Document Number: MPC5775E  
Rev. 1, 05/2018

## Contents

| Section number            | Title                        | Page |
|---------------------------|------------------------------|------|
| <b>Chapter 1</b>          |                              |      |
| <b>Preface</b>            |                              |      |
| 1.1                       | Overview.....                | 71   |
| 1.2                       | Device versions.....         | 71   |
| 1.3                       | Audience.....                | 71   |
| 1.4                       | Document organization.....   | 71   |
| 1.5                       | Conventions.....             | 72   |
| 1.5.1                     | Numbering systems.....       | 72   |
| 1.5.2                     | Typographic notation.....    | 72   |
| 1.5.3                     | Special terms.....           | 73   |
| 1.6                       | References.....              | 73   |
| <b>Chapter 2</b>          |                              |      |
| <b>Introduction</b>       |                              |      |
| 2.1                       | Overview.....                | 75   |
| 2.2                       | Device Description.....      | 75   |
| 2.2.1                     | Family comparison.....       | 75   |
| 2.2.2                     | Block diagram.....           | 77   |
| 2.2.3                     | Packages.....                | 78   |
| 2.2.4                     | Features summary.....        | 79   |
| <b>Chapter 3</b>          |                              |      |
| <b>Signal Description</b> |                              |      |
| 3.1                       | Production packages.....     | 81   |
| 3.2                       | Pad ring and ball maps.....  | 81   |
| 3.3                       | Pin function selection.....  | 81   |
| 3.3.1                     | Pad output multiplexing..... | 81   |
| 3.3.2                     | Pin input multiplexing.....  | 81   |
| 3.3.3                     | LVDS signal selection.....   | 82   |

| Section number | Title                                                           | Page |
|----------------|-----------------------------------------------------------------|------|
| 3.4            | External signal descriptions, multiplexing, and attributes..... | 83   |
| 3.4.1          | IBE and OBE control special cases.....                          | 83   |
| 3.4.2          | FCCU signals.....                                               | 90   |

## Chapter 4 Memory Map, Interrupts, and DMA Requests

|     |                                   |     |
|-----|-----------------------------------|-----|
| 4.1 | Memory map.....                   | 93  |
| 4.2 | Interrupt vector assignments..... | 100 |
| 4.3 | DMA request mapping.....          | 120 |

## Chapter 5 Device Configuration Format (DCF) Records

|        |                                                                                      |     |
|--------|--------------------------------------------------------------------------------------|-----|
| 5.1    | Overview.....                                                                        | 125 |
| 5.2    | DCF records in boot sequence.....                                                    | 126 |
| 5.3    | DCF records location.....                                                            | 126 |
| 5.4    | DCF record structure.....                                                            | 126 |
| 5.5    | DCF records sequence.....                                                            | 127 |
| 5.6    | DCF client Chip Select module assignments.....                                       | 129 |
| 5.7    | DCF clients.....                                                                     | 130 |
| 5.7.1  | UTEST Miscellaneous DCF client.....                                                  | 137 |
| 5.7.2  | UTEST Secure Boot Configurations DCF client.....                                     | 140 |
| 5.7.3  | UTEST Secure Boot Code Address DCF client.....                                       | 141 |
| 5.7.4  | UTEST Secure Boot Code Length DCF client.....                                        | 142 |
| 5.7.5  | UTEST Analog External Oscillator (XOSC ANA) DCF client.....                          | 143 |
| 5.7.6  | UTEST Error Functions Pads Configuration DCF client.....                             | 143 |
| 5.7.7  | UTEST Reset Escalation Configuration DCF client.....                                 | 145 |
| 5.7.8  | UTEST PMC Reset Enable Control (REE CTRL) DCF client.....                            | 146 |
| 5.7.9  | UTEST PMC Temperature Sensor Reset Event Enable Control (REE TMPSNS) DCF client..... | 146 |
| 5.7.10 | UTEST PMC Voltage Regulator Enable (VREG ENB) DCF client.....                        | 146 |

## Chapter 6 e200z7 Core Complex Overview

|     |                   |     |
|-----|-------------------|-----|
| 6.1 | Core complex..... | 149 |
|-----|-------------------|-----|

| Section number | Title                         | Page |
|----------------|-------------------------------|------|
| 6.2            | Core0 and Core1 overview..... | 149  |
| 6.3            | Checker core overview.....    | 149  |

## Chapter 7 Platform Coherency Unit (PCU)

|       |                                                                 |     |
|-------|-----------------------------------------------------------------|-----|
| 7.1   | Introduction.....                                               | 151 |
| 7.2   | Memory map and register descriptions.....                       | 151 |
| 7.2.1 | PCU Configuration and Error Status Register (PCU_CESR).....     | 152 |
| 7.2.2 | PCU Error Address Register, Core n (PCU_EAR <sub>n</sub> )..... | 156 |
| 7.2.3 | PCU Error Detail Register, Core n (PCU_EDR <sub>n</sub> ).....  | 157 |
| 7.2.4 | PCU Interrupt Register, Core n (PCU_IR <sub>n</sub> ).....      | 158 |

## Chapter 8 System Integration Unit (SIU, SIU\_B)

|        |                                                         |     |
|--------|---------------------------------------------------------|-----|
| 8.1    | Introduction.....                                       | 161 |
| 8.1.1  | Block diagram.....                                      | 161 |
| 8.1.2  | Overview.....                                           | 162 |
| 8.1.3  | Modes of operation.....                                 | 163 |
| 8.2    | Memory Map and Register Definition.....                 | 164 |
| 8.2.1  | MCU Identification Register (SIU_MIDR).....             | 217 |
| 8.2.2  | Reset Status Register (SIU_RSR).....                    | 218 |
| 8.2.3  | System Reset Control Register (SIU_SRCR).....           | 221 |
| 8.2.4  | External IRQ Status Register (SIU_EISR).....            | 222 |
| 8.2.5  | DMA/Interrupt Request Enable Register (SIU_DIRER).....  | 225 |
| 8.2.6  | DMA/Interrupt Request Select Register (SIU_DIRSR).....  | 228 |
| 8.2.7  | Overrun Status Register (SIU_OSR).....                  | 230 |
| 8.2.8  | Overrun Request Enable Register (SIU_ORER).....         | 232 |
| 8.2.9  | IRQ Rising-Edge Event Enable Register (SIU_IREER).....  | 234 |
| 8.2.10 | IRQ Falling-Edge Event Enable Register (SIU_IFEER)..... | 236 |
| 8.2.11 | IRQ Digital Filter Register (SIU_IDFR).....             | 239 |
| 8.2.12 | IRQ Filtered Input Register (SIU_IFIR).....             | 239 |

| Section number | Title                                                                          | Page |
|----------------|--------------------------------------------------------------------------------|------|
| 8.2.13         | Pad Configuration Register (SIU_PCR $n$ ).....                                 | 241  |
| 8.2.14         | GPIO Pin Data Output Register (SIU_GPDO $n$ ).....                             | 244  |
| 8.2.15         | GPIO Pin Data Input Register (legacy) (SIU_GPDInL).....                        | 245  |
| 8.2.16         | External IRQ Input Select Register (SIU_EIISR).....                            | 246  |
| 8.2.17         | DSPI Input Select Register (SIU_DISR).....                                     | 248  |
| 8.2.18         | eQADC Command FIFO Trigger Source Registers (SIU_ISEL4).....                   | 250  |
| 8.2.19         | eQADC Command FIFO Trigger Source Registers (SIU_ISEL5).....                   | 255  |
| 8.2.20         | eQADC Command FIFO Trigger Source Registers (SIU_ISEL6).....                   | 258  |
| 8.2.21         | eQADC Command FIFO Trigger Source Registers (SIU_ISEL7).....                   | 262  |
| 8.2.22         | eTPU_A Input Select Register (SIU_ISEL8).....                                  | 265  |
| 8.2.23         | eQADC Advance Trigger Source Register (SIU_ISEL9).....                         | 266  |
| 8.2.24         | Sigma-Delta Gate Selection Register (SIU_SDGATE_SEL).....                      | 269  |
| 8.2.25         | Sigma-Delta to eTPU_A Connection Configuration Register (SIU_SDETPUA).....     | 270  |
| 8.2.26         | Sigma-Delta to eTPU_B Connection Configuration Register (SIU_SDETPUB).....     | 273  |
| 8.2.27         | Sigma-Delta to eTPU_C Connection Configuration Register (SIU_SDETPUC).....     | 275  |
| 8.2.28         | Trigger Burst Generator Control Registers for eQADC_A (SIU_TBG_CR_A $n$ )..... | 278  |
| 8.2.29         | Trigger Burst Generator Control Registers for eQADC_B (SIU_TBG_CR_B $n$ )..... | 279  |
| 8.2.30         | External Clock Control Register (SIU_ECCR).....                                | 280  |
| 8.2.31         | System Clock Register (SIU_SYSDIV).....                                        | 281  |
| 8.2.32         | Halt Register 1 (SIU_HLT1).....                                                | 284  |
| 8.2.33         | Halt Acknowledge Register 1 (SIU_HLTACK1).....                                 | 288  |
| 8.2.34         | Core0 Reset Vector Register (SIU_RSTVEC0).....                                 | 291  |
| 8.2.35         | Core1 Reset Vector Register (SIU_RSTVEC1).....                                 | 292  |
| 8.2.36         | Core0 PID mapping control register (SIU_C0PID).....                            | 294  |
| 8.2.37         | Core1 PID mapping control register (SIU_C1PID).....                            | 295  |
| 8.2.38         | Halt Register 2 (SIU_HLT2).....                                                | 296  |
| 8.2.39         | Halt Acknowledge Register 2 (SIU_HLTACK2).....                                 | 299  |
| 8.2.40         | Sigma-Delta Clock Configuration Register (SIU_SDCLKCFG).....                   | 301  |
| 8.2.41         | Reset Configuration Register (SIU_RCR).....                                    | 302  |

| Section number | Title                                                                      | Page |
|----------------|----------------------------------------------------------------------------|------|
| 8.2.42         | Lock-Step Status Register (SIU_LOCKSTEP).....                              | 302  |
| 8.2.43         | Progressive Clock Switch Interrupt Enable Register (SIU_PCSER).....        | 303  |
| 8.2.44         | Progressive Clock Switch Interrupt Flag Register (SIU_PCSIFR).....         | 304  |
| 8.2.45         | Fast Ethernet Controller Control Register (SIU_FECCR).....                 | 305  |
| 8.2.46         | ECC Error Injection Register (SIU_ECCEIR).....                             | 305  |
| 8.2.47         | Parallel GPIO Pin Data Output Registers (SIU_PGPDOn).....                  | 306  |
| 8.2.48         | Parallel GPIO Pin Data Input Registers (SIU_PGPDIn).....                   | 310  |
| 8.2.49         | Masked Parallel GPIO Pin Data Output Registers (SIU_MPGPDOn).....          | 314  |
| 8.2.50         | Mask-Output High Register (SIU_DSPIInH).....                               | 318  |
| 8.2.51         | Mask-Output Low Register (SIU_DSPIInL).....                                | 322  |
| 8.2.52         | Serialized Output Signal Selection Register for DSPI_A (SIU_ETPUBA).....   | 327  |
| 8.2.53         | Serialized Output Signal Selection Register for DSPI_A (SIU_EMIOSA).....   | 331  |
| 8.2.54         | Serialized Output Signal Selection Register for DSPI_A (SIU_DSPIAHLA)..... | 334  |
| 8.2.55         | Serialized Output Signal Selection Register for DSPI_B (SIU_ETPUAB).....   | 338  |
| 8.2.56         | Serialized Output Signal Selection Register for DSPI_B (SIU_EMIOSB).....   | 342  |
| 8.2.57         | Serialized Output Signal Selection Register for DSPI_B (SIU_DSPIBHLB)..... | 346  |
| 8.2.58         | Serialized Output Signal Selection Register for DSPI_C (SIU_ETPUAC).....   | 350  |
| 8.2.59         | Serialized Output Signal Selection Register for DSPI_C (SIU_EMIOSC).....   | 353  |
| 8.2.60         | Serialized Output Signal Selection Register for DSPI_C (SIU_DSPICHLA)..... | 357  |
| 8.2.61         | Serialized Output Signal Selection Register for DSPI_C (SIU_ETPUBC).....   | 361  |
| 8.2.62         | Serialized Output Signal Selection Register for DSPI_D (SIU_ETPUBD).....   | 365  |
| 8.2.63         | Serialized Output Signal Selection Register for DSPI_D (SIU_EMIOSD).....   | 367  |
| 8.2.64         | Serialized Output Signal Selection Register for DSPI_D (SIU_DSPIDHLD)..... | 368  |
| 8.2.65         | GPIO Pin Data Input Register (SIU_GPDIn).....                              | 372  |
| 8.2.66         | Input Multiplexing Register0 (SIU_IMUX0).....                              | 373  |
| 8.2.67         | Input Multiplexing Register1 (SIU_IMUX1).....                              | 375  |
| 8.2.68         | Input Multiplexing Register2 (SIU_IMUX2).....                              | 376  |
| 8.2.69         | Input Multiplexing Register3 (SIU_IMUX3).....                              | 378  |
| 8.2.70         | Input Multiplexing Register4 (SIU_IMUX4).....                              | 379  |

| Section number | Title                                                                   | Page |
|----------------|-------------------------------------------------------------------------|------|
| 8.2.71         | Input Multiplexing Register5 (SIU_IMUX5).....                           | 381  |
| 8.2.72         | Input Multiplexing Register7 (SIU_IMUX7).....                           | 383  |
| 8.2.73         | Input Multiplexing Register10 (SIU_IMUX10).....                         | 385  |
| 8.2.74         | Input Multiplexing Register12 (SIU_IMUX12).....                         | 387  |
| 8.3            | SIU_B.....                                                              | 388  |
| 8.3.1          | Pad Configuration Register Mirrored (SIU_B_PCRnM).....                  | 389  |
| 8.3.2          | GPIO Pin Data Output Register Mirrored (SIU_B_GPDO <sub>n</sub> M)..... | 392  |
| 8.3.3          | GPIO Pin Data Input Register Mirrored (SIU_B_GPDI <sub>n</sub> M).....  | 393  |
| 8.4            | Functional Description.....                                             | 394  |
| 8.4.1          | Pad configuration.....                                                  | 394  |
| 8.4.2          | Interrupts.....                                                         | 394  |
| 8.4.3          | General Purpose I/O (GPIO).....                                         | 398  |
| 8.4.4          | Pin serialization for DSPI.....                                         | 398  |
| 8.4.5          | Internal multiplexing.....                                              | 400  |
| 8.4.6          | Trigger Burst Generators (TBG).....                                     | 401  |

## Chapter 9 Crossbar Switch (XBAR)

|       |                                                                     |     |
|-------|---------------------------------------------------------------------|-----|
| 9.1   | Chip-specific XBAR information.....                                 | 407 |
| 9.1.1 | XBAR master and slave assignments.....                              | 407 |
| 9.1.2 | Unimplemented PRS <sub>n</sub> and CRS <sub>n</sub> registers.....  | 408 |
| 9.1.3 | Reset value of PRS <sub>n</sub> and CRS <sub>n</sub> registers..... | 408 |
| 9.1.4 | Master priority elevation.....                                      | 409 |
| 9.2   | Introduction.....                                                   | 411 |
| 9.2.1 | Features.....                                                       | 411 |
| 9.3   | Memory Map / Register Definition.....                               | 411 |
| 9.3.1 | Priority Registers Slave (XBAR_PRS <sub>n</sub> ).....              | 412 |
| 9.3.2 | Control Register (XBAR_CRS <sub>n</sub> ).....                      | 415 |
| 9.4   | Functional Description.....                                         | 418 |
| 9.4.1 | General operation.....                                              | 418 |

| Section number | Title                                       | Page |
|----------------|---------------------------------------------|------|
| 9.4.2          | Register coherency.....                     | 419  |
| 9.4.3          | Arbitration.....                            | 419  |
| 9.5            | Initialization/application information..... | 421  |

## Chapter 10 Crossbar Integrity Checker (XBIC)

|        |                                               |     |
|--------|-----------------------------------------------|-----|
| 10.1   | Chip-specific XBIC information.....           | 423 |
| 10.1.1 | XBIC master and slave assignments.....        | 423 |
| 10.1.2 | Unimplemented MCR and ESR fields.....         | 423 |
| 10.2   | Overview.....                                 | 423 |
| 10.3   | Features.....                                 | 423 |
| 10.4   | Block diagram.....                            | 424 |
| 10.5   | External signal description.....              | 424 |
| 10.6   | Memory map and register definition.....       | 425 |
| 10.6.1 | XBIC Module Control Register (XBIC_MCR).....  | 425 |
| 10.6.2 | XBIC Error Injection Register (XBIC_EIR)..... | 427 |
| 10.6.3 | XBIC Error Status Register (XBIC_ESR).....    | 428 |
| 10.6.4 | XBIC Error Address Register (XBIC_EAR).....   | 430 |
| 10.7   | Functional description.....                   | 431 |

## Chapter 11 Peripheral Bridge (AIPS/PBRIDGE)

|        |                                                  |     |
|--------|--------------------------------------------------|-----|
| 11.1   | Chip-specific AIPS/PBRIDGE information.....      | 433 |
| 11.1.1 | Modules assigned to PACRn and OPACRn fields..... | 433 |
| 11.1.2 | AIPS/PBRIDGE register reset values.....          | 436 |
| 11.2   | Introduction.....                                | 437 |
| 11.2.1 | Features.....                                    | 437 |
| 11.2.2 | General operation.....                           | 437 |
| 11.3   | Memory map/register definition.....              | 437 |
| 11.3.1 | Master Privilege Register A (AIPS_MPRA).....     | 438 |
| 11.3.2 | Master Privilege Register B (AIPS_MPRB).....     | 442 |

| Section number | Title                                                                           | Page |
|----------------|---------------------------------------------------------------------------------|------|
| 11.3.3         | Peripheral Access Control Register (AIPS_PACR <sub>n</sub> ).....               | 444  |
| 11.3.4         | Off-Platform Peripheral Access Control Register (AIPS_OPACR <sub>n</sub> )..... | 449  |
| 11.4           | Functional description.....                                                     | 454  |
| 11.4.1         | Access support.....                                                             | 454  |

## Chapter 12 Platform Configuration Module (PCM)

|        |                                                                  |     |
|--------|------------------------------------------------------------------|-----|
| 12.1   | PCM memory map and register descriptions.....                    | 455 |
| 12.1.1 | FEC Burst Optimization Master Control Register (PCM_FBOMCR)..... | 456 |
| 12.1.2 | Bus Bridge Configuration Register 1 (PCM_IAHB_BE1).....          | 457 |
| 12.1.3 | Bus Bridge Configuration Register 2 (PCM_IAHB_BE2).....          | 460 |

## Chapter 13 Semaphores (SEMA4)

|         |                                                 |     |
|---------|-------------------------------------------------|-----|
| 13.1    | Introduction .....                              | 463 |
| 13.1.1  | Multi-Core Programming 101: Software Gates..... | 463 |
| 13.1.2  | Overview.....                                   | 465 |
| 13.1.3  | Features.....                                   | 466 |
| 13.1.4  | Modes of Operation.....                         | 467 |
| 13.2    | External Signal Description.....                | 467 |
| 13.3    | Memory map and register definition.....         | 468 |
| 13.3.1  | Semaphores Gate 0 Register (SEMA4_Gate00).....  | 469 |
| 13.3.2  | Semaphores Gate 1 Register (SEMA4_Gate01).....  | 470 |
| 13.3.3  | Semaphores Gate 2 Register (SEMA4_Gate02).....  | 471 |
| 13.3.4  | Semaphores Gate 3 Register (SEMA4_Gate03).....  | 472 |
| 13.3.5  | Semaphores Gate 4 Register (SEMA4_Gate04).....  | 473 |
| 13.3.6  | Semaphores Gate 5 Register (SEMA4_Gate05).....  | 474 |
| 13.3.7  | Semaphores Gate 6 Register (SEMA4_Gate06).....  | 475 |
| 13.3.8  | Semaphores Gate 7 Register (SEMA4_Gate07).....  | 476 |
| 13.3.9  | Semaphores Gate 8 Register (SEMA4_Gate08).....  | 477 |
| 13.3.10 | Semaphores Gate 9 Register (SEMA4_Gate09).....  | 478 |

| Section number | Title                                                              | Page |
|----------------|--------------------------------------------------------------------|------|
| 13.3.11        | Semaphores Gate 10 Register (SEMA4_Gate10).....                    | 479  |
| 13.3.12        | Semaphores Gate 11 Register (SEMA4_Gate11).....                    | 480  |
| 13.3.13        | Semaphores Gate 12 Register (SEMA4_Gate12).....                    | 481  |
| 13.3.14        | Semaphores Gate 13 Register (SEMA4_Gate13).....                    | 482  |
| 13.3.15        | Semaphores Gate 14 Register (SEMA4_Gate14).....                    | 483  |
| 13.3.16        | Semaphores Gate 15 Register (SEMA4_Gate15).....                    | 484  |
| 13.3.17        | Semaphores Processor n IRQ Notification Enable (SEMA4_CPnINE)..... | 485  |
| 13.3.18        | Semaphores Processor n IRQ Notification (SEMA4_CPnNTF).....        | 487  |
| 13.3.19        | Semaphores (Secure) Reset Gate n (SEMA4_RSTGT).....                | 488  |
| 13.3.20        | Semaphores (Secure) Reset IRQ Notification (SEMA4_RSTNTF).....     | 490  |
| 13.4           | Functional Description.....                                        | 491  |
| 13.4.1         | SEMA4_GATEn Operation.....                                         | 491  |
| 13.4.2         | SEMA4_CPnNTF Operation.....                                        | 493  |
| 13.5           | Initialization Information.....                                    | 496  |
| 13.6           | Application Information.....                                       | 496  |

## Chapter 14 Memory Protection Unit (MPU)

|        |                                                      |     |
|--------|------------------------------------------------------|-----|
| 14.1   | Chip-specific MPU information.....                   | 499 |
| 14.1.1 | MPU master and slave assignments.....                | 499 |
| 14.1.2 | MPU register reset values.....                       | 500 |
| 14.2   | Introduction.....                                    | 500 |
| 14.3   | Overview.....                                        | 500 |
| 14.3.1 | Block diagram.....                                   | 500 |
| 14.3.2 | Features.....                                        | 501 |
| 14.4   | Memory map/register definition.....                  | 502 |
| 14.4.1 | Control/Error Status Register (MPU_CESR).....        | 505 |
| 14.4.2 | Error Address Register, slave port n (MPU_EARn)..... | 506 |
| 14.4.3 | Error Detail Register, slave port n (MPU_EDRn).....  | 507 |
| 14.4.4 | Region Descriptor n, Word 0 (MPU_RGDn_WORD0).....    | 508 |

| Section number | Title                                                           | Page |
|----------------|-----------------------------------------------------------------|------|
| 14.4.5         | Region Descriptor n, Word 1 (MPU_RGDn_WORD1).....               | 508  |
| 14.4.6         | Region Descriptor n, Word 2 (MPU_RGDn_WORD2).....               | 509  |
| 14.4.7         | Region Descriptor n, Word 3 (MPU_RGDn_WORD3).....               | 512  |
| 14.4.8         | Region Descriptor Alternate Access Control n (MPU_RGDAACn)..... | 513  |
| 14.5           | Functional description.....                                     | 515  |
| 14.5.1         | Access evaluation macro.....                                    | 515  |
| 14.5.2         | Putting it all together and error terminations.....             | 517  |
| 14.5.3         | Power management.....                                           | 517  |
| 14.6           | Initialization information.....                                 | 518  |
| 14.7           | Application information.....                                    | 518  |

## Chapter 15 Interrupt Controller (INTC)

|        |                                                                                   |     |
|--------|-----------------------------------------------------------------------------------|-----|
| 15.1   | Chip-specific INTC information.....                                               | 521 |
| 15.2   | Introduction.....                                                                 | 521 |
| 15.3   | Block diagram.....                                                                | 522 |
| 15.4   | Features.....                                                                     | 524 |
| 15.5   | Modes of operation.....                                                           | 524 |
| 15.5.1 | Software vector mode.....                                                         | 524 |
| 15.5.2 | Hardware vector mode.....                                                         | 527 |
| 15.6   | External signal description.....                                                  | 528 |
| 15.7   | Memory map and register definition.....                                           | 528 |
| 15.7.1 | INTC Module Configuration Register (INTC_MCR).....                                | 543 |
| 15.7.2 | INTC Current Priority Register for Processor <i>n</i> (INTC_CPR_PRCn).....        | 544 |
| 15.7.3 | INTC Interrupt Acknowledge Register for Processor <i>n</i> (INTC_IACKR_PRCn)..... | 545 |
| 15.7.4 | INTC End Of Interrupt Register for Processor <i>n</i> (INTC_EOIR_PRCn).....       | 546 |
| 15.7.5 | INTC Software Set/Clear Interrupt Register (INTC_SSCIRn).....                     | 547 |
| 15.7.6 | INTC Priority Select Register (INTC_PSRn).....                                    | 548 |

| Section number | Title                                                              | Page |
|----------------|--------------------------------------------------------------------|------|
| 15.8           | Functional description.....                                        | 548  |
| 15.8.1         | Interrupt request sources.....                                     | 549  |
| 15.8.2         | Priority management.....                                           | 550  |
| 15.8.3         | Handshaking with processor.....                                    | 552  |
| 15.9           | Initialization/application information.....                        | 555  |
| 15.9.1         | Initialization flow.....                                           | 555  |
| 15.9.2         | Interrupt exception handler.....                                   | 556  |
| 15.9.3         | ISR, RTOS, and task hierarchy.....                                 | 557  |
| 15.9.4         | Order of execution.....                                            | 558  |
| 15.9.5         | Priority ceiling protocol.....                                     | 559  |
| 15.9.6         | Selecting priorities according to request rates and deadlines..... | 562  |
| 15.9.7         | Software-settable interrupt requests.....                          | 563  |
| 15.9.8         | Lowering priority within an ISR.....                               | 564  |
| 15.9.9         | Negating an interrupt request outside of its ISR.....              | 564  |
| 15.9.10        | Examining LIFO contents.....                                       | 565  |
| 15.10          | Interrupt sources.....                                             | 566  |

## Chapter 16

### Direct Memory Access Controller (eDMA)

|        |                                     |     |
|--------|-------------------------------------|-----|
| 16.1   | Chip-specific eDMA information..... | 567 |
| 16.2   | Introduction.....                   | 567 |
| 16.2.1 | eDMA system block diagram.....      | 567 |
| 16.2.2 | Block parts.....                    | 568 |
| 16.2.3 | Features.....                       | 569 |
| 16.3   | Modes of operation.....             | 570 |
| 16.4   | Memory map/register definition..... | 571 |
| 16.4.1 | TCD memory.....                     | 571 |
| 16.4.2 | TCD initialization.....             | 571 |
| 16.4.3 | TCD structure.....                  | 572 |
| 16.4.4 | Reserved memory and bit fields..... | 572 |

| Section number | Title                                                                                                                        | Page |
|----------------|------------------------------------------------------------------------------------------------------------------------------|------|
| 16.4.5         | Control Register (DMA_CR).....                                                                                               | 623  |
| 16.4.6         | Error Status Register (DMA_ES).....                                                                                          | 626  |
| 16.4.7         | Enable Request Register High (DMA_ERQH).....                                                                                 | 629  |
| 16.4.8         | Enable Request Register Low (DMA_ERQL).....                                                                                  | 632  |
| 16.4.9         | Enable Error Interrupt Register High (DMA_EEIH).....                                                                         | 636  |
| 16.4.10        | Enable Error Interrupt Register Low (DMA_EEIL).....                                                                          | 639  |
| 16.4.11        | Set Enable Request Register (DMA_SERQ).....                                                                                  | 643  |
| 16.4.12        | Clear Enable Request Register (DMA_CERQ).....                                                                                | 643  |
| 16.4.13        | Set Enable Error Interrupt Register (DMA_SEEI).....                                                                          | 644  |
| 16.4.14        | Clear Enable Error Interrupt Register (DMA_CEEI).....                                                                        | 645  |
| 16.4.15        | Clear Interrupt Request Register (DMA_CINT).....                                                                             | 646  |
| 16.4.16        | Clear Error Register (DMA_CERR).....                                                                                         | 647  |
| 16.4.17        | Set START Bit Register (DMA_SSRT).....                                                                                       | 648  |
| 16.4.18        | Clear DONE Status Bit Register (DMA_CDNE).....                                                                               | 649  |
| 16.4.19        | Interrupt Request Register High (DMA_INTH).....                                                                              | 649  |
| 16.4.20        | Interrupt Request Register Low (DMA_INTL).....                                                                               | 653  |
| 16.4.21        | Error Register High (DMA_ERRH).....                                                                                          | 657  |
| 16.4.22        | Error Register Low (DMA_ERRL).....                                                                                           | 661  |
| 16.4.23        | Hardware Request Status Register High (DMA_HRSH).....                                                                        | 664  |
| 16.4.24        | Hardware Request Status Register Low (DMA_HRSL).....                                                                         | 668  |
| 16.4.25        | Global PCU Output Register (DMA_GPOR <sub>n</sub> ).....                                                                     | 672  |
| 16.4.26        | Channel n Priority Register (DMA_DCHPRIn).....                                                                               | 673  |
| 16.4.27        | TCD Source Address (DMA_TCD <sub>n</sub> _SADDR).....                                                                        | 674  |
| 16.4.28        | TCD Transfer Attributes (DMA_TCD <sub>n</sub> _ATTR).....                                                                    | 674  |
| 16.4.29        | TCD Signed Source Address Offset (DMA_TCD <sub>n</sub> _SOFF).....                                                           | 675  |
| 16.4.30        | TCD Minor Byte Count (Minor Loop Mapping Disabled) (DMA_TCD <sub>n</sub> _NBYTES_MLNO).....                                  | 675  |
| 16.4.31        | TCD Signed Minor Loop Offset (Minor Loop Mapping Enabled and Offset Disabled)<br>(DMA_TCD <sub>n</sub> _NBYTES_MLOFFNO)..... | 676  |

| Section number | Title                                                                                                       | Page |
|----------------|-------------------------------------------------------------------------------------------------------------|------|
| 16.4.32        | TCD Signed Minor Loop Offset (Minor Loop Mapping and Offset Enabled)<br>(DMA_TCDn_NBYTES_MLOFFYES).....     | 677  |
| 16.4.33        | TCD Last Source Address Adjustment (DMA_TCDn_SLAST).....                                                    | 678  |
| 16.4.34        | TCD Destination Address (DMA_TCDn_DADDR).....                                                               | 679  |
| 16.4.35        | TCD Current Minor Loop Link, Major Loop Count (Channel Linking Enabled)<br>(DMA_TCDn_CITER_ELINKYES).....   | 679  |
| 16.4.36        | TCD Current Minor Loop Link, Major Loop Count (Channel Linking Disabled)<br>(DMA_TCDn_CITER_ELINKNO).....   | 680  |
| 16.4.37        | TCD Signed Destination Address Offset (DMA_TCDn_DOFF).....                                                  | 681  |
| 16.4.38        | TCD Last Destination Address Adjustment/Scatter Gather Address (DMA_TCDn_DLASTSGA).....                     | 682  |
| 16.4.39        | TCD Beginning Minor Loop Link, Major Loop Count (Channel Linking Enabled)<br>(DMA_TCDn_BITER_ELINKYES)..... | 682  |
| 16.4.40        | TCD Beginning Minor Loop Link, Major Loop Count (Channel Linking Disabled)<br>(DMA_TCDn_BITER_ELINKNO)..... | 683  |
| 16.4.41        | TCD Control and Status (DMA_TCDn_CSR).....                                                                  | 684  |
| 16.5           | Functional description.....                                                                                 | 686  |
| 16.5.1         | eDMA basic data flow.....                                                                                   | 686  |
| 16.5.2         | Fault reporting and handling.....                                                                           | 689  |
| 16.5.3         | Channel preemption.....                                                                                     | 692  |
| 16.5.4         | Performance.....                                                                                            | 692  |
| 16.6           | Initialization/application information.....                                                                 | 697  |
| 16.6.1         | eDMA initialization.....                                                                                    | 697  |
| 16.6.2         | Programming errors.....                                                                                     | 699  |
| 16.6.3         | Arbitration mode considerations.....                                                                        | 700  |
| 16.6.4         | Performing DMA transfers.....                                                                               | 702  |
| 16.6.5         | Monitoring transfer descriptor status.....                                                                  | 706  |
| 16.6.6         | Channel Linking.....                                                                                        | 708  |

| Section number | Title                                                                   | Page |
|----------------|-------------------------------------------------------------------------|------|
| 16.6.7         | Dynamic programming.....                                                | 709  |
| 16.6.8         | Suspend/resume a DMA channel with active hardware service requests..... | 712  |

## Chapter 17 Error Injection Module (EIM)

|        |                                                                   |     |
|--------|-------------------------------------------------------------------|-----|
| 17.1   | Chip-specific EIM information.....                                | 715 |
| 17.1.1 | EIM channels.....                                                 | 715 |
| 17.1.2 | EIM channel assignments.....                                      | 715 |
| 17.1.3 | EIM_EICHDN_Word register bit mapping.....                         | 716 |
| 17.2   | Introduction.....                                                 | 716 |
| 17.2.1 | Overview.....                                                     | 717 |
| 17.2.2 | Features.....                                                     | 718 |
| 17.3   | Memory map and register definition.....                           | 718 |
| 17.3.1 | Error Injection Module Configuration Register (EIM_EIMCR).....    | 720 |
| 17.3.2 | Error Injection Channel Enable register (EIM_EICHEN).....         | 721 |
| 17.3.3 | Error Injection Channel Descriptor, Word0 (EIM_EICHDN_WORD0)..... | 723 |
| 17.3.4 | Error Injection Channel Descriptor, Word1 (EIM_EICHDN_WORD1)..... | 724 |
| 17.3.5 | Error Injection Channel Descriptor, Word2 (EIM_EICHDN_WORD2)..... | 724 |
| 17.4   | Functional description.....                                       | 725 |
| 17.4.1 | Error injection scenarios.....                                    | 725 |

## Chapter 18 Error Reporting Module (ERM)

|        |                                                       |     |
|--------|-------------------------------------------------------|-----|
| 18.1   | Chip-specific ERM information.....                    | 727 |
| 18.1.1 | ERM memory channels.....                              | 727 |
| 18.1.2 | Sources of memory error events.....                   | 727 |
| 18.1.3 | Managing single-bit faults of TCD RAM for eDMA_A..... | 728 |
| 18.2   | Introduction.....                                     | 728 |
| 18.2.1 | Overview.....                                         | 728 |
| 18.2.2 | Features.....                                         | 729 |

| Section number | Title                                                                          | Page |
|----------------|--------------------------------------------------------------------------------|------|
| 18.3           | Memory map and register definition.....                                        | 729  |
| 18.3.1         | ERM Configuration Register (ERM_CR0).....                                      | 731  |
| 18.3.2         | ERM Configuration Register (ERM_CR1).....                                      | 734  |
| 18.3.3         | ERM Configuration Register (ERM_CR2).....                                      | 737  |
| 18.3.4         | ERM Status Register (ERM_SR0).....                                             | 740  |
| 18.3.5         | ERM Status Register (ERM_SR1).....                                             | 744  |
| 18.3.6         | ERM Status Register (ERM_SR2).....                                             | 748  |
| 18.3.7         | ERM Memory <i>n</i> Error Address Register (ERM_EAR <sub><i>n</i></sub> )..... | 750  |

| 18.4           | Functional description.....                                                    | 751  |
| 18.4.1         | Single-bit correction events.....                                              | 751  |
| 18.4.2         | Non-correctable error events.....                                              | 752  |
| 18.5           | Initialization.....                                                            | 753  |

## Chapter 19 Clocking

|        |                                    |     |
|--------|------------------------------------|-----|
| 19.1   | Introduction.....                  | 755 |
| 19.2   | Clock generation.....              | 756 |
| 19.3   | SIU registers.....                 | 757 |
| 19.4   | Operating frequencies.....         | 758 |
| 19.5   | Default clock configuration.....   | 759 |
| 19.6   | Clock sources.....                 | 760 |
| 19.6.1 | 16 MHz RC oscillator (IRC).....    | 760 |
| 19.6.2 | External oscillator (XOSC).....    | 760 |
| 19.6.3 | PLL.....                           | 761 |
| 19.7   | Clock gating.....                  | 764 |
| 19.8   | Core and on-platform clocking..... | 765 |
| 19.9   | Peripheral clocks.....             | 766 |
| 19.9.1 | eTPU clocking.....                 | 767 |
| 19.9.2 | FlexCAN and MCAN clocking.....     | 768 |

| Section number | Title                                     | Page |
|----------------|-------------------------------------------|------|
| 19.9.3         | Ethernet clocking.....                    | 768  |
| 19.9.4         | SDADC clocking.....                       | 768  |
| 19.10          | Serial boot clocking.....                 | 769  |
| 19.11          | MCKO.....                                 | 769  |
| 19.12          | CLKOUT / ENGCLK.....                      | 769  |
| 19.13          | Clock monitoring.....                     | 770  |
| 19.13.1        | CMU-monitored clocks.....                 | 770  |
| 19.13.2        | CMU_0 configuration.....                  | 770  |
| 19.13.3        | CMU_1 to CMU_8 configuration.....         | 771  |
| 19.13.4        | CMU output signals to FCCU and INTC.....  | 773  |
| 19.13.5        | CMU register and field availability ..... | 773  |
| 19.13.6        | CMU_0_CSR reset value.....                | 774  |
| 19.13.7        | CMU use restrictions.....                 | 774  |
| 19.13.8        | Loss-of-clock behavior.....               | 774  |
| 19.14          | PLL loss of lock interrupt.....           | 775  |
| 19.15          | Debug mode.....                           | 775  |

## Chapter 20

### Progressive Clock Switch (PCS)

|        |                                                       |     |
|--------|-------------------------------------------------------|-----|
| 20.1   | Introduction.....                                     | 777 |
| 20.2   | Block diagram.....                                    | 777 |
| 20.3   | Features.....                                         | 777 |
| 20.4   | Memory map and register definition.....               | 778 |
| 20.4.1 | PCS Switch Duration Register (PCS_SDUR).....          | 779 |
| 20.4.2 | PCS Divider Change Register for XOSC (PCS_DIVC1)..... | 779 |
| 20.4.3 | PCS Divider End Register for XOSC (PCS_DIVE1).....    | 780 |
| 20.4.4 | PCS Divider Start Register for XOSC (PCS_DIVS1).....  | 780 |
| 20.4.5 | PCS Divider Change Register for PLL1 (PCS_DIVC2)..... | 781 |
| 20.4.6 | PCS Divider End Register for PLL1 (PCS_DIVE2).....    | 782 |
| 20.4.7 | PCS Divider Start Register for PLL1 (PCS_DIVS2).....  | 782 |

| Section number | Title                                                 | Page |
|----------------|-------------------------------------------------------|------|
| 20.4.8         | PCS Divider Change Register for PLL0 (PCS_DIVC3)..... | 783  |
| 20.4.9         | PCS Divider End Register for PLL0 (PCS_DIVE3).....    | 783  |
| 20.4.10        | PCS Divider Start Register for PLL0 (PCS_DIVS3).....  | 784  |
| 20.5           | Functional description.....                           | 785  |
| 20.5.1         | Generic clock change requirements.....                | 786  |
| 20.5.2         | Configuration of PCS_SDUR.....                        | 786  |
| 20.5.3         | Configuration of PCS_DIVCn[RATE].....                 | 786  |
| 20.5.4         | Generic clock change properties.....                  | 787  |
| 20.5.5         | Clock ramp-down.....                                  | 787  |
| 20.5.6         | Clock ramp-up.....                                    | 788  |

