How to use the 16-channel high voltage pulser evaluation kit for ultrasound imaging applications

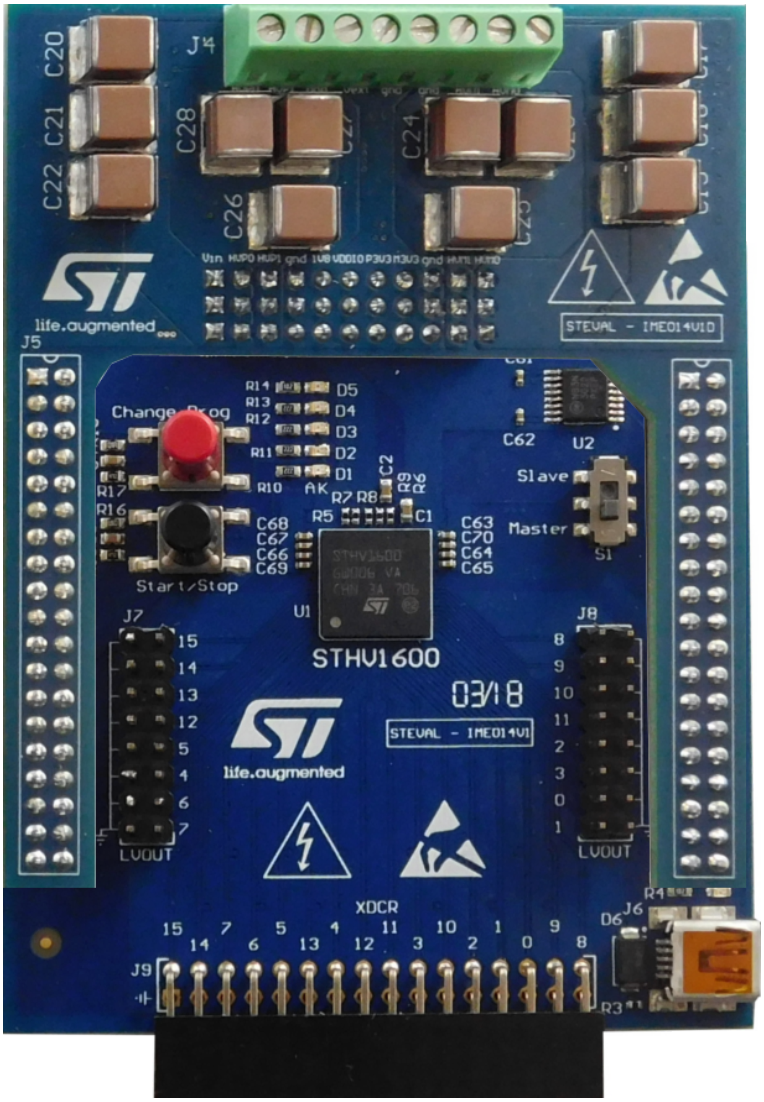
Introduction

The STEVAL-IME014V1B evaluation kit, based on the STHV1600 16-channel high voltage pulser for ultrasound imaging applications, can be used to evaluate the characteristics and functionality of the HV pulser.

Four preset programs are available to test the pulser in typical conditions, and output waveforms can be displayed on an oscilloscope by connecting the scope probe to the relative connectors.

A graphical user interface is available to help you change waveforms and configurations easily.

Figure 1. STEVAL-IME014V1B high voltage pulser evaluation kit



1 Safety recommendations

Attention: *The STEVAL-IME014V1B evaluation kit must be used by expert technicians only.*

Danger:
Due to the high voltage (±100 V_{DC}) present on the non-isolated parts, special care must be taken to avoid the risk of electric shocks and burns.

Caution: There are no protections against accidental human contact with high voltage components.

Caution:
Never touch live board components when the board is connected or immediately after the board is disconnected, as the capacitors may still be charged.

Caution:
Do not connect probes to any high voltage components if the board is not isolated from the mains supply, as this may cause damage to equipment.

