    ADCP_TRG_SRC_OCMP5,
    ADCP_TRG_SRC_COMP1_COUT,
    ADCP_TRG_SRC_COMP2_COUT
} ADCP_TRG_SRC;

```

Description

ADCP Trigger Source Select

This data type defines the ADCP Trigger Source Selections

Members

Members	Description
ADCP_TRG_SRC_NONE	No trigger source is selected
ADCP_TRG_SRC_SOFTWARE	Global Software trigger selected as the trigger source
ADCP_TRG_SRC_SCAN_TRG	Use the Channel Scan Trigger as the trigger source (input is part of ch scan)
ADCP_TRG_SRC_INT0	Interrupt 0 (INT0) selected as the trigger source
ADCP_TRG_SRC_TMR1_MATCH	Timer 1 Match (TMR1) selected as the trigger source
ADCP_TRG_SRC_TMR3_MATCH	Timer 3 Match (TMR3) selected as the trigger source
ADCP_TRG_SRC_TMR5_MATCH	Timer 5 Match (TMR5) selected as the trigger source
ADCP_TRG_SRC_OCMP1	Output Compare 1 (OCMP1) selected as the trigger source
ADCP_TRG_SRC_OCMP3	Output Compare 3 (OCMP3) selected as the trigger source
ADCP_TRG_SRC_OCMP5	Output Compare 5 (OCMP5) selected as the trigger source
ADCP_TRG_SRC_COMP1_COUT	Analog Comparator 1 (COUT) selected as the trigger source
ADCP_TRG_SRC_COMP2_COUT	Analog Comparator 2 (COUT) selected as the trigger source

Remarks

These are the super set enumerations provided for documentation, not all constants are available on all parts

5.6.2.5.9.14 AN_SELECT Union**C**

```

};

```

Description

ADCP AN Select Union

Structure labels identify the analog inputs associated with each bit when initializing the structure. Unsigned 32 bit integers, lowWord and highWord are used as arguments to the function.

Remarks

See the Channel Scanning example in the ADCP Help documentation regarding use of this type define.

5.6.2.5.9.15 AN_READY Type**C**

```
typedef AN_SELECT AN_READY;
```

Description

ADCP AN Ready Union

Structure labels identify the analog inputs associated with each bit for testing ready status of individual inputs. Unsigned 32 bit integers, lowWord and highWord allow for testing ready status of groups of bits using a mask.

Remarks

See the Simultaneous Sampling or Channel Scanning examples in the ADCP Help documentation regarding use of this type define.

Name	Description
plib_adcp.h	ADCP PLIB Interface Header for ADCP common definitions

Description

5.6.2.6.1 plib_adcp.h

ADCP - Analog to Digital Converter, Pipelined Peripheral Library Interface Header

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the ADCP PLIB for all families of Microchip microcontrollers..The definitions in this file are common to ADCP peripheral.

Functions

	Name	Description
≡	PLIB_ADCP_AlternateInputSelect	Selects the alternate physical input for the specified dedicated (Class 1) S&H.
≡	PLIB_ADCP_CalibrationStart	Initiates Pipelined ADC Calibration.
≡	PLIB_ADCP_ChannelScanConfigure	Selects input to include in Channel Scan Mode
≡	PLIB_ADCP_Class12TriggerConfigure	Configures a Class 1 or Class 2 Trigger Source.
≡	PLIB_ADCP_Configure	Configures the Pipelined ADC converter including the ADC calibration registers.
≡	PLIB_ADCP_DefaultInputSelect	Selects the default physical input for the specified dedicated (Class 1) S&H.
≡	PLIB_ADCP_DigCmpAldGet	Returns the Analog Input ID of for the Comparator Event
≡	PLIB_ADCP_DigCmpConfig	Configures the Digital Comparator on the Pipelined ADC converter.
≡	PLIB_ADCP_DigCmpDisable	Disables the Digital Comparator in the Pipelined ADC module
≡	PLIB_ADCP_DigCmpEnable	Enables the Digital Comparator in the Pipelined ADC module
≡	PLIB_ADCP_Disable	Pipelined ADC module is disabled (turned OFF).
≡	PLIB_ADCP_Enable	Enables the Pipelined ADC module
≡	PLIB_ADCP_ExistsCalibration	Identifies whether the Calibration feature exists on the ADCP module
≡	PLIB_ADCP_ExistsChannelScan	Identifies whether the ChannelScan feature exists on the ADCP module
≡	PLIB_ADCP_ExistsConfiguration	Identifies whether the Configuration feature exists on the ADCP module
≡	PLIB_ADCP_ExistsConversionResults	Identifies whether the ConversionResults feature exists on the ADCP module
≡	PLIB_ADCP_ExistsDigCmp	Identifies whether the DigitalComparator feature exists on the ADCP module
≡	PLIB_ADCP_ExistsEnableControl	Identifies whether the EnableControl feature exists on the ADCP module
≡	PLIB_ADCP_ExistsInputSelect	Identifies whether the InputSelect feature exists on the ADCP module
≡	PLIB_ADCP_ExistsLowPowerControl	Identifies whether the LowPowerControl feature exists on the ADCP module
≡	PLIB_ADCP_ExistsModeSelect	Identifies whether the ModeSelect feature exists on the ADCP module
≡	PLIB_ADCP_ExistsOsampDigFilter	Identifies whether the OsampDigitalFilter feature exists on the ADCP module

	PLIB_ADCP_ExistsReadyStatus	Identifies whether the ReadyStatus feature exists on the ADCP module
	PLIB_ADCP_ExistsTriggering	Identifies whether the Triggering feature exists on the ADCP module
	PLIB_ADCP_GlobalSoftwareTrigger	Initiate a Global Software Trigger on the specified module.
	PLIB_ADCP_IndividualTrigger	Triggers an individual channel independent of the configured trigger source
	PLIB_ADCP_LowPowerStateEnter	Places the Pipelined ADC module in a low power state.
	PLIB_ADCP_LowPowerStateExit	Takes the Pipelined ADC module out of low power state and puts it into an operational mode.
	PLIB_ADCP_LowPowerStateGet	Returns the state of the low power setting.
	PLIB_ADCP_ModuleIsReady	Returns the overall ready status of the module.
	PLIB_ADCP_OsampDigFilterConfig	Configures the Oversampling Digital Filter on the Pipelined ADC converter.
	PLIB_ADCP_OsampDigFilterDataGet	Used to fetch the data result from the Oversampling Digital Filter.
	PLIB_ADCP_OsampDigFilterDataRdy	Used to determine if the Oversampling Digital Filter has data ready.
	PLIB_ADCP_OsampDigFilterDisable	Disables the Oversampling Digital Filter in the Pipelined ADC module
	PLIB_ADCP_OsampDigFilterEnable	Enables the Oversampling Digital Filter in the Pipelined ADC module
	PLIB_ADCP_ResultGet	Returns a Pipelined ADC conversion result.
	PLIB_ADCP_ResultReady	Returns the ADC conversion result ready bits for the module.
	PLIB_ADCP_ResultReadyGrpIntConfigure	Selects input to include in global interrupt.
	PLIB_ADCP_SHModeSelect	Selects the mode for the specified S&H.

Types

	Name	Description
	AN_READY	This union (identical to the AN_SELECT union) is used as the return value by the PLIB_ADCP_Result_Ready() function.

Unions

	Name	Description
	AN_SELECT	This union of structures is provided to simply selection of analog inputs for inclusion in a particular function.

5.6.3 BMX Peripheral Library

5.6.3.1 Introduction

Bus Matrix (BMX) Peripheral Library

for

Microchip Microcontrollers

This library provides a low-level abstraction of the Bus Matrix (BMX) modules on Microchip microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, thus hiding differences from one microcontroller variant to another.

Bus Matrix Overview

The Bus Matrix is essentially a high-speed switch that establishes connections between devices. Devices can be either master (initiator) or slave (target).

The Bus Matrix also performs these other important functions:

- Partition memory - The Bus Matrix provides the ability to partition both RAM and flash memory into kernel and user areas. It also controls the type of access, program or data, for each memory area.
- Enable/disable program Flash memory cache for Direct Memory Access (DMA)
- Enable/disable bus error exceptions - The Bus Matrix provides the ability to disable bus error exceptions for debugging. They are enabled by default.
- Set Bus Arbitration mode - The Bus Matrix provides the ability to select between arbitration modes. The arbitration modes control the order and priority of initiator access to peripherals.

5.6.3.2 Release Notes

MPLAB Harmony Version: v0.70b **BMX Peripheral Library Version :** 0.70b Alpha **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.6.3.3 SW License Agreement

© 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS." MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.6.3.4 Using the Library

This topic describes the basic architecture of the BMX Peripheral Library and provides information and examples on how to use it.

Interface Header File: `peripheral.h`

The interface to the BMX library is defined in the "`plib_bmx.h`" header file, which is included by the "`peripheral.h`" peripheral library header file. Any C language source (.c) file that uses the BMX library must include "`peripheral.h`".

Library File:

The BMX Peripheral Library is part of the processor-specific peripheral library archive (.a) file installed with the compiler. Libraries in this archive are automatically available to the linker (in the default search path) for any project built using the Microchip compiler.

5.6.3.4.1 Hardware Abstraction Model

This library provides a low-level abstraction of the BMX module on Microchip family microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Description

The following figure shows the Bus Matrix hardware abstraction model.

Hardware Abstraction Model

The BMX Peripheral Library provides interface routines to interact with the blocks shown in the diagram above.

The **Exception Generator** generates a bus error exception for unmapped address accesses from all Bus Matrix initiators:

- Initiator Expansion Interface (IXI) shared bus
- In-Circuit Debug (ICD) unit
- Direct Memory Access (DMA) controller
- CPU data bus
- CPU instruction bus

Each of the above can be individually enabled or disabled with Exception Generator peripheral library routines. All are enabled by default.

The **Cache Control** simply enables/disables program Flash memory (PFM) data cacheability for DMA accesses. The default setting is disabled. When enabled, the PCACHE module must have data caching enabled.

The **Bus Arbitrator** assigns priority levels to bus initiators following one of three priority schemes:

- Fixed, with CPU higher than DMA
- Fixed, with DMA higher than CPU (default)
- Rotating between four priority sequences

The **Memory Access Control** partitions program Flash memory and RAM into kernel and user areas. The RAM can be further partitioned into data and program segments for both kernel and user areas. By default, the full PFM and RAM are mapped to Kernel mode.

5.6.3.4.2 How the Library Works

The Bus Matrix is initialized in the start-up code, before an application is invoked. Most applications will not need to modify the Bus Matrix default settings. The BMX Peripheral Library is available for those applications requiring more complex memory partitioning, including operating systems and applications requiring specialized memory access. The ability to disable exceptions for unmapped memory access may be useful for debugging, but is not recommended for normal use. Changes to the arbitration scheme may improve performance for CPU or DMA intensive applications.

5.6.3.4.2.1 Exception Generator

Any unmapped address access by a Bus Matrix initiator will by default generate an exception. These exceptions may be individually enabled or disabled with the peripheral library.

Example: Enable CPU instruction exception

```
// Enable CPU instruction exception
PLIB_BMX_ISBusExceptionEnable();
```

5.6.3.4.2.2 Cache Control

This peripheral library function enables program Flash memory (data) cacheability for DMA accesses. Data caching must be enabled in the pcache. Hits are still read from the cache, but misses do not update the cache. This function is disabled by default.

Example: Enable PFM Cacheability for DMA access

```
PLIB_BMX_EnablePfmCacheDma();
```

5.6.3.4.2.3 Bus Arbiter

Since there can be more than one initiator attempting to access the same target, an arbitration scheme must be used to control access to the target. The arbitration modes assign priority levels to all the initiators. The initiator with the higher priority level will always win target access over a lower priority initiator. The BMX Bus Arbitrator allows the programmer to select from one of three arbitration modes.

PLIB_BMX_ARB_MODE_INST

Arbitration mode 0 is a fixed priority scheme, with the CPU given higher priority than DMA. This mode can starve the DMA, so choose this mode when DMA is not being used.

**PLIB_BMX_ARB_MODE_DMA**

Arbitration Mode 1 is a fixed priority scheme like Mode 0, except that the CPU is always the lowest priority. Mode 1 is the default mode.

**PLIB_BMX_ARB_MODE_ROT**

Mode 2 arbitration supports rotating priority assignments to all initiators. Instead of a fixed priority assignment, each initiator is assigned the highest priority in a rotating fashion. In this mode, the rotating priority is applied with the following exceptions:

1. CPU data is always selected over CPU instruction.
2. ICD is always the highest priority.
3. When the CPU is processing an exception (EXL = 1) or an error (ERL = 1), the arbitrator temporarily reverts to Mode 0.

Note: Priority Sequence 2 is not selected in the rotation priority scheme if there is a pending CPU data access. In this case, once the data access is complete, Sequence 2 is selected.

Example: Set Bus Arbitration Mode to Rotating Priority

```
PLIB_BMX_SetArbitrationMode(PLIB_BMX_ARB_ROT);
```

5.6.3.4.2.4 Memory Access Control

The Bus Matrix allows the programmer to partition program Flash memory into user and kernel partitions. It also allows the programmer to partition data RAM into user and kernel partitions, each of which can be sub-divided into program and data partitions. At reset, the entire program Flash memory is one kernel partition and the entire data RAM is one kernel data partition.

Program Flash Memory Partitioning

Partitioning of the program Flash memory is accomplished by setting the offset of the user partition within the program Flash memory using the `PLIB_BMX_ProgramFlashPartition()` function. The size of the program Flash memory varies among devices, but can be retrieved with the `PLIB_BMX_ProgramFlashMemorySizeGet()` function. The offset must be a multiple of the program Flash memory block size. The program Flash memory block size may vary among devices. If programmed with a value that is not a multiple of the block size, the value will automatically be truncated to a block size boundary. At reset, the entire program Flash memory is mapped to Kernel mode.

Allocation of Program Flash Memory

Example: Create a User Mode Partition of 12K in Program Flash Memory

```

size_t pfmSize;
size_t userSize = (6 * PLIB_PCACHE_PFM_BLOCK_SIZE);
size_t userOffset;

// Get size of PFM
pfmSize = PLIB_BMX_ProgramFlashMemorySizeGet();
userOffset = pfmSize - userSize;
if (userOffset > 0)
{
    PLIB_BMX_ProgramFlashPartitionSet(userOffset);
}

```

Data RAM Memory Partitioning

The Data RAM Can be partitioned into four sections:

- Kernel Data
- Kernel Program
- User Data
- User Program

Similar to the program Flash memory partitioning, the data RAM partitions are created by setting the base addresses of the various partitions. The BMX Peripheral Library provides a function to set all of the partitions at once. The size of the data RAM varies among devices, but may be retrieved with the [PLIB_BMX_DataRAMSizeGet\(\)](#) function. The partitions must be a multiple of the Data RAM memory block size. The data RAM memory block size may vary among devices. If programmed with a value that is not a multiple of the block size, the partition will automatically be truncated to a block size boundary. At reset, the entire data RAM is mapped to Kernel mode.

Note: At reset, the entire data RAM is mapped to Kernel mode and all of the offsets are set to zero. To partition the data RAM, all of the offsets must be programmed. If any of the offsets are set to zero, the entire data RAM is allocated to kernel data.

Allocation of Data RAM

Example: RAM Partitioned as Kernel Data, Kernel Program, User Data and User Program

```

//Total Data RAM = 32KB.
size_t totalRamSize;
size_t kernProgOffset;
size_t userDataOffset;
size_t userProgOffset;

```

```

size_t kernDataRamSize = (3 * PLIB_PCACHE_DRM_BLOCK_SIZE); //Kernel Data RAM = 6KB
size_t kernProgRamSize = (2 * PLIB_PCACHE_DRM_BLOCK_SIZE); //Kernel Program RAM = 4KB
size_t userDataRamSize = (6 * PLIB_PCACHE_DRM_BLOCK_SIZE); //User Data RAM = 12KB
size_t userProgRamSize = (5 * PLIB_PCACHE_DRM_BLOCK_SIZE); //User Program RAM = 10KB

//Get Size of Data RAM
totalRamSize = PLIB_BMX_DataRAMSizeGet();

//Verify our partition sizes fit our RAM
if ((kernDataRamSize + kernProgRamSize + userDataRamSize + userProgRamSize) != totalRamSize)
{
    printf("RAM Partitioning Error\n");
    return -1;
}

kernProgOffset = kernDataRamSize;
userDataOffset = kernDataRamSize + kernProgRamSize;
userProgOffset = userDataOffset + userDataRamSize;

PLIB_BMX_DataRAMPartitionSet(kernProgOffset, userDataOffset, userProgOffset);

```

Example: Determine the size of Data RAM partitions

```

size_t kernProgOffset;
size_t userDataOffset;
size_t userProgOffset;
size_t kernDataPart;
size_t kernProgPart;
size_t userDataPart;
size_t userProgPart;
size_t totalRamSize;
totalRamSize = PLIB_BMX_DataRAMSizeGet();
kernProgOffset = PLIB_BMX_DataRAMKernelProgramOffsetGet();
userDataOffset = PLIB_BMX_DataRAMUserDataOffsetGet();
userProgOffset = PLIB_BMX_DataRAMUserProgramOffsetGet();

kernDataPart = kernProgOffset;
kernProgPart = userDataOffset - kernProgOffset;
userDataPart = userProgOffset - userDataOffset;
userProgPart = totalRamSize - userProgOffset;

```

5.6.3.4.3 Configuring the Library

The library is configured for the supported BMX module when the processor is chosen in the MPLAB IDE.

5.6.3.5 Library Interface

Data Types and Constants

	Name	Description
	<u>BMX_MODULE_ID</u>	Lists the possible Module IDs for the bus matrix.
	<u>PLIB_BMX_ARB_MODE</u>	Lists the possible arbitration modes for the bus matrix.
	<u>PLIB_BMX_DATA_RAM_WAIT_STATES</u>	Defines the number of data RAM wait states for address setup.
	<u>PLIB_BMX_EXCEPTION_SRC</u>	Defines which events trigger a bus exception.
	<u>PLIB_BMX_DRM_BLOCK_SIZE</u>	Defines the minimum partition block size in data RAM memory.
	<u>PLIB_BMX_PFM_BLOCK_SIZE</u>	Defines the minimum partition block size in program Flash memory.

Arbiter Routines

	Name	Description
≡	PLIB_BMX_ArbitrationModeGet	Returns the bus matrix arbitration mode.
≡	PLIB_BMX_ArbitrationModeSet	Sets the bus matrix arbitration mode.

Bus Exception Routines

	Name	Description
≡	PLIB_BMX_BusExceptionDataDisable	Disables the data bus exception.
≡	PLIB_BMX_BusExceptionDataEnable	Enables the Data bus exception.
≡	PLIB_BMX_BusExceptionDMADisable	Disables the DMA bus exception.
≡	PLIB_BMX_BusExceptionDMAEnable	Enables the DMA bus exception.
≡	PLIB_BMX_BusExceptionICDDisable	Disables the ICD bus exception.
≡	PLIB_BMX_BusExceptionICDEnable	Enables the ICD bus exception.
≡	PLIB_BMX_BusExceptionInstructionDisable	Disables the instruction bus exception.
≡	PLIB_BMX_BusExceptionInstructionEnable	Enables the instruction bus exception.
≡	PLIB_BMX_BusExceptionIXIDisable	Disables the IXI bus exception.
≡	PLIB_BMX_BusExceptionIXIEnable	Enables the IXI bus exception.

Feature Existence Routines

	Name	Description
≡	PLIB_BMX_ExistsArbitrationMode	Identifies that the ArbitrationMode feature exists on the BMX module.
≡	PLIB_BMX_ExistsBusExceptionData	Identifies that the BusExceptionData feature exists on the BMX module.
≡	PLIB_BMX_ExistsBusExceptionDMA	Identifies that the BusExceptionDMA feature exists on the BMX module.
≡	PLIB_BMX_ExistsBusExceptionICD	Identifies that the BusExceptionICD feature exists on the BMX module.
≡	PLIB_BMX_ExistsBusExceptionInstruction	Identifies that the BusExceptionInstruction feature exists on the BMX module.
≡	PLIB_BMX_ExistsBusExceptionIXI	Identifies that the BusExceptionIXI feature exists on the BMX module.
≡	PLIB_BMX_ExistsDataRAMPartition	Identifies that the DataRAMPartition feature exists on the BMX module.
≡	PLIB_BMX_ExistsDataRAMSize	Identifies that the DataRAMSize feature exists on the BMX module.
≡	PLIB_BMX_ExistsDataRamWaitState	Identifies that the DataRamWaitState feature exists on the BMX module.
≡	PLIB_BMX_ExistsProgramFlashBootSize	Identifies that the ProgramFlashBootSize feature exists on the BMX module.
≡	PLIB_BMX_ExistsProgramFlashMemoryCacheDma	Identifies that the ProgramFlashMemoryCacheDma feature exists on the BMX module.
≡	PLIB_BMX_ExistsProgramFlashMemorySize	Identifies that the ProgramFlashMemorySize feature exists on the BMX module.
≡	PLIB_BMX_ExistsProgramFlashPartition	Identifies that the ProgramFlashPartition feature exists on the BMX module.

Memory Access Control Routines

	Name	Description
≡	PLIB_BMX_DataRAMKernelProgramOffsetGet	Gets the offset (from start of RAM) of the kernel program partition.
≡	PLIB_BMX_DataRAMPartitionSet	Sets the size of the kernel and user partitions in data RAM memory.
≡	PLIB_BMX_DataRAMSizeGet	Gets the size of data RAM memory.
≡	PLIB_BMX_DataRAMUserDataOffsetGet	Gets the offset (from start of RAM) of the user data partition.
≡	PLIB_BMX_DataRAMUserProgramOffsetGet	Gets the offset (from start of RAM) of the user program partition.
≡	PLIB_BMX_DataRamWaitStateGet	Returns the number of data RAM Wait states.
≡	PLIB_BMX_DataRamWaitStateSet	Sets the number of data RAM Wait states.
≡	PLIB_BMX_ProgramFlashBootSizeGet	Gets the size of boot program Flash memory.
≡	PLIB_BMX_ProgramFlashMemorySizeGet	Gets the size of program Flash memory.
≡	PLIB_BMX_ProgramFlashPartitionGet	Gets the size of the kernel partition in program Flash memory.
≡	PLIB_BMX_ProgramFlashPartitionSet	Sets the size of the kernel and user partitions in program Flash memory.

Program Flash Cache Routines

	Name	Description
≡	PLIB_BMX_ProgramFlashMemoryCacheDmaDisable	Disables the bus matrix program Flash cacheability for DMA.
≡	PLIB_BMX_ProgramFlashMemoryCacheDmaEnable	Enables the bus matrix program Flash cacheability for DMA.

Description

The BMX peripheral library consists of a set of interface routines, data types and constants, and macros provided by the [plib_bmx.h](#) header file. This section describes those items.

5.6.3.5.1 Bus Exception Routines**5.6.3.5.1.1 PLIB_BMX_BusExceptionDataDisable Function****C**

```
void PLIB_BMX_BusExceptionDataDisable(
    BMX_MODULE_ID index
);
```

Description

This function disables the data bus exception.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be disabled

Returns

None.

Remarks

This function implements an operation of the BusExceptionData feature. This feature may not be available on all devices. Please

refer to the specific device data sheet to determine availability or use [PLIB_BMX_ExistsBusExceptionData](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_BMX_BusExceptionDataDisable(BMX_ID_0);
```

5.6.3.5.1.2 PLIB_BMX_BusExceptionDataEnable Function**C**

```
void PLIB_BMX_BusExceptionDataEnable(  
    BMX_MODULE_ID index  
);
```

Description

This function enables the Data bus exception.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be enabled

Returns

None.

Remarks

This function implements an operation of the BusExceptionData feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_BMX_ExistsBusExceptionData](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_BMX_BusExceptionDataEnable(BMX_ID_0);
```

5.6.3.5.1.3 PLIB_BMX_BusExceptionDMADisable Function**C**

```
void PLIB_BMX_BusExceptionDMADisable(  
    BMX_MODULE_ID index  
);
```

Description

This function disables the DMA bus exception.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be disabled

Returns

None.

Remarks

This function implements an operation of the BusExceptionDMA feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_BMX_ExistsBusExceptionDMA](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_BMX_BusExceptionDMADisable(BMX_ID_0);
```

5.6.3.5.1.4 PLIB_BMX_BusExceptionDMAEnable Function**C**

```
void PLIB_BMX_BusExceptionDMAEnable(  
    BMX_MODULE_ID index  
);
```

Description

This function enables the DMA bus exception.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be enabled

Returns

None.

Remarks

This function implements an operation of the BusExceptionDMA feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_BMX_ExistsBusExceptionDMA](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_BMX_BusExceptionDMAEnable(BMX_ID_0);
```

5.6.3.5.1.5 PLIB_BMX_BusExceptionICDDisable Function**C**

```
void PLIB_BMX_BusExceptionICDDisable(  
    BMX_MODULE_ID index  
);
```

Description

This function disables the ICD bus exception.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be disabled

Returns

None.

Remarks

This function implements an operation of the BusExceptionICD feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_BMX_ExistsBusExceptionICD](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_BMX_BusExceptionICDDisable(BMX_ID_0);
```

5.6.3.5.1.6 PLIB_BMX_BusExceptionICDEnable Function**C**

```
void PLIB_BMX_BusExceptionICDEnable(  
    BMX_MODULE_ID index  
);
```

Description

This function enables the ICD bus exception.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be enabled

Returns

None.

Remarks

This function implements an operation of the BusExceptionICD feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_BMX_ExistsBusExceptionICD](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_BMX_BusExceptionICDEnable(BMX_ID_0);
```

5.6.3.5.1.7 PLIB_BMX_BusExceptionInstructionDisable Function**C**

```
void PLIB_BMX_BusExceptionInstructionDisable(  
    BMX_MODULE_ID index  
);
```

Description

This function disables the instruction bus exception.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be disabled

Returns

None.

Remarks

This function implements an operation of the BusExceptionInstruction feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_BMX_ExistsBusExceptionInstruction](#) in your application to to automatically determine whether this feature is available.

Example

```
PLIB_BMX_BusExceptionInstructionDisable(BMX_ID_0);
```

5.6.3.5.1.8 PLIB_BMX_BusExceptionInstructionEnable Function**C**

```
void PLIB_BMX_BusExceptionInstructionEnable(  
    BMX_MODULE_ID index  
);
```

Description

This function enables the instruction bus exception.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be enabled

Returns

None.

Remarks

This function implements an operation of the BusExceptionInstruction feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_BMX_ExistsBusExceptionInstruction](#) in your application to to automatically determine whether this feature is available.

Example

```
PLIB_BMX_BusExceptionInstructionEnable(BMX_ID_0);
```

5.6.3.5.1.9 PLIB_BMX_BusExceptionIXIDisable Function**C**

```
void PLIB_BMX_BusExceptionIXIDisable(  
    BMX_MODULE_ID index  
);
```

Description

This function disables the IXI bus exception.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be disabled

Returns

None.

Remarks

This function implements an operation of the BusExceptionIXI feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_BMX_ExistsBusExceptionIXI](#) in your application to to automatically determine whether this feature is available.

Example

```
PLIB_BMX_BusExceptionIXIDisable(BMX_ID_0);
```

5.6.3.5.1.10 PLIB_BMX_BusExceptionIXIEnable Function**C**

```
void PLIB_BMX_BusExceptionIXIEnable(  
    BMX_MODULE_ID index  
);
```

Description

This function enables the IXI bus exception.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be enabled

Returns

None.

Remarks

This function implements an operation of the BusExceptionIXI feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_BMX_ExistsBusExceptionIXI](#) in your application to to automatically determine whether this feature is available.

Example

```
PLIB_BMX_BusExceptionIXIEnable(BMX_ID_0);
```

5.6.3.5.2 Program Flash Cache Routines**5.6.3.5.2.1 PLIB_BMX_ProgramFlashMemoryCacheDmaDisable Function****C**

```
void PLIB_BMX_ProgramFlashMemoryCacheDmaDisable(  
    BMX_MODULE_ID index
```

```
);
```

Description

This function disables the program Flash cacheability for DMA.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be disabled

Returns

None.

Remarks

This function implements an operation of the ProgramFlashMemoryCacheDma feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_BMX_ExistsProgramFlashMemoryCacheDma](#) in your application to to automatically determine whether this feature is available.

Example

```
PLIB_BMX_ProgramFlashMemoryCacheDmaDisable(BMX_ID_0);
```

5.6.3.5.2.2 PLIB_BMX_ProgramFlashMemoryCacheDmaEnable Function

C

```
void PLIB_BMX_ProgramFlashMemoryCacheDmaEnable(  
    BMX_MODULE_ID index  
);
```

Description

This function enables the program Flash cacheability for DMA.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be enabled

Returns

None.

Remarks

This function implements an operation of the ProgramFlashMemoryCacheDma feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_BMX_ExistsProgramFlashMemoryCacheDma](#) in your application to to automatically determine whether this feature is available.

Example

```
PLIB_BMX_ProgramFlashMemoryCacheDmaEnable(BMX_ID_0);
```

5.6.3.5.3 Arbiter Routines

5.6.3.5.3.1 PLIB_BMX_ArbitrationModeGet Function

C

```
PLIB_BMX_ARB_MODE PLIB_BMX_ArbitrationModeGet(  
    BMX_MODULE_ID index  
);
```

Description

This function returns the bus matrix arbitration mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be read

Returns

[PLIB_BMX_ARB_MODE](#) enumerator value representing the arbitration mode.

Remarks

This function implements an operation of the ArbitrationMode feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_BMX_ExistsArbitrationMode](#) in your application to to automatically determine whether this feature is available.

Example

```
PLIB_BMX_ARB_MODE mode;  
mode = PLIB_BMX_ArbitrationModeGet(BMX_ID_0);
```

5.6.3.5.3.2 PLIB_BMX_ArbitrationModeSet Function

C

```
void PLIB_BMX_ArbitrationModeSet(  
    BMX_MODULE_ID index,  
    PLIB_BMX_ARB_MODE mode  
);
```

Description

This function sets the bus matrix arbitration mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
mode	Identifies the desired arbitration mode

Returns

None.

Remarks

This function implements an operation of the ArbitrationMode feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_BMX_ExistsArbitrationMode](#) in your application to to

automatically determine whether this feature is available.

Example

```
PLIB_BMX_ArbitrationModeSet(BMX_ID_0, PLIB_BMX_ARB_MODE_DMA);
```

5.6.3.5.4 Memory Access Control Routines

5.6.3.5.4.1 PLIB_BMX_DataRAMKernelProgramOffsetGet Function

C

```
size_t PLIB_BMX_DataRAMKernelProgramOffsetGet(  
    BMX_MODULE_ID index  
);
```

Description

This function returns the offset of start address of the kernel program RAM partition. This represents the size of the kernel data RAM partition.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be read

Returns

Offset of kernel program partition from base of RAM.

Remarks

This function implements an operation of the DataRAMPartition feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_BMX_ExistsDataRAMPartition](#) in your application to automatically determine whether this feature is available.

Example

```
size_t kernProgOffset;  
kernProgOffset = PLIB_BMX_DataRAMKernelProgramOffsetGet(BMX_ID_0);
```

5.6.3.5.4.2 PLIB_BMX_DataRAMPartitionSet Function

C

```
void PLIB_BMX_DataRAMPartitionSet(  
    BMX_MODULE_ID index,  
    size_t kernProgOffset,  
    size_t userDataOffset,  
    size_t userProgOffset  
);
```

Description

This function sets the size of the kernel and user partitions in the data RAM memory (DRM). By default, the entire data RAM is mapped to Kernel mode and all of the offsets are zero. To partition the data RAM, all of the offsets must be set to a minimum of one DRM block size. If any of the offsets are set to zero, the entire data RAM is allocated to kernel data. The partitions must be a multiple of [PLIB_BMX_DRM_BLOCK_SIZE](#). If programmed with a value that is not a multiple of [PLIB_BMX_DRM_BLOCK_SIZE](#), the value will be automatically truncated to [PLIB_BMX_DRM_BLOCK_SIZE](#).

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
kernProgOffset	Size of the offset of the Kernel Program partition
userDataOffset	Size of the offset of the User Data partition
userProgOffset	Size of the offset of the User Program partition

Returns

None.

Remarks

This function implements an operation of the DataRAMPartition feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_BMX_ExistsDataRAMPartition](#) in your application to automatically determine whether this feature is available.

Example

```
//Total Data RAM = 32 KB.
size_t totalRamSize;
size_t kernDataRamSize = (3 * PLIB_BMX_DRM_BLOCK_SIZE);
size_t kernProgRamSize = (2 * PLIB_BMX_DRM_BLOCK_SIZE);
size_t userDataRamSize = (6 * PLIB_BMX_DRM_BLOCK_SIZE);
size_t userProgRamSize = (5 * PLIB_BMX_DRM_BLOCK_SIZE);

//Get Size of Data RAM
totalRamSize = PLIB_BMX_DataRAMSizeGet(BMX_ID_0);

//Verify our partition sizes fit our RAM
if ((kernDataRamSize + kernProgRamSize + userDataRamSize +
    userProgRamSize) != totalRamSize)
{
    printf("RAM Partitioning Error\n");
}

size_t kernProgOffset;
size_t userDataOffset;
size_t userProgOffset;

kernProgOffset = kernDataRamSize;
userDataOffset = kernDataRamSize + kernProgRamSize;
userProgOffset = userDataOffset + userDataRamSize;

PLIB_BMX_DataRAMPartitionSet(BMX_ID_0, kernProgOffset,
    userDataOffset, userProgOffset);
```

5.6.3.5.4.3 PLIB_BMX_DataRAMSizeGet Function**C**

```
size_t PLIB_BMX_DataRAMSizeGet(
    BMX_MODULE_ID index
);
```

Description

This function returns the size of the data RAM memory.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be read

Returns

Size of data RAM memory.

Remarks

This function implements an operation of the DataRAMSize feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_BMX_ExistsDataRAMSize](#) in your application to automatically determine whether this feature is available.

Example

```
size_t drmSize;
drnSize = PLIB_BMX_DataRAMSizeGet(BMX_ID_0);
```

5.6.3.5.4.4 PLIB_BMX_DataRAMUserDataOffsetGet Function**C**

```
size_t PLIB_BMX_DataRAMUserDataOffsetGet(
    BMX_MODULE_ID index
);
```

Description

This function returns the offset of start address of the user data RAM partition. Subtracting the kernel program offset from the user data offset gives the size of the kernel program RAM partition.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

Offset of user data partition from base of RAM.

Remarks

This function implements an operation of the DataRAMPartition feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_BMX_ExistsDataRAMPartition](#) in your application to automatically determine whether this feature is available.

Example

```
size_t userDataOffset;
userDataOffset = PLIB_BMX_DataRAMUserDataOffsetGet(BMX_ID_0);
```

5.6.3.5.4.5 PLIB_BMX_DataRAMUserProgramOffsetGet Function**C**

```
size_t PLIB_BMX_DataRAMUserProgramOffsetGet(
    BMX_MODULE_ID index
);
```

```
);
```

Description

This function returns the offset of start address of the user program RAM partition. Subtracting the user data offset from the user program offset gives the size of the user data RAM partition.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be read

Returns

Offset of user data partition from base of RAM.

Remarks

This function implements an operation of the DataRAMPartition feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_BMX_ExistsDataRAMPartition](#) in your application to automatically determine whether this feature is available.

Example

```
size_t userProgOffset;  
userProgOffset = PLIB_BMX_DataRAMUserProgramOffsetGet(BMX_ID_0);
```

5.6.3.5.4.6 PLIB_BMX_DataRamWaitStateGet Function**C**

```
PLIB_BMX_DATA_RAM_WAIT_STATES PLIB_BMX_DataRamWaitStateGet(  
    BMX_MODULE_ID index  
);
```

Description

This function returns the number of data RAM Wait states.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be read

Returns

[PLIB_BMX_DATA_RAM_WAIT_STATES](#) enumeration representing the number of wait states.

Remarks

This function implements an operation of the DataRamWaitState feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_BMX_ExistsDataRamWaitState](#) in your application to automatically determine whether this feature is available.

Example

```
PLIB_BMX_DATA_RAM_WAIT_STATES wait;  
wait = PLIB_BMX_DataRamWaitStateGet(BMX_ID_0);
```

5.6.3.5.4.7 PLIB_BMX_DataRamWaitStateSet Function

C

```
void PLIB_BMX_DataRamWaitStateSet(  
    BMX_MODULE_ID index,  
    PLIB_BMX_DATA_RAM_WAIT_STATES wait  
);
```

Description

This function sets the number of data RAM Wait states.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
PLIB_BMX_DATA_RAM_WAIT_STATES	Enumeration representing the number of Wait states

Returns

None.

Remarks

This function implements an operation of the DataRamWaitState feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_BMX_ExistsDataRamWaitState](#) in your application to to automatically determine whether this feature is available.

Example

```
PLIB_BMX_DataRamWaitStateSet(BMX_ID_0, PLIB_BMX_DATA_RAM_WAIT_ONE);
```

5.6.3.5.4.8 PLIB_BMX_ProgramFlashBootSizeGet Function

C

```
size_t PLIB_BMX_ProgramFlashBootSizeGet(  
    BMX_MODULE_ID index  
);
```

Description

This function returns the size of the boot program Flash memory.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be read

Returns

Size of boot program Flash memory.

Remarks

This function implements an operation of the ProgramFlashBootSize feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_BMX_ExistsProgramFlashBootSize](#) in your application to to automatically determine whether this feature is available.

Example

```
size_t bootSize;  
bootSize = PLIB_BMX_ProgramFlashBootSizeGet(BMX_ID_0);
```

5.6.3.5.4.9 PLIB_BMX_ProgramFlashMemorySizeGet Function**C**

```
size_t PLIB_BMX_ProgramFlashMemorySizeGet(  
    BMX_MODULE_ID index  
);
```

Description

This function returns the size of the program Flash memory.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be read

Returns

Size of program Flash memory.

Remarks

This function implements an operation of the ProgramFlashMemorySize feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_BMX_ExistsProgramFlashMemorySize](#) in your application to automatically determine whether this feature is available.

Example

```
size_t pfmSize;  
pfmSize = PLIB_BMX_ProgramFlashMemorySizeGet(BMX_ID_0);
```

5.6.3.5.4.10 PLIB_BMX_ProgramFlashPartitionGet Function**C**

```
size_t PLIB_BMX_ProgramFlashPartitionGet(  
    BMX_MODULE_ID index  
);
```

Description

This function gets the size of the kernel partition in the program Flash memory. The remaining Flash is set to user mode, and may be accessed by user programs. On reset, the entire Flash is mapped to Kernel mode, and this function will return zero.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be read

Returns

Size of the kernel partition in program Flash memory.

Remarks

This function implements an operation of the ProgramFlashPartition feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_BMX_ExistsProgramFlashPartition](#) in your application to automatically determine whether this feature is available.

Example

```
size_t pfmSize;
size_t userPfmSize;
size_t kernPfmSize;

// Get size of PFM
pfmSize = PLIB_BMX_ProgramFlashMemorySizeGet(BMX_ID_0);
kernPfmSize = PLIB_BMX_ProgramFlashPartitionGet(BMX_ID_0);
userPfmSize = pfmSize - kernPfmSize;
```

5.6.3.5.4.11 PLIB_BMX_ProgramFlashPartitionSet Function

C

```
void PLIB_BMX_ProgramFlashPartitionSet(
    BMX_MODULE_ID index,
    size_t user_size
);
```

Description

This function sets the size of the kernel and user partitions in program Flash memory (PFM). Kernel programs may access both partitions, but user programs may not access the kernel partition (including peripheral registers). By default, the entire Flash is mapped to Kernel mode. If called with a non-zero value, a user partition of size `user_size` is created, and the remaining PFM remains in Kernel mode. The user partition must be a multiple of [PLIB_BMX_PFM_BLOCK_SIZE](#). If programmed with a value that is not a multiple of [PLIB_BMX_PFM_BLOCK_SIZE](#), the value will be truncated to a [PLIB_BMX_PFM_BLOCK_SIZE](#) boundary.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
userSize	Size of the user partition in PFM

Returns

None.

Remarks

This function implements an operation of the ProgramFlashPartition feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_BMX_ExistsProgramFlashPartition](#) in your application to automatically determine whether this feature is available.

Example

```
size_t pfm_size;
size_t userSize = (6 * PLIB_BMX_PFM_BLOCK_SIZE);
size_t userOffset;

// Get size of PFM
size_t pfmSize;
pfmSize = PLIB_BMX_ProgramFlashMemorySizeGet(BMX_ID_0);
userOffset = pfmSize - userSize;
```

```
if (userOffset > 0)
{
    PLIB_BMX_ProgramFlashPartitionSet(BMX_ID_0, userOffset);
}
```

5.6.3.5.5 Data Types and Constants

5.6.3.5.5.1 BMX_MODULE_ID Enumeration

C

```
typedef enum {
    BMX_ID_0,
    BMX_NUMBER_OF_MODULES
} BMX_MODULE_ID;
```

Description

Module ID

This enumeration lists the possible Module IDs for the bus matrix.

Remarks

Refer to the specific device data sheet to obtain the correct number of modules defined for the desired device.

5.6.3.5.5.2 PLIB_BMX_ARB_MODE Enumeration

C

```
typedef enum {
    PLIB_BMX_ARB_MODE_INST,
    PLIB_BMX_ARB_MODE_DMA,
    PLIB_BMX_ARB_MODE_ROT
} PLIB_BMX_ARB_MODE;
```

Description

Arbitration Mode

This enumeration lists the possible arbitration modes for the bus matrix.

Members

Members	Description
PLIB_BMX_ARB_MODE_INST	Arbitration Mode 0
PLIB_BMX_ARB_MODE_DMA	Arbitration Mode 1
PLIB_BMX_ARB_MODE_ROT	Arbitration Mode 2

5.6.3.5.5.3 PLIB_BMX_DATA_RAM_WAIT_STATES Enumeration

C

```
typedef enum {
    PLIB_BMX_DATA_RAM_WAIT_ZERO,
    PLIB_BMX_DATA_RAM_WAIT_ONE
} PLIB_BMX_DATA_RAM_WAIT_STATES;
```

Description

Wait States

This definition specifies the number of data RAM wait states for address setup.

Members

Members	Description
PLIB_BMX_DATA_RAM_WAIT_ZERO	Zero wait states for address setup
PLIB_BMX_DATA_RAM_WAIT_ONE	One wait state for address setup

5.6.3.5.5.4 PLIB_BMX_EXCEPTION_SRC Enumeration**C**

```
typedef enum {
    PLIB_BMX_ERR_IXI,
    PLIB_BMX_ERR_ICD,
    PLIB_BMX_ERR_DMA,
    PLIB_BMX_ERR_DATA,
    PLIB_BMX_ERR_INST
} PLIB_BMX_EXCEPTION_SRC;
```

Description

Exception Bits

This definition specifies which events trigger a bus exception.

Members

Members	Description
PLIB_BMX_ERR_IXI	IXI Shared Bus
PLIB_BMX_ERR_ICD	In-Circuit Debugger
PLIB_BMX_ERR_DMA	DMA Controller
PLIB_BMX_ERR_DATA	CPU Data Bus
PLIB_BMX_ERR_INST	CPU Instruction Bus

5.6.3.5.5.5 PLIB_BMX_DRM_BLOCK_SIZE Macro**C**

```
#define PLIB_BMX_DRM_BLOCK_SIZE 2048
```

Description

Program Flash Partition Block Size

This definition specifies the minimum partition block size in data RAM memory.

5.6.3.5.5.6 PLIB_BMX_PFM_BLOCK_SIZE Macro**C**

```
#define PLIB_BMX_PFM_BLOCK_SIZE 2048
```

Description

Program Flash Partition Block Size

This definition specifies the minimum partition block size in program Flash memory.

5.6.3.5.6 Feature Existence Routines

5.6.3.5.6.1 PLIB_BMX_ExistsArbitrationMode Function

C

```
bool PLIB_BMX_ExistsArbitrationMode(  
    BMX_MODULE_ID index  
);
```

Description

This interface identifies that the ArbitrationMode feature is available on the BMX module. When this interface returns true, these functions are supported on the device:

- [PLIB_BMX_ArbitrationModeSet](#)
- [PLIB_BMX_ArbitrationModeGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The ArbitrationMode feature is supported on the device
- false = The ArbitrationMode feature is not supported on the device

Remarks

None.

5.6.3.5.6.2 PLIB_BMX_ExistsBusExceptionData Function

C

```
bool PLIB_BMX_ExistsBusExceptionData(  
    BMX_MODULE_ID index  
);
```

Description

This interface identifies that the BusExceptionData feature is available on the BMX module. When this interface returns true, these functions are supported on the device:

- [PLIB_BMX_BusExceptionDataEnable](#)
- [PLIB_BMX_BusExceptionDataDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The BusExceptionData feature is supported on the device
- false = The BusExceptionData feature is not supported on the device

Remarks

None.

5.6.3.5.6.3 PLIB_BMX_ExistsBusExceptionDMA Function**C**

```
bool PLIB_BMX_ExistsBusExceptionDMA(  
    BMX_MODULE_ID index  
);
```

Description

This interface identifies that the BusExceptionDMA feature is available on the BMX module. When this interface returns true, these functions are supported on the device:

- [PLIB_BMX_BusExceptionDMAEnable](#)
- [PLIB_BMX_BusExceptionDMADisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The BusExceptionDMA feature is supported on the device
- false = The BusExceptionDMA feature is not supported on the device

Remarks

None.

5.6.3.5.6.4 PLIB_BMX_ExistsBusExceptionICD Function**C**

```
bool PLIB_BMX_ExistsBusExceptionICD(  
    BMX_MODULE_ID index  
);
```

Description

This interface identifies that the BusExceptionICD feature is available on the BMX module. When this interface returns true, these functions are supported on the device:

- [PLIB_BMX_BusExceptionICDEnable](#)
- [PLIB_BMX_BusExceptionICDDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The BusExceptionICD feature is supported on the device
- false = TheWhen BusExceptionICD feature is not supported on the device

Remarks

None.

5.6.3.5.6.5 PLIB_BMX_ExistsBusExceptionInstruction Function**C**

```
bool PLIB_BMX_ExistsBusExceptionInstruction(  
    BMX_MODULE_ID index  
);
```

Description

This interface identifies that the BusExceptionInstruction feature is available on the BMX module. When this interface returns true, these functions are supported on the device:

- [PLIB_BMX_BusExceptionInstructionEnable](#)
- [PLIB_BMX_BusExceptionInstructionDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The BusExceptionInstruction feature is supported on the device
- false = The BusExceptionInstruction feature is not supported on the device

Remarks

None.

5.6.3.5.6.6 PLIB_BMX_ExistsBusExceptionIXI Function**C**

```
bool PLIB_BMX_ExistsBusExceptionIXI(  
    BMX_MODULE_ID index  
);
```

Description

This interface identifies that the BusExceptionIXI feature is available on the BMX module. When this interface returns true, these functions are supported on the device:

- [PLIB_BMX_BusExceptionIXIEnable](#)
- [PLIB_BMX_BusExceptionIXIDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The BusExceptionIXI feature is supported on the device
- false = The BusExceptionIXI feature is not supported on the device

Remarks

None.

5.6.3.5.6.7 PLIB_BMX_ExistsDataRAMPartition Function**C**

```
bool PLIB_BMX_ExistsDataRAMPartition(  
    BMX_MODULE_ID index  
);
```

Description

This interface identifies that the DataRAMPartition feature is available on the BMX module. When this interface returns true, these functions are supported on the device:

- [PLIB_BMX_DataRAMPartitionSet](#)
- [PLIB_BMX_DataRAMKernelProgramOffsetGet](#)
- [PLIB_BMX_DataRAMUserDataOffsetGet](#)
- [PLIB_BMX_DataRAMUserProgramOffsetGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The DataRAMPartition feature is supported on the device
- false = The DataRAMPartition feature is not supported on the device

Remarks

None.

5.6.3.5.6.8 PLIB_BMX_ExistsDataRAMSize Function**C**

```
bool PLIB_BMX_ExistsDataRAMSize(  
    BMX_MODULE_ID index  
);
```

Description

This interface identifies that the DataRAMSize feature is available on the BMX module. When this interface returns true, this function is supported on the device:

- [PLIB_BMX_DataRAMSizeGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The DataRAMSize feature is supported on the device
- false = The DataRAMSize feature is not supported on the device

Remarks

None.

5.6.3.5.6.9 PLIB_BMX_ExistsDataRamWaitState Function**C**

```
bool PLIB_BMX_ExistsDataRamWaitState(  
    BMX_MODULE_ID index  
);
```

Description

This interface identifies that the DataRamWaitState feature is available on the BMX module. When this interface returns true, these functions are supported on the device:

- [PLIB_BMX_DataRamWaitStateSet](#)
- [PLIB_BMX_DataRamWaitStateGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The DataRamWaitState feature is supported on the device
- false = The DataRamWaitState feature is not supported on the device

Remarks

None.

5.6.3.5.6.10 PLIB_BMX_ExistsProgramFlashBootSize Function**C**

```
bool PLIB_BMX_ExistsProgramFlashBootSize(  
    BMX_MODULE_ID index  
);
```

Description

This interface identifies that the ProgramFlashBootSize feature is available on the BMX module. When this interface returns true, this function is supported on the device:

- [PLIB_BMX_ProgramFlashBootSizeGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The ProgramFlashBootSize feature is supported on the device
- false = The ProgramFlashBootSize feature is not supported on the device

Remarks

None.

5.6.3.5.6.11 PLIB_BMX_ExistsProgramFlashMemoryCacheDma Function**C**

```
bool PLIB_BMX_ExistsProgramFlashMemoryCacheDma(  
    BMX_MODULE_ID index  
);
```

Description

This interface identifies that the ProgramFlashMemoryCacheDma feature is available on the BMX module. When this interface returns true, these functions are supported on the device:

- [PLIB_BMX_ProgramFlashMemoryCacheDmaEnable](#)
- [PLIB_BMX_ProgramFlashMemoryCacheDmaDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The ProgramFlashMemoryCacheDma feature is supported on the device
- false = The ProgramFlashMemoryCacheDma feature is not supported on the device

Remarks

None.

5.6.3.5.6.12 PLIB_BMX_ExistsProgramFlashMemorySize Function**C**

```
bool PLIB_BMX_ExistsProgramFlashMemorySize(  
    BMX_MODULE_ID index  
);
```

Description

This interface identifies that the ProgramFlashMemorySize feature is available on the BMX module. When this interface returns true, this function is supported on the device:

- [PLIB_BMX_ProgramFlashMemorySizeGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The ProgramFlashMemorySize feature is supported on the device
- false = The ProgramFlashMemorySize feature is not supported on the device

Remarks

None.

5.6.3.5.6.13 PLIB_BMX_ExistsProgramFlashPartition Function

C

```
bool PLIB_BMX_ExistsProgramFlashPartition(  
    BMX_MODULE_ID index  
);
```

Description

This interface identifies that the ProgramFlashPartition feature is available on the BMX module. When this interface returns true, these functions are supported on the device:

- [PLIB_BMX_ProgramFlashPartitionGet](#)
- [PLIB_BMX_ProgramFlashPartitionSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The ProgramFlashPartition feature is supported on the device
- false = The ProgramFlashPartition feature is not supported on the device

Remarks

None.

5.6.3.6 Files

Files

Name	Description
plib_bmx.h	Defines the Bus Matrix (BMX) Peripheral Library interface

Description

5.6.3.6.1 plib_bmx.h

Bus Matrix Peripheral Library Interface Header

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the bus matrix (BMX) peripheral library (PLIB) for Microchip microcontrollers. The definitions in this file are for the bus matrix controller module.

Enumerations

	Name	Description
	<u>PLIB_BMX_ARB_MODE</u>	Lists the possible arbitration modes for the bus matrix.
	<u>PLIB_BMX_DATA_RAM_WAIT_STATES</u>	Defines the number of data RAM wait states for address setup.
	<u>PLIB_BMX_EXCEPTION_SRC</u>	Defines which events trigger a bus exception.

Functions

	Name	Description
	<u>PLIB_BMX_ArbitrationModeGet</u>	Returns the bus matrix arbitration mode.
	<u>PLIB_BMX_ArbitrationModeSet</u>	Sets the bus matrix arbitration mode.
	<u>PLIB_BMX_BusExceptionDataDisable</u>	Disables the data bus exception.
	<u>PLIB_BMX_BusExceptionDataEnable</u>	Enables the Data bus exception.
	<u>PLIB_BMX_BusExceptionDMADisable</u>	Disables the DMA bus exception.
	<u>PLIB_BMX_BusExceptionDMAEnable</u>	Enables the DMA bus exception.
	<u>PLIB_BMX_BusExceptionICDDisable</u>	Disables the ICD bus exception.
	<u>PLIB_BMX_BusExceptionICDEnable</u>	Enables the ICD bus exception.
	<u>PLIB_BMX_BusExceptionInstructionDisable</u>	Disables the instruction bus exception.
	<u>PLIB_BMX_BusExceptionInstructionEnable</u>	Enables the instruction bus exception.
	<u>PLIB_BMX_BusExceptionIXIDisable</u>	Disables the IXI bus exception.
	<u>PLIB_BMX_BusExceptionIXIEnable</u>	Enables the IXI bus exception.
	<u>PLIB_BMX_DataRAMKernelProgramOffsetGet</u>	Gets the offset (from start of RAM) of the kernel program partition.
	<u>PLIB_BMX_DataRAMPartitionSet</u>	Sets the size of the kernel and user partitions in data RAM memory.
	<u>PLIB_BMX_DataRAMSizeGet</u>	Gets the size of data RAM memory.
	<u>PLIB_BMX_DataRAMUserDataOffsetGet</u>	Gets the offset (from start of RAM) of the user data partition.
	<u>PLIB_BMX_DataRAMUserProgramOffsetGet</u>	Gets the offset (from start of RAM) of the user program partition.
	<u>PLIB_BMX_DataRamWaitStateGet</u>	Returns the number of data RAM Wait states.
	<u>PLIB_BMX_DataRamWaitStateSet</u>	Sets the number of data RAM Wait states.
	<u>PLIB_BMX_ExistsArbitrationMode</u>	Identifies that the ArbitrationMode feature exists on the BMX module.
	<u>PLIB_BMX_ExistsBusExceptionData</u>	Identifies that the BusExceptionData feature exists on the BMX module.
	<u>PLIB_BMX_ExistsBusExceptionDMA</u>	Identifies that the BusExceptionDMA feature exists on the BMX module.
	<u>PLIB_BMX_ExistsBusExceptionICD</u>	Identifies that the BusExceptionICD feature exists on the BMX module.
	<u>PLIB_BMX_ExistsBusExceptionInstruction</u>	Identifies that the BusExceptionInstruction feature exists on the BMX module.

	PLIB_BMX_ExistsBusExceptionIXI	Identifies that the BusExceptionIXI feature exists on the BMX module.
	PLIB_BMX_ExistsDataRAMPartition	Identifies that the DataRAMPartition feature exists on the BMX module.
	PLIB_BMX_ExistsDataRAMSize	Identifies that the DataRAMSize feature exists on the BMX module.
	PLIB_BMX_ExistsDataRamWaitState	Identifies that the DataRamWaitState feature exists on the BMX module.
	PLIB_BMX_ExistsProgramFlashBootSize	Identifies that the ProgramFlashBootSize feature exists on the BMX module.
	PLIB_BMX_ExistsProgramFlashMemoryCacheDma	Identifies that the ProgramFlashMemoryCacheDma feature exists on the BMX module.
	PLIB_BMX_ExistsProgramFlashMemorySize	Identifies that the ProgramFlashMemorySize feature exists on the BMX module.
	PLIB_BMX_ExistsProgramFlashPartition	Identifies that the ProgramFlashPartition feature exists on the BMX module.
	PLIB_BMX_ProgramFlashBootSizeGet	Gets the size of boot program Flash memory.
	PLIB_BMX_ProgramFlashMemoryCacheDmaDisable	Disables the bus matrix program Flash cacheability for DMA.
	PLIB_BMX_ProgramFlashMemoryCacheDmaEnable	Enables the bus matrix program Flash cacheability for DMA.
	PLIB_BMX_ProgramFlashMemorySizeGet	Gets the size of program Flash memory.
	PLIB_BMX_ProgramFlashPartitionGet	Gets the size of the kernel partition in program Flash memory.
	PLIB_BMX_ProgramFlashPartitionSet	Sets the size of the kernel and user partitions in program Flash memory.

Macros

	Name	Description
	PLIB_BMX_DRM_BLOCK_SIZE	Defines the minimum partition block size in data RAM memory.
	PLIB_BMX_PFM_BLOCK_SIZE	Defines the minimum partition block size in program Flash memory.

5.6.4 CAN Peripheral Library

5.6.4.1 Introduction

CAN Peripheral Library
for
Microchip Microcontrollers

The Controller Area Network (CAN) is used primarily in industrial and automotive applications. It is an asynchronous serial data communication protocol that provides reliable communication in an electrically noisy environment.

This library provides a low-level abstraction of the CAN module on Microchip microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, thus hiding differences from one microcontroller variant to another.

Note: Trademarks and Intellectual Property are property of their respective owners. Customers are responsible for obtaining appropriate licensing or rights before using this software.

5.6.4.2 Release Notes

MPLAB Harmony Version: v0.70b **CAN Peripheral Library Version :** 0.70b **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.6.4.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.6.4.4 How the Library Works

Note: Not all modes are available on all the devices. Please refer to the specific device data sheet to determine the set of modes that are supported for your device.

5.6.4.4.1 About CAN Protocol

The following section briefly discusses the CAN Protocol briefly. For complete details on the CAN protocol, refer to the CAN 2.0 specification available from Bosch.

The CAN bus protocol uses asynchronous communication. Information is passed from transmitters to receivers in data frames, which are composed of byte fields that define the contents of the data frame. This is shown in the figure below.

Each frame begins with a Start-of-Frame (SOF) bit and terminates with an End-of-Frame (EOF) bit field. The SOF is followed by arbitration and control fields, which identify the message type, format, length and priority. This information allows each node on the CAN bus to respond appropriately to the message. The data field conveys the message content and is of variable length, ranging from 0 to 8 bytes. Error protection is provided by the Cyclic Redundancy Check (CRC) and acknowledgement (ACK) fields.

5.6.4.4.1.1 Standard ID Message Format

The Standard ID message begins with a Start-of-Frame bit followed by a 12-bit arbitration field. The arbitration field contains an 11-bit identifier and the Remote Transmit Request (RTR) bit. The identifier defines the type of information contained in the message and is used by each receiving node to determine if the message is of interest. The RTR bit distinguishes a data frame from a remote frame. For a standard data frame, the RTR bit is clear.

Following the arbitration field is a 6-bit control field, which provides more information about the contents of the message. The first bit in the control field is an Identifier Extension (IDE) bit, which distinguishes the message as either a standard or extended data frame. A standard data frame is indicated by a dominant state (logic level '0') during transmission of the IDE bit. The second bit in the control field is a reserved (RBO) bit, which is in the dominant state (logic level '0'). The last 4 bits in the control field represent the Data Length Code (DLC), which specifies the number of data bytes present in the message.

The data field follows the control field. This field carries the message data – the actual payload of the data frame. This field is of variable length, ranging from 0 to 8 bytes. The number of bytes is user-selectable.

The data field is followed by the Cyclic Redundancy Check (CRC) field, which is a 15-bit CRC sequence with one delimiter bit. The acknowledgement (ACK) field is sent as a recessive bit (logic level '1') and is overwritten as a dominant bit by any receiver that has received the data correctly. The message is acknowledged by the receiver regardless of the result of the acceptance filter comparison. The last field is the End-of-Frame field, which consists of 7 recessive bits that indicate the end of message.

5.6.4.4.1.2 Extended ID Message Format

The Extended ID Message frame begins with an SFF bit followed by a 31-bit arbitration field. The arbitration field for the extended data frame contains 29 identifier bits in two fields separated by a Substitute Remote Request (SRR) bit and an IDE bit. The SRR bit determines if the message is a remote frame. SRR = 1 for extended data frames. The IDE bit indicates the data frame type. For the extended data frame, IDE = 1.

The extended data frame Control field consists of 7 bits. The first bit is the RTR. For the extended data frame, RTR = 0. The next two bits, RB1 and RB0, are reserved bits that are in the dominant state (logic level '0'). The last 4 bits in the Control field are the Data Length Code, which specifies the number of data bytes present in the message. The remaining fields in an extended data frame are identical to a standard data frame.

5.6.4.4.1.3 Can Bit Time Quanta

The nominal bit rate is the number of bits per second transmitted on the CAN bus.

Nominal bit time = $1 \div \text{Nominal Bit Rate}$.

There are four time segments in a bit time to compensate for any phase shifts due to oscillator drifts or propagation delays. These time segments do not overlap each other and are represented in terms of Time Quantum (TQ). One TQ is a fixed unit of time derived from the oscillator clock. The total number of time quanta in a nominal bit time must be programmed between 8 and 25 TQ.

Each bit transmission time consists of four time segments:

Synchronization Segment – This time segment synchronizes the different nodes connected on the CAN bus. A bit edge is expected to be within this segment. Based on CAN protocol, the Synchronization Segment is assumed to be one Time Quantum.

Propagation Segment – This time segment compensates for any time delay that may occur due to the bus line or due to the various transceivers connected on that bus.

Phase Segment 1 – This time segment compensates for errors that may occur due to phase shift in the edges. The time segment may be lengthened during resynchronization to compensate for the phase shift.

Phase Segment 2 – This time segment compensates for errors that may occur due to phase shift in the edges. The time segment may be shortened during resynchronization to compensate for the phase shift. The Phase Segment 2 time can be configured to be either programmable or specified by the Phase Segment 1 time.

Two types of synchronization are used – Hard Synchronization and Resynchronization. A Hard Synchronization occurs once at the start of a frame. Resynchronization occurs inside a frame.

Hard synchronization takes place on the recessive-to-dominant transition of the start bit. The bit time is restarted from that edge.

Resynchronization takes place when a bit edge does not occur within the Synchronization Segment in a message. One of the Phase Segments is shortened or lengthened by an amount that depends on the phase error in the signal. The maximum amount that can be used is determined by the Synchronization Jump Width parameter.

The length of Phase Segment 1 and Phase Segment 2 can be changed depending on oscillator tolerances of the transmitting and receiving node. Resynchronization compensates for any phase shifts that may occur due to the different oscillators used by the transmitting and receiving nodes.

Bit Lengthening – If the transmitting node in CAN has a slower oscillator than the receiving node, the next falling edge, and therefore, the sample point, can be delayed by lengthening Phase Segment 1 in the bit time.

Bit Shortening – If the transmitting node in CAN has a faster oscillator than the receiving node, then the next falling edge, and therefore, the sample point of the next bit, can be reduced by shortening the Phase Segment 2 in the bit time.

Synchronization Jump Width (SJW) – This determines the synchronization jump width by limiting the amount of lengthening or shortening that can be applied to the Phase Segment 1 and Phase Segment 2 time intervals. This segment should not be longer than Phase Segment 2 time. The width can be 1-4 TQ

5.6.4.4.2 Initialization of CAN

5.6.4.4.2.1 Mode Configuration

The CAN module must be enabled before configuration. Enabling the CAN module gives it control over the CAN pins of the device. The following code example shows how the `PLIB_CAN_Enable` function is used to enable the module.

```
/* This code expects the data direction settings to be done from other modules */  
/* Switch the CAN module ON */  
PLIB_CAN_Enable(CAN_ID_1);
```

The CAN module must be placed in Configuration mode before attempting to configure it. The following features are available in Configuration mode only:

- Configuring the CAN module clock and CAN bus speed
- Configuring the message acceptance filter mask
- Assigning the channel buffer memory
- Configuring channel size and Receive Channel Data-only mode.

The CAN module operating mode can be changed by using the `PLIB_CAN_OperationModeSelect` function. The caller should

wait until the operating mode is set before proceeding. The `PLIB_CAN_OperationModeGet` function can be used to obtain the current operating mode of the CAN module.

```
/* Switch the CAN module to Configuration mode. Wait until the switch is complete */
PLIB_CAN_Enable(CAN_ID_1);
PLIB_CAN_OperationModeSelect(CAN_ID_1, CAN_CONFIGURATION_MODE);
while(PLIB_CAN_OperationModeGet(CAN_ID_1) != CAN_CONFIGURATION_MODE);
```

The CAN module must be placed in Normal mode in order to be able to **send** and receive messages.

The caller should wait until the Normal operating mode is set before proceeding. The `PLIB_CAN_OperationModeSelect` function can be used to obtain the current operating mode of the CAN module.

```
/* Switch the CAN module to Normal mode. Wait until the switch is complete */
PLIB_CAN_OperationModeSelect(CAN_ID_1, CAN_NORMAL_MODE);
while(PLIB_CAN_OperationModeGet(CAN_ID_1) != CAN_NORMAL_MODE);
```

5.6.4.4.2.2 Setting Bus Speed

The bus speed at which the CAN node operates is determined by the CAN module clock and the number of Bit Time Quanta (TQ) assigned to the CAN bit.

The following code snippet shows an example of setting the CAN module clock and CAN bus speed. In this example, the number of Bit TQ is 10.

```
/* Configure the CAN Module Clock. The propagation segment, phase segment 1 and phase segment 2
 * are configured to have 3TQ. The CANSetSpeed function sets the baud. The CPU
 * core frequency is 80000000 Hz and the desired CAN bus speed is 250000 bps.
 */

PLIB_CAN_PhaseSegment2LengthSet(CAN_ID_1, CAN_TIME_SEGMENT_LEN_3TQ);
PLIB_CAN_PhaseSegment1LengthSet(CAN_ID_1, CAN_TIME_SEGMENT_LEN_3TQ);
PLIB_CAN_PropagationTimeSegmentSet(CAN_ID_1, CAN_TIME_SEGMENT_LEN_3TQ);
PLIB_CAN_PhaseSegment2LengthFreelyProgrammableEnable(CAN_ID_1);

PLIB_CAN_BusLine3TimesSamplingEnable(CAN_ID_1);
PLIB_CAN_SyncJumpWidthSet(CAN_ID_1, CAN_TIME_SEGMENT_LEN_2TQ);
```

5.6.4.4.2.3 Assigning Buffer Memory

The CAN module requires RAM memory to store received messages and queue message that need to be transmitted. The total amount of memory required depends on the size of each channel. While each channel has a minimum size of one message buffer (16 bytes), to simplify usage issues, channels should be used in a sequentially ascending order starting with channel 0.

To better understand the buffer memory requirements of the CAN module, consider the following examples:

Example 1: Two transmit channels (each with eight message buffers) and one full receive channel (with 10 message buffers):

- Two transmit channels with eight message buffers: $2 * 8 * 16 = 256$ bytes
- One receive channel with 10 message buffers: $1 * 10 * 16 = 160$ bytes
- Total memory required in bytes = 416 bytes

Example 2: Four transmit channels (two with eight message buffers and other two with 10 message buffers) and two full receive channels (one with 10 message buffers and one with 20 message buffers):

- Two transmit channels with eight message buffers: $2 * 8 * 16 = 256$ bytes
- Two transmit channels with 10 message buffers: $2 * 10 * 16 = 320$ bytes
- One receive channel with 10 message buffers: $1 * 10 * 16 = 160$ bytes
- One receive channel with 20 message buffers: $1 * 20 * 16 = 320$ bytes
- Total memory required in bytes = 1056 bytes

Example 3: One transmit channel (with maximum message buffers) and two receive Channels (one full receive with 10 message buffers and one data-only channel with maximum message buffers):

- One transmit channel with maximum (32) message buffers: $1 * 32 * 16 = 512$ bytes
- One receive channel with 10 message buffers: $1 * 10 * 16 = 160$ bytes
- One data-only receive channel with 32 message buffers: $1 * 32 * 8 = 256$ bytes
- Total memory required in bytes = 928 bytes

The [PLIB_CAN_MemoryBufferAssign](#) function is used to assign a memory buffer to the CAN module, which is shown in the following example.

```
/* Assign the buffer area to the CAN module.
 * In this case assign enough memory for 2
 * channels, each with 8 message buffers.*/

uint8_t MY_CAN_MessageFifoArea[2 * 8 * 16];
PLIB_CAN_MemoryBufferAssign(CAN_ID_1, MY_CAN_MessageFifoArea, (2 * 8 * 16));
```

5.6.4.4.2.4 Channel Configuration

To transmit and receive CAN messages, the user application must configure channels. The [PLIB_CAN_ChannelForTransmitSet](#) function is used to configure a channel for transmit operation. The [PLIB_CAN_ChannelForReceiveSet](#) function is used to configure a channel for receive operation.

Note: To receive CAN messages, at least one message acceptance filter with a receive channel must be configured.

A CAN Transmit channel can be enabled to process a Remote Transmit Request (RTR). In this case, the transmit channel will automatically transmit all queued messages when an RTR message is accepted by the CAN module.

The following code shows an example of configuring a CAN Transmit channel.

```
/* Configure CAN1 Channel 0 for Transmit operation. Allocate 8 message buffer,
 * disable the RTR feature and assign low medium priority for transmissions. */

PLIB_CAN_ChannelForTransmitSet(CAN_ID_1, CAN_CHANNEL0, 8, CAN_TX_RTR_DISABLED,
    CAN_LOW_MEDIUM_PRIORITY);
```

A CAN receive channel can be enabled to store the data payload portion of an accepted message. This mode is called the Data-only mode. The CAN module otherwise stores both the ID and data payload portion of the accepted message.

The following code shows an example of configuring a CAN Receive channel.

```
/* Configure CAN1 Channel 1 for Receive operation. Allocate 8 message buffers,
 * disable the Data-only feature (specify full receive mode). */

PLIB_CAN_ChannelForReceiveSet(CAN_ID_1, CAN_CHANNEL1, 8, CAN_RX_FULL_RECEIVE);
```

5.6.4.4.2.5 Filters and Masks Configuration

The CAN message acceptance filter allows an application to [accept](#) only selected messages from the CAN bus. The CAN module achieves this by comparing the Standard or Extended ID of a message with the configured filter ID. The message is accepted on an ID match. The accepted message is stored in the configured destination channel.

The CAN message acceptance filter mask directs the CAN module to ignore specified bits in the filter comparison. This allows the application to [accept](#) messages within an ID range.

At least one filter and one mask must be configured for the CAN module to be able to receive messages. The destination channel for a filter must be a receive channel unless the channel is a transmit channel with the RTR feature enabled.

The [PLIB_CAN_FilterConfigure](#) function is used to configure a message acceptance filter. The [PLIB_CAN_FilterMaskConfigure](#) function is used to configure a message acceptance filter mask. The filter and mask must be linked together to a channel. This is done using the [PLIB_CAN_FilterToChannelLink](#) function. The CAN filter should be enabled to allow messages to be processed.

This is done using the [PLIB_CAN_FilterEnable](#) function.

To better understand how the filter and masks can be used to implement filtering, consider the following code examples:

Example 1: Configure a CAN filter to [accept](#) a Standard ID message with ID 0x201

```
/* Only one message ID is to be accepted. All bits are to be compared
 * hence the mask value should be 0x7FF. The message type is Standard ID.
 * Configure CAN1, Filter 0, Mask 0 and set the destination channel as
 * Channel 1. */
```

```
PLIB_CAN_FilterConfigure(CAN_ID_1, CAN_FILTER0, 0x201, CAN_SID);
PLIB_CAN_FilterMaskConfigure(CAN_ID_1, CAN_FILTER_MASK0, 0x7FF, CAN_SID,
    CAN_FILTER_MASK_IDE_TYPE);
PLIB_CAN_FilterToChannelLink(CAN_ID_1, CAN_FILTER0, CAN_FILTER_MASK0,
    CAN_CHANNEL1);
PLIB_CAN_FilterEnable(CAN_ID_1, CAN_FILTER0);
```

Example 2: Configure a CAN filter to [accept](#) an Extended ID message with ID 0x8004001

```
/* Only one message ID is to be accepted. All bits are to be compared
 * hence the mask value should be 0x8004001. The message type is Extended ID.
 * Configure CAN1, Filter 0, Mask 0 and set the destination channel as
 * Channel 1. */
```

```
PLIB_CAN_FilterConfigure(CAN_ID_1, CAN_FILTER0, 0x8004001, CAN_EID);
PLIB_CAN_FilterMaskConfigure(CAN_ID_1, CAN_FILTER_MASK0, 0x3FFFFFFF, CAN_EID,
    CAN_FILTER_MASK_IDE_TYPE);
PLIB_CAN_FilterToChannelLink(CAN_ID_1, CAN_FILTER0, CAN_FILTER_MASK0,
    CAN_CHANNEL1);
PLIB_CAN_FilterEnable(CAN_ID_1, CAN_FILTER0);
```

Example 3: Configure a CAN filter to [accept](#) an Extended ID message within ID range 0x8004000 - 0x8004003

```
/* A message ID range is to be implemented. The 2 least significant bits can be
 * ignored. Therefore, the mask value should be 0x3FFFFFFC. The message type is
 * Extended ID. Configure CAN1, Filter 0, Mask 0 and set the destination channel
 * as Channel 1. */
```

```
PLIB_CAN_FilterConfigure(CAN_ID_1, CAN_FILTER0, 0x8004000, CAN_EID);
PLIB_CAN_FilterMaskConfigure(CAN_ID_1, CAN_FILTER_MASK0, 0x3FFFFFFC,
    CAN_EID, CAN_FILTER_MASK_IDE_TYPE);
PLIB_CAN_FilterToChannelLink(CAN_ID_1, CAN_FILTER0, CAN_FILTER_MASK0,
    CAN_CHANNEL1);
PLIB_CAN_FilterEnable(CAN_ID_1, CAN_FILTER0);
```

Note: Refer to About CAN Bus Protocol for more information on Standard and Extended ID addressing.

5.6.4.4.2.6 Enabling Events

The CAN module can generate events that indicate the status of the module. Events can be generated at the channel level and at the module level. Enabling a channel event will cause the CAN module to generate a module level event when the channel event occurs. Enabling a module event will cause the CAN module to interrupt the CPU.

The following code shows an example of using the [PLIB_CAN_ChannelEventEnable](#) and [PLIB_CAN_ModuleEventEnable](#) functions to enable channel and module events.

```
/* Enable the Receive channel not empty and Receive channel
 * full events at the channel level. Enable the Receive event
 * at the module level. */
PLIB_CAN_ChannelEventEnable(CAN_ID_1, CAN_CHANNEL1,
    (CAN_RX_CHANNEL_NOT_EMPTY|CAN_RX_CHANNEL_FULL));
PLIB_CAN_ModuleEventEnable (CAN_ID_1, CAN_RX_EVENT);
```

Note: The caller must use the Interrupt Peripheral Library to enable the CAN CPU interrupt.

5.6.4.4.3 Transmitting a CAN Message

The caller application can transmit a CAN message by queuing the message in a transmit channel, updating the channel, and then flushing it. Flushing a transmit channel will cause the CAN module to transmit all of the CAN messages that are queued in the channel.

The [PLIB_CAN_TransmitBufferGet](#) function should be used to obtain a [CAN_TX_MSG_BUFFER](#) handle type to an empty message buffer. The application should then populate this buffer. The [PLIB_CAN_ChannelUpdate](#) function must be called when the buffer has been populated. Finally, the [PLIB_CAN_TransmitChannelFlush](#) function is called to flush the channel.

The following code shows an example of transmitting an Extended ID message using Channel 0 on the CAN1 module.

```
CAN_TX_MSG_BUFFER * My_Message;

/* Get a pointer to the next buffer in the Transmit channel
 * check if the returned value is null. */
My_Message = PLIB_CAN_TransmitBufferGet(CAN_ID_1, CAN_CHANNEL0);

if(My_Message != NULL)
{
    /* Form a Extended ID CAN message. Start by clearing the buffer.
    Set the IDE bit to 1 to indicate extended ID message. Clear RTR bit
    as this is not a RTR message. */
    My_Message->messageWord[0] = 0;
    My_Message->messageWord[1] = 0;
    My_Message->messageWord[2] = 0;
    My_Message->messageWord[3] = 0;
    My_Message->msgSID.sid = 0x200;
    My_Message->msgEID.eid = 0x4002;
    My_Message->msgEID.ide = 1;
    My_Message->msgEID.sub_remote_req = 0;
    My_Message->msgEID.data_length_code = 1;
    My_Message->data[0] = 0xAA;

    /* This function lets the CAN module
    know that the message processing is done.*/
    PLIB_CAN_ChannelUpdate(CAN_ID_1, CAN_CHANNEL0);

    /* Direct the CAN module to flush the
    Transmit channel. This will send any pending
    message in the Transmit channel. */
    PLIB_CAN_TransmitChannelFlush(CAN_ID_1, CAN_CHANNEL0);
}
```

Note: The [PLIB_CAN_TransmitBufferGet](#) function will return NULL if the transmit channel is full. In this occurs, the [PLIB_CAN_TransmitChannelFlush](#) function should be called to empty the channel.

The following code shows an example of transmitting a Standard ID message using Channel 0 on the CAN1 module.

```
CAN_TX_MSG_BUFFER * myMessage;

/* Get a pointer to the next buffer in the channel
 * check if the returned value is null. */
myMessage = PLIB_CAN_TransmitBufferGet(CAN_ID_1, CAN_CHANNEL0);

if(myMessage != NULL)
{
    /* Form a Standard ID CAN message. Start by clearing the buffer.
    Send message to the CAN2 module. IDE = 0 means Standard ID message.
    Send one byte of data.
    */
    myMessage->messageWord[0] = 0;
    myMessage->messageWord[1] = 0;
```

```

myMessage->messageWord[2] = 0;
myMessage->messageWord[3] = 0;

myMessage->msgSID.sid      = 0x202;
myMessage->msgEID.ide      = 0;
myMessage->msgEID.data_length_code = 1;
myMessage->data[0]         = 0x23;

/* This function lets the CAN module
   know that the message processing is done
   and message is ready to be processed. */
PLIB_CAN_ChannelUpdate(CAN_ID_1, CAN_CHANNEL0);

/* Direct the CAN module to flush the
   Transmit channel. This will send any pending
   message in the Transmit channel. */
PLIB_CAN_TransmitChannelFlush(CAN_ID_1, CAN_CHANNEL0);
}

```

5.6.4.4.4 Receiving a CAN Message

The caller application can use either the interrupt or polling technique to detect when a message has been received.

The following code shows how the [PLIB_CAN_ReceivedMessageGet](#) function can be used to read a received message.

```

CAN_RX_MSG_BUFFER * message;

message = (CAN_RX_MSG_BUFFER *)PLIB_CAN_ReceivedMessageGet(CAN_ID_1,
    CAN_CHANNEL1);
if(message != NULL)
{
    //Process the message received

    /* Call the PLIB_CAN_ChannelUpdate function to let
       the CAN module know that the message processing
       is done. */
    PLIB_CAN_ChannelUpdate(CAN_ID_1, CAN_CHANNEL1);
}

```

The [PLIB_CAN_ReceivedMessageGet\(\)](#) function returns NULL if the channel is empty.

5.6.4.4.5 Handling Events

The CAN module can generate events at the channel level and at the module level. An enabled channel event will cause a module event. An enabled module event will cause a CAN CPU interrupt. See [Channel Events](#) and [Module Events](#) more information on each type of event.

5.6.4.4.5.1 Channel Events

Each channel in the module has its own set of events. The type of events are common to all channels. While a specific channel event may be active and can be inspected, it will cause a module event only if the channel event is enabled.

The following code shows an example of enabling and disabling channel events using the [PLIB_CAN_ChannelEventEnable](#) function.

```

/* CAN 1 Channel 1 and 3 are Transmit channels and Channel 2 and 4 are Receive
   channels */
/* Enable Channel 1 empty event and channel not full event. Disable Channel 2 full
   and overflow event */
/* Enable all Transmit events on Channel 2 and disable all RX events on Channel 4 */

PLIB_CAN_ChannelEventEnable(CAN_ID_1, CAN_CHANNEL1,

```

```

    (CAN_TX_CHANNEL_EMPTY | CAN_TX_CHANNEL_NOT_FULL));
    PLIB_CAN_ChannelEventEnable(CAN_ID_1, CAN_CHANNEL2,
    (CAN_RX_CHANNEL_FULL | CAN_RX_CHANNEL_OVERFLOW));
    PLIB_CAN_ChannelEventEnable(CAN_ID_1, CAN_CHANNEL3, CAN_TX_CHANNEL_ANY_EVENT);
    PLIB_CAN_ChannelEventEnable(CAN_ID_1, CAN_CHANNEL4, CAN_RX_CHANNEL_ANY_EVENT);

```

The [PLIB_CAN_ModuleEventGet](#) function can be used to check if a specific event is active in a specific channel.

It is only necessary for the event to be active and not enabled for this to work, as shown in the following code example.

```

// Check if RX Channel 2 of CAN module 1 is not empty or if its full.
CAN_CHANNEL_EVENT channelEvent;

channelEvent = PLIB_CAN_ChannelEventGet(CAN_ID_1, CAN_CHANNEL2);

if((channelEvent & (CAN_RX_CHANNEL_NOT_EMPTY | CAN_RX_CHANNEL_FULL)) != 0)
{
    // This means that either RX Channel 2 is not empty
    // or the Channel is full.
}

```

If a channel event is enabled and is active, it will set a channel event status flag. This flag indicates that some event in the channel is active.

The following code example shows how the [PLIB_CAN_AllChannelEventsGet](#) function is used to check if any channel event is active.

```

/* Check if RX Channel 2 of CAN module 1 is not empty or if its full */
CAN_CHANNEL_EVENT channelEvent;

channelEvent = PLIB_CAN_ChannelEventGet(CAN_ID_1, CAN_CHANNEL2);

if((channelEvent & (CAN_RX_CHANNEL_NOT_EMPTY | CAN_RX_CHANNEL_FULL)) != 0)
{
    // This means that either RX Channel 2 is not empty
    // or the Channel is full.
}

```

A receive channel overflow condition is special channel event and is available as a module event as well. The [PLIB_CAN_AllChannelOverflowStatusGet](#) function returns the status of all channels that have an active overflow event. Only channels with enabled overflow events will be reflected.

The following code shows an example of how this function is used.

```

/* Check if Channel 2 or 3 of CAN module 1 have any active events */
CAN_CHANNEL_MASK channelEvents;

channelEvents = PLIB_CAN_AllChannelEventsGet(CAN_ID_1);

if((channelEvents & (CAN_CHANNEL2_MASK | CAN_CHANNEL3_MASK)) != 0)
{
    // Either Channel 2 or 3 has an active event.
    // The PLIB_CAN_ChannelEventGet function can be
    // used to query the channel for more details.
}

```

5.6.4.4.5.2 Module Events

The CAN module has various sources of events, which includes the channel events. The [PLIB_CAN_ModuleEventEnable](#) function can be used to enable and disable module level events. Enabling a module event will cause the CAN module to generate a CPU interrupt, as shown in the following code example.

```

// Enable CAN1 module Transmit Event and Receive Events.
// Disable Receive Overflow event and operation
// mode change event.
PLIB_CAN_ModuleEventEnable(CAN_ID_1, (CAN_TX_EVENT | CAN_RX_EVENT));

```

```
PLIB_CAN_ModuleEventDisable(CAN_ID_1,
    (CAN_OPERATION_MODE_CHANGE_EVENT | CAN_RX_OVERFLOW_EVENT));
```

The [PLIB_CAN_ModuleEventGet](#) function can be used to check if any module level events are active. This is shown in the code snippet below.

```
// Check if the CAN Module 1 Receive event
// or if Transmit event is active
if((PLIB_CAN_ModuleEventGet(CAN_ID_1) & (CAN_RX_EVENT | CAN_TX_EVENT)) != 0)
{
    // Handle the Receive or Transmit module Event here.
}
```

The CAN module also provides code to indicate the highest priority pending event in the CAN module. The [PLIB_CAN_PendingEventsGet](#) function can be used to read and analyze this code, as shown in the following code example.

```
/* Implement a switch to check and process any active CAN module events */
CAN_EVENT_CODE eventCode;

eventCode = PLIB_CAN_PendingEventsGet(CAN_ID_1);

switch(eventCode)
{
    case CAN_NO_EVENT:
        /* Procedure to handle no CAN events */
        break;
    case CAN_WAKEUP_EVENT:
        /* Procedure to handle device wake-up on CAN bus activity event */
        break;
    default:
        break;
}
```

5.6.4.4.6 Using the Library

This topic describes the basic architecture of the CAN Peripheral Library and provides information and examples on how to use it.

Interface Header File: [plib_can.h](#)

The interface to the CAN Peripheral library is defined in the "[plib_can.h](#)" header file. Any C language source (.c) file that uses the CAN Peripheral library should include "peripheral.h".

Library File:

The CAN Peripheral library archive (.a) file installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the Peripheral interacts with the framework.

5.6.4.4.6.1 Hardware Abstraction Model

Note: The interface provided is a super set of all of the functionality of the available CAN on the device. Refer to the specific device data sheet or the related family reference manual to determine the set of functions that are supported for each CAN module on the device.

This library provides the low-level abstraction of the CAN module on the Microchip family of microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in the software and introduces the library interface.

CAN Software Abstraction Block Diagram

Software Model:

The CAN Peripheral Library provides interface routines to interact with the blocks shown in the diagram above. A channel can be either a transmit channel or a receive channel. The size of a CAN message is typically 16 bytes (8 bytes for data-only receive messages). The size of a channel (the number of messages it can buffer) is configurable. Each channel has a minimum size of one message buffer. The message buffer area for all channels is assigned at configuration time. The CAN Peripheral Library then provides access to these channels and buffers via the library interface.

The user code must enable and configure message acceptance filters to receive messages. These filters compare the ID field of the incoming message with configured value and accepts the messages if IDs match. The message is then stored in a selectable receive channel. At least one message acceptance filter and one filter mask should be enabled for the CAN module to receive messages. A filter mask allows specified filter bits to be ignored during the comparison process. This allows the filter to accept a message with an ID range.

The CAN Peripheral Library allows the CAN module to generate events. Events can be generated at the channel level and at the module level.

Events:

The CAN module is capable of notifying the user application when specific events occur in the module. The following diagram shows these events and how they are organized.

There are two types of events in the CAN module: Channel events and Module events. Channel events are generated by transmit and receive channels. Module events are generated by various sources (including channels) within the CAN module. Each event can be enabled or disabled. Enabling a channel event will cause the CAN module to generate a module event. An enabled module level event will cause the CAN module to generate an interrupt to the CPU.

The application can also poll channel events to check if these are active. This may be done in cases where a polling scheme (rather than an interrupt scheme) needs to be implemented. In this case, the CAN module provides events status on a channel basis. If a channel event is found active, the application can then use library API calls to inspect which channel condition caused the channel event.

5.6.4.4.6.2 Library Overview

The library interface routines are divided into various subsections, each of the sub section addresses one of the blocks or the overall operation of the CAN module.

Library Interface Section	Description
Basic Configuration	APIs that are used for basic control of the module, such as enabling and disabling the module.
Advanced Configuration	Advance configuration, such as selection of the operation mode.
Bus Speed Configuration	Bus speed configuration.
Event Management	APIs to manage the events.
Message Transmit Functions	Transmit APIs.
Message Receive Functions	APIs that are related to data reception.
Error State Tracking	Error tracking.
Information Functions	Information about the module.

5.6.4.4.7 Configuring the Library

The library is configured for the supported processor when the processor is chosen in the MPLAB IDE.

5.6.4.5 Library Interface

Data Types and Constants

	Name	Description
	<u>CAN_CHANNEL</u>	Identifies the supported CAN Channels.
	<u>CAN_CHANNEL_EVENT</u>	Identifies all Layer 3 interrupts.
	<u>CAN_CHANNEL_MASK</u>	Lists the series of useful masks.
	<u>CAN_DNET_FILTER_SIZE</u>	Specifies the size of the DeviceNet filter.
	<u>CAN_ERROR_STATE</u>	Specifies the CAN module error states.
	<u>CAN_FILTER</u>	CAN event code returned by the CAN module.
	<u>CAN_FILTER_MASK</u>	Identifies the available CAN filter masks.
	<u>CAN_FILTER_MASK_TYPE</u>	Specifies the CAN filter mask type.
	<u>CAN_FUNCTIONAL_MODES</u>	Lists all possible CAN module functional modes.
	<u>CAN_ID_TYPE</u>	Specifies the CAN ID type.
	<u>CAN_MODULE_EVENT</u>	Specifies the CAN module events
	<u>CAN_MODULE_ID</u>	Enumeration: CAN_MODULE_ID This enumeration defines the number of modules that are available on the microcontroller. This is the super set of all the possible instances that might be available on Microchip microcontrollers. Refer to the specific device data sheet to get the correct number of modules defined for the desired microcontroller.
	<u>CAN_MSG_EID</u>	Defines the structure of the EID word section of the transmit and receive message.
	<u>CAN_OPERATION_MODES</u>	Lists all possible CAN module operational modes.
	<u>CAN_RECEIVE_CHANNEL</u>	Lists all possible CAN module receive channels.
	<u>CAN_RECEIVE_MODES</u>	Lists all possible CAN module receive modes.
	<u>CAN_RX_DATA_MODE</u>	Enables the Data-only Receive mode or Full Receive mode of a CAN receive channel.
	<u>CAN_RX_MSG_BUFFER</u>	Defines the structure of the CAN receive message buffer
	<u>CAN_RX_MSG_SID</u>	Defines the structure of the SID word section of the receive message.
	<u>CAN_TIME_SEGMENT_LENGTH</u>	All possible values for the assignable number of Time Quanta.
	<u>CAN_TX_CHANNEL_STATUS</u>	Identifies possible transmit channel-specific conditions.
	<u>CAN_TX_MSG_BUFFER</u>	Defines the structure of the CAN transmit message buffer.
	<u>CAN_TX_MSG_SID</u>	Defines the structure of the SID word section of the transmit message.
	<u>CAN_TX_RTR</u>	Specifies the status of the CAN Remote Transmit Request (RTR) feature for a CAN transmit channel.
	<u>CAN_TXCHANNEL_PRIORITY</u>	Specifies the priority of a transmit channel.
	<u>CAN_RX_DATA_ONLY_SIZE_BYTES</u>	Used as the size of the CAN data-only receive message buffer in bytes.
	<u>CAN_TX_RX_MESSAGE_SIZE_BYTES</u>	Used as the array size of the CAN transmit and full receive message buffer.

Advanced Configuration

	Name	Description
	<u>PLIB_CAN_ChannelResetsComplete</u>	Returns 'true' if the specified channel reset is complete.
	<u>PLIB_CAN_DeviceNetConfigure</u>	Configures the CAN module DeviceNet(TM) filter feature.
	<u>PLIB_CAN_FunctionalModeGet</u>	Obtains the functional mode of the CAN module.

	PLIB_CAN_MemoryBufferAssign	Assigns buffer memory to the CAN module.
	PLIB_CAN_TimeStampPrescalarSet	Sets the CAN receive message time stamp timer prescalar.
	PLIB_CAN_TimeStampValueGet	Returns the current value of the CAN receive message time stamp timer value.
	PLIB_CAN_TimeStampValueSet	Sets the CAN receive message time stamp timer value.
	PLIB_CAN_FunctionalModeSelect	Selects the functional mode of the CAN module.

Basic Configuration

	Name	Description
	PLIB_CAN_BusActivityWakeupDisable	Disables the wake-up on bus activity receive line filter.
	PLIB_CAN_BusActivityWakeupEnable	Enables the wake-up on bus activity receive line filter.
	PLIB_CAN_Disable	Disables the specified CAN module.
	PLIB_CAN_Enable	Enables the specified CAN module.
	PLIB_CAN_IsActive	Returns 'true' if the CAN module is active.
	PLIB_CAN_OperationModeGet	Obtains the current CAN operating mode.
	PLIB_CAN_OperationModeSelect	Sets the CAN operating mode.
	PLIB_CAN_StopInIdleDisable	Disables the Stop in Idle feature.
	PLIB_CAN_StopInIdleEnable	Enables the CAN module to stop when the processor enters Idle mode.
	PLIB_CAN_TimeStampDisable	Disables the time stamp feature for the CAN module.
	PLIB_CAN_TimeStampEnable	Enables the time stamp feature for the CAN module.

Bus Speed Configuration

	Name	Description
	PLIB_CAN_BusLine3TimesSamplingDisable	Disables the bus line three times sampling.
	PLIB_CAN_BusLine3TimesSamplingEnable	Enables the bus line three times sampling.
	PLIB_CAN_PhaseSegment1LengthSet	Selects the CAN phase buffer segment1 length.
	PLIB_CAN_PhaseSegment2LengthFreelyProgrammableDisable	Disables the CAN phase buffer segment2 length freely programmable mode.
	PLIB_CAN_PhaseSegment2LengthFreelyProgrammableEnable	Makes the CAN phase buffer segment2 length freely programmable.
	PLIB_CAN_PhaseSegment2LengthSet	Selects the CAN phase buffer segment2 length.
	PLIB_CAN_PropagationTimeSegmentSet	Selects the propagation time segment.
	PLIB_CAN_SyncJumpWidthSet	Selects the synchronization jump width.

Channel Configuration

	Name	Description
	PLIB_CAN_ChannelForReceiveSet	Configures a CAN channel for receive operation.
	PLIB_CAN_ChannelForTransmitSet	Configures a CAN channel for transmission.
	PLIB_CAN_ChannelReset	Resets a CAN channel.
	PLIB_CAN_ChannelUpdate	Updates the CAN Channel internal pointers.
	PLIB_CAN_ChannelEventDisable	Enables channel level events.

Error State Tracking

	Name	Description
	PLIB_CAN_ReceiveErrorCountGet	Returns the CAN receive error count.
	PLIB_CAN_ErrorStateGet	Returns the CAN error status word.

Event Management

	Name	Description
≡	PLIB_CAN_ModuleEventClear	Clears the CAN module level events.
≡	PLIB_CAN_ModuleEventDisable	Disables the module level events.
≡	PLIB_CAN_ModuleEventEnable	Enables the module level events.
≡	PLIB_CAN_ModuleEventGet	Returns the status of the CAN module events.
≡	PLIB_CAN_AllChannelEventsGet	Returns a value representing the event status of all CAN channels.
≡	PLIB_CAN_AllChannelOverflowStatusGet	Returns a value representing the receive overflow event status of all CAN channels.
≡	PLIB_CAN_ChannelEventClear	Clears CAN channel events.
≡	PLIB_CAN_ChannelEventEnable	Enables channel level events.
≡	PLIB_CAN_ChannelEventGet	Returns a value representing the event status of a CAN channel.
≡	PLIB_CAN_PendingEventsGet	Returns a value representing the highest priority active event in the module.

Feature Existence Routines

	Name	Description
≡	PLIB_CAN_ExistsActiveStatus	Identifies whether the ActiveStatus feature exists on the CAN module.
≡	PLIB_CAN_ExistsAllChannelEvents	Identifies whether the AllChannelEvents feature exists on the CAN module.
≡	PLIB_CAN_ExistsAllChannelOverflow	Identifies whether the AllChannelOverflow feature exists on the CAN module.
≡	PLIB_CAN_ExistsBusActivityWakeup	Identifies whether the BusActivityWakeup feature exists on the CAN module.
≡	PLIB_CAN_ExistsBusLine3TimesSampling	Identifies whether the BusLine3TimesSampling feature exists on the CAN module.
≡	PLIB_CAN_ExistsChannelEvent	Identifies whether the ChannelEventGet feature exists on the CAN module.
≡	PLIB_CAN_ExistsChannelEventEnable	Identifies whether the ChannelEventEnable feature exists on the CAN module.
≡	PLIB_CAN_ExistsChannelForReceiveSet	Identifies whether the ChannelForReceiveSet feature exists on the CAN module.
≡	PLIB_CAN_ExistsChannelForTransmitSet	Identifies whether the ChannelForTransmitSet feature exists on the CAN module.
≡	PLIB_CAN_ExistsChannelReset	Identifies whether the ChannelReset feature exists on the CAN module.
≡	PLIB_CAN_ExistsChannelUpdate	Identifies whether the ChannelUpdate feature exists on the CAN module.
≡	PLIB_CAN_ExistsDeviceNet	Identifies whether the DeviceNet feature exists on the CAN module.
≡	PLIB_CAN_ExistsEnableControl	Identifies whether the EnableControl feature exists on the CAN module.
≡	PLIB_CAN_ExistsErrorState	Identifies whether the ErrorStateGet feature exists on the CAN module.
≡	PLIB_CAN_ExistsFilterConfigure	Identifies whether the FilterConfigure feature exists on the CAN module.
≡	PLIB_CAN_ExistsFilterEnable	Identifies whether the FilterEnable feature exists on the CAN module.

	<u>PLIB_CAN_ExistsFilterMaskConfigure</u>	Identifies whether the FilterMaskConfigure feature exists on the CAN module.
	<u>PLIB_CAN_ExistsFilterToChannelLink</u>	Identifies whether the FilterToChannelLink feature exists on the CAN module.
	<u>PLIB_CAN_ExistsFunctionalMode</u>	Identifies whether the FunctionalModeSelect feature exists on the CAN module.
	<u>PLIB_CAN_ExistsLatestFilterMatchGet</u>	Identifies whether the LatestFilterMatchGet feature exists on the CAN module.
	<u>PLIB_CAN_ExistsMemoryBufferAssign</u>	Identifies whether the MemoryBufferAssign feature exists on the CAN module.
	<u>PLIB_CAN_ExistsMessageIsReceived</u>	Identifies whether the MessageIsReceived feature exists on the CAN module.
	<u>PLIB_CAN_ExistsModuleEventClear</u>	Identifies whether the ModuleEvents feature exists on the CAN module.
	<u>PLIB_CAN_ExistsModuleEventEnable</u>	Identifies whether the ModuleEventEnable feature exists on the CAN module.
	<u>PLIB_CAN_ExistsModuleInfo</u>	Identifies whether the ModuleInformation feature exists on the CAN module.
	<u>PLIB_CAN_ExistsOperationModeRead</u>	Identifies whether the OperationModeRead feature exists on the CAN module.
	<u>PLIB_CAN_ExistsOperationModeWrite</u>	Identifies whether the OperationModeSet feature exists on the CAN module.
	<u>PLIB_CAN_ExistsPendingEventsGet</u>	Identifies whether the PendingEventsGet feature exists on the CAN module.
	<u>PLIB_CAN_ExistsPendingTransmissionsAbort</u>	Identifies whether the PendingTransmissionsAbort feature exists on the CAN module.
	<u>PLIB_CAN_ExistsPhaseSegment1Length</u>	Identifies whether the PhaseSegment1Length feature exists on the CAN module.
	<u>PLIB_CAN_ExistsPhaseSegment2Length</u>	Identifies whether the PhaseSegment2Length feature exists on the CAN module.
	<u>PLIB_CAN_ExistsPhaseSegment2LengthFreelyProgrammable</u>	Identifies whether the PhaseSegment2LengthFreelyProgrammable feature exists on the CAN module.
	<u>PLIB_CAN_ExistsPropagationTimeSegment</u>	Identifies whether the PropagationTimeSegment feature exists on the CAN module.
	<u>PLIB_CAN_ExistsReceiveBufferClear</u>	Identifies whether the ReceiveBufferClear feature exists on the CAN module.
	<u>PLIB_CAN_ExistsReceiveBufferIsEmpty</u>	Identifies whether the ReceiveBufferIsEmpty feature exists on the CAN module.
	<u>PLIB_CAN_ExistsReceivedMessageGet</u>	Identifies whether the ReceivedMessageGet feature exists on the CAN module.
	<u>PLIB_CAN_ExistsReceiveErrorCount</u>	Identifies whether the ReceiveErrorCount feature exists on the CAN module.
	<u>PLIB_CAN_ExistsReceiveModeSelect</u>	Identifies whether the ReceiveModeSelect feature exists on the CAN module.
	<u>PLIB_CAN_ExistsRemoteTransmitReq</u>	Identifies whether the RemoteTransmitReq feature exists on the CAN module.
	<u>PLIB_CAN_ExistsRxFIFOFourLeftNotify</u>	Identifies whether the RxFIFOFourLeftNotify feature exists on the CAN module.
	<u>PLIB_CAN_ExistsRxFIFOOneLeftNotify</u>	Identifies whether the RxFIFOOneLeftNotify feature exists on the CAN module.

	PLIB_CAN_ExistsStopInIdle	Identifies whether the StopInIdle feature exists on the CAN module.
	PLIB_CAN_ExistsSyncJumpWidthSet	Identifies whether the SyncJumpWidth feature exists on the CAN module.
	PLIB_CAN_ExistsTimeStampEnable	Identifies whether the TimeStampEnable feature exists on the CAN module.
	PLIB_CAN_ExistsTimeStampPrescaler	Identifies whether the TimeStampPrescaler feature exists on the CAN module.
	PLIB_CAN_ExistsTimeStampValue	Identifies whether the TimeStampValue feature exists on the CAN module.
	PLIB_CAN_ExistsTransmissionIsAborted	Identifies whether the TransmissionAbortStatus feature exists on the CAN module.
	PLIB_CAN_ExistsTransmitBufferGet	Identifies whether the TransmitBufferGet feature exists on the CAN module.
	PLIB_CAN_ExistsTransmitChannelFlush	Identifies whether the TransmitChannelFlush feature exists on the CAN module.
	PLIB_CAN_ExistsTransmitChannelStatus	Identifies whether the TransmitChannelStatus feature exists on the CAN module.
	PLIB_CAN_ExistsTransmitErrorCountGet	Identifies whether the TransmitErrorCountGet feature exists on the CAN module.

Information Functions

	Name	Description
	PLIB_CAN_TotalChannelsGet	Returns the total number of CAN channels per CAN module.
	PLIB_CAN_TotalFiltersGet	Returns the total number of CAN Filters per CAN module.
	PLIB_CAN_TotalMasksGet	Returns the total number of CAN masks per CAN module.

Message Filtering Functions

	Name	Description
	PLIB_CAN_FilterConfigure	Configures a CAN message acceptance filter.
	PLIB_CAN_FilterDisable	Disables a CAN message acceptance filter.
	PLIB_CAN_FilterEnable	Enables a CAN message acceptance filter.
	PLIB_CAN_FilterIsDisabled	Returns 'true' if the specified filter is disabled.
	PLIB_CAN_FilterMaskConfigure	Configures a CAN filter mask.
	PLIB_CAN_FilterToChannelLink	Links a filter to a channel.
	PLIB_CAN_LatestFilterMatchGet	Returns the index of the filter that accepted the latest message.

Message Receive Functions

	Name	Description
	PLIB_CAN_ReceivedMessageGet	Returns a pointer to a message to be read from the CAN channel.
	PLIB_CAN_RxFIFOFourLeftNotify	Configures the module to generate an interrupt when the FIFO has four receive buffers left.
	PLIB_CAN_RxFIFOOneLeftNotify	Configures the module to generate an interrupt when the FIFO has only one receive buffer left.
	PLIB_CAN_ReceiveModeSelect	Selects the receive mode of the CAN module.
	PLIB_CAN_ReceiveModeGet	Obtains the receive mode of the CAN module.
	PLIB_CAN_MessageIsReceived	Returns whether a message was received and the receive buffer is not empty.
	PLIB_CAN_ReceiveBufferIsEmpty	Returns whether the receive buffer of the specified channel is empty.
	PLIB_CAN_ReceiveBufferClear	Clears the received message flag.

	PLIB_CAN_RemoteTransmitReqlsReceived	Returns whether the message received is a remote transmit request.

Message Transmit Functions

	Name	Description
	PLIB_CAN_PendingTransmissionsAbort	Aborts any pending transmit operations.
	PLIB_CAN_TransmissionIsAborted	Returns 'true' if the transmit abort operation is complete.
	PLIB_CAN_TransmitBufferGet	Returns a pointer to an empty transmit buffer.
	PLIB_CAN_TransmitChannelFlush	Causes all messages in the specified transmit channel to be transmitted.
	PLIB_CAN_TransmitChannelStatusGet	Returns the condition of the transmit channel.
	PLIB_CAN_TransmitErrorCountGet	Returns the CAN transmit error count

Description

This section describes the APIs of the CAN Peripheral. Refer to each section for a detailed description.

5.6.4.5.1 Basic Configuration

5.6.4.5.1.1 PLIB_CAN_BusActivityWakeupDisable Function

C

```
void PLIB_CAN_BusActivityWakeupDisable(
    CAN_MODULE_ID index
);
```

Description

This function disables the Wake up on bus activity receive line filter.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module

Returns

None.

Remarks

The MY_CAN_ID macro in the example above is used as a placeholder for the actual CAN bus ID (as defined by the processor-specific [CAN_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsBusActivityWakeup](#) in your application to determine whether this feature is available.

Example

```
#define MY_CAN_ID CAN_ID_1

PLIB_CAN_BusActivityWakeupDisable(MY_CAN_ID);
```

5.6.4.5.1.2 PLIB_CAN_BusActivityWakeupEnable Function

C

```
void PLIB_CAN_BusActivityWakeupEnable(
```

```
    CAN_MODULE_ID index
);
```

Description

This function enables the wake-up on bus activity receive line filter.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module

Returns

None.

Remarks

The MY_CAN_ID macro in the example above is used as a placeholder for the actual CAN bus ID (as defined by the processor-specific [CAN_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsBusActivityWakeup](#) in your application to determine whether this feature is available.

Example

```
#define MY_CAN_ID CAN_ID_1

PLIB_CAN_BusActivityWakeupEnable(MY_CAN_ID);
```

5.6.4.5.1.3 PLIB_CAN_Disable Function**C**

```
void PLIB_CAN_Disable(
    CAN_MODULE_ID index
);
```

Description

This function disables the specified CAN module.

Preconditions

None

Parameters

Parameters	Description
index	Identifies the desired CAN module

Returns

None.

Remarks

The MY_CAN_ID macro in the example above is used as a placeholder for the actual CAN bus ID (as defined by the processor-specific [CAN_MODULE_ID](#) enum).

If the user application clears this bit, it may take a number of cycles before the CAN module completes the current transaction and responds to this request. The user application should check this using the [PLIB_CAN_IsActive](#) function to verify that the request has been honored.

This function works only if the CAN module is in Configuration mode. Use the [PLIB_CAN_OperationModeGet](#) function to get the current mode and the [PLIB_CAN_OperationModeSelect](#) function to change the mode.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsEnableControl](#) in your application to determine whether this feature is available.

Example

```
#define MY_CAN_ID CAN_ID_1

PLIB_CAN_Disable(MY_CAN_ID);
```

5.6.4.5.1.4 PLIB_CAN_Enable Function

C

```
void PLIB_CAN_Enable(
    CAN_MODULE_ID index
);
```

Description

This function enables the specified CAN module.

Preconditions

The module should be appropriately configured before being enabled.

Parameters

Parameters	Description
index	Identifies the desired CAN module

Returns

None.

Remarks

The MY_CAN_ID macro in the example above is used as a placeholder for the actual CAN bus ID (as defined by the processor-specific [CAN_MODULE_ID](#) enum).

Some of the CAN module settings can be done only when the module is off. Therefore, always call the PLIB_CAN_Enable Function after all other configurations are complete.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsEnableControl](#) in your application to determine whether this feature is available.

Example

```
#define MY_CAN_ID CAN_ID_1

//Do all the other configurations before enabling.

PLIB_CAN_Enable(MY_CAN_ID);
```

5.6.4.5.1.5 PLIB_CAN_IsActive Function

C

```
bool PLIB_CAN_IsActive(
    CAN_MODULE_ID index
);
```

Description

This function returns 'true' if the CAN module is active. This function is typically called after the CAN module is disabled using the [PLIB_CAN_Disable](#) function. The CAN module disable request does not complete immediately when requested and depends on

the CAN bus status. This function should be called to check whether the module disable is completed.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module

Returns

- true = The module is still active
- false = The module is completely disabled

Remarks

The CAN module disable operation should not be confused with placing the CAN module in the Disable mode using the [PLIB_CAN_OperationModeSelect](#) function. The Disable mode is one of the operating modes of the CAN module. The CAN module is still enabled while in Disable mode. The module disable operation switches the CAN module off.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsActiveStatus](#) in your application to determine whether this feature is available.

Example

```
// Disable CAN module 1. Wait until the module is completely disabled.  
PLIB_CAN_Disable(CAN_ID_1);  
  
while(PLIB_CAN_IsActive(CAN_ID_1) == true);
```

5.6.4.5.1.6 PLIB_CAN_OperationModeGet Function

C

```
CAN_OPERATION_MODES PLIB_CAN_OperationModeGet(  
    CAN_MODULE_ID index  
);
```

Description

This function obtains the current CAN operating mode. This function is typically called after the [PLIB_CAN_OperationModeSelect](#) function to check if the requested operation mode change is complete.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module

Returns

The current CAN_OP_MODE type of operation mode of the CAN module.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsOperationModeRead](#) in your application to determine whether this feature is available.

Example

```
// Check and wait until the CAN module is in Disable Mode.
```

```
while(PLIB_CAN_OperationModeGet(CAN_ID_1) != CAN_DISABLE_MODE);
```

5.6.4.5.1.7 PLIB_CAN_OperationModeSelect Function

C

```
void PLIB_CAN_OperationModeSelect(  
    CAN_MODULE_ID index,  
    CAN_OPERATION_MODES opMode  
);
```

Description

This function sets the CAN operating mode. The CAN module requires itself to be in certain modes to gain access to module functionality. For example, the module should be in Normal mode to [send](#) and receive messages. Note that after this function is called, it should be checked to determine whether the mode was set by using the [PLIB_CAN_OperationModeGet](#) function.

Preconditions

None.

Parameters

Parameters	Description
module	Identifies the desired CAN module
opMode	Desired CAN_OP_MODE type of the mode to be set

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsOperationModeWrite](#) in your application to determine whether this feature is available.

Example

```
// Set the CAN_ID_1 operating mode to Configuration mode.  
  
PLIB_CAN_OperationModeSelect(CAN_ID_1, CAN_CONFIGURATION_MODE);
```

5.6.4.5.1.8 PLIB_CAN_StopInIdleDisable Function

C

```
void PLIB_CAN_StopInIdleDisable(  
    CAN_MODULE_ID index  
);
```

Description

This function disables the CAN module from stopping operation when the system enters Idle mode. The module continues operation when the system enters Idle mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module

Returns

None.

Remarks

The MY_CAN_ID macro in the example above is used as a placeholder for the actual CAN bus ID (as defined by the processor-specific [CAN_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsStopInIdle](#) in your application to determine whether this feature is available.

Example

```
#define MY_CAN_ID CAN_ID_1

PLIB_CAN_StopInIdleDisable(MY_CAN_ID);
```

5.6.4.5.1.9 PLIB_CAN_StopInIdleEnable Function**C**

```
void PLIB_CAN_StopInIdleEnable(
    CAN_MODULE_ID index
);
```

Description

This function configures the CAN module to stop operation when the system enters Idle mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module

Returns

None.

Remarks

The MY_CAN_ID macro in the example above is used as a placeholder for the actual CAN bus ID (as defined by the processor-specific [CAN_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsStopInIdle](#) in your application to determine whether this feature is available.

Example

```
#define MY_CAN_ID CAN_ID_1

PLIB_CAN_StopInIdleEnable(MY_CAN_ID);
```

5.6.4.5.1.10 PLIB_CAN_TimeStampDisable Function**C**

```
void PLIB_CAN_TimeStampDisable(
    CAN_MODULE_ID index
);
```

Description

This function disables time stamp capture feature for the CAN module. This conserves power by stopping the CAN timer.

Preconditions

None

Parameters

Parameters	Description
index	Identifies the desired CAN module

Returns

None.

Remarks

The MY_CAN_ID macro in the example above is used as a placeholder for the actual CAN bus ID (as defined by the processor-specific [CAN_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsTimeStampEnable](#) in your application to determine whether this feature is available.

Example

```
#define MY_CAN_ID CAN_ID_1

PLIB_CAN_TimeStampDisable(MY_CAN_ID);
```

5.6.4.5.1.11 PLIB_CAN_TimeStampEnable Function**C**

```
void PLIB_CAN_TimeStampEnable(
    CAN_MODULE_ID index
);
```

Description

This function enables the time stamp capture feature for the CAN module. The CAN timer value will be stored on valid message reception and is stored with the message.

Preconditions

None

Parameters

Parameters	Description
index	Identifies the desired CAN module

Returns

None.

Remarks

The MY_CAN_ID macro in the example above is used as a placeholder for the actual CAN bus ID (as defined by the processor-specific [CAN_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsTimeStampEnable](#) in your application to determine whether this feature is available.

Example

```
#define MY_CAN_ID CAN_ID_1

PLIB_CAN_TimeStampEnable(MY_CAN_ID);
```

5.6.4.5.2 Advanced Configuration

5.6.4.5.2.1 PLIB_CAN_ChannelResetIsComplete Function

C

```
bool PLIB_CAN_ChannelResetIsComplete(  
    CAN_MODULE_ID index,  
    CAN_CHANNEL channel  
);
```

Description

This function returns 'true' if the specified channel reset is complete. This function should preferably be called after calling the [PLIB_CAN_ChannelReset](#) function.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module
channel	Identifies the CAN Channel to be inspected for reset

Returns

- true = Channel reset is complete
- false = Channel reset is in progress

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsChannelReset](#) in your application to determine whether this feature is available.

Example

```
// Reset channel 4 of CAN_ID_1 module  
// and wait until the reset is complete  
PLIB_CAN_ChannelReset(CAN_ID_1, CAN_CHANNEL4);  
  
while(PLIB_CAN_ChannelResetIsComplete(CAN_ID_1, CAN_CHANNEL4) != true);
```

5.6.4.5.2.2 PLIB_CAN_DeviceNetConfigure Function

C

```
void PLIB_CAN_DeviceNetConfigure(  
    CAN_MODULE_ID index,  
    CAN_DNET_FILTER_SIZE dncnt  
);
```

Description

This function configures the CAN module DeviceNet filter feature. DeviceNet filtering allows a portion of the data payload to be used as a filter criteria. This function allows the size of this filter to be configured in bits. The filter can also be disabled.

Preconditions

The CAN module should preferably be in Configuration mode (using the [PLIB_CAN_OperationModeSelect](#) function).

Parameters

Parameters	Description
index	Identifies the desired CAN module
dncnt	Specifies the CAN_DNET_FILTER_SIZE size of the DeviceNet filter in bits

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsDeviceNet](#) in your application to determine whether this feature is available.

Example

```
// Disable the CAN_ID_1 DeviceNet filter feature.  
PLIB_CAN_DeviceNetConfigure(CAN_ID_1, CAN_DNET_FILTER_DISABLE);  
  
// Set the CAN_ID_2 Device Net Filter Size to 10 bits.  
PLIB_CAN_DeviceNetConfigure(CAN_ID_2, CAN_DNET_FILTER_SIZE_10_BIT);
```

5.6.4.5.2.3 PLIB_CAN_FunctionalModeGet Function**C**

```
CAN_FUNCTIONAL_MODES PLIB_CAN_FunctionalModeGet(  
    CAN_MODULE_ID index  
);
```

Description

This function obtains the functional mode of the CAN module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsFunctionalMode](#) in your application to determine whether this feature is available.

Example

```
CAN_FUNCTIONAL_MODES funcMode;  
  
funcMode = PLIB_CAN_FunctionalModeGet(CAN_ID_1);
```

5.6.4.5.2.4 PLIB_CAN_MemoryBufferAssign Function**C**

```
void PLIB_CAN_MemoryBufferAssign(  
    CAN_MODULE_ID index,  
    void * buffer,  
    int sizeInBytes  
);
```

Description

This function assigns buffer memory to the CAN module. The CAN module uses this buffer memory to store messages to be

transmitted and received. The size of the memory buffer should be enough to accommodate the required number of message buffers and channels.

Preconditions

The module should be in Configuration mode (using the [PLIB_CAN_OperationModeSelect](#) function).

Parameters

Parameters	Description
index	Identifies the desired CAN module
buffer	Pointer to the buffer memory area
sizeInBytes	Size of the buffer memory in bytes

Returns

None.

Remarks

This API is useful only if the CAN module uses device RAM for message buffers and message FIFO location is software configurable. This should not be used if the device message buffer is part of SFR.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsMemoryBufferAssign](#) in your application to determine whether this feature is available.

Example

```
// Define and assign a CAN 1 memory buffer for 2 Transmit channels and 1 Receive  
// channel, each with 4 message buffers
```

```
uint8_t canMemoryBuffer [3 * 4 * CAN_TX_RX_MESSAGE_SIZE_BYTES];
```

```
PLIB_CAN_MemoryBufferAssign(CAN_ID_1, canMemoryBuffer, (3 * 4 *  
    CAN_TX_RX_MESSAGE_SIZE_BYTES));
```

5.6.4.5.2.5 PLIB_CAN_TimeStampPrescalarSet Function

C

```
void PLIB_CAN_TimeStampPrescalarSet(  
    CAN_MODULE_ID index,  
    unsigned prescalar  
);
```

Description

This function sets the CAN receive message time stamp timer prescalar. This prescalar determines the rate at which the time stamp timer is incremented. For example, if the prescalar value is 0xFF, the time stamp timer is incremented by 1 every 255 system clock periods.

Preconditions

None.

Parameters

Parameters	Description
module	Identifies the desired CAN module
prescalar	Prescalar for the CAN receive message time stamp timer. This value should be between 0x0 and 0xFFFF.

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsTimeStampPrescalar](#) in your application to determine whether this feature is available.

Example

```
// Set the CAN_ID_1 Receive Message Time Stamp Timer prescalar to increment
//the Timestamp Timer every 1024 system clock periods.

PLIB_CAN_TimeStampPrescalarSet(CAN_ID_1, 1024);
```

5.6.4.5.2.6 PLIB_CAN_TimeStampValueGet Function**C**

```
unsigned PLIB_CAN_TimeStampValueGet(
    CAN_MODULE_ID index
);
```

Description

This function gets the current value of the CAN receive message time stamp timer value.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module

Returns

The current value of the CAN receive message time stamp timer.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsTimeStampValue](#) in your application to determine whether this feature is available.

Example

```
unsigned int timeStampTimerVal;

// Get the current time stamp timer value.
timeStampTimerVal = PLIB_CAN_TimeStampValueGet(CAN_ID_1);
```

5.6.4.5.2.7 PLIB_CAN_TimeStampValueSet Function**C**

```
void PLIB_CAN_TimeStampValueSet(
    CAN_MODULE_ID index,
    unsigned value
);
```

Description

This function sets the CAN receive message time stamp timer value. The timer will then start counting up from this value.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module
value	Start value of the receive message yime stamp timer. This value should be between 0x0 and 0xFFFF.

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsTimeStampValue](#) in your application to determine whether this feature is available.

Example

```
// Set start value of CAN_ID_1 Receive Message Time Stamp Timer to 0x100  
PLIB_CAN_TimeStampValueSet(CAN_ID_1, 0x0100);
```

5.6.4.5.2.8 PLIB_CAN_FunctionalModeSelect Function**C**

```
void PLIB_CAN_FunctionalModeSelect(  
    CAN_MODULE_ID index,  
    CAN_FUNCTIONAL_MODES funcMode  
);
```

Description

This function selects the functional mode of the CAN module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module
funcMode	Select the functional mode of the CAN module. One of the possible values from CAN_FUNCTIONAL_MODES

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsFunctionalMode](#) in your application to determine whether this feature is available.

Example

```
PLIB_CAN_FunctionalModeSelect(CAN_ID_1, CAN_LEGACY_MODE0);
```

5.6.4.5.3 Bus Speed Configuration**5.6.4.5.3.1 PLIB_CAN_BusLine3TimesSamplingDisable Function****C**

```
void PLIB_CAN_BusLine3TimesSamplingDisable(  

```

```
    CAN_MODULE_ID index
);
```

Description

The bus line will be sampled only once at the sampling point.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module

Returns

None.

Remarks

The MY_CAN_ID macro in the example above is used as a placeholder for the actual CAN bus ID (as defined by the processor-specific [CAN_MODULE_ID](#) enum).

This function works only if the CAN module is in Configuration mode. Use the [PLIB_CAN_OperationModeGet](#) function to get the current mode and the [PLIB_CAN_OperationModeSelect](#) function to change the mode.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsBusLine3TimesSampling](#) in your application to determine whether this feature is available.

Example

```
#define MY_CAN_ID CAN_ID_1

if (CAN_CONFIGURATION_MODE != PLIB_CAN_OperationModeGet(MY_CAN_ID))
{
    PLIB_CAN_BusLine3TimesSamplingDisable(MY_CAN_ID);
}
```

5.6.4.5.3.2 PLIB_CAN_BusLine3TimesSamplingEnable Function**C**

```
void PLIB_CAN_BusLine3TimesSamplingEnable(
    CAN_MODULE_ID index
);
```

Description

The bus line will be sampled three times at the sampling point. If this is disabled, the bus line will be sampled only once.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module

Returns

None.

Remarks

The MY_CAN_ID macro in the example above is used as a placeholder for the actual CAN bus ID (as defined by the processor-specific [CAN_MODULE_ID](#) enum).

This function works only if the CAN module is in Configuration mode. Use the [PLIB_CAN_OperationModeGet](#) function to get the current mode and the [PLIB_CAN_OperationModeSelect](#) function to change the mode.

This API may not function if the baud rate prescaler value is more than a certain limit. Refer to the specific device data sheet to determine the maximum prescaler that allows three times sampling.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsBusLine3TimesSampling](#) in your application to determine whether this feature is available.

Example

```
#define MY_CAN_ID CAN_ID_1

if (CAN_CONFIGURATION_MODE != PLIB_CAN_OperationModeGet(MY_CAN_ID))
{
    PLIB_CAN_BusLine3TimesSamplingEnable(MY_CAN_ID);
}
```

5.6.4.5.3.3 PLIB_CAN_PhaseSegment1LengthSet Function

C

```
void PLIB_CAN_PhaseSegment1LengthSet(
    CAN_MODULE_ID index,
    CAN_TIME_SEGMENT_LENGTH length
);
```

Description

This function selects the CAN phase buffer segment1 length.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module
length	Desired segment length

Returns

None.

Remarks

The MY_CAN_ID macro in the example above is used as a placeholder for the actual CAN bus ID (as defined by the processor-specific [CAN_MODULE_ID](#) enum).

This function works only if the CAN module is in configuration mode. Use the [PLIB_CAN_OperationModeGet](#) function to get the current mode and the [PLIB_CAN_OperationModeSelect](#) function to change the mode.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsPhaseSegment1Length](#) in your application to determine whether this feature is available.

Example

```
#define MY_CAN_ID CAN_ID_1

if (CAN_CONFIGURATION_MODE != PLIB_CAN_OperationModeGet(MY_CAN_ID))
{
    PLIB_CAN_PhaseSegment1LengthSet(MY_CAN_ID, CAN_TIME_SEGMENT_LEN_8TQ);
}
```

5.6.4.5.3.4 PLIB_CAN_PhaseSegment2LengthFreelyProgrammableDisable Function

C

```
void PLIB_CAN_PhaseSegment2LengthFreelyProgrammableDisable(  
    CAN_MODULE_ID index  
);
```

Description

This function disables the CAN phase buffer segment2 length freely programmable mode. The segment2 length will be the maximum of the segment1 length or information processing time, whichever is greater.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module

Returns

None.

Remarks

The MY_CAN_ID macro in the example above is used as a placeholder for the actual CAN bus ID (as defined by the processor-specific [CAN_MODULE_ID](#) enum).

This function works only if the CAN module is in Configuration mode. Use the [PLIB_CAN_OperationModeGet](#) function to get the current mode and the [PLIB_CAN_OperationModeSelect](#) function to change the mode.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsPhaseSegment2LengthFreelyProgrammable](#) in your application to determine whether this feature is available.

Example

```
#define MY_CAN_ID CAN_ID_1  
  
if (CAN_CONFIGURATION_MODE != PLIB_CAN_OperationModeGet(MY_CAN_ID))  
{  
    PLIB_CAN_PhaseSegment2LengthFreelyProgrammableDisable(MY_CAN_ID);  
}
```

5.6.4.5.3.5 PLIB_CAN_PhaseSegment2LengthFreelyProgrammableEnable Function

C

```
void PLIB_CAN_PhaseSegment2LengthFreelyProgrammableEnable(  
    CAN_MODULE_ID index  
);
```

Description

This function makes the CAN phase buffer segment2 length freely programmable. If this mode is not set, the segment2 length will be the maximum of the segment1 length or information processing time, whichever is greater.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module

Returns

None.

Remarks

The MY_CAN_ID macro in the example above is used as a placeholder for the actual CAN bus ID (as defined by the processor-specific [CAN_MODULE_ID](#) enum).

This function works only if the CAN module is in Configuration mode. Use the [PLIB_CAN_OperationModeGet](#) function to get the current mode and the [PLIB_CAN_OperationModeSelect](#) function to change the mode.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsPhaseSegment2LengthFreelyProgrammable](#) in your application to determine whether this feature is available.

Example

```
#define MY_CAN_ID CAN_ID_1

if (CAN_CONFIGURATION_MODE != PLIB_CAN_OperationModeGet(MY_CAN_ID))
{
    PLIB_CAN_PhaseSegment2LengthFreelyProgrammableEnable(MY_CAN_ID);
}
```

5.6.4.5.3.6 PLIB_CAN_PhaseSegment2LengthSet Function**C**

```
void PLIB_CAN_PhaseSegment2LengthSet(
    CAN_MODULE_ID index,
    CAN_TIME_SEGMENT_LENGTH length
);
```

Description

This function selects the CAN phase buffer segment2 length.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module
length	Desired segment length, select from CAN_TIME_SEGMENT_LENGTH enum

Returns

None.

Remarks

The MY_CAN_ID macro in the example above is used as a placeholder for the actual CAN bus ID (as defined by the processor-specific [CAN_MODULE_ID](#) enum).

This function works only if the CAN module is in Configuration mode. Use the [PLIB_CAN_OperationModeGet](#) function to get the current mode and the [PLIB_CAN_OperationModeSelect](#) function to change the mode.

This function will not work if the freely programmable mode is disabled.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsPhaseSegment2Length](#) in your application to determine whether this feature is available.

Example

```
#define MY_CAN_ID CAN_ID_1

if (CAN_CONFIGURATION_MODE != PLIB_CAN_OperationModeGet(MY_CAN_ID))
{
    PLIB_CAN_PhaseSegment2LengthFreelyProgrammableEnable(MY_CAN_ID);

    PLIB_CAN_PhaseSegment2LengthSet(MY_CAN_ID,
        CAN_TIME_SEGMENT_LEN_8TQ);
}
```

5.6.4.5.3.7 PLIB_CAN_PropagationTimeSegmentSet Function**C**

```
void PLIB_CAN_PropagationTimeSegmentSet(
    CAN_MODULE_ID index,
    CAN_TIME_SEGMENT_LENGTH length
);
```

Description

This function selects the propagation time segment.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module.

Returns

None.

Remarks

The MY_CAN_ID macro in the example above is used as a placeholder for the actual CAN bus ID (as defined by the processor-specific [CAN_MODULE_ID](#) enum).

This function works only if the CAN module is in configuration mode. Use [PLIB_CAN_OperationModeGet](#) function to get the current mode and [PLIB_CAN_OperationModeSelect](#) function to change the mode.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsPropagationTimeSegment](#) in your application to determine whether this feature is available.

Example

```
#define MY_CAN_ID CAN_ID_1

if (CAN_CONFIGURATION_MODE != PLIB_CAN_OperationModeGet(MY_CAN_ID))
{
    PLIB_CAN_PropagationTimeSegmentSet(MY_CAN_ID, CAN_TIME_SEGMENT_LEN_8TQ);
}
```

5.6.4.5.3.8 PLIB_CAN_SyncJumpWidthSet Function**C**

```
void PLIB_CAN_SyncJumpWidthSet(
    CAN_MODULE_ID index,
    CAN_TIME_SEGMENT_LENGTH length
);
```

```
);
```

Description

This function selects the synchronization jump width.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module

Returns

None.

Remarks

The MY_CAN_ID macro in the example above is used as a placeholder for the actual CAN bus ID (as defined by the processor-specific [CAN_MODULE_ID](#) enum).

This function works only if the CAN module is in Configuration mode. Use the [PLIB_CAN_OperationModeGet](#) function to get the current mode and the [PLIB_CAN_OperationModeSelect](#) function to change the mode.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsSyncJumpWidthSet](#) in your application to determine whether this feature is available.

Example

```
#define MY_CAN_ID CAN_ID_1

if (CAN_CONFIGURATION_MODE != PLIB_CAN_OperationModeGet(MY_CAN_ID))
{
    PLIB_CAN_SyncJumpWidthSet(MY_CAN_ID,
        CAN_TIME_SEGMENT_LEN_8TQ);
}
```

5.6.4.5.4 Channel Configuration

5.6.4.5.4.1 PLIB_CAN_ChannelForReceiveSet Function

C

```
void PLIB_CAN_ChannelForReceiveSet(
    CAN_MODULE_ID index,
    CAN_CHANNEL channel,
    uint32_t channelSize,
    CAN_RX_DATA_MODE dataOnly
);
```

Description

This function configures a CAN channel for receive operation. A receive channel can be either a full CAN message receive channel, which receives an entire CAN message (Arbitration field + Data field) or a data-only message channel, which receives only the data payload section of the message. A receive channel can buffer upto 32 messages. The number of messages to buffer (i.e., the size of the channel) is set by the channelSize parameter.

Preconditions

The CAN module should be in Configuration mode. This is achieved by using the [PLIB_CAN_OperationModeSelect](#) function.

Parameters

Parameters	Description
index	Identifies the desired CAN module
channel	Identifies the desired CAN Receive channel
channelSize	Specifies the number of received messages that the channel can buffer before it overflows. This should be a value between 1 and 32.

5.6.4.5.4.2 PLIB_CAN_ChannelForTransmitSet Function**C**

```
void PLIB_CAN_ChannelForTransmitSet(  
    CAN_MODULE_ID index,  
    CAN_CHANNEL channel,  
    uint8_t channelSize,  
    CAN_TX_RTR rtren,  
    CAN_TXCHANNEL_PRIORITY priority  
);
```

Description

This function configures a CAN Channel for transmission. The size of the channel specifies the number of messages that the channel can buffer. The channel is a First In First Out (FIFO) type of buffer. The remote transmit request feature allows the transmit channel to start transmitting when an associated filter has received a message. The transmit channel priority determines the priority as compared to other transmit channels. If two transmit channels have the same priority, the natural channel priority determines which channel transmits first.

Preconditions

The CAN Module should be in Configuration mode. This is achieved by using the [PLIB_CAN_OperationModeSelect](#) function.

Parameters

Parameters	Description
index	Identifies the desired CAN module
channel	Identifies the desired CAN Channel
channelSize	Size of the channel in messages. This value should be between 1 and 32.

5.6.4.5.4.3 PLIB_CAN_ChannelReset Function**C**

```
void PLIB_CAN_ChannelReset(  
    CAN_MODULE_ID index,  
    CAN_CHANNEL channel  
);
```

Description

This function resets a CAN channel. Resetting a CAN channel causes it to discard any unread received messages or any messages that have not been transmitted yet. The reset operation will wait if a message is being currently transmitted or is being received. The [PLIB_CAN_ChannelResetIsComplete](#) function can be used to check if the channel reset is complete.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module

channel	Identifies the CAN channel to be reset

Returns

None.

Remarks

Attempting to read from a channel that is reset will return messages that may have already been read or may not have been read at all.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsChannelReset](#) in your application to determine whether this feature is available.

Example

```
// Reset channel 4 of CAN_ID_1 module  
// and wait until the reset is complete  
  
PLIB_CAN_ChannelReset(CAN_ID_1, CAN_CHANNEL4);  
  
while(PLIB_CAN_ChannelResetIsComplete(CAN_ID_1, CAN_CHANNEL4) != true);
```

5.6.4.5.4.4 PLIB_CAN_ChannelUpdate Function**C**

```
void PLIB_CAN_ChannelUpdate(  
    CAN_MODULE_ID index,  
    CAN_CHANNEL channel  
);
```

Description

This function updates the CAN Channel internal pointers. This function should be called when a message has been read or processed completely from a CAN receive channel (using the [PLIB_CAN_ReceivedMessageGet](#) function). It should be called after a new message has been written to a CAN transmit channel (using the [PLIB_CAN_TransmitBufferGet](#) function) and before the [PLIB_CAN_TransmitChannelFlush](#) function.

Trying to read a CAN receive channel that has not been updated will cause the [PLIB_CAN_ReceivedMessageGet](#) function to return the same message. Writing to a CAN transmit channel that has not been updated will cause the last written message to be overwritten.

Preconditions

This function is effective only when the CAN module is not in Configuration mode or Disable mode.

Parameters

Parameters	Description
index	Identifies the desired CAN module
channel	Identifies the CAN channel to be updated

Returns

None.

Remarks

The PLIB_CAN_ChannelUpdate function should be called on a CAN receive channel only after the message obtained using the [PLIB_CAN_ReceivedMessageGet](#) function has been read or processed completely. The CAN module peripheral library does not provide access to older messages once the PLIB_CAN_ChannelUpdate function has been called.

When using the PLIB_CAN_TransmitMessageBuffer function to write to a CAN transmit channel the PLIB_CAN_ChannelUpdate function should be called only when a valid message has been written to the channel. Calling the update function without writing

to the CAN channel will cause an incorrect message to be output on the CAN channel when the transmit channel is flushed.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsChannelUpdate](#) in your application to determine whether this feature is available.

Example

```
// CAN_ID_1 Channel 1 is a Receive channel and Channel 2 is a Transmit  
// channel. Read and update Channel 1. Write a message to Channel 2 and then  
// update and flush the channel.  
  
CAN_TX_MSG_BUFFER * TransmitMessage;  
CAN_RX_MSG_BUFFER * rxMessage;  
  
rxMessage = PLIB_CAN_ReceivedMessageGet(CAN_ID_1, CAN_CHANNEL1);  
  
if(rxMessage != NULL)  
{  
    // Process the received message.  
  
    PLIB_CAN_ChannelUpdate(CAN_ID_1, CAN_CHANNEL1);  
}  
  
TransmitMessage = PLIB_CAN_TransmitBufferGet(CAN_ID_1, CAN_CHANNEL2);  
if(TransmitMessage != NULL)  
{  
    // Write a message to buffer  
  
    PLIB_CAN_ChannelUpdate(CAN_ID_1, CAN_CHANNEL2);  
    PLIB_CAN_TransmitChannelFlush(CAN_ID_1, CAN_CHANNEL2);  
}
```

5.6.4.5.4.5 PLIB_CAN_ChannelEventDisable Function

C

```
void PLIB_CAN_ChannelEventDisable(  
    CAN_MODULE_ID index,  
    CAN_CHANNEL channel,  
    CAN_CHANNEL_EVENT flags  
);
```

Description

This function disables channel level events. Any enabled channel event will cause a CAN module event.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module
channel	Identifies the desired CAN channel
flags	Identifies the CAN channel event(s) to be affected. Several events can be controlled by logically ORed combination of events.

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsChannelEventEnable](#) in your application to determine whether this feature is available.

Example

```
PLIB_CAN_ChannelEventDisable(CAN_ID_1, CAN_CHANNEL1, CAN_TX_CHANNEL_EMPTY);
```

5.6.4.5.5 Event Management

5.6.4.5.5.1 PLIB_CAN_ModuleEventClear Function

C

```
void PLIB_CAN_ModuleEventClear(  
    CAN_MODULE_ID index,  
    CAN_MODULE_EVENT flags  
);
```

Description

This function clears module level events. If the event condition is persistent, clearing the event will have no effect. The event condition itself should be cleared. The CAN_SYSTEM_ERROR_EVENT can only be cleared by disabling the CAN module using the [PLIB_CAN_Enable](#) function.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module
flags	Identifies the CAN module level events to be affected. Several events can be cleared by specifying a logically ORed combination of events.

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsModuleEventClear](#) in your application to determine whether this feature is available.

Example

```
// Clear CAN_ID_1 Transmit Event and Receive Events.  
  
PLIB_CAN_ModuleEventClear(CAN_ID_1, (CAN_TX_EVENT | CAN_RX_EVENT));
```

5.6.4.5.5.2 PLIB_CAN_ModuleEventDisable Function

C

```
void PLIB_CAN_ModuleEventDisable(  
    CAN_MODULE_ID index,  
    CAN_MODULE_EVENT flags  
);
```

Description

This function disables module level events. Any enabled module event will cause the CAN module to generate a CPU interrupt.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module
flags	Identifies the CAN module level events to be affected. Several events can be controlled by logically ORed combination of events.

Returns

None.

Remarks

An event can be active regardless of it being enabled or disabled.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsModuleEventEnable](#) in your application to determine whether this feature is available.

Example

```
// Enable CAN_ID_1 Transmit Event and Receive Events.  
// Disable Receive Overflow event and operation  
// mode change event.  
  
PLIB_CAN_ModuleEventDisable(CAN_ID_1, (CAN_TX_EVENT | CAN_RX_EVENT));  
PLIB_CAN_ModuleEventDisable(CAN_ID_1, (CAN_OPERATION_MODE_CHANGE_EVENT |  
    CAN_RX_OVERFLOW_EVENT));
```

5.6.4.5.5.3 PLIB_CAN_ModuleEventEnable Function**C**

```
void PLIB_CAN_ModuleEventEnable(  
    CAN_MODULE_ID index,  
    CAN_MODULE_EVENT flags  
);
```

Description

This function enables module level events. Any enabled module event will cause the CAN module to generate a CPU interrupt.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module
flags	Identifies the CAN module level events to be affected. Several events can be controlled by logically ORed combination of events.

Returns

None.

Remarks

An event can be active regardless of it being enabled or disabled.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsModuleEventEnable](#) in your application to determine whether this feature is available.

Example

```
// Enable CAN_ID_1 Transmit Event and Receive Events.  
// Disable Receive Overflow event and operation
```

```
// mode change event.
```

```
PLIB_CAN_ModuleEventEnable(CAN_ID_1, (CAN_TX_EVENT | CAN_RX_EVENT));
PLIB_CAN_ModuleEventEnable(CAN_ID_1, (CAN_OPERATION_MODE_CHANGE_EVENT |
    CAN_RX_OVERFLOW_EVENT));
```

5.6.4.5.5.4 PLIB_CAN_ModuleEventGet Function

C

```
CAN_MODULE_EVENT PLIB_CAN_ModuleEventGet(
    CAN_MODULE_ID index
);
```

Description

This function returns the status of the CAN module events. The routine returns a status word. This word should be logically ANDed with the desired [CAN_MODULE_EVENT](#) event mask. A non-zero result of such an operation would mean that the events specified in the event mask are active. An event mask can contain one event or can be a logical OR combination of multiple events.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module

Returns

A status word representing the status of the CAN module events.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsModuleEventClear](#) in your application to determine whether this feature is available.

Example

```
// Check if the CAN_ID_1 Module Receive event
// or if Transmit event is active

if((PLIB_CAN_ModuleEventGet(CAN_ID_1) & (CAN_RX_EVENT | CAN_TX_EVENT)) != 0)
{
    // Handle the Receive or Transmit module Event here.
}

// Check if the CAN_ID_2 System Error Event
// is active

if((PLIB_CAN_ModuleEventGet(CAN_ID_2) & CAN_SYSTEM_ERROR_EVENT) != 0)
{
    // CAN_ID_2 System error event is active.
}
```

5.6.4.5.5.5 PLIB_CAN_AllChannelEventsGet Function

C

```
CAN_CHANNEL_MASK PLIB_CAN_AllChannelEventsGet(
    CAN_MODULE_ID index
);
```

Description

This function returns a value representing the event status of all of the CAN channels. The return value can be logically ANDed with a [CAN_CHANNEL_MASK](#) type to check whether the channel has any active events. Only an enabled channel event will cause the bit to be updated.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module

Returns

Returns a value that can be logically ANDed with a [CAN_CHANNEL_MASK](#) mask value to check if any event on a channel is active.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsAllChannelEvents](#) in your application to determine whether this feature is available.

Example

```
// Check if Channel 2 or 3 of CAN_ID_1 module
// have any active events

CAN_CHANNEL_MASK channelEvents;

channelEvents = PLIB_CAN_AllChannelEventsGet(CAN_ID_1);

if((channelEvents & (CAN_CHANNEL2_MASK | CAN_CHANNEL3_MASK)) != 0)
{
    // Either Channel 2 or 3 has an active event.
    // The PLIB_CAN_ChannelEventGet function can be
    // used to query the channel for more details.
}

// Check if Channel 31 of CAN_ID_2 module
// has an any active events

channelEvents = PLIB_CAN_AllChannelEventsGet(CAN_ID_2);

if((channelEvents & CAN_CHANNEL31_MASK) != 0)
{
    // Channel 31 of CAN_ID_2 module
    // has an active event.
}
```

5.6.4.5.5.6 PLIB_CAN_AllChannelOverflowStatusGet Function**C**

```
CAN_CHANNEL_MASK PLIB_CAN_AllChannelOverflowStatusGet(
    CAN_MODULE_ID index
);
```

Description

This function returns a value representing the Receive overflow event status of all the CAN Channels. The return value can be logically ANDed with a [CAN_CHANNEL_MASK](#) type to check whether a channel has any active receive overflow events. The return value will reflect the channel status only if the receive overflow event of the channel is enabled.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module

Returns

Returns a value that can be logically ANDed with a [CAN_CHANNEL_MASK](#) mask value to check if a receive channel overflow event is active.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsAllChannelOverflow](#) in your application to determine whether this feature is available.

Example

```
// Check if Receive Channel 2 or 3 of CAN_ID_1 module
// have overflowed

CAN_CHANNEL_MASK channelOverflowEvent;

channelOverflowEvent = PLIB_CAN_AllChannelOverflowStatusGet(CAN_ID_1);

if((channelOverflowEvent & (CAN_CHANNEL2_MASK | CAN_CHANNEL3_MASK)) != 0)
{
    // Either Receive Channel 2 or 3 has overflowed.
    // The PLIB_CAN_ChannelEventGet function can be
    // used to query the channel for more details.
}

// Check if Receive Channel 31 of CAN_ID_2 module
// has overflowed

channelOverflowEvent = PLIB_CAN_AllChannelOverflowStatusGet(CAN_ID_2);

if((channelOverflowEvent & CAN_CHANNEL31_MASK) != 0)
{
    // Channel 31 of CAN_ID_2 module
    // has overflowed.
}
```

5.6.4.5.5.7 PLIB_CAN_ChannelEventClear Function**C**

```
void PLIB_CAN_ChannelEventClear(
    CAN_MODULE_ID index,
    CAN_CHANNEL channel,
    CAN_CHANNEL_EVENT events
);
```

Description

This function clears channel events. The events to be cleared are specified as mask. Note that only the receive overflow event is clearable. Attempting to clear other events will have no effect since these events are persistent and clear only when the event condition is cleared.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module
channel	Identifies the desired CAN Channel
events	Mask specifying the events to be cleared

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsChannelEvent](#) in your application to determine whether this feature is available.

Example

```
// Clear CAN_ID_2 Receive Channel 3 overflow event  
PLIB_CAN_ChannelEventClear(CAN_ID_2, CAN_CHANNEL3, CAN_RX_CHANNEL_OVERFLOW);
```

5.6.4.5.8 PLIB_CAN_ChannelEventEnable Function**C**

```
void PLIB_CAN_ChannelEventEnable(  
    CAN_MODULE_ID index,  
    CAN_CHANNEL channel,  
    CAN_CHANNEL_EVENT flags  
);
```

Description

This function enables channel level events. Any enabled channel event will cause a CAN module event. An event can be active regardless of it being enabled or disabled. Enabling a transmit type of event for a receive channel will have no any effect.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module
channel	Identifies the desired CAN Channel
flags	Identifies the CAN channel event(s) to be affected. Several events can be controlled by logically ORed combination of events.

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsChannelEventEnable](#) in your application to determine whether this feature is available.

Example

```
// CAN_ID_1 Channel 1 and 3 are Transmit channels and Channel 2 and 4 are  
// Receive channels. Enable Channel 1 empty event and channel not full  
// event. Disable Channel 2 full and overflow event.  
// Enable all Transmit events on Channel 2 and disable all Receive events on  
// on Channel 4.
```

```

PLIB_CAN_ChannelEventEnable(CAN_ID_1, CAN_CHANNEL1, (CAN_TX_CHANNEL_EMPTY |
    CAN_TX_CHANNEL_NOT_FULL));

PLIB_CAN_ChannelEventEnable(CAN_ID_1, CAN_CHANNEL2, (CAN_RX_CHANNEL_FULL |
    CAN_RX_CHANNEL_OVERFLOW));

PLIB_CAN_ChannelEventEnable(CAN_ID_1, CAN_CHANNEL3, CAN_TX_CHANNEL_ANY_EVENT);
PLIB_CAN_ChannelEventEnable(CAN_ID_1, CAN_CHANNEL4, CAN_RX_CHANNEL_ANY_EVENT);

```

5.6.4.5.9 PLIB_CAN_ChannelEventGet Function

C

```

CAN_CHANNEL_EVENT PLIB_CAN_ChannelEventGet(
    CAN_MODULE_ID index,
    CAN_CHANNEL channel
);

```

Description

This function returns a value representing the event status of a CAN channel. The return value can be logically ANDed with [CAN_CHANNEL_EVENT](#) type to check for a specific event(s). Channels events are affected regardless of whether the event itself is enabled or disabled.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module
channel	Identifies the desired CAN Channel

Returns

Returns a value that can be logically ANDed with a [CAN_CHANNEL_EVENT](#) type to check if specific CAN channel events are active.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsChannelEvent](#) in your application to determine whether this feature is available.

Example

```

// Check if Receive Channel 2 of CAN_ID_1 module
// is not empty or if its full.

CAN_CHANNEL_EVENT channelEvent;

channelEvent = PLIB_CAN_ChannelEventGet(CAN_ID_1, CAN_CHANNEL2);

if((channelEvent & (CAN_RX_CHANNEL_NOT_EMPTY | CAN_RX_CHANNEL_FULL)) != 0)
{
    // This means that either Receive Channel 2 is not empty
    // or the Channel is full.

}

// Check if Transmit Channel 3 of CAN_ID_2 module
// has any active events

channelEvent = PLIB_CAN_ChannelEventGet(CAN_ID_2, CAN_CHANNEL3);

if((channelEvent & CAN_TX_CHANNEL_ANY_EVENT) != 0)

```

```
{
    // This means that some event is active
}

// Check if Transmit Channel 6 of CAN_ID_2 module is not full
channelEvent = PLIB_CAN_ChannelEventGet(CAN_ID_2, CAN_CHANNEL6);
if((channelEvent & CAN_TX_CHANNEL_NOT_FULL) != 0)
{
    // This means the Channel is not full.
}
}
```

5.6.4.5.5.10 PLIB_CAN_PendingEventsGet Function

C

```
CAN_EVENT_CODE PLIB_CAN_PendingEventsGet(
    CAN_MODULE_ID index
);
```

Description

This function returns a value representing the highest priority active event in the module. The return value is a CAN_EVENT_CODE type.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module

Returns

Returns a CAN_EVENT_CODE type representing the highest priority active event in the module.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsPendingEventsGet](#) in your application to determine whether this feature is available.

Example

```
// Implement a switch to check and process
// any active CAN module events.

CAN_EVENT_CODE eventCode;

eventCode = PLIB_CAN_PendingEventsGet(CAN_ID_1);

switch(eventCode)
{
    case CAN_NO_EVENT:
        // Procedure to handle no CAN events
        break;

    case CAN_WAKEUP_EVENT:
        // Procedure to handle device wake-up
        // on CAN bus activity event
        break;

    default:
        break;
}
```

```
}
```

5.6.4.5.6 Message Transmit Functions

5.6.4.5.6.1 PLIB_CAN_PendingTransmissionsAbort Function

C

```
void PLIB_CAN_PendingTransmissionsAbort(  
    CAN_MODULE_ID index,  
    CAN_CHANNEL channel  
);
```

Description

This function aborts any pending transmit operations. Any messages that are yet to be transmitted will not be transmitted. The messages will still be present in the respective channel. Any message that is in the process of being transmitted will be transmitted completely. Either one channel or all channels can be specified.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module
channel	Identifies the desired CAN channel. By specifying CAN_ALL_CHANNELS, transmission on all transmit channels will be aborted.

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsPendingTransmissionsAbort](#) in your application to determine whether this feature is available.

Example

```
// Abort any pending transmissions on CAN_ID_1 Channel 4 and  
// Channel 5.  
PLIB_CAN_PendingTransmissionsAbort(CAN_ID_1, CAN_CHANNEL4);  
PLIB_CAN_PendingTransmissionsAbort(CAN_ID_1, CAN_CHANNEL5);
```

5.6.4.5.6.2 PLIB_CAN_TransmissionIsAborted Function

C

```
bool PLIB_CAN_TransmissionIsAborted(  
    CAN_MODULE_ID index,  
    CAN_CHANNEL channel  
);
```

Description

This function returns 'true' if the transmit abort operation is complete. Either individual channels can be specified or all channels can be specified.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module
channel	Identifies the desired CAN channel. By specifying CAN_ALL_CHANNELS the status of transmit abort on all transmit channels will be returned.

Returns

- true = If channel = CAN_ALL_CHANNELS, Transmit Abort is complete = If channel = CAN_CHANNELx, Transmit Abort was successful
- false = If channel = CAN_ALL_CHANNELS, Transmit Abort is in progress = If channel = CAN_CHANNELx, Transmit Abort was not successful

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsTransmissionIsAborted](#) in your application to determine whether this feature is available.

Example

```
// Abort any pending transmissions on CAN_ID_1 Channel 4 and
// check if the current message transmission was aborted.

PLIB_CAN_PendingTransmissionsAbort(CAN_ID_1, CAN_CHANNEL4);

if(PLIB_CAN_TransmissionIsAborted(CAN_ID_1, CAN_CHANNEL4) == false)
{
    // The message was not aborted.
}
else
{
    // The message was aborted.
}
```

5.6.4.5.6.3 PLIB_CAN_TransmitBufferGet Function**C**

```
CAN_TX_MSG_BUFFER * PLIB_CAN_TransmitBufferGet(
    CAN_MODULE_ID index,
    CAN_CHANNEL channel
);
```

Description

This function returns a pointer to an empty transmit buffer. The routine will return a NULL pointer if there aren't any empty transmit buffers. In such a case, the application should flush the channel and wait until the transmit channel has at least one empty buffer. In order to function correctly, it is essential that the [PLIB_CAN_ChannelUpdate](#) function is called in the proper sequence for the PLIB_CAN_TransmitBufferGet function to return a pointer to an empty buffer.

Preconditions

[PLIB_CAN_MemoryBufferAssign](#) must be called if the 'transmit buffer' should be in the device RAM. It is not required if the 'transmit buffer' is in SFR space.

Parameters

Parameters	Description
index	Identifies the desired CAN module
channel	Identifies the desired CAN Channel

Returns

Returns a [CAN_TX_MSG_BUFFER](#) type pointer to an empty message buffer in the Transmit channel. Returns NULL if the channel is full and there aren't any empty message buffers.

Remarks

Calling the `PLIB_CAN_TransmitBufferGet` function on a channel that has not been updated after a message was written to the channel, will cause the function to return a pointer to the written message in case of transmit buffer FIFO. Therefore, a non-transmitted message could get overwritten.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsTransmitBufferGet](#) in your application to determine whether this feature is available.

Example

```
// Transmit a message through CAN_ID_1 Channel 4

CAN_TX_MSG_BUFFER * msgBuffer;

msgBuffer = PLIB_CAN_TransmitBufferGet(CAN_ID_1, CAN_CHANNEL4);

if(msgBuffer != NULL)
{
    // Load the message here
}
else
{
    // No space in the channel
    // wait until a message
    // buffer is free.

    while((PLIB_CAN_ChannelEventGet(CAN_ID_1, CAN_CHANNEL4) &
        CAN_TX_CHANNEL_NOT_FULL) == 0);
}
```

5.6.4.5.6.4 PLIB_CAN_TransmitChannelFlush Function

C

```
void PLIB_CAN_TransmitChannelFlush(
    CAN_MODULE_ID index,
    CAN_CHANNEL channel
);
```

Description

This function causes all messages in the specified transmit channel to be transmitted. All messages in the channel at the time of the flush operation will be transmitted. The transmit channel flush operation should preferably be called immediately after the [PLIB_CAN_ChannelUpdate](#) function. This will ensure that messages are transmitted promptly.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module
channel	Identifies the desired CAN channel

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsTransmitChannelFlush](#) in your application to determine whether this feature is available.

Example

```
// Flush CAN_ID_1 Transmit Channel 4.

PLIB_CAN_TransmitChannelFlush(CAN_ID_1, CAN_CHANNEL4);
```

5.6.4.5.6.5 PLIB_CAN_TransmitChannelStatusGet Function**C**

```
CAN_TX_CHANNEL_STATUS PLIB_CAN_TransmitChannelStatusGet(
    CAN_MODULE_ID index,
    CAN_CHANNEL channel
);
```

Description

This function returns the condition of the transmit channel. The return value can be logically ANDed with [CAN_TX_CHANNEL_STATUS](#) type values.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module
channel	Identifies the desired CAN channel

Returns

Returns a status word that can be logically ANDed with the [CAN_TX_CHANNEL_STATUS](#) type to check whether a condition exists.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsTransmitChannelStatus](#) in your application to determine whether this feature is available.

Example

```
// Check if CAN_ID_1 Transmit Channel 4
// is still transmitting

CAN_TX_CHANNEL_STATUS status;

status = PLIB_CAN_TransmitChannelStatusGet(CAN_ID_1, CAN_CHANNEL4);

if((status & CAN_TX_CHANNEL_TRANSMITTING) != 0)
{
    // This means that channel is still
    // transmitting.
}

// Check if CAN_ID_2 Transmit Channel 5 has lost arbitration
// or other Transmit errors.

status = PLIB_CAN_TransmitChannelStatusGet(CAN_ID_2, CAN_CHANNEL5);

if((status & (CAN_TX_CHANNEL_ARBITRATION_LOST | CAN_TX_CHANNEL_ERROR)) != 0)
```

```
{  
    // This means that the Transmit channel has either  
    // lost arbitration or a Transmit error has occurred.  
}
```

5.6.4.5.6 PLIB_CAN_TransmitErrorCountGet Function

C

```
int PLIB_CAN_TransmitErrorCountGet(  
    CAN_MODULE_ID index  
);
```

Description

This function returns the CAN transmit error count. Refer to CAN 2.0B specification for more details on the CAN transmit error count and its significance.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module

Returns

Returns the CAN transmit error count.

Remarks

There are multiple bus conditions, which could cause the transmit error count to increase. Please refer to the CAN 2.0B specification for details.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsTransmitErrorCountGet](#) in your application to determine whether this feature is available.

Example

```
// Check if the CAN_ID_1 Transmit error count is more than 200  
int errorCount;  
  
errorCount = PLIB_CAN_TransmitErrorCountGet(CAN_ID_1);  
if(errorCount > 200)  
{  
    // This error count is high.  
    // Do some diagnostics.  
}
```

5.6.4.5.7 Message Receive Functions

5.6.4.5.7.1 PLIB_CAN_ReceivedMessageGet Function

C

```
CAN_RX_MSG_BUFFER * PLIB_CAN_ReceivedMessageGet(  
    CAN_MODULE_ID index,  
    CAN_CHANNEL channel  
);
```

Description

This function returns a [CAN_RX_MSG_BUFFER](#) pointer to a message to be read from the CAN channel. The routine will return

NULL if there are no new messages to be read. The [PLIB_CAN_ChannelUpdate](#) routine should be called after the received message has been processed.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module.
channel	Identifies the desired CAN Receive channel.

Returns

Returns NULL if there are no messages in the channel; otherwise returns a [CAN_RX_MSG_BUFFER](#) type pointer to a received CAN message. If the receive channel is a full CAN message receive channel, the caller should use the msgSID, msgEID and data members of the [CAN_RX_MSG_BUFFER](#) data structure to access the received CAN message. If the receive channel is a data-only channel, the message will only contain 8 payload data bytes (even if the message was placed on the bus with less than 8 bytes). The caller in this case should use the dataOnlyMsgData member of the [CAN_RX_MSG_BUFFER](#) data structure to read the data contained in the received CAN message.

Remarks

The CAN receive channel is configured as a full CAN message receive channel or a data-Only channel while configuring the channel using the [PLIB_CAN_ChannelForReceiveSet](#) function.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsReceivedMessageGet](#) in your application to determine whether this feature is available.

Example

```
// Read a message from the CAN_ID_1 Channel 8
// which is configured as full CAN message
// receive channel.

CAN_RX_MSG_BUFFER * receivedMsg;

receivedMsg = (CAN_RX_MSG_BUFFER *)PLIB_CAN_ReceivedMessageGet(CAN_ID_1,
    CAN_CHANNEL8);

if(receivedMsg != NULL)
{
    // rxMsg is pointing to
    // a CAN message. Process
    // the message and then update
    // the CAN channel.

    PLIB_CAN_ChannelUpdate(CAN_ID_1, CAN_CHANNEL8);
}

// Read a message from the CAN_ID_2 Channel 9
// which is configured as data only message
// receive channel. Access the message
// as bytes;

CAN_RX_MSG_BUFFER * rxMsg;

rxMsg = PLIB_CAN_ReceivedMessageGet(CAN_ID_2, CAN_CHANNEL9);

if(rxMsg != NULL)
{
    // rxMsg is pointing to
    // a CAN message. Process
```

```
// the message and then update
// the CAN channel.