## Chapter 21

### Dual PLL Digital Interface (PLLDIG)

|        |                                                                |     |
|--------|----------------------------------------------------------------|-----|
| 21.1   | Chip-specific PLLDIG information.....                          | 791 |
| 21.2   | Introduction.....                                              | 791 |
| 21.3   | Acronyms and Abbreviations.....                                | 791 |
| 21.4   | Block Diagram.....                                             | 792 |
| 21.5   | Features.....                                                  | 792 |
| 21.6   | Modes of operation.....                                        | 792 |
| 21.6.1 | Normal mode with reference, PLL0 or both PLLs enabled.....     | 792 |
| 21.7   | Memory map and register definition.....                        | 793 |
| 21.7.1 | PLLDIG PLL0 Control Register (PLLDIG_PLL0CR).....              | 794 |
| 21.7.2 | PLLDIG PLL0 Status Register (PLLDIG_PLL0SR).....               | 795 |
| 21.7.3 | PLLDIG PLL0 Divider Register (PLLDIG_PLL0DV).....              | 796 |
| 21.7.4 | PLLDIG PLL1 Control Register (PLLDIG_PLL1CR).....              | 798 |
| 21.7.5 | PLLDIG PLL1 Status Register (PLLDIG_PLL1SR).....               | 799 |
| 21.7.6 | PLLDIG PLL1 Divider Register (PLLDIG_PLL1DV).....              | 800 |
| 21.7.7 | PLLDIG PLL1 Frequency Modulation Register (PLLDIG_PLL1FM)..... | 801 |
| 21.7.8 | PLLDIG PLL1 Fractional Divide Register (PLLDIG_PLL1FD).....    | 802 |

| Section number | Title                           | Page |
|----------------|---------------------------------|------|
| 21.8           | Functional description.....     | 803  |
| 21.8.1         | Input clock frequency.....      | 803  |
| 21.8.2         | Clock configuration.....        | 804  |
| 21.8.3         | Loss of lock.....               | 806  |
| 21.8.4         | Frequency modulation.....       | 806  |
| 21.9           | Maximum lock time.....          | 809  |
| 21.10          | Initialization information..... | 809  |

## Chapter 22 Clock Monitor Unit (CMU)

|        |                                                                |     |
|--------|----------------------------------------------------------------|-----|
| 22.1   | Chip-specific CMU information.....                             | 811 |
| 22.2   | Introduction.....                                              | 811 |
| 22.2.1 | Main features.....                                             | 812 |
| 22.3   | Block diagram.....                                             | 812 |
| 22.4   | Signals.....                                                   | 812 |
| 22.5   | Register description and memory map.....                       | 813 |
| 22.5.1 | CMU Control Status Register (CMU_CSR).....                     | 814 |
| 22.5.2 | CMU Frequency Display Register (CMU_FDR).....                  | 815 |
| 22.5.3 | CMU High Frequency Reference Register CLKMN1 (CMU_HFREFR)..... | 816 |
| 22.5.4 | CMU Low Frequency Reference Register CLKMN1 (CMU_LFREFR).....  | 816 |
| 22.5.5 | CMU Interrupt Status Register (CMU_ISR).....                   | 817 |
| 22.5.6 | CMU Measurement Duration Register (CMU_MDR).....               | 818 |
| 22.6   | Functional description.....                                    | 819 |
| 22.6.1 | Frequency meter.....                                           | 819 |
| 22.6.2 | CLKMN0_RMT supervisor.....                                     | 819 |
| 22.6.3 | CLKMN1 supervisor.....                                         | 820 |

## Chapter 23 Embedded Memories

|      |                                                |     |
|------|------------------------------------------------|-----|
| 23.1 | Overview.....                                  | 823 |
| 23.2 | End-to-end Error Correction Code (e2eECC)..... | 823 |

## Chapter 24

### RAM Controller (PRAMC)

|        |                                                          |     |
|--------|----------------------------------------------------------|-----|
| 24.1   | Chip-specific PRAM information.....                      | 827 |
| 24.1.1 | PRAM optional read wait states.....                      | 827 |
| 24.1.2 | Reset effects on System RAM accesses.....                | 827 |
| 24.2   | Introduction.....                                        | 828 |
| 24.3   | SRAM controller memory map and register definition.....  | 830 |
| 24.3.1 | Platform RAM Configuration Register 1 (PRAMC_PRCR1)..... | 830 |
| 24.4   | Functional description.....                              | 832 |
| 24.4.1 | Read and Write operations.....                           | 832 |
| 24.4.2 | Writes.....                                              | 833 |
| 24.5   | Initialization/application information.....              | 835 |
| 24.6   | Reliability considerations.....                          | 835 |
| 24.6.1 | Hsiao ECC algorithm.....                                 | 835 |
| 24.6.2 | Transaction monitor.....                                 | 838 |

## Chapter 25

### Flash Memory Controller (PFLASH)

|        |                                                               |     |
|--------|---------------------------------------------------------------|-----|
| 25.1   | Chip-specific PFLASH information.....                         | 841 |
| 25.2   | Introduction.....                                             | 841 |
| 25.3   | Features.....                                                 | 842 |
| 25.4   | Block diagrams.....                                           | 842 |
| 25.5   | Flash memory controller memory map.....                       | 843 |
| 25.5.1 | Platform Flash Configuration Register 1 (PFLASH_PFCR1).....   | 845 |
| 25.5.2 | Platform Flash Configuration Register 2 (PFLASH_PFCR2).....   | 848 |
| 25.5.3 | Platform Flash Configuration Register 3 (PFLASH_PFCR3).....   | 851 |
| 25.5.4 | Platform Flash Access Protection Register (PFLASH_PFAPR)..... | 853 |
| 25.6   | Functional description.....                                   | 856 |
| 25.6.1 | Basic interface protocol.....                                 | 856 |

| Section number | Title                                         | Page |
|----------------|-----------------------------------------------|------|
| 25.6.2         | Access protections.....                       | 856  |
| 25.6.3         | Access pipelining.....                        | 857  |
| 25.6.4         | Line read buffers and prefetch operation..... | 858  |
| 25.6.5         | Instruction/Data prefetch triggering.....     | 859  |
| 25.6.6         | Per-Master prefetch triggering.....           | 859  |
| 25.6.7         | Buffer allocation.....                        | 859  |
| 25.6.8         | Reliability considerations.....               | 860  |
| 25.6.9         | ECC on data flash accesses.....               | 862  |
| 25.6.10        | Array integrity considerations.....           | 862  |

## Chapter 26 Embedded Flash Memory (C55FMC)

|        |                                                                            |     |
|--------|----------------------------------------------------------------------------|-----|
| 26.1   | Chip-specific C55FMC information.....                                      | 865 |
| 26.1.1 | C55FMC register reset values.....                                          | 865 |
| 26.1.2 | Access to and configuration of blocks mapped to C55FMC_LOCK1 register..... | 865 |
| 26.1.3 | C55FMC_LOCKn register bit mapping.....                                     | 866 |
| 26.1.4 | C55FMC_SELn register bit mapping.....                                      | 869 |
| 26.1.5 | C55FMC_OPPn register bit mapping.....                                      | 873 |
| 26.2   | Introduction.....                                                          | 876 |
| 26.2.1 | Overview.....                                                              | 877 |
| 26.2.2 | Features.....                                                              | 877 |
| 26.2.3 | Modes of operation.....                                                    | 877 |
| 26.3   | UTest NVM block.....                                                       | 878 |
| 26.4   | Test mode disable seal.....                                                | 878 |
| 26.5   | Memory map and register definition.....                                    | 880 |
| 26.5.1 | Module Configuration Register (C55FMC_MCR).....                            | 882 |
| 26.5.2 | Extended Module Configuration Register (C55FMC_MCRE).....                  | 887 |
| 26.5.3 | Lock 0 register (C55FMC_LOCK0).....                                        | 890 |
| 26.5.4 | Lock 1 register (C55FMC_LOCK1).....                                        | 892 |
| 26.5.5 | Lock 2 register (C55FMC_LOCK2).....                                        | 892 |

| Section number | Title                                                       | Page |
|----------------|-------------------------------------------------------------|------|
| 26.5.6         | Lock 3 register (C55FMC_LOCK3).....                         | 893  |
| 26.5.7         | Select 0 register (C55FMC_SEL0).....                        | 894  |
| 26.5.8         | Select 1 register (C55FMC_SEL1).....                        | 895  |
| 26.5.9         | Select 2 register (C55FMC_SEL2).....                        | 896  |
| 26.5.10        | Select 3 register (C55FMC_SEL3).....                        | 897  |
| 26.5.11        | Address register (C55FMC_ADR).....                          | 898  |
| 26.5.12        | UTest 0 register (C55FMC_UT0).....                          | 900  |
| 26.5.13        | UMISR register (C55FMC_UMn).....                            | 903  |
| 26.5.14        | UMISR register (C55FMC_UM9).....                            | 904  |
| 26.5.15        | Over-Program Protection 0 register (C55FMC_OPP0).....       | 905  |
| 26.5.16        | Over-Program Protection 1 register (C55FMC_OPP1).....       | 906  |
| 26.5.17        | Over-Program Protection 2 register (C55FMC_OPP2).....       | 907  |
| 26.5.18        | Over-Program Protection 3 register (C55FMC_OPP3).....       | 907  |
| 26.5.19        | Test Mode Disable Password Check register (C55FMC_TMD)..... | 908  |
| 26.6           | Functional Description.....                                 | 909  |
| 26.6.1         | User Mode.....                                              | 910  |
| 26.6.2         | UTest mode.....                                             | 918  |
| 26.7           | Initialization information.....                             | 922  |

## Chapter 27 Analog Modules Overview

|      |                                         |     |
|------|-----------------------------------------|-----|
| 27.1 | Introduction .....                      | 925 |
| 27.2 | EQADC subsystem.....                    | 925 |
| 27.3 | SDADC connections to other modules..... | 927 |

## Chapter 28 Sigma Delta Analog-to-Digital Converter (SDADC) Digital Interface

|        |                                           |     |
|--------|-------------------------------------------|-----|
| 28.1   | Chip-specific SDADC information.....      | 929 |
| 28.1.1 | SDADC triggers and synchronous start..... | 929 |
| 28.1.2 | Connections among SDADCs and eTPUs.....   | 931 |
| 28.2   | Introduction.....                         | 931 |

| Section number | Title                                                | Page |
|----------------|------------------------------------------------------|------|
| 28.3           | Overview.....                                        | 931  |
| 28.4           | Features.....                                        | 932  |
| 28.5           | Modes of operation.....                              | 933  |
| 28.5.1         | Differential input mode.....                         | 933  |
| 28.5.2         | Single-ended input mode.....                         | 933  |
| 28.6           | External signal description.....                     | 934  |
| 28.7           | Memory map and register definition.....              | 934  |
| 28.7.1         | Module Configuration Register (SDADC_MCR).....       | 935  |
| 28.7.2         | Channel Selection Register (SDADC_CSR).....          | 938  |
| 28.7.3         | Reset Key Register (SDADC_RKR).....                  | 940  |
| 28.7.4         | Status Flag Register (SDADC_SFR).....                | 941  |
| 28.7.5         | Request Select and Enable Register (SDADC_RSER)..... | 943  |
| 28.7.6         | Output Settling Delay Register (SDADC_OSDR).....     | 945  |
| 28.7.7         | FIFO Control Register (SDADC_FCR).....               | 946  |
| 28.7.8         | Software Trigger Key Register (SDADC_STKR).....      | 948  |
| 28.7.9         | Converted Data Register (SDADC_CDR).....             | 948  |
| 28.7.10        | WDG Threshold Register (SDADC_WTHHLR).....           | 949  |
| 28.8           | Functional description.....                          | 949  |
| 28.8.1         | Differential input mode.....                         | 950  |
| 28.8.2         | Single-ended input mode.....                         | 950  |
| 28.8.3         | Low consumption mode.....                            | 950  |
| 28.8.4         | Analog input multiplexing and bias support.....      | 950  |
| 28.8.5         | Programmable gain and decimation rate.....           | 951  |
| 28.8.6         | High-pass filter support.....                        | 951  |
| 28.8.7         | Data conversion.....                                 | 951  |
| 28.8.8         | Hardware triggering.....                             | 953  |
| 28.8.9         | Interrupt/DMA request support.....                   | 954  |
| 28.8.10        | Gain calibration support.....                        | 954  |
| 28.8.11        | Offset calibration support.....                      | 955  |

| Section number | Title                           | Page |
|----------------|---------------------------------|------|
| 28.9           | Initialization information..... | 956  |
| 28.9.1         | Data conversion step.....       | 957  |

## Chapter 29

### Enhanced Queued Analog-to-Digital Converter (EQADC)

|        |                                                                   |     |
|--------|-------------------------------------------------------------------|-----|
| 29.1   | Chip-specific EQADC information.....                              | 959 |
| 29.1.1 | EQADC connections to other modules.....                           | 960 |
| 29.1.2 | EQADC Stop mode entry.....                                        | 960 |
| 29.1.3 | EQADC pre-gain control.....                                       | 960 |
| 29.1.4 | CFIFO and RFIFO depth.....                                        | 961 |
| 29.1.5 | EQADC pin pullup/pulldown control.....                            | 961 |
| 29.1.6 | EQADC pin-to-channel mapping.....                                 | 961 |
| 29.2   | Introduction.....                                                 | 963 |
| 29.2.1 | Module overview.....                                              | 963 |
| 29.2.2 | Block diagram.....                                                | 963 |
| 29.2.3 | Features.....                                                     | 966 |
| 29.3   | Modes of operation.....                                           | 967 |
| 29.3.1 | Normal Mode.....                                                  | 967 |
| 29.3.2 | Debug Mode.....                                                   | 967 |
| 29.3.3 | Stop Mode.....                                                    | 969 |
| 29.4   | External signal description.....                                  | 970 |
| 29.4.1 | Overview.....                                                     | 970 |
| 29.4.2 | Detailed signal descriptions.....                                 | 972 |
| 29.5   | Memory map and register definition.....                           | 977 |
| 29.5.1 | EQADC Module Configuration Register (EQADC_MCR).....              | 981 |
| 29.5.2 | EQADC Test Register (EQADC_TST).....                              | 982 |
| 29.5.3 | EQADC External Trigger Digital Filter Register (EQADC_ETDFR)..... | 983 |
| 29.5.4 | EQADC CFIFO Push Register (EQADC_CFPR <sub>n</sub> ).....         | 984 |
| 29.5.5 | EQADC Result FIFO Pop Register (EQADC_RFPR <sub>n</sub> ).....    | 985 |
| 29.5.6 | EQADC CFIFO Control Register 0 (EQADC_CFCR0).....                 | 986 |

| Section number | Title                                                                    | Page |
|----------------|--------------------------------------------------------------------------|------|
| 29.5.7         | EQADC CFIFO Control Register 1 (EQADC_CFCR1).....                        | 990  |
| 29.5.8         | EQADC CFIFO Control Register 2 (EQADC_CFCR2).....                        | 993  |
| 29.5.9         | EQADC Interrupt and DMA Control Register 0 (EQADC_IDCR0).....            | 996  |
| 29.5.10        | EQADC Interrupt and DMA Control Register 1 (EQADC_IDCR1).....            | 1000 |
| 29.5.11        | EQADC Interrupt and DMA Control Register 2 (EQADC_IDCR2).....            | 1005 |
| 29.5.12        | EQADC FIFO and Interrupt Status Register (EQADC_FISR <sub>n</sub> )..... | 1010 |
| 29.5.13        | EQADC CFIFO Transfer Counter Register 0 (EQADC_CFTCR0).....              | 1014 |
| 29.5.14        | EQADC CFIFO Transfer Counter Register 1 (EQADC_CFTCR1).....              | 1015 |
| 29.5.15        | EQADC CFIFO Transfer Counter Register 2 (EQADC_CFTCR2).....              | 1016 |
| 29.5.16        | EQADC CFIFO Status Snapshot Register 0 (EQADC_CFSSR0).....               | 1017 |
| 29.5.17        | EQADC CFIFO Status Snapshot Register 1 (EQADC_CFSSR1).....               | 1019 |
| 29.5.18        | EQADC CFIFO Status Register (EQADC_CFSR).....                            | 1021 |
| 29.5.19        | EQADC STAC Bus Client Configuration Register (EQADC_STACCCR).....        | 1022 |
| 29.5.20        | EQADC CFIFO0 Register (EQADC_CF0R <sub>n</sub> ).....                    | 1023 |
| 29.5.21        | EQADC CFIFO0 Extension Register (EQADC_CF0ER <sub>n</sub> ).....         | 1024 |
| 29.5.22        | EQADC CFIFO1 Register (EQADC_CF1R <sub>n</sub> ).....                    | 1024 |
| 29.5.23        | EQADC CFIFO2 Register (EQADC_CF2R <sub>n</sub> ).....                    | 1025 |
| 29.5.24        | EQADC CFIFO3 Register (EQADC_CF3R <sub>n</sub> ).....                    | 1026 |
| 29.5.25        | EQADC CFIFO4 Register (EQADC_CF4R <sub>n</sub> ).....                    | 1026 |
| 29.5.26        | EQADC CFIFO5 Register (EQADC_CF5R <sub>n</sub> ).....                    | 1027 |
| 29.5.27        | EQADC RFIFO0 Register (EQADC_RF0R <sub>n</sub> ).....                    | 1028 |
| 29.5.28        | EQADC RFIFO1 Register (EQADC_RF1R <sub>n</sub> ).....                    | 1028 |
| 29.5.29        | EQADC RFIFO2 Register (EQADC_RF2R <sub>n</sub> ).....                    | 1029 |
| 29.5.30        | EQADC RFIFO3 Register (EQADC_RF3R <sub>n</sub> ).....                    | 1030 |
| 29.5.31        | EQADC RFIFO4 Register (EQADC_RF4R <sub>n</sub> ).....                    | 1030 |
| 29.5.32        | EQADC RFIFO5 Register (EQADC_RF5R <sub>n</sub> ).....                    | 1031 |
| 29.5.33        | On-chip ADC registers.....                                               | 1031 |
| 29.6           | Functional description.....                                              | 1054 |
| 29.6.1         | Overview.....                                                            | 1054 |

| Section number | Title                                              | Page |
|----------------|----------------------------------------------------|------|
| 29.6.2         | Data flow in EQADC.....                            | 1055 |
| 29.6.3         | Command/result queues.....                         | 1068 |
| 29.6.4         | EQADC command FIFOs.....                           | 1069 |
| 29.6.5         | EQADC result FIFOs.....                            | 1096 |
| 29.6.6         | On-chip ADC configuration and control.....         | 1100 |
| 29.6.7         | Internal/external multiplexing.....                | 1113 |
| 29.6.8         | EQADC DMA/interrupt request.....                   | 1117 |
| 29.6.9         | EQADC Parallel Side Interface (PSI) sub-block..... | 1120 |
| 29.6.10        | Analog sub-block.....                              | 1124 |
| 29.7           | Initialization/application information.....        | 1128 |
| 29.7.1         | Multiple queues control setup example.....         | 1128 |
| 29.7.2         | EQADC/DMAC interface.....                          | 1133 |
| 29.7.3         | Sending immediate command setup example.....       | 1135 |
| 29.7.4         | Modifying queues.....                              | 1136 |
| 29.7.5         | CQueue and RQueues usage.....                      | 1137 |
| 29.7.6         | ADC Result Calibration.....                        | 1139 |
| 29.7.7         | EQADC versus QADC.....                             | 1142 |

## Chapter 30 Temperature Sensor (TSENS)

|        |                                                                  |      |
|--------|------------------------------------------------------------------|------|
| 30.1   | Chip-specific Temperature Sensor information.....                | 1147 |
| 30.1.1 | Temperature Sensor programming control.....                      | 1147 |
| 30.1.2 | Accessing TSC parameters.....                                    | 1147 |
| 30.1.3 | Temperature name alignment.....                                  | 1147 |
| 30.2   | Introduction.....                                                | 1148 |
| 30.3   | Functional Description.....                                      | 1148 |
| 30.3.1 | Temperature threshold detection (digital output generation)..... | 1148 |
| 30.3.2 | Linear temperature sensor (analog output generation).....        | 1149 |
| 30.4   | Temperature formula.....                                         | 1150 |
| 30.5   | Calculating device temperature.....                              | 1151 |

## Chapter 31

### System Timer Module (STM)

|        |                                                             |      |
|--------|-------------------------------------------------------------|------|
| 31.1   | Chip-specific STM information.....                          | 1153 |
| 31.2   | Introduction.....                                           | 1153 |
| 31.2.1 | Overview.....                                               | 1153 |
| 31.2.2 | Features.....                                               | 1153 |
| 31.2.3 | Modes of operation.....                                     | 1154 |
| 31.3   | External signal description.....                            | 1154 |
| 31.4   | Memory map and registers.....                               | 1154 |
| 31.4.1 | STM Control Register (STM_CR).....                          | 1155 |
| 31.4.2 | STM Count Register (STM_CNT).....                           | 1156 |
| 31.4.3 | STM Channel Control Register (STM_CCR <sub>n</sub> ).....   | 1156 |
| 31.4.4 | STM Channel Interrupt Register (STM_CIR <sub>n</sub> )..... | 1157 |
| 31.4.5 | STM Channel Compare Register (STM_CMP <sub>n</sub> ).....   | 1157 |
| 31.5   | Functional description.....                                 | 1158 |

## Chapter 32

### Software Watchdog Timer (SWT)

|        |                                                                                         |      |
|--------|-----------------------------------------------------------------------------------------|------|
| 32.1   | Chip-specific SWT information.....                                                      | 1159 |
| 32.1.1 | SWT register reset values.....                                                          | 1159 |
| 32.1.2 | SWT time-out events and invalid accesses: configuring reset and interrupt requests..... | 1159 |
| 32.2   | Introduction.....                                                                       | 1160 |
| 32.2.1 | Overview.....                                                                           | 1160 |
| 32.2.2 | Features.....                                                                           | 1161 |
| 32.2.3 | Modes of operation.....                                                                 | 1161 |
| 32.3   | External signal description.....                                                        | 1162 |
| 32.4   | Memory Map and Registers.....                                                           | 1162 |
| 32.4.1 | SWT Control Register (SWT_CR).....                                                      | 1163 |
| 32.4.2 | SWT Interrupt Register (SWT_IR).....                                                    | 1166 |
| 32.4.3 | SWT Time-out Register (SWT_TO).....                                                     | 1167 |

| Section number | Title                                     | Page |
|----------------|-------------------------------------------|------|
| 32.4.4         | SWT Window Register (SWT_WN).....         | 1167 |
| 32.4.5         | SWT Service Register (SWT_SR).....        | 1168 |
| 32.4.6         | SWT Counter Output Register (SWT_CO)..... | 1168 |
| 32.4.7         | SWT Service Key Register (SWT_SK).....    | 1169 |
| 32.5           | Functional description.....               | 1169 |
| 32.5.1         | Introduction.....                         | 1169 |
| 32.5.2         | Configuration locking.....                | 1170 |
| 32.5.3         | Unlock sequence.....                      | 1171 |
| 32.5.4         | Servicing operations.....                 | 1171 |
| 32.5.5         | Time-out.....                             | 1172 |
| 32.5.6         | Initialization.....                       | 1173 |

## Chapter 33

### Periodic Interrupt Timer (PIT-RTI)

|         |                                                      |      |
|---------|------------------------------------------------------|------|
| 33.1    | Chip-specific PIT information.....                   | 1175 |
| 33.2    | Introduction.....                                    | 1175 |
| 33.2.1  | Block diagram.....                                   | 1175 |
| 33.2.2  | Features.....                                        | 1176 |
| 33.3    | Signal description.....                              | 1177 |
| 33.4    | Memory map/register description.....                 | 1177 |
| 33.4.1  | PIT Module Control Register (PIT_MCR).....           | 1178 |
| 33.4.2  | PIT Upper Lifetime Timer Register (PIT_LTMR64H)..... | 1179 |
| 33.4.3  | PIT Lower Lifetime Timer Register (PIT_LTMR64L)..... | 1180 |
| 33.4.4  | Timer Load Value Register (PIT_RTI_LDVAL).....       | 1180 |
| 33.4.5  | Current Timer Value Register (PIT_RTI_CVAL).....     | 1181 |
| 33.4.6  | Timer Control Register (PIT_RTI_TCTRL).....          | 1181 |
| 33.4.7  | Timer Flag Register (PIT_RTI_TFLG).....              | 1182 |
| 33.4.8  | Timer Load Value Register (PIT_LDVALn).....          | 1183 |
| 33.4.9  | Current Timer Value Register (PIT_CVALn).....        | 1183 |
| 33.4.10 | Timer Control Register (PIT_TCTRLn).....             | 1184 |

| Section number | Title                                             | Page |
|----------------|---------------------------------------------------|------|
| 33.4.11        | Timer Flag Register (PIT_TFLGn).....              | 1185 |
| 33.5           | Functional description.....                       | 1185 |
| 33.5.1         | General operation.....                            | 1185 |
| 33.5.2         | Interrupts.....                                   | 1187 |
| 33.5.3         | Chained timers.....                               | 1188 |
| 33.6           | Initialization and application information.....   | 1188 |
| 33.7           | Example configuration for chained timers.....     | 1189 |
| 33.8           | Example configuration for the lifetime timer..... | 1190 |

## Chapter 34

### Enhanced Modular IO Subsystem (eMIOS)

|        |                                                         |      |
|--------|---------------------------------------------------------|------|
| 34.1   | Chip-specific eMIOS information.....                    | 1191 |
| 34.1.1 | eMIOS channels and counter buses.....                   | 1191 |
| 34.1.2 | eMIOS unimplemented channels.....                       | 1191 |
| 34.1.3 | eMIOS interaction with other modules.....               | 1192 |
| 34.2   | Introduction.....                                       | 1194 |
| 34.2.1 | Overview.....                                           | 1194 |
| 34.2.2 | Features.....                                           | 1195 |
| 34.2.3 | Modes of operation.....                                 | 1196 |
| 34.3   | Memory map / register definition.....                   | 1197 |
| 34.3.1 | Memory map.....                                         | 1197 |
| 34.4   | Control Memory Map and Registers.....                   | 1198 |
| 34.4.1 | eMIOS Module Configuration Register (eMIOS_MCR).....    | 1199 |
| 34.4.2 | eMIOS Global FLAG Register (eMIOS_GFLAG).....           | 1201 |
| 34.4.3 | eMIOS Output Update Disable register (eMIOS_OUDIS)..... | 1201 |
| 34.5   | Unified Channels Memory Map and Registers.....          | 1202 |
| 34.5.1 | eMIOS UC A register n (eMIOS_An).....                   | 1205 |
| 34.5.2 | eMIOS UC B register n (eMIOS_Bn).....                   | 1206 |
| 34.5.3 | eMIOS CNT register n (eMIOS_CNTn).....                  | 1207 |
| 34.5.4 | eMIOS UC Control register n (eMIOS_Cn).....             | 1208 |

| Section number | Title                                                          | Page |
|----------------|----------------------------------------------------------------|------|
| 34.5.5         | eMIOS UC Status register n (eMIOS_ <i>Sn</i> ).....            | 1214 |
| 34.5.6         | eMIOS Alternate Address register n (eMIOS_ <i>ALTAn</i> )..... | 1216 |
| 34.5.7         | eMIOS UC A register n (eMIOS_ <i>An</i> ).....                 | 1217 |
| 34.5.8         | eMIOS UC B register n (eMIOS_ <i>Bn</i> ).....                 | 1217 |
| 34.5.9         | eMIOS CNT register n (eMIOS_ <i>CNTn</i> ).....                | 1218 |
| 34.5.10        | eMIOS UC Control register n (eMIOS_ <i>Cn</i> ).....           | 1219 |
| 34.5.11        | eMIOS UC Status register n (eMIOS_ <i>Sn</i> ).....            | 1224 |
| 34.5.12        | eMIOS Alternate Address register n (eMIOS_ <i>ALTAn</i> )..... | 1226 |
| 34.6           | Functional Description.....                                    | 1226 |
| 34.6.1         | Unified Channel (UC).....                                      | 1228 |
| 34.6.2         | IP Bus Interface Unit (BIU).....                               | 1268 |
| 34.6.3         | STAC Bus Client submodule.....                                 | 1269 |
| 34.6.4         | Global Clock Prescaler Submodule (GCP).....                    | 1270 |
| 34.7           | Initialization/Application Information.....                    | 1270 |
| 34.7.1         | Considerations.....                                            | 1270 |
| 34.7.2         | Application Information.....                                   | 1271 |

## Chapter 35

### Enhanced Time Processing Unit (eTPU)

|        |                                                           |      |
|--------|-----------------------------------------------------------|------|
| 35.1   | Chip-specific eTPU information.....                       | 1275 |
| 35.1.1 | eTPU register field reset values.....                     | 1276 |
| 35.1.2 | Access to eTPU registers in chip-level Stop mode.....     | 1276 |
| 35.1.3 | STAC server IDs.....                                      | 1276 |
| 35.1.4 | eTPU inputs with Glitch Filters.....                      | 1277 |
| 35.1.5 | eMIOS and eTPU signal passthrough from pins via IGFs..... | 1277 |
| 35.1.6 | eTPU output disable channel groups.....                   | 1278 |
| 35.1.7 | Control of the eTPU Output Buffer Enable signal.....      | 1278 |
| 35.2   | Device-specific Information.....                          | 1278 |

| Section number | Title                                                                          | Page |
|----------------|--------------------------------------------------------------------------------|------|
| 35.3           | Introduction.....                                                              | 1279 |
| 35.3.1         | Overview.....                                                                  | 1280 |
| 35.3.2         | Features.....                                                                  | 1287 |
| 35.3.3         | Modes of operation.....                                                        | 1294 |
| 35.4           | Detailed signal descriptions.....                                              | 1296 |
| 35.4.1         | eTPU channel output signals.....                                               | 1296 |
| 35.4.2         | eTPU channel input signals.....                                                | 1296 |
| 35.4.3         | Time Base Clock Signal — TCRCLK.....                                           | 1297 |
| 35.4.4         | eTPU channel output disable signals.....                                       | 1297 |

| <b>Chapter 37</b>    |                                                       |      |
| <b>FlexCAN (CAN)</b> |                                                       |      |
| 37.1                 | Chip-specific FlexCAN information.....                | 1667 |
| 37.1.1               | FlexCAN RAM.....                                      | 1667 |
| 37.1.2               | FlexCAN reset.....                                    | 1667 |
| 37.1.3               | CAN_MCR[SUPV] and access to FlexCAN registers.....    | 1667 |
| 37.2                 | Introduction.....                                     | 1667 |
| 37.2.1               | Overview.....                                         | 1668 |
| 37.2.2               | FlexCAN module features.....                          | 1669 |
| 37.2.3               | Modes of operation.....                               | 1671 |
| 37.3                 | FlexCAN signal descriptions.....                      | 1672 |
| 37.3.1               | CAN Rx .....                                          | 1672 |
| 37.3.2               | CAN Tx .....                                          | 1673 |
| 37.4                 | Memory map/register definition.....                   | 1673 |
| 37.4.1               | FlexCAN memory mapping.....                           | 1673 |
| 37.4.2               | Module Configuration Register (CAN_MCR).....          | 1679 |
| 37.4.3               | Control 1 register (CAN_CTRL1).....                   | 1683 |
| 37.4.4               | Free Running Timer (CAN_TIMER).....                   | 1686 |
| 37.4.5               | Rx Mailboxes Global Mask Register (CAN_RXMGMASK)..... | 1687 |
| 37.4.6               | Rx 14 Mask register (CAN_RX14MASK).....               | 1688 |
| 37.4.7               | Rx 15 Mask register (CAN_RX15MASK).....               | 1689 |
| 37.4.8               | Error Counter (CAN_ECR).....                          | 1690 |
| 37.4.9               | Error and Status 1 register (CAN_ESR1).....           | 1691 |
| 37.4.10              | Interrupt Masks 2 register (CAN_IMASK2).....          | 1695 |
| 37.4.11              | Interrupt Masks 1 register (CAN_IMASK1).....          | 1696 |
| 37.4.12              | Interrupt Flags 2 register (CAN_IFLAG2).....          | 1696 |
| 37.4.13              | Interrupt Flags 1 register (CAN_IFLAG1).....          | 1697 |
| 37.4.14              | Control 2 register (CAN_CTRL2).....                   | 1699 |
| 37.4.15              | Error and Status 2 register (CAN_ESR2).....           | 1703 |

| Section number | Title                                                       | Page |
|----------------|-------------------------------------------------------------|------|
| 37.4.16        | CRC Register (CAN_CRCCR).....                               | 1704 |
| 37.4.17        | Rx FIFO Global Mask register (CAN_RXFGMASK).....            | 1705 |
| 37.4.18        | Rx FIFO Information Register (CAN_RXFIR).....               | 1706 |
| 37.4.19        | Rx Individual Mask Registers (CAN_RXIMR <sub>n</sub> )..... | 1706 |
| 37.4.20        | Memory Error Control Register (CAN_MECR).....               | 1707 |
| 37.4.21        | Error Injection Address Register (CAN_ERRIAR).....          | 1709 |
| 37.4.22        | Error Injection Data Pattern Register (CAN_ERRIDPR).....    | 1711 |
| 37.4.23        | Error Injection Parity Pattern Register (CAN_ERRIPPR).....  | 1711 |
| 37.4.24        | Error Report Address Register (CAN_RERRAR).....             | 1712 |
| 37.4.25        | Error Report Data Register (CAN_RERRDR).....                | 1713 |
| 37.4.26        | Error Report Syndrome Register (CAN_RERRSYNR).....          | 1714 |
| 37.4.27        | Error Status Register (CAN_ERRSR).....                      | 1716 |
| 37.4.28        | Message buffer structure.....                               | 1717 |
| 37.4.29        | Rx FIFO structure.....                                      | 1723 |
| 37.5           | Functional description.....                                 | 1725 |
| 37.5.1         | Transmit process.....                                       | 1726 |
| 37.5.2         | Arbitration process.....                                    | 1726 |
| 37.5.3         | Receive process.....                                        | 1730 |
| 37.5.4         | Matching process.....                                       | 1732 |
| 37.5.5         | Move process.....                                           | 1737 |
| 37.5.6         | Data coherence.....                                         | 1738 |
| 37.5.7         | Rx FIFO.....                                                | 1742 |
| 37.5.8         | CAN protocol related features.....                          | 1743 |
| 37.5.9         | Clock domains and restrictions.....                         | 1750 |
| 37.5.10        | Modes of operation details.....                             | 1751 |
| 37.5.11        | Interrupts.....                                             | 1754 |
| 37.5.12        | Bus interface.....                                          | 1755 |

| Section number | Title                                          | Page |
|----------------|------------------------------------------------|------|
| 37.5.13        | Detection and Correction of Memory Errors..... | 1756 |
| 37.6           | Initialization/application information.....    | 1760 |
| 37.6.1         | FlexCAN initialization sequence.....           | 1760 |

## Chapter 38 Modular CAN (M\_CAN)

|         |                                                             |      |
|---------|-------------------------------------------------------------|------|
| 38.1    | Chip-specific M_CAN information.....                        | 1763 |
| 38.1.1  | M_CAN Message RAM allocation.....                           | 1763 |
| 38.1.2  | Introduction.....                                           | 1763 |
| 38.1.3  | Functional Description.....                                 | 1764 |
| 38.1.4  | External Signals.....                                       | 1766 |
| 38.2    | Overview.....                                               | 1767 |
| 38.2.1  | Features.....                                               | 1767 |
| 38.2.2  | Block Diagram.....                                          | 1768 |
| 38.2.3  | Dual Clock Sources.....                                     | 1770 |
| 38.2.4  | Dual Interrupt Lines.....                                   | 1770 |
| 38.3    | Memory Map and Register Description.....                    | 1771 |
| 38.3.1  | Core Release Register (M_CAN_CREL).....                     | 1773 |
| 38.3.2  | Endian Register (M_CAN_ENDN).....                           | 1774 |
| 38.3.3  | Data Bit Timing and Prescaler Register (M_CAN_DBTP).....    | 1775 |
| 38.3.4  | Test Register (M_CAN_TEST).....                             | 1776 |
| 38.3.5  | RAM Watchdog Register (M_CAN_RWD).....                      | 1778 |
| 38.3.6  | CC Control Register (M_CAN_CCCR).....                       | 1779 |
| 38.3.7  | Nominal Bit Timing and Prescaler Register (M_CAN_NBTP)..... | 1781 |
| 38.3.8  | Timestamp Counter Configuration Register (M_CAN_TSCC).....  | 1783 |
| 38.3.9  | Timestamp Counter Value Register (M_CAN_TSCV).....          | 1784 |
| 38.3.10 | Timeout Counter Configuration Register (M_CAN_TOCC).....    | 1784 |
| 38.3.11 | Timeout Counter Value Register (M_CAN_TOCV).....            | 1785 |
| 38.3.12 | Error Counter Register (M_CAN_ECR).....                     | 1786 |
| 38.3.13 | Protocol Status Register (M_CAN_PSR).....                   | 1787 |

| Section number | Title                                                                   | Page |
|----------------|-------------------------------------------------------------------------|------|
| 38.3.14        | Transmitter Delay Compensation Register (M_CAN_TDCR).....               | 1790 |
| 38.3.15        | Interrupt Register (M_CAN_IR).....                                      | 1791 |
| 38.3.16        | Interrupt Enable Register (M_CAN_IE).....                               | 1794 |
| 38.3.17        | Interrupt Line Select Register (M_CAN_ILS).....                         | 1797 |
| 38.3.18        | Interrupt Line Enable Register (M_CAN_ILE).....                         | 1801 |
| 38.3.19        | Global Filter Configuration Register (M_CAN_GFC).....                   | 1802 |
| 38.3.20        | Standard ID Filter Configuration Register (M_CAN_SIDFC).....            | 1803 |
| 38.3.21        | Extended ID Filter Configuration Register (M_CAN_XIDFC).....            | 1804 |
| 38.3.22        | Extended ID and Mask Register (M_CAN_XIDAM).....                        | 1804 |
| 38.3.23        | High Priority Message Status Register (M_CAN_HPMS).....                 | 1805 |
| 38.3.24        | New Data 1 Register (M_CAN_NDAT1).....                                  | 1806 |
| 38.3.25        | New Data 2 Register (M_CAN_NDAT2).....                                  | 1806 |
| 38.3.26        | Rx FIFO 0 Configuration Register (M_CAN_RXF0C).....                     | 1807 |
| 38.3.27        | Rx FIFO 0 Status Register (M_CAN_RXF0S).....                            | 1808 |
| 38.3.28        | Rx FIFO 0 Acknowledge Register (M_CAN_RXF0A).....                       | 1809 |
| 38.3.29        | Rx Buffer Configuration Register (M_CAN_RXBC).....                      | 1809 |
| 38.3.30        | Rx FIFO 1 Configuration Register (M_CAN_RXF1C).....                     | 1810 |
| 38.3.31        | Rx FIFO 1 Status Register (M_CAN_RXF1S).....                            | 1811 |
| 38.3.32        | Rx FIFO 1 Acknowledge Register (M_CAN_RXF1A).....                       | 1812 |
| 38.3.33        | Rx Buffer / FIFO Element Size Configuration Register (M_CAN_RXESC)..... | 1813 |
| 38.3.34        | Tx Buffer Configuration Register (M_CAN_TXBC).....                      | 1815 |
| 38.3.35        | Tx FIFO/Queue Status Register (M_CAN_TXFQS).....                        | 1816 |
| 38.3.36        | Tx Buffer Element Size Configuration (M_CAN_TXESC).....                 | 1817 |
| 38.3.37        | Tx Buffer Request Pending Register (M_CAN_TXBRP).....                   | 1818 |
| 38.3.38        | Tx Buffer Add Request Register (M_CAN_TXBAR).....                       | 1819 |
| 38.3.39        | Tx Buffer Cancellation Request Register (M_CAN_TXBCR).....              | 1819 |
| 38.3.40        | Tx Buffer Transmission Occurred Register (M_CAN_TXBTO).....             | 1820 |
| 38.3.41        | Tx Buffer Cancellation Finished Register (M_CAN_TXBCF).....             | 1820 |
| 38.3.42        | Tx Buffer Transmission Interrupt Enable Register (M_CAN_TXBTIE).....    | 1821 |

| Section number | Title                                                                         | Page |
|----------------|-------------------------------------------------------------------------------|------|
| 38.3.43        | Tx Buffer Cancellation Finished Interrupt Enable Register (M_CAN_TXBCIE)..... | 1821 |
| 38.3.44        | Tx Event FIFO Configuration Register (M_CAN_TXEFC).....                       | 1822 |
| 38.3.45        | Tx Event FIFO Status Register (M_CAN_TXEFS).....                              | 1823 |
| 38.3.46        | Tx Event FIFO Acknowledge Register (M_CAN_TXEFA).....                         | 1824 |
| 38.4           | Message RAM.....                                                              | 1824 |
| 38.4.1         | Rx Buffer and FIFO Element.....                                               | 1825 |
| 38.4.2         | Tx Buffer Element.....                                                        | 1827 |
| 38.4.3         | Tx Event FIFO Element.....                                                    | 1829 |
| 38.4.4         | Standard Message ID Filter Element.....                                       | 1830 |
| 38.4.5         | Extended Message ID Filter Element.....                                       | 1832 |
| 38.5           | Functional Description.....                                                   | 1833 |
| 38.5.1         | Operating Modes.....                                                          | 1833 |
| 38.5.2         | Timestamp Generation.....                                                     | 1843 |
| 38.5.3         | Timeout Counter.....                                                          | 1843 |
| 38.5.4         | Rx Handling.....                                                              | 1844 |
| 38.5.5         | Tx Handling.....                                                              | 1855 |
| 38.5.6         | FIFO Acknowledge Handling.....                                                | 1861 |