Note:
STMicroelectronics assumes no responsibility for accidents or injury caused by improper use of this development tool.

2 STEVAL-IME014V1B specifications

- 16 channel high voltage outputs (XDCR): female strip connectors 2x16
  - typical load directly connected on XDCRs (100Ω // 270pF)
  - can disconnect load on XDCR by removing solder bridges
- 16 channel low voltage outputs (LVOUT): male strip connectors 2x16
  - no load on LVOUT
- four preset programs
- USB connector to change programs and waveforms
- button interface to build, select, start and stop the generation of waveforms
- button interface to reset the device
- LEDs to monitor STHV1600 behavior
- system based on STM32 microcontroller
- kit consists of three stacked boards:
  - Nucleo (NUCLEO-F401RE)
  - STHV1600 Module (STEVAL-IME014V1)
  - Power Supply Module (STEVAL-IME014V1D)
- can connect and synchronize multiple STEVAL-IME014V1B kits in master and slave modes
- requires only four high voltage lines and one low voltage (7V-12V) line
- GUI interface to let you configure the STEVAL-IME014V1B evaluation kit

2.1 STEVAL-IME014V1B programs, clock and modes

The STEVAL-IME014V1B can store up to four programs, which can be accessed through the PB2 button.
The available SYSCLK frequencies are:

- 10 MHz
- 50 MHz
- 100 MHz
- 200 MHz

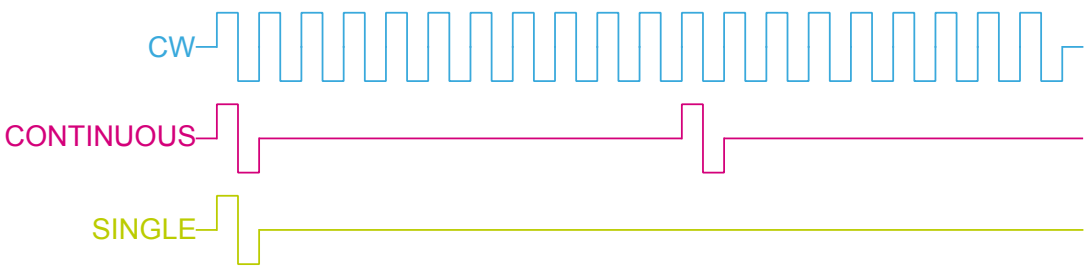
Note: The system may not function properly at 200 MHz because the STEVAL-IME014V1B interface is CMOS.

Note: The real clock in case for 100MHz selection is: f_{SYSCLK} = 101.5 MHz → T_{SYSCLK} = 9.85 ns

The available operating modes are:

- Continuous: a multiple trigger is generated. A pulse train will be provided on XDCRs.
- Single: a single trigger event is generated. On XDCRs just a single repetition of the waveform is generated
- CW: a continuous switching wave is generated.

