User manual

Getting started with the X-CUBE-SPN17 low voltage three-phase brushless DC motor driver software expansion for STM32Cube

Description

The X-CUBE-SPN17 is an expansion software for STM32Cube. The software runs on the STM32 Nucleo providing management of STSPIN233 to control low voltage three-phase brushless DC motors. The expansion is built on STM32Cube software technology to ease portability across different STM32 microcontrollers.

The software comes with a sample implementation driving a low voltage three-phase brushless DC motor, with BEMF sensing.

It is compatible with NUCLEO-F030R8, NUCLEO-F103RB, NUCLEO-F302R8 and NUCLEO-F401RE boards when connected to one or more X-NUCLEO-IHM17M1 expansion boards.

The package contains a user interface layer enabling real-time transmission of data to a PC through the terminal.

1 Acronyms and abbreviations

Table 1. List of acronyms

| Acronym | Description | | | |
|---------------------------------------|---|--|--|--|
| API Application programming interface | | | | |
| BSP Board support package | | | | |
| CMSIS | Cortex® microcontroller software interface standard | | | |
| HAL | Hardware abstraction layer | | | |
| IDE | Integrated development environment | | | |
| LED | Light emitting diode | | | |
| BLDC motor | Brushless DC motor | | | |
| BEMF | Back electromotive force | | | |

2 What is STM32Cube?

57/

STM32Cube[™] represents the STMicroelectronics initiative to make developers' lives easier by reducing development effort, time and cost. STM32Cube covers the STM32 portfolio.

STM32Cube version 1.x includes:

- STM32CubeMX, a graphical software configuration tool that allows the generation of C initialization code using graphical wizards.
- A comprehensive embedded software platform specific to each series (such as the STM32CubeF4 for the STM32F4 series), which includes:
 - the STM32Cube HAL embedded abstraction-layer software, ensuring maximized portability across the STM32 portfolio
 - a consistent set of middleware components such as RTOS, USB, TCP/IP and graphics
 - all embedded software utilities with a full set of examples

2.1 STM32Cube architecture

The STM32Cube firmware solution is built around three independent levels that can easily interact with one another, as described in the diagram below.

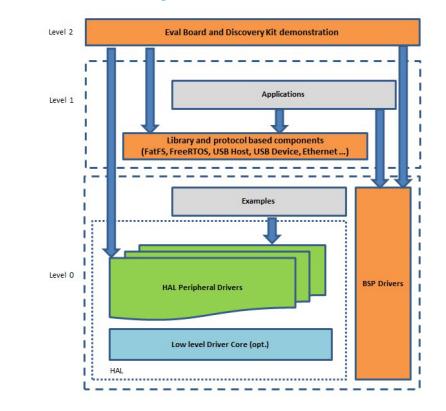

Figure 1. Firmware architecture

Level 0: This level is divided into three sub-layers:

 Board Support Package (BSP): this layer offers a set of APIs relative to the hardware components in the hardware boards (Audio codec, IO expander, Touchscreen, SRAM driver, LCD drivers. etc...); it is based on modular architecture allowing it to be easily ported on any hardware by just implementing the low level routines. It is composed of two parts:

- Component: is the driver relative to the external device on the board and not related to the STM32, the component driver provides specific APIs to the external components of the BSP driver, and can be ported on any other board.
- BSP driver: links the component driver to a specific board and provides a set of easy to use APIs. The API naming convention is BSP_FUNCT_Action(): e.g., BSP_LED_Init(), BSP_LED_On().
- Hardware Abstraction Layer (HAL): this layer provides the low level drivers and the hardware interfacing
 methods to interact with the upper layers (application, libraries and stacks). It provides generic, multiinstance and function-oriented APIs to help offload user application development time by providing ready to
 use processes. For example, for the communication peripherals (I²C, UART, etc.) it provides APIs for
 peripheral initialization and configuration, data transfer management based on polling, interrupt or DMA
 processes, and communication error management. The HAL Drivers APIs are split in two categories: generic
 APIs providing common, generic functions to all the STM32 series and extension APIs which provide
 special, customized functions for a specific family or a specific part number.
- Basic peripheral usage examples: this layer houses the examples built around the STM32 peripherals using the HAL and BSP resources only.