## Chapter 39

### Deserial Serial Peripheral Interface (DSPI)

|        |                                                         |      |
|--------|---------------------------------------------------------|------|
| 39.1   | Chip-specific DSPI information.....                     | 1863 |
| 39.1.1 | DSPI and eMIOS direct connections.....                  | 1863 |
| 39.1.2 | DSPI connections with SIU, eTPU, and eMIOS modules..... | 1864 |
| 39.2   | Introduction.....                                       | 1865 |
| 39.2.1 | Block Diagram.....                                      | 1865 |
| 39.2.2 | Features.....                                           | 1866 |
| 39.2.3 | Interface configurations.....                           | 1869 |
| 39.2.4 | Modes of Operation.....                                 | 1870 |
| 39.3   | Module signal descriptions.....                         | 1871 |
| 39.3.1 | HT—Hardware Trigger.....                                | 1872 |

| Section number | Title                                                                                       | Page |
|----------------|---------------------------------------------------------------------------------------------|------|
| 39.3.2         | PCS0/SS—Peripheral Chip Select/Slave Select.....                                            | 1872 |
| 39.3.3         | PCS1—PCS3—Peripheral Chip Selects 1–3.....                                                  | 1872 |
| 39.3.4         | PCS4—Peripheral Chip Select 4.....                                                          | 1873 |
| 39.3.5         | PCS5/PCSS—Peripheral Chip Select 5/Peripheral Chip Select Strobe.....                       | 1873 |
| 39.3.6         | SCK—Serial Clock.....                                                                       | 1873 |
| 39.3.7         | SIN—Serial Input.....                                                                       | 1873 |
| 39.3.8         | SOUT—Serial Output.....                                                                     | 1874 |
| 39.4           | Memory Map/Register Definition.....                                                         | 1874 |
| 39.4.1         | Module Configuration Register (DSPI_MCR).....                                               | 1876 |
| 39.4.2         | Transfer Count Register (DSPI_TCR).....                                                     | 1879 |
| 39.4.3         | Clock and Transfer Attributes Register (In Master Mode) (DSPI_CTAR <sub>n</sub> ).....      | 1880 |
| 39.4.4         | Clock and Transfer Attributes Register (In Slave Mode) (DSPI_CTAR <sub>n</sub> _SLAVE)..... | 1885 |
| 39.4.5         | Status Register (DSPI_SR).....                                                              | 1887 |
| 39.4.6         | DMA/Interrupt Request Select and Enable Register (DSPI_RSER).....                           | 1890 |
| 39.4.7         | PUSH TX FIFO Register In Master Mode (DSPI_PUSHR).....                                      | 1892 |
| 39.4.8         | PUSH TX FIFO Register In Slave Mode (DSPI_PUSHR_SLAVE).....                                 | 1894 |
| 39.4.9         | POP RX FIFO Register (DSPI_POPR).....                                                       | 1895 |
| 39.4.10        | Transmit FIFO Registers (DSPI_TXFR <sub>n</sub> ).....                                      | 1895 |
| 39.4.11        | Receive FIFO Registers (DSPI_RXFR <sub>n</sub> ).....                                       | 1896 |
| 39.4.12        | DSI Configuration Register 0 (DSPI_DSICR0).....                                             | 1897 |
| 39.4.13        | DSI Serialization Data Register 0 (DSPI_SDR0).....                                          | 1899 |
| 39.4.14        | DSI Alternate Serialization Data Register 0 (DSPI_ASDR0).....                               | 1900 |
| 39.4.15        | DSI Transmit Comparison Register 0 (DSPI_COMPR0).....                                       | 1900 |
| 39.4.16        | DSI Deserialization Data Register 0 (DSPI_DDR0).....                                        | 1901 |
| 39.4.17        | DSI Configuration Register 1 (DSPI_DSICR1).....                                             | 1902 |
| 39.4.18        | DSI Serialization Source Select Register 0 (DSPI_SSR0).....                                 | 1903 |
| 39.4.19        | DSI Parallel Input Select Register 0 (DSPI_PISR0).....                                      | 1904 |
| 39.4.20        | DSI Parallel Input Select Register 1 (DSPI_PISR1).....                                      | 1905 |
| 39.4.21        | DSI Parallel Input Select Register 2 (DSPI_PISR2).....                                      | 1906 |

| Section number | Title                                                                 | Page |
|----------------|-----------------------------------------------------------------------|------|
| 39.4.22        | DSI Parallel Input Select Register 3 (DSPI_PISR3).....                | 1907 |
| 39.4.23        | DSI Deserialized Data Interrupt Mask Register 0 (DSPI_DIMR0).....     | 1908 |
| 39.4.24        | DSI Deserialized Data Polarity Interrupt Register 0 (DSPI_DPIR0)..... | 1908 |
| 39.5           | Functional description.....                                           | 1909 |
| 39.5.1         | Start and Stop of module transfers.....                               | 1910 |
| 39.5.2         | Serial Peripheral Interface DSPI configuration.....                   | 1911 |
| 39.5.3         | Deserial Serial Interface (DSI) Configuration.....                    | 1915 |
| 39.5.4         | Combined Serial Interface (CSI) Configuration.....                    | 1920 |
| 39.5.5         | Module baud rate and clock delay generation.....                      | 1922 |
| 39.5.6         | Transfer formats.....                                                 | 1925 |
| 39.5.7         | Continuous Serial Communications Clock.....                           | 1935 |
| 39.5.8         | Slave Mode Operation Constraints.....                                 | 1937 |
| 39.5.9         | Timed Serial Bus (TSB).....                                           | 1937 |
| 39.5.10        | Parity Generation and Check.....                                      | 1941 |
| 39.5.11        | Interrupts/DMA requests.....                                          | 1942 |
| 39.5.12        | Power saving features.....                                            | 1945 |
| 39.6           | Initialization/application information.....                           | 1946 |
| 39.6.1         | How to manage queues.....                                             | 1946 |
| 39.6.2         | Switching Master and Slave mode.....                                  | 1947 |
| 39.6.3         | Initializing Module in Master/Slave Modes.....                        | 1947 |
| 39.6.4         | Baud rate settings.....                                               | 1947 |
| 39.6.5         | Delay settings.....                                                   | 1948 |
| 39.6.6         | Calculation of FIFO pointer addresses.....                            | 1949 |

## Chapter 40

### Fast Ethernet Controller (FEC)

|        |                                    |      |
|--------|------------------------------------|------|
| 40.1   | Chip-specific FEC information..... | 1953 |
| 40.1.1 | FEC interface selection.....       | 1953 |
| 40.1.2 | FEC clocking.....                  | 1953 |

| Section number | Title                                                         | Page |
|----------------|---------------------------------------------------------------|------|
| 40.2           | Introduction.....                                             | 1953 |
| 40.2.1         | Block diagram.....                                            | 1953 |
| 40.2.2         | Features.....                                                 | 1955 |
| 40.2.3         | Clocking requirements.....                                    | 1956 |
| 40.3           | Modes of operation.....                                       | 1956 |
| 40.3.1         | Full and half duplex operation.....                           | 1957 |
| 40.3.2         | Interface options.....                                        | 1957 |
| 40.3.3         | Address recognition options.....                              | 1959 |
| 40.3.4         | Internal loopback.....                                        | 1959 |
| 40.4           | External signal description.....                              | 1959 |
| 40.5           | Memory map and register definition.....                       | 1960 |
| 40.5.1         | Interrupt Event Register (FEC_EIR).....                       | 1965 |
| 40.5.2         | Interrupt Mask Register (FEC_EIMR).....                       | 1967 |
| 40.5.3         | Receive Descriptor Active Register (FEC_RDAR).....            | 1969 |
| 40.5.4         | Transmit Descriptor Active Register (FEC_TDAR).....           | 1970 |
| 40.5.5         | Ethernet Control Register (FEC_ECR).....                      | 1971 |
| 40.5.6         | MII Management Frame Register (FEC_MMFR).....                 | 1972 |
| 40.5.7         | MII Speed Control Register (FEC_MSCR).....                    | 1973 |
| 40.5.8         | MIB Control Register (FEC_MIBC).....                          | 1974 |
| 40.5.9         | Receive Control Register (FEC_RCR).....                       | 1976 |
| 40.5.10        | Transmit Control Register (FEC_TCR).....                      | 1978 |
| 40.5.11        | Physical Address Low Register (FEC_PALR).....                 | 1979 |
| 40.5.12        | Physical Address High Register and Type Field (FEC_PAUR)..... | 1980 |
| 40.5.13        | Opcode/Pause Duration (FEC_OPD).....                          | 1980 |
| 40.5.14        | Descriptor Individual Upper Address Register (FEC_IAUR).....  | 1981 |
| 40.5.15        | Descriptor Individual Lower Address Register (FEC_IALR).....  | 1981 |
| 40.5.16        | Descriptor Group Upper Address Register (FEC_GAUR).....       | 1982 |
| 40.5.17        | Descriptor Group Lower Address Register (FEC_GALR).....       | 1982 |
| 40.5.18        | Transmit FIFO Watermark (FEC_TFWR).....                       | 1983 |

| Section number | Title                                                                    | Page |
|----------------|--------------------------------------------------------------------------|------|
| 40.5.19        | FIFO Receive Bound Register (FEC_FRBR).....                              | 1984 |
| 40.5.20        | FIFO Receive Start Register (FEC_FRSR).....                              | 1984 |
| 40.5.21        | Receive Descriptor Ring Start Register (FEC_ERDSR).....                  | 1985 |
| 40.5.22        | Transmit Buffer Descriptor Ring Start Register (FEC_ETDSR).....          | 1986 |
| 40.5.23        | Receive Buffer Size Register (FEC_EMRR).....                             | 1986 |
| 40.5.24        | Count of frames not counted correctly (FEC_RMON_T_DROP).....             | 1987 |
| 40.5.25        | RMON Tx packet count (FEC_RMON_T_PACKETS).....                           | 1988 |
| 40.5.26        | RMON Tx broadcast packets (FEC_RMON_T_BC_PKT).....                       | 1988 |
| 40.5.27        | RMON Tx multicast packets (FEC_RMON_T_MC_PKT).....                       | 1989 |
| 40.5.28        | RMON Tx packets with CRC/align error (FEC_RMON_T_CRC_ALIGN).....         | 1989 |
| 40.5.29        | RMON Tx packets < 64 bytes, good CRC (FEC_RMON_T_UNDERSIZE).....         | 1990 |
| 40.5.30        | RMON Tx packets > MAX_FL bytes, good CRC (FEC_RMON_T_OVERSIZE).....      | 1990 |
| 40.5.31        | RMON Tx packets < 64 bytes, bad CRC (FEC_RMON_T_FRAG).....               | 1991 |
| 40.5.32        | RMON Tx packets > MAX_FL bytes, bad CRC (FEC_RMON_T_JAB).....            | 1991 |
| 40.5.33        | RMON Tx collision count (FEC_RMON_T_COL).....                            | 1992 |
| 40.5.34        | RMON Tx 64 byte packets (FEC_RMON_T_P64).....                            | 1992 |
| 40.5.35        | RMON Tx 65 to 127 byte packets (FEC_RMON_T_P65TO127).....                | 1993 |
| 40.5.36        | RMON Tx 128 to 255 byte packets (FEC_RMON_T_P128TO255).....              | 1993 |
| 40.5.37        | RMON Tx 256 to 511 byte packets (FEC_RMON_T_P256TO511).....              | 1994 |
| 40.5.38        | RMON Tx 512 to 1023 byte packets (FEC_RMON_T_P512TO1023).....            | 1994 |
| 40.5.39        | RMON Tx 1024 to 2047 byte packets (FEC_RMON_T_P1024TO2047).....          | 1995 |
| 40.5.40        | RMON Tx packets with > 2048 bytes (FEC_RMON_T_P_GTE2048).....            | 1995 |
| 40.5.41        | RMON Tx Octets (FEC_RMON_T_OCTETS).....                                  | 1996 |
| 40.5.42        | Count of transmitted frames not counted correctly (FEC_IEEE_T_DROP)..... | 1996 |
| 40.5.43        | Frames transmitted OK (FEC_IEEE_T_FRAME_OK).....                         | 1997 |
| 40.5.44        | Frames transmitted with single collision (FEC_IEEE_T_1COL).....          | 1997 |
| 40.5.45        | Frames transmitted with multiple collisions (FEC_IEEE_T_MCOL).....       | 1998 |
| 40.5.46        | Frames transmitted after deferral delay (FEC_IEEE_T_DEF).....            | 1998 |
| 40.5.47        | Frames transmitted with late collision (FEC_IEEE_T_LCOL).....            | 1999 |

| Section number | Title                                                                        | Page |
|----------------|------------------------------------------------------------------------------|------|
| 40.5.48        | Frames transmitted with excessive collisions (FEC_IEEE_T_EXCOL).....         | 1999 |
| 40.5.49        | Frames transmitted with Tx FIFO underrun (FEC_IEEE_T_MACERR).....            | 2000 |
| 40.5.50        | Frames transmitted with carrier sense error (FEC_IEEE_T_CSERR).....          | 2000 |
| 40.5.51        | Frames transmitted with SQE error (FEC_IEEE_T_SQE).....                      | 2001 |
| 40.5.52        | Flow control pause frames transmitted (FEC_IEEE_T_FDXFC).....                | 2001 |
| 40.5.53        | Octet count for frames transmitted without error (FEC_IEEE_T_OCTETS_OK)..... | 2002 |
| 40.5.54        | Count of received frames not counted correctly (FEC_RMON_R_DROP).....        | 2002 |
| 40.5.55        | RMON Rx packet count (FEC_RMON_R_PACKETS).....                               | 2003 |
| 40.5.56        | RMON Rx broadcast packets (FEC_RMON_R_BC_PKT).....                           | 2003 |
| 40.5.57        | RMON Rx multicast packets (FEC_RMON_R_MC_PKT).....                           | 2004 |
| 40.5.58        | RMON Rx packets with CRC/Align error (FEC_RMON_R_CRC_ALIGN).....             | 2004 |
| 40.5.59        | RMON Rx packets < 64 bytes, good CRC (FEC_RMON_R_UNDERSIZE).....             | 2005 |
| 40.5.60        | RMON Rx packets > MAX_FL bytes, good CRC (FEC_RMON_R_OVERSIZE).....          | 2005 |
| 40.5.61        | RMON Rx packets < 64 bytes, bad CRC (FEC_RMON_R_FRAG).....                   | 2006 |
| 40.5.62        | RMON Rx packets > MAX_FL bytes, bad CRC (FEC_RMON_R_JAB).....                | 2006 |
| 40.5.63        | Reserved (FEC_RMON_R_RESVD_0).....                                           | 2007 |
| 40.5.64        | RMON Rx 64 byte packets (FEC_RMON_R_P64).....                                | 2007 |
| 40.5.65        | RMON Rx 65 to 127 byte packets (FEC_RMON_R_P65TO127).....                    | 2008 |
| 40.5.66        | RMON Rx 128 to 255 byte packets (FEC_RMON_R_P128TO255).....                  | 2008 |
| 40.5.67        | RMON Rx 256 to 511 byte packets (FEC_RMON_R_P256TO511).....                  | 2009 |
| 40.5.68        | RMON Rx 512 to 1023 byte packets (FEC_RMON_R_P512TO1023).....                | 2009 |
| 40.5.69        | RMON Rx 1024 to 2047 byte packets (FEC_RMON_R_P1024TO2047).....              | 2010 |
| 40.5.70        | RMON Rx packets with > 2048 bytes (FEC_RMON_R_P_GTE2048).....                | 2010 |
| 40.5.71        | RMON Rx octets (FEC_RMON_R_OCTETS).....                                      | 2011 |
| 40.5.72        | Count of received frames not counted correctly (FEC_IEEE_R_DROP).....        | 2011 |
| 40.5.73        | Frames received OK (FEC_IEEE_R_FRAME_OK).....                                | 2012 |
| 40.5.74        | Frames received with CRC error (FEC_IEEE_R_CRC).....                         | 2012 |
| 40.5.75        | Frames received with alignment error (FEC_IEEE_R_ALIGN).....                 | 2013 |
| 40.5.76        | Receive FIFO overflow count (FEC_IEEE_R_MACERR).....                         | 2013 |

| Section number | Title                                                                     | Page |
|----------------|---------------------------------------------------------------------------|------|
| 40.5.77        | Flow control pause frames received (FEC_IEEE_R_FDXFC).....                | 2014 |
| 40.5.78        | Octet count for frames received without error (FEC_IEEE_R_OCTETS_OK)..... | 2014 |
| 40.5.79        | Using the RMON and IEEE registers.....                                    | 2014 |
| 40.6           | Functional description.....                                               | 2015 |
| 40.6.1         | MII data frame.....                                                       | 2015 |
| 40.6.2         | MII management frame structure.....                                       | 2016 |
| 40.6.3         | Buffer descriptors.....                                                   | 2017 |
| 40.6.4         | Initialization sequence.....                                              | 2023 |
| 40.6.5         | User initialization (Prior to Setting ECR[ETHER_EN]).....                 | 2023 |
| 40.6.6         | Microcontroller initialization.....                                       | 2024 |
| 40.6.7         | User initialization (after setting ECR[ETHER_EN]).....                    | 2025 |
| 40.6.8         | Network interface options.....                                            | 2025 |
| 40.6.9         | FEC frame transmission.....                                               | 2026 |
| 40.6.10        | FEC frame reception.....                                                  | 2028 |
| 40.6.11        | Ethernet address recognition.....                                         | 2029 |
| 40.6.12        | Hash algorithm.....                                                       | 2032 |
| 40.6.13        | Full duplex flow control.....                                             | 2035 |
| 40.6.14        | Inter-Packet Gap (IPG) time.....                                          | 2036 |
| 40.6.15        | Collision managing.....                                                   | 2036 |
| 40.6.16        | MII internal and external loopback.....                                   | 2036 |
| 40.6.17        | RMII loopback.....                                                        | 2037 |
| 40.6.18        | RMII echo.....                                                            | 2037 |
| 40.6.19        | Ethernet error-managing procedure.....                                    | 2037 |

## Chapter 41 SENT Receiver (SRX)

|        |                                    |      |
|--------|------------------------------------|------|
| 41.1   | Chip-specific SRX information..... | 2041 |
| 41.2   | Introduction.....                  | 2041 |
| 41.2.1 | Features.....                      | 2042 |

| Section number | Title                                                                                     | Page |
|----------------|-------------------------------------------------------------------------------------------|------|
| 41.2.2         | Modes of operation.....                                                                   | 2043 |
| 41.2.3         | Block diagram.....                                                                        | 2045 |
| 41.2.4         | Design overview.....                                                                      | 2047 |
| 41.3           | External signal description.....                                                          | 2048 |
| 41.3.1         | SENT_RX [(CH-1):0].....                                                                   | 2048 |
| 41.4           | Memory map and register definition.....                                                   | 2049 |
| 41.4.1         | Global Control Register (SRX_GBL_CTRL).....                                               | 2053 |
| 41.4.2         | Channel Enable Register (SRX_CHNL_EN).....                                                | 2055 |
| 41.4.3         | Global Status Register (SRX_GBL_STATUS).....                                              | 2056 |
| 41.4.4         | Fast Message Ready Status Register (SRX_FMSG_RDY).....                                    | 2057 |
| 41.4.5         | Slow Serial Message Ready Status Register (SRX_SMSG_RDY).....                             | 2058 |
| 41.4.6         | Data Control Register 1 (SRX_DATA_CTRL1).....                                             | 2059 |
| 41.4.7         | Fast Message DMA Control Register (SRX_FDMA_CTRL).....                                    | 2061 |
| 41.4.8         | Slow Serial Message DMA Control Register (SRX_SDMA_CTRL).....                             | 2061 |
| 41.4.9         | Fast Message Ready Interrupt Control Register (SRX_FRDY_IE).....                          | 2062 |
| 41.4.10        | Slow Serial Message Ready Interrupt Enable Register (SRX_SRDY_IE).....                    | 2063 |
| 41.4.11        | DMA Fast Message Data Read Register (SRX_DMA_FMSG_DATA).....                              | 2063 |
| 41.4.12        | DMA Fast Message CRC Read Register (SRX_DMA_FMSG_CRC).....                                | 2064 |
| 41.4.13        | DMA Fast Message Time Stamp Read Register (SRX_DMA_FMSG_TS).....                          | 2065 |
| 41.4.14        | DMA Slow Serial Message Bit3 Read Register (SRX_DMA_SMSG_BIT3).....                       | 2065 |
| 41.4.15        | DMA Slow Serial Message Bit2 Read Register (SRX_DMA_SMSG_BIT2).....                       | 2067 |
| 41.4.16        | DMA Slow Serial Message Time Stamp Read Register (SRX_DMA_SMSG_TS).....                   | 2067 |
| 41.4.17        | Channel 'n' Clock Control Register (n = 0 to (CH-1)) (SRX_CHn_CLK_CTRL).....              | 2068 |
| 41.4.18        | Channel 'n' Status Register (n=0 to (CH-1)) (SRX_CHn_STATUS).....                         | 2070 |
| 41.4.19        | Channel 'n' Configuration Register (n=0 to (CH-1)) (SRX_CHn_CONFIG).....                  | 2073 |
| 41.4.20        | Channel 'n' Fast Message Data Read Register (n=0 to (CH-1)) (SRX_CHn_FMSG_DATA).....      | 2076 |
| 41.4.21        | Channel 'n' Fast Message CRC Read Register (n=0 to (CH-1)) (SRX_CHn_FMSG_CRC).....        | 2077 |
| 41.4.22        | Channel 'n' Fast Message Time Stamp Read Register (n=0 to (CH-1)) (SRX_CHn_FMSG_TS).....  | 2077 |
| 41.4.23        | Channel 'n' Serial Message Read Register (Bit 3) (n=0 to (CH-1)) (SRX_CHn_SMSG_BIT3)..... | 2078 |

| Section number | Title                                                                                      | Page |
|----------------|--------------------------------------------------------------------------------------------|------|
| 41.4.24        | Channel 'n' Serial Message Read Register (Bit 2)(n=0 to (CH-1)) (SRX_CHn_SMSG_BIT2).....   | 2079 |
| 41.4.25        | Channel 'n' Serial Message Time Stamp Read Register (n=0 to (CH-1)) (SRX_CHn_SMSG_TS)..... | 2080 |
| 41.5           | Functional description.....                                                                | 2080 |
| 41.5.1         | Initialization sequence.....                                                               | 2080 |
| 41.5.2         | DMA read logic.....                                                                        | 2081 |
| 41.5.3         | Message reading via interrupts.....                                                        | 2089 |
| 41.5.4         | Overflow behavior.....                                                                     | 2091 |
| 41.5.5         | Adjustment for variation in sensor (Tx) clock.....                                         | 2092 |
| 41.5.6         | Input programmable filter.....                                                             | 2093 |
| 41.5.7         | Receiver diagnostics.....                                                                  | 2093 |
| 41.5.8         | Time stamp logic.....                                                                      | 2100 |
| 41.5.9         | Bus Idle Diagnostic.....                                                                   | 2101 |
| 41.6           | Clocks and resets.....                                                                     | 2101 |
| 41.6.1         | Clocking strategy.....                                                                     | 2101 |
| 41.6.2         | System bus clock requirements.....                                                         | 2102 |
| 41.6.3         | High frequency receiver clock (protocol clock) requirements.....                           | 2103 |

## Chapter 42

### Enhanced Serial Communication Interface (eSCI)

|        |                                                     |      |
|--------|-----------------------------------------------------|------|
| 42.1   | Chip-specific eSCI information.....                 | 2105 |
| 42.1.1 | eSCI clocking.....                                  | 2105 |
| 42.1.2 | eSCI registers: core access in supervisor mode..... | 2105 |
| 42.2   | Introduction.....                                   | 2106 |
| 42.2.1 | Bibliography.....                                   | 2106 |
| 42.2.2 | Acronyms and Abbreviations.....                     | 2106 |
| 42.2.3 | Glossary.....                                       | 2106 |
| 42.2.4 | Overview.....                                       | 2107 |
| 42.2.5 | Features.....                                       | 2108 |

| Section number | Title                                                  | Page |
|----------------|--------------------------------------------------------|------|
| 42.2.6         | Modes of Operation.....                                | 2110 |
| 42.3           | External Signal Description.....                       | 2111 |
| 42.3.1         | Detailed Signal Descriptions.....                      | 2111 |
| 42.4           | Memory Map and Register Definition.....                | 2111 |
| 42.4.1         | Baud Rate Register (eSCI_BRR).....                     | 2112 |
| 42.4.2         | Control Register 1 (eSCI_CR1).....                     | 2113 |
| 42.4.3         | Control Register 2 (eSCI_CR2).....                     | 2115 |
| 42.4.4         | SCI Data Register (eSCI_SDR).....                      | 2117 |
| 42.4.5         | Interrupt Flag and Status Register 1 (eSCI_IFSR1)..... | 2119 |
| 42.4.6         | Interrupt Flag and Status Register 2 (eSCI_IFSR2)..... | 2121 |
| 42.4.7         | LIN Control Register 1 (eSCI_LCR1).....                | 2122 |
| 42.4.8         | LIN Control Register 2 (eSCI_LCR2).....                | 2124 |
| 42.4.9         | LIN Transmit Register (eSCI_LTR).....                  | 2124 |
| 42.4.10        | LIN Receive Register (eSCI_LRR).....                   | 2126 |
| 42.4.11        | LIN CRC Polynomial Register (eSCI_LPR).....            | 2127 |
| 42.4.12        | Control Register 3 (eSCI_CR3).....                     | 2127 |
| 42.5           | Functional Description.....                            | 2128 |
| 42.5.1         | Module Control.....                                    | 2128 |
| 42.5.2         | Frame Formats.....                                     | 2128 |
| 42.5.3         | Baud Rate and Clock Generation.....                    | 2132 |
| 42.5.4         | Baud Rate Tolerance.....                               | 2134 |
| 42.5.5         | SCI Mode.....                                          | 2136 |
| 42.5.6         | LIN Mode.....                                          | 2153 |
| 42.5.7         | Interrupts.....                                        | 2164 |
| 42.6           | Application Information.....                           | 2165 |
| 42.6.1         | SCI Data Frames Separated by Preamble.....             | 2165 |

## Chapter 43

### Resets

|      |               |      |
|------|---------------|------|
| 43.1 | Overview..... | 2167 |
|------|---------------|------|

| Section number | Title                                | Page |
|----------------|--------------------------------------|------|
| 43.2           | Reset sequence.....                  | 2168 |
| 43.3           | Reset pins.....                      | 2171 |
| 43.3.1         | RESET.....                           | 2171 |
| 43.3.2         | RSTOUT.....                          | 2171 |
| 43.4           | Reset sources.....                   | 2172 |
| 43.4.1         | Power-on reset.....                  | 2172 |
| 43.4.2         | External reset.....                  | 2174 |
| 43.4.3         | FCCU reset.....                      | 2174 |
| 43.4.4         | FOSU reset.....                      | 2175 |
| 43.4.5         | Dual core reset.....                 | 2175 |
| 43.4.6         | JTAG reset.....                      | 2175 |
| 43.4.7         | Software system reset.....           | 2176 |
| 43.4.8         | Software external reset.....         | 2176 |
| 43.4.9         | STCU reset.....                      | 2176 |
| 43.4.10        | Life cycle manipulation reset.....   | 2177 |
| 43.5           | Reset configuration.....             | 2177 |
| 43.5.1         | Weak pull up/down configuration..... | 2177 |
| 43.5.2         | Boot configuration.....              | 2178 |
| 43.6           | Boot sequence.....                   | 2178 |

## Chapter 44 System Boot

|        |                           |      |
|--------|---------------------------|------|
| 44.1   | Overview.....             | 2181 |
| 44.2   | Features.....             | 2181 |
| 44.3   | Modes of operation.....   | 2182 |
| 44.3.1 | Normal boot.....          | 2182 |
| 44.3.2 | Parallel secure boot..... | 2182 |
| 44.3.3 | Debug mode.....           | 2182 |
| 44.3.4 | Internal boot mode.....   | 2182 |
| 44.3.5 | Serial boot mode.....     | 2183 |

| Section number | Title                                     | Page |
|----------------|-------------------------------------------|------|
| 44.3.6         | Development bus boot mode.....            | 2183 |
| 44.4           | Memory Map.....                           | 2183 |
| 44.5           | Functional Description.....               | 2184 |
| 44.5.1         | BAM program flow chart.....               | 2184 |
| 44.5.2         | BAM program operation.....                | 2184 |
| 44.5.3         | Reset Configuration Half Word (RCHW)..... | 2186 |
| 44.5.4         | Internal boot mode.....                   | 2188 |
| 44.5.5         | Serial boot mode.....                     | 2189 |
| 44.5.6         | Booting from the development bus.....     | 2198 |

## Chapter 45

### System Status and Configuration Module (SSCM)

|        |                                                              |      |
|--------|--------------------------------------------------------------|------|
| 45.1   | Chip-specific SSCM information.....                          | 2201 |
| 45.1.1 | SSCM and UTEST flash memory.....                             | 2201 |
| 45.1.2 | SSCM security reset and LC state.....                        | 2202 |
| 45.1.3 | SSCM_ERROR[PAE] and abort responses to illegal accesses..... | 2203 |
| 45.2   | Introduction.....                                            | 2203 |
| 45.2.1 | Overview.....                                                | 2203 |
| 45.2.2 | Glossary.....                                                | 2204 |
| 45.2.3 | Features.....                                                | 2204 |
| 45.2.4 | Modes of operation.....                                      | 2205 |
| 45.3   | External signal description.....                             | 2205 |
| 45.4   | Memory map and register definition.....                      | 2205 |
| 45.4.1 | SSCM System Status (SSCM_STATUS).....                        | 2206 |
| 45.4.2 | SSCM Error Configuration Register (SSCM_ERROR).....          | 2208 |
| 45.4.3 | Life Cycle Status Register (SSCM_LCSTAT).....                | 2209 |
| 45.5   | Functional description.....                                  | 2209 |
| 45.5.1 | DCF mechanism.....                                           | 2210 |
| 45.5.2 | Life Cycle.....                                              | 2212 |

| Section number | Title                                           | Page |
|----------------|-------------------------------------------------|------|
| 45.6           | Initialization and application information..... | 2214 |
| 45.6.1         | Reset.....                                      | 2214 |
| 45.7           | Additional safety measures.....                 | 2214 |
| 45.7.1         | Spurious reset protection.....                  | 2214 |

## Chapter 46 Power Management

|      |                                          |      |
|------|------------------------------------------|------|
| 46.1 | Overview.....                            | 2215 |
| 46.2 | Functional description.....              | 2216 |
| 46.3 | Power modes.....                         | 2216 |
| 46.4 | External supply.....                     | 2216 |
| 46.5 | Power management supply description..... | 2216 |
| 46.6 | Voltage monitoring.....                  | 2217 |

## Chapter 47 Power Management Controller (PMC)

|         |                                                                       |      |
|---------|-----------------------------------------------------------------------|------|
| 47.1    | Introduction.....                                                     | 2219 |
| 47.1.1  | Features.....                                                         | 2219 |
| 47.2    | Memory Map and Registers.....                                         | 2221 |
| 47.2.1  | Temperature Sensor Interrupt Enable Register (PMC_TS_IER).....        | 2222 |
| 47.2.2  | Temperature Event Status Register (PMC_ESR_TD).....                   | 2224 |
| 47.2.3  | Temperature Reset Event Enable register (PMC_REE_TD).....             | 2226 |
| 47.2.4  | Temperature Reset Event Selection Register (PMC_RES_TD).....          | 2228 |
| 47.2.5  | Temperature Detector Configuration Register (PMC_CTL_TD).....         | 2229 |
| 47.2.6  | Temperature Sensor Fault Injection Register (PMC_TS_FIR).....         | 2230 |
| 47.2.7  | Voltage Detect User Mode Test Register (PMC_SELF_TEST_UM_VD_REG)..... | 2231 |
| 47.2.8  | FCCU Fault Injection Register (PMC_FIR).....                          | 2234 |
| 47.2.9  | LVD/HVD Interrupt Enable Control Register (PMC_LVD_HVD_INTR_ENB)..... | 2235 |
| 47.2.10 | LVD/HVD Event Status Register (PMC_LVD_HVD_EVENT_STATUS).....         | 2238 |
| 47.2.11 | ADC Channel Select Register (PMC_ADC_CS).....                         | 2240 |
| 47.2.12 | Reset Event Enable Register (PMC_REE).....                            | 2242 |

| Section number | Title                                   | Page |
|----------------|-----------------------------------------|------|
| 47.3           | Functional description.....             | 2244 |
| 47.3.1         | Analog PMC interface.....               | 2244 |
| 47.3.2         | Temperature Sensor interface logic..... | 2244 |
| 47.3.3         | POR phase gates.....                    | 2244 |
| 47.3.4         | Flash memory interface to DCF.....      | 2244 |
| 47.3.5         | FCCU interface.....                     | 2245 |
| 47.3.6         | LVD/HVD self test mechanism.....        | 2245 |

## Chapter 48 JTAG Controller (JTAGC)

|        |                                      |      |
|--------|--------------------------------------|------|
| 48.1   | Chip-specific JTAGC information..... | 2249 |
| 48.1.1 | JTAG ID.....                         | 2249 |
| 48.2   | Introduction.....                    | 2249 |
| 48.2.1 | Block diagram.....                   | 2249 |
| 48.2.2 | Features.....                        | 2250 |
| 48.2.3 | Modes of operation.....              | 2250 |
| 48.3   | External signal description.....     | 2252 |
| 48.3.1 | TCK—Test clock input.....            | 2252 |
| 48.3.2 | TDI—Test data input.....             | 2252 |
| 48.3.3 | TDO—Test data output.....            | 2252 |
| 48.3.4 | TMS—Test mode select.....            | 2253 |
| 48.3.5 | JCOMP—JTAG compliancy.....           | 2253 |
| 48.4   | Register description.....            | 2253 |
| 48.4.1 | Instruction register.....            | 2253 |
| 48.4.2 | Bypass register.....                 | 2254 |
| 48.4.3 | Device identification register.....  | 2254 |
| 48.4.4 | JTAG_PASSWORD register.....          | 2255 |
| 48.4.5 | Boundary scan register.....          | 2255 |
| 48.5   | Functional description.....          | 2256 |
| 48.5.1 | JTAGC reset configuration.....       | 2256 |

| 48.6           | Initialization/Application information.....   | 2262 |

## Chapter 49

### IEEE 1149.7 Compact JTAG Test Access Port Controller (CJTAG)

|        |                                   |      |
|--------|-----------------------------------|------|
| 49.1   | References.....                   | 2263 |
| 49.2   | Abbreviations.....                | 2263 |
| 49.3   | Introduction.....                 | 2264 |
| 49.3.1 | Types of operation.....           | 2265 |
| 49.3.2 | Deployment by class.....          | 2265 |
| 49.3.3 | 1149.7 TAP signals.....           | 2266 |
| 49.3.4 | TAP.7 architecture.....           | 2267 |
| 49.3.5 | Protocols.....                    | 2268 |
| 49.4   | Operating models.....             | 2270 |
| 49.5   | CJTAG implementation summary..... | 2270 |
| 49.5.1 | T0 functions.....                 | 2270 |
| 49.5.2 | T1 functions.....                 | 2271 |
| 49.5.3 | T2 functions.....                 | 2271 |
| 49.5.4 | T3 functions.....                 | 2271 |
| 49.5.5 | T4 functions.....                 | 2271 |
| 49.6   | Ancillary services.....           | 2271 |
| 49.6.1 | Overview.....                     | 2271 |
| 49.6.2 | Resets.....                       | 2272 |
| 49.6.3 | Start-up Options.....             | 2275 |
| 49.6.4 | RSU operation.....                | 2276 |
| 49.6.5 | TAPC State Machine.....           | 2278 |

| Section number | Title                                                      | Page |
|----------------|------------------------------------------------------------|------|
| 49.7           | EPU (Extended Protocol Unit) Operation.....                | 2279 |
| 49.7.1         | EPU Operation.....                                         | 2279 |
| 49.7.2         | EPU Registers.....                                         | 2282 |
| 49.7.3         | EPU Commands.....                                          | 2293 |
| 49.7.4         | EPU operating states.....                                  | 2301 |
| 49.7.5         | System and EPU Paths.....                                  | 2302 |
| 49.8           | APU (Advanced Protocol Unit) Operation.....                | 2302 |
| 49.8.1         | Overview.....                                              | 2302 |
| 49.8.2         | Operation.....                                             | 2305 |
| 49.8.3         | Escape sequences.....                                      | 2307 |
| 49.8.4         | Signal behaviors.....                                      | 2307 |
| 49.8.5         | APU Functions.....                                         | 2308 |
| 49.8.6         | Configuration Change Packets (CP).....                     | 2314 |
| 49.8.7         | Scan Packet.....                                           | 2315 |
| 49.8.8         | SP Format.....                                             | 2315 |
| 49.9           | Functional Description.....                                | 2322 |
| 49.9.1         | Switching from Standard Protocol to Advanced Protocol..... | 2322 |