// rxMsg->dataOnlyMsgData[0] is the first byte of message
// data payload. rxMsg->dataOnlyMsgData[0] is the second
// byte of message data payload and so on.
```

```
    PLIB_CAN_ChannelUpdate(CAN_ID_2, CAN_CHANNEL9);
}
```

5.6.4.5.7.2 PLIB_CAN_RxFIFOFourLeftNotify Function

C

```
void PLIB_CAN_RxFIFOFourLeftNotify(
    CAN_MODULE_ID index
);
```

Description

This function configures the module to generate an interrupt when the FIFO has four receive buffers left. If this API is not called, the module will interrupt if four receive buffers are empty.

Preconditions

The functional mode of the module should be configured for "CAN_ENHANCED_FIFO_MODE2" using [PLIB_CAN_FunctionalModeSelect](#) function.

Parameters

Parameters	Description
index	Identifies the desired CAN module

Returns

The total number of CAN Masks per CAN module.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsRxFIFOFourLeftNotify](#) in your application to determine whether this feature is available.

Example

```
PLIB_CAN_RxFIFOFourLeftNotify(CAN_ID_1);
```

5.6.4.5.7.3 PLIB_CAN_RxFIFOOneLeftNotify Function

C

```
void PLIB_CAN_RxFIFOOneLeftNotify(
    CAN_MODULE_ID index
);
```

Description

This function configures the module to generate an interrupt when the FIFO has only one receive buffer left. If this API is not called, the module will interrupt if four receive buffers are empty.

Preconditions

The functional mode of the module should be configured for "CAN_ENHANCED_FIFO_MODE2" using [PLIB_CAN_FunctionalModeSelect](#) function.

Parameters

Parameters	Description
index	Identifies the desired CAN module

Returns

The total number of CAN Masks per CAN module.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsRxFIFOOneLeftNotify](#) in your application to determine whether this feature is available.

Example

```
PLIB_CAN_RxFIFOOneLeftNotify(CAN_ID_1);
```

5.6.4.5.7.4 PLIB_CAN_ReceiveModeSelect Function**C**

```
void PLIB_CAN_ReceiveModeSelect(  
    CAN_MODULE_ID index,  
    CAN_RECEIVE_CHANNEL rcvChannel,  
    CAN_RECEIVE_MODES recMode  
);
```

Description

This function selects the receive mode of the CAN module.

Preconditions

The functional mode should support the 'receive mode' selected.

Parameters

Parameters	Description
index	Identifies the desired CAN module
rcvChannel	Receive channel number, one of the possible values from CAN_RECEIVE_CHANNEL
recMode	Receive mode, one of the possible values from CAN_RECEIVE_MODES

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsReceiveModeSelect](#) in your application to determine whether this feature is available.

Example

```
PLIB_CAN_FunctionalModeSelect(CAN_ID_1, CAN_LEGACY_MODE0);  
  
PLIB_CAN_ReceiveModeSelect(CAN_ID_1, CAN_RECEIVE_CHANNEL0, CAN_RECEIVE_ALL_MSG_MODE);
```

5.6.4.5.7.5 PLIB_CAN_ReceiveModeGet Function**C**

```
CAN_RECEIVE_MODES PLIB_CAN_ReceiveModeGet(  
    CAN_MODULE_ID index,  
    CAN_RECEIVE_CHANNEL rcvChannel  
);
```

Description

This function obtains the receive mode of the CAN module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module
rcvChannel	Receive channel number, one of the possible values from CAN_RECEIVE_CHANNEL

Returns

Receive mode, one of the possible values from [CAN_RECEIVE_MODES](#).

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsReceiveModeSelect](#) in your application to determine whether this feature is available.

Example

```
CAN_RECEIVE_MODES recMode;

recMode = PLIB_CAN_ReceiveModeGet(CAN_ID_1, CAN_RECEIVE_CHANNEL0);
```

5.6.4.5.7.6 PLIB_CAN_MessageIsReceived Function**C**

```
bool PLIB_CAN_MessageIsReceived(
    CAN_MODULE_ID index,
    CAN_RECEIVE_CHANNEL rcvChannel
);
```

Description

This function returns 'true' if a message was received and the receive buffer is not empty.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module
rcvChannel	Receive channel number, one of the possible values from CAN_RECEIVE_CHANNEL

Returns

- true = A message was received for the specified channel
- false = The receive buffer is not empty for the specified channel

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsMessageIsReceived](#) in your application to determine whether this feature is available.

Example

```
if (PLIB_CAN_MessageIsReceived(CAN_ID_1, CAN_RECEIVE_CHANNEL0))
```

```
{  
    //Read the message  
  
    //Acknowledge read; otherwise, it will cause the interrupt to  
    //generated again  
    PLIB_CAN_ReceiveBufferClear(CAN_ID_1, CAN_RECEIVE_CHANNEL0);  
}
```

5.6.4.5.7.7 PLIB_CAN_ReceiveBufferIsEmpty Function

C

```
bool PLIB_CAN_ReceiveBufferIsEmpty(  
    CAN_MODULE_ID index,  
    CAN_RECEIVE_CHANNEL rcvChannel  
);
```

Description

This function returns 'true' if the receive buffer of the specified channel is empty.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module
rcvChannel	Receive channel number, one of the possible values from CAN_RECEIVE_CHANNEL

Returns

- true = The receive buffer is not empty for the specified channel
- false = A message was received for the specified channel

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsReceiveBufferIsEmpty](#) in your application to determine whether this feature is available.

Example

```
if (PLIB_CAN_ReceiveBufferIsEmpty(CAN_ID_1, CAN_RECEIVE_CHANNEL0))  
{  
    //Buffer is empty  
}
```

5.6.4.5.7.8 PLIB_CAN_ReceiveBufferClear Function

C

```
void PLIB_CAN_ReceiveBufferClear(  
    CAN_MODULE_ID index,  
    CAN_RECEIVE_CHANNEL rcvChannel  
);
```

Description

This function clears the received message flag.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module
rcvChannel	Receive channel number, one of the possible values from CAN_RECEIVE_CHANNEL

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsReceiveBufferClear](#) in your application to determine whether this feature is available.

This API should be called once the receive message buffer is read. This function must be called once the receive message buffer has been read or the interrupt request will still be active and the interrupt may occur again immediately.

Example

```
if (PLIB_CAN_MessageIsReceived(CAN_ID_1, CAN_RECEIVE_CHANNEL0))
{
    //Read the message

    //Acknowledge read, otherwise it will cause the interrupt to
    //be generated again
    PLIB_CAN_ReceiveBufferClear(CAN_ID_1, CAN_RECEIVE_CHANNEL0);
}
```

5.6.4.5.7.9 PLIB_CAN_RemoteTransmitReqIsReceived Function**C**

```
bool PLIB_CAN_RemoteTransmitReqIsReceived(
    CAN_MODULE_ID index,
    CAN_RECEIVE_CHANNEL rcvChannel
);
```

Description

This function returns 'true' if the message received is a remote transmit request.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module
rcvChannel	Receive channel number, one of the possible values from CAN_RECEIVE_CHANNEL

Returns

- true = Received message is a remote transmission request
- false = Received message is not a remote transmission request

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsRemoteTransmitReq](#) in your application to determine whether this feature is available.

Example

```
if (PLIB_CAN_RemoteTransmitReqIsReceived(CAN_ID_1, CAN_RECEIVE_CHANNEL0))
{
    //Request for remote transmit
}
```

5.6.4.5.8 Message Filtering Functions

5.6.4.5.8.1 PLIB_CAN_FilterConfigure Function

C

```
void PLIB_CAN_FilterConfigure(
    CAN_MODULE_ID index,
    CAN_FILTER filter,
    uint32_t id,
    CAN_ID_TYPE filterType
);
```

Description

This function configures a CAN message acceptance filter. The ID field of the incoming message must match the filter bits for the CAN module to **accept** the message. A filter can be a EID type filter, which filters EID messages or a SID filter, which in turn filters SID messages. The filter mask bits (configured using the [PLIB_CAN_FilterMaskConfigure](#) function) additionally allow specified message ID bits to be ignored in the filtering process.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module
filter	Identifies the desired CAN receive filter
id	A value in the range 0x0 to 0x7FF for SID filter type or 0x0 to 0x1FFFFFFF for EID filter type.

5.6.4.5.8.2 PLIB_CAN_FilterDisable Function

C

```
void PLIB_CAN_FilterDisable(
    CAN_MODULE_ID index,
    CAN_FILTER filter
);
```

Description

This function disables a CAN message acceptance filter. At least one filter must be enabled for the CAN module to receive messages. A receive channel associated with a filter will not receive messages unless the filter is enabled. After a filter is disabled, the [PLIB_CAN_FilterIsDisabled](#) function should be called to verify that the filter is disabled. A filter must be disabled before it can be configured.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module
filter	Identifies the desired CAN Message Acceptance Filter

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsFilterEnable](#) in your application to determine whether this feature is available.

Example

```
// Enable filter 6 of CAN_ID_2
PLIB_CAN_FilterDisable (CAN_ID_2, CAN_FILTER6);

while(PLIB_CAN_FilterIsDisabled(CAN_ID_1, CAN_FILTER4));
```

5.6.4.5.8.3 PLIB_CAN_FilterEnable Function**C**

```
void PLIB_CAN_FilterEnable(
    CAN_MODULE_ID index,
    CAN_FILTER filter
);
```

Description

This function enables a CAN message acceptance filter. At least one filter must be enabled for the CAN module to receive messages. A receive channel associated with a filter will not receive messages unless the filter is enabled. After a filter is disabled, the [PLIB_CAN_FilterIsDisabled](#) function should be called to verify that the filter is disabled. A filter must be disabled before it can be configured.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module
filter	Identifies the desired CAN message acceptance filter

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsFilterEnable](#) in your application to determine whether this feature is available.

Example

```
// Enable filter 6 of CAN_ID_2
PLIB_CAN_FilterEnable (CAN_ID_2, CAN_FILTER6);
```

```
while(!PLIB_CAN_FilterIsDisabled(CAN_ID_1, CAN_FILTER4));
```

5.6.4.5.8.4 PLIB_CAN_FilterIsDisabled Function

C

```
bool PLIB_CAN_FilterIsDisabled(  
    CAN_MODULE_ID index,  
    CAN_FILTER filter  
);
```

Description

Returns 'true' if the specified filter is disabled. This function should be called to check if the filter is disabled before calling the [PLIB_CAN_FilterConfigure](#) function and [PLIB_CAN_FilterToChannelLink](#) function.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module
filter	Identifies the desired CAN filter

Returns

- true = The filter is disabled
- false = The filter is enabled

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsFilterEnable](#) in your application to determine whether this feature is available.

Example

```
// Disable CAN_ID_1 filter 3 and wait until the  
// filter is disabled.  
PLIB_CAN_FilterEnable(CAN_ID_1, CAN_FILTER3);  
  
while(PLIB_CAN_FilterIsDisabled(CAN_ID_1, CAN_FILTER3) == false);
```

5.6.4.5.8.5 PLIB_CAN_FilterMaskConfigure Function

C

```
void PLIB_CAN_FilterMaskConfigure(  
    CAN_MODULE_ID index,  
    CAN_FILTER_MASK mask,  
    uint32_t maskbits,  
    CAN_ID_TYPE idType,  
    CAN_FILTER_MASK_TYPE mide  
);
```

Description

This function configures a CAN filter mask. The mask bits determine which message ID bits are ignored and compared during the filtering process.

Preconditions

The CAN module should be in Configuration mode. This is achieved by using the [PLIB_CAN_OperationModeSelect](#) function.

Parameters

Parameters	Description
index	Identifies the desired CAN module
mask	Identifies the desired CAN receive filter mask.
maskbits	A value in the range 0x0 to 0x7FF for SID range or 0x0 to 0x1FFFFFFF for the EID range. Each set bit will mean that the corresponding bit in the filter will be compared to the corresponding bit in the message ID. A clear mask bit means the corresponding bit in the incoming message ID field will be ignored.

5.6.4.5.8.6 PLIB_CAN_FilterToChannelLink Function**C**

```
void PLIB_CAN_FilterToChannelLink(
    CAN_MODULE_ID index,
    CAN_FILTER filter,
    CAN_FILTER_MASK mask,
    CAN_CHANNEL channel
);
```

Description

This function links a filter to a channel. A filter is typically linked to a receive channel. This allows the channel to receive messages accepted by the filter. A filter can also be linked to a transmit channel if the transmit channel is configured for remote request transmit. In this case, a message accepted by the filter will automatically cause the linked transmit channel to transmit CAN messages that are buffered in the channel. Note that a filter should be enabled using the [PLIB_CAN_FilterEnable](#) function after the filter has been linked to the desired channel.

Preconditions

Filter should have been disabled using the [PLIB_CAN_FilterDisable](#) function.

Parameters

Parameters	Description
index	Identifies the desired CAN module
filter	Identifies the desired CAN Filter
mask	Identifies the mask to be used with this filter
channel	Identifies the channel to be linked to this filter. If a transmit channel is linked, the transmit channel should have its remote transmit request feature enabled.

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsFilterToChannelLink](#) in your application to determine whether this feature is available.

Example

```
// Configure CAN_ID_1 filter 3 to accept extended ID messages
// with EID 0x1D400 and link the filter to CAN_ID_1 Channel 5.
// Note the sequence in which the steps are performed.
// Disable the filter and check if its disabled.
// Configure the filter. Link it to the Channel and then
// enable the filter.

PLIB_CAN_FilterDisable(CAN_ID_1, CAN_FILTER3);

while(PLIB_CAN_FilterIsDisabled(CAN_ID_1, CAN_FILTER3) == false);
```

```
PLIB_CAN_FilterConfigure(CAN_ID_1, CAN_FILTER3, 0x1D400, CAN_EID);

PLIB_CAN_FilterToChannelLink(CAN_ID_1, CAN_FILTER3, CAN_FILTER_MASK0,
    CAN_CHANNEL5);

PLIB_CAN_FilterEnable(CAN_ID_1, CAN_FILTER3);
```

5.6.4.5.8.7 PLIB_CAN_LatestFilterMatchGet Function

C

```
CAN_FILTER PLIB_CAN_LatestFilterMatchGet(
    CAN_MODULE_ID index
);
```

Description

This function returns the index of the filter that accepted the latest message.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module

Returns

Index of the filter that accepted the latest message

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsLatestFilterMatchGet](#) in your application to determine whether this feature is available.

Example

```
// Check if CAN_ID_2 module Receive Buffer event
// is active and if so check which filter
// accepted the message.

CAN_FILTER filter;

if((PLIB_CAN_ModuleEventGet(CAN_ID_1) & CAN_RX_EVENT) != 0)
{
    // Check which filter accepted the message

    filter = PLIB_CAN_LatestFilterMatchGet(CAN_ID_1);
}
```

5.6.4.5.9 Error State Tracking

5.6.4.5.9.1 PLIB_CAN_ReceiveErrorCountGet Function

C

```
int PLIB_CAN_ReceiveErrorCountGet(
    CAN_MODULE_ID index
);
```

Description

This function returns the CAN receive error count. Refer to the CAN 2.0B specification for more details on the CAN receive error

count and its significance.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module

Returns

Returns the CAN receive error count.

Remarks

There are multiple bus conditions, which could cause the receive error count to increase. Please refer to the CAN 2.0b specification for details.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsReceiveErrorCount](#) in your application to determine whether this feature is available.

Example

```
// Check if CAN_ID_1 Receive error count is more than 200.
int errCount;

errCount = PLIB_CAN_ReceiveErrorCountGet(CAN_ID_1);
if(errCount > 200)
{
    // This error count is high.
    // Do some diagnostics.
}
```

5.6.4.5.9.2 PLIB_CAN_ErrorStateGet Function

C

```
CAN_ERROR_STATE PLIB_CAN_ErrorStateGet(
    CAN_MODULE_ID index
);
```

Description

This function returns the CAN error status word. The return word can be logically ANDed with the desired [CAN_ERROR_STATE](#) member to check if the CAN module is in a specific error state.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module

Returns

Returns the [CAN_ERROR_STATE](#) word, which can be logically ANDed with the desired [CAN_ERROR_STATE](#) member to check whether the CAN module is in a specific error state.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsErrorState](#) in your application to determine whether this feature is available.

Example

```

// Check if CAN_ID_1 is in the Transmit or Receive warning state.
CAN_ERROR_STATE errorState;

errorState = PLIB_CAN_ErrorStateGet(CAN_ID_1);

if((errorState & CAN_TX_RX_WARNING_STATE) != 0)
{
    // CAN_ID_1 is in either Transmit or Receive warning state.
}
// Check if CAN_ID_2 is in the Receive Bus Passive or Transmit Bus passive
// state.
errorState = PLIB_CAN_ErrorStateGet(CAN_ID_2);

if((errorState & (CAN_TX_BUS_PASSIVE_STATE | CAN_RX_BUS_PASSIVE_STATE)) != 0)
{
    // This means that the CAN module is in Transmit Bus Passive
    // or Receive Bus Passive state.
}

```

5.6.4.5.10 Information Functions**5.6.4.5.10.1 PLIB_CAN_TotalChannelsGet Function****C**

```

char PLIB_CAN_TotalChannelsGet(
    CAN_MODULE_ID index
);

```

Description

This function returns the total number of CAN channels per CAN module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module

Returns

The total number of CAN channels per CAN module.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsModuleInfo](#) in your application to determine whether this feature is available.

Example

```

char totalChannels;

totalChannels = PLIB_CAN_TotalChannelsGet(CAN_ID_1);

```

5.6.4.5.10.2 PLIB_CAN_TotalFiltersGet Function**C**

```

char PLIB_CAN_TotalFiltersGet(
    CAN_MODULE_ID index
);

```

Description

This function returns the total number of CAN filters per CAN module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module

Returns

The total number of CAN Filters per CAN module.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsModuleInfo](#) in your application to determine whether this feature is available.

Example

```
char totalFilters;  
  
totalFilters = PLIB_CAN_TotalFiltersGet(CAN_ID_1);
```

5.6.4.5.10.3 PLIB_CAN_TotalMasksGet Function**C**

```
char PLIB_CAN_TotalMasksGet(  
    CAN_MODULE_ID index  
);
```

Description

This function returns the total number of CAN masks per CAN module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired CAN module

Returns

The total number of CAN Masks per CAN module.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CAN_ExistsModuleInfo](#) in your application to determine whether this feature is available.

Example

```
char totalMasks;  
  
totalMasks = PLIB_CAN_TotalMasksGet(CAN_ID_1);
```

5.6.4.5.11 Data Types and Constants

5.6.4.5.11.1 CAN_CHANNEL Enumeration

C

```
typedef enum {

5.6.4.5.11.2 CAN_CHANNEL_EVENT Enumeration

C

```
typedef enum {
    CAN_RX_CHANNEL_NOT_EMPTY,
    CAN_RX_CHANNEL_HALF_FULL,
    CAN_RX_CHANNEL_FULL,
    CAN_RX_CHANNEL_OVERFLOW,
    CAN_RX_CHANNEL_ANY_EVENT,
    CAN_TX_CHANNEL_EMPTY,
    CAN_TX_CHANNEL_HALF_EMPTY,
    CAN_TX_CHANNEL_NOT_FULL,
    CAN_TX_CHANNEL_ANY_EVENT
} CAN_CHANNEL_EVENT;
```

Description

CAN Layer 3 Interrupts

This enumerates all the leading interrupts generated due to CAN transmit and receive events. This enumeration can be used to enable or disable channel events and as a mask to check if a channel event is active.

A single or a combination of the interrupts can be logically ORed to specify the interrupt(s) to be enabled disabled or events to check.

This enumeration is used by [PLIB_CAN_ChannelEventEnable](#), [PLIB_CAN_ChannelEventDisable](#), [PLIB_CAN_ChannelEventClear](#), and [PLIB_CAN_ChannelEventGet](#) functions.

Members

Members	Description
CAN_RX_CHANNEL_NOT_EMPTY	CAN Receive Channel Not Empty Event Mask
CAN_RX_CHANNEL_HALF_FULL	CAN Receive Channel Half Full Event Mask

CAN_RX_CHANNEL_FULL	CAN Receive Channel Full Event Mask
CAN_RX_CHANNEL_OVERFLOW	CAN Receive Channel Overflow Event Mask
CAN_RX_CHANNEL_ANY_EVENT	CAN Receive Channel Any Event Mask
CAN_TX_CHANNEL_EMPTY	CAN Transmit Channel Empty Event Mask
CAN_TX_CHANNEL_HALF_EMPTY	CAN Transmit Channel Half Empty Event Mask
CAN_TX_CHANNEL_NOT_FULL	CAN Transmit Channel Not Full Event Mask
CAN_TX_CHANNEL_ANY_EVENT	CAN Transmit Channel Any Event Mask

5.6.4.5.11.3 CAN_CHANNEL_MASK Enumeration

C

```
typedef enum {
    CAN_CHANNEL0_MASK,

    CAN_CHANNEL28_MASK,
    CAN_CHANNEL29_MASK,
    CAN_CHANNEL30_MASK,
    CAN_CHANNEL31_MASK,
    CAN_ANYCHANNEL_MASK
} CAN_CHANNEL_MASK;
```

Description

CAN Channel Masks

This enumeration identifies a series of useful masks. Each mask represents a CAN channel. These masks are used with the [PLIB_CAN_AllChannelEventsGet](#) and [PLIB_CAN_AllChannelOverflowStatusGet](#) functions. The value returned by these functions can be logically ANDed with any of these masks to check if an event or overflow event for that channel is active.

Members

Members	Description
CAN_CHANNEL0_MASK	Channel 0 Mask
CAN_CHANNEL1_MASK	Channel 1 Mask

CAN_CHANNEL2_MASK	Channel 2 Mask

5.6.4.5.11.4 CAN_DNET_FILTER_SIZE Enumeration

C

```
typedef enum {
    CAN_DNET_FILTER_SIZE_18_BIT,
    CAN_DNET_FILTER_SIZE_17_BIT,
    CAN_DNET_FILTER_SIZE_16_BIT,
    CAN_DNET_FILTER_SIZE_15_BIT,
    CAN_DNET_FILTER_SIZE_14_BIT,
    CAN_DNET_FILTER_SIZE_13_BIT,
    CAN_DNET_FILTER_SIZE_12_BIT,
    CAN_DNET_FILTER_SIZE_11_BIT,
    CAN_DNET_FILTER_SIZE_10_BIT,
    CAN_DNET_FILTER_SIZE_9_BIT,
    CAN_DNET_FILTER_SIZE_8_BIT,
    CAN_DNET_FILTER_SIZE_7_BIT,
    CAN_DNET_FILTER_SIZE_6_BIT,
    CAN_DNET_FILTER_SIZE_5_BIT,
    CAN_DNET_FILTER_SIZE_4_BIT,
```

```

    CAN_DNET_FILTER_SIZE_3_BIT,
    CAN_DNET_FILTER_SIZE_2_BIT,
    CAN_DNET_FILTER_SIZE_1_BIT,
    CAN_DNET_FILTER_DISABLE
} CAN_DNET_FILTER_SIZE;

```

Description

CAN DeviceNet filter bit numbers.

This enumeration identifies the size of the DeviceNet filter in bits. If the size of the DeviceNet filter is "n", the "n" most significant bits of the data payload are compared with the EID field of enabled filters.

Members

Members	Description
CAN_DNET_FILTER_SIZE_18_BIT	Compare up to data byte 2 bit 6 with filter mask bit 17
CAN_DNET_FILTER_SIZE_17_BIT	Compare up to data byte 2 bit 7 with filter mask bit 16
CAN_DNET_FILTER_SIZE_16_BIT	Compare up to data byte 1 bit 0 with filter mask bit 15
CAN_DNET_FILTER_SIZE_15_BIT	Compare up to data byte 1 bit 1 with filter mask bit 14
CAN_DNET_FILTER_SIZE_14_BIT	Compare up to data byte 1 bit 2 with filter mask bit 13
CAN_DNET_FILTER_SIZE_13_BIT	Compare up to data byte 1 bit 3 with filter mask bit 12
CAN_DNET_FILTER_SIZE_12_BIT	Compare up to data byte 1 bit 4 with filter mask bit 11
CAN_DNET_FILTER_SIZE_11_BIT	Compare up to data byte 1 bit 5 with filter mask bit 10
CAN_DNET_FILTER_SIZE_10_BIT	Compare up to data byte 1 bit 6 with filter mask bit 9
CAN_DNET_FILTER_SIZE_9_BIT	Compare up to data byte 1 bit 7 with filter mask bit 8
CAN_DNET_FILTER_SIZE_8_BIT	Compare up to data byte 0 bit 0 with filter mask bit 7
CAN_DNET_FILTER_SIZE_7_BIT	Compare up to data byte 0 bit 1 with filter mask bit 6
CAN_DNET_FILTER_SIZE_6_BIT	Compare up to data byte 0 bit 2 with filter mask bit 5
CAN_DNET_FILTER_SIZE_5_BIT	Compare up to data byte 0 bit 3 with filter mask bit 4
CAN_DNET_FILTER_SIZE_4_BIT	Compare up to data byte 0 bit 4 with filter mask bit 3
CAN_DNET_FILTER_SIZE_3_BIT	Compare up to data byte 0 bit 5 with filter mask bit 2
CAN_DNET_FILTER_SIZE_2_BIT	Compare up to data byte 0 bit 6 with filter mask bit 1
CAN_DNET_FILTER_SIZE_1_BIT	Compare up to data byte 0 bit 7 with filter mask bit 0
CAN_DNET_FILTER_DISABLE	Do not compare data bytes, Device Net Filtering is disabled

5.6.4.5.11.5 CAN_ERROR_STATE Enumeration

C

```

typedef enum {
    CAN_TX_RX_WARNING_STATE,
    CAN_RX_WARNING_STATE,
    CAN_TX_WARNING_STATE,
    CAN_RX_BUS_PASSIVE_STATE,
    CAN_TX_BUS_PASSIVE_STATE,
    CAN_TX_BUS_OFF_STATE
} CAN_ERROR_STATE;

```

Description

CAN Error States

This enumeration identifies all of the CAN module error states events. The CAN module enters or exits an error state as the transmit and receive error counter values change. Refer to the CAN 2.0B specification for more details on the error states.

This enumeration is used with the [PLIB_CAN_ErrorStateGet](#) function.

Members

Members	Description
CAN_TX_RX_WARNING_STATE	CAN Module is in a Transmit or Receive warning state.
CAN_RX_WARNING_STATE	CAN Module is in a Receive warning state.
CAN_TX_WARNING_STATE	CAN Module is in a Transmit warning state.
CAN_RX_BUS_PASSIVE_STATE	CAN Receive is in a Bus Passive state.
CAN_TX_BUS_PASSIVE_STATE	CAN Transmit is in a Bus Passive state.
CAN_TX_BUS_OFF_STATE	CAN Transmit is in Bus Off state.

5.6.4.5.11.6 CAN_FILTER Enumeration**C**

```
typedef enum {
    CAN_CHANNEL0_EVENT,
    CAN_CHANNEL1_EVENT,
    CAN_CHANNEL2_EVENT,
    CAN_CHANNEL3_EVENT,
    CAN_CHANNEL4_EVENT,
    CAN_CHANNEL5_EVENT,
    CAN_CHANNEL6_EVENT,
    CAN_CHANNEL7_EVENT,
    CAN_CHANNEL8_EVENT,
    CAN_CHANNEL9_EVENT,

Description

CAN Event Code

This enumeration identifies all of the event codes returned by the [PLIB_CAN_PendingEventsGet](#) function.

Members

Members	Description
CAN_CHANNEL0_EVENT	An event on Channel 0 is active
CAN_CHANNEL1_EVENT	An event on Channel 1 is active
CAN_CHANNEL2_EVENT	An event on Channel 2 is active
CAN_CHANNEL3_EVENT	An event on Channel 3 is active
CAN_CHANNEL4_EVENT	An event on Channel 4 is active
CAN_CHANNEL5_EVENT	An event on Channel 5 is active
CAN_CHANNEL6_EVENT	An event on Channel 6 is active
CAN_CHANNEL7_EVENT	An event on Channel 7 is active
CAN_CHANNEL8_EVENT	An event on Channel 8 is active
CAN_CHANNEL9_EVENT	An event on Channel 9 is active
CAN_CHANNEL10_EVENT	An event on Channel 10 is active
CAN_CHANNEL11_EVENT	An event on Channel 11 is active
CAN_CHANNEL12_EVENT	An event on Channel 12 is active
CAN_CHANNEL13_EVENT	An event on Channel 13 is active
CAN_CHANNEL14_EVENT	An event on Channel 14 is active
CAN_CHANNEL15_EVENT	An event on Channel 15 is active
CAN_CHANNEL16_EVENT	An event on Channel 16 is active
CAN_CHANNEL17_EVENT	An event on Channel 17 is active
CAN_CHANNEL18_EVENT	An event on Channel 18 is active
CAN_CHANNEL19_EVENT	An event on Channel 19 is active
CAN_CHANNEL20_EVENT	An event on Channel 20 is active
CAN_CHANNEL21_EVENT	An event on Channel 21 is active

CAN_CHANNEL22_EVENT	An event on Channel 22 is active
CAN_CHANNEL23_EVENT	An event on Channel 23 is active
CAN_CHANNEL24_EVENT	An event on Channel 24 is active
CAN_CHANNEL25_EVENT	An event on Channel 25 is active
CAN_CHANNEL26_EVENT	An event on Channel 26 is active
CAN_CHANNEL27_EVENT	An event on Channel 27 is active
CAN_CHANNEL28_EVENT	An event on Channel 28 is active
CAN_CHANNEL29_EVENT	An event on Channel 29 is active
CAN_CHANNEL30_EVENT	An event on Channel 30 is active
CAN_CHANNEL31_EVENT	An event on Channel 31 is active
CAN_NO_EVENT	No Event is active
CAN_ERROR_EVENT	CAN Bus Error Event is active
CAN_WAKEUP_EVENT	CAN Bus Wakeup Event is active
CAN_RX_CHANNEL_OVERFLOW_EVENT	CAN Receive Channel Overflow Event is active
CAN_ADDRESS_ERROR_EVENT	CAN Address Error Event is active
CAN_BUS_BANDWIDTH_ERROR	CAN Bus Bandwidth Error is active
CAN_TIMESTAMP_TIMER_EVENT	CAN Timestamp Timer Overflow event is active
CAN_MODE_CHANGE_EVENT	CAN Module Mode Change is active

5.6.4.5.11.7 CAN_FILTER_MASK Enumeration

C

```
typedef enum {
    CAN_FILTER_MASK0,
    CAN_FILTER_MASK1,
    CAN_FILTER_MASK2,
    CAN_FILTER_MASK3,
    CAN_NUMBER_OF_FILTER_MASKS
} CAN_FILTER_MASK;
```

Description

CAN Filter Masks

This enumeration identifies the available filters masks in each CAN module.

Members

Members	Description
CAN_FILTER_MASK0	CAN Filter Mask 0
CAN_FILTER_MASK1	CAN Filter Mask 1
CAN_FILTER_MASK2	CAN Filter Mask 2
CAN_FILTER_MASK3	CAN Filter Mask 3
CAN_NUMBER_OF_FILTER_MASKS	Total number of filter masks in the module

5.6.4.5.11.8 CAN_FILTER_MASK_TYPE Enumeration

C

```
typedef enum {
    CAN_FILTER_MASK_IDE_TYPE,
    CAN_FILTER_MASK_ANY_TYPE
} CAN_FILTER_MASK_TYPE;
```

Description

CAN Filter Mask Type

This enumeration specifies the filter mask type. The filter mask can either process messages with any type of ID (extended or standard) or can only process by ID specified in the filter configuration. For example, if the filter associated with the mask only accepts EID type messages and if the mask is configured to process by ID type, then SID messages will not be accepted. If the mask is configured to process any type of message, both SID and EID messages will be accepted on a filter match.

Members

Members	Description
CAN_FILTER_MASK_IDE_TYPE	Mask processes only Filter type of message
CAN_FILTER_MASK_ANY_TYPE	Mask processes any type (SID or EID) of message

5.6.4.5.11.9 CAN_FUNCIONAL_MODES Enumeration**C**

```
typedef enum {
    CAN_LEGACY_MODE0,
    CAN_ENHANCED_LEGACY_MODE1,
    CAN_ENHANCED_FIFO_MODE2
} CAN_FUNCIONAL_MODES;
```

Description

CAN Functional Modes

This enumerates all operating modes of the CAN module. The application should set the desired mode using the [PLIB_CAN_FunctionalModeSelect](#) function, and should then use the [PLIB_CAN_FunctionalModeGet](#) function to check if the CAN module has entered the requested mode.

Members

Members	Description
CAN_LEGACY_MODE0	CAN Mode 0, Legacy Mode. This mode enabled minimum features. Hides features of Enhanced CAN. This is the default mode of operation on all Reset conditions
CAN_ENHANCED_LEGACY_MODE1	CAN Mode 1, Enhanced Legacy Mode. Enables ECAN features. Enables DeviceNet filtering.
CAN_ENHANCED_FIFO_MODE2	CAN Mode 2, Enhanced FIFO Mode. In this mode, two or more receive buffers are used to form the receive FIFO buffer.

5.6.4.5.11.10 CAN_ID_TYPE Enumeration**C**

```
typedef enum {
    CAN_EID,
    CAN_SID
} CAN_ID_TYPE;
```

Description

CAN ID Type

This enumeration specifies the two CAN ID types: Standard and Extended. The Standard Type ID is 11 bits long and the Extended ID is 29 bits long. This enumeration then specifies the type of the ID specified while configuring filters and filter masks.

Members

Members	Description
CAN_EID	CAN Extended ID
CAN_SID	CAN Standard ID

5.6.4.5.11.11 CAN_MODULE_EVENT Enumeration**C**

```
typedef enum {
    CAN_TX_EVENT,
    CAN_RX_EVENT,
    CAN_TIMESTAMP_TIMER_OVERFLOW_EVENT,
    CAN_OPERATION_MODE_CHANGE_EVENT,
    CAN_RX_OVERFLOW_EVENT,
    CAN_SYSTEM_ERROR_EVENT,
    CAN_BUS_ERROR_EVENT,
    CAN_BUS_ACTIVITY_WAKEUP_EVENT,
    CAN_INVALID_RX_MESSAGE_EVENT
} CAN_MODULE_EVENT;
```

Description

CAN Module Events

This enumeration identifies all of the CAN module events. A combination of listed events can be logically ORed to enable or disable module level events. Similarly, a combination of events can be checked if active.

This enumeration is used with the [PLIB_CAN_ModuleEventEnable](#) function and [PLIB_CAN_ModuleEventGet](#) function.

Members

Members	Description
CAN_TX_EVENT	Transmit channel event. This event will occur if any of the Transmit Channel events are active.
CAN_RX_EVENT	Receive channel event. This event will occur if any of the Receive Channel events are active.
CAN_TIMESTAMP_TIMER_OVERFLOW_EVENT	CAN Timer Stamp Timer Overflow event occurs. This event occurs when the Timestamp Timer has overflowed.
CAN_OPERATION_MODE_CHANGE_EVENT	CAN Operation Mode Change Event. This event occurs when the CAN module has changed it's operating mode successfully.
CAN_RX_OVERFLOW_EVENT	CAN Receive Channel Overflow Event. This event occurs when any of the Receive Channel has overflowed.
CAN_SYSTEM_ERROR_EVENT	CAN System Error Event. This event occurs when CAN module tries to access an invalid Device RAM location.
CAN_BUS_ERROR_EVENT	CAN Bus Error Event. This event occurs when the CAN module cannot access the system bus.
CAN_BUS_ACTIVITY_WAKEUP_EVENT	CAN Bus Activity Wakeup. This event occurs when the device is in Sleep mode and bus activity is detected on the CAN bus.
CAN_INVALID_RX_MESSAGE_EVENT	CAN Bus Invalid Receive Message Event. This event occurs when the CAN module receives an Invalid message.

5.6.4.5.11.12 CAN_MODULE_ID Enumeration**C**

```
typedef enum {
    CAN_ID_1,
    CAN_ID_2,
```

```

    CAN_ID_3,
    CAN_NUMBER_OF_MODULES
} CAN_MODULE_ID;

```

Description

Enumeration: CAN_MODULE_ID

This enumeration defines the number of modules that are available on the microcontroller. This is the super set of all the possible instances that might be available on Microchip microcontrollers.

Refer to the specific device data sheet to get the correct number of modules defined for the desired microcontroller.

Members

Members	Description
CAN_NUMBER_OF_MODULES	The total number of modules available.

5.6.4.5.11.13 CAN_MSG_EID Structure

C

```

typedef struct {
    unsigned data_length_code : 4;
    unsigned reserved0 : 1;
    unsigned unimplemented1 : 3;
    unsigned reserved1 : 1;
    unsigned remote_request : 1;
    unsigned eid : 18;
    unsigned ide : 1;
    unsigned sub_remote_req : 1;
    unsigned unimplemented2 : 2;
} CAN_MSG_EID;

```

Description

CAN Message EID Word

This data structure represents the EID section of the CAN transmit and receive message. The data structure is an element of the [CAN_TX_MSG_BUFFER](#) and [CAN_RX_MSG_BUFFER](#) data structure.

Members

Members	Description
unsigned data_length_code : 4;	Data Length Control. Specifies the size of the data payload section of the CAN packet. Valid values are 0x0 - 0x8
unsigned reserved0 : 1;	Reserved bit. Should be always 0.
unsigned unimplemented1 : 3;	Unimplemented bit. Should be always 0.
unsigned reserved1 : 1;	Reserved bit. Should be always 0.
unsigned remote_request : 1;	Remote Transmit Request bit. Should be set for RTR messages, clear otherwise.
unsigned eid : 18;	CAN Transmit and Receive Extended ID field. Valid values are in range 0x0 - 0x3FFFF
unsigned ide : 1;	Identifier bit. If 0 means that message is SID. If 1 means that message is EID type.
unsigned sub_remote_req : 1;	Substitute Remote request bit. This bit should always be clear for an EID message. It is ignored for an SID message.
unsigned unimplemented2 : 2;	Unimplemented bit. Should be always 0.

5.6.4.5.11.14 CAN_OPERATION_MODES Enumeration

C

```

typedef enum {

```

```

    CAN_LISTEN_ALL_MESSAGES_MODE,
    CAN_CONFIGURATION_MODE,
    CAN_LISTEN_ONLY_MODE,
    CAN_LOOPBACK_MODE,
    CAN_DISABLE_MODE,
    CAN_NORMAL_MODE
} CAN_OPERATION_MODES;

```

Description

CAN Operation Modes

This enumerates all operating modes of the CAN module. The application should set the desired mode using the [PLIB_CAN_OperationModeSelect](#) function, and should then use the [PLIB_CAN_OperationModeGet](#) function to check if the CAN module has entered the requested mode.

Members

Members	Description
CAN_LISTEN_ALL_MESSAGES_MODE	CAN Listen All Message Mode. The CAN module listens to all messages, regardless of errors
CAN_CONFIGURATION_MODE	CAN Configuration Mode. Various CAN module settings can be configured in this mode
CAN_LISTEN_ONLY_MODE	CAN Listen Only Mode. In this mode, the CAN module will not acknowledge signal and will not participate in error signaling. All messages are captured
CAN_LOOPBACK_MODE	CAN Loopback Mode. In this mode, the CAN module Transmit is internally connected to the Receive line. This mode is useful for debugging operation
CAN_DISABLE_MODE	CAN Disable Mode. The CAN module does not transmit or receive messages in this mode
CAN_NORMAL_MODE	CAN Normal Operation Mode. The CAN module transmits and receives messages in this mode

5.6.4.5.11.15 CAN_RECEIVE_CHANNEL Enumeration

C

```

typedef enum {
    CAN_RECEIVE_CHANNEL0,
    CAN_RECEIVE_CHANNEL1
} CAN_RECEIVE_CHANNEL;

```

Description

CAN Receive Channels

This enumerates all CAN module receive channels(channels that are not allowed to be configured for transmit).

Members

Members	Description
CAN_RECEIVE_CHANNEL0	CAN receive channel 0
CAN_RECEIVE_CHANNEL1	CAN receive channel 1

5.6.4.5.11.16 CAN_RECEIVE_MODES Enumeration

C

```

typedef enum {
    CAN_RECEIVE_ALL_MSG_MODE,
    CAN_RECEIVE_VALID_EID_MODE,
    CAN_RECEIVE_VALID_STD_MODE,
    CAN_RECEIVE_VALID_MODE
}

```

```
} CAN_RECEIVE_MODES;
```

Description

CAN Receive Modes

This enumerates all operating modes of the CAN module. The application should set the desired mode using the [PLIB_CAN_ReceiveModeSelect](#) function, and should then use the [PLIB_CAN_ReceiveModeGet](#) function to check if the CAN module has entered the requested mode.

Members

Members	Description
CAN_RECEIVE_ALL_MSG_MODE	Receive all messages(Including with errors). The message filters will not be considered
CAN_RECEIVE_VALID_EID_MODE	Receive only valid messages(with error will be discarded, filter will be considered) with extended identifier. This is applicable only for functional mode 0
CAN_RECEIVE_VALID_STD_MODE	Receive only valid messages(with error will be discarded, filter will be considered) with standard identifier. This is applicable only for functional mode 0
CAN_RECEIVE_VALID_MODE	Receive only valid messages(with error will be discarded, filter will be considered) with extended identifier/standard identifier Based on the configuration

5.6.4.5.11.17 CAN_RX_DATA_MODE Enumeration

C

```
typedef enum {
    CAN_RX_DATA_ONLY,
    CAN_RX_FULL_RECEIVE
} CAN_RX_DATA_MODE;
```

Description

CAN Receive Channel Data Only Mode

This enumeration specifies the status of the CAN receive channel data-only feature. If the feature is enabled, the CAN module will store only the data payload portion of the received CAN message. If the Full Receive mode is specified, the CAN module stores the entire CAN message (ID field plus data payload). The receive channel can be either in Data-Only mode or Full Receive mode.

Members

Members	Description
CAN_RX_DATA_ONLY	CAN Receive Channel Data Only Mode is enabled
CAN_RX_FULL_RECEIVE	CAN Receive Channel Full Receive Mode is enabled

5.6.4.5.11.18 CAN_RX_MSG_BUFFER Union

C

```
typedef union {
    struct {
        CAN_RX_MSG_SID msgSID;
        CAN_MSG_EID msgEID;
        uint8_t data[8];
    }
    uint8_t dataOnlyMsgData[8];
    uint32_t messageWord[4];
} CAN_RX_MSG_BUFFER;
```

Description

CAN Receive Message Buffer

This data structure represents the CAN receive message buffer. Received messages could be either full-receive messages or data-only messages. A full-receive message contains the message header and data payload section. For a full-receive CAN receive channel, the caller should use the msgSID, msgEID and data members. A data-only message contains only an 8-byte data payload. While using this data structure with a data-only type of CAN receive channel, the caller should use the dataOnlyMsgData member of the structure and should read only 8 bytes of data.

Members

Members	Description
CAN_RX_MSG_SID msgSID;	This is SID portion of the CAN Receive message
CAN_MSG_EID msgEID;	This is EID portion of the CAN Receive message
uint8_t data[8];	This is the data payload section of the received message
uint8_t dataOnlyMsgData[8];	This can be used if the message buffer is to be read from a Data-Only type of CAN Receive Channel
uint32_t messageWord[4];	This is CAN Receive message organized as a set of 32 bit words

5.6.4.5.11.19 CAN_RX_MSG_SID Structure

C

```
typedef struct {
    unsigned sid : 11;
    unsigned filter_hit : 5;
    unsigned msg_timestamp : 16;
} CAN_RX_MSG_SID;
```

Description

CAN Receive Message SID Word

This data structure represents the SID section of the CAN receive message. The data structure is an element of the [CAN_RX_MSG_BUFFER](#) data structure.

Members

Members	Description
unsigned sid : 11;	SID of the Received CAN Message
unsigned filter_hit : 5;	Filter which accepted this message
unsigned msg_timestamp : 16;	Time stamp of the received message. This is valid only if the Timestamping is enabled

5.6.4.5.11.20 CAN_TIME_SEGMENT_LENGTH Enumeration

C

```
typedef enum {
    CAN_TIME_SEGMENT_LEN_8TQ,
    CAN_TIME_SEGMENT_LEN_7TQ,
    CAN_TIME_SEGMENT_LEN_6TQ,
    CAN_TIME_SEGMENT_LEN_5TQ,
    CAN_TIME_SEGMENT_LEN_4TQ,
    CAN_TIME_SEGMENT_LEN_3TQ,
    CAN_TIME_SEGMENT_LEN_2TQ,
    CAN_TIME_SEGMENT_LEN_1TQ
} CAN_TIME_SEGMENT_LENGTH;
```

Description

CAN Segment length

This enumeration defines values that can be assigned while defining the number of Time Quanta in a bit.

Members

Members	Description
CAN_TIME_SEGMENT_LEN_8TQ	Segment length is 8 x TQ
CAN_TIME_SEGMENT_LEN_7TQ	Segment length is 7 x TQ
CAN_TIME_SEGMENT_LEN_6TQ	Segment length is 6 x TQ
CAN_TIME_SEGMENT_LEN_5TQ	Segment length is 5 x TQ
CAN_TIME_SEGMENT_LEN_4TQ	Segment length is 4 x TQ
CAN_TIME_SEGMENT_LEN_3TQ	Segment length is 3 x TQ
CAN_TIME_SEGMENT_LEN_2TQ	Segment length is 2 x TQ
CAN_TIME_SEGMENT_LEN_1TQ	Segment length is 1 x TQ

5.6.4.5.11.21 CAN_TX_CHANNEL_STATUS Enumeration**C**

```
typedef enum {
    CAN_TX_CHANNEL_TRANSMITTING,
    CAN_TX_CHANNEL_ERROR,
    CAN_TX_CHANNEL_ARBITRATION_LOST
} CAN_TX_CHANNEL_STATUS;
```

Description

CAN Transmit Channel Condition

This enumeration identifies the possible transmit channel condition. These masks can be logically ANDed with values returned by the [PLIB_CAN_TransmitChannelStatusGet](#) function to check if a condition is active.

Members

Members	Description
CAN_TX_CHANNEL_TRANSMITTING	CAN Transmit Channel is currently Transmitting.
CAN_TX_CHANNEL_ERROR	CAN Transmit Channel Error has occurred.
CAN_TX_CHANNEL_ARBITRATION_LOST	CAN Transmit Channel lost arbitration.

5.6.4.5.11.22 CAN_TX_MSG_BUFFER Union**C**

```
typedef union {
    struct {
        CAN_TX_MSG_SID msgSID;
        CAN_MSG_EID msgEID;
        unsigned char data[8];
    }
    uint32_t messageWord[4];
} CAN_TX_MSG_BUFFER;
```

Description

CAN Transmit Message Buffer

This data structure represents the CAN transmit message buffer. This should be used for writing data to a CAN transmit channel and transmitting data. A pointer to this type of data structure is returned by the [PLIB_CAN_TransmitBufferGet](#) function.

The data structure allows the transmit message buffer to be accessed as fields of a CAN transmit message and also as an array of four 32-bit words. The latter allows for quick initialization of the message buffer.

Members

Members	Description
CAN_TX_MSG_SID msgSID;	This is SID portion of the CAN Transmit message
CAN_MSG_EID msgEID;	This is EID portion of the CAN Transmit message
unsigned char data[8];	This is the data portion of the CAN Transmit message
uint32_t messageWord[4];	This is CAN Transmit message organized as a set of 32 bit words

5.6.4.5.11.23 CAN_TX_MSG_SID Structure**C**

```
typedef struct {
    unsigned sid : 11;
} CAN_TX_MSG_SID;
```

Description

CAN Transmit Message SID Word

This data structure represents the SID section of the CAN transmit message. The data structure is an element of the [CAN_TX_MSG_BUFFER](#) data structure.

Members

Members	Description
unsigned sid : 11;	CAN Transmit Message Standard ID. This value should be between 0x0 - 0x7FF

5.6.4.5.11.24 CAN_TX_RTR Enumeration**C**

```
typedef enum {
    CAN_TX_RTR_ENABLED,
    CAN_TX_RTR_DISABLED
} CAN_TX_RTR;
```

Description

CAN Transmit Channel Remote Transmit Request (RTR)

This enumeration specifies the status of the CAN RTR feature for a CAN transmit channel. The RTR feature allows a node on the CAN Bus to request a transmission from another node on the bus. The responding node in this case should have a RTR enabled Transmit Channel in order to be able to respond to this request.

Members

Members	Description
CAN_TX_RTR_ENABLED	CAN Transmit Channel RTR Feature is enabled
CAN_TX_RTR_DISABLED	CAN Transmit Channel RTR Feature is disabled

5.6.4.5.11.25 CAN_TXCHANNEL_PRIORITY Enumeration**C**

```
typedef enum {
    CAN_LOWEST_PRIORITY,
    CAN_LOW_MEDIUM_PRIORITY,
    CAN_HIGH_MEDIUM_PRIORITY,
    CAN_HIGHEST_PRIORITY
} CAN_TXCHANNEL_PRIORITY;
```

Description

CAN Transmit Channel Priority

This enumeration identifies the available transmit channel priorities. A transmit channel has its own natural priority order, which determines priority when two or more transmit channels are assigned the same priority level. Channel 1 has higher natural priority than channel 0 and channel 2 has a natural priority than channel 1, and so on.

Members

Members	Description
CAN_LOWEST_PRIORITY	CAN lowest priority
CAN_LOW_MEDIUM_PRIORITY	CAN low medium priority
CAN_HIGH_MEDIUM_PRIORITY	CAN high medium priority
CAN_HIGHEST_PRIORITY	CAN highest priority

5.6.4.5.11.26 CAN_RX_DATA_ONLY_SIZE_BYTES Macro

C

```
#define CAN_RX_DATA_ONLY_SIZE_BYTES 8
```

Description

CAN Data-Only Receive Message Buffer

This constant is used as the size of the CAN data-only receive message buffer in bytes.

5.6.4.5.11.27 CAN_TX_RX_MESSAGE_SIZE_BYTES Macro

C

```
#define CAN_TX_RX_MESSAGE_SIZE_BYTES 16
```

Description

CAN Transmit and Receive Message Buffer size

This constant is used as the array size of the CAN transmit and full receive message buffer.

5.6.4.5.12 Feature Existence Routines**5.6.4.5.12.1 PLIB_CAN_ExistsActiveStatus Function**

C

```
bool PLIB_CAN_ExistsActiveStatus(
    CAN_MODULE_ID index
);
```

Description

This function identifies whether the ActiveStatus feature is available on the CAN module. When this function returns true, this function is supported on the device:

- [PLIB_CAN_IsActive](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The ActiveStatus feature is supported on the device
- false = The ActiveStatus feature is not supported on the device

Remarks

None.

5.6.4.5.12.2 PLIB_CAN_ExistsAllChannelEvents Function**C**

```
bool PLIB_CAN_ExistsAllChannelEvents(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the AllChannelEvents feature is available on the CAN module. When this function returns true, this function is supported on the device:

- [PLIB_CAN_AllChannelEventsGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The AllChannelEvents feature is supported on the device
- false = The AllChannelEvents feature is not supported on the device

Remarks

None.

5.6.4.5.12.3 PLIB_CAN_ExistsAllChannelOverflow Function**C**

```
bool PLIB_CAN_ExistsAllChannelOverflow(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the AllChannelOverflow feature is available on the CAN module. When this function returns true, this function is supported on the device:

- [PLIB_CAN_AllChannelOverflowStatusGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The AllChannelOverflow feature is supported on the device
- false = The AllChannelOverflow feature is not supported on the device

Remarks

None.

5.6.4.5.12.4 PLIB_CAN_ExistsBusActivityWakeup Function**C**

```
bool PLIB_CAN_ExistsBusActivityWakeup(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the BusActivityWakeup feature is available on the CAN module. When this function returns true, these functions are supported on the device:

- [PLIB_CAN_BusActivityWakeupEnable](#)
- [PLIB_CAN_BusActivityWakeupDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The BusActivityWakeup feature is supported on the device
- false = The BusActivityWakeup feature is not supported on the device

Remarks

None.

5.6.4.5.12.5 PLIB_CAN_ExistsBusLine3TimesSampling Function**C**

```
bool PLIB_CAN_ExistsBusLine3TimesSampling(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the BusLine3TimesSampling feature is available on the CAN module. When this function returns true, these functions are supported on the device:

- [PLIB_CAN_BusLine3TimesSamplingEnable](#)
- [PLIB_CAN_BusLine3TimesSamplingDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The BusLine3TimesSampling feature is supported on the device
- false = The BusLine3TimesSampling feature is not supported on the device

Remarks

None.

5.6.4.5.12.6 PLIB_CAN_ExistsChannelEvent Function**C**

```
bool PLIB_CAN_ExistsChannelEvent(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the ChannelEventGet feature is available on the CAN module. When this function returns true, these functions are supported on the device:

- [PLIB_CAN_ChannelEventGet](#)
- [PLIB_CAN_ChannelEventClear](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The ChannelEventGet feature is supported on the device
- false = The ChannelEventGet feature is not supported on the device

Remarks

None.

5.6.4.5.12.7 PLIB_CAN_ExistsChannelEventEnable Function**C**

```
bool PLIB_CAN_ExistsChannelEventEnable(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the ChannelEventEnable feature is available on the CAN module. When this function returns true, these functions are supported on the device:

- [PLIB_CAN_ChannelEventEnable](#)
- [PLIB_CAN_ChannelEventDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The ChannelEventEnable feature is supported on the device
- false = The ChannelEventEnable feature is not supported on the device

Remarks

None.

5.6.4.5.12.8 PLIB_CAN_ExistsChannelForReceiveSet Function

C

```
bool PLIB_CAN_ExistsChannelForReceiveSet(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the ChannelForReceiveSet feature is available on the CAN module. When this function returns true, this function is supported on the device:

- [PLIB_CAN_ChannelForReceiveSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The ChannelForReceiveSet feature is supported on the device
- false = The ChannelForReceiveSet feature is not supported on the device

Remarks

None.

5.6.4.5.12.9 PLIB_CAN_ExistsChannelForTransmitSet Function

C

```
bool PLIB_CAN_ExistsChannelForTransmitSet(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the ChannelForTransmitSet feature is available on the CAN module. When this function returns true, this function is supported on the device:

- [PLIB_CAN_ChannelForTransmitSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The ChannelForTransmitSet feature is supported on the device
- false = The ChannelForTransmitSet feature is not supported on the device

Remarks

None.

5.6.4.5.12.10 PLIB_CAN_ExistsChannelReset Function**C**

```
bool PLIB_CAN_ExistsChannelReset(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the ChannelReset feature is available on the CAN module. When this function returns true, these functions are supported on the device:

- [PLIB_CAN_ChannelReset](#)
- [PLIB_CAN_ChannelResetIsComplete](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The ChannelReset feature is supported on the device
- false = The ChannelReset feature is not supported on the device

Remarks

None.

5.6.4.5.12.11 PLIB_CAN_ExistsChannelUpdate Function**C**

```
bool PLIB_CAN_ExistsChannelUpdate(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the ChannelUpdate feature is available on the CAN module. When this function returns true, this function is supported on the device:

- [PLIB_CAN_ChannelUpdate](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The ChannelUpdate feature is supported on the device
- false = The ChannelUpdate feature is not supported on the device

Remarks

None.

5.6.4.5.12.12 PLIB_CAN_ExistsDeviceNet Function**C**

```
bool PLIB_CAN_ExistsDeviceNet(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the DeviceNet feature is available on the CAN module. When this function returns true, this function is supported on the device:

- [PLIB_CAN_DeviceNetConfigure](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The DeviceNet feature is supported on the device
- false = The DeviceNet feature is not supported on the device

Remarks

None.

5.6.4.5.12.13 PLIB_CAN_ExistsEnableControl Function**C**

```
bool PLIB_CAN_ExistsEnableControl(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the EnableControl feature is available on the CAN module. When this function returns true, these functions are supported on the device:

- [PLIB_CAN_Enable](#)

- [PLIB_CAN_Disable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The EnableControl feature is supported on the device
- false = The EnableControl feature is not supported on the device

Remarks

None.

5.6.4.5.12.14 PLIB_CAN_ExistsErrorState Function**C**

```
bool PLIB_CAN_ExistsErrorState(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the ErrorStateGet feature is available on the CAN module. When this function returns true, this function is supported on the device:

- [PLIB_CAN_ErrorStateGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The ErrorStateGet feature is supported on the device
- false = The ErrorStateGet feature is not supported on the device

Remarks

None.

5.6.4.5.12.15 PLIB_CAN_ExistsFilterConfigure Function**C**

```
bool PLIB_CAN_ExistsFilterConfigure(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the FilterConfigure feature is available on the CAN module. When this function returns true, this function is supported on the device:

- [PLIB_CAN_FilterConfigure](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The FilterConfigure feature is supported on the device
- false = the FilterConfigure feature is not supported on the device

Remarks

None.

5.6.4.5.12.16 PLIB_CAN_ExistsFilterEnable Function**C**

```
bool PLIB_CAN_ExistsFilterEnable(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the FilterEnable feature is available on the CAN module. When this function returns true, these functions are supported on the device:

- [PLIB_CAN_FilterEnable](#)
- [PLIB_CAN_FilterDisable](#)
- [PLIB_CAN_FilterIsDisabled](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The FilterEnable feature is supported on the device
- false = The FilterEnable feature is not supported on the device

Remarks

None.

5.6.4.5.12.17 PLIB_CAN_ExistsFilterMaskConfigure Function**C**

```
bool PLIB_CAN_ExistsFilterMaskConfigure(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the FilterMaskConfigure feature is available on the CAN module. When this function returns true,

this function is supported on the device:

- [PLIB_CAN_FilterMaskConfigure](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The FilterMaskConfigure feature is supported on the device
- false = The FilterMaskConfigure feature is not supported on the device

Remarks

None.

5.6.4.5.12.18 PLIB_CAN_ExistsFilterToChannelLink Function

C

```
bool PLIB_CAN_ExistsFilterToChannelLink(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the FilterToChannelLink feature is available on the CAN module. When this function returns true, this function is supported on the device:

- [PLIB_CAN_FilterToChannelLink](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The FilterToChannelLink feature is supported on the device
- false = The FilterToChannelLink feature is not supported on the device

Remarks

None.

5.6.4.5.12.19 PLIB_CAN_ExistsFunctionalMode Function

C

```
bool PLIB_CAN_ExistsFunctionalMode(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the FunctionalModeSelect feature is available on the CAN module. When this function returns true, these functions are supported on the device:

- [PLIB_CAN_FunctionalModeSelect](#)
- [PLIB_CAN_FunctionalModeGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The FunctionalModeSelect feature is supported on the device
- false = The FunctionalModeSelect feature is not supported on the device

Remarks

None.

5.6.4.5.12.20 PLIB_CAN_ExistsLatestFilterMatchGet Function

C

```
bool PLIB_CAN_ExistsLatestFilterMatchGet(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the LatestFilterMatchGet feature is available on the CAN module. When this function returns true, this function is supported on the device:

- [PLIB_CAN_LatestFilterMatchGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The LatestFilterMatchGet feature is supported on the device
- false = The LatestFilterMatchGet feature is not supported on the device

Remarks

None.

5.6.4.5.12.21 PLIB_CAN_ExistsMemoryBufferAssign Function

C

```
bool PLIB_CAN_ExistsMemoryBufferAssign(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the MemoryBufferAssign feature is available on the CAN module. When this function returns true, this function is supported on the device:

- [PLIB_CAN_MemoryBufferAssign](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The MemoryBufferAssign feature is supported on the device
- false = The MemoryBufferAssign feature is not supported on the device

Remarks

None.

5.6.4.5.12.22 PLIB_CAN_ExistsMessageIsReceived Function**C**

```
bool PLIB_CAN_ExistsMessageIsReceived(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the MessageIsReceived feature is available on the CAN module. When this function returns true, this function is supported on the device:

- [PLIB_CAN_MessageIsReceived](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The MessageIsReceived feature is supported on the device
- false = The MessageIsReceived feature is not supported on the device

Remarks

None.

5.6.4.5.12.23 PLIB_CAN_ExistsModuleEventClear Function**C**

```
bool PLIB_CAN_ExistsModuleEventClear(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the ModuleEvents feature is available on the CAN module. When this function returns true, these functions are supported on the device:

- [PLIB_CAN_ModuleEventClear](#)

- [PLIB_CAN_ModuleEventGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The ModuleEvents feature is supported on the device
- false = The ModuleEvents feature is not supported on the device

Remarks

None.

5.6.4.5.12.24 PLIB_CAN_ExistsModuleEventEnable Function**C**

```
bool PLIB_CAN_ExistsModuleEventEnable(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the ModuleEventEnable feature is available on the CAN module. When this function returns true, these functions are supported on the device:

- [PLIB_CAN_ModuleEventEnable](#)
- [PLIB_CAN_ModuleEventDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The ModuleEventEnable feature is supported on the device
- false = The ModuleEventEnable feature is not supported on the device

Remarks

None.

5.6.4.5.12.25 PLIB_CAN_ExistsModuleInfo Function**C**

```
bool PLIB_CAN_ExistsModuleInfo(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the ModuleInformation feature is available on the CAN module. When this function returns true, these functions are supported on the device:

- [PLIB_CAN_TotalChannelsGet](#)
- [PLIB_CAN_TotalFiltersGet](#)
- [PLIB_CAN_TotalMasksGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The ModuleInformation feature is supported on the device
- false = The ModuleInformation feature is not supported on the device

Remarks

None.

5.6.4.5.12.26 PLIB_CAN_ExistsOperationModeRead Function**C**

```
bool PLIB_CAN_ExistsOperationModeRead(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the OperationModeRead feature is available on the CAN module. When this function returns true, this function is supported on the device:

- [PLIB_CAN_OperationModeGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The OperationModeRead feature is supported on the device
- false = The OperationModeRead feature is not supported on the device

Remarks

None.

5.6.4.5.12.27 PLIB_CAN_ExistsOperationModeWrite Function**C**

```
bool PLIB_CAN_ExistsOperationModeWrite(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the OperationModeSet feature is available on the CAN module. When this function returns true, this function is supported on the device:

- [PLIB_CAN_OperationModeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The OperationModeSet feature is supported on the device
- false = The OperationModeSet feature is not supported on the device

Remarks

None.

5.6.4.5.12.28 PLIB_CAN_ExistsPendingEventsGet Function**C**

```
bool PLIB_CAN_ExistsPendingEventsGet(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the PendingEventsGet feature is available on the CAN module. When this function returns true, this function is supported on the device:

- [PLIB_CAN_PendingEventsGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The PendingEventsGet feature is supported on the device
- false = The PendingEventsGet feature is not supported on the device

Remarks

None.

5.6.4.5.12.29 PLIB_CAN_ExistsPendingTransmissionsAbort Function**C**

```
bool PLIB_CAN_ExistsPendingTransmissionsAbort(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the PendingTransmissionsAbort feature is available on the CAN module. When this function returns true, this function is supported on the device:

- [PLIB_CAN_PendingTransmissionsAbort](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The PendingTransmissionsAbort feature is supported on the device
- false = The PendingTransmissionsAbort feature is not supported on the device

Remarks

None.

5.6.4.5.12.30 PLIB_CAN_ExistsPhaseSegment1Length Function**C**

```
bool PLIB_CAN_ExistsPhaseSegment1Length(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the PhaseSegment1Length feature is available on the CAN module. When this function returns true, this function is supported on the device:

- [PLIB_CAN_PhaseSegment1LengthSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The PhaseSegment1Length feature is supported on the device
- false = The PhaseSegment1Length feature is not supported on the device

Remarks

None.

5.6.4.5.12.31 PLIB_CAN_ExistsPhaseSegment2Length Function**C**

```
bool PLIB_CAN_ExistsPhaseSegment2Length(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the PhaseSegment2Length feature is available on the CAN module. When this function returns true, this function is supported on the device:

- [PLIB_CAN_PhaseSegment2LengthSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The PhaseSegment2Length feature is supported on the device
- false = The PhaseSegment2Length feature is not supported on the device

Remarks

None.

5.6.4.5.12.32 PLIB_CAN_ExistsPhaseSegment2LengthFreelyProgrammable Function**C**

```
bool PLIB_CAN_ExistsPhaseSegment2LengthFreelyProgrammable(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the PhaseSegment2LengthFreelyProgrammable feature is available on the CAN module. When this function returns true, these functions are supported on the device:

- [PLIB_CAN_PhaseSegment2LengthFreelyProgrammableEnable](#)
- [PLIB_CAN_PhaseSegment2LengthFreelyProgrammableDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The PhaseSegment2LengthFreelyProgrammable feature is supported on the device
- false = The PhaseSegment2LengthFreelyProgrammable feature is not supported on the device

Remarks

None.

5.6.4.5.12.33 PLIB_CAN_ExistsPropagationTimeSegment Function**C**

```
bool PLIB_CAN_ExistsPropagationTimeSegment(  
    CAN_MODULE_ID index
```

```
);
```

Description

This function identifies whether the PropagationTimeSegment feature is available on the CAN module. When this function returns true, this function is supported on the device:

- [PLIB_CAN_PropagationTimeSegmentSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The PropagationTimeSegment feature is supported on the device
- false = The PropagationTimeSegment feature is not supported on the device

Remarks

None.

5.6.4.5.12.34 PLIB_CAN_ExistsReceiveBufferClear Function

C

```
bool PLIB_CAN_ExistsReceiveBufferClear(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the ReceiveBufferClear feature is available on the CAN module. When this function returns true, this function is supported on the device:

- [PLIB_CAN_ReceiveBufferClear](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The ReceiveBufferClear feature is supported on the device
- false = The ReceiveBufferClear feature is not supported on the device

Remarks

None.

5.6.4.5.12.35 PLIB_CAN_ExistsReceiveBufferIsEmpty Function

C

```
bool PLIB_CAN_ExistsReceiveBufferIsEmpty(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the ReceiveBufferIsEmpty feature is available on the CAN module. When this function returns true, this function is supported on the device:

- [PLIB_CAN_ReceiveBufferIsEmpty](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The ReceiveBufferIsEmpty feature is supported on the device
- false = The ReceiveBufferIsEmpty feature is not supported on the device

Remarks

None.

5.6.4.5.12.36 PLIB_CAN_ExistsReceivedMessageGet Function**C**

```
bool PLIB_CAN_ExistsReceivedMessageGet(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the ReceivedMessageGet feature is available on the CAN module. When this function returns true, this function is supported on the device:

- [PLIB_CAN_ReceivedMessageGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The ReceivedMessageGet feature is supported on the device
- false = The ReceivedMessageGet feature is not supported on the device

Remarks

None.

5.6.4.5.12.37 PLIB_CAN_ExistsReceiveErrorCount Function**C**

```
bool PLIB_CAN_ExistsReceiveErrorCount(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the ReceiveErrorCount feature is available on the CAN module. When this function returns true, this function is supported on the device:

- [PLIB_CAN_ReceiveErrorCountGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The ReceiveErrorCount feature is supported on the device
- false = The ReceiveErrorCount feature is not supported on the device

Remarks

None.

5.6.4.5.12.38 PLIB_CAN_ExistsReceiveModeSelect Function**C**

```
bool PLIB_CAN_ExistsReceiveModeSelect(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the ReceiveModeSelect feature is available on the CAN module. When this function returns true, these functions are supported on the device:

- [PLIB_CAN_ReceiveModeSelect](#)
- [PLIB_CAN_ReceiveModeGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The ReceiveModeSelect feature is supported on the device
- false = The ReceiveModeSelect feature is not supported on the device

Remarks

None.

5.6.4.5.12.39 PLIB_CAN_ExistsRemoteTransmitReq Function**C**

```
bool PLIB_CAN_ExistsRemoteTransmitReq(  
    CAN_MODULE_ID index
```

```
);
```

Description

This function identifies whether the RemoteTransmitReq feature is available on the CAN module. When this function returns true, this function is supported on the device:

- [PLIB_CAN_RemoteTransmitReqlsReceived](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The RemoteTransmitReq feature is supported on the device
- false = The RemoteTransmitReq feature is not supported on the device

Remarks

None.

5.6.4.5.12.40 PLIB_CAN_ExistsRxFIFOFourLeftNotify Function

C

```
bool PLIB_CAN_ExistsRxFIFOFourLeftNotify(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the RxFIFOFourLeftNotify feature is available on the CAN module. When this function returns true, this function is supported on the device:

- [PLIB_CAN_RxFIFOFourLeftNotify](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The RxFIFOFourLeftNotify feature is supported on the device
- false = The RxFIFOFourLeftNotify feature is not supported on the device

Remarks

None.

5.6.4.5.12.41 PLIB_CAN_ExistsRxFIFOOneLeftNotify Function

C

```
bool PLIB_CAN_ExistsRxFIFOOneLeftNotify(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the RxFIFOOneLeftNotify feature is available on the CAN module. When this function returns true, this function is supported on the device:

- [PLIB_CAN_RxFIFOOneLeftNotify](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The RxFIFOOneLeftNotify feature is supported on the device
- false = The RxFIFOOneLeftNotify feature is not supported on the device

Remarks

None.

5.6.4.5.12.42 PLIB_CAN_ExistsStopInIdle Function**C**

```
bool PLIB_CAN_ExistsStopInIdle(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the StopInIdle feature is available on the CAN module. When this function returns true, these functions are supported on the device:

- [PLIB_CAN_StopInIdleEnable](#)
- [PLIB_CAN_StopInIdleDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The StopInIdle feature is supported on the device
- false = The StopInIdle feature is not supported on the device

Remarks

None.

5.6.4.5.12.43 PLIB_CAN_ExistsSyncJumpWidthSet Function**C**

```
bool PLIB_CAN_ExistsSyncJumpWidthSet(  
    CAN_MODULE_ID index
```

```
);
```

Description

This function identifies whether the SyncJumpWidth feature is available on the CAN module. When this function returns true, this function is supported on the device:

- [PLIB_CAN_SyncJumpWidthSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The SyncJumpWidth feature is supported on the device
- false = The SyncJumpWidth feature is not supported on the device

Remarks

None.

5.6.4.5.12.44 PLIB_CAN_ExistsTimeStampEnable Function

C

```
bool PLIB_CAN_ExistsTimeStampEnable(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the TimeStampEnable feature is available on the CAN module. When this function returns true, these functions are supported on the device:

- [PLIB_CAN_TimeStampEnable](#)
- [PLIB_CAN_TimeStampDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The TimeStampEnable feature is supported on the device
- false = The TimeStampEnable feature is not supported on the device

Remarks

None.

5.6.4.5.12.45 PLIB_CAN_ExistsTimeStampPrescalar Function

C

```
bool PLIB_CAN_ExistsTimeStampPrescalar(  

```

```
    CAN_MODULE_ID index
);
```

Description

This function identifies whether the TimeStampPrescalar feature is available on the CAN module. When this function returns true, this function is supported on the device:

- [PLIB_CAN_TimeStampPrescalarSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The TimeStampPrescalar feature is supported on the device
- false = The TimeStampPrescalar feature is not supported on the device

Remarks

None.

5.6.4.5.12.46 PLIB_CAN_ExistsTimeStampValue Function

C

```
bool PLIB_CAN_ExistsTimeStampValue(
    CAN_MODULE_ID index
);
```

Description

This function identifies whether the TimeStampValue feature is available on the CAN module. When this function returns true, these functions are supported on the device:

- [PLIB_CAN_TimeStampValueSet](#)
- [PLIB_CAN_TimeStampValueGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The TimeStampValue feature is supported on the device
- false = The TimeStampValue feature is not supported on the device

Remarks

None.

5.6.4.5.12.47 PLIB_CAN_ExistsTransmissionIsAborted Function

C

```
bool PLIB_CAN_ExistsTransmissionIsAborted(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the TransmissionAbortStatus feature is available on the CAN module. When this function returns true, this function is supported on the device:

- [PLIB_CAN_TransmissionIsAborted](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The TransmissionAbortStatus feature is supported on the device
- false = The TransmissionAbortStatus feature is not supported on the device

Remarks

None.

5.6.4.5.12.48 PLIB_CAN_ExistsTransmitBufferGet Function

C

```
bool PLIB_CAN_ExistsTransmitBufferGet(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the TransmitBufferGet feature is available on the CAN module. When this function returns true, this function is supported on the device:

- [PLIB_CAN_TransmitBufferGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The TransmitBufferGet feature is supported on the device
- false = The TransmitBufferGet feature is not supported on the device

Remarks

None.

5.6.4.5.12.49 PLIB_CAN_ExistsTransmitChannelFlush Function

C

```
bool PLIB_CAN_ExistsTransmitChannelFlush(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the TransmitChannelFlush feature is available on the CAN module. When this function returns true, this function is supported on the device:

- [PLIB_CAN_TransmitChannelFlush](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The TransmitChannelFlush feature is supported on the device
- false = The TransmitChannelFlush feature is not supported on the device

Remarks

None.

5.6.4.5.12.50 PLIB_CAN_ExistsTransmitChannelStatus Function

C

```
bool PLIB_CAN_ExistsTransmitChannelStatus(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the TransmitChannelStatus feature is available on the CAN module. When this function returns true, this function is supported on the device:

- [PLIB_CAN_TransmitChannelStatusGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The TransmitChannelStatus feature is supported on the device
- false = The TransmitChannelStatus feature is not supported on the device

Remarks

None.

5.6.4.5.12.51 PLIB_CAN_ExistsTransmitErrorCountGet Function

C

```
bool PLIB_CAN_ExistsTransmitErrorCountGet(  
    CAN_MODULE_ID index  
);
```

Description

This function identifies whether the TransmitErrorCountGet feature is available on the CAN module. When this function returns true, this function is supported on the device:

- [PLIB_CAN_TransmitErrorCountGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The TransmitErrorCountGet feature is supported on the device
- false = The TransmitErrorCountGet feature is not supported on the device

Remarks

None.

5.6.4.6 Files

Files

Name	Description
plib_can.h	This file contains the interface definition for the CAN Peripheral Library.

Description

5.6.4.6.1 plib_can.h

CAN Peripheral Library Interface Header

This library provides a low-level abstraction of the Controller Area Network (CAN) module on Microchip microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, thus hiding differences between one microcontroller variant and another.

Functions

	Name	Description
≡	PLIB_CAN_AllChannelEventsGet	Returns a value representing the event status of all CAN channels.
≡	PLIB_CAN_AllChannelOverflowStatusGet	Returns a value representing the receive overflow event status of all CAN channels.

	PLIB_CAN_BusActivityWakeupDisable	Disables the wake-up on bus activity receive line filter.
	PLIB_CAN_BusActivityWakeupEnable	Enables the wake-up on bus activity receive line filter.
	PLIB_CAN_BusLine3TimesSamplingDisable	Disables the bus line three times sampling.
	PLIB_CAN_BusLine3TimesSamplingEnable	Enables the bus line three times sampling.
	PLIB_CAN_ChannelEventClear	Clears CAN channel events.
	PLIB_CAN_ChannelEventDisable	Enables channel level events.
	PLIB_CAN_ChannelEventEnable	Enables channel level events.
	PLIB_CAN_ChannelEventGet	Returns a value representing the event status of a CAN channel.
	PLIB_CAN_ChannelForReceiveSet	Configures a CAN channel for receive operation.
	PLIB_CAN_ChannelForTransmitSet	Configures a CAN channel for transmission.
	PLIB_CAN_ChannelReset	Resets a CAN channel.
	PLIB_CAN_ChannelResetIsComplete	Returns 'true' if the specified channel reset is complete.
	PLIB_CAN_ChannelUpdate	Updates the CAN Channel internal pointers.
	PLIB_CAN_DeviceNetConfigure	Configures the CAN module DeviceNet(TM) filter feature.
	PLIB_CAN_Disable	Disables the specified CAN module.
	PLIB_CAN_Enable	Enables the specified CAN module.
	PLIB_CAN_ErrorStateGet	Returns the CAN error status word.
	PLIB_CAN_ExistsActiveStatus	Identifies whether the ActiveStatus feature exists on the CAN module.
	PLIB_CAN_ExistsAllChannelEvents	Identifies whether the AllChannelEvents feature exists on the CAN module.
	PLIB_CAN_ExistsAllChannelOverflow	Identifies whether the AllChannelOverflow feature exists on the CAN module.
	PLIB_CAN_ExistsBusActivityWakeup	Identifies whether the BusActivityWakeup feature exists on the CAN module.
	PLIB_CAN_ExistsBusLine3TimesSampling	Identifies whether the BusLine3TimesSampling feature exists on the CAN module.
	PLIB_CAN_ExistsChannelEvent	Identifies whether the ChannelEventGet feature exists on the CAN module.
	PLIB_CAN_ExistsChannelEventEnable	Identifies whether the ChannelEventEnable feature exists on the CAN module.
	PLIB_CAN_ExistsChannelForReceiveSet	Identifies whether the ChannelForReceiveSet feature exists on the CAN module.
	PLIB_CAN_ExistsChannelForTransmitSet	Identifies whether the ChannelForTransmitSet feature exists on the CAN module.
	PLIB_CAN_ExistsChannelReset	Identifies whether the ChannelReset feature exists on the CAN module.
	PLIB_CAN_ExistsChannelUpdate	Identifies whether the ChannelUpdate feature exists on the CAN module.
	PLIB_CAN_ExistsDeviceNet	Identifies whether the DeviceNet feature exists on the CAN module.
	PLIB_CAN_ExistsEnableControl	Identifies whether the EnableControl feature exists on the CAN module.
	PLIB_CAN_ExistsErrorState	Identifies whether the ErrorStateGet feature exists on the CAN module.

	<u>PLIB_CAN_ExistsFilterConfigure</u>	Identifies whether the FilterConfigure feature exists on the CAN module.
	<u>PLIB_CAN_ExistsFilterEnable</u>	Identifies whether the FilterEnable feature exists on the CAN module.
	<u>PLIB_CAN_ExistsFilterMaskConfigure</u>	Identifies whether the FilterMaskConfigure feature exists on the CAN module.
	<u>PLIB_CAN_ExistsFilterToChannelLink</u>	Identifies whether the FilterToChannelLink feature exists on the CAN module.
	<u>PLIB_CAN_ExistsFunctionalMode</u>	Identifies whether the FunctionalModeSelect feature exists on the CAN module.
	<u>PLIB_CAN_ExistsLatestFilterMatchGet</u>	Identifies whether the LatestFilterMatchGet feature exists on the CAN module.
	<u>PLIB_CAN_ExistsMemoryBufferAssign</u>	Identifies whether the MemoryBufferAssign feature exists on the CAN module.
	<u>PLIB_CAN_ExistsMessagesReceived</u>	Identifies whether the MessagesReceived feature exists on the CAN module.
	<u>PLIB_CAN_ExistsModuleEventClear</u>	Identifies whether the ModuleEvents feature exists on the CAN module.
	<u>PLIB_CAN_ExistsModuleEventEnable</u>	Identifies whether the ModuleEventEnable feature exists on the CAN module.
	<u>PLIB_CAN_ExistsModuleInfo</u>	Identifies whether the ModuleInformation feature exists on the CAN module.
	<u>PLIB_CAN_ExistsOperationModeRead</u>	Identifies whether the OperationModeRead feature exists on the CAN module.
	<u>PLIB_CAN_ExistsOperationModeWrite</u>	Identifies whether the OperationModeSet feature exists on the CAN module.
	<u>PLIB_CAN_ExistsPendingEventsGet</u>	Identifies whether the PendingEventsGet feature exists on the CAN module.
	<u>PLIB_CAN_ExistsPendingTransmissionsAbort</u>	Identifies whether the PendingTransmissionsAbort feature exists on the CAN module.
	<u>PLIB_CAN_ExistsPhaseSegment1Length</u>	Identifies whether the PhaseSegment1Length feature exists on the CAN module.
	<u>PLIB_CAN_ExistsPhaseSegment2Length</u>	Identifies whether the PhaseSegment2Length feature exists on the CAN module.
	<u>PLIB_CAN_ExistsPhaseSegment2LengthFreelyProgrammable</u>	Identifies whether the PhaseSegment2LengthFreelyProgrammable feature exists on the CAN module.
	<u>PLIB_CAN_ExistsPropagationTimeSegment</u>	Identifies whether the PropagationTimeSegment feature exists on the CAN module.
	<u>PLIB_CAN_ExistsReceiveBufferClear</u>	Identifies whether the ReceiveBufferClear feature exists on the CAN module.
	<u>PLIB_CAN_ExistsReceiveBufferIsEmpty</u>	Identifies whether the ReceiveBufferIsEmpty feature exists on the CAN module.
	<u>PLIB_CAN_ExistsReceivedMessageGet</u>	Identifies whether the ReceivedMessageGet feature exists on the CAN module.
	<u>PLIB_CAN_ExistsReceiveErrorCount</u>	Identifies whether the ReceiveErrorCount feature exists on the CAN module.
	<u>PLIB_CAN_ExistsReceiveModeSelect</u>	Identifies whether the ReceiveModeSelect feature exists on the CAN module.
	<u>PLIB_CAN_ExistsRemoteTransmitReq</u>	Identifies whether the RemoteTransmitReq feature exists on the CAN module.

	PLIB_CAN_ExistsRxFIFOFourLeftNotify	Identifies whether the RxFIFOFourLeftNotify feature exists on the CAN module.
	PLIB_CAN_ExistsRxFIFOOneLeftNotify	Identifies whether the RxFIFOOneLeftNotify feature exists on the CAN module.
	PLIB_CAN_ExistsStopInIdle	Identifies whether the StopInIdle feature exists on the CAN module.
	PLIB_CAN_ExistsSyncJumpWidthSet	Identifies whether the SyncJumpWidth feature exists on the CAN module.
	PLIB_CAN_ExistsTimeStampEnable	Identifies whether the TimeStampEnable feature exists on the CAN module.
	PLIB_CAN_ExistsTimeStampPrescaler	Identifies whether the TimeStampPrescaler feature exists on the CAN module.
	PLIB_CAN_ExistsTimeStampValue	Identifies whether the TimeStampValue feature exists on the CAN module.
	PLIB_CAN_ExistsTransmissionIsAborted	Identifies whether the TransmissionAbortStatus feature exists on the CAN module.
	PLIB_CAN_ExistsTransmitBufferGet	Identifies whether the TransmitBufferGet feature exists on the CAN module.
	PLIB_CAN_ExistsTransmitChannelFlush	Identifies whether the TransmitChannelFlush feature exists on the CAN module.
	PLIB_CAN_ExistsTransmitChannelStatus	Identifies whether the TransmitChannelStatus feature exists on the CAN module.
	PLIB_CAN_ExistsTransmitErrorCountGet	Identifies whether the TransmitErrorCountGet feature exists on the CAN module.
	PLIB_CAN_FilterConfigure	Configures a CAN message acceptance filter.
	PLIB_CAN_FilterDisable	Disables a CAN message acceptance filter.
	PLIB_CAN_FilterEnable	Enables a CAN message acceptance filter.
	PLIB_CAN_FilterIsDisabled	Returns 'true' if the specified filter is disabled.
	PLIB_CAN_FilterMaskConfigure	Configures a CAN filter mask.
	PLIB_CAN_FilterToChannelLink	Links a filter to a channel.
	PLIB_CAN_FunctionalModeGet	Obtains the functional mode of the CAN module.
	PLIB_CAN_FunctionalModeSelect	Selects the functional mode of the CAN module.
	PLIB_CAN_IsActive	Returns 'true' if the CAN module is active.
	PLIB_CAN_LatestFilterMatchGet	Returns the index of the filter that accepted the latest message.
	PLIB_CAN_MemoryBufferAssign	Assigns buffer memory to the CAN module.
	PLIB_CAN_MessageIsReceived	Returns whether a message was received and the receive buffer is not empty.
	PLIB_CAN_ModuleEventClear	Clears the CAN module level events.
	PLIB_CAN_ModuleEventDisable	Disables the module level events.
	PLIB_CAN_ModuleEventEnable	Enables the module level events.
	PLIB_CAN_ModuleEventGet	Returns the status of the CAN module events.
	PLIB_CAN_OperationModeGet	Obtains the current CAN operating mode.
	PLIB_CAN_OperationModeSelect	Sets the CAN operating mode.
	PLIB_CAN_PendingEventsGet	Returns a value representing the highest priority active event in the module.
	PLIB_CAN_PendingTransmissionsAbort	Aborts any pending transmit operations.
	PLIB_CAN_PhaseSegment1LengthSet	Selects the CAN phase buffer segment1 length.

	PLIB_CAN_PhaseSegment2LengthFreelyProgrammableDisable	Disables the CAN phase buffer segment2 length freely programmable mode.
	PLIB_CAN_PhaseSegment2LengthFreelyProgrammableEnable	Makes the CAN phase buffer segment2 length freely programmable.
	PLIB_CAN_PhaseSegment2LengthSet	Selects the CAN phase buffer segment2 length.
	PLIB_CAN_PropagationTimeSegmentSet	Selects the propagation time segment.
	PLIB_CAN_ReceiveBufferClear	Clears the received message flag.
	PLIB_CAN_ReceiveBufferIsEmpty	Returns whether the receive buffer of the specified channel is empty.
	PLIB_CAN_ReceivedMessageGet	Returns a pointer to a message to be read from the CAN channel.
	PLIB_CAN_ReceiveErrorCountGet	Returns the CAN receive error count.
	PLIB_CAN_ReceiveModeGet	Obtains the receive mode of the CAN module.
	PLIB_CAN_ReceiveModeSelect	Selects the receive mode of the CAN module.
	PLIB_CAN_RemoteTransmitReqIsReceived	Returns whether the message received is a remote transmit request.
	PLIB_CAN_RxFIFOFourLeftNotify	Configures the module to generate an interrupt when the FIFO has four receive buffers left.
	PLIB_CAN_RxFIFOOneLeftNotify	Configures the module to generate an interrupt when the FIFO has only one receive buffer left.
	PLIB_CAN_StopInIdleDisable	Disables the Stop in Idle feature.
	PLIB_CAN_StopInIdleEnable	Enables the CAN module to stop when the processor enters Idle mode.
	PLIB_CAN_SyncJumpWidthSet	Selects the synchronization jump width.
	PLIB_CAN_TimeStampDisable	Disables the time stamp feature for the CAN module.
	PLIB_CAN_TimeStampEnable	Enables the time stamp feature for the CAN module.
	PLIB_CAN_TimeStampPrescalerSet	Sets the CAN receive message time stamp timer prescaler.
	PLIB_CAN_TimeStampValueGet	Returns the current value of the CAN receive message time stamp timer value.
	PLIB_CAN_TimeStampValueSet	Sets the CAN receive message time stamp timer value.
	PLIB_CAN_TotalChannelsGet	Returns the total number of CAN channels per CAN module.
	PLIB_CAN_TotalFiltersGet	Returns the total number of CAN Filters per CAN module.
	PLIB_CAN_TotalMasksGet	Returns the total number of CAN masks per CAN module.
	PLIB_CAN_TransmissionIsAborted	Returns 'true' if the transmit abort operation is complete.
	PLIB_CAN_TransmitBufferGet	Returns a pointer to an empty transmit buffer.
	PLIB_CAN_TransmitChannelFlush	Causes all messages in the specified transmit channel to be transmitted.
	PLIB_CAN_TransmitChannelStatusGet	Returns the condition of the transmit channel.
	PLIB_CAN_TransmitErrorCountGet	Returns the CAN transmit error count

Macros

	Name	Description
	CAN_RX_DATA_ONLY_SIZE_BYTES	Used as the size of the CAN data-only receive message buffer in bytes.
	CAN_TX_RX_MESSAGE_SIZE_BYTES	Used as the array size of the CAN transmit and full receive message buffer.

Structures

	Name	Description
	CAN_MSG_EID	Defines the structure of the EID word section of the transmit and receive message.
	CAN_RX_MSG_SID	Defines the structure of the SID word section of the receive message.
	CAN_TX_MSG_SID	Defines the structure of the SID word section of the transmit message.

Unions

	Name	Description
	CAN_RX_MSG_BUFFER	Defines the structure of the CAN receive message buffer
	CAN_TX_MSG_BUFFER	Defines the structure of the CAN transmit message buffer.

5.6.5 Comparator Peripheral Library

5.6.5.1 Introduction

Comparator Peripheral Library

for

Microchip Microcontrollers

The Comparator module is comprised of several identical analog comparator blocks, each complete with its own supporting input selectors and output logic. Each Comparator can be configured in a variety of ways, independent of the other comparators. The input voltage to the module can be either fed externally or it can be configured to use the internal voltage.

Description

This library provides a low-level abstraction of the Comparator module on Microchip microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, thereby abstracting hardware differences from one microcontroller variant to another facilitating future migration.

5.6.5.2 Release Notes

MPLAB Harmony Version: v0.70b **Comparator Peripheral Library Version :** 0.70b **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.6.5.3 SW License Agreement

5.6.5.4 Using the Library

This topic describes the basic architecture of the Comparator Peripheral Library and provides information and examples on how to use it.

Description

Using the Library

Interface Header File: [plib_cmp.h](#)

The interface to the Comparator Peripheral Library is defined in the "[plib_cmp.h](#)" header file, which is included by the "peripheral.h" peripheral library header file. Any C language source (.c) file that uses the Comparator Peripheral Library must include "peripheral.h".

Library File:

The Comparator Peripheral Library is part of the processor-specific peripheral library installed with the compiler. This library is automatically available (in the default search path) for any project built using the Microchip compilers.

Peripheral Module IDs

Peripheral libraries are indexed to allow a single library to control any number of instances of a peripheral in a single microcontroller. The first parameter to each operation in a peripheral library is the module instance ID. The module instance ID is defined by an enumeration that is defined in the processor-specific header files (included by the library's interface header). For the Comparator Peripheral Library, the module instance IDs are defined by the Comparator module enumeration.

5.6.5.4.1 Hardware Abstraction Model

This library provides a low-level abstraction of the Comparator (CMP) module on Microchip PIC microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Description

Hardware Abstraction Model Diagram

Hardware Abstraction Model Description

The Comparator Peripheral Library provides interface routines to interact with the blocks shown in the diagram above.

The Comparator VIN+ and VIN- block selects the Comparator non-inverting and inverting inputs, which can be either external or internal inputs.

The Comparator module block compares the voltage level on the inputs and produce an output. If the input VIN+ > VIN-, the output will be high. The output will be low when VIN+ < VIN-.

The Comparator Output Polarity block selects the Comparator output polarity.

The Comparator Output Control block enables/disables the Comparator output pin.

The Comparator Interrupt Logic Control block decide the comparator interrupt generation.The interrupt can happen at Low-to-high, High-to-Low, and for both transitions of the Comparator output.

5.6.5.4.2 Library Usage Model

The set of interface routines for the CMP Peripheral Library are:

Library Interface Section	Description

5.6.5.4.3 How the Library Works

The following processes are involved while using a Comparator module:

- Initialization
- Configuring the Comparator interrupt (optional)
- Power-saving modes
- Turning on the Comparator module

Name	Description
Initialization	Initialize the comparator module.
Configuring the Comparator Interrupts	Enable the Comparator interrupt (optional)
Power-Saving Modes	Enable the Comparator power-saving modes (optional)

5.6.5.4.3.1 Initialization

This section describes Comparator module initialization.

Description

The following steps are involved while using a Comparator module.

#	Description	Function Associated
1	Select the Comparator inverting input.	PLIB_CMP_InvertingInputChannelSelect
2	Select the Comparator non-inverting input.	PLIB_CMP_NonInvertingInputChannelSelect
3	Select the Comparator output polarity.	PLIB_CMP_InvertedOutputSelect PLIB_CMP_NonInvertedOutputSelect
4	Select the Comparator output pin.	PLIB_CMP_OutputEnable PLIB_CMP_OutputDisable
5	Turn on the Comparator module.	PLIB_CMP_Enable

Example

```
#define MY_CMP_ID          CMP_ID_1

//Select the comparator inverting input
PLIB_CMP_InvertingInputChannelSelect(MY_CMP_INSTANCE, CMP_INVERTING_INPUT_CHANNEL_B);

//Select the comparator non-inverting input
PLIB_CMP_NonInvertingInputChannelSelect(MY_CMP_INSTANCE, CMP_NON_INVERTING_INPUT_A);

//Select the comparator output polarity
PLIB_CMP_NonInvertedOutputSelect(MY_CMP_INSTANCE);

//Enable the comparator output pin
PLIB_CMP_OutputEnable(MY_CMP_INSTANCE);

//Turn on the comparator module
PLIB_CMP_Enable(MY_CMP_INSTANCE);
```

5.6.5.4.3.2 Configuring the Comparator Interrupts

This section describes the configuration of Comparator module interrupts.

Description

The following steps are involved while configuring a Comparator interrupt.

The comparator interrupt can happen for three events. The user must configure the event-detection logic to report changes to the output state of the Comparator, which can in turn be used for event or interrupt generation. The options include event generation on rising state changes (low-to-high), falling state changes (high-to-low), and all state changes. When a configured event occurs, it is flagged by the event detection flag. The user must clear this flag for the next interrupt generation.

#	Description	Function Associated
1	Comparator event select.	PLIB_CMP_InterruptEventSelect
2	Comparator event flag read/clear	PLIB_CMP_EventHasOccurred PLIB_CMP_EventStatusClear

Example

```
#define MY_CMP_ID          CMP_ID_1

//This code expects the comparator interrupt
//enabled in the interrupt module

//Select the comparator interrupt event
```

```

PLIB_CMP_InterruptEventSelect(MY_CMP_INSTANCE, CMP_LOW_TO_HIGH);

//This part of the code should be in ISR
if(PLIB_CMP_EventHasOccurred(CMP_ID_1))
{
    //Do some operations
    \
    //Clear the event flag
    PLIB_CMP_EventStatusClear(CMP_ID_1);
}

//Clear the interrupt flag in the interrupt module

```

Note: Not all functionality is available on all devices. Please refer to the specific device data sheet for availability.

5.6.5.4.3.3 Power-Saving Modes

This section provides information on the Power-Saving modes for the Comparator module.

Description

Operation in Sleep mode: If the Comparator interrupt is enabled, the device will wake up from Sleep mode on the Comparator interrupt. If the Comparator interrupt is disabled, the comparator will work, but it will not wake up the device from sleep.

Operation in Idle mode: The functions [PLIB_CMP_StopInIdleModeEnable](#) and [PLIB_CMP_StopInIdleModeDisable](#) determine if the Comparator module stops or continues operation in Idle mode. If the function [PLIB_CMP_StopInIdleModeDisable](#) is used, the module will continue operation in the Idle mode. If the Comparator interrupt is enabled, the device will wake up from Idle mode on the Comparator interrupt. If the function [PLIB_CMP_StopInIdleModeEnable](#) is used, the module will work in Idle mode but the interrupt will not generate if it is enabled.

#	Decscription	Function Associated
1	Enable Comparator Stop in Idle mode.	PLIB_CMP_StopInIdleModeEnable
2	Disable Comparator Stop in Idle mode.	PLIB_CMP_StopInIdleModeDisable

Example

```

//Select comparator stop in idle mode
PLIB_CMP_StopInIdleModeEnable(MY_CMP_INSTANCE);

```

Note: Not all functionality is available on all devices. Please refer to the specific device data sheet for availability.

5.6.5.5 Library Interface

Data Types and Constants

	Name	Description
	CMP_CLOCK_DIVIDE	Defines CMP Filter Clock Divide
	CMP_CVREF_BANDGAP_SELECT	Lists the bandgap selection options.
	CMP_CVREF_REFERENCE_SELECT	Lists the reference selection options.
	CMP_CVREF_VALUE	Lists the voltage reference value selection options.
	CMP_CVREF_VOLTAGE_SOURCE	Lists the Voltage source options.
	CMP_FILTER_CLOCK	Defines CMP filter input clock
	CMP_INTERRUPT_EVENT	Defines CMP interrupt events.
	CMP_INVERTING_INPUT	Defines the list of CMP inverting Input
	CMP_MASK_A	Defines CMP Mask A Input.

	CMP_MASK_B	Defines CMP Mask B Input.
	CMP_MASK_C	Defines CMP Mask C Input.
	CMP_MODULE_ID	Identifies the CMP modules supported
	CMP_NON_INVERTING_INPUT	Defines the list of CMP non inverting Input
	CMP_SPEED_POWER	Defines CMP Speed/Power

Comparator AND Gate Configuration Functions

	Name	Description
	PLIB_CMP_AndGateAInputDisable	A input disabled as input to the AND gate
	PLIB_CMP_AndGateAInputEnable	A input enabled as input to the AND gate.
	PLIB_CMP_AndGateBInputDisable	B input disabled as input to the AND gate.
	PLIB_CMP_AndGateBInputEnable	B input enabled as input to the AND gate.
	PLIB_CMP_AndGateCInputEnable	C input enabled as input to the AND gate.
	PLIB_CMP_AndGateInvertedAInputDisable	Inverted A input disabled as input to the AND gate.
	PLIB_CMP_AndGateInvertedAInputEnable	Inverted A input enabled as input to the AND gate.
	PLIB_CMP_AndGateInvertedBInputDisable	Inverted B input disabled as input to the AND gate.
	PLIB_CMP_AndGateInvertedBInputEnable	Inverted B input enabled as input to the AND gate.
	PLIB_CMP_AndGateInvertedCInputDisable	Inverted C input disabled as input to the AND gate.
	PLIB_CMP_AndGateInvertedCInputEnable	Inverted C input enabled as input to the AND gate.
	PLIB_CMP_NegativeAndGateOutputDisable	Negative AND gate output disable.
	PLIB_CMP_NegativeAndGateOutputEnable	Negative AND gate output enable.
	PLIB_CMP_PositiveAndGateOutputDisable	Positive AND gate output disable.
	PLIB_CMP_PositiveAndGateOutputEnable	Positive AND gate output enable.
	PLIB_CMP_AndGateCInputDisable	C input disabled as input to the AND gate.

Comparator Feature Configuration Functions

	Name	Description
	PLIB_CMP_Cmp1OutputHighSelect	Comparator output bit is set to '1'.
	PLIB_CMP_Cmp1OutputLowSelect	Comparator output bit is set to '0'.
	PLIB_CMP_Cmp2OutputHighSelect	Comparator output bit is set to '1'.
	PLIB_CMP_Cmp2OutputLowSelect	Comparator output bit is set to '0'.
	PLIB_CMP_HysteresisDisable	Comparator hysteresis disable.
	PLIB_CMP_HysteresisEnable	Comparator hysteresis enable.
	PLIB_CMP_OutputHighSelect	Comparator output bit is set to '1'.
	PLIB_CMP_OutputLowSelect	Comparator output bit is set to '0'.
	PLIB_CMP_OutputSynchronousWithTimer1Disable	Comparator output is asynchronous.
	PLIB_CMP_OutputSynchronousWithTimer1Enable	Comparator Output Synchronous mode select.
	PLIB_CMP_StopInIdleModeDisable	Disables Stop in Idle mode.
	PLIB_CMP_StopInIdleModeEnable	Enables Stop in Idle mode.

Comparator Filter Clock Configuration Functions

	Name	Description
	PLIB_CMP_FilterClockDivideSelect	Comparator filter clock divide select.
	PLIB_CMP_FilterDisable	Comparator filter disable.
	PLIB_CMP_FilterEnable	Comparator filter enable.
	PLIB_CMP_FilterInputClockSelect	Comparator filter input clock select.

Comparator Mask Select Configuration Functions

	Name	Description
	PLIB_CMP_HighLevelMaskSelect	High-level masking select.
	PLIB_CMP_LowLevelMaskSelect	Low-level masking select.

Comparator Op amp Mode Configuration Functions

	Name	Description
	PLIB_CMP_OpAmpModeDisable	Op amp operation mode disable.
	PLIB_CMP_OpAmpModeEnable	Op amp operation mode enable.
	PLIB_CMP_OpAmpOutputDisable	Op amp output disable.
	PLIB_CMP_OpAmpOutputEnable	Op amp output enable.

Comparator OR Gate Configuration Functions

	Name	Description
	PLIB_CMP_OrGateAInputDisable	OR gate A input disable.
	PLIB_CMP_OrGateAInputEnable	A input connected to OR gate.
	PLIB_CMP_OrGateBInputDisable	OR gate B input disable.
	PLIB_CMP_OrGateBInputEnable	B input connected to OR gate.
	PLIB_CMP_OrGateCInputDisable	OR gate C input disable.
	PLIB_CMP_OrGateCInputEnable	C input connected to OR gate.
	PLIB_CMP_OrGateInvertedAInputDisable	OR gate inverted A input disable.
	PLIB_CMP_OrGateInvertedAInputEnable	Inverted A input connected to OR gate.
	PLIB_CMP_OrGateInvertedBInputDisable	OR gate inverted B input disable.
	PLIB_CMP_OrGateInvertedBInputEnable	Inverted B input connected to OR gate
	PLIB_CMP_OrGateInvertedCInputDisable	OR gate inverted C input disable.
	PLIB_CMP_OrGateInvertedCInputEnable	Inverted C input connected to OR gate

Feature Existence Functions

	Name	Description
	PLIB_CMP_ExistsCVREFBGRRefVoltageRangeSelect	Identifies whether the CVREFBGRRefVoltageRangeSelect feature exists on the Comparator module.
	PLIB_CMP_ExistsCVREFEnableControl	Identifies whether the CVREFEnableControl feature exists on the Comparator module.
	PLIB_CMP_ExistsCVREFOutputEnableControl	Identifies whether the CVREFOutputEnableControl feature exists on the Comparator module.
	PLIB_CMP_ExistsCVREFRefVoltageRangeSelect	Identifies whether the CVREFRefVoltageRangeSelect feature exists on the Comparator module.
	PLIB_CMP_ExistsCVREFValueSelect	Identifies whether the CVREFValueSelect feature exists on the Comparator module.
	PLIB_CMP_ExistsCVREFVoltageRangeSelect	Identifies whether the CVREFVoltageRangeSelect feature exists on the Comparator module.
	PLIB_CMP_ExistsCVREFWideRangeControl	Identifies whether the CVREFWideRangeControl feature exists on the Comparator module.
	PLIB_CMP_ExistsEnableControl	Identifies whether the ComparatorEnableControl feature exists on the Comparator module.
	PLIB_CMP_ExistsInterruptEventSelect	Identifies whether the InterruptEventSelect feature exists on the Comparator module.

	PLIB_CMP_ExistsInvertingInputSelect	Identifies whether the InvertingInputSelect feature exists on the Comparator module.
	PLIB_CMP_ExistsInvertOutputControl	Identifies whether the InvertOutputSelectControl feature exists on the Comparator module.
	PLIB_CMP_ExistsNonInvertingInputSelect	Identifies whether the NonInvertingInputSelect feature exists on the Comparator module.
	PLIB_CMP_ExistsOutputEnableControl	Identifies whether the ComparatorOutputEnableControl feature exists on the Comparator module.
	PLIB_CMP_ExistsOutputLevelControl	Identifies whether the OutputLevelSelectControl feature exists on the Comparator module.
	PLIB_CMP_ExistsStopInIdle	Identifies whether the StopInIdle feature exists on the Comparator module.

General Configuration Functions

	Name	Description
	PLIB_CMP_CVREF_BandGapReferenceSourceSelect	Selects the band gap reference voltage source.
	PLIB_CMP_CVREF_Enable	Enables the voltage reference of the Comparator module.
	PLIB_CMP_CVREF_Output2Disable	Disables the Vsource/2 voltage output.
	PLIB_CMP_CVREF_Output2Enable	Enables the Vsource/2 voltage output.
	PLIB_CMP_CVREF_OutputDisable	Disables the output voltage.
	PLIB_CMP_CVREF_OutputEnable	Enables the voltage output.
	PLIB_CMP_CVREF_ReferenceVoltageSelect	Selects the voltage reference value.
	PLIB_CMP_CVREF_SourceNegativeInputSelect	Configures the Comparator module to use the selected input as a negative reference.
	PLIB_CMP_CVREF_SourceVoltageSelect	Connects the Comparator module to the selected voltage source.
	PLIB_CMP_CVREF_ValueGet	Returns the voltage setting value.
	PLIB_CMP_CVREF_ValueSelect	Selects the voltage reference value.
	PLIB_CMP_CVREF_WideRangeDisable	Disables the wide range.
	PLIB_CMP_CVREF_WideRangeEnable	Enables the wide range.
	PLIB_CMP_CVREF_WideRangeIsEnabled	Returns whether the wide range is selected for the reference voltage.
	PLIB_CMP_Disable	Disables the Comparator module.
	PLIB_CMP_Enable	Enables the Comparator module.
	PLIB_CMP_EventHasOccurred	Comparator event status.
	PLIB_CMP_EventStatusClear	Comparator event clear.
	PLIB_CMP_InterruptEventSelect	Comparator interrupt event select.
	PLIB_CMP_InvertedOutputSelect	Comparator output is inverted.
	PLIB_CMP_InvertingInputChannelSelect	Comparator inverting input channel select.
	PLIB_CMP_NonInvertedOutputSelect	Comparator output is non-inverted.
	PLIB_CMP_NonInvertingInputChannelSelect	Comparator input channel select.
	PLIB_CMP_OutputDisable	Disables the Comparator output.
	PLIB_CMP_OutputEnable	Enables the Comparator output.
	PLIB_CMP_OutputStatusGet	Comparator output status.
	PLIB_CMP_CVREF_Disable	Disables the voltage reference of the Comparator module.

Description

This section lists and describes the functions, data types, and constants available in the Comparator Peripheral Library.

5.6.5.5.1 General Configuration Functions

5.6.5.5.1.1 PLIB_CMP_CVREF_BandGapReferenceSourceSelect Function

C

```
void PLIB_CMP_CVREF_BandGapReferenceSourceSelect(  
    CMP_MODULE_ID index,  
    CMP_CVREF_BANDGAP_SELECT select  
);
```

Description

This function selects the band gap reference voltage source from the available options from [CMP_CVREF_BANDGAP_SELECT](#).

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
select	Select a band gap reference source from CMP_CVREF_BANDGAP_SELECT

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_CMP_CVREF_ExistsCVREFBGRefVoltageRangeSelect` in your application to determine whether this feature is available.

Example

```
PLIB_CMP_CVREF_BandGapReferenceSourceSelect ( CMP_CVREF_ID_1,  PLIB_CMP_CVREF_BANDGAP_0_6V );
```

5.6.5.5.1.2 PLIB_CMP_CVREF_Enable Function

C

```
void PLIB_CMP_CVREF_Enable(  
    CMP_MODULE_ID index  
);
```

Description

This function enables the voltage reference of the Comparator module.

Preconditions

The Comparator module should be appropriately configured before being enabled.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use

PLIB_CMP_CVREF_ExistsCVREFEnableControl in your application to determine whether this feature is available.

Example

```
PLIB_CMP_CVREF_Enable(CMP_CVREF_ID_1);
```

5.6.5.5.1.3 PLIB_CMP_CVREF_Output2Disable Function**C**

```
void PLIB_CMP_CVREF_Output2Disable(  
    CMP_MODULE_ID index  
);
```

Description

This function disables the Vsource/2 voltage output.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_CMP_CVREF_Output2Disable(CMP_CVREF_ID_1);
```

5.6.5.5.1.4 PLIB_CMP_CVREF_Output2Enable Function**C**

```
void PLIB_CMP_CVREF_Output2Enable(  
    CMP_MODULE_ID index  
);
```

Description

This function enables the Vsource/2 voltage output. This is independent of voltage output 1.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_CMP_CVREF_Output2Enable(CMP_CVREF_ID_1);
```

5.6.5.5.1.5 PLIB_CMP_CVREF_OutputDisable Function

C

```
void PLIB_CMP_CVREF_OutputDisable(  
    CMP_MODULE_ID index  
);
```

Description

This function disables the reference voltage output.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_CMP_CVREF_ExistsCVREFOutputEnableControl` in your application to determine whether this feature is available.

Example

```
PLIB_CMP_CVREF_VoltageOutputDisable(CMP_CVREF_ID_1);
```

5.6.5.5.1.6 PLIB_CMP_CVREF_OutputEnable Function

C

```
void PLIB_CMP_CVREF_OutputEnable(  
    CMP_MODULE_ID index  
);
```

Description

This function enables the voltage output

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_CMP_CVREF_ExistsCVREFOutputEnableControl` in your application to determine whether this feature is available.

Example

```
PLIB_CMP_CVREF_OutputEnable(CMP_CVREF_ID_1);
```

5.6.5.5.1.7 PLIB_CMP_CVREF_ReferenceVoltageSelect Function

C

```
void PLIB_CMP_CVREF_ReferenceVoltageSelect(  
    CMP_MODULE_ID index,  
    CMP_CVREF_REFERENCE_SELECT reference  
);
```

Description

This function selects the voltage reference value. This value decides how many resistance units will be added and thus decides the output voltage.

Preconditions

Determine the correct value that should be passed.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
value	Select value from CMP_CVREF_VALUE

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_CMP_CVREF_ExistsCVREFRefVoltageRangeSelect` in your application to determine whether this feature is available.

Example

```
PLIB_CMP_CVREF_ReferenceVoltageSelect ( CMP_CVREF_ID_1,  CMP_CVREF_VALUE_13 );
```

5.6.5.5.1.8 PLIB_CMP_CVREF_SourceNegativeInputSelect Function

C

```
void PLIB_CMP_CVREF_SourceNegativeInputSelect(  
    CMP_MODULE_ID index,  
    CMP_CVREF_VOLTAGE_SOURCE_NEG_REFERENCE negInput  
);
```

Description

This function configures the Comparator module to use the selected input as a negative reference for the voltage source.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured.
negInput	Select the voltage source negative reference from <code>CMP_CVREF_VOLTAGE_SOURCE_NEG_REFERENCE</code>

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability. For such devices, selecting the positive source will automatically select the negative input.

Example

```
PLIB_CMP_CVREF_SourceNegativeInputSelect (CMP_CVREF_ID_1,  
CMP_CVREF_VOLTAGE_SOURCE_NEG_REF_GROUND);
```

5.6.5.5.1.9 PLIB_CMP_CVREF_SourceVoltageSelect Function**C**

```
void PLIB_CMP_CVREF_SourceVoltageSelect(  
    CMP_MODULE_ID index,  
    CMP_CVREF_VOLTAGE_SOURCE source  
);
```

Description

This function connects the Comparator module to the selected voltage source.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
source	Select the voltage source from CMP_CVREF_VOLTAGE_SOURCE

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_CMP_CVREF_ExistsCVREFVoltageRangeSelect` in your application to determine whether this feature is available.

Example

```
PLIB_CMP_CVREF_SourceVoltageSelect (CMP_CVREF_ID_1, CMP_CVREF_VOLTAGE_SOURCE_INTERNAL);
```

5.6.5.5.1.10 PLIB_CMP_CVREF_ValueGet Function**C**

```
CMP_CVREF_VALUE PLIB_CMP_CVREF_ValueGet(  
    CMP_MODULE_ID index  
);
```

Description

This function returns the configured reference voltage value.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

[CMP_CVREF_VALUE](#) - Reference voltage value

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_CMP_CVREF_ExistsCVREFValueSelect` in your application to determine whether this feature is available.

Example

```
CMP_CVREF_VALUE value;

value = PLIB_CMP_CVREF_ValueGet ( CMP_CVREF_ID_1 );
```

5.6.5.5.1.11 PLIB_CMP_CVREF_ValueSelect Function

C

```
void PLIB_CMP_CVREF_ValueSelect(
    CMP_MODULE_ID index,
    CMP_CVREF_VALUE value
);
```

Description

This function selects the voltage reference value. This value decides how many resistance units will be added and therefore, decides the output voltage.

Preconditions

Determine the correct value that should be passed.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
value	Select value from CMP_CVREF_VALUE

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_CMP_CVREF_ExistsCVREFValueSelect` in your application to determine whether this feature is available.

Example

```
PLIB_CMP_CVREF_ValueSelect ( CMP_CVREF_ID_1,  CMP_CVREF_VALUE_13 );
```

5.6.5.5.1.12 PLIB_CMP_CVREF_WideRangeDisable Function

C

```
void PLIB_CMP_CVREF_WideRangeDisable(
    CMP_MODULE_ID index
);
```

Description

This function disables the wide range for reference voltage. The range of possible voltages will become narrower, and finer voltage options can be achieved in this case.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_CMP_CVREF_ExistsCVREFWideRangeControl` in your application to determine whether this feature is available.

Example

```
PLIB_CMP_CVREF_WideRangeDisable(CMP_CVREF_ID_1);
```

5.6.5.5.1.13 PLIB_CMP_CVREF_WideRangeEnable Function**C**

```
void PLIB_CMP_CVREF_WideRangeEnable(  
    CMP_MODULE_ID index  
);
```

Description

This function enables the wide range for reference voltage. The voltage range starts from zero if the wide range is selected.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_CMP_CVREF_ExistsCVREFWideRangeControl` in your application to determine whether this feature is available.

Example

```
PLIB_CMP_CVREF_WideRangeEnable(CMP_CVREF_ID_1);
```

5.6.5.5.1.14 PLIB_CMP_CVREF_WideRangeIsEnabled Function**C**

```
bool PLIB_CMP_CVREF_WideRangeIsEnabled(  
    CMP_MODULE_ID index  
);
```

Description

This function returns whether the wide range is enabled.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

- true = The wide range is enabled
- false = The wide range is not enabled

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_CMP_CVREF_ExistsCVREFWideRangeControl` in your application to determine whether this feature is available.

Example

```
bool range;  
  
range = PLIB_CMP_CVREF_WideRangeIsEnabled(MY_CMP_CVREF_ID);
```

5.6.5.5.1.15 PLIB_CMP_Disable Function**C**

```
void PLIB_CMP_Disable(  
    CMP_MODULE_ID index  
);
```

Description

This function disables (i.e., turns OFF) the selected Comparator module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CMP_ExistsEnableControl](#) in your application to determine whether this feature is available.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the  
// application developer.  
PLIB_CMP_Disable(MY_CMP_INSTANCE);
```

5.6.5.5.1.16 PLIB_CMP_Enable Function**C**

```
void PLIB_CMP_Enable(  
    CMP_MODULE_ID index  
);
```

Description

This function enables (i.e., turns ON) the selected Comparator module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CMP_ExistsEnableControl](#) in your application to determine whether this feature is available.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the
// application developer.
PLIB_CMP_Enable(MY_CMP_INSTANCE);
```

5.6.5.5.1.17 PLIB_CMP_EventHasOccurred Function**C**

```
bool PLIB_CMP_EventHasOccurred(
    CMP_MODULE_ID index
);
```

Description

This function will return the current event status of the Comparator.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

- true = The event flag is set
- false = The event flag is clear

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the
// application developer.
// bool cmp_event_status = PLIB_CMP_EventHasOccurred(MY_CMP_INSTANCE);
```

5.6.5.5.1.18 PLIB_CMP_EventStatusClear Function**C**

```
void PLIB_CMP_EventStatusClear(
    CMP_MODULE_ID index
);
```

Description

This function will clear event status bit of the Comparator. Subsequent triggers and interrupts are disabled until the bit is cleared.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the  
// application developer.  
// PLIB_CMP_EventStatusClear(MY_CMP_INSTANCE);
```

5.6.5.5.1.19 PLIB_CMP_InterruptEventSelect Function**C**

```
void PLIB_CMP_InterruptEventSelect(  
    CMP_MODULE_ID index,  
    CMP_INTERRUPT_EVENT event  
);
```

Description

This function will select when the Comparator interrupt should occur.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
event	One of the possible values from CMP_INTERRUPT_EVENT

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CMP_ExistsInterruptEventSelect](#) in your application to determine whether this feature is available.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the  
// application developer.  
// CMP_INTERRUPT_EVENT - CMP_LOW_TO_HIGH  
PLIB_CMP_InterruptEventSelect(MY_CMP_INSTANCE, CMP_LOW_TO_HIGH);
```

5.6.5.5.1.20 PLIB_CMP_InvertedOutputSelect Function

C

```
void PLIB_CMP_InvertedOutputSelect(  
    CMP_MODULE_ID index  
);
```

Description

This function will select the inverted comparator output.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_CMP_ExistsOutputEnableControlExistsInvertOutputControl` in your application to determine whether this feature is available.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the  
// application developer.  
PLIB_CMP_InvertedOutputSelect(MY_CMP_INSTANCE, );
```

5.6.5.5.1.21 PLIB_CMP_InvertingInputChannelSelect Function

C

```
void PLIB_CMP_InvertingInputChannelSelect(  
    CMP_MODULE_ID index,  
    CMP_INVERTING_INPUT channel  
);
```

Description

This function will select the inverting input channels for the Comparator.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	One of the possible values from <code>CMP_INVERTING_INPUT</code>

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use

[PLIB_CMP_ExistsInvertingInputSelect](#) in your application to determine whether this feature is available.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the
// application developer.
// PLIB_CMP_InvertingInputChannelSelect(MY_CMP_INSTANCE, CMP_INVERTING_INPUT_CHANNEL_B);
```

5.6.5.5.1.22 PLIB_CMP_NonInvertedOutputSelect Function

C

```
void PLIB_CMP_NonInvertedOutputSelect(
    CMP_MODULE_ID index
);
```

Description

This function will select the non-inverted comparator output.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CMP_ExistsOutputEnableControlExistsInvertOutputControl](#) in your application to determine whether this feature is available.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the
// application developer.
PLIB_CMP_NonInvertedOutputSelect(MY_CMP_INSTANCE, );
```

5.6.5.5.1.23 PLIB_CMP_NonInvertingInputChannelSelect Function

C

```
void PLIB_CMP_NonInvertingInputChannelSelect(
    CMP_MODULE_ID index,
    CMP_NON_INVERTING_INPUT input
);
```

Description

This function will select the non-inverting input channels for the Comparator.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
channel	One of the possible values from CMP_NON_INVERTING_INPUT

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CMP_ExistsNonInvertingInputSelect](#) in your application to determine whether this feature is available.s

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the  
// application developer.  
// PLIB_CMP_NonInvertingInputChannelSelect(MY_CMP_INSTANCE, CMP_NON_INVERTING_INPUT_A);
```

5.6.5.5.1.24 PLIB_CMP_OutputDisable Function**C**

```
void PLIB_CMP_OutputDisable(  
    CMP_MODULE_ID index  
);
```

Description

This function disables (i.e., turns OFF) the Comparator output.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CMP_ExistsOutputEnableControl](#) in your application to determine whether this feature is available.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the  
// application developer.  
PLIB_CMP_OutputDisable(MY_CMP_INSTANCE);
```

5.6.5.5.1.25 PLIB_CMP_OutputEnable Function**C**

```
void PLIB_CMP_OutputEnable(  
    CMP_MODULE_ID index  
);
```

Description

This function enables (i.e., turns ON) the Comparator output.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CMP_ExistsOutputEnableControl](#) in your application to determine whether this feature is available.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the
// application developer.
PLIB_CMP_OutputEnable(MY_CMP_INSTANCE);
```

5.6.5.5.1.26 PLIB_CMP_OutputStatusGet Function**C**

```
bool PLIB_CMP_OutputStatusGet(
    CMP_MODULE_ID index
);
```

Description

This function will return the current status of the Comparator output.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

- true = The status flag is set
- false = The status flag is clear

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the
// application developer.
// bool cmp_status=PLIB_CMP_OutputStatusGet(MY_CMP_INSTANCE);
```

5.6.5.5.1.27 PLIB_CMP_CVREF_Disable Function**C**

```
void PLIB_CMP_CVREF_Disable(
    CMP_MODULE_ID index
);
```

Description

This function disables the voltage reference of the Comparator module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_CMP_CVREF_ExistsCVREFEnableControl` in your application to determine whether this feature is available.

Example

```
PLIB_CMP_CVREF_Disable (CMP_CVREF_ID_1);
```

5.6.5.5.2 Comparator Feature Configuration Functions

5.6.5.5.2.1 PLIB_CMP_Cmp1OutputHighSelect Function

C

```
void PLIB_CMP_Cmp1OutputHighSelect(  
    CMP_MODULE_ID index  
)
```

Description

This function will set the Comparator output bit to '1'.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the  
// application developer.  
PLIB_CMP_Cmp1OutputHighSelect(MY_CMP_INSTANCE, );
```

5.6.5.5.2.2 PLIB_CMP_Cmp1OutputLowSelect Function

C

```
void PLIB_CMP_Cmp1OutputLowSelect(  
    CMP_MODULE_ID index  
)
```

Description

This function will set the Comparator output bit to '0'.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the  
// application developer.  
PLIB_CMP_Cmp1OutputLowSelect(MY_CMP_INSTANCE, );
```

5.6.5.5.2.3 PLIB_CMP_Cmp2OutputHighSelect Function**C**

```
void PLIB_CMP_Cmp2OutputHighSelect(  
    CMP_MODULE_ID index  
);
```

Description

This function will set the Comparator output bit to '1'.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the  
// application developer.  
PLIB_CMP_Cmp2OutputHighSelect(MY_CMP_INSTANCE, );
```

5.6.5.5.2.4 PLIB_CMP_Cmp2OutputLowSelect Function**C**

```
void PLIB_CMP_Cmp2OutputLowSelect(  
    CMP_MODULE_ID index  
);
```

Description

This function will set the Comparator output bit to '0'.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the  
// application developer.  
PLIB_CMP_Cmp2OutputLowSelect(MY_CMP_INSTANCE, );
```

5.6.5.5.2.5 PLIB_CMP_HysteresisDisable Function**C**

```
void PLIB_CMP_HysteresisDisable(  
    CMP_MODULE_ID index  
);
```

Description

This function will disable the hysteresis of the Comparator.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the  
// application developer.  
// PLIB_CMP_HysteresisDisable(MY_CMP_INSTANCE);
```

5.6.5.5.2.6 PLIB_CMP_HysteresisEnable Function**C**

```
void PLIB_CMP_HysteresisEnable(  
    CMP_MODULE_ID index  
);
```

Description

This function will enable the hysteresis of the Comparator.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the  
// application developer.  
// PLIB_CMP_HysteresisEnable(MY_CMP_INSTANCE);
```

5.6.5.5.2.7 PLIB_CMP_OutputHighSelect Function**C**

```
void PLIB_CMP_OutputHighSelect(  
    CMP_MODULE_ID index  
);
```

Description

This function will set the Comparator output bit to '1'.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CMP_ExistsOutputLevelControl](#) in your application to determine whether this feature is available.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the  
// application developer.  
PLIB_CMP_OutputHighSelect(MY_CMP_INSTANCE, );
```

5.6.5.5.2.8 PLIB_CMP_OutputLowSelect Function**C**

```
void PLIB_CMP_OutputLowSelect(  
    CMP_MODULE_ID index
```

```
);
```

Description

This function will set the Comparator output bit to '0'.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CMP_ExistsOutputLevelControl](#) in your application to determine whether this feature is available.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the
// application developer.
PLIB_CMP_OutputLowSelect(MY_CMP_INSTANCE, );
```

5.6.5.5.2.9 PLIB_CMP_OutputSynchronousWithTimer1Disable Function

C

```
void PLIB_CMP_OutputSynchronousWithTimer1Disable(
    CMP_MODULE_ID index
);
```

Description

This function will disable the synchronized comparator output with the Timer1 clock.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the
// application developer.
// PLIB_CMP_OutputSynchronousWithTimer1Disable(MY_CMP_INSTANCE);
```

5.6.5.5.2.10 PLIB_CMP_OutputSynchronousWithTimer1Enable Function

C

```
void PLIB_CMP_OutputSynchronousWithTimer1Enable(
```

```
    CMP_MODULE_ID index  
);
```

Description

This function will synchronize comparator output to the rising edge of the Timer1 clock.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the  
// application developer.  
// PLIB_CMP_OutputSynchronousWithTimer1Enable(MY_CMP_INSTANCE);
```

5.6.5.5.2.11 PLIB_CMP_StopInIdleModeDisable Function

C

```
void PLIB_CMP_StopInIdleModeDisable(  
    CMP_MODULE_ID index  
);
```

Description

This function will continue operation of all enabled comparators when the device enters Idle mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CMP_ExistsStopInIdle](#) in your application to determine whether this feature is available.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the  
// application developer.  
// PLIB_CMP_StopInIdleModeDisable(MY_CMP_INSTANCE);
```

5.6.5.5.2.12 PLIB_CMP_StopInIdleModeEnable Function

C

```
void PLIB_CMP_StopInIdleModeEnable(  
    CMP_MODULE_ID index  
);
```

Description

This function will discontinue operation of all comparators when the device enters Idle mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_CMP_ExistsStopInIdle](#) in your application to determine whether this feature is available.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the  
// application developer.  
// PLIB_CMP_StopInIdleModeEnable(MY_CMP_INSTANCE);
```

5.6.5.5.3 Comparator AND Gate Configuration Functions

5.6.5.5.3.1 PLIB_CMP_AndGateAInputDisable Function

C

```
void PLIB_CMP_AndGateAInputDisable(  
    CMP_MODULE_ID index  
);
```

Description

This function will disable the A input as the input to the AND gate.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the
// application developer.
// PLIB_CMP_AndGateAInputDisable(MY_CMP_INSTANCE);
```

5.6.5.5.3.2 PLIB_CMP_AndGateAInputEnable Function**C**

```
void PLIB_CMP_AndGateAInputEnable(
    CMP_MODULE_ID index
);
```

Description

This function will select the A input as the input to the AND gate.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the
// application developer.
// PLIB_CMP_AndGateAInputEnable(MY_CMP_INSTANCE);
```

5.6.5.5.3.3 PLIB_CMP_AndGateBInputDisable Function**C**

```
void PLIB_CMP_AndGateBInputDisable(
    CMP_MODULE_ID index
);
```

Description

This function will disable the B input as the input to the AND gate.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the
// application developer.
// PLIB_CMP_AndGateBInputDisable(MY_CMP_INSTANCE);
```

5.6.5.5.3.4 PLIB_CMP_AndGateBInputEnable Function**C**

```
void PLIB_CMP_AndGateBInputEnable(
    CMP_MODULE_ID index
);
```

Description

This function will select the B input as the input to the AND gate.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the
// application developer.
// PLIB_CMP_AndGateBInputEnable(MY_CMP_INSTANCE);
```

5.6.5.5.3.5 PLIB_CMP_AndGateCInputEnable Function**C**

```
void PLIB_CMP_AndGateCInputEnable(
    CMP_MODULE_ID index
);
```

Description

This function will select the C input as the input to the AND gate.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the  
// application developer.  
// PLIB_CMP_AndGateCInputEnable(MY_CMP_INSTANCE);
```

5.6.5.5.3.6 PLIB_CMP_AndGateInvertedAInputDisable Function**C**

```
void PLIB_CMP_AndGateInvertedAInputDisable(  
    CMP_MODULE_ID index  
)
```

Description

This function will disable the inverted A input as the input to the AND gate.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the  
// application developer.  
// PLIB_CMP_AndGateInvertedAInputDisable(MY_CMP_INSTANCE);
```

5.6.5.5.3.7 PLIB_CMP_AndGateInvertedAInputEnable Function**C**

```
void PLIB_CMP_AndGateInvertedAInputEnable(  
    CMP_MODULE_ID index  
)
```

Description

This function will enable the inverted A input as the input to the AND gate.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the  
// application developer.  
// PLIB_CMP_AndGateInvertedAInputEnable(MY_CMP_INSTANCE);
```

5.6.5.5.3.8 PLIB_CMP_AndGateInvertedBInputDisable Function**C**

```
void PLIB_CMP_AndGateInvertedBInputDisable(  
    CMP_MODULE_ID index  
)
```

Description

This function will disable the inverted B input as the input to the AND gate.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the  
// application developer.  
// PLIB_CMP_AndGateInvertedBInputDisable(MY_CMP_INSTANCE);
```

5.6.5.5.3.9 PLIB_CMP_AndGateInvertedBInputEnable Function**C**

```
void PLIB_CMP_AndGateInvertedBInputEnable(  
    CMP_MODULE_ID index  
)
```

Description

This function will enable the inverted B input as the input to the AND gate.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the
// application developer.
// PLIB_CMP_AndGateInvertedBInputEnable(MY_CMP_INSTANCE);
```

5.6.5.5.3.10 PLIB_CMP_AndGateInvertedCInputDisable Function**C**

```
void PLIB_CMP_AndGateInvertedCInputDisable(
    CMP_MODULE_ID index
);
```

Description

This function will disable the inverted C input as the input to the AND gate.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the
// application developer.
// PLIB_CMP_AndGateInvertedCInputDisable(MY_CMP_INSTANCE);
```

5.6.5.5.3.11 PLIB_CMP_AndGateInvertedCInputEnable Function**C**

```
void PLIB_CMP_AndGateInvertedCInputEnable(
    CMP_MODULE_ID index
);
```

Description

This function will enable the inverted C input as the input to the AND gate.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the
// application developer.
// PLIB_CMP_AndGateInvertedCInputEnable(MY_CMP_INSTANCE);
```

5.6.5.5.3.12 PLIB_CMP_NegativeAndGateOutputDisable Function**C**

```
void PLIB_CMP_NegativeAndGateOutputDisable(
    CMP_MODULE_ID index
);
```

Description

This function will disable the negative AND gate output to the OR gate.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the
// application developer.
// PLIB_CMP_NegativeAndGateOutputDisable (MY_CMP_INSTANCE);
```

5.6.5.5.3.13 PLIB_CMP_NegativeAndGateOutputEnable Function**C**

```
void PLIB_CMP_NegativeAndGateOutputEnable(
    CMP_MODULE_ID index
);
```

Description

This function will enable the negative AND gate output to the OR gate.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the
// application developer.
// PLIB_CMP_NegativeAndGateOutputEnable(MY_CMP_INSTANCE);
```

5.6.5.5.3.14 PLIB_CMP_PositiveAndGateOutputDisable Function**C**

```
void PLIB_CMP_PositiveAndGateOutputDisable(
    CMP_MODULE_ID index
);
```

Description

This function will disable the positive AND gate output to the OR gate.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the
// application developer.
// PLIB_CMP_PositiveAndGateOutputDisable (MY_CMP_INSTANCE);
```

5.6.5.5.3.15 PLIB_CMP_PositiveAndGateOutputEnable Function**C**

```
void PLIB_CMP_PositiveAndGateOutputEnable(
    CMP_MODULE_ID index
);
```

Description

This function will enable the positive AND gate output to the OR gate.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the
// application developer.
// PLIB_CMP_PositiveAndGateOutputEnable(MY_CMP_INSTANCE);
```

5.6.5.5.3.16 PLIB_CMP_AndGateCInputDisable Function**C**

```
void PLIB_CMP_AndGateCInputDisable(
    CMP_MODULE_ID index
);
```

Description

This function will disable the C input as the input to the AND gate.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the
// application developer.
// PLIB_CMP_AndGateCInputDisable(MY_CMP_INSTANCE);
```

5.6.5.5.4 Comparator Filter Clock Configuration Functions**5.6.5.5.4.1 PLIB_CMP_FilterClockDivideSelect Function****C**

```
void PLIB_CMP_FilterClockDivideSelect(
    CMP_MODULE_ID index,
    CMP_CLOCK_DIVIDE scale
);
```

Description

This function will select the Comparator filter clock divide.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
scale	One of the possible values from CMP_CLOCK_DIVIDE

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the  
// application developer.  
// PLIB_CMP_FilterClockDivideSelect (MY_CMP_INSTANCE, CMP_FILTER_CLOCK_DIVIDE_1_2);
```

5.6.5.5.4.2 PLIB_CMP_FilterDisable Function**C**

```
void PLIB_CMP_FilterDisable(  
    CMP_MODULE_ID index  
);
```

Description

This function will disable the Comparator digital filter.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the  
// application developer.  
// PLIB_CMP_FilterDisable (MY_CMP_INSTANCE);
```

5.6.5.5.4.3 PLIB_CMP_FilterEnable Function**C**

```
void PLIB_CMP_FilterEnable(  
    CMP_MODULE_ID index  
);
```

Description

This function will enable the Comparator digital filter.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the  
// application developer.  
// PLIB_CMP_FilterEnable (MY_CMP_INSTANCE);
```

5.6.5.5.4 PLIB_CMP_FilterInputClockSelect Function**C**

```
void PLIB_CMP_FilterInputClockSelect(  
    CMP_MODULE_ID index,  
    CMP_FILTER_CLOCK inputclock  
);
```

Description

This function will select the Comparator filter input clock.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
inputclock	One of the possible values from CMP_FILTER_CLOCK

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the  
// application developer.  
// PLIB_CMP_FilterInputClockSelect (MY_CMP_INSTANCE, CMP_FILTER_CLOCK_FP);
```

5.6.5.5.5 Comparator Op amp Mode Configuration Functions**5.6.5.5.5.1 PLIB_CMP_OpAmpModeDisable Function****C**

```
void PLIB_CMP_OpAmpModeDisable(  
    CMP_MODULE_ID index  
);
```

Description

This function will cause the circuit to operate as a Comparator.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the  
// application developer.  
// PLIB_CMP_OpAmpModeDisable(MY_CMP_INSTANCE);
```

5.6.5.5.2 PLIB_CMP_OpAmpModeEnable Function**C**

```
void PLIB_CMP_OpAmpModeEnable(  
    CMP_MODULE_ID index  
);
```

Description

This function will cause the circuit to operate as an Op amp.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the  
// application developer.  
// PLIB_CMP_OpAmpModeEnable(MY_CMP_INSTANCE);
```

5.6.5.5.3 PLIB_CMP_OpAmpOutputDisable Function**C**

```
void PLIB_CMP_OpAmpOutputDisable(  
    CMP_MODULE_ID index  
);
```

Description

This function will disable the Op amp output pin.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the  
// application developer.  
// PLIB_CMP_OpAmpOutputDisable(MY_CMP_INSTANCE);
```

5.6.5.5.4 PLIB_CMP_OpAmpOutputEnable Function**C**

```
void PLIB_CMP_OpAmpOutputEnable(  
    CMP_MODULE_ID index  
);
```

Description

This function will enable the Op amp output pin.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the  
// application developer.  
// PLIB_CMP_OpAmpOutputEnable(MY_CMP_INSTANCE);
```

5.6.5.5.6 Comparator OR Gate Configuration Functions**5.6.5.5.6.1 PLIB_CMP_OrGateAInputDisable Function****C**

```
void PLIB_CMP_OrGateAInputDisable(  
    CMP_MODULE_ID index  
);
```

Description

This function will disable the A input as the input to the OR gate.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the  
// application developer.  
// PLIB_CMP_OrGateAInputDisable(MY_CMP_INSTANCE);
```

5.6.5.5.6.2 PLIB_CMP_OrGateAInputEnable Function**C**

```
void PLIB_CMP_OrGateAInputEnable(  
    CMP_MODULE_ID index  
);
```

Description

This function will select the A input as the input to the OR gate.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the  
// application developer.  
// PLIB_CMP_OrGateAInputEnable(MY_CMP_INSTANCE);
```

5.6.5.5.6.3 PLIB_CMP_OrGateBInputDisable Function**C**

```
void PLIB_CMP_OrGateBInputDisable(  
    CMP_MODULE_ID index  
);
```

Description

This function will disable the B input as the input to the OR gate.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the  
// application developer.  
// PLIB_CMP_OrGateBInputDisable(MY_CMP_INSTANCE);
```

5.6.5.5.6 PLIB_CMP_OrGateBInputEnable Function**C**

```
void PLIB_CMP_OrGateBInputEnable(  
    CMP_MODULE_ID index  
);
```

Description

This function will select the B input as the input to the OR gate.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the  
// application developer.  
// PLIB_CMP_OrGateBInputEnable(MY_CMP_INSTANCE);
```

5.6.5.5.6 PLIB_CMP_OrGateCInputDisable Function**C**

```
void PLIB_CMP_OrGateCInputDisable(  
    CMP_MODULE_ID index  
);
```

Description

This function will disable the C input as the input to the OR gate.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the  
// application developer.  
// PLIB_CMP_OrGateCInputDisable(MY_CMP_INSTANCE);
```

5.6.5.5.6 PLIB_CMP_OrGateCInputEnable Function**C**

```
void PLIB_CMP_OrGateCInputEnable(  
    CMP_MODULE_ID index  
);
```

Description

This function will select the C input as the input to the OR gate.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the  
// application developer.  
// PLIB_CMP_OrGateCInputEnable(MY_CMP_INSTANCE);
```

5.6.5.5.6.7 PLIB_CMP_OrGateInvertedAInputDisable Function**C**

```
void PLIB_CMP_OrGateInvertedAInputDisable(  
    CMP_MODULE_ID index  
);
```

Description

This function will disable the inverted A input as the input to the OR gate.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the  
// application developer.  
// PLIB_CMP_OrGateInvertedAInputDisable (MY_CMP_INSTANCE);
```

5.6.5.5.6.8 PLIB_CMP_OrGateInvertedAInputEnable Function**C**

```
void PLIB_CMP_OrGateInvertedAInputEnable(  
    CMP_MODULE_ID index  
);
```

Description

This function will select the inverted A input as the input to the OR gate.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the  
// application developer.  
// PLIB_CMP_OrGateInvertedAInputEnable (MY_CMP_INSTANCE);
```

5.6.5.5.6.9 PLIB_CMP_OrGateInvertedBInputDisable Function**C**

```
void PLIB_CMP_OrGateInvertedBInputDisable(  
    CMP_MODULE_ID index  
);
```

Description

This function will disable the inverted B input as the input to the OR gate.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the
// application developer.
// PLIB_CMP_OrGateInvertedBInputDisable (MY_CMP_INSTANCE);
```

5.6.5.5.6.10 PLIB_CMP_OrGateInvertedBInputEnable Function**C**

```
void PLIB_CMP_OrGateInvertedBInputEnable(
    CMP_MODULE_ID index
);
```

Description

This function will select the inverted B input as the input to the OR gate.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the
// application developer.
// PLIB_CMP_OrGateInvertedBInputEnable (MY_CMP_INSTANCE);
```

5.6.5.5.6.11 PLIB_CMP_OrGateInvertedCInputDisable Function**C**

```
void PLIB_CMP_OrGateInvertedCInputDisable(
    CMP_MODULE_ID index
);
```

Description

This function will disable the inverted C input as the input to the OR gate.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the  
// application developer.  
// PLIB_CMP_OrGateInvertedCInputDisable (MY_CMP_INSTANCE);
```

5.6.5.5.6.12 PLIB_CMP_OrGateInvertedCInputEnable Function**C**

```
void PLIB_CMP_OrGateInvertedCInputEnable(  
    CMP_MODULE_ID index  
);
```

Description

This function will select the inverted C input as the input to the OR gate.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the  
// application developer.  
// PLIB_CMP_OrGateInvertedCInputEnable (MY_CMP_INSTANCE);
```

5.6.5.5.7 Comparator Mask Select Configuration Functions

5.6.5.5.7.1 PLIB_CMP_HighLevelMaskSelect Function

C

```
void PLIB_CMP_HighLevelMaskSelect(  
    CMP_MODULE_ID index  
);
```

Description

This function will select the high-level masking.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the  
// application developer.  
// PLIB_CMP_HighLevelMaskSelect(MY_CMP_INSTANCE);
```

5.6.5.5.7.2 PLIB_CMP_LowLevelMaskSelect Function

C

```
void PLIB_CMP_LowLevelMaskSelect(  
    CMP_MODULE_ID index  
);
```

Description

This function will select the low-level masking

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet for availability.

Example

```
// Where MY_CMP_INSTANCE, is the Comparator instance selected for use by the  
// application developer.  
// PLIB_CMP_LowLevelMaskSelect(MY_CMP_INSTANCE);
```

5.6.5.5.8 Data Types and Constants

5.6.5.5.8.1 CMP_CLOCK_DIVIDE Enumeration

C

```
typedef enum {
    CMP_FILTER_CLOCK_DIVIDE_1_1,
    CMP_FILTER_CLOCK_DIVIDE_1_2,
    CMP_FILTER_CLOCK_DIVIDE_1_4,
    CMP_FILTER_CLOCK_DIVIDE_1_8,
    CMP_FILTER_CLOCK_DIVIDE_1_16,
    CMP_FILTER_CLOCK_DIVIDE_1_32,
    CMP_FILTER_CLOCK_DIVIDE_1_64,
    CMP_FILTER_CLOCK_DIVIDE_1_128
} CMP_CLOCK_DIVIDE;
```

Description

CMP Filter Clock Divide Select

This macro defines the CMP filter clock divide

Members

Members	Description
CMP_FILTER_CLOCK_DIVIDE_1_1	Comparator Filter Clock Division is 1:1
CMP_FILTER_CLOCK_DIVIDE_1_2	Comparator Filter Clock Division is 1:2
CMP_FILTER_CLOCK_DIVIDE_1_4	Comparator Filter Clock Division is 1:4
CMP_FILTER_CLOCK_DIVIDE_1_8	Comparator Filter Clock Division is 1:8
CMP_FILTER_CLOCK_DIVIDE_1_16	Comparator Filter Clock Division is 1:16
CMP_FILTER_CLOCK_DIVIDE_1_32	Comparator Filter Clock Division is 1:32
CMP_FILTER_CLOCK_DIVIDE_1_64	Comparator Filter Clock Division is 1:64
CMP_FILTER_CLOCK_DIVIDE_1_128	Comparator Filter Clock Division is 1:128

5.6.5.5.8.2 CMP_CVREF_BANDGAP_SELECT Enumeration

C

```
typedef enum {
    CMP_CVREF_BANDGAP_1_2V,
    CMP_CVREF_BANDGAP_0_6V,
    CMP_CVREF_BANDGAP_VREFPLUS
} CMP_CVREF_BANDGAP_SELECT;
```

Description

CVREF bandgap select enumeration

This enumeration lists the possible Bandgap selection options.

Members

Members	Description
CMP_CVREF_BANDGAP_1_2V	Select the Band Gap Reference Source as 1.2 V
CMP_CVREF_BANDGAP_0_6V	Select the Band Gap Reference Source as 0.6 V
CMP_CVREF_BANDGAP_VREFPLUS	Select the Band Gap Reference Source as VREF

Remarks

None.

5.6.5.5.8.3 CMP_CVREF_REFERENCE_SELECT Enumeration**C**

```
typedef enum {  
    CMP_CVREF_RESISTOR_LADDER_VOLTAGE,  
    CMP_CVREF_POSITIVE_REFERENCE_VOLTAGE  
} CMP_CVREF_REFERENCE_SELECT;
```

Description

CVREF reference select enumeration

This enumeration lists the possible reference selection options.

Members

Members	Description
CMP_CVREF_RESISTOR_LADDER_VOLTAGE	Select the Band Gap Reference Source as 1.2 V
CMP_CVREF_POSITIVE_REFERENCE_VOLTAGE	Select the Band Gap Reference Source as 0.6 V

Remarks

None.

5.6.5.5.8.4 CMP_CVREF_VALUE Enumeration**C**

```
typedef enum {  
    CMP_CVREF_VALUE_0,  
    CMP_CVREF_VALUE_1,  
    CMP_CVREF_VALUE_2,  
    CMP_CVREF_VALUE_3,  
    CMP_CVREF_VALUE_4,  
    CMP_CVREF_VALUE_5,  
    CMP_CVREF_VALUE_6,  
    CMP_CVREF_VALUE_7,  
    CMP_CVREF_VALUE_8,  
    CMP_CVREF_VALUE_9,  
    CMP_CVREF_VALUE_10,  
    CMP_CVREF_VALUE_11,  
    CMP_CVREF_VALUE_12,  
    CMP_CVREF_VALUE_13,  
    CMP_CVREF_VALUE_14,  
    CMP_CVREF_VALUE_15  
} CMP_CVREF_VALUE;
```

Description

CVREF voltage reference value selection enumeration

This enumeration lists the possible Voltage reference value selection options.

Members

Members	Description
CMP_CVREF_VALUE_0	Voltage reference value 0
CMP_CVREF_VALUE_1	Voltage reference value 1
CMP_CVREF_VALUE_2	Voltage reference value 2

CMP_CVREF_VALUE_3	Voltage reference value 3
CMP_CVREF_VALUE_4	Voltage reference value 4
CMP_CVREF_VALUE_5	Voltage reference value 5
CMP_CVREF_VALUE_6	Voltage reference value 6
CMP_CVREF_VALUE_7	Voltage reference value 7
CMP_CVREF_VALUE_8	Voltage reference value 8
CMP_CVREF_VALUE_9	Voltage reference value 9
CMP_CVREF_VALUE_10	Voltage reference value 10
CMP_CVREF_VALUE_11	Voltage reference value 11
CMP_CVREF_VALUE_12	Voltage reference value 12
CMP_CVREF_VALUE_13	Voltage reference value 13
CMP_CVREF_VALUE_14	Voltage reference value 14
CMP_CVREF_VALUE_15	Voltage reference value 15

Remarks

None.

5.6.5.5.8.5 CMP_CVREF_VOLTAGE_SOURCE Enumeration**C**

```
typedef enum {
    CMP_CVREF_VOLTAGE_SOURCE_INTERNAL,
    CMP_CVREF_VOLTAGE_SOURCE_EXTERNAL
} CMP_CVREF_VOLTAGE_SOURCE;
```

Description

CVREF Voltage source selection enumeration

This enumeration lists the possible Voltage source selection options.

Members

Members	Description
CMP_CVREF_VOLTAGE_SOURCE_INTERNAL	Select vdd/vss source
CMP_CVREF_VOLTAGE_SOURCE_EXTERNAL	Select external voltage source

Remarks

None.

5.6.5.5.8.6 CMP_FILTER_CLOCK Enumeration**C**

```
typedef enum {
    CMP_FILTER_CLOCK_FP,
    CMP_FILTER_CLOCK_FOSC,
    CMP_FILTER_CLOCK_SYNC01,
    CMP_FILTER_CLOCK_T2CLK,
    CMP_FILTER_CLOCK_T3CLK,
    CMP_FILTER_CLOCK_T4CLK,
    CMP_FILTER_CLOCK_T5CLK
} CMP_FILTER_CLOCK;
```

Description

CMP Filter Input Clock Select

This macro defines the CMP filter input clock

Members

Members	Description
CMP_FILTER_CLOCK_FP	FP will be the CMP filter input clock
CMP_FILTER_CLOCK_FOSC	FOSC will be the CMP filter input clock
CMP_FILTER_CLOCK_SYNCO1	SYNCO1 will be the CMP filter input clock
CMP_FILTER_CLOCK_T2CLK	T2CLK will be the CMP filter input clock
CMP_FILTER_CLOCK_T3CLK	T3CLK will be the CMP filter input clock
CMP_FILTER_CLOCK_T4CLK	T4CLK will be the CMP filter input clock
CMP_FILTER_CLOCK_T5CLK	T5CLK will be the CMP filter input clock

5.6.5.5.8.7 CMP_INTERRUPT_EVENT Enumeration

C

```
typedef enum {
    CMP_INTERRUPT_GENERATION_DISABLED
} CMP_INTERRUPT_EVENT;
```

Description

CMP interrupt event Select

This macro defines the CMP interrupt events.

Members

Members	Description
CMP_INTERRUPT_GENERATION_DISABLED	Select vdd/vss source

5.6.5.5.8.8 CMP_INVERTING_INPUT Enumeration

C

```
typedef enum {
    CMP_INPUT_C2IN_NEGATIVE
} CMP_INVERTING_INPUT;
```

Description

CMP inverting input channel select

This macro defines the list of CMP inverting Input

Members

Members	Description
CMP_INPUT_C2IN_NEGATIVE	Select vdd/vss source

5.6.5.5.8.9 CMP_MASK_A Enumeration

C

```
typedef enum {
    CMP_MASK_A_PWM1L,
    CMP_MASK_A_PWM1H,
    CMP_MASK_A_PWM2L,
    CMP_MASK_A_PWM2H,
    CMP_MASK_A_PWM3L,
    CMP_MASK_A_PWM3H,
    CMP_MASK_A_PTG018,
```

```

    CMP_MASK_A_PTGO19,
    CMP_MASK_A_FLT2,
    CMP_MASK_A_FLT4
} CMP_MASK_A;

```

Description

CMP Mask A Input Select

This macro defines the CMP Mask A Input.

Members

Members	Description
CMP_MASK_A_PWM1L	PWM1L will be the CMP mask A input
CMP_MASK_A_PWM1H	PWM1H will be the CMP mask A input
CMP_MASK_A_PWM2L	PWM2L will be the CMP mask A input
CMP_MASK_A_PWM2H	PWM2H will be the CMP mask A input
CMP_MASK_A_PWM3L	PWM3L will be the CMP mask A input
CMP_MASK_A_PWM3H	PWM3H will be the CMP mask A input
CMP_MASK_A_PTGO18	PTGO18 will be the CMP mask A input
CMP_MASK_A_PTGO19	PTGO19 will be the CMP mask A input
CMP_MASK_A_FLT2	FLT2 will be the CMP mask A input
CMP_MASK_A_FLT4	FLT4 will be the CMP mask A input

5.6.5.5.8.10 CMP_MASK_B Enumeration**C**

```

typedef enum {
    CMP_MASK_B_PWM1L,
    CMP_MASK_B_PWM1H,
    CMP_MASK_B_PWM2L,
    CMP_MASK_B_PWM2H,
    CMP_MASK_B_PWM3L,
    CMP_MASK_B_PWM3H,
    CMP_MASK_B_PTGO18,
    CMP_MASK_B_PTGO19,
    CMP_MASK_B_FLT2,
    CMP_MASK_B_FLT4
} CMP_MASK_B;

```

Description

CMP Mask B Input Select

This macro defines the CMP Mask B Input.

Members

Members	Description
CMP_MASK_B_PWM1L	PWM1L will be the CMP mask B input
CMP_MASK_B_PWM1H	PWM1H will be the CMP mask B input
CMP_MASK_B_PWM2L	PWM2L will be the CMP mask B input
CMP_MASK_B_PWM2H	PWM2H will be the CMP mask B input
CMP_MASK_B_PWM3L	PWM3L will be the CMP mask B input
CMP_MASK_B_PWM3H	PWM3H will be the CMP mask B input
CMP_MASK_B_PTGO18	PTGO18 will be the CMP mask B input
CMP_MASK_B_PTGO19	PTGO19 will be the CMP mask B input

CMP_MASK_B_FLT2	FLT2 will be the CMP mask B input
CMP_MASK_B_FLT4	FLT4 will be the CMP mask B input

5.6.5.5.8.11 CMP_MASK_C Enumeration

C

```
typedef enum {
    CMP_MASK_C_PWM1L,
    CMP_MASK_C_PWM1H,
    CMP_MASK_C_PWM2L,
    CMP_MASK_C_PWM2H,
    CMP_MASK_C_PWM3L,
    CMP_MASK_C_PWM3H,
    CMP_MASK_C_PTGO18,
    CMP_MASK_C_PTGO19,
    CMP_MASK_C_FLT2,
    CMP_MASK_C_FLT4
} CMP_MASK_C;
```

Description

CMP Mask C Input Select

This macro defines the CMP Mask C Input.

Members

Members	Description
CMP_MASK_C_PWM1L	PWM1L will be the CMP mask C input
CMP_MASK_C_PWM1H	PWM1H will be the CMP mask C input
CMP_MASK_C_PWM2L	PWM2L will be the CMP mask C input
CMP_MASK_C_PWM2H	PWM2H will be the CMP mask C input
CMP_MASK_C_PWM3L	PWM3L will be the CMP mask C input
CMP_MASK_C_PWM3H	PWM3H will be the CMP mask C input
CMP_MASK_C_PTGO18	PTGO18 will be the CMP mask C input
CMP_MASK_C_PTGO19	PTGO19 will be the CMP mask C input
CMP_MASK_C_FLT2	FLT2 will be the CMP mask C input
CMP_MASK_C_FLT4	FLT4 will be the CMP mask C input

5.6.5.5.8.12 CMP_MODULE_ID Enumeration

C

```
typedef enum {
    CMP_ID_1,
    CMP_ID_2,
    CMP_ID_3
} CMP_MODULE_ID;
```

Description

CMP Module ID

This enumeration identifies the CMP modules which are available on the microcontroller. This is the super set of all the possible instances that might be available on the Microchip microcontrollers.

Members

Members	Description
CMP_ID_1	CMP Module 1 ID

CMP_ID_2	CMP Module 2 ID
CMP_ID_3	CMP Module 3 ID

Remarks

The caller should not rely on the specific numbers assigned to any of these values as they may change from one processor to the next.

Not all modules will be available on all microcontrollers. Refer to the data sheet for the specific controller in use to determine which modules are supported. The numbers used in the enumeration values will match the numbers given in the data sheet.

5.6.5.5.8.13 CMP_NON_INVERTING_INPUT Enumeration**C**

```
typedef enum {
    CMP_INPUT_C2IN_POSITIVE,
    CMP_INPUT_INTERNAL_CVREF
} CMP_NON_INVERTING_INPUT;
```

Description

CMP Non inverting input channel select

This macro defines the list of CMP non inverting Input

Members

Members	Description
CMP_INPUT_C2IN_POSITIVE	Select vdd/vss source
CMP_INPUT_INTERNAL_CVREF	Select external voltage source

5.6.5.5.8.14 CMP_SPEED_POWER Enumeration**C**

```
typedef enum {
    CMP_SPEED_POWER_LOWER,
    CMP_SPEED_POWER_HIGHER
} CMP_SPEED_POWER;
```

Description

CMP Speed/Power Select

This macro defines the Speed/Power of CMP

Members

Members	Description
CMP_SPEED_POWER_LOWER	CMP low-power, low-speed
CMP_SPEED_POWER_HIGHER	CMP normal power, higher speed

5.6.5.5.9 Feature Existence Functions**5.6.5.5.9.1 PLIB_CMP_ExistsCVREFBGRefVoltageRangeSelect Function****C**

```
bool PLIB_CMP_ExistsCVREFBGRefVoltageRangeSelect(
    CMP_MODULE_ID index
);
```

Description

This function identifies whether the CVREFBGRefVoltageRangeSelect feature is available on the Comparator module. When this function returns true, these functions are supported on the device:

- [PLIB_CMP_CVREF_BandGapReferenceSourceSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The CVREFBGRefVoltageRangeSelect feature is supported on the device
- false = The CVREFBGRefVoltageRangeSelect feature is not supported on the device

Remarks

None.

5.6.5.5.9.2 PLIB_CMP_ExistsCVREFEnableControl Function**C**

```
bool PLIB_CMP_ExistsCVREFEnableControl(  
    CMP_MODULE_ID index  
);
```

Description

This function identifies whether the CVREFEnableControl feature is available on the Comparator module. When this function returns true, these functions are supported on the device:

- [PLIB_CMP_CVREF_Enable](#)
- [PLIB_CMP_CVREF_Disable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The CVREFEnableControl feature is supported on the device
- false = The CVREFEnableControl feature is not supported on the device

Remarks

None.

5.6.5.5.9.3 PLIB_CMP_ExistsCVREFOutputEnableControl Function**C**

```
bool PLIB_CMP_ExistsCVREFOutputEnableControl(  
    CMP_MODULE_ID index
```

```
);
```

Description

This function identifies whether the CVREFOutputEnableControl feature is available on the Comparator module. When this function returns true, these functions are supported on the device:

- [PLIB_CMP_CVREF_OutputEnable](#)
- [PLIB_CMP_CVREF_OutputDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The CVREFOutputEnableControl feature is supported on the device
- false = The CVREFOutputEnableControl feature is not supported on the device

Remarks

None.

5.6.5.5.9.4 PLIB_CMP_ExistsCVREFRefVoltageRangeSelect Function

C

```
bool PLIB_CMP_ExistsCVREFRefVoltageRangeSelect(  
    CMP_MODULE_ID index  
);
```

Description

This function identifies whether the CVREFRefVoltageRangeSelect feature is available on the Comparator module. When this function returns true, the following function is supported on the device:

- [PLIB_CMP_CVREF_ReferenceVoltageSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The CVREFRefVoltageRangeSelect feature is supported on the device
- false = The CVREFRefVoltageRangeSelect feature is not supported on the device

Remarks

None.

5.6.5.5.9.5 PLIB_CMP_ExistsCVREFValueSelect Function

C

```
bool PLIB_CMP_ExistsCVREFValueSelect(  

```

```
    CMP_MODULE_ID index
);
```

Description

This function identifies whether the CVREFValueSelect feature is available on the Comparator module. When this function returns true, the following function is supported on the device:

- [PLIB_CMP_CVREF_ValueSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The CVREFValueSelect feature is supported on the device
- false = The CVREFValueSelect feature is not supported on the device

Remarks

None.

5.6.5.5.9.6 PLIB_CMP_ExistsCVREFVoltageRangeSelect Function

C

```
bool PLIB_CMP_ExistsCVREFVoltageRangeSelect(
    CMP_MODULE_ID index
);
```

Description

This function identifies whether the CVREFVoltageRangeSelect feature is available on the Comparator module. When this function returns true, the following function is supported on the device:

- [PLIB_CMP_CVREF_SourceVoltageSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The CVREFVoltageRangeSelect feature is supported on the device
- false = The CVREFVoltageRangeSelect feature is not supported on the device

Remarks

None.

5.6.5.5.9.7 PLIB_CMP_ExistsCVREFWideRangeControl Function

C

```
bool PLIB_CMP_ExistsCVREFWideRangeControl(
    CMP_MODULE_ID index
);
```

```
);
```

Description

This function identifies whether the CVREFWideRangeControl feature is available on the Comparator module. When this function returns true, these functions are supported on the device:

- [PLIB_CMP_CVREF_WideRangeEnable](#)
- [PLIB_CMP_CVREF_WideRangeDisable](#)
- [PLIB_CMP_CVREF_WideRangeIsEnabled](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The CVREFWideRangeControl feature is supported on the device
- false = The CVREFWideRangeControl feature is not supported on the device

Remarks

None.

5.6.5.5.9.8 PLIB_CMP_ExistsEnableControl Function

C

```
bool PLIB_CMP_ExistsEnableControl(  
    CMP_MODULE_ID index  
);
```

Description

This function identifies whether the ComparatorEnableControl feature is available on the Comparator module. When this function returns true, these functions are supported on the device:

- [PLIB_CMP_Enable](#)
- [PLIB_CMP_Disable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The ComparatorEnableControl feature is supported on the device
- false = The ComparatorEnableControl feature is not supported on the device

Remarks

None.

5.6.5.5.9.9 PLIB_CMP_ExistsInterruptEventSelect Function

C

```
bool PLIB_CMP_ExistsInterruptEventSelect(  
    CMP_MODULE_ID index  
);
```

Description

This function identifies whether the InterruptEventSelect feature is available on the Comparator module. When this function returns true, this function is supported on the device:

- [PLIB_CMP_InterruptEventSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The InterruptEventSelect feature is supported on the device
- false = The InterruptEventSelect feature is not supported on the device

Remarks

None.

5.6.5.5.9.10 PLIB_CMP_ExistsInvertingInputSelect Function

C

```
bool PLIB_CMP_ExistsInvertingInputSelect(  
    CMP_MODULE_ID index  
);
```

Description

This function identifies whether the InvertingInputSelect feature is available on the Comparator module. When this function returns true, this function is supported on the device:

- [PLIB_CMP_InvertingInputChannelSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The InvertingInputSelect feature is supported on the device
- false = The InvertingInputSelect feature is not supported on the device

Remarks

None.

5.6.5.5.9.11 PLIB_CMP_ExistsInvertOutputControl Function

C

```
bool PLIB_CMP_ExistsInvertOutputControl(  
    CMP_MODULE_ID index  
);
```

Description

This function identifies whether the InvertOutputSelectControl feature is available on the Comparator module. When this function returns true, these functions are supported on the device:

- [PLIB_CMP_InvertedOutputSelect](#)
- [PLIB_CMP_NonInvertedOutputSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The InvertOutputSelectControl feature is supported on the device
- false = The InvertOutputSelectControl feature is not supported on the device

Remarks

None.

5.6.5.5.9.12 PLIB_CMP_ExistsNonInvertingInputSelect Function

C

```
bool PLIB_CMP_ExistsNonInvertingInputSelect(  
    CMP_MODULE_ID index  
);
```

Description

This function identifies whether the NonInvertingInputSelect feature is available on the Comparator module. When this function returns true, this function is supported on the device:

- PLIB_CMP_adc

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The NonInvertingInputSelect feature is supported on the device
- false = The NonInvertingInputSelect feature is not supported on the device

Remarks

None.

5.6.5.5.9.13 PLIB_CMP_ExistsOutputEnableControl Function

C

```
bool PLIB_CMP_ExistsOutputEnableControl(  
    CMP_MODULE_ID index  
);
```

Description

This function identifies whether the ComparatorOutputEnableControl feature is available on the Comparator module. When this function returns true, these functions are supported on the device:

- [PLIB_CMP_OutputEnable](#)
- [PLIB_CMP_OutputDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The ComparatorOutputEnableControl feature is supported on the device
- false = The ComparatorOutputEnableControl feature is not supported on the device

Remarks

None.

5.6.5.5.9.14 PLIB_CMP_ExistsOutputLevelControl Function

C

```
bool PLIB_CMP_ExistsOutputLevelControl(  
    CMP_MODULE_ID index  
);
```

Description

This function identifies whether the OutputLevelSelectControl feature is available on the Comparator module. When this function returns true, these functions are supported on the device:

- [PLIB_CMP_OutputHighSelect](#)
- [PLIB_CMP_OutputLowSelect](#)
- [PLIB_CMP_Cmp1OutputHighSelect](#)
- [PLIB_CMP_Cmp1OutputLowSelect](#)
- [PLIB_CMP_Cmp2OutputHighSelect](#)
- [PLIB_CMP_Cmp2OutputLowSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The OutputLevelSelectControl feature is supported on the device
- false = The OutputLevelSelectControl feature is not supported on the device

Remarks

None.

5.6.5.5.9.15 PLIB_CMP_ExistsStopInIdle Function**C**

```
bool PLIB_CMP_ExistsStopInIdle(  
    CMP_MODULE_ID index  
);
```

Description

This function identifies whether the StopInIdle feature is available on the Comparator module. When this function returns true, these functions are supported on the device:

- [PLIB_CMP_StopInIdleModeEnable](#)
- [PLIB_CMP_StopInIdleModeDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true = The StopInIdle feature is supported on the device
- false = The StopInIdle feature is not supported on the device

Remarks

None.

5.6.5.6 Files**Files**

Name	Description
plib_cmp.h	Comparator Peripheral Library Interface Header for Comparator module definitions.

Description**5.6.5.6.1 plib_cmp.h**

Comparator Peripheral Library Interface Header

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the Comparator Peripheral Library for all families of Microchip microcontrollers. The definitions in this file are common to the

Comparator peripheral.

