$\qquad$

## Introduction

Generally, when we in the United States talk about weather and temperature, we use the Fahrenheit scale. Scientists, however, often use a different scale-the Celsius scale. This scale is also used outside of the United States for everyday temperatures. In addition to the Celsius scale, scientists use the Kelvin scale. On the Kelvin scale, 0 K is called absolute zero. Nothing can be colder than absolute zero. (Note that temperature in the Kelvin scale is not given in degrees.)

## Objectives

In this activity, you will:

- review the different temperature scales
- use the List Editor stat to convert from one temperature scale to another

## You'll Need

- TI-84 Plus CE calculator

## Entering the Data

1. Start by clearing all existing lists from your calculator. To do this, press 2nd, [MEM], then use the arrow keys to scroll to ClrAll Lists. Press ENTER, ENTER.

| NORHAL | FLOAT AU | JTO REFLL | RADIAN | MP | [1] |
| :---: | :---: | :---: | :---: | :---: | :---: |
| L1 | L2 | L\% | L4 | Ls | 1 |
| 6 |  | ------ | ------ |  |  |
| 14 |  |  |  |  |  |
| 32 65 |  |  |  |  |  |
| 65 98 |  |  |  |  |  |
| 145 |  |  |  |  |  |
| 212 |  |  |  |  |  |
| 390 |  |  |  |  |  |
| - |  |  |  |  |  |
|  |  |  |  |  |  |
| L1(9)= |  |  |  |  |  |

$\qquad$
4. Use the arrow keys to highlight the header of L3. This column is for kelvins. Enter the conversion equation for degrees Celsius to kelvins: 2nd [L2] + 273 ENTER. Record the values from L3 into the third column of the data table.

| NORMAL | Flont mu | UTO REAL | RADIAN | MP | I |
| :---: | :---: | :---: | :---: | :---: | :---: |
| ${ }_{1}$ | L2 | L9 | 4 | Ls | 3 |
| 14 | ------ | ------ | ------ | ------ |  |
| 32 |  |  |  |  |  |
| 65 98 |  |  |  |  |  |
| 145 142 212 |  |  |  |  |  |
| 212 390 |  |  |  |  |  |
| ------ |  |  |  |  |  |
| $\mathrm{Ls}=\mathrm{L} 2+273$ |  |  |  |  |  |
|  |  |  |  |  |  |

5. To compare the different temperature scales, graph your values for ${ }^{\circ} \mathrm{F}$ and ${ }^{\circ} \mathrm{C}$ using the SciTools App. Press APPS and scroll to highlight SCI TOOLS. Press ENTER, ENTER. Scroll to DATA/GRAPHS WIZARD and press ENTER.
6. Press WINDOW to select PLOT DATA. Press $y=$ to select SCATTERPLOT. Select L1 as the INDEPENDENT Variable and press ENTER. Select L2 as the DEPENDENT Variable and press ENTER.
7. Press apps and choose a line fit. Highlight LIN REG for a linear regression, and press ENTER. Your graph should look similar to the one shown here. You can use this graph to convert other temperature values. Press TRACE $\triangle$. and use the left and right arrow keys $\square$ to move the cursor along the linear model. Ordered pairs along the bottom of the screen give you equivalent temperatures on the Fahrenheit and Celsius scales.

Temperature Conversions
Name $\qquad$

Data Table

| Degrees Fahrenheit $\left({ }^{\circ} \mathrm{F}\right)$ | Degrees Celsius $\left({ }^{\circ} \mathrm{C}\right)$ | Kelvin (K) |
| :---: | :--- | :--- |
| 0 |  |  |
| 14 |  |  |
| 32 |  |  |
| 65 |  |  |
| 98 |  |  |
| 145 |  |  |
| 212 |  |  |
| 300 |  |  |

## Data Analysis

1. In the graph below, what is the temperature in ${ }^{\circ} \mathrm{F}$ ? What is the temperature in ${ }^{\circ} \mathrm{C}$ ? (Round to one decimal place.)

2. How would you find the Celsius temperature shown above in Kelvins? Calculate this value.
3. Why do you think it is helpful for scientists to use the Celsius scale rather than the Fahrenheit scale?
4. What advantage does the Kelvin scale offer over the Celsius scale in science?