## Chapter 50 JTAG Data Communication (JDC)

|        |                                               |      |
|--------|-----------------------------------------------|------|
| 50.1   | Introduction.....                             | 2323 |
| 50.2   | Overview.....                                 | 2323 |
| 50.3   | Memory mapped registers.....                  | 2324 |
| 50.3.1 | Module Configuration Register (JDC_MCR).....  | 2325 |
| 50.3.2 | Module Status Register (JDC_MSR).....         | 2326 |
| 50.3.3 | JTAG Output Data Register (JDC_JOUT_IPS)..... | 2327 |
| 50.3.4 | JTAG Input Data Register (JDC_JIN_IPS).....   | 2328 |
| 50.4   | Non-Memory mapped register definition.....    | 2328 |
| 50.4.1 | JTAG output data register (JOUT).....         | 2328 |
| 50.4.2 | JTAG input data register (JIN).....           | 2329 |

| Section number | Title                       | Page |
|----------------|-----------------------------|------|
| 50.5           | Functional description..... | 2329 |
| 50.5.1         | JTAG register access.....   | 2330 |

## Chapter 51 Nexus Development Interface (NDI)

|        |                                                                  |      |
|--------|------------------------------------------------------------------|------|
| 51.1   | Overview.....                                                    | 2331 |
| 51.2   | Nexus clients for TAP access.....                                | 2332 |
| 51.3   | Debug break and cross-triggering.....                            | 2332 |
| 51.3.1 | Break control.....                                               | 2333 |
| 51.3.2 | Cross-triggering control.....                                    | 2333 |
| 51.3.3 | Synchronous restart control.....                                 | 2333 |
| 51.4   | Nexus eDMA Interface (NXDM) and Nexus SIPI Interface (NXSI)..... | 2334 |
| 51.4.1 | Introduction.....                                                | 2334 |
| 51.4.2 | External Signal Description.....                                 | 2336 |
| 51.4.3 | NXDM and NXSI Programmers Model.....                             | 2336 |
| 51.4.4 | Functional Description.....                                      | 2347 |

## Chapter 52 Nexus Port Controller (NPC)

|        |                                    |      |
|--------|------------------------------------|------|
| 52.1   | Chip-specific NPC information..... | 2357 |
| 52.1.1 | DID register reset value.....      | 2357 |
| 52.1.2 | NPC MDO pins.....                  | 2357 |
| 52.2   | Introduction.....                  | 2358 |
| 52.2.1 | Overview.....                      | 2358 |
| 52.2.2 | Features.....                      | 2358 |
| 52.2.3 | Modes of operation.....            | 2359 |
| 52.3   | External signal description.....   | 2361 |
| 52.3.1 | Overview.....                      | 2361 |

| Section number | Title                                       | Page |
|----------------|---------------------------------------------|------|
| 52.3.2         | Detailed signal descriptions.....           | 2361 |
| 52.4           | Register definition.....                    | 2363 |
| 52.4.1         | Register descriptions.....                  | 2363 |
| 52.5           | Functional Description.....                 | 2368 |
| 52.5.1         | NPC reset configuration.....                | 2368 |
| 52.5.2         | Auxiliary Output Port.....                  | 2368 |
| 52.5.3         | IEEE 1149.1-2001 (JTAG) TAP.....            | 2371 |
| 52.5.4         | Nexus JTAG Port Sharing.....                | 2376 |
| 52.5.5         | MCKO Control .....                          | 2376 |
| 52.5.6         | EVTO Sharing.....                           | 2377 |
| 52.5.7         | Nexus Reset Control.....                    | 2377 |
| 52.5.8         | System Clock Locked Indication.....         | 2377 |
| 52.6           | Initialization/Application Information..... | 2378 |
| 52.6.1         | Accessing NPC tool-mapped registers.....    | 2378 |

## Chapter 53

### Nexus eTPU Development Interface (NDEDI)

|        |                                             |      |
|--------|---------------------------------------------|------|
| 53.1   | Chip-specific NDEDI information.....        | 2379 |
| 53.1.1 | NDEDI/NSEDI device-specific parameters..... | 2379 |
| 53.2   | Introduction.....                           | 2380 |
| 53.3   | Features.....                               | 2381 |
| 53.4   | Modes of operation.....                     | 2383 |
| 53.4.1 | Reset.....                                  | 2383 |
| 53.4.2 | Disabled-port mode.....                     | 2383 |
| 53.4.3 | Full-port mode.....                         | 2383 |
| 53.4.4 | Reduced-port mode.....                      | 2384 |
| 53.4.5 | Stop mode.....                              | 2384 |
| 53.5   | External signal description.....            | 2384 |
| 53.5.1 | Overview.....                               | 2384 |

| Section number | Title                                       | Page |
|----------------|---------------------------------------------|------|
| 53.5.2         | Detailed signal descriptions.....           | 2385 |
| 53.6           | Register definition.....                    | 2387 |
| 53.6.1         | Register descriptions.....                  | 2389 |
| 53.6.2         | Unimplemented Registers.....                | 2421 |
| 53.7           | Functional description.....                 | 2421 |
| 53.7.1         | NDEDI reset configuration.....              | 2421 |
| 53.7.2         | Auxiliary output port.....                  | 2422 |
| 53.7.3         | IEEE 1149.1 (JTAG) Input Port.....          | 2432 |
| 53.7.4         | Microcode Development Support.....          | 2437 |
| 53.7.5         | Debug Status.....                           | 2438 |
| 53.7.6         | Ownership Trace.....                        | 2440 |
| 53.7.7         | Program Trace.....                          | 2441 |
| 53.7.8         | Data Trace.....                             | 2456 |
| 53.7.9         | Watchpoint Trace.....                       | 2463 |
| 53.7.10        | ETPU Message Queue.....                     | 2465 |
| 53.8           | Initialization/Application Information..... | 2469 |
| 53.8.1         | Accessing NDEDI tool-mapped registers.....  | 2469 |
| 53.8.2         | Program Trace Reconstruction.....           | 2470 |
| 53.8.3         | Microcode Development Support.....          | 2474 |

## Chapter 54 Development Trigger Semaphore (DTS)

|        |                                          |      |
|--------|------------------------------------------|------|
| 54.1   | Introduction.....                        | 2479 |
| 54.2   | Overview.....                            | 2479 |
| 54.3   | DTS device connections.....              | 2481 |
| 54.3.1 | DTS register access.....                 | 2482 |
| 54.4   | Memory mapped registers.....             | 2483 |
| 54.4.1 | Output Enable Register (DTS_ENABLE)..... | 2483 |
| 54.4.2 | Startup Register (DTS_STARTUP).....      | 2484 |
| 54.4.3 | Semaphore Register (DTS_SEMAPHORE).....  | 2485 |

| Section number | Title                                      | Page |
|----------------|--------------------------------------------|------|
| 54.4.4         | Semaphore Extension (DTS_SEMAPHORE_B)..... | 2486 |
| 54.5           | Example application.....                   | 2486 |

## Chapter 55

### Fault Collection and Control Unit (FCCU)

|        |                                                                              |      |
|--------|------------------------------------------------------------------------------|------|
| 55.1   | Chip-specific FCCU information.....                                          | 2489 |
| 55.1.1 | FCCU register default values.....                                            | 2489 |
| 55.1.2 | FOSU_COUNT value.....                                                        | 2489 |
| 55.1.3 | FCCU fault inputs.....                                                       | 2490 |
| 55.1.4 | Error signal flow diagram.....                                               | 2494 |
| 55.1.5 | Restriction on configuring RESET and NMI reactions on same FCCU channel..... | 2495 |
| 55.1.6 | FCCU_CFG register event bit values by source (N and C).....                  | 2496 |
| 55.2   | Introduction.....                                                            | 2497 |
| 55.2.1 | Acronyms and abbreviations.....                                              | 2498 |
| 55.3   | Main features.....                                                           | 2499 |
| 55.4   | Block diagram.....                                                           | 2499 |
| 55.5   | Signal description.....                                                      | 2501 |
| 55.5.1 | Signals.....                                                                 | 2501 |
| 55.6   | Put FCCU in Configuration or Normal state.....                               | 2502 |
| 55.6.1 | Introduction.....                                                            | 2502 |
| 55.6.2 | About changing states.....                                                   | 2503 |
| 55.6.3 | About locking the configuration.....                                         | 2503 |
| 55.6.4 | Put FCCU in Configuration state.....                                         | 2503 |
| 55.6.5 | Put FCCU in Normal state.....                                                | 2504 |
| 55.7   | Run operations.....                                                          | 2505 |
| 55.7.1 | Introduction.....                                                            | 2505 |
| 55.7.2 | About running operations.....                                                | 2505 |
| 55.7.3 | Run an operation.....                                                        | 2505 |
| 55.8   | Functional description.....                                                  | 2506 |
| 55.8.1 | Definitions.....                                                             | 2506 |

| Section number | Title                                                       | Page |
|----------------|-------------------------------------------------------------|------|
| 55.8.2         | FSM description.....                                        | 2506 |
| 55.8.3         | Fault priority scheme and nesting.....                      | 2509 |
| 55.8.4         | STCU interface.....                                         | 2510 |
| 55.8.5         | Nonvolatile memory interface.....                           | 2511 |
| 55.8.6         | EOUT interface.....                                         | 2512 |
| 55.8.7         | Error signal flow.....                                      | 2519 |
| 55.9           | Register descriptions.....                                  | 2519 |
| 55.9.1         | Control (FCCU_CTRL).....                                    | 2522 |
| 55.9.2         | Control Key (FCCU_CTRLK).....                               | 2524 |
| 55.9.3         | Configuration (FCCU_CFG).....                               | 2525 |
| 55.9.4         | Noncritical Fault Configuration (FCCU_NCF_CFGn).....        | 2528 |
| 55.9.5         | Noncritical Fault State Configuration (FCCU_NCFS_CFGn)..... | 2529 |
| 55.9.6         | Noncritical Fault Status (FCCU_NCF_Sn).....                 | 2530 |
| 55.9.7         | Noncritical Fault Key (FCCU_NCFK).....                      | 2532 |
| 55.9.8         | Noncritical Fault Enable (FCCU_NCF_En).....                 | 2533 |
| 55.9.9         | Noncritical Fault Timeout Enable (FCCU_NCF_TOEn).....       | 2534 |
| 55.9.10        | Noncritical Fault Timeout (FCCU_NCF_TO).....                | 2535 |
| 55.9.11        | Configuration-State Timer Interval (FCCU_CFG_TO).....       | 2535 |
| 55.9.12        | IO Control (FCCU_EINOUT).....                               | 2536 |
| 55.9.13        | Status (FCCU_STAT).....                                     | 2538 |
| 55.9.14        | NA Freeze Status (FCCU_N2AF_STATUS).....                    | 2540 |
| 55.9.15        | AF Freeze Status (FCCU_A2FF_STATUS).....                    | 2541 |
| 55.9.16        | NF Freeze Status (FCCU_N2FF_STATUS).....                    | 2542 |
| 55.9.17        | FA Freeze Status (FCCU_F2A_STATUS).....                     | 2543 |
| 55.9.18        | Noncritical Fault Fake (FCCU_NCF_F).....                    | 2544 |
| 55.9.19        | IRQ Status (FCCU_IRQ_STAT).....                             | 2545 |
| 55.9.20        | IRQ Enable (FCCU_IRQ_EN).....                               | 2546 |
| 55.9.21        | X Timer (FCCU_XTMR).....                                    | 2547 |
| 55.9.22        | Transient Configuration Lock (FCCU_TRANS_LOCK).....         | 2548 |

| Section number | Title                                                                               | Page |
|----------------|-------------------------------------------------------------------------------------|------|
| 55.9.23        | Permanent Configuration Lock (FCCU_PERMNT_LOCK).....                                | 2549 |
| 55.9.24        | Delta T (FCCU_DELTA_T).....                                                         | 2549 |
| 55.9.25        | IRQ Alarm Enable (FCCU_IRQ_ALARM_EN <sub>n</sub> ).....                             | 2550 |
| 55.9.26        | NMI Enable (FCCU_NMI_EN <sub>n</sub> ).....                                         | 2551 |
| 55.9.27        | Noncritical Fault-State EOUT Signaling Enable (FCCU_EOUT_SIG_EN <sub>n</sub> )..... | 2552 |
| 55.9.28        | Configuration registers.....                                                        | 2553 |
| 55.9.29        | FCCU_CFG register bit value sources (N and C) by event.....                         | 2553 |
| 55.10          | FCCU Output Supervision Unit.....                                                   | 2555 |
| 55.11          | Use cases and limitations.....                                                      | 2557 |
| 55.11.1        | Configuration guidelines.....                                                       | 2557 |
| 55.11.2        | Recommendations to configure FCCU.....                                              | 2558 |

## Chapter 56

### Self-Test Control Unit (STCU2)

|         |                                                                                                 |      |
|---------|-------------------------------------------------------------------------------------------------|------|
| 56.1    | Chip-specific STCU information.....                                                             | 2559 |
| 56.1.1  | Supported BIST sequences.....                                                                   | 2559 |
| 56.1.2  | Configure or bypass STCU2 off-line self-tests.....                                              | 2560 |
| 56.1.3  | STCU interfaces to other modules.....                                                           | 2560 |
| 56.1.4  | On-line LBIST and MBIST clock configuration.....                                                | 2561 |
| 56.1.5  | STCU2_PLL_CFG configuration of PLLDIG_PLL0DV.....                                               | 2562 |
| 56.1.6  | Wait time for writing to the on-line registers.....                                             | 2562 |
| 56.1.7  | On-line MBIST.....                                                                              | 2562 |
| 56.1.8  | LBIST scenarios.....                                                                            | 2565 |
| 56.1.9  | STCU register default values.....                                                               | 2569 |
| 56.1.10 | AUTOLOCK_VALUE for register write access and DCF_COMPLETION value for DCF write completion..... | 2569 |
| 56.2    | Introduction.....                                                                               | 2570 |
| 56.3    | Main features.....                                                                              | 2570 |
| 56.4    | Block diagram.....                                                                              | 2572 |
| 56.5    | IPS bus interface.....                                                                          | 2573 |

| Section number | Title                                                 | Page |
|----------------|-------------------------------------------------------|------|
| 56.6           | BISTs and BIST partitions.....                        | 2574 |
| 56.6.1         | Definition: BIST.....                                 | 2574 |
| 56.6.2         | Definition: BIST partition.....                       | 2574 |
| 56.6.3         | Example: BIST partitions on a chip.....               | 2575 |
| 56.6.4         | Types of BIST partitions.....                         | 2575 |
| 56.7           | BIST sequences.....                                   | 2575 |
| 56.7.1         | Definition: BIST sequence.....                        | 2575 |
| 56.7.2         | STCU2 executes MBISTs before LBISTs.....              | 2575 |
| 56.7.3         | Example: Single-phase BIST sequence.....              | 2576 |
| 56.7.4         | Example: Multiphase BIST sequence.....                | 2576 |
| 56.7.5         | Types of BIST sequences.....                          | 2576 |
| 56.7.6         | Supported BIST sequences.....                         | 2577 |
| 56.7.7         | Definition: Default offline BIST sequence.....        | 2577 |
| 56.8           | Functional description.....                           | 2577 |
| 56.8.1         | FSM description.....                                  | 2577 |
| 56.8.2         | Reset management.....                                 | 2578 |
| 56.8.3         | Built-in self-test scheduling.....                    | 2578 |
| 56.8.4         | PLL interface.....                                    | 2579 |
| 56.8.5         | Interrupt interface.....                              | 2579 |
| 56.8.6         | FCCU interface.....                                   | 2580 |
| 56.8.7         | Watchdogs.....                                        | 2580 |
| 56.8.8         | SSCM interface.....                                   | 2581 |
| 56.9           | Register description.....                             | 2582 |
| 56.9.1         | STCU2 Run Register (STCU2_RUN).....                   | 2589 |
| 56.9.2         | STCU2 Run Software Register (STCU2_RUNSW).....        | 2590 |
| 56.9.3         | STCU2 SK Code Register (STCU2_SKC).....               | 2591 |
| 56.9.4         | STCU2 Configuration Register (STCU2_CFG).....         | 2593 |
| 56.9.5         | STCU2 PLL Configuration Register (STCU2_PLL_CFG)..... | 2596 |
| 56.9.6         | STCU2 Watchdog Granularity (STCU2_WDG).....           | 2597 |

| Section number | Title                                                                        | Page |
|----------------|------------------------------------------------------------------------------|------|
| 56.9.7         | STCU2 Interrupt Flag Register (STCU2_INT_FLG).....                           | 2599 |
| 56.9.8         | STCU2 Error Register (STCU2_ERR_STAT).....                                   | 2600 |
| 56.9.9         | STCU2 Error FM Register (STCU2_ERR_FM).....                                  | 2603 |
| 56.9.10        | STCU2 Off-Line LBIST Status Register (STCU2_LBS).....                        | 2604 |
| 56.9.11        | STCU2 Off-Line LBIST End Flag Register (STCU2_LBE).....                      | 2605 |
| 56.9.12        | STCU2 On-Line LBIST Status Register (STCU2_LBSSW).....                       | 2606 |
| 56.9.13        | STCU2 On-Line LBIST End Flag Register (STCU2_LBESW).....                     | 2608 |
| 56.9.14        | STCU2 On-Line LBIST Reset Management (STCU2_LBRMSW).....                     | 2609 |
| 56.9.15        | STCU2 LBIST Unrecoverable FM Register (STCU2_LBUFM).....                     | 2611 |
| 56.9.16        | STCU2 Off-Line MBIST Status Low Register (STCU2_MBSL).....                   | 2612 |
| 56.9.17        | STCU2 Off-Line MBIST Status Medium Register (STCU2_MBSM).....                | 2617 |
| 56.9.18        | STCU2 Off-Line MBIST Status High Register (STCU2_MBSH).....                  | 2622 |
| 56.9.19        | STCU2 Off-Line MBIST End Flag Low Register (STCU2_MBEL).....                 | 2623 |
| 56.9.20        | STCU2 Off-Line MBIST End Flag Medium Register (STCU2_MBEM).....              | 2627 |
| 56.9.21        | STCU2 Off-Line MBIST End Flag High Register (STCU2_MBEH).....                | 2631 |
| 56.9.22        | STCU2 On-Line MBIST Status Low Register (STCU2_MBSLSW).....                  | 2632 |
| 56.9.23        | STCU2 On-Line MBIST Status Medium Register (STCU2_MBSMSW).....               | 2635 |
| 56.9.24        | STCU2 On-Line MBIST Status High Register (STCU2_MBSHSW).....                 | 2639 |
| 56.9.25        | STCU2 On-Line MBIST End Flag Low Register (STCU2_MBELSW).....                | 2640 |

| 59.5.3         | Secure storage.....                     | 2698 |
| 59.5.4         | Encryption and decryption.....          | 2700 |
| 59.5.5         | Message authentication.....             | 2700 |
| 59.5.6         | Secure boot.....                        | 2701 |
| 59.5.7         | Random number generation.....           | 2702 |
| 59.5.8         | Error handling.....                     | 2702 |
| 59.6           | CSE commands.....                       | 2704 |
| 59.6.1         | Encrypt ECB.....                        | 2704 |
| 59.6.2         | Encrypt CBC.....                        | 2705 |
| 59.6.3         | Decrypt ECB.....                        | 2705 |
| 59.6.4         | Decrypt CBC.....                        | 2705 |
| 59.6.5         | Generate MAC.....                       | 2706 |
| 59.6.6         | Verify MAC.....                         | 2706 |
| 59.6.7         | Load Key.....                           | 2707 |
| 59.6.8         | Load Plain Key.....                     | 2708 |
| 59.6.9         | Export RAM Key.....                     | 2708 |
| 59.6.10        | Initialize RNG.....                     | 2708 |
| 59.6.11        | Extend PRNG Seed.....                   | 2709 |
| 59.6.12        | Generate Random Number.....             | 2709 |
| 59.6.13        | Secure Boot.....                        | 2710 |
| 59.6.14        | Boot Failure.....                       | 2710 |
| 59.6.15        | Boot OK.....                            | 2710 |
| 59.6.16        | Get ID.....                             | 2711 |
| 59.6.17        | Cancel.....                             | 2711 |
| 59.6.18        | Debug Challenge.....                    | 2711 |
| 59.6.19        | Debug Authorization.....                | 2712 |
| 59.6.20        | Generate TRNG Random Number.....        | 2712 |
| 59.6.21        | Initialize CSE.....                     | 2713 |
| 59.6.22        | Miyaguchi-Preneel (MP) Compression..... | 2713 |

## Chapter 60

### Password and Device Security Module (PASS)

|        |                                                                        |      |
|--------|------------------------------------------------------------------------|------|
| 60.1   | Chip-specific PASS information.....                                    | 2715 |
| 60.1.1 | Accesses to unimplemented PASS registers.....                          | 2715 |
| 60.1.2 | PASS_LOCKm_PGn register bit mapping.....                               | 2715 |
| 60.1.3 | PASS chip select (client select).....                                  | 2719 |
| 60.1.4 | Flash memory read protection scenarios.....                            | 2719 |
| 60.1.5 | Debug Interface Access.....                                            | 2720 |
| 60.1.6 | Duration of Debug Interface Access via JTAG password.....              | 2721 |
| 60.1.7 | Production Disable enablement.....                                     | 2721 |
| 60.1.8 | PASS_LCSTAT[LIFE] value source.....                                    | 2722 |
| 60.2   | Introduction.....                                                      | 2722 |
| 60.2.1 | Overview.....                                                          | 2722 |
| 60.2.2 | Features.....                                                          | 2722 |
| 60.2.3 | Modes of operation.....                                                | 2723 |
| 60.3   | Memory map and register definition.....                                | 2723 |
| 60.3.1 | Life Cycle Status Register (PASS_LCSTAT).....                          | 2725 |
| 60.3.2 | Challenge Selector Register (PASS_CHSEL).....                          | 2726 |
| 60.3.3 | Challenge Status Register (PASS_CSTAT).....                            | 2727 |
| 60.3.4 | Challenge Input Register (PASS_CINn).....                              | 2727 |
| 60.3.5 | Password Group <i>n</i> - Lock 0 Status Register (PASS_LOCK0_PGn)..... | 2728 |
| 60.3.6 | Password Group <i>n</i> - Lock 1 Status Register (PASS_LOCK1_PGn)..... | 2730 |
| 60.3.7 | Password Group <i>n</i> - Lock 2 Status Register (PASS_LOCK2_PGn)..... | 2731 |
| 60.3.8 | Password Group <i>n</i> - Lock 3 Status Register (PASS_LOCK3_PGn)..... | 2732 |
| 60.4   | DCF clients.....                                                       | 2735 |

# Chapter 1

## Preface

### 1.1 Overview

The primary objective of this document is to define the functionality of the MPC5775E Qorivva microcontroller for use by software and hardware developers. The MPC5775E is based on the Power Architecture® developed by NXP.

The information in this document is preliminary and subject to change. As with any technical documentation, it is the reader's responsibility to ensure he or she is using the most recent version of the documentation.

To locate any published errata or updates for this document, visit <http://www.nxp.com>.

### 1.2 Device versions

This release of this document describes the functionality and programming model of maskset 3N45H.

### 1.3 Audience

This manual is intended for system software and hardware developers and applications programmers who want to develop products with the MPC5775E. It is assumed that the reader understands operating systems, microprocessor system design, basic principles of software and hardware, and basic details of the Power Architecture.

### 1.4 Document organization

This document includes two major sets of chapters.

**Table 1-1. Chapter sets**

| Chapters or chapter groups                                                                                                                                                                                                     | Description                                                                        |

## 1.5 Conventions

### 1.5.1 Numbering systems

The following suffixes identify different numbering systems:

| This suffix | Identifies a                                                                                                                                                       |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| b           | Binary number. For example, the binary equivalent of the number 5 is written 101b. In some cases, binary numbers are shown with the prefix 0b.                     |
| d           | Decimal number. Decimal numbers are followed by this suffix only when the possibility of confusion exists. In general, decimal numbers are shown without a suffix. |
| h           | Hexadecimal number. For example, the hexadecimal equivalent of the number 60 is written 3Ch. In some cases, hexadecimal numbers are shown with the prefix 0x.      |

### 1.5.2 Typographic notation

The following typographic notation is used throughout this document:

| Example               | Description                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>placeholder, x</i> | Items in italics are placeholders for information that you provide. Italicized text is also used for the titles of publications and for emphasis. Plain lowercase letters are also used as placeholders for single letters and numbers.                                                                                                                                                                              |
| code                  | Fixed-width type indicates text that must be typed exactly as shown. It is used for instruction mnemonics, directives, symbols, subcommands, parameters, and operators. Fixed-width type is also used for example code. Instruction mnemonics and directives in text and tables are shown in all caps; for example, BSR.                                                                                             |
| SR[SCM]               | A mnemonic in brackets represents a named field in a register. This example refers to the Scaling Mode (SCM) field in the Status Register (SR).                                                                                                                                                                                                                                                                      |
| REVNO[6:4], XAD[7:0]  | Numbers in brackets and separated by a colon represent either: <ul style="list-style-type: none"> <li>• A subset of a register's named field<br/>For example, REVNO[6:4] refers to bits 6–4 that are part of the COREREV field that occupies bits 6–0 of the REVNO register.</li> <li>• A continuous range of individual signals of a bus<br/>For example, XAD[7:0] refers to signals 7–0 of the XAD bus.</li> </ul> |

### 1.5.3 Special terms

The following terms have special meanings:

| Term       | Meaning                                                                                                                                                                                                                                                                                                                                                                                                |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| asserted   | Refers to the state of a signal as follows: <ul style="list-style-type: none"> <li>• An active-high signal is asserted when high (1).</li> <li>• An active-low signal is asserted when low (0).</li> </ul>                                                                                                                                                                                             |
| deasserted | Refers to the state of a signal as follows: <ul style="list-style-type: none"> <li>• An active-high signal is deasserted when low (0).</li> <li>• An active-low signal is deasserted when high (1).</li> </ul> <p>In some cases, deasserted signals are described as <i>negated</i>.</p>                                                                                                               |
| reserved   | Refers to a memory space, register, field, or programming setting. Writes to a reserved location can result in unpredictable functionality or behavior. <ul style="list-style-type: none"> <li>• Do not modify the default value of a reserved programming setting, such as the reset value of a reserved register field.</li> <li>• Consider undefined locations in memory to be reserved.</li> </ul> |
| w1c        | Write 1 to clear: Refers to a register bitfield that must be written as 1 to be "cleared."                                                                                                                                                                                                                                                                                                             |

## 1.6 References

In addition to this reference manual, the following documents provide information about the operation of the MPC5775E:

# Chapter 2

## Introduction

### 2.1 Overview

The MPC5700 family of devices is closely compatible with the MPC5600 families, while introducing new features coupled with high performance CMOS technology to provide substantial cost reduction per feature and significant performance improvement. This document summarizes features and critical performance parameters of the MPC5775E/B.

The two e200z7 host processor cores of the MPC5775E/B are compatible with the Power Architecture Book E architecture. They are 100% user-mode compatible (with floating point library) with the classic PowerPC instruction set. The Book E architecture has enhancements that improve the architecture's fit in embedded applications. In addition to the standard and VLE Power Architecture instruction sets, the cores of the MPC5775E/B have instruction support for digital signal processing (DSP).

The MPC5775E/B has two levels of memory hierarchy: separate 16 KB instruction and 16 KB data caches for each of two cores and 512 KB of on-chip SRAM as well as 4 MB of internal flash memory.

### 2.2 Device Description

#### 2.2.1 Family comparison

The following table summarizes major features of the family of devices defined in this document and compares the family with predecessor families of similar devices. The feature column represents a combination of module names and capabilities of certain modules.

Table 2-1. Family comparison

| Feature                         | MPC5676R                           | MPC5777C                                        | MPC5775B <sup>1</sup>        | MPC5775E <sup>1</sup>        |

1. The External Bus Interface (EBI), Zipwire (SIPI and LFAST), Decimation Filter (DECIL), PSI5 and Reaction Module (REACM) are not available on MPC5775B and MPC5775E. Any references to these modules in this Reference Manual should be ignored.
2. There are two cores on the MPC5676R, MPC5777C, MPC5775B and MPC5775E. Both cores have identical features.
3. External Bus Interface (EBI) is not available on 416 PBGA
4. Calibration bus is combined with EBI.
5. EQADCA is available on 5775B
6. External 3.3 V may be needed for external 3.3 V pins.

## 2.2.2 Block diagram

The following figure shows a top-level block diagram of the MPC5777E. The purpose of the block diagram is to show the general interconnection of functional modules through the crossbar switch.

Figure 2-1. MPC5775E block diagram

## 2.2.3 Packages

The MPC5775E is offered in the following package types:

- 416-ball MAPBGA, 1 mm ball pitch, 27 mm × 27 mm outline, without EBI

## 2.2.4 Features summary

On-chip modules available within the family include the following features:

- Three dual issue, 32-bit CPU core complexes (e200z7), two of which run in lockstep
  - Power Architecture embedded specification compliance
  - Instruction set enhancement allowing variable length encoding (VLE), optional encoding of mixed 16-bit and 32-bit instructions, for code size footprint reduction
  - On the two computational cores: Signal processing extension (SPE1.1) instruction support for digital signal processing (DSP)
  - Single-precision floating point operations
  - On the two computational cores: 16 KB I-Cache and 16 KB D-Cache
  - Hardware cache coherency between cores
- 16 hardware semaphores
- 3-channel CRC module
- 4 MB on-chip flash memory
  - Supports read during program and erase operations, and multiple blocks allowing EEPROM emulation
- 512 KB on-chip general-purpose SRAM including 64 KB standby RAM
- Two multichannel direct memory access controllers (eDMA)
  - 64 channels per eDMA
- Dual core Interrupt Controller (INTC)
- Dual phase-locked loops (PLLs) with stable clock domain for peripherals and frequency modulation (FM) domain for computational shell
- Crossbar Switch architecture for concurrent access to peripherals, flash memory, or RAM from multiple bus masters with End-To-End ECC
- System Integration Unit (SIU)
- Error Injection Module (EIM) and Error Reporting Module (ERM)
- Four protected port output (PPO) pins
- Boot Assist Module (BAM) supports serial bootload via CAN or SCI
- Up to three second-generation Enhanced Time Processor Units (eTPUs)
  - 32 channels per eTPU
  - Total of 36 KB code RAM
  - Total of 9 KB parameter RAM
- Enhanced Modular Input/Output System (eMIOS) supporting 32 unified channels with each channel capable of single action, double action, pulse width modulation (PWM) and modulus counter operation
- Up to two Enhanced Queued Analog-to-Digital Converter (eQADC) modules with:

- Two separate analog converters per eQADC module
- Support for a total of 70 analog input pins, expandable to 182 inputs with off-chip multiplexers
- Up to four independent 16-bit Sigma-Delta ADCs (SDADCs)
- Ethernet (FEC)
- Two SENT Receiver (SRX) modules supporting 12 channels
- Five Deserial Serial Peripheral Interface (DSPI) modules
- Five Enhanced Serial Communication Interface (eSCI) modules
- Four Controller Area Network (FlexCAN) modules
- Two M\_CAN modules that support FD
- Fault Collection and Control Unit (FCCU)
- Clock Monitor Units (CMUs)
- Tamper Detection Module (TDM)
- Cryptographic Services Engine (CSE)
  - Complies with *Secure Hardware Extension (SHE) Functional Specification Version 1.1* security functions
  - Includes software selectable enhancement to key usage flag for MAC verification and increase in number of memory slots for security keys
- PASS module to support security features
- Nexus development interface (NDI) per IEEE-ISTO 5001-2003 standard, with some support for 2010 standard
- Device and board test support per Joint Test Action Group (JTAG) IEEE 1149.1 and 1149.7
- On-chip voltage regulator controller (VRC) that derives the core logic supply voltage from the high-voltage supply
- On-chip voltage regulator for flash memory
- Self Test capability

## Chapter 3

# Signal Description

### 3.1 Production packages

The following production packages are available for MPC5775E/B:

- BGA416

Case number and outline drawings for each package are provided in the MPC5775E data sheet.

### 3.2 Pad ring and ball maps

Refer to the MPC5775E data sheet for ball-map figures.

### 3.3 Pin function selection

#### 3.3.1 Pad output multiplexing

Most pins on the package support more than one output function. The selection of which function is driven to the pin is done by a set of Port Control Registers (SIU\_PCR) within the SIU module. These registers also configure electrical attributes such as drive strength and pull up/down selection. Refer to the SIU\_PCR section of the SIU chapter for more information.

### 3.3.2 Pin input multiplexing

Some modules in this device are allowed to receive input signals from multiple package pins. The selection of which pin drives the function is done by a set of Input Multiplexing Registers (SIU\_IMUX) within the SIU module. Refer to the SIU\_IMUX section of the SIU chapter for more information.

### 3.3.3 LVDS signal selection

A pin that is driven by a signal from a 5V pad or from an LVDS pad has a single PCR controlling both signals. Different values of PA select either the 5V signal or the LVDS signal. Note that a single LVDS pad supplies two signals: a "true" and a "complement" output. This means that one LVDS pad drives two balls, but each ball has a separate PCR (and PA field). The two LVDS signals are enabled only when the PA values in both PCRs are set to select LVDS operation. Both LVDS signals are deselected when either PA is set to a value that deselects its LVDS signal. The ball that has its PA field still set to LVDS will go to an undriven state until its PA field is updated to a non-LVDS value.

The following table is an example of the options for PA on two balls, where LVDS "true" and LVDS "complement" LVDS outputs are multiplexed with SCK\_C and SINC.

**Table 3-1. LVDS example**

| PCR235 <sup>1</sup> PA selection | PCR236 <sup>2</sup> PA selection | SCKC ball function | SINC ball function |
|----------------------------------|----------------------------------|--------------------|--------------------|
| SCKC                             | SINC                             | SCKC               | SINC               |
| LVDS                             | LVDS                             | SCK_C_LVDS_P       | SCK_C_LVDS_N       |
| SCKC                             | LVDS                             | SCKC               | undriven           |
| LVDS                             | SINC                             | undriven           | SINC               |

1. SCKC\_SCK\_C\_LVDS\_P\_GPIO235

2. SINC\_SCK\_C\_LVDS\_N\_GPIO236

[Table 3-2](#) lists all LVDS pads available on the MPC5775E/B and respective SIU PCR configuration registers and PA values. When LVDS TX functions are enabled on the balls, they can be configured to operate in mode or Micro-Second Bus mode. Also, LVDS RX pads can be configured to increase bias current and enhance timing performance. [Table 3-3](#) lists the register bits used to configure LVDS pad operating modes.

**NOTE**

Differential signal output swing can be configured on MPC5776R LVDS pads. This feature is not available on MPC5775E/B LVDS pads.

**Table 3-2. LVDS function selection**

| LVDS function | Pin polarity | Description                                       | SIU_PCR[PA] configuration              |
|---------------|--------------|---------------------------------------------------|----------------------------------------|
| SCK_C_LVDS    | +            | MSC LVDS+ downstream signal positive output clock | PCR235[PA]=10b AND<br>PCR236[PA]=10b   |
|               | –            | MSC LVDS– downstream signal negative output clock |                                        |
| SOUT_C_LVDS   | +            | MSC LVDS+ downstream signal positive output data  | PCR237[PA]=10b AND<br>PCR238[PA]=10b   |
|               | –            | MSC LVDS– downstream signal negative output data  |                                        |
| SCK_D_LVDS    | +            | MSC LVDS+ downstream signal positive output clock | PCR240[PA]=10b AND<br>PCR241[PA]=10b   |
|               | –            | MSC LVDS– downstream signal negative output clock |                                        |
| SOUT_D_LVDS   | +            | MSC LVDS+ downstream signal positive output data  | PCR242[PA]=011b AND<br>PCR243[PA]=011b |
|               | –            | MSC LVDS– downstream signal negative output data  |                                        |

**Table 3-3. LVDS pad operating modes**

| LVDS function | Configuration register/bit | Value | Pad effect            |
|---------------|----------------------------|-------|-----------------------|
| SCK_C_LVDS    | SIU_PCR235/SRC[0]          | 0     | Micro-Second Bus mode |
| SOUT_C_LVDS   | SIU_PCR237/SRC[0]          | 0     | Micro-Second Bus mode |
| SCK_D_LVDS    | SIU_PCR240/SRC[0]          | 0     | Micro-Second Bus mode |
| SOUT_D_LVDS   | SIU_PCR242/SRC[0]          | 0     | Micro-Second Bus mode |

## 3.4 External signal descriptions, multiplexing, and attributes

Details about external signal functions, their static electrical characteristics, and pad configuration settings for this chip appear in the spreadsheet that is embedded within this document:

**MPC5775B\_MPC5775E\_System\_IO\_Definition.xlsx**

To access this spreadsheet, view the document's list of attachments.

The signal properties and their electrical characteristics are set in the SIU's Pad Configuration Registers (PCRs).

### 3.4.1 IBE and OBE control special cases

The "input buffer enable" and/or "output buffer enable" of some signals are not controlled by the IBE/OBE bits of the corresponding SIU\_PCR. The following tables list these special-case signals:

- IBE always ON: [Table 3-4](#)
- OBE always ON: [Table 3-5](#)
- IBE and OBE always ON: [Table 3-6](#)
- IBE and/ or OBE controlled by a peripheral or controller: [Table 3-7](#)

**Table 3-4. IBE always ON signals**

| Signal              | Direction | PCR |
|---------------------|-----------|-----|
| BOOTCFG0            | I         | 211 |
| BOOTCFG1            | I         | 212 |

| TCRCLKC              | I         | 445 |
|                      |           | 440 |
| WKPCFG               | I         | 213 |

1. ERROR0 and ERROR1 IBE are forced ON when DCF client is set to lock ERROR0/1 functions on respective pads. See [FCCU signals](#). When function is not locked, IBE control depends on FCCU control.
2. PLLCFG0 and PLLCFG1 have no function on MPC5775E. These pin names exist only for compatibility with MPC5676R.

### 3.4.2 FCCU signals

A DCF client, as defined in the DCF Records chapter, is used to enable ERROR0, ERROR1, and ERRORIN functions on each pin independently. If one of the ERROR functions is disabled by the DCF client at power-on reset (POR), the associated pin resets as GPIO.