Level 1: This level is divided into two sub-layers:

- Middleware components: set of libraries covering USB Host and Device Libraries, STemWin, FreeRTOS, FatFS, LwIP, and PolarSSL. Horizontal interaction among the components in this layer is performed directly by calling the feature APIs, while vertical interaction with low-level drivers is managed by specific callbacks and static macros implemented in the library system call interface. For example, FatFs implements the disk I/O driver to access a microSD drive or USB Mass Storage Class.
- Examples based on the middleware components: each middleware component comes with one or more examples (or applications) showing how to use it. Integration examples that use several middleware components are provided as well.

Level 2: This level is a single layer with a global, real-time and graphical demonstration based on the middleware service layer, the low level abstraction layer and basic peripheral usage applications for board-based functions.

3 X-CUBE-SPN17 software expansion for STM32Cube

3.1 Overview

The X-CUBE-SPN17 software package expands STM32Cube functionality, and features:

- Sample application to drive a low voltage three phase brushless motor, managing an STSPIN233 (single driver) and an X-NUCLEO-IHM17M1
- Sample implementation available on the X-NUCLEO-IHM17M1 expansion board plugged on top of a NUCLEO-F030R8, NUCLEO-F103RB, NUCLEO-F302R8 or NUCLEO-F401RE board.
- Timer to generate step clock and voltage reference
- Management of parameters like minimum and maximum speed, direction etc.
- GPIO, PWM and IRQ configuration
- API function available to send any application command to the motor driver
- User interface utility based on PC terminal to control the motor
- Speed control through potentiometer
- Motor control by user button
- Easy portability across different MCU families, thanks to STM32Cube
- Free, user-friendly license terms

To use the STSPIN233 driver library, first call its initialization function to:

- set up the required GPIOs to handle the bridges, enable the EN\FAULT and the STBY\RESET pins
- set up the drivers
- load the driver parameters with the values in "MC_SixStep_param.h" (acceleration, deceleration, minimum and maximum speed, starting Duty Cycle, PWM frequency, etc.).

You can easily modify the driver parameters in "MC_SixStep_param.h". The speed profile is completely handled by the microcontroller depending on the potentiometer setting. The 6-step algorithm is based on the 1-shunt current sensing mode and the sensorless algorithm for BEMF detection.

Motor activity is commanded differently, depending on workspace configuration:

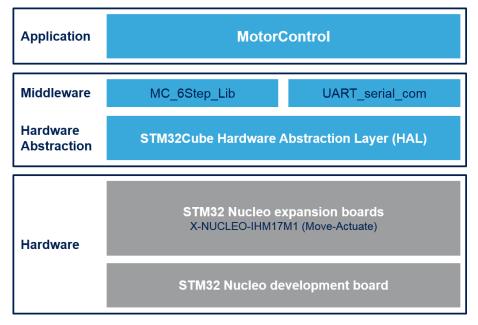

- configuration mode waits for the blue button event to start the motor and the black button to reset the firmware
- comm mode enables communication via an external PC terminal
- · demo mode starts and stop the motor automatically

A motion command can be stopped at any moment by pushing the user button, via the external PC terminal, or automatically. The firmware can be reset by pushing the reset button on the STM32 Nucleo development board.

3.2 Architecture

This fully compliant STM32Cube software expansion enables development of BLDC applications using motor drivers.

The software is based on the STM32CubeHAL hardware abstraction layer for the STM32 microcontroller and extends STM32Cube with a board support package (BSP) for the DC motor driver expansion board (X-NUCLEO-IHM17M1) and some middleware components for motor control and serial communication with a PC.

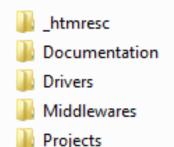

The software layers used by the application software to access and use the three-phase brushless DC motor drivers expansion board are:

STM32Cube HAL layer: provides a generic, multi-instance set of simple APIs (application programming interfaces) to interact with the upper layers (application, libraries and stacks). These generic and extension APIs are based on a common architecture and the layers above them like the middleware layer can function without requiring specific hardware configuration data for a given microcontroller unit (MCU). This structure improves the library code reusability and guarantees easy portability across other devices.