Figure 2. STEVAL-IME014V1B operating modes



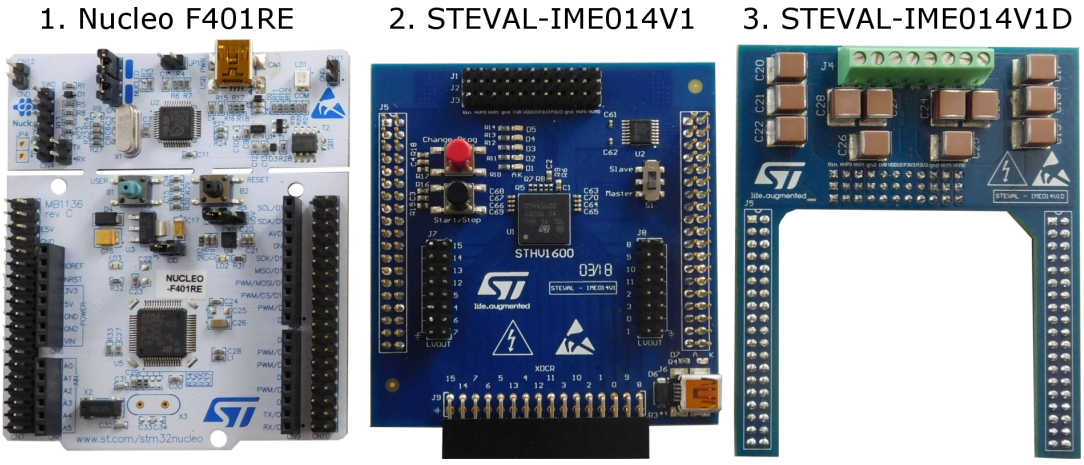
3 Hardware description

3.1 STEVAL-IME014V1B evaluation kit components

The STEVAL-IME014V1B evaluation kit consists of three stacked boards:

1. the Nucleo-F401RE main board with STM32 microcontroller, used to generate the correct signals for STHV1600
2. the STEVAL-IME014V1 board with embedded STHV1600 pulser, CLKSYS generator, connectors and buttons
3. the STEVAL-IME014V1D power supply module used to generate four on-board low voltage supplies and manage all power supplies

Figure 3. STEVAL-IME014V1B component boards



3.1.1 STEVAL-IME014V1D power supply module

The power supply module receives input power through an eight pin connector for four high voltage lines that feed the device and one low voltage line.

The LDO voltage regulators and DC/DC converters on the board generate all the low VDDM, VDDP, DVDD and IOVDD voltages for the STHV1600 pulser from the low voltage VEXT line on the eight-pin input connector.

Finally, the decoupling capacitors isolate the ICs from high frequency noise.

Figure 4. STEVAL-IME014V1D input pin numbers

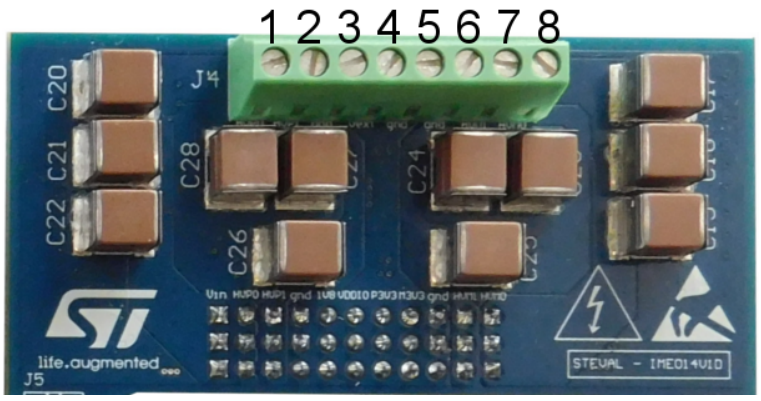


Table 1. Power supply connector pin descriptions

Pin	Signal	Description
1	HVP0	Positive high voltage TX0 supply
2	HVP1	Positive high voltage TX1 supply
3	GND	Ground
4	VEXT	7 V to 12 V supply
5	GND	Ground
6	GND	Ground
7	HVM1	Negative high voltage TX1 supply
8	HVM0	Negative high voltage TX0 supply

3.1.2 STEVAL-IME014V1 pulser module

The STEVAL-IME014V1 board includes the STHV1600 pulser, a clock generator for SYSCLK, a USB port and the button interface.