If the ERROR0, ERROR1, or ERRORIN function is enabled on the pin by the DCF client bits E0E, E1E, or EINE, respectively, the ERROR function and its attributes are locked on the pin until the next POR. A reset of the device that is not a POR will not disrupt the ERROR pins' function or state.

When the ERROR function is enabled by the DCF client at POR, the following applies to the ERROR0 and ERROR1 pins:

- POR state of the pins is Hi-Z
- Input to the FCCU is enabled
- FCCU drives the output data on the pin and no muxing change can occur on the pin, but software can read the pin state via GPIO if it enables the input buffer in the corresponding PCR
- Bits in the DCF client select the open-drain or push-pull output configuration (see the DCF Records chapter for details):
  - E1OD (ERROR1)
  - E0OD (ERROR0)
- The slew rate of the ERROR0/1 pins is set to the maximum
- Weak pull up/down is disabled, which overrides the weak pull up/down configuration for the GPIO pins determined by the WKPCFG pin or WKPCFG DCF client

When the ERROR function is enabled by the DCF client at POR, the following applies to the ERRORIN pin:

- POR state of the pins is Hi-Z
- Input to the FCCU is enabled
- Weak pull up/down is disabled, which overrides the weak pull up/down configuration for the GPIO pins determined by the WKPCFG pin or WKPCFG DCF client

# Chapter 4

## Memory Map, Interrupts, and DMA Requests

### 4.1 Memory map

All addresses in the device are identified in the following table. The addresses represent the physical addresses assigned to each block. Logical addresses are translated by the MMU into physical addresses.

Under software control of the Memory Management Unit (MMU), the logical addresses allocated to IP blocks may be changed on a minimum of a 1 KB boundary.

#### NOTE

Address ranges not declared in the memory map table must be considered reserved.

**Table 4-1. Memory map**

| Address range                                          | Module                                                             |
|--------------------------------------------------------|--------------------------------------------------------------------|
| Flash memory—see <a href="#">Table 4-2</a> for details |                                                                    |

1. Programmed by NXP during test. Contains the temperature sensor and bandgap ADC readings to be used by software to improve the accuracy of the temp sensor readings.
2. Programmed by NXP during test. In production devices, UTEST is sealed (one-time programmable) from the factory.
3. Programmed by the customer to select which blocks cannot be tested in Failure Analysis.
4. Secondary location that can be programmed by the customer to select which blocks cannot be tested in Failure Analysis.
5. Programmed by NXP to include ECC/EDC errors to allow testing of ECC/EDC hardware.

## Interrupt vector assignments

6. Programmed by NXP during test. The UID includes information on wafer lot, X/Y-position on the wafer, manufacturing data, test results, and company ID (65 for NXP).
7. Protected from read operations by flash memory BIU from OEM Production life cycle. Programmed by customer. Becomes unreadable (hidden) as soon as customer programs life cycle to OEM Production or later.
8. MCU Production life cycle slot. Programmed by NXP during test.
9. Customer Delivery life cycle slot. Programmed by NXP during test.
10. OEM Production life cycle slot. Programmed by customer during ECO module production/test.
11. In Field life cycle slot. Programmed by customer during ECO module production/test.
12. Failure Analysis life cycle slot. Programmed by the customer on returned modules.
13. DCF start record. Programmed by NXP during test. Contiguous list of DCF records start at this address.
14. Contiguous list of DCF records. Initial records programmed by NXP. Subsequent records added to the end of the list by the customer.
15. Programmed by the customer.

## 4.2 Interrupt vector assignments

### NOTE

The following table shows the mapping between interrupt sources and interrupt vectors. Some interrupt sources have a separate mechanism for enabling the interrupt, such as an interrupt enable register field. To support the mapping between a source and a vector, any such separate mechanism must be set to enable the interrupt source.

**Table 4-4. Interrupt vectors and request sources**

| Offset | Vector | Source                                                   | Module     | Description                                                    |
|--------|--------|----------------------------------------------------------|------------|----------------------------------------------------------------|
| 0x0000 | 0      | INTC_SSCIR0[CLR0]                                        | Software   | INTC software settable Clear flag 0                            |

## 4.3 DMA request mapping

This chip has two separate eDMA controllers: eDMA\_A and eDMA\_B. Each has 64 channels.

The following tables show the sources of DMA requests for each controller.

**Table 4-5. eDMA\_A channel request allocation**

| Channel | Requesting source                                             | Description                                                                                                                  |
|---------|---------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| 0       | EQADC_A_FISR0[CFFF0]                                          | EQADC_A Command FIFO 0 Fill Flag                                                                                             |

# Chapter 5

## Device Configuration Format (DCF) Records

### 5.1 Overview

Device Configuration Format (DCF) records are used by the System Status and Configuration Module (SSCM) to configure certain registers in the device during system boot while the reset signal is asserted.

There are two kinds of DCF records:

- Factory-written DCF records: written to UTEST flash memory by the factory.
- User-supplied DCF records: written to UTEST flash memory by the user.

The following figure is a high-level conceptual representation of the functionality of DCF records.

**Figure 5-1. Conceptual representation of DCF record functionality**

## 5.2 DCF records in boot sequence

The following is a high-level summary of the boot sequence leading to the use of DCF records:

1. When power is applied to a properly programmed device, the Power Management Controller (PMC) takes control of the device.
2. After the system power supplies have reached predefined levels, the flash memory array is initialized and the SSCM is enabled.
3. The SSCM reads the DCF records.
4. The SSCM writes the configuration information to the specified registers.
5. After registers are initialized: If the STCU2 is enabled by DCF record information, it begins executing the tasks enabled by its DCF record configuration.

## 5.3 DCF records location

Factory-written DCF records start at the first address allocated to the DCF records in the UTEST flash memory area. See the UTEST flash memory map.

User-supplied UTEST DCF records may be added at the next location in the UTEST memory map immediately following the factory-written UTEST DCF records.

## 5.4 DCF record structure

A DCF record is a contiguous double-word (64-bit) entry consisting of the following:

- Control word: Information to locate the corresponding DCF client internal to the device (pointer to the location of a register internal to the device)
- Data word: Data to be written to that client

Figure 5-2. DCF record structure

Table 5-1. DCF record field descriptions

| Field | Name          | Description                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0-31  | Data[0:31]    | 32 bits of data to be written to the DCF client                                                                                                                                                                                                                                                                                                                                                              |
| 32-46 | CS $n$        | Chip Select $n$<br><br>For each DCF record, one Chip Select bit is asserted (1b) to select the target module for the DCF client. All other Chip Select bits per DCF record should be negated (0b).                                                                                                                                                                                                           |
| 47-61 | Address[16:2] | Address of the DCF client within the selected module<br><br><b>NOTE:</b> Address decoding for DCF clients may not match the standard software address map decoding.<br><br>Details of DCF client addresses are defined in each applicable module chapter.                                                                                                                                                    |
| 62    | Parity        | Parity bit for the DCF record                                                                                                                                                                                                                                                                                                                                                                                |
| 63    | Stop          | Stop bit<br><br>Indicates the end of the list of DCF records.<br><br>0 indicates the DCF record is not the end of the list<br><br>1 indicates the DCF record is the end of the list<br><br><b>NOTE:</b> The erased state of flash memory is 0xFFFF_FFFF_FFFF_FFFF. As a result, the list ends with the first unprogrammed double word. This location can be programmed with a new record to extend the list. |

## 5.5 DCF records sequence

DCF records must appear as contiguous series of entries programmed from the beginning of the UTEST flash memory area in the following order.

1. **Start DCF record:** The first DCF record must be a start record. This record must be found at the beginning of a DCF area in flash memory to indicate to the device that the following records must be processed.
2. **DCF records containing configuration data:** DCF records containing configuration data must immediately follow the start record with no blank records in between.
3. **Stop DCF record:** The end of the configuration records is indicated by the stop record. A record with the stop bit set is a stop record. All other bits are ignored. No DCF records following the stop record are processed.

SSCM recognizes the following record as a start record.

**Table 5-2. DCF start record**

|             |              |
|-------------|--------------|
| 0x00 (0:31) | 0x04 (32:63) |
| 0x05AA_55AF | 0x0000_0000  |

The start bit is set by the factory at the beginning of the UTEST flash memory area.

SSCM recognizes the following record as a stop record.

**Table 5-3. DCF stop record**

|         |         |    |
|---------|---------|----|
| 0:31    | 32:62   | 63 |
| Ignored | Ignored | 1  |

The stop bit is never set by the factory, since this would not allow the user to add DCF records. The flash memory location following the last factory-written UTEST DCF record is unprogrammed, with the content of 0xFFFF\_FFFF. This is interpreted as the stop record, since the stop bit is set.

User-supplied DCF records may be added in a contiguous manner immediately following the factory-written DCF records. There must never be an unprogrammed record in the series of DCF records as it will be interpreted as a stop record.

The following table shows the series of DCF records when  $n$  data records are stored in the UTEST flash.

**Table 5-4. Series of DCF records in UTEST flash memory**

| Record type  | ADDR offset | DATA        |            |      |        |
|--------------|-------------|-------------|------------|------|--------|
| Start record | 0x00        | 0x05AA_55AF |            |      |        |
|              | 0x04        | 0x0000_0000 |            |      | STOP=0 |
| Data records | 0x08        | WDATA[31:0] |            |      |        |
|              | 0x0C        | CS[14:0]    | ADDR[16:2] | PRTY | STOP=0 |

*Table continues on the next page...*

**Table 5-4. Series of DCF records in UTEST flash memory (continued)**

| Record type | ADDR offset  | DATA        |            |      |        |
|-------------|--------------|-------------|------------|------|--------|
|             | 0x10         | WDATA[31:0] |            |      |        |
|             | 0x14         | CS[14:0]    | ADDR[16:2] | PRTY | STOP=0 |
|             | ...          | ...         |            |      |        |
| Stop record | $8n-1 + 0x0$ | Reserved    |            |      |        |
|             | $8n-1 + 0x4$ | Reserved    |            |      | 1      |
|             | $8n + 0x0$   |             |            |      |        |
|             | $8n + 0x4$   |             |            |      |        |

It is possible for more than one DCF Record to write to the same DCF client. In this case the later record usually overrides a DCF client value set by a previous record. However, not all DCF clients allow overwrites; this depends on the DCF client implementation.

**Figure 5-3. Appending DCF records**

## 5.6 DCF client Chip Select module assignments

The following table shows the Chip Select (CS) for each group of DCF clients. A CS can be assigned to one module or multiple modules, as indicated. CSs not listed are reserved.

**Table 5-5. DCF client CS module assignments**

| CS    | DCF client target module(s) |
|-------|-----------------------------|
| CS[0] | Reserved                    |
| CS[1] | SSCM (Reserved)             |
| CS[2] | STCU2                       |
| CS[3] | PASS                        |
| CS[4] | Tamper Detect (TDM)         |

Table continues on the next page...

**Table 5-5. DCF client CS module assignments (continued)**

| CS    | DCF client target module(s)                                                                                                                                   |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CS[5] | Reserved                                                                                                                                                      |
| CS[6] | Reserved                                                                                                                                                      |

## 5.7 DCF clients

DCF clients are 32-bit-wide hardware registers inside a module that receive and store the data from a DCF record. This stored data is used to initialize registers and to configure features. Their characteristics include:

- DCF clients have a default value before any DCF records are written.
- DCF clients are not required to implement all 32 bits.

The following table below shows the DCF clients that are available in this chip's UTEST area of flash memory. The following list of terms defines the meaning of the table's column headings.

### DCF CS: Chip Select

The CS field is a 15-bit field with each bit in the field assigned to a particular module. These bits act as module select signals for the internal modules. Only one bit in this field should be set in a DCF record.

### DCF Address[10:2]

The Address[16:2] field of a DCF record specifies an internal address for a DCF client. The following table provides the Address[10:2] portion of the field. The address is used only by the SSCM when interpreting DCF records and writing the data to specified modules.

### DCF client description

This entry contains the name of the DCF client.

### DCF client reset value

This field contains one of the following:

- the reset value of the DCF client before the SSCM writes the client with the associated DCF record
- a factory-programmed value

#### DCF client target module

This entry identifies the module that uses the DCF client information.

#### DCF client special strategy

Special requirements apply to how some DCF clients are written. The SSCM examines the DCF client to determine any correct special strategy to use and then appropriately writes a DCF record to that client.

##### None

No special DCF strategy is used.

##### Parity

On this chip, parity is implemented only for PMC DCF clients.

##### Triple Voted

DCF clients that use the Triple Voted strategy have three copies of the register. The SSCM writes to all three registers in a single write cycle. The outputs of the three registers are majority voted together to determine the correct data value. Triple voting allows a bit-flip error to occur without changing the DCF client output data.

##### write\_once

A register using the Write Once strategy can only be written once. The DCF client ignores subsequent writes.

### CAUTION

Plan carefully before writing write-once DCF clients. Any DCF client that has a write-once attribute cannot be reprogrammed by user software until the next reset or by more than one DCF record. Subsequent DCF records are ignored.

##### wr0\_only: Write 0 only

A bit in a DCF client can be written only from a logic 1 to a logic 0. An attempt to write a bit with this attribute to a logic 1 is ignored.

##### wr1\_only: Write 1 only

A bit in a DCF client can be written only from a logic 0 to a logic 1. An attempt to write a bit with this attribute to a logic 0 is ignored.

Any UTEST DCF client can be programmed as UTEST non-differential.

**Table 5-6. UTEST DCF clients**

| DCF CS[14:0]                                       | DCF Address[10:2] | DCF client description | DCF client reset value (hex) | DCF client target module | DCF client special strategy |
|----------------------------------------------------|-------------------|------------------------|------------------------------|--------------------------|-----------------------------|
| STCU2: support for 6 LBIST partitions; 64-bit MISR |                   |                        |                              |                          |                             |

1. See Miscellaneous DCF client description

2. Be careful when programming the UTEST Miscellaneous, XOSC ANA, and VREG Enable DCF clients. DCF records are processed sequentially in the order they are read from flash memory. DCF records that control actions such as enabling/disabling voltage regulators or detectors should not be programmed more than once with different values.

### 5.7.1 UTEST Miscellaneous DCF client

This is a 32-bit Triple-Voting DCF Client that implements a variety of settings related to different modules and functionalities, such as boot settings on SIU, oscillator trimming, oscillator enable/disable, and lockstep mode selection. The reset value indicated below is the value when no DCF record has been read or written.

#### NOTE

Be careful when programming the UTEST Miscellaneous, XOSC ANA, and VREG Enable DCF clients. DCF records are processed sequentially in the order they are read from flash

memory. DCF records that control actions such as enabling/disabling voltage regulators or detectors should not be programmed more than once with different values.

**Figure 5-4. UTEST Miscellaneous DCF client**

**Table 5-7. UTEST Miscellaneous DCF client field descriptions**

| Field            | Description                                                                                                                                                                                                                                  |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0<br>LEG         | Legacy Mode. This bit indicates whether the WKPCFG, ABR, and BOOTCFG settings should come from package pins or from the Miscellaneous DCF client.<br><br>0 Settings come from this DCF client<br>1 Settings driven from pins                 |
| 1-7<br>XOSC_CNT  | Oscillator Stabilization Counter. These seven bits are used to pre-load a counter clocked by the crystal oscillator. Upon reset negation, the counter runs for 512 x XOSC_CNT clock cycles, then sets the XOSC flag in the SIU_RSR register. |
| 8-11<br>Reserved | Reserved                                                                                                                                                                                                                                     |
| 12<br>WKPCFG     | Weak Pull Configuration. SIU_RSR stores this configuration during reset. This information is then used to configure pull up/down of external pins.<br><br>0 Weak pulldown is selected<br>1 Weak pullup is selected                           |

| 26-30<br>XOSC_LOAD_CAP_SEL | Oscillator Load Capacitance Selection. Five bits to program the load capacitance. Load capacitor values are determined by the crystal manufacturer data sheet.                                                                                                                                                                                                                                                                                                                                               |

1. "Low" is the setting commonly used for crystals at 8 MHz, "medium" is commonly used for crystals greater than 8 MHz to 20 MHz, and "high" is commonly used for crystals greater than 20 MHz to 40 MHz. However, the user must characterize

carefully to determine the best  $g_m$  setting for the intended application because crystal load capacitance, board layout, and other factors affect the  $g_m$  value that is needed. See the Data Sheet for additional information.

5.7.2 UTEST Secure Boot Configurations DCF client

This DCF client, in conjunction with the UTEST Secure Boot Code Address and UTEST Secure Boot Code Length clients, configures the CSE security module to carry out a secure boot in the device. This 32-bit write-once DCF client selects:

- whether the CSE module is enabled
- whether the secure boot is to be executed
- the mode (sequential or parallel) in which the secure boot runs
- whether CSE must be disabled in the Failure Analysis (FA) life cycle

The CSE module must be enabled for the secure boot to execute.

When this client selects to execute the secure boot, the boot occurs during reset on the memory space defined by the Secure Boot Code Address and Code Length DCF clients.

NOTE

This write-once DCF client is programmed at the factory with the value 0000\_000Dh. This value cannot be overwritten. This configuration:

- enables CSE
- enables CSE to execute the secure boot during reset
- configures the secure boot to occur in parallel mode
- disables CSE when the life cycle advances to FA

| 31<br>MEN | <p>CSE Module Enable</p> <p>This bit indicates that the CSE module will be used in the part.</p> <p>0 CSE is not used. The CSE clock is disabled, and accesses to the registers generate a bus error.</p> <p>1 CSE is enabled.</p> <p><b>NOTE:</b> The secure boot functionality works only if MEN is set to 1. The secure boot functionality does not work if CSE is disabled.</p>                                                                                                                                                                                                                                                                                                                                                                                  |

### 5.7.3 UTEST Secure Boot Code Address DCF client

This DCF client, in conjunction with the UTEST Secure Boot Configurations and UTEST Secure Boot Code Length clients, configures the CSE security module to carry out a secure boot in the device. This 32-bit DCF client provides CSE with the location in memory of the boot code to be verified.

## DCF clients

**Figure 5-6. UTEST Secure Boot Code Address DCF client**

**Table 5-9. UTEST Secure Boot Code Address DCF client field descriptions**

| Field | Description                                                            |
|-------|------------------------------------------------------------------------|
| 0-31  | Secure Boot Code Address                                               |
| SBCA  | This 32-bit field indicates the start address of the secure boot code. |

## 5.7.4 UTEST Secure Boot Code Length DCF client

This DCF client, in conjunction with the UTEST Secure Boot Configurations and UTEST Secure Boot Code Address clients, configures the CSE security module to carry out a secure boot in the device. This 32-bit DCF client provides CSE with the length of the secure boot code.

### NOTE

Users whose applications do not use the CSE module, which is automatically enabled, should ensure that the Secure Boot Code Length DCF client has the value 0000\_0000h (its default value).

**Figure 5-7. UTEST Secure Boot Code Length DCF client**

**Table 5-10. UTEST Secure Boot Code Length DCF client field descriptions**

| Field | Description                                                            |
|-------|------------------------------------------------------------------------|
| 0-31  | Secure Boot Code Length                                                |
| SBCL  | This 32-bit field indicates the size in bytes of the secure boot code. |

### 5.7.5 UTEST Analog External Oscillator (XOSC ANA) DCF client

This 32-bit DCF client is used to apply settings to the analog external oscillator. The internal current control setting is the only feature available and is used to boot the current. This setting is accessible in functional mode for test and debug purposes.

#### NOTE

Be careful when programming the UTEST Miscellaneous, XOSC ANA, and VREG Enable DCF clients. DCF records are processed sequentially in the order they are read from flash memory. DCF records that control actions such as enabling/disabling voltage regulators or detectors should not be programmed more than once with different values.

**Figure 5-8. UTEST Analog External Oscillator DCF client**

**Table 5-11. UTEST Analog External Oscillator DCF client field descriptions**

| Field            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## 5.7.6 UTEST Error Functions Pads Configuration DCF client

This 32-bit Triple-Voting DCF client enables the ERROR function on the ERROR0, ERROR1, and ERRORIN pins independently.

### CAUTION

The ERROR function is disabled by the DCF at power-on reset (POR). After it is enabled, the ERROR function is locked on the pin until the next POR. Any other type of reset has no effect on these settings.

### 5.7.7 UTEST Reset Escalation Configuration DCF client

This 32-bit Triple-Voting DCF client enables the Reset Escalation function on the reset sequence of the device. See the Reset chapter for further details on this feature.

#### CAUTION

The Reset Escalation function is disabled by the DCF at power-on reset (POR). After it is enabled, the Reset Escalation function is locked until the next POR. Any other type of reset has no effect on these settings.

**Figure 5-10. UTEST Reset Escalation Configuration DCF client****Table 5-13. UTEST Reset Escalation Configuration DCF client field descriptions**

| Field            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| 31<br>REE        | Reset Escalation Enable<br>Enables a reset escalation counter that is incremented at the end of every reset cycle. If the counter exceeds the number programmed in SIU_RCR[RET], the device is locked into a reset state that can be undone only by a power-up cycle.<br><b>NOTE:</b> LVD/HVD and temperature events that are enabled in the PMC to trigger a reset cause a POR. In these cases, the reset escalation counter resets.<br>0 Reset Escalation disabled<br>1 Reset Escalation enabled |

### 5.7.8 UTEST PMC Reset Enable Control (REE CTRL) DCF client

This DCF client trims the PMC\_REE register. See the PMC chapter for details about this register.

Offset: 0000\_0000\_0001\_1111

### 5.7.9 UTEST PMC Temperature Sensor Reset Event Enable Control (REE TMPSNS) DCF client

This DCF client trims the PMC\_REE\_TD register. See the PMC chapter for details about this register.

Offset: 0000\_0000\_0010\_0000

Access: DCF Client

**Figure 5-11. UTEST PMC Temperature Sensor Reset Event Enable Control DCF client**

## 5.7.10 UTEST PMC Voltage Regulator Enable (VREG ENB) DCF client

This 32-bit DCF client implements the active low enables for three PMC voltage regulators.

### NOTE

Be careful when programming the UTEST Miscellaneous, XOSC ANA, and VREG Enable DCF clients. DCF records are processed sequentially in the order they are read from flash memory. DCF records that control actions such as enabling/disabling voltage regulators or detectors should not be programmed more than once with different values.

Figure 5-12. UTEST PMC Voltage Regulator Enable DCF client

Table 5-15. UTEST PMC Voltage Regulator Enable DCF client field descriptions

| Field                | Description                                                           |

## Chapter 6

# e200z7 Core Complex Overview

### 6.1 Core complex

The following table summarizes the cores on this chip.

**Table 6-1. Core complex overview**

| Core identifier | Core type  | Brief description                                                                                             |
|-----------------|------------|---------------------------------------------------------------------------------------------------------------|
| Core0           | e200z759n3 | Main boot computational core                                                                                  |
| Core1           | e200z759n3 | Duplicated computational core                                                                                 |
| Checker core    | e200z758   | Operates in delayed lockstep with Core1, executing exactly the same instructions to confirm correct execution |

### 6.2 Core0 and Core1 overview

The two e200z759n3 cores are identical.

For a comprehensive core description, see the *e200z759n3 Core Reference Manual* (document number e200z759n3CRM).

See [End-to-end Error Correction Code \(e2eECC\)](#) for any limitations of the cores due to the implementation of e2eECC.

### 6.3 Checker core overview

The e200z758 core does not have these features of the e200z759n3 computational cores:

- Instruction cache and data cache
- Nexus 3+ module

Otherwise, the e200z758 checker core has the same features as the e200z759n3 cores.

# Chapter 7

## Platform Coherency Unit (PCU)

### 7.1 Introduction

The Platform Coherency Unit is a hardware mechanism for maintaining memory coherency between multiple bus masters. It supports cache coherency between the two cores, including writes via the Nexus read-write access block. In addition, DMA writes to system memory may be configured to provide cache coherency.

For writes originating from either core, the MMU for the core must be configured with Memory Coherence (M bit) and Write Through (W bit) set for the address spaces to be accessed. For writes originating from either DMA module, use the [Global PCU Output Register \(DMA\\_GPOR<sub>n</sub>\)](#) to enable coherency on a channel-by-channel basis. Finally, set the Master Write Monitor Enable bits for each master, requiring coherency for its writes, and the global enable bit (ENB) in the PCU's configuration register.

#### NOTE

On predecessor devices, the Platform Coherency Unit (PCU) was named the Cache Coherency Unit (CCU).

### 7.2 Memory map and register descriptions

The programming model contains control and status registers. It can be referenced using only 32-bit (word) accesses. Writes to the configuration fields can be performed only in supervisor mode. Attempted accesses using non-32-bit data sizes, accesses to undefined or reserved addresses, or accesses with a non-supported access type result in a bus error termination.

## PCU memory map

| Address offset (hex) | Register name                                          | Width (in bits) | Access | Reset value | Section/ page             |

|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0–1<br>CP1ERR[1:0] | <p>Core Processor 1 Error</p> <p>This field represents a flag maintained by the PCU for signaling the presence of a captured snoop error or the occurrence of a queue overflow. The error details are contained in PCU_EAR1 and PCU_EDR1. CP1ERR[1] is set when the snoop queue for Core1 has overflowed; the address and attributes of the global write that caused the queue overflow are recorded in PCU_EAR1 and PCU_EDR1. CP1ERR[0] is set when the hardware detects a snoop error and records the faulting address and attributes. This field is cleared when the corresponding bits are written as 1. If another Core1 error occurs before the CP1ERR bit is cleared, CP1ERR remains set while PCU_EAR1 and PCU_EDR1 capture address and attributes for the most recent error event.</p> <p>00 PCU_EAR1/PCU_EDR1 do not contain a captured snoop error.<br/> 01 PCU_EAR1/PCU_EDR1 contain a captured snoop error.<br/> 10 PCU_EAR1/PCU_EDR1 contain a queue overflow occurrence.<br/> 11 A snoop error event occurred, followed by a queue overflow event. Because the PCU_EAR1/PCU_EDR1 registers capture the most recent error event, PCU_EAR1/PCU_EDR1 contain the queue overflow occurrence.</p> |
| 2–3<br>CP0ERR[1:0] | <p>Core Processor 0 Error</p> <p>This field represents a flag maintained by the PCU for signaling the presence of a captured snoop error or the occurrence of a queue overflow. The error details are contained in PCU_EAR0 and PCU_EDR0. CP0ERR[1] is set when the snoop queue for Core0 has overflowed; the address and attributes of the global write that caused the queue overflow are recorded in PCU_EAR0 and PCU_EDR0. CP0ERR[0] is set when the hardware detects a snoop error and records the faulting address and attributes. This field is cleared when the corresponding bits are written as 1. If another Core0 error occurs before the CP0ERR bit is cleared, CP0ERR remains set while PCU_EAR0 and PCU_EDR0 capture address and attributes for the most recent error event.</p> <p>00 PCU_EAR0/PCU_EDR0 do not contain a captured snoop error.<br/> 01 PCU_EAR0/PCU_EDR0 contain a captured snoop error.<br/> 10 PCU_EAR0/PCU_EDR0 contain a queue overflow occurrence.<br/> 11 A snoop error event occurred, followed by a queue overflow event. Because the PCU_EAR0/PCU_EDR0 registers capture the most recent error event, PCU_EAR0/PCU_EDR0 contain the queue overflow occurrence.</p> |
| 4<br>SRST_FLAG     | <p>Software Reset Flag</p> <p>This field represents a flag maintained by the PCU to indicate that a software reset event has occurred. A software reset of the PCU is invoked by programming the PCU_CESR[SRST_EN] field.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**PCU\_IR<sub>n</sub> field descriptions (continued)**

| Field | Description                                                                                                                                                                                                                    |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|       | This field indicates an outstanding interrupt request as a result of a snoop that terminated with error if PCU_CESR[CPnIEN]. The flag and interrupt are cleared by writing 1 to this bit. Writing 0 to this bit has no effect. |
| 0     | No interrupt request                                                                                                                                                                                                           |
| 1     | Interrupt request due to snoop termination with error                                                                                                                                                                          |

## Chapter 8

# System Integration Unit (SIU, SIU\_B)

### 8.1 Introduction

This chapter describes the device system integration units (SIU, and SIU\_B) that configure and initialize the following features in the SIU:

- MCU reset configuration
- System reset operation
- Pad configuration
- External interrupts
- General-purpose I/O (GPIO)
- Internal peripheral multiplexing
- GPDI and GPDO I/Os of the DSPI modules
- TLB Entry Selector

as well as the following feature in SIU\_B:

- Mirrored pad configuration and GPIO registers for Protected Port Output mode

#### 8.1.1 Block diagram

The figure below is a block diagram of the SIU. The Power-on Reset Detection, Pad Ring/Pad Interface, and the Peripheral I/O Channels are external to the SIU.

Figure 8-1. SIU block diagram

## 8.1.2 Overview

The following table lists the features that the SIU configures.

**Table 8-1. SIU features**

| Feature                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MCU reset operations             | Controls the external pin boot logic                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| System reset operations          | Monitors internal and external reset sources, and drives the $\overline{\text{RSTOUT}}$ signal <ul style="list-style-type: none"> <li>• Power-on reset support</li> <li>• Reset status register providing last reset source to software</li> <li>• Glitch detection on reset input</li> <li>• Software controlled reset assertion</li> </ul>                                                                                                                                            |
| Pad configuration registers      | Enables the configuration and initialization of the I/O pin electrical characteristics using software to select the following: <ul style="list-style-type: none"> <li>• Active function from the set of multiplexed functions</li> <li>• Pullup and pulldown characteristics of the pin</li> <li>• Slew rate for slow and medium pads</li> <li>• Open drain mode for output pins</li> <li>• Hysteresis for input pins</li> <li>• Drive strength of bus signals for fast pads</li> </ul> |
| External interrupt operations    | 16 interrupt requests<br>Rising- or falling-edge event detection<br>Programmable digital filter for glitch rejection<br>NMI and critical interrupt control                                                                                                                                                                                                                                                                                                                              |
| General purpose I/O (GPIO)       | Provides uniform and discrete I/O control of MCU general-purpose I/O pins, where each GPIO signal has an input register and an output register.                                                                                                                                                                                                                                                                                                                                         |
| Internal peripheral multiplexing | Provides flexibility to customize signal/pin assignments for application development that allows: <ul style="list-style-type: none"> <li>• Flexible selection of eQADC trigger inputs</li> <li>• Assignment of interrupt requests (IRQs) between external pins and DSPI</li> </ul>                                                                                                                                                                                                      |
| TLB entry selector               | Allows an external tool to non-intrusively change the TLB entry that is used by the cores to access memory.                                                                                                                                                                                                                                                                                                                                                                             |
| Protected Port Output            | Allows up to four GPIO pins to be reserved by any one of the two cores.                                                                                                                                                                                                                                                                                                                                                                                                                 |

## 8.1.3 Modes of operation

### 8.1.3.1 Normal mode

In normal mode, the SIU provides the register interface and logic that controls the device and system configuration, the reset controller, and GPIO.

### 8.1.3.2 Debug mode

SIU operation in debug mode is identical to operation in normal mode.

## 8.2 Memory Map and Register Definition

Register offsets are relative to SIU's base address.

### Pad Configuration Register (PCR) details

[Pad Configuration Register \(SIU\\_PCR<sub>n</sub>\)](#) provides a general description of the PCRs. The following tables provide details about individual PCRs. Gaps exist in the memory map where registers correspond to GPIO pins that are not implemented in the package.

[Table 8-2](#) defines the symbols for PCR<sub>n</sub> fields' reset values that appear in [Table 8-3](#).

**Table 8-2. SIU\_PCR<sub>n</sub> field reset-value symbols**

| Symbol | Meaning                                                                                                                                                 |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| —      | Not implemented in the PCR. Software should write a default value of 0.                                                                                 |
| 0 or 1 | Function is implemented. For its definition, see the applicable field's description.                                                                    |
| U      | Function is implemented and is defined by the WKPCFG bit of the Miscellaneous DCF client (or, in legacy mode, by the value of the WKPCFG pin at reset). |

**Table 8-3. SIU\_PCR<sub>n</sub> settings**

| P<br>C<br>R     | Offset<br>(hex) | GPIO   | Primary<br>function | Alternate 1       | Alternate 2          | Alternate 3 | SIU_PCR <sub>n</sub> [3:15]<br>(SIU_PCR <sub>n</sub> [0:2] = reserved) |             |             |             |             |                  |                  |                       |                       |                       |                       |                       |                       |

1. The choice between MDO and GPIO functions is based on Nexus programming. If Nexus is enabled, this pin takes the role of MDO, otherwise it is GPIO. The OBE and IBE fields only apply when the pin is working as GPIO, otherwise it is an output-only MDO pin.
2. This input function is also present in other pins, but only one pin can be selected at any given time. Select the pin to drive the function using the SIU\_IMUX registers.
3. The choice between MDO and GPIO functions is based on Nexus programming. If Nexus is enabled and configured to use Full Port Mode, then this pin takes the role of MDO. If Nexus is not enabled or it is enabled but configured to use Reduced Port Mode, then this pin takes the role of GPIO. The OBE and IBE fields only apply when the pin is working as GPIO, otherwise it is an output-only MDO pin.

## 8.2.1 MCU Identification Register (SIU\_MIDR)

The SIU\_MIDR contains the part number and mask number revisions specific to the device. The part number is a read-only field that is mask programmed with the part number of the device on which the SIU resides. It is intended to help factory test and user code which are sensitive to part changes. The part number is changed if a new module is added to the device or a memory size is changed, for example. It is not changed for bug fixes or process changes.

The mask number is a read-only field that is mask programmed with the specific mask revision level of the device. It is intended to help factory test and user code which is sensitive to mask changes.

Address: 0h base + 4h offset = 4h

| 24–27<br>MASKNUM_ MAJOR | Major revision of MCU Mask. Read-only, mask programmed mask number of the MCU. Reads 0x0 for the initial mask set of the device, and changes sequentially for each mask set. |
| 28–31<br>MASKNUM_ MINOR | Minor revision MCU Mask. Read-only, mask programmed mask number of the MCU. Reads 0x0 for the initial mask set of the device, and changes sequentially for each mask set.    |

8.2.2 Reset Status Register (SIU\_RSR)

The Reset Status Register contains the sources of the most recent reset as well as a number of configuration bits defined by the Miscellaneous DCF record, which the SSCM reads from flash memory during reset. Alternatively, if the LEG bit of the Miscellaneous DCF record is set to 1, then the reset controller assumes that a backwards compatible legacy mode must be used. In this case, the values of the configuration bits are latched from package pins at the end of the reset cycle instead of coming from the DCF record.

The reset values of status bits are applied at POR. The reset value of the configuration bits (WKPCFG, XOSCHIGH, ABR, BOOTCFG) are loaded from the Miscellaneous DCF record or from external pins.

| Field            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                  | bit is determined by the value of the EVTO pin upon negation of reset as follows. If no debug tool is attached to the device and EVTO is held at low logic level during reset, the ABR bit reset state is logic one. Otherwise it is zero.<br><br>0 Auto Baud Rate Disabled.<br>1 Auto Baud Rate Enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 29–30<br>BOOTCFG | Boot configuration. BOOTCFG[0:1] is used by the Boot Assist Module (BAM) to configure the boot mode. If the component life cycle is "in field", then the value of BOOTCFG is fixed to 0b00 (internal boot). For all other life cycles, the value of BOOTCFG is loaded from bits 14-15 of the Miscellaneous DCF record by the SSCM during reset. Alternatively, if the MSB bit of the Miscellaneous DCF record (Legacy Bit) is set to '1', then the value of this field is latched from the BOOTCFG pins upon negation of reset, instead of being loaded from the DCF record.<br><br>00 Internal boot mode.<br>01 Serial boot mode.<br>10 Non-muxed EBI boot mode (16-bit data, non-muxed address bus).<br>11 Muxed EBI boot mode (16-bit data, muxed address bus). |
| 31<br>RGF        | Reset glitch flag. Set by the reset controller when a glitch is detected on the RESET pin. This bit is cleared by the assertion of the power-on reset or a write of one to the RGF bit.<br><br>0 No glitch has been detected on the RESET pin.<br>1 A glitch has been detected on the RESET pin.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## 8.2.3 System Reset Control Register (SIU\_SRCR)

The system reset control register configures whether a software system reset or a software external reset is generated. A software system reset uses an internal system reset. A software external reset asserts  $\overline{\text{RSTOUT}}$ .

Address: 0h base + 10h offset = 10h

## SIU\_SRCR field descriptions

| Field            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0<br>SSR         | Software system reset. The software system reset is processed as a synchronous reset. Except for a software external reset, the bit automatically clears if any other reset source asserts.<br><br><b>NOTE:</b> The SSR bit always reads as zero. A write of zero to this bit has no effect.<br><br>0 No software system reset.<br>1 Generate a software internal system reset.                                                                                                                                                                                                                                                                                                                              |
| 1<br>SER         | Software external reset. Used to generate a Software External Reset. Writing 1 to this bit asserts RSTOUT for 2480 clock cycles, but the internal reset is not asserted. The bit is automatically cleared when the software external reset completes or any other reset source is asserted. After a software external reset has been initiated, RSTOUT negates if this bit is cleared before the 2480 clock cycles period expires.<br><br><b>NOTE:</b> Write 1 to the SER bit to generate a software external reset. A write of 0 to this bit has no effect. When reset completes, the SER bit is cleared to 0.<br><br>0 Do not generate a software external reset.<br>1 Generate a software external reset. |
| 2–31<br>Reserved | This field is reserved.<br>This read-only field is reserved and always has the value 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## 8.2.4 External IRQ Status Register (SIU\_EISR)

The external interrupt status register is used to record edge-triggered events on the  $\overline{\text{IRQ}}[0]\text{--}\overline{\text{IRQ}}[15]$  inputs to the SIU and record the critical interrupts NMI and SWT. When an edge-detect enable bit is set in the SIU\_IREER or SIU\_IFEER registers for an IRQ and an IRQ edge-event is detected, the flag bit is set in the SIU\_EISR. The flag bits are cleared by writing 1 to the bit. Writing 0 has no effect.

The flag bit is set regardless of the state of the DMA or interrupt request enable bit in SIU\_DIRER. The flag bit remains set until cleared by software or through the servicing of a DMA or interrupt request.

Address: 0h base + 14h offset = 14h

## SIU\_EISR field descriptions (continued)

| Field | Description                                                                            |
|-------|----------------------------------------------------------------------------------------|
| 0     | No edge triggered event has occurred on the corresponding $\overline{\text{IRQ}}$ pin. |
| 1     | An edge triggered event has occurred on the corresponding $\overline{\text{IRQ}}$ pin. |

## 8.2.5 DMA/Interrupt Request Enable Register (SIU\_DIRER)

The SIU\_DIRER enables external signals on selected pins to generate DMA or interrupt requests, and the SWT modules to generate interrupt requests. The EIRE[0:3] bits enable requests to either the DMA or INTC modules, based on the value of the DIRSn bits in the SIU\_DIRSR register. The EIRE[4:15] bits enable requests only to the INTC module. The NMISELn bits enable requests to either the critical or non-maskable interrupt inputs of the cores. For a pin to generate an interrupt, the appropriate bit in either SIU\_IREER or SIU\_IFEER registers must additionally be set.