Board support package (BSP) layer: supports the peripherals on the STM32 Nucleo board, except for the MCU. This limited set of APIs provides a programming interface for certain board specific peripherals like the user button, the reset button, etc, and helps in identifying the specific board version. The BSP in the X-CUBE-SPN17 software provides the drivers to manage the STSPIN233 motor driver.

3.3 Folder structure

The software is packaged in the following main folders:

Documentation: with a compiled HTML file generated from the source code that details the software components and APIs.

- Drivers:
 - STM32Cube HAL driver files located in the STM32Fxxx_HAL_Driver subdirectories. These files are not
 described here as they derive directly from the STM32Cube framework. Only those files required to run
 the motor driver examples are present.
 - CMSIS folder with the CMSIS (Cortex[®] microcontroller software interface standard) files from ARM. These files form a vendor-independent hardware abstraction layer for the Cortex-M processor series. This folder is also unchanged from the STM32Cube framework.
 - BSP folder with code files required to the STSPIN233 driver and the motor control API. The STSPIN233.c file implements all the API functions to manage the motor driver: start/stop PWM signals, enable/disable each inverter leg, etc.
- Projects: contains a sample MC application using the X-NUCLEO-IHM17M1 board plugged on top of a NUCLEO-F030R8, NUCLEO-F103RB, NUCLEO-F302R8 or NUCLEO-F401RE board..
- Middlewares: contains MC libraries and the serial driver-PC communication protocol. The middleware folder includes the core 6-step sensorless algorithm with BEMF detection, able to drive a generic three-phase brushless DC motor with speed control loop. The respective header file contains the data structure and the list of main APIs for the MC.

3.4 APIs

Detailed function and parameter descriptions for the user-APIs are compiled in an HTML file in the software package Documentation folder.

3.5 Sample application description

A sample application using the X-NUCLEO-IHM17M1 expansion board mounted on different Nucleo boards is provided in the Projects directory. Ready to be built projects are available for multiple IDEs. In this application, a low voltage three-phase brushless motor is driven by the STSPIN233 device. The firmware implements a 6-Step sensorless algorithm.

The main functions are:

4 System setup guide

4.1 Hardware description

This section describes the hardware components which are required to execute the X-CUBE-SPN17 software and successfully drive a low voltage three-phase brushless motor.

4.1.1 STM32 Nucleo platform

STM32 Nucleo development boards provide an affordable and flexible way for users to test solutions and build prototypes with any STM32 microcontroller line.

The Arduino[™] connectivity support and ST morpho connectors make it easy to expand the functionality of the STM32 Nucleo open development platform with a wide range of specialized expansion boards to choose from. The STM32 Nucleo board does not require separate probes as it integrates the ST-LINK/V2-1 debugger/ programmer.

The STM32 Nucleo board comes with the comprehensive STM32 software HAL library together with various packaged software examples.

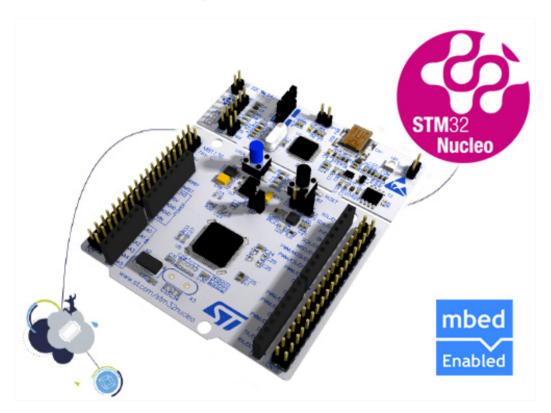

Figure 4. STM32 Nucleo board

Information regarding the STM32 Nucleo board is available at www.st.com/stm32nucleo

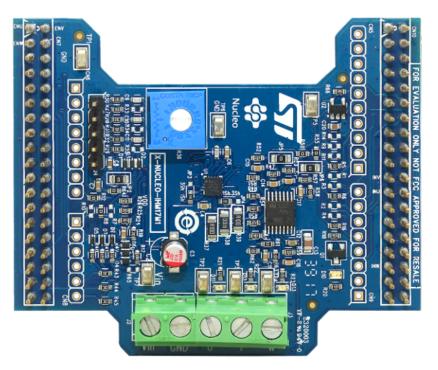

4.1.2 Introduction

The X-NUCLEO-IHM17M1 is a low voltage three-phase brushless DC motor driver expansion board based on STSPIN233 for STM32 Nucleo. It is an affordable and easy-to-use solution with motor driver operation in low voltage battery scenarios, allowing zero consumption state (such as in thermal printers, robotics, toys, etc..).