Figure 5. STEVAL-IME014V1 connectors, switches and buttons

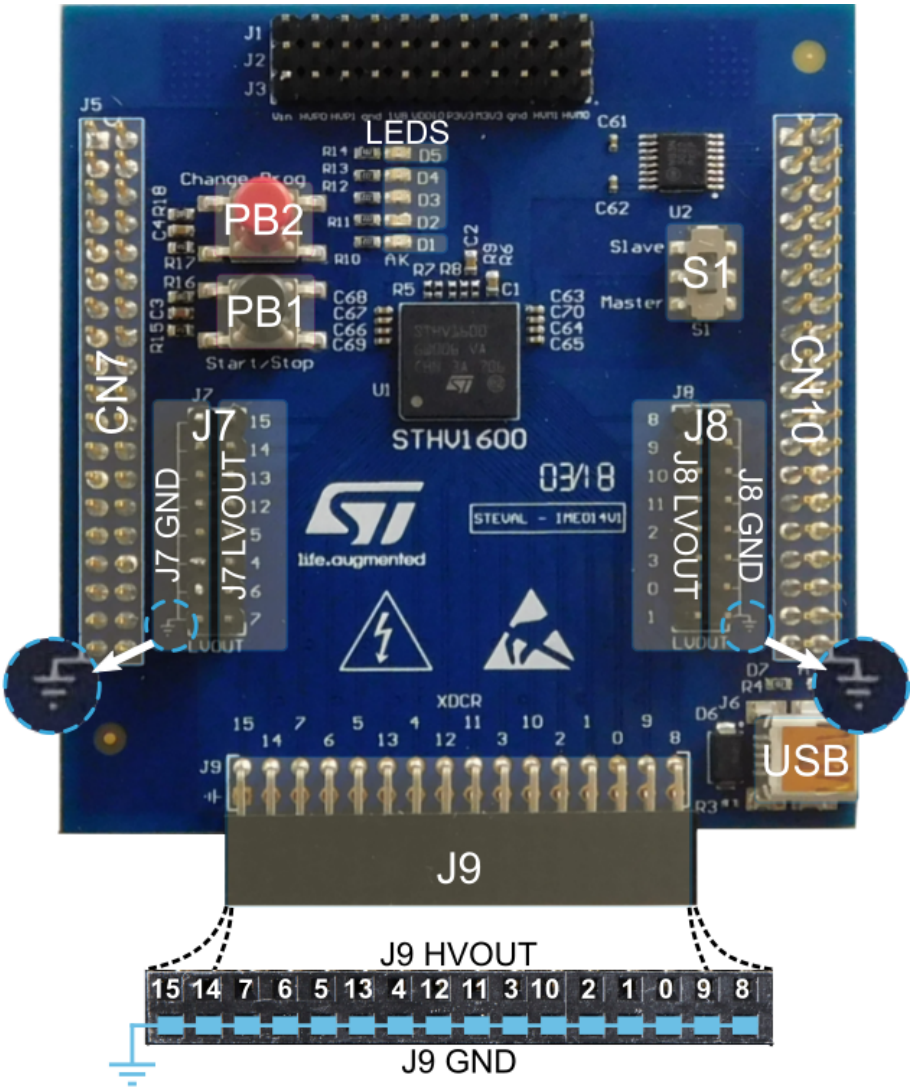

Table 2. STEVAL-IME014V1 connector, switch and button descriptions

Component	Description
PB1	Press once to Start waveform generation (Master mode trigger) Press again to Stop waveform generation (Continuous mode only) Press and hold for 2 seconds to RESET the device
PB2	Press to change program Press and hold for 2 seconds to save a program in Flash memory
D1	Blinking: wave execution (or waiting for trigger in Slave mode trigger) Single flash: Flash memory written
D4, D3, D2	Selected program in binary code (D2 is the least significant bit)
D5	Lights red when an interrupt occurs
USB Port	Connect to a PC USB port to update the programs
J7	In Figure 5. STEVAL-IME014V1 connectors, switches and buttons: • J7LVOUT: STHV1600 LVOUTs output (pin numbers are inscribed) • J7 GND: ground net
J8	In Figure 5. STEVAL-IME014V1 connectors, switches and buttons: • J8LVOUT: STHV1600 LVOUTs output (pin numbers are inscribed) • J8 GND: ground net
S1	Master or slave selector
J9	In Figure 5. STEVAL-IME014V1 connectors, switches and buttons: • J9HVOUT: STHV1600 XDCR15 to XDCR0 high voltage output (pin numbers are inscribed) • JN GND: ground net