Address: 0h base + 18h offset = 18h

## SIU\_DIRER field descriptions (continued)

| Field       | Description                                                                                                                                                                                                                                                                                                                                                      |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|             | 0 DMA and interrupt requests are disabled.<br>1 DMA or interrupt request is enabled.                                                                                                                                                                                                                                                                             |
| 31<br>EIRE0 | DMA/interrupt request enable 0. This bit enables the assertion of a DMA request or an interrupt request when an edge-triggered event occurs on the $\overline{\text{IRQ}}[0]$ pin.<br><br><b>NOTE:</b> EIRE[0:3] can optionally enable DMA requests instead of IRQs.<br><br>0 DMA and interrupt requests are disabled.<br>1 DMA or interrupt request is enabled. |

## 8.2.6 DMA/Interrupt Request Select Register (SIU\_DIRSR)

The SIU\_DIRSR selects between DMA and interrupt requests for events on the  $\overline{\text{IRQ}}[0]$ - $\overline{\text{IRQ}}[3]$ . If the corresponding bits are set in SIU\_EISR and SIU\_DIRER, then the DMA/Interrupt Request Select bit (DIRS $n$ ) determines whether a DMA or interrupt request is asserted.

Address: 0h base + 1Ch offset = 1Ch

## SIU\_DIRSR field descriptions

| Field            | Description                                                                                                                                                                                                                                   |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0–27<br>Reserved | This field is reserved.<br>This read-only field is reserved and always has the value 0.                                                                                                                                                       |
| 28<br>DIRS3      | DMA/interrupt select 3. Selects between a DMA or external interrupt request when an edge-triggered event occurs on $\overline{\text{IRQ}}[3]$ pin.<br><br>0 Interrupt request is selected.<br>1 DMA request to eDMA_A channel 51 is selected. |

Table continues on the next page...

**SIU\_DIRSR field descriptions (continued)**

| <b>Field</b> | <b>Description</b>                                                                                                                                                                                                                                                    |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 29<br>DIRS2  | DMA/interrupt select 2. Selects between a DMA or external interrupt request when an edge-triggered event occurs on the corresponding $\overline{\text{IRQ}}[2]$ pin.<br><br>0    Interrupt request is selected.<br>1    DMA request to eDMA_A channel 50 is selected. |
| 30<br>DIRS1  | DMA/interrupt select 1. Selects between a DMA or external interrupt request when an edge-triggered event occurs on the corresponding $\overline{\text{IRQ}}[1]$ pin.<br><br>0    Interrupt request is selected.<br>1    DMA request to eDMA_A channel 49 is selected. |
| 31<br>DIRS0  | DMA/interrupt select 0. Selects between a DMA or external interrupt request when an edge-triggered event occurs on the corresponding $\overline{\text{IRQ}}[0]$ pin.<br><br>0    Interrupt request is selected.<br>1    DMA request to eDMA_A channel 48 is selected. |

## 8.2.7 Overrun Status Register (SIU\_OSR)

The SIU\_OSR flag bits indicate that an overrun has occurred. An overrun is generated if an event on an  $\overline{\text{IRQ}}$  pin occurs while the corresponding flag bit is set in SIU\_EISR. The overrun flag bit is set regardless of the state of the corresponding DMA/Interrupt Request Enable bit in SIU\_DIRER or the corresponding Overrun Request Enable bit in SIU\_ORER. The numbering of the Overrun Flag bits correspond to the numbering of the flag bits in SIU\_EISR. The Overrun Flag bit remains set until cleared by software. Each Overrun Flag bit is cleared by writing 1. Writing 0 has no effect.

Address: 0h base + 20h offset = 20h

| Bit   | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 |

|            | 0 No overrun occurred.<br>1 An overrun occurred.                                                                                                                                                                                                                                                   |
| 28<br>OVF3 | Overrun flag 3. This bit is set when a DMA or interrupt overrun occurs on $\overline{\text{IRQ}}[3]$ . Bit 31 (OVF0) is the overrun flag for $\overline{\text{IRQ}}[0]$ ; bit 16 (OVF15) is overrun flag for $\overline{\text{IRQ}}[15]$ .<br><br>0 No overrun occurred.<br>1 An overrun occurred. |
| 29<br>OVF2 | Overrun flag 2. This bit is set when a DMA or interrupt overrun occurs on $\overline{\text{IRQ}}[2]$ . Bit 31 (OVF0) is the overrun flag for $\overline{\text{IRQ}}[0]$ ; bit 16 (OVF15) is overrun flag for $\overline{\text{IRQ}}[15]$ .<br><br>0 No overrun occurred.<br>1 An overrun occurred. |
| 30<br>OVF1 | Overrun flag 1. This bit is set when a DMA or interrupt overrun occurs on $\overline{\text{IRQ}}[1]$ . Bit 31 (OVF0) is the overrun flag for $\overline{\text{IRQ}}[0]$ ; bit 16 (OVF15) is overrun flag for $\overline{\text{IRQ}}[15]$ .<br><br>0 No overrun occurred.<br>1 An overrun occurred. |
| 31<br>OVF0 | Overrun flag 0. This bit is set when a DMA or interrupt overrun occurs on $\overline{\text{IRQ}}[0]$ . Bit 31 (OVF0) is the overrun flag for $\overline{\text{IRQ}}[0]$ ; bit 16 (OVF15) is overrun flag for $\overline{\text{IRQ}}[15]$ .<br><br>0 No overrun occurred.<br>1 An overrun occurred. |

## 8.2.8 Overrun Request Enable Register (SIU\_ORER)

The SIU\_ORER contains bits to enable an overrun if the corresponding flag bit is set in the SIU\_OSR. If the overrun request enable bit and the flag bit are set, the single combined overrun request from the SIU to the interrupt controller is asserted.

Address: 0h base + 24h offset = 24h

|       |       |       |       |       |       |       |      |      |      |      |      |      |      |      |      |      |

## 8.2.9 IRQ Rising-Edge Event Enable Register (SIU\_IREER)

The SIU\_IREER enables rising edge-triggered events on  $\overline{\text{IRQ}}[n]$ . Rising- and falling-edge events are enabled by setting the bits in SIU\_IREER and SIU\_IFEER.

SIU\_IREER bits used for NMI events are write once after a reset.

Address: 0h base + 28h offset = 28h

| 30<br>IREE1 | IRQ rising-edge event enable 1. Enables rising edge triggered events on the external $\overline{\text{IRQ}}[1]$ pin.<br>0 Rising edge event is disabled.<br>1 Rising edge event is enabled. |
| 31<br>IREE0 | IRQ rising-edge event enable 0. Enables rising edge triggered events on the external $\overline{\text{IRQ}}[0]$ pin.<br>0 Rising edge event is disabled.<br>1 Rising edge event is enabled. |

**8.2.10 IRQ Falling-Edge Event Enable Register (SIU\_IFEER)**

The SIU\_IFEER enables falling edge-triggered events on  $\overline{\text{IRQ}}[n]$ . Rising- and falling-edge events are enabled by setting the bits in both SIU\_IREER and SIU\_IFEER.

SIU\_IFEER bits used for NMI events are write once after a reset.

### 8.2.11 IRQ Digital Filter Register (SIU\_IDFR)

The SIU\_IDFR specifies the amount of digital filtering on  $\overline{\text{IRQ}}[0]-\overline{\text{IRQ}}[15]$  and NMI. The digital filter length field specifies the number of system clocks that define the period of the digital filter and the minimum time an IRQ or NMI signal must hold the active state to qualify as an edge-triggered event.

Address: 0h base + 30h offset = 30h

#### SIU\_IDFR field descriptions

| Field            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0–27<br>Reserved | This field is reserved.<br>This read-only field is reserved and always has the value 0.                                                                                                                                                                                                                                                                                                                                                                                                    |
| 28–31<br>DFL     | Digital filter length. Defines the digital filter period on the $\overline{\text{IRQ}}[n]$ and NMI inputs according to the following equation:<br><br>$\text{FilterPeriod} = (\text{PeripheralClockPeriod} \times 2^{\text{DFL}}) + 1(\text{PeripheralClockPeriod})$<br>For a 100 MHz peripheral clock, this gives a range of 20 ns to 328 ns. The minimum time of two system clocks accounts for synchronization of the $\overline{\text{IRQ}}$ and NMI input pins with the system clock. |

### 8.2.12 IRQ Filtered Input Register (SIU\_IFIR)

The SIU\_IFIR is a read only register where the filtered values of the NMI and  $\overline{\text{IRQ}}[0]-\overline{\text{IRQ}}[15]$  pins are captured.

Address: 0h base + 34h offset = 34h

**8.2.13 Pad Configuration Register (SIU\_PCRn)**

These registers define the pad configuration for all configurable device pins by specifying the active function, direction, and electrical attributes for the pin. PCR information includes the register fields that are active for a given pin or group of pins and the reset state of the register.

The reset states of SIU\_PCRs reflect the values before the BAM program executes. The BAM program can change some pad configuration registers based on the reset configuration. Refer to the System Boot chapter for more information.

The SIU\_PCRs are 16-bit registers that are read from or written to as:

- 16-bit values aligned on 16-bit boundaries, or
- 32-bit values aligned on 32-bit address boundaries.

The PCR registers allow software to control the following range of electrical characteristics of the external pads:

- Weak pullup/down enable/disable
- Weak pullup/down selection
- Slew-rate selection for outputs
- Drive strength selection for outputs
- Input buffer enable (when direction is configured for output)
- Input hysteresis enable/disable
- Open drain/push-pull output selection
- Multiplexed function selection
- Data direction selection

NOTE

The actual characteristics available in any SIU\_PCR depend on the type of pad it controls.

All device pin names begin with the primary function, followed by the alternate function, and then GPIO. In some cases, the third function can be a secondary alternate, which supersedes the GPIO. Those exceptions are noted. For example, SIU\_PCR85 configures the CNTXB\_PCSC[3]\_GPIO[85] muxed signal, where CNTXB is the primary function and PCSC[3] is the alternate function. See [External signal descriptions, multiplexing, and attributes](#) for how to identify the source module for primary and alternate functions and the description of these signals. For an additional signal description, see the chapter for the module that uses this signal.

A number of input signals on the device have multiple external pins as input sources. Only one input source can be active at any time for these pins. A set of multiplexers controlled by the SIU\_IMUX0 to SIU\_IMUX12 registers selects which input drives the function.

For information about implemented fields and reset states of individual PCR<sub>s</sub>, see [Pad Configuration Register \(PCR\) details](#).

|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|           | 0 Disable weak pull device for the pad.<br>1 Enable weak pull device for the pad.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 15<br>WPS | Weak pull up/down select. Controls whether weak pullup or weak pulldown devices are used for the pad when weak pullup/down devices are enabled. During reset, the weak pull up/down behavior is controlled by the WKPCFG bit of the Miscellaneous DCF client, or by the WKPCFG pin when operating in legacy mode ((LEG=1 in the Miscellaneous DCF client). The WPS bit determines whether weak pullup or pulldown devices are used after reset, or for pads in which the WKPCFG pin does not determine the reset weak pullup/down state.<br><br>0 Pulldown is enabled for the pad.<br>1 Pullup is enabled for the pad. |

**8.2.14 GPIO Pin Data Output Register (SIU\_GPDO<sub>n</sub>)**

Each SIU\_GPDO<sub>n</sub> register specifies the output data for the function assigned to the GPIO[*n*] pin. The *n* notation in the SIU\_GPDO<sub>n</sub> register name relate to the [*n*] in GPIO[*n*] signal name. For example, SIU\_GPDO246 contains the PDO246 bit for CNTXD\_GPIO246. The address for a GPDO pin is the GPIO number plus an offset of SIU\_BASE + 0600h. Gaps exist in the memory map where registers correspond to GPIO pins that are not implemented in the package.

Software writes to the SIU\_GPDO<sub>n</sub> registers to drive data out on the external pin. Each register drives one external pin, which allows independent control of the pin. Writes to the SIU\_GPDO<sub>n</sub> register will not be reflected to the pin when a primary or alternate function is assigned, or when an input function is assigned to the pin.

If the direction of a GPIO signal changes from input to output, the SIU\_GPDO<sub>n</sub> register value is automatically driven out to the external pin without the need for a software update.

Writes to an SIU\_GPDO<sub>n</sub> register have no effect when a primary or alternate function is assigned.

Address: 0h base + 64Bh offset + (1d × *i*), where *i*=0d to 416d

| 7<br>PDO <sub>n</sub> | Pin Data Out. This bit stores the data to be driven out on the external GPIO. If the register is read, it returns the value written.<br><br>0 Logic low value is driven to the external GPIO pin when the pin is configured as an output.<br>1 Logic high value is driven to the external GPIO pin when the pin is configured as an output. |

**8.2.15 GPIO Pin Data Input Register (legacy) (SIU\_GPDI<sub>n</sub>L)****NOTE**

These registers are implemented for legacy purposes and are limited to 256 general purpose input registers. The GPDI address for a particular pin is the GPIO number plus an offset of SIU\_BASE + 0800h. For full access to all 512 general purpose input registers, the SIU\_GPDI<sub>n</sub> registers starting at address offset 0E00h should be used.

Each SIU\_GPDI<sub>n</sub> register specifies the input state for the GPDI[*n*] pin. The *n* notation in the SIU\_GPDI<sub>n</sub> register name relates to the [*n*] in GPIO[*n*] signal name. For example, SIU\_GPDI246 contains the PDI246 bit for CNTXD\_GPIO246. Gaps exist in the memory map where registers correspond to GPIO pins that are not implemented in the package.

Software reads the SIU\_GPDI<sub>n</sub> registers to get the input state of the external GPIO pin. Each GPDI register contains the input state of one external GPIO pin. If a GPDI register is configured as output, and the input buffer enable bit is set to one in the PCR register, the SIU\_GPDI<sub>n</sub> register reflects the state of the output pin.

Address: 0h base + 84Bh offset + (1d × i), where i=0d to 178d

**8.2.17 DSPI Input Select Register (SIU\_DISR)**

The SIU\_DISR specifies the following operations for each DSPI:

- Data input source
- Slave select
- Clock input

Address: 0h base + 908h offset = 908h

**8.2.18 eQADC Command FIFO Trigger Source Registers (SIU\_ISEL4)**

The eQADC Command FIFO[5:2] Trigger Source Register (SIU\_ISEL4) is used to select a trigger source for a command FIFO. SIU\_ISEL4 is used to select a trigger source for command FIFO[5:2] in eQADC\_A. The cTSEL (combined Trigger Select) field is used to configure one of many possible trigger sources for each command FIFO.

To trigger the eQADC, the trigger source must change to the state that the input to the command FIFO has been programmed to recognize. A command FIFO trigger input can be programmed to recognize either rising or falling edges, and low or high gated trigger types.

**Table 8-1036. eQADC\_A Command FIFO 2 Trigger Sources**

| cTSEL_2_A |   |   |   |   |   |   | eQADC_A Trigger Inputs  |
|-----------|---|---|---|---|---|---|-------------------------|
| 0         | 0 | 0 | 0 | 0 | 0 | 0 | Not Connected (default) |
| 0         | 0 | 0 | 0 | 0 | 0 | 1 | RTI Trigger             |

**8.2.19 eQADC Command FIFO Trigger Source Registers (SIU\_ISEL5)**

The eQADC Command FIFO[1:0] Trigger Source Register (SIU\_ISEL5) is used to select a trigger source for a command FIFO. SIU\_ISEL5 is used to select a trigger source for command FIFO[1:0] in eQADC\_A. The cTSEL (combined Trigger Select) field is used to configure one of many possible trigger sources for each command FIFO.

To trigger the eQADC, the trigger source must change to the state that the input to the command FIFO has been programmed to recognize. A command FIFO trigger input can be programmed to recognize either rising or falling edges, and low or high gated trigger types.

## 8.2.20 eQADC Command FIFO Trigger Source Registers (SIU\_ISEL6)

The eQADC Command FIFO[5:2] Trigger Source Register (SIU\_ISEL6) is used to select a trigger source for a command FIFO. SIU\_ISEL6 is used to select a trigger source for command FIFO[5:2] in eQADC\_B. The cTSEL (combined Trigger Select) field is used to configure one of many possible trigger sources for each command FIFO.

To trigger the eQADC, the trigger source must change to the state that the input to the command FIFO has been programmed to recognize. A command FIFO trigger input can be programmed to recognize either rising or falling edges, and low or high gated trigger types.

**8.2.21 eQADC Command FIFO Trigger Source Registers (SIU\_ISEL7)**

The eQADC Command FIFO[1:0] Trigger Source Register (SIU\_ISEL7) is used to select a trigger source for a command FIFO. SIU\_ISEL7 is used to select a trigger source for command FIFO[1:0] in eQADC\_B. The cTSEL (combined Trigger Select) field is used to configure one of many possible trigger sources for each command FIFO.

To trigger the eQADC, the trigger source must change to the state that the input to the command FIFO has been programmed to recognize. A command FIFO trigger input can be programmed to recognize either rising or falling edges, and low or high gated trigger types.

**Table 8-1049. eQADC\_B Command FIFO 0 Trigger Sources**

**8.2.22 eTPU\_A Input Select Register (SIU\_ISEL8)**

The SIU\_ISEL8 register is used to multiplex the eTPU\_A[24:29] inputs. These 6 eTPU\_A channels can come from the output of the DSPI or the corresponding pad. When SIU\_ISEL8 is in its default state, the eTPU pins listed in the figure below will not be enabled as inputs, irrespective of the SIU\_PCR[PA] field (PCR138-143).

**8.2.23 eQADC Advance Trigger Source Register (SIU\_ISEL9)**

The eQADC streaming mode requires a second trigger for command queue 0. Selectable source options for this trigger consist of eTPU, eMIOS or PIT channels. This mux register selects the source of the command queue 0 trigger.

**8.2.24 Sigma-Delta Gate Selection Register (SIU\_SDGATE\_SEL)**

Each Sigma-Delta ADC supports an input that gates (disable) interrupt and DMA requests. The SIU\_SDGATE\_SEL register selects the source of the interrupt/DMA gating input. The sources selected by this register come from eTPU output channels. Gating DMA and interrupt requests is useful for applications like knock processing when —outside the knock window—the ADC results are not needed, but the Sigma-Delta ADC is still converting due to its architecture.

## 8.2.25 Sigma-Delta to eTPU\_A Connection Configuration Register (SIU\_SDETPUA)

This register configures the connection between Sigma-Delta ADCs and eTPU\_A input channels. Two ADC signals can be connected to eTPU channel inputs. The first one is a signal that indicates valid data conversion completion. The second one is a watchdog signal that flags a conversion which is outside pre-programmed high/low threshold limits.

## 8.2.26 Sigma-Delta to eTPU\_B Connection Configuration Register (SIU\_SDETPUB)

This register configures the connection between Sigma-Delta ADCs and eTPU\_B input channels. Two ADC signals can be connected to eTPU channel inputs. The first one is a signal that indicates valid data conversion completion. The second one is a watchdog signal that flags a conversion which is outside pre-programmed high/low threshold limits.

## 8.2.28 Trigger Burst Generator Control Registers for eQADC\_A (SIU\_TBГ\_CR\_An)

These registers provide control bits for the Trigger Burst Generators (TBG) connected at the trigger inputs of the 6 CFIFOS of eQADC\_A. There is one register for each eQADC\_A CFIFO input. The numbering goes from 0 to 5, n=0 corresponding to address 0x950 and CFIFO0, n=5 corresponding to address 0x964 and CFIFO5. See Trigger Burst Generators for detailed information on the TBG feature.

Address: 0h base + 950h offset + (4d × i), where i=0d to 5d

### SIU\_ECCR field descriptions

| Field             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0–15<br>Reserved  | This field is reserved.<br>This read-only field is reserved and always has the value 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 16–23<br>ENGDIV   | Engineering Clock Division Factor. The ENGDIV field specifies the frequency ratio between the platform clock (plat_clk) and ENGCLK. The ENGCLK frequency is divided from the platform clock frequency according to the following equation:<br>$EngineeringClockFrequency = \frac{PlatformClockFrequency}{(ENGDIV \times 2)}$ Setting ENGDIV to 0 makes the ENGCLK frequency equal to the platform clock frequency.<br><b>NOTE:</b> Maximum ENGCLK frequency is limited by the pad performance. Refer to the Electrical Specifications in the Data Sheet document for this device. |
| 24<br>ECSS        | Engineering clock source select. The ECSS bit selects the source clock to be divided to generate the ENGCLK clock.<br><br>0 The system clock is the source of the ENGCLK.<br>1 The crystal oscillator clock is the source of ENGCLK.                                                                                                                                                                                                                                                                                                                                              |
| 25–27<br>Reserved | This field is reserved.<br>This read-only field is reserved and always has the value 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 28<br>EBTS        | External Bus Tap Select. Changes the phase relationship between the system clock and CLKOUT. Changing the phase relationship so that CLKOUT is advanced in relation to system clock increases the output hold time of the external bus signals to a non-zero value. It also increases the output delay times, increases the input hold times to non-zero values, and decreases the input setup times. Refer to the Data Sheet document for how the EBTS bit affects the electrical specifications.                                                                                |

**8.2.31 System Clock Register (SIU\_SYSDIV)**

The SIU\_SYSDIV register provides clock multiplexing control and clock frequency division factors to configure the system clocks. Please refer to the clocking section for a diagram showing how the fields of this register are used to control the various clock muxes and dividers.

**NOTE**

Do not change the contents of this register while the FEC is operating, otherwise transactions in the crossbar may be corrupted.

| 18–19<br>SYSCLKSEL | System Clock Select. The SYSCLKSEL field directly selects the source of the system clock if the Progressive Clock Switch (PCS) is disabled. If the PCS is enabled, then the SYSCLKSEL field is a request to change the clock, and the actual changing is controlled by the PCS. In this case, information about the actual clock source driving the system clock is available in the SIU_PCSIFR[PCSMS] field. Note that if the PCS fails to switch (because, for example, it was programmed incorrectly), then the system clock will not switch to the clock requested by SYSCLKSEL, and SIU_PCSIFR[PCSMS] will still indicate the previous clock.<br><br>00 The system clock is driven by the 16 MHz Internal RC Oscillator (IRC).<br>01 The system clock is driven by the external oscillator (XOSC).<br>10 The system clock is driven by the FM PLL (PLL1).<br>11 The system clock is driven by the non-FM PLL (PLL0). |

## 8.2.32 Halt Register 1 (SIU\_HLT1)

This register is used to dispatch a request to various modules to halt their clock inputs. Each register bit drives a separate halt request signal. Modules respond differently to the halt request. The CPUs will allow their clock inputs to be halted only after the execution of the WAIT instruction. Most other modules will wait for internal activities to finish before allowing their clock inputs to be halted, but a few modules will allow the clocks to be halted immediately.

Some peripherals have an MDIS (module disable) bit in the module control register that can be set to disable the module clock, reducing power consumption. In most cases the peripheral registers are still readable and writeable. However, using the SIU\_HALT1 register also disables the read/write functions of the disabled peripheral registers for additional power saving.

When the clocks of all CPUs have been halted and all cross-bar masters are idle, then the clocks of the following modules are also halted automatically: cross-bar, peripheral bridges, system RAM, DMA, STM and Semaphores. The interrupt controller and SWT\_A/SWT\_B clocks are never stopped.

Address: 0h base + 9A4h offset = 9A4h

8.2.33 Halt Acknowledge Register 1 (SIU\_HLTACK1)

The SIU\_HLTACK1 bits indicate that the request to halt the modules via the respective SIU\_HLT1 bits have completed and the clock inputs to the modules have been disabled.

**8.2.34 Core0 Reset Vector Register (SIU\_RSTVEC0)**

This register contains the reset vector, reset control and instruction execution type selection for Core0. The RST bit is qualified by the CORE0 halt bit in the SIU\_HLT1 register, such that both must be 1 for a core reset to occur. The order in which the RST and core halt bits are asserted does not matter. After both halt and RST bits are asserted, internal logic places a request to halt the corresponding core clocks, but the core may continue to run until such time that it terminates any pending crossbar master bus cycles and interrupt controller interaction that might prevent their use by other bus masters. When all pending transactions finish, the core will be in reset state with clock stopped. Exit of reset state is done by negating either SIU\_HLT1[CORE0] or the RST bit. Negating just one is enough to remove the core from reset state.

The reset value of the halt and RST bits for Core0 is 0 by default to allow Core0 to execute out of reset. The halt and RST bits for Core1 are 1 by default to prevent Core1 from executing out of reset.

Any attempt to reset both cores by setting both RST bits will result in an immediate system reset, with the cause of the reset recorded in the SIU\_RSR[CPURS] bit.

**NOTE**

The halt acknowledge bit in the SIU\_HLTACK1 register will not be asserted for a core in reset state. Even though setting the halt bit is part of the procedure to put a core in reset state, the halt acknowledge bit is only asserted when the WAIT

instruction is executed and the core is stopped, but not in reset state.

## 8.2.35 Core1 Reset Vector Register (SIU\_RSTVEC1)

This register contains the reset vector, reset control and instruction execution type selection for Core1. The RST bit is qualified by the CORE1 halt bit in the SIU\_HLT1 register, such that both must be 1 for a core reset to occur. The order in which the RST and core halt bits are asserted does not matter. After both halt and RST bits are asserted, internal logic places a request to halt the corresponding core clocks, but the core may continue to run until such time that it terminates any pending crossbar master bus cycles and interrupt controller interaction that might prevent their use by other bus masters. When all pending transactions finish, the core will be in reset state with clock stopped. Exit of reset state is done by negating either SIU\_HLT1[CORE1] or the RST bit. Negating just one is enough to remove the core from reset state.

The reset value of the halt and RST bits for Core0 is 0 by default to allow Core0 to execute out of reset. The halt and RST bits for Core1 are 1 by default to prevent Core1 from executing out of reset.

Any attempt to reset both cores by setting both RST bits will result in an immediate system reset, with the cause of the reset recorded in the SIU\_RSR[CPURS] bit.

### NOTE

The halt acknowledge bit in the SIU\_HLTACK1 register will not be asserted for a core in reset state. Even though setting the halt bit is part of the procedure to put a core in reset state, the halt acknowledge bit is only asserted when the WAIT instruction is executed and the core is stopped, but not in reset state.

Address: 0h base + 9B0h offset = 9B0h

## 8.2.36 Core0 PID mapping control register (SIU\_C0PID)

This register allows an external tool to modify the logical to physical address mapping without interrupting normal application code execution in either core. An optional synchronization mechanism using the nex\_wevto[2] watchpoint event output from each core allows the mapping that is selected by the tool to change deterministically, when a specified instruction address is reached or a specified load/store address is accessed. If the synchronization mechanism is not enabled, a write to the register is propagated immediately to the MMU.

## 8.2.38 Halt Register 2 (SIU\_HLT2)

This register is used to dispatch a request to various modules to halt their clock inputs. Each register bit drives a separate halt request signal. Modules respond differently to the halt request. Most modules will wait for internal activities to finish before allowing their clock inputs to be halted, but a few modules will allow the clocks to be halted immediately.

Some peripherals have an MDIS (module disable) bit in the module control register that can be set to disable the module clock, reducing power consumption. In most cases the peripheral registers are still readable and writeable. However, using the SIU\_HALT2 register also disables the read/write functions of the disabled peripheral registers for additional power saving.

When the clocks of all CPUs have been halted and all cross-bar masters are idle, then the clocks of the following modules are also halted automatically: cross-bar, peripheral bridges, system RAM, DMA, STM and Semaphores. The interrupt controller and SWT\_A/SWT\_B clocks are never stopped.

\* Notes:

- RET field: RET is loaded with 1000b when the REE bit of the UTEST Reset Escalation Configuration DCF client is 1.

### SIU\_RCR field descriptions

| Field            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0–27<br>Reserved | This field is reserved.<br>This read-only field is reserved and always has the value 0.                                                                                                                                                                                                                                                                                                                                                      |
| 28–31<br>RET     | Reset Escalation Threshold. This field defines the number of reset cycles not caused by POR that the device can execute before being held permanently in reset state, waiting for a POR. The defined number of non-POR reset cycles is the decimal value of RET plus 1, except when RET is 0. A value of 0 in this field disables the reset escalation feature. Any CPU write to the RET field re-initiates the escalation counting process. |

## 8.2.42 Lock-Step Status Register (SIU\_LOCKSTEP)

The SIU\_LOCKSTEP register contains a status bit that indicates whether the checker core is enabled or not. The checker core is enabled by setting the LOCKSTEP\_EN in the Miscellaneous DCF client. A reset cycle is required for a change in LOCKSTEP\_EN to take effect.

Address: 0h base + 9D4h offset = 9D4h

**8.2.43 Progressive Clock Switch Interrupt Enable Register (SIU\_PCSE)**

The SIU\_PCSE controls the generation of an interrupt request when the SIU\_PCSIFR[PCSI] becomes set at the end of a progressive clock switch (PCS) operation.

Pad configuration must be done in the PCR registers.<br><br>0 RMII mode is selected.<br>1 MII-Lite mode is selected. |

### 8.2.46 ECC Error Injection Register (SIU\_ECCEIR)

The SIU\_ECCEIR is used to inject ECC errors into reading operations on the MCAN RAM array. This register is intended to support testing of the error reporting path from the MCAN ECC logic to the FCCU input. Before programming this register, it is recommended to disable MCAN operations and then access the MCAN memories directly with the CPU.

ECC errors will be introduced into the read data path, therefore the memory contents remain intact. As soon as the error injection is disabled, normal MCAN operation can be resumed without the need to fix any memory content.

## Memory Map and Register Definition

Address: 0h base + 9E4h offset = 9E4h

## 8.2.47 Parallel GPIO Pin Data Output Registers (SIU\_PGPDO<sub>n</sub>)

The PGPDO<sub>x</sub> registers are written to by software to drive data out on external GPIO pins. These registers access the same GPIO pins accessed by the SIU\_GPDO0 - SIU\_GPDO511 registers, and they share the same hardware registers. For example, SIU\_PGPDO0 bit 0 is the same as SIU\_GPDO0 bit 7, SIU\_PGPDO0 bit 1 is the same as SIU\_GPDO1 bit 7, and so on.

The parallel GPIO read/write addresses map to the same physical addresses of the normal GPIO. This way both GPDO and corresponding PGPDO registers will be updated by a single write to either registers.

Address: 0h base + C00h offset + (4d × i), where i=0d to 15d

## 8.2.48 Parallel GPIO Pin Data Input Registers (SIU\_PGPDIn)

The GPD<sub>I</sub>x registers are read-only registers that allow reading of external GPIO pins. These registers access the same GPIO pins accessed by the SIU\_GPD<sub>I</sub>0 - SIU\_GPD<sub>I</sub>15 registers, and they share the same hardware registers. For example, SIU\_PGPD<sub>I</sub>0 bit 0 is the same as SIU\_GPD<sub>I</sub>0 bit 7, SIU\_PGPD<sub>I</sub>0 bit 1 is the same as SIU\_GPD<sub>I</sub>1 bit 7, and so on.

The parallel GPIO read/write addresses map to the same physical addresses of the normal GPIO. This way both the GPD<sub>I</sub> and corresponding PGPD<sub>I</sub> registers are updated when a pin state changes, provided that the IBE bit is asserted in the corresponding PCR register.

## 8.2.49 Masked Parallel GPIO Pin Data Output Registers (SIU\_MPGPDO<sub>n</sub>)

The MPGPDO<sub>n</sub> are write-only registers that are used to drive data out on external GPIO pins. These registers access the same GPIO pins accessed by SIU\_GPDO0 - SIU\_GPDO511 bit registers. The 16 least significant bits in the SIU\_MPGPDO share the same hardware registers used by SIU\_GPDO. For example, SIU\_MPGPDO<sub>n</sub> bit 16 is the same as SIU\_GPDO<sub>n</sub> bit 7, SIU\_MPGPDO0 bit 17 is the same as SIU\_GPDO1 bit 7, and so on.

The mask bits qualify the write operation of the data bits. Writing to DATAn is only effective if the corresponding MASK<sub>n</sub> bit is written to logic one at the same time (same access to the register). The value that was written to SIU\_MPGPDO cannot be read back by a read operation to the same register. It can, however, be accessed by reading the corresponding SIU\_GPDO register.

### 8.2.50 Mask-Output High Register (SIU\_DSPI<sub>n</sub>H)

Each bit in the DSPI serialized output frame can contain a signal routed from the output of one of three on-chip sources. The sources on this device are the eTPU module, eMIOS module, or a software-updated GPO data register. The mapping between module or data register and the output frame for a single DSPI channel is performed by independent 32-bit registers, one for each module plus one for the data register.

These registers are one of the possible sources for the DSPI serialized output frame. The purpose of these registers is to allow any combination of bits in each half of the 32 bit serialized data frame to be updated with a single 32-bit write operation, while allowing other bits to maintain their previous state. This is accomplished by writing a 16 bit masked value coherently with an update value contained in a 16 bit output field, and only updating those bits in the output register for which the corresponding mask bit is set. The mask bits are write-only. A value written to a MASK bit only takes effect on the corresponding DATA bit on the same write cycle in which it is written. Reading a mask bit always returns zero.

Address: 0h base + D00h offset + (8d × i), where i=0d to 3d

| Bit   | 0     | 1     | 2     | 3     | 4     | 5     | 6     | 7     | 8     | 9     | 10     | 11     | 12     | 13     | 14     | 15     |

**8.2.51 Mask-Output Low Register (SIU\_DSPIInL)**

Each bit in the DSPI serialized output frame can contain a signal routed from the output of one of three on-chip sources. The sources on this device are the eTPU module, eMIOS module, or a software-updated GPO data register. The mapping between module or data register and the output frame for a single DSPI channel is performed by independent 32-bit registers, one for each module plus one for the data register.

These registers are one of the possible sources for the DSPI serialized output frame. The purpose of these registers is to allow any combination of bits in each half of the 32 bit serialized data frame to be updated with a single 32-bit write operation, while allowing other bits to maintain their previous state. This is accomplished by writing a 16 bit masked value coherently with an update value contained in a 16 bit output field, and only updating those bits in the output register for which the corresponding mask bit is set. The

mask bits are write-only. A value written to a MASK bit only takes effect on the corresponding DATA bit on the same write cycle in which it is written. Reading a mask bit always returns zero.

Address: 0h base + D04h offset + (8d × i), where i=0d to 3d

### 8.2.52 Serialized Output Signal Selection Register for DSPI\_A (SIU\_ETPUBA)

Each bit in the DSPI serialized output frame can contain a signal routed from the output of one of three on-chip sources. The sources on this device are the eTPU module, eMIOS module, or a software-updated GPO data register. The mapping between module or data register and the output frame for a single DSPI channel is performed by independent 32-bit registers, one for each module plus one for the data register.

The following register is used by DSPI\_A to select the sources of the serialized output when running in DSI or CSI configuration.

Each register bit enables a path from the eTPU\_B channel, eMIOS channel and data register bit SIU\_DSPIAH/SIU\_DSPIAL to the equivalent bit position in the DSPI\_A serialized output frame. The user must ensure that bit selections from each of these registers do not overlap. Multiple sources are logically ORed, which provides the potential for combining outputs from multiple timer channels and data registers to produce more complex bit behavior.

Address: 0h base + D40h offset = D40h

### 8.2.53 Serialized Output Signal Selection Register for DSPI\_A (SIU\_EMIOA)

Each bit in the DSPI serialized output frame can contain a signal routed from the output of one of three on-chip sources. The sources on this device are the eTPU module, eMIOS module, or a software-updated GPO data register. The mapping between module or data register and the output frame for a single DSPI channel is performed by independent 32-bit registers, one for each module plus one for the data register.

The following register is used by DSPI\_A to select the sources of the serialized output when running in DSI or CSI configuration.

Each register bit enables a path from the eTPU\_B channel, eMIOS channel and data register bit SIU\_DSPIAH/SIU\_DSPIAL to the equivalent bit position in the DSPI\_A serialized output frame. The user must ensure that bit selections from each of these registers do not overlap. Multiple sources are logically ORed, which provides the potential for combining outputs from multiple timer channels and data registers to produce more complex bit behavior.

**8.2.55 Serialized Output Signal Selection Register for DSPI\_B (SIU\_ETPUAB)**

Each bit in the DSPI serialized output frame can contain a signal routed from the output of one of three on-chip sources. The sources on this device are the eTPU module, eMIOS module, or a software-updated GPO data register. The mapping between module or data register and the output frame for a single DSPI channel is performed by independent 32-bit registers, one for each module plus one for the data register.

The following register is used by DSPI\_B to select the sources of the serialized output when running in DSI or CSI configuration.

Each register bit enables a path from the eTPU\_A channel, eMIOS channel and data register bit SIU\_DSPIBH/SIU\_DSPIBL to the equivalent bit position in the DSPI\_B serialized output frame. The user must ensure that bit selections from each of these registers do not overlap. Multiple sources are logically ORed, which provides the potential for combining outputs from multiple timer channels and data registers to produce more complex bit behavior.

Address: 0h base + D50h offset = D50h

**8.2.56 Serialized Output Signal Selection Register for DSPI\_B (SIU\_EMIOSB)**

Each bit in the DSPI serialized output frame can contain a signal routed from the output of one of three on-chip sources. The sources on this device are the eTPU module, eMIOS module, or a software-updated GPO data register. The mapping between module or data register and the output frame for a single DSPI channel is performed by independent 32-bit registers, one for each module plus one for the data register.

The following register is used by DSPI\_B to select the sources of the serialized output when running in DSI or CSI configuration.

Each register bit enables a path from the eTPU\_A channel, eMIOS channel and data register bit SIU\_DSPIBH/SIU\_DSPIBL to the equivalent bit position in the DSPI\_B serialized output frame. The user must ensure that bit selections from each of these registers do not overlap. Multiple sources are logically ORed, which provides the potential for combining outputs from multiple timer channels and data registers to produce more complex bit behavior.

Address: 0h base + D54h offset = D54h

| Bit   | 0         | 1         | 2         | 3         | 4         | 5         | 6         | 7         | 8         | 9         | 10        | 11         | 12        | 13        | 14        | 15        |

## 8.2.57 Serialized Output Signal Selection Register for DSPI\_B (SIU\_DSPIBHLB)

Each bit in the DSPI serialized output frame can contain a signal routed from the output of one of three on-chip sources. The sources on this device are the eTPU module, eMIOS module, or a software-updated GPO data register. The mapping between module or data register and the output frame for a single DSPI channel is performed by independent 32-bit registers, one for each module plus one for the data register.

The following register is used by DSPI\_B to select the sources of the serialized output when running in DSI or CSI configuration.

Each register bit enables a path from the eTPU\_A channel, eMIOS channel and data register bit SIU\_DSPIBH/SIU\_DSPIBL to the equivalent bit position in the DSPI\_B serialized output frame. The user must ensure that bit selections from each of these registers do not overlap. Multiple sources are logically ORed, which provides the potential for combining outputs from multiple timer channels and data registers to produce more complex bit behavior.

Address: 0h base + D58h offset = D58h

**SIU\_DSPIBHLB field descriptions (continued)**

| Field | Description                                                                                |
|-------|--------------------------------------------------------------------------------------------|
| 0     | This bit in the DSPI_B serialized output frame will not use the respective SIU_DSPIBL bit. |
| 1     | This bit in the DSPI_B serialized output frame will use the respective SIU_DSPIBL bit.     |

**8.2.58 Serialized Output Signal Selection Register for DSPI\_C (SIU\_ETPUAC)**

Each bit in the DSPI serialized output frame can contain a signal routed from the output of one of three on-chip sources. The sources on this device are the eTPU module, eMIOS module, or a software-updated GPO data register. The mapping between module or data register and the output frame for a single DSPI channel is performed by independent 32-bit registers, one for each module plus one for the data register.

