

# Area Measures and Right Triangles

## Student Activity

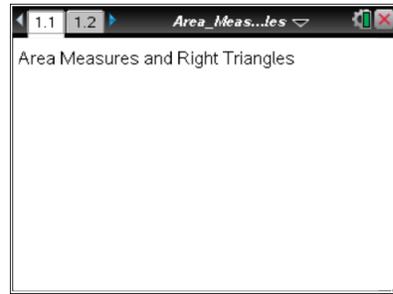

Name \_\_\_\_\_

Class \_\_\_\_\_

Open or create the TI-Nspire document

***Area\_Measures\_and\_Right\_Triangles.tns***. It is highly encouraged that you create the document.

In this activity, you will make a conjecture about the relationships among the areas of three equilateral triangles and make a connection to the Pythagorean Theorem.

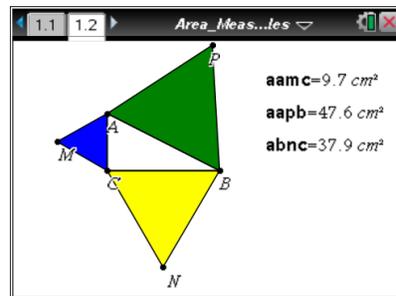

**Move to page 1.2.**

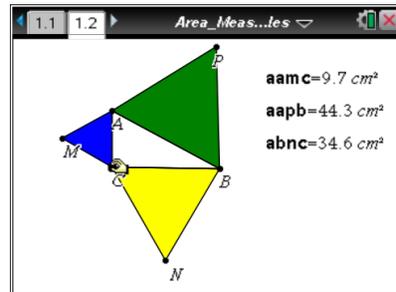

### Part 1: Making a conjecture

- Which of the points  $A$ ,  $B$ ,  $C$ ,  $M$ ,  $N$ , and  $P$  cannot be moved? Explain why.

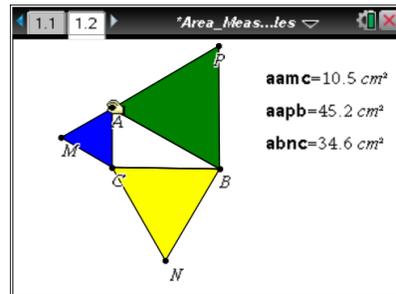

Press **ctrl** **▶** and **ctrl** **◀** to navigate through the lesson.

- Grab and drag point  $C$ . Observe the four triangles and the three area measures. What changes and what stays the same?

- Grab and drag points  $A$  and  $B$ . Observe the four triangles and the three area measures. Compare your observations to those you made when dragging point  $C$ .

- Make a conjecture about the relationship between the three area measures.

### Part 2: Testing the conjecture

To test your conjecture, you will store some area measurements in a spreadsheet.

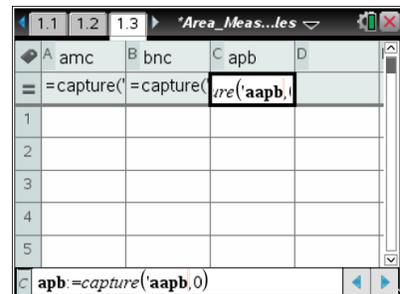

To insert a list and spreadsheet page: Press **ctrl** **doc** > **Lists & Spreadsheet**.

Name the columns: Highlight the cell above the formula row in Column A and type *amc*. Press **enter**. Move to Column B above the formula row and type *bnc*. Press **enter**. Move to Column C above the formula row and type *apb*. Press **enter**.

Set up the manual data capture: Move to Column A in the formula row. Press **Menu > Data > Data Capture > Manual**. Press **var** and select *aamc* by pressing **2nd**. Press **enter**.

Move to Column B in the formula row. Set the data capture as described above and select *abnc*. Move to Column C in the formula row. Set the data capture as described above and select *aapb*.

Press **ctrl** **left arrow** to return to page 1.2. Press **ctrl** **.** to collect data.

Drag points *A*, *B*, or *C*. Press **ctrl** **.** to collect data again. Drag a point and continue to collect at least four different data points.

Press **ctrl** **right arrow** to return to page 1.3.

5. What relationship do you observe among the data lists?

Move to Column D in the row above the formula row. Type **S** and press **enter**. Remain in the formula row of Column D. Press **=** **var** and select *amc*. Press **+** **var** and select *bnc*. Press **enter** to perform the calculation that adds columns A and B. Compare the values in Column D with the areas in Column C.

	A amc	B bnc	C apb	D s
1	9.68595	25.9262	35.6122	
2	9.68595	1.09619	10.7821	
3	9.68595	4.05591	13.7419	
4	9.68595	12.786	22.4719	
5	9.68595	33.9732	43.6591	

6. How does this data verify or disprove your conjecture?

	A amc	B bnc	C apb	D s
1	9.68595	25.9262	35.6122	35.6122
2	9.68595	1.09619	10.7821	10.7821
3	9.68595	4.05591	13.7419	13.7419
4	9.68595	12.786	22.4719	22.4719
5	9.68595	33.9732	43.6591	43.6591

7. Use what you know about the relationship of the measures of the legs of a 30°-60°-90° triangle to express the height of equilateral triangles with sides lengths *a*, *b*, and *c*.

8. If the equilateral triangles have side lengths *a*, *b*, and *c*, what are the areas of the three triangles?

9. Use the answers to question 8 to write an equation for the conjecture.

10. Divide the left and right sides of this equation by the GCF of all the terms. Do you recognize this equation? Where have you seen this equation before?

11. What other figures could be drawn on the sides of right triangles for which the following statement would be true?

*The sum of the areas of the two figures on the legs equals the area of the figure on the hypotenuse.*