Functions

	Name	Description
≡	PLIB_CMP_AndGateAInputDisable	A input disabled as input to the AND gate
≡	PLIB_CMP_AndGateAInputEnable	A input enabled as input to the AND gate.
≡	PLIB_CMP_AndGateBInputDisable	B input disabled as input to the AND gate.
≡	PLIB_CMP_AndGateBInputEnable	B input enabled as input to the AND gate.
≡	PLIB_CMP_AndGateCInputDisable	C input disabled as input to the AND gate.
≡	PLIB_CMP_AndGateCInputEnable	C input enabled as input to the AND gate.
≡	PLIB_CMP_AndGateInvertedAInputDisable	Inverted A input disabled as input to the AND gate.
≡	PLIB_CMP_AndGateInvertedAInputEnable	Inverted A input enabled as input to the AND gate.
≡	PLIB_CMP_AndGateInvertedBInputDisable	Inverted B input disabled as input to the AND gate.
≡	PLIB_CMP_AndGateInvertedBInputEnable	Inverted B input enabled as input to the AND gate.
≡	PLIB_CMP_AndGateInvertedCInputDisable	Inverted C input disabled as input to the AND gate.
≡	PLIB_CMP_AndGateInvertedCInputEnable	Inverted C input enabled as input to the AND gate.
≡	PLIB_CMP_Cmp1OutputHighSelect	Comparator output bit is set to '1'.
≡	PLIB_CMP_Cmp1OutputLowSelect	Comparator output bit is set to '0'.
≡	PLIB_CMP_Cmp2OutputHighSelect	Comparator output bit is set to '1'.
≡	PLIB_CMP_Cmp2OutputLowSelect	Comparator output bit is set to '0'.
≡	PLIB_CMP_CVREF_BandGapReferenceSourceSelect	Selects the band gap reference voltage source.
≡	PLIB_CMP_CVREF_Disable	Disables the voltage reference of the Comparator module.
≡	PLIB_CMP_CVREF_Enable	Enables the voltage reference of the Comparator module.
≡	PLIB_CMP_CVREF_Output2Disable	Disables the Vsource/2 voltage output.
≡	PLIB_CMP_CVREF_Output2Enable	Enables the Vsource/2 voltage output.
≡	PLIB_CMP_CVREF_OutputDisable	Disables the output voltage.
≡	PLIB_CMP_CVREF_OutputEnable	Enables the voltage output.
≡	PLIB_CMP_CVREF_ReferenceVoltageSelect	Selects the voltage reference value.
≡	PLIB_CMP_CVREF_SourceNegativeInputSelect	Configures the Comparator module to use the selected input as a negative reference.
≡	PLIB_CMP_CVREF_SourceVoltageSelect	Connects the Comparator module to the selected voltage source.
≡	PLIB_CMP_CVREF_ValueGet	Returns the voltage setting value.
≡	PLIB_CMP_CVREF_ValueSelect	Selects the voltage reference value.
≡	PLIB_CMP_CVREF_WideRangeDisable	Disables the wide range.
≡	PLIB_CMP_CVREF_WideRangeEnable	Enables the wide range.
≡	PLIB_CMP_CVREF_WideRangeIsEnabled	Returns whether the wide range is selected for the reference voltage.
≡	PLIB_CMP_Disable	Disables the Comparator module.
≡	PLIB_CMP_Enable	Enables the Comparator module.
≡	PLIB_CMP_EventHasOccurred	Comparator event status.
≡	PLIB_CMP_EventStatusClear	Comparator event clear.
≡	PLIB_CMP_ExistsCVREFBGRefVoltageRangeSelect	Identifies whether the CVREFBGRefVoltageRangeSelect feature exists on the Comparator module.
≡	PLIB_CMP_ExistsCVREFEnableControl	Identifies whether the CVREFEnableControl feature exists on the Comparator module.

	PLIB_CMP_ExistsCVREFOutputEnableControl	Identifies whether the CVREFOutputEnableControl feature exists on the Comparator module.
	PLIB_CMP_ExistsCVREFRefVoltageRangeSelect	Identifies whether the CVREFRefVoltageRangeSelect feature exists on the Comparator module.
	PLIB_CMP_ExistsCVREFValueSelect	Identifies whether the CVREFValueSelect feature exists on the Comparator module.
	PLIB_CMP_ExistsCVREFVoltageRangeSelect	Identifies whether the CVREFVoltageRangeSelect feature exists on the Comparator module.
	PLIB_CMP_ExistsCVREFWideRangeControl	Identifies whether the CVREFWideRangeControl feature exists on the Comparator module.
	PLIB_CMP_ExistsEnableControl	Identifies whether the ComparatorEnableControl feature exists on the Comparator module.
	PLIB_CMP_ExistsInterruptEventSelect	Identifies whether the InterruptEventSelect feature exists on the Comparator module.
	PLIB_CMP_ExistsInvertingInputSelect	Identifies whether the InvertingInputSelect feature exists on the Comparator module.
	PLIB_CMP_ExistsInvertOutputControl	Identifies whether the InvertOutputSelectControl feature exists on the Comparator module.
	PLIB_CMP_ExistsNonInvertingInputSelect	Identifies whether the NonInvertingInputSelect feature exists on the Comparator module.
	PLIB_CMP_ExistsOutputEnableControl	Identifies whether the ComparatorOutputEnableControl feature exists on the Comparator module.
	PLIB_CMP_ExistsOutputLevelControl	Identifies whether the OutputLevelSelectControl feature exists on the Comparator module.
	PLIB_CMP_ExistsStopInIdle	Identifies whether the StopInIdle feature exists on the Comparator module.
	PLIB_CMP_FilterClockDivideSelect	Comparator filter clock divide select.
	PLIB_CMP_FilterDisable	Comparator filter disable.
	PLIB_CMP_FilterEnable	Comparator filter enable.
	PLIB_CMP_FilterInputClockSelect	Comparator filter input clock select.
	PLIB_CMP_HighLevelMaskSelect	High-level masking select.
	PLIB_CMP_HysteresisDisable	Comparator hysteresis disable.
	PLIB_CMP_HysteresisEnable	Comparator hysteresis enable.
	PLIB_CMP_InterruptEventSelect	Comparator interrupt event select.
	PLIB_CMP_InvertedOutputSelect	Comparator output is inverted.
	PLIB_CMP_InvertingInputChannelSelect	Comparator inverting input channel select.
	PLIB_CMP_LowLevelMaskSelect	Low-level masking select.
	PLIB_CMP_NegativeAndGateOutputDisable	Negative AND gate output disable.
	PLIB_CMP_NegativeAndGateOutputEnable	Negative AND gate output enable.
	PLIB_CMP_NonInvertedOutputSelect	Comparator output is non-inverted.
	PLIB_CMP_NonInvertingInputChannelSelect	Comparator input channel select.
	PLIB_CMP_OpAmpModeDisable	Op amp operation mode disable.
	PLIB_CMP_OpAmpModeEnable	Op amp operation mode enable.
	PLIB_CMP_OpAmpOutputDisable	Op amp output disable.
	PLIB_CMP_OpAmpOutputEnable	Op amp output enable.
	PLIB_CMP_OrGateAInputDisable	OR gate A input disable.
	PLIB_CMP_OrGateAInputEnable	A input connected to OR gate.
	PLIB_CMP_OrGateBInputDisable	OR gate B input disable.

	PLIB_CMP_OrGateBInputEnable	B input connected to OR gate.
	PLIB_CMP_OrGateCInputDisable	OR gate C input disable.
	PLIB_CMP_OrGateCInputEnable	C input connected to OR gate.
	PLIB_CMP_OrGateInvertedAInputDisable	OR gate inverted A input disable.
	PLIB_CMP_OrGateInvertedAInputEnable	Inverted A input connected to OR gate.
	PLIB_CMP_OrGateInvertedBInputDisable	OR gate inverted B input disable.
	PLIB_CMP_OrGateInvertedBInputEnable	Inverted B input connected to OR gate
	PLIB_CMP_OrGateInvertedCInputDisable	OR gate inverted C input disable.
	PLIB_CMP_OrGateInvertedCInputEnable	Inverted C input connected to OR gate
	PLIB_CMP_OutputDisable	Disables the Comparator output.
	PLIB_CMP_OutputEnable	Enables the Comparator output.
	PLIB_CMP_OutputHighSelect	Comparator output bit is set to '1'.
	PLIB_CMP_OutputLowSelect	Comparator output bit is set to '0'.
	PLIB_CMP_OutputStatusGet	Comparator output status.
	PLIB_CMP_OutputSynchronousWithTimer1Disable	Comparator output is asynchronous.
	PLIB_CMP_OutputSynchronousWithTimer1Enable	Comparator Output Synchronous mode select.
	PLIB_CMP_PositiveAndGateOutputDisable	Positive AND gate output disable.
	PLIB_CMP_PositiveAndGateOutputEnable	Positive AND gate output enable.
	PLIB_CMP_StopInIdleModeDisable	Disables Stop in Idle mode.
	PLIB_CMP_StopInIdleModeEnable	Enables Stop in Idle mode.

5.6.6 DMA Peripheral Library Help

5.6.6.1 Introduction

DMA Peripheral Library

for

Microchip Microcontrollers

Direct Memory Access (DMA) is a feature (sub-system) of the microcontroller that allows certain hardware sub-systems within the microcontroller to access the system memory independently of the processor (or the CPU).

Description

DMA also assists in accessing peripheral memory along with the system memory (data RAM). The DMA sub-system in the PIC family of microcontrollers is optimized for high-performance, real-time, embedded applications where determinism and system latency are priorities.

Figure-1: DMA Hardware Abstraction Model

5.6.6.2 Release Notes

MPLAB Harmony Version: v0.70b **DMA PLIB Library Version :** 0.70b **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.6.6.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.6.6.4 Using the Library

This topic describes the basic architecture of the DMA Peripheral Library and provides information and examples on how to use it.

Interface Header File: [plib_dma.h](#)

The interface to the DMA Peripheral Library is defined in the "[plib_dma.h](#)" header file. Any C language source (.c) file that uses the DMA Peripheral library should include "[plib_dma.h](#)".

Library File:

The DMA Peripheral Library (.a) file installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the peripheral interacts with the framework.

5.6.6.4.1 Hardware Abstraction Model

This library provides the low-level abstraction of the DMA module on the Microchip family of microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in the software and introduces the library interface.

Description

The DMA Peripheral Library software is depicted using the following block diagram.

Figure-2: DMA Software Abstraction Block Diagram

The DMA Peripheral Library takes requests from application software or the DMA device driver and controls the DMA core (the DMA hardware) as per the inputs passed to the library.

The major components of the DMA Peripheral Library are:

- Source/Destination/Peripheral Address Management
- Source/Destination/Peripheral Data Management
- DMA Operating/Addressing Mode Management
- DMA Channel Management
- Interrupt Control and Management

The topic [Library Overview](#) explains in detail each block of the DMA Peripheral Library software architecture.

Note: The interface provided is a superset of all the functionality of the available DMA module on the device. Refer to the specific device data sheet or related family reference manual to determine the set of functions that are supported for each DMA module on your device.

5.6.6.4.2 Library Usage Model

The library interface routines are divided into various topics, each of which addresses one of the blocks or the overall operation of the DMA module.

Library Interface Section	Description
Transfer/Abort (Synchronous)	Handles the synchronous DMA transfer start and End. This feature request is controlled fully by the software.
Transfer/Abort (Asynchronous) Trigger Management	Each DMA transaction can be asynchronously initiated or aborted by an interrupt. This feature handles the required configuration.
Interrupt Control and Management	Each DMA channel can be configured to respond to events such as address error (upper address error, lower address error, etc.), transfer count half done, transfer count done, source data completely transferred, etc.
Operating/Addressing Mode Management	Before initiating a DMA transaction, the addressing and operating modes of the DMA module need to be configured (per channel basis). As an example, the DMA module can be configured for one shot mode with peripheral indirect addressing mode for a DMA transaction.
Channel Management	Each DMA channel can be individually configured for a DMA transaction. Priorities can be assigned, a channel can be enabled or disabled, channel chaining can be used, etc.
Source/Destination/Peripheral Address Management	For each DMA transaction to start, the DMA core needs to know the source and destination addresses. This feature handles this type of configuration.
Source/Destination/Peripheral Data Management	For each DMA transaction, the amount of data to be transferred, the source and destination size, the transaction type (byte/word), and transaction size can be configured by this feature.
Special Function Modules (CRC)	Certain high-end controllers support this CRC generator. This feature can be assigned to any of the available DMA channels. This feature handles the configuration of these aspects.
Status (Including Channel)	This feature specifies the application to access the status information of the DMA and each channel.

5.6.6.4.3 How the Library Works

Note: Not all modes are available on all devices. Please refer to the specific device data sheet to determine which modes are supported.

5.6.6.4.3.1 General Configuration

DMA General configuration includes enabling, disabling DMA module globally. It also involves DMA suspend control and behavior in Idle mode.

Enable/Disable DMA

Enabling and disabling the DMA are the basic routines that may be called during initialization and exit routines of the application.

DMA Enable/Disable Example:

```
// Enable the DMA controller
PLIB_DMA_Enable ( DMA_ID_0 );
// Disable the DMA
PLIB_DMA_Disable ( DMA_ID_0 );
// Check the enable status of the DMA controller.
if(PLIB_DMA_IsEnabled( DMA_ID_0 ))
{
    // application code
}
```

5.6.6.4.3.2 Transfer/Abort (Synchronous)

A DMA transaction can be initiated/aborted asynchronously by configuring an interrupt for a channel. Refer to [Transfer/Abort \(Asynchronous\) Trigger Management](#) for details.

In many instances, an application or a device driver needs to initiate a DMA transfer or abort an ongoing DMA transfer for reasons not necessarily known. To handle such cases, the DMA core supports a forceful DMA start and abort.

Note: The DMA abort is not supported by all devices. Refer to the specific device data sheet to determine availability of this feature.

When a DMA force start request is sent and the channel is already processing/pending to process an interrupt-based DMA transfer, the force transfer request will be ignored. In certain devices, a flag is raised to indicate a collision of DMA requests. Refer to [Status \(Including Channel\)](#) for details. In certain devices, an interrupt is issued to indicate that the active channel may not be able to keep up with the demands from the peripheral module being serviced. For more details refer to [Interrupt Control and Management](#).

A DMA force transfer is initiated by the [PLIB_DMA_StartTransferSet Function](#).

A DMA force abort is initiated by the [PLIB_DMA_AbortTransferSet Function](#).

DMA Transfer/Abort (Synchronous) Configuration

A DMA transfer can be initiated or aborted forcefully by the software.

Example:

```
// Initiate a forced transfer on channel-3
PLIB_DMA_StartTransferSet ( DMA_ID_0, DMA_CHANNEL_3 );
// Abort a transfer on channel-3
PLIB_DMA_AbortTransferSet ( DMA_ID_0, DMA_CHANNEL_3 );
```

5.6.6.4.3.3 Transfer/Abort (Asynchronous) Trigger Management

DMA Start IRQ

Each channel can be configured to initiate a DMA transaction based on the interrupt from a source. This can be enabled/disable per channel basis. To initiate a DMA transfer upon an interrupt trigger, the IRQ number needs to be configured as the start IRQ for this channel. Which source can act as the start IRQ is device-dependent. In certain devices, any of the available IRQs can be configured as the starting IRQ, while in other devices, there is restriction on which interrupt source can act as the start IRQ. Refer to the specific device data sheet to determine feature availability.

The starting IRQ is enabled by the [PLIB_DMA_ChannelXTriggerEnable Function](#). A DMA channel can be configured to start a DMA transfer based on the event on an IRQ using the [PLIB_DMA_ChannelXStartIRQSet Function](#).

DMA Abort IRQ

Each channel can be configured to abort a DMA transaction based on the interrupt from a source. This can be enabled/disabled per channel basis. To abort a DMA transfer upon an interrupt trigger, the IRQ number needs to be configured as the abort IRQ for this channel.

The abort IRQ is enabled by the [PLIB_DMA_ChannelXTriggerEnable Function](#). A DMA channel can be configured to abort a

DMA transfer based on the event on an IRQ using the `ChannelXAbortIRQSet` Function.

DMA Pattern Matching Termination

Pattern Match Termination mode allows the user to end a transfer if a byte of data written during a transaction matches a specific pattern. This feature is useful in applications where a variable data size is required and eases the setup of the DMA channel. The UART module is a good example of where this can be effectively used. For details about the pattern data configuration refer to [Channel Management](#).

DMA Pattern match mode is enabled using the [PLIB_DMA_ChannelXTriggerEnable Function](#). It can also be disabled using the [PLIB_DMA_ChannelXTriggerDisable Function](#).

DMA Transfer/Abort (Asynchronous) Configuration

A DMA transfer can also be triggered/aborted asynchronously by using an interrupt event. The interrupt event required to initiate/abort a DMA transfer for a channel needs to be set. Prior to this, the start IRQ and abort IRQ both need to be enabled.

Example:

```
// Enable the start IRQ. An interrupt event can trigger a DMA transfer.
PLIB_DMA_ChannelXTriggerEnable ( DMA_ID_0, DMA_CHANNEL_3, DMA_CHANNEL_TRIGGER_TRANSFER_START );
// Enable the abort IRQ. An interrupt event can abort a DMA transfer on channel-3
PLIB_DMA_ChannelXTriggerEnable ( DMA_ID_0, DMA_CHANNEL_3, DMA_CHANNEL_TRIGGER_TRANSFER_ABORT );
// Set the start IRQ to UART-2 RX Interrupt
PLIB_DMA_ChannelXStartIRQSet ( DMA_ID_0, DMA_CHANNEL_3, DMA_TRIGGER_USART_2_RECEIVE );
// Set the abort IRQ to UART-2 error Interrupt
PLIB_DMA_ChannelXAbortIRQSet ( DMA_ID_0, DMA_CHANNEL_3, DMA_TRIGGER_USART_2_ERROR );
```

In some devices, abort IRQ trigger is not supported. Refer to the specific device data sheet to determine availability.

DMA Transfer Pattern Match Abort Configuration

The DMA transfer can also be aborted on a pattern match trigger (supported on PIC32 devices). Refer to Transfer/Abort (Asynchronous) Trigger Management for more information on pattern match abort. To use this feature, it must first be enabled. The pattern data needs to be programmed for the required channel. Once this is done, when a DMA transfer is in progress on that particular channel, if the DMA controller comes across the data matching the programmed data the transfer is automatically aborted.

Example:

```
// Enable the pattern match abort for channel-3
PLIB_DMA_ChannelXTriggerEnable ( DMA_ID_0, DMA_CHANNEL_3,
DMA_CHANNEL_TRIGGER_PATTERN_MATCH_ABORT );
// Set a pattern data to match
PLIB_DMA_ChannelXPatternDataSet ( DMA_ID_0, DMA_CHANNEL_3, 0xEE );
```

5.6.6.4.3.4 Interrupt Control and Management

The DMA module has the ability to generate interrupts reflecting the events that occur during the channel's data transfer.

The following are all of the possible interrupts generated during DMA operation. This topic provides information for configuring these interrupts.

Error Interrupts

This type of event is signalled when an address error has occurred during the channel transfer operation. An address error also can occur if a DMA operation accesses an address beyond configured address limits (low and high).

Abort Interrupts

This type of event is signalled when a DMA transfer is aborted because of a system event matching the abort IRQ configured for the current channel.

DMA Completion Interrupts (Block Completion Interrupts)

This event occurs when a channel transfers a block of configured data.

Call Complete Interrupts

This event occurs when a channel completes a cell sized data transfer.

DMA Midpoint Interrupts

This event occurs when the channel is at the midpoint of completing the data transfer.

Overrun Interrupts

When a DMA channel receives a trigger (software or hardware) while it is servicing another request, an overrun condition occurs. This indicates that the channel is being requested before its current transaction is finished. An overrun condition will not result in termination of the current transaction.

Source Address Pointer Activity Interrupts

This event occurs when the channel source pointer reached the end of the source or when it reaches the midpoint of the source depending on the way this interrupt is configured.

Destination Address Pointer Activity Interrupts

This event occurs when the channel destination pointer reached the end of the destination or when it reaches the midpoint of the destination depending on the way this interrupt is configured.

This feature helps in configuring the previously listed interrupts. Depending on the device selected, all or some of the interrupts can be individually enabled and disabled. In addition, this feature obtains the status of the interrupts previously mentioned.

All of the interrupts belonging to the DMA channel map to the corresponding channel interrupt vector. In general, each channel of the DMA has a dedicated vectored interrupt. Therefore, the ISR for each channel should internally check for the status of the previously mentioned interrupts to respond to the corresponding events.

DMA Interrupt Control and Management

Each DMA channel has a vectored interrupt. However, each DMA channel internally generates various interrupts, which will invoke the same channel interrupt based on various events. This feature helps to enable/disable them and is also used to obtain the interrupt status.

Example:

```
// Enable the channel-3 source done interrupt
PLIB_DMA_ChannelXINTSourceEnable ( DMA_ID_0, DMA_CHANNEL_3, DMA_INT_SOURCE_DONE );
// Get the status of address error on channel-3
if(PLIB_DMA_ChannelXINTSourceFlagGet ( DMA_ID_0, DMA_CHANNEL_3, DMA_INT_ADDRESS_ERROR ))
{
    // application code for error handling
}
// Disable the channel abort interrupt
PLIB_DMA_ChannelXINTSourceDisable (DMA_ID_0, DMA_CHANNEL_3, DMA_INT_TRANSFER_ABORT);
```

5.6.6.4.3.5 Operating/Addressing Mode Management

DMA Operating Modes

The various operating/transfer modes supported are:

- One-Shot mode

- Repeated One-Shot mode
- Continuous mode
- Repeated Continuous mode
- Ping-Pong mode
- Null Data Write mode

One-Shot Mode

In One-Shot mode, a single transfer is performed for each trigger event. The trigger event can be synchronous (refer to [Transfer/Abort \(Synchronous\)](#) or asynchronous (refer to [Transfer/Abort \(Asynchronous\) Trigger Management](#)). When a single one-shot transfer occurs and the DMA count is decremented to zero, this disables the channel and requires the channel to be re-enabled to perform the next transaction.

Repeated One-Shot Mode

In Repeated One-Shot mode, single transfers occurs repeatedly so long as triggers are being provided. When the DMA count reaches zero, the channel is not disabled as in One-Shot mode, but the count is reloaded and transfers begin again.

Continuous Mode

In Continuous mode, a single trigger starts a sequence of back-to-back transfers. These continue with each transfer decrementing the DMA count until it reaches zero. At this point, and like one-shot mode, the channel is disabled.

Repeated Continuous Mode

This mode can be seen as a combination of Continuous and Repeated One-Shot modes. Data transfers keep occurring so as long as triggers are provided and multiple transfers can occur with each trigger. When the DMA count reaches zero, the address and data registers are reloaded and the process is repeated.

Ping-Pong Mode

Certain devices support Ping-Pong mode, which allows the CPU to process one buffer while a second buffer operates with the DMA channel. The net result is that the CPU has the entire DMA block transfer time to process the buffer that is currently not being used by the DMA channel.

The following figure demonstrates the data flow for four DMA transactions using Ping-Pong mode.

Figure: Ping-Pong Mode

When the DMA is filling buffer-B, the CPU can process buffer-A and vice-versa.

Ping-Pong mode can be combined with One-Shot and Continuous modes (previously discussed) to create other combinations.

Null Data Write Mode

A DMA transfer operates only in one direction from the source address to the destination address. However, some communication protocols require symmetrical buffer accesses, meaning that for every read operation performed on a buffer, there must be an accompanying write operation. The Null Write mode is designed to satisfy this requirement. This mode works

by transferring data from the source to the destination like any other DMA operation. Once this is done, the transferred data still with the DMA buffer is written back to the source.

DMA Addressing Modes

The addressing modes can be broadly classified into the following categories:

- Register Indirect with Post Increment Addressing mode
- Register Indirect without Post Increment Addressing mode
- Source/destination increment based on size
- Source/destination decrement based on size
- Peripheral Indirect Addressing mode

Register Indirect With Post Increment Addressing Mode

In this mode, the source data address is incremented by one location after each DMA transaction. The starting address is provided by a start address offset register.

Register Indirect Without Post Increment Addressing Mode

In this mode, the source data address is not updated after each DMA transaction. Therefore, the next DMA transfer is initiated from the same RAM address. The starting address is provided by a start address offset register.

Figure: Register Indirect Addressing with and without post-increment.

Source/Destination Increment Based on Size

After each DMA transaction, the source/destination (a separate configuration exist for each) address increments by the size of data (word/byte) configured.

Source/Destination Decrement Based on Size

After each DMA transaction, the source/destination (a separate configuration exist for each) address decrements by the size of data (word/byte) configured.

Peripheral Indirect Addressing Mode

Peripheral Indirect Addressing (PIA) is a special auto-incrementing mode for the transfer of data to and from a multi-level peripheral buffer. This mode is only available for specific peripherals designed with its use in mind. Refer to the specific device data sheet to determine availability of this mode.

PIA-capable peripherals - When selected, the PIA-enabled peripheral generates a short Indirect Address (IA) (size defined by the peripheral) to the DMA channel. The IA is logically ORed with either the contents of the source address or the destination address to define a specific address for the peripheral inside the DMA address space.

DMA Operating/Transfer Modes:

Refer to Operating/Addressing Mode Management for descriptions of the available operating modes.

The following code demonstrates usage of Continuous mode.

Example:

```
// Enable the DMA
PLIB_DMA_Enable ( DMA_ID_0 );
// disable the selected channel-3
PLIB_DMA_ChannelXDisable ( DMA_ID_0, DMA_CHANNEL_3);
// program the source and destination addresses
// Set the source starting address to 0x1000
PLIB_DMA_ChannelXSourceStartAddressSet ( DMA_ID_0, DMA_CHANNEL_3, 0x1000 );
// Set the destination starting address to 0x2000
PLIB_DMA_ChannelXDestinationStartAddressSet ( DMA_ID_0, DMA_CHANNEL_3, 0x2000 );
// Set the transfer count to 100.
PLIB_DMA_ChannelXTransferCountSet ( DMA_ID_0, DMA_CHANNEL_3, 100 );
// set the data transfer mode to one-shot
PLIB_DMA_ChannelXOperatingTransferModeSelect ( DMA_ID_0, DMA_CHANNEL_3, DMA_MODE_CONTINUOUS );
// select the source addressing mode
PLIB_DMA_ChannelXSourceAddressModeSelect ( DMA_ID_0, DMA_CHANNEL_3,
DMA_ADDRESSING_SOURCE_INCREMENT_BASED_ON_SIZE );
// select the destination addressing mode
PLIB_DMA_ChannelXDestinationAddressModeSelect ( DMA_ID_0, DMA_CHANNEL_3,
DMA_ADDRESSING_DESTINATION_INCREMENT_BASED_ON_SIZE );
// Enable the channel
PLIB_DMA_ChannelXEnable ( DMA_ID_0, DMA_CHANNEL_3 );
// Initiate the transfer
PLIB_DMA_StartTransferSet ( DMA_ID_0, DMA_CHANNEL_3 );
```

DMA Addressing Modes:

DMA addressing modes can be selected by using following code snippet.

DMA Addressing mode Example:

```
// set the source address to increment upon each transfer
PLIB_DMA_ChannelXSourceAddressModeSelect ( DMA_ID_0, DMA_CHANNEL_3,
DMA_ADDRESSING_SOURCE_INCREMENT_BASED_ON_SIZE );
// Set the destination address to decrement upon each transfer
PLIB_DMA_ChannelXDestinationAddressModeSelect ( DMA_ID_0, DMA_CHANNEL_3,
DMA_ADDRESSING_DESTINATION_DECREMENT_BASED_ON_SIZE );
```

5.6.6.4.3.6 Channel Management

Each Channel in the DMA module is can be independently configured for a specific transaction with different properties.

The following aspects of the channel can be configured using this feature.

DMA Channel Enable/Disable

Each channel can be enabled or disabled to control the transactions on the channel. A DMA transfer can only occur when the

channel is enabled. A DMA channel can be enabled using the [PLIB_DMA_ChannelXEnable Function](#). When a channel is disabled by calling the [PLIB_DMA_ChannelXDisable Function](#) function, no data transfers can occur on the channel.

DMA Channel Priority

The DMA module has a natural priority associated with each of the channels. Channel 0 has the highest priority. Each DMA channel can be assigned priority. This priority scheme changes depending on the device selected. There are three ways in which priorities are assigned in PIC microcontrollers. In the first method, two bits are allocated for each channel for priority. Therefore, priorities 0 to 3 can be assigned to channels. The second is called round-robin. In this method, the module starts by giving Channel 0 preference in any data transfer conflicts. For each successive transfer conflict, the next higher channel receives preference, continuing as a cycle through all the channels. The third method is called fixed scheme, which always gives priority to the lowest requesting channel number. The channel priority can be set using the [PLIB_DMA_ChannelPrioritySelect Function](#) or the [PLIB_DMA_ChannelXPrioritySelect Function](#) depending on the device selected.

DMA Channel Chaining

Channel chaining is an enhancement to the DMA channel operation. A channel (slave channel) can be chained to an adjacent channel (master channel). The slave channel will be enabled when a block transfer of the master channel completes. At this point, any event on the slave channel will initiate a DMA transfer. If the channel has an event pending, a DMA transfer will begin immediately. The channel chaining can be enabled or disabled using the [PLIB_DMA_ChannelXChainEnable Function](#) and the [PLIB_DMA_ChannelXChainDisable Function](#), respectively. The channel chaining higher/lower channel number can be configured using the [PLIB_DMA_ChannelXChainToHigher Function](#) and the [PLIB_DMA_ChannelXChainToLower Function](#).

DMA Channel Transfer Direction

Each DMA transfer will have a direction. It can be memory to peripheral, peripheral to memory, or memory to memory. This can be set using the [PLIB_DMA_ChannelXTransferDirectionSelect Function](#).

DMA Channel Pattern Data

On supported devices, a DMA transfer can be aborted by a pattern match (refer to [Transfer/Abort \(Asynchronous\) Trigger Management](#)). The pattern data is per channel basis. It can be set using the [PLIB_DMA_ChannelXPatternDataSet Function](#).

Channel Auto Enable

This feature can be used to keep the channel active even if a block transfer or pattern match occurs. This mode is useful for applications that do repeated pattern matching. To enable this feature use the [PLIB_DMA_ChannelXAutoEnable Function](#). To disable this feature use the [PLIB_DMA_ChannelXAutoDisable Function](#).

DMA Channel Configuration

The following example configures DMA Channel 3 by setting its priority to two, enabling the auto-enable feature (refer to Channel Management section), enabling the channel chain feature and chaining Channel 3 and Channel 2, and finally enabling Channel 3.

Example:

```
// Disable the channel-3
PLIB_DMA_ChannelXDisable ( DMA_ID_0, DMA_CHANNEL_3 );
// set the channel priority to 2
PLIB_DMA_ChannelXPrioritySelect ( DMA_ID_0, DMA_CHANNEL_3, DMA_CHANNEL_PRIORITY_2 );
// Configure the channel auto enable feature
PLIB_DMA_ChannelXAutoEnable ( DMA_ID_0, DMA_CHANNEL_3 );
// Enable the channel chain feature
PLIB_DMA_ChannelXChainEnable ( DMA_ID_0, DMA_CHANNEL_3 );
// chain channel 3 to channel 2
PLIB_DMA_ChannelXChainToLower ( DMA_ID_0, DMA_CHANNEL_3 );
// Enable channel-3
PLIB_DMA_ChannelXEnable ( DMA_ID_0, DMA_CHANNEL_3 );
```

In some devices it is required to select the DMA transfer direction before initiating DMA transfer. This can be done using the

following code.

Example:

```
// Disable channel-3
PLIB_DMA_ChannelXDisable ( DMA_ID_0, DMA_CHANNEL_3 );
// Set the data transfer direction from memory to peripheral
PLIB_DMA_ChannelXTransferDirectionSelect ( DMA_ID_0, DMA_CHANNEL_3,
DMA_READ_FROM_MEMORY_WRITE_TO_PERIPHERAL );
// we can also check the current channels transfer direction
// check the data transfer direction
if ( DMA_READ_FROM_PERIPHERAL_WRITE_TO_MEMORY == PLIB_DMA_ChannelXTransferDirectionGet (
DMA_ID_0, DMA_CHANNEL_3 ) )
{

// application code

}
```

5.6.6.4.3.7 Source/Destination/Peripheral Address Management

This topic describes configuring the source/destination/peripheral addresses involved in the DMA transfer.

Source/Destination Start Address

Before initiating a DMA transfer, the channel should be programmed with the source and the destination addresses. In supported devices, this can be done using the [PLIB_DMA_ChannelXSourceStartAddressSet Function](#) and the [PLIB_DMA_ChannelXDestinationStartAddressSet Function](#), respectively. At any point, the programmed addresses can be read using the [PLIB_DMA_ChannelXSourceStartAddressGet Function](#) and the [PLIB_DMA_ChannelXDestinationStartAddressGet Function](#).

Source/Destination Start Address Offset

In some devices, a dedicated region of RAM is allocated for DMA transfers typically called DMA RAM. For any DMA transfer, the source or destination address needs to be defined as an offset from the starting of the DMA RAM for such devices. Use the [PLIB_DMA_ChannelXStartAddressOffsetSet Function](#) to set the offset addresses of buffers A and B. Buffers A and B are used in Ping-Pong mode. To learn more, refer to [Operating/Addressing Mode Management](#).

Peripheral Address

When DMA is used for a peripheral to memory or a memory to peripheral transfer, the peripheral address within a register must be set. This register needs to be programmed with the peripheral location where data transfers takes place. For example this can be the I²C buffer Special Function Register (SFR) location or the UART Receive register, etc. To set the peripheral address use the [PLIB_DMA_ChannelXPeripheralAddressSet Function](#).

DMA Source/Destination/Peripheral Address Control

The first step in initiating a DMA transfer is to set the source and destination addresses.

The following example sets the source address and the destination address for Channel 3.

Example:

```
// Set the source starting address to 0x1000
PLIB_DMA_ChannelXSourceStartAddressSet ( DMA_ID_0, DMA_CHANNEL_3, 0x1000 );
// Set the destination starting address to 0x2000
PLIB_DMA_ChannelXDestinationStartAddressSet ( DMA_ID_0, DMA_CHANNEL_3, 0x2000 );
```

On certain devices, the source starting address needs to be given as an offset from the start of the DMA RAM address (in such devices, only memory to peripheral transfers and vice-versa are possible). In such devices, the source start address is set using the [PLIB_DMA_ChannelXStartAddressOffsetSet](#) function, as shown in the following code.

Example:

```
// Set the offset-A register to 0x1000
PLIB_DMA_ChannelXStartAddressOffsetSet ( DMA_ID_0, DMA_CHANNEL_3, 0x1000,
DMA_ADDRESS_OFFSET_PRIMARY);
// If ping-pong mode is enabled we will make use of buffer-B, and in that case
// we need to set an address for that also
// Set the offset-B to 0x2000
PLIB_DMA_ChannelXStartAddressOffsetSet ( DMA_ID_0, DMA_CHANNEL_3, 0x2000,
DMA_ADDRESS_OFFSET_SECONDARY);
```

The following example sets the peripheral address when the DMA needs to be initiated between memory and peripheral.

DMA Peripheral Address Set Example:

```
// Set the peripheral address to ADC1 buffer for channel-3 transfers.
PLIB_DMA_ChannelXPeripheralAddressSet ( DMA_ID_0, DMA_CHANNEL_3, (volatile
uint16_t)(&ADC1BUF0));
```

There are also equivalent functions available within this library that read the source/destination/peripheral address set.

5.6.6.4.3.8 Source/Destination/Peripheral Data Management

This topic describes the data configuration.

Source/Destination Transfer Size Configuration

In supported devices, each channel can be programmed to read a particular sized data from a source, and write in a particular size to a destination. Both the source and destination sizes are configurable. Use the [PLIB_DMA_ChannelXSourceSizeSet Function](#) and the [PLIB_DMA_ChannelXDestinationSizeSet Function](#) for read size and write size configuration, respectively. For example, the source size can be 200 bytes and the destination size can be 100 bytes. However, it is logical to have both set to the same value. In some devices, the amount of data that needs to be transferred is independent of the source and destination, and is called transfer count. In such devices use the [PLIB_DMA_ChannelXTransferCountSet Function](#) to set the total amount of data (block transfer data).

Cell Size Configuration

In supported devices, when DMA transfer is initiated, the amount of data configured for a cell transfer will be delivered to the destination per trigger. This can be configured using the [PLIB_DMA_ChannelXCellSizeSet Function](#).

Channel Data Size

The DMA controller can handle both byte and word (16-bit) transactions. Each DMA channel is individually configurable for the data size using the [PLIB_DMA_ChannelXDataSizeSelect Function](#).

Source/Destination Pointer Read

In supported devices, the application can read the byte in source/destination to which the DMA core is currently pointing. This can be done using the [PLIB_DMA_ChannelXSourcePointer Function](#) and the [PLIB_DMA_ChannelXDestinationPointer Function](#) for source and destination, respectively.

DMA Source/Destination/Peripheral Data Control

After setting the source/destination address the amount of data that needs to be transferred is set in a DMA operation.

However, prior to that the data transaction type (byte/word) needs to be configured on certain devices.

Example:

```
// Set channel-3 transactions as byte transactions
PLIB_DMA_ChannelXDataSizeSelect ( DMA_ID_0, DMA_CHANNEL_3, DMA_CHANNEL_DATA_8 );
// Set channel-3 transactions as 16-bit transactions
```

```

PLIB_DMA_ChannelXDataSizeSelect ( DMA_ID_0, DMA_CHANNEL_3, DMA_CHANNEL_DATA_16 );
// Get the current data size configured
if( DMA_CHANNEL_BYTE == PLIB_DMA_ChannelXDataSizeGet ( DMA_ID_0, DMA_CHANNEL_3 ))
{
    // application code
}

```

Example:

```

// Set the transfer count to 100.
PLIB_DMA_ChannelXTransferCountSet ( DMA_ID_0, DMA_CHANNEL_3, 100 );

```

Some high-end microcontrollers (especially PIC32 devices) use the method of cell transfer and block transfer. A cell transfer is the amount of data a DMA channel transfers per an event. In such microcontrollers the application can configure the sizes of the source and destination (per channel basis). A block transfer is defined as the number of bytes transferred when a channel is enabled. A block transfer is comprised of several cell transfers. For example, if the source and destination size is 100 and the cell size is 10, it will take 10 cell transfers to complete the block transfer, which is 100 bytes (larger of source or destination sizes).

DMA cell transfer configuration Example:

```

// Set the source size to be 100
PLIB_DMA_ChannelXSourceSizeSet ( DMA_ID_0, DMA_CHANNEL_3, 100 );
// Set the destination size to be 100
PLIB_DMA_ChannelXDestinationSizeSet ( DMA_ID_0, DMA_CHANNEL_3, 100 );
// Set the cell size to be 10
PLIB_DMA_ChannelXCellSizeSet ( DMA_ID_0, DMA_CHANNEL_3, 10 );

```

5.6.6.4.3.9 Special Function Modules (CRC)

Selected high-end devices support a special feature called the CRC generator.

Depending on the device, there is a highly configurable, 16-bit or 32-bit CRC generator. The CRC can be assigned to any available DMA channel using [PLIB_DMA_CRCChannelSelect Function](#). The CRC is enabled using the [PLIB_DMA_CRCEnable Function](#).

Optionally, the data from the source can be subjected to byte reordering using the [PLIB_DMA_CRCByteOrderSelect Function](#). The data is then optionally passed to the Linear Shift Feedback Register (LFSR) CRC or the IP header checksum blocks using the [PLIB_DMA_CRCTypeSet Function](#).

The CRC feature is attached to a channel in one of two possible modes, Background or Append.

Background Mode

The CRC is calculated in the background, with normal DMA behavior maintained. This can be selected by disabling the Append mode.

Append Mode

Data read from the source is not written to the destination, but the CRC data is accumulated in the CRC data register. The accumulated CRC is written to the location specified by the destination address when a block transfer completes. This mode is enabled by the [PLIB_DMA_CRCAppendModeEnable Function](#).

The following code shows DMA CRC calculation in Append mode.

Example:

```

// CRC of the Flash block
uint32_t blockCRC;
bool error = false;
// disable the channel 0 interrupts using the Interrupts Peripheral Library
// Enable the DMA controller
PLIB_DMA_Enable ( DMA_ID_0 );
// disable the selected channel-3
PLIB_DMA_ChannelXDisable ( DMA_ID_0, DMA_CHANNEL_3 );

```

```

// set the channel priority to 2
PLIB_DMA_ChannelXPrioritySelect ( DMA_ID_0, DMA_CHANNEL_3, DMA_CHANNEL_PRIORITY_2 );
// Configure the channel auto enable feature
PLIB_DMA_ChannelXAutoEnable ( DMA_ID_0, DMA_CHANNEL_3 );
// Disable the channel chain feature
PLIB_DMA_ChannelXChainDisable ( DMA_ID_0, DMA_CHANNEL_3 );
// Disable the start IRQ.
PLIB_DMA_ChannelXTriggerDisable ( DMA_ID_0, DMA_CHANNEL_3, DMA_CHANNEL_TRIGGER_TRANSFER_START );
// Seed the CRC generator
PLIB_DMA_CRCDataWrite ( DMA_ID_0, 0xFFFF );
// use the standard CCITT CRC 16 polynomial :  $X^{16}+X^{12}+X^5+1$ 
PLIB_DMA_CRCXOREnableSet ( DMA_ID_0, 0x1021 );
// set polynomial length to 16
PLIB_DMA_CRCPolynomialLengthSet ( DMA_ID_0, 16 );
// Enable append mode
PLIB_DMA_CRCAppendModeEnable ( DMA_ID_0 );
// Attach CRC to DMA channel-3
PLIB_DMA_CRCChannelSelect ( DMA_ID_0, DMA_CHANNEL_3 );
// Enable the CRC
PLIB_DMA_CRCEnable ( DMA_ID_0 );
// Set the source starting address to 0x1000
PLIB_DMA_ChannelXSourceStartAddressSet ( DMA_ID_0, DMA_CHANNEL_3, 0x1000 );
// Set the destination starting address to 0x2000
PLIB_DMA_ChannelXDestinationStartAddressSet ( DMA_ID_0, DMA_CHANNEL_3, 0x2000 );
// set source and destination size to 100
PLIB_DMA_ChannelXSourceSizeSet ( DMA_ID_0, DMA_CHANNEL_3, 100 );
PLIB_DMA_ChannelXDestinationSizeSet ( DMA_ID_0, DMA_CHANNEL_3, 100 );
// Set cell size to 100
PLIB_DMA_ChannelXCellSizeSet ( DMA_ID_0, DMA_CHANNEL_3, 100 );
//Enable channel-3
PLIB_DMA_ChannelXEnable ( DMA_ID_0, DMA_CHANNEL_3 );
// Force initiate a transfer
PLIB_DMA_StartTransferSet ( DMA_ID_0, DMA_CHANNEL_3 );

```

5.6.6.4.3.10 Status (including Channel)

This module gives application access to various DMA and channel status information.

5.6.6.5 Configuring the Library

The library is configured for the supported DMA Peripheral Library.

5.6.6.6 Library Interface

Data Types and Constants

	Name	Description
	DMA_ADDRESS_OFFSET_TYPE	Lists the possible DMA address offsets.
	DMA_CHANNEL	Lists the possible DMA channels available.
	DMA_CHANNEL_ADDRESSING_MODE	Lists the possible channel addressing modes.
	DMA_CHANNEL_COLLISION	Lists the possible channel collision types.
	DMA_CHANNEL_DATA_SIZE	Lists the possible data sizes for the DMA channel.
	DMA_CHANNEL_PRIORITY	Lists the possible channel priorities.
	DMA_CHANNEL_TRANSFER_DIRECTION	Lists the possible data transfer directions.
	DMA_CHANNEL_TRIGGER_TYPE	Lists the possible DMA channel triggers.
	DMA_CRC_BIT_ORDER	Lists the possible CRC calculation bit orders.

	DMA_CRC_BYTE_ORDER	Lists the possible byte orders.
	DMA_CRC_TYPE	Lists the possible checksums.
	DMA_DESTINATION_ADDRESSING_MODE	Lists the possible destination addressing modes.
	DMA_INT_TYPE	Lists the possible Interrupt types for a particular channel-X
	DMA_MODULE_ID	Possible instances of the DMA module.
	DMA_PATTERN_LENGTH	Gives the DMA pattern length
	DMA_PING_PONG_MODE	Lists the possible ping-pong modes.
	DMA_SOURCE_ADDRESSING_MODE	Lists the possible source addressing modes.
	DMA_TRANSFER_MODE	Lists the possible DMA transfer/operating modes.
	DMA_TRIGGER_SOURCE	Lists the possible DMA trigger sources.

DMA Channel Configuration

	Name	Description
	PLIB_DMA_ChannelPrioritySelect	Sets the priority scheme of the DMA channels.
	PLIB_DMA_ChannelPriorityGet	Gets the priority scheme of the DMA channels.
	PLIB_DMA_ChannelXAutoDisable	Channel is disabled after a block transfer is complete.
	PLIB_DMA_ChannelXAutoEnable	Channel is continuously enabled.
	PLIB_DMA_ChannelXBusyActiveSet	Sets the Busy bit to active.
	PLIB_DMA_ChannelXBusyInActiveSet	Sets the Busy bit to inactive.
	PLIB_DMA_ChannelXChainDisable	Disables the channel chaining for the specified DMA channel.
	PLIB_DMA_ChannelXChainEnable	Channel chain feature is enabled.
	PLIB_DMA_ChannelXChainToHigher	Chains the specified channel to a channel higher in natural priority.
	PLIB_DMA_ChannelXChainToLower	Chains the specified channel to a channel lower in natural priority.
	PLIB_DMA_ChannelXDisable	Disable the specified channel.
	PLIB_DMA_ChannelXEnable	Enable the specified channel.
	PLIB_DMA_ChannelXPriorityGet	Gets the priority of the specified channel.
	PLIB_DMA_ChannelXPrioritySelect	Sets the priority of the specified channel.
	PLIB_DMA_ChannelXTransferDirectionGet	Returns the data transfer direction of the specified channel.
	PLIB_DMA_ChannelXTransferDirectionSelect	Selects the data transfer direction of the specified channel.
	PLIB_DMA_ChannelXDisabledDisablesEvents	Channel start/abort events will be ignored even if the channel is disabled.
	PLIB_DMA_ChannelXDisabledEnablesEvents	Channel start/abort events will be registered even if the channel is disabled.
	PLIB_DMA_ChannelXPatternIgnoreByteDisable	Disables the pattern match ignore byte.
	PLIB_DMA_ChannelXPatternIgnoreByteEnable	Enables the pattern match ignore byte.
	PLIB_DMA_ChannelXPatternIgnoreByteIsEnabled	Returns the state of the pattern match ignore byte.
	PLIB_DMA_ChannelXPatternIgnoreGet	Returns the pattern match ignore value.
	PLIB_DMA_ChannelXPatternIgnoreSet	Sets the pattern match ignore value.
	PLIB_DMA_ChannelXPatternLengthGet	Returns the pattern match length.
	PLIB_DMA_ChannelXPatternLengthSet	Sets the pattern match length.

DMA Channel Status Routines

	Name	Description
	PLIB_DMA_ChannelXAutoIsEnabled	Returns the channel automatic enable status.
	PLIB_DMA_ChannelXBufferedDataIsWritten	Returns the buffered data write status for the specified channel.

	PLIB_DMA_ChannelXBusyIsBusy	Returns the busy status of the specified channel.
	PLIB_DMA_ChannelXChainIsEnabled	Returns the chain status of the specified channel.
	PLIB_DMA_ChannelXCollisionStatus	Returns the status of the specified collision type for the specified channel.
	PLIB_DMA_ChannelXEventIsDetected	Returns the event status on the specified channel.
	PLIB_DMA_ChannelXIIsEnabled	Return the enable status of the specified channel.
	PLIB_DMA_ChannelXNullWriteModelsEnabled	Returns the enable status of the Null Write mode for the specified channel.
	PLIB_DMA_ChannelXPingPongModeGet	Returns the Ping-Pong mode status for the specified channel.
	PLIB_DMA_ChannelBitsGet	Returns the DMA channel bits.

DMA CRC Module Interface Routines

	Name	Description
	PLIB_DMA_CRCAppendModeDisable	Disables the CRC append mode.
	PLIB_DMA_CRCAppendModeEnable	Enables the CRC append mode.
	PLIB_DMA_CRCAppendModelsEnabled	Gets the enable status of the CRC append mode.
	PLIB_DMA_CRCBitOrderSelect	Selects the bit order for checksum calculation.
	PLIB_DMA_CRCByteOrderGet	Gets the current byte order selected by the DMA module CRC feature.
	PLIB_DMA_CRCByteOrderSelect	Selects the byte order.
	PLIB_DMA_CRCChannelGet	Returns the current DMA channel to which the CRC is assigned.
	PLIB_DMA_CRCChannelSelect	Assigns the CRC to the specified DMA channel.
	PLIB_DMA_CRCDataRead	Reads the contents of the DMA CRC data register.
	PLIB_DMA_CRCDataWrite	Writes the contents of the DMA CRC data register with the specified data.
	PLIB_DMA_CRCDisable	Disables the DMA module CRC feature.
	PLIB_DMA_CRCEnable	Enables the DMA module CRC feature.
	PLIB_DMA_CRCPolynomialLengthGet	Gets the current polynomial length.
	PLIB_DMA_CRCPolynomialLengthSet	Selects the polynomial length.
	PLIB_DMA_CRCTypeGet	Gets the current DMA module CRC feature type.
	PLIB_DMA_CRCTypeSet	Selects the DMA module CRC feature type.
	PLIB_DMA_CRCWriteByteOrderAlter	The source data is written to the destination reordered as defined by the BYTO<1:0> bits.
	PLIB_DMA_CRCWriteByteOrderMaintain	The source data is written to the destination unaltered.
	PLIB_DMA_CRCXOREnableGet	Reads the CRC XOR register.
	PLIB_DMA_CRCXOREnableSet	Writes to the CRC XOR enable register as per the specified enable mask.

DMA General Configuration Routines

	Name	Description
	PLIB_DMA_BusyActiveReset	Resets the BUSY bit of the DMA controller.
	PLIB_DMA_BusyActiveSet	Sets the BUSY bit of the DMA controller.
	PLIB_DMA_Disable	DMA module is disabled.
	PLIB_DMA_Enable	DMA module is enabled.
	PLIB_DMA_StopInIdleDisable	DMA transfers continue during Idle mode.
	PLIB_DMA_StopInIdleEnable	DMA transfers are halted during Idle mode.
	PLIB_DMA_SuspendDisable	DMA suspend is disabled and the DMA module operates normally.

	PLIB_DMA_SuspendEnable	DMA transfers are suspended to allow uninterrupted access by the CPU to the data bus.

DMA Global Status Routines

	Name	Description
	PLIB_DMA_CRCIsEnabled	Gets the enable status of the CRC feature.
	PLIB_DMA_IsBusy	Gets the BUSY bit of the DMA controller.
	PLIB_DMA_IsEnabled	Returns the DMA module enable status.
	PLIB_DMA_LastBusAccessIsRead	Returns true if the last DMA bus access was a read.
	PLIB_DMA_LastBusAccessIsWrite	Returns true if the last DMA bus access was a write.
	PLIB_DMA_LastChannelActive	Returns the last DMA channel that participated in the data transfer.
	PLIB_DMA_RecentAddressAccessed	Returns the address of the most recent DMA access.
	PLIB_DMA_SuspendIsEnabled	Returns the DMA suspend status.

DMA Interrupt Control and Management

	Name	Description
	PLIB_DMA_ChannelXINTSourceDisable	Disables the specified interrupt source for the specified channel.
	PLIB_DMA_ChannelXINTSourceEnable	Enables the specified interrupt source for the specified channel.
	PLIB_DMA_ChannelXINTSourceFlagClear	Clears the interrupt flag of the specified DMA interrupt source for the specified channel.
	PLIB_DMA_ChannelXINTSourceFlagGet	Returns the status of the interrupt flag of the specified DMA interrupt source for the specified channel.
	PLIB_DMA_ChannelXINTSourceFlagSet	Sets the interrupt flag of the specified DMA interrupt source for the specified channel.
	PLIB_DMA_ChannelXINTSourceIsEnabled	Returns the enable status of the specified interrupt source for the specified channel.

DMA Operating/Addressing Mode Configuration

	Name	Description
	PLIB_DMA_ChannelXAddressModeGet	Gets the channel address mode.
	PLIB_DMA_ChannelXAddressModeSelect	Sets the channel address mode.
	PLIB_DMA_ChannelXDestinationAddressModeGet	Gets the source address mode of the specified channel.
	PLIB_DMA_ChannelXDestinationAddressModeSelect	Sets the source address mode of the specified channel.
	PLIB_DMA_ChannelXNullWriteModeDisable	Disables the Null Write mode.
	PLIB_DMA_ChannelXNullWriteModeEnable	Enables the Null Write mode.
	PLIB_DMA_ChannelXOperatingTransferModeGet	Returns the current transfer/operating mode for the specified channel.
	PLIB_DMA_ChannelXOperatingTransferModeSelect	Selects the transfer/operating mode for the specified channel.
	PLIB_DMA_ChannelXReloadDisable	Disables reloading of the address and count registers.
	PLIB_DMA_ChannelXReloadEnable	Enables reloading of the address and count registers.
	PLIB_DMA_ChannelXSourceAddressModeGet	Gets the source address mode of the specified channel.
	PLIB_DMA_ChannelXSourceAddressModeSelect	Sets the source address mode of the specified channel.
	PLIB_DMA_ChannelXReloadIsEnabled	Returns the address and count registers reload enable status.

DMA Source/Destination/Peripheral Address Control Interface Routines

	Name	Description
≡	PLIB_DMA_ChannelXDestinationStartAddressGet	Reads the destination start address configured for the specified channel.
≡	PLIB_DMA_ChannelXDestinationStartAddressSet	Writes the specified destination start address into the register corresponding to the specified channel.
≡	PLIB_DMA_ChannelXPeripheralAddressGet	Gets the peripheral address configured for the specified channel.
≡	PLIB_DMA_ChannelXPeripheralAddressSet	Sets the peripheral address for the specified channel.
≡	PLIB_DMA_ChannelXSourceStartAddressGet	Reads the source start address configured for the specified channel.
≡	PLIB_DMA_ChannelXSourceStartAddressSet	Writes the specified source start address into the register corresponding to the specified channel.
≡	PLIB_DMA_ChannelXStartAddressOffsetGet	Gets the primary/secondary start address (DPSRAM) offset.
≡	PLIB_DMA_ChannelXStartAddressOffsetSet	Sets the primary/secondary start address (DPSRAM) offset to the value specified depending on the offset type specified for the specified channel.

DMA Source/Destination/Peripheral Data Management

	Name	Description
≡	PLIB_DMA_ChannelXCellProgressPointerGet	Returns the number of bytes transferred since the last event.
≡	PLIB_DMA_ChannelXCellSizeGet	Reads the cell size (in bytes) configured for the specified channel.
≡	PLIB_DMA_ChannelXCellSizeSet	Writes the specified cell size into the register corresponding to the specified channel.
≡	PLIB_DMA_ChannelXDataSizeGet	Returns the current data size for the specified channel.
≡	PLIB_DMA_ChannelXDataSizeSelect	Selects the data size for the specified channel.
≡	PLIB_DMA_ChannelXDestinationPointerGet	Reads the current byte of the destination being pointed to for the specified channel.
≡	PLIB_DMA_ChannelXDestinationSizeGet	Reads the destination size configured for the specified channel.
≡	PLIB_DMA_ChannelXDestinationSizeSet	Writes the specified destination size into the register corresponding to the specified channel.
≡	PLIB_DMA_ChannelXPatternDataGet	Returns the pattern matching (for DMA abort) data programmed for the specified channel.
≡	PLIB_DMA_ChannelXPatternDataSet	Writes the specified pattern matching data (for DMA abort) into the register corresponding to the specified channel.
≡	PLIB_DMA_ChannelXSourcePointerGet	Reads the current byte of the source being pointed to for the specified channel.
≡	PLIB_DMA_ChannelXSourceSizeGet	Reads the source size configured for the specified channel.
≡	PLIB_DMA_ChannelXSourceSizeSet	Writes the specified source size into the register corresponding to the specified channel.
≡	PLIB_DMA_ChannelXTransferCountGet	Gets the DMA data transfer count that is programmed for the specified channel.
≡	PLIB_DMA_ChannelXTransferCountSet	Sets the DMA data transfer count for the specified channel.

DMA Transfer/Abort (Asynchronous) Trigger Management

	Name	Description
≡	PLIB_DMA_ChannelXAbortIRQSet	Sets the IRQ to abort the DMA transfer on the specified channel.
≡	PLIB_DMA_ChannelXStartIRQSet	Sets the IRQ to initiate the DMA transfer on the specified channel.
≡	PLIB_DMA_ChannelXTriggerDisable	Disables the DMA transfer abort via a matching interrupt (specified by the IRQ).

	PLIB_DMA_ChannelXTriggerEnable	Enables the specified DMA channel trigger.
	PLIB_DMA_ChannelXTriggerIsEnabled	Returns the enable status of the specified DMA transfer/abort trigger.

DMA Transfer/Abort (Synchronous)

	Name	Description
	PLIB_DMA_AbortTransferSet	Aborts transfer on the specified channel.
	PLIB_DMA_StartTransferSet	Initiates transfer on the specified channel.

Feature Existence Routines

	Name	Description
	PLIB_DMA_ExistsAbortTransfer	Identifies whether the AbortTransfer feature exists on the DMA module.
	PLIB_DMA_ExistsBusy	Identifies whether the Busy feature exists on the DMA module.
	PLIB_DMA_ExistsChannelBits	Identifies whether the ChannelBits feature exists on the DMA module.
	PLIB_DMA_ExistsChannelX	Identifies whether the ChannelX feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXAbortIRQ	Identifies whether the ChannelXAbortIRQ feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXAuto	Identifies whether the ChannelXAuto feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXBusy	Identifies whether the ChannelXBusy feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXCellProgressPointer	Identifies whether the ChannelXCellProgressPointer feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXCellSize	Identifies whether the ChannelXCellSize feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXChain	Identifies whether the ChannelXChain feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXChainEnbl	Identifies whether the ChannelXChainEnbl feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXDestinationPointer	Identifies whether the ChannelXDestinationPointer feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXDestinationSize	Identifies whether the ChannelXDestinationSize feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXDestinationStartAddress	Identifies whether the ChannelXDestinationStartAddress feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXDisabled	Identifies whether the ChannelXDisabled feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXEvent	Identifies whether the ChannelXEvent feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXINTSource	Identifies whether the ChannelXINTSource feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXINTSourceFlag	Identifies whether the ChannelXINTSourceFlag feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXPatternData	Identifies whether the ChannelXPatternData feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXPatternIgnore	Identifies whether the ChannelXPatternIgnore feature exists on the DMA module.

	<u>PLIB_DMA_ExistsChannelXPatternIgnoreByte</u>	Identifies whether the ChannelXPatternIgnoreByte feature exists on the DMA module.
	<u>PLIB_DMA_ExistsChannelXPatternLength</u>	Identifies whether the ChannelXPatternLength feature exists on the DMA module.
	<u>PLIB_DMA_ExistsChannelXPriority</u>	Identifies whether the ChannelXPriority feature exists on the DMA module.
	<u>PLIB_DMA_ExistsChannelXSourcePointer</u>	Identifies whether the ChannelXSourcePointer feature exists on the DMA module.
	<u>PLIB_DMA_ExistsChannelXSourceSize</u>	Identifies whether the ChannelXSourceSize feature exists on the DMA module.
	<u>PLIB_DMA_ExistsChannelXSourceStartAddress</u>	Identifies whether the ChannelXSourceStartAddress feature exists on the DMA module.
	<u>PLIB_DMA_ExistsChannelXStartIRQ</u>	Identifies whether the ChannelXStartIRQ feature exists on the DMA module.
	<u>PLIB_DMA_ExistsChannelXTrigger</u>	Identifies whether the ChannelXTrigger feature exists on the DMA module.
	<u>PLIB_DMA_ExistsCRC</u>	Identifies whether the CRC feature exists on the DMA module.
	<u>PLIB_DMA_ExistsCRCAppendMode</u>	Identifies whether the CRCAppendMode feature exists on the DMA module.
	<u>PLIB_DMA_ExistsCRCBitOrder</u>	Identifies whether the CRCBitOrder feature exists on the DMA module.
	<u>PLIB_DMA_ExistsCRCByteOrder</u>	Identifies whether the CRCByteOrder feature exists on the DMA module.
	<u>PLIB_DMA_ExistsCRCChannel</u>	Identifies whether the CRCChannel feature exists on the DMA module.
	<u>PLIB_DMA_ExistsCRCDData</u>	Identifies whether the CRCDData feature exists on the DMA module.
	<u>PLIB_DMA_ExistsCRCPolynomialLength</u>	Identifies whether the CRCPolynomialLength feature exists on the DMA module.
	<u>PLIB_DMA_ExistsCRCType</u>	Identifies whether the CRCType feature exists on the DMA module.
	<u>PLIB_DMA_ExistsCRCWriteByteOrder</u>	Identifies whether the CRCWriteByteOrder feature exists on the DMA module.
	<u>PLIB_DMA_ExistsCRCXOREnable</u>	Identifies whether the CRCXOREnable feature exists on the DMA module.
	<u>PLIB_DMA_ExistsEnableControl</u>	Identifies whether the EnableControl feature exists on the DMA module.
	<u>PLIB_DMA_ExistsLastBusAccess</u>	Identifies whether the LastBusAccess feature exists on the DMA module.
	<u>PLIB_DMA_ExistsRecentAddress</u>	Identifies whether the RecentAddress feature exists on the DMA module.
	<u>PLIB_DMA_ExistsStartTransfer</u>	Identifies whether the StartTransfer feature exists on the DMA module.
	<u>PLIB_DMA_ExistsStopInIdle</u>	Identifies whether the StopInIdle feature exists on the DMA module.
	<u>PLIB_DMA_ExistsSuspend</u>	Identifies whether the Suspend feature exists on the DMA module.

Description

This topic describes the functions of the DMA Peripheral Library.

Refer to each topic for a detailed description.

5.6.6.6.1 DMA General Configuration Routines

5.6.6.6.1.1 PLIB_DMA_BusyActiveReset Function

C

```
void PLIB_DMA_BusyActiveReset(  
    DMA_MODULE_ID index  
);
```

Description

This function resets the BUSY bit of the DMA controller. The DMA module is disabled and is not actively transferring data.

Preconditions

None.

Returns

None.

Remarks

This function implements an operation of the Busy feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsBusy](#) function in your application to automatically determine whether this feature is available.

Example

```
PLIB_DMA_BusyActiveReset( DMA_ID_0 );
```

5.6.6.6.1.2 PLIB_DMA_BusyActiveSet Function

C

```
void PLIB_DMA_BusyActiveSet(  
    DMA_MODULE_ID index  
);
```

Description

This function sets the BUSY bit of the DMA controller. The DMA module is active.

Preconditions

None.

Returns

None.

Remarks

This function implements an operation of the Busy feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsBusy](#) function in your application to automatically determine whether this feature is available.

Example

```
PLIB_DMA_BusyActiveSet( DMA_ID_0 );
```

5.6.6.6.1.3 PLIB_DMA_Disable Function

C

```
void PLIB_DMA_Disable(  
    DMA_MODULE_ID index  
);
```

Description

This function disables the DMA module.

Preconditions

None.

Returns

None.

Remarks

This function implements an operation of the EnableControl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsEnableControl](#) function in your application to automatically determine whether this feature is available.

Example

```
PLIB_DMA_Disable( DMA_ID_0 );
```

5.6.6.6.1.4 PLIB_DMA_Enable Function

C

```
void PLIB_DMA_Enable(  
    DMA_MODULE_ID index  
);
```

Description

This function enables the DMA module.

Preconditions

None.

Returns

None.

Remarks

This function implements an operation of the EnableControl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsEnableControl](#) function in your application to automatically determine whether this feature is available.

Example

```
PLIB_DMA_Enable( DMA_ID_0 );
```

5.6.6.6.1.5 PLIB_DMA_StopInIdleDisable Function

C

```
void PLIB_DMA_StopInIdleDisable(  
    DMA_MODULE_ID index  
);
```

Description

This function causes DMA transfers to continue during Idle mode.

Preconditions

None.

Returns

None.

Remarks

This function implements an operation of the StopInIdle feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsStopInIdle](#) function in your application to automatically determine whether this feature is available.

Example

```
PLIB_DMA_StopInIdleDisable( DMA_ID_0 );
```

5.6.6.6.1.6 PLIB_DMA_StopInIdleEnable Function**C**

```
void PLIB_DMA_StopInIdleEnable(  
    DMA_MODULE_ID index  
);
```

Description

This function halts DMA transfers during Idle mode.

Preconditions

None.

Returns

None.

Remarks

This function implements an operation of the StopInIdle feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsStopInIdle](#) function in your application to automatically determine whether this feature is available.

Example

```
PLIB_DMA_StopInIdleEnable( DMA_ID_0 );
```

5.6.6.6.1.7 PLIB_DMA_SuspendDisable Function**C**

```
void PLIB_DMA_SuspendDisable(  
    DMA_MODULE_ID index  
);
```

Description

This function disables the DMA suspend. The DMA module continues to operate normally.

Preconditions

None.

Returns

None.

Remarks

This function implements an operation of the Suspend feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsSuspend](#) function in your application to automatically determine whether this feature is available.

Example

```
PLIB_DMA_SuspendDisable( DMA_ID_0 );
```

5.6.6.1.8 PLIB_DMA_SuspendEnable Function**C**

```
void PLIB_DMA_SuspendEnable(  
    DMA_MODULE_ID index  
);
```

Description

This function suspends the DMA transfers to allow uninterrupted access by the CPU to the data bus.

Preconditions

None.

Returns

None.

Remarks

This function implements an operation of the Suspend feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsSuspend](#) function in your application to automatically determine whether this feature is available.

Example

```
PLIB_DMA_SuspendEnable( DMA_ID_0 );
```

5.6.6.6.2 DMA Transfer/Abort (Synchronous)**5.6.6.6.2.1 PLIB_DMA_AbortTransferSet Function****C**

```
void PLIB_DMA_AbortTransferSet(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL channel  
);
```

Description

This function aborts transfer on the specified channel. This is a forced abort controlled via software.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

None.

Remarks

This function implements an operation of the AbortTransfer feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsAbortTransfer](#) function in your application to automatically determine whether this feature is available.

Example

```
PLIB_DMA_AbortTransferSet (    DMA_ID_0,  
                             DMA_CHANNEL_4 );
```

5.6.6.6.2 PLIB_DMA_StartTransferSet Function**C**

```
void PLIB_DMA_StartTransferSet(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL channel  
);
```

Description

This function initiates transfer on the specified channel. This is a forced transfer controlled via software.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

None.

Remarks

This function implements an operation of the StartTransfer feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsStartTransfer](#) function in your application to automatically determine whether this feature is available.

Example

```
PLIB_DMA_StartTransferSet (    DMA_ID_0,  
                             DMA_CHANNEL_4 );
```

5.6.6.6.3 DMA Transfer/Abort (Asynchronous) Trigger Management**5.6.6.6.3.1 PLIB_DMA_ChannelXAbortIRQSet Function****C**

```
void PLIB_DMA_ChannelXAbortIRQSet(  
    DMA_MODULE_ID index,
```

```
DMA_CHANNEL channel,  
DMA_TRIGGER_SOURCE IRQ  
);
```

Description

This function sets the IRQ to abort the DMA transfer on the specified channel. (IRQ to start the channel transfer.)

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL
IRQnum	The IRQ number of the trigger source of type DMA_TRIGGER_SOURCE

Returns

None.

Remarks

This function implements an operation of the ChannelXAbortIRQ feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXAbortIRQ](#) function in your application to automatically determine whether this feature is available.

Example

```
DMA_TRIGGER_SOURCE irq = DMA_TRIGGER_TIMER_CORE;  
PLIB_DMA_ChannelXAbortIRQSet ( DMA_ID_0,  
                                DMA_CHANNEL_4,  
                                irq );
```

5.6.6.6.3.2 PLIB_DMA_ChannelXStartIRQSet Function

C

```
void PLIB_DMA_ChannelXStartIRQSet(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL channel,  
    DMA_TRIGGER_SOURCE IRQnum  
);
```

Description

This function sets the IRQ to initiate the DMA transfer on the specified channel. (IRQ to start the channel transfer.)

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL
IRQnum	The IRQ number of the trigger source of type DMA_TRIGGER_SOURCE

Returns

None.

Remarks

This function implements an operation of the ChannelXStartIRQ feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXStartIRQ](#) function in your application to automatically determine whether this feature is available.

Example

```
//This code is for PIC24F family
DMA_TRIGGER_SOURCE irq = DMA_TRIGGER_OUTPUT_COMPARE_1;
PLIB_DMA_ChannelXStartIRQSet ( DMA_ID_0,
                                DMA_CHANNEL_4,
                                irq );
```

5.6.6.6.3.3 PLIB_DMA_ChannelXTriggerDisable Function**C**

```
void PLIB_DMA_ChannelXTriggerDisable(
    DMA_MODULE_ID index,
    DMA_CHANNEL channel,
    DMA_CHANNEL_TRIGGER_TYPE trigger
);
```

Description

This function disables the DMA transfer abort via a matching interrupt (specified by the IRQ). The interrupt number IRQ is ignored and does not terminate a transfer.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL
trigger	Type of trigger (transfer start/abort/pattern match abort)

Returns

None.

Remarks

This function implements an operation of the ChannelXTrigger feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXTrigger](#) function in your application to automatically determine whether this feature is available.

Example

```
PLIB_DMA_ChannelXTriggerDisable ( DMA_ID_0,
                                   DMA_CHANNEL_4,
                                   DMA_CHANNEL_TRIGGER_PATTERN_MATCH_ABORT );
```

5.6.6.6.3.4 PLIB_DMA_ChannelXTriggerEnable Function**C**

```
void PLIB_DMA_ChannelXTriggerEnable(
    DMA_MODULE_ID index,
    DMA_CHANNEL channel,
    DMA_CHANNEL_TRIGGER_TYPE trigger
);
```

Description

This function enables the the specified DMA channel trigger.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL
trigger	Type of trigger (transfer start/abort/pattern match abort)

Returns

None.

Remarks

This function implements an operation of the ChannelXTrigger feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXTrigger](#) function in your application to automatically determine whether this feature is available.

Example

```
PLIB_DMA_ChannelXTriggerEnable (    DMA_ID_0,
                                   DMA_CHANNEL_4,
                                   DMA_CHANNEL_TRIGGER_TRANSFER_ABORT );
```

5.6.6.6.3.5 PLIB_DMA_ChannelXTriggerIsEnabled Function**C**

```
bool PLIB_DMA_ChannelXTriggerIsEnabled(
    DMA_MODULE_ID index,
    DMA_CHANNEL channel,
    DMA_CHANNEL_TRIGGER_TYPE trigger
);
```

Description

This function returns the enable status of the specified DMA transfer/abort trigger.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL
trigger	Type of trigger (transfer start/abort/pattern match abort)

Returns

- true - The specified trigger is enabled
- false - The specified trigger is disabled

Remarks

This function implements an operation of the ChannelXTrigger feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXTrigger](#) function in your application to automatically determine whether this feature is available.

Example

```
bool startTriggerstatus;
startTriggerstatus = PLIB_DMA_ChannelXTriggerIsEnabled (
    DMA_ID_0,
    DMA_CHANNEL_4,
    DMA_CHANNEL_TRIGGER_TRANSFER_START );
```

5.6.6.6.4 DMA Interrupt Control and Management

5.6.6.6.4.1 PLIB_DMA_ChannelXINTSourceDisable Function

C

```
void PLIB_DMA_ChannelXINTSourceDisable(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL dmaChannel,  
    DMA_INT_TYPE dmaINTSource  
);
```

Description

This function disables the specified interrupt source for the specified channel.

Preconditions

None.

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL
dmaINTSource	One of the DMA interrupt sources specified by DMA_INT_TYPE

Returns

None.

Remarks

This function implements an operation of the ChannelXINTSource feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXINTSource](#) function in your application to automatically determine whether this feature is available.

Example

```
DMA_CHANNEL spiDMAChannel = DMA_CHANNEL_2;  
PLIB_DMA_ChannelXINTSourceDisable ( DMA_ID_0,  
                                     spiDMAChannel,  
                                     DMA_INT_ADDRESS_ERROR );
```

5.6.6.6.4.2 PLIB_DMA_ChannelXINTSourceEnable Function

C

```
void PLIB_DMA_ChannelXINTSourceEnable(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL dmaChannel,  
    DMA_INT_TYPE dmaINTSource  
);
```

Description

This function enables the specified interrupt source for the specified channel.

Preconditions

None.

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL

dmaINTSource	One of the DMA interrupt sources specified by DMA_INT_TYPE

Returns

None.

Remarks

This function implements an operation of the ChannelXINTSource feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXINTSource](#) function in your application to automatically determine whether this feature is available.

Example

```
DMA_CHANNEL spiDMAChannel = DMA_CHANNEL_2;
PLIB_DMA_ChannelXINTSourceEnable ( DMA_ID_0,
                                   spiDMAChannel,
                                   DMA_INT_ADDRESS_ERROR );
```

5.6.6.6.4.3 PLIB_DMA_ChannelXINTSourceFlagClear Function

C

```
void PLIB_DMA_ChannelXINTSourceFlagClear(
    DMA_MODULE_ID index,
    DMA_CHANNEL dmaChannel,
    DMA_INT_TYPE dmaINTSource
);
```

Description

This function clears the interrupt flag of the specified DMA interrupt source for the specified channel.

Preconditions

None.

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL
dmaINTSource	One of the DMA interrupt sources specified by DMA_INT_TYPE

Returns

None.

Remarks

This function implements an operation of the ChannelXINTSourceFlag feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXINTSourceFlag](#) function in your application to automatically determine whether this feature is available.

Example

```
DMA_CHANNEL spiDMAChannel = DMA_CHANNEL_2;
PLIB_DMA_ChannelXINTSourceFlagClear ( DMA_ID_0,
                                       spiDMAChannel,
                                       DMA_INT_ADDRESS_ERROR );
```

5.6.6.6.4.4 PLIB_DMA_ChannelXINTSourceFlagGet Function

C

```
bool PLIB_DMA_ChannelXINTSourceFlagGet(
    DMA_MODULE_ID index,
    DMA_CHANNEL dmaChannel,
```

```
    DMA_INT_TYPE dmaINTSource  
);
```

Description

This function returns the status of the interrupt flag of the specified DMA interrupt source for the specified channel.

Preconditions

None.

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL
dmaINTSource	One of the DMA interrupt sources specified by DMA_INT_TYPE

Returns

- true - The interrupt flag is set
- false - The interrupt flag is not set

Remarks

This function implements an operation of the ChannelXINTSourceFlag feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXINTSourceFlag](#) function in your application to automatically determine whether this feature is available.

Example

```
DMA_CHANNEL spiDMAChannel = DMA_CHANNEL_2;  
bool AddressErrorINTStatus;  
AddressErrorINTStatus = PLIB_DMA_ChannelXINTSourceFlagGet (  
    DMA_ID_0,  
    spiDMAChannel,  
    DMA_INT_ADDRESS_ERROR );
```

5.6.6.6.4.5 PLIB_DMA_ChannelXINTSourceFlagSet Function

C

```
void PLIB_DMA_ChannelXINTSourceFlagSet(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL dmaChannel,  
    DMA_INT_TYPE dmaINTSource  
);
```

Description

This function sets the interrupt flag of the specified DMA interrupt source for the specified channel.

Preconditions

None.

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL
dmaINTSource	One of the DMA interrupt sources specified by DMA_INT_TYPE

Returns

None.

Remarks

This function implements an operation of the ChannelXINTSourceFlag feature. This feature may not be available on all devices.

Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXINTSourceFlag](#) function in your application to automatically determine whether this feature is available.

Example

```
DMA_CHANNEL spiDMAChannel = DMA_CHANNEL_2;
PLIB_DMA_ChannelXINTSourceFlagSet ( DMA_ID_0,
                                     spiDMAChannel,
                                     DMA_INT_ADDRESS_ERROR );
```

5.6.6.6.4 PLIB_DMA_ChannelXINTSourceIsEnabled Function

C

```
bool PLIB_DMA_ChannelXINTSourceIsEnabled(
    DMA_MODULE_ID index,
    DMA_CHANNEL dmaChannel,
    DMA_INT_TYPE dmaINTSource
);
```

Description

This function returns the enable status of the specified interrupt source for the specified channel.

Preconditions

None.

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL
dmaINTSource	One of the DMA interrupt sources specified by DMA_INT_TYPE

Returns

- true - The interrupt is enabled
- false - The interrupt is not enabled

Remarks

This function implements an operation of the ChannelXINTSource feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXINTSource](#) function in your application to automatically determine whether this feature is available.

Example

```
DMA_CHANNEL spiDMAChannel = DMA_CHANNEL_2;
bool dmaINTSourceEnableStatus;
dmaINTSourceEnableStatus = PLIB_DMA_ChannelXINTSourceIsEnabled (
    DMA_ID_0,
    spiDMAChannel,
    DMA_INT_ADDRESS_ERROR );
```

5.6.6.6.5 DMA Operating/Addressing Mode Configuration

5.6.6.6.5.1 PLIB_DMA_ChannelXAddressModeGet Function

C

```
DMA_CHANNEL_ADDRESSING_MODE PLIB_DMA_ChannelXAddressModeGet(
    DMA_MODULE_ID index,
    DMA_CHANNEL channel
);
```

Description

This function gets the channel address mode.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

channelAddressMode - One of the possible source addressing modes listed by [DMA_CHANNEL_ADDRESSING_MODE](#)

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
DMA_CHANNEL_ADDRESSING_MODE channelAddressMode;  
channelAddressMode = PLIB_DMA_ChannelXAddressModeGet ( DMA_ID_0,  
                                                         DMA_CHANNEL_4 );
```

5.6.6.6.5.2 PLIB_DMA_ChannelXAddressModeSelect Function**C**

```
void PLIB_DMA_ChannelXAddressModeSelect(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL channel,  
    DMA_CHANNEL_ADDRESSING_MODE channelAddressMode  
);
```

Description

This function sets the channel address mode.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL
channelAddressMode	One of the possible channel addressing modes listed by DMA_CHANNEL_ADDRESSING_MODE

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_DMA_ChannelXAddressModeSelect (  
    DMA_ID_0,  
    DMA_CHANNEL_4,  
    DMA_ADDRESSING_REGISTER_INDIRECT_WITH_POST_INCREMENT );
```

5.6.6.6.5.3 PLIB_DMA_ChannelXDestinationAddressModeGet Function

C

```
DMA_DESTINATION_ADDRESSING_MODE PLIB_DMA_ChannelXDestinationAddressModeGet(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL channel  
);
```

Description

This function gets the source address mode of the specified channel.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

destinationAddressMode - One of the possible source addressing modes listed by [DMA_DESTINATION_ADDRESSING_MODE](#)

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
DMA_SOURCE_ADDRESSING_MODE destinationAddressMode;  
destinationAddressMode = PLIB_DMA_ChannelXDestinationAddressModeGet (  
    DMA_ID_0,  
    DMA_CHANNEL_4 );
```

5.6.6.6.5.4 PLIB_DMA_ChannelXDestinationAddressModeSelect Function

C

```
void PLIB_DMA_ChannelXDestinationAddressModeSelect(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL channel,  
    DMA_DESTINATION_ADDRESSING_MODE destinationAddressMode  
);
```

Description

This function Sets the source address mode of the specified channel.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL
destinationAddressMode	One of the possible source addressing modes listed by DMA_DESTINATION_ADDRESSING_MODE

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_DMA_ChannelXDestinationAddressModeSelect (
    DMA_ID_0,
    DMA_CHANNEL_4,
    DMA_ADDRESSING_DESTINATION_INCREMENT_BASED_ON_SIZE );
```

5.6.6.6.5.5 PLIB_DMA_ChannelXNullWriteModeDisable Function**C**

```
void PLIB_DMA_ChannelXNullWriteModeDisable(
    DMA_MODULE_ID index,
    DMA_CHANNEL channel
);
```

Description

This function disables the Null Write mode. No dummy write is initiated.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_DMA_ChannelXNullWriteModeDisable ( DMA_ID_0,
    DMA_CHANNEL_4 );
```

5.6.6.6.5.6 PLIB_DMA_ChannelXNullWriteModeEnable Function**C**

```
void PLIB_DMA_ChannelXNullWriteModeEnable(
    DMA_MODULE_ID index,
    DMA_CHANNEL channel
);
```

Description

This function enables the Null Write mode. A dummy write is initiated to the source address for every write to the destination address.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_DMA_ChannelXNullWriteModeEnable ( DMA_ID_0,
                                         DMA_CHANNEL_4 );
```

5.6.6.6.5.7 PLIB_DMA_ChannelXOperatingTransferModeGet Function

C

```
DMA_TRANSFER_MODE PLIB_DMA_ChannelXOperatingTransferModeGet(
    DMA_MODULE_ID index,
    DMA_CHANNEL channel
);
```

Description

This function returns the current transfer/operating mode for the specified channel. (Transfer mode and operating mode are used interchangeably.)

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

channeltransferMode - One of the possible operating/transfer modes listed by [DMA_TRANSFER_MODE](#)

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
DMA_TRANSFER_MODE channeltransferMode;
channeltransferMode = PLIB_DMA_ChannelXOperatingTransferModeGet (
                                                                DMA_ID_0,
                                                                DMA_CHANNEL_4 );
```

5.6.6.6.5.8 PLIB_DMA_ChannelXOperatingTransferModeSelect Function

C

```
void PLIB_DMA_ChannelXOperatingTransferModeSelect(
    DMA_MODULE_ID index,
    DMA_CHANNEL channel,
    DMA_TRANSFER_MODE channeltransferMode
);
```

Description

This function selects the transfer/operating mode for the specified channel. (Transfer mode and operating mode are used interchangeably.)

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL
channeltransferMode	One of the possible operating/transfer modes listed by DMA_TRANSFER_MODE

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
DMA_TRANSFER_MODE channeltransferMode = DMA_MODE_REPEATED_CONTINUOUS;
PLIB_DMA_ChannelXOperatingTransferModeSelect ( DMA_ID_0,
                                                DMA_CHANNEL_4,
                                                channeltransferMode );
```

5.6.6.6.5.9 PLIB_DMA_ChannelXReloadDisable Function**C**

```
void PLIB_DMA_ChannelXReloadDisable(
    DMA_MODULE_ID index,
    DMA_CHANNEL channel
);
```

Description

This function disables reloading of the address and count registers. The source, destination address, and the DMA count registers are not reloaded to their previous values upon the start of the next operation.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_DMA_ChannelXReloadDisable ( DMA_ID_0,
                                  DMA_CHANNEL_4 );
```

5.6.6.6.5.10 PLIB_DMA_ChannelXReloadEnable Function**C**

```
void PLIB_DMA_ChannelXReloadEnable(
    DMA_MODULE_ID index,
    DMA_CHANNEL channel
);
```

Description

This function enables reloading of the address and count registers. The source, destination address, and the DMA count registers are reloaded to their previous values upon the start of the next operation.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_DMA_ChannelXReloadEnable ( DMA_ID_0,
                                DMA_CHANNEL_4 );
```

5.6.6.6.5.11 PLIB_DMA_ChannelXSourceAddressModeGet Function**C**

```
DMA_SOURCE_ADDRESSING_MODE PLIB_DMA_ChannelXSourceAddressModeGet (
    DMA_MODULE_ID index,
    DMA_CHANNEL channel
);
```

Description

This function gets the source address mode of the specified channel.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

[DMA_SOURCE_ADDRESSING_MODE](#) - One of the possible source addressing modes listed by [DMA_SOURCE_ADDRESSING_MODE](#)

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
DMA_SOURCE_ADDRESSING_MODE sourceAddressMode;
sourceAddressMode = PLIB_DMA_ChannelXSourceAddressModeGet ( DMA_ID_0,
                                                            DMA_CHANNEL_4 );
```

5.6.6.6.5.12 PLIB_DMA_ChannelXSourceAddressModeSelect Function**C**

```
void PLIB_DMA_ChannelXSourceAddressModeSelect (
```

```
DMA_MODULE_ID index,  
DMA_CHANNEL channel,  
DMA_SOURCE_ADDRESSING_MODE sourceAddressMode  
);
```

Description

This function sets the source address mode of the specified channel.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL
sourceAddressMode	One of the possible source addressing modes listed by DMA_SOURCE_ADDRESSING_MODE

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_DMA_ChannelXSourceAddressModeSelect (  
    DMA_ID_0,  
    DMA_CHANNEL_4,  
    DMA_ADDRESSING_SOURCE_INCREMENT_BASED_ON_SIZE );
```

5.6.6.6.5.13 PLIB_DMA_ChannelXReloadIsEnabled Function

C

```
bool PLIB_DMA_ChannelXReloadIsEnabled(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL channel  
);
```

Description

This function returns the address and count registers reload enable status.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

- true - The address and count registers reload is enabled
- false - The address and count registers reload is disabled

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
bool chAddressCountReloadStatus;
```

```
chAddressCountReloadStatus = PLIB_DMA_ChannelXReloadIsEnabled (
    DMA_ID_0,
    DMA_CHANNEL_4 );
```

5.6.6.6.6 DMA Source/Destination/Peripheral Address Control Interface Routines

5.6.6.6.6.1 PLIB_DMA_ChannelXDestinationStartAddressGet Function

C

```
uint32_t PLIB_DMA_ChannelXDestinationStartAddressGet(
    DMA_MODULE_ID index,
    DMA_CHANNEL dmaChannel
);
```

Description

This function reads the destination start address configured for the specified channel.

Preconditions

None.

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

uint32_t - The destination start address configured for this channel

Remarks

This function implements an operation of the ChannelXDestinationStartAddress feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXDestinationStartAddress](#) function in your application to automatically determine whether this feature is available.

Example

```
DMA_CHANNEL spiDMAChannel = DMA_CHANNEL_2;
uint32_t DestinationStartAddress;
DestinationStartAddress = PLIB_DMA_ChannelXDestinationStartAddressGet (
    DMA_ID_0,
    spiDMAChannel );
```

5.6.6.6.6.2 PLIB_DMA_ChannelXDestinationStartAddressSet Function

C

```
void PLIB_DMA_ChannelXDestinationStartAddressSet(
    DMA_MODULE_ID index,
    DMA_CHANNEL dmaChannel,
    uint32_t destinationStartAddress
);
```

Description

This function writes the specified destination start address into the register corresponding to the specified channel.

Preconditions

None.

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL
destinationStartAddress	The destination start address

Returns

None.

Remarks

This function implements an operation of the ChannelXDestinationStartAddress feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXDestinationStartAddress](#) function in your application to automatically determine whether this feature is available.

Example

```
DMA_CHANNEL spiDMAChannel = DMA_CHANNEL_2;
uint32_t destinationStartAddress = 0x00FDEA00;
PLIB_DMA_ChannelXDestinationStartAddressSet(
    DMA_ID_0,
    spiDMAChannel,
    destinationStartAddress );
```

5.6.6.6.3 PLIB_DMA_ChannelXPeripheralAddressGet Function**C**

```
uint16_t PLIB_DMA_ChannelXPeripheralAddressGet(
    DMA_MODULE_ID index,
    DMA_CHANNEL channel
);
```

Description

This function gets the peripheral address configured for the specified channel.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

uint16_t - The peripheral address configured for the specified channel

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
uint16_t peripheraladdress;
peripheraladdress = PLIB_DMA_ChannelXPeripheralAddressGet ( DMA_ID_0,
    DMA_CHANNEL_4 );
```

5.6.6.6.4 PLIB_DMA_ChannelXPeripheralAddressSet Function**C**

```
void PLIB_DMA_ChannelXPeripheralAddressSet(
    DMA_MODULE_ID index,
```

```
    DMA_CHANNEL channel,
    uint16_t peripheraladdress
);
```

Description

This function sets the peripheral address for the specified channel.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL
peripheraladdress	The peripheral address for the specified channel

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
uint16_t peripheraladdress = 0x100;
PLIB_DMA_ChannelXPeripheralAddressSet ( DMA_ID_0,
                                         DMA_CHANNEL_4,
                                         peripheraladdress );
```

5.6.6.6.5 PLIB_DMA_ChannelXSourceStartAddressGet Function

C

```
uint32_t PLIB_DMA_ChannelXSourceStartAddressGet(
    DMA_MODULE_ID index,
    DMA_CHANNEL dmaChannel
);
```

Description

This function reads the source start address configured for the specified channel.

Preconditions

None.

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

uint32_t - The source start address configured for this channel

Remarks

This function implements an operation of the ChannelXSourceStartAddress feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXSourceStartAddress](#) function in your application to automatically determine whether this feature is available.

Example

```
DMA_CHANNEL spiDMAChannel = DMA_CHANNEL_2;
```

```
uint32_t SourceStartAddress;
SourceStartAddress = PLIB_DMA_ChannelXSourceStartAddressGet(DMA_ID_0,
                                                             spiDMACHannel );
```

5.6.6.6.6 PLIB_DMA_ChannelXSourceStartAddressSet Function

C

```
void PLIB_DMA_ChannelXSourceStartAddressSet(
    DMA_MODULE_ID index,
    DMA_CHANNEL dmaChannel,
    uint32_t sourceStartAddress
);
```

Description

This function writes the specified Source start address into the register corresponding to the specified channel.

Preconditions

None.

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL
sourceStartAddress	The source start address

Returns

None.

Remarks

This function implements an operation of the ChannelXSourceStartAddress feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXSourceStartAddress](#) function in your application to automatically determine whether this feature is available.

Example

```
DMA_CHANNEL spiDMACHannel = DMA_CHANNEL_2;
uint32_t sourceStartAddress = 0x00FDEA00;
PLIB_DMA_ChannelXSourceStartAddressSet (    DMA_ID_0,
                                             spiDMACHannel,
                                             sourceStartAddress );
```

5.6.6.6.7 PLIB_DMA_ChannelXStartAddressOffsetGet Function

C

```
uint16_t PLIB_DMA_ChannelXStartAddressOffsetGet(
    DMA_MODULE_ID index,
    DMA_CHANNEL channel,
    DMA_ADDRESS_OFFSET_TYPE offset
);
```

Description

This function gets the primary/secondary start address (DPSRAM) offset.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL
offset	The type of the address offset (primary/secondary)

Returns

uint16_t - The primary/secondary DPSRAM start address offset

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
uint16_t addressOffsetA;  
addressOffsetA = PLIB_DMA_ChannelXStartAddressOffsetGet (  
    DMA_ID_0,  
    DMA_CHANNEL_4,  
    address,  
    DMA_ADDRESS_OFFSET_PRIMARY );
```

5.6.6.6.8 PLIB_DMA_ChannelXStartAddressOffsetSet Function**C**

```
void PLIB_DMA_ChannelXStartAddressOffsetSet(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL channel,  
    uint16_t address,  
    DMA_ADDRESS_OFFSET_TYPE offset  
);
```

Description

This function sets the primary/secondary start address (DPSRAM) offset to the value specified depending on the offset type specified for the specified channel.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL
address	The primary/secondary DPSRAM start address offset
offset	The type of the address offset (primary/secondary)

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
uint16_t address = 0x100;  
PLIB_DMA_ChannelXStartAddressOffsetSet (    DMA_ID_0,  
    DMA_CHANNEL_4,  
    address,  
    DMA_ADDRESS_OFFSET_PRIMARY );
```

5.6.6.6.7 DMA Source/Destination/Peripheral Data Management

5.6.6.6.7.1 PLIB_DMA_ChannelXCellProgressPointerGet Function

C

```
uint16_t PLIB_DMA_ChannelXCellProgressPointerGet(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL dmaChannel  
);
```

Description

This function returns the number of bytes transferred since the last event.

Preconditions

None.

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

uint16_t - The number of bytes transferred since the last event. (The cell progress pointer (8-bit, 16-bit) is device-specific. Please refer to the specific device data sheet to determine availability.)

Remarks

This function implements an operation of the ChannelXCellProgressPointer feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXCellProgressPointer](#) function in your application to automatically determine whether this feature is available.

Example

```
DMA_CHANNEL spiDMAChannel = DMA_CHANNEL_2;  
uint16_t CellProgress;  
CellProgress = PLIB_DMA_ChannelXCellProgressPointerGet ( DMA_ID_0,  
                                                         spiDMAChannel );
```

5.6.6.6.7.2 PLIB_DMA_ChannelXCellSizeGet Function

C

```
uint16_t PLIB_DMA_ChannelXCellSizeGet(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL dmaChannel  
);
```

Description

This function reads the cell size (in bytes) configured for the specified channel.

Preconditions

None.

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

uint16_t - The cell size configured (in bytes) for this channel (The cell size (8-bit, 16-bit) is device-specific. Please refer to the specific device data sheet to determine availability.)

Remarks

This function implements an operation of the ChannelXCellSize feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXCellSize](#) function in your application to automatically determine whether this feature is available.

Example

```
DMA_CHANNEL spiDMAChannel = DMA_CHANNEL_2;
uint16_t cellSize;
cellSize = PLIB_DMA_ChannelXCellSizeGet (    DMA_ID_0,
                                             spiDMAChannel );
```

5.6.6.6.7.3 PLIB_DMA_ChannelXCellSizeSet Function**C**

```
void PLIB_DMA_ChannelXCellSizeSet(
    DMA_MODULE_ID index,
    DMA_CHANNEL dmaChannel,
    uint16_t CellSize
);
```

Description

This function writes the specified cell size into the register corresponding to the specified channel.

Preconditions

None.

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL
cellSize	The cell size in bytes (The cell size (8-bit, 16-bit) is device-specific. Please refer to the specific device data sheet to determine availability.)

Returns

None.

Remarks

This function implements an operation of the ChannelXCellSize feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXCellSize](#) function in your application to automatically determine whether this feature is available.

Example

```
DMA_CHANNEL spiDMAChannel = DMA_CHANNEL_2;
uint16_t cellSize = 0x10;
PLIB_DMA_ChannelXCellSizeSet ( DMA_ID_0, spiDMAChannel, cellSize );
```

5.6.6.6.7.4 PLIB_DMA_ChannelXDataSizeGet Function**C**

```
DMA_CHANNEL_DATA_SIZE PLIB_DMA_ChannelXDataSizeGet(
    DMA_MODULE_ID index,
    DMA_CHANNEL channel
);
```

Description

This function returns the current data size for the specified channel.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

channelDataSize - One of the possible data sizes listed by [DMA_CHANNEL_DATA_SIZE](#)

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
DMA_CHANNEL_DATA_SIZE channelDataSize;  
channelDataSize = PLIB_DMA_ChannelXDataSizeGet( DMA_ID_0,  
                                                  DMA_CHANNEL_4 );
```

5.6.6.6.7.5 PLIB_DMA_ChannelXDataSizeSelect Function**C**

```
void PLIB_DMA_ChannelXDataSizeSelect(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL channel,  
    DMA_CHANNEL_DATA_SIZE channelDataSize  
);
```

Description

This function selects the data size for the specified channel.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL
channelDataSize	One of the possible data sizes listed by DMA_CHANNEL_DATA_SIZE

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
DMA_CHANNEL_DATA_SIZE channelDataSize = DMA_CHANNEL_DATA_8;  
PLIB_DMA_ChannelXDataSizeSelect ( DMA_ID_0,  
                                   DMA_CHANNEL_4,  
                                   channelDataSize );
```

5.6.6.6.7.6 PLIB_DMA_ChannelXDestinationPointerGet Function

C

```
uint16_t PLIB_DMA_ChannelXDestinationPointerGet(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL dmaChannel  
);
```

Description

This function reads the current byte of the destination being pointed to for the specified channel.

Preconditions

None.

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

uint16_t - The destination byte being pointed to for this channel (The destination pointer (8-bit, 16-bit) is device-specific. Please refer to the specific device data sheet to determine availability.)

Remarks

This function implements an operation of the ChannelXDestinationPointer feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXDestinationPointer](#) function in your application to automatically determine whether this feature is available.

Example

```
DMA_CHANNEL spiDMAChannel = DMA_CHANNEL_2;  
uint16_t destinationbyte;  
destinationbyte = PLIB_DMA_ChannelXDestinationPointerGet ( DMA_ID_0,  
                                                         spiDMAChannel );
```

5.6.6.6.7.7 PLIB_DMA_ChannelXDestinationSizeGet Function

C

```
uint16_t PLIB_DMA_ChannelXDestinationSizeGet(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL dmaChannel  
);
```

Description

This function reads the destination size configured for the specified channel.

Preconditions

None.

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

uint16_t - The destination size configured (in bytes) for this channel. (The destination size (8-bit, 16-bit) is device-specific. Please refer to the specific device data sheet to determine availability.)

Remarks

This function implements an operation of the ChannelXDestinationSize feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXDestinationSize](#) function in your application to automatically determine whether this feature is available.

Example

```
DMA_CHANNEL spiDMAChannel = DMA_CHANNEL_2;
uint16_t DestinationSize;
DestinationSize = PLIB_DMA_ChannelXDestinationSizeGet ( DMA_ID_0,
                                                         spiDMAChannel );
```

5.6.6.6.7.8 PLIB_DMA_ChannelXDestinationSizeSet Function**C**

```
void PLIB_DMA_ChannelXDestinationSizeSet(
    DMA_MODULE_ID index,
    DMA_CHANNEL dmaChannel,
    uint16_t destinationSize
);
```

Description

This function writes the specified destination size into the register corresponding to the specified channel.

Preconditions

None.

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL
destinationSize	The destination size (The destination size (8-bit, 16-bit) is device-specific. Please refer to the specific device data sheet to determine availability.)

Returns

None.

Remarks

This function implements an operation of the ChannelXDestinationSize feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXDestinationSize](#) function in your application to automatically determine whether this feature is available.

Example

```
DMA_CHANNEL spiDMAChannel = DMA_CHANNEL_2;
uint16_t destinationSize = 0xA00;
PLIB_DMA_ChannelXDestinationSizeSet( DMA_ID_0, spiDMAChannel, destinationSize );
```

5.6.6.6.7.9 PLIB_DMA_ChannelXPatternDataGet Function**C**

```
uint16_t PLIB_DMA_ChannelXPatternDataGet(
    DMA_MODULE_ID index,
    DMA_CHANNEL dmaChannel
);
```

Description

This function returns pattern matching (for DMA abort) data programmed for the specified channel. (The size of pattern matching data(8-bit, 16-bit) is device-specific. Please refer to the specific device data sheet to determine availability.)

Preconditions

None.

Parameters

Parameters	Description
<code>dmaChannel</code>	One of the possible DMA channels listed by DMA_CHANNEL

Returns

`uint16_t` - The pattern matching data programmed for the current channel (The size of pattern matching data(8-bit, 16-bit) is device-specific. Please refer to the specific device data sheet to determine availability.)

Remarks

This function implements an operation of the ChannelXPatternData feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXPatternData](#) function in your application to automatically determine whether this feature is available.

Example

```
DMA_CHANNEL spiDMAChannel = DMA_CHANNEL_2;
uint16_t patternData;
patternData = PLIB_DMA_ChannelXPatternDataGet ( DMA_ID_0, spiDMAChannel );
```

5.6.6.6.7.10 PLIB_DMA_ChannelXPatternDataSet Function**C**

```
void PLIB_DMA_ChannelXPatternDataSet(
    DMA_MODULE_ID index,
    DMA_CHANNEL dmaChannel,
    uint16_t patternData
);
```

Description

This function writes the specified pattern matching data (for DMA abort) into the register corresponding to the specified channel. (The size of pattern matching data(8-bit, 16-bit) is device-specific. Please refer to the specific device data sheet to determine availability.)

Preconditions

None.

Parameters

Parameters	Description
<code>dmaChannel</code>	One of the possible DMA channels listed by DMA_CHANNEL
<code>patternData</code>	The pattern matching DATA programmed for the current channel (The size of pattern matching data(8-bit, 16-bit) is device-specific. Please refer to the specific device data sheet to determine availability.)

Returns

None.

Remarks

This function implements an operation of the ChannelXPatternData feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXPatternData](#) function in your application to automatically determine whether this feature is available.

Example

```
DMA_CHANNEL spiDMAChannel = DMA_CHANNEL_2;
uint16_t patternData = '0';
PLIB_DMA_ChannelXPatternDataSet ( DMA_ID_0, spiDMAChannel, patternData );
```

5.6.6.6.7.11 PLIB_DMA_ChannelXSourcePointerGet Function**C**

```
uint16_t PLIB_DMA_ChannelXSourcePointerGet(
    DMA_MODULE_ID index,
    DMA_CHANNEL dmaChannel
);
```

Description

This function reads the current byte of the source being pointed to for the specified channel.

Preconditions

None.

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

uint16_t - The source byte being pointed to for this channel. (The source pointer (8-bit, 16-bit) is device-specific. Please refer to the specific device data sheet to determine availability.)

Remarks

This function implements an operation of the ChannelXSourcePointer feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXSourcePointer](#) function in your application to automatically determine whether this feature is available.

Example

```
DMA_CHANNEL spiDMAChannel = DMA_CHANNEL_2;
uint16_t sourcebyte;
sourcebyte = PLIB_DMA_ChannelXSourcePointerGet ( DMA_ID_0, spiDMAChannel );
```

5.6.6.6.7.12 PLIB_DMA_ChannelXSourceSizeGet Function**C**

```
uint16_t PLIB_DMA_ChannelXSourceSizeGet(
    DMA_MODULE_ID index,
    DMA_CHANNEL dmaChannel
);
```

Description

This function reads the source size configured for the specified channel.

Preconditions

None.

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

uint16_t - The Source size configured (in bytes) for this channel. (The source size (8-bit, 16-bit) is device-specific. Please refer to the specific device data sheet to determine availability.)

Remarks

This function implements an operation of the ChannelXSourceSize feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXSourceSize](#) function in your application to automatically determine whether this feature is available.

Example

```
DMA_CHANNEL spiDMAChannel = DMA_CHANNEL_2;
uint16_t sourceSize;
sourceSize = PLIB_DMA_ChannelXSourceSizeGet (    DMA_ID_0,
                                                spiDMAChannel );
```

5.6.6.6.7.13 PLIB_DMA_ChannelXSourceSizeSet Function**C**

```
void PLIB_DMA_ChannelXSourceSizeSet(
    DMA_MODULE_ID index,
    DMA_CHANNEL dmaChannel,
    uint16_t sourceSize
);
```

Description

This function writes the specified source size into the register corresponding to the specified channel.

Preconditions

None.

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL
sourceSize	The source size (The source size (8-bit, 16-bit) is device-specific. Please refer to the specific device data sheet to determine availability.)

Returns

None.

Remarks

This function implements an operation of the ChannelXSourceSize feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXSourceSize](#) function in your application to automatically determine whether this feature is available.

Example

```
DMA_CHANNEL spiDMAChannel = DMA_CHANNEL_2;
uint16_t sourceSize = 0xA00;
PLIB_DMA_ChannelXSourceSizeSet (    DMA_ID_0,
                                    spiDMAChannel,
                                    sourceSize );
```

5.6.6.6.7.14 PLIB_DMA_ChannelXTransferCountGet Function**C**

```
uint16_t PLIB_DMA_ChannelXTransferCountGet(
    DMA_MODULE_ID index,
```

```
    DMA_CHANNEL channel  
);
```

Description

This function gets the DMA data transfer count that is programmed for the specified channel.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

uint16_t - The DMA transfer count for the channel

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
uint16_t transferCount;  
transferCount = PLIB_DMA_ChannelXTransferCountGet ( DMA_ID_0,  
                                                    DMA_CHANNEL_4 );
```

5.6.6.6.7.15 PLIB_DMA_ChannelXTransferCountSet Function**C**

```
void PLIB_DMA_ChannelXTransferCountSet(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL channel,  
    uint16_t transferCount  
);
```

Description

This function sets the DMA data transfer count for the specified channel.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL
transferCount	The DMA transfer count for the channel

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
uint16_t transferCount = 0x10;  
PLIB_DMA_ChannelXTransferCountSet ( DMA_ID_0,  
                                    DMA_CHANNEL_4,  
                                    transferCount );
```

5.6.6.6.8 DMA Channel Configuration

5.6.6.6.8.1 PLIB_DMA_ChannelPrioritySelect Function

C

```
void PLIB_DMA_ChannelPrioritySelect(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL_PRIORITY channelPriority  
);
```

Description

This function sets the priority scheme of the DMA channels at the global level. This function is used in devices that do not have the per channel priority feature.

Preconditions

None.

Parameters

Parameters	Description
channelPriority	One of the supported priorities listed by DMA_CHANNEL_PRIORITY

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
DMA_CHANNEL_PRIORITY channelPriority = DMA_CHANNEL_ROUND_ROBIN;  
PLIB_DMA_ChannelPrioritySelect( DMA_ID_0, channelPriority );
```

5.6.6.6.8.2 PLIB_DMA_ChannelPriorityGet Function

C

```
DMA_CHANNEL_PRIORITY PLIB_DMA_ChannelPriorityGet(  
    DMA_MODULE_ID index  
);
```

Description

This function gets the priority scheme of the DMA channels at the global level. This function is used in devices that do not have the per channel priority feature.

Preconditions

None.

Returns

channelPriority - One of the supported priorities listed by [DMA_CHANNEL_PRIORITY](#)

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
DMA_CHANNEL_PRIORITY channelPriority;  
channelPriority = PLIB_DMA_ChannelPriorityGet( DMA_ID_0 );
```

5.6.6.6.8.3 PLIB_DMA_ChannelXAutoDisable Function

C

```
void PLIB_DMA_ChannelXAutoDisable(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL channel  
);
```

Description

This function disables a channel after a block transfer is complete.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

None.

Remarks

This function implements an operation of the ChannelXAuto feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXAuto](#) function in your application to determine whether this feature is available.

Example

```
PLIB_DMA_ChannelXAutoDisable( DMA_ID_0, DMA_CHANNEL_2 );
```

5.6.6.6.8.4 PLIB_DMA_ChannelXAutoEnable Function

C

```
void PLIB_DMA_ChannelXAutoEnable(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL channel  
);
```

Description

This function enables the channel continuously. The channel is not automatically disabled after a block transfer is complete.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

None.

Remarks

This function implements an operation of the ChannelXAuto feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXAuto](#) function in your application to determine whether this feature is available.

Example

```
PLIB_DMA_ChannelXAutoEnable( DMA_ID_0, DMA_CHANNEL_2 );
```

5.6.6.6.8.5 PLIB_DMA_ChannelXBusyActiveSet Function**C**

```
void PLIB_DMA_ChannelXBusyActiveSet(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL channel  
);
```

Description

This function sets the busy bit to active, indicating the channel is active or has been enabled.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

None.

Remarks

This function implements an operation of the ChannelXBusy feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXBusy](#) function in your application to automatically determine whether this feature is available.

Example

```
PLIB_DMA_ChannelXBusyActiveSet ( DMA_ID_0, DMA_CHANNEL_4 );
```

5.6.6.6.8.6 PLIB_DMA_ChannelXBusyInActiveSet Function**C**

```
void PLIB_DMA_ChannelXBusyInActiveSet(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL channel  
);
```

Description

This function sets the busy bit to inactive, indicating the channel is inactive or has been disabled.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

None.

Remarks

This function implements an operation of the ChannelXBusy feature. This feature may not be available on all devices. Please

refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXBusy](#) function in your application to automatically determine whether this feature is available.

Example

```
PLIB_DMA_ChannelXBusyInActiveSet ( DMA_ID_0, DMA_CHANNEL_4 );
```

5.6.6.6.8.7 PLIB_DMA_ChannelXChainDisable Function**C**

```
void PLIB_DMA_ChannelXChainDisable(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL channel  
);
```

Description

This function disables the channel chaining for the specified DMA channel.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

None.

Remarks

This function implements an operation of the ChannelXChainEnbl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the the [PLIB_DMA_ExistsChannelXChainEnbl](#) function in your application to determine whether this feature is available.

Example

```
PLIB_DMA_ChannelXChainDisable( DMA_ID_0, DMA_CHANNEL_2 );
```

5.6.6.6.8.8 PLIB_DMA_ChannelXChainEnable Function**C**

```
void PLIB_DMA_ChannelXChainEnable(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL channel  
);
```

Description

This function enables the channel chain feature.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

None.

Remarks

This function implements an operation of the ChannelXChainEnbl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXChainEnbl](#) function in your application to determine whether this feature is available.

Example

```
PLIB_DMA_ChannelXChainEnable( DMA_ID_0, DMA_CHANNEL_2 );
```

5.6.6.6.8.9 PLIB_DMA_ChannelXChainToHigher Function**C**

```
void PLIB_DMA_ChannelXChainToHigher(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL channel  
);
```

Description

This function will Chain the specified channel to a channel higher in natural priority. CH5 will be enabled by a CH4 transfer complete.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

None.

Remarks

This function implements an operation of the ChannelXChain feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXChain](#) function in your application to automatically determine whether this feature is available.

Example

```
PLIB_DMA_ChannelXChainToHigher ( DMA_ID_0, DMA_CHANNEL_4 );
```

5.6.6.6.8.10 PLIB_DMA_ChannelXChainToLower Function**C**

```
void PLIB_DMA_ChannelXChainToLower(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL channel  
);
```

Description

This function will chain the specified channel to a channel lower in natural priority. CH3 will be enabled by a CH4 transfer complete.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

None.

Remarks

This function implements an operation of the ChannelXChain feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXChain](#) function in your application to automatically determine whether this feature is available.

Example

```
PLIB_DMA_ChannelXChainToLower ( DMA_ID_0, DMA_CHANNEL_4 );
```

5.6.6.6.8.11 PLIB_DMA_ChannelXDisable Function**C**

```
void PLIB_DMA_ChannelXDisable(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL channel  
);
```

Description

This function will disable the specified channel.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

None.

Remarks

This function implements an operation of the ChannelX feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelX](#) function in your application to automatically determine whether this feature is available.

Example

```
PLIB_DMA_ChannelXDisable ( DMA_ID_0, DMA_CHANNEL_2 );
```

5.6.6.6.8.12 PLIB_DMA_ChannelXEnable Function**C**

```
void PLIB_DMA_ChannelXEnable(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL channel  
);
```

Description

This function will enable the specified channel.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

None.

Remarks

This function implements an operation of the ChannelX feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelX](#) function in your application to automatically determine whether this feature is available.

Example

```
PLIB_DMA_ChannelXEnable ( DMA_ID_0, DMA_CHANNEL_2 );
```

5.6.6.6.8.13 PLIB_DMA_ChannelXPriorityGet Function**C**

```
DMA_CHANNEL_PRIORITY PLIB_DMA_ChannelXPriorityGet(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL channel  
);
```

Description

This function gets the priority of the specified channel.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the existing DMA channels listed by DMA_CHANNEL

Returns

channelPriority - One of the supported priorities listed by [DMA_CHANNEL_PRIORITY](#)

Remarks

This function implements an operation of the ChannelXPriority feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXPriority](#) function in your application to determine whether this feature is available.

Example

```
DMA_CHANNEL channel = DMA_CHANNEL_0;  
DMA_CHANNEL_PRIORITY channelPriority;  
channelPriority = PLIB_DMA_ChannelXPriorityGet( DMA_ID_0, channel );
```

5.6.6.6.8.14 PLIB_DMA_ChannelXPrioritySelect Function**C**

```
void PLIB_DMA_ChannelXPrioritySelect(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL channel,
```

```
    DMA_CHANNEL_PRIORITY channelPriority  
);
```

Description

This function sets the priority of the specified channel.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the existing DMA channels listed by DMA_CHANNEL
channelPriority	One of the supported priorities listed by DMA_CHANNEL_PRIORITY

Returns

None.

Remarks

This function implements an operation of the ChannelXPriority feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXPriority](#) function in your application to determine whether this feature is available.

Example

```
DMA_CHANNEL channel = DMA_CHANNEL_0;  
DMA_CHANNEL_PRIORITY channelPriority = DMA_CHANNEL_PRIORITY_3;  
PLIB_DMA_ChannelXPrioritySelect( DMA_ID_0, channel, channelPriority );
```

5.6.6.6.8.15 PLIB_DMA_ChannelXTransferDirectionGet Function**C**

```
DMA_CHANNEL_TRANSFER_DIRECTION PLIB_DMA_ChannelXTransferDirectionGet(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL channel  
);
```

Description

This function returns the data transfer direction of the specified channel.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

[DMA_CHANNEL_TRANSFER_DIRECTION](#) - The transfer direction indicated by the [DMA_CHANNEL_TRANSFER_DIRECTION](#)

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
DMA_CHANNEL_TRANSFER_DIRECTION chTransferDirection;  
chTransferDirection = PLIB_DMA_ChannelXTransferDirectionGet (  
    DMA_ID_0,  
    DMA_CHANNEL_4 );
```

5.6.6.6.8.16 PLIB_DMA_ChannelXTransferDirectionSelect Function

C

```
void PLIB_DMA_ChannelXTransferDirectionSelect(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL channel,  
    DMA_CHANNEL_TRANSFER_DIRECTION chTransferDirection  
);
```

Description

This function selects the data transfer direction of the specified channel.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL
chTransferDirection	The transfer direction indicated by the DMA_CHANNEL_TRANSFER_DIRECTION

Returns

None.

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_DMA_ChannelXTransferDirectionSelect (  
    DMA_ID_0,  
    DMA_CHANNEL_4,  
    DMA_READ_FROM_MEMORY_WRITE_TO_PERIPHERAL );
```

5.6.6.6.8.17 PLIB_DMA_ChannelXDisabledDisablesEvents Function

C

```
void PLIB_DMA_ChannelXDisabledDisablesEvents(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL channel  
);
```

Description

This function will allow the channel start/abort events to be ignored even if the channel is disabled.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

None.

Remarks

This function implements an operation of the ChannelXDisabled feature. This feature may not be available on all devices. Please

refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXDisabled](#) function in your application to automatically determine whether this feature is available.

Example

```
PLIB_DMA_ChannelXDisabledDisablesEvents ( DMA_ID_0, DMA_CHANNEL_2 );
```

5.6.6.6.8.18 PLIB_DMA_ChannelXDisabledEnablesEvents Function**C**

```
void PLIB_DMA_ChannelXDisabledEnablesEvents(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL channel  
);
```

Description

This function will allow the channel register start/abort events even if the channel is disabled.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

None.

Remarks

This function implements an operation of the ChannelXDisabled feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXDisabled](#) function in your application to automatically determine whether this feature is available.

Example

```
PLIB_DMA_ChannelXDisabledEnablesEvents ( DMA_ID_0, DMA_CHANNEL_2 );
```

5.6.6.6.8.19 PLIB_DMA_ChannelXPatternIgnoreByteDisable Function**C**

```
void PLIB_DMA_ChannelXPatternIgnoreByteDisable(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL channel  
);
```

Description

This function disables the pattern match ignore byte.

Preconditions

None.

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

None.

Remarks

This function implements an operation of the ChannelXPatternIgnoreByte feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXPatternIgnoreByte](#) function in your application to automatically determine whether this feature is available.

Example

```
DMA_CHANNEL dmaChannel = DMA_CHANNEL_2;
PLIB_DMA_ChannelXPatternIgnoreByteDisable(DMA_ID_0, dmaChannel);
```

5.6.6.6.8.20 PLIB_DMA_ChannelXPatternIgnoreByteEnable Function**C**

```
void PLIB_DMA_ChannelXPatternIgnoreByteEnable(
    DMA_MODULE_ID index,
    DMA_CHANNEL channel
);
```

Description

This function enables the pattern match ignore byte.

Preconditions

None.

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

None.

Remarks

This function implements an operation of the ChannelXPatternIgnoreByte feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXPatternIgnoreByte](#) function in your application to automatically determine whether this feature is available.

Example

```
DMA_CHANNEL dmaChannel = DMA_CHANNEL_2;
PLIB_DMA_ChannelXPatternIgnoreByteEnable(DMA_ID_0, dmaChannel);
```

5.6.6.6.8.21 PLIB_DMA_ChannelXPatternIgnoreByteIsEnabled Function**C**

```
bool PLIB_DMA_ChannelXPatternIgnoreByteIsEnabled(
    DMA_MODULE_ID index,
    DMA_CHANNEL channel
);
```

Description

This function returns the state (enabled or disabled) of the pattern match ignore byte.

Preconditions

None.

Parameters

Parameters	Description
<code>dmaChannel</code>	One of the possible DMA channels listed by DMA_CHANNEL

Returns

- `true` - The pattern match ignore byte is enabled
- `false` - The pattern match ignore byte is disabled

Remarks

This function implements an operation of the `ChannelXPatternIgnoreByte` feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXPatternIgnoreByte](#) function in your application to automatically determine whether this feature is available.

Example

```
bool patternIsEnabled;  
DMA_CHANNEL dmaChannel = DMA_CHANNEL_2;  
patternIsEnabled = PLIB_DMA_ChannelXPatternIgnoreByteIsEnabled(DMA_ID_0, dmaChannel);
```

5.6.6.6.8.22 PLIB_DMA_ChannelXPatternIgnoreGet Function**C**

```
uint8_t PLIB_DMA_ChannelXPatternIgnoreGet(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL channel  
);
```

Description

This function returns the value of the pattern match ignore.

Preconditions

None.

Parameters

Parameters	Description
<code>dmaChannel</code>	One of the possible DMA channels listed by DMA_CHANNEL

Returns

`uint8_t` - Pattern match ignore value

Remarks

This function implements an operation of the `ChannelXPatternIgnore` feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXPatternIgnore](#) function in your application to automatically determine whether this feature is available.

Example

```
uint8_t patternMatch;  
DMA_CHANNEL dmaChannel = DMA_CHANNEL_2;  
patternMatch = PLIB_DMA_ChannelXPatternIgnoreGet ( DMA_ID_0, dmaChannel);
```

5.6.6.6.8.23 PLIB_DMA_ChannelXPatternIgnoreSet Function**C**

```
void PLIB_DMA_ChannelXPatternIgnoreSet(  

```

```
DMA_MODULE_ID index,  
DMA_CHANNEL channel,  
uint8_t pattern  
);
```

Description

This function sets the value of the pattern match ignore.

Preconditions

None.

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL
pattern	Pattern match ignore value

Returns

None.

Remarks

This function implements an operation of the ChannelXPatternIgnore feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXPatternIgnore](#) function in your application to automatically determine whether this feature is available.

Example

```
uint8_t patternMatch = 0x8;  
DMA_CHANNEL dmaChannel = DMA_CHANNEL_2;  
PLIB_DMA_ChannelXPatternIgnoreSet ( DMA_ID_0, dmaChannel, patternMatch);
```

5.6.6.6.8.24 PLIB_DMA_ChannelXPatternLengthGet Function

C

```
DMA_PATTERN_LENGTH PLIB_DMA_ChannelXPatternLengthGet(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL dmaChannel  
);
```

Description

This function returns the length of the byte matching the CHPIGN bits during a pattern match that may be ignored during the pattern match determination when the CHPIGNEN bit is set.

Preconditions

None.

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

patternLen - Length of pattern match (either 1 or 2)

Remarks

This function implements an operation of the ChannelXPatternLength feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXPatternLength](#) function in your application to automatically determine whether this feature is available.

Example

```
DMA_CHANNEL dmaChannel = DMA_CHANNEL_2;
DMA_PATTERN_LENGTH patternLen;
patternLen = PLIB_DMA_ChannelXPatternLengthGet(DMA_ID_0, dmaChannel);
```

5.6.6.6.8.25 PLIB_DMA_ChannelXPatternLengthSet Function**C**

```
void PLIB_DMA_ChannelXPatternLengthSet(
    DMA_MODULE_ID index,
    DMA_CHANNEL dmaChannel,
    DMA_PATTERN_LENGTH patternLen
);
```

Description

This function sets the length of the pattern match ignore to 1 or 2 bytes.

Preconditions

None.

Parameters

Parameters	Description
dmaChannel	One of the possible DMA channels listed by DMA_CHANNEL
patternLen	Length of pattern match (either 1 or 2)

Returns

None.

Remarks

This function implements an operation of the ChannelXPatternLength feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXPatternLength](#) function in your application to automatically determine whether this feature is available.

Example

```
DMA_CHANNEL dmaChannel = DMA_CHANNEL_2;
DMA_PATTERN_LENGTH patternLen;
patternLen = DMA_PATTERN_MATCH_LENGTH_1BYTE;
PLIB_DMA_ChannelXPatternLengthSet(DMA_ID_0, dmaChannel, patternLen);
```

5.6.6.6.9 DMA CRC Module Interface Routines**5.6.6.6.9.1 PLIB_DMA_CRCAppendModeDisable Function****C**

```
void PLIB_DMA_CRCAppendModeDisable(
    DMA_MODULE_ID index
);
```

Description

This function disables the CRC append mode. The DMA transfers data from the source through the CRC obeying WBO ([DMA_MODULE_ID](#) index, write byte order) as it writes the data to the destination.

Preconditions

None.

Returns

None.

Remarks

This function implements an operation of the CRCAppendMode feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsCRCAppendMode](#) function in your application to automatically determine whether this feature is available.

Example

```
PLIB_DMA_CRCAppendModeDisable( DMA_ID_0 );
```

5.6.6.6.9.2 PLIB_DMA_CRCAppendModeEnable Function**C**

```
void PLIB_DMA_CRCAppendModeEnable(  
    DMA_MODULE_ID index  
);
```

Description

This function enables the CRC append mode. The DMA transfers data from the source into the CRC, but not to the destination. When a block transfer completes, the DMA writes the calculated CRC value to the location specified by the CHxDSA register.

Preconditions

None.

Returns

None.

Remarks

This function implements an operation of the CRCAppendMode feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsCRCAppendMode](#) function in your application to automatically determine whether this feature is available.

Example

```
PLIB_DMA_CRCAppendModeEnable( DMA_ID_0 );
```

5.6.6.6.9.3 PLIB_DMA_CRCAppendModeIsEnabled Function**C**

```
bool PLIB_DMA_CRCAppendModeIsEnabled(  
    DMA_MODULE_ID index  
);
```

Description

This function gets the enable status of the CRC append mode.

Preconditions

None.

Returns

- true - CRC append mode is enabled
- false - CRC append mode is disabled

Remarks

This function implements an operation of the CRCAppendMode feature. This feature may not be available on all devices. Please

refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsCRCAppendMode](#) function in your application to automatically determine whether this feature is available.

Example

```
bool DMAcrcAppendMode;
DMAcrcAppendMode = PLIB_DMA_CRCAppendModeIsEnabled( DMA_ID_0 );
```

5.6.6.6.9.4 PLIB_DMA_CRCBitOrderSelect Function

C

```
void PLIB_DMA_CRCBitOrderSelect(
    DMA_MODULE_ID index,
    DMA_CRC_BIT_ORDER bitOrder
);
```

Description

This function selects the bit order for checksum caluculation.

Preconditions

None.

Parameters

Parameters	Description
bitOrder	Specifies the bit order for CRC caluculation

Returns

None.

Remarks

This function implements an operation of the CRCBitOrder feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsCRCBitOrder](#) function in your application to automatically determine whether this feature is available.

Example

```
PLIB_DMA_CRCBitOrderSelect ( DMA_ID_0,DMA_CRC_BIT_ORDER_LSB );
```

5.6.6.6.9.5 PLIB_DMA_CRCByteOrderGet Function

C

```
DMA_CRC_BYTE_ORDER PLIB_DMA_CRCByteOrderGet(
    DMA_MODULE_ID index
);
```

Description

This function gets the current byte order selected by the DMA module CRC feature.

Preconditions

The WBO bit must be set to use this function.

Returns

byteOrder - One of the possible byte orders specified by [DMA_CRC_BYTE_ORDER](#)

Remarks

This function implements an operation of the CRCByteOrder feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsCRCByteOrder](#) function in your application to automatically determine whether this feature is available.

Example

```
DMA_CRC_BYTE_ORDER byteOrder;  
byteOrder = PLIB_DMA_CRCByteOrderGet ( DMA_ID_0 );
```

5.6.6.6.9.6 PLIB_DMA_CRCByteOrderSelect Function**C**

```
void PLIB_DMA_CRCByteOrderSelect(  
    DMA_MODULE_ID index,  
    DMA_CRC_BYTE_ORDER byteOrder  
);
```

Description

This function selects the byte order.

Preconditions

The WBO bit must be set to use this function.

Parameters

Parameters	Description
byteOrder	One of the possible byte orders specified by DMA_CRC_BYTE_ORDER

Returns

None.

Remarks

This function implements an operation of the CRCByteOrder feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsCRCByteOrder](#) function in your application to automatically determine whether this feature is available.

Example

```
PLIB_DMA_CRCByteOrderSelect (    DMA_ID_0,  
                                DMA_CRC_SWAP_HALF_WORD_ON_WORD_BOUNDARY );
```

5.6.6.6.9.7 PLIB_DMA_CRCChannelGet Function**C**

```
DMA_CHANNEL PLIB_DMA_CRCChannelGet(  
    DMA_MODULE_ID index  
);
```

Description

This function returns the current DMA channel to which the CRC is assigned.

Preconditions

None.

Returns

crcChannel - One of the possible DMA channels listed by [DMA_CHANNEL](#)

Remarks

This function implements an operation of the CRCChannel feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsCRCChannel](#) function in your application to automatically determine whether this feature is available.

Example

```
DMA_CHANNEL crcChannel;  
crcChannel = PLIB_DMA_CRCChannelGet( DMA_ID_0 );
```

5.6.6.6.9.8 PLIB_DMA_CRCChannelSelect Function

C

```
void PLIB_DMA_CRCChannelSelect(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL channel  
);
```

Description

This function assigns the CRC feature to the specified channel.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

None.

Remarks

This function implements an operation of the CRCChannel feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsCRCChannel](#) function in your application to automatically determine whether this feature is available.

Example

```
PLIB_DMA_CRCChannelSelect( DMA_ID_0,  
                           DMA_CHANNEL_5 );
```

5.6.6.6.9.9 PLIB_DMA_CRCDataRead Function

C

```
uint32_t PLIB_DMA_CRCDataRead(  
    DMA_MODULE_ID index  
);
```

Description

This function reads the contents of the DMA CRC data register.

Preconditions

None.

Returns

uint32_t - 32-bit CRC data (The CRC data (16-bit, 32-bit) is device-specific. Please refer to the specific device data sheet to determine availability.)

Remarks

This function implements an operation of the CRCData feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsCRCData](#) function in your application to automatically determine whether this feature is available.

Example

```
uint32_t DMACRCdata;  
DMACRCdata = PLIB_DMA_CRCDataRead ( DMA_ID_0 );
```

5.6.6.6.9.10 PLIB_DMA_CRCDataWrite Function**C**

```
void PLIB_DMA_CRCDataWrite(  
    DMA_MODULE_ID index,  
    uint32_t DMACRCdata  
);
```

Description

This function writes the contents of the DMA CRC data register.

Preconditions

None.

Parameters

Parameters	Description
DMACRCdata	32-bit CRC data (The CRC data (16-bit, 32-bit) is device-specific. Please refer to the specific device data sheet to determine availability.)

Returns

None.

Remarks

This function implements an operation of the CRCData feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsCRCData](#) function in your application to automatically determine whether this feature is available.

Example

```
uint32_t DMACRCdata = 0x0E0E0E;  
PLIB_DMA_CRCDataWrite ( DMA_ID_0, DMACRCdata );
```

5.6.6.6.9.11 PLIB_DMA_CRCDisable Function**C**

```
void PLIB_DMA_CRCDisable(  
    DMA_MODULE_ID index  
);
```

Description

This function disables the DMA module CRC feature. The channel transfers proceed normally.

Preconditions

None.

Returns

None.

Remarks

This function implements an operation of the CRC feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsCRC](#) function in your application to automatically determine whether this feature is available.

Example

```
PLIB_DMA_CRCDisable( DMA_ID_0 );
```

5.6.6.6.9.12 PLIB_DMA_CRCEnable Function**C**

```
void PLIB_DMA_CRCEnable(  
    DMA_MODULE_ID index  
);
```

Description

This function enables the DMA module CRC feature. The channel transfers are routed through the CRC.

Preconditions

None.

Returns

None.

Remarks

This function implements an operation of the CRC feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsCRC](#) function in your application to automatically determine whether this feature is available.

Example

```
PLIB_DMA_CRCEnable( DMA_ID_0 );
```

5.6.6.6.9.13 PLIB_DMA_CRCPolynomialLengthGet Function**C**

```
uint8_t PLIB_DMA_CRCPolynomialLengthGet(  
    DMA_MODULE_ID index  
);
```

Description

This function gets the current polynomial length.

Preconditions

None.

Returns

uint8_t - Polynomial length

Remarks

This function implements an operation of the CRCPolynomialLength feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsCRCPolynomialLength](#) function in your application to automatically determine whether this feature is available.

Example

```
uint8_t polyLength;  
polyLength = PLIB_DMA_CRCPolynomialLengthGet( DMA_ID_0 );
```

5.6.6.6.9.14 PLIB_DMA_CRCPolynomialLengthSet Function

C

```
void PLIB_DMA_CRCPolynomialLengthSet(  
    DMA_MODULE_ID index,  
    uint8_t polyLength  
);
```

Description

This function Selects the polynomial length.

Preconditions

None.

Parameters

Parameters	Description
polyLength	Polynomial length

Returns

None.

Remarks

This function implements an operation of the CRCPolynomialLength feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsCRCPolynomialLength](#) function in your application to automatically determine whether this feature is available.

Example

```
uint8_t polyLength = 0x2;  
PLIB_DMA_CRCPolynomialLengthSet( DMA_ID_0, polyLength );
```

5.6.6.6.9.15 PLIB_DMA_CRCTypeGet Function

C

```
DMA_CRC_TYPE PLIB_DMA_CRCTypeGet(  
    DMA_MODULE_ID index  
);
```

Description

This function gets the DMA module CRC feature type. The CRC feature will compute either the IP header checksum or the Linear Shift Feedback Register (LFSR) checksum.

Preconditions

None.

Returns

CRCType - One of the possible CRC checksums listed by [DMA_CRC_TYPE](#).

Remarks

This function implements an operation of the CRCType feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsCRCType](#) function in your application to automatically determine whether this feature is available.

Example

```
DMA_CRC_TYPE CRCType;  
CRCType = PLIB_DMA_CRCTypeGet( DMA_ID_0 );
```

5.6.6.6.9.16 PLIB_DMA_CRCTypeSet Function

C

```
void PLIB_DMA_CRCTypeSet(  
    DMA_MODULE_ID index,  
    DMA_CRC_TYPE CRCType  
)  
;
```

Description

This function selects the DMA module CRC feature type. The CRC feature will compute either the IP header checksum or the Linear Shift Feedback Register (LFSR) checksum.

Preconditions

None.

Parameters

Parameters	Description
CRCType	One of the possible CRC checksums listed by DMA_CRC_TYPE

Returns

None.

Remarks

This function implements an operation of the CRCType feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsCRCType](#) function in your application to automatically determine whether this feature is available.

Example

```
PLIB_DMA_CRCTypeSet(DMA_ID_0,  
    DMA_CRC_IP_HEADER );
```

5.6.6.6.9.17 PLIB_DMA_CRCWriteByteOrderAlter Function

C

```
void PLIB_DMA_CRCWriteByteOrderAlter(  
    DMA_MODULE_ID index  
)  
;
```

Description

This function enables byte order alteration as specified by the BYTO<1:0> bits. The source data is written to the destination reordered as defined by the BYTO<1:0> bits.

Preconditions

None.

Returns

None.

Remarks

This function implements an operation of the CRCWriteByteOrder feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsCRCWriteByteOrder](#) function in your application to automatically determine whether this feature is available.

Example

```
PLIB_DMA_CRCWriteByteOrderAlter ( DMA_ID_0 );
```

5.6.6.6.9.18 PLIB_DMA_CRCWriteByteOrderMaintain Function

C

```
void PLIB_DMA_CRCWriteByteOrderMaintain(  
    DMA_MODULE_ID index  
);
```

Description

This function disables byte order alteration. The source data is written to the destination unaltered.

Preconditions

None.

Returns

None.

Remarks

This function implements an operation of the CRCWriteByteOrder feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsCRCWriteByteOrder](#) function in your application to automatically determine whether this feature is available.

Example

```
PLIB_DMA_CRCWriteByteOrderMaintain ( DMA_ID_0 );
```

5.6.6.6.9.19 PLIB_DMA_CRCXOREnableGet Function

C

```
uint32_t PLIB_DMA_CRCXOREnableGet(  
    DMA_MODULE_ID index  
);
```

Description

This function reads the CRC XOR register.

Preconditions

None.

Returns

uint32_t - 32-bit CRC XOR enable mask data (The CRC data (16-bit, 32-bit) is device-specific. Please refer to the specific device data sheet to determine availability.)

Remarks

This function implements an operation of the CRCXOREnable feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsCRCXOREnable](#) function in your application to automatically determine whether this feature is available.

Example

```
uint32_t DMACRCXORdata;  
DMACRCXORdata = PLIB_DMA_CRCXOREnableGet ( DMA_ID_0 );
```

5.6.6.6.9.20 PLIB_DMA_CRCXOREnableSet Function

C

```
void PLIB_DMA_CRCXOREnableSet(  
    DMA_MODULE_ID index,
```

```
uint32_t DMACRCXOREnableMask
);
```

Description

This function writes to the CRC XOR enable register as per the specified enable mask. Each enabled bit will be taken as input to the shift register.

Preconditions

None.

Parameters

Parameters	Description
DMACRCXOREnableMask	32-bit CRC XOR enable mask data (The CRC data (16-bit, 32-bit) is device-specific. Please refer to the specific device data sheet to determine availability.)

Returns

None.

Remarks

This function implements an operation of the CRCXOREnable feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsCRCXOREnable](#) function in your application to automatically determine whether this feature is available.

Example

```
uint32_t DMACRCXOREnableMask = 0x05FFFFFF;
PLIB_DMA_CRCXOREnableSet ( DMA_ID_0, DMACRCXOREnableMask );
```

5.6.6.6.10 DMA Global Status Routines

5.6.6.6.10.1 PLIB_DMA_CRCIsEnabled Function

C

```
bool PLIB_DMA_CRCIsEnabled(
    DMA_MODULE_ID index
);
```

Description

This function gets the enable status of the CRC feature.

Preconditions

None.

Returns

- true - The CRC feature is enabled
- false - The CRC feature is disabled

Remarks

This function implements an operation of the CRC feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsCRC](#) function in your application to automatically determine whether this feature is available.

Example

```
bool DMAcrcStatus;
```

```
DMAcrcStatus = PLIB_DMA_CRCIsEnabled( DMA_ID_0 );
```

5.6.6.6.10.2 PLIB_DMA_IsBusy Function

C

```
bool PLIB_DMA_IsBusy(  
    DMA_MODULE_ID index  
);
```

Description

This function gets the BUSY bit of the DMA controller.

Preconditions

None.

Returns

- true - DMA module is active
- false - DMA module is disabled and is not actively transferring data

Remarks

This function implements an operation of the Busy feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsBusy](#) function in your application to automatically determine whether this feature is available.

Example

```
bool dmaBusyStatus;  
dmaBusyStatus = PLIB_DMA_IsBusy( DMA_ID_0 );
```

5.6.6.6.10.3 PLIB_DMA_IsEnabled Function

C

```
bool PLIB_DMA_IsEnabled(  
    DMA_MODULE_ID index  
);
```

Description

This function returns the DMA module enable status.

Preconditions

None.

Returns

- true - The DMA is enabled
- false - The DMA is disabled

Remarks

This function implements an operation of the EnableControl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsEnableControl](#) function in your application to automatically determine whether this feature is available.

Example

```
PLIB_DMA_IsEnabled( DMA_ID_0 );
```

5.6.6.6.10.4 PLIB_DMA_LastBusAccessIsRead Function

C

```
bool PLIB_DMA_LastBusAccessIsRead(  
    DMA_MODULE_ID index  
);
```

Description

This function returns true if the last DMA bus access was a read.

Preconditions

None.

Returns

- true - The last bus access was a read
- false - The last bus access was not a read

Remarks

This function implements an operation of the LastBusAccess feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsLastBusAccess](#) function in your application to automatically determine whether this feature is available.

Example

```
bool dmaLastBusAccessType;  
dmaLastBusAccessType = PLIB_DMA_LastBusAccessIsRead( DMA_ID_0 );
```

5.6.6.6.10.5 PLIB_DMA_LastBusAccessIsWrite Function

C

```
bool PLIB_DMA_LastBusAccessIsWrite(  
    DMA_MODULE_ID index  
);
```

Description

This function returns true if the last DMA bus access was a write operation.

Preconditions

None.

Returns

- true - The last bus access was a write operation
- false - The last bus access was not a write operation

Remarks

This function implements an operation of the LastBusAccess feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsLastBusAccess](#) function in your application to automatically determine whether this feature is available.

Example

```
bool dmaLastBusAccessType;  
dmaLastBusAccessType = PLIB_DMA_LastBusAccessIsWrite( DMA_ID_0 );
```

5.6.6.6.10.6 PLIB_DMA_LastChannelActive Function

C

```
DMA_CHANNEL PLIB_DMA_LastChannelActive(  
    DMA_MODULE_ID index  
);
```

Description

This function returns the last DMA channel that participated in the data transfer.

Preconditions

None.

Returns

channel - One of the existing DMA channels listed by [DMA_CHANNEL](#)

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
DMA_CHANNEL lastActiveChannel;  
lastActiveChannel = PLIB_DMA_LastChannelActive( DMA_ID_0 );
```

5.6.6.6.10.7 PLIB_DMA_RecentAddressAccessed Function

C

```
uint32_t PLIB_DMA_RecentAddressAccessed(  
    DMA_MODULE_ID index  
);
```

Description

This function returns the address of the most recent DMA access.

Preconditions

None.

Returns

uint32_t - The most recent address accessed by the DMA

Remarks

This function implements an operation of the RecentAddress feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsRecentAddress](#) function in your application to automatically determine whether this feature is available.

Example

```
uint32_t dmaLastAddressAccessed;  
dmaLastAddressAccessed = PLIB_DMA_RecentAddressAccessed( DMA_ID_0 );
```

5.6.6.6.10.8 PLIB_DMA_SuspendIsEnabled Function

C

```
bool PLIB_DMA_SuspendIsEnabled(  
    DMA_MODULE_ID index  
);
```

Description

This function returns the DMA suspend status.

Preconditions

None.

Returns

- true - The DMA transfers are suspended
- false - The DMA operates normally

Remarks

This function implements an operation of the Suspend feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsSuspend](#) function in your application to automatically determine whether this feature is available.

Example

```
bool dmaSuspendStatus;  
dmaSuspendStatus = PLIB_DMA_SuspendIsEnabled( DMA_ID_0 );
```

5.6.6.6.11 DMA Channel Status Routines

5.6.6.6.11.1 PLIB_DMA_ChannelXAutoIsEnabled Function

C

```
bool PLIB_DMA_ChannelXAutoIsEnabled(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL channel  
);
```

Description

This function returns the channel automatic enable status.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

- true - Channel automatic enable is on
- false - Channel automatic enable is off

Remarks

This function implements an operation of the ChannelXAuto feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXAuto](#) function in your application to determine whether this feature is available.

Example

```
bool ChAutoEnableStatus;  
ChAutoEnableStatus = PLIB_DMA_ChannelXAutoIsEnabled(DMA_ID_0,  
    DMA_CHANNEL_2 );
```

5.6.6.6.11.2 PLIB_DMA_ChannelXBufferedDataIsWritten Function

C

```
bool PLIB_DMA_ChannelXBufferedDataIsWritten(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL channel  
);
```

Description

This function returns the buffered data write status for the specified channel.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the existing DMA channels listed by DMA_CHANNEL

Returns

- true - The content of the DMA buffer has not been written to the location specified in the destination/source address or in Null Write mode
- false - The content of the DMA buffer has been written to the location specified in the destination/source address or in Null Write mode

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
bool chBuffWriteStatus;  
chBuffWriteStatus = PLIB_DMA_ChannelXBufferedDataIsWritten( DMA_ID_0,  
                                                             DMA_CHANNEL_3 );
```

5.6.6.6.11.3 PLIB_DMA_ChannelXBusyIsBusy Function

C

```
bool PLIB_DMA_ChannelXBusyIsBusy(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL channel  
);
```

Description

This function returns the busy status of the specified channel.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

- true - The channel is active or has been enabled
- false - The channel is inactive or has been disabled

Remarks

This function implements an operation of the ChannelXBusy feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXBusy](#) function in your application to automatically determine whether this feature is available.

Example

```
bool chBusyStatus;  
chBusyStatus = PLIB_DMA_ChannelXBusyIsBusy ( DMA_ID_0, DMA_CHANNEL_4 );
```

5.6.6.6.11.4 PLIB_DMA_ChannelXChainIsEnabled Function**C**

```
bool PLIB_DMA_ChannelXChainIsEnabled(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL channel  
);
```

Description

This function returns the chain status of the specified channel.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

- true - The channel chain is on for this channel
- false - The channel chain is off for this channel

Remarks

This function implements an operation of the ChannelXChainEnbl feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelXChainEnbl](#) function in your application to determine whether this feature is available.

Example

```
bool ChchainStatus;  
ChchainStatus = PLIB_DMA_ChannelXChainIsEnabled( DMA_ID_0, DMA_CHANNEL_2 );
```

5.6.6.6.11.5 PLIB_DMA_ChannelXCollisionStatus Function**C**

```
bool PLIB_DMA_ChannelXCollisionStatus(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL channel,  
    DMA_CHANNEL_COLLISION collisionType  
);
```

Description

This function returns the status of the specified collision type for the specified channel.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the existing DMA channels listed by DMA_CHANNEL
collisonType	Collision type listed by DMA_CHANNEL_COLLISION

Returns

- true - A collision specified by collisonType was detected
- false - No collision of type collisonType was detected

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
bool memWriteCollisionStatus;  
memWriteCollisionStatus = PLIB_DMA_ChannelXMemoryWriteCollisionStatus(  
    DMA_ID_0,  
    DMA_CHANNEL_3,  
    DMA_CHANNEL_COLLISION_MEMORY );
```

5.6.6.6.11.6 PLIB_DMA_ChannelXEventIsDetected Function**C**

```
bool PLIB_DMA_ChannelXEventIsDetected(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL channel  
);
```

Description

This function returns the event status on the specified channel.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

- true - An event was detected
- false - No events were detected

Remarks

This function implements an operation of the ChannelXEvent feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or include the [PLIB_DMA_ExistsChannelXEvent](#) function in your application to determine whether this feature is available.

Example

```
bool channeleventStatus;  
channeleventStatus = PLIB_DMA_ChannelXEventIsDetected( DMA_ID_0,  
    DMA_CHANNEL_2 );
```

5.6.6.6.11.7 PLIB_DMA_ChannelXIsEnabled Function

C

```
bool PLIB_DMA_ChannelXIsEnabled(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL channel  
);
```

Description

This function will return the enable status of the specified channel.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

- true - The specified DMA channel is enabled
- false - The specified DMA channel is disabled

Remarks

This function implements an operation of the ChannelX feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelX](#) function in your application to automatically determine whether this feature is available.

Example

```
bool chEnableStatus;  
chEnableStatus = PLIB_DMA_ChannelXIsEnabled ( DMA_ID_0, DMA_CHANNEL_2 );
```

5.6.6.6.11.8 PLIB_DMA_ChannelXNullWriteModeIsEnabled Function

C

```
bool PLIB_DMA_ChannelXNullWriteModeIsEnabled(  
    DMA_MODULE_ID index,  
    DMA_CHANNEL channel  
);
```

Description

This function returns the enable status of the Null Write mode for the specified channel.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the possible DMA channels listed by DMA_CHANNEL

Returns

- true - Null write mode is enabled for this channel
- false - Null write mode is disabled for this channel

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
bool chNullWriteStatus;
chNullWriteStatus = PLIB_DMA_ChannelXNullWriteModeIsEnabled (
    DMA_ID_0,
    DMA_CHANNEL_4 );
```

5.6.6.6.11.9 PLIB_DMA_ChannelXPingPongModeGet Function

C

```
DMA_PING_PONG_MODE PLIB_DMA_ChannelXPingPongModeGet (
    DMA_MODULE_ID index,
    DMA_CHANNEL channel
);
```

Description

This function returns the Ping-Pong mode status for the specified channel.

Preconditions

None.

Parameters

Parameters	Description
channel	One of the existing DMA channels listed by DMA_CHANNEL

Returns

mode - One of the possible Ping-Pong modes

Remarks

This feature is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
DMA_PING_PONG_MODE chPingPongStatus;
chPingPongStatus = PLIB_DMA_ChannelXPingPongModeGet(DMA_ID_0,
    DMA_CHANNEL_3 );
if (DMA_PING_PONG_SECONDARY == chPingPongStatus)
{
    \Application
}
```

5.6.6.6.11.10 PLIB_DMA_ChannelBitsGet Function

C

```
uint8_t PLIB_DMA_ChannelBitsGet(
    DMA_MODULE_ID index
);
```

Description

This function returns the channel bits.

Preconditions

None.

Returns

uint8_t - DMA channel bits

Remarks

This function implements an operation of the ChannelBits feature. This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use the [PLIB_DMA_ExistsChannelBits](#) function in your application to automatically determine whether this feature is available.

Example

```
uint8_t dmaChBits;  
dmaChBits = PLIB_DMA_ChannelBitsGet( DMA_ID_0 );
```

5.6.6.6.12 Data Types and Constants

5.6.6.6.12.1 DMA_ADDRESS_OFFSET_TYPE Enumeration

C

```
typedef enum {  
    DMA_ADDRESS_OFFSET_PRIMARY,  
    DMA_ADDRESS_OFFSET_SECONDARY  
} DMA_ADDRESS_OFFSET_TYPE;
```

Description

DMA address offsets

This enumeration lists all the possible DMA address offsets.

Members

Members	Description
DMA_ADDRESS_OFFSET_PRIMARY	address offset-A
DMA_ADDRESS_OFFSET_SECONDARY	address offset-B

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.6.6.12.2 DMA_CHANNEL Enumeration

C

```
typedef enum {  
    DMA_CHANNEL_0,  
    DMA_CHANNEL_1,  
    DMA_CHANNEL_2,  
    DMA_CHANNEL_3,  
    DMA_CHANNEL_4,  
    DMA_CHANNEL_5,  
    DMA_CHANNEL_6,  
    DMA_CHANNEL_7  
} DMA_CHANNEL;
```

Description

DMA channel

This enumeration lists all the possible DMA channels available.

Members

Members	Description
DMA_CHANNEL_0	DMA Channel 0

DMA_CHANNEL_1	DMA Channel 1
DMA_CHANNEL_2	DMA Channel 2
DMA_CHANNEL_3	DMA Channel 3
DMA_CHANNEL_4	DMA Channel 4
DMA_CHANNEL_5	DMA Channel 5
DMA_CHANNEL_6	DMA Channel 6
DMA_CHANNEL_7	DMA Channel 7

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.6.6.12.3 DMA_CHANNEL_ADDRESSING_MODE Enumeration**C**

```
typedef enum {
    DMA_ADDRESSING_REGISTER_INDIRECT_WITH_POST_INCREMENT,
    DMA_ADDRESSING_REGISTER_INDIRECT_WITHOUT_POST_INCREMENT,
    DMA_ADDRESSING_PERIPHERAL_INDIRECT
} DMA_CHANNEL_ADDRESSING_MODE;
```

Description

DMA channel addressing modes

This enumeration lists all the possible channel addressing modes.

Members

Members	Description
DMA_ADDRESSING_REGISTER_INDIRECT_WITH_POST_INCREMENT	register indirect with post increment
DMA_ADDRESSING_REGISTER_INDIRECT_WITHOUT_POST_INCREMENT	register indirect without post increment
DMA_ADDRESSING_PERIPHERAL_INDIRECT	peripheral indirect addressing

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.6.6.12.4 DMA_CHANNEL_COLLISION Enumeration**C**

```
typedef enum {
    DMA_CHANNEL_COLLISION_MEMORY,
    DMA_CHANNEL_COLLISION_PERIPHERAL,
    DMA_CHANNEL_COLLISION_TRANSFER_REQUEST
} DMA_CHANNEL_COLLISION;
```

Description

DMA channel collision types

This enumeration lists all the possible channel collision types.

Members

Members	Description
DMA_CHANNEL_COLLISION_MEMORY	Memory Write Collision
DMA_CHANNEL_COLLISION_PERIPHERAL	Peripheral Write collision
DMA_CHANNEL_COLLISION_TRANSFER_REQUEST	Transfer request collision

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.6.6.12.5 DMA_CHANNEL_DATA_SIZE Enumeration**C**

```
typedef enum {  
    DMA_CHANNEL_DATA_8,  
    DMA_CHANNEL_DATA_16  
} DMA_CHANNEL_DATA_SIZE;
```

Description

DMA channel data size

This enumeration lists all the possible data sizes for the DMA channels.

Members

Members	Description
DMA_CHANNEL_DATA_8	8 bit data size
DMA_CHANNEL_DATA_16	16 bit data size

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.6.6.12.6 DMA_CHANNEL_PRIORITY Enumeration**C**

```
typedef enum {  
    DMA_CHANNEL_PRIORITY_0,  
    DMA_CHANNEL_PRIORITY_1,  
    DMA_CHANNEL_PRIORITY_2,  
    DMA_CHANNEL_PRIORITY_3,  
    DMA_CHANNEL_ROUND_ROBIN,  
    DMA_CHANNEL_FIXED_PRIORITY  
} DMA_CHANNEL_PRIORITY;
```

Description

DMA channel priority types

This enumeration lists all the possible channel priorities.

Members

Members	Description
DMA_CHANNEL_PRIORITY_0	priority 0
DMA_CHANNEL_PRIORITY_1	priority 1
DMA_CHANNEL_PRIORITY_2	priority 2
DMA_CHANNEL_PRIORITY_3	priority 3
DMA_CHANNEL_ROUND_ROBIN	round-robin scheme
DMA_CHANNEL_FIXED_PRIORITY	fixed priority scheme

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.6.6.12.7 DMA_CHANNEL_TRANSFER_DIRECTION Enumeration

C

```
typedef enum {
    DMA_READ_FROM_MEMORY_WRITE_TO_PERIPHERAL,
    DMA_READ_FROM_PERIPHERAL_WRITE_TO_MEMORY,
    DMA_READ_FROM_MEMORY_WRITE_TO_MEMORY,
    DMA_READ_FROM_PERIPHERAL_WRITE_TO_PERIPHERAL
} DMA_CHANNEL_TRANSFER_DIRECTION;
```

Description

DMA channel data transfer direction

This enumeration lists all the possible data transfer directions.

Members

Members	Description
DMA_READ_FROM_MEMORY_WRITE_TO_PERIPHERAL	DMA transfer happens from the memory to peripheral
DMA_READ_FROM_PERIPHERAL_WRITE_TO_MEMORY	DMA transfer happens from the peripheral to memory
DMA_READ_FROM_MEMORY_WRITE_TO_MEMORY	DMA transfer happens from the memory to memory
DMA_READ_FROM_PERIPHERAL_WRITE_TO_PERIPHERAL	DMA transfer happens from the peripheral to peripheral

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.6.6.12.8 DMA_CHANNEL_TRIGGER_TYPE Enumeration

C

```
typedef enum {
    DMA_CHANNEL_TRIGGER_TRANSFER_START,
    DMA_CHANNEL_TRIGGER_TRANSFER_ABORT,
    DMA_CHANNEL_TRIGGER_PATTERN_MATCH_ABORT
} DMA_CHANNEL_TRIGGER_TYPE;
```

Description

DMA trigger types

This enumeration lists all the possible DMA channel triggers.

Members

Members	Description
DMA_CHANNEL_TRIGGER_TRANSFER_START	Trigger for DMA transfer start
DMA_CHANNEL_TRIGGER_TRANSFER_ABORT	Trigger for DMA transfer abort
DMA_CHANNEL_TRIGGER_PATTERN_MATCH_ABORT	Trigger for DMA transfer abort via pattern match

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.6.6.12.9 DMA_CRC_BIT_ORDER Enumeration

C

```
typedef enum {
    DMA_CRC_BIT_ORDER_LSB,
    DMA_CRC_BIT_ORDER_MSB
}
```

```
} DMA_CRC_BIT_ORDER;
```

Description

DMA CRC calculation bit order

This enumeration lists all the possible CRC calculation bit orders

Members

Members	Description
DMA_CRC_BIT_ORDER_LSB	CRC is calculated least significant bit first
DMA_CRC_BIT_ORDER_MSB	CRC is calculated most significant bit first

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.6.6.12.10 DMA_CRC_BYTE_ORDER Enumeration

C

```
typedef enum {
    DMA_CRC_BYTEORDER_NO_SWAPPING,
    DMA_CRC_SWAP_BYTE_ON_WORD_BOUNDARY,
    DMA_CRC_SWAP_HALF_WORD_ON_WORD_BOUNDARY,
    DMA_CRC_SWAP_BYTE_ON_HALF_WORD_BOUNDARY
} DMA_CRC_BYTE_ORDER;
```

Description

CRC Byte order type

This enumeration lists all the possible byte orders handled by CRC module.

Members

Members	Description
DMA_CRC_BYTEORDER_NO_SWAPPING	No swapping, Source byte order
DMA_CRC_SWAP_BYTE_ON_WORD_BOUNDARY	Endian byte swap on word boundaries (reverse source byte order)
DMA_CRC_SWAP_HALF_WORD_ON_WORD_BOUNDARY	Swap half-words on word boundaries (reverse source half-word order with source byte order per half-word)
DMA_CRC_SWAP_BYTE_ON_HALF_WORD_BOUNDARY	Endian byte swap on half-word boundaries (reverse source half-word order with reverse source byte order per half-word)

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.6.6.12.11 DMA_CRC_TYPE Enumeration

C

```
typedef enum {
    DMA_CRC_IP_HEADER,
    DMA_CRC_LFSR
} DMA_CRC_TYPE;
```

Description

CRC type

This enumeration lists all the possible checksums handled by CRC module.

Members

Members	Description
DMA_CRC_IP_HEADER	CRC module will calculate IP header checksum
DMA_CRC_LFSR	CRC module will calculate Linear Feedback Shift Registers checksum

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.6.6.12.12 DMA_DESTINATION_ADDRESSING_MODE Enumeration**C**

```
typedef enum {
    DMA_ADDRESSING_DESTINATION_UNCHANGED,
    DMA_ADDRESSING_DESTINATION_INCREMENT_BASED_ON_SIZE,
    DMA_ADDRESSING_DESTINATION_DECREMENT_BASED_ON_SIZE,
    DMA_ADDRESSING_DESTINATION_PERIPHERAL_INDIRECT
} DMA_DESTINATION_ADDRESSING_MODE;
```

Description

DMA destination addressing modes

This enumeration lists all the possible destination addressing modes.

Members

Members	Description
DMA_ADDRESSING_DESTINATION_UNCHANGED	DMADST remains unchanged after a transfer completion
DMA_ADDRESSING_DESTINATION_INCREMENT_BASED_ON_SIZE	DMADST is incremented based on SIZE bit after a transfer completion
DMA_ADDRESSING_DESTINATION_DECREMENT_BASED_ON_SIZE	DMADST is decremented based on SIZE bit after a transfer completion
DMA_ADDRESSING_DESTINATION_PERIPHERAL_INDIRECT	DMADST is used in peripheral indirect addressing and remains unchanged

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.6.6.12.13 DMA_INT_TYPE Enumeration**C**

```
typedef enum {
    DMA_INT_ADDRESS_ERROR,
    DMA_INT_TRANSFER_ABORT,
    DMA_INT_CELL_TRANSFER_COMPLETE,
    DMA_INT_BLOCK_TRANSFER_COMPLETE,
    DMA_INT_DESTINATION_HALF_FULL,
    DMA_INT_DESTINATION_DONE,
    DMA_INT_SOURCE_HALF_EMPTY,
    DMA_INT_SOURCE_DONE,
    DMA_INT_COUNT_HALF_DONE,
    DMA_INT_CHANNEL_OVERRUN,
    DMA_INT_COMPLETE,
    DMA_INT_LOW_ADDRESS_LIMIT,
    DMA_INT_HIGH_ADDRESS_LIMIT
} DMA_INT_TYPE;
```

Description

DMA channel X interrupt types

This enumeration lists all the possible interrupt types for a channel. Not to be confused with the DMA trigger/abort interrupt sources (supported only for few parts).

Members

Members	Description
DMA_INT_ADDRESS_ERROR	Channel address error interrupt
DMA_INT_TRANSFER_ABORT	channel transfer abort interrupt
DMA_INT_CELL_TRANSFER_COMPLETE	channel cell transfer complete
DMA_INT_BLOCK_TRANSFER_COMPLETE	Channel block transfer complete
DMA_INT_DESTINATION_HALF_FULL	Channel destination half full interrupt
DMA_INT_DESTINATION_DONE	Channel destination done interrupt
DMA_INT_SOURCE_HALF_EMPTY	Channel source half empty interrupt
DMA_INT_SOURCE_DONE	Channel source done interrupt
DMA_INT_COUNT_HALF_DONE	DMA count has reached its halfway
DMA_INT_CHANNEL_OVERRUN	channel overrun. channel is triggered while it is still completing the operation based on the previous trigger
DMA_INT_COMPLETE	DMA complete operation interrupt
DMA_INT_LOW_ADDRESS_LIMIT	DMA low address limit interrupt
DMA_INT_HIGH_ADDRESS_LIMIT	DMA high address limit interrupt

Remarks

Not to be confused with the DMA trigger/abort interrupt sources (supported only for few parts). This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.6.6.12.14 DMA_MODULE_ID Enumeration**C**

```
typedef enum {
    DMA_ID_0
} DMA_MODULE_ID;
```

Description

DMA module ID

This data type defines the possible instances of the DMA module.

Members

Members	Description
DMA_ID_0	first instance of the DMA

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.6.6.12.15 DMA_PATTERN_LENGTH Enumeration**C**

```
typedef enum {
    DMA_PATTERN_MATCH_LENGTH_1BYTE,
```

```

    DMA_PATTERN_MATCH_LENGTH_2BYTES
} DMA_PATTERN_LENGTH;

```

Description

DMA pattern length

This enumeration gives the length of the pattern to be matched with CHPIGN<7:0> in DCHxCON<31:24>.

Members

Members	Description
DMA_PATTERN_MATCH_LENGTH_1BYTE	The Length of matching pattern with CHPIGN<7:0> in DCHxCON<31:24> is 1 BYTE
DMA_PATTERN_MATCH_LENGTH_2BYTES	The Length of matching pattern with CHPIGN<7:0> in DCHxCON<31:24> is 2 BYTES

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.6.6.12.16 DMA_PING_PONG_MODE Enumeration**C**

```

typedef enum {
    DMA_PING_PONG_PRIMARY,
    DMA_PING_PONG_SECONDARY
} DMA_PING_PONG_MODE;

```

Description

DMA PING-PONG modes

This enumeration lists all the possible ping-pong modes.

Members

Members	Description
DMA_PING_PONG_PRIMARY	DMAxSTA is selected in the ping-pong mode
DMA_PING_PONG_SECONDARY	DMAxSTB is selected in the ping-pong mode

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.6.6.12.17 DMA_SOURCE_ADDRESSING_MODE Enumeration**C**

```

typedef enum {
    DMA_ADDRESSING_SOURCE_UNCHANGED,
    DMA_ADDRESSING_SOURCE_INCREMENT_BASED_ON_SIZE,
    DMA_ADDRESSING_SOURCE_DECREMENT_BASED_ON_SIZE,
    DMA_ADDRESSING_SOURCE_PERIPHERAL_INDIRECT
} DMA_SOURCE_ADDRESSING_MODE;

```

Description

DMA source addressing modes

This enumeration lists all the possible source addressing modes.

Members

Members	Description
DMA_ADDRESSING_SOURCE_UNCHANGED	DMASRC remains unchanged after a transfer completion
DMA_ADDRESSING_SOURCE_INCREMENT_BASED_ON_SIZE	DMASRC is incremented based on SIZE bit after a transfer completion
DMA_ADDRESSING_SOURCE_DECREMENT_BASED_ON_SIZE	DMASRC is decremented based on SIZE bit after a transfer completion
DMA_ADDRESSING_SOURCE_PERIPHERAL_INDIRECT	DMASRC is used in peripheral indirect addressing and remains unchanged

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.6.6.12.18 DMA_TRANSFER_MODE Enumeration**C**

```
typedef enum {
    DMA_MODE_ONE_SHOT,
    DMA_MODE_REPEATED_ONE_SHOT,
    DMA_MODE_CONTINUOUS,
    DMA_MODE_REPEATED_CONTINUOUS,
    DMA_MODE_ONE_SHOT_PING_PONG_ENABLED,
    DMA_MODE_ONE_SHOT_PING_PONG_DISABLED,
    DMA_MODE_CONTINUOUS_PING_PONG_DISABLED,
    DMA_MODE_CONTINUOUS_PING_PONG_ENABLED
} DMA_TRANSFER_MODE;
```

Description

DMA transfer/operating mode

This enumeration lists the possible DMA transfer/operating modes.