3.2 STEVAL-IME014V1B power supply and ST morpho connectors

Figure 6. **Power supply and ST morpho connector pinouts**

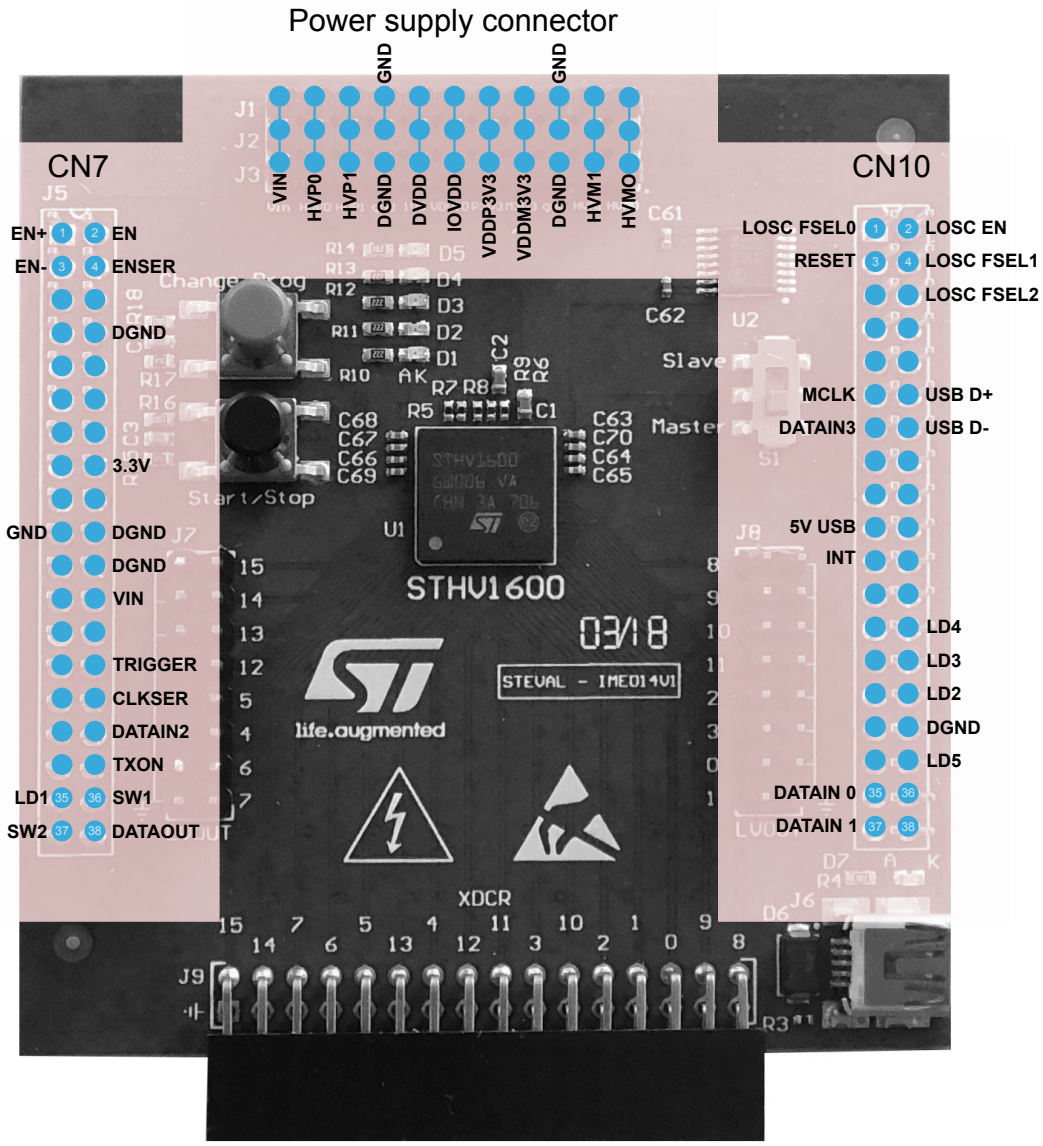

Table 3. **Output supply connector**

Pin Number	Signal Name	Function
1-2-3	VIN	Positive low voltage supply
4-5-6	HVP0	Positive high voltage TX0 supply
7-8-9	HVP1	Positive high voltage TX1 supply
10	DGND	Digital Ground (0V)
11-12	GND	Power Ground (0V)
13-14-15	DVDD	Positive logic supply (1.8V) → generated on Power supply Module
16-17-18	IOVDD	CMOS IO supply (3.3V) → generated on Power supply Module