The X-NUCLEO-IHM17M1 supports the addition of other boards to a single STM32 Nucleo board through the Arduino UNO R3 and the ST morpho connectors.

Furthermore, the board is designed for six-step and FOC algorithms.

Figure 5. X-NUCLEO-IHM17M1 expansion board

4.1.3 Miscellaneous hardware components

To complete the hardware setup, you will need:

- an STM32 Nucleo development board (one among NUCLEO-F030R8, NUCLEO-F103RB, NUCLEO-F302R8 and NUCLEO-F401RE)
- a three-phase low voltage brushless DC motor
- an external DC power supply with two electric cables
- a USB type A to mini-B USB cable to connect the STM32 Nucleo to a PC
- a Windows[™] PC (XP, Win 7, Win 8) Laptop/PC

4.2 Software description

The following software components are needed for a suitable development environment for applications based on the motor driver expansion board:

- ST-LINK/V2-1 USB driver
- ST-LINK/V2-1 firmware upgrade
- X-CUBE-SPN17 expansion for STM32Cube dedicated to STSPIN233 low voltage, 3 phase, brushless motor driver applications development. The X-CUBE-SPN17 firmware and related documentation is available on www.st.com.
- One of the following development tool-chain and compilers:
 - Keil RealView Microcontroller Development Kit (MDK-ARM) toolchain V5.22
 - IAR Embedded Workbench for ARM (EWARM) toolchain V7.80
 - OpenSTM32 System Workbench for STM32 (SW4STM32) V4.6.3

4.3 Hardware and software setup

This section describes the hardware and software setup procedure for executing the provided examples and to develop new applications based on the motor driver expansion board.

4.3.1 Setup to drive a three-phase brushless motor

Procedure Step 1.

Configure your STM32 Nucleo development board. JP1 off JP5 (PWR) on UV5 side JP6 (IDD) on

Step 2. An STM32 Nucleo expansion board (X-NUCLEO-IHM17M1) with the following configuration:

| Board | Curr fbk 1 | | | Curr ref | | VBUS fbk | | EN/FAULT | | | Enc. A/H1 | | |
|--------------------------------|------------|----|----|----------|-----|----------|----|----------|----|----|-----------|-----|-----|
| Board | R1 | R3 | R5 | R9 | R11 | R14 | R7 | R8 | R2 | R4 | R6 | R10 | R12 |
| NUCLEO- F401RE (default) | NM | NM | 0R | NM | 22k | NM | NM | 0R | NM | NM | 0R | NM | 0R |
| NUCLEO- F302R8 | NM | 0R | NM | NM | NM | 22k | NM | 0R | NM | 0R | NM | NM | 0R |
| NUCLEO- F103RB | NM | NM | 0R | NM | NM | NM | 0R | NM | NM | NM | 0R | 0R | NM |
| NUCLEO- F030R8 | NM | NM | 0R | NM | NM | NM | NM | 0R | NM | NM | 0R | NM | 0R |

Table 2. Mounting options

Step 3. Plug the X-NUCLEO-IHM17M1 expansion board onto the ST morpho connectors on the STM32 Nucleo board.