Members

Members	Description
DMA_MODE_ONE_SHOT	one-shot transfer
DMA_MODE_REPEATED_ONE_SHOT	repeated one-shot transfer
DMA_MODE_CONTINUOUS	continuous transfer
DMA_MODE_REPEATED_CONTINUOUS	repeated continuous transfer
DMA_MODE_ONE_SHOT_PING_PONG_ENABLED	one-shot transfer with ping-pong buffers
DMA_MODE_ONE_SHOT_PING_PONG_DISABLED	one-shot transfer without the ping-pong buffers
DMA_MODE_CONTINUOUS_PING_PONG_DISABLED	continuous transfer without the ping-pong buffers
DMA_MODE_CONTINUOUS_PING_PONG_ENABLED	continuous transfer with ping-pong buffers

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.6.6.12.19 DMA_TRIGGER_SOURCE Enumeration**C**

```
typedef enum {
    DMA_TRIGGER_TIMER_CORE,
    DMA_TRIGGER_SOFTWARE_0,
    DMA_TRIGGER_SOFTWARE_1,

```

DMA_TRIGGER_EXTERNAL_0,
DMA_TRIGGER_EXTERNAL_1,
DMA_TRIGGER_EXTERNAL_2,
DMA_TRIGGER_EXTERNAL_3,
DMA_TRIGGER_EXTERNAL_4,
DMA_TRIGGER_TIMER_1,
DMA_TRIGGER_TIMER_2,
DMA_TRIGGER_TIMER_3,
DMA_TRIGGER_TIMER_4,
DMA_TRIGGER_TIMER_5,
DMA_TRIGGER_INPUT_CAPTURE_1,
DMA_TRIGGER_INPUT_CAPTURE_2,
DMA_TRIGGER_INPUT_CAPTURE_3,
DMA_TRIGGER_INPUT_CAPTURE_4,
DMA_TRIGGER_INPUT_CAPTURE_5,
DMA_TRIGGER_INPUT_CAPTURE_1_ERROR,
DMA_TRIGGER_INPUT_CAPTURE_2_ERROR,
DMA_TRIGGER_INPUT_CAPTURE_3_ERROR,
DMA_TRIGGER_INPUT_CAPTURE_4_ERROR,
DMA_TRIGGER_INPUT_CAPTURE_5_ERROR,
DMA_TRIGGER_OUTPUT_COMPARE_1,
DMA_TRIGGER_OUTPUT_COMPARE_2,
DMA_TRIGGER_OUTPUT_COMPARE_3,
DMA_TRIGGER_OUTPUT_COMPARE_4,
DMA_TRIGGER_OUTPUT_COMPARE_5,
DMA_TRIGGER_SPI_1_ERROR,
DMA_TRIGGER_SPI_1_RECEIVE,
DMA_TRIGGER_SPI_1_TRANSMIT,
DMA_TRIGGER_SPI_1A_ERROR,
DMA_TRIGGER_SPI_1A_RECEIVE,
DMA_TRIGGER_SPI_1A_TRANSMIT,
DMA_TRIGGER_SPI_2_ERROR,
DMA_TRIGGER_SPI_2_RECEIVE,
DMA_TRIGGER_SPI_2_TRANSMIT,
DMA_TRIGGER_SPI_2A_ERROR,
DMA_TRIGGER_SPI_2A_RECEIVE,
DMA_TRIGGER_SPI_2A_TRANSMIT,
DMA_TRIGGER_SPI_3_ERROR,
DMA_TRIGGER_SPI_3_RECEIVE,
DMA_TRIGGER_SPI_3_TRANSMIT,
DMA_TRIGGER_SPI_3A_ERROR,
DMA_TRIGGER_SPI_3A_RECEIVE,
DMA_TRIGGER_SPI_3A_TRANSMIT,
DMA_TRIGGER_SPI_4_ERROR,
DMA_TRIGGER_SPI_4_RECEIVE,
DMA_TRIGGER_SPI_4_TRANSMIT,
DMA_TRIGGER_I2C_1_ERROR,
DMA_TRIGGER_I2C_1_SLAVE,
DMA_TRIGGER_I2C_1_MASTER,
DMA_TRIGGER_I2C_1A_ERROR,
DMA_TRIGGER_I2C_1A_SLAVE,
DMA_TRIGGER_I2C_1A_MASTER,
DMA_TRIGGER_I2C_2_ERROR,
DMA_TRIGGER_I2C_2_SLAVE,
DMA_TRIGGER_I2C_2_MASTER,
DMA_TRIGGER_I2C_2A_ERROR,
DMA_TRIGGER_I2C_2A_SLAVE,
DMA_TRIGGER_I2C_2A_MASTER,
DMA_TRIGGER_I2C_3_ERROR,
DMA_TRIGGER_I2C_3_SLAVE,
DMA_TRIGGER_I2C_3_MASTER,
DMA_TRIGGER_I2C_3A_ERROR,
DMA_TRIGGER_I2C_3A_SLAVE,
DMA_TRIGGER_I2C_3A_MASTER,
DMA_TRIGGER_I2C_4_ERROR,
DMA_TRIGGER_I2C_4_SLAVE,

```
DMA_TRIGGER_I2C_4_MASTER,  
DMA_TRIGGER_I2C_5_ERROR,  
DMA_TRIGGER_I2C_5_SLAVE,  
DMA_TRIGGER_I2C_5_MASTER,  
DMA_TRIGGER_USART_1_ERROR,  
DMA_TRIGGER_USART_1_RECEIVE,

DMA_TRIGGER_FLASH_CONTROL,
```

```

DMA_TRIGGER_USB_1,
DMA_TRIGGER_ETH_1,
DMA_TRIGGER_PARALLEL_PORT_ERROR,
DMA_TRIGGER_CTMU
} DMA_TRIGGER_SOURCE;

```

Description

DMA trigger sources

This enumeration lists all the possible DMA trigger sources.

Members

Members	Description
DMA_TRIGGER_TIMER_CORE	Core timer
DMA_TRIGGER_SOFTWARE_0	Software 0
DMA_TRIGGER_SOFTWARE_1	Software 1
DMA_TRIGGER_EXTERNAL_0	External 0
DMA_TRIGGER_EXTERNAL_1	External 1
DMA_TRIGGER_EXTERNAL_2	External 2
DMA_TRIGGER_EXTERNAL_3	External 3
DMA_TRIGGER_EXTERNAL_4	External 4
DMA_TRIGGER_TIMER_1	Timer 1
DMA_TRIGGER_TIMER_2	Timer 2
DMA_TRIGGER_TIMER_3	Timer 3
DMA_TRIGGER_TIMER_4	Timer 4
DMA_TRIGGER_TIMER_5	Timer 5
DMA_TRIGGER_INPUT_CAPTURE_1	Input Capture 1
DMA_TRIGGER_INPUT_CAPTURE_2	Input Capture 2
DMA_TRIGGER_INPUT_CAPTURE_3	Input Capture 3
DMA_TRIGGER_INPUT_CAPTURE_4	Input Capture 4
DMA_TRIGGER_INPUT_CAPTURE_5	Input Capture 5
DMA_TRIGGER_INPUT_CAPTURE_1_ERROR	Input Capture 1 error
DMA_TRIGGER_INPUT_CAPTURE_2_ERROR	Input Capture 2 error
DMA_TRIGGER_INPUT_CAPTURE_3_ERROR	Input Capture 3 error
DMA_TRIGGER_INPUT_CAPTURE_4_ERROR	Input Capture 4 error
DMA_TRIGGER_INPUT_CAPTURE_5_ERROR	Input Capture 5 error
DMA_TRIGGER_OUTPUT_COMPARE_1	Output compare 1
DMA_TRIGGER_OUTPUT_COMPARE_2	Output compare 2
DMA_TRIGGER_OUTPUT_COMPARE_3	Output compare 3
DMA_TRIGGER_OUTPUT_COMPARE_4	Output compare 4
DMA_TRIGGER_OUTPUT_COMPARE_5	Output compare 5
DMA_TRIGGER_SPI_1_ERROR	SPI 1 error
DMA_TRIGGER_SPI_1_RECEIVE	SPI 1 receive
DMA_TRIGGER_SPI_1_TRANSMIT	SPI 1 transmit
DMA_TRIGGER_SPI_1A_ERROR	SPI 1A error
DMA_TRIGGER_SPI_1A_RECEIVE	SPI 1A receive
DMA_TRIGGER_SPI_1A_TRANSMIT	SPI 1A transmit
DMA_TRIGGER_SPI_2_ERROR	SPI 2 erro
DMA_TRIGGER_SPI_2_RECEIVE	SPI 2 receive

DMA_TRIGGER_SPI_2_TRANSMIT	SPI 2 transmit

DMA_TRIGGER_I2C_3A_SLAVE	I2C 3A slave
DMA_TRIGGER_I2C_3A_MASTER	I2C 3A master
DMA_TRIGGER_I2C_4_ERROR	I2C 4 error
DMA_TRIGGER_I2C_4_SLAVE	I2C 4 slave
DMA_TRIGGER_I2C_4_MASTER	I2C 4 master
DMA_TRIGGER_I2C_5_ERROR	I2C 5 error
DMA_TRIGGER_I2C_5_SLAVE	I2C 5 slave
DMA_TRIGGER_I2C_5_MASTER	I2C 5 master
DMA_TRIGGER_USART_1_ERROR	USART 1 error
DMA_TRIGGER_USART_1_RECEIVE	USART 1 receive
DMA_TRIGGER_USART_1_TRANSMIT	USART 1 transmit
DMA_TRIGGER_USART_1A_ERROR	USART 1A error
DMA_TRIGGER_USART_1A_RECEIVE	USART 1A receive
DMA_TRIGGER_USART_1A_TRANSMIT	USART 1A transmit
DMA_TRIGGER_USART_1B_ERROR	USART 1B error
DMA_TRIGGER_USART_1B_RECEIVE	USART 1B receive

DMA_TRIGGER_USART_1B_TRANSMIT	USART 1B transmit
DMA_TRIGGER_USART_2_ERROR	USART 2 error
DMA_TRIGGER_USART_2_RECEIVE	USART 2 receive
DMA_TRIGGER_USART_2_TRANSMIT	USART 2 transmit
DMA_TRIGGER_USART_2A_ERROR	USART 2A error
DMA_TRIGGER_USART_2A_RECEIVE	USART 2A receive
DMA_TRIGGER_USART_2A_TRANSMIT	USART 2A transmit
DMA_TRIGGER_USART_2B_ERROR	USART 2B error
DMA_TRIGGER_USART_2B_RECEIVE	USART 2B receive
DMA_TRIGGER_USART_2B_TRANSMIT	USART 2B transmit
DMA_TRIGGER_USART_3_ERROR	USART 3 error
DMA_TRIGGER_USART_3_RECEIVE	USART 3 receive
DMA_TRIGGER_USART_3_TRANSMIT	USART 3 transmit
DMA_TRIGGER_USART_3A_ERROR	USART 3A error
DMA_TRIGGER_USART_3A_RECEIVE	USART 3A receive
DMA_TRIGGER_USART_3A_TRANSMIT	USART 3A transmit
DMA_TRIGGER_USART_3B_ERROR	USART 3B error
DMA_TRIGGER_USART_3B_RECEIVE	USART 3B receive
DMA_TRIGGER_USART_3B_TRANSMIT	USART 3B transmit
DMA_TRIGGER_USART_4_ERROR	USART 4 error
DMA_TRIGGER_USART_4_RECEIVE	USART 4 receive
DMA_TRIGGER_USART_4_TRANSMIT	USART 4 transmit
DMA_TRIGGER_USART_5_ERROR	USART 5 error
DMA_TRIGGER_USART_5_RECEIVE	USART 5 receive
DMA_TRIGGER_USART_5_TRANSMIT	USART 5 transmit
DMA_TRIGGER_USART_6_ERROR	USART 6 error
DMA_TRIGGER_USART_6_RECEIVE	USART 6 receive
DMA_TRIGGER_USART_6_TRANSMIT	USART 6 transmit
DMA_TRIGGER_CHANGE_NOTICE	Change notice
DMA_TRIGGER_CHANGE_NOTICE_A	Change notice A
DMA_TRIGGER_CHANGE_NOTICE_B	Change notice B
DMA_TRIGGER_CHANGE_NOTICE_C	Change notice C
DMA_TRIGGER_CHANGE_NOTICE_D	Change notice D
DMA_TRIGGER_CHANGE_NOTICE_E	Change notice E
DMA_TRIGGER_CHANGE_NOTICE_F	Change notice F
DMA_TRIGGER_CHANGE_NOTICE_G	Change notice G
DMA_TRIGGER_DMA_0	DMA Channel 0
DMA_TRIGGER_DMA_1	DMA Channel 1
DMA_TRIGGER_DMA_2	DMA Channel 2
DMA_TRIGGER_DMA_3	DMA Channel 3
DMA_TRIGGER_DMA_4	DMA Channel 4
DMA_TRIGGER_DMA_5	DMA Channel 5
DMA_TRIGGER_DMA_6	DMA Channel 6
DMA_TRIGGER_DMA_7	DMA Channel 7
DMA_TRIGGER_COMPARATOR_1	Comparator 1

DMA_TRIGGER_COMPARATOR_2	DMA Channel 2
DMA_TRIGGER_COMPARATOR_3	DMA Channel 3
DMA_TRIGGER_ADC_1	ADC 1
DMA_TRIGGER_PARALLEL_PORT	Parallel port
DMA_TRIGGER_CAN_1	CAN 1
DMA_TRIGGER_CAN_2	CAN 2
DMA_TRIGGER_CLOCK_MONITOR	Clock monitor
DMA_TRIGGER_RTCC	RTCC
DMA_TRIGGER_FLASH_CONTROL	Flash control
DMA_TRIGGER_USB_1	USB 1
DMA_TRIGGER_ETH_1	ETH 1
DMA_TRIGGER_PARALLEL_PORT_ERROR	Parallel port error
DMA_TRIGGER_CTMU	CTMU

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.6.6.13 Feature Existence Routines

5.6.6.6.13.1 PLIB_DMA_ExistsAbortTransfer Function

C

```
bool PLIB_DMA_ExistsAbortTransfer(
    DMA_MODULE_ID index
);
```

Description

This function identifies whether the AbortTransfer feature is available on the DMA module. When this function returns true, this function is supported on the device:

- [PLIB_DMA_AbortTransferSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The AbortTransfer feature is supported on the device
- false - The AbortTransfer feature is not supported on the device

Remarks

None.

5.6.6.6.13.2 PLIB_DMA_ExistsBusy Function

C

```
bool PLIB_DMA_ExistsBusy(
```

```
    DMA_MODULE_ID index
);
```

Description

This function identifies whether the Busy feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- [PLIB_DMA_BusyActiveSet](#)
- [PLIB_DMA_BusyActiveReset](#)
- [PLIB_DMA_IsBusy](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The Busy feature is supported on the device
- false - The Busy feature is not supported on the device

Remarks

None.

5.6.6.6.13.3 PLIB_DMA_ExistsChannelBits Function

C

```
bool PLIB_DMA_ExistsChannelBits(
    DMA_MODULE_ID index
);
```

Description

This function identifies whether the ChannelBits feature is available on the DMA module. When this function returns true, this function is supported on the device:

- [PLIB_DMA_ChannelBitsGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChannelBits feature is supported on the device
- false - The ChannelBits feature is not supported on the device

Remarks

None.

5.6.6.6.13.4 PLIB_DMA_ExistsChannelX Function

C

```
bool PLIB_DMA_ExistsChannelX(  
    DMA_MODULE_ID index  
);
```

Description

This function identifies whether the ChannelX feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- [PLIB_DMA_ChannelXEnable](#)
- [PLIB_DMA_ChannelXIsEnabled](#)
- [PLIB_DMA_ChannelXDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChannelX feature is supported on the device
- false - The ChannelX feature is not supported on the device

Remarks

None.

5.6.6.6.13.5 PLIB_DMA_ExistsChannelXAbortIRQ Function

C

```
bool PLIB_DMA_ExistsChannelXAbortIRQ(  
    DMA_MODULE_ID index  
);
```

Description

This function identifies whether the ChannelXAbortIRQ feature is available on the DMA module. When this function returns true, this function is supported on the device:

- [PLIB_DMA_ChannelXAbortIRQSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChannelXAbortIRQ feature is supported on the device
- false - The ChannelXAbortIRQ feature is not supported on the device

Remarks

None.

5.6.6.6.13.6 PLIB_DMA_ExistsChannelXAuto Function**C**

```
bool PLIB_DMA_ExistsChannelXAuto(  
    DMA_MODULE_ID index  
);
```

Description

This function identifies whether the ChannelXAuto feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- [PLIB_DMA_ChannelXAutoEnable](#)
- [PLIB_DMA_ChannelXAutoDisable](#)
- [PLIB_DMA_ChannelXAUTOIsEnabled](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChannelXAuto feature is supported on the device
- false - The ChannelXAuto feature is not supported on the device

Remarks

None.

5.6.6.6.13.7 PLIB_DMA_ExistsChannelXBusy Function**C**

```
bool PLIB_DMA_ExistsChannelXBusy(  
    DMA_MODULE_ID index  
);
```

Description

This function identifies whether the ChannelXBusy feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- [PLIB_DMA_ChannelXBusyActiveSet](#)
- [PLIB_DMA_ChannelXBusyInActiveSet](#)
- [PLIB_DMA_ChannelXBusyIsBusy](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChannelXBusy feature is supported on the device
- false - The ChannelXBusy feature is not supported on the device

Remarks

None.

5.6.6.6.13.8 PLIB_DMA_ExistsChannelXCellProgressPointer Function**C**

```
bool PLIB_DMA_ExistsChannelXCellProgressPointer(  
    DMA_MODULE_ID index  
);
```

Description

This function identifies whether the ChannelXCellProgressPointer feature is available on the DMA module. When this function returns true, this function is supported on the device:

- [PLIB_DMA_ChannelXCellProgressPointerGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChannelXCellProgressPointer feature is supported on the device
- false - The ChannelXCellProgressPointer feature is not supported on the device

Remarks

None.

5.6.6.6.13.9 PLIB_DMA_ExistsChannelXCellSize Function**C**

```
bool PLIB_DMA_ExistsChannelXCellSize(  
    DMA_MODULE_ID index  
);
```

Description

This function identifies whether the ChannelXCellSize feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- [PLIB_DMA_ChannelXCellSizeGet](#)
- [PLIB_DMA_ChannelXCellSizeSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChannelXCellSize feature is supported on the device
- false - The ChannelXCellSize feature is not supported on the device

Remarks

None.

5.6.6.6.13.10 PLIB_DMA_ExistsChannelXChain Function**C**

```
bool PLIB_DMA_ExistsChannelXChain(  
    DMA_MODULE_ID index  
);
```

Description

This function identifies whether the ChannelXChain feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- [PLIB_DMA_ChannelXChainToLower](#)
- [PLIB_DMA_ChannelXChainToHigher](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChannelXChain feature is supported on the device
- false - The ChannelXChain feature is not supported on the device

Remarks

None.

5.6.6.6.13.11 PLIB_DMA_ExistsChannelXChainEnbl Function**C**

```
bool PLIB_DMA_ExistsChannelXChainEnbl(  
    DMA_MODULE_ID index  
);
```

Description

This function identifies whether the ChannelXChainEnbl feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- [PLIB_DMA_ChannelXChainEnable](#)
- [PLIB_DMA_ChannelXChainDisable](#)
- [PLIB_DMA_ChannelXChainIsEnabled](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChannelXChainEnbl feature is supported on the device
- false - The ChannelXChainEnbl feature is not supported on the device

Remarks

None.

5.6.6.6.13.12 PLIB_DMA_ExistsChannelXDestinationPointer Function**C**

```
bool PLIB_DMA_ExistsChannelXDestinationPointer(  
    DMA_MODULE_ID index  
);
```

Description

This function identifies whether the ChannelXDestinationPointer feature is available on the DMA module. When this function returns true, this function is supported on the device:

- [PLIB_DMA_ChannelXDestinationPointerGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChannelXDestinationPointer feature is supported on the device
- false - The ChannelXDestinationPointer feature is not supported on the device

Remarks

None.

5.6.6.6.13.13 PLIB_DMA_ExistsChannelXDestinationSize Function**C**

```
bool PLIB_DMA_ExistsChannelXDestinationSize(  
    DMA_MODULE_ID index  
);
```

Description

This function identifies whether the ChannelXDestinationSize feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- [PLIB_DMA_ChannelXDestinationSizeGet](#)
- [PLIB_DMA_ChannelXDestinationSizeSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChannelXDestinationSize feature is supported on the device
- false - The ChannelXDestinationSize feature is not supported on the device

Remarks

None.

5.6.6.6.13.14 PLIB_DMA_ExistsChannelXDestinationStartAddress Function**C**

```
bool PLIB_DMA_ExistsChannelXDestinationStartAddress(  
    DMA_MODULE_ID index  
);
```

Description

This function identifies whether the ChannelXDestinationStartAddress feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- [PLIB_DMA_ChannelXDestinationStartAddressGet](#)
- [PLIB_DMA_ChannelXDestinationStartAddressSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChannelXDestinationStartAddress feature is supported on the device
- false - The ChannelXDestinationStartAddress feature is not supported on the device

Remarks

None.

5.6.6.6.13.15 PLIB_DMA_ExistsChannelXDisabled Function

C

```
bool PLIB_DMA_ExistsChannelXDisabled(  
    DMA_MODULE_ID index  
);
```

Description

This function identifies whether the ChannelXDisabled feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- [PLIB_DMA_ChannelXDisabledEnablesEvents](#)
- [PLIB_DMA_ChannelXDisabledDisablesEvents](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChannelXDisabled feature is supported on the device
- false - The ChannelXDisabled feature is not supported on the device

Remarks

None.

5.6.6.6.13.16 PLIB_DMA_ExistsChannelXEvent Function

C

```
bool PLIB_DMA_ExistsChannelXEvent(  
    DMA_MODULE_ID index  
);
```

Description

This function identifies whether the ChannelXEvent feature is available on the DMA module. When this function returns true, this function is supported on the device:

- [PLIB_DMA_ChannelXEventIsDetected](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChannelXEvent feature is supported on the device
- false - The ChannelXEvent feature is not supported on the device

Remarks

None.

5.6.6.6.13.17 PLIB_DMA_ExistsChannelXINTSource Function

C

```
bool PLIB_DMA_ExistsChannelXINTSource(  
    DMA_MODULE_ID index  
);
```

Description

This function identifies whether the ChannelXINTSource feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- [PLIB_DMA_ChannelXINTSourceEnable](#)
- [PLIB_DMA_ChannelXINTSourceDisable](#)
- [PLIB_DMA_ChannelXINTSourceIsEnabled](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChannelXINTSource feature is supported on the device
- false - The ChannelXINTSource feature is not supported on the device

Remarks

None.

5.6.6.6.13.18 PLIB_DMA_ExistsChannelXINTSourceFlag Function

C

```
bool PLIB_DMA_ExistsChannelXINTSourceFlag(  
    DMA_MODULE_ID index  
);
```

Description

This function identifies whether the ChannelXINTSourceFlag feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- [PLIB_DMA_ChannelXINTSourceFlagGet](#)
- [PLIB_DMA_ChannelXINTSourceFlagSet](#)
- [PLIB_DMA_ChannelXINTSourceFlagClear](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChannelXINTSourceFlag feature is supported on the device

- false - The ChannelXINTSourceFlag feature is not supported on the device

Remarks

None.

5.6.6.6.13.19 PLIB_DMA_ExistsChannelXPatternData Function**C**

```
bool PLIB_DMA_ExistsChannelXPatternData(  
    DMA_MODULE_ID index  
);
```

Description

This function identifies whether the ChannelXPatternData feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- [PLIB_DMA_ChannelXPatternDataGet](#)
- [PLIB_DMA_ChannelXPatternDataSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChannelXPatternData feature is supported on the device
- false - The ChannelXPatternData feature is not supported on the device

Remarks

None.

5.6.6.6.13.20 PLIB_DMA_ExistsChannelXPatternIgnore Function**C**

```
bool PLIB_DMA_ExistsChannelXPatternIgnore(  
    DMA_MODULE_ID index  
);
```

Description

This function identifies whether the ChannelXPatternIgnore feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- [PLIB_DMA_ChannelXPatternIgnoreSet](#)
- [PLIB_DMA_ChannelXPatternIgnoreGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChannelXPatternIgnore feature is supported on the device
- false - The ChannelXPatternIgnore feature is not supported on the device

Remarks

None.

5.6.6.6.13.21 PLIB_DMA_ExistsChannelXPatternIgnoreByte Function**C**

```
bool PLIB_DMA_ExistsChannelXPatternIgnoreByte(  
    DMA_MODULE_ID index  
);
```

Description

This function identifies whether the ChannelXPatternIgnoreByte feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- [PLIB_DMA_ChannelXPatternIgnoreByteEnable](#)
- [PLIB_DMA_ChannelXPatternIgnoreByteIsEnabled](#)
- [PLIB_DMA_ChannelXPatternIgnoreByteDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChannelXPatternIgnoreByte feature is supported on the device
- false - The ChannelXPatternIgnoreByte feature is not supported on the device

Remarks

None.

5.6.6.6.13.22 PLIB_DMA_ExistsChannelXPatternLength Function**C**

```
bool PLIB_DMA_ExistsChannelXPatternLength(  
    DMA_MODULE_ID index  
);
```

Description

This function identifies whether the ChannelXPatternLength feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- [PLIB_DMA_ChannelXPatternLengthSet](#)
- [PLIB_DMA_ChannelXPatternLengthGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChannelXPatternLength feature is supported on the device
- false - The ChannelXPatternLength feature is not supported on the device

Remarks

None.

5.6.6.6.13.23 PLIB_DMA_ExistsChannelXPriority Function**C**

```
bool PLIB_DMA_ExistsChannelXPriority(  
    DMA_MODULE_ID index  
);
```

Description

This function identifies whether the ChannelXPriority feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- [PLIB_DMA_ChannelXPrioritySelect](#)
- [PLIB_DMA_ChannelXPriorityGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChannelXPriority feature is supported on the device
- false - The ChannelXPriority feature is not supported on the device

Remarks

None.

5.6.6.6.13.24 PLIB_DMA_ExistsChannelXSourcePointer Function**C**

```
bool PLIB_DMA_ExistsChannelXSourcePointer(  
    DMA_MODULE_ID index  
);
```

Description

This function identifies whether the ChannelXSourcePointer feature is available on the DMA module. When this function returns true, this function is supported on the device:

- [PLIB_DMA_ChannelXSourcePointerGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChannelXSourcePointer feature is supported on the device
- false - The ChannelXSourcePointer feature is not supported on the device

Remarks

None.

5.6.6.6.13.25 PLIB_DMA_ExistsChannelXSourceSize Function**C**

```
bool PLIB_DMA_ExistsChannelXSourceSize(  
    DMA_MODULE_ID index  
);
```

Description

This function identifies whether the ChannelXSourceSize feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- [PLIB_DMA_ChannelXSourceSizeGet](#)
- [PLIB_DMA_ChannelXSourceSizeSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChannelXSourceSize feature is supported on the device
- false - The ChannelXSourceSize feature is not supported on the device

Remarks

None.

5.6.6.6.13.26 PLIB_DMA_ExistsChannelXSourceStartAddress Function**C**

```
bool PLIB_DMA_ExistsChannelXSourceStartAddress(  
    DMA_MODULE_ID index  
);
```

Description

This function identifies whether the ChannelXSourceStartAddress feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- [PLIB_DMA_ChannelXSourceStartAddressGet](#)
- [PLIB_DMA_ChannelXSourceStartAddressSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChannelXSourceStartAddress feature is supported on the device
- false - The ChannelXSourceStartAddress feature is not supported on the device

Remarks

None.

5.6.6.6.13.27 PLIB_DMA_ExistsChannelXStartIRQ Function

C

```
bool PLIB_DMA_ExistsChannelXStartIRQ(  
    DMA_MODULE_ID index  
);
```

Description

This function identifies whether the ChannelXStartIRQ feature is available on the DMA module. When this function returns true, this function is supported on the device:

- [PLIB_DMA_ChannelXStartIRQSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChannelXStartIRQ feature is supported on the device
- false - The ChannelXStartIRQ feature is not supported on the device

Remarks

None.

5.6.6.6.13.28 PLIB_DMA_ExistsChannelXTrigger Function

C

```
bool PLIB_DMA_ExistsChannelXTrigger(  
    DMA_MODULE_ID index  
);
```

Description

This function identifies whether the ChannelXTrigger feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- [PLIB_DMA_ChannelXTriggerEnable](#)
- [PLIB_DMA_ChannelXTriggerIsEnabled](#)
- [PLIB_DMA_ChannelXTriggerDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChannelXTrigger feature is supported on the device
- false - The ChannelXTrigger feature is not supported on the device

Remarks

None.

5.6.6.6.13.29 PLIB_DMA_ExistsCRC Function**C**

```
bool PLIB_DMA_ExistsCRC(  
    DMA_MODULE_ID index  
);
```

Description

This function identifies whether the CRC feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- [PLIB_DMA_CRCEnable](#)
- [PLIB_DMA_CRCDisable](#)
- [PLIB_DMA_CRCIsEnabled](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The CRC feature is supported on the device
- false - The CRC feature is not supported on the device

Remarks

None.

5.6.6.6.13.30 PLIB_DMA_ExistsCRCAppendMode Function**C**

```
bool PLIB_DMA_ExistsCRCAppendMode(  
    DMA_MODULE_ID index  
);
```

Description

This function identifies whether the CRCAppendMode feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- [PLIB_DMA_CRCAppendModeEnable](#)
- [PLIB_DMA_CRCAppendModeDisable](#)
- [PLIB_DMA_CRCAppendModeIsEnabled](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The CRCAppendMode feature is supported on the device
- false - The CRCAppendMode feature is not supported on the device

Remarks

None.

5.6.6.6.13.31 PLIB_DMA_ExistsCRCBitOrder Function**C**

```
bool PLIB_DMA_ExistsCRCBitOrder(  
    DMA_MODULE_ID index  
);
```

Description

This function identifies whether the CRCBitOrder feature is available on the DMA module. When this function returns true, this function is supported on the device:

- [PLIB_DMA_CRCBitOrderSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The CRCBitOrder feature is supported on the device
- false - The CRCBitOrder feature is not supported on the device

Remarks

None.

5.6.6.6.13.32 PLIB_DMA_ExistsCRCByteOrder Function

C

```
bool PLIB_DMA_ExistsCRCByteOrder(  
    DMA_MODULE_ID index  
);
```

Description

This function identifies whether the CRCByteOrder feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- [PLIB_DMA_CRCByteOrderSelect](#)
- [PLIB_DMA_CRCByteOrderGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The CRCByteOrder feature is supported on the device
- false - The CRCByteOrder feature is not supported on the device

Remarks

None.

5.6.6.6.13.33 PLIB_DMA_ExistsCRCChannel Function

C

```
bool PLIB_DMA_ExistsCRCChannel(  
    DMA_MODULE_ID index  
);
```

Description

This function identifies whether the CRCChannel feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- [PLIB_DMA_CRCChannelSelect](#)
- [PLIB_DMA_CRCChannelGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The CRCChannel feature is supported on the device
- false - The CRCChannel feature is not supported on the device

Remarks

None.

5.6.6.6.13.34 PLIB_DMA_ExistsCRCDData Function**C**

```
bool PLIB_DMA_ExistsCRCDData(  
    DMA_MODULE_ID index  
);
```

Description

This function identifies whether the CRCDData feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- [PLIB_DMA_CRCDDataRead](#)
- [PLIB_DMA_CRCDDataWrite](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The CRCDData feature is supported on the device
- false - The CRCDData feature is not supported on the device

Remarks

None.

5.6.6.6.13.35 PLIB_DMA_ExistsCRCPolynomialLength Function**C**

```
bool PLIB_DMA_ExistsCRCPolynomialLength(  
    DMA_MODULE_ID index  
);
```

Description

This function identifies whether the CRCPolynomialLength feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- [PLIB_DMA_CRCPolynomialLengthSet](#)
- [PLIB_DMA_CRCPolynomialLengthGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The CRCPolynomialLength feature is supported on the device
- false - The CRCPolynomialLength feature is not supported on the device

Remarks

None.

5.6.6.6.13.36 PLIB_DMA_ExistsCRCType Function**C**

```
bool PLIB_DMA_ExistsCRCType(  
    DMA_MODULE_ID index  
);
```

Description

This function identifies whether the CRCType feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- [PLIB_DMA_CRCTypeGet](#)
- [PLIB_DMA_CRCTypeSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The CRCType feature is supported on the device
- false - The CRCType feature is not supported on the device

Remarks

None.

5.6.6.6.13.37 PLIB_DMA_ExistsCRCWriteByteOrder Function**C**

```
bool PLIB_DMA_ExistsCRCWriteByteOrder(  
    DMA_MODULE_ID index  
);
```

Description

This function identifies whether the CRCWriteByteOrder feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- [PLIB_DMA_CRCWriteByteOrderAlter](#)
- [PLIB_DMA_CRCWriteByteOrderMaintain](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The CRCWriteByteOrder feature is supported on the device
- false - The CRCWriteByteOrder feature is not supported on the device

Remarks

None.

5.6.6.6.13.38 PLIB_DMA_ExistsCRCXOREnable Function**C**

```
bool PLIB_DMA_ExistsCRCXOREnable(  
    DMA_MODULE_ID index  
);
```

Description

This function identifies whether the CRCXOREnable feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- [PLIB_DMA_CRCXOREnableSet](#)
- [PLIB_DMA_CRCXOREnableGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The CRCXOREnable feature is supported on the device
- false - The CRCXOREnable feature is not supported on the device

Remarks

None.

5.6.6.6.13.39 PLIB_DMA_ExistsEnableControl Function**C**

```
bool PLIB_DMA_ExistsEnableControl(  
    DMA_MODULE_ID index  
);
```

Description

This function identifies whether the EnableControl feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- [PLIB_DMA_Enable](#)
- [PLIB_DMA_Disable](#)

- [PLIB_DMA_IsEnabled](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The EnableControl feature is supported on the device
- false - The EnableControl feature is not supported on the device

Remarks

None.

5.6.6.6.13.40 PLIB_DMA_ExistsLastBusAccess Function**C**

```
bool PLIB_DMA_ExistsLastBusAccess(  
    DMA_MODULE_ID index  
);
```

Description

This function identifies whether the LastBusAccess feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- [PLIB_DMA_LastBusAccessIsRead](#)
- [PLIB_DMA_LastBusAccessIsWrite](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The LastBusAccess feature is supported on the device
- false - The LastBusAccess feature is not supported on the device

Remarks

None.

5.6.6.6.13.41 PLIB_DMA_ExistsRecentAddress Function**C**

```
bool PLIB_DMA_ExistsRecentAddress(  
    DMA_MODULE_ID index  
);
```

Description

This function identifies whether the RecentAddress feature is available on the DMA module. When this function returns true, this function is supported on the device:

- [PLIB_DMA_RecentAddressAccessed](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The RecentAddress feature is supported on the device
- false - The RecentAddress feature is not supported on the device

Remarks

None.

5.6.6.6.13.42 PLIB_DMA_ExistsStartTransfer Function**C**

```
bool PLIB_DMA_ExistsStartTransfer(  
    DMA_MODULE_ID index  
);
```

Description

This function identifies whether the StartTransfer feature is available on the DMA module. When this function returns true, this function is supported on the device:

- [PLIB_DMA_StartTransferSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The StartTransfer feature is supported on the device
- false - The StartTransfer feature is not supported on the device

Remarks

None.

5.6.6.6.13.43 PLIB_DMA_ExistsStopInIdle Function**C**

```
bool PLIB_DMA_ExistsStopInIdle(  
    DMA_MODULE_ID index  
);
```

Description

This function identifies whether the StopInIdle feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- [PLIB_DMA_StopInIdleEnable](#)

- [PLIB_DMA_StopInIdleDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The StopInIdle feature is supported on the device
- false - The StopInIdle feature is not supported on the device

Remarks

None.

5.6.6.6.13.44 PLIB_DMA_ExistsSuspend Function

C

```
bool PLIB_DMA_ExistsSuspend(  
    DMA_MODULE_ID index  
);
```

Description

This function identifies whether the Suspend feature is available on the DMA module. When this function returns true, these functions are supported on the device:

- [PLIB_DMA_SuspendEnable](#)
- [PLIB_DMA_SuspendDisable](#)
- [PLIB_DMA_SuspendIsEnabled](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The Suspend feature is supported on the device
- false - The Suspend feature is not supported on the device

Remarks

None.

5.6.6.7 Files

Files

Name	Description
plib_dma.h	Defines the DMA Peripheral Library interface functions.

Description

5.6.6.7.1 plib_dma.h

DMA Peripheral Library Interface Header

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the Direct Memory Access (DMA) Peripheral Library for Microchip microcontrollers. The definitions in this file are for the DMA module.

Functions

	Name	Description
≡	<u>PLIB_DMA_AbortTransferSet</u>	Aborts transfer on the specified channel.
≡	<u>PLIB_DMA_BusyActiveReset</u>	Resets the BUSY bit of the DMA controller.
≡	<u>PLIB_DMA_BusyActiveSet</u>	Sets the BUSY bit of the DMA controller.
≡	<u>PLIB_DMA_ChannelBitsGet</u>	Returns the DMA channel bits.
≡	<u>PLIB_DMA_ChannelPriorityGet</u>	Gets the priority scheme of the DMA channels.
≡	<u>PLIB_DMA_ChannelPrioritySelect</u>	Sets the priority scheme of the DMA channels.
≡	<u>PLIB_DMA_ChannelXAbortIRQSet</u>	Sets the IRQ to abort the DMA transfer on the specified channel.
≡	<u>PLIB_DMA_ChannelXAddressModeGet</u>	Gets the channel address mode.
≡	<u>PLIB_DMA_ChannelXAddressModeSelect</u>	Sets the channel address mode.
≡	<u>PLIB_DMA_ChannelXAutoDisable</u>	Channel is disabled after a block transfer is complete.
≡	<u>PLIB_DMA_ChannelXAutoEnable</u>	Channel is continuously enabled.
≡	<u>PLIB_DMA_ChannelXAutsEnabled</u>	Returns the channel automatic enable status.
≡	<u>PLIB_DMA_ChannelXBufferedDataIsWritten</u>	Returns the buffered data write status for the specified channel.
≡	<u>PLIB_DMA_ChannelXBusyActiveSet</u>	Sets the Busy bit to active.
≡	<u>PLIB_DMA_ChannelXBusyInactiveSet</u>	Sets the Busy bit to inactive.
≡	<u>PLIB_DMA_ChannelXBusyIsBusy</u>	Returns the busy status of the specified channel.
≡	<u>PLIB_DMA_ChannelXCellProgressPointerGet</u>	Returns the number of bytes transferred since the last event.
≡	<u>PLIB_DMA_ChannelXCellSizeGet</u>	Reads the cell size (in bytes) configured for the specified channel.
≡	<u>PLIB_DMA_ChannelXCellSizeSet</u>	Writes the specified cell size into the register corresponding to the specified channel.
≡	<u>PLIB_DMA_ChannelXChainDisable</u>	Disables the channel chaining for the specified DMA channel.
≡	<u>PLIB_DMA_ChannelXChainEnable</u>	Channel chain feature is enabled.
≡	<u>PLIB_DMA_ChannelXChainIsEnabled</u>	Returns the chain status of the specified channel.
≡	<u>PLIB_DMA_ChannelXChainToHigher</u>	Chains the specified channel to a channel higher in natural priority.
≡	<u>PLIB_DMA_ChannelXChainToLower</u>	Chains the specified channel to a channel lower in natural priority.
≡	<u>PLIB_DMA_ChannelXCollisionStatus</u>	Returns the status of the specified collision type for the specified channel.
≡	<u>PLIB_DMA_ChannelXDataSizeGet</u>	Returns the current data size for the specified channel.
≡	<u>PLIB_DMA_ChannelXDataSizeSelect</u>	Selects the data size for the specified channel.
≡	<u>PLIB_DMA_ChannelXDestinationAddressModeGet</u>	Gets the source address mode of the specified channel.

	PLIB_DMA_ChannelXDestinationAddressModeSelect	Sets the source address mode of the specified channel.
	PLIB_DMA_ChannelXDestinationPointerGet	Reads the current byte of the destination being pointed to for the specified channel.
	PLIB_DMA_ChannelXDestinationSizeGet	Reads the destination size configured for the specified channel.
	PLIB_DMA_ChannelXDestinationSizeSet	Writes the specified destination size into the register corresponding to the specified channel.
	PLIB_DMA_ChannelXDestinationStartAddressGet	Reads the destination start address configured for the specified channel.
	PLIB_DMA_ChannelXDestinationStartAddressSet	Writes the specified destination start address into the register corresponding to the specified channel.
	PLIB_DMA_ChannelXDisable	Disable the specified channel.
	PLIB_DMA_ChannelXDisabledDisablesEvents	Channel start/abort events will be ignored even if the channel is disabled.
	PLIB_DMA_ChannelXDisabledEnablesEvents	Channel start/abort events will be registered even if the channel is disabled.
	PLIB_DMA_ChannelXEnable	Enable the specified channel.
	PLIB_DMA_ChannelXEventIsDetected	Returns the event status on the specified channel.
	PLIB_DMA_ChannelXINTSourceDisable	Disables the specified interrupt source for the specified channel.
	PLIB_DMA_ChannelXINTSourceEnable	Enables the specified interrupt source for the specified channel.
	PLIB_DMA_ChannelXINTSourceFlagClear	Clears the interrupt flag of the specified DMA interrupt source for the specified channel.
	PLIB_DMA_ChannelXINTSourceFlagGet	Returns the status of the interrupt flag of the specified DMA interrupt source for the specified channel.
	PLIB_DMA_ChannelXINTSourceFlagSet	Sets the interrupt flag of the specified DMA interrupt source for the specified channel.
	PLIB_DMA_ChannelXINTSourceIsEnabled	Returns the enable status of the specified interrupt source for the specified channel.
	PLIB_DMA_ChannelXIIsEnabled	Return the enable status of the specified channel.
	PLIB_DMA_ChannelXNullWriteModeDisable	Disables the Null Write mode.
	PLIB_DMA_ChannelXNullWriteModeEnable	Enables the Null Write mode.
	PLIB_DMA_ChannelXNullWriteModeIsEnabled	Returns the enable status of the Null Write mode for the specified channel.
	PLIB_DMA_ChannelXOperatingTransferModeGet	Returns the current transfer/operating mode for the specified channel.
	PLIB_DMA_ChannelXOperatingTransferModeSelect	Selects the transfer/operating mode for the specified channel.
	PLIB_DMA_ChannelXPatternDataGet	Returns the pattern matching (for DMA abort) data programmed for the specified channel.
	PLIB_DMA_ChannelXPatternDataSet	Writes the specified pattern matching data (for DMA abort) into the register corresponding to the specified channel.
	PLIB_DMA_ChannelXPatternIgnoreByteDisable	Disables the pattern match ignore byte.
	PLIB_DMA_ChannelXPatternIgnoreByteEnable	Enables the pattern match ignore byte.
	PLIB_DMA_ChannelXPatternIgnoreByteIsEnabled	Returns the state of the pattern match ignore byte.
	PLIB_DMA_ChannelXPatternIgnoreGet	Returns the pattern match ignore value.
	PLIB_DMA_ChannelXPatternIgnoreSet	Sets the pattern match ignore value.
	PLIB_DMA_ChannelXPatternLengthGet	Returns the pattern match length.
	PLIB_DMA_ChannelXPatternLengthSet	Sets the pattern match length.

	PLIB_DMA_ChannelXPeripheralAddressGet	Gets the peripheral address configured for the specified channel.
	PLIB_DMA_ChannelXPeripheralAddressSet	Sets the peripheral address for the specified channel.
	PLIB_DMA_ChannelXPingPongModeGet	Returns the Ping-Pong mode status for the specified channel.
	PLIB_DMA_ChannelXPriorityGet	Gets the priority of the specified channel.
	PLIB_DMA_ChannelXPrioritySelect	Sets the priority of the specified channel.
	PLIB_DMA_ChannelXReloadDisable	Disables reloading of the address and count registers.
	PLIB_DMA_ChannelXReloadEnable	Enables reloading of the address and count registers.
	PLIB_DMA_ChannelXReloadIsEnabled	Returns the address and count registers reload enable status.
	PLIB_DMA_ChannelXSourceAddressModeGet	Gets the source address mode of the specified channel.
	PLIB_DMA_ChannelXSourceAddressModeSelect	Sets the source address mode of the specified channel.
	PLIB_DMA_ChannelXSourcePointerGet	Reads the current byte of the source being pointed to for the specified channel.
	PLIB_DMA_ChannelXSourceSizeGet	Reads the source size configured for the specified channel.
	PLIB_DMA_ChannelXSourceSizeSet	Writes the specified source size into the register corresponding to the specified channel.
	PLIB_DMA_ChannelXSourceStartAddressGet	Reads the source start address configured for the specified channel.
	PLIB_DMA_ChannelXSourceStartAddressSet	Writes the specified source start address into the register corresponding to the specified channel.
	PLIB_DMA_ChannelXStartAddressOffsetGet	Gets the primary/secondary start address (DPSRAM) offset.
	PLIB_DMA_ChannelXStartAddressOffsetSet	Sets the primary/secondary start address (DPSRAM) offset to the value specified depending on the offset type specified for the specified channel.
	PLIB_DMA_ChannelXStartIRQSet	Sets the IRQ to initiate the DMA transfer on the specified channel.
	PLIB_DMA_ChannelXTransferCountGet	Gets the DMA data transfer count that is programmed for the specified channel.
	PLIB_DMA_ChannelXTransferCountSet	Sets the DMA data transfer count for the specified channel.
	PLIB_DMA_ChannelXTransferDirectionGet	Returns the data transfer direction of the specified channel.
	PLIB_DMA_ChannelXTransferDirectionSelect	Selects the data transfer direction of the specified channel.
	PLIB_DMA_ChannelXTriggerDisable	Disables the DMA transfer abort via a matching interrupt (specified by the IRQ).
	PLIB_DMA_ChannelXTriggerEnable	Enables the specified DMA channel trigger.
	PLIB_DMA_ChannelXTriggerIsEnabled	Returns the enable status of the specified DMA transfer/abort trigger.
	PLIB_DMA_CRCAppendModeDisable	Disables the CRC append mode.
	PLIB_DMA_CRCAppendModeEnable	Enables the CRC append mode.
	PLIB_DMA_CRCAppendModeIsEnabled	Gets the enable status of the CRC append mode.
	PLIB_DMA_CRCBitOrderSelect	Selects the bit order for checksum calculation.
	PLIB_DMA_CRCByteOrderGet	Gets the current byte order selected by the DMA module CRC feature.
	PLIB_DMA_CRCByteOrderSelect	Selects the byte order.
	PLIB_DMA_CRCChannelGet	Returns the current DMA channel to which the CRC is assigned.
	PLIB_DMA_CRCChannelSelect	Assigns the CRC to the specified DMA channel.
	PLIB_DMA_CRCDataRead	Reads the contents of the DMA CRC data register.

	PLIB_DMA_CRCDataWrite	Writes the contents of the DMA CRC data register with the specified data.
	PLIB_DMA_CRCDisable	Disables the DMA module CRC feature.
	PLIB_DMA_CRCEnable	Enables the DMA module CRC feature.
	PLIB_DMA_CRCIsEnabled	Gets the enable status of the CRC feature.
	PLIB_DMA_CRCPolynomialLengthGet	Gets the current polynomial length.
	PLIB_DMA_CRCPolynomialLengthSet	Selects the polynomial length.
	PLIB_DMA_CRCTypeGet	Gets the current DMA module CRC feature type.
	PLIB_DMA_CRCTypeSet	Selects the DMA module CRC feature type.
	PLIB_DMA_CRCWriteByteOrderAlter	The source data is written to the destination reordered as defined by the BYTO<1:0> bits.
	PLIB_DMA_CRCWriteByteOrderMaintain	The source data is written to the destination unaltered.
	PLIB_DMA_CRCXOREnableGet	Reads the CRC XOR register.
	PLIB_DMA_CRCXOREnableSet	Writes to the CRC XOR enable register as per the specified enable mask.
	PLIB_DMA_Disable	DMA module is disabled.
	PLIB_DMA_Enable	DMA module is enabled.
	PLIB_DMA_ExistsAbortTransfer	Identifies whether the AbortTransfer feature exists on the DMA module.
	PLIB_DMA_ExistsBusy	Identifies whether the Busy feature exists on the DMA module.
	PLIB_DMA_ExistsChannelBits	Identifies whether the ChannelBits feature exists on the DMA module.
	PLIB_DMA_ExistsChannelX	Identifies whether the ChannelX feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXAbortIRQ	Identifies whether the ChannelXAbortIRQ feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXAuto	Identifies whether the ChannelXAuto feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXBusy	Identifies whether the ChannelXBusy feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXCellProgressPointer	Identifies whether the ChannelXCellProgressPointer feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXCellSize	Identifies whether the ChannelXCellSize feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXChain	Identifies whether the ChannelXChain feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXChainEnbl	Identifies whether the ChannelXChainEnbl feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXDestinationPointer	Identifies whether the ChannelXDestinationPointer feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXDestinationSize	Identifies whether the ChannelXDestinationSize feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXDestinationStartAddress	Identifies whether the ChannelXDestinationStartAddress feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXDisabled	Identifies whether the ChannelXDisabled feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXEvent	Identifies whether the ChannelXEvent feature exists on the DMA module.

	PLIB_DMA_ExistsChannelXINTSource	Identifies whether the ChannelXINTSource feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXINTSourceFlag	Identifies whether the ChannelXINTSourceFlag feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXPatternData	Identifies whether the ChannelXPatternData feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXPatternIgnore	Identifies whether the ChannelXPatternIgnore feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXPatternIgnoreByte	Identifies whether the ChannelXPatternIgnoreByte feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXPatternLength	Identifies whether the ChannelXPatternLength feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXPriority	Identifies whether the ChannelXPriority feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXSourcePointer	Identifies whether the ChannelXSourcePointer feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXSourceSize	Identifies whether the ChannelXSourceSize feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXSourceStartAddress	Identifies whether the ChannelXSourceStartAddress feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXStartIRQ	Identifies whether the ChannelXStartIRQ feature exists on the DMA module.
	PLIB_DMA_ExistsChannelXTrigger	Identifies whether the ChannelXTrigger feature exists on the DMA module.
	PLIB_DMA_ExistsCRC	Identifies whether the CRC feature exists on the DMA module.
	PLIB_DMA_ExistsCRCAppendMode	Identifies whether the CRCAppendMode feature exists on the DMA module.
	PLIB_DMA_ExistsCRCBitOrder	Identifies whether the CRCBitOrder feature exists on the DMA module.
	PLIB_DMA_ExistsCRCByteOrder	Identifies whether the CRCByteOrder feature exists on the DMA module.
	PLIB_DMA_ExistsCRCChannel	Identifies whether the CRCChannel feature exists on the DMA module.
	PLIB_DMA_ExistsCRCDData	Identifies whether the CRCDData feature exists on the DMA module.
	PLIB_DMA_ExistsCRCPolynomialLength	Identifies whether the CRCPolynomialLength feature exists on the DMA module.
	PLIB_DMA_ExistsCRCType	Identifies whether the CRCType feature exists on the DMA module.
	PLIB_DMA_ExistsCRCWriteByteOrder	Identifies whether the CRCWriteByteOrder feature exists on the DMA module.
	PLIB_DMA_ExistsCRCXOREnable	Identifies whether the CRCXOREnable feature exists on the DMA module.
	PLIB_DMA_ExistsEnableControl	Identifies whether the EnableControl feature exists on the DMA module.
	PLIB_DMA_ExistsLastBusAccess	Identifies whether the LastBusAccess feature exists on the DMA module.
	PLIB_DMA_ExistsRecentAddress	Identifies whether the RecentAddress feature exists on the DMA module.
	PLIB_DMA_ExistsStartTransfer	Identifies whether the StartTransfer feature exists on the DMA module.

	PLIB_DMA_ExistsStopInIdle	Identifies whether the StopInIdle feature exists on the DMA module.
	PLIB_DMA_ExistsSuspend	Identifies whether the Suspend feature exists on the DMA module.
	PLIB_DMA_IsBusy	Gets the BUSY bit of the DMA controller.
	PLIB_DMA_IsEnabled	Returns the DMA module enable status.
	PLIB_DMA_LastBusAccessIsRead	Returns true if the last DMA bus access was a read.
	PLIB_DMA_LastBusAccessIsWrite	Returns true if the last DMA bus access was a write.
	PLIB_DMA_LastChannelActive	Returns the last DMA channel that participated in the data transfer.
	PLIB_DMA_RecentAddressAccessed	Returns the address of the most recent DMA access.
	PLIB_DMA_StartTransferSet	Initiates transfer on the specified channel.
	PLIB_DMA_StopInIdleDisable	DMA transfers continue during Idle mode.
	PLIB_DMA_StopInIdleEnable	DMA transfers are halted during Idle mode.
	PLIB_DMA_SuspendDisable	DMA suspend is disabled and the DMA module operates normally.
	PLIB_DMA_SuspendEnable	DMA transfers are suspended to allow uninterrupted access by the CPU to the data bus.
	PLIB_DMA_SuspendIsEnabled	Returns the DMA suspend status.

5.6.7 EBI Peripheral Library

5.6.7.1 Introduction

EBI Peripheral Library

for

Microchip Microcontrollers

Note 1: No EBIA address pins are available on 64-pin devices and the EBIA<23:20> address pins are only available on 144-pin devices.

This library provides a low-level abstraction of the EBI Peripheral Library that is available on the Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, thereby hiding differences from one microcontroller variant to another.

Description

The External Bus Interface (EBI) allows for external physical memory to be mapped into the kernel's virtual memory map. The External Bus Interface (EBI) module provides a high-speed, convenient way to interface

external parallel memory devices to the PIC32 family device. With the EBI module, it is possible to **connect** asynchronous SRAM and NOR Flash devices, as well as non-memory devices such as camera sensors. The module also supports Low-Cost Controllerless (LCC) Graphics devices.

5.6.7.2 Release Notes

MPLAB Harmony Version: v0.70b **EBI Peripheral Library Version :** 0.70b **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.6.7.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.6.7.4 Using the Library

This topic describes the basic architecture of the EBI Peripheral Library and provides information and examples on how to use it.

Interface Header File: [plib_ebi.h](#)

The interface to the EBI Peripheral library is defined in the "[plib_ebi.h](#)" header file. This file is included by the "peripheral.h" file. Any C language source (.c) file that uses the EBI Peripheral library should include "[plib_ebi.h](#)".

Library File:

The EBI Peripheral library archive (.a) file installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the Peripheral interacts with the framework.

5.6.7.5 How the Library Works

Before using the EBI module, it must be enabled by the application developer(s). To work correctly, the device characteristics of the attached Memory/Flash must be set with the functions in this library. The Characteristics of the Memory/Flash will be found in the specific device data sheet.

Note: Not all modes are available on all devices. Please refer to the specific device data sheet to determine the supported modes.

5.6.7.6 Configuring the Library

The library is configured for the supported processor when the processor is chosen in the MPLAB IDE.

5.6.7.7 Library Interface

Existence Functions

	Name	Description
	PLIB_EBI_ExistsAddressHoldTime	Identifies whether the AddressHoldTime feature exists on the EBI module
	PLIB_EBI_ExistsAddressPinEnableBits	Identifies whether the AddressPinEnableBits feature exists on the EBI module

	PLIB_EBI_ExistsAddressSetupTime	Identifies whether the AddressSetupTime feature exists on the EBI module
	PLIB_EBI_ExistsBaseAddress	Identifies whether the Base_Address feature exists on the EBI module
	PLIB_EBI_ExistsByteSelectPin	Identifies whether the ByteSelectPin feature exists on the EBI module
	PLIB_EBI_ExistsChipSelectEnable	Identifies whether the ChipSelectEnable feature exists on the EBI module
	PLIB_EBI_ExistsControlEnable	Identifies whether the ControlEnable feature exists on the EBI module
	PLIB_EBI_ExistsDataEnable	Identifies whether the DataEnable feature exists on the EBI module
	PLIB_EBI_ExistsDataTurnAroundTime	Identifies whether the DataTurnAroundTime feature exists on the EBI module
	PLIB_EBI_ExistsFlashPowerDownMode	Identifies whether the FlashPowerDownMode feature exists on the EBI module
	PLIB_EBI_ExistsFlashResetPin	Identifies whether the FlashResetPin feature exists on the EBI module
	PLIB_EBI_ExistsFlashTiming	Identifies whether the FlashTiming feature exists on the EBI module
	PLIB_EBI_ExistsMemoryCharacteristics	Identifies whether the MemoryCharacteristics feature exists on the EBI module
	PLIB_EBI_ExistsMemoryPaging	Identifies whether the MemoryPaging feature exists on the EBI module
	PLIB_EBI_ExistsMemoryTimingConfig	Identifies whether the MemoryTimingConfig feature exists on the EBI module
	PLIB_EBI_ExistsPageMode	Identifies whether the PageMode feature exists on the EBI module
	PLIB_EBI_ExistsPageReadTime	Identifies whether the PageReadTime feature exists on the EBI module
	PLIB_EBI_ExistsReadCycleTime	Identifies whether the ReadCycleTime feature exists on the EBI module
	PLIB_EBI_ExistsReadyMode	Identifies whether the ReadyMode feature exists on the EBI module
	PLIB_EBI_ExistsReadyPin1Config	Identifies whether the ReadyPin1Config feature exists on the EBI module
	PLIB_EBI_ExistsReadyPin2Config	Identifies whether the ReadyPin2Config feature exists on the EBI module
	PLIB_EBI_ExistsReadyPin3Config	Identifies whether the ReadyPin3Config feature exists on the EBI module
	PLIB_EBI_ExistsReadyPinSens	Identifies whether the ReadyPinSens feature exists on the EBI module
	PLIB_EBI_ExistsStaticMemoryWidthRegister	Identifies whether the StaticMemoryWidthRegister feature exists on the EBI module
	PLIB_EBI_ExistsWriteOutputControl	Identifies whether the WriteOutputControl feature exists on the EBI module
	PLIB_EBI_ExistsWritePulseWidth	Identifies whether the WritePulseWidth feature exists on the EBI module

General Functions

	Name	Description
	PLIB_EBI_ControlEnableClear	This function gets the set power down state.

Get Functions

	Name	Description
	PLIB_EBI_AddressHoldTimeGet	This function returns the Address Hold Time

	PLIB_EBI_AddressSetupTimeGet	This function is to get the set hold time
	PLIB_EBI_BaseAddressGet	This function returns the Base Address set for each chip select
	PLIB_EBI_ControlEnableGet	This function gets the status of the enable bit for EBI.
	PLIB_EBI_DataTurnAroundTimeGet	This function gets the data turn time set for the EBI Bus.
	PLIB_EBI_FlashPowerDownModeGet	This function gets the set power down state.
	PLIB_EBI_FlashResetPinGet	This function sets the the control use of Ready pin and the inverts status
	PLIB_EBI_FlashTimingGet	This function gets the set flash timing for external flash
	PLIB_EBI_PageModeGet	This function returns Paging mode settings
	PLIB_EBI_PageReadCycleTimeGet	This function returns the cycle time for a page read.
	PLIB_EBI_PageSizeGet	This function returns Paging mode settings
	PLIB_EBI_ReadCycleTimeGet	This function returns the read time in number of clock cycles
	PLIB_EBI_ReadyModeGet	This function returns whether or not the Ready Mode was set.
	PLIB_EBI_StaticMemoryWidthRegisterGet	This function get the width of the set data bus
	PLIB_EBI_WritePulseWidthGet	This function returns the set hold time in clock cycles.

Set Functions

	Name	Description
	PLIB_EBI_AddressPinEnableBitsSet	This function sets the address pins used for EBI.
	PLIB_EBI_BaseAddressSet	This function sets the Base address for physical memory at each chip select
	PLIB_EBI_ByteSelectPinSet	This function sets the data Byte Select High [15:8] and Low [7:0] enable pins for use.
	PLIB_EBI_ChipSelectEnableSet	This function sets the Chip Select pins for use with the EBI or GPIO.
	PLIB_EBI_DataEnableSet	This function sets the use of Data Byte Select Pins, High and Low, for control with EBI or GPIO use.
	PLIB_EBI_FlashPowerDownModeSet	This function sets the pin state for flash devices on power down/reset
	PLIB_EBI_FlashResetPinSet	This function sets the the control use of Ready pin and the inverts status
	PLIB_EBI_FlashTimingSet	This function sets the timing for hold in reset for external flash
	PLIB_EBI_MemoryCharacteristicsSet	This function set the Memory Characteristics for Memory or attached devices attached to that pin
	PLIB_EBI_MemoryPagingSet	This function sets the size of the memory page if paging is used.
	PLIB_EBI_MemoryTimingConfigSet	This function is to set the cycle time for page reading
	PLIB_EBI_ReadyPin1ConfigSet	This function sets the the control use of Ready pin and the inverts status.
	PLIB_EBI_ReadyPin2ConfigSet	This function sets the the control use of Ready pin and the inverts status
	PLIB_EBI_ReadyPin3ConfigSet	This function sets the the control use of Ready pin and the inverts status
	PLIB_EBI_ReadyPinSensSet	This function sets the the control use of Ready pin and the inverts status
	PLIB_EBI_StaticMemoryWidthRegisterSet	This function set the data width of static memory.
	PLIB_EBI_WriteOutputControlSet	This function sets the Write Enable & Output Enable control pins
	PLIB_EBI_ControlEnableSet	This function sets the enable bit for turning on or off the EBI Bus.
	PLIB_EBI_ReadyModeSet	This function sets the use of ready mode for each pin. The attached device will either pull the ready pin high or low.

Description

This section describes the Application Programming Interface (API) functions of the EBI Peripheral.

Refer to each section for a detailed description.

5.6.7.7.1 General Functions

5.6.7.7.1.1 PLIB_EBI_ControlEnableClear Function

C

```
void PLIB_EBI_ControlEnableClear(  
    EBI_MODULE_ID index  
);
```

Description

EBIPINEN - in datasheet EBI Pin Enable bit 1 = EBI controls access of pins shared with PMP 0 = Pins shared with EBI are available for general use

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None

Remarks

None.

5.6.7.7.2 Get Functions

5.6.7.7.2.1 PLIB_EBI_AddressHoldTimeGet Function

C

```
int PLIB_EBI_AddressHoldTimeGet(  
    EBI_MODULE_ID index,  
    int ChipSelectNumber  
);
```

Description

TWR - in the datasheet.

Parameters

Parameters	Description
index	Identifier for the device instance
ChipSelectNumber	Identifies the specific chip select pin

Returns

Returns a integer, the Address & Data Hold time in number of clocks.

Remarks

None.

5.6.7.7.2.2 PLIB_EBI_AddressSetupTimeGet Function

C

```
int PLIB_EBI_AddressSetupTimeGet(  
    EBI_MODULE_ID index,  
    int ChipSelectNumber  
);
```

Description

TAS - in the data sheet Clock cycles for address setup time. A value of '0' is only valid in the case of SSRAM.

Parameters

Parameters	Description
index	Identifier for the device instance
ChipSelectNumber	Identifies the specific chip select pin

Returns

Returns a integer, the address setup time in number of clocks

Remarks

None.

5.6.7.7.2.3 PLIB_EBI_BaseAddressGet Function

C

```
uint32_t PLIB_EBI_BaseAddressGet(  
    EBI_MODULE_ID index,  
    int ChipSelectNumber  
);
```

Description

CSADDR- in datasheet.

This function returns the base address for each chip select pin

Parameters

Parameters	Description
index	Identifier for the device instance.
ChipSelectNumber	Identifies what chip select address pin address is being read.

Returns

Returns a unsigned integer that is the physical address of the attached device

Remarks

None.

5.6.7.7.2.4 PLIB_EBI_ControlEnableGet Function

C

```
bool PLIB_EBI_ControlEnableGet(  
    EBI_MODULE_ID index  
);
```

Description

EBIPINEN - in datasheet.

EBI Pin Enable bit 1 = EBI controls access of pins shared with PMP 0 = Pins shared with EBI are available for general use

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

Returns a bool, if EBI is ON or OFF.

Remarks

None.

5.6.7.7.2.5 PLIB_EBI_DataTurnAroundTimeGet Function**C**

```
int PLIB_EBI_DataTurnAroundTimeGet(  
    EBI_MODULE_ID index,  
    int ChipSelectNumber  
);
```

Description

TBTA - in the datasheet.

Returns the clock cycles (0-7) for static memory between read-to-write, write-to-read, and read-to-read when Chip Select changes.

Parameters

Parameters	Description
index	Identifier for the device instance
ChipSelectNumber	Identifies the specific chip select pin

Returns

Returns a integer, the number of clock cycles that is set in the Turn Around Register

Remarks

None.

5.6.7.7.2.6 PLIB_EBI_FlashPowerDownModeGet Function**C**

```
bool PLIB_EBI_FlashPowerDownModeGet(  
    EBI_MODULE_ID index  
);
```

Description

SMRP - in datasheet After a Reset, the controller internally performs a power-down for Flash, and then sets this bit to '1'. 1 = Flash is taken out of Power-down mode 0 = Flash is forced into Power-down mode

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

returns a bool, depending on how FlashPowerDownMode its set

Remarks

None.

5.6.7.7.2.7 PLIB_EBI_FlashResetPinGet Function**C**

```
bool PLIB_EBI_FlashResetPinGet(  
    EBI_MODULE_ID index  
);
```

Description

EBIRPEN - in datasheet.

EBIRP Flash Reset pin, 1 = pin is enabled for use by the EBI module 0 = pin is available for general use.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

returns a bool.

Remarks

None.

5.6.7.7.2.8 PLIB_EBI_FlashTimingGet Function**C**

```
int PLIB_EBI_FlashTimingGet(  
    EBI_MODULE_ID index,  
    int ChipSelectNumber  
);
```

Description

TRPD -in data sheet The number of clock cycles to hold the external Flash memory in reset.

Preconditions

MemoryType set to Flash

Returns

returns a integer, the number of clock cycles

Remarks

None.

5.6.7.7.2.9 PLIB_EBI_PageModeGet Function

C

```
bool PLIB_EBI_PageModeGet(  
    EBI_MODULE_ID index,  
    int ChipSelectNumber  
);
```

Description

PAGEMODE - in datasheet.

This Function returns the state of the register PAGEMODE, If the function returns a 1, Device supports Page mode. If the Function returns a 0, Device does not support Page mode .

Parameters

Parameters	Description
index	Identifier for the device instance
ChipSelectNumber	Identifies the specific chip select pin

Returns

This function Returns a bool, 1 = Page Mode is used, 0 = Page Mode is not used.

Remarks

None.

5.6.7.7.2.10 PLIB_EBI_PageReadCycleTimeGet Function

C

```
int PLIB_EBI_PageReadCycleTimeGet(  
    EBI_MODULE_ID index,  
    int ChipSelectNumber  
);
```

Description

TPRC - in datasheet.

Read cycle time = TPRC + 1cycle. The value set and return are the same, the controller performs the read on the next clock, that is why there is a +1.

Parameters

Parameters	Description
index	Identifier for the device instance
ChipSelectNumber	Identifies the specific chip select pin

Returns

Returns a integer, the number of clock cycles used to read a memory page.

Remarks

None.

5.6.7.7.2.11 PLIB_EBI_PageSizeGet Function

C

```
EBI_PAGE_SIZE PLIB_EBI_PageSizeGet(  

```

```
    EBI_MODULE_ID index,  
    int ChipSelectNumber  
);
```

Description

PAGESIZE- in datasheet.

Parameters

Parameters	Description
index	Identifier for the device instance
ChipSelectNumber	Identifies the specific chip select pin

Returns

This function Returns the size of the memory page.

Remarks

None.

5.6.7.7.2.12 PLIB_EBI_ReadCycleTimeGet Function

C

```
int PLIB_EBI_ReadCycleTimeGet(  
    EBI_MODULE_ID index,  
    int ChipSelectNumber  
);
```

Description

TRC in datasheet.

Read Cycle time = TRC +1 clock cycle, the controller will always take 1 extra clock (the next clock) for a Read Cycle. The return will be the time set by the user.

setting a the Read Cycle time to a 0 will return a 0 when read, but the controller will add 1 to that value for the next available clock.

Parameters

Parameters	Description
index	Identifier for the device instance
ChipSelectNumber	Identifies which chip select number the device is attached to.

Returns

returns a integer, the read cycle time in system clocks.

Remarks

None.

5.6.7.7.2.13 PLIB_EBI_ReadyModeGet Function

C

```
bool PLIB_EBI_ReadyModeGet(  
    EBI_MODULE_ID index,  
    int ChipSelectNumber  
);
```

Description

RDYMODE - in datasheet.

This Function returns the state of the register RDYMODE, If the function returns a 1, Ready input is used. If the Function returns a 0, Ready input is not used.

Parameters

Parameters	Description
index	Identifier for the device instance
ChipSelectNumber	Identifies the specific chip select pin

Returns

This function Returns a bool, 1 = Ready input is used, 0 = Ready input is not used.

Remarks

None.

5.6.7.7.2.14 PLIB_EBI_StaticMemoryWidthRegisterGet Function**C**

```
EBI_STATIC_MEMORY_WIDTH PLIB_EBI_StaticMemoryWidthRegisterGet(  
    EBI_MODULE_ID index,  
    int RegstierNumber  
);
```

Description

SMDWIDTH - in data sheet 100 = 16 bits 000 = 8 bits

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

returns a enum type, which bus mode is used

Remarks

None.

5.6.7.7.2.15 PLIB_EBI_WritePulseWidthGet Function**C**

```
int PLIB_EBI_WritePulseWidthGet(  
    EBI_MODULE_ID index,  
    int ChipSelectNumber  
);
```

Description

TWP in the datasheet.

Write Pulse with = TWP + 1 clock cycle

Parameters

Parameters	Description
index	Identifier for the device instance
ChipSelectNumber	Identifies the specific chip select pin

Returns

Returns a integer, the number of clock cycles the write pulse width is set to.

Remarks

None.

5.6.7.7.3 Set Functions

5.6.7.7.3.1 PLIB_EBI_AddressPinEnableBitsSet Function

C

```
void PLIB_EBI_AddressPinEnableBitsSet(  
    EBI_MODULE_ID index,  
    EBI_ADDRESS_PORT AddressPort  
);
```

Description

These pins have to be enabled for the size of the data bus in a contiguous order.

EBIA23EN:EBIA0EN - in datasheet.

EBI Address Pin Enable bits,

1 = pin is enabled for use by EBI, 0 = pin has is available for general use.

Parameters

Parameters	Description
index	Identifier for the device instance.
AddressPort	Identifies how many pins are used for addressing on the EBI bus.

Returns

None.

Remarks

None.

5.6.7.7.3.2 PLIB_EBI_BaseAddressSet Function

C

```
void PLIB_EBI_BaseAddressSet(  
    EBI_MODULE_ID index,  
    int ChipSelectNumber,  
    uint32_t BaseAddress  
);
```

Description

CSADDR- in datasheet.

This function sets the base address for physical memory at each chip select pin.

Preconditions

EBI has to be supported by the microcontroller and has to have a device attached to it.

Parameters

Parameters	Description
index	Identifier for the device instance.
ChipSelectNumber	Identifies what chip select address pin is being assigned an address
BaseAddress	a physical address for memory

Returns

None.

Remarks

None.

5.6.7.7.3 PLIB_EBI_ByteSelectPinSet Function**C**

```
void PLIB_EBI_ByteSelectPinSet(  
    EBI_MODULE_ID index,  
    bool ByteSelect0,  
    bool ByteSelect1  
);
```

Description

If the system uses Byte Select High/Low pins for the data, the pins must be enabled for use in the EBI controller.

EBIBSEN0 - in datasheet.

EBIBSEN0, This Controls the pin Enable bit for the Lower Data Byte Select. Lower Data Byte is bits 8:0.

1 = pin is enabled for use by the EBI module, 0 = pin is available for general use.

EBIBSEN1 - in datasheet.

EBIBSEN1, This Controls the pin Enable bit for the Upper Data Byte Select. Upper Data Byte is bits 15:8.

1 = pin is enabled for use by the EBI module, 0 = pin is available for general use.

Preconditions

Registers EBIDEN0 & EBIDEN1 must be enabled first, this can be done in the function [PLIB_EBI_DataEnableSet\(\)](#).

Parameters

Parameters	Description
index	Identifier for the device instance
ByteSelect0	Identifies Lower Byte Select Pin for enabling.
ByteSelect1	Identifies Upper Byte Select Pin for enabling.

Returns

None.

Remarks

None.

5.6.7.7.3.4 PLIB_EBI_ChipSelectEnableSet Function

C

```
void PLIB_EBI_ChipSelectEnableSet(  
    EBI_MODULE_ID index,  
    bool ChipSelect0,  
    bool ChipSelect1,  
    bool ChipSelect2,  
    bool ChipSelect3  
);
```

Description

EBICSEN0 = EBI ChipSelect0 Pin Enable bit. 1 = pin is enabled for use by the EBI module, 0 = pin is available for general use.

EBICSEN1 = EBI ChipSelect1 Pin Enable bit. 1 = pin is enabled for use by the EBI module, 0 = pin is available for general use.

EBICSEN2 = EBI ChipSelect2 Pin Enable bit. 1 = pin is enabled for use by the EBI module, 0 = pin is available for general use.

EBICSEN3 = EBI ChipSelect3 Pin Enable bit. 1 = pin is enabled for use by the EBI module, 0 = pin is available for general use.

Parameters

Parameters	Description
index	Identifier for the device instance
ChipSelect0	Identifies control of Chip Select 0 for enabling.
ChipSelect1	Identifies control of Chip Select 1 for enabling.
ChipSelect2	Identifies control of Chip Select 2 for enabling.
ChipSelect3	Identifies control of Chip Select 3 for enabling.

Returns

None.

Remarks

None.

5.6.7.7.3.5 PLIB_EBI_DataEnableSet Function

C

```
void PLIB_EBI_DataEnableSet(  
    EBI_MODULE_ID index,  
    bool DataUpperByte,  
    bool DataLowerByte  
);
```

Description

EBIDEN1 - in datasheet.

EBI Data Upper Byte Pin Enable bit.

1 = [15:8] pins are enabled for use by the EBI module, 0 = [15:8] pins have reverted to general use.

EBIDEN0 - in datasheet.

EBI Data Upper Byte Pin Enable bit.

1 = [7:0] pins are enabled for use by the EBI module, 0 = [7:0] pins have reverted to general use.

Parameters

Parameters	Description
index	Identifier for the device instance
DataUpperByte	Identifies control of Upper Data Byte for enabling.
DataLowerByte	Identifies control of Lower Data Byte for enabling.

Returns

None.

Remarks

None.

5.6.7.7.3.6 PLIB_EBI_FlashPowerDownModeSet Function**C**

```
void PLIB_EBI_FlashPowerDownModeSet(  
    EBI_MODULE_ID index,  
    bool FlashPowerDownMode  
);
```

Description

SMRP- in datasheet.

After a Reset, the controller internally performs a power-down for Flash, and then sets this bit to '1'.

1 = Flash is taken out of Power-down mode.

0 = Flash is forced into Power-down mode.

Parameters

Parameters	Description
index	Identifier for the device instance
FlashPowerDownMode	a bool, sets the power down state for flash memory

Returns

None.

Remarks

None.

5.6.7.7.3.7 PLIB_EBI_FlashResetPinSet Function**C**

```
void PLIB_EBI_FlashResetPinSet(  
    EBI_MODULE_ID index,  
    bool FlashResetPin  
);
```

Description

EBIRPEN - in datasheet.

EBIRP Flash Reset pin, 1 = pin is enabled for use by the EBI module 0 = pin is available for general use.

Parameters

Parameters	Description
index	Identifier for the device instance
FlashReadPin	Flash Rest Pin is Used

Returns

None.

Remarks

None.

5.6.7.7.3.8 PLIB_EBI_FlashTimingSet Function**C**

```
void PLIB_EBI_FlashTimingSet(  
    EBI_MODULE_ID index,  
    int FlashTiming  
);
```

Description

TRPD - in datasheet.

The number of clock cycles to hold the external Flash memory in reset.

Preconditions

NOR Flash has to be used with EBI instead of SRAM

Parameters

Parameters	Description
index	Identifier for the device instance
FlashTiming	an int, the number of clock cycles

Returns

None.

Remarks

None.

5.6.7.7.3.9 PLIB_EBI_MemoryCharacteristicsSet Function**C**

```
void PLIB_EBI_MemoryCharacteristicsSet(  
    EBI_MODULE_ID index,  
    int ChipSelectNumber,  
    EBI_MEMORY_TYPE MemoryType,  
    EBI_MEMORY_SIZE MemorySize,  
    EBI_CS_TIMING TimingReg  
);
```

Description

EBIMSKx -SRF name index - Identifier for the device instance.

ChipSelectNumber - Identifies what chip select address pin is being assigned an address

MEMTYPE - in datasheet.

MEMSIZE - in the datasheet.

REGSEL - in the datasheet.

Preconditions

EBI has to be supported by the microcontroller.

Parameters

Parameters	Description
index	Identifier for the device instance.
ChipSelectNumber	Identifies which chip select pin
MemoryType	Identifies which memory is used
MemorySize	a enum type, sets the size of the attached memory device
TimingRegSet	Identifies the timing register

Returns

None.

Remarks

None.

5.6.7.7.3.10 PLIB_EBI_MemoryPagingSet Function

C

```
void PLIB_EBI_MemoryPagingSet(  
    EBI_MODULE_ID index,  
    int ChipSelectNumber,  
    bool PageMode,  
    EBI_PAGE_SIZE MemoryPageSize  
);
```

Description

PAGESIZE in datasheet.

PAGEMODE in datasheet.

1 = Device supports Page mode

0 = Device does not support Page mode

Parameters

Parameters	Description
index	Identifier for the device instance
ChipSelectNumber	Sets for that Chip Select pin [0:3]
PageMode	enable or disable page mode
MemoryPageSize	size of memory pages

Returns

none

Remarks

None.

5.6.7.7.3.11 PLIB_EBI_MemoryTimingConfigSet Function

C

```
void PLIB_EBI_MemoryTimingConfigSet(
    EBI_MODULE_ID index,
    int CS_Timing_Reg,
    int PageReadTime,
    int DataTurnAroundTime,
    int WritePulseWidth,
    int AddressHoldTime,
    int AddressSetupTime,
    int ReadCycleTime
);
```

Description

SFR = EBISMT[0:2] TPRC - in datasheet. Read cycle time = TPRC + 1cycle.

TBTA - in the datasheet. Clock cycles (0-7) for static memory between read-to-write, write-to-read, and read-to-read when Chip Select changes.

TWP in the datasheet. Write Pulse with = TWP + 1 clock cycle.

TWR - in datasheet. Write Address/Data Hold Time

TAS - in datasheet. Clock cycles for address setup time. A value of '0' is only valid in the case of SSRAM.

TRC - in datasheet. Read Cycle time = TRC +1 clock cycle.

Preconditions

EBI has to be supported by the microcontroller.

Parameters

Parameters	Description
index	Identifier for the device instance
CS_Timing_Reg	Identifies which chip select Timing register to use EBISMT[0:2]
PageReadTime	The clock cycle needed for a Memory Page read
DataTurnAroundTime	Time between read-to-write, write-to-read, and read-to-read when Chip Select changes state.
WritePulseWidth	The clock cycles needed for a memory write
AddressHoldTime	The clock time needed for the address bus to hold
AddressSetupTime	The time needed for the address to settle
ReadCycleTime	_nt_

Returns

None.

Remarks

None.

5.6.7.7.3.12 PLIB_EBI_ReadyPin1ConfigSet Function

C

```
void PLIB_EBI_ReadyPin1ConfigSet(
    EBI_MODULE_ID index,
    bool ReadyPin1Enable,
    bool ReadyPin1Invert
```

```
);
```

Description

EBIRDYEN1 - in datasheet.

EBIRDY1 Pin Enable bit, 1 = pin is enabled for use by the EBI module, 0 = pin is available for general use

EBIRDYINV1 - in datasheet.

EBIRDYx Inversion Control bit 1 = Invert EBIRDYx pin before use 0 = Do not invert EBIRDYx pin before use.

Parameters

Parameters	Description
index	Identifier for the device instance
ReadyPin1Invert	Identifies the on/off for invert
ReadyPin1Enable	Identifies if this pin is used by the control part

Returns

None.

Remarks

None.

5.6.7.7.3.13 PLIB_EBI_ReadyPin2ConfigSet Function**C**

```
void PLIB_EBI_ReadyPin2ConfigSet(  
    EBI_MODULE_ID index,  
    bool ReadyPin2Enable,  
    bool ReadyPin2Invert  
);
```

Description

EBIRDYEN2 - in datasheet.

EBIRDY2 Pin Enable bit, 1 = pin is enabled for use by the EBI module, 0 = pin is available for general use

EBIRDYINV2 - in datasheet.

EBIRDYx Inversion Control bit 1 = Invert EBIRDYx pin before use 0 = Do not invert EBIRDYx pin before use.

Parameters

Parameters	Description
index	Identifier for the device instance
ReadyPin2Invert	Identifies the on/off for invert
ReadyPin2Enable	Identifies if this pin is used by the control part

Returns

None.

Remarks

None.

5.6.7.7.3.14 PLIB_EBI_ReadyPin3ConfigSet Function

C

```
void PLIB_EBI_ReadyPin3ConfigSet(  
    EBI_MODULE_ID index,  
    bool ReadyPin3Enable,  
    bool ReadyPin3Invert  
);
```

Description

EBIRDYEN2 - in datasheet.

EBIRDY2 Pin Enable bit, 1 = pin is enabled for use by the EBI module, 0 = pin is available for general use

EBIRDYINV2 - in datasheet.

EBIRDYx Inversion Control bit 1 = Invert EBIRDYx pin before use 0 = Do not invert EBIRDYx pin before use.

Parameters

Parameters	Description
index	Identifier for the device instance
ReadyPin3Invert	Identifies the on/off for invert
ReadyPin3Enable	Identifies if this pin is used by the control part

Returns

None.

Remarks

None.

5.6.7.7.3.15 PLIB_EBI_ReadyPinSensSet Function

C

```
void PLIB_EBI_ReadyPinSensSet(  
    EBI_MODULE_ID index,  
    bool SensitivityControl  
);
```

Description

EBIRDYLVL - in datasheet.

EBI Ready Pin trigger detection 1 = Use level detect for EBIRDYx pins, 0 = Use edge detect for EBIRDYx pins

Parameters

Parameters	Description
index	Identifier for the device instance
SensitivityControl	for selection edge or level detection

Returns

None.

Remarks

None.

5.6.7.7.3.16 PLIB_EBI_StaticMemoryWidthRegisterSet Function

C

```
void PLIB_EBI_StaticMemoryWidthRegisterSet(  
    EBI_MODULE_ID index,  
    int RegstierNumber,  
    EBI_STATIC_MEMORY_WIDTH StaticMemoryWidthRegister  
);
```

Description

SMDWIDTH - in the datasheet.

000 = 16 bits

100 = 8 bits

Parameters

Parameters	Description
index	Identifier for the device instance
RegstierNumber	the ID for the register being set StaticMemoryWidthRegister -identifies weither a bus width of 8bit or 16bits

Returns

None.

Remarks

None.

5.6.7.7.3.17 PLIB_EBI_WriteOutputControlSet Function

C

```
void PLIB_EBI_WriteOutputControlSet(  
    EBI_MODULE_ID index,  
    bool WriteEnable,  
    bool OutputEnable  
);
```

Description

EBIWEEN - in datasheet.

EBIWE, This controls the Enable bit for the Write Enable Pin.

1 = pin is enabled for use by the EBI module, 0 = pin is available for general use.

EBIOEEN - in datasheet.

EBIOE, This controls the enable bit for the Output Enable Pin.

1 = pin is enabled for use by the EBI module, 0 = pin is available for general use.

Parameters

Parameters	Description
index	Identifier for the device instance
WriteEnable	for enabling Write Enable
OutputEnable	for enabling Output Enable

Returns

None.

Remarks

None.

5.6.7.7.3.18 PLIB_EBI_ControlEnableSet Function**C**

```
void PLIB_EBI_ControlEnableSet(  
    EBI_MODULE_ID index,  
    bool EnableBit  
);
```

Description

EBIPINEN - in datasheet.

EBI Pin Enable bit, 1 = EBI controls access of pins shared with PMP 0 = Pins shared with EBI are available for general use.

Parameters

Parameters	Description
index	Identifier for the device instance
EnableBit	Identifies the enable bit

Returns

None

Remarks

None.

5.6.7.7.3.19 PLIB_EBI_ReadyModeSet Function**C**

```
void PLIB_EBI_ReadyModeSet(  
    EBI_MODULE_ID index,  
    bool ReadyPin0,  
    bool ReadyPin1,  
    bool ReadyPin2  
);
```

Description

RDYMODE- The device associated with EBI is a data-ready device, and will use the READY pin.

1 = Ready input is used 0 = Ready input is not used

Parameters

Parameters	Description
index	Identifier for the device instance ReadyPin0 ReadyPin1 ReadyPin2
ReadyPin(x)	Identifies the ready pin (1-3) that

Returns

None.

Remarks

None.

5.6.7.7.4 Existence Functions

5.6.7.7.4.1 PLIB_EBI_ExistsAddressHoldTime Function

C

```
bool PLIB_EBI_ExistsAddressHoldTime(  
    EBI_MODULE_ID index  
);
```

Description

This function identifies whether the AddressHoldTime feature is available on the EBI module. When this function returns true, these functions are supported on the device:

- [PLIB_EBI_AddressHoldTimeGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The AddressHoldTime feature is supported on the device
- false - The AddressHoldTime feature is not supported on the device

Remarks

None.

5.6.7.7.4.2 PLIB_EBI_ExistsAddressPinEnableBits Function

C

```
bool PLIB_EBI_ExistsAddressPinEnableBits(  
    EBI_MODULE_ID index  
);
```

Description

This function identifies whether the AddressPinEnableBits feature is available on the EBI module. When this function returns true, these functions are supported on the device:

- [PLIB_EBI_AddressPinEnableBitsSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The AddressPinEnableBits feature is supported on the device
- false - The AddressPinEnableBits feature is not supported on the device

Remarks

None.

5.6.7.7.4.3 PLIB_EBI_ExistsAddressSetupTime Function**C**

```
bool PLIB_EBI_ExistsAddressSetupTime(  
    EBI_MODULE_ID index  
);
```

Description

This function identifies whether the AddressSetupTime feature is available on the EBI module. When this function returns true, these functions are supported on the device:

- [PLIB_EBI_AddressSetupTimeGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The AddressSetupTime feature is supported on the device
- false - The AddressSetupTime feature is not supported on the device

Remarks

None.

5.6.7.7.4.4 PLIB_EBI_ExistsBaseAddress Function**C**

```
bool PLIB_EBI_ExistsBaseAddress(  
    EBI_MODULE_ID index  
);
```

Description

This function identifies whether the Base_Address feature is available on the EBI module. When this function returns true, these functions are supported on the device:

- [PLIB_EBI_BaseAddressSet](#)
- [PLIB_EBI_BaseAddressGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The Base_Address feature is supported on the device
- false - The Base_Address feature is not supported on the device

Remarks

None.

5.6.7.7.4.5 PLIB_EBI_ExistsByteSelectPin Function**C**

```
bool PLIB_EBI_ExistsByteSelectPin(  
    EBI_MODULE_ID index  
);
```

Description

This function identifies whether the ByteSelectPin feature is available on the EBI module. When this function returns true, these functions are supported on the device:

- [PLIB_EBI_ByteSelectPinSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ByteSelectPin feature is supported on the device
- false - The ByteSelectPin feature is not supported on the device

Remarks

None.

5.6.7.7.4.6 PLIB_EBI_ExistsChipSelectEnable Function**C**

```
bool PLIB_EBI_ExistsChipSelectEnable(  
    EBI_MODULE_ID index  
);
```

Description

This function identifies whether the ChipSelectEnable feature is available on the EBI module. When this function returns true, these functions are supported on the device:

- [PLIB_EBI_ChipSelectEnableSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ChipSelectEnable feature is supported on the device
- false - The ChipSelectEnable feature is not supported on the device

Remarks

None.

5.6.7.7.4.7 PLIB_EBI_ExistsControlEnable Function**C**

```
bool PLIB_EBI_ExistsControlEnable(  
    EBI_MODULE_ID index  
);
```

Description

This function identifies whether the ControlEnable feature is available on the EBI module. When this function returns true, these functions are supported on the device:

- [PLIB_EBI_ControlEnableSet](#)
- [PLIB_EBI_ControlEnableGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ControlEnable feature is supported on the device
- false - The ControlEnable feature is not supported on the device

Remarks

None.

5.6.7.7.4.8 PLIB_EBI_ExistsDataEnable Function**C**

```
bool PLIB_EBI_ExistsDataEnable(  
    EBI_MODULE_ID index  
);
```

Description

This function identifies whether the DataEnable feature is available on the EBI module. When this function returns true, these functions are supported on the device:

- [PLIB_EBI_DataEnableSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The DataEnable feature is supported on the device
- false - The DataEnable feature is not supported on the device

Remarks

None.

5.6.7.7.4.9 PLIB_EBI_ExistsDataTurnAroundTime Function**C**

```
bool PLIB_EBI_ExistsDataTurnAroundTime(  
    EBI_MODULE_ID index  
);
```

Description

This function identifies whether the DataTurnAroundTime feature is available on the EBI module. When this function returns true, these functions are supported on the device:

- [PLIB_EBI_DataTurnAroundTimeGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The DataTurnAroundTime feature is supported on the device
- false - The DataTurnAroundTime feature is not supported on the device

Remarks

None.

5.6.7.7.4.10 PLIB_EBI_ExistsFlashPowerDownMode Function**C**

```
bool PLIB_EBI_ExistsFlashPowerDownMode(  
    EBI_MODULE_ID index  
);
```

Description

This function identifies whether the FlashPowerDownMode feature is available on the EBI module. When this function returns true, these functions are supported on the device:

- [PLIB_EBI_FlashPowerDownModeSet](#)

- [PLIB_EBI_FlashPowerDownModeGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The FlashPowerDownMode feature is supported on the device
- false - The FlashPowerDownMode feature is not supported on the device

Remarks

None.

5.6.7.7.4.11 PLIB_EBI_ExistsFlashResetPin Function**C**

```
bool PLIB_EBI_ExistsFlashResetPin(  
    EBI_MODULE_ID index  
);
```

Description

This function identifies whether the FlashResetPin feature is available on the EBI module. When this function returns true, these functions are supported on the device:

- [PLIB_EBI_FlashResetPinSet](#)
- [PLIB_EBI_FlashResetPinGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The FlashResetPin feature is supported on the device
- false - The FlashResetPin feature is not supported on the device

Remarks

None.

5.6.7.7.4.12 PLIB_EBI_ExistsFlashTiming Function**C**

```
bool PLIB_EBI_ExistsFlashTiming(  
    EBI_MODULE_ID index  
);
```

Description

This function identifies whether the FlashTiming feature is available on the EBI module. When this function returns true, these functions are supported on the device:

- [PLIB_EBI_FlashTimingSet](#)
- [PLIB_EBI_FlashTimingGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The FlashTiming feature is supported on the device
- false - The FlashTiming feature is not supported on the device

Remarks

None.

5.6.7.7.4.13 PLIB_EBI_ExistsMemoryCharacteristics Function

C

```
bool PLIB_EBI_ExistsMemoryCharacteristics(  
    EBI_MODULE_ID index  
);
```

Description

This function identifies whether the MemoryCharacteristics feature is available on the EBI module. When this function returns true, these functions are supported on the device:

- [PLIB_EBI_MemoryCharacteristicsSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The MemoryCharacteristics feature is supported on the device
- false - The MemoryCharacteristics feature is not supported on the device

Remarks

None.

5.6.7.7.4.14 PLIB_EBI_ExistsMemoryPaging Function

C

```
bool PLIB_EBI_ExistsMemoryPaging(  
    EBI_MODULE_ID index  
);
```

Description

This function identifies whether the MemoryPaging feature is available on the EBI module. When this function returns true, these functions are supported on the device:

- [PLIB_EBI_MemoryPagingSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The MemoryPaging feature is supported on the device
- false - The MemoryPaging feature is not supported on the device

Remarks

None.

5.6.7.7.4.15 PLIB_EBI_ExistsMemoryTimingConfig Function**C**

```
bool PLIB_EBI_ExistsMemoryTimingConfig(  
    EBI_MODULE_ID index  
);
```

Description

This function identifies whether the MemoryTimingConfig feature is available on the EBI module. When this function returns true, these functions are supported on the device:

- [PLIB_EBI_MemoryTimingConfigSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The MemoryTimingConfig feature is supported on the device
- false - The MemoryTimingConfig feature is not supported on the device

Remarks

None.

5.6.7.7.4.16 PLIB_EBI_ExistsPageMode Function**C**

```
bool PLIB_EBI_ExistsPageMode(  
    EBI_MODULE_ID index  
);
```

Description

This function identifies whether the PageMode feature is available on the EBI module. When this function returns true, these functions are supported on the device:

- [PLIB_EBI_PageModeGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The PageMode feature is supported on the device
- false - The PageMode feature is not supported on the device

Remarks

None.

5.6.7.7.4.17 PLIB_EBI_ExistsPageReadTime Function**C**

```
bool PLIB_EBI_ExistsPageReadTime(  
    EBI_MODULE_ID index  
);
```

Description

This function identifies whether the PageReadTime feature is available on the EBI module. When this function returns true, these functions are supported on the device:

- [PLIB_EBI_PageReadCycleTimeGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The PageReadTime feature is supported on the device
- false - The PageReadTime feature is not supported on the device

Remarks

None.

5.6.7.7.4.18 PLIB_EBI_ExistsReadCycleTime Function**C**

```
bool PLIB_EBI_ExistsReadCycleTime(  
    EBI_MODULE_ID index  
);
```

Description

This function identifies whether the ReadCycleTime feature is available on the EBI module. When this function returns true, these functions are supported on the device:

- [PLIB_EBI_ReadCycleTimeGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ReadCycleTime feature is supported on the device
- false - The ReadCycleTime feature is not supported on the device

Remarks

None.

5.6.7.7.4.19 PLIB_EBI_ExistsReadyMode Function**C**

```
bool PLIB_EBI_ExistsReadyMode(  
    EBI_MODULE_ID index  
);
```

Description

This function identifies whether the ReadyMode feature is available on the EBI module. When this function returns true, these functions are supported on the device:

- [PLIB_EBI_ReadyModeSet](#)
- [PLIB_EBI_ReadyModeGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ReadyMode feature is supported on the device
- false - The ReadyMode feature is not supported on the device

Remarks

None.

5.6.7.7.4.20 PLIB_EBI_ExistsReadyPin1Config Function**C**

```
bool PLIB_EBI_ExistsReadyPin1Config(  
    EBI_MODULE_ID index  
);
```

Description

This function identifies whether the ReadyPin1Config feature is available on the EBI module. When this function returns true, these functions are supported on the device:

- [PLIB_EBI_ReadyPin1ConfigSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ReadyPin1Config feature is supported on the device
- false - The ReadyPin1Config feature is not supported on the device

Remarks

None.

5.6.7.7.4.21 PLIB_EBI_ExistsReadyPin2Config Function

C

```
bool PLIB_EBI_ExistsReadyPin2Config(  
    EBI_MODULE_ID index  
);
```

Description

This function identifies whether the ReadyPin2Config feature is available on the EBI module. When this function returns true, these functions are supported on the device:

- [PLIB_EBI_ReadyPin2ConfigSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ReadyPin2Config feature is supported on the device
- false - The ReadyPin2Config feature is not supported on the device

Remarks

None.

5.6.7.7.4.22 PLIB_EBI_ExistsReadyPin3Config Function

C

```
bool PLIB_EBI_ExistsReadyPin3Config(  
    EBI_MODULE_ID index  
);
```

Description

This function identifies whether the ReadyPin3Config feature is available on the EBI module. When this function returns true, these functions are supported on the device:

- [PLIB_EBI_ReadyPin3ConfigSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ReadyPin3Config feature is supported on the device
- false - The ReadyPin3Config feature is not supported on the device

Remarks

None.

5.6.7.7.4.23 PLIB_EBI_ExistsReadyPinSens Function**C**

```
bool PLIB_EBI_ExistsReadyPinSens(  
    EBI_MODULE_ID index  
);
```

Description

This function identifies whether the ReadyPinSens feature is available on the EBI module. When this function returns true, these functions are supported on the device:

- [PLIB_EBI_ReadyPinSensSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ReadyPinSens feature is supported on the device
- false - The ReadyPinSens feature is not supported on the device

Remarks

None.

5.6.7.7.4.24 PLIB_EBI_ExistsStaticMemoryWidthRegister Function**C**

```
bool PLIB_EBI_ExistsStaticMemoryWidthRegister(  
    EBI_MODULE_ID index  
);
```

Description

This function identifies whether the StaticMemoryWidthRegister feature is available on the EBI module. When this function returns true, these functions are supported on the device:

- [PLIB_EBI_StaticMemoryWidthRegisterSet](#)

- [PLIB_EBI_StaticMemoryWidthRegisterGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The StaticMemoryWidthRegister feature is supported on the device
- false - The StaticMemoryWidthRegister feature is not supported on the device

Remarks

None.

5.6.7.7.4.25 PLIB_EBI_ExistsWriteOutputControl Function

C

```
bool PLIB_EBI_ExistsWriteOutputControl(  
    EBI_MODULE_ID index  
);
```

Description

This function identifies whether the WriteOutputControl feature is available on the EBI module. When this function returns true, these functions are supported on the device:

- [PLIB_EBI_WriteOutputControlSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The WriteOutputControl feature is supported on the device
- false - The WriteOutputControl feature is not supported on the device

Remarks

None.

5.6.7.7.4.26 PLIB_EBI_ExistsWritePulseWidth Function

C

```
bool PLIB_EBI_ExistsWritePulseWidth(  
    EBI_MODULE_ID index  
);
```

Description

This function identifies whether the WritePulseWidth feature is available on the EBI module. When this function returns true, these functions are supported on the device:

- [PLIB_EBI_WritePulseWidthGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The WritePulseWidth feature is supported on the device
- false - The WritePulseWidth feature is not supported on the device

Remarks

None.

5.6.7.8 Files

Files

Name	Description
plib_ebi.h	External Bus Interface (EBI) Peripheral Library Interface Header.

Description

5.6.7.8.1 plib_ebi.h

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the EBI Peripheral Library.

Functions

	Name	Description
≡	PLIB_EBI_AddressHoldTimeGet	This function returns the Address Hold Time
≡	PLIB_EBI_AddressPinEnableBitsSet	This function sets the address pins used for EBI.
≡	PLIB_EBI_AddressSetupTimeGet	This function is to get the set hold time
≡	PLIB_EBI_BaseAddressGet	This function returns the Base Address set for each chip select
≡	PLIB_EBI_BaseAddressSet	This function sets the Base address for physical memory at each chip select
≡	PLIB_EBI_ByteSelectPinSet	This function sets the data Byte Select High [15:8] and Low [7:0] enable pins for use.
≡	PLIB_EBI_ChipSelectEnableSet	This function sets the Chip Select pins for use with the EBI or GPIO.
≡	PLIB_EBI_ControlEnableClear	This function gets the set power down state.
≡	PLIB_EBI_ControlEnableGet	This function gets the status of the enable bit for EBI.
≡	PLIB_EBI_ControlEnableSet	This function sets the enable bit for turning on or off the EBI Bus.
≡	PLIB_EBI_DataEnableSet	This function sets the use of Data Byte Select Pins, High and Low, for control with EBI or GPIO use.
≡	PLIB_EBI_DataTurnAroundTimeGet	This function gets the data turn time set for the EBI Bus.
≡	PLIB_EBI_ExistsAddressHoldTime	Identifies whether the AddressHoldTime feature exists on the EBI module

	PLIB_EBI_ExistsAddressPinEnableBits	Identifies whether the AddressPinEnableBits feature exists on the EBI module
	PLIB_EBI_ExistsAddressSetupTime	Identifies whether the AddressSetupTime feature exists on the EBI module
	PLIB_EBI_ExistsBaseAddress	Identifies whether the Base_Address feature exists on the EBI module
	PLIB_EBI_ExistsByteSelectPin	Identifies whether the ByteSelectPin feature exists on the EBI module
	PLIB_EBI_ExistsChipSelectEnable	Identifies whether the ChipSelectEnable feature exists on the EBI module
	PLIB_EBI_ExistsControlEnable	Identifies whether the ControlEnable feature exists on the EBI module
	PLIB_EBI_ExistsDataEnable	Identifies whether the DataEnable feature exists on the EBI module
	PLIB_EBI_ExistsDataTurnAroundTime	Identifies whether the DataTurnAroundTime feature exists on the EBI module
	PLIB_EBI_ExistsFlashPowerDownMode	Identifies whether the FlashPowerDownMode feature exists on the EBI module
	PLIB_EBI_ExistsFlashResetPin	Identifies whether the FlashResetPin feature exists on the EBI module
	PLIB_EBI_ExistsFlashTiming	Identifies whether the FlashTiming feature exists on the EBI module
	PLIB_EBI_ExistsMemoryCharacteristics	Identifies whether the MemoryCharacteristics feature exists on the EBI module
	PLIB_EBI_ExistsMemoryPaging	Identifies whether the MemoryPaging feature exists on the EBI module
	PLIB_EBI_ExistsMemoryTimingConfig	Identifies whether the MemoryTimingConfig feature exists on the EBI module
	PLIB_EBI_ExistsPageMode	Identifies whether the PageMode feature exists on the EBI module
	PLIB_EBI_ExistsPageReadTime	Identifies whether the PageReadTime feature exists on the EBI module
	PLIB_EBI_ExistsReadCycleTime	Identifies whether the ReadCycleTime feature exists on the EBI module
	PLIB_EBI_ExistsReadyMode	Identifies whether the ReadyMode feature exists on the EBI module
	PLIB_EBI_ExistsReadyPin1Config	Identifies whether the ReadyPin1Config feature exists on the EBI module
	PLIB_EBI_ExistsReadyPin2Config	Identifies whether the ReadyPin2Config feature exists on the EBI module
	PLIB_EBI_ExistsReadyPin3Config	Identifies whether the ReadyPin3Config feature exists on the EBI module
	PLIB_EBI_ExistsReadyPinSens	Identifies whether the ReadyPinSens feature exists on the EBI module
	PLIB_EBI_ExistsStaticMemoryWidthRegister	Identifies whether the StaticMemoryWidthRegister feature exists on the EBI module
	PLIB_EBI_ExistsWriteOutputControl	Identifies whether the WriteOutputControl feature exists on the EBI module
	PLIB_EBI_ExistsWritePulseWidth	Identifies whether the WritePulseWidth feature exists on the EBI module
	PLIB_EBI_FlashPowerDownModeGet	This function gets the set power down state.
	PLIB_EBI_FlashPowerDownModeSet	This function sets the pin state for flash devices on power down/reset
	PLIB_EBI_FlashResetPinGet	This function sets the the control use of Ready pin and the inverts status
	PLIB_EBI_FlashResetPinSet	This function sets the the control use of Ready pin and the inverts status

	PLIB_EBI_FlashTimingGet	This function gets the set flash timing for external flash
	PLIB_EBI_FlashTimingSet	This function sets the timing for hold in reset for external flash
	PLIB_EBI_MemoryCharacteristicsSet	This function set the Memory Characteristics for Memory or attached devices attached to that pin
	PLIB_EBI_MemoryPagingSet	This function sets the size of the memory page if paging is used.
	PLIB_EBI_MemoryTimingConfigSet	This function is to set the cycle time for page reading
	PLIB_EBI_PageModeGet	This function returns Paging mode settings
	PLIB_EBI_PageReadCycleTimeGet	This function returns the cycle time for a page read.
	PLIB_EBI_PageSizeGet	This function returns Paging mode settings
	PLIB_EBI_ReadCycleTimeGet	This function returns the read time in number of clock cycles
	PLIB_EBI_ReadyModeGet	This function returns whether or not the Ready Mode was set.
	PLIB_EBI_ReadyModeSet	This function sets the use of ready mode for each pin. The attached device will either pull the ready pin high or low.
	PLIB_EBI_ReadyPin1ConfigSet	This function sets the the control use of Ready pin and the inverts status.
	PLIB_EBI_ReadyPin2ConfigSet	This function sets the the control use of Ready pin and the inverts status
	PLIB_EBI_ReadyPin3ConfigSet	This function sets the the control use of Ready pin and the inverts status
	PLIB_EBI_ReadyPinSensSet	This function sets the the control use of Ready pin and the inverts status
	PLIB_EBI_StaticMemoryWidthRegisterGet	This function get the width of the set data bus
	PLIB_EBI_StaticMemoryWidthRegisterSet	This function set the data width of static memory.
	PLIB_EBI_WriteOutputControlSet	This function sets the Write Enable & Output Enable control pins
	PLIB_EBI_WritePulseWidthGet	This function returns the set hold time in clock cycles.

5.6.8 Ethernet Peripheral Library

5.6.8.1 Introduction

Ethernet Peripheral Library**for****Microchip Microcontrollers**

The Ethernet Peripheral Library provides a low-level abstraction of the Ethernet module in the Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without interacting directly with the module's registers, thereby hiding the differences in microcontroller variations.

Description

Overview

Ethernet is the most widely deployed network in offices and homes. Ethernet's infrastructure, interoperability, and scalability serve to ease development and facilitate communications to the device. Once equipment is connected to an Ethernet network, it can be monitored or controlled through the internet with low latency – “real time” remote delivery.

The Ethernet Controller is a bus master module that interfaces with an off-chip PHY in order to implement a complete Ethernet node in a system.

Following are some of the key features of this module:

- Supports 10/100 Mbps data transfer rates
- Supports Full-Duplex and Half-Duplex operation
- Supports Reduced Media Independent Interface (RMII) and Media Independent Interface (MII) PHY interface
- Supports MII Management (MIIM) PHY Management interface

- Supports both manual and automatic flow control
- Supports Auto-MDIX and enabled PHYs
- RAM descriptor based DMA operation for both receive and transmit path
- Fully configurable interrupts
- Configurable receive packet filtering:
 - CRC Check
 - 64-byte Pattern Match
 - Broadcast, Multicast and Unicast packets
 - Magic Packet™
 - 64-bit Hash Table
 - Runt Packet
- Supports Packet Payload Checksum calculation
- Supports various hardware statistics counters

5.6.8.2 Release Notes

MPLAB Harmony Version: v0.70b **Ethernet Peripheral Library Version :** 0.70b **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.6.8.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.6.8.4 Using the Library

This topic describes the basic architecture of the Ethernet Peripheral Library and provides information and examples on how to use it.

Interface Header File: [plib_eth.h](#)

The interface to the Ethernet Peripheral Library is defined in the "[plib_eth.h](#)" header file. Any C language source (.c) file that uses the Ethernet Peripheral Library should include "[plib_eth.h](#)".

Library File:

The Ethernet Peripheral Library archive (.a) file installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the Peripheral interacts with the framework.

5.6.8.4.1 Hardware Abstraction Model

This section describes how the low-level abstraction is modeled in the software and introduces the library interface. The interface provided is a superset of all the functionality of the available Ethernet on the device. Refer to the specific data sheet or family reference manual to determine the set of functions that are supported for each Ethernet module on your device.

Description

Hardware Model

This library provides the low-level abstraction of the Ethernet module on Microchip family of microcontrollers with a convenient C language interface.

Ethernet Controller Block Diagram

Note: For information on off-chip options to provide Ethernet functionality, refer to the specific device data sheet.

5.6.8.4.2 How the Library Works

This section provides information on the operation of the Ethernet Peripheral Library.

Description

The Peripheral Library is an abstraction of hardware which can be used to control hardware and obtain status. It is intended to allow the programmer access to hardware registers without knowing the exact bit or register names which may vary on individual devices. For example, instead of turning on the Ethernet module using:

ETHCON1bits.EON = 1; the programmer can turn on the Ethernet module using: `PLIB_ETH_Enable(moduleId)`. This allows the programmer to use the same command for any device containing an Ethernet module without having to learn the individual device register names.

Basic Overview

The Ethernet Controller provides the modules needed to implement a 10/100 Mbps Ethernet node using an external PHY chip. To off-load the CPU from moving packet data to and from the module, internal descriptor-based DMA engines are included in the controller.

The Ethernet Controller consists of the following modules:

- Media Access Control (MAC) block: Responsible for implementing the MAC functions of the Ethernet IEEE 802.3 Specification
- Flow Control (FC) block, which provides:
 - Manual flow control
 - Automatic flow control
 - Transmission of PAUSE frames
 - Reception of PAUSE frame is handled within the MAC
- RX Filter (RXF) block: This module performs filtering on every receive packet to determine whether each packet should be accepted or rejected and includes:
 - CRC Check
 - 64-byte Pattern Match
 - Broadcast, Multicast and Unicast packets
 - Magic Packet™
 - 64-bit Hash Table
 - Runt Packet
- TX DMA/TX BM Engine: The TX DMA and TX Buffer Management engines perform data transfers from the memory (using descriptor tables) to the MAC Transmit Interface
- RX DMA/RX BM Engine: The RX DMA and RX Buffer Management engines transfer receive packets from the MAC to the memory (using descriptor tables)

Basic Ethernet Controller Operation

The Ethernet Controller is enabled using [PLIB_ETH_Enable](#) and is disabled using [PLIB_ETH_Disable](#). The Ethernet Controller is disabled by default after any Reset. If the Ethernet Controller is disabled, all of the I/O pins used for the MII/RMII and MIIM interfaces operate as port pins and are under the control of the respective PORTx latch bit and TRISx bit.

Disabling the controller resets the internal DMA state machines and all transmit and receive operations are aborted. The Special Function Registers (SFRs) are still accessible and their values are preserved.

Clearing the ON bit while the Ethernet Controller is active will abort all pending operations and reset the peripheral as previously defined.

Re-enabling the ON bit will restart the Ethernet Controller in its clean reset state while preserving the SFR values.

Ethernet Controller Section Block Diagram

MAC Overview

The MAC sub-layer is part of the functionality described in the OSI model for the Data Link Layer. It defines a medium-independent facility, built on the medium-dependent physical facility provided by the Physical Layer, and under the access-layer-independent LLC sub-layer or other MAC client. It is applicable to a general class of local area broadcast media suitable for use with the Carrier Sense Multiple Access with Collision Detection (CSMA/CD).

The CSMA/CD MAC sub-layer provides services to the MAC client required for the transmission and reception of frames. The CSMA/CD MAC sub-layer makes a best effort to acquire the medium and transfer a serial stream of bits to the Physical Layer. Although certain errors are reported to the client, error recovery is not provided by the MAC.

The following is a summary of the functional capabilities of the CSMA/CD MAC sub-layer as shown in the previous diagram.

- For Frame Transmission:
 - Accepts data from the MAC client and constructs a frame
 - Presents a bit-serial data stream to the Physical Layer for transmission on the medium
 - In half-duplex mode, defers transmission of a bit-serial stream whenever the physical medium is busy
 - It can append proper Frame Check Sequence (FCS) value to outgoing frames and verifies full octet boundary alignment

- Delays transmission of frame bit stream for specified inter-frame gap period
- In half-duplex mode, halts transmission when collision is detected
- In half-duplex mode, schedules retransmission after a collision until a specified retry limit is reached
- In half-duplex mode, enforces collision to ensure propagation throughout network by sending jam message
- Prepends preamble and Start Frame Delimiter and appends FCS to all frame Appends PAD field for frames whose data length is less than a minimum value
- For Frame Reception:
 - Receives a bit-serial data stream from the Physical Layer
 - Presents the received frames to the MAC client (broadcast, multicast, unicast frames, etc.)
 - Checks incoming frames for transmission errors by way of FCS and verifies octet boundary alignment
 - Removes preamble, Start Frame Delimiter and PAD field (if necessary) from received frames
 - Implements the MII Management block that provides control/status connection to the external MII PHY

Note: Not all modes are available on all devices, please refer to the specific device data sheet to determine the set of modes supported for your device. In addition, refer to the **"Ethernet"** section in the family reference manual or the Ethernet Driver Library for more information.

5.6.8.4.2.1 Ethernet Frame Overview

Ethernet Frame Overview

IEEE 802.3-compliant Ethernet frames (packets) are between 64 and 1518 bytes long (Preamble and Start -of-Frame Delimiter not included). Frames containing less than 64 bytes are known as "runt" frames, while frames containing more than 1518 bytes are known as "huge" frames.

An Ethernet frame is made up of the following fields:

- Start-of-Stream/Preamble
- Start-of-Frame Delimiter (SFD)
- Destination MAC address (DA)
- Source MAC address (SA)
- Type/Length field
- Data Payload
- Optional Padding field
- Frame Check Sequence (FCS)
- Traffic on the actual physical cable

Please refer to the IEEE 802.3 Specification for detailed information about the Ethernet protocol.

5.6.8.4.2.2 Ethernet Controller Operation

Basic Ethernet Controller Operation

The Ethernet Controller is enabled using [PLIB_ETH_Enable](#) and is disabled using [PLIB_ETH_Disable](#). The Ethernet Controller is disabled by default after any Reset. If the Ethernet Controller is disabled, all of the I/O pins used for the MII/RMII and MIIM interfaces operate as port pins and are under the control of the respective PORT latch bit and TRIS bit.

Disabling the controller resets the internal DMA state machines and all transmit and receive operations are aborted. The SFRs are still accessible and their values preserved.

Clearing the ON bit while the Ethernet Controller is active will abort all pending operations and reset the peripheral as previously defined.

Re-enabling the ON bit will restart the Ethernet Controller in its clean reset state while preserving the SFR values.

5.6.8.4.2.3 Media Independent Interface (MII)

This section describes the Media Independent Interface (MII).

Description

Media Independent Interface (MII)

The Media Independent Interface (MII) is a standard interconnection between the MAC and the PHY for communicating TX and RX frame data. This MII has the following important characteristics:

- Capable of supporting 10/100 Mbps rates for data transfer, and offers support for management functions
- Provides independent four bit wide transmit and receive data paths
- Uses TTL signal levels, compatible with common digital CMOS processes
- Provides full-duplex operation

In 10 Mbps mode, the MII runs at 2.5 MHz; in 100 Mbps mode it runs at 25 MHz. PHYs that provide MII are not required to support both data rates, and may support either one or both.

5.6.8.4.2.4 Reduced Media Independent Interface (RMII)

This section describes the Reduced Media Independent Interface (RMII).

Description

Reduced Media Independent Interface (RMII)

The management interface (MDIO/MDC) is assumed to be identical to that defined in MII.

The RMII has the following characteristics:

- Capable of supporting 10 Mbps and 100 Mbps data rates
- Single clock reference for both MAC and the PHY (can be sourced from the MAC or from an external source)
- Provides independent 2 bit wide transmit and receive data paths
- Uses TTL signal levels, compatible with common digital CMOS processes
- Provides full-duplex operation
- The interface runs at 50 MHz

5.6.8.4.2.5 Flow Control Overview

Flow Control Overview

Ethernet flow control consists of the ability to **send** and receive PAUSE frames, which cause the receiving node to stop transmitting for a specific amount of time.

On the transmit side, the Flow Control (FC) block handles the hardware handshaking between the MAC and the CPU when the transmit flow control is enabled. Flow control for the received packets is part of the MAC functionality.

The PIC32 MAC supports both Symmetric PAUSE and Asymmetric PAUSE as described in Clause 28, Table 28B-2, and Clause 31 and Annex 31B of the IEEE 802.3 Specification.

The FC block supports two modes of operation: manual and automatic. In addition, the mode of transmission (Full-Duplex or

Half-Duplex) programmed into the MAC registers, is used by the FC block.

5.6.8.4.2.6 Receive Filtering Overview

Receive Filtering Overview

The Receive Filter (RXF) block examines all incoming receive packets and accepts or rejects the packet, based on user-selectable filters. The following RX filters are supported:

- CRC Error Acceptance Filter
- Runt Error Acceptance Filter
- CRC Check Rejection Filter
- Runt Rejection Filter
- Unicast Acceptance Filter
- Not Me Unicast Acceptance Filter
- Multicast Acceptance Filter
- Broadcast Acceptance Filter
- Hash Table Acceptance Filter
- Magic Packet Acceptance Filter
- Pattern Match Acceptance Filter with logical inversion

5.6.8.4.2.7 Ethernet DMA and Buffer Management Engine

Ethernet DMA and Buffer Management Engines

To reduce the overhead on the CPU to move the packet data between data memory and the Ethernet controller, internal receive (RX) and transmit (TX) DMA engines are integrated into the module. The DMA engines are responsible for transferring data from system memory to the MAC for transmit packets and for transferring data from the MAC to system memory for receive packets. The DMA engines each have access to the system memory by acting as two different bus masters, one bus master for transmit and one for receive.

The DMA engines use separate Ethernet Descriptor Tables (EDTs) for TX and RX operations to determine where the TX/RX packet buffer resides in the system memory.

Both transmit and receive descriptors, called Ethernet Descriptors (EDs), used by the DMA engines have a similar format, with only the status word formats being different.

Refer to the "**Ethernet**" section in the family reference manual for more information.

5.6.8.4.3 Sample Code

This section provides information for initialization, transmit, and receive using code samples.

Description

Sample Code

The basic functionality of the Ethernet Peripheral Library is grouped into these sections:

- Initialization
- Transmit
- Receive

For a properly functioning Ethernet port, development of a data queue and use of interrupts will be necessary.

For this additional functionality, see the **"Ethernet"** section in the family reference manual or the Ethernet Driver Library for more information.

Initialization Sequence

The Ethernet Controller is enabled using [PLIB_ETH_Enable](#) and is disabled using [PLIB_ETH_Disable](#). The Ethernet Controller is disabled by default after any Reset.

After being Enabled, disabling the controller resets the internal DMA state machines and all transmit and receive operations are aborted. All registers remain accessible and their values are preserved. It is important to reset the PHY and MII Management registers to ensure the PHY is in a known initialized state.

Before enabling the module for transmitting or receiving packets, there are several registers that must be initialized. To initialize the Ethernet Controller to receive and transmit, Microchip recommends the following sequence:

1. Begin with the module.
 - Disable the CPU Ethernet interrupt
 - Turn the Ethernet Controller off
 - Disable receive
 - Disable transmit
 - Wait until the Ethernet module is no longer busy
 - Disable all Ethernet Interrupts
 - Clear the Ethernet Interrupt Pending Flag(s)
 - Clear the transmit and receive start addresses
2. MAC initialize.
 - Reset the MAC
 - A configuration fuse (FETHIO) setting shows which pins will be used for connection to the PHY
 - A configuration fuse (FMIIEN) settings shows whether MII or RMII will be used
3. PHY Initialize is PHY dependent. Common procedures (which may vary by PHY vender) include the following:
 - Reset PHY (using Control Register 0)
 - Set the MII/RMII operation mode
 - Set the normal, swapped, or auto (preferred)MDIX
 - Check the PY capabilities (using Status Register 1)
 - Preferably the auto-negotiation should be selected if the PHY supports it.
 - Expose the supported capabilities (extended Register 4)
 - Start the negotiation (using Control Register 0)
 - wait for the negotiation to complete and get the link partner capabilities (extended Register 5)
 - negotiation result (vendor-specific register)
 - If auto-negotiation is not supported (or not selected)
 - update the PHY Duplex and speed settings (use Control Register 0 or vender-specific register)
4. MAC Configuration
 - Enable MAC receive and pause both transmit and receive direction control frames.
 - Select the desired auto-padding, duplex, huge frame, and CRC capabilities.

- Program back-to-back inter-packet gap and non-back-to-back interpacket gap.
- Program collision window and maximum retransmissions.
- Set Maximum frame length.
- Optionally set the station MAC address(es) (or let them default to the factory value).

5. Continue Ethernet Controller initialization:

- If planning to turn on flow control, update the Pause Timer Value
- If using auto flow control, setup the full/empty watermarks and enable it
- Set the receive filters
- Set receive buffer size - using packets that are too small impacts performance
- Prepare the list/ring of transmit descriptors - refer to the device data sheet for more information
- Prepare the list of receive descriptors populated with valid buffers for messages to be received - refer to the device data sheet for more information
- Update the transmit buffer start address and the receive buffer start address
- Enable the Ethernet Controller and wait until the module is ready
- Enable Ethernet Receive.

Receive Loop

1. Wait until the receive buffer count has been incremented.
2. Inspect the receive descriptor to see whether it is still owned by the Ethernet Module.
3. If the receive descriptor is still owned by the Ethernet module, nothing has been received. Loop to 1.
4. Otherwise, a message was received and software has control of the memory where it is stored.
5. Extract a message and do something with it.
6. Reinitialize buffer descriptor and return receive buffer to list and decrement the receive packet buffer count.
7. Loop.

Transmit Loop

1. Software writes the packet data to packet data memory. A pointer to the packet data is inserted into the transmit buffer descriptor.
2. Update the necessary number of transmit descriptors, starting from the head of the list - setting the data buffer address (large packet fragmentation will impact performance).
3. Update the byte count for each descriptor with the number of bytes contained in each buffer.
4. Set the flag in each transmit descriptor that belongs to the packet to give the descriptor to the Ethernet module for transmission.
5. Enable the transmission.
6. Wait until the Ethernet module returns the transmit buffer descriptor ownership to software.
7. Inspect the results of the transmission.
8. Loop.

The packet transmit process is as follows:

1. Software writes the packet data to a packet buffer in data memory and programs a buffer descriptor entry to point to the packet data buffer. The buffer descriptor is used to define the Transmission Packet data buffer location and length, and its address is written to the Ethernet Controller.
2. Software then calls the TransmitRequestToSendEnable function, which starts the TX DMA and TXBM logic.

3. After the TX DMA engine reads the DATA_BUFFER_ADDRESS value, the engine will begin reading the packet data from the location read from the descriptor.
4. The TXBM indicates the start-of-frame to the MAC and transmits the entire frame data from the transmit buffer, until the end address is reached. The TXBM simply transmits from the start address until the specified number of bytes has been transmitted to the MAC transmit interface.
5. The MAC can retry a transmission due to an early collision.
6. The MAC can abort a transmission due to a late collision, excessive collisions or excessive defers. This condition is signaled by TXABORT bit (ETHIRQ<2>).
7. Once transmission has completed, the TX DMA engine stores the relevant bits of the TSV into the first descriptor entry of the packet.
8. After the packet has been transmitted, all the descriptors used for the transmission are released to the software via the EOWN bits being cleared.
9. If more valid TX descriptors are available (EOWN = 1), the DMA engine will go back to step 3 to begin the next packet's transmission. Otherwise, if the next descriptor is still owned by hardware (EOWN = 0), transmission will halt and wait for the software to set the TXRTS bit again.

Note that any collision that occurs within the CWINDOW bit (EMAC1CLRT<8:14>) boundary is an early collision and results in a Retry operation. A collision that happens beyond the CWINDOW boundary will be treated as a late collision and will cause an abort. The CWINDOW bit in the EMAC1CLRT register is typically set to 64 bytes. An abort condition can also result from reaching the maximum collision count RETX bit (EMAC1CLRT<0:3>) for a packet trying to be sent.

See the "Ethernet" section in the family reference manual or the Ethernet Driver Library for more information.

5.6.8.4.3.1 Initialization

```
#include "plib_eth.h"
```

```

/*****
*/
void my_ETH_Initialize(ETH_MODULE_ID id)

}

//Receive the packet
//doSomethingWithReceivedPacket()
// After the received packet has been processed, restore EOWN to 1 and
PLIB_ETH_RxBufferCountDecrement(id);
}

```

5.6.8.4.4 Support for Legacy "Ethernet Controller Library"

These routines (PLIB_ETH_Legacy*) provide MPLAB Harmony support for applications that use the "Ethernet Controller Library for Microchip PIC32MX Microcontrollers" that is installed with XC32 compilers. (See <Microchip\xc32\v1.20\docs\pic32-lib-help\hlpETH.chm> for information on this legacy support.)

An additional argument, an index value from the ETH_MODULE_ID enumeration, has been added to allow these functions to work from within the context of this MPLAB Harmony Peripheral Library.

Legacy Controller Library	MPLAB Harmony
EthClose	DRV_ETHMAC_LegacyClose
EthDescriptorGetBuffer	DRV_ETHMAC_LegacyDescriptorGetBuffer
EthDescriptorsPoolAdd	DRV_ETHMAC_LegacyDescriptorsPoolAdd
EthDescriptorsPoolCleanUp	DRV_ETHMAC_LegacyDescriptorsPoolCleanUp

5.6.8.5 Library Interface

Data Types and Constants

	Name	Description
	<u>ETH_AUTOPAD_OPTION</u>	Lists the possible automatic padding configurations.
	<u>ETH_INTERRUPT_SOURCES</u>	Lists the possible values of ETH_INTERRUPT_SOURCES.
	<u>ETH_MIIM_CLK</u>	Lists the possible speed selection for the Reduced Media Independent Interface (RMII).
	<u>ETH_PATTERN_MATCH_MODE</u>	Lists the possible pattern match values.
	<u>ETH_RECEIVE_FILTER</u>	Lists the possible values of the receive filter.
	<u>ETH_RMII_SPEED</u>	Lists the possible speed selection for the Reduced Media Independent Interface (RMII).

Control Functions

	Name	Description
	<u>PLIB_ETH_MCSRxResetDisable</u>	Disables the reset EMAC Control Sub-layer/Receive domain logic.
	<u>PLIB_ETH_MCSRxResetEnable</u>	Enables the reset EMAC Control Sub-layer/Receive domain logic.
	<u>PLIB_ETH_MCSRxResetIsEnabled</u>	Gets the EMAC Control Sub-layer/Receive domain logic reset status.
	<u>PLIB_ETH_MCSTxResetDisable</u>	Disables the reset EMAC Control Sub-layer/Transmit domain logic.
	<u>PLIB_ETH_MCSTxResetEnable</u>	Enables the reset of EMAC Control Sub-layer/Transmit domain logic.

	PLIB_ETH_MCSTxResetIsEnabled	Gets the EMAC Control Sub-layer/Transmit domain logic reset status.
	PLIB_ETH_MIIMReadDataGet	Gets EMAC MIIM management read data after a MII read cycle has completed.
	PLIB_ETH_MIIMReadStart	Initiates an MII management read command.
	PLIB_ETH_MIIMResetDisable	Disables EMAC Reset MII Management.
	PLIB_ETH_MIIMResetEnable	Enables EMAC Reset Media Independent Interface (MII) Management.
	PLIB_ETH_MIIMResetIsEnabled	Gets the EMAC Reset MII Management enable status.
	PLIB_ETH_MIIMScanIncrEnable	Enables EMAC MIIM Scan Increment.
	PLIB_ETH_MIIMScanIncrDisable	Disables the EMAC MIIM Scan Increment.
	PLIB_ETH_MIIMScanIncrIsEnabled	Gets the EMAC MIIM scan increment enable status.
	PLIB_ETH_MIIMScanModeDisable	Disables MIIM scan mode.
	PLIB_ETH_MIIMScanModeEnable	Enables MIIM scan mode.
	PLIB_ETH_MIIMScanModeIsEnabled	Gets the MII management scan enable status.
	PLIB_ETH_MIIMWriteDataSet	Sets the EMAC MIIM write data before initiating an MII write cycle.
	PLIB_ETH_MIIMWriteStart	Initiates an MII management write command.
	PLIB_ETH_MIIRResetDisable	Disables the EMAC Soft reset.
	PLIB_ETH_MIIRResetEnable	Enables the EMAC MIIM Soft reset.
	PLIB_ETH_MIIRResetIsEnabled	Gets EMAC MIIM Soft Reset enable status.
	PLIB_ETH_PHYAddressGet	Gets the EMAC MIIM management PHY address.
	PLIB_ETH_PHYAddressSet	Sets the EMAC MIIM PHY address.
	PLIB_ETH_RegisterAddressGet	Gets the EMAC MIIM management register address.
	PLIB_ETH_RegisterAddressSet	Sets EMAC MIIM register address.
	PLIB_ETH_RMIIResetDisable	Disables EMAC Reset RMII.
	PLIB_ETH_RMIIResetEnable	Enables EMAC Reset RMII.
	PLIB_ETH_RMIIResetIsEnabled	Gets the EMAC Reset RMII enable status.
	PLIB_ETH_RxBufferCountDecrement	Causes the Receive Descriptor Buffer Counter to decrement by 1.
	PLIB_ETH_RxDisable	Disables the Ethernet module receive logic.
	PLIB_ETH_RxEnable	Enables the Ethernet receive logic.
	PLIB_ETH_RxFuncResetDisable	Disables the EMAC reset receive function logic.
	PLIB_ETH_RxFuncResetEnable	Enables the EMAC reset receive function logic.
	PLIB_ETH_RxFuncResetIsEnabled	Gets the EMAC reset receive function status.
	PLIB_ETH_RxIsEnabled	Gets the Ethernet module receive enable status.
	PLIB_ETH_RxPacketDescAddrGet	Gets the address of the next receive descriptor.
	PLIB_ETH_RxPacketDescAddrSet	Sets the Ethernet module receive packet descriptor start address.
	PLIB_ETH_TestPauseDisable	Disables EMAC test pause.
	PLIB_ETH_TestPauseEnable	Enables EMAC test pause.
	PLIB_ETH_TestPauseIsEnabled	Gets the EMAC test pause enable status.
	PLIB_ETH_TxFuncResetDisable	Disables the EMAC Transmit function reset.
	PLIB_ETH_TxFuncResetEnable	Enables the EMAC transmit function reset.
	PLIB_ETH_TxFuncResetIsEnabled	Gets the EMAC Transmit function reset status.
	PLIB_ETH_TxPacketDescAddrGet	Gets the address of the next descriptor to be transmitted.
	PLIB_ETH_TxPacketDescAddrSet	Sets the Ethernet module transmit packet descriptor start address.
	PLIB_ETH_TxRTSDisable	Aborts an Ethernet module transmission.
	PLIB_ETH_TxRTSEnable	Enables the Ethernet transmit request to send .
	PLIB_ETH_TxRTSIsEnabled	Gets the Ethernet module transmit request to send status.

	PLIB_ETH_CRCDisable	Disables EMAC CRC.
	PLIB_ETH_CRCEnable	Enables EMAC CRC.
	PLIB_ETH_CRCIsEnabled	Gets the EMAC CRC enable status.

Existence Functions

	Name	Description
	PLIB_ETH_ExistsAlignmentErrorCount	Identifies whether the AlignmentErrorCount feature exists on the Ethernet module.
	PLIB_ETH_ExistsAutoFlowControl	Identifies whether the AutoFlowControl feature exists on the Ethernet module.
	PLIB_ETH_ExistsCollisionCounts	Identifies whether the CollisionCounts feature exists on the Ethernet module.
	PLIB_ETH_ExistsCollisionWindow	Identifies whether the CollisionWindow feature exists on the Ethernet module.
	PLIB_ETH_ExistsEnable	Identifies whether the Enable feature exists on the Ethernet module.
	PLIB_ETH_ExistsEthernetControllerStatus	Identifies whether the EthernetControllerStatus feature exists on the Ethernet module.
	PLIB_ETH_ExistsFCSErrorCount	Identifies whether the FCSErrorCount feature exists on the Ethernet module.
	PLIB_ETH_ExistsFramesTransmittedOK	Identifies whether the FramesTransmittedOK feature exists on the Ethernet module.
	PLIB_ETH_ExistsFrameReceivedOK	Identifies whether the FrameReceivedOK feature exists on the Ethernet module.
	PLIB_ETH_ExistsHashTable	Identifies whether the HashTable feature exists on the Ethernet module.
	PLIB_ETH_ExistsInterPacketGaps	Identifies whether the InterPacketGaps feature exists on the Ethernet module.
	PLIB_ETH_ExistsInterrupt	Identifies whether the Interrupt feature exists on the Ethernet module.
	PLIB_ETH_ExistsMAC_Configuration	Identifies whether the MAC_Configuration feature exists on the Ethernet module.
	PLIB_ETH_ExistsMAC_Resets	Identifies whether the MAC_Resets feature exists on the Ethernet module.
	PLIB_ETH_ExistsMAC_Testing	Identifies whether the MAC_Testing feature exists on the Ethernet module.
	PLIB_ETH_ExistsManualFlowControl	Identifies whether the ManualFlowControl feature exists on the Ethernet module.
	PLIB_ETH_ExistsMaxFrameLength	Identifies whether the MaxFrameLength feature exists on the Ethernet module.
	PLIB_ETH_ExistsMIIM_Config	Identifies whether the MIIM_Config feature exists on the Ethernet module.
	PLIB_ETH_ExistsMIIM_Indicators	Identifies whether the MIIM_Indicators feature exists on the Ethernet module.
	PLIB_ETH_ExistsMIIMAddresses	Identifies whether the MIIMAddresses feature exists on the Ethernet module.
	PLIB_ETH_ExistsMIIMReadWrite	Identifies whether the MIIMReadWrite feature exists on the Ethernet module.
	PLIB_ETH_ExistsMIIMScanMode	Identifies whether the MIIMScanMode feature exists on the Ethernet module.
	PLIB_ETH_ExistsMIIMWriteReadData	Identifies whether the MIIMWriteReadData feature exists on the Ethernet module.

	PLIB_ETH_ExistsPatternMatch	Identifies whether the PatternMatch feature exists on the Ethernet module.
	PLIB_ETH_ExistsPauseTimer	Identifies whether the PauseTimer feature exists on the Ethernet module.
	PLIB_ETH_ExistsReceiveBufferSize	Identifies whether the ReceiveBufferSize feature exists on the Ethernet module.
	PLIB_ETH_ExistsReceiveFilters	Identifies whether the ReceiveFilters feature exists on the Ethernet module.
	PLIB_ETH_ExistsReceiveOverflowCount	Identifies whether the ReceiveOverflowCount feature exists on the Ethernet module.
	PLIB_ETH_ExistsReceiveWmarks	Identifies whether the ReceiveWmarks feature exists on the Ethernet module.
	PLIB_ETH_ExistsRetransmissionMaximum	Identifies whether the RetransmissionMaximum feature exists on the Ethernet module.
	PLIB_ETH_ExistsRMII_Support	Identifies whether the RMII_Support feature exists on the Ethernet module.
	PLIB_ETH_ExistsRxBufferCountDecrement	Identifies whether the RxBufferCountDecrement feature exists on the Ethernet module.
	PLIB_ETH_ExistsRxEnable	Identifies whether the ReceiveEnable feature exists on the Ethernet module.
	PLIB_ETH_ExistsRxPacketDescriptorAddress	Identifies whether the RxPacketDescriptorAddress feature exists on the Ethernet module.
	PLIB_ETH_ExistsStationAddress	Identifies whether the StationAddress feature exists on the Ethernet module.
	PLIB_ETH_ExistsStopInIdle	Identifies whether the StopInIdle feature exists on the Ethernet module.
	PLIB_ETH_ExistsTransmitRTS	Identifies whether the TransmitRTS feature exists on the Ethernet module.
	PLIB_ETH_ExistsTxPacketDescriptorAddress	Identifies whether the TxPacketDescriptorAddress feature exists on the Ethernet module.

Filtering Functions

	Name	Description
	PLIB_ETH_HashTableGet	Gets the value of the Hash table.
	PLIB_ETH_HashTableSet	Sets the Ethernet module Hash table with the new value.
	PLIB_ETH_PassAllDisable	Disables the EMAC PassAll.
	PLIB_ETH_PassAllEnable	Enables the EMAC PassAll.
	PLIB_ETH_PassAllIsEnabled	Gets the EMAC PassAll enable status.
	PLIB_ETH_PatternMatchChecksumGet	Gets the value of the pattern match checksum register.
	PLIB_ETH_PatternMatchChecksumSet	Sets the Ethernet module pattern match checksum register with the new value.
	PLIB_ETH_PatternMatchGet	Gets the value of the selected pattern match mask register.
	PLIB_ETH_PatternMatchModeGet	Gets the value of the selected pattern match mask register.
	PLIB_ETH_PatternMatchModeSet	Sets the Ethernet module pattern match mode.
	PLIB_ETH_PatternMatchOffsetGet	Gets the value of the patter match offset register.
	PLIB_ETH_PatternMatchOffsetSet	Sets the Ethernet module patter match offset register with the new value.
	PLIB_ETH_PatternMatchSet	Sets the Ethernet module pattern match mask register with the new value.
	PLIB_ETH_PurePreambleDisable	Disables EMAC pure preamble enforcement.
	PLIB_ETH_PurePreambleEnable	Enables EMAC pure preamble enforcement.
	PLIB_ETH_PurePreambleIsEnabled	Gets EMAC pure preamble enforcement enable status.

	PLIB_ETH_ReceiveFilterDisable	Disables the specified receive filter.
	PLIB_ETH_ReceiveFilterEnable	Enables the specified receive filter.
	PLIB_ETH_ReceiveFilterIsEnable	Disables the specified receive filter.
	PLIB_ETH_StationAddressGet	Gets the selected EMAC station address.
	PLIB_ETH_StationAddressSet	Sets the selected EMAC Station Address.

Flow Control Functions

	Name	Description
	PLIB_ETH_AutoFlowControlDisable	Disables the Ethernet module Automatic Flow Control logic.
	PLIB_ETH_AutoFlowControlEnable	Enables the Ethernet Automatic Flow Control logic.
	PLIB_ETH_AutoFlowControlsEnabled	Gets the Ethernet module Automatic Flow Control status.
	PLIB_ETH_BackPresNoBackoffDisable	Disables EMAC back pressure/no backoff.
	PLIB_ETH_BackPresNoBackoffEnable	Enables EMAC back pressure/no back-off.
	PLIB_ETH_BackPresNoBackoffIsEnabled	Gets the EMAC back pressure/no back-off enable status.
	PLIB_ETH_ManualFlowControlDisable	Disable Ethernet module Manual Flow Control logic.
	PLIB_ETH_ManualFlowControlEnable	Enables the Ethernet Manual Flow Control logic.
	PLIB_ETH_ManualFlowControlsEnabled	Gets the Ethernet module Manual Flow Control enable status.
	PLIB_ETH_NoBackoffDisable	Disables EMAC no back-offs.
	PLIB_ETH_NoBackoffEnable	Enables EMAC no backoff.
	PLIB_ETH_NoBackoffIsEnabled	Gets the EMAC no back-off enable status.
	PLIB_ETH_RxEmptyWmarkGet	Gets the Ethernet module receive empty watermark.
	PLIB_ETH_RxEmptyWmarkSet	Sets the Ethernet module receive empty water mark.
	PLIB_ETH_RxFullWmarkGet	Gets the Ethernet module receive full watermark.
	PLIB_ETH_RxFullWmarkSet	Sets the Ethernet module receive full water mark.
	PLIB_ETH_RxPauseDisable	Disables the EMAC receive flow control.
	PLIB_ETH_RxPauseEnable	Enables the EMAC receive flow control.
	PLIB_ETH_RxPauseIsEnabled	Gets the EMAC receive flow pause enable status.
	PLIB_ETH_ShortcutQuantaDisable	Disables EMAC shortcut pause quanta.
	PLIB_ETH_ShortcutQuantaEnable	Enables EMAC shortcut pause quanta.
	PLIB_ETH_ShortcutQuantaIsEnabled	Gets EMAC shortcut pause quanta enable status.
	PLIB_ETH_SimResetDisable	Disables the EMAC simulation reset.
	PLIB_ETH_SimResetEnable	Enables the EMAC simulation reset.
	PLIB_ETH_SimResetIsEnabled	Gets the EMAC simulation reset status.
	PLIB_ETH_TestBackPressDisable	Disables EMAC Test backpressure.
	PLIB_ETH_TestBackPressEnable	Enables EMAC Test backpressure.
	PLIB_ETH_TestBackPressIsEnabled	Gets the EMAC test backpressure enable status.
	PLIB_ETH_TxPauseDisable	Disables the transmission of Pause frames.
	PLIB_ETH_TxPauseEnable	Enables the the tansmission Pause frames.
	PLIB_ETH_TxPauseIsEnabled	Gets the Ethernet module enable status.

Initialization Functions

	Name	Description
	PLIB_ETH_AutoDetectPadClear	Clears the EMAC Auto-Pad option.
	PLIB_ETH_AutoDetectPadGet	Gets the current EMAC Auto-Pad setting.
	PLIB_ETH_AutoDetectPadSet	Sets the EMAC Auto-Pad option.
	PLIB_ETH_BackToBackIPGGet	Gets the EMAC back-to-back interpacket gap.

	PLIB_ETH_BackToBackIPGSet	Sets the EMAC back-to-back interpacket gap.
	PLIB_ETH_CollisionWindowGet	Gets the EMAC collision window.
	PLIB_ETH_CollisionWindowSet	Sets the EMAC collision window.
	PLIB_ETH_DelayedCRCDisable	Disables EMAC delayed CRC.
	PLIB_ETH_DelayedCRCEnable	Enables EMAC delayed CRC.
	PLIB_ETH_DelayedCRCIsEnabled	Gets the EMAC delayed CRC enable status.
	PLIB_ETH_Disable	Disables the Ethernet module.
	PLIB_ETH_Enable	Enables the Ethernet module.
	PLIB_ETH_ExcessDeferDisable	Disables EMAC excess defer.
	PLIB_ETH_ExcessDeferEnable	Enables EMAC excess defer.
	PLIB_ETH_ExcessDeferIsEnabled	Gets the EMAC excess defer enable status.
	PLIB_ETH_FrameLengthCheckDisable	Disables the EMAC frame length check.
	PLIB_ETH_FrameLengthCheckEnable	Enables the EMAC frame length check.
	PLIB_ETH_FrameLengthCheckIsEnabled	Gets the EMAC frame length check status.
	PLIB_ETH_FullDuplexDisable	Disables the EMAC full duplex operatio.
	PLIB_ETH_FullDuplexEnable	Enables the EMAC full deuplex operation.
	PLIB_ETH_FullDuplexIsEnabled	Gets the EMAC full duplex enable status.
	PLIB_ETH_HugeFrameDisable	Disables the EMAC from receiving huge frames.
	PLIB_ETH_HugeFrameEnable	Enables the EMAC to receive huge frames.
	PLIB_ETH_HugeFrameIsEnabled	Gets the EMAC huge frame enable status.
	PLIB_ETH_IsEnabled	Gets the Ethernet module enable status.
	PLIB_ETH_LongPreambleDisable	Disables EMAC long preamble enforcement.
	PLIB_ETH_LongPreambleEnable	Enables EMAC long preamble enforcement.
	PLIB_ETH_LongPreambleIsEnabled	Gets the EMAC long preamble enforcement enable status.
	PLIB_ETH_LoopbackDisable	Disables the EMAC loopback logic.
	PLIB_ETH_LoopbackEnable	Enables the EMAC loopback logic.
	PLIB_ETH_LoopbackIsEnabled	Gets the EMAC Loopback interface enable status.
	PLIB_ETH_MaxFrameLengthGet	Gets the EMAC maximum frame length.
	PLIB_ETH_MaxFrameLengthSet	Sets the EMAC maximum frame length.
	PLIB_ETH_MIIMClockGet	Gets the current EMAC MIIM clock selection.
	PLIB_ETH_MIIMClockSet	Sets the EMAC MIM clock selection.
	PLIB_ETH_MIIMNoPreDisable	Disables EMAC No Preamble (allows preamble).
	PLIB_ETH_MIIMNoPreEnable	Enables EMAC MIIM No Preamble (suppresses preamble).
	PLIB_ETH_MIIMNoPreIsEnabled	Gets the EMAC MIIM No Preamble enable status.
	PLIB_ETH_NonBackToBackIPG1Get	Gets the EMAC non-back-to-back interpacket gap register 1.
	PLIB_ETH_NonBackToBackIPG1Set	Sets the EMAC non-back-to-back interpacket gap register 1.
	PLIB_ETH_NonBackToBackIPG2Get	Gets the EMAC non-back-to-back interpacket gap register 2.
	PLIB_ETH_NonBackToBackIPG2Set	Sets the EMAC non-back-to-back interpacket gap register 2.
	PLIB_ETH_PauseTimerGet	Gets the Pause Timer value used for flow control.
	PLIB_ETH_PauseTimerSet	Sets the Pause Timer value used for flow control.
	PLIB_ETH_ReceiveBufferSizeGet	Gets the Ethernet module receive buffer size.
	PLIB_ETH_ReceiveBufferSizeSet	Sets the Ethernet module receive buffer size.
	PLIB_ETH_ReceiveDisable	Disables the EMAC from receiving frames.
	PLIB_ETH_ReceiveEnable	Enables the EMAC to receive the frames.
	PLIB_ETH_ReceiveIsEnabled	Gets the Ethernet EMAC receive enable status.

	PLIB_ETH_ReTxMaxGet	Gets the EMAC maximum retransmissions.
	PLIB_ETH_ReTxMaxSet	Sets the EMAC maximum retransmissions.
	PLIB_ETH_RMII SpeedGet	Gets the current EMAC RMII speed.
	PLIB_ETH_RMII SpeedSet	Sets EMAC RMII Speed.
	PLIB_ETH_StopInIdleDisable	Ethernet module operation will continue when the device enters Idle mode.
	PLIB_ETH_StopInIdleEnable	Ethernet module operation will stop when the device enters Idle mode.
	PLIB_ETH_StopInIdleIsEnabled	Gets the Ethernet module Stop in Idle mode enable status.

Interrupt Functions

	Name	Description
	PLIB_ETH_InterruptClear	Clears the Ethernet module interrupt source status as a group, using a mask.
	PLIB_ETH_InterruptSet	Sets the Ethernet module interrupt source status as a group, using a mask.
	PLIB_ETH_InterruptsGet	Gets the Ethernet module Interrupt Flag register as a group.
	PLIB_ETH_InterruptSourceDisable	Clears the Ethernet module Interrupt Enable register as a group, using a mask.
	PLIB_ETH_InterruptSourceEnable	Sets the Ethernet module Interrupt Enable register in a group, using a mask.
	PLIB_ETH_InterruptSourceIsEnabled	Gets the Ethernet module Interrupt Enable register singularly or as a group.
	PLIB_ETH_InterruptSourcesGet	Returns the entire interrupt enable register.
	PLIB_ETH_InterruptStatusGet	Gets the Ethernet module Interrupt Flag register as a group, using a mask.

Statistics Functions

	Name	Description
	PLIB_ETH_AlignErrorCountClear	Sets the count of Ethernet alignment errors to zero.
	PLIB_ETH_AlignErrorCountGet	Gets the count of Ethernet alignment errors.
	PLIB_ETH_FCSErrorCountClear	Sets the value of the Ethernet frame check sequence error to zero.
	PLIB_ETH_FCSErrorCountGet	Gets the count of the frame check sequence error.
	PLIB_ETH_FramesRxdOkCountClear	Sets the value of the Ethernet received frames 'OK' count to zero.
	PLIB_ETH_FramesRxdOkCountGet	Gets the count of the frames frames received successfully.
	PLIB_ETH_FramesTxdOkCountClear	Sets the count of Ethernet Control frames transmitted to zero.
	PLIB_ETH_FramesTxdOkCountGet	Gets the count of Ethernet Control Frames transmitted successfully.
	PLIB_ETH_MultipleCollisionCountClear	Sets the value of the Ethernet multiple collision frame count to zero.
	PLIB_ETH_MultipleCollisionCountGet	Gets the count of the frames transmitted successfully after there was more than one collision.
	PLIB_ETH_RxOverflowCountClear	Sets the value of the Ethernet receive overflow count to zero.
	PLIB_ETH_RxOverflowCountGet	Gets the count of the dropped Ethernet receive frames.
	PLIB_ETH_RxPacketCountGet	Gets the value of the receive packet buffer count.
	PLIB_ETH_SingleCollisionCountClear	Sets the value of the Ethernet single collision frame count to zero.
	PLIB_ETH_SingleCollisionCountGet	Gets the count of the frames transmitted successfully on a second attempt.

Status Functions

	Name	Description
	PLIB_ETH_DataNotValid	Gets the MII management read data not valid status.
	PLIB_ETH_EthernetIsBusy	Gets the status value of the Ethernet logic busy.
	PLIB_ETH_LinkHasFailed	Gets the MII management link fail status.
	PLIB_ETH_MIIMIsBusy	Gets the MII management busy status.
	PLIB_ETH_MIIMIsScanning	Gets the MII Management scanning status.

	PLIB_ETH_ReceiveIsBusy	Gets the the Ethernet receive logic busy status.
	PLIB_ETH_TransmitIsBusy	Gets the status value of the Ethernet transmit logic busy status

Description

This section describes the functions, data types, and constants provided in the Ethernet Peripheral Library. Refer to each section for detailed descriptions.

- Interrupt Functions

5.6.8.5.1 Initialization Functions

5.6.8.5.1.1 PLIB_ETH_AutoDetectPadClear Function

C

```
void PLIB_ETH_AutoDetectPadClear(
    ETH_MODULE_ID index,
    ETH_AUTOPAD_OPTION option
);
```

Description

This function sets the EMAC Auto-Pad option. If any auto-pad option other than ETH_AUTOPAD_DISABLED_CHECK_CRC is selected, the CRC must be enabled by [PLIB_ETH_CRCEnable](#).

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_AutoDetectPadClear(MY_ETH_INSTANCE, PAD_OPTION);
```

5.6.8.5.1.2 PLIB_ETH_AutoDetectPadGet Function

C

```
ETH_AUTOPAD_OPTION PLIB_ETH_AutoDetectPadGet(
    ETH_MODULE_ID index
);
```

Description

This function gets the current EMAC Auto-Pad setting.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

[ETH_AUTOPAD_OPTION](#)

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
autoPadOption = PLIB_ETH_AutoDetectPadGet(MY_ETH_INSTANCE);
```

5.6.8.5.1.3 PLIB_ETH_AutoDetectPadSet Function**C**

```
void PLIB_ETH_AutoDetectPadSet(  
    ETH_MODULE_ID index,  
    ETH_AUTOPAD_OPTION option  
);
```

Description

This function sets the EMAC Auto-Pad option. If any auto-pad option other than [ETH_AUTOPAD_DISABLED_CHECK_CRC](#) is selected, the CRC must be enabled by [PLIB_ETH_CRCEnable](#).

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_AutoDetectPadSet(MY_ETH_INSTANCE, PAD_OPTION);
```

5.6.8.5.1.4 PLIB_ETH_BackToBackIPGGet Function**C**

```
uint8_t PLIB_ETH_BackToBackIPGGet(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the EMAC back-to-back interpacket gap.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

backToBackIPGValue - Back-to-back inter-packet gap (7-bits)

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
value = PLIB_ETH_BackToBackIPGGet(MY_ETH_INSTANCE);
```

5.6.8.5.1.5 PLIB_ETH_BackToBackIPGSet Function**C**

```
void PLIB_ETH_BackToBackIPGSet(  
    ETH_MODULE_ID index,  
    uint8_t backToBackIPGValue  
);
```

Description

This function sets the EMAC back-to-back interpacket gap.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
backToBackIPGValue	Back-to-back inter-packet gap

Returns

None.

Remarks

In Full-Duplex mode, the register value should be the desired period in nibble times minus 3. In Full-Duplex, the recommended setting is 0x15.

In Half-Duplex mode, the register value should be the desired period in nibble times minus 6. In Half-Duplex, the recommended setting is 0x12.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_BackToBackIPGSet(MY_ETH_INSTANCE, backToBackIPGValue);
```

5.6.8.5.1.6 PLIB_ETH_CollisionWindowGet Function

C

```
uint8_t PLIB_ETH_CollisionWindowGet(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the EMAC collision window.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

collisionWindowValue - A uint8_t (6-bit) value.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
value = PLIB_ETH_CollisionWindowGet(MY_ETH_INSTANCE);
```

5.6.8.5.1.7 PLIB_ETH_CollisionWindowSet Function

C

```
void PLIB_ETH_CollisionWindowSet(  
    ETH_MODULE_ID index,  
    uint8_t collisionWindowValue  
);
```

Description

This function sets the EMAC collision window.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
collisionWindowValue	Collision window

Returns

None.

Remarks

This is a programmable field representing the slot time or collision window during which collisions occur in properly configured networks. Since the collision window starts at the beginning of transmission, the preamble and SFD is included. Its default of 0x37 (55d) corresponds to the count of frame bytes at the end of the window.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_CollisionWindowSet(MY_ETH_INSTANCE, collisionWindowValue);
```

5.6.8.5.1.8 PLIB_ETH_DelayedCRCDisable Function**C**

```
void PLIB_ETH_DelayedCRCDisable(  
    ETH_MODULE_ID index  
);
```

Description

This function disables EMAC delayed CRC. No proprietary header exists.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_DelayedCRCDisable(MY_ETH_INSTANCE);
```

5.6.8.5.1.9 PLIB_ETH_DelayedCRCEnable Function**C**

```
void PLIB_ETH_DelayedCRCEnable(  
    ETH_MODULE_ID index  
);
```

Description

This function enables EMAC delayed CRC. A proprietary packet header exists. Four bytes of the packet header are ignored by the CRC function.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_DelayedCRCEnable(MY_ETH_INSTANCE);
```

5.6.8.5.1.10 PLIB_ETH_DelayedCRCIsEnabled Function

C

```
bool PLIB_ETH_DelayedCRCIsEnabled(  
    ETH_MODULE_ID index  
);
```

Description

This function returns the EMAC delayed CRC enable status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - A proprietary header exists. Four bytes of packet header are ignored by the CRC function.
- false - No proprietary header

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
stat = PLIB_ETH_DelayedCRCIsEnabled(MY_ETH_INSTANCE);
```

5.6.8.5.1.11 PLIB_ETH_Disable Function

C

```
void PLIB_ETH_Disable(  
    ETH_MODULE_ID index  
);
```

Description

This function disables the Ethernet module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_Disable(MY_ETH_INSTANCE);
```

5.6.8.5.1.12 PLIB_ETH_Enable Function

C

```
void PLIB_ETH_Enable(  
    ETH_MODULE_ID index  
);
```

Description

This function enables the Ethernet module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_Enable(MY_ETH_INSTANCE);
```

5.6.8.5.1.13 PLIB_ETH_ExcessDeferDisable Function

C

```
void PLIB_ETH_ExcessDeferDisable(  
    ETH_MODULE_ID index  
);
```

Description

This function disables EMAC excess defer. The EMAC will abort when the excessive deferral limit is reached.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_ExcessDeferDisable(MY_ETH_INSTANCE);
```

5.6.8.5.1.14 PLIB_ETH_ExcessDeferEnable Function

C

```
void PLIB_ETH_ExcessDeferEnable(  
    ETH_MODULE_ID index  
);
```

Description

This function enables EMAC excess defer. The EMAC will defer to the carrier indefinitely.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_ExcessDeferEnable(MY_ETH_INSTANCE);
```

5.6.8.5.1.15 PLIB_ETH_ExcessDeferIsEnabled Function

C

```
bool PLIB_ETH_ExcessDeferIsEnabled(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the EMAC excess defer enable status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The EMAC will defer to carrier indefinitely as per the Standard
- false - The EMAC will abort when the excessive deferral limit is reached

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
stat = PLIB_ETH_ExcessDeferIsEnabled(MY_ETH_INSTANCE);
```

5.6.8.5.1.16 PLIB_ETH_FrameLengthCheckDisable Function

C

```
void PLIB_ETH_FrameLengthCheckDisable(  
    ETH_MODULE_ID index  
);
```

Description

This function disables the EMAC frame length check.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_FrameLengthCheckDisable(MY_ETH_INSTANCE);
```

5.6.8.5.1.17 PLIB_ETH_FrameLengthCheckEnable Function

C

```
void PLIB_ETH_FrameLengthCheckEnable(  
    ETH_MODULE_ID index  
);
```

Description

This function enables the EMAC frame length check. Both transmit and receive frame lengths are compared to the Length/Type field. If the Length/Type field represents a length, the check is performed. Mismatches are reported on the transmit/receive statistics vector.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_FrameLengthCheckEnable(MY_ETH_INSTANCE);
```

5.6.8.5.1.18 PLIB_ETH_FrameLengthCheckIsEnabled Function

C

```
bool PLIB_ETH_FrameLengthCheckIsEnabled(  
    ETH_MODULE_ID index  
);
```

Description

This function returns the EMAC frame length check status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - Both transmit and receive frame lengths are compared to the Length/Type field. If the Length/Type field represents a length then the check is performed. Mismatches are reported on the transmit/receive statistics vector.
- false - Length/Type field check is not performed

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
stat = PLIB_ETH_FrameLengthCheckIsEnabled(MY_ETH_INSTANCE);
```

5.6.8.5.1.19 PLIB_ETH_FullDuplexDisable Function

C

```
void PLIB_ETH_FullDuplexDisable(  
    ETH_MODULE_ID index  
);
```

Description

This function disables the EMAC full-duplex operation, which results in the EMAC operating in half-duplex.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_FullDuplexDisable(MY_ETH_INSTANCE);
```

5.6.8.5.1.20 PLIB_ETH_FullDuplexEnable Function

C

```
void PLIB_ETH_FullDuplexEnable(  
    ETH_MODULE_ID index  
);
```

Description

This function enables the EMAC full duplex operation.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_FullDuplexEnable(MY_ETH_INSTANCE);
```

5.6.8.5.1.21 PLIB_ETH_FullDuplexIsEnabled Function

C

```
bool PLIB_ETH_FullDuplexIsEnabled(  
    ETH_MODULE_ID index  
);
```

Description

This function returns the EMAC full duplex enable status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The EMAC operates in Full-Duplex mode
- false - The EMAC operates in Half-Duplex mode

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
stat = PLIB_ETH_FullDuplexIsEnabled(MY_ETH_INSTANCE);
```

5.6.8.5.1.22 PLIB_ETH_HugeFrameDisable Function

C

```
void PLIB_ETH_HugeFrameDisable(  
    ETH_MODULE_ID index  
);
```

Description

This function disables the EMAC from receiving huge frames.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_HugeFrameDisable(MY_ETH_INSTANCE);
```

5.6.8.5.1.23 PLIB_ETH_HugeFrameEnable Function

C

```
void PLIB_ETH_HugeFrameEnable(  
    ETH_MODULE_ID index  
);
```

Description

This function enables the EMAC receiving the frames of any length.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_HugeFrameEnable(MY_ETH_INSTANCE);
```

5.6.8.5.1.24 PLIB_ETH_HugeFrameIsEnabled Function

C

```
bool PLIB_ETH_HugeFrameIsEnabled(  
    ETH_MODULE_ID index  
);
```

Description

This function returns the EMAC huge frame enable status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - Frames of any length are transmitted and received
- false - Huge frames are not allowed for receive or transmit

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
stat = PLIB_ETH_HugeFrameIsEnabled(MY_ETH_INSTANCE);
```

5.6.8.5.1.25 PLIB_ETH_IsEnabled Function

C

```
bool PLIB_ETH_IsEnabled(  
    ETH_MODULE_ID index  
);
```

Description

This function returns the Ethernet module enable status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - Ethernet module is enabled
- false - Ethernet module is disabled

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
stat = PLIB_ETH_IsEnabled(MY_ETH_INSTANCE);
```

5.6.8.5.1.26 PLIB_ETH_LongPreambleDisable Function

C

```
void PLIB_ETH_LongPreambleDisable(  
    ETH_MODULE_ID index  
);
```

Description

This function disables EMAC long preamble enforcement. The EMAC allows any length preamble.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_LongPreambleDisable(MY_ETH_INSTANCE);
```

5.6.8.5.1.27 PLIB_ETH_LongPreambleEnable Function

C

```
void PLIB_ETH_LongPreambleEnable(  
    ETH_MODULE_ID index  
);
```

Description

This function enables EMAC long preamble enforcement. The EMAC only allows receive packets which contain preamble fields less than 12 bytes in length.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_LongPreambleEnable(MY_ETH_INSTANCE);
```

5.6.8.5.1.28 PLIB_ETH_LongPreambleIsEnabled Function

C

```
bool PLIB_ETH_LongPreambleIsEnabled(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the EMAC long preamble enforcement enable status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The EMAC only allows receive packets, which contain preamble fields less than 12 bytes in length
- false - The EMAC allows any length preamble

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
stat = PLIB_ETH_LongPreambleIsEnabled(MY_ETH_INSTANCE);
```

5.6.8.5.1.29 PLIB_ETH_LoopbackDisable Function

C

```
void PLIB_ETH_LoopbackDisable(  
    ETH_MODULE_ID index  
);
```

Description

This function disables the EMAC loopback. EMAC resumes normal operation.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_LoopbackDisable(MY_ETH_INSTANCE);
```

5.6.8.5.1.30 PLIB_ETH_LoopbackEnable Function

C

```
void PLIB_ETH_LoopbackEnable(  
    ETH_MODULE_ID index  
);
```

Description

This function enables the EMAC loopback logic. The EMAC transmit interface is looped back to the EMAC receive interface.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_LoopbackEnable(MY_ETH_INSTANCE);
```

5.6.8.5.1.31 PLIB_ETH_LoopbackIsEnabled Function

C

```
bool PLIB_ETH_LoopbackIsEnabled(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the EMAC Loopback interface enable status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - EMAC transmit interface is looped back to the EMAC receive interface
- false - EMAC normal operation

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
stat = PLIB_ETH_LoopbackIsEnabled(MY_ETH_INSTANCE);
```

5.6.8.5.1.32 PLIB_ETH_MaxFrameLengthGet Function

C

```
uint16_t PLIB_ETH_MaxFrameLengthGet(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the EMAC maximum frame length.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

MaxFrameLength - Maximum frame length

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
value = PLIB_ETH_MaxFrameLengthGet(MY_ETH_INSTANCE);
```

5.6.8.5.1.33 PLIB_ETH_MaxFrameLengthSet Function

C

```
void PLIB_ETH_MaxFrameLengthSet(  
    ETH_MODULE_ID index,  
    uint16_t MaxFrameLength  
);
```

Description

This function sets the EMAC maximum frame length.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
MaxFrameLength	Maximum frame length

Returns

None.