Pin Number	Signal Name	Function
19-20-21	VDDP3V3	Positive low voltage supply (3.3V) → generated on Power supply Module
22-23-24	VDDP3M3	Negative low voltage supply (-3.3V) → generated on Power supply Module
25	DGND	Digital Ground (0V)
26-27	GND	Power Ground (0V)
28-29-30	HVM1	Negative high voltage TX1 supply
31-32-33	HVM0	Negative high voltage TX0 supply

Table 4. ST morpho CN7 connector

Pin Number	Signal Name	Function
1	EN +	Enable VDDP3V3 voltage regulator
2	EN	Enable DVDD and IOVDD voltage regulator
3	EN -	Enable VDDM3V3 voltage regulator
4	ENSER	STHV1600 ENSERP signal
8, 19, 20, 22	DGND	Digital ground
16	3.3V	3.3V supply
18	VIN	VIN supply
28	TRIGGER	STHV1600 TRIGGERP signal
30	CLKSER	STHV1600 CLKSERP signal
32	DATAIN2	STHV1600 DATA_INP[2] signal
34	TXON	STHV1600 TX_ON signal
35	LD1	LED D1 driving signal
36	SW1	Button PB1 logic state (start/stop)
37	SW2	Button PB2 logic state (change program, save program)
38	DATAOUT	STHV1600 DATA_OUT signal

Table 5. ST morpho CN10 connector

Pin Number	Signal Name	Function
1	LOSC_FSEL0	PLL frequency selection, bit 0
2	LOSC_EN	PLL enable
3	RESET	STHV1600 RESET signal
4	LOSC_FSEL1	PLL frequency selection, bit 1
6	LOSC_FSEL2	PLL frequency selection, bit 2
11	MCLK	PLL clock input signal (from Nucleo)
12	USB D+	USB data +
13	DATAIN3	STHV1600 DATA_INP[3] signal
14	USB D-	USB data -
35	DATAIN0	STHV1600 DATA_INP[0] signal
23	INT	STHV1600 INT signal
26	LD4	LED 4 driving signal

Pin Number	Signal Name	Function
28	LD3	LED 3 driving signal
30	LD2	LED 2 driving signal
34	LD5	LED 5 driving signal
35	DATAIN0	STHV1600 DATA_INP[0] signal
37	DATAIN1	STHV1600 DATA_INP[1] signal

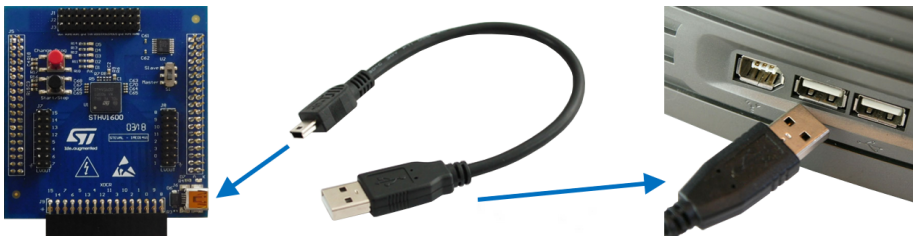
4 How to connect the board and generate wavefoms

4.1 How to connect STEVAL-IME014V1B to your PC

Step 1. Connect a type A to mini type B USB cable between the USB connector on the STEVAL-IME014V1 board and a USB port on your PC

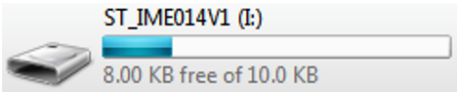
Note: *Do not use the USB connector on the Nucleo board, only the STEVAL-IME014V1 board.*
Normally no power supplies from the STEVAL-IME014V1 module are needed.