The following register is used by DSPI\_C to select the sources of the serialized output when running in DSI or CSI configuration.

Each register bit enables a path from the eTPU\_A/B channel, eMIOS channel and data register bit SIU\_DSPICH/SIU\_DSPICL to the equivalent bit position in the DSPI\_C serialized output frame. The user must ensure that bit selections from each of these registers do not overlap. Multiple sources are logically ORed, which provides the potential for combining outputs from multiple timer channels and data registers to produce more complex bit behavior.

Address: 0h base + D60h offset = D60h

**8.2.59 Serialized Output Signal Selection Register for DSPI\_C (SIU\_EMIOSC)**

Each bit in the DSPI serialized output frame can contain a signal routed from the output of one of three on-chip sources. The sources on this device are the eTPU module, eMIOS module, or a software-updated GPO data register. The mapping between module or data register and the output frame for a single DSPI channel is performed by independent 32-bit registers, one for each module plus one for the data register.

The following register is used by DSPI\_C to select the sources of the serialized output when running in DSI or CSI configuration.

## Memory Map and Register Definition

Each register bit enables a path from the eTPU\_A/B channel, eMIOS channel and data register bit SIU\_DSPICH/SIU\_DSPICL to the equivalent bit position in the DSPI\_C serialized output frame. The user must ensure that bit selections from each of these registers do not overlap. Multiple sources are logically ORed, which provides the potential for combining outputs from multiple timer channels and data registers to produce more complex bit behavior.

Address: 0h base + D64h offset = D64h

| Bit   | 0         | 1         | 2         | 3         | 4          | 5         | 6         | 7         | 8         | 9         | 10        | 11        | 12        | 13        | 14        | 15        |

**8.2.60 Serialized Output Signal Selection Register for DSPI\_C (SIU\_DSPICHL)**

Each bit in the DSPI serialized output frame can contain a signal routed from the output of one of three on-chip sources. The sources on this device are the eTPU module, eMIOS module, or a software-updated GPO data register. The mapping between module or data register and the output frame for a single DSPI channel is performed by independent 32-bit registers, one for each module plus one for the data register.

The following register is used by DSPI\_C to select the sources of the serialized output when running in DSI or CSI configuration.

Each register bit enables a path from the eTPU\_A/B channel, eMIOS channel and data register bit SIU\_DSPICH/SIU\_DSPICL to the equivalent bit position in the DSPI\_C serialized output frame. The user must ensure that bit selections from each of these registers do not overlap. Multiple sources are logically ORed, which provides the potential for combining outputs from multiple timer channels and data registers to produce more complex bit behavior.

Address: 0h base + D68h offset = D68h

| Bit   | 0       | 1       | 2       | 3       | 4       | 5       | 6       | 7       | 8       | 9       | 10       | 11       | 12       | 13       | 14       | 15       |

**8.2.61 Serialized Output Signal Selection Register for DSPI\_C (SIU\_ETPUBC)**

Each bit in the DSPI serialized output frame can contain a signal routed from the output of one of three on-chip sources. The sources on this device are the eTPU module, eMIOS module, or a software-updated GPO data register. The mapping between module or data register and the output frame for a single DSPI channel is performed by independent 32-bit registers, one for each module plus one for the data register.

The following register is used by DSPI\_C to select the sources of the serialized output when running in DSI or CSI configuration.

Each register bit enables a path from the eTPU\_A/B channel, eMIOS channel and data register bit SIU\_DSPICH/SIU\_DSPICL to the equivalent bit position in the DSPI\_C serialized output frame. The user must ensure that bit selections from each of these registers do not overlap. Multiple sources are logically ORed, which provides the potential for combining outputs from multiple timer channels and data registers to produce more complex bit behavior.

## 8.2.62 Serialized Output Signal Selection Register for DSPI\_D (SIU\_ETPUBD)

Each bit in the DSPI serialized output frame can contain a signal routed from the output of one of three on-chip sources. The sources on this device are the eTPU module, eMIOS module, or a software-updated GPO data register. The mapping between module or data register and the output frame for a single DSPI channel is performed by independent 32-bit registers, one for each module plus one for the data register.

The following register is used by DSPI\_D to select the sources of the serialized output when running in DSI or CSI configuration.

The register bit enables a path from the eTPU\_B channel or eMIOS channel to the equivalent bit position in the DSPI\_D serialized output frame. The user must ensure that bit selections from each of these registers do not overlap. Multiple sources are logically ORed, which provides the potential for combining outputs from multiple timer channels and data registers to produce more complex bit behavior.

### 8.2.63 Serialized Output Signal Selection Register for DSPI\_D (SIU\_EMIOSD)

Each bit in the DSPI serialized output frame can contain a signal routed from the output of one of three on-chip sources. The sources on this device are the eTPU module, eMIOS module, or a software-updated GPO data register. The mapping between module or data register and the output frame for a single DSPI channel is performed by independent 32-bit registers, one for each module plus one for the data register.

The following register is used by DSPI\_D to select the sources of the serialized output when running in DSI or CSI configuration.

The register bit enables a path from the eTPU\_B channel or eMIOS channel to the equivalent bit position in the DSPI\_D serialized output frame. The user must ensure that bit selections from each of these registers do not overlap. Multiple sources are logically ORed, which provides the potential for combining outputs from multiple timer channels and data registers to produce more complex bit behavior.

Address: 0h base + D74h offset = D74h

| 1     | This bit in the DSPI_D serialized output frame will use the respective SIU_DSPIDL bit.     |

**8.2.65 GPIO Pin Data Input Register (SIU\_GPDIn)**

Previous devices are limited to supporting a maximum of 256 general purpose input registers, and thus a maximum GPIO input assignment of GPIO[0:255]. The reason was that only 256 bytes of SIU address space were allocated for the GPIO Pin Data Input registers, and adjacent memory locations are unavailable. To accommodate the extended number of the GPIO pads, this device has a new memory map definition of 512 bytes for allocating up to 512 GPIO Pin Data Input registers. For compatibility, the first used 256 GPIO Pin Data Input registers are mapped to both the old and new locations.

Each SIU\_GPDIn register specifies the input state for the GPDIn[n] pin. The *n* notation in the SIU\_GPDIn register name relates to the *[n]* in GPIO[n] signal name. For example, SIU\_GPDIn246 contains the PDI246 bit for CNTXD\_GPIO246. Gaps exist in the memory map where registers correspond to GPIO pins that are not implemented in the package.

Software reads the SIU\_GPDIn registers to get the input state of the external GPIO pin. Each GPDIn register contains the input state of one external GPIO pin. If a GPDIn register is configured as output, and the input buffer enable bit is set to one in the PCR register, the SIU\_GPDIn register reflects the state of the output pin.

**Table 8-1183. Implemented GPIO Pin Data Input Registers**

| Offset          | GPIO register                         |

| 0–6<br>Reserved | This field is reserved.<br>This read-only field is reserved and always has the value 0.                                                                                         |
| 7<br>PDIn       | Pin Data In. This bit reflects the state on the external GPIO/GPI pin. If PCR <sub>n</sub> [IBE] is 1, then:<br>0 Signal on pin is logic zero.<br>1 Signal on pin is logic one. |

## 8.2.66 Input Multiplexing Register0 (SIU\_IMUX0)

The SIU\_IMUX registers specify the source of peripheral inputs that may come from multiple package pins. The registers allow selection from 4 sources for each input. Each SIU\_IMUX register contains 16 inputs, each with 2 bits (4 sources).

Some registers are reserved for future use, and some fields within some of the registers are also reserved.

## Memory Map and Register Definition

Address: 0h base + 1200h offset = 1200h

**8.2.70 Input Multiplexing Register4 (SIU\_IMUX4)**

The SIU\_IMUX registers specify the source of peripheral inputs that may come from multiple package pins. The registers allow selection from 4 sources for each input. Each SIU\_IMUX register contains 16 inputs, each with 2 bits (4 sources).

Some registers are reserved for future use, and some fields within some of the registers are also reserved

**8.2.72 Input Multiplexing Register7 (SIU\_IMUX7)**

The SIU\_IMUX registers specify the source of peripheral inputs that may come from multiple package pins. The registers allow selection from 4 sources for each input. Each SIU\_IMUX register contains 16 inputs, each with 2 bits (4 sources).

Some registers are reserved for future use, and some fields within some of the registers are also reserved.

**8.2.74 Input Multiplexing Register12 (SIU\_IMUX12)**

The SIU\_IMUX registers specify the source of peripheral inputs that may come from multiple package pins. The registers allow selection from 4 sources for each input. Each SIU\_IMUX register contains 16 inputs, each with 2 bits (4 sources).

Some registers are reserved for future use, and some fields within some of the registers are also reserved.

Address: 0h base + 1230h offset = 1230h

## SIU\_IMUX12 field descriptions (continued)

| Field | Description |
|-------|-------------|
|-------|-------------|

## 8.3 SIU\_B

SIU\_B contains a set of mirrored PCR configuration registers, GPO data registers, and GPI data registers for GPIO[240:243] balls.

By default after reset, the mirrored registers are disabled and provide no function. The disabled state is indicated by PA[2:0] = 111b in the mirrored PCR (PCR<sub>nM</sub>) register.

When a mirrored PCR<sub>nM</sub> is enabled by writing a different value to its PA[2:0]:

- The PCR<sub>nM</sub> has priority over the equivalent non-mirrored PCR register.
- The PCR<sub>nM</sub> controls the ball function and characteristics defined by its implemented bit fields.
- The mirrored GPO data (GPDO<sub>nM</sub>) and GPI data (GPDIn<sub>M</sub>) registers control and reflect the logic level.

When the mirrored registers are enabled, writes to the non-mirrored registers have no effect.

Offsets for SIU\_B registers are relative to SIU\_B's base address, which differs from SIU's base address.

**8.3.1 Pad Configuration Register Mirrored (SIU\_B\_PCRnM)**

By default after reset, each mirrored register is disabled and provides no function. The disabled state is indicated by the reset value of PA[2:0] = 111b.

When a mirrored PCR<sub>n</sub>M is enabled by writing a different value to its PA[2:0]:

- The PCR<sub>n</sub>M has priority over the equivalent non-mirrored PCR register.
- The PCR<sub>n</sub>M controls the ball function and characteristics defined by its implemented bit fields.

When the mirrored registers are enabled, writes to the non-mirrored registers have no effect.

These 16-bit registers are read from or written to as:

- 16-bit values aligned on 16-bit boundaries, or
- 32-bit values aligned on 32-bit address boundaries.

The PCRs allow software to control the following range of electrical characteristics of the external pads:

- Weak pullup/down enable/disable
- Weak pullup/down selection
- Slew-rate selection for outputs
- Drive strength selection for outputs
- Input buffer enable (when direction is configured for output)
- Input hysteresis enable/disable
- Open drain/push-pull output selection
- Multiplexed function selection
- Data direction selection

**NOTE**

The actual characteristics available in any SIU\_B\_PCR $n$ M depend on the type of pad it controls. See the SIU\_B\_PCR $n$ M definition table.

All device pin names begin with the primary function, followed by the alternate function, and then GPIO. See [External signal descriptions, multiplexing, and attributes](#) for how to identify the source module for primary and alternate functions and the description of these signals. For an additional signal description, see the chapter for the module that uses the signal.

There are a number of input signals on the device that have multiple external pins as input sources. Only one input source can be active at any time for these pins. To achieve this, a set of multiplexers controlled by the SIU\_IMUX registers select which input will drive the function. See [Input Multiplexing Register0 \(SIU\\_IMUX0\)](#) to [Input Multiplexing Register12 \(SIU\\_IMUX12\)](#) for more details.

[Table 8-2027](#) defines the symbols for PCR $n$ M fields' reset values that appear in [Table 8-2028](#).

**Table 8-2030. SIU\_B\_PCR $n$ M field reset-value symbols**

| Symbol | Meaning                                                                                                              |
|--------|----------------------------------------------------------------------------------------------------------------------|
| —      | Not implemented in the PCR $n$ M. Software should write a default value of 0.                                        |
| 0 or 1 | Function is implemented. For the exact definition of the 0 or 1 reset value, see the applicable field's description. |

**SIU\_B\_PCRnM field descriptions (continued)**

| Field     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|           | 0 Disable weak pull device for the pad.<br>1 Enable weak pull device for the pad.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 15<br>WPS | Weak pull up/down select. Controls whether weak pullup or weak pulldown devices are used for the pad when weak pullup/down devices are enabled. During reset, the weak pull up/down behavior is controlled by the WKPCFG bit of the Miscellaneous DCF client, or by the WKPCFG pin when operating in legacy mode ((LEG=1 in the Miscellaneous DCF client). The WPS bit determines whether weak pullup or pulldown devices are used after reset, or for pads in which the WKPCFG pin does not determine the reset weak pullup/down state.<br><br>0 Pulldown is enabled for the pad.<br>1 Pullup is enabled for the pad. |

**8.3.2 GPIO Pin Data Output Register Mirrored (SIU\_B\_GPDO<sub>n</sub>M)**

By default after reset, each mirrored register is disabled and provides no function. The disabled state is indicated by PA[2:0] = 111b in the mirrored PCR (PCR<sub>n</sub>M) register.

When a mirrored PCR<sub>n</sub>M is enabled by writing a different value to its PA[2:0], the mirrored GPO data (GPDO<sub>n</sub>M) and GPI data (GPDInM) registers control and reflect the logic level.

When the mirrored registers are enabled, writes to the non-mirrored registers have no effect.

Each GPDO register specifies the output data for the function assigned to the GPIO[*n*] pin. The *n* notation in the SIU\_B\_GPDO<sub>n</sub>M register name relate to the [*n*] in GPIO[*n*] signal name. For example, SIU\_B\_GPDO240M contains the PDO240 bit for CNTXD\_GPIO240.

Software writes to the SIU\_B\_GPDO<sub>n</sub>M registers to drive data out on the external pin. Each register drives one external pin, which allows independent control of the pin. Writes to the SIU\_B\_GPDO<sub>n</sub>M register are not reflected to the pin when a primary or alternate function is assigned or when an input function is assigned to the pin.

If the direction of a GPIO signal changes from input to output, the SIU\_B\_GPDO<sub>n</sub>M register value is automatically driven out to the external pin without the need for a software update.

Writes to a SIU\_B\_GPDO<sub>n</sub>M register have no effect when a primary or alternate function is assigned.

### SIU\_B\_GPDO<sub>n</sub>M field descriptions

| Field                 | Description                                                                                                                                                                                                                                                                                                                                 |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0–6<br>Reserved       | This field is reserved.<br>This read-only field is reserved and always has the value 0.                                                                                                                                                                                                                                                     |
| 7<br>PDO <sub>n</sub> | Pin Data Out. This bit stores the data to be driven out on the external GPIO. If the register is read, it returns the value written.<br><br>0 Logic low value is driven to the external GPIO pin when the pin is configured as an output.<br>1 Logic high value is driven to the external GPIO pin when the pin is configured as an output. |

### 8.3.3 GPIO Pin Data Input Register Mirrored (SIU\_B\_GPDI<sub>n</sub>M)

By default after reset, each mirrored register is disabled and provides no function. The disabled state is indicated by PA[2:0] = 111b in the mirrored PCR (PCR<sub>n</sub>M) register.

When a mirrored PCR<sub>n</sub>M is enabled by writing a different value to its PA[2:0], the mirrored GPO data (GPDO<sub>n</sub>M) and GPI data (GPDI<sub>n</sub>M) registers control and reflect the logic level.

When the mirrored registers are enabled, writes to the non-mirrored registers have no effect.

Each SIU\_B\_GPDI<sub>n</sub>M register specifies the input state for the GPDI[*n*] pin. The *n* notation in the SIU\_GPDI<sub>n</sub> register name relates to the [*n*] in GPIO[*n*] signal name. For example, SIU\_B\_GPDI240M contains the PDI240 bit for CNTXD\_GPIO240.

Software reads the SIU\_B\_GPDI<sub>n</sub>M registers to get the input state of the external GPIO pin. Each GPDI register contains the input state of one external GPIO pin. If a GPDI register is configured as output, and the input buffer enable bit is set to 1 in the PCR<sub>n</sub>M register, the SIU\_B\_GPDI<sub>n</sub>M register reflects the state of the output pin.

## 8.4 Functional Description

The following sections provide a functional overview of the SIU operation.

### 8.4.1 Pad configuration

The pad configuration registers (SIU\_PCR) in the SIU allow software control over the following electrical characteristics of the external pads:

- Weak pullup/down enable/disable
- Weak pullup/down selection
- Slew-rate selection for outputs
- Drive strength selection for outputs
- Input buffer enable (when direction is configured for output)
- Input hysteresis enable/disable
- Open drain/push-pull output selection
- Multiplexed function selection
- Data direction selection

The pad configuration registers are provided to allow centralized control over external pins that are shared by more than one module. Each pad configuration register controls a single pin.

### 8.4.2 Interrupts

There are 16 external interrupt inputs  $\overline{\text{IRQ}}[0]–\overline{\text{IRQ}}[15]$  to the SIU. The IRQ inputs can be configured for rising-edge events, falling-edge events, or both.

External interrupt requests are triggered by rising- and/or falling-edge events that are enabled by setting a bit in:

- IRQ rising-edge event enable register (SIU\_IREER)
- IRQ falling-edge event enable register (SIU\_IFEER)

If the bit is set in both registers, both rising- and falling-edge events trigger an interrupt request. Each IRQ has a counter that tracks the number of system clock cycles that occur between the rising- and falling-edge events. An IRQ counter exists for each IRQ rising- or falling-edge event enable bit.

The digital filter length field in the IRQ digital filter register (SIU\_IDFR) specifies the minimum number of system clocks that the IRQ signal must hold a logic value to qualify the edge-triggered event as a valid state change. When the number of system clocks in the IRQ counter equals the value in the digital filter length field, the IRQ state latches and the IRQ counter is cleared.

If the previous filtered state of the IRQ does not match the current state, and the rising- or falling-edge event is enabled, the IRQ flag bit is set to 1. For example, the IRQ flag bit is set if a rising-edge event occurs under the following conditions:

- Previous filtered IRQ state was a logic 0
- Current latched IRQ state is a logic 1
- Rising-edge event is enabled for the IRQ

When the counter for an IRQ is not enabled, the state of the IRQ is held in the current and previous state latches. The IRQ counter operates independently of the IRQ or overrun flag bit. Clearing the IRQ flag or overrun flag bits does not clear or reload the counter.

### 8.4.2.1 External interrupts

The IRQ signals map to 16 independent interrupt requests output from the SIU. The IRQ flag bit is set when a rising-edge and/or falling-edge event occurs for the IRQ. An external IRQ signal is asserted when all of the following occur:

- Enable bit is set in the IRQ rising- and/or falling-edge event registers (SIU\_IREER, SIU\_IFEER)
- IRQ flag bit is set in the external interrupt status register (SIU\_EISR)
- Enable bit is set in the DMA/Interrupt request enable register (SIU\_DIRER)
- Select bit is cleared in the DMA/Interrupt select register (SIU\_DIRSR)

The NMI pin function or platform SWT can generate either an NMI or a critical interrupt. FCCU may also generate NMI if any fault is configured to cause NMI and this fault is triggered.

When WKPCFG\_NMI\_GPIO213 is enabled as NMI, the pin will override the PCR configuration after reset. SIU\_DIRER selects between critical and non maskable interrupt use, SIU\_EISR reports status of NMI and SIU\_IFEER selects edge sensitivity of NMI input. See in the figure below the NMI and critical interrupt connections.

Figure 8-1605. NMI, critical, and SWT interrupts

### 8.4.2.2 DMA transfers

DMA IRQ signals ( $\overline{\text{IRQ}}[0]$  through  $\overline{\text{IRQ}}[3]$ ) map to four independent DMA transfer or interrupt request outputs configured in the SIU. A DMA transfer or interrupt request asserts when all of the following occur:

- IRQ flag bit is set in the external interrupt status register (SIU\_EISR)
- Enable bit is set in the DMA transfer or interrupt request enable register (SIU\_DIRER)
- Select bit is set in the DMA transfer or interrupt request select register (SIU\_DIRSR)

The SIU receives a “DMA transfer done” signal for each DMA or interrupt request transmitted. When the “DMA done” signal asserts, the IRQ flag bit is cleared.

### 8.4.2.3 Overruns

An overrun IRQ exists for each overrun flag bit in the overrun status register (SIU\_OSR). An overrun IRQ asserts when all of the following occur:

- Enable bit is set in the IRQ rising- and/or falling-edge event registers (SIU\_IREER, SIU\_IFEER)
- IRQ flag bit is set in the external interrupt status register (SIU\_EISR)
- Bit is set in the overrun request enable and overrun status registers (SIU\_ORER, SIU\_OSR)
- Rising- or falling-edge event triggers an interrupt request

The SIU outputs one overrun IRQ bit that is the logical OR of all of the IRQ overrun bits.

### 8.4.2.4 Edge-detect events

An IRQ asserts when:

- An edge-detect event is enabled
- An edge-detect event occurs

To assert an IRQ when an edge-detect event occurs:

1. Set the enable bit in the IRQ rising- and falling-edge event enable registers (SIU\_IREER, SIU\_IFEER)
2. Set the enable bits for the DMA/Interrupt request enable register (SIU\_DIRER)

The IRQ bit is set in the external IRQ status register (SIU\_EISR) when an edge-detect event occurs for that IRQ. The following figure illustrates the behavior of DMA/interrupt requests within the SIU.

Figure 8-1606. SIU DMA/interrupt request diagram

### 8.4.3 General Purpose I/O (GPIO)

All GPIO functions for the device are provided by the SIU. Each device pad that has a GPIO signal has a pin configuration register (PCR) in the SIU where the GPIO function is selected. In addition, each device GPIO signal has an input data register (SIU\_GPDI $n$ ) and an output data register (SIU\_GPDO $n$ ).

The SIU also implements several parallel GPIO registers (SIU\_PGPDO $n$  and SIU\_PGPDIn) that can be used to access up to 32 GPIO bits in a single- and word-sized accesses. The values read/written to these parallel registers are coherent with the data read/written to the SIU\_GPDO $n$  and SIU\_GPDI $n$  registers.

### 8.4.4 Pin serialization for DSPI

The SIU has four 32-bit outputs to DSPI modules. Each data frame contains the result of the selection, bit by bit, of three sources of data. Each data frame could receive data from eTPU, eMIOS, or an internally implemented GPO register. These registers are defined to provide compliance with the AutoSAR requirements for a PORT driver and support for coherent bit manipulation of up to 16 serialized data bits in a multitasking or multi-processor system. Because the DSPI frame size has been extended to a maximum of 32 bits, the coherent bit manipulation mechanism is partitioned into two separate 16-bit halves of the frame. The purpose of these registers is to allow any combination of bits in each half of the 32-bit serialized data frame to be updated with a single 32-bit write

operation, while allowing other bits to maintain their previous state. This is accomplished by writing a 16-bit masked value coherently with an update value contained in a 16 bit output field, and only updating those bits in the output register for which the corresponding mask bit is set.

The selection of which bits are actually output on the DSPI data frame is determined by a separate signal selection register. Each register bit enables a path from a single eTPU channel, eMIOS channel, and masked GPO register bit to the equivalent bit position in the DSPI channel frame. Note that each DSPI bit position can be driven by multiple inputs. Software must ensure that the correct bit sources are enabled for correct insertion of the required bit in the bit frame. Multiple sources are logically ORed, which provides the potential for combining outputs from multiple timer channels and data registers to produce more complex bit behavior. An example of how these registers are used to create the DSPI serialized output is shown below.

Functional Description

Figure 8-1607. Example of pin multiplexing

## 8.4.5 Internal multiplexing

The internal multiplexing select registers (SIU\_ISEL4–8, SIU\_EISR, and SIU\_DISR) select the input sources for the following components:

- eTPUA[24:29] inputs
- eQADC command FIFO trigger sources
- SIU external interrupt request signals

### 8.4.5.1 eQADC external trigger input multiplexing

The eQADC external trigger inputs can connect to one of the following pins:

- External pin
- eTPU channel
- eMIOS channel
- Periodic interrupt timer

The input source for each eQADC external trigger is configured in the eQADC Command FIFO Trigger Source Select Registers (SIU\_ISEL4–7). For example, you can select one of the following signals to source the ETRIG[0] input trigger for the eQADC:

- TXDC\_ETRIG[0]\_GPIO[244] pin
- eTPUA[30] channel output
- eMIOS\_1 channel 2 output
- Extended trigger source selection

All ETRIG inputs are multiplexed in the same manner. If an eTPU or eMIOS channel is selected as an ETRIG input to the eQADC, you can activate the alternate function of that eTPU or eMIOS signal on the external pin.

## 8.4.6 Trigger Burst Generators (TBG)

The Trigger Burst Generator module generates triggers for the eQADC CFIFOs based on a trigger window provided by several sources connected to the IMUX. eTPU, eMIOS, PIT and external SoC inputs can be selected by the IMUX, thus allowed to provide a time window in which the triggers are generated by the Trigger Burst Generator (TBG) module. The TBG is in bypass out of reset, thus backwards compatible functionality is provided. In this backwards compatible setting, the triggers are generated by the signals connected to the IMUX, thus TBG is transparent to the trigger generation. The following figure shows the Trigger Burst Generator block diagram and the waveforms associated with the input trigger window, the output trigger burst (on the left) and the counter waveform (on the right).

**Figure 8-1608. Trigger Burst Generator block diagram**

The following figure is a block diagram of the Trigger Burst Generator module interconnection with other modules. The TBG is connected between the multiplexers controlled by ISEL4–7 and eQADC\_A/b CIFIFO trigger inputs. There are six CFIFOs on each eQADC and two instances of the eQADC modules, thus 12 TBG instances are used in order to provide trigger burst for all CFIFOs.

**Figure 8-1609. Trigger Burst Generator interconnection**

The TBG instances generate a continuous sequence of triggers while the signals selected by ISEL4–7 are asserted. When the trigger sources deassert, then the trigger burst is stopped. The output is identified as the trigger window in the subsequent sections. The opening of a trigger window means that the ISEL4–7 mux outputs enable the TBGs to start generating triggers.

#### 8.4.6.1 Clock selection for the trigger burst

There are three clocks that can be selected for the TBG module. The system clock, the ADC0 clock, and the ADC1 clock. If no clock is selected the output trigger remains negated. It is necessary to have GEN = 0 when changing the CLKSEL to avoid unwanted triggers.

Figure 8-1610 shows the timing diagram of the signals when the peripheral clock (per\_clk) is selected to generate the trigger burst. In this case, the trigger counter is enabled to count in all per\_clk pulses. Therefore, the time interval between two trigger pulses is calculated as (TRIGPER + 1) per\_clk periods. The figure shows the counter values when TRIGPER is configured to 4.

The first trigger occurs after one clock cycle after the trigger window begins. And the last trigger pulse occurs before the trigger window ends. Therefore, there is no trigger pulse outside the trigger window.

NOTE

When the trigger period register is zero (TRIGPER = 0), the trigger output switches to ON one per\_clk period after the trigger window is opened, and remains ON (no transition) until the trigger window is closed.

Figure 8-1610. Trigger Burst Generator timing diagram when per\_clk is selected

Figure 8-1611 shows the timing diagram of the signals when the ADC0/1 clocks are selected to generate the trigger burst. In this case, the trigger counter is enabled to count only in the positive edge events of that ADC clock. Therefore, the time interval between two trigger pulses is calculated as (TRIGPER + 1) ADC clock periods.

NOTE

When the trigger period register is zero (TRIGPER = 0) the trigger output pulse occurs for each ADC clock pulse.

The first trigger occurs one system clock cycle after the first detected rising edge of the selected ADC clock after the opening of the trigger window. And the last trigger pulse occurs before the trigger window closes. Therefore, there is no trigger pulse outside the trigger window.

**Figure 8-1611. Trigger Burst Generator timing diagram when ADC0/1 is selected**

#### 8.4.6.2 Trigger generator configuration procedure

The trigger burst generator (TBG) is disabled out of reset because the GEN bit at the SIU\_TBGR\_CR\_A/Bn register from reset state is clear. This means the trigger window and internal/external selector input signals are bypassed to the respective output ports.

It is recommended to disable the TBG by clearing the GEN bit when the trigger period has to be changed. However, the input trigger window signal at the input port is bypassed to the trigger burst output. If this unwanted trigger must be avoided, the GEN bit must be maintained set and the CLKSEL bit must be configured to all 0 (the trigger counter is cleared at this time). Then it is possible to safely change the trigger period.

# Chapter 9

## Crossbar Switch (XBAR)

### 9.1 Chip-specific XBAR information

This chip has one instance of the XBAR module.

#### 9.1.1 XBAR master and slave assignments

The following table lists the XBAR physical port numbers and logical IDs for all master ports on this SoC.

- Each port number matches the default priority assigned to the corresponding physical master port. This default priority equals the reset value of the priority field for each master port in the PRS*n* registers.
- A priority value of 0 is the highest priority. There is no "disabled" value for the priority.
- A Nexus\_3 module and core data bus share the same physical master port for each core.

The logical master ID corresponds to the logical address provided by the master module and is unique for each module. The logical master IDs are used by the bus masters connected to the XBAR. The Nexus master is identified by setting the MSB in the 4-bit field that supplies the master ID number.

**Table 9-1. XBAR master ports and logical master IDs**

| Module            | Physical master port | Logical master ID | Comment                                              |
|-------------------|----------------------|-------------------|------------------------------------------------------|
| Core0 instruction | 0                    | 0                 |                                                      |
| Core0 data        | 1                    | 0                 |                                                      |
| Nexus_3_0         |                      | 8                 | Nexus_3_0 arbitrates with Core0 data for XBAR port 1 |

Table continues on the next page...

**Table 9-1. XBAR master ports and logical master IDs (continued)**

| Module | Physical master port | Logical master ID | Comment                                                  |
|--------|----------------------|-------------------|----------------------------------------------------------|
| eDMA_A | 4                    | 4                 |                                                          |
| eDMA_B | 5                    | 5                 |                                                          |
| CSE    | 6                    | 3                 | CSE is connected to master 6 port through a concentrator |
| FEC    | 7                    | 2                 | FEC on dedicated master via 2:1 clock gasket             |

The following table lists the XBAR slave port assignments and the master ports that can access each slave port. Each of the two slave ports for the Flash Memory Controller (PFLASH) module is dedicated to a different core master port. The two slave ports for SRAM support concurrent data accesses to the SRAM.

**Table 9-2. XBAR slave port assignments**

| Module                       | Slave port | Select Address                      | Accessible by master port numbers |
|------------------------------|------------|-------------------------------------|-----------------------------------|
| PFLASH                       | 0          | Address[31:29] = 000b               | 0,1 <sup>1</sup>                  |
| PRAMC_0                      | 2          | Address[31:18] = 0100_0000_0000_00b | 0,1,2,3,4,5,6,7                   |
| PFLASH                       | 3          | Address[31:29] = 000b               | 2,3,4,5,6,7                       |
| PRAMC_1                      | 4          | Address[31:18] = 0100_0000_0000_01b | 0,1,2,3,4,5,6,7                   |
| —                            | 5          | —                                   | —                                 |
| AIPS_1 (Peripheral Bridge A) | 6          | Address[31:29] = 110b               | 0,1,2,3,4,5,6,7                   |
| AIPS_0 (Peripheral Bridge B) | 7          | Address[31:29] = 111b               | 0,1,2,3,4,5,6,7                   |

1. Master ports 2,3,4,5,6,7 access the flash memory module through slave port 3.

### 9.1.2 Unimplemented PRS<sub>n</sub> and CRS<sub>n</sub> registers

On this chip, the PRS5 and CRS5 registers are not implemented. In [Memory Map / Register Definition](#), the locations of these registers are reserved and should not be accessed.

### 9.1.3 Reset value of PRS<sub>n</sub> and CRS<sub>n</sub> registers

The reset value of the XBAR\_PRS<sub>n</sub> registers is 7654\_3210h.

The reset value of the XBAR\_CRS<sub>n</sub> registers is 00FF\_0000h.

## 9.1.4 Master priority elevation

Each implemented XBAR slave has a corresponding [Control Register \(XBAR\\_CRSn\)](#) whose number is the same as the slave's physical port. Each of these registers has HPE<sub>n</sub> fields corresponding to the physical port numbers of the implemented XBAR masters.

In general, set the HPE<sub>n</sub> field for a particular master to 1 to allow the elevation of that master's priority of access to the applicable slave.

### 9.1.4.1 Master priority elevation not used by CSE or FEC

The CSE is connected to XBAR master physical port 6, and the FEC is connected to XBAR master physical port 7. The CSE and FEC cannot signal a request for priority elevation, regardless of the value of the HPE6 and HPE7 fields in every [Control Register \(XBAR\\_CRSn\)](#).

### 9.1.4.2 Additional programming for some masters' priority elevation

Enabling the elevation of priority requires additional programming for some masters. The following table summarizes this information. The table refers to fields in the HID1 register that [Hardware Implementation Dependent Register 1 \(HID1\)](#) defines further.

**Table 9-3. Additional programming for priority elevation**

| Master            | XBAR physical port | Additional programming                                                                                                                                                                                                                                                                                         | Result                                                                                                                                                                                                                                                           |
|-------------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Core0 instruction | 0                  | In addition to setting HPE0 to 1 in XBAR_CRSn for the applicable slave, set to 1 either or both of these fields in the special-purpose HID1 register for core0: <ul style="list-style-type: none"> <li>Elevate External Exceptions (EEE), bit 22</li> <li>Elevate Critical Exceptions (ECE), bit 23</li> </ul> | Core0's priority is elevated when an event occurs that corresponds to the HID1 field or fields whose value is 1: <ul style="list-style-type: none"> <li>External exception when HID1[EEE] is 1</li> <li>Critical or NMI exception when HID1[ECE] is 1</li> </ul> |
| Core0 data        | 1                  | In addition to setting HPE1 to 1 in XBAR_CRSn for the applicable slave, set to 1 either or both of these fields in the special-purpose HID1 register for core0: <ul style="list-style-type: none"> <li>Elevate External Exceptions (EEE), bit 22</li> <li>Elevate Critical Exceptions (ECE), bit 23</li> </ul> | Core0's priority is elevated when an event occurs that corresponds to the HID1 field or fields whose value is 1: <ul style="list-style-type: none"> <li>External exception when HID1[EEE] is 1</li> <li>Critical or NMI exception when HID1[ECE] is 1</li> </ul> |
| Core1 instruction | 2                  | In addition to setting HPE2 to 1 in XBAR_CRSn for the applicable slave, set to 1 either or both of these fields in the special-purpose HID1 register for core1:                                                                                                                                                | Core1's priority is elevated when an event occurs that corresponds to the HID1 field or fields whose value is 1:                                                                                                                                                 |

*Table continues on the next page...*

**Table 9-3. Additional programming for priority elevation (continued)**

| Master     | XBAR physical port | Additional programming                                                                                                                                                                                                                                                                                         | Result                                                                                                                                                                                                                                                           |

|            |                    | <ul style="list-style-type: none"> <li>Elevate External Exceptions (EEE), bit 22</li> <li>Elevate Critical Exceptions (ECE), bit 23</li> </ul>                                                                                                                                                                 | <ul style="list-style-type: none"> <li>External exception when HID1[EEE] is 1</li> <li>Critical or NMI exception when HID1[ECE] is 1</li> </ul>                                                                                                                  |
| Core1 data | 3                  | In addition to setting HPE3 to 1 in XBAR_CRSn for the applicable slave, set to 1 either or both of these fields in the special-purpose HID1 register for core1: <ul style="list-style-type: none"> <li>Elevate External Exceptions (EEE), bit 22</li> <li>Elevate Critical Exceptions (ECE), bit 23</li> </ul> | Core1's priority is elevated when an event occurs that corresponds to the HID1 field or fields whose value is 1: <ul style="list-style-type: none"> <li>External exception when HID1[EEE] is 1</li> <li>Critical or NMI exception when HID1[ECE] is 1</li> </ul> |
| eDMA_A     | 4                  | In addition to setting HPE4 to 1 in XBAR_CRSn for the applicable slave, set eDMA_A's TCD[BWC] field to 01b.                                                                                                                                                                                                    | Only eDMA_A can elevate its priority for the applicable slave.                                                                                                                                                                                                   |
| eDMA_B     | 5                  | In addition to setting HPE5 to 1 in XBAR_CRSn for the applicable slave, set eDMA_B's TCD[BWC] field to 01b.                                                                                                                                                                                                    | Only eDMA_B can elevate its priority for the applicable slave.                                                                                                                                                                                                   |

## Hardware Implementation Dependent Register 1 (HID1)

The following HID1 details supplement and replace information in the *e200z759n3 Core Reference Manual* (document number e200z759n3CRM).

HID1 is the core register (SPR 1009) that controls XBAR priority elevation.

## 9.2 Introduction

The information found here provides information on the layout, configuration, and programming of the crossbar switch.

The crossbar switch connects bus masters and bus slaves using a crossbar switch structure. This structure allows all bus masters to access different bus slaves simultaneously, while providing arbitration among the bus masters when they access the same slave. A variety of bus arbitration methods and attributes may be programmed on a slave-by-slave basis.

### 9.2.1 Features

The crossbar switch includes these features:

- Symmetric crossbar bus switch implementation
  - Allows concurrent accesses from different masters to different slaves
  - Slave arbitration attributes configured on a slave-by-slave basis
- Up to single-clock 64-bit transfer
- Support for burst transfers of up to 16 beats of data
- Low-Power Park mode support
- Master priority elevation

## 9.3 Memory Map / Register Definition

Each slave port of the crossbar switch contains configuration registers. Read- and write-transfers require two bus clock cycles. The registers can be read from and written to only in supervisor mode. Additionally, these registers can be read from or written to only by 32-bit accesses.

A bus error response is returned if an unimplemented location is accessed within the crossbar switch.

The  $CRS_n$  and  $PRS_n$  registers can be programmed to be read-only to prevent changes to their configuration. After being read-only protected, future writes to them will terminate with an error.

**NOTE**

This section shows the registers for all eight master and slave ports. If a master or slave is not used on this particular device, then unexpected results occur when writing to its registers. See the chip configuration details for the exact master/slave assignments for your device.

All references to the crossbar switch registers are based on the physical port connections.

**XBAR memory map**

**9.3.1 Priority Registers Slave (XBAR\_PRSn)**

The priority registers (PRSn) set the priority of each master port on a per slave port basis and reside in each slave port. The priority register can be accessed only with 32-bit accesses. After the CRSn[RO] bit is set, the PRSn register can only be read; attempts to write to it have no effect on PRSn and result in a bus-error response to the master initiating the write.

Two available masters must not be programmed with the same priority level. Attempts to program two or more masters with the same priority level result in a bus-error response and the PRSn is not updated.

**NOTE**

Valid values for the  $M_n$  priority fields depend on which masters are available on the chip. This information can be found in the chip-specific information for the crossbar.

- If the chip contains fewer than three masters, only one bit is valid.
- If the chip contains fewer than five masters, only two bits are valid.
- If five or more masters are present, all three bits of the priority field are used.