Remarks

This field resets to 0x05EE, which represents a maximum receive frame of 1518 bytes. An untagged maximum size Ethernet frame is 1518 bytes. A tagged frame adds four octets for a total of 1522 bytes. If a shorter/longer maximum length restriction is desired, program this 16-bit field.

If a proprietary header is allowed, this field should be adjusted accordingly. For example, if 4-byte headers are prepended to

frames, MACMAXF could be set to 1527 bytes. This would allow the maximum VLAN tagged frame plus the 4-byte header.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_MaxFrameLengthSet(MY_ETH_INSTANCE, MaxFrameLength);
```

5.6.8.5.1.34 PLIB_ETH_MIIMClockGet Function**C**

```
ETH_MIIM_CLK PLIB_ETH_MIIMClockGet(  
    ETH_MODULE_ID index  
);
```

Description

This function returns the current EMAC MIIM clock selection.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

MIIMClock - of type PLIB_ETH_MIIM_CLK

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
clkstat = PLIB_ETH_MIIMClockGet(MY_ETH_INSTANCE);
```

5.6.8.5.1.35 PLIB_ETH_MIIMClockSet Function**C**

```
void PLIB_ETH_MIIMClockSet(  
    ETH_MODULE_ID index,  
    ETH_MIIM_CLK MIIMClock  
);
```

Description

This function sets the EMAC MIIM clock selection.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
MIIMClock	of type ETH_MIIM_CLK - the system clock divisor for MII

Returns

None.

Remarks

This field is used by the clock divide logic in creating the MII Management Clock (MDC), which the IEEE 802.3 Specification defines to be no faster than 2.5 MHz. Some PHYs support clock rates up to 12.5 MHz.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_MIIMClockSet(MY_ETH_INSTANCE, MIIMClock);
```

5.6.8.5.1.36 PLIB_ETH_MIIMNoPreDisable Function**C**

```
void PLIB_ETH_MIIMNoPreDisable(  
    ETH_MODULE_ID index  
);
```

Description

This function disables EMAC No preamble (allows preamble). Normal read/write cycles are performed.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_MIIMNoPreDisable(MY_ETH_INSTANCE);
```

5.6.8.5.1.37 PLIB_ETH_MIIMNoPreEnable Function**C**

```
void PLIB_ETH_MIIMNoPreEnable(  
    ETH_MODULE_ID index  
);
```

Description

This function enables EMAC MIIM No Preamble (suppresses preamble). The MII Management will perform read/write cycles without the 32-bit preamble field. Some PHYs support suppressed preamble.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_MIIMNoPreEnable(MY_ETH_INSTANCE);
```

5.6.8.5.1.38 PLIB_ETH_MIIMNoPrelsEnabled Function**C**

```
bool PLIB_ETH_MIIMNoPreIsEnabled(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the EMAC MIIM No Preamble enable status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The MII Management will perform read/write cycles without the 32-bit preamble field. Some PHYs support suppressed preamble.
- false - Normal read/write cycles are performed

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
stat = PLIB_ETH_MIIMNoPreIsEnabled(MY_ETH_INSTANCE);
```

5.6.8.5.1.39 PLIB_ETH_NonBackToBackIPG1Get Function**C**

```
uint8_t PLIB_ETH_NonBackToBackIPG1Get(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the EMAC non-back-to-back interpacket gap register 1.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

nonBackToBackIPGValue - Non-back-to-back inter-packet gap (7-bits)

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
value = PLIB_ETH_NonBackToBackIPG1Get(MY_ETH_INSTANCE);
```

5.6.8.5.1.40 PLIB_ETH_NonBackToBackIPG1Set Function**C**

```
void PLIB_ETH_NonBackToBackIPG1Set(  
    ETH_MODULE_ID index,  
    uint8_t nonBackToBackIPGValue  
);
```

Description

This function sets the EMAC non-back-to-back interpacket gap register 1. A value of 0x0C is recommended.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
nonBackToBackIPGValue	Non-back-to-back inter-packet gap

Returns

None.

Remarks

This is a programmable field representing the optional carrierSense window referenced in the IEEE 802.3 Specification. If a carrier is detected during the timing of IPGR1, the MAC defers to the carrier. If, however, the carrier comes after IPGR1, the MAC continues timing IPGR2 and transmits, knowingly causing a collision, thereby ensuring fair access to the medium. Its range of values is 0x0 to IPGR2. Its recommended value is 0xC (12d).

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_NonBackToBackIPG1Set(MY_ETH_INSTANCE, nonBackToBackIPGValue);
```

5.6.8.5.1.41 PLIB_ETH_NonBackToBackIPG2Get Function**C**

```
uint8_t PLIB_ETH_NonBackToBackIPG2Get(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the EMAC non-back-to-back interpacket gap register 2.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

nonBackToBackIPGValue - Non-back-to-back inter-packet gap (7-bits)

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
value = PLIB_ETH_NonBackToBackIPG2Get(MY_ETH_INSTANCE);
```

5.6.8.5.1.42 PLIB_ETH_NonBackToBackIPG2Set Function**C**

```
void PLIB_ETH_NonBackToBackIPG2Set(  
    ETH_MODULE_ID index,  
    uint8_t nonBackToBackIPGValue  
);
```

Description

This function sets the EMAC non-back-to-back interpacket gap register 2. A value of 0x12 is recommended.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
nonBackToBackIPGValue	Non-back-to-back inter-packet gap

Returns

None.

Remarks

This is a programmable field representing the non-back-to-back Inter-Packet-Gap. Its recommended value is 0x12 (18d), which represents the minimum IPG of 0.96 us (in 100 Mbps) or 9.6 us (in 10 Mbps).

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_NonBackToBackIPG2Set(MY_ETH_INSTANCE, nonBackToBackIPGValue);
```

5.6.8.5.1.43 PLIB_ETH_PauseTimerGet Function**C**

```
uint16_t PLIB_ETH_PauseTimerGet(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the Pause Timer value used for flow control.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

PauseTimerValue - Pause Timer Value

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PauseTimerValue = PLIB_ETH_PauseTimerGet(MY_ETH_INSTANCE);
```

5.6.8.5.1.44 PLIB_ETH_PauseTimerSet Function**C**

```
void PLIB_ETH_PauseTimerSet(  
    ETH_MODULE_ID index,  
    uint16_t PauseTimerValue  
);
```

Description

This function sets the Pause Timer value used for flow control.

Preconditions

Write to the Pause Timer register before enabling the receiver. Call this function before calling [PLIB_ETH_ReceiveEnable\(\)](#)

Parameters

Parameters	Description
index	Identifier for the device instance
PauseTimerValue	used for Flow Control

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_PauseTimerSet(MY_ETH_INSTANCE, PauseTimerValue);
```

5.6.8.5.1.45 PLIB_ETH_ReceiveBufferSizeGet Function**C**

```
uint8_t PLIB_ETH_ReceiveBufferSizeGet(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the Ethernet receive buffer size. The buffer size is set from 16 bytes up to 2032 bytes in increments of 16 bytes each.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

ReceiveBufferSize - receive buffer size divided by 16

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
size = PLIB_ETH_ReceiveBufferSizeGet(MY_ETH_INSTANCE);
```

5.6.8.5.1.46 PLIB_ETH_ReceiveBufferSizeSet Function**C**

```
void PLIB_ETH_ReceiveBufferSizeSet(  
    ETH_MODULE_ID index,  
    uint8_t ReceiveBufferSize  
);
```

Description

This function sets the Ethernet receive buffer size. The buffer size is set from 16 bytes up to 2032 bytes in increments of 16 bytes each.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
ReceiveBufferSize	In units of 16 bytes, must be a value of 0x01 to 0x7F, 0x00 is invalid

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_ReceiveBufferSizeSet(MY_ETH_INSTANCE, ReceiveBufferSize/16 );
```

5.6.8.5.1.47 PLIB_ETH_ReceiveDisable Function**C**

```
void PLIB_ETH_ReceiveDisable(  
    ETH_MODULE_ID index  
);
```

Description

This function disables the EMAC from receiving frames.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_ReceiveDisable(MY_ETH_INSTANCE);
```

5.6.8.5.1.48 PLIB_ETH_ReceiveEnable Function**C**

```
void PLIB_ETH_ReceiveEnable(  
    ETH_MODULE_ID index  
);
```

Description

This function enables the EMAC to receive the frames.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_ReceiveEnable(MY_ETH_INSTANCE);
```

5.6.8.5.1.49 PLIB_ETH_ReceiveIsEnabled Function**C**

```
bool PLIB_ETH_ReceiveIsEnabled(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the Ethernet EMAC receive enable status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - Enable the EMAC to receive frames
- false - Disable the EMAC to receive frames

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
stat = PLIB_ETH_ReceiveIsEnabled(MY_ETH_INSTANCE);
```

5.6.8.5.1.50 PLIB_ETH_ReTxMaxGet Function**C**

```
uint8_t PLIB_ETH_ReTxMaxGet(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the EMAC maximum retransmissions.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

retransmitMax - Maximum number of retransmissions

Remarks

The maximum number of attempts is limited to 0x0F.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
value = PLIB_ETH_ReTxMaxGet(MY_ETH_INSTANCE);
```

5.6.8.5.1.51 PLIB_ETH_ReTxMaxSet Function**C**

```
void PLIB_ETH_ReTxMaxSet(  
    ETH_MODULE_ID index,  
    uint16_t retransmitMax  
);
```

Description

This function sets the EMAC maximum retransmissions.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
retransmitMax	Maximum number of retransmissions

Returns

None.

Remarks

This is a programmable field specifying the number of retransmission attempts following a collision before aborting the packet due to excessive collisions. The IEEE 802.3 Specification standard specifies the maximum number of attempts (attemptLimit) to be 0xF (15d). Its default is 000.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_ReTxMaxSet(retransmitMax);
```

5.6.8.5.1.52 PLIB_ETH_RMII SpeedGet Function**C**

```
ETH_RMII_SPEED PLIB_ETH_RMII SpeedGet(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the current EMAC RMII speed.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

RMII_100Mbps - RMII running at 100Mbps RMII_10Mbps - RMII running at 10Mbps

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_RMII SpeedGet(MY_ETH_INSTANCE);
```

5.6.8.5.1.53 PLIB_ETH_RMII SpeedSet Function**C**

```
void PLIB_ETH_RMII SpeedSet(  
    ETH_MODULE_ID index,  
    ETH_RMII_SPEED RMII Speed  
);
```

Description

This function sets EMAC RMII speed. RMII speed can be either RMII_100Mbps or RMII_10Mbps.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
RMII Speed	RMII_100Mbps or RMII_10Mbps of type ETH_RMII_SPEED

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_RMII SpeedSet (MY_ETH_INSTANCE, ETH_RMII_SPEED RMII Speed);
```

5.6.8.5.1.54 PLIB_ETH_StopInIdleDisable Function**C**

```
void PLIB_ETH_StopInIdleDisable(  
    ETH_MODULE_ID index  
);
```

Description

This function directs the Ethernet module to continue operation when the device enters Idle mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_StopInIdleDisable (MY_ETH_INSTANCE);
```

5.6.8.5.1.55 PLIB_ETH_StopInIdleEnable Function**C**

```
void PLIB_ETH_StopInIdleEnable(  
    ETH_MODULE_ID index  
);
```

Description

This function directs the Ethernet module to stop operation when the device enters Idle mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_StopInIdleEnable(MY_ETH_INSTANCE);
```

5.6.8.5.1.56 PLIB_ETH_StopInIdleIsEnabled Function

C

```
bool PLIB_ETH_StopInIdleIsEnabled(  
    ETH_MODULE_ID index  
);
```

Description

This function returns the Ethernet module Stop in Idle mode enable status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - Ethernet module transfers stop during Idle mode
- false - Ethernet module transfers continue to run during Idle mode

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
stat = PLIB_ETH_StopInIdleIsEnabled(MY_ETH_INSTANCE);
```

5.6.8.5.2 Control Functions

5.6.8.5.2.1 PLIB_ETH_MCSRxResetDisable Function

C

```
void PLIB_ETH_MCSRxResetDisable(  
    ETH_MODULE_ID index  
);
```

Description

This function disables the reset EMAC Control Sub-layer/Receive domain logic. The MCS/Receive domain logic is released from reset.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_MCSRxResetDisable(MY_ETH_INSTANCE);
```

5.6.8.5.2.2 PLIB_ETH_MCSRxResetEnable Function**C**

```
void PLIB_ETH_MCSRxResetEnable(  
    ETH_MODULE_ID index  
);
```

Description

This function enables the reset EMAC Control Sub-layer/Receive domain logic. The MCS/Receive domain logic is held in reset.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_MCSRxResetEnable(MY_ETH_INSTANCE);
```

5.6.8.5.2.3 PLIB_ETH_MCSRxResetIsEnabled Function**C**

```
bool PLIB_ETH_MCSRxResetIsEnabled(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the EMAC Control Sub-layer/Receive domain logic reset status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - EMAC Control Sub-layer/Receive domain logic is in reset
- false - EMAC Control Sub-layer/Receive domain logic is not in reset

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
stat = PLIB_ETH_MCSRxResetIsEnabled(MY_ETH_INSTANCE);
```

5.6.8.5.2.4 PLIB_ETH_MCSTxResetDisable Function**C**

```
void PLIB_ETH_MCSTxResetDisable(  
    ETH_MODULE_ID index  
);
```

Description

This function disables the reset EMAC Control Sub-layer/Transmit domain logic. The MCS/Transmit domain logic is released from reset.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_MCSTxResetDisable(MY_ETH_INSTANCE);
```

5.6.8.5.2.5 PLIB_ETH_MCSTxResetEnable Function**C**

```
void PLIB_ETH_MCSTxResetEnable(  
    ETH_MODULE_ID index  
);
```

Description

This function resets the EMAC Control Sub-layer/Transmit domain logic. The MCS/Transmit domain logic is held in reset.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_MCSTxResetEnable(MY_ETH_INSTANCE);
```

5.6.8.5.2.6 PLIB_ETH_MCSTxResetIsEnabled Function**C**

```
bool PLIB_ETH_MCSTxResetIsEnabled(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the EMAC Control Sub-layer/Transmit domain logic reset status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - EMAC Control Sub-layer/Transmit domain logic is held in reset
- false - EMAC Control Sub-layer/Transmit domain logic is not in reset

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
stat = PLIB_ETH_MCSTxResetIsEnabled(MY_ETH_INSTANCE);
```

5.6.8.5.2.7 PLIB_ETH_MIIMReadDataGet Function**C**

```
uint16_t PLIB_ETH_MIIMReadDataGet(  
    ETH_MODULE_ID index  
);
```

Description

This function gets EMAC MIIM management read data after a MII read cycle has completed.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

readData - MII read data

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
readData = PLIB_ETH_MIIMReadDataGet(MY_ETH_INSTANCE);
```

5.6.8.5.2.8 PLIB_ETH_MIIMReadStart Function**C**

```
void PLIB_ETH_MIIMReadStart(  
    ETH_MODULE_ID index  
);
```

Description

This function initiates an MII read command. The MII Management module will perform a single read cycle. To get data, use PLIB_ETH_MIIReadDataGet.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
while (PLIB_ETH_MIIMIsBusy(MY_ETH_INSTANCE))  
{  
    //Wait until MII Link is not busy  
}  
PLIB_ETH_MIIReadStart(MY_ETH_INSTANCE);  
while (PLIB_ETH_MIIReadIsDataNotValid(MY_ETH_INSTANCE))  
{  
    //Wait until read is complete  
}  
data = PLIB_ETH_MIIReadDataGet(MY_ETH_INSTANCE);
```

5.6.8.5.2.9 PLIB_ETH_MIIMResetDisable Function**C**

```
void PLIB_ETH_MIIMResetDisable(  

```

```
    ETH_MODULE_ID index
);
```

Description

This function disables EMAC Reset MII Management. EMAC will resume normal operation.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_MIIMResetDisable(MY_ETH_INSTANCE);
```

5.6.8.5.2.10 PLIB_ETH_MIIMResetEnable Function**C**

```
void PLIB_ETH_MIIMResetEnable(
    ETH_MODULE_ID index
);
```

Description

This function enables EMAC Reset MII Management and holds the MII Management module in reset while enabled.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

MII Management held in Reset after This function is called. Disable ResetMIIanagement to return to normal operation.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_MIIMResetEnable(MY_ETH_INSTANCE);
```

5.6.8.5.2.11 PLIB_ETH_MIIMResetIsEnabled Function**C**

```
bool PLIB_ETH_MIIMResetIsEnabled(
    ETH_MODULE_ID index
);
```

Description

This function gets the EMAC Reset MII Management enable status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - Reset the MII Management module
- false - Normal operation

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
stat = PLIB_ETH_MIIMResetIsEnabled(MY_ETH_INSTANCE);
```

5.6.8.5.2.12 PLIB_ETH_MIIMScanIncrEnable Function**C**

```
void PLIB_ETH_MIIMScanIncrEnable(  
    ETH_MODULE_ID index  
);
```

Description

This function enables EMAC MIIM Scan Increment. The MII Management module will perform read cycles across a range of PHYs. The read cycles will start from address 1 through the value set in the PHY address register.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

The read cycles will start at PHY address 1 and continue through the value set for as the PHY address register.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_MIIMScanIncrEnable(MY_ETH_INSTANCE);
```

5.6.8.5.2.13 PLIB_ETH_MIIMScanIncrDisable Function**C**

```
void PLIB_ETH_MIIMScanIncrDisable(  
    ETH_MODULE_ID index  
);
```

Description

This function disables the EMAC MIIM Scan Increment. Allows continuous reads of the same PHY.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_MIIMScanIncrDisable(MY_ETH_INSTANCE);
```

5.6.8.5.2.14 PLIB_ETH_MIIMScanIncrIsEnabled Function**C**

```
bool PLIB_ETH_MIIMScanIncrIsEnabled(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the EMAC MIIM scan increment enable status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The MII Management module will perform read cycles across a range of PHYs. The read cycles will start from address 1 through the value set in the PHY address register.
- false - Continuous reads of the same PHY

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
ScanIncrement = PLIB_ETH_MIIMScanIncrIsEnabled(MY_ETH_INSTANCE);
```

5.6.8.5.2.15 PLIB_ETH_MIIMScanModeDisable Function**C**

```
void PLIB_ETH_MIIMScanModeDisable(  
    ETH_MODULE_ID index  
);
```

Description

This function disables MIIM scan mode. Scan is disabled for Normal operation.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_MIIMScanModeDisable(MY_ETH_INSTANCE);
```

5.6.8.5.2.16 PLIB_ETH_MIIMScanModeEnable Function**C**

```
void PLIB_ETH_MIIMScanModeEnable(  
    ETH_MODULE_ID index  
);
```

Description

This function enables MIIM scan mode. The MII Management module will perform read cycles continuously. (Useful for monitoring the Link Fail.)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_MIIMScanModeEnable(MY_ETH_INSTANCE);
```

5.6.8.5.2.17 PLIB_ETH_MIIMScanModeIsEnabled Function**C**

```
bool PLIB_ETH_MIIMScanModeIsEnabled(  
    ETH_MODULE_ID index  
);
```

Description

This function returns the MII management scan enable status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The MII Management module will perform read cycles continuously (for example, useful for monitoring the Link Fail)
- false - Normal operation

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
stat = PLIB_ETH_MIIMScanModeIsEnabled(MY_ETH_INSTANCE);
```

5.6.8.5.2.18 PLIB_ETH_MIIMWriteDataSet Function**C**

```
void PLIB_ETH_MIIMWriteDataSet(  
    ETH_MODULE_ID index,  
    uint16_t writeData  
);
```

Description

This function sets the EMAC MIIM write data before initiating write cycle.

Preconditions

Prior to a call to this routine, the PHY and Register addresses should be set using PLIB_ETH_MIIPHYAddressSet and PLIB_ETH_MIIMRegisterAddressSet.

Parameters

Parameters	Description
index	Identifier for the device instance
writeData	MII write data

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_MIIMWriteDataSet(MY_ETH_INSTANCE, WriteData);
```

5.6.8.5.2.19 PLIB_ETH_MIIMWriteStart Function**C**

```
void PLIB_ETH_MIIMWriteStart(  
    ETH_MODULE_ID index  
);
```

Description

This function initiates an MII management read command. The MII Management module will perform a write cycle.

Preconditions

The PHY address and MII register address must be configured before a write using `PLIB_ETH_MIIPHYAddressSet(MY_ETH_INSTANCE, phyAddr)` and `PLIB_ETH_MIIRegisterAddressSet(MY_ETH_INSTANCE, regAddr)`

Data to be written must be first loaded into the MII write register using `PLIB_ETH_MIIWriteDataSet(MY_ETH_INSTANCE, writeData)`

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_MIIWriteDataSet(MY_ETH_INSTANCE, dataToWrite);  
PLIB_ETH_MIIWriteStart(MY_ETH_INSTANCE);
```

5.6.8.5.2.20 PLIB_ETH_MIIResetDisable Function**C**

```
void PLIB_ETH_MIIResetDisable(  
    ETH_MODULE_ID index  
);
```

Description

This function disables the EMAC MIIM Soft reset.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_MIIResetDisable(MY_ETH_INSTANCE);
```

5.6.8.5.2.21 PLIB_ETH_MIIResetEnable Function

C

```
void PLIB_ETH_MIIResetEnable(  
    ETH_MODULE_ID index  
);
```

Description

This function enables the EMAC MIIM soft reset.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_MIIResetEnable(MY_ETH_INSTANCE);
```

5.6.8.5.2.22 PLIB_ETH_MIIResetIsEnabled Function

C

```
bool PLIB_ETH_MIIResetIsEnabled(  
    ETH_MODULE_ID index  
);
```

Description

This function gets EMAC MIIM Soft reset enable status. By default this bit is set to '1'.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - MAC MII is in reset
- false - MAC MII is not in reset

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
stat = PLIB_ETH_MIIResetIsEnabled(MY_ETH_INSTANCE);
```

5.6.8.5.2.23 PLIB_ETH_PHYAddressGet Function

C

```
uint8_t PLIB_ETH_PHYAddressGet(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the EMAC MIIM management PHY address.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

phyAddr - A 5-bit address of the PHY

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
phyAddr = PLIB_ETH_PHYAddressGet(MY_ETH_INSTANCE);
```

5.6.8.5.2.24 PLIB_ETH_PHYAddressSet Function

C

```
void PLIB_ETH_PHYAddressSet(  
    ETH_MODULE_ID index,  
    uint8_t phyAddr  
);
```

Description

This function sets the EMAC MIIM PHY address. This field represents the 5-bit PHY Address field of Management cycles. Up to 31 PHYs can be addressed (0 is reserved).

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
phyAddr	A 5-bit address of the PHY

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_PHYAddressSet(MY_ETH_INSTANCE, PhyAddr);
```

5.6.8.5.2.25 PLIB_ETH_RegisterAddressGet Function

C

```
uint8_t PLIB_ETH_RegisterAddressGet(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the EMAC MIIM management register address.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

regAddr - The (5-bit) address of the MII Registers

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
regAddr = PLIB_ETH_RegisterAddressGet(MY_ETH_INSTANCE);
```

5.6.8.5.2.26 PLIB_ETH_RegisterAddressSet Function

C

```
void PLIB_ETH_RegisterAddressSet(  
    ETH_MODULE_ID index,  
    uint8_t regAddr  
);
```

Description

This function sets the EMAC MIIM register address. Up to 32 registers may be accessed.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
regAddr	The (5-bit) address of the MII Registers.

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_RegisterAddressSet(MY_ETH_INSTANCE, regAddr);
```

5.6.8.5.2.27 PLIB_ETH_RMIIResetDisable Function

C

```
void PLIB_ETH_RMIIResetDisable(  
    ETH_MODULE_ID index  
);
```

Description

This function disables EMAC Reset RMII for normal operation.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_RMIIResetDisable(MY_ETH_INSTANCE);
```

5.6.8.5.2.28 PLIB_ETH_RMIIResetEnable Function

C

```
void PLIB_ETH_RMIIResetEnable(  
    ETH_MODULE_ID index  
);
```

Description

This function enables EMAC Reset RMII.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_RMIIResetEnable(MY_ETH_INSTANCE);
```

5.6.8.5.2.29 PLIB_ETH_RMIIResetIsEnabled Function

C

```
bool PLIB_ETH_RMIIResetIsEnabled(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the EMAC Reset RMII enable status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - Reset the EMAC RMII module
- false - Normal operation

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
stat = PLIB_ETH_RMIIResetIsEnabled(MY_ETH_INSTANCE);
```

5.6.8.5.2.30 PLIB_ETH_RxBufferCountDecrement Function

C

```
void PLIB_ETH_RxBufferCountDecrement(  
    ETH_MODULE_ID index  
);
```

Description

This function causes the Receive Descriptor Buffer Counter to decrement by 1.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

Hardware increments the receive buffer counter and software decrements it. If the receive buffer counter is incremented by the receive logic at the same time, the receive buffer counter will appear unchanged.

Always reads as '0', so there is no get value routine.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_RxBufferCountDecrement(MY_ETH_INSTANCE);
```

5.6.8.5.2.31 PLIB_ETH_RxDisable Function**C**

```
void PLIB_ETH_RxDisable(  
    ETH_MODULE_ID index  
);
```

Description

This function disables the Ethernet receive logic.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

Disabling Ethernet receive is not recommended for making changes to any receive-related registers. After the receiver has been enabled, the Ethernet module must be reinitialized to implement changes.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_RxDisable(MY_ETH_INSTANCE);
```

5.6.8.5.2.32 PLIB_ETH_RxEnable Function**C**

```
void PLIB_ETH_RxEnable(  
    ETH_MODULE_ID index  
);
```

Description

This function enables the Ethernet receive logic. Packets are received and stored in the receive buffer as controlled by the filter configuration.

Preconditions

All receive registers must be configured before calling this function.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_RxEnable(MY_ETH_INSTANCE);
```

5.6.8.5.2.33 PLIB_ETH_RxFuncResetDisable Function**C**

```
void PLIB_ETH_RxFuncResetDisable(  
    ETH_MODULE_ID index  
);
```

Description

This function disables the EMAC reset receive function logic. The reset receive function logic is released from reset.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_RxFuncResetDisable(MY_ETH_INSTANCE);
```

5.6.8.5.2.34 PLIB_ETH_RxFuncResetEnable Function**C**

```
void PLIB_ETH_RxFuncResetEnable(  
    ETH_MODULE_ID index  
);
```

Description

This function enables the EMAC reset receive function logic. The receive function logic is held in reset.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_RxFuncResetEnable(MY_ETH_INSTANCE);
```

5.6.8.5.2.35 PLIB_ETH_RxFuncResetIsEnabled Function

C

```
bool PLIB_ETH_RxFuncResetIsEnabled(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the EMAC reset receive function status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - EMAC Receive function logic is held in reset
- false - EMAC Receive function logic is not in reset

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
stat = PLIB_ETH_RxFuncResetIsEnabled(MY_ETH_INSTANCE);
```

5.6.8.5.2.36 PLIB_ETH_RxIsEnabled Function

C

```
bool PLIB_ETH_RxIsEnabled(  
    ETH_MODULE_ID index  
);
```

Description

This function returns the Ethernet module receive enable status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - Ethernet module receive is enabled
- false - Ethernet module receive is disabled

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
stat = PLIB_ETH_ReceiveIsEnabled(MY_ETH_INSTANCE);
```

5.6.8.5.2.37 PLIB_ETH_RxPacketDescAddrGet Function

C

```
uint8_t * PLIB_ETH_RxPacketDescAddrGet(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the address of the next receive descriptor to be used.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

ReceivePacketDescriptorAddress - receive packet descriptor address

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
RxPacketDescAddr = PLIB_ETH_RxPacketDescAddrGet(MY_ETH_INSTANCE);
```

5.6.8.5.2.38 PLIB_ETH_RxPacketDescAddrSet Function

C

```
void PLIB_ETH_RxPacketDescAddrSet(  
    ETH_MODULE_ID index,  
    uint8_t * rxPacketDescStartAddr  
);
```

Description

This function sets the Ethernet receive packet descriptor start address.

Preconditions

No transmit, receive, or DMA operations should be in progress when this function is called. Call this function before enabling transmit and receive.

Parameters

Parameters	Description
index	Identifier for the device instance
rxPacketDescStartAddr	This address must be 4-byte aligned. (The least significant 2 bits must be '00'.)

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_RxPacketDescAddrSet(MY_ETH_INSTANCE, rxPacketDescStartAddr)
```

5.6.8.5.2.39 PLIB_ETH_TestPauseDisable Function

C

```
void PLIB_ETH_TestPauseDisable(  
    ETH_MODULE_ID index  
)  
;
```

Description

This function disables EMAC Test Pause. The EMAC will resume normal operation.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is intended for testing only.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_TestPauseDisable(MY_ETH_INSTANCE);
```

5.6.8.5.2.40 PLIB_ETH_TestPauseEnable Function

C

```
void PLIB_ETH_TestPauseEnable(  
    ETH_MODULE_ID index  
)  
;
```

Description

This function enables EMAC test pause. The EMAC Control sub-layer will inhibit transmissions, just as if a Pause Receive Control frame with a non-zero pause time parameter was received.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is intended for testing only.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_TestPauseEnable(MY_ETH_INSTANCE);
```

5.6.8.5.2.41 PLIB_ETH_TestPauseIsEnabled Function**C**

```
bool PLIB_ETH_TestPauseIsEnabled(  
    ETH_MODULE_ID index  
);
```

Description

This function returns the EMAC test pause enable status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The EMAC Control sub-layer will inhibit transmissions, just as if a Pause Receive Control frame with a non-zero pause time parameter was received
- false - Normal operation

Remarks

This functionality is intended for testing only.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
stat = PLIB_ETH_TestPauseIsEnabled(MY_ETH_INSTANCE);
```

5.6.8.5.2.42 PLIB_ETH_TxFuncResetDisable Function**C**

```
void PLIB_ETH_TxFuncResetDisable(  
    ETH_MODULE_ID index  
);
```

Description

This function disables the EMAC Transmit function reset. The EMAC transmit function is released from reset for normal operation.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_TxFuncResetDisable(MY_ETH_INSTANCE);
```

5.6.8.5.2.43 PLIB_ETH_TxFuncResetEnable Function**C**

```
void PLIB_ETH_TxFuncResetEnable(  
    ETH_MODULE_ID index  
);
```

Description

This function enables the EMAC transmit function reset. The transmit function is held in reset.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_TxFuncResetEnable(MY_ETH_INSTANCE);
```

5.6.8.5.2.44 PLIB_ETH_TxFuncResetIsEnabled Function**C**

```
bool PLIB_ETH_TxFuncResetIsEnabled(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the EMAC Transmit function reset status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - EMAC transmit function logic is held in reset
- false - EMAC transmit function logic is not in reset

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_TxFuncResetIsEnabled(MY_ETH_INSTANCE);
```

5.6.8.5.2.45 PLIB_ETH_TxPacketDescAddrGet Function**C**

```
uint8_t * PLIB_ETH_TxPacketDescAddrGet(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the address of the next transmit descriptor.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

Transmit Packet Descriptor Start Address.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
txPacketDescAddr = PLIB_ETH_TxPacketDescAddrGet(MY_ETH_INSTANCE);
```

5.6.8.5.2.46 PLIB_ETH_TxPacketDescAddrSet Function**C**

```
void PLIB_ETH_TxPacketDescAddrSet(  
    ETH_MODULE_ID index,  
    uint8_t * txPacketDescStartAddr  
);
```

Description

This function sets the Ethernet transmit packet descriptor start address.

Preconditions

No transmit, receive, or DMA operations should be in progress when this function is called. Call this function before enabling transmit and receive.

Parameters

Parameters	Description
index	Identifier for the device instance
txPacketDescStartAddr	This address must be 4-byte aligned. (The least significant 2 bits must be '00'.)

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_TxPacketDescAddrSet(MY_ETH_INSTANCE, txPacketDescStartAddr)
```

5.6.8.5.2.47 PLIB_ETH_TxRTSDisable Function**C**

```
void PLIB_ETH_TxRTSDisable(  
    ETH_MODULE_ID index  
);
```

Description

This function aborts an Ethernet module transmission and disables the transmitter after the current packet has completed.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

When disabled by software, transmission stops after the current packet has been completed.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_TxRTSDisable(MY_ETH_INSTANCE);
```

5.6.8.5.2.48 PLIB_ETH_TxRTSEnable Function**C**

```
void PLIB_ETH_TxRTSEnable(  
    ETH_MODULE_ID index  
);
```

Description

This function enables the Ethernet request to [send](#). Transmit logic is activated and packet(s) defined in the Ethernet descriptor table are transmitted.

Preconditions

The TX descriptor list and TX DMA must be initialized using PLIB_ETH_TransmitPacketDescStartAddrSet.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This status is cleared by hardware when the transmission is complete.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_TxRTSEnable(MY_ETH_INSTANCE);
```

5.6.8.5.2.49 PLIB_ETH_TxRTSIsEnabled Function**C**

```
bool PLIB_ETH_TxRTSIsEnabled(  
    ETH_MODULE_ID index  
);
```

Description

This function returns the Ethernet module transmit request to [send](#) status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - Ethernet module transmit is active
- false - Ethernet module transmission has stopped or has completed

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
stat = PLIB_ETH_TransmitRTSIsEnabled(MY_ETH_INSTANCE);
```

5.6.8.5.2.50 PLIB_ETH_CRCDisable Function**C**

```
void PLIB_ETH_CRCDisable(  
    ETH_MODULE_ID index  
);
```

Description

This function disables EMAC CRC.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

The frames presented to the EMAC have a valid CRC

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_CRCDisable(MY_ETH_INSTANCE);
```

5.6.8.5.2.51 PLIB_ETH_CRCEnable Function**C**

```
void PLIB_ETH_CRCEnable(  
    ETH_MODULE_ID index  
);
```

Description

This function enables EMAC CRC. The EMAC will append CRC whether padding is required or not. This must be enabled if auto-padding is enabled.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_CRCEnable(MY_ETH_INSTANCE);
```

5.6.8.5.2.52 PLIB_ETH_CRCIsEnabled Function**C**

```
bool PLIB_ETH_CRCIsEnabled(  
    ETH_MODULE_ID index  
);
```

Description

This function returns the EMAC CRC enable status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The EMAC will append a CRC to every frame whether or not padding was required. Must be set if auto-padding is enabled.

- false - The frames presented to the EMAC have a valid CRC

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
stat = PLIB_ETH_CRCIsEnabled(MY_ETH_INSTANCE);
```

5.6.8.5.3 Status Functions

5.6.8.5.3.1 PLIB_ETH_DataNotValid Function

C

```
bool PLIB_ETH_DataNotValid(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the MII management read data not valid status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The MII Management read cycle has not completed and the read data is not yet valid
- false - The MII Management read cycle is complete and the read data is valid

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
stat = PLIB_ETH_DataNotValid(MY_ETH_INSTANCE);
```

Also see the example for function: PLIB_ETH_MIIReadStart().

5.6.8.5.3.2 PLIB_ETH_EthernetIsBusy Function

C

```
bool PLIB_ETH_EthernetIsBusy(  
    ETH_MODULE_ID index  
);
```

Description

This function sets the value of the Ethernet logic busy. A request indicates that the module has just been turned ON or is completing a transaction after being turned OFF.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - Ethernet logic has been turned ON or is completing a transaction
- false - Ethernet logic is idle

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
stat = PLIB_ETH_EthernetIsBusy(MY_ETH_INSTANCE);
```

5.6.8.5.3.3 PLIB_ETH_LinkHasFailed Function**C**

```
bool PLIB_ETH_LinkHasFailed(  
    ETH_MODULE_ID index  
);
```

Description

This function returns the MII management link fail status. This value reflects the last read from the PHY status register.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The MII Management module link fail has occurred
- false - The MII Management module link fail has not occurred

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
stat = PLIB_ETH_LinkHasFailed(MY_ETH_INSTANCE);
```

5.6.8.5.3.4 PLIB_ETH_MIIMIsBusy Function**C**

```
bool PLIB_ETH_MIIMIsBusy(  
    ETH_MODULE_ID index  
);
```

Description

This function returns the MII management busy status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The MII Management module is currently performing an MII Management read or write cycle
- false - The MII Management is free

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
stat = PLIB_ETH_MIIMIsBusy(MY_ETH_INSTANCE);
```

5.6.8.5.3.5 PLIB_ETH_MIIMIsScanning Function**C**

```
bool PLIB_ETH_MIIMIsScanning(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the MII Management scanning status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The MII Management module scan operation (continuous MII Management Read cycles) is in progress
- false - The MII Management scan operation is not in progress

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
stat = PLIB_ETH_MIIMIsScanning(MY_ETH_INSTANCE);
```

5.6.8.5.3.6 PLIB_ETH_ReceiveIsBusy Function**C**

```
bool PLIB_ETH_ReceiveIsBusy(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the Ethernet receive logic busy status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - Receive logic is receiving data
- false - Receive logic is idle

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
stat = PLIB_ETH_ReceiveIsBusy(MY_ETH_INSTANCE);
```

5.6.8.5.3.7 PLIB_ETH_TransmitIsBusy Function**C**

```
bool PLIB_ETH_TransmitIsBusy(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the value of the Ethernet transmit logic busy status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - Transmit logic is sending data
- false - Transmit logic is idle

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
stat = PLIB_ETH_TransmitIsBusy(MY_ETH_INSTANCE);
```

5.6.8.5.4 Filtering Functions**5.6.8.5.4.1 PLIB_ETH_HashTableGet Function****C**

```
uint32_t PLIB_ETH_HashTableGet(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the value of the Hash table.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

hashTable - Hash table value (64-bits)

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
value = PLIB_ETH_HashTableGet(MY_ETH_INSTANCE);
```

5.6.8.5.4.2 PLIB_ETH_HashTableSet Function**C**

```
void PLIB_ETH_HashTableSet(  
    ETH_MODULE_ID index,  
    uint64_t hashTableValue  
);
```

Description

This function sets the Hash table with the new value.

Preconditions

Call `PLIB_ETH_HashTableFilterDisable` to disable the Hash table filter before changing the hash table, or set the Hash Table prior to calling [PLIB_ETH_ReceiveEnable](#).

Parameters

Parameters	Description
index	Identifier for the device instance
hashTableValue	hash table value (64-bits)

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_HashTableSet(MY_ETH_INSTANCE, hashTableValue);
```

5.6.8.5.4.3 PLIB_ETH_PassAllDisable Function**C**

```
void PLIB_ETH_PassAllDisable(  
    ETH_MODULE_ID index  
);
```

Description

This function disables the EMAC PassAll. Control frames are ignored.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_PassAllDisable(MY_ETH_INSTANCE);
```

5.6.8.5.4.4 PLIB_ETH_PassAllEnable Function**C**

```
void PLIB_ETH_PassAllEnable(  
    ETH_MODULE_ID index  
);
```

Description

This function enables the EMAC PassAll, which enables both the normal and the control frames to be passed.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_PassAllEnable(MY_ETH_INSTANCE);
```

5.6.8.5.4.5 PLIB_ETH_PassAllIsEnabled Function**C**

```
bool PLIB_ETH_PassAllIsEnabled(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the EMAC PassAll enable status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The EMAC will **accept** all frames regardless of type (normal vs. Control)
- false - The received Control frames are ignored

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
stat = PLIB_ETH_PassAllIsEnabled(MY_ETH_INSTANCE);
```

5.6.8.5.4.6 PLIB_ETH_PatternMatchChecksumGet Function**C**

```
uint16_t PLIB_ETH_PatternMatchChecksumGet(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the value of the patter match checksum register.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

The pattern match checksum.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
value = PLIB_ETH_PatternMatchChecksumGet(MY_ETH_INSTANCE);
```

5.6.8.5.4.7 PLIB_ETH_PatternMatchChecksumSet Function**C**

```
void PLIB_ETH_PatternMatchChecksumSet(  
    ETH_MODULE_ID index,  
    uint16_t PatternMatchChecksumValue  
);
```

Description

This function sets the pattern match checksum register with the new value.

Preconditions

Call **PLIB_ETH_PatternMatchModeSet**(ETH_PATTERN_MATCH_DISABLED) to disable PatternMatch before changing the pattern match mask, or set the value before calling **PLIB_ETH_ReceiveEnable**.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
PatternMatchChecksumValue	Pattern match checksum value

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_PatternMatchChecksumSet(MY_ETH_INSTANCE, PatternMatchChecksumValue);
```

5.6.8.5.4.8 PLIB_ETH_PatternMatchGet Function**C**

```
uint64_t PLIB_ETH_PatternMatchGet(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the selected value of the patter match mask register.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

patternMatchMaskValue - Pattern Match Mask Values

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
value = PLIB_ETH_PatternMatchGet(MY_ETH_INSTANCE);
```

5.6.8.5.4.9 PLIB_ETH_PatternMatchModeGet Function**C**

```
ETH_PATTERN_MATCH_MODE PLIB_ETH_PatternMatchModeGet(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the selected value of the patter match mask register.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

modeSel - The method of pattern matching from ETH_PATTERN_MATCH_DISABLED

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
value = PLIB_ETH_PatternMatchModeGet(MY_ETH_INSTANCE);
```

5.6.8.5.4.10 PLIB_ETH_PatternMatchModeSet Function**C**

```
void PLIB_ETH_PatternMatchModeSet(  
    ETH_MODULE_ID index,  
    ETH_PATTERN_MATCH_MODE modeSel  
);
```

Description

This function sets the pattern match mode.

Preconditions

Set the value before calling [PLIB_ETH_ReceiveEnable\(\)](#).

Parameters

Parameters	Description
index	Identifier for the device instance
modeSel	The method of pattern matching from ETH_PATTERN_MATCH_DISABLED

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_PatternMatchModeSet(MY_ETH_INSTANCE, ETH_PATTERN_MATCH_DISABLED);
```

5.6.8.5.4.11 PLIB_ETH_PatternMatchOffsetGet Function**C**

```
uint16_t PLIB_ETH_PatternMatchOffsetGet(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the value of the patter match offset register.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

PatternMatchOffsetValue - Pattern match offset value

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
value = PLIB_ETH_PatternMatchOffsetGet(MY_ETH_INSTANCE);
```

5.6.8.5.4.12 PLIB_ETH_PatternMatchOffsetSet Function**C**

```
void PLIB_ETH_PatternMatchOffsetSet(  
    ETH_MODULE_ID index,  
    uint16_t PatternMatchOffsetValue  
);
```

Description

This function sets the pattern match offset register with the new value.

Preconditions

Call [PLIB_ETH_PatternMatchModeSet](#)(ETH_PATTERN_MATCH_DISABLED) to disable PatternMatch before changing the pattern match mask, or set the value before calling [PLIB_ETH_ReceiveEnable](#)().

Parameters

Parameters	Description
index	Identifier for the device instance
PatternMatchOffsetValue	Pattern match offset value

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_PatternMatchOffsetSet(MY_ETH_INSTANCE, PatternMatchOffsetValue);
```

5.6.8.5.4.13 PLIB_ETH_PatternMatchSet Function**C**

```
void PLIB_ETH_PatternMatchSet(  
    ETH_MODULE_ID index,  
    uint64_t patternMatchMaskValue  
);
```

Description

This function sets the pattern match mask register with the new value.

Preconditions

Call [PLIB_ETH_PatternMatchModeSet](#)(index,ETH_PATTERN_MATCH_DISABLED) to disable PatternMatch before changing

the pattern match mask, or set the value before calling `PLIB_ETH_ReceiveEnable`.

Parameters

Parameters	Description
index	Identifier for the device instance
patternMatchMaskValue	Pattern Match Mask Values (64-bits)

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_PatternMatchSet(MY_ETH_INSTANCE, patternMatchMaskValue);
```

5.6.8.5.4.14 PLIB_ETH_PurePreambleDisable Function

C

```
void PLIB_ETH_PurePreambleDisable(  
    ETH_MODULE_ID index  
);
```

Description

This function disables the EMAC pure preamble enforcement. The EMAC does not perform any preamble checking.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Example

```
PLIB_ETH_PurePreambleDisable(MY_ETH_INSTANCE);
```

Remarks: This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

5.6.8.5.4.15 PLIB_ETH_PurePreambleEnable Function

C

```
void PLIB_ETH_PurePreambleEnable(  
    ETH_MODULE_ID index  
);
```

Description

This function enables EMAC pure preamble enforcement. The EMAC will verify the contents of the preamble and discard packets with errors in the preamble.

sPrecondition: None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

The EMAC will verify the content of the preamble to ensure it contains 0x55 and is error-free. A packet with errors in its preamble is discarded.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_PurePreambleEnable(MY_ETH_INSTANCE);
```

5.6.8.5.4.16 PLIB_ETH_PurePreambleIsEnabled Function**C**

```
bool PLIB_ETH_PurePreambleIsEnabled(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the EMAC pure preamble enforcement enable status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The EMAC will verify the content of the preamble to ensure it contains 0x55 and is error-free. A packet with errors in its preamble is discarded.
- false - The EMAC does not perform any preamble checking

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
stat = PLIB_ETH_PurePreambleIsEnabled(MY_ETH_INSTANCE);
```

5.6.8.5.4.17 PLIB_ETH_ReceiveFilterDisable Function**C**

```
void PLIB_ETH_ReceiveFilterDisable(  
    ETH_MODULE_ID index,  
    ETH_RECEIVE_FILTER filter  
);
```

Description

This function disables the specified receive filter.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
filter	The selection of receive filters to be disabled from the enumerated selection ETH_RECEIVE_FILTER

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_ReceiveFilterDisable(index,  
                              ETH_CRC_OK_FILTER    |  
                              ETH_RUNT_ENABLE_FILTER |  
                              ETH_UNICAST_FILTER    );
```

5.6.8.5.4.18 PLIB_ETH_ReceiveFilterEnable Function**C**

```
void PLIB_ETH_ReceiveFilterEnable(  
    ETH_MODULE_ID index,  
    ETH_RECEIVE_FILTER filter  
);
```

Description

This function enables the specified receive filter.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
filter	The selection of receive filters to be enabled from the enumerated selection ETH_RECEIVE_FILTER

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_ReceiveFilterEnable(index,  
                              ETH_CRC_OK_FILTER    |  
                              ETH_RUNT_ENABLE_FILTER |  
                              ETH_UNICAST_FILTER    );
```

5.6.8.5.4.19 PLIB_ETH_ReceiveFilterIsEnable Function

C

```
bool PLIB_ETH_ReceiveFilterIsEnable(  
    ETH_MODULE_ID index,  
    ETH_RECEIVE_FILTER filter  
);
```

Description

This function disables the specified receive filter.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
filter	The selection of receive filters to be disabled from the enumerated selection ETH_RECEIVE_FILTER

Returns

- true - If at least one of the specified filters is enabled
- false - If no specified filter is enabled

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
if (PLIB_ETH_ReceiveFilterIsEnable(index, ETH_UNICAST_FILTER))  
{  
    PLIB_ETH_ReceiveFilterDisable(MY_MODULE_ID, ETH_UNICAST_FILTER);  
}
```

5.6.8.5.4.20 PLIB_ETH_StationAddressGet Function

C

```
uint8_t PLIB_ETH_StationAddressGet(  
    ETH_MODULE_ID index,  
    uint8_t which  
);
```

Description

This function gets the selected EMAC station address.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
which	Select station address to change. Valid values are 1,2,3,4,5,6.

Returns

stationAddress1 - Station address

Remarks

On a reset, this register is loaded with the factory preprogrammed station address.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
stationAddr1 = PLIB_ETH_StationAddress1Get(MY_ETH_INSTANCE, which);
```

5.6.8.5.4.21 PLIB_ETH_StationAddressSet Function**C**

```
void PLIB_ETH_StationAddressSet(  
    ETH_MODULE_ID index,  
    uint8_t which,  
    uint8_t stationAddress  
);
```

Description

This function sets the selected EMAC Station Address.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
which	Select station address to change. Valid values are 1,2,3,4,5,6.
stationAddress	Station Address.

Returns

None.

Remarks

On a reset, this register is loaded with the factory preprogrammed station address.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_StationAddressSet(MY_ETH_INSTANCE, which, stationAddress);
```

5.6.8.5.5 Flow Control Functions**5.6.8.5.5.1 PLIB_ETH_AutoFlowControlDisable Function****C**

```
void PLIB_ETH_AutoFlowControlDisable(  
    ETH_MODULE_ID index  
);
```

Description

This function disables the Ethernet Automatic Flow Control logic.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_AutoFlowControlDisable(MY_ETH_INSTANCE);
```

5.6.8.5.5.2 PLIB_ETH_AutoFlowControlEnable Function**C**

```
void PLIB_ETH_AutoFlowControlEnable(  
    ETH_MODULE_ID index  
);
```

Description

This function enables Ethernet Automatic Flow Control logic.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

The full and empty watermarks are used to automatically enable and disable flow control, respectively. When the number of received buffers rises to the full watermark, flow control is automatically enabled. When the receive buffer count falls to the empty watermark, flow control is automatically disabled.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_AutoFlowControlEnable(MY_ETH_INSTANCE);
```

5.6.8.5.5.3 PLIB_ETH_AutoFlowControlIsEnabled Function**C**

```
bool PLIB_ETH_AutoFlowControlIsEnabled(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the Ethernet Automatic Flow Control enable status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - Ethernet module Automatic Flow Control is enabled
- false - Ethernet module Automatic Flow Control is disabled

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
stat = PLIB_ETH_AutoFlowControlIsEnabled(MY_ETH_INSTANCE);
```

5.6.8.5.5.4 PLIB_ETH_BackPresNoBackoffDisable Function**C**

```
void PLIB_ETH_BackPresNoBackoffDisable(  
    ETH_MODULE_ID index  
);
```

Description

This function disables EMAC back pressure/no back-off. The EMAC will back-off when there is backpressure and collisions occur.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_BackPresNoBackoffDisable(MY_ETH_INSTANCE);
```

5.6.8.5.5.5 PLIB_ETH_BackPresNoBackoffEnable Function**C**

```
void PLIB_ETH_BackPresNoBackoffEnable(  
    ETH_MODULE_ID index  
);
```

Description

This function enables EMAC backpressure/no back-off. The EMAC will not back-off when there is backpressure and collisions occur.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

The EMAC after incidentally causing a collision during backpressure will immediately retransmit without back-off reducing the chance of further collisions and ensuring transmit packets get sent.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_BackPresNoBackoffEnable(MY_ETH_INSTANCE);
```

5.6.8.5.5.6 PLIB_ETH_BackPresNoBackoffIsEnabled Function**C**

```
bool PLIB_ETH_BackPresNoBackoffIsEnabled(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the EMAC back pressure/no back-off enable status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The EMAC after incidentally causing a collision during backpressure will immediately retransmit without back-off reducing the chance of further collisions and ensuring transmit packets get sent
- false - The EMAC will not remove the back-off

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
stat = PLIB_ETH_BackPresNoBackoffIsEnabled(MY_ETH_INSTANCE);
```

5.6.8.5.5.7 PLIB_ETH_ManualFlowControlDisable Function**C**

```
void PLIB_ETH_ManualFlowControlDisable(  
    ETH_MODULE_ID index  
);
```

Description

This function disables the Ethernet Manual Flow Control logic and automatically sends a Pause frame with a 0x0000 Pause Timer value. This function affects both transmit and receive operations.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

Disabling Manual Flow Control will automatically [send](#) a Pause frame with a 0x0000 Pause Timer value to disable flow control.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_ManualFlowControlDisable(MY_ETH_INSTANCE);
```

5.6.8.5.5.8 PLIB_ETH_ManualFlowControlEnable Function**C**

```
void PLIB_ETH_ManualFlowControlEnable(  
    ETH_MODULE_ID index  
);
```

Description

This function enables the Ethernet Manual Flow Control logic. Enabling Manual Flow Control will [send](#) a Pause frame using the Pause Timer value. While enabled, a Pause frame is repeated every $128 \times (\text{Pause timer value})/2$ transmit clock cycles.

Affects both transmit and receive operations.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_ManualFlowControlEnable(MY_ETH_INSTANCE);
```

5.6.8.5.5.9 PLIB_ETH_ManualFlowControlIsEnabled Function**C**

```
bool PLIB_ETH_ManualFlowControlIsEnabled(  
    ETH_MODULE_ID index  
);
```

Description

This function returns the Ethernet module Manual Flow Control enable status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - Ethernet module Manual Flow Control is enabled
- false - Ethernet module Manual Flow Control is disabled

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
stat = PLIB_ETH_ManualFlowControlIsEnabled(MY_ETH_INSTANCE);
```

5.6.8.5.5.10 PLIB_ETH_NoBackoffDisable Function**C**

```
void PLIB_ETH_NoBackoffDisable(  
    ETH_MODULE_ID index  
);
```

Description

This function disables EMAC no back-off. The EMAC will back-off when a collision occurs.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_NoBackoffDisable(MY_ETH_INSTANCE);
```

5.6.8.5.5.11 PLIB_ETH_NoBackoffEnable Function**C**

```
void PLIB_ETH_NoBackoffEnable(  
    ETH_MODULE_ID index  
);
```

Description

This function enables EMAC no back-off. The EMAC will not back-off when a collision occurs.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

Following a collision, the EMAC will immediately retransmit rather than using the Binary Exponential Back-off algorithm as specified in the Standard.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_NoBackoffEnable(MY_ETH_INSTANCE);
```

5.6.8.5.5.12 PLIB_ETH_NoBackoffIsEnabled Function**C**

```
bool PLIB_ETH_NoBackoffIsEnabled(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the EMAC no back-off enable status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - Following a collision, the EMAC will immediately retransmit
- false - Following a collision, the EMAC will use the Binary Exponential Back-off algorithm

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
stat = PLIB_ETH_NoBackoffIsEnabled(MY_ETH_INSTANCE);
```

5.6.8.5.5.13 PLIB_ETH_RxEmptyWmarkGet Function**C**

```
uint8_t PLIB_ETH_RxEmptyWmarkGet(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the Ethernet receive empty watermark.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

receiveEmptyWmark - Empty watermark value

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
watermarkValue = PLIB_ETH_RxEmptyWmarkGet(MY_ETH_INSTANCE);
```

5.6.8.5.5.14 PLIB_ETH_RxEmptyWmarkSet Function**C**

```
void PLIB_ETH_RxEmptyWmarkSet(  
    ETH_MODULE_ID index,  
    uint8_t watermarkValue  
);
```

Description

This function sets the Ethernet receive empty water mark with a new value. The software controlled Receive Buffer Empty Wmark is compared against the receive buffer count to determine the empty watermark condition for the empty watermark interrupt and for disabling flow control if Auto Flow Control is enabled.

The Full Wmark value should always be greater than the Empty Wmark value.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
watermarkValue	Empty watermark value

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_RxEmptyWmarkSet(MY_ETH_INSTANCE, watermarkValue);
```

5.6.8.5.5.15 PLIB_ETH_RxFullWmarkGet Function

C

```
uint8_t PLIB_ETH_RxFullWmarkGet(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the Ethernet receive full watermark.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

receiveFullWmark - Full watermark value

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
watermarkValue = PLIB_ETH_RxFullWmarkGet(MY_ETH_INSTANCE);
```

5.6.8.5.5.16 PLIB_ETH_RxFullWmarkSet Function

C

```
void PLIB_ETH_RxFullWmarkSet(  
    ETH_MODULE_ID index,  
    uint8_t watermarkValue  
);
```

Description

This function sets the Ethernet receive full water mark with a new value.

The software controlled RX Buffer Full Wmark Pointer is compared against the receive buffer count to determine the full watermark condition for the full watermark interrupt and for enabling flow control if Auto Flow Control is enabled.

The Full Wmark value should always be greater than the Empty Wmark value.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
watermarkValue	Full watermark value

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_RxFullWmarkSet(MY_ETH_INSTANCE, watermarkValue);
```

5.6.8.5.5.17 PLIB_ETH_RxPauseDisable Function**C**

```
void PLIB_ETH_RxPauseDisable(  
    ETH_MODULE_ID index  
);
```

Description

This function disables the EMAC receive flow control. The received Pause Flow control frames are ignored.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_RxPauseDisable(MY_ETH_INSTANCE);
```

5.6.8.5.5.18 PLIB_ETH_RxPauseEnable Function**C**

```
void PLIB_ETH_RxPauseEnable(  
    ETH_MODULE_ID index  
);
```

Description

This function enables the EMAC receive flow control. The EMAC will act upon the received Pause frames.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_RxPauseEnable(MY_ETH_INSTANCE);
```

5.6.8.5.5.19 PLIB_ETH_RxPauseIsEnabled Function

C

```
bool PLIB_ETH_RxPauseIsEnabled(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the EMAC receive flow pause enable status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The EMAC acts upon received Pause Flow Control frames
- false - Received Pause Flow Control frames are ignored

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
status = PLIB_ETH_RxPauseIsEnabled(MY_ETH_INSTANCE);
```

5.6.8.5.5.20 PLIB_ETH_ShortcutQuantaDisable Function

C

```
void PLIB_ETH_ShortcutQuantaDisable(  
    ETH_MODULE_ID index  
);
```

Description

This function disables EMAC shortcut pause quanta. The EMAC will resume normal operation.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_ShortcutQuantaDisable(MY_ETH_INSTANCE);
```

5.6.8.5.5.21 PLIB_ETH_ShortcutQuantaEnable Function

C

```
void PLIB_ETH_ShortcutQuantaEnable(  
    ETH_MODULE_ID index  
);
```

Description

This function enables EMAC shortcut pause quanta. The EMAC reduces the effective pause quanta from 64 byte-times to 1 byte-time.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is intended for testing only.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_ShortcutQuantaEnable(MY_ETH_INSTANCE);
```

5.6.8.5.5.22 PLIB_ETH_ShortcutQuantaIsEnabled Function

C

```
bool PLIB_ETH_ShortcutQuantaIsEnabled(  
    ETH_MODULE_ID index  
);
```

Description

This function returns EMAC shortcut pause quanta enable status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The EMAC reduces the effective Pause Quanta from 64 byte-times to 1 byte-time
- false - Normal operation

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
stat = PLIB_ETH_ShortcutQuantaIsEnabled(MY_ETH_INSTANCE);
```

5.6.8.5.5.23 PLIB_ETH_SimResetDisable Function

C

```
void PLIB_ETH_SimResetDisable(  
    ETH_MODULE_ID index  
);
```

Description

This function disables the EMAC simulation reset.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_SimResetDisable(MY_ETH_INSTANCE);
```

5.6.8.5.5.24 PLIB_ETH_SimResetEnable Function

C

```
void PLIB_ETH_SimResetEnable(  
    ETH_MODULE_ID index  
);
```

Description

This function enables the EMAC simulation reset and resets the random number generator within the transmit (TX) function.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_SimResetEnable(MY_ETH_INSTANCE);
```

5.6.8.5.5.25 PLIB_ETH_SimResetIsEnabled Function

C

```
bool PLIB_ETH_SimResetIsEnabled(  
    ETH_MODULE_ID index  
);
```

Description

This function returns the EMAC simulation reset status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - Simulation Reset is enabled
- false - Simulation Reset is disabled

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
stat = PLIB_ETH_SimResetIsEnabled(MY_ETH_INSTANCE);
```

5.6.8.5.5.26 PLIB_ETH_TestBackPressDisable Function

C

```
void PLIB_ETH_TestBackPressDisable(  
    ETH_MODULE_ID index  
);
```

Description

This function disables EMAC Test backpressure. The EMAC will resume normal operation.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_TestBackPressDisable(MY_ETH_INSTANCE);
```

5.6.8.5.5.27 PLIB_ETH_TestBackPressEnable Function

C

```
void PLIB_ETH_TestBackPressEnable(  
    ETH_MODULE_ID index  
);
```

Description

This function enables EMAC Test backpressure. The EMAC will assert backpressure on the link. Backpressure causes preamble to be transmitted, raising carrier sense. A transmit packet from the system will be sent during backpressure.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is intended for testing only.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_TestBackPressEnable(MY_ETH_INSTANCE);
```

5.6.8.5.5.28 PLIB_ETH_TestBackPressIsEnabled Function

C

```
bool PLIB_ETH_TestBackPressIsEnabled(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the EMAC test backpressure enable status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The EMAC will assert backpressure on the link. Backpressure causes the preamble to be transmitted, raising the carrier sense. A transmit packet from the system will be sent during backpressure.
- false - Normal operation

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_TestBackPressIsEnabled(MY_ETH_INSTANCE);
```

5.6.8.5.5.29 PLIB_ETH_TxPauseDisable Function**C**

```
void PLIB_ETH_TxPauseDisable(  
    ETH_MODULE_ID index  
);
```

Description

This function disables the transmit Pause frames. The Pause frames are blocked from being transmitted.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_TxPauseDisable(MY_ETH_INSTANCE);
```

5.6.8.5.5.30 PLIB_ETH_TxPauseEnable Function**C**

```
void PLIB_ETH_TxPauseEnable(  
    ETH_MODULE_ID index  
);
```

Description

This function enables the transmission Pause frames. The Pause frames are allowed for transmission.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_TxPauseEnable(MY_ETH_INSTANCE);
```

5.6.8.5.5.31 PLIB_ETH_TxPauseIsEnabled Function

C

```
bool PLIB_ETH_TxPauseIsEnabled(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the Ethernet module enable status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - Pause Flow Control frames are allowed to be transmitted
- false - Pause Flow Control frames are blocked

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
status = PLIB_ETH_TxPauseIsEnabled(MY_ETH_INSTANCE);
```

5.6.8.5.6 Interrupt Functions

5.6.8.5.6.1 PLIB_ETH_InterruptClear Function

C

```
void PLIB_ETH_InterruptClear(  
    ETH_MODULE_ID index,  
    ETH_INTERRUPT_SOURCES intmask  
);
```

Description

This function clears the Ethernet module interrupt source status using a mask. Logically 'OR' the masks together. Any masks not ORed with the others will be disabled.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
intmask	Members of ETH_INTERRUPT_SOURCES logically ORed together

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
// To clear several interrupts with one command, execute the following:
PLIB_ETH_InterruptClear(MY_ETH_INSTANCE,
                        ETH_EMPTY_WATERMARK_INTERRUPT |
                        ETH_FULL_WATERMARK_INTERRUPT |
                        ETH_RX_FIFO_OVERFLOW_ERROR_INTERRUPT );
```

5.6.8.5.6.2 PLIB_ETH_InterruptSet Function**C**

```
void PLIB_ETH_InterruptSet(
    ETH_MODULE_ID index,
    ETH_INTERRUPT_SOURCES intmask
);
```

Description

This function sets the Ethernet module interrupt source status using a mask. Logically 'OR' the masks together. Any masks not OR'd with the others will be disabled.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
intmask	Members of ETH_INTERRUPT_SOURCES logically ORed together

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
// To set several interrupt flags with one command, execute the following:
PLIB_ETH_InterruptSet(MY_ETH_INSTANCE,
                      ETH_EMPTY_WATERMARK_INTERRUPT |
                      ETH_FULL_WATERMARK_INTERRUPT |
                      ETH_RX_FIFO_OVERFLOW_ERROR_INTERRUPT );
```

5.6.8.5.6.3 PLIB_ETH_InterruptsGet Function**C**

```
ETH_INTERRUPT_SOURCES PLIB_ETH_InterruptsGet(
    ETH_MODULE_ID index
);
```

Description

Gets the Ethernet module Interrupt Flag register as a group.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

Interrupt bit map, as defined in [ETH_INTERRUPT_SOURCES](#), showing which interrupts have fired.

Remarks

none.

Example**5.6.8.5.6.4 PLIB_ETH_InterruptSourceDisable Function****C**

```
void PLIB_ETH_InterruptSourceDisable(  
    ETH_MODULE_ID index,  
    ETH_INTERRUPT_SOURCES intmask  
);
```

Description

This function disables the Ethernet module interrupts by using a mask to select one or multiple interrupts to disable. Logically 'OR' elements of [ETH_INTERRUPT_SOURCES](#) together.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
intmask	Members of ETH_INTERRUPT_SOURCES logically ORed together

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
// To disable some interrupts with one command, execute the following:  
PLIB_ETH_InterruptSourceDisble(MY_ETH_INSTANCE,  
    ETH_TRANSMIT_DONE_INTERRUPT  
    ETH_TRANSMIT_ABORT_INTERRUPT  
    ETH_RECEIVE_BUFFER_NOT_AVAILABLE_INTERRUPT  
    ETH_RECEIVE_FIFO_OVERFLOW_ERROR_INTERRUPT );  
  
// Or to disable one interrupt with one command, execute the following:  
PLIB_ETH_InterruptSourceDisble(MY_ETH_INSTANCE, ETH_TRANSMIT_DONE_INTERRUPT);  
  
// Or to disable all interrupts with one command, execute the following:  
PLIB_ETH_InterruptSourceDisble(MY_ETH_INSTANCE, ETH_ALL_ETH_INTERRUPTS);
```

5.6.8.5.6.5 PLIB_ETH_InterruptSourceEnable Function**C**

```
void PLIB_ETH_InterruptSourceEnable(  

```

```

    ETH_MODULE_ID index,
    ETH_INTERRUPT_SOURCES intmask
);

```

Description

This function enables the Ethernet module interrupts by using a mask to enable one or multiple interrupt enables. Logically 'OR' elements of [ETH_INTERRUPT_SOURCES](#) together.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
intmask	Members of ETH_INTERRUPT_SOURCES logically ORed together

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```

// To enable some interrupts with one command, execute the following:
PLIB_ETH_InterruptSourceEnable(MY_ETH_INSTANCE,
                                ETH_TRANSMIT_DONE_INTERRUPT
                                ETH_TRANSMIT_ABORT_INTERRUPT
                                ETH_RECEIVE_BUFFER_NOT_AVAILABLE_INTERRUPT
                                ETH_RECEIVE_FIFO_OVERFLOW_ERROR_INTERRUPT);

// Or to enable one interrupt with one command, execute the following:
PLIB_ETH_InterruptSourceEnable(MY_ETH_INSTANCE, ETH_TRANSMIT_DONE_INTERRUPT);

// Or to enable all interrupts with one command, execute the following:
PLIB_ETH_InterruptSourceEnable(MY_ETH_INSTANCE, ETH_ALL_ETH_INTERRUPTS);

```

5.6.8.5.6 PLIB_ETH_InterruptSourceIsEnabled Function

C

```

bool PLIB_ETH_InterruptSourceIsEnabled(
    ETH_MODULE_ID index,
    ETH_INTERRUPT_SOURCES intmask
);

```

Description

This function returns a true if any of the specified interrupt sources are enabled.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
mask	The interrupt mask(s) to be checked

Returns

- true - If any of the specified sources are enabled

- false - If none of the specified sources are enabled

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
if ( PLIB_ETH_InterruptSourceIsEnabled(index, ETH_TRANSMIT_DONE_INTERRUPT))
{
    //If the interrupt is enabled, disable it...
    PLIB_ETH_InterruptSourceDisable(index, ETH_TRANSMIT_DONE_INTERRUPT);
}
```

5.6.8.5.6.7 PLIB_ETH_InterruptSourcesGet Function**C**

```
ETH_INTERRUPT_SOURCES PLIB_ETH_InterruptSourcesGet(
    ETH_MODULE_ID index
);
```

Description

This function returns the entire interrupt enable register.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

Bit map of interrupt sources, all ORed together, as defined by [ETH_INTERRUPT_SOURCES](#).

Remarks

None.

Example**5.6.8.5.6.8 PLIB_ETH_InterruptStatusGet Function****C**

```
bool PLIB_ETH_InterruptStatusGet(
    ETH_MODULE_ID index,
    ETH_INTERRUPT_SOURCES intmask
);
```

Description

This function gets the Ethernet module Interrupt Flag register using a mask.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
intmask	Members of ETH_INTERRUPT_SOURCES logically ORed together

Returns

- true - If any of the specified source statuses are enabled
- false - If none of the specified source statuses are enabled

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
if (PLIB_ETH_InterruptStatusGet(index, ETH_TRANSMIT_DONE_INTERRUPT))
{
    PLIB_ETH_InterruptClear(index, ETH_TRANSMIT_DONE_INTERRUPT);
}
```

5.6.8.5.7 Statistics Functions

5.6.8.5.7.1 PLIB_ETH_AlignErrorCountClear Function

C

```
void PLIB_ETH_AlignErrorCountClear(
    ETH_MODULE_ID index
);
```

Description

This function sets the count of Ethernet alignment errors to zero.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
value	count of alignment errors

Returns

None.

Remarks

Setting or clearing any bits in this register should be done for debug/test purposes only.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_AlignErrorCountClear(MY_ETH_INSTANCE);
```

5.6.8.5.7.2 PLIB_ETH_AlignErrorCountGet Function

C

```
uint16_t PLIB_ETH_AlignErrorCountGet(
    ETH_MODULE_ID index
);
```

Description

This function gets the count of Ethernet alignment errors.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

value - Count of alignment errors

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
count = PLIB_ETH_AlignErrorCountGet(MY_ETH_INSTANCE);
```

5.6.8.5.7.3 PLIB_ETH_FCSErrorCountClear Function**C**

```
void PLIB_ETH_FCSErrorCountClear(  
    ETH_MODULE_ID index  
);
```

Description

This function sets the value of the Ethernet frame check sequence error to zero.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
value	Count of FCS Errors

Returns

None.

Remarks

Setting or clearing any bits in this register should be done for debug/test purposes only.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_FCSErrorCountClear(MY_ETH_INSTANCE);
```

5.6.8.5.7.4 PLIB_ETH_FCSErrorCountGet Function**C**

```
uint16_t PLIB_ETH_FCSErrorCountGet(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the count of the frame check sequence error.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

value - Count of FCS Errors

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
count = PLIB_ETH_FCSErrorCountGet(MY_ETH_INSTANCE);
```

5.6.8.5.7.5 PLIB_ETH_FramesRxdOkCountClear Function**C**

```
void PLIB_ETH_FramesRxdOkCountClear(  
    ETH_MODULE_ID index  
);
```

Description

This function sets the value of the Ethernet frames 'OK' count to zero.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
value	Count of frames received correctly

Returns

None.

Remarks

Changing the value of this register should be done for debug/test purposes only.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_FramesRxdOkCountClear(MY_ETH_INSTANCE);
```

5.6.8.5.7.6 PLIB_ETH_FramesRxdOkCountGet Function**C**

```
uint16_t PLIB_ETH_FramesRxdOkCountGet(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the count of the frames received successfully. Increment count for frames received successfully by the RX Filter. This count will not be incremented if there is a Frame Check Sequence (FCS) or Alignment error.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

value - Count of frames received correctly

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
count = PLIB_ETH_FramesRxdOkCountGet(MY_ETH_INSTANCE);
```

5.6.8.5.7.7 PLIB_ETH_FramesTxdOkCountClear Function**C**

```
void PLIB_ETH_FramesTxdOkCountClear(  
    ETH_MODULE_ID index  
);
```

Description

This function sets the count of Ethernet Control frames transmitted to zero.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
value	Count of control frames transmitted correctly

Returns

None.

Remarks

Setting or clearing any bits in this register should be done for debug/test purposes only.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_FramesTxdOkCountClear(MY_ETH_INSTANCE);
```

5.6.8.5.7.8 PLIB_ETH_FramesTxdOkCountGet Function**C**

```
uint16_t PLIB_ETH_FramesTxdOkCountGet(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the count of Ethernet Control Frames transmitted successfully.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

count - count of control frames transmitted correctly

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
count = PLIB_ETH_FramesTxdOkCountGet(MY_ETH_INSTANCE);
```

5.6.8.5.7.9 PLIB_ETH_MultipleCollisionCountClear Function**C**

```
void PLIB_ETH_MultipleCollisionCountClear(  
    ETH_MODULE_ID index  
);
```

Description

This function sets the value of the Ethernet multiple collision frame count to zero.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
value	Count of multiple collision frames

Returns

None.

Remarks

Setting or clearing any bits in this register should be done for debug/test purposes only.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_MultipleCollisionCountClear(MY_ETH_INSTANCE);
```

5.6.8.5.7.10 PLIB_ETH_MultipleCollisionCountGet Function**C**

```
uint16_t PLIB_ETH_MultipleCollisionCountGet(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the count of the frames transmitted successfully after there was more than one collision.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

count - Count of multiple collision frames

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
count = PLIB_ETH_MultipleCollisionCountGet(MY_ETH_INSTANCE);
```

5.6.8.5.7.11 PLIB_ETH_RxOverflowCountClear Function**C**

```
void PLIB_ETH_RxOverflowCountClear(  
    ETH_MODULE_ID index  
);
```

Description

This function sets the value of the Ethernet receive overflow count to zero. Increment counter for frames accepted by the RX filter and subsequently dropped due to internal receive error. This event also sets the receive overflow interrupt flag.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

None.

Remarks

Setting or clearing any bits in this register should be done for debug/test purposes only.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_RxOverflowCountClear(MY_ETH_INSTANCE);
```

5.6.8.5.7.12 PLIB_ETH_RxOverflowCountGet Function**C**

```
uint16_t PLIB_ETH_RxOverflowCountGet(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the count of the dropped Ethernet receive frames.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

count - uint16_t receiver overflow counts

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
count = PLIB_ETH_RxOverflowCountGet(MY_ETH_INSTANCE);
```

5.6.8.5.7.13 PLIB_ETH_RxPacketCountGet Function**C**

```
uint8_t PLIB_ETH_RxPacketCountGet(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the value of the the receive packet buffer count. When a packet has been successfully received, this value is incremented by hardware. Software decrements the counter after a packet has been read. Call PLIB_ETH_ReceiveBufferCountDecrement(ETH_MODULE_ID index) to decrement.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

RxPacketCount - Number of received packets in memory

Remarks

Receive Packet Buffer Counter cannot be decremented below 0x00 Cleared when the Ethernet module is reset.

The Receive Packet Buffer Count is not set to '0' when the Ethernet module is turned OFF. This allows software to continue to utilize and decrement the count.

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
count = PLIB_ETH_RxPacketCountGet(MY_ETH_INSTANCE);
```

5.6.8.5.7.14 PLIB_ETH_SingleCollisionCountClear Function**C**

```
void PLIB_ETH_SingleCollisionCountClear(  
    ETH_MODULE_ID index  
);
```

Description

This function sets the value of the Ethernet single collision frame count to zero.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance
value	Count of single collision frames

Returns

None.

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_ETH_SingleCollisionCountClear(MY_ETH_INSTANCE);
```

5.6.8.5.7.15 PLIB_ETH_SingleCollisionCountGet Function**C**

```
uint16_t PLIB_ETH_SingleCollisionCountGet(  
    ETH_MODULE_ID index  
);
```

Description

This function gets the count of the frames transmitted successfully on a second attempt.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

count - Count of frames transmitted successfully on second attempt

Remarks

This functionality is not available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
count = PLIB_ETH_SingleCollisionCountGet(MY_ETH_INSTANCE);
```

5.6.8.5.8 Existence Functions**5.6.8.5.8.1 PLIB_ETH_ExistsAlignmentErrorCount Function****C**

```
bool PLIB_ETH_ExistsAlignmentErrorCount(  
    ETH_MODULE_ID index
```

```
);
```

Description

This function identifies whether the AlignmentErrorCount feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- [PLIB_ETH_AlignErrorCountClear](#)
- [PLIB_ETH_AlignErrorCountGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The AlignmentErrorCount feature is supported on the device
- false - The AlignmentErrorCount feature is not supported on the device

Remarks

None.

5.6.8.5.8.2 PLIB_ETH_ExistsAutoFlowControl Function

C

```
bool PLIB_ETH_ExistsAutoFlowControl(  
    ETH_MODULE_ID index  
);
```

Description

This function identifies whether the AutoFlowControl feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- [PLIB_ETH_AutoFlowControlEnable](#)
- [PLIB_ETH_AutoFlowControlDisable](#)
- [PLIB_ETH_AutoFlowControlIsEnabled](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The AutoFlowControl feature is supported on the device
- false - The AutoFlowControl feature is not supported on the device

Remarks

None.

5.6.8.5.8.3 PLIB_ETH_ExistsCollisionCounts Function

C

```
bool PLIB_ETH_ExistsCollisionCounts(  
    ETH_MODULE_ID index  
);
```

Description

This function identifies whether the CollisionCounts feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- [PLIB_ETH_SingleCollisionCountClear](#)
- [PLIB_ETH_SingleCollisionCountGet](#)
- [PLIB_ETH_MultipleCollisionCountClear](#)
- [PLIB_ETH_MultipleCollisionCountGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The CollisionCounts feature is supported on the device
- false - The CollisionCounts feature is not supported on the device

Remarks

None.

5.6.8.5.8.4 PLIB_ETH_ExistsCollisionWindow Function

C

```
bool PLIB_ETH_ExistsCollisionWindow(  
    ETH_MODULE_ID index  
);
```

Description

This function identifies whether the CollisionWindow feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- [PLIB_ETH_CollisionWindowGet](#)
- [PLIB_ETH_CollisionWindowSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The CollisionWindow feature is supported on the device

- false - The CollisionWindow feature is not supported on the device

Remarks

None.

5.6.8.5.8.5 PLIB_ETH_ExistsEnable Function

C

```
bool PLIB_ETH_ExistsEnable(  
    ETH_MODULE_ID index  
)
```

Description

This function identifies whether the Enable feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- [PLIB_ETH_Enable](#)
- [PLIB_ETH_Disable](#)
- [PLIB_ETH_IsEnabled](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The Enable feature is supported on the device
- false - The Enable feature is not supported on the device

Remarks

None.

5.6.8.5.8.6 PLIB_ETH_ExistsEthernetControllerStatus Function

C

```
bool PLIB_ETH_ExistsEthernetControllerStatus(  
    ETH_MODULE_ID index  
)
```

Description

This function identifies whether the EthernetControllerStatus feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- [PLIB_ETH_RxPacketCountGet](#)
- [PLIB_ETH_EthernetIsBus](#)
- [PLIB_ETH_TransmitsBusy](#)
- [PLIB_ETH_ReceiveIsBusy](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The EthernetControllerStatus feature is supported on the device
- false - The EthernetControllerStatus feature is not supported on the device

Remarks

None.

5.6.8.5.8.7 PLIB_ETH_ExistsFCSErrorCount Function**C**

```
bool PLIB_ETH_ExistsFCSErrorCount(  
    ETH_MODULE_ID index  
);
```

Description

This function identifies whether the FCSErrorCount feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- [PLIB_ETH_FCSErrorCountClear](#)
- [PLIB_ETH_FCSErrorCountGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The FCSErrorCount feature is supported on the device
- false - The FCSErrorCount feature is not supported on the device

Remarks

None.

5.6.8.5.8.8 PLIB_ETH_ExistsFramesTransmittedOK Function**C**

```
bool PLIB_ETH_ExistsFramesTransmittedOK(  
    ETH_MODULE_ID index  
);
```

Description

This function identifies whether the FramesTransmittedOK feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- [PLIB_ETH_FramesTxdOkCountClear](#)
- [PLIB_ETH_FramesTxdOkCountGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The FramesTransmittedOK feature is supported on the device
- false - The FramesTransmittedOK feature is not supported on the device

Remarks

None.

5.6.8.5.8.9 PLIB_ETH_ExistsFramexReceivedOK Function**C**

```
bool PLIB_ETH_ExistsFramexReceivedOK(  
    ETH_MODULE_ID index  
);
```

Description

This function identifies whether the FramexReceivedOK feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- [PLIB_ETH_FramesRxdOkCountClear](#)
- [PLIB_ETH_FramesRxdOkCountGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The FramexReceivedOK feature is supported on the device
- false - The FramexReceivedOK feature is not supported on the device

Remarks

None.

5.6.8.5.8.10 PLIB_ETH_ExistsHashTable Function**C**

```
bool PLIB_ETH_ExistsHashTable(  
    ETH_MODULE_ID index  
);
```

Description

This function identifies whether the HashTable feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- [PLIB_ETH_HashTableSet](#)
- [PLIB_ETH_HashTableGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The HashTable feature is supported on the device
- false - The HashTable feature is not supported on the device

Remarks

None.

5.6.8.5.8.11 PLIB_ETH_ExistsInterPacketGaps Function**C**

```
bool PLIB_ETH_ExistsInterPacketGaps(  
    ETH_MODULE_ID index  
);
```

Description

This function identifies whether the InterPacketGaps feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- [PLIB_ETH_BackToBackIPGGet](#)
- [PLIB_ETH_BackToBackIPGSet](#)
- [PLIB_ETH_NonBackToBackIPG1Get](#)
- [PLIB_ETH_NonBackToBackIPG1Set](#)
- [PLIB_ETH_NonBackToBackIPG2Get](#)
- [PLIB_ETH_NonBackToBackIPG2Set](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The InterPacketGaps feature is supported on the device
- false - The InterPacketGaps feature is not supported on the device

Remarks

None.

5.6.8.5.8.12 PLIB_ETH_ExistsInterrupt Function

C

```
bool PLIB_ETH_ExistsInterrupt(  
    ETH_MODULE_ID index  
);
```

Description

This function identifies whether the Interrupt feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- [PLIB_ETH_InterruptSourceEnable](#)
- [PLIB_ETH_InterruptSourceDisable](#)
- [PLIB_ETH_InterruptSourceIsEnabled](#)
- [PLIB_ETH_InterruptSet](#)
- [PLIB_ETH_InterruptClear](#)
- [PLIB_ETH_InterruptStatusGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The Interrupt feature is supported on the device
- false - The Interrupt feature is not supported on the device

Remarks

None.

5.6.8.5.8.13 PLIB_ETH_ExistsMAC_Configuration Function

C

```
bool PLIB_ETH_ExistsMAC_Configuration(  
    ETH_MODULE_ID index  
);
```

Description

This function identifies whether the MAC_Configuration feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- [PLIB_ETH_LoopbackEnable](#)
- [PLIB_ETH_LoopbackDisable](#)
- [PLIB_ETH_LoopbackIsEnabled](#)
- [PLIB_ETH_TxPauseEnable](#)
- [PLIB_ETH_TxPauseDisable](#)
- [PLIB_ETH_TxPauselsEnabled](#)
- [PLIB_ETH_RxPauseEnable](#)

- [PLIB_ETH_RxPauseDisable](#)
- [PLIB_ETH_RxPausesIsEnabled](#)
- [PLIB_ETH_PassAllEnable](#)
- [PLIB_ETH_PassAllDisable](#)
- [PLIB_ETH_PassAllIsEnabled](#)
- [PLIB_ETH_ReceiveEnable](#)
- [PLIB_ETH_ReceiveDisable](#)
- [PLIB_ETH_ReceiveIsEnabled](#)
- [PLIB_ETH_ExcessDeferEnable](#)
- [PLIB_ETH_ExcessDeferDisable](#)
- [PLIB_ETH_ExcessDeferIsEnabled](#)
- [PLIB_ETH_BackPresNoBackoffEnable](#)
- [PLIB_ETH_BackPresNoBackoffDisable](#)
- [PLIB_ETH_BackPresNoBackoffIsEnabled](#)
- [PLIB_ETH_NoBackoffEnable](#)
- [PLIB_ETH_NoBackoffDisable](#)
- [PLIB_ETH_NoBackoffIsEnabled](#)
- [PLIB_ETH_LongPreambleEnable](#)
- [PLIB_ETH_LongPreambleDisable](#)
- [PLIB_ETH_LongPreambleIsEnabled](#)
- [PLIB_ETH_PurePreambleEnable](#)
- [PLIB_ETH_PurePreambleDisable](#)
- [PLIB_ETH_PurePreambleIsEnabled](#)
- [PLIB_ETH_AutoDetectPadGet](#)
- [PLIB_ETH_AutoDetectPadSet](#)
- [PLIB_ETH_AutoDetectPadClear](#)
- [PLIB_ETH_CRCEnable](#)
- [PLIB_ETH_CRCDisable](#)
- [PLIB_ETH_CRCIsEnabled](#)
- [PLIB_ETH_DelayedCRCEnable](#)
- [PLIB_ETH_DelayedCRCDisable](#)
- [PLIB_ETH_DelayedCRCIsEnabled](#)
- [PLIB_ETH_HugeFrameEnable](#)
- [PLIB_ETH_HugeFrameDisable](#)
- [PLIB_ETH_HugeFrameIsEnabled](#)
- [PLIB_ETH_FrameLengthCheckEnable](#)
- [PLIB_ETH_FrameLengthCheckDisable](#)
- [PLIB_ETH_FrameLengthCheckIsEnabled](#)
- [PLIB_ETH_FullDuplexEnable](#)

- [PLIB_ETH_FullDuplexDisable](#)
- [PLIB_ETH_FullDuplexIsEnabled](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The MAC_Configuration feature is supported on the device
- false - The MAC_Configuration feature is not supported on the device

Remarks

None.

5.6.8.5.8.14 PLIB_ETH_ExistsMAC_Resets Function**C**

```
bool PLIB_ETH_ExistsMAC_Resets(
    ETH_MODULE_ID index
);
```

Description

This function identifies whether the MAC_Resets feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- [PLIB_ETH_MIIResetEnable](#)
- [PLIB_ETH_MIIResetDisable](#)
- [PLIB_ETH_MIIResetIsEnabled](#)
- [PLIB_ETH_SimResetEnable](#)
- [PLIB_ETH_SimResetDisable](#)
- [PLIB_ETH_SimResetIsEnabled](#)
- [PLIB_ETH_MCSRxResetEnable](#)
- [PLIB_ETH_MCSRxResetDisable](#)
- [PLIB_ETH_MCSRxResetIsEnabled](#)
- [PLIB_ETH_RxFuncResetEnable](#)
- [PLIB_ETH_RxFuncResetDisable](#)
- [PLIB_ETH_RxFuncResetIsEnabled](#)
- [PLIB_ETH_MCSTxResetEnable](#)
- [PLIB_ETH_MCSTxResetDisable](#)
- [PLIB_ETH_MCSTxResetIsEnabled](#)
- [PLIB_ETH_TxFuncResetEnable](#)
- [PLIB_ETH_TxFuncResetDisable](#)
- [PLIB_ETH_TxFuncResetIsEnabled](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The MAC_Resets feature is supported on the device
- false - The MAC_Resets feature is not supported on the device

Remarks

None.

5.6.8.5.8.15 PLIB_ETH_ExistsMAC_Testing Function**C**

```
bool PLIB_ETH_ExistsMAC_Testing(  
    ETH_MODULE_ID index  
);
```

Description

This function identifies whether the MAC_Testing feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- [PLIB_ETH_TestBackPressEnable](#)
- [PLIB_ETH_TestBackPressDisable](#)
- [PLIB_ETH_TestBackPressIsEnabled](#)
- [PLIB_ETH_TestPauseEnable](#)
- [PLIB_ETH_TestPauseDisable](#)
- [PLIB_ETH_TestPauseIsEnabled](#)
- [PLIB_ETH_ShortcutQuantaEnable](#)
- [PLIB_ETH_ShortcutQuantaDisable](#)
- [PLIB_ETH_ShortcutQuantaIsEnabled](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The MAC_Testing feature is supported on the device
- false - The MAC_Testing feature is not supported on the device

Remarks

None.

5.6.8.5.8.16 PLIB_ETH_ExistsManualFlowControl Function

C

```
bool PLIB_ETH_ExistsManualFlowControl(  
    ETH_MODULE_ID index  
);
```

Description

This function identifies whether the ManualFlowControl feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- [PLIB_ETH_ManualFlowControlEnable](#)
- [PLIB_ETH_ManualFlowControlDisable](#)
- [PLIB_ETH_ManualFlowControlIsEnabled](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ManualFlowControl feature is supported on the device
- false - The ManualFlowControl feature is not supported on the device

Remarks

None.

5.6.8.5.8.17 PLIB_ETH_ExistsMaxFrameLength Function

C

```
bool PLIB_ETH_ExistsMaxFrameLength(  
    ETH_MODULE_ID index  
);
```

Description

This function identifies whether the MaxFrameLength feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- [PLIB_ETH_MaxFrameLengthGet](#)
- [PLIB_ETH_MaxFrameLengthSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The MaxFrameLength feature is supported on the device
- false - The MaxFrameLength feature is not supported on the device

Remarks

None.

5.6.8.5.8.18 PLIB_ETH_ExistsMIIM_Config Function**C**

```
bool PLIB_ETH_ExistsMIIM_Config(  
    ETH_MODULE_ID index  
);
```

Description

This function identifies whether the MIIM_Config feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- [PLIB_ETH_MIIMResetEnable](#)
- [PLIB_ETH_MIIMResetDisable](#)
- [PLIB_ETH_MIIMResetIsEnabled](#)
- [PLIB_ETH_MIIMClockGet](#)
- [PLIB_ETH_MIIMClockSet](#)
- [PLIB_ETH_MIIMNoPreEnable](#)
- [PLIB_ETH_MIIMNoPreDisable](#)
- [PLIB_ETH_MIIMNoPreIsEnabled](#)
- [PLIB_ETH_MIIMScanIncrEnable](#)
- [PLIB_ETH_MIIMScanIncrDisable](#)
- [PLIB_ETH_MIIMScanIncrIsEnabled](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The MIIM_Config feature is supported on the device
- false - The MIIM_Config feature is not supported on the device

Remarks

None.

5.6.8.5.8.19 PLIB_ETH_ExistsMIIM_Indicators Function**C**

```
bool PLIB_ETH_ExistsMIIM_Indicators(  
    ETH_MODULE_ID index  
);
```

Description

This function identifies whether the MIIM_Indicators feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- [PLIB_ETH_LinkHasFailed](#)
- [PLIB_ETH_DataNotValid](#)
- [PLIB_ETH_MIIMIsScanning](#)
- [PLIB_ETH_MIIMIsBusy](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The MIIM_Indicators feature is supported on the device
- false - The MIIM_Indicators feature is not supported on the device

Remarks

None.

5.6.8.5.8.20 PLIB_ETH_ExistsMIIMAddresses Function**C**

```
bool PLIB_ETH_ExistsMIIMAddresses(  
    ETH_MODULE_ID index  
);
```

Description

This function identifies whether the MIIMAddresses feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- [PLIB_ETH_PHYAddressGet](#)
- [PLIB_ETH_PHYAddressSet](#)
- [PLIB_ETH_RegisterAddressGet](#)
- [PLIB_ETH_RegisterAddressSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The MIIMAddresses feature is supported on the device
- false - The MIIMAddresses feature is not supported on the device

Remarks

None.

5.6.8.5.8.21 PLIB_ETH_ExistsMIIMReadWrite Function

C

```
bool PLIB_ETH_ExistsMIIMReadWrite(  
    ETH_MODULE_ID index  
);
```

Description

This function identifies whether the MIIMReadWrite feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- [PLIB_ETH_MIIMReadStart](#)
- [PLIB_ETH_MIIMWriteStart](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The MIIMReadWrite feature is supported on the device
- false - The MIIMReadWrite feature is not supported on the device

Remarks

None.

5.6.8.5.8.22 PLIB_ETH_ExistsMIIMScanMode Function

C

```
bool PLIB_ETH_ExistsMIIMScanMode(  
    ETH_MODULE_ID index  
);
```

Description

This function identifies whether the MIIMScanMode feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- [PLIB_ETH_MIIMScanModeEnable](#)
- [PLIB_ETH_MIIMScanModeDisable](#)
- [PLIB_ETH_MIIMScanModeIsEnabled](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The MIIMScanMode feature is supported on the device
- false - The MIIMScanMode feature is not supported on the device

Remarks

None.

5.6.8.5.8.23 PLIB_ETH_ExistsMIWriteReadData Function**C**

```
bool PLIB_ETH_ExistsMIWriteReadData(  
    ETH_MODULE_ID index  
);
```

Description

This function identifies whether the MIWriteReadData feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- [PLIB_ETH_MIIMWriteDataSet](#)
- [PLIB_ETH_MIIMReadDataGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The MIWriteReadData feature is supported on the device
- false - The MIWriteReadData feature is not supported on the device

Remarks

None.

5.6.8.5.8.24 PLIB_ETH_ExistsPatternMatch Function**C**

```
bool PLIB_ETH_ExistsPatternMatch(  
    ETH_MODULE_ID index  
);
```

Description

This function identifies whether the PatternMatch feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- [PLIB_ETH_PatternMatchSet](#)
- [PLIB_ETH_PatternMatchGet](#)
- [PLIB_ETH_PatternMatchChecksumSet](#)
- [PLIB_ETH_PatternMatchChecksumGet](#)
- [PLIB_ETH_PatternMatchOffsetSet](#)
- [PLIB_ETH_PatternMatchOffsetGet](#)
- [PLIB_ETH_PatternMatchModeSet](#)
- [PLIB_ETH_PatternMatchModeGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The PatternMatch feature is supported on the device
- false - The PatternMatch feature is not supported on the device

Remarks

None.

5.6.8.5.8.25 PLIB_ETH_ExistsPauseTimer Function**C**

```
bool PLIB_ETH_ExistsPauseTimer(  
    ETH_MODULE_ID index  
);
```

Description

This function identifies whether the PauseTimer feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- [PLIB_ETH_PauseTimerSet](#)
- [PLIB_ETH_PauseTimerGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The PauseTimer feature is supported on the device
- false - The PauseTimer feature is not supported on the device

Remarks

None.

5.6.8.5.8.26 PLIB_ETH_ExistsReceiveBufferSize Function**C**

```
bool PLIB_ETH_ExistsReceiveBufferSize(  
    ETH_MODULE_ID index  
);
```

Description

This function identifies whether the ReceiveBufferSize feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- [PLIB_ETH_ReceiveBufferSizeGet](#)
- [PLIB_ETH_ReceiveBufferSizeSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ReceiveBufferSize feature is supported on the device
- false - The ReceiveBufferSize feature is not supported on the device

Remarks

None.

5.6.8.5.8.27 PLIB_ETH_ExistsReceiveFilters Function**C**

```
bool PLIB_ETH_ExistsReceiveFilters(  
    ETH_MODULE_ID index  
);
```

Description

This function identifies whether the ReceiveFilters feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- [PLIB_ETH_ReceiveFilterEnable](#)
- [PLIB_ETH_ReceiveFilterDisable](#)
- [PLIB_ETH_ReceiveFilterIsEnable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ReceiveFilters feature is supported on the device
- false - The ReceiveFilters feature is not supported on the device

Remarks

None.

5.6.8.5.8.28 PLIB_ETH_ExistsReceiveOverflowCount Function**C**

```
bool PLIB_ETH_ExistsReceiveOverflowCount(  
    ETH_MODULE_ID index  
);
```

Description

This function identifies whether the ReceiveOverflowCount feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- [PLIB_ETH_RxOverflowCountClear](#)
- [PLIB_ETH_RxOverflowCountGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ReceiveOverflowCount feature is supported on the device
- false - The ReceiveOverflowCount feature is not supported on the device

Remarks

None.

5.6.8.5.8.29 PLIB_ETH_ExistsReceiveWmarks Function**C**

```
bool PLIB_ETH_ExistsReceiveWmarks(  
    ETH_MODULE_ID index  
);
```

Description

This function identifies whether the ReceiveWmarks feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- [PLIB_ETH_RxFullWmarkSet](#)
- [PLIB_ETH_RxFullWmarkGet](#)
- [PLIB_ETH_RxEmptyWmarkSet](#)
- [PLIB_ETH_RxEmptyWmarkGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ReceiveWmarks feature is supported on the device
- false - The ReceiveWmarks feature is not supported on the device

Remarks

None.

5.6.8.5.8.30 PLIB_ETH_ExistsRetransmissionMaximum Function

C

```
bool PLIB_ETH_ExistsRetransmissionMaximum(  
    ETH_MODULE_ID index  
)  
;
```

Description

This function identifies whether the RetransmissionMaximum feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- [PLIB_ETH_ReTxMaxGet](#)
- [PLIB_ETH_ReTxMaxSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The RetransmissionMaximum feature is supported on the device
- false - The RetransmissionMaximum feature is not supported on the device

Remarks

None.

5.6.8.5.8.31 PLIB_ETH_ExistsRMII_Support Function

C

```
bool PLIB_ETH_ExistsRMII_Support(  
    ETH_MODULE_ID index  
)  
;
```

Description

This function identifies whether the RMII_Support feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- [PLIB_ETH_RMIIResetEnable](#)
- [PLIB_ETH_RMIIResetDisable](#)
- [PLIB_ETH_RMIIResetIsEnabled](#)
- [PLIB_ETH_RMIIISpeedGet](#)
- [PLIB_ETH_RMIIISpeedSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The RMII_Support feature is supported on the device
- false - The RMII_Support feature is not supported on the device

Remarks

None.

5.6.8.5.8.32 PLIB_ETH_ExistsRxBufferCountDecrement Function**C**

```
bool PLIB_ETH_ExistsRxBufferCountDecrement(  
    ETH_MODULE_ID index  
);
```

Description

This function identifies whether the RxBufferCountDecrement feature is available on the Ethernet module. When this function returns true, this function is supported on the device:

- [PLIB_ETH_RxBufferCountDecrement](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The RxBufferCountDecrement feature is supported on the device
- false - The RxBufferCountDecrement feature is not supported on the device

Remarks

None.

5.6.8.5.8.33 PLIB_ETH_ExistsRxEnable Function**C**

```
bool PLIB_ETH_ExistsRxEnable(  
    ETH_MODULE_ID index  
);
```

Description

This function identifies whether the ReceiveEnable feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- [PLIB_ETH_RxEnable](#)
- [PLIB_ETH_RxDisable](#)
- [PLIB_ETH_RxIsEnabled](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ReceiveEnable feature is supported on the device
- false - The ReceiveEnable feature is not supported on the device

Remarks

None.

5.6.8.5.8.34 PLIB_ETH_ExistsRxPacketDescriptorAddress Function**C**

```
bool PLIB_ETH_ExistsRxPacketDescriptorAddress(  
    ETH_MODULE_ID index  
);
```

Description

This function identifies whether the RxPacketDescriptorAddress feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- [PLIB_ETH_RxPacketDescAddrSet](#)
- [PLIB_ETH_RxPacketDescAddrGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The RxPacketDescriptorAddress feature is supported on the device
- false - The RxPacketDescriptorAddress feature is not supported on the device

Remarks

None.

5.6.8.5.8.35 PLIB_ETH_ExistsStationAddress Function**C**

```
bool PLIB_ETH_ExistsStationAddress(  
    ETH_MODULE_ID index  
);
```

Description

This function identifies whether the StationAddress feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- [PLIB_ETH_StationAddressGet](#)
- [PLIB_ETH_StationAddressSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The StationAddress feature is supported on the device
- false - The StationAddress feature is not supported on the device

Remarks

None.

5.6.8.5.8.36 PLIB_ETH_ExistsStopInIdle Function**C**

```
bool PLIB_ETH_ExistsStopInIdle(  
    ETH_MODULE_ID index  
);
```

Description

This function identifies whether the StopInIdle feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- [PLIB_ETH_StopInIdleEnable](#)
- [PLIB_ETH_StopInIdleDisable](#)
- [PLIB_ETH_StopInIdleIsEnabled](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The StopInIdle feature is supported on the device
- false - The StopInIdle feature is not supported on the device

Remarks

None.

5.6.8.5.8.37 PLIB_ETH_ExistsTransmitRTS Function**C**

```
bool PLIB_ETH_ExistsTransmitRTS(  
    ETH_MODULE_ID index  
);
```

Description

This function identifies whether the TransmitRTS feature is available on the Ethernet module. When this function returns true,

these functions are supported on the device:

- [PLIB_ETH_TxRTSEnable](#)
- [PLIB_ETH_TxRTSDisable](#)
- [PLIB_ETH_TxRTSIsEnabled](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The TransmitRTS feature is supported on the device
- false - The TransmitRTS feature is not supported on the device

Remarks

None.

5.6.8.5.8.38 PLIB_ETH_ExistsTxPacketDescriptorAddress Function

C

```
bool PLIB_ETH_ExistsTxPacketDescriptorAddress(  
    ETH_MODULE_ID index  
);
```

Description

This function identifies whether the TxPacketDescriptorAddress feature is available on the Ethernet module. When this function returns true, these functions are supported on the device:

- [PLIB_ETH_TxPacketDescAddrSet](#)
- [PLIB_ETH_TxPacketDescAddrGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The TxPacketDescriptorAddress feature is supported on the device
- false - The TxPacketDescriptorAddress feature is not supported on the device

Remarks

None.

5.6.8.5.9 Data Types and Constants

5.6.8.5.9.1 ETH_AUTOPAD_OPTION Enumeration

C

```
typedef enum {  
    ETH_AUTOPAD_DISABLED_CHECK_CRC,  
    ETH_AUTOPAD_TO_60BYTES_ADD_CRC,  
    ETH_AUTOPAD_TO_64BYTES_ADD_CRC,  
    ETH_AUTOPAD_BY_PKT_TYPE_ADD_CRC  
} ETH_AUTOPAD_OPTION;
```

Description

AutoDetectPad Selection

This enumeration lists the possible automatic padding configurations.

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.8.5.9.2 ETH_INTERRUPT_SOURCES Enumeration

C

```
typedef enum {  
    ETH_TRANSMIT_BVCI_BUS_ERROR_INTERRUPT,  
    ETH_RECEIVE_BVCI_BUS_ERROR_INTERRUPT,  
    ETH_EMPTY_WATERMARK_INTERRUPT,  
    ETH_FULL_WATERMARK_INTERRUPT,  
    ETH_RECEIVE_DONE_INTERRUPT,  
    ETH_PACKET_PENDING_INTERRUPT,  
    ETH_RECEIVE_ACTIVITY_INTERRUPT,  
    ETH_TRANSMIT_DONE_INTERRUPT,  
    ETH_TRANSMIT_ABORT_INTERRUPT,  
    ETH_RECEIVE_BUFFER_NOT_AVAILABLE_INTERRUPT,  
    ETH_RECEIVE_FIFO_OVERFLOW_ERROR_INTERRUPT,  
    ETH_ALL_INTERRUPT_SOURCES  
} ETH_INTERRUPT_SOURCES;
```

Description

ETH Module Interrupt Mask

This enumeration lists the possible values of ETH_INTERRUPT_SOURCES.

Remarks

See also ETH_LEGACY_EVENTS in plib_eth_legacy.h.

5.6.8.5.9.3 ETH_MIIM_CLK Enumeration

C

```
typedef enum {  
    ETH_MIIM_SYSCLK_DIV_BY_4,  
    ETH_MIIM_SYSCLK_DIV_RSVD,  
    ETH_MIIM_SYSCLK_DIV_BY_6,  
    ETH_MIIM_SYSCLK_DIV_BY_8,  
    ETH_MIIM_SYSCLK_DIV_BY_10,  
    ETH_MIIM_SYSCLK_DIV_BY_14,  
    ETH_MIIM_SYSCLK_DIV_BY_20,  
    ETH_MIIM_SYSCLK_DIV_BY_28,  
    ETH_MIIM_SYSCLK_DIV_BY_40  
} ETH_MIIM_CLK;
```

Description

II Clock Selection

This enumeration lists the possible speed selection for RMII. The body contains only two states: RMII_10Mbps or RMII_100Mbps.

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.8.5.9.4 ETH_PATTERN_MATCH_MODE Type**C**

```
typedef enum _ETH_PATTERN_MATCH_MODE_ ETH_PATTERN_MATCH_MODE;
```

Description

Pattern Match Modes

This enumeration lists the pattern match mode values.

Remarks

In all pattern match enabled cases, it is the pattern match inversion XOR pattern match checksum AND .

Some states were omitted from the enumeration since they were duplicates.

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.8.5.9.5 ETH_RECEIVE_FILTER Enumeration**C**

```
typedef enum {
    ETH_HASH_FILTER,
    ETH_MAGIC_PACKET_FILTER,
    ETH_PATTERN_MATCH_INVERSION,
    ETH_CRC_ERROR_FILTER,
    ETH_CRC_OK_FILTER,
    ETH_RUNT_ERROR_FILTER,
    ETH_RUNT_ENABLE_FILTER,
    ETH_UNICAST_FILTER,
    ETH_NOT_ME_UNICAST_FILTER,
    ETH_MULTICAST_FILTER,
    ETH_BROADCAST_FILTER,
    ETH_ENABLE_ALL_FILTER
} ETH_RECEIVE_FILTER;
```

Description

ETH Module Receive Filter Mask

This enumeration lists the possible values of the receive filter.

Members

Members	Description
ETH_HASH_FILTER	Enable: Hash Table Filtering.
ETH_MAGIC_PACKET_FILTER	Enable: Magic Packet Filtering.
ETH_PATTERN_MATCH_INVERSION	Enable: Pattern Match Checksum must not match to be accepted.
ETH_CRC_ERROR_FILTER	Enable: Received packet CRC must be invalid to be accepted.
ETH_CRC_OK_FILTER	Enable: Received packet CRC must be valid to be accepted.

ETH_RUNT_ERROR_FILTER	Enable: Received packet must be runt packet to be accepted.
ETH_RUNT_ENABLE_FILTER	Enable: Received packet must not be a runt packet to be accepted.
ETH_UNICAST_FILTER	Enable: Unicast Packets whose destination address matches the station address are accepted.
ETH_NOT_ME_UNICAST_FILTER	Enable: Unicast Packets whose destination address do NOT match the station address are accepted.
ETH_MULTICAST_FILTER	Enable: Multicast Address Packets are accepted.
ETH_BROADCAST_FILTER	Enable: Broadcast Address Packets are accepted.
ETH_ENABLE_ALL_FILTER	Enable: All of the above packets are accepted.

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.8.5.9.6 ETH_RMII_SPEED Enumeration**C**

```
typedef enum {
    ETH_RMII_10Mbps,
    ETH_RMII_100Mbps
} ETH_RMII_SPEED;
```

Description

RMII Speed Selection

This enumeration lists the possible speed selection for RMII. The body contains only two states: RMII_10Mbps or RMII_100Mbps.

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.8.6 Files**Files**

Name	Description
plib_eth.h	Defines the Ethernet Peripheral Library Interface.

Description**5.6.8.6.1 plib_eth.h**

Ethernet Peripheral Library Interface Header

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the Ethernet Peripheral Library for Microchip microcontrollers. The definitions in this file are for the Ethernet module.

Enumerations

	Name	Description
	ETH_AUTOPAD_OPTION	Lists the possible automatic padding configurations.
	ETH_INTERRUPT_SOURCES	Lists the possible values of ETH_INTERRUPT_SOURCES.

	ETH_MIIM_CLK	Lists the possible speed selection for the Reduced Media Independent Interface (RMII).
	ETH_RECEIVE_FILTER	Lists the possible values of the receive filter.
	ETH_RMII_SPEED	Lists the possible speed selection for the Reduced Media Independent Interface (RMII).

Functions

	Name	Description
	PLIB_ETH_AlignErrorCountClear	Sets the count of Ethernet alignment errors to zero.
	PLIB_ETH_AlignErrorCountGet	Gets the count of Ethernet alignment errors.
	PLIB_ETH_AutoDetectPadClear	Clears the EMAC Auto-Pad option.
	PLIB_ETH_AutoDetectPadGet	Gets the current EMAC Auto-Pad setting.
	PLIB_ETH_AutoDetectPadSet	Sets the EMAC Auto-Pad option.
	PLIB_ETH_AutoFlowControlDisable	Disables the Ethernet module Automatic Flow Control logic.
	PLIB_ETH_AutoFlowControlEnable	Enables the Ethernet Automatic Flow Control logic.
	PLIB_ETH_AutoFlowControlsEnabled	Gets the Ethernet module Automatic Flow Control status.
	PLIB_ETH_BackPresNoBackoffDisable	Disables EMAC back pressure/no backoff.
	PLIB_ETH_BackPresNoBackoffEnable	Enables EMAC back pressure/no back-off.
	PLIB_ETH_BackPresNoBackoffIsEnabled	Gets the EMAC back pressure/no back-off enable status.
	PLIB_ETH_BackToBackIPGGet	Gets the EMAC back-to-back interpacket gap.
	PLIB_ETH_BackToBackIPGSet	Sets the EMAC back-to-back interpacket gap.
	PLIB_ETH_CollisionWindowGet	Gets the EMAC collision window.
	PLIB_ETH_CollisionWindowSet	Sets the EMAC collision window.
	PLIB_ETH_CRCDisable	Disables EMAC CRC.
	PLIB_ETH_CRCEnable	Enables EMAC CRC.
	PLIB_ETH_CRCIsEnabled	Gets the EMAC CRC enable status.
	PLIB_ETH_DataNotValid	Gets the MII management read data not valid status.
	PLIB_ETH_DelayedCRCDisable	Disables EMAC delayed CRC.
	PLIB_ETH_DelayedCRCEnable	Enables EMAC delayed CRC.
	PLIB_ETH_DelayedCRCIsEnabled	Gets the EMAC delayed CRC enable status.
	PLIB_ETH_Disable	Disables the Ethernet module.
	PLIB_ETH_Enable	Enables the Ethernet module.
	PLIB_ETH_EthernetIsBusy	Gets the status value of the Ethernet logic busy.
	PLIB_ETH_ExcessDeferDisable	Disables EMAC excess defer.
	PLIB_ETH_ExcessDeferEnable	Enables EMAC excess defer.
	PLIB_ETH_ExcessDeferIsEnabled	Gets the EMAC excess defer enable status.
	PLIB_ETH_ExistsAlignmentErrorCount	Identifies whether the AlignmentErrorCount feature exists on the Ethernet module.
	PLIB_ETH_ExistsAutoFlowControl	Identifies whether the AutoFlowControl feature exists on the Ethernet module.
	PLIB_ETH_ExistsCollisionCounts	Identifies whether the CollisionCounts feature exists on the Ethernet module.
	PLIB_ETH_ExistsCollisionWindow	Identifies whether the CollisionWindow feature exists on the Ethernet module.
	PLIB_ETH_ExistsEnable	Identifies whether the Enable feature exists on the Ethernet module.
	PLIB_ETH_ExistsEthernetControllerStatus	Identifies whether the EthernetControllerStatus feature exists on the Ethernet module.

	<u>PLIB_ETH_ExistsFCSErrorCount</u>	Identifies whether the FCSErrorCount feature exists on the Ethernet module.
	<u>PLIB_ETH_ExistsFramesTransmittedOK</u>	Identifies whether the FramesTransmittedOK feature exists on the Ethernet module.
	<u>PLIB_ETH_ExistsFrameReceivedOK</u>	Identifies whether the FrameReceivedOK feature exists on the Ethernet module.
	<u>PLIB_ETH_ExistsHashTable</u>	Identifies whether the HashTable feature exists on the Ethernet module.
	<u>PLIB_ETH_ExistsInterPacketGaps</u>	Identifies whether the InterPacketGaps feature exists on the Ethernet module.
	<u>PLIB_ETH_ExistsInterrupt</u>	Identifies whether the Interrupt feature exists on the Ethernet module.
	<u>PLIB_ETH_ExistsMAC_Configuration</u>	Identifies whether the MAC_Configuration feature exists on the Ethernet module.
	<u>PLIB_ETH_ExistsMAC_Resets</u>	Identifies whether the MAC_Resets feature exists on the Ethernet module.
	<u>PLIB_ETH_ExistsMAC_Testing</u>	Identifies whether the MAC_Testing feature exists on the Ethernet module.
	<u>PLIB_ETH_ExistsManualFlowControl</u>	Identifies whether the ManualFlowControl feature exists on the Ethernet module.
	<u>PLIB_ETH_ExistsMaxFrameLength</u>	Identifies whether the MaxFrameLength feature exists on the Ethernet module.
	<u>PLIB_ETH_ExistsMIIM_Config</u>	Identifies whether the MIIM_Config feature exists on the Ethernet module.
	<u>PLIB_ETH_ExistsMIIM_Indicators</u>	Identifies whether the MIIM_Indicators feature exists on the Ethernet module.
	<u>PLIB_ETH_ExistsMIIMAddresses</u>	Identifies whether the MIIMAddresses feature exists on the Ethernet module.
	<u>PLIB_ETH_ExistsMIIMReadWrite</u>	Identifies whether the MIIMReadWrite feature exists on the Ethernet module.
	<u>PLIB_ETH_ExistsMIIMScanMode</u>	Identifies whether the MIIMScanMode feature exists on the Ethernet module.
	<u>PLIB_ETH_ExistsMIIMWriteReadData</u>	Identifies whether the MIIMWriteReadData feature exists on the Ethernet module.
	<u>PLIB_ETH_ExistsPatternMatch</u>	Identifies whether the PatternMatch feature exists on the Ethernet module.
	<u>PLIB_ETH_ExistsPauseTimer</u>	Identifies whether the PauseTimer feature exists on the Ethernet module.
	<u>PLIB_ETH_ExistsReceiveBufferSize</u>	Identifies whether the ReceiveBufferSize feature exists on the Ethernet module.
	<u>PLIB_ETH_ExistsReceiveFilters</u>	Identifies whether the ReceiveFilters feature exists on the Ethernet module.
	<u>PLIB_ETH_ExistsReceiveOverflowCount</u>	Identifies whether the ReceiveOverflowCount feature exists on the Ethernet module.
	<u>PLIB_ETH_ExistsReceiveWmarks</u>	Identifies whether the ReceiveWmarks feature exists on the Ethernet module.
	<u>PLIB_ETH_ExistsRetransmissionMaximum</u>	Identifies whether the RetransmissionMaximum feature exists on the Ethernet module.
	<u>PLIB_ETH_ExistsRMII_Support</u>	Identifies whether the RMII_Support feature exists on the Ethernet module.
	<u>PLIB_ETH_ExistsRxBufferCountDecrement</u>	Identifies whether the RxBufferCountDecrement feature exists on the Ethernet module.

	PLIB_ETH_ExistsRxEnable	Identifies whether the ReceiveEnable feature exists on the Ethernet module.
	PLIB_ETH_ExistsRxPacketDescriptorAddress	Identifies whether the RxPacketDescriptorAddress feature exists on the Ethernet module.
	PLIB_ETH_ExistsStationAddress	Identifies whether the StationAddress feature exists on the Ethernet module.
	PLIB_ETH_ExistsStopInIdle	Identifies whether the StopInIdle feature exists on the Ethernet module.
	PLIB_ETH_ExistsTransmitRTS	Identifies whether the TransmitRTS feature exists on the Ethernet module.
	PLIB_ETH_ExistsTxPacketDescriptorAddress	Identifies whether the TxPacketDescriptorAddress feature exists on the Ethernet module.
	PLIB_ETH_FCSErrorCountClear	Sets the value of the Ethernet frame check sequence error to zero.
	PLIB_ETH_FCSErrorCountGet	Gets the count of the frame check sequence error.
	PLIB_ETH_FrameLengthCheckDisable	Disables the EMAC frame length check.
	PLIB_ETH_FrameLengthCheckEnable	Enables the EMAC frame length check.
	PLIB_ETH_FrameLengthCheckIsEnabled	Gets the EMAC frame length check status.
	PLIB_ETH_FramesRxdOkCountClear	Sets the value of the Ethernet received frames 'OK' count to zero.
	PLIB_ETH_FramesRxdOkCountGet	Gets the count of the frames frames received successfully.
	PLIB_ETH_FramesTxdOkCountClear	Sets the count of Ethernet Control frames transmitted to zero.
	PLIB_ETH_FramesTxdOkCountGet	Gets the count of Ethernet Control Frames transmitted successfully.
	PLIB_ETH_FullDuplexDisable	Disables the EMAC full duplex operatio.
	PLIB_ETH_FullDuplexEnable	Enables the EMAC full deuplex operation.
	PLIB_ETH_FullDuplexIsEnabled	Gets the EMAC full duplex enable status.
	PLIB_ETH_HashTableGet	Gets the value of the Hash table.
	PLIB_ETH_HashTableSet	Sets the Ethernet module Hash table with the new value.
	PLIB_ETH_HugeFrameDisable	Disables the EMAC from receiving huge frames.
	PLIB_ETH_HugeFrameEnable	Enables the EMAC to receive huge frames.
	PLIB_ETH_HugeFrameIsEnabled	Gets the EMAC huge frame enable status.
	PLIB_ETH_InterruptClear	Clears the Ethernet module interrupt source status as a group, using a mask.
	PLIB_ETH_InterruptSet	Sets the Ethernet module interrupt source status as a group, using a mask.
	PLIB_ETH_InterruptsGet	Gets the Ethernet module Interrupt Flag register as a group.
	PLIB_ETH_InterruptSourceDisable	Clears the Ethernet module Interrupt Enable register as a group, using a mask.
	PLIB_ETH_InterruptSourceEnable	Sets the Ethernet module Interrupt Enable register in a group, using a mask.
	PLIB_ETH_InterruptSourceIsEnabled	Gets the Ethernet module Interrupt Enable register singularly or as a group.
	PLIB_ETH_InterruptSourcesGet	Returns the entire interrupt enable register.
	PLIB_ETH_InterruptStatusGet	Gets the Ethernet module Interrupt Flag register as a group, using a mask.
	PLIB_ETH_IsEnabled	Gets the Ethernet module enable status.
	PLIB_ETH_LinkHasFailed	Gets the MII management link fail status.
	PLIB_ETH_LongPreambleDisable	Disables EMAC long preamble enforcement.
	PLIB_ETH_LongPreambleEnable	Enables EMAC long preamble enforcement.
	PLIB_ETH_LongPreambleIsEnabled	Gets the EMAC long preamble enforcement enable status.

	PLIB_ETH_LoopbackDisable	Disables the EMAC loopback logic.
	PLIB_ETH_LoopbackEnable	Enables the EMAC loopback logic.
	PLIB_ETH_LoopbackIsEnabled	Gets the EMAC Loopback interface enable status.
	PLIB_ETH_ManualFlowControlDisable	Disable Ethernet module Manual Flow Control logic.
	PLIB_ETH_ManualFlowControlEnable	Enables the Ethernet Manual Flow Control logic.
	PLIB_ETH_ManualFlowControlIsEnabled	Gets the Ethernet module Manual Flow Control enable status.
	PLIB_ETH_MaxFrameLengthGet	Gets the EMAC maximum frame length.
	PLIB_ETH_MaxFrameLengthSet	Sets the EMAC maximum frame length.
	PLIB_ETH_MCSRxResetDisable	Disables the reset EMAC Control Sub-layer/Receive domain logic.
	PLIB_ETH_MCSRxResetEnable	Enables the reset EMAC Control Sub-layer/Receive domain logic.
	PLIB_ETH_MCSRxResetIsEnabled	Gets the EMAC Control Sub-layer/Receive domain logic reset status.
	PLIB_ETH_MCSTxResetDisable	Disables the reset EMAC Control Sub-layer/Transmit domain logic.
	PLIB_ETH_MCSTxResetEnable	Enables the reset of EMAC Control Sub-layer/Transmit domain logic.
	PLIB_ETH_MCSTxResetIsEnabled	Gets the EMAC Control Sub-layer/Transmit domain logic reset status.
	PLIB_ETH_MIIMClockGet	Gets the current EMAC MIIM clock selection.
	PLIB_ETH_MIIMClockSet	Sets the EMAC MIM clock selection.
	PLIB_ETH_MIIMIsBusy	Gets the MII management busy status.
	PLIB_ETH_MIIMIsScanning	Gets the MII Management scanning status.
	PLIB_ETH_MIIMNoPreDisable	Disables EMAC No Preamble (allows preamble).
	PLIB_ETH_MIIMNoPreEnable	Enables EMAC MIIM No Preamble (suppresses preamble).
	PLIB_ETH_MIIMNoPreIsEnabled	Gets the EMAC MIIM No Preamble enable status.
	PLIB_ETH_MIIMReadDataGet	Gets EMAC MIIM management read data after a MII read cycle has completed.
	PLIB_ETH_MIIMReadStart	Initiates an MII management read command.
	PLIB_ETH_MIIMResetDisable	Disables EMAC Reset MII Management.
	PLIB_ETH_MIIMResetEnable	Enables EMAC Reset Media Independent Interface (MII) Management.
	PLIB_ETH_MIIMResetIsEnabled	Gets the EMAC Reset MII Management enable status.
	PLIB_ETH_MIIMScanIncrDisable	Disables the EMAC MIIM Scan Increment.
	PLIB_ETH_MIIMScanIncrEnable	Enables EMAC MIIM Scan Increment.
	PLIB_ETH_MIIMScanIncrIsEnabled	Gets the EMAC MIIM scan increment enable status.
	PLIB_ETH_MIIMScanModeDisable	Disables MIIM scan mode.
	PLIB_ETH_MIIMScanModeEnable	Enables MIIM scan mode.
	PLIB_ETH_MIIMScanModeIsEnabled	Gets the MII management scan enable status.
	PLIB_ETH_MIIMWriteDataSet	Sets the EMAC MIIM write data before initiating an MII write cycle.
	PLIB_ETH_MIIMWriteStart	Initiates an MII management write command.
	PLIB_ETH_MIIRResetDisable	Disables the EMAC Soft reset.
	PLIB_ETH_MIIRResetEnable	Enables the EMAC MIIM Soft reset.
	PLIB_ETH_MIIRResetIsEnabled	Gets EMAC MIIM Soft Reset enable status.
	PLIB_ETH_MultipleCollisionCountClear	Sets the value of the Ethernet multiple collision frame count to zero.
	PLIB_ETH_MultipleCollisionCountGet	Gets the count of the frames transmitted successfully after there was more than one collision.
	PLIB_ETH_NoBackoffDisable	Disables EMAC no back-offs.
	PLIB_ETH_NoBackoffEnable	Enables EMAC no backoff.

	PLIB_ETH_NoBackoffIsEnabled	Gets the EMAC no back-off enable status.
	PLIB_ETH_NonBackToBackIPG1Get	Gets the EMAC non-back-to-back interpacket gap register 1.
	PLIB_ETH_NonBackToBackIPG1Set	Sets the EMAC non-back-to-back interpacket gap register 1.
	PLIB_ETH_NonBackToBackIPG2Get	Gets the EMAC non-back-to-back interpacket gap register 2.
	PLIB_ETH_NonBackToBackIPG2Set	Sets the EMAC non-back-to-back interpacket gap register 2.
	PLIB_ETH_PassAllDisable	Disables the EMAC PassAll.
	PLIB_ETH_PassAllEnable	Enables the EMAC PassAll.
	PLIB_ETH_PassAllIsEnabled	Gets the EMAC PassAll enable status.
	PLIB_ETH_PatternMatchChecksumGet	Gets the value of the pattern match checksum register.
	PLIB_ETH_PatternMatchChecksumSet	Sets the Ethernet module pattern match checksum register with the new value.
	PLIB_ETH_PatternMatchGet	Gets the value of the selected pattern match mask register.
	PLIB_ETH_PatternMatchModeGet	Gets the value of the selected pattern match mask register.
	PLIB_ETH_PatternMatchModeSet	Sets the Ethernet module pattern match mode.
	PLIB_ETH_PatternMatchOffsetGet	Gets the value of the patter match offset register.
	PLIB_ETH_PatternMatchOffsetSet	Sets the Ethernet module patter match offset register with the new value.
	PLIB_ETH_PatternMatchSet	Sets the Ethernet module pattern match mask register with the new value.
	PLIB_ETH_PauseTimerGet	Gets the Pause Timer value used for flow control.
	PLIB_ETH_PauseTimerSet	Sets the Pause Timer value used for flow control.
	PLIB_ETH_PHYAddressGet	Gets the EMAC MIIM management PHY address.
	PLIB_ETH_PHYAddressSet	Sets the EMAC MIIM PHY address.
	PLIB_ETH_PurePreambleDisable	Disables EMAC pure preamble enforcement.
	PLIB_ETH_PurePreambleEnable	Enables EMAC pure preamble enforcement.
	PLIB_ETH_PurePreambleIsEnabled	Gets EMAC pure preamble enforcement enable status.
	PLIB_ETH_ReceiveBufferSizeGet	Gets the Ethernet module receive buffer size.
	PLIB_ETH_ReceiveBufferSizeSet	Sets the Ethernet module receive buffer size.
	PLIB_ETH_ReceiveDisable	Disables the EMAC from receiving frames.
	PLIB_ETH_ReceiveEnable	Enables the EMAC to receive the frames.
	PLIB_ETH_ReceiveFilterDisable	Disables the specified receive filter.
	PLIB_ETH_ReceiveFilterEnable	Enables the specified receive filter.
	PLIB_ETH_ReceiveFilterIsEnable	Disables the specified receive filter.
	PLIB_ETH_ReceiveIsBusy	Gets the the Ethernet receive logic busy status.
	PLIB_ETH_ReceiveIsEnabled	Gets the Ethernet EMAC receive enable status.
	PLIB_ETH_RegisterAddressGet	Gets the EMAC MIIM management register address.
	PLIB_ETH_RegisterAddressSet	Sets EMAC MIIM register address.
	PLIB_ETH_ReTxMaxGet	Gets the EMAC maximum retransmissions.
	PLIB_ETH_ReTxMaxSet	Sets the EMAC maximum retransmissions.
	PLIB_ETH_RMIIResetDisable	Disables EMAC Reset RMII.
	PLIB_ETH_RMIIResetEnable	Enables EMAC Reset RMII.
	PLIB_ETH_RMIIResetIsEnabled	Gets the EMAC Reset RMII enable status.
	PLIB_ETH_RMII SpeedGet	Gets the current EMAC RMII speed.
	PLIB_ETH_RMII SpeedSet	Sets EMAC RMII Speed.
	PLIB_ETH_RxBufferCountDecrement	Causes the Receive Descriptor Buffer Counter to decrement by 1.
	PLIB_ETH_RxDisable	Disables the Ethernet module receive logic.

	PLIB_ETH_RxEmptyWmarkGet	Gets the Ethernet module receive empty watermark.
	PLIB_ETH_RxEmptyWmarkSet	Sets the Ethernet module receive empty water mark.
	PLIB_ETH_RxEnable	Enables the Ethernet receive logic.
	PLIB_ETH_RxFullWmarkGet	Gets the Ethernet module receive full watermark.
	PLIB_ETH_RxFullWmarkSet	Sets the Ethernet module receive full water mark.
	PLIB_ETH_RxFuncResetDisable	Disables the EMAC reset receive function logic.
	PLIB_ETH_RxFuncResetEnable	Enables the EMAC reset receive function logic.
	PLIB_ETH_RxFuncResetIsEnabled	Gets the EMAC reset receive function status.
	PLIB_ETH_RxIsEnabled	Gets the Ethernet module receive enable status.
	PLIB_ETH_RxOverflowCountClear	Sets the value of the Ethernet receive overflow count to zero.
	PLIB_ETH_RxOverflowCountGet	Gets the count of the dropped Ethernet receive frames.
	PLIB_ETH_RxPacketCountGet	Gets the value of the receive packet buffer count.
	PLIB_ETH_RxPacketDescAddrGet	Gets the address of the next receive descriptor.
	PLIB_ETH_RxPacketDescAddrSet	Sets the Ethernet module receive packet descriptor start address.
	PLIB_ETH_RxPauseDisable	Disables the EMAC receive flow control.
	PLIB_ETH_RxPauseEnable	Enables the EMAC receive flow control.
	PLIB_ETH_RxPauseIsEnabled	Gets the EMAC receive flow pause enable status.
	PLIB_ETH_ShortcutQuantaDisable	Disables EMAC shortcut pause quanta.
	PLIB_ETH_ShortcutQuantaEnable	Enables EMAC shortcut pause quanta.
	PLIB_ETH_ShortcutQuantaIsEnabled	Gets EMAC shortcut pause quanta enable status.
	PLIB_ETH_SimResetDisable	Disables the EMAC simulation reset.
	PLIB_ETH_SimResetEnable	Enables the EMAC simulation reset.
	PLIB_ETH_SimResetIsEnabled	Gets the EMAC simulation reset status.
	PLIB_ETH_SingleCollisionCountClear	Sets the value of the Ethernet single collision frame count to zero.
	PLIB_ETH_SingleCollisionCountGet	Gets the count of the frames transmitted successfully on a second attempt.
	PLIB_ETH_StationAddressGet	Gets the selected EMAC station address.
	PLIB_ETH_StationAddressSet	Sets the selected EMAC Station Address.
	PLIB_ETH_StopInIdleDisable	Ethernet module operation will continue when the device enters Idle mode.
	PLIB_ETH_StopInIdleEnable	Ethernet module operation will stop when the device enters Idle mode.
	PLIB_ETH_StopInIdleIsEnabled	Gets the Ethernet module Stop in Idle mode enable status.
	PLIB_ETH_TestBackPressDisable	Disables EMAC Test backpressure.
	PLIB_ETH_TestBackPressEnable	Enables EMAC Test backpressure.
	PLIB_ETH_TestBackPressIsEnabled	Gets the EMAC test backpressure enable status.
	PLIB_ETH_TestPauseDisable	Disables EMAC test pause.
	PLIB_ETH_TestPauseEnable	Enables EMAC test pause.
	PLIB_ETH_TestPauseIsEnabled	Gets the EMAC test pause enable status.
	PLIB_ETH_TransmitIsBusy	Gets the status value of the Ethernet transmit logic busy status
	PLIB_ETH_TxFuncResetDisable	Disables the EMAC Transmit function reset.
	PLIB_ETH_TxFuncResetEnable	Enables the EMAC transmit function reset.
	PLIB_ETH_TxFuncResetIsEnabled	Gets the EMAC Transmit function reset status.
	PLIB_ETH_TxPacketDescAddrGet	Gets the address of the next descriptor to be transmitted.
	PLIB_ETH_TxPacketDescAddrSet	Sets the Ethernet module transmit packet descriptor start address.
	PLIB_ETH_TxPauseDisable	Disables the transmission of Pause frames.

	PLIB_ETH_TxPauseEnable	Enables the the tansmission Pause frames.
	PLIB_ETH_TxPausesIsEnabled	Gets the Ethernet module enable status.
	PLIB_ETH_TxRTSDisable	Aborts an Ethernet module transmission.
	PLIB_ETH_TxRTSEnable	Enables the Ethernet transmit request to send .
	PLIB_ETH_TxRTSIsEnabled	Gets the Ethernet module transmit request to send status.

5.6.9 I2C Peripheral Library

5.6.9.1 Introduction

This library provides a low-level abstraction of the Inter-Integrated Circuit (I²C) module on Microchip microcontrollers.

Description

I²C Peripheral Library
for
Microchip Microcontrollers

This library provides a low-level abstraction of the Inter-Integrated Circuit (I^2C) module on Microchip microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, thus hiding differences from one microcontroller variant to another.

Please refer to the I^2C -Bus Specification (v2.1), available from Philips Semiconductor (see the **Note** below) for complete details on the operation and requirements for the I^2C bus.

Note: Trademarks and Intellectual Property are property of their respective owners. Customers are responsible for obtaining appropriate licensing or rights before using this software.

5.6.9.2 Release Notes

MPLAB Harmony Version: v0.70b **I^2C Peripheral Library Version :** 0.70b **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.6.9.3 SW License Agreement

© 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS." MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO

YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.6.9.4 How the Library Works

How the Library Works

Before enabling the I²C module the caller must initialize basic configuration, clock frequency, and Slave address recognition features (see [Initializing the I2C](#)).

After the module has been enabled, it can begin monitoring the bus as a slave device waiting to be addressed by an external master (see [Operating as a Slave Receiver](#)). A slave device only transfers data on the bus when it has been addressed by a master (see [Operating as a Slave Transmitter](#)). If the module is used to start a transfer, then it is operating as a master. A master addresses a slave and controls the transfer of data by providing the clock (see [Operating as a Master Transmitter](#) and [Operating as a Master Receiver](#)).

Some operations in the I²C library initiate actions on the I²C bus that require time to complete. Also, some events occur asynchronously on the bus. In each of these cases, the module causes either a "master", "slave", or "error" interrupt. [Interrupt State Machine](#) describes the different states that can cause an interrupt and show what causes the transition from one state to another. [Handling Errors](#) describes the various errors that can occur and how to deal with them.

Data transfers on the I²C bus must follow specific formats defined by the I²C bus protocol. (Refer to [Forming Transfers](#) for details)

Note: The I²C peripheral library does not directly respond to interrupts. The client software (usually a driver, middleware layer, or application) should implement the Interrupt Service Routine (ISR) and call the I²C library's interface routines from that ISR to manage the state of the I²C module.

5.6.9.4.1 Initializing the I2C

To initialize the I²C module, perform the following sequence:

1. Select the desired general configuration options using General Initialization Functions to select the desired operation of the following features:
 - Slave Clock Stretching
 - General Call Address Recognition
 - System Management Bus (SMBus) Support
 - High Frequency Operation
 - Reserved Address Protection
 - Stop-in-Idle Operation
2. Program the Baud Rate Generator to set the desired baud rate using the [PLIB_I2C_BaudRateSet](#) function.
3. If operating in slave mode, set the desired slave address using the [PLIB_I2C_SlaveAddress7BitSet](#) function (for 7-bit mode operation) or [PLIB_I2C_SlaveAddress10BitSet](#) function (for 10-bit mode operation).
4. If running in an interrupt-driven environment, clear any pending interrupts and enable the appropriate (master, slave, and error) I²C interrupts. Refer to the **"Interrupt Controller"** section in the related family reference manual section for information.

5. Enable the module for operation using the [PLIB_I2C_Enable](#) function.

Example

```
#define MY_I2C_ID I2C_ID_1
uint32_t actualClock;

// Configure General I2C Options
PLIB_I2C_SlaveClockStretchingEnable(MY_I2C_ID);
PLIB_I2C_GeneralCallEnable(MY_I2C_ID);
PLIB_I2C_SMBDisable(MY_I2C_ID);
PLIB_I2C_HighFrequencyDisable(MY_I2C_ID);
PLIB_I2C_ReservedAddressProtectEnable(MY_I2C_ID);
PLIB_I2C_StopInIdleEnable(MY_I2C_ID);

// Set Desired baud rate
PLIB_I2C_BaudRateSet ( MY_I2C_ID, MY_PERIPHEAL_CLOCK_FREQ, MY_I2C_BAUD_RATE);

// Set the appropriate slave address (slave only)
PLIB_I2C_SlaveAddress7BitSet(MY_I2C_ID, MY_SLAVE_ADDRESS);

// Optional: Clear and enable interrupts before enabling the I2C module.

// Enable the module
PLIB_I2C_Enable(MY_I2C_ID);
```

Note: Refer to the "Interrupt Controller" section in the related family reference manual section for details on how to clear and enable the I²C module interrupts.

The previous example uses the following constants:

Symbol	Description
I2C_ID_1	Defined as the selected I ² C module value from the I2C Module enumeration . Example: #define MY_I2C_ID I2C_ID_1
MY_I2C_PERIPHERAL_CLOCK	Defined as the peripheral clock frequency (in Hz) of the I ² C module. Example: #define MY_I2C_PERIPHERAL_CLOCK 80000000
MY_I2C_BAUD_RATE	Defined as desired I ² C baud rate. Example: #define MY_I2C_BAUD_RATE 100000
MY_SLAVE_ADDRESS	Defined as the desired 7-bit I ² C slave address. Example #define 0x1A // Slave address 0011010 in binary Note: If 0 is passed in as the mask value, the I ² C module will only respond to single slave address passed in the second parameter.

5.6.9.4.2 Operating as a Slave Receiver

Before enabling the module, the module's "local" slave address and mask should be programmed using the [PLIB_I2C_SlaveAddress7BitSet](#) function or the [PLIB_I2C_SlaveAddress10BitSet](#) function, depending on the desired address width. If slave address masking is supported on the chosen processor the "don't care bits" mask can be set using the [PLIB_I2C_SlaveMask7BitSet](#) function or the [PLIB_I2C_SlaveMask10BitSet](#) function, also depending on the desired address width. Once the I²C module has been enabled, it will begin waiting for an I²C master to address it. When the programmed local slave address is recognized (ignoring any bits in the programmed mask value, if supported), the module will ACK the address and notify software that it has received an address byte. If the R/W bit of the address is 0, the module enters receive mode automatically. As additional bytes are received, the module will automatically ACK them if the previous byte has been read from the RX buffer before the new byte has been completely received and notify software of the newly available byte. Both address and data bytes received must be read from the RX buffer by software.

Preconditions

1. The module must have had it's basic options and clock frequency initialized and have been enabled (see [Initializing the I2C](#)).
2. An external master must have started a transfer.
3. The address address of the transfer must have matched with the address (ignoring any bits in the mask) programmed into the module by software.

Process

Software must follow this sequence:

1. Ensure that a byte has been received either by polling the [PLIB_I2C_ReceivedByteIsAvailable](#) function or by waiting for a slave interrupt (at which time, this function should still be checked).
2. Identify if the byte is a data byte or an address byte using the [PLIB_I2C_SlaveAddressIsDetected](#) function.
3. If the byte is an address byte, software must identify if it is starting a read or write operation using the [PLIB_I2C_SlaveReadIsRequested](#) function.
4. Software must read the byte from the RX buffer using the [PLIB_I2C_ReceivedByteGet](#) function, even if it was an address byte.
5. If clock stretching was enabled during initialization, then software must call the [PLIB_I2C_SlaveClockRelease](#) function to release the SCL line.

Example

```
#define MY_I2C_ID  I2C_ID_1
uint8_t data;

if ( PLIB_I2C_ReceivedByteIsAvailable(MY_I2C_ID) )
{
    // Check to see if the byte is data or an address
    if (PLIB_I2C_SlaveAddressWasDetected(MY_I2C_ID))
    {
        if ( PLIB_I2C_SlaveReadWasRequested(MY_I2C_ID) )
        {
            // Beginning a slave receive sequence
        }
        else
        {
            // Beginning a slave transmit sequence
        }
    }
    else
    {
        // Data Byte Received
    }
    // Read the data or address from the RX buffer
    data = PLIB_I2C_ReceivedByteGet(MY_I2C_ID);

    // Free the SCL line (only if clock stretching was enabled)
    PLIB_I2C_SlaveClockRelease(MY_I2C_ID);
}
```

The above example uses the following constants and variables:

Symbol	Description
MY_I2C_ID	Defined as the selected I ² C module value from the I2C Module enumeration . Example: #define MY_I2C_ID I2C_ID_1
data	This is the variable used to hold the byte received.

5.6.9.4.3 Operating as a Slave Transmitter

Once an an external master has addressed the the I²C module (see [Operating as a Slave Receiver](#)) with the read-write bit set

(as determined by calling the [PLIB_I2C_SlaveReadIsRequested](#) function), software can begin transmitting data to the master.

Pre-Conditions

1. The module must have had it's basic options and clock frequency initialized and have been enabled(see [Initializing the I2C](#))
2. An external master must have started a transfer.
3. The address address of the transfer must have matched with the address slave programmed into the I²C module (see [Managing Slave Addresses](#)).
4. A slave read must have been requested (as described above).

Note: When the address has been received and matched the programmed local slave address, a slave interrupt will occur if it has been enabled.

Transmitting a Byte

When operating as a slave transmitter on the I²C bus, the software must use the following sequence to transmit data bytes.

1. Ensure that the TX buffer is currently ready to [accept](#) a byte to be transmitted using the [PLIB_I2C_TransmitterIsReady](#) function.
2. Write the byte to be transmitted to the TX buffer using the [PLIB_I2C_TransmitterByteSend](#) function.
3. If clock stretching was enabled (using the [PLIB_I2C_SlaveClockStretchingEnable](#) function) and the previous byte was ACKed, the [PLIB_I2C_SlaveClockRelease](#) function must be called to release the SCL line (it is safe to call this even if the previous byte was NAKed.)

Example

```
#define MY_I2C_ID  I2C_ID_1
uint8_t          data;

// Assign the desired byte value into the "data" variable

if (PLIB_I2C_TransmitterIsReady(MY_I2C_ID))
{
    // Write the byte to the TX buffer
    PLIB_I2C_TransmitterByteSend(MY_I2C_ID, data);

    // Free the SCL line (only if clock stretching was enabled)
    PLIB_I2C_SlaveClockRelease(MY_I2C_ID);
}
```

Checking Acknowledgement

After a byte has been transmitted, the module latches the ACK/NAK response from the master so that software may use the following sequence to verify it and causes another slave interrupt (if it has been enabled).

1. Ensure that the byte has been completely transmitted using the [PLIB_I2C_TransmitterByteHasCompleted](#) function (and/or by responding to the slave interrupt).
2. Determine if the byte was ACKed or NAKed using the [PLIB_I2C_TransmitterByteWasAcknowledged](#) function.

Example

```
#define MY_I2C_ID  I2C_ID_1

if (PLIB_I2C_TransmitterByteHasCompleted(MY_I2C_ID))
{
    if (PLIB_I2C_TransmitterByteWasAcknowledged(MY_I2C_ID))
    {
        // Transmission successful
    }
    else
    {
        // Transmission was not successful
    }
}
```

```
}

```

The above examples use the following constants and variables:

Symbol	Description
MY_I2C_ID	Defined as the selected I ² C module value from the I2C_Module_enumeration . Example: #define MY_I2C_ID I2C_ID_1
data	This is the buffer containing byte of data to transmit.

5.6.9.4.4 Operating as a Master Transmitter

Whenever the I²C module initiates a transfer on the bus, it is acting as master. A transfer can be initiated any time the bus is idle. If two masters attempt to initiate transfers at nearly the same time, one of them will lose arbitration at some point during the transfer and must retry the transfer later when the bus becomes idle. The winner of arbitration can continue, without any data loss.

An I²C bus transfer always begins with a Start condition, followed by one or two properly formatted bytes containing the 7-bit or 10-bit target slave address (address of the slave device that is the target of the transfer). The direction of the remainder of transfers (after the address has been sent) is indicated by bit 0 of the address (0 = write/transmitting, 1 = read/receiving, from the point of view of the master). After that, any amount of data may be transferred and a repeated Start condition (followed by another properly formatted address) can occur to change the direction of the transfer or even the target slave device. See [Forming Transfers](#) for details of the possible transfer formats. When the master is finished, an I²C bus transfer always ends with a Stop condition. These steps are summarized below.

Summary of Steps

1. Send a Start condition.
2. Send a 7-bit or 10-bit address (one or two bytes with a write transfer indication in bit 0).
3. Send data bytes.
4. Send a Stop condition.

Each of these steps making up a transfer will take some time to complete. The completion of each step will cause an I²C master interrupt. The software must always keep track of which state it was in, check the I²C status, and respond to the interrupt by performing the next appropriate step.

Note 1: Arbitration loss can occur after each step has completed. Software should check for arbitration loss by calling the [PLIB_I2C_ArbitrationLossHasOccurred](#) function. If arbitration loss occurs, it must be cleared by calling the [PLIB_I2C_ArbitrationLossClear](#) function.

Note 2: After any step completes, but before sending the Stop condition (see step 4), the master may [send](#) a repeated Start condition and start over at step 2 to change slave targets and/or transfer direction.

Sending a Start Condition

To start a master transfer, the software must do the following:

Preconditions

The module must have had its basic options and clock frequency initialized and have been enabled (see [Initializing the I2C](#)).

Process

1. Verify that the bus is idle using the [PLIB_I2C_BusIsIdle](#) function.
2. Send the start signal using the [PLIB_I2C_MasterStart](#) function.
3. Check for arbitration loss after the start condition has completed using the [PLIB_I2C_ArbitrationLossHasOccurred](#) function.

Example: Sending a Start Condition

```
#define MY_I2C_ID  I2C_ID_1

if (PLIB_I2C_BusIsIdle(MY_I2C_ID))
{
    PLIB_I2C_MasterStart(MY_I2C_ID);
}
```

The Start condition must be allowed to complete before any additional steps can be taken. The only way to determine this is to wait for a master interrupt to occur after the Start condition has been initiated. Even if the bus is verified to be idle before sending the start condition, a bus collision can still occur while the Start condition is being transmitted. To verify that arbitration has not been lost during transmission of the Start condition, the software should check the [PLIB_I2C_ArbitrationLossHasOccurred](#) function after the Start condition has completed.

Example: Checking for Arbitration Loss

```
#define MY_I2C_ID  I2C_ID_1

if (PLIB_I2C_ArbitrationLossHasOccurred(MY_I2C_ID))
{
    // Abort transfer, retry later

    PLIB_I2C_ArbitrationLossClear(MY_I2C_ID);
}
```

Sending a 7-bit Address

To [send](#) a 7-bit address, the software must do the following:

Preconditions

The Start condition must have been sent and completed as previously described.

Process

1. Ensure that the TX buffer is currently ready to [accept](#) a byte to be transmitted using the [PLIB_I2C_TransmitterIsReady](#) function.
2. Format the address byte correctly with the 7-bit address and the read/write bit appropriately set (for a read transfer) or cleared (for a write transfer). This can be done easily using the `PLIB_I2C_ADDRESS_7_BIT_FORMAT` macro and the `I2C_READ` or `I2C_WRITE` constants.
3. Write the address byte to the TX buffer using the [PLIB_I2C_TransmitterByteSend](#) function (the address byte can be easily accessed using the `PLIB_I2C_ADDRESS_7_BIT_BYTE_ACCESS` macro)

Note: A master interrupt will occur once the address byte has been transmitted and ACKed or NAKed by the targeted slave device. (If the slave device doesn't answer, an implicit NAK will occur.)

4. Once the address byte has been ACKed or NAKed by the slave target, software must verify the result and respond appropriately. The Acknowledgement and Arbitration process is described in a subsequent section, just before the description of how to [send](#) a Stop condition.)

Example: Sending a 7-bit Address

```
#define MY_I2C_ID  I2C_ID_1
#define SLAVE_TARGET_7BIT_ADDRESS 23
I2C_7_BIT_ADDRESS slaveTargetAddress7Bit;

// Format the 7-bit address byte with the read or write indication in bit 0
I2C_ADDRESS_7_BIT_FORMAT(slaveTargetAddress7Bit, SLAVE_TARGET_7BIT_ADDRESS,
    I2C_WRITE);

// Send the address byte
if (PLIB_I2C_TransmitterIsReady(MY_I2C_ID))
{
    PLIB_I2C_TransmitterByteSend(MY_I2C_ID,
```

```
I2C_ADDRESS_7_BIT_BYTE_ACCESS(slaveTargetAddress7Bit));
}
```

Note: Bits 7-1 contain the 7-bit target slave address. Bit 0 indicates read or write direction for the remainder of the transfer.

Sending a 10-bit Target Slave Address

To **send** a 10-bit address, the software must do the following:

Preconditions

The Start condition must have been sent and completed as previously described.

Process

1. Format the two address bytes correctly with the 10-bit address and the read/write bit appropriately set (for a read transfer) or cleared (for a write transfer). This can be done using the `I2C_ADDRESS_10_BIT_FORMAT` macro and the `I2C_READ` or `I2C_WRITE` constants.
2. Ensure that the TX buffer is currently ready to **accept** a byte to be transmitted using the `PLIB_I2C_TransmitterIsReady` function.
3. Write the first address byte to the TX buffer using the `PLIB_I2C_TransmitterByteSend` function (the first address byte can be easily accessed using the `PLIB_I2C_ADDRESS_10_BIT_1ST_BYTE_ACCESS` macro)

Note: After the first byte has been sent and ACKed or NAKed by the slave, a master interrupt will occur (or you can poll the `PLIB_I2C_TransmitterByteHasCompleted` function).

4. Ensure that the first address byte was ACKed by the slave target (to do this, follow the Acknowledgement process described further below)
5. Write the second address byte to the TX buffer using the `PLIB_I2C_TransmitterIsReady` function and the `PLIB_I2C_TransmitterByteSend` function (the second address byte can be easily accessed using the `PLIB_I2C_ADDRESS_10_BIT_2ND_BYTE_ACCESS` macro).

Note: After the second byte has been sent and ACKed or NAKed by the slave, a master interrupt will occur (or you can poll the `PLIB_I2C_TransmitterByteHasCompleted` function).

6. Ensure that the second address byte was ACKed by the slave target (to do this, follow the process in the Acknowledgement and Arbitration, which is described later in this section).

Example: Formatting the 10-bit Address in Two Bytes

```
#define MY_I2C_ID I2C_ID_1
#define SLAVE_TARGET_10BIT_ADDRESS 0x23

I2C_10_BIT_ADDRESS slaveAddress10Bit;

I2C_ADDRESS_10_BIT_FORMAT(slaveAddress10Bit, SLAVE_TARGET_10BIT_ADDRESS, I2C_WRITE);
```

Note: The `slaveAddress10Bit` variable is used in the following two examples.

Example: Sending the First Byte of a 10-bit Address

```
#define MY_I2C_ID I2C_ID_1

if (PLIB_I2C_TransmitterIsReady(MY_I2C_ID))
{
    PLIB_I2C_TransmitterByteSend(MY_I2C_ID,
    I2C_ADDRESS_10_BIT_1ST_BYTE_ACCESS(slaveAddress10Bit));
}
```

Wait for transmission to complete and check for acknowledgement and/or arbitration loss.

Example: Sending the Second Byte of a 10-bit Address

```
#define MY_I2C_ID I2C_ID_1

if (PLIB_I2C_TransmitterIsReady(MY_I2C_ID))
```

```
{
    PLIB_I2C_TransmitterByteSend(MY_I2C_ID,
    I2C_ADDRESS_10_BIT_2ND_BYTE_ACCESS(slaveAddress10Bit));
}
```

Wait for transmission to complete and check for acknowledgement and/or arbitration loss.

Sending a Data Byte

The following sequence can be used to [send](#) a data byte and repeated to [send](#) an arbitrary number of data bytes.

Preconditions

- The Start condition must have been sent and completed as previously described
- The target slave address has been fully transmitted (with the write indication in bit 0) and ACKed by the targeted slave device

Process

1. Ensure that the TX buffer is currently ready to [accept](#) a byte to be transmitted using the [PLIB_I2C_TransmitterIsReady Function](#).
2. Write the byte to be transmitted to the TX buffer using the [PLIB_I2C_TransmitterByteSend Function](#).

Note: After the byte has been sent and ACKed or NAKed by the slave, a master interrupt will occur (or poll the [PLIB_I2C_TransmitterByteHasCompleted](#) function).

3. Check for arbitration loss or an ACK or NAK from the slave as described in the next section, Acknowledgement and Arbitration.

Example

```
#define MY_I2C_ID I2C_ID_1
uint8_t          data;

// Assign the data value into the "data" variable

if (PLIB_I2C_TransmitterIsReady(MY_I2C_ID))
{
    PLIB_I2C_TransmitterByteSend(MY_I2C_ID, data);
}
```

Wait for transmission to complete and check for acknowledgement and/or arbitration loss.

Acknowledgement and Arbitration

After sending a data or address byte (as described above), the master transmitter must check to see if arbitration was lost and if the byte was ACK'd or NAK'd. If the byte was ACK'd, the slave receiver is ready to receive more bytes. If the byte was NAKed, the slave receiver cannot [accept](#) any more bytes at this time.

Preconditions

- The start condition must have been sent and completed as previously described
- A byte (address or data) must have been transmitted, using one of the the previous processes

Process

1. Ensure that the byte has been completely transmitted using the [PLIB_I2C_TransmitterByteHasCompleted](#) function (and/or by waiting for the master interrupt)
2. Determine if arbitration loss has occurred using the [PLIB_I2C_ArbitrationLossHasOccurred](#) function.
3. Determine if the byte was ACKed or NAKed using the [PLIB_I2C_TransmitterByteWasAcknowledged](#) function.

Example

```
#define MY_I2C_ID I2C_ID_1

if (PLIB_I2C_TransmitterByteHasCompleted(MY_I2C_ID))
```

```

{
    if (PLIB_I2C_ArbitrationLossHasOccurred(MY_I2C_ID))
    {
        // Handle arbitration loss

        PLIB_I2C_ArbitrationLossClear(MY_I2C_ID);
    }
    else
    {
        if (PLIB_I2C_TransmitterByteWasAcknowledged(MY_I2C_ID))
        {
            // Transmission successful
        }
        else
        {
            // Transmission was not successful
        }
    }
}

```

To handle arbitration loss, the master transmitter must stop the transfer process and retry the entire transfer again at a later time when the bus is not busy.

Sending a Repeated Start Condition

If the master wants to change slave targets or transfer directions, it can [send](#) a repeated Start condition followed by a new address at any time after the previous target slave address has been acknowledged (and before the Stop condition has been sent).

Preconditions

- The Start condition must have been sent and completed as previously described
- A target slave address must have been transmitted and ACKed
- Zero or more data bytes may also have been sent and ACKed

Process

Send the repeated Start condition using the [PLIB_I2C_MasterStartRepeat](#) function.

Example

```
#define MY_I2C_ID I2C_ID_1
```

```
PLIB_I2C_MasterStartRepeat(MY_I2C_ID);
```

The Start condition must be allowed to complete before any additional steps can be taken. The only way to determine this is to wait for a master interrupt to occur after the Start condition has been initiated.

The repeated Start must be followed by another target slave address (either 7-bit or 10-bit, as appropriate).

Sending a Stop Condition

When the master transmitter has finished sending data, it must end the transfer with a stop condition.

Preconditions

- The Start condition must have been sent and completed as previously described
- A target slave address must have been transmitted and ACKed
- Zero or more data bytes may also have been sent and ACKed

Note: At least one address byte must be transmitted between the Start and Stop conditions. Following a Start condition immediately with a Stop condition is a protocol error and can cause some slave devices to lock up and stop responding to the bus.

Process

Send a stop condition using the [PLIB_I2C_MasterStop](#) function.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_MasterStop(MY_I2C_ID);
```

The Stop condition must be allowed to complete before any additional steps can be taken. The only way to determine this is to wait for a master interrupt to occur after the Stop condition has been initiated.

After a Stop condition, the bus should be idle unless a master immediately starts a new transfer. Strictly speaking, a bus collision can still occur while the Stop condition is being transmitted. Although the transfer is already completed when the Stop condition has been sent, software does not have to abort the transfer; however, it should still check for and clear the arbitration loss condition if it occurs.

Example: Checking for Arbitration Loss

```
#define MY_I2C_ID I2C_ID_1

if (PLIB_I2C_ArbitrationLossHasOccurred(MY_I2C_ID))
{
    PLIB_I2C_ArbitrationLossClear(MY_I2C_ID);
}
```

The previous examples use the following constants and variables:

Symbol	Description
MY_I2C_ID	Defined as the selected I ² C module value from the I2C Module enumeration . Example: <code>#define MY_I2C_ID I2C_ID_1</code>
data	This is the buffer containing byte of data to transmit.
slaveTargetAddress7Bit	This variable is used to demonstrate how to properly format and access a 7-bit target slave address
SLAVE_TARGET_7BIT_ADDRESS	This constant is used as a placeholder for the actual 7-bit target slave address that must be defined by the client code.
slaveAddress10Bit	This variable is used to demonstrate how to properly format and access a 10-bit slave address.
SLAVE_TARGET_10BIT_ADDRESS	This constant is used as a placeholder for the actual 10-bit slave address that must be defined by the client code.

5.6.9.4.5 Operating as a Master Receiver

Any time the I²C module initiates a transfer on the bus, it is acting as a master. A transfer can be initiated any time the bus is idle. If two masters attempt to initiate transfers at nearly the same time, one of them will lose arbitration and must retry the transfer later when the bus becomes idle. The winner of arbitration can continue, without any data loss.

An I²C bus transfer always begins with a Start condition, followed by a 7-bit or 10-bit (1-byte or 2-byte) target slave address. Therefore, every master transfer starts off transmitting at least one byte. The direction of transfer of subsequent bytes (after the first byte has been sent) is indicated by bit 0 of the first address byte (0 = write/transmitting, 1 = read/receiving, from the point of view of the master). If 10-bit addressing is used or additional data (such as an internal address) is to be transmitted after the first address byte, the first address byte must indicate a write transfer. To change the direction after transmitting more than just a single address byte, a repeated Start condition (followed by another single address byte) must be sent (see [Forming Transfers](#) for details of the possible transfer formats). When the master is finished, an I²C bus transfer always ends with a Stop condition. This results in two basic formats for receiving data as a master, as summarized below.

Summary of Steps: Read Only

1. Send a Start condition.
2. Send a 7-bit address with a read transfer indication in bit 0.
3. Receive data bytes.
4. Send a Stop condition.

Summary of Steps: Combined Read-Write

1. Send a Start condition.
2. Send a 7-bit address (or the first byte of a 10-bit address) with a write transfer indication in bit 0.
3. Send the second byte of a 10-bit address (and/or any additional data to be transmitted).
4. Send a repeated Start condition.
5. Resend the first byte of the 10-bit address (or a 7-bit address) with a read indication in bit 0.
6. Receive data bytes.
7. Send a Stop condition.

Each of these steps making up a transfer will take some time to complete. The completion of each step will cause an I²C master interrupt. The software must always keep track of which state it was in and respond to the interrupt by performing the next appropriate step.

Sending a Start Condition

To start a master transfer, the software must do the following:

Preconditions

The module must have had its basic options and clock frequency initialized and have been enabled (see Initializing the I2C).

Process

1. Verify that the bus is idle using the [PLIB_I2C_BusIsIdle](#) function.
2. Send the start signal using the [PLIB_I2C_MasterStart](#) function.

Example

```
#define MY_I2C_ID  I2C_ID_1
if (PLIB_I2C_BusIsIdle(MY_I2C_ID))
{
    PLIB_I2C_MasterStart(MY_I2C_ID);
}
```

The Start condition must be allowed to complete before any additional steps can be taken. The only way to determine this is to wait for a master interrupt to occur after the Start condition has been initiated. Even if the bus is verified to be idle before sending the Start condition, a bus collision can still occur while the Start condition is being transmitted. To verify that arbitration has not been lost during transmission of the Start condition, the software should check the [PLIB_I2C_ArbitrationLossHasOccurred](#) function after the Start condition has completed.

Example: Checking for Arbitration Loss

```
#define MY_I2C_ID  I2C_ID_1
if (PLIB_I2C_ArbitrationLossHasOccurred(MY_I2C_ID))
{
    // Abort transfer, retry later
    PLIB_I2C_ArbitrationLossClear(MY_I2C_ID);
}
```

Sending a 7-bit Address

To **send** a 7-bit address (or the first byte of a 10-bit address), the software must do the following:

Preconditions

The Start condition must have been sent and completed as previously described.

Process

1. Ensure that the TX buffer is currently ready to **accept** a byte to be transmitted using the [PLIB_I2C_TransmitterIsReady](#) function.
2. Format the address byte correctly with the 7-bit address and the read/write bit appropriately set (for a read transfer) or cleared (for a write transfer). This can be done easily using the `PLIB_I2C_ADDRESS_7_BIT_FORMAT` macro. and the `I2C_READ` or `I2C_WRITE` constants.
3. Write the address byte to the TX buffer using the [PLIB_I2C_TransmitterByteSend](#) function (the address byte can be easily accessed using the `I2C_ADDRESS_7_BIT_BYTE_ACCESS` macro).

Note: A master interrupt will occur once the address byte has been transmitted and ACKed or NAKed by the targeted slave device (or if arbitration was lost). If the slave device does not answer, an implicit NAK will occur.

4. Once the address byte has been ACKed or NAKed by the slave target (or if arbitration was lost), software must verify the result and respond appropriately. The Acknowledgement and Arbitration process is described in a subsequent section, just before the description of how to **send** a Stop condition.)

Example: Sending a 7-bit Address

```
#define MY_I2C_ID    I2C_ID_1
I2C_7_BIT_ADDRESS  slaveTargetAddress7Bit;

// Format the 7-bit address byte with the read or write indication in bit 0
I2C_ADDRESS_7_BIT_FORMAT(slaveTargetAddress7Bit, SLAVE_TARGET_7BIT_ADDRESS, I2C_WRITE);

// Send the address byte
if (PLIB_I2C_TransmitterIsReady(MY_I2C_ID))
{
    PLIB_I2C_TransmitterByteSend(MY_I2C_ID,
    I2C_ADDRESS_7_BIT_BYTE_ACCESS(slaveTargetAddress7Bit));
}
```

Note: Bits 7-1 contain the 7-bit target slave address. Bit 0 indicates read or write direction for the remainder of the transfer.

Sending a 10-bit Target Slave Address

To **send** a 10-bit address, the software must do the following:

Preconditions

The Start condition must have been sent and completed as previously described.

Process

1. Format the two address bytes correctly with the 10-bit address and the read/write bit cleared, indicating a write transfer. This can be done easily using the `PLIB_I2C_ADDRESS_10_BIT_FORMAT` macro and the `I2C_WRITE` constant.
2. Ensure that the TX buffer is currently ready to **accept** a byte to be transmitted using the [PLIB_I2C_TransmitterIsReady](#) function.
3. Write the first address byte to the TX buffer using the [PLIB_I2C_TransmitterByteSend](#) function (the first address byte can be easily accessed using the `I2C_ADDRESS_10_BIT_1ST_BYTE_ACCESS` Macro)

Note: After the first byte has been sent and ACKed or NAKed by the slave, a master interrupt will occur (or poll the [PLIB_I2C_TransmitterByteHasCompleted](#) function).

4. Ensure that the first address byte was ACKed by the slave target and check for arbitration loss. To do this, use the Acknowledgement and Arbitration process, which described in the next section.
5. Write the second address byte to the TX buffer using the [PLIB_I2C_TransmitterIsReady](#) function and the [PLIB_I2C_TransmitterByteSend](#) function (the second address byte can be easily accessed using the `I2C_ADDRESS_10_BIT_2ND_BYTE_ACCESS` macro).

Note: After the second byte has been sent and ACKed or NAKed by the slave, a master interrupt will occur (or you can poll the [PLIB_I2C_TransmitterByteHasCompleted](#) function).

6. Ensure that the second address byte was ACKed by the slave target and that arbitration was not lost. To do this, use the Acknowledgement and Arbitration process, which described in the next section.

Example: Formatting the 10-bit Address in Two Bytes

```
#define MY_I2C_ID I2C_ID_1
#define SLAVE_TARGET_10BIT_ADDRESS 0x23

I2C_10_BIT_ADDRESS slaveAddress10Bit;
I2C_ADDRESS_10_BIT_FORMAT(slaveAddress10Bit, SLAVE_TARGET_10BIT_ADDRESS, I2C_WRITE);
```

Note: The slaveAddress10Bit variable is used in the following two examples.

Example: Sending the First Byte of a 10-bit Address

```
#define MY_I2C_ID I2C_ID_1
if (PLIB_I2C_TransmitterIsReady(MY_I2C_ID))
{
    PLIB_I2C_TransmitterByteSend(MY_I2C_ID,
    I2C_ADDRESS_10_BIT_1ST_BYTE_ACCESS(slaveAddress10Bit));
}
```

Wait for transmission to complete and check for acknowledgement and/or arbitration loss.

Example: Sending the Second Byte of a 10-bit Address

```
#define MY_I2C_ID I2C_ID_1

if (PLIB_I2C_TransmitterIsReady(MY_I2C_ID))
{
    PLIB_I2C_TransmitterByteSend(MY_I2C_ID,
    I2C_ADDRESS_10_BIT_2ND_BYTE_ACCESS(slaveAddress10Bit));
}
```

Wait for transmission to complete and check for acknowledgement and/or arbitration loss.

Acknowledgement and Arbitration

After sending a data or address byte (as described above), the master transmitter must check to see if arbitration was lost and if the byte was ACKed or NAKed. If the byte was ACKed, the slave receiver is ready to receive more bytes. If the byte was NAKed, the slave receiver cannot [accept](#) any more bytes at this time.

Preconditions

- The Start condition must have been sent and completed as previously described
- A byte (address or data) must have been transmitted, using one of the the previous processes

Process

1. Ensure that the byte has been completely transmitted using the [PLIB_I2C_TransmitterByteHasCompleted](#) function (and/or by waiting for the master interrupt).
2. Determine if arbitration loss has occurred using the [PLIB_I2C_ArbitrationLossHasOccurred](#) function.
3. Determine if the byte was ACKed or NAKed using the [PLIB_I2C_TransmitterByteWasAcknowledged](#) function.