Figure 7. USB connection



Step 2. A removable disk appears in the Computer Resources.
The name of the disk is ST_IME014V1 and has 10 KB capacity

Figure 8. ST_IME014V1 disk drive



1. If the USB device is not recognized use a USB + charging port with the symbol.
2. If this doesn't work, provide VEXT (pin 4) power supply and GND (pin 5) on the STEVAL-IME014V1D power supply module before connecting the USB cable.

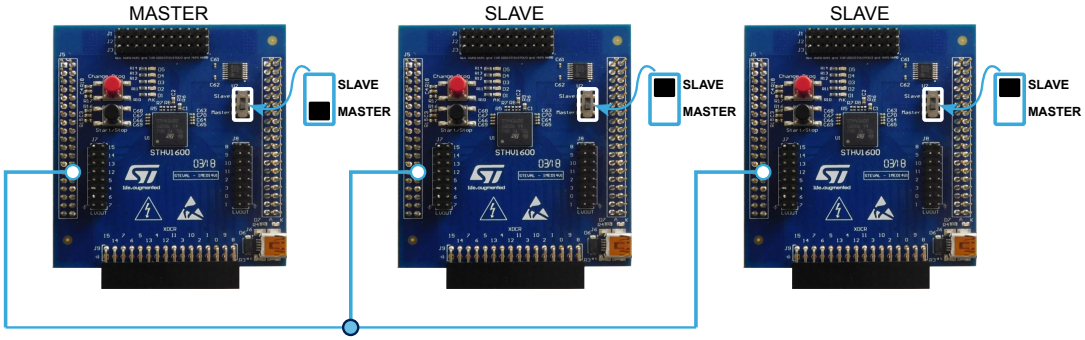
4.2 Multi-board mode

More than one STEVAL-IME014V1B can be chained in a multi-board configuration to simulate a multi-device system. In this mode, all the devices are synchronized to the same trigger event.

One STEVAL-IME014V1B kit must be set to MASTER and the rest set to SLAVE. The trigger is generated by the MASTER, while the SLAVE boards wait for an external trigger.

The external trigger can be provided by a simple wire that is usually connected to the output trigger of the MASTER (pin 28, CN7 connector).

Figure 9. **Multiple STEVAL-IME014V1 boards in Master-Slave configuration**



4.3 How to generate a waveform

The STEVAL-IME014V1B kit must have a valid .bin file loaded before waveform generation can begin.

Step 1. Connect the required supply voltages according to the specifications.
Disconnect the USB cable when connecting high voltage supplies.

Step 2. Connect the probes you need to evaluate high voltage waveforms and digital signals.

Step 3. Press the PB2 button to select the desired program.
Keep pressing the PB2 button to loop through the available waveform programs.
The currently selected program is indicated in binary format by LEDs D4, D3 and D2:

- D2 on, D3 off, D3 off: program 1 selected
- D2 off, D3 on, D4 off: program 2 selected
- D2 on, D3 on, D4 off: program 3 selected
- D2 off, D3 off, D4 on: program 4 selected

Step 4. Press PB1 to start the program.
In single mode, waveform generation stops automatically at the end of the program.

Step 5. Press PB1 to stop waveform generation in continuous and CW modes.

4.3.1 How to generate waveforms in Multi-board mode

Step 1. Configure each STEVAL-IME014V1 board with a bin file.

Step 2. Select the correct program on each board using PB2.

Step 3. Press the PB1 Start button on each SLAVE module.
LED D1 will blink.

Step 4. Press the PB1 Start button on the MASTER module.
Waveforms are generated on XDCR output pins

Step 5. To stop waveform generation:

- In continuous mode, press the Stop button on the MASTER module and then on all the SLAVE modules.
- In single mode, just press the Stop button on the SLAVE modules.