**NOTE**

See the chip-specific crossbar information for the reset value of this register.

Address:  $0h \text{ base} + 0h \text{ offset} + (256d \times i)$ , where  $i=0d \text{ to } 7d$

**9.3.2 Control Register (XBAR\_CRSn)**

These registers control several features of each slave port and must be accessed using 32-bit accesses. After CRSn[RO] is set, the PRSn can only be read; attempts to write to it have no effect and result in an error response.

**NOTE**

See the chip-specific crossbar information for the reset value of this register.

Not all HPE<sub>n</sub> fields may be active. See the chip-specific crossbar information for which masters support master high-priority elevation. Setting a field corresponding to a master that does not support master high-priority elevation has no effect.

Address: 0h base + 10h offset + (256d × i), where i=0d to 7d

## 9.4 Functional Description

### 9.4.1 General operation

When a master accesses the crossbar switch, the access is immediately taken. If the targeted slave port of the access is available, then the access is immediately presented on the slave port. Single-clock or zero-wait-state accesses are possible through the crossbar. If the targeted slave port of the access is busy or parked on a different master port, the requesting master simply sees wait states inserted until the targeted slave port can service the master's request. The latency in servicing the request depends on each master's priority level and the responding slave's access time.

Because the crossbar switch appears to be just another slave to the master device, the master device has no knowledge of whether it actually owns the slave port it is targeting. While the master does not have control of the slave port it is targeting, it simply waits.

After the master has control of the slave port it is targeting, the master remains in control of the slave port until it relinquishes the slave port by running an IDLE cycle or by targeting a different slave port for its next access.

The master can also lose control of the slave port if another higher-priority master makes a request to the slave port. However, if the master is running a fixed-length burst transfer it retains control of the slave port until that transfer completes.

The crossbar terminates all master IDLE transfers, as opposed to allowing the termination to come from one of the slave buses. Additionally, when no master is requesting access to a slave port, the crossbar drives IDLE transfers onto the slave bus, even though a default master may be granted access to the slave port.

When a slave bus is being idled by the crossbar, it can park the slave port on the master port indicated by  $CRS_n[PARK]$ . This is done to save the initial clock of arbitration delay that otherwise would be seen if the same master had to arbitrate to gain control of the slave port. The slave port can also be put into Low Power Park mode to save power, by using  $CRS_n[PCTL]$ .

## 9.4.2 Register coherency

The operation of the crossbar is affected as soon as a register is written. The values of the registers do not track with slave-port-related master accesses, but instead track only with slave accesses.

## 9.4.3 Arbitration

The crossbar switch supports two arbitration algorithms:

- Fixed priority
- Round-robin

The arbitration scheme is independently programmable for each slave port.

### 9.4.3.1 Fixed-priority operation

When operating in fixed-priority mode, each master is assigned a unique priority level in the priority registers ( $PRS_n$ ). If two masters request access to the same slave port, the master with the highest priority in the selected priority register gains control over the slave port.

#### NOTE

In this arbitration mode, a higher-priority master can monopolize a slave port, preventing accesses from any lower-priority master to the port.

When a master makes a request to a slave port, the slave port checks whether the new requesting master's priority level is higher than that of the master that currently has control over the slave port, unless the slave port is in a parked state. The slave port performs an arbitration check at every clock edge to ensure that the proper master, if any, has control of the slave port.

The following table describes possible scenarios based on the requesting master port:

**Table 9-24. How the Crossbar Switch grants control of a slave port to a master**

| When                                                                                                                                                                                                                                                           | Then the Crossbar Switch grants control to the requesting master                                                                                                                            |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Both of the following are true: <ul style="list-style-type: none"> <li>The current master is running a fixed length burst transfer or a locked transfer.</li> <li>The requesting master's priority level is higher than that of the current master.</li> </ul> | At the end of the burst transfer or locked transfer                                                                                                                                         |
| The requesting master's priority level is lower than the current master.                                                                                                                                                                                       | At the conclusion of one of the following cycles: <ul style="list-style-type: none"> <li>An IDLE cycle</li> <li>A non-IDLE cycle to a location other than the current slave port</li> </ul> |

### 9.4.3.2 Round-robin priority operation

When operating in round-robin mode, each master is assigned a relative priority based on the master port number. This relative priority is compared to the master port number (ID) of the last master to perform a transfer on the slave bus. The highest priority requesting master becomes owner of the slave bus at the next transfer boundary, accounting for locked and fixed-length burst transfers. Priority is based on how far ahead the ID of the requesting master is to the ID of the last master.

After granted access to a slave port, a master may perform as many transfers as desired to that port until another master makes a request to the same slave port. The next master in line is granted access to the slave port at the next transfer boundary, or possibly on the next clock cycle if the current master has no pending access request.

As an example of arbitration in round-robin mode, assume the crossbar is implemented with master ports 0, 1, 4, and 5. If the last master of the slave port was master 1, and master 0, 4, and 5 make simultaneous requests, they are serviced in the order: 4 then 5 then 0.

Parking may continue to be used in a round-robin mode, but does not affect the round-robin pointer unless the parked master actually performs a transfer. Handoff occurs to the next master in line after one cycle of arbitration. If the slave port is put into low-power park mode, the round-robin pointer is reset to point at master port 0, giving it the highest priority.

### 9.4.3.3 Priority assignment

Each master port must be assigned a unique 3-bit priority level. If an attempt is made to program multiple master ports with the same priority level within the priority registers (PRSn), the crossbar switch responds with a bus error and the registers are not updated.

## 9.5 Initialization/application information

No initialization is required for the crossbar switch.

Hardware reset ensures that all the register bits used by the crossbar switch are properly initialized to a valid state. However, settings and priorities may be programmed to achieve maximum system performance.

### NOTE

- During configuration of the crossbar switch, all other masters must be idle.
- To prevent reconfiguration of the crossbar switch, write 1 to CRSn[RO].

# Chapter 10

## Crossbar Integrity Checker (XBIC)

### 10.1 Chip-specific XBIC information

This chip has one instance of the XBIC module.

#### 10.1.1 XBIC master and slave assignments

The XBIC identifies each XBAR master and slave in terms of the master or slave's physical port number. See the "Physical master port" assignments in [Table 9-1](#) and the "Slave port" assignments in [Table 9-2](#).

#### 10.1.2 Unimplemented MCR and ESR fields

On this chip, the MCR[SE5] and ESR[DPSE5] fields are not implemented. In [XBIC Module Control Register \(XBIC\\_MCR\)](#) and [XBIC Error Status Register \(XBIC\\_ESR\)](#), these fields are reserved.

### 10.2 Overview

The Crossbar Integrity Checker (XBIC) verifies the integrity of the crossbar transfers.

### 10.3 Features

The XBIC has the following features:

- Verification of attribute information for all crossbar transfers

- EDC (72,64) code protects against single and double bit errors
- Verification of feedback information for each data phase during crossbar transfer
- Error injection for testing
  - Programmable master and slave port specifiers
  - Programmable 8-bit toggle vector to insert error in master EDC checkbit value
  - Address, EDC syndrome, master and slave port information captured on error
- Programmable integrity check enable on a per-slave-port basis
- Programmable integrity feedback check enable on a per-master-port basis

## 10.4 Block diagram

The crossbar transfer attribute information for all master and slave ports is routed to the XBIC, which calculates and checks the EDC parity over the attribute information as shown in the following diagram.

Figure 10-1. XBIC system block diagram

## 10.5 External signal description

The XBIC has no external interface signals.

## 10.6 Memory map and register definition

The XBIC programming model has four 32-bit registers. The programming model can only be accessed in supervisor mode using 32-bit (word) accesses. Attempted references with a different access size, to an undefined (reserved) address, with a non-supported access type (a write to a read-only register), or in user mode generate an error termination.

**XBIC memory map**

**10.6.2 XBIC Error Injection Register (XBIC\_EIR)**

The XBIC\_EIR contains fields for controlling the XBIC error injection function. When an error is injected, the EDC syndrome associated with the programmed master and slave ports is modified, causing the XBIC to assert the error indication to the FCCU and capturing the transfer information in the XBIC\_ESR and XBIC\_EAR registers.

Otherwise, transfers are not affected by XBIC error injection.

| 1–16<br>Reserved | This field is reserved.<br>This read-only field is reserved and always has the value 0.                                                                                                  |
| 17–19<br>SLV     | Target Slave Port. Error injection is enabled for the designated slave port. Other slave ports are unaffected.                                                                           |
| 20–23<br>MST     | Target Master ID. Error injection is enabled for the designated master ID. Transfers with other master IDs are not affected.                                                             |
| 24–31<br>SYN     | Syndrome. This value is exclusive-ored with the calculated syndrome (which should be zero) to generate an error with the specified syndrome. A value of zero does not generate an error. |

10.6.3 XBIC Error Status Register (XBIC\_ESR)

The Error Status Register (XBIC\_ESR) contains two types of error information about the last transfer. If an attribute integrity check error was detected, the slave port, the master port, and the syndrome are captured in the SLV, MST, and SYN fields. If there is a mismatch among internal signals (hready, hresp0, and hresp2) during the data phase, the slave and master port are catured in the DPSE0-7 and DPME0-7 fields.

This register is cleared only on reset.

NOTE

When the XBIC detects back-to-back faults on a system bus path through the crossbar switch, the fault information captured in the XBIC\_ESR does not correspond to the initial fault event but rather the subsequent fault event. While the fault event is properly detected, diagnostic status information in the XBIC\_ESR register describing the initial fault event is lost. This can only occur in the event of a series of bus transactions targeting the same crossbar slave target where the series of bus transactions are not separated by idle or stall cycles.

| 17–19<br>SLV | Slave Port. The slave port targeted by the last transfer with an error.                                                                                             |
| 20–23<br>MST | Master ID. The master ID value of the last transfer with an error.                                                                                                  |
| 24–31<br>SYN | Syndrom. The syndrome calculated for the last transfer with an error. For single bit errors the signal in error can be determined, see <a href="#">Table 10-6</a> . |

**10.6.4 XBIC Error Address Register (XBIC\_EAR)**

The Error Address Register (XBIC\_EAR) contains the address of the first transfer in which an attribute integrity check error was detected on an enabled slave port. This register is only cleared on reset.

**NOTE**

When the XBIC detects back-to-back faults on a system bus path through the crossbar switch, the fault information captured in the XBIC\_EAR does not correspond to the initial fault event but rather the subsequent fault event. While the fault event is properly detected, diagnostic status information in the XBIC\_ESR register describing the initial fault event is lost. This can only occur in the event of a series of bus transactions targeting the same crossbar slave target where the series of bus transactions are not separated by idle or stall cycles.

Address: 0h base + Ch offset = Ch

| 0–31<br>ADDR | The address of the last transfer with an error. |

## 10.7 Functional description

The Crossbar Integrity Checker (XBIC) verifies the integrity of the crossbar interface. The Module Control Register (XBIC\_MCR) allows integrity checking to be enabled on a individual port basis. When an error is detected, it is captured in XBIC\_ESR register and XBIC also sends out an error signal to the Fault Collection and Control Unit (FCCU). Detection of an error does not generate a bus error. The XBIC integrity checking is independent from the end-to-end ECC that covers the transfer address and data.

During the AHB address phase, the crossbar attribute information is checked using an 8-bit Error Detection Code (EDC), which detects any single- or double-bit errors. When an error is detected, due either to hardware fault or error injection, information related to the error is captured and reported in XBIC\_ESR and XBIC\_EAR. The cause of a single-bit error can be determined by the syndrome value reported in the XBIC\_ESR as shown in [Table 10-6](#). Any other syndrome indicates a multi-bit error.

During the AHB data phase, the responding signals from the slave to master are checked when passing through the crossbar. When an error is detected, the information is captured in the XBIC\_ESR DPSE0-7 and DPME0-7 fields.

During the AHB data phase, the XBIC will additionally send an alarm to the FCCU if a master port attempts a back-to-back access where the first access terminates normally, but the second access attempts to access an address space that is not mapped to any slave on the Crossbar (AXBS). The resultant 'absent slave error' causes the AXBS to generate a bus error response to the requesting master that the XBIC will detect as a difference since the bus error did not originate from the slave port.

The XBIC can also be programmed to intentionally inject EDC errors for testing. Error injection is targeted toward a single slave port and a single master ID at a time as determined by the settings in the Error Injection Register (XBIC\_EIR). When an error is injected, the EDC syndrome is modified which causes the XBIC to assert the error indication to the FCCU. Otherwise transfers are unaffected by XBIC error injection. This approach allows the check logic to be verified without compromising the integrity of the data transfer. Once the error injection function is enabled by setting XBIC\_EIR[EIE], errors are induced on all subsequent targeted transactions until XBIC\_EIR[EIE] is cleared

# Chapter 11

## Peripheral Bridge (AIPS/PBRIDGE)

### 11.1 Chip-specific AIPS/PBRIDGE information

This chip has two instances of the AIPS (PBRIDGE) module:

- AIPS\_0 (PBRIDGE\_B)
- AIPS\_1 (PBRIDGE\_A)

#### 11.1.1 Modules assigned to PACR $n$ and OPACR $n$ fields

Each module attached to the Peripheral Bridges is assigned to a memory map slot corresponding to an AIPS register field.

- Every on-platform module has an assigned PACR $n$  field within the PACRA to PACRD registers.
- Every off-platform module has an assigned OPACR $n$  field within the OPACRA to OPACRH registers.

The [Peripheral Access Control Register \(AIPS\\_PACR \$n\$ \)](#) description provides the location of each PACR $n$  field, and the [Off-Platform Peripheral Access Control Register \(AIPS\\_OPACR \$n\$ \)](#) description provides the location of each OPACR $n$  field.

The following tables provide the module slot assignments for this chip.

#### NOTE

Unused PACR $n$  and OPACR $n$  fields are reserved.

**Table 11-1. AIPS\_0 (PBRIDGE\_B) PACR<sub>n</sub> field assignments**

| Module  | PACR field |
|---------|------------|

## 11.2 Introduction

The peripheral bridge converts the crossbar switch interface to an interface that can access most of the slave peripherals on this chip.

The peripheral bridge occupies 64 MB of the address space, which is divided into peripheral slots of 16 KB. (It might be possible that all the peripheral slots are not used. See the memory map chapter for details on slot assignments.) The bridge includes separate clock enable inputs for each of the slots to accommodate slower peripherals.

### 11.2.1 Features

Key features of the peripheral bridge are:

- Supports peripheral slots with 8-, 16-, and 32-bit datapath width
- Supports a pair of 32-bit transactions for selected 64-bit memory accesses
- Programming model provides memory protection functionality

### 11.2.2 General operation

The slave devices connected to the peripheral bridge are modules which contain a programming model of control and status registers. The system masters read and write these registers through the peripheral bridge.

The register maps of the peripherals are located on 16 KB boundaries. Each peripheral is allocated one or more 16-KB block(s) of the memory map.

## 11.3 Memory map/register definition

The 32-bit peripheral bridge registers can be accessed only in supervisor mode by trusted bus masters. Additionally, these registers must be read from or written to only by a 32-bit aligned access. The peripheral bridge registers are mapped into the Peripheral Access Control Register A PACRA[PACR0] address space.

## AIPS memory map

| Address offset (hex) | Register name                                                 | Width (in bits) | Access | Reset value                 | Section/ page              |

### 11.3.1 Master Privilege Register A (AIPS\_MPRA)

The MPRA specifies identical 4-bit fields defining the access-privilege level associated with a bus master to various peripherals on the chip. The register provides one field per bus master.

#### NOTE

At reset, the default value loaded into the MPRA fields is chip-specific. See the chip configuration details for the value of a particular device.

A register field that maps to an unimplemented master or peripheral behaves as read-only-zero.

Each master is assigned a logical ID from 0 to 15. See the master logical ID assignment table in the chip-specific AIPS information.

Address: 0h base + 0h offset = 0h

**11.3.2 Master Privilege Register B (AIPS\_MPRB)**

The MPRB registers specifies identical 4-bit fields defining the access-privilege level associated with a bus master to the various peripherals on the chip. The register provides one field per bus master.

**NOTE**

At reset, the default value loaded into the MPRB fields is chip-specific. See the chip configuration information for the value on your particular device.

Accesses to registers or register fields which correspond to master or peripheral locations which are not implemented return zeros on reads, and are ignored on writes.

Each master is assigned a logical ID from 0 to 15. See the master logical ID assignment table in the AIPS chip-specific information.

**11.3.3 Peripheral Access Control Register (AIPS\_PACRn)**

Each PACR register consists of eight 4-bit PACR fields. Each PACR field defines the access levels for a particular on-platform peripheral. The peripheral assignment to each PACR field is defined by the memory map slot of the peripheral. See the chip-specific AIPS information for the field assignment of a particular peripheral.

Every PACR field to which no peripheral is assigned is reserved. Reads to reserved locations return zeros, and writes are ignored.

The following table shows the location of each peripheral slot's PACR field in the PACR registers.

| Offset | Register | [0:3]  | [4:7]  | [8:11] | [12:15] | [16:19] | [20:23] | [24:27] | [28:31] |
|--------|----------|--------|--------|--------|---------|---------|---------|---------|---------|
| 0x20   | PACRA    | PACR0  | PACR1  | PACR2  | PACR3   | PACR4   | PACR5   | PACR6   | PACR7   |
| 0x24   | PACRB    | PACR8  | PACR9  | PACR10 | PACR11  | PACR12  | PACR13  | PACR14  | PACR15  |

**11.3.4 Off-Platform Peripheral Access Control Register (AIPS\_OPACR<sub>n</sub>)**

Each OPACR register consists of eight 4-bit OPACR fields. Each OPACR field defines the access levels for a particular off-platform peripheral. The peripheral assignment to each OPACR field is defined by the memory map slot of the peripheral. See the chip-specific AIPS information for the field assignment of a particular peripheral.

Every OPACR field to which no peripheral is assigned is reserved. Reads to reserved locations return zeros, and writes are ignored.

The following table shows the location of each peripheral slot's OPACR field in the OPACR registers.

| Offset | Register | [0:3]   | [4:7]   | [8:11]  | [12:15] | [16:19] | [20:23] | [24:27] | [28:31] |
|--------|----------|---------|---------|---------|---------|---------|---------|---------|---------|
| 0x40   | OPACRA   | OPACR0  | OPACR1  | OPACR2  | OPACR3  | OPACR4  | OPACR5  | OPACR6  | OPACR7  |

When this field is set and an access is attempted by an untrusted master, the access terminates with an error response and no peripheral access initiates.<br><br>0 Accesses from an untrusted master are allowed.<br>1 Accesses from an untrusted master are not allowed. |

## 11.4 Functional description

The peripheral bridge functions as a bus protocol translator between the crossbar switch and the slave peripheral bus.

Support is provided for generating a pair of 32-bit slave accesses when performing certain 64-bit peripheral accesses.

The peripheral bridge manages all transactions destined for the attached slave devices and generates select signals for modules on the peripheral bus by decoding accesses within the attached address space.

### 11.4.1 Access support

All combinations of access size and peripheral data port width are supported. An access that is larger than the target peripheral's data width will be decomposed to multiple, smaller accesses. Bus decomposition is terminated by a transfer error caused by an access to an empty register area.

## Chapter 12

# Platform Configuration Module (PCM)

### 12.1 PCM memory map and register descriptions

The Platform Configuration Module contains three miscellaneous configuration registers for the chip. Currently, the configuration registers are related to the operation of the FEC and intelligent bus bridging gasket. The module is mapped to AIPS\_0 (PBRIDGE\_B) on-platform slot 27 with a base address of FFF6\_C000h.

#### NOTE

These registers can be accessed only in supervisor mode.

#### PCM memory map

| Address offset (hex) | Register name                                               | Width (in bits) | Access | Reset value | Section/page               |
|----------------------|-------------------------------------------------------------|-----------------|--------|-------------|----------------------------|

## 12.1.1 FEC Burst Optimization Master Control Register (PCM\_FBOMCR)

This register controls FEC burst optimization behavior on the system bus.

Address: 0h base + 0h offset = 0h

| 21<br>ACCERR     | Accumulate Error<br><br>This field determines whether an error response for the first half of the write burst is accumulated to the second half of the write burst or discarded. To complete the burst, the FEC interface to the system bus responds by indicating that the first half of the burst completed without error before it actually writes the data so that it can fetch the second half of the write data from the FIFO. When actually written onto the system bus, the first half of the write burst can have an error. Because this half initially responded without an error to the FIFO, the error is discarded or accumulated with the error response for the second half of the burst.<br><br>0 Any error to the first half of the write burst is discarded.<br>1 Any actual error response to the first half of the write burst is accumulated in the second half's response. In other words, an error response to the first half is seen in the response to the second half, even if the second half does not contain an error. |
| 22<br>WBEN       | Global write burst enable to XBAR slave port designated by FXSBE <sub>n</sub><br><br>0 Write bursting to all XBAR slave ports is disabled.<br>1 Write bursting is enabled to any XBAR slave port whose FXSBE <sub>n</sub> bit is 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

# Chapter 13

## Semaphores (SEMA4)

### 13.1 Introduction

The module provides the hardware support needed in multi-core systems for implementing semaphores and provide a simple mechanism to achieve "lock/unlock" operations via a single write access. This approach eliminates architecture-specific implementations like atomic (indivisible) read-modify-write instructions or reservation mechanisms. The result is an architecture-neutral solution that provides hardware-enforced gates as well as other useful system functions related to the gating mechanisms.

#### 13.1.1 Multi-Core Programming 101: Software Gates

Multi-processor systems require a function that can be used to safely and easily provide a locking mechanism which is then used by system software to control access to shared data structures, shared hardware resources, etc. These "gating" mechanisms are used by the software to serialize (and synchronize) writes to shared data and/or resources to prevent race conditions and preserve memory coherency between different processes and processors.

Consider the following description of a typical use-case. Processor X enters a section of code where shared data values are to be updated. It must first acquire a semaphore; this can be considered "locking (or closing) a software gate." Once the gate has been locked, a properly-architected software system does not allow other processes (or processors) to execute the same code segment or modify the shared data structure protected by the gate, that is, other processes/processors are locked out. Many software implementations include a *spin-wait loop* within the lock function until the locking of the gate is accomplished. Once the lock has been obtained, Processor X continues execution and updates the data values protected by the particular lock. Once the updates are complete, Processor X unlocks (or opens) the software gate, allowing other processes/processors access to the updated data values.

There are three important rules that must be followed for a correctly-implemented system solution:

1. All writes to shared data values or shared hardware resources must be protected by a "gate" variable.
2. Once a processor locks a gate, accesses to the shared data or resources by other processes/processors must be blocked. This is enforced by software conventions.
3. The processor that locks a particular gate is the only processor that can open (unlock) that gate.

Information in the hardware gate identifying the locking processor can be extremely useful for system-level debugging.

The Hennessy/Patterson text on computer architecture offers the following description of software gating.

"One of the major requirements of a shared-memory architecture multiprocessor is being able to coordinate processes that are working on a common task. Typically, a programmer will use *lock variables* to synchronize the processes.

The difficulty for the architect of a multiprocessor is to provide a mechanism to decide which processor gets the lock and to provide the operation that locks a variable. Arbitration is easy for shared-bus multiprocessors, since the bus is the only path to memory. The processor that gets the bus locks out all the other processors from memory. If the CPU and bus provide an atomic swap operation, programmers can create locks with the proper semantics. The adjective *atomic* is key, for it means that a processor can both read a location **and** set it to the locked value in the same bus operation, preventing any other processor from reading or writing memory." [Hennessy/Patterson, *Computer Architecture: A Quantitative Approach*, ppg. 471-472]

The classic text continues with a description of the steps required to lock/unlock a variable using an *atomic swap instruction*.

"Assume that 0 means unlocked and 1 means locked. A processor first reads the lock variable to test its state. A processor keeps reading and testing until the value indicates that the lock is unlocked. The processor then races against all other processes that were similarly "spin waiting" to see who can lock the variable first. All processes use a swap instruction that reads the old value and stores a 1 into the lock variable. The single winner will see the 0, and the losers will see a 1 that was placed there by the winner. (The losers will continue to set the variable to the locked value, but that doesn't matter.) The winning processor executes the code after the lock and then stores a 0 into the lock when it exits,

starting the race all over again. Testing the old value and then setting to a new value is why the atomic swap instruction is called *test and set* in some instruction sets."

[Hennessy/Patterson, *Computer Architecture: A Quantitative Approach*, ppg. 472-473]

For multi-core SoCs developed in the Microcontroller Division, a hardware-enforced semaphore implementation as a platform IPS module is used for the following reasons:

- A smaller module size versus a platform reservation monitor for PowerPC-based designs and it does not introduce any timing-critical paths, for example, the AHB system bus address phase cycle like a reservation monitor
- Provides a more robust implementation with features not possible in a reservation-only approach
- Provides a more generic, architecture-neutral solution, applicable across *all* the processor families supported by the Microcontroller Division

The sole drawback to a hardware-based semaphore module is the limited number of semaphores versus the "infinite" number that can be supported with PowerPC reservation instructions.

### 13.1.2 Overview

The IPS\_Semaphores module provides a platform IPS slave device which implements 16 hardware-enforced gates with the following features:

- Module definition supports 16 hardware-enforced gates in a dual-processor configuration, where cp0 is core processor 0 and cp1 is core processor 1
  - Hardware gates appear as a 16-entry byte-size array with read and write accesses
    - Processors lock gates by writing "processor\_number+1" to the appropriate gate and must read back the gate value to verify the lock operation was successful
    - Once locked, the gate is unlocked by a write of zeroes from the locking processor
- Optional interrupt notification after a failed lock write provides a mechanism to indicate when the gate is unlocked

- Secure reset mechanisms are supported to clear the contents of individual semaphore gates or notification logic, as well as a clear\_all capability
- Programming model allocates memory space to support up to 8 processors and up to 64 gates

A simplified block diagram of the Semaphores module is shown in [Figure 13-1](#). In the diagram, the register blocks named gate0, gate1,..., gate 15 include the finite state machines implementing the semaphore gates plus the interrupt notification logic.

**Figure 13-1. IPS\_Semaphores Block Diagram**

### 13.1.3 Features

The Semaphores module implements hardware-enforced semaphores as an IPS-mapped slave peripheral device. The feature set includes:

- Support for 16 hardware-enforced gates in a dual-processor configuration
  - Each hardware gate appears as a 3-state, 2-bit state machine, with all 16 gates mapped as a byte-size array
    - 3-state implementation
      - if gate = 0b00, then state = unlocked
      - if gate = 0b01, then state = locked by processor 0
      - if gate = 0b10, then state = locked by processor 1
  - Uses the bus master number as a reference attribute plus the specified data patterns to validate all write operations
  - Once locked, the gate can (and must) be unlocked by a write of zeroes from the locking processor
- Optional interrupt notification after a failed lock write provides a mechanism to indicate when the gate is unlocked
- Secure reset mechanisms are supported to clear the contents of individual gates or notification logic, as well as a clear\_all capability
- Memory-mapped IPS slave peripheral platform module
  - Interface to the IPS bus for programming-model accesses
  - Two outputs (one per processor) for interrupt notification of failed lock writes

### 13.1.4 Modes of Operation

The Semaphores module does not support any special modes of operation. As a slave peripheral memory-mapped device located on the platform's IPS slave bus, it responds based strictly on the memory addresses of the connected bus. The IPS bus is used to access the Semaphores ' programming model.

## 13.2 External Signal Description

The Semaphores module does not include any external interfaces.

## 13.3 Memory map and register definition

The Semaphores module provides an IPS programming model mapped to an SPP-standard on-platform 16 KB space. The description here specifies a dual-core configuration with 16 semaphore gates. All the register names are prefixed with "Sema4" as an abbreviation for the full module name.

The programming model is referenced using 8-, 16- and 32-bit accesses. Reads can use any reference size, while writes are generally restricted to the size of the register. Exceptions to the write size restrictions are detailed in the individual register descriptions. Attempted references using inappropriate access sizes, to undefined (reserved) addresses, or with a non-supported access type (for example, a write to a read-only register) generate an IPS error termination.

Finally, the programming model allocates space for a definition with up to 64 gates and up to 8 processor cores, even though this definition is considerably larger than any currently-planned module implementations. The number of gates and supported processor cores are independent; there is no relationship between these two system variables.

The 16 KB Semaphores programming model map is shown in the following table.

**SEMA4 memory map**

| Address offset (hex) | Register name                              | Width (in bits) | Access | Reset value | Section/ page               |
|----------------------|--------------------------------------------|-----------------|--------|-------------|-----------------------------|
| 0                    | Semaphores Gate 0 Register (SEMA4_Gate00)  | 8               | R/W    | 00h         | <a href="#">13.3.1/469</a>  |

**13.3.1 Semaphores Gate 0 Register (SEMA4\_Gate00)**

Each semaphore gate is implemented in a 2-bit finite state machine, right-justified in a byte data structure. The hardware uses the bus master number in conjunction with the data patterns to validate all attempted write operations. Only processor bus masters can modify the gate registers. Once locked, a gate can (and must) be opened (unlocked) by the locking processor core.

Multiple gate values can be read in a single access, but only a single gate can be updated via a write operation at a time. 16- and 32-bit writes to multiple gates are allowed, but the write data operand must only update the state of a single gate. A byte write data value of 0x03 is defined as "no operation" and does not affect the state of the corresponding gate register. Attempts to write multiple gates in a single aligned access with a size larger than an 8-bit (byte) reference generate an error termination and do not allow any gate state changes

Address: 0h base + 0h offset = 0h

### 13.3.5 Semaphores Gate 4 Register (SEMA4\_Gate04)

Each semaphore gate is implemented in a 2-bit finite state machine, right-justified in a byte data structure. The hardware uses the bus master number in conjunction with the data patterns to validate all attempted write operations. Only processor bus masters can modify the gate registers. Once locked, a gate can (and must) be opened (unlocked) by the locking processor core.

Multiple gate values can be read in a single access, but only a single gate can be updated via a write operation at a time. 16- and 32-bit writes to multiple gates are allowed, but the write data operand must only update the state of a single gate. A byte write data value of 0x03 is defined as "no operation" and does not affect the state of the corresponding gate register. Attempts to write multiple gates in a single aligned access with a size larger than an 8-bit (byte) reference generate an error termination and do not allow any gate state changes

Address: 0h base + 4h offset = 4h

### 13.3.9 Semaphores Gate 8 Register (SEMA4\_Gate08)

Each semaphore gate is implemented in a 2-bit finite state machine, right-justified in a byte data structure. The hardware uses the bus master number in conjunction with the data patterns to validate all attempted write operations. Only processor bus masters can modify the gate registers. Once locked, a gate can (and must) be opened (unlocked) by the locking processor core.

Multiple gate values can be read in a single access, but only a single gate can be updated via a write operation at a time. 16- and 32-bit writes to multiple gates are allowed, but the write data operand must only update the state of a single gate. A byte write data value of 0x03 is defined as "no operation" and does not affect the state of the corresponding gate register. Attempts to write multiple gates in a single aligned access with a size larger than an 8-bit (byte) reference generate an error termination and do not allow any gate state changes

Attempted writes of 0x03 are treated as "no operation" and do not affect the gate state machine. |

### 13.3.13 Semaphores Gate 12 Register (SEMA4\_Gate12)

Each semaphore gate is implemented in a 2-bit finite state machine, right-justified in a byte data structure. The hardware uses the bus master number in conjunction with the data patterns to validate all attempted write operations. Only processor bus masters can modify the gate registers. Once locked, a gate can (and must) be opened (unlocked) by the locking processor core.

Multiple gate values can be read in a single access, but only a single gate can be updated via a write operation at a time. 16- and 32-bit writes to multiple gates are allowed, but the write data operand must only update the state of a single gate. A byte write data value of 0x03 is defined as "no operation" and does not affect the state of the corresponding gate register. Attempts to write multiple gates in a single aligned access with a size larger than an 8-bit (byte) reference generate an error termination and do not allow any gate state changes

### 13.3.17 Semaphores Processor n IRQ Notification Enable (SEMA4\_CPnINE)

The application of a hardware semaphore module provides an opportunity for implementation of helpful system-level features. An example is an optional mechanism to generate a processor interrupt after a failed lock attempt. Recall traditional software gate functions execute a spin-wait loop in an effort to obtain and lock the referenced gate. With this module, the processor that fails in the lock attempt could continue with other tasks and allow a properly-enabled notification interrupt to return its execution to the original lock function.

The optional notification interrupt function consists of two registers for each processor: an interrupt notification enable register (SEMA4\_CPnINE) and the interrupt request register (SEMA4\_CPnNTF). To support implementations with more than 16 gates, these registers can be referenced with aligned 16- or 32-bit accesses. For the SEMA4\_CPnINE registers, unimplemented bits read as zeroes, and writes are ignored.

Address: 0h base + 40h offset + (8d × i), where i=0d to 1d

**13.3.18 Semaphores Processor n IRQ Notification (SEMA4\_CPnNTF)**

The Semaphores module optionally allows the processor that fails in the lock attempt to continue with other tasks and allow a properly-enabled notification interrupt to return its execution to the original lock function rather than simply execute in a spin-wait loop.

The optional notification interrupt mechanism consists of two registers for each processor: an interrupt notification enable register (SEMA4\_CPnINE) and the read-only notification interrupt request register (SEMA4\_CPnNTF). To support implementations with more than 16 gates, these registers can be referenced with aligned 16- or 32-bit accesses. For the SEMA4\_CPnNTF registers, unimplemented bits read as zeroes.

The notification interrupt is generated via a unique finite state machine, one per hardware gate. This machine operates in the following manner:

1. When an attempted lock fails, the FSM enters a first state where it waits until the gate is unlocked.
2. Once unlocked, the FSM enters a second state where it generates an interrupt request to the “failed lock” processor.
3. When the “failed lock” processor succeeds in locking the gate, the IRQ is automatically negated and the FSM returns to the idle state. However, if the other processor again locks the gate, the FSM returns to the first state, negates the interrupt request, and then waits for the gate to be unlocked (again).

The notification interrupt request is implemented in a 3-bit, 5-state machine, where two specific states are encoded and program-visible as SEMA4\_CP0NTF[GNn] and SEMA4\_CP1NTF[GNn].

## 13.3.19 Semaphores (Secure) Reset Gate n (SEMA4\_RSTGT)

Although the intent of the hardware gate implementation specifies a protocol where the locking processor must unlock the gate, it is recognized that system operation may require a reset function to re-initialize the state of any gate(s) without requiring a system-level reset.

To support this special gate reset requirement, the Semaphores module implements a "secure" reset mechanism which allows a hardware gate (or all the gates) to be initialized by following a specific dual-write access pattern. Using a technique similar to that required for the servicing of a software watchdog timer, the secure gate reset requires two consecutive writes with predefined data patterns from the same processor to force the clearing of the specified gate(s). The required access pattern is:

1. A processor performs a 16-bit write to the SEMA4\_RSTGT memory location. The most significant byte (SEMA4\_RSTGT[RSTGDP]) must be 0xE2; the least significant byte is a "don't\_care" for this reference.
2. The same processor then performs a second 16-bit write to the SEMA4\_RSTGT location. For this write, the upper byte (SEMA4\_RSTGT[RSTGDP]) is the logical complement of the first data pattern (0x1D) and the lower byte (SEMA4\_RSTGT[RSTGTN]) specifies the gate(s) to be reset. This gate field can specify a single gate be cleared, or that all gates are cleared.
3. Reads of the SEMA4\_RSTGT location return information on the 2-bit state machine (SEMA4\_RSTGT[RSTGSM]) which implements this function, the bus master performing the reset (SEMA4\_RSTGT[RSTGMS]) and the gate number(s) last cleared (SEMA4\_RSTGT[RSTGTN]). Reads of the SEMA4\_RSTGT register do not affect the secure reset finite state machine in any manner.

| 0–7<br>RSTGSM_<br>RSTGMS_<br>RSTGDP | <p><b>NOTE:</b> This field contains subfields that vary depending on whether it is being read or written. Sub-fields indicated as having read access are valid only for read operations. Sub-fields indicated as having write access are valid only for write operations. Bit numbering in the descriptions begins with the most significant bit numbered 0. See the following table for details.</p> <table><tr><th>Access</th><th>Sub-Field</th><th>Description</th></tr><tr><td rowspan="4">Read-Only</td><td>0-1<br/>Reserved</td><td>Reserved. Always reads 0.</td></tr><tr><td>2-3<br/>RSTGSM</td><td>Reset Gate Finite State Machine. Reads of the SEMA4_RSTGT register return the encoded state machine value. The reset state machine is maintained in a 2-bit, 3-state implementation, defined as:<br/>00 Idle, waiting for the first data pattern write.<br/>01 Waiting for the second data pattern write.<br/>10 The 2-write sequence has completed. Generate the specified gate reset(s). After the reset is performed, this machine returns to the idle (waiting for first data pattern write) state. Note that the RSTGSM = 0b10 state is valid for only a single machine cycle, so it is impossible for a read to return this value<br/>11 This state encoding is never used and therefore reserved.</td></tr><tr><td>4<br/>Reserved</td><td>Reserved. Always reads 0.</td></tr><tr><td>5-7<br/>RSTGMS</td><td>Reset Gate Bus Master. This 3-bit read-only field records the logical number of the bus master performing the gate reset function. The reset function requires that the two consecutive writes to this register be initiated by the same bus master to succeed. This field is updated each time a write to this register occurs. The association between system bus master port numbers, the associated bus master device and the logical processor number is SoC-specific. See the chip configuration chapter for this information.</td></tr><tr><td>Write-Only</td><td>0-7<br/>RSTGDP</td><td>Reset Gate Data Pattern. This write-only field is accessed with the specified data patterns on the two consecutive writes to enable the gate reset mechanism. For the first write, RSTGDP = 0xE2 while the second write requires RSTGDP = 0x1D.</td></tr></table> | Access                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Sub-Field | Description | Read-Only | 0-1<br>Reserved | Reserved. Always reads 0. | 2-3<br>RSTGSM | Reset Gate Finite State Machine. Reads of the SEMA4_RSTGT register return the encoded state machine value. The reset state machine is maintained in a 2-bit, 3-state implementation, defined as:<br>00 Idle, waiting for the first data pattern write.<br>01 Waiting for the second data pattern write.<br>10 The 2-write sequence has completed. Generate the specified gate reset(s). After the reset is performed, this machine returns to the idle (waiting for first data pattern write) state. Note that the RSTGSM = 0b10 state is valid for only a single machine cycle, so it is impossible for a read to return this value<br>11 This state encoding is never used and therefore reserved. | 4<br>Reserved | Reserved. Always reads 0. | 5-7<br>RSTGMS | Reset Gate Bus Master. This 3-bit read-only field records the logical number of the bus master performing the gate reset function. The reset function requires that the two consecutive writes to this register be initiated by the same bus master to succeed. This field is updated each time a write to this register occurs. The association between system bus master port numbers, the associated bus master device and the logical processor number is SoC-specific. See the chip configuration chapter for this information. | Write-Only | 0-7<br>RSTGDP | Reset Gate Data Pattern. This write-only field is accessed with the specified data patterns on the two consecutive writes to enable the gate reset mechanism. For the first write, RSTGDP = 0xE2 while the second write requires RSTGDP = 0x1D. |