```
#define MY_I2C_ID I2C_ID_1
if (PLIB_I2C_TransmitterByteHasCompleted(MY_I2C_ID))
{
    if (PLIB_I2C_ArbitrationLossHasOccurred(MY_I2C_ID))
    {
        // Handle arbitration loss
        PLIB_I2C_ArbitrationLossClear(MY_I2C_ID);
    }
    else
```

```

    {
        if (PLIB_I2C_TransmitterByteWasAcknowledged(MY_I2C_ID))
        {
            // Transmission successful
        }
        else
        {
            // Transmission was not successful
        }
    }
}

```

To handle arbitration loss, the master must stop the transfer process and retry the entire transfer again at a later time when the bus is not busy.

Sending a Repeated Start Condition

If the master wants to change slave targets or transfer directions, it must **send** a repeated Start condition followed by a new address at any time after the previous target slave address has been acknowledged (and before the Stop condition has been sent).

Preconditions

- The Start condition must have been sent and completed as previously described
- A target slave address must have been transmitted and ACKed.
- Zero or more data bytes may also have been sent or received and ACKed as appropriate.

Process

Send the repeated Start condition using the [PLIB_I2C_MasterStartRepeat](#) function.

Example

```
#define MY_I2C_ID I2C_ID_1
```

```
PLIB_I2C_MasterStartRepeat(MY_I2C_ID);
```

The repeated Start condition must be allowed to complete before any additional steps can be taken. The only way to determine this is to wait for a master interrupt to occur after the Start condition has been initiated. It must then be followed by another target slave address (either 7-bit or 10-bit, as appropriate). Strictly speaking, a bus collision can still occur while the repeated start condition is being transmitted. To verify that arbitration has not been lost during transmission of the repeated Start condition, the software should check the [PLIB_I2C_ArbitrationLossHasOccurred](#) function after the repeated Start condition has completed.

Example: Checking for Arbitration Loss

```
#define MY_I2C_ID I2C_ID_1
```

```

if (PLIB_I2C_ArbitrationLossHasOccurred(MY_I2C_ID))
{
    // Abort transfer, retry later

    PLIB_I2C_ArbitrationLossClear(MY_I2C_ID);
}

```

Receiving a Data Byte

The following sequence can be used to receive a data byte and repeated to receive an arbitrary number of data bytes.

Preconditions

- The Start condition must have been sent and completed as previously described
- The target slave address must have been fully transmitted (with the read indication in bit 0) and ACKed by the targeted slave device

Process

1. Start the I²C module cycling the clock line to receive one byte by calling the [PLIB_I2C_MasterReceiverClock1Byte](#) function. The I2C module will generate a master interrupt once the eighth clock cycle has completed, but before the ninth cycle has started.
2. Ensure that a byte was received and is available in the RX buffer using the [PLIB_I2C_ReceivedByteIsAvailable](#) function.
3. If a byte is available, get it from the RX buffer using the [PLIB_I2C_ReceivedByteGet](#) function.
4. ACK or NAK the byte (as determined by software) using the [PLIB_I2C_ReceivedByteAcknowledge](#) function. The master receiver indicates to the slave transmitter that it wishes to terminate the transfer by NAKing the last byte. All other bytes should be ACKed after reception.
5. Ensure that the ACK/NAK signal has completed using the [PLIB_I2C_ReceiverByteAcknowledgeHasCompleted](#) function or by waiting for the master interrupt

Note: Arbitration loss cannot occur during a master reception (only during transmission).

Example: Enabling the Receiver

```
#define MY_I2C_ID I2C_ID_1
PLIB_I2C_MasterReceiverClock1Byte(MY_I2C_ID);
```

Wait for reception to complete before attempting to get the byte from the receiver.

Example: Reading a Byte from the RX Buffer

```
#define MY_I2C_ID I2C_ID_1
#define MY_MAX_COUNT 10
uint8_t data;
int count;

if ( PLIB_I2C_ReceivedByteIsAvailable(MY_I2C_ID) )
{
    data = PLIB_I2C_ReceivedByteGet(MY_I2C_ID);
    count++;

    // Determine if the data should be ACK'd or NAK'd
    if (count < MY_MAX_COUNT)
    {
        PLIB_I2C_ReceivedByteAcknowledge(MY_I2C_ID, true);
    }
    else
    {
        PLIB_I2C_ReceivedByteAcknowledge(MY_I2C_ID, false);
    }
}
```

Wait for the ACK/NAK to complete by waiting for the next master interrupt.

Example: Verifying ACK/NAK Signal is Complete

```
#define MY_I2C_ID I2C_ID_1

if (PLIB_I2C_ReceiverByteAcknowledgeHasCompleted(MY_I2C_ID))
{
    // Byte reception sequence complete
}
```

Sending a Stop Condition

When the master transmitter has finished sending data, it must end the transfer with a Stop condition.

Preconditions

- The Start condition must have been sent and completed as previously described
- A target slave address must have been transmitted and ACKed.

- Zero or more data bytes may also have been sent or received and ACKed as appropriate

Note: At least one address byte must be transmitted between the Start and Stop conditions. Following a Start condition immediately with a Stop condition is a protocol error and can cause some slave devices to lock up and stop responding to the bus.

Process

Send a Stop condition using the [PLIB_I2C_MasterStop](#) function.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_MasterStop(MY_I2C_ID);
```

The Stop condition must be allowed to complete before any additional steps can be taken. The only way to determine this is to wait for a master interrupt to occur after the Stop condition has been initiated.

After a Stop condition, the bus should be idle unless a master immediately starts a new transfer. Strictly speaking, a bus collision can still occur while the stop condition is being transmitted. Although the transfer is already completed when the Stop condition has been sent, software does not have to abort the transfer; however, it should still check for and clear the arbitration loss condition if it occurs.

Example: Checking for Arbitration Loss

```
#define MY_I2C_ID I2C_ID_1

if (PLIB_I2C_ArbitrationLossHasOccurred(MY_I2C_ID))
{
    PLIB_I2C_ArbitrationLossClear(MY_I2C_ID);
}
```

The previous example uses the following constants and variables:

Symbol	Description
MY_I2C_ID	Defined as the selected I ² C module value from the I2C Module enumeration . Example: <code>#define MY_I2C_ID I2C_ID_1</code>
data	This is the buffer to hold byte of data received.
slaveTargetAddress7Bit	This variable is used to demonstrate how to properly format and access a 7-bit target slave address
SLAVE_TARGET_7BIT_ADDRESS	This constant is used as a place holder for the actual 7-bit target slave address that must be defined by the client code.
slaveAddress10Bit	This variable is used to demonstrate how to properly format and access a 10-bit target slave address
SLAVE_TARGET_10BIT_ADDRESS	This constant is used as a place holder for the actual 10-bit target slave address that must be defined by the client code.

5.6.9.4.6 Interrupt State Machine

The I²C state machine can be used in either a polled or an interrupt-driven manner. However, even when polled, software must check the state of the master, slave, and error interrupt flags to identify when a state transition occurs.

The I²C module can cause three different interrupts:

- Slave Interrupt - A byte was sent or received in Slave mode
- Master Interrupt - A bus action has completed in Master mode

- Error Interrupt - An error has occurred in any mode (see [Handling Errors](#))

Note: Refer to the "Interrupt Controller" section in the related family reference manual for directions on how to enable, detect, and respond to interrupts.

The I²C module will not start generating interrupts (setting the I²C interrupt flags, even if interrupts are disabled) until it is properly configured and enabled. After that, interrupts are generated as described below. Software has to respond appropriately once the interrupt has occurred (the flag has been set) to allow the state machine to advance to the next state. These actions are described below the state machine diagram to which they refer.

Notes:

1. These state machine diagrams show the normal operations. Error and exception cases are explained in the [Handling Errors](#) section and are not shown in the diagrams.
2. The transition labels sometimes represent hardware interrupts (or the setting of an interrupt flag) and sometimes represent software actions. Refer to the transition tables to understand the transitions.
3. The Wait state is shared between all state machines (i.e., while in the Wait state, the I²C module can start a new master-mode transfer or be addressed by an external master).
4. The Start state is shared between both read and write master transfer state machines (i.e., when starting a new transfer, software can choose start either a read or a write transfer).

Slave Mode State Machine

Slave Mode State Transitions

In Slave mode, state transitions occur under hardware control automatically or in response to an interrupt. Software must respond appropriately to ensure that the module continues to operate correctly.

Transition	From State	To State	Software Actions
Enable	Initialize	Wait	Enable the module, using the PLIB_I2C_Enable function
Slave Interrupt, 7-bit Address Match, Write	Wait	Receive mode	Software should call the PLIB_I2C_ReceivedByteIsAvailable function to verify that a byte has been received and the PLIB_I2C_SlaveAddressWasDetected function to verify that a 7-bit address (or the first byte of a 10-bit address) has been received. Then, software must get the address byte from the receiver buffer (the byte is automatically ACKed), using the PLIB_I2C_ReceivedByteGet function. Software must also release the clock by calling PLIB_I2C_SlaveClockRelease function to allow reception of the next byte. Note: This transition occurs on a write transfer with either a 7-bit or 10-bit address (for the first of two address bytes).

Slave Interrupt, Byte Received	Receive mode	Receive mode	Software should call the PLIB_I2C_ReceivedByteIsAvailable function to verify that a byte has been received and, if one has, get the byte from the receiver buffer by calling PLIB_I2C_ReceivedByteGet function. Then, software must release the clock by calling PLIB_I2C_SlaveClockRelease function to allow reception of the next byte.
Slave Interrupt, 10-bit Address Match	Receive mode	Receive mode	Software should call the PLIB_I2C_ReceivedByteIsAvailable function to verify that a byte has been received and (if 10-bit addressing is being used) call the PLIB_I2C_SlaveAddress10BitWasDetected function to verify that the second byte of the 10-bit address matched the low-order 8-bits of the local-slave 10-bit address. Next, software must get the address byte received from the receiver buffer (the byte is automatically ACKed), using the PLIB_I2C_ReceivedByteGet function. Note: This transition occurs on write transfer when using 10-bit (2-byte) addressing when the second address byte is received.
End Receive	Receive mode	Wait	None. Software is not aware of this transition. A receive transfer can end with a stop condition, a repeated start, or if the second-half of a 10-bit slave address does not match the programmed local slave address (and possibly the optional mask).
Slave Interrupt, 7-bit Address Match, Read	Wait	Transmit mode	Software should call the PLIB_I2C_ReceivedByteIsAvailable function to verify that a byte has been received and the PLIB_I2C_SlaveAddressWasDetected function to verify that an address has been received. Then, software must get the address byte from the receiver buffer (the byte is automatically ACKed), using the PLIB_I2C_ReceivedByteGet function. Notes: This transition occurs on a read transfer with a 7-bit (1-byte) address or after a repeated-start with a 10-bit slave address. The second byte of a 10-bit address is not sent after a repeated-start condition, only the first byte. The 10-bit slave device must remember if it was addressed at the beginning of this transfer. After handling the address byte received, software should call the PLIB_I2C_TransmitterIsReady function to make sure that the transmitter buffer is able to accept a byte and, if it is, call the PLIB_I2C_TransmitterByteSend function to send the requested byte.
Slave Interrupt, Byte Completed	Transmit mode	Transmit mode	Software must call the PLIB_I2C_TransmitterByteWasAcknowledged function to check to see if the byte was ACKed or NAKed. If the byte was ACKed, software must send the next byte by calling the PLIB_I2C_TransmitterIsReady function to make sure that the transmitter buffer is able to accept a byte and, if it is, call the PLIB_I2C_TransmitterByteSend function to send the next byte.
NAK	Transmit mode	Wait	Software must call the PLIB_I2C_TransmitterByteWasAcknowledged function to check to see if the byte was ACKed or NAKed. The master will NAK the last byte it wishes to receive. At that point, the transfer is effectively over and software must not attempt to send any more bytes. The module automatically transitions back to the Wait state when the Stop condition occurs, but software does not receive an interrupt at that point.

Master Mode Write Transfer State Machine

Master-Mode Write-Transfer State Transitions

Transition	From State	To State	Software Actions
Begin Master Transfer	Wait	Start	This state transition occurs when software initiates transmission of the start condition. Software should call the PLIB_I2C_BusIdle function to verify that the bus is not currently in use by another master. Then it must call the PLIB_I2C_MasterStart function (or PLIB_I2C_MasterStartRepeat function) to send the start (or repeated start) condition.
Master Interrupt, Start Completed	Start	7-Bit Address, Write	After the start condition has completed, software should check for a possible collision by calling the PLIB_I2C_ArbitrationLossHasOccurred function. Then, it must send an appropriately formatted 7-bit address byte (or the first byte of the 10-bit address) to the I ² C bus to address a slave target. To do this, it should first call the PLIB_I2C_TransmitterIsReady function to verify that the transmitter buffer is ready to accept a byte and then call the PLIB_I2C_TransmitterByteSend function to send the byte.
Master Interrupt, 7-bit Address, Write Completed	7-bit Address, Write	Transmit	When the master interrupt occurs (or the PLIB_I2C_TransmitterByteHasCompleted function returns true) to indicate that the last byte sent has completed, software must check to ensure that the slave device ACKed the byte by calling the PLIB_I2C_TransmitterByteWasAcknowledged function. Software should also call the PLIB_I2C_ArbitrationLossHasOccurred function to determine if a collision occurred. If all is well, software may then send another byte to the slave using the PLIB_I2C_TransmitterIsReady function and the PLIB_I2C_TransmitterByteSend function. If 10-bit addressing is being used for this transfer, then the start condition and first byte of the 10-bit address must be followed by the second byte of the 10-bit address. Multiple slaves may respond to the first byte of the 10-bit address. It requires the second byte to uniquely identify the 10-bit slave. However, this is sent using the same process as if it were a data byte.

Master Interrupt, Byte Completed	Transmit	Transmit	Software must call the PLIB_I2C_TransmitterByteWasAcknowledged function check to ensure that the slave device ACKed the byte and the PLIB_I2C_ArbitrationLossHasOccurred function to determine if a collision occurred. If all is well, software may call the PLIB_I2C_TransmitterIsReady function and PLIB_I2C_TransmitterByteSend function to send another byte to the slave and remain in the Transmit state. If not, software should abort the transfer by sending a Stop condition and transition to the Stop, repeated Start state.
Master Interrupt, Byte Completed	7-bit Address, Write	Stop, repeated Start	If the slave NAKed any byte sent or if software wishes to end or re-start the transfer (perhaps to change direction) it can do so by sending a stop condition (using the PLIB_I2C_MasterStop function) or repeated Start condition (using the PLIB_I2C_MasterStartRepeat function).
Master Interrupt, Byte Completed	Transmit	Stop, repeated Start	Software must call the PLIB_I2C_TransmitterByteWasAcknowledged function check to check to see if the slave ACKed or NAKed the byte. If the slave NAKed the byte or if software wishes to end or re-start the transfer (perhaps to change direction) it can do so by sending a Stop condition (using the PLIB_I2C_MasterStop function) or repeated Start condition (using the PLIB_I2C_MasterStartRepeat function).
Restart	Stop, repeated Start	Start	Immediately after initiating the repeated Start condition, software transitions back to the Start state where it must decide what sort of transfer it will start next. Note: Read transfers will transition to the Start state in the Master Mode Read Transfer state machine.
Master Interrupt, Stop Completed	Stop, repeated Start	Wait	When the master interrupt occurs, indicating that the Stop condition has completed, software transitions back to the Wait state (which is actually part of the Slave Mode state machine).

Master-Mode Read-Transfer State Machine

Master Mode Read Transfer State Transitions

In Master mode, transitions are initiated under software control and interrupts occur (the master interrupt flag is set, even when interrupts are disabled) when the action initiated has completed.

If at any point, an address or data byte is NAKed by the slave or an error occurs, usually the safest thing for the master to do is to end the transfer with a Stop condition and release the bus.

Transition	From State	To State	Software Actions
Begin Master Transfer	Wait	Start	This state transition occurs when software initiates transmission of the start condition. Software should call the PLIB_I2C_BusIdle function to verify that the bus is not currently in use by another master. Then it must call the PLIB_I2C_MasterStart function (or PLIB_I2C_MasterStartRepeat function) to send the start (or repeated Start) condition.

Master Interrupt, Start Completed	Start	7-Bit Address, Read	After the start condition has completed, software should check for a possible collision by calling the PLIB_I2C_ArbitrationLossHasOccurred function. Then, it must send an appropriately formatted 7-bit address byte (or the first byte of the 10-bit address) to the I ² C bus to address a slave target. To do this, it should first call the PLIB_I2C_TransmitterIsReady function to verify that the transmitter buffer is ready to accept a byte and then call the PLIB_I2C_TransmitterByteSend function to send the byte. Note: If using 10-bit addressing, this is a repeated transmission of the first byte of the 10-bit address since all 10-bit transfers must start off as write transfers (so both address bytes can be sent) then be re-started to become read transfers.
Master Interrupt, Byte Completed	7-Bit Address, Read	Receive	Software must initiate the "Clock1Byte" operation (using the PLIB_I2C_MasterReceiverClock1Byte function) so that the I ² C module will cycle the SCL line eight times causing the slave to send the requested byte of data.
Master Interrupt, Byte Available	Receive	ACK NAK	When a byte has been received (which software can verify using the PLIB_I2C_ReceivedBytesAvailable function), software must get the received byte from the RX buffer (using the PLIB_I2C_ReceivedByteGet function) and initiate transmission of the ACK/NAK bit (using the PLIB_I2C_ReceivedByteAcknowledge function). If it intends to receive another byte, software must ACK the byte just received. If it does not intend to receive another byte, software must NAK the byte just received.
Master Interrupt, ACK Completed	ACK, NAK	Receive	Software can verify that the ACK signal has completed using the PLIB_I2C_ReceiverByteAcknowledgeHasCompleted function. If software ACKed the previously received byte, it must initiate the "Clock1Byte" operation (using the PLIB_I2C_MasterReceiverClock1Byte function) so that the I ² C module will cycle the SCL line eight times so that the slave can send the requested byte. Otherwise, software must have NAKed the previous byte to end the transfer.
Master Interrupt, NAK Completed	ACK, NAK	Stop, Restart	Software can verify that the NAK signal has completed using the PLIB_I2C_ReceiverByteAcknowledgeHasCompleted function. If software intends to continue the transfer without allowing the bus to go idle, it must initiate a repeated-start (using the PLIB_I2C_MasterStartRepeat function) and transition immediately to the Start state. If software intends to end the transfer and allow the bus to go idle, it must initiate a Stop condition using the PLIB_I2C_MasterStop function.
Restart	Stop, repeated Start	Start	Immediately after initiating the repeated Start condition, software automatically transitions back to the "Start" state where it must decide if it will restart with a read or write transfer. Note: Write transfers will transition to the Start state in the Master Mode Write Transfer state machine.
Master Interrupt, Stop Completed	Stop, repeated Start	Wait	When the master interrupt occurs, indicating that the Stop condition has completed, software transitions back to the waiting state (which is actually part of the Slave Mode state machine).

5.6.9.4.7 Managing Slave Addresses

An I²C address identifies which slave device is being targeted by a master device on a transfer-by-transfer basis. I²C addresses can be either 7-bits or 10-bits, as shown in the following sections, 7-Bit Slave Addresses and 10-Bit Slave Addresses.

Addresses that are 7-bits long are sent in a single byte where bit 0 identifies the direction of the remaining data in the transfer. Addresses that are 10-bits long are sent in two bytes using a reserved range in the 7-bit address space (addresses 0x78 through 0x7C) to encode the two high-order bits (bits A9 and A8) in the first byte. The second byte encodes the eight low-order bites (A7 through A0). These formats are in the following two sections.

7-Bit Slave Addresses

When using 7-bit slave addressing, the address byte is the first byte sent by any I²C master device immediately following a

"Start" condition. The 7-bit address is shifted left by 1 bit to fill bits 7-to-1 in the address byte. Bit 0 in the 7-bit address byte indicates the transfer direction, as follows.

7-Bit Address Format

A6 A5 A4 A3	A2 A1 A0 R/W

Bits	Usage
A6:A0	Bits 7 through 1 of the address byte contain the 7-bit slave address.
R/W	Bit 0 of the address byte is the read/write bit (0 = Read, 1 = Write).

The `I2C_ADDRESS_7_BIT_FORMAT` macro can be used to correctly format a 7-bit slave address. The `I2C_ADDRESS_7_BIT_BYTE_ACCESS` macro can be used to access the byte-format of the address (including the read/write bit). See [Operating as a Master Transmitter](#) and [Operating as a Master Receiver](#) for examples.

10-Bit Slave Addresses

When using 10-bit slave addresses, the first address byte must be sent immediately following a start or repeated Start condition. The second byte must immediately follow the first byte when performing a write transfer. Read transfers must begin as write transfers so that both bytes may be sent. Immediately after sending the second address byte, the master will issue a repeated Start condition and resend the first address byte only (with the read/write bit cleared, indicating a read transfer. The second byte is not retransmitted. Since the transfer has been restarted, all listening 10-bit slave devices know that they will not be address again until the transfer has been ended with a Stop condition. However, devices that respond to 7-bit addresses might respond, so the first byte of the 10-bit address must be repeated to prevent that. The format of the 10-bit address is shown as follows.

10-Bit Address Format

1st Byte

2nd Byte

1 1 1 1	0 A9 A8 R/W	A7 A6 A5 A4	A3 A2 A1 A0

Bits	Usage
11110	Bits 7 through 3 of the first byte are constants. This guarantees that the first byte of the 10-bit address will fall within the reserved range of the 7-bit addresses.
A9:A8	Bits 2 through 1 of the first byte are the two high-order bits of the 10-bit address.
R/W	Bit 0 of the first byte is the Read/Write bit (0 = Read, 1 = Write).
A7:A0	The second byte contains the 8 low-order bits of the 10-bit address.

The `I2C_ADDRESS_10_BIT_FORMAT` macro can be used to correctly format a 10-bit slave address. The `I2C_ADDRESS_10_BIT_1ST_BYTE_ACCESS` macro can be used to access the first byte of the 10-bit address and the `I2C_ADDRESS_10_BIT_2ND_BYTE_ACCESS` macro can be used to access the second byte of the 10-bit address. See [Operating as a Master Transmitter](#) and [Operating as a Master Receiver](#) for examples.

Operating in Slave Mode

In Slave mode, the "slave address" refers to the address (and optional mask) programmed into the I²C module to determine to which address or addresses the module will respond when addressed by an external master. The "raw" (unformatted) address is passed to or returned from the Managing Slave Addresses routines (without being formatted as shown above). Likewise, the mask passed to or returned from the Slave Mask Control Functions is unformatted.

Operating in Master Mode

In Master mode, the "slave address" refers to the address transmitted on the I²C bus to identify the slave target of the transfer. In these cases, the slave address must be correctly formatted (as shown above) and sent on the bus one byte at a time.

5.6.9.4.8 Forming Transfers

Forming Transfers

Transfers are formed by chaining the basic "building blocks" shown in the following transfer format legend.

The following are all valid I²C transfer formats:

- This format allows a master to transmit n bytes of data to an I²C slave supporting a 7-bit address.

Master-Transmit (7-bit Address)

- This format allows a master to receive $n+1$ bytes of data from a "streaming" slave. Such a slave has no internal addressing capability. That is, it has no internal registers or addresses. It can only "stream" data to a master that reads from it.

Master-Receive ONLY (7-bit Address)

- This format allows a master to write n bytes of data to a slave, followed immediately by reading $n+1$ bytes of data from a slave by sending a repeated Start condition after the first transfer. This format is useful for specifying an internal address to a device, and then reading data from that address. A repeated Start condition can also be used to chain transfers together without letting the bus go idle and potentially losing arbitration.

Master Combined Format (Repeated Start, 7-bit Address)

- The following format allows a master to **send** n bytes of data to a target supporting a 10-bit address.

Master Transmit (10-bit Address)

- This format is used to receive $n+1$ bytes of data from a slave supporting a 10-bit address. The repeated Start condition must be used because the second byte of the 10-bit address must be sent after the first byte of the 10-bit address. Then, the direction of the transfer must be switched to a "read". To do this, after the repeated Start, the master repeats the first byte of

the 10-bit address with a "read" indication in the low-order bit and 10-bit slave devices must "remember" if they were being addressed once the transfer has started.

Master Receive (10-bit Address)

- This format allows a master to **send** n bytes of data to a slave device supporting a 10-bit address and immediately read $n+1$ bytes of data from the same device using the repeated Start and resending the first byte of the 10-bit address technique as shown in the previous format. This format is useful when the master needs to read data from a specific address within a device and it needs to **send** that address before performing the read.

Master Combined Format (10-bit write, 10-bit read)

- This format allows a master to chain writes to multiple slaves supporting 10-bit addresses.

Master Combined Format (10-bit write, 10-bit write)

- This format allows a master to chain multiple writes to different slaves. Note that only the first write can be to a slave supporting a 7-bit address. The second (and any subsequent) writes must be to slaves with 10-bit addresses once any 10-bit device has been addressed.

Master Combined Format (7-bit write, 10-bit write)

- This format can be used by a "hardware" master that does not have a programmable address. This allows the hardware master to broadcast to all slaves on the bus using the "General Call" address, followed by the master's address. (The master address is generally the same as the device's slave address if it can also act as a slave device.) This format is not normally used by a microcontroller acting as a master. However, it may be received by a microcontroller if such a hardware master exists on the bus.

HW Master Transmit

5.6.9.4.9 Handling Errors

There are three basic types of errors that can occur during various I²C operations:

- Transmitter Overflow
- Receiver Overflow
- Arbitration Loss

Handling Transmitter Overflow Errors

A transmitter overflow error occurs when the software attempts to write to the TX buffer (by calling the [PLIB_I2C_TransmitterByteSend](#) function) while the transmitter is busy. When this occurs, the write is not allowed and the transmitter overflow status bit is set. This can be identified by calling the [PLIB_I2C_TransmitterOverflowHasOccurred](#) function.

Additional attempts to write to the TX buffer will not be allowed until the transmitter overflow error is cleared by calling the [PLIB_I2C_TransmitterOverflowClear](#) function. This sort of error should be either avoided by checking the [PLIB_I2C_TransmitterIsReady](#) function before attempting to **send** a byte or by checking for the error after attempting to **send** a byte.

Interrupts: The transmitter overflow error does not trigger an interrupt.

Handling Receiver Overflow Errors

A receiver overflow error occurs when an incoming byte has been completely received and is ready to be transferred to the RX buffer, but software has not yet gotten the previous byte from the RX buffer. When this happens the receiver overflow status bit is set and the incoming byte will be lost. This can happen when software does not respond quickly enough to a slave or master interrupt when receiving data. Software should check for this error before calling the [PLIB_I2C_ReceivedByteGet](#) function to get a byte from the RX buffer to determine if any data has been lost. This error can be identified by calling the [PLIB_I2C_ReceiverOverflowHasOccurred](#) function. This error must be cleared by calling the [PLIB_I2C_ReceiverOverflowClear](#) function or no additional data will be received.

Interrupts: The receiver overflow error does not trigger an interrupt (although the incoming data byte does, even though it is lost.)

Handling Arbitration Loss Errors

Strictly speaking, arbitration loss is not an error. Rather it is a normal part of bus operation in a multi-master environment. Arbitration loss occurs when more than one master attempts to transmit on the bus at the same (or nearly the same) time. When this happens, at some point one of the masters will attempt to transmit a binary one ('1') when the other attempts to transmit a binary zero ('0'). At that point, the master transmitting the zero will win the transmission, because the zero transmission will dominate on the bus. The master detecting that the bus signals a zero when it attempted to transmit a one will lose arbitration and must immediately stop transmitting on the bus (which happens automatically).

Arbitration loss can be detected during any of the following actions:

- Transmission of a Start condition
- Transmission of a repeated Start condition
- Transmission of an address or data byte
- Transmission of an acknowledge bit
- Transmission of a Stop condition

Arbitration loss can be identified by calling the [PLIB_I2C_ArbitrationLossHasOccurred](#) function. The arbitration loss condition can be cleared by calling the [PLIB_I2C_ArbitrationLossClear](#) function. Once arbitration loss occurs, the losing master must wait until the bus is once again idle (at which time a master interrupt will occur if arbitration loss has occurred) and retransmit the transfer from the beginning.

Interrupts: The I²C module will trigger an error interrupt when arbitration loss occurs.

5.6.9.4.10 Other Features

Other Features

Note: The following features are not available on all devices. Please refer to the specific device data sheet to determine which features are supported by your device.

General Call Address Support

The I²C General Call address (reserved address 0) allows a master to address all slave devices on the bus. During slave operation the module can be made to respond to or ignore the general call address using the [PLIB_I2C_GeneralCallEnable](#) function or the [PLIB_I2C_GeneralCallDisable](#) function. When a slave address byte is received, software can identify if it was the general call address using the [PLIB_I2C_SlaveAddressIsGeneralCall](#) function (or by checking the value of the address byte

received).

Note: The general call address is always 7-bits.

SMBus Support

The I²C module can support communication on a System Management Bus (SMBus) by calling the [PLIB_I2C_SMBEnable](#) function to adjust the electrical characteristics of the SMBus.

Operation During Sleep Mode

When the device enters Sleep mode, all clock sources supplied to the I²C modules are shut down. If the device enters Sleep mode in the middle of an I²C master transmission or reception operation, the operation is aborted. If the device enters Sleep mode when the module is operating in slave mode, the external master's clock will continue run the slave state machine. If a slave address match occurs, an interrupt will be provided to wake up the device.

Note: Indeterminate results can occur if an error occurs during Sleep mode.

Operation During Idle Mode

When the device enters Idle mode, the system clock sources remain functional and the CPU stops code execution.

I²C operation during Idle mode can be controlled using the [PLIB_I2C_StopInIdleEnable](#) function or the [PLIB_I2C_StopInIdleDisable](#) function.

By default, the I²C module continues to operate in Idle mode and provide full functionality.

Operation with DMA

Software activity must occur between the transfer of each byte, making DMA inappropriate for use with the I²C module.

5.6.9.4.11 Using the Library

Using the Library

This section describes the basic architecture of the I²C Peripheral Library and provides information and examples on how to use it.

Interface Header File: [plib_i2c.h](#)

The interface to the I²C library is defined in the "[plib_i2c.h](#)" header file, which is included by the "peripheral.h" peripheral library header file. Any C language source (.c) file that uses the I²C library must include "peripheral.h".

Peripheral Module IDs

Peripheral libraries are indexed to allow a single library to control any number of instances of a peripheral in a single microcontroller. To support this, the first parameter to each operation in a peripheral library is the module instance ID. The module instance ID is defined by an enumeration that is defined in the processor-specific header files (included by the library's interface header). For the I²C Peripheral Library, the module instance IDs are defined by the [I2C Module enumeration](#). Not all microcontrollers will have all instances of the module listed in this enumeration. Please refer to the specific device data sheet for more information.

5.6.9.4.11.1 Hardware Abstraction Model

This library provides a low-level abstraction of the Inter-Integrated Circuit (I²C) module on Microchip PIC microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Hardware Abstraction Model Diagram

Hardware Abstraction Model Description

The I²C Peripheral Library provides interface routines to interact with the blocks shown in the previous diagram.

The **TX Buffer** and **RX Buffer** are 1-byte (8-bit) buffers for data transmitted (TX) or received (RX) by the **Serial Interface** to the I²C bus over the **SDA** line synchronized with the **SCL** line by the **Clock Control** logic.

The desired baud rate frequency can be programmed in the **Clock Control** logic (within I²C bus specifications of 0-100 kHz for Low-to-Fast I²C mode and up to 3.4 MHz for High-Speed I²C mode) by setting the **Baud Rate** value. However, the nature of the I²C bus allows slower targets to stretch the clock to slower rates as required, in real time.

The I²C bus is a transfer-based multi-master bus, allowing multiple masters to initiate transfers at any time the bus is not currently busy. The **Master Arbiter** logic monitors transfers and determines if arbitration has been lost. There is no loss of data for the winning master. However, the losing master must retry the entire transfer again later, when the bus is idle. Slave devices are identified by either 7- or-10 bit addresses. The I²C module can act as either a bus master that can initiate transfers or as a slave, responding to transfers initiated by other masters on the bus.

The **Slave Address Detect** logic monitors transfers initiated by other masters to recognize when other masters have addressed this module when it is acting as a slave. The Slave **Address** is programmed into the I²C module by the software along with an (optional) address **Mask**, specifying bits in the address that can be ignored. This ability to "mask off" certain bits in the address allows the I²C module to identify multiple addresses and respond as if it were more than one slave device.

5.6.9.4.11.2 Library Usage Model

Usage Model

The items in the diagram correspond to the groupings in the [Library Interface](#) section.

Library Interface Section	Description

5.6.9.4.12 Configuring the Library

This library is appropriate for microcontrollers with a dedicated I²C module (not an SSP or MSSP module).

5.6.9.5 Library Interface

Data Types and Constants

	Name	Description
	I2C_MODULE_ID	Identifies the supported I2C modules.

Baud Rate Generator Control Functions

	Name	Description
	PLIB_I2C_BaudRateGet	Calculates the I2C module's current SCL clock frequency.
	PLIB_I2C_BaudRateSet	Sets the desired baud rate.

Existence Functions

	Name	Description
	PLIB_I2C_ExistsAcksequenceInProgress	Identifies whether the AcksequenceInProgress feature exists on the I2C module
	PLIB_I2C_ExistsArbitrationLoss	Identifies whether the ArbitrationLoss feature exists on the I2C module
	PLIB_I2C_ExistsBaudRate	Identifies whether the BaudRate feature exists on the I2C module
	PLIB_I2C_ExistsBusIdle	Identifies whether the BusIdle feature exists on the I2C module
	PLIB_I2C_ExistsClockStretching	Identifies whether the ClockStretching feature exists on the I2C module
	PLIB_I2C_ExistsDataLineHoldTime	Identifies whether the DataLineHoldTime feature exists on the I2C module
	PLIB_I2C_ExistsGeneralCall	Identifies whether the GeneralCall feature exists on the I2C module
	PLIB_I2C_ExistsGeneralCallAddressDetect	Identifies whether the GeneralCallAddressDetect feature exists on the I2C module

	PLIB_I2C_ExistsHighFrequency	Identifies whether the HighFrequency feature exists on the I2C module
	PLIB_I2C_ExistsIPMI	Identifies whether the IPMI feature exists on the I2C module
	PLIB_I2C_ExistsMasterReceiverClock1Byte	Identifies whether the MasterReceiverClock1Byte feature exists on the I2C module
	PLIB_I2C_ExistsMasterStart	Identifies whether the MasterStart feature exists on the I2C module
	PLIB_I2C_ExistsMasterStartRepeat	Identifies whether the MasterStartRepeat feature exists on the I2C module
	PLIB_I2C_ExistsMasterStop	Identifies whether the MasterStop feature exists on the I2C module
	PLIB_I2C_ExistsModuleEnable	Identifies whether the ModuleEnable feature exists on the I2C module
	PLIB_I2C_ExistsReceivedByteAcknowledge	Identifies whether the ReceivedByteAcknowledge feature exists on the I2C module
	PLIB_I2C_ExistsReceivedByteAvailable	Identifies whether the ReceivedByteAvailable feature exists on the I2C module
	PLIB_I2C_ExistsReceivedByteGet	Identifies whether the ReceivedByteGet feature exists on the I2C module
	PLIB_I2C_ExistsReceiverOverflow	Identifies whether the ReceiverOverflow feature exists on the I2C module
	PLIB_I2C_ExistsReservedAddressProtect	Identifies whether the ReservedAddressProtect feature exists on the I2C module
	PLIB_I2C_ExistsSlaveAddress10Bit	Identifies whether the SlaveAddress10Bit feature exists on the I2C module
	PLIB_I2C_ExistsSlaveAddress7Bit	Identifies whether the SlaveAddress7Bit feature exists on the I2C module
	PLIB_I2C_ExistsSlaveAddressDetect	Identifies whether the SlaveAddressDetect feature exists on the I2C module
	PLIB_I2C_ExistsSlaveAddressHoldEnable	Identifies whether the SlaveAddressHoldEnable feature exists on the I2C module
	PLIB_I2C_ExistsSlaveBufferOverwrite	Identifies whether the SlaveBufferOverwrite feature exists on the I2C module
	PLIB_I2C_ExistsSlaveBusCollisionDetect	Identifies whether the SlaveBusCollisionDetect feature exists on the I2C module
	PLIB_I2C_ExistsSlaveClockHold	Identifies whether the SlaveClockHold feature exists on the I2C module
	PLIB_I2C_ExistsSlaveDataDetect	Identifies whether the SlaveDataDetect feature exists on the I2C module
	PLIB_I2C_ExistsSlaveInterruptOnStart	Identifies whether the SlaveInterruptOnStart feature exists on the I2C module
	PLIB_I2C_ExistsSlaveInterruptOnStop	Identifies whether the SlaveInterruptOnStop feature exists on the I2C module
	PLIB_I2C_ExistsSlaveMask	Identifies whether the SlaveMask feature exists on the I2C module
	PLIB_I2C_ExistsSlaveReadRequest	Identifies whether the SlaveReadRequest feature exists on the I2C module
	PLIB_I2C_ExistsSMBus	Identifies whether the SMBus feature exists on the I2C module
	PLIB_I2C_ExistsStartDetect	Identifies whether the StartDetect feature exists on the I2C module
	PLIB_I2C_ExistsStopDetect	Identifies whether the StopDetect feature exists on the I2C module
	PLIB_I2C_ExistsStopInIdle	Identifies whether the StopInIdle feature exists on the I2C module
	PLIB_I2C_ExistsTransmitterByteAcknowledge	Identifies whether the TransmitterByteAcknowledge feature exists on the I2C module

	PLIB_I2C_ExistsTransmitterByteComplete	Identifies whether the TransmitterByteComplete feature exists on the I2C module
	PLIB_I2C_ExistsTransmitterByteSend	Identifies whether the TransmitterByteSend feature exists on the I2C module
	PLIB_I2C_ExistsTransmitterIsBusy	Identifies whether the TransmitterBusy feature exists on the I2C module
	PLIB_I2C_ExistsTransmitterOverflow	Identifies whether the TransmitterOverflow feature exists on the I2C module

General Initialization Functions

	Name	Description
	PLIB_I2C_Disable	Disables the specified I2C module.
	PLIB_I2C_Enable	Enables the specified I2C module.
	PLIB_I2C_GeneralCallDisable	Disables the I2C module from recognizing the general call address.
	PLIB_I2C_GeneralCallEnable	Enables the I2C module to recognize the general call address.
	PLIB_I2C_HighFrequencyDisable	Disables the I2C module from using high frequency (400 kHz or 1 MHz) signaling.
	PLIB_I2C_HighFrequencyEnable	Enables the I2C module to use high frequency (400 kHz or 1 MHz) signaling.
	PLIB_I2C_IPMIDisable	Disables the I2C module's support for the IPMI specification
	PLIB_I2C_IPMIEnable	Enables the I2C module to support the Intelligent Platform Management Interface (IPMI) specification (see Remarks).
	PLIB_I2C_ReservedAddressProtectDisable	Disables the I2C module from protecting reserved addresses, allowing it to respond to them.
	PLIB_I2C_ReservedAddressProtectEnable	Enables the I2C module to protect (not respond to) reserved addresses.
	PLIB_I2C_SlaveClockStretchingDisable	Disables the I2C module from stretching the slave clock.
	PLIB_I2C_SlaveClockStretchingEnable	Enables the I2C module to stretch the slave clock.
	PLIB_I2C_SMBDisable	Disable the I2C module support for SMBus electrical signaling levels.
	PLIB_I2C_SMBEnable	Enables the I2C module to support System Management Bus (SMBus) electrical signaling levels.
	PLIB_I2C_StopInIdleDisable	Disables the Stop-in-Idle feature.
	PLIB_I2C_StopInIdleEnable	Enables the I2C module to stop when the processor enters Idle mode

General Status Functions

	Name	Description
	PLIB_I2C_ArbitrationLossClear	Clears the arbitration loss status flag
	PLIB_I2C_ArbitrationLossHasOccurred	Identifies if bus arbitration has been lost.
	PLIB_I2C_BusIsIdle	Determines whether the I2C bus is idle or busy.
	PLIB_I2C_StartClear	Clears the start status flag
	PLIB_I2C_StartWasDetected	Identifies when a Start condition has been detected.
	PLIB_I2C_StopClear	Clears the stop status flag
	PLIB_I2C_StopWasDetected	Identifies when a Stop condition has been detected

Master Control Functions

	Name	Description
	PLIB_I2C_MasterReceiverClock1Byte	Drives the bus clock to receive 1 byte of data from a slave device.
	PLIB_I2C_MasterStart	Sends an I2C Start condition on the I2C bus in Master mode.

	PLIB_I2C_MasterStartRepeat	Sends a repeated Start condition during an ongoing transfer in Master mode.
	PLIB_I2C_MasterStop	Sends an I2C Stop condition to terminate a transfer in Master mode.

Receiver Control Functions

	Name	Description
	PLIB_I2C_ReceivedByteAcknowledge	Allows a receiver to acknowledge a that a byte of data has been received.
	PLIB_I2C_ReceivedByteGet	Gets a byte of data received from the I2C bus interface.
	PLIB_I2C_ReceivedBytesAvailable	Detects whether the receiver has data available.
	PLIB_I2C_ReceiverByteAcknowledgeHasCompleted	Determines if the previous acknowledge has completed.
	PLIB_I2C_ReceiverOverflowClear	Clears the receiver overflow status flag.
	PLIB_I2C_ReceiverOverflowHasOccurred	Identifies if a receiver overflow error has occurred.
	PLIB_I2C_MasterReceiverReadyToAcknowledge	Checks whether the hardware is ready to acknowledge.

Slave Address Control Functions

	Name	Description
	PLIB_I2C_SlaveAddress10BitGet	Identifies the current 10-bit Slave mode address.
	PLIB_I2C_SlaveAddress10BitSet	Selects 10-bit Slave mode addressing and sets the address value.
	PLIB_I2C_SlaveAddress10BitWasDetected	Detects reception of the second byte of a 10-bit slave address.
	PLIB_I2C_SlaveAddress7BitGet	Identifies the current 7-bit Slave mode address.
	PLIB_I2C_SlaveAddress7BitSet	Selects 7-bit Slave mode addressing and sets the slave address value.
	PLIB_I2C_SlaveAddressHoldDisable	Disables Address holding.
	PLIB_I2C_SlaveAddressHoldEnable	Enables address holding.
	PLIB_I2C_SlaveAddressIsDetected	Detects if the most recent byte received is a data or an address byte.
	PLIB_I2C_SlaveAddressIsGeneralCall	Identifies if the current slave address received is the general call address.
	PLIB_I2C_SlaveAddressModeIs10Bits	Identifies if the current slave address mode is 7-bits or 10-bits.
	PLIB_I2C_SlaveDataIsDetected	Detects if the most recent byte received is a data or an address byte.
	PLIB_I2C_SlaveReadIsRequested	Detects if the request from the master was a read or write.

Slave Control Functions

	Name	Description
	PLIB_I2C_AcksequenceIsInProgress	Checks whether the acknowledge sequence is in progress or it is completed.
	PLIB_I2C_DataLineHoldTimeSet	Sets the data line hold time.
	PLIB_I2C_SlaveBufferOverwriteDisable	Disables buffer overwrite.
	PLIB_I2C_SlaveBufferOverwriteEnable	Enables buffer overwrite.
	PLIB_I2C_SlaveBusCollisionDetectDisable	Disables bus collision detect interrupts.
	PLIB_I2C_SlaveBusCollisionDetectEnable	Enables slave bus collision interrupts.
	PLIB_I2C_SlaveClockHold	Holds the SCL clock line low after receiving a byte.
	PLIB_I2C_SlaveClockRelease	Releases a previously held SCL clock line.
	PLIB_I2C_SlaveDataHoldDisable	Disables data holding.
	PLIB_I2C_SlaveDataHoldEnable	Enables data holding.
	PLIB_I2C_SlaveInterruptOnStartDisable	Disables the feature of generating interrupt on start condition.
	PLIB_I2C_SlaveInterruptOnStartEnable	Enables the feature of generating interrupt on start condition.
	PLIB_I2C_SlaveInterruptOnStopDisable	Disables the feature of generating interrupt on stop condition.

	PLIB_I2C_SlaveInterruptOnStopEnable	Enables the feature of generating interrupt on stop condition.

Slave Mask Control Functions

	Name	Description
	PLIB_I2C_SlaveMask10BitGet	Identifies the current 10-bit Slave mode address mask.
	PLIB_I2C_SlaveMask10BitSet	Sets the 10-bit mask for Slave mode addressing.
	PLIB_I2C_SlaveMask7BitGet	Identifies the current 7-bit Slave mode address mask.
	PLIB_I2C_SlaveMask7BitSet	Sets the 7-bit mask for Slave mode addressing .

Transmitter Control Functions

	Name	Description
	PLIB_I2C_TransmitterByteHasCompleted	Detects whether the module has finished transmitting the most recent byte.
	PLIB_I2C_TransmitterByteSend	Sends a byte of data on the I2C bus.
	PLIB_I2C_TransmitterByteWasAcknowledged	Determines whether the most recently sent byte was acknowledged.
	PLIB_I2C_TransmitterIsBusy	Identifies if the transmitter of the specified I2C module is currently busy (unable to accept more data).
	PLIB_I2C_TransmitterIsReady	Detects if the transmitter is ready to accept data to transmit.
	PLIB_I2C_TransmitterOverflowClear	Clears the transmitter overflow status flag.
	PLIB_I2C_TransmitterOverflowHasOccurred	Identifies if a transmitter overflow error has occurred.

Description

The I²C peripheral library consists of a set of interface routines, data types and constants, and macros provided by the [plib_i2c.h](#) header file. This section describes those items.

5.6.9.5.1 General Initialization Functions

5.6.9.5.1.1 PLIB_I2C_Disable Function

C

```
void PLIB_I2C_Disable(
    I2C_MODULE_ID index
);
```

Description

This function disables the specified I2C module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

None.

Remarks

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsModuleEnable](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_Disable( MY_I2C_ID );
```

5.6.9.5.1.2 PLIB_I2C_Enable Function

C

```
void PLIB_I2C_Enable(
    I2C_MODULE_ID index
);
```

Description

This function enables the specified I2C module.

Preconditions

The module should be appropriately configured before being enabled.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

None.

Remarks

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsModuleEnable](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID          I2C_ID_1
#define MY_CLOCK_FREQUENCY 80000000
#define MY_BAUD_RATE      10000
#define MY_SLAVE_ADDRESS  0x23

PLIB_I2C_SlaveClockStretchingEnable ( MY_I2C_ID );
PLIB_I2C_SMBDisable ( MY_I2C_ID );
PLIB_I2C_HighFrequencyDisable ( MY_I2C_ID );
PLIB_I2C_ReservedAddressProtectEnable ( MY_I2C_ID );
PLIB_I2C_StopInIdleDisable ( MY_I2C_ID );
PLIB_I2C_BaudRateSet ( MY_I2C_ID, MY_CLOCK_FREQUENCY, MY_BAUD_RATE );

PLIB_I2C_SlaveAddress7BitSet( MY_I2C_ID, MY_SLAVE_ADDRESS );
PLIB_I2C_Enable ( MY_I2C_ID );
```

5.6.9.5.1.3 PLIB_I2C_GeneralCallDisable Function

C

```
void PLIB_I2C_GeneralCallDisable(
    I2C_MODULE_ID index
);
```

Description

This function disables the I2C module from recognizing the general call address when operating as a slave receiver.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

None.

Remarks

The General-call feature can be re-enabled by calling the [PLIB_I2C_GeneralCallEnable](#) function.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsGeneralCall](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_GeneralCallDisable(MY_I2C_ID);
```

5.6.9.5.1.4 PLIB_I2C_GeneralCallEnable Function**C**

```
void PLIB_I2C_GeneralCallEnable(
    I2C_MODULE_ID index
);
```

Description

This function enables the I2C module to recognize the general call address when operating as a slave receiver.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

None.

Remarks

The General-call feature can be disabled by calling the [PLIB_I2C_GeneralCallDisable](#) function.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsGeneralCall](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_GeneralCallEnable ( MY_I2C_ID );
```

5.6.9.5.1.5 PLIB_I2C_HighFrequencyDisable Function**C**

```
void PLIB_I2C_HighFrequencyDisable(
    I2C_MODULE_ID index
);
```

Description

This function disables the I2C module from using high-frequency signaling, preventing it from using the 400 kHz and 1 MHz signaling rates.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

None.

Remarks

The high-frequency feature can be re-enabled by calling the [PLIB_I2C_HighFrequencyEnable](#) function.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsHighFrequency](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_HighFrequencyDisable ( MY_I2C_ID );
```

5.6.9.5.1.6 PLIB_I2C_HighFrequencyEnable Function**C**

```
void PLIB_I2C_HighFrequencyEnable(
    I2C_MODULE_ID index
);
```

Description

This function enables the I2C module to use high-frequency signaling, allowing it to use the 400 kHz and 1 MHz signaling rates.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

None.

Remarks

The high-speed feature can be disabled by calling the `PLIB_I2C_HighSpeedEnable` function.

This feature must be enabled if frequencies higher than 100 kHz programmed using the [PLIB_I2C_BaudRateSet](#) function.

The `MY_I2C_ID` macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsHighFrequency](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_HighFrequencyEnable ( MY_I2C_ID );
```

5.6.9.5.1.7 PLIB_I2C_IPMIDisable Function**C**

```
void PLIB_I2C_IPMIDisable(
    I2C_MODULE_ID index
);
```

Description

This function disables the I2C module's support for the IPMI specification.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

None.

Remarks

Please refer to the IPMI specification for details of the Intelligent Platform Management Interface. The IPMI specification is the property of Intel Corporation, Hewlett-Packard Company, NEC Corporation, and Dell Inc.

The `MY_I2C_ID` macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsIPMI](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_IPMIDisable ( MY_I2C_ID );
```

5.6.9.5.1.8 PLIB_I2C_IPMIEnable Function

C

```
void PLIB_I2C_IPMIEnable(  
    I2C_MODULE_ID index  
);
```

Description

This function enables the I2C module to support the IPMI specification.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

None.

Remarks

Please refer to the IPMI specification for details of the Intelligent Platform Management Interface. The IPMI specification is the property of Intel Corporation, Hewlett-Packard Company, NEC Corporation, and Dell Inc.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsIPMI](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1  
  
PLIB_I2C_IPMIEnable ( MY_I2C_ID );
```

5.6.9.5.1.9 PLIB_I2C_ReservedAddressProtectDisable Function

C

```
void PLIB_I2C_ReservedAddressProtectDisable(  
    I2C_MODULE_ID index  
);
```

Description

This function disables the I2C module from protecting reserved addresses, allowing it to respond to them when they match the module's slave address and mask.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

None.

Remarks

The reserved-address-protect feature can be re-enabled by calling the [PLIB_I2C_ReservedAddressProtectEnable](#) function.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsReservedAddressProtect](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_ReservedAddressProtectDisable ( MY_I2C_ID );
```

5.6.9.5.1.10 PLIB_I2C_ReservedAddressProtectEnable Function**C**

```
void PLIB_I2C_ReservedAddressProtectEnable(
    I2C_MODULE_ID index
);
```

Description

This function enables the I2C module to protect reserved addresses by not responding to them, even if they match the module's slave address and mask.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

None.

Remarks

The reserved-address-protect feature can be disabled by calling the [PLIB_I2C_ReservedAddressProtectDisable](#) function.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsReservedAddressProtect](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_ReservedAddressProtectEnable(MY_I2C_ID);
```

5.6.9.5.1.11 PLIB_I2C_SlaveClockStretchingDisable Function**C**

```
void PLIB_I2C_SlaveClockStretchingDisable(
    I2C_MODULE_ID index
);
```

Description

This function disables the I2C module from stretching the slave clock to allow time for software to respond to bytes received from the master.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

None.

Remarks

The clock stretching feature can be re-enabled by calling the [PLIB_I2C_SlaveClockStretchingEnable](#) function.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsClockStretching](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_SlaveClockStretchingDisable ( MY_I2C_ID );
```

5.6.9.5.1.12 PLIB_I2C_SlaveClockStretchingEnable Function**C**

```
void PLIB_I2C_SlaveClockStretchingEnable(
    I2C_MODULE_ID index
);
```

Description

This function enables the I2C module to stretch the slave clock to allow time for software to respond to bytes received from the master.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

None.

Remarks

The clock stretching feature can be disabled by calling the [PLIB_I2C_SlaveClockStretchingDisable](#) function.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsClockStretching](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_SlaveClockStretchingEnable ( MY_I2C_ID );
```

5.6.9.5.1.13 PLIB_I2C_SMBDisable Function**C**

```
void PLIB_I2C_SMBDisable(
    I2C_MODULE_ID index
);
```

Description

This function disables the I2C module support for SMBus electrical signaling levels.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

None.

Remarks

The SMB feature can be re-enabled by calling the [PLIB_I2C_SMBEnable](#) function.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsSMBus](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_SMBDisable ( MY_I2C_ID );
```

5.6.9.5.1.14 PLIB_I2C_SMBEnable Function**C**

```
void PLIB_I2C_SMBEnable(
    I2C_MODULE_ID index
);
```

Description

This function enables the I2C module to support SMBus electrical signaling levels.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

None.

Remarks

The SMB feature can be disabled by calling the [PLIB_I2C_SMBDisable](#) function.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsSMBus](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1  
  
PLIB_I2C_SMBEnable ( MY_I2C_ID );
```

5.6.9.5.1.15 PLIB_I2C_StopInIdleDisable Function**C**

```
void PLIB_I2C_StopInIdleDisable(  
    I2C_MODULE_ID index  
);
```

Description

This function disables the Stop-in-Idle feature, preventing the I2C module from stopping when the processor enters Idle mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

None.

Remarks

The Stop-in-Idle feature can be re-enabled by calling the [PLIB_I2C_StopInIdleEnable](#) function.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsStopInIdle](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1  
  
PLIB_I2C_StopInIdleDisable ( MY_I2C_ID );
```

5.6.9.5.1.16 PLIB_I2C_StopInIdleEnable Function

C

```
void PLIB_I2C_StopInIdleEnable(  
    I2C_MODULE_ID index  
);
```

Description

This function enables the I2C module to stop when the processor enters Idle mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

None.

Remarks

The Stop-in-Idle feature can be disabled by calling the [PLIB_I2C_StopInIdleDisable](#) function.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsStopInIdle](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1  
  
PLIB_I2C_StopInIdleEnable ( MY_I2C_ID );
```

5.6.9.5.2 General Status Functions

5.6.9.5.2.1 PLIB_I2C_ArbitrationLossClear Function

C

```
void PLIB_I2C_ArbitrationLossClear(  
    I2C_MODULE_ID index  
);
```

Description

This function clears the arbitration loss status flag.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

None.

Remarks

This flag is set by hardware when bus arbitration loss occurs. Its status can be tested using the [PLIB_I2C_ArbitrationLossHasOccurred](#) function. This flag should be cleared by software after the arbitration loss has been handled. To handle the error, the entire transmission (from the Start condition to the Stop or restart condition) must be retried later when the bus becomes idle.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsArbitrationLoss](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1

if ( PLIB_I2C_ArbitrationLossHasOccurred ( MY_I2C_ID ) )
{
    // Handle bus collision

    PLIB_I2C_ArbitrationLossClear ( MY_I2C_ID );
}
```

5.6.9.5.2.2 PLIB_I2C_ArbitrationLossHasOccurred Function**C**

```
bool PLIB_I2C_ArbitrationLossHasOccurred(
    I2C_MODULE_ID index
);
```

Description

This function identifies if bus arbitration has been lost.

Preconditions

Bus collisions can occur during any master-mode transmission including:

- Sending a Start condition
- Sending a repeated Start condition
- Sending an address or data byte
- sending an ACK/NAK bit
- Sending a Stop condition

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

- true - If software if a bus collision occurred, resulting in loss of bus arbitration
- false - If no bus collision occurred

Remarks

The arbitration status should be checked after any Master mode transmission or if an error interrupt occurs. If a bus collision occurs, the entire transmission (from the Start condition to the Stop or restart condition) must be retried later when the bus becomes idle.

This flag should be cleared by software using the [PLIB_I2C_ArbitrationLossClear](#) function.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsArbitrationLoss](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1

if ( PLIB_I2C_ArbitrationLossHasOccurred ( MY_I2C_ID ) )
{
    // Handle bus collision

    PLIB_I2C_ArbitrationLossClear( MY_I2C_ID );
}
```

5.6.9.5.2.3 PLIB_I2C_BusIsIdle Function

C

```
bool PLIB_I2C_BusIsIdle(
    I2C_MODULE_ID index
);
```

Description

This function checks to see if the I2C bus is currently idle or if there is some activity currently taking place.

Preconditions

The module must be configured appropriately and enabled.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

- true - The bus is currently idle. It is safe to start a master transfer.
- false - The bus is currently busy. Do not start a master transfer.

Remarks

When this function returns true it does not guarantee that a bus arbitration loss cannot occur. Two or more masters can start a transfer within the minimum start signal hold time. (Refer to the I2C specification for a definition of the minimum Start condition hold time.)

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsBusIsIdle](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1
```

```
if (PLIB_I2C_BusIsIdle ( MY_I2C_ID ))
{
    PLIB_I2C_MasterStart ( MY_I2C_ID );
}
```

5.6.9.5.2.4 PLIB_I2C_StartClear Function

C

```
void PLIB_I2C_StartClear(
    I2C_MODULE_ID index
);
```

Description

This function clears the start status flag.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

None.

Remarks

This flag is cleared automatically by the hardware when a Stop condition is detected, but it can also be cleared by software.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsStartDetect](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1

if ( PLIB_I2C_StartWasDetected( MY_I2C_ID ) )
{
    // Handle Start condition

    PLIB_I2C_StartClear(MY_I2C_ID);
}
```

5.6.9.5.2.5 PLIB_I2C_StartWasDetected Function

C

```
bool PLIB_I2C_StartWasDetected(
    I2C_MODULE_ID index
);
```

Description

This function identifies when a Start condition has been detected.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

- true - A Start Condition has been detected
- false - No Start condition has been detected since the last time a Stop condition was detected (or the module was initialized)

Remarks

This flag is cleared automatically by the hardware when a stop condition is detected, but it can also be cleared by software using [PLIB_I2C_StartClear](#) function.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsStartDetect](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1

if ( PLIB_I2C_StartWasDetected ( MY_I2C_ID ) )
{
    // Handle Start condition
}
```

5.6.9.5.2.6 PLIB_I2C_StopClear Function**C**

```
void PLIB_I2C_StopClear(
    I2C_MODULE_ID index
);
```

Description

This function clears the stop status flag.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

None.

Remarks

This flag is cleared automatically by the hardware when a Start condition is detected, but it can also be cleared by software.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsStopDetect](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1

if ( PLIB_I2C_StopWasDetected ( MY_I2C_ID ) )
{
    // Handle stop condition

    PLIB_I2C_StopClear ( MY_I2C_ID );
}
```

5.6.9.5.2.7 PLIB_I2C_StopWasDetected Function**C**

```
bool PLIB_I2C_StopWasDetected(
    I2C_MODULE_ID index
);
```

Description

This function identifies when a Stop condition has been detected.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

- true - A Stop condition has been detected
- false - No Stop condition has been detected since the last time a Start condition was detected (or the module was initialized)

Remarks

This flag is cleared automatically by the hardware when a Start condition is detected, but it can also be cleared by software using the [PLIB_I2C_StopClear](#) function.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsStopDetect](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1

if ( PLIB_I2C_StopWasDetected ( MY_I2C_ID ) )
{
    // Handle stop condition
}
```

5.6.9.5.3 Baud Rate Generator Control Functions

5.6.9.5.3.1 PLIB_I2C_BaudRateGet Function

C

```
I2C_BAUD_RATE PLIB_I2C_BaudRateGet(  
    I2C_MODULE_ID index,  
    uint32_t clockFrequencyHz  
);
```

Description

This function calculates the I2C module's current SCL clock frequency.

Preconditions

The returned value may not be valid if [PLIB_I2C_BaudRateSet](#) has not been previously called to set the SCL clock frequency.

Parameters

Parameters	Description
index	Identifies the desired I2C module
clockFrequencyHz	Clock Frequency (Hz) provided for the I2C module

Returns

SCL frequency currently used

Remarks

The actual frequency provided may be slightly different than the frequency requested due to truncation errors. The actual frequency observed on the SCL line may be lower due to clock stretching.

The MY_CLOCK_FREQUENCY macro in the example is used as placeholder for the actual clock frequency.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsBaudRate](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1  
#define MY_CLOCK_FREQ_INPUT 80000000  
uint32_t myBaudRate;  
  
myBaudRate = PLIB_I2C_BaudRateGet ( MY_I2C_ID, MY_CLOCK_FREQ_INPUT );
```

5.6.9.5.3.2 PLIB_I2C_BaudRateSet Function

C

```
void PLIB_I2C_BaudRateSet(  
    I2C_MODULE_ID index,  
    uint32_t clockFrequencyHz,  
    I2C_BAUD_RATE baudRate  
);
```

Description

This function sets the desired baud rate so that the I2C module will operate at the desired clock frequency (on the SCL line of the bus.)

Preconditions

The source clock, being sent to the I2C module (internal to the microcontroller) must be operating at the frequency passed.

Parameters

Parameters	Description
index	Identifies the desired I2C module
clockFrequencyHz	Clock Frequency (Hz)
baudRate	The desired baud rate value. This should be an appropriate value for the frequency and microcontroller in use.

Returns

None.

Remarks

IMPORTANT: The I2C module's high-frequency mode must be enabled for frequencies higher than 100 kHz using the [PLIB_I2C_HighFrequencyEnable](#) function. Otherwise, the high-frequency mode must be disabled using the [PLIB_I2C_HighFrequencyDisable](#) function.

The actual frequency selected may be slightly different than the frequency requested due to truncation errors. Use the [PLIB_I2C_BaudRateGet](#) function to obtain the actual baud rate value that has been programmed.

The actual frequency observed on the SCL line may be lower due to clock stretching.

If the system clock is changed during an active receive operation, a receiver error or data loss may result. To avoid this issue, verify that no receptions are in progress before changing the system clock.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsBaudRate](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1
#define MY_CLOCK_FREQUENCY_INPUT 80000000

PLIB_I2C_HighFrequencyDisable ( MY_I2C_ID );
PLIB_I2C_BaudRateSet ( MY_I2C_ID, MY_CLOCK_FREQUENCY_INPUT, 40000 );
```

5.6.9.5.4 Slave Address Control Functions**5.6.9.5.4.1 PLIB_I2C_SlaveAddress10BitGet Function****C**

```
uint16_t PLIB_I2C_SlaveAddress10BitGet(
    I2C_MODULE_ID index
);
```

Description

This function identifies the 10-bit slave address to which the module will currently respond.

Preconditions

The address provided may not be valid if it has not been previously set.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

The 10-bit slave address to which the module is currently set to respond.

Remarks

The 16-bit address will be right-aligned in the 16-bit return value.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsSlaveAddress10Bit](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1
uint16_t slaveAddress;

if (PLIB_I2C_SlaveAddressModeIs10Bits ( MY_I2C_ID ) )
{
    slaveAddress = PLIB_I2C_SlaveAddress10BitGet ( MY_I2C_ID );
}
```

5.6.9.5.4.2 PLIB_I2C_SlaveAddress10BitSet Function

C

```
void PLIB_I2C_SlaveAddress10BitSet(
    I2C_MODULE_ID index,
    uint16_t address
);
```

Description

This function selects 10-bit Slave mode addressing sets the slave address to which the module will respond when operating in Slave mode.

Preconditions

None

Parameters

Parameters	Description
index	Identifies the desired I2C module
address	The 10-bit slave address to which the module will respond (The address should be right-aligned in the 16-bit parameter, without any read/write bit in the 0 position)

Returns

None.

Remarks

I2C modules on some microcontroller families may also support an address mask (to allow the module to respond to multiple addresses. When using these microcontrollers, the [PLIB_I2C_SlaveAddress10BitSetMasked](#) may be used to support the mask feature. Refer to the specific device data sheet to determine whether this feature is supported for your device.

The MY_SLAVE_ADDRESS_10_BIT macro in the example is used as a placeholder for the actual desired slave address.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsSlaveAddress10Bit](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1
#define MY_SLAVE_ADDR_10_BIT    0x23

PLIB_I2C_SlaveAddress10BitSet ( MY_I2C_ID, MY_SLAVE_ADDR_10_BIT );
```

5.6.9.5.4.3 PLIB_I2C_SlaveAddress10BitWasDetected Function**C**

```
bool PLIB_I2C_SlaveAddress10BitWasDetected(
    I2C_MODULE_ID index
);
```

Description

This function detects if the second byte of a 10-bit slave address (containing the low-order 8 bits) matching the local address has been received.

Preconditions

The module must have been configured for 10-bit addressing in Slave mode, enabled, and the first byte of the 10-bit local slave address must have already been received and matched.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

- true - If the second byte of the local 10-bit address has been received
- false - If the second byte of the local 10-bit address has not been received

Remarks

This function should only be used by slave receivers.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsSlaveAddressDetect](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1
uint8_t i2cReadData;

if ( PLIB_I2C_SlaveAddress10BitWasDetected ( MY_I2C_ID ) )
{
    i2cReadData = PLIB_I2C_ReceivedByteGet ( MY_I2C_ID );
}
```

5.6.9.5.4.4 PLIB_I2C_SlaveAddress7BitGet Function**C**

```
uint8_t PLIB_I2C_SlaveAddress7BitGet(
    I2C_MODULE_ID index
);
```

Description

This function identifies the 7-bit slave address to which the module will currently respond.

Preconditions

The address provided may not be valid if it has not been previously set.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

The 7-bit slave address to which the module is currently set to respond.

Remarks

The 7-bit address will be right-aligned in the 8-bit return value.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsSlaveAddress7Bit](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1
uint8_t slave_address7bit;

if (!PLIB_I2C_SlaveAddressModeIs10Bits ( MY_I2C_ID ) )
{
    slave_address7bit = PLIB_I2C_SlaveAddress7BitGet ( MY_I2C_ID );
}
```

5.6.9.5.4.5 PLIB_I2C_SlaveAddress7BitSet Function**C**

```
void PLIB_I2C_SlaveAddress7BitSet(
    I2C_MODULE_ID index,
    uint8_t address
);
```

Description

This function selects 7-bit Slave mode addressing sets the address to which the module will respond when operating in Slave mode.

Preconditions

None

Parameters

Parameters	Description
index	Identifies the desired I2C module
address	The 7-bit slave address to which the module will respond (The address should be right-aligned in the 8-bit parameter, without any read/write bit in the 0 position)

Returns

None.

Remarks

I2C modules on some microcontroller families may also support an address mask (to allow the module to respond to multiple addresses. When using these microcontrollers, the [PLIB_I2C_SlaveAddress7BitSetMasked](#) may be used to support the mask feature. Refer to the specific device data sheet to determine whether this feature is supported for your device.

The MY_SLAVE_ADDRESS_7_BIT macro in the example is used as a placeholder for the actual desired slave address.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsSlaveAddress7Bit](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_SlaveAddress7BitSet ( MY_I2C_ID, MY_SLAVE_ADDRESS_7_BIT );
```

5.6.9.5.4.6 PLIB_I2C_SlaveAddressHoldDisable Function

C

```
void PLIB_I2C_SlaveAddressHoldDisable(
    I2C_MODULE_ID index
);
```

Description

This function disables address holding.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

None.

Remarks

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_SlaveAddressHoldEnable](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_SlaveAddressHoldDisable ( MY_I2C_ID );
```

5.6.9.5.4.7 PLIB_I2C_SlaveAddressHoldEnable Function

C

```
void PLIB_I2C_SlaveAddressHoldEnable(
    I2C_MODULE_ID index
);
```

Description

This function enables address holding. If address byte is received, following the 8th falling edge of clock for a clock line will be held low.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

None.

Remarks

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use `PLIB_I2C_SlaveAddressHoldEnable` in your application to determine whether this feature is available.

This API is applicable only in I2C slave mode.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_SlaveAddressHoldEnable ( MY_I2C_ID );
```

5.6.9.5.4.8 PLIB_I2C_SlaveAddressIsDetected Function**C**

```
bool PLIB_I2C_SlaveAddressIsDetected(
    I2C_MODULE_ID index
);
```

Description

This function identifies if the most recent byte received was a data byte or an address byte.

Preconditions

The module must have been configured appropriately and enabled, and a transfer must have been previously started.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

- true - If the byte received is an address byte
- false - If the byte received is a data byte

Remarks

This function should only be used by slave receivers.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsSlaveReadRequest](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1
uint8_t getData;

if ( PLIB_I2C_ReceivedByteIsAvailable ( MY_I2C_ID ) )
{
    if ( PLIB_I2C_SlaveAddressIsDetected ( MY_I2C_ID ) )
    {
```

```

    if ( PLIB_I2C_SlaveReadIsRequested ( MY_I2C_ID ) )
    {
        // Begin slave transmit mode
    }
    else
    {
        // Begin slave receive mode
    }
}

// Read the data and release the bus
getData = PLIB_I2C_ReceivedByteGet ( MY_I2C_ID );
PLIB_I2C_SlaveClockRelease ( MY_I2C_ID );
}

```

5.6.9.5.4.9 PLIB_I2C_SlaveAddressIsGeneralCall Function

C

```

bool PLIB_I2C_SlaveAddressIsGeneralCall(
    I2C_MODULE_ID index
);

```

Description

This function identifies if the current slave address received is the general call address.

Preconditions

A slave address must have been received.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

- true - If the slave address received is the general call address
- false - if the slave address received is not the general call address

Remarks

This bit is set when the general call address has been received.

This bit is automatically cleared by hardware when a Stop condition occurs and cannot be cleared by software.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsGeneralCallAddressDetect](#) in your application to determine whether this feature is available.

Example

```

#define MY_I2C_ID I2C_ID_1
uint8_t slaveAddress7Bit;

if ( !PLIB_I2C_SlaveAddressModeIs10Bits ( MY_I2C_ID ) )
{
    if ( PLIB_I2C_SlaveAddressIsGeneralCall( MY_I2C_ID ) )
    {
        // Handle general call address
    }

    slaveAddress7Bit = PLIB_I2C_SlaveAddress7BitGet ( MY_I2C_ID );
}

```

```
}
```

5.6.9.5.4.10 PLIB_I2C_SlaveAddressModeIs10Bits Function

C

```
bool PLIB_I2C_SlaveAddressModeIs10Bits(  
    I2C_MODULE_ID index  
);
```

Description

This function identifies if the current slave addressing mode is 7-bits or 10-bits.

Preconditions

The mode provided may not be valid if the address mode has not been previously set.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

- true - If the current slave addressing mode is 10-bits
- false - if the current slave addressing mode is 7-bits

Remarks

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsSlaveAddress10Bit](#) in your application to determine whether this feature is available.

Example

```
uint8_t slave_address7Bit;  
uint16_t slave_address10Bit;  
  
if ( PLIB_I2C_SlaveAddressModeIs10Bits ( MY_I2C_ID ) )  
{  
    slave_address10Bit = PLIB_I2C_SlaveAddress10BitGet ( MY_I2C_ID );  
}  
else  
{  
    slave_address7Bit = PLIB_I2C_SlaveAddress7BitGet ( MY_I2C_ID );  
}
```

5.6.9.5.4.11 PLIB_I2C_SlaveDataIsDetected Function

C

```
bool PLIB_I2C_SlaveDataIsDetected(  
    I2C_MODULE_ID index  
);
```

Description

This function identifies if the most recent byte received was a data byte or an address byte.

Preconditions

The module must have been configured appropriately and enabled, and a transfer must have been previously started.

Parameters

Parameters	Description
index	Identifies the desired I2C module.

Returns

- true - If the byte received is a data byte
- false - If the byte received is an address byte

Remarks

This function should only be used by slave receivers.

This function returns the opposite of the [PLIB_I2C_SlaveAddressIsDetected](#) function.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsSlaveDataDetect](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1
uint8_t dataReceived;

if ( PLIB_I2C_ReceivedByteIsAvailable ( MY_I2C_ID ) )
{
    if ( PLIB_I2C_SlaveDataIsDetected( MY_I2C_ID ) )
    {
        // Read the data and release the bus
        dataReceived = PLIB_I2C_ReceivedByteGet ( MY_I2C_ID );
        PLIB_I2C_SlaveClockRelease ( MY_I2C_ID );
    }
}
```

5.6.9.5.4.12 PLIB_I2C_SlaveReadIsRequested Function**C**

```
bool PLIB_I2C_SlaveReadIsRequested(
    I2C_MODULE_ID index
);
```

Description

This function identifies if a slave read (transmit) or a slave write (receive) was requested by the master that addressed the module.

Preconditions

The module must have been configured appropriately and enabled, and a transfer must have been previously started.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

- true - If an external master is requesting data (slave read/transmit)
- false - If an external master is sending data (slave write/receive)

Remarks

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsSlaveReadRequest](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1
uint8_t slaveTxData;
uint8_t slaveRxData;

if ( PLIB_I2C_SlaveReadIsRequested ( MY_I2C_ID ) )
{
    if ( PLIB_I2C_TransmitterIsReady ( MY_I2C_ID ) )
    {
        PLIB_I2C_TransmitterByteSend ( MY_I2C_ID, slaveTxData );
    }
}
else
{
    slaveRxData = PLIB_I2C_ReceivedByteGet ( MY_I2C_ID );
}
```

5.6.9.5.5 Slave Mask Control Functions

5.6.9.5.5.1 PLIB_I2C_SlaveMask10BitGet Function

C

```
uint16_t PLIB_I2C_SlaveMask10BitGet(
    I2C_MODULE_ID index
);
```

Description

This function identifies the 10-bit slave address mask that is currently being used to determine which slave addresses the module will respond.

Preconditions

The address mask provided may not be valid if it has not been previously been set.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

The 10-bit slave address mask that the module is currently using to determine to which addresses the module will respond.

Remarks

The 10-bit address mask will be Right-aligned in the 16-bit return value.

This function is not supported on microcontrollers with I2C modules that do not support the slave address mask feature. Refer to the specific device data sheet to determine whether this feature is supported for your device.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use

[PLIB_I2C_ExistsSlaveMask](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1

uint16_t slave_address;
uint16_t slave_addressMask;

if ( PLIB_I2C_SlaveAddressModeIs10Bits ( MY_I2C_ID ) )
{
    slave_address      = PLIB_I2C_SlaveAddress10BitGet ( MY_I2C_ID );
    slave_addressMask = PLIB_I2C_SlaveMask10BitGet ( MY_I2C_ID );
}
```

5.6.9.5.5.2 PLIB_I2C_SlaveMask10BitSet Function

C

```
void PLIB_I2C_SlaveMask10BitSet(
    I2C_MODULE_ID index,
    uint16_t mask
);
```

Description

This function sets the 10-bit mask for Slave mode addressing. The address mask (if supported) is used, along with the slave address to identify to which addresses the module will respond when operating in Slave mode. It acts as an "ignore" mask, allowing the module to ignore bits within the slave address and thus respond to multiple slave addresses on microcontrollers with I2C modules that support the mask feature.

Preconditions

None

Parameters

Parameters	Description
index	Identifies the desired I2C module
mask	This parameter identifies bits in the address that are "don't care" bits. These bits will be ignored when attempting to match the address, effectively allowing the module to recognize multiple slave addresses. (To match an address exactly, this
value must be zero (0).) (This value must also be right	aligned in the 16-bit parameter.)

Returns

None.

Remarks

I2C modules on some microcontroller families may not support the mask feature, in which case the `PLIB_I2C_SlaveMask10BitSet` function will not be supported. Refer to the specific device data sheet to determine whether his feature is supported for your device.

The `MY_SLAVE_ADDRESS_10_BIT` and `MY_SLAVE_ADDRESS_MASK_10_BIT` macros in the example code are used as placeholders for the actual desired slave address and mask that must be filled in by the caller.

The `MY_I2C_ID` macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific `I2C_MODULE_ID` enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsSlaveMask](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID          I2C_ID_1
#define MY_SLAVE_ADDR_10_BIT 0x23
#define MY_SLAVE_ADDR_MASK_10_BIT 0x12

PLIB_I2C_SlaveAddress10BitSet ( MY_I2C_ID, MY_SLAVE_ADDR_10_BIT );
PLIB_I2C_SlaveMask10BitSet ( MY_I2C_ID, MY_SLAVE_ADDR_MASK_10_BIT );
```

5.6.9.5.5.3 PLIB_I2C_SlaveMask7BitGet Function**C**

```
uint8_t PLIB_I2C_SlaveMask7BitGet(
    I2C_MODULE_ID index
);
```

Description

This function identifies the 7-bit Slave mode address mask that is currently being used to determine which slave addresses the module will respond.

Preconditions

The address mask provided may not be valid if it has not been previously been set.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

The 7-bit Slave mode address mask that the module is currently using to determine to which addresses the module will respond.

Remarks

The 7-bit address mask will be right-aligned in the 8-bit return value.

This function is not supported on microcontrollers with I2C modules that do not support the slave address mask feature. Refer to the specific device data sheet to determine whether this feature is supported for your device.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsSlaveMask](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1
uint8_t slaveAddr;
uint8_t slaveAddressMsk;

if ( !PLIB_I2C_SlaveAddressModeIs10Bits ( MY_I2C_ID ) )
{
    slaveAddr      = PLIB_I2C_SlaveAddress7BitGet ( MY_I2C_ID );
    slaveAddressMsk = PLIB_I2C_SlaveMask7BitGet ( MY_I2C_ID );
}
```

5.6.9.5.5.4 PLIB_I2C_SlaveMask7BitSet Function**C**

```
void PLIB_I2C_SlaveMask7BitSet(
    I2C_MODULE_ID index,
    uint8_t mask
```

```
);
```

Description

This function sets the 7-bit mask for Slave mode addressing. The address mask (if supported) is used, along with the slave address to identify to which addresses the module will respond when operating in Slave mode. It acts as an "ignore" mask, allowing the module to ignore bits within the slave address and will respond to multiple slave addresses on microcontrollers with I2C modules that support the mask feature.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired I2C module
mask	This parameter identifies bits in the address that are "don't care" bits. These bits will be ignored when attempting to match the address, effectively allowing the module to recognize multiple slave addresses. (To match an address exactly, this parameter must be zero (0).)

Returns

None.

Remarks

I2C modules on some microcontroller families may not support the mask feature, in which case the `PLIB_I2C_SlaveMask7BitSet` function will not be supported. Refer to the specific device data sheet to determine whether this feature is supported for your device.

The `MY_SLAVE_ADDRESS_7_BIT` and `MY_SLAVE_ADDRESS_MASK_7_BIT` macros in the example code are used as placeholders for the actual desired slave address and mask that must be filled in by the caller.

The `MY_I2C_ID` macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific `I2C_MODULE_ID` enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsSlaveMask](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID           I2C_ID_1
#define MY_SLAVE_ADDR_7_BIT 0x23
#define MY_SLAVE_ADDR_MASK_7_BIT 0x12

PLIB_I2C_SlaveAddress7BitSet ( MY_I2C_ID, MY_SLAVE_ADDR_7_BIT );
PLIB_I2C_SlaveMask7BitSet ( MY_I2C_ID, MY_SLAVE_ADDR_MASK_7_BIT );
```

5.6.9.5.6 Slave Control Functions

5.6.9.5.6.1 PLIB_I2C_AcksequenceIsInProgress Function

C

```
bool PLIB_I2C_AcksequenceIsInProgress(
    I2C_MODULE_ID index
);
```

Description

This function checks whether the acknowledge sequence is in progress or it is completed.

Preconditions

The module must have been configured appropriately and enabled.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

true - Acknowledge sequence is in progress. false - Acknowledge sequence is not started or completed.

Remarks

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsAcksequenceProgress](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1

if ( PLIB_I2C_AcksequenceIsInProgress ( MY_I2C_ID ) )
{
    //Transmission completed
}
```

5.6.9.5.6.2 PLIB_I2C_DataLineHoldTimeSet Function**C**

```
void PLIB_I2C_DataLineHoldTimeSet(
    I2C_MODULE_ID index,
    I2C_SDA_MIN_HOLD_TIME sdaHoldTimeNs
);
```

Description

This function sets the data line hold time.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired I2C module.
sdaHoldTimeNs	SDA hold time in nano seconds.

Returns

None.

Remarks

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsDataLineHoldTime](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_PLIB_I2C_DataLineHoldTimeSet ( MY_I2C_ID, I2C_SDA_MIN_HOLD_TIME_300NS );
```

5.6.9.5.6.3 PLIB_I2C_SlaveBufferOverwriteDisable Function**C**

```
void PLIB_I2C_SlaveBufferOverwriteDisable(
    I2C_MODULE_ID index
);
```

Description

This function disables buffer overwrite. If the buffer overwrite is disabled, on data receive, when the previous data is not read, the buffer will not be overwritten.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

None.

Remarks

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsSlaveBufferOverwrite](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_SlaveBufferOverwriteDisable ( MY_I2C_ID );
```

5.6.9.5.6.4 PLIB_I2C_SlaveBufferOverwriteEnable Function**C**

```
void PLIB_I2C_SlaveBufferOverwriteEnable(
    I2C_MODULE_ID index
);
```

Description

This function enables buffer overwrite. If the buffer overwrite is enabled, on data receive, even if the previous data is not read, the buffer will be filled with new data and acknowledge will be generated.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

None.

Remarks

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsSlaveBufferOverwrite](#) in your application to determine whether this feature is available.

This API is applicable only in I2C slave mode.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_SlaveBufferOverwriteEnable ( MY_I2C_ID );
```

5.6.9.5.6.5 PLIB_I2C_SlaveBusCollisionDetectDisable Function**C**

```
void PLIB_I2C_SlaveBusCollisionDetectDisable(
    I2C_MODULE_ID index
);
```

Description

This function disables bus collision detect interrupts.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

None.

Remarks

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_SlaveBusCollisionDetect](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_SlaveBusCollisionDetectDisable ( MY_I2C_ID );
```

5.6.9.5.6.6 PLIB_I2C_SlaveBusCollisionDetectEnable Function**C**

```
void PLIB_I2C_SlaveBusCollisionDetectEnable(
    I2C_MODULE_ID index
);
```

Description

This function enables bus collision interrupts.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

None.

Remarks

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use PLIB_I2C_SlaveBusCollisionDetect in your application to determine whether this feature is available.

This API is applicable only in I2C slave mode.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_SlaveAddressHoldEnable ( MY_I2C_ID );
```

5.6.9.5.6.7 PLIB_I2C_SlaveClockHold Function**C**

```
void PLIB_I2C_SlaveClockHold(
    I2C_MODULE_ID index
);
```

Description

This function allows an I2C slave to stretch the SCL clock line, holding it low to throttle data transfer from a master transmitter.

Preconditions

The module must have been configured appropriately and enabled, and a transfer must have been previously started by an external master.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

None.

Remarks

This function will cause the SCL line to be forced low, after the current byte has been fully received.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use

[PLIB_I2C_ExistsSlaveClockHold](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_SlaveClockHold ( MY_I2C_ID );
```

5.6.9.5.6.8 PLIB_I2C_SlaveClockRelease Function**C**

```
void PLIB_I2C_SlaveClockRelease(
    I2C_MODULE_ID index
);
```

Description

This function allows a slave receiver to release a previously held SCL clock line, allowing it to go high and allowing data transfer to continue.

Preconditions

The module must have been configured appropriately and enabled, and a transfer must have been previously started by an external master, and the SCL clock line should have been previously held (forced low) by the I2C module.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

None.

Remarks

Calling this function when the clock has not been held will not cause any problems.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsSlaveClockHold](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_SlaveClockRelease ( MY_I2C_ID );
```

5.6.9.5.6.9 PLIB_I2C_SlaveDataHoldDisable Function**C**

```
void PLIB_I2C_SlaveDataHoldDisable(
    I2C_MODULE_ID index
);
```

Description

This function disables data holding.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

None.

Remarks

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_SlaveDataHoldEnable](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_SlaveDataHoldDisable ( MY_I2C_ID );
```

5.6.9.5.6.10 PLIB_I2C_SlaveDataHoldEnable Function**C**

```
void PLIB_I2C_SlaveDataHoldEnable(
    I2C_MODULE_ID index
);
```

Description

This function enables data holding. If a data byte is received, following the 8th falling edge of clock for a clock line will be held low.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

None.

Remarks

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_SlaveDataHoldEnable](#) in your application to determine whether this feature is available.

This API is supported only for the slave mode of I2C.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_SlaveDataHoldEnable ( MY_I2C_ID );
```

5.6.9.5.6.11 PLIB_I2C_SlaveInterruptOnStartDisable Function

C

```
void PLIB_I2C_SlaveInterruptOnStartDisable(  
    I2C_MODULE_ID index  
);
```

Description

This function disables the feature of generating interrupt on start condition.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

None.

Remarks

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsSlaveInterruptOnStart](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1  
  
PLIB_I2C_SlaveInterruptOnStartDisable ( MY_I2C_ID );
```

5.6.9.5.6.12 PLIB_I2C_SlaveInterruptOnStartEnable Function

C

```
void PLIB_I2C_SlaveInterruptOnStartEnable(  
    I2C_MODULE_ID index  
);
```

Description

This function enables the feature of generating interrupt on start condition.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

None.

Remarks

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsSlaveInterruptOnStart](#) in your application to determine whether this feature is available.

This API is applicable only in I2C slave mode.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_SlaveInterruptOnStartEnable ( MY_I2C_ID );
```

5.6.9.5.6.13 PLIB_I2C_SlaveInterruptOnStopDisable Function

C

```
void PLIB_I2C_SlaveInterruptOnStopDisable(
    I2C_MODULE_ID index
);
```

Description

This function disables the feature of generating interrupt on stop condition.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

None.

Remarks

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsSlaveInterruptOnStop](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_SlaveInterruptOnStopDisable ( MY_I2C_ID );
```

5.6.9.5.6.14 PLIB_I2C_SlaveInterruptOnStopEnable Function

C

```
void PLIB_I2C_SlaveInterruptOnStopEnable(
    I2C_MODULE_ID index
);
```

Description

This function enables the feature of generating interrupt on stop condition.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

None.

Remarks

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsSlaveInterruptOnStop](#) in your application to determine whether this feature is available.

This API is applicable only in I2C slave mode.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_SlaveInterruptOnStopEnable ( MY_I2C_ID );
```

5.6.9.5.7 Master Control Functions

5.6.9.5.7.1 PLIB_I2C_MasterReceiverClock1Byte Function

C

```
void PLIB_I2C_MasterReceiverClock1Byte(
    I2C_MODULE_ID index
);
```

Description

This function drives the bus clock to receive 1 byte of data from a slave device.

Preconditions

The module must have been configured appropriately and enabled, a transfer must have been previously started, and the module must be the intended receiver of the next byte of data.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

None.

Remarks

The module stops driving the bus clock after the reception of a single byte of data and this function must be called again to receive another byte.

After the module has finished receiving a data byte (determined by responding to an I2C master interrupt and/or by checking the [PLIB_I2C_ReceivedByteIsAvailable](#) function), software should check the [PLIB_I2C_ReceiverOverflowHasOccurred](#) function to ensure that no data was lost because the receiver buffer was full when the byte was completely received and ready to be placed into the receiver buffer.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the

processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsMasterReceiverClock1Byte](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_MasterReceiverClock1Byte ( MY_I2C_ID );
```

5.6.9.5.7.2 PLIB_I2C_MasterStart Function

C

```
void PLIB_I2C_MasterStart(
    I2C_MODULE_ID index
);
```

Description

This function sends the start signal (a falling edge on SDA while SCL is high) to start a transfer on the I2C bus when acting in Master mode.

Preconditions

The module must have been configured appropriately and enabled and the I2C bus must currently be idle.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

None.

Remarks

Only an I2C master can start a transfer on the bus. The bus is considered to be busy after a Start condition.

After the Start condition has completed (detected by responding to the I2C master interrupt), software should check for arbitration loss by calling the [PLIB_I2C_ArbitrationLossHasOccurred](#) function.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsMasterStart](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1

if ( PLIB_I2C_BusIsIdle ( MY_I2C_ID ) )
{
    PLIB_I2C_MasterStart ( MY_I2C_ID );
}
```

5.6.9.5.7.3 PLIB_I2C_MasterStartRepeat Function

C

```
void PLIB_I2C_MasterStartRepeat(
    I2C_MODULE_ID index
);
```

Description

This function supports sending a repeated Start condition to change slave targets or transfer direction to support certain I2C transfer formats in Master mode.

Preconditions

The module must have been configured appropriately and enabled, and a transfer must have been previously started.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

None.

Remarks

Only an I2C master that has already started a transfer can [send](#) a repeated Start condition.

After the repeated-start condition has completed (detected by responding to the I2C master interrupt), software should check for arbitration loss by the [PLIB_I2C_ArbitrationLossHasOccurred](#) function.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsMasterStartRepeat](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_MasterStartRepeat ( MY_I2C_ID );
```

5.6.9.5.7.4 PLIB_I2C_MasterStop Function

C

```
void PLIB_I2C_MasterStop(
    I2C_MODULE_ID index
);
```

Description

This function sends the stop signal (a rising edge on SDA while SCL is high) on the I2C bus, to end a transfer on the I2C bus when in Master mode.

Preconditions

The module must have been configured appropriately, enabled, and a previously started transfer must be completed.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

None.

Remarks

Only an I2C master that has already started a transfer can [send](#) a Stop condition.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsMasterStop](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1

PLIB_I2C_MasterStop ( MY_I2C_ID );
```

5.6.9.5.8 Transmitter Control Functions

5.6.9.5.8.1 PLIB_I2C_TransmitterByteHasCompleted Function

C

```
bool PLIB_I2C_TransmitterByteHasCompleted(
    I2C_MODULE_ID index
);
```

Description

This function determines if the transmitter has finished sending the most recently sent byte on the I2C bus.

Preconditions

The module must have been configured appropriately and enabled, a transfer must have been previously started, and a data or address byte must have been sent.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

- true - If the transmitter has completed sending the data byte
- false - If the transmitter is still busy sending the data byte

Remarks

This function should be used by both master and slave transmitters.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsTransmitterByteComplete](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1

if ( PLIB_I2C_TransmitterByteHasCompleted ( MY_I2C_ID ) )
{
    //Transmission completed
}
```

5.6.9.5.8.2 PLIB_I2C_TransmitterByteSend Function

C

```
void PLIB_I2C_TransmitterByteSend(
```

```

    I2C_MODULE_ID index,
    uint8_t data
);

```

Description

This function allows the caller to [send](#) a byte of data on the I2C bus.

Preconditions

The module must have been configured appropriately and enabled, a transfer must have been previously started, and the I2C module's transmitter must be ready to [accept](#) a byte of data to [send](#).

Parameters

Parameters	Description
index	Identifies the desired I2C module
data	Data byte to send on the I2C bus

Returns

None.

Remarks

This function should be used by both master and slave transmitters.

The caller must either first call the [PLIB_I2C_TransmitterIsReady](#) function before calling this function to ensure that the transmitter is ready to receive a new byte to transmit or call the [PLIB_I2C_TransmitterOverflowHasOccurred](#) function immediately after calling this function to ensure that a transmitter write collision did not occur.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsTransmitterByteSend](#) in your application to determine whether this feature is available.

Example

```

#define MY_I2C_ID I2C_ID_1
uint8_t transmitData;

//set 'transmitData' variable

if ( PLIB_I2C_TransmitterIsReady ( MY_I2C_ID ) )
{
    PLIB_I2C_TransmitterByteSend ( MY_I2C_ID, transmitData );
}

```

5.6.9.5.8.3 PLIB_I2C_TransmitterByteWasAcknowledged Function

C

```

bool PLIB_I2C_TransmitterByteWasAcknowledged(
    I2C_MODULE_ID index
);

```

Description

This function allows a transmitter to determine if the byte just sent was positively acknowledged (ACKed) or negatively acknowledged (NAKed) by the receiver.

Preconditions

The module must have been configured appropriately and enabled, a transfer must have been previously started, a byte of data must have been sent on the I2C bus, and the transmission must have completed.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

- true - If the receiver ACKed the byte
- false - If the receiver NAKed the byte

Remarks

This function can be used by both master or slave transmitters.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsTransmitterByteAcknowledge](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1

if ( PLIB_I2C_TransmitterByteHasCompleted ( MY_I2C_ID ) )
{
    if ( PLIB_I2C_TransmitterByteWasAcknowledged ( MY_I2C_ID ) )
    {
        // transmission successful
    }
}
```

5.6.9.5.8.4 PLIB_I2C_TransmitterIsBusy Function**C**

```
bool PLIB_I2C_TransmitterIsBusy(
    I2C_MODULE_ID index
);
```

Description

This function identifies if the transmitter of the specified I2C module is currently busy (unable to [accept](#) more data).

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

- true - The transmitter is busy (unable to [accept](#) new data)
- false - The transmitter is ready (able to [accept](#) new data)

Remarks

This function returns the inverse of the [PLIB_I2C_TransmitterIsReady](#) function.

This flag is cleared automatically by the hardware when the transmitter is ready. It cannot be cleared by software.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsTransmitterIsBusy](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1
uint8_t transData;

//set 'transData' variable

if ( !PLIB_I2C_TransmitterIsBusy( MY_I2C_ID ) )
{
    PLIB_I2C_TransmitterByteSend( MY_I2C_ID, transData );
}
```

5.6.9.5.8.5 PLIB_I2C_TransmitterIsReady Function**C**

```
bool PLIB_I2C_TransmitterIsReady(
    I2C_MODULE_ID index
);
```

Description

This function determines if the transmitter is ready to [accept](#) more data to be transmitted on the I2C bus.

Preconditions

The module must have been configured appropriately, enabled, and a transfer must have been previously started.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

- true - If the transmitter is ready to [accept](#) more data
- false - If the transmitter is not ready to [accept](#) more data

Remarks

This function should be used by both master and slave transmitters.

This function returns the inverse of the [PLIB_I2C_TransmitterIsBusy](#) function.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsTransmitterIsBusy](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1
uint8_t sendData;

//set 'sendData' variable

if ( PLIB_I2C_TransmitterIsReady ( MY_I2C_ID ) )
{
    PLIB_I2C_TransmitterByteSend ( MY_I2C_ID, sendData );
}
```

5.6.9.5.8.6 PLIB_I2C_TransmitterOverflowClear Function

C

```
void PLIB_I2C_TransmitterOverflowClear(  
    I2C_MODULE_ID index  
)  
;
```

Description

This function clears the transmitter overflow status flag.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

None.

Remarks

This flag is set by hardware when an overflow error occurs. Its status can be tested using the [PLIB_I2C_TransmitterOverflowHasOccurred](#) function. This flag must be cleared by software after the overflow error has been handled. To handle the error, software must retry the write later after the [PLIB_I2C_TransmitterByteSend](#) function returns TRUE.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsTransmitterOverflow](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1  
uint8_t my_data;  
  
//set 'my_data' variable  
PLIB_I2C_TransmitterByteSend ( MY_I2C_ID, my_data );  
if ( PLIB_I2C_TransmitterOverflowHasOccurred ( MY_I2C_ID ) )  
{  
    // Handle overflow error  
  
    PLIB_I2C_TransmitterOverflowClear ( MY_I2C_ID );  
}
```

5.6.9.5.8.7 PLIB_I2C_TransmitterOverflowHasOccurred Function

C

```
bool PLIB_I2C_TransmitterOverflowHasOccurred(  
    I2C_MODULE_ID index  
)  
;
```

Description

This function identifies if a transmitter overflow error has occurred.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

true - If software attempted to write a byte to the transmitter buffer while the transmitter was busy and unable to [accept](#) a new byte (i.e., the write will not occur)

false - If no transmitter overflow occurred when software attempted to write a byte to the transmitter buffer (i.e., the write occurred successfully)

Remarks

This flag must be cleared by software using the [PLIB_I2C_TransmitterOverflowClear](#) function.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsTransmitterOverflow](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1
uint8_t txData;

//set 'txData' variable

PLIB_I2C_TransmitterByteSend ( MY_I2C_ID, txData );
if ( PLIB_I2C_TransmitterOverflowHasOccurred ( MY_I2C_ID ) )
{
    // Handle overflow error

    PLIB_I2C_TransmitterOverflowClear ( MY_I2C_ID );
}
```

5.6.9.5.9 Receiver Control Functions

5.6.9.5.9.1 PLIB_I2C_ReceivedByteAcknowledge Function

C

```
void PLIB_I2C_ReceivedByteAcknowledge(
    I2C_MODULE_ID index,
    bool ack
);
```

Description

This function allows a receiver to positively acknowledge (ACK) or negatively acknowledge (NAK) a byte of data that has been received from the I2C bus.

Preconditions

The module must have been configured appropriately and enabled, a transfer must have been previously started, and a byte of data must have been received from the I2C bus.

Parameters

Parameters	Description
index	Identifies the desired I2C module

5.6.9.5.9.2 PLIB_I2C_ReceivedByteGet Function

C

```
uint8_t PLIB_I2C_ReceivedByteGet(  
    I2C_MODULE_ID index  
);
```

Description

This function allows the caller to read a byte of data received from the I2C bus.

Preconditions

The module must have been configured appropriately and enabled, a transfer must have been previously started, and a byte of data must have been received from the I2C bus.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

A byte of data received from the I2C bus.

Remarks

This function should be used by both master and slave receivers.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsReceivedByteGet](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1  
uint8_t receivedData;  
  
if ( PLIB_I2C_ReceivedByteIsAvailable ( MY_I2C_ID ) )  
{  
    PLIB_I2C_ReceivedByteAcknowledge ( MY_I2C_ID, true );  
    receivedData = PLIB_I2C_ReceivedByteGet ( MY_I2C_ID );  
}
```

5.6.9.5.9.3 PLIB_I2C_ReceivedByteIsAvailable Function

C

```
bool PLIB_I2C_ReceivedByteIsAvailable(  
    I2C_MODULE_ID index  
);
```

Description

This function determines if the receiver has data available to be read by software.

Preconditions

The I2C module must have been configured appropriately and enabled, and a transfer must have been previously started.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

- true - If the receiver has data available
- false - If the receiver does not have data available

Remarks

This function should be used by both master and slave receivers.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsReceivedByteAvailable](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1
uint8_t readData;

if ( PLIB_I2C_ReceivedByteIsAvailable ( MY_I2C_ID ) )
{
    readData = PLIB_I2C_ReceivedByteGet ( MY_I2C_ID );
}
```

5.6.9.5.9.4 PLIB_I2C_ReceiverByteAcknowledgeHasCompleted Function**C**

```
bool PLIB_I2C_ReceiverByteAcknowledgeHasCompleted(
    I2C_MODULE_ID index
);
```

Description

This function allows the receiver to determine if the acknowledgment signal has completed.

Preconditions

The module must have been configured appropriately and enabled, a transfer must have been previously started, a byte of data must have been received on the I2C bus, and the acknowledgement must have been started (by calling the [PLIB_I2C_ReceivedByteAcknowledge](#) function).

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

- true - If the acknowledgment has completed
- false - If the acknowledgment has not completed

Remarks

This function can only be used by master receivers. Slave receivers automatically ACK or NAK bytes.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsReceivedByteAcknowledge](#) in your application to determine whether this feature is available.

Example

```
PLIB_I2C_ReceivedByteAcknowledge ( MY_I2C_ID, true );
```

```
if ( PLIB_I2C_ReceiverByteAcknowledgeHasCompleted ( MY_I2C_ID ) )
{
    // acknowledgment completed
}
```

5.6.9.5.9.5 PLIB_I2C_ReceiverOverflowClear Function

C

```
void PLIB_I2C_ReceiverOverflowClear(
    I2C_MODULE_ID index
);
```

Description

This function clears the receiver overflow status flag.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

None.

Remarks

This flag is set by hardware when an overflow error occurs. It's status can be tested using the [PLIB_I2C_ReceiverOverflowHasOccurred](#) function. This flag should be cleared by software after the overflow error has been handled by reading the byte in the receiver buffer.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsReceiverOverflow](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1

if ( PLIB_I2C_ReceiverOverflowHasOccurred ( MY_I2C_ID ) )
{
    // Handle overflow error

    PLIB_I2C_ReceiverOverflowClear ( MY_I2C_ID );
}
```

5.6.9.5.9.6 PLIB_I2C_ReceiverOverflowHasOccurred Function

C

```
bool PLIB_I2C_ReceiverOverflowHasOccurred(
    I2C_MODULE_ID index
);
```

Description

This function identifies if a receiver overflow error has occurred.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

- true - If a byte was received while the receiver buffer still held a previously received byte (The new byte will be lost)
- false - If no receiver overflow occurred when a byte has been received

Remarks

This flag should be cleared by software using the [PLIB_I2C_ReceiverOverflowClear](#) function.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsReceiverOverflow](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1

if ( PLIB_I2C_ReceiverOverflowHasOccurred ( MY_I2C_ID ) )
{
    // Handle overflow error

    PLIB_I2C_ReceiverOverflowClear ( MY_I2C_ID );
}
```

5.6.9.5.9.7 PLIB_I2C_MasterReceiverReadyToAcknowledge Function**C**

```
bool PLIB_I2C_MasterReceiverReadyToAcknowledge(
    I2C_MODULE_ID index
);
```

Description

This function checks for preconditions before acknowledging a slave.

Preconditions

The module must have been configured appropriately and enabled, a transfer must have been previously started and a byte of data must have been received from the I2C bus.

Parameters

Parameters	Description
index	Identifies the desired I2C module

Returns

- true - If the hardware status is ready to acknowledge
- false - If the hardware is not ready to acknowledge

Remarks

This function can only be used by master receivers.

The MY_I2C_ID macro in the example above is used as a placeholder for the actual I2C bus ID (as defined by the processor-specific [I2C_MODULE_ID](#) enum).

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_I2C_ExistsReceivedByteAcknowledge](#) in your application to determine whether this feature is available.

Example

```
#define MY_I2C_ID I2C_ID_1
uint8_t data;

if ( PLIB_I2C_ReceivedByteIsAvailable ( MY_I2C_ID ) )
{
    if ( PLIB_I2C_MasterReceiverReadyToAcknowledge ( MY_I2C_ID ) )
    {
        PLIB_I2C_ReceivedByteAcknowledge ( MY_I2C_ID, true );
        data = PLIB_I2C_ReceivedByteGet ( MY_I2C_ID );
    }
}
```

5.6.9.5.10 Existence Functions

5.6.9.5.10.1 PLIB_I2C_ExistsAcksequenceProgress Function

C

```
bool PLIB_I2C_ExistsAcksequenceProgress(
    I2C_MODULE_ID index
);
```

Description

This function identifies whether the AcksequenceInProgress feature is available on the I2C module. When this function returns true, these functions are supported on the device:

- [PLIB_I2C_AcksequenceInProgress](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the AcksequenceInProgress feature is supported on the device
- false - If the AcksequenceInProgress feature is not supported on the device

Remarks

None.

5.6.9.5.10.2 PLIB_I2C_ExistsArbitrationLoss Function

C

```
bool PLIB_I2C_ExistsArbitrationLoss(
    I2C_MODULE_ID index
);
```

Description

This function identifies whether the ArbitrationLoss feature is available on the I2C module. When this function returns true, these functions are supported on the device:

- [PLIB_I2C_ArbitrationLossHasOccurred](#)
- [PLIB_I2C_ArbitrationLossClear](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the ArbitrationLoss feature is supported on the device
- false - If the ArbitrationLoss feature is not supported on the device

Remarks

None.

5.6.9.5.10.3 PLIB_I2C_ExistsBaudRate Function**C**

```
bool PLIB_I2C_ExistsBaudRate(  
    I2C_MODULE_ID index  
);
```

Description

This function identifies whether the BaudRate feature is available on the I2C module. When this function returns true, these functions are supported on the device:

- [PLIB_I2C_BaudRateSet](#)
- [PLIB_I2C_BaudRateGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the BaudRate feature is supported on the device
- false - If the BaudRate feature is not supported on the device

Remarks

None.

5.6.9.5.10.4 PLIB_I2C_ExistsBusIsIdle Function

C

```
bool PLIB_I2C_ExistsBusIsIdle(  
    I2C_MODULE_ID index  
);
```

Description

This function identifies whether the BusIdle feature is available on the I2C module. When this function returns true, these functions are supported on the device:

- [PLIB_I2C_BusIsIdle](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the BusIdle feature is supported on the device
- false - If the BusIdle feature is not supported on the device

Remarks

None.

5.6.9.5.10.5 PLIB_I2C_ExistsClockStretching Function

C

```
bool PLIB_I2C_ExistsClockStretching(  
    I2C_MODULE_ID index  
);
```

Description

This function identifies whether the ClockStretching feature is available on the I2C module. When this function returns true, these functions are supported on the device:

- [PLIB_I2C_SlaveClockStretchingEnable](#)
- [PLIB_I2C_SlaveClockStretchingDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the ClockStretching feature is supported on the device
- false - If the ClockStretching feature is not supported on the device

Remarks

None.

5.6.9.5.10.6 PLIB_I2C_ExistsDataLineHoldTime Function

C

```
bool PLIB_I2C_ExistsDataLineHoldTime(  
    I2C_MODULE_ID index  
);
```

Description

This function identifies whether the DataLineHoldTime feature is available on the I2C module. When this function returns true, these functions are supported on the device:

- [PLIB_I2C_DataLineHoldTimeSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the DataLineHoldTime feature is supported on the device
- false - If the DataLineHoldTime feature is not supported on the device

Remarks

None.

5.6.9.5.10.7 PLIB_I2C_ExistsGeneralCall Function

C

```
bool PLIB_I2C_ExistsGeneralCall(  
    I2C_MODULE_ID index  
);
```

Description

This function identifies whether the GeneralCall feature is available on the I2C module. When this function returns true, these functions are supported on the device:

- [PLIB_I2C_GeneralCallEnable](#)
- [PLIB_I2C_GeneralCallDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the GeneralCall feature is supported on the device
- false - If the GeneralCall feature is not supported on the device

Remarks

None.

5.6.9.5.10.8 PLIB_I2C_ExistsGeneralCallAddressDetect Function

C

```
bool PLIB_I2C_ExistsGeneralCallAddressDetect(  
    I2C_MODULE_ID index  
);
```

Description

This function identifies whether the GeneralCallAddressDetect feature is available on the I2C module. When this function returns true, these functions are supported on the device:

- [PLIB_I2C_SlaveAddressIsGeneralCall](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the GeneralCallAddressDetect feature is supported on the device
- false - If the GeneralCallAddressDetect feature is not supported on the device

Remarks

None.

5.6.9.5.10.9 PLIB_I2C_ExistsHighFrequency Function

C

```
bool PLIB_I2C_ExistsHighFrequency(  
    I2C_MODULE_ID index  
);
```

Description

This function identifies whether the HighFrequency feature is available on the I2C module. When this function returns true, these functions are supported on the device:

- [PLIB_I2C_HighFrequencyEnable](#)
- [PLIB_I2C_HighFrequencyDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the HighFrequency feature is supported on the device
- false - If the HighFrequency feature is not supported on the device

Remarks

None.

5.6.9.5.10.10 PLIB_I2C_ExistsIPMI Function

C

```
bool PLIB_I2C_ExistsIPMI(  
    I2C_MODULE_ID index  
);
```

Description

This function identifies whether the IPMI feature is available on the I2C module. When this function returns true, these functions are supported on the device:

- [PLIB_I2C_IPMIEnable](#)
- [PLIB_I2C_IPMIDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the IPMI feature is supported on the device
- false - If the IPMI feature is not supported on the device

Remarks

None.

5.6.9.5.10.11 PLIB_I2C_ExistsMasterReceiverClock1Byte Function

C

```
bool PLIB_I2C_ExistsMasterReceiverClock1Byte(  
    I2C_MODULE_ID index  
);
```

Description

This function identifies whether the MasterReceiverClock1Byte feature is available on the I2C module. When this function returns true, these functions are supported on the device:

- [PLIB_I2C_MasterReceiverClock1Byte](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the MasterReceiverClock1Byte feature is supported on the device
- false - If the MasterReceiverClock1Byte feature is not supported on the device

Remarks

None.

5.6.9.5.10.12 PLIB_I2C_ExistsMasterStart Function

C

```
bool PLIB_I2C_ExistsMasterStart(  
    I2C_MODULE_ID index  
);
```

Description

This function identifies whether the MasterStart feature is available on the I2C module. When this function returns true, these functions are supported on the device:

- [PLIB_I2C_MasterStart](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the MasterStart feature is supported on the device
- false - If the MasterStart feature is not supported on the device

Remarks

None.

5.6.9.5.10.13 PLIB_I2C_ExistsMasterStartRepeat Function

C

```
bool PLIB_I2C_ExistsMasterStartRepeat(  
    I2C_MODULE_ID index  
);
```

Description

This function identifies whether the MasterStartRepeat feature is available on the I2C module. When this function returns true, these functions are supported on the device:

- [PLIB_I2C_MasterStartRepeat](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the MasterStartRepeat feature is supported on the device
- false - If the MasterStartRepeat feature is not supported on the device

Remarks

None.

5.6.9.5.10.14 PLIB_I2C_ExistsMasterStop Function

C

```
bool PLIB_I2C_ExistsMasterStop(  
    I2C_MODULE_ID index  
);
```

Description

This function identifies whether the MasterStop feature is available on the I2C module. When this function returns true, these functions are supported on the device:

- [PLIB_I2C_MasterStop](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the MasterStop feature is supported on the device
- false - If the MasterStop feature is not supported on the device

Remarks

None.

5.6.9.5.10.15 PLIB_I2C_ExistsModuleEnable Function

C

```
bool PLIB_I2C_ExistsModuleEnable(  
    I2C_MODULE_ID index  
);
```

Description

This function identifies whether the ModuleEnable feature is available on the I2C module. When this function returns true, these functions are supported on the device:

- [PLIB_I2C_Enable](#)
- [PLIB_I2C_Disable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the ModuleEnable feature is supported on the device
- false - If the ModuleEnable feature is not supported on the device

Remarks

None.

5.6.9.5.10.16 PLIB_I2C_ExistsReceivedByteAcknowledge Function

C

```
bool PLIB_I2C_ExistsReceivedByteAcknowledge(  
    I2C_MODULE_ID index  
);
```

Description

This function identifies whether the ReceivedByteAcknowledge feature is available on the I2C module. When this function returns true, these functions are supported on the device:

- [PLIB_I2C_ReceivedByteAcknowledge](#)
- [PLIB_I2C_ReceiverByteAcknowledgeHasCompleted](#)
- [PLIB_I2C_MasterReceiverReadyToAcknowledge](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the ReceivedByteAcknowledge feature is supported on the device
- false - If the ReceivedByteAcknowledge feature is not supported on the device

Remarks

None.

5.6.9.5.10.17 PLIB_I2C_ExistsReceivedByteAvailable Function

C

```
bool PLIB_I2C_ExistsReceivedByteAvailable(  
    I2C_MODULE_ID index  
);
```

Description

This function identifies whether the ReceivedByteAvailable feature is available on the I2C module. When this function returns true, these functions are supported on the device:

- [PLIB_I2C_ReceivedByteIsAvailable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the ReceivedByteAvailable feature is supported on the device
- false - If the ReceivedByteAvailable feature is not supported on the device

Remarks

None.

5.6.9.5.10.18 PLIB_I2C_ExistsReceivedByteGet Function**C**

```
bool PLIB_I2C_ExistsReceivedByteGet(  
    I2C_MODULE_ID index  
);
```

Description

This function identifies whether the ReceivedByteGet feature is available on the I2C module. When this function returns true, these functions are supported on the device:

- [PLIB_I2C_ReceivedByteGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the ReceivedByteGet feature is supported on the device
- false - If the ReceivedByteGet feature is not supported on the device

Remarks

None.

5.6.9.5.10.19 PLIB_I2C_ExistsReceiverOverflow Function**C**

```
bool PLIB_I2C_ExistsReceiverOverflow(  
    I2C_MODULE_ID index  
);
```

Description

This function identifies whether the ReceiverOverflow feature is available on the I2C module. When this function returns true, these functions are supported on the device:

- [PLIB_I2C_ReceiverOverflowHasOccurred](#)
- [PLIB_I2C_ReceiverOverflowClear](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the ReceiverOverflow feature is supported on the device

- false - If the ReceiverOverflow feature is not supported on the device

Remarks

None.

5.6.9.5.10.20 PLIB_I2C_ExistsReservedAddressProtect Function**C**

```
bool PLIB_I2C_ExistsReservedAddressProtect(  
    I2C_MODULE_ID index  
);
```

Description

This function identifies whether the ReservedAddressProtect feature is available on the I2C module. When this function returns true, these functions are supported on the device:

- [PLIB_I2C_ReservedAddressProtectEnable](#)
- [PLIB_I2C_ReservedAddressProtectDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the ReservedAddressProtect feature is supported on the device
- false - If the ReservedAddressProtect feature is not supported on the device

Remarks

None.

5.6.9.5.10.21 PLIB_I2C_ExistsSlaveAddress10Bit Function**C**

```
bool PLIB_I2C_ExistsSlaveAddress10Bit(  
    I2C_MODULE_ID index  
);
```

Description

This function identifies whether the SlaveAddress10Bit feature is available on the I2C module. When this function returns true, these functions are supported on the device:

- [PLIB_I2C_SlaveAddress10BitSet](#)
- [PLIB_I2C_SlaveAddress10BitGet](#)
- [PLIB_I2C_SlaveAddressModels10Bits](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the SlaveAddress10Bit feature is supported on the device
- false - If the SlaveAddress10Bit feature is not supported on the device

Remarks

None.

5.6.9.5.10.22 PLIB_I2C_ExistsSlaveAddress7Bit Function**C**

```
bool PLIB_I2C_ExistsSlaveAddress7Bit(  
    I2C_MODULE_ID index  
);
```

Description

This function identifies whether the SlaveAddress7Bit feature is available on the I2C module. When this function returns true, these functions are supported on the device:

- [PLIB_I2C_SlaveAddress7BitSet](#)
- [PLIB_I2C_SlaveAddress7BitGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the SlaveAddress7Bit feature is supported on the device
- false - If the SlaveAddress7Bit feature is not supported on the device

Remarks

None.

5.6.9.5.10.23 PLIB_I2C_ExistsSlaveAddressDetect Function**C**

```
bool PLIB_I2C_ExistsSlaveAddressDetect(  
    I2C_MODULE_ID index  
);
```

Description

This function identifies whether the SlaveAddressDetect feature is available on the I2C module. When this function returns true, these functions are supported on the device:

- [PLIB_I2C_SlaveAddress10BitWasDetected](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the SlaveAddressDetect feature is supported on the device
- false - If the SlaveAddressDetect feature is not supported on the device

Remarks

None.

5.6.9.5.10.24 PLIB_I2C_ExistsSlaveAddressHoldEnable Function**C**

```
bool PLIB_I2C_ExistsSlaveAddressHoldEnable(  
    I2C_MODULE_ID index  
);
```

Description

This function identifies whether the SlaveAddressHoldEnable feature is available on the I2C module. When this function returns true, these functions are supported on the device:

- [PLIB_I2C_SlaveAddressHoldEnable](#)
- [PLIB_I2C_SlaveAddressHoldDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the SlaveAddressHoldEnable feature is supported on the device
- false - If the SlaveAddressHoldEnable feature is not supported on the device

Remarks

None.

5.6.9.5.10.25 PLIB_I2C_ExistsSlaveBufferOverwrite Function**C**

```
bool PLIB_I2C_ExistsSlaveBufferOverwrite(  
    I2C_MODULE_ID index  
);
```

Description

This function identifies whether the SlaveBufferOverwrite feature is available on the I2C module. When this function returns true, these functions are supported on the device:

- [PLIB_I2C_SlaveBufferOverwriteEnable](#)
- [PLIB_I2C_SlaveBufferOverwriteDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the SlaveBufferOverwrite feature is supported on the device
- false - If the SlaveBufferOverwrite feature is not supported on the device

Remarks

None.

5.6.9.5.10.26 PLIB_I2C_ExistsSlaveBusCollisionDetect Function**C**

```
bool PLIB_I2C_ExistsSlaveBusCollisionDetect(  
    I2C_MODULE_ID index  
);
```

Description

This function identifies whether the SlaveBusCollisionDetect feature is available on the I2C module. When this function returns true, these functions are supported on the device:

- [PLIB_I2C_SlaveBusCollisionDetectEnable](#)
- [PLIB_I2C_SlaveBusCollisionDetectDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the SlaveBusCollisionDetect feature is supported on the device
- false - If the SlaveBusCollisionDetect feature is not supported on the device

Remarks

None.

5.6.9.5.10.27 PLIB_I2C_ExistsSlaveClockHold Function**C**

```
bool PLIB_I2C_ExistsSlaveClockHold(  
    I2C_MODULE_ID index  
);
```

Description

This function identifies whether the SlaveClockHold feature is available on the I2C module. When this function returns true, these functions are supported on the device:

- [PLIB_I2C_SlaveClockHold](#)
- [PLIB_I2C_SlaveClockRelease](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the SlaveClockHold feature is supported on the device
- false - If the SlaveClockHold feature is not supported on the device

Remarks

None.

5.6.9.5.10.28 PLIB_I2C_ExistsSlaveDataDetect Function**C**

```
bool PLIB_I2C_ExistsSlaveDataDetect(  
    I2C_MODULE_ID index  
);
```

Description

This function identifies whether the SlaveDataDetect feature is available on the I2C module. When this function returns true, these functions are supported on the device:

- [PLIB_I2C_SlaveDataIsDetected](#)
- [PLIB_I2C_SlaveAddressIsDetected](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the SlaveDataDetect feature is supported on the device
- false - If the SlaveDataDetect feature is not supported on the device

Remarks

None.

5.6.9.5.10.29 PLIB_I2C_ExistsSlaveInterruptOnStart Function**C**

```
bool PLIB_I2C_ExistsSlaveInterruptOnStart(  
    I2C_MODULE_ID index  
);
```

Description

This function identifies whether the SlaveInterruptOnStart feature is available on the I2C module. When this function returns true, these functions are supported on the device:

- [PLIB_I2C_SlaveInterruptOnStartEnable](#)
- [PLIB_I2C_SlaveInterruptOnStartDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the SlaveInterruptOnStart feature is supported on the device
- false - If the SlaveInterruptOnStart feature is not supported on the device

Remarks

None.

5.6.9.5.10.30 PLIB_I2C_ExistsSlaveInterruptOnStop Function**C**

```
bool PLIB_I2C_ExistsSlaveInterruptOnStop(  
    I2C_MODULE_ID index  
);
```

Description

This function identifies whether the SlaveInterruptOnStop feature is available on the I2C module. When this function returns true, these functions are supported on the device:

- [PLIB_I2C_SlaveInterruptOnStopEnable](#)
- [PLIB_I2C_SlaveInterruptOnStopDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the SlaveInterruptOnStop feature is supported on the device
- false - If the SlaveInterruptOnStop feature is not supported on the device

Remarks

None.

5.6.9.5.10.31 PLIB_I2C_ExistsSlaveMask Function

C

```
bool PLIB_I2C_ExistsSlaveMask(  
    I2C_MODULE_ID index  
);
```

Description

This function identifies whether the SlaveMask feature is available on the I2C module. When this function returns true, these functions are supported on the device:

- [PLIB_I2C_SlaveMask7BitSet](#)
- [PLIB_I2C_SlaveMask7BitGet](#)
- [PLIB_I2C_SlaveMask10BitSet](#)
- [PLIB_I2C_SlaveMask10BitGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the SlaveMask feature is supported on the device
- false - If the SlaveMask feature is not supported on the device

Remarks

None.

5.6.9.5.10.32 PLIB_I2C_ExistsSlaveReadRequest Function

C

```
bool PLIB_I2C_ExistsSlaveReadRequest(  
    I2C_MODULE_ID index  
);
```

Description

This function identifies whether the SlaveReadRequest feature is available on the I2C module. When this function returns true, these functions are supported on the device:

- [PLIB_I2C_SlaveReadIsRequested](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the SlaveReadRequest feature is supported on the device
- false - If the SlaveReadRequest feature is not supported on the device

Remarks

None.

5.6.9.5.10.33 PLIB_I2C_ExistsSMBus Function**C**

```
bool PLIB_I2C_ExistsSMBus(  
    I2C_MODULE_ID index  
);
```

Description

This function identifies whether the SMBus feature is available on the I2C module. When this function returns true, these functions are supported on the device:

- [PLIB_I2C_SMBEnable](#)
- [PLIB_I2C_SMBDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the SMBus feature is supported on the device
- false - If the SMBus feature is not supported on the device

Remarks

None.

5.6.9.5.10.34 PLIB_I2C_ExistsStartDetect Function**C**

```
bool PLIB_I2C_ExistsStartDetect(  
    I2C_MODULE_ID index  
);
```

Description

This function identifies whether the StartDetect feature is available on the I2C module. When this function returns true, these functions are supported on the device:

- [PLIB_I2C_StartWasDetected](#)
- [PLIB_I2C_StartClear](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the StartDetect feature is supported on the device
- false - If the StartDetect feature is not supported on the device

Remarks

None.

5.6.9.5.10.35 PLIB_I2C_ExistsStopDetect Function**C**

```
bool PLIB_I2C_ExistsStopDetect(  
    I2C_MODULE_ID index  
);
```

Description

This function identifies whether the StopDetect feature is available on the I2C module. When this function returns true, these functions are supported on the device:

- [PLIB_I2C_StopWasDetected](#)
- [PLIB_I2C_StopClear](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the StopDetect feature is supported on the device
- false - If the StopDetect feature is not supported on the device

Remarks

None.

5.6.9.5.10.36 PLIB_I2C_ExistsStopInIdle Function**C**

```
bool PLIB_I2C_ExistsStopInIdle(  
    I2C_MODULE_ID index  
);
```

Description

This function identifies whether the StopInIdle feature is available on the I2C module. When this function returns true, these functions are supported on the device:

- [PLIB_I2C_StopInIdleEnable](#)
- [PLIB_I2C_StopInIdleDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the StopInIdle feature is supported on the device
- false - If the StopInIdle feature is not supported on the device

Remarks

None.

5.6.9.5.10.37 PLIB_I2C_ExistsTransmitterByteAcknowledge Function**C**

```
bool PLIB_I2C_ExistsTransmitterByteAcknowledge(  
    I2C_MODULE_ID index  
);
```

Description

This function identifies whether the TransmitterByteAcknowledge feature is available on the I2C module. When this function returns true, these functions are supported on the device:

- [PLIB_I2C_TransmitterByteWasAcknowledged](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the TransmitterByteAcknowledge feature is supported on the device
- false - If the TransmitterByteAcknowledge feature is not supported on the device

Remarks

None.

5.6.9.5.10.38 PLIB_I2C_ExistsTransmitterByteComplete Function**C**

```
bool PLIB_I2C_ExistsTransmitterByteComplete(  
    I2C_MODULE_ID index  
);
```

Description

This function identifies whether the TransmitterByteComplete feature is available on the I2C module. When this function returns true, these functions are supported on the device:

- [PLIB_I2C_TransmitterByteHasCompleted](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the TransmitterByteComplete feature is supported on the device
- false - If the TransmitterByteComplete feature is not supported on the device

Remarks

None.

5.6.9.5.10.39 PLIB_I2C_ExistsTransmitterByteSend Function**C**

```
bool PLIB_I2C_ExistsTransmitterByteSend(  
    I2C_MODULE_ID index  
);
```

Description

This function identifies whether the TransmitterByteSend feature is available on the I2C module. When this function returns true, these functions are supported on the device:

- [PLIB_I2C_TransmitterByteSend](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the TransmitterByteSend feature is supported on the device
- false - If the TransmitterByteSend feature is not supported on the device

Remarks

None.

5.6.9.5.10.40 PLIB_I2C_ExistsTransmitterIsBusy Function**C**

```
bool PLIB_I2C_ExistsTransmitterIsBusy(  
    I2C_MODULE_ID index  
);
```

Description

This function identifies whether the TransmitterBusy feature is available on the I2C module. When this function returns true, these functions are supported on the device:

- [PLIB_I2C_TransmitterIsBusy](#)
- [PLIB_I2C_TransmitterIsReady](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the TransmitterBusy feature is supported on the device
- false - If the TransmitterBusy feature is not supported on the device

Remarks

None.

5.6.9.5.10.41 PLIB_I2C_ExistsTransmitterOverflow Function**C**

```
bool PLIB_I2C_ExistsTransmitterOverflow(  
    I2C_MODULE_ID index  
);
```

Description

This function identifies whether the TransmitterOverflow feature is available on the I2C module. When this function returns true, these functions are supported on the device:

- [PLIB_I2C_TransmitterOverflowHasOccurred](#)
- [PLIB_I2C_TransmitterOverflowClear](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the TransmitterOverflow feature is supported on the device
- false - If the TransmitterOverflow feature is not supported on the device

Remarks

None.

5.6.9.5.11 Data Types and Constants**5.6.9.5.11.1 I2C_MODULE_ID Enumeration****C**

```
typedef enum {  
    I2C_ID_1,  
    I2C_ID_2,  
    I2C_ID_3,  
    I2C_ID_4,  
};
```

```

    I2C_ID_5,
    I2C_NUMBER_OF_MODULES
} I2C_MODULE_ID;

```

Description

I2C Module ID

This enumeration identifies the available I2C modules.

Members

Members	Description
I2C_ID_1	I2C Module 1 ID
I2C_ID_2	I2C Module 2 ID
I2C_ID_3	I2C Module 3 ID
I2C_ID_4	I2C Module 4 ID
I2C_ID_5	I2C Module 5 ID
I2C_NUMBER_OF_MODULES	Number of available I2C modules.

Remarks

The caller should not rely on the specific numbers assigned to any of these values as they may change from one processor to the next.

Not all modules will be available on all microcontrollers. Refer to the data sheet for the specific controller in use to determine which modules are supported. The numbers used in the enumeration values will match the numbers specified in the data sheet.

5.6.9.6 Files

Files

Name	Description

Description

5.6.9.6.1 plib_i2c.h

I2C Peripheral Library Interface Header

This library provides a low-level abstraction of the Inter-Integrated Circuit (I2C) module on Microchip microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, thus hiding differences between one microcontroller variant and another.

Functions

	Name	Description
≡	PLIB_I2C_AcksequenceInProgress	Checks whether the acknowledge sequence is in progress or it is completed.
≡	PLIB_I2C_ArbitrationLossClear	Clears the arbitration loss status flag
≡	PLIB_I2C_ArbitrationLossHasOccurred	Identifies if bus arbitration has been lost.
≡	PLIB_I2C_BaudRateGet	Calculates the I2C module's current SCL clock frequency.
≡	PLIB_I2C_BaudRateSet	Sets the desired baud rate.

	PLIB_I2C_BusIdle	Determines whether the I2C bus is idle or busy.
	PLIB_I2C_DataLineHoldTimeSet	Sets the data line hold time.
	PLIB_I2C_Disable	Disables the specified I2C module.
	PLIB_I2C_Enable	Enables the specified I2C module.
	PLIB_I2C_ExistsAckSequenceProgress	Identifies whether the AckSequenceInProgress feature exists on the I2C module
	PLIB_I2C_ExistsArbitrationLoss	Identifies whether the ArbitrationLoss feature exists on the I2C module
	PLIB_I2C_ExistsBaudRate	Identifies whether the BaudRate feature exists on the I2C module
	PLIB_I2C_ExistsBusIdle	Identifies whether the BusIdle feature exists on the I2C module
	PLIB_I2C_ExistsClockStretching	Identifies whether the ClockStretching feature exists on the I2C module
	PLIB_I2C_ExistsDataLineHoldTime	Identifies whether the DataLineHoldTime feature exists on the I2C module
	PLIB_I2C_ExistsGeneralCall	Identifies whether the GeneralCall feature exists on the I2C module
	PLIB_I2C_ExistsGeneralCallAddressDetect	Identifies whether the GeneralCallAddressDetect feature exists on the I2C module
	PLIB_I2C_ExistsHighFrequency	Identifies whether the HighFrequency feature exists on the I2C module
	PLIB_I2C_ExistsIPMI	Identifies whether the IPMI feature exists on the I2C module
	PLIB_I2C_ExistsMasterReceiverClock1Byte	Identifies whether the MasterReceiverClock1Byte feature exists on the I2C module
	PLIB_I2C_ExistsMasterStart	Identifies whether the MasterStart feature exists on the I2C module
	PLIB_I2C_ExistsMasterStartRepeat	Identifies whether the MasterStartRepeat feature exists on the I2C module
	PLIB_I2C_ExistsMasterStop	Identifies whether the MasterStop feature exists on the I2C module
	PLIB_I2C_ExistsModuleEnable	Identifies whether the ModuleEnable feature exists on the I2C module
	PLIB_I2C_ExistsReceivedByteAcknowledge	Identifies whether the ReceivedByteAcknowledge feature exists on the I2C module
	PLIB_I2C_ExistsReceivedByteAvailable	Identifies whether the ReceivedByteAvailable feature exists on the I2C module
	PLIB_I2C_ExistsReceivedByteGet	Identifies whether the ReceivedByteGet feature exists on the I2C module
	PLIB_I2C_ExistsReceiverOverflow	Identifies whether the ReceiverOverflow feature exists on the I2C module
	PLIB_I2C_ExistsReservedAddressProtect	Identifies whether the ReservedAddressProtect feature exists on the I2C module
	PLIB_I2C_ExistsSlaveAddress10Bit	Identifies whether the SlaveAddress10Bit feature exists on the I2C module
	PLIB_I2C_ExistsSlaveAddress7Bit	Identifies whether the SlaveAddress7Bit feature exists on the I2C module
	PLIB_I2C_ExistsSlaveAddressDetect	Identifies whether the SlaveAddressDetect feature exists on the I2C module
	PLIB_I2C_ExistsSlaveAddressHoldEnable	Identifies whether the SlaveAddressHoldEnable feature exists on the I2C module

	PLIB_I2C_ExistsSlaveBufferOverwrite	Identifies whether the SlaveBufferOverwrite feature exists on the I2C module
	PLIB_I2C_ExistsSlaveBusCollisionDetect	Identifies whether the SlaveBusCollisionDetect feature exists on the I2C module
	PLIB_I2C_ExistsSlaveClockHold	Identifies whether the SlaveClockHold feature exists on the I2C module
	PLIB_I2C_ExistsSlaveDataDetect	Identifies whether the SlaveDataDetect feature exists on the I2C module
	PLIB_I2C_ExistsSlaveInterruptOnStart	Identifies whether the SlaveInterruptOnStart feature exists on the I2C module
	PLIB_I2C_ExistsSlaveInterruptOnStop	Identifies whether the SlaveInterruptOnStop feature exists on the I2C module
	PLIB_I2C_ExistsSlaveMask	Identifies whether the SlaveMask feature exists on the I2C module
	PLIB_I2C_ExistsSlaveReadRequest	Identifies whether the SlaveReadRequest feature exists on the I2C module
	PLIB_I2C_ExistsSMBus	Identifies whether the SMBus feature exists on the I2C module
	PLIB_I2C_ExistsStartDetect	Identifies whether the StartDetect feature exists on the I2C module
	PLIB_I2C_ExistsStopDetect	Identifies whether the StopDetect feature exists on the I2C module
	PLIB_I2C_ExistsStopInIdle	Identifies whether the StopInIdle feature exists on the I2C module
	PLIB_I2C_ExistsTransmitterByteAcknowledge	Identifies whether the TransmitterByteAcknowledge feature exists on the I2C module
	PLIB_I2C_ExistsTransmitterByteComplete	Identifies whether the TransmitterByteComplete feature exists on the I2C module
	PLIB_I2C_ExistsTransmitterByteSend	Identifies whether the TransmitterByteSend feature exists on the I2C module
	PLIB_I2C_ExistsTransmitterIsBusy	Identifies whether the TransmitterBusy feature exists on the I2C module
	PLIB_I2C_ExistsTransmitterOverflow	Identifies whether the TransmitterOverflow feature exists on the I2C module
	PLIB_I2C_GeneralCallDisable	Disables the I2C module from recognizing the general call address.
	PLIB_I2C_GeneralCallEnable	Enables the I2C module to recognize the general call address.
	PLIB_I2C_HighFrequencyDisable	Disables the I2C module from using high frequency (400 kHz or 1 MHz) signaling.
	PLIB_I2C_HighFrequencyEnable	Enables the I2C module to use high frequency (400 kHz or 1 MHz) signaling.
	PLIB_I2C_IPMIDisable	Disables the I2C module's support for the IPMI specification
	PLIB_I2C_IPMIEnable	Enables the I2C module to support the Intelligent Platform Management Interface (IPMI) specification (see Remarks).
	PLIB_I2C_MasterReceiverClock1Byte	Drives the bus clock to receive 1 byte of data from a slave device.
	PLIB_I2C_MasterReceiverReadyToAcknowledge	Checks whether the hardware is ready to acknowledge.
	PLIB_I2C_MasterStart	Sends an I2C Start condition on the I2C bus in Master mode.
	PLIB_I2C_MasterStartRepeat	Sends a repeated Start condition during an ongoing transfer in Master mode.

	PLIB_I2C_MasterStop	Sends an I2C Stop condition to terminate a transfer in Master mode.
	PLIB_I2C_ReceivedByteAcknowledge	Allows a receiver to acknowledge a that a byte of data has been received.
	PLIB_I2C_ReceivedByteGet	Gets a byte of data received from the I2C bus interface.
	PLIB_I2C_ReceivedByteIsAvailable	Detects whether the receiver has data available.
	PLIB_I2C_ReceiverByteAcknowledgeHasCompleted	Determines if the previous acknowledge has completed.
	PLIB_I2C_ReceiverOverflowClear	Clears the receiver overflow status flag.
	PLIB_I2C_ReceiverOverflowHasOccurred	Identifies if a receiver overflow error has occurred.
	PLIB_I2C_ReservedAddressProtectDisable	Disables the I2C module from protecting reserved addresses, allowing it to respond to them.
	PLIB_I2C_ReservedAddressProtectEnable	Enables the I2C module to protect (not respond to) reserved addresses.
	PLIB_I2C_SlaveAddress10BitGet	Identifies the current 10-bit Slave mode address.
	PLIB_I2C_SlaveAddress10BitSet	Selects 10-bit Slave mode addressing and sets the address value.
	PLIB_I2C_SlaveAddress10BitWasDetected	Detects reception of the second byte of a 10-bit slave address.
	PLIB_I2C_SlaveAddress7BitGet	Identifies the current 7-bit Slave mode address.
	PLIB_I2C_SlaveAddress7BitSet	Selects 7-bit Slave mode addressing and sets the slave address value.
	PLIB_I2C_SlaveAddressHoldDisable	Disables Address holding.
	PLIB_I2C_SlaveAddressHoldEnable	Enables address holding.
	PLIB_I2C_SlaveAddressIsDetected	Detects if the most recent byte received is a data or an address byte.
	PLIB_I2C_SlaveAddressIsGeneralCall	Identifies if the current slave address received is the general call address.
	PLIB_I2C_SlaveAddressModels10Bits	Identifies if the current slave address mode is 7-bits or 10-bits.
	PLIB_I2C_SlaveBufferOverwriteDisable	Disables buffer overwrite.
	PLIB_I2C_SlaveBufferOverwriteEnable	Enables buffer overwrite.
	PLIB_I2C_SlaveBusCollisionDetectDisable	Disables bus collision detect interrupts.
	PLIB_I2C_SlaveBusCollisionDetectEnable	Enables slave bus collision interrupts.
	PLIB_I2C_SlaveClockHold	Holds the SCL clock line low after receiving a byte.
	PLIB_I2C_SlaveClockRelease	Releases a previously held SCL clock line.
	PLIB_I2C_SlaveClockStretchingDisable	Disables the I2C module from stretching the slave clock.
	PLIB_I2C_SlaveClockStretchingEnable	Enables the I2C module to stretch the slave clock.
	PLIB_I2C_SlaveDataHoldDisable	Disables data holding.
	PLIB_I2C_SlaveDataHoldEnable	Enables data holding.
	PLIB_I2C_SlaveDataIsDetected	Detects if the most recent byte received is a data or an address byte.
	PLIB_I2C_SlaveInterruptOnStartDisable	Disables the feature of generating interrupt on start condition.
	PLIB_I2C_SlaveInterruptOnStartEnable	Enables the feature of generating interrupt on start condition.
	PLIB_I2C_SlaveInterruptOnStopDisable	Disables the feature of generating interrupt on stop condition.
	PLIB_I2C_SlaveInterruptOnStopEnable	Enables the feature of generating interrupt on stop condition.
	PLIB_I2C_SlaveMask10BitGet	Identifies the current 10-bit Slave mode address mask.
	PLIB_I2C_SlaveMask10BitSet	Sets the 10-bit mask for Slave mode addressing.
	PLIB_I2C_SlaveMask7BitGet	Identifies the current 7-bit Slave mode address mask.

	PLIB_I2C_SlaveMask7BitSet	Sets the 7-bit mask for Slave mode addressing .
	PLIB_I2C_SlaveReadIsRequested	Detects if the request from the master was a read or write.
	PLIB_I2C_SMBDisable	Disable the I2C module support for SMBus electrical signaling levels.
	PLIB_I2C_SMBEnable	Enables the I2C module to support System Management Bus (SMBus) electrical signaling levels.
	PLIB_I2C_StartClear	Clears the start status flag
	PLIB_I2C_StartWasDetected	Identifies when a Start condition has been detected.
	PLIB_I2C_StopClear	Clears the stop status flag
	PLIB_I2C_StopInIdleDisable	Disables the Stop-in-Idle feature.
	PLIB_I2C_StopInIdleEnable	Enables the I2C module to stop when the processor enters Idle mode
	PLIB_I2C_StopWasDetected	Identifies when a Stop condition has been detected
	PLIB_I2C_TransmitterByteHasCompleted	Detects whether the module has finished transmitting the most recent byte.
	PLIB_I2C_TransmitterByteSend	Sends a byte of data on the I2C bus.
	PLIB_I2C_TransmitterByteWasAcknowledged	Determines whether the most recently sent byte was acknowledged.
	PLIB_I2C_TransmitterIsBusy	Identifies if the transmitter of the specified I2C module is currently busy (unable to accept more data).
	PLIB_I2C_TransmitterIsReady	Detects if the transmitter is ready to accept data to transmit.
	PLIB_I2C_TransmitterOverflowClear	Clears the transmitter overflow status flag.
	PLIB_I2C_TransmitterOverflowHasOccurred	Identifies if a transmitter overflow error has occurred.

5.6.10 Input Capture Peripheral Library

5.6.10.1 Introduction

Input Capture Peripheral Library

for

Microchip Microcontrollers

This library provides a low-level abstraction of the Input Capture (IC) Peripheral Library that is available on the Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, there by hiding differences from one microcontroller variant to another.

Description

The Input Capture (IC) module is used to capture a timer value on the occurrence of an event on an input pin. The IC module plays a major role in applications requiring frequency measurement.

Figure 1: Input Capture Module

Figure 1 shows the functionality of an Input Capture module. An input signal is provided to the input of this module. The input may be prescaled. An edge detection block detects if the input is undergoing a rising or falling transition. Control logic undertakes the capture of the timer value depending upon the operating mode selected.

Some devices have Input Capture modules with dedicated timers that can be used to synchronize multiple IC modules together or cascade 16-bit timers to obtain a 32-bit timer. The timer may be triggered by an external, asynchronous input to start counting as well.

The IC module has multiple modes of operation which can be used for different applications. Operating modes include the following:

- Timer value capture at falling edge of input signal
- Timer value capture at rising edge of input signal
- Timer value capture at both edges of input signal
- Timer value capture on a specified edge of the input signal and every edge thereafter
- Timer value capture on every fourth or sixteenth rising edge of the input signal
- Interrupt-only mode in which Input Capture module acts as a source of external interrupt. This mode is functional only in device sleep and idle modes.

The IC module also incorporates a First In First Out (FIFO) buffer, which temporarily holds the captured value until it is read by the user application. The IC module is capable of generating interrupts when a set number of captures have taken place.

5.6.10.2 Release Notes

MPLAB Harmony Version: v0.70b **IC Peripheral Library Version :** 0.70b **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.6.10.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.6.10.4 Using the Library

This topic describes the basic architecture of the IC Peripheral Library and provides information and examples on how to use it.

Interface Header File: [plib_ic.h](#)

The interface to the IC Peripheral library is defined in the "[plib_ic.h](#)" header file. This file is included by the "peripheral.h" file. Any C language source (.c) file that uses the IC Peripheral library should include "peripheral.h".

Library File: The IC Peripheral library archive (.a) file installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the Peripheral interacts with the framework.

5.6.10.4.1 Hardware Abstraction Model

This library provides the low-level abstraction of the Input Capture (IC) module on the Microchip family of microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in the software and introduces the library interface.

Note: The interface provided is a superset of all of the functionality of the available IC module on the device. Refer to the specific device data sheet or related family reference manual section to determine the set of functions that are supported for each IC module on your device.

Description

The IC Peripheral Library is used to simplify low-level access to the IC module without having the need to directly interact with the module registers. The names of the functions are generic and lead to easier access to the IC module on different device variants.

Figure 2: Input Capture module Software Abstraction Block Diagram

The IC module can be described from a software standpoint as having functions to configure the module itself and select an intended mode of operation. Separate functions exist to select the timer whose value is captured by the IC module. When an external input event occurs, the IC module captures the timer value and stores it in a First In First Out (FIFO) buffer. The captured value can be read from the FIFO buffer by performing an input buffer read by calling the respective function.

5.6.10.4.2 How the Library Works

Note: Not all modes are available on all devices. Please refer to the specific device data sheet to determine the supported modes.

All of the interface functions in this library are classified according to:

- General setup functions: These functions deal with general setup of the IC module
- Timer functions: These routines are used to select the timer, input for the timer, and configure synchronous or triggered operation for the timer
- Operation Modes routine: The [PLIB_IC_ModeSelect](#) function is used to select an operation mode of IC module
- Input capture buffer routines: These routines deal with reading the capture value stored in the IC buffer and performing status checks on the IC buffer
- Power-Saving modes:
 - In Sleep mode, the IC module can function only as an external interrupt source. A rising edge input wakes the device from sleep. An interrupt will be generated if it is enabled for that module.
 - In Idle mode, the IC module can be configured to either stop its operation or continue its operation
- Exists functions: These functions determine whether or not a particular feature is present on a device

Subsequent sections provide examples that depict the use of interface routines to perform general tasks such as IC module setup and reading captured values.

5.6.10.4.2.1 Input Capture Module Setup

This section shows the steps required to initialize and configure the IC module. The IC module is configured such that a capture event occurs at the first falling edge of the input signal, and then at every subsequent edge of the input signal.

Example:

```

/* This example shows how to initialize and configure IC module */
/* Disable IC module */
PLIB_IC_Disable(MY_IC_ID);

/* Disable any peripherals multiplexed with Input Capture pin */

/* Configure I/O pin as input pin. Refer PORTS Peripheral Library */

/* Stop in Idle mode is disabled for IC module. IC mode functions even in Idle mode */
PLIB_IC_StopInIdleDisable(MY_IC_ID);

/* Every Edge Capture mode of operation is selected for IC module */
PLIB_IC_ModeSelect(MY_IC_ID, IC_INPUT_CAPTURE_EVERY_EDGE_MODE);

/* Falling edge capture is set for IC module. IC module captures the timer value at the first falling edge of input signal and subsequently at every edge */
PLIB_IC_FirstEdgeCaptureSet(MY_IC_ID, IC_EDGE_FALLING);

/* 32-bit timer is selected*/
PLIB_IC_BufferSizeSelect(MY_IC_ID, IC_BUFFER_SIZE_32BIT);

/* IC module is enabled */
PLIB_IC_Enable(MY_IC_ID);

```

5.6.10.4.2.2 Reading a Capture Value

This section shows how to read a capture value from the input capture buffer.

Example:

```

/* This example shows how to read a Capture value */
uint32_t bufferVal;

/* Reading a value from an empty Capture Buffer leads to indeterminate data*/
/* Read value from a non-empty buffer */
if(!PLIB_IC_BufferIsEmpty(MY_IC_ID))
{
    /* Read the buffer value */
    bufferVal = PLIB_IC_Buffer32BitGet(MY_IC_ID);
}

/* Buffer Overflow condition */
while(PLIB_IC_BufferOverflowHasOccurred)
{
    /*Read buffer values till buffer is empty and overflow condition ceases*/
    bufferVal = PLIB_IC_Buffer32BitGet(MY_IC_ID);
}

```

5.6.10.4.2.3 Synchronizing Timer

This section shows how to enable synchronous IC timer operation for the input capture buffer. The timer of IC2 is used as the synchronization source for the IC1 module.

Example:

```

/* This example shows how to enable synchronous timer operation. Timer of IC1 is operated in synchronism with timer of IC2 */
#define MY_IC_ID1 IC_ID_1

#define MY_IC_ID2 IC_ID_2

/* Disable IC2 module */
PLIB_IC_Disable(MY_IC_ID2);

/* Disable IC1 module */

```

```

PLIB_IC_Disable(MY_IC_ID1);

/* Select synchronous mode of operation for IC1 */
PLIB_IC_SyncModeSelect(MY_IC_ID1, IC_MODE_SYNC);

/* Timer of IC2 is selected as synchronizing input */
PLIB_IC_SyncModeInputSelect(MY_IC_ID1, IC_SYNC_MODE_INPUT_ICAP2);

/*Timer-2 is selected as clock source for IC1 timer. It is important that
clock source should match with the clock source of synchronizing input*/
PLIB_IC_ClockSourceSelect(MY_IC_ID1, IC_CLOCK_SOURCE_TIMER2);

/* Select synchronous mode of operation for IC2 */
PLIB_IC_SyncModeSelect(MY_IC_ID2, IC_MODE_SYNC);

/*Timer-2 is selected as clock source for IC2 timer*/
PLIB_IC_ClockSourceSelect(MY_IC_ID2, IC_CLOCK_SOURCE_TIMER2);

/* Disable any peripherals multiplexed with IC1 pin */
/* Disable any peripherals multiplexed with IC2 pin */
/* Configure I/O pin as input pin for IC1. Refer PORTS Peripheral Library */
/* Configure I/O pin as input pin for IC2. Refer PORTS Peripheral Library */
/* IC1 module is enabled. It is important that IC2 is enabled last as IC2 timer
is being used as the source of synchronization */
PLIB_IC_Enable(MY_IC_ID1);

/* IC2 module is enabled. It is important that IC2 is enabled last as IC2 timer
is being used as the source of synchronization */
PLIB_IC_Enable(MY_IC_ID2);

```

5.6.10.4.3 Configuring the Library

The library is configured for the supported processor when the processor is chosen in the MPLAB IDE.

5.6.10.5 Library Interface

Data Types and Constants

	Name	Description
	<u>IC_BUFFER_SIZE</u>	Selects the IC Buffer size.
	<u>IC_CLOCK_SOURCES</u>	Lists all of the input capture modes for the IC module.
	<u>IC_EDGE_TYPES</u>	Lists the options to select a rising or falling edge for input capture.
	<u>IC_EVENTS_PER_INTERRUPT</u>	Lists the number of input capture events for an interrupt to occur.
	<u>IC_INPUT_CAPTURE_MODES</u>	Lists all of the input capture modes for the IC module.
	<u>IC_MODULE_ID</u>	IC_MODULE_ID This enumeration defines the number of modules that are available on the microcontroller. This is the superset of all of the possible instances that might be available on a Microchip microcontroller. Refer to the specific device data sheet to determine the correct number of modules defined for the device.
	<u>IC_SYNC_MODE_INPUTS</u>	Lists the input sources for synchronous and asynchronous operation of the IC module.
	<u>IC_SYNC_MODES</u>	Lists the synchronization modes for the IC module.

	IC_TIMERS	Lists the different 16-bit timers for the IC module.

Feature Existence Functions

	Name	Description
	PLIB_IC_ExistsAlternateClock	Identifies whether the AlternateClock feature exists on the IC module
	PLIB_IC_ExistsBufferIsEmptyStatus	Identifies whether the BufferIsEmptyStatus feature exists on the IC module
	PLIB_IC_ExistsBufferOverflowStatus	Identifies whether the BufferOverflowStatus feature exists on the IC module.
	PLIB_IC_ExistsBufferSize	Identifies whether the BufferSize feature exists on the IC module.
	PLIB_IC_ExistsBufferValue	Identifies whether the BufferValue feature exists on the IC module.
	PLIB_IC_ExistsCaptureMode	Identifies whether the CaptureMode feature exists on the IC module.
	PLIB_IC_ExistsClockSource	Identifies whether the ClockSource feature exists on the IC module.
	PLIB_IC_ExistsEdgeCapture	Identifies whether the EdgeCapture feature exists on the IC module.
	PLIB_IC_ExistsEnable	Identifies whether the EnableControl feature exists on the IC module
	PLIB_IC_ExistsEventsPerInterruptSelect	Identifies whether the EventsPerInterruptSelect feature exists on the IC module.
	PLIB_IC_ExistsStopInIdle	Identifies whether the StopInIdle feature exists on the IC module.
	PLIB_IC_ExistsSyncMode	Identifies whether the SyncMode feature exists on the IC module.
	PLIB_IC_ExistsSyncModeInput	Identifies whether the SyncModeInput feature exists on the IC module.
	PLIB_IC_ExistsTimerSelect	Identifies whether the TimerSelect feature exists on the IC module.
	PLIB_IC_ExistsTimerTriggered	Identifies whether the TimerTriggered feature exists on the IC module.

General Setup Functions

	Name	Description
	PLIB_IC_Disable	Disables the IC module.
	PLIB_IC_Enable	Enables the IC module.
	PLIB_IC_EventsPerInterruptSelect	Selects the number of capture events before an interrupt is issued.
	PLIB_IC_FirstCaptureEdgeSelect	Captures the timer count value at the first selected edge of input signal.

Input Capture Buffer Functions

	Name	Description
	PLIB_IC_Buffer16BitGet	Obtains the 16-bit input capture buffer value.
	PLIB_IC_Buffer32BitGet	Obtains the 32-bit input capture buffer value.
	PLIB_IC_BufferIsEmpty	Checks whether the input capture buffer is empty.
	PLIB_IC_BufferOverflowHasOccurred	Checks whether an input capture buffer overflow has occurred.
	PLIB_IC_BufferSizeSelect	Sets the input capture buffer size.

Operation Modes Functions

	Name	Description
	PLIB_IC_ModeSelect	Selects the input capture mode for IC module.

Power-Saving Modes Functions

	Name	Description
	PLIB_IC_StopInIdleDisable	Continues module operation when the device enters Idle mode
	PLIB_IC_StopInIdleEnable	Discontinues IC module operation when the device enters Idle mode.

Timer Functions

	Name	Description
≡	PLIB_IC_ClockSourceSelect	Selects the clock source for the IC module.
≡	PLIB_IC_SyncModeInputSelect	Selects the input source for synchronous or asynchronous (triggered) operation of the IC module.
≡	PLIB_IC_SyncModeSelect	Selects the synchronization mode for Input Capture module.
≡	PLIB_IC_TimerIsTriggered	Checks whether or not the input capture timer has been triggered.
≡	PLIB_IC_TimerSelect	Selects the 16-bit timer source for the IC module.
≡	PLIB_IC_AlternateClockDisable	Selects Timer 2/3 instead of the alternate clock source.
≡	PLIB_IC_AlternateClockEnable	Selects the alternate clock source.

Description

This section describes the Application Programming Interface (API) functions of the Input Capture Peripheral.

Refer to each section for a detailed description.

5.6.10.5.1 General Setup Functions**5.6.10.5.1.1 PLIB_IC_Disable Function****C**

```
void PLIB_IC_Disable(
    IC_MODULE_ID index
);
```

Description

This function disables the IC module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the IC module

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_IC_ExistsEnable](#) in your application to determine whether this feature is available.

Example

```
#define MY_IC_ID IC_ID_1

PLIB_IC_Disable(MY_IC_ID);
```

5.6.10.5.1.2 PLIB_IC_Enable Function**C**

```
void PLIB_IC_Enable(
    IC_MODULE_ID index
```

```
);
```

Description

This function enables the IC module.

Preconditions

The module should be appropriately configured before being enabled.

Parameters

Parameters	Description
index	Identifies the desired IC module

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_IC_ExistsEnable](#) in your application to determine whether this feature is available.

Example

```
#define MY_IC_ID IC_ID_1

//Do all the other configurations before enabling.