4.4 How to troubleshoot interrupt events

LED D5 signals an interrupt event triggered by a fault, which stops the device if the safe condition is enabled. Use the procedure below to check the cause and restart the device.

Step 1. Press PB1 to stop waveform generation if the current operating mode is Continuous or CW.

Step 2. Check the STEVAL-IME014_log.txt log file written to the ST_IME014V1 drive.
Each line in the log file represents the hexadecimal address of a memory register and a corresponding status code. For example, the code strings returned below reveal the following information:

– `0x1028` = STATUS register and `0x0F00` = all HV voltage references fail
– `0x1029` = TH_CH_FAIL_NUM register and `0x0000` = no channel thermal issues

```
0x1028 0x0F00
0x1029 0x0000
```

Step 3. Press and hold PB1 for 2 seconds.
LED D5 will turn off and the device will reset.

4.5 Default waveforms

The STEVAL-IME014V1B can store up to four programs in the on-board Flash memory to demonstrate the performance of each pulser output. A default set of selectable patterns is already stored in the Flash memory in a file named prog_def.bin and ready to use.

4.5.1 Program 1

The first program is based on a 100 MHz SYSCLK.
Odd outputs are all in phase and they are 180° phase-shifted with respect to the even outputs.
All channels are enabled in TX and RX.

Figure 10. Program 1 waveform

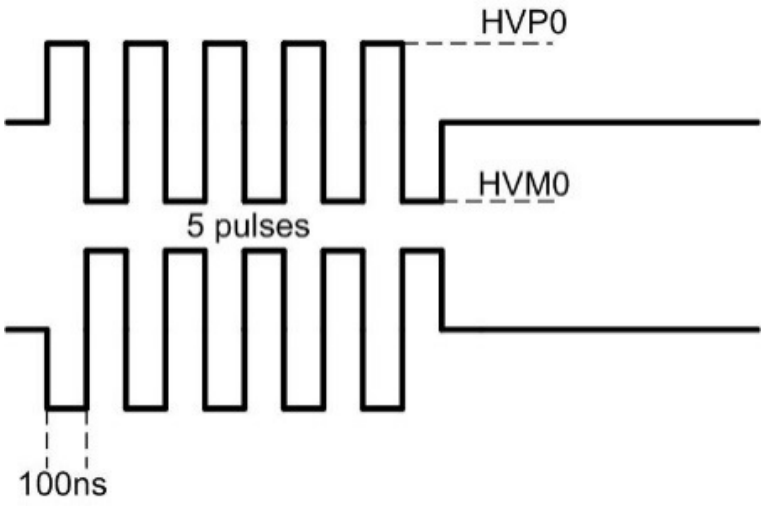


Table 6. Program 1 waveform output

Output	Mode	Frequency [MHz]	Number of pulses	Initial Pulse	PRF [µs]	H-Bridge
XDCR0	PW continuous	5	5	Positive	300	TX0
XDCR1	PW continuous	5	5	Negative	300	TX0

4.5.2 Program 2

The second program is based on a 100 MHz SYSCLK.
Odd outputs are in phase and they are 180° phase-shifted with respect to even outputs.
Only 4 channels run on this program.

Note: A supply higher than 10 V in not allowed in CW mode

4.6 How to store new waveforms

You can change the default waveforms stored on the STEVAL-IME014V1B by loading new bin files with your own waveform and configuration setup information.

Step 1. Connect the STEVAL-IME014V1 module to your PC via USB cable.

Step 2. Double click on the Mass Storage drive to open it.

Step 3. Delete any *.bin files on the drive.

Step 4. Copy and paste your new *.bin file.
You can download new bin files from www.st.com or you can build your own by using the GUI.
The file is now temporarily stored in the RAM.

Step 5. To store the file in the Flash memory, press PB2 for 3 seconds while the USB cable is still connected
LED D1 will light up (red) to indicate the new file is now stored in the Flash memory.