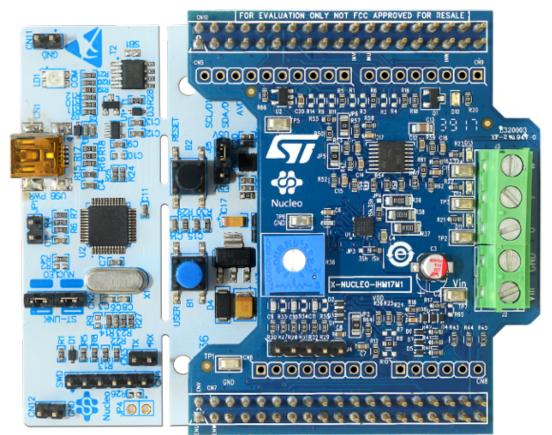

Figure 6. STM32 Nucleo board plus X-Nucleo-IHM17M1 expansion board

- Step 4. Connect the STM32 Nucleo development board to a PC with the USB cable through USB connector CN1 to power the board
- Step 5. Power on the X-NUCLEO-IHM17M1 expansion board by connecting its connectors Vin and Gnd to the DC power supply. The DC supply must be set to deliver the required voltage to the three-phase brushless motor.
- Step 6. Connect the three-phase of motor to the X-NUCLEO-IHM17M1 bridge connectors U,V,W.
- Step 7. Open your preferred toolchain (MDK-ARM from Keil, EWARM from IAR, or SW4STM32 from www.openstm32.org)
- Step 8. Open the software project in \Projects\Multi\Applications\MotorControl\ YourToolChainName\STM32 Nucleo board name-Nucleo
- Step 9. Adapt the default parameters used by the STSPIN233 to your low voltage three phase brushless DC motor characteristics by modifying the parameters in \Projects\Multi\Applications\MotorControl\Inc \MC_SixStep_param.h. MC_SixStep_param.h contains all the motor driving parameters like the number of pole pairs, target speed, PI parameters for speed regulation, etc.
- Step 10. Rebuild all files and load your image \Projects\Multi\Applications\MotorControl\Binary\STM32F401RE-Nucleo\STM32F401RE-Nucleo-YourMode.bin into target memory.
- **Step 11.** Run the sample application.
- Step 12. Push the blue button to start and the black button to stop the motor.
- Step 13. Push the black button to reset the firmware.
- Step 14. You can also use a user interface utility based on PC terminal to control the motor (see the following section)

4.3.2 PC utility

The X-CUBE-SPN17 expansion for STM32Cube implements serial communication between the STM32 Nucleo board UART peripheral and a Windows PC-terminal. This utility is available by recompiling the project in COMM mode and configuring a terminal emulation software supporting COM connection. Before using this utility, ensure

| at the necessary drivers are installed and the expansion board along with STM32 Nucleo board is connected to PC. |
|--|
| |

Procedure Step 1.

Step 1. Ensure you have the minimum requirements

- PC with Intel or AMD/INTEL processor running one of following Microsoft operating systems:
 - Windows XP SP3
 - Windows Vista
 - Windows 7
- At least 128 MBs of RAM
- 1 x USB port
- Terminal emulation software (e.g. Hyper-terminal, PuTTY, Tera Term).
- Step 2. Find the ST COM port number in Device Manager (COM4 in the example below).

| Fig | aure | 7. | Finding | the | STlink | COM | Port | number | in | Windows ^T | м | Device | Mana | aer |
|------|------|----|----------|-----|--------|-----|-------|--------|----|-----------------------------|---|--------|------|-----|

Step 3. Open an IDE like IAR Workbench and open the EWARM project. On the project configuration tool selector, select COMM mode and upload the firmware to the STM32 Nucleo board.

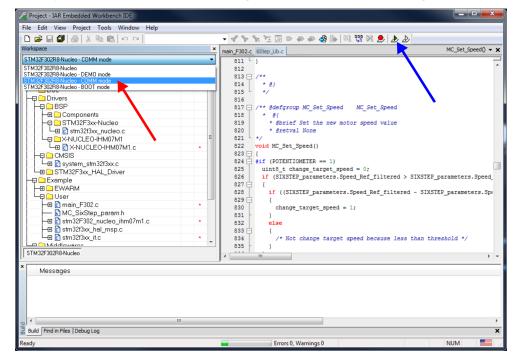

Figure 8. IAR Workbench - compiling in COMM mode and uploading firmware

Step 4. Launch the terminal emulation software on the PC and check that the COM Device number for the current STM32 expansion board is correct and set the parameters as shown below.

| | Figure | 9. | PC | terminal | parameters |