PLIB_IC_Enable(MY_IC_ID);
```

5.6.10.5.1.3 PLIB_IC_EventsPerInterruptSelect Function

C

```
void PLIB_IC_EventsPerInterruptSelect(
    IC_MODULE_ID index,
    IC_EVENTS_PER_INTERRUPT event
);
```

Description

The IC module can be configured to generate interrupts depending upon the the occurrence of a certain number of capture events. The number of capture events before an interrupt is generated is set by this function.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired IC module
event	Identifies the interrupt control mode

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_IC_ExistsEventsPerInterruptSelect](#) in your application to determine whether this feature is available.

Example

```
#define MY_IC_ID IC_ID_1
// IC module is configured to generate interrupt on every capture event
```

```
PLIB_IC_EventsPerInterruptSelect(MY_IC_ID, IC_INTERRUPT_ON_EVERY_CAPTURE_EVENT );
```

5.6.10.5.1.4 PLIB_IC_FirstCaptureEdgeSelect Function

C

```
void PLIB_IC_FirstCaptureEdgeSelect(  
    IC_MODULE_ID index,  
    IC_EDGE_TYPES edgeType  
);
```

Description

This function captures the timer count value at the first selected edge of the input signal.

Preconditions

This setting applies only when the Every Edge Capture mode is set. The capture mode is set by the [PLIB_IC_ModeSelect\(\)](#) function.

Parameters

Parameters	Description
index	Identifies the desired IC module
edgeType	Identifies the edge type (i.e., whether rising or falling edge)

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_IC_ExistsEdgeCapture](#) in your application to determine whether this feature is available.

Example

```
#define MY_IC_ID IC_ID_1  
  
PLIB_IC_FirstCaptureEdgeSelect(MY_IC_ID, IC_EDGE_FALLING);
```

5.6.10.5.2 Timer Functions

5.6.10.5.2.1 PLIB_IC_ClockSourceSelect Function

C

```
void PLIB_IC_ClockSourceSelect(  
    IC_MODULE_ID index,  
    IC_CLOCK_SOURCES src  
);
```

Description

This function selects the clock source for the IC module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired IC module
src	Identifies the clock source

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_IC_ExistsClockSource](#) in your application to determine whether this feature is available.

Example

```
#define MY_IC_ID IC_ID_1
// Clock source of Timer2 is selected as clock source for Input Capture module
PLIB_IC_ClockSourceSelect(MY_IC_ID, IC_CLOCK_SOURCE_TIMER2);
```

5.6.10.5.2 PLIB_IC_SyncModeInputSelect Function**C**

```
void PLIB_IC_SyncModeInputSelect(
    IC_MODULE_ID index,
    IC_SYNC_MODE_INPUTS input
);
```

Description

This function selects the input source for synchronous or asynchronous (triggered) operation of the IC module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired IC module

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_IC_ExistsSyncModeInput](#) in your application to determine whether this feature is available.

Example

```
#define MY_IC_ID IC_ID_1
//
PLIB_IC_SyncModeInputSelect(MY_IC_ID, IC_SYNC_MODE_INPUT_OC1);
```

5.6.10.5.2.3 PLIB_IC_SyncModeSelect Function**C**

```
void PLIB_IC_SyncModeSelect(
    IC_MODULE_ID index,
    IC_SYNC_MODES syncMode
);
```

Description

This function selects the synchronization mode for the IC module. The Synchronous or Asynchronous mode of operation can be selected for the IC module timer.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired IC module
syncMode	Identifies the mode (Synchronous or Asynchronous)

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_IC_ExistsSyncMode](#) in your application to determine whether this feature is available.

Example

```
#define MY_IC_ID IC_ID_1
// External input triggers Input Capture module asynchronously
PLIB_IC_SyncModeSelect(MY_IC_ID, IC_MODE_ASYNC);
```

5.6.10.5.2.4 PLIB_IC_TimerIsTriggered Function**C**

```
bool PLIB_IC_TimerIsTriggered(
    IC_MODULE_ID index
);
```

Description

This function checks whether or not the input capture timer has been triggered. This function returns 'true' if the IC timer is triggered and running and returns 'false' if the IC timer is cleared and stopped.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired IC module

Returns

- bool - true - The IC timer is triggered and running
- false - The IC timer is stopped and held in clear

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_IC_ExistsTimerTriggered](#) in your application to determine whether this feature is available.

Example

```
#define MY_IC_ID IC_ID_1
if(!PLIB_IC_TimerIsTriggered(MY_IC_ID))
{
    // Do some operation
};
```

5.6.10.5.2.5 PLIB_IC_TimerSelect Function**C**

```
void PLIB_IC_TimerSelect(
```

```
    IC_MODULE_ID index,  
    IC_TIMERS tmr  
);
```

Description

This function selects the 16-bit timer source for the IC module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired IC module
tmr	Identifies the 16-bit timer

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_IC_ExistsTimerSelect](#) in your application to determine whether this feature is available.

Example

```
#define MY_IC_ID IC_ID_1  
// 16-bit Timer-2 is selected  
PLIB_IC_TimerSelect(MY_IC_ID, IC_TIMER_TMR2);
```

5.6.10.5.2.6 PLIB_IC_AlternateClockDisable Function**C**

```
void PLIB_IC_AlternateClockDisable(  
    IC_MODULE_ID index  
);
```

Description

Selects Timer 2/3 instead of the alternate clock source.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired IC module

Returns

None.

Remarks

The feature is not supported on all devices. Check your device's data sheet. A system unlock must be performed before this function can be executed. This function applies to all input capture modules, regardless of the [IC_MODULE_ID](#) passed in the call.

Example

```
// Call system service to unlock oscillator  
#define MY_IC_ID IC_ID_1  
PLIB_IC_AlternateClockDisable( MY_IC_ID );
```

5.6.10.5.2.7 PLIB_IC_AlternateClockEnable Function

C

```
void PLIB_IC_AlternateClockEnable(  
    IC_MODULE_ID index  
);
```

Description

Selects the alternate clock source instead of Timer 2/3.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired IC module

Returns

None.

Remarks

The feature is not supported on all devices. Check your device's data sheet. A system unlock must be performed before this function can be executed. This function applies to all input capture modules, regardless of the `IC_MODULE_ID` passed in the call.

Example

```
// Call system service to unlock oscillator  
#define MY_IC_ID IC_ID_1  
PLIB_IC_AlternateClockEnable( MY_IC_ID );
```

5.6.10.5.3 Input Capture Buffer Functions

5.6.10.5.3.1 PLIB_IC_Buffer16BitGet Function

C

```
uint16_t PLIB_IC_Buffer16BitGet(  
    IC_MODULE_ID index  
);
```

Description

This function reads the 16-bit value of the IC buffer to obtain the captured timer value. This function is used when the buffer size is set to 16-bits.

Preconditions

The buffer size should be set to 16 bits (i.e., `PLIB_IC_BufferSizeSet(MY_IC_ID, IC_BUFFER_SIZE_16BIT)`).

Parameters

Parameters	Description
index	Identifies the desired IC module

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_IC_ExistsBufferValue](#) in your application to determine whether this feature is available.

Example

```
#define MY_IC_ID IC_ID_1
uint16_t bufferVal;
// Read input capture buffer value and store it in 'bufferVal'
bufferVal = PLIB_IC_Buffer16BitGet(MY_IC_ID);
```

5.6.10.5.3.2 PLIB_IC_Buffer32BitGet Function**C**

```
uint32_t PLIB_IC_Buffer32BitGet(
    IC_MODULE_ID index
);
```

Description

This function reads the 32-bit value of the IC buffer to obtain the captured timer value. This function is used when the buffer size is set to 32-bits.

Preconditions

The buffer size should be set to 32 bits (i.e., `PLIB_IC_BufferSizeSet(MY_IC_ID, IC_BUFFER_SIZE_32BIT)`).

Parameters

Parameters	Description
index	Identifies the desired IC module

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_IC_ExistsBufferValue](#) in your application to determine whether this feature is available.

Example

```
#define MY_IC_ID IC_ID_1
uint32_t bufferVal;
// Read input capture buffer value and store it in 'bufferVal'
bufferVal = PLIB_IC_Buffer32BitGet(MY_IC_ID);
```

5.6.10.5.3.3 PLIB_IC_BufferIsEmpty Function**C**

```
bool PLIB_IC_BufferIsEmpty(
    IC_MODULE_ID index
);
```

Description

This function returns 'true' if the input capture buffer is empty and 'false' if the buffer is not empty.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired IC module

Returns

- bool - true - The input capture buffer is empty
- false - The input capture buffer is not empty

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_IC_ExistsBufferIsEmptyStatus](#) in your application to determine whether this feature is available.

Example

```
#define MY_IC_ID IC_ID_1
if(!PLIB_IC_BufferIsEmpty(MY_IC_ID))
{
    // Do some operation
};
```

5.6.10.5.3.4 PLIB_IC_BufferOverflowHasOccurred Function**C**

```
bool PLIB_IC_BufferOverflowHasOccurred(
    IC_MODULE_ID index
);
```

Description

This function returns 'true' if an input capture buffer has overflowed and 'false' if the buffer has not overflowed.

Preconditions

This function only applies when not in Edge Detect mode.

Parameters

Parameters	Description
index	Identifies the desired IC module

Returns

- bool - true - An overflow of the input capture buffer has occurred
- false - An overflow of the input capture buffer has not occurred

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_IC_ExistsBufferOverflowStatus](#) in your application to determine whether this feature is available.

Example

```
#define MY_IC_ID IC_ID_1
if(!PLIB_IC_BufferOverflowHasOccurred(MY_IC_ID))
{
    // Do some operation
};
```

5.6.10.5.3.5 PLIB_IC_BufferSizeSelect Function**C**

```
void PLIB_IC_BufferSizeSelect(
```

```
    IC_MODULE_ID index,  
    IC_BUFFER_SIZE bufSize  
);
```

Description

This function sets the input capture buffer size for IC module. The buffer size can be set to 16 bits or 32 bits. The buffer size should be consistent with the timer selected. A 32-bit timer requires a 32-bit buffer and a 16-bit timer requires a 16-bit buffer.

Preconditions

The buffer size should be consistent with the timer selected.

Parameters

Parameters	Description
index	Identifies the desired IC module
bufSize	Sets the buffer size to 16 bits or 32 bits

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_IC_ExistsBufferSize](#) in your application to determine whether this feature is available.

Example

```
#define MY_IC_ID IC_ID_1  
// 32-bit timer resource is selected  
PLIB_IC_BufferSizeSelect(MY_IC_ID, IC_BUFFER_SIZE_32BIT);
```

5.6.10.5.4 Operation Modes Functions

5.6.10.5.4.1 PLIB_IC_ModeSelect Function

C

```
void PLIB_IC_ModeSelect(  
    IC_MODULE_ID index,  
    IC_INPUT_CAPTURE_MODES modeSel  
);
```

Description

This function selects the input capture mode for the IC module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired IC module
modeSel	Identifies the timer type required

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use

[PLIB_IC_ExistsCaptureMode](#) in your application to determine whether this feature is available.

Example

```
#define MY_IC_ID IC_ID_1
// Every Edge Mode is selected
PLIB_IC_ModeSelect(MY_IC_ID, IC_INPUT_CAPTURE_EVERY_EDGE_MODE);
```

5.6.10.5.5 Power-Saving Modes Functions

5.6.10.5.5.1 PLIB_IC_StopInIdleDisable Function

C

```
void PLIB_IC_StopInIdleDisable(
    IC_MODULE_ID index
);
```

Description

The function continues operation of the IC module when the device enters Idle mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired IC module

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_IC_ExistsStopInIdle](#) in your application to determine whether this feature is available.

Example

```
#define MY_IC_ID IC_ID_1

PLIB_IC_StopInIdleDisable(MY_IC_ID);
```

5.6.10.5.5.2 PLIB_IC_StopInIdleEnable Function

C

```
void PLIB_IC_StopInIdleEnable(
    IC_MODULE_ID index
);
```

Description

This function discontinues IC module operation when the device enters Idle mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired IC module

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_IC_ExistsStopInIdle](#) in your application to determine whether this feature is available.

Example

```
#define MY_IC_ID IC_ID_1

PLIB_IC_StopInIdleEnable(MY_IC_ID);
```

5.6.10.5.6 Data Types and Constants

5.6.10.5.6.1 IC_BUFFER_SIZE Enumeration

C

```
typedef enum {
    IC_BUFFER_SIZE_32BIT,
    IC_BUFFER_SIZE_16BIT
} IC_BUFFER_SIZE;
```

Description

IC Buffer Size

The IC buffer can be set to 16 bits or 32 bits. The buffer size is set by the [PLIB_IC_BufferSizeSelect\(\)](#) function.

Members

Members	Description
IC_BUFFER_SIZE_32BIT	32-bit timer source select
IC_BUFFER_SIZE_16BIT	16-bit timer source select

5.6.10.5.6.2 IC_CLOCK_SOURCES Enumeration

C

```
typedef enum {
    IC_CLOCK_SOURCE_TIMER1,
    IC_CLOCK_SOURCE_TIMER2,
    IC_CLOCK_SOURCE_TIMER3,
    IC_CLOCK_SOURCE_TIMER4,
    IC_CLOCK_SOURCE_TIMER5,
    IC_CLOCK_SOURCE_SYSTEM
} IC_CLOCK_SOURCES;
```

Description

IC Clock Sources Select

This enumeration lists all of the input capture modes for IC module. The capture mode is set via the [PLIB_IC_ClockSourceSelect\(\)](#) function.

Members

Members	Description
IC_CLOCK_SOURCE_TIMER1	Clock source of Timer1 is the clock source of the capture counter
IC_CLOCK_SOURCE_TIMER2	Clock source of Timer2 is the clock source of the capture counter

IC_CLOCK_SOURCE_TIMER3	Clock source of Timer3 is the clock source of the capture counter
IC_CLOCK_SOURCE_TIMER4	Clock source of Timer4 is the clock source of the capture counter
IC_CLOCK_SOURCE_TIMER5	Clock source of Timer5 is the clock source of the capture counter
IC_CLOCK_SOURCE_SYSTEM	System Clock is the clock source of the capture counter

5.6.10.5.6.3 IC_EDGE_TYPES Enumeration

C

```
typedef enum {
    IC_EDGE_FALLING,
    IC_EDGE_RISING
} IC_EDGE_TYPES;
```

Description

IC Edge Types Select

This enumeration lists the options to select a rising edge input capture or a falling edge input capture. The selection is made by the [PLIB_IC_FirstCaptureEdgeSelect\(\)](#) function.

Members

Members	Description
IC_EDGE_FALLING	Select Falling Edge
IC_EDGE_RISING	Select Rising Edge

5.6.10.5.6.4 IC_EVENTS_PER_INTERRUPT Enumeration

C

```
typedef enum {
    IC_INTERRUPT_ON_EVERY_4TH_CAPTURE_EVENT,
    IC_INTERRUPT_ON_EVERY_3RD_CAPTURE_EVENT,
    IC_INTERRUPT_ON_EVERY_2ND_CAPTURE_EVENT,
    IC_INTERRUPT_ON_EVERY_CAPTURE_EVENT
} IC_EVENTS_PER_INTERRUPT;
```

Description

IC Capture Events Per Interrupt Select

This enumeration lists the number of events that should occur before an interrupt is generated. An interrupt can occur on every capture event, every second, every third, or every fourth capture event.

Members

Members	Description
IC_INTERRUPT_ON_EVERY_4TH_CAPTURE_EVENT	Interrupt on every 4th capture event
IC_INTERRUPT_ON_EVERY_3RD_CAPTURE_EVENT	Interrupt on every 3rd capture event
IC_INTERRUPT_ON_EVERY_2ND_CAPTURE_EVENT	Interrupt on every 2nd capture event
IC_INTERRUPT_ON_EVERY_CAPTURE_EVENT	Interrupt on every capture event

5.6.10.5.6.5 IC_INPUT_CAPTURE_MODES Enumeration

C

```
typedef enum {
    IC_INPUT_CAPTURE_INTERRUPT_MODE,
    IC_INPUT_CAPTURE_EVERY_EDGE_MODE,
    IC_INPUT_CAPTURE_EVERY_16TH_EDGE_MODE,
    IC_INPUT_CAPTURE_EVERY_4TH_EDGE_MODE,
```

```

    IC_INPUT_CAPTURE_RISING_EDGE_MODE,
    IC_INPUT_CAPTURE_FALLING_EDGE_MODE,
    IC_INPUT_CAPTURE_EDGE_DETECT_MODE,
    IC_INPUT_CAPTURE_DISABLE_MODE
} IC_INPUT_CAPTURE_MODES;

```

Description

IC Input Capture Mode Select

This enumeration lists all of the input capture modes for IC module. The capture mode is set via the [PLIB_IC_ModeSelect\(\)](#) function.

Members

Members	Description
IC_INPUT_CAPTURE_INTERRUPT_MODE	Interrupt only mode: Rising edge on input triggers an interrupt. This mode is used only when device is in Sleep/Idle mode
IC_INPUT_CAPTURE_EVERY_EDGE_MODE	Every Edge Capture mode: The first edge of the input signal is specified via PLIB_IC_RisingEdgeCaptureSet() or PLIB_IC_FallingEdgeCaptureSet() routines. Subsequently, timer count value is captured on every rising and falling of the input signal
IC_INPUT_CAPTURE_EVERY_16TH_EDGE_MODE	Prescaled Capture mode: Timer count value is captured every 16th rising edge of input signal
IC_INPUT_CAPTURE_EVERY_4TH_EDGE_MODE	Prescaled Capture mode: Timer count value is captured every 4th rising edge of input signal
IC_INPUT_CAPTURE_RISING_EDGE_MODE	Rising Edge mode: Timer count value is captured on every rising edge of input signal
IC_INPUT_CAPTURE_FALLING_EDGE_MODE	Falling Edge mode: Timer count value is captured on every falling edge of input signal
IC_INPUT_CAPTURE_EDGE_DETECT_MODE	Edge Detect mode: Timer count value is captured on every rising and falling of the input signal. Interrupt control bits are ignored and an interrupt event is generated for every capture. Overflow status is not updated.
IC_INPUT_CAPTURE_DISABLE_MODE	Capture module is disabled. Input signal is ignored and no capture events or interrupts are generated

5.6.10.5.6.6 IC_MODULE_ID Enumeration

C

```

typedef enum {
    IC_ID_1,
    IC_ID_2,
    IC_ID_3,
    IC_ID_4,
    IC_ID_5,
    IC_ID_6,
    IC_ID_7,
    IC_ID_8,
    IC_ID_9,
    IC_NUMBER_OF_MODULES
} IC_MODULE_ID;

```

Description

IC_MODULE_ID

This enumeration defines the number of modules that are available on the microcontroller. This is the superset of all of the possible instances that might be available on a Microchip microcontroller.

Refer to the specific device data sheet to determine the correct number of modules defined for the device.

Members

Members	Description
IC_NUMBER_OF_MODULES	The total number of modules available.

5.6.10.5.6.7 IC_SYNC_MODE_INPUTS Enumeration**C**

```
typedef enum {
    IC_SYNC_MODE_INPUT_OC1,
    IC_SYNC_MODE_INPUT_OC2,
    IC_SYNC_MODE_INPUT_OC3,
    IC_SYNC_MODE_INPUT_OC4,
    IC_SYNC_MODE_INPUT_OC5,
    IC_SYNC_MODE_INPUT_OC6,
    IC_SYNC_MODE_INPUT_OC7,
    IC_SYNC_MODE_INPUT_OC8,
    IC_SYNC_MODE_INPUT_OC9,
    IC_SYNC_MODE_INPUT_ICAP1,
    IC_SYNC_MODE_INPUT_ICAP2,
    IC_SYNC_MODE_INPUT_ICAP3,
    IC_SYNC_MODE_INPUT_ICAP4,
    IC_SYNC_MODE_INPUT_ICAP5,
    IC_SYNC_MODE_INPUT_ICAP6,
    IC_SYNC_MODE_INPUT_ICAP7,
    IC_SYNC_MODE_INPUT_ICAP8,
    IC_SYNC_MODE_INPUT_ICAP9,
    IC_SYNC_MODE_INPUT_TMR1,
    IC_SYNC_MODE_INPUT_TMR2,
    IC_SYNC_MODE_INPUT_TMR3,
    IC_SYNC_MODE_INPUT_TMR4,
    IC_SYNC_MODE_INPUT_TMR5,
    IC_SYNC_MODE_INPUT_PTG,
    IC_SYNC_MODE_INPUT_CMP1,
    IC_SYNC_MODE_INPUT_CMP2,
    IC_SYNC_MODE_INPUT_CMP3,
    IC_SYNC_MODE_INPUT_AD,
    IC_SYNC_MODE_INPUT_CTMU,
    IC_SYNC_MODE_INPUT_NONE
} IC_SYNC_MODE_INPUTS;
```

Description

IC Synchronization and Trigger input select

This enumeration lists all of the input sources for synchronous and asynchronous operation of IC module. The Input source can be selected by the [PLIB_IC_SyncModeInputSelect\(\)](#) function.

Members

Members	Description
IC_SYNC_MODE_INPUT_OC1	Synchronization and trigger input is Output Compare1
IC_SYNC_MODE_INPUT_OC2	Synchronization and trigger input is Output Compare2
IC_SYNC_MODE_INPUT_OC3	Synchronization and trigger input is Output Compare3
IC_SYNC_MODE_INPUT_OC4	Synchronization and trigger input is Output Compare4
IC_SYNC_MODE_INPUT_OC5	Synchronization and trigger input is Output Compare5
IC_SYNC_MODE_INPUT_OC6	Synchronization and trigger input is Output Compare6
IC_SYNC_MODE_INPUT_OC7	Synchronization and trigger input is Output Compare7
IC_SYNC_MODE_INPUT_OC8	Synchronization and trigger input is Output Compare8
IC_SYNC_MODE_INPUT_OC9	Synchronization and trigger input is Output Compare9

IC_SYNC_MODE_INPUT_ICAP1	Synchronization and trigger input is Input Capture1
IC_SYNC_MODE_INPUT_ICAP2	Synchronization and trigger input is Input Capture2
IC_SYNC_MODE_INPUT_ICAP3	Synchronization and trigger input is Input Capture3
IC_SYNC_MODE_INPUT_ICAP4	Synchronization and trigger input is Input Capture4
IC_SYNC_MODE_INPUT_ICAP5	Synchronization and trigger input is Input Capture5
IC_SYNC_MODE_INPUT_ICAP6	Synchronization and trigger input is Input Capture6
IC_SYNC_MODE_INPUT_ICAP7	Synchronization and trigger input is Input Capture7
IC_SYNC_MODE_INPUT_ICAP8	Synchronization and trigger input is Input Capture8
IC_SYNC_MODE_INPUT_ICAP9	Synchronization and trigger input is Input Capture9
IC_SYNC_MODE_INPUT_TMR1	Synchronization and trigger input is Timer1
IC_SYNC_MODE_INPUT_TMR2	Synchronization and trigger input is Timer2
IC_SYNC_MODE_INPUT_TMR3	Synchronization and trigger input is Timer3
IC_SYNC_MODE_INPUT_TMR4	Synchronization and trigger input is Timer4
IC_SYNC_MODE_INPUT_TMR5	Synchronization and trigger input is Timer5
IC_SYNC_MODE_INPUT_PTG	Synchronization and trigger input is Peripheral Trigger Generator Module
IC_SYNC_MODE_INPUT_CMP1	Trigger input is Comparator1. This input is not used for Synchronization
IC_SYNC_MODE_INPUT_CMP2	Trigger input is Comparator2. This input is not used for Synchronization
IC_SYNC_MODE_INPUT_CMP3	Trigger input is Comparator3. This input is not used for Synchronization
IC_SYNC_MODE_INPUT_AD	Trigger input is ADC. This input is not used for Synchronization
IC_SYNC_MODE_INPUT_CTMU	Trigger input is Charge Time Measurement Unit. This input is not used for Synchronization
IC_SYNC_MODE_INPUT_NONE	No synchronization and trigger input

5.6.10.5.6.8 IC_SYNC_MODES Enumeration

C

```
typedef enum {
    IC_MODE_ASYNC,
    IC_MODE_SYNC
} IC_SYNC_MODES;
```

Description

IC Synchronization Mode Select

This enumeration lists the synchronization modes for the IC module. The IC module timer can function in synchronism with the input source or triggered asynchronously by an input trigger.

Members

Members	Description
IC_MODE_ASYNC	Input source acts as an asynchronous trigger to start Input Capture timer. The Input source can be selected by PLIB_IC_SyncModeInputSelect() routine
IC_MODE_SYNC	Input source synchronizes Input Capture timer to other modules. The Input source can be selected by PLIB_IC_SyncModeInputSelect() routine

5.6.10.5.6.9 IC_TIMERS Enumeration

C

```
typedef enum {
    IC_TIMER_TMR3,
    IC_TIMER_TMR2
} IC_TIMERS;
```

Description

IC 16-bit Timer Select

This enumeration lists the different 16-bit timers for the IC timebase when the IC module is configured with a 16-bit timer resource.

Members

Members	Description
IC_TIMER_TMR3	Timer3 select
IC_TIMER_TMR2	Timer2 select

5.6.10.5.7 Feature Existence Functions

5.6.10.5.7.1 PLIB_IC_ExistsAlternateClock Function

C

```
bool PLIB_IC_ExistsAlternateClock(  
    IC_MODULE_ID index  
);
```

Description

This function identifies whether the AlternateClock feature is available on the IC module. When this function returns true, these functions are supported on the device:

- [PLIB_IC_AlternateClockEnable](#)
- [PLIB_IC_AlternateClockDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The AlternateClock feature is supported on the device
- false - The AlternateClock feature is not supported on the device

Remarks

None.

5.6.10.5.7.2 PLIB_IC_ExistsBufferIsEmptyStatus Function

C

```
bool PLIB_IC_ExistsBufferIsEmptyStatus(  
    IC_MODULE_ID index  
);
```

Description

This function identifies whether the BufferIsEmptyStatus feature is available on the IC module. When this function returns true, this function is supported on the device:

- [PLIB_IC_BufferIsEmpty](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The BufferIsEmptyStatus feature is supported on the device
- false - The BufferIsEmptyStatus feature is not supported on the device

Remarks

None.

5.6.10.5.7.3 PLIB_IC_ExistsBufferOverflowStatus Function**C**

```
bool PLIB_IC_ExistsBufferOverflowStatus(  
    IC_MODULE_ID index  
);
```

Description

This function identifies whether the BufferOverflowStatus feature is available on the IC module. When this function returns true, this function is supported on the device:

- [PLIB_IC_BufferOverflowHasOccurred](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The BufferOverflowStatus feature is supported on the device
- false - The BufferOverflowStatus feature is not supported on the device

Remarks

None.

5.6.10.5.7.4 PLIB_IC_ExistsBufferSize Function**C**

```
bool PLIB_IC_ExistsBufferSize(  
    IC_MODULE_ID index  
);
```

Description

This function identifies whether the BufferSize feature is available on the IC module. When this function returns true, this function is supported on the device:

- [PLIB_IC_BufferSizeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The BufferSize feature is supported on the device
- false - The BufferSize feature is not supported on the device

Remarks

None.

5.6.10.5.7.5 PLIB_IC_ExistsBufferValue Function**C**

```
bool PLIB_IC_ExistsBufferValue(  
    IC_MODULE_ID index  
);
```

Description

This function identifies whether the BufferValue feature is available on the IC module. When this function returns true, these functions are supported on the device:

- [PLIB_IC_Buffer32BitGet](#)
- [PLIB_IC_Buffer16BitGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The BufferValue feature is supported on the device
- false - The BufferValue feature is not supported on the device

Remarks

None.

5.6.10.5.7.6 PLIB_IC_ExistsCaptureMode Function**C**

```
bool PLIB_IC_ExistsCaptureMode(  
    IC_MODULE_ID index  
);
```

Description

This function identifies whether the CaptureMode feature is available on the IC module. When this function returns true, this function is supported on the device:

- [PLIB_IC_ModeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The CaptureMode feature is supported on the device
- false - The CaptureMode feature is not supported on the device

Remarks

None.

5.6.10.5.7.7 PLIB_IC_ExistsClockSource Function**C**

```
bool PLIB_IC_ExistsClockSource(  
    IC_MODULE_ID index  
);
```

Description

This function identifies whether the ClockSource feature is available on the IC module. When this function returns true, this function is supported on the device:

- [PLIB_IC_ClockSourceSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the ClockSource feature is supported on the device
- false - If the ClockSource feature is not supported on the device

Remarks

None.

5.6.10.5.7.8 PLIB_IC_ExistsEdgeCapture Function**C**

```
bool PLIB_IC_ExistsEdgeCapture(  
    IC_MODULE_ID index  
);
```

Description

This function identifies whether the EdgeCapture feature is available on the IC module. When this function returns true, this function is supported on the device:

- [PLIB_IC_FirstCaptureEdgeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The EdgeCapture feature is supported on the device
- false - The EdgeCapture feature is not supported on the device

Remarks

None.

5.6.10.5.7.9 PLIB_IC_ExistsEnable Function**C**

```
bool PLIB_IC_ExistsEnable(  
    IC_MODULE_ID index  
);
```

Description

This function identifies whether the EnableControl feature is available on the IC module. When this function returns true, these functions are supported on the device:

- [PLIB_IC_Enable](#)
- [PLIB_IC_Disable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The EnableControl feature is supported on the device
- false - The EnableControl feature is not supported on the device

Remarks

None.

5.6.10.5.7.10 PLIB_IC_ExistsEventsPerInterruptSelect Function**C**

```
bool PLIB_IC_ExistsEventsPerInterruptSelect(  
    IC_MODULE_ID index  
);
```

Description

This function identifies whether the EventsPerInterruptSelect feature is available on the IC module. When this function returns true, this function is are supported on the device:

- [PLIB_IC_EventsPerInterruptSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The EventsPerInterruptSelect feature is supported on the device
- false - The EventsPerInterruptSelect feature is not supported on the device

Remarks

None.

5.6.10.5.7.11 PLIB_IC_ExistsStopInIdle Function

C

```
bool PLIB_IC_ExistsStopInIdle(  
    IC_MODULE_ID index  
);
```

Description

This function identifies whether the StopInIdle feature is available on the IC module. When this function returns true, these functions are supported on the device:

- [PLIB_IC_StopInIdleEnable](#)
- [PLIB_IC_StopInIdleDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The StopInIdle feature is supported on the device
- false - The StopInIdle feature is not supported on the device

Remarks

None.

5.6.10.5.7.12 PLIB_IC_ExistsSyncMode Function

C

```
bool PLIB_IC_ExistsSyncMode(  
    IC_MODULE_ID index  
);
```

Description

This function identifies whether the SyncMode feature is available on the IC module. When this function returns true, this function is supported on the device:

- [PLIB_IC_SyncModeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the SyncMode feature is supported on the device
- false - If the SyncMode feature is not supported on the device

Remarks

None.

5.6.10.5.7.13 PLIB_IC_ExistsSyncModeInput Function

C

```
bool PLIB_IC_ExistsSyncModeInput(  
    IC_MODULE_ID index  
);
```

Description

This function identifies whether the SyncModeInput feature is available on the IC module. When this function returns true, this function is supported on the device:

- [PLIB_IC_SyncModeInputSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the SyncModeInput feature is supported on the device
- false - If the SyncModeInput feature is not supported on the device

Remarks

None.

5.6.10.5.7.14 PLIB_IC_ExistsTimerSelect Function

C

```
bool PLIB_IC_ExistsTimerSelect(  
    IC_MODULE_ID index  
);
```

Description

This function identifies whether the TimerSelect feature is available on the IC module. When this function returns true, this function is supported on the device:

- [PLIB_IC_TimerSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The TimerSelect feature is supported on the device
- false - The TimerSelect feature is not supported on the device

Remarks

None.

5.6.10.5.7.15 PLIB_IC_ExistsTimerTriggered Function

C

```
bool PLIB_IC_ExistsTimerTriggered(  
    IC_MODULE_ID index  
);
```

Description

This function identifies whether the TimerTriggered feature is available on the IC module. When this function returns true, this function is supported on the device:

- [PLIB_IC_TimerIsTriggered](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the TimerTriggered feature is supported on the device
- false - If the TimerTriggered feature is not supported on the device

Remarks

None.

5.6.10.6 Files

Files

Name	Description
plib_ic.h	This file contains the interface definition for the Input Capture (IC) peripheral library.

Description

5.6.10.6.1 plib_ic.h

IC Module Peripheral Library Interface Header

This library provides a low-level abstraction of the Input Capture (IC) module on Microchip microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, thus hiding differences between one microcontroller variant and another.

Functions

	Name	Description
≡	<u>PLIB_IC_AlternateClockDisable</u>	Selects Timer 2/3 instead of the alternate clock source.
≡	<u>PLIB_IC_AlternateClockEnable</u>	Selects the alternate clock source.
≡	<u>PLIB_IC_Buffer16BitGet</u>	Obtains the 16-bit input capture buffer value.
≡	<u>PLIB_IC_Buffer32BitGet</u>	Obtains the 32-bit input capture buffer value.
≡	<u>PLIB_IC_BufferIsEmpty</u>	Checks whether the input capture buffer is empty.
≡	<u>PLIB_IC_BufferOverflowHasOccurred</u>	Checks whether an input capture buffer overflow has occurred.
≡	<u>PLIB_IC_BufferSizeSelect</u>	Sets the input capture buffer size.
≡	<u>PLIB_IC_ClockSourceSelect</u>	Selects the clock source for the IC module.
≡	<u>PLIB_IC_Disable</u>	Disables the IC module.
≡	<u>PLIB_IC_Enable</u>	Enables the IC module.
≡	<u>PLIB_IC_EventsPerInterruptSelect</u>	Selects the number of capture events before an interrupt is issued.
≡	<u>PLIB_IC_ExistsAlternateClock</u>	Identifies whether the AlternateClock feature exists on the IC module
≡	<u>PLIB_IC_ExistsBufferIsEmptyStatus</u>	Identifies whether the BufferIsEmptyStatus feature exists on the IC module
≡	<u>PLIB_IC_ExistsBufferOverflowStatus</u>	Identifies whether the BufferOverflowStatus feature exists on the IC module.
≡	<u>PLIB_IC_ExistsBufferSize</u>	Identifies whether the BufferSize feature exists on the IC module.
≡	<u>PLIB_IC_ExistsBufferValue</u>	Identifies whether the BufferValue feature exists on the IC module.
≡	<u>PLIB_IC_ExistsCaptureMode</u>	Identifies whether the CaptureMode feature exists on the IC module.
≡	<u>PLIB_IC_ExistsClockSource</u>	Identifies whether the ClockSource feature exists on the IC module.
≡	<u>PLIB_IC_ExistsEdgeCapture</u>	Identifies whether the EdgeCapture feature exists on the IC module.
≡	<u>PLIB_IC_ExistsEnable</u>	Identifies whether the EnableControl feature exists on the IC module
≡	<u>PLIB_IC_ExistsEventsPerInterruptSelect</u>	Identifies whether the EventsPerInterruptSelect feature exists on the IC module.
≡	<u>PLIB_IC_ExistsStopInIdle</u>	Identifies whether the StopInIdle feature exists on the IC module.
≡	<u>PLIB_IC_ExistsSyncMode</u>	Identifies whether the SyncMode feature exists on the IC module.
≡	<u>PLIB_IC_ExistsSyncModeInput</u>	Identifies whether the SyncModeInput feature exists on the IC module.
≡	<u>PLIB_IC_ExistsTimerSelect</u>	Identifies whether the TimerSelect feature exists on the IC module.
≡	<u>PLIB_IC_ExistsTimerTriggered</u>	Identifies whether the TimerTriggered feature exists on the IC module.
≡	<u>PLIB_IC_FirstCaptureEdgeSelect</u>	Captures the timer count value at the first selected edge of input signal.
≡	<u>PLIB_IC_ModeSelect</u>	Selects the input capture mode for IC module.
≡	<u>PLIB_IC_StopInIdleDisable</u>	Continues module operation when the device enters Idle mode
≡	<u>PLIB_IC_StopInIdleEnable</u>	Discontinues IC module operation when the device enters Idle mode.
≡	<u>PLIB_IC_SyncModeInputSelect</u>	Selects the input source for synchronous or asynchronous (triggered) operation of the IC module.
≡	<u>PLIB_IC_SyncModeSelect</u>	Selects the synchronization mode for Input Capture module.
≡	<u>PLIB_IC_TimerIsTriggered</u>	Checks whether or not the input capture timer has been triggered.

	PLIB_IC_TimerSelect	Selects the 16-bit timer source for the IC module.

5.6.11 Interrupt Peripheral Library

5.6.11.1 Introduction

Interrupt Peripheral Library

for

Microchip Microcontrollers

This library provides a low-level abstraction of the Interrupt Controller module on Microchip microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, thus hiding differences from one microcontroller variant to another.

Description**Interrupt Controller Overview**

The Interrupt Controller is a key component of a microcontroller. The Interrupt Controller reduces the numerous peripheral interrupt request signals to a single interrupt request signal to the microcontroller core.

The key features present on an Interrupt Controller are:

- **Interrupt source configuration:** Provides the ability to enable, disable, and prioritize a source that may interrupt the core
- **Interrupt status flags:** Identify the source of an interrupt request or exception, usually generated by a peripheral

The interrupt will be sent to the core, only if the source is enabled to generate an interrupt and interrupts have been enabled (if supported). Sources will be prioritized so that the highest priority interrupt will be sent to the core if multiple sources cause interrupts at the same time.

Many interrupt controllers also include, other optional features:

- **Global enable configuration:** Controls the generation of any interrupt to the core from the Interrupt Controller
- **Choice of edge transition:** Controls the edge transition (high-to-low or low-to-high) on which the interrupts are generated
- **Priority configuration:** Associates a programmable priority with the interrupt source

Interrupts can be handled inside the core in the following ways:

- **Vectored:** Each interrupt has an associated interrupt handler routine
- **Non-vectored:** All interrupts have a single (shared) interrupt handler routine. The software determines the interrupt source based on the interrupt status-flags register.
- **Combination of vectored and non-vectored:** Interrupts combined in groups. Each group has a single common interrupt vector or handler, but there are multiple groups (i.e., multiple vectors). Within a specific vector group, software determines which one in the group sources caused the interrupt.

A microcontroller can support one, or more than one of the these modes.

Note: Please refer to the the specific device data sheet to determine availability of these features for your device.

5.6.11.2 Release Notes

MPLAB Harmony Version: v0.70b **Interrupt Peripheral Library Version :** 0.70b **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.6.11.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.6.11.4 Using the Library

This topic describes the basic architecture of the Interrupt Peripheral Library and provides information and examples on how to use it.

Interface Header File: plib_int.h

The interface to the Interrupt Peripheral Library is defined in the "plib_int.h" header file. Any C language source (.c) file that uses the Interrupt Peripheral Library should include "plib_int.h".

Library File:

The Interrupt Peripheral Library (.a) file installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the peripheral interacts with the framework.

5.6.11.4.1 Hardware Abstraction Model

This library provides a low-level abstraction of the Interrupt Controller module on Microchip microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Description

The **Interrupt Controller** receives requests from multiple **Interrupt Sources**. The **Interrupt Controller Configuration** controls the overall operation of the interrupt controller. Not all microcontrollers support all the features listed below:

- Interrupt nesting configuration
- Edge selection of the external interrupts
- Vector mode selection
- Priority level configuration
- Current CPU interrupt and priority status information

Source Enable Configuration enables or disables a particular source. On some microcontrollers other CPU exceptions or traps can also be controlled. **Source Status Flags** give the status of the interrupt request from a specific interrupt source.

Other optional features include the **Vector Priority Configuration**, which is available on some micro controllers and the **Proximity Timer**. Priority configuration allows a priority level to be associated with each interrupt vector. The proximity timer creates a temporal window in which a group of interrupts of the same, or lower, priority will be held off. This provides an opportunity to queue these interrupt requests and process them using tail-chaining of multiple IRQs and allows higher priority interrupts to pass through during the hold-off window.

Traps and Exceptions

Some of the things that can interrupt the normal flow of instruction execution of the CPU core are not actual interrupt sources. These are things such as a division-by-zero error or attempting to address unimplemented memory. These errors are either internal to the CPU core itself or are so catastrophic that they are non-maskable and are trapped separately. This library refers to them in general as "traps" and there are interface elements provided to allow software to handle them.

5.6.11.4.2 Library Usage Model

This section provides library usage model information.

Description

The following diagram shows the major components of the usage model.

Each of the blocks in the diagram correspond to the library interface section.

Library Interface Section	Description
General Configuration Functions	Provides setup, configuration, and status interface routines for the overall operation of the Interrupt Controller module.

5.6.11.4.3 How the Library Works

This section provides information on initialization and interrupt source setup and handling.

Description

Initialization

The steps that are required to initialize the Interrupt Controller module vary for different microcontrollers.

Note: Refer to the specific device data sheet for the correct initialization sequence for your device.

Interrupt Source Setup

An interrupt Source needs to be enabled in order for it to be able to generate a interrupt to the core. Use the function [PLIB_INT_SourceEnable](#) to enable the interrupt source. [INT_SOURCE](#) is a list of the possible interrupt sources

On some microcontrollers, each interrupt vector can be associated with a priority. Use the function [PLIB_INT_VectorPrioritySet](#) to set the interrupt vector priority. [INT_VECTOR](#) is a list of the possible interrupt vectors and [INT_PRIORITY_LEVEL](#) is the list of possible priority levels.

On some microcontrollers, each interrupt vector can be associated with a sub-priority. Use the function [PLIB_INT_VectorSubPrioritySet](#) to set the interrupt source sub-priority. [INT_SUBPRIORITY_LEVEL](#) is a list of possible sub-priority levels.

On most microcontrollers, it will be necessary to enable interrupt generation to the core by calling the [PLIB_INT_Enable](#) function.

Interrupt Handling

The status of the interrupt indicates whether or not the interrupt request was generated by the source. The status of the trap source can be obtained using the function [PLIB_INT_TrapSourceFlagGet](#) and the status of the interrupt source can be obtained using the function [PLIB_INT_SourceFlagGet](#). The interrupt status flags can be used to indicate the interrupt status even if the interrupt is not enabled for the source. When the interrupt is not enabled for the source, no interrupt is generated to the core even though the interrupt controller still recognizes that the source requested an interrupt. [INT_TRAP_SOURCE](#) is a list of possible trap events, and [INT_SOURCE](#) is a list of possible interrupt sources.

Before the Interrupt Service Routine (ISR) ends, the status of the interrupt needs to be cleared to avoid entering the ISR repeatedly for the same interrupt event. A trap source status can be cleared using the function [PLIB_INT_TrapSourceFlagClear](#), and an interrupt source status can be cleared using the function [PLIB_INT_SourceFlagClear](#). [INT_TRAP_SOURCE](#) is a list of possible trap events, and [INT_SOURCE](#) is a list of possible interrupt sources.

5.6.11.5 Configuring the Library

The library is configured for the supported Interrupt Peripheral Library.

5.6.11.6 Library Interface

Data Types and Constants

	Name	Description
	<u>INT_EXTERNAL_SOURCES</u>	Lists the possible external sources that can cause an interrupt to occur.
	<u>INT_PRIORITY_LEVEL</u>	Lists the possible interrupt priority levels
	<u>INT_SOURCE</u>	Lists the possible sources that can cause an interrupt to occur
	<u>INT_SUBPRIORITY_LEVEL</u>	Lists the possible interrupt sub priority levels
	<u>INT_TRAP_SOURCE</u>	Lists the names of the trap or exception sources
	<u>INT_VECTOR</u>	Lists the possible interrupt vectors.

Feature Existence Functions

	Name	Description
	<u>PLIB_INT_ExistsAlternateVectorTable</u>	Identifies whether the AlternateVectorTable feature exists on the Interrupt Controller module.
	<u>PLIB_INT_ExistsCPUCurrentPriorityLevel</u>	Identifies whether the CPUCurrentPriorityLevel feature exists on the Interrupt Controller module.
	<u>PLIB_INT_ExistsEnableControl</u>	Identifies whether the EnableControl feature exists on the Interrupt Controller module.
	<u>PLIB_INT_ExistsExternalINTEdgeSelect</u>	Identifies whether the ExternalINTEdgeSelect feature exists on the Interrupt Controller module.
	<u>PLIB_INT_ExistsHighPriority</u>	Identifies whether the HighPriority feature exists on the Interrupt Controller module.
	<u>PLIB_INT_ExistsINTCPUPriority</u>	Identifies whether the INTCPUPriority feature exists on the Interrupt Controller module.
	<u>PLIB_INT_ExistsINTCPUVector</u>	Identifies whether the INTCPUVector feature exists on the Interrupt Controller module.
	<u>PLIB_INT_ExistsINTNesting</u>	Identifies whether the INTNesting feature exists on the Interrupt Controller module.
	<u>PLIB_INT_ExistsLowPriority</u>	Identifies whether the LowPriority feature exists on the Interrupt Controller module.
	<u>PLIB_INT_ExistsPeripheralControl</u>	Identifies whether the PeripheralControl feature exists on the Interrupt Controller module.
	<u>PLIB_INT_ExistsPriority</u>	Identifies whether the Priority feature exists on the Interrupt Controller module.
	<u>PLIB_INT_ExistsProximityTimerControl</u>	Identifies whether the ProximityTimerControl feature exists on the Interrupt Controller module.
	<u>PLIB_INT_ExistsProximityTimerEnable</u>	Identifies whether the ProximityTimerEnable feature exists on the Interrupt Controller module.
	<u>PLIB_INT_ExistsSingleVectorShadowSet</u>	Identifies whether the SingleVectorShadowSet feature exists on the Interrupt Controller module.
	<u>PLIB_INT_ExistsSourceControl</u>	Identifies whether the SourceControl feature exists on the Interrupt Controller module.
	<u>PLIB_INT_ExistsSourceFlag</u>	Identifies whether the SourceFlag feature exists on the Interrupt Controller module.
	<u>PLIB_INT_ExistsTrapSource</u>	Identifies whether the TrapSource feature exists on the Interrupt Controller module.
	<u>PLIB_INT_ExistsVectorPriority</u>	Identifies whether the VectorPriority feature exists on the Interrupt Controller module.

	PLIB_INT_ExistsVectorSelect	Identifies whether the VectorSelect feature exists on the Interrupt Controller module.

General Configuration Functions

	Name	Description
	PLIB_INT_AlternateVectorTableSelect	Enables the use of the alternate vector table.
	PLIB_INT_Disable	Disables the generation of interrupts to the CPU.
	PLIB_INT_DISIStatusGet	Returns the status of the DISI instruction status.
	PLIB_INT_Enable	Enables the generation of interrupts to the CPU.
	PLIB_INT_ExternalFallingEdgeSelect	Selects the falling edge as the edge polarity of the external interrupt.
	PLIB_INT_ExternalRisingEdgeSelect	Selects the rising edge as the edge polarity of the external interrupt.
	PLIB_INT_IsEnabled	Identifies if interrupts are currently enabled or disabled at the top level.
	PLIB_INT_MultiVectorSelect	Configures the Interrupt Controller for Multiple Vector mode.
	PLIB_INT_NestingDisable	Disables interrupt nesting.
	PLIB_INT_NestingEnable	Enables interrupt nesting.
	PLIB_INT_PeripheralsDisable	Disables the generation of interrupts to the CPU by the peripherals.
	PLIB_INT_PeripheralsEnable	Enables the generation of interrupts to the CPU by the peripherals.
	PLIB_INT_PriorityDisable	Disables interrupt priority levels.
	PLIB_INT_PriorityEnable	Enables interrupt priority levels.
	PLIB_INT_PriorityGet	Returns the priority level of the latest interrupt presented to the CPU.
	PLIB_INT_PriorityHighDisable	Disables the generation of high-priority interrupts to the CPU.
	PLIB_INT_PriorityHighEnable	Enables the generation of high-priority interrupts to the CPU.
	PLIB_INT_PriorityLowDisable	Disables the generation of low-priority interrupts to the CPU.
	PLIB_INT_PriorityLowEnable	Enables generation of low-priority interrupts to the CPU.
	PLIB_INT_ProximityTimerDisable	Disables the interrupt temporal-proximity timer.
	PLIB_INT_ProximityTimerEnable	Enables the interrupt temporal-proximity timer and selects the priority levels that start the timer.
	PLIB_INT_SingleVectorSelect	Configures the Interrupt Controller for Single Vector mode.
	PLIB_INT_SingleVectorShadowSetDisable	Disables the Shadow Register Set in Single Vector mode.
	PLIB_INT_SingleVectorShadowSetEnable	Enables the Shadow Register Set in Single Vector mode.
	PLIB_INT_StandardVectorTableSelect	Enables the use of the standard vector table.

Interrupt Source Control Functions

	Name	Description
	PLIB_INT_SourceDisable	Disables the interrupt source
	PLIB_INT_SourceEnable	Enables the interrupt source. This section provides information on initialization and interrupt source setup and handling.
	PLIB_INT_SourceFlagClear	Clears the status of the interrupt flag for the selected source.
	PLIB_INT_SourceFlagGet	Returns the status of the interrupt flag for the selected source.
	PLIB_INT_SourceFlagSet	Sets the status of the interrupt flag for the selected source.
	PLIB_INT_SourceIsEnabled	Gets the enable state of the interrupt source.
	PLIB_INT_VectorPriorityGet	Gets the priority of the interrupt vector.
	PLIB_INT_VectorPrioritySet	Sets the priority of the interrupt vector.
	PLIB_INT_VectorSubPriorityGet	Gets the sub-priority of the interrupt vector.
	PLIB_INT_VectorSubPrioritySet	Sets the sub-priority of the interrupt vector.

Other Status and Control Functions

	Name	Description
≡	PLIB_INT_CPUCurrentPriorityLevelGet	Gets the interrupt priority level at which the CPU is currently operating.
≡	PLIB_INT_ProximityTimerGet	Returns the value used by the temporal proximity timer as a reload value when the temporal proximity timer is triggered by an interrupt event.
≡	PLIB_INT_ProximityTimerSet	Sets the temporal proximity timer reload value. This value is used to reload the proximity timer after it has been triggered by an interrupt event.
≡	PLIB_INT_TrapSourceFlagClear	Clears the flag for the selected trap.
≡	PLIB_INT_TrapSourceFlagGet	Returns the status of the flag for the selected trap.
≡	PLIB_INT_VectorGet	Returns the interrupt vector that is presented to the CPU.

Description

This section provides descriptions and examples for the functions provided in the Interrupt Peripheral Library.

5.6.11.6.1 General Configuration Functions

5.6.11.6.1.1 PLIB_INT_AlternateVectorTableSelect Function

C

```
void PLIB_INT_AlternateVectorTableSelect(
    INT_MODULE_ID index
);
```

Description

This function enables the processor to use the alternate vector table instead of the default vector table. If the alternate vector table is enabled using this function, all interrupt and exception processing uses the alternate vectors instead of the default vectors. The alternate vectors are organized in the same manner as the default vectors.

Alternate vectors support emulation and debugging by providing a means to switch between an application and support environment, without requiring the interrupt vectors to be reprogrammed. This feature can also be used to enable switching between different software algorithms during run time for evaluation.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the module instance to be configured (it should be INT_ID_0 for all the devices which has only interrupt module).

Returns

None.

Remarks

This function implements an operation of the AlternateVectorTable feature. This feature may not be available on all parts. Please refer to the data sheet to determine if this feature is available or call the [PLIB_INT_ExistsAlternateVectorTable](#) API to write flexible code to automatically determine if this feature is available.

Example

```
PLIB_INT_AlternateVectorTableSelect( INT_ID_0 );
```

5.6.11.6.1.2 PLIB_INT_Disable Function

C

```
void PLIB_INT_Disable(  
    INT_MODULE_ID index  
);
```

Description

This function disables the generation of interrupts to the CPU.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the module instance to be configured (it should be INT_ID_0 for all the devices which has only one interrupt module).

Returns

None.

Remarks

This function implements an operation of the EnableControl feature. This feature may not be available on all parts. Please refer to the data sheet to determine if this feature is available or call the [PLIB_INT_ExistsEnableControl](#) API to write flexible code to automatically determine if this feature is available.

Example

```
PLIB_INT_Disable( INT_ID_0 );
```

5.6.11.6.1.3 PLIB_INT_DISIStatusGet Function

C

```
bool PLIB_INT_DISIStatusGet(  
    INT_MODULE_ID index  
);
```

Description

This function returns the status of the DISI instruction status.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the module instance to be configured (it should be INT_ID_0 for all the devices which has only one interrupt module).

Returns

- true - If DISI is active
- false - If DISI is not active

Remarks

This function implements an operation of the DISI feature. This feature may not be available on all parts. Please refer to the data sheet to determine if this feature is available or call the [PLIB_INT_ExistsDISI](#) API to write flexible code to automatically

determine if this feature is available.

Example

```
PLIB_INT_DISISStatusGet( INT_ID_0 );
```

5.6.11.6.1.4 PLIB_INT_Enable Function**C**

```
void PLIB_INT_Enable(  
    INT_MODULE_ID index  
);
```

Description

This function enables the generation of interrupts to the CPU.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the module instance to be configured (it should be INT_ID_0 for all the devices which has only interrupt module).

Returns

None.

Remarks

This function implements an operation of the EnableControl feature. This feature may not be available on all parts. Please refer to the data sheet to determine if this feature is available or call the [PLIB_INT_ExistsEnableControl](#) API to write flexible code to automatically determine if this feature is available.

Example

```
PLIB_INT_Enable( INT_ID_0 );
```

5.6.11.6.1.5 PLIB_INT_ExternalFallingEdgeSelect Function**C**

```
void PLIB_INT_ExternalFallingEdgeSelect(  
    INT_MODULE_ID index,  
    INT_EXTERNAL_SOURCES source  
);
```

Description

This function selects the falling edge as the edge polarity of the external interrupt.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the module instance to be configured (it should be INT_ID_0 for all the devices which has only interrupt module).
source	One or more of the values from INT_EXTERNAL_SOURCES . Values can be combined using a bitwise "OR" operation.

Returns

None.

Remarks

This function implements an operation of the ExternalINTEdgeSelect feature. This feature may not be available on all parts. Please refer to the data sheet to determine if this feature is available or call the [PLIB_INT_ExistsExternalINTEdgeSelect](#) API to write flexible code to automatically determine if this feature is available.

Example

```
PLIB_INT_ExternalFallingEdgeSelect( INT_ID_0,
                                   (INT_EXTERNAL_INT_SOURCE0 |
                                   INT_EXTERNAL_INT_SOURCE1) );
```

5.6.11.6.1.6 PLIB_INT_ExternalRisingEdgeSelect Function

C

```
void PLIB_INT_ExternalRisingEdgeSelect(
    INT_MODULE_ID index,
    INT_EXTERNAL_SOURCES source
);
```

Description

This function selects the rising edge as the edge polarity of the external interrupt.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the module instance to be configured (it should be INT_ID_0 for all the devices which has only interrupt module).
source	One or more of the values from INT_EXTERNAL_SOURCES . Values can be combined using a bitwise "OR" operation.

Returns

None.

Remarks

This function implements an operation of the ExternalINTEdgeSelect feature. This feature may not be available on all parts. Please refer to the data sheet to determine if this feature is available or call the [PLIB_INT_ExistsExternalINTEdgeSelect](#) API to write flexible code to automatically determine if this feature is available.

Example

```
PLIB_INT_ExternalRisingEdgeSelect( INT_ID_0,
                                   ( INT_EXTERNAL_INT_SOURCE0 |
                                   INT_EXTERNAL_INT_SOURCE1 ) );
```

5.6.11.6.1.7 PLIB_INT_IsEnabled Function

C

```
bool PLIB_INT_IsEnabled(
    INT_MODULE_ID index
);
```

Description

This function identifies if interrupts are enabled or disabled at the top level.

Preconditions

None.

Returns

- true - If the interrupts are currently enabled
- false - If the interrupts are currently disabled

Remarks

This function implements an operation of the EnableControl feature. This feature may not be available on all parts. Please refer to the data sheet to determine if this feature is available or call the [PLIB_INT_ExistsEnableControl](#) API to write flexible code to automatically determine if this feature is available.

Example

```
status = PLIB_INT_IsEnabled( INT_ID_0 );
```

5.6.11.6.1.8 PLIB_INT_MultiVectorSelect Function**C**

```
void PLIB_INT_MultiVectorSelect(  
    INT_MODULE_ID index  
);
```

Description

This function configures the Interrupt Controller for Multiple Vector mode. Interrupt requests will serviced at the calculated vector addresses. The CPU vectors to the unique address for each vector number.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the module instance to be configured (it should be INT_ID_0 for all the devices which has only interrupt module).

Returns

None.

Remarks

While the user can, during run-time, reconfigure the interrupt controller from Single Vector mode to Multiple Vector mode, such action is strongly discouraged, as it may result in undefined behavior.

This function implements an operation of the VectorSelect feature. This feature may not be available on all parts. Please refer to the data sheet to determine if this feature is available or call the [PLIB_INT_ExistsVectorSelect](#) API to write flexible code to automatically determine if this feature is available.

Example

```
PLIB_INT_MultiVectorSelect( INT_ID_0 );
```

5.6.11.6.1.9 PLIB_INT_NestingDisable Function

C

```
void PLIB_INT_NestingDisable(  
    INT_MODULE_ID index  
);
```

Description

This function disables interrupt nesting on processors that support it.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the module instance to be configured (it should be INT_ID_0 for all the devices which has only interrupt module).

Returns

None.

Remarks

This function implements an operation of the INTNesting feature. This feature may not be available on all parts. Please refer to the data sheet to determine if this feature is available or call the [PLIB_INT_ExistsINTNesting](#) API to write flexible code to automatically determine if this feature is available.

Example

```
PLIB_INT_NestingDisable( INT_ID_0 );
```

5.6.11.6.1.10 PLIB_INT_NestingEnable Function

C

```
void PLIB_INT_NestingEnable(  
    INT_MODULE_ID index  
);
```

Description

This function enables interrupt nesting on processors that support it.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the module instance to be configured (it should be INT_ID_0 for all the devices which has only interrupt module).

Returns

None.

Remarks

This function implements an operation of the INTNesting feature. This feature may not be available on all parts. Please refer to the data sheet to determine if this feature is available or call the [PLIB_INT_ExistsINTNesting](#) API to write flexible code to automatically determine if this feature is available.

Example

```
PLIB_INT_NestingEnable( INT_ID_0 );
```

5.6.11.6.1.11 PLIB_INT_PeripheralsDisable Function**C**

```
void PLIB_INT_PeripheralsDisable(  
    INT_MODULE_ID index  
);
```

Description

This function disables the generation of interrupts to the CPU by the peripherals on devices that support this feature.

Preconditions

None.

Returns

None.

Remarks

This function implements an operation of the PeripheralControl feature. This feature may not be available on all parts. Please refer to the data sheet to determine if this feature is available or call the [PLIB_INT_ExistsPeripheralControl](#) API to write flexible code to automatically determine if this feature is available.

Example

```
PLIB_INT_PeripheralsDisable( INT_ID_0 );
```

5.6.11.6.1.12 PLIB_INT_PeripheralsEnable Function**C**

```
void PLIB_INT_PeripheralsEnable(  
    INT_MODULE_ID index  
);
```

Description

This function enables the generation of interrupts to the CPU by the peripherals on devices with the ability to disable them.

Preconditions

None.

Returns

None.

Remarks

This function implements an operation of the PeripheralControl feature. This feature may not be available on all parts. Please refer to the data sheet to determine if this feature is available or call the [PLIB_INT_ExistsPeripheralControl](#) API to write flexible code to automatically determine if this feature is available.

Example

```
PLIB_INT_PeripheralsEnable( INT_ID_0 );
```

5.6.11.6.1.13 PLIB_INT_PriorityDisable Function**C**

```
void PLIB_INT_PriorityDisable(  

```

```
    INT_MODULE_ID index
);
```

Description

This function disables interrupt priority levels on devices that support programmable interrupt priorities.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the module instance to be configured (it should be INT_ID_0 for all the devices which has only one interrupt module).

Returns

None.

Remarks

This function implements an operation of the Priority feature. This feature may not be available on all parts. Please refer to the data sheet to determine if this feature is available or call the [PLIB_INT_ExistsPriority](#) API to write flexible code to automatically determine if this feature is available.

Example

```
PLIB_INT_PriorityDisable( INT_ID_0 );
```

5.6.11.6.1.14 PLIB_INT_PriorityEnable Function**C**

```
void PLIB_INT_PriorityEnable(
    INT_MODULE_ID index
);
```

Description

This function enables interrupt priority levels on devices that support programmable interrupt priorities.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the module instance to be configured (it should be INT_ID_0 for all the devices which has only one interrupt module).

Returns

None.

Remarks

This function implements an operation of the Priority feature. This feature may not be available on all parts. Please refer to the data sheet to determine if this feature is available or call the [PLIB_INT_ExistsPriority](#) API to write flexible code to automatically determine if this feature is available.

Example

```
PLIB_INT_PriorityEnable( INT_ID_0 );
```

5.6.11.6.1.15 PLIB_INT_PriorityGet Function

C

```
INT_PRIORITY_LEVEL PLIB_INT_PriorityGet(  
    INT_MODULE_ID index  
);
```

Description

This function returns the priority level of the latest interrupt presented to the CPU.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the module instance to be configured (it should be INT_ID_0 for all the devices which has only interrupt module).

Returns

One of the possible values from [INT_PRIORITY_LEVEL](#).

Remarks

This value should only be used when the interrupt controller is configured for single vector mode using the function [PLIB_INT_SingleVectorSelect](#).

This function implements an operation of the INTCPUPriority feature. This feature may not be available on all parts. Please refer to the data sheet to determine if this feature is available or call the [PLIB_INT_ExistsINTCPUPriority](#) API to write flexible code to automatically determine if this feature is available.

Example

```
INT_PRIORITY_LEVEL level = PLIB_INT_RequestedPriorityLevelGet( INT_ID_0 );
```

5.6.11.6.1.16 PLIB_INT_PriorityHighDisable Function

C

```
void PLIB_INT_PriorityHighDisable(  
    INT_MODULE_ID index  
);
```

Description

This function disables the generation of high-priority interrupts to the CPU on devices that support high-priority interrupts.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the module instance to be configured (it should be INT_ID_0 for all the devices which has only one interrupt module).

Returns

None.

Remarks

This function implements an operation of the HighPriority feature. This feature may not be available on all parts. Please refer to

the data sheet to determine if this feature is available or call the [PLIB_INT_ExistsHighPriority](#) API to write flexible code to automatically determine if this feature is available.

Example

```
PLIB_INT_PriorityHighDisable( INT_ID_0 );
```

5.6.11.6.1.17 PLIB_INT_PriorityHighEnable Function**C**

```
void PLIB_INT_PriorityHighEnable(  
    INT_MODULE_ID index  
);
```

Description

This function enables the generation of high-priority interrupts to the CPU on devices that support this feature.

Preconditions

None.

Returns

None.

Remarks

This function implements an operation of the HighPriority feature. This feature may not be available on all parts. Please refer to the data sheet to determine if this feature is available or call the [PLIB_INT_ExistsHighPriority](#) API to write flexible code to automatically determine if this feature is available.

Example

```
PLIB_INT_PriorityHighEnable( INT_ID_0 );
```

5.6.11.6.1.18 PLIB_INT_PriorityLowDisable Function**C**

```
void PLIB_INT_PriorityLowDisable(  
    INT_MODULE_ID index  
);
```

Description

This function disables the generation of low-priority interrupts to the CPU on devices that support this feature.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the module instance to be configured (it should be INT_ID_0 for all the devices which has only one interrupt module).

Returns

None.

Remarks

This function implements an operation of the LowPriority feature. This feature may not be available on all parts. Please refer to the data sheet to determine if this feature is available or call the [PLIB_INT_ExistsLowPriority](#) API to write flexible code to automatically determine if this feature is available.

Example

```
PLIB_INT_PriorityLowDisable( INT_ID_0 );
```

5.6.11.6.1.19 PLIB_INT_PriorityLowEnable Function**C**

```
void PLIB_INT_PriorityLowEnable(  
    INT_MODULE_ID index  
);
```

Description

This function enables generation of low-priority interrupts to the CPU on devices that support this feature.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the module instance to be configured (it should be INT_ID_0 for all the devices which has only one interrupt module).

Returns

None.

Remarks

This function implements an operation of the LowPriority feature. This feature may not be available on all parts. Please refer to the data sheet to determine if this feature is available or call the [PLIB_INT_ExistsLowPriority](#) API to write flexible code to automatically determine if this feature is available.

Example

```
PLIB_INT_PriorityLowEnable( INT_ID_0 );
```

5.6.11.6.1.20 PLIB_INT_ProximityTimerDisable Function**C**

```
void PLIB_INT_ProximityTimerDisable(  
    INT_MODULE_ID index  
);
```

Description

This function disables the interrupt temporal-proximity timer.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the module instance to be configured (it should be INT_ID_0 for all the devices which has only interrupt module).

Returns

None.

Remarks

This function implements an operation of the ProximityTimerEnable feature. This feature may not be available on all parts.

Please refer to the data sheet to determine if this feature is available or call the [PLIB_INT_ExistsProximityTimerEnable](#) API to write flexible code to automatically determine if this feature is available.

Example

```
PLIB_INT_ProximityTimerDisable(INT_PRIORITY_LEVEL3);
```

5.6.11.6.1.21 PLIB_INT_ProximityTimerEnable Function**C**

```
void PLIB_INT_ProximityTimerEnable(
    INT_MODULE_ID index,
    INT_PRIORITY_LEVEL priority
);
```

Description

This function enables the interrupt temporal-proximity timer and selects the priority levels that start the timer. One of the possible values from `PLIB_INT_PRIORITY_LEVEL` can be selected. Interrupts of that priority and lower start the temporal proximity timer.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the module instance to be configured (it should be <code>INT_ID_0</code> for all the devices which has only interrupt module).
priority	One of possible values from INT_PRIORITY_LEVEL .

Returns

None.

Remarks

This function implements an operation of the `ProximityTimerEnable` feature. This feature may not be available on all parts. Please refer to the data sheet to determine if this feature is available or call the [PLIB_INT_ExistsProximityTimerEnable](#) API to write flexible code to automatically determine if this feature is available.

Choosing `INT_PRIORITY_0` disables the proximity timer (exactly the same as if [PLIB_INT_ProximityTimerDisable](#) had been called.

Example

```
//Interrupts of group priority 3 or lower start the temporal proximity timer
PLIB_INT_ProximityTimerEnable( INT_ID_0, INT_PRIORITY_LEVEL3 );
```

5.6.11.6.1.22 PLIB_INT_SingleVectorSelect Function**C**

```
void PLIB_INT_SingleVectorSelect(
    INT_MODULE_ID index
);
```

Description

The function configures the Interrupt Controller for Single Vector mode. All interrupt requests will serviced at one vector address. The CPU vectors to the same address for all interrupt sources.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the module instance to be configured (it should be INT_ID_0 for all the devices which has only interrupt module).

Returns

None.

Remarks

While the user can, during run-time, reconfigure the Interrupt Controller from Single Vector mode to Multiple Vector mode, such action is strongly discouraged, as it may result in undefined behavior.

This function implements an operation of the VectorSelect feature. This feature may not be available on all parts. Please refer to the data sheet to determine if this feature is available or call the [PLIB_INT_ExistsVectorSelect](#) API to write flexible code to automatically determine if this feature is available.

Example

```
PLIB_INT_SingleVectorSelect( INT_ID_0 );
```

5.6.11.6.1.23 PLIB_INT_SingleVectorShadowSetDisable Function**C**

```
void PLIB_INT_SingleVectorShadowSetDisable(  
    INT_MODULE_ID index  
);
```

Description

This function disables usage of the "shadow" set of processor registers when operating in Single Vector mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the module instance to be configured (it should be INT_ID_0 for all the devices which has only interrupt module).

Returns

None.

Remarks

This function implements an operation of the SingleVectorShadowSet feature. This feature may not be available on all parts. Please refer to the data sheet to determine if this feature is available or call the [PLIB_INT_ExistsSingleVectorShadowSet](#) API to write flexible code to automatically determine if this feature is available.

Example

```
PLIB_INT_SingleVectorShadowSetEnable( INT_ID_0 );
```

5.6.11.6.1.24 PLIB_INT_SingleVectorShadowSetEnable Function**C**

```
void PLIB_INT_SingleVectorShadowSetEnable(  
    INT_MODULE_ID index  
);
```

Description

This function enables usage of the "shadow" set of processor registers when operating in Single Vector mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the module instance to be configured (it should be INT_ID_0 for all the devices which has only interrupt module).

Returns

None.

Remarks

This function implements an operation of the SingleVectorShadowSet feature. This feature may not be available on all parts. Please refer to the data sheet to determine if this feature is available or call the [PLIB_INT_ExistsSingleVectorShadowSet](#) API to write flexible code to automatically determine if this feature is available.

Example

```
PLIB_INT_SingleVectorShadowSetEnable( INT_ID_0 );
```

5.6.11.6.1.25 PLIB_INT_StandardVectorTableSelect Function

C

```
void PLIB_INT_StandardVectorTableSelect(  
    INT_MODULE_ID index  
);
```

Description

This function enables use of the standard vector table. This is the default. It is only necessary to use this function if the alternate vector table was enabled using the [PLIB_INT_AlternateVectorTableSelect](#) function.

Preconditions

None.

Returns

None.

Remarks

This function implements an operation of the AlternateVectorTable feature. This feature may not be available on all parts. Please refer to the data sheet to determine if this feature is available or call the [PLIB_INT_ExistsAlternateVectorTable](#) API to write flexible code to automatically determine if this feature is available.

Example

```
PLIB_INT_StandardVectorTableSelect( INT_ID_0 );
```

5.6.11.6.2 Interrupt Source Control Functions

5.6.11.6.2.1 PLIB_INT_SourceDisable Function

C

```
void PLIB_INT_SourceDisable(  

```

```
    INT_MODULE_ID index,
    INT_SOURCE source
);
```

Description

This function disables the given interrupt source.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the module instance to be configured (it should be INT_ID_0 for all the devices which has only interrupt module).
source	One of the possible values from INT_SOURCE .

Returns

None.

Remarks

This function implements an operation of the SourceControl feature. This feature may not be available on all parts. Please refer to the data sheet to determine if this feature is available or call the [PLIB_INT_ExistsSourceControl](#) API to write flexible code to automatically determine if this feature is available.

Example

```
PLIB_INT_SourceDisable(INT_ID_0, INT_SOURCE_TIMER_1);
```

5.6.11.6.2.2 PLIB_INT_SourceEnable Function

C

```
void PLIB_INT_SourceEnable(
    INT_MODULE_ID index,
    INT_SOURCE source
);
```

Description

This function enables the interrupt source. The interrupt flag is set when the interrupt request is sampled. The pending interrupt request will not cause further processing if the interrupt is not enabled using this function or if interrupts are not enabled (on processors that support the [PLIB_INT_Enable](#) feature).

Initialization

The steps that are required to initialize the Interrupt Controller module vary for different microcontrollers.

Note: Refer to the specific device data sheet for the correct initialization sequence for your device.

Interrupt Source Setup <<<<<<< .mine

1. An interrupt Source needs to be enabled in order for it to be able to generate a interrupt to the core. Use the functions PLIB_INT_SourceEnable to enable the interrupt source. [INT_SOURCE](#) is a list of possible interrupt sources
2. On some micro controllers, each interrupt can be associated with a priority. Use the function PLIB_INT_SourcePrioritySet to set the interrupt source priority. INT_SOURCES is list of possible interrupt sources and INT_PRIORITY_LEVELS is the list of possible priority levels.
3. On some micro controllers, each interrupt can be associated with a sub priority. Use the function PLIB_INT_SourceSubPrioritySet to set the interrupt source sub priority. INT_SUBPRIORITY_LEVELS is a list of possible sub priority levels.
4. On most microcontrollers, it will be necessary to enable interrupt generation to the core by calling the [PLIB_INT_Enable](#)

routine.

=====

An interrupt Source needs to be enabled in order for it to be able to generate a interrupt to the core. Use the function `PLIB_INT_SourceEnable` to enable the interrupt source. [INT_SOURCE](#) is a list of the possible interrupt sources

On some microcontrollers, each interrupt can be associated with a priority. Use the function `PLIB_INT_VectorPrioritySet` to set the interrupt source priority. [INT_SOURCE](#) is a list of the possible interrupt sources and [INT_PRIORITY_LEVEL](#) is the list of possible priority levels.

On some microcontrollers, each interrupt can be associated with a sub-priority. Use the function `PLIB_INT_VectorSubPrioritySet` to set the interrupt source sub-priority. [INT_SUBPRIORITY_LEVEL](#) is a list of possible sub-priority levels.

On most microcontrollers, it will be necessary to enable interrupt generation to the core by calling the `PLIB_INT_Enable` function.

>>>>>> .r21563 Interrupt Handling

The status of the interrupt indicates whether or not the interrupt request was generated by the source. The status of the trap source can be obtained using the function `PLIB_INT_TrapSourceFlagGet` and the status of the interrupt source can be obtained using the function `PLIB_INT_SourceFlagGet`. The interrupt status flags can be used to indicate the interrupt status even if the interrupt is not enabled for the source. When the interrupt is not enabled for the source, no interrupt is generated to the core even though the interrupt controller still recognizes that the source requested an interrupt. [INT_TRAP_SOURCE](#) is a list of possible trap events, and [INT_SOURCE](#) is a list of possible interrupt sources.

Before the Interrupt Service Routine (ISR) ends, the status of the interrupt needs to be cleared to avoid entering the ISR repeatedly for the same interrupt event. A trap source status can be cleared using the function `PLIB_INT_TrapSourceFlagClear`, and an interrupt source status can be cleared using the function `PLIB_INT_SourceFlagClear`. [INT_TRAP_SOURCE](#) is a list of possible trap events, and [INT_SOURCE](#) is a list of possible interrupt sources.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the module instance to be configured (it should be <code>INT_ID_0</code> for all the devices which has only interrupt module).
source	One of the possible values from INT_SOURCE .

Returns

None.

Remarks

This function implements an operation of the SourceControl feature. This feature may not be available on all parts. Please refer to the data sheet to determine if this feature is available or call the `PLIB_INT_ExistsSourceControl` API to write flexible code to automatically determine if this feature is available.

Example

```
PLIB_INT_SourceEnable(INT_ID_0, INT_SOURCE_TIMER_1);
```

5.6.11.6.2.3 PLIB_INT_SourceFlagClear Function

C

```
void PLIB_INT_SourceFlagClear(
    INT_MODULE_ID index,
    INT_SOURCE source
);
```

Description

This function clears the status of the interrupt flag for the selected source. The flag is set when the interrupt request is identified. The pending interrupt request will not cause further processing if the interrupt is not enabled using the function `PLIB_INT_SourceEnable` or if interrupts are not enabled (on processors that support the [PLIB_INT_Enable](#) feature).

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the module instance to be configured (it should be <code>INT_ID_0</code> for all the devices which has only interrupt module).
source	One of the possible values from INT_SOURCE .

Returns

None.

Remarks

This function implements an operation of the SourceFlag feature. This feature may not be available on all parts. Please refer to the data sheet to determine if this feature is available or call the [PLIB_INT_ExistsSourceFlag](#) API to write flexible code to automatically determine if this feature is available.

Example

```
if(PLIB_INT_SourceFlagGet(INT_ID_0, INT_SOURCE_TIMER_1))
{
    PLIB_INT_SourceFlagClear(INT_ID_0, INT_SOURCE_TIMER_1);
}
```

5.6.11.6.2.4 PLIB_INT_SourceFlagGet Function**C**

```
bool PLIB_INT_SourceFlagGet(
    INT_MODULE_ID index,
    INT_SOURCE source
);
```

Description

This function returns the status of the interrupt flag for the selected source. The flag is set when the interrupt request is recognized. The pending interrupt request will not cause further processing if the interrupt is not enabled using the function `PLIB_INT_SourceEnable` or if interrupts are not enabled (on processors that support the [PLIB_INT_Enable](#) feature).

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the module instance to be configured (it should be <code>INT_ID_0</code> for all the devices which has only interrupt module).
source	One of the possible values from INT_SOURCE .

Returns

true - If the interrupt request is recognized for the source
false - If the interrupt request is not recognized for the source

Remarks

This function implements an operation of the SourceFlag feature. This feature may not be available on all parts. Please refer to the data sheet to determine if this feature is available or call the [PLIB_INT_ExistsSourceFlag](#) API to write flexible code to automatically determine if this feature is available.

Example

```
if(PLIB_INT_SourceFlagGet(INT_ID_0, INT_SOURCE_TIMER_1))
{
    PLIB_INT_SourceFlagClear(INT_ID_0, INT_SOURCE_TIMER_1);
}
```

5.6.11.6.2.5 PLIB_INT_SourceFlagSet Function**C**

```
void PLIB_INT_SourceFlagSet(
    INT_MODULE_ID index,
    INT_SOURCE source
);
```

Description

This function sets the status of the interrupt flag for the selected source. This function will not be used during normal operation of the system. It is used to generate test interrupts for debug and testing purposes.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the module instance to be configured (it should be INT_ID_0 for all the devices which has only interrupt module).
source	One of the possible values from INT_SOURCE .

Returns

None.

Remarks

This function implements an operation of the SourceFlag feature. This feature may not be available on all parts. Please refer to the data sheet to determine if this feature is available or call the [PLIB_INT_ExistsSourceFlag](#) API to write flexible code to automatically determine if this feature is available.

Example

```
PLIB_INT_SourceFlagSet(INT_ID_0, INT_SOURCE_TIMER_1);
```

5.6.11.6.2.6 PLIB_INT_SourceIsEnabled Function**C**

```
bool PLIB_INT_SourceIsEnabled(
    INT_MODULE_ID index,
    INT_SOURCE source
);
```

Description

This function gets the enable state of the interrupt source.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the module instance to be configured (it should be INT_ID_0 for all the devices which has only interrupt module).
source	One of the possible values from INT_SOURCE .

Returns

- true - If the interrupt source is enabled
- false - If the interrupt source is disabled

Remarks

This function implements an operation of the SourceControl feature. This feature may not be available on all parts. Please refer to the data sheet to determine if this feature is available or call the [PLIB_INT_ExistsSourceControl](#) API to write flexible code to automatically determine if this feature is available.

Example

```
if(PLIB_INT_SourceIsEnabled(INT_ID_0, INT_SOURCE_TIMER_1) != true)
{
    PLIB_INT_SourceEnable(INT_ID_0, INT_SOURCE_TIMER_1);
}
```

5.6.11.6.2.7 PLIB_INT_VectorPriorityGet Function**C**

```
INT_PRIORITY_LEVEL PLIB_INT_VectorPriorityGet(
    INT_MODULE_ID index,
    INT_VECTOR vector
);
```

Description

Gets the priority of the interrupt vector. The priority is one of the possible values from [INT_PRIORITY_LEVEL](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the module instance to be configured (it should be INT_ID_0 for all the devices which has only interrupt module).
vector	One of the possible values from INT_VECTOR

Returns

priority - One of the possible values from [INT_PRIORITY_LEVEL](#)

Remarks

This function implements an operation of the VectorPriority feature. This feature may not be available on all parts. Please refer to the data sheet to determine if this feature is available or call the [PLIB_INT_ExistsVectorPriority](#) API to write flexible code to automatically determine if this feature is available.

Example

```
INT_PRIORITY_LEVEL level;
```

```
level = PLIB_INT_VectorPriorityGet(INT_ID_0, INT_VECTOR_T1);
```

5.6.11.6.2.8 PLIB_INT_VectorPrioritySet Function

C

```
void PLIB_INT_VectorPrioritySet(  
    INT_MODULE_ID index,  
    INT_VECTOR vector,  
    INT_PRIORITY_LEVEL priority  
);
```

Description

Sets the priority of the interrupt vector. The priority is one of the possible values from [INT_PRIORITY_LEVEL](#).

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the module instance to be configured (it should be INT_ID_0 for all the devices which has only interrupt module).
vector	One of the possible values from INT_VECTOR
priority	One of the possible values from INT_PRIORITY_LEVEL

Returns

None.

Remarks

This function implements an operation of the VectorPriority feature. This feature may not be available on all parts. Please refer to the data sheet to determine if this feature is available or call the [PLIB_INT_ExistsVectorPriority](#) API to write flexible code to automatically determine if this feature is available.

Example

```
PLIB_INT_VectorPrioritySet(INT_ID_0, INT_VECTOR_T1, INT_PRIORITY_LEVEL_4);
```

5.6.11.6.2.9 PLIB_INT_VectorSubPriorityGet Function

C

```
INT_SUBPRIORITY_LEVEL PLIB_INT_VectorSubPriorityGet(  
    INT_MODULE_ID index,  
    INT_VECTOR vector  
);
```

Description

This function gets the sub-priority of the interrupt vector. The priority is one of the possible values from [INT_SUBPRIORITY_LEVEL](#).

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the module instance to be configured (it should be INT_ID_0 for all the devices which has only interrupt module).
vector	One of the possible values from INT_VECTOR

Returns

priority - One of the possible values from [INT_SUBPRIORITY_LEVEL](#)

Remarks

This function implements an operation of the VectorPriority feature. This feature may not be available on all parts. Please refer to the data sheet to determine if this feature is available or call the [PLIB_INT_ExistsVectorPriority](#) API to write flexible code to automatically determine if this feature is available.

Example

```
INT_SUBPRIORITY_LEVEL level;  
level = PLIB_INT_VectorSubPriorityGet(INT_ID_0, INT_VECTOR_T1);
```

5.6.11.6.2.10 PLIB_INT_VectorSubPrioritySet Function**C**

```
void PLIB_INT_VectorSubPrioritySet(  
    INT_MODULE_ID index,  
    INT_VECTOR vector,  
    INT_SUBPRIORITY_LEVEL subPriority  
);
```

Description

This function sets the sub priority of the interrupt vector. The sub-priority is one of the possible values from [INT_SUBPRIORITY_LEVEL](#).

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the module instance to be configured (it should be INT_ID_0 for all the devices which has only interrupt module).
vector	One of the possible values from INT_VECTOR
subPriority	One of the possible values from INT_SUBPRIORITY_LEVEL

Returns

None.

Remarks

This function implements an operation of the VectorPriority feature. This feature may not be available on all parts. Please refer to the data sheet to determine if this feature is available or call the [PLIB_INT_ExistsVectorPriority](#) API to write flexible code to automatically determine if this feature is available.

Example

```
PLIB_INT_VectorSubPrioritySet(INT_ID_0, INT_VECTOR_T1, INT_SUBPRIORITY_LEVEL_1);
```

5.6.11.6.3 Other Status and Control Functions**5.6.11.6.3.1 PLIB_INT_CPUCurrentPriorityLevelGet Function****C**

```
INT_PRIORITY_LEVEL PLIB_INT_CPUCurrentPriorityLevelGet(  
    INT_MODULE_ID index
```

```
);
```

Description

This function gets the interrupt priority level at which the CPU is currently operating.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the module instance to be configured (it should be INT_ID_0 for all the devices which has only interrupt module).

Returns

priority - The current interrupt priority of the CPU. Range (0 - 15)

Remarks

User interrupts are disabled when the CPU priority is more than 7.

This function implements an operation of the CPUCurrentPriorityLevel feature. This feature may not be available on all parts. Please refer to the data sheet to determine if this feature is available or call the [PLIB_INT_ExistsCPUCurrentPriorityLevel](#) API to write flexible code to automatically determine if this feature is available.

Example

```
INT_PRIORITY_LEVEL currentCPUPriority;  
currentCPUPriority = PLIB_INT_CPUCurrentPriorityLevelGet( INT_ID_0 );
```

5.6.11.6.3.2 PLIB_INT_ProximityTimerGet Function**C**

```
uint32_t PLIB_INT_ProximityTimerGet(  
    INT_MODULE_ID index  
);
```

Description

This function returns the value used by the temporal proximity timer as a reload value when the temporal proximity timer is triggered by an interrupt event.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the module instance to be configured (it should be INT_ID_0 for all the devices which has only interrupt module).

Returns

Timer reload value.

Remarks

This function implements an operation of the ProximityTimerControl feature. This feature may not be available on all parts. Please refer to the data sheet to determine if this feature is available or call the [PLIB_INT_ExistsProximityTimerControl](#) API to write flexible code to automatically determine if this feature is available.

Example

```
uint32_t timer;  
  
timer = PLIB_INT_ProximityTimerGet( INT_ID_0 );
```

5.6.11.6.3.3 PLIB_INT_ProximityTimerSet Function**C**

```
void PLIB_INT_ProximityTimerSet(  
    INT_MODULE_ID index,  
    uint32_t timerreloadvalue  
);
```

Description

This function sets the temporal proximity timer reload value. This value is used to reload the proximity timer after it has been triggered by an interrupt event.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the module instance to be configured (it should be INT_ID_0 for all the devices which has only interrupt module).
timerReloadValue	Timer reload value.

Returns

None.

Remarks

This function implements an operation of the ProximityTimerControl feature. This feature may not be available on all parts. Please refer to the data sheet to determine if this feature is available or call the [PLIB_INT_ExistsProximityTimerControl](#) API to write flexible code to automatically determine if this feature is available.

Example

```
PLIB_INT_ProximityTimerSet(INT_ID_0, 0x12345678);
```

5.6.11.6.3.4 PLIB_INT_TrapSourceFlagClear Function**C**

```
void PLIB_INT_TrapSourceFlagClear(  
    INT_MODULE_ID index,  
    INT_TRAP_SOURCE trapsource  
);
```

Description

This function clears the flag for the selected trap. The flag is set when the request is recognized.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the module instance to be configured (it should be INT_ID_0 for all the devices which has only interrupt module).

trapSource	One of the possible values from INT_TRAP_SOURCE

Returns

None.

Remarks

Some processor documentation uses the term "Exception" instead of the term "Trap". For purposes of the Interrupt Peripheral Library, these two terms are synonyms. The difference between a trap (or exception) and an interrupt is that a trap cannot be enabled or disabled, whereas an interrupt can be.

This function implements an operation of the TrapSource feature. This feature may not be available on all parts. Please refer to the data sheet to determine if this feature is available or call the [PLIB_INT_ExistsTrapSource](#) API to write flexible code to automatically determine if this feature is available.

Example

```
if(PLIB_INT_TrapSourceFlagGet(INT_ID_0, INT_ADDRESS_OVERFLOW_TRAP))
{
    PLIB_INT_TrapSourceFlagClear(INT_ID_0, INT_ADDRESS_OVERFLOW_TRAP);
}
```

5.6.11.6.3.5 PLIB_INT_TrapSourceFlagGet Function**C**

```
bool PLIB_INT_TrapSourceFlagGet(
    INT_MODULE_ID index,
    INT_TRAP_SOURCE trapSource
);
```

Description

This function returns the status of the flag for the selected trap. The flag is set when the trap request is recognized.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the module instance to be configured (it should be INT_ID_0 for all the devices which has only interrupt module).
trapSource	One of the possible values from INT_TRAP_SOURCE

Returns

- true - If the request has been recognized for the trap
- false - If the request is not recognized for the trap

Remarks

Some processor documentation uses the term "Exception" instead of the term "Trap". For purposes of the Interrupt Peripheral Library, these two terms are synonyms. The difference between a trap (or exception) and an interrupt is that a trap cannot be enabled or disabled, whereas an interrupt can be.

This function implements an operation of the TrapSource feature. This feature may not be available on all parts. Please refer to the data sheet to determine if this feature is available or call the [PLIB_INT_ExistsTrapSource](#) API to write flexible code to automatically determine if this feature is available.

Example

```
if(PLIB_INT_TrapSourceFlagGet(INT_ID_0, INT_ADDRESS_OVERFLOW_TRAP))
{
```

```
    PLIB_INT_TrapSourceFlagClear( INT_ID_0, INT_ADDRESS_OVERFLOW_TRAP );
}
```

5.6.11.6.3.6 PLIB_INT_VectorGet Function

C

```
INT_VECTOR PLIB_INT_VectorGet(
    INT_MODULE_ID index
);
```

Description

This function returns the interrupt vector that is presented to the CPU.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the module instance to be configured (it should be INT_ID_0 for all the devices which has only interrupt module).

Returns

One of the possible values from [INT_VECTOR](#).

Remarks

This value should only be used when the interrupt controller is configured for single vector mode using the function `PLIB_INT_MultiVectorDisable`.

This function implements an operation of the `INTCPUVector` feature. This feature may not be available on all parts. Please refer to the data sheet to determine if this feature is available or call the [PLIB_INT_ExistsINTCPUVector](#) API to write flexible code to automatically determine if this feature is available.

Example

```
INT_VECTOR level = PLIB_INT_VectorGet( INT_ID_0 );
```

5.6.11.6.4 Data Types and Constants

5.6.11.6.4.1 INT_EXTERNAL_SOURCES Enumeration

C

```
typedef enum {
    INT_EXTERNAL_INT_SOURCE0,
    INT_EXTERNAL_INT_SOURCE1,
    INT_EXTERNAL_INT_SOURCE2,
    INT_EXTERNAL_INT_SOURCE3,
    INT_EXTERNAL_INT_SOURCE4,
} INT_EXTERNAL_SOURCES;
```

Description

External Interrupt Sources

This enumeration lists the possible external sources that can cause an interrupt to occur.

Members

Members	Description
INT_EXTERNAL_INT_SOURCE0	External Interrupt Source 0

INT_EXTERNAL_INT_SOURCE1	External Interrupt Source 1
INT_EXTERNAL_INT_SOURCE2	External Interrupt Source 2
INT_EXTERNAL_INT_SOURCE3	External Interrupt Source 3
INT_EXTERNAL_INT_SOURCE4	External Interrupt Source 4

Remarks

This enumeration is processor-specific and is defined in the processor- specific header files (see processor.h).

5.6.11.6.4.2 INT_PRIORITY_LEVEL Enumeration**C**

```
typedef enum {
    INT_PRIORITY_LEVEL0,
    INT_PRIORITY_LEVEL1,
    INT_PRIORITY_LEVEL2,
    INT_PRIORITY_LEVEL3,
    INT_PRIORITY_LEVEL4,
    INT_PRIORITY_LEVEL5,
    INT_PRIORITY_LEVEL6,
    INT_PRIORITY_LEVEL7,
} INT_PRIORITY_LEVEL;
```

Description

Priority Level

This enumeration lists the possible interrupt priority levels that can be selected for each source.

Members

Members	Description
INT_PRIORITY_LEVEL0	Disabled
INT_PRIORITY_LEVEL1	Priority 1
INT_PRIORITY_LEVEL2	Priority 2
INT_PRIORITY_LEVEL3	Priority 3
INT_PRIORITY_LEVEL4	Priority 4
INT_PRIORITY_LEVEL5	Priority 5
INT_PRIORITY_LEVEL6	Priority 6
INT_PRIORITY_LEVEL7	Priority 7

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.11.6.4.3 INT_SOURCE Enumeration**C**

```
typedef enum {
    INT_SOURCE_SOFTWARE_0,
    INT_SOURCE_SOFTWARE_1,
    INT_SOURCE_EXTERNAL_0,

INT_SOURCE_CAN_1,
INT_SOURCE_CAN_2,
INT_SOURCE_ETH_1
} INT_SOURCE;

```

Description

Interrupt Source

This enumeration lists the possible sources that can cause an interrupt to occur.

Members

Members	Description
INT_SOURCE_SOFTWARE_0	Software interrupt 0
INT_SOURCE_SOFTWARE_1	Software interrupt 1
INT_SOURCE_EXTERNAL_0	External interrupt 0
INT_SOURCE_EXTERNAL_1	External interrupt 1
INT_SOURCE_EXTERNAL_2	External interrupt 2
INT_SOURCE_EXTERNAL_3	External interrupt 3
INT_SOURCE_EXTERNAL_4	External interrupt 4
INT_SOURCE_TIMER_CORE	Core timer interrupt
INT_SOURCE_TIMER_1	Timer 1 interrupt
INT_SOURCE_TIMER_2	Timer 2 interrupt
INT_SOURCE_TIMER_3	Timer 3 interrupt
INT_SOURCE_TIMER_4	Timer 4 interrupt
INT_SOURCE_TIMER_5	Timer 5 interrupt
INT_SOURCE_INPUT_CAPTURE_1	Input Capture 1 interrupt
INT_SOURCE_INPUT_CAPTURE_1_ERROR	Input Capture 1 Error interrupt
INT_SOURCE_INPUT_CAPTURE_2	Input Capture 2 interrupt
INT_SOURCE_INPUT_CAPTURE_2_ERROR	Input Capture 2 Error interrupt
INT_SOURCE_INPUT_CAPTURE_3	Input Capture 3 interrupt
INT_SOURCE_INPUT_CAPTURE_3_ERROR	Input Capture 3 Error interrupt
INT_SOURCE_INPUT_CAPTURE_4	Input Capture 4 interrupt
INT_SOURCE_INPUT_CAPTURE_4_ERROR	Input Capture 4 Error interrupt
INT_SOURCE_INPUT_CAPTURE_5	Input Capture 5 interrupt
INT_SOURCE_INPUT_CAPTURE_5_ERROR	Input Capture 5 Error interrupt
INT_SOURCE_OUTPUT_COMPARE_1	Output Compare 1 interrupt
INT_SOURCE_OUTPUT_COMPARE_2	Output Compare 2 interrupt
INT_SOURCE_OUTPUT_COMPARE_3	Output Compare 3 interrupt

INT_SOURCE_OUTPUT_COMPARE_4	Output Compare 4 interrupt
INT_SOURCE_OUTPUT_COMPARE_5	Output Compare 5 interrupt
INT_SOURCE_SPI_1_ERROR	SPI-1 Error interrupt
INT_SOURCE_SPI_1_RECEIVE	SPI-1 Receive Done interrupt
INT_SOURCE_SPI_1_TRANSMIT	SPI-1 Transmit Done interrupt
INT_SOURCE_SPI_2_ERROR	SPI-2 Error interrupt
INT_SOURCE_SPI_2_RECEIVE	SPI-2 Receive Done interrupt
INT_SOURCE_SPI_2_TRANSMIT	SPI-2 Transmit Done interrupt
INT_SOURCE_SPI_3_ERROR	SPI-3 Error interrupt
INT_SOURCE_SPI_3_RECEIVE	SPI-3 Receive Done interrupt
INT_SOURCE_SPI_3_TRANSMIT	SPI-3 Transmit Done interrupt
INT_SOURCE_SPI_4_ERROR	SPI-4 Error interrupt
INT_SOURCE_SPI_4_RECEIVE	SPI-4 Receive Done interrupt
INT_SOURCE_SPI_4_TRANSMIT	SPI-4 Transmit Done interrupt
INT_SOURCE_USART_1_ERROR	UART-1 Error interrupt
INT_SOURCE_USART_1_RECEIVE	UART-1 Receive interrupt
INT_SOURCE_USART_1_TRANSMIT	UART-1 Transmit interrupt
INT_SOURCE_USART_2_ERROR	UART-2 Error interrupt
INT_SOURCE_USART_2_RECEIVE	UART-2 Receive interrupt
INT_SOURCE_USART_2_TRANSMIT	UART-2 Transmit interrupt
INT_SOURCE_USART_3_ERROR	UART-3 Error interrupt
INT_SOURCE_USART_3_RECEIVE	UART-3 Receive interrupt
INT_SOURCE_USART_3_TRANSMIT	UART-3 Transmit interrupt
INT_SOURCE_USART_4_ERROR	UART-4 Error interrupt
INT_SOURCE_USART_4_RECEIVE	UART-4 Receive interrupt
INT_SOURCE_USART_4_TRANSMIT	UART-4 Transmit interrupt
INT_SOURCE_USART_5_ERROR	UART-5 Error interrupt
INT_SOURCE_USART_5_RECEIVE	UART-5 Receive interrupt
INT_SOURCE_USART_5_TRANSMIT	UART-5 Transmit interrupt
INT_SOURCE_USART_6_ERROR	UART-6 Error interrupt
INT_SOURCE_USART_6_RECEIVE	UART-6 Receive interrupt
INT_SOURCE_USART_6_TRANSMIT	UART-6 Transmit interrupt
INT_SOURCE_I2C_1_ERROR	I2C-1 Bus Error Event interrupt
INT_SOURCE_I2C_1_SLAVE	I2C-1 Slave Event interrupt
INT_SOURCE_I2C_1_MASTER	I2C-1 Master Event interrupt
INT_SOURCE_I2C_2_ERROR	I2C-2 Bus Error Event interrupt
INT_SOURCE_I2C_2_SLAVE	I2C-2 Slave Event interrupt
INT_SOURCE_I2C_2_MASTER	I2C-2 Master Event interrupt
INT_SOURCE_I2C_3_ERROR	I2C-3 Bus Error Event interrupt
INT_SOURCE_I2C_3_SLAVE	I2C-3 Slave Event interrupt
INT_SOURCE_I2C_3_MASTER	I2C-3 Master Event interrupt
INT_SOURCE_I2C_4_ERROR	I2C-4 Bus Error Event interrupt
INT_SOURCE_I2C_4_SLAVE	I2C-4 Slave Event interrupt
INT_SOURCE_I2C_4_MASTER	I2C-4 Master Event interrupt
INT_SOURCE_I2C_5_ERROR	I2C-5 Bus Error Event interrupt

INT_SOURCE_I2C_5_SLAVE	I2C-5 Slave Event interrupt
INT_SOURCE_I2C_5_MASTER	I2C-5 Master Event interrupt
INT_SOURCE_CHANGE_NOTICE	Input Change Notice interrupt
INT_SOURCE_ADC_1	Analog-to-Digital Converter 1 interrupt
INT_SOURCE_PARALLEL_PORT	Parallel Master Port interrupt
INT_SOURCE_PARALLEL_PORT_ERROR	Parallel Master Port Error interrupt
INT_SOURCE_COMPARATOR_1	Comparator 1 interrupt
INT_SOURCE_COMPARATOR_2	Comparator 2 interrupt
INT_SOURCE_CLOCK_MONITOR	Fail-Safe Clock Monitor interrupt
INT_SOURCE_RTCC	Real-Time Clock and Calender interrupt
INT_SOURCE_DMA_0	Direct Memory Access Channel 0 interrupt
INT_SOURCE_DMA_1	Direct Memory Access Channel 1 interrupt
INT_SOURCE_DMA_2	Direct Memory Access Channel 2 interrupt
INT_SOURCE_DMA_3	Direct Memory Access Channel 3 interrupt
INT_SOURCE_DMA_4	Direct Memory Access Channel 4 interrupt
INT_SOURCE_DMA_5	Direct Memory Access Channel 5 interrupt
INT_SOURCE_DMA_6	Direct Memory Access Channel 6 interrupt
INT_SOURCE_DMA_7	Direct Memory Access Channel 7 interrupt
INT_SOURCE_FLASH_CONTROL	Flash Control Event interrupt
INT_SOURCE_USB_1	Universal Serial Bus 1 interrupt
INT_SOURCE_CAN_1	Controller Area Network 1 interrupt
INT_SOURCE_CAN_2	Controller Area Network 2 interrupt
INT_SOURCE_ETH_1	Ethernet interrupt

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.11.6.4.4 INT_SUBPRIORITY_LEVEL Enumeration**C**

```
typedef enum {
    INT_SUBPRIORITY_LEVEL0,
    INT_SUBPRIORITY_LEVEL1,
    INT_SUBPRIORITY_LEVEL2,
    INT_SUBPRIORITY_LEVEL3
} INT_SUBPRIORITY_LEVEL;
```

Description

Sub Priority Level

This enumeration lists the possible interrupt sub priority levels that can be selected for each source.

Members

Members	Description
INT_SUBPRIORITY_LEVEL0	Sub Priority 0
INT_SUBPRIORITY_LEVEL1	Sub Priority 1
INT_SUBPRIORITY_LEVEL2	Sub Priority 2
INT_SUBPRIORITY_LEVEL3	Sub Priority 3

Remarks

This enumeration (INT_SUBPRIORITY_LEVEL) is processor specific and is defined in the processor-specific header files (see processor.h).

5.6.11.6.4.5 INT_TRAP_SOURCE Enumeration**C**

```
typedef enum {
    INT_TRAP_ADDRESS_ERROR_LOAD,
    INT_TRAP_ADDRESS_ERROR_STORE,
    INT_TRAP_BUS_ERROR_INSTRUCTION,
    INT_TRAP_BUS_ERROR_DATA,
    INT_TRAP_SYSCALL,
    INT_TRAP_BREAKPOINT,
    INT_TRAP_RESERVED_INSTRUCTION,
    INT_TRAP_UNUSABLE_COPROCESSOR,
    INT_TRAP_ARITHMETIC_OVERFLOW,
    INT_TRAP_GENERAL
} INT_TRAP_SOURCE;
```

Description

Trap Source

This enumeration lists the names of the trap or exception sources.

Members

Members	Description
INT_TRAP_ADDRESS_ERROR_LOAD	Address error exception on a data load or instruction fetch
INT_TRAP_ADDRESS_ERROR_STORE	Address error exception on a data store
INT_TRAP_BUS_ERROR_INSTRUCTION	Bus error exception on an instruction fetch
INT_TRAP_BUS_ERROR_DATA	Bus error exception on a data load or store
INT_TRAP_SYSCALL	Exception do to a Syscall instruction
INT_TRAP_BREAKPOINT	Exception do to hitting a debug breakpoint
INT_TRAP_RESERVED_INSTRUCTION	Exception do to fetching a reserved instruction
INT_TRAP_UNUSABLE_COPROCESSOR	Exception do to fetching a reference to an unusable coprocessor
INT_TRAP_ARITHMETIC_OVERFLOW	Arithmetic Overflow exception
INT_TRAP_GENERAL	General exception trap

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.11.6.4.6 INT_VECTOR Enumeration**C**

```
typedef enum {
    INT_VECTOR_CT,
    INT_VECTOR_CS0,
    INT_VECTOR_CS1,
    INT_VECTOR_INT0,
    INT_VECTOR_T1,
    INT_VECTOR_IC1,
    INT_VECTOR_OC1,
    INT_VECTOR_INT1,
    INT_VECTOR_T2,
    INT_VECTOR_IC2,
```

```
INT_VECTOR_OC2,  
INT_VECTOR_INT2,  
INT_VECTOR_T3,  
INT_VECTOR_IC3,  
INT_VECTOR_OC3,  
INT_VECTOR_INT3,  
INT_VECTOR_T4,  
INT_VECTOR_IC4,  
INT_VECTOR_OC4,  
INT_VECTOR_INT4,  
INT_VECTOR_T5,  
INT_VECTOR_IC5,  
INT_VECTOR_OC5,  
INT_VECTOR_SPI1,  
INT_VECTOR_UART1,  
INT_VECTOR_SPI3,  
INT_VECTOR_I2C3,  
INT_VECTOR_I2C1,  
INT_VECTOR_CN,  
INT_VECTOR_AD1,  
INT_VECTOR_PMP,  
INT_VECTOR_CMP1,  
INT_VECTOR_CMP2,  
INT_VECTOR_UART3,  
INT_VECTOR_SPI2,  
INT_VECTOR_I2C4,  
INT_VECTOR_UART2,  
INT_VECTOR_SPI4,

} INT_VECTOR;
```

Description

Interrupt Vectors

This enumeration lists the possible interrupt vectors.

Remarks

This enumeration is processor specific and is defined in the processor- specific header files (see processor.h).

5.6.11.6.5 Feature Existence Functions

5.6.11.6.5.1 PLIB_INT_ExistsAlternateVectorTable Function

C

```
bool PLIB_INT_ExistsAlternateVectorTable(  
    INT_MODULE_ID index  
);
```

Description

This function identifies whether the AlternateVectorTable feature is available on the Interrupt Controller module. When this function returns true, these functions are supported on the device:

- [PLIB_INT_AlternateVectorTableSelect](#)
- [PLIB_INT_StandardVectorTableSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The AlternateVectorTable feature is supported on the device
- false - The AlternateVectorTable feature is not supported on the device

Remarks

None.

5.6.11.6.5.2 PLIB_INT_ExistsCPUCurrentPriorityLevel Function

C

```
bool PLIB_INT_ExistsCPUCurrentPriorityLevel(  
    INT_MODULE_ID index  
);
```

Description

This function identifies whether the CPUCurrentPriorityLevel feature is available on the Interrupt Controller module. When this function returns true, this function is supported on the device:

- [PLIB_INT_CPUCurrentPriorityLevelGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The CPUCurrentPriorityLevel feature is supported on the device
- false - The CPUCurrentPriorityLevel feature is not supported on the device

Remarks

None.

5.6.11.6.5.3 PLIB_INT_ExistsEnableControl Function

C

```
bool PLIB_INT_ExistsEnableControl(  
    INT_MODULE_ID index  
);
```

Description

This function identifies whether the EnableControl feature is available on the Interrupt Controller module. When this function returns true, these functions are supported on the device:

- [PLIB_INT_Enable](#)
- [PLIB_INT_Disable](#)
- [PLIB_INT_IsEnabled](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The EnableControl feature is supported on the device
- false - The EnableControl feature is not supported on the device

Remarks

None.

5.6.11.6.5.4 PLIB_INT_ExistsExternalINTEdgeSelect Function

C

```
bool PLIB_INT_ExistsExternalINTEdgeSelect(  
    INT_MODULE_ID index  
);
```

Description

This function identifies whether the ExternalINTEdgeSelect feature is available on the Interrupt Controller module. When this function returns true, these functions are supported on the device:

- [PLIB_INT_ExternalRisingEdgeSelect](#)
- [PLIB_INT_ExternalFallingEdgeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

Existence of the ExternalINTEdgeSelect feature:

- true - The ExternalINTEdgeSelect feature is supported on the device

- false - The ExternalINTEdgeSelect feature is not supported on the device

Remarks

None.

5.6.11.6.5.5 PLIB_INT_ExistsHighPriority Function**C**

```
bool PLIB_INT_ExistsHighPriority(  
    INT_MODULE_ID index  
);
```

Description

This function identifies whether the HighPriority feature is available on the Interrupt Controller module. When this function returns true, these functions are supported on the device:

- [PLIB_INT_PriorityHighEnable](#)
- [PLIB_INT_PriorityHighDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The HighPriority feature is supported on the device
- false - The HighPriority feature is not supported on the device

Remarks

None.

5.6.11.6.5.6 PLIB_INT_ExistsINTCPUPriority Function**C**

```
bool PLIB_INT_ExistsINTCPUPriority(  
    INT_MODULE_ID index  
);
```

Description

This function identifies whether the INTCPUPriority feature is available on the Interrupt Controller module. When this function returns true, this function is supported on the device:

- [PLIB_INT_PriorityGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The INTCPUPriority feature is supported on the device

- false - The INTCPUriority feature is not supported on the device

Remarks

None.

5.6.11.6.5.7 PLIB_INT_ExistsINTCPUVector Function**C**

```
bool PLIB_INT_ExistsINTCPUVector(  
    INT_MODULE_ID index  
);
```

Description

This function identifies whether the INTCPUVector feature is available on the Interrupt Controller module. When this function returns true, this function is supported on the device:

- [PLIB_INT_VectorGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The INTCPUVector feature is supported on the device
- false - The INTCPUVector feature is not supported on the device

Remarks

None.

5.6.11.6.5.8 PLIB_INT_ExistsINTNesting Function**C**

```
bool PLIB_INT_ExistsINTNesting(  
    INT_MODULE_ID index  
);
```

Description

This function identifies whether the INTNesting feature is available on the Interrupt Controller module. When this function returns true, these functions are supported on the device:

- [PLIB_INT_NestingEnable](#)
- [PLIB_INT_NestingDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The INTNesting feature is supported on the device

- false - The INTNesting feature is not supported on the device

Remarks

None.

5.6.11.6.5.9 PLIB_INT_ExistsLowPriority Function**C**

```
bool PLIB_INT_ExistsLowPriority(  
    INT_MODULE_ID index  
);
```

Description

This function identifies whether the LowPriority feature is available on the Interrupt Controller module. When this function returns true, these functions are supported on the device:

- [PLIB_INT_PriorityLowEnable](#)
- [PLIB_INT_PriorityLowDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The LowPriority feature is supported on the device
- false - The LowPriority feature is not supported on the device

Remarks

None.

5.6.11.6.5.10 PLIB_INT_ExistsPeripheralControl Function**C**

```
bool PLIB_INT_ExistsPeripheralControl(  
    INT_MODULE_ID index  
);
```

Description

This function identifies whether the PeripheralControl feature is available on the Interrupt Controller module. When this function returns true, these functions are supported on the device:

- [PLIB_INT_PeripheralsEnable](#)
- [PLIB_INT_PeripheralsDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

Existence of the PeripheralControl feature:

- true - The PeripheralControl feature is supported on the device
- false - The PeripheralControl feature is not supported on the device

Remarks

None.

5.6.11.6.5.11 PLIB_INT_ExistsPriority Function**C**

```
bool PLIB_INT_ExistsPriority(  
    INT_MODULE_ID index  
);
```

Description

This function identifies whether the Priority feature is available on the Interrupt Controller module. When this function returns true, these functions are supported on the device:

- [PLIB_INT_PriorityEnable](#)
- [PLIB_INT_PriorityDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The Priority feature is supported on the device
- false - The Priority feature is not supported on the device

Remarks

None.

5.6.11.6.5.12 PLIB_INT_ExistsProximityTimerControl Function**C**

```
bool PLIB_INT_ExistsProximityTimerControl(  
    INT_MODULE_ID index  
);
```

Description

This function identifies whether the ProximityTimerControl feature is available on the Interrupt Controller module. When this function returns true, these functions are supported on the device:

- [PLIB_INT_ProximityTimerSet](#)
- [PLIB_INT_ProximityTimerGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ProximityTimerControl feature is supported on the device
- false - The ProximityTimerControl feature is not supported on the device

Remarks

None.

5.6.11.6.5.13 PLIB_INT_ExistsProximityTimerEnable Function**C**

```
bool PLIB_INT_ExistsProximityTimerEnable(  
    INT_MODULE_ID index  
);
```

Description

This function identifies whether the ProximityTimerEnable feature is available on the Interrupt Controller module. When this function returns true, these functions are supported on the device:

- [PLIB_INT_ProximityTimerEnable](#)
- [PLIB_INT_ProximityTimerDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ProximityTimerEnable feature is supported on the device
- false - The ProximityTimerEnable feature is not supported on the device

Remarks

None.

5.6.11.6.5.14 PLIB_INT_ExistsSingleVectorShadowSet Function**C**

```
bool PLIB_INT_ExistsSingleVectorShadowSet(  
    INT_MODULE_ID index  
);
```

Description

This function identifies whether the SingleVectorShadowSet feature is available on the Interrupt Controller module. When this function returns true, these functions are supported on the device:

- [PLIB_INT_SingleVectorShadowSetDisable](#)
- [PLIB_INT_SingleVectorShadowSetEnable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The SingleVectorShadowSet feature is supported on the device
- false - The SingleVectorShadowSet feature is not supported on the device

Remarks

None.

5.6.11.6.5.15 PLIB_INT_ExistsSourceControl Function**C**

```
bool PLIB_INT_ExistsSourceControl(  
    INT_MODULE_ID index  
);
```

Description

This function identifies whether the SourceControl feature is available on the Interrupt Controller module. When this function returns true, these functions are supported on the device:

- [PLIB_INT_SourceEnable](#)
- [PLIB_INT_SourceDisable](#)
- [PLIB_INT_SourcesIsEnabled](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The SourceControl feature is supported on the device
- false - The SourceControl feature is not supported on the device

Remarks

None.

5.6.11.6.5.16 PLIB_INT_ExistsSourceFlag Function**C**

```
bool PLIB_INT_ExistsSourceFlag(  
    INT_MODULE_ID index  
);
```

Description

This function identifies whether the SourceFlag feature is available on the Interrupt Controller module. When this function returns

true, these functions are supported on the device:

- [PLIB_INT_SourceFlagGet](#)
- [PLIB_INT_SourceFlagSet](#)
- [PLIB_INT_SourceFlagClear](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The SourceFlag feature is supported on the device
- false - The SourceFlag feature is not supported on the device

Remarks

None.

5.6.11.6.5.17 PLIB_INT_ExistsTrapSource Function

C

```
bool PLIB_INT_ExistsTrapSource(  
    INT_MODULE_ID index  
);
```

Description

This function identifies whether the TrapSource feature is available on the Interrupt Controller module. When this function returns true, these functions are supported on the device:

- [PLIB_INT_TrapSourceFlagGet](#)
- [PLIB_INT_TrapSourceFlagClear](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The TrapSource feature is supported on the device
- false - The TrapSource feature is not supported on the device

Remarks

None.

5.6.11.6.5.18 PLIB_INT_ExistsVectorPriority Function

C

```
bool PLIB_INT_ExistsVectorPriority(  
    INT_MODULE_ID index
```

```
);
```

Description

This function identifies whether the VectorPriority feature is available on the Interrupt Controller module. When this function returns true, these functions are supported on the device:

- [PLIB_INT_VectorPrioritySet](#)
- [PLIB_INT_VectorPriorityGet](#)
- [PLIB_INT_VectorSubPrioritySet](#)
- [PLIB_INT_VectorSubPriorityGet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The VectorPriority feature is supported on the device
- false - The VectorPriority feature is not supported on the device

Remarks

None.

5.6.11.6.5.19 PLIB_INT_ExistsVectorSelect Function

C

```
bool PLIB_INT_ExistsVectorSelect(  
    INT_MODULE_ID index  
);
```

Description

This function identifies whether the VectorSelect feature is available on the Interrupt Controller module. When this function returns true, these functions are supported on the device:

- [PLIB_INT_MultiVectorSelect](#)
- [PLIB_INT_SingleVectorSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The VectorSelect feature is supported on the device
- false - The VectorSelect feature is not supported on the device

Remarks

None.

5.6.11.7 Files

Files

Name	Description
plib_int.h	Defines the Interrupt Peripheral Library interface

Description

5.6.11.7.1 plib_int.h

Interrupt Peripheral Library Interface Header

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the Interrupt Peripheral Library for Microchip microcontrollers. The definitions in this file are for the Interrupt Controller module.

Functions

	Name	Description
≡	PLIB_INT_AlternateVectorTableSelect	Enables the use of the alternate vector table.
≡	PLIB_INT_CPUCurrentPriorityLevelGet	Gets the interrupt priority level at which the CPU is currently operating.
≡	PLIB_INT_Disable	Disables the generation of interrupts to the CPU.
≡	PLIB_INT_DISIStatusGet	Returns the status of the DISI instruction status.
≡	PLIB_INT_Enable	Enables the generation of interrupts to the CPU.
≡	PLIB_INT_ExistsAlternateVectorTable	Identifies whether the AlternateVectorTable feature exists on the Interrupt Controller module.
≡	PLIB_INT_ExistsCPUCurrentPriorityLevel	Identifies whether the CPUCurrentPriorityLevel feature exists on the Interrupt Controller module.
≡	PLIB_INT_ExistsEnableControl	Identifies whether the EnableControl feature exists on the Interrupt Controller module.
≡	PLIB_INT_ExistsExternalINTEdgeSelect	Identifies whether the ExternalINTEdgeSelect feature exists on the Interrupt Controller module.
≡	PLIB_INT_ExistsHighPriority	Identifies whether the HighPriority feature exists on the Interrupt Controller module.
≡	PLIB_INT_ExistsINTCPUPriority	Identifies whether the INTCPUPriority feature exists on the Interrupt Controller module.
≡	PLIB_INT_ExistsINTCPUVector	Identifies whether the INTCPUVector feature exists on the Interrupt Controller module.
≡	PLIB_INT_ExistsINTNesting	Identifies whether the INTNesting feature exists on the Interrupt Controller module.
≡	PLIB_INT_ExistsLowPriority	Identifies whether the LowPriority feature exists on the Interrupt Controller module.
≡	PLIB_INT_ExistsPeripheralControl	Identifies whether the PeripheralControl feature exists on the Interrupt Controller module.
≡	PLIB_INT_ExistsPriority	Identifies whether the Priority feature exists on the Interrupt Controller module.
≡	PLIB_INT_ExistsProximityTimerControl	Identifies whether the ProximityTimerControl feature exists on the Interrupt Controller module.
≡	PLIB_INT_ExistsProximityTimerEnable	Identifies whether the ProximityTimerEnable feature exists on the Interrupt Controller module.

	PLIB_INT_ExistsSingleVectorShadowSet	Identifies whether the SingleVectorShadowSet feature exists on the Interrupt Controller module.
	PLIB_INT_ExistsSourceControl	Identifies whether the SourceControl feature exists on the Interrupt Controller module.
	PLIB_INT_ExistsSourceFlag	Identifies whether the SourceFlag feature exists on the Interrupt Controller module.
	PLIB_INT_ExistsTrapSource	Identifies whether the TrapSource feature exists on the Interrupt Controller module.
	PLIB_INT_ExistsVectorPriority	Identifies whether the VectorPriority feature exists on the Interrupt Controller module.
	PLIB_INT_ExistsVectorSelect	Identifies whether the VectorSelect feature exists on the Interrupt Controller module.
	PLIB_INT_ExternalFallingEdgeSelect	Selects the falling edge as the edge polarity of the external interrupt.
	PLIB_INT_ExternalRisingEdgeSelect	Selects the rising edge as the edge polarity of the external interrupt.
	PLIB_INT_IsEnabled	Identifies if interrupts are currently enabled or disabled at the top level.
	PLIB_INT_MultiVectorSelect	Configures the Interrupt Controller for Multiple Vector mode.
	PLIB_INT_NestingDisable	Disables interrupt nesting.
	PLIB_INT_NestingEnable	Enables interrupt nesting.
	PLIB_INT_PeripheralsDisable	Disables the generation of interrupts to the CPU by the peripherals.
	PLIB_INT_PeripheralsEnable	Enables the generation of interrupts to the CPU by the peripherals.
	PLIB_INT_PriorityDisable	Disables interrupt priority levels.
	PLIB_INT_PriorityEnable	Enables interrupt priority levels.
	PLIB_INT_PriorityGet	Returns the priority level of the latest interrupt presented to the CPU.
	PLIB_INT_PriorityHighDisable	Disables the generation of high-priority interrupts to the CPU.
	PLIB_INT_PriorityHighEnable	Enables the generation of high-priority interrupts to the CPU.
	PLIB_INT_PriorityLowDisable	Disables the generation of low-priority interrupts to the CPU.
	PLIB_INT_PriorityLowEnable	Enables generation of low-priority interrupts to the CPU.
	PLIB_INT_ProximityTimerDisable	Disables the interrupt temporal-proximity timer.
	PLIB_INT_ProximityTimerEnable	Enables the interrupt temporal-proximity timer and selects the priority levels that start the timer.
	PLIB_INT_ProximityTimerGet	Returns the value used by the temporal proximity timer as a reload value when the temporal proximity timer is triggered by an interrupt event.
	PLIB_INT_ProximityTimerSet	Sets the temporal proximity timer reload value. This value is used to reload the proximity timer after it has been triggered by an interrupt event.
	PLIB_INT_SingleVectorSelect	Configures the Interrupt Controller for Single Vector mode.
	PLIB_INT_SingleVectorShadowSetDisable	Disables the Shadow Register Set in Single Vector mode.
	PLIB_INT_SingleVectorShadowSetEnable	Enables the Shadow Register Set in Single Vector mode.
	PLIB_INT_SourceDisable	Disables the interrupt source
	PLIB_INT_SourceEnable	Enables the interrupt source. This section provides information on initialization and interrupt source setup and handling.
	PLIB_INT_SourceFlagClear	Clears the status of the interrupt flag for the selected source.
	PLIB_INT_SourceFlagGet	Returns the status of the interrupt flag for the selected source.
	PLIB_INT_SourceFlagSet	Sets the status of the interrupt flag for the selected source.
	PLIB_INT_SourceIsEnabled	Gets the enable state of the interrupt source.
	PLIB_INT_StandardVectorTableSelect	Enables the use of the standard vector table.

	PLIB_INT_TrapSourceFlagClear	Clears the flag for the selected trap.
	PLIB_INT_TrapSourceFlagGet	Returns the status of the flag for the selected trap.
	PLIB_INT_VectorGet	Returns the interrupt vector that is presented to the CPU.
	PLIB_INT_VectorPriorityGet	Gets the priority of the interrupt vector.
	PLIB_INT_VectorPrioritySet	Sets the priority of the interrupt vector.
	PLIB_INT_VectorSubPriorityGet	Gets the sub-priority of the interrupt vector.
	PLIB_INT_VectorSubPrioritySet	Sets the sub-priority of the interrupt vector.

5.6.12 NVM Peripheral Library

5.6.12.1 Introduction

NVM Peripheral Library

for

Microchip Microcontrollers

This library provides a low-level abstraction of the Non-Volatile Memory (NVM) component (Flash) on the Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, thus hiding differences from one microcontroller variant to another.

Description**Flash Program Memory**

The Flash program memory is readable, writeable and erasable during normal operation over the entire operating voltage range.

A read from program memory is executed at one byte/word at a time depending on the width of the data bus.

A write to the program memory is executed in either blocks of specific sizes or a single word depending on the type of processor used.

An erase is performed in blocks. A bulk erase may be performed from user code depending on the type of processor supporting the operation.

Writing or erasing program memory will cease instruction fetches until the operation is complete thus restricting memory access and therefore preventing code execution. This is controlled by an internal programming timer.

There are three processor dependant methods for program memory modification.

- Run-Time Self Programming (RTSP)
- In-Circuit Serial Programming (ICSP)
- EJTAG programming

Note: This topic covers the RTSP techniques.

5.6.12.2 Release Notes

MPLAB Harmony Version: v0.70b **NVM Peripheral Library Version :** 0.70b **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.6.12.3 SW License Agreement

© 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS." MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL MICROCHIP BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, LOST PROFITS OR LOST DATA, HARM TO YOUR EQUIPMENT, COST OF PROCUREMENT OF SUBSTITUTE GOODS, TECHNOLOGY OR SERVICES, ANY CLAIMS BY THIRD PARTIES (INCLUDING BUT NOT LIMITED TO ANY DEFENSE THEREOF), ANY CLAIMS FOR INDEMNITY OR CONTRIBUTION, OR OTHER SIMILAR COSTS.

To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.6.12.4 Using the Library

This topic describes the basic architecture of the NVM Peripheral Library and provides information and examples on how to use it.

Interface Header File: peripheral.h

The interface to the NVM library is defined in the "[plib_nvm.h](#)" header file, which is included by the "peripheral.h" peripheral library header file. Any C language source (.c) file that uses the NVM library must include "peripheral.h".

Library File:

The NVM peripheral library is part of the processor-specific peripheral library archive (.a) file installed with the compiler. Libraries in this archive are automatically available to the linker (in the default search path) for any project built using the Microchip compiler.

5.6.12.4.1 Hardware Abstraction Model

This library provides a low-level abstraction of the NVM module on the Microchip family of microcontrollers with a convenient C

language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Description

Abstraction Model

The NVM Peripheral Library provides interface routines to interact with the blocks shown in the diagram.

NVM Software Abstraction Block Diagram

The **Flash Status and Control logic** ensures that the Flash memory is configured appropriately for modification. It also provides the status of the different operations in progress as well as errors, if any. It also decides if the operation is for Flash program memory or the special device Configuration registers.

The **Flash Read/Write** block ensures that the user data is written to/read from the program memory holding latches. It provides a layer of abstraction over the sequence of processor specific instructions which are required to access this data. Depending on the processor type, either block or Word programming options are available.

5.6.12.4.2 Library Usage Model

The topic describes the major components of the usage model.

Description

Each of the blocks in the diagram correspond to the library interface section.

Usage Model

Library Interface Section	Description
Flash Configuration	Provides setup, configuration and status control interface routines for Flash program memory.

Flash Read/Write	Provides bitwise, pagewise and blockwise Memory access along with NVM keysequence interface routines.

5.6.12.4.3 How the Library Works

The usage model for this library is explained in the following sections.

5.6.12.4.3.1 State Machine

The following state machine is for the NVM Read and Write during the normal operation. This state machine is provided to give a general idea of the usage model of the peripheral library. Refer to the usage model for more detailed steps for the scenario that is being used.

State	Associated Function
Setup and Initialization	Refer to mode of NVM for detailed instructions of setup.
Select Type of memory	Once the NVM has been appropriately set up and initialized, the state machine waits for the application to select the type of memory to be accessed Flash program memory or configuration registers.
Configure and enable write/read	Configures the registers and enables the write/read operation.
Select Address	The application provides the write/read address from which to access memory.
Send Data/Read Data	When the application is polling it can fill data/ read data into the internal holding registers and initiate write via PLIB_NVM_FlashWriteStart(NVM_ID_0) .
Read Error/Write Status	The error/write status is available to the application via PLIB_NVM_FlashWriteCycleHasCompleted(NVM_ID_0) and other status APIs.

Note: Refer to the mode used for the NVM for the setup and initialization steps.

5.6.12.4.3.2 Flash Operations

Note: Flash program memory operations vary across microcontrollers. Please refer to the specific device data sheet or related family reference manual section to determine which features are supported by the device in use.

Flash Read Operation

Setup

1. Provide the Flash program memory from which the data memory has to be read via the API [PLIB_NVM_FlashRead\(\)](#). This address is then updated in the respective address registers or the Table Pointers depending on the device.
2. Ensure the alignment of the address as specified by the specific device data sheet.
3. The size of the data read depends upon the microcontroller in use. For specific details please refer to the Family Reference manual.

Example : Program Memory Read

```
// Determine the address from which to read
#define MY_FLASH_BASE_ADDRESS      0xA0007862 //Or any address in flash to read

uint32_t    address = MY_FLASH_BASE_ADDRESS;
// The Data Available at the memory location
size_t      DataToBeRead;

// where, MY_NVM_INSTANCE - is a specific instance of the hardware peripheral.
// where, address        - The address in the memory from which to read.
DataToBeRead = PLIB_NVM_FlashRead(NVM_ID_0, address);
```

5.6.12.4.3.3 Miscellaneous Functions

Note: Flash program memory operations vary across microcontrollers. Please refer to the specific device data sheet or related family reference manual to determine which features are supported by the device in use.

This section will detail out a few niche and processor specific APIs provided by this library.

Stop in Idle Mode

The [PLIB_NVM_StopInIdleEnable](#) and [PLIB_NVM_StopInIdleDisable](#) functions cater to this functionality. These functions ensure that Flash operations are discontinued in Idle mode.

Low Voltage Detection

The [PLIB_NVM_LowVoltageIsDetected](#) and [PLIB_NVM_LowVoltageEventIsActive](#) functions support low-voltage error detection and triggering of a low-voltage event.

5.6.12.4.4 Configuring the Library

The library is configured for the supported processor when the processor is chosen in the MPLAB IDE.

5.6.12.4.5 Building the Library

This section lists the files that are available in the \src of the NVM driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

5.6.12.5 Library Interface

Configuration and Status Functions

	Name	Description
≡	PLIB_NVM_LowVoltageEventsActive	Provides low voltage detection status
≡	PLIB_NVM_LowVoltageIsDetected	Provides low voltage error detection status
≡	PLIB_NVM_MemoryModifyEnable	Allows write cycles to Flash/EEPROM
≡	PLIB_NVM_MemoryModifyInhibit	Inhibits write cycles to Flash/EEPROM
≡	PLIB_NVM_MemoryOperationSelect	Selects the operation to be performed on Flash/EEPROM memory.
≡	PLIB_NVM_StopInIdleDisable	Continues Flash operation when device enters idle mode.
≡	PLIB_NVM_StopInIdleEnable	Discontinues Flash operation when device enters idle mode.
≡	PLIB_NVM_WriteOperationHasTerminated	This routine provides the status of the Flash/EEPROM write operation or sequence.

Feature Existence Functions

	Name	Description
≡	PLIB_NVM_ExistsAccessEnable	Identifies whether the AccessEnableControl feature exists on the NVM module
≡	PLIB_NVM_ExistsAddressModifyControl	Identifies whether the AddressModifyControl feature exists on the NVM module
≡	PLIB_NVM_ExistsBootPageWriteProtect	Identifies whether the BootPageWriteProtect feature exists on the NVM module
≡	PLIB_NVM_ExistsEEPROMReadInitiate	Identifies whether the EEPROMReadInitiate feature exists on the NVM module
≡	PLIB_NVM_ExistsFlashBankRegionSelect	Identifies whether the FlashBankRegionSelect feature exists on the NVM module
≡	PLIB_NVM_ExistsFlashWPMemoryRangeProvide	Identifies whether the FlashWPMemoryRangeProvide feature exists on the NVM module
≡	PLIB_NVM_ExistsKeySequence	Identifies whether the KeySequence feature exists on the NVM module
≡	PLIB_NVM_ExistsLockBootSelect	Identifies whether the LockBootSelect feature exists on the NVM module
≡	PLIB_NVM_ExistsLockPFMSelect	Identifies whether the LockPFMSelect feature exists on the NVM module
≡	PLIB_NVM_ExistsLowVoltageError	Identifies whether the LowVoltageError feature exists on the NVM module
≡	PLIB_NVM_ExistsLowVoltageStatus	Identifies whether the LowVoltageStatus feature exists on the NVM module
≡	PLIB_NVM_ExistsMemoryModificationControl	Identifies whether the MemoryModificationControl feature exists on the NVM module
≡	PLIB_NVM_ExistsOperationMode	Identifies whether the OperationMode feature exists on the NVM module
≡	PLIB_NVM_ExistsProgramEraseOperation	Identifies whether the ProgramEraseOperation feature exists on the NVM module
≡	PLIB_NVM_ExistsProvideData	Identifies whether the ProvideData feature exists on the NVM module
≡	PLIB_NVM_ExistsProvideQuadData	Identifies whether the ProvideQuadData feature exists on the NVM module

	PLIB_NVM_ExistsSourceAddress	Identifies whether the SourceAddress feature exists on the NVM module
	PLIB_NVM_ExistsStopInIdle	Identifies whether the StopInIdle feature exists on the NVM module
	PLIB_NVM_ExistsWriteErrorStatus	Identifies whether the WriteErrorStatus feature exists on the NVM module
	PLIB_NVM_ExistsWriteOperation	Identifies whether the WriteOperation feature exists on the NVM module

Flash Memory Functions

	Name	Description
	PLIB_NVM_DataBlockSourceAddress	Takes the address parameter in the argument and loads the base address from which data has to be copied into flash.
	PLIB_NVM_FlashAccessEnable	Allows access to the Flash program memory
	PLIB_NVM_FlashAddressToModify	Takes the address parameter in the argument and loads the address which will be modified by the actual write operation to the appropriate pointer registers .
	PLIB_NVM_FlashEraseOperationSelect	For ERASE and FREE
	PLIB_NVM_FlashEraseStart	Initiates a Program memory erase/write cycle
	PLIB_NVM_FlashProvideData	Provides the user data to intermediate registers before written into flash
	PLIB_NVM_FlashProvideQuadData	Provides low voltage detection status
	PLIB_NVM_FlashRead	Takes the address parameter in the argument and loads the read address to the appropriate register and returns the value read.
	PLIB_NVM_FlashWriteCycleHasCompleted	This routine provides the status of the Flash/EEPROM write cycle.
	PLIB_NVM_FlashWriteKeySequence	Copies the mandatory KEY sequence into the respective registers.
	PLIB_NVM_FlashWriteOperationSelect	Performs erase operation on the memory row selected
	PLIB_NVM_FlashWriteProtectMemoryAreaRange	Provides low voltage detection status
	PLIB_NVM_FlashWriteStart	Initiates a Program memory erase/write cycle
	PLIB_NVM_IsProgramFlashMemoryLocked	Provides low voltage detection status
	PLIB_NVM_ProgramFlashBank1LowerRegion	Provides low voltage detection status
	PLIB_NVM_ProgramFlashBank2LowerRegion	Provides low voltage detection status

Other Functions

	Name	Description
	PLIB_NVM_BootPageWriteProtectionDisable	Provides low voltage detection status
	PLIB_NVM_BootPageWriteProtectionEnable	Provides low voltage detection status
	PLIB_NVM_IsBootMemoryLocked	Provides low voltage detection status
	PLIB_NVM_IsBootPageWriteProtected	Provides low voltage detection status
	PLIB_NVM_LockBootMemory	Provides low voltage detection status
	PLIB_NVM_LockProgramFlashMemory	Provides low voltage detection status

Description

This section describes the Application Programming Interface (API) functions of the NVM Peripheral Library.

Refer to each section for detailed descriptions.

5.6.12.5.1 Configuration and Status Functions

5.6.12.5.1.1 PLIB_NVM_LowVoltageEventIsActive Function

C

```
bool PLIB_NVM_LowVoltageEventIsActive(  
    NVM_MODULE_ID index  
);
```

Description

This routine provides detection of low voltage event if any.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

1 - Low Voltage Event active. 0 - Low Voltage Event not Active

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_NVM_ExistsLowVoltageStatus](#) in your application to determine whether this feature is available.

Example

```
bool status;  
status = PLIB_NVM_LowVoltageEventIsActive(MY_NVM_INSTANCE);
```

5.6.12.5.1.2 PLIB_NVM_LowVoltageIsDetected Function

C

```
bool PLIB_NVM_LowVoltageIsDetected(  
    NVM_MODULE_ID index  
);
```

Description

This routine provides detection of low voltage error status

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

1 - Low Voltage detection and possible data corruption 0 - Voltage Level Acceptable for programming.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_NVM_ExistsLowVoltageStatus](#) in your application to determine whether this feature is available.

Example

```
bool status;  
status = PLIB_NVM_LowVoltageIsDetected(MY_NVM_INSTANCE);
```

5.6.12.5.1.3 PLIB_NVM_MemoryModifyEnable Function**C**

```
void PLIB_NVM_MemoryModifyEnable(  
    NVM_MODULE_ID index  
);
```

Description

This routine allows write cycles to Flash/EEPROM

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_NVM_ExistsMemoryModificationControl](#) in your application to determine whether this feature is available.

Example

```
PLIB_NVM_MemoryModifyEnable(MY_NVM_INSTANCE);
```

5.6.12.5.1.4 PLIB_NVM_MemoryModifyInhibit Function**C**

```
void PLIB_NVM_MemoryModifyInhibit(  
    NVM_MODULE_ID index  
);
```

Description

This routine Inhibits write cycles to Flash/EEPROM

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_NVM_ExistsMemoryModificationControl](#) in your application to determine whether this feature is available.

Example

```
PLIB_NVM_MemoryModifyInhibit(MY_NVM_INSTANCE);
```

5.6.12.5.1.5 PLIB_NVM_MemoryOperationSelect Function**C**

```
void PLIB_NVM_MemoryOperationSelect(  
    NVM_MODULE_ID index,  
    NVM_OPERATION_MODE operationmode  
);
```

Description

This routine selects the operation to be performed on Flash/EEPROM memory.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_NVM_ExistsOperationMode](#) in your application to determine whether this feature is available.

Example

```
PLIB_NVM_MemoryOperationSelect(MY_NVM_INSTANCE, NVM_MEMORY_ROW_PROGRAM_OPERATION);
```

5.6.12.5.1.6 PLIB_NVM_StopInIdleDisable Function**C**

```
void PLIB_NVM_StopInIdleDisable(  
    NVM_MODULE_ID index  
);
```

Description

This routine continues Flash operation when device enters idle mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_NVM_ExistsStopInIdle](#) in your application to determine whether this feature is available.

Example

```
PLIB_NVM_StopInIdleDisable(MY_NVM_INSTANCE, DataToWrite);
```

5.6.12.5.1.7 PLIB_NVM_StopInIdleEnable Function**C**

```
void PLIB_NVM_StopInIdleEnable(  
    NVM_MODULE_ID index  
);
```

Description

This routine discontinues Flash operation when device enters idle mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_NVM_ExistsStopInIdle](#) in your application to determine whether this feature is available.

Example

```
PLIB_NVM_StopInIdleEnable(MY_NVM_INSTANCE, DataToWrite);
```

5.6.12.5.1.8 PLIB_NVM_WriteOperationHasTerminated Function**C**

```
bool PLIB_NVM_WriteOperationHasTerminated(  
    NVM_MODULE_ID index  
);
```

Description

This routine provides the status of the Flash/EEPROM write operation or sequence which was initiated by a write/erase operation.

Preconditions

The Address row to be erased must be provided earlier using [PLIB_NVM_FlashAddressToModify\(\)](#). The module should be configured to access Flash memory using [PLIB_NVM_FlashMemoryAccessEnable\(\)](#). A Write cycle must have been initiated via [PLIB_NVM_EEPROMWriteInitiate\(\)](#).

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

1 - Write operation prematurely terminated. 0 - Write operation completed.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_NVM_ExistsWriteErrorStatus](#) in your application to determine whether this feature is available.

Example

```
bool status;  
status = PLIB_NVM_WriteOperationHasTerminated(MY_NVM_INSTANCE);
```

5.6.12.5.2 Flash Memory Functions

5.6.12.5.2.1 PLIB_NVM_DataBlockSourceAddress Function

C

```
void PLIB_NVM_DataBlockSourceAddress(  
    NVM_MODULE_ID index,  
    uint32_t address  
);
```

Description

This routine takes the address parameter in the argument and loads the base address from which data has to be copied into flash. This is to copy a row of data directly into flash in one iteration without handling any intermediate holding registers.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
address	The starting address in the user data memory from which data will be written

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_NVM_ExistsSourceAddress](#) in your application to determine whether this feature is available.

Example

```
uint32_t address = MY_RAM_BASE_ADDRESS;  
PLIB_NVM_DataBlockSourceAddress(MY_NVM_INSTANCE, address);
```

5.6.12.5.2.2 PLIB_NVM_FlashAccessEnable Function

C

```
void PLIB_NVM_FlashAccessEnable(  
    NVM_MODULE_ID index  
);
```

Description

This routine allows access to the Flash program memory

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_NVM_ExistsAccessEnable](#) in your application to determine whether this feature is available.

Example

```
PLIB_NVM_FlashAccessEnable(MY_NVM_INSTANCE);
```

5.6.12.5.2.3 PLIB_NVM_FlashAddressToModify Function**C**

```
void PLIB_NVM_FlashAddressToModify(  
    NVM_MODULE_ID index,  
    uint32_t address  
);
```

Description

This routine takes the address parameter in the argument and loads the address which will be modified by the actual write operation. The write operation following this will write the user data into the program memory.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
address	The starting address in the memory from which data will be written

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_NVM_ExistsAddressModifyControl](#) in your application to determine whether this feature is available.

Example

```
uint32_t address = MY_FLASH_BASE_ADDRESS;  
PLIB_NVM_FlashAddressToModify(MY_NVM_INSTANCE, address);
```

5.6.12.5.2.4 PLIB_NVM_FlashEraseOperationSelect Function**C**

```
void PLIB_NVM_FlashEraseOperationSelect(  
    NVM_MODULE_ID index  
);
```

Description

For ERASE and FREE

5.6.12.5.2.5 PLIB_NVM_FlashEraseStart Function

C

```
void PLIB_NVM_FlashEraseStart(  
    NVM_MODULE_ID index  
)  
;
```

Description

This routine initiates the program memory erase or write cycles

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_NVM_ExistsWriteOperation](#) in your application to determine whether this feature is available.

Example

```
PLIB_NVM_FlashEraseStart(MY_NVM_INSTANCE, DataToWrite);
```

5.6.12.5.2.6 PLIB_NVM_FlashProvideData Function

C

```
void PLIB_NVM_FlashProvideData(  
    NVM_MODULE_ID index,  
    uint32_t data  
)  
;
```

Description

This routine provides the user data to intermediate registers before written into flash.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
data	Data to be written.

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_NVM_ExistsProvideData](#) in your application to determine whether this feature is available.

Example

```
uint32_t DataToWrite;
PLIB_NVM_FlashProvideData(MY_NVM_INSTANCE, DataToWrite);
```

5.6.12.5.2.7 PLIB_NVM_FlashProvideQuadData Function**C**

```
void PLIB_NVM_FlashProvideQuadData(
    NVM_MODULE_ID index,
    uint32_t * data
);
```

Description

This routine provides detection of low voltage event if any.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

1 - Low Voltage Event active. 0 - Low Voltage Event not Active

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_NVM_ExistsLowVoltageStatus](#) in your application to determine whether this feature is available.

Example

```
bool status;
status = PLIB_NVM_LowVoltageEventIsActive(MY_NVM_INSTANCE);
```

5.6.12.5.2.8 PLIB_NVM_FlashRead Function**C**

```
uint32_t PLIB_NVM_FlashRead(
    NVM_MODULE_ID index,
    uint32_t address
);
```

Description

This routine takes the address parameter in the argument and loads the read address to the appropriate register. The read operation provides data from the above address.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured
address	The address in the memory from which to read

Returns

Data value read at the memory address.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_NVM_ExistsWriteOperation](#) in your application to determine whether this feature is available.

Example

```
uint32_t    DataToBeRead;
DataToBeRead = PLIB_NVM_FlashRead(MY_NVM_INSTANCE);
```

5.6.12.5.2.9 PLIB_NVM_FlashWriteCycleHasCompleted Function**C**

```
bool PLIB_NVM_FlashWriteCycleHasCompleted(
    NVM_MODULE_ID index
);
```

Description

This routine provides the status of the Flash/EEPROM write cycle which was initiated by a write/erase operation.

Preconditions

The Address row to be erased must be provided earlier using [PLIB_NVM_FlashAddressToModify\(\)](#). The module should be configured to access Flash memory using [PLIB_NVM_FlashMemoryAccessEnable\(\)](#). A Write cycle must have been initiated via [PLIB_NVM_EEPROMWriteInitiate\(\)](#).

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

1 - Write/Erase Cycle is incomplete. 0 - Write cycle completed

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_NVM_ExistsWriteOperation](#) in your application to determine whether this feature is available.

Example

```
bool status;
status = PLIB_NVM_FlashWriteCycleHasCompleted(MY_NVM_INSTANCE);
```

5.6.12.5.2.10 PLIB_NVM_FlashWriteKeySequence Function**C**

```
void PLIB_NVM_FlashWriteKeySequence(
    NVM_MODULE_ID index,
    uint32_t keysequence
);
```

Description

This routine copies the mandatory KEY sequence into the respective registers.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

keysequence	Mandatory KEY sequence depending on the controller type

Returns

None.

Remarks

Without the KEY sequence write/erase operation will not be executed.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_NVM_ExistsKeySequence](#) in your application to determine whether this feature is available.

Example

```
PLIB_NVM_FlashWriteKeySequence(MY_NVM_INSTANCE, keysequence);
```

5.6.12.5.2.11 PLIB_NVM_FlashWriteOperationSelect Function**C**

```
void PLIB_NVM_FlashWriteOperationSelect(  
    NVM_MODULE_ID index  
);
```

Description

This routine Performs erase operation on the flash memory row selected

Preconditions

The Address row to be erased must be provided earlier using [PLIB_NVM_FlashAddressToModify\(\)](#). The module should be configured to access Flash memory using [PLIB_NVM_FlashMemoryAccessEnable\(\)](#).

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_NVM_ExistsProgramEraseOperation](#) in your application to determine whether this feature is available.

Example

```
PLIB_NVM_FlashWriteOperationSelect(MY_NVM_INSTANCE);
```

5.6.12.5.2.12 PLIB_NVM_FlashWriteProtectMemoryAreaRange Function**C**

```
void PLIB_NVM_FlashWriteProtectMemoryAreaRange(  
    NVM_MODULE_ID index,  
    uint32_t address  
);
```

Description

This routine provides detection of low voltage event if any.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

1 - Low Voltage Event active. 0 - Low Voltage Event not Active

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_NVM_ExistsLowVoltageStatus](#) in your application to determine whether this feature is available.

Example

```
bool status;  
status = PLIB_NVM_LowVoltageEventIsActive(MY_NVM_INSTANCE);
```

5.6.12.5.2.13 PLIB_NVM_FlashWriteStart Function**C**

```
void PLIB_NVM_FlashWriteStart(  
    NVM_MODULE_ID index  
);
```

Description

This routine initiates the program memory erase or write cycles

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_NVM_ExistsWriteOperation](#) in your application to determine whether this feature is available.

Example

```
PLIB_NVM_FlashWriteStart(MY_NVM_INSTANCE);
```

5.6.12.5.2.14 PLIB_NVM_IsProgramFlashMemoryLocked Function**C**

```
bool PLIB_NVM_IsProgramFlashMemoryLocked(  
    NVM_MODULE_ID index  
);
```

Description

This routine provides detection of low voltage event if any.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

1 - Low Voltage Event active. 0 - Low Voltage Event not Active

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_NVM_ExistsLowVoltageStatus](#) in your application to determine whether this feature is available.

Example

```
bool status;  
status = PLIB_NVM_LowVoltageEventIsActive(MY_NVM_INSTANCE);
```

5.6.12.5.2.15 PLIB_NVM_ProgramFlashBank1LowerRegion Function**C**

```
void PLIB_NVM_ProgramFlashBank1LowerRegion(  
    NVM_MODULE_ID index  
);
```

Description

This routine provides detection of low voltage event if any.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

1 - Low Voltage Event active. 0 - Low Voltage Event not Active

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_NVM_ExistsLowVoltageStatus](#) in your application to determine whether this feature is available.

Example

```
bool status;  
status = PLIB_NVM_LowVoltageEventIsActive(MY_NVM_INSTANCE);
```

5.6.12.5.2.16 PLIB_NVM_ProgramFlashBank2LowerRegion Function**C**

```
void PLIB_NVM_ProgramFlashBank2LowerRegion(  
    NVM_MODULE_ID index  
);
```

Description

This routine provides detection of low voltage event if any.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

1 - Low Voltage Event active. 0 - Low Voltage Event not Active

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_NVM_ExistsLowVoltageStatus](#) in your application to determine whether this feature is available.

Example

```
bool status;  
status = PLIB_NVM_LowVoltageEventIsActive(MY_NVM_INSTANCE);
```

5.6.12.5.3 Other Functions

5.6.12.5.3.1 PLIB_NVM_BootPageWriteProtectionDisable Function

C

```
void PLIB_NVM_BootPageWriteProtectionDisable(  
    NVM_MODULE_ID index,  
    NVM_BOOT_MEMORY_PAGE bootPage  
);
```

Description

This routine provides detection of low voltage event if any.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

1 - Low Voltage Event active. 0 - Low Voltage Event not Active

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_NVM_ExistsLowVoltageStatus](#) in your application to determine whether this feature is available.

Example

```
bool status;  
status = PLIB_NVM_LowVoltageEventIsActive(MY_NVM_INSTANCE);
```

5.6.12.5.3.2 PLIB_NVM_BootPageWriteProtectionEnable Function

C

```
void PLIB_NVM_BootPageWriteProtectionEnable(  
    NVM_MODULE_ID index,  
    NVM_BOOT_MEMORY_PAGE bootPage  
);
```

Description

This routine provides detection of low voltage event if any.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

1 - Low Voltage Event active. 0 - Low Voltage Event not Active

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_NVM_ExistsLowVoltageStatus](#) in your application to determine whether this feature is available.

Example

```
bool status;  
status = PLIB_NVM_LowVoltageEventIsActive(MY_NVM_INSTANCE);
```

5.6.12.5.3.3 PLIB_NVM_IsBootMemoryLocked Function**C**

```
bool PLIB_NVM_IsBootMemoryLocked(  
    NVM_MODULE_ID index,  
    NVM_BOOT_MEMORY_AREA memoryArea  
);
```

Description

This routine provides detection of low voltage event if any.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

1 - Low Voltage Event active. 0 - Low Voltage Event not Active

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_NVM_ExistsLowVoltageStatus](#) in your application to determine whether this feature is available.

Example

```
bool status;  
status = PLIB_NVM_LowVoltageEventIsActive(MY_NVM_INSTANCE);
```

5.6.12.5.3.4 PLIB_NVM_IsBootPageWriteProtected Function**C**

```
bool PLIB_NVM_IsBootPageWriteProtected(  
    NVM_MODULE_ID index,
```

```
    NVM_BOOT_MEMORY_PAGE bootPage  
);
```

Description

This routine provides detection of low voltage event if any.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

1 - Low Voltage Event active. 0 - Low Voltage Event not Active

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_NVM_ExistsLowVoltageStatus](#) in your application to determine whether this feature is available.

Example

```
bool status;  
status = PLIB_NVM_LowVoltageEventIsActive(MY_NVM_INSTANCE);
```

5.6.12.5.3.5 PLIB_NVM_LockBootMemory Function

C

```
void PLIB_NVM_LockBootMemory(  
    NVM_MODULE_ID index,  
    NVM_BOOT_MEMORY_AREA memoryArea  
);
```

Description

This routine provides detection of low voltage event if any.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

1 - Low Voltage Event active. 0 - Low Voltage Event not Active

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_NVM_ExistsLowVoltageStatus](#) in your application to determine whether this feature is available.

Example

```
bool status;  
status = PLIB_NVM_LowVoltageEventIsActive(MY_NVM_INSTANCE);
```

5.6.12.5.3.6 PLIB_NVM_LockProgramFlashMemory Function

C

```
void PLIB_NVM_LockProgramFlashMemory(  
    NVM_MODULE_ID index  
);
```

Description

This routine provides detection of low voltage event if any.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance to be configured

Returns

1 - Low Voltage Event active. 0 - Low Voltage Event not Active

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_NVM_ExistsLowVoltageStatus](#) in your application to determine whether this feature is available.

Example

```
bool status;  
status = PLIB_NVM_LowVoltageEventIsActive(MY_NVM_INSTANCE);
```

5.6.12.5.4 Feature Existence Functions

5.6.12.5.4.1 PLIB_NVM_ExistsAccessEnable Function

C

```
bool PLIB_NVM_ExistsAccessEnable(  
    NVM_MODULE_ID index  
);
```

Description

This function identifies whether the AccessEnableControl feature is available on the NVM module. When this function returns true, these functions are supported on the device:

- [PLIB_NVM_FlashAccessEnable](#)
- [PLIB_NVM_EEPROMAccessEnable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The AccessEnableControl feature is supported on the device

- false - The AccessEnableControl feature is not supported on the device

Remarks

None.

5.6.12.5.4.2 PLIB_NVM_ExistsAddressModifyControl Function**C**

```
bool PLIB_NVM_ExistsAddressModifyControl(  
    NVM_MODULE_ID index  
);
```

Description

This function identifies whether the AddressModifyControl feature is available on the NVM module. When this function returns true, these functions are supported on the device:

- [PLIB_NVM_FlashAddressToModify](#)
- [PLIB_NVM_EEPROMAddressToModify](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The AddressModifyControl feature is supported on the device
- false - The AddressModifyControl feature is not supported on the device

Remarks

None.

5.6.12.5.4.3 PLIB_NVM_ExistsBootPageWriteProtect Function**C**

```
bool PLIB_NVM_ExistsBootPageWriteProtect(  
    NVM_MODULE_ID index  
);
```

Description

This function identifies whether the BootPageWriteProtect feature is available on the NVM module. When this function returns true, these functions are supported on the device:

- [PLIB_NVM_BootPageWriteProtectionEnable](#)
- [PLIB_NVM_BootPageWriteProtectionDisable](#)
- [PLIB_NVM_IsBootPageWriteProtected](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The BootPageWriteProtect feature is supported on the device
- false - The BootPageWriteProtect feature is not supported on the device

Remarks

None.

5.6.12.5.4.4 PLIB_NVM_ExistsEEPROMReadInitiate Function**C**

```
bool PLIB_NVM_ExistsEEPROMReadInitiate(  
    NVM_MODULE_ID index  
);
```

Description

This function identifies whether the EEPROMReadInitiate feature is available on the NVM module. When this function returns true, these functions are supported on the device:

- PLIB_NVM_EEPROMReadStart

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The EEPROMReadInitiate feature is supported on the device
- false - The EEPROMReadInitiate feature is not supported on the device

Remarks

None.

5.6.12.5.4.5 PLIB_NVM_ExistsFlashBankRegionSelect Function**C**

```
bool PLIB_NVM_ExistsFlashBankRegionSelect(  
    NVM_MODULE_ID index  
);
```

Description

This function identifies whether the FlashBankRegionSelect feature is available on the NVM module. When this function returns true, these functions are supported on the device:

- [PLIB_NVM_ProgramFlashBank1LowerRegion](#)
- [PLIB_NVM_ProgramFlashBank2LowerRegion](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The FlashBankRegionSelect feature is supported on the device
- false - The FlashBankRegionSelect feature is not supported on the device

Remarks

None.

5.6.12.5.4.6 PLIB_NVM_ExistsFlashWPMemoryRangeProvide Function**C**

```
bool PLIB_NVM_ExistsFlashWPMemoryRangeProvide(  
    NVM_MODULE_ID index  
);
```

Description

This function identifies whether the FlashWPMemoryRangeProvide feature is available on the NVM module. When this function returns true, these functions are supported on the device:

- [PLIB_NVM_FlashWriteProtectMemoryAreaRange](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The FlashWPMemoryRangeProvide feature is supported on the device
- false - The FlashWPMemoryRangeProvide feature is not supported on the device

Remarks

None.

5.6.12.5.4.7 PLIB_NVM_ExistsKeySequence Function**C**

```
bool PLIB_NVM_ExistsKeySequence(  
    NVM_MODULE_ID index  
);
```

Description

This function identifies whether the KeySequence feature is available on the NVM module. When this function returns true, these functions are supported on the device:

- [PLIB_NVM_FlashWriteKeySequence](#)
- PLIB_NVM_EEPROMWriteKeySequence

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The KeySequence feature is supported on the device
- false - The KeySequence feature is not supported on the device

Remarks

None.

5.6.12.5.4.8 PLIB_NVM_ExistsLockBootSelect Function**C**

```
bool PLIB_NVM_ExistsLockBootSelect(  
    NVM_MODULE_ID index  
);
```

Description

This function identifies whether the LockBootSelect feature is available on the NVM module. When this function returns true, these functions are supported on the device:

- [PLIB_NVM_LockBootMemory](#)
- [PLIB_NVM_IsBootMemoryLocked](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The LockBootSelect feature is supported on the device
- false - The LockBootSelect feature is not supported on the device

Remarks

None.

5.6.12.5.4.9 PLIB_NVM_ExistsLockPFMSelect Function**C**

```
bool PLIB_NVM_ExistsLockPFMSelect(  
    NVM_MODULE_ID index  
);
```

Description

This function identifies whether the LockPFMSelect feature is available on the NVM module. When this function returns true, these functions are supported on the device:

- [PLIB_NVM_LockProgramFlashMemory](#)
- [PLIB_NVM_IsProgramFlashMemoryLocked](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The LockPFMSelect feature is supported on the device
- false - The LockPFMSelect feature is not supported on the device

Remarks

None.

5.6.12.5.4.10 PLIB_NVM_ExistsLowVoltageError Function

C

```
bool PLIB_NVM_ExistsLowVoltageError(  
    NVM_MODULE_ID index  
);
```

Description

This function identifies whether the LowVoltageStatus feature is available on the NVM module. When this function returns true, these functions are supported on the device:

- [PLIB_NVM_LowVoltageIsDetected](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The LowVoltageStatus feature is supported on the device
- false - The LowVoltageStatus feature is not supported on the device

Remarks

None.

5.6.12.5.4.11 PLIB_NVM_ExistsLowVoltageStatus Function

C

```
bool PLIB_NVM_ExistsLowVoltageStatus(  
    NVM_MODULE_ID index  
);
```

Description

This function identifies whether the LowVoltageStatus feature is available on the NVM module. When this function returns true, these functions are supported on the device:

- [PLIB_NVM_LowVoltageEventsActive](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The LowVoltageStatus feature is supported on the device
- false - The LowVoltageStatus feature is not supported on the device

Remarks

None.

5.6.12.5.4.12 PLIB_NVM_ExistsMemoryModificationControl Function

C

```
bool PLIB_NVM_ExistsMemoryModificationControl(  
    NVM_MODULE_ID index  
);
```

Description

This function identifies whether the MemoryModificationControl feature is available on the NVM module. When this function returns true, these functions are supported on the device:

- [PLIB_NVM_MemoryModifyEnable](#)
- [PLIB_NVM_MemoryModifyInhibit](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The MemoryModificationControl feature is supported on the device
- false - The MemoryModificationControl feature is not supported on the device

Remarks

None.

5.6.12.5.4.13 PLIB_NVM_ExistsOperationMode Function

C

```
bool PLIB_NVM_ExistsOperationMode(  
    NVM_MODULE_ID index  
);
```

Description

This function identifies whether the OperationMode feature is available on the NVM module. When this function returns true, these functions are supported on the device:

- [PLIB_NVM_MemoryOperationSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The OperationMode feature is supported on the device
- false - The OperationMode feature is not supported on the device

Remarks

None.

5.6.12.5.4.14 PLIB_NVM_ExistsProgramEraseOperation Function**C**

```
bool PLIB_NVM_ExistsProgramEraseOperation(  
    NVM_MODULE_ID index  
);
```

Description

This function identifies whether the ProgramEraseOperation feature is available on the NVM module. When this function returns true, these functions are supported on the device:

- [PLIB_NVM_FlashEraseOperationSelect](#)
- [PLIB_NVM_FlashWriteOperationSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ProgramEraseOperation feature is supported on the device
- false - The ProgramEraseOperation feature is not supported on the device

Remarks

None.

5.6.12.5.4.15 PLIB_NVM_ExistsProvideData Function**C**

```
bool PLIB_NVM_ExistsProvideData(  
    NVM_MODULE_ID index  
);
```

Description

This function identifies whether the ProvideData feature is available on the NVM module. When this function returns true, these functions are supported on the device:

- [PLIB_NVM_FlashProvideData](#)
- [PLIB_NVM_EEPROMProvideData](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ProvideData feature is supported on the device
- false - The ProvideData feature is not supported on the device

Remarks

None.

5.6.12.5.4.16 PLIB_NVM_ExistsProvideQuadData Function

C

```
bool PLIB_NVM_ExistsProvideQuadData(  
    NVM_MODULE_ID index  
);
```

Description

This function identifies whether the ProvideQuadData feature is available on the NVM module. When this function returns true, these functions are supported on the device:

- [PLIB_NVM_FlashProvideQuadData](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The ProvideQuadData feature is supported on the device
- false - The ProvideQuadData feature is not supported on the device

Remarks

None.

5.6.12.5.4.17 PLIB_NVM_ExistsSourceAddress Function

C

```
bool PLIB_NVM_ExistsSourceAddress(  
    NVM_MODULE_ID index  
);
```

Description

This function identifies whether the SourceAddress feature is available on the NVM module. When this function returns true, these functions are supported on the device:

- [PLIB_NVM_DataBlockSourceAddress](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The SourceAddress feature is supported on the device
- false - The SourceAddress feature is not supported on the device

Remarks

None.

5.6.12.5.4.18 PLIB_NVM_ExistsStopInIdle Function**C**

```
bool PLIB_NVM_ExistsStopInIdle(  
    NVM_MODULE_ID index  
);
```

Description

This function identifies whether the StopInIdle feature is available on the NVM module. When this function returns true, these functions are supported on the device:

- [PLIB_NVM_StopInIdleEnable](#)
- [PLIB_NVM_StopInIdleDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The StopInIdle feature is supported on the device
- false - The StopInIdle feature is not supported on the device

Remarks

None.

5.6.12.5.4.19 PLIB_NVM_ExistsWriteErrorStatus Function**C**

```
bool PLIB_NVM_ExistsWriteErrorStatus(  
    NVM_MODULE_ID index  
);
```

Description

This function identifies whether the WriteErrorStatus feature is available on the NVM module. When this function returns true, these functions are supported on the device:

- [PLIB_NVM_WriteOperationHasTerminated](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The WriteErrorStatus feature is supported on the device
- false - The WriteErrorStatus feature is not supported on the device

Remarks

None.

5.6.12.5.4.20 PLIB_NVM_ExistsWriteOperation Function

C

```
bool PLIB_NVM_ExistsWriteOperation(  
    NVM_MODULE_ID index  
);
```

Description

This function identifies whether the WriteOperation feature is available on the NVM module. When this function returns true, these functions are supported on the device:

- [PLIB_NVM_FlashRead](#)
- PLIB_NVM_EEPROMRead
- [PLIB_NVM_FlashWriteStart](#)
- [PLIB_NVM_FlashEraseStart](#)
- PLIB_NVM_EEPROMWriteStart
- PLIB_NVM_EEPROMEraseStart
- [PLIB_NVM_FlashWriteCycleHasCompleted](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The WriteOperation feature is supported on the device
- false - The WriteOperation feature is not supported on the device

Remarks

None.

5.6.12.6 Files

Files

Name	Description
plib_nvm.h	NVM PLIB Interface Header for NVM common definitions

Description

5.6.12.6.1 plib_nvm.h

NVM Peripheral Library Interface Header

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the NVM PLIB for all families of Microchip microcontrollers..The definitions in this file are common to NVM peripheral.

Functions

	Name	Description
≡	PLIB_NVM_BootPageWriteProtectionDisable	Provides low voltage detection status
≡	PLIB_NVM_BootPageWriteProtectionEnable	Provides low voltage detection status
≡	PLIB_NVM_DataBlockSourceAddress	Takes the address parameter in the argument and loads the base address from which data has to be copied into flash.
≡	PLIB_NVM_ExistsAccessEnable	Identifies whether the AccessEnableControl feature exists on the NVM module
≡	PLIB_NVM_ExistsAddressModifyControl	Identifies whether the AddressModifyControl feature exists on the NVM module
≡	PLIB_NVM_ExistsBootPageWriteProtect	Identifies whether the BootPageWriteProtect feature exists on the NVM module
≡	PLIB_NVM_ExistsEEPROMReadInitiate	Identifies whether the EEPROMReadInitiate feature exists on the NVM module
≡	PLIB_NVM_ExistsFlashBankRegionSelect	Identifies whether the FlashBankRegionSelect feature exists on the NVM module
≡	PLIB_NVM_ExistsFlashWPMemoryRangeProvide	Identifies whether the FlashWPMemoryRangeProvide feature exists on the NVM module
≡	PLIB_NVM_ExistsKeySequence	Identifies whether the KeySequence feature exists on the NVM module
≡	PLIB_NVM_ExistsLockBootSelect	Identifies whether the LockBootSelect feature exists on the NVM module
≡	PLIB_NVM_ExistsLockPFMSelect	Identifies whether the LockPFMSelect feature exists on the NVM module
≡	PLIB_NVM_ExistsLowVoltageError	Identifies whether the LowVoltageError feature exists on the NVM module
≡	PLIB_NVM_ExistsLowVoltageStatus	Identifies whether the LowVoltageStatus feature exists on the NVM module
≡	PLIB_NVM_ExistsMemoryModificationControl	Identifies whether the MemoryModificationControl feature exists on the NVM module
≡	PLIB_NVM_ExistsOperationMode	Identifies whether the OperationMode feature exists on the NVM module

	PLIB_NVM_ExistsProgramEraseOperation	Identifies whether the ProgramEraseOperation feature exists on the NVM module
	PLIB_NVM_ExistsProvideData	Identifies whether the ProvideData feature exists on the NVM module
	PLIB_NVM_ExistsProvideQuadData	Identifies whether the ProvideQuadData feature exists on the NVM module
	PLIB_NVM_ExistsSourceAddress	Identifies whether the SourceAddress feature exists on the NVM module
	PLIB_NVM_ExistsStopInIdle	Identifies whether the StopInIdle feature exists on the NVM module
	PLIB_NVM_ExistsWriteErrorStatus	Identifies whether the WriteErrorStatus feature exists on the NVM module
	PLIB_NVM_ExistsWriteOperation	Identifies whether the WriteOperation feature exists on the NVM module
	PLIB_NVM_FlashAccessEnable	Allows access to the Flash program memory
	PLIB_NVM_FlashAddressToModify	Takes the address parameter in the argument and loads the address which will be modified by the actual write operation to the appropriate pointer registers .
	PLIB_NVM_FlashEraseOperationSelect	For ERASE and FREE
	PLIB_NVM_FlashEraseStart	Initiates a Program memory erase/write cycle
	PLIB_NVM_FlashProvideData	Provides the user data to intermediate registers before written into flash
	PLIB_NVM_FlashProvideQuadData	Provides low voltage detection status
	PLIB_NVM_FlashRead	Takes the address parameter in the argument and loads the read address to the appropriate register and returns the value read.
	PLIB_NVM_FlashWriteCycleHasCompleted	This routine provides the status of the Flash/EEPROM write cycle.
	PLIB_NVM_FlashWriteKeySequence	Copies the mandatory KEY sequence into the respective registers.
	PLIB_NVM_FlashWriteOperationSelect	Performs erase operation on the memory row selected
	PLIB_NVM_FlashWriteProtectMemoryAreaRange	Provides low voltage detection status
	PLIB_NVM_FlashWriteStart	Initiates a Program memory erase/write cycle
	PLIB_NVM_IsBootMemoryLocked	Provides low voltage detection status
	PLIB_NVM_IsBootPageWriteProtected	Provides low voltage detection status
	PLIB_NVM_IsProgramFlashMemoryLocked	Provides low voltage detection status
	PLIB_NVM_LockBootMemory	Provides low voltage detection status
	PLIB_NVM_LockProgramFlashMemory	Provides low voltage detection status
	PLIB_NVM_LowVoltageEventIsActive	Provides low voltage detection status
	PLIB_NVM_LowVoltageIsDetected	Provides low voltage error detection status
	PLIB_NVM_MemoryModifyEnable	Allows write cycles to Flash/EEPROM
	PLIB_NVM_MemoryModifyInhibit	Inhibits write cycles to Flash/EEPROM
	PLIB_NVM_MemoryOperationSelect	Selects the operation to be performed on Flash/EEPROM memory.
	PLIB_NVM_ProgramFlashBank1LowerRegion	Provides low voltage detection status
	PLIB_NVM_ProgramFlashBank2LowerRegion	Provides low voltage detection status
	PLIB_NVM_StopInIdleDisable	Continues Flash operation when device enters idle mode.
	PLIB_NVM_StopInIdleEnable	Discontinues Flash operation when device enters idle mode.

	PLIB_NVM_WriteOperationHasTerminated	This routine provides the status of the Flash/EEPROM write operation or sequence.

5.6.13 Output Compare Peripheral Library

5.6.13.1 Introduction

Output Compare Peripheral Library for Microchip Microcontrollers

This library provides a low-level abstraction of the Output Compare Peripheral Library that is available on the Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, thereby hiding differences from one microcontroller variant to another.

Description

The Output Compare module is primarily used to generate a single pulse or a series of pulses in response to selected time base events.

Output Compare module operation essentially requires a timer and one or two compare values. Users have an option to select either a 32-bit timer or a 16-bit timer. The timer can be programmed to count at a desired frequency and count up to a desired period value. Details regarding timer operation and setup can be found in the Timer Peripheral Library. The Output Compare module compares the value of the timer with the compare values depending on the selected operating mode. When a compare match occurs between a timer value and compare values, the Output Compare module outputs a change of state on its output pins in accordance with the chosen Output Compare compare mode logic. Either a single pulse or a sequence of pulses may be generated.

Some of the key operating modes of the OC module are:

- **Single Compare Set High/Low modes:** In these compare modes, a compare match between the timer and the buffer (primary compare value) sets the output High/Low. The output remains at the same state after compare match event unless the module is disabled or the mode is changed.
- **Single Compare Toggle mode:** Output toggles state at every compare match event between the timer and the buffer (primary compare value)
- **Dual compare Single/Continuous Pulse modes:** These modes require two compare values. Leading edge of output pulse is generated during compare match of the incrementing timer and the buffer (primary compare value). Trailing edge of output pulse results when a compare match occurs between the incrementing timer and the pulse width value (secondary compare value). The output may be a single pulse or a sequence of pulses.
- **Pulse-Width Modulation (PWM) modes:** In this mode, output goes high when a compare match occurs between timer and the pulse width value (duty cycle). The output is reset back to its initial state when the timer resets after attaining its maximum count.

The Output Compare module also provides programmable interrupt generation on a compare match event. In PWM mode, hardware-based Fault detection and automatic output disable features are provided.

Figure 1 shows a block diagram of the Output Compare module. A compare match between the timer value and the compare values generates a pulse at the output.

Figure 1: Output Compare Module Block Diagram

Figure 2 shows a block diagram of the Output Compare module with dedicated timers, present on some devices. It facilitates the use of multiple Output Compare modules operating synchronously or the use of an asynchronous trigger to generate a pulse.

Figure 2: Output Compare Module Block Diagram with Dedicated Timers

5.6.13.2 Release Notes

MPLAB Harmony Version: v0.70b **Output Compare Peripheral Library Version :** 0.70b **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.6.13.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.6.13.4 Using the Library

This topic describes the basic architecture of the Output Compare Peripheral Library and provides information and examples on how to use it.

Interface Header File: [plib_oc.h](#)

The interface to the Output Compare Peripheral library is defined in the "[plib_oc.h](#)" header file. This file is included by the "peripheral.h" file. Any C language source (.c) file that uses the Output Compare Peripheral Library should include "peripheral.h".

Library File:

The Output Compare Peripheral library archive (.a) file installed with MPLAB Harmony.

Please refer to the [MPLAB Harmony Overview](#) for how the Peripheral interacts with the framework.

5.6.13.4.1 Hardware Abstraction Model

This library provides the low-level abstraction of the Output Compare module on the Microchip family of microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in the software and introduces the library interface.

Note: The interface provided is a superset of all the functionality of the available Output Compare modules on the device. Refer to the specific device data sheet or related family reference manual section to determine the set of functions that are supported for each Output Compare module on your device.

Description

The Output Compare Peripheral Library is used to simplify low-level access to the Output Compare module without having the need to directly interact the module's registers. The function names are generic and lead to easier access to the Output Compare module on different devices.

Figure 3: Output Compare module Software Abstraction Block Diagram

The Output Compare module can be described from a software standpoint as having functions to configure the module itself, to select the timer, set the buffer and pulse width values, and select the mode of operation. The desired nature of the output pulse is thus obtained.

A 16-bit or a 32-bit timer can be selected for the output compare time base. In some devices, the Output Compare module can be synchronized to an external input source. The Output Compare module can also operate asynchronously, based on a trigger by an input source. The Output Compare module entails the use of some functions dealing with Timer set up. These details can be found in Timer Peripheral Library.

Functions have been provided to set buffer values and pulse-width values. Pulse-width values are used only in Dual compare and PWM modes. In PWM mode, the buffer value provides the initial duty cycle for the first time period, while all later time cycles employ the 'pulse-width' value as the duty cycle value.

Compare modes:

- Single Compare Level Mode: Sets the output of Output Compare module at either 'High' or 'Low' at a compare match event
- Single Compare Toggle Mode: Toggles the output of OC module at each compare match event. This mode will produce continuous pulses.
- Dual Compare Mode: Output Compare module output is driven 'High' on compare match with buffer value and driven 'Low' on a compare match with the pulse-width value. The output can be either a single pulse or a continuous stream of pulses.
- PWM Mode: In Edge-aligned PWM mode, the Output Compare module output is driven 'High' whenever the timer resets, and is driven 'Low' on a compare match with the pulse-width value. Faults may or may not be enabled. In Center-aligned PWM mode, the Output Compare module output is driven 'High' on a compare match with the buffer value and driven 'Low' on a compare match with the pulse-width value.

Note: In PWM mode, it is vital that the user selects the mode of operation before selecting a Fault input.

5.6.13.4.2 How the Library Works

Note: Not all modes are available on all devices. Please refer to the specific device data sheet to determine the supported modes.

All of the interface functions in this library are classified according to:

- General Setup: These routines deal with general setup of Output Compare module
- Compare/PWM Mode: These routines facilitate the selection of a Compare/PWM mode and setting up the compare values
- Timer: These functions deal with configuring the timer, selection of the clock source, and setting up a synchronous or asynchronous mode of operation for the OC module
- Power-Saving Modes:
 - Sleep Mode: The Output Compare module output is driven to the same state as it was in prior to the device entering Sleep mode. In PWM Fault mode, Fault detection is active. A Fault forces output of the OC module to tri-state or to a fixed predetermined state.
 - Idle Mode: The Output Compare module can be configured to suspend its operations or continue its operations. If the Output Compare module suspends its operations, it has the same behavior as it does in Sleep mode.
- Faults: These functions are used to select Fault inputs and identify occurrences of Faults when the Output Compare module functions in PWM mode
- Exists: These functions notify whether or not a particular feature is present on a device

The following sections provide examples that depict the use of interface functions to perform general tasks such as initialization and set up of the Output Compare module and setting up the Output Compare module in different compare modes.

5.6.13.4.2.1 Single Compare Set High Mode

The Single Compare Set High mode sets the output of the Output Compare module 'High' at a compare match event. This section illustrates the steps required to configure the Output Compare module in Single Compare Set High mode.

Example:

```
/* This example illustrates setting up Output Compare Module in Single Compare Set High mode */

/* Configure Timer2 in 16-bit mode. Refer to Timer Peripheral Library for the API */

/* Disable OC module */
PLIB_OC_Disable(MY_OC_ID);

/* Select Timer2 as timebase */
PLIB_OC_TimerSelect(MY_OC_ID, OC_TIMER_16BIT_TMR2);

/* Set period of time base. Refer to Timer Peripheral Library for the API */

/* Select compare mode */
PLIB_OC_ModeSelect(MY_OC_ID, OC_SET_HIGH_SINGLE_PULSE_MODE);

/* Set buffer size to 16-bits */
PLIB_OC_BufferSizeSelect(MY_OC_ID, OC_BUFFER_SIZE_16BIT);

/* Set buffer value */
PLIB_OC_Buffer16BitSet(MY_OC_ID, 0x00FF);

/* Configure interrupts associated with Output Compare module. Refer to Timer Peripheral Library for the API */

/* Enable Timer2. Refer to Timer Peripheral Library for the API */

/* Enable the Output Compare module */
PLIB_OC_Enable(MY_OC_ID);
```

5.6.13.4.2.2 Single Compare Toggle Mode

The Single Compare Toggle mode toggles the output of the Output Compare module at each compare match event. This section illustrates the steps required to configure the Output Compare module in Single Compare Toggle mode.

Example:

```
/* This example illustrates setting up Output Compare Module in Single Compare Toggle mode */  
  
/* Configure Timer2 in 16-bit mode. Refer to Timer Peripheral Library for the API */  
  
/* Disable OC module */  
PLIB_OC_Disable(MY_OC_ID);  
  
/* Select Timer2 as timebase */  
PLIB_OC_TimerSelect(MY_OC_ID, OC_TIMER_16BIT_TMR2);  
  
/* Set period of time base. Refer to Timer Peripheral Library for the API */  
  
/* Select compare mode */  
PLIB_OC_ModeSelect(MY_OC_ID, OC_TOGGLE_CONTINUOUS_PULSE_MODE);  
  
/* Set buffer size to 16-bits */  
PLIB_OC_BufferSizeSelect(MY_OC_ID, OC_BUFFER_SIZE_16BIT);  
  
/* Set Buffer Value */  
PLIB_OC_Buffer16BitSet(MY_OC_ID, 0x00FF);  
  
/* Configure interrupts associated with Output Compare module. Refer to Interrupts Peripheral Library for the API */  
  
/* Enable Timer2. Refer to Timer Peripheral Library for the API */  
  
/* Enable Output Compare module */  
PLIB_OC_Enable(MY_OC_ID);
```

5.6.13.4.2.3 Dual Compare Continuous Mode

In this mode, the Output Compare module output is driven 'High' on a compare match with the buffer value and driven 'Low' on a compare match with the pulse-width value. A continuous stream of pulses is generated. This section illustrates the steps required to configure the Output Compare module in Dual Compare Continuous Pulse mode.

Example:

```
/* This example illustrates setting up Output Compare Module in Dual Compare Continuous Pulse mode */  
  
/* Configure Timer2 in 16-bit mode. Refer to Timer Peripheral Library for the API */  
  
/* Disable OC module */  
PLIB_OC_Disable(MY_OC_ID);  
  
/* Select Timer2 as timebase */  
PLIB_OC_TimerSelect(MY_OC_ID, OC_TIMER_16BIT_TMR2);  
  
/* Set period of time base. Refer to Timer Peripheral Library for the API */  
  
/* Select compare mode */  
PLIB_OC_ModeSelect(MY_OC_ID, OC_DUAL_COMPARE_CONTINUOUS_PULSE_MODE);  
  
/* Set buffer size to 16-bits */  
PLIB_OC_BufferSizeSelect(MY_OC_ID, OC_BUFFER_SIZE_16BIT);
```

```

/* Set buffer(primary compare) value */
PLIB_OC_Buffer16BitSet(MY_OC_ID, 0x00FF);

/*Set pulse width(secondary compare) value */
PLIB_OC_PulseWidth16BitSet(MY_OC_ID, 0x0FFF);

/* Configure interrupts associated with Output Compare module. Refer to
Interrupts Peripheral Library for the API */

/* Enable Timer2. Refer to Timer Peripheral Library for the API */

/* Enable the Output Compare module */
PLIB_OC_Enable(MY_OC_ID);

```

5.6.13.4.2.4 PWM Mode with Enabled Faults

This section illustrates the steps required to configure the Output Compare module in PWM mode.

Note: In PWM mode, it is vital that the user selects the mode of operation before selecting a Fault input.

Example:

```

/* This example illustrates setting up Output Compare Module in Dual Compare Continuous Pulse
mode */

/* Configure Timer2 in 16-bit mode. Refer to Timer Peripheral Library for the API */

/* Disable OC module */
PLIB_OC_Disable(MY_OC_ID);

/* Select Timer2 as timebase */
PLIB_OC_TimerSelect(MY_OC_ID, OC_TIMER_16BIT_TMR2);

/* Set period of time base. Refer to Timer Peripheral Library for the API */

/* Select compare mode. PWM Edge aligned mode is selected */
PLIB_OC_ModeSelect(MY_OC_ID, OC_COMPARE_PWM_EDGE_ALIGNED_MODE );

/* Select Fault input. In Output Compare modules that do not have dedicated timers,
fault selection is preset in hardware */
PLIB_OC_FaultInputSelect(MY_OC_ID, OC_FAULT_PRESET);

/* Set buffer size to 16-bits. Refer to Timer Peripheral Library for the API */
PLIB_OC_BufferSizeSelect(MY_OC_ID, OC_BUFFER_SIZE_16BIT);

/* Set buffer (initial duty cycle) Value */
PLIB_OC_Buffer16BitSet(MY_OC_ID, 0x00FF);

/*Set pulse width (Duty cycle) value */
PLIB_OC_PulseWidth16BitSet(MY_OC_ID, 0x0FFF);

/* Configure interrupts associated with Output Compare module. Refer to
Interrupts Peripheral Library for the API */

/* Enable Timer2. Refer to Timer Peripheral Library for the API */

/* Enable OC module */
PLIB_OC_Enable(MY_OC_ID);

/* Check for PWM Fault */
while(!PLIB_OC_FaultHasOccurred)
{
    /* If no PWM fault, continue normal operation*/
}

```

5.6.13.4.3 Configuring the Library

The library is configured for the supported processor when the processor is chosen in the MPLAB IDE.

5.6.13.5 Library Interface

Data Types and Constants

	Name	Description
	<u>OC_16BIT_TIMERS</u>	Lists different 16 bit time bases for OC module
	<u>OC_BUFFER_SIZE</u>	Lists different buffer sizes for compare value
	<u>OC_CLOCK_RESOLUTION</u>	Lists different PWM resolutions for PWM mode and OC output falling edge delay for compare modes
	<u>OC_COMPARE_MODES</u>	Lists different compare modes for OC module
	<u>OC_FAULT_MODES</u>	Lists modes to clear fault mode
	<u>OC_FAULT_OUT</u>	Provides state of OC output pin when a fault occurs
	<u>OC_FAULT_TRISTATE</u>	Lists modes to clear fault mode
	<u>OC_FAULTS</u>	Lists different fault sources for OC module
	<u>OC_MODULE_ID</u>	OC_MODULE_ID This enumeration defines number of modules which are available on the microcontroller. This is the super set of all the possible instances that might be available on Microchip microcontrollers. Refer to the specific device data sheet to get the correct number of modules defined for the desired microcontroller.
	<u>OC_SYNC_MODES</u>	Lists different synchronization modes for OC module
	<u>OC_SYNC_SOURCES</u>	Lists different synchronization sources for OC module
	<u>OC_TRIGGER_STATUS_MODES</u>	Lists different trigger status reset modes for OC module

Compare Mode Functions

	Name	Description
	<u>PLIB_OC_Buffer16BitSet</u>	Sets a 16-bit primary compare value for compare operations.
	<u>PLIB_OC_Buffer32BitSet</u>	Sets a 32-bit primary compare value for compare operations.
	<u>PLIB_OC_BufferSizeSelect</u>	Sets the buffer size and pulse width to 16-bits or 32-bits.
	<u>PLIB_OC_PulseWidth16BitSet</u>	Sets a 16-bit pulse width for OC module output.
	<u>PLIB_OC_PulseWidth32BitSet</u>	Sets a 32-bit pulse width for OC module output.
	<u>PLIB_OC_PWMdutyCycleResolutionSet</u>	Sets the PWM duty cycle resolution and delays the falling edge of OC output in compare modes.

Faults Functions

	Name	Description
	<u>PLIB_OC_FaultHasOccurred</u>	Checks if a PWM fault has occurred.
	<u>PLIB_OC_FaultInputSelect</u>	Selects a Fault input for the OC module.
	<u>PLIB_OC_FaultModeSelect</u>	Selects an automatic or software-based mode to clear the Fault.
	<u>PLIB_OC_FaultOutSelect</u>	OC output pin is driven to a known state on a Fault.
	<u>PLIB_OC_FaultTristateSelect</u>	The OC module output can be tristated or driven to a known state when a Fault occurs.

Feature Existence Functions

	Name	Description
	PLIB_OC_ExistsAlternateClock	Identifies whether the AlternateClock feature exists on the OC module.
	PLIB_OC_ExistsBufferSize	Identifies whether the BufferSize feature exists on the OC module.
	PLIB_OC_ExistsBufferValue	Identifies whether the BufferValue feature exists on the OC module.
	PLIB_OC_ExistsCompareModeSelect	Identifies whether the CompareModeSelect feature exists on the OC module.
	PLIB_OC_ExistsEnableControl	Identifies whether the EnableControl feature exists on the OC module.
	PLIB_OC_ExistsFaultInput	Identifies whether the FaultInput feature exists on the OC module.
	PLIB_OC_ExistsFaultModeSelect	Identifies whether the FaultModeSelect feature exists on the OC module.
	PLIB_OC_ExistsFaultOutSelect	Identifies whether the FaultOut feature exists on the OC module.
	PLIB_OC_ExistsFaultStatus	Identifies whether the FaultStatus feature exists on the OC module.
	PLIB_OC_ExistsFaultTristateSelect	Identifies whether the FaultTristateSelect feature exists on the OC module.
	PLIB_OC_ExistsPolarityInvert	Identifies whether the PolarityInvert feature exists on the OC module.
	PLIB_OC_ExistsPulseWidth	Identifies whether the PulseWidth feature exists on the OC module.
	PLIB_OC_ExistsPWMDutyCycleResolutionControl	Identifies whether the PWMDutyCycleResolution feature exists on the OC module.
	PLIB_OC_ExistsStopInIdle	Identifies whether the StopInIdle feature exists on the OC module.
	PLIB_OC_ExistsSyncModeSelect	Identifies whether the SyncModeSelect feature exists on the OC module.
	PLIB_OC_ExistsSyncSourceSelect	Identifies whether the SyncSourceSelect feature exists on the OC module.
	PLIB_OC_ExistsTimerSelect	Identifies whether the TimerSelect feature exists on the OC module.
	PLIB_OC_ExistsTimerTriggered	Identifies whether the TimerTriggered feature exists on the OC module.
	PLIB_OC_ExistsTriggerControl	Identifies whether the TriggerControl feature exists on the OC module.
	PLIB_OC_ExistsTriggerStatusModeSelect	Identifies whether the TriggerStatusModeSelect feature exists on the OC module.

General Setup Functions

	Name	Description
	PLIB_OC_Disable	Disable the OC module
	PLIB_OC_Enable	Enables the OC module.
	PLIB_OC_ModeSelect	Selects the compare mode for the OC module.
	PLIB_OC_PolarityInvertedDisable	Disables OC module output inversion polarity.
	PLIB_OC_PolarityInvertedEnable	Output compare polarity is inverted.

Power-Saving Modes Functions

	Name	Description
≡	PLIB_OC_StopInIdleDisable	OC module continues operating when the device enters Idle mode
≡	PLIB_OC_StopInIdleEnable	Discontinues OC module operation when the device enters Idle mode

Timer Functions

	Name	Description
≡	PLIB_OC_IsTriggered	Checks whether or not a timer source has been triggered.
≡	PLIB_OC_SyncModeSelect	Selects the synchronization mode for the OC module.
≡	PLIB_OC_SyncSourceSelect	Selects the input source for synchronous or asynchronous (triggered) operation of the OC module.
≡	PLIB_OC_TimerSelect	Selects a clock source for the OC module.
≡	PLIB_OC_TriggerClear	Clears the trigger status for the OC module.
≡	PLIB_OC_TriggerSet	Sets the trigger status for the OC module.
≡	PLIB_OC_TriggerStatusModeSelect	Selects the trigger status reset mode.
≡	PLIB_OC_AlternateClockDisable	Selects Timer 2/3 instead of the alternate clock source.
≡	PLIB_OC_AlternateClockEnable	Selects the alternate clock source.

Description**5.6.13.5.1 General Setup Functions****5.6.13.5.1.1 PLIB_OC_Disable Function****C**

```
void PLIB_OC_Disable(
    OC_MODULE_ID index
);
```

Description

This function disables the OC module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the OC module

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OC_ExistsEnableControl](#) in your application to determine whether this feature is available.

Example

```
#define MY_OC_ID OC_ID_1
```

```
PLIB_OC_Disable(MY_OC_ID);
```

5.6.13.5.1.2 PLIB_OC_Enable Function

C

```
void PLIB_OC_Enable(  
    OC_MODULE_ID index  
);
```

Description

This function enables the OC module.

Preconditions

The module should be appropriately configured before being enabled.

Parameters

Parameters	Description
index	Identifies the desired OC module

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OC_ExistsEnableControl](#) in your application to determine whether this feature is available.

Example

```
#define MY_OC_ID OC_ID_1  
  
//Do all the other configurations before enabling.  
  
PLIB_OC_Enable(MY_OC_ID);
```

5.6.13.5.1.3 PLIB_OC_ModeSelect Function

C

```
void PLIB_OC_ModeSelect(  
    OC_MODULE_ID index,  
    OC_COMPARE_MODES cmpMode  
);
```

Description

This function selects the compare mode for the OC module.

Preconditions

The OC module must be turned off before a new mode is selected. The OC module is turned off via `PLIB_OC_ModeSelect(MY_OC_ID,OC_COMPARE_TURN_OFF_MODE)`

Parameters

Parameters	Description
index	Identifies the desired OC module
cmpMode	Identifies the compare mode for OC module

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OC_ExistsCompareModeSelect](#) in your application to determine whether this feature is available.

Example

```
#define MY_OC_ID OC_ID_1
// Dual compare continuous pulse mode is selected
PLIB_OC_ModeSelect(MY_OC_ID, OC_DUAL_COMPARE_CONTINUOUS_PULSE_MODE );
```

5.6.13.5.1.4 PLIB_OC_PolarityInvertedDisable Function**C**

```
void PLIB_OC_PolarityInvertedDisable(
    OC_MODULE_ID index
);
```

Description

This function disables polarity inversion of OC module output.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired OC module

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OC_ExistsPolarityInvert](#) in your application to determine whether this feature is available.

Example

```
#define MY_OC_ID OC_ID_1
// Polarity of OC module output is Non-inverted
PLIB_OC_PolarityInvertedDisable(OC_MODULE_ID index);
```

5.6.13.5.1.5 PLIB_OC_PolarityInvertedEnable Function**C**

```
void PLIB_OC_PolarityInvertedEnable(
    OC_MODULE_ID index
);
```

Description

This function inverts the polarity of the OC module output.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired OC module

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OC_ExistsPolarityInvert](#) in your application to determine whether this feature is available.

Example

```
#define MY_OC_ID OC_ID_1
// Invert polarity of OC module output
PLIB_OC_PolarityInvertedEnable(MY_OC_ID);
```

5.6.13.5.2 Compare Mode Functions

5.6.13.5.2.1 PLIB_OC_Buffer16BitSet Function

C

```
void PLIB_OC_Buffer16BitSet(
    OC_MODULE_ID index,
    uint16_t val16Bit
);
```

Description

This function sets a 16-bit primary compare value for compare operations in all modes except PWM modes.

Preconditions

The PWM mode of operation should not be selected. The buffer size should be set to 16-bits by the [PLIB_OC_BufferSizeSelect\(\)](#) function.

Parameters

Parameters	Description
index	Identifies the desired OC module
val16Bit	Sets a 16-bit primary compare value

Returns

None

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OC_ExistsBufferValue](#) in your application to determine whether this feature is available.

Example

```
#define MY_OC_ID OC_ID_1

PLIB_OC_Buffer16BitSet(MY_OC_ID, 0x00FF);
```

5.6.13.5.2.2 PLIB_OC_Buffer32BitSet Function

C

```
void PLIB_OC_Buffer32BitSet(
    OC_MODULE_ID index,
    uint32_t val32Bit
);
```

Description

This function sets a 32-bit primary compare value for compare operations in all modes except PWM modes.

Preconditions

The PWM mode of operation should not be selected. The buffer size should be set to 32-bits by the [PLIB_OC_BufferSizeSelect\(\)](#) function.

Parameters

Parameters	Description
index	Identifies the desired OC module
val32Bit	Sets a 32-bit primary compare value

Returns

None

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OC_ExistsBufferValue](#) in your application to determine whether this feature is available.

Example

```
#define MY_OC_ID OC_ID_1

PLIB_OC_Buffer32BitSet(MY_OC_ID, 0x000000FF);
```

5.6.13.5.2.3 PLIB_OC_BufferSizeSelect Function**C**

```
void PLIB_OC_BufferSizeSelect(
    OC_MODULE_ID index,
    OC_BUFFER_SIZE size
);
```

Description

This function sets the size of the buffer and pulse width to 16-bits or 32-bits. The choice is made based on whether a 16-bit timer or a 32-bit timer is selected.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired OC module
size	Identifies the size of compare value

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OC_ExistsBufferSize](#) in your application to determine whether this feature is available.

Example

```
#define MY_OC_ID OC_ID_1
// Buffer size and pulse width size are set to 32-bits
```

```
PLIB_OC_BufferSizeSelect(MY_OC_ID, OC_BUFFER_SIZE_32BIT);
```

5.6.13.5.2.4 PLIB_OC_PulseWidth16BitSet Function

C

```
void PLIB_OC_PulseWidth16BitSet(  
    OC_MODULE_ID index,  
    uint16_t pulsewidth  
);
```

Description

This function sets a 16-bit pulse width for the OC module in dual compare modes. A dual compare mode can be selected using the [PLIB_OC_ModeSelect\(\)](#) function. Secondary compare match event (pulse width) decides the trailing (falling) edge of the OC module output.

Preconditions

Dual compare operation should be selected. The buffer size should be set to 16-bits by the [PLIB_OC_BufferSizeSelect\(\)](#) function.

Parameters

Parameters	Description
index	Identifies the desired OC module
pulseWidth	Pulse width value

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OC_ExistsPulseWidth](#) in your application to determine whether this feature is available.

Example

```
#define MY_OC_ID OC_ID_1  
  
PLIB_OC_PulseWidth16BitSet(MY_OC_ID, 0x0FFF);
```

5.6.13.5.2.5 PLIB_OC_PulseWidth32BitSet Function

C

```
void PLIB_OC_PulseWidth32BitSet(  
    OC_MODULE_ID index,  
    uint32_t pulsewidth  
);
```

Description

This function sets a 32-bit pulse width for OC module in dual compare modes. A dual compare mode can be selected using [PLIB_OC_ModeSelect\(\)](#) routine. Secondary compare match event (pulse width) decides the trailing(falling) edge of OC module output.

Preconditions

Dual compare operation should be selected. The buffer size should be set to 32-bits by the [PLIB_OC_BufferSizeSelect\(\)](#) function.

Parameters

Parameters	Description
index	Identifies the desired OC module
pulseWidth	Pulse width value

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OC_ExistsPulseWidth](#) in your application to determine whether this feature is available.

Example

```
#define MY_OC_ID OC_ID_1

PLIB_OC_PulseWidth32BitSet(MY_OC_ID, 0x00000FFF);
```

5.6.13.5.2.6 PLIB_OC_PWMDutyCycleResolutionSet Function**C**

```
void PLIB_OC_PWMDutyCycleResolutionSet(
    OC_MODULE_ID index,
    OC_CLOCK_RESOLUTION clkResolution
);
```

Description

This function sets the PWM duty cycle resolution in PWM mode and delays the falling edge of OC output in compare modes.

Preconditions

Dual compare mode must be selected for this function.

Parameters

Parameters	Description
index	Identifies the desired OC module
clkResolution	Select clock resolution

Returns

None

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OC_ExistsPWMDutyCycleResolutionControl](#) in your application to determine whether this feature is available.

Example

```
#define MY_OC_ID OC_ID_1

PLIB_OC_PWMDutyCycleResolutionSet(MY_OC_ID, OC_CLOCK_P1);
```

5.6.13.5.3 Timer Functions**5.6.13.5.3.1 PLIB_OC_IsTriggered Function****C**

```
bool PLIB_OC_IsTriggered(
    OC_MODULE_ID index
);
```

Description

This function checks whether Output Compare timer has been triggered or not. This function returns 'true' if OC timer is triggered

and running and 'false' if the OC timer is cleared and stopped.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired OC module

Returns

bool - true - OC timer is triggered and running

- false - OC timer is stopped and held in clear

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OC_ExistsTimerTriggered](#) in your application to determine whether this feature is available.

Example

```
#define MY_OC_ID OC_ID_1
if(!PLIB_OC_IsTriggered(MY_OC_ID))
{
    // Do some operation
};
```

5.6.13.5.3.2 PLIB_OC_SyncModeSelect Function

C

```
void PLIB_OC_SyncModeSelect(
    OC_MODULE_ID index,
    OC_SYNC_MODES mode
);
```

Description

This function selects the synchronization mode for Othe OC module. The Synchronous or Asynchronous mode of operation can be selected.

Preconditions

If Asynchronous mode is selected and an OC trigger is selected, that OC module must be disabled first before enabling the trigger functionality.

Parameters

Parameters	Description
index	Identifies the desired OC module
mode	Identifies the mode (Synchronous or Asynchronous)

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OC_ExistsSyncModeSelect](#) in your application to determine whether this feature is available.

Example

```
#define MY_OC_ID OC_ID_1
// Synchronous mode of operation is selected.
```

```
PLIB_OC_SyncModeSelect(MY_OC_ID, OC_MODE_SYNC);
```

5.6.13.5.3.3 PLIB_OC_SyncSourceSelect Function

C

```
void PLIB_OC_SyncSourceSelect(  
    OC_MODULE_ID index,  
    OC_SYNC_SOURCES src  
);
```

Description

This function selects the input source for synchronous or asynchronous (triggered) operation of the OC module.

Preconditions

If an OC trigger is selected, that OC module must be disabled before it is configured to be used as a trigger to the next OC module.

Parameters

Parameters	Description
index	Identifies the desired OC module
src	Identifies the input source

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OC_ExistsSyncSourceSelect](#) in your application to determine whether this feature is available.

Example

```
#define MY_OC_ID OC_ID_1  
//Input Capture is selected as the input source  
PLIB_OC_SyncSourceSelect(MY_OC_ID, OC_SYNC_SOURCE_IC6);
```

5.6.13.5.3.4 PLIB_OC_TimerSelect Function

C

```
void PLIB_OC_TimerSelect(  
    OC_MODULE_ID index,  
    OC_16BIT_TIMERS tmr  
);
```

Description

This function selects a clock source for the OC module if the 16-bit time base is set.

Preconditions

The 16-bit time base needs to be set.

Parameters

Parameters	Description
index	Identifies the desired OC module
tmr	Identifies the timer

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OC_ExistsTimerSelect](#) in your application to determine whether this feature is available.

Example

```
#define MY_OC_ID OC_ID_1
// 16-bit Timer2 is selected
PLIB_OC_TimerSelect(MY_OC_ID, OC_TIMER_16BIT_TMR2);
```

5.6.13.5.3.5 PLIB_OC_TriggerClear Function**C**

```
void PLIB_OC_TriggerClear(
    OC_MODULE_ID index
);
```

Description

This function clears the trigger status for the OC module.

Preconditions

Dual compare mode must be selected for this function.

Parameters

Parameters	Description
index	Identifies the desired OC module

Returns

None

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OC_ExistsTriggerControl](#) in your application to determine whether this feature is available.

Example

```
#define MY_OC_ID OC_ID_1

PLIB_OC_TriggerClear(MY_OC_ID);
```

5.6.13.5.3.6 PLIB_OC_TriggerSet Function**C**

```
void PLIB_OC_TriggerSet(
    OC_MODULE_ID index
);
```

Description

This function sets the trigger status for the OC module.

Preconditions

Dual compare mode must be selected for this function.

Parameters

Parameters	Description
index	Identifies the desired OC module

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OC_ExistsTriggerControl](#) in your application to determine whether this feature is available.

Example

```
#define MY_OC_ID OC_ID_1

PLIB_OC_TriggerSet(MY_OC_ID);
```

5.6.13.5.3.7 PLIB_OC_TriggerStatusModeSelect Function**C**

```
void PLIB_OC_TriggerStatusModeSelect(
    OC_MODULE_ID index,
    OC_TRIGGER_STATUS_MODES modes
);
```

Description

This function lets the user to reset the trigger status via software or a compare match.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired OC module
modes	Identifies the trigger status reset mode

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OC_ExistsTriggerStatusModeSelect](#) in your application to determine whether this feature is available.

Example

```
#define MY_OC_ID OC_ID_1
//Trigger status is reset by compare match
PLIB_OC_TriggerStatusModeSelect(MY_OC_ID, OC_TRIGGER_STATUS_MATCH);
```

5.6.13.5.3.8 PLIB_OC_AlternateClockDisable Function**C**

```
void PLIB_OC_AlternateClockDisable(
    OC_MODULE_ID index
);
```

Description

Selects Timer 2/3.instead of the alternate clock source.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired OC module

Returns

None.

Remarks

The feature is not supported on all devices. Check your device's data sheet. A system unlock must be performed before this function can be executed. This function applies to all input capture modules, regardless of the [OC_MODULE_ID](#) passed in the call.

Example

```
// Call system service to unlock oscillator
#define MY_OC_ID OC_ID_1
PLIB_OC_AlternateClockDisable( MY_OC_ID );
```

5.6.13.5.3.9 PLIB_OC_AlternateClockEnable Function**C**

```
void PLIB_OC_AlternateClockEnable(
    OC_MODULE_ID index
);
```

Description

Selects the alternate clock source instead of Timer 2/3.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired OC module

Returns

None.

Remarks

The feature is not supported on all devices. Check your device's data sheet. A system unlock must be performed before this function can be executed. This function applies to all input capture modules, regardless of the [OC_MODULE_ID](#) passed in the call.

Example

```
// Call system service to unlock oscillator
#define MY_OC_ID OC_ID_1
PLIB_OC_AlternateClockEnable( MY_OC_ID );
```

5.6.13.5.4 Power-Saving Modes Functions**5.6.13.5.4.1 PLIB_OC_StopInIdleDisable Function****C**

```
void PLIB_OC_StopInIdleDisable(
```

```
    OC_MODULE_ID index
);
```

Description

The function continues OC module operation when the device enters Idle mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired OC module

Returns

None

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OC_ExistsStopInIdle](#) in your application to determine whether this feature is available.

Example

```
#define MY_OC_ID OC_ID_1

PLIB_OC_StopInIdleDisable(MY_OC_ID);
```

5.6.13.5.4.2 PLIB_OC_StopInIdleEnable Function

C

```
void PLIB_OC_StopInIdleEnable(
    OC_MODULE_ID index
);
```

Description

This function discontinues OC module operation when the device enters Idle mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired OC module

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OC_ExistsStopInIdle](#) in your application to determine whether this feature is available.

Example

```
#define MY_OC_ID OC_ID_1

PLIB_OC_StopInIdleEnable(MY_OC_ID);
```

5.6.13.5.5 Faults Functions

5.6.13.5.5.1 PLIB_OC_FaultHasOccurred Function

C

```
bool PLIB_OC_FaultHasOccurred(  
    OC_MODULE_ID index  
);
```

Description

This function returns 'true' if a PWM Fault has occurred and 'false' if no Fault condition exists.

Preconditions

This function should be used only in Edge or Center-Aligned PWM mode set by the [PLIB_OC_ModeSelect\(\)](#) function.

Parameters

Parameters	Description
index	Identifies the desired OC module

Returns

bool - true - PWM Fault has occurred

- false - No PWM fault

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OC_ExistsFaultStatus](#) in your application to determine whether this feature is available.

Example

```
#define MY_OC_ID OC_ID_1  
if(!PLIB_OC_FaultHasOccurred(MY_OC_ID))  
{  
    // Do some operation  
};
```

5.6.13.5.5.2 PLIB_OC_FaultInputSelect Function

C

```
void PLIB_OC_FaultInputSelect(  
    OC_MODULE_ID index,  
    OC_FAULTS flt  
);
```

Description

This function selects a Fault input for the OC module.

Preconditions

Set the operation mode using [PLIB_OC_ModeSelect\(\)](#) before selecting the Fault input.

Parameters

Parameters	Description
index	Identifies the desired OC module
flt	Identifies the OC fault input

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OC_ExistsFaultInput](#) in your application to determine whether this feature is available.

Example

```
#define MY_OC_ID OC_ID_1
// Fault B is enabled for Output Compare Module
PLIB_OC_FaultInputSelect(MY_OC_ID, OC_FAULT_B);
```

5.6.13.5.5.3 PLIB_OC_FaultModeSelect Function**C**

```
void PLIB_OC_FaultModeSelect(
    OC_MODULE_ID index,
    OC_FAULT_MODES modes
);
```

Description

This function selects a mode to clear the Fault mode. The Fault mode can be reset automatically or by software once the Fault source ceases to exist.

Preconditions

Set the operation mode using [PLIB_OC_ModeSelect\(\)](#) routine before selecting the fault input.

Parameters

Parameters	Description
index	Identifies the desired OC module
modes	Identifies the mode to reset Fault status

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OC_ExistsFaultModeSelect](#) in your application to determine whether this feature is available.

Example

```
#define MY_OC_ID OC_ID_1
// Fault mode is maintained even after fault ceases. Fault mode is reset in software.
PLIB_OC_FaultModeSelect(MY_OC_ID, OC_SOFTWARE_CLEAR);
```

5.6.13.5.5.4 PLIB_OC_FaultOutSelect Function**C**

```
void PLIB_OC_FaultOutSelect(
    OC_MODULE_ID index,
    OC_FAULT_OUT fltState
);
```

Description

This function sets OC output to a known state on occurrence of a Fault in Edge or Center-Aligned PWM modes.

Preconditions

Edge or Center-Aligned PWM mode with Faults enabled should be selected. OC module output tristate should be disabled on occurrence of a Fault via [PLIB_OC_TriStateDisable\(\)](#).

Parameters

Parameters	Description
index	Identifies the desired OC module
fltState	Identifies the high or low state to which the output is driven on a fault

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OC_ExistsFaultOutSelect](#) in your application to determine whether this feature is available.

Example

```
#define MY_OC_ID OC_ID_1

//PWM output is set to High on occurrence of fault

PLIB_OC_FaultOutSelect(MY_OC_ID, OC_HIGH);
```

5.6.13.5.5.5 PLIB_OC_FaultTristateSelect Function**C**

```
void PLIB_OC_FaultTristateSelect(
    OC_MODULE_ID index,
    OC_FAULT_TRISTATE tristateSel
);
```

Description

This function is used to enable or disable tristating of OC module outputs when a Fault occurs.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired OC module
tristateSel	Enable/Disable Tristate

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OC_ExistsFaultTristateSelect](#) in your application to determine whether this feature is available.

Example

```
#define MY_OC_ID OC_ID_1

//Tristate OC module output

PLIB_OC_FaultTristateSelect(MY_OC_ID, OC_ENABLE_TRISTATE);
```

5.6.13.5.6 Data Types and Constants

5.6.13.5.6.1 OC_16BIT_TIMERS Enumeration

C

```
typedef enum {
    OC_TIMER_16BIT_TMR2,
    OC_TIMER_16BIT_TMR3,
    OC_TIMER_16BIT_TMR4,
    OC_TIMER_16BIT_TMR5,
    OC_TIMER_16BIT_TMR1,
    OC_TIMER_PTG,
    OC_TIMER_PERIPHERAL_CLK
} OC_16BIT_TIMERS;
```

Description

OC 16 bit Timer Select

This enumeration lists different 16 bit time bases for OC module. The time base is set by [PLIB_OC_TimerSelect\(\)](#) routine.

Members

Members	Description
OC_TIMER_16BIT_TMR2	Clock source of Timer2 is the clock source of OC module
OC_TIMER_16BIT_TMR3	Clock source of Timer3 is the clock source of OC module
OC_TIMER_16BIT_TMR4	Clock source of Timer4 is the clock source of OC module
OC_TIMER_16BIT_TMR5	Clock source of Timer5 is the clock source of OC module
OC_TIMER_16BIT_TMR1	Clock source of Timer1 is the clock source of OC module
OC_TIMER_PTG	Peripheral Trigger Generator output is the clock source for OC module
OC_TIMER_PERIPHERAL_CLK	Peripheral clock is the clock source for OC module

5.6.13.5.6.2 OC_BUFFER_SIZE Enumeration

C

```
typedef enum {
    OC_BUFFER_SIZE_16BIT,
    OC_BUFFER_SIZE_32BIT
} OC_BUFFER_SIZE;
```

Description

OC Buffer Size

This enumeration lists different buffer sizes for compare value. and duty cycle value.

Members

Members	Description
OC_BUFFER_SIZE_16BIT	Buffer size is 16-bits. Duty cycle and compare values will have 16-bit values.
OC_BUFFER_SIZE_32BIT	Buffer size is 32-bits. Duty cycle and compare values will have 32-bit values.

5.6.13.5.6.3 OC_CLOCK_RESOLUTION Enumeration

C

```
typedef enum {
    OC_CLOCK_P1,
    OC_CLOCK_P2,
    OC_CLOCK_P3,
    OC_CLOCK_P4
} OC_CLOCK_RESOLUTION;
```

Description

OC PWM Clock Resolution

Lists different PWM resolutions in PWM mode and falling edge delay of Output Compare module output in compare modes.

Members

Members	Description
OC_CLOCK_P1	OC output falling edge transitionson rising edge of P1 clock
OC_CLOCK_P2	OC output falling edge transitionson rising edge of P2 clock
OC_CLOCK_P3	OC output falling edge transitionson rising edge of P3 clock
OC_CLOCK_P4	OC output falling edge transitionson rising edge of P4 clock

5.6.13.5.6.4 OC_COMPARE_MODES Enumeration

C

```
typedef enum {
    OC_COMPARE_PWM_CENTER_ALIGNED_MODE,
    OC_COMPARE_PWM_EDGE_ALIGNED_MODE,
    OC_DUAL_COMPARE_CONTINUOUS_PULSE_MODE,
    OC_DUAL_COMPARE_SINGLE_PULSE_MODE,
    OC_TOGGLE_CONTINUOUS_PULSE_MODE,
    OC_SET_LOW_SINGLE_PULSE_MODE,
    OC_SET_HIGH_SINGLE_PULSE_MODE,
    OC_COMPARE_TURN_OFF_MODE
} OC_COMPARE_MODES;
```

Description

OC Compare Modes

This enumeration lists different compare modes for OC module. The compare mode is set by [PLIB_OC_ModeSelect\(\)](#) routine.

Members

Members	Description
OC_COMPARE_PWM_CENTER_ALIGNED_MODE	PWM center aligned mode: OC module output is a center aligned PWM signal
OC_COMPARE_PWM_EDGE_ALIGNED_MODE	PWM edge aligned mode: OC module output is an edge aligned PWM signal
OC_DUAL_COMPARE_CONTINUOUS_PULSE_MODE	Dual Compare, Continuous Pulse mode: OC module output is driven high on compare match with primary compare value and driven low on compare match with secondary compare value. A continuous stream of pulses is generated unless the compare mode is changed or the module is disabled. If the secondary compare value is greater than time base period value, secondary compare match does not occur. As a consequence, OC module output stays high.
OC_DUAL_COMPARE_SINGLE_PULSE_MODE	Dual Compare, Single Pulse mode: OC module output is driven high on compare match with primary compare value and driven low on compare match with secondary compare value. If the secondary compare value is greater than time base period value, secondary compare match does not occur. As a consequence, OC module output stays high until a mode change is made or module is disabled
OC_TOGGLE_CONTINUOUS_PULSE_MODE	Single Compare Toggle mode: OC module output is initialized to Low. OC module output toggles at every compare match event with primary compare value with a single peripheral bus clock cycle delay. This scheme generates a square wave with 50% duty cycle. An interrupt is generated each time the output toggles.

OC_SET_LOW_SINGLE_PULSE_MODE	Single Compare Set Low mode: A compare match event with primary compare value will set the output of OC module 'Low' with a single peripheral bus clock cycle delay. Output stays Low unless OC module is disabled or a new compare mode is chosen. An interrupt is generated at compare match event. OC module output is initially forced High.
OC_SET_HIGH_SINGLE_PULSE_MODE	Single Compare Set High mode: A compare match event with primary compare value will set the output of OC module 'High' with a single peripheral bus clock cycle delay. Output stays High unless OC module is disabled or a new compare mode is chosen. An interrupt is generated at compare match event. OC module output is initially forced Low.
OC_COMPARE_TURN_OFF_MODE	Turn OFF mode: OC module is disabled but still draws current. This mode is used to temporarily turn OFF the OC module before a new compare mode is selected

5.6.13.5.6.5 OC_FAULT_MODES Enumeration

C

```
typedef enum {
    OC_SOFTWARE_CLEAR,
    OC_AUTOMATIC_CLEAR
} OC_FAULT_MODES;
```

Description

OC Fault Clear Modes

This enumeration lists modes to clear fault mode after the fault source is removed.

Members

Members	Description
OC_SOFTWARE_CLEAR	Fault mode needs to be cleared in software after the fault source is removed.
OC_AUTOMATIC_CLEAR	Fault mode is cleared automatically once fault source is removed.

5.6.13.5.6.6 OC_FAULT_OUT Enumeration

C

```
typedef enum {
    OC_FAULT_LOW,
    OC_FAULT_HIGH
} OC_FAULT_OUT;
```

Description

OC Fault Output State

This enumeration lists different states of OC output pin when a fault occurs.

Members

Members	Description
OC_FAULT_LOW	OC output is driven low when fault occurs.
OC_FAULT_HIGH	OC output is driven high when fault occurs.

5.6.13.5.6.7 OC_FAULT_TRISTATE Enumeration

C

```
typedef enum {
    OC_DISABLE_TRISTATE,
    OC_ENABLE_TRISTATE
} OC_FAULT_TRISTATE;
```

Description

OC Fault Output Tristate select

This enumeration lists modes to clear fault mode after the fault source is removed.

Members

Members	Description
OC_DISABLE_TRISTATE	OC module outputs are set in a known state on the occurrence of a fault
OC_ENABLE_TRISTATE	OC module outputs are tristated on the occurrence of a fault

5.6.13.5.6.8 OC_FAULTS Enumeration

C

```
typedef enum {
    OC_FAULT_A,
    OC_FAULT_B,
    OC_FAULT_C,
    OC_FAULT_PRESET,
    OC_FAULT_DISABLE
} OC_FAULTS;
```

Description

OC Fault Select

This enumeration lists different fault sources for OC module. The fault source is selected by `PLIB_OC_CompareClockSelect()` routine.

Members

Members	Description
OC_FAULT_A	Fault A input
OC_FAULT_B	Fault B input
OC_FAULT_C	Fault C input
OC_FAULT_PRESET	Preset hardware fault input. This value is used for OC modules that have a preset hardware configured fault input selection.
OC_FAULT_DISABLE	Faults are disabled. PWM operation without faults.

5.6.13.5.6.9 OC_MODULE_ID Enumeration

C

```
typedef enum {
    OC_ID_1,
    OC_ID_2,
    OC_ID_3,
    OC_NUMBER_OF_MODULES
} OC_MODULE_ID;
```

Description

OC_MODULE_ID

This enumeration defines number of modules which are available on the microcontroller. This is the super set of all the possible instances that might be available on Microchip microcontrollers.

Refer to the specific device data sheet to get the correct number of modules defined for the desired microcontroller.

Members

Members	Description
OC_NUMBER_OF_MODULES	The total number of modules available.

5.6.13.5.6.10 OC_SYNC_MODES Enumeration

C

```
typedef enum {
    OC_MODE_TRIGGER,
    OC_MODE_SYNC
} OC_SYNC_MODES;
```

Description

OC Synchronization modes Status

This enumeration lists different synchronization modes for OC module timer. The timer can be made to operate synchronously with an external input or asynchronously on receiving an input trigger.

Members

Members	Description
OC_MODE_TRIGGER	OC module is asynchronously triggered by a chosen trigger input source
OC_MODE_SYNC	OC module is synchronized to the input source

5.6.13.5.6.11 OC_SYNC_SOURCES Enumeration

C

```
typedef enum {
    OC_SYNC_SOURCE_NONE,
    OC_SYNC_SOURCE_OC1,
    OC_SYNC_SOURCE_OC2,
    OC_SYNC_SOURCE_OC3,
    OC_SYNC_SOURCE_OC4,
    OC_SYNC_SOURCE_OC5,
    OC_SYNC_SOURCE_OC6,
    OC_SYNC_SOURCE_OC7,
    OC_SYNC_SOURCE_OC8,
    OC_SYNC_SOURCE_OC9,
    OC_SYNC_SOURCE_PTG,
    OC_SYNC_SOURCE_TMR1,
    OC_SYNC_SOURCE_TMR2,
    OC_SYNC_SOURCE_TMR3,
    OC_SYNC_SOURCE_TMR4,
    OC_SYNC_SOURCE_TMR5,
    OC_SYNC_SOURCE_IC1,
    OC_SYNC_SOURCE_IC2,
    OC_SYNC_SOURCE_IC3,
    OC_SYNC_SOURCE_IC4,
    OC_SYNC_SOURCE_IC5,
    OC_SYNC_SOURCE_IC6,
    OC_SYNC_SOURCE_IC7,
```

```

OC_SYNC_SOURCE_IC8,
OC_SYNC_SOURCE_CMP1,
OC_SYNC_SOURCE_CMP2,
OC_SYNC_SOURCE_CMP3,
OC_SYNC_SOURCE_AD,
OC_SYNC_SOURCE_CTMU,
OC_SYNC_SOURCE_INT1,
OC_SYNC_SOURCE_INT2
} OC_SYNC_SOURCES;

```

Description

OC Synchronization Sources

This enumeration lists all the input sources for synchronous and asynchronously triggered operation. OC module timer can be synchronized to an input source or operate asynchronously on the receipt on an input trigger. The Input source can be selected by [PLIB_OC_SyncSourceSelect\(\)](#) routine.

Members

Members	Description
OC_SYNC_SOURCE_NONE	No synchronization and trigger input
OC_SYNC_SOURCE_OC1	Synchronization and trigger input is Output Compare1
OC_SYNC_SOURCE_OC2	Synchronization and trigger input is Output Compare2
OC_SYNC_SOURCE_OC3	Synchronization and trigger input is Output Compare3
OC_SYNC_SOURCE_OC4	Synchronization and trigger input is Output Compare4
OC_SYNC_SOURCE_OC5	Synchronization and trigger input is Output Compare5
OC_SYNC_SOURCE_OC6	Synchronization and trigger input is Output Compare6
OC_SYNC_SOURCE_OC7	Synchronization and trigger input is Output Compare7
OC_SYNC_SOURCE_OC8	Synchronization and trigger input is Output Compare8
OC_SYNC_SOURCE_OC9	Synchronization and trigger input is Output Compare9
OC_SYNC_SOURCE_PTG	Synchronization and trigger input is Peripheral Trigger Generator Module
OC_SYNC_SOURCE_TMR1	Synchronization and trigger input is Timer1
OC_SYNC_SOURCE_TMR2	Synchronization and trigger input is Timer2
OC_SYNC_SOURCE_TMR3	Synchronization and trigger input is Timer3
OC_SYNC_SOURCE_TMR4	Synchronization and trigger input is Timer4
OC_SYNC_SOURCE_TMR5	Synchronization and trigger input is Timer5
OC_SYNC_SOURCE_IC1	Synchronization and trigger input is Input Capture1
OC_SYNC_SOURCE_IC2	Synchronization and trigger input is Input Capture2
OC_SYNC_SOURCE_IC3	Synchronization and trigger input is Input Capture3
OC_SYNC_SOURCE_IC4	Synchronization and trigger input is Input Capture4
OC_SYNC_SOURCE_IC5	Synchronization and trigger input is Input Capture5
OC_SYNC_SOURCE_IC6	Synchronization and trigger input is Input Capture6
OC_SYNC_SOURCE_IC7	Synchronization and trigger input is Input Capture7
OC_SYNC_SOURCE_IC8	Synchronization and trigger input is Input Capture8
OC_SYNC_SOURCE_CMP1	Trigger input is Comparator1. This input is not used for Synchronization
OC_SYNC_SOURCE_CMP2	Trigger input is Comparator2. This input is not used for Synchronization
OC_SYNC_SOURCE_CMP3	Trigger input is Comparator3. This input is not used for Synchronization
OC_SYNC_SOURCE_AD	Trigger input is ADC. This input is not used for Synchronization
OC_SYNC_SOURCE_CTMU	Trigger input is Charge Time Measurement Unit. This input is not used for Synchronization
OC_SYNC_SOURCE_INT1	Synchronization and trigger input is External Interrupt1

OC_SYNC_SOURCE_INT2	Synchronization and trigger input is External Interrupt2

5.6.13.5.6.12 OC_TRIGGER_STATUS_MODES Enumeration

C

```
typedef enum {
    OC_TRIGGER_STATUS_MATCH,
    OC_TRIGGER_STATUS_SOFTWARE
} OC_TRIGGER_STATUS_MODES;
```

Description

OC Trigger Status

This enumeration lists different trigger status reset modes. Trigger status can be reset in software or by a compare match between timer value and pulse width value.

Members

Members	Description
OC_TRIGGER_STATUS_MATCH	Trigger status is cleared on compare match between timer value and pulse width value
OC_TRIGGER_STATUS_SOFTWARE	Trigger status is cleared in software

5.6.13.5.7 Feature Existence Functions

5.6.13.5.7.1 PLIB_OC_ExistsAlternateClock Function

C

```
bool PLIB_OC_ExistsAlternateClock(
    OC_MODULE_ID index
);
```

Description

This function identifies whether the AlternateClock feature is available on the OC module. When this function returns true, these functions are supported on the device:

- [PLIB_OC_AlternateClockEnable](#)
- [PLIB_OC_AlternateClockDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - The AlternateClock feature is supported on the device
- false - The AlternateClock feature is not supported on the device

Remarks

None.

5.6.13.5.7.2 PLIB_OC_ExistsBufferSize Function

C

```
bool PLIB_OC_ExistsBufferSize(  
    OC_MODULE_ID index  
);
```

Description

This function identifies whether the BufferSize feature is available on the OC module. When this function returns true, this function is supported on the device:

- [PLIB_OC_BufferSizeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the BufferSize feature is supported on the device
- false - If the BufferSize feature is not supported on the device

Remarks

None.

5.6.13.5.7.3 PLIB_OC_ExistsBufferValue Function

C

```
bool PLIB_OC_ExistsBufferValue(  
    OC_MODULE_ID index  
);
```

Description

This function identifies whether the BufferValue feature is available on the OC module. When this function returns true, these functions are supported on the device:

- [PLIB_OC_Buffer32BitSet](#)
- [PLIB_OC_Buffer16BitSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the BufferValue feature is supported on the device
- false - If the BufferValue feature is not supported on the device

Remarks

None.

5.6.13.5.7.4 PLIB_OC_ExistsCompareModeSelect Function

C

```
bool PLIB_OC_ExistsCompareModeSelect(  
    OC_MODULE_ID index  
);
```

Description

This function identifies whether the CompareModeSelect feature is available on the OC module. When this function returns true, this function is supported on the device:

- [PLIB_OC_ModeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the CompareModeSelect feature is supported on the device
- false - If the CompareModeSelect feature is not supported on the device

Remarks

None.

5.6.13.5.7.5 PLIB_OC_ExistsEnableControl Function

C

```
bool PLIB_OC_ExistsEnableControl(  
    OC_MODULE_ID index  
);
```

Description

This function identifies whether the EnableControl feature is available on the OC module. When this function returns true, these functions are supported on the device:

- [PLIB_OC_Enable](#)
- [PLIB_OC_Disable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the EnableControl feature is supported on the device
- false - If the EnableControl feature is not supported on the device

Remarks

None.

5.6.13.5.7.6 PLIB_OC_ExistsFaultInput Function

C

```
bool PLIB_OC_ExistsFaultInput(  
    OC_MODULE_ID index  
);
```

Description

This function identifies whether the FaultInput feature is available on the OC module. When this function returns true, this function is supported on the device:

- [PLIB_OC_FaultInputSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the FaultInput feature is supported on the device
- false - If the FaultInput feature is not supported on the device

Remarks

None.

5.6.13.5.7.7 PLIB_OC_ExistsFaultModeSelect Function

C

```
bool PLIB_OC_ExistsFaultModeSelect(  
    OC_MODULE_ID index  
);
```

Description

This function identifies whether the FaultModeSelect feature is available on the OC module. When this function returns true, this function is supported on the device:

- [PLIB_OC_FaultModeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the FaultModeSelect feature is supported on the device
- false - If the FaultModeSelect feature is not supported on the device

Remarks

None.

5.6.13.5.7.8 PLIB_OC_ExistsFaultOutSelect Function

C

```
bool PLIB_OC_ExistsFaultOutSelect(  
    OC_MODULE_ID index  
);
```

Description

This function identifies whether the FaultOut feature is available on the OC module. When this function returns true, this function is supported on the device:

- [PLIB_OC_FaultOutSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the FaultOut feature is supported on the device
- false - If the FaultOut feature is not supported on the device

Remarks

None.

5.6.13.5.7.9 PLIB_OC_ExistsFaultStatus Function

C

```
bool PLIB_OC_ExistsFaultStatus(  
    OC_MODULE_ID index  
);
```

Description

This function identifies whether the FaultStatus feature is available on the OC module. When this function returns true, this function is supported on the device:

- [PLIB_OC_FaultHasOccurred](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the FaultStatus feature is supported on the device
- false - If the FaultStatus feature is not supported on the device

Remarks

None.

5.6.13.5.7.10 PLIB_OC_ExistsFaultTristateSelect Function

C

```
bool PLIB_OC_ExistsFaultTristateSelect(  
    OC_MODULE_ID index  
);
```

Description

This function identifies whether the FaultTristateSelect feature is available on the OC module. When this function returns true, this function is supported on the device:

- [PLIB_OC_FaultTristateSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the FaultTristateSelect feature is supported on the device
- false - If the FaultTristateSelect feature is not supported on the device

Remarks

None.

5.6.13.5.7.11 PLIB_OC_ExistsPolarityInvert Function

C

```
bool PLIB_OC_ExistsPolarityInvert(  
    OC_MODULE_ID index  
);
```

Description

This function identifies whether the PolarityInvert feature is available on the OC module. When this function returns true, these functions are supported on the device:

- [PLIB_OC_PolarityInvertedEnable](#)
- [PLIB_OC_PolarityInvertedDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the PolarityInvert feature is supported on the device
- false - If the PolarityInvert feature is not supported on the device

Remarks

None.

5.6.13.5.7.12 PLIB_OC_ExistsPulseWidth Function

C

```
bool PLIB_OC_ExistsPulseWidth(  
    OC_MODULE_ID index  
);
```

Description

This function identifies whether the PulseWidth feature is available on the OC module. When this function returns true, these functions are supported on the device:

- [PLIB_OC_PulseWidth32BitSet](#)
- [PLIB_OC_PulseWidth16BitSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the PulseWidth feature is supported on the device
- false - If the PulseWidth feature is not supported on the device

Remarks

None.

5.6.13.5.7.13 PLIB_OC_ExistsPWMDutyCycleResolutionControl Function

C

```
bool PLIB_OC_ExistsPWMDutyCycleResolutionControl(  
    OC_MODULE_ID index  
);
```

Description

This function identifies whether the PWMDutyCycleResolution feature is available on the OC module. When this function returns true, this function is supported on the device:

- [PLIB_OC_PWMDutyCycleResolutionSet](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the PWMDutyCycleResolution feature is supported on the device
- false - If the PWMDutyCycleResolution feature is not supported on the device

Remarks

None.

5.6.13.5.7.14 PLIB_OC_ExistsStopInIdle Function

C

```
bool PLIB_OC_ExistsStopInIdle(  
    OC_MODULE_ID index  
);
```

Description

This function identifies whether the StopInIdle feature is available on the OC module. When this function returns true, these functions are supported on the device:

- [PLIB_OC_StopInIdleEnable](#)
- [PLIB_OC_StopInIdleDisable](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the StopInIdle feature is supported on the device
- false - If the StopInIdle feature is not supported on the device

Remarks

None.

5.6.13.5.7.15 PLIB_OC_ExistsSyncModeSelect Function

C

```
bool PLIB_OC_ExistsSyncModeSelect(  
    OC_MODULE_ID index  
);
```

Description

This function identifies whether the SyncModeSelect feature is available on the OC module. When this function returns true, this function is supported on the device:

- [PLIB_OC_SyncModeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the SyncModeSelect feature is supported on the device
- false - If the SyncModeSelect feature is not supported on the device

Remarks

None.

5.6.13.5.7.16 PLIB_OC_ExistsSyncSourceSelect Function

C

```
bool PLIB_OC_ExistsSyncSourceSelect(  
    OC_MODULE_ID index  
);
```

Description

This function identifies whether the SyncSourceSelect feature is available on the OC module. When this function returns true, this function is supported on the device:

- [PLIB_OC_SyncSourceSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the SyncSourceSelect feature is supported on the device
- false - If the SyncSourceSelect feature is not supported on the device

Remarks

None.

5.6.13.5.7.17 PLIB_OC_ExistsTimerSelect Function

C

```
bool PLIB_OC_ExistsTimerSelect(  
    OC_MODULE_ID index  
);
```

Description

This function identifies whether the TimerSelect feature is available on the OC module. When this function returns true, this function is supported on the device:

- [PLIB_OC_TimerSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the TimerSelect feature is supported on the device
- false - If the TimerSelect feature is not supported on the device

Remarks

None.

5.6.13.5.7.18 PLIB_OC_ExistsTimerTriggered Function

C

```
bool PLIB_OC_ExistsTimerTriggered(  
    OC_MODULE_ID index  
);
```

Description

This function identifies whether the TimerTriggered feature is available on the OC module. When this function returns true, this function is supported on the device:

- [PLIB_OC_IsTriggered](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the TimerTriggered feature is supported on the device
- false - If the TimerTriggered feature is not supported on the device

Remarks

None.

5.6.13.5.7.19 PLIB_OC_ExistsTriggerControl Function

C

```
bool PLIB_OC_ExistsTriggerControl(  
    OC_MODULE_ID index  
);
```

Description

This function identifies whether the TriggerControl feature is available on the OC module. When this function returns true, this function is supported on the device:

- [PLIB_OC_TriggerSet](#)
- [PLIB_OC_TriggerClear](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the TriggerControl feature is supported on the device
- false - If the TriggerControl feature is not supported on the device

Remarks

None.

5.6.13.5.7.20 PLIB_OC_ExistsTriggerStatusModeSelect Function

C

```
bool PLIB_OC_ExistsTriggerStatusModeSelect(  
    OC_MODULE_ID index  
);
```

Description

This function identifies whether the TriggerStatusModeSelect feature is available on the OC module. When this function returns true, this function is supported on the device:

- [PLIB_OC_TriggerStatusModeSelect](#)

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the device instance

Returns

- true - If the TriggerStatusModeSelect feature is supported on the device
- false - If the TriggerStatusModeSelect feature is not supported on the device

Remarks

None.

5.6.13.6 Files

Files

Name	Description
plib_oc.h	This file contains the interface definition for the Output Compare (OC) peripheral library.

Description

5.6.13.6.1 plib_oc.h

Output Compare Module Peripheral Library Interface Header

This library provides a low-level abstraction of the Output Compare module on Microchip microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, thus hiding differences between one microcontroller variant and another.

Functions

	Name	Description
≡	PLIB_OC_AlternateClockDisable	Selects Timer 2/3.instead of the alternate clock source.
≡	PLIB_OC_AlternateClockEnable	Selects the alternate clock source.
≡	PLIB_OC_Buffer16BitSet	Sets a 16-bit primary compare value for compare operations.

	PLIB_OC_Buffer32BitSet	Sets a 32-bit primary compare value for compare operations.
	PLIB_OC_BufferSizeSelect	Sets the buffer size and pulse width to 16-bits or 32-bits.
	PLIB_OC_Disable	Disable the OC module
	PLIB_OC_Enable	Enables the OC module.
	PLIB_OC_ExistsAlternateClock	Identifies whether the AlternateClock feature exists on the OC module
	PLIB_OC_ExistsBufferSize	Identifies whether the BufferSize feature exists on the OC module.
	PLIB_OC_ExistsBufferValue	Identifies whether the BufferValue feature exists on the OC module.
	PLIB_OC_ExistsCompareModeSelect	Identifies whether the CompareModeSelect feature exists on the OC module.
	PLIB_OC_ExistsEnableControl	Identifies whether the EnableControl feature exists on the OC module.
	PLIB_OC_ExistsFaultInput	Identifies whether the FaultInput feature exists on the OC module.
	PLIB_OC_ExistsFaultModeSelect	Identifies whether the FaultModeSelect feature exists on the OC module.
	PLIB_OC_ExistsFaultOutSelect	Identifies whether the FaultOut feature exists on the OC module.
	PLIB_OC_ExistsFaultStatus	Identifies whether the FaultStatus feature exists on the OC module.
	PLIB_OC_ExistsFaultTristateSelect	Identifies whether the FaultTristateSelect feature exists on the OC module.
	PLIB_OC_ExistsPolarityInvert	Identifies whether the PolarityInvert feature exists on the OC module.
	PLIB_OC_ExistsPulseWidth	Identifies whether the PulseWidth feature exists on the OC module.
	PLIB_OC_ExistsPWMDutyCycleResolutionControl	Identifies whether the PWMDutyCycleResolution feature exists on the OC module.
	PLIB_OC_ExistsStopInIdle	Identifies whether the StopInIdle feature exists on the OC module.
	PLIB_OC_ExistsSyncModeSelect	Identifies whether the SyncModeSelect feature exists on the OC module.
	PLIB_OC_ExistsSyncSourceSelect	Identifies whether the SyncSourceSelect feature exists on the OC module.
	PLIB_OC_ExistsTimerSelect	Identifies whether the TimerSelect feature exists on the OC module.
	PLIB_OC_ExistsTimerTriggered	Identifies whether the TimerTriggered feature exists on the OC module.
	PLIB_OC_ExistsTriggerControl	Identifies whether the TriggerControl feature exists on the OC module.
	PLIB_OC_ExistsTriggerStatusModeSelect	Identifies whether the TriggerStatusModeSelect feature exists on the OC module.
	PLIB_OC_FaultHasOccurred	Checks if a PWM fault has occurred.
	PLIB_OC_FaultInputSelect	Selects a Fault input for the OC module.
	PLIB_OC_FaultModeSelect	Selects an automatic or software-based mode to clear the Fault.
	PLIB_OC_FaultOutSelect	OC output pin is driven to a known state on a Fault.
	PLIB_OC_FaultTristateSelect	The OC module output can be tristated or driven to a known state when a Fault occurs.

	PLIB_OC_IsTriggered	Checks whether or not a timer source has been triggered.
	PLIB_OC_ModeSelect	Selects the compare mode for the OC module.
	PLIB_OC_PolarityInvertedDisable	Disables OC module output inversion polarity.
	PLIB_OC_PolarityInvertedEnable	Output compare polarity is inverted.
	PLIB_OC_PulseWidth16BitSet	Sets a 16-bit pulse width for OC module output.
	PLIB_OC_PulseWidth32BitSet	Sets a 32-bit pulse width for OC module output.
	PLIB_OC_PWMdutyCycleResolutionSet	Sets the PWM duty cycle resolution and delays the falling edge of OC output in compare modes.
	PLIB_OC_StopInIdleDisable	OC module continues operating when the device enters Idle mode
	PLIB_OC_StopInIdleEnable	Discontinues OC module operation when the device enters Idle mode
	PLIB_OC_SyncModeSelect	Selects the synchronization mode for the OC module.
	PLIB_OC_SyncSourceSelect	Selects the input source for synchronous or asynchronous (triggered) operation of the OC module.
	PLIB_OC_TimerSelect	Selects a clock source for the OC module.
	PLIB_OC_TriggerClear	Clears the trigger status for the OC module.
	PLIB_OC_TriggerSet	Sets the trigger status for the OC module.
	PLIB_OC_TriggerStatusModeSelect	Selects the trigger status reset mode.

5.6.14 Oscillator Peripheral Library

5.6.14.1 Introduction

Oscillator Peripheral Library

for

Microchip Microcontrollers

This library provides a low-level abstraction of the Oscillator module on Microchip microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, thereby hiding differences from one microcontroller variant to another.

Description**Oscillator Overview**

The Oscillator is the heart of the microcontroller and provides the clock on which the core and the peripherals run.

For all of the oscillators present on a Microchip microcontroller, two kinds of configurations exist:

- Through Configuration bits
- At execution time

The first is through 'Configuration bits', which is a one-time configuration done during the programming of the device. These one-time configurations are programmed in the code memory.

The other is 'Execution time' configuration, which deals with features that are allowed to be changed during run-time. This peripheral library provides functions which deal only with the 'execution time' configurable features of the Oscillator module.

Certain Oscillator module features can only be selected through 'Configuration bits'. However, most of the features can be altered during run-time by using the functions provided in this library.

5.6.14.2 Release Notes

MPLAB Harmony Version: v0.70b **Oscillator Peripheral Library Version :** 0.70b **Release Date:** 18Nov2013

New This Release:

This is the first release of the library. The interface can change in the beta and/or 1.0 release.

Known Issues:

Nothing to report in this release.

5.6.14.3 SW License Agreement

(c) 2013 Microchip Technology Inc.

Microchip licenses this software to you solely for use with Microchip products. The software is owned by Microchip and its licensors, and is protected under applicable copyright laws. All rights reserved.

SOFTWARE IS PROVIDED "AS IS" MICROCHIP EXPRESSLY DISCLAIMS ANY WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. To the fullest extent allowed by law, Microchip and its licensors liability shall not exceed the amount of fees, if any, that you have paid directly to Microchip to use this software.

MICROCHIP PROVIDES THIS SOFTWARE CONDITIONALLY UPON YOUR ACCEPTANCE OF THESE TERMS.

5.6.14.4 Using the Library

Using the Library

This topic describes the basic architecture of the Oscillator Peripheral Library and provides information and examples on its use.

Interface Header File: plib_osc.h

The interface to the Oscillator Peripheral Library is defined in the "plib_osc.h" header file, which is included by the "peripheral.h" peripheral library header file. Any C language source (.c) file that uses the Oscillator Peripheral Library must include "peripheral.h".

5.6.14.4.1 Hardware Abstraction Model

This library provides a low-level abstraction of the Oscillator module on Microchip microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Description

Hardware Abstraction Model

The Oscillator hardware model is shown in the following figure. The blocks represented in dashed lines may not be present in all microcontrollers. Refer to the **"Oscillator"** chapter in the specific device data sheet to determine availability.

To understand the Oscillator module and how each feature is mapped in this library, it is important to understand the following terminology.

Clock Source

A clock source is hardware that generates oscillations, which may be internal or external.

Divisor and Multiplier/PLL

These are hardware modules that can scale the clock. The rate at which the scaling is done may be fixed or configurable.

Clock Outputs

Clock outputs means output lines from the Oscillator module, which may route to different modules of the device or to the CPU (i.e., the system clock).

The following diagram provides a simplified explanation and the relationship between the previously mentioned terms. In most cases, there are multiple clock source options available for each of the clock outputs. However, not all the clock sources are

available for all the output clocks. Scaling is an optional feature in most of the cases.

5.6.14.4.2 Library Usage Model

The usage model for the Oscillator Peripheral Library is described in this section.

Description

The following diagram shows the major components of the usage model:

Each of the blocks in the diagram above correspond to the library interface section.

Library Interface Section	Description

5.6.14.4.3 How the Library Works

The library can be used to control the Oscillator module. The usage model is explained in this section.

5.6.14.4.3.1 Oscillator Selection and Switching

Note: The device Configuration options change with the microcontroller family. Refer to the **"Oscillator"** chapter in the specific device data sheet for possible device configurations.

On devices that allow it, the oscillator selection can be overridden at run-time using the Oscillator Peripheral Library, as shown in the following code example:

```
//Do the configuration bit settings
OSC_SYS_TYPE currOsc;
OSC_SYS_TYPE newOsc=OSC_PRIMARY;

//get the current oscillator
currOsc = PLIB_OSC_CurrentSysClockGet(OSC_ID_0);

//check if the current oscillator is same as new oscillator
if(currOsc != newOsc)
{
    //set the new oscillator request to Fast RC oscillator
    PLIB_OSC_SysClockSelect ( OSC_ID_0, newOsc );
}
```

Example: Oscillator Selection Change During Run-time

In the event the clock switch did not complete, the clock switch logic can be reset by calling the following API:

```
bool oscSwitch_st;

oscSwitch_st = PLIB_OSC_ClockSwitchingIsComplete(OSC_ID_0);

if(!oscSwitch_st)
{
```

```
    PLIB_OSC_ClockSwitchingAbort(OSC_ID_0);
}
```

Note: This function takes care of the register unlock, which is required as per the device data sheet. Therefore, the user does not need to explicitly perform the unlock sequence.

Example: Oscillator Switch Abort

This will abandon the clock switch process, stop and reset the oscillator start-up timer (if applicable), and stop the PLL (if applicable). The clock switch process can be aborted at any time. A clock switch that is already in progress can also be aborted by performing a second clock switch.

5.6.14.4.3.2 Clock Sources

This section explains the available clock sources and their setup.

The following clock sources are available in Microchip microcontrollers:

- Primary Oscillator (Posc)
- Secondary Oscillator (Sosc)
- Internal Fast RC (FRC) Oscillator
- Internal Low-Power RC (LPRC) Oscillator

Primary Oscillator (Posc)

The Primary Oscillator has several operating modes (refer to the "**Oscillator**" chapter in the specific device data sheet for exact operating modes). The selection of the operating mode is done using the device Configuration registers during device programming. During run-time this can be changed using the oscillator switch option. However, changing the operating mode from High Gain (HC) to External Clock (EC) or External Resonator(XT) is not possible.

If a PLL is available, the PLL input divider can only be programmed during device programming. However, the PLL output divider and the PLL multiplier can be changed during run-time using the PLL functions described in the PLL section.

Secondary Oscillator (Sosc)

The optional Secondary Oscillator is designed specifically for low-power operation with an external crystal. The Secondary Oscillator is enabled in hardware by the device Configuration bits. Once it is enabled in hardware, it can be switched on during software run-time.

```
bool oscSecondary_st;

oscSecondary_st = PLIB_OSC_SecondaryIsEnabled(OSC_ID_0);
if(oscSecondary_st)
{
    PLIB_OSC_SecondaryEnable(OSC_ID_0);
}
//Do something
PLIB_OSC_SecondaryDisable(OSC_ID_0);
```

Internal Fast RC (FRC) Oscillator

The FRC Oscillator is a fast user-trimmable internal RC oscillator with a user-selectable input divider, PLL multiplier, and output divider. See the "**Oscillator**" chapter in the specific device data sheet for more information on the FRC oscillator.

Once the FRC oscillator is selected using the device Configuration registers or an oscillator switch is initiated selecting the FRC as a new oscillator, the FRC Oscillator PLL divider can be changed during run-time.

```
OSC_FRC_DIV FRCDivisor;

//Get the current divider value for FRC
```

```
FRCDivisor = PLIB_OSC_FRCDivisorGet(OSC_ID_0);

if(FRCDivisor != OSC_FRC_DIV_4)
{
    PLIB_OSC_FRCDivisorSelect ( OSC_ID_0, OSC_FRC_DIV_4 );
}
```

Internal Low-Power RC (LPRC) Oscillator

The LPRC Oscillator is separate from the FRC Oscillator. It oscillates at a nominal frequency of 31.25 kHz (this value is device-dependent). The LPRC Oscillator can act as the clock source for the Power-up Timer (PWRT), Watchdog Timer (WDT), Fail-Safe Clock Monitor (FSCM), and PLL reference circuits. It can also be used to provide a low-frequency clock source option for the device in those applications where power consumption is critical and timing accuracy is not required.

The LPRC remains enabled after power on in the following conditions:

- Fail-safe clock monitoring is enabled
- Watchdog Timer is enabled
- LPRC is selected as the system clock

PLL Configuration

```
OSC_SYSPLL_OUT_DIV PLLOutDiv;
OSC_SYSPLL_MULTIPLIER pll_multiply;

pll_multiply = PLIB_OSC_SysPLLMultiplierGet(OSC_ID_0);
if(pll_multiply != 15)
{
    PLIB_OSC_SysPLLMultiplierSelect(OSC_ID_0, 15);
}
PLLOutDiv = PLIB_OSC_SysPLLOutputDivisorGet(OSC_ID_0);

if(PLLOutDiv != OSC_SYSPLL_OUT_DIV_8)
{
    PLIB_OSC_SysPLLOutputDivisorSelect(OSC_ID_0, OSC_SYSPLL_OUT_DIV_8);
}
```

5.6.14.4.3.3 Fail-Safe Clock Monitor

Fail-Safe Clock Monitor (FSCM)

The Fail-Safe Clock Monitor (FSCM) is designed to allow continued device operation if the current oscillator fails. It is intended for use with the Primary Oscillator (Posc) and automatically switches to the FRC oscillator if a Posc failure is detected. The switch to the FRC oscillator allows continued device operation and the ability to retry the Posc or to execute the appropriate for a clock failure.

The FSCM can be enabled in the device configuration during the programming of the device. During run-time, the clock failure status can be obtained as follows:

```
bool clockFail;

//Returns true if clock failure is detected.
clockFail = PLIB_OSC_ClockHasFailed(OSC_ID_0);
```

5.6.14.4.3.4 Internal FRC Oscillator Tuning

Tuning the Oscillator

Oscillator tuning will help compensate for temperature effects on the FRC frequency over a wide range of temperatures. The tuning step size is an approximation, the application is supposed to try different values to achieve the best result. In some of the devices there are different tuning modes available.

Direct Number Method

FRC tuning is based on the number specified by the [PLIB_OSC_FRCTuningSelect](#) function.

```
PLIB_OSC_FRCTuningModeSet(OSC_ID_0, OSC_TUNING_USING_NUMBER);
```

```
PLIB_OSC_FRCTuningSelect(OSC_ID_0, 0x11);
```

Sequential Dithering

To get the sequential dithering working, the client needs to set eight sequencer values. Value 0 is set using the [PLIB_OSC_FRCTuningSelect](#) function. The other seven values (values 1 through 7) are set using the [PLIB_OSC_FRCTuningSequenceValueSet](#) function.

```
PLIB_OSC_FRCTuningModeSet(OSC_ID_0, OSC_TUNING_SEQ_DITHER);

PLIB_OSC_FRCTuningSelect(OSC_ID_0, 0x11);

PLIB_OSC_FRCTuningSequenceValueSet(OSC_ID_0, OSC_TUNING_SEQUENCER_1,
    OSC_FRC_TUNE_MINUS_2_25_PERCENT);

PLIB_OSC_FRCTuningSequenceValueSet(OSC_ID_0, OSC_TUNING_SEQUENCER_2,
    OSC_FRC_TUNE_MINUS_1_5_PERCENT);

PLIB_OSC_FRCTuningSequenceValueSet(OSC_ID_0, OSC_TUNING_SEQUENCER_3,
    OSC_FRC_TUNE_MINUS_0_375_PERCENT);

PLIB_OSC_FRCTuningSequenceValueSet(OSC_ID_0, OSC_TUNING_SEQUENCER_4,
    OSC_FRC_TUNE_PLUS_0_43_PERCENT);

PLIB_OSC_FRCTuningSequenceValueSet(OSC_ID_0, OSC_TUNING_SEQUENCER_5,
    OSC_FRC_TUNE_PLUS_1_29_PERCENT);

PLIB_OSC_FRCTuningSequenceValueSet(OSC_ID_0, OSC_TUNING_SEQUENCER_6,
    OSC_FRC_TUNE_PLUS_2_54_PERCENT);

PLIB_OSC_FRCTuningSequenceValueSet(OSC_ID_0, OSC_TUNING_SEQUENCER_7,
    OSC_FRC_TUNE_MINUS_3_PERCENT);
```

```
//Configure PWM (period, pulse width and turn on the module)
```

Pseudo-Random Number

Select the tuning mode. Then, configure the PWM module and set the period and pulse width. The Oscillator system generates a 4-bit number based on a pseudo-random number generation algorithm. It then uses this value to tune the FRC oscillator. The module will generate different frequencies corresponding to the generated pseudo-random numbers every eighth PWM cycle.

```
PLIB_OSC_FRCTuningModeSet(OSC_ID_0, OSC_TUNING_PSEUDO_RANDOM);
```

```
//15 bit Linear Feedback Shift register value
PLIB_OSC_LinearFeedbackShiftRegSet(OSC_ID_0, 0x7FFF);
```

```
//Configure PWM (period, pulse width and turn on the module)
```

Note: This function takes care of the register unlock, which is required as per the device data sheet. Therefore, the user does not need to explicitly perform the unlock sequence.

5.6.14.5 Configuring the Library

The library is configured for the supported oscillator modules when the processor is chosen in the MPLAB IDE.

5.6.14.6 Library Interface

Data Types and Constants

	Name	Description
	<u>OSC_PB_CLOCK_DIV_TYPE</u>	Type of the oscillator PB Clock divisor value.
	<u>OSC_REF_DIVISOR_TYPE</u>	Reference oscillator divisor type.
	<u>OSC_REFERENCE_MAX_DIV</u>	Defines the reference clock output divisor maximum value.
	<u>OSC_SYSPLL_MULTIPLIER_TYPE</u>	Type of the oscillator system PLL multiplier value.
	<u>OSC_AUX_CLOCK_SOURCE</u>	Lists the possible Auxiliary PLL input divider values.
	<u>OSC_AUX_MODE</u>	Lists the possible Auxiliary Oscillator mode values.
	<u>OSC_AUXPLL_IN_DIV</u>	Lists the possible Auxiliary PLL input divider values.
	<u>OSC_AUXPLL_MULTIPLIER</u>	Lists the possible Auxiliary PLL multiplier
	<u>OSC_AUXPLL_OUT_DIV</u>	Lists the possible Auxiliary PLL output divider values.
	<u>OSC_DOZE_RATIO</u>	Lists the possible doze values.
	<u>OSC_FRC_DIV</u>	Lists the possible Fast RC (FRC) Oscillator divider values.
	<u>OSC_FRC_TUNE</u>	Lists the oscillator tuning values.
	<u>OSC_GFX_CLOCK</u>	Lists the possible Graphics (display) module clock values.
	<u>OSC_LFSR_TYPE</u>	Lists the possible Auxiliary PLL input divider values.
	<u>OSC_MODULE_ID</u>	Possible instances of the OSC module.
	<u>OSC_OPERATION_ON_WAIT</u>	Lists the possible status on a WAIT instruction.
	<u>OSC_PERIPHERAL_BUS</u>	Lists the possible Peripheral buses
	<u>OSC_PLL_SELECT</u>	Lists the PLLs in the Oscillator module.
	<u>OSC_PLLAUX_CLOCK_SOURCE</u>	Lists the possible Auxiliary PLL clock source.
	<u>OSC_REF_BASECLOCK</u>	Lists the possible base clock values for the reference oscillator.
	<u>OSC_REF_DIV</u>	Lists the possible reference oscillator divisor values.
	<u>OSC_REFERENCE</u>	Lists the possible reference oscillator
	<u>OSC_SYS_CLOCK_DIV</u>	Lists the possible system clock divisor bits.
	<u>OSC_SYS_TYPE</u>	Lists the possible oscillator type values.
	<u>OSC_SYSPLL_FREQ_RANGE</u>	Lists the possible PLL frequency range
	<u>OSC_SYSPLL_IN_CLK_SOURCE</u>	Lists the possible input clock source for PLL module
	<u>OSC_SYSPLL_IN_DIV</u>	Lists the possible PLL input divider values.
	<u>OSC_SYSPLL_OUT_DIV</u>	Lists the possible PLL output divider values.
	<u>OSC_TUNING_MODE</u>	Lists the oscillator tuning modes.
	<u>OSC_TUNING_SEQUENCERS</u>	Lists the oscillator sequencer entries.
	<u>OSC_USBCLOCK_SOURCE</u>	Lists the possible USB clock sources.

Auxiliary Oscillator Setup Functions

	Name	Description
	<u>PLIB_OSC_AuxClockSourceGet</u>	Gets the clock source for the auxiliary clock.
	<u>PLIB_OSC_AuxClockSourceSet</u>	Sets the clock source for the auxiliary clock divisor.
	<u>PLIB_OSC_AuxModeGet</u>	Gets the selected Auxiliary Oscillator mode.
	<u>PLIB_OSC_AuxModeSelect</u>	Selects the Auxiliary Oscillator mode.

Clock Fail Monitoring Functions

	Name	Description
	PLIB_OSC_ClockHasFailed	Returns 'true' if the clock fails.

Doze Setup Functions

	Name	Description
	PLIB_OSC_DozeModeDisable	Disables Doze mode.
	PLIB_OSC_DozeModeEnable	Enables Doze mode.
	PLIB_OSC_DozeRatioGet	Gets the ratio of the processor clock to the peripheral clock.
	PLIB_OSC_DozeRatioSelect	Selects the Doze ratio of the processor clock to the peripheral clock.
	PLIB_OSC_DozeRecoverOnInterruptDisable	Disables the recovery from Doze mode upon an interrupt.
	PLIB_OSC_DozeRecoverOnInterruptEnable	Enables recovery from Doze mode upon an interrupt.
	PLIB_OSC_DozeRecoverOnInterruptIsEnabled	Returns 'true' if recover from Doze mode on interrupt is enabled.

Fast RC Oscillator Setup Functions

	Name	Description
	PLIB_OSC_FRCDitherEnable	Enables the FRC Oscillator clock dithering.
	PLIB_OSC_FRCDivisorGet	Gets the FRC clock divisor.
	PLIB_OSC_FRCDivisorSelect	Sets the FRC clock divisor to the specified value.
	PLIB_OSC_FRCTuningModeGet	Gets the FRC oscillator tuning mode.
	PLIB_OSC_FRCTuningModeSet	Selects the FRC oscillator tuning mode.
	PLIB_OSC_FRCTuningSelect	Sets the FRC tuning value.
	PLIB_OSC_FRCTuningSequenceValueGet	Gets the value set in the FRC tune sequencer.
	PLIB_OSC_FRCTuningSequenceValueSet	Sets the value in the FRC tune sequencer.
	PLIB_OSC_LinearFeedbackShiftRegGet	Gets the value from linear feedback shift register.
	PLIB_OSC_LinearFeedbackShiftRegSet	Sets the linear feedback shift register.

Feature Existence Functions

	Name	Description
	PLIB_OSC_ExistsClockFail	Identifies whether the ClockFail feature exists on the OSC module
	PLIB_OSC_ExistsFRCDivisor	Identifies whether the FRCDivisor feature exists on the OSC module
	PLIB_OSC_ExistsFRCTuning	Identifies whether the FRCTuning feature exists on the OSC module
	PLIB_OSC_ExistsOnWaitAction	Identifies whether the OnWaitAction feature exists on the OSC module
	PLIB_OSC_ExistsOscCurrentGet	Identifies whether the OscCurrentGet feature exists on the OSC module
	PLIB_OSC_ExistsOscSelect	Identifies whether the OscSelect feature exists on the OSC module
	PLIB_OSC_ExistsOscSwitchInit	Identifies whether the OscSwitchInit feature exists on the OSC module
	PLIB_OSC_ExistsPBClockDivisor	Identifies whether the PBClockDivisor feature exists on the OSC module
	PLIB_OSC_ExistsPBClockOutputEnable	Identifies whether the PBClockOutputEnable feature exists on the OSC module

	PLIB_OSC_ExistsPBClockReady	Identifies whether the PBClockReady feature exists on the OSC module
	PLIB_OSC_ExistsPLLClockLock	Identifies whether the PLLClockLock feature exists on the OSC module
	PLIB_OSC_ExistsPLLLockStatus	Identifies whether the PLLLockStatus feature exists on the OSC module
	PLIB_OSC_ExistsReferenceOscBaseClock	Identifies whether the ReferenceOscBaseClock feature exists on the OSC module
	PLIB_OSC_ExistsReferenceOscChange	Identifies whether the ReferenceOscChange feature exists on the OSC module
	PLIB_OSC_ExistsReferenceOscChangeActive	Identifies whether the ReferenceOscChangeActive feature exists on the OSC module
	PLIB_OSC_ExistsReferenceOscDivisor	Identifies whether the ReferenceOscDivisor feature exists on the OSC module
	PLIB_OSC_ExistsReferenceOscEnable	Identifies whether the ReferenceOscEnable feature exists on the OSC module
	PLIB_OSC_ExistsReferenceOscStopInIdleEnable	Identifies whether the ReferenceOscStopInIdleEnable feature exists on the OSC module
	PLIB_OSC_ExistsReferenceOscStopInSleep	Identifies whether the ReferenceOscStopInSleep feature exists on the OSC module
	PLIB_OSC_ExistsReferenceOscTrim	Identifies whether the ReferenceOscTrim feature exists on the OSC module
	PLIB_OSC_ExistsReferenceOutputEnable	Identifies whether the ReferenceOutputEnable feature exists on the OSC module
	PLIB_OSC_ExistsSecondaryEnable	Identifies whether the SecondaryEnable feature exists on the OSC module
	PLIB_OSC_ExistsSecondaryReady	Identifies whether the SecondaryReady feature exists on the OSC module
	PLIB_OSC_ExistsSysPLLFrequencyRange	Identifies whether the PLLFrequencyRange feature exists on the OSC module
	PLIB_OSC_ExistsSysPLLInputClockSource	Identifies whether the PLLInputClockSource feature exists on the OSC module
	PLIB_OSC_ExistsSysPLLInputDivisor	Identifies whether the PLLInputDivisor feature exists on the OSC module
	PLIB_OSC_ExistsSysPLLMultiplier	Identifies whether the PLLMultiplier feature exists on the OSC module
	PLIB_OSC_ExistsSysPLLOutputDivisor	Identifies whether the PLLOutputDivisor feature exists on the OSC module
	PLIB_OSC_ExistsUsbClockSource	Identifies whether the UsbClockSource feature exists on the OSC module

General Setup Functions

	Name	Description
	PLIB_OSC_OnWaitActionGet	Gets the configured operation to be performed when a WAIT instruction is executed.
	PLIB_OSC_OnWaitActionSet	Selects the operation to be performed when a WAIT instruction is executed.
	PLIB_OSC_StartupTimerHasExpired	Returns 'true' if the oscillator start-up time-out timer has expired.

Oscillator Switch Setup Functions

	Name	Description
	PLIB_OSC_ClockSwitchingAbort	Aborts an oscillator switch.

	PLIB_OSC_ClockSwitchingIsComplete	Gets the oscillator switch progress status.
	PLIB_OSC_CurrentSysClockGet	Gets the current oscillator selected.
	PLIB_OSC_SysClockSelect	Selects the new oscillator.

Peripheral Clock Setup Functions

	Name	Description
	PLIB_OSC_PBClockDivisorGet	Gets the peripheral bus clock divisor.
	PLIB_OSC_PBClockDivisorIsReady	Checks whether the peripheral bus clock divisor is ready to be written.
	PLIB_OSC_PBClockDivisorSet	Sets the peripheral bus clock divisor to the specified value.
	PLIB_OSC_PBOutputClockDisable	Disables the peripheral bus output clock
	PLIB_OSC_PBOutputClockEnable	Enables the peripheral bus output clock
	PLIB_OSC_PBOutputClockIsEnabled	Checks whether the peripheral bus clock output is enabled or not

PLL Setup Functions

	Name	Description
	PLIB_OSC_PLLAuxClockSourceGet	Returns the clock source selected for the Auxiliary PLL.
	PLIB_OSC_PLLAuxClockSourceSelect	Sets the Auxiliary PLL clock source.
	PLIB_OSC_PLLAuxInputDivisorGet	Gets the input divisor for the Auxiliary PLL.
	PLIB_OSC_PLLAuxInputDivisorSelect	Sets the input divisor for the Auxiliary PLL to the specified value.
	PLIB_OSC_PLLAuxIsLocked	Returns whether the Auxiliary PLL is locked.
	PLIB_OSC_PLLAuxMultiplierGet	Gets the Auxiliary PLL multiplier.
	PLIB_OSC_PLLAuxMultiplierSelect	Sets the Auxiliary PLL multiplier to the specified value.
	PLIB_OSC_PLLAuxOutputDivisorGet	Gets the output divisor for the Auxiliary PLL.
	PLIB_OSC_PLLAuxOutputDivisorSet	Sets the output divisor for the Auxiliary PLL to the specified value.
	PLIB_OSC_PLLClockIsLocked	Gets the lock status for the clock and PLL selections.
	PLIB_OSC_PLLClockLock	Locks the clock and PLL selections.
	PLIB_OSC_PLLClockUnlock	Unlocks the clock and PLL selections.
	PLIB_OSC_PLLEnable	Disables the specified PLL.
	PLIB_OSC_PLLIsEnabled	Enables the specified PLL.
	PLIB_OSC_PLLIsLocked	Returns 'true' if the specified PLL is enabled.
	PLIB_OSC_PLLIsLocked	Returns 'true' if the selected PLL is locked.
	PLIB_OSC_SysPLLFrequencyRangeGet	Returns the frequency range for PLL
	PLIB_OSC_SysPLLFrequencyRangeSet	Sets the frequency range for PLL
	PLIB_OSC_SysPLLInputClockSourceGet	Returns the input clock source for the PLL module
	PLIB_OSC_SysPLLInputClockSourceSet	Sets the input clock source for the PLL module
	PLIB_OSC_SysPLLInputDivisorGet	Gets the input divisor for the PLL.
	PLIB_OSC_SysPLLInputDivisorSet	Sets the input divider for the PLL to the specified value.
	PLIB_OSC_SysPLLMultiplierGet	Gets the PLL multiplier.
	PLIB_OSC_SysPLLMultiplierSelect	Sets the PLL multiplier to the specified value.
	PLIB_OSC_SysPLLOutputDivisorGet	Gets the output divisor for the PLL.
	PLIB_OSC_SysPLLOutputDivisorSet	Sets the output divider for the PLL to the specified value.

Primary Oscillator Setup Functions

	Name	Description
	PLIB_OSC_PrimaryOscInSleepModeDisable	The Primary Oscillator is disabled during Sleep mode.
	PLIB_OSC_PrimaryOscInSleepModeEnable	The Primary Oscillator continues to operate during Sleep mode.

	<u>PLIB_OSC_PrimaryOscInSleepModelsEnabled</u>	Returns 'true' if the Primary Oscillator is disabled during Sleep mode.

Reference Oscillator Setup Functions

	Name	Description
	<u>PLIB_OSC_ReferenceOscBaseClockSelect</u>	Sets the base clock for the reference oscillator.
	<u>PLIB_OSC_ReferenceOscDisable</u>	Disables the reference oscillator output.
	<u>PLIB_OSC_ReferenceOscDivisorValueSet</u>	Selects the reference oscillator divisor value.
	<u>PLIB_OSC_ReferenceOscEnable</u>	Enables the reference oscillator.
	<u>PLIB_OSC_ReferenceOscIsEnabled</u>	Gets the enable status of the reference oscillator output.
	<u>PLIB_OSC_ReferenceOscSourceChangeIsActive</u>	Returns 'true' if a reference oscillator source change request is active.
	<u>PLIB_OSC_ReferenceOscStopInIdleDisable</u>	Enables the reference oscillator in Idle mode.
	<u>PLIB_OSC_ReferenceOscStopInIdleEnable</u>	Configures the reference oscillator to stop operating in Idle mode.
	<u>PLIB_OSC_ReferenceOscStopInIdleIsEnabled</u>	Returns 'true' if the reference oscillator is disabled in Idle mode.
	<u>PLIB_OSC_ReferenceOscStopInSleepDisable</u>	Enables the reference oscillator in Sleep mode.
	<u>PLIB_OSC_ReferenceOscStopInSleepEnable</u>	Configures the reference oscillator to stop operating in Sleep mode.
	<u>PLIB_OSC_ReferenceOscStopInSleepIsEnabled</u>	Returns 'true' if the reference oscillator is disabled in Sleep mode.
	<u>PLIB_OSC_ReferenceOscSwitchIsComplete</u>	Returns 'true' if the reference oscillator base clock switching is complete.
	<u>PLIB_OSC_ReferenceOscTrimSet</u>	Sets the reference oscillator divisor trim value.
	<u>PLIB_OSC_ReferenceOutputDisable</u>	Disables the reference oscillator output.
	<u>PLIB_OSC_ReferenceOutputEnable</u>	Enables the reference oscillator output.
	<u>PLIB_OSC_ReferenceOutputIsEnabled</u>	Returns 'true' if the reference oscillator output is enabled.

Secondary Oscillator Setup Functions

	Name	Description
	<u>PLIB_OSC_SecondaryDisable</u>	Disables the Secondary Oscillator.
	<u>PLIB_OSC_SecondaryEnable</u>	Enables the Secondary Oscillator.
	<u>PLIB_OSC_SecondaryIsEnabled</u>	Returns 'true' if the Secondary Oscillator is enabled.
	<u>PLIB_OSC_SecondaryIsReady</u>	Returns 'true' if the Secondary Oscillator is ready.

USB and Display Clock Setup Functions

	Name	Description
	<u>PLIB_OSC_GraphicsClockDivisorGet</u>	Gets the Graphics module clock divisor.
	<u>PLIB_OSC_GraphicsClockDivisorSet</u>	Sets the Graphics module clock divisor.
	<u>PLIB_OSC_GraphicsClockSourceGet</u>	Gets the Graphics Controller module clock frequency value.
	<u>PLIB_OSC_GraphicsClockSourceSelect</u>	Sets the Graphics Controller module clock.
	<u>PLIB_OSC_UsbClockSourceGet</u>	Gets the USB module clock source.
	<u>PLIB_OSC_UsbClockSourceSelect</u>	Sets the USB module clock source.

Description

This section lists and describes the functions, data types, and constants provided in the Oscillator Peripheral Library.

5.6.14.6.1 General Setup Functions

5.6.14.6.1.1 PLIB_OSC_OnWaitActionGet Function

C

```
OSC_OPERATION_ON_WAIT PLIB_OSC_OnWaitActionGet(  
    OSC_MODULE_ID index  
);
```

Description

This function gets the configured operation that is to be performed when a WAIT instruction is executed.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module

Returns

On a WAIT action, one of the possible values of [OSC_OPERATION_ON_WAIT](#).

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsOnWaitAction](#) in your application to determine whether this feature is available.

Example

```
if (PLIB_OSC_OnWaitActionGet(OSC_ID_0) == OSC_ON_WAIT_SLEEP)  
{  
    //Do some action  
}
```

5.6.14.6.1.2 PLIB_OSC_OnWaitActionSet Function

C

```
void PLIB_OSC_OnWaitActionSet(  
    OSC_MODULE_ID index,  
    OSC_OPERATION_ON_WAIT onWait  
);
```

Description

This function selects the operation to be performed when a WAIT instruction is executed.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
onWait	Operation to be performed when a WAIT instruction is executed. One of the possible values of OSC_OPERATION_ON_WAIT .

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use

[PLIB_OSC_ExistsOnWaitAction](#) in your application to determine whether this feature is available.

If this API is not called, the device will enter Idle mode on execution of a WAIT instruction.

Example

```
PLIB_OSC_OnWaitActionSet(OSC_ID_0, OSC_ON_WAIT_SLEEP);
```

5.6.14.6.1.3 PLIB_OSC_StartupTimerHasExpired Function

C

```
bool PLIB_OSC_StartupTimerHasExpired(  
    OSC_MODULE_ID index  
);
```

Description

This function returns 'true' if the oscillator start-up time-out timer has expired.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module

Returns

- true - Oscillator start-up time-out timer has expired
- false - Oscillator start-up time-out timer is running

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
bool startUpTimer;  
  
startUpTimer = PLIB_OSC_StartupTimerHasExpired(OSC_ID_0);
```

5.6.14.6.2 Primary Oscillator Setup Functions

5.6.14.6.2.1 PLIB_OSC_PrimaryOscInSleepModeDisable Function

C

```
void PLIB_OSC_PrimaryOscInSleepModeDisable(  
    OSC_MODULE_ID index  
);
```

Description

This function disables the Primary Oscillator during Sleep mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_OSC_PrimaryOscInSleepModeDisable(OSC_ID_0);
```

5.6.14.6.2.2 PLIB_OSC_PrimaryOscInSleepModeEnable Function**C**

```
void PLIB_OSC_PrimaryOscInSleepModeEnable(  
    OSC_MODULE_ID index  
);
```

Description

This function enables the Primary Oscillator during Sleep mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_OSC_PrimaryOscInSleepModeEnable(OSC_ID_0);
```

5.6.14.6.2.3 PLIB_OSC_PrimaryOscInSleepModeIsEnabled Function**C**

```
bool PLIB_OSC_PrimaryOscInSleepModeIsEnabled(  
    OSC_MODULE_ID index  
);
```

Description

This function gets the enable status of the Primary Oscillator during Sleep mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module

Returns

- true - Primary Oscillator is enabled during Sleep mode

- false - Primary Oscillator is disabled during Sleep mode

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
bool priOscStatus;  
  
priOscStatus = PLIB_OSC_PrimaryOscInSleepModeIsEnabled(OSC_ID_0);
```

5.6.14.6.3 Secondary Oscillator Setup Functions

5.6.14.6.3.1 PLIB_OSC_SecondaryDisable Function

C

```
void PLIB_OSC_SecondaryDisable(  
    OSC_MODULE_ID index  
);
```

Description

This function disables the Secondary Oscillator.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsSecondaryEnable](#) in your application to determine whether this feature is available.

Example

```
PLIB_OSC_SecondaryDisable(OSC_ID_0);
```

5.6.14.6.3.2 PLIB_OSC_SecondaryEnable Function

C

```
void PLIB_OSC_SecondaryEnable(  
    OSC_MODULE_ID index  
);
```

Description

This function enables the Secondary Oscillator.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsSecondaryEnable](#) in your application to determine whether this feature is available.

Example

```
PLIB_OSC_SecondaryEnable(OSC_ID_0);
```

5.6.14.6.3.3 PLIB_OSC_SecondaryIsEnabled Function**C**

```
bool PLIB_OSC_SecondaryIsEnabled(  
    OSC_MODULE_ID index  
);
```

Description

This function returns 'true' if the Secondary Oscillator is enabled.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module

Returns

- true - Secondary Oscillator is enabled
- false - Secondary Oscillator is disabled

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsSecondaryEnable](#) in your application to determine whether this feature is available.

Example

```
bool secOscEnable;  
  
secOscEnable = PLIB_OSC_SecondaryIsEnabled(OSC_ID_0);
```

5.6.14.6.3.4 PLIB_OSC_SecondaryIsReady Function**C**

```
bool PLIB_OSC_SecondaryIsReady(  
    OSC_MODULE_ID index  
);
```

Description

This function returns the ready status of the Secondary Oscillator.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module

Returns

- true - Indicates that the Secondary Oscillator is running and is stable
- false - Secondary Oscillator is either turned off or is still warming up

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsSecondaryReady](#) in your application to determine whether this feature is available.

Example

```
bool secOscReady;  
  
secOscReady = PLIB_OSC_SecondaryIsReady(OSC_ID_0);
```

5.6.14.6.4 Auxiliary Oscillator Setup Functions

5.6.14.6.4.1 PLIB_OSC_AuxClockSourceGet Function

C

```
OSC_AUX_CLOCK_SOURCE PLIB_OSC_AuxClockSourceGet(  
    OSC_MODULE_ID index  
);
```

Description

This function gets the clock source for the auxiliary clock.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module

Returns

One of the possible values from [OSC_AUX_CLOCK_SOURCE](#).

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
OSC_AUX_CLOCK_SOURCE auxClockSource;  
  
auxClockSource = PLIB_OSC_AuxClockSourceGet(OSC_ID_0);
```

5.6.14.6.4.2 PLIB_OSC_AuxClockSourceSet Function

C

```
void PLIB_OSC_AuxClockSourceSet(  
    OSC_MODULE_ID index,  
    OSC_AUX_CLOCK_SOURCE auxClockSource  
);
```

Description

This function sets the clock source for the auxiliary clock divisor.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
auxClockSource	Clock source for the auxiliary clock divisor. One of the possible values from OSC_AUX_CLOCK_SOURCE .

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_OSC_AuxClockSourceSet( OSC_ID_0, OSC_AUX_CLOCK_PRIMARY );
```

5.6.14.6.4.3 PLIB_OSC_AuxModeGet Function**C**

```
OSC_AUX_MODE PLIB_OSC_AuxModeGet(  
    OSC_MODULE_ID index  
);
```

Description

This function gets the Auxiliary Oscillator mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module

Returns

One of the possible values of [OSC_AUX_MODE](#).

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
OSC_AUX_MODE auxOscMode;  
  
auxOscMode = PLIB_OSC_AuxModeGet( OSC_ID_0 );
```

5.6.14.6.4.4 PLIB_OSC_AuxModeSelect Function**C**

```
void PLIB_OSC_AuxModeSelect(  
    OSC_MODULE_ID index,  
    OSC_AUX_MODE AuxOscMode
```

```
);
```

Description

This function selects the Auxiliary Oscillator mode based on the input.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
auxOscMode	One of the possible values of OSC_AUX_MODE

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_OSC_AuxModeSelect(OSC_ID_0, OSC_AUX_MODE_HS);
```

5.6.14.6.5 Reference Oscillator Setup Functions

5.6.14.6.5.1 PLIB_OSC_ReferenceOscBaseClockSelect Function

C

```
void PLIB_OSC_ReferenceOscBaseClockSelect(  
    OSC_MODULE_ID index,  
    OSC_REFERENCE referenceOsc,  
    OSC_REF_BASECLOCK refOscBaseClock  
);
```

Description

This function sets the base clock for the reference oscillator. There are multiple clock sources by which the user can configure the module to output to the pin. Users can check the accuracy of the clock by probing the pin. Use the [PLIB_OSC_ReferenceOscDivisorValueSet](#) function to divide the clock if it is a very high value.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
referenceOsc	Identifies the desired reference oscillator
refOscBaseClk	One of the possible values of OSC_REF_BASECLOCK

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsReferenceOscBaseClock](#) in your application to determine whether this feature is available.

Example

```
PLIB_OSC_ReferenceOscBaseClockSelect(OSC_ID_0, OSC_REFERENCE_1, OSC_REF_BASECLOCK_PBCLK);
```

5.6.14.6.5.2 PLIB_OSC_ReferenceOscDisable Function**C**

```
void PLIB_OSC_ReferenceOscDisable(  
    OSC_MODULE_ID index,  
    OSC_REFERENCE referenceOsc  
);
```

Description

This function disables output from the reference oscillator.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
referenceOsc	Identifies the desired reference oscillator

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsReferenceOscEnable](#) in your application to determine whether this feature is available.

Example

```
PLIB_OSC_ReferenceOscDisable(OSC_ID_0, OSC_REFERENCE_1);
```

5.6.14.6.5.3 PLIB_OSC_ReferenceOscDivisorValueSet Function**C**

```
void PLIB_OSC_ReferenceOscDivisorValueSet(  
    OSC_MODULE_ID index,  
    OSC_REFERENCE referenceOsc,  
    OSC_REF_DIVISOR_TYPE refOscValue  
);
```

Description

This function selects the reference oscillator divisor value.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
referenceOsc	Identifies the desired reference oscillator
refOscDiv	One of the possible values of OSC_REF_DIV

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsReferenceOscDivisor](#) in your application to determine whether this feature is available.

The value entered may not be the actual divisor. Please refer to the specific device data sheet to determine the actual divisor corresponding to the value entered.

Example

```
// Select the clock source.
PLIB_OSC_ReferenceOscBaseClockSelect(OSC_ID_0, OSC_REFERENCE_1, OSC_REF_BASECLOCK_PBCLK);

PLIB_OSC_ReferenceOscDivisorValueSet(OSC_ID_0, OSC_REFERENCE_1, 128);

PLIB_OSC_ReferenceOscEnable(OSC_ID_0, OSC_REFERENCE_1);
```

5.6.14.6.5.4 PLIB_OSC_ReferenceOscEnable Function

C

```
void PLIB_OSC_ReferenceOscEnable(
    OSC_MODULE_ID index,
    OSC_REFERENCE referenceOsc
);
```

Description

This function enables the reference oscillator.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
referenceOsc	Identifies the desired reference oscillator

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsReferenceOscEnable](#) in your application to determine whether this feature is available.

If the device has a reference clock output enable control, calling this function may not give the reference clock output. Use the [PLIB_OSC_ReferenceOutputEnable](#) function to enable the output.

Example

```
PLIB_OSC_ReferenceOscEnable(OSC_ID_0, OSC_REFERENCE_1);
```

5.6.14.6.5.5 PLIB_OSC_ReferenceOscIsEnabled Function

C

```
bool PLIB_OSC_ReferenceOscIsEnabled(
    OSC_MODULE_ID index,
    OSC_REFERENCE referenceOsc
);
```

```
);
```

Description

This function gets the enable status of the reference oscillator output.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
referenceOsc	Identifies the desired reference oscillator

Returns

- true - Reference oscillator is enabled
- false - Reference oscillator is disabled

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsReferenceOscEnable](#) in your application to determine whether this feature is available.

Example

```
if(PLIB_OSC_ReferenceOscIsEnabled(OSC_ID_0, OSC_REFERENCE_1))
{
    //Do some action
}
```

5.6.14.6.5.6 PLIB_OSC_ReferenceOscSourceChangeIsActive Function**C**

```
bool PLIB_OSC_ReferenceOscSourceChangeIsActive(
    OSC_MODULE_ID index,
    OSC_REFERENCE referenceOsc
);
```

Description

This function returns 'true' if the reference oscillator source change is in progress. The software is not allowed to give a new source change request.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
referenceOsc	Identifies the desired reference oscillator

Returns

- true - Reference oscillator change request is active
- false - Reference oscillator change request is not active

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsReferenceOscChangeActive](#) in your application to determine whether this feature is available.

Example

```
if (!PLIB_OSC_ReferenceOscSourceChangeIsActive(OSC_ID_0, OSC_REFERENCE_1))
{
    //Allowed to change the reference clock source
}
```

5.6.14.6.5.7 PLIB_OSC_ReferenceOscStopInIdleDisable Function**C**

```
void PLIB_OSC_ReferenceOscStopInIdleDisable(
    OSC_MODULE_ID index,
    OSC_REFERENCE referenceOsc
);
```

Description

This function enables the reference oscillator in Idle mode. The reference oscillator continues to run in Idle mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
referenceOsc	Identifies the desired reference oscillator

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsReferenceOscStopInIdleEnable](#) in your application to determine whether this feature is available.

The default state of the device is the reference oscillator is enabled in Idle mode.

Example

```
PLIB_OSC_ReferenceOscStopInSleepDisable(OSC_ID_0, OSC_REFERENCE_1);
```

5.6.14.6.5.8 PLIB_OSC_ReferenceOscStopInIdleEnable Function**C**

```
void PLIB_OSC_ReferenceOscStopInIdleEnable(
    OSC_MODULE_ID index,
    OSC_REFERENCE referenceOsc
);
```

Description

This function configures the reference oscillator to stop operating in Idle mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
referenceOsc	Identifies the desired reference oscillator

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsReferenceOscStopInIdleEnable](#) in your application to determine whether this feature is available.

The default state of the device is reference oscillator enabled in Idle mode. Therefore, calling this function is necessary only if the [PLIB_OSC_ReferenceOscStopInIdleDisable](#) function was previously called, and the software wants to enable oscillator operation in Sleep mode.

Example

```
PLIB_OSC_ReferenceOscStopInIdleEnable(OSC_ID_0, OSC_REFERENCE_1);
```

5.6.14.6.5.9 PLIB_OSC_ReferenceOscStopInIdleIsEnabled Function**C**

```
bool PLIB_OSC_ReferenceOscStopInIdleIsEnabled(  
    OSC_MODULE_ID index,  
    OSC_REFERENCE referenceOsc  
);
```

Description

This function returns 'true' if the reference oscillator is disabled in Idle mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
referenceOsc	Identifies the desired reference oscillator

Returns

- true - Reference oscillator is disabled in Idle mode
- false - Reference oscillator is enabled in Idle mode

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsReferenceOscStopInIdleEnable](#) in your application to determine whether this feature is available.

Example

```
bool refOscIdle;  
  
refOscIdle = PLIB_OSC_ReferenceOscStopInIdleIsEnabled(OSC_ID_0, OSC_REFERENCE_1);
```

5.6.14.6.5.10 PLIB_OSC_ReferenceOscStopInSleepDisable Function**C**

```
void PLIB_OSC_ReferenceOscStopInSleepDisable(  
    OSC_MODULE_ID index,  
    OSC_REFERENCE referenceOsc  
);
```

Description

This function enables the reference oscillator in Sleep mode. The reference oscillator continues to run in Sleep mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
referenceOsc	Identifies the desired reference oscillator

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsReferenceOscStopInSleep](#) in your application to determine whether this feature is available.

The reference clock output will be stopped in Sleep mode if the base clock selected is 'System Clock' or 'Peripheral Clock' regardless of this function.

The default state of the device is for the reference oscillator to be enabled in Sleep mode. Therefore, calling this function is necessary only if the [PLIB_OSC_ReferenceOscStopInSleepEnable](#) function was previously called, and the software wants to enable oscillator operation in Sleep mode.

Example

```
PLIB_OSC_ReferenceOscStopInSleepDisable(OSC_ID_0, OSC_REFERENCE_1);
```

5.6.14.6.5.11 PLIB_OSC_ReferenceOscStopInSleepEnable Function**C**

```
void PLIB_OSC_ReferenceOscStopInSleepEnable(  
    OSC_MODULE_ID index,  
    OSC_REFERENCE referenceOsc  
);
```

Description

This function configures the reference oscillator to stop operating in Sleep mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
referenceOsc	Identifies the desired reference oscillator

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsReferenceOscStopInSleep](#) in your application to determine whether this feature is available.

The default state of the device is for the reference oscillator to be enabled in Sleep mode.

Example

```
PLIB_OSC_ReferenceOscStopInSleepEnable(OSC_ID_0, OSC_REFERENCE_1);
```

5.6.14.6.5.12 PLIB_OSC_ReferenceOscStopInSleepIsEnabled Function**C**

```
bool PLIB_OSC_ReferenceOscStopInSleepIsEnabled(  
    OSC_MODULE_ID index,  
    OSC_REFERENCE referenceOsc  
);
```

Description

This function returns 'true' if the reference oscillator is disabled in Sleep mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
referenceOsc	Identifies the desired reference oscillator

Returns

- true - Reference oscillator is disabled in Sleep mode
- false - Reference oscillator is enabled in Sleep mode

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsReferenceOscStopInSleep](#) in your application to determine whether this feature is available.

Example

```
bool refOscSleep;  
  
refOscSleep = PLIB_OSC_ReferenceOscStopInSleepIsEnabled(OSC_ID_0, OSC_REFERENCE_1);
```

5.6.14.6.5.13 PLIB_OSC_ReferenceOscSwitchIsComplete Function**C**

```
bool PLIB_OSC_ReferenceOscSwitchIsComplete(  
    OSC_MODULE_ID index,  
    OSC_REFERENCE referenceOsc  
);
```

Description

This function returns 'true' if the reference oscillator base clock switching is complete.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
referenceOsc	Identifies the desired reference oscillator

Returns

- true - Reference clock base clock switching is complete
- false - Reference clock base clock switching is not complete; switching is not started

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsReferenceOscChange](#) in your application to determine whether this feature is available.

Example

```
bool refOscIdle;  
  
refOscIdle = PLIB_OSC_ReferenceOscSwitchIsComplete(OSC_ID_0, OSC_REFERENCE_1);
```

5.6.14.6.5.14 PLIB_OSC_ReferenceOscTrimSet Function**C**

```
void PLIB_OSC_ReferenceOscTrimSet(  
    OSC_MODULE_ID index,  
    OSC_REFERENCE referenceOsc,  
    OSC_REF_TRIM_TYPE trimValue  
);
```

Description

This function selects the reference oscillator divisor trim value. The value selected divided by OSC_REF_TRIM_MAX_VALUE will be added to the oscillator divisor value.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
referenceOsc	Identifies the desired reference oscillator
trimValue	Reference oscillator trim value

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsReferenceOscTrim](#) in your application to determine whether this feature is available.

Example

```
PLIB_OSC_ReferenceOscTrimSet(OSC_ID_0, OSC_REFERENCE_1, 50);
```

5.6.14.6.5.15 PLIB_OSC_ReferenceOutputDisable Function**C**

```
void PLIB_OSC_ReferenceOutputDisable(  
    OSC_MODULE_ID index,  
    OSC_REFERENCE referenceOsc  
);
```

Description

This function disables the reference oscillator output.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
referenceOsc	Identifies the desired reference oscillator

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsReferenceOutputEnable](#) in your application to determine whether this feature is available.

The default state of the device is reference oscillator output disabled.

Example

```
PLIB_OSC_ReferenceOutputDisable(OSC_ID_0, OSC_REFERENCE_1);
```

5.6.14.6.5.16 PLIB_OSC_ReferenceOutputEnable Function**C**

```
void PLIB_OSC_ReferenceOutputEnable(  
    OSC_MODULE_ID index,  
    OSC_REFERENCE referenceOsc  
)
```

Description

This function enables the reference oscillator output.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
referenceOsc	Identifies the desired reference oscillator

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsReferenceOutputEnable](#) in your application to determine whether this feature is available.

The default state of the device is reference oscillator output disabled.

Example

```
PLIB_OSC_ReferenceOutputEnable(OSC_ID_0, OSC_REFERENCE_1);
```

5.6.14.6.5.17 PLIB_OSC_ReferenceOutputIsEnabled Function**C**

```
bool PLIB_OSC_ReferenceOutputIsEnabled(  

```

```
    OSC_MODULE_ID index,  
    OSC_REFERENCE referenceOsc  
);
```

Description

This function returns 'true' if the reference oscillator output is enabled.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
referenceOsc	Identifies the desired reference oscillator

Returns

- true - Reference oscillator output is enabled
- false - Reference oscillator output is disabled

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsReferenceOutputEnable](#) in your application to determine whether this feature is available.

Example

```
bool refOscIdle;  
  
refOscIdle = PLIB_OSC_ReferenceOutputIsEnabled(OSC_ID_0, OSC_REFERENCE_1);
```

5.6.14.6.6 Fast RC Oscillator Setup Functions

5.6.14.6.6.1 PLIB_OSC_FRCDitherEnable Function

C

```
void PLIB_OSC_FRCDitherEnable(  
    OSC_MODULE_ID index  
);
```

Description

This function enables the FRC Oscillator clock dithering.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_OSC_FRCDitherEnable(OSC_ID_0);
```

5.6.14.6.6.2 PLIB_OSC_FRCDivisorGet Function**C**

```
OSC_FRC_DIV PLIB_OSC_FRCDivisorGet(  
    OSC_MODULE_ID index  
);
```

Description

This function gets the FRC clock divisor.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module

Returns

One of the possible values from [OSC_FRC_DIV](#).

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsFRCDivisor](#) in your application to determine whether this feature is available.

Example

```
OSC_FRC_DIV divisorFRC;  
  
divisorFRC = PLIB_OSC_FRCDivisorGet(OSC_ID_0);
```

5.6.14.6.6.3 PLIB_OSC_FRCDivisorSelect Function**C**

```
void PLIB_OSC_FRCDivisorSelect(  
    OSC_MODULE_ID index,  
    OSC_FRC_DIV divisorFRC  
);
```

Description

This function sets the FRC clock divisor to the specified value.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
divisorFRC	One of the possible values from OSC_FRC_DIV

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsFRCDivisor](#) in your application to determine whether this feature is available.

Example

```
PLIB_OSC_FRCDivisorSelect ( OSC_ID_0, OSC_FRC_DIV_4 );
```

5.6.14.6.6.4 PLIB_OSC_FRCTuningModeGet Function**C**

```
OSC_TUNING_MODE PLIB_OSC_FRCTuningModeGet(  
    OSC_MODULE_ID index  
);
```

Description

This function gets the FRC oscillator tuning mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module

Returns

One of the possible value from [OSC_TUNING_MODE](#) enum.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
if (OSC_TUNING_USING_NUMBER == PLIB_OSC_FRCTuningModeGet(OSC_ID_0))  
{  
    //Do some action  
}
```

5.6.14.6.6.5 PLIB_OSC_FRCTuningModeSet Function**C**

```
void PLIB_OSC_FRCTuningModeSet(  
    OSC_MODULE_ID index,  
    OSC_TUNING_MODE tuningMode  
);
```

Description

This function selects the FRC oscillator tuning mode.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
tuningMode	One of the possible value from OSC_TUNING_MODE .

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsFRCTuning](#) in your application to determine whether this feature is available.

This function takes care of the register unlock, which is required per the device data sheet. Therefore, the user need not explicitly perform the unlock sequence.

Example

```
PLIB_OSC_FRCTuningModeSet(OSC_ID_0, OSC_TUNING_USING_NUMBER);
```

5.6.14.6.6 PLIB_OSC_FRCTuningSelect Function**C**

```
void PLIB_OSC_FRCTuningSelect(  
    OSC_MODULE_ID index,  
    OSC_FRC_TUNE_TYPE tuningValue  
);
```

Description

This function tunes the FRC oscillator to the value specified. The application is supposed to try different values and find the best one. If the device has different tuning modes, this function will be used differently. See the example provided for the [PLIB_OSC_FRCTuningSequenceValueSet](#) function for details.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
tuningValue	Tuning value. One of the possible values from OSC_FRC_TUNE_TYPE.

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsFRCTuning](#) in your application to determine whether this feature is available.

This function takes care of the register unlock, which is required per the device data sheet. Therefore, the user need not explicitly perform the unlock sequence.

Example

```
PLIB_OSC_FRCTuningSelect(OSC_ID_0, 0x05);
```

5.6.14.6.6.7 PLIB_OSC_FRCTuningSequenceValueGet Function**C**

```
OSC_FRC_TUNE_TYPE PLIB_OSC_FRCTuningSequenceValueGet(  
    OSC_MODULE_ID index,  
    OSC_TUNING_SEQUENCERS oscSequencer  
);
```

Description

This function gets the value set in the selected FRC tune sequencer.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
oscSequencer	Value to be set in the sequencer

Returns

Value in the sequencer specified. One of the possible value from OSC_FRC_TUNE_TYPE.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability.

This API takes care of the register unlock, which is required per the device datasheet. Therefore, the need not explicitly perform the unlock sequence.

Example

```
OSC_FRC_TUNE_TYPE seqValue;  
  
seqValue = PLIB_OSC_FRCTuningSequenceValueGet(OSC_ID_0,  
        OSC_TUNING_SEQUENCER_1);
```

5.6.14.6.6.8 PLIB_OSC_FRCTuningSequenceValueSet Function**C**

```
void PLIB_OSC_FRCTuningSequenceValueSet(  
    OSC_MODULE_ID index,  
    OSC_TUNING_SEQUENCERS oscSequencer,  
    OSC_FRC_TUNE_TYPE seqValue  
);
```

Description

This function sets the value in the FRC tune sequencer.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
oscSequencer	Select the sequencer
seqValue	Value to be set in the sequencer. One of the possible values from OSC_FRC_TUNE_TYPE.

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_OSC_FRCTuningModeSet(OSC_ID_0, OSC_TUNING_SEQ_DITHER);

PLIB_OSC_FRCTuningSelect(OSC_ID_0, 0x01);

PLIB_OSC_FRCTuningSequenceValueSet(OSC_ID_0, OSC_TUNING_SEQUENCER_1,
    OSC_FRC_TUNE_MINUS_2_25_PERCENT);

PLIB_OSC_FRCTuningSequenceValueSet(OSC_ID_0, OSC_TUNING_SEQUENCER_2,
    OSC_FRC_TUNE_MINUS_1_5_PERCENT);

PLIB_OSC_FRCTuningSequenceValueSet(OSC_ID_0, OSC_TUNING_SEQUENCER_3,
    OSC_FRC_TUNE_MINUS_0_375_PERCENT);

PLIB_OSC_FRCTuningSequenceValueSet(OSC_ID_0, OSC_TUNING_SEQUENCER_4,
    OSC_FRC_TUNE_PLUS_0_43_PERCENT);

PLIB_OSC_FRCTuningSequenceValueSet(OSC_ID_0, OSC_TUNING_SEQUENCER_5,
    OSC_FRC_TUNE_PLUS_1_29_PERCENT);

PLIB_OSC_FRCTuningSequenceValueSet(OSC_ID_0, OSC_TUNING_SEQUENCER_6,
    OSC_FRC_TUNE_PLUS_2_54_PERCENT);

PLIB_OSC_FRCTuningSequenceValueSet(OSC_ID_0, OSC_TUNING_SEQUENCER_7,
    OSC_FRC_TUNE_MINUS_3_PERCENT);

//Configure PWM (period, pulse width and turn on the module)
```

5.6.14.6.6.9 PLIB_OSC_LinearFeedbackShiftRegGet Function

C

```
OSC_LFSR_TYPE PLIB_OSC_LinearFeedbackShiftRegGet(
    OSC_MODULE_ID index
);
```

Description

This function gets the value from the linear feedback shift register.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module

Returns

OSC_LFSR_TYPE - Linear Feedback shift register

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
OSC_LFSR_TYPE linearFbValue;

linearFbValue = PLIB_OSC_LinearFeedbackShiftRegGet(OSC_ID_0);
```

5.6.14.6.6.10 PLIB_OSC_LinearFeedbackShiftRegSet Function

C

```
void PLIB_OSC_LinearFeedbackShiftRegSet(  
    OSC_MODULE_ID index,  
    OSC_LFSR_TYPE linearFbValue  
);
```

Description

This function sets the linear feedback shift register. When the FRC oscillator tuning mode is configured for pseudo-random number-based dithering, this function is used to provide the seed number for the pseudo-random number generation algorithm.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
linearFbValue	The pseudo-random FRC trim value

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability.

This function takes care of the register unlock, which is required per the device data sheet. Therefore, the user need not explicitly perform the unlock sequence.

Example

```
PLIB_OSC_FRCTuningModeSet(OSC_ID_0, OSC_TUNING_PSEUDO_RANDOM);  
  
//15 bit Linear Feedback shift register value  
  
PLIB_OSC_LinearFeedbackShiftRegSet(OSC_ID_0, 0x7F);
```

5.6.14.6.7 Oscillator Switch Setup Functions

5.6.14.6.7.1 PLIB_OSC_ClockSwitchingAbort Function

C

```
void PLIB_OSC_ClockSwitchingAbort(  
    OSC_MODULE_ID index  
);
```

Description

This function aborts the oscillator switch to the selection specified by the new oscillator selection bits.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsOscSwitchInit](#) in your application to determine whether this feature is available.

Example

```
PLIB_OSC_ClockSwitchingAbort(OSC_ID_0);
```

5.6.14.6.7.2 PLIB_OSC_ClockSwitchingIsComplete Function**C**

```
bool PLIB_OSC_ClockSwitchingIsComplete(  
    OSC_MODULE_ID index  
);
```

Description

This function gets the status of the oscillator switch progress.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module

Returns

true - Oscillator switch is complete false - Oscillator switch is in progress

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsOscSwitchInit](#) in your application to determine whether this feature is available.

This function takes care of the register unlock, which is required per the device datasheet. Therefore, the user need not explicitly perform the unlock sequence.

Example

```
PLIB_OSC_SysClockSelect(OSC_ID_0, OSC_PRIMARY);  
  
while(!PLIB_OSC_ClockSwitchingIsComplete(OSC_ID_0));
```

5.6.14.6.7.3 PLIB_OSC_CurrentSysClockGet Function**C**

```
OSC_SYS_TYPE PLIB_OSC_CurrentSysClockGet(  
    OSC_MODULE_ID index  
);
```

Description

This function gets the current oscillator. If the application hasn't changed the oscillator selection, this will be same as the oscillator selected through the Configuration bits.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module

Returns

One of the possible values from [OSC_SYS_TYPE](#).

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsOscCurrentGet](#) in your application to determine whether this feature is available.

Example

```
OSC_SYS_TYPE oscCurrent;  
  
oscCurrent = PLIB_OSC_CurrentSysClockGet(OSC_ID_0);
```

5.6.14.6.7.4 PLIB_OSC_SysClockSelect Function**C**

```
void PLIB_OSC_SysClockSelect(  
    OSC_MODULE_ID index,  
    OSC_SYS_TYPE newOsc  
)
```

Description

This function selects the new oscillator.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
newOsc	One of the possible values from OSC_SYS_TYPE

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsOscSelect](#) in your application to determine whether this feature is available.

This function takes care of the register unlock, which is required per the device datasheet. Therefore, the user need not explicitly perform the unlock sequence.

This function adds the necessary delay (NOP instructions) after switching the oscillator. Therefore, the user need not add any delay as specified in the device data sheet.

Example

```
PLIB_OSC_SysClockSelect(OSC_ID_0, OSC_PRIMARY);
```

5.6.14.6.8 Doze Setup Functions

5.6.14.6.8.1 PLIB_OSC_DozeModeDisable Function

C

```
void PLIB_OSC_DozeModeDisable(  
    OSC_MODULE_ID index  
);
```

Description

This function disables Doze mode. The CPU peripheral clock ratio is set to 1:1.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability.

This function adds the necessary delay (NOP instructions), which must be added immediately before entering Doze mode and immediately after exiting Doze mode.

Example

```
PLIB_OSC_DozeModeDisable(OSC_ID_0);
```

5.6.14.6.8.2 PLIB_OSC_DozeModeEnable Function

C

```
void PLIB_OSC_DozeModeEnable(  
    OSC_MODULE_ID index  
);
```

Description

This function enables Doze mode. This is a method to reduce power consumption By reducing the processor clock. Use the [PLIB_OSC_DozeRatioSelect](#) function to specify the CPU peripheral clock ratio.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability.

This function adds the necessary delay (NOP instructions), which must be added immediately before entering Doze mode and immediately after exiting Doze mode.

Example

```
PLIB_OSC_DozeModeEnable(OSC_ID_0);
```

5.6.14.6.8.3 PLIB_OSC_DozeRatioGet Function**C**

```
OSC_DOZE_RATIO PLIB_OSC_DozeRatioGet(  
    OSC_MODULE_ID index  
);
```

Description

This function gets the Doze ratio, which is the ratio between the processor clock and the peripheral clock.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module

Returns

One of the possible values of [OSC_DOZE_RATIO](#).

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
OSC_DOZE_RATIO dozeRatio;  
  
dozeRatio = PLIB_OSC_DozeRatioGet(OSC_ID_0);
```

5.6.14.6.8.4 PLIB_OSC_DozeRatioSelect Function**C**

```
void PLIB_OSC_DozeRatioSelect(  
    OSC_MODULE_ID index,  
    OSC_DOZE_RATIO dozeRatio  
);
```

Description

This function selects the Doze ratio, which is the ratio between the processor clock and the peripheral clock. By default, the ratio between the processor clock and the peripheral clock is 1:1.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
dozeRatio	One of the possible values of OSC_DOZE_RATIO

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_OSC_DozeRatioSelect(OSC_ID_0, OSC_DOZE_RATIO_4);
```

5.6.14.6.8.5 PLIB_OSC_DozeRecoverOnInterruptDisable Function**C**

```
void PLIB_OSC_DozeRecoverOnInterruptDisable(  
    OSC_MODULE_ID index  
);
```

Description

This function disables feature of recovering from Doze mode upon an interrupt. Interrupts will not affect the power-saving Doze mode enable.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_OSC_DozeRecoverOnInterruptDisable(OSC_ID_0);
```

5.6.14.6.8.6 PLIB_OSC_DozeRecoverOnInterruptEnable Function**C**

```
void PLIB_OSC_DozeRecoverOnInterruptEnable(  
    OSC_MODULE_ID index  
);
```

Description

This function enables the feature of recovering from Doze mode upon an interrupt. Interrupts clear the power-saving Doze mode enable and reset the CPU peripheral clock ratio to 1:1.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_OSC_DozeRecoverOnInterruptEnable(OSC_ID_0);
```

5.6.14.6.8.7 PLIB_OSC_DozeRecoverOnInterruptIsEnabled Function**C**

```
bool PLIB_OSC_DozeRecoverOnInterruptIsEnabled(  
    OSC_MODULE_ID index  
);
```

Description

This function returns 'true' if recover from Doze mode on interrupt is enabled.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module

Returns

- true - Recover from Doze mode on interrupt is enabled
- false - Recover from Doze mode on interrupt is disabled

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
bool recoverOnInt;  
  
recoverOnInt = PLIB_OSC_DozeRecoverOnInterruptIsEnabled(OSC_ID_0);
```

5.6.14.6.9 USB and Display Clock Setup Functions**5.6.14.6.9.1 PLIB_OSC_GraphicsClockDivisorGet Function****C**

```
uint8_t PLIB_OSC_GraphicsClockDivisorGet(  
    OSC_MODULE_ID index  
);
```

Description

This function gets the Graphics module clock divisor.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module

Returns

Graphics module clock divisor.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
uint8_t    displayClockDiv;

displayClockDiv = PLIB_OSC_GraphicsClockDivisorGet(OSC_ID_0);
```

5.6.14.6.9.2 PLIB_OSC_GraphicsClockDivisorSet Function**C**

```
void PLIB_OSC_GraphicsClockDivisorSet(
    OSC_MODULE_ID index,
    uint8_t clockDivisor
);
```

Description

This function sets the Graphics module clock divisor.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
clockDivisor	Graphics module clock divisor

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_OSC_GraphicsClockDivisorSet(OSC_ID_0, 127);
```

5.6.14.6.9.3 PLIB_OSC_GraphicsClockSourceGet Function**C**

```
OSC_GFX_CLOCK PLIB_OSC_GraphicsClockSourceGet(
    OSC_MODULE_ID index
);
```

Description

This function gets the clock frequency used for the Graphics Controller module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
OSC_GFX_CLOCK gfxClock;  
  
gfxClock = PLIB_OSC_GraphicsClockSourceGet (OSC_ID_0);
```

5.6.14.6.9.4 PLIB_OSC_GraphicsClockSourceSelect Function

C

```
void PLIB_OSC_GraphicsClockSourceSelect(  
    OSC_MODULE_ID index,  
    OSC_GFX_CLOCK gfxClock  
);
```

Description

This function sets the clock frequency for the Graphics Controller module.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
gfxClock	One of the possible values of OSC_GFX_CLOCK

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_OSC_GraphicsClockSourceSelect (OSC_ID_0, OSC_GFX_CLOCK_96M);
```

5.6.14.6.9.5 PLIB_OSC_UsbClockSourceGet Function

C

```
OSC_USBCLOCK_SOURCE PLIB_OSC_UsbClockSourceGet(  
    OSC_MODULE_ID index  
);
```

Description

This function gets the USB module clock source.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module

Returns

USB module clock source. One of the possible values from [OSC_USBCLOCK_SOURCE](#).

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsUsbClockSource](#) in your application to determine whether this feature is available.

Example

```
if (SYS_OSC_USBCLK_FRC == PLIB_OSC_UsbClockSourceGet(OSC_ID_0))
{
    //Do some action
}
```

5.6.14.6.9.6 PLIB_OSC_UsbClockSourceSelect Function

C

```
void PLIB_OSC_UsbClockSourceSelect(
    OSC_MODULE_ID index,
    OSC_USBCLOCK_SOURCE usbClock
);
```

Description

This function sets the USB module clock source.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
usbClock	Select the USB module clock source. One of the possible values from OSC_USBCLOCK_SOURCE .

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsUsbClockSource](#) in your application to determine whether this feature is available.

Before placing the USB module in Suspend mode, use this function to enable the FRC clock.

Example

```
PLIB_OSC_UsbClockSourceSelect(OSC_ID_0, SYS_OSC_USBCLK_FRC);
```

5.6.14.6.10 PLL Setup Functions

5.6.14.6.10.1 PLIB_OSC_PLLAuxClockSourceGet Function

C

```
OSC_PLLAUX_CLOCK_SOURCE PLIB_OSC_PLLAuxClockSourceGet(
    OSC_MODULE_ID index
);
```

Description

This function returns the clock source selected for the Auxiliary PLL.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module

Returns

The source for the auxiliary clock. One of the possible values from [OSC_PLLAUX_CLOCK_SOURCE](#).

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
if(OSC_PLLAUX_CLOCK == PLIB_OSC_PLLAuxClockSourceGet(OSC_ID_0))
{
    //Take some action
}
```

5.6.14.6.10.2 PLIB_OSC_PLLAuxClockSourceSelect Function**C**

```
void PLIB_OSC_PLLAuxClockSourceSelect(
    OSC_MODULE_ID index,
    OSC_PLLAUX_CLOCK_SOURCE auxPLLClkSrc
);
```

Description

This function sets the Auxiliary PLL clock source to either the Primary oscillator or the Auxiliary oscillator depending on the input.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
auxPLLClkSrc	The source for the auxiliary clock. One of the possible values from OSC_PLLAUX_CLOCK_SOURCE .

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_OSC_PLLAuxClockSourceSelect(OSC_ID_0, OSC_PLLAUX_CLOCK);
```

5.6.14.6.10.3 PLIB_OSC_PLLAuxInputDivisorGet Function**C**

```
OSC_AUXPLL_IN_DIV PLIB_OSC_PLLAuxInputDivisorGet(
```

```
    OSC_MODULE_ID index  
);
```

Description

This function gets the input divisor for the Auxiliary PLL.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module

Returns

One of the possible values from [OSC_AUXPLL_IN_DIV](#).

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
OSC_AUXPLL_IN_DIV auxPLLInDiv;  
  
auxPLLInDiv = PLIB_OSC_PLLAuxInputDivisorGet(OSC_ID_0);
```

5.6.14.6.10.4 PLIB_OSC_PLLAuxInputDivisorSelect Function

C

```
void PLIB_OSC_PLLAuxInputDivisorSelect(  
    OSC_MODULE_ID index,  
    OSC_AUXPLL_IN_DIV auxPLLInDiv  
);
```

Description

This function sets the input divisor for the Auxiliary PLL to the specified value.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
auxPLLInDiv	One of the possible values from OSC_AUXPLL_IN_DIV

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_OSC_PLLAuxInputDivisorSelect(OSC_ID_0, OSC_AUXPLL_IN_DIV_2);
```

5.6.14.6.10.5 PLIB_OSC_PLLAuxIsLocked Function

C

```
bool PLIB_OSC_PLLAuxIsLocked(  

```

```
    OSC_MODULE_ID index  
);
```

Description

This function returns 'true' if the Auxiliary PLL is locked.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module

Returns

- true - Auxiliary PLL is in lock
- false - Auxiliary PLL is not in lock

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
bool lockAuxPLL;  
  
lockAuxPLL = PLIB_OSC_PLLAuxIsLocked(OSC_ID_0);
```

5.6.14.6.10.6 PLIB_OSC_PLLAuxMultiplierGet Function

C

```
OSC_AUXPLL_MULTIPLIER PLIB_OSC_PLLAuxMultiplierGet(  
    OSC_MODULE_ID index  
);
```

Description

This function gets the Auxiliary PLL multiplier.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module

Returns

One of the possible values from OSC_PLL_MUL.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
OSC_AUXPLL_MULTIPLIER auxpllMultiply;  
  
auxpllMultiply = PLIB_OSC_PLLAuxMultiplierGet(OSC_ID_0);
```

5.6.14.6.10.7 PLIB_OSC_PLLAuxMultiplierSelect Function

C

```
void PLIB_OSC_PLLAuxMultiplierSelect(  
    OSC_MODULE_ID index,  
    OSC_AUXPLL_MULTIPLIER auxPllMultiplier  
);
```

Description

This function sets the Auxiliary PLL multiplier to the specified value.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
auxPllMultiplier	One of the possible values from OSC_AUXPLL_MULTIPLIER

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_OSC_PLLAuxMultiplierSelect (OSC_ID_0, OSC_AUXPLL_MULTIPLIER_4);
```

5.6.14.6.10.8 PLIB_OSC_PLLAuxOutputDivisorGet Function

C

```
OSC_AUXPLL_OUT_DIV PLIB_OSC_PLLAuxOutputDivisorGet(  
    OSC_MODULE_ID index  
);
```

Description

This function gets the output divisor for the Auxiliary PLL.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module

Returns

One of the possible values from [OSC_AUXPLL_OUT_DIV](#).

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
OSC_AUXPLL_OUT_DIV auxOutputDiv;  
  
auxOutputDiv = PLIB_OSC_PLLAuxOutputDivisorGet(OSC_ID_0);
```

5.6.14.6.10.9 PLIB_OSC_PLLAuxOutputDivisorSet Function

C

```
void PLIB_OSC_PLLAuxOutputDivisorSet(  
    OSC_MODULE_ID index,  
    OSC_AUXPLL_OUT_DIV auxOutputDiv  
);
```

Description

This function sets the output divisor for the Auxiliary PLL to the specified value.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
auxOutputDiv	One of the possible values from OSC_AUXPLL_OUT_DIV

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_OSC_PLLAuxOutputDivisorSet(OSC_ID_0, OSC_AUXPLL_OUT_DIV_2);
```

5.6.14.6.10.10 PLIB_OSC_PLLClockIsLocked Function

C

```
bool PLIB_OSC_PLLClockIsLocked(  
    OSC_MODULE_ID index  
);
```

Description

This function gets the lock status for the clock and PLL selections.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module

Returns

- true - clock and PLL selections are locked
- false - clock and PLL selections are not locked

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsPLLClockLock](#) in your application to determine whether this feature is available.

If the PLL does not stabilize properly during start-up, this function may not reflect the actual status of PLL lock, nor does it detect

when the PLL loses lock during normal operation.

Example

```
bool clockPLL_st;  
  
clockPLL_st = PLIB_OSC_PLLClockIsLocked(OSC_ID_0);
```

5.6.14.6.10.11 PLIB_OSC_PLLClockLock Function**C**

```
void PLIB_OSC_PLLClockLock(  
    OSC_MODULE_ID index  
);
```

Description

This function locks the clock and PLL selections.

Preconditions

The Fail-Safe Clock Monitor (FSCM) should be enabled.

Parameters

Parameters	Description
index	Identifies the desired oscillator module

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsPLLClockLock](#) in your application to determine whether this feature is available.

The data given by this API is valid only if clock switching and monitoring is enabled. Otherwise Clock and PLL selections are never locked and may be modified.

Example

```
PLIB_OSC_PLLClockLock(OSC_ID_0);
```

5.6.14.6.10.12 PLIB_OSC_PLLClockUnlock Function**C**

```
void PLIB_OSC_PLLClockUnlock(  
    OSC_MODULE_ID index  
);
```

Description

This function unlocks the clock and PLL selection so that the clock and PLL may be modified.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsPLL](#) in your application to determine whether this feature is available.

This function takes care of the register unlock, which is required per the device data sheet. Therefore, the user need not explicitly perform the unlock sequence.

Example

```
PLIB_OSC_PLLClockUnlock(OSC_ID_0);
```

5.6.14.6.10.13 PLIB_OSC_PLLEnable Function**C**

```
void PLIB_OSC_PLLEnable(  
    OSC_MODULE_ID index,  
    OSC_PLL_SELECT selectPLL  
);
```

Description

This function disables the the specified PLL.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
selectPLL	PLL to be enabled. One of the possible values from OSC_PLL_SELECT .

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_OSC_PLLEnable(OSC_ID_0, OSC_PLL_SYSTEM);
```

5.6.14.6.10.14 PLIB_OSC_PLLEnable Function**C**

```
void PLIB_OSC_PLLEnable(  
    OSC_MODULE_ID index,  
    OSC_PLL_SELECT selectPLL  
);
```

Description

This function enables the the specified PLL.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module

selectPLL	PLL to be enabled. One of the possible values from OSC_PLL_SELECT .

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
PLIB_OSC_PLLEnable(OSC_ID_0, OSC_PLL_SYSTEM);
```

5.6.14.6.10.15 PLIB_OSC_PLLIsEnabled Function**C**

```
bool PLIB_OSC_PLLIsEnabled(  
    OSC_MODULE_ID index,  
    OSC_PLL_SELECT selectPLL  
);
```

Description

This function returns 'true' if the specified PLL is enabled.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
selectPLL	PLL to be enabled. One of the possible values from OSC_PLL_SELECT .

Returns

- true - The specified PLL is enabled
- false - The specified PLL is disabled

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability.

Example

```
if (PLIB_OSC_PLLIsEnabled(OSC_ID_0, OSC_PLL_SYSTEM))  
{  
    //Do some action  
}
```

5.6.14.6.10.16 PLIB_OSC_PLLIsLocked Function**C**

```
bool PLIB_OSC_PLLIsLocked(  
    OSC_MODULE_ID index,  
    OSC_PLL_SELECT pllselect  
);
```

Description

This function returns the status of the PLL lock.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
pllselect	Selects the PLL.

Returns

- true - PLL module is in lock or PLL module start-up timer is satisfied
- false - PLL module is out of lock, PLL start-up timer is running, or PLL is disabled

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsPLLLockStatus](#) in your application to determine whether this feature is available.

If the PLL does not stabilize properly during start-up, this function may not reflect the actual status of PLL lock, nor does it detect when the PLL loses lock during normal operation.

Example

```
bool lockPLL_status;  
  
lockPLL_status = PLIB_OSC_PLLIsLocked(OSC_ID_0, OSC_PLL_SYSTEM);
```

5.6.14.6.10.17 PLIB_OSC_SysPLLFrequencyRangeGet Function**C**

```
OSC_SYSPLL_FREQ_RANGE PLIB_OSC_SysPLLFrequencyRangeGet(  
    OSC_MODULE_ID index  
);
```

Description

This function returns the frequency range set for PLL

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module

Returns

PLLFrequencyRange - One of the possible values from [OSC_SYSPLL_FREQ_RANGE](#)

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsSysPLLFrequencyRange](#) in your application to determine whether this feature is available.

Example

```
OSC_SYSPLL_FREQ_RANGE PLLFrequencyRange;  
PLLFrequencyRange = PLIB_OSC_SysPLLFrequencyRangeGet(OSC_ID_0);
```

5.6.14.6.10.18 PLIB_OSC_SysPLLFrequencyRangeSet Function**C**

```
void PLIB_OSC_SysPLLFrequencyRangeSet(  
    OSC_MODULE_ID index,  
    OSC_SYSPLL_FREQ_RANGE PLLFrequencyRange
```

```
);
```

Description

This function sets the frequency range for PLL

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
PLLFrequencyRange	One of the possible values from OSC_SYSPLL_FREQ_RANGE

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsSysPLLFrequencyRange](#) in your application to determine whether this feature is available.

Example

```
PLIB_OSC_SysPLLFrequencyRangeSet(OSC_ID_0, OSC_SYSPLL_FREQ_RANGE_5M_TO_10M);
```

5.6.14.6.10.19 PLIB_OSC_SysPLLInputClockSourceGet Function**C**

```
OSC_SYSPLL_IN_CLK_SOURCE PLIB_OSC_SysPLLInputClockSourceGet(  
    OSC_MODULE_ID index  
);
```

Description

This function returns the input clock source for the PLL module

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module

Returns

PLLInClockSource - One of the possible values from [OSC_SYSPLL_IN_CLK_SOURCE](#)

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsSysPLLInputClockSource](#) in your application to determine whether this feature is available.

Example

```
OSC_SYSPLL_IN_CLK_SOURCE PLLInClockSource;  
PLLInClockSource = PLIB_OSC_SysPLLInputClockSourceGet(OSC_ID_0);
```

5.6.14.6.10.20 PLIB_OSC_SysPLLInputClockSourceSet Function**C**

```
void PLIB_OSC_SysPLLInputClockSourceSet(  

```

```
    OSC_MODULE_ID index,  
    OSC_SYSPLL_IN_CLK_SOURCE PLLInClockSource  
);
```

Description

This function sets the input clock source for the PLL module

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
PLLInClockSource	One of the possible values from OSC_SYSPLL_IN_CLK_SOURCE

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsSysPLLInputClockSource](#) in your application to determine whether this feature is available.

Example

```
PLIB_OSC_SysPLLInputClockSourceSet(OSC_ID_0, OSC_SYSPLL_IN_CLK_SOURCE_FRC);
```

5.6.14.6.10.21 PLIB_OSC_SysPLLInputDivisorGet Function**C**

```
OSC_SYSPLL_IN_DIV PLIB_OSC_SysPLLInputDivisorGet(  
    OSC_MODULE_ID index  
);
```

Description

This function gets the input divisor for the PLL.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module

Returns

One of the possible values from [OSC_SYSPLL_IN_DIV](#).

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsSysPLLInputDivisor](#) in your application to determine whether this feature is available.

Example

```
OSC_SYSPLL_IN_DIV PLLInDiv;  
  
PLLInDiv = PLIB_OSC_SysPLLInputDivisorGet(OSC_ID_0);
```

5.6.14.6.10.22 PLIB_OSC_SysPLLInputDivisorSet Function

C

```
void PLIB_OSC_SysPLLInputDivisorSet(  
    OSC_MODULE_ID index,  
    OSC_SYSPLL_IN_DIV PLLInDiv  
);
```

Description

This function sets the input divider for the PLL to the specified value.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
PLLInDiv	One of the possible values from OSC_SYSPLL_In_DIV

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsSysPLLInputDivisor](#) in your application to determine whether this feature is available.

Example

```
PLIB_OSC_SysPLLInputDivisorSet(OSC_ID_0, OSC_SYSPLL_IN_DIV_1);
```

5.6.14.6.10.23 PLIB_OSC_SysPLLMultiplierGet Function

C

```
OSC_SYSPLL_MULTIPLIER_TYPE PLIB_OSC_SysPLLMultiplierGet(  
    OSC_MODULE_ID index  
);
```

Description

This function gets the PLL multiplier.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module

Returns

One of the possible values of PB clock divisor of type [OSC_SYSPLL_MULTIPLIER_TYPE](#).

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsSysPLLMultiplier](#) in your application to determine whether this feature is available.

Actual Multiplier value will be returned, NOT the 'PLLMULT' field value. Refer the data sheet of the device for the detail.

Example

```
OSC_SYSPLL_MULTIPLIER_TYPE pll_multiply;  
  
pll_multiply = PLIB_OSC_SysPLLMultiplierGet(OSC_ID_0);
```

5.6.14.6.10.24 PLIB_OSC_SysPLLMultiplierSelect Function**C**

```
void PLIB_OSC_SysPLLMultiplierSelect(  
    OSC_MODULE_ID index,  
    OSC_SYSPLL_MULTIPLIER_TYPE pll_multiplier  
);
```

Description

This function sets the PLL multiplier to the specified value.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
pll_multiplier	One of the possible values of PB clock divisor of type OSC_PLL_MUL_TYPE

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsSysPLLMultiplier](#) in your application to determine whether this feature is available.

Use PLL Multiplier value directly for the parameter 'pll_multiplier', NOT the value of the 'PLLMULT' field. Library behaviour is undefined in case of used PLL Multiplier value is not supported by the selected device. Refer the data sheet of the device for the detail.

Example

```
PLIB_OSC_SysPLLMultiplierSelect (OSC_ID_0, 0x08);
```

5.6.14.6.10.25 PLIB_OSC_SysPLLOutputDivisorGet Function**C**

```
OSC_SYSPLL_OUT_DIV PLIB_OSC_SysPLLOutputDivisorGet(  
    OSC_MODULE_ID index  
);
```

Description

This function gets the output divisor for the PLL.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module

Returns

One of the possible values from [OSC_SYSPLL_OUT_DIV](#).

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsSysPLLOutputDivisor](#) in your application to determine whether this feature is available.

Example

```
OSC_SYSPLL_OUT_DIV PLLOutDiv;  
  
PLLOutDiv = PLIB_OSC_SysPLLOutputDivisorGet(OSC_ID_0);
```

5.6.14.6.10.26 PLIB_OSC_SysPLLOutputDivisorSet Function**C**

```
void PLIB_OSC_SysPLLOutputDivisorSet(  
    OSC_MODULE_ID index,  
    OSC_SYSPLL_OUT_DIV PLLOutDiv  
);
```

Description

This function sets the output divider for the PLL to the specified value.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
PLLOutDiv	One of the possible values from OSC_SYSPLL_OUT_DIV

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsSysPLLOutputDivisor](#) in your application to determine whether this feature is available.

Example

```
PLIB_OSC_SysPLLOutputDivisorSelect(OSC_ID_0, OSC_SYSPLL_OUT_DIV_1);
```

5.6.14.6.11 Peripheral Clock Setup Functions**5.6.14.6.11.1 PLIB_OSC_PBClockDivisorGet Function****C**

```
OSC_PB_CLOCK_DIV_TYPE PLIB_OSC_PBClockDivisorGet(  
    OSC_MODULE_ID index,  
    OSC_PERIPHERAL_BUS peripheralBusNumber  
);
```

Description

This function gets the peripheral bus clock divisor.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
peripheralBusNumber	Identifies the desired peripheral bus

Returns

One of the possible values of PB clock divisor of type [OSC_PB_CLOCK_DIV_TYPE](#).

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsPBClockDivisor](#) in your application to determine whether this feature is available.

Actual Divisor value will be returned, NOT the 'PBDIV' field value. Refer the data sheet of the device for the detail.

Example

```
OSC_PB_CLOCK_DIV_TYPE peripheralBusClkDiv;  
  
peripheralBusClkDiv = PLIB_OSC_PBClockDivisorGet(OSC_ID_0,  
                                                  OSC_PERIPHERAL_BUS_1);
```

5.6.14.6.11.2 PLIB_OSC_PBClockDivisorIsReady Function**C**

```
bool PLIB_OSC_PBClockDivisorIsReady(  
    OSC_MODULE_ID index,  
    OSC_PERIPHERAL_BUS peripheralBusNumber  
);
```

Description

This function checks whether the peripheral bus clock divisor is ready to be written.

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
peripheralBusNumber	Identifies the desired peripheral bus

Returns

- true - Peripheral bus clock divisor can be written
- false - Peripheral bus clock divisor cannot be written

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsPBClockReady](#) in your application to determine whether this feature is available.

Example

```
if (PLIB_OSC_PBClockDivisorIsReady(OSC_ID_0, OSC_PERIPHERAL_BUS_1))  
{  
    PLIB_OSC_PBClockDivisorSet (OSC_ID_0, OSC_PERIPHERAL_BUS_1,  
                                0x01);  
}
```

```
}
```

5.6.14.6.11.3 PLIB_OSC_PBClockDivisorSet Function

C

```
void PLIB_OSC_PBClockDivisorSet(  
    OSC_MODULE_ID index,  
    OSC_PERIPHERAL_BUS peripheralBusNumber,  
    OSC_PB_CLOCK_DIV_TYPE peripheralBusClkDiv  
);
```

Description

This function sets the peripheral bus clock divisor to the specified value.

Preconditions

Peripheral bus clock divisor should be ready to be written.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
peripheralBusNumber	Identifies the desired peripheral bus
peripheralBusClkDiv	One of the possible values of PB clock divisor of type OSC_PB_CLOCK_DIV_TYPE

Returns

None.

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsPBClockDivisor](#) in your application to determine whether this feature is available.

Use PB Divider value directly for the parameter 'peripheralBusClkDiv', NOT the value of the 'PBDIV' field. Library behaviour is undefined in case of used PB Divider value is not supported by the selected device. Refer the data sheet of the device for the detail.

Example

```
PLIB_OSC_PBClockDivisorSet (OSC_ID_0, OSC_PERIPHERAL_BUS_1, 0x01);
```

5.6.14.6.11.4 PLIB_OSC_PBOutputClockDisable Function

C

```
void PLIB_OSC_PBOutputClockDisable(  
    OSC_MODULE_ID index,  
    OSC_PERIPHERAL_BUS peripheralBusNumber  
);
```

Description

This function disables the peripheral bus output clock

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
peripheralBusNumber	Identifies the desired peripheral bus

Returns

None

Remarks

The clock for peripheral bus 1 cannot be turned off.

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsPBClockOutputEnable](#) in your application to determine whether this feature is available.

Example

```
PLIB_OSC_PBClockDisable (OSC_ID_0, OSC_PERIPHERAL_BUS_2);
```

5.6.14.6.11.5 PLIB_OSC_PBClockEnable Function

C

```
void PLIB_OSC_PBClockEnable(  
    OSC_MODULE_ID index,  
    OSC_PERIPHERAL_BUS peripheralBusNumber  
);
```

Description

This function enables the peripheral bus output clock

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
peripheralBusNumber	Identifies the desired peripheral bus

Returns

None

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsPBClockOutputEnable](#) in your application to determine whether this feature is available.

Example

```
PLIB_OSC_PBClockEnable (OSC_ID_0, OSC_PERIPHERAL_BUS_2);
```

5.6.14.6.11.6 PLIB_OSC_PBClockIsEnabled Function

C

```
bool PLIB_OSC_PBClockIsEnabled(  
    OSC_MODULE_ID index,  
    OSC_PERIPHERAL_BUS peripheralBusNumber  
);
```

Description

This function checks whether the peripheral bus clock output is enabled or not

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module
peripheralBusNumber	Identifies the desired peripheral bus

Returns

- true - Peripheral bus clock output is enabled
- false - Peripheral bus clock output is disabled

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsPBClockOutputEnable](#) in your application to determine whether this feature is available.

Example

```
if (PLIB_OSC_PBOutputClockIsEnabled(OSC_ID_0, OSC_PERIPHERAL_BUS_2))
{
    PLIB_OSC_PBOutputClockDisable(OSC_ID_0, OSC_PERIPHERAL_BUS_2);
}
```

5.6.14.6.12 Clock Fail Monitoring Functions

5.6.14.6.12.1 PLIB_OSC_ClockHasFailed Function

C

```
bool PLIB_OSC_ClockHasFailed(
    OSC_MODULE_ID index
);
```

Description

This function returns 'true' if the clock fails. Monitors the Fail-Safe Clock Monitor (FSCM).

Preconditions

None.

Parameters

Parameters	Description
index	Identifies the desired oscillator module

Returns

- true - Fail-Safe Clock Monitor (FSCM) detected a clock failure
- false - No clock failure has been detected

Remarks

This feature may not be available on all devices. Please refer to the specific device data sheet to determine availability or use [PLIB_OSC_ExistsClockFail](#) in your application to determine whether this feature is available.

Example

```
bool clockStatus;
clockStatus = PLIB_OSC_ClockHasFailed(OSC_ID_0);
```

5.6.14.6.13 Data Types and Constants

5.6.14.6.13.1 OSC_PB_CLOCK_DIV_TYPE Macro

C

```
#define OSC_PB_CLOCK_DIV_TYPE SFR_TYPE
```

Description

Oscillator Peripheral Bus Clock Divisor Value Type

This macro defines the type of the oscillator PB Clock divisor value.

Remarks

None

5.6.14.6.13.2 OSC_REF_DIVISOR_TYPE Macro

C

```
#define OSC_REF_DIVISOR_TYPE SFR_TYPE
```

Description

Reference oscillator divisor type

This macro defines the reference oscillator divisor type. Please refer to the specific device data sheet to determine the possible values of this type.

Remarks

None.

5.6.14.6.13.3 OSC_REFERENCE_MAX_DIV Macro

C

```
#define OSC_REFERENCE_MAX_DIV 65534
```

Description

Reference clock output divisor maximum

This macro defines the reference clock output divisor maximum value.

Remarks

None

5.6.14.6.13.4 OSC_SYSPLL_MULTIPLIER_TYPE Macro

C

```
#define OSC_SYSPLL_MULTIPLIER_TYPE SFR_TYPE
```

Description

Oscillator System PLL Multiplier Value Type

This macro defines the type of the oscillator system PLL multiplier value.

Remarks

None

5.6.14.6.13.5 OSC_AUX_CLOCK_SOURCE Enumeration

C

```
typedef enum {  
    OSC_AUX_CLOCK_PRIMARY  
} OSC_AUX_CLOCK_SOURCE;
```

Description

AUX PLL Input divider.

This enumeration lists the possible Auxiliary PLL input divider values.

Remarks

This enumeration is processor specific and is defined in the processor- specific header files.

5.6.14.6.13.6 OSC_AUX_MODE Enumeration

C

```
typedef enum {  
    OSC_AUX_MODE_EC,  
    OSC_AUX_MODE_XT,  
    OSC_AUX_MODE_HS,  
    OSC_AUX_DISABLE  
} OSC_AUX_MODE;
```

Description

AUX Oscillator modes.

This enumeration lists the possible Auxiliary Oscillator mode values.

Members

Members	Description
OSC_AUX_MODE_EC	External clock Input
OSC_AUX_MODE_XT	Crystal/resonator
